The information in this document is subject to change without notice. The statements, configurations, technical data, and recommendations in this document are believed to be accurate and reliable, but are presented without express or implied warranty. Users must take full responsibility for their applications of any products specified in this document. The information in this document is proprietary to Nortel Networks Inc.

The software described in this document is furnished under a license agreement and may only be used in accordance with the terms of that license. The software license agreement is included in this document.

Trademarks

Nortel Networks, the Nortel Networks logo, the Globemark, Unified Networks, and AN, BCN, BLN, BN, BayRS, BCC, and Passport are trademarks of Nortel Networks.

Adobe and Acrobat Reader are trademarks of Adobe Systems Incorporated.

Adobe and Acrobat Reader are trademarks of Adobe Systems Incorporated.

Cisco is a trademark of Cisco Technology, Inc.

FireWall-1 is a trademark of Check Point Software Technologies Ltd.

Microsoft, Windows, and Windows NT are trademarks of Microsoft Corporation.

NetWare is a trademark of Novell, Inc.

UNIX is a trademark of X/Open Company Limited.

An asterisk after a name denotes a trademarked item.

Restricted Rights Legend

Use, duplication, or disclosure by the United States Government is subject to restrictions as set forth in subparagraph (c)(1)(ii) of the Rights in Technical Data and Computer Software clause at DFARS 252.227-7013.

Notwithstanding any other license agreement that may pertain to, or accompany the delivery of, this computer software, the rights of the United States Government regarding its use, reproduction, and disclosure are as set forth in the Commercial Computer Software-Restricted Rights clause at FAR 52.227-19.

Statement of Conditions

In the interest of improving internal design, operational function, and/or reliability, Nortel Networks Inc. reserves the right to make changes to the products described in this document without notice.

Nortel Networks Inc. does not assume any liability that may occur due to the use or application of the product(s) or circuit layout(s) described herein.

Portions of the code in this software product may be Copyright © 1988, Regents of the University of California. All rights reserved. Redistribution and use in source and binary forms of such portions are permitted, provided that the above copyright notice and this paragraph are duplicated in all such forms and that any documentation, advertising materials, and other materials related to such distribution and use acknowledge that such portions of the software were developed by the University of California, Berkeley. The name of the University may not be used to endorse or promote products derived from such portions of the software without specific prior written permission.

SUCH PORTIONS OF THE SOFTWARE ARE PROVIDED "AS IS" AND WITHOUT ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, WITHOUT LIMITATION, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

In addition, the program and information contained herein are licensed only pursuant to a license agreement that contains restrictions on use and disclosure (that may incorporate by reference certain limitations and notices imposed by third parties).

Nortel Networks Inc. Software License Agreement

This Software License Agreement (“License Agreement”) is between you, the end-user (“Customer”) and Nortel Networks Corporation and its subsidiaries and affiliates (“Nortel Networks”). PLEASE READ THE FOLLOWING CAREFULLY. YOU MUST ACCEPT THESE LICENSE TERMS IN ORDER TO DOWNLOAD AND/OR USE THE SOFTWARE. USE OF THE SOFTWARE CONSTITUTES YOUR ACCEPTANCE OF THIS LICENSE AGREEMENT. If you do not accept these terms and conditions, return the Software, unused and in the original shipping container, within 30 days of purchase to obtain a credit for the full purchase price.

“Software” is owned or licensed by Nortel Networks, its parent or one of its subsidiaries or affiliates, and is copyrighted and licensed, not sold. Software consists of machine-readable instructions, its components, data, audio-visual content (such as images, text, recordings or pictures) and related licensed materials including all whole or partial copies. Nortel Networks grants you a license to use the Software only in the country where you acquired the Software. You obtain no rights other than those granted to you under this License Agreement. You are responsible for the selection of the Software and for the installation of, use of, and results obtained from the Software.

1. Licensed Use of Software. Nortel Networks grants Customer a nonexclusive license to use a copy of the Software on only one machine at any one time or to the extent of the activation or authorized usage level, whichever is applicable. To the extent Software is furnished for use with designated hardware or Customer furnished equipment (“CFE”), Customer is granted a nonexclusive license to use Software only on such hardware or CFE, as applicable. Software contains trade secrets and Customer agrees to treat Software as confidential information using the same care and discretion Customer uses with its own similar information that it does not wish to disclose, publish or disseminate. Customer will ensure that anyone who uses the Software does so only in compliance with the terms of this Agreement. Customer shall not a) use, copy, modify, transfer or distribute the Software except as expressly authorized; b) reverse assemble, reverse compile, reverse engineer or otherwise translate the Software; c) create derivative works or modifications unless expressly authorized; or d) sublicense, rent or lease the Software. Licensors of intellectual property to Nortel Networks are beneficiaries of this provision. Upon termination or breach of the license by Customer or in the event designated hardware or CFE is no longer in use, Customer will promptly return the Software to Nortel Networks or certify its destruction. Nortel Networks may audit by remote polling or other reasonable means to determine Customer’s Software activation or usage levels. If suppliers of third party software included in Software require Nortel Networks to include additional or different terms, Customer agrees to abide by such terms provided by Nortel Networks with respect to such third party software.

2. Warranty. Except as may be otherwise expressly agreed to in writing between Nortel Networks and Customer, Software is provided “AS IS” without any warranties (conditions) of any kind. NORTEL NETWORKS DISCLAIMS ALL WARRANTIES (CONDITIONS) FOR THE SOFTWARE, EITHER EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE AND ANY WARRANTY OF NON-INFRINGEMENT. Nortel Networks is not obligated to provide support of any kind for the Software. Some jurisdictions do not allow exclusion of implied warranties, and, in such event, the above exclusions may not apply.

3. Limitation of Remedies. IN NO EVENT SHALL NORTEL NETWORKS OR ITS AGENTS OR SUPPLIERS BE LIABLE FOR ANY OF THE FOLLOWING: a) DAMAGES BASED ON ANY THIRD PARTY CLAIM; b) LOSS OF, OR DAMAGE TO, CUSTOMER’S RECORDS, FILES OR DATA; OR c) DIRECT, INDIRECT, SPECIAL, INCIDENTAL, PUNITIVE, OR CONSEQUENTIAL DAMAGES (INCLUDING LOST PROFITS OR SAVINGS), WHETHER IN CONTRACT, TORT OR OTHERWISE (INCLUDING NEGLIGENCE) ARISING OUT OF YOUR USE OF THE SOFTWARE, EVEN IF NORTEL NETWORKS, ITS AGENTS OR SUPPLIERS HAVE BEEN ADVISED OF THEIR POSSIBILITY. The forgoing limitations of remedies also apply to any developer and/or supplier of the Software. Such developer and/or supplier is an intended beneficiary of this Section. Some jurisdictions do not allow these limitations or exclusions and, in such event, they may not apply.

4. General

- a. If Customer is the United States Government, the following paragraph shall apply: All Nortel Networks Software available under this License Agreement is commercial computer software and commercial computer software documentation and, in the event Software is licensed for or on behalf of the United States Government, the respective rights to the software and software documentation are governed by Nortel Networks standard commercial license in accordance with U.S. Federal Regulations at 48 C.F.R. Sections 12.212 (for non-DoD entities) and 48 C.F.R. 227.7202 (for DoD entities).
- b. Customer may terminate the license at any time. Nortel Networks may terminate the license if Customer fails to comply with the terms and conditions of this license. In either event, upon termination, Customer must either return the Software to Nortel Networks or certify its destruction.
- c. Customer is responsible for payment of any taxes, including personal property taxes, resulting from Customer's use of the Software. Customer agrees to comply with all applicable laws including all applicable export and import laws and regulations.
- d. Neither party may bring an action, regardless of form, more than two years after the cause of the action arose.
- e. The terms and conditions of this License Agreement form the complete and exclusive agreement between Customer and Nortel Networks.
- f. This License Agreement is governed by the laws of the country in which Customer acquires the Software. If the Software is acquired in the United States, then this License Agreement is governed by the laws of the state of New York.

Release Notes for BayRS Version 15.1.0.0

Upgrading to Version 15.1.0.0	2
Upgrading ATM Configurations	2
Upgrading DVMRP Configurations	2
Upgrading FireWall-1 Configurations	3
Upgrading IP Route Filters	6
Upgrading L2TP Configurations	6
Upgrading OSPF Configurations	7
Upgrading Static Forwarding Policy Filters	7
New Features	7
BCC Support for BootP and DHCP Services	7
DVMRP Holddown Timer for Deleted Routes	8
Exclusive Login Authentication via RADIUS	8
Dropping IP Source Record Routing Packets	8
IPsec Support on Ethernet Interfaces	9
BCC Guidelines	9
BCC and BayRS Compatibility	9
Setting the Impedance Value for the Passport 2430	10
Creating FTP from the BCC	10
Deleting Interfaces with the BCC	10
Memory Requirements	10
Platforms Supported	11
Interfaces Supported	11
Protocols Supported	12

Identifying Board Types	13
AN and ANH Board Types	13
ARN Board Types	16
ASN Board Types	17
BLN and BCN Board Types	18
Passport 2430 Board Types	20
Passport 5430 Board Types	20
System 5000 Board Types	21
Technician Interface Guidelines	22
Using Scripts and Aliases to Dynamically Configure a Router	22
Diagnostics On/Off Option for ARN, Passport 2340, and Passport 5430	22
Setting Default Route Cost Using the Technician Interface	22
General Guidelines	24
Using Both Site Manager and the BCC	24
AN/ANH and ARN Guidelines	24
Allocating Memory on ARN Routers	24
DSU/CSU Test LED Remains On After Reset	25
Network Booting on DSU/CSU Interfaces	25
ARN Router Not a Supported DVS RADIUS Client	25
Increasing Buffer Size on Non-Token-Ring AN Routers	25
ATM Guidelines	26
ATM Half Bridge Support	26
Deleting ATM from a Router If Signaling Is Enabled	26
Failover and Load Balancing for ATM VCs Not Supported	26
Aggregate Limitations for Sustainable Cell Rate	26
Embedded Web Server Guidelines	27
Using the Embedded Web Server to Transfer Files	27
Accessing the Embedded Web Server Using Internet Explorer	27
DLSw Guideline	27
NAT Guidelines	28
Configuring NAT Dynamically	28
ISP Mode Not Supported by NAT	28
Configuring Bidirectional NAT	28
Protocols/Configurations Not Supported by Bidirectional NAT	29
OSPF Guidelines	29

Traffic Filters Guidelines	29
Downloading Internet Routes from an ISP	31
Interoperability with Non-Compliant Implementations of PIM	31
Fragment Tagging in Bootstrap Messages	31
Non-Compliant Router Drops RP Advertisement with Zero Prefix	32
Incorrect Computation of Checksum of PIM Register Messages	32
Routers Ignore RP Priority and Hash Value During RP Selection	32
CES and TDM on Passport 5430 Only	33
MPOA and VRRP over LANE Support	33
FRE-2 DRAM Requirements	33
BayRS Bandwidth Broker for Differentiated Services	33
Event Database	34
Protocol Statistics for MPLS	34
BayRS Flash Memory Requirements	35
Configuring PU 4 and SDLC Link Stations	35
Creating Multiple GRE Tunnels	35
Protocol Prioritization No Call Filters and TCP Applications	35
Support for Strata-Flash Card	36
Adding SDLC Changes Serial Parameter Settings	36
IPv6 Supported on ATM PVCs	37
Configuring RADIUS Servers	37
Operating Limitations and Cautions	38
ATM Services	38
APPN	39
BCC	39
Deleting a Hybrid Mode Permanent Virtual Circuit (PVC)	39
DLSw — SDLC Fast and Slow Poll Timer Defaults	40
DLSw/APPN Boundary Port Use with AS400s and Others	40
DSQMS	40
DVMRP Use with Interfaces with More than One IP Address	40
FireWall-1 Services	41
Flash Compaction or Extensive File Management Use on ARE	41
GRE Services	41
Hot-Swapping Link Modules	42
IPsec Services	42

IP Services	42
ISDN-BRI – Configuring B Channels on the ARN and Passport 2430	42

Preface

The Nortel Networks* BayRS* Version 15.1.0.0 is a software release that includes bug fixes and new features added since BayRS Version 15.0.0.0. These release notes contain guidelines for using BayRS Version 15.1.0.0.

Hard-Copy Technical Manuals

You can print selected technical manuals and release notes free, directly from the Internet. Go to the www.nortelnetworks.com/documentation URL. Find the product for which you need documentation. Then locate the specific category and model or version for your hardware or software product. Use Adobe* Acrobat Reader* to open the manuals and release notes, search for the sections you need, and print them on most standard printers. Go to Adobe Systems at the www.adobe.com URL to download a free copy of the Adobe Acrobat Reader.

You can purchase selected documentation sets, CDs, and technical publications through the Internet at the www1.fatbrain.com/documentation/nortel/ URL.

How to Get Help

If you purchased a service contract for your Nortel Networks product from a distributor or authorized reseller, contact the technical support staff for that distributor or reseller for assistance.

If you purchased a Nortel Networks service program, contact one of the following Nortel Networks Technical Solutions Centers:

Technical Solutions Center	Telephone
Europe, Middle East, and Africa	(33) (4) 92-966-968
North America	(800) 4NORTEL or (800) 466-7835
Asia Pacific	(61) (2) 9927-8800
China	(800) 810-5000

Additional information about the Nortel Networks Technical Solutions Centers is available from the www.nortelnetworks.com/help/contact/global URL.

An Express Routing Code (ERC) is available for many Nortel Networks products and services. When you use an ERC, your call is routed to a technical support person who specializes in supporting that product or service. To locate an ERC for your product or service, go to the <http://www130.nortelnetworks.com/cgi-bin/eserv/common/essContactUs.jsp> URL.

Release Notes for BayRS Version 15.1.0.0

This document contains the latest information about Nortel Networks BayRS Version 15.1.0.0, including information on the following topics:

Topic	Page
Upgrading to Version 15.1.0.0	2
New Features	7
BCC Guidelines	9
Technician Interface Guidelines	22
General Guidelines	24
Operating Limitations and Cautions	38
Documentation Changes	48
Protocols Supported	50
Standards Supported	53
Flash Memory Cards Supported	58

Upgrading to Version 15.1.0.0

To upgrade BayRS to Version 15.1.0.0, see *Upgrading Routers to BayRS Version 15.xx*, in your upgrade package. In addition, read the following sections.

Upgrading ATM Configurations

If you are upgrading from a BayRS version earlier than 12.20 and you defined log event traps for asynchronous transfer mode (ATM), ATM signaling, or ATM LAN emulation, you must redefine these traps.

The ATM, ATM signaling, and ATM LAN emulation log event messages changed in BayRS Version 12.20. The ATM_SIG entity (entity #95) no longer exists as a separate entity. We have combined the ATM_SIG entity with the ATM entity (entity #78). Combining and reorganizing these entities resulted in changes to the ATM log event message numbers. We added new log events to the ATM_LE entity (entity #100), resulting in log event message number changes for LAN emulation as well.

You can view the new and modified ATM log event messages in the event database on the BayRS Online Library Version 15.1.0.0 CD, or on the World Wide Web at this URL:

<http://www25.nortelnetworks.com/library/tpubs/events/>

Upgrading DVMRP Configurations

In BayRS Version 15.1.0.0, the default values for two DVMRP timer parameters have been changed to conform with the latest RFC for DVMRP (draft-ietf-idmr-dvmrp-v3-10). [Table 1](#) lists the parameters with their old and new default values.

Table 1. DVMRP Parameter Defaults Changed in Version 15.1.0.0

Parameter Name		Default Value (in seconds)	
Site Manager	BCC	Earlier Than 15.1.0.0	Version 15.1.0.0
Garbage Timeout	unconfirmed-route-timeout	340	260
Route Expiration Timeout	route-expiration-timeout	200	140

DVMRP timers must be the same throughout the network. Therefore, if your DVMRP network changes—for example, if you add a DVMRP router running Version 15.1.0.0 to the network, or if you create a Version 15.1.0.0 configuration file that contains DVMRP— make sure that the values for the timer parameters match the ones already configured for the network as a whole.

Upgrading FireWall-1 Configurations

To upgrade FireWall-1* from a BayRS version earlier than 13.20, complete the following steps.

Note: If you are currently running Firewall-1 from BayRS Version 13.20 or higher and want to upgrade to BayRS Version 15.1.0.0, you do not have to follow these steps. Firewall-1 is not supported on the Passport* 2430 and Passport 5430 platforms.

1. Familiarize yourself with the Bay Command Console (BCC*).

Starting with BayRS Version 13.20, FireWall-1 no longer supports Site Manager as a configuration tool. You must use the BCC to manage and configure FireWall-1. For basic information about using the BCC, see *Using the Bay Command Console (BCC)*.

2. Make sure that you will not lose access to your router.

When you upgrade to BayRS Version 15.1.0.0, once you boot your router, the Version 15.1.0.0 software invokes the default FireWall-1 security policy. This default security policy drops all attempts at communication with the router.

If you manage a router at a remote location, you will no longer be able to gain access to the router through the WAN connection. Before you upgrade, make sure that you can gain access to the router by dialing in through the console port, or that there is someone at the remote location who can configure the router.

3. Reboot the router with BayRS Version 15.1.0.0, using an existing configuration file.

4. Use the BCC to reenable FireWall-1 on each IP interface.

To reenable FireWall-1 on each IP interface, use the BCC to navigate to the prompt for the slot/connector on which you have configured the IP interface (for example, **box; eth 2/2**). Then enter:

ip address <ip_address> **mask** <address_mask>

ip_address is the IP address you have assigned to the interface.

address_mask is the mask associated with the IP address.

The prompt for the IP interface appears.

For example, the following command invokes the prompt for IP interface 2.2.2.2/255.0.0.0 (which has been configured on Ethernet slot 2, connector 2):

```
ethernet/2/2# ip address 2.2.2.2 mask 255.0.0.0  
ip/2.2.2.2/255.0.0.0#
```

At the prompt for the IP interface, enter the following command to reenable FireWall-1:

firewall

The firewall prompt appears.

For example, the following command reenables FireWall-1 on the IP interface 2.2.2.2/255.0.0.0:

```
ip/2.2.2.2/255.0.0.0# firewall  
firewall/2.2.2.2#
```

5. To use FireWall-1 on more than 32 circuits, set the policy index number for each IP interface.

The policy index allows multiple circuits to share the same instance of FireWall-1. You can have up to 32 instances of FireWall-1, with many circuits making up each FireWall-1 instance. All circuits in a grouping must share the same security policy.

By default, the policy index for a circuit is equal to the circuit number. If you are using FireWall-1 on fewer than 33 circuits, you do not have to use policy indexes.

If you are using FireWall-1 on more than 32 circuits, group circuits that share the same security policy. Then, set the policy index on each circuit in a group to the same value.

For example, suppose you want to use FireWall-1 on 40 circuits. The first five circuits share one security policy; the next 35 share a different security policy. Using the BCC, assign policy index 1 to the first five circuits and policy index 2 to the next 35 circuits. You then have a total of 40 firewall circuits on the router, with two policy index values and two security policies.

Note: If you do not use policy index values and you configure more than 32 circuits on the router, all IP forwarding is disabled on circuits after the 32nd. If you use policy index values, but configure more than 32 policy index groupings, all circuits assigned policy indexes after the 32nd will have all IP forwarding disabled. The router logs warning messages that can help you determine whether you have any circuits on which all IP forwarding is disabled.

The Check Point log viewer treats circuits that share a policy index as one circuit.

If you are running FireWall-1 on more than 32 circuits and you therefore need to set the policy index value, use the BCC to navigate to the firewall prompt, as described in step 4. Then enter:

policy-index <value>

value is the index value, from 1 to 1023.

For example, the following command sets the policy index to 1:

```
firewall/2.2.2.2# policy-index 1
firewall/2.2.2.2#
```

6. Save the configuration file and reboot the router.

7. Reinstall the security policy.

Since you previously defined a security policy (using the earlier version of BaySecure FireWall-1), you do not need to define it again. However, you must reinstall it in on the router. For complete instructions on how to install the security policy, see your Check Point FireWall-1 documentation.

If you want to install different security policies for different policy indexes, use the Check Point FireWall-1 command line interface to enter the following command:

fw load ../conf/<config_file> pol<policy_index_number>@<router_name>

For example, the following command specifies that the system install the security policy in the configuration file *drop_ftp* on policy index number 1 on the router named *asn1*:

```
fw load ../conf/drop_ftp pol1@asn1
```

Upgrading IP Route Filters

If you have configured IP route filters and then disabled those filters (rather than deleted them), when you upgrade to Version 15.1.0.0 from a version earlier than 14.00, the filters will be re-enabled. You must disable the filters again after the upgrade is complete. If you do not want to use the filters, you might want to consider deleting them before you upgrade to Version 15.1.0.0.

Upgrading L2TP Configurations

If you have a BayRS Version 12.10 configuration file that includes L2TP operating on a router using BayRS Version 15.1.0.0, the router automatically upgrades the assigned user network addresses to L2TP IP interface addresses. L2TP IP interface addresses are internal to the router. When communicating with the remote user, the router associates the user's IP address with an L2TP IP interface address that you configure.

The user network addresses assigned to Version 12.10 apply to the entire router. In Version 15.1.0.0, each slot has a unique L2TP IP address. Consequently, if the number of configured L2TP slots is greater than the number of configured assigned user network addresses, the router will not be able to upgrade every slot from a Version 12.10 configuration to a Version 15.1.0.0 configuration. For slots that exceed the number of assigned user network addresses, you must manually configure L2TP IP interface addresses. To do this, delete L2TP from the slot, and then configure a new L2TP interface. Each slot must have L2TP IP interface addresses.

If the number of configured L2TP slots is less than or equal to the number of configured assigned user network addresses, the router automatically converts all assigned user network addresses to L2TP IP addresses.

Upgrading OSPF Configurations

When you upgrade BayRS from releases earlier than Version 12.20, there must not be an open shortest path first maximum transmission unit (OSPF MTU) interface mismatch. If a mismatch exists, adjacencies will not form between upgraded routers. All the OSPF routers forming adjacencies on a segment (broadcast, point-to-point [PPP], Point-to-Multipoint, or nonbroadcast multi-access [NBMA]) should have the same OSPF MTU size. You configure the OSPF MTU size through the MTU Size parameter in the OSPF Interfaces window in Site Manager.

BayRS Versions 14.00 and later comply with RFC 2328, which requires the OSPF MTU size feature.

Upgrading Static Forwarding Policy Filters

Internet Group Management Protocol (IGMP) static forwarding policy filters that you created in versions earlier than Site Manager Version 7.20 will not work correctly using Site Manager Version 7.20. To use these IGMP static forwarding policy filters, you must re-create them. For information about creating IGMP static forwarding policy filters, see *Configuring IP Multicasting and Multimedia Services*.

New Features

The following sections provide brief descriptions of the new features in BayRS Version 15.1.0.0.

BCC Support for BootP and DHCP Services

BayRS 15.1.0.0 now allows you to configure the router as a BootP relay agent and as a DHCP server using the BCC. This enhancement extends BCC support for all BootP and DHCP functionality previously supported in Site Manager only.

For more information, see *Configuring SNMP, BootP, and DHCP Services*.

DVMRP Holddown Timer for Deleted Routes

To avoid problems that can occur when a route is deleted, DVMRP implements a holddown timer (see draft-ietf-idmr-dvmrp-v3-10, section 3.4.8). During the holddown period, the deleted route is advertised as unreachable, and all forwarding cache entries based on the route are flushed. The holddown period lasts for two route report intervals.

The Nortel Networks implementation of DVMRP now supports the holddown timer for deleted routes. You can use the BCC or Site Manager to enable or disable the DVMRP holddown timer on the router. If your router needs to be backward compatible with older implementations of DVMRP, use the default value (holddown disabled).

For more information, see *Configuring IP Multicasting and Multimedia Services*.

Exclusive Login Authentication via RADIUS

This feature enables a router to authenticate multiple users (with individual profiles) via RADIUS. If authentication between the RADIUS client and server fails, other means will allow access to the router via Telnet and console connections. When the server is not reachable, the router will periodically attempt to re-establish communications as configured.

For more information, see *Configuring RADIUS*.

Dropping IP Source Record Routing Packets

This feature provides an IP global parameter to enable (default) or disable IP source routing for a router. When IP source routing is disabled, the router drops loose source record route (LSSR) and strict source record route (SRRR) packets. This feature provides greater network security to users of IP source routing.

For more information, see *Configuring IP, ARP, RARP, RIP, and OSPF Services*.

IPsec Support on Ethernet Interfaces

IP Security (IPsec) is a set of emerging standards being developed by the IETF to provide secure communication over public networks. These standards were developed to ensure secure, private communication for remote access, extranet, and intranet virtual private networks (VPNs). IPsec is designed to work flexibly with different encryption algorithms, authentication methods, and key exchange methods.

In earlier releases of BayRS, the Nortel Networks implementation of IPsec provided network layer (layer 3) security services only on WAN interfaces configured with PPP or frame relay. With the release of BayRS Version 15.1.0.0, you can now also configure IPsec services on Ethernet interfaces on all BayRS routers.

For information about IPsec and instructions on how to configure it, see *Configuring IPsec Services*.

BCC Guidelines

The BCC is a command-line interface for configuring Nortel Networks devices.

Before using the BCC, see the following guidelines for using the software and the platforms, protocols, interfaces, and hardware modules that the BCC supports.

BCC and BayRS Compatibility

Starting with BayRS Version 14.00, the BCC software version number matches that of BayRS. For example, the version for both the BCC and BayRS is 15.1.0.0. We have made this change to help you align versions of the BCC with versions of BayRS.

Setting the Impedance Value for the Passport 2430

The Passport 2430 can accommodate either BNC (requires 75 ohm impedance) or RJ45 (requires 120 ohm impedance) connectors. You can use the BCC to set the impedance-value attribute to either 75 ohms or 120 ohms.

To set the impedance value on the FE1 interface, go to the FE1 prompt (for example, **box; fe1**) and enter:

impedance-value <value>

value is one of the following:

rj45-120-ohms (default)

bnc-75-ohms

For example, the following command sets the impedance value to 75 ohms for this interface on the router:

```
fe1/1/1# impedance-value bnc-75-ohms
fe1/1/1#
```

Creating FTP from the BCC

From the BCC, if you create FTP on the router, then delete it and re-create it, the BCC faults. In this case, you must restart the BCC and create FTP on the router again.

Deleting Interfaces with the BCC

Before using the BCC to delete an interface, make sure that you did not use Site Manager to configure the interface with a protocol that the BCC does not recognize. If you did, use Site Manager to delete the interface.

Memory Requirements

To use the BCC, each slot on the router must have:

- 16 MB of dynamic RAM (DRAM)
- 2 MB of free memory available when you start the BCC

If you try to start the BCC with insufficient DRAM or free memory on a slot, the BCC returns the following message. In this case, you must use Site Manager instead of the BCC to configure the router.

```
**Error** Unable to load bcc command from file system.  
Loadable Module: bcc.exe
```

Platforms Supported

The BCC runs on AN*, ANH, ARN, ASN, Passport2430, Passport 5430, System 5000, and BN* platforms including ARE, FRE-2, and FRE-4 processor modules.

Interfaces Supported

You can use BCC commands to configure the following interfaces:

- ATM
- Console
- DCM
- DSU/CSU
- Ethernet
- FDDI
- FE1
- FT1
- HSSI
- ISDN/BRI
- MCE1/MCT1
- Serial (synchronous)
- Token ring
- Virtual (referred to in Site Manager as Circuitless IP)

[Table 2](#) through [Table 8](#) on pages [page 13](#) through [21](#) list the link and net modules that the BCC supports.

Protocols Supported

You can use BCC commands to configure the following protocols and services:

- Access (multiuser access accounts)
- ARP
- ATM
- BGP (including accept and announce policies)
- Data compression (WCP and Hi/fn)
- Dial backup
- Dial-on-demand
- DLSw
- DNS
- DVMRP (including accept and announce policies)
- FireWall-1
- Frame relay (multilink not supported)
- FTP
- GRE
- HTTP
- IGMP
- IP (including accept policies, adjacent hosts, static routes, and traffic filters)
- IPX (including static-netbios-route)
- IPXWAN
- LLC2
- MPOA
- NAT
- NHRP
- NTP
- OSPF (including accept and announce policies)
- PPP (certain line parameters only; no multiline or multilink supported)
- Proprietary Standard Point-to-Point
- RADIUS
- RIP (including accept and announce policies)
- Router discovery (RDISC)

- SDLC
- SNMP
- Source route bridge
- Spanning tree
- Syslog
- Telnet
- TFTP
- Transparent Bridge
- VRRP (Virtual Router Redundancy Protocol)

Identifying Board Types

[Table 2](#) through [Table 8](#) identify the board type parameter values displayed by the BCC.

Note: You cannot use BCC commands to configure an X.25 PAD or V.34 console modem daughterboard for the ARN router. Use Site Manager to configure these daughterboards.

Inserting a daughterboard into an AN base module redefines its module ID and board type.

AN and ANH Board Types

[Table 2](#) lists the AN and ANH board types.

Table 2. BCC Board Types: AN and ANH Modules

BCC Board Type	Technician Interface or MIB Module ID	Description
andeds	1033	AN-ENET (2 Ethernet ports, 2 serial ports)
andedsg	1050	ANH-8 (2 Ethernet ports, 2 serial ports) and an 8-port Ethernet hub active for the first Ethernet port
andedsh	1035	ANH-12 (2 Ethernet ports, 2 serial ports) and a 12-port Ethernet hub
andedst	1034	AN-ENET (2 Ethernet ports, 2 serial ports, 1 token ring port)

(continued)

Table 2. BCC Board Types: AN and ANH Modules *(continued)*

BCC Board Type	Technician Interface or MIB Module ID	Description
andst	1037	AN-TOKEN (2 serial ports, 1 token ring port)
andstc	1091	AN-TOKEN with CSU/DSU (2 serial ports, 1 token ring port)
andsti	1038	AN-TOKEN with ISDN (2 serial ports, 1 token ring port)
andsdsdst	1041	AN-ENET/TOKEN (1 Ethernet port, 2 serial ports, 1 token ring port)
anseds	1024	AN-ENET (1 Ethernet port, 2 serial ports) with 16 MB DRAM
ansedsc	1090	AN-ENET with CSU/DSU (2 Ethernet ports, 2 serial ports)
ansedsf	1100	AN-ENET with T1/FT1 (2 Ethernet ports, 2 serial ports)
ansedsg	1047	ANH-8 (1 Ethernet port, 2 serial ports) and an 8-port Ethernet hub
ansedsgc	1094	ANH-8 with CSU/DSU (1 Ethernet port, 2 serial ports) and an 8-port Ethernet hub
ansedsgf	1108	ANH-8 with T1/FT1 (1 Ethernet port, 2 serial ports) and an 8-port Ethernet hub
ansedsgi	1051	ANH-8 with ISDN (1 Ethernet port, 2 serial ports) and an 8-port Ethernet hub
ansedsgj	1127	AN-ENET (1 Ethernet port, 2 serial ports, 1 fractional E1 port) and an 8-port Ethernet hub
ansedsgjx	1137	AN-ENET (1 Ethernet port, 2 serial ports, 1 fractional E1 port) and an 8-port Ethernet hub and DCM
ansedsgx	1048	ANH-8 with DCM (1 Ethernet port, 2 serial ports) and an 8-port Ethernet hub
ansedsh	1026	ANH-12 (1 Ethernet port, 2 serial ports) and a 12-port Ethernet hub
ansedshc	1093	ANH-12 with CSU/DSU (1 Ethernet port, 2 serial ports) and a 12-port Ethernet hub
ansedshf	1106	ANH-12 with T1/FT1 (1 Ethernet port, 2 serial ports) and a 12-port Ethernet hub
ansedshi	1029	ANH-12 with ISDN (1 Ethernet port, 2 serial ports) and a 12-port Ethernet hub
ansedshj	1125	AN-ENET (1 Ethernet port, 2 serial ports, 1 fractional E1 port) and a 12-port Ethernet hub

ds1e1atm	8160	DS1/E1 ATM
fbrmbdfen	8000	FBR Ethernet Module

System 5000 Board Types

[Table 8](#) lists the System 5000 board types.

Table 8. BCC Board Types: System 5000 Modules

BCC Board Type	Technician Interface or MIB Module ID	Description
asnbri	2560	Router Quad Port ISDN BRI Net Module
atm5000bh	524544	Centillion Multiprotocol Engine
denm	1280	Router Dual Ethernet Net Module
dmct1nm	2944	Router Dual Port MCT1 Net Module
dsnm1n	1540	Router Dual Synchronous Net Module
dtm	2048	Router Dual Token Ring Net Module
iqe	1408	5380 Ethernet Router Module
mce1nm	2816	Router MCE1 Net Module
mmasmbdas	1833	Router Hybrid PHY B FDDI Net Module
mmfsddas	1793	Router Multimode FDDI Net Module
qsyncnm	1664	Router Quad Port Synchronous Net Module
se100nm	2304	Router 100BASE-T Ethernet Net Module
shssinm	3584	Router HSSI Net Module
smammbdas	1825	Router Hybrid PHY A FDDI Net Module
smfsddas	1801	Router Single Mode FDDI Net Module

Technician Interface Guidelines

The Technician Interface is a command-line interface that Nortel Networks support technicians can use to troubleshoot and configure Nortel Networks devices.

We provide this section as an interim supplement to one or more of the following Technician Interface books:

- *Using Technician Interface Scripts*
- *Using Technician Interface Software*
- *Writing Technician Interface Scripts*

This information will appear in the Release Notes until we integrate it in to the next released version of the associated Technician Interface book.

Using Scripts and Aliases to Dynamically Configure a Router

Use of rapid-fire scripts or aliases to dynamically set a router's configuration via the MIBs can put the router into a corrupted state and cause connectivity issues. When you use the Technician Interface to launch scripts or aliases to configure the router be sure to include pauses (one to two seconds) to allow sufficient time for the router to make the required changes to the MIBs.

Diagnostics On/Off Option for ARN, Passport 2340, and Passport 5430

For ARN, Passport 2430 and Passport 5430 platforms *only*, the Technician Interface **diags** command supports an option to enable or disable diagnostics, effective the next time you cycle power on the router. Disabling the diagnostics results in a faster boot time, but leaves the hardware components unverified. The syntax for this option is as follows:

```
diags [- on|off] [ <slot_id>]
```

Setting Default Route Cost Using the Technician Interface

When the routing table does not contain the route to a particular destination address, the router looks for a default route. As it does for any other route, the routing table either acquires the default route dynamically (through a routing protocol), or you can enter the default route statically.

You can use the Technician Interface to set the `wfRipIntfDefaultRouteCost` (RIP default route cost) MIB attribute. This attribute interacts with the Site Manager parameter Default Route Supply or BCC parameter default-supply in one of two ways:

- If you select Enable for Default Route Supply or default-supply, RIP advertises the default route cost you set for `wfRipIntfDefaultRouteCost` attribute *plus* the default route learned from the network.
- If you select Generate for Default Route Supply or default-supply, RIP advertises the default route cost you set for `wfRipIntfDefaultRouteCost`.

For additional information, see “Supplying a Default Route on an Interface” in *Configuring IP, ARP, RARP, RIP and OSPF Services*.

With the Technician Interface, enter the following commands to set the `wfRipIntfDefaultRouteCost` (RIP default route cost) attribute:

set wfRipIntfDefaultRouteCost <value>

value is any integer from 0 through 15. The default value is 1.

commit

save config <vol>: <filename>

You must have Manager access to issue a **set** command. The **commit** command causes the changes you made to the configuration to take effect in active memory, but not in flash memory. The **save config** command saves changes to a configuration file (config) and flash volume on the router.

General Guidelines

The following guidelines supplement the instructions in the BayRS Version 15.1.0.0 documentation set.

Using Both Site Manager and the BCC

You can use either Site Manager or the BCC to manage Nortel Networks routers. If you want to use both tools, follow these guidelines:

- Do not try to use both Site Manager and the BCC to manage a single router at the same time. You are prohibited from doing so with a lock-out mechanism.
- Site Manager cannot understand traffic filters you configured using the BCC.
- Site Manager configuration files that contain the / (forward slash) character in any of the ASCII text inputs (for example, Unnumbered CCT Name) cause an error when viewed in the BCC using the **show config -all** command. This error halts printing of the text parameter at the / character and displays the message "Too many BCC ID values" at the end of the display. To prevent this problem, do not use the / character when entering ASCII text for parameters in Site Manager.

AN/ANH and ARN Guidelines

Follow these guidelines when using AN, ANH, or ARN routers.

Allocating Memory on ARN Routers

Although you can change the default memory allocation on other Nortel Networks router platforms, the ARN platform does not support this “buffer carving” feature.

On the ARN, Site Manager does not support the Admin > Kernel Configuration option, and the Technician Interface does not support the **set** command for wfKernCfgParamEntry objects. Attempting to set wfKernCfgParamGlobMem on the ARN results in a warning message.

DSU/CSU Test LED Remains On After Reset

The ARN DSU/CSU Test LED properly goes on when the interface enters test or loopback mode. However, the LED remains on after resetting the DSU/CSU module, even though all looping terminates and the module hardware resets.

Restarting the router turns the LED off. However, this action is not necessary for proper operation of the DSU/CSU interface.

Network Booting on DSU/CSU Interfaces

AN and ANH DSU/CSU interfaces do not support network booting.

ARN Router Not a Supported DVS RADIUS Client

The ARN router is not a supported DVS RADIUS client.

Increasing Buffer Size on Non-Token-Ring AN Routers

By default, AN routers without token ring modules installed initialize with a buffer size of 1824 bytes, which makes these ANs unable to accept packets larger than 1590 bytes. To allow ANs without token ring modules to accept larger packets, you can increase the buffer size by setting the MIB variable wfKernCfgParamEntry.wfKernCfgParamBufSize to 4800.

For complete instructions on using the Technician Interface to set MIB variables, see *Using Technician Interface Software*. The following example shows Technician Interface commands you might use to reset the MIB variable wfKernCfgParamEntry.wfKernCfgParamBufSize to 4800:

```
set wfKernCfgParamEntry.wfKernCfgParamDelete.1 1  
set wfKernCfgParamEntry.wfKernCfgParamBufSize.1 4800  
set wfKernCfgParamEntry.wfKernCfgParamDelete.1 2  
commit  
save config 2:config  
reset 1
```

To set the buffer size back to its default of 1824 bytes, issue the following command:

```
set wfKernCfgParamEntry.wfKernCfgParamBufSizeReset.1 1  
commit
```

ATM Guidelines

Follow these guidelines when configuring ATM:

ATM Half Bridge Support

BayRS Version 15.1.0.0 includes support of the ATM Half Bridge (AHB) feature.

Please be aware that some users, operating under certain conditions, may encounter issues such as the following:

- When AHB caches an unsecure host that it learned via ARP, the associated idle time is 0. The idle time remains at 0 and does not age correctly.
- When you boot a router running AHB, the ARE slot logs a fault message.
- When you reset the AHB, it stops forwarding traffic out of the AHB port.
- If you configure AHB on an ATM null PVC, the router may crash.
- If you configure AHB and add a PVC to the router while another system is sending a ping message to your router, the ARE slot may crash and may begin executing the cold start hardware diagnostics.

Deleting ATM from a Router If Signaling Is Enabled

Do not delete ATM from a router if you enabled signaling on an ATM circuit. Otherwise, Site Manager, the BCC, or the Technician Interface will restart after a few minutes.

Failover and Load Balancing for ATM VCs Not Supported

You can configure multiple ATM virtual circuits (VCs) to the same destination address. However, this kind of configuration does not provide load balancing or failover support.

Aggregate Limitations for Sustainable Cell Rate

The *aggregate* sustainable cell rate (SCR) for all PVCs configured should not exceed 353207 cells per second for ARE OC-3 SONET/SDH ILI pairs. It is advisable to set SCR to less than that to ensure there is sufficient bandwidth for any SVCs that may also be configured on this interface. The SCR is set at the Xmit Sustainable Cell Rate (cells/s) parameter using Site Manager and at the scr parameter using the BCC.

Embedded Web Server Guidelines

Follow these guidelines when using the embedded web server:

Using the Embedded Web Server to Transfer Files

When you use the embedded Web server to transfer files to or from the router, HTTP (Hypertext Transfer Protocol) encapsulates the data. You do not need to be concerned with selecting a file format (text or binary, for example) the way you would if you were using FTP (File Transfer Protocol) or TFTP (Trivial File Transfer Protocol) to transfer the files.

For example, to transfer an image file to the router, use your browser's default file format type to transfer the file to the router's flash memory. The file arrives at the router as an image file from which you can boot the router.

Accessing the Embedded Web Server Using Internet Explorer

When you access the embedded Web server using Microsoft Internet Explorer Version 4.72.2106.8, the file page is blank. However, Internet Explorer Version 4.72.3110.8 works correctly. We suggest that you upgrade to Version 4.72.3110.8 or later.

DLSw Guideline

To establish connectivity for NetBIOS Clients where DLSw is configured and attached to a switched environment, enter the following command string using the Technician Interface:

set wflcInterfaceEntry.24.<circuit number> 2;commit

Within your set command you must specify the Ethernet <circuit number> on the DLSw router where the clients are attached. You should also set the value for the MIB attribute to "2" to force the encapsulation of broadcast packets in the token ring format.

NAT Guidelines

Follow these guidelines when configuring NAT:

Configuring NAT Dynamically

When you configure a local or global interface for NAT in dynamic mode, the router returns an SNMP set error. However, this error does not affect the configuration of the router.

ISP Mode Not Supported by NAT

NAT does not support the ISP mode feature. ISP mode is a BayRS global IP parameter that allows you to enable the BGP soloist and disable IP forwarding caches. By default, ISP mode is disabled in BayRS.

Configuring Bidirectional NAT

For multidomain NAT to work, in addition to configuring bidirectional NAT on the router, you must:

1. **Configure RIP2 on the NAT router interfaces and on each router with which the NAT router will be exchanging routing updates. Otherwise, you must configure static routes or a combination of RIP2 and static routes.**
2. **Install Domain Name System (DNS) server on a machine that is running UNIX or Windows NT and that has access to the NAT router. DNS server software is available from third-party suppliers and may be included with your operating system software.**
3. **Configure BayRS DNS proxy on each interface of a NAT router to be used for dynamic bidirectional translation. You do not need to configure DNS proxy for a static bidirectional network address translation.**
4. **Configure BayRS DNS client on each device that will be initiating traffic in the domains of your multidomain NAT configuration.**

Protocols/Configurations Not Supported by Bidirectional NAT

- OSPF
- BGP
- IPsec on the same interfaces configured for bidirectional NAT
- BayRS ECMP

OSPF Guidelines

If you are using Open Shortest Path First (OSPF) services, please keep the following guidelines in mind:

- As of BayRS Version 14.00, we do not support the OSPF backup soloist feature.
- According to RFC 2328, the cost of an OSPF route to an aggregated group of networks should be the distance to the furthest network in the group. A new MIB parameter, wfOspfAggrUseMaxCost, allows you to determine how to summarize the subnets using the area range. To use the furthest cost in the routing table, set this MIB to **1** (Enable). If you accept the default, **2** (Disable), the OSPF route cost is represented as the shortest path to a network within the aggregated group of networks.
- When OSPF is configured on a synchronous PPP interface using Site Manager, the interface type is set to Point-to-point rather than to the actual default, Broadcast.

Traffic Filters Guidelines

Follow these guidelines when configuring traffic filters:

- If you apply a traffic filter to a *multinetted interface* (that is, an interface with more than one IP address), the traffic filter might not work correctly. To ensure that the filter works correctly, you must assign the same filter to all of the IP addresses on the interface.
- Site Manager cannot understand traffic filters that you configured using the BCC.

- When implementing outbound traffic filters for LAN protocols, in some configurations the filters might cause a decline in throughput performance. For LAN circuits where the forwarding rate of the router is critical, monitor the throughput performance after configuring outbound traffic filters. If you notice an unacceptable performance degradation, try using inbound traffic filters.
- If you use Site Manager or the BCC to configure IP traffic filters with precedence values that are higher than the number of traffic filters configured, you might reach the maximum precedence value before you create the maximum number of filters. When you reach the maximum precedence value of 31 traffic filters, the router generates an error if you try to configure a filter with a precedence of 32. The system does not place you in extended filtering mode.

For example, if you create the following five traffic filters, an error occurs when you create the fifth filter:

Filter 1 precedence = 28

Filter 2 precedence = 29

Filter 3 precedence = 30

Filter 4 precedence = 31

Filter 5 precedence = 32 (error occurs here)

As a workaround, you can take one of the following actions:

- Reassign the precedence value of traffic filters 1 through 5 to lower values.
- Use the Technician Interface to turn on extended filtering mode and let the system assign precedence values to additional traffic filters on the IP interface.

Downloading Internet Routes from an ISP

To minimize the time required to download routes from an Internet service provider (ISP), adjust two IP global parameters. Use the BCC to set the routing-table-indexes value to 10000 and the routing-table-deviation value to 50, as follows:

```
ip#routing-table-indexes 10000  
ip#routing-table-deviation 50
```

See *Configuring IP, ARP, RARP, RIP, and OSPF Services* for more information about these commands.

Interoperability with Non-Compliant Implementations of PIM

This section describes compatibility issues that exist when running Protocol Independent Multicast (PIM) in a network that consists of both Nortel Networks routers and non-compliant implementations of PIM on routers.

Note: The term “non-compliant router” is used in the following sections to indicate routers (such as Cisco* routers) that run implementations of PIM that do not comply with all elements of RFC 2362.

Nortel Networks routers can be configured for compatibility with non-standard implementations of PIM at the RFC2362 Non-Compatibility parameter using Site Manager. For additional information see “Enabling and Disabling Router Compatibility with RFC 2362” in *Configuring IP Multicasting and Multimedia Services*.

Fragment Tagging in Bootstrap Messages

In a PIM network in which Nortel Networks and non-compliant routers interoperate, a non-compliant router sends bootstrap packets that contain a fragment tag set to a zero value. When the Nortel Networks router receives these packets, it treats them as duplicate packets and immediately drops them.

To enable a Nortel Networks router to accept bootstrap packets from a non-compliant router, select the PIM_BSR_ZERO_FRAGMENT_TAG option at the RFC2362 Non-Compatibility parameter using Site Manager.

Non-Compliant Router Drops RP Advertisement with Zero Prefix

If you configure a non-compliant router to serve as the bootstrap router (BSR) and you configure a Nortel Networks router to serve as an RP router for a PIM domain, the non-compliant router drops any RP advertisement packet it receives from the RP router that contains a zero group prefix count. As a result, the non-compliant router cannot advertise RP set information to all PIM routers in the domain.

To ensure that the non-compliant router sends advertisement messages to all multicast group ranges using address 224.0.0.0/4, select the `PIM_RP_ZERO_PREFIX_COUNT` option at the RFC2362 Non-Compatibility parameter using Site Manager. Selecting this option sends non-zero prefix count in RP advertisement messages.

Incorrect Computation of Checksum of PIM Register Messages

By default, Nortel Networks routers compute checksum on the PIM header only. Compatibility issues arise when Nortel Networks routers interoperate with non-compliant routers which compute checksum on the PIM header *and* data portion of the packet.

To enable checksum compatibility with a non-compliant router, select the `PIM_REGISTER_CHECKSUM` option at the RFC2362 Non-Compatibility parameter using Site Manager.

Routers Ignore RP Priority and Hash Value During RP Selection

You configure multiple RPs responsible for the same or overlapping group ranges in a PIM domain. For RPs responsible for the same group ranges, a non-compliant router selects the first RP on the RP list, regardless of the RP priority and hash value. For RPs responsible for overlapping group ranges, a non-compliant router selects the router with the most specific group range, regardless of the RP priority and hash value.

As a workaround, configure only one RP router for each unique group range. This allows the Nortel Networks router and the non-compliant router to select the same RP.

CES and TDM on Passport 5430 Only

The following features and parameters are supported for the Passport 5430 only:

- Circuit Emulation Services (CES)
- Time Division Multiplexing (TDM)
- Traffic Shaping parameters: Service Category, AAL Type, VBR Type, Congestion indication, Cell loss priority, Initial and Minimum Cell Rates, Cell rate increase and decrease factors

MPOA and VRRP over LANE Support

BayRS Version 15.1.0.0 does not support running both Virtual Router Redundancy Protocol (VRRP) and Multi-Protocol Over ATM (MPOA) over LAN Emulation (LANE).

FRE-2 DRAM Requirements

The FRE-2 processor card requires a minimum of 16 MB DRAM.

BayRS Bandwidth Broker for Differentiated Services

To implement a differentiated services network using a BayRS bandwidth broker, you must install the BayRS Bandwidth Broker, also known as the *policy server*, software on a PC running Microsoft* Windows NT* 4.0. The Nortel Networks router that communicates with the bandwidth broker must be operating with BayRS Version 13.20 or later software.

To download the policy server software and learn how to configure it:

1. **Go to the Router Management Labs page at the following URL:**
<http://www.nortelnetworks.com/rml>.
2. **Click on Software Solutions.**
3. **If you are a registered user, enter your email address. If not, register.**

You see a list of solutions for which you can download software.

4. **Scroll through the list to locate the Policy Server.**

From here you can download the software and the user manual.

Event Database

You can view the event database on the World Wide Web and the BayRS Online Library Version 15.1.0.0 CD. To access the event database on the World Wide Web, go to: <http://www25.nortelnetworks.com/library/tpubs/events/>

To access the event database on the BayRS Online Library Version 15.1.0.0 CD, follow the instructions in the CD booklet.

The event database includes a search facility that allows you to sort events by entity number, event number, severity, and text of the event message. For example, you can list only the warning messages for the IPX entity.

Protocol Statistics for MPLS

The HTTP Server interface contains a folder icon for displaying Multiprotocol Label Switching (MPLS) statistics. The following table summarizes these statistics and how to get them using the HTTP Server interface.

Clicking on Statistics > Protocols > MPLS in the navigational frame reveals the following subordinate links: MLM Interface, MLM Sessions, MLM Connections, LDP Sessions, and LDP Information.

To see these statistics	Use this path
MLM Interface	Statistics > Protocols > MPLS > MLM Interfaces
MLM Sessions	Statistics > Protocols > MPLS > MLM Sessions
MLM Connections	Statistics > Protocols > MPLS > MLM Connections
LDP Sessions	Statistics > Protocols > MPLS > LDP Sessions
LDP Information	Statistics > Protocols > MPLS > LDP Information

BayRS Flash Memory Requirements

BayRS software ships the following software suites on flash memory cards for each platform listed:

Platform	Flash Memory Required	Associated Software Suites
AN/ANH	16 MB	corp_suite, ip_access, office_suite
ARN	8 or 16 MB	corp_suite, ip_access, office_suite
ASN	16 MB	corp_suite, lan_suite, system_suite, wan_suite
BN	16 or 32 MB	atm_suite, corp_suite, corpfre2_suite, lan_suite, system_suite, vnr_suite, wan_suite
Passport 2430	16 MB	corp_suite, ip_access, office_suite
Passport 5430	32 MB	corp_suite, ip_access, office_suite
System 5000	16 MB	corp_suite, lan_suite, system_suite, vnr_suite, wan_suite

Configuring PU 4 and SDLC Link Stations

If you use PU 4 devices with Synchronous Data Link Control (SDLC) and modulo 128, set the SDLC parameters MAXOUT and MAXIN to 127. You see these parameters in the SDLC Link Station Configuration window. For instructions on setting these parameters, see *Configuring SDLC Services*.

Creating Multiple GRE Tunnels

When creating multiple GRE tunnels dynamically, you can configure a maximum of five point-to-point GRE tunnels. In multipoint configurations, you can configure 64 GRE tunnels per interface.

Protocol Prioritization No Call Filters and TCP Applications

Using a no call filter that applies to any TCP application can cause TCP to retransmit the filtered packet.

When two routers running a TCP application are connected using a demand line, and the demand line becomes inactive, the TCP application remains connected.

If a demand line configured with a no call filter goes down, the no call filter drops the TCP packet that matches the no call filter rule. Because TCP never receives an acknowledgment that the packet was dropped, the TCP application continues to retransmit that packet until the connection times out and the application stops operating.

Note: No call filters are specific to dial services. For additional information about traffic filters and protocol prioritization, see *Configuring Traffic Filters and Protocol Prioritization*.

Support for Strata-Flash Card

BayRS supports the Strata-Flash card on AN, ANH, ARN, ASN, and BN routers. For details about flash cards, see “[Flash Memory Cards Supported](#)” on [page 58](#).

Adding SDLC Changes Serial Parameter Settings

When you configure SDLC on a serial interface, the router software automatically changes the values for the following serial parameters:

- cable type
- clock source
- internal clock speed
- signal mode

Defaults for serial parameters, without SDLC, are listed in [Table 9](#).

Table 9. Default Settings for Serial Parameters without SDLC

Parameter	Default Setting
cable type	null
clock source	external
internal clock speed	clk64k
signal mode	balanced

After you add SDLC to an interface, the settings for the serial parameters change. The new settings are listed in [Table 10](#).

Table 10. Default Settings for Serial Parameters with SDLC

Parameter	Default Setting
cable type	rs232
clock source	internal
internal clock speed	clk19200
signal mode	unbalanced

IPv6 Supported on ATM PVCs

BayRS supports IPv6. You can configure IPv6 using Site Manager on an ATM PVC interface.

Configuring RADIUS Servers

To enable RADIUS authentication for multilevel access or to use vendor-specific attributes (VSAs), you must configure the BSAC RADIUS server with the following files:

- bayrs.dct
- vendor.ini
- dictiona.dcm

These files load at server startup and enable the server to recognize the vendor-specific RADIUS clients. You can locate these files in the *bsac* directory on the BayRS Router and Site Manager Software update CD.

- To configure a Nortel Networks RADIUS server, copy the three files to the directory that you define at installation time (typically C:\RADIUS\Service).

- To configure a non-Nortel Networks RADIUS server, use the bayrs.dct file as a reference to change the existing RADIUS dictionary. Because bayrs.dct is in the format of some popular RADIUS servers, you might be able to use it as a direct replacement for the existing RADIUS dictionary. For more information, see the vendor's documentation.

Note: To use RADIUS with IP utilities such as FTP, NTP, HTTP, and Telnet, your RADIUS server must support VSAs.

The RADIUS dictionary file (bayrs.dct) defines the Nortel Networks vendor-specific attributes. The Nortel Networks vendor ID is 1584, as allocated by the Internet Assigned Numbers Authority. Use this ID in the header when using VSAs.

For more information on	See this document
RADIUS	<i>Configuring RADIUS</i>
BaySecure Access Control	BaySecure Access Control Administration Guide (for your specific platform: UNIX*, NetWare*, or Windows NT)
Multilevel Access	<i>Using the Bay Command Console (BCC)</i>

Operating Limitations and Cautions

Be aware of the following limitations and cautions when using BayRS 15.1.0.0.

ATM Services

The following limitations exist for ATM services in BayRS:

- Failover and load balancing for ATM VCs is not supported. You can configure multiple ATM virtual circuits (VCs) to the same destination address. However, this kind of configuration does not provide load balancing or failover support.
- The ATM traffic parameter maximum burst size (MBS) is not supported.
- Differentiated Services Queue Management and Scheduling (DSQMS) is not supported in ATM.

- Using the BCC to delete an ATM interface or a service record with more than 570 PVCs can cause a watchdog timeout on the router. To prevent this from occurring on configurations with more than 570 PVCs, use Site Manager to delete the interface, or use the BCC to delete the PVCs before you delete the ATM interface.
- If there is a loss of signal to a router during a period of heavy traffic, the ATM interface on the router might stop functioning. If the ATM interface stops functioning, you must reboot the router to recover.
- The following three MIB attributes: wfAtmizerVclRxOctets, wfAtmizerVclTxOctets, and wfAtmizerVclTxClipFrames. Ignore the values that these statistics return.
- On the ARE, BayRS does not release virtual channel connections when they time out. To maintain the availability of VCCs for new activities, configure a LAN emulation client (LEC) other than the router to release the inactive VCCs.
- Setting ATM signal ports on a Switch and Router Conflict
- If you are using a switch with ATM signal ports set to V3.1, be sure to set the signaling setting on the router to V3.1 to prevent a conflict between the two devices. If you accept the default setting of V3.0 for the router, the router faults repeatedly until you change the setting to V3.1.

APPN

The value configured for the Advanced Peer-to-Peer Networking (APPN) TG Number parameter in Site Manager is not being used; the TG number on a link station is being auto-negotiated.

BCC

If a context is deleted and re-created in the same BCC source file, unexpected results may occur. The create/delete MIB is set to deleted when issuing the deletion, but it is not reset to created when re-configuring the context.

Deleting a Hybrid Mode Permanent Virtual Circuit (PVC)

If you configure SRB on a router, do not delete hybrid mode PVCs. Otherwise, all slots will restart.

DLSw — SDLC Fast and Slow Poll Timer Defaults

If you have a router performing SDLC to LLC conversion, and you use the default values for the SDLC parameters Fast Poll Timer and Slow Poll Timer, SDLC controller performance is degraded. To avoid this problem, change the Fast Poll Timer to 200 and the Slow Poll Timer to 400. Changing these settings improves performance for both single- and dual-switch DLSw configurations in which the router acts as an SDLC primary device. Depending on the number of SDLC controllers you are supporting, you may need to increase or decrease the numbers to improve controller response time and router performance.

DLSw/APPN Boundary Port Use with AS400s and Others

Do not configure any explicit APPN adjacent link stations on the DLSw/APPN boundary (VCCT) port, unless you are certain that the adjacent link station (for example, an AS400) will not attempt to connect to the APPN node. Otherwise, the DLSw/APPN boundary (VCCT) function fails to operate correctly and the router might restart.

DSQMS

The following limitations exist for DSQMS services in BayRS:

- Queue starvation can occur despite priority-time-quantum settings. Queues with the same priority level and priority-time-quantum settings may nevertheless experience queue starvation if one of the queues is bandwidth-heavy.

To address this condition you can configure traffic policing for the bandwidth-heavy traffic flow to an acceptable rate for its assigned DSQMS Priority Queue. Configure traffic policing before the DSQMS outbound interface to control UDP as well as TCP flows.

- DSQMS is not supported with Protocol Priority Queuing (PPQ)..

DVMRP Use with Interfaces with More than One IP Address

You cannot use the BayRS Version 15.1.0.0 implementation of Distance Vector Multicast Routing Protocol (DVMRP) with circuits with multinetted interfaces (that is, interfaces with more than one IP address).

FireWall-1 Services

The following problems can occur while using FireWall-1 services in BayRS:

- Check Point Log Viewer displays the incorrect time which is approximately one hour behind. For example, if the correct time is 12:17, the Log Viewer displays the time as 11:17. Log events from the management station (or fw daemon) display the correct time.
- Check Point Log Viewer incorrectly reports that a router has stopped logging. You can ignore the “Stopped Logging” message whenever the logging continues uninterrupted.
- You cannot define an address range for source and destination addresses for a FireWall-1 Security policy.
- You cannot disable FireWall-1 dynamically using the BCC even though the legal values for the state object of firewall are listed as enabled and disabled.
- FireWall-1 is not supported for the Passport 2430 or Passport 5430.
- Running the GUI version of Packet Capture (UNIX or Windows) connected to an interface with Firewall-1 services configured may result in tag violations on several slots.

Flash Compaction or Extensive File Management Use on ARE

Do not perform a flash compaction or extensive file management on a busy or production ARE module. Doing so may cause a fault in the module.

GRE Services

If a Generic Routing Encapsulation (GRE) tunnel is configured with an incorrect remote physical IP address, and the IP address is then corrected, the GRE tunnel does not come up as expected. This condition occurs when you configure a GRE tunnel using either the BCC or Site Manager.

However, the following workaround is available. To change the remote physical IP address to a valid IP address for a GRE tunnel, first delete and then re-create the adjacent host entry (IP) or the static host entry (IPX) for that connection.

Hot-Swapping Link Modules

Attempts to remove and reinsert (hot-swap) a link module without first powering down the router can cause a fault to occur. Following the fault, the slot does recover. When a link module is hot-swapped, the protocols must reset, so there is no additional downtime caused by the fault. However, you can prevent this router fault by disabling the interfaces on the slot before removing the link module. After reinserting the link module you can then reenabling the interfaces on the slot.

IPsec Services

If you change the setting of the router's Internet Protocol Security (IPsec) feature (MIB variable `wfIpIntFCfgEnableSecurity`) from Disabled to Enabled, the router loses its IP connection. You must reboot the router to recover.

IP Services

If you disable the IP directed broadcast feature while configuring a router, a global reset of IP occurs, resulting in a temporary outage and the closing of all IP utility sessions such as TCP and Telnet.

ISDN-BRI – Configuring B Channels on the ARN and Passport 2430

The ARN and Passport 2430 can use only three B channels. If you select 2B + D service for one BRI interface, you must use 1B + D service for the second interface.

MIBs

- The MIB-II `ifIndex` is incorrect after you delete a circuit, causing problems with Omniview. The router creates MIB-II attributes when you create circuits on the router platform. The MIB-II attributes include the `ifNumber`, which is the number of network interfaces (regardless of their current state) present on the system, and the `ifIndex`, which is a unique value for each interface (the `ifIndex` value is in the range from 1 through the value of `ifNumber`).

If you dynamically delete a circuit on the router, the MIB-II attribute `ifNumber` decreases by 1. If you check the `IfIndex`, the result will be noncontiguous. When the router is polled for `ifNumber`, it shows the correct value but when the `ifIndex` is polled, there is a chance that there are indexes/circuits outside the correct range.

The result is that SNMP management stations such as Omniview will display an error.

- If a router receives a Breath of Life (BofL) packet, the router considers it an unknown protocol. The router increments the MIB entry that tracks unknown protocols each time an interface receives a BofL packet, `wfIfEntry.wfIfInUnknownProtos`. However, you can disable BofL packets for the interface as a workaround to this problem.

MPLS

The implementation of Multiprotocol Label Switching (MPLS) in BayRS (Versions 13.10 and later) is based on an early draft of the specification developed by the IETF MPLS working group. BayRS MPLS will not interoperate with ATM networks where MPLS is implemented in compliance with IETF RFC 3031. Nortel Networks recommends that you do not use MPLS in BayRS as there are plans to remove this implementation in a future release.

NAT Services

The following limitations and cautions exist for NAT services in BayRS:

- NAT does not operate in IP ISP Mode. To avoid this problem you should disable the global IP ISP mode parameter.
- NAT and IPsec cannot interoperate with overlapping source IP address ranges, because NAT takes precedence. IPsec cannot process a source address that is also in a NAT address range. However, the following workarounds are available:

For UNIX systems, you can separate IP hosts on the networks into two groups: a NAT-only group and an IPsec-only group. You can then use the multinetted interfaces or two network interface cards on a host to establish these two logical groups on one physical host.

You can also configure NAT and IPsec on different devices so that one BayRS router runs IPsec and another BayRS router runs NAT.

- If you are using BayRS version 14.20 or later, you must use version 14.20 or later of the nat.bat script file.
- NAT cannot handle more than 600 dynamic translations at an inter-packet rate of less than 10 milliseconds. For inter-packet rates of 10 milliseconds or greater, NAT successfully handles 1500 dynamic translations per slot. These performance thresholds pertain to the BN, BLN, and Passport 5430 routers with 64 MB processor cards installed.
- If you are using NAT and FireWall-1 on the same router, the FTP application does not work correctly using port 20.

OSI Services

You cannot filter OSI over X.25 with a user-defined filter.

Passport 2430 and Passport 5430

The following limitations exist on the Passport 2430 and/or Passport 5430 platforms:

- RMON and Mini-RMON are not supported in the Passport 2430. RMON is not supported on the Passport 5430.
- Passport 5430 does not support any LAN emulation services (LANE or MPOA).
- Passport 2430 does not support ATM, except for ATM DXI.
- Hi/fn* LZS* data compression is not supported on either the Passport 2430 or Passport 5430 platforms. However, Hi/fn data compression is supported on all other BayRS platforms.
- X.25 is not supported for the Passport 2430 and 5430.
- If you want to run either of the following protocols/configurations on the Passport 2430, you must upgrade the router to 32 MB of dynamic RAM (DRAM):
 - Advanced Peer-to-Peer Networking (APPN)
 - IP with MTU size greater than 2048 bytes on the Passport 2430

- Passport 5430 Ethernet flow control on the 10/100 Ethernet module does not function correctly when the flow control pause time in the received MAC control frame is set to 65535 (the default value). When the router receives a control frame with a pause time value of 65535, it begins retransmitting data prematurely. However, the following workaround is available. Reset the Flow Control Pause Time parameter in Site Manager, or the fc-pause-time parameter in the BCC, to a value from 32 through 65534.
- The BCC CES admin-status parameter does not work on the Passport 5430. If you attempt to disable the CES PVC using the BCC admin-status down command, the CES circuit continues to pass traffic. However, the following workaround is available. To disable the CES PVC, go back one level in the BCC and enter state disabled. To reenable the CES PVC, go back one level and enter state enabled.

RADIUS

The following limitations and cautions exist for RADIUS services in BayRS:

- Setting the debug message level for RADIUS enables you to specify the amount of information contained in the messages logged by a device. When an authorized user sets the debug message level to high, debug messages containing the server secret (password) are logged by the device. Because any user can view the message log, this could potentially compromise the security of your network. If you have to set the debug message level to high for debug purposes, be sure to complete the following steps to reset the debug message level and remove the server secret from the log following your debug:
 1. **Using either the BCC or the Technician Interface, set the debug message level to no-debug (default) for the device.**
 2. **Clear the log to remove instances of the server secret that could potentially be viewed by users with any and all access privileges.**
- Cutting and pasting BCC commands to configure RADIUS entries on the router may cause a fault in RADIUS to occur. This fault is caused by the timing delays introduced when commands are copied across the network to the router interface. To prevent this fault, use the BCC **source** command to enter RADIUS entries on multiple slots.

RIP Export Filters

Setting the From Protocols parameter for a RIP export filter to any value other than the “Any” option causes the filter to fail. Consequently, the RIP export route filter does not work if you specify any of the following options: RIP, EGP, OSPF, Direct, Static, or BGP-3. To avoid this problem, be sure to use the “Any” option when configuring all RIP export filters.

show ip routes Displays Partial Information in the Technician Interface

For a router configuration encompassing IP equal cost routes, the **show ip routes** command in Technician Interface displays partial information only.

When using the Technician Interface, you must use the following command to retrieve all equal-cost routes and show the complete routing table information:

ip routes -A

Sync

If the cable is removed from any synchronous port except octal sync on a BN, the router gives no indication of the problem and the link remains active. The configured WAN protocol closes all connections when the synchronous line driver detects connection signal lost. To prevent this problem, enable the Sync Polling parameter (Configuration Manager -> Edit Line -> Edit Sync Parameters).

SYSLOG

The status of syslog changes to down when you set the slot-lower-bound and slot-upper-bound parameters to the same value (same slot) on a BN router platform. Both syslog and filter logging terminate operation. However, the following workaround is available. Do not set the slot-lower-bound and slot-upper-bound parameters to the same value.

TFTP

If you try to use the Router File Manager to TFTP a file to the router from a Windows directory that includes long names and spaces, the transfer fails. To prevent this problem, move the file you want to send to a directory with a simple name of no more than 15 bytes and no space characters.

Unnumbered IP Interfaces

You cannot use the disable and enable scripts on unnumbered IP interfaces. The scripts do not allow an interface IP address format specifying both the IP address 0.0.0.0 and the circuit number. However, you can use Site Manager or the Technician Interface to disable unnumbered IP interfaces.

VRRP Over LANE

Virtual Router Redundancy Protocol (VRRP) over LAN Emulation (LANE) and Multi-Protocol Over ATM (MPOA) are not supported on the same service record.

WAN Encryption

DES-40 WAN Encryption Option (WEP) or DES-56 WEP are no longer supported on any BayRS platform. However, BayRS will support backward compatibility with earlier versions of BayRS that are currently running WEP. We recommend that you use Internet Protocol Security (IPsec) services for security.

WCP

WCP for PPP Multilink

If you configure an existing PPP/WCP non-multilink circuit for multilink (on BayRS Version 12.10 or later) and the CCP Type parameter is set to CCP, WCP must be deleted and re-added to the circuit to negotiate WCP above the bundle.

See *Configuring Data Compression Services* for additional information.

Adding Bandwidth on Demand Disables WCP Data Compression

Adding Bandwidth on Demand to a PRI circuit disables WCP data compression. The call comes up and traffic flows, but WCP never creates a VC and does not compress traffic.

Documentation Changes

This section contains changes to BayRS documentation that could not be incorporated during the current release. These changes will be added for the next revision of the associated book.

Configuring Differentiated Services

The following change is required to Table 6-1 in the “Modifying RED Parameters” section of the *Configuring Differentiated Services* book.

The proper range of values for the **id** parameter is from 1 through 65535. The proper range is shown in the following table, which lists RED parameters that can be configured under **dsqms-red**, their values, and functions.

Parameter	Values	Function
id	integer 1 through 65535	Identifies the RED function. You cannot change this parameter.
min-threshold	integer 0 through 100 (default 20)	Indicates the queue size below which no packets are dropped by RED
max-threshold	integer 1 through 100 (default 80)	Indicates the queue size above which all packets are dropped by RED
first-order-const	integer 0 through 100 (default 1)	Specifies the first order constant used when calculating drop probability based on the average queue fraction, the queue size, and the min-threshold value
second-order-const	integer 0 through 1000 (default 10)	Specifies the second order constant used when calculating drop probability based on the average queue fraction, the queue size, and the min-threshold value

Configuring Frame Relay Services

The following changes are required to the *Configuring Frame Relay Services* book.

A new frame relay parameter, Bw Threshold, has been added to the PVC List for Services window in Site Manager. Bw Threshold works in conjunction with the Committed Burst, Excess Burst, and Throughput parameters to shape traffic. The following sections update the Site Manager procedure within the “Using Traffic Shaping” section in Chapter 4 and adds the parameter description to “Appendix A: Site Manager Parameters.”

Using Traffic Shaping – Site Manager

To enable traffic shaping, complete the following tasks using Site Manager:

Site Manager Procedure	
You do this	System responds
1. In the Configuration Manager window, click on a port configured for frame relay.	The Edit Connector window opens.
2. Click on Edit Circuit .	The Frame Relay Circuit Definition window opens.
3. Click on Services .	The Frame Relay Service List window opens.
4. Select the appropriate service record and click on PVCs .	The FR PVC List for Service window opens.
5. Click on a PVC that you want to configure for traffic shaping.	
6. Set the following parameters: • Committed Burst • Excess Burst • Throughput • Bw Threshold Click on Help or see the parameter description in the following section, “Site Manager Parameter.”	
7. Click on Done .	You return to the Frame Relay Service List window.

(continued)

Site Manager Procedure <i>(continued)</i>	
You do this	System responds
8. Click on Done .	You return to the Frame Relay Circuit Definition window.
9. Click on Done .	You return to the Configuration Manager window.

Site Manager Parameter

Parameter: Bw Threshold

Path: Configuration Manager > Protocols > Frame Relay > Services > PVCs

Default: 0

Options: 0 to maximum physical line speed (b/s)

Function: Specifies the bandwidth threshold that you want to set for this PVC for traffic shaping purposes.

Instructions: To minimize starvation of normal- and low-priority traffic over a high-speed physical line (such as a 56 Kb/s lines over HSSI), set the bandwidth threshold to a value 3 to 10 times that set for the Throughput (CIR) parameter. Otherwise, accept the default, 0.

MIB Object ID: 1.3.6.1.4.1.18.3.5.9.9.2.1.58

Protocols Supported

BayRS Version 15.1.0.0 supports the following bridging/routing protocols and router configuration features:

- Advanced Peer-to-Peer Networking (APPN)
- AppleTalk and AppleTalk Update Routing Protocol (AURP)
- Asynchronous transfer mode (ATM)
- ATM Data Exchange Interface (ATM DXI)
- ATM Half Bridge (AHB)
- ATM LAN Emulation (802.3 and 802.5)
- Bandwidth Allocation Protocol (BAP)
- Binary Synchronous Communication Type 3 (BSC3)

- Bisync over TCP (BOT)
- Bootstrap Protocol (BootP)
- Border Gateway Protocol (BGP-3 and BGP-4)
- Circuit Emulation Services (CES) for Passport 5430 only
- Classless interdomain routing (CIDR)
- Data compression (WCP and Hi/fn)
- Data link switching (DLSw)
- DECnet Phase IV
- Differentiated services (except on ATM)
- Distance Vector Multicast Routing Protocol (DVMRP)
- Dynamic Host Configuration Protocol (DHCP)
- Exterior Gateway Protocol-2 (EGP-2)
- File Transfer Protocol (FTP)
- Frame relay (PVC, SVC)
- HP Probe
- Hypertext Transfer Protocol (HTTP)
- Integrated Services Digital Network (ISDN)
- Interface redundancy (proprietary)
- Internet Control Message Protocol (ICMP)
- Internet Gateway Management Protocol (IGMP)
- Internet Key Exchange (IKE)
- Internet Packet Exchange (IPX)
- Internet Protocol (IP)
- Internet Protocol Version 6 (IPv6)
- Internet Stream Protocol (ST2)
- IP Security (IPsec)
- IPsec Encapsulating Security Payload (ESP)
- IPv6 PPP Control Protocol (IPv6CP)

- Layer 2 Tunneling Protocol (L2TP)
- Learning bridge
- Logical Link Control 2 (LLC2)
- Multicast OSPF (MOSPF)
- Multiprotocol Label Switching (MPLS)
- Multiprotocol Over ATM (MPOA)
- Native Mode LAN (NML)
- Network Time Protocol (NTP)
- Open Shortest Path First (OSPF)
- Open Systems Interconnection (OSI)
- Point-to-Point Protocol (PPP)
- Polled Asynch (PAS), also called Asynch Passthru over TCP
- Protocol prioritization
- Qualified Logical Link Control (QLLC)
- RaisedTR dialup
- Remote Authentication Dial-In User Service (RADIUS)
- Resource Reservation Protocol (RSVP)
- Router discovery (RDISC)
- Router redundancy (proprietary)
- Routing Information Protocol (RIP)
- Service Advertisement Protocol (SAP)
- Simple Network Management Protocol (SNMP)
- Source route bridging (SRB)
- Source route bridging over ATM permanent virtual circuits (PVCs)
- Spanning tree
- Switched Multimegabit Data Service (SMDS)
- Synchronous Data Link Control (SDLC)
- Telnet (inbound and outbound)

- Time Division Multiplexing (TDM) for Passport 5430 only
- Transmission Control Protocol (TCP)
- Transparent bridge
- Transparent-to-source routing translation bridge
- Trivial File Transfer Protocol (TFTP)
- User Datagram Protocol (UDP)
- V.25bis dialup
- Virtual Network Systems (VINES)
- Virtual Router Redundancy Protocol (VRRP)
- X.25 with QLLC
- Xerox Network System (XNS)
- XMODEM and YMODEM

Standards Supported

[Table 11](#) lists the Requests For Comments (RFCs) and other standards documents with which Version 15.1.0.0 complies. BayRS Version 15.1.0.0 might support additional standards that are not listed in this table.

Table 11. Standards Supported by Version 15.1.0.0

Standard	Description
ANSI T1.107b-1991	Digital Hierarchy -- Supplement to formats specifications
ANSI T1.404	DS3 Metallic Interface Specification
ANSI X3t9.5	Fiber Distributed Data Interface (FDDI)
Bellcore FR-440	Transport Systems Generic Requirements (TSGR)
Bellcore TR-TSY-000009	Asynchronous Digital Multiplexes, Requirements, and Objectives
Bellcore TR-TSY-000010	Synchronous DS3 Add-Drop Multiplex (ADM 3/X) Requirements and Objectives
FIPS 46-2	Data Encryption Standard (DES)

(continued)

Table 11. Standards Supported by Version 15.1.0.0 *(continued)*

Standard	Description
FIPS 81	DES Modes of Operation (ECB, CBC)
IEEE 802.1	Logical Link Control (LLC)
IEEE 802.1Q	IEEE 802.1Q VLAN tagging
IEEE 802.3	Carrier Sense Multiple Access with Collision Detection (CSMA/CD)
IEEE 802.5	Token Ring Access Method and Physical Layer Specifications
IEEE 802.1D	Spanning Tree Bridges
ITU Q.921	ISDN Layer 2 Specification
ITU Q.931	ISDN Layer 3 Specification
ITU X.25	Interface between data terminal equipment (DTE) and data circuit-terminating equipment (DCE) for terminals operating in the packet mode and connected to public data networks by dedicated circuits
RFC 768	User Datagram Protocol (UDP)
RFC 791	Internet Protocol (IP)
RFC 792	Internet Control Message Protocol (ICMP)
RFC 793	Transmission Control Protocol (TCP)
RFC 813	Window and Acknowledgment Strategy in TCP
RFC 826	Ethernet Address Resolution Protocol
RFC 827	Exterior Gateway Protocol (EGP)
RFC 854	Telnet Protocol Specification
RFC 855	Telnet Option Specification
RFC 856	Telnet Binary Transmission
RFC 857	Telnet Echo Option
RFC 858	Telnet Suppress Go Ahead Option
RFC 859	Telnet Status Option
RFC 860	Telnet Timing Mark Option
RFC 861	Telnet Extended Options: List Option
RFC 863	Discard Protocol
RFC 877	Transmission of IP Datagrams over Public Data Networks
RFC 879	TCP Maximum Segment Size and Related Topics
RFC 888	"STUB" Exterior Gateway Protocol

(continued)

Table 11. Standards Supported by Version 15.1.0.0 *(continued)*

Standard	Description
RFC 894	Transmission of IP Datagrams over Ethernet Networks
RFC 896	Congestion Control in IP/TCP Internetworks
RFC 903	Reverse Address Resolution Protocol
RFC 904	Exterior Gateway Protocol Formal Specification
RFC 919	Broadcasting Internet Datagrams
RFC 922	Broadcasting Internet Datagrams in Subnets
RFC 925	Multi-LAN Address Resolution
RFC 950	Internet Standard Subnetting Procedure
RFC 951	Bootstrap Protocol
RFC 959	File Transfer Protocol
RFC 994	Protocol for Providing the Connectionless-Mode Network Service
RFC 1009	Requirements for Internet Gateways
RFC 1027	Using ARP to Implement Transparent Subnet Gateways
RFC 1042	Transmission of IP over IEEE/802 Networks
RFC 1058	Routing Information Protocol
RFC 1075	Distance Vector Multicast Routing Protocol (DVMRP)
RFC 1076	Redefinition of Managed Objects for IEEE 802.3 Repeater Devices (AN hubs only)
RFC 1079	Telnet Terminal Speed Option
RFC 1084	BOOTP Vendor Information Extensions
RFC 1091	Telnet Terminal-Type Option
RFC 1108	Security Options for the Internet Protocol
RFC 1112	Host Extensions for IP Multicasting Appendix I, Internet Group Management Protocol
RFC 1116	Telnet Line-Mode Option
RFC 1139	Echo Function for ISO 8473
RFC 1155	Structure and Identification of Management Information for TCP/IP-based Internets
RFC 1157	Simple Network Management Protocol (SNMP)
RFC 1163	BGP-2 (obsoleted by RFC 1267)
RFC 1164	Application of BGP in the Internet

(continued)

Table 11. Standards Supported by Version 15.1.0.0 *(continued)*

Standard	Description
RFC 1166	Internet Numbers
RFC 1188	Proposed Standard for the Transmission of IP over FDDI
RFC 1191	Path MTU Discovery
RFC 1209	Transmission of IP Datagrams over SMDS
RFC 1212	Concise MIB Definitions
RFC 1213	MIB for Network Management of TCP/IP-Based Internets
RFC 1267	Border Gateway Protocol 3 (BGP-3; obsoletes RFC 1163)
RFC 1293	Inverse ARP for Frame Relay (obsoleted by RFC 2390)
RFC 1294	Multiprotocol Interconnect over Frame Relay (obsoleted by RFC 1490 and RFC 2427)
RFC 1304	Definition of Managed Objects for the SIP Interface Type
RFC 1305	Network Time Protocol
RFC 1321	The MD5 Message – Digest Algorithm
RFC 1323	TCP Extensions for High Performance
RFC 1331	Point-to-Point Protocol (PPP; obsoleted by RFC 1661)
RFC 1332	PPP Internet Protocol Control Protocol (IPCP)
RFC 1333	PPP Link Quality Monitoring (obsoleted by RFC 1989)
RFC 1334	PPP Authentication Protocols
RFC 1350	The TFTP Protocol (Revision 2)
RFC 1356	Multiprotocol Interconnect on X.25 and ISDN in the Packet Mode
RFC 1376	PPP DECnet Phase IV Control Protocol (DNCP)
RFC 1377	OSI over PPP
RFC 1378	PPP AppleTalk Control Protocol (ATCP)
RFC 1390	Transmission of IP and ARP over FDDI Networks
RFC 1403	BGP OSPF Interaction
RFC 1434	Data Link Switching: Switch-to-Switch Protocol
RFC 1483	Multiprotocol Encapsulation over ATM AAL5
RFC 1490	Multiprotocol Interconnect over Frame Relay (obsoletes RFC 1294, obsoleted by RFC 2427)
RFC 1541	Dynamic Host Configuration Protocol

(continued)

Table 11. Standards Supported by Version 15.1.0.0 *(continued)*

Standard	Description
RFC 1552	The PPP Internetwork Packet Exchange Control Protocol (IPXCP)
RFC 1577	Classical IP and ARP over ATM
RFC 1585	MOSPF: Analysis and Experience
RFC 1634	Novell IPX over Various WAN Media (IPXWAN)
RFC 1638	PPP Bridging Control Protocol (BCP)
RFC 1654	Border Gateway Protocol 4 (BGP-4; obsolete by RFC 1771)
RFC 1661	Point-to-Point Protocol (PPP; obsoletes RFC 1331)
RFC 1662	PPP in HDLC-like Framing
RFC 1717	PPP Multilink Protocol (MP; obsolete by RFC 1990)
RFC 1755	Signaling Support for IP over ATM
RFC 1757	Remote Network Monitoring Management Information Base (RMON) for AN, ANH, and ARN equipped with data collection module only
RFC 1762	PPP Banyan VINES Control Protocol (BVCP)
RFC 1763	PPP DECnet Phase IV Control Protocol (DNCP)
RFC 1764	PPP XNS IDP Control Protocol (XNSCP)
RFC 1771	Border Gateway Protocol 4 (BGP-4; obsoletes RFC 1654)
RFC 1795	Data Link Switching: Switch-to-Switch Protocol, Version 1
RFC 1819	Internet Stream Protocol, Version 2
RFC 1974	PPP Stac LZS Compression Protocol
RFC 1989	PPP Link Quality Monitoring (obsoletes RFC 1333)
RFC 1990	PPP Multilink Protocol (MP; obsoletes RFC 1717)
RFC 2068	HTTP Version 1.1
RFC 2069	An extension to HTTP: Digest Access Authentication
RFC 2104	HMAC: Keyed-Hashing for Message Authentication
RFC 2138	Remote Authentication Dial-In User Service (RADIUS)
RFC 2139	RADIUS Accounting
RFC 2166	Data Link Switching, Version 2.0, Enhancements
RFC 2205	Resource ReSerVation Protocol (RSVP) -- Version 1 Functional Specification
RFC 2328	OSPF Version 2
RFC 2338	Virtual Router Redundancy Protocol

(continued)

Table 11. Standards Supported by Version 15.1.0.0 *(continued)*

Standard	Description
RFC 2385	Protection of BGP Sessions via the TCP MD5 Signature Option
RFC 2390	Inverse Address Resolution Protocol (obsoletes RFC 1293)
RFC 2403	Use of HMAC-MD5-96 within ESP and AH
RFC 2404	Use of HMAC-SHA-1-96 within ESP and AH
RFC 2405	ESP DES-CBC Cipher Algorithm with Explicit IV
RFC 2406	IP Encapsulating Security Payload (ESP)
RFC 2407	Internet IP Security Domain of Interpretation for ISAKMP
RFC 2409	Internet Key Exchange (IKE)
RFC 2410	NULL Encryption Algorithm and Its Use with IPsec
RFC 2427	Multiprotocol Interconnect over Frame Relay (obsoletes RFC 1294 and RFC 1490)
RFC 2451	ESP CBC-Mode Cipher Algorithms
VINES 4.11	BayRS works with the Banyan VINES 4.11 standard. BayRS Version 8.10 (and later) also supports VINES 5.50 sequenced routing.

Flash Memory Cards Supported

You use Personal Computer Memory Card International Association (PCMCIA) flash memory cards to store the software image and the configuration files in Nortel Networks routers.

Note: The Passport 2430 and 5430 platforms support 5-volt flash memory cards only. All other BayRS router platforms support both the 5-volt and 12-volt flash memory cards. See [“BayRS Flash Memory Requirements”](#) on page [35](#) for the flash memory requirements by platform.

[Table 12](#) lists the flash memory cards approved for use.

Table 12. Approved Flash Memory Cards

Size	Vendor	Part Number
4 MB	Advanced Micro Devices (AMD)	AMC004CFLKA-150
	AMP	797262-3
		797263-2
	Centennial	FL04M-20-11119
		FL04M-20-11138
		FL04M-20-11119-61
		FL04M-20-11119-67
	Epson	HWB401BNX2
	IBM	IBM1700400D1DA-25
	Intel	IMC004FLSAQ1381
8 MB	AMD	AMC008CFLKA-150
		AMC008CFLKA-200
		AMC008CFLKA-250
		AMC008DFLKA-150
		AMC008DFLKA-200
		AMC008DFLKA-250
	Centennial	FL08M-25-11119-01
		FL08M-15-11119-01
		FL08M-20-11138
		FL08M-20-11119-01
		FL08M-20-11119-61
		FL08M-20-11119-67
	Centennial (Strata-Flash)	FL08M-20-11736-J5-61
	Epson	HWB801BNX0
	Intel	IMC008FLSP/Q1422
16 MB	Epson	HWB161BNX2
	Centennial (Strata-Flash)	FL16M-20-11736-J5-61
		FL16M-20-11119-61
		FL16M-20-11119-67

Table 12. **Approved Flash Memory Cards** *(continued)*

Size	Vendor	Part Number
32 MB	Centennial	FL32M-20-11119-61
