The Case that Connection Source Is FBX DKU and Connection Destination Is LFF DKU/SFF DKU

1. Pattern of Cable De-installation

   There are four kinds of patterns that the connections source is the FBX DKU and the connection destination is the LFF DKU/SFF DKU when the Device Interface Cable UFEX (DKC-F710I-UFEXC) is removed from the rack.

   For the case that the connection source is the LFF DKU/SFF DKU and the connection destination is the FBX DKU, refer to INST04-01C-6090.

   In this procedure, the output side of the Device Interface Cable is defined as a Connection Source, and the RACK is called a Connection Source RACK, and the DKU is called a Connection Source DKU. Moreover, the input side of the Device Interface Cable is defined as a Connection Destination, and the RACK is called a Connection Destination RACK, and the DKU is called a Connection Destination DKU.

   Before starting operation according to this procedure, understand each process name and the position.

The Case that Connection Source Is LFF DKU/SFF DKU and Connection Destination Is FBX DKU

1. Pattern of Cable De-installation

   There are four kinds of patterns that the connections source is the LFF DKU/SFF DKU and the connection destination is the FBX DKU when the Device Interface Cable UFEX (DKC-F710I-UFEXC) is removed from the rack.

   In this procedure, the output side of the Device Interface Cable is defined as a Connection Source, and the RACK is called a Connection Source RACK, and the DKU is called a Connection Source DKU. Moreover, the input side of the Device Interface Cable is defined as a Connection Destination, and the RACK is called a Connection Destination RACK, and the DKU is called a Connection Destination DKU.

   Before starting operation according to this procedure, understand each process name and the position.

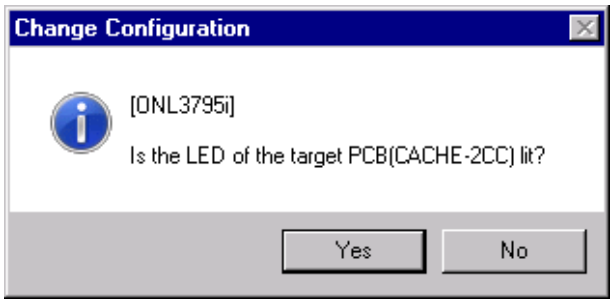
(7) <Check shut down LED>
Select (CL)
* [Yes] if LED is on
* [No] if LED is off
in response to “Is the LED of the target PCB(CACHE-nnn) lit?”.



(Eg. CACHE-2CB)

If [No] is selected:
Select (CL) [OK] after response to “Check the location of the target PCB(s)(CACHE-nnn), then pull out the PCB(s) without considering the status of LED.”.
(Refer INST04-03-250)
Go to step (8).

4. De-Installation Procedure of PCI Express Switch Adapter

De-Installation Condition

The PCI Express Switch Adapter (DKC-F710I-ESW) is an indispensable option that is to be removed when the subsystem configuration of DKC is corresponding to the following conditions.

In case of DKC-0

When it corresponds to all the following two conditions, remove the second set (1SB/2SD)

- When the standard model is selected
- When the CHA is removed from the Option 2 (1FU/2RU) and the Option 3 (1FL/2RL) of the CHA slots
- When the DKA or the CHA is removed from the Option 1 (1AL/2ML) of the DKA slots

In case of DKC-1

When it corresponds to all the following two conditions, remove the second set (1SF/2SH)

- When the standard model is selected
- When the CHA is removed from the Option 2 (1HU/2UU) and the Option 3 (1HL/2UL) of the CHA slots
- When the DKA or the CHA is removed from the Option 1 (1LL/2XL) of the DKA slots

Twin DKC Model

For the twin DKC model, the ESWs that are installed in the DKC-0 and the DKC-1 should be the same in number.

- The ESWs (1SB/2SD/1SF/2SH) can be removed from the DKC-0 and the DKC-1 only when it meets both requirements of removing the ESWs from the ESW slot option 1 (1SB/2SD) of the DKC-0 and requirements of removing ESWs from the ESW slot option 1 (1SF/2SH) of the DKC-1.

Note: Be sure to wear your wrist strap and attach to ground prior to performing the following work. This will ensure that the IC and LSI on the PCB are protected from static electricity.

8. De-Installation Procedure of PCI Express Switch Adapter

De-Installation Condition

The PCI Express Switch Adapter (DKC-F710I-ESW) is an indispensable option that is to be removed when the subsystem configuration of DKC is corresponding to the following conditions.

In case of DKC-0

When it corresponds to all the following two conditions, remove the second set (1SB/2SD)

- When the standard model is selected
- When the CHA is removed from the Option 2 (1FU/2RU) and the Option 3 (1FL/2RL) of the CHA slots
- When the DKA or the CHA is removed from the Option 1 (1AL/2ML) of the DKA slots

In case of DKC-1

When it corresponds to all the following two conditions, remove the second set (1SF/2SH)

- When the standard model is selected
- When the CHA is removed from the Option 2 (1HU/2UU) and the Option 3 (1HL/2UL) of the CHA slots
- When the DKA or the CHA is removed from the Option 1 (1LL/2XL) of the DKA slots

Twin DKC Model

For the twin DKC model, the ESWs that are installed in the DKC-0 and the DKC-1 should be the same in number.

- The ESWs (1SB/2SD/1SF/2SH) can be removed from the DKC-0 and the DKC-1 only when it meets both requirements of removing the ESWs from the ESW slot option 1 (1SB/2SD) of the DKC-0 and requirements of removing ESWs from the ESW slot option 1 (1SF/2SH) of the DKC-1.

Note: Be sure to wear your wrist strap and attach to ground prior to performing the following work. This will ensure that the IC and LSI on the PCB are protected from static electricity.

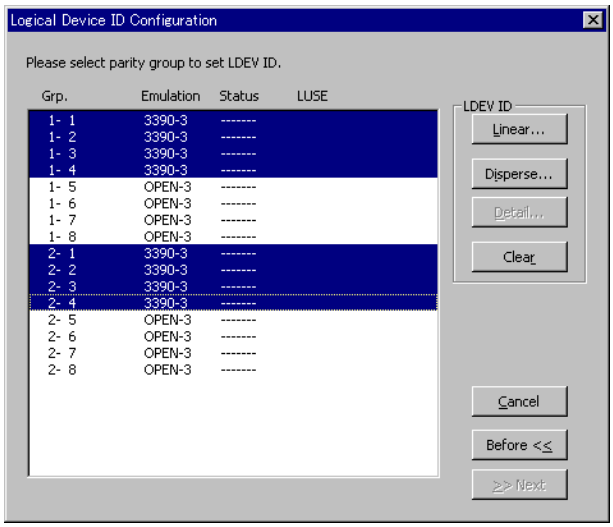
5.2.2.1 LDEV ID setting procedure when the emulation types of different systems coexist

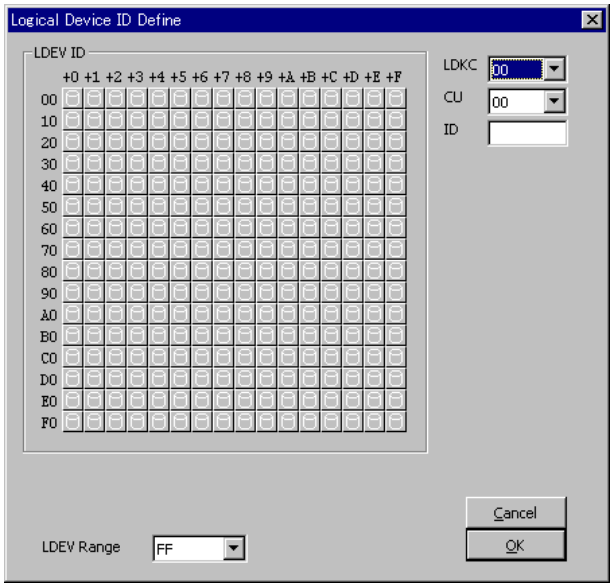
5.2.2.1.1 Coexistence in units of parity group

The LDEV ID setting procedure is explained using an example of a case in which both the 3390 system LDEV and OPEN system LDEV are set in the same subsystem. This example shows the ID setting procedure when the B4-1/B4-2 is fully equipped with RAID5 (3D+1P), and the B4-1 and the B4-2 are defined as the 3390-3/OPEN-3 and the 3390-9/OPEN-3 respectively. Since systems other than the 3390 system and the 3390-3R cannot coexist in the parity group, the ID can be defined in this procedure.

1. Select only the parity group for which the 3390 system emulation type has been defined.



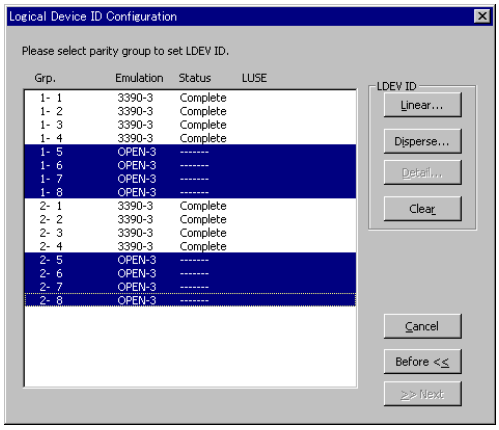
2. Press the Linear or Disperse button to open the LDEV ID input screen and input the LDEV ID. (In the example, the Disperse button is pressed.)



Copyright © 2010, Hitachi, Ltd.

3.

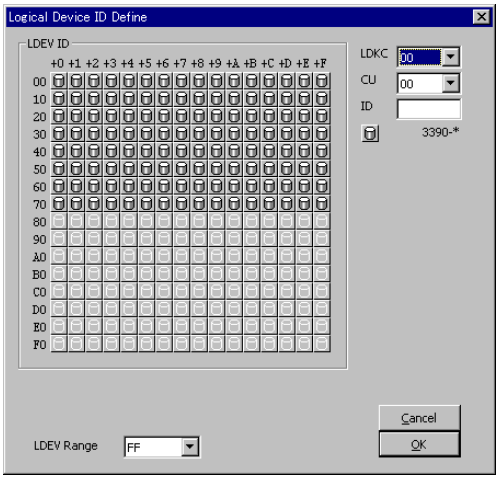
Next, select only the parity group for which the OPEN system emulation type has been set.



4.

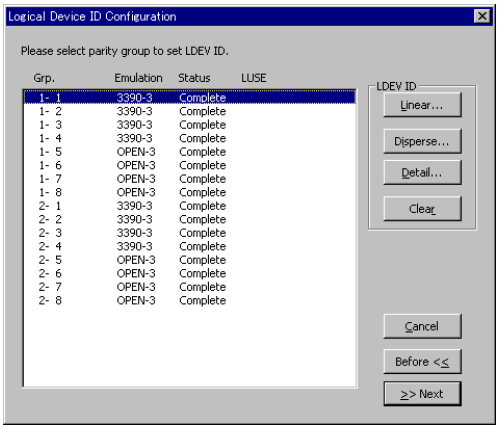
Press the Linear or Disperse button to open the LDEV ID input screen and input the LDEV ID. In this case, take care not to make a coexistence occur in the block. In the example, 0:a0 and the subsequent are unused blocks. Therefore, input a0.

Note: The definition range (terminal) is decided with LDEV Range.
For example, if LEDV Range is defined as 7F, LDEV ID is assigned only within the range of 00 to 7F.



5.

Setting is completed.



Needless to say, the setting sequence of steps (1) and (3) may reversed.
If emulation types of different systems are selected at the same time, the guarding function works to prevent the setting by making the Linear and Dispense buttons unselect able.

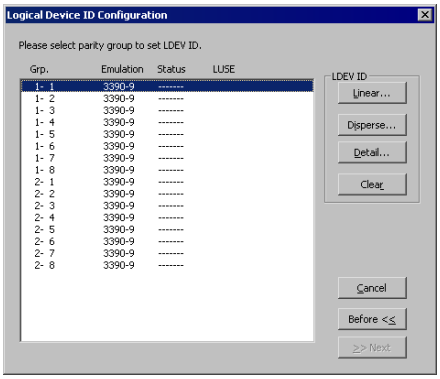
Copyright © 2010, Hitachi, Ltd.

5.2.2.1.2 Coexistence in a parity group

The 3390-3R can be set as a CV in the 3390 system parity group. The 3390 system LDEV can also be set as a CV in the 3390-3R parity group. If the ID is set in the procedure explained in Section 3.1 when this emulation setting has been performed, an intra-block coexistence setting violation occurs. To prevent the coexistence violation, set the ID following the procedure below.

1.

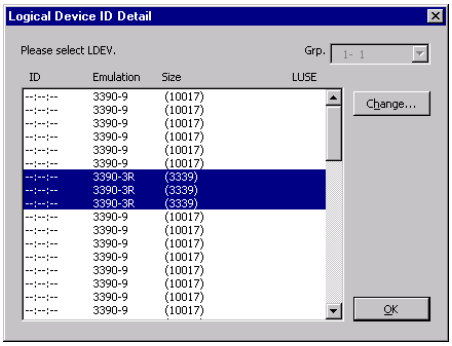
Select one parity group defining the 3390-3R as the CV and press the Detail button to open the screen displaying the LDEV definition detail in the parity group.



2.

Select the 3390-3R on the detail screen and define the LDEV ID.

Note: In the case of a RAID Concatenation Group, LDEV of the parity group selected by the “Grp List” is displayed.



3.

Repeat (1) and (2) until the definition of the 3390-3R LDEV ID is finished. In the example, the 3390-3R is assigned to IDs starting from ID 0:80.

4.

When the definition of the 3390-3R is completed, select the parity group defining emulation type of the same system and define the LDEV ID in the same way as that Section 3.1.

5.2.3 Check Procedure

> **⚠ CAUTION**
> This operation is necessary only when a subsystem is newly installed. It is not performed afterward. If it is performed by mistake, a system down or a data loss may be caused.

1. <Execute Power-on CUDG>
   Perform the power-on procedure from the DKCPANEL.
   (See INST03-14-10)
   Power-on CUDG is automatically executed on the DKC logic circuitry.
   If an error occurs, SIM Log, SSB Log has logging.
   (See SVP02-30)

---

2. <Execute DKU Path inline test>
   Perform DKU Path inline tests on all DKAs installed during the new installation procedure to check the validity of the drives.
   Please carry out A3 routine after carrying out A0 routine.
   See DIAGNOSIS SECTION for the test procedure. (DIAG04-130) (*1)

   If it ends abnormally, the following message is output. Check the parameter.
   "Parameter is invalid.
   Confirm the execution parameter and try again."

   Note: If all accounts registered to SVP are disabled, you cannot log into SVP (Authentication can be done in the authentication server).
   Prevent all accounts from being disabled.

(2) Procedure for switching to the account lock function

1. In SVP, select (CL) [Start]-[Run], enter the following command, and select (CL) [OK] to run the batch file.

*3: Marks used in the columns of Judgment Factor of SM Capacity means as follows.
× (N?): Functions and Program Products described in the table are not available as the SM used by the functions and the Program Product is ineffective.
○ (Y?): Functions and Program Products described in the table are available as the SM used by the functions and Program Products is effective. (To use the Program Products, performing installation operation separately is required (*4))

Example: The SM capacity when DP is applied is 16GB or over.
(The SM becomes effective regardless of functional necessity of SI/VM, FCv2/FCSE/DP/CoW/TI/TPF, and SI/VM Extension1, and they can be available to use by installation. Functions with × (N?) marked or more than described cannot be used)

*5: When Dynamic Provisioning/Dynamic Provisioning for Mainframe/Dynamic Tierring/ Dynamic Tiering for Mainframe is used, pool/virtual volume capacity that can be made according to the increase situation of a shared memory is enhanced. When using it exceeding the capacity of pool/virtual volume of 1.1PB (OPEN) or 1.0PB (MF), it is necessary to increase DP/HDT/TI Extension.
When DP/HDT/TI Extension is decreased, it is necessary to delete all DP, HDT and TI pools.

*1, 2: When using ShadowImage/ShadowImage for Mainframe/FlashCopy (R) V2/ VolumeMigration, these calculations are used for deciding the correct selection of "Extension1 and Extention2".

The number of the maximum pairs that can be created is extended according to the addition condition of SM. When creating a pair, a resource called a difference table is required. This difference table is extended depending on the SM addition condition, and the number of pairs that can be created in the disk subsystem is decided. Table 6.2-3 shows the total number of difference tables according to the addition condition of SM.

Table 6.2-3 Relation between the SM addition condition and the number of bitmap areas of the disk subsystem

Extension1 exists.	104,768

[ShadowImage/ShadowImage for Mainframe/VolumeMigration]

■ Calculation method of OPEN system emulation

—In case of OPEN-3, OPEN-8, OPEN-9, OPEN-E, OPEN-L and OPEN-K (TC only)

The number of difference tables for one pair = ↑ ((X) ÷ 48 + (Y) × 15) ÷ (Z) ↑

—In case of OPEN-V

The number of difference tables for one pair = ↑ ((X) ÷ 256) ÷ (Z) ↑

X: Volume size (KB), Y: Refer to Table 6.2-4, Z: 20,448 (the number of slots managed by one difference table)

■ Calculation method of MF system emulation

The number of difference tables for one pair = ↑ ((X) + (Y)) × 15) ÷ (Z) ↑

X: The number of the cylinders of the volume which is divided at arbitrary size.
Y: Refer to Table 6.2-4.
Z: 20,448 (the number of slots managed by one difference table)

[FlashCopy (R) V2]
In case of FlashCopy (R) V2, it calculates the number of difference tables required for volume units. When the number of copy destinations is N, N times the number of difference tables may be required depending on a creation method of relation (refer to "Hitachi Compatible FlashCopy (R) User Guide" for detail).

The number of difference tables for one volume (one copy destination) = ↑ ((X) + (Y)) × 15) ÷ (Z) ↑

Table 6.2-4 Number of the Control Cylinders According to the Emulation Types

OPEN-3	8
OPEN-8, OPEN-9	27
OPEN-E	19
OPEN-K	9

3390-3	6
3390-9	25

*3: When using CoW (CoW Extension), use these calculations to determine the correct selection of "CoW and CoW Extension".

Calculation of Necessary SM amount is as follows.
Necessary SM amount = [1] + [2]
[1] = ([P-VOL amount (in bytes) / 256(KB)] / 2048) * 8736 +
([(P-VOL amount (in bytes) / 256(KB)) / 1024] / 2048) * 8736
[2] = ([(Pool capacity (B) / 256(KB)) * 32(B)] / 8736) * 8736 +
([(Pool capacity (B) / 256(KB)) / 270] / 2048) * 8736

Here is the SM size (CoW and CoW Extension).

Table 6.2-5 Necessary SM amount

	Necessary SM amount (MB)
CoW	714
CoW Extension	4,092

SM used depends on the P-VOL total amount and the POOL capacity.
If the POOL capacity becomes large, the P-VOL capacity that can have a pair becomes smaller. But it does not depend on the number of Snapshots created to one P-VOL.
SM use amount doesn't change if it is 1(P-VOL):1(S-VOL) configuration or if it is 1(P-VOL):64(S-VOL) configuration; the SM amount used is the same.

Copyright © 2010, 2011, Hitachi, Ltd.

Calculation Example:
If the desired condition is P-VOL amount=10TB and Pool capacity=10TB, the necessary SM amount becomes as follows.

[1] = ([P-VOL amount (in bytes) / 256(KB)] / 2048) * 8736 +
([(P-VOL amount (in bytes) / 256(KB)) / 1024] / 2048) * 8736
= ([(10 * 1024 * 1024 * 1024 * 1024) / (256 * 1024)] / 2048) * 8736 +
([((10 * 1024 * 1024 * 1024 * 1024) / (256 * 1024)) / 1024] / 2048) * 8736
= ([(10,995,116,277,760) / (262,144)] / 2048) * 8736 +
([((10,995,116,277,760) / (262,144)) / 1024] / 2048) * 8736
= ([41,943,040] / 2048) * 8736 + ([40,960] / 2048) * 8736
= (20,480) * 8736 + (20) * 8736
= 178,913,280 + 174,720
= 179,088,000(B)
Convert to MB:
= 179,088,000 / 1,048,576 = 170.792(MB)
Round up to whole number = 171(MB)

[2] = ([Pool capacity (B) / 256(KB) * 32(B)] / 8736) * 8736 +
([Pool capacity (B) / 256(KB) / 270] / 2048) * 8736
= ([(10 * 1024 * 1024 * 1024 * 1024) / (256 * 1024) * 32] / 8736) * 8736 +
([(10 * 1024 * 1024 * 1024 * 1024) / (256 * 1024) / 270] / 2048) * 8736
= ([(10,995,116,277,760) / (262,144) * 32] / 8736) * 8736 +
([(10,995,116,277,760) / (262,144) / 270] / 2048) * 8736
= ([41,943,040 * 32] / 8736) * 8736 +
([41,943,040 / 270] / 2048) * 8736
= ([1,342,177,280] / 8736) * 8736 +
([155,344.593~] / 2048) * 8736
The second clause round up to whole number.
= ([1,342,177,280] / 8736) * 8736 +
([155,345] / 2048) * 8736
= (153,637.509~) * 8736 + (75.852~) * 8736
Then, round up to the next whole number.
= (153,638) * 8736 + (76) * 8736
= 1,342,181,568 + 663,936
= 1,342,845,504(B)
Convert to MB:
= 1,342,845,504 / 1,048,576 = 1,280.637~(MB)
Then, round up to whole number. = 1,281(MB)

Copyright © 2010, 2011, Hitachi, Ltd.

Necessary SM amount = [1] + [2]
= 171(MB) + 1,281(MB)
= 1,452(MB)

It is necessary to install up to CoW Extension according to the calculated necessary SM amount and the total SM amount in Table 6.2-5.

Note: '256KB' is the control unit of Cache and Parity Group and is called as 'slot', so 'Pool capacity (B) / 256(KB)' obtains number of slot for POOL Vol.
'32Byte' is SM size to control slot of Pool. (It is the size for 1 slot.)

*4: It will be used for enhancement.

(2) Cache Capacity

The cache capacity of VSP is determined by the number of installed MP PCB, the RAID level, the drives installed in the disk array system, whether Dynamic Provisioning (DP)/Dyanamic Tiering (DT)/Dynamic Cache Residency (DCR)/Extend Remote Copy (XRC)/Universal Volume Manager (UVM) is applied/not applied etc.
The required cache capacity installed in VSP depends on the number of MP PCB as shown in the following table.

Table 6.2-6 Relation between the number of MP PCB and the required cache memory capacity

Number of MP PCB	Required cache capacity (*1)
2	8GB or more (*2)
4	16GB or more
6	24GB or more
8	32GB or more

*1: The sum of data cache capacity and cache directory capacity

*2: 1GB = $1{,}024^3$Byte

The recommended cache capacity is determined by the number of installed MP PCB, the drives installed in the disk array system, whether DP/DT/DCR/XRC/UVM is applied/not applied etc. The calculation process of the recommended data cache capacity is shown below.

The recommended data cache capacity per CLPR =

(iii) In case of CLPR to which DCR is applied

It is recommended to install cache capacity according to the number of areas to which the Priority mode of DCR Extent setting is applied. The purpose is to avoid the possible access performance degradation of non-DCR data when DCR is set. In other words, if data is written to the area to which the Priority mode is applied, the data is written to the cache (standard cache) other than the DCR cache. If data is written to the area to which the Priority mode is applied while the standard cache is overloaded (available cache capacity is small), there would be no available capacity in the standard cache, and wait for available standard cache would occur frequently. Consequently access performance of non-DCR data could be degraded.

If the recommended data cache capacity shown in the following table is larger than the recommended data cache capacities calculated in (i) and (ii), install the recommended data cache capacity shown in the following table.

Table 6.2-9 Recommended data cache capacity in case DCR Priority mode is applied

Settings of priority mode	Recommended data cache capacity per CLPR
The specified number of cache extents is 8,192 or less and the specified capacity is 128 GB or less.	16GB or more
The specified number of cache extents exceeds 8,192 or the specified capacity exceeds 128 GB.	32GB or more

(iv) In case of CLPR to which XRC is applied

CLPR to which XRC is applied uses cache for the management information called sidefile. Therefore it is recommended install larger capacity than the recommended data cache capacity calculated in (i) through (iii) by taking “the level-1 threshold” of XRC into account. Use the following formula to calculate it.

Recommended data cache capacity ≥

(Recommended data cache capacity calculated in (i) through (iii)) × 100 ÷ (100 − (the level-1 threshold))

(v) In case of CLPR for UVM

If the configuration of the CLPR meets the conditions described in Table 6.2-10, you can apply the recommended data cache capacity shown in Table 6.2-11.

Table 6.2-10 CLPR for UVM

Conditions of CLPR for UVM
• One CLPR consists of only external volumes • Performance is not important • The cache mode of the mapped volumes is “Disable” • It consists of only volumes for open systems

Table 6.2-11 Recommended cache memory capacity of CLPR for UVM

Total logical capacity of external volumes in CLPR for UVM	Number of MP PCB	Recommended cache capacity of CLPR for UVM
Less than 128,000GB	2/4	4GB
	6/8	8GB
128,000GB or more	2/4	8GB
	6/8	16GB

(3) Total CM Capacity

Required total CM capacity is determined by the sum of SM capacity, Data CM capacity and cache directory capacity. Data CM capacity of each CPC recommends constitution becoming equal as possible. Because SM capacity is included in CPC0, it is necessary to increase cache memory capacity of CPC0 for SM capacity. As an example, relation between total CM capacity and installing location in case of 128GB or less shown in Table 6.2-12.

*1: The number of HDD options is only the number of data disks, and the number of spare disks is not included.

*2: OPEN-V is volume based on CVS. A customer can set up the volume capacity of OPEN-V freely from 48.1MB among almost 1 RAID group capacity. This volume capacity is the default value and is nearly equal to 1 RAID group capacity.

*1: The number of HDD options is only the number of data disks, and the number of spare disks is not included.

*2: OPEN-V is volume based on CVS. A customer can set up the volume capacity of OPEN-V freely from 48.1MB among almost 1 RAID group capacity. This volume capacity is the default value and is nearly equal to 1 RAID group capacity.

*1: The number of HDD options is only the number of data disks, and the number of spare disks is not included.

*2: OPEN-V is volume based on CVS. A customer can set up the volume capacity of OPEN-V freely from 48.1MB among almost 1 RAID group capacity. This volume capacity is the default value and is nearly equal to 1 RAID group capacity.

*1: The number of SSD options is only the number of data disks, and the number of spare disks is not included.

*2: OPEN-V is volume based on CVS. A customer can set up the volume capacity of OPEN-V freely from 48.1MB among almost 1 RAID group capacity. This volume capacity is the default value and is nearly equal to 1 RAID group capacity.

*1: The number of SSD options is only the number of data disks, and the number of spare disks is not included.

*2: OPEN-V is volume based on CVS. A customer can set up the volume capacity of OPEN-V freely from 48.1MB among almost 1 RAID group capacity. This volume capacity is the default value and is nearly equal to 1 RAID group capacity.

*1: The number of HDD options is only the number of data disks, and the number of spare disks is not included.

*2: OPEN-V is volume based on CVS. A customer can set up the volume capacity of OPEN-V freely from 48.1MB among almost 1 RAID group capacity. This volume capacity is the default value.

*1: The number of HDD options is only the number of data disks, and the number of spare disks is not included.

*2: OPEN-V is volume based on CVS. A customer can set up the volume capacity of OPEN-V freely from 48.1MB among almost 1 RAID group capacity. This volume capacity is the default value and is nearly equal to 1 RAID group capacity.

*1: The number of HDD options is only the number of data disks, and the number of spare disks is not included.

*2: OPEN-V is volume based on CVS. A customer can set up the volume capacity of OPEN-V freely from 48.1MB among almost 1 RAID group capacity. This volume capacity is the default value and is nearly equal to 1 RAID group capacity.

*1: The number of SSD options is only the number of data disks, and the number of spare disks is not included.

*2: OPEN-V is volume based on CVS. A customer can set up the volume capacity of OPEN-V freely from 48.1MB among almost 1 RAID group capacity. This volume capacity is the default value and is nearly equal to 1 RAID group capacity.

*1: The number of HDD options is only the number of data disks, and the number of spare disks is not included.

*2: OPEN-V is volume based on CVS. A customer can set up the volume capacity of OPEN-V freely from 48.1MB among almost 1 RAID group capacity. This volume capacity is the default value.

*1: The number of HDD options is only the number of data disks, and the number of spare disks is not included.

*2: OPEN-V is volume based on CVS. A customer can set up the volume capacity of OPEN-V freely from 48.1MB among almost 1 RAID group capacity. This volume capacity is the default value and is nearly equal to 1 RAID group capacity.

*1: The number of HDD options is only the number of data disks, and the number of spare disks is not included.

*2: OPEN-V is volume based on CVS. A customer can set up the volume capacity of OPEN-V freely from 48.1MB among almost 1 RAID group capacity. This volume capacity is the default value.

*1: The number of HDD options is only the number of data disks, and the number of spare disks is not included.

*2: OPEN-V is volume based on CVS. A customer can set up the volume capacity of OPEN-V freely from 48.1MB among almost 1 RAID group capacity. This volume capacity is the default value.

*1: The number of HDD options is only the number of data disks, and the number of spare disks is not included.

*2: OPEN-V is volume based on CVS. A customer can set up the volume capacity of OPEN-V freely from 48.1MB among almost 1 RAID group capacity. This volume capacity is the default value.

*1: The number of HDD options is only the number of data disks, and the number of spare disks is not included.

*2: OPEN-V is volume based on CVS. A customer can set up the volume capacity of OPEN-V freely from 48.1MB among almost 1 RAID group capacity. This volume capacity is the default value and is nearly equal to 1 RAID group capacity.

*1: The number of HDD options is only the number of data disks, and the number of spare disks is not included.

*2: OPEN-V is volume based on CVS. A customer can set up the volume capacity of OPEN-V freely from 48.1MB among almost 1 RAID group capacity. This volume capacity is the default value and is nearly equal to 1 RAID group capacity.

*1: The number of HDD options is only the number of data disks, and the number of spare disks is not included.

*2: OPEN-V is volume based on CVS. A customer can set up the volume capacity of OPEN-V freely from 48.1MB among almost 1 RAID group capacity. This volume capacity is the default value and is nearly equal to 1 RAID group capacity.

*1: The number of SSD options is only the number of data disks, and the number of spare disks is not included.

*2: OPEN-V is volume based on CVS. A customer can set up the volume capacity of OPEN-V freely from 48.1MB among almost 1 RAID group capacity. This volume capacity is the default value and is nearly equal to 1 RAID group capacity.

*1: The number of SSD options is only the number of data disks, and the number of spare disks is not included.

*2: OPEN-V is volume based on CVS. A customer can set up the volume capacity of OPEN-V freely from 48.1MB among almost 1 RAID group capacity. This volume capacity is the default value and is nearly equal to 1 RAID group capacity.

*1: The number of HDD options is only the number of data disks, and the number of spare disks is not included.

*2: OPEN-V is volume based on CVS. A customer can set up the volume capacity of OPEN-V freely from 48.1MB among almost 1 RAID group capacity. This volume capacity is the default value and is nearly equal to 1 RAID group capacity.

*1: The number of HDD options is only the number of data disks, and the number of spare disks is not included.

*2: OPEN-V is volume based on CVS. A customer can set up the volume capacity of OPEN-V freely from 48.1MB among almost 1 RAID group capacity. This volume capacity is the default value and is nearly equal to 1 RAID group capacity.
