Introduction

This document provides information about the management information bases (MIBs) available for the device, including public and private MIBs.

This document also provides information about the notifications available for the device, including standard notifications and private notifications.

Important information

About MIB support status

A MIB, table, or scalar object is commented as "Not supported" if it is not supported by the device. To avoid unknown issues, do not access such a MIB, table, or scalar object even if it is accessible.

If a MIB is not supported, its notifications are not supported as well.

For backward compatibility and interoperability with third-party vendors, the software release might contain deprecated or obsolete MIBs. This document lists these MIBs but does not provide detailed information about the MIBs.

About configuring the device by setting MIB objects

You can configure the device by setting its supported MIB objects. To make sure the values set in MIB objects can be restored correctly in CLI, use the following restrictions and guidelines:

- As a best practice, use visible characters from 0x21 to 0x7E, except for 0x3F, which represents the question mark (?). If you want to use a special character, make sure the CLI supports that character. For example, CLI uses the space for delimitation and uses the question mark for help indication. If a value contains a space or question mark, the CLI might be unable to restore that value.
- Make sure the value set in the MIB object is in the value range supported in the CLI. In rare situations, an MIB object might support a different value range than the CLI. For example, an OCTET STRING type MIB object might support longer strings than the maximum length allowed in the CLI. If the value set in the MIB object exceeds the maximum length allowed in the CLI, the CLI will be unable to restore the value correctly. Conversely, if a value set in the CLI is beyond the value range for the MIB object, the system cannot set that value in the MIB object.

Using this document

This document describes MIBs in alphabetical order.

Information about scalar and tabular MIB objects is presented in tabular form, as shown in the following example:

Object (OID)	Access	PDS	Description
ifIndex (1.3.6.1.2.1.2.2.1.1)	read-only	Yes	As per MIB

Table 1 describes the purpose of each column.

Table 1 Table field description

Item	Description
Object (OID)	Object name and its OID.
Access	ACCESS or MAX-ACCESS value as defined in MIBs.
PDS	<p>Permanent data storage. This field describes whether the value in a MIB object can survive a reboot.</p> <p>PDS status:</p> <ul style="list-style-type: none"> • Yes—The value set in the MIB object is automatically saved and can survive a reboot. • No—The value set in the MIB object cannot survive a reboot. The PDS is always "No" for a MIB object that is Counter, Counter32, or Counter64 type. • Current—The value set in the MIB object can survive a reboot if it is save, for example, from the CLI. If a save operation is not performed, the value cannot survive a reboot.
Comments	<p>Comments on the object, such as a value range.</p> <p>Typical comments:</p> <ul style="list-style-type: none"> • As per MIB—The object is implemented in full compliance with the MIB. • Not supported— The object is accessible but it is not supported or tested. To avoid unknown issues, do not use such MIB objects.

Name	Access	PDS	Description
ifIndex (1.3.6.1.2.1.2.2.1.1)	read-only	Current	As per MIB
ifDescr (1.3.6.1.2.1.2.2.1.2)	read-only	No	A textual string containing information about the interface. Such as Aux0/0/0, null0, Vlan-interface2, ethernet1/0/1
ifType (1.3.6.1.2.1.2.2.1.3)	read-only	Current	As per MIB
ifMtu (1.3.6.1.2.1.2.2.1.4)	read-only	Current	The size of the largest datagram which can be sent/received by interface in octets. If this port is stack port, the vlaue is invalid.
ifSpeed (1.3.6.1.2.1.2.2.1.5)	read-only	Current	An estimate of the interface's current bandwidth in bits per second.
ifPhysAddress (1.3.6.1.2.1.2.2.1.6)	read-only	Current	MAC address For switches, the following type of interfaces support mac address: M-Ethernet(Management Ethernet) port Vlan interface Ethernet port Gigabit Ethernet port Other type of interfaces don't support mac address
ifAdminStatus (1.3.6.1.2.1.2.2.1.7)	read- write	Current	enable or disable an interface, "testing" is not supported
ifOperStatus (1.3.6.1.2.1.2.2.1.8)	read-only	Current	The current operational state (link status) of the interface.
ifLastChange (1.3.6.1.2.1.2.2.1.9)	read-only	No	The value of sysUpTime at the time the interface entered its current operational state. If the current state was entered prior to the last re-initialization of the local network management subsystem, then this object contains a zero value.

PIM-BSR-MIB

pimBsrCandidateRPTTable

OID of this table is: 1.3.6.1.2.1.172.1.1

This table only supports public net.

This table only corresponds to "c-rp" command, and doesn't support commands "c-rp advertisement-interval" or "c-rp hold-time". When the "c-rp" command not configed "advertisement-interval" and "hold-time", the default values not the command "c-rp advertisement-interval" and "c-rp hold-time" configed values will be got.

This table doesn't support the command "c-rp policy",so the group address and prefix length can only be all the multicast group range,which is equal to that the command "c-rp policy" is not configed. When the "c-rp policy" is configed, there are no corresponding contents in this table.

The index “pimBsrCandidateRPAAddressType” and “pimBsrCandidateRPAAddress” must correspond to an effective interface.

Creating the table will lead to create the PIM view first, but destroying the table will not delete the PIM view.

If current configed value is larger than the mib value range, the largest value in the mib range will be got.

pimBsrCandidateBSRTable

OID of this table is: 1.3.6.1.2.1.172.1.3

This table only supports IPv4 public net.

This table only corresponds to commands “c-bsr”, “c-bsr hash-length” and “c-bsr priority”. This table doesn’t support other c-bsr relative commands.

The nodes “pimBsrCandidateBSRAddressType” and “pimBsrCandidateBSRAddress” must be set the values corresponding to an effective interface.

This table exists when an effective interface address or “c-bsr hash-length” or “c-bsr priority” is configured.

When creating the table, the node “pimBsrCandidateBSRStatus” must be set “createAndGo(4)”, and the node “pimBsrCandidateBSRAddressType” and “pimBsrCandidateBSRAddress” or the node “pimBsrCandidateBSRPriority” or the node “pimBsrCandidateBSRHashMaskLength” must be set right values at the same time.

Creating the table will lead to create the PIM view first, but destroying the table will not delete the PIM view.

If current configured value is larger than the mib value range, the largest value in the mib range will be got.

snmpEngineMaxMessageSize (1.3.6.1.6.3.10.2.1.4)	read-only	Current	As per MIB

the allocation algorithm of snmpEngineID

The snmpEngineID has a length of 12 octets:

The first four octets are set to the binary equivalent of the agent's SNMP management private enterprise number as assigned by the Internet Assigned Numbers Authority (IANA), and the very first bit is set to 1. For example, if HP Networks has been assigned enterprises 25506, the first four octets would be assigned '800063A2'H.

For switches, the fifth octet is 3 indicates that the following is MAC address. The remaining six octets are the MAC address main board.

Entity-MIB

This MIB is supported only when the switch support RFC4133.

This chapter describes the information of Entity MIB. The Entity MIB contains five groups of MIB objects: entityPhysical group, entityLogical group, entityMapping group, entityGeneral group and entityNotifications group. Thereinto, the entityPhysical group describes the physical entities managed by a single agent. This group contains a single table to identify physical system components, called the entPhysicalTable. The entPhysicalTable contains one row per physical entity, and must always contain at least one row for an "overall" physical entity, which should have an entPhysicalClass value of 'chassis(3)' or 'module(9)'. Each row is indexed by an arbitrary, small integer, and contains a description and type of the physical entity. It also optionally contains the index number of another entPhysicalEntry indicating a containment relationship between the two.

The entityLogical group describes the logical entities managed by a single agent. This group contains a single table to identify logical entities, called the entLogicalTable. The entLogicalTable contains one row per logical entity. Each row is indexed by an arbitrary, small integer and contains a name, description, and type of the logical entity. It also contains information to allow access to the MIB information for the logical entity. This includes SNMP versions that use a community name (with some form of implied context representation) and SNMP versions that use the SNMP ARCH [RFC2571] method of context identification. If a agent represents multiple logical entities with this MIB, then this group must be implemented for all logical entities known to the agent. If an agent represents a single logical entity, or multiple logical entities within a single naming scope, then implementation of this group may be omitted by the agent.

The entityMapping group describes the associations between the physical entities logical entities, interfaces, and non-interface ports managed by a single agent. This group contains three tables to identify associations between different system components. The entLPMappingTable contains mappings between entLogicallyIndex values (logical entities) and entPhysicallyIndex values (the physical components supporting that entity). A logical entity can map to more than one physical component, and more than one logical entity can map to (share) the same physical component. If an agent represents a single logical entity, or multiple logical entities within a single naming scope, then implementation of this table may be omitted by the agent. The entAliasMappingTable contains mappings between entLogicallyIndex, entPhysicallyIndex pairs and 'alias' object identifier values. This allows resources managed with other MIBs (e.g., repeater ports, bridge ports, physical and logical interfaces) to be identified in the physical entity hierarchy. Note that each alias identifier is only relevant in a particular naming scope. If an agent represents a single logical entity, or multiple logical entities within a single naming scope, then implementation of this table may be omitted by the agent. The entPhysicalContainsTable contains simple mappings between 'entPhysicalContainedIn' values for each container/'containee' relationship in the managed system. The indexing of this table allows an NMS to quickly discover the 'entPhysicallyIndex' values for all children of a given physical entity.

The entityGeneral group describes general system attributes shared by potentially all types of entities managed by a single agent. This group contains general information relating to the other object groups. At this time, the entGeneral group contains a single scalar object (entLastChangeTime), which represents the value of sysUptime when any part of the Entity MIB configuration last changed.

The entityNotifications group contains status indication notifications. This group contains notification definitions relating to the overall status of the Entity MIB instantiation.

pingCtlTable

OID of this table is :1.3.6.1.2.1.80.1.2

- The parameter which is not supported by the corresponding pingCtlType cannot be configured.
- When creating a test entry, the default value of pingCtlType is pingIcmpEcho. Once created, pingCtlType cannot be changed, so pingCtlType must be set as the entry created.
- When creating an entry, if the parameter which is not supported by the corresponding pingCtlType is set, the operation will be failed.
- Any of the configurations in pingCtlTable changed, the corresponding results, histories and statistics will be cleared, except the following objects:
 - pingCtlTrapGeneration,
 - pingCtlTrapProbeFailureFilter,
 - pingCtlTrapTestFailureFilter,
 - pingCtlDescr,
 - pingCtlMaxRows(If the value of this object is smaller than the previous value, the redundant histories records will be deleted.)

The results, histories and statistics must be the factual reflection of the test results of current configurations.

Users will be puzzled when they get the results which caused by the previous configurations.

- e) pingCtlTargetAddressType and pingCtlTargetAddress must be modified together.
- f) pingCtlSourceAddressType and pingCtlSourceAddress must be modified together.
- g) If the parameter which is not supported by the corresponding pingCtlType is read, the result is invalid.

The following objects are supported by all pingCtlTypes:

pingCtlOwnerIndex, pingCtlTestName, pingCtlTimeOut,
pingCtlAdminStatus, pingCtlFrequency, pingCtlMaxRows,
pingCtlStorageType, pingCtlTrapGeneration, pingCtlType, pingCtlDescr, pingCtlRowStatus

The remainder objects is supported by part of pingCtlTypes.

The relationship between these objects and corresponding pingCtlType are described in the following table:

SNMP-TARGET-MIB

snmpTargetAddrTable and snmpTargetParamsTable combined are used to create a valid target host row in device. The command line corresponding to this entry can be displayed as “snmp-agent target-host trap address udp-domain ...”. There are some rules need conformed with.

For a valid target host entry which is made up of one entry in snmpTargetAddrTable and another entry in snmpTargetParamsTable:

- 1) The value of snmpTargetAddrName is the same as the value of snmpTargetAddrParams.
- 2) The value of snmpTargetAddrParams is the same as the value of snmpTargetParamsName.
- 3) The value format of snmpTargetAddrName is something like “traphost.” + snmpTargetParamsSecurityName + IpAddress+ VPN Instance name.. The IpAddress is the ip address part of snmpTargetAddrTAddress. If not support VPN, VPN Instance name does not need to be configured.
- 4) The value of snmpTargetAddrTagList must be octect string “TrapHost”.
- 5) For IPV4, the value of snmpTargetAddrTDomain must be snmpUDPDDomain. For IPv6, the value of snmpTargetAddrTDomain must be transportDomainUdplpv6.
- 6) The value of snmpTargetAddrStorageType should be nonVolatile.
- 7) The length of snmpTargetParamsSecurityName in snmpTargetAddrParams restricted in 1 to 32 octets.
- 8) The length of VPN Instance name in snmpTargetAddrParams restricted in 1 to 31 octets.

LLDP-EXT-DOT1-MIB

Notes:

The following section defines the Management Information Base (MIB) for link layer discovery protocol in the Internet community. In particular, it describes a set of managed objects that allow managing discovery operations, which are used on LAN switch products. The definitions of managed objects in the following section are formed into a specification for link layer discovery used for switches.

The Link Layer Discovery Protocol (LLDP) allows stations attached to an IEEE 802 LAN to advertise, to other stations attached to the same IEEE 802 LAN, the major capabilities provided by the system incorporating that station, the management address or addresses of the entity or entities that provide management of those capabilities, and the identification of the station's point of attachment to the IEEE 802 LAN required by those management entity or entities.

The information distributed via this protocol is stored by its recipients in a standard Management Information Base (MIB), making it possible for the information to be accessed by a Network

Management System (NMS) using a management protocol such as the Simple Network Management Protocol (SNMP).

In this section, several set operations about enable IEEE802.1 organizational specific TLVs transmission on given port are presented. For this purpose, the value of associated objects should be set to:

IldpXdot1ConfigPortVlanTxEnable. 20 = 'TRUE', Allowed Port VLAN ID TLV transmission on given port.

IldpXdot1ConfigVlanNameTxEnable. 20 = 'FALSE', Allowed VLAN Name TLV transmission on given port.

IldpXdot1ConfigProtoVlanTxEnable. 20 = 'FALSE', Allowed Port and Protocol VLAN TLV transmission on given port.

LLDP-EXT-DOT3-MIB

Notes:

The managed objects defined in this document are belonging to the LLDP-EXT-DOT3-MIB module for IEEE 802.3 organizationally defined discovery information. These managed objects can be used for dynamically configuring the LLDP, advertise the IEEE 802.3 organizationally defined discovery information of the local system ports, store the IEEE 802.3 organizationally defined discovery information of the remote system ports.

All the IEEE 802.3 organizationally defined discovery information will be transmitted on every port as default configuration, so when LLDP is global enabled on a switch , the following value will be set:

IldpXdot3PortConfigTLVsTxEnable.20 = 'f' H

The network management can configure to transmit some of that information and let the others not to be transmitted.

For example, if the network management only want to transmit Link Aggregation TLV and Maximum Frame Size TLV in the LLDPDU on a given port, the following value will be set:

IldpXdot3PortConfigTLVsTxEnable.20 = 'c' H

LLDP-MIB

Notes:

This document defines the LLDP basic MIB for use with SNMP in TCP/IP based internets. The LLDP MIB consists of two types of MIB modules, the mandatory basic MIB defined in this clause and from zero to n optional organizationally specific MIB extensions such as LLDP-EXT-DOT1-MIB, LLDP-EXT-DOT3-MIB. Each MIB module is divided into two major sections to allow selective MIB support for the particular operating mode (transmit only, receive only, or both transmit and receive) being implemented. The basic MIB in this document describes LLDP configuration, statistics, local system data and remote systems data components.

All the basic discovery information will be transmitted on every port as default configuration. So when LLDP is global enabled on a switch , the following value will be set:

IldpPortConfigTLVsTxEnable = ' f ' H

The network management can configure to transmit some of that information and let the others not to be transmitted.

For example, if the network management only want to transmit System Name TLV in the LLDPDU on a given port, the following value will be set:

IldpPortConfigTLVsTxEnable.20 = ' 2 ' H

- The parameter which is not supported by the corresponding pingCtlType cannot be configured.
- Once the configuration is modified, the result and histories of the corresponding entry will be cleared.
The results and histories must be the factual reflection of the test results of current configurations.
Users will be puzzled when they get the results which caused by the previous configurations.
- If the parameter which is not supported by the corresponding pingCtlType is read, the result is invalid.

1.hh3cdot1qVlanMIBTable is used for vlan information management and monitor, It can be used for VLAN row creation, deletion, and VLAN property configuration and query.

In this table the leaf node can be classified as config node and query node, config node can both be used for config and query purposes, while query node can be used for query only.

The config node in this table include:

hh3cdot1qVlanName

hh3cdot1qVlanPorts

hh3cdot1qVlanType

hh3cdot1qVlanPriority

hh3cdot1qVlanRowStatus

hh3cdot1qVlanBroadcastSuppression

hh3cdot1qVlanBcastSuppressionPPS

hh3cdot1qVlanMulticast (Not support)

Rest of the leaf nodes are query nodes.

2.hh3cdot1qVlanMIBTable configuration instruction:

hh3cdot1qVlanMIBTable use VLAN Index as the table index, which is normally called VLANID,

if a row is to be created, it is recommended to traverse this table first and use the unused VLAN index to create the row. In this table rowstatus only support active(1), createAndGo(4), destory(6).

For this MIB ,there are two kinds of operation:

2.1 hh3cdot1qVlanRowStatus(createAndGo(4)) and nodes are set together

When the rowstatus node and the following nodes are set simultaneously

hh3cdot1qVlanName

hh3cdot1qVlanPorts

hh3cdot1qVlanType

hh3cdot1qVlanPriority

hh3cdot1qVlanBroadcastSuppression

hh3cdot1qVlanBcastSuppressionPPS

hh3cdot1qVlanMulticast (Not support)

For hh3cdot1qVlanName, VLAN name string check is performed, the row is created only if the string check succeeds.

For rest of the leaf nodes listed above, the row will be created before setting the properties. If errors happen when setting the properties, the operation will fail while the row has already been created.

Here is some examples for the error mentioned above:

1) hh3cdot1qPorts: through this MIB node only access type ports can be added or deleted. Operation will fail while the row has already been created, if some of the ports to be added or deleted are not of access type.

2) hh3cdot1qVlanType: with value sub-vlan(3) can not be set using this MIB, when rowstatus(createAndGo(4)) and hh3cdot1qVlanType(sub-vlan(3)) are set together, Operation will fail while the row has already been created.

It is recommended to set hh3cdot1qVlanRowStatus(createAndGo(4)) and other node properties separately to avoid such kind of error.

2.2 Row already exist and set node properities:

For the following nodes:

hh3cdot1qVlanName The name length can not exceed 32 charcters.

hh3cdot1qVlanPorts To set the node successfully you should first get the value of the node, and then only change the corresponding bit of the access port.

hh3cdot1qVlanType sub-vlan(3) secondary-vlan(5) can not be set using this MIB

hh3cdot1qVlanPriority

hh3cdot1qVlanBroadcastSuppression

hh3cdot1qVlanBcastSuppressionPPS

hh3cdot1qVlanMulticast (Not support)

3. configuration example

1) Configuration success

hh3cdot1qVlanRowStatus(createAndGo(4)) are set together with hh3cdot1qVlanName using value "vlantest", use the index unused in this table, the row is created and hh3cdot1qVlanName is set successfully.

2) Configuration fail

Precondition: there is trunk type port existing on the device and port not belongs to this vlan. hh3cdot1qVlanRowStatus(createAndGo(4)) and hh3cdot1qVlanPorts with trunk port corresponding bit in the octet string setting to 1 are set together, Operation will fail while the row has already been created.

hh3cInterfaceRowStatus (1.3.6.1.4.1.25506.8.35.2.1.2.1.7)	read-create	No	Only support active(1), createAndgo(4) and destroy(6). When the rowstatus node and the other nodes in this table are set simultaneously, the row will be created before setting the properties, if errors happen when setting the properties, operation will fail while the row has already been created. It is recommended to set hh3cInterfaceRowStatus (createAndGo(4)) and other node properties separately to avoid such kind of error. Set status column to createAndGo when the status column is active, it will be succeed.

HH3C-TRNG-MIB

This MIB is used to manage time-range.

When creating an absolute time-range, configure hh3cTrngCreateTimerangeTable firstly, then use the value of hh3cTrngIndex as the value of hh3cTrngAbsoluteNameIndex to create hh3cTrngAbsoluteTable. For example, hh3cTrngCreateTimerangeTable is configured, and value of hh3cTrngIndex are 1,2,5, then 1,2,5 can be specified as index for creating hh3cTrngAbsoluteTable.

When creating a periodic time-range, configure hh3cTrngCreateTimerangeTable firstly, then use the value of hh3cTrngIndex as the value of hh3cTrngPeriodicNameIndex to create hh3cTrngPeriodicTable. For example, hh3cTrngCreateTimerangeTable is configured, and value of hh3cTrngIndex are 1,2,5, then 1,2,5 can be specified as index for creating hh3cTrngPeriodicTable.

After saving and rebooting, the value of hh3cTrngIndex, hh3cTrngAbsoluteNameIndex, hh3cTrngAbsoluteSubIndex, hh3cTrngPeriodicNameIndex and hh3cTrngPeriodicSubIndex may be adjusted.

If hh3cTrngCreateTimerangeTable is configured, hh3cTrngAbsoluteTable and hh3cTrngPeriodicTable are not configured, time-range does not actually exist, and the configuration of hh3cTrngCreateTimerangeTable may be lost after saving and rebooting.

hh3clfQoSQSWeightedTable

OID of this table is: 1.3.6.1.4.1.25506.2.65.1.1.1.2

The set operation of this table only supports multiple variable bindings.

If the system supports hh3clfQoSQueueGroupType, variables that must be bound in a set operation include hh3clfQoSQueueGroupType, or hh3clfQoSQueueGroupType must not be bound in the set operation.

If the hh3clfQoSQueueGroupType is group0(1), hh3clfQoSQueueType and hh3clfQoSQueueValue must not be bound in the set operation.

If the hh3clfQoSQueueGroupType is group1(2) or group2(3), hh3clfQoSQueueType and hh3clfQoSQueueValue must be bound in the set operation.

If the system does not support hh3clfQoSQueueGroupType, hh3clfQoSQueueGroupType must not be bound in the set operation. And variables that must be bound in the set operation include hh3clfQoSQueueType and hh3clfQoSQueueValue.

If the hh3clfQoSQueueMinBandwidth is set, the hh3clfQoSQueueMode must be wfq mode.

HH3C-CONFIG-MAN-MIB

A configuration management MIB, includes configuration log management and Backup & Restore operation of configuration.

All the configuration change events can be managed by the log management MIB. The configuration may be changed by CLI, SNMP or other ways defined as the MIB.

Backup & Restore MIB group provides the configuration backup and restore among flash, memory and network.

Note: Writing flash can be done by Backup(save) as described in figure below.

It is recommended that **hh3cWriteConfig** is replaced by this MIB.

✧ Terms

(The terms listed below are just used in the range of this section.)

BootRom: a special program which is used to boot the system on system startup.

BOOT ROM: a specific zone in system in which a BootRom is stored.

Bootrom file: a file which exists in file system. The content of such file is BootRom.

✧ Function

The responsibility of this table is to update BootRom from a BootRom file in file system to BOOT ROM.

It assumes that the source Bootrom file already exists in the file system of the device before doing operation. On system startup, this table is empty.

✧ Notes

1) Be careful that the operation on BOOT ROM updating is risky. Other operations may halt during updating BOOT ROM. Such operation may take a long time as well.

2) The value of hh3cSysCurUpdateBtmFileName will not be updated until updating operation completed.

3) The value of hh3cSysBtmLoadIndex is divided into two parts as follows:

The entityIndex is the same as entPhysicalIndex as defined in the entPhysicalTable, and must be the entPhysicalIndex of the entity whose entPhysicalClass is 'module'. The randomIndex is determined by users. Algorithm of hh3cSysBtmLoadIndex:

$hh3cSysBtmLoadIndex = (entityIndex \ll 16) | randomIndex$

4) It is strongly recommended that the name of a Bootrom file ends with valid filename extension, but this table will not check the filename. The verification of validity of a Bootrom file will be performed after the hh3cSysBtmRowStatus of this instance turns into 'active'.

5) If hh3cSysBtmFileName of the instance includes a path, that path must refer to the same device identified by 'entityIndex' part of hh3cSysBtmLoadIndex of the instance. If hh3cSysBtmFileName includes just a filename without a path, the root directory will be used internally.

6) At present, hh3cSysBtmFileType must be set to 'main'.

7) All necessary objects, which are hh3cSysBtmFileName and hh3cSysBtmFileType, should be provided with hh3cSysBtmRowStatus simultaneously in creation.

8) hh3cSysBtmErrorStatus can be used to get current progress or result of the updating operation. At any time, there is only one instance of which the hh3cSysBtmErrorStatus is 'InProgress' in the same device. Creating a new instance will fall into fail if there is an instance of which hh3cSysBtmErrorStatus is 'inProcess'.

9) If there is an attempt to remove the instance of which the hh3cSysBtmErrorStatus is 'InProgress', such attempt may fail.

The Boot Rom in BOOT ROM can not be removed through hh3cSysBtmLoadTable, but it can be updated through this table.

When removing an instance from this table, there is no any deletion of the corresponding file in file system.

After updating a Bootrom file into BOOT ROM, the corresponding file can be removed from the file system, but it is not the responsibility of this table to remove a Bootrom file from the file system.

10) Please refer to the switch guideline to make sure that the module supports updating.

✧ Examples

Creating a new instance.

A valid Bootrom file named with "flash:/s4e01_06.btm" is supposed existing in file system.

The entPhysicalIndex of the entity (the entPhysicalClass of this entity is 'module') is 2 (Here the value 2 is used just as illustration, the actual value must be got from entPhysicalIndex in

entPhysicalTable of ENTITY-MIB), the customized randomIndex is 1. Then the value of hh3cSysBtmLoadIndex is 131073, and the value of the necessary objects should be set to:

hh3cSysBtmFileName.131073 = "flash:/s4e01_06.btm"

hh3cSysBtmFileType.131073 = 'main'

hh3cSysBtmRowStatus.131073 = 'createAndGo'

HH3C-ENTITY-EXT-MIB

This MIB is used to describe the extend properties of entity of switches.

hh3cEntityExtStateTable

OID of this table is :1.3.6.1.4.1.25506.2.6.1.1.1

The information of this MIB depends on the information of the hardware, so As per MIB when filling the value of items.

Name	Access	PDS	Description
hh3cEntityExtPhysicalIndex (1.3.6.1.4.1.25506.2.6.1.1.1.1.1)	accessible-for-notify	No	The index of the table, the same as the entPhysicalIndex defined in ENTITY-MIB.
hh3cEntityExtAdminStatus (1.3.6.1.4.1.25506.2.6.1.1.1.1.2)	read-write	No	notSupported(1) and shuttingDown(3) can not be set
hh3cEntityExtOperStatus (1.3.6.1.4.1.25506.2.6.1.1.1.1.3)	read-only	No	Represent the possible values of operational states. A value of disabled means the entity goes wrong, and cannot be operated. A value of enabled means the entity is partially or fully operable.

Table 2 Explain the table:

1. "Yes" means the property of that entity is implemented. Others are not supported.
2. If the result of the operation is "no such name/instance", then this MIB object is not to be supported for the specific entity.

HH3C-IF-EXT-MIB

This MIB is an extension of interface MIBs such as IF-MIB. This MIB is applicable to switches. Some objects in this may be used only for some specific switches, so users should refer to the related documents to acquire more detail information.

Scalar Objects

This MIB has no scalar object.

- The parameter which is not supported by the corresponding pingCtlType cannot be configured.
- Once the configuration is modified, the result, histories, and statistics of the corresponding entry will be cleared.
- The results, histories and statistics must be the factual reflection of the test results of current configurations.
- Users will be puzzled when they get the results which caused by the previous configurations.
- If the parameter which is not supported by the corresponding pingCtlType is read, the result is invalid.

HH3C-RADIUS-MIB

A configuration management and statistical MIB, includes configuration of RADIUS Server, and statistics about Accounting Server which complements the IETF standard MIB. In addition, there are two traps supported to notify the RADIUS Server's down state.

Note: Creating and deleting a row in either hh3cRdInfoTable or hh3cRdAcclInfoTable will work on another table. That is, to create a new row in hh3cRdInfoTable, a row with the same group name will appear in hh3cRdAcclInfoTable. To delete a row from hh3cRdInfoTable, corresponding row in hh3cRdAcclInfoTable will be cleared away and vice versa.

HH3C-STACK-MIB

Scalar objects

Name	Access	PDS	Description
------	--------	-----	-------------

hh3cStackMaxMember (1.3.6.1.4.1.25506.2.91.1.1)	read-only	No	The maximum number of members in a stack.
hh3cStackMemberNum (1.3.6.1.4.1.25506.2.91.1.2)	read-only	No	The number of members currently in a stack.
hh3cStackMaxConfigPriority (1.3.6.1.4.1.25506.2.91.1.3)	read-only	No	The highest priority that can be configured for a member in a stack.
hh3cStackAutoUpdate (1.3.6.1.4.1.25506.2.91.1.4)	read-write	Current	<p>The function for automatically updating the image from master to slave. When a new device tries to join a stack, the image version is checked. When this function is enabled, if the image version of the new device is different from that of the master, the image of the new device will be updated to be consistent with that of the master. When this function is disabled, the new device can not join the stack if the image version of the new device is different from that of the master.</p> <p>disabled: disable auto update function</p> <p>enabled: enable auto update function</p>
hh3cStackMacPersistence (1.3.6.1.4.1.25506.2.91.1.5)	read-write	Current	<p>The modes of bridge MAC address persistence. When a stack starts, the bridge MAC address of master board will be used as that of the stack. If the master board leaves the stack, the bridge MAC address of the stack will change based on the mode of bridge MAC address persistence.</p> <p>notPersist: The bridge MAC address of the new master board will be used as that of the stack immediately.</p> <p>persistForSixMin: The bridge MAC address will be reserved for six minutes. In this period, if the master board which has left the stack rejoins the stack, the bridge MAC address of the stack will not change. Otherwise, the bridge MAC address of the new master board will be used as that of the stack.</p> <p>persistForever: Whether the master leaves or not, the bridge MAC address of the stack will never change.</p>
hh3cStackLinkDelayInterval (1.3.6.1.4.1.25506.2.91.1.6)	read-write	Current	The delay time for a device in a stack to report the change of stack port link status. If the delay time is configured, a device in a stack will not report the change

			<p>immediately when the stack port link status changes to down. During the delay period, if the stack port link status is resumed, the device will ignore the current change of the stack port link status. If the stack port link status is not resumed after the delay time, the device will report the change.</p> <p>0 means no delay, namely, the device will report the change as soon as the stack port link status changes to down.</p> <p>0: no delay 200-2000(ms): delay time</p>
hh3cStackTopology (1.3.6.1.4.1.25506.2.91.1.7)	read-only	No	<p>The topology of the stack.</p> <p>chainConn: chain connection ringConn: ring connection</p>

Name	Access	PDS	Description
hh3cStackMemberID (1.3.6.1.4.1.25506.2.91.2.1.1)	read-only	No	The member ID of the device in a stack.
hh3cStackConfigMemberID (1.3.6.1.4.1.25506.2.91.2.1.2)	read-write	Yes	The configured member ID of the device. The valid value ranges from 1 to the value of hh3cStackMaxMember. After the member ID is configured for a device, if this ID is not the same with that of another device, the ID will be used as the member ID of the device when the device reboots. If a same ID exists, the member ID of the device will be set as another exclusive ID automatically.
hh3cStackPriority (1.3.6.1.4.1.25506.2.91.2.1.3)	read-write	Yes	The priority of a device in a stack. The valid value ranges from 1 to the value of hh3cStackMaxConfigPriority.
hh3cStackPortNum (1.3.6.1.4.1.25506.2.91.2.1.4)	read-only	No	The number of stack ports which is enabled in a device.
hh3cStackPortMaxNum (1.3.6.1.4.1.25506.2.91.2.1.5)	read-only	No	The maximum number of stack ports in a device.

Name	Access	PDS	Description
hh3cStackPortIndex (1.3.6.1.4.1.25506.2.91.4.1.1)	accessible-for-notify	No	The index of a stack port of the device in a stack.
hh3cStackPortEnable (1.3.6.1.4.1.25506.2.91.4.1.2)	read-only	No	The status of the stack port of the device in a stack. If no physical port is added to the stack port, its status is 'disabled'; otherwise, its status is 'enabled'. disabled: The stack port is disabled. enabled: The stack port is enabled.
hh3cStackPortStatus (1.3.6.1.4.1.25506.2.91.4.1.3)	read-only	No	The link status of the stack port of the device in a stack. up: The link status of a stack port with reasonable physical connection is up. down: The link status of a stack port without physical connection is down. silent: The link status of a stack port which can not be used normally is silent. disabled: The link status of a stack port in disabled status is disabled.
hh3cStackNeighbor (1.3.6.1.4.1.25506.2.91.4.1.4)	read-only	No	The member ID of the stack port's neighbor in a stack. 0 means no neighbor exists.

hh3cStackPhyPortInfoTable

OID of this table is: 1.3.6.1.4.1.25506.2.91.5

Name	Access	PDS	Description
hh3cStackBelongtoPort (1.3.6.1.4.1.25506.2.91.5.1.1)	read-write	Yes	The index of the stack port to which the physical port is added. 0 means the physical port is not

			added to any stack port. The value will be valid after the device in the stack reboots.

HH3C-TUNNEL-MIB

A configuration management MIB, configuration of tunnel.

All the configuration change events can be managed by the mib. The configuration may be changed by CLI, SNMP or other ways defined as the MIB.

hh3cTunnellfTable

OID of this table is: 1.3.6.1.4.1.25506.2.53.1.1.1

Name	Access	PDS	Description
hh3cTunnellfEncapsMethod (1.3.6.1.4.1.25506.2.53.1.1.1.1.3)	read-write	Current	IPv6-IPv4 manual, IPv6-IPv4 auto, IPv6-IPv4 6to4, IPv6-IPv4 isatap are supported.
hh3cTunnellfHopLimit (1.3.6.1.4.1.25506.2.53.1.1.1.1.4)	read-only	Current	The IPv4 TTL or IPv6 Hop Limit to use in the outer IP header. A value of 0 indicates that the value is copied from the payload's header. We use 0 in our implementation.
hh3cTunnellfSecurity (1.3.6.1.4.1.25506.2.53.1.1.1.1.5)	read-only	Current	The method used by the tunnel to secure the outer IP header. We use 1 in our implementation. 1 means no security.
hh3cTunnellfTOS (1.3.6.1.4.1.25506.2.53.1.1.1.1.6)	read-only	Current	The method used to set the high 6 bits (the differentiated services codepoint) of the IPv4 TOS or IPv6 Traffic Class in the outer IP header. A value of -1 indicates that the bits are copied from the payload's header. A value of -2 indicates that a traffic conditioner is invoked and more information may be available in a traffic conditioner MIB module. A value between 0 and 63 inclusive indicates that the bit field is set to the indicated value. We use -1 in our implementation.
hh3cTunnellfFlowLabel (1.3.6.1.4.1.25506.2.53.1.1.1.1.7)	read-only	Current	The method used to set the IPv6 Flow Label value. This object need not be present in rows where h3cTunnellfAddressType indicates the tunnel is not over IPv6. A value of -1 indicates that a traffic conditioner is invoked and

			more information may be available in a traffic conditioner MIB. Any other value indicates that the Flow Label field is set to the indicated value. We use -1 in our implementation, and tunnel over IPv6 has not been supported.
hh3cTunnelIfAddressType (1.3.6.1.4.1.25506.2.53.1.1.1.1.8)	read-write	Current	The address type of local address or remote address of tunnel. Only IPv4 is supported.
hh3cTunnelIfLocalNetAddress (1.3.6.1.4.1.25506.2.53.1.1.1.1.9)	read-write	Current	As per MIB
hh3cTunnelIfRemoteNetAddress (1.3.6.1.4.1.25506.2.53.1.1.1.1.10)	read-write	Current	As per MIB
hh3cTunnelIfEncapsLimit (1.3.6.1.4.1.25506.2.53.1.1.1.1.11)	read-only	Current	The maximum number of additional encapsulations permitted for packets undergoing encapsulation at this node. A value of -1 indicates that no limit is present. We use 3 in our implementation

HH3C-STORM-CONSTRAIN

The storm-constrain provides the function to control a port forwarding state. If all types of the flux in normal, the port will be in normal (forwarding) state. If any type of the flux exceeds its upper limit, the port will be change into controlled (discarding) state to avoid packets storm. When all flux of the port which exceed upper limit falling under their lower limit, the port in controlled (discarding) will recover normal (forwarding) state.
