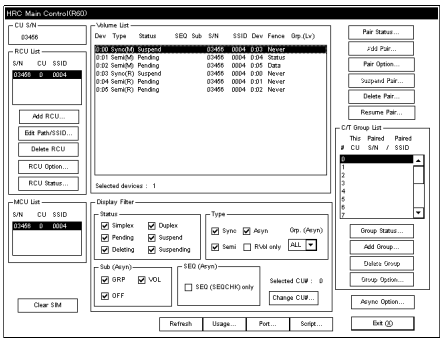
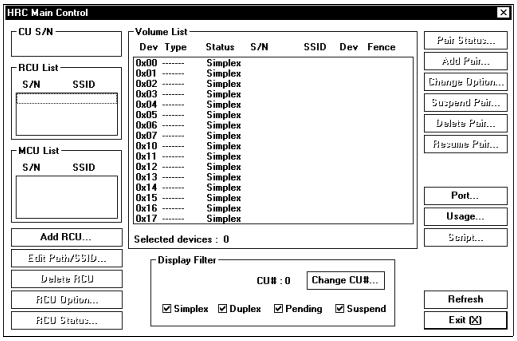
Copyright ©1998,2000, Hitachi, Ltd.

4. Verifying the RCU deletion

Press (CL) the [Refresh] button on the HRC (HODM) screen to verify if the RCU selected from the RCU list (see the figure) is deleted.



(HRC)



(HODM)

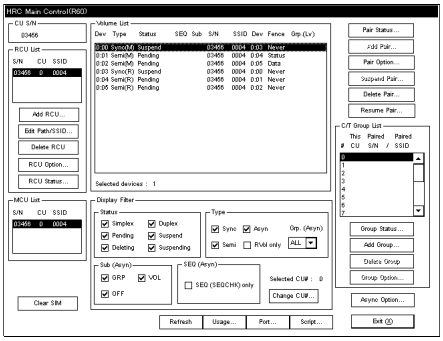
Copyright ©1999,2000, Hitachi, Ltd.

2.23.8 Adding the Path(s) to the RCU

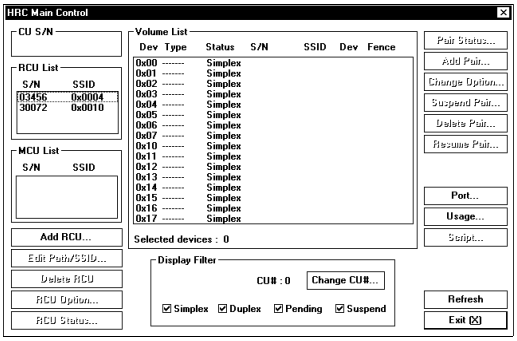
This operation adds the path(s) to the RCU already registered. The operation can be performed from both the MCU and the RCU.

1. Display the HRC (HODM) screen.
   Select (CL) [HRC] ([HODM]) in the 'SVP' window.

2. Selecting an RCU
   Set the CU# corresponding to the CU image address of the subsystem.
   Select an RCU the number of paths to which is desired to be increased from the RCU list (see the figure) on the HRC (HODM) screen. (Only one RCU can be selected here.)

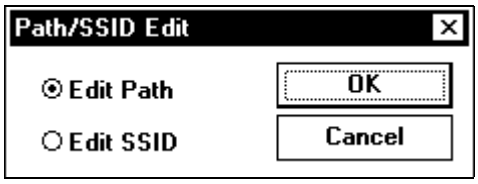


(HRC)



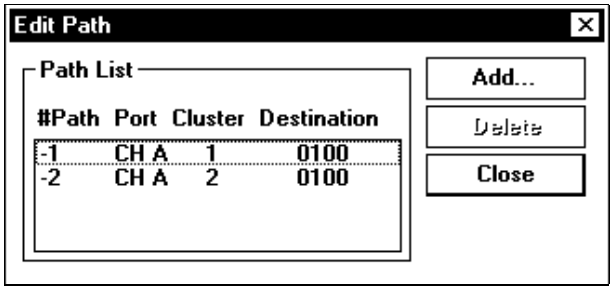
(HODM)

3. Selecting a function
   Select (CL) the [Edit Path/SSID...] button on the HRC (HODM) screen.
   The Path/SSID Edit screen will appear.
   Select (CL) the [Edit Path] radio button then press (CL) the [OK] button on the screen.

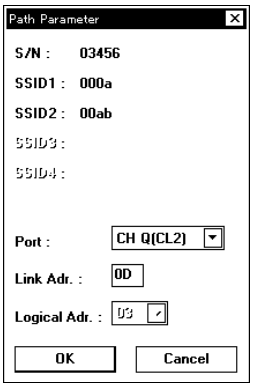


Copyright ©1998,2000, Hitachi, Ltd.

4. Instructing the addition of the path(s)
The Edit Path screen will appear. Then press (CL) the [Add...] button on the screen.

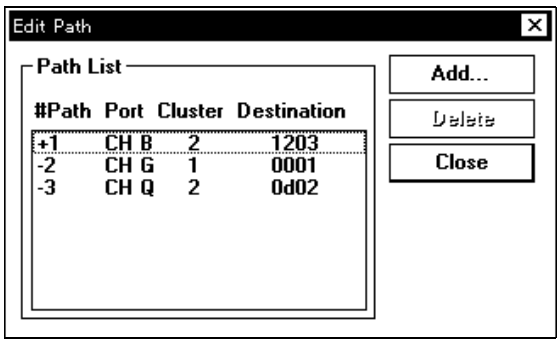


5. Inputting the parameters
When the Path Parameter screen appears, input the necessary parameters and press (CL) the [OK] button.
- Port
  Specify the RCP port.
- Destination link address
  Specify the RCU side link address. When the ESCD is to be used, input the RCU-connected link address. When the ESCD is not used, input '00'.
- Logical address



HRC:
The Logical address can not be specified.
HODM:
Please select a logical address which are defined as CU images (00 through 03) in the RCU.
(Notes) DKC210I : It has only #00 as CU image.
DKC80I-3 : When the RCU is MPSD, select “00”. When the RCU is SPSD, select “00” or “01” according to the device position.
Other DKC : There are some DKCs that have four CU images (00 through 03).). In this case, please select corresponding logical address according to the device position.

6. Verifying the path added
Make sure on the Edit Path screen that the specified path has been added correctly.



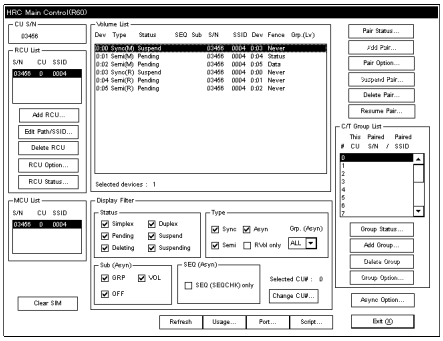
Copyright ©1998,1999, Hitachi, Ltd.

2.23.9 Reducing the Path(s) from the RCU

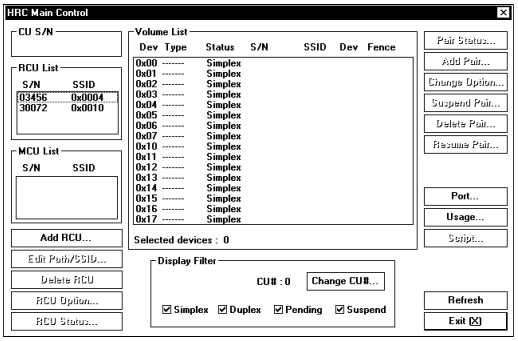
This operation reduces the number of paths connected to an RCU registered already.

1. Display the HRC (HODM) screen.
   Select (CL) [HRC] ([HODM]) in the 'SVP' window.

2. Selecting an RCU selection
   Set the CU# corresponding to the CU image address of the subsystem.
   Select an RCU the number of paths to which is desired to be reduced from the RCU list (see the figure) on the HRC (HODM) screen. (Only one RCU can be selected here.)

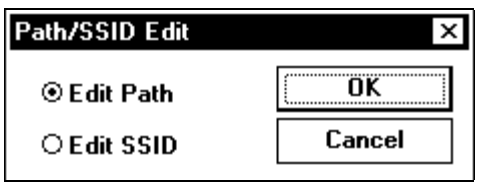


(HRC)



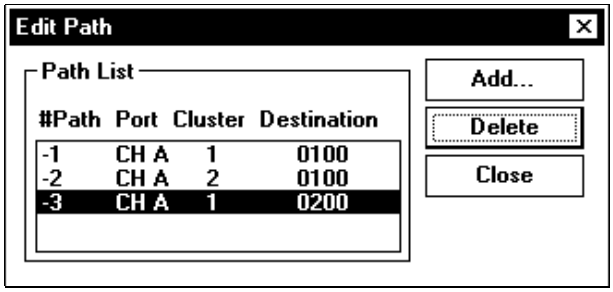
(HODM)

3. Instructing the reduction of the path(s)
   Select (CL) the [Edit Path/SSID...] button on the HRC (HODM) screen. The Edit Path/SSID screen will appear.
   Select (CL) the [Edit Path] radio button then press (CL) the [OK] button on the screen.

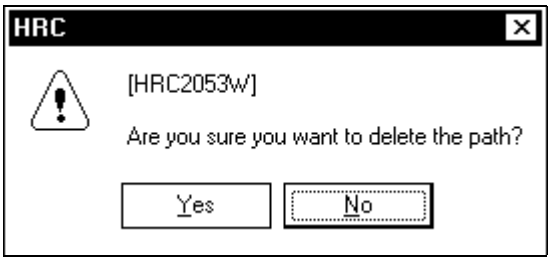


Copyright ©1998,2000, Hitachi, Ltd.

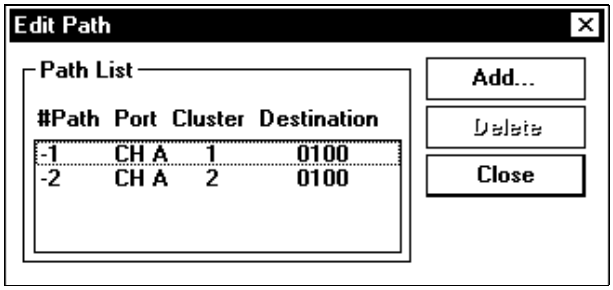
4. Selecting a path to be deleted
Select a path desired to be deleted from the path list displayed on the Edit Path screen and press (CL) the [Delete] button.



5. Confirmation message
When the confirmation message appears, confirm the path to be deleted and press (CL) the [Yes] button.



6. Verifying the path deleted
Make sure on the Edit Path screen that the path specified has been deleted correctly.



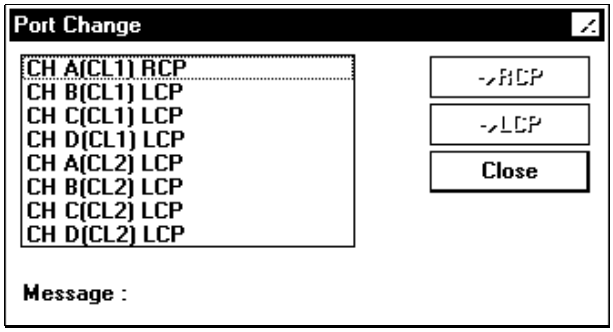
Copyright ©1998, Hitachi, Ltd.

2.23.10 Changing the Port Type

This operation specifies which port type is selected, LCP (to connect to the host) or RCP (to connect to the RCU).

1. Display the HRC (HODM) screen.
   Select (CL) [HRC] ([HODM]) in the 'SVP' window.

2. Selecting the processing to change the port type
   Select (CL) the [Port...] button on the on the HRC (HODM) screen to display the Path Change screen.

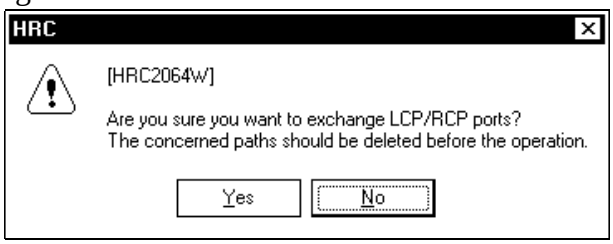


3. Instructing the port change
   When the port list and the port types are displayed in the list box on the Path Change screen, select one or more ports whose type(s) is(are) to be changed.
   To select LCP for the port type, press the [-> LCP] button. Then go to step 4.
   To select RCP for the port type, press the [-> RCP] button. Then go to step 5.

Copyright ©1998, Hitachi, Ltd.

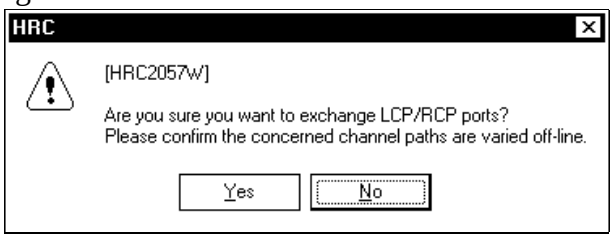
4. Confirmation message and indication of executing status

When the confirmation message appears, confirm the port(s) whose type(s) is(are) to be changed again. If it is correct, press (CL) the [Yes] button.
Status of execution is displayed in the "Message" field on the Port Change screen.
Go to step 6.



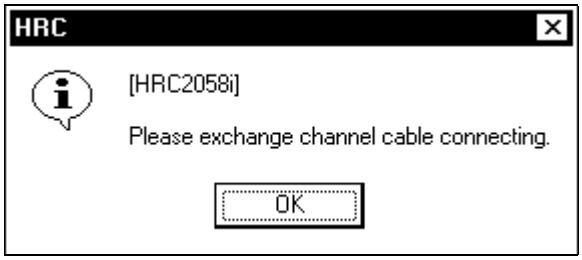
5. Confirmation message and indication of executing status

When the confirmation message appears, confirm the port(s) whose type(s) is(are) to be changed again. If it is correct, press (CL) the [Yes] button.
Status of execution is displayed in the "Message" field on the Port Change screen.



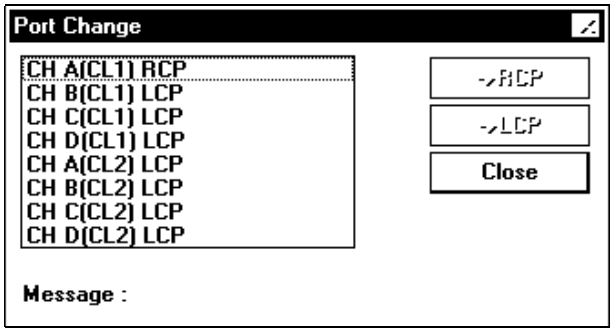
6. Indication message

After exchanging channel cable connecting, press (CL) the [OK] button.



7. Verifying port change

After the change is finished, make sure on the Port Change screen that the type(s) of the specified port(s) has(have) been changed correctly.



Copyright ©1998, Hitachi, Ltd.

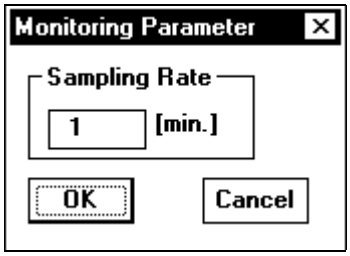
2.23.11 Displaying HRC/HODM Operation Status

This operation displays a graphic indication of the HRC/HODM operation status.

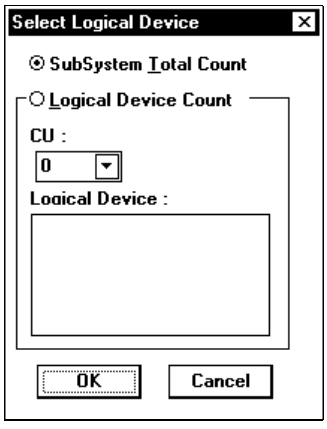
1. Display the HRC (HODM) screen.

   To display HRC operation of some devices:
   Select (CL) [HRC] in the 'SVP' window.
   To display HODM operation of some devices:
   Select (CL) [HODM] in the 'SVP' window.
   To display HRC and HODM operation of Subsystem:
   Select (CL) either [HRC] or [HODM] in the 'SVP' window.

2. Setting a sampling rate
   Press (CL) the [Usage...] button on the on the HRC (HODM) screen to display the Sampling Rate Setting screen. Then, input a sampling rate and press (CL) the [OK] button. (Sampling rate can be set within 1 to 546 minutes in steps of 1 minute.)



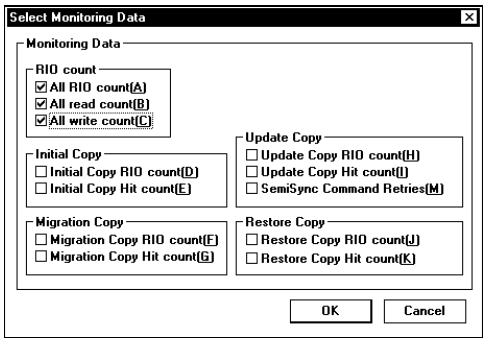
3. Selecting an object device
   When the valid logical device list is displayed in the list box on the Select Logical Device screen, select a logical device and press (CL) the [OK] button. To display the information of the whole subsystem, select "Sub System".



Copyright ©1998, Hitachi, Ltd.

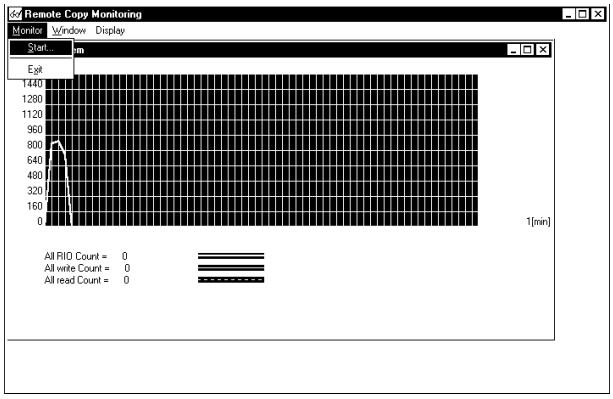
4. Selecting information desired to be acquired

Select one or more data items on the Select Monitoring Data screen, then press (CL) the [OK] button.



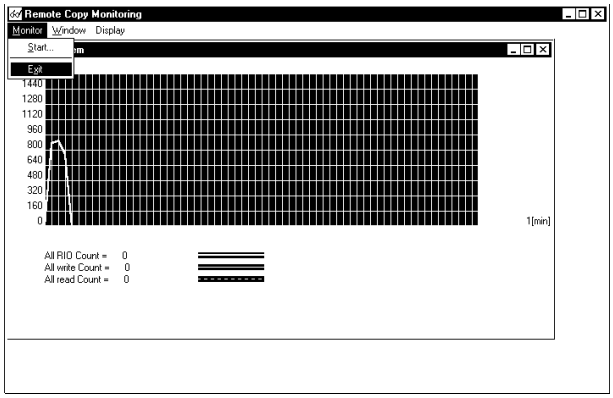
5. Displaying the operation information

The Operation Information Display window appears. To view operation information of other devices, select Monitor-Start from the menu and go to step 3. (Two or more screens can be displayed at a time.)



6. Terminating the operation information display

To terminate the operation information display, select Monitor-Exit to return to the HRC (HODM) screen.



Copyright ©1998, Hitachi, Ltd.

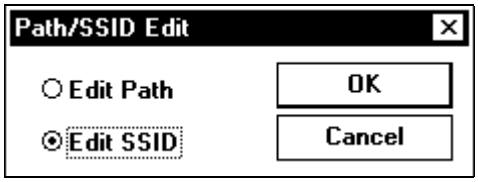
2.23.12 Adding the SSID(s) to the RCU

This operation adds the SSID(s) to the RCU already registered. The operation can be performed from both the MCU and the RCU.

1. Selecting an RCU
   Set the CU# corresponding to the CU image address of the subsystem.
   Display the HRC (HODM) screen and select (CL) an RCU from RCU List which is desired to be increased SSIDs. (Only one RCU can be selected here.)

2. Selecting a function
   Select (CL) the [Edit Path SSID...] button on the HRC (HODM) screen.
   The Path/SSID Edit screen will appear.

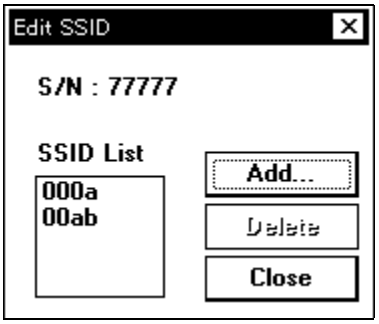
   Select (CL) the [Edit SSID] radio button then press (CL) the [OK] button on the screen.



3. Confirming the number of SSID(s)
   The Edit SSID screen will appear.

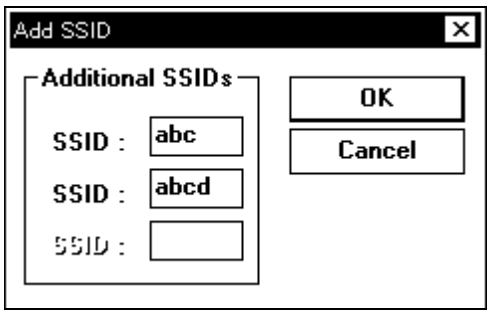
   Press (CL) [Add] button on the screen.
   (See the figure.)

   Note: If 4 SSIDs are registered on the RCU, you can not add a SSID further. ([Add...] button will be not active.)



4. Adding the SSID(s) to the RCU
   The Add SSID screen will appear.

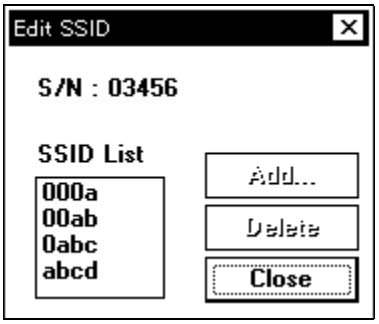
   Input 4-digit hexadecimal SSID(s) number in SSID, then press (CL) [OK] button.



Copyright ©1998,1999, Hitachi, Ltd.

5. Verifying the SSIDs added

Make sure on the Edit SSID screen that the specified SSIDs have been added correctly.



Copyright ©1998,1999, Hitachi, Ltd.

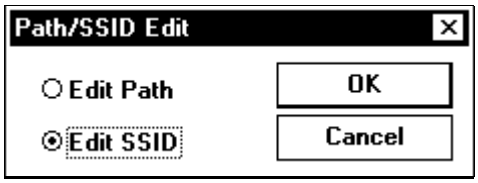
2.23.13 Reducing the SSID(s) from the RCU

This operation reduces the SSID(s) from the RCU already registered.

1. Selecting an RCU
   Set the CU# corresponding to the CU image address of the subsystem.
   Display the HRC (HODM) screen and select (CL) an RCU from RCU List which is desired to be reduced SSIDs. (Only one RCU can be selected here.)

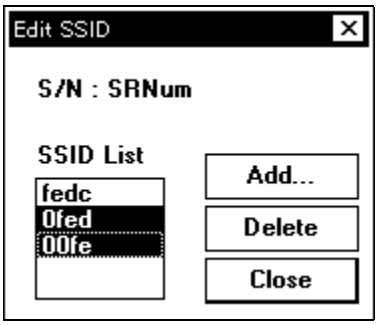
2. Selecting a function
   Select (CL) the [Edit Path SSID...] button on the HRC (HODM) screen.
   The Path/SSID Edit screen will appear.

   Select (CL) the [Edit SSID] radio button then press (CL) the [OK] button on the screen.

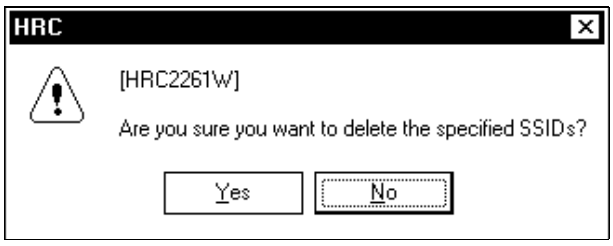


3. Selecting SSID(s) to be deleted
   The Edit SSID screen will appear.

   Select SSIDs desired to be deleted from the SSID List displayed on the Edit SSID screen and press (CL) [Delete] button (See the figure).



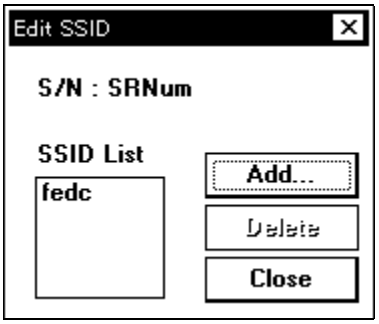
4. Confirmation message
   When the confirmation message appears, confirm the SSIDs to be deleted and press (CL) the [Yes] button.



Copyright ©1998,1999, Hitachi, Ltd.

5. Verifying the SSIDs deleted

Make sure on the Edit SSID screen that the specified SSIDs have been deleted correctly.

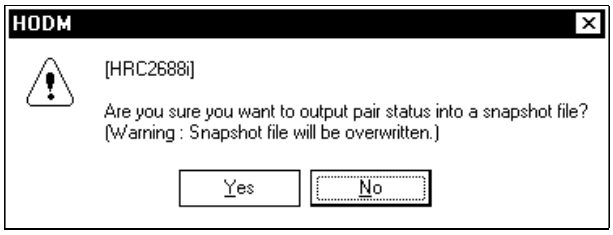


Copyright ©1999, Hitachi, Ltd.

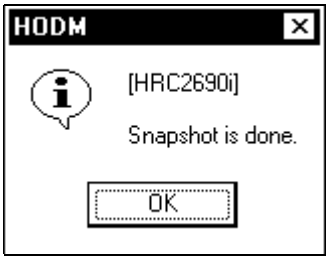
2.23.14 HODM Snapshot

This operation creates or overwrites a text file, in which HODM pairs status is described.

1. Confirmation message
   Select (CL) the [Snapshot] button on the HODM screen.
   The confirmation message will appear.
   If you want to create or overwrite a snapshot file, press (CL) the [Yes] button.



2. End of snapshot
   After HODM snapshot is done, press (CL) [OK] button, and confirm the contents of snapshot file (C:\DKC200\DUMP\SVP\HODMSNAP.TXT).



(Note: All HODM pairs whose status are “Complete” or “Suspend” are listed.)

Copyright ©1999, Hitachi, Ltd.

A sample snapshot file is as follows:

(1)
<Snapshot at 08/04/98 09:43:46>

(2) S/N	(3) CU	(4) SSID	(5) M-VOL	(6) R-VOL	(7) Emulation	(8) Prio	(9) Status	(10) Establish		(11) Update	
SRNum	1	0001	04	fb	3390-9	004	Suspend	06/16/1998	09:37:36	06/20/1998	00:05:08
SRNum	1	0001	3e	c1	3390-9	062	Complete	06/16/1998	09:37:50	06/19/1998	01:15:17
77777	3	000a	82	7d	3390	130	Suspend	06/17/1998	11:04:36	07/01/1998	21:39:32
77777	3	000a	84	7b	3390	132	Complete	06/17/1998	11:51:36	08/03/1998	22:00:05

(1) The time you have done the snapshot.
(2) “S/N” means the RCU sequence number of the volume shown as “M-VOL”.
(3) “CU” means the CU# of the volume shown as “M-VOL”.
(4) “SSID” means the SSID (hexadecimal) of the RCU shown as “S/N”.
(5) “M-VOL” means the M-VOL# (hexadecimal).
(6) “R-VOL” means the R-VOL# (hexadecimal).
(7) “Emulation” means the device emulation type of the volume shown as “M-VOL”.
(8) “Prio” means the copy priority of the volume shown as “M-VOL”.
(9) “Status” means the pair status of the volume shown as “M-VOL”.
(10) “Establish” means the pair establish time of the volume shown as “M-VOL”.
(11) “Update” means the last update time of the volume shown as “M-VOL”.

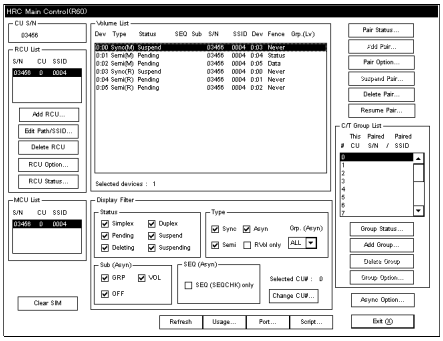
Copyright ©1999, Hitachi, Ltd.

2.23.15 Referring the C/T group status

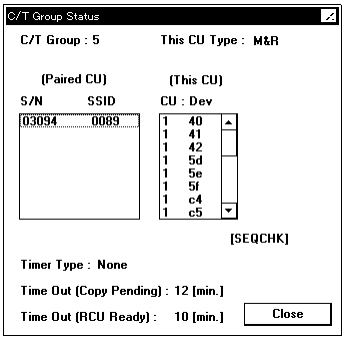
This operation shows the specified C/T group status.

1. Display the HRC screen
   Select (CL) [HRC] in the 'SVP' window.

2. Selecting a C/T group
   Select a C/T group whose status is desired to be referred to from the C/T Group List (see the figure) on the HRC screen. (Only one C/T group can be selected here.)



3. Confirming the C/T group status
   Select (CL) the [Group Status...] button on the HRC screen.
   The C/T Group Status screen will appear.
   Press (CL) the [Close] button to close the screen.



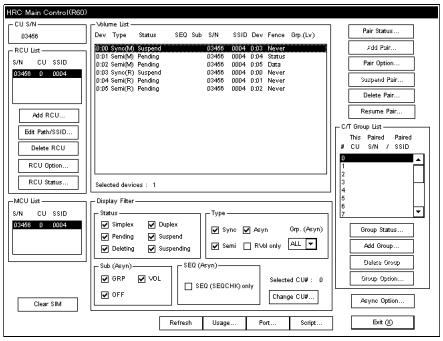
Copyright ©1999,2000, Hitachi, Ltd.

2.23.16 Releasing the using C/T group

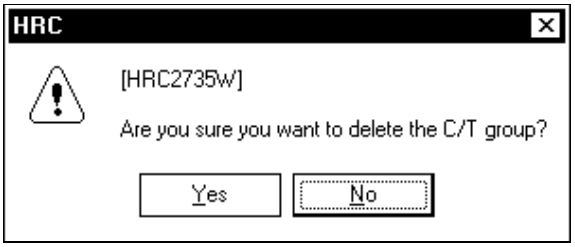
This operation releases the specified C/T group already used. This operation can be performed only from the MCU.

1. Display the HRC screen
   Select (CL) [HRC] in the 'SVP' window.

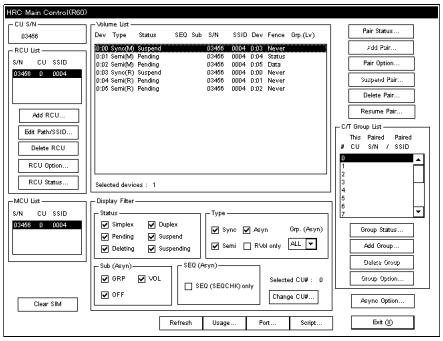
2. Selecting a C/T group
   Select a C/T group desired to be released from the C/T Group List (see the figure) on the HRC screen. (Only one C/T group can be selected here.)



3. Instructing a release
   Press (CL) the [Delete Group] button on the HRC screen. The confirmation message will appear. To release the C/T group really, press (CL) the [Yes] button.



4. Verifying the C/T group released
   Verify if the C/T group selected from C/T Group List (see the figure) is displayed as blank.



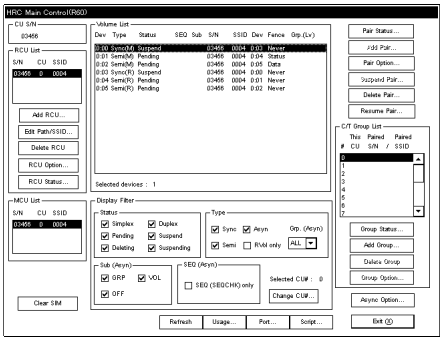
Copyright ©1998,2000, Hitachi, Ltd.

2.23.17 Changing the using C/T group parameters

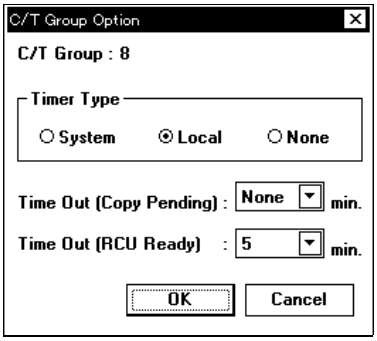
This operation changes the specified C/T group parameters which already used.
This operation can be performed only from the MCU.

1. Display the HRC screen
   Select (CL) [HRC] in the 'SVP' window.

2. Selecting a C/T group
   Select a C/T group desired to be changed from the C/T Group List (see the figure) on the HRC screen. (Only one C/T group can be selected here.)



3. Inputting the C/T group parameters
   Press (CL) [Group Option...] button on the HRC screen. The C/T Group Option screen will appear.
   On the C/T Group Option screen, perform the following.
   Select the timer type of the C/T indicated at Timer Type.
   Select maximum delay time of update data from combo-box at Time Out (Copy Pending).
   Select maximum waiting time for the RCU gets ready from combo-box at Time Out (RCU Ready).
   When all the above operations are finished, press (CL) the [OK] button.



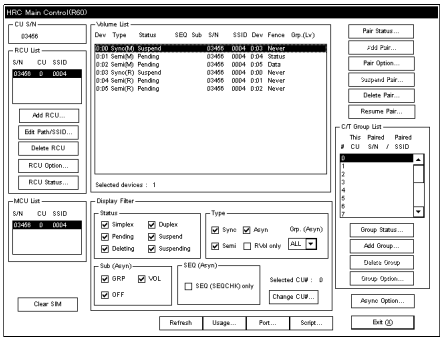
4. Verifying the C/T group status
   Open the C/T Group Status screen, then verify the C/T group parameters are correctly changed. (Refer to 2.23.15)

Copyright ©1998,2000, Hitachi, Ltd.

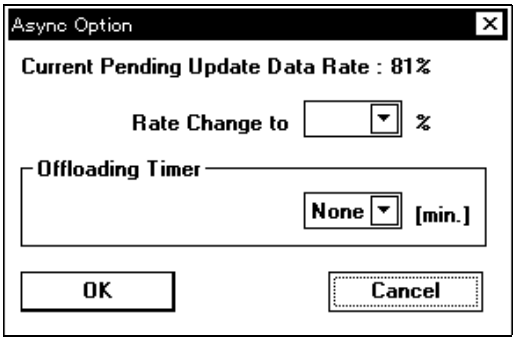
2.23.18 Changing the asynchronous option parameters

This operation changes the asynchronous option parameters.

1. Display the HRC screen
   Select (CL) [HRC] in the 'SVP' window.
   The HRC screen will appear.
   Press (CL) the [Async Option...] button on the HRC screen.



2. Inputting the asynchronous option parameters
   The Async Option screen will appear.
   On the Async Option screen, perform the following.
   If there is necessity for changing the occupation rate of pending update data among the Record Set, select a number of rate from combo-box at Rate Change to.
   (Note: If there is a C/T group used by HORC, the rate cannot be changed.)
   Select monitoring time for the Record Set from combo-box indicated at Offloading Timer.
   When all the above operations are finished, press (CL) the [OK] button.



3. Verifying the asynchronous option parameters
   Open the Async Option screen again, then verify the occupation rate indicated at Current Pending Update Data Rate is correct.
   Verify the monitoring time indicated at Offloading Timer is correct, too.

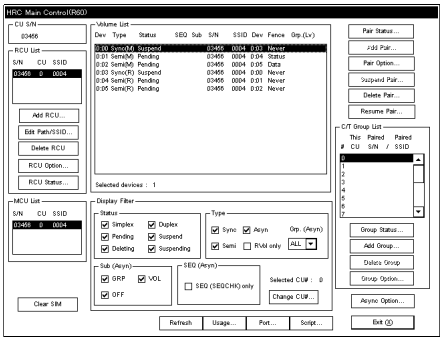
Copyright ©1998,2000, Hitachi, Ltd.

2.23.19 Clear reported SIM

This section is described how to clear reported SIM.

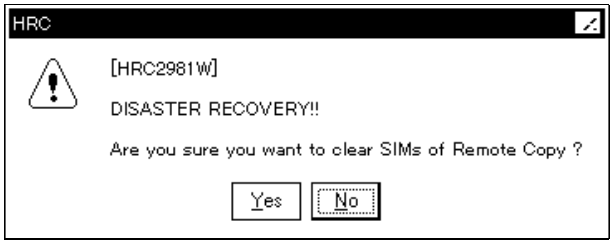
1. Open HRC screen
   Select (CL) [HRC] in the SVP window.

2. Clear reported SIM
   Select (CL) [Clear SIM] in the HRC window.



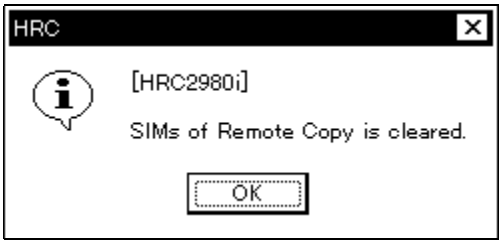
3. Execute
   Select (CL) [Yes] in the confirmation message if you want to clear.

   Notice: This operation clears HODM/HORC SIM(s) too.



4. End message
   Select (CL) [OK] in the end message.
   When SIM is cleared, the SUBSYSTEM MESSAGE lamp of the SYSTEM PANEL is turned off.

   Notice: The SUBSYSTEM MESSAGE lamp is not turned off when there are SIM other than a remote copy.
   It occasionally takes about 30 minutes until the SUBSYSTEM MASSAGE lamp is turned off.



Copyright ©2000, Hitachi, Ltd.

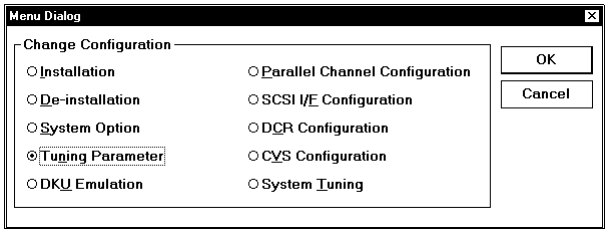
2.24 Tuning Parameter

(1) Exchange threshold information. (See MICRO-FC08-10)

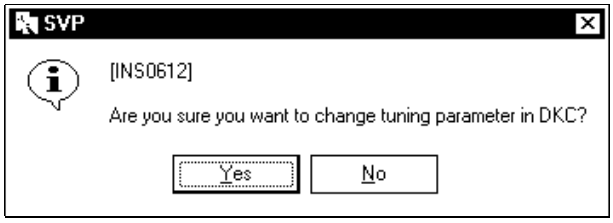
(2) Select (CL) [Install].

(3) Select (CL) [Change Configuration] menu in the 'Install' window and select (CL) [OK].

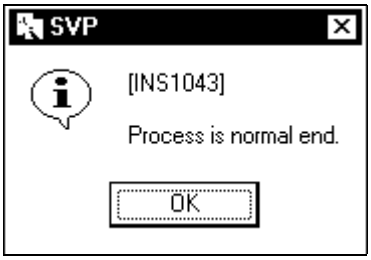
(4) Select (CL) the [Tuning Parameter] menu in the 'Menu Dialog' window and select (CL) [OK].



(5) Select (CL) [Yes] for a message of confirming.



(6) Select (CL) [OK] for a message of finishing.

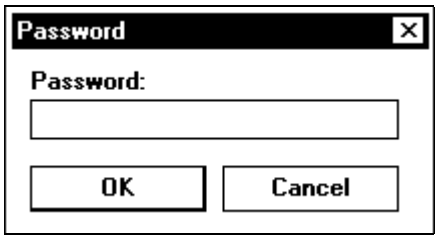


Copyright ©1998, Hitachi, Ltd.

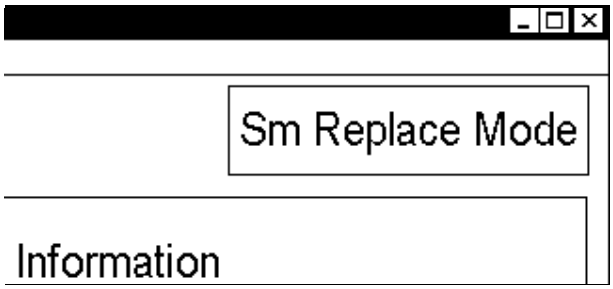
2.25 Change SM Module group size

1. Close the all SVP functions.

2. <Enter the password>
   Press “Shift+Ctrl+S” in the ‘SVP’ window.
   Enter the password, and select (CL) [OK].
   (Please call Technical Support Center for asking it.)

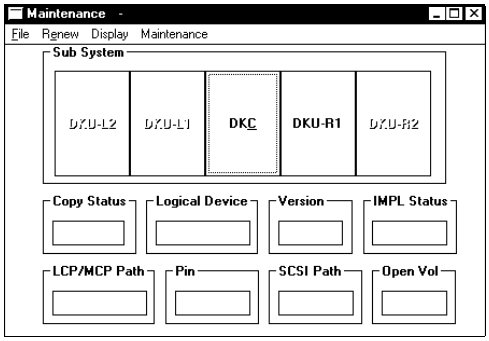


3. <SM Replace Mode>
   ‘Sm Replace Mode’ is displayed.
   Select (CL) [Maintenance].

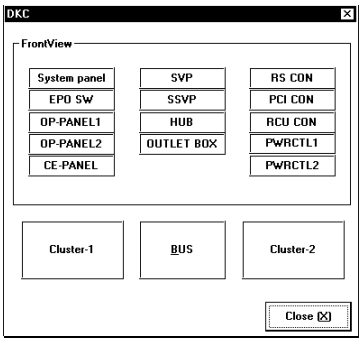


Copyright ©1998, Hitachi, Ltd.

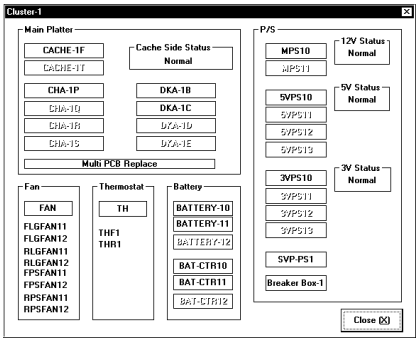
4. <Maintenance window>
'Maintenance' window is displayed.
In the 'Maintenance' window, check and select (CL) [DKC] to be replaced.



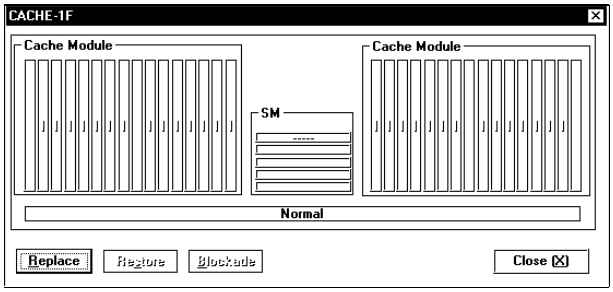
5. <DKC screen>
Select (CL) [Cluster-n] in the 'DKC'.



6. <Select Cache>
Select (CL) part.

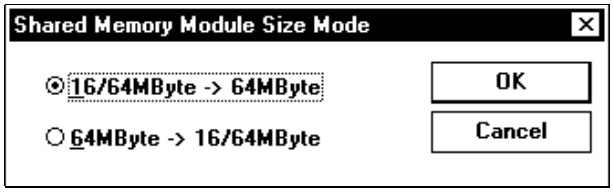


7. <Replace>
Check status display.
Select (CL) [Replace].

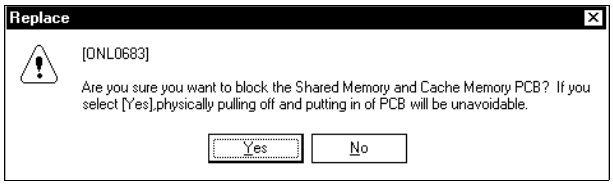


Copyright ©1998, Hitachi, Ltd.

8. <Change the Shared Memory Module Size>
Select (CL) module size in the 'Shared Memory Module Size Mode', and select (CL) [OK].



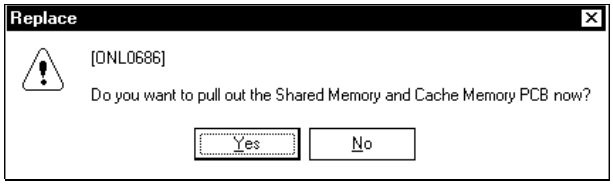
9. <Check beginning of cache blocking>
Select (CL) [Yes] after making sure that the package to be blocked is correct in response to:
"Are you sure you want to block the Shared Memory and Cache Memory PCB? If you select [Yes], physically pulling off and putting in of PCB will be unavoidable."



10. <Cache blocking>
"The Cache Memory PCB is being blocked." is displayed.
"The Shared Memory PCB is being blocked…" is displayed.

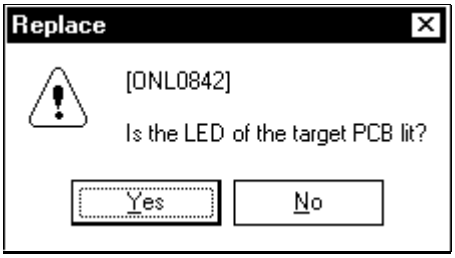
Copyright ©1998, Hitachi, Ltd.

11. <Check removal of cache>
    Select (CL) [Yes] in response to:
    "Do you want to pull out the Shared Memory and Cache Memory PCB now?"

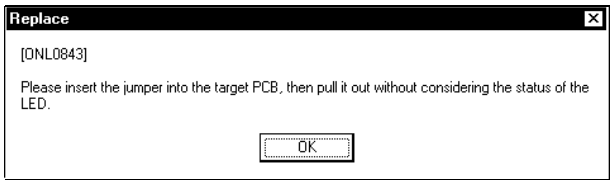


Copyright ©1998, Hitachi, Ltd.

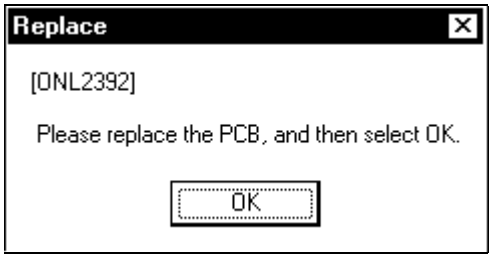
12. <Check shut down LED>
Select (CL)
* [Yes] if LED is on
* [No] if LED is off
in response to “Is the LED of the target PCB lit?”.



<Forcing shut down LED on>
If [No] is selected:
Insert a jumper in response to “Please insert jumper into the target PCB, then pull it out without considering the status of the LED”.
(Refer REP03-60)
Go to step 9.



13. <Cache Replacement>
“Please replace the PCB, and then select OK.” is displayed.
(Select (CL) [OK] after replacing the PCB.)

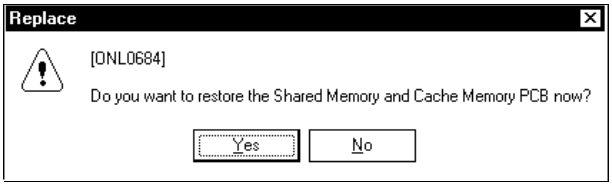


14. <Replace cache PCB>
Replace cache.

See HARDWARE B (REP03-50)

Copyright ©1998, Hitachi, Ltd.

15. <Check the beginning of cache/SM recovery>
Select (CL) [Yes] in response to:
"Do you want to restore the Shared Memory and Cache Memory PCB now?"



16. <Restoring the Shared Memory>
"Restoring the Shared Memory PCB..." is displayed.

17. <Restoring the Cache Memory>
"Restoring the Cache Memory PCB..." is displayed.

Copyright ©1998, Hitachi, Ltd.

18. <Check the end of Cache/Shared Memory recovery>
Select (CL) [OK] in response to “Replace finished.”.

19.
Close ‘CACHE-xx’ window.
Close ‘Cluster-n’ window.
(If finishing in the Cluster-2 side, go to 21.)

20. <Change the Shared Memory module size in Cluster-2 side>
Perform steps 5 to 19.
Select [Cluster-2], [CACHE-2G].

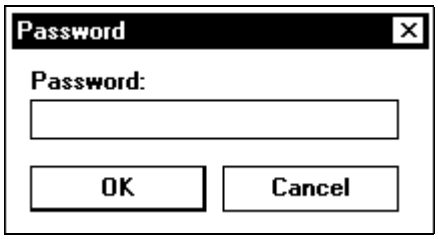
21.
Close ‘DKC’ window.
Close ‘Maintenance’ window.
Change the mode to [View Mode].

Copyright ©1998, Hitachi, Ltd.

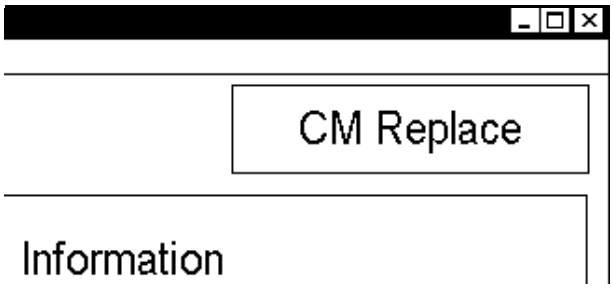
2.26 Change CM Module group size

1. Close the all SVP menu.

2. <Enter the password>
   Press “Shift+Ctrl+C” in the ‘SVP’ window.
   Enter the password, and select (CL) [OK].
   (Please call Technical Support Center for asking it.)

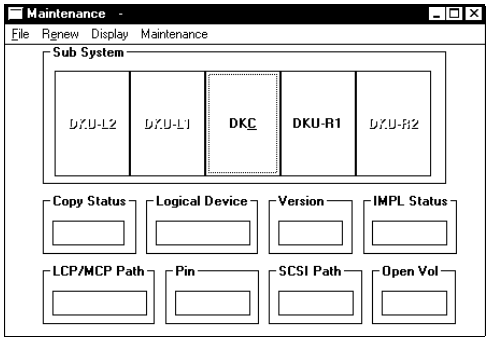


3. <CM Replace Mode>
   ‘CM Replace’ is displayed.
   Select (CL) [Maintenance].

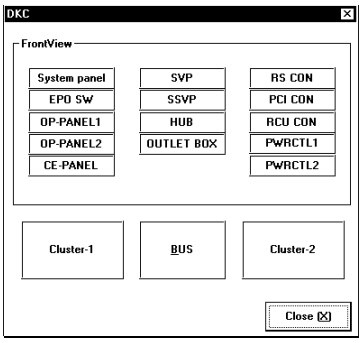


Copyright ©1998, Hitachi, Ltd.

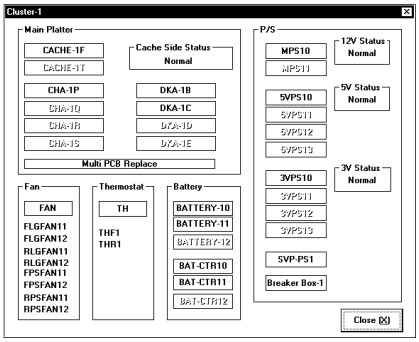
4. <Maintenance window>
'Maintenance' window is displayed.
In the 'Maintenance' window, check and select (CL) [DKC] to be replaced.



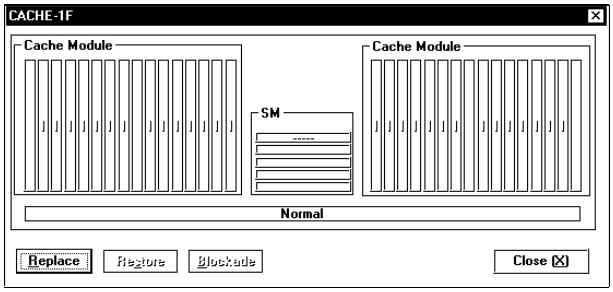
5. <DKC screen>
Select (CL) [Cluster-n] in the 'DKC'.



6. <Select Cache>
Select (CL) part.

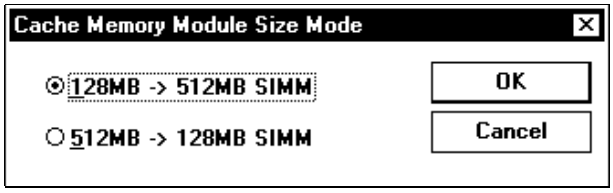


7. <Replace>
Check status display.
Select (CL) [Replace].

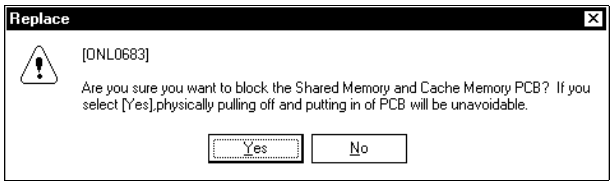


Copyright ©1998, Hitachi, Ltd.

8. <Change the Cache Memory Module Size>
Select (CL) module size in the 'Cache Memory Module Size Mode', and select (CL) [OK].



9. <Check beginning of cache blocking>
Select (CL) [Yes] after making sure that the package to be blocked is correct in response to:
"Are you sure you want to block the Shared Memory and Cache Memory PCB? If you select [Yes], physically pulling off and putting in of PCB will be unavoidable."



10. <Cache blocking>
"The Cache Memory PCB is being blocked." is displayed.
"The Shared Memory PCB is being blocked…" is displayed.

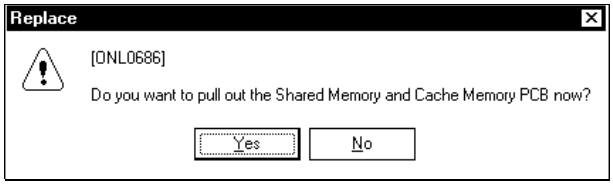
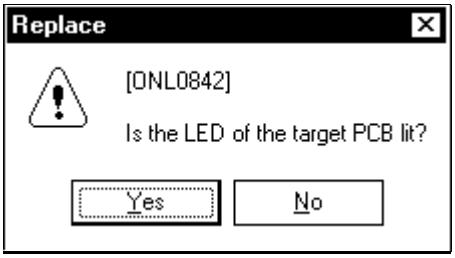
11. <Check removal of cache>
    Select (CL) [Yes] in response to:
    "Do you want to pull out the Shared Memory and Cache Memory PCB now?"

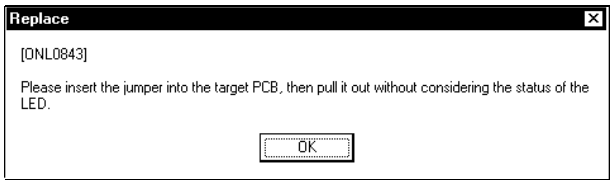


Copyright ©1998, Hitachi, Ltd.

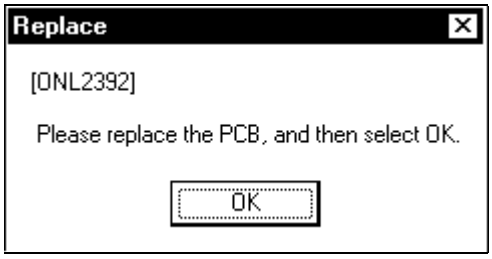
12. <Check shut down LED>
Select (CL)
* [Yes] if LED is on
* [No] if LED is off
in response to “Is the LED of the target PCB lit?”.



<Forcing shut down LED on>
If [No] is selected:
Insert a jumper in response to “Please insert jumper into the target PCB, then pull it out without considering the status of the LED”.
(Refer REP03-60)
Go to step 9.



13. <Cache Replacement>
“Please replace the PCB, and then select OK.” is displayed.
(Select (CL) [OK] after replacing the PCB.)

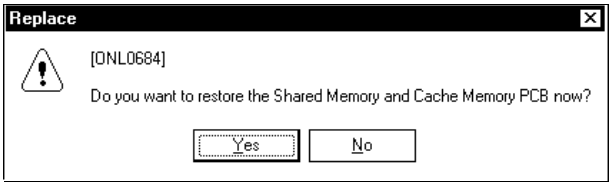


14. <Replace cache PCB>
Replace cache.

See HARDWARE B (REP03-50)

Copyright ©1998, Hitachi, Ltd.

15. <Check the beginning of cache/SM recovery>
Select (CL) [Yes] in response to:
"Do you want to restore the Shared Memory and Cache Memory PCB now?"



16. <Restoring the Shared Memory>
"Restoring the Shared Memory PCB..." is displayed.

17. <Restoring the Cache Memory>
"Restoring the Cache Memory PCB..." is displayed.

Copyright ©1998, Hitachi, Ltd.

18. <Check the end of Cache/Shared Memory recovery>
Select (CL) [OK] in response to “Replace finished.”.

19.
Close ‘CACHE-xx’ window.
Close ‘Cluster-n’ window.
(If finishing in the Cluster-2 side, go to 21.)

20. <Change the Cache Memory module size in Cluster-2 side>
Perform steps 5 to 19.
Select [Cluster-2], [CACHE-2G].

21.
Close ‘DKC’ window.
Close ‘Maintenance’ window.
Change the mode to [View Mode].

2.27 HORC Operation (for OPEN VOL)

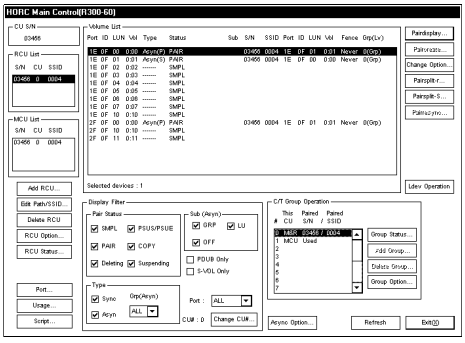
If SVP Micro-program version is not over “51-36-01”, refer to the “2.28 HORC Operation (for LDEV) (SVP02-1560)”.

2.27.1 Referring to the Path Status

Refer to the MCU-RCU connection status. This operation is possible only from the MCU.

1. Display the HORC screen.
   Select (CL) [HORC] in the ‘SVP’ window.

2. Selecting an RCU
   Select an RCU whose path status is desired to be referred to from the RCU list (see the figure) on the HORC screen. (Two or more RCUs cannot be selected here.)

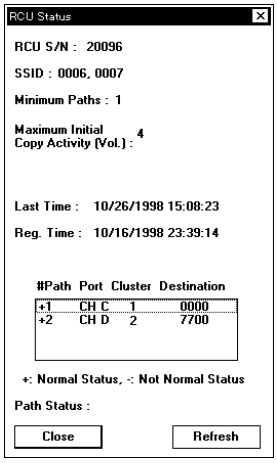


3. Displaying the RCU status
   Select (CL) the [RCU Status...] button on the HORC screen to display the RCU Status screen.

Copyright ©1998,2000, Hitachi, Ltd.

4. Selecting a path to be displayed

The path list is displayed on the RCU Status screen. Select a path whose status is desired to be displayed from the list. (Two or more paths cannot be selected here.)



5. Updating the path status

Select (CL) the [Refresh] button on the RCU Status screen to update the screen display. When updating the screen display, select (CL) the [Refresh] button. When closing the screen, select (CL) the [Close] button.

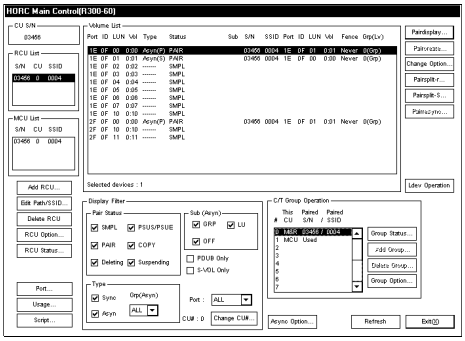
Copyright ©1998,1999, Hitachi, Ltd.

2.27.2 Referring to the Pairdisplay of OPEN VOL (open volume)

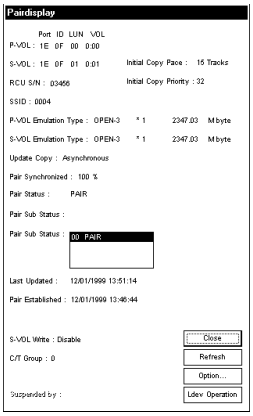
Refer to the object volume Pairdisplay of OPEN VOL (open voluem). The screen data displayed will differ between when this operation is executed from only the MCU and when it is executed from the RCU.

1. Displaying the HORC screen.
   Select (CL) [HORC] in the 'SVP' window.

2. Selecting a volume
   Select a volume whose status is desired to be referred to from the volume list (see the figure) on the HORC screen. (Select only one volumes here although two or more volume can be selected from the list.)



3. Displaying the Pairdisplay of OPEN VOL
   Select (CL) the [Pairdisplay...] button on the HORC screen. The Pairdisplay screen will appear.



4. Updating the Pairdisplay of OPEN VOL
   Select (CL) the [Refresh] button on the Pairdisplay screen. This operation updates the display of the Pairdisplay. Press (CL) the [Close] button to close the screen.

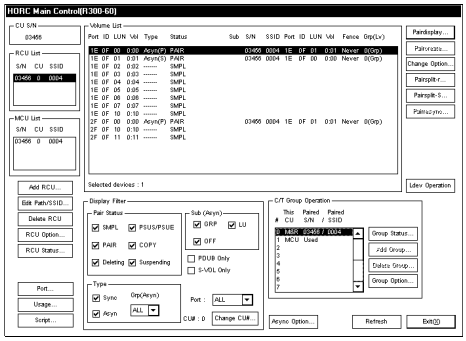
Copyright ©1998,2000, Hitachi, Ltd.

2.27.3 Referring to the Pairdisplay of LDEV

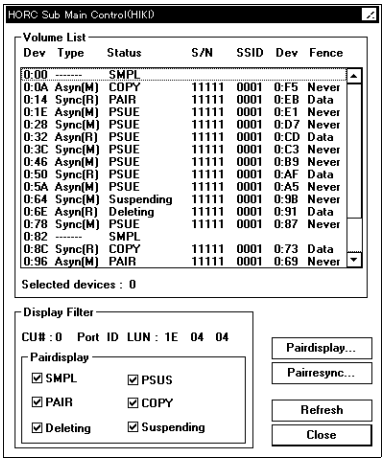
Refer to the object volume Pairdisplay of LDEV. The screen data displayed will differ between when this operation is executed from only the MCU and when it is executed from the RCU.

1. Displaying the HORC screen.
   Select (CL) [HORC] in the 'SVP' window.

2. Selecting a volume
   Select a volume whose status is desired to be referred to from the volume list (see the figure) on the HORC screen. (Select only one volumes here although two or more volume can be selected from the list.)
   Select (CL) the [Ldev Operation] button on the HORC screen.
   This operation display the HORC sub screen.

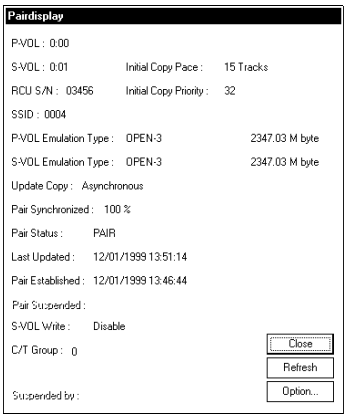


3. Selecting a LDEV
   Select a LDEV whose status is desired to be referred to from the volume list (see the figure) on the HORC sub screen.



Copyright ©1998,2000, Hitachi, Ltd.

4. Displaying the Pairdisplay of LDEV
Select (CL) the [Pairdisplay...] button on the HORC sub screen. The Pairdisplay of LDEV screen will appear.



5. Updating the Pairdisplay of LDEV
Select (CL) the [Refresh] button on the Pairdisplay screen. This operation updates the display of the Pairdisplay. Press (CL) the [Close] button to close the screen.

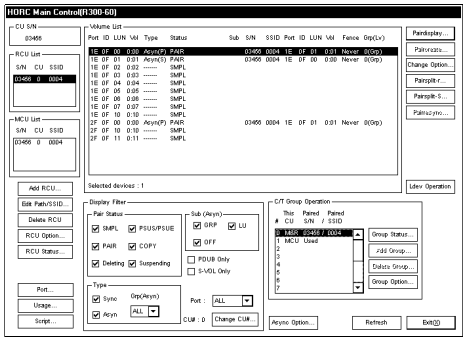
Copyright ©1998,2000, Hitachi, Ltd.

2.27.4 Suspending the Volume Pair(s) of OPEN VOL (open volume)

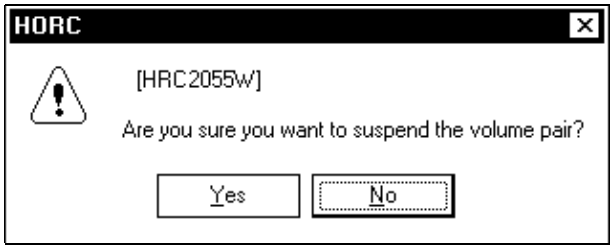
This operation suspends the object volume pair(s). The operation can be executed from both the MCU and the RCU.

1. Display the HORC screen.
   Select (CL) [HORC] in the 'SVP' window.

2. Selecting the volume(s)
   Select the volume(s) desired to be suspended from the volume list (see the figure) on the HORC screen.
   (You can select several volumes. However, you can't select the synchronous copy pair and asynchronous copy pair at the same time.)



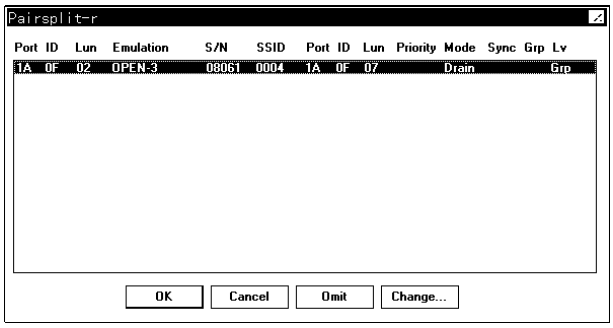
3. Instructing a suspension
   Select (CL) the [Pairsplit-r...] button on the HORC screen. A confirmation message will appear. To suspend the pair really, press (CL) the [Yes] button. The Pairsplit-r screen will appear.



Copyright ©1998,2000, Hitachi, Ltd.

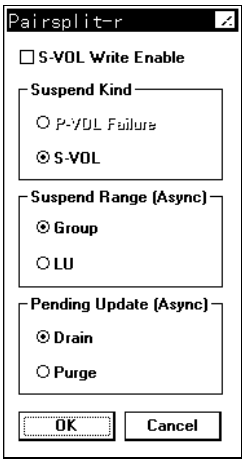
4. Confirm the suspension volumes

Confirm the suspension volumes that are displayed to the Pairsplit-r screen and select (CL) [OK] button and go to 6.
If you want to change suspend parameters, select the volumes from the volume list and select (CL) [Change...] button and go to 5.
If you want to omit the volume suspension, select the volumes from the volume list and select (CL) [Omit] button.



5. Inputting the suspending parameters

Press (CL) the [OK] button on the Pairsplit-r screen to execute the suspending processing.

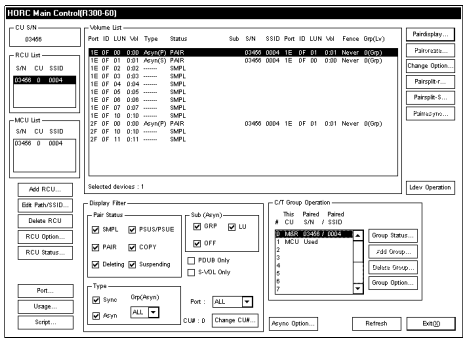


- S-VOL Write Enable
  This parameter specifies whether to enable S-VOL to write.
  If you want to use this parameter, select “S-VOL” in Suspend Kind parameter.
- Suspend kind
  This parameter specifies which instruction is to be issued, an P-VOL suspension or an S-VOL suspension. “P-VOL Failure”cannot be specified for asynchronous copy pairs.
- Suspend Range (Async)
  This parameter specifies the kind of suspension.
  “Group” means all volume pair(s) suspension which are assigned to the same C/T group as the specified volume pair(s).
  “LU” means only specified volume pair(s) will be suspended. If 2 or more volume pairs are specified, this parameter is fixed to “LU”.
  This parameter can be spedcified HORC asynchronous copy volume pairs only.
- Pending update (Async)
  This parameter specifies the method of the release of the Record set.
  “Drain” means that the volume pair(s) should be suspended after all pending record set are settled. If “Drain” is specified, please stop I/O from the hosts.
  “Purge” means that the volume pair(s) should be suspended even if pending record set remain. The pending record set will be copied when the Pairresync operated.
  This parameter can be specified HORC asynchronous copy volume pair(s) only.

Copyright ©1998,2000, Hitachi, Ltd.

6. Verifying the suspension

Verify if the volume selected from the volume list (see the figure) is in the suspended status or not by pressing (CL) the [Refresh] button on the HORC screen.



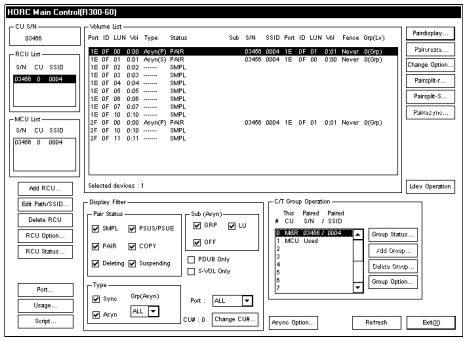
Copyright ©2000, Hitachi, Ltd.

2.27.5 Resuming the Suspended Pair(s) of OPEN VOL (open volume)

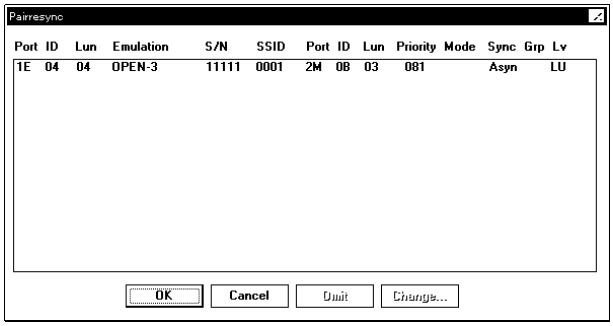
This operation resumes the volume pair(s) of OPEN VOL suspended. The operation can be performed only from the MCU.

1. Display the HORC screen.
   Select (CL) [HORC] in the 'SVP' window.

2. Selecting the volume(s)
   Select the volume(s) desired to be resumed from the volume list (see the figure) on the HORC screen to resume it.
   Select the [Pairresync...] button on the HORC screen.
   The Pairresync screen will appear.
   (You can select several volumes. However, you can't select the synchronous copy pair and asynchronous copy pair at the same time.)

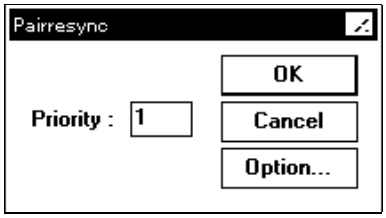


3. Confirm a resume parameter
   Confirm a resume option on the Pairresync screen.
   Select (CL) the [OK] button on the Pairresync screen and go to 5.
   If you want to change resume parameter, select the volumes from the volume list and select (CL) [Change...] button and go to 4.
   If you want to omit Pairresync, select the volumes from the volume list and select (CL) [Omit] button.



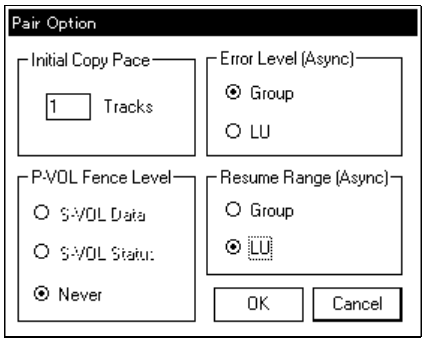
Copyright ©1998,2000, Hitachi, Ltd.

4. Inputting the resume parameter



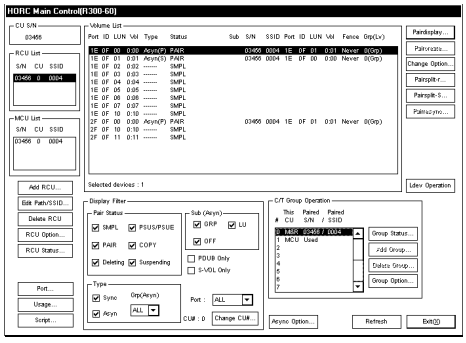
On the Resume HORC pair Parameter Input screen, perform the following.
Input the initial copy priority to the Priority.
In the case of asynchronous copy pairs, you can't input the initial copy prionity if the Resume Range (see 5.) is "Group".
If you want to set pair option, press (CL) [Option...] button and go to 5.
When all operations above are finished, press (CL) the [OK] button (see the figure) and go to 3.

5. Setting HORC pair option



On the Pair Option screen, perform the following.
Set one of the following in Initial Copy Pace.
• 1 ~ 15 Tracks
Set one of the following in P-VOL Fence Level.
(Fixed "Never" when asynchronous copy pairing)
• S-VOL Data
• S-VOL Status
• Never
Set one of the following in Error Level.
(Effective only asynchronous copy pairing and Resume Range is "LU".)
• Group
• LU
Set one of the following in Resume Range.
(Effective only asynchronous copy pairing. If 2 or more volume pairs are specified, this parameter is fixed to "LU".)
• Group
• LU
When all above operation are finished, press (CL) [OK] button.
Then go to 4.

6. Verifying the resumption



Verify if the volume(s) selected from the volume list (see the figure) is in the COPY (or PAIR) status by pressing (CL) the [Refresh] button on the HORC screen.

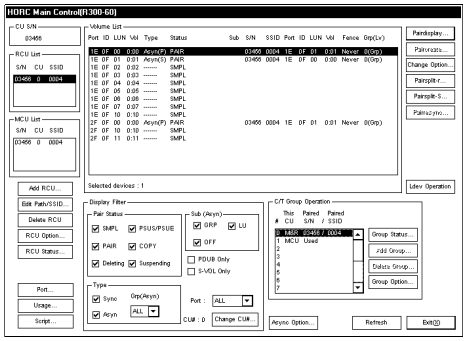
Copyright ©1998,2000, Hitachi, Ltd.

2.27.6 Resuming the Suspended Pair(s) of LDEV

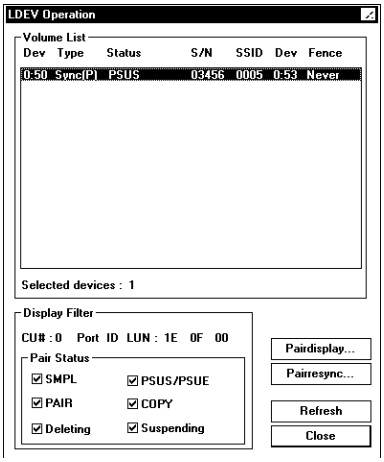
This operation resumes the volume pair(s) of LDEV suspended. The operation can be performed only from the MCU.

1. Display the HORC screen.
   Select (CL) [HORC] in the 'SVP' window.

2. Selecting the volume of OPEN VOL
   Select the volume desired to be resumed from the volume list (see the figure) on the HORC screen to resume it.
   Select the [Ldev Operation...] button on the HORC screen.
   The HORC Sub screen screen will appear.



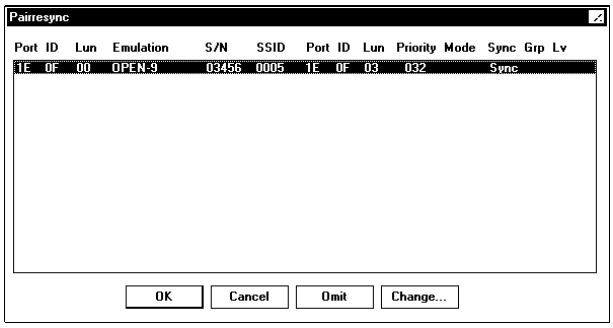
3. Selecting the volume(s) of LDEV
   Select the volume(s) desired to be resumed from the volume list (see figure) on the HORC Sub screen to resume it.
   Select (CL) the [Pairresync...] button on the HORC screen.
   The Pairresync screen will appear.



Copyright ©1998,2000, Hitachi, Ltd.

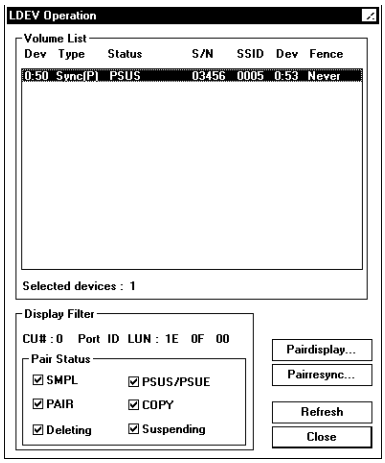
4. Confirm a resume parameter

Confirm a resume option on the Resume HORC Pair screen.
Select (CL) the [OK] button on the Resume HORC Pair screen and go to 5.
If you want to omit Pairresync, select the volumes from the volume list and select (CL) [Omit] button.



5. Verifying the resumption

Verify if the volume(s) selected from the volume list (see the figure) is in the COPY (or PAIR) status by pressing (CL) the [Refresh] button on the HORC sub screen.



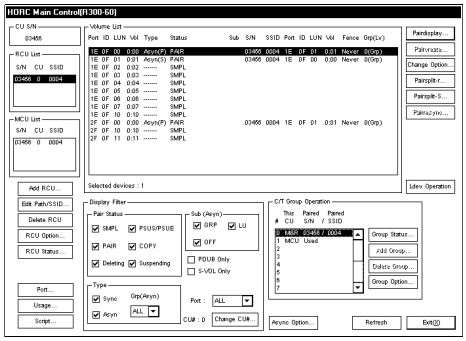
Copyright ©1998,2000, Hitachi, Ltd.

2.27.7 Deleting the Existing HORC Pair(s)

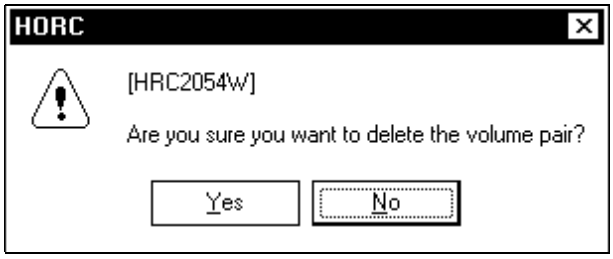
This operation deletes the HORC pair(s). The operation can be performed from both the MCU and the RCU.

1. Display the HORC screen.
   Select (CL) [HORC] in the 'SVP' window.

2. Selecting the volume(s)
   Select the volume pair(s) desired to be deleted from the volume list (see the figure) on the HORC screen.
   (You can select several volumes. However, you can't select the synchronous copy pair and asynchronous copy pair at the same time.)



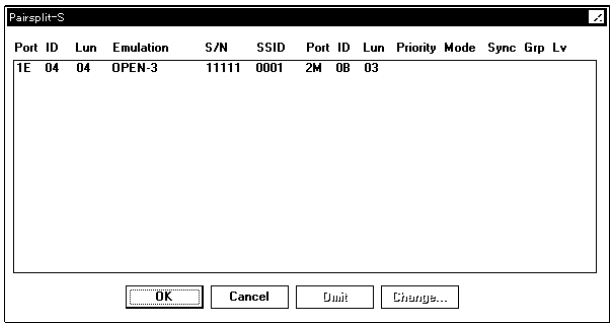
3. Instructing the deletion
   Select (CL) the [Pairsplit-S...] button on the HORC screen. The confirmation message will appear. To delete the pair(s) really, press (CL) the [Yes] button. Then Pairsplit-S screen will appear.



Copyright ©1998,2000, Hitachi, Ltd.

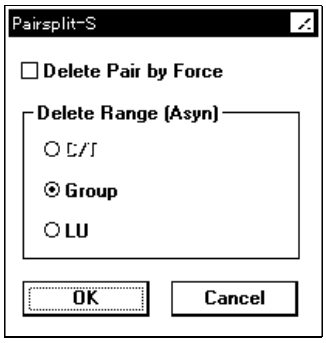
4. Confirm the deletion volumes

Confirm the deletion volumes that are displayed to the Pairsplit-S screen and select (CL) [OK] button and go to 6.
If you want to change delete parameters, select the volumes from the volume list and select (CL) [Change...] button and go to 5.
If you want to omit the volume deletion, select the volumes from the volume list and select (CL) [Omit] button.



5. Inputting a deleting parameter

Press (CL) the [OK] button on the Pairsplit-S screen to execute the deletion and go to 4.



• Delete Pair by Force

This parameter deletes the selected pair(s) forcibly regardless of the status of the communication between MCU and RCU. In the case of asynchronous copy pairs, "Delete Pair by Force" can be specified if the Delete Range is "Group". Set one of the following in Delete Range (Asyn).
(Effective only asynchronous copy pair. Fixed "LU" if 2 or more volumes are specified.)

• C/T
• Group
• LU

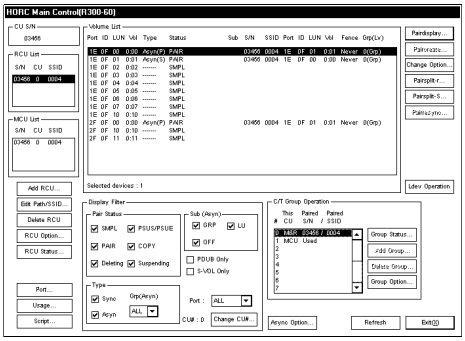
"C/T" means all pair(s) deletion which have the same C/T as the specified pair.
"C/T" can be specified only if the specified pair is :

• S-VOL
• Neither "Suspending" status nor "Deleting" status

"Group" means all pair(s) deletion which is(are) assigned to the same C/T group as the specified pair.
"LU" means only specified pair(s) will be deleted.

6. Verifying the pair(s) deleted

Verify if the volume(s) selected from the volume list (see the figure) is(are) in the SMPL status by pressing (CL) the [Refresh] button on the HORC screen.



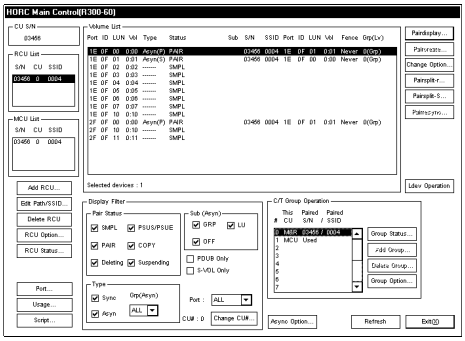
Copyright ©1998,2000, Hitachi, Ltd.

2.27.8 Deleting an RCU Registered

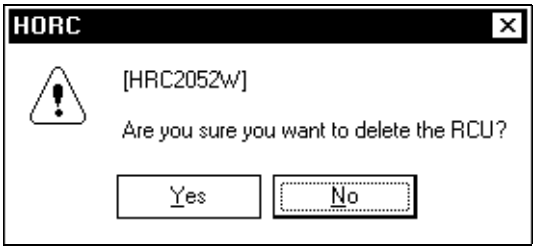
This function deletes an RCU. The function can be executed only from the MCU.

1. Display the HORC screen.
   Select (CL) [HORC] in the 'SVP' window.

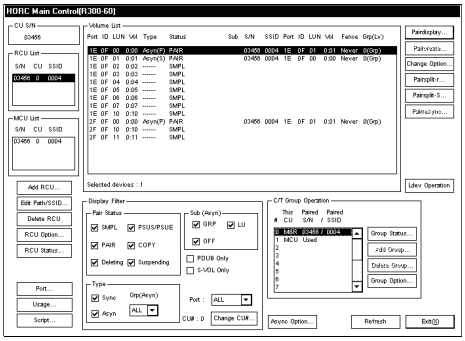
2. Selecting an RCU
   Select an RCU desired to be deleted from the RCU list (see the figure) on the HORC screen. (Only one RCU can be selected here.)



3. Instructing the deletion
   Select (CL) the [Delete RCU] button on the HORC screen. The confirmation message will appear. To delete the RCU really, press (CL) the [Yes] button.



4. Verifying the RCU deletion
   Press (CL) the [Refresh] button on the HORC screen to verify if the RCU selected from the RCU list (see the figure) is deleted.



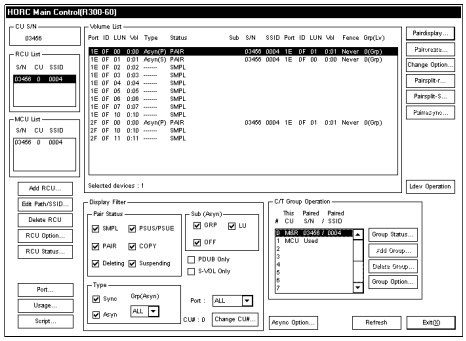
Copyright ©1998,2000, Hitachi, Ltd.

2.27.9 Adding the Path(s) to the RCU

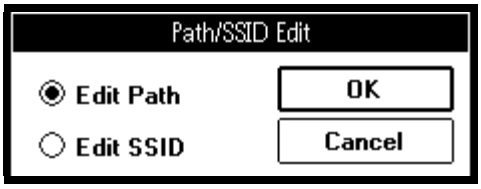
This operation adds the path(s) to the RCU already registered. The operation can be performed from both the MCU and the RCU.

1. Display the HORC screen.
   Select (CL) [HORC] in the 'SVP' window.

2. Selecting an RCU
   Select an RCU the number of paths to which is desired to be increased from the RCU list (see the figure) on the HORC screen. (Only one RCU can be selected here.)

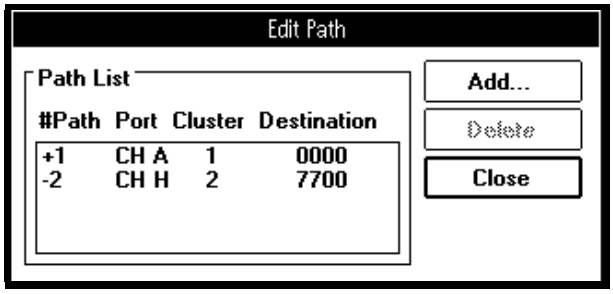


3. Selecting a function
   Select (CL) the [Edit Path/SSID...] button on the HORC screen.
   The Path/SSID Edit screen will appear.
   Select (CL) the [Edit Path] radio button then press (CL) the [OK] button on the screen.



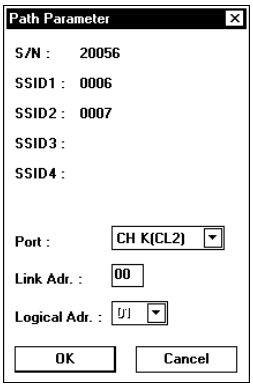
Copyright ©1998,2000, Hitachi, Ltd.

4. Instructing the addition of the path(s)
The Edit Path screen will appear. Then press (CL) the [Add...] button on the screen.

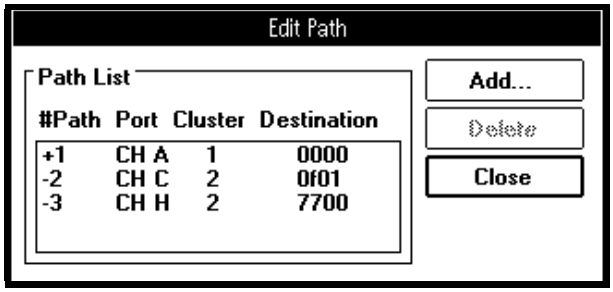


5. Inputting the parameters
When the Path Parameter screen appears, input the necessary parameters and press (CL) the [OK] button.
- Port :
  Specify the RCP port.
- Link Adr. :
  Specify the RCU side link address. When the ESCD is to be used, input the RCU-connected link address. When the ESCD is not used, input '00'.
- Logical Adr. :

As for the logical address, the CU number which was already registered by the RCU addition is displayed.



6. Verifying the path added
Make sure on the Edit Path screen that the specified path has been added correctly.



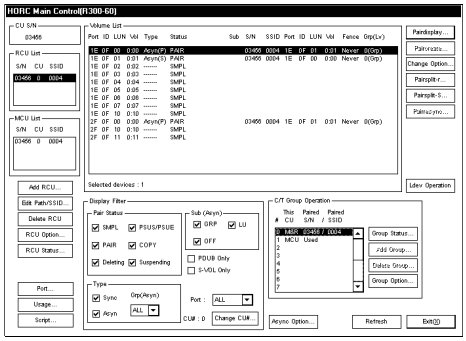
Copyright ©1998,2000, Hitachi, Ltd.

2.27.10 Reducing the Path(s) from the RCU

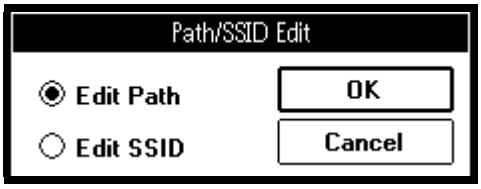
This operation reduces the number of paths connected to an RCU registered already.

1. Display the HORC screen.
   Select (CL) [HORC] in the 'SVP' window.

2. Selecting an RCU selection
   Select an RCU the number of paths to which is desired to be reduced from the RCU list (see the figure) on the HORC screen. (Only one RCU can be selected here.)

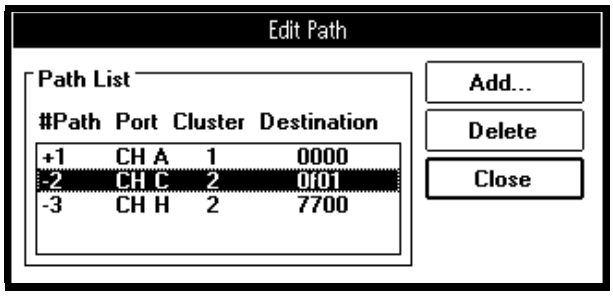


3. Instructing the reduction of the path(s)
   Select (CL) the [Edit Path/SSID...] button on the HORC screen. The Edit Path/SSID screen will appear.
   Select (CL) the [Edit Path] radio button then press (CL) the [OK] button on the screen.

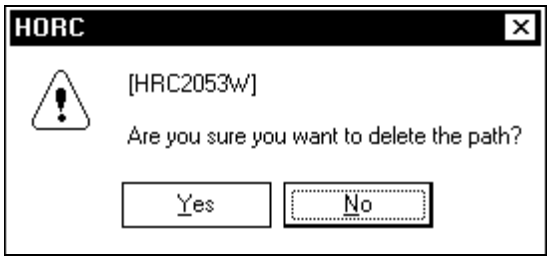


Copyright ©1998,2000, Hitachi, Ltd.

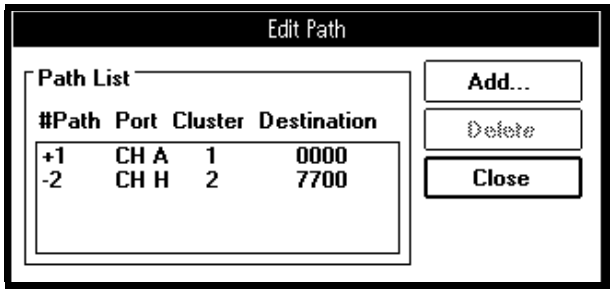
4. Selecting a path to be deleted
Select a path desired to be deleted from the path list displayed on the Edit Path screen and press (CL) the [Delete] button.



5. Confirmation message
When the confirmation message appears, confirm the path to be deleted and press (CL) the [Yes] button.



6. Verifying the path deleted
Make sure on the Edit Path screen that the path specified has been deleted correctly.



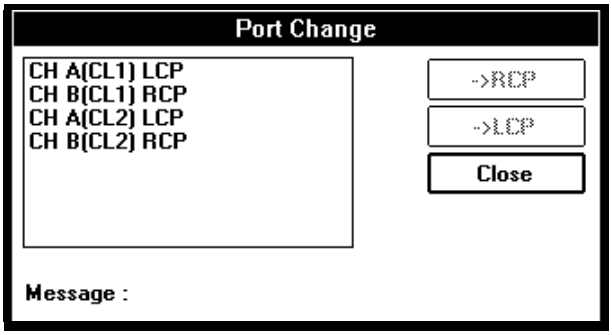
Copyright ©1998, Hitachi, Ltd.

2.27.11 Changing the Port Type

This operation specifies which port type is selected, LCP (to connect to the host) or RCP (to connect to the RCU).

1. Display the HORC screen.
   Select (CL) [HORC] in the 'SVP' window.

2. Selecting the processing to change the port type
   Select (CL) the [Port...] button on the on the HORC screen to display the Path Change screen.

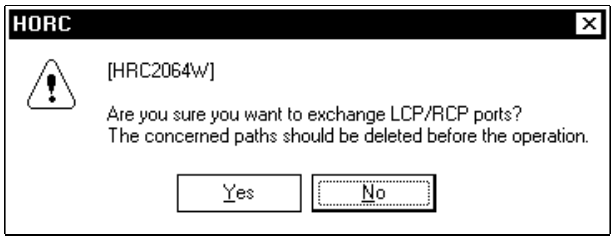


3. Instructing the port change
   When the port list and the port types are displayed in the list box on the Path Change screen, select one or more ports whose type(s) is(are) to be changed.
   To select LCP for the port type, press the [-> LCP] button. Then go to step 4.
   To select RCP for the port type, press the [-> RCP] button. Then go to step 5.

Copyright ©1998, Hitachi, Ltd.

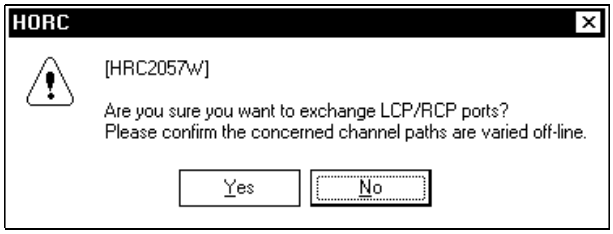
4. Confirmation message and indication of executing status

When the confirmation message appears, confirm the port(s) whose type(s) is(are) to be changed again. If it is correct, press (CL) the [Yes] button.
Status of execution is displayed in the "Message" field on the Port Change screen.
Go to step 6.



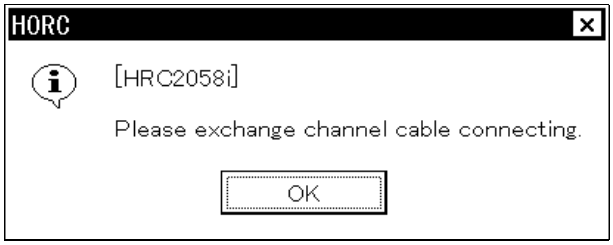
5. Confirmation message and indication of executing status

When the confirmation message appears, confirm the port(s) whose type(s) is(are) to be changed again. If it is correct, press (CL) the [Yes] button.
Status of execution is displayed in the "Message" field on the Port Change screen.



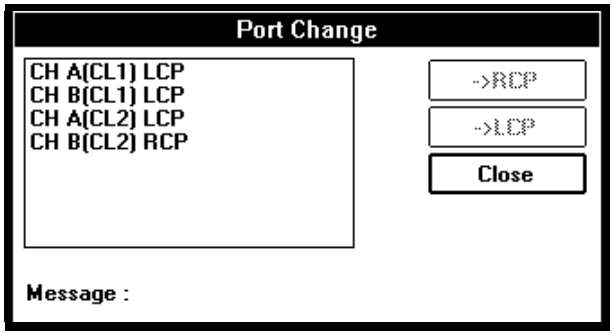
6. Indication message

After exchanging channel cable connecting, press (CL) the [OK] button.



7. Verifying port change

After the change is finished, make sure on the Port Change screen that the type(s) of the specified port(s) has(have) been changed correctly.



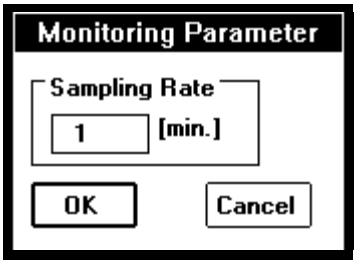
Copyright ©1998, Hitachi, Ltd.

2.27.12 Displaying HORC Operation Status

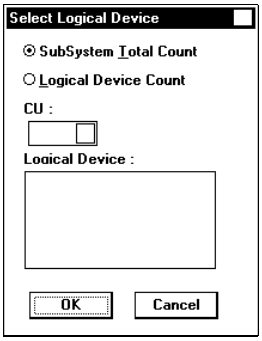
This operation displays a graphic indication of the HORC operation status.

1. Display the HORC screen.
   Select (CL) [HORC] in the 'SVP' window.

2. Setting a sampling rate
   Press (CL) the [Usage...] button on the on the HORC screen to display the Sampling Rate Setting screen. Then, input a sampling rate and press (CL) the [OK] button. (Sampling rate can be set within 1 to 546 minutes in steps of 1 minute.)

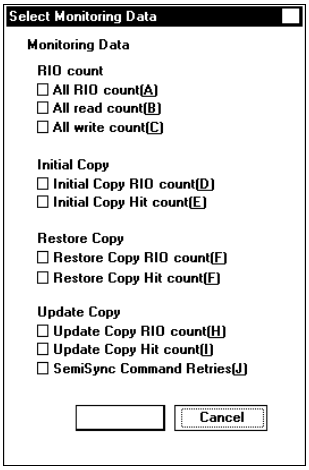


3. Selecting an object device
   When the valid logical device list is displayed in the list box on the Select Logical Device screen, select a logical device and press (CL) the [OK] button. To display the information of the whole subsystem, select "Sub System".



Copyright ©1998, Hitachi, Ltd.

4. Selecting information desired to be acquired
Select one or more data items on the Select Monitoring Data screen, then press (CL) the [OK] button.



5. Displaying the operation information
The Operation Information Display window appears. To view operation information of other devices, select Monitor-Start from the menu and go to step 3. (Two or more (MAX. 15) screens can be displayed at a time.)

6. Terminating the operation information display
To terminate the operation information display, select Monitor-Exit to return to the HORC screen.

Copyright ©1998, Hitachi, Ltd.

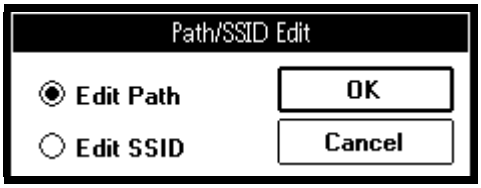
2.27.13 Adding the SSID(s) to the RCU

This operation adds the SSID(s) to the RCU already registered. The operation can be performed from both the MCU and the RCU.

1. Selecting an RCU
   Display the HORC screen and select (CL) an RCU from RCU List which is desired to be increased SSIDs. (Only one RCU can be selected here.)

2. Selecting a function
   Select (CL) the [Edit Path SSID...] button on the HORC screen.
   The Path/SSID Edit screen will appear.

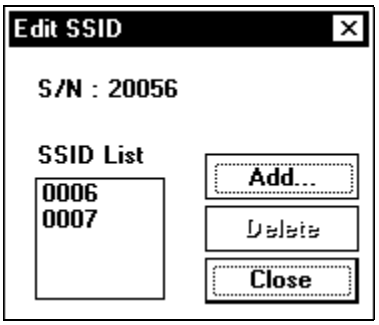
   Select (CL) the [Edit SSID] radio button then press (CL) the [OK] button on the screen.



3. Confirming the number of SSID(s)
   The Edit SSID screen will appear.

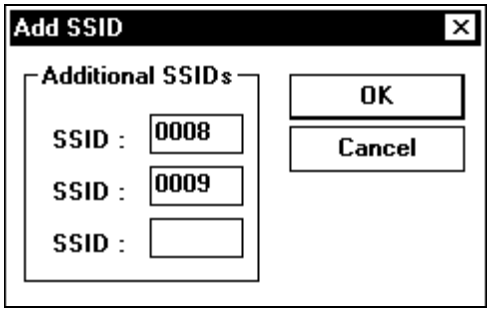
   Press (CL) [Add] button on the screen.
   (See the figure.)

   Note: If 4 SSIDs are registered on the RCU, you can not add a SSID further. ([Add...] button will be not active.)



4. Adding the SSID(s) to the RCU
   The Add SSID screen will appear.

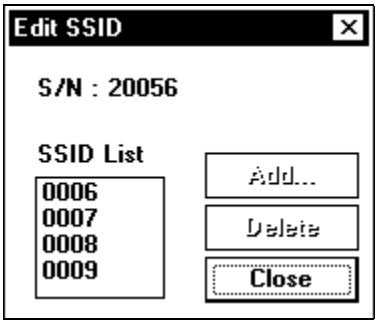
   Input 4-digit hexadecimal SSID(s) number in SSID, then press (CL) [OK] button.



Copyright ©1998,1999, Hitachi, Ltd.

5. Verifying the SSIDs added

Make sure on the Edit SSID screen that the specified SSIDs have been added correctly.



Copyright ©1998,1999, Hitachi, Ltd.

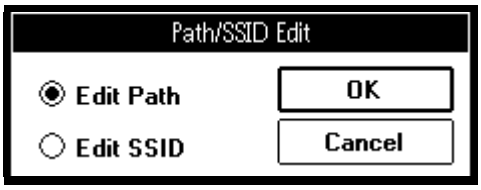
2.27.14 Reducing the SSID(s) from the RCU

This operation reduces the SSID(s) from the RCU already registered.

1. Selecting an RCU
   Display the HORC screen and select (CL) an RCU from RCU List which is desired to be reduced SSIDs. (Only one RCU can be selected here.)

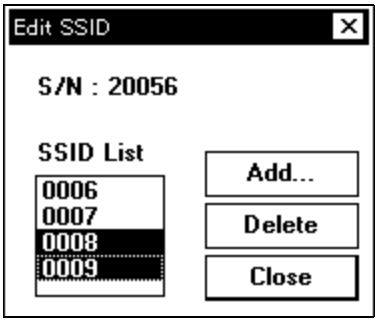
2. Selecting a function
   Select (CL) the [Edit Path SSID...] button on the HORC screen.
   The Path/SSID Edit screen will appear.

   Select (CL) the [Edit SSID] radio button then press (CL) the [OK] button on the screen.



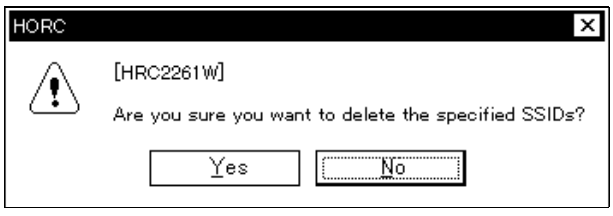
3. Selecting SSID(s) to be deleted
   The Edit SSID screen will appear.

   Select SSIDs desired to be deleted from the SSID List displayed on the Edit SSID screen and press (CL) [Delete] button (See the figure).



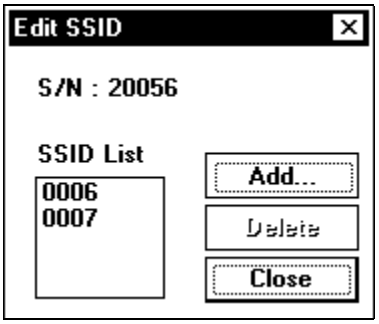
4. Confirmation message
   A confirmation message will appear.

   If wanting to delete the SSID really, press (CL) the [YES] button.



Copyright ©1998,1999, Hitachi, Ltd.

5. Verifying the SSIDs added
   Make sure on the Edit SSID screen that the specified SSIDs have been deleted correctly.



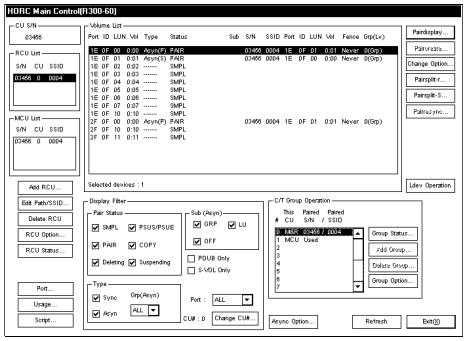
Copyright ©2000, Hitachi, Ltd.

2.27.15 Referring the C/T group status

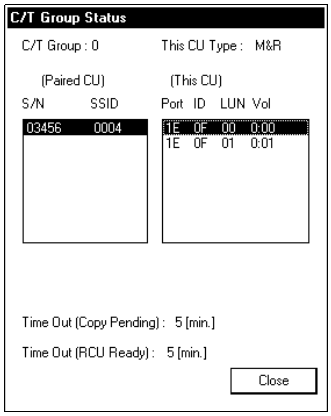
This operation shows the specified C/T group status.

1. Display the HORC screen
   Select (CL) [HORC] in the 'SVP' window.

2. Selecting a C/T group
   Select a C/T group whose status is desired to be referred to from the C/T Group List (see the figure) on the HORC screen.
   (Only one C/T group can be selected here.)
   (Note: C/T groups which are assigned by HRC are not displayed on the list.)



3. Confirming the C/T group status
   Select (CL) the [Group Status...] button on the HORC screen.
   The C/T Group Status screen will appear.
   Press (CL) the [Close] button to close the screen.



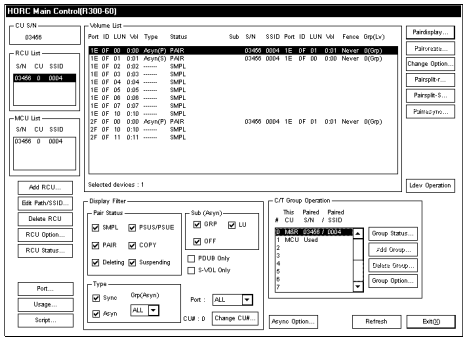
Copyright ©2000, Hitachi, Ltd.

2.27.16 Releasing the using C/T group

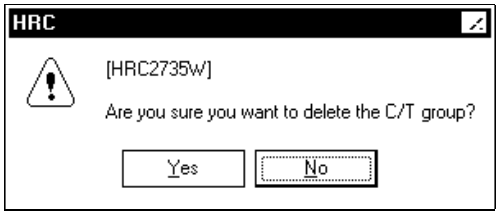
This operation releases the specified C/T group already used.
This operation can be performed only from the MCU.

1. Display the HORC screen
   Select (CL) [HORC] in the 'SVP' window.

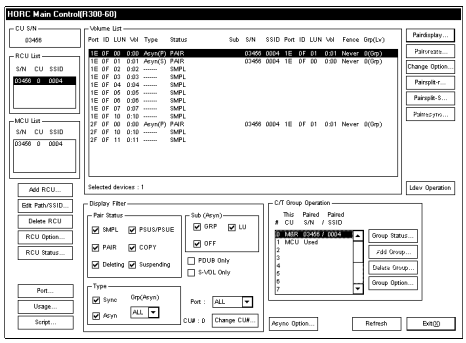
2. Selecting a C/T group
   Select a C/T group desired to be released from the C/T Group List (see the figure) on the HORC screen. (Only one C/T group can be selected here.)
   (Note: C/T groups which are assigned by HRC are not displayed on the list.)



3. Instructing a release
   Press (CL) the [Delete Group] button on the HORC screen. The confirmation message will appear. To release the C/T group really, press (CL) the [Yes] button.



4. Verifying the C/T group released
   Verify if the C/T group selected from C/T Group List (see the figure) is displayed as blank.



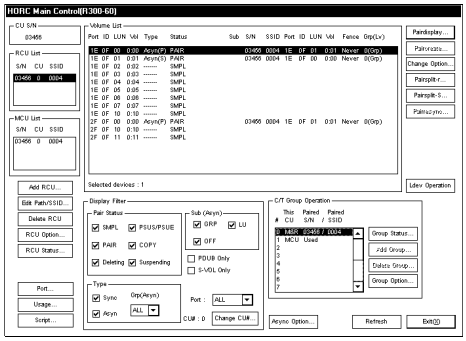
Copyright ©2000, Hitachi, Ltd.

2.27.17 Changing the using C/T group parameters

This operation changes the specified C/T group parameters which already used.
This operation can be performed only from the MCU.

1. Display the HORC screen
   Select (CL) [HORC] in the 'SVP' window.

2. Selecting a C/T group
   Select a C/T group desired to be changed from the C/T Group List (see the figure) on the HORC screen. (Only one C/T group can be selected here.)
   (Note: C/T groups which are assigned by HRC are not displayed on the list.)



3. Inputting the C/T group parameter
   Press (CL) [Group Option...] button on the HORC screen. The C/T Group Option screen will appear.
   On the C/T Group Option screen. Perform the following.
   Select the timer type of the C/T indicated at Timer Type.
   Select maximum delay time of update data from combo-box at Time Out (Copy Pending).
   Select maximum waiting time for the RCU gets ready from combo-box at Time Out (RCU Ready).
   When all the above operations are finished, press (CL) the [OK] button.

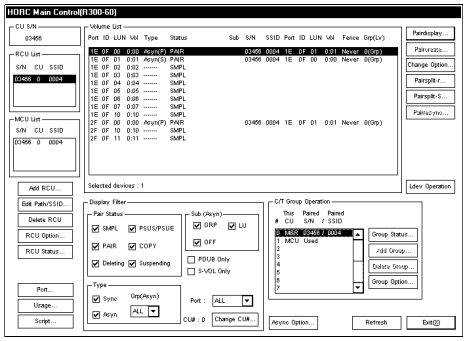
4. Verifying the C/T group status
   Open the C/T Group Status screen, then verify the C/T group parameters are correctly changed. (Refer to 2.27.15)

Copyright ©2000, Hitachi, Ltd.

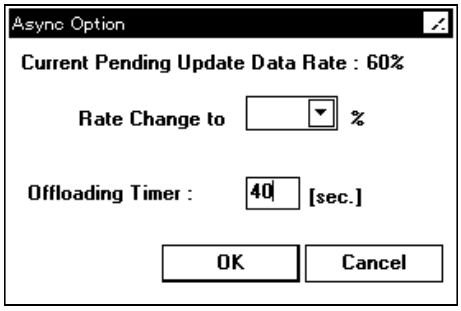
2.27.18 Changing the asynchronous option parameters

This operation changes the asynchronous option parameters.

1. Display the HORC screen
   Select (CL) [HORC] in the 'SVP' window.
   The HORC screen will appear Press (CL) the [Async Option...] button on the HORC screen.



2. Inputting the asynchronous option parameters
   The Async Option screen will appear.
   On the Async Option screen, perform the following. If there is necessity for changing the occupation rate of pending update data among the Record set, select a number of rate from combo-box at Rate Change to.
   (Notice1)
   If the C/T group(s) which is(are) assigned by HORC is(are) exist, the rate can not be changed.
   (Notice2)
   When using SVP version 51-44-XX, the rate can be turned within 40 through 70. When using 51-45-XX or later, it can be turned within 30 through 70.
   Select monitoring time for the Record Set form combo-box indicated at Offloading Timer. (1 ~ 255)
   When all the above operations are finished, press (CL) the [OK] button.



3. Verifying the asynchronous option parameters
   Open the Async Option screen again, then verify the occupation rate indicated at Current Pending Update Data Rate is correct.
   Verify the monitoring time indicated at Offloading Timer is correct, too.

Copyright ©1999,2000, Hitachi, Ltd.

2.28 HORC Operation (for LDEV)

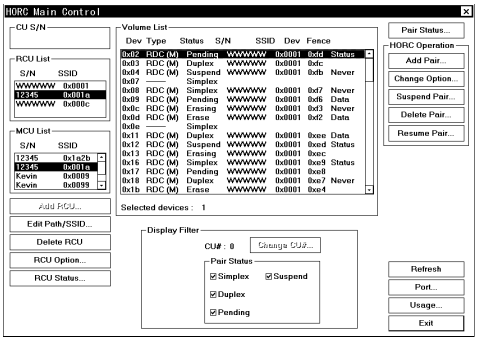
If SVP Micro-program version is over “51-36-01”, refer to the “2.27 HORC Operation (for OPEN VOL) (SVP02-1350)”.

2.28.1 Referring to the Path Status

Refer to the MCU-RCU connection status. This operation is possible only from the MCU.

1. Display the HORC screen.
   Select (CL) [HORC] in the ‘SVP’ window.

2. Selecting an RCU
   Select an RCU whose path status is desired to be referred to from the RCU list (see the figure) on the HORC screen. (Two or more RCUs cannot be selected here.)

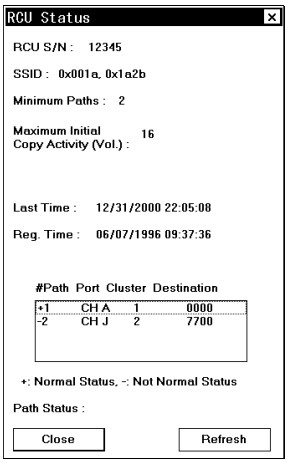


3. Displaying the RCU status
   Select (CL) the [RCU Status...] button on the HORC screen to display the RCU Status screen.

Copyright ©1998, Hitachi, Ltd.

4. Selecting a path to be displayed

The path list is displayed on the RCU Status screen. Select a path whose status is desired to be displayed from the list. (Two or more paths cannot be selected here.)



5. Updating the path status

Select (CL) the [Refresh] button on the RCU Status screen to update the screen display. When updating the screen display, select (CL) the [Refresh] button. When closing the screen, select (CL) the [Close] button.

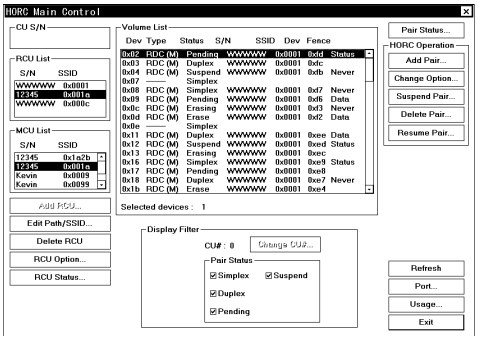
Copyright ©1998, Hitachi, Ltd.

2.28.2 Referring to the Pair Status

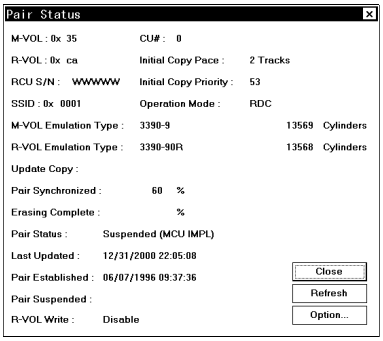
Refer to the object volume pair status. The screen data displayed will differ between when this operation is executed from only the MCU and when it is executed from the RCU.

1. Displaying the HORC screen.
   Select (CL) [HORC] in the 'SVP' window.

2. Selecting a volume
   Select a volume whose status is desired to be referred to from the volume list (see the figure) on the HORC screen. (Select only one volumes here although two or more volume can be selected from the list.)



3. Displaying the pair status
   Select (CL) the [Pair Status...] button on the HORC screen. The Pair Status screen will appear.



4. Updating the pair status
   Select (CL) the [Refresh] button on the Pair Status screen. This operation updates the display of the pair status. Press (CL) the [Close] button to close the screen.

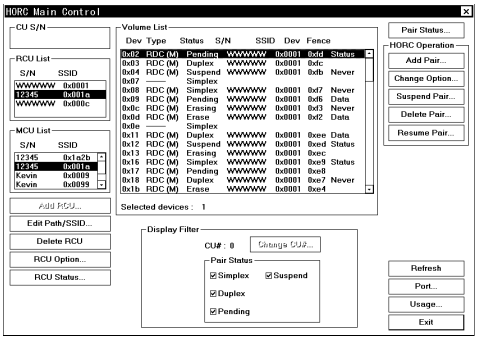
Copyright ©1998, Hitachi, Ltd.

2.28.3 Suspending the Volume Pair(s)

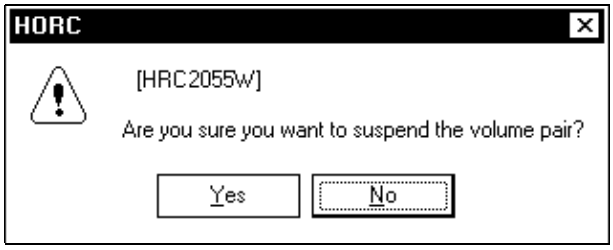
This operation suspends the object volume pair(s). The operation can be executed from both the MCU and the RCU.

1. Display the HORC screen.
   Select (CL) [HORC] in the 'SVP' window.

2. Selecting the volume(s)
   Select the volume(s) desired to be suspended from the volume list (see the figure) on the HORC screen.



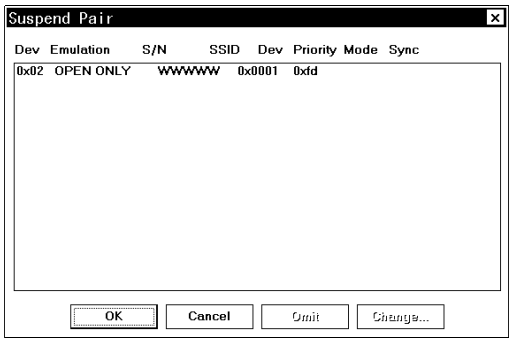
3. Instructing a suspension
   Select (CL) the [Suspend Pair...] button on the HORC screen. A confirmation message will appear. To suspend the pair really, press (CL) the [Yes] button. The Suspend Pair screen will appear.



Copyright ©1998, Hitachi, Ltd.

4. Confirm the suspension volumes

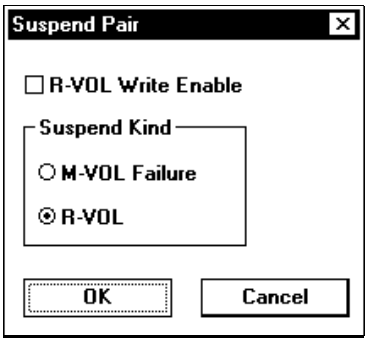
Confirm the suspension volumes that are displayed to the Suspend pair screen and select (CL) [OK] button and go to 6.
If you want to change suspend parameters, select the volumes from the volume list and select (CL) [Change...] button and go to 5.
If you want to omit the volume suspension, select the volumes from the volume list and select (CL) [Omit] button.



5. Inputting the suspending parameters

Press (CL) the [OK] button on the Suspend Pair screen to execute the suspending processing.

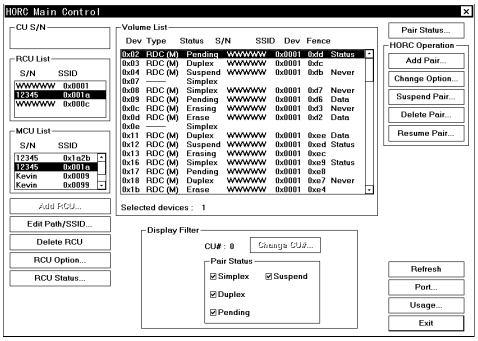
- R-VOL Write Enable
  This parameter specifies whether to enable R-VOL to read/write.
  If you want to use this parameter, select “R-VOL” in Suspend Kind parameter.
- Suspend kind
  This parameter specifies which instruction is to be issued, an M-VOL suspension or an R-VOL suspension.



Notice : During the initial copy, M-VOL suspension is rejected. (Error Code = 0102)

6. Verifying the suspension

Verify if the volume selected from the volume list (see the figure) is in the suspended status or not by pressing (CL) the [Refresh] button on the HORC screen.



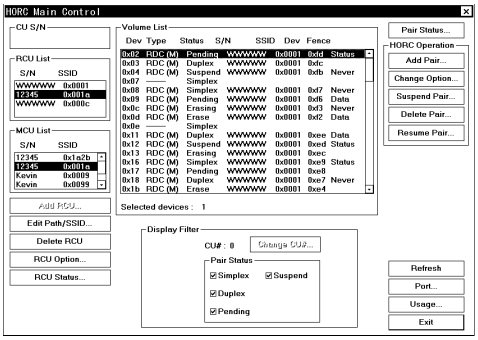
Copyright ©1998, Hitachi, Ltd.

2.28.4 Resuming the Suspended Pair(s)

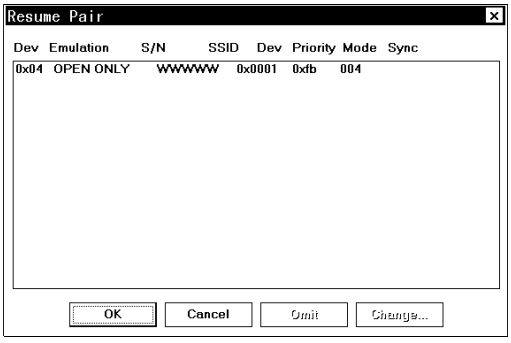
This operation resumes the volume pair(s) suspended. The operation can be performed only from the MCU.

1. Display the HORC screen.
   Select (CL) [HORC] in the 'SVP' window.

2. Selecting the volume(s)
   Select the volume(s) desired to be resumed from the volume list (see the figure) on the HORC screen to resume it.
   Select the [Resume Pair...] button on the HORC screen.
   The Resume Pair screen will appear.



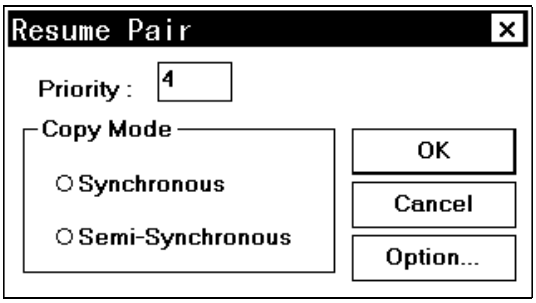
3. Confirm a resume parameter
   Confirm a resume option on the Resume HORC Pair screen.
   Select (CL) the [OK] button on the Resume HORC Pair screen and go to 5.
   If you want to change resume parameter, select the volumes from the volume list and select (CL) [Change...] button and go to 4.
   If you want to omit resume pair, select the volumes from the volume list and select (CL) [Omit] button.



Copyright ©1998, Hitachi, Ltd.

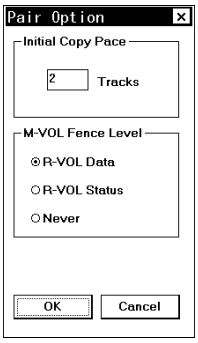
4. Inputting the resume parameter

On the Resume HORC pair Parameter Input screen, perform the following.
Input the initial copy priority to the Priority.
Select one of the copy mode indicated at Copy Mode.
If you want to set pair option, press (CL) [Option...] button and go to 5.
When all operations above are finished, press (CL) the [OK] button (see the figure) and go to 3.



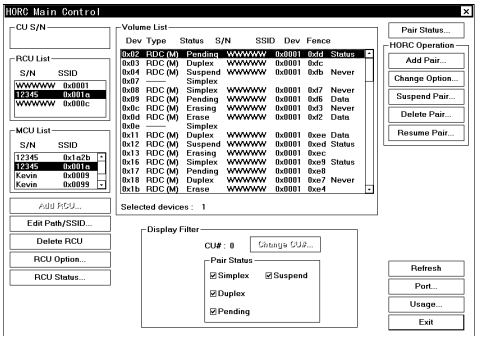
5. Setting HORC pair option

On the Pair Option screen, perform the following.
Set one of the following in Initial Copy Pace.
• 1 ~ 15 Tracks
Set one of the following in M-VOL Fence Level.
• R-VOL Data
• R-VOL Status
• Never
When all above operation are finished, press (CL) [OK] button.
Then go to 4.



6. Verifying the resumption

Verify if the volume(s) selected from the volume list (see the figure) is in the pending (or duplex) status by pressing (CL) the [Refresh] button on the HORC screen.



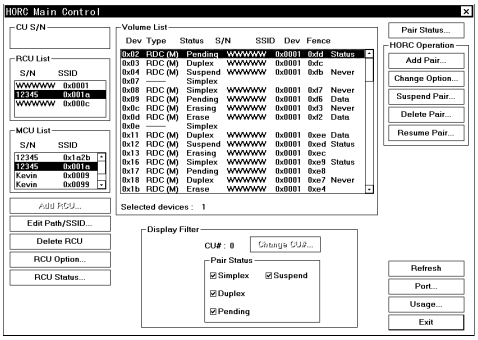
Copyright ©1998, Hitachi, Ltd.

2.28.5 Deleting the Existing HORC Pair(s)

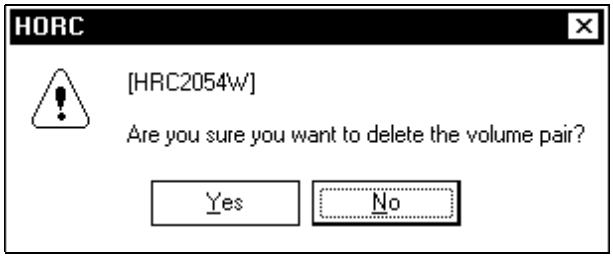
This operation deletes the HORC pair(s). The operation can be performed from both the MCU and the RCU.

1. Display the HORC screen.
   Select (CL) [HORC] in the 'SVP' window.

2. Selecting the volume(s)
   Select the volume pair(s) desired to be deleted from the volume list (see the figure) on the HORC screen.



3. Instructing the deletion
   Select (CL) the [Delete Pair...] button on the HORC screen. The confirmation message will appear. To delete the pair(s) really, press (CL) the [Yes] button. Then Delete Pair screen will appear.



Copyright ©1998, Hitachi, Ltd.

4. Confirm the deletion volumes

Confirm the deletion volumes that are displayed to the Delete pair screen and select (CL) [OK] button and go to 6.

If you want to change delete parameters, select the volumes from the volume list and select (CL) [Change...] button and go to 5.

If you want to omit the volume deletion, select the volumes from the volume list and select (CL) [Omit] button.

5. Inputting a deleting parameter

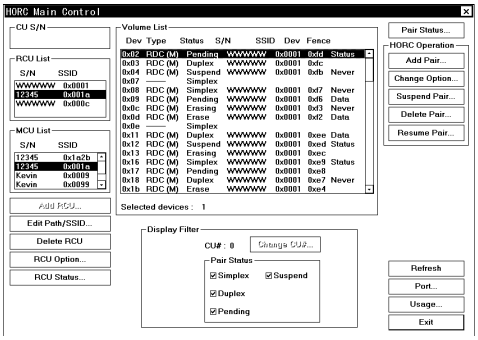
Press (CL) the [OK] button on the Delete Pair screen to execute the deletion and go to 4.

• Delete by Force

This parameter deletes the selected pair(s) forcibly regardless of the status of the communication between MCU and RCU.

6. Verifying the pair(s) deleted

Verify if the volume(s) selected from the volume list (see the figure) is(are) in the simplex status by pressing (CL) the [Refresh] button on the HORC screen.



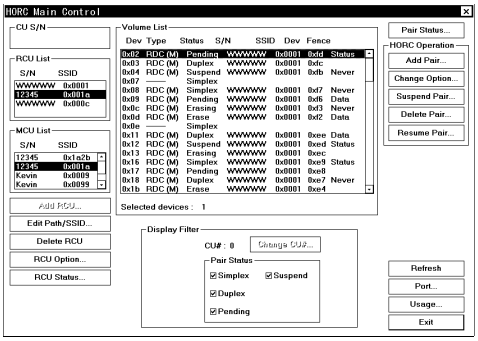
Copyright ©1998, Hitachi, Ltd.

2.28.6 Deleting an RCU Registered

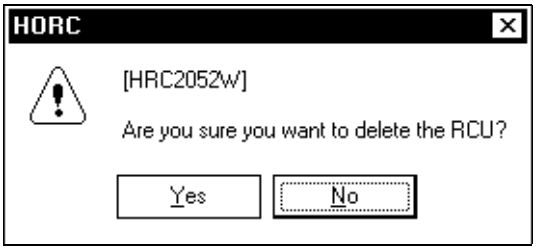
This function deletes an RCU. The function can be executed only from the MCU.

1. Display the HORC screen.
   Select (CL) [HORC] in the 'SVP' window.

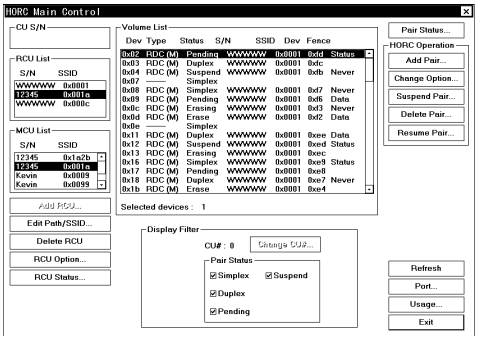
2. Selecting an RCU
   Select an RCU desired to be deleted from the RCU list (see the figure) on the HORC screen. (Only one RCU can be selected here.)



3. Instructing the deletion
   Select (CL) the [Delete RCU] button on the HORC screen. The confirmation message will appear. To delete the RCU really, press (CL) the [Yes] button.



4. Verifying the RCU deletion
   Press (CL) the [Refresh] button on the HORC screen to verify if the RCU selected from the RCU list (see the figure) is deleted.



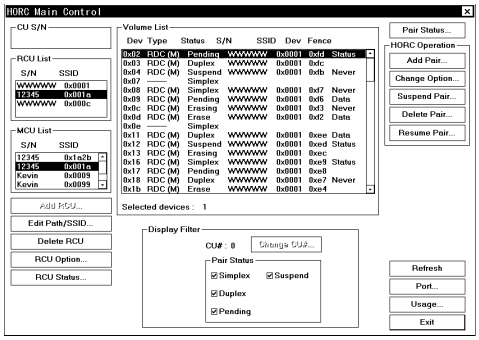
Copyright ©1998, Hitachi, Ltd.

2.28.7 Adding the Path(s) to the RCU

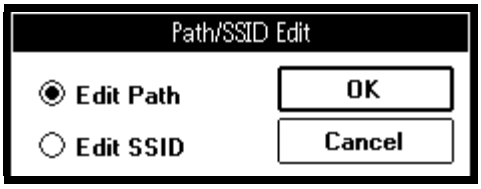
This operation adds the path(s) to the RCU already registered. The operation can be performed from both the MCU and the RCU.

1. Display the HORC screen.
   Select (CL) [HORC] in the 'SVP' window.

2. Selecting an RCU
   Select an RCU the number of paths to which is desired to be increased from the RCU list (see the figure) on the HORC screen. (Only one RCU can be selected here.)

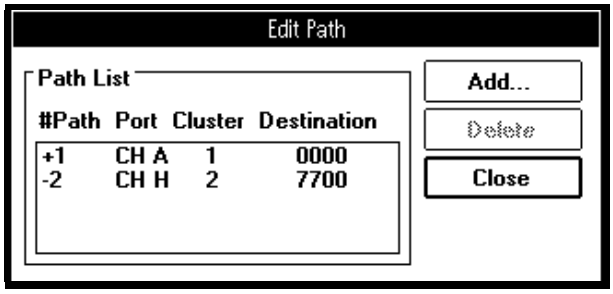


3. Selecting a function
   Select (CL) the [Edit Path/SSID...] button on the HORC screen.
   The Path/SSID Edit screen will appear.
   Select (CL) the [Edit Path] radio button then press (CL) the [OK] button on the screen.



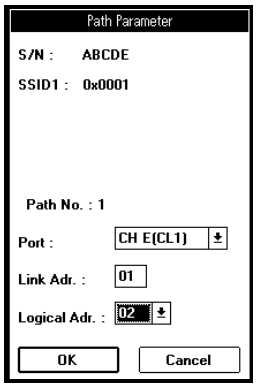
Copyright ©1998, Hitachi, Ltd.

4. Instructing the addition of the path(s)
   The Edit Path screen will appear. Then press (CL) the [Add...] button on the screen.

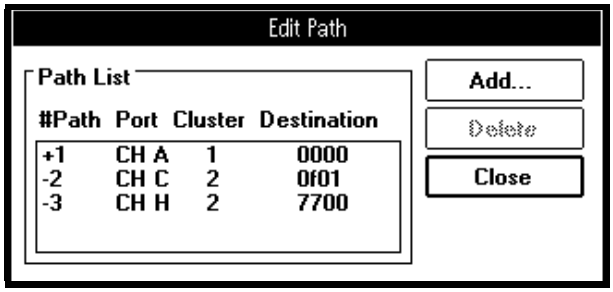


5. Inputting the parameters
   When the Path Parameter screen appears, input the necessary parameters and press (CL) the [OK] button.
   - Port
     Specify the RCP port.
   - Destination link address
     Specify the RCU side link address. When the ESCD is to be used, input the RCU-connected link address. When the ESCD is not used, input '00'.
   - Logical address

     Please select only 00 as a logical address.



6. Verifying the path added
   Make sure on the Edit Path screen that the specified path has been added correctly.



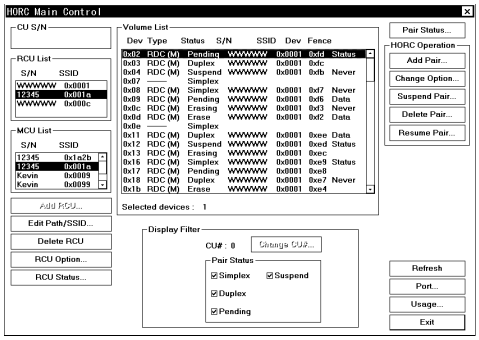
Copyright ©1998, Hitachi, Ltd.

2.28.8 Reducing the Path(s) from the RCU

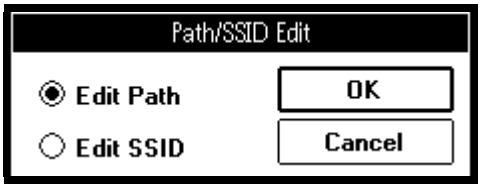
This operation reduces the number of paths connected to an RCU registered already.

1. Display the HORC screen.
   Select (CL) [HORC] in the 'SVP' window.

2. Selecting an RCU selection
   Select an RCU the number of paths to which is desired to be reduced from the RCU list (see the figure) on the HORC screen. (Only one RCU can be selected here.)

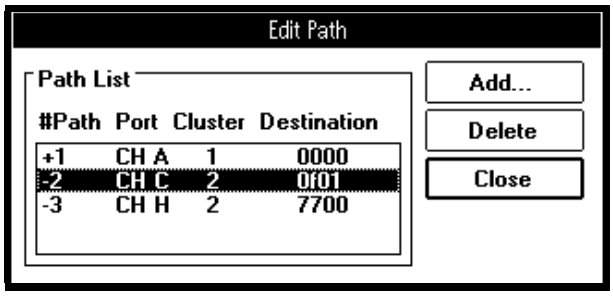


3. Instructing the reduction of the path(s)
   Select (CL) the [Edit Path/SSID...] button on the HORC screen. The Edit Path/SSID screen will appear.
   Select (CL) the [Edit Path] radio button then press (CL) the [OK] button on the screen.

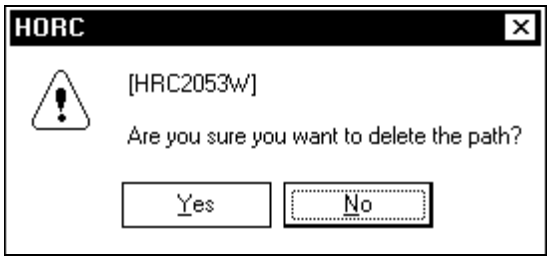


Copyright ©1998, Hitachi, Ltd.

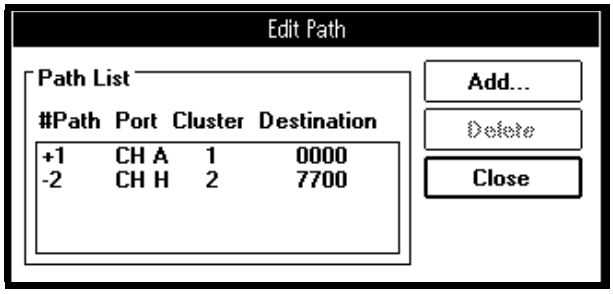
4. Selecting a path to be deleted
Select a path desired to be deleted from the path list displayed on the Edit Path screen and press (CL) the [Delete] button.



5. Confirmation message
When the confirmation message appears, confirm the path to be deleted and press (CL) the [Yes] button.



6. Verifying the path deleted
Make sure on the Edit Path screen that the path specified has been deleted correctly.



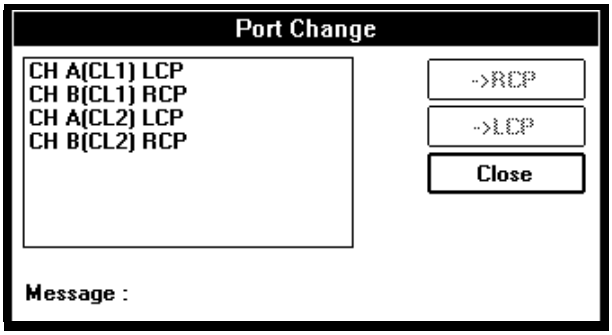
Copyright ©1998, Hitachi, Ltd.

2.28.9 Changing the Port Type

This operation specifies which port type is selected, LCP (to connect to the host) or RCP (to connect to the RCU).

1. Display the HORC screen.
   Select (CL) [HORC] in the 'SVP' window.

2. Selecting the processing to change the port type
   Select (CL) the [Port...] button on the on the HORC screen to display the Path Change screen.

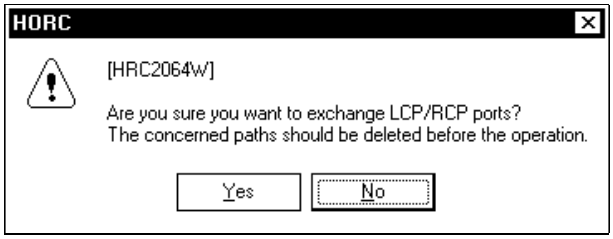


3. Instructing the port change
   When the port list and the port types are displayed in the list box on the Path Change screen, select one or more ports whose type(s) is(are) to be changed.
   To select LCP for the port type, press the [-> LCP] button. Then go to step 4.
   To select RCP for the port type, press the [-> RCP] button. Then go to step 5.

Copyright ©1998, Hitachi, Ltd.

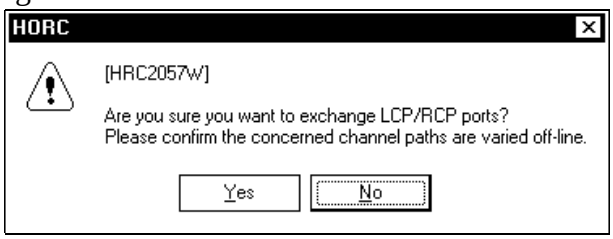
4. Confirmation message and indication of executing status

When the confirmation message appears, confirm the port(s) whose type(s) is(are) to be changed again. If it is correct, press (CL) the [Yes] button.
Status of execution is displayed in the "Message" field on the Port Change screen.
Go to step 6.



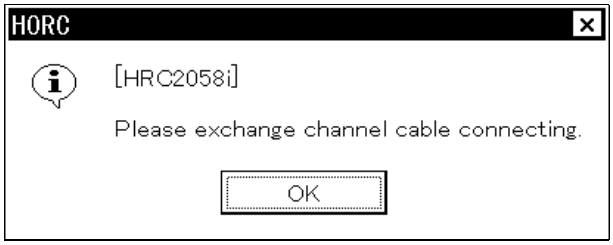
5. Confirmation message and indication of executing status

When the confirmation message appears, confirm the port(s) whose type(s) is(are) to be changed again. If it is correct, press (CL) the [Yes] button.
Status of execution is displayed in the "Message" field on the Port Change screen.



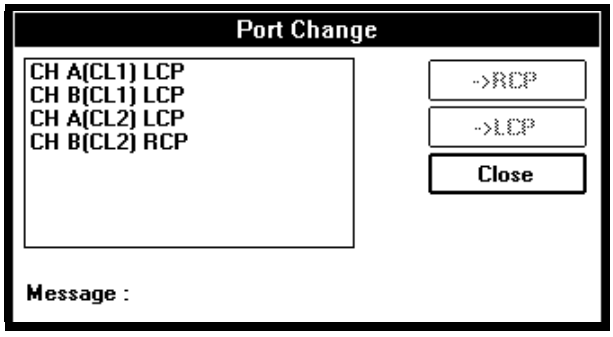
6. Indication message

After exchanging channel cable connecting, press (CL) the [OK] button.



7. Verifying port change

After the change is finished, make sure on the Port Change screen that the type(s) of the specified port(s) has(have) been changed correctly.



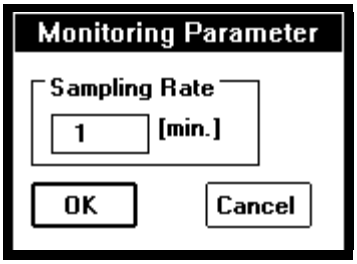
Copyright ©1998, Hitachi, Ltd.

2.28.10 Displaying HORC Operation Status

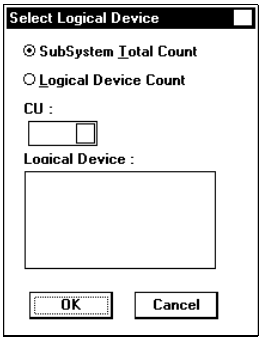
This operation displays a graphic indication of the HORC operation status.

1. Display the HORC screen.
   Select (CL) [HORC] in the 'SVP' window.

2. Setting a sampling rate
   Press (CL) the [Usage...] button on the on the HORC screen to display the Sampling Rate Setting screen. Then, input a sampling rate and press (CL) the [OK] button. (Sampling rate can be set within 1 to 546 minutes in steps of 1 minute.)



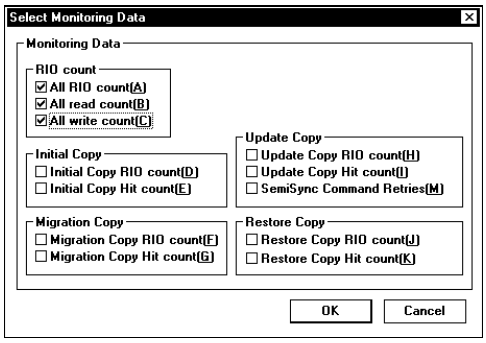
3. Selecting an object device
   When the valid logical device list is displayed in the list box on the Select Logical Device screen, select a logical device and press (CL) the [OK] button. To display the information of the whole subsystem, select "Sub System".



Copyright ©1998, Hitachi, Ltd.

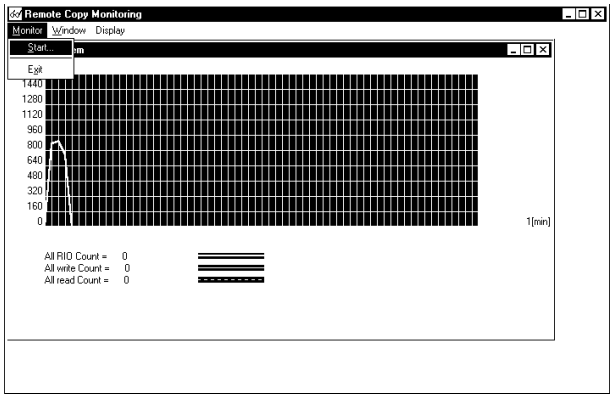
4. Selecting information desired to be acquired

Select one or more data items on the Select Monitoring Data screen, then press (CL) the [OK] button.



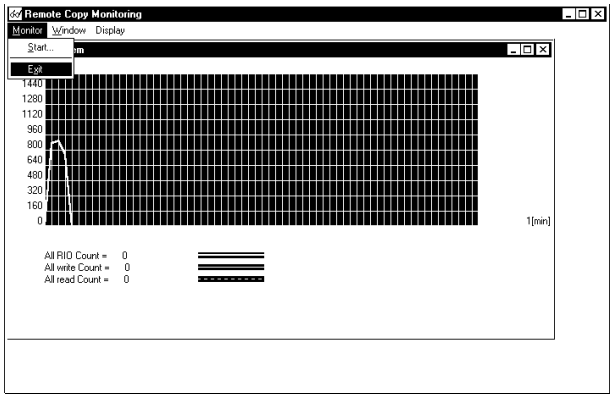
5. Displaying the operation information

The Operation Information Display window appears. To view operation information of other devices, select Monitor-Start from the menu and go to step 3. (Two or more (MAX. 15) screens can be displayed at a time.)



6. Terminating the operation information display

To terminate the operation information display, select Monitor-Exit to return to the HORC screen.



Copyright ©1998, Hitachi, Ltd.

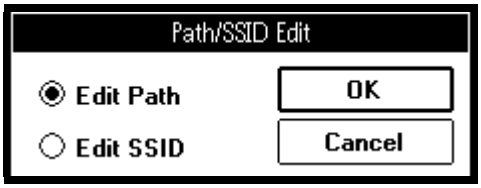
2.28.11 Adding the SSID(s) to the RCU

This operation adds the SSID(s) to the RCU already registered. The operation can be performed from both the MCU and the RCU.

1. Selecting an RCU
   Display the HORC screen and select (CL) an RCU from RCU List which is desired to be increased SSIDs. (Only one RCU can be selected here.)

2. Selecting a function
   Select (CL) the [Edit Path SSID...] button on the HORC screen.
   The Path/SSID Edit screen will appear.

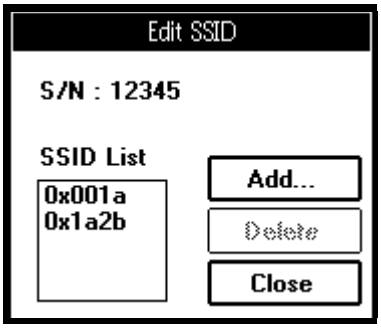
   Select (CL) the [Edit SSID] radio button then press (CL) the [OK] button on the screen.



3. Confirming the number of SSID(s)
   The Edit SSID screen will appear.

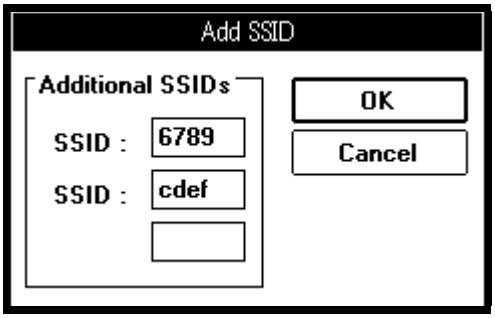
   Press (CL) [Add] button on the screen.
   (See the figure.)

   Note: If 4 SSIDs are registered on the RCU, you can not add a SSID further. ([Add...] button will be not active.)



4. Adding the SSID(s) to the RCU
   The Add SSID screen will appear.

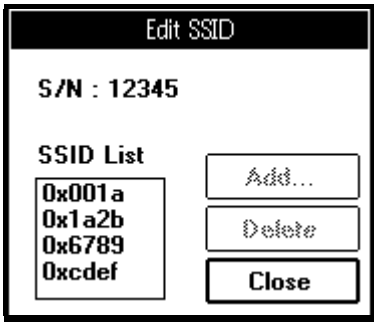
   Input 4-digit hexadecimal SSID(s) number in SSID, then press (CL) [OK] button.



Copyright ©1998, Hitachi, Ltd.

5. Verifying the SSIDs added

Make sure on the Edit SSID screen that the specified SSIDs have been added correctly.



Copyright ©1998, Hitachi, Ltd.

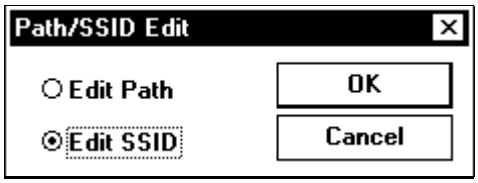
2.28.12 Reducing the SSID(s) from the RCU

This operation reduces the SSID(s) from the RCU already registered.

1. Selecting an RCU
   Display the HRC (HODM) screen and select (CL) an RCU from RCU List which is desired to be reduced SSIDs. (Only one RCU can be selected here.)

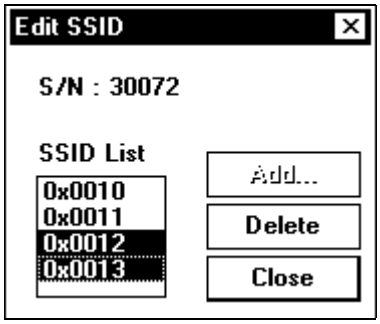
2. Selecting a function
   Select (CL) the [Edit Path SSID...] button on the HORC screen.
   The Path/SSID Edit screen will appear.

   Select (CL) the [Edit SSID] radio button then press (CL) the [OK] button on the screen.

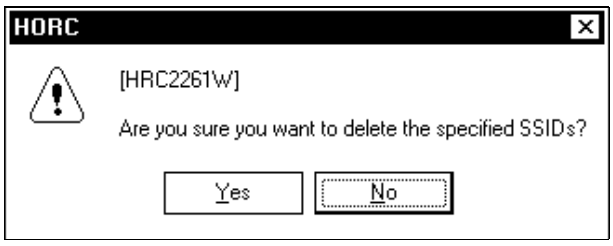


3. Selecting SSID(s) to be deleted
   The Edit SSID screen will appear.

   Select SSIDs desired to be deleted from the SSID List displayed on the Edit SSID screen and press (CL) [Delete] button (See the figure).



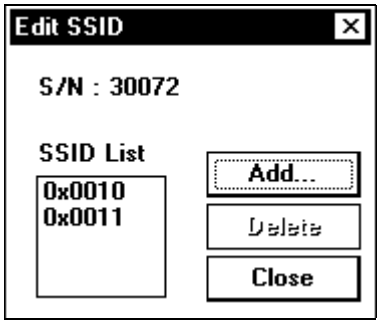
4. Confirmation message
   When the confirmation message appears, confirm the SSIDs to be deleted and press (CL) the [Yes] button.



Copyright ©1998, Hitachi, Ltd.

5. Verifying the SSIDs deleted

Make sure on the Edit SSID screen that the specified SSIDs have been deleted correctly.



Copyright ©1998, Hitachi, Ltd.

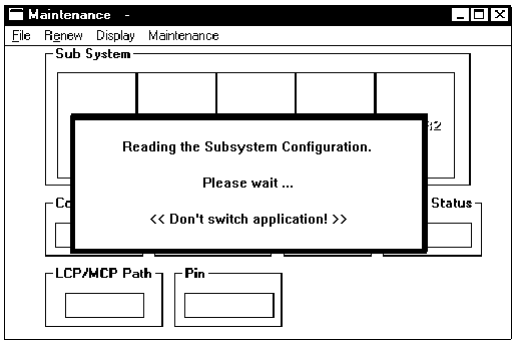
3 Activating and Terminating STATUS

3.1 Activating STATUS

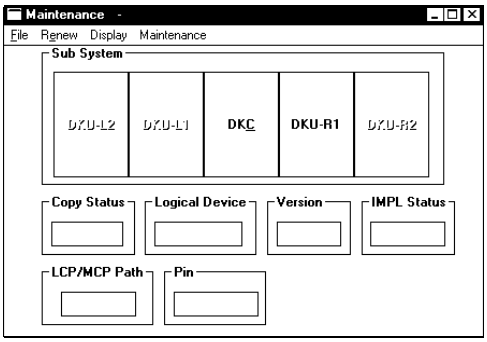
(1) Select (CL) the [Maintenance] in the 'SVP' window.

(2) The 'Maintenance' window will appear, on which the message "Reading the Subsystem Configuration. Please wait..." is displayed. Upon completion of reading the system configuration information, go to step (3). If a read error occurs, go to step (4) or (5).

* Please do not change an application's window until SVP-DKC communication finish.

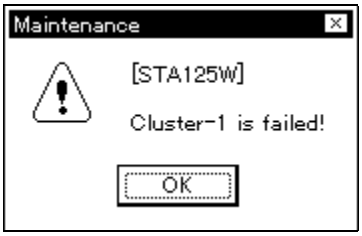


(3) The main screen shown on the right will appear on the 'Maintenance' window, completing activation of STATUS.



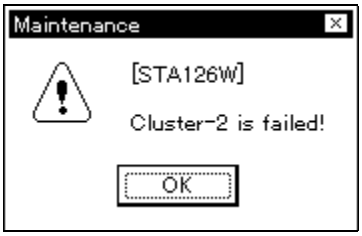
Copyright ©1998, Hitachi, Ltd.

(4) If an error occurs, the nature of error is displayed.
"Cluster X is failed!"
X : 1 or 2
Select (CL) [OK].

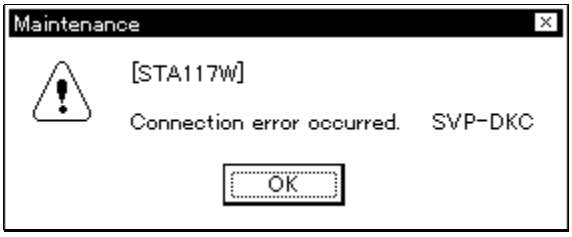


If status of power supplies is failure (refer to step SVP03-20), see TROUBLE SHOOTING SECTION (refer to step 3.2.7 (TRBL03-80)).

If status of power supplies is normal (refer to step SVP03-20), see SVP SECTION (refer to step 2.19 (SVP02-890)).

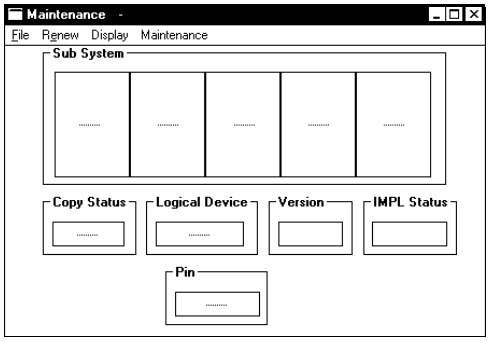


(5) If an error occurs, the nature of the error is displayed.
① "Connection error occurred. SVP-XXX" is displayed.
XXX : DKC or SSVP
② "Initializing SSVP (Phase X/16) Please Wait"
X : 1~16
③ "SSVP Dump is being performed (Phase X/15). Environment Status Can't be read."
X : 1~15
Select (CL) [OK].



(6) The similar screen as in step (3) will appear, but the buttons are indicated by "-----" to indicate an error. Terminate STATUS and remove the cause of the error. Then reactivate STATUS.

Note :When a communication error has occurred on either the SVP-DKC or the SVP-SSVP, the status that was taken through communication is displayed.
The example on the right is the screen displayed when a SVP-DKC and a SVP-SSVP communication error occurs.

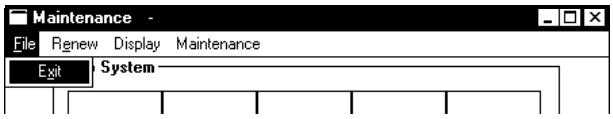


* When a communication error has occurred on either SVP-DKC or SVP-SSVP, refer to the "5.3 Recovery Procedure for LAN Error (TRBL05-70)".

Copyright ©1998, Hitachi, Ltd.

3.2 Terminating STATUS

(1) Close the ‘Maintenance’ window.
Select (CL) [File] - [Exit] in menu bar on ‘Maintenance’. (Screen on the right.)
or
Select (DC) Control Box at the left on the title bar.
or
Select (CL) Control Box - [Close].



Copyright ©1998, Hitachi, Ltd.

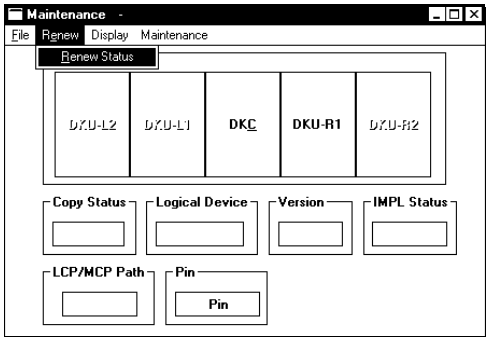
3.3 Updating the STATUS display

The STATUS display remains unchanged while the screen is displayed or being switched.
To display the latest status, follow the procedure below.

(1) Select (CL) [Renew] - [Renew Status] in the menu bar on the main screen. (Screen on the right)

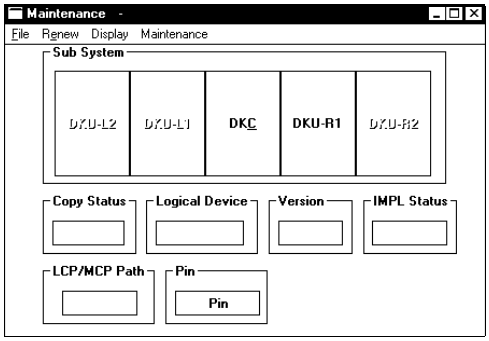
or

(2) Terminate STATUS and activate it again.



3.4 Main screen

After STATUS is activated, the buttons on the 'Maintenance' window indicate each status as follows.



DKC ..... Status of the DKC (Details are displayed on the lower layered screen.)
- Valid button : Normal
- Blinking button : Failure or under maintenance

DKU-R1,R2,L1,L2 ..... Status of the DKU (Details are displayed on the lower layered screen.)
- Valid button : Normal
- Blinking button : Failure or under maintenance or during a copy operation
- Invalid button : Non-mounted

Copy Status ..... Status of copy work
- Blinking "Copy" in the button : Copy work is in progress. (Details are displayed on the lower layered screen.)
- No display in the button : Copy work is not performed. (The lower layered screen is not provided.)

Logical Device .. Logical device information is displayed on the lower layered screen.

Version ..... Version information on the micro-program is displayed on the lower layered screen.

LCP/MCP Path . LCP/MCP Path information is displayed on the lower layered screen.

SCSI Path ..... SCSI Path definition is displayed.

Pin ..... Pinned Track is displayed.

IMPL Status ..... IMPL Sequence codes each MP are displayed.

The menus in the menu bar are explained below.

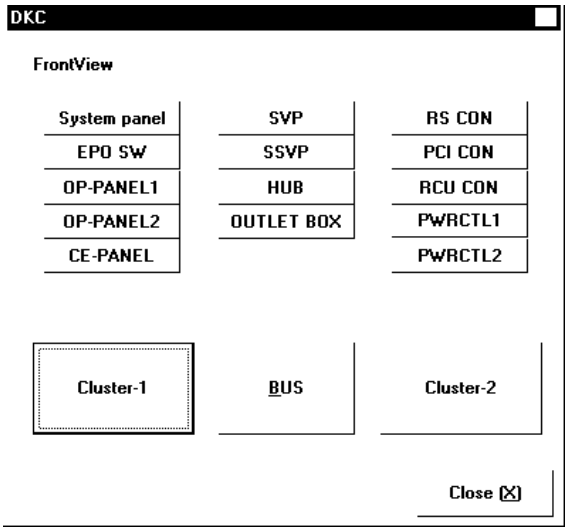
Renew ..... The configuration information is read. The status display is updated.(Select (CL) [Renew] - [Renew Status].)

File ..... The pull-down menu to terminate STATUS appears.
Selecting (CL) [Exit] terminates STATUS.

Copyright ©1998, Hitachi, Ltd.

3.5 DKC

(1) Status of DKC
Select (CL) [DKC] on the main screen.
The 'DKC' window will appear.



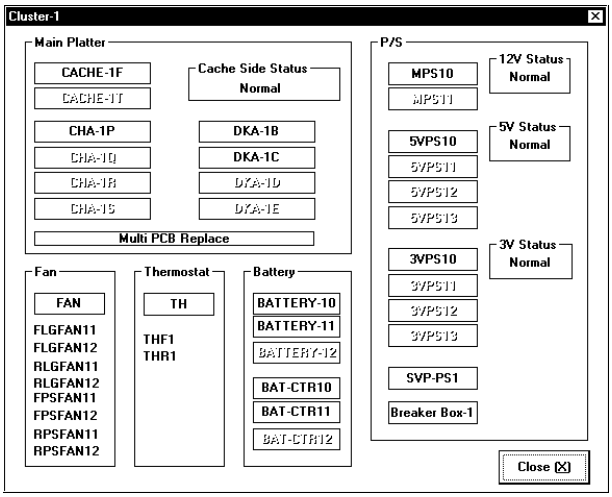
PWRCTL 1 ---- Status of PWRCTL1 and
PWRCTL 2 PWRCTL2
Valid button : Normal
Blinking button : Failure

Cluster-1 ------- Status of Cluster-1 and Cluster-2 and BUS (Details are
Cluster-2 displayed on the lower layered screen.)
BUS Valid button : Normal
Blinking button : Failure or under maintenance
" ---- "button : No information due to SVP-DKC error

System panel -- Only parts names are displayed.
EPO SW
OP-PANEL 1
OP-PANEL 2
CE-PANEL
SVP
SSVP
HUB
OUTLET BOX
RS CON
PCI CON
RCU CON

Copyright ©1998, Hitachi, Ltd.

(2) Status of Cluster-1 and 2
Select (CL) [Cluster-1] or [Cluster-2] in the 'DKC' window.
The 'Cluster-1/2' window will appear.



3VPSn0 --- Status of the power supplies
5VPSn0 Valid button : Normal
3VPSn1 Blinking button : Failure
5VPSn1
3VPSn2
5VPSn2
3VPSn3
5VPSn3
MPSn0
MPSn1
SVP-PSn
Breaker Box-n--- Only Breaker Box names are displayed.
12V Status ------ Status of the 12 voltage
5V Status -------- Status of the 5 voltage
3V Status -------- Status of the 3 voltage
• Normal
• Warning (abnormal)
FLGFANn1 --- Status of the fans
FLGFANn2 Valid button : Normal
RLGFANn1 Blinking button : Failure
RLGFANn2
FPSFANn1
FPSFANn2
RPSFANn1
RPSFANn2
THFn ---------- Status of the temperature
THRn Valid button : Normal
Blinking button: Abnormal
BATTERY-n0--- Status of the expanded power supplies
BATTERY-n1 Valid button : Normal
BATTERY-n2 Blinking button: Abnormal
BAT-CTR-n0
BAT-CTR-n1
BAT-CTR-n2
Cache Side Status ---- Status of the Cache Side
• Normal
• Warning (abnormal)
CACHE-nx --- Status of Cache (Details are displayed on the lower layered screen.)
Valid button : Normal
Blinking button: Failure or under maintenance
Invalid button : Non-mounted

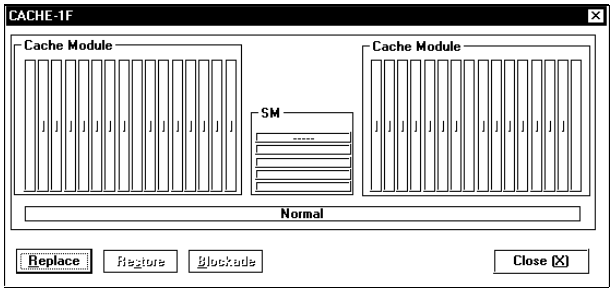
Copyright ©1998, Hitachi, Ltd.

CHA-nx -------- Status of the CHA (Details are displayed on the lower layered screen.)
Valid button : Normal
Blinking button: Abnormal
Invalid button : Non-mounted
DKA-nx -------- Status of the DKA (Details are displayed on the lower layered screen.)
Valid button : Normal
Blinking button: Abnormal
Invalid button : Non-mounted

The number n is 1 for cluster 1 or 2 for cluster 2.

(3) Status of each PCB (Cache)
Select (CL) one of [Cache-nxx/nx] in the 'Cluster-1/2' window.

The window for the selected PCB will appear.
The same configuration is used for all PCBs.

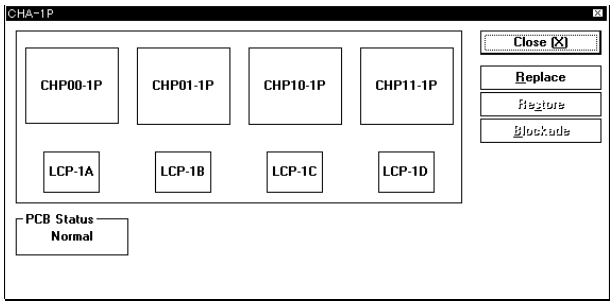


Cache Module - Status of the cache memory module (Displayed for each module group)
Valid button : Normal
Blinking '*' in the button : Failure
'¦' displayed in the button : Non-mounted
SM ---------- Status of the shared memory module
Valid button : Normal
Blinking '*' in the button : Failure or under maintenance
'--' displayed in the button : Non-mounted
PCB Status ----- Status of this package
Valid button : Normal
Blinking button : Warning (abnormal)
: Blocked (blocked for maintenance)
: Failed (blocked due to a failure)
: Cache Access Error (PCB blocked and CMG normal)

Copyright ©1998, Hitachi, Ltd.

(4) Status of the CHA

Select (CL) one of [CHA-nx] in the 'Cluster-1/2' window. The 'CHA' window will appear. The CHA part location number is displayed in the title.



CHPX-XX Status of program CHP in the CHA
- Valid button : Normal
- Blinking button : Failure

LCPXX ---- Status of program LCP or MCP
MCPXX in the LCM
- Valid button : Normal
- Blinking button : Failure
- Invalid button : Non-mounted

PCB Status Status of the CHA package
- Normal
- Warning (abnormal)
- Blocked (blocked for maintenance)
- Failed (blocked due to a failure)

SCP XX --- Status of processor SCP
- Valid button : Normal
- Blinking button : Failed or Blocked (status displayed under SCP button)
- Invalid button : Non-mounted

FCP XX --- Status of processor FCP
- Valid button : Normal
- Blinking button : Failed or Blocked (status displayed under FCP button)
- Invalid button : Non-mounted

PERFORMANCE FIBRE ------ High performance type of FIBRE package.

FOP XX --- Status of processor FOP
- Valid button : Normal
- Blinking button : Failed or Blocked (status displayed under FOP button)
- Invalid button : Non-mounted

Copyright ©1998,1999, Hitachi, Ltd.

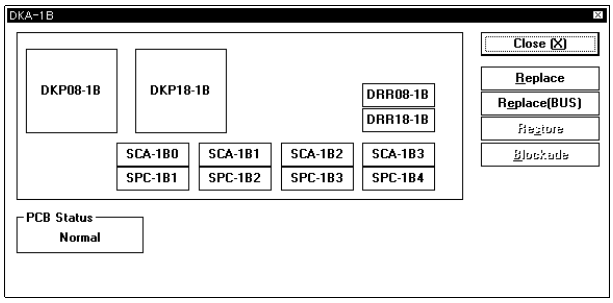
(5) Status of the DKA

Select (CL) one of [DKA-nx] in the 'Cluster-1/2' window. The 'DKA' window will appear.

DKPX-XX Status of programs DMP and DSP in the DKA

Valid button : Normal

Blinking button : Failure or under maintenance



SCA-XXX Status of the SCA (No. 0 ~ 3)

SPC-XXX - Status of the SPC (No. 1 ~ 4)

PCB Status Status of the DKA package

- Normal
- Warning (abnormal)
- Blocked (blocked for maintenance)
- Failed (blocked due to a failure)

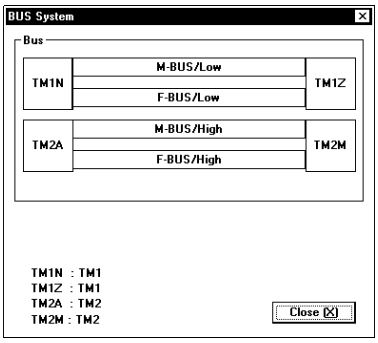
DRR-XX -- Status of DRR

Valid button : Normal

Blinking button : Failure

Copyright ©1998, Hitachi, Ltd.

(6) Status of the BUS in the DKC
Select (CL) [BUS] in the 'DKC' window.
The status of each bus will be displayed.



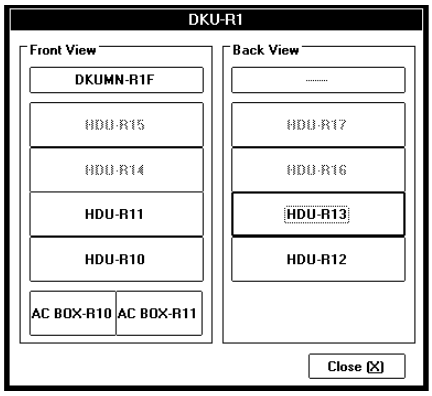
F-BUS/Low --- Status of the F-BUS and M-BUS
F-BUS/High Valid button : Normal
M-BUS/Low Blinking button: Failure or under maintenance
M-BUS/High
TM1N ---------- Terminator (Only terminator names are
TM1Z displayed.)
TM2A
TM2M

Copyright ©1998, Hitachi, Ltd.

3.6 DKU

(1) Status of the DKU

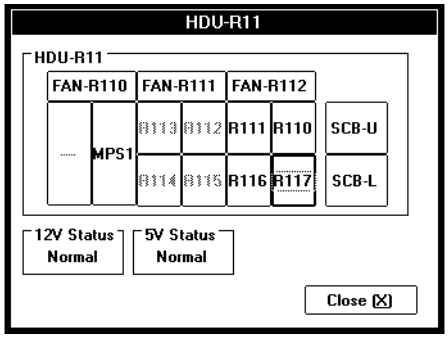
Select (CL) [DKU-R1] , [DKU-R2] , [DKU-L1] , or [DKU-L2] in the main screen.
The 'DKU' window will appear.
The DKU part location number is displayed in the title.



HDU-XX0 Status of the HDUs constituting the selected DKU
HDU-XX1 (Details are displayed on the lower layered screen.)
HDU-XX2 Valid button : Normal
HDU-XX3 Blinking button: Failure or under
HDU-XX4 maintenance or copy work in progress
HDU-XX5 Invalid button : Non-mounted
HDU-XX6
HDU-XX7
DKUMN-XXF - Status of DKU monitor
DKUMN-XXR Valid button : Normal
Blinking button : Failure
AC BOX-Rnn --- Only AC BOX names are displayed.
XX represents XX in DKU-XX: for example, R1 for DKU-R1 and L2 for DKU-L2.

(2) Status of the HDU

Select (CL) one of [HDU-XX0] to [HDU-XX7] in the 'DKU' window. The 'HDU' window will appear.



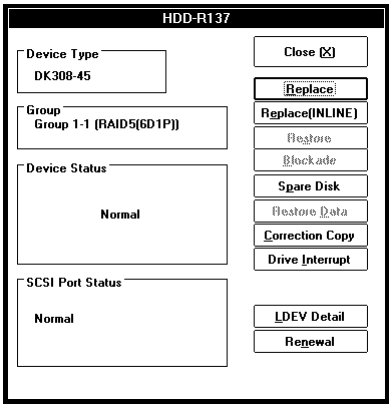
YYY0 -------- Status of the HDDs constituting the HDU
YYY1 (Details are displayed on the lower layer
YYY2 screen.)
YYY3 Valid button : Normal
YYY4 Blinking button : PDEV error, failure, or
YYY5 under maintenance
YYY6 Blocked port Copy work in progress
YYY7 Invalid button : Non-mounted
" ---- "button : No information due to SVP-DKC error
MPS0 -------- Status of the HDU power supplies
MPS1 Valid button : Normal
Blinking button : Failure
" ---- "button : No information due to SVP-SSVP error
FAN-YYY0 - Status of the fans in the HDU
FAN-YYY1 Valid button : Normal
FAN-YYY2 Blinking button : Failure
" ---- "button : No information due to SVP-SSVP error

Copyright ©1998, Hitachi, Ltd.

SCB-U-------- Only SCSI Buffer names are displayed.
SCB-L " ---- "button : No information due to SVP-SSVP error
12V Status -- Status of the 12 voltage
5V Status ---- Status of the 5 voltage
- Normal
- Warning (abnormal)

YYY represents YYY in HDU-YYY: when HDU-R12 is selected, for example, YYY is R12.

(3) Status of the HDD
Select (CL) one of [YYY0] to [YYY7] in the 'HDU' window.
The 'HDD' window will appear.
The HDD part location number is displayed in the title.



Device Type --- Model name of the HDD
Group ---------- Number of the parity group to which the HDD belongs
LDEV Detail --- The involved logical devices are listed.
Device Status -- The status of the HDD and the work name are displayed.
- Normal
- Correction Copy (xx%)
- Copy Back (xx%)
- Drive Copy (xx%)
- Dynamic Sparing (xx%)
- Blocked (blocked for maintenance)
- Failed (blocked due to failure)
- Warning (Either SCSI port is blocked.)
- Failed (Both SCSI ports are blocked.)
- Free (available spare disk.)
- Reserved (not available spare disk. The spare disk is reserved.)

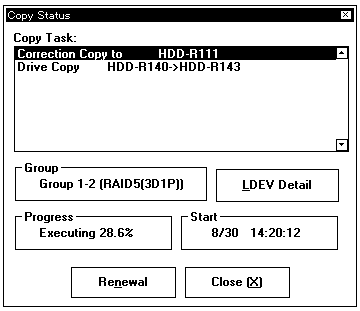
During a copy operation, copy destination/copy source is displayed.
- to HDD-xx : Data is copied form this drive to HDD-xx.
- from HDD-xx : Data is copied from HDD-xx to this drive.

SCSI Port Status -- SCSI port status
- Normal
- Warning (Port 0 failed): port 0 is blocked.
- Warning (Port 1 failed): port 1 is blocked.
- Failed: Both ports are blocked.

Copyright ©1998, Hitachi, Ltd.

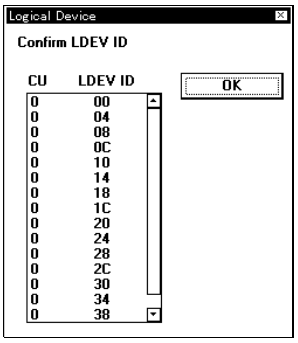
3.7 Copy status

(1) Select (CL) [Copy Status] in the main screen.
The 'Copy Status' window will appear.



Copy Task - The operations of the drive copy currently running are listed.
- Correction Copy to HDD-XXXX
- Dynamic Sparing HDD-XXXX->HDD-XXXX
- Copy Back HDD-XXXX->HDD-XXXX
- Drive Copy HDD-XXXX->HDD-XXXX

Group ------ Number of the parity group to which the target drive belongs.
Start -------- Date and time when the job started
Progress --- Degree of job progress (indicated in percent)

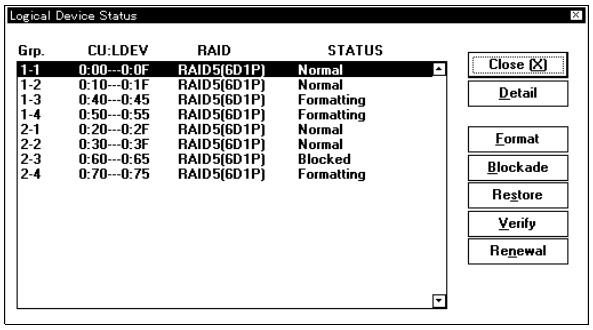


Select (CL) one job item from the list. And select (CL) [LDEV Detail] in the 'Copy Status' screen. The following information concerning the selected LDEV ID will be displayed:

CU ---------- CU ID
LDEV ID -- Logical Device ID

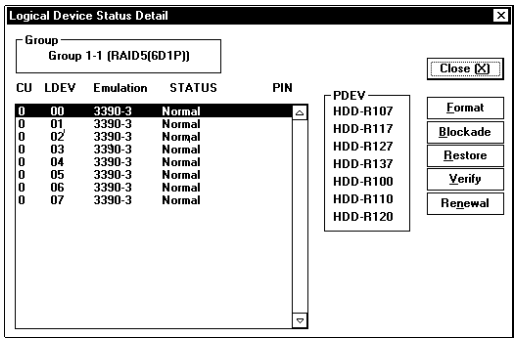
3.8 Logical device

(1) Select (CL) [Logical Device] in the main screen.
The 'Logical Device Status' window will appear.



Grp---------- Grp ID
CU:LDEV - List of the mounted logical devices
RAID ------- RAID Level
Status ------- Status of the logical device

Select (CL) a logical device from the list. And select (CL) [Detail] in the 'logical device status' screen. The following information concerning the selected logical device will be displayed:



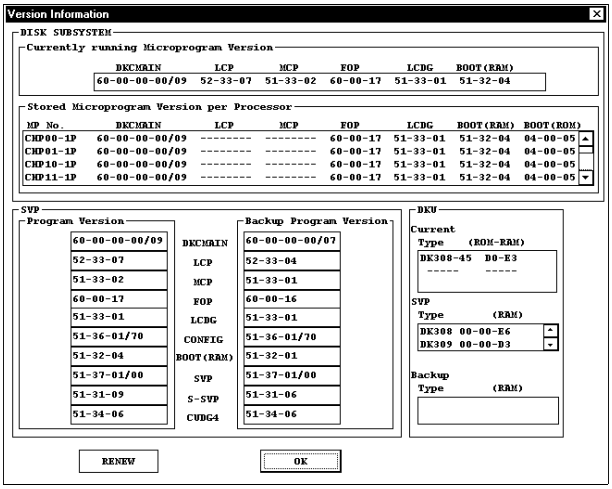
Parity Group --- Parity group to which the Logical Device belongs
PDEV---------- Number of the HDD including the Logical Device
PIN---------- If an Ldev has PIN, SVP will indicate the PIN status as '*'.
- '*' : PIN occurred.
- ' ' : Normal (not occurred).

Copyright ©1998, Hitachi, Ltd.

3.9 Micro-program version

Select (CL) [Version] from the main screen.
The message indicating that the version data of the micro-program currently running is being read is displayed, followed by the message indicating that the version data of the disk drive is read. Finally, the message indicating that the version data of the micro-program in the processor is being read is displayed.
Then, the 'Version Information' dialog box is displayed.

* Please do not change an application's window until SVP-DKC communication finish.



DISK SUBSYSTEM area : Displays the version of the currently running micro-program.
- Representative version
- Version of each processor

SVP area : Displays the version of the micro-program saved in the SVP.
- Latest version in the SVP
- Old version in the SVP

DKU area
- Drive version

In the version display areas, a hyphen "-" indicates that micro-program is not installed.
In the version display areas, a question mark "?" indicates that version data could not be obtained while the letter "x" indicates that the obtained data is invalid.

If the version of the PCB which has already been installed is displayed as "x", please exchange the micro-code corresponding to "x" by micro FC (refer to MICRO-FC SECTION 4.4 Hard Disk Download (MICRO-FC04-140)).

Copyright ©1998,1999, Hitachi, Ltd.

To obtain new version data, select (CL) [RENEW]. The contents of the display will be updated accordingly.

To quit the version display, select (CL) [OK]. This will take you back to the main screen.

Copyright ©1998, Hitachi, Ltd.

[1] DISK SUBSYSTEM area

DISK SUBSYSTEM

Currently running Microprogram Version

DKCMAIN	LCP	MCP	FOP	LCDG	BOOT(RAM)
60-00-00-00/09	52-33-07	51-33-02	60-00-17	51-33-01	51-32-04

Stored Microprogram Version per Processor

MP No.	DKCMAIN	LCP	MCP	FOP	LCDG	BOOT(RAM)	BOOT(ROM)
CHP00-1P	60-00-00-00/09	--------	--------	60-00-17	51-33-01	51-32-04	04-00-05
CHP01-1P	60-00-00-00/09	--------	--------	60-00-17	51-33-01	51-32-04	04-00-05

CHP11-1P	60-00-00-00/09	--------	--------	60-00-17	51-33-01	51-32-04	04-00-05

(1) Representative version and version for each processor
The Currently running Micro-program Version area displays the representative version of micro-program currently running.
The Stored Micro-program Version per Processor area displays the version of the currently running micro-program for each processor.
A micro-program is divided into seven items: MAIN, LCP, MCP, FOP, LCDG, BOOT (RAM), BOOT (ROM). The version of MAIN is displayed in the form of VV-RR-NN-PP/nn. The other versions are displayed in the form of VV-RR-NN.

The representative version may be displayed in reverse video. This display indicates that there is a processor version that does not match the representative version. The processor displayed in reverse video in the Stored Micro-program Version per Processor area is the one that caused a mismatch. An asterisk "*" in front of a version number indicates the mismatching item in the mismatching processor.

DISK SUBSYSTEM

Currently running Microprogram Version

DKCMAIN	LCP	MCP	FOP	LCDG	BOOT(RAM)
60-00-00-00/09	52-33-07	51-33-02	60-00-17	51-33-01	51-32-04

Stored Microprogram Version per Processor

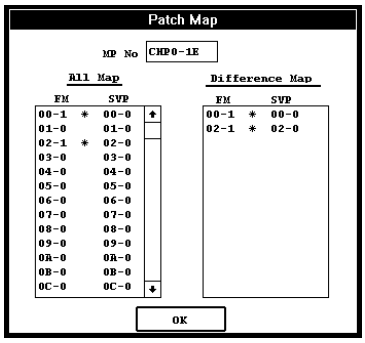
(2) Patch status display

Select the (DC) one line from the list in the Stored Micro-program Version per Processor area on the 'Version Information' dialog box.
'Patch Map' dialog box will be displayed, showing the patch status for the target processor.

MP No ---------- Processor ID
All Map ---------- List of all maps. All maps in the FM and SVP are displayed. When a match is not found between a map in the FM and the corresponding map in the SVP, an asterisk "*" is displayed between them.
Difference Map -- Only the maps which do not provide a match between the FM and SVP in All Map.



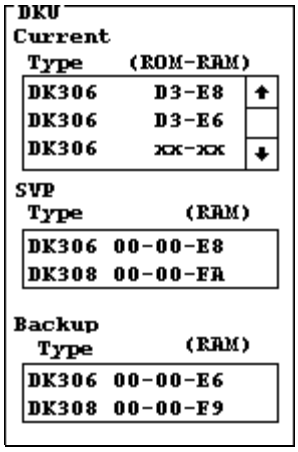
The example on the right shows that, in processor CHP0-1E, the contents for patch ID numbers 00 and 02 are contained in the flash memory (FM) but not in the SVP.

To quit the patch status map display, select (CL) [OK].

(3) Drive version

The DKU area on the 'Version Information' dialog box lists drive versions as ROM Version-RAM Version.

Type : Types of drives currently running (DKxxx).
Current : Version of micro-program currently running.
SVP : New version of micro-program stored in SVP hard disk. (00-00-RAM Version)
Backup : Old version of micro-program stored in SVP hard disk. (00-00-RAM Version)

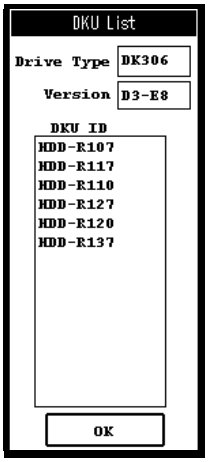


(4) Drive name display

Select (DC) one line from the list in the DKU area on the 'Version Information' dialog box. The 'DKU List' dialog box will be displayed, in which the drive identified by the version are listed.

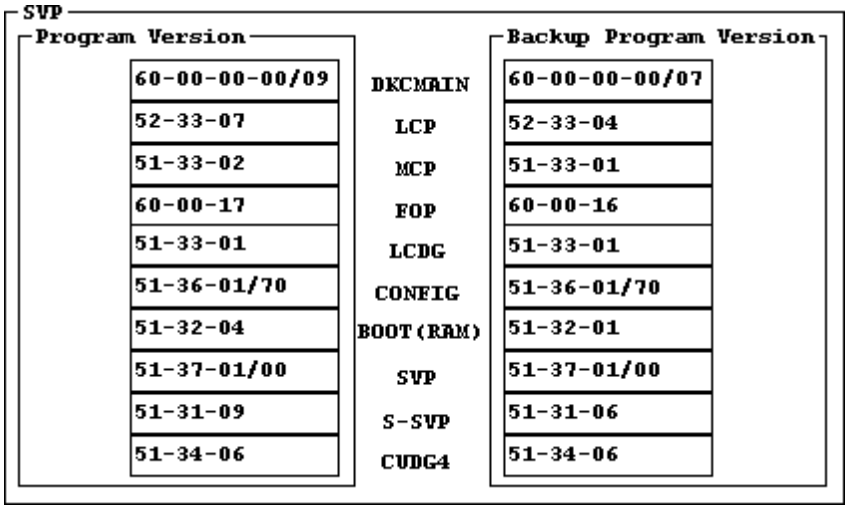
Drive Type - Types of drives identified by the selected version.
Version ----- Selected version
DKU ID ---- List of IDs of the drives identified by the selected version.

To quit 'Drive List', select (CL) [OK].



Copyright ©1998, Hitachi, Ltd.

[2] SVP area



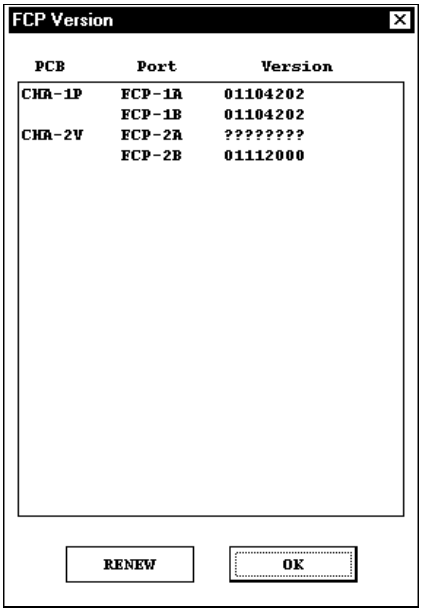
This area displays the versions of two generations (previous and most recent) of micro-programs saved on the SVP hard disk. Each micro-program is divided into ten items: MAIN, LCP, MCP, FOP, LCDG, CONFIG, BOOT (RAM), SVP, S-SVP, and CUDG4. The version of MAIN is displayed in the form of VV-RR-NN-PP/nn while that of SVP, CONFIG is displayed in the form of VV-RR-NN/nn. The other versions are displayed in the form of VV-RR-NN.

Program Version ---------- The latest version is displayed.
Backup Program Version ----- The old version is displayed.

[3] FCP Version

Select (CL) [FCP Version...] in the 'Version Information'.

To obtain new FCP version data, select (CL) [RENEW].
The contents of the display will be updated accordingly.
To quit the version display, select (CL) [OK].
This will take you back to the 'Version Information'.

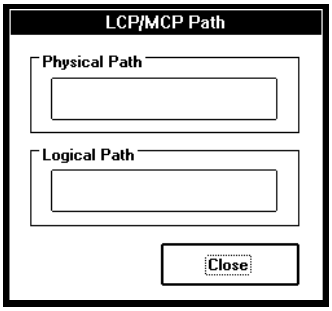


Copyright ©1998,1999, Hitachi, Ltd.

3.10 LCP/MCP Path

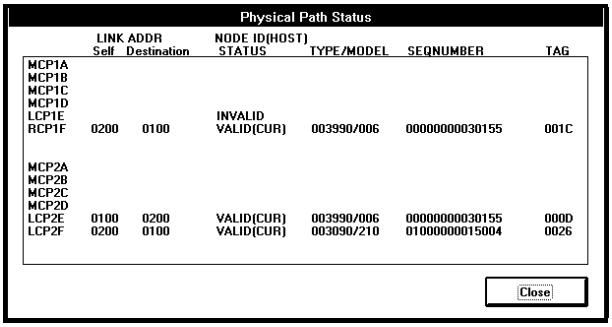
Select (CL) [LCP/MCP Path] from the main screen.
The message shown on the right is displayed while the SVP is reading path information from the DKC.

Upon completion of reading the path information, the LCP/MCP Path screen is displayed for selecting the physical or logical path.



* Please do not change window until SVP-DKC communication finish.

(1) Physical Path
Select (CL) [Physical Path] in the screen.
The 'Physical Path Status' window will appear.

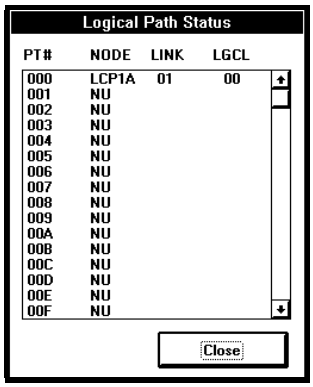


LCPxx/RCPxx/MCPxx -- LCP/RCP/MCP mount position
LINK ADDR
Self ---------- LCP/RCP/MCP link address
Destination --------- Connection destination (host) link address
NODE ID (HOST)
STATUS ---------- Node ID obtainment status
TYPE/MODEL --- Connection destination type/model name
SEQNUMBER ---- Connection destination production number
TAG ---------- Connection destination tag

To exit the display, press [Close].

---

(2) Logical Path
Select (CL) [Logical Path] in the screen.
The 'Logical Path Status' window will appear.



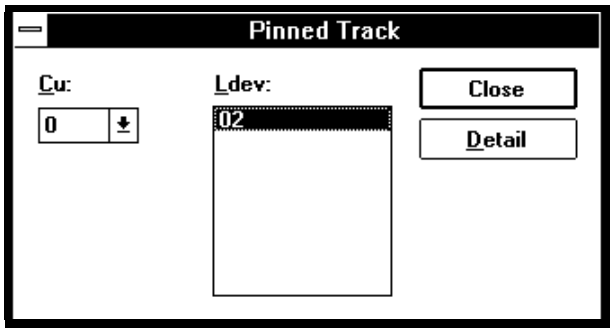
PT# ----------Path number
NODE -------LCPxx : LCP to which the logical path is allocated
RCPxx : RCP to which the logical path is allocated.
CLSW : Metal channel
NU : Unused logical path
LINK --------Link address of the connected host
"NA" is displayed when the metal channel is specified.
LGCL--------Logical address of the connected host
A blank is displayed when the metal channel is specified.

Copyright ©1998, Hitachi, Ltd.

Since data can be displayed only in 16 rows within a screen, use the scroll bar to display data not included in the screen.
To exit the display, press (CL) [Close].

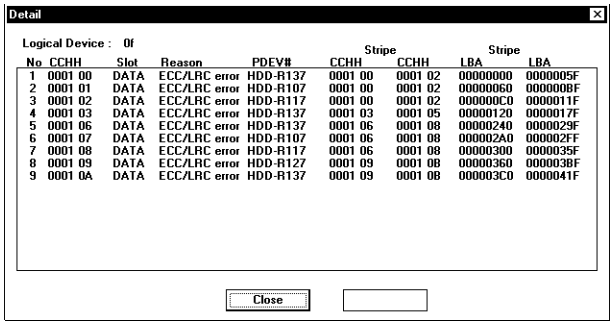
3.11 Pin

(1) Select (CL) [Pin] in the main screen.
The 'Pinnec Track' windows will appear.



CU ---------- CU ID
Ldev -------- Logical device number which PIN exists.

Select (CL) a Ldev from the list. And select (CL) [Detail] in the 'Pinned Track' screen. The following information concerning the selected Ldev will be displayed.



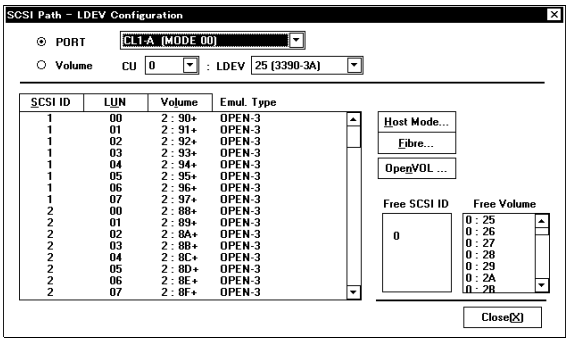
CCHH ------ Number of cylinder and head which PIN exist.
Slot---------- Kind of Track which PIN exists.
DATA : DATA Track
PRTY : Parity Track
Reason------ Cause of Pin.
ELC/LRC error : see TRBL04-20
WRITE error : see TRBL04-30
PDEV# ----- HDD number which Logical device has PIN.
Stripe ------- The first and the last CCHH of parity stripes.
The first and the last LBA of parity stripes.

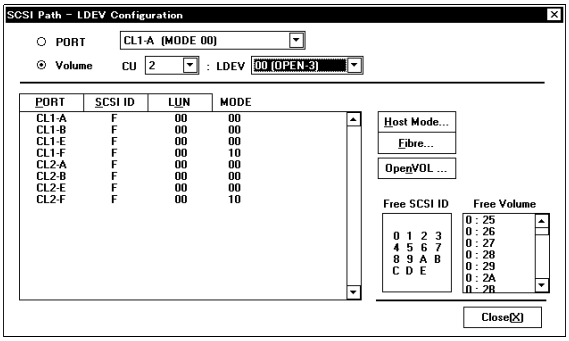
Copyright ©1998,1999, Hitachi, Ltd.

3.12 SCSI Path

(1) Status of SCSI Path

Select (CL) [SCSI Path] in the main screen.
The 'SCSI Path-LDEV Configuration' window will appear.

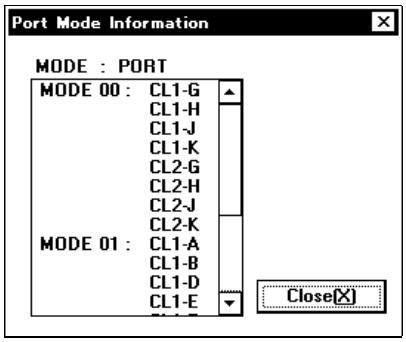




PORT list ---------- List of the ports installed CHSs and CHFs
CU:LDEV list -------- List of installed CU:LDEV IDs corresponding to OPEN-LDEV
PORT button --------- SCSI paths are sorted increasingly in port number.
SCSI ID button ------- SCSI paths are sorted increasingly in ID.
LUN button ---------- SCSI paths are sorted increasingly in LUN.
CU:LDEV button ---- SCSI paths are sorted increasingly CU:LDEV ID.
SCSI Path list--------- List of defined SCSI paths.
The string '[for Cmd. Dev.]' denotes 'Command Device'.
Free SCSI ID area --- Unused SCSI IDs
Free LDEV ID list --- Unused CU:LDEV IDs
Host Mode button --- 'Port Mode Information' window will appear.
Fibre button---------- 'Fibre Information' window will appear.
Open VOL button---- 'LU Expansion Define' window will appear.

(2) Status of Port Mode

Select (CL) [Host Mode...] in the 'SCSI Path-LDEV Configuration' window.
The 'Port Mode Information' window will appear.



MODE:PORT list---- Displays mode of each port

CAUTION

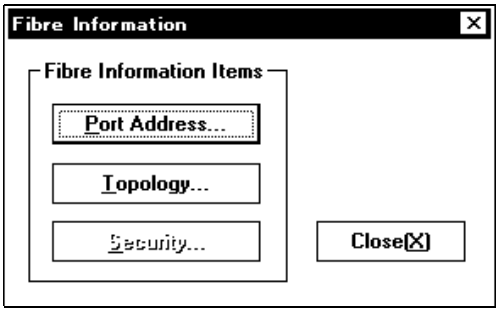
On the CHF, Host Mode must be set to "MODE 00".

Copyright ©1998, Hitachi, Ltd.

(3) Status of Fibre Port

Select (CL) [Fibre...] in the 'SCSI Path-LDEV Configuration' window.
The 'Fibre Information' window will appear.

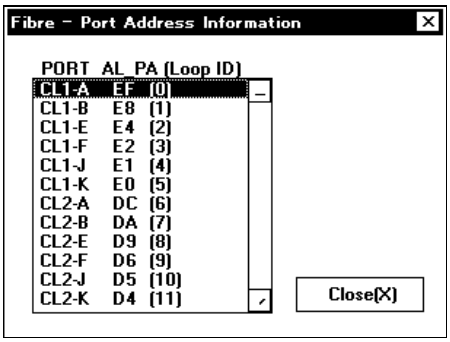
Port Address button - 'Fibre-Port Address Information' window will appear.
Topology button ----- 'Fibre-Topology Information' window will appear.



(3.1) Status of Port Address

Select (CL) [Port Address...] in the 'Fibre Information' window.
The 'Fibre-Port Address Information' window will appear.

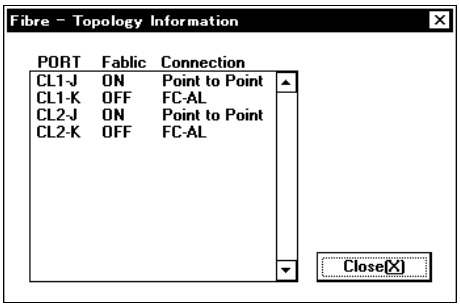
PORT Address list--- Displays address of each port



(3.2) Status of Topology

Select (CL) [Topology...] in the 'Fibre Information' window.
The 'Fibre-Topology Information' window will appear.

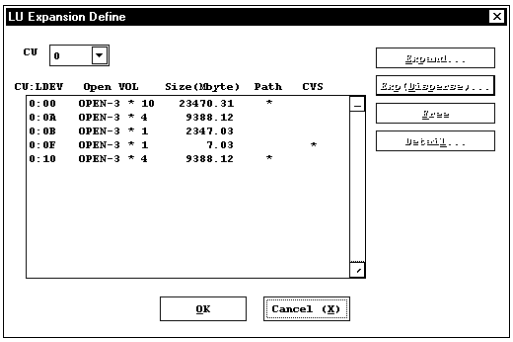
PORT Fablic Connection list
---------- Displays Fablic and connection type of each port.



Copyright ©1998,1999, Hitachi, Ltd.

(4) Status of Open VOL

Select (CL) [Open VOL...] button in 'SCSI Path-LDEV Configuration' window.
'LU Expansion Define' window is displayed.



Detail of the list

CU:LDEV : The list is displayed line by line in CU (The selection can be done on CU list).

OPEN VOL : The number of LDEVs connected sequentially together which formalize LU Expansion (Open VOL).
ex.) The first line on the right figure indicates that 10 LDEVs whose emulation type is OPEN-3 are connected together sequentially.

Size (Mbyte) : The capacity of Open VOL

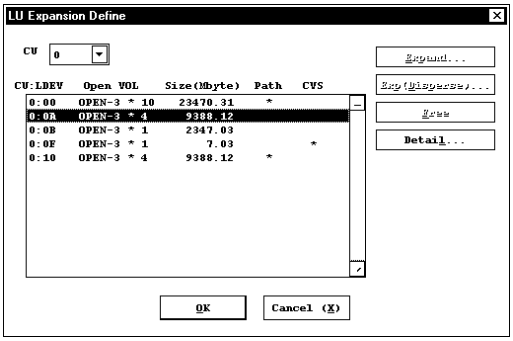
Path : The existence of SCSI path definition to the Open VOL
ex.) In the first line, '*' shows that CU:LDEV=0:00 has a SCSI path definition.

CVS : The existence of CVS definition to the Open VOL
ex.) In the fourth line '*' shows that CU:LDEV=0:0F has a CVS definition.

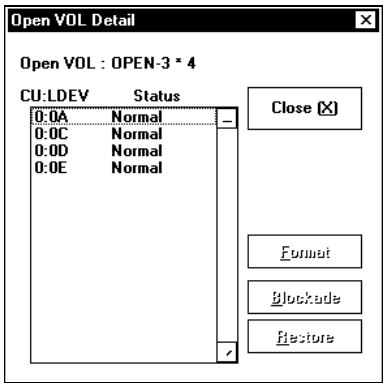
[Detail...] button : To display 'Open VOL Detail' window.

(4.1) Display detail information of Open VOL ('Open VOL Detail' window)

After the selection (CL) of LDEV at 'LU Expansion Define' window, select (CL) [Detail...] button.



'Open VOL Detail' window is displayed.



Detail of displayed information

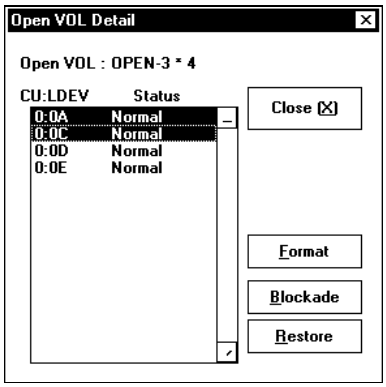
CU:LDEV : CU:LDEV# of LDEV compose Open VOL

Status : Status of CU:LDEV

Copyright ©1998,1999, Hitachi, Ltd.

After selection (CL) of CU:LDEV from the list, maintenance logical device.

[Format] button : Format logical device
[Blockade] button : Block logical device
[Restore] button : Restore logical device



Copyright ©1999, Hitachi, Ltd.

3.13 Error or Failure Status Action

When an error status of, Warning, Failed, or other is displayed on the screen and action is required, locate the part in error and follow the instructions sccording to the action code (ACC). The ACC can be obtained by executing the SSB log or SIM log displayed function of the SVP.

Notice

1. In case that DKU INLINE is unsuccessful, neither SSB log nor SIM log may be created. When HDD status button is flashing, please check DIAG log additionally.
2. When you execute the transfer of dump, log or the other data, please confirm that SVP does not work. When SVP is working, please stop the process or wait for the end of the process. Otherwise SVP may be hang up.
   When you cannot stop the process of SVP but you must transfer data urgently, please use the other SVP or PC. For your information, in case that “SVP working status” is going on for very long time, please inform the Technical Support Center of it.

Copyright ©1999,2000, Hitachi, Ltd.

Port Operation

Port.....Changes the port type between LCP and RCP.

When the MCU is connected to the RCU, the MCU side port type must be set to RCP.

Path Operation

Add RCU.....Establishes the path between the MCU and the RCU. When establishing the path, the MCU must register the object RCU first. This function registers the object RCU and establishes the path at a time. When the MCU registers the object RCU successfully, the RCU is added to the RCU list. (Up to 4 RCU units can be registered for one MCU.)

Edit Path/SSID ...Adds/reduces the number of paths or SSIDs to an RCU selected from the RCU list within a range of 1 to 4.

Delete RCU .....Deletes an RCU selected from the RCU list and the path(s) to the RCU at a time. Before executing this function, all the units paired with the RCU must be set to simplex status.

RCU Option .....Changes the option for connection to an RCU selected from the RCU list. The connection option can also be specified when the RCU is registered, but this function is used to change the option during operation.

RCU Status.....Displays the status of an RCU selected from the RCU list. This function can also display the status of each path to the RCU.

Pair Operation

(Note : All pair operations are disabled if the synchronous (Semi-synchronous) copy volume pair(s) and asynchronous copy volume pair(s) are selected at the same time.)

Pair Status .....Displays the status of a volume selected from the volume list. This function is disabled if two or more volumes are selected from the volume list.

Add Pair .....Creates the HRC pair(s) by making the simplex volume(s) selected from the volume list become the M-VOL(s). Before executing this function, the CU that includes the R-VOL(s) must be registered as the RCU(s). This function is disabled if the volume(s) selected include(s) the volume(s) in the status other than simplex.

Change Option ...Changes the pair option of the volume(s) selected from the volume list. The pair option can also be specified when the pair is created, but this function is used to change the option during the operation. This function is disabled if any volume(s) selected include(s) the simplex, suspending, deleting and remote volume(s).

Suspend Pair.....Suspends the pair(s) of the volume(s) selected from the volume list. This function is disabled if any volume(s) selected include(s) the simplex, suspend, suspending, and deleting volume(s).

Delete Pair.....Deletes the pair of the volume(s) selected from the volume list.

Copyright ©1998,1999, Hitachi, Ltd.

Resume Pair .....Resume the pair of the volume(s) (in the suspend status) selected from the volume list. This function is enabled if the selected volume(s) is(are) suspended M-VOL(s).

HODM Pair Operation

Add Pair .....Instructs the simplex volume(s) selected from the volume list to migrate data to volume(s). Before executing this function, the CU that includes source volume(s) must be registered as the RCU. This function is disabled if the selected volume(s) include(s) the volume(s) in the status other than simplex.

Suspend Pair.....Suspends the pair(s) of the volume(s) (not in the simplex status) selected from the volume list. This function is disabled if any volume(s) selected include(s) the simplex volume(s).

Delete Pair.....Deletes the pair of the volume(s) (not in the simplex status) selected from the volume list. This function is disabled if the volume(s) selected include(s) a simplex volume(s).

Resume Pair .....Resume the pair of the volume(s) (in the suspend status) selected from the volume list. This function is disabled if the volume(s) selected include(s) a simplex volume(s).

Erase R-VOL.....Instructs the volume(s) (waiting for data erasure) selected from the volume list to erase R-VOL data.

C/T Group Operation

C/T Group List ...X XXX XXXXX / XXX ...
① ② ③ ④ ⑤ ⑥
① C/T group# (0 ~ F)
② Type of own CU.
MCU: Own CU is MCU for the paired CU.
RCU: Own CU is RCU for the paired CU.
M&R: Own CU and the paired CU are the same.
③ S/N of the paired CU.
If “Used” is displayed, the paired CU is not exist.
④ Slash.
⑤ SSID of the paired CU.
⑥ If “...” is displayed, own CU have two or more paired CU.

Group Status.....Displays the status of a C/T group selected from C/T group list.

Add Group.....Assigns the C/T group selected from C/T group list. This function is disabled if the specified if the specified C/T group has already assigned.

Delete Group .....Releases the C/T group selected from C/T group list. This function is enabled if the CU type of the specified C/T group is “MCU” (Displayed “MCU” on the C/T group list).

Copyright ©2000, Hitachi, Ltd.

Group Option .....Changes the option parameters of the C/T group selected from C/T group list. This function is disabled if the CU type of the specified C/T group is “RCU” (Displayed “RCU” on the C/T group list). Also, the specified C/T group is not assigned, too.

Async Option Operation

Async Option.....Changes the option parameters of the asynchronous function

Other Functions

Usage.....Displays HRC/HODM operation control information.

Refresh. .....Updates information displayed on the screen. Information displayed on the screen is kept as is until this function is executed.

Script .....Executes HRC Script.

Exit.....Exits the operation screen.

"Simplex" : Simplex
"Copying" : Copying
"Suspend" : Suspend
"Complete" : Simplex (Waiting for Erasure)
"Erasing" : Simplex (Erasing in progress)
⑥ Serial Number/SSID Serial Number and SSID of destination Controller.
⑦ #LDEV..... LDEV address on the destination Controller.

Display Filter..... Display filter of the Volume List.
"Simplex" ~ "Complete".....LDEVs that were selected by check box are displayed.

Change CU#..... Specifies CU address (CU#) to display the RCU List and the Volume List concerned with the CU.

Copyright ©1998,1999, Hitachi, Ltd.

Port Operation

Port.....Changes the port type between LCP and RCP.

When the MCU is connected to the RCU, the MCU side port type must be set to RCP.

Path Operation

Add RCU.....Establishes the path between the MCU and the RCU. When establishing the path, the MCU must register the object RCU first. This function registers the object RCU and establishes the path at a time. When the MCU registers the object RCU successfully, the RCU is added to the RCU list. (Up to 4 RCU units can be registered for one MCU.)

Edit Path/SSID ...Adds/reduces the number of paths or SSIDs to an RCU selected from the RCU list within a range of 1 to 4.

Delete RCU .....Deletes an RCU selected from the RCU list and the path(s) to the RCU at a time. Before executing this function, all the units paired with the RCU must be set to simplex status.

RCU Option .....Changes the option for connection to an RCU selected from the RCU list. The connection option can also be specified when the RCU is registered, but this function is used to change the option during operation.

RCU Status.....Displays the status of an RCU selected from the RCU list. This function can also display the status of each path to the RCU.

Pair Operation

Pair Status .....Displays the status of a volume selected from the volume list. This function is disabled if two or more volumes are selected from the volume list.

Copyright ©1998, Hitachi, Ltd.

Add Pair .....Instructs the simplex volume(s) selected from the volume list to migrate data to volume(s). Before executing this function, the CU that includes source volume(s) must be registered as the RCU. This function is disabled if the selected volume(s) include(s) the volume(s) in the status other than simplex.

Suspend Pair.....Suspends the pair(s) of the volume(s) (not in the simplex status) selected from the volume list. This function is disabled if any volume(s) selected include(s) the simplex volume(s).

Delete Pair.....Deletes the pair of the volume(s) (not in the simplex status) selected from the volume list. This function is disabled if the volume(s) selected include(s) a simplex volume(s).

Resume Pair .....Resume the pair of the volume(s) (in the suspend status) selected from the volume list. This function is disabled if the volume(s) selected include(s) a simplex volume(s).

Erase R-VOL.....Instructs the volume(s) (waiting for data erasure) selected from the volume list to erase R-VOL data.

Other Functions

Usage.....Displays HODM operation control information.

Refresh. .....Updates information displayed on the screen. Information displayed on the screen is kept as is until this function is executed.

Script .....Executes HODM Script.

Exit.....Exits the operation screen.

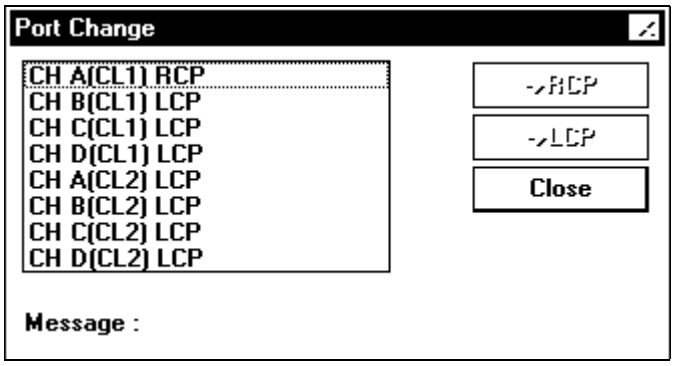
4.2 Port... screen



List ..... Displays the list of usable serial channels.
CH X[CL Y] XXX
① ② ③
① Channel ID (A to R)
② Cluster ID (1 or 2)
③ Channel type (LCP or RCP)

-> RCP ..... Changes the channel type selected from the list to the RCP.

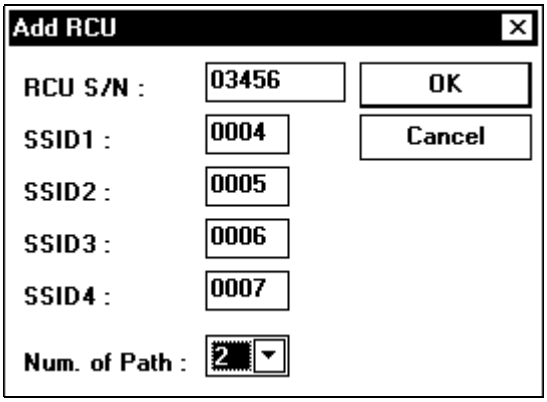
-> LCP..... Changes the channel type selected from the list to the LCP.

Message..... Displays the progress of each changing process when the Changing function is started.
Checking port# CH X[CL Y] ...
Blocking port# CH X[CL Y] ...
Setting port# CH X[CL Y] ...
Restoring port# CH X[CL Y] ...

Copyright ©1998, Hitachi, Ltd.

4.3 Add RCU... screen

• Specify RCU parameter.



RCU S/N.....Input the Serial number of RCU.
"XXXXX" .....5 characters. (Use only lower 5 figures in the RCU serial number. Ignore over 6'th figures)

SSID1 ~ 4.....Input the SSID of RCU. (Note)
"XXXX" .....4 hexadecimal digits number.

Num. Of Path .....Specifies the number of path between MCU & RCU.(1 ~ 4)

Option... .....Specified RCU option item. (Refer to RCU Option...)

Note: How to Set Up HRC/HODM between DKC210I and DKC310I

1. Difference in Setting SSIDs

   Both DKC210I and DKC310I can have different SSIDs for each 64 boundary of LDEV#.

   For DKC210I, only one SSID can be specified. Adding zero, one, two, and three to the specified value, DKC210I generates four consecutive SSIDs. These four consecutive SSIDs are automatically given to LDEVs x'00'-x'3F', x'40'-x'7F', x'80'-x'BF', and x'C0'-x'FF' respectively.

   It is possible for DKC310I to have independent SSIDs for each 64 boundary of LDEV#.

Copyright ©1998, Hitachi, Ltd.

2. RCU/R-VOL Setting When MCU is DKC210I and RCU is DKC310I

Since DKC210I can accept only one SSID per one RCU, each 64 LDEVs must be registered as a different RCU.

DKC210I expects that SSIDs read from R-VOLs have the same rule as itself because conventional DKC210I can not detect the difference between DKC210I and DKC310I. That is, DKC210I expects that zero, one, two, and three are implicitly added to the registered value for R-VOLs x‘00’-x‘3F’, x‘40’-x‘7F’, x‘80’-x‘BF’, and x‘C0’-x‘FF’ respectively.

Therefore, an operator should subtract one, two, and three from SSIDs set to DKC310I, and enter the result of this subtraction. Note that SSID is defined as 16 bits unsigned hexadecimal value. For example, two subtracted from x‘0201’ leaves x‘01FF’. The result of subtraction is called an “adjusted SSID”.

The table 4-1 shown below describes the summary. Boldfaced italic letters (***A*** to ***E***) denote the values specified by configuration setting. Numbers 1 to 4 in the RCU# column just means that each row should be treated as different RCU.

Table 4-1 RCU/R-VOL Settings to MCU (DKC210I)

Configuration of RCU (DKC310I)			RCU/R-VOL Settings to MCU (DKC210I)			
Serial #	SSID	LDEV #	RCU #	Serial #	SSID	R-VOL #
A	***B***	x‘00’ - x‘3F’	1	***A***	***B*** - *0*	x‘00’ - x‘3F’
A	***C***	x‘40’ - x‘7F’	2	***A***	***C*** - *1*	x‘40’ - x‘7F’
A	***D***	x‘80’ - x‘BF’	3	***A***	***D*** - *2*	x‘80’ - x‘BF’
A	***E***	x‘C0’ - x‘FF’	4	***A***	***E*** - *3*	x‘C0’ - x‘FF’

If the R-VOLs are behind several SSIDs, as many adjusted SSIDs must be registered by separate ADDRCU/ESTPATH operations. The same serial number must be specified. Path parameters (LCP port number and link destination address) may be the same or different.

For ADDPAIR/ESTPAIR, DELPAIR, SUSPEND, and RECOVER operations, the adjusted SSID that the R-VOL belongs to must be specified.

To remove all of the RCU registrations which have been specified to have different SSIDs, as many DELRCU/DELPATH operations are required.

Copyright ©1998, Hitachi, Ltd.

3. RCU/R-VOL Setting When MCU is DKC310I and RCU is DKC210I

DKC310I expects that SSID read from an R-VOL is always identical to the specified value. Therefore corresponding SSID must be explicitly specified including SSIDs automatically generated by DKC210I.

Since DKC310I can handle up to four SSIDs per an RCU, one RCU registration is enough to register all SSIDs of one DKC210I.

The table 4-2 shown below describes the summary. Boldfaced italic letters (A and B) denote the values specified by configuration setting. Number 1 in the RCU# column just means that up to four SSIDs can be set to the same RCU registration.

Table 4-2 RCU/R-VOL Settings to MCU (DKC310I)

Configuration of RCU (DKC210I)			RCU/R-VOL Settings to MCU (DKC310I)			
Serial #	SSID	LDEV #	RCU #	Serial #	SSID	R-VOL #
A	***B***	x‘00’ - x‘3F’	1	***A***	***B***	x‘00’ - x‘3F’
A	*(**B**+ 1)*	x‘40’ - x‘7F’	1	***A***	***B*** *+ 1*	x‘40’ - x‘7F’
A	*(**B**+ 2)*	x‘80’ - x‘BF’	1	***A***	***B*** *+2*	x‘80’ - x‘BF’
A	*(**B**+ 3)*	x‘C0’ - x‘FF’	1	***A***	***B*** *+3*	x‘C0’ - x‘FF’

ADDRCU panel has been modified so that it can accept up to four SSIDs at the time of the RCU registration. EDITSSID panel is also available. It is possible to add new SSID(s) to, or remove SSID(s) from, the RCU registration.

To register several SSIDs by using ESTPATH command, as many separate commands are required. The same serial number must be specified. Path parameters (LCP port number and link destination address) may be the same or different. If the same path parameters are specified, the specified SSID is added to SSIDs of the existing RCU registration. Otherwise, it is registered as a different RCU.

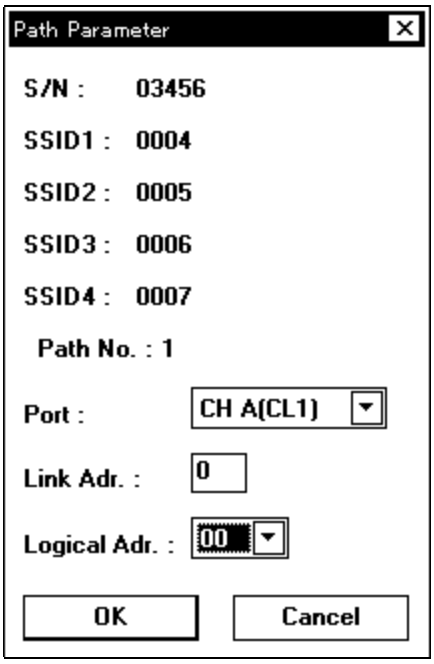
For ADDPAIR/ESTPAIR, DELPAIR, SUSPEND, and RECOVER operations, the actual SSID that the R-VOL belongs to must be specified.

DELRCU operation removes RCU registration. For just removing specified SSID(s) from the RCU registration, EDITSSID panel is available.

DELPATH command removes specified SSID from the RCU registration if more than one SSID have been registered. When the last SSID is removed by DELPATH, the RCU registration is also removed.

Copyright ©1998, Hitachi, Ltd.

• Specify PATH parameter.
Input the RCU parameter, then input the path parameter for each specified path.



Port.....Specified port using as RCP in the Combo Box.

Link Adr.....Input the destination link address.
"XX" ..... 2 characters of hexadecimal number. ("00" through "fd")
If RCU is connected to MCU directly without ESCD, specified "00" at the [Link Adr.].
If RCU is connected to MCU with ESCD, specified destination link address at the [Link Adr.].

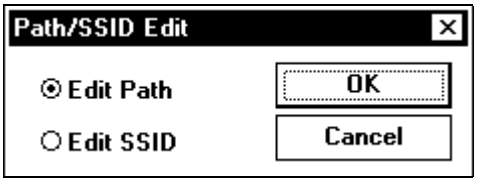
Logical Adr. .....Specified logical address of the destination DKC.
Please select a logical address which are defined as CU images (00 through 03) in the RCU.

(Notes) DKC210I : It has only #00 as CU image.
DKC80I-3 : When the RCU is MPSD, select "00". When the RCU is SPSD, select "00" or "01" according to the device position.
Other DKC : There are some DKCs that have four CU images (00 through 03).). In this case, please select corresponding logical address according to the device position.

Copyright ©1998,1999, Hitachi, Ltd.

4.4 Edit Path/SSID

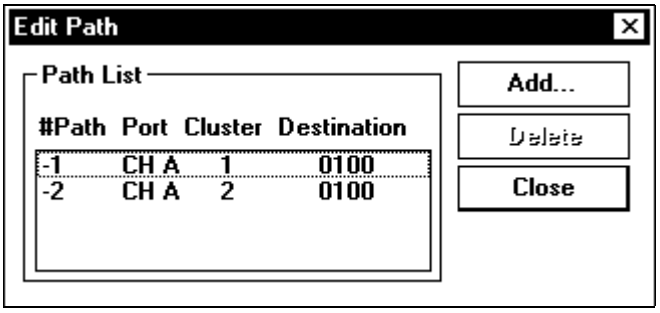
4.4.1 Path/SSID Edit... screen



Edit Path... Adding/reducing the number of paths.

Edit SSID . Adding/reducing the number of SSIDs.

4.4.2 Edit Path... screen



Path List ... Display current path's information.

"X CH X X XXXX"

① ② ③ ④

① #Path.....Status(+:Normal -:Abnormal) and Path No.(1 ~ 4)

② #Port .....Port of path creating.(CH A ~ CH R)

③ #Cluster .....Cluster. (1 ~ 2)

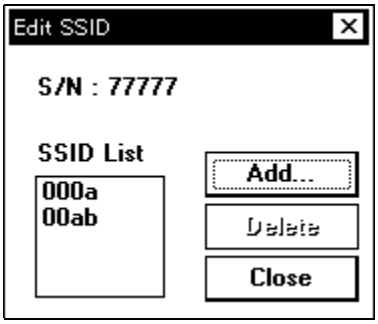
④ Destination.....Link address (2 hexadecimal numbers) + Logical address (2 hexadecimal numbers)

Add..... Adding new path. (Refer to Add.. RCU-Specified Path Parameter)

Delete ..... Deleting the path selected in the Path List.

Copyright ©1998, Hitachi, Ltd.

4.4.3 Edit SSID... screen

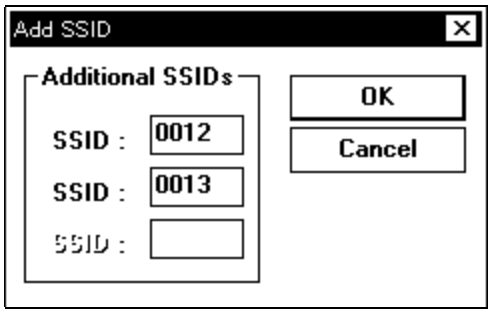


SSID List.. Display current SSIDs information.

Add..... Adding new SSIDs.

Delete ..... Deleting the SSIDs selected in the SSID List.

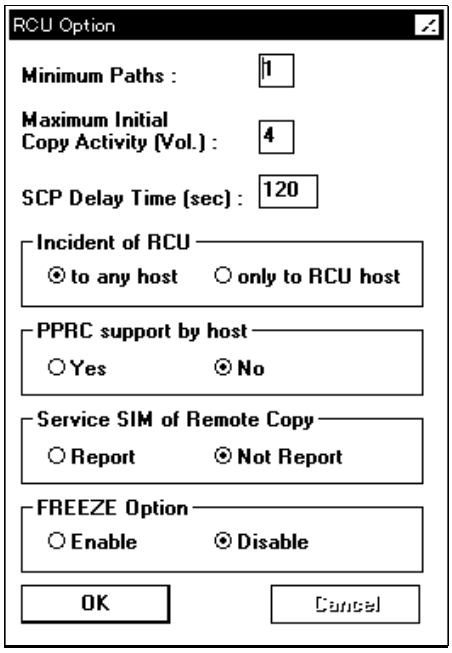
4.4.4 Add SSID... screen



Additional SSIDs ..... To add the SSIDs, input 4 hexadecimal digits numbers.

Copyright ©1998,1999, Hitachi, Ltd.

4.5 RCU Option... screen



Minimum Paths.....Specifies lowest number of paths needed for continuation of HRC (HODM).
Defined between 1 to 4.

Maximum Initial .....Specifies maximum number of Initial copy execution.
(First group of defined HRC volume pairs.)
Defined between 1 to 4.

SCP Delay Time [sec].....Specifies SCP delay time (Available for HRC only).
Defined between 0 to 600.

Incident of RCU.....Specifies method for handling Incident that occurs in RCU.
"to any host" .....Incident is reported to MCU host too.
"only to RCU host".....Incident is reported to only RCU host .

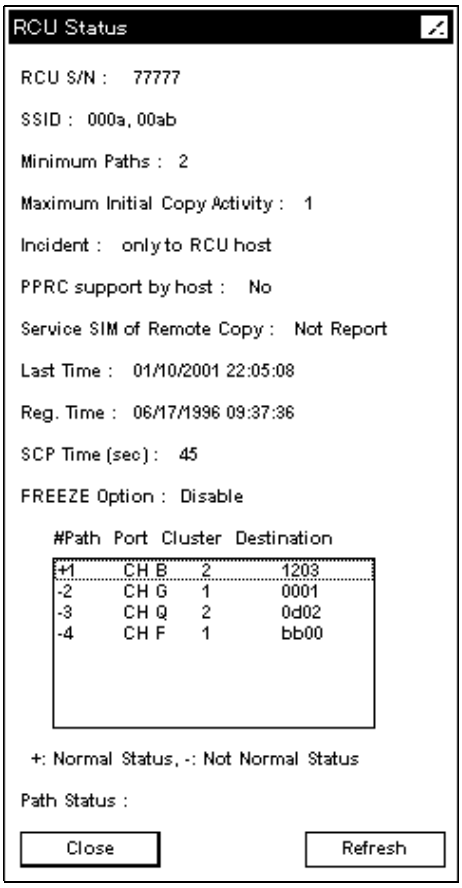
PPRC support by host.....Is PPRC(HRC) supported by RCU host .
"Yes" .....Supported.
"No".....Not supported.

Service SIM of Remote Copy..... Specifies method for handling SIM of Remote Copy.
"Report".....SIM is reported.
"Not Report".....SIM is not reported.

FREEZE Option.....Specifies freeze option (Available for HRC only).
"Enable".....Freeze option is enable.
"Disable" .....Freeze option is disable.

Copyright ©1998,1999, Hitachi, Ltd.

4.6 RCU Status... screen



RCU s#.....Display Serial number of the RCU.
"XXXXX" .....5 decimal digits.

SSID.....Display SSID of the RCU.
"XXXX" .....4 hexadecimal digits.

Minimum Paths.....Display lowest number of paths necessity for continuation of HRC (HODM).

Maximum Initial Copy Activity..... Display maximum number of initial copies.

Incident .....Display method for handling Incident that occurs in RCU.
"to any host" .....Incident is reported to MCU host too.
"only to RCU host".....Incident is reported to only RCU host.

PPRC support by host .....Display PPRC support information of HOST system.
"Yes" .....PPRC is supported by HOST.
"No".....PPRC isn't supported by HOST.

Service SIM of Remote Copy ..... Specifies method for handling SIM of Remote Copy.
"Report".....SIM is reported.
"Not Report".....SIM is not reported.

Copyright ©1998,1999, Hitachi, Ltd.

Last Time .....Display last update time & date of the RCU.

Reg. Time.....Display registration time & date of the RCU.

SCP Time [sec].....Display SCP delay time (Available for HRC only).

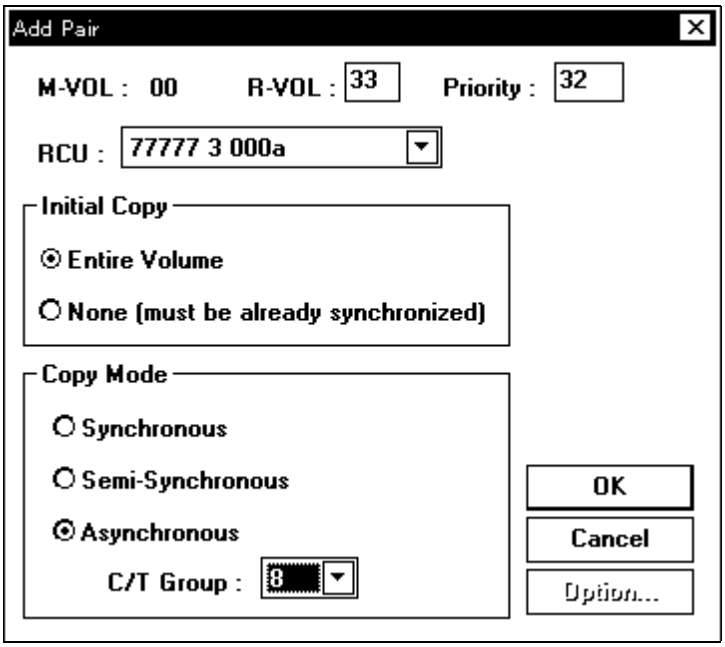
FREEZE Option.....Display freeze option.
"Enable".....Freeze option is enable.
"Disable" .....Freeze option is disable.

Path Status.....Display status of path that selected in list.
If it isn't "Normal", do the recovery action according to TRBL06-190 "Recovery Action of Path Status Error".
"Nothing"..... No established.
"Normal" ..... The status of path is normal.
"Initialization Failed" ..... Error has occurred in the path initialization.
"Communication Time Out" Communication between MCU and RCU time out.
"Resource Shortage(MCU)". Resource at the MCU is short.
"Resource Shortage(RCU).. Resource at the RCU is short.
"Serial Number Mismatch" .. Specified serial number is mismatch.
"Invalid Port"..... Specified port is invalid.

Refresh .....Refresh displayed information.

Copyright ©1998,1999, Hitachi, Ltd.

4.7 Add Pair... screen (HRC)



M-VOL .....Display volume(LDEV) that is MCU side.

R-VOL .....Specifies volume(LDEV) that is RCU side.
"XX" ..... 2 hexadecimal digits.

Priority .....Specifies priority of initial copy execution.

RCU .....Select RCU from the Combo Box.
The list of RCUs currently registered will appear.

Initial Copy .....Specifies initial copy type. (Valid only for the remote dual copy function.)
"Entire Volume" .....Specifies all cylinders.
"None" .....Nothing

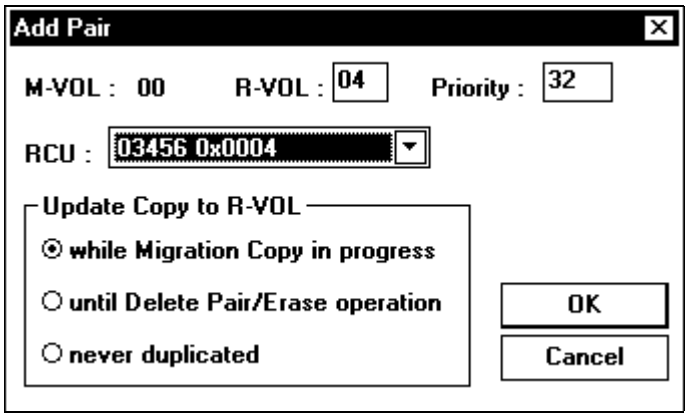
Copy Mode.....Specifies copy mode. (Valid only for the remote dual copy function.)
"Synchronous" .....Specifies synchronous copy.
"Semi-Synchronous" .....Specifies semi-synchronous copy.
"Asynchronous".....Specifies asynchronous copy.

C/T Group... .....Select C/T group# from the combo box.
The list of C/T group currently assigned will appear, except the CU type of the C/T group is not RCU. (Displayed as "RCU" in the C/T group list of HRC Main screen.)
This combo box is displayed effectively if the "Asynchronous" is specified.

Option... .....Specifies pair option item. (Refer to Pair Option...)

Copyright ©1998,2000, Hitachi, Ltd.

4.8 Add Pair... screen (HODM)



M-VOL .....Display volume(LDEV) that is MCU side.

R-VOL .....Specifies volume(LDEV) that is RCU side.
"XX" ..... 2 hexadecimal digits.

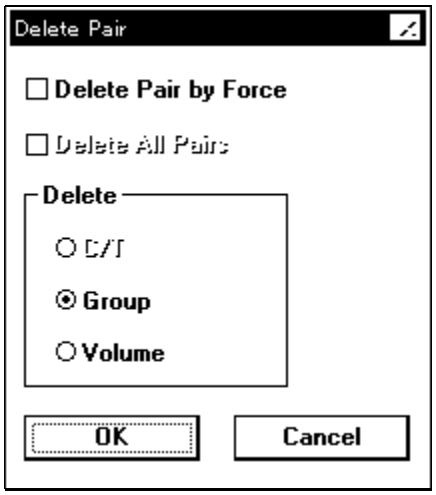
Priority .....Specifies priority of initial copy execution.

RCU .....Select RCU from the Combo Box.
The list of RCUs currently registered will appear.

Update Copy to R-VOL .....Specifies update copy mode to R-VOL.
"while Migration Copy in progress"
.....Enable while migration copy is progress.
"until Delete Pair/Erase operation"
.....Enable until Delete Pair/Erase R-VOL operation is executed.
"never duplicated"
.....Disable while migration copy is progress.

Copyright ©1998, Hitachi, Ltd.

4.9 Delete Pair... screen



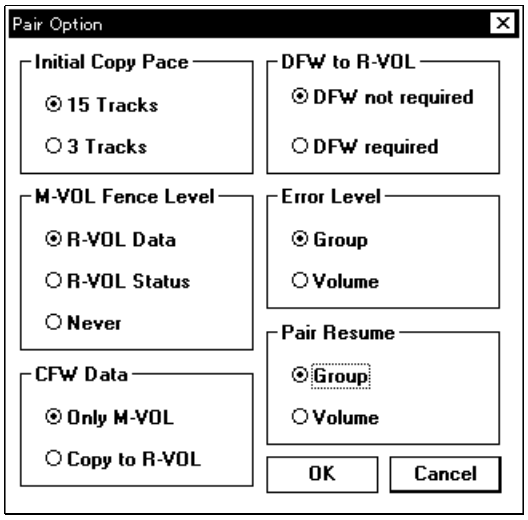
Delete Pair by Force.... Specified forcibly delete mode.
The pair status is deleted even when the communication with the CU is disabled.
(Note : Fixed at forcibly delete mode if the status of the specified volume(s) is(are) suspending or deleting state.)

Delete All Pairs..... To delete all pairs except HRC asynchronous pairs.

Delete ..... Select the kind of deletion. (Effective only asynchronous copy pair.)
- C/T ..... All volume(s) will be deleted which have the same C/T as the specified volume(s). (Displayed effectively if the specified volume(s) is(are) R-VOL(s).
- Group ..... All volume(s) will be deleted which are assigned to the same C/T group as the specified volume(s).
- Volume .. Only specified volume(s) will be deleted.

Copyright ©1998,2000, Hitachi, Ltd.

4.10 Pair Option... screen



Initial Copy Pace..... Specifies Initial copy pace. (Remote Dual Copy)(HRC option)
"15 Tracks" 15tracks
"3 Tracks" 3tracks

DFW to R-VOL ..... Is Remote Dual Copy continued when DFW blockade occurred. (HRC option)
"DFW not required".... When DFW block, Remote Dual Copy do not stop.
"DFW required"..... When DFW block, Remote Dual Copy stop.

CFW Data ..... Is the CFW data on the subject of Remote Dual Copy ? (HRC option)
Displayed ineffectively if the specified volume is asynchronous copy volume.
"Copy to R-VOL" ..... Yes
"Only to M-VOL" ..... No

M-VOL Fence Level... M-VOL fence level(HRC option)
"R-VOL Data"..... M-VOL fence when data is unmatched
"R-VOL Status" ..... M-VOL fence when status can not be changed.
"Never" ..... Never fence
(Note : Fixed "Never" if the specified volume is asynchronous copy volume)

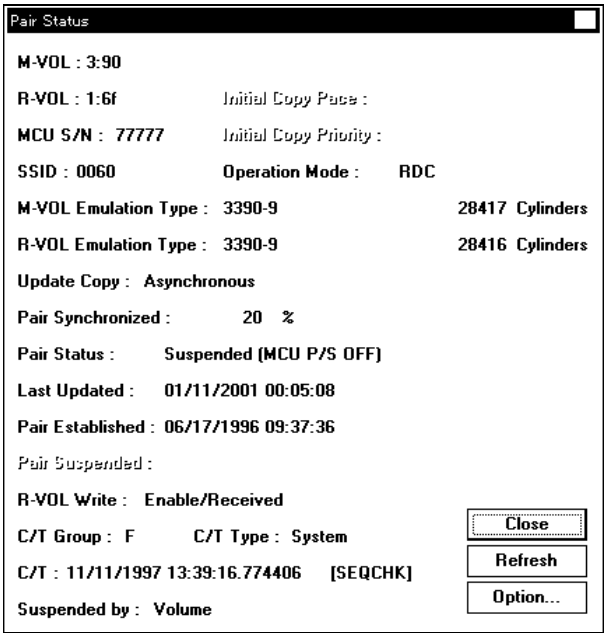
Error Level ..... The suspension kind when asynchronous pairing is failed. (HRC Option)
Displayed effectively if the specified volume is asynchronous copy volume.
"Group" ..... All asynchronous copy volumes under the same C/T group as the specified volume(s) will be suspended.
"Volume" ..... Only specified volume(s) will be suspended.

Pair Resume ..... The resumption kind of suspended asynchronous copy volume. (HRC option)
Displayed effectively when asynchronous copy pair resuming.
"Group" ..... All asynchronous copy volumes under the same C/T group as the specified volume(s) will be resumed.
"Volume" ..... Only specified volume(s) will be resumed.

Copyright ©1998,1999, Hitachi, Ltd.

4.11 Pair Status... screen

4.11.1 Pair Status... screen (HRC)



M-VOL .....Displays CU# : LDEV#(MCU side).

R-VOL .....Displays CU# : LDEV#(RCU side).

RCU S/N.....Displays serial number of the RCU.

SSID.....Displays SSID of the RCU.

Initial Copy Pace.....Displays Initial copy pace.
"15 Tracks"..... 15tracks
"3 Tracks"..... 3tracks

Initial Copy Priority .....Displays priority of initial copy execution.

Operation Mode .....Displays pair creative mode.
"RDC" ..... Remote Dual Copy (HRC)

M-VOL Emulation Type.....Displays M-VOL device emulation type and number of cylinders.

R-VOL Emulation Type.....Displays R-VOL device emulation type and number of cylinders.

Update Copy .....Displays pair synchronous mode.

Pair Synchronized .....Displays progress of initial copy.
(Note: There is a possibility to be displayed as "Not Valid (Initial copy not complete)" when agreeing with undermentioned condition.
• The specified volume is R-VOL.
• The specified volume is asynchronous copy pair.
• The specified volume is in the suspended state.)

Copyright ©1998,2000, Hitachi, Ltd.

Pair Status .....Displays pair status information.
"Simplex"
"Duplex Pending"
"Duplex"
"Suspended(M-VOL by Operator)"
"Suspended(R-VOL by Operator)"
"Suspended(by MCU)"
"Suspended(by RCU)"
"Suspended(Delete pair to RCU)"
"Suspended(R-VOL failure)"
"Suspended(MCU IMPL)"
"Suspended(Initial Copy Failed)"
"Suspended(by FREEZE)"
"Suspended(MCU P/S OFF)"
"Suspending"
"Deleting"

Last Updated .....Displays last update time of pair status.

Pair Established.....Displays registration time the volume pair.

Pair Suspended.....Displays suspension time of the volume pair.

R-VOL Write .....Displays R-VOL write permission status.
"Enable"..... R-VOL write permission is enabled.
"Enable/Received"..... R-VOL write command is received.
"Enable/Not Received".... R-VOL write command is not received.
"Disable" ..... R-VOL write permission is disabled.

C/T Group .....Displays the C/T group# ('0' ~ 'F') of the volume.
(Displayed effectively if the volume is asynchronous copy volume.)

C/T Type .....Displays the timer type of the volume.
(Displayed effectively if the volume is asynchronous copy volume.)
"System" ..... Use the timer of the HOST.
"Local"..... Use the timer of the SVP.
"None" ..... The correctness of the C/T is not guaranteed.

C/T .....Display the consistency time of the volume.
(Displayed effectively if the volume is asynchronous copy volume.)
(Note : If "Overflow" is displayed, the consistency time is after 2042. If "Underflow" is displayed, the consistency time is before 1972.)

[SEQCHK].....Displayed if the volume is in the "SEQCHK" status.

Copyright ©1998,1999, Hitachi, Ltd.

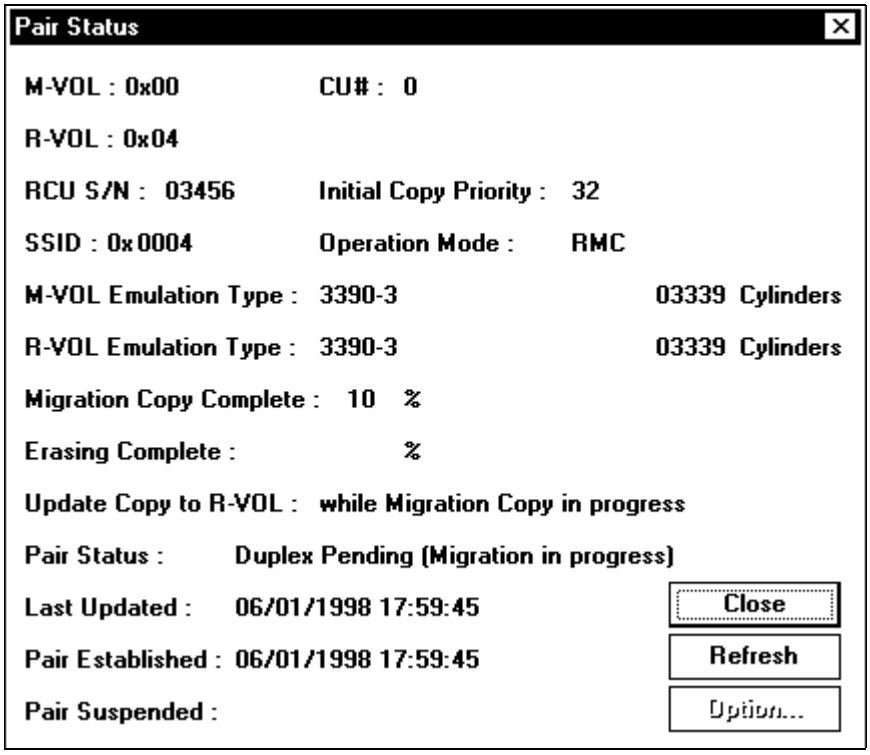
Suspended by ..... Displays the C/T status of the volume.
(Displayed effectively if the volume is asynchronous copy R-VOL.)
"Group" ..... The consistency time of the volume correspond to the C/T group's which the volume belongs to.
"Volume"..... The consistency time of the volume is different from the C/T group's which the volume belongs to.

Option... ..... Displays pair option item. (Same to Pair Option...)

Refresh ..... Refresh displayed information.

Copyright ©1999, Hitachi, Ltd.

4.11.2 Pair Status... screen (HODM)



M-VOL .....Displays volume (LDEV) (MCU side).

R-VOL .....Displays volume (LDEV) (RCU side).

RCU S/N.....Displays serial number of the RCU.

SSID.....Displays SSID of the RCU.

CU#.....Displays current CU number.

Initial Copy Priority .....Displays priority of initial copy execution.

Operation Mode .....Displays pair creative mode.
"RMC"..... Migration Copy (HODM)

M-VOL Emulation Type.....Displays M-VOL device emulation type and number of cylinders.

R-VOL Emulation Type.....Displays R-VOL device emulation type and number of cylinders.

Migration Copy Complete ....Displays progress of migration copy.

Erasing Complete.....Displays progress of erasing R-VOL data.

Update Copy to R-VOL .....Displays update copy mode to R-VOL. (Remote Migration Copy)

Copyright ©1998, Hitachi, Ltd.

Pair Status .....Displays pair status information.
“Simplex”
“Suspended(by MCU)”
“Suspended(by RCU)”
“Suspended(R-VOL failure)”
“Suspended(MCU IMPL)”
“Simplex(Migration in progress)”
“Simplex(Migration Complete)”
“Simplex(Erasing in progress)”
“Simplex(Erasing Error)”
“Duplex Pending(Migration in progress)”
“Suspended(Migration Error, M-VOL)”
“Suspended(Migration Error, R-VOL)”

Last Updated .....Displays last update time of pair status.

Pair Established.....Displays registration time the volume pair.

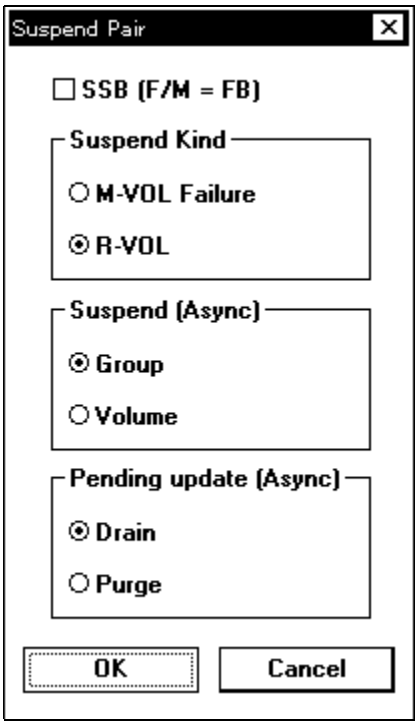
Pair Suspended.....Displays suspension time of the volume pair.

Option... .....Displays pair option item. (Same to Pair Option...)

Refresh .....Refresh displayed information.

Copyright ©1998, Hitachi, Ltd.

4.12 Suspend Pair... screen



SSB (F/M=FB)..... Specifies suspension reporting method.

Suspend Kind..... Specifies suspended type.
"M-VOL Failure" ..... M-VOL suspension reported as M-VOL failure
"R-VOL" ..... R-VOL suspension
(Note : Fixed "R-VOL" if asynchronous copy pair suspension.)

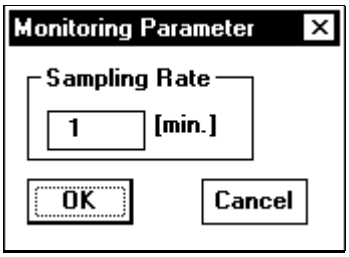
Suspend (Async) ..... Specifies suspension kind of asynchronous copy pair(s).
Displayed effectively when asynchronous copy pair(s) suspension.
"Group" ..... All asynchronous copy pairs which belong to the same C/T group as the specified volumes will be suspended.
"Volume"..... Only specified volume(s) will be suspended.

Pending update (Async)... Specifies releasing method of the Record Set.
Displayed effectively when asynchronous copy pair(s) suspension.
"Drain" ..... The pair volume(s) of the specified volume(s) will be updated with pending data in the Record Set.
"Purge" ..... The pair volume(s) of the specified volume(s) will be not updated.

Copyright ©1998,1999, Hitachi, Ltd.

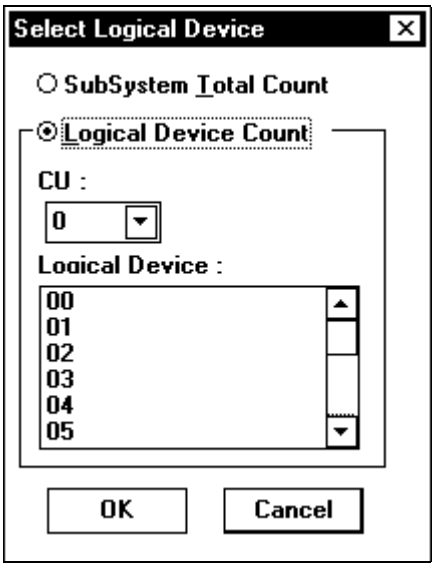
4.13 Usage... screen

Monitoring Parameter



Sampling Rate.... Sets the sampling rate of operation control information within a range of 1 to 546 in steps of a minute.

Select Logical Device

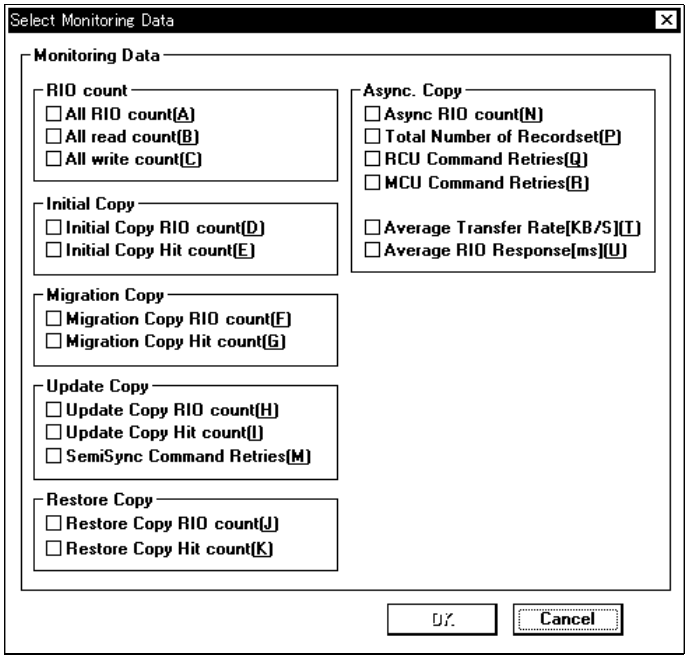


Logical Device: .. Displays the list of logical devices valid in the subsystem. Select the device from the list to display its operation information. To display the operation information of the whole subsystem, select "Sub System".

Copyright ©1998, Hitachi, Ltd.

Select Monitoring Data

(1) Subsystem



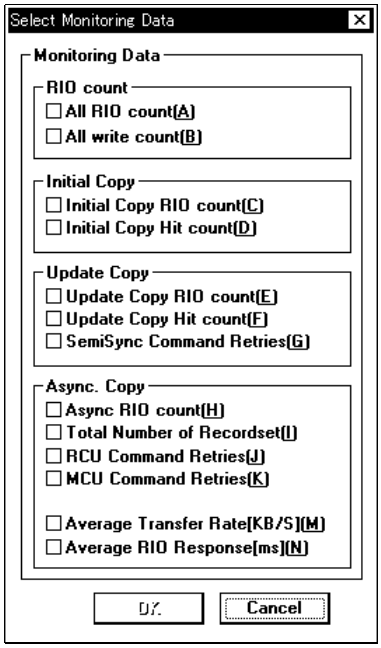
[CAUTION]

• Average Transfer Rate [KB/s]

• Average RIO Response [ms]

You can’t select above 2 items with other items.

(2) Logical Device for HRC



[CAUTION]

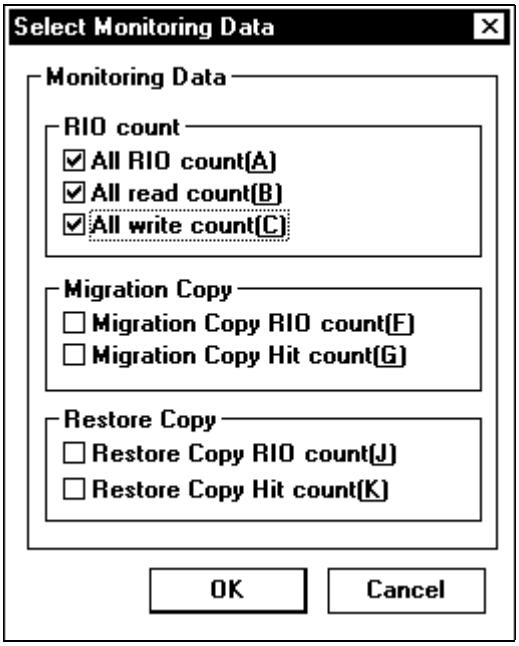
• Average Transfer Rate [KB/s]

• Average RIO Response [ms]

You can’t select above 2 items with other items.

Copyright ©1998,1999, Hitachi, Ltd.

(3) Logical Device for HODM



RIO count.....Specifies the read/write count concerning the Remote Copy.

Initial Copy .....I/O count for the initial copy

Migration Copy..I/O count for migration copy

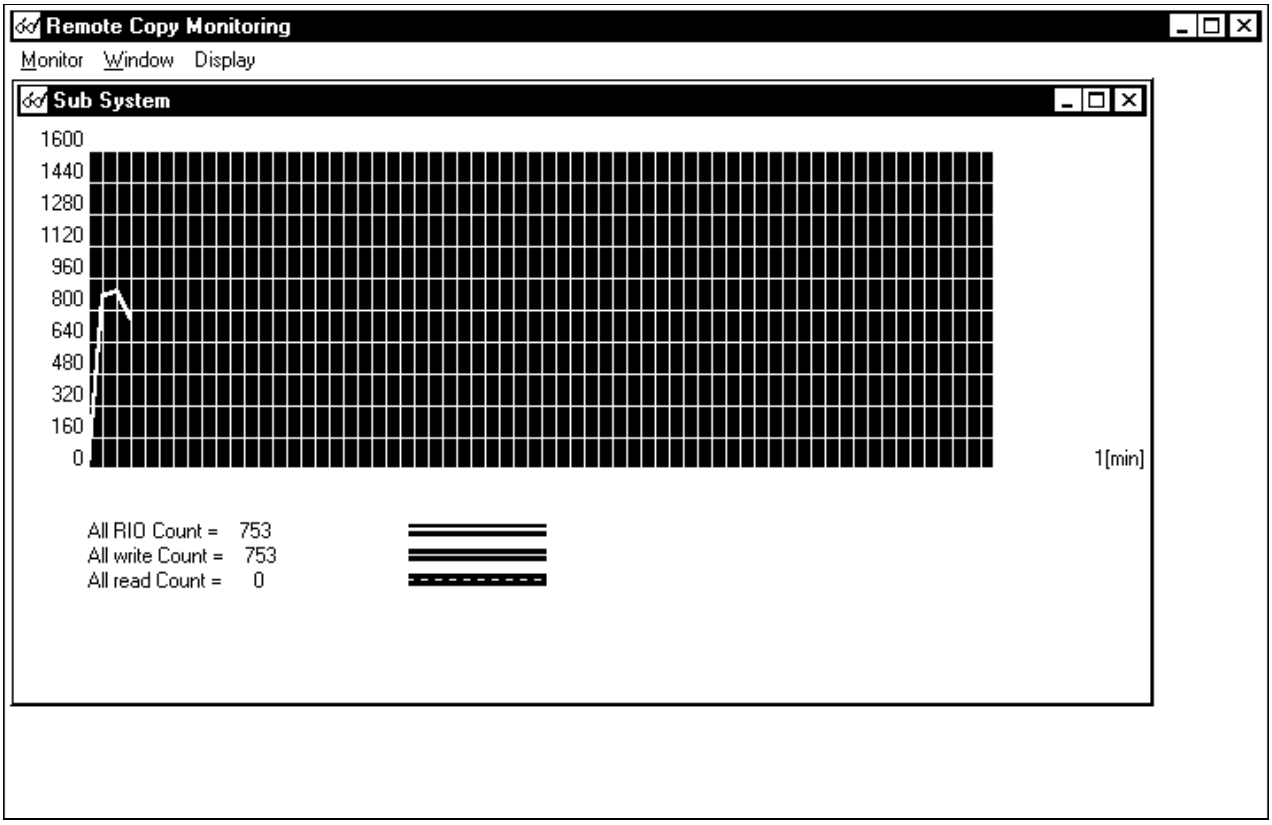
Update Copy .....I/O count for renewal copy

Restore Copy.....I/O count for recovering copy

Async. Copy.....I/O count for Asynchronous Remote Copy

Copyright ©1998,1999, Hitachi, Ltd.

Remote Copy Monitoring Screen



Monitor Menu .... Start.....Displays another Remote Copy Monitoring screen.
EXit.....Closes the Remote Copy Monitoring screen.

Window Menu ... Cascade (C)....Displays Remote Copy Monitoring windows side by side.
Tile (T).....Displays lined-up Remote Copy Monitoring windows.
Icon (I) .....Lines up Remote Copy Monitoring window icons.
All close (A) ..Closes all the Remote Copy Monitoring windows.

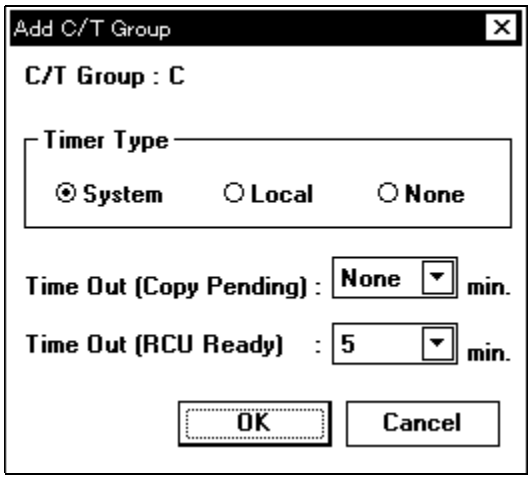
Display Menu..... Line Model ....Displays or hides the explanation of lines.

Vertical Axis ..... Indicates the count number.

Horizontal axis... Indicates the time elapsed. A scale division on the horizontal axis indicates a sampling rate. The latest data is drawn to the right.

Copyright ©1998, Hitachi, Ltd.

4.14 Add Group/Group Option... screen



C/T Group ..... Displays C/T group# selected from C/T group list.

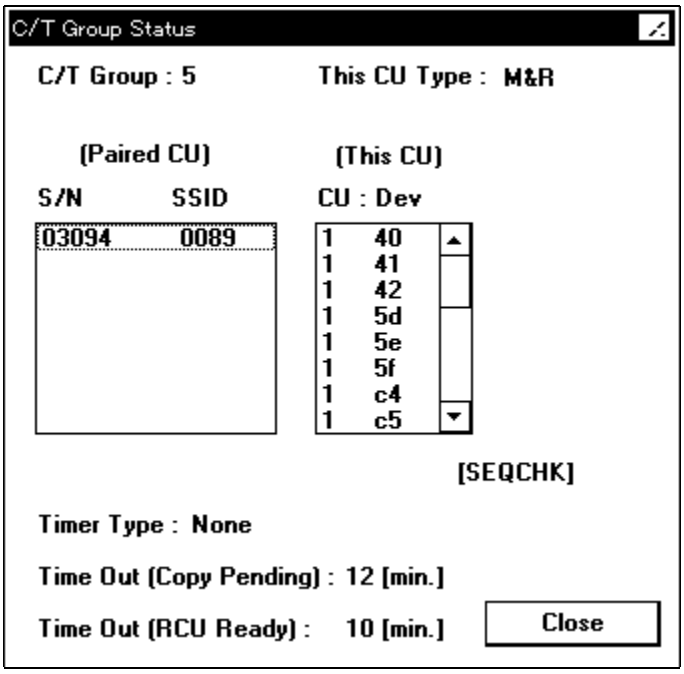
Timer Type..... Select the timer type of the specified C/T group#.
"System" .....Use the timer of HOST.
"Local".....Use the timer of SVP.
"None" .....The correctness of the C/T is not guaranteed.

Time Out (Copy Pending)..... Specifies the maximum delay time of the update data.
(None, 3 ~ 15[min.])

Time Out (RCU Ready) ..... Specifies the maximum waiting time for the RCU gets ready.
(None, 1 ~ 10[min.])

Copyright ©1999, Hitachi, Ltd.

4.15 Group Status... screen



C/T Group ..... Displays C/T group# selected from C/T group list.

CU Type ..... Displays the CU type of the specified C/T group#.
"MCU" ..... MCU
"RCU" ..... RCU
"M&R" ..... MCU&RCU

S/N SSID List Box ..... Displays the serial numbers and SSIDs of RCUs which are registered in the specified C/T group#.

CU:Dev List Box ..... Displays the CU# and LDEV# which belongs to the specified C/T group#.

C/T ..... Displays the consistency time of the specified C/T group#.
(Note : If specified C/T group is in the SEQCHK state, "[SEQCHK]" is displayed.)
(Note : If "Overflow" is displayed, the consistency time is after 2042. If "Underflow" is displayed, the consistency time is before 1972.)

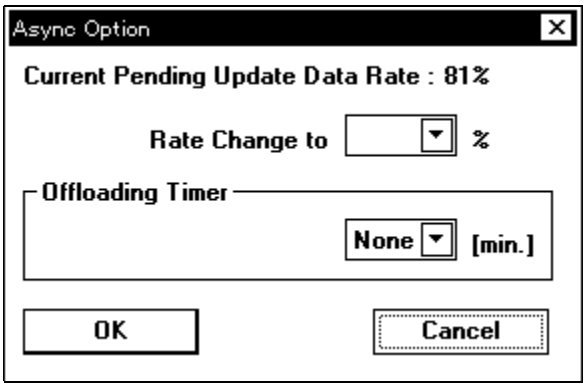
Timer Type ..... Displays the timer type of the specified C/T group#.

Time Out (Copy Pending) ..... Displays the maximum delay time of the specified C/T group#.

Time Out (RCU Ready) ..... Displays the maximum waiting time of the specified C/T group#.

Copyright ©1999,2000, Hitachi, Ltd.

4.16 Async Option... screen



Current Pending Update Data Rate.....Displays current occupation rate of pending update data among the Record Set.

Rate Change to..... Specifies occupation rate of pending update data among the Record Set. (30 through 70)

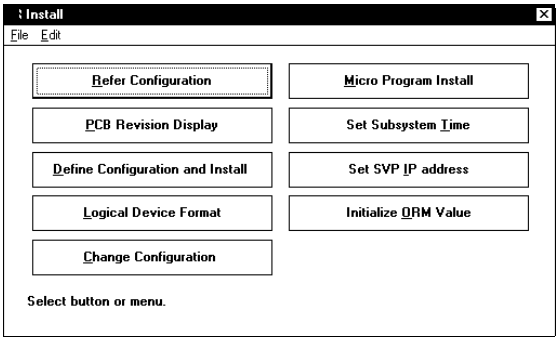
Offloading Timer ..... Specifies monitoring time for the Record Set. (None, 1 through 20)

Copyright ©1999, Hitachi, Ltd.

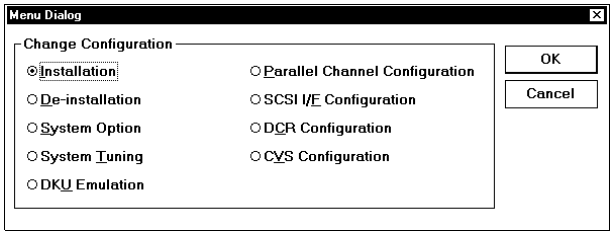
5 Option Install

(1) Select Install
Select (CL) [Install].

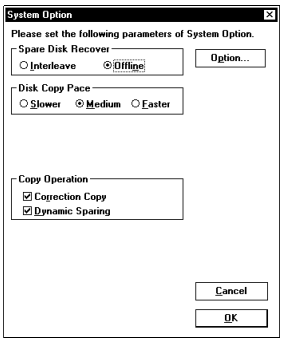
(2) Select Change Configuration
Select (CL) the [Change Configuration] menu in the 'Install Subsystem' window and select (CL) [OK].



(3) Select System Option
Select (CL) [System Option] menu in the 'Menu Dialog' window and select (CL) [OK].



(4) Select Option
Select (CL) [Option...] menu in the 'System Option' window.



Copyright ©1998, Hitachi, Ltd.

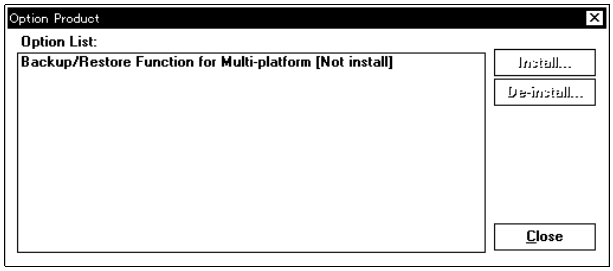
(5) Change Option

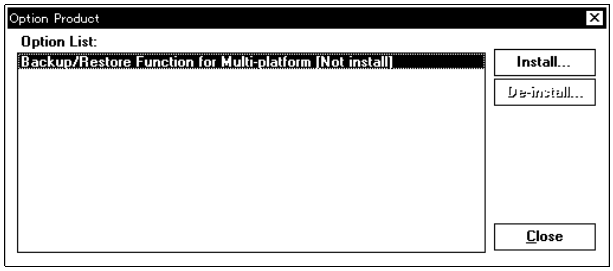
Option Install

Select (CL) option item you want to install from 'Option List' and select (CL) [Install...] button.

Option De-install

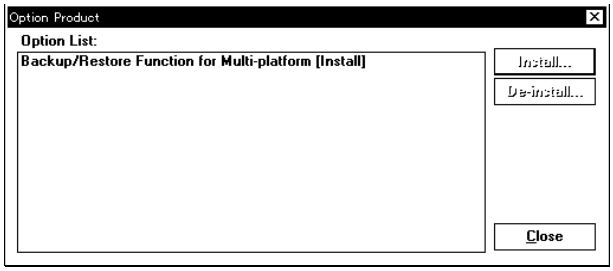
Select (CL) option item you want to de-install from the 'Option List' and select (CL) [De-install...] button





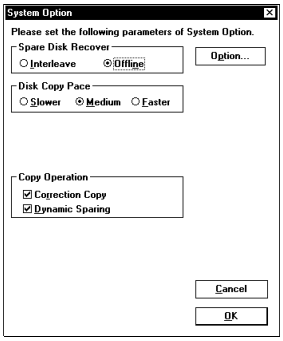
(6) Changing finish

Select (CL) [Close].

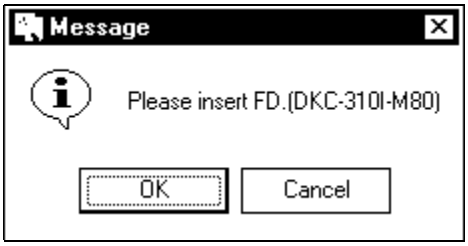


Copyright ©1998, Hitachi, Ltd.

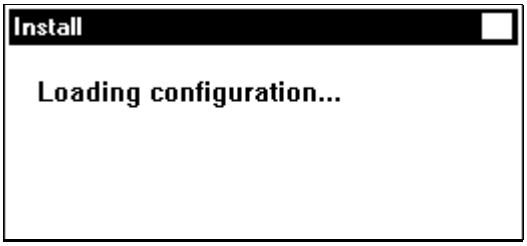
(7) Close System Option
Select (CL) [OK].



(8) Insert Special FD
Insert Special FD in accordance with following message.
And remove Special FD when 'remove' message is displayed.
If you want to change other item then go to (5).

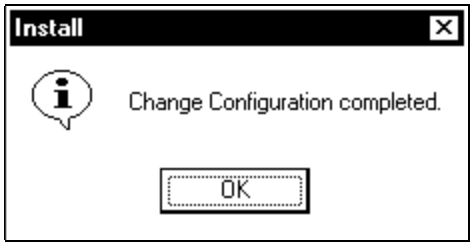


(9) Configuration down loading
The down loading message is displayed.



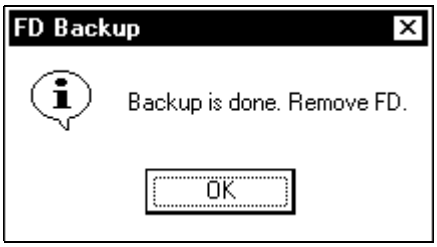
Copyright ©1998, Hitachi, Ltd.

(10) Change system option is finished
The finished message is displayed. Select (CL) [OK].



(11) “Reading subsystem configuration data...” is displayed.
“Please insert config FD in FDD.” is displayed.
Insert the configuration FD into FDD, select (CL) [OK].

(12) When this procedure is completed, message “Back up is done. Remove FD.” is displayed.
Remove the FD, select (CL) [OK].



(13) Close ‘Install’ window

Copyright ©1998, Hitachi, Ltd.

6 Display of Disk Drive Model

SVP displays each drive model as the following table.

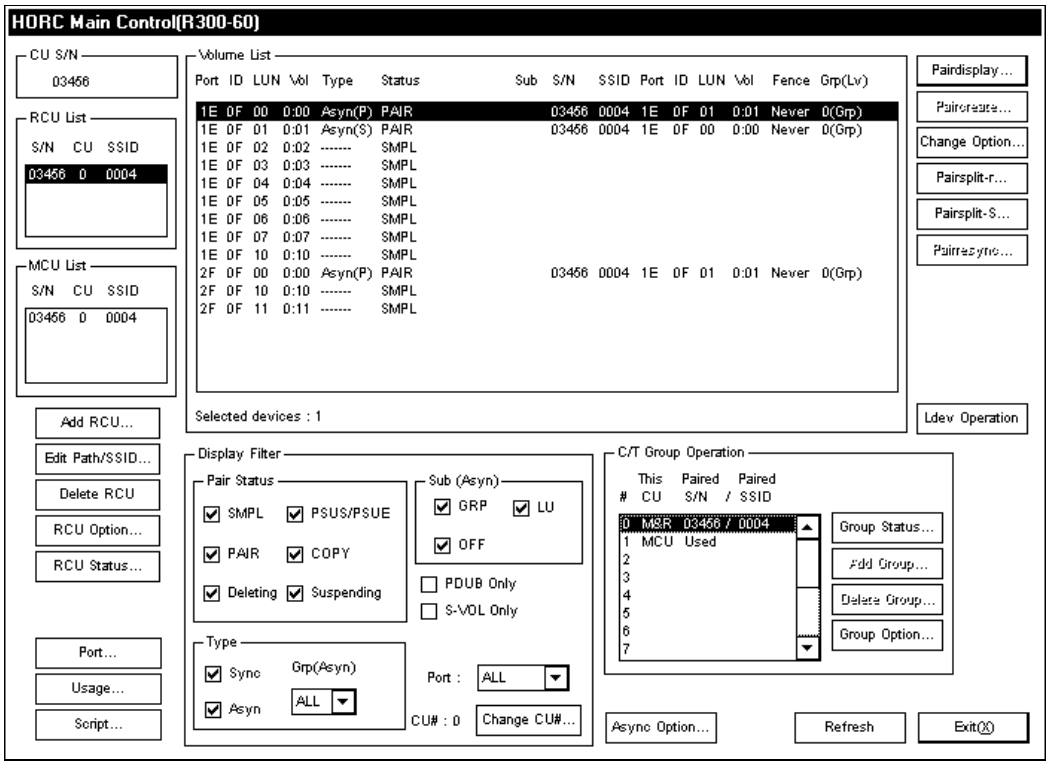
Disk drive model	SVP screen
DK309-180	DK309-18
DK3F1-60	DK3F1-06

Copyright ©1998, Hitachi, Ltd.

7 References for HORC Operation Screen (for OPEN VOL)

If SVP Micro-program version is not over “51-36-01”, refer to the “9 References for HORC Operation Screen (for LDEV) (SVP09-10)”.

7.1 HORC Main screen



RCU List ..... This List Box displays Controllers as RCU(Remote disk Control Unit).
“XXXXX X XXXX”
Serial Number CU# SSID

MCU List ..... This List Box displays Controllers as MCU(Main disk Control Unit).
(Only volume pairing is established.)
“XXXXX X XXXX”
Serial Number CU# SSID

Copyright ©1998,2000, Hitachi, Ltd.

Volume List ..... This List Box displays valid OPEN VOL (open volume) and the Pairdisplay.

"XX XX XX X:XX XXX(X) XXXXXXX XXX XXXXX XXXX XX
① ② ③ ④ ⑤ ⑥ ⑦ ⑨ ⑩ ⑪ ⑫
XX XX X:XX X X(XXX)"
⑬ ⑭ ⑮ ⑯ ⑰

① #OPEN VOL:PORT ....PORT Number of OPEN VOL
② #OPEN VOL:ID .....SCSI ID Number of OPEN VOL
③ #OPEN VOL:LUN .....LUN Number of OPEN VOL
④ #CU:#LDEV .....CU address:LDEV top address of OPEN VOL
⑤ Copy Mode ..... "Sync" : Synchronous
"Asyn" : Asynchronous
" - " : SMPL Volume
⑥ Volume Type ..... "P" : Primary Volume
"S" : Secondary Volume
" - " : SMPL Volume
⑦ Status .....Volume Pairdisplay
"SMPL" : SMPL
"PAIR" : PAIR
"COPY" : COPY
"PSUS/PSUE" : Suspend
"Suspending" : Suspending
"Deleting" : Deleting
"PDUB" : PDUB
⑨ Sub Status .....Suspend sub status.
"GRP" : The consistency time of the volume is corresponding to the C/T group's.
"LU" : The consistency time of the volume is not corresponding to the C/T group's.
"OFF" : The volume is suspended by MCU P/S off.
⑩ Serial Number.....Serial Number of Destination Controller.
⑪ SSID .....SSID of destination Controller.
⑫ #OPEN VOL:PORT....PORT Number of OPEN VOL on the destination Controller.
⑬ #OPEN VOL:ID.....SCSI ID Number of OPEN VOL on the destination Controller.
⑭ #OPEN VOL:LUN.....LUN Number of OPEN VOL on the destination Controller.
⑮ #CU:#LDEV .....CU address on the destination Controller :LDEV top address of OPEN VOL on the destination Controller.
⑯ Fence Level .....OPEN VOL Fence Level
⑰ Grp. (Lv) .....C/T group#(Error Level)

Copyright ©1998,2000, Hitachi, Ltd.

Display Filter..... Display filter of the Volume List.

• Pair Status

"SMPL" ~ "Deleting" check box

..... LDEVs whose status are selected by check box are displayed.

(Note: If "PSUS/PSUE" check box is not selected, "GRP" ~ "LU" check box are displayed ineffectively.)

• Type

"Sync" ~ "Asyn" check box

..... LDEVs whose synchronous mode are selected by check box are displayed.

(Note: If "Asyn" check box is not selected, "Deleting", "Suspending", "GRP", "OFF", "LU" check box and "Grp(Asyn)" combo box are displayed ineffectively.)

"Grp (Asyn)" combo box

..... LDEVs whose C/T group# is selected by combo box is displayed. ("ALL" displays all C/T groups.)

• Sub (Asyn)

"GRP" ~ "LU" check box

..... LDEVs whose sub status are selcted by check box are displayed.

"PDUB Only" check box

..... Only Warning OPEN VOLs are displayed.

"S-VOL Only" check box

..... Displays only S-VOL pairs.

"SMPL" check box are displayed ineffectively.

"Port" combo box..... Select the port number to be connected to the object form the combo-box in Port(s).

("ALL" displays all connected Port(s).)

Select the RCP port to be connected to the object RCU from the combo-box in Port.

Change CU#..... Specifies CU address (CU#) to display the RCU List, the MCU List and the Volume List concerned with the CU.

Copyright ©2000, Hitachi, Ltd.

Port Operation

Port.....Changes the port type between LCP and RCP.

When the MCU is connected to the RCU, the MCU side port type must be set to RCP.

Path Operation

Add RCU.....Establishes the path between the MCU and the RCU. When establishing the path, the MCU must register the object RCU first. This function registers the object RCU and establishes the path at a time. When the MCU registers the object RCU successfully, the RCU is added to the RCU list. (Up to 4 RCU units can be registered for one MCU.)

Edit Path/SSID ...Adds/reduces the number of paths or SSIDs to an RCU selected from the RCU list within a range of 1 to 4.

Delete RCU .....Deletes an RCU selected from the RCU list and the path(s) to the RCU at a time. Before executing this function, all the units paired with the RCU must be set to SMPL status.

RCU Option .....Changes the option for connection to an RCU selected from the RCU list. The connection option can also be specified when the RCU is registered, but this function is used to change the option during operation.

RCU Status.....Displays the status of an RCU selected from the RCU list. This function can also display the status of each path to the RCU.

Pair Operation

(Note: All pair operations are disabled if the synchronous copy pair(s) and asynchronous copy pair(s) are selected at the same time.)

Pairdisplay.....Displays the status of a volume selected from the volume list. This function is disabled if two or more volumes are selected from the volume list.

Paircreate.....Creates the HORC pair(s) by making the SMPL volume(s) selected from the volume list become the P-VOL(s). Before executing this function, the CU that includes the S-VOL(s) must be registered as the RCU(s). This function is disabled if the volume(s) selected include(s) the volume(s) in the status other than SMPL.

Change Option ...Changes the pair option of the volume(s) (not in the SMPL status) selected from the volume list. The pair option can also be specified when the pair is created, but this function is used to change the option during the operation. This function is disabled if any volume(s) selected include(s) the SMPL, suspending, deleting and Secondary Volume(s).

Pairsplit-r.....Suspends the pair(s) of the volume(s) selected from the volume list. This function is disabled if any volume(s) selected include(s) the SMPL, PSUS, PSUE suspending, and deleting volume(s).

Pairsplit-S.....Deletes the pair of the volume(s) selected from the volume list.

Copyright ©1998,2000, Hitachi, Ltd.

Pairresync.....Resume the pair of the volume(s) (in the suspend status) selected from the volume list. This function is enabled if the selected volume(s) is(are) suspended P-VOL(s).

C/T Group Operation

C/T Group List...X XXX XXXXX / XXXX ...
① ② ③ ④ ⑤ ⑥

① C/T group# (0 ~ F)
② Type of own CU.
MCU : Own CU is MCU for the paired CU.
RCU : Own CU is RCU for the paired CU.
M&R : Own CU and the paired CU are the same.
③ S/N of the paired CU.
If "Used" is displayed, the paired CU is not exist.
④ Slash.
⑤ SSID of the paired CU.
⑥ If "..." is displayed, own CU have two or more paired CU.

Group Status.....Displays the status of a C/T group selected from C/T group list.

Add Group.....Assigns the C/T group selected from C/T group list. This function is disabled if the specified C/T group has already assigned.

Delete Group. .....Releases the C/T group selected from C/T group list. This function is enabled if the CU type of the specified C/T group is "MCU" (Displayed "MCU" on the C/T group list).

Group Option .....Changes the option parameters of the C/T group selected from C/T group list. This function is disabled if the CU type of the specified C/T group is "RCU" (Displayed "RCU" on the C/T group list). Also, the specified C/T group is not assigned, too.

Async Option Operation

Async Option.....Changes the option parameters of the asynchronous function.

Other Functions

Ldev Operation...Displays HORC Sub Main Screen of OPEN VOL selected from Volume List of HORC Main screen.

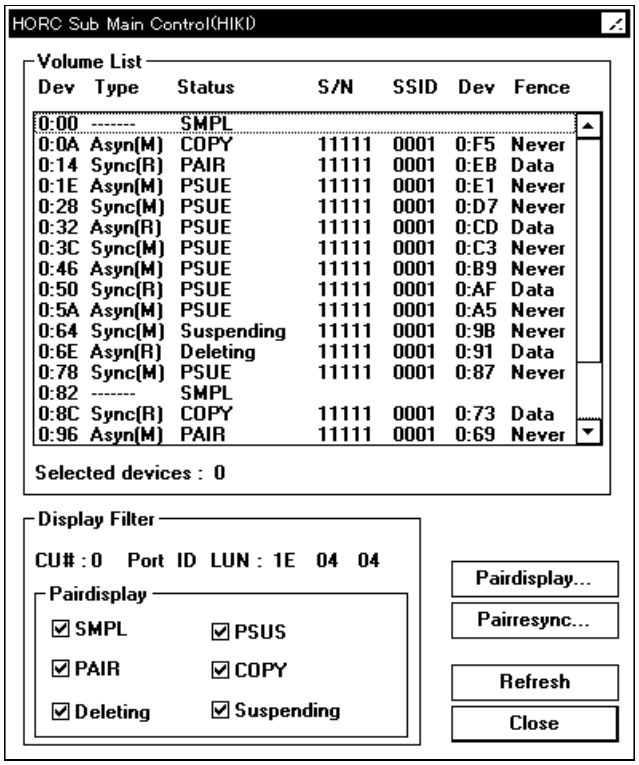
Usage.....Displays HORC operation control information.

Refresh. .....Updates information displayed on the screen. Information displayed on the screen is kept as is until this function is executed.

Exit.....Exits the operation screen.

Copyright ©1998,2000, Hitachi, Ltd.

7.2 HORC Sub Main screen



Volume List ..... This list box displays valid LDEV of OPEN VOL and the Pairdisplay.
"X:XX XXXX(X) XXXXXXX XXXXX XXXX X:XX X"
① ② ③ ④ ⑤ ⑥ ⑦ ⑧

① #CU:#LDEV..... CU address:LDEV address
② Copy Type ..... Sync : Synchronous copy pair
Asyn : Asynchronous copy pair
"---" : SMPL Volume
③ Volume Type ..... "P" : Primary Volume
"S" : Secondary Volume
"-" : SMPL Volume
④ Pairdisplay ..... Volume Pairdisplay
"SMPL" : SMPL
"PAIR" : PAIR
"COPY" : COPY
"PSUS/PSUE" : Suspend
"Suspending" : Suspending
"Deleting" : Deleting
⑤ Serial Number of Destination Controller
⑥ SSID of Destination Controller
⑦ #CU:#LDEV..... CU address on the destination Controller
:LDEV address on the destination Controller
⑧ Fence Level..... LDEV Fence Level

Display Filter..... Display filter of the Volume List.

Copyright ©1998,2000, Hitachi, Ltd.

Pair Operation

Pairdisplay.....Displays the status of a volume selected from the volume list. This function is disabled if two or more volumes are selected from the volume list.

HORC Pair Operation

Pairresync.....Resume the pair of the volume(s) (in the suspend status) selected from the volume list. This function is disabled if the volume(s) selected include(s) a asynchronous copy pair(s).
If all the pair of the volume(s) (in the suspend status) are not resumed, PDUB is displayed at this OPEN VOL in the HORC Main screen.

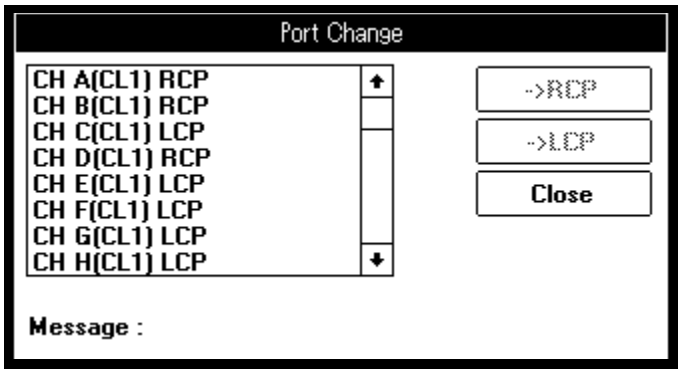
Other Functions

Refresh .....Updates information displayed on the screen. Information displayed on the screen is kept as is until this function is executed.

Close.....Close the operation screen.

Copyright ©1998,2000, Hitachi, Ltd.

7.3 Port...screen



List ..... Displays the list of usable serial channels.

CH X[CL Y] XXX
① ② ③

① Channel ID (A to R)

② Cluster ID (1 or 2)

③ Channel type (LCP or RCP)

-> RCP ..... Changes the channel type selected from the list to the RCP.

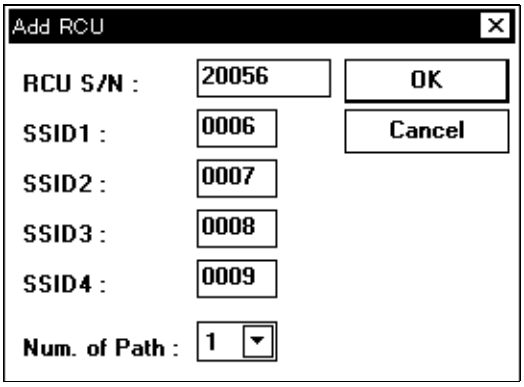
-> LCP..... Changes the channel type selected from the list to the LCP.

Message..... Displays the progress of each changing process when the Changing function is started.
Checking port# CH X[CL Y] ...
Blocking port# CH X[CL Y] ...
Setting port# CH X[CL Y] ...
Restoring port# CH X[CL Y] ...

Copyright ©1998, Hitachi, Ltd.

7.4 Add RCU... screen

• Specify RCU parameter.



RCU S/N.....Input the Serial number of RCU.
"XXXXX" .....5 characters.

SSID1 ~ 4.....Input the SSID of RCU. (Note)
"XXXX" .....4 hexadecimal digits number.

Num. Of Path .....Specifies the number of path between MCU & RCU.(1 ~ 4)

Option... .....Specified RCU option item. (Refer to RCU Option...)

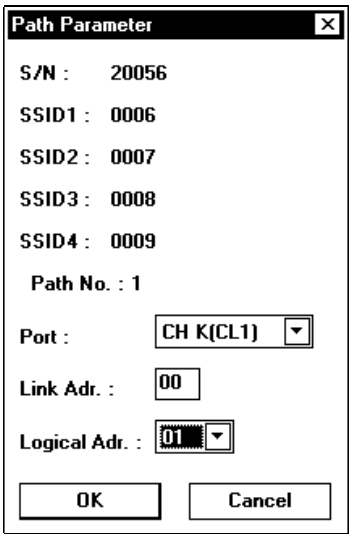
Note: How to Set Up HORC of DKC310I.

1. Setting SSIDs
   DKC310I can have different SSIDs for each 64 boundary of LDEV#.

   It is possible for DKC310I to have independent SSIDs for each 64 boundary of LDEV#.

Copyright ©1998,1999, Hitachi, Ltd.

• Specify PATH parameter.
Input the RCU parameter, then input the path parameter for each specified path.



Port.....Specified port using as RCP in the Combo Box.

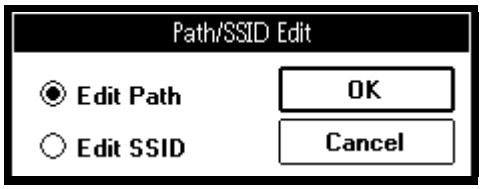
Link Adr. .....Input the destination link address.
"XX" ..... 2 characters of hexadecimal number. ("00" through "fd")
If RCU is connected to MCU directly without ESCD, specified "00" at the [Link Adr.].
If RCU is connected to MCU with ESCD, specified destination link address at the [Link Adr.].

Logical Adr. .....Specified logical address of the destination DKC.
Please select a logical address which is defined as CU images (00 through 03) in the RCU.

Copyright ©1998,1999, Hitachi, Ltd.

7.5 Edit Path/SSID

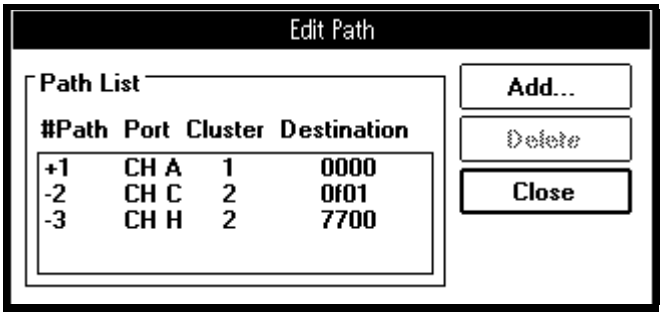
7.5.1 Path/SSID Edit... screen



Edit Path... Adding/reducing the number of paths.

Edit SSID . Adding/reducing the number of SSIDs.

7.5.2 Edit Path... screen



Path List ... Display current path's information.

"X CH X X XXXX"
① ② ③ ④

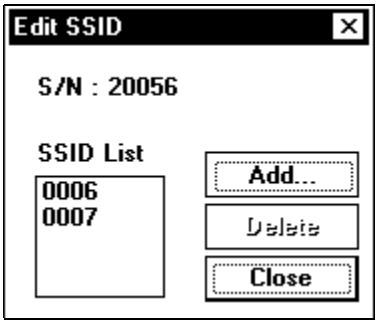
① #Path.....Status(+:Normal -:Abnormal) and Path No.(1 ~ 4)
② #Port .....Port of path creating.(CH A ~ CH R)
③ #Cluster .....Cluster. (1 ~ 2)
④ Destination.....Link address (2 hexadecimal numbers) + Logical address (2 hexadecimal numbers)

Add..... Adding new path.(Refer to Add.. RCU-Specified Path Parameter)

Delete ..... Deleting the path selected in the Path List.

Copyright ©1998, Hitachi, Ltd.

7.5.3 Edit SSID... screen

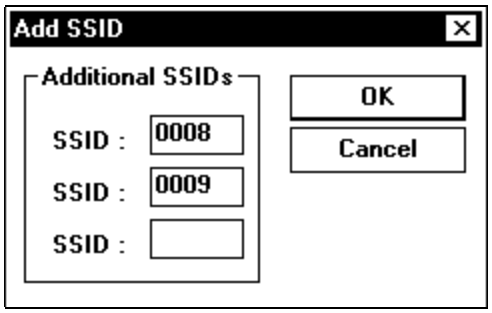


SSID List.. Display current SSIDs information.

Add..... Adding new SSIDs.

Delete ..... Deleting the SSIDs selected in the SSID List.

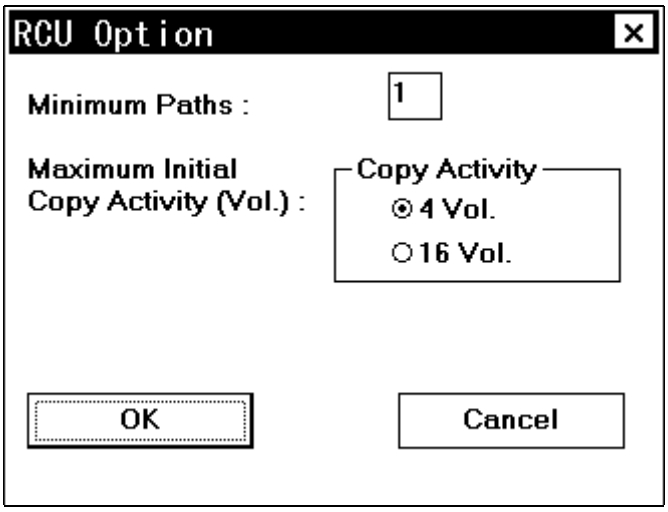
7.5.4 Add SSID... screen



Additional SSIDs ..... To add the SSIDs, input 4 hexadecimal digits numbers.

Copyright ©1998,1999, Hitachi, Ltd.

7.6 RCU Option... screen

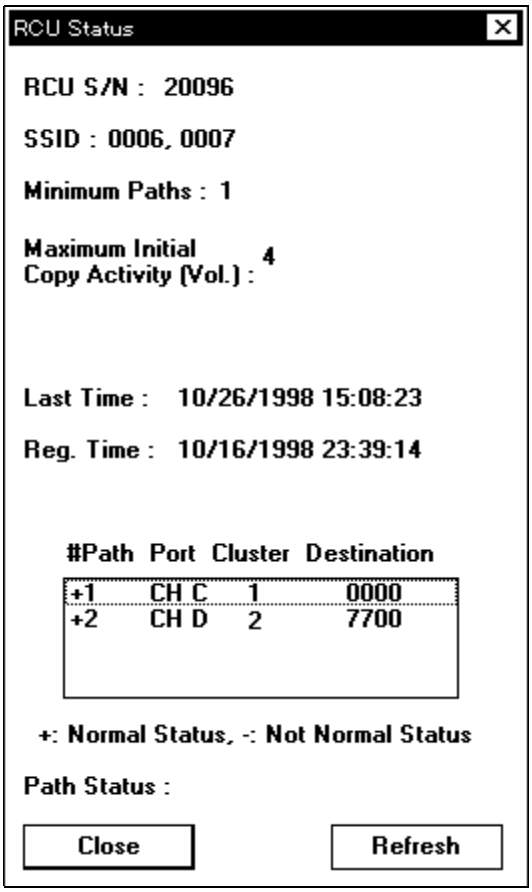


Minimum Paths.....Specifies lowest number of paths needed for continuation of HORC. Defined between 1 to 4.

Maximum Initial Copy Activity (Vol.).....Specifies maximum number of Initial copy execution. (First group of defined HORC volume pairs.) Defined 4 or 16.

Copyright ©1998,2000, Hitachi, Ltd.

7.7 RCU Status... screen



RCU s#.....Display Serial number of the RCU.
"XXXXX" .....5 decimal digits.

SSID.....Display SSID of the RCU.
"XXXX" .....4 hexadecimal digits.

Minimum Paths.....Display lowest number of paths necessity for continuation of HORC.

Maximum Initial Copy Activity (Vol.).....Display maximum number of Initial copy execution.

Last Time .....Display last update time & date of the RCU.

Reg. Time.....Display registration time & date of the RCU.

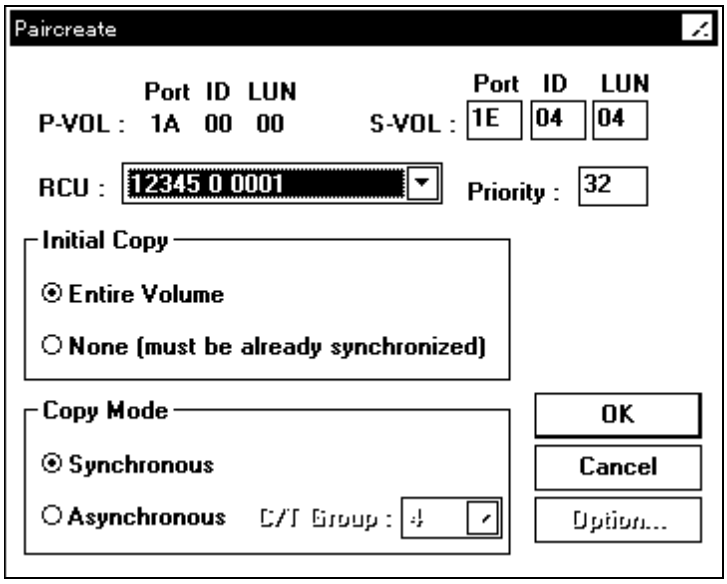
Copyright ©1998,2000, Hitachi, Ltd.

Path Status.....Display status of path that selected in list.
If it isn't "Normal", do the recovery action according to TRBL06-190 "Recovery Action of Path Status Error".
"Nothing".....No established.
"Normal" .....The status of path is normal.
"Initialization Failed" .....Error has occurred in the path initialization.
"Communication Time Out" Communication between MCU and RCU time out.
"Resource Shortage(MCU)" Resource at the MCU is short.
"Resource Shortage(RCU)" Resource at the RCU is short.
"Serial Number Mismatch" Specified serial number is mismatch.
"Invalid Port".....Specified port is invalid.

Refresh.....Refresh displayed information.

Copyright ©1998, Hitachi, Ltd.

7.8 Paircreate... screen



P-VOL.....Display volume(OPEN VOL) that is MCU side.
PORT ..... Display PORT Number of OPEN VOL.
ID ..... Display SCSI ID Number of OPEN VOL.
LUN ..... Display LUN Number of OPEN VOL.

S-VOL.....Specifies volume(OPEN VOL) that is RCU side.
PORT ..... Specifies PORT Number of OPEN VOL that is RCU side.
ID ..... Specifies SCSI ID Number of OPEN VOL that is RCU side.
LUN ..... Specifies LUN Number of OPEN VOL that is RCU side.
"XX" ..... 2 hexadecimal digits.

Priority .....Specifies priority of initial copy execution.

RCU .....Select RCU from the Combo Box.
The list of RCUs currently registered will appear.

Initial Copy .....Specifies initial copy type. (Valid only for the remote dual copy function.)
"Entire Volume" .....Specifies all cylinders.
"None" .....Nothing

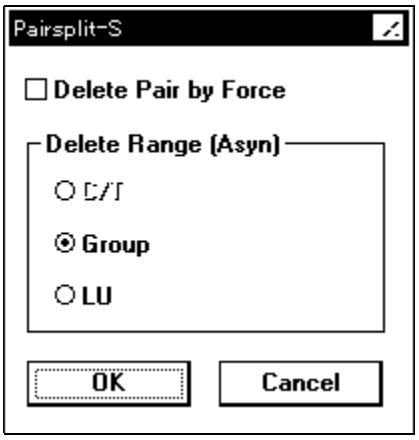
Copy Mode.....Specifies copy mode.
"Synchronous" .....Specifies synchronous copy.
"Asynchronous".....Specifies asynchronous copy.

C/T Group .....Select C/T group# from the combo box.
The list of C/T group currently assigned will appear, except the CU type of the C/T group is not RCU (Displayed as "RCU" in the C/T group list).
This combo box is displayed effectively if the "Asynchronous" is specified.

Option... .....Specifies pair option item. (Refer to Pair Option...)

Copyright ©1998,2000, Hitachi, Ltd.

7.9 Pairsplit-S... screen



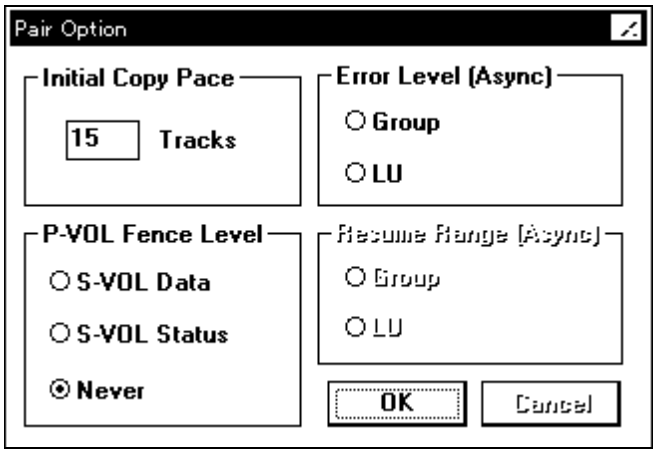
Delete Pair by Force.... Specified forcibly delete mode.
The Pairdisplay is deleted even when the communication with the CU is disabled. In the case of asynchronous copy pairs, “Delete Pair by Force” can be specified if the Delete Range is “Group”.

Delete Range(Asyn).....Select the kind of deletion. (Effective only asynchronous copy pair. Fixed “LU” if 2 or more volume are specified.)

- C/T..... All pair(s) will be deleted which have the same C/T as the specified pair. (Displayed effectively if the specified pair(s) is(are)) :
  - S-VOL
  - Neither “Suspending” status nor “Deleting” status
- Group... All pair(s) will be deleted which are assigned to the same C/T group as the specified pair.
- LU..... Only specified pair(s) will be deleted.

Copyright ©1998,2000, Hitachi, Ltd.

7.10 Pair Option... screen



Initial Copy Pace..... Specifies Initial copy pace.
"NN".....Decimal number within a range of 1 to 15.

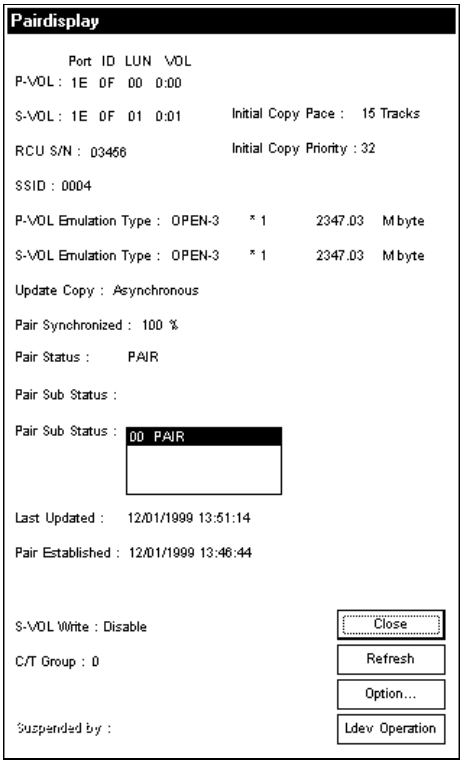
P-VOL Fence Level ..... P-VOL fence level
"S-VOL Data" ..... P-VOL fence when data is unmatched
"S-VOL Status"..... P-VOL fence when status can not be changed.
"Never"..... Never fence
(Note: Fixed "Never" when asynchronous copy pairing)

Error Level (Async) ..... The suspension kind when asynchronous pairing is failed. Displayed effectively if the specified volume is asynchronous copy volume.
"Group" .....All asynchronous copy volumes under the same C/T group as the specified volume(s) will be suspended.
"LU" .....Only specified volume(s) will be suspended.

Resume Range (Async).... The resumption kind of suspended asynchronous copy volume. Displayed effectively when asynchronous copy pair resuming.
"Group" .....All asynchronous copy volumes under the same C/T group as the specified volume(s) will be resumed.
"LU" .....Only specified volume(s) will be resumed.

Copyright ©1998,2000, Hitachi, Ltd.

7.11 Pairdisplay... screen (of OPEN VOL)



P-VOL.....Displays volume(OPEN VOL) (MCU side).
PORT...Display PORT Number of OPEN VOL.
ID.....Display SCSI ID Number of OPEN VOL.
LUN.....Display LUN Number of OPEN VOL.
VOL.....Display LDEV top address of OPEN VOL.

S-VOL.....Displays volume(OPEN VOL) (RCU side).
PORT...Display PORT Number of OPEN VOL.
ID.....Display SCSI ID Number of OPEN VOL.
LUN.....Display LUN Number of OPEN VOL.
VOL.....Display LDEV top address of OPEN VOL.

RCU S/N.....Displays serial number of the RCU.

SSID.....Displays SSID of the RCU.

Initial Copy Pace.....Displays Initial copy pace. (Remote Dual Copy)
"NN".....Decimal number within a range of 1 to 15.

Initial Copy Priority .....Displays priority of initial copy execution.

Operation Mode .....Displays pair creative mode.
"RDC" .....Remote Dual Copy(HORC)

P-VOL Emulation Type.....Displays P-VOL device emulation type and volume size (OPEN VOL).

S-VOL Emulation Type.....Displays S-VOL device emulation type and volume size (OPEN VOL).

Copyright ©1998,2000, Hitachi, Ltd.

Update Copy .....Displays pair synchronous mode.

Pair Synchronized .....Displays progress of initial copy.
(Note: There is a possibility to be displayed as “Not Valid(Initial copy not complete)” when agreeing with undermentioned condition.
• The specified volume is S-VOL.
• The specified volume is asynchronous copy pair.
• The specified volume is in the suspended state.)

Pair status .....Displays Pairdisplay information.
“SMPL”
“PDUB”
“COPY”
“PAIR”
“PSUS(P-VOL by Operator)”
“PSUS(S-VOL by Operator)”
“PSUS(by MCU)”
“PSUE(by RCU)”
“PSUS(Delete pair to RCU)”
“PSUE(S-VOL failure)”
“PSUE(MCU IMPL)”
“PSUE(Initial Copy Failed)”
“Suspending”
“Deleting”
“PSUE(MCU P/S OFF)”

Pair Sub Status .....Displays pair sub status information.
“Warning in SMPL”
“Warning in PSUE”
“Warning in PAIR”

Last Updated .....Displays last update time of Pairdisplay.

Pair Established.....Displays registration time the volume pair.

Pair Suspended.....Displays suspension time of the volume pair.

S-VOL write.....Display whether to enable S-VOL to read/write.

C/T Group .....Displays the C/T group# (‘0’ ~ ‘F’) of the volume.
(Displayed effectively if the volume is asynchronous copy volume.)

Copyright ©1998,2000, Hitachi, Ltd.

Suspended by .....Displays the C/T status the volume.
(Displayed effectively when agreeing with undermentioned condition.)
• The volume is S-VOL.
"Group" ....The consistency time of the volume correspond to the C/T group's which the volume belongs to.
"LU" .....The consistency time of the volume is different from the C/T group's which the volume belongs to.

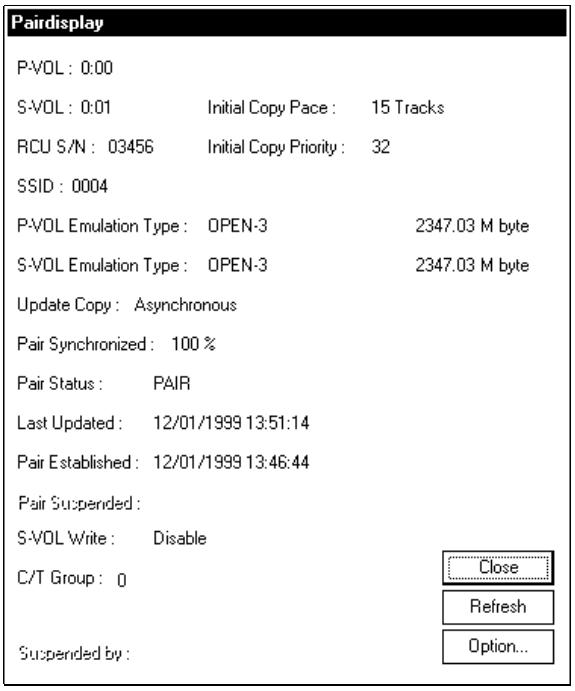
Option... .....Displays pair option item. (Same to Pair Option...)

Refresh .....Refresh displayed information.

Ldev Operation .....Displays HORC Sub Main screen of OPEN VOL, and resuming operation for LDEV can be performed.

Copyright ©1998,2000, Hitachi, Ltd.

7.12 Pairdisplay... screen (of LDEV)



P-VOL.....Displays volume(LDEV) (MCU side).

S-VOL.....Displays volume(LDEV) (RCU side).

RCU S/N.....Displays serial number of the RCU.

SSID.....Displays SSID of the RCU.

Initial Copy Pace.....Displays Initial copy pace. (Remote Dual Copy)
"NN".....Decimal number within a range of 1 to 15.

Initial Copy Priority .....Displays priority of initial copy execution.

Operation Mode .....Displays pair creative mode.
"RDC" .....Remote Dual Copy(HORC)

P-VOL Emulation Type.....Displays P-VOL device emulation type and volume size.

S-VOL Emulation Type.....Displays S-VOL device emulation type and volume size.

Update Copy .....Displays pair synchronous mode.

Pair Synchronized .....Displays progress of initial copy(Remote Dual Copy).
(Note: There is a possibility to be displayed as "Not Valid(Initial copy not complete)" when agreeing with undermentioned condition.
• The specified volume is S-VOL.
• The specified volume is asynchronous copy pair.
• The specified volume is in the suspended state.)

Copyright ©1998,2000, Hitachi, Ltd.

Pair status ..... Displays Pairdisplay information.
"SMPL"
"PDUB"
"COPY"
"PAIR"
"PSUS(P-VOL by Operator)"
"PSUS(S-VOL by Operator)"
"PSUS(by MCU)"
"PSUE(by RCU)"
"PSUS(Delete pair to RCU)"
"PSUE(S-VOL failure)"
"PSUE(MCU IMPL)"
"PSUE(Initial Copy Failed)"
"Suspending"
"Deleting"
"PSUE(MCU P/S OFF)"

Last Updated ..... Displays last update time of Pairdisplay.

Pair Established..... Displays registration time the volume pair.

Pair Suspended..... Displays suspension time of the volume pair.

S-VOL write..... Display whether to enable S-VOL to read/write.

C/T Group ..... Displays the C/T group# ('0' ~ 'F') of the volume.
(Displayed effectively if the volume is asynchronous copy volume.)

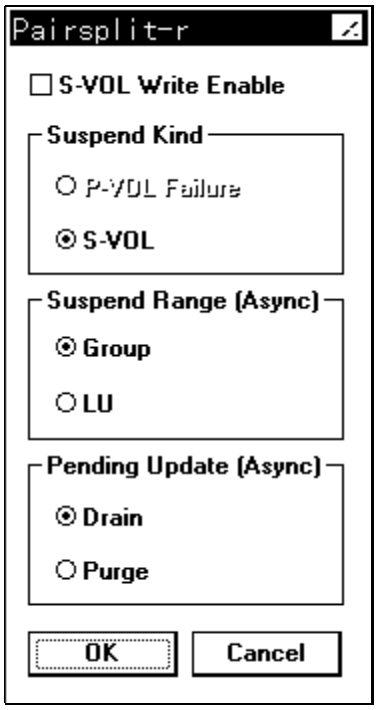
Suspended by ..... Displays the C/T status the volume.
(Displayed effectively when agreeing with undermentioned condition.)
• The volume is S-VOL.
"Group" .... The consistency time of the volume correspond to the C/T group's which the volume belongs to.
"LU" ..... The consistency time of the volume is different from the C/T group's which the volume belongs to.

Option... ..... Displays pair option item. (Same to Pair Option...)

Refresh ..... Refresh displayed information.

Copyright ©2000, Hitachi, Ltd.

7.13 Pairsplit-r... screen



S-VOL Write Enable..... Specifies whether to enable S-VOL write.
If you want to use this parameter, select “S-VOL” in Suspend Kind parameter.

Suspend Kind..... Specifies suspended type.
“P-VOL Failure” .... P-VOL suspension reported as P-VOL failure.,
“S-VOL”..... S-VOL suspension
(Note: “P-VOL Failure” cannot be specified for asynchronous copy pair.)

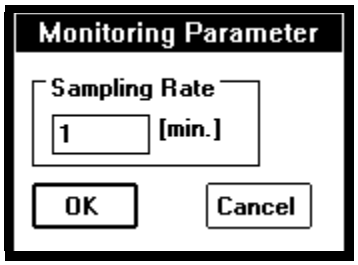
Suspend Range (Async)... Specifies suspension kind of asynchronous copy pair(s).
Displayed effectively when asynchronous copy pair(s) suspension.
“Group” .....All asynchronous copy pair which belong to the same C/T group as the specified volumes will be suspended.
“LU” .....Only specified volume(s) will be suspended.
(Note: If 2 or more volume pairs are specified, fixed to “LU”.)

Pending update (Async)... Specifies releasing method of the Record Set.
Displayed effectively when asynchronous copy pair(s) suspension.
“Drain” .....The pair volume(s) of the specified volume(s) will be updated with pending data in the Record Set.
“Purge” .....The pair volume(s) of the specified volume(s) will be not updated.

Copyright ©1998,2000, Hitachi, Ltd.

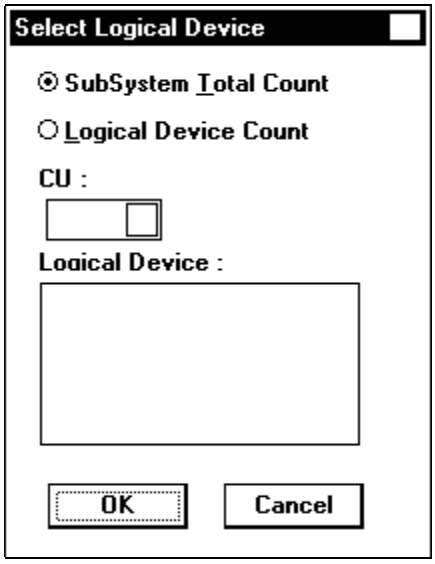
7.14 Usage... screen

Monitoring Parameter



Sampling Rate.... Sets the sampling rate of operation control information within a range of 1 to 546 in steps of a minute.

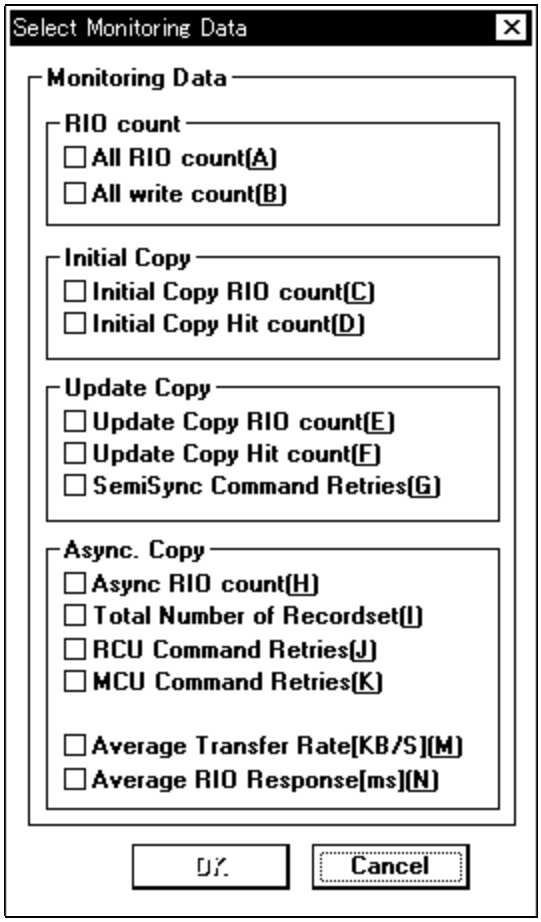
Select Logical Device



Logical Device:.. Displays the list of logical devices valid in the subsystem. Select the device from the list to display its operation information. To display the operation information of the whole subsystem, select "Sub System".

Copyright ©1998, Hitachi, Ltd.

Select Monitoring Data



RIO count.....Specifies the read/write count concerning the HORC.

Initial Copy .....I/O count for the initial copy

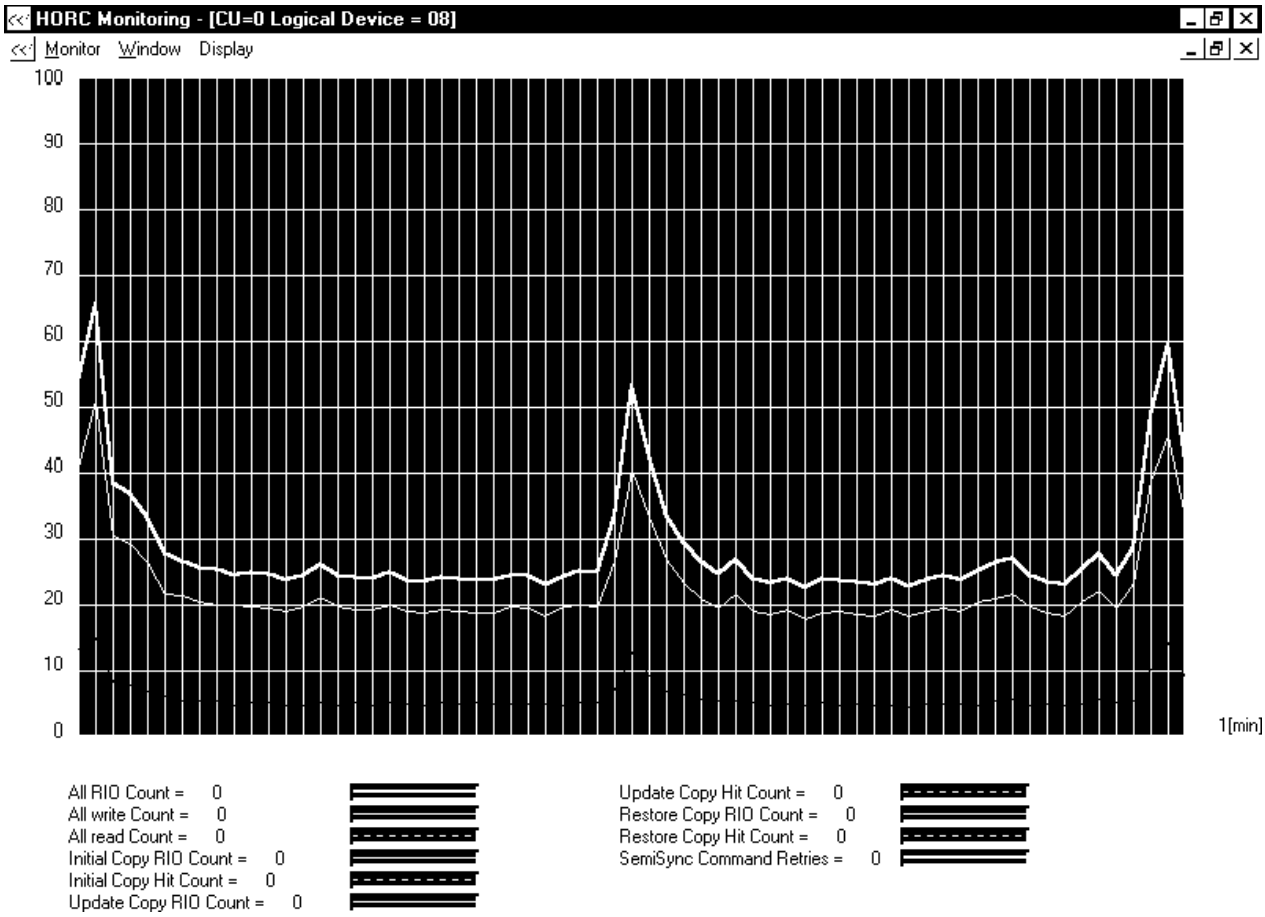
Update Copy .....I/O count for renewal copy

Restore Copy.....Count for recovering copy

Async. Copy.....I/O count for Asynchronous Remote Copy

Copyright ©1998,1999, Hitachi, Ltd.

Remote Copy Monitoring Screen



Monitor Menu .... Start.....Displays another Remote Copy Monitoring screen.
EXit.....Closes the Remote Copy Monitoring screen.

Window Menu ... Cascade (C)....Displays Remote Copy Monitoring windows side by side.
Tile (T).....Displays lined-up Remote Copy Monitoring windows.
Icon (I) .....Lines up Remote Copy Monitoring window icons.
All close (A) ..Closes all the Remote Copy Monitoring windows.

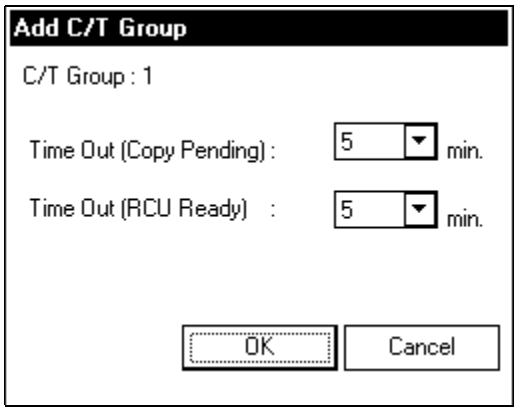
Display Menu..... Line Model ....Displays or hides the explanation of lines.

Vertical Axis ..... Indicates the count number.

Horizontal axis... Indicates the time elapsed. A scale division on the horizontal axis indicates a sampling rate. The latest data is drawn to the right.

Copyright ©1998, Hitachi, Ltd.

7.15 Add Group/Group Option... screen



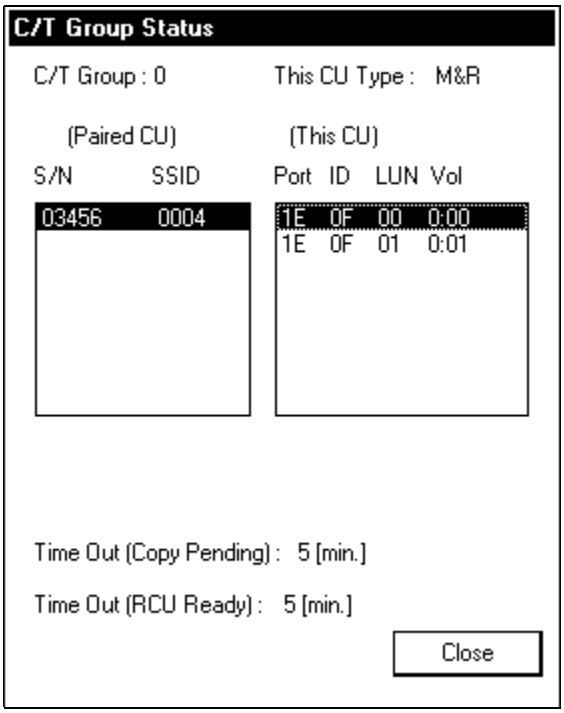
C/T group.....Displays C/T group# selected from C/T group list.

Time Out (Copy Pending).....Specifies the maximum delay time of the update data.
(None, 1 ~ 15 [min.])

Time Out (RCU Ready).....Specifies the maximum waiting time for the RCU gets ready.
(None, 1 ~ 10 [min.])

Copyright ©2000, Hitachi, Ltd.

7.16 Group status... screen



C/T group.....Displays C/U group# selected from C/T group list.

CU Type.....Displays the CU type of the specified C/T group#.
"MCU"..... MCU
"RCU" ..... RCU
"M&R" ..... MCU&RCU

S/N SSID List Box.....Displays the serial numbers and SSIDs of RCUs which are registered in the specified C/T group#.

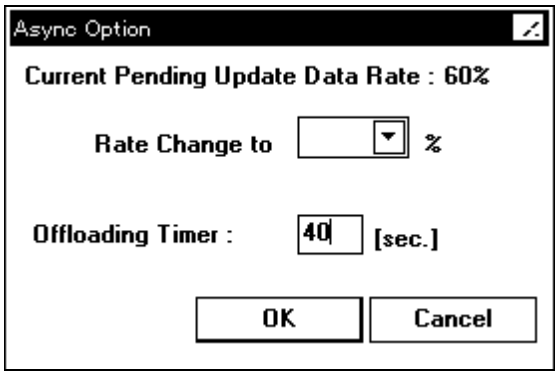
Port ID LUN Vol.....Displays the LUN#(Port, ID, LUN) and Vol# which belongs to the specified C/T group#

Time Out (Copy Pending).....Display the maximum delay time of the specified C/T group#.

Time Out (RCU Ready).....Display the maximum waiting time of the specified C/T group#.

Copyright ©2000, Hitachi, Ltd.

7.17 Async Option... screen



Current Pending Update Data Rate..... Displays current occupation rate of pending update data among the Record Set.

Rate Change to..... Specifies occupation rate of pending update data among the Record Set.(30 through 70)
(Note: If the C/T group(s) which is(are) assigned by HORC is(are) exist, the rate can not be changed.)
(Notice)
When using SVP version 51-44-XX, the rate can be turned within 40 through 70. When using 51-45-XX or later, it can be turned within 30 through 70.

Offloading Timer ..... Specifies monitoring time for the Record Set. (1 through 255)

Copyright ©2000, Hitachi, Ltd.

8 Details of the HMRCF Operation Screen

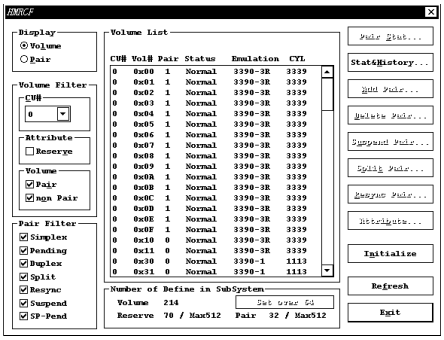
[0] Display HMRCF main screen

(1) Select the mode View or Modify.
View Mode: Only confirming the volume status is available.
Modify Mode: All operation and confirming the volume status are available.

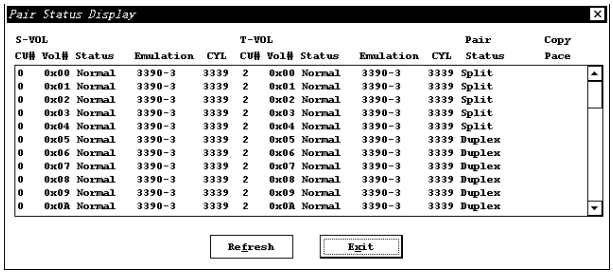
(2) Click the [HMRCF] button on the svp window.
After reading some configuration and HMRCF information.
The HMRCF main screen comes out.

[1] Procedure for confirming the volume status

(1) Select the volumes whose statuses you want to confirm, then click the [Pair Stat...] button.



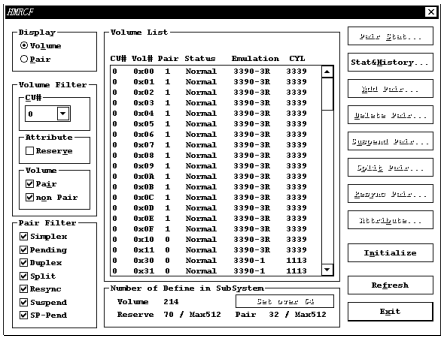
(2) The statuses of the volumes you selected are displayed. To update the displayed information to the latest one, click the [Refresh] button. The screen can be closed by clicking the [Exit] button.



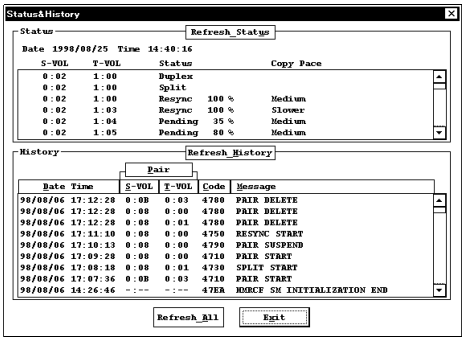
Copyright ©1998, Hitachi, Ltd.

[2] Procedure for confirming Status & History

(1) Click the [Stat&History] button of HMRCF main screen.



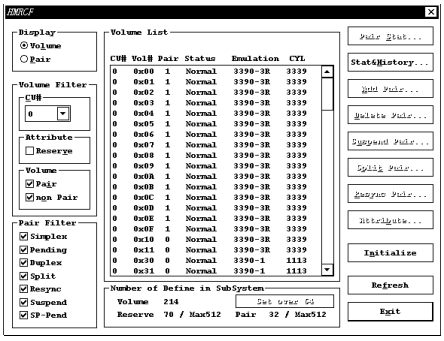
(2) The status situation of the present pairs are displayed in the Status frame. To update the displayed information of the side of Status to the latest one, click the [Refresh_Status] button.
The one to have sorted a condition transfer history by the time series is displayed in the History frame. When sorting in the time series, click the [Date Time] button. When sorting in the number of S-VOL series, click the [S-VOL] button. When sorting in the number of T-VOL series, click the [T-VOL] button. When sorting in the Message Code series, click the [Code] button. When sorting in the Message series, click the [Message] button. When sorting in the Pair series, click the [Pair] button. When updating the history of the condition transfer of the pair, click the [Refresh_History] button.
When updating the all information, click the [Refresh_All] button. The screen can be closed by clicking the [Close] button.



Copyright ©1998, Hitachi, Ltd.

[3] Procedure for creating a volume pair

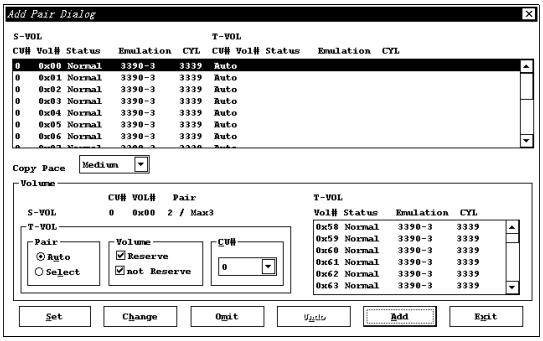
(1) Don't check the display attribute to "Reserve" on the HMRCF main screen, select a volume with which you want to create a volume pair, then click the [Add Pair...] button.



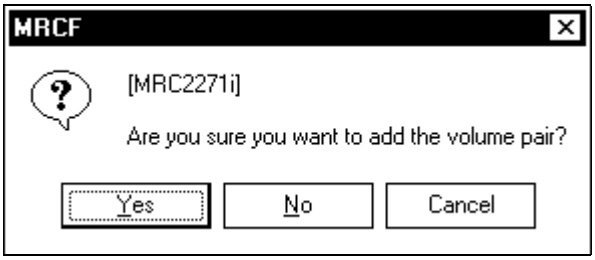
⚠ NOTICE

To create a volume pair, reserve volume must be defined. Refer to SVP08-80 and define reserve volume.

(2) A T-VOL is automatically selected for the S-VOL that you selected. When you add the T-VOL, select it on the screen, then click the [Set] button. To delete a pair from the Pair Volume list, select the pair you want to delete from the Pair Volume list and click the [Omit] button.
When you create a volume pair using the reserve volume displayed, click the [Add] button.
To stop the pairing, click the [Exit] button.



(3) A message box asking for confirmation whether to execute the pairing appears. To execute the pairing with the selected volumes, click the [Yes] button. To stop the pairing, click the [No] button. When you click the [Cancel] button, the screen for creating volume pairs returns.

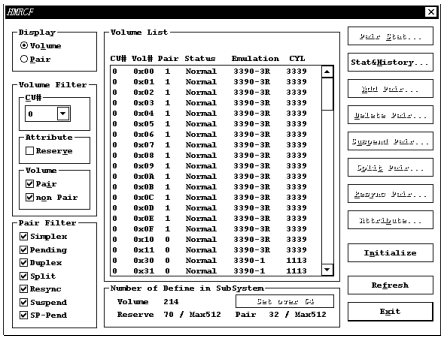


(4) When indicating the making of a pair, a status display screen is displayed. It confirms that status of pair which referred to SVP08-10 and indicated making becomes duplex.

Copyright ©1998, Hitachi, Ltd.

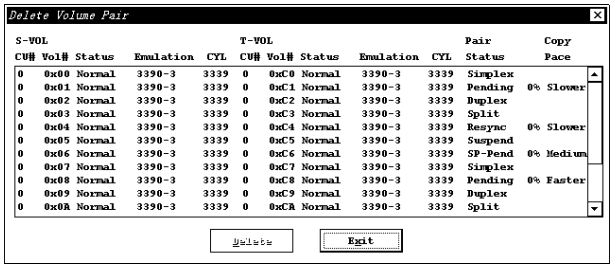
[4] Procedure for parting a volume pair

(1) Don't check the display attribute to "Reserve" on the HMRCF main screen, select a volume that you want to part the pair, then click the [Del Pair...] button.

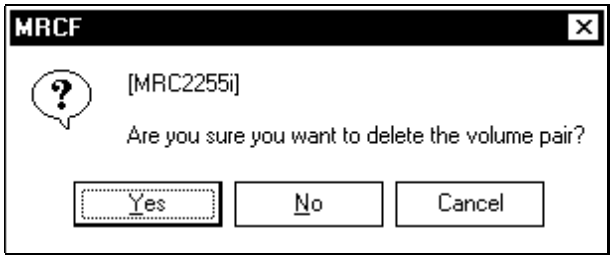


NOTICE
When the selected volume pair is not split status, the data of the T-VOL is not guarantied because there are differential data from the S-VOL.

(2) Select a volume pair that you want to part from the Pairs displayed and click the [Delete] button. To stop the parting, click the [Exit] button.



(3) A message box asking for confirmation whether to execute the parting appears. To actually part the selected volume pair, click [Yes] button. To stop the parting, click [No] button. When you click the [Cancel] button, the screen for parting volume pairs returns.

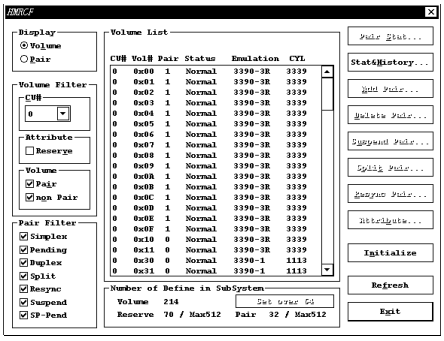


(4) When indicating the partition of the pair, it confirms that the pair which was specified by the HMRCF main screen is partitioned. When the pair status is displayed with Simplex, concerned pair is in the transition condition of the pair partition. Push [Refresh] button with the HMRCF main screen and confirm that concerned pair is partitioned.

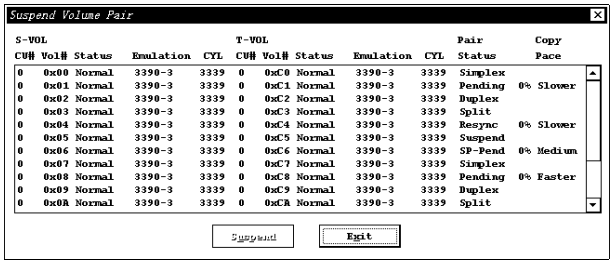
Copyright ©1998, Hitachi, Ltd.

[5] Procedure for suspending a volume pair

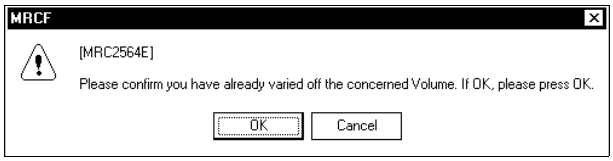
(1) Don't check the display attribute to "Reserve" on the HMRCF main screen, select a volume that you want to suspend, then click the [Suspend Pair...] button.



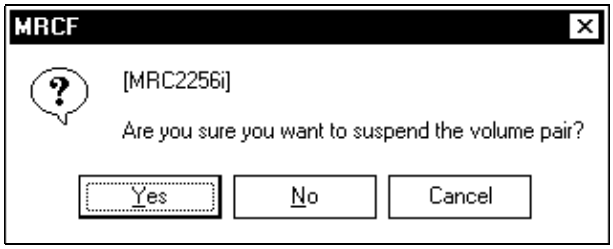
(2) Select a volume pair that you want to suspend from the pairs displayed and click the [Suspend] button. To stop the suspension, click the [Exit] button.



(3) The message to confirm that concerned Volume is an off line is displayed. It pushes [OK] button if confirming that concerned Volume is an off line. When you click the [Cancel] button, the screen for suspending volume pairs returns.



(4) A message box asking for confirmation whether to execute the suspension appears. To actually suspend the selected volume pair, click the [Yes] button. To stop the suspension, click the [No] button. When you click the [Cancel] button, the screen for suspending volume pairs returns.

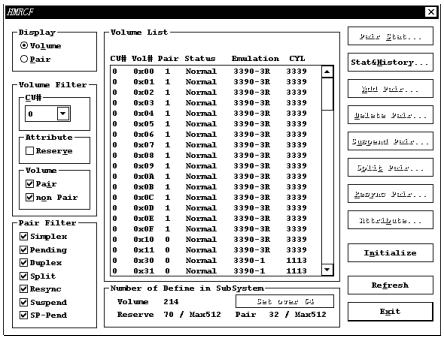


(5) When indicating suspend of pair, status display screen is displayed. It confirms that status of pair which referred to SVP08-10 and indicated making becomes suspend.

Copyright ©1998, Hitachi, Ltd.

[6] Procedure for splitting a volume pair

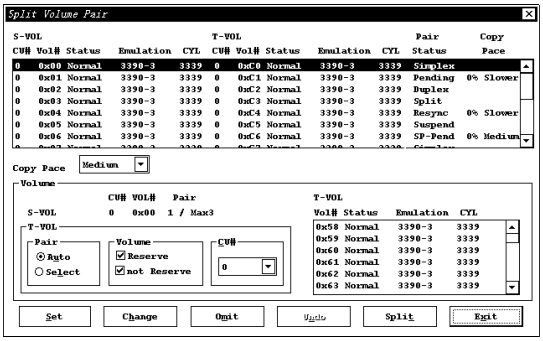
(1) Don't check the display attribute to "Reserve" on the HMRCF main screen, select a volume that you want to split, then click the [Split Pair...] button.



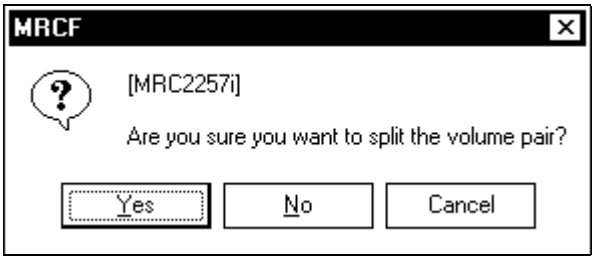
⚠ NOTICE

To splitting a volume pair newly, reserve volume must be defined. Refer to SVP08-80 and define reserve volume.

(2) A T-VOL is automatically selected for the S-VOL that you selected. When you add the T-VOL, select it on the screen, then click the [Set] button. To delete a pair from the Pair Volume list, select the pair you want to delete from the Pair Volume list and click the [Omit] button.
When you split a volume pair using the reserve volume displayed, click the [Split] button.
To stop the spliting, click the [Exit] button.



(3) A message box asking for confirmation whether to execute the splitting of the volume pair appears. To actually split the selected volume pair, click [Yes] button. To stop the splitting, click the [No] button. When you click the [Cancel] button, the screen for splitting volume pairs returns.

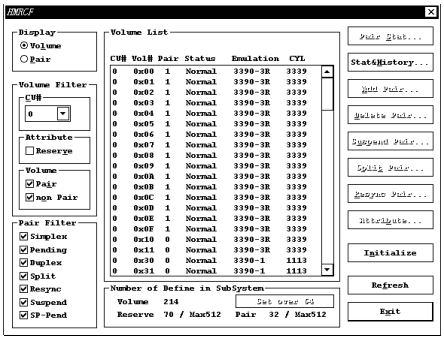


(4) When indicating split of pair, status display screen is displayed. It confirms that status of pair which referred to SVP08-10 and indicated making becomes split.

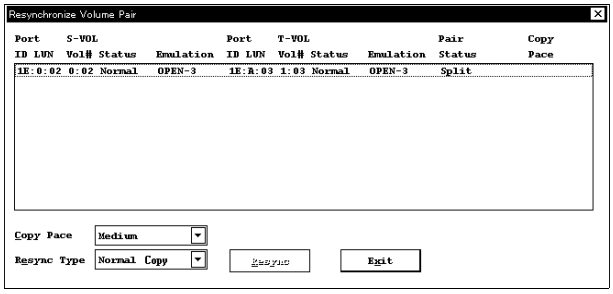
Copyright ©1998, Hitachi, Ltd.

[7] Procedure for resynchronizing a volume pair

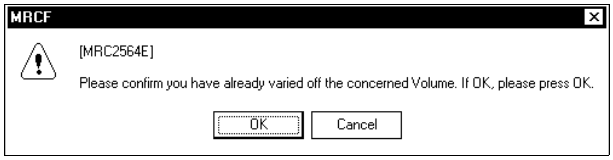
(1) Don't check the display attribute to "Reserve" on the HMRCF main screen, select a volume that you want to resynchronize, then click the [Resync Pair...] button.



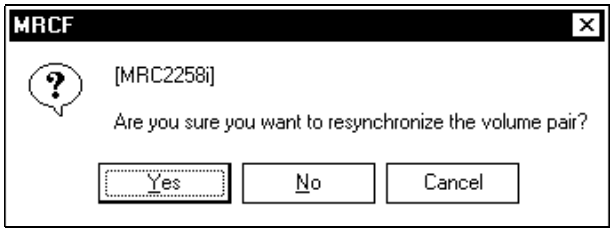
(2) Select a volume pair that you want to resynchronize from the pairs displayed and click the [Resync] button. To stop the resynchronization, click the [Exit] button.



(3) The message to confirm that concerned Volume is an off line is displayed. It pushes [OK] button if confirming that concerned Volume is an off line. When you click the [Cancel] button, the screen for resynchronizing volume pairs returns.



(4) A message box asking for confirmation whether to execute the resynchronization appears. To actually resynchronize the selected volume pair, click the [Yes] button. To stop the synchronization, click the [No] button. When you click the [Cancel] button, the screen for resynchronizing volume pairs returns.

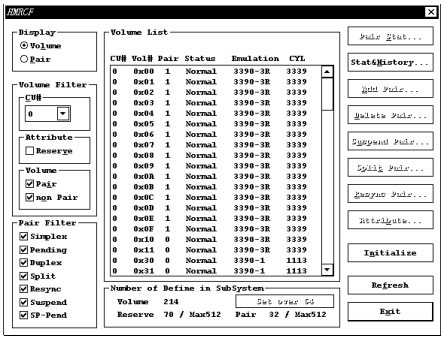


(5) When indicating making in resynchronization of pair, status display screen is displayed. It confirms that status of pair which referred to SVP08-10 and indicated making becomes duplex.

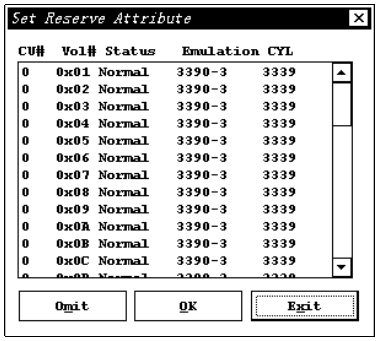
Copyright ©1998,1999, Hitachi, Ltd.

[8] Procedure for changing volume attribute

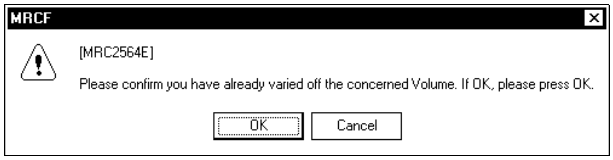
(1) Select the volumes whose attribute you want to change, then click the [Attribute...] button.



(2) When there are some volumes whose attributes you want to left unchanged, select the volumes and click the [Omit] button. To change the attributes of the selected volumes, click the [OK] button. To stop the attribute change, click the [Exit] button.



(3) When set the reserve attribute, the message to confirm that concerned Volume is an off line is displayed. It pushes [OK] button if confirming that concerned Volume is an off line. When you click the [Cancel] button, the screen for set volume attribute returns.

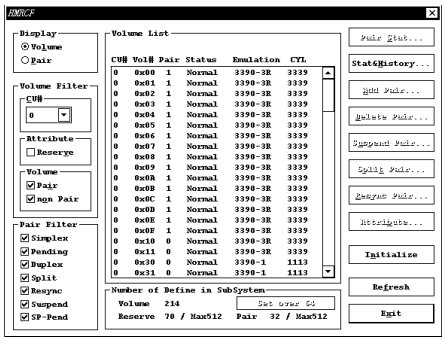


(4) When indicating the attribute change of the volume, it confirms that an attribute with the volume which was specified by the HMRCF main screen is changed.

Copyright ©1998, Hitachi, Ltd.

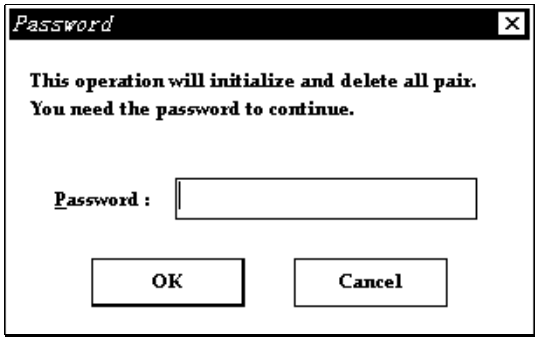
[9] Procedure for initializing a Volume pair

(1) On the HMRCF main screen, click the [Initialize] button.



⚠ NOTICE
All the pairs of HMRCF are deleted by this operation.

(2) "This operation will initialize and delete all pair. You need the password to continue." is displayed. Enter the password and select [OK] button.



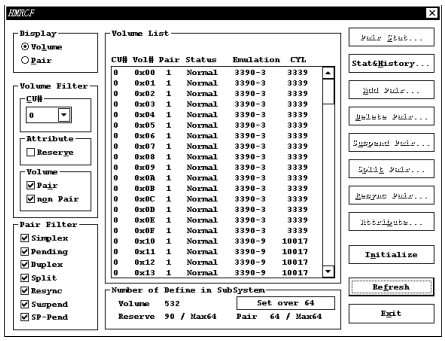
⚠ NOTICE
This is a special (exceptional) operation and requires an input of a password. Ask the technical support center about the appropriateness of the operation and input the password after getting an approval of executing the operation.

(3) When indicating the compulsion initialization of the pair, it confirms that all pairs are initialized with the HMRCF main screen.

Copyright ©1998, Hitachi, Ltd.

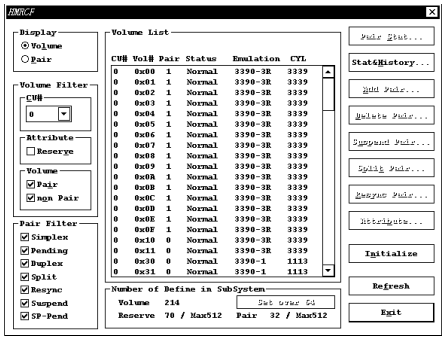
[10] Procedure of extending the number of maximum pair

(1) On the HMRCF main screen, when the [Set over 64] button is enable, the number of maximum pair can be extended from 64 to 512.
When the [Set over 64] button is disable, the following case is thought of.



- It has extended the number of maximum pair
  Confirm the HMRCF main screen number of maximum pair.
- During maximum pair number extension
  Press the [Refresh] button of the HMRCF main screen.
- The SM capacity lack
  Refer to INST05-230 and confirm SM capacity.
- The nonconformity of the DKCMAIN program version
  Refer to SVP03-130 and confirm DKCMAIN program version.

(2) Push the [Set over 64] button. Confirm that the HMRCF main screen number of maximum pair and the number of maximum Reserve are extended to 512. After maximum pair number extension, refer to MICRO-FC08-10 and acquire the backup of the configuration of the subsystem.

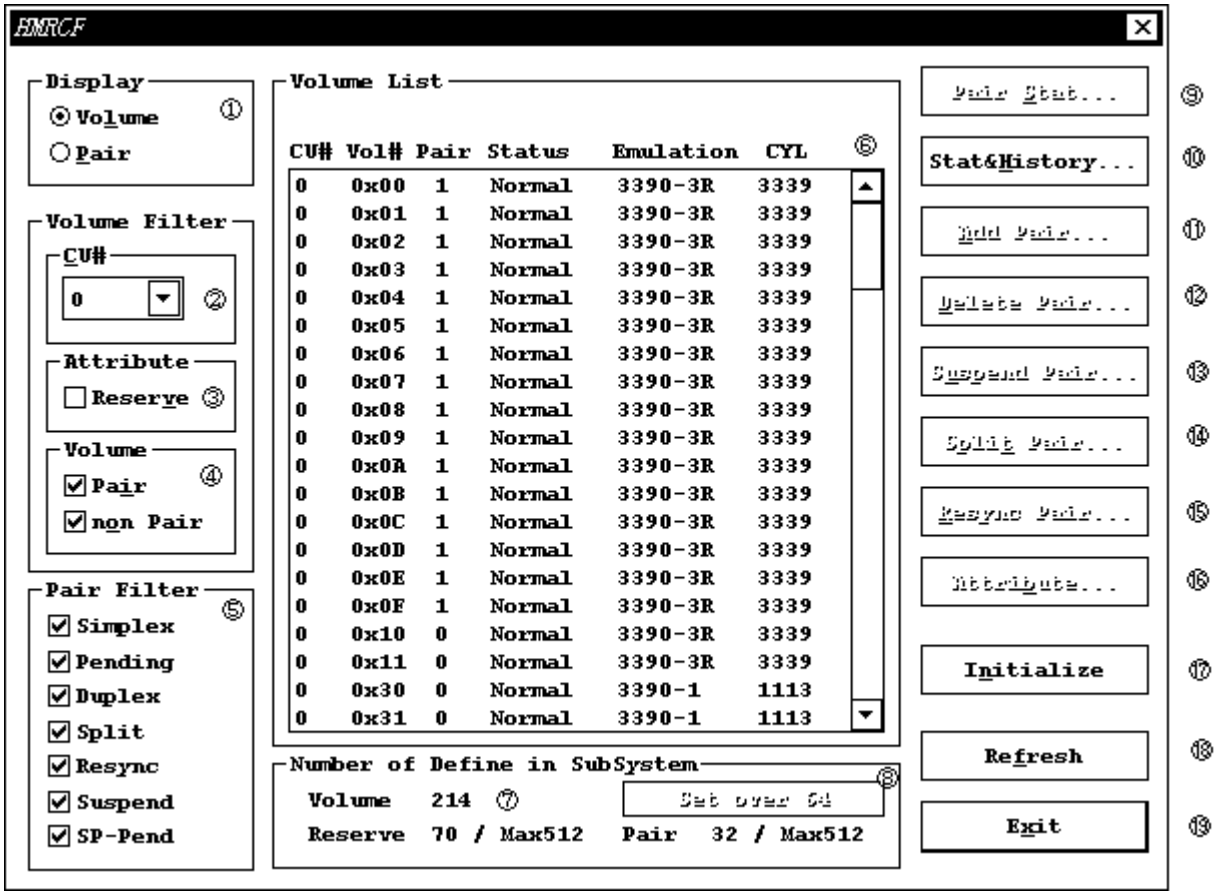


(3) When indicating maximum pair number extension, it confirms that the number of the maximum pairs is extended with the HMRCF main screen.

Copyright ©1998, Hitachi, Ltd.

8.1 Details for Screen

HMRCF main screen



(1) : Specifies the classification to display.
Volume : Displays Volume
Pair : Displays Pair

(2) : Specifies the CU# to which volumes to be displayed belong.
However, this specification is not valid when “Pair” is selected in step (1).

(3) : Display Filter Attribute
When the check box is checked, volumes with “Reserve” attribute are displayed. When the check box is not checked, volumes with attributes other than “Reserve” are displayed.
However, this specification is not valid when “Pair” is selected in step (1).

(4) : Display Filter Volume
Pair : Volumes with paired are Display
non Pair : Volumes with not paired are Display
However, this specification is not valid when “Pair” is selected in step (1).

Copyright ©1998, Hitachi, Ltd.

(5) : Pair Filter
Simplex : Pair with Simplex are Display
Pending : Pair with Pending are Display
Duplex : Pair with Duplex are Display
Split : Pair with Split are Display
Resync : Pair with Resynchronization or Reverse Resynchronization are Display
Suspend : Pair with Suspend are Display
SP-Pend : Pair with SP-Pend are Display
However, this specification is not valid when “Volume” is selected in step (1).

(6) : Volume List box
“Volume” is selected in step (1).
CU# : Number of the CU to which the volume concerned belongs
Vol# : Number of the volume concerned
Pair : Number of pairs of the volume concerned
Status : Status of the volume concerned
Emulation : Emulation type of the volume concerned
CYL : Number of cylinders that contain the volume concerned
“Pair” is selected in step (1).
S-VOL Vol# : Number of CU:Volume of S-VOL
S-VOL Status : Status of S-VOL
T-VOL Vol# : Number of CU:Volume of T-VOL
T-VOL Status : Status of T-VOL
Pair Status : Status of the volume pair concerned

(7) : Displays information concerning the volumes.
Volume : Number of volumes defined in the whole subsystem
Reserve : Number of reserves defined in the whole subsystem
Pair : Number of volume pairs defined in the whole subsystem

(8) : Extending the number of maximum pair. (Including HMRCF/HOMRCF/HIHSM pairs)

(9) : Displays a name of the screen for displaying the statuses of the volumes selected in step (6).

(10) : Displays a name of the screen for displaying the statuses of the all pair and pair history.

(11) : Displays a name of the screen for specifying the pairing of the volume selected in step (6).

(12) : Displays a name of the screen for specifying the parting of the volume pair selected in step (6).

(13) : Displays a name of the screen for specifying the suspension of the volume selected in step (6).

(14) : Displays a name of the screen for specifying the splitting of the volume pair selected in step (6).

(15) : Displays a name of the screen for specifying the resynchronization of the volume pair selected in step (6).

(16) : Displays a name of the screen for specifying the attribute change of the volumes selected in step (6).

Copyright ©1998,1999, Hitachi, Ltd.

(17) : Initialize the all pairs.
All HMRCF/HOMRCF/HIHSM pairs will be initialized and deleted by force. This operation needs password.

(18) : Updates the displayed information to the latest one.

(19) : Quits the HMRCF screen.

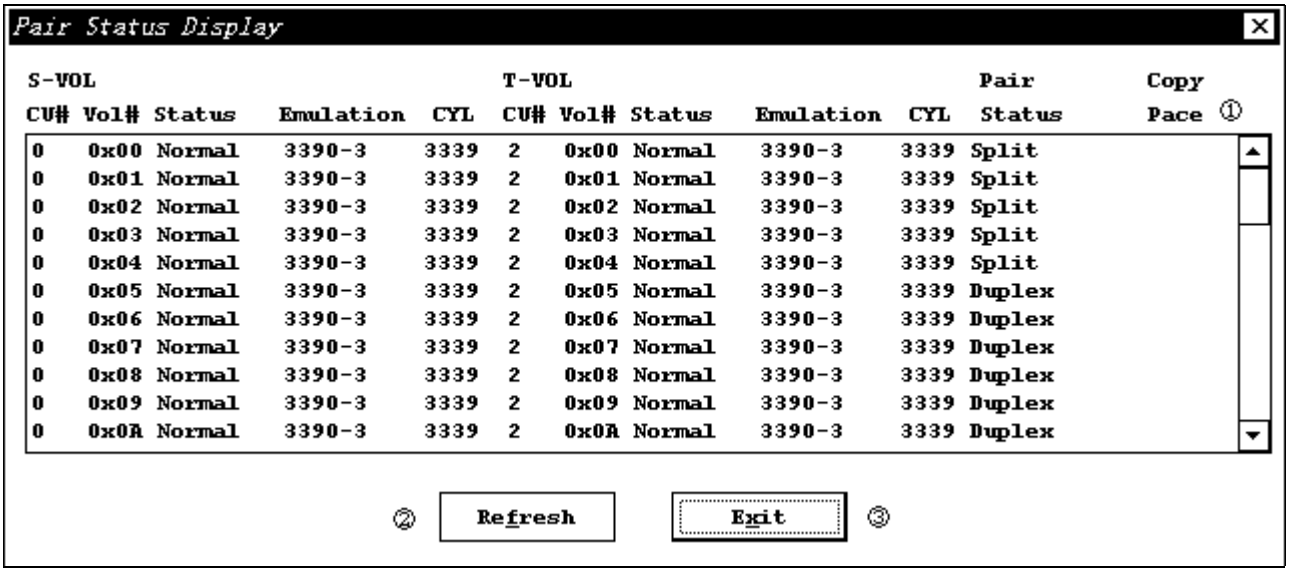
[2] Screen displaying pair status



(1) : Status information list box

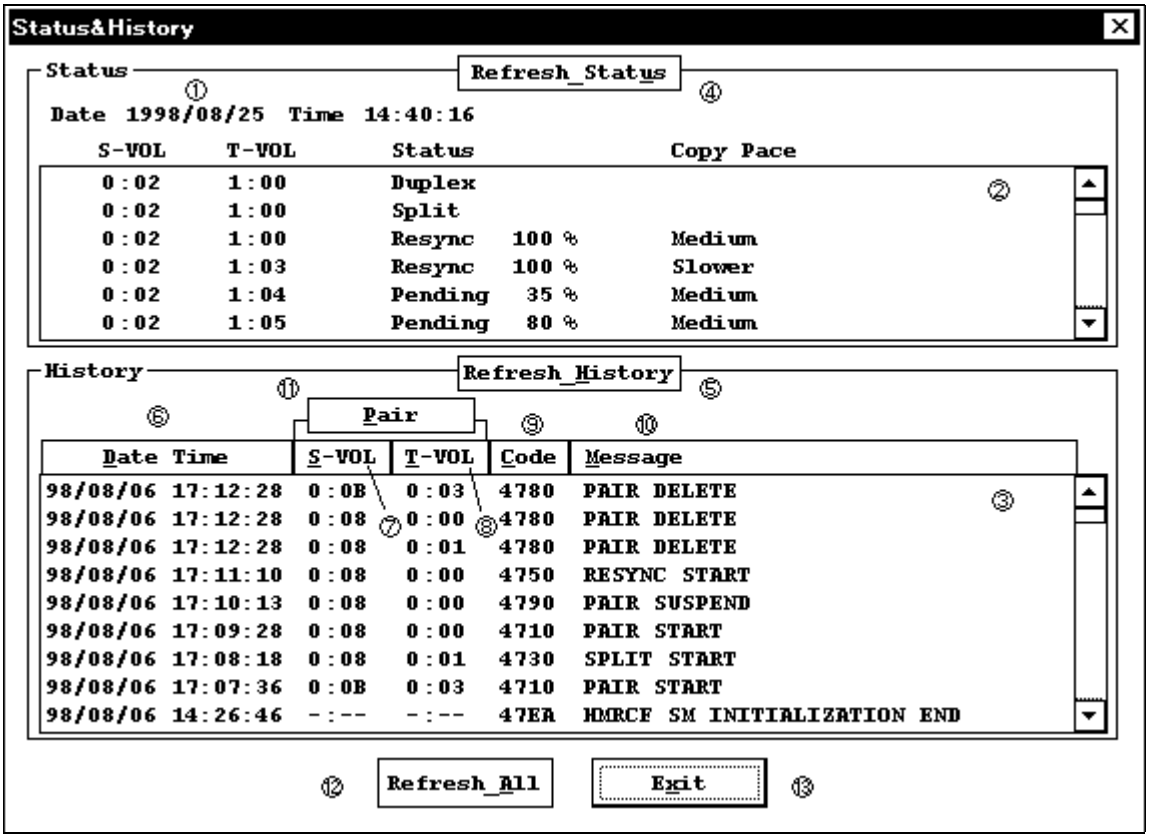
S-VOL CU#	: Number of the CU to which the S-VOL belongs
S-VOL Vol#	: Number of the S-VOL
S-VOL Status	: Status of the S-VOL
S-VOL Emulation	: Emulation type of the S-VOL
S-VOL CYL	: Number of cylinders that contain the S-VOL
T-VOL CU#	: Number of the CU to which the T-VOL belongs
T-VOL Vol#	: Number of the T-VOL
T-VOL Status	: Status of the T-VOL
T-VOL Emulation	: Emulation type of the T-VOL
T-VOL CYL	: Number of cylinders that contain the T-VOL
Pair Status	: Status of the volume pair concerned
Copy Pace	: Copy pace of the volume pair

(2) : Updates the displayed information to the latest one.

(3) : Closes the screen.

Copyright ©1998, Hitachi, Ltd.

[3] Status & History Screen



(1) : It displays the time when the present pairs status was acquired.

(2) : The present pair status display list box
- S-VOL : Number of the CU of S-VOL (Left) Number of the Volume (Right)
- T-VOL : Number of the CU of T-VOL (Left) Number of the Volume (Right)
- Status : The present pairs of volume concerned.
- Copy Pace : Copy pace of the volume pair.

(3) : History of the condition transfer of the pairs display list box.
- Date Time : The time which history SIM occurred to.
- S-VOL : Number of the CU of S-VOL (Left) Number of the Volume (Right)
- T-VOL : Number of the CU of T-VOL (Left) Number of the Volume (Right)
- Code : Reference Code.
- Message : The message which corresponded to Reference Code.

(4) : Updates the status to the latest one.

(5) : Updates the history to the latest one.

(6) : It sorts with the key with time.

(7) : It sorts with the key with S-VOL.

(8) : It sorts with the key with T-VOL.

Copyright ©1998, Hitachi, Ltd.

(9) : It sorts with the key with code.

(10) : It sorts with the key with message.

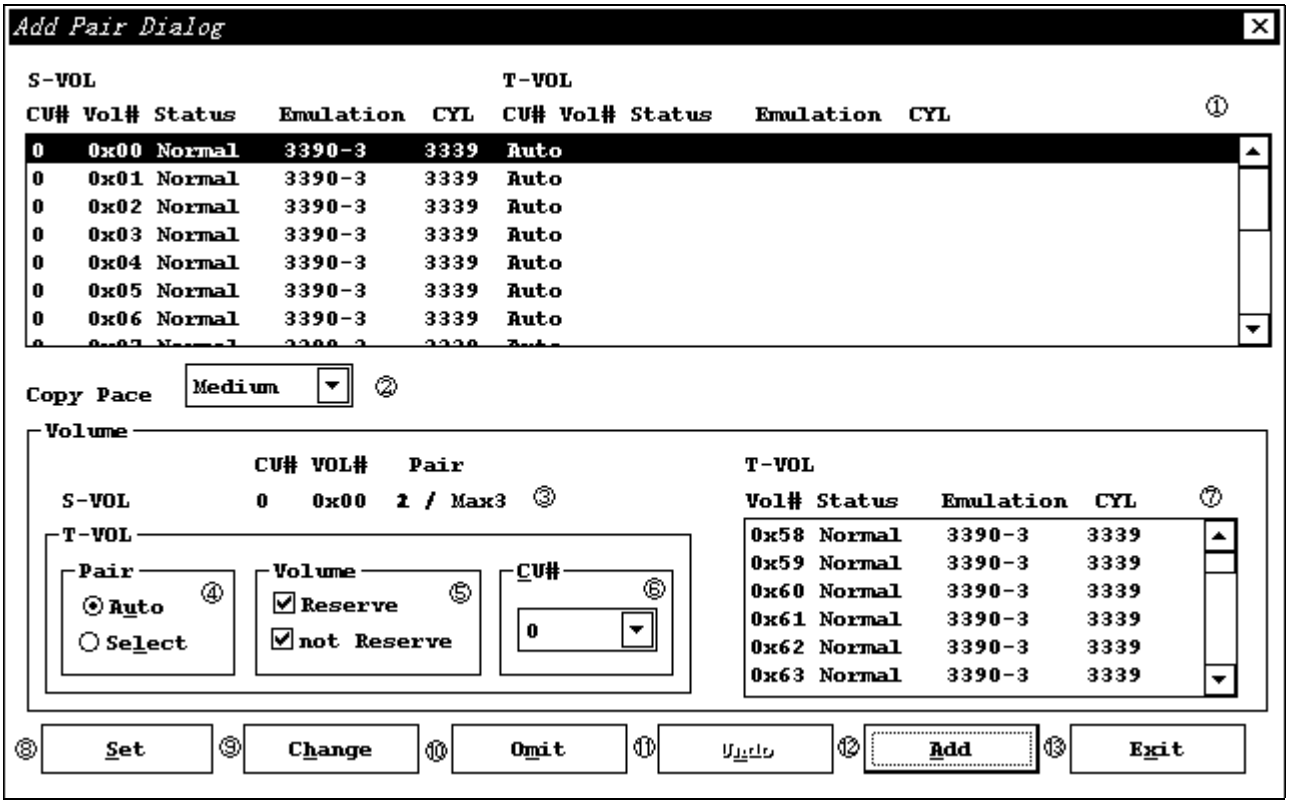
(11) : It sorts with the key with pair.

(12) : Updates the displayed information to the latest one.

(13) : Quits the Screen.

Copyright ©1998, Hitachi, Ltd.

[4] Screen for specifying pairing



(1) : Volume information list box
- S-VOL CU# : Number of the CU to which the S-VOL belongs
- S-VOL Vol# : Number of the S-VOL
- S-VOL Status : Status of the S-VOL
- S-VOL Emulation : Emulation type of the S-VOL
- S-VOL CYL : Number of cylinders that contain the S-VOL
- T-VOL CU# : Number of the CU to which the T-VOL belongs
- T-VOL Vol# : Number of the T-VOL
- T-VOL Status : Status of the T-VOL
- T-VOL Emulation : Emulation type of the T-VOL
- T-VOL CYL : Number of cylinders that contain the T-VOL

When “AUTO” is specified for the T-VOL, the DKC automatically selects the T-VOL.

(2) : Specifies a copy pace.

(3) : S-VOL information
- CU# : Number of the CU to which the S-VOL belongs
- VOL# : Number of the S-VOL
- Pair : Number of pairs of the S-VOL

(4) : Specifies the method to select the T-VOL.
- Auto : Selects a T-VOL automatically.
- Select : Specifies a T-VOL for selection.

Copyright ©1998, Hitachi, Ltd.

(5) : Specifies T-VOL to display
Reserve : Display volume of the reserve attribute.
not Reserve : Display volume of the non-reserve attribute.
This control is available when the number of the maximum pairs is 512.

(6) : Specifies a CU# from which the T-VOL is selected.

(7) : Information of the T-VOL to be paired
Vol# : Number of the T-VOL
Status : Status of the T-VOL
Emulation : Emulation type of the T-VOL
CYL : Number of cylinders that contain the T-VOL

(8) : Adds the selected T-VOL as a volume to be paired.

(9) : Changes into T-VOL which chose T-VOL which is set at present.

(10) : Deletes the selected T-VOL from the volumes to be paired.

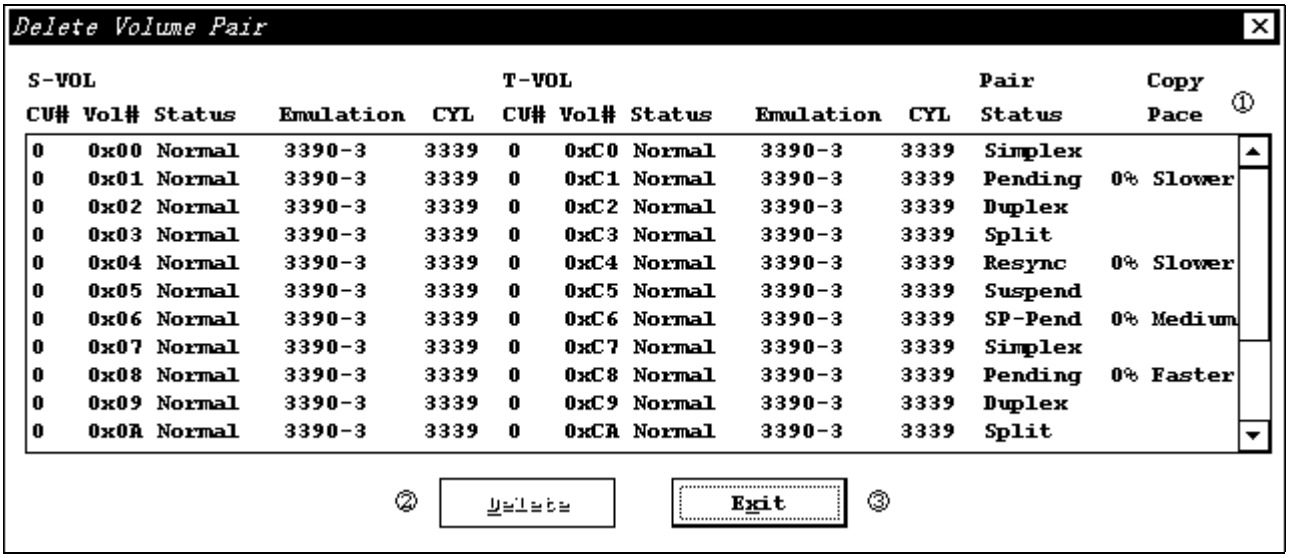
(11) : Returns 1 step of operation done by (8), (9) or (10).

(12) : Execute the pairing.

(13) : Stops the pairing.

Copyright ©1998, Hitachi, Ltd.

[5] Screen for specifying paring of volume pair



(1) : Volume pair information list box

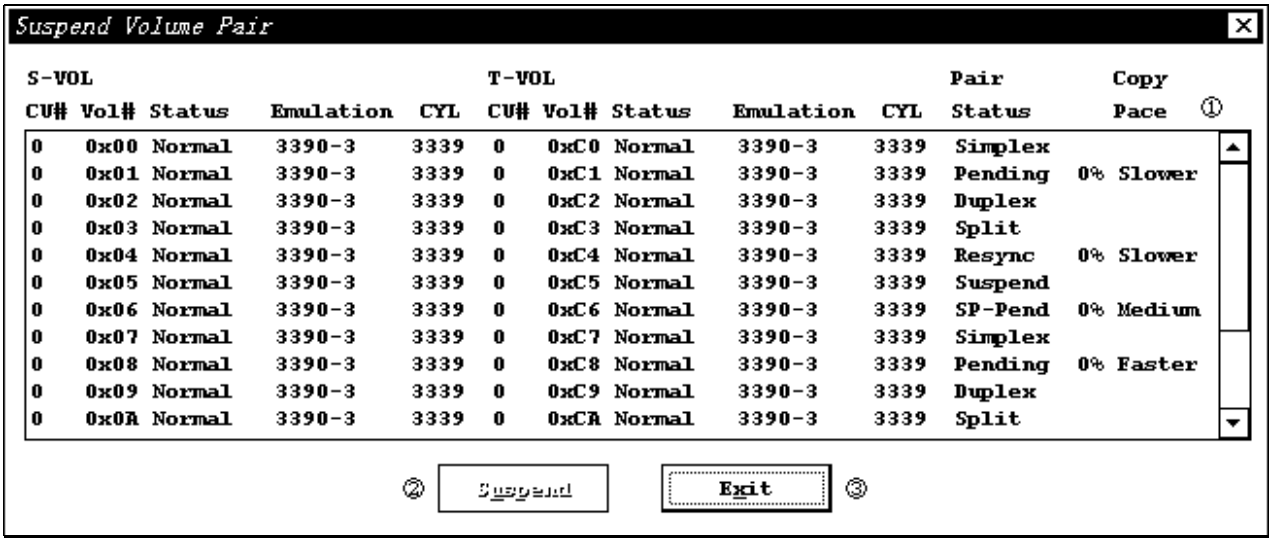
S-VOL CU#	: Number of the CU to which the S-VOL belongs
S-VOL Vol#	: Number of the S-VOL
S-VOL Status	: Status of the S-VOL
S-VOL Emulation	: Emulation type of the S-VOL
S-VOL CYL	: Number of cylinders that contain the S-VOL
T-VOL CU#	: Number of the CU to which the T-VOL belongs
T-VOL Vol#	: Number of the T-VOL
T-VOL Status	: Status of the T-VOL
T-VOL Emulation	: Emulation type of the T-VOL
T-VOL CYL	: Number of cylinders that contains the T-VOL
Pair Status	: Status of the volume pair
Copy Pace	: Copy pace of the volume pair.

(2) : Executes an parting of the volume pair.

(3) : Stops parting of the volume pair.

Copyright ©1998, Hitachi, Ltd.

[6] Screen for specifying pair suspension



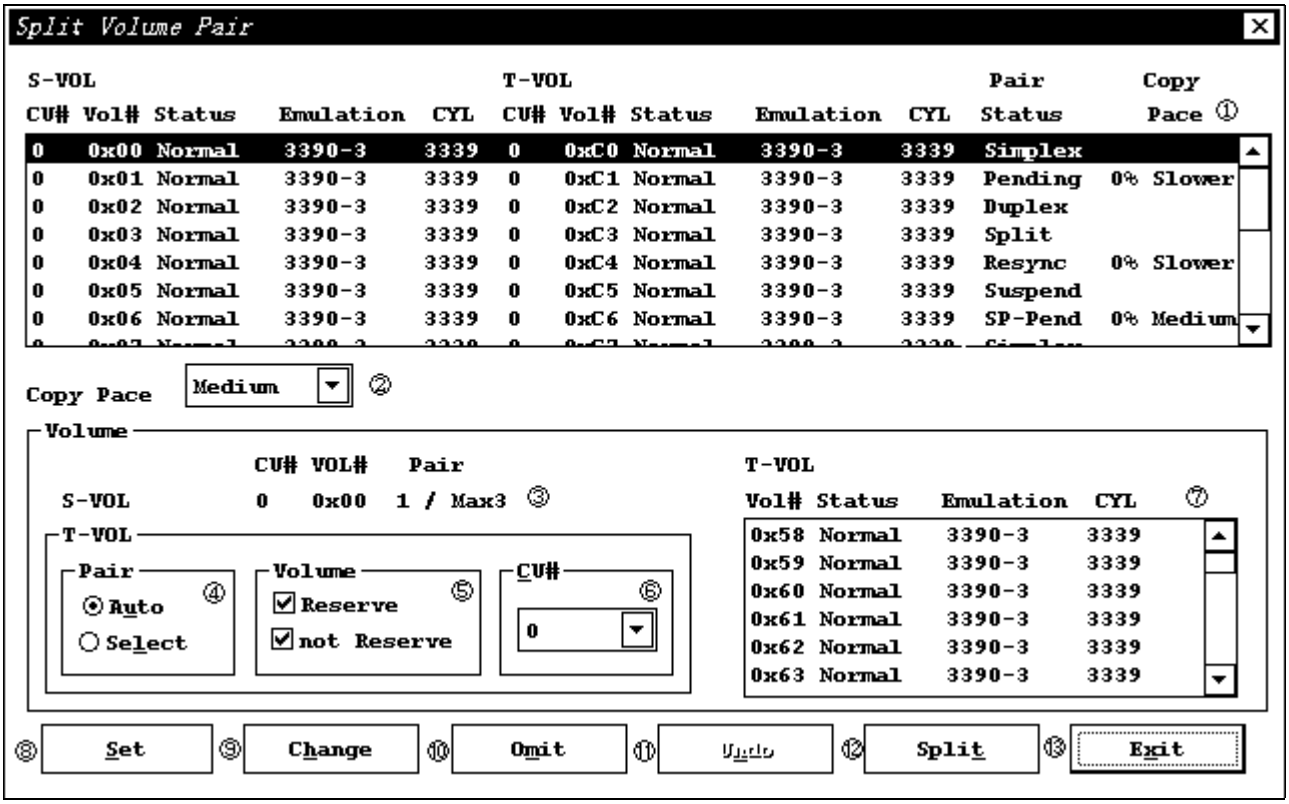
(1) : Volume pair information list box
- S-VOL CU# : Number of the CU to which the S-VOL belongs
- S-VOL Vol# : Number of the S-VOL
- S-VOL Status : Status of the S-VOL
- S-VOL Emulation : Emulation type of the S-VOL
- S-VOL CYL : Number of cylinders that contain the S-VOL
- T-VOL CU# : Number of the CU to which the T-VOL belongs
- T-VOL Vol# : Number of the T-VOL
- T-VOL Status : Status of the T-VOL
- T-VOL Emulation : Emulation type of the T-VOL
- T-VOL CYL : Number of cylinders that contain the T-VOL
- Pair Status : Status of the volume pair concerned
- Copy Pace : Copy pace of the volume pair.

(2) : Executes a suspension of the volume pair.

(3) : Stops a suspension of the volume pair.

Copyright ©1998, Hitachi, Ltd.

[7] Screen for specifying pair splitting



(1) : Volume pair information list box
- S-VOL CU# : Number of the CU to which the S-VOL belongs
- S-VOL Vol# : Number of the S-VOL
- S-VOL Status : Status of the S-VOL
- S-VOL Emulation : Emulation type of the S-VOL
- S-VOL CYL : Number of cylinders that contain the S-VOL
- T-VOL CU# : Number of the CU to which the T-VOL belongs
- T-VOL Vol# : Number of the T-VOL
- T-VOL Status : Status of the T-VOL
- T-VOL Emulation : Emulation type of the T-VOL
- T-VOL CYL : Number of cylinders that contain the T-VOL
- Pair Status : Status of the volume pair
- Copy Pace : Copy pace of the volume pair.

When “Auto” is specified for the T-VOL, the DKC automatically selects the T-VOL.

(2) : Specifies a copy pace.

(3) : S-VOL information
- CU# : Number of the CU to which the S-VOL belongs
- Vol# : Number of the S-VOL
- Pair : Number of volume pairs

Copyright ©1998, Hitachi, Ltd.

(4) : Specifies the method to select the T-VOL.
- Auto : Selects a T-VOL automatically.
- Select : Specifies a T-VOL for selection.

(5) : Specifies T-VOL to display
- Reserve : Display volume of the reserve attribute.
- not Reserve : Display volume of the non-reserve attribute.

This control is available when the number of the maximum pair is 512.

(6) : Specifies a CU# from which the T-VOL is selected.

(7) : Information of the T-VOL to be paired
- Vol# : Number of the T-VOL
- Status : Status of the T-VOL
- Emulation : Emulation type of the T-VOL
- CYL : Number of cylinders that contain the T-VOL

(8) : Adds a selected T-VOL as the one to be paired.

(9) : Changes into T-VOL which chose T-VOL which is set at present.

(10) : Deletes a selected T-VOL from the ones to be paired.

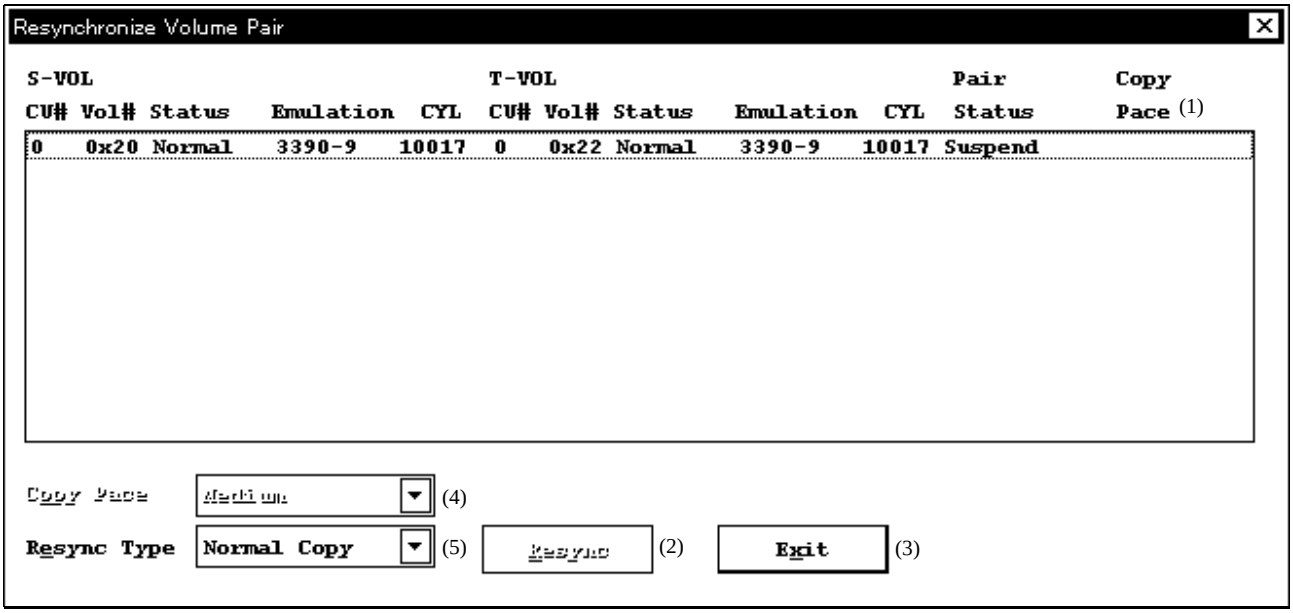
(11) : Returns 1 setp of operation done by (8), (9) or (10).

(12) : Execute a splitting of the volume pair.

(13) : Stops a splitting of the volume pair.

Copyright ©1998, Hitachi, Ltd.

[8] Screen for specifying pair resynchronization



(1) : Volume pair information list box
- S-VOL CU# : Number of the CU to which the S-VOL belongs
- S-VOL Vol# : Number of the S-VOL
- S-VOL Status : Status of the S-VOL
- S-VOL Emulation : Emulation type of the S-VOL
- S-VOL CYL : Number of cylinders that contain the S-VOL
- T-VOL CU# : Number of the CU to which the T-VOL belongs
- T-VOL Vol# : Number of the T-VOL
- T-VOL Status : Status of the T-VOL
- T-VOL Emulation : Emulation type of the T-VOL
- T-VOL CYL : Number of cylinders that contain the T-VOL
- Pair Status : Status of the volume pair concerned
- Copy Pace : Copy pace of the volume pair.

(2) : Execute a resynchronization of the volume pair.

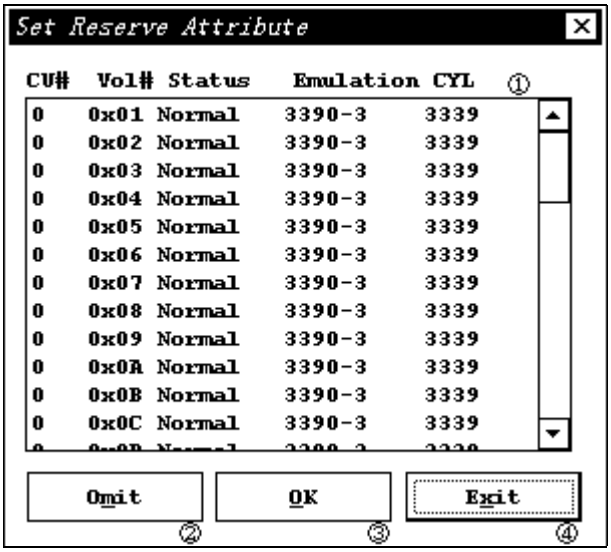
(3) : Stops a resynchronization of the volume pair.

(4) : Specifies a copy pace.

(5) : Resync Type
Specifies the resynchronization type used when the resynchronization is executed.
When executing the resynchronization, the resynchronization is applied to all the pairs.
- Normal Copy : Displays the Normal Resync
- Reverse Copy : Displays the Reverse Resync

Copyright ©1998,1999, Hitachi, Ltd.

[9] Screen specifying volume attribute change



(1) : Volume information list box
- CU# : Number of the CU to which the volume belongs
- Vol# : Number of the volume
- Status : Status of the volume
- Emulation : Emulation type of the volume
- CYL : Number of cylinders that contain the volume

(2) : Removes the volume selected in step (1) from the ones whose attribute is to be changed.

(3) : Changes the attribute of the volume.

(4) : Stops changing the attribute of the volume.

Copyright ©1998, Hitachi, Ltd.

Message	Status
Reading configuration...	Update of configuration information
CU? Attribute Reading...	Reading of the attribute of all volumes belong to the CU?
Reading pair status...	Reading of the status of all volumes

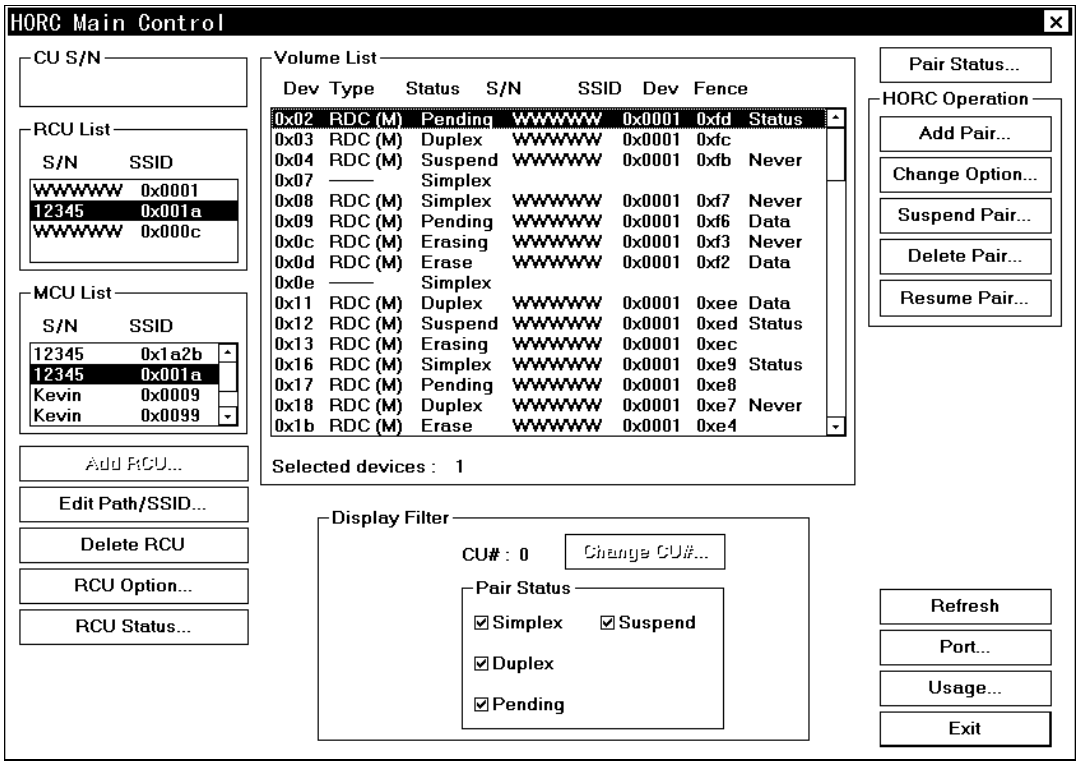
9 References for HORC Operation Screen (for LDEV)

If SVP Micro-program version is over “51-36-01”, refer to the “7 References for HORC Operation Screen (for OPEN VOL) (SVP07-10)”.

9.1 HORC Main screen



RCU List ..... This List Box displays Controllers as RCU(Remote disk Control Unit).
“XXXXX 0xXXXX”
Serial Number SSID

MCU List ..... This List Box displays Controllers as MCU(Main disk Control Unit).
(Only volume pairing is established.)
“XXXXX 0xXXXX”
Serial Number SSID

Volume List ..... This List Box displays valid LDEV(Logical Device) and the pair status.
“0xXX XXXX(X) XXXXXXX XXXXX 0xXXXX 0xXX X”
① ② ③ ④ ⑤ ⑥ ⑦ ⑧

① #LDEV..... LDEV address
② Copy Type ..... “RDC” : Remote Dual Copy(HORC)
“---” : SIMPLEX Volume
③ Copy Mode ..... “0” : Synchronous
“1” : Semi-Synchronous
“-” : SIMPLEX Volume

Copyright ©1998, Hitachi, Ltd.

④ Volume Type ..... "M" : Main Volume,
"R" : Remote Volume
" - " : SIMPLEX Volume

⑤ Pair status..... Volume pair status
"Simplex" : Simplex
"Duplex" : Duplex
"Pending" : Pending
"Suspend" : Suspend

⑥ Serial Number/SSID Serial Number and SSID of destination Controller.

⑦ #LDEV..... LDEV address on the destination Controller.

⑧ Fence Level..... LDEV Fence Level

Display Filter..... Display filter of the Volume List.
"Simplex" ~ "Suspend".... LDEVs that were selected by check box are displayed.

Port Operation

Port.....Changes the port type between LCP and RCP.

When the MCU is connected to the RCU, the MCU side port type must be set to RCP.

Path Operation

Add RCU.....Establishes the path between the MCU and the RCU. When establishing the path, the MCU must register the object RCU first. This function registers the object RCU and establishes the path at a time. When the MCU registers the object RCU successfully, the RCU is added to the RCU list. (Up to 4 RCU units can be registered for one MCU.)

Edit Path/SSID ...Adds/reduces the number of paths or SSIDs to an RCU selected from the RCU list within a range of 1 to 4.

Delete RCU .....Deletes an RCU selected from the RCU list and the path(s) to the RCU at a time. Before executing this function, all the units paired with the RCU must be set to simplex status.

RCU Option .....Changes the option for connection to an RCU selected from the RCU list. The connection option can also be specified when the RCU is registered, but this function is used to change the option during operation.

RCU Status.....Displays the status of an RCU selected from the RCU list. This function can also display the status of each path to the RCU.

Pair Operation

Pair Status .....Displays the status of a volume selected from the volume list. This function is disabled if two or more volumes are selected from the volume list.

Add Pair .....Creates the HORC pair(s) by making the simplex volume(s) selected from the volume list become the M-VOL(s). Before executing this function, the CU that includes the R-VOL(s) must be registered as the RCU(s). This function is disabled if the volume(s) selected include(s) the volume(s) in the status other than simplex.

Change Option ...Changes the pair option of the volume(s) (not in the simplex status) selected from the volume list. The pair option can also be specified when the pair is created, but this function is used to change the option during the operation. This function is disabled if any volume(s) selected include(s) the simplex volume(s).

Suspend Pair.....Suspends the pair(s) of the volume(s) (not in the simplex status) selected from the volume list. This function is disabled if any volume(s) selected include(s) the simplex volume(s).

Delete Pair.....Deletes the pair of the volume(s) (not in the simplex status) selected from the volume list. This function is disabled if the volume(s) selected include(s) a simplex volume(s).

Copyright ©1998, Hitachi, Ltd.

Resume Pair .....Resume the pair of the volume(s) (in the suspend status) selected from the volume list. This function is disabled if the volume(s) selected include(s) a simplex volume(s).

Other Functions

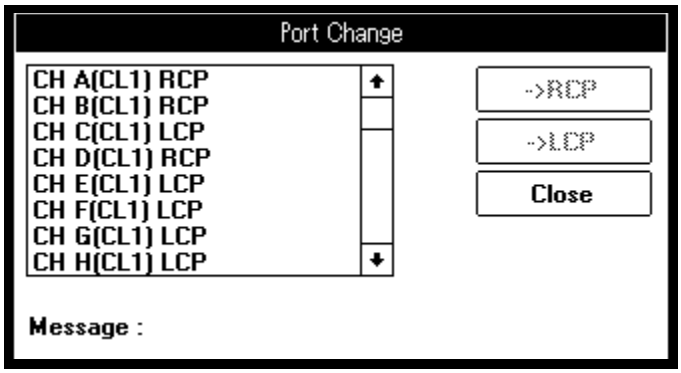
Usage.....Displays HORC operation control information.

Refresh. .....Updates information displayed on the screen. Information displayed on the screen is kept as is until this function is executed.

Exit.....Exits the operation screen.

Copyright ©1998, Hitachi, Ltd.

9.2 Port...screen



List ..... Displays the list of usable serial channels.

CH X[CL Y] XXX
① ② ③

① Channel ID (A to R)

② Cluster ID (1 or 2)

③ Channel type (LCP or RCP)

-> RCP ..... Changes the channel type selected from the list to the RCP.

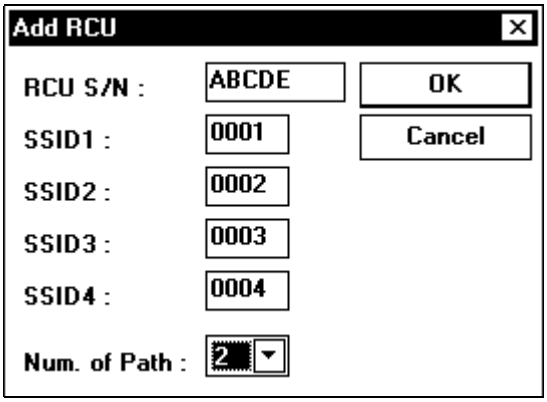
-> LCP..... Changes the channel type selected from the list to the LCP.

Message..... Displays the progress of each changing process when the Changing function is started.
Checking port# CH X[CL Y] ...
Blocking port# CH X[CL Y] ...
Setting port# CH X[CL Y] ...
Restoring port# CH X[CL Y] ...

Copyright ©1998, Hitachi, Ltd.

9.3 Add RCU... screen

• Specify RCU parameter.



RCU S/N.....Input the Serial number of RCU.
"XXXXX" .....5 characters.

SSID1 ~ 4.....Input the SSID of RCU. (Note)
"XXXX" .....4 hexadecimal digits number.

Num. Of Path .....Specifies the number of path between MCU & RCU.(1 ~ 4)

Option... .....Specified RCU option item. (Refer to RCU Option...)

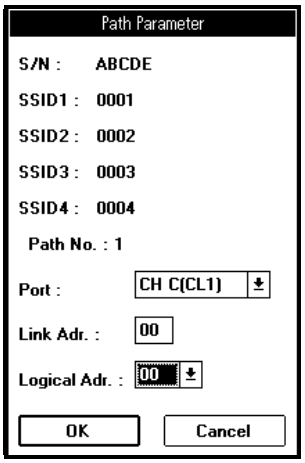
Note: How to Set Up HORC of DKC310I.

1. Setting SSIDs
   DKC310I can have different SSIDs for each 64 boundary of LDEV#.

   It is possible for DKC310I to have independent SSIDs for each 64 boundary of LDEV#.

Copyright ©1998, Hitachi, Ltd.

• Specify PATH parameter.
Input the RCU parameter, then input the path parameter for each specified path.



Port.....Specified port using as RCP in the Combo Box.

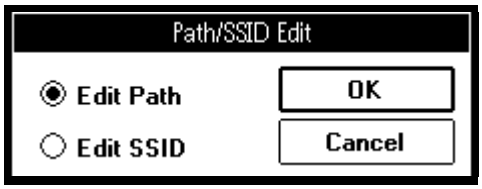
Link Adr. .....Input the destination link address.
"XX" ..... 2 characters of hexadecimal number. ("00" through "fd")
If RCU is connected to MCU directly without ESCD, specified "00" at the [Link Adr.].
If RCU is connected to MCU with ESCD, specified destination link address at the [Link Adr.].

Logical Adr. .....Specified logical address of the destination DKC.
Please select only 00 as a logical address.

Copyright ©1998, Hitachi, Ltd.

9.4 Edit Path/SSID

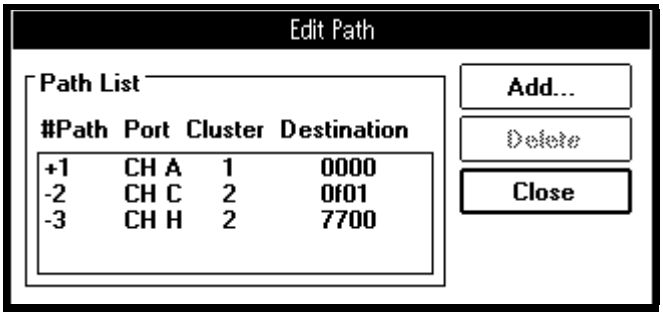
9.4.1 Path/SSID Edit... screen



Edit Path... Adding/reducing the number of paths.

Edit SSID . Adding/reducing the number of SSIDs.

9.4.2 Edit Path... screen



Path List ... Display current path's information.

"X CH X X XXXX"
① ② ③ ④

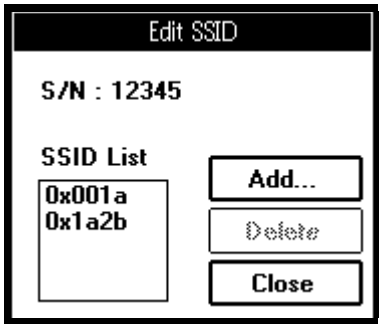
① #Path.....Status(+:Normal -:Abnormal) and Path No.(1 ~ 4)
② #Port .....Port of path creating.(CH A ~ CH R)
③ #Cluster .....Cluster. (1 ~ 2)
④ Destination.....Link address (2 hexadecimal numbers) + Logical address (2 hexadecimal numbers)

Add..... Adding new path.(Refer to Add.. RCU-Specified Path Parameter)

Delete ..... Deleting the path selected in the Path List.

Copyright ©1998, Hitachi, Ltd.

9.4.3 Edit SSID... screen

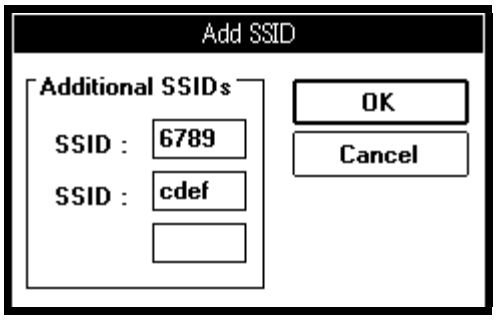


SSID List.. Display current SSIDs information.

Add..... Adding new SSIDs.

Delete ..... Deleting the SSIDs selected in the SSID List.

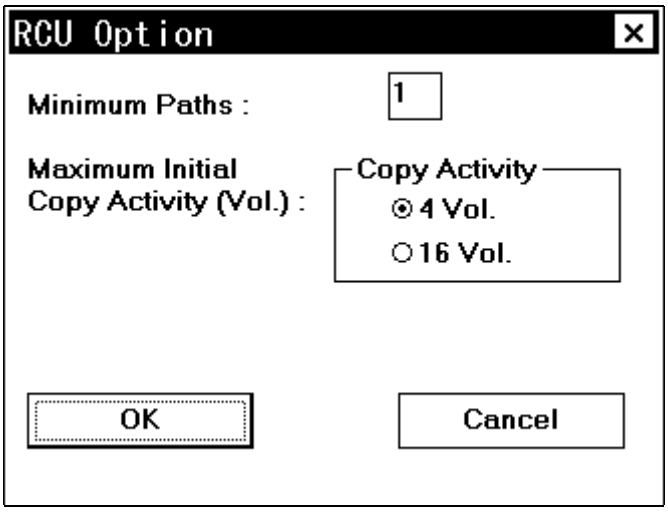
9.4.4 Add SSID... screen



Additional SSIDs ..... To add the SSIDs, input 4 hexadecimal digits numbers.

Copyright ©1998, Hitachi, Ltd.

9.5 RCU Option... screen

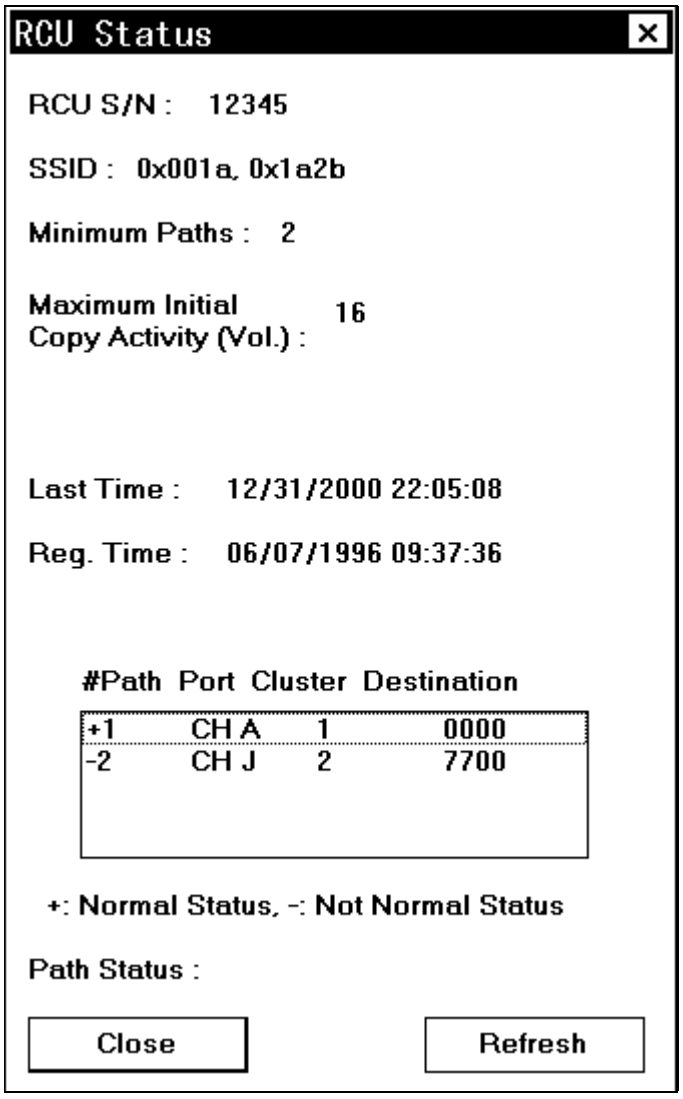


Minimum Paths.....Specifies lowest number of paths needed for continuation of HORC. Defined between 1 to 4.

Maximum Initial .....Specifies maximum number of Initial copy execution. (First group of defined HORC volume pairs.) Defined 4 or 16.

Copyright ©1998, Hitachi, Ltd.

9.6 RCU Status... screen



RCU s#.....Display Serial number of the RCU.
"XXXXX" .....5 decimal digits.

SSID.....Display SSID of the RCU.
"XXXX" .....4 hexadecimal digits.

Minimum Paths.....Display lowest number of paths necessity for continuation of HORC.

Maximum Initial .....Display maximum number of Initial copy execution.

Last Time .....Display last update time & date of the RCU.

Reg. Time.....Display registration time & date of the RCU.

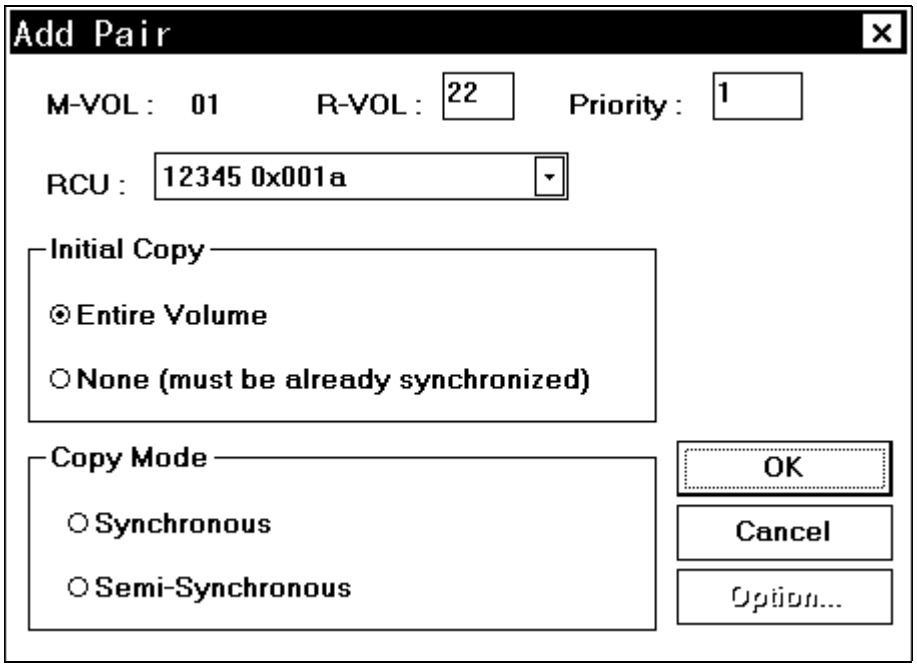
Copyright ©1998, Hitachi, Ltd.

Path Status.....Display status of path that selected in list.
If it isn't "Normal", do the recovery action according to TRBL06-190 "Recovery Action of Path Status Error".
"Nothing".....No established.
"Normal" .....The status of path is normal.
"Initialization Failed" .....Error has occurred in the path initialization.
"Communication Time Out" Communication between MCU and RCU time out.
"Resource Shortage(MCU)" Resource at the MCU is short.
"Resource Shortage(RCU)" Resource at the RCU is short.
"Serial Number Mismatch" Specified serial number is mismatch.
"Invalid Port".....Specified port is invalid.

Refresh.....Refresh displayed information.

Copyright ©1998, Hitachi, Ltd.

9.7 Add Pair... screen



M-VOL .....Display volume(LDEV) that is MCU side.

R-VOL .....Specifies volume(LDEV) that is RCU side.
"XX" ..... 2 hexadecimal digits.

Priority .....Specifies priority of initial copy execution.

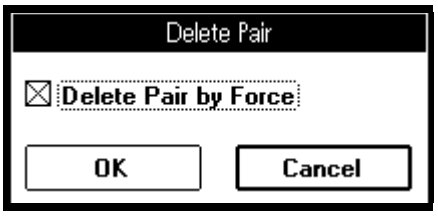
RCU .....Select RCU from the Combo Box.
The list of RCUs currently registered will appear.

Initial Copy .....Specifies initial copy type. (Valid only for the remote dual copy function.)
"Entire Volume" .....Specifies all cylinders.
"None" .....Nothing

Option... .....Specifies pair option item. (Refer to Pair Option...)

Copyright ©1998, Hitachi, Ltd.

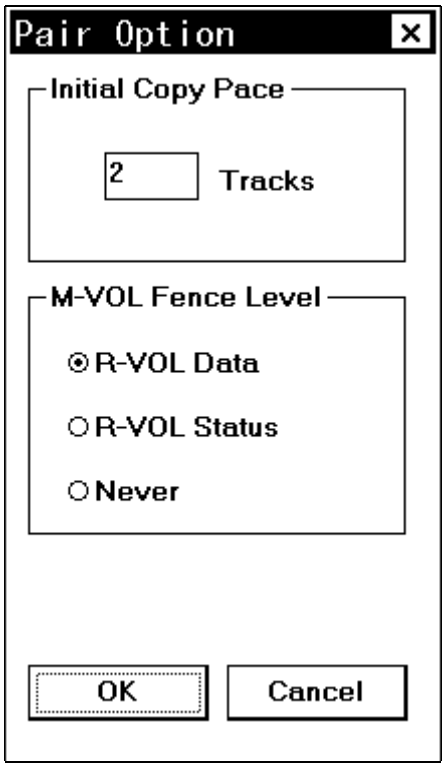
9.8 Delete Pair... screen



Delete Pair by Force.... Specified forcibly delete mode.
The pair status is deleted even when the communication with the CU is disabled.

Copyright ©1998, Hitachi, Ltd.

9.9 Pair Option... screen

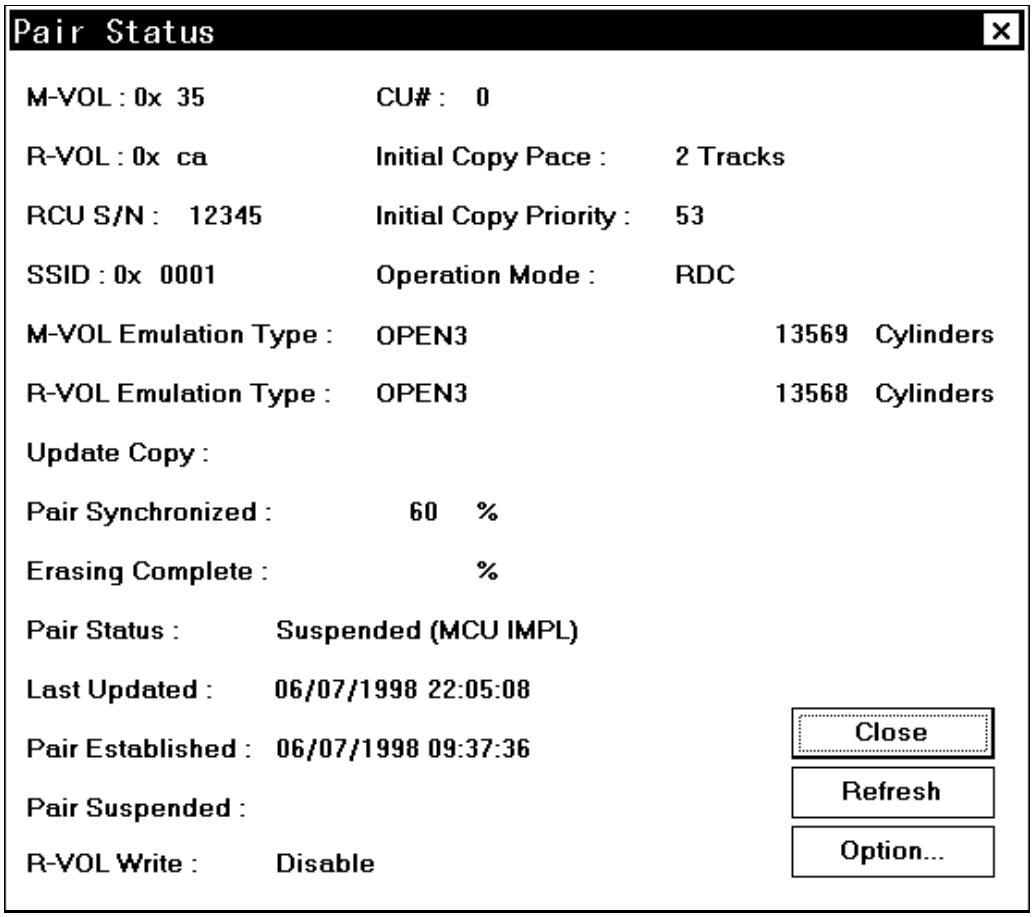


Initial Copy Pace..... Specifies Initial copy pace. (Remote Dual Copy)(HORC option)
"NN"..... Decimal number within a range of 1 to 15.

M-VOL Fence Level..... M-VOL fence level(HORC option)
"R-VOL Data"..... M-VOL fence when data is unmatched
"R-VOL Status" ..... M-VOL fence when status can not be changed.
"Never"..... Never fence

Copyright ©1998, Hitachi, Ltd.

9.10 Pair Status... screen



M-VOL .....Displays volume(LDEV) (MCU side).

R-VOL .....Displays volume(LDEV) (RCU side).

RCU S/N.....Displays serial number of the RCU.

SSID.....Displays SSID of the RCU.

CU#.....Displays current CU number.

Initial Copy Pace.....Displays Initial copy pace. (Remote Dual Copy)
"NN" ..... Decimal number within a range of 1 to 15.

Initial Copy Priority .....Displays priority of initial copy execution.

Operation Mode .....Displays pair creative mode.
"RDC" ..... Remote Dual Copy(HORC)

M-VOL Emulation Type.....Displays M-VOL device emulation type and number of cylinders.

R-VOL Emulation Type.....Displays R-VOL device emulation type and number of cylinders.

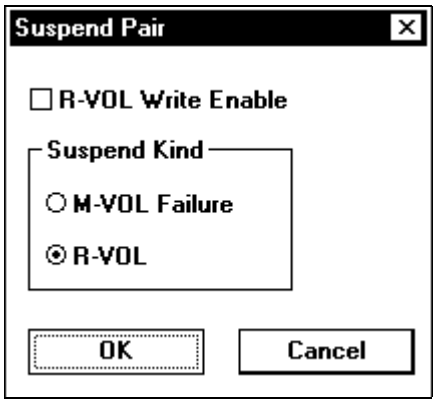
Pair Synchronized .....Displays progress of initial copy(Remote Dual Copy).

Copyright ©1998, Hitachi, Ltd.

Pair Status	Displays pair status information. “Simplex" “Duplex Pending” “Duplex” “Suspended(M-VOL by Operator)” “Suspended(R-VOL by Operator)” “Suspended(by MCU)” “Suspended(by RCU)” “Suspended(Delete pair to RCU)” “Suspended(R-VOL failure)” “Suspended(MCU IMPL)” “Suspended(Initial Copy Failed)”
Last Updated	Displays last update time of pair status.
Pair Established	Displays registration time the volume pair.
Pair Suspended	Displays suspension time of the volume pair.
R-VOL write	Display whether to enable R-VOL to read/write.
Option...	Displays pair option item. (Same to Pair Option...)
Refresh	Refresh displayed information.

Copyright ©1998, Hitachi, Ltd.

9.11 Suspend Pair... screen



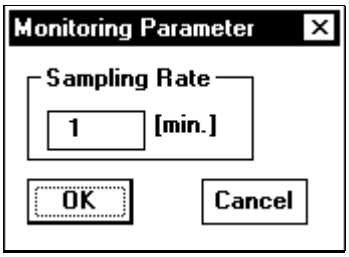
R-VOL Write Enable .. Specifies whether to enable R-VOL read/write.
If you want to use this parameter, select “R-VOL” in Suspend Kind parameter.

Suspend Kind..... Specifies suspended type.
“M-VOL Failure”..... M-VOL suspension reported as M-VOL failure.,
“R-VOL”..... R-VOL suspension

Copyright ©1998, Hitachi, Ltd.

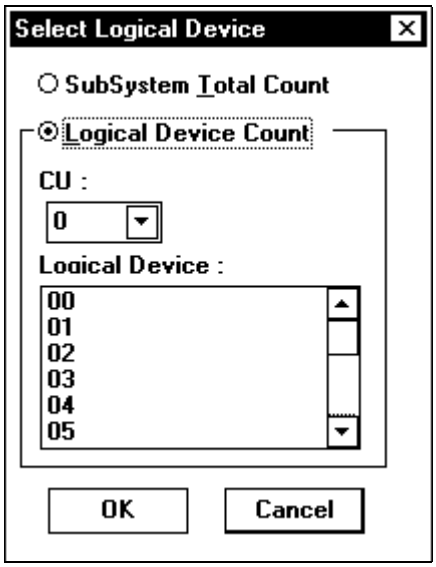
9.12 Usage... screen

Monitoring Parameter



Sampling Rate.... Sets the sampling rate of operation control information within a range of 1 to 546 in steps of a minute.

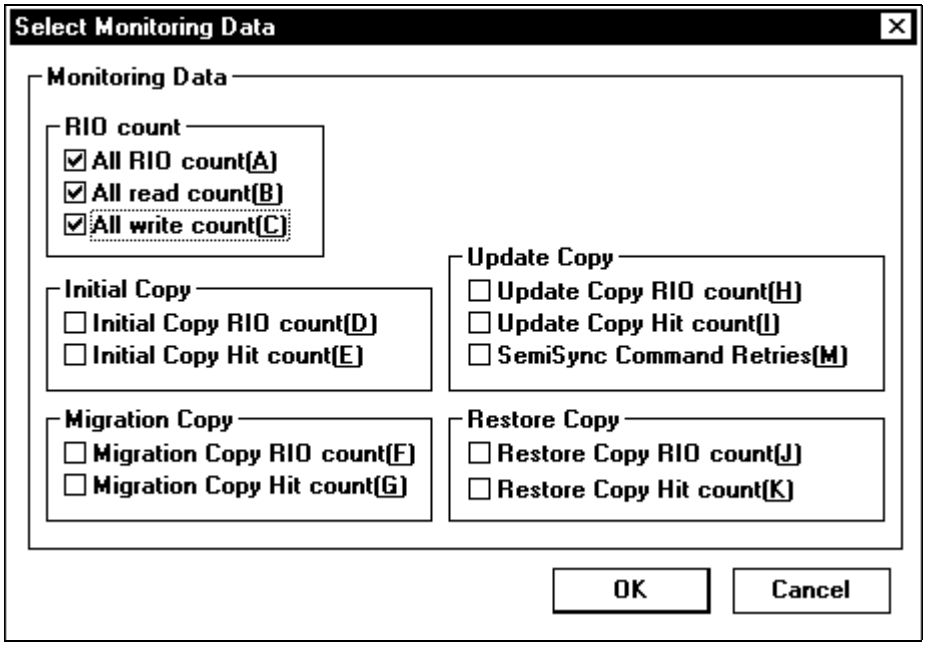
Select Logical Device



Logical Device: .. Displays the list of logical devices valid in the subsystem. Select the device from the list to display its operation information. To display the operation information of the whole subsystem, select "Sub System".

Copyright ©1998, Hitachi, Ltd.

Select Monitoring Data
(1) Subsystem



RIO count.....Specifies the read/write count concerning the Remote Copy.

Initial Copy .....I/O count for the initial copy

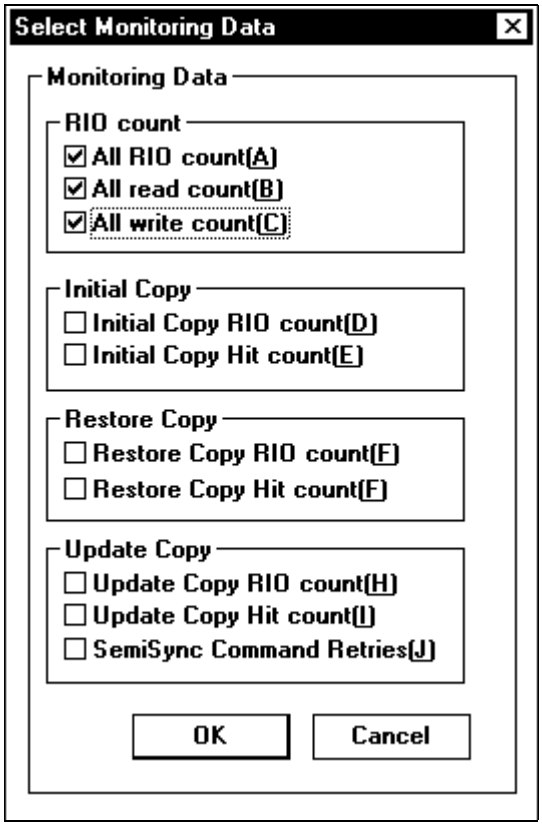
Migration Copy..I/O count for migration copy

Update Copy .....I/O count for renewal copy

Restore Copy.....I/O count for recovering copy

Copyright ©1998, Hitachi, Ltd.

(2) Logical Device for HORC



RIO count.....Specifies the read/write count concerning the Remote Copy.

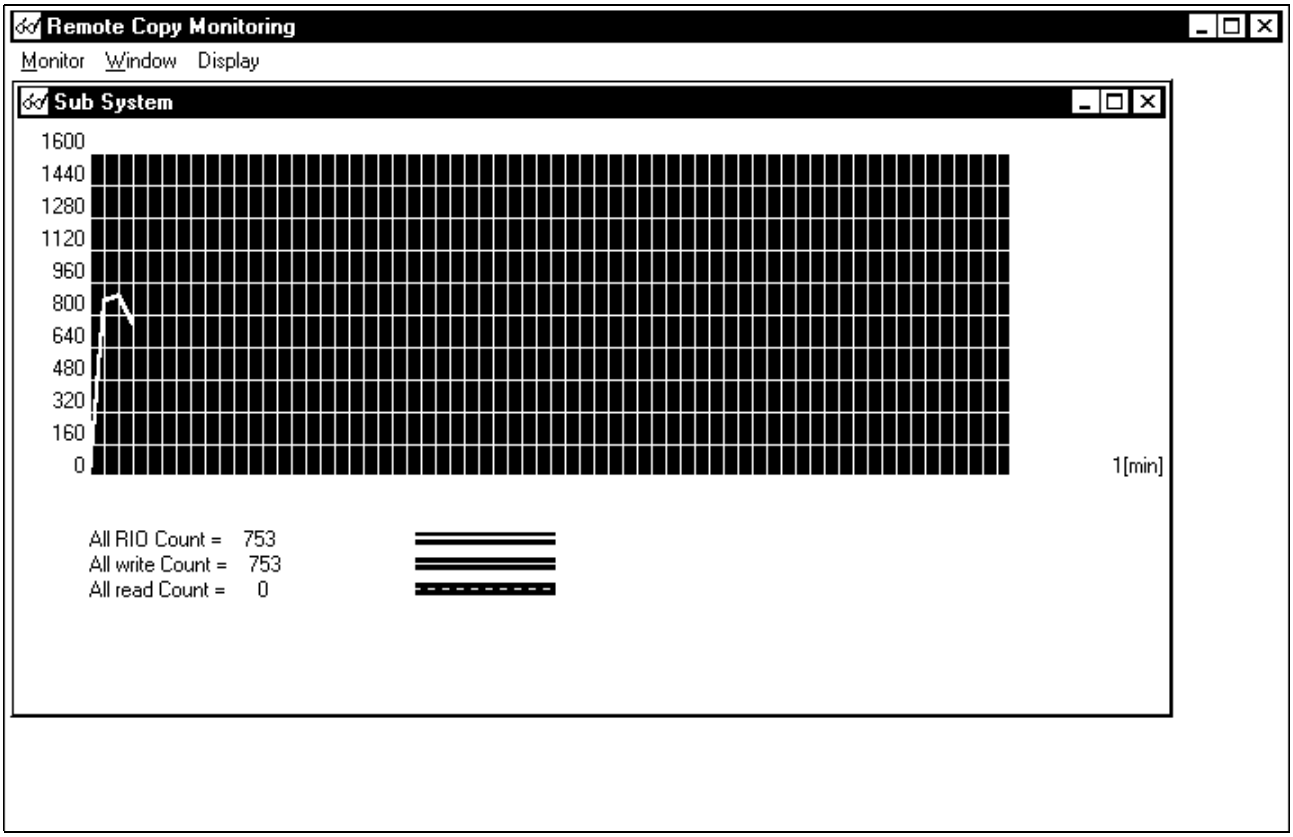
Initial Copy .....I/O count for the initial copy

Update Copy .....I/O count for renewal copy

Restore Copy.....I/O count for recovering copy

Copyright ©1998, Hitachi, Ltd.

Remote Copy Monitoring Screen



Monitor Menu .... Start.....Displays another Remote Copy Monitoring screen.
EXit.....Closes the Remote Copy Monitoring screen.

Window Menu ... Cascade (C)....Displays Remote Copy Monitoring windows side by side.
Tile (T).....Displays lined-up Remote Copy Monitoring windows.
Icon (I) .....Lines up Remote Copy Monitoring window icons.
All close (A) ..Closes all the Remote Copy Monitoring windows.

Display Menu..... Line Model ....Displays or hides the explanation of lines.

Vertical Axis ..... Indicates the count number.

Horizontal axis... Indicates the time elapsed. A scale division on the horizontal axis indicates a sampling rate. The latest data is drawn to the right.

Copyright ©1998, Hitachi, Ltd.

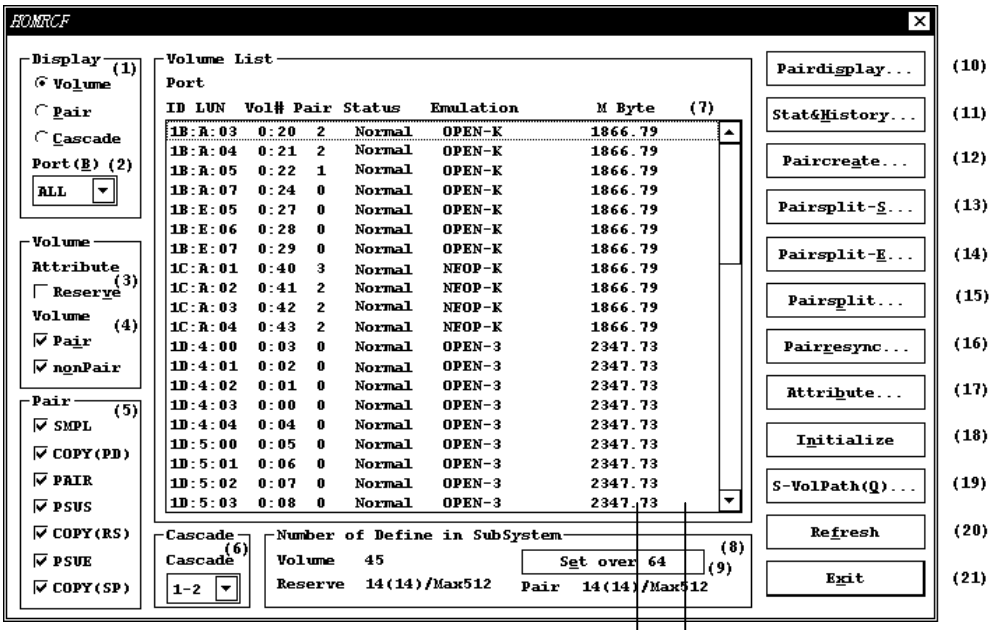
10 Details of the HOMRCF Operation Screen

10.1 Operation of HOMRCF

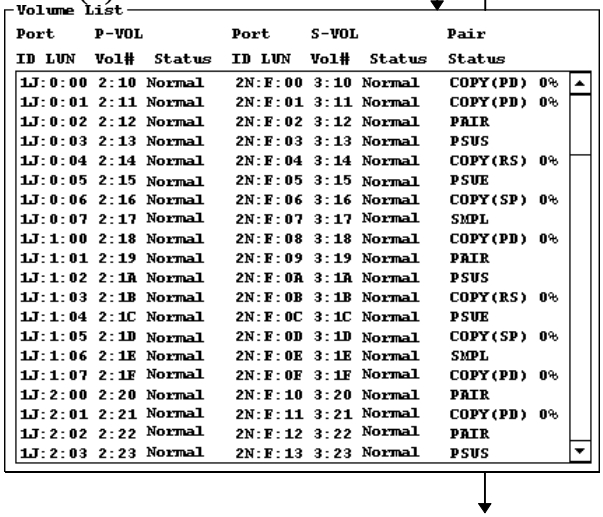
■ HOMRCF Main screen

HOMRCF has two modes of the volume display and the pair display and the cascade display. The volume display mode displays information for each of the volumes on the list. The pair display mode shows the list about pair's information that is making currently. The cascade display mode, it displays matching information in the form of cascade.

<The volume display>
Select [Volume] radio button on the (1)

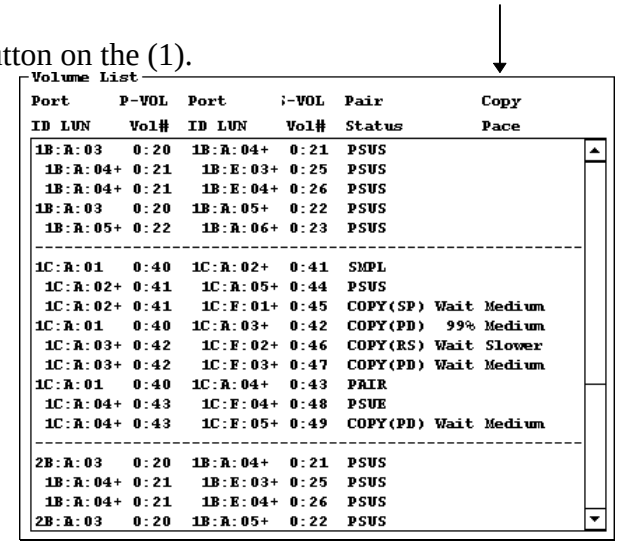


<The pair display>
Select [Pair] radio button on the (1).



Copyright ©1999,2000, Hitachi, Ltd.

<The cascade display>
Select [Cascade] radio button on the (1).



(1) : Display
Specifies the classification to display.
Volume : Displays Volume
Pair : Displays Pair
Cascade : Displays Cascade

(2) : Specifies the Port number (Cluster and Channel number) to which volumes to be displayed belong.
When specifying 'ALL', it specifies all port.
When selecting Pair display in step (1), it specifies Port of P-VOL (Source Volume).
When selecting Cascade display in step (1), it specifies Port of Root Volume.

(3) : Display Filter Attribute
This specification is valid when [Volume] is selected in step (1).
Reserved volumes mean that they are reserved as target volumes when adding pairs are executed.
When the check box is checked, volumes with *Reserve* attribute are displayed.
When the check box is not checked, volumes with attributes other than *Reserve* are displayed.

(4) : Display Filter Volume
This specification is valid when [Volume] is selected in step (1).
Pair : Volumes with paired are Display
non Pair : Volumes with not paired are Display

(5) : Pair Filter
This specification is valid when [Pair] is selected in step (1).
SMPL : Pair with SMPL are Display
COPY(PD) : Pair with COPY(PD) are Display
PAIR : Pair with PAIR are Display
PSUS : Pair with PSUS are Display
COPY(RS) : Pair with Resynchronization or Reverse-Resynchronization are Display
PSUE : Pair with PSUE are Display
COPY(SP) : Pair with COPY(SP) are Display

Copyright ©1999,2000, Hitachi, Ltd.

(6) : Cascade

This specification is valid when [Cascade] is selected in step (1).

1 : It displays only L1-Pair.

1-2 : It displays L1-Pair and L2-Pair.

(7) : Volume List box

When [Volume] is selected in step (1).

Port : Number of Port number (Cluster and Channel number) of the volume concerned

ID : Number of Target(SCSI) ID of the volume concerned

LUN : Number of LUN of the volume concerned

Vol# : Number of the volume concerned

Pair : Number of pairs of the volume concerned

Status : Status of the volume concerned

Emulation : Emulation type of the volume concerned

M Byte : Size of the volume concerned

When [Pair] is selected in step (1).

P-VOL Port : Port number (Cluster and Channel number) to which the P-VOL belongs

P-VOL ID : Target(SCSI) ID to which the P-VOL belongs

P-VOL LUN : LUN number to which the P-VOL belongs

P-VOL Vol# : Number of CU:Volume of P-VOL

P-VOL Status : Status of P-VOL

S-VOL Port : Port number (Cluster and Channel number) to which the S-VOL (Target Volume) belongs

S-VOL ID : Target(SCSI) ID to which the S-VOL belongs

S-VOL LUN : LUN number to which the S-VOL belongs

S-VOL Vol# : Number of CU:Volume of S-VOL

S-VOL Status : Status of S-VOL

Pairdisplay : Status of the volume pair concerned

When [+] is displayed after LUN, it shows that SCSI pass is defined in addition to being displayed too.

When [Cascade] is selected in step (1).

P-VOL Port : Port number (Cluster and Channel number) to which the P-VOL belongs

P-VOL ID : Target(SCSI) ID to which the P-VOL belongs

P-VOL LUN : LUN number to which the P-VOL belongs

P-VOL Vol# : Number of CU:Volume of P-VOL

S-VOL Port : Port number (Cluster and Channel number) to which the S-VOL (Target Volume) belongs

S-VOL ID : Target(SCSI) ID to which the S-VOL belongs

S-VOL LUN : LUN number to which the S-VOL belongs

S-VOL Vol# : Number of CU:Volume of S-VOL

Pairdisplay : Status of the volume pair concerned

Copy Status : Pace of the copy

When [+] is displayed after LUN, it shows that SCSI pass is defined in addition to being displayed too.

Copyright ©1999,2000, Hitachi, Ltd.

(8) : Number of Define Subsystem
Displays information concerning the volumes.

Volume	: Number of volumes defined in the whole subsystem A summation with the number of reserved logical volumes which is defined at both of HMRCF/HOMRCF is shown in the brackets.
Reserve	: Number of reserves defined in the whole subsystem
Pair	: Number of volume pairs defined in the whole subsystem A summation with the number of pair of logical volumes which is defined at both of HMRCF/HOMRCF is shown in the brackets. Pair can be created to the extent that the value in the brackets is maximum value displayed on the right side.

(9) : Set Over 64
It extends the number of the maximum pairs to 512.
(Including HOMRCF/HMRCF/HIHSM pairs)

(10) : Pairdisplay ...
Displays a name of the screen for displaying the statuses of the volumes selected in step (7).

(11) : Stat & History ...
Displays a name of the screen for displaying the statuses of the all pair and pair history.

(12) : Paircreate ...
Displays a name of the screen for specifying the pairing of the volume selected in step (7).

(13) : Pairsplit-S ...
Displays a name of the screen for specifying the parting of the volume pair selected in step (7).

(14) : Pairsplit-E ...
Displays a name of the screen for specifying the suspension of the volume selected in step (7).

(15) : Pairsplit ...
Displays a name of the screen for specifying the splitting of the volume pair selected in step (7).

(16) : Pairresync ...
Displays a name of the screen for specifying the resynchronization of the volume pair selected in step (7).

Copyright ©1999,2000, Hitachi, Ltd.

(17) : Attribute ...
Displays a name of the screen for specifying the attribute change of the volumes selected in step (7).

(18) : Initialize
It initializes all pairs. (HMRCF/HOMRCF/HIHSM pairs)

(19) : S-VOL Path ...
It displays the screen which refers to the SCSI pass which was defined by S-VOL of Pair which was chosen in (7).

(20) : Refresh
Updates the displayed information to the latest one.

(21) : Exit
Quits the HOMRCF screen.

If you choose the pair display or cascade display in step(1), you can choose the pairs of the status which are shown in the following Table 10-1.

Table 10-1 Enable buttons

Pairdisplay / Button	SMPL	COPY(PD)	PAIR	COPY(SP)	PSUS	COPY(RS)	COPY(RS-R)	PSUE
Pairsplit-E	x	OK	OK	OK	OK	OK	OK	x
Pairresync	x	x	x	x	OK	x	x	OK
Pairsplit-S	x	OK	OK	OK	OK	OK	OK	OK
Pairsplit	x	OK	OK	x	x	x	x	x

OK: Select the button x: Could not select the button

When you select several pairs by (1), buttons which your selected pairs can be operated will be available to be selected.
When select [cascade] in (1), the pair gets for the choice of the [Paircreate] button only when it is possible to add to be possible.

In the following Table 10-1-2, items of Volume Status in the (6) Volume List box are shown.

Table 10-1-2 Volume Status in the Volume List box

Item	Volume Status
Normal	The Volume is normal.
Blocked	The Volume is blocked.
Format	The Volume is formatting now.
Correct	The Volume is under correction access by HDD error.
Copying	The Volume is under correction copy by recovering HDD error.
Unknown	Status of the volume is unknown.

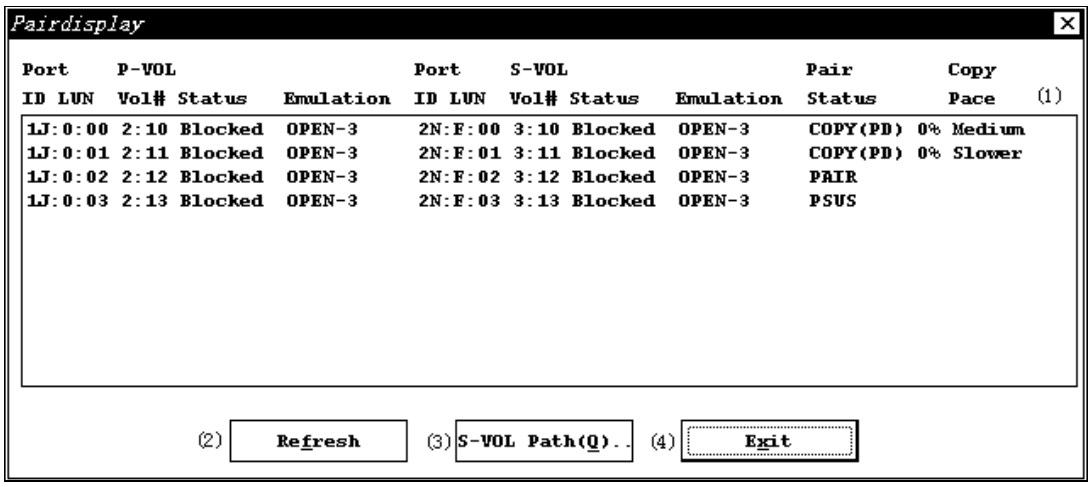
■ Pairdisplay Display Screen



(1) : Status information list box

P-VOL Port	:	Port number (Cluster and Channel number) to which the P-VOL belongs
P-VOL ID	:	Target(SCSI) ID to which the P-VOL belongs
P-VOL LUN	:	LUN number to which the P-VOL belongs
P-VOL Vol#	:	Volume number of the P-VOL
P-VOL Status	:	Status of the P-VOL
P-VOL Emulation	:	Emulation type of the P-VOL
S-VOL Port	:	Port number (Cluster and Channel number) to which the S-VOL belongs
S-VOL ID	:	Target(SCSI) ID to which the S-VOL belongs
S-VOL LUN	:	LUN number to which the S-VOL belongs
S-VOL Vol#	:	Volume number of the S-VOL
S-VOL Status	:	Status of the S-VOL
S-VOL Emulation	:	Emulation type of the S-VOL
Pairdisplay	:	Status of the volume pair concerned
Copy Pace	:	Mode of copy pace.

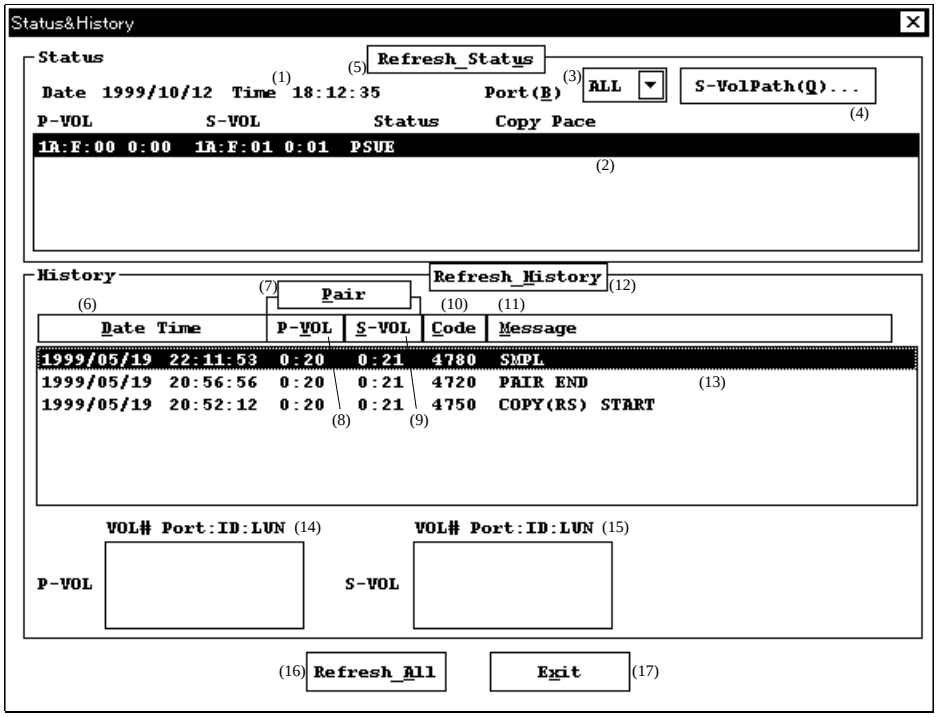
(2) : Refresh
Updates the displayed information to the latest one.

(3) : S-VOL Path ...
It displays the screen which refers to the SCSI pass which was defined by S-VOL.

(4) : Exit
Closes the screen.

Copyright ©1999,2000, Hitachi, Ltd.

■ Status & History Screen



(1) : Date, Time
It displays the time when the Pairdisplay was acquired.

(2) : The present Pairdisplay at the (1) display list box
- P-VOL : The Port number (Cluster and Channel number), Target (SCSI) ID, LUN, the CU number:Volume number of P-VOL is shown.
- S-VOL : The Port number (Cluster and Channel number), Target (SCSI) ID, LUN, the CU number:Volume number of S-VOL is shown.
- Status : The present pairs of volume concerned.
- Copy Pace : Copy pace against the target pair.

(3) : Port (B)
It specifies Port number (Cluster and Channel number) of P-VOL of Pair to display.

(4) : S-VOL Path ...
It displays the screen which refers to the Port number (Cluster and Channel number), Target (SCSI) ID, LUN which was defined by S-VOL of chosen Pair.

(5) : Refresh_Status
Updates the displayed information to the latest one in the Pairdisplay list.

(6) : Date Time
It sorts with the key with Date/Time.

(7) : Pair
It sorts with the key with Pair.

Copyright ©1999,2000, Hitachi, Ltd.

(8) : P-VOL
It sorts with the key with P-VOL.

(9) : S-VOL
It sorts with the key with S-VOL.

(10) : Code
It sorts with the key with Code. Codes and messages are shown as Table 10-2 List of Reference Codes and Messages.

(11) : Message
It sorts with the key with kind of Message.

(12) : Refresh_History
Updates the displayed information to the latest one in the History list.

(13) : History of the condition transfer of the pairs display list box.

Date Time	: The time which history SIM occurred to.
P-VOL	: CU number of P-VOL (Left) Number of the Volume (Right)
S-VOL	: CU number of S-VOL (Left) Number of the Volume (Right)
Code	: Reference Code.
Message	: The message which corresponded to Reference Code.

The following table is described about these Reference Codes and messages.

Copyright ©1999,2000, Hitachi, Ltd.

Table 10-2 List of Reference Codes and Messages

Reference Code	Message	contents
4710 - 4713	PAIR START	Starting data copy by this pair.
4720 - 4723	PAIR END	End PAIR
4730 - 4733	PSUS START	Start PSUS
4740 - 4743	PSUS END	End PSUS
4750 - 4753	COPY(RS) START	Pair resynchonization was started
	COPY(RS-R) START	Pair reverse resynchonization was started
4760 - 4763	COPY(RS) END	Pair resynchonization was completed
	COPY(RS-R) END	Pair reverse resynchonization was completed
4780 - 4783	SMPL	End deleting the Pair
4790 - 4793	PSUE	Suspended the pair
4798	ALL COPY(SP) PSUE BY SM VOLATILE	PSUE all COPY(SP) Pairs by SM volatile.
47A0 - 47A3	COPY WARNING END	End copy warning. *1
47B0 - 47B3	COPY ABNORMAL END (SVOL BLOCKADE)	End copy abnormally (by blocking P-VOL). *1
47C0 - 47C3	COPY ABNORMAL END (TVOL BLOCKADE)	End copy abnormally (by blocking S-VOL). *1
47D0 - 47D3	COPY ABNORMAL END	End copy abnormally (by the other reason). *1
47E9	HOMRCF SM INITIALIZATION START	Start initializing a extensible table of HMRCF/HOMRCF
47EA	HOMRCF SM INITIALIZATION END	End initializing a extensible table of HMRCF/HOMRCF
47EB	HOMRCF SM INITIALIZATION FAILED	Failed initializing a extensible table of HMRCF/HOMRCF
FFFF	Reference Code unknown	Unknown reference code.

(14) : It displays the CU number, the volume number and the Port number (Cluster and Channel number), Target (SCSI) ID, LUN of chosen P-VOL.

(15) : It displays the CU number, the volume number and the Port number (Cluster and Channel number), Target (SCSI) ID, LUN of chosen S-VOL.

(16) : Refresh_All
Updates the displayed information to the latest one in both Pairdisplay list and History list.

(17) : Exit
Quits the Screen

*1 : When these messages occurs, please retry the same copies or operations against the volume. Even though the same messages are occurred again, please call your technical support center.

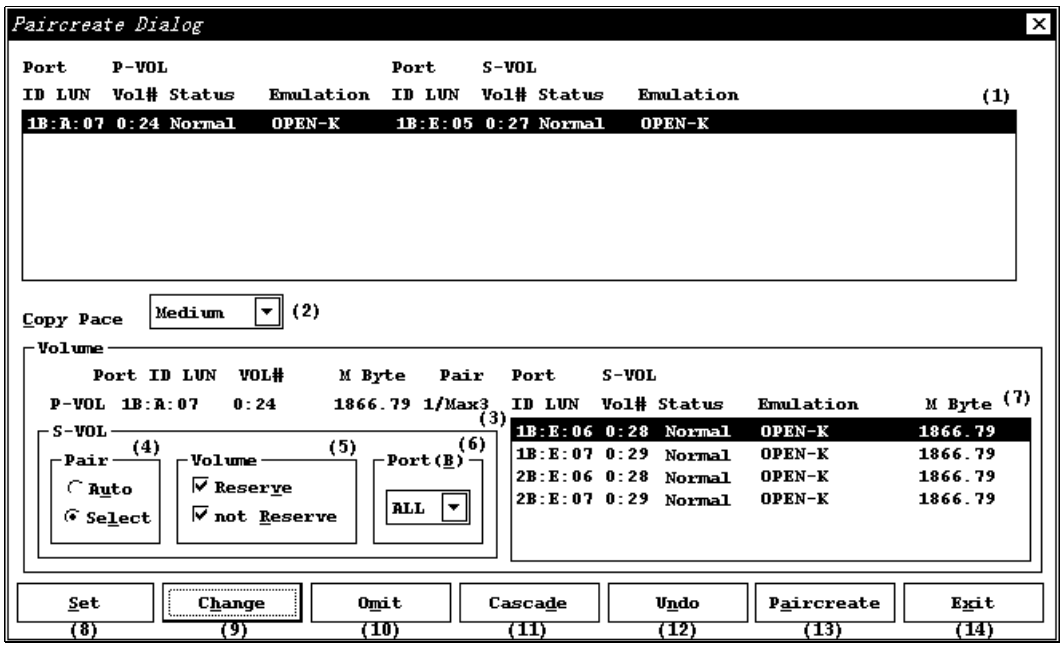
■ Paircreate Dialog Screen



(1) : Volume information list box

P-VOL Port	:	Port number (Cluster and Channel number) to which the P-VOL belongs
P-VOL ID	:	Target(SCSI) ID to which the P-VOL belongs
P-VOL LUN	:	LUN number to which the P-VOL belongs
P-VOL Vol#	:	Volume number of the P-VOL
P-VOL Status	:	Status of the P-VOL
P-VOL Emulation	:	Emulation type of the P-VOL
S-VOL Port	:	Port number (Cluster and Channel number) to which the S-VOL belongs
S-VOL ID	:	Target(SCSI) ID to which the S-VOL belongs
S-VOL LUN	:	LUN number to which the S-VOL belongs
S-VOL Vol#	:	Volume number of the S-VOL
S-VOL Status	:	Status of the S-VOL
S-VOL Emulation	:	Emulation type of the S-VOL

(Notice) When "AUTO" is specified for the S-VOL, the DKC automatically selects the S-VOL.

(2) : Copy Pace

Selecting Copy Pace

You can select one of the copy pace (Faster/Medium/Slower) mode. It will be applied to all adding pairs.

There are three paces and you can choose one of them.

Slower	: Copy pace is slower than medium pace.
Medium	: Copy pace is normal.
Faster	: Copy pace is faster than medium pace.

please be careful to select “Faster”, because this copy pace will be reflected to Host I/O Performance.

Copyright ©1999,2000, Hitachi, Ltd.

(3) : P-VOL information

Port	: Port number (Cluster and Channel number) to which the P-VOL belongs
ID	: Target(SCSI) ID to which the P-VOL belongs
LUN	: LUN number to which the P-VOL belongs
Vol#	: Volume number of the P-VOL
M Byte	: Size of the P-VOL
Pair	: Number of pairs against the P-VOL

(4) : Specifies the method to select the S-VOL.

Auto	: Selects a S-VOL automatically.
Select	: Specifies a S-VOL for selection.

(5) : S-VOL Volumes

Reserve	: Displaying the reserved volumes (It means that those volumes' attribution are "Reserve") in the S-VOL list.
not Reserve	: Displaying volumes except reserved volumes in the S-VOL list.

(6) : Port

It specifies Port number (Cluster and Channel number) to display on the S-VOL display list box.

(7) : Information of the S-VOL to be paired

Port	: Port number (Cluster and Channel number) to which the S-VOL belongs
ID	: Target(SCSI) ID to which the S-VOL belongs
LUN	: LUN number to which the S-VOL belongs
Vol#	: Volume number of the S-VOL
Status	: Status of the S-VOL
Emulation	: Emulation type of the S-VOL
M Byte	: Size of the S-VOL

(8) : Set

Adds the selected S-VOL as a volume to be paired.

(9) : Change

Changes into S-VOL which chose S-VOL which is set at present.

(10) : Omit

Deletes the selected S-VOL from the volumes to be paired.

(11) : Cascade

It adds S-VOL of Pair which was chosen in (1) to the Pair display list box as P-VOL.
Changes into S-VOL which chose S-VOL which is set at present.
Only when all of the following conditions are met, the concerned button becomes possible to be selected.

- A L1-Pair is Pairsplit.
- A L1-Pair is selected.
- A S-VOL is selected by optional specification.
- It is possible to add a L2-Pair.

When there is L1-Pair excepted Pairsplit already and it adds only L2-Pair, the concerned button can not be chosen.

Copyright ©1999,2000, Hitachi, Ltd.

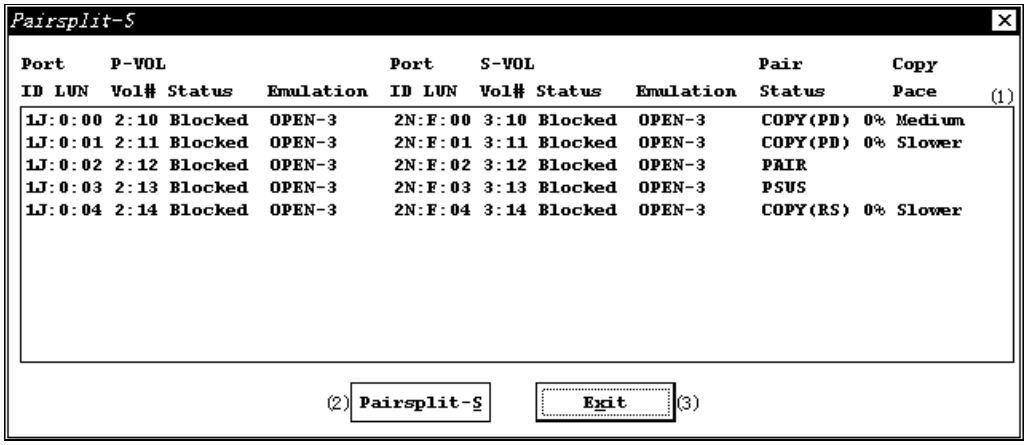
(12) : Undo
Returns 1 step of operation done by (8), (9), (10) or (11).

(13) : Paircreate
Execute paring.

(14) : Exit
Stop the pairing and quits the screen.

Copyright ©1999,2000, Hitachi, Ltd.

■ Delete Volume Pair Screen



(1) : Volume pair information list box

P-VOL Port	:	Port number (Cluster and Channel number) to which the P-VOL belongs
P-VOL ID	:	Target(SCSI) ID to which the P-VOL belongs
P-VOL LUN	:	LUN number to which the P-VOL belongs
P-VOL Vol#	:	Volume number of the P-VOL
P-VOL Status	:	Status of the P-VOL
P-VOL Emulation	:	Emulation type of the P-VOL
S-VOL Port	:	Port number (Cluster and Channel number) to which the S-VOL belongs
S-VOL ID	:	Target(SCSI) ID to which the S-VOL belongs
S-VOL LUN	:	LUN number to which the S-VOL belongs
S-VOL Vol#	:	Volume number of the S-VOL
S-VOL Status	:	Status of the S-VOL
S-VOL Emulation	:	Emulation type of the S-VOL
Pairdisplay	:	Status of the volume pair concerned
Copy Pace	:	Mode of copy pace (Faster/Medium/Slower).

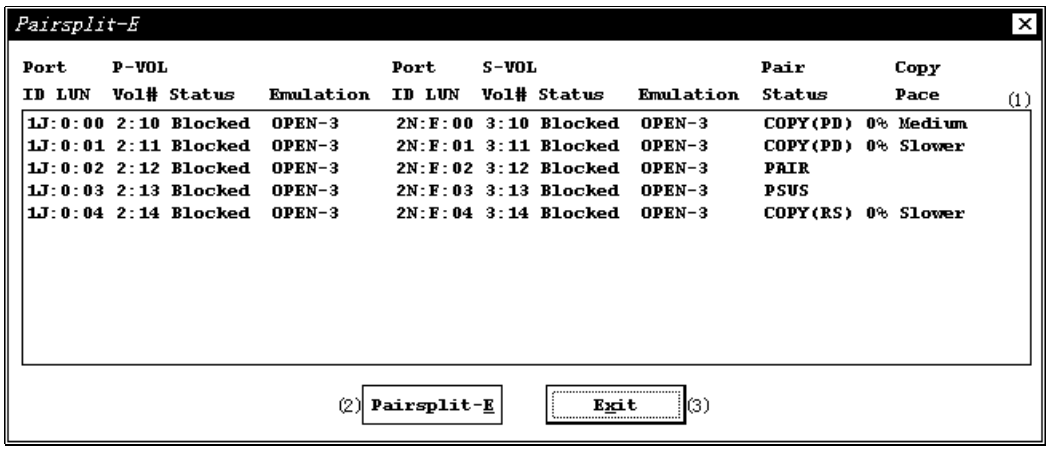
(2) : Pairsplit-S
Executes an parting of the volume pair.

(3) : Exit
Stops parting of the volume pair and quits the screen.

When “SMPL” is in Pairdisplay, the pair is in a transition state to SMPL.
Please click [Refresh] button on HOMRCF Main Screen.

Copyright ©1999,2000, Hitachi, Ltd.

■ PSUE Volume Pair Screen



(1) : Volume pair information list box

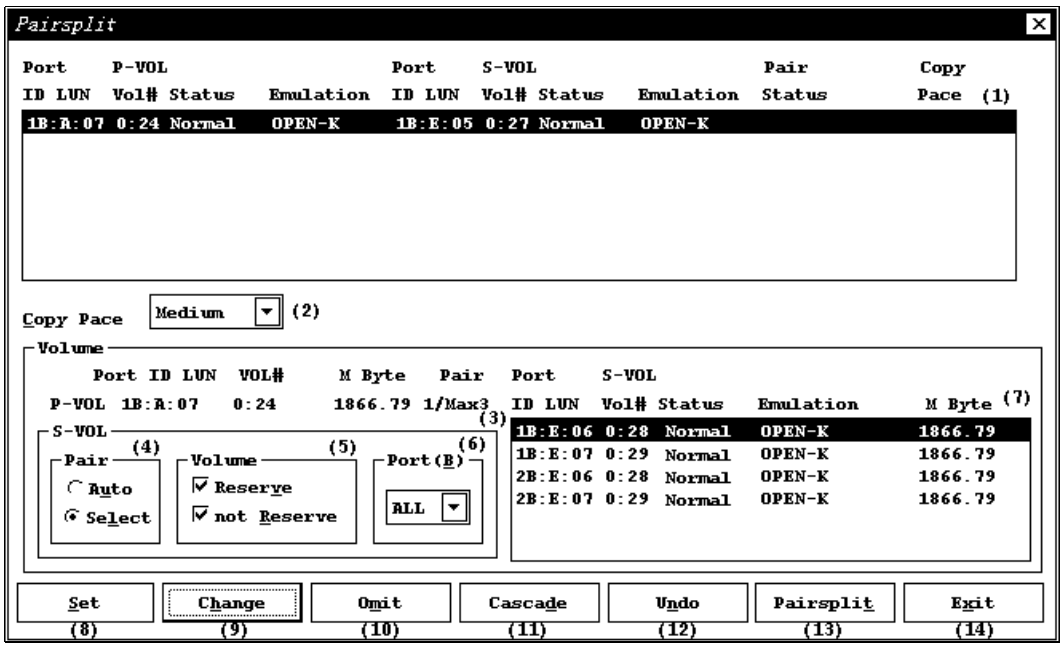
P-VOL Port	:	Port number (Cluster and Channel number) to which the P-VOL belongs
P-VOL ID	:	Target(SCSI) ID to which the P-VOL belongs
P-VOL LUN	:	LUN number to which the P-VOL belongs
P-VOL Vol#	:	Volume number of the P-VOL
P-VOL Status	:	Status of the P-VOL
P-VOL Emulation	:	Emulation type of the P-VOL
S-VOL Port	:	Port number (Cluster and Channel number) to which the S-VOL belongs
S-VOL ID	:	Target(SCSI) ID to which the S-VOL belongs
S-VOL LUN	:	LUN number to which the S-VOL belongs
S-VOL Vol#	:	Volume number of the S-VOL
S-VOL Status	:	Status of the S-VOL
S-VOL Emulation	:	Emulation type of the S-VOL
Pairdisplay	:	Status of the volume pair concerned
Copy Pace	:	Mode of copy pace (Faster/Medium/Slower).

(2) : Pairsplit-E
Executes a suspension of the volume pair.

(3) : Exit
Stops a suspension of the volume pair.

Copyright ©1999,2000, Hitachi, Ltd.

■ Screen for Pairsplit



(1) : Volume pair information list box

P-VOL Port	:	Port number (Cluster and Channel number) to which the P-VOL belongs
P-VOL ID	:	Target(SCSI) ID to which the P-VOL belongs
P-VOL LUN	:	LUN number to which the P-VOL belongs
P-VOL Vol#	:	Volume number of the P-VOL
P-VOL Status	:	Status of the P-VOL
P-VOL Emulation	:	Emulation type of the P-VOL
S-VOL Port	:	Port number (Cluster and Channel number) to which the S-VOL belongs
S-VOL ID	:	Target(SCSI) ID to which the S-VOL belongs
S-VOL LUN	:	LUN number to which the S-VOL belongs
S-VOL Vol#	:	Volume number of the S-VOL
S-VOL Status	:	Status of the S-VOL
S-VOL Emulation	:	Emulation type of the S-VOL
Pairdisplay	:	Status of the pair concerned.
Copy Pace	:	Displays a copy pace (Faster/Medium/Slower).

When "AUTO" is specified for the S-VOL, the DKC automatically selects the S-VOL.

(2) : Copy Pace

Selecting Copy Pace

You can select one of the copy pace mode. It will be applied to all adding pairs.

There are three paces and you can choose one of them.

Slower	: Copy pace is slower than medium pace.
Medium	: Copy pace is normal.
Faster	: Cop pace is faster than medium pace.

please be careful to select “Faster”, because this copy pace will be reflected to Host I/O Performance.

Copyright ©1999,2000, Hitachi, Ltd.

(3) : P-VOL information

Port	: Port number (Cluster and Channel number) to which the P-VOL belongs
ID	: Target(SCSI) ID to which the P-VOL belongs
LUN	: LUN number to which the P-VOL belongs
Vol#	: Volume number of the P-VOL
M Byte	: Size of the P-VOL
Pair	: Number of pairs against the P-VOL

(4) : Specifies the method to select the S-VOL.

Auto	: Selects a S-VOL automatically.
Select	: Specifies a S-VOL for selection.

(5) : S-VOL Volumes

Reserve	: Displaying the reserved volumes (It means that those volumes' attribution are "Reserve") in the S-VOL list.
not Reserve	: Displaying volumes except reserved volumes in the S-VOL list.

(6) : Port

It specifies Port number (Cluster and Channel number) to display on the S-VOL display list box.

(7) : Information of the S-VOL to be paired

Port	: Port number to which the S-VOL belongs
ID	: ID number to which the S-VOL belongs
LUN	: LUN number to which the S-VOL belongs
Vol#	: Volume number of the S-VOL
Status	: Status of the S-VOL
Emulation	: Emulation type of the S-VOL
M Byte	: Size of the S-VOL

(8) : Set

Adds a selected S-VOL as the one to be PSUS.

(9) : Change

Changes into S-VOL which chose S-VOL which is set at present.

(10) : Omit

Deletes a selected S-VOL from the ones to be PSUS.

(11) : Cascade

It adds S-VOL of Pair which was chosen in (1) to the Pair display list box as P-VOL.
Changes into S-VOL which chose S-VOL which is set at present.
It chooses when making L1-Pair and L2-Pair at the same time.
Only when all of the following conditions are met, the concerned button becomes possible to be selected.

- A L1-Pair is selected.
- A S-VOL is selected by optional specification.
- It is possible to add a L2-Pair.

When there is L1-Pair already and it adds only L2-Pair, the concerned button can not be chosen.

Copyright ©1999,2000, Hitachi, Ltd.

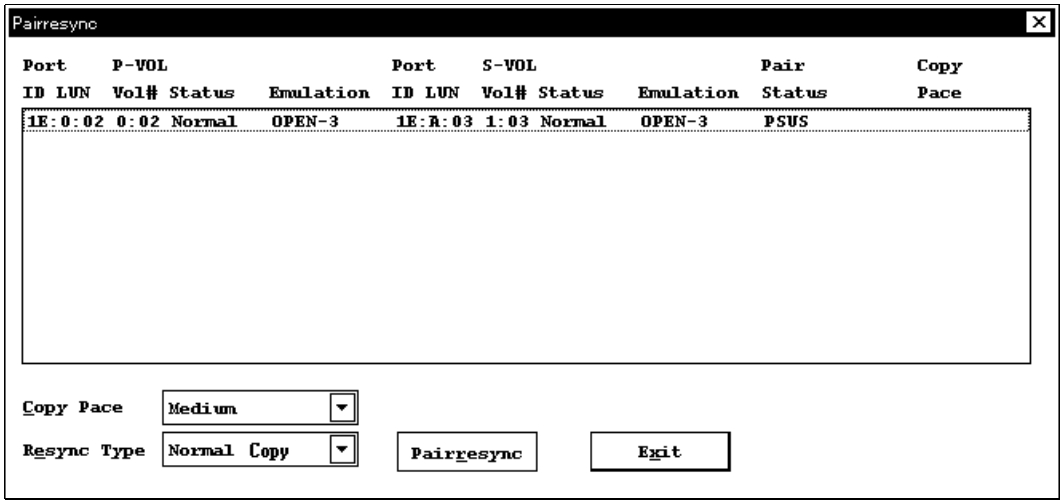
(12) : Undo
Returns 1 step of operation done by (8), (9), (10) or (11).

(13) : PSUS
Execute a splitting of the volume pair.

(14) : Exit
Stops a splitting of the volume pair.

Copyright ©1999, Hitachi, Ltd.

■ Re-synchronization Volume Pair Screen



(1) : Volume pair information list box

P-VOL Port	:	Port number (Cluster and Channel number) to which the P-VOL belongs
P-VOL ID	:	Target(SCSI) ID to which the P-VOL belongs
P-VOL LUN	:	LUN number to which the P-VOL belongs
P-VOL Vol#	:	Volume number of the P-VOL
P-VOL Status	:	Status of the P-VOL
P-VOL Emulation	:	Emulation type of the P-VOL
S-VOL Port	:	Port number (Cluster and Channel number) to which the S-VOL belongs
S-VOL ID	:	Target(SCSI) ID to which the S-VOL belongs
S-VOL LUN	:	LUN number to which the S-VOL belongs
S-VOL Vol#	:	Volume number of the S-VOL
S-VOL Status	:	Status of the S-VOL
S-VOL Emulation	:	Emulation type of the S-VOL
Pairdisplay	:	Status of the volume pair concerned
Copy Pace	:	Mode of copy pace (Faster/Medium/Slower).

(2) : Copy Pace

Selects one of the copy pace modes.
When executing re-synchronization, your selected mode will be applied to all pairs.
There are three paces and you \can choose one of them.

Slower	: Copy pace is slower than medium pace.
Medium	: Copy pace is normal.
Faster	: Cop pace is faster than medium pace.

please be careful to select “Faster”, because this copy pace will be reflected to Host I/O Performance.

(3) : COPY(RS)

Execute a re-synchronization of the volume pair.

Copyright ©1999,2000, Hitachi, Ltd.

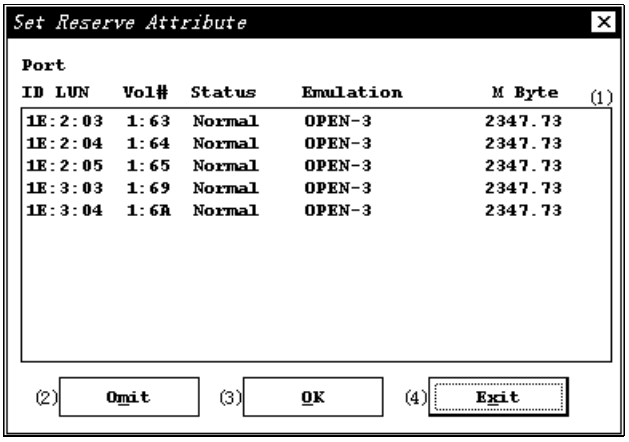
(4) : Exit
Stops a re-synchronization of the volume pair.

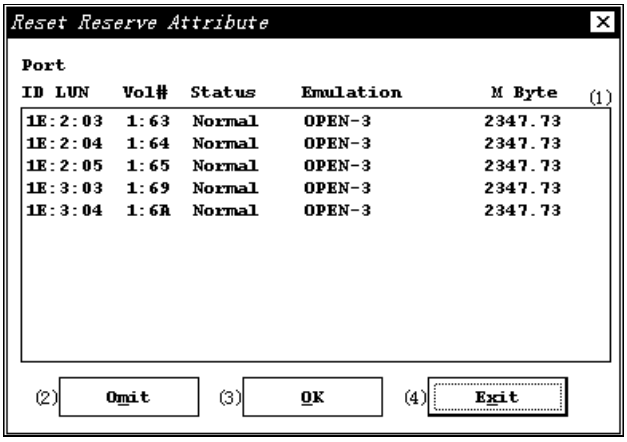
(5) : COPY(RS) Type
Specifies the re-synchronization type used when the re-synchronization is executed.
When executing the re-synchronization, the re-synchronization in (5) is applied to all the pairs.

Normal Copy	: Displays the Normal copy
Reverse Copy	: Displays the Reverse copy

Copyright ©1999,2000, Hitachi, Ltd.

■ Screen specifying volume attribute change





(1) : Volume information list box

Port	:	Port number (Cluster and Channel number) to which the volume belongs.
ID	:	Target(SCSI) ID to which the volume belongs.
LUN	:	LUN number to which the volume belongs.
Vol#	:	Volume number of the volume belongs.
Status	:	Status of the volume belongs.
Emulation	:	Emulation type of the volume belongs.
M Byte	:	Size of the volume belongs.

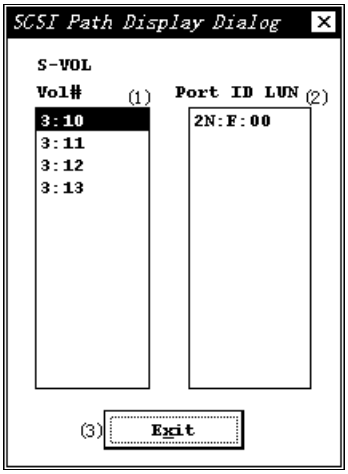
(2) : Omit
Removes the volume selected in step (1) from the ones whose attribute is to be changed.

(3) : OK
Set/reset the “Reserve” attribute of the volume.

(4) : Exit
Stops setting /resetting the “Reserve” attribute of the volumes and quits the screen.

Copyright ©1999, Hitachi, Ltd.

■ **S-VOL SCSI pass reference screen**



(1) : S-VOL display list box

Vol# : Volume number of the S-VOL

(2) : SCSI pass display list box

Port : Port number (Cluster and Channel number) to which the S-VOL belongs

ID : Target(SCSI) ID to which the S-VOL belongs

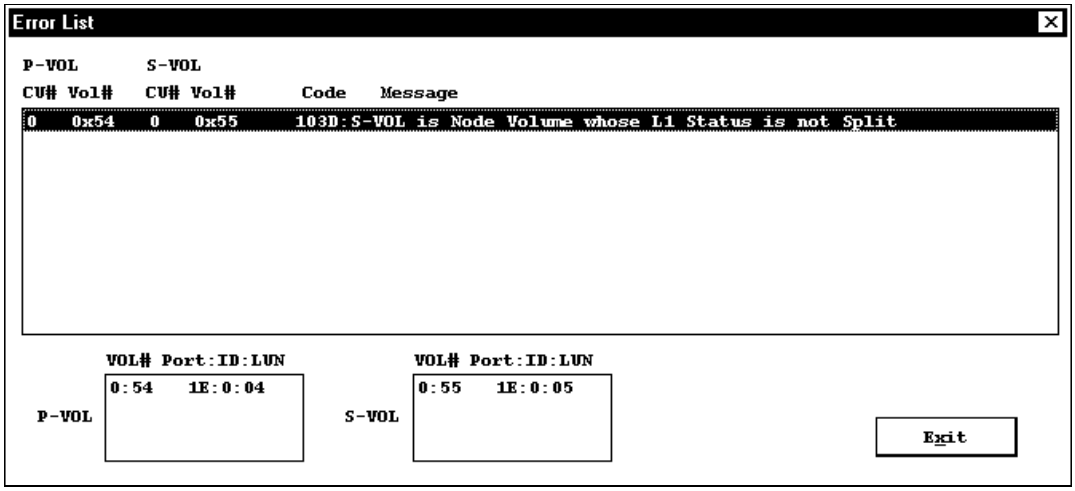
LUN : LUN number to which the S-VOL belongs

(3) : Exit

Closes the screen.

Copyright ©1999,2000, Hitachi, Ltd.

■ Error display screen



(1) : Information display list box

P-VOL CU#	: CU number of the P-VOL
P-VOL Vol#	: Volume number of the P-VOL
S-VOL CU#	: CU number of the S-VOL
S-VOL Vol#	: Volume number of the S-VOL
Code	: Error code is shown
Message	: Contents of the error code are shown

(2) : Exit

Closes the screen.

(3) : Path define of P-VOL

VOL#	: CU number : Displays the Volume number
Port	: Displays the Cluster and Channel number
ID	: Displays the Target (SCSI) ID
LUN	: Displays the discriminate number of Logical unit

(4) : Path define of S-VOL

VOL#	: CU number : Displays the Volume number
Port	: Displays the Cluster and Channel number
ID	: Displays the Target (SCSI) ID
LUN	: Displays the discriminate number of Logical unit

The list of the error code is shown after the next page.

Copyright ©1999,2000, Hitachi, Ltd.

Error Code	contents	way of coping
0401	It detected a lock time over during internal process.	Reexecutes after about 5 seconds.
0402	The indication could not be received because it was not internally in the SMPL condition.	Reexecutes after about 5 seconds.
0801	HMRCF/HOMRCF can not use. because lock of PP.	Installs PP of HMRCF/HOMRCF.
0810	In the present condition, the command can not be received.	Confirms a matching condition and it confirms whether or not it is the command which can be allowed.
0811	This command is handled as NOP	Confirms a matching condition and it confirms whether or not it is the command is allowed.
0812	It is impossible to create a pair because a pass group is set with S-VOL.	vary offline from the host or cancel the pass of Remote Copy.
0813	Pairsplit command is required to the pair of the PSUS state.	Because it is already in the PSUS state, the Pairsplit command can not be required.
0814	Paircreate command is required to the pair of the PSUS state.	Because it is already in the PSUS state, the Paircreate command can not be required.
0815	Pairsplit command with Quiesce is required to S-VOL.	1. Request without Quiesce. 2. or Request to P-VOL.
0816	This command with PRIMA option is required to S-VOL	1. Request without PRIMA. 2. or Request to P-VOL.
0817	Impossible to set reserve volume because a pass group is set	Vary offline the volume which makes Reserve volume from the host or cancel the pair of Remote Copy.
0818	Pairsplit-E command to the COPY(RS) being impossible because a pass group is set	Vary offline S-VOL from the host or cancel the pair of Remote Copy.
081F	Command Reject. P-VOL is used from HOST or Remote Copy volume.	Disconnect from the host or cancel the Remote Copy path.
0830	The pair can not be created because the track format is different.	Confirms whether the emulation type of P-VOL and S-VOL is equal.
0831	The pair can not be created because the number of the slots is different.	Confirms whether the capacity of P-VOL and S-VOL is equal.
0834	The emulation type of specified P-VOL is not-supported by HOMRCF.	Confirms whether or not the emulation type of P-VOL is supported by HOMRCF.
0835	The emulation type of specified S-VOL is not-supported by HOMRCF.	Confirms whether or not the emulation type of S-VOL is supported by HOMRCF.
0836	The pair can not be created	Confirms whether the emulation type of P-VOL, S-VOL is equal.
0852	Command Reject. P-VOL and S-VOL are used from HOST or Remote Copy volume.	Disconnect from the host or cancel the Remote Copy path.
0C20	Detected the fault of the cache.	Make cache a normal condition.
0C21	Cache capacity unmatch.	Adjusts the capacity of the side A and the side B of cache.

Copyright ©1999,2000, Hitachi, Ltd.

Error Code	contents	way of coping
0C30	Detected the fault of the SM.	Make SM a normal condition.
0C31	Capacity of SM is not enough.	Add the capacity of SM.
0C34	Failed in the initialization of SM.	Reexecute.
0C35	SM capacity unmatch.	Adjusts the capacity of the side A and the side B of SM.
0C36	SM that the capacity is 16 MB intermingles.	Uses SM that the capacity is 64 MB.
0C70	P-VOL isn't equipped.	Unequipped volume is not a processing object.
0C71	Impossible to use P-VOL.	Calls a maintenance member to make the condition of P-VOL normal.
0C72	P-VOL is formatting.	Waits until the format of P-VOL ends.
0C73	P-VOL is Command Device	Command Device is not an object of HOMRCF Pair.
0C80	S-VOL isn't equipped.	Unequipped volume is not a processing object.
0C81	Impossible to use S-VOL.	Calls a maintenance member to make the condition of S-VOL normal.
0C82	S-VOL is formatting.	Waits until the format of S-VOL ends.
0C83	S-VOL is Command Device	Command Device is not an object of HOMRCF Pair.
0C90	Logical volume which was specified as the Reserve volume isn't equipped.	Unequipped volume is not a processing object.
0C91	It is impossible to use logical volume which was specified as the Reserve volume.	Calls a maintenance member to make a condition with the volume which was specified in the Reserve volume normal.
0C92	Logical volume which was specified as the Reserve volume is formatting.	Waits until the format with the volume which was specified in the Reserve volume ends.
0C93	Reserve-Volume is Command Device	Command Device is not an object of HOMRCF Pair.
1009	Exceeded the multiple degree of HMRCF/HOMRCF.	Cancels some of pairs of the P-VOL.
1011	The logical volume which was specified as the Reserve volume is already set as the Reserve volume.	If you mistake changes the logical volume to specify as the Reserve volume.
1012	The logical volume number which was specified as the Reserve volume is used as P-VOL.	Changes the Volume number to specify as the Reserve volume.
1013	The logical volume number which was specified as the Reserve volume is used for HIHSM.	Changes the Volume number to specify as the Reserve volume.
1014	The logical volume which was specified as the Reserve volume is used for HIHSM.	Changes the Volume number to specify in the Reserve volume.
1015	Logical volume which was specified as the Reserve volume isn't set as the Reserve volume at reset reserve request.	Confirms a volume condition.

Copyright ©1999,2000, Hitachi, Ltd.

Error Code	contents	way of coping
1016	Logical volume which can allocate suitably as S-VOL doesn't exist.	Cancels some of the Reserve volume which can allocate as S-VOL.
1017	It is impossible to set Reserve volume because it exceeded the number of the maximum allocations with Reserve volume	Cancels some of Reserve volume.
101E	There is not Reserve volume itself in the system.	Sets Reserve volume for AUTO operation.
1026	It is impossible to make a pair any more because the volume which was specified as P-VOL is root volume already.	It delete some of the pairs of Root Volume.
1027	It is impossible to make a pair any more because the volume which was specified as P-VOL is node volume already.	It delete some of the pairs of Node Volume.
1028	It is impossible to make a pair because the volume which was specified as P-VOL is Leaf Volume already.	It confirms a pair condition.
1029	It is pmpossible to make a pair because the volume which was specified as S-VOL is Leaf Volume already	It confirms a pair condition.
102E	P-VOL is used as Source Volume for HIHSM.	Confirms a matching conditon.
102F	P-VOL is used as Destination Volume for HIHSM.	Confirms a matching conditon.
1030	The specified P-VOL number doesn't exist.	Please refresh the screen.
1031	Specified P-VOL is set as the Reserve volume.	Confirms a matching condition.
1032	Specified P-VOL can not set a pair any more.	Cancels some of the pairs of the P-VOL.
1033	Specified P-VOL is not P-VOL at pair operation.	Confirms a matching condition.
1037	Specified P-VOL is used as S-VOL of HOMRCF.	Confirms a matching condition.
1038	Specified P-VOL is used as M-VOL of HODM.	Cancels the pair of HODM.
103A	COPY(RS) command is requested at the device of the SMPL condition.	Confirms a matching condition.
103B	It is impossible to make a pair because Volume which was specified as S-VOL is Root Volume already	It confirms a pair condition.
103C	It is impossible to make a pair because Volume which was specified as S-VOL is Node Volume already	It confirms a pair condition.
103D	It is impossible for L2 Pair to require a Pairsplit because L1 Pair is not in the PSUS condition.	After making L1 Pair a PSUS condition, it reexecutes.
103E	This request is rejected because of Remote Copy cooperation conditions.	Make the volume to SMPL state.

Copyright ©1999,2000, Hitachi, Ltd.

Error Code	contents	way of coping
103F	Condition transfer's being impossible because of the Remote Copy cooperation conditions.	It makes the pair of Remote Copy M-VOL of which is S-VOL PSUE condition or SMPL condition.
1040	The specified S-VOL doesn't exist.	Please refresh the screen.
1042	S-VOL is used as Destination Volume for HIHSM.	Confirms a matching conditon.
1043	A specified S-VOL is used as S-VOL of HOMRCF.	Confirms a matching condition.
1044	Specified S-VOL is not S-VOL of HMRCF/HOMRCF.	Confirms a matching condition.
1046	Specified S-VOL is used as M-VOL of Remote Copy.	Cancels the pair of Remote Copy.
1047	Specified S-VOL is used as R-VOL of Remote Copy.	Cancels the pair of Remote Copy.
1048	Specified S-VOL is used as M-VOL of HODM.	Cancels the pair of HODM
104A	Specified S-VOL is used as P-VOL of HMRCF/HOMRCF.	Confirms a matching condition.
104B	S-VOL is used as Source Volume for HIHSM.	Confirms a matching conditon.
104C	Logical volume which was specified as Reserve is used as M-VOL of HODM.	Cancels the pair of HODM
104D	Logical volume which was specified as Reserve is used as R-VOL of HODM.	Cancels the pair of HODM
104E	Logical volume which was specified as Reserve is used as M-VOL of Remote Copy.	Cancels the pair of Remote Copy
104F	Logical volume which was specified as Reserve is used as R-VOL of Remote Copy.	Cancels the pair of Remote Copy
1050	Specified P-VOL & S-VOL are not the pair of HMRCF/HOMRCF.	Confirms a matching condition.
1051	The logical volume number of specified P-VOL and S-VOL is the same.	Reexecutes a screen behind Refresh.
1058	S-VOL is Node Volume whose L2 status is COPY(SP).	Confirms a matching conditon.
1084	Volume was used for Reserve volume of HIHSM.	Check the volume or Cancel the Reserve volume of HIHSM.
1085	P-VOL was used for Reserve volume of HIHSM.	Check the P-VOL or Cancel the Reserve volume of HIHSM.
1086	S-VOL was used for Reserve volume of HIHSM.	Check the S-VOL or Cancel the Reserve volume of HIHSM.
1087	P-VOL is used as Source Volume for HIHSM.	Confirms a matching conditon.
1095	Request could not be accepted because status of pair who shared with P-VOL was Reverse Copy.	Confirms a matching condition.

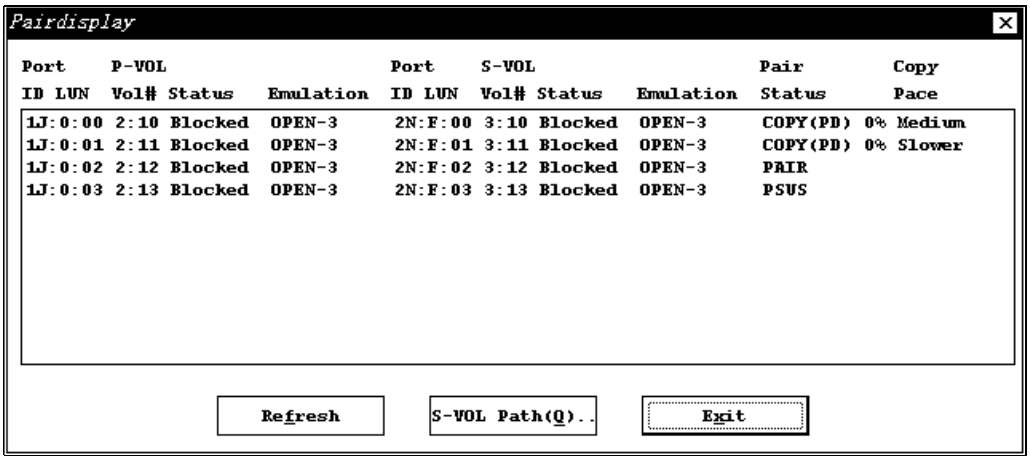
10.2 Procedure for confirming the volume status

■ Procedure for confirming the volume status

(1) Display of HOMRCF main screen
Click the [HOMRCF] button on SVP function screen, the HOMRCF main screen comes out.

(2) Select the volume
Select the volumes whose statuses you want to confirm at HOMRCF main screen volume list, then click the [Pair Stat...] button. When you want to confirm sequential several volumes, please select them by pushing [Shift] key. When you want to select volumes at random (not sequentially), please use [Ctrl] key.

(3) Status display
The statuses of the volumes you selected are displayed. To update the displayed information to the latest one, click the [Refresh] button. The screen can be closed by clicking the [Exit] button.



Copyright ©1999,2000, Hitachi, Ltd.

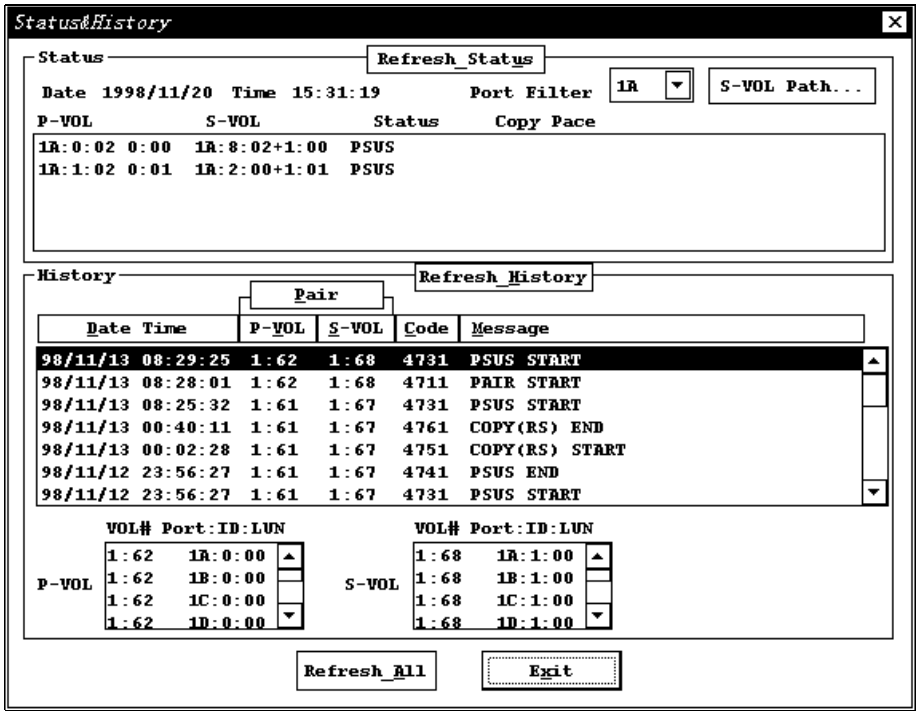
Procedure for confirming Status & History

■ Procedure for confirming Status & History

(1) Display of HOMRCF main screen
Click the [HOMRCF] button on SVP function screen, the HOMRCF main screen comes out.

(2) Status & History
Click the [Stat&History] button of the HOMRCF main screen.

(3) Display the status and history
The status situation of the present pairs are displayed in the Status frame. To update the displayed information of the side of Status to the latest one, click the [Refresh_Status] button. The one to have sorted a condition transfer history by the time series is displayed in the History frame. When you want to sort by time, please select [Date Time] button. When you want to sort by the volume number of P-VOL, please select [P-VOL] button. When you want to sort by the volume number of S-VOL, please select [S-VOL] button. When you want to sort by the code, please select [Code] button.
When updating the history of the condition transfer of the pair, click the [Refresh_History] button. When updating the all information, click the [Refresh_All] button.
The screen can be closed by clicking the [Exit] button.



Copyright ©1999,2000, Hitachi, Ltd.

Procedure for changing volume attribute

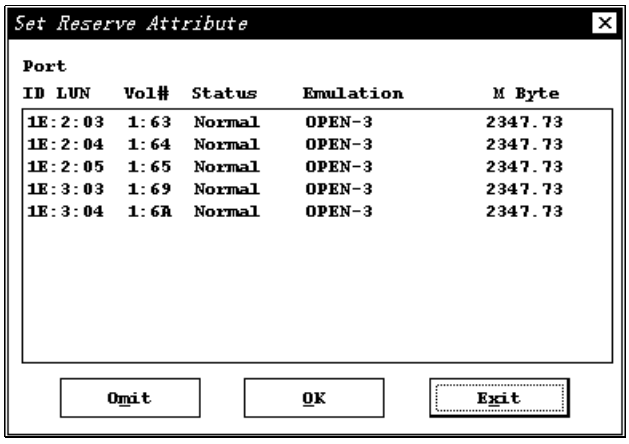
■ Procedure for changing volume attribute

In this section, we'd like to describe how to change the volume attribute as "Reserve" for S-VOLs.

(1) Display of HOMRCF main screen
Click the [HOMRCF] button on SVP function screen, the HOMRCF main screen comes out.

(2) Select volumes
Select the volumes whose attribute you want to change, then click the [Attribute...] button. If you want to select sequential volumes, please select volumes by pushing [Shift] key. If you want to select them at random, please use [Ctrl] key.

(3) Changing the volume attribute
When there are some volumes whose attributes you want to left unchanged, select the volumes and click the [Omit] button to delete them from the list. If you use [Shift] key, you can select sequential volumes. If [Ctrl] key, you can select volumes at random. To change the attributes of the selected volumes, click the[OK] button. To stop the attribute change, click the [Exit] button.



Copyright ©1999,2000, Hitachi, Ltd.

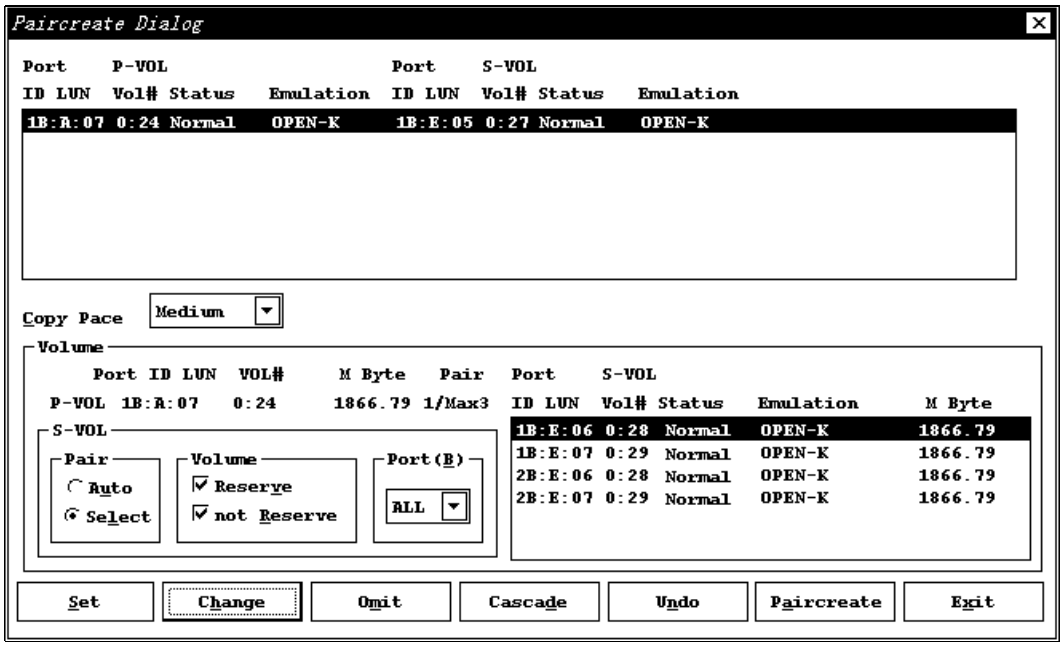
Procedure for creating/parting a volume pair

■ Procedure for creating a volume pair

(1) Display of HOMRCF main screen
Click the [HOMRCF] button on SVP function screen, the HOMRCF main screen comes out.

(2) Select a Source Volume (P-VOL)
You can choose [Display] on the HOMRCF main screen as the volume display or the pair display. If you choose the volume display, don't check the display attribute to [Reserve] on the HOMRCF main screen. Select a volume with which you want to create a volume pair, then click the [Paircreate...] button. If you want to select sequential volumes, please select volumes by pushing [Shift] key. If you want to select them at random, please use [Ctrl] key. If you select a mode to display by the pair unit, you could not select [Paircreate...].

(3) Edit pair & Execute
A S-VOL is automatically selected for the P-VOL that you selected.



Notice

Before you create pairs by selecting S-VOLs as "AUTO", you should define the volumes as "Reserved". Please refer to the procedure of changing the volume attribute.
In the Paircreate screen, it makes pair to all pair which are displayed in operation object volume list. If you do not want to use some volumes by pairs, please select them in the volume list and select [Omit] button to delete them from the list.

Copyright ©1999,2000, Hitachi, Ltd.

<Select Target Volume (S-VOL)>

(A) By Manual

◆ In the case of which you want to select S-VOL by manually (not “AUTO”).
  (a) Select volumes as P-VOL.
  (b) Select [Select] in the Paircreate Dialog .
  (c) Select volumes from the S-VOL list. You can select any Port#.
  (d) Select [Change].

◆ In the case of which you want to add several pairs by manually.
  (a) Select a volume as P-VOL.
  (b) Select [Select] in the Paircreate Dialog .
  (c) Select volumes from the S-VOL list.
  (d) Select [Set].
  If you want to create more pairs, please repeat these operations.

(B) By automatic method

◆ In the case of which you select S-VOL by “AUTO”.
  (a) Select volumes as P-VOL.
  (b) Select [AUTO] in the [S-VOL Select]. (Default setting is [AUTO])
  (c) Select [Change].

◆ In the case of which you want to add several pairs by selecting one P-VOL with “AUTO”.
  (a) Select a volume as P-VOL.
  (b) Select [AUTO] in the [S-VOL Select].
  (c) Select [Set].
  If you want to create more pairs, please repeat these operations.

<Specification of the cascade>

Click [Cascade] button after choice in L1 Pair and S-VOL of L2 Pair.
Changes into S-VOL which chose S-VOL which is set at present.
Only when all of the following conditions are met, the concerned button becomes possible to be selected.

- A L1-Pair is Pairsplit.
- A L1-Pair is selected.
- A S-VOL is selected by optional specification.
- It is possible to add a L2-Pair.

When there is L1-Pair excepted Pairsplit already and it adds only L2-Pair, the concerned button can not be chosen.

<In case of selecting wrong pairs>

If you want to Pairsplits-S, please select those pairs and select [Omit].

Copyright ©1999,2000, Hitachi, Ltd.

<Execute adding pairs>
If you want to Pairsplits-S, please select those pairs and select [Omit].
If you want to Paircreates against all pairs in the Pair Volume list, please select [Paircreate]. Remote Console will Paircreates and display the result. If you want to stop adding pairs, please select [Exit] button. The screen will be back to the HOMRCF main screen.

It is able to specify “Not Reserve”, “Reserve” when choosing S-VOL.

Copy pace is available these three mode [Slower] [Medium] [Faster].
[Faster] mode should be used in offline environment.

(4) Confirmation of Pairdisplay.
You can confirm Pairdisplay in HOMRCF Main Screen.
lease click “Refresh” button if necessary.

Copyright ©1999,2000, Hitachi, Ltd.

■ Procedure for delete a volume pair

(1) Display of HOMRCF main screen
Click the [HOMRCF] button on SVP function screen, the HOMRCF main screen comes out.

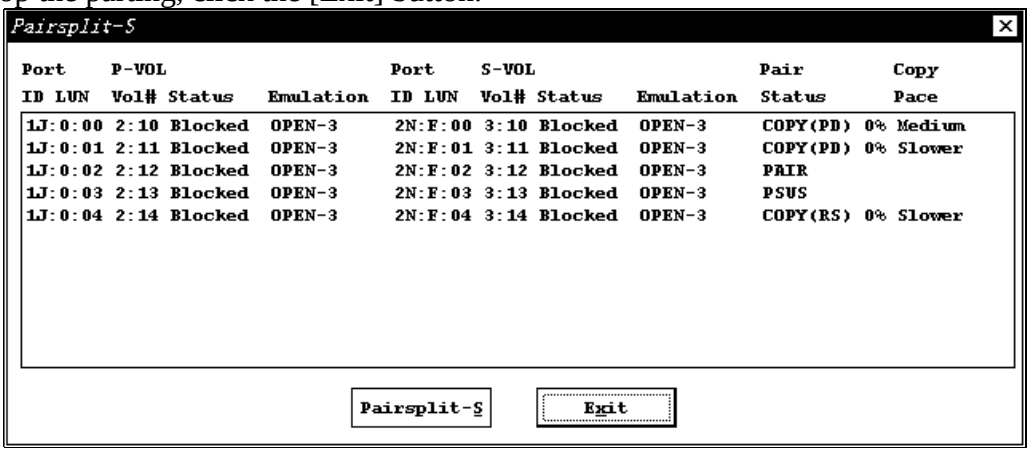
(2) Select volume/pair/Cascade
You can choose [Display] on the HOMRCF main screen as the volume display, the pair display or Cascade display.
If you choose the volume display, don't check the display attribute to [Reserve] on the HOMRCF main screen. Select a volume that you want to part the pair, then click the [Pairsplit-S...] button. If you want to select sequential volumes, please select volumes by pushing [Shift] key. If you want to select them at random, please use [Ctrl] key. If you choose the pair display or Cascade, [Pairsplit-S...] button sometimes will not be available by the Pairdisplay.
You can choose the pairs of the status which are shown in the following Table 10-3.

Table 10-3 Status Allow Selection of [Pairsplit-S ...] Button

Pairdisplay / Button	SMPL	COPY(PD)	PAIR	COPY(SP)	PSUS	COPY(RS)	COPY(RS-R)	PSUE
Pairsplit-S	x	OK	OK	OK	OK	OK	OK	OK

OK: Select the button x: Could not select the button

(3) Execution of deleting pairs
Select a volume pair that you want to part from the Pairs displayed and click the [Pairsplit-S] button. If you want to select sequential volumes, please select volumes by pushing [Shift] key. If you want to select them at random, please use [Ctrl] key.
To stop the parting, click the [Exit] button.



(4) confirmation of Pair
With the HOMRCF main screen, confirm the condition of the pair. According to the necessity, push and confirm [Refresh] button in the latest condition.
Also, click [Stat & History] button and confirm a table revelation condition in the Status & History screen.

⚠ Notice

If a pair in PAIR state is deleted, there may be difference between P-VOL and S-VOL.
Be sure to be PSUS state when a pair is deleted.

Procedure for suspending/splitting/resynchronize a volume pair

■ Procedure for suspending a volume pair

When stopping the copy of Pair temporarily, and so on, it does.

(1) Display of HOMRCF main screen
Click the [HOMRCF] button on SVP function screen, the HOMRCF main screen comes out.

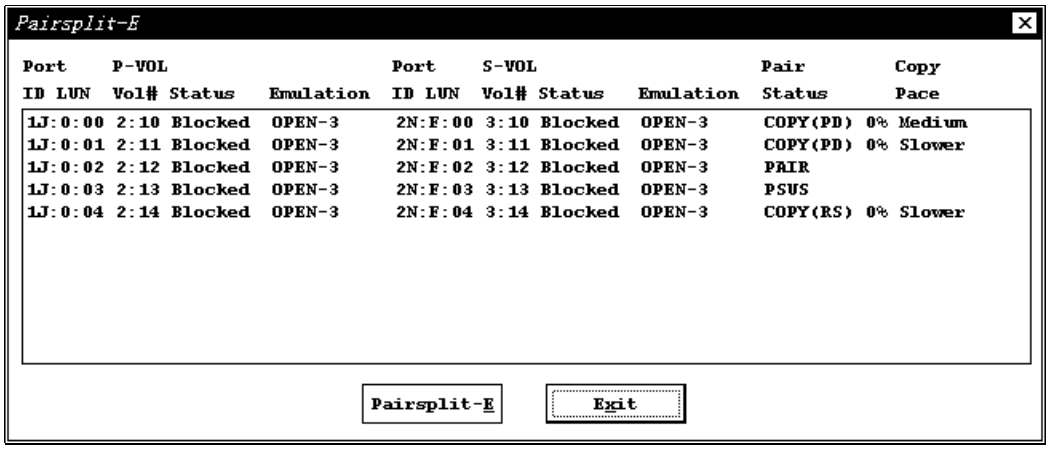
(2) Select volume/pair/Cascade
You can choose [Display] on the HOMRCF main screen as the volume display, the pair display or Cascade display.
If you choose the volume display, don't check the display attribute to [Reserve] on the HOMRCF main screen. Select a volume that you want to part the pair, then click the [Pairsplit-E...] button. If you want to select sequential volumes, please select volumes by pushing [Shift] key. If you want to select them at random, please use [Ctrl] key. If you choose the pair display or Cascade display, [Pairsplit-E...] button sometimes will not be available by the Pairdisplay.
If you choose the pair display, you can choose the pairs of the status which are shown in the following Table 10-4.

Table 10-4 Statuses Allow Selection of [Pairsplit-E ...] Button

Pairdisplay / Button	SMPL	COPY(PD)	PAIR	COPY(SP)	PSUS	COPY(RS)	COPY(RS-R)	PSUE
Pairsplit-E	x	OK	OK	OK	OK	OK	OK	x

OK: Select the button x: Could not select the button

(3) Execution of suspending pairs
Select a volume pair that you want to PSUE from the pairs displayed and click the [Pairsplit-E] button. If you want to select sequential volumes, please select volumes by pushing [Shift] key. If you want to select them at random, please use [Ctrl] key. It executes PSUE of Pair and it displays an execution result. To stop the suspension, click the [Exit] button. The screen will be back to the HOMRCF main screen.



(4) Confirmation of Pairdisplay.
You can confirm Pairdisplay in HOMRCF Main Screen.
lease click "Refresh" button if necessary.

Copyright ©1999,2000, Hitachi, Ltd.

■ **Procedure for splitting a volume pair**

It does when wanting to use P-VOL and S-VOL separately after Pair forming.

(1) Display of HOMRCF main screen
Click the [HOMRCF] button on SVP function screen, the HOMRCF main screen comes out.

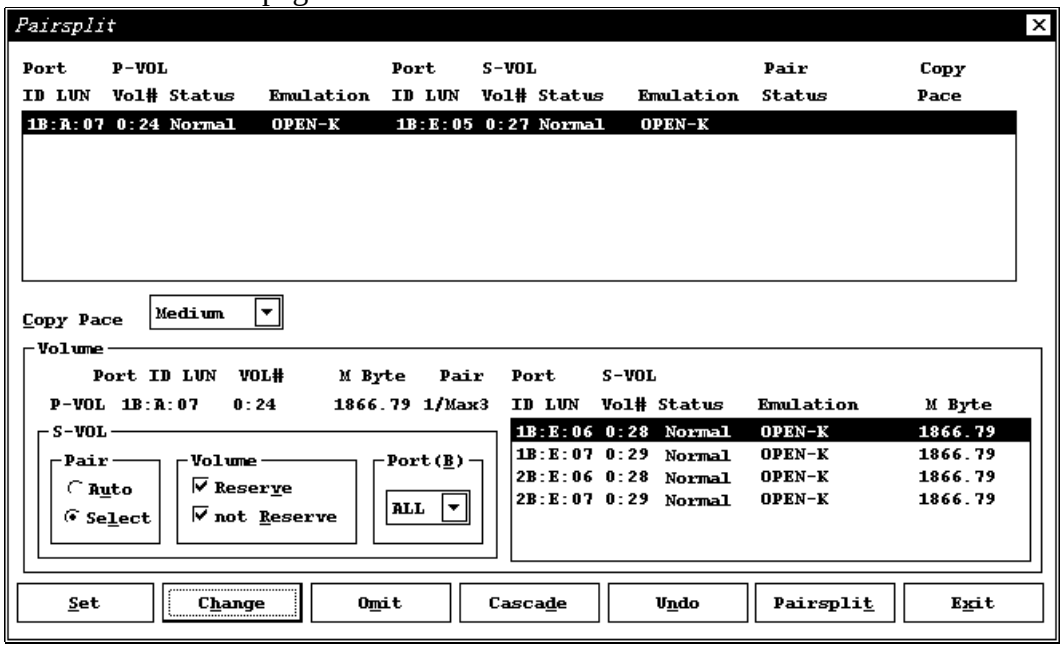
(2) Select volume/pair/Cascade
You can choose [Display] on the HOMRCF main screen as the volume display, the pair display or Cascade display.
If you choose the volume display, don't check the display attribute to [Reserve] on the HOMRCF main screen. Select a volume or cascade that you want to PSUS the pair, then click the [Pairsplit...] button.
If you choose the pair display or cascade display, you can choose the pairs of the status which are shown in the following Table 10-5.

Table 10-5 Statuses Allow Selection of [Pairsplit-S ...] Button

Pairdisplay / Button	SMPL	COPY(PD)	PAIR	COPY(SP)	PSUS	COPY(RS)	COPY(RS-R)	PSUE
Pairsplit	x	OK	OK	x	x	x	x	x

OK: Select the button x: Could not select the button

(3) Edit pair & Execute
If your selected P-VOL is not created as pair, S-VOL will be selected automatically. And S-VOL is displayed as "AUTO".
If your selected P-VOL is created as pair, created pairs will be displayed.
Procedure of changing the S-VOL which P-VOL does not have any pairs or other operations will be described in the next page.



Copyright ©1999,2000, Hitachi, Ltd.

Notice

Before you Pairsplits whose status is SMPL by “AUTO”, you should define the volumes as “Reserved”. Please refer to the procedure of changing the volume attribute.
In the PSUS volume pair screen, it does PSUS to all pair which are displayed in operation object volume list. If you do not want to splits some pairs, please select them in the volume list and select [Omit] button to delete them from the list.

<Select Target Volume (S-VOL)>

(A) By Manual

◆ In the case of which you want to select S-VOL by manually (not “AUTO”).
  (a) Select volumes as P-VOL.
  (b) Select [Select] in the PSUS Volume Pair Screen.
  (c) Select volumes from the S-VOL list.
  (d) Select [Change].

◆ In the case of which you want to add several pairs by manually.
  (a) Select a volume as P-VOL.
  (b) Select [Select] in the PSUS Volume Pair Screen .
  (c) Select volumes from the S-VOL list.
  (d) Select [Set].
  If you want to create more pairs, please repeat these operations.

(B) By automatic method

◆ In the case of which you select S-VOL by “AUTO”.
  (a) Select volumes as P-VOL.
  (b) Select [AUTO] in the [S-VOL Select]. (default setting is [Auto])
  (c) Select [Change].

◆ In the case of which you want to add several pairs by selecting one P-VOL with “AUTO”.
  (a) Select a volume as P-VOL.
  (b) Select [AUTO] in the [S-VOL Select].
  (c) Select [Set].
  If you want to create more pairs, please repeat these operations.

Notice

Before you Pairsplits by selecting SMPL volumes is the automatic method, you should change those volumes as “Reserved”.

Copyright ©1999,2000, Hitachi, Ltd.

<Specification of the cascade>
Click [Cascade] button after choice in L1 Pair and S-VOL of L2 Pair.
Changes into S-VOL which chose S-VOL which is set at present.
Only when all of the following conditions are met, the concerned button becomes possible to be selected.
- A L1-Pair is Pairsplit.
- A L1-Pair is selected.
- A S-VOL is selected by optional specification.
- It is possible to add a L2-Pair.

When there is L1-Pair excepted Pairsplit already and it adds only L2-Pair, the concerned button can not be chosen.

<In case of selecting wrong pairs>
If you want to Pairsplits-S, please select those pairs and select [Omit].

<Execute adding pairs>
If you want to Pairsplits-S, please select those pairs and select [Omit].
If you want to Pairsplits against all pairs in the Pair Volume list, please select [PSUS]. SVP will Pairsplits and display the result. If you want to stop splitting pairs, please select [Exit] button. The screen will be back to the HOMRCF main screen.

It is able to specify “Not Reserve”, “Reserve” when choosing S-VOL.

Copy pace is available these three mode [Slower] [Medium] [Faster].
[Faster] mode should be used in offline environment.

(4) Confirmation of Pairdisplay.
You can confirm Pairdisplay in HOMRCF Main Screen.
lease click “Refresh” button if necessary.

Copyright ©1999,2000, Hitachi, Ltd.

■ **Procedure for resynchronizing a volume pair**

It makes once Pairsplit PAIR condition again. Or, it makes Pair of the PSUE condition PAIR condition.

(1) Display of HOMRCF main screen
Click the [HOMRCF] button on SVP function screen, the HOMRCF main screen comes out.

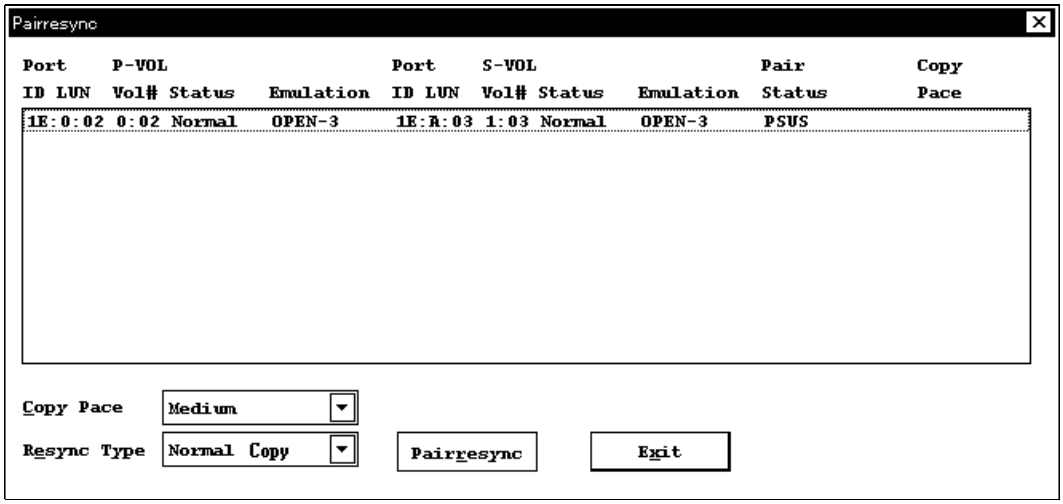
(2) Select volume or pair
You can choose [Display] on the HOMRCF main screen as the volume display, the pair display or Cascade display.
If you choose the volume display, don't check the display attribute to [Reserve] on the HOMRCF main screen. Select a volume that you want to part the pair, then click the [Pairresync...] button. If you want to select sequential volumes, please select volumes by pushing [Shift] key. If you want to select them at random, please use [Ctrl] key. If you choose the pair display or Cascade display, you can choose the pairs of the status which are shown in the following Table 10-6.

Table 10-6 Statuses Allow Selection of [Pairresyncs ...] Button

Pairdisplay / Button	SMPL	COPY(PD)	PAIR	COPY(SP)	PSUS	COPY(RS)	COPY(RS-R)	PSUE
Pairresync	x	x	x	x	OK	x	x	OK

OK: Select the button x: Could not select the button

(3) Execution of resynchronizing pair
Select a volume pair that you want to re-synchronize from the pairs displayed and click the [COPY(RS)] button. If you want to select sequential volumes, please select volumes by pushing [Shift] key. If you want to select them at random, please use [Ctrl] key. It executes re-synchronize of pair and it displays an execution result. To stop the re-synchronization, click the [Exit] button. The screen will be back to the HOMRCF main screen.



(4) Confirmation of Pairdisplay.
You can confirm Pairdisplay in HOMRCF Main Screen.
lease click "Refresh" button if necessary.

Copyright ©1999,2000, Hitachi, Ltd.

■ **Procedure for initializing a Volume pair**

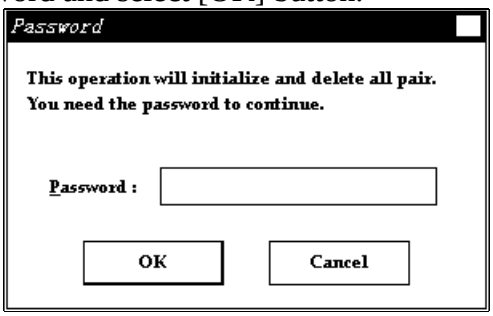
It initializes all Pair of HMRCF/HOMRCF.

(1) Display of HOMRCF main screen
Click the [HOMRCF] button on SVP function screen, the HOMRCF main screen comes out.

(2) Initialization
In the HOMRCF main screen, it pushes [Initialize] button.

> **⚠ NOTICE**
> All Pair of HMRCF/HOMRCF are deleted by this operation.

(3) Inputs a password.
"This operation will initialize and delete all pair. You need the password to continue." is displayed. Enter the password and select [OK] button.



> **⚠ NOTICE**
> This is a special (exceptional) operation and requires an input of a password. Ask the technical support center about the appropriateness of the operation and input the password after getting an approval of executing the operation.

(4) Confirms an execution result
When indicating the compulsion initialization of Pair, it confirms that all Pair are deleted with the HOMRCF Main screen.

Copyright ©1999, Hitachi, Ltd.

■ **Procedure of extending the number of maximum pair**

It extends the HMRCF/HOMRCF number of maximum Pair to 512.

(1) Display of HOMRCF main screen
Click the [HOMRCF] button on SVP function screen, the HOMRCF main screen comes out.

(2) Confirmation of the thing about which it is possible to extend
On the HMRCF main screen, when the [Set over 64] button is enable, the number of maximum pair can be extended from 64 to 512.
When the [Set over 64] button is disable, the following case is thought of.
- It has extended the number of maximum pair
  Confirm the HOMRCF main screen number of maximum pair.
- During maximum pair number extension
  Press the [Refresh] button of the HOMRCF main screen.
- The SM capacity lack
  Refer to INST08-30 and confirm SM capacity.
- The nonconformity of the DKCMAIN program version
  Refer to SVP03-130 and confirm DKCMAIN program version.

(3) Extends
[Set over 64] It pushes a button. Confirm that the HOMRCF main screen number of maximum Pair and the number of maximum Reserve are extended to 512. After maximum Pair number extension, refer to M-FC08-10 and acquire the backup of the composition information.

(4) Confirms an execution result
When indicating maximum Pair number extension, confirm that the number of maximum Pair is extended with the HOMRCF Main screen.

Copyright ©1999, Hitachi, Ltd.

10.3 Notice about HOMRCF operation

■ **Restrictions on maintenance**

Dynamic Sparing/ Automatic collection copy : Even if a Dynamic Sparing or an automatic collection copy is performed in a PDEV concerning a pair, it does not affect a pairing status.

PDEV maintenance work : The maintenance of each PDEV does not affect a pair but when it affects a logical volume, it is restricted in the same way as the following LDEV maintenance work.

LDEV maintenance work : The LDEV maintenance work cannot be done when a pair exists.
(1) LDEV blockade : It is required to delete a pair and cancel the “Reserve” specification.
(2) LDEV formatting : Because an LDEV must be blocked, it is required to perform the above operation beforehand.

Cache maintenance work : In the case of cache maintenance under heavy I/O load, pair may be suspended.
So you should reduce I/O load before cache maintenance.

■ **When a failure occurs**

When a failure which prevents a copy among the logical volumes occurs, it places a pair in the “PSUE” status.

When an LDEV failure occurs : It places a pair in the “PSUE” status.
When a PDEV failure occurs : A pairing status is not changed owing to a collection access (single PDEV blockade).

Copyright ©1999,2000, Hitachi, Ltd.

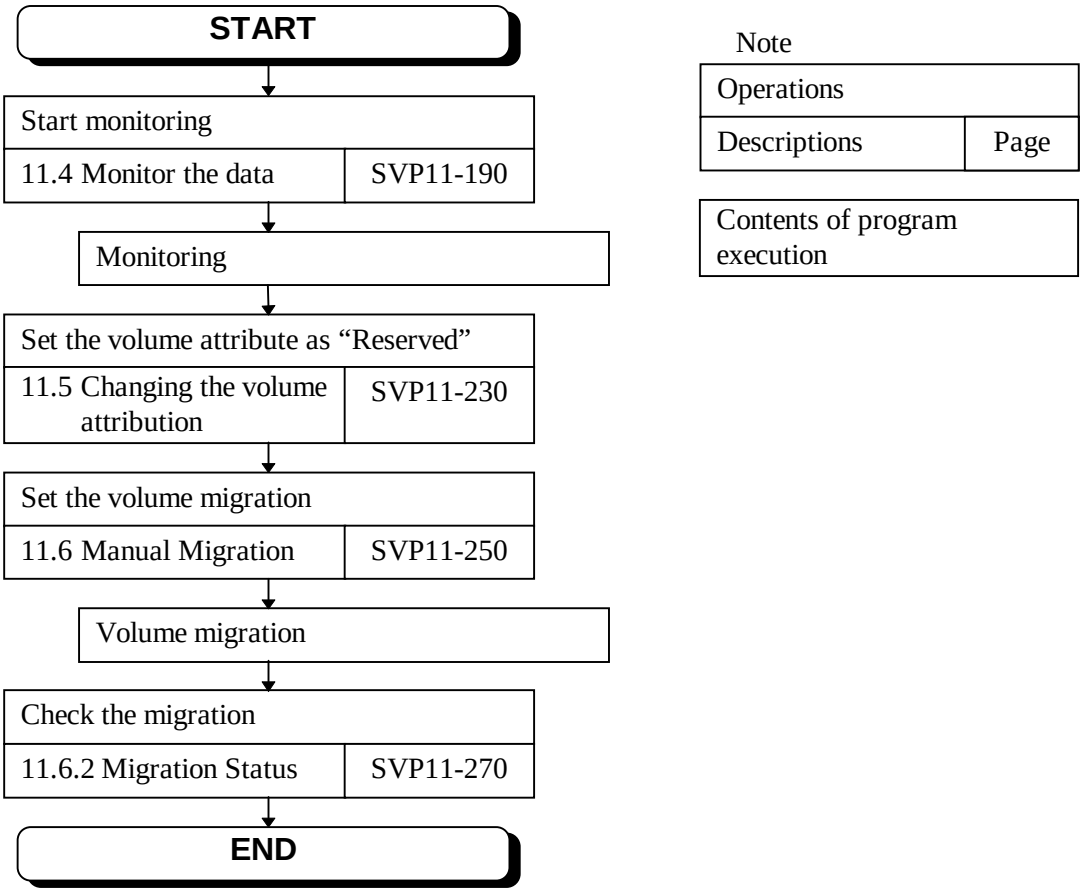
11 HIHSM

11.1 Flowchart of HIHSM operations

11.1.1 Basic Operations

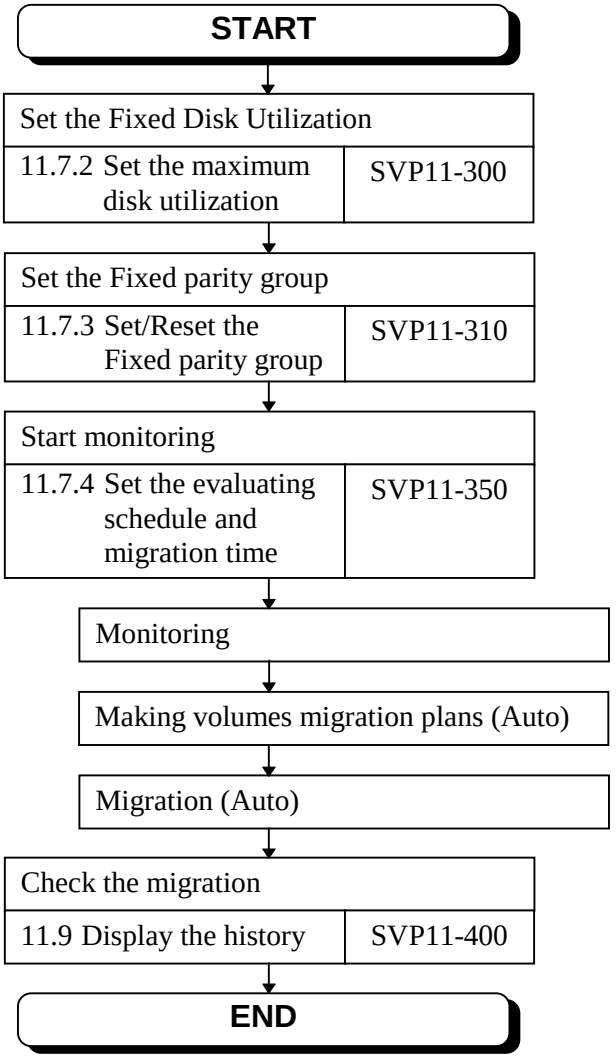
HIHSM (Hitachi Internal Hierarchy Storage Management) is a function that plans and does the volumes migration by the monitoring data. There are two methods about the volume migrations, one is by hand (it is called manual operations) and the other is by automatic (automatic operations) of preset function.
In the case of the manual operations, the program immediately execute the volume migrations. In the case of the automatic operations, the program set the migration schedule and execute the migrations by the schedule.

(1) Manual Operations
We'd like to describe the flowchart of HIHSM's manual operations in the following diagram.



Copyright ©1999, Hitachi, Ltd.

(2) Automatic Operations



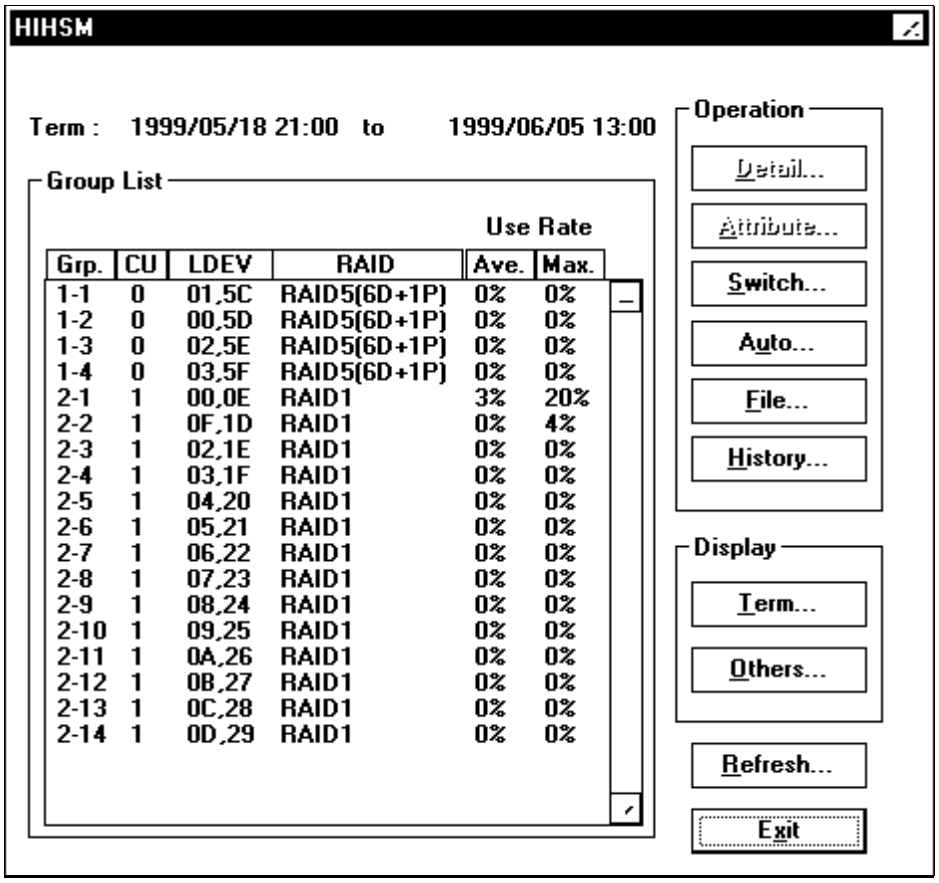
Note

Operations	
Descriptions	Page
Contents of program execution	

Copyright ©1999, Hitachi, Ltd.

11.2 HIHSM Screens

11.2.1 Main Screen



This screen will be displayed after selecting [HIHSM] button in the function launcher.

(1) Term
Monitoring term which the program displays in this screen. Users can specify the term by selecting [Term].

(2) Group List
Displays the monitoring data by each parity group.

Grp.	Number of the parity group
CU	CU number
LDEV	Logical volume number
RAID	RAID type
Ave. (*1)	Average usage rate in the parity group during the term.
Max.	Maximum usage rate in the parity group during the term.

(*1) After volume migration, precision of the old data before migration will be low.

Copyright ©1999, Hitachi, Ltd.

(3) Operation buttons

[Detail...]	To operate volume migration by manual (manual operations). After selecting this button, the program will displays the Manual Migration Main screen.
[Attribute...]	To change the volume attribute. After selecting this button, the program will display the Change Attribute screen.
[Switch...]	To set or reset the execution of gathering monitoring data. After selecting this button, the program will display Data Gathering screen.
[Auto...]	To operate volume migration by automatic (Automatic operations). After selecting this button, the program will display Automatic Migration Main screen.
[File...]	To save the monitor data files. After selecting this button, the program will display File Operation screen.
[History...]	To display the operations history. After selecting this button, the program will display History screen.

(4) Display buttons

[Term...]	To set the data term to display. After selecting this button, the program will display Data Term screen.
[Others...]	To display the processor usage rate, bus usage rate, and DRR usage rate. After selecting this button, the program will display Usage screen.

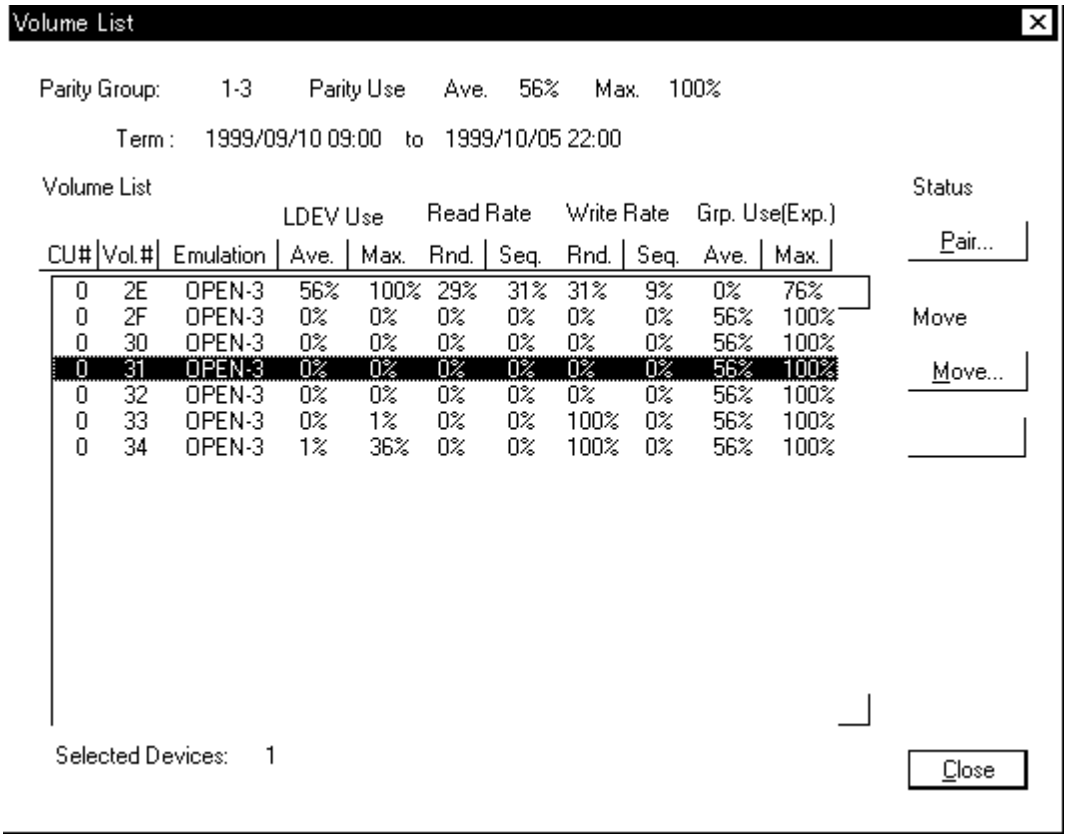
(5) Other buttons

[Refresh...]	To refresh the display data to read the configuration data. After selecting this button, the program will display the last group list.
[Exit]	To exit the main screen.

Copyright ©1999, Hitachi, Ltd.

11.2.2 Manual Migration Main Screen

This screen is Manual Migration Main Screen to operate by manual operations.



This screen will be displayed after you select one of the parity group and push [Detail...] button in the main screen. The program will displays the information about your selected parity group.

(1) Information of the parity group

"Parity Group"	Number of the parity group.
"Parity Use"	Usage rate of the parity group.
"Ave."	Average rate of the usage in the parity group.
"Max."	Maximum rate of the usage in the parity group.

(2) Term

Sampling term which the monitoring data is displayed.

Copyright ©1999,2000, Hitachi, Ltd.

(3) Volume List

In this list, the following information of the volumes in the parity group is displayed.

"CU#"	CU number.
"Vol#"	Logical volume number in the parity group.
"Emulation"	Emulation type of the volume.
"LDEV Use"	Usage rate of the volume.
"Ave."	Average rate of the volume usage.
"Max."	Maximum rate of the volume usage.
"Read Rate"	Read I/O rate.
"Rnd."	Read access rate in random mode.
"Seq."	Read access rate in Sequential Access Mode.
"Write Rate"	Write I/O rate.
"Rnd."	Write access rate in random mode.
"Seq."	Write access rate in Sequential Access Mode.
"Grp.Use(Exp.)	Usage rate of the parity group in the case of that the volume is not installed.
"Ave."	Average rate of the volume usage.
"Max."	Maximum rate of the volume usage

(4) Status button

[Pair...]	To display the status of the volume migration. After selecting this button, the program will display Pair Status screen.

(5) Move button

[Move...]	To migrate the volume. After selecting this button, the program will display Manual Migration Setting screen.
[Delete...]	To stop the volume migration. After selecting this button, the program will display Delete Pair Confirmation screen.

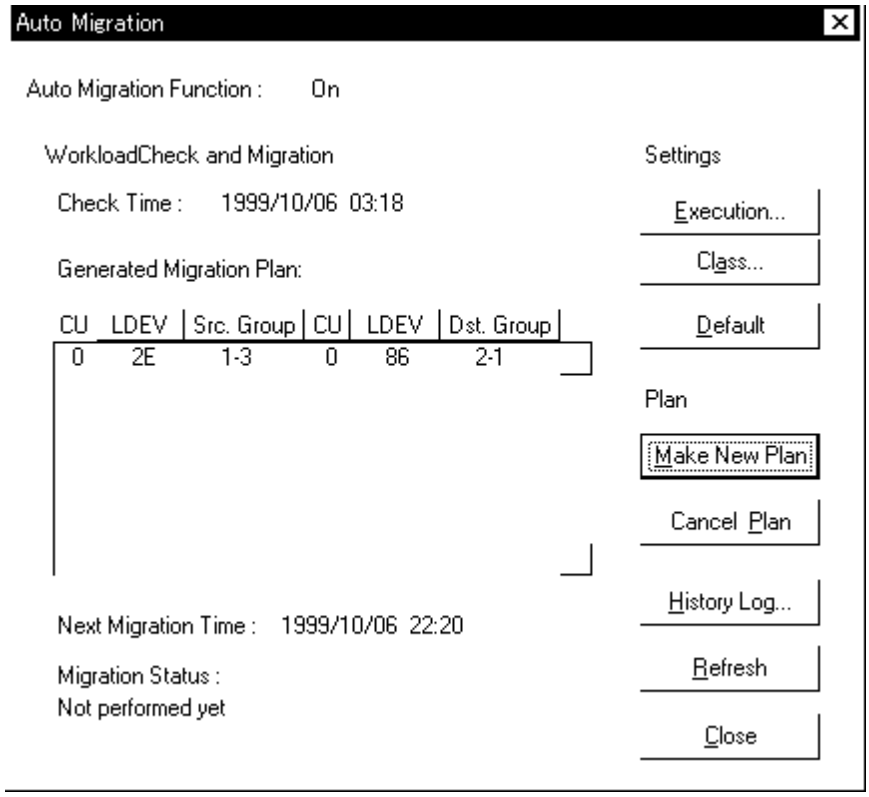
(6) Close button

[close]	To exit this screen. After selecting this button, the program will display Main screen.

Copyright ©1999,2000, Hitachi, Ltd.

11.2.3 Automatic Migration Main Screen

This screen is Automatic Migration Main screen for automatic operations.



This screen will be displayed after selecting [Auto...] button in the main screen. And, this screen is to operate automatic migration.

(1) Function availability flag

"Auto Migration Function" To set the function to be available(ON) or not available(OFF). After selecting [Execution...] button, the program will display the Automatic Migration Setting screen so that you can set the flag in that screen.

(2) WorkloadCheck and Migration

The screen is displayed the setting status of automatic migration.

"Check Time" The next check time to determine the volume migration plan.

"Generated Migration Plan" Volume migration plan.

- "CU" CU number of the source volume.
- "LDEV" Logical volume number of the source volume.
- "CU" CU number of the target volume.
- "LDEV" Logical volume number of the target volume.
- "Src. Group" Parity group number which the source volume belongs to.
- "Dst. Group" Parity group number which the target volume belongs to.

Copyright ©1999,2000, Hitachi, Ltd.

"Next Migration Time"	The time to execute volume migration.
"Migration Status"	The status whether the above migration plan is done. Not planed yet : No plan was made. Not peformed yet : Plan has been made but not be executed. Failed to make plan : Could not make a plan. Under migration : HIHSM is migration the volumes. Last migration has canceled (Please see log file) : HIHSM canceled the migration plan. Migration successfully ended. Plan has done : Plan has executed.

(3) Setting button

[Execution...]	To set the detail parameters for volume migration. After selecting this button, the program will display Automatic Migration Setting screen.
[Class...]	To display the class attribution in each parity group. There are three classes according to the installed drive type. After selecting this button, the program will display the Class List screen.
[Default]	To reset the detail parameters for volume migration as default value.

(4) Plan button

[Make New Plan]	To make new migration plan. After selecting this button, the program will make a new migration plan and display the plan in the "Generated Migration Plan" (The program will delete the remain plans). If "Migration Status" is "Under Migration", don't make plan.
[Cancel Plan]	To delete the migration plans in the "Generated Migration Plan".

(5) History button

[History Log...]	To display Automatic migration history screen.

(6) Refresh button

[Refresh]	To refresh the status to read configuration information.

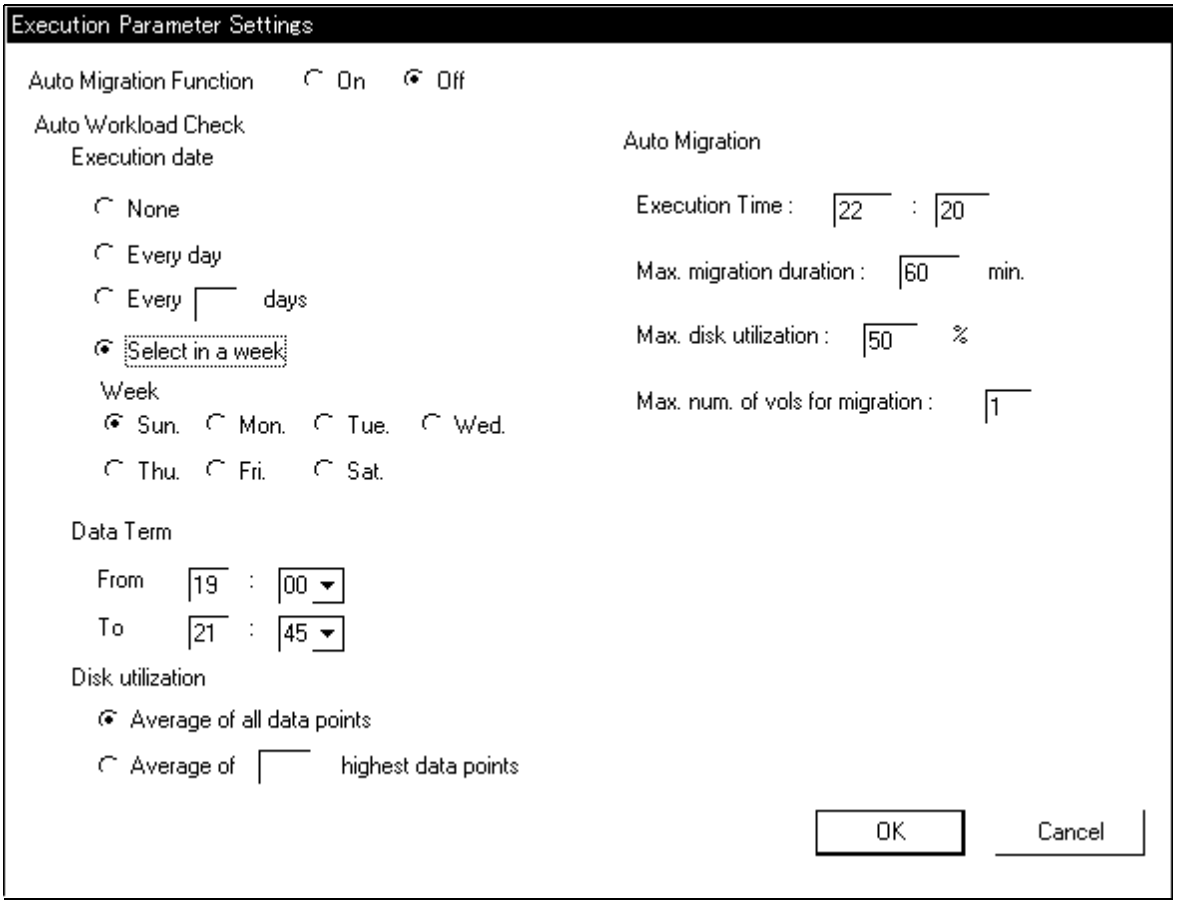
(7) Close button

[Close]	To exit this screen. After selecting it, the program will display the main screen.

Notice: Generated migration plan will be executed at the setting time. Though you delete the plan by selecting [Cancel plan] during the planed migration, the program will not cancel that executing migration.
If you want to cancel those migrations, you should cancel the volume migrations one by one manually.

Copyright ©1999, Hitachi, Ltd.

11.2.4 Automatic Migration Setting Screen



This screen is to set the automatic migration function (Preset function). After selecting [Execution...] button in the HIHSM main screen, this screen will be appeared.
Notice: You should set the monitoring switch to ON before using this function.

(1) Auto Migration Function
To set the automatic migration function to be available or not.
ON : Available to execute automatic migration.
OFF : Not available to execute automatic migration.

(2) Auto Workload Check
To set the monitoring term. The monitor data will be used whether the migration will be executed or not. The following three data you should set.
(a) Execution date
(b) Date Term
(c) Disk Utilization

Copyright ©1999,2000, Hitachi, Ltd.

(a) Execution date

To set date to make a plan. The next "Data Term" is the monitoring term which the program uses to make a plan, and you can set the hours in this day.

None	: Not making a plan. If old plan is remain, the program will execute the migration using by the plan.
Every day	: Execute in every day.
Every [x]days	: Execute in every other x days. You should input x. (Value: 2 – 31days)
Select in a day of the week	: Execute in a day of the week. If you check it, please select a day of the week.

(b) Data Term

To set the hour of the day which monitoring data the program uses to make a plan. (*1)

From	Starting time of monitor data to make a plan. (Value: 0 – 23; 0, 15, 30, 45)
To	Ending time of monitor data to make a plan. (Value: 0 – 23; 0, 15, 30, 45)

(c) Disk Utilization

To set the determination point to make a plan. If the program determine to execute migration at that point, the program will make a plan.

Average of all data points	: To determine by using average usage rate against all sampling points.
Average of [x] higest data points	: To determine by using the average of the [x]th highest usage.

(3) Auto Migration

To set the migration schedule to execute migration.

Execution Time (*2)	: Starting time of migration. (Program executes at the same time in every day)
Max. migration duration	: Your available migration term. If the program could not finish migrating during this duration, the program will stop migrating. (Value: 10 – 120 min)
Max. disk utilization	: To set the maximum disk usage rate. If the usage is over the Maximum disk utilization during migration, the program will stop the migration. (Value: 10 – 100%)
Max. num of vols for migration	: To set the number of the migration volumes at the same migration term. (Value: 1 – 20 vols)

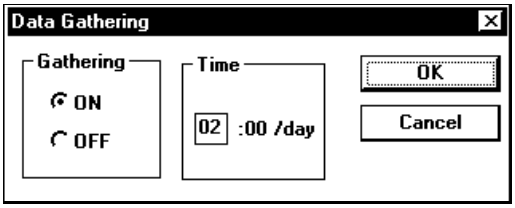
(*1) Automatic reboot or automatic data gathering should not be set in the following duration.
  (i) from the end of the target term to an hour.

(*2) (a) Automatic reboot or automatic data gathering should not be set in the following duration.
  (i) 15 minutes before starting making the plan (15 + Migration time)
  (ii) 30 minutes after starting making the plan
  (b) Time when the plan is made is not within the duration from 15 minutes before the target term (15 + Migration time) to one hour after the term.

Copyright ©1999,2000, Hitachi, Ltd.

11.2.5 Data Gathering Screen

This screen will be displayed when you select [Switch...] button in the main screen. In this screen, you can set the start time of monitoring, the end time of monitoring, and time of gathering monitoring data.

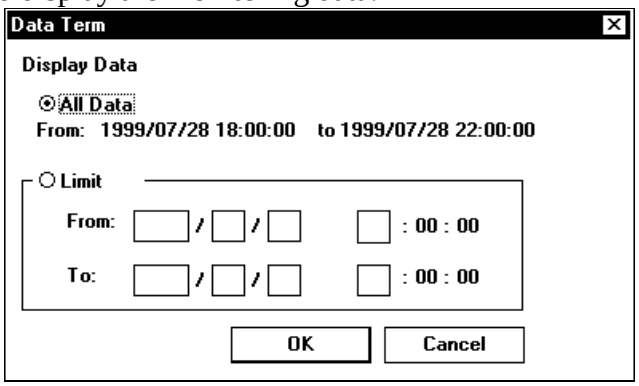


NOTICE

1. During data gathering, “Statistics Data Reading...” is displayed.
2. When maintenance is done during data gathering or data gathering starts during maintenance operation, maintenance is executed prior to data gathering. Then SVP stops data gathering temporarily but it will retry 15 minutes later. All the time “Statistics Data Reading...” remains displayed.

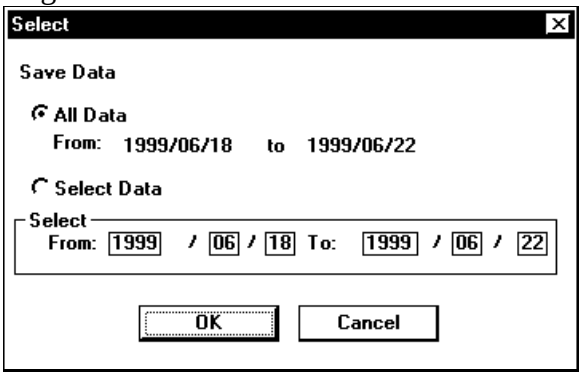
11.2.6 Data Term Screen

This screen will be displayed after selecting [Term...] button in the main screen.
You can set the term to display the monitoring data.



11.2.7 File Operation Screen

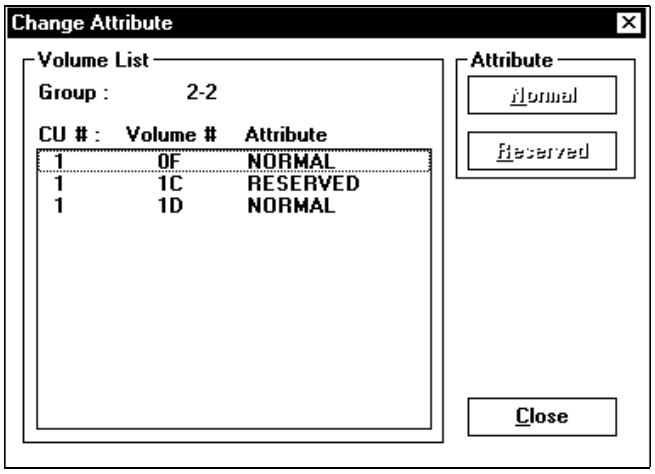
This screen will be displayed after selecting [File...] button in the main screen.
You can save the monitoring data into the FD.



Copyright ©1999, Hitachi, Ltd.

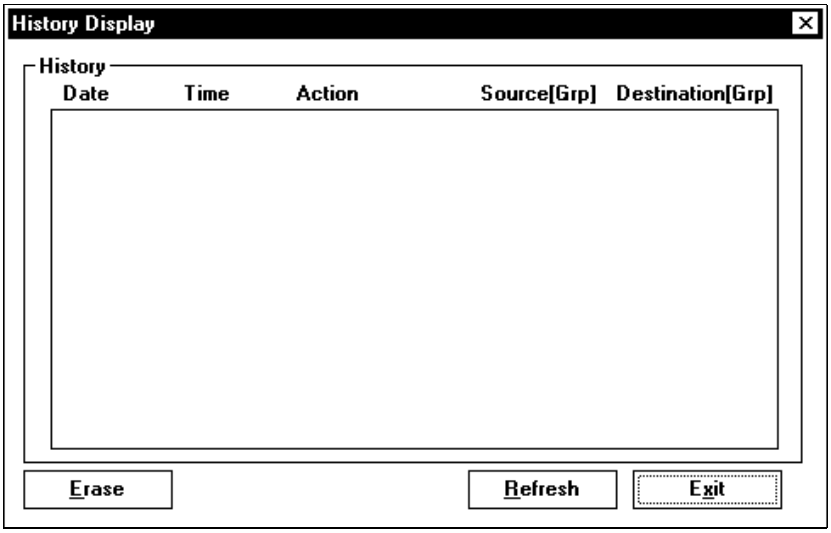
11.2.8 Change Attribute Screen

This screen will be displayed after selecting one of the parity group and pushing [Attribute...] button. You can change the volume attribution.



11.2.9 History Screen

This screen will be displayed after selecting [History...] button in the main screen. You can refer to the previous operations in this screen.



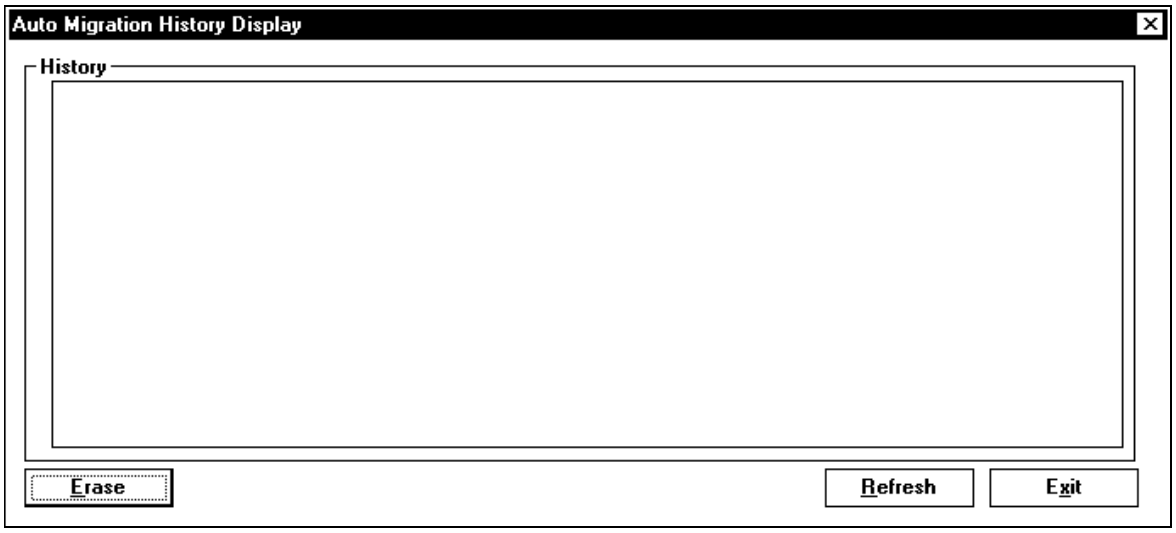
The following items are displayed in the Action.

Migration Start	: Started migrating volumes.
Migration Complete	: Migration was finished.
Migration Cancel	: Migration was canceled.
Migration Failed	: Migration was failed.
Migration Give Up	: Migration was gave up.

Copyright ©1999, Hitachi, Ltd.

11.2.10 Automatic Migration History Screen

This screen is to display a history for automatic function and displayed by selecting [History Log...] button in the Automatic Migration Main Screen.



(1) Normal end of migration

"Migration Complete (CU:LDEV->CU:LDEV) Start:yyyy/mm/dd hh:min:sec -> End:yyyy/mm/dd hh:min:sec"
(a) (b) (c) (d)

(a) Original logical device (source volume)
(b) Target logical device (target volume)
(c) Copy start time
(d) Copy end time

(2) Cancel the migration (over the limit duration)

"Migration Canceled (CU:LDEV->CU:LDEV) Start:yyyy/mm/dd hh:min:sec -> End:yyyy/mm/dd hh:min:sec"
(a) (b) (c) (d)

(a) Original logical device (source volume)
(b) Target logical device (target volume)
(c) Copy start time
(d) Copy end time

Copyright ©1999, Hitachi, Ltd.

(3) Cancel the migration (other reason)

"Migration Canceled (CU:LDEV->CU:LDEV) yyyy/mm/dd hh:min:sec (XXXXXXXXXXXX)"
(a) (b) (c) (d)

(a) Original logical device (source volume)
(b) Target logical device (target volume)
(c) Canceled time
(d) Reason :

No Reserve Volume	: No reserved volume is set. Please make the other plan again.
Reserve Volume Emulation is different	: The reserved volume's emulation type is different.
Utilization Check	: The usage rate is over the limited rate. Or there is no monitoring data
Migration failed. Error Code:XXXX	: The indication of the migration was failed
Reserve Volume Size is different	: Reserve volume size is different.
Reserve Volume emulation is not supported	: The emulation type of reserved volume is not supported.
Utilization Check failed	: The check of the utilization rate finished abnormally.
Reserve Volume Check failed.	: The check of the reserved volume finished abnormally.

(4) Cancel the migration (Invalid Parity Group)

"Migration Canceled (CU:LDEV (X-X)->CU:LDEV (X-X)) yyyy/mm/dd hh:min:sec (Invalid Parity Group)"
(a) (b) (c) (d) (e)

(a) Original logical device (source volume)
(b) Parity group including the source volume.
(c) Target logical device (target volume)
(d) Parity group including the target volume.
(e) Canceled time.

(5) Deleted the migration plan (A migration plan was deleted because the previous plan had been deleted.)

"Migration Plan deleted (CU:LDEV->CU:LDEV) yyyy/mm/dd hh:min:sec (Pre-Plan is deleted)"
(a) (b) (c)

(a) Original logical device (source volume)
(b) Target logical device (target volume)
(c) Canceled time

Copyright ©1999, Hitachi, Ltd.

(6) Making plan

(i) Start making a plan

"yyyy/mm/dd hh:min : MakePlan function starts"
(a)

The program starts making a plan
(a) Start time

(ii) End making a plan

"yyyy/mm/dd hh:min : MakePlan function finishes"
(a)

The program ends making a plan
(a) End time

(iii) The number of made plans

"X plans are output"
(a)

The program outputs the x number of plans.
(a) The number of output plans

(iv) Contents of made plan

"PlanXXX: Src Hdev CU:LDEV in Grp X-X, Dst Hdev CU:LDEV in Grp X-X"
(a) (b) (c) (d) (e)

The program made the plan.
(a) Plan number
(b) Original volume (source volume)
(c) Parity group including the source volume
(d) Target volume
(e) Parity group including the source volume

(7) Failed making the plan

(i) Failed making the plan.

"yyyy/mm/dd hh:min : MakePlan is terminated by error: XXXXXXXXXX"
(a) (b)

The program failed to make plans.
(a) End time
(b) Failed reason (Refer to the following items)

Copyright ©1999, Hitachi, Ltd.

Cannot make a proper plan
[Message] Cannot make proper migration plan by this function
[Contents] The program could not make a proper migration plan.
[Action] Check the number of the reserved volumes and their locations.
Check the limit number of disk utilization and change if necessary.

Lack of data
[Message] Not enough HIHSM data in the workload check term
[Contents] The program did not have enough data to make the plan in the target term.
[Action] Check the monitored data and gather them again if necessary.
Check the workload check term.

Failed to get the information
[Message] Failed to get XXXXXXXXXX
(c)
[Contents] The program failed to get the information or data to make a plan.
(c) The kind of information or data.
[Action] In the case of information : Make the initial value again by selecting [Default].
In the case of data : Check the status of gathered data and get them again.

Failed to write the information.
[Message] Failed to write to XXXXXXXXXX
(c)
[Contents] The program failed to write the information to make a plan.
(c) The kind of information.

Invalid information / data
[Message] Invalid XXXXXXXXXX
(c)
[Contents] The program need the information to make the plan , but could not use it because the information was invalid.
(c) The kind of information / data
[Action] In the case of information : Make the initial value again by selecting [Default].
In the case of data : Check the status of gathered data and get them again.

Failed to allocate the memory
[Message] Memory allocation error
[Contents] The program failed to allocate the memory to make the plan.

Copyright ©1999, Hitachi, Ltd.

(8) Report the additional information

(i) history that the plan could not be made

"Cannot make plan: Class X Grp X-X"
(a) (b)

The plan of a certain group in the indicated class could not be made.
(a) Class
(b) Parity Group

(ii) Some samples were invalidated

"X samples are invalidated because of migration"
(a)

To reduce the influence of migration in the workload check term, the program made a plan without some samples.
(a) The number of invalidated samples

(iii) Add some volumes.

"new entries are added for following HDEVs: CU:LDEV, CU:LDEV, ..."
(a)

According to changing the volume configuration, the program added the information against those added volumes.
(a) Added volumes

(iv) Invalid data

"too many invalid data: invalidated all data"
The contents of data in the indicated group or volumes is invalid. The program made a plan without those data.

(9) Chech the migrating volumes.

(i) Failed to check the volume utilization.

"Utilization Check failed"
The program failed to check the volume utilization because it could not get the necessary data in this check. Please get the data again.

(ii) Failed to check the reserved volumes

"Reserve volume Check failed"
The program failed to check the volume attributions. The program could not get the necessary information.

Notice: Auto Migration History function determines to record whether the Auto Plan is executed or not.
If you want to see the actual migration history, please refer to Main History.

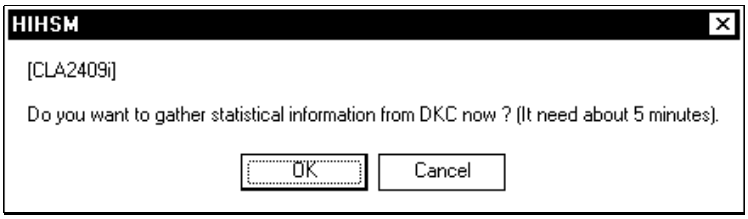
Copyright ©1999, Hitachi, Ltd.

11.3 Start HIHSM

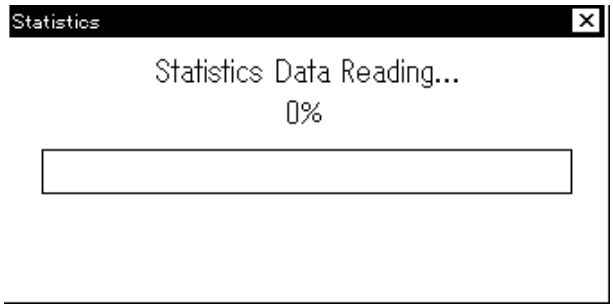
You can start "HIHSM" funtion to select "HIHSM" button in the Function Launcher screen. After selecting the button, the program will display a message about a monitoring data. If you have already started monitoring function, you can get those monitoring data. Please refer to "Monitor the data" for more detail description.

(1) Start HIHSM
Select [HIHSM] button in the Function Launcher screen.

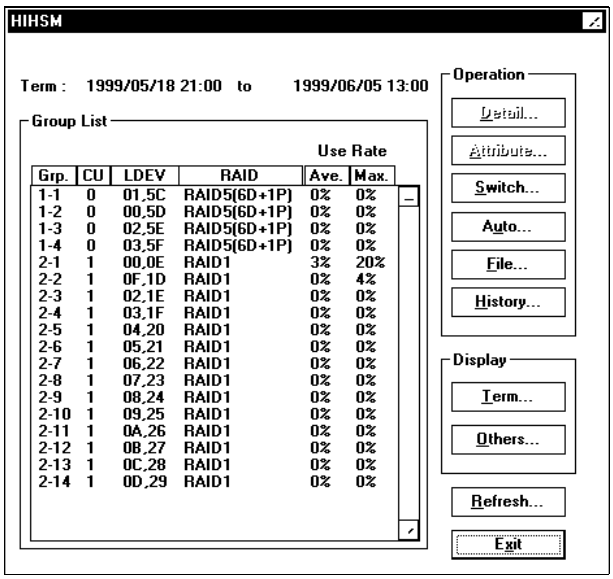
(2) Display a messa ge
The program will display the following message. If you have already started monitoring, please select [OK]. The program will start gathering the monitoring data. If you do not start, please select [Cancel]. You can go to the HIHSM's main screen.



(3) Gathering the d ata
The program is gathering the data. After finishing, the HIHSM's main screen will be displayed.



(4) Display HIHSM's main screen
The prgraom will display the main screen.



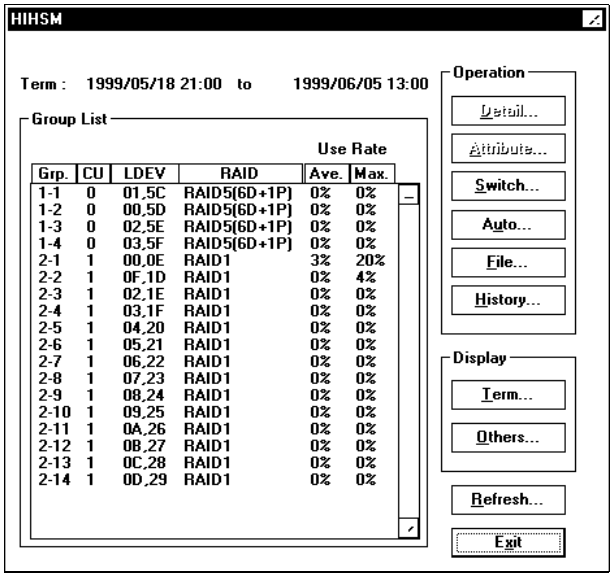
Copyright ©1999,2000, Hitachi, Ltd.

11.4 Monitor the data

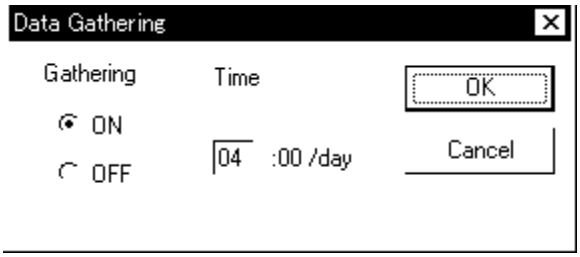
11.4.1 Start monitoring

(1) Start HIHSM
Select [HIHSM] button in the Function Launcher screen.

(2) Operation in the main screen
Select [Switch...] button in the main screen.



(3) Operation in the Data Gathering screen
Select [On] in the Data Gathering screen and input the time to gather the data. After, select [OK].

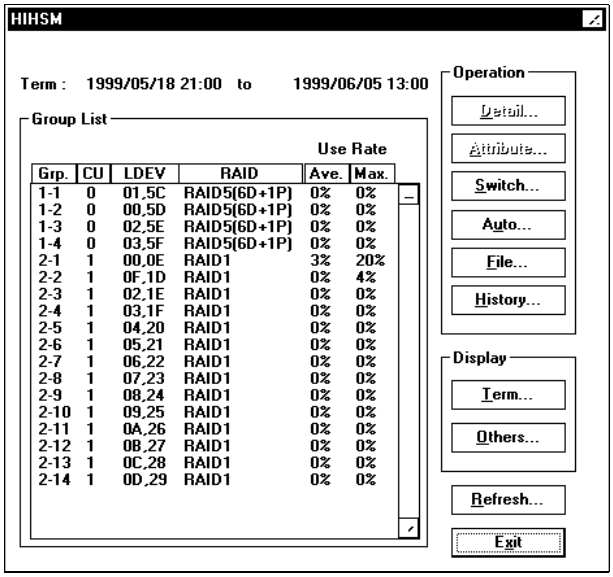


Copyright ©1999,2000, Hitachi, Ltd.

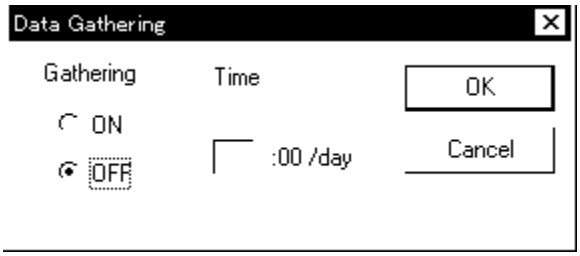
11.4.2 Stop monitoring

(1) Start HIHSM
Select [HIHSM] button in the Function Launcher screen.

(2) Operation in the main screen
Select [Switch...] button in the main screen.



(3) Operation in the Data Gathering screen
Select [Off:] in the Data Gathering screen and select [OK].



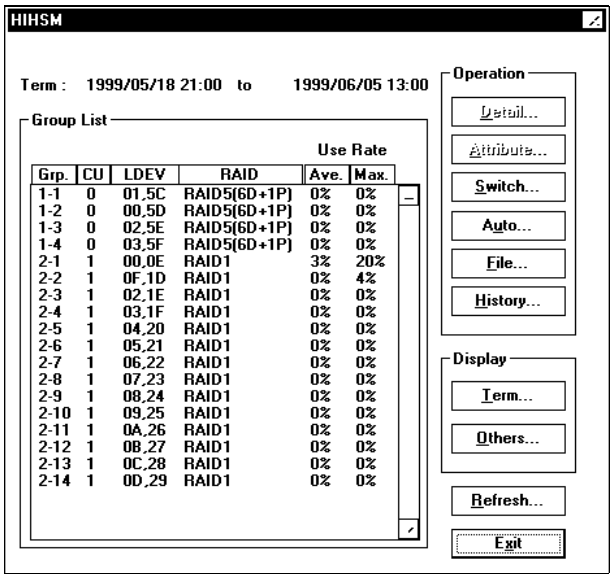
Notice: If you select [Off], the monitoring data which has not be read will be deleted. If you need these data, please exit this HIHSM function and restart again.

Copyright ©1999,2000, Hitachi, Ltd.

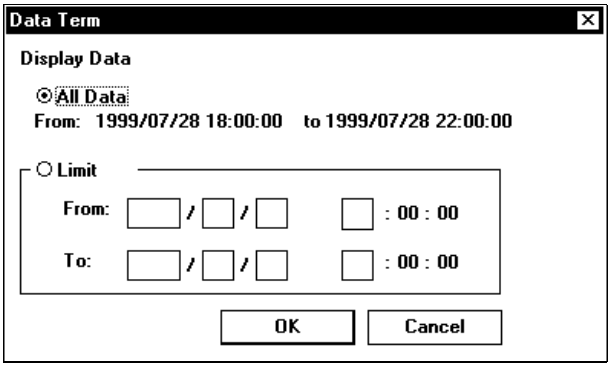
11.4.3 Set the term to display the monitoring data

(1) Start HIHSM
Select [HIHSM] button in the Function Launcher screen.

(2) Operation in the main screen
Select [Term...] button in the main screen.



(3) Set the term to display the monitoring data
Data Term Screen is displayed. You can do one of the following operations.
(a) If you want to display all monitoring data
Please select “All Data” and select [OK]. The program will display the all monitoring data.
(b) If you want to display some monitoring data
Please select “Limit” and input the term which is From data and To data.
After inputting the term, please select [OK].
The program will display your inputted term of monitoring data.

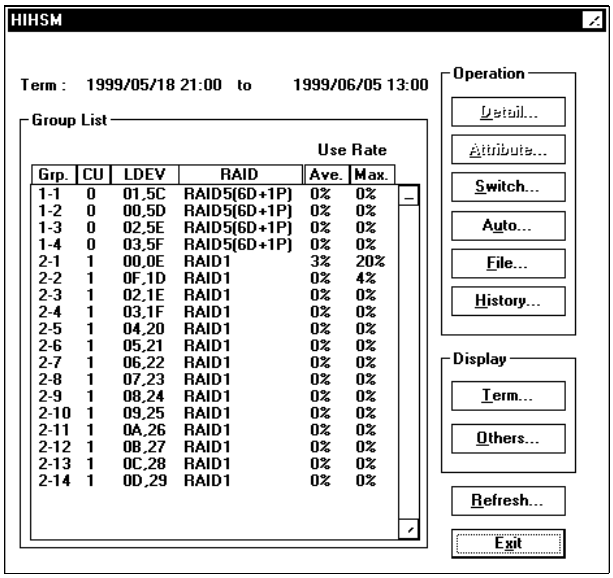


Copyright ©1999, Hitachi, Ltd.

11.4.4 Save monitoring data to FD

(1) Start HIHSM
Select [HIHSM] button in the Function Launcher screen.

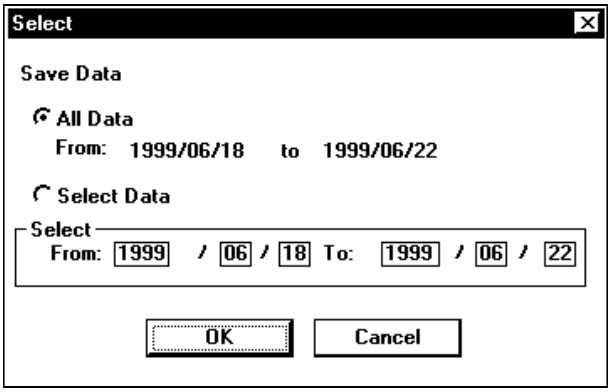
(2) Operation in the main screen
Select [Switch...] button in the main screen.



(3) Operation in the File Operation screen
File Operation Screen is displayed. You can select one of the operations.

(a) If you want to save all monitoring data
Please select “All Data” and select [OK]. The program will save the all monitoring data into the FD.

(b) If you want to save some of the all monitoring data
- Select “Select Data” and input “From” date and “To” date
- Select [OK]. The program will save your selected monitoring data into the FD.



Copyright ©1999, Hitachi, Ltd.

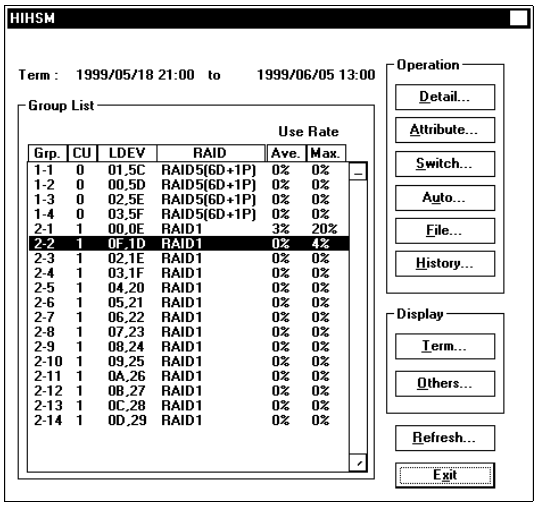
11.5 Changing the volume attribution

11.5.1 Changing the volume attribution to “Reserved”

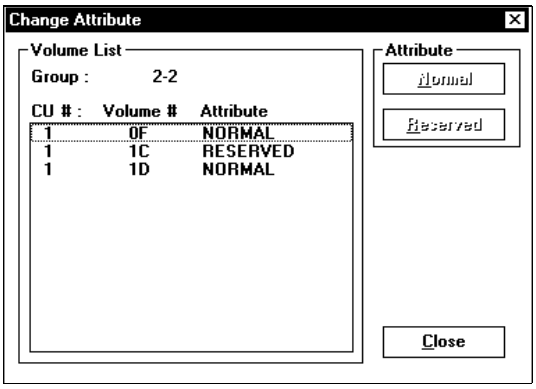
There are “Normal” and “Reserved” attributions. The normal volumes has the “Normal” attribution. Before executing the volume migration, you should decide the target volumes changing the volume attributions as “Reserved”.
In this section, the operation to change the attribute will be described.

(1) Start HIHSM function
Select [HIHSM] button in the Function Launcher screen.

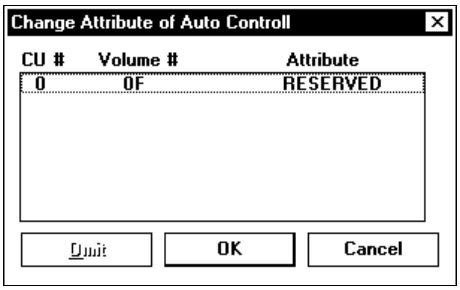
(2) Select parity group
Select one of the parity group in the Group List and push [Attribute...].



(3) Set the attribute as “Reserved”
Change Attribute screen is displayed.
Select the volume in the Volume List and push [Reserved] button.



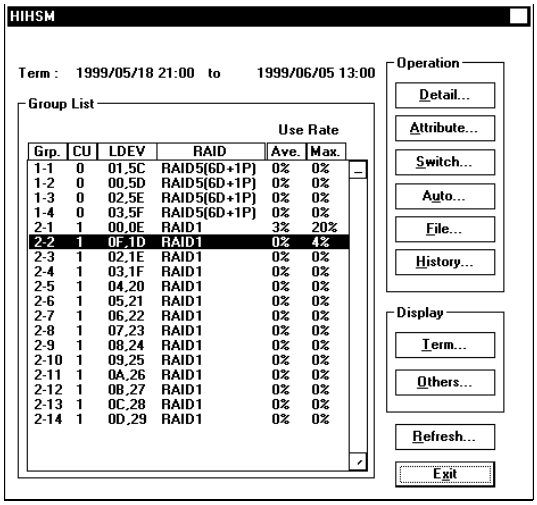
(4) Confirm the attribution
The program displays the list of your setting attribution.
If you want to set, please the select [OK].
If you want to delete one of then, please select it in the list and select [Omit]. The program will delete it from the list.
If you want to cancel, please select [Cancel].



Copyright ©1999, Hitachi, Ltd.

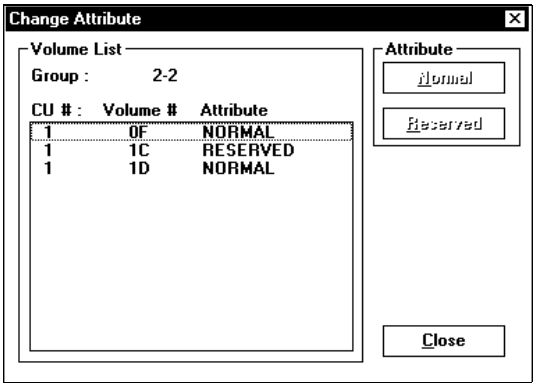
11.5.2 Changing the volume attribute to “Normal”

(1) Start HIHSM
Select [HIHSM] button in the Function Launcher screen.

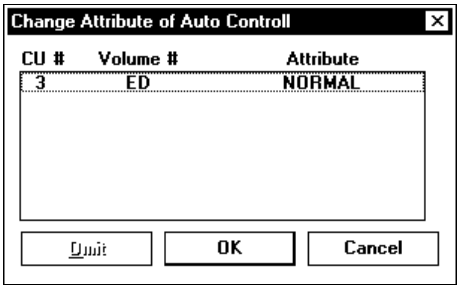


(2) Select parity group
Select one of the parity group in the main screen and push [Attribute...] button.

(3) Set the attribute
Change Attribute screen is displayed.
Select the volume in the Volume List and push [Normal] button.



(4) Confirm the attribution
The program displays the list of your setting attribution.
If you want to set, please the select [OK].
If you want to delete one of then, please select it in the list and select [Omit]. The program will delete it from the list.
If you want to cancel, please select [Cancel].



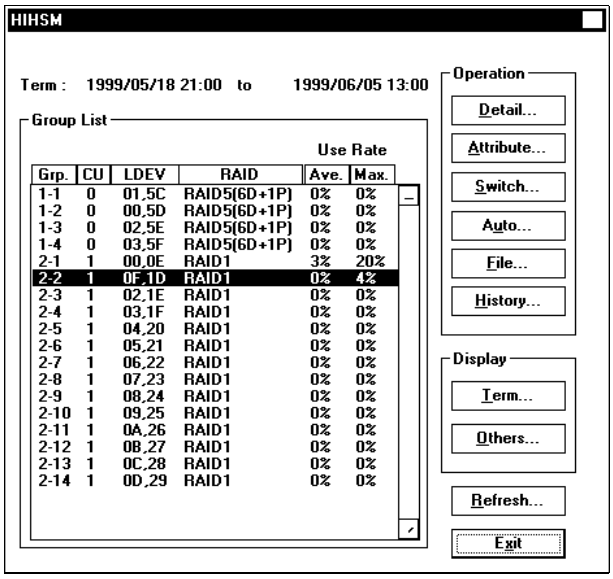
Copyright ©1999, Hitachi, Ltd.

11.6 Manual Migration

If you want to refer the migrate LDEV number in the group after finishing the volume migration by SVP or Remote Console, you should refer to “Refer Configuration” in “Install” function to get the latest configuration information.

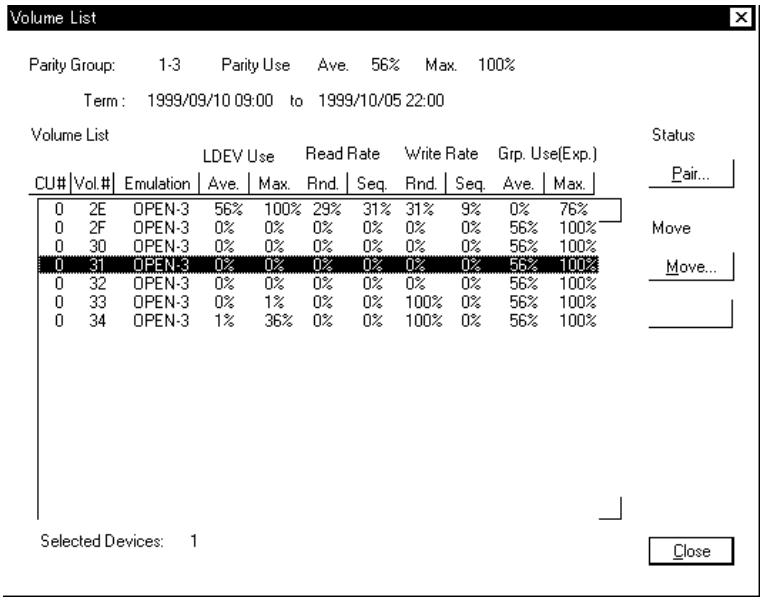
11.6.1 Manual Migration

(1) Start HIHSM
Select [HIHSM] button in the Function Launcher screen.



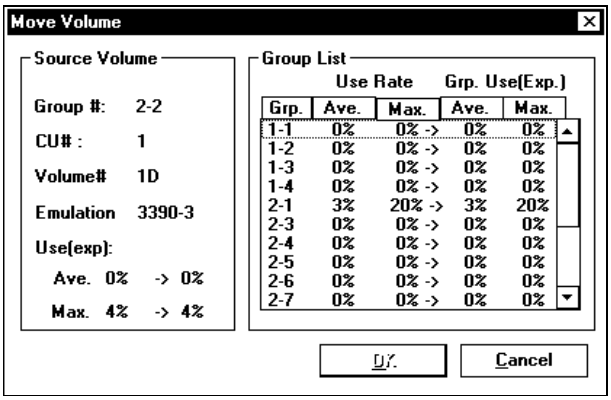
(2) Operation in the main screen
Select one of the parity group which you want to migrate, and push [Detail...] button in the main screen.

(3) Select the volume
Manual Migration Main screen will be displayed.
Select a volume and push [Move...].

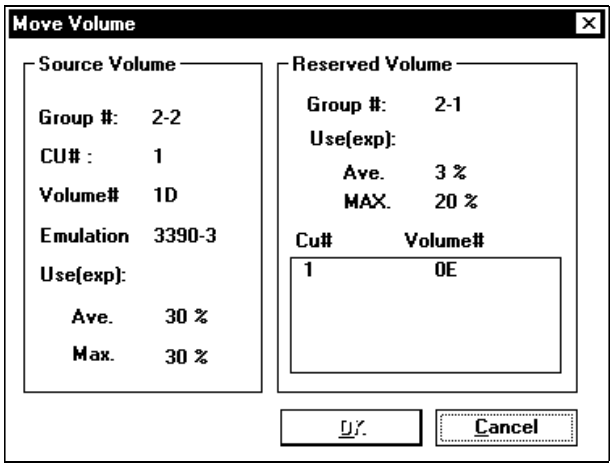


Copyright ©1999,2000, Hitachi, Ltd.

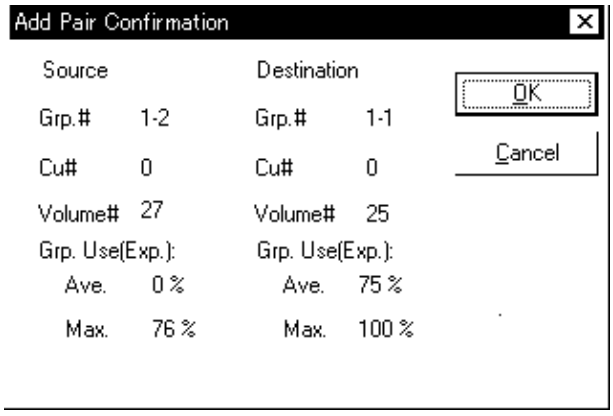
(4) Select the target parity group
Manual Migration Setting screen will be displayed. In this screen, the actual volume usage rate and the estimated volume usage after migration are displayed.
Please check the estimated rate.
Select the target parity group and push [OK].



(5) Select the target volume
The program displays the reserved volume list.
Select the target volume from the reserved volume list and push [OK].



(6) Confirm the migration
The program displays the source volume and the target volume with the usage rate.
Please confirm them and select [OK]. The program will start executing the migration. If you do not want to execute, select [Cancel].

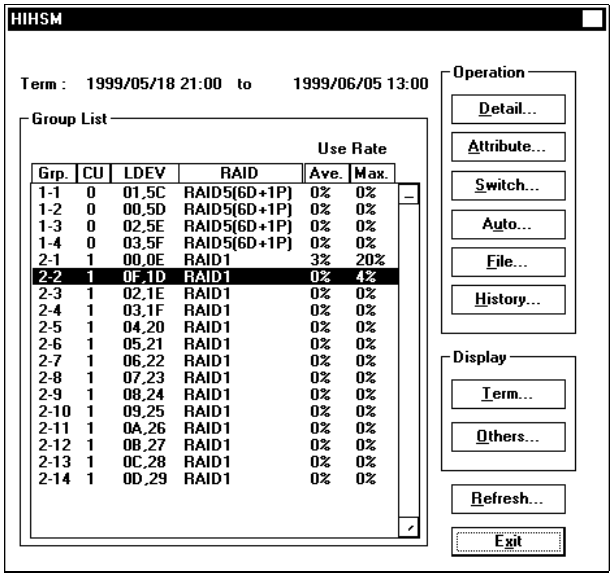


(7) Check during the migration
If you want to check the migration status, please refer to “Migration Status” section.

Copyright ©1999,2000, Hitachi, Ltd.

11.6.2 Migration Status

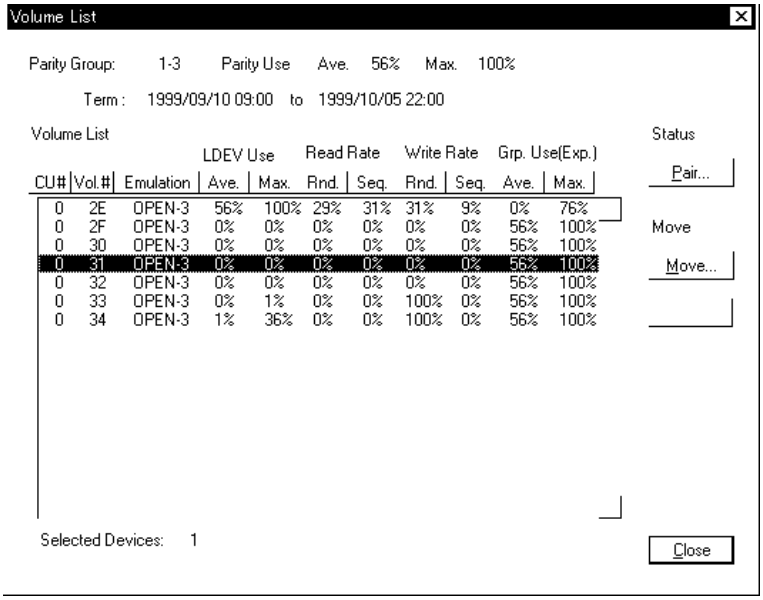
(1) Start HIHSM
Select [HIHSM] button in the Function Launcher screen.



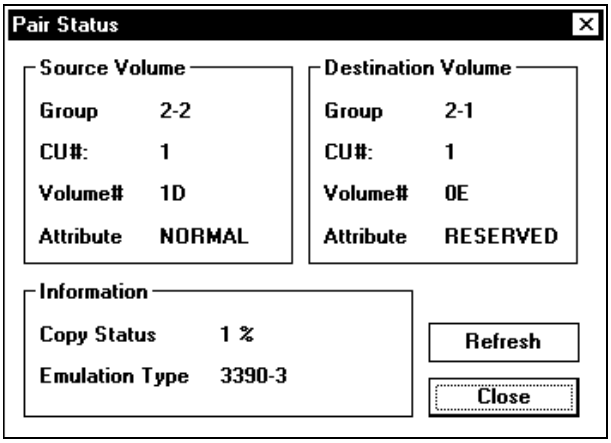
(2) Select parity group
Select one of the parity group which you want to refer to volume migration, and push [Detail...] button in the main screen.

(3) Select volume
Manual Migration Main screen is displayed.
Select one of the volume and push [Pair...] button.

Notice: Migration volumes are indicated as "*" in the left side.



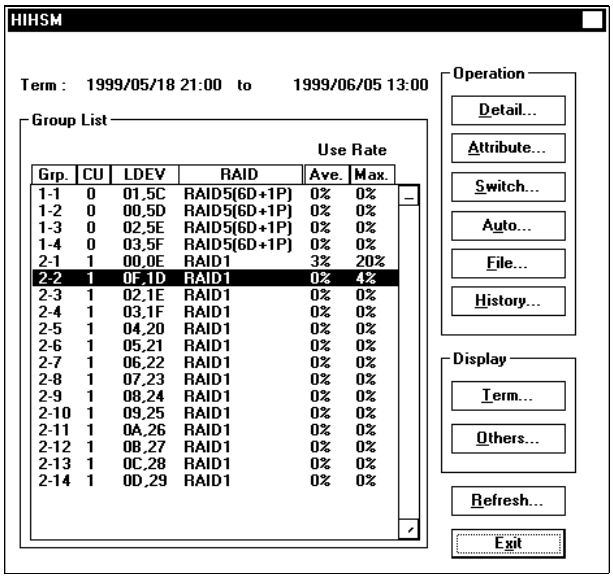
(4) Check the status
The source and target volumes are displayed with the migration status. Please continue selecting [Refresh] to get the last status.



Copyright ©1999,2000, Hitachi, Ltd.

11.6.3 Stop migration

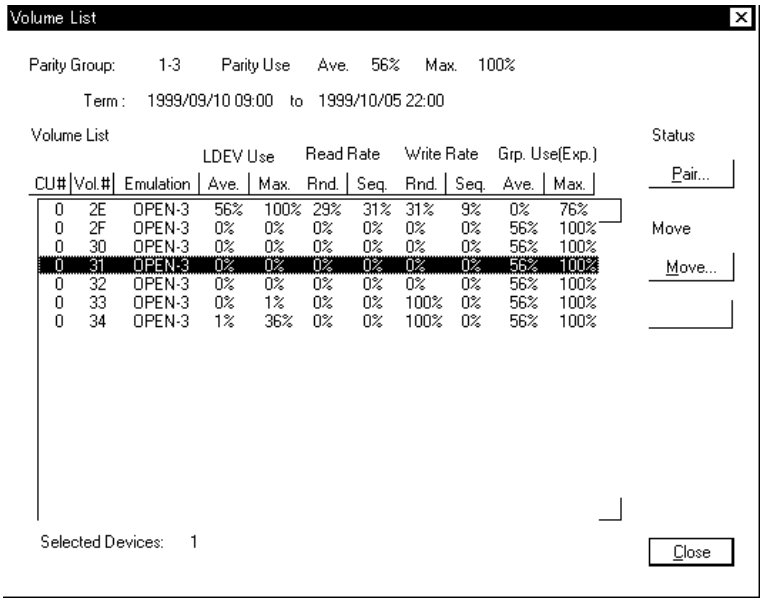
(1) Start HIHSM
Select [HIHSM] button in the Function Launcher screen.



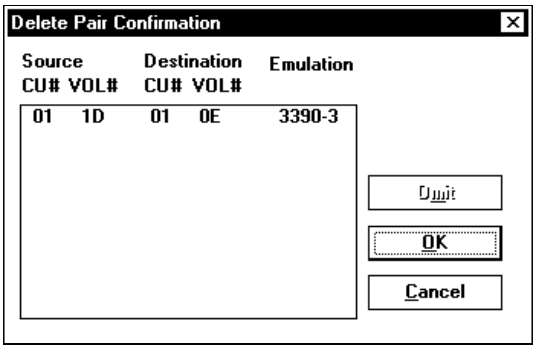
(2) Select parity group
Select one of the parity group which you want to refer to volume migration, and push [Detail...] button in the main screen.

(3) Select volume
Manual Migration Main screen is displayed.
Select one of the volume and push [Delete...] button.

Notice: Migration volumes are indicated as "*" in the left side.



(4) Confirmation
Your selected volumes which you want to stop the migration are displayed in the volume list.
Please confirm them.
If you want to stop the migration, please select [OK].
If you do not want, please select [Cancel].
If you want to remove the volumes from the volume list, please select the volumes and push [Omit]. The volume is deleted from the volume list ,which means that your omitted volume does not stop the migration. After selecting [OK], the program will stop the migration against the volumes in the list.



Copyright ©1999,2000, Hitachi, Ltd.

11.7 Automatic Migration

In the case of this automatic migration, the program automatically selects the volumes to migrate by using the following maximum disk utilization value.
The idea of these threshold control are described in the "Preset function". Please refer to it more detailed description.

11.7.1 Classification according to each disk type

The program automatically classifies according to each disk type. The following table are described the detailed desk type classification.

(1) Desk type classification
The program determines a class by the disk type (disk performance).

Disk Type	Order
DK306	5
DK308	4
DK309	3
DK30A	2
DK3F1	1
DK3F2	0

low performance

high performance

(2) Relationship between the installed disk types and those classes
The program assigns the highest performance disk type as Class A, and the lower performance type as Class B,C,D,E,F. The program assigns maximum 6 classes according to the disk types. But these classes are depend on the installed disk types. The following tables are examples of these classified result.

Example 1

Installed type	Order	Assigned Class
DK3F2	0	Class A
DK30A	2	Class B
DK308	4	Class C

Example 2

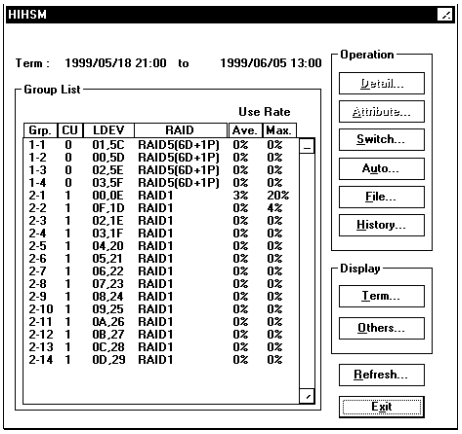
Installed type	Order	Assigned Class
DK309	3	Class A
DK308	4	Class B

Copyright ©1999, Hitachi, Ltd.

11.7.2 Set the maximum disk utilization

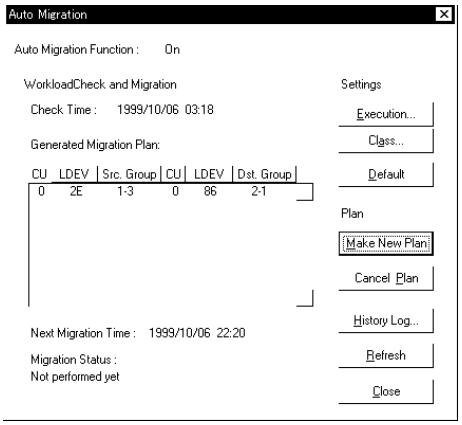
Set the maximum disk utilization for each class

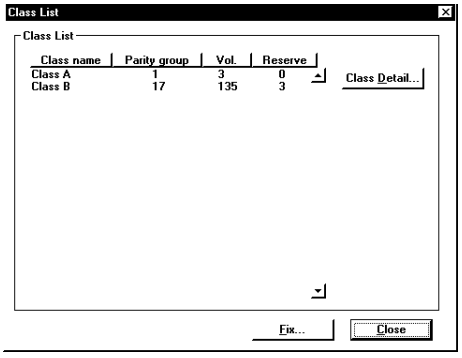
(1) Start HIHSM function
Select [HIHSM] button in the Function Launcher screen.



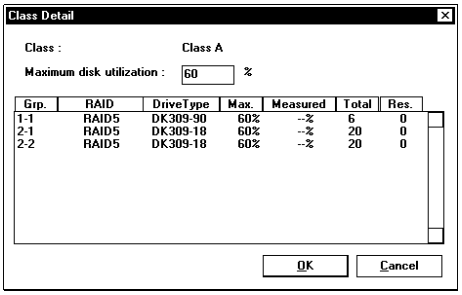
(2) Operation in the main screen
Select [Auto...] button in the main screen.

(3) Operation in Auto Migration scren
Select [Class...] button in the Auto Migration screen.
And select “Class Name”, push [Class Detail].





(4) Set the maximum disk utilization
In the Class Detail screen, input the value in the “Maximum disk utilization” field.
After inputting, select [OK].



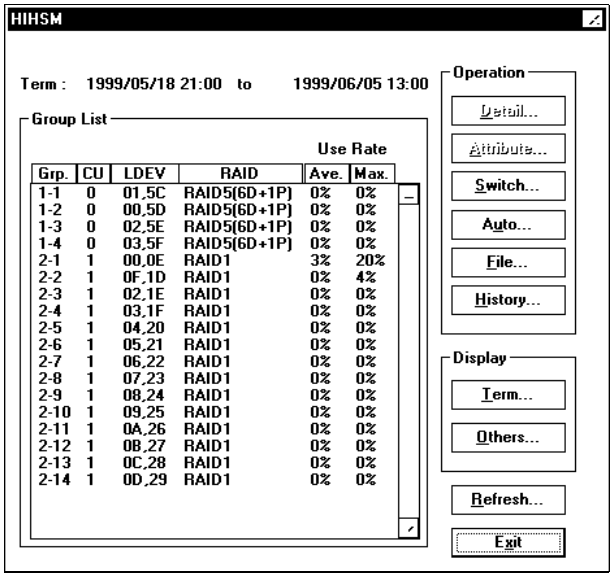
Copyright ©1999,2000, Hitachi, Ltd.

11.7.3 Set/Reset the Fixed parity group

Fixed parity group is the volume group that is not selected as the automatic volume migration. If you want to remove some parity group from the automatic volume migration, you should set them as the fixed parity group before executing automatic migration.

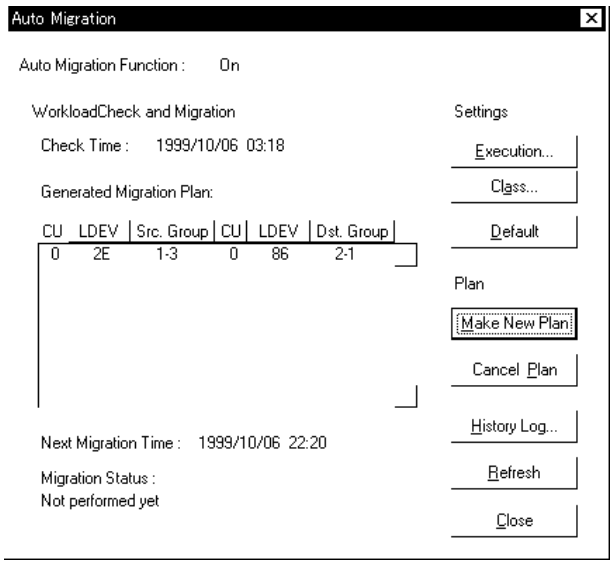
Set the fixed parity group.

(1) Start HIHSM function
Select [HIHSM] button in the Function Launcher screen.



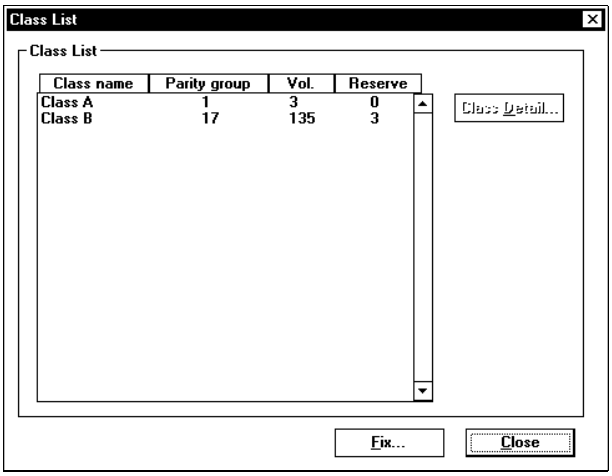
(2) Operation in the main screen
Select [Auto...] button in the main screen.

(3) Operation in the Automatic Migration Main screen
Automatic Migration Main screen is displayed.
Please select [Class...] button.

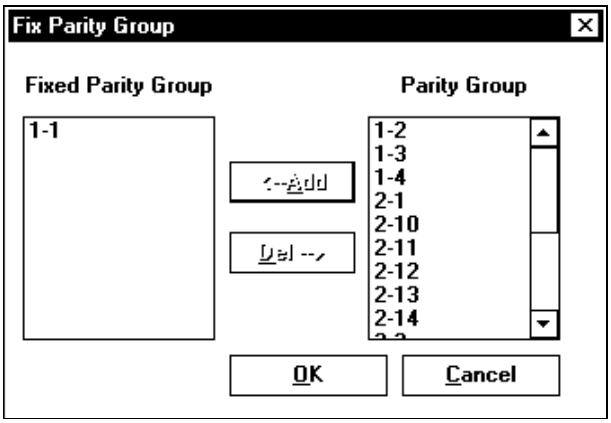


Copyright ©1999,2000, Hitachi, Ltd.

(4) Operation in the Class List screen
Select [Fix...] button in the Class List screen.



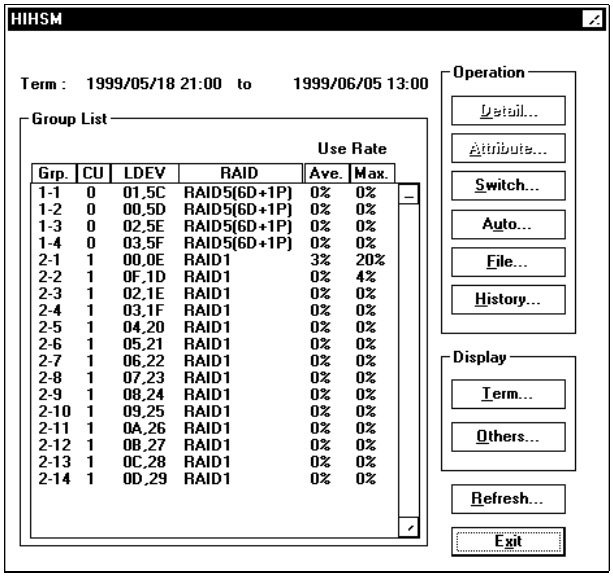
(5) Select Fixed parity group
Select the group which you want to fix from the Parity Group list and [<-Add] button. After selecting, the selected parity group will move to the Fixed Parity Group list.
If you want to reset the fixed parity group, please select the group from the Fixed Parity Group and push [Del->] button. After selecting, the selected parity group will move to Parity Group list.
If you want to set, please select [OK]. The program will set the group in the Fixed Parity Group list as the Fixed parity group.



Copyright ©1999, Hitachi, Ltd.

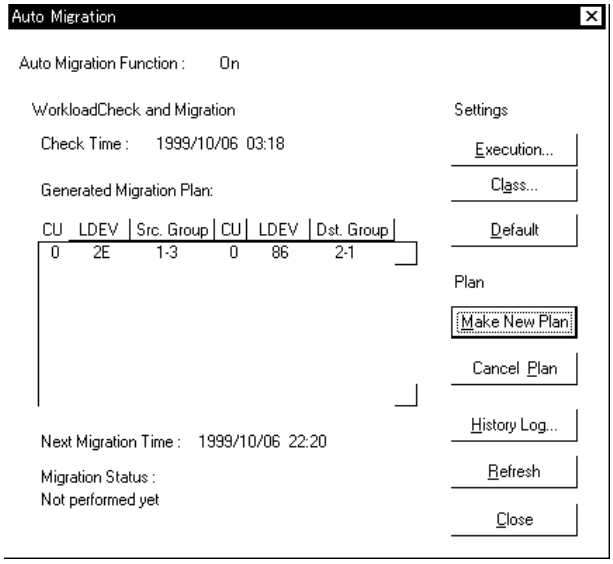
Reset the fixed parity group.

(1) Start HIHSM function
Select [HIHSM] button in the Function Launcher screen.



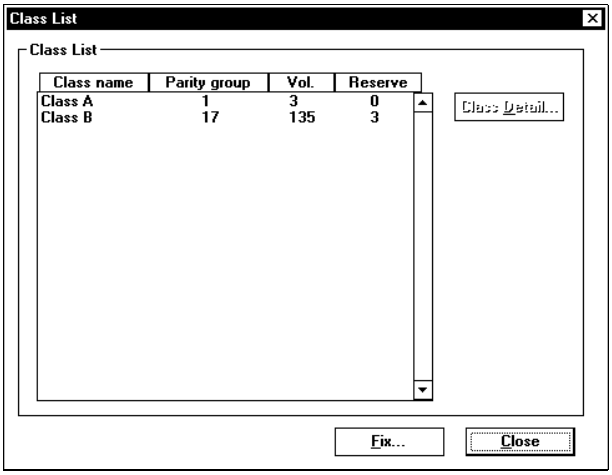
(2) Operation in the main screen
Select [Auto...] button in the main screen.

(3) Operation in the Automatic Migration Main screen
Automatic Migration Main screen is displayed.
Please select [Class...] button.

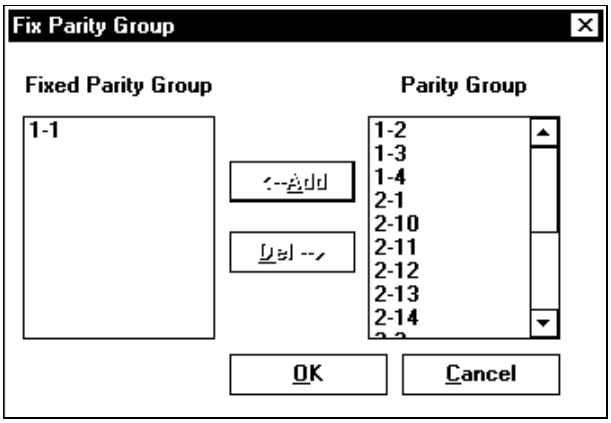


Copyright ©1999,2000, Hitachi, Ltd.

(4) Operation in the Class List screen
Select [Fix...] button in the Class List screen.



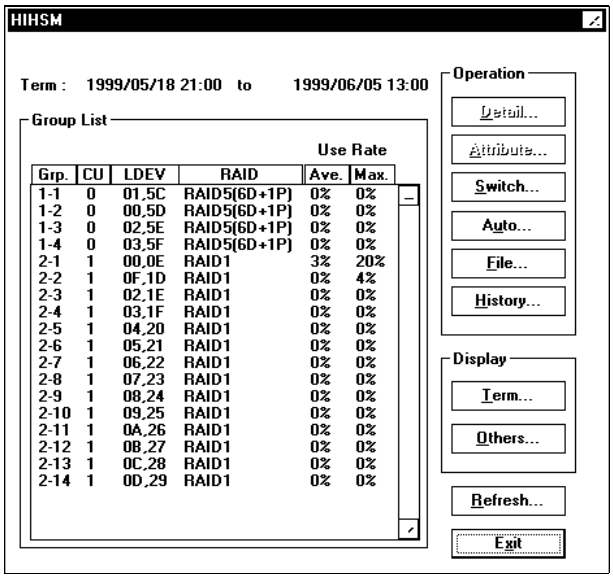
(5) Select the fixed parity group
Select the group which you want to reset the fixed parity group from the Fixed Parity Group list and [Del->] button. After selecting, the selected parity group will move to the Parity Group list.
If you want to set the parity group as Fixed, please select the group from the Parity Group and push [<-Add] button. After selecting, the selected parity group will move to Fixed Parity Group list.
If you want to set, please select [OK]. The program will set the group in the Parity Group list as the usual parity group.



Copyright ©1999, Hitachi, Ltd.

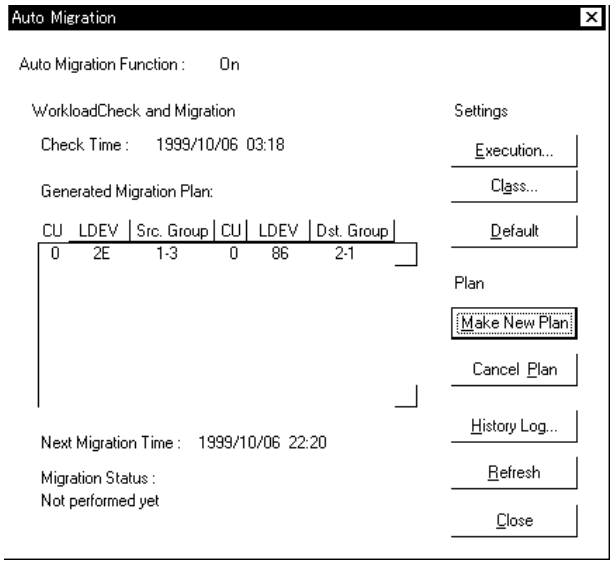
11.7.4 Set the evaluating schedule and migration time

(1) Start HIHSM function
Select [HIHSM] button in the Function Launcher screen.



(2) Operation in the main screen
Select [Auto...]button in the main screen.

(3) Operation in the screen
Automatic Migration Main screen is displayed.
Please select [Execution...] button.



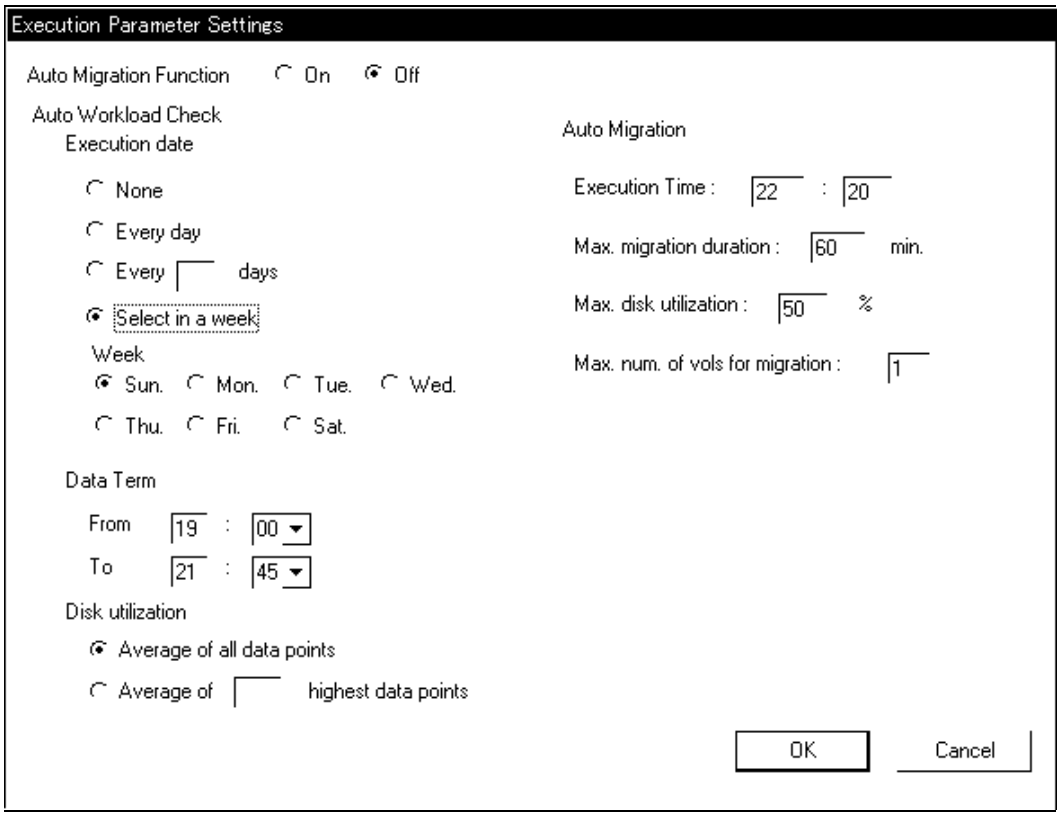
(4) Set the parameter
Automatic Migration Setting screen is displayed. This screen is to set the detail parameter about the automatic migration. At the next step it will be described how to set these parameter.

Copyright ©1999,2000, Hitachi, Ltd.

(5) Set the detail parameter

Set the check schecule migration timeto execute automatic migration function.

Notice: You should set the monitoring switch to “ON” before using this function.



(a) Set Auto Migration Function

Select "On" at the Auto Migration Function.

(b) Execution date

Set the date to make a plan. Please select one of the following three items, "Every Day", "Every x Day", "Select in a week", or "None".

(i) In the case of selecting "Every x Day"

Input the days. If you input "3" for example, the program will check every three days.

(ii) In the case of selecting "Select in a week"

Select one of the week.

(iii) In the case of selecting "None"

The program will not make a plan. But the program will execute the volume migration if the other old plans remain.

(c) Data Term

Input the term which monitoring data the program uses to make a plan.

From : Input the start time of monitor data to make a plan.

To : Input the end time of monitor data to make a plan.

In these term, the program will execute monitoring.

Copyright ©1999,2000, Hitachi, Ltd.

(d) Disk Utilization

Select one of the following two kinds of determination points.

(i) Average of all data points

Program calculates average usage from all data points to determine the migration.

(ii) Average of [x] highest data points

Program calculates the average usage from the highest value to the x highest value. You should input the number [x].

(e) Auto Migration

Input the migration schedule.

(i) Execution Time : Input the start time (Program executes at that time in every day)

(ii) Max. migration duration : Input the minutes. This value is a duration that you permits to execute migration. For example, if you input "90", the available duration is 90 minutes and if the migration could not finish in this duration, the program will stop the migration. (Value: 10 – 120 min)

(iii) Max. disk utilization

The available disk utilization rate during the migration. Input the maximum available rate (%). For example, if you input "60" and the disk utilization is higher than 60 %, the migration will be stopped. (Value: 10 – 100%)

(iv) Max. num of vols for migration

To set the number of the migration volumes at the same time. (Value: 1 – 20 vols)

(6) Confirm the parameter

Confirm your inputted parameter again, and select [OK].

Notice: If SVP reboots during auto migration, HIHSM will display as "SVP Reboot" in the History screen but will not record the migration result. Please refer to the main history.
HIHSM remains the old plans before SVP rebooting in the Auto plan, and displays as "Under Migration" in the Status. Please cancel those "Under Migration" volumes.

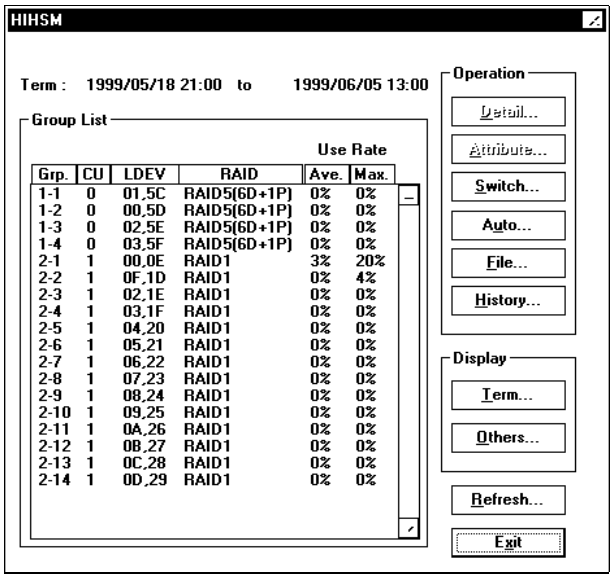
11.7.5 Make the migration plan

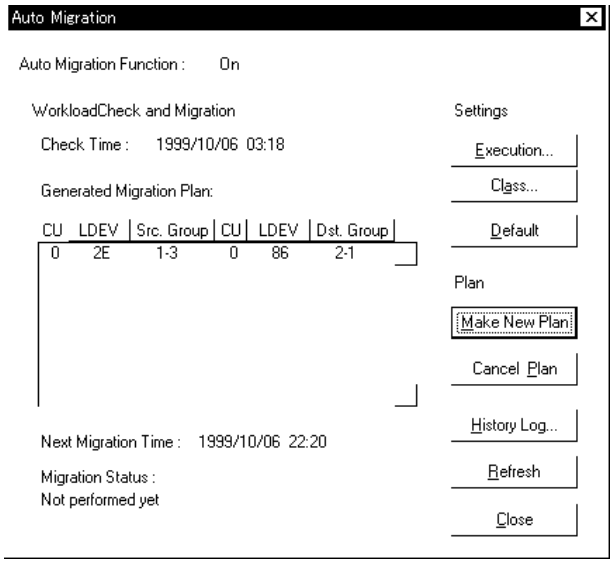
After monitoring the disk usage according to the evaluating schedule, the migration plan will be made.
HIHSM usually make these plan automatically. But you can make them by the following operations.

(1) Start HIHSM function
Select [HIHSM] button in the Function Launcher screen.

(2) Operation in the main screen
Select [Auto...]button in the main screen.



(3) Make plan
Automatic Migration Main screen is displayed. To make the migration plan, please select [Make New Plan] button. The program will display new plans in the "Generated Migration Plan".
The program will execute the volume migration according to the generated migration plans at the time which are displayed in the "Next Migration Time".



Notice: HIHSM sometimes does not make a plan as the result of "Make New Plan". Please refer to "History".

(4) Review the plans
Please check the generated plan. If you cannot agree this plan, please select [Cancel Plan].

Notice: HIHSM will delete plans made after the specified migration plan according to the migration order. You can not delete one of these plans.

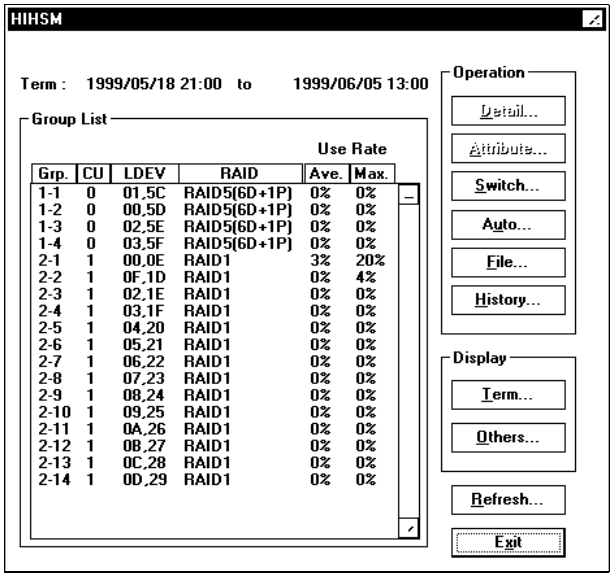
Copyright ©1999,2000, Hitachi, Ltd.

11.8 Display the volume usage rate

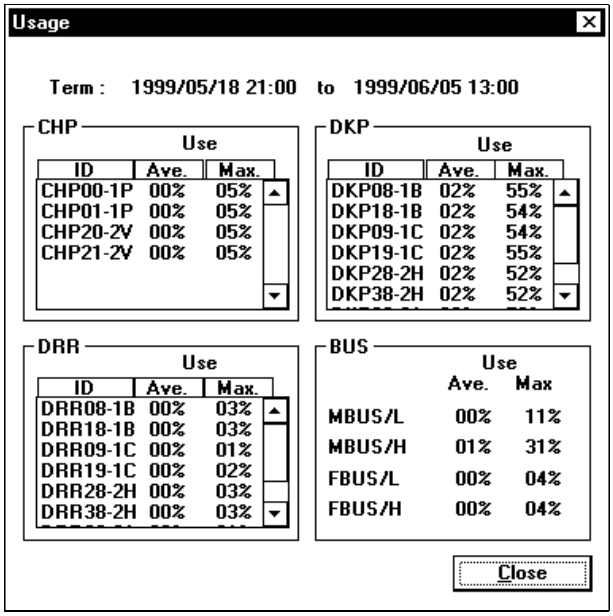
This screen is to display the physical volume usage rate.

(1) Start HIHSM function
Select [HIHSM] button in the Function Launcher screen.

(2) Operation in the main screen.
Select [Other...] button in the main screen.



(3) Display the rate
The program will display the usage rate of each processor, BUS and DRR. After you check them, please select [Close] button to exit this screen.



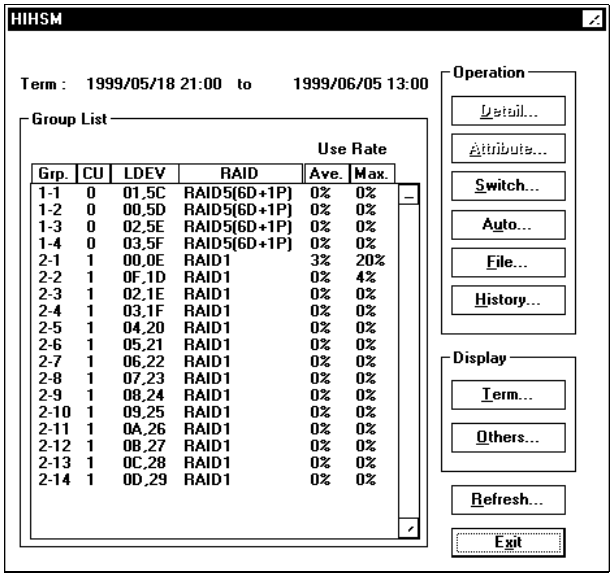
Copyright ©1999, Hitachi, Ltd.

11.9 Display the history

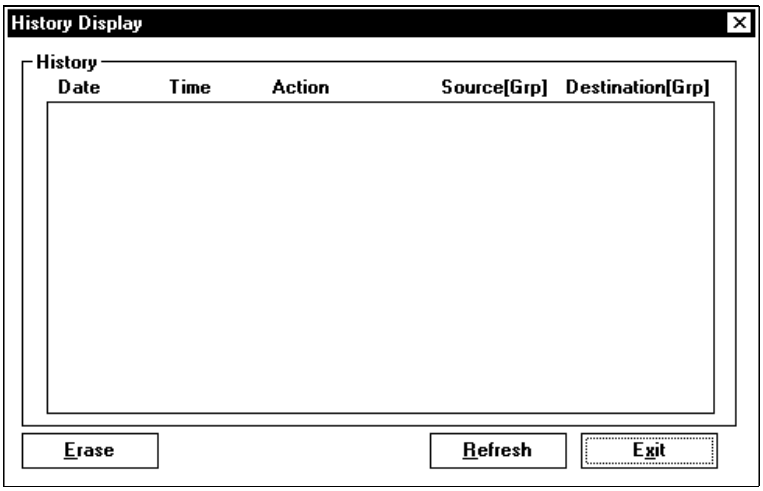
11.9.1 History Screen

(1) Start HIHSM function
Select [HIHSM] button in the Function Launcher screen.

(2) Operation in the main screen.
Select [Auto...] button in the main screen.



(3) History
History Screen is displayed.
If you want to delete the history, please select [Erase] button.
After checking, please select [Exit] to close this screen.

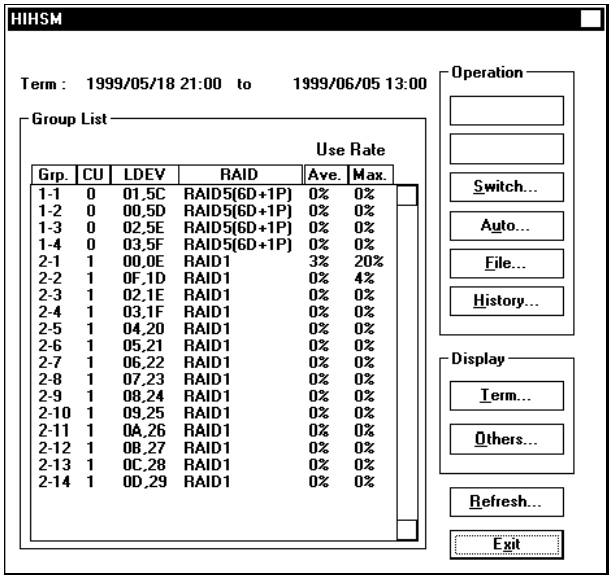


Copyright ©1999, Hitachi, Ltd.

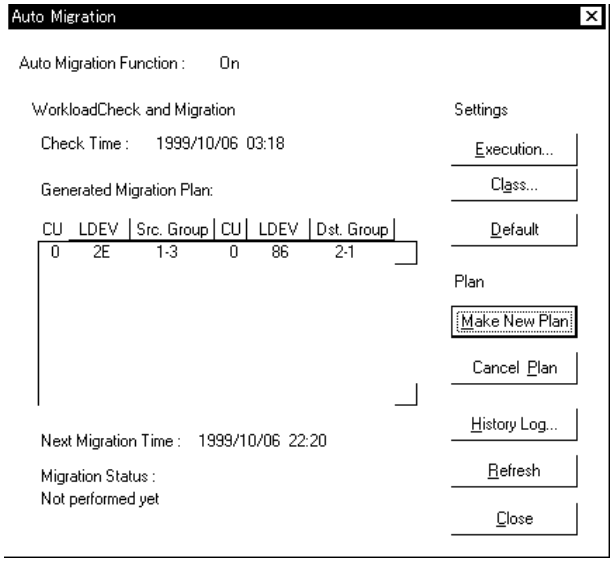
11.9.2 Display the history for automatic migration function

(1) Start HIHSM function
Select [HIHSM] button in the Function Launcher screen.

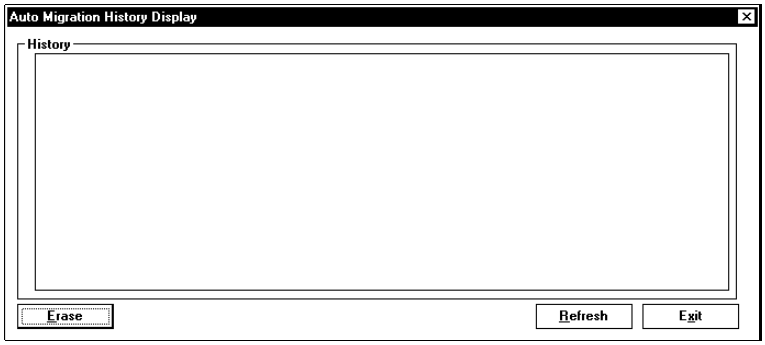
(2) Operation in the main screen
Select [Auto...] button in the main screen.



(3) Operation in the Automatic Migration Main screen
Select [History Log...] button.



(3) History
Automatic Migration History Screen is displayed.
If you want to delete the history, select [Erase] button.
After checking, select [Exit] to close this screen.
Sometimes an error code may be displayed.
Please refer to the next page which is described about those error.



Copyright ©1999,2000, Hitachi, Ltd.

Error Code	Description	Action to cope with an error
0401	A locking time-out was detected during an internal processing. (A retry may result in a normal termination.)	Retry about five seconds later.
0801	The HIHSM could not be used.	Install the PP or the HIHSM.
0810	The issued command cannot accepted in this status. (The command was rejected.)	Check the pair status and confirm whether the command is allowed to be issued.
0811	The issued command is treated as an NOP.	The issued command is treated as an NOP.
0830	A pair cannot be created because the track format is different.	Check if the emulation types of the source and the target volume are the same.
0831	A pair cannot be created because a number of slots is different.	Check if the capacities of the source and the target volume are the same.
0834	The emulation type of the specified source volume is not supported by the HIHSM.	Check if the emulation type of the source volume is supported by the HIHSM
0835	The emulation type of the specified target volume is not supported by the HIHSM	Check if the emulation type of the target is supported by the HIHSM.
0836	The pair can not be created.	Confirms whether the emulation type of the source and the target volume are the same.
0C70	An the source volume is not installed.	Volumes not installed are not included in the object to be processed.
0C71	The source volume cannot be used.	Call the service personnel to make the source volume status normal.
0C72	The source volume is being formatted.	Wait until the formatting of the source volume is completes.
0C73	The source volume is command device.	The command device does not execute HIHSM function
0C80	The target volume is not installed.	Volumes not installed are not included in the object to be processed.
0C81	The target volume cannot be used.	Call the service personnel to make the target volume status normal.
0C82	The target volume is being formatted.	Wait until the formatting of the target volume completes.
0C83	The target volume is command device.	The command device does not execute HIHSM function.
0C90	The HDEV specified to be a Reserve volume is not installed.	Volumes not installed are not included in the object to be processed.
0C91	The HDEV specified to be a Reserve volume cannot be used.	Call the service personnel to make the volume specified to be a Reserve volume normal.
0C92	The HDEV specified to be a Reserve volume is being formatted.	Wait until the formatting of the volume specified to be a Reserve volume completes.
0C93	The HDEV specified to be a Reserve volume is command device.	The command device does not execute HIHSM function.

Error Code	Description	Action to cope with an error
1009	The multiplicity of the HIHSM exceeded its limit.	Delete some of the pairs.
1011	The number of the HDEV specified to be a Reserve volume has already been used for a Reserve volume.	Change the HDEV number for specifying a Reserve volume.
1012	The number of the HDEV specified to be a Reserve volume has already been used for a primary HDEV of the HMRCF/HOMRCF.	Change the HDEV number for specifying a Reserve volume.
1013	The number of the HDEV specified to be a Reserve volume has already been used for a source volume of the hierarchical control.	Change the HDEV number for specifying a Reserve volume.
1014	The number of the HDEV specified to be a Reserve volume has already been used for a destination volume of the hierarchical control.	Change the HDEV number for specifying a Reserve volume.
1015	The HDEV specified to be a Reserve volume is not set as a Reserve volume.	Check the volume status.
1017	A Reserve volume cannot be set because the number of Reserve volumes allocated for them was exceeded.	Delete any of the Reserve volumes
102B	The specified volume as the “Reserved” has been set as the HMRCF/HOMRCF target volume.	Check the volume status.
102C	The specified source volume has been set as the HRC/HORC source volume.	Check the volume status.
102D	The specified target volume has been set as the HRC/HORC target volume.	Check the volume status.
102F	The specified source volume has been set as the HIHSM source volume.	Check the volume status.
1030	The specified source volume number does not exist.	Retry after refreshing the screen.
1031	The specified source volume has been set as a Reserve volume.	Check the pair status.
1034	The specified source volume has been set as other source volume.	Check the pair status.
1036	The specified source volume has been set as the HMRCF/HOMRCF source volume.	Delete the pair of the HMRCF/HOMRCF.
1037	The specified source volume has been set as a target volume of the HMRCF/HOMRCF.	Delete the pair of the HMRCF/HOMRCF.
1038	The specified source volume has been set as a M-VOL of the HODM.	Delete the pair of the HODM. (*1)
103B	It is impossible to make a pair because Volume which was specified as a target volume is Root Volume already	It confirms a pair condition.

Copyright ©1999, Hitachi, Ltd.

Error Code	Description	Action to cope with an error
103C	It is impossible to make a pair because Volume which was specified as a target volume is Node Volume already	It confirms a pair condition.
1040	The specified target volume does not exist.	Execute "Refresh" and do again.
1041	The specified target volume does not set as the Reserve volume.	Check the volume status.
1042	The specified target volume has been used as other HIHSM target volume.	Check the volume status.
1043	The specified target volume has been used as HMRCF/HOMRCF target volume.	Delete pair of HMRCF/HOMRCF
1046	The specified secondary HDEV is used as an M-VOL of the HORC.	Delete the HORC pair.
1047	The specified secondary HDEV is used as an R-VOL of the HORC.	Delete the HORC pair.
1048	The specified secondary HDEV is used as an M-VOL of the HODM.	Delete the HORC pair.
104A	The specified secondary HDEV is used as an source volume of the HMRCF / HOMRCF.	Delete the HMRCF/HOMRCF pair.
104B	The specified target volume has been used as other HIHSM source volume.	Check the volume status.
104C	The HDEV specified as a Reserve volume is being used as an M-VOL of the HODM.	Delete the HODM pair. (*1)
104E	The HDEV specified as a Reserve volume is being used as an M-VOL of the HRC/HORC.	Delete the HRC/HORC pair.
104F	The HDEV specified as a Reserve volume is being used as an R-VOL of the HRC/HORC.	Delete the HRC/HORC pair.
1051	The HDEV numbers of the specified source and the target volumes are the same.	Retry after refreshing the screen.
1085	The source volume was used for Reserve volume of HIHSM.	Check the source volume or Cancel the Reserve volume of HIHSM.
1088	The specified reserve volume has been set as DCR.	Reset the DCR.
1089	The specified source volume has been set as DCR	Reset the DCR
108A	The specified target volume has been set as DCR.	Reset the DCR
108B	The specified reserve volume has been constructed as LUSE.	Reset the LUSE.
108C	The specified reserve volume has been set as HMRCF/HOMRCF reserved volume.	Check the pair status.

(*1) These error codes are displayed only when HODM function is installed.

1 HOW TO USE PARTS CATALOG

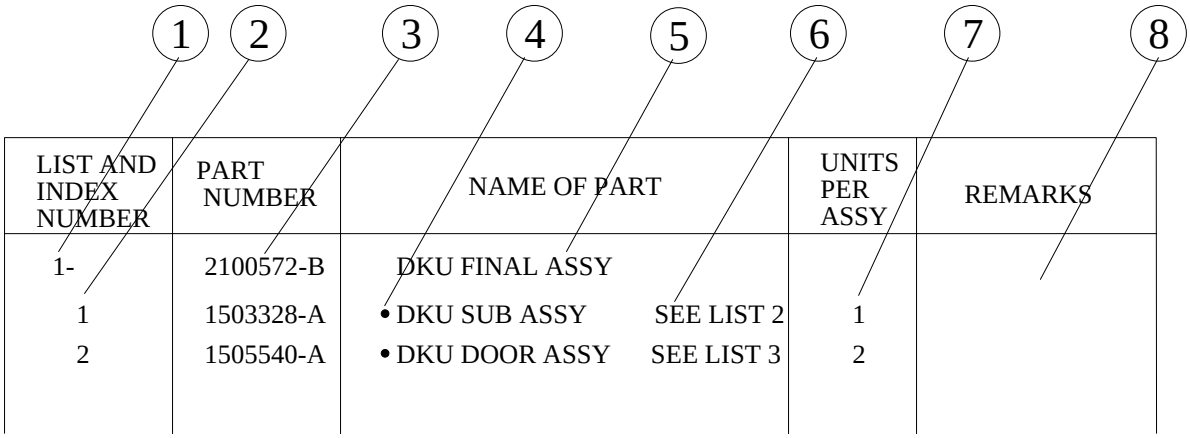
1. Parts list
   Table 1-1 shows the reference page of each part.

Table 1-1 Reference page of each part

No.	Part Name	Pages
1	DKU	PARTS02-10 through 02-130
2	DKC	PARTS03-10 through 03-100
3	PCBs and Memory Modules	PARTS04-10 through 04-60
4	Cable Assemblies	PARTS05-10 through 05-140
5	Spare Parts	PARTS06-10 through 06-40

2. Tool list
   This list shows tools necessary to exchange a part or to troubleshoot DKC310I and DKU305I.

3. How to refer to parts list



① : Indicates the list number of the assembly.
② : Indicates the item number given in the figure.
③ : Indicates the part number.
④ : Non-dot mark indicates a main assembly in a parts list.
One-dot mark indicates a part included in a main assembly.
Two-dot mark indicates a part included in a one-dot marked part.
⑤ : Indicates the unit type.
⑥ : Indicates the detailed list number if any.
⑦ : Indicates a quantity per main assembly.
⑧ : If 'SP' is written, it indicates a spare part.

7 TOOL LIST

The following table shows the maintenance tools:

TOOL MANE	SPECIFICATION	REMARKS
Monkey wrench	100mm	Used for installation, maintenance, trouble-shooting, and parts change.
Monkey wrench	300mm	
Hexagon wrench key set	1.27, 1.4, 1.58, 2.0, 2.5, 3.0, 4.0, 5.0, 6.0, 8.0mm	
Box driver set	4.0, 5.5, 6.0, 7.0, 8.0, 10.0mm	
Stubby driver set (PHILIPS TYPE)	No. 2 x 38	
Stubby driver set (PHILIPS TYPE)		
Screw driver set (STRAIGHT TYPE)		
Insulated cutting pliers	175mm	
Insulated radio pliers	150mm	
Insulated cutting nipper	150mm	
Pincette	125mm	
Soldering iron	25W	Used for field change.
Soldering iron	100W	
Wrapping tool		
Oscilloscope	200MHz	Used for inspection.
Digital voltmeter	AC, DC, OHM	

The following table shows the special tools:

TOOL MANE	PART NO.	REMARKS
Fiber wraparound connector	5430106-1	For diagnostics for serial channel interface
Torques driver	5480359-1	For replacement of SVP
Simm puller	5480389-A	For removing memory module (SM / CM)
Power Supply check cable	3243301-A	For check of DC voltage
Screw driver with insulated blade	5480302-1	For removing screw
Outlet Box (IE Type)	5497351-B	For convenience
Outlet Box (IU Type)	5497351-A	For convenience
Hitrack Bracket	5503467-A	For Hitrack converter mount

1. RAID Architecture Overview

The objectives of the RAID technology are the low cost, high reliability, and high I/O performance of disk storage devices. To achieve these objectives, this subsystem supports levels 1, and 5 of RAID technologies (in this section, part of level 3 RAID technology is explained to make the outline of RAID5 more understandable). The features of the levels of RAID technologies are described below.

1.1 RAID0 and RAID1

RAID0 uses small-scale disk storage devices instead of conventional expensive large-scale disk storage devices for cost reduction. To increase the reliability of RAID0 devices, all disk devices are duplexed in RAID1.
Strictly speaking, RAID0 and RAID1 subsystems are not disk array systems; their performance is the same as conventional disk subsystems. Controlling these subsystems are rather simple and many RAID0 and RAID1 subsystems have been put into market by several vendors.

1.2 RAID3

In RAID3, a stream of data to be transferred is split and distributed into two or more disk devices (1 parity group) on a byte or bit basis (striping). This enables two or more disk devices to run simultaneously and increase the speed of data transfer between the DKC and disk drives. In addition, since parity data for the parity group is created and stored on a separate disk device (parity disk), data can easily be recovered even if a device in a parity group gets inoperative or causes a read error. This enhances the reliability of the disk storage subsystem.
Since RAID3 lacks the parallel I/O capability and it entails a long latency time because of the need to drive two or more drives at a time, it exhibits little performance in applications that process small-volume data repeatedly (transaction processing) though it shows a real advantage when running applications that process large-volume data in a single run (e.g., scientific computations).

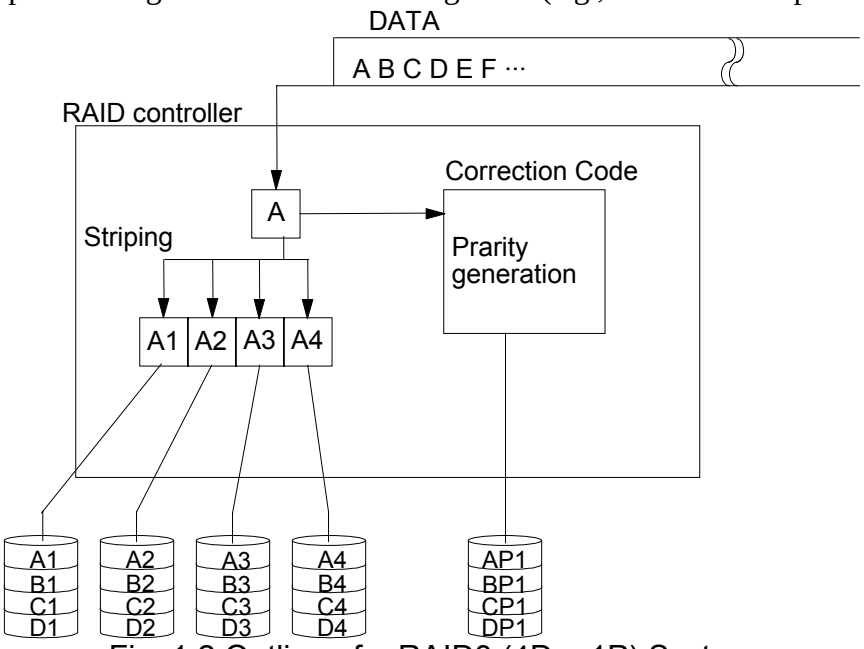

Fig. 1.2 Outline of a RAID3 (4D + 1P) System

Copyright ©1997, 1998, Hitachi, Ltd.

1.3 RAID5

Small-sized records are intensively read and written randomly in transaction processing. This type of processing generates many I/O requests for transferring small amounts of data. In such a situation, greater importance is placed on increased I/O performance (parallel I/O processing) than on increase in the rate of transferring large-volume data. RAID5 has been introduced to be suitable for this type of transaction processing.

In RAID5, the striping size is set to that of blocks which are transferred in a small-scale I/O processing mode and which are distributed in two or more disk devices (1 parity group). This entails the RAID controller to access each disk device only for one stripe equivalence of data and allows it to perform I/O operations on other disks in parallel, increasing the I/O performance substantially; though its data transfer rate remains the same as that of conventional subsystems in small-scale I/O applications. In large-scale (sequential) I/O applications, it permits the blocks in the same parity group to be processed in parallel as does RAID3, resulting in an increase in data transfer rate. In addition, like RAID3, RAID5 uses a parity disk for improved reliability. In individual writes to single-blocks (small-scale writes), however, this parity scheme raises various problems for the following reasons:

- The parity disk entails rewrites of new parity data.
- It is necessary to read the old parity data and old (before-update data) to generate new parity data.

Consequently, RAID5 entails extra reads from the data and parity disks in small-size write operations (this is called “write penalty”). If the parity data were fixed at a single disk device, the parity disk would be occupied during a single write that is executed to update the parity data, thus making it impossible to perform parallel I/O processing. To alleviate this problem, RAID5 adopts a system of distributing parity data on several disks in the group. This will not solve the write penalty problem completely.

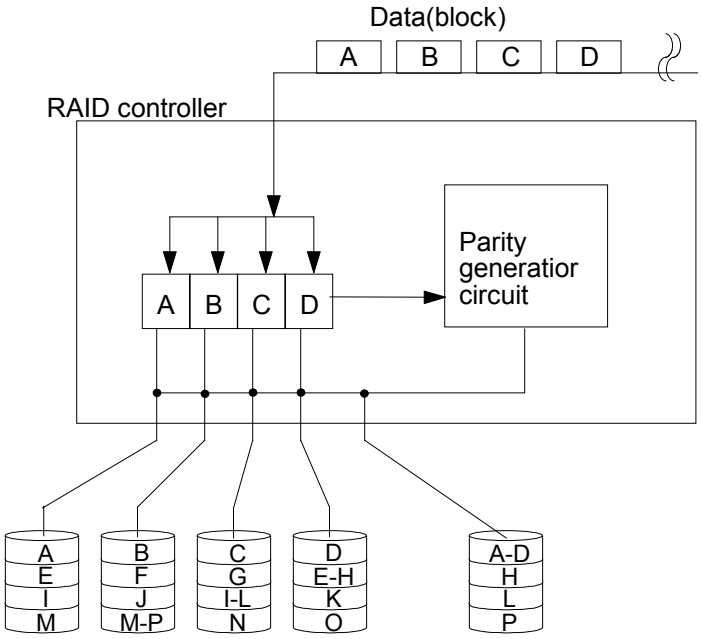

Fig. 1.3 Outline of RAID5 (4D + 1P)

Copyright ©1997, 1998, Hitachi, Ltd.

1.4 Application of the RAID technologies DKC310 and DKU305

RAID5 will not show its stuff during transaction processing if a single I/O operation spans over two or more disk devices (when the stripe size is too small). Consequently, adequate consideration should be given to the stripe size.

In this subsystem, the stripe size is 58 KB which is equivalent to one track of the 3390-3 so that the 3390-3 can be emulated. This is because it is anticipated that a single transaction will not span over two or more tracks when the 3390-3 is emulated. This subsystem also uses cache memory to preclude write penalties from occurring wherever possible. The cache memory can pool the data to be written onto the disk drives and prefetch old data.

- On write penalty

A parity group of a this subsystem (level 5) system consists of seven disk devices (6D + 1P) or four disk devices (3D+1P). Since the parity data is made up of parity data for six data disks (6D+1P) or three data disks (3D+1P) in the group, once a 1 stripe equivalence of partial write occurs in the group during transaction processing, it becomes necessary to regenerate the corresponding parity data in that group.

Since parity data is calculated using the formula shown below, “data established before update,” “parity established before update,” and “data established after update” are required to generate parity. The extra processing required to read this “data before update” is referred to as a write penalty.

“New parity data”
= (“Data before update” EOR “Data after update”) EOR “Parity before update”

2. Specifications

2.1 DKC310I Specifications

Specifications are shown in the following table.

DKC310I Specifications

Item		Specifications
Data transfer rate (MB/s)		3.0/4.5/6.0/9.0/10/17/20/40/100 Note
Nonstop maintenance	Disk drive	✓
	Control package	✓
	Microcode	✓
	Power supply, fan	✓
	Battery	✓
	Maintenance package	✓
	Duplex bus	✓
	Spare disk support	✓

Note: 6.0MB/s and 9MB/s data transfer can be applied on the Channel Interface when attached to Hitachi CPU.
10MB/s and 17MB/s data transfer can be applied on the Serial Channel Interface.
20MB/s data transfer can be applied on the Fast/Wide SCSI Channel Interface.
40MB/s data transfer can be applied on the Ultra/Wide SCSI Channel Interface.
100MB/s data transfer can be applied on the Fibre Channel Interface.

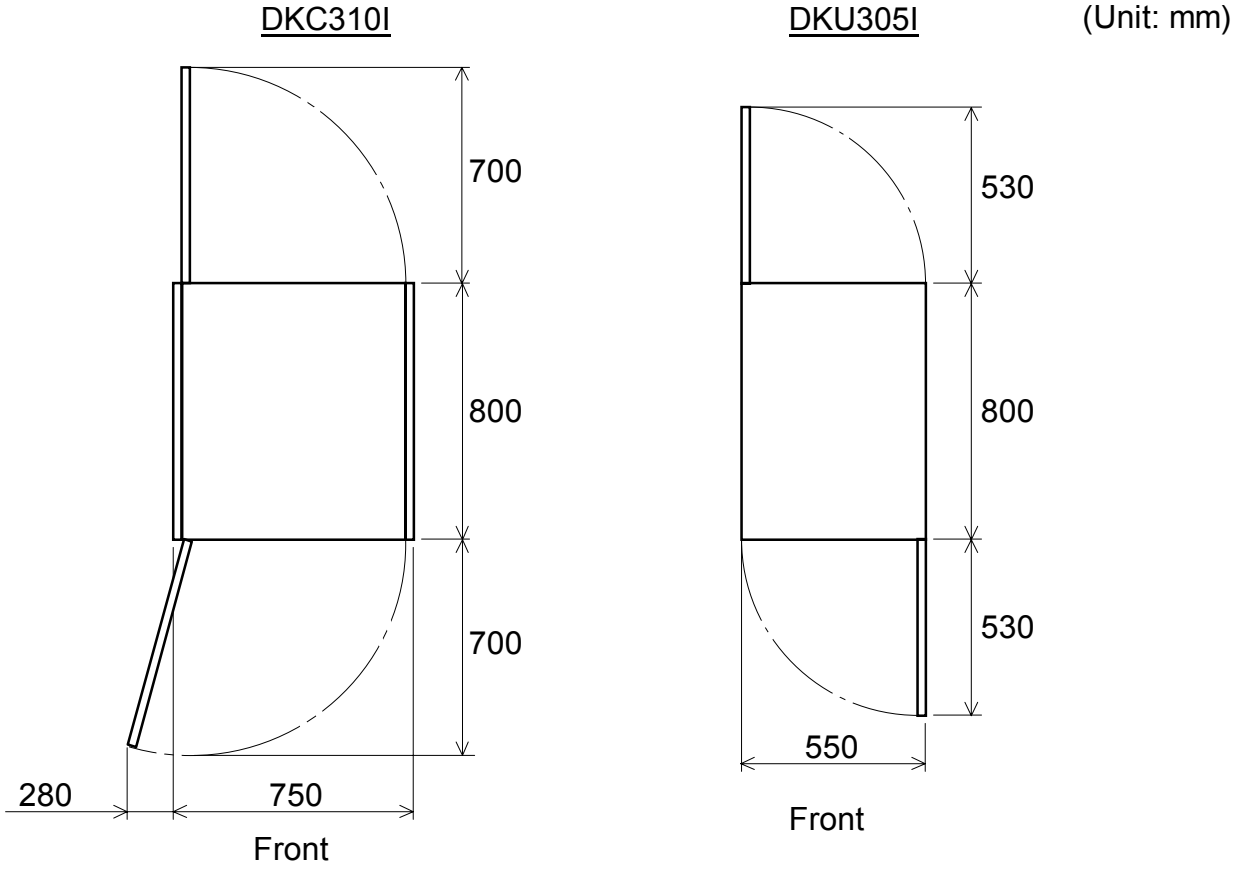
2.3 Physical Specifications

DKC310I/DKU305I physical specifications are shown in the following figures and table.



Item		DKC310I		DKU305I
Dimension (mm)	Width	750 *1	750 *1	550
	Depth	800	800	800
	Height	1,790	1,790	1,790
Weight (kg)		427 *2	463 *3	430 *4
Heat Output (kW)		1.65 *2	2.57 *3	2.46 *4
Power Consumption (kVA)		1.76 *2	2.75 *3	2.64 *4
Air Flow (m^3/min.)		24 *2	24 *3	6 *4

*1: This includes the thickness of side covers (16mm × 2).
*2: These values are used when DKC310I has 4GB Cache Memory, two Serial 8-port Adapter and DKC Redundant Power Supply.
*3: These values are used when DKC310I has full options.
*4: These values are used when DKU305I has full options.

3. Internal Operation

3.1 Hardware Block Diagram

The controller of this unit consists of channel adapters for channel processing, disk adapters for disk unit processing, and a cache card having a non-volatile memory. The controller can control and transfer data to the cache and a shared memory from each adapter via a high-speed I/O bus and multi-I/O bus. Furthermore, the controller connects to small disk drives to form disk arrays.

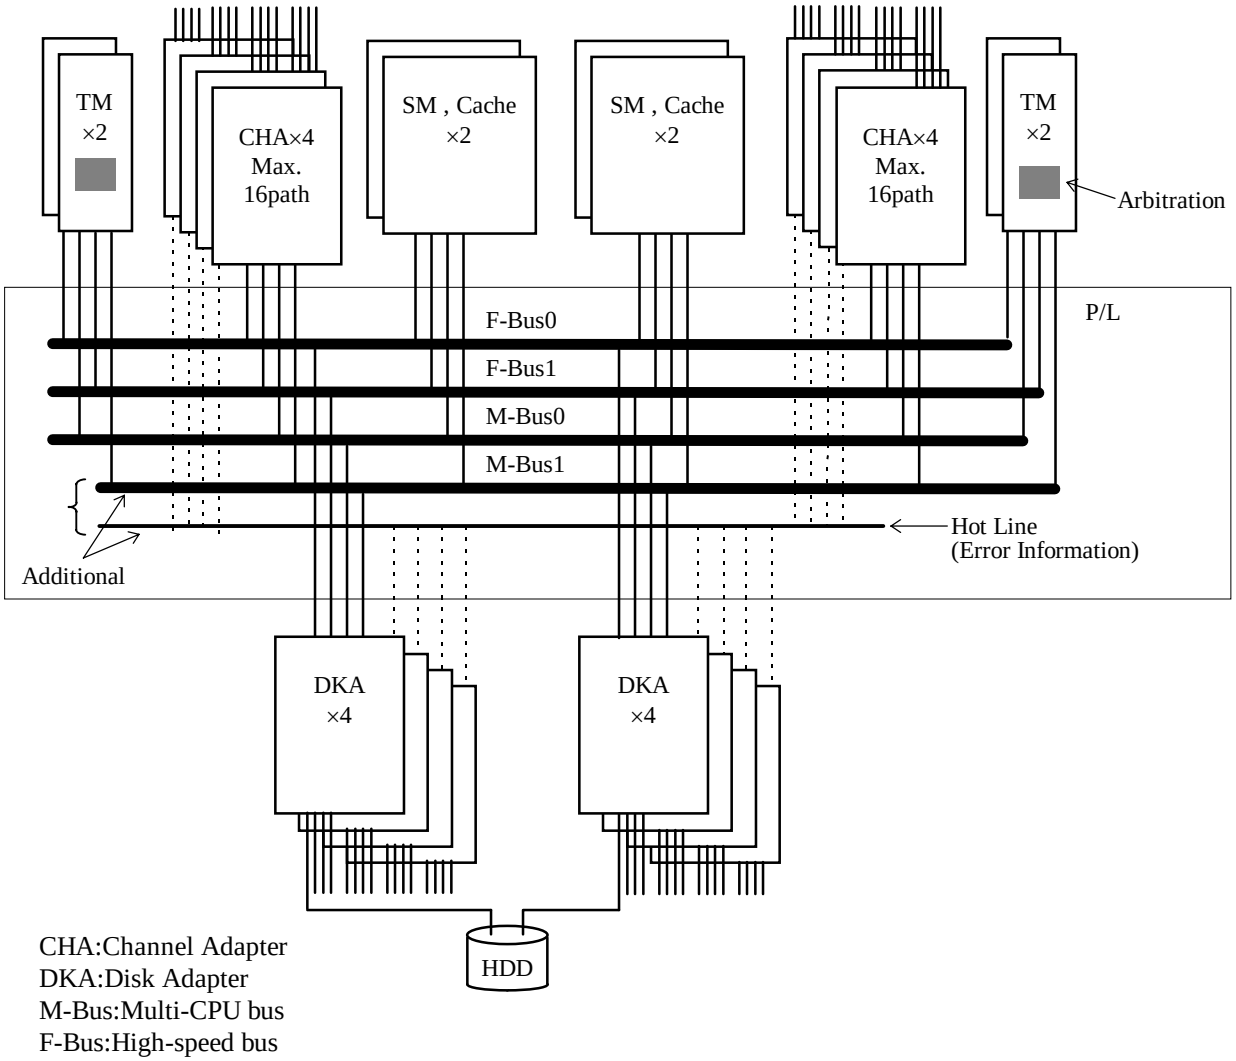

Fig. 3.1 Internal Hardware Configuration

Copyright ©1997,1998, Hitachi, Ltd.

3.2 Software Organization

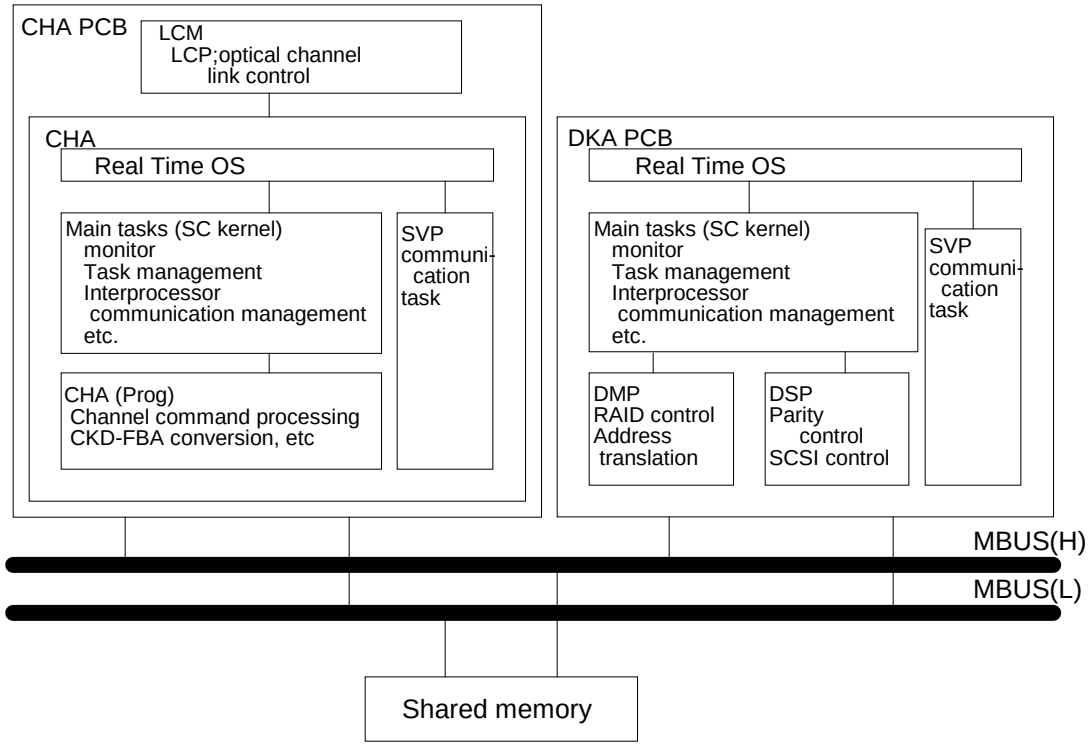

Fig. 3.2 Software Organization

Real Time OS:

A basic OS for controlling the RISC processor. Its primary tasks are to control and switch between the main tasks and SVP communication tasks.

Main tasks:

Made up of DKC control tasks (CHA Prog, DMP, DSP) and the SC kernel tasks that supervise the DKC control tasks. They switch the control tasks by making use of the SC kernel's task switching facility.

SVP communication task:

Controls the communication with the SVP.

LCP (Link Control Program):

Controls the optical channel links. LCP is identical to that which is used in the DKC90. LCP is located in the LCM.

CHA (Prog):

Is a channel command control layer that processes channel commands and controls cache and data transfer operations. It is located in the CHA. CHA Prog is recognized by the logical volume number and logical block number.

Copyright ©1997,1999, Hitachi, Ltd.

DMP (Disk Master Program):

Is a RAID control layer and provides cache control, logical-to-physical address translation, and RAID control functions. DMP is located in the DKA. DMP is recognized by the logical volume number and logical block number.

DSP (Disk Slave Program):

Is a SCSI drive control layer and provides SCSI control, drive data transfer control, and parity control functions. It is located in the DKA. DSP is recognized by the physical volume number and LBA number.

- On Interprocessor (interprogram) communication

Interprocessor communications are initiated from the MBUS via the shared memory. They are performed by MBUS (L) and MBUS (H). If one MBUS is blocked, interprocessor communications are carried out via the other MBUS. Programs running on the same processor (DMP and DSP) perform interprogram communications through program interrupts.

3.3 Data Formats

(1) Data Conversion Overview
Since the disk subsystem uses SCSI drives, data in the CKD format are converted to the FBA format on an interface before being written on the drives. The data format is shown in Fig. 3.3.1.

CKD-to-FBA conversion is carried out by the CHA. Data is stored in cache (in the DKC) in the FBA format. Consequently, the drive need not be aware of the data format when transferring to and receiving data from cache.

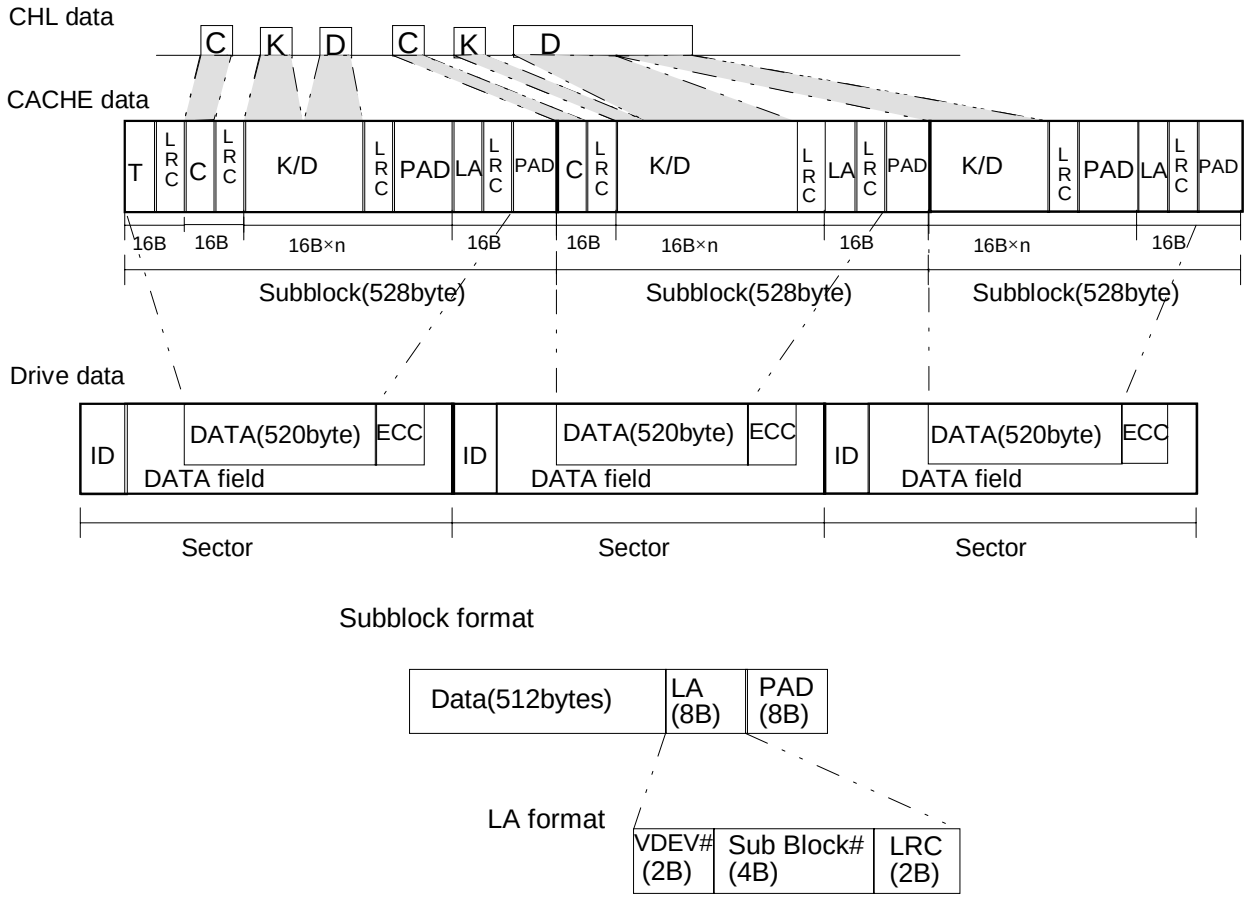
Each field of the CKD-format record is left-justified and the data is controlled in units of 528-byte subblocks (because data is transferred in 16-byte units). Each field is provided with data integrity code (LRC). An address integrity code (LA: logical address) is appended to the end of each subblock. A count area (C area) is always placed at the beginning of the subblock.

Four subblocks make up a single block. The first subblock of a block is provided with T information (record position information).

If a record proves not to fit in a subblock during CKD-to-FBA conversion, a field is split into the next subblock when it is recorded. If a record does not fill a subblock, the subblock is padded with 00s, from the end of the last field to the LA.

On a physical drive, data is recorded data fields in 520-byte units (physical data format). The format of the LA in the subblock in cache is shown in Fig. 3.3.1. The last 8 bytes of the LA area are padding data which is insignificant (the reason for this is because data is transferred to cache in 16 byte units). When data is transferred to a drive from cache, the last 8 bytes of each LA area are discarded and 520 bytes are transferred.

Copyright ©1997, Hitachi, Ltd.



Subblock format

Fig. 3.3.1 Data Format

Copyright ©1997, 1998, Hitachi, Ltd.

(2) Block format

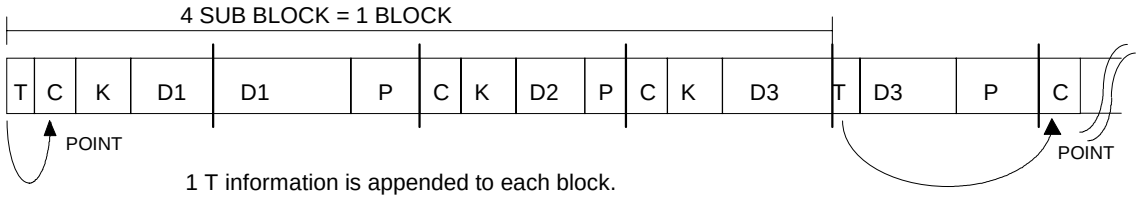


Fig. 3.3.2 Block Format

The RAID system records T information for each block of 4 subblocks as positional information that is used during record search. This unit of data is called a block.

1 block = 4 subblocks = 2 KB

The T information is 16 bytes long. However, only two bytes have meaning and the remaining 14 byte positions are padded with 0s. The reason for this is the same as that for the LA area. Unlike the LA, the insignificant bytes are also stored on the drive as are.

As seen from Fig. 3.3.2, the T information points to the closest count area in its block in the form of an SN (segment number). The drive computes the block number from the sector number with the SET SECT and searches the T information for the target block. From the T information, the drive computes the location of the closest count area and starts processing the block at the count area. This means that the information plays the role of the AM of the conventional disk storage.

Copyright ©1997, 1998, Hitachi, Ltd.

(3) Data integrity provided

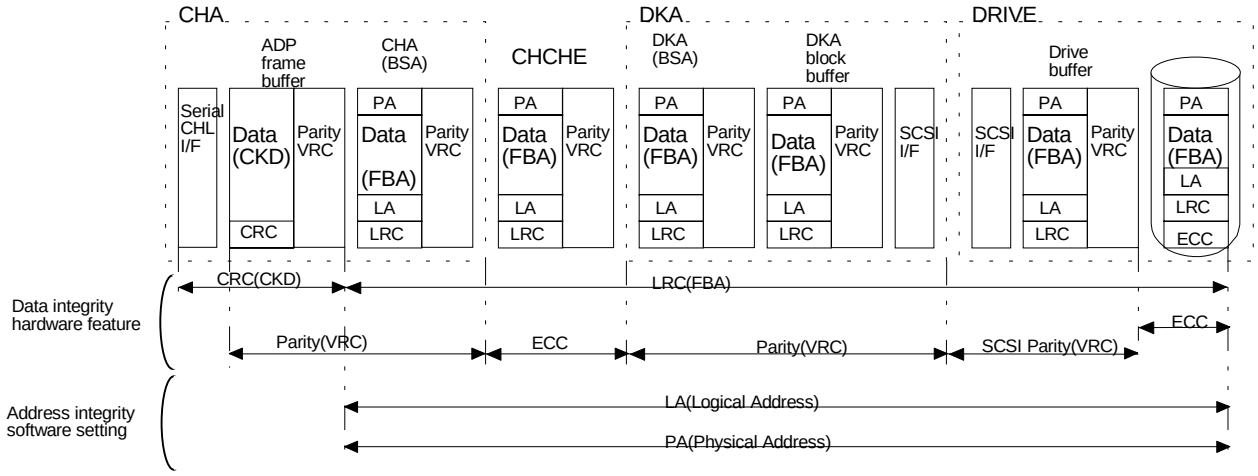

Fig. 3.3.3 Outline of Data Integrity

In the DKC310 and DKU305 system, a data integrity code is appended to the data being transferred at each component as shown in Fig. 3.3.3. Since data is striped onto two or more disk devices and the address integrity code is also appended. The data integrity codes are appended by hardware and the address integrity codes by software.

Copyright ©1997, Hitachi, Ltd.

3.4 Cache Management

Since the DKC requires no through operation, its cache system is implemented by two memory areas called cache A and cache B so that write data can be duplexed. To prevent data loss due to power failures, cache is made non-volatile by being fully battery-backed (48 hours). This dispenses with the need for the conventional NVS.

The minimum unit of cache is the 16 KB segment. Cache is destaged in segment units. Emulation Disk type at three or four segments make up one slot. The read and write slots are always controlled in pair. Cache data is enqueued and dequeued usually in slot units. In real practice, the segments of the same slot are not always stored in a contiguous area in cache, but are stored in discreet areas. These segments are controlled suing CACHE-SLCB and CACHE-SGCB so that the segments belonging to the same slot are seemingly stored in a contiguous area in cache.

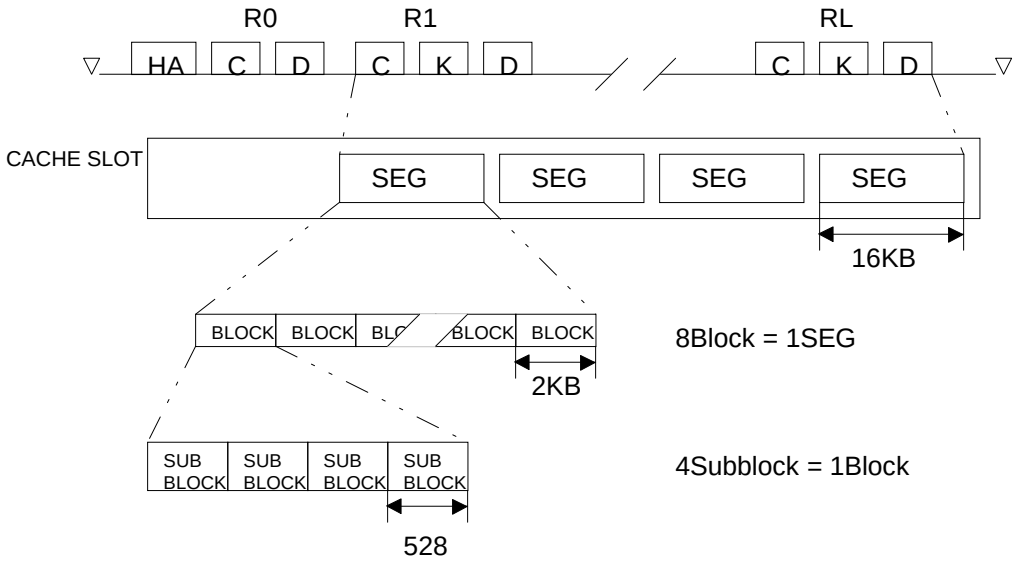

Fig. 3.4 Cache Data Structure

For increased directory search efficiency, a single virtual device (VDEV) is divided into 16-slot groups which are controlled using VDEV-GRPP and CACHE-GRPT.

1 cache segment = 8 blocks = 32 subblocks = 16 KB
1 slot = 1 stripe = 4 segments = 64 KB

The directories VDEV-GRPP, CACHE-GRPT, CACHE-SLCB, and CACHE-SGCB are used to identify the cache hit and miss conditions. These control tables are stored in the shared memory.

In addition to cache hit and miss control, the shared memory is used to classify and control the data in cache according to its attributes. Queues are something like boxes that are used to classify data according to its attributes.

Basically, queues are controlled in slot units (some queues are controlled in segment units). Like SLCB-SGCB, queues are controlled using a queue control table so that queue data of the seemingly same attribute can be controlled as a single data group. These control tables are briefly described below.

Copyright ©1997, Hitachi, Ltd.

(1) Cache control tables (directories)

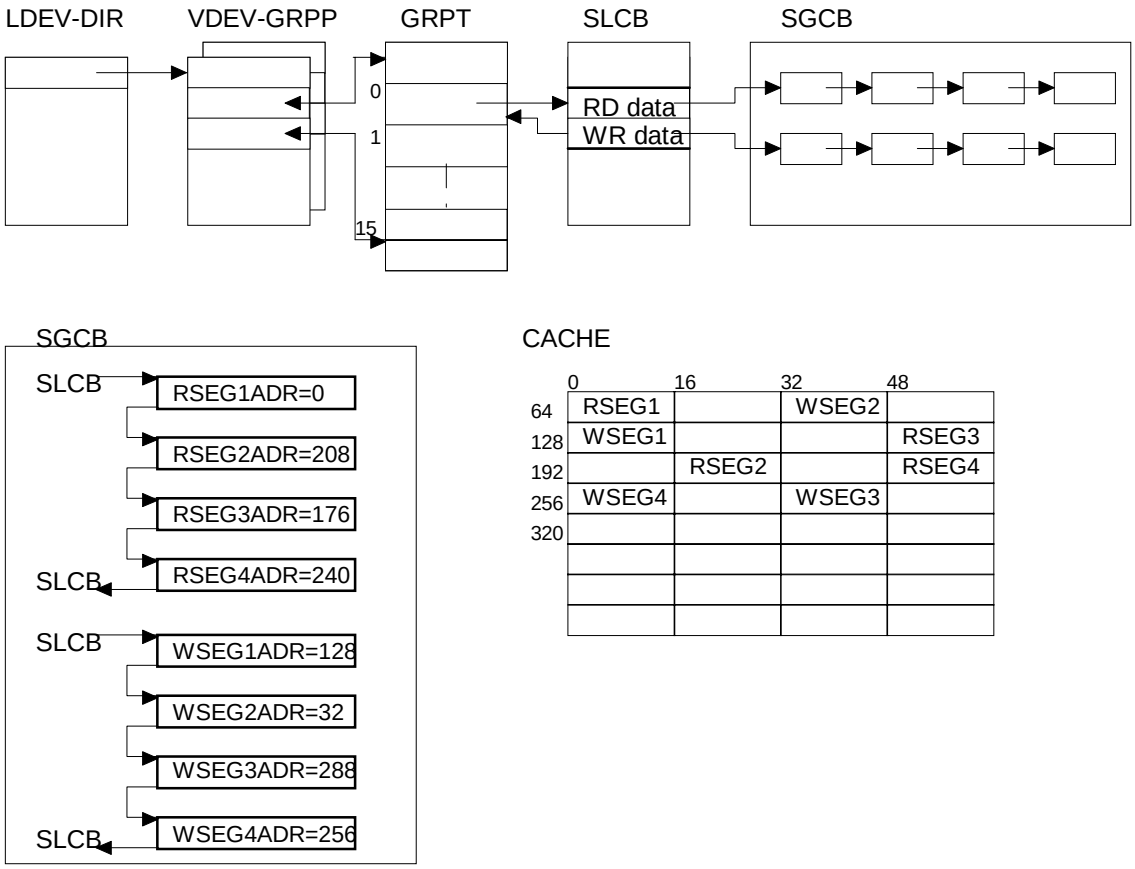

Fig. 3.4.1 Cache Control Tables

LDEV-DIR (Logical DEV-directory):

Contains the shared memory addresses of VDEV-GRPPs for an LDEV. LDEV-DIR is located in the local memory in the CHA.

VDEV-GRPP (Virtual DEV-group Pointer):

Contains the shared memory addresses of the GRPTs associated with the group numbers in the VDEV.

GRPT (Group Table):

A table that contains the shared memory address of the SLCBs for 16 slots in the group. Slots are grouped to facilitate slot search and to reduce the space for the directory area.

SLCB (Slot Control Block):

Contains the shared memory addresses of the starting and ending SGCBs in the slot. One or more SGCBs are chained. The SLCB also stores slot status and points to the queue that is connected to the slot. The state transitions of clean and dirty queues occur in slot units. The processing tasks reserve and release cache areas in this unit.

SGCB (Segment Control Block):

Contains the control information about a cache segment. It contains the cache address of the segment. It is used to control the staged subblock bit map, dirty subblock bitmap, and other information. The state transitions of only free queues occur in segment units.

Copyright ©1997, 1998, Hitachi, Ltd.

(2) Cache control table access method (hit/miss identification procedure)

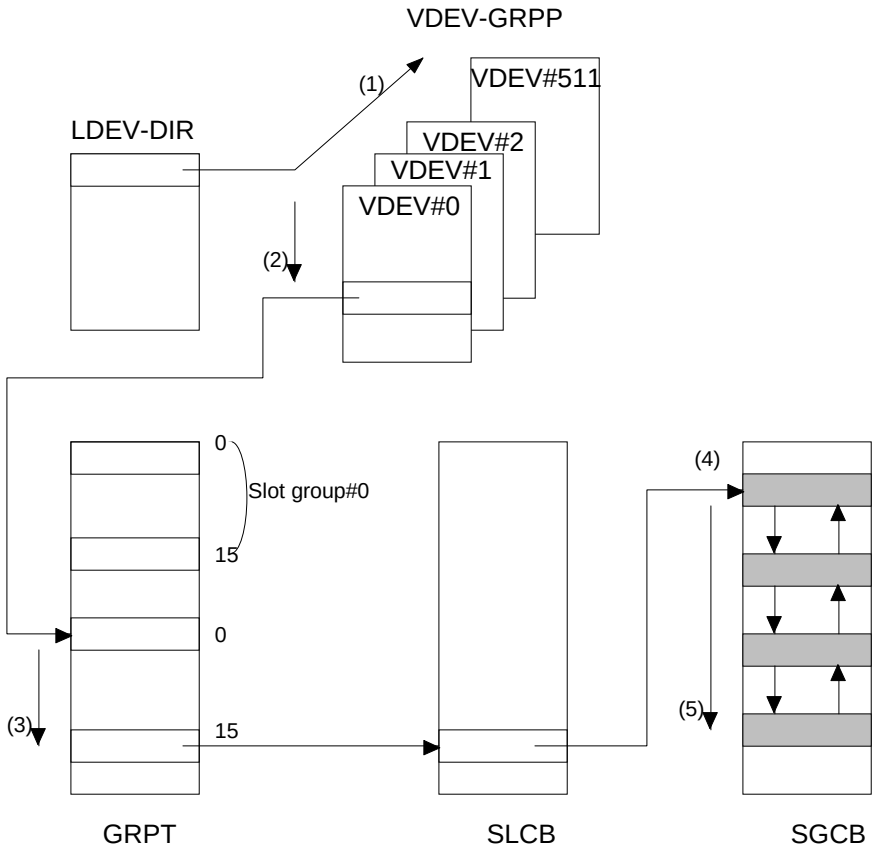

Fig. 3.4.2 Outline of Cache Control Table Access

1. The current VDEV-GRPP is referenced through the LDEV-DIR to determine the hit/miss condition of the VDEV-groups.
2. If a VDEV-group hits, CACHE-GRPT is referenced to determine the hit/miss condition of the slots.
3. If a slot hits, CACHE-SLCB is referenced to determine the hit/miss condition of the segments.
4. If a segment hits, CACHE-SGCB is referenced to access the data in cache.

If a search miss occurs during the searches from 1. through 4., the target data causes a cache miss.

Definition of VDEV number
Since the host processor recognizes addresses only by LDEV, it is unaware of the device address of the parity device. Accordingly, the RAID system is provided with a VDEV address which identifies the parity device associated with an LDEV. Since VDEVs are used to control data devices and parity devices systematically, their address can be computed using the following formulas:
Data VDEV number = LDEV number
Parity VDEV number = 1024 + LDEV number

From the above formulas, the VDEV number ranges from 0 to 2047.

Copyright ©1997, 1998, Hitachi, Ltd.

(3) Queue structures

The DKC310 and DKU305 uses 10 types of queues to control data in cache segments according to its attributes. These queues are explained below.

- CACHE-GRPT free queue

This queue is used to control segments that are currently not used by CACHE-GRPT (free segments) on an FIFO (First In First Out) basis. When a new table is added to CACHE-GRPT, the segment that is located by the head pointer of the queue is used.

- CACHE-SLCB free queue

This queue is used to control segments that are currently not used by CACHE-SLCB (free segments) on an FIFO basis. When a new slot is added to CACHE-SLCB, the segment that is located by the head pointer of the queue is used.

- CACHE-SGCB free queue

This queue is used to control segments that are currently not used by CACHE-SGCB (free segments) on an FIFO basis. When a new segment is added to CACHE-SGCB, the segment that is located by the head pointer of the queue is used.

- Clean queue

This queue is used to control the segments that are reflected on the drive on an LRU basis.

- Bind queue

This queue is defined when the bind mode is specified and used to control the segments of the bind attribute on an LRU basis.

- Error queue

This queue controls the segments that are no longer reflected on the drive due to some error (pinned data) on an LRU basis.

- Parity in-creation queue

This queue controls the slots (segments) that are creating parity on an LRU basis.

- DFW queue (host dirty queue)

This queue controls the segments that are not reflected on the drive in the DFW mode on an LRU basis.

- CFW queue (host dirty queue)

This queue controls the segments that are not reflected on the drive in the CFW mode on an LRU basis.

- PDEV queue (physical dirty queue)

This queue controls the data (segments) that are not reflected on the drive and that occur after parity is generated. Data is destaged from this queue onto the physical DEV. There are 32 PDEV queues per physical DEV.

The control table for these queues is located in the shared memory and points to the head and tail segments of the queues.

Copyright ©1997, 1998, Hitachi, Ltd.

(4) Queue state transitions
Figure 3.4.4 shows the state transitions of the queues used in. A brief description of the queue state transitions follows.

- State transition from a free queue
When a read miss occurs, the pertinent segment is staged and enqueued to a clean queue. When a write miss occurs, the pertinent segment is temporarily staged and enqueued to a host dirty queue.

- State transition from a clean queue
When a write hit occurs, the segment is enqueued to a host dirty queue. Transition from clean to free queues is performed on an LRU basis.

- State transition from a host dirty queue
The host dirty queue contains data that reflects no parity. When parity generation is started, a state transition occurs to the parity in-creation queue.

- State transition from the parity in-creation queue
The parity in-creation queue contains parity in-creation data. When parity generation is completed, a transition to a physical dirty queue occurs.

- State transition from a physical dirty queue
When a write hit occurs in the data segment that is enqueued in a physical dirty queue, the segment is enqueued into the host dirty queue again. When destaging of the data segment is completed, the segment is enqueued into a queue (destaging of data segments occur asynchronously on an LRU basis).

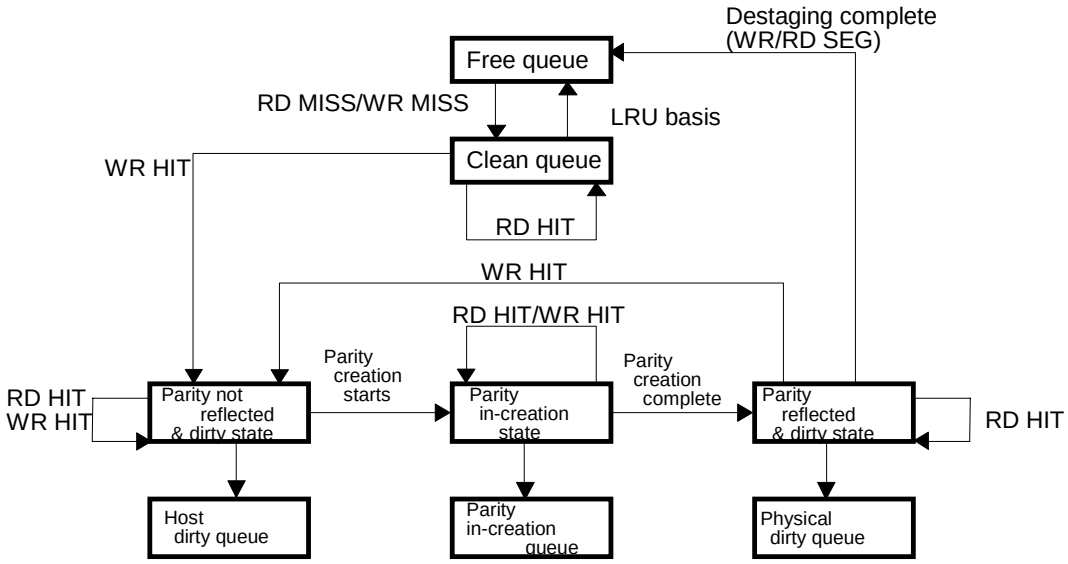

Fig. 3.4.4 Queue Segment State Transition Diagram

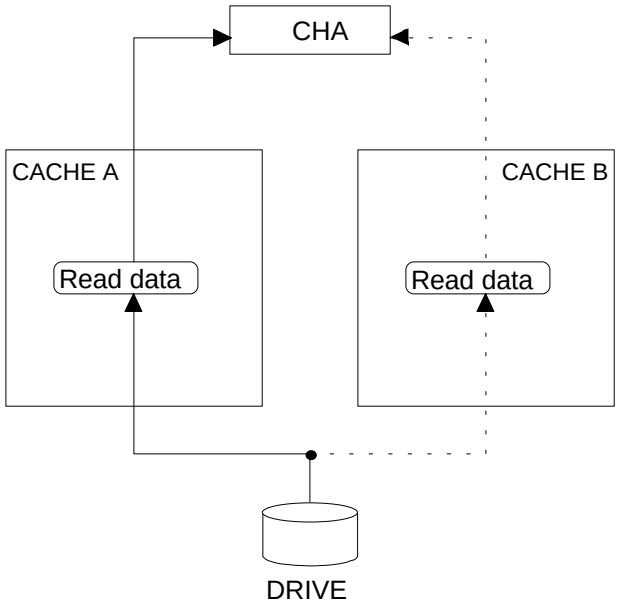
Copyright ©1997, 1998, Hitachi, Ltd.

(5) Cache usage in the read mode



The cache area to be used for destaging read data is determined depending on whether the result of evaluating the following expression is odd or even:

(CYL# x 15 + HD#) / 16

The read data is destaged into area A if the result is even and into area B if the result is odd.

Fig. 3.4.5 Cache Usage in the Read Mode

Read data is not duplexed and its destaging cache area is determined by the formula shown in Fig. 3.4.5. Staging is performed not only on the segments containing the pertinent block but also on the subsequent segments up to the end of track (for increased hit ratio). Consequently, one track equivalence of data is prefetched starting at the target block. This formula is introduced so that the cache activity ratios for areas A and B are even. The staged cache area is called the cache area and the other area NVS area.

Copyright ©1997, Hitachi, Ltd.

(6) Cache usage in the write mode

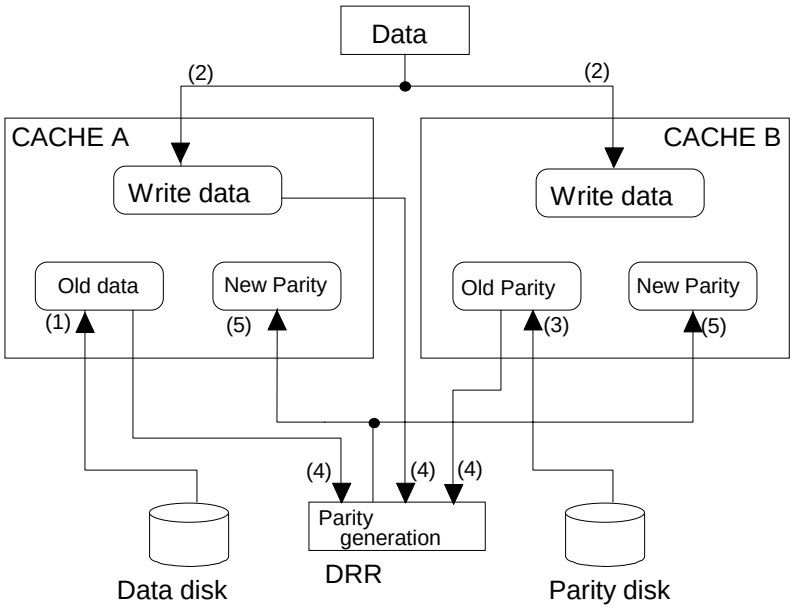


Fig. 3.4.6 Cache Usage in the Write Mode

This system handles write data (new data) and read data (old data) in separate segments as shown in Fig. 3.4.6 (not overwritten as in the conventional systems), whereby compensating for the write penalty.

(1) If the write data in question causes a cache miss, the data from the block containing the target record up to the end of the track is staged into a read data slot.
(2) In parallel with step (1), the write data is transferred when the block in question is established in the read data slot.
(3) The parity data for the block in question is checked for a hit or miss condition and, if a cache miss condition is detected, the old parity is staged into a read parity slot.
(4) When all data necessary for generating new parity is established, it is transferred to the DRR circuit in the DKA.
(5) When the new parity is completed, the DRR transfers it into the write parity slots for cache A and cache B (the new parity is handled in the same manner as the write data).

The reason for writing the write data into both cache areas is that data will be lost if a cache error occurs when it is not yet written on the disk.

Although two cache areas are used as explained above, the read data (including parity) is staged into either cache A or cache B simply by duplexing only the write data (including parity) (in the same manner as in the read mode).

Copyright ©1997, 1998, Hitachi, Ltd.

(7) Pseudo Through
The DKC80/90 systems write data directly onto disk storage in the form of cache through, without performing a DFW, when a cache error occurs. In this system, cache must always be passed, which fact disables the through operation. Consequently, the write data is duplexed, and a pseudo through operation is performed; that is, when one cache subsystem goes down, the end of processing status is not reported until the data write in the other cache subsystem is completed. This process is called pseudo through.

The control information necessary for controlling cache is stored in the shared memory.

(8) Shared memory

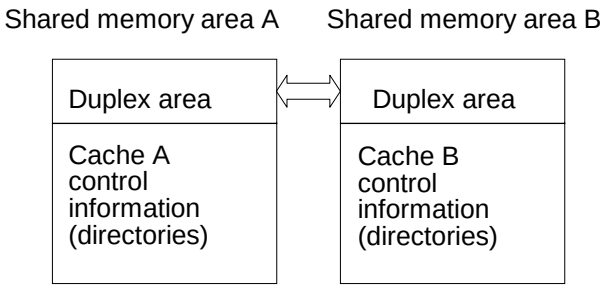

Fig. 3.4.7 Outline of Shared Memory

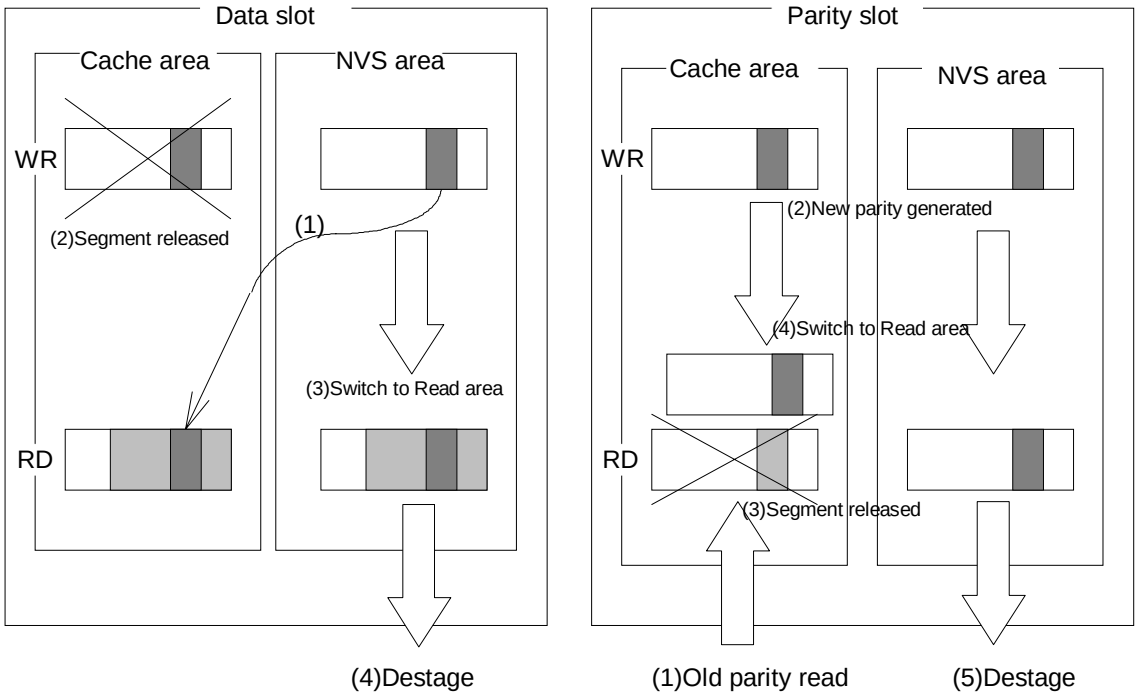
This system has two areas of cache memory, shown in Fig. 3.4.7, as it has two areas of cache memory. One part of its internal data is fully duplexed (this serves as the role of the conventional ECM). The other part of the shared memory area contains the control information about the corresponding cache area (shared memory area A for cache A and shared memory area B for cache B). If an error occurs on one side of shared memory (A or B), the corresponding cache area becomes inoperative (equivalent to a cache error).

Like cache, shared memory is made non-volatile (approximately 96 hours) to prevent data loss in case of power failures.

Copyright ©1997, 1998, Hitachi, Ltd.

3.5 Destaging Operations

(1) Cache management in the destage mode (RAID5)
Destaging onto a drive is deferred until parity generation is completed. Data and parity slot transitions in the destage mode occur as shown in Fig. 3.5.1



① The write data is copied from the NVS area into the read area.
② The write segment in the cache area is released.
③ Simultaneously, the segment in the NVS area is switched from write to read segment.
④ Destaging.
⑤ The read segment in the NVS area is released.

① Parity generation correction read (old parity) occurs.
② New parity is generated.
③ The old parity in the read segment is released.
④ The segments in the cache and NVS areas are switched from write to read segment.
⑤ Destaging.
⑥ The read segment in the NVS area is released.

Fig. 3.5.1 Cache Operation in the Destage Mode

Write data is stored in write segments before parity is generated but stored in read segments after parity is generated. When drive data is stored, therefore, the data from the read segment is transferred.

Copyright ©1997, 1998, Hitachi, Ltd.

(2) Cache management in the destage mode (RAID1)
Data slot read segment is copied to parity slot then destage to primary/secondary drive synchronously.

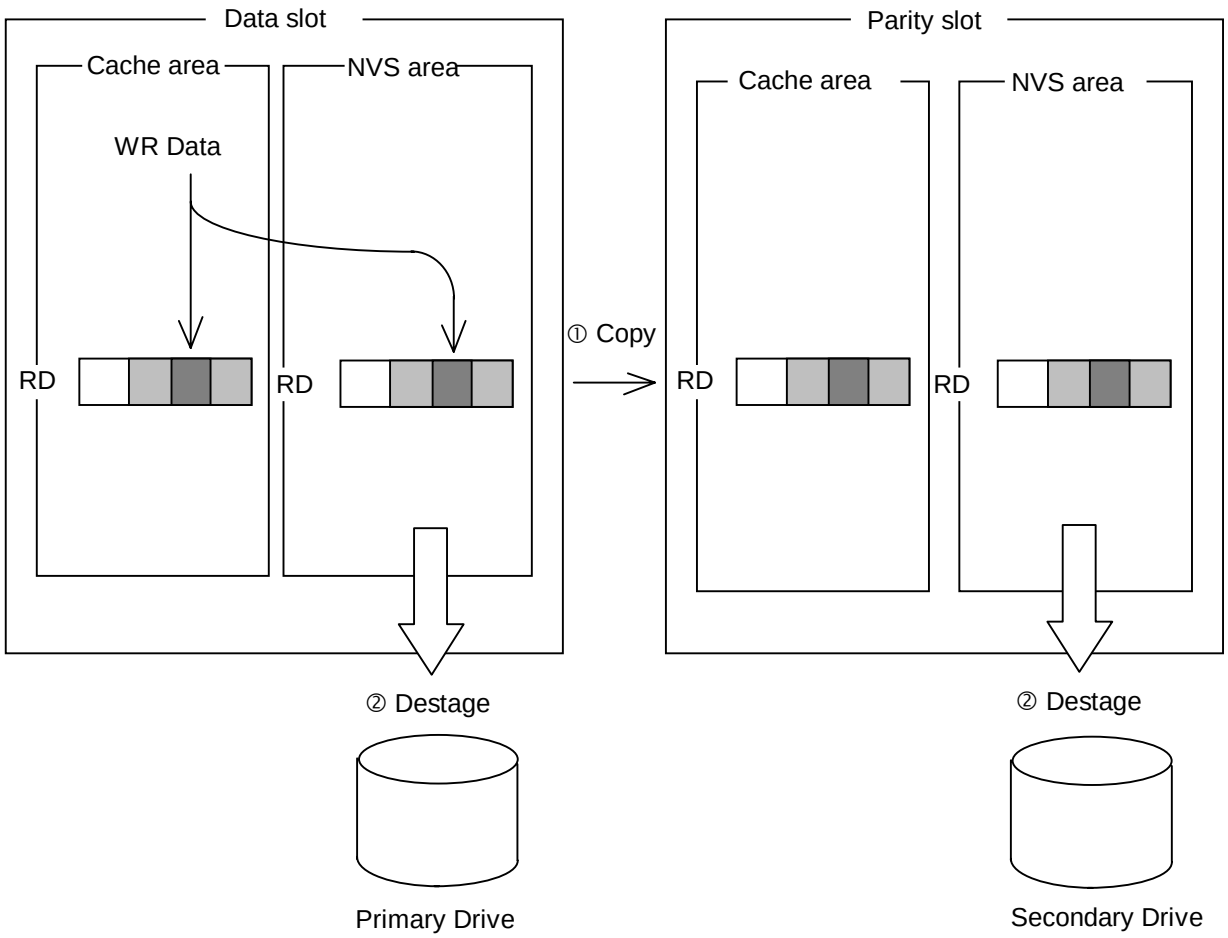


Fig. 3.5.2 RAID1 synchronous destage

① Copy the data slot read segment to the parity slot.
② Destage.
③ The data read segment in the NVS area of the data slot and the parity slot are released.

Copyright ©1997, Hitachi, Ltd.

Data slot is destage to primary/secondary drive.

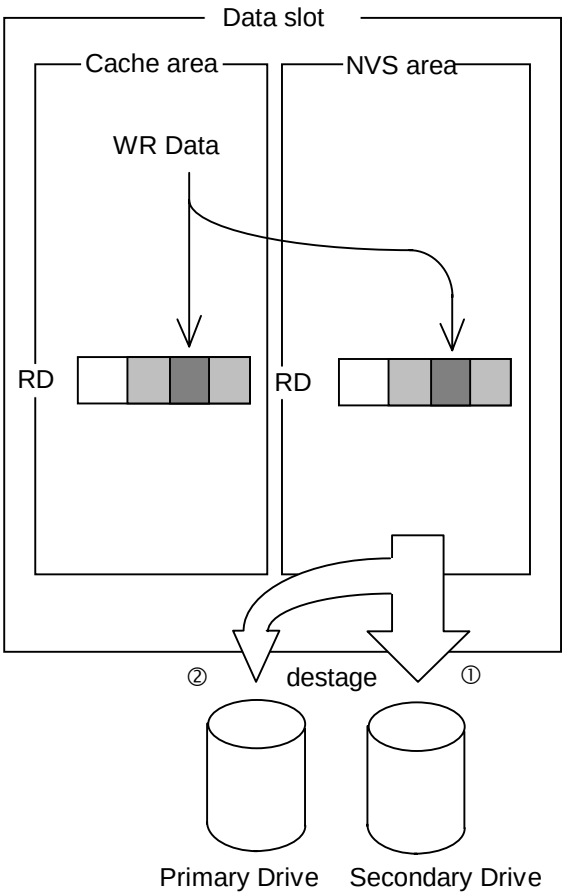

Fig. 3.5.3 RAID1 asynchronous destage

① Destage to secondary drive.
② Destage to primary drive.
③ The data read segment in the NVS area is released.

Copyright ©1997, Hitachi, Ltd.

(3) Blocked data write

The purpose of blocked data write is to reduce the number of accesses to the drive during destaging, whereby increasing the subsystem performance. There are three modes of blocked data write: single-stripe blocking, multiple-stripe blocking, and drive blocking. These modes are briefly explained below.

- Single-stripe blocking

Two or more dirty segments in a stripe are combined into a single dirty data block. Contiguous dirty blocks are placed in a single area. If an unloaded block exists between dirty blocks, the system destages the dirty blocks separately at the unloaded block. If a clean block exists between dirty blocks, the system destages the blocks including the clean block.

- Multiple-stripe blocking

The sequence of stripes in a parity group are blocked to reduce the number of write penalties. This mode is useful for sequential data transfer.

- Drive blocking

In the drive blocking mode, blocks to be destaged are written in a block with a single drive command if they are contiguous when viewed from a physical drive to shorten the drive's latency time.

The single- and multiple-stripe blocking modes are also called in-cache blocking modes. The DMP determines which mode to use. The drive blocking mode is identified by the DSP.

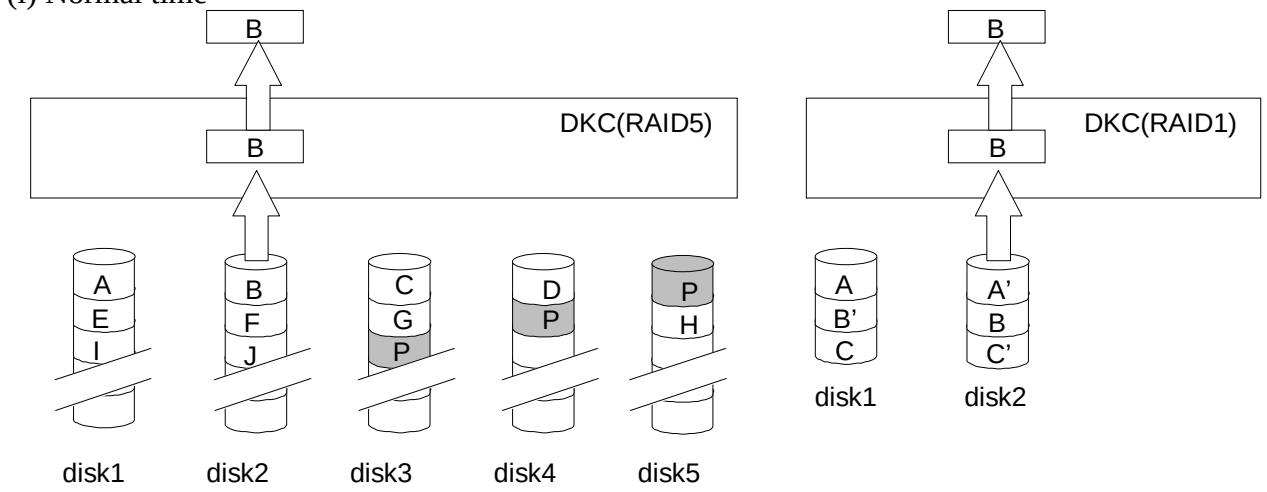
Copyright ©1997, Hitachi, Ltd.

3.6 Operations Performed when Drive Errors Occur

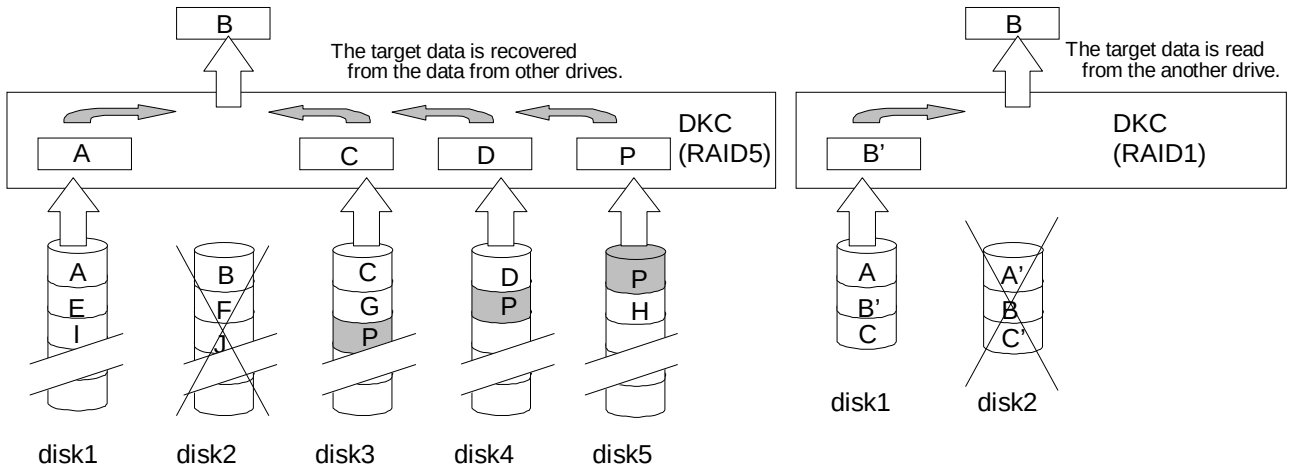
(1) I/O operations performed when drive errors occur
This system can recover target data using parity data and data stored on normal disk storage even when it cannot read data due to errors occurring on physical drives. This feature ensures non-disruptive processing of applications in case of drive errors. This system can also continue processing for the same reason in case errors occur on physical drives while processing write requests.

Figure 3.6.1 shows the outline of data read processing in case a drive error occurs.

Request for reading data B
(i) Normal time



(ii) When a disk error occurs



A,B,C • • • ; Data (A=A', B=B', C=C')
P ; Parity data

Fig. 3.6.1 Outline of Data Read Processing

Copyright ©1997, Hitachi, Ltd.

(2) Data integrity feature and drive errors
This system uses spare disk drives and reconfigures any drives that are blocked due to errors or drives whose error count exceeds a specified limit value using spare disks.

Since this processing is executed on the host in the background, this system can continue to accept I/O requests. The data saved on spare disks are copied into the original location after the error drives are replaced with new ones.

1. Dynamic sparing
This system keeps track of the number of errors that occurred, for each drive, when it executes normal read or write processing. If the number of errors occurring on a certain drive exceeds a predetermined value, this system considers that the drive is likely to cause unrecoverable errors and automatically copies data from that drive to a spare disk. This function is called dynamic sparing.In RAID1 method, this system is same as RAID5 dynamic sparing.

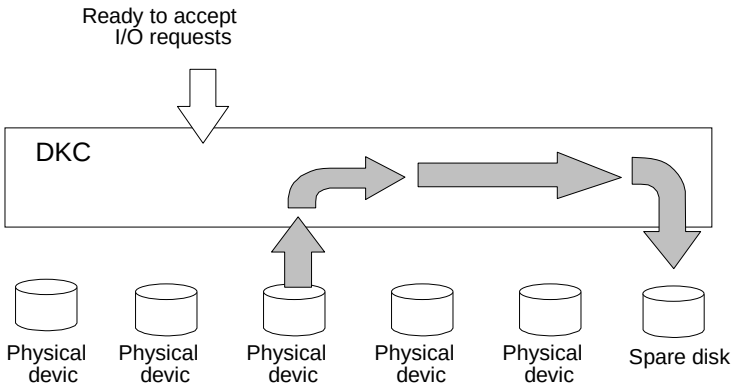


Fig. 3.6.2 Outline of the Dynamic Sparing Function

2. Correction copy
When this system cannot read or write data from or to a drive due to an error occurring on that drive, it regenerates the original data for that drive using data from the other drives and the parity data, and copies it onto a spare disk. In RAID1 method, this system copies data from the another drive to a spare disk.

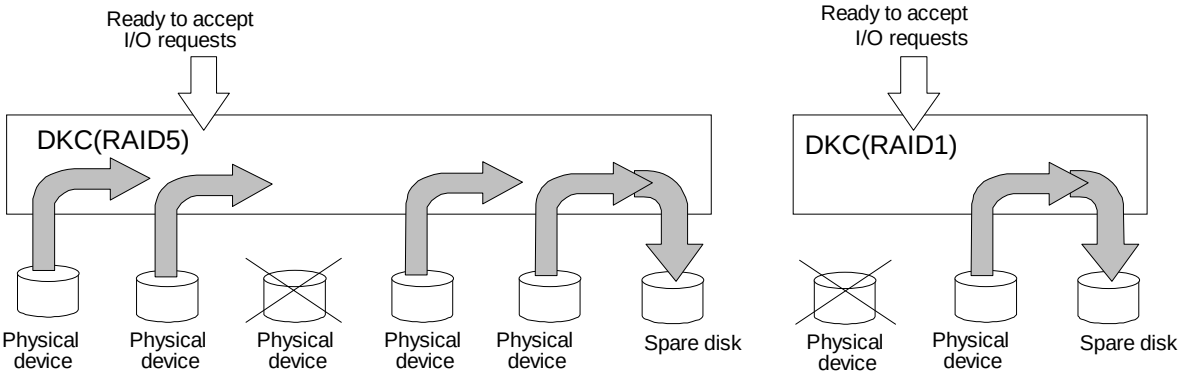

Fig. 3.6.3 Outline of the Correction Copy Function

3.7 Inter Mix of Drives and Emulation types

3.7.1 Drives to be Connected

The models of disk units which are connectable with the RAID300 disk subsystem and the specifications of each disk unit are shown in Table 3.7.1.

Table 3.7.1 Disk Drive Specifications

		Disk drive model						
		DK308/309-90	DK309-180 *1 DK30A-180 *2	DK30A-360	DK3F1-60	DK3F2-90	DK3F2-150	DKR1B-J47
Formatted capacity (User Area)		9.23 GB	17.93 GB	36.92 GB	6.15 GB	9.23 GB	14.94 GB	47.19 GB
Sector length		520 bytes	520 bytes	520 bytes	520 bytes	520 bytes	520 bytes	520 bytes
Maximum transfer rate		16.0 MB/s	16.0 MB/s	20.0 MB/s	16.0 MB/s	20.0 MB/s	20.0 MB/s	20.0 MB/s
Data transfer rate (drive transfer rate)		7.6 to 10.7 MB/s	10.0 to 15.3 MB/s	12.8 to 22.1 MB/s	13.8 to 16.2 MB/s	18.6 to 27.5 MB/s	18.6 to 27.5 MB/s	30.2 to 45.6 MB/s
Seek time (ms)	MIN.	2.0/2.0	2.0/2.0 *1 0.6/0.8 *2	0.6/0.8	0.6/0.8	0.6/0.8	0.6/0.8	0.5/0.7
(Read/Write)	AVE.	11.5/12.5	11.5/12.5	11.5/12.5	6.0/7.0	5.5/6.5	5.5/6.5	5.7/6.5
	MAX	24.0/26.0	24.0/26.0	24.0/26.0	14.0/16.0	12.0/13.0	12.0/13.0	12.0/13.0
Revolution speed		6300 rpm	6300 rpm	6300 rpm	12030 rpm	12030 rpm	12030 rpm	10025 rpm
Mean latency time		4.8 ms	4.8 ms	4.8 ms	2.5 ms	2.5 ms	2.5 ms	3.0 ms

The RAID300 disk subsystem can connect up to 240 disk drives mentioned above, though the number of connectable disk drives varies with the emulation types and the RAID configuration. These will be explained in detail in Section 3.7.2.

SVP displays each drive model as the following table.

Disk drive model	SVP screen
DK309-180	DK309-18
DK30A-180	DK30A-18
DK3F1-60	DK3F1-06
DK30A-360	DK30A-36
DK3F2-150	DK3F2-15
DK3F2-90	DK3F2-09

Copyright ©1997,2000, Hitachi, Ltd.

3.7.2 Emulation Device Type

(1) The emulation types of disk controller and disk units of the RAID300 are shown in Tables 3.7.2.1 to 3.7.2.4.

Table 3.7.2.1 List of RAID300 Emulation Types (for RAID5)

Item		Emulation contents						
Emulation Type	DKC	3990-3						
	DKU	3390-9	3390-3/3R	3390-2	3390-1	3380-K	3380-E	3380-J

(2) Specifications for coexistence of elements

Table 3.7.2.5 shows permitted coexistence of RAID levels, HDD types, and emulation types respectively.

Table 3.7.2.5 Specifications for Coexistence of Elements in Raid 300

Item	Specification	Remarks
Coexistence of RAID levels	• RAID1/5 can exist in DKC.	
Coexistence of numbers of PDEVs composing ECC group (coexistence of configurations 6D+1P, 3D+1P and 1D+1D)	• The numbers of PDEVs inside an ECC group are 7 PDEVs (6D+1P) and 4 PDEVs (3D+1P) and they are applicable only to RAID5. • The numbers of PDEVs inside an ECC group are 2 PDEVs (1D+1D) and they are applicable only to RAID1. • DK308/9-90 support a configuration of 6D+1P (RAID5)/1D+1D (RAID1). • DK309-180, DK30A-360 supports a configuration of 3D+1P (RAID5)/1D+1D (RAID1). • DK3F1-60, DK3F2-150, DK3F2-90 supports a configuration of 3D+1P (RAID5)/1D+1D (RAID1). • Configurations 6D+1P, 3D+1P and 1D+1D can not coexist within units of same DKA pair.	
Coexistence of HDD types	• HDD types can coexist in each ECC group. • The specification for selecting the spare HDD can be common in the subsystem if there exists a spare HDD having the same capacity as that of the data HDD, though the HDD types coexist.	
Coexistence of emulation types	• Emulation types can coexist in each ECC group. • LDEV ID addressing must be of the same emulation type (3380-K/E/J, 3390-9/3/2/1, or 3390-3R) for every 32-address boundary.	An emulation of the same system should be set for every 32 addressings due to generation restriction by the host.

3.9 32 concurrent data transfers / 512 logical path

The number of logical paths per physical path in the RAID300 is up to 16 in the case of LCP and 1 in the case of MCP. As a result, the maximum number of logical paths is 512.
The specifications for number of logical paths are summarized in Table 3.9.1.

Table 3.9.1 Specifications for Number of Logical Paths

ESCON channel	Per port	16 paths
	Per channel processor	32 paths
	Per channel adapter	64 paths
Metal channel	Per port	1 path
	Per channel processor	4 paths
	Per channel adapter	4 paths
Number of logical paths per DKC		Number of mounted LCPs × *16 + Number of mounted MCPs × 1

With respect to the logical path number of each logical path,

"LCP (MCP) number × 16"

is set as the first LPN (logical path number) of each LCP (MCP) and the logical path numbers are controlled in units of 16 paths. When the MCPs are connected, only one LPN can be established per MCP. Tables 3.9.2 and 3.9.3 show the logical path number in each LCP and MCP and the connectable CHP number.

Table 3.9.2 Logical Path Control Number Corresponding to LCP/MCP and Connectable CHP Number (Cluster 1)

	LCP/MCP ID															
	1A	1B	1C	1D	1E	1F	1G	1H	1J	1K	1L	1M	1N	1P	1Q	1R
LCP/MCP number	00	01	02	03	04	05	06	07	08	09	0A	0B	0C	0D	0E	0F
LPN number (LCP)	00 | 0F	10 | 1F	20 | 2F	30 | 3F	40 | 4F	50 | 5F	60 | 6F	70 | 7F	80 | 8F	90 | 9F	A0 | AF	B0 | BF	C0 | CF	D0 | DF	E0 | EF	F0 | FF
LPN number (MCP)	00	10	20	30	40	50	60	70	Not Installable							
CHP number (LCP)	0/1		10/11		2/3		12/13		4/5		14/15		6/7		16/17

Table 3.9.3 Logical Path Control Number Corresponding to LCP/MCP and Connectable CHP Number (Cluster 2)

	LCP/MCP ID															
	2A	2B	2C	2D	2E	2F	2G	2H	2J	2K	2L	2M	2N	2P	2Q	2R
LCP/MCP number	10	11	12	13	14	15	16	17	18	19	1A	1B	1C	1D	1E	1F
LPN number (LCP)	100 | 10F	110 | 11F	120 | 12F	130 | 13F	140 | 14F	150 | 15F	160 | 16F	170 | 17F	180 | 18F	190 | 19F	1A0 | 1AF	1B0 | 1BF	1C0 | 1CF	1D0 | 1DF	1E0 | 1EF	1F0 | 1FF
LPN number (MCP)	100	110	120	130	140	150	160	170	Not Installable							
CHP number (LCP)	20/21		30/31		22/23		32/33		24/25		34/35		26/27		36/37	
CHP number (MCP)	20/30				22/32				Not Installable							
Package number	4				5				6				7			

A sequence has been provided for the data transfer between the channels and the DKC so as to recognize the physical port number on the DKC side by the channel interface ID, and it makes LCP1A to LCP1H of the cluster 1 of the LCP port correspond to 08 to 0F (00 to 07 in commands), and LCP2A to LCP2H of the cluster 2 correspond to 18 to 1H (17 to 1F in commands).
In the RAID300, to realize 32 concurrent data transfers, the number of connectable physical paths is set to 32, however, there are only 16 patterns of channel interface IDs as shown above (because the IBM systems have only 16 physical interfaces connectable to channels).
Therefore, it is necessary to make the channel interface IDs of 16 patterns correspond to the 32 physical paths.
In the RAID300, one channel interface ID is made correspond to two physical paths; for examples, LCP1A and 1B is made correspond to the channel interface ID 08 (0), and LCP1C and 1D to 09 (10). The correspondences above are made using *8 packages in total by treating 2 IDs by one package.
Tables 3.9.4 and 3.9.5 show correspondence between the physical paths of the LCP and MCP and the channel interface IDs.

Table 3.9.4 Correspondence between Physical Paths of LCP/MCP and Channel Interface IDs (Cluster 1)

Channel interface ID (used in commands)	08 (00)	09 (01)	0A (02)	0B (03)	0C (04)	0D (05)	0E (06)	0F (07)
LCP/MCP ID	1A • 1B	1C • 1D	1E • 1F	1G • 1H	1J • 1K	1L • 1M	1N • 1P	1Q • 1R

Table 3.9.5 Correspondence between Physical Paths of LCP/MCP and Channel Interface IDs (Cluster 2)

Channel interface ID (used in commands)	18 (10)	19 (11)	1A (12)	1B (13)	1C (14)	1D (15)	1E (16)	1F (17)
LCP/MCP ID	2A • 2B	2C • 2D	2E • 2F	2G • 2H	2J • 2K	2L • 2M	2N • 2P	2Q • 2R

3.11 High-Speed LDEV Formatting

3.11.1 Outlines

In RAID300, the LDEV formatting time is automatically shortened by providing the PDEV with the LDEV formatting function and by making the PDEVs perform the formatting concurrently.

Item No.	Item	RAID300
1	SVP operation	The operation is performed by selecting functions from the Maintenance menu.
2	Display of execution status	Display of the execution progress in the SVP message box (%)
3	Execution result	Normal/abnormal LDEV: Same indications as the conventional ones are displayed. Normal/abnormal PDEV: STATUS is displayed.
4	Recovery action when a failure occurs	Same as the conventional one. However, a retry is to be executed in units of ECC. (Because the LDEV-FMT is terminated abnormally in units of ECC when a failure occurs in the HDD.)
5	Operation of the SVP which is a high-speed LDEV-FMT object	When an LDEV-FMT of more than one ECC is instructed, the high-speed processing is performed.
6	HDD which is an object of the high-speed LDEV-FMT	HDD-DK309 and DK3F1 supporting the high-speed LDEV formatting
7	PS/OFF or powering off	The LDEV formatting is suspended. No automatic restart is executed.
8	SVP PC powering off during execution of an LDEV-FMT	After the SVP is rebooted, the indication before the PC powering off is displayed in succession.

3.11.2 Estimation of LDEV Formatting Time

Number of LDEVs	Conventional method (using measured value)	New method
1	11 minutes and 29 seconds	11 minutes and 29 seconds (Since the formatting is executed using the conventional method, the time is not changed.)
8	32 minutes and 16 seconds	14 minutes and 31 seconds
32	1 hour and 45 minutes	58 minutes and 04 seconds
1024	8 hours or longer.	1 hour and 12 minutes and 57 seconds

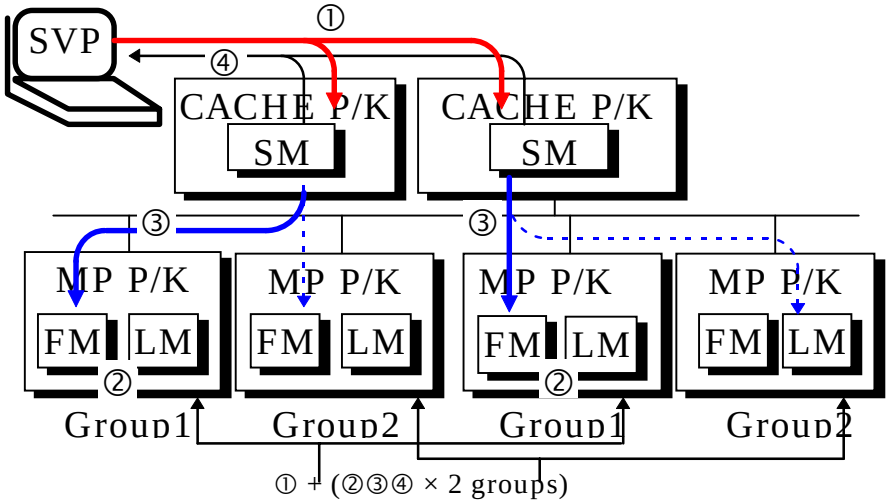
Copyright ©1997,1998, Hitachi, Ltd.

3.12 High-Speed Online Replacement of Microprogram

The microprograms are stored in the shared memory and transferred in a batch. Thus the number of times of the transfer from the SVP to the DKC via the LAN is reduced and the online microprogram replacement is speeded up by recovering two or more processors at the same time.

3.12.1 Outline

A microprogram storage area is reserved in the shared memory. The microprogram by which each processor operates is stored in it, and data is written into the flash memory from the shared memory by rebooting the processor. The reason for executing the writing during reboot processing is that it is intended to unify the microprogram writing processings executed in the PCB replacement and cold replacement (not supported at present). In addition, when the microprograms are stored in the shared memory, processors can execute the microprogram writing processings at the same time and the processing time can be shorted substantially.



Two or more processors execute the processings at the same time.

[Processing sequence]

① The SVP transfers the microprograms (DKCMAIN, RAMBOOT, LCP/LCDG, and MCP) to the shared memory.
② The SVP executes a reboot instruction for each processor of the first group.
③ In the reboot processing, the microprograms are transferred from the shared memory to the flash memory and the writing processing is executed.
④ The SVP monitors the status of the processors executing the reboot processing and writing processing to the flash memory and waits until the status changes to normal finally.
⑤ The SVP executes the processings of steps ② to ④ repeatedly for each group.

Copyright ©1997, Hitachi, Ltd.

3.12.2 Processing Time

The estimated time of microprogram replacement is shown below. The time below is required for the process for the programs DKCMAIN, RAMBOOT, LCP, and MCP. The SVP and DKU are processed in the conventional processing sequences and the time required for the sequences are not included in the processing time.

Processing time required for microprogram replacement	
RAID300 method (Estimated time for 4 groups)	RAID200 method (sequential)
24 min. / 48 processors	**240 min./ 48 processors**

3.13 HRC & HODM

3.13.1 HRC/HODM Components

There are three modes of the update copy, a synchronous copy, semi synchronous copy and asynchronous copy.
Description of the asynchronous is described in chapter 3.17 HRC Asynchronous.

(1) HRC Components

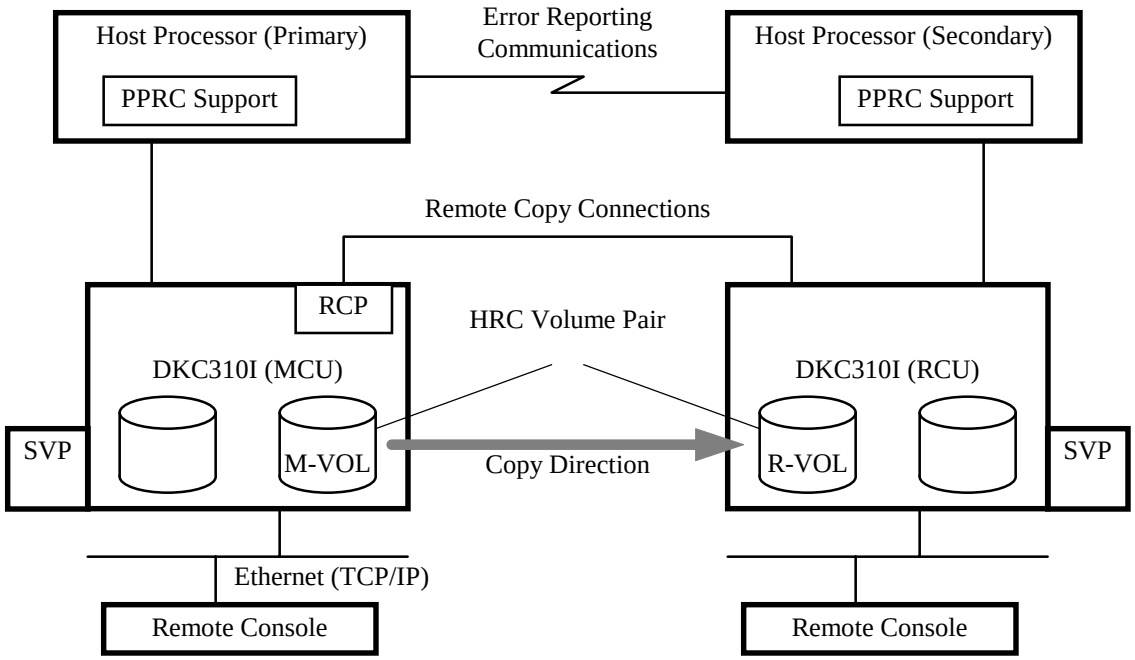

Fig. 3.13.1-1 HRC Components

(a) HRC Volume Pair

An **HRC volume pair** consists of two logical volumes, an M-VOL and an R-VOL, in different DKC310I subsystems.

An **M-VOL** (main volume) is a primary volume. It can be read or written by I/O operations from host processors.

An **R-VOL** (remote volume) is a secondary or a mirrored volume. Under control of the DKC310I subsystems, contents of an M-VOL and updates from host processors are copied to an R-VOL. Read or write I/O operations from host processors to R-VOLs are rejected.

Copyright ©1998,1999, Hitachi, Ltd.

Note ; R-VOL Read Only function

HRC has R-VOL Read Only function to accept read commands to R-VOL of suspended pairs of HRC.

R-VOL Read Only function becomes effective with SVP system option setting for RCU of HRC.

Copyright ©1998,1999, Hitachi, Ltd.

With this function, RCU accepts all RD commands including CTL/SNS commands and WR command to cylinder zero, head zero, record three of R-VOL. (It is necessary to change VOLSER of the volume.)

The RCU rejects some PPRC commands such as ADDPAIR to the R-VOL nevertheless the status of the R-VOL looks 'Simplex'. They must be controlled by system administration.

With this function, RCU displays the status of the R-VOL as 'Simplex' instead of 'Suspended'. It is necessary to accept I/O to R-VOL.

MCU copies cylinder zero of the pair at RESYNC copy unconditionally, besides the ordinary RESYNC copy.

The M-VOLs of the HRC volume pairs and the R-VOLs of other HRC volume pairs can be intermixed in one DKC310I subsystem.

(b) MCU and RCU

An **MCU** (main disk control unit) and an **RCU** (remote disk control unit) are disk control units in the DKC310I subsystems to which the M-VOLs and the R-VOLs are connected respectively.

An MCU controls I/O operations from host processors to the M-VOLs and copy activities between the M-VOLs and the R-VOLs. An MCU also provides functions to manage HRC status and configuration.

An RCU executes write operations directed by the MCU. The manner to execute write operations is almost same as that of I/O operations from host processors. An RCU also provides a part of functions to manage HRC status and configuration.

Note that an MCU/RCU is defined on each HRC volume pair basis. One disk control unit can operate as an MCU to control the M-VOLs and an RCU to control the R-VOLs.

(c) Remote Copy Connections

An MCU and an RCU must be connected with serial interface (ESCON) cables. Only multi mode ESCON cables whose length is up to 3km can be connected to the DKC310I subsystems. In order to locate the DKC310I subsystems more than 3km apart, IBM 9032/9033 ESCON directors or 9036 ESCON repeaters are required.

At least two independent remote copy connections should be established between an MCU and an RCU.

Copyright ©1998, Hitachi, Ltd.

(d) RCP

An **RCP** (remote control port) is a serial interface port to which an RCU is connected. Any serial interface port of the DKC310I subsystems can be configured as an RCP.

When an MCU communicates with an RCU through ESCON interface protocol, the RCP plays the role of a host processor channel. The RCP supports ESCON dynamic connection. A serial interface port of the RCU to which the MCU is connected can be connected to host processor channels by using dynamic switching capability provided by ESCON directors.

However an RCP can not communicate with host processor channel. Channel interface paths must be connected to other serial interface ports.

(e) SVP and Remote Console

An **SVP** provides functions to set up , modify and display HRC/HODM configuration and status.

A **remote console** is a personal computer compatible with the PC/AT. It should be connected to DKC310I subsystems with an Ethernet network (TCP/IP) . A remote console provides same managing HRC/HODM functions as an SVP. Several DKC310I subsystems can be connected with one Ethernet network.

For remote console, Hitachi provides only two software components, an HRC/HODM application program and dynamic link library. Both of them require Microsoft Windows operating system. A personal computer, Ethernet materials and other software products are not provided by Hitachi.

(f) Error Reporting Communications

Error reporting communication is a communication means between host processors. An MCU generates the sense information when it fails in keeping synchronization of HRC volume pair. The sense information causes the corresponding message to be displayed on the host processor console. For the reference during disaster recovery at the secondary (recovery) site, this console message should be transferred to the secondary site through the error reporting communication.

The error reporting communications may be configured by using channel-to-channel communications, Netview technology or other interconnect technologies, depending on installation. Hitachi does not provide any product for error reporting communications.

(g) PPRC Support

HRC provides a host processor interface compatible with IBM PPRC. TSO commands, DSF commands and disaster recovery PTFs provided for PPRC can be used for HRC.

Copyright ©1998, Hitachi, Ltd.

(2) HODM Components

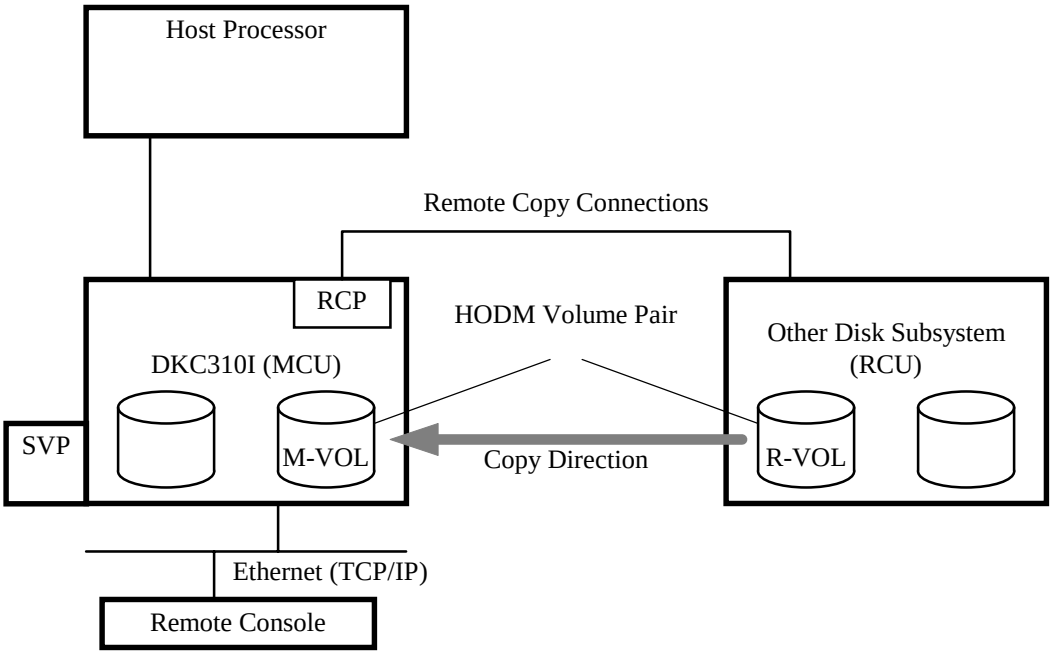

Fig. 3.13.1-2 HODM Components

(a) HODM Volume Pair

An **HODM volume pair** consists of one logical volume in a DKC310I subsystem and another disk volume in another disk subsystem, called an **M-VOL** (main volume) and an **R-VOL** (remote volume) respectively. But you can not establish HODM volume pair on condition that R-VOL is Dual Copy volume.

HODM copies the data written in the R-VOL into the M-VOL. Responding to read I/O operations from host processors to the M-VOL, HODM transfers the data read from the R-VOL if the requested data has not yet copied.

R-VOL should be protected from being updated during HODM. An operating environment must ensure this requirement because HODM does not protect it.

(b) MCU and RCU

An **MCU** (main disk control unit) is the disk control unit of a DKC310I subsystem. An **RCU** is the disk control unit of another disk subsystem in the HODM configuration.

Copyright ©1998, Hitachi, Ltd.

(c) Remote Copy Connections

An MCU and an RCU must be connected with serial interface (ESCON) cables. Only multi mode ESCON cables whose length is up to 1km can be connected to the DKC310I subsystems. Although IBM 9032/9033 ESCON directors and 9036 ESCON repeaters are supported, the longer distance is not recommended because of performance reasons.

At least two independent remote copy connections should be established between an MCU and an RCU.

(d) RCP

An **RCP** (remote control port) is a serial interface port to which an RCU is connected. Any port of DKC310I subsystems can be configured as an RCP.
When an MCU communicates with an RCU through an ESCON interface protocol, an RCP plays the role of a host processor channel. An RCP supports ESCON dynamic connection. A serial interface port of an RCU to which an MCU is connected can be connected to host processor channels by using dynamic switching capability provided by ESCON directors.

However an RCP can not communicate with a host processor channel. Channel interface paths must be connected to other serial interface ports.

(e) SVP and Remote Console

An **SVP** provides functions to set up , modify and display HRC/HODM configuration and status.

A **remote console** is a personal computer compatible with a PC/AT. It should be connected to the DKC310I subsystems with an Ethernet network (TCP/IP). A remote console provides same managing HRC/HODM functions as an SVP. Several DKC310I subsystems can be connected with one Ethernet network.

For a remote console, Hitachi provides only two software components, an HRC/HODM application program and dynamic link library. Both of them require Microsoft Windows operating system. A personal computer, Ethernet materials and other software products are not provided by Hitachi.

Copyright ©1998, Hitachi, Ltd.

3.13.2 HRC/HODM Theory of Operations

(1) HRC Copy Activities

HRC executes two kind of copy activities, **initial copy** and **update copy**.

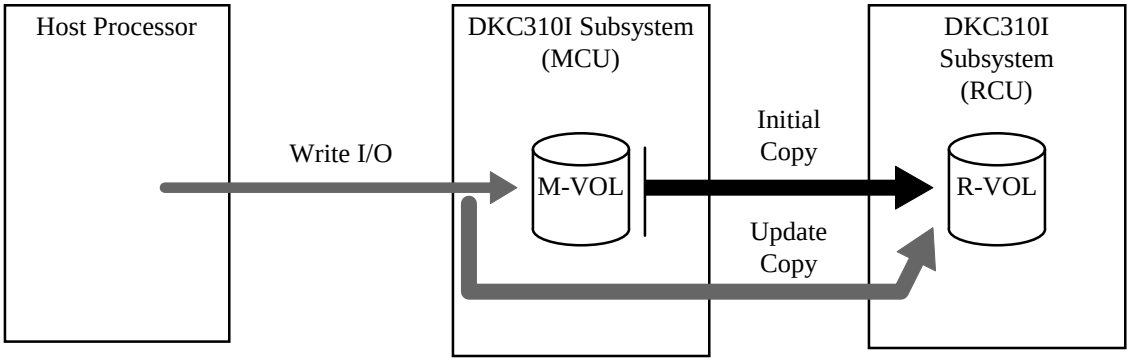

Fig. 3.13.2-1 HRC Copy Activities

(a) Initial Copy

Responding to an Establish HRC Volume Pair operation from an SVP/remote console or an ESTPAIR PPRC command, HRC begins initial copy. Data field of record zero and following records on all tracks, except for alternate and CE tracks, are copied from M-VOL to R-VOL. The initial copy operation is performed in ascending order of cylinder numbers.

"No copy" can be specified as a parameter to the initial copy. When "no copy" is specified, HRC will complete an Establish HRC Volume Pair operation without copying any data. An operator or a system administrator should be responsible for ensuring that data on the M-VOL and the R-VOL is already identical.

"Only out-of-sync cylinders" can also be specified as a parameter to the initial copy. This parameter is used to recover (re-establish) HRC volume pair from suspended condition. After suspending HRC volume pair, the MCU maintains a cylinder basis bit map which indicates the cylinders updated by I/O operations from the host processors. When this parameter is specified, HRC will copy only cylinders indicated by the bit map.

(b) Controlling Initial Copy

Number of tracks copied by one initial copy activity can be specified by an SVP/remote console or an ESTPAIR PPRC command.

Number of volume pairs for which the initial copy are concurrently executed and priority of each volume pair can be specified from an SVP/remote console.

Copyright ©1998, Hitachi, Ltd.

(c) Update Copy

Responding to the write I/O operations from the host processors, HRC copies the records updated by the write I/O operation to the R-VOL.

The update copy is a **synchronous remote copy**. An MCU starts the update copy after responding only channel-end status to the host processor channel, and sends device-end status after completing the update copy. The MCU will start the update copy when it receives:

- the last write command in the current domain specified by preceding locate record command;
- a write command for which track switch to the next track is required;
- each write command without being preceded by locate record command.

If many consecutive records are updated by single CCW chain which does not use locate record command, the third condition above may cause the significant impact on performance.

(d) Update Copy for Cache Fast Write Data

Cache fast write (CFW) data does not always have to be copied because CFW is used for temporary files, such as sort work data sets. These temporary files are not always necessary for disaster recovery.

In order to reduce update copy activities, HRC supports a parameter which specifies whether CFW data should be copied or not.

(e) Special Write Command for Initial Copy and Update Copy

In order to reduce overhead by the copy activities, HRC uses a special write command which is allowed only for copy activities between the DKC310I subsystems. The single write command transfers control parameters and an FBA formatted data which includes consecutive updated records in a track. It reduces interlocks on ESCON interface protocol and overhead required for converting FBA-to-CKD format and CKD-to-FBA format.

(2) HRC Read I/O Operations

Responding to read I/O operations, an MCU transfers the requested records form an M-VOL to a host processor. Even if reading records from the M-VOL is failed, the R-VOL is not automatically read for recovery. The redundancy of the M-VOL itself provided by RAID5 or RAID1 technique would recover the failure.

Copyright ©1998, Hitachi, Ltd.

(3) HODM Copy Activities

HODM performs three kind of copy operations, **migration copy**, **restore copy** and **update copy**.

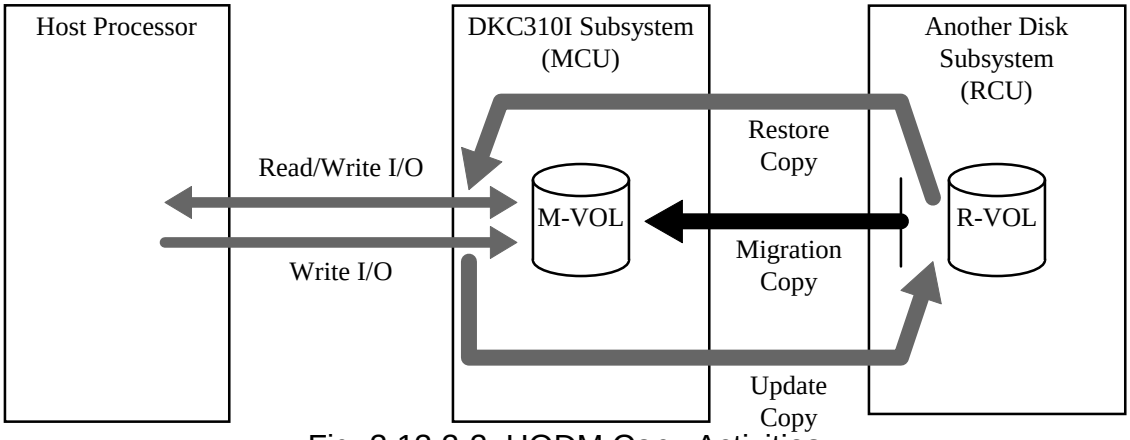

Fig. 3.13.2-2 HODM Copy Activities

(a) Migration Copy Operation

Responding to establishing HODM volume pair operation from SVP/Remote Console, HODM begins the migration copy. Data field of record zero and following records on all tracks, excluding alternate and CE tracks, are copied from R-VOL to M-VOL. The migration copy is performed in ascending order of cylinder numbers.

(b) Controlling Migration Copy

Number of volume pairs for which the migration copy operations are concurrently performed and priority of each volume pair can be specified from SVP/Remote Console.

(c) Restore Copy

When MCU receives read/write I/O operations from host processors and the requested data is not yet copied by the migration copy, HODM executes the restore copy. The restore copy copies the cylinder in which the requested records are stored. After completing the restore copy, MCU reads the requested records from the M-VOL for read I/O operation or executes the update copy for the write I/O operation.

While executing the restore copy, host processor channel is disconnected from the MCU with a command retry procedure.

Copyright ©1998, Hitachi, Ltd.

(d) Update Copy

Responding to the write I/O operations while the migration copy is in progress, HODM copies the records updated by the write I/O operations to the R-VOL. The purpose of the update duplication is to keep consistency of data on the R-VOL during data migration.

Update Copy mode can be selected by SVP Add Pair operation. (refer to THEORY03-550, SVP04-160)

"while Migration Copy in progress" (default):
Update Copy to R-VOL is enabled until the migration of the each device is complete.

"until Delete Pair/Erase operation":
Update Copy to R-VOL is enabled until Delete Pair or Erase operation, even if the migration for the volume is completed. This function is to avoid data lost, if HODM is failed and the situation is under the necessity of recovering by means of return the system to the RCU. But, this function effects heavier load to MCU and should cause performance degradation.

"never duplicated":
Update Copy to R-VOL is not enabled.

(4) HRC Volume Pair Status

All volumes in a DKC310I subsystem are in one of the states shown in Table 3.13.2-1.

Status of the M-VOLs or the R-VOLs are kept by the MCU and the RCU respectively. The MCU is responsible to keep status of the R-VOLs identical to status of the M-VOLs. However, in the case of communication failure between the MCU and the RCU, they could be different.

From an SVP/remote console or by using an appropriate command for IBM PPRC, status of M-VOLs or status of R-VOLs can be obtained from the MCU or the RCU respectively.

Copyright ©1998, Hitachi, Ltd.

Table 3.13.2-1 HRC Volume Status

Status	Description
Simplex	This volume does not belong to HRC volume pair. When the initial copy is started by an Add Pair operation, the volume is changed to “pending duplex” state.
Pending Duplex	The initial copy is in progress. Data on HRC volume pair is not fully identical. When completing the initial copy, the volume will be changed to “duplex” state.
Duplex	Volumes in HRC volume pair are synchronized. All updates from the host processors to the M-VOL are duplicated to the R-VOL.
Suspended	Volumes in HRC volume pair are not synchronized. When the MCU can not keep synchronization between HRC volume pair due to, for example, failure on the update copy, the MCU will put the M-VOL and the R-VOL in this state. When the MCU or the RCU accepts an Suspend operation from an SVP/remote console, the M-VOL and the R-VOL will be put in this state. When the RCU accepts the Delete Pair operation from the SVP/remote console, the MCU will detect the operation and put the M-VOL in this state.

For “suspended” volumes, cause of suspension is defined as shown in Table 3.13.2-2. The cause of suspension is displayed in the form of “Suspended (cause of suspension)” on an SVP/remote console.

Table 3.13.2-2 HRC Volume Status - Sub-status of Suspended Volume

Cause of Suspension	Description
M-VOL by Operator	The Suspend operation with “M-VOL failure” option was issued to the M-VOL. This cause of suspension is defined only for the M-VOLs.
R-VOL by Operator	The Suspend operation with “R-VOL” option was issued to the M-VOL or the R-VOL. This cause of suspension is defined for both the M-VOLs and the R-VOLs.
by MCU	The RCU received a request to suspend the R-VOL from an MCU. This cause of suspension is defined for only the R-VOLs.
by RCU	The MCU detected an error condition of the RCU which caused HRC volume pair to be suspended. This cause of suspension is defined only for the M-VOLs.
Delete Pair to RCU	The MCU detected that the R-VOL had been changed to “simplex” state by the Delete Pair operation. This cause of suspension is defined only for the M-VOLs.
R-VOL Failure	The MCU detected an error condition on the communication between the RCU or I/O error on the update copy. This cause of suspension is defined only for the M-VOLs. The cause of suspension of the R-VOLs are usually set to “by MCU” in this situation.
MCU IMPL	The MCU could not find valid control information in its non-volatile memory during its IMPL procedure. This situation may occur after the power supply failure.
Initial Copy Failed	The volume pair was suspended before completing the initial copy. Even if no write I/O has been issued after being suspended, the data in the R-VOL is not completely identical to the M-VOL.

Copyright ©1998, Hitachi, Ltd.

(5) HODM Volume Pair Status

The M-VOLs of HODM volume pair are in one of the states shown in Table 3.13.2-3. From an SVP/remote console connected to the MCU, status of the M-VOLs can be obtained.

Table 3.13.2-3 HODM Volume Status

Status	Sub-status	Description
Simplex	(with no substatus)	This volume does not belong to HODM volume pair. When the initial copy is started by an Add Pair operation, the volume is set to "pending duplex" state.
	Migration Complete	All data on the R-VOL has been successfully copied to the M-VOL. When the Delete Pair operation is directed, the volume will return to pure "simplex " state. When the R-VOL Erase operation is directed, the volume will be put into "erasing in progress" state.
	Erasing in Progress	All data on the R-VOL has been successfully copied to M-VOL, and data on the R-VOL are being erased. When all tracks are successfully erased, the volume will return to pure "simplex" state. When an MCU is powered off, the volume will be put into "migration complete" state after the MCU is re-IMPLed. To complete erasing, the R-VOL Erase operation must be operated again.
	Erasing Error	Erasing process failed.
Pending Duplex	Migration in Progress	Data on the R-VOL is being copied to the M-VOL. During in this state, updates to the M-VOL from the host processors are duplicated to the R-VOL.
Suspended	Migration Error, M-VOL	The migration copy failed due to an error condition at the MCU or the M-VOL. Although the migration copy has been terminated, the MCU tries to execute the update copy and the restore copy to respond to the I/O operations from the host processors. In order to restart the migration copy, the Delete Pair operation followed by another Add Pair operation is required after removing the error condition from the MCU/M-VOL.
	Migration Error, R-VOL	The migration copy failed due to an error condition at the RCU or the R-VOL. Although the migration copy has been terminated, the MCU tries to execute the update copy and the restore copy to respond to the I/O operations from the host processors. In order to restart the migration copy, the Delete Pair operation followed by another Add Pair operation is required after removing the error condition from the RCU/R-VOL.
	R-VOL by Operator	The Suspend operation with "R-VOL" option was issued to the M-VOL.
	MCU IMPL	The MCU could not find valid control information in its non-volatile memory during its IMPL procedure. This situation may occur after the power supply failure.

Copyright ©1998, Hitachi, Ltd.

3.13.3 HRC/HODM Control Operations

This section describes HRC/HODM control operations from an SVP or a remote console.

(1) Add RCU Operation

An Add RCU operation makes an MCU register the specified disk control unit as an RCU and establish the logical paths to the RCU. This operation also provides a function to modify the HRC/HODM options which will be applied to all HRC/HODM volume pairs in this subsystem. Refer to “SVP SECTION 4.3 Add RCU... Screen” for GUI image of this operation.

To register the RCU, the following parameters are required:

RCU S#	Serial number of the RCU.
SSID	SSID (subsystem identifier) of the RCU.
Num. of Path	Number of logical paths which should be established to the RCU on the remote copy connections.

Path parameters to specify one logical path are shown below. Up to four sets of the path parameters, as many as the “Num. of Paths” parameter specifies, must be specified. The description of path parameters is similar to the channel path definitions in IOCDS (I/O configuration dataset). In the IOCDS, a logical path is described with a sub-channel number, a link destination address and a logical address of the control unit image. A “Port” parameter, instead of the sub-channel number, is used to specify the serial interface port in the DKC310I subsystem.

Port	The serial interface port of the DKC310I subsystem where the logical path begins from. Before this operation, the serial interface port must be set to the RCP mode.
Link Adr	The link destination address. Similar to the logical path definitions in the IOCDS, this is the destination port address on the ESCD which is set to provide the dynamic connection capability. If the remote copy connection does not include the dynamic connection, x’00’ must be specified.
Logical Adr	The logical control unit address of the control unit image. If the RCU is configured as an SPSD (single path storage director), either x’00’ or x’01” must be specified. Otherwise, x’00’ must be specified.

Fig. 3.13.3-1 shows an example for the RCU and the path parameters.

Copyright ©1998,1999, Hitachi, Ltd.

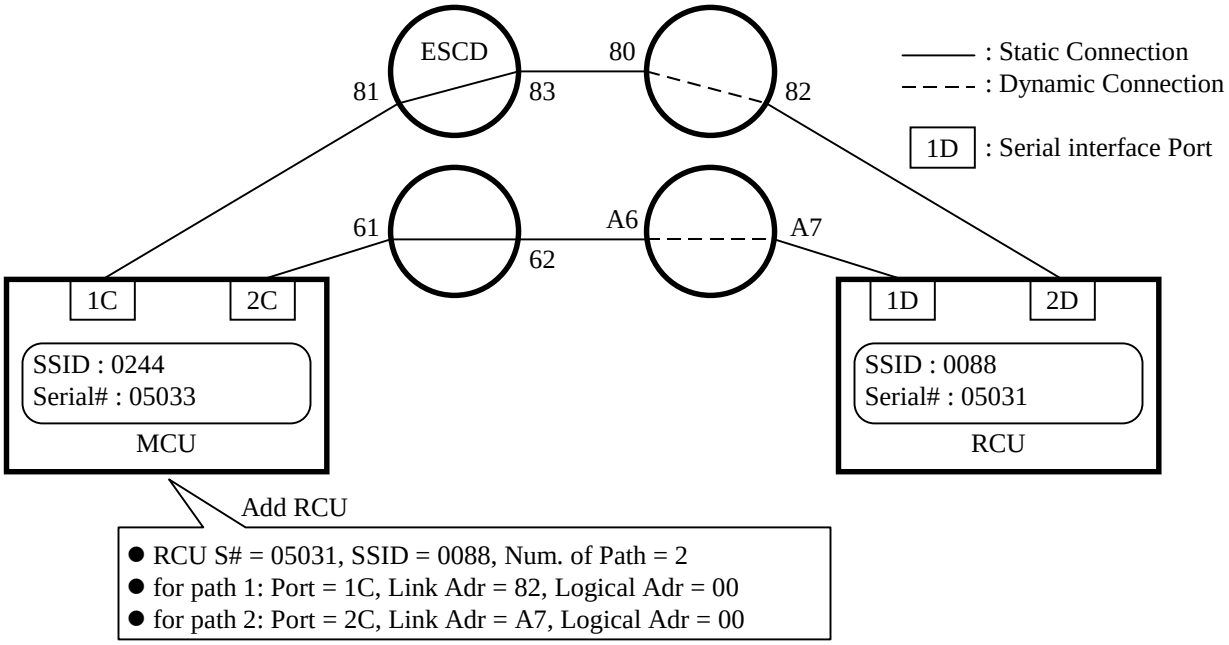

Fig. 3.13.3-1 Add RCU Operation Parameters Example

Copyright ©1998, Hitachi, Ltd.

The following parameters modify the HRC/HODM options which will be applied to all HRC/HODM volume pairs in this subsystem. Refer to “SVP SECTION 4.5 RCU Option... Screen” for GUI image to set these parameters.

Minimum Paths	When the MCU blocks the logical path due to communication failure, if the number of remaining paths becomes less than the number specified by this parameter, the MCU will suspend all of the HRC/HODM volume pairs. The default value is set to “1”. If the installation requirements prefers the subsystem I/O performance to the continuation of HRC/HODM, value between “2” and the number of the established logical paths can be specified.
Maximum Initial Copy Activities	It specifies how many HRC initial copy and HODM migration copy can be simultaneously executed by the MCU. If more HRC/HODM volume pairs are specified by an Add Pair operation, the MCU will execute the initial copy or the migration copy for as many volumes as specified by this parameter. The initial copy or the migration copy for other volumes is delayed until one of the initial copy or the migration copy is completed. This parameter can control the performance impact caused by the initial copy activity or the migration copy activity. Note: Default value of this parameter is “4”.
Incident of RCU	This parameter specifies whether the link incident record generated by the RCU is to be sent or not to the host processor connected to the MCU.
PPRC supported by HOST	If “Yes” is specified, the MCU will generate the sense information which is compatible with IBM PPRC when the HRC volume pair is suspended, but DEV_SIM of HRC/HODM will not be reported to the HOST except “DF40” and “DF48” DEV_SIM. If “No” is specified, the MCU will generate only service information messages. Even if the SSB (F/M=FB) is specified by the Suspend Pair Operation, the x’FB’ sense information will not be reported to the HOST.
Service SIM of HRC&HODM	If “Report” is specified, the HRC/HODM Service SIM will be reported to the HOST. If “Yes” is specified in PPRC supported by HOST option, DEV_SIM of HRC will not be reported to the HOST except “DF40” and “DF48” DEV_SIM. If “Not Report” is specified, the HRC/HODM Service SIM reporting will be suppressed. Refer to “SIM Reference Codes Detected by the Processor for HRC/HODM/HORC” in SIM-RC SECTION.

Note that these parameters will be applied to ALL RCUs registered to the MCU. If different parameters are specified, the last parameter will be applied.

Copyright ©1998,1999, Hitachi, Ltd.

(2) Edit Path Operation

An Edit Path operation makes the MCU add/delete the logical path to/from the registered RCU.

To add a logical path, the same path parameters as an Add RCU operation are required. The added logical path will be automatically used to execute the copy activities.

When deleting a logical path, pay attention to the number of remaining logical paths. If it becomes less than the number specified by “Minimum Paths”, HRC/HODM volume pair could be suspended.

(3) RCU Option Operation

An RCU Option operation modifies the HRC/HODM options described in “3.13.3(1) Add RCU operation”.

(4) Delete RCU Operation

A Delete RCU operation makes the MCU delete the specified RCU from RCU registration. All logical paths to the specified RCU will be removed.

If some volumes connected to the specified RCU are active R-VOLs, this operation will be rejected. All R-VOLs must be deleted by a Delete Pair operation before a Delete RCU operation.

(5) RCU Status Operation

An RCU Status operation makes the MCU display the status of RCU registration. It also provides the current status, time of registration and time of changing status for each logical path.

The current status of each logical path is defined as follows:

Normal	This logical path has been successfully established and can be used for the HRC/HODM copy activities.
Initialization Failed	The link initialization procedure between the RCU is failed. It occurred due to Missing physical path connection between MCU and RCU, or connecting MCU with HOST as RCU.
Resource Shortage (RCU)	Establish Logical Path link control function has been rejected by the RCU. All logical path resources in the RCU might be used for other connections.
Serial Number Mismatch	The serial number of the control unit which is connected to this logical path does not match to the serial number specified by “RCU S#” parameter.
Invalid Port	The serial interface port specified by “Port” parameter is not in the RCP mode.

Copyright ©1998, Hitachi, Ltd.

(6) Add Pair Operation

An Add Pair operation makes the MCU establish a new HRC/HODM volume pair. It also provides function to modify the HRC/HODM options which will be applied to the selected HRC/HODM volume pair. Up to 256 HRC/HODM volume pairs can be established in one DKC310I subsystem.

To establish HRC/HODM volume pair, following parameters are required:

RCU	The disk control unit which controls the R-VOL of this HRC/HODM volume pair. It must be selected from RCUs which have already been registered by Add RCU operations.
R-VOL	Device number of the R-VOL.
Priority	Priority (scheduling order) of the initial copy or the migration copy for this volume pair. When the initial copy or the migration copy for one volume pair has been terminated, the MCU selects and start the initial copy or the migration copy for another volume pair which has the lowest value of this parameter. For the Add Pair operations, the value "1" through "256" can be specified. For establishing HRC volume pair by TSO command or DSF command for PPRC, "0" is implicitly applied to. "0" is the highest priority, "256" is the lowest, and default value for the Add Pair operation is "32". For the volume pairs to which the priority have been specified, the MCU prioritizes the volume pairs in the arrival order of the Add Pair operations or TSO/DSF commands. If the MCU are performing the initial copy or the migration copy for the number of volume pairs, as much as the value of "maximum initial copy activities", and accepts further Add Pair operation, the MCU does not start other initial copy or the migration copy until one of the copy being performed will be completed.
Operation Mode	It specifies what kind of remote copy capability should be applied to this volume pair. "Remote Dual Copy" and "Migration Copy" means HRC and HODM respectively. "Erase after Migration" will make the MCU start erasing the R-VOL of this HODM volume pair. Note: "Erase after Migration" is not supported at the first version of HRC/HODM.
Initial Copy	It specifies what kind of initial copy activity should be executed for this HRC volume pair. The kind of the initial copy can be selected out of: - "Entire Volume" specifies that all cylinders excluding the alternate cylinder and the CE cylinders should be copied. - "Only Out-of-Sync Cylinders" specifies that only cylinders which have been updated during this HRC volume pair is in "suspended" state - "None" specifies that the initial copy does not need to be executed. The synchronization between volume pair must have been ensured by the operator.

Copyright ©1998, Hitachi, Ltd.

HRC/HODM option parameters which will be applied to this HRC/HODM volume pair are as follows:

Initial Copy Pace	It specifies how many tracks should be copied at once by the initial copy. “15 Tracks” or “3 Tracks” can be specified. When “15 Tracks” is selected, elapsed time to complete the initial copy becomes shorter, however, the subsystem I/O performance during the initial copy could become worse. This parameter is valid only for HRC volume pair. Note: The default value of this parameter is “15”.
DFW to R-VOL	It specifies whether the DFW capability of the R-VOL is required or not. If “DFW required” is specified, the HRC volume pair will be suspended when the RCU can not execute the DFW due to, for example, cache failure. If the installation requirements prefers the continuation of HRC to the subsystem I/O performance, “DFW not required” is recommended. This parameter is valid only for HRC volume pair.
CFW Data	It specifies whether the records updated by CFW should be copied to the R-VOL or not. “Only M-VOL”, which means that CFW updates are not copied, is recommended because CFW data is not always necessary for disaster recovery.
When M-VOL Fails	It specifies whether the migration copy should be continued or stopped when the MCU detected unusual conditions, such as the correction copy or the dynamic sparing, of the M-VOL. This parameter is valid only for HODM volume pair. Note: This option is not effective. The migration copy will be continued regardless of correction access, correction copy and dynamic sparing.
M-VOL Fence Level	It specifies by what conditions the M-VOL will be fenced (the MCU will reject the write I/O operations to the M-VOL). - “R-VOL Data”: The M-VOL will be fenced when the MCU can not successfully execute the update copy. - “R-VOL Status”: The M-VOL will be fenced when the MCU can not put the R-VOL into “suspended” state. If status of the R-VOL is successfully changed to “suspended”, the subsequent write I/O operations to the M-VOL will be permitted. - “Never”: The M-VOL will never be fenced. The subsequent write I/O operations after the HRC volume pair has been suspended will be permitted. This parameter is valid only for HRC volume pairs.
Update Copy to R-VOL	Specifies update copy mode to R-VOL. - “while Migration Copy in progress”: Enable while migration copy is progress. - “until Delete Pair/Erase operation”: Enable until Delete Pair/Erase R-VOL operation is executed. - “never duplicated”: Disable while migration copy is progress.

Copyright ©1998, Hitachi, Ltd.

Note : The Add Pair operation to establish the HODM volume pair will be rejected if the specified M-VOL is in “simplex” state and belongs to any path group. Before the Add Pair operation, the M-VOL must be varied offline from all attached host processors.
Add Pair operation will be failed if the specified volume is in “correction access” or “correction copy” state. The error message is described in SVPMSG section 4.

The HRC volume pair and the HODM volume pair can not concurrently exist under the same controller (MCU-RCU). Without DEL RCU operation, the HODM (HRC) volume pair can not establish in the controller that had the HRC (HODM) volume pair before.

Copyright ©1998,1999, Hitachi, Ltd.

(7) Delete Pair Operation

A Delete Pair operation makes the specified HRC/HODM volume pair being terminated. It can be operated on either the MCU or the RCU.

- When operated on the MCU, both the M-VOL and the R-VOL will be put into the "simplex" state.
- When operated on the RCU, only the R-VOL will be put into the "simplex" state. The M-VOL will be suspended when the MCU detects this operation. To complete deleting this volume pair, the MCU requires another Delete Pair operation.

When the MCU accepts this operation and it can not communicate with the RCU, this operation will be rejected. "Delete Pair by Force" option can make the MCU complete this operation, even if it can not communicate with the RCU.

The Delete Pair operation to the HODM volume pair without "Force" option is rejected if the M-VOL is not in "simplex (migration complete)" status and the M-VOL belongs to any path group. The Delete Pair operation to the HODM volume pair with "Force" option will be accepted regardless of status and path group of the M-VOL.

For the purpose of the recovery operation simply, "Delete All Pairs" option is provided in the delete pair operation. This option is need to use "Delete Pair by Force" option together, and specifies that the all volume pairs in the same RCU(CU Image) should be deleted. In the case of the delete operation at the RCU, specifies that the all volume pairs in the same serial number of the MCU and the same CU image of the MCU should be deleted.

(8) Suspend Pair Operation

A Suspend Pair operation makes the MCU or the RCU suspend the specified HRC/HODM volume pair.
This operation also cancel erasing operation of an HODM volume pair. The specified volume will be put into "migration complete" state. To complete erasing, the R-VOL Erase operation must be operated again.

The option parameter of this operation are as follows:

SSB (F/M=FB)	The MCU and the RCU will generate sense information to notify the suspension of this volume pair to the attached host processors. This option is valid only for HRC volume pairs.
M-VOL Failure	The subsequent write I/O operations to the M-VOL will be rejected regardless of the fence level parameter. This option can be selected only when operating on the MCU. This option is valid for only HRC volume pairs.
R-VOL	For HRC volume pairs, the subsequent write I/O operations to the M-VOL will be permitted or rejected, depending on the fence level parameter. This option can be accepted by the MCU and the RCU. For HODM volume pairs, only the migration copy is suspended. It does not affect on I/O operations from host processors.

Copyright ©1998,2000, Hitachi, Ltd.

(9) Pair Option Operation

A Pair Option operation modifies the HRC/HODM option parameters which has been applied to the selected HRC/HODM volume pair. Refer to “3.13.3(6) Add Pair Operation” for the option parameters.

(10) Pair Status Operation

A Pair Status operation makes the MCU or the RCU display the result of the Add Pair operation or the Pair Status operation to the specified HRC/HODM volume pair, along with the following information:

Initial Copy Complete	When this HRC/HODM volume pair is in “pending duplex” state, it indicates how many cylinders have been successfully copied by the initial copy or the migration copy. When this HRC/HODM volume pair is in “suspended” state, it indicates how many cylinders are currently identical between this HRC/HODM volume pair. This information is provided only by the MCU.
Erase Complete	It indicates how many cylinders of the R-VOL have been successfully erased. This information is provided only by the MCU.
Pair Status	It indicates the status of the M-VOL or the R-VOL. Definition of the volume states is described in “3.13.2(4) HRC Volume Pair Status” and “3.13.2(5) HODM Volume Pair Status”.
Last Update	It indicate the time stamp when the volume pair status has been updated. Note that the time stamp value is obtained from an internal clock in the DKC210I subsystem.
Pair Established	It indicates the time stamp when the volume pair has been established by an Add Pair operation. Note that the time stamp value is obtained from an internal clock in the DKC310I subsystem.

Copyright ©1998, Hitachi, Ltd.

(11) Resume Pair Operation

A Resume Pair operation restart the suspended HRC/HODM volume pair. It also provides function to modify the HRC/HODM options which will be applied to the selected HRC/HODM volume pair.

As the initial copy parameters to the HRC volume pairs, only the “Only Out-of-Sync Cylinders” parameter can be specified.

“Out-of-Sync Cylinders” are recorded in the form of cylinder-bit-map allocated in SM (shared memory) of the DKC310I. If the MCU is powered off and the cylinder-bit-map is not retained due to the battery being discharged, the MCU resumes the initial copy as follows:

(a) For the HRC volume pair in “pending duplex” state, the initial copy is automatically resumed. The all cylinders of this volume will be copied.
(b) For the HRC volume pair in “suspended” state, the all cylinders of this volume will be copied responding to the Resume Pair operation.

(12) R-VOL Erase Operation

An R-VOL Erase operation makes the MCU start erasing the R-VOL. The migration copy from the R-VOL must have been successfully completed for this operation.

This operation can also restart an erasing operation of the R-VOL which is in “erasing error” or “migration complete” state. When restarting the R-VOL erasing, the MCU will erase the R-VOL from the cylinder 0.

(13) Port Operation

All serial interface ports in the DKC310I subsystem are initially set to the LCP mode, to which the host processor channels can be connected. At least two serial interface ports, one port from each storage cluster, must be set to the RCP mode for remote copy connections.

A Port operation makes the DKC310I subsystem change the operating mode of the specified serial interface port(s).

Before changing the operating mode from the LCP mode to the RCP mode, all channel paths to the specified port must be removed using host processor console or ESCD commands.

Before changing the operating mode from the RCP mode to the LCP mode, all RCUs which are connected through the specified port must be deleted by an Delete RCU operation.

Note: The Define Configuration & Installation operation also provide the function to set the operating mode of each serial interface mode.

3.13.4 Managing HRC Environment

(1) Setting Up HRC Volume Pairs

(a) Sequence of Operations

Sequence of operations to establish the HRC volume pairs are shown below.

Table 3.13.4-1 Operations to Set Up HRC Volume Pairs

Step		Operation	
		SVP*	Others
1	Set appropriate serial interface ports to the RCP mode.	Port	
2	Establish logical paths between the DKC310I HRC subsystems	Add RCU	Before this step, remote copy connections must be established between DKC310I subsystems.
3	Ensure that the R-VOLs are offline from host processors		If necessary, perform the following system command. <In case of MVS system> • VARY OFFLINE <In case of VM system> • VARY OFFLINE from guest OS • VARY PATH OFFLINE from VM
4	Establish HRC volume pairs.	Add Pair	

* : Operations form the SVP/remote console attached to the MCU.

Several volume pairs can be specified within one Add Pair Operation. After completing an Add Pair operation, another Add Pair operation can be executed to establish another HRC volume pairs.

Be sure to vary the R-VOLs offline from the attached host processors before executing the Add Pair operation. The RCU will reject the write I/O operations to the R-VOLs once the Add RCU operation has been accepted.

Copyright ©1998, Hitachi, Ltd.

(b) Considering HRC Parameters

Setting of the “fence level” parameter to the Add Pair operation and the “PPRC supported by host” and “Service SIM of HRC/HODM” option to the Add RCU operation depends on your disaster recovery planning. Refer to “3.13.5(1) Preparing for Disaster Recovery” for these parameters.

Setting of the “CFW data” and “DFW to R-VOL” parameters to the Add Pair operation and the “minimum paths” parameter to the Add RCU operation depends on your performance requirement to the DKC310I subsystem at the primary site. Refer to “3.13.3(6) Add Pair operation” and “3.13.3(1) Add RCU operation” for these parameters.

Setting of the “maximum initial copy activities” parameter to the Add RCU operation and the “priority” and the “initial copy pace” parameters can control performance effect from the initial copy activities. Refer to “3.13.4(1)(c) Controlling Initial Copy Activities” for more detailed description.

Refer to “3.13.3(1) Add RCU operation and “3.13.3(6) Add Pair operation” for other parameters.

Copyright ©1998, Hitachi, Ltd.

(c) Controlling Initial Copy Activities

To control performance effect from the initial copy activities, the “maximum initial copy activities” parameter and the “priority” and the “copy pace” parameters can be specified:

- The “maximum initial copy activities” parameter controls the number of volumes for which the initial copy are concurrently executed;
- The “priority” parameter specifies the executing order of the migration copy on volume pair basis;
- The “copy pace” parameter specifies how many tracks should be copied by each initial copy activity.

Refer to the following example for the “maximum initial copy activities” and the “priority” parameters.

Example
Conditions:
- The Add Pair operation specifies that devices 00~05 should be M-VOLs.
- “Maximum initial copy activities” is set to “4” (this is the default value).
- “Priority” parameters for devices 00~05 are set to “3”, ”5”, ”5”, “1”, “4”, and “2” respectively.

Under the above conditions, the MCU will performs the initial copy:
- for devices 00, 03, 04 and 05 immediately.
- for device 01 when one of the initial copy has been terminated.
- for device 02 when the initial copy for the second device has been terminated.

(2) Suspending and Resuming the HRC Volume Pairs

This section describes the operations to suspend or resume the HRC volume pair, which are necessary for the following sections in this chapter.

The Suspend Pair operation with the “R-VOL” option parameters can suspend the specified HRC volume pairs while the M-VOLs are still accessed from the attached host processors. The “SSB” option should not be selected to prevent the sense information from being generated.

To resume the suspended HRC volumes pairs, the Resume Pair operation must be executed.

Refer to “3.13.3(8) Suspend Pair Operation” and “3.13.3(6) Add Pair Operation” for more detailed description.

Copyright ©1998, Hitachi, Ltd.

(3) Managing Power On/Off of HRC Components

(a) Cutting Power to HRC component

Cutting power to the RCU or the ESCDs on the remote copy connections, or other equivalent events which make the MCU unable to communicate with the RCU should be controlled in order not to affect the remote copy activities. If the MCU detects these events when it intends to communicate with the RCU, it would suspend all HRC volume pairs.

To avoid this problem, the applications on the primary host processors must be terminated or all HRC volume pairs must be suspended or terminated, before performing these events.

Refer to “3.13.4(2) Suspending and Resuming the HRC Volume Pairs” for the operations to suspend and resume the HRC volume pairs.

(b) Power Control Interface at the Secondary Site

In the secondary site, It is not recommended to use the power control interface which remotely cuts the power to the RCU or the ESCD on the remote copy connections in order to avoid the situation described in “3.13.4(3)(a) Cutting Power to HRC components”.

(c) Power-on-sequence

The RCU and the ESCDs on the remote copy connections must become operable before the MCU accepts to first write I/O operation to the M-VOLs.

After the power-on-reset sequence of the MCU, It communicates with the RCU in order to confirm the status of the R-VOLs. If it is not possible, the MCU retries the confirmation until it is successfully completed or the MCU accepts the first write I/O operations to the M-VOLs.

If the MCU accepts the first write I/O operation before completing the confirmation, the MCU will suspend the HRC volume pair. This situation is critical because the status of the R-VOL can not be changed, that is, remains “duplex” state.

(4)Executing ICKDSF to HRC Volume Pairs

The updates by the channel programs which specify “diagnostic authorization” or “device support authorization” are not reflected to the R-VOL. ICKDSF commands which issue the write I/O operations to the M-VOL must be controlled. The HRC volume pairs must be suspended or terminated before performing ICKDSF commands.

Refer to “3.13.4(2) Suspending and Resuming the HRC Volume Pairs” for the operations to suspend and resume the HRC volume pairs.

Copyright ©1998, Hitachi, Ltd.

3.13.5 HRC Error Recovery

(1) Preparing for Disaster Recovery

(a) Considering Fence Level Parameter

Table 3.13.5-1 shows how the fence level parameter of the Add Pair operation has an effect on the write I/O operations to the M-VOL after the HRC volume pair has been suspended. You should select one of the fence level considering the "degree of the currency" of the R-VOL required by your disaster recovery planning. The SVP or remote console, which is connected to either the MCU or the RCU, can display the fence level parameter which has been set to the HRC volume pairs.

Table 3.13.5-1 Effect of the Fence Level Parameter

Failure		Subsequent write I/O operations to the M-VOL will be ...		
		"Data"	"Status"	"Never"
1)	The update copy has failed,	rejected*	-	-
2)	(1) & however the status of the R-VOL could have been successfully changed to "suspended" state.	rejected*	accepted	accepted
3)	(1) & furthermore the status of the R-VOL could not have been changed to "suspended" state.	rejected*	rejected*	accepted

*) Sense bytes includes "command reject" and x'0F' of format/message.

Note: "Data" and "Status" has an effect when an HRC volume pair of "duplex" state is suspended. For HRC volume pairs which are in "pending duplex" state, subsequent write I/O operations will not be rejected regardless of Fence Level parameter.

1) Fence Level = "Data"

The data of the R-VOL is always identical to the M-VOL if once the HRC volume pair has been successfully synchronized. You can reduce the time to analyze whether the R-VOL is current or not in your disaster recovery procedures.

However, this parameter will make the M-VOL not accessible from your applications whenever the HRC copy activity has failed. Therefore you should specify this parameter to the most critical volumes for your disaster recovery planning.

Most of the database system supports duplexing the critical files, for example log files of DB2, for its file recovering capability. It is recommended to locate the duplexed files on the volumes in the physically separated DKC310I subsystems, and establish HRC volume pairs for each volumes by using physically separated remote copy connections.

Copyright ©1998, Hitachi, Ltd.

Note 1: If the failure has occurred before completing the initial copy, the R-VOL can not be used for disaster recovery because the data of the R-VOL is not fully consistent yet. You can became aware of this situation with referring status of the R-VOL in your disaster recovery procedures. Refer to "3.13.5(2)(b) Analyzing the Currency of R-VOLs" for more detailed description.

Note 2: Only the difference between the HRC volume pair must be the last update from the host processor. HRC is a synchronous remote copy. The MCU reports a "unit check" if it detects the failure on the write I/O operation including the update copy to the R-VOL. Therefore, the operating system and the application program does not regard the last (failed) I/O operation as successfully completed.

This parameter is functionally equivalent to "CRIT=YES" parameter for IBM PPRC

2) Fence Level = Never

The subsequent write I/O operations to the M-VOL will be accepted even if the HRC volume pair has been suspended. Therefore the contents of the R-VOL can become "older" (behind the currency of corresponding M-VOL) if the application program continue updating the M-VOL. Furthermore, the status of the R-VOL which will be obtained from the RCU can not be in a "suspended" state.

To use this parameter, your disaster recovery planning must satisfy the following requirements:

- The currency of the R-VOL should be decided by referring the error message which might have been transferred through the error reporting communications or analyzing the R-VOL itself with other files which are confirmed to be current.
- The data of the R-VOL should be recovered by using other files which are ensured to be current.

This parameter is functionally equivalent to "CRIT=NO" parameter for IBM PPRC

3) Fence Level = Status

The level of this parameter is between "Data" and "Never". Only when the status of the R-VOL can be ensured, the subsequent write I/O operations to the M-VOL will be permitted. Therefore the disaster recovery procedure of deciding the currency of the R-VOL can be reduced.

(b) Transferring the Sense Information through Error Reporting Communications

When the HRC volume pair is suspended, the MCU generates the sense information which notifies the host processor of the failure. This will help in deciding the currency of the R-VOLs in the disaster recovery procedures by transferring the sense information, or the system console message caused by the sense information, with the system time stamp information.

Copyright ©1998, Hitachi, Ltd.

The sense information can be selected out of:

- x'FB' of format/message. The sense information is compatible with IBM PPRC and result on a corresponding system console message, for example IEA491E of MVS, if the operating system supports it.
- service information message whose reference code means that the HRC volume pair has been suspended.

Note: The first version of HRC is not completely certified under the operating system which does not support IBM PPRC. Therefore the x'FB' sense information must be selected.

The error reporting communications are essential if you use the fence level of "Status" or "Never".

(c) File Recovery Procedures Depending on Installations

HRC is a synchronous remote copy. All updates to the M-VOLs are copied to their R-VOLs before completing each channel program of the write I/O operations. When the HRC volume pairs have been suspended or the MCU has become inoperable due to a disaster, therefore, many data "in progress" could remain in the R-VOLs. That is, some data set might be still opened, or some transactions might not be committed yet. All breakdown cases should be previously considered.

Therefore, even if you have selected the fence level of "Data" for all HRC volume pairs, you should establish the file or volume recovery procedures. The situation which should be assumed is similar to that where the volumes have became not accessible due to the disk controller failure in non-remote copied environment.

If you use the fence level of "Status" or "Never", the suspended R-VOLs could become "ancient" compared to other volumes. This situation might cause a data inconsistency problem among several volumes.
You should prepare, in your disaster recovery, for recovering some files or some volumes which have become "ancient" by using:

- files for file recovery, for example DB2 log files, which have been confirmed to be current. To ensure the currency of these files, it is recommended to use the fence level of "Data" for these critical volumes.
- the sense information with the system time stamp which have been transferred through the error reporting communications.
- full consistent file or volume backups, if the sense information and the system time stamp can not be used.

Copyright ©1998, Hitachi, Ltd.

(d) CSUSPEND/QUIESCE for IBM PPRC

PPRC recommends to customers to establish their disaster recovery planning where the CSUSPEND/QUIESCE TSO command is programmed to be issued responding to the IEA491E system console messages. This procedure intentionally suspend the remaining volume pairs when some volume pairs have been suspended due to a disaster.

The CSUSPEND/QUIESCE TSO command will be supported as the enhancement to HRC.

(e) All SIM of the HRC clear option

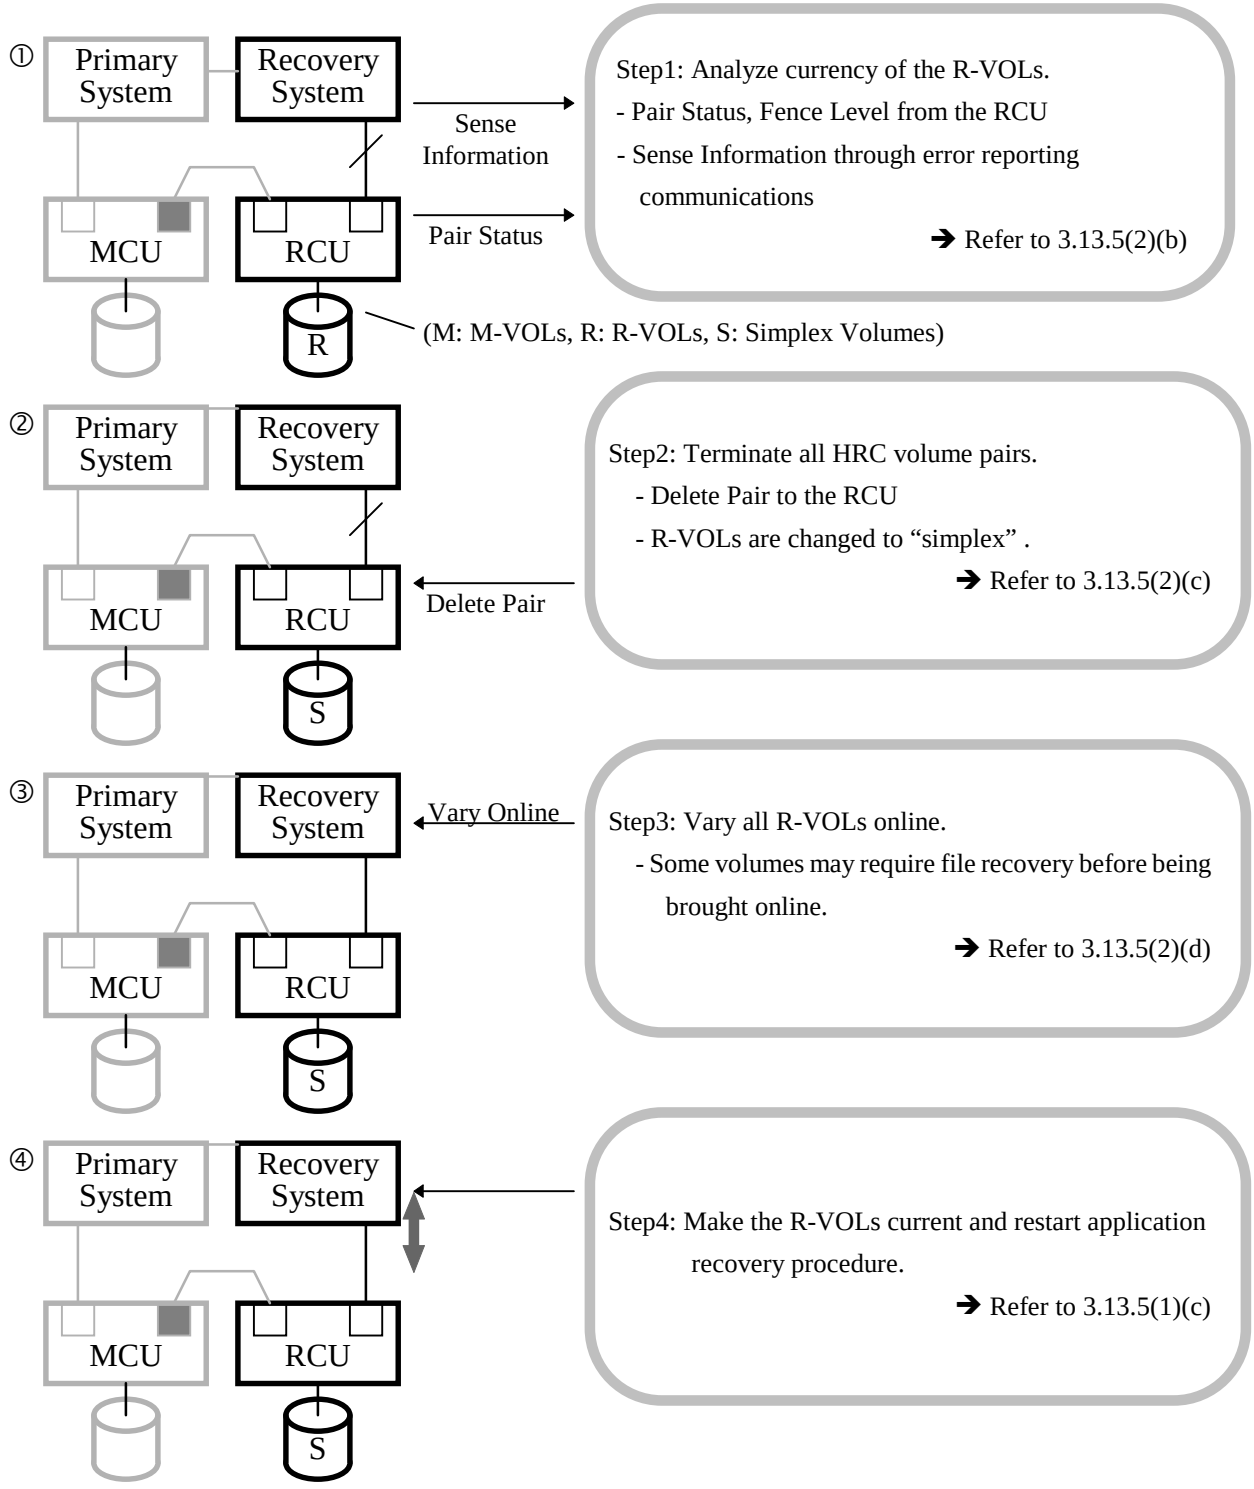
For the purpose of the restrain to report the HRC SIM which should be generated at the disaster and the recovery operations during the OS IPL, “Clear SIM” button is provided on HRC Main Control Screen at the SVP and the RMC. This function is able to use for the disaster recovery operation, and specifies that the all Remote Copy SIM in the subsystem should be deleted.

Copyright ©1998,2000, Hitachi, Ltd.

(2) Disaster Recovery Procedures - Switching to the Recovery System

(a) Summary

⓪ Primary system and MCU becomes inoperable due to disaster.



Copyright ©1998,2000, Hitachi, Ltd.

(b) Analyzing the Currency of R-VOLs (Step 1)

1) Analyzing Status of the R-VOLs and Fence Level Parameter

Table 3.13.5-2 Currency of the R-VOLs

	Fence Level for this HRC volume pair		
Status of R-VOL	Data	Status	Never
Simplex	To be confirmed	To be confirmed	To be confirmed
Pending Duplex	Inconsistent	Inconsistent	Inconsistent
Duplex	Current	Current	To be analyzed
Suspended (Initial Copy Failed)	Inconsistent	Inconsistent	Inconsistent
Suspended (by other reason)	Current	Suspected	Suspected

Table 3.13.5-2 shows how to analyze the currency of the R-VOLs referring the status of the R-VOLs and the fence level parameter which have been specified when establishing the HRC volume pairs. The status of the R-VOLs must be obtained from the RCU in your disaster recovery procedures. The fence level parameter must be previously field since it cannot be obtained From RCU.

Meaning of the results or further actions shown in each column of table 3.13.5-2 are as follows:

To be confirmed This volume does not belong to any HRC volume pair. If you have certainly established the HRC volume pair for this volume and you have never deleted it, you should regard this volume as inconsistent.

Inconsistent The data on this volume is inconsistent because not all cylinders have successfully been copied to this volume yet. You can not use this volume for the applications unless this volume is initialized (or successfully copied from the M-VOL at later time).

Current The data on this volume is completely synchronized with the corresponding M-VOL.

To be analyzed The currency on this volume can not determined. To determine the currency, further analysis described in (2) of this section should be performed.

Suspected The data on this volume must be “older”, behind the currency of corresponding M-VOL. You should restore the consistency of this volume at least, and the currency of this volume if required. The system time information which might have been transferred through the error reporting communications or time of suspension obtained from the Pair Status operation will help you decide the last time when this volume was current.

Copyright ©1998, Hitachi, Ltd.

2) Further Analysis by Referring to Other Information

The M-VOLs, to which the fence level parameter has been set to “Never”, will accepts the subsequent write I/O operations regardless of the result of communication to change the R-VOL into the “suspended” state. Therefore, the status of the R-VOL should be analyzed by referring to the following information:

- The sense information through the error reporting communications. If the sense information which denote the suspension of this volume is found, you can return to table 3.13.5-2 with assumption of the “suspended” state.
- The status of the M-VOL obtained from the MCU, if possible. You should return to table 3.13.5-2 with assumption of the same status as the M-VOL and fence level of “Status”.
- The other related files, for example DB2 log files, which have been confirmed to be current.

(c) Terminating HRC Volume Pairs (Step 2)

The “Delete Pair” operation to the RCU terminates the specified HRC volume pairs. These R-VOLs will be changed to “simplex” state. Specified “Delete Pair by Force” option and “Delete All Pairs” option the all volume pairs in the same serial number of the MCU and the same CU image of the MCU should be deleted. Refer to “3.13.3(7) Delete Pair Operation”.

(d) Vary all R-VOLs online (Step 3)

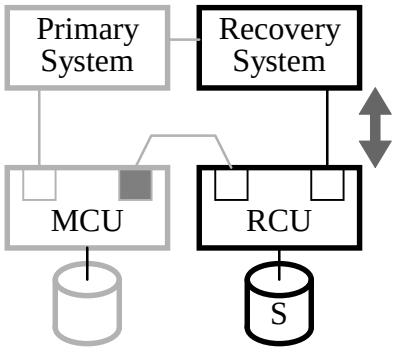
In the case of the OS IPL, execute the “Clear SIM” operation at the SVP or the RMC before OS IPL. Refer to “2.23.19 Clear reported SIM” Operation.

Copyright ©1998,2000, Hitachi, Ltd.

(3) Disaster Recovery Procedures - Returning to the Primary Site

(a) Summary

⓪



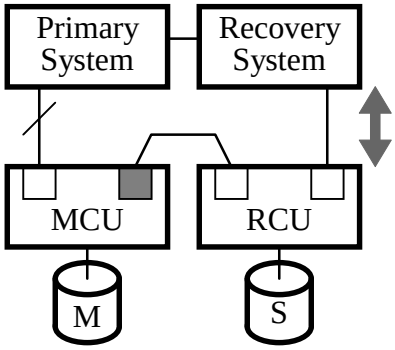
Applications are working at the recovery system.

①

Step1: Make the components in the primary system operable.

Repair Actions

Repair Actions



②

Step2: Terminate the HRC settings remaining in the MCU.

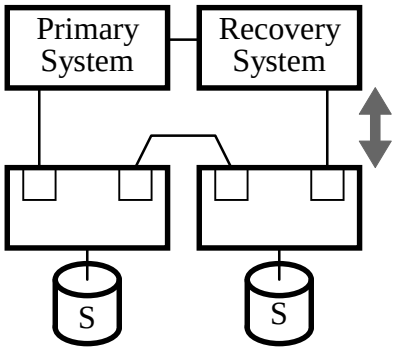
(1) Delete Pair: Delete all HRC volume pairs.

(2) Delete RCU

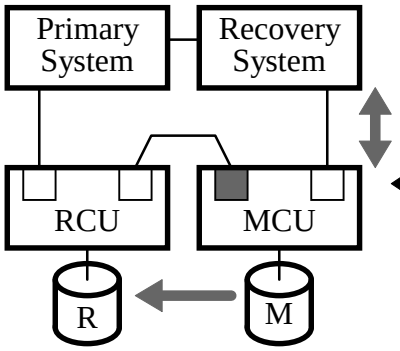
(3) Port: Change from RCP to LCP mode.

➔ Refer to 3.13.5(3)(b)

Delete Pair
Delete RCU
Port



③



Port
Add RCU
Add Pair

Step3: Establish HRC with the reverse direction

(1) Port: Change from LCP to RCP mode.

(2) Add RCU

(3) Add Pair

➔ Refer to 3.13.5(3)(c)

(b) Terminating the HRC Settings Remaining in the MCU (Step2)

After the DKC310I subsystem becomes operable, the remaining registration of the HRC volume pairs and the RCU should be deleted by performing the Delete Pair operation and Delete RCU operation respectively.

To complete the Delete Pair operation, the “delete pair unconditionally” option is required because the original R-VOLs do not belong presently to any HRC volume pairs. The MCU will change the specified M-VOLs into “simplex” state without checking the current status of the corresponding R-VOLs.

Specified “Delete Pair by Force” option and “Delete All Pairs” option the all volume pairs in the same RCU should be deleted.

Note that the status of M-VOLs may be “Suspended (Delete Pair to RCU)” because of Delete Pair operation issued to the RCU in step 2 of “3.13.5(2) Disaster Recovery Procedures - Switching to the Recovery System”. It is normal condition in this situation.

Before performing the Delete RCU operation, all HRC volume pairs must be deleted.

If you want to use same remote copy connections for step 3, the serial interface ports which have been set to the RCP mode should be changed to the LCP mode by the Port operation.

(c) Establish HRC with the Reverse Direction (Step3)

The HRC volume pair should be established with the reverse direction to synchronize the original M-VOLs with the original R-VOLs. The procedures for this step are same as those described in “3.13.4(1) Setting Up HRC Volume Pairs”. Note that the DKC310I subsystems in the original primary site and the recovery site are treated as the RCUs/R-VOLs and the MCUs/M-VOLs respectively.

Do not select “only out-of-sync cylinders” or “none” parameter to the Add Pair operations. The volumes in the original primary site are now behind the volumes in the recovery site. Furthermore the updates to the volumes in the recovery site have not been accumulated in cylinder bit map.

Copyright ©1998,2000, Hitachi, Ltd.

(d) Terminate Applications and HRC Settings at the Recovery Site (Step 4~6)

HRC settings with the reverse direction must be deleted after halting the applications in the recovery site (step 4) and confirming that all HRC volume pairs are in “duplex” state (step 5).

Specified “Delete Pair by Force” option and “Delete All Pairs” option the all volume pairs in the same RCU should be deleted.

If you want to use same remote copy connections for step 7, the serial interface ports which have been set to the RCP mode should be changed to the LCP mode by the Port operation.

(e) Establish HRC Pair with the Original Direction and Start Applications (Step 7)

The HRC volume pair should be established with the original direction to synchronize the original M-VOLs with the original R-VOLs. The procedures for this step are same as those described in “3.13.4(1) Setting Up HRC Volume Pairs”.

Do not select “only out-of-sync cylinders” or “none” parameter to the Add Pair operations. The volumes in the original primary site are now behind the volumes in the recovery site. Furthermore the updates to the volumes in the recovery site have not been accumulated in cylinder bit map.

Copyright ©1998,2000, Hitachi, Ltd.

3.13.6 Data Migration Procedure by HODM

(1) Data Migration Scenario

There are two possible data migration scenarios, **volumes by volumes** data migration and **subsystem to subsystem** data migration.

(a) Volumes by Volumes Data Migration

As shown in Fig. 3.13.6-1, only selected volumes are migrated by HODM at once. Other volumes in the existing disk subsystem should be accessed through the existing channel paths. After completing the migration copy for the selected volumes, another selected volumes can start being migrated.

The typical migration procedures are as follows:

① Define the volumes in DKC310I subsystem for the different volumes from the existing volumes in the I/O generations.
② Establish the remote copy connections between the existing disk subsystem and DKC310I subsystem
③ Connect the DKC310I subsystem to the host processor with different channel paths. Leave all volumes in the DKC310I subsystem offline from the host processors.
④ Vary offline the selected volume in the existing subsystem, for example A80~A83.
⑤ Start HODM for the selected volumes, for example device 00~03.
⑥ Vary online the corresponding volumes in DKC310I subsystem, for example C00~C03.
⑦ After completing HODM for device 00~03, continue procedures ④ to ⑥ for another volume group, for example A84~A87 and C04~C07.

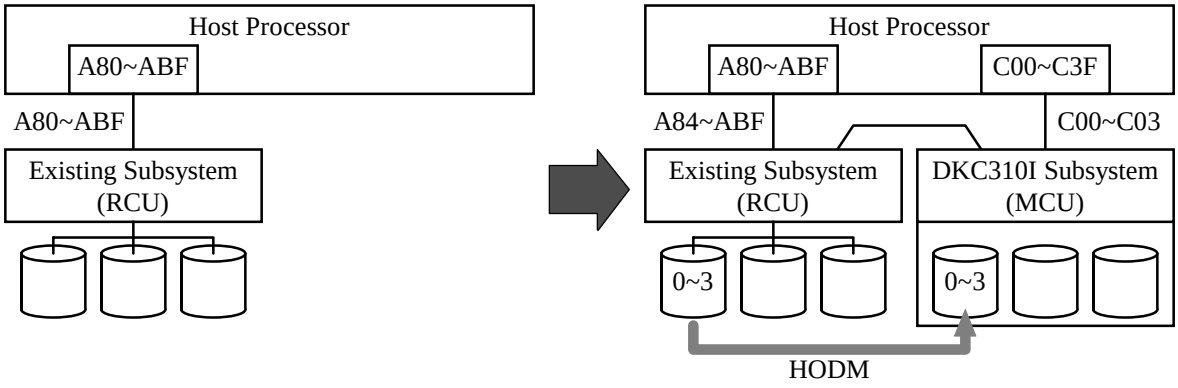

Fig. 3.13.6-1 Volumes by Volumes Data Migration

In this scenario, the I/O generations for the volumes in the DKC310I subsystem and the repeated operations for each volume group must be permitted. The performance degradation, instead, may be lower than the subsystem to subsystem migration scenario. Additionally, if the data migration failed, the existing volumes, A80~A83 for example, could return to be accessible in the short recovery time.

To perform this scenario, the restrictions described in (note) should be especially considered.

Copyright ©1998, Hitachi, Ltd.

(note)

HODM can migrate data between volumes of which device address are different. However HODM does not translate their device addresses for the I/O operations from the host processors.

Fig. 3.13.6-2 shows an example where device 05 are being migrated to device 00 by HODM and device 05 in the DKC310I subsystem does not belong to any HODM volume pair. Responding to read I/O operations directed to device 00, the DKC310I subsystem provides the data which have been stored in device 05 in another disk subsystem. It also provides the data from device 05 in the DKC310I subsystem for I/O operations directed to device 05.

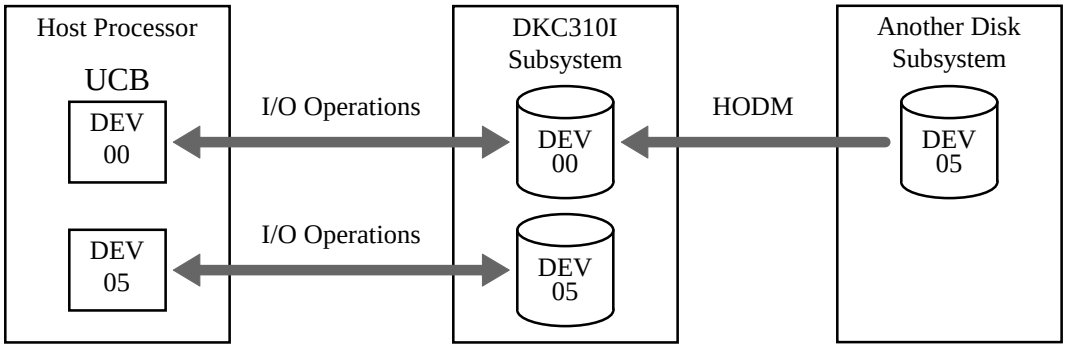

Fig. 3.13.6-2 HODM between Deferent Device Addresses

Customers' JCLs, catalogues and application programs should be modified if they depend on device address and HODM between different device addresses must be configured.

(b) Subsystem to Subsystem Data Migration

As shown in Fig. 3.13.6-3, all volumes in the existing disk subsystem are migrated at once.

The typical migration procedures are as follows:

① Vary offline all volume in the existing disk subsystem, A80~ABF for example.
② Disconnect the existing disk subsystem from the host processor.
③ Establish the remote copy connections between the existing disk subsystem and DKC310I subsystem.
④ Connect the DKC310I subsystem to the host processor with the same channel paths.
⑤ Start HODM for the all volumes, for example device 00~3F.
⑥ Vary online all volumes in DKC310I subsystem, for example A80~ABF.

In this scenario, the additional I/O generation may not be needed, except for restrictions described in (note). And the operating procedures are simple. However the performance during HODM could become worse than volume by volume data migration. And the error recovery procedures would be relatively complex.

Copyright ©1998, Hitachi, Ltd.

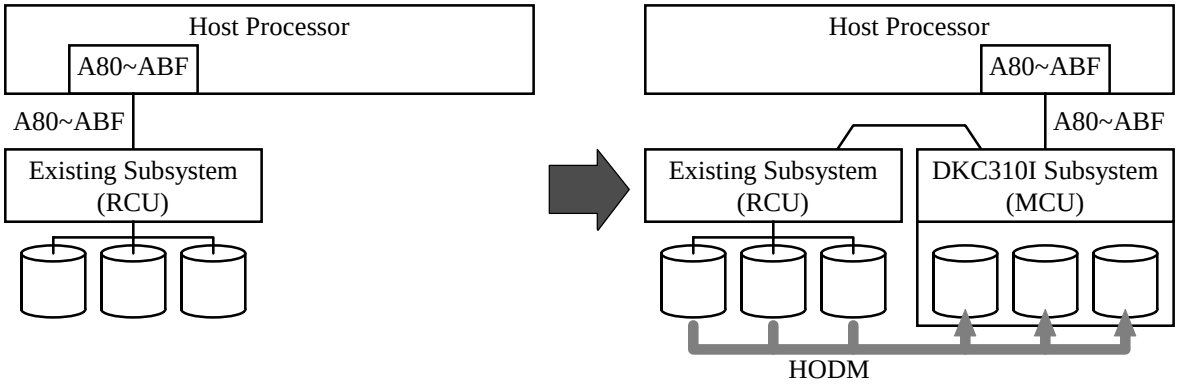

Fig. 3.13.6-3 Subsystem to Subsystem Data Migration

(note)

HODM does not emulate the device/control unit characteristics of the R-VOL/RCU. Responding to I/O operations from host processors, the DKC310I subsystems always provides device model, device serial number, control unit model, control unit serial number, subsystem ID and other device/control unit characteristics of the M-VOL/MCU itself.

Copyright ©1998, Hitachi, Ltd.

(2) Ordinary HODM Procedures

(a) Sequence of Operations

Ordinary sequence of operations is shown below.

Table 3.13.6-1 HODM Sequence of Operations

Procedure		Operation	
		SVP*	Others
1	Set appropriate serial interface port to the RCP mode.	Port	
2	Establish logical paths to the existing disk subsystem.	Add RCU	Before this procedure, DKC310I subsystem and the existing disk subsystem must be physically connected.
3	Ensure that the M-VOLs and the R-VOLs are offline from host processors		If necessary, perform the following system command. <In case of MVS system> • VARY OFFLINE <In case of VM system> • VARY OFFLINE from guest OS • VARY PATH OFFLINE from VM
4	Establish HODM volume pairs.	Add Pair	
5	Bring the M-VOLs online.		VARY ONLINE system command, If necessary.
6	Start the customer's application.		
7	Confirm that the migration copy has been successfully completed.	Pair Status	
8	Start erasing the R-VOLs, if required.	R-VOL Erase	
9	Confirm that the erasing the R-VOLs has been successfully completed. Status of the HODM volume pair will be changed to "simplex" state when the R-VOL erasing is completed.	Pair Status	
10	Remove logical paths to the existing disk subsystem.	Delete RCU	The existing disk subsystem can be physically removed after this procedure.

* : Operated from the SVP/remote console

For the volumes by volumes data migration scenario, procedure #3 to #9 should be performed for only the selected volumes.

For the subsystem to subsystem data migration scenario, procedure #3 to #9 should be performed for all volumes in the existing disk subsystem.

Copyright ©1998,1999, Hitachi, Ltd.

(b) Device Online/Offline from Host Processors

Be sure to keep the following sequence of procedures to ensure data consistency of the HODM volume pair:

- The R-VOLs must be varied offline *before* the Add Pair operation. If the R-VOLs are still online and write I/Os are issued to R-VOLs, the updated data may not copied to the M-VOLs.
- The corresponding M-VOLs must be brought online *after* the Add Pair operation has successfully completed. For the I/O operations to the M-VOLs before starting the migration copy, the old data on the M-VOLs may be read or the updated data may be overlaid by the migration copy.

To check the second requirement described above, the Add Pair operation is be rejected if the specified M-VOL belongs to any path group.

(c) Confirming HODM Volume Status

By the Pair Status operation, the MCU can display the status of the specified volume pair.

- If the migration copy has been successfully started, the status of the M-VOL will turn to "Pending Duplex" state.
- If the migration copy has been successfully completed, the status of the M-VOL will turn to "simplex (migration complete)" state.
- If the erasing the R-VOL has been successfully started, the status of the M-VOL will turn to "simplex (erasing in progress)" state.
- If the erasing the R-VOL has been successfully terminated, the status of the M-VOL will turn to "simplex" state (without sub-status).

Refer to "3.13.2(5) HODM Volume Status" for more detailed description.

(d) Controlling Migration Copy Activities

Concerning to the I/O performance during HODM, following factors must be considered:

- Copy activities use the subsystem performance resources
- The restore copy and the update copy make I/O response time of the M-VOL longer

Note: Refer to "3.13.2(3) HODM Copy Activities" for the "restore copy" and the "update copy".

To control these factors, the "maximum initial copy activities" parameter and "priority" parameter can be specified. The first parameter controls the number of volumes for which the migration copy are concurrently executed. The second parameter specifies the executing order of the migration copy on volume pair basis.

Refer to the following example and "3.13.3(1) Add RCU Operation" and "3.13.3(6) Add Pair Operation" for detailed description about these parameters.

Copyright ©1998,1999, Hitachi, Ltd.

Example
Conditions:
- The Add Pair operation specifies HODM to M-VOLs 00~05.
- "Maximum initial copy activities" is set to "4" (this is the default value).
- "Priority" parameters for devices 00~05 are set to "3", "5", "5", "1", "4", and "2" respectively.

Under the above conditions, the MCU will performs the migration copy:
- for devices 00, 03, 04 and 05 immediately.
- for device 01 when one of the migration copy has been terminated.
- for device 02 when the migration copy for the second device has been terminated.

To the R-VOL erasing operations, "maximum initial copy activities" and "priority" parameters are not applied.

(3) Canceling and Restarting HODM

1) Canceling HODM

The Suspend Pair operation and the Delete Pair operation can terminate the migration copy the R-VOL erasing for the specified volume. The deference between "suspend" and "delete" is:

- When the HODM volume pair is suspended, before the migration copy being complete the MCU still executes the restore copy and/or the update copy responding to I/O operations to the M-VOL.
- When the HODM volume pair is deleted, the MCU reads/write the data only on the M-VOL (even through it is not fully identical to the R-VOL)

Therefore, if you want to "delete" the HODM volume pair *before* completing the migration copy;
- The I/O operations to the M-VOL *must be previously quiesced*, for example, by VARY OFFLINE command.
- The M-VOL will *never be reused* by the applications until another migration copy to the M-VOL will successfully complete or the M-VOL will be completely initialized.

To check the first requirement described above, the Delete Pair operation without "unconditional" option is rejected if the M-VOL is not in "simplex (migration complete)" status and the M-VOL belongs to any path group.

Note: The Delete Pair operation with "unconditional" option will be accepted regardless of status and path group of the M-VOL.

HODM keeps the data consistency on R-VOL until the migration copy will complete. So the R-VOL can be used to resume the quiesced applications.

Copyright ©1998, Hitachi, Ltd.

2) Restarting HODM

All of the updates to the M-VOL are copied to the R-VOL while the HODM volume pair is in "pending" or "suspended" status. Therefor, the Resume Pair operation can resume the migration copy for the "suspended" HODM volume pair. Only cylinders which have not copied yet will be copied by the resumed migration copy. In this case, the M-VOL need not to be varied offline from host processors before restarting HODM.

Note that the updates to the M-VOL are not copied to R-VOL once the migration copy is completed or canceled by the Delete Pair operation. Therefore *never* restart HODM for the volumes if;

- the migration copy have been successfully completed or canceled by the Delete Pair operation and;
- some updates have been issued to the M-VOL after completion of the migration copy or deleting the HODM volume pair.

You should confirm the volume status at the time of deleting the HODM volume pair to prevent this problem from occurring.

The R-VOL Erase operation can restart the R-VOL erasing which has been terminated due to the Suspend Pair operation, MCU being powered off or erasing failure.

(4) HODM Error Recovery Procedures

(a) Actions of MCU for Unrecoverable Failures

When the MCU detects an error conditions on copy activity, it retries the failed copy activity. If the failure can not be recovered in the specific time of retries, the MCU executes the following actions:

- Turns the status of the M-VOL to "suspended" state.
- Stops the migration copy for this volume pair.
- Generates the service information message (SIM) which indicates that the HODM volume pair has been suspended. This SIM will be reported to the host processor when the next I/O operation will issue to the M-VOL.
- Generates the internal sense information. The SVP of the MCU will store the sense information into SSB LOG file. The sense information may include the 32 bytes of sense data which have been reported from the RCU.
- Reports unit-check to the host processor channel if the failure have been occurred on the restore copy or the update copy activity. The sense data to the host processor indicates an "equipment check".

The MCU will still try to execute the restore copy and the update copy when the subsequent I/O operations require to do them. If the restore copy and the update copy can be successfully completed, the I/O operations will continue. If the restore copy or the update copy encounters the failure, an equipment check will be reported again.

Copyright ©1998,1999, Hitachi, Ltd.

(b) Error Recovery Procedures

Error recovery procedures are shown bellow:

① Quiesce customer's applications to access the failed volumes.
② Delete the failed HODM volume pair by the Delete Pair operation
③ Decide the failed portion by referring the sense information generated by the MCU.
④ Recover the failed portion according to the related sense information
⑤ Restart HODM volume pair
⑥ Resume the quiesced applications

Basically, the procedure ④ is similar to that which is currently performed for non-HODM disk subsystem except that the failed portion may be included in the existing disk subsystem. If the 32 bytes of sense data from the existing disk subsystem has been logged in the MCU, analyzing the sense data should be analyzed at procedure ③.

Be sure that procedure ⑤ will be performed only for the volumes for which the migration copy have been is progress. Refer to "3.13.6(3) Canceling and Restarting HODM" for restarting procedure and its cautions.

Copyright ©1998,1999, Hitachi, Ltd.

3.13.7 Guard Concept for Maintenance Operation in HRC/HODM

(1) In this maintenance manual.....
SVP requires Password input for each setting operation. In each paragraph of this maintenance manual, we does not describe the password operation. If SVP requires to input password, please call TSC what the password is.

(2) Basic concept for password.
HRC / HODM applications which are installed in the SVP have guard process especially if the operator selects a button to execute HRC/HODM setting (Edit path, Add Pair, Delete Pair..). SVP requires the password input. These operations must be concerned with the direct access to customer data. So it is very dangerous operation for the system so that SVP needs guard operation.

(3) summary table
We arranged these concept as the following table.

#	Button (Function)	Operation which needs a password input
1	Add RCU	Y
2	Edit Path	Y
3	Delete RCU	Y
4	RCU Option	Y
5	RCU Status	N
6	Add Pair	Y
7	Delete Pair	Y
8	Pair Option	Y
9	Pair Status	N
10	Suspend Pair	Y
11	R-Vol Erase	Y
12	User	— (*1)
13	Usage	N
14	Connect	— (*1)
15	Port	* (*2)
16	Renew	N
17	Exit	N
	Explanatory notes	Y : It's necessary to input password. The all password are fixed N : Not necessary to input password * : It's necessary to input password when the operator uses some setting function. — : It is not supported(Displayed as gray color),

(*1) "User" and "Connect" functions are supported in the remote console application only. In the SVP, these button is displayed as gray to guard.
(*2) SVP does not require the password input at the first button selection. If the user selects port changing function (LCP-RCP), SVP requires the password input.

Copyright ©1998, Hitachi, Ltd.

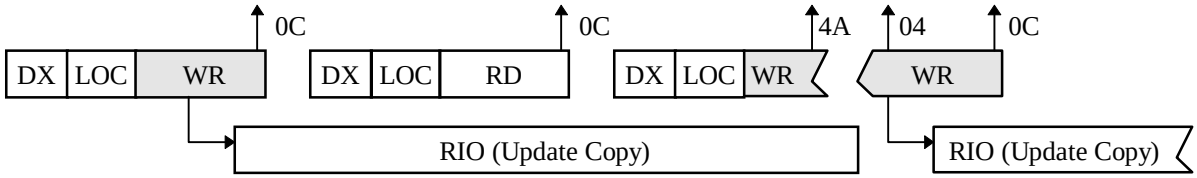
3.13.8 Outline & Specification of SemiSynchronous HRC

On the HRC Update copy operation accompanied HOST I/O, former operation which the Remote I/O is executed during CHL END & DEV END split to the HOST is called Synchronous Copy Mode. (Sync Copy). HRC supports new operation called SemiSynchronous Copy Mode. (SemiSync Copy)

(1) Write operation of SemiSynchronous HRC

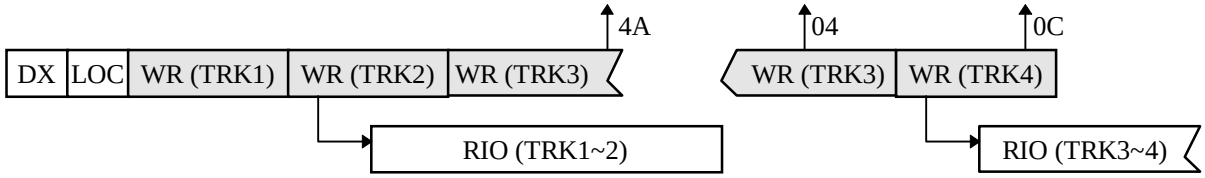
(a) Basic Operation of SemiSync Copy

- At final Write command in the Locate Domain, MCU reports DSB=0C (CHL END & DEV END) instead of DSB=08 (CHL END), then MCU issues Remote I/O.
- MCU accepts and performs subsequent I/O except WRT command, even if the preceding Remote I/O is still proceeding and has not completed yet. (In case of Read I/O to the same Track, MCU waits until the Slot is free. ; Slot Busy.)
- When MCU accepts the WRT I/O to the Device, if the preceding Remote I/O has not completed yet, the Write I/O waits by CMD Retry until the Remote I/O will be complete.



(b) Exception

Even if the HRC pair is specified SemiSync Copy mode, microprogram behave the I/O as Sync Copy mode in case that MCU issues Remote I/O during DSB=4A Retry.



(c) The order of Update Copy Schedule

Remote I/O of SemiSync Update Copy is arbitrary performed according to MCU internal algorithm. That is, Update Copy to R-VOL is issued by independent timing of the order of Write I/O to each devices.

(d) The opportunity of reporting SSB detected by Remote I/O operation

If Remote I/O of SemiSync Update Copy detects and creates some error SSB, MCU reports the SSB as asynchronous SSB at the first connection to the HOST. (At the timing of Req-Con and CHL initiate I/O.)

1) In case that MCU reports the Unit CHK at the Req-Con, the SSB which is created in Remote I/O attributed to preceding Write I/O may be reports during new CCW CHN.

2) CCHH in the SSB shows the CYL/HD# on which Update Copy is executing, it is not relating to the CYL/HD# executing HOST command.

Note; All of SSB created by Remote I/O are EQC, therefore above 1), 2) do not affect the OS Recovery procedure.

Copyright ©1998, Hitachi, Ltd.

(2) Sync/SemiSync mode setting and display

(a) Definition

- The mode permit above Update Copy operation is defined as SemiSync mode. The mode restricts only Sync Update Copy is defined as Sync mode. (prior HRC)
- The both mode is defined as attribute of HRC pair, it is possible to set to each HRC pair independently.
- It allows to intermixing the Sync and SemiSync mode pair in one of MCU/RCU relation.

(b) Setting of the mode (Sync/SemiSync) ; Refer to “SVP SECTION 4.7 Add Pair... screen”.

1) Add Pair operation
   Add Pair parameter ;
   M-VOL(LDEV#), R-VOL(LDEV#), priority, RCU(Serial#, SSID), Initial Copy ={Entire Volume/None}, Update Copy={Synchronous Mode/Semi-Synchronous Mode}
   Note; The default is Sync. mode.
2) Mode Change
   It is only allowed in case of Resume Pair. If operator would like to change the mode, it is necessary to suspend the pair.
3) PPRC command
   In case of ESTPAIR from host, Sync. mode is set on as default.

(c) Display of the Pair Status

1) SVP Display
   Refer to “SVP SECTION 4.1.1 HRC Main screen”. On HRC & HODM Main Control Screen, the mode is displayed at column “Type”, “RDC0[x]” means Sync mode, and “RDC1[x]” means SemiSync mode.
2) PPRC command
   Display of CQUERY is same as current specification. Sync/SemiSync is not displayed.

(d) Others

1) In case of SemiSync, other parameter and pair option (Initial Copy, Initial Copy Pace, M-VOL Fence Level, CFW Data, DFW to R-VOL) are possible to set independently, and they function as same as Sync Mode.
2) DELPAIR and SUSPEND from both of SVP and PPRC command are treated as same as current specification.

(e) Usage

The count of command retry due to waiting SemiSync Update Copy completion is newly added to Usage screen.

(3) HRC SIM

MCU distinguishes to report the Reference Code of HRC Pair SIM from Sync and SemiSync.

REF CODE= D4xx ; Sync Mode
REF CODE= DCxx ; SemiSync Mode

Copyright ©1998,1999, Hitachi, Ltd.

(4) Application

(a) Pair Status

SemiSync Copy operation is available only Duplex Avail status. That is, even if SemiSync mode is specified at Add Pair operation, Update Copy is performed as synchronous during Pending Duplex.

Copyright ©1998, Hitachi, Ltd.

3.14 HMRCF & HOMRCF

3.14.1 HMRCF

3.14.1.1 Overview

(1) Main object
1) Reduce Backup time.
2) Easy testing with the data which applications are actually using before system upgrade.

(2) Function Outline
1) Making a duplicated volume.
2) There is no conflict on volume, because the duplicated volume is on another physical storage.
3) Three destination volumes can be with one master volume.
Those three pairs can split independently each other.
4) HMRCF (Hitachi Multiple RAID Coupling Feature) can be controlled by PPRC Command interface.

Table 3.14.1.1 Outline of HMRCF

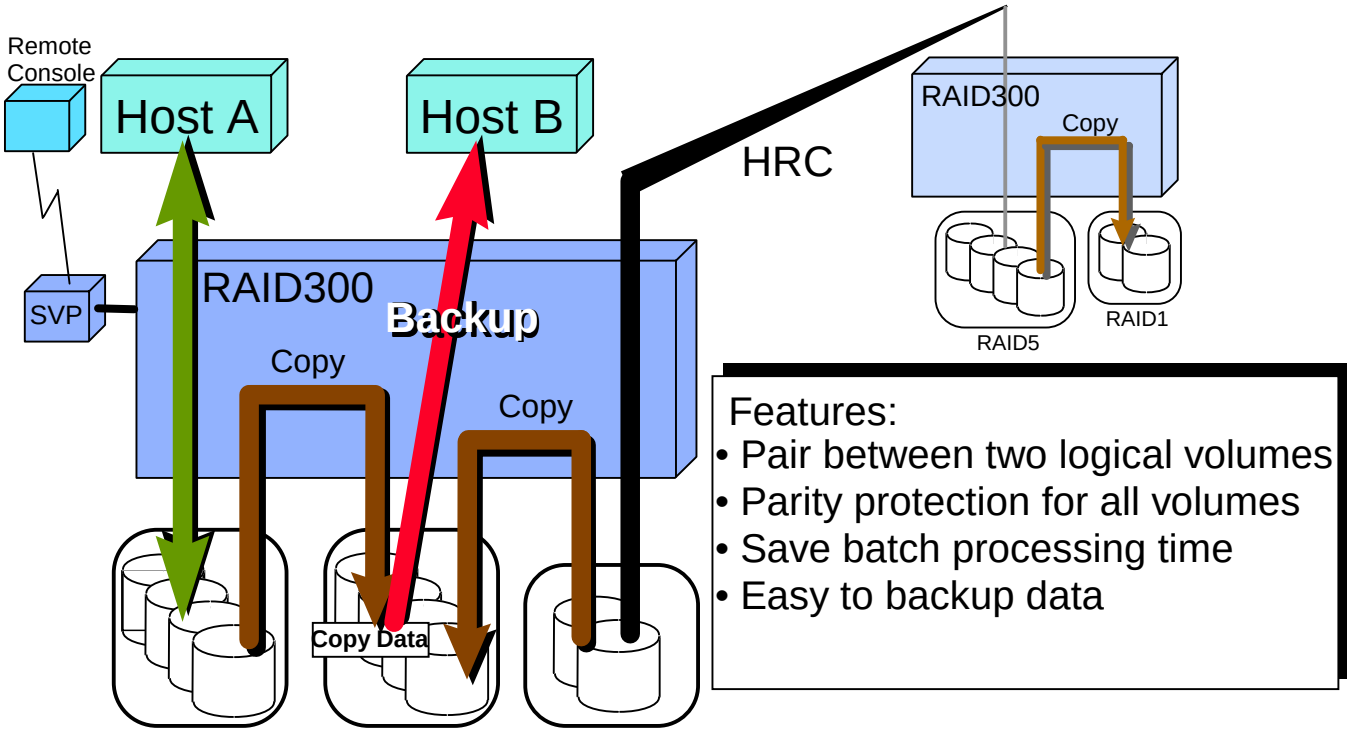
No.	Items	Specification
1	Coupling object	One logical volume (LDEV)
2	Support emulation type of LDEV	3390-1/2/3/3R/9, 3380-J/G/K, NF80-K
3	Requirement for create a pair	(1) Pair LDEVs have to be a same track format and same capacity. (2) Pair LDEVs have to exist in a same subsystem. (3) It is not possible to share a destination volume at same time.
4	Support of CVS(Customized Volume Size)	Supported
5	Combination of RAID level between master volume and destination volume	RAID1←→RAID1 RAID5(3D+1P)←→RAID5(3D+1P) RAID5(6D+1P)←→RAID5(6D+1P) RAID5(3D+1P)←→RAID5(6D+1P) RAID5(3D+1P)←→RAID1 RAID5(6D+1P)←→RAID1
6	Data protection	There is a parity protection for both master volume and destination volume.
7	RESYNC pattern	From Master Volume data to destination volume
8	Time for transition from Duplex to Split.	3 min./VOL(3390-3) without IO (Depend on the number of pairs and the load of DKC)
9	When the destination volume can be accessed from HOST.	The destination volume can be accessed at only Split status.

Copyright ©1998,2000, Hitachi, Ltd.

10	Cooperation with HRC/XRC	HMRCF : Supported The master volume of HMRCF can be a M-VOL or R-VOL of HRC.
11	Cooperation with HODM	It is not supported.

⚠ CAUTION

Copy process is done asynchronously with HOST i/o according to differential bit map.
Differential bit map is recorded on shared memory. So if shared memory is lost by offline micro exchange or volatile PSon etc., DKC lost differential bit map.
In these cases DKC treat as whole volume area has differential data, so copy process will take longer time than usual. And if the pair is SPLIT-PEND status, the pair become SUSPEND status because lost of differential bit map.



Copyright ©2000, Hitachi, Ltd.

3.14.1.2 Construction of HMRCF

- HMRCF can be controlled from SVP, Remote Console and HOST.
- DKA with LA exchange have to be exist in the subsystem.

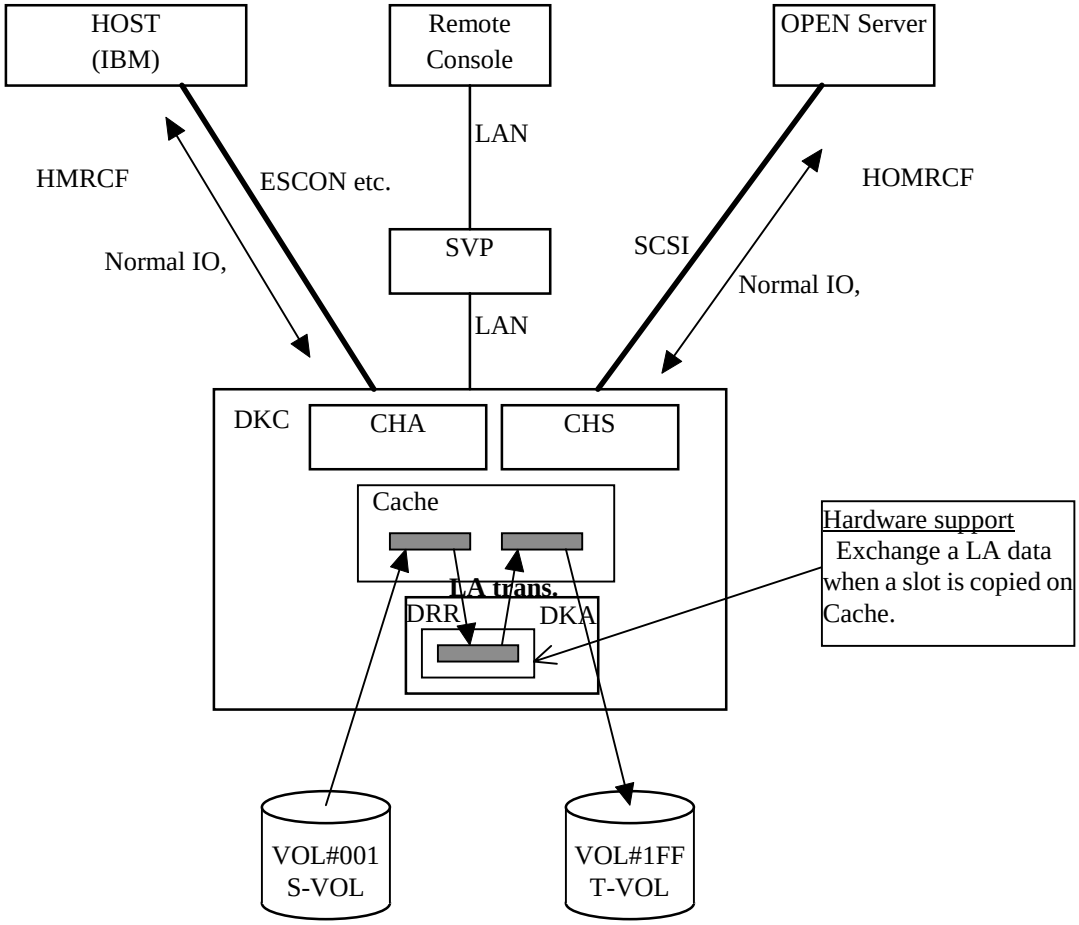


Fig. 3.14.1.2 Construction of HMRCF

Copyright ©2000, Hitachi, Ltd.

3.14.1.3 Status transition

Table 3.14.1.3 Status of HMRCF

No.	Status	Definition
1	Simplex	There is no pair with the volume.
2	Pending	At this status, there is a job to copy the data from the master volume to the destination volume.
3	Duplex	The copy from master to destination is finished. The destination volume can not be accessed from HOST.
4	Split Pending	At this status, there is a job to copy the differential data from the master volume.
5	Split	The pair is splited. The destination volume can be accessed from HOST. At this status, the position of write data from the HOST is recorded on a bitmap to reduce the copy time on RESYNC.
6	Resync	There is a job to copy the differential data from master to destination.
7	Suspend	(1) There is an error with the pair. (2) After a running copy job was stopped by operation of SVP, the pair status is “suspend”.

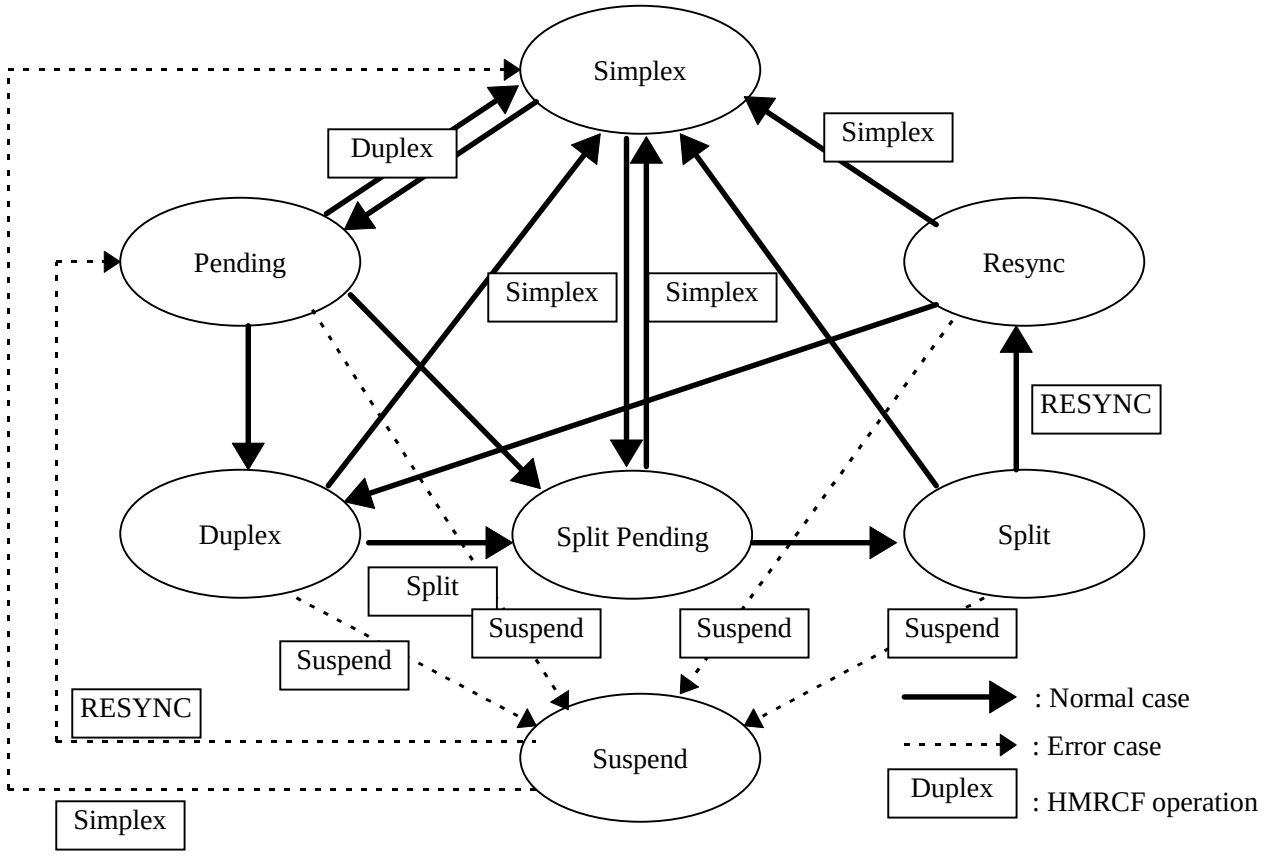

Fig. 3.14.1.3 Status transition map

Copyright ©2000, Hitachi, Ltd.

3.14.1.4 Interface

(1) Outline

HMRCF support a command set to control HMRCF functions.
This command set is a common interface in a subsystem. So the command from different HOST is translated to HMRCF command at each command process.

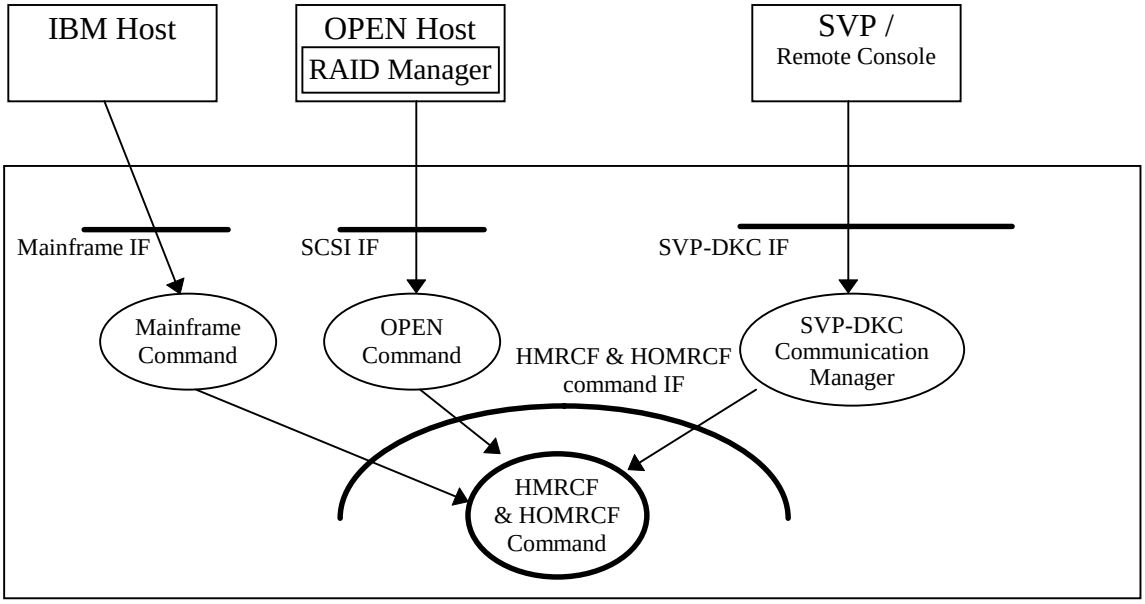

Fig. 3.14.1.4 Outline of HMRCF IF

(2) HMRCF operation

Table 3.14.1.4 HMRCF operation

No.	Command	Operation
1	Duplex	Create a pair and start initial copy
2	Split	Split the pair
3	RESYNC	Resume the pair and start differential copy
4	Simple	Delete the pair
5	Suspend	Suspend the pair action
6	Status Check	Requirement for status information
7	Reserve	Marking and Unmarking the volume for a candidate of destination volume

3.14.1.5 Reverse-RESYNC

(1) Reverse-RESYNC Function

The Reverse-RESYNC function is an extension of the RESYNC function of the MRCF.

When a pair in the Split status is requested to perform the Reverse-RESYNC, the differential data between the target volume and the source volume is copied to the source volume from the target volume.

When a pair in the Suspend status is requested to perform the Reverse-RESYNC, the whole data of the target volume is copied to the source volume.

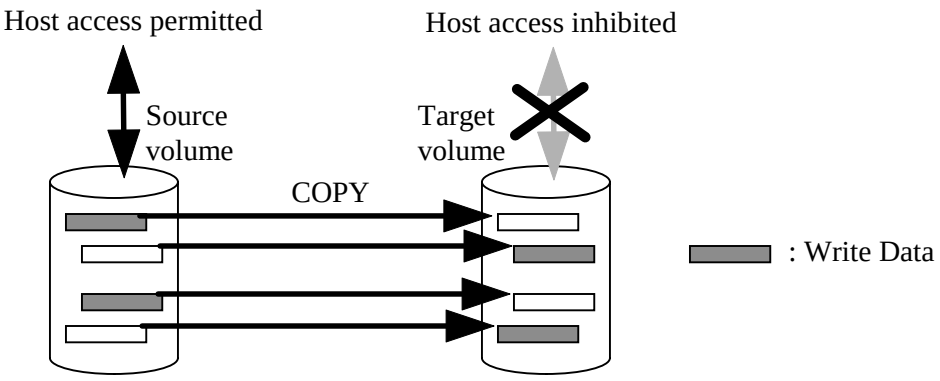

Fig. 3.14.1.5-1 Normal RESYNC Process

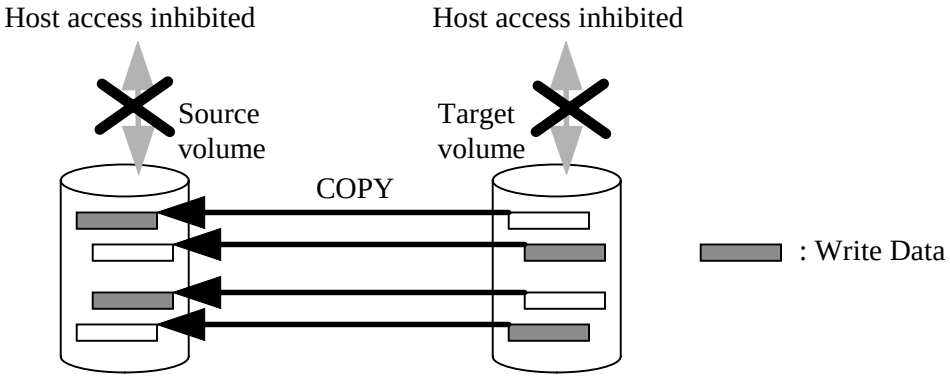

Fig. 3.14.1.5-2 Reverse RESYNC Process

Copyright ©2000, Hitachi, Ltd.

(2) Specifications

No.	Item	Description
1	RESYNC copy pattern	• The data of the target volume is copied to the source volume. • The copy pattern can be selected by specifying a unit of operation. Specified operation unit : SVP/RMC: In units of pair operation at a time
2	Copy range	• In the case of the Reverse-Copy in the Split status, range for merging writing into the regular and target volumes • In the case of the Reverse-Copy in the Suspend status, whole volume
3	Copy format	• Same format as that of a copy in the Duplex status
4	Applicable LDEV type	• 3390-1, 2, 3, 3R, and 9, 3380-J, G, and K, and CVSs of them
5	Host access during copying	• Source volume: Reading and writing disabled • Target volume: Reading and writing disabled
6	Specification method	• SVP/RMC: Add a specification for the RESYNC pattern onto the Pair Resync screen.
7	Conditions of command reception	• The pair concerned is in the Split or Suspend status. • Another pair sharing the source volume is in the Suspend or Split status. → If this condition is not satisfied, the CMD RJT takes place. • When the Reverse-Resync is being executed by another pair which is sharing the source volume, it is impossible to change the pair status of the pair concerned. (However, the pair deletion and pair suspension requests are excluded.) • The source volume of the pair concerned has no pair of the HRC or in the Suspend status. (See Item No.13 in this table.)
8	Status display during copying	• SVP/remote console Pair status display: RESYNC-R (RESYNC is currently displayed.) The display of the attribute, source or target, is not changed.
9	Condition after the copying terminates normally	• The pair concerned enters the Duplex status. • The conditions of the host access after the status transition are shown below. Source volume: Reading and writing enabled Target volume: Reading and writing disabled

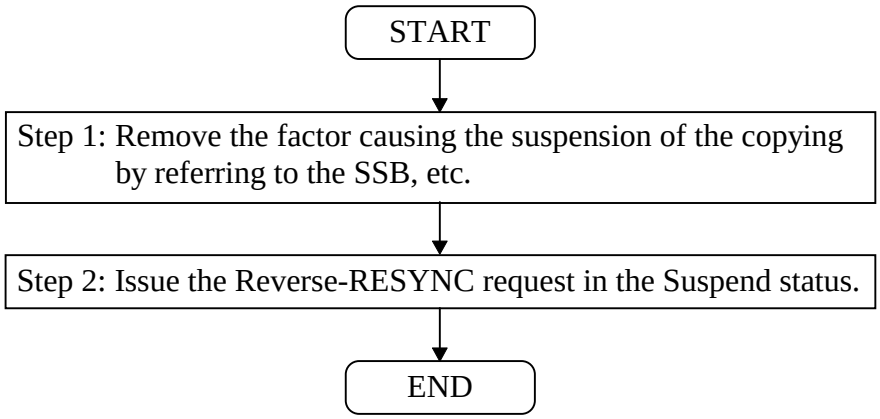
Copyright ©2000, Hitachi, Ltd.

10	Effects on another pair	In another pair sharing the source volume, the part actually copied becomes the difference after execution of this function. Example: Pair of the other target volumes in the 1:3 configuration
11	Operation when the copying terminates abnormally	(1) The pair concerned enters the Suspend status. (2) The source volume of the pair concerned is enabled to read and write. → Data is not assured. The target volume of the pair concerned is disabled to read nor write in the case of the main frame volume and disabled to write in the case of the open volume. (3) The status of a pair sharing the source volume is not changed.
12	Operation when a suspension request is received during copying	Same as above
13	Relation to the HRC	• In the case where “M-volume of the HRC” = “Source volume of the MRCF” → The Reserve-Resync cannot be executed. (Command Reject) • In the case where “R-volume of the HRC” = “Source volume of the MRCF” → The Reserve-Resync cannot be executed. (Command Reject) • In the case where “Target volume of the MRCF” = “M-VOL of the HRC” → The Reserve-Resync cannot be executed. (Command Reject) • A pair of the HRC cannot be created with the volume of the MRCF executing the Reserve-Resync. (Command Reject)

Copyright ©2000, Hitachi, Ltd.

(3) Action to be taken when the pair is suspended during the Reverse-RESYNC
The recovery procedure to be used when the pair executing the Reverse-RESYNC is suspended owing to some problem or it explicitly placed the Suspend status by a command from the SVP/remote console is explained below.

(a) Case 1: A case where the Suspend status can be recovered without deleting the pair concerned
This is equivalent to a case where the pair encounter an event that copying cannot be continued owing to a detection of pinned data or a staging time- out.
Or, it is equivalent to a case where the pair explicitly placed in the Suspend status by a command.
<<Recovery procedure>>



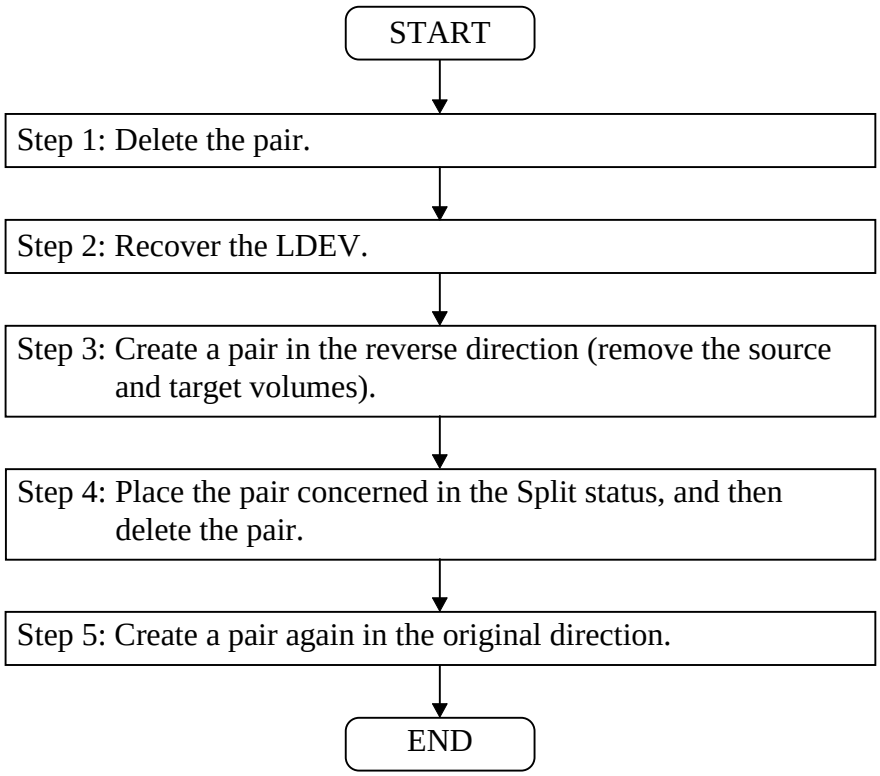
Copyright ©1998,2000, Hitachi, Ltd.

(b) Case 2: A case where the Suspend status cannot be recovered unless the pair concerned is deleted

This is equivalent to a case that the LDEV is blocked.
To recover the blockade of the LDEV, an LDEV formatting or LDEV recovery is required. Both of them cannot be executed in the state that the MRCF pair is created. (A guard works against it.) Therefore, delete the pair once, recover the LDEV, and then create the pair once again.
However, care should be taken because, in the pending state, the data of the source volume is copied to the target volume if simply create the pair again. Recover the blockade following the procedure below.

The following procedure is applicable just to a restoration of the source volume using the target volume. A procedure for directly restoring the source volume when the target volume is blocked is not included.

• Case 2-1: A case where the source volume is blocked
<<Recovery procedure>>



Copyright ©2000, Hitachi, Ltd.

• Case 2-2: A case where the target volume is blocked

A recovery procedure for restoring data of the target volume is added because the copy source of the Reverse-RESYNC cannot be accessed.

<<Recovery procedure>>

3.14.2 HOMRCF

3.14.2.1 Overview

(1) Main object
1) Reduce Backup time.
2) Easy testing with the data which applications are actually using before system upgrade.

(2) Function Outline
1) Making a duplicated volume.
2) There is no conflict on volume, because the duplicated volume is on another physical storage.
3) Three S-VOL can be with one P-VOL.
Those three pairs can split independently each other.
4) HOMRCF (Hitachi Open Multiple RAID Coupling Feature) can be controlled from RAID Manager.

Table 3.14.2.1 Outline of HOMRCF

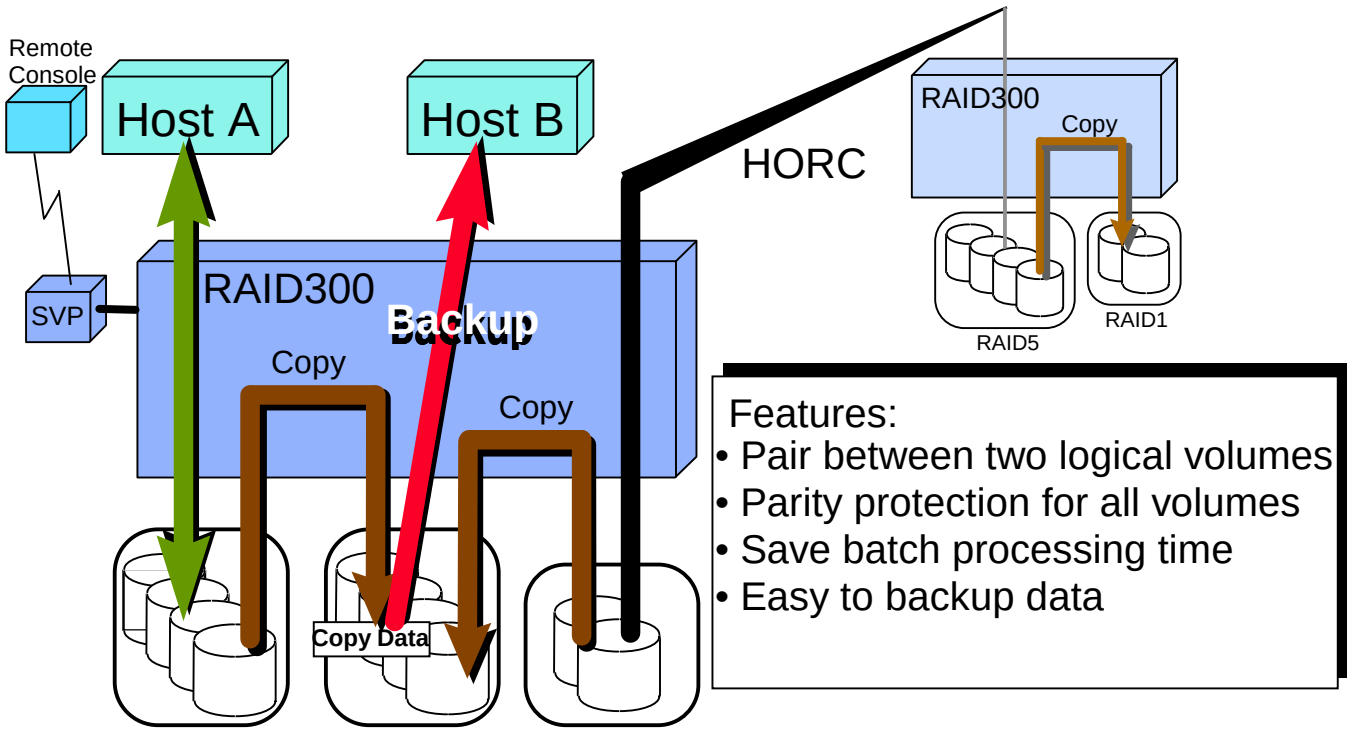
No.	Items	Specification
1	Coupling object	One logical volume (LDEV)
2	Support emulation type of LDEV	OPEN-3/8/9/K and LUSE, NFOP-K
3	Requirement for create a pair	(1) Pair LDEVs have to be a same track format and same capacity. (2) Pair LDEVs have to exist in a same subsystem. (3) It is not possible to share a S-VOL at same time.
4	Support of CV(Customized Volume Size)	Supported
5	Combination of RAID level between master volume and destination volume	RAID1←→RAID1 RAID5(3D+1P)←→RAID5(3D+1P) RAID5(6D+1P)←→RAID5(6D+1P) RAID5(3D+1P)←→RAID5(6D+1P) RAID5(3D+1P)←→RAID1 RAID5(6D+1P)←→RAID1
6	Data protection	There is a parity protection for both P-VOL and S-VOL.
7	RESYNC pattern	From P-VOL data to S-VOL
8	Time for transition from Duplex to Split.	3 min./VOL(OPEN-3) without IO (Depend on the number of pairs and the load of DKC)
9	When the destination volume can be accessed from HOST.	The S-VOL can be accessed at only PSUS status.

Copyright ©1998,2000, Hitachi, Ltd.

10	Cooperation with HORC	Supported The P-VOL of HOMRCF can be a P-VOL or S-VOL of HORC.
	Cooperation with HORC	Supported • The P-VOL or S-VOL of HORC can be a primary volume of HOMRCF. • The S-VOL of HOMRCF can be a P-VOL of HORC.
	Cooperation with HMBR	Supported • A P-VOL of HOMRCF can access from HOST like a usual volume. • A S-VOL of HOMRCF can not access from HOST if the pair is not PSUS status. In PSUS status, a S-VOL of HOMRCF can access from HOST like a usual volume.

⚠ CAUTION

Copy process is done asynchronously with HOST i/o according to differential bit map.
Differential bit map is recorded on shared memory. So if shared memory is lost by offline micro exchange or volatile PSon etc., DKC lost differential bit map.
In these cases DKC treat as whole volume area has differential data, so copy process will take longer time than usual. And if the pair is COPY(SP) status, the pair become PSUE status because lost of differential bit map.



Copyright ©2000, Hitachi, Ltd.

3.14.2.2 Construction of HOMRCF

- HOMRCF can be controlled from SVP, Remote Console and RAID Manager.
- DKA with LA exchange have to be exist in the subsystem.

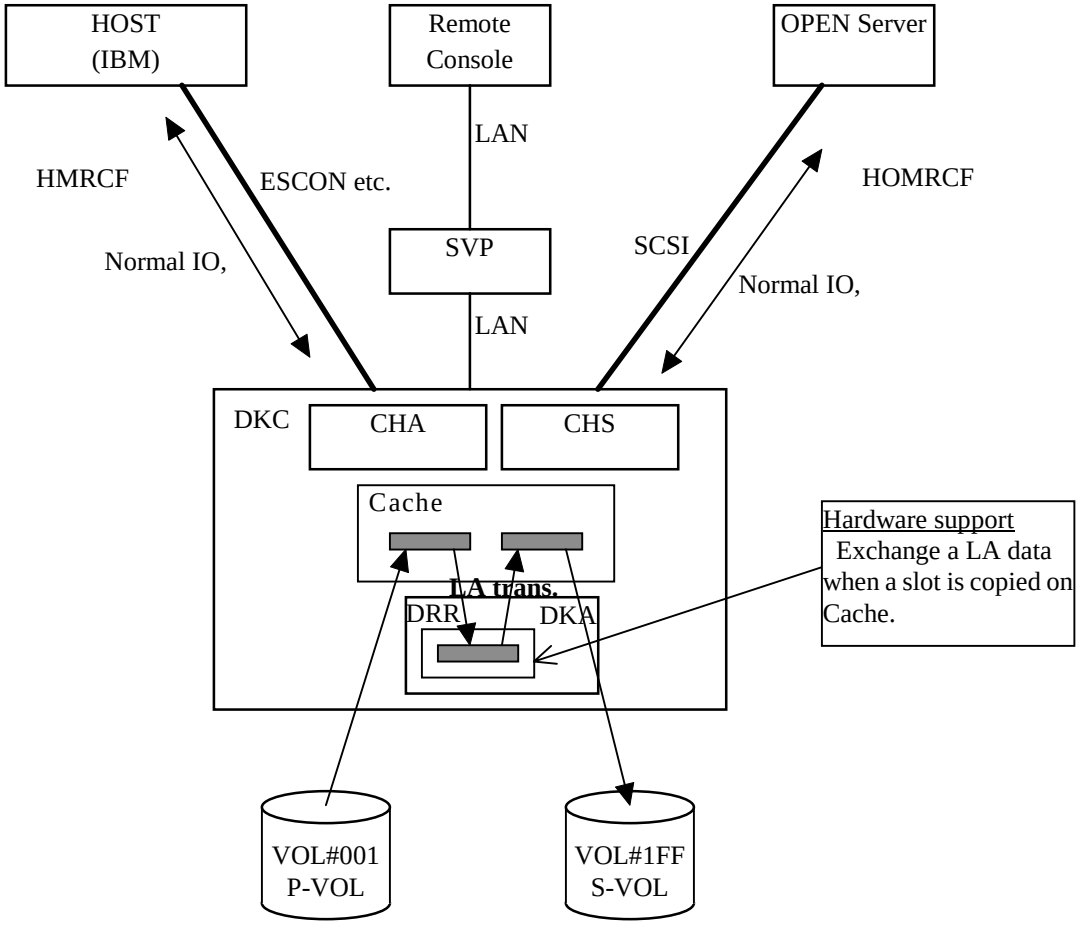


Fig. 3.14.2.2 Construction of HOMRCF

Copyright ©2000, Hitachi, Ltd.

3.14.2.3 Status transition

Table 3.14.3 Status of HOMRCF

No.	Status	Definition
1	SMPL	There is no pair with the volume.
2	COPY(PD)	At this status, there is a job to copy the data from the master volume to the destination volume.
3	PAIR	The copy from master to destination is finished. The destination volume can not be accessed from HOST.
4	COPY(SP)	At this status, there is a job to copy the differential data from the master volume.
5	PSUS	The pair is splited. The destination volume can be accessed from HOST. At this status, the position of write data from the HOST is recorded on a bitmap to reduce the copy time on RESYNC.
6	COPY(RS)	There is a job to copy the differential data from master to destination.
7	PSUE	(1) There is an error with the pair. (2) After a running copy job was stopped by operation of SVP, the pair status is “suspend”.

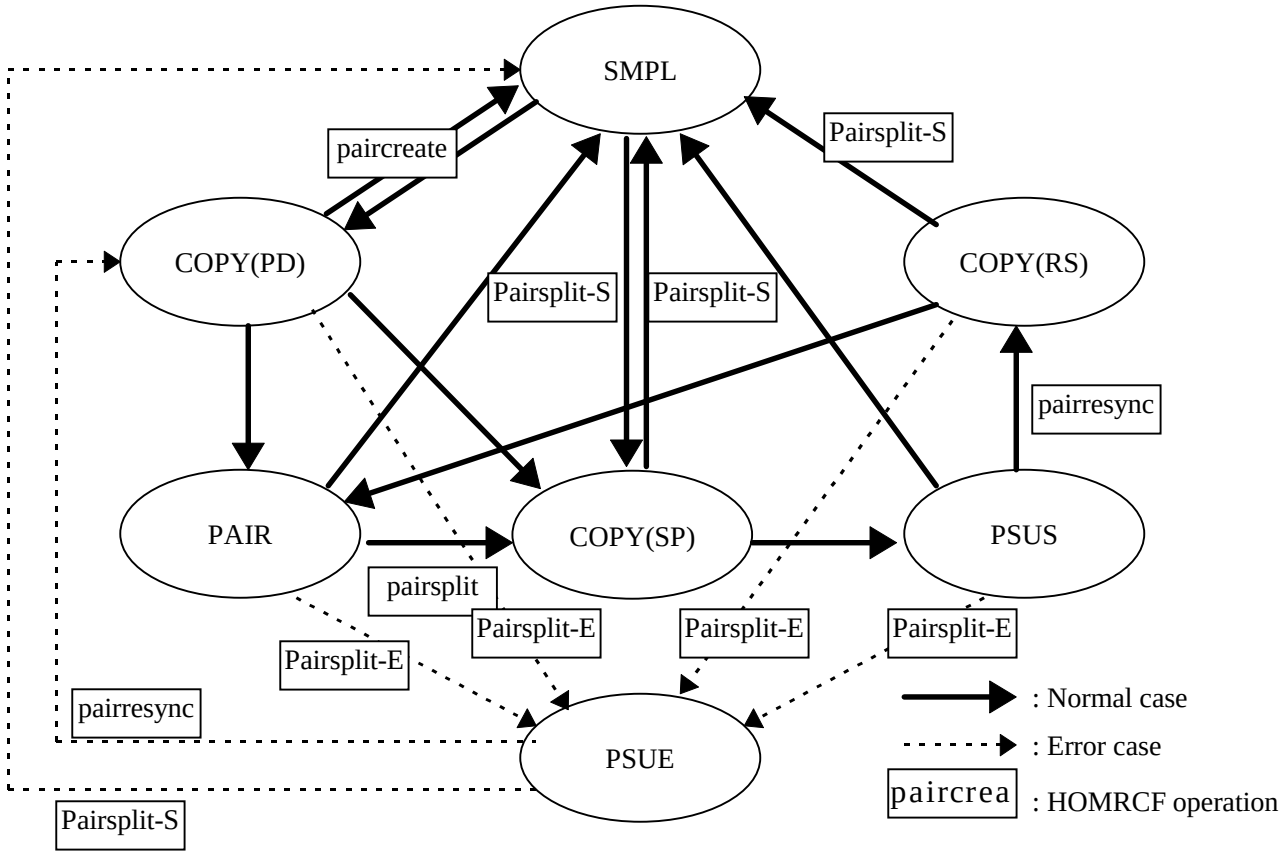

Fig. 3.14.2.3 Status transition map

3.14.2.4 Interface

(1) Outline

HOMRCF support a command set to control HOMRCF functions.
This command set is a common interface in a subsystem. So the command from different HOST is translated to HOMRCF command at each command process.

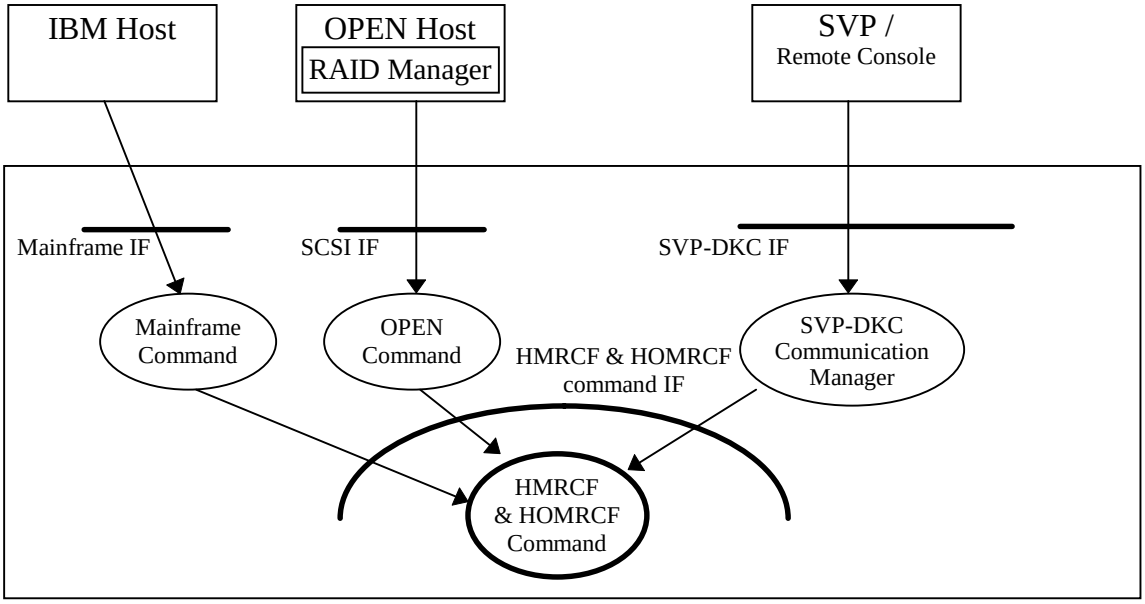

Fig. 3.14.2.4 Outline of HOMRCF IF

Notice
It is necessary to define Command Device before using RAID Manager on OPEN HOST.
(See INST05-599A)
Please do not define Command Device on heavy loaded path.

(2) HOMRCF operation

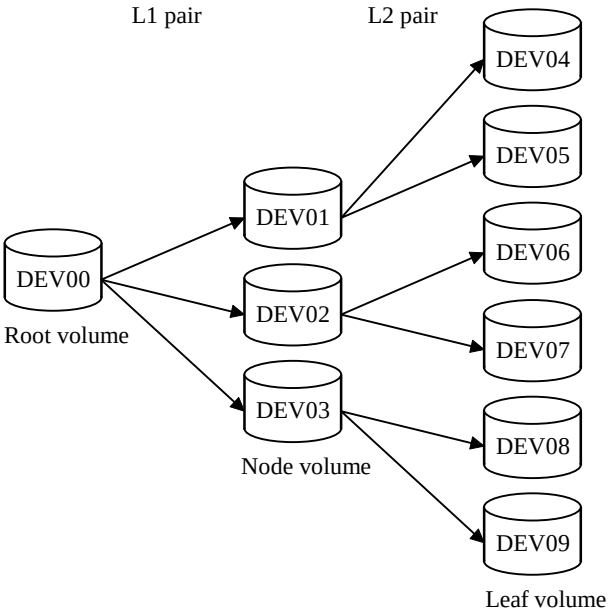
Table 3.14.2.4 HOMRCF operation

No.	Command	Operation
1	paircreate	Create a pair and start initial copy
2	pairsplit	Split the pair
3	pairresync	Resume the pair and start differential copy
4	pairsplit -S	Delete the pair
5	pairsplit -E	Suspend the pair action
6	pairdisplay	Requirement for status information
7	Reserve	Marking and Unmarking the volume for a candidate of destination volume

Copyright ©1998,2000, Hitachi, Ltd.

3.14.2.5 Cascade function

It is possible to make a pair with a existed Target volume as a new S-VOL by using Cascade function. See below figure.
This function is available for HOMRCF only.



No.	Content	Specification	Note
1	Pair structure	A S-VOL of L1 pair (=Node volume) can be a P-VOL of L2 pair.	
2	Number of copies	Root : Node = 1 : 3 Node : Leaf = 1 : 2 Root : (Node + Leaf) = 1 : 9	
3	Create pair condition	L2 pair have to be created after L1 pair.	The reverse is not true.
4	Split pair condition	L2 pair is able to execute pairsplit request only when the L1 pair is already PSUS status.	
5	Resync pair condition	• No conditions.	
6	Delete pair condition	• No conditions. • When L1 pair is deleted, then L2 pair become L1 pair.	
7	Combination with HORC	Possible But Node volume and Leaf volume are treated as a S-VOL.	

Copyright ©1999,2000, Hitachi, Ltd.

- Name of volume type
  The P-VOL of first pair : Root Volume
  The S-VOL of first pair : Node Volume
  The P-VOL of 2nd pair : Node Volume
  The S-VOL of 2nd pair : Leaf Volume
- Name of pair
  - The first pair (A pair of root volume is P-VOL) : L1 pair
  - The second pair (A pair of node volume is P-VOL) : L2 pair
- Name of pair chain
  - a chain of L1 pair and L2 pair with a node volume: stream

Copyright ©1999,2000, Hitachi, Ltd.

3.14.2.6 Reverse-RESYNC

(1) Reverse-RESYNC Function
The Reverse-RESYNC function is an extension of the RESYNC function of the HOMRCF.

When a pair in the Split status is requested to perform the Reverse-RESYNC, the differential data between the target volume and the source volume is copied to the source volume from the target volume.
When a pair in the Suspend status is requested to perform the Reverse-RESYNC, the whole data of the target volume is copied to the source volume.

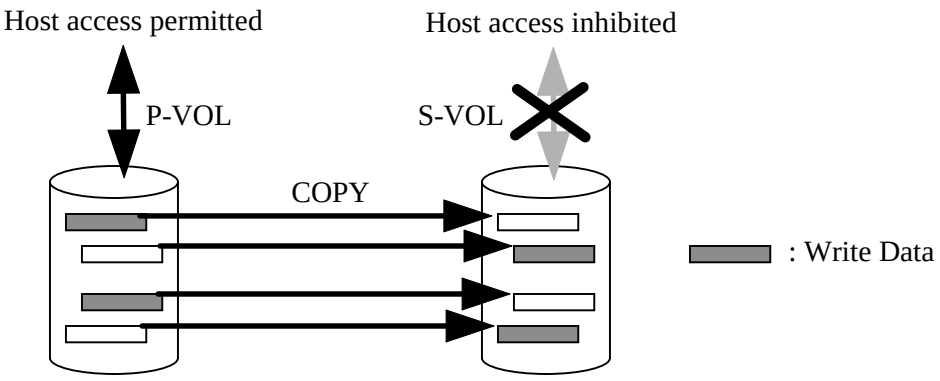


Fig. 3.14.2.6-1 Normal RESYNC Process

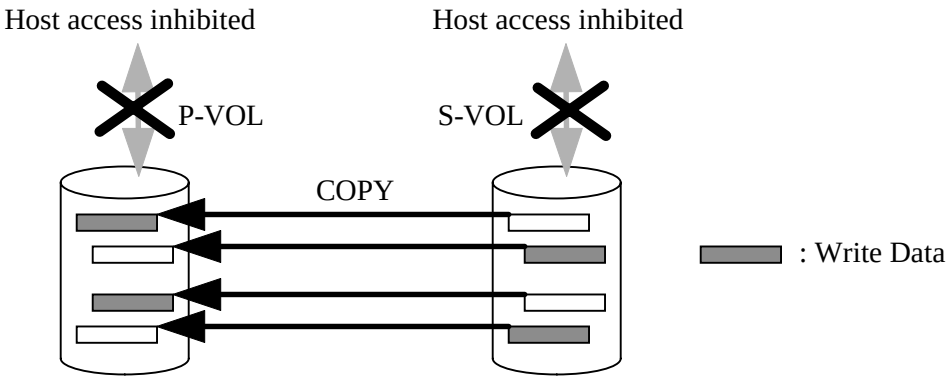

Fig. 3.14.2.6-2 Reverse RESYNC Process

Copyright ©1999,2000, Hitachi, Ltd.

(2) Specifications

No.	Item	Description
1	RESYNC copy pattern	• The data of the S-VOL is copied to the P-VOL. • The copy pattern can be selected by specifying a unit of operation. Specified operation unit : SVP/RMC: In units of pair operation at a time RAID manager: In units of command
2	Copy range	• In the case of the Reverse-Copy in the PSUS status, range for merging writing into the regular and target volumes • In the case of the Reverse-Copy in the PSUE status, whole volume
3	Copy format	• Same format as that of a copy in the PAIR status
4	Applicable LDEV type	• Open-3, 8, 9, and K, and CVSs and LUSEs of them
5	Host access during copying	• P-VOL: Writing disabled S-VOL: Reading and writing disabled Note: The reason why the P-VOL is not disabled to read is to make the volume recognizable by the host and it does not mean that the data is assured.
6	Specification method	• SVP/RMC: Add a specification for the RESYNC pattern onto the pairresync screen.
7	Conditions of command reception	• The pair concerned is in the PSUS or PSUE status. • Another pair sharing the P-VOL is in the PSUE or PSUS status. → If this condition is not satisfied, the CMD RJT takes place. • When the Reverse-Resync is being executed by another pair which is sharing the P-VOL, it is impossible to change the pair status of the pair concerned. (However, the pair deletion and pair suspension requests are excluded.) • The P-VOL of the pair concerned has no pair of the HORC or in the PSUE status. (See Item No.14 in this table.)
8	Status display during copying	• SVP/remote console Pair status display: COPY(RS-R) The display of the attribute, P-VOL or S-VOL, is not changed. • RAID manager Pair status display: A new name (RCPY) is added. (COPY is currently displayed.) The display of the attribute, source or target, is not changed.
9	Condition after the copying terminates normally	• The pair concerned enters the PAIR status. • The conditions of the host access after the status transition are shown below. P-VOL: Reading and writing enabled S-VOL: Writing disabled

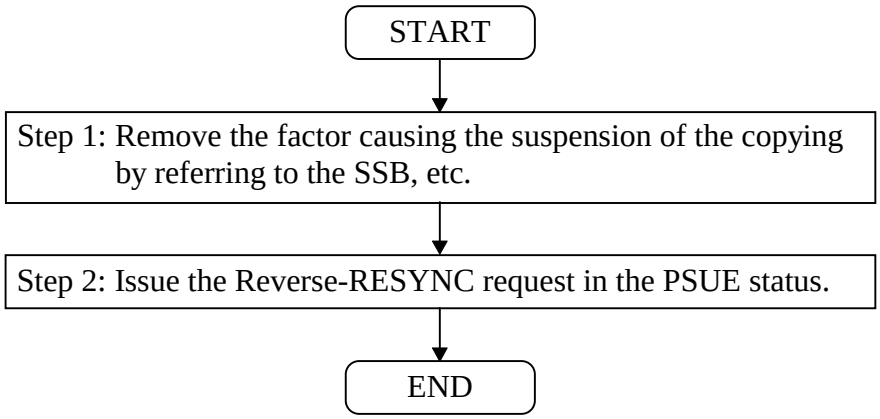
Copyright ©1999,2000, Hitachi, Ltd.

10	Effects on another pair	In another pair sharing the P-VOL, the part actually copied becomes the difference after execution of this function. Example: Pair of the other target volumes in the 1:3 configuration
11	Operation when the copying terminates abnormally	(1) The pair concerned enters the PSUE status. (2) The P-VOL of the pair concerned is enabled to read and write. → Data is not assured. The S-VOL of the pair concerned is disabled to read nor write in the case of the main frame volume and disabled to write in the case of the open volume. (3) The status of a pair sharing the source volume is not changed.
12	Operation when a suspension request is received during copying	Same as above
13	Relation to the cascade function	• The Reverse-RESYNC cannot be executed for the L2 pair.
14	Relation to the HORC	• In the case where “P-VOL of the HORC” = “P-VOL of the MRCF” → The Reserve-Resync cannot be executed. (Command Reject) • In the case where “S-VOL of the HORC” = “P-VOL of the MRCF” → The Reserve-Resync cannot be executed. (Command Reject) • In the case where “S-VOL of the MRCF” = “P-VOL of the HORC” → The Reserve-Resync cannot be executed. (Command Reject) • A pair of the HORC cannot be created with the volume of the MRCF executing the Reserve-Resync. (Command Reject)

Copyright ©1999,2000, Hitachi, Ltd.

(3) Action to be taken when the pair is suspended during the Reverse-RESYNC
The recovery procedure to be used when the pair executing the Reverse-RESYNC is suspended owing to some problem or it explicitly placed the PSUE status by a command from the SVP/remote console/RAID manager is explained below.

(a) Case 1: A case where the PSUE status can be recovered without deleting the pair concerned
This is equivalent to a case where the pair encounter an event that copying cannot be continued owing to a detection of pinned data or a staging time- out.
Or, it is equivalent to a case where the pair explicitly placed in the Suspend status by a command.
<<Recovery procedure>>



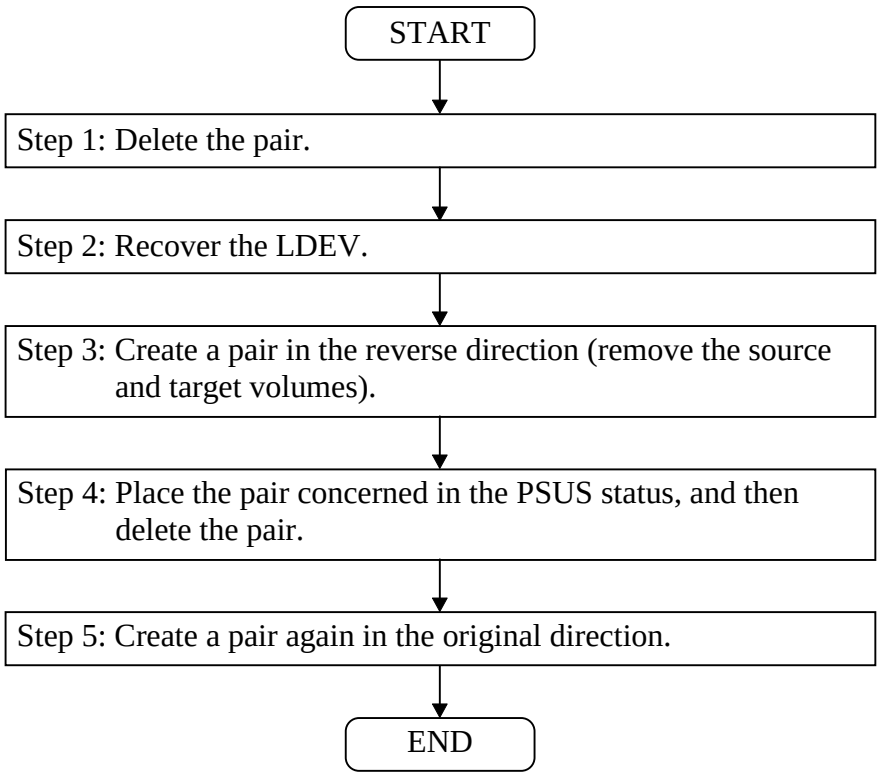
Copyright ©1999,2000, Hitachi, Ltd.

(b) Case 2: A case where the Suspend status cannot be recovered unless the pair concerned is deleted

This is equivalent to a case that the LDEV is blocked.
To recover the blockade of the LDEV, an LDEV formatting or LDEV recovery is required. Both of them cannot be executed in the state that the MRCF pair is created. (A guard works against it.) Therefore, delete the pair once, recover the LDEV, and then create the pair once again.
However, care should be taken because, in the COPY(PD) state, the data of the P-VOL is copied to the S-VOL if simply create the pair again. Recover the blockade following the procedure below.

The following procedure is applicable just to a restoration of the P-VOL using the S-VOL. A procedure for directly restoring the P-VOL when the S-VOL is blocked is not included.

• Case 2-1: A case where the source volume is blocked
<<Recovery procedure>>



Copyright ©1999,2000, Hitachi, Ltd.

• Case 2-2: A case where the target volume is blocked

A recovery procedure for restoring data of the S-VOL is added because the copy source of the Reverse-RESYNC cannot be accessed.

<<Recovery procedure>>

3.15 TPF

3.15.1 An outline of TPF

TPF is one of operating system (OS) which mainly used for airline customer reservation systems (CRS).
To correspond to TPF, DKC must support logical exclusive lock facility and extended cache facility. The former is a function which called MPLF (Multi-Path Lock Facility) and the later is a function which called RC (Record Cache).

7700E(MPLF) has implemented the MPLF and RC functions of TPF feature(RPQ#8B0178), using IBM public manuals;
(a) IBM3990 Transaction Processing Facility support RPQs (GA32-0134-03)
(b) IBM3990 Storage Control Reference for Model 6 (GA32-0274-03)

Copyright ©1998, Hitachi, Ltd.

(1) An outline of MPLF

This facility provides a means, using a DKC, to control concurrent usage of resources in host systems via use of logical locks. A logical lock may be defined for the control of a shared resource, where the sharing of that resource must be controlled. Each shared resource has it own name called Lock Name. Every Lock Name controls multiple lock states (2 to 16).
Figure. shows the outline of I/O sequence which uses MPLF.
DKC recognizes up to 16 MPLF users. In this figure, user A and user B are used. These users may belong to same HOST or different HOSTs. Each user must indicate MPLP (Multi-Path Lock Partition) when uses MPLF. MPLP is a means of logically subdividing the MPLs (Multi-Path Locks) for a user set. The maximum number of MPLP is four. Each MPLP has numbered from 1 to 4. The process to get permission for use MPLF is called CONNECT.
The connected user execute SET LOCK STATE process using Lock Name. The MPL corresponding to specified Lock Name is assigned to the user. This assignment is canceled by UNLOCK process. HOSTs can share the DASD without contradiction by using this MPLF.

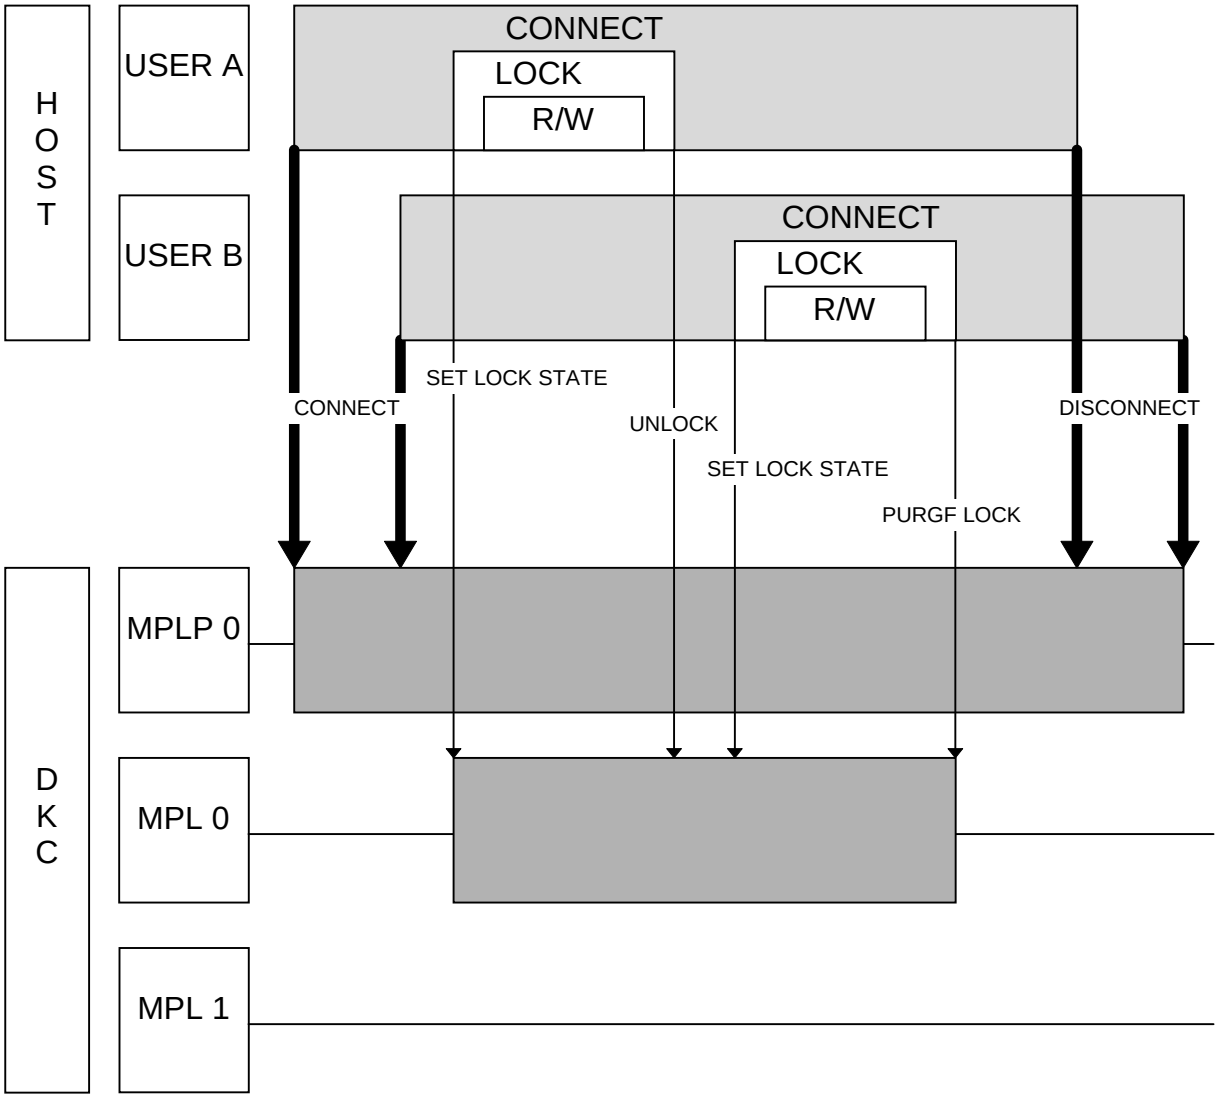

Fig. 3.15.1 An outline of MPLF

Copyright ©1998, Hitachi, Ltd.

(2) An outline of RC

RC has following two feature.
(a) Record Mode Chain
(b) Record Caching

The followings explain these features.
(a) Record Mode Chain

Record Mode Chain consist of following 4 command chains.

1) Mainline Processing (Read)
2) Mainline Processing (Write)
3) Capture
4) Restore

To execute Record Mode Chain, subsystem must be initialized for Record Caching, and Record Mode must be allowed for the addressed device. Under these conditions, Record Mode Chain works when Record Mode Chain is indicated in the Extended Global Attributes of Define Extent command. Otherwise, the chain is processed in standard mode.

A Mainline Processing chain consists of a Define Extent command, a Locate Record command, and a single Read Data or Write Update Data command.

A Capture chain consists of a Define Extent command followed by a Seek command and multiple Read Count, Key, and Data commands.

A Restore chain consists of a Define Extent command, a Locate Record command, and multiple Write Update Data commands.

(b) Record Caching

Record Caching is the naming contract with Track Caching used in standard model. At the point first initialize complete, all of cache is allocated to Track Slot as standard model. Record Cache will be allocated if Set Cache Allocation Parameters Order is issued.

Copyright ©1998, Hitachi, Ltd.

3.15.2 TPF Support Requirement

(1) OS

TPF Ver.4.1.

(2) Hardware

TPF Support Hardware Specification.

Table 3.15.2 TPF Support Hardware Specification

	7700E/MPLF
Number of logical volumes (MODs) per Box	Max.144 (6GB drives) (*1) or Max.128 (9/18GB drives) (*1)
Number of LCUs (Logical Control Unit)s per Box	Max.4
RAID level	5 or 1
Emulation type (1) LCU (2) Device	3990-6 (3990-3) 3390-1/2/3, 9 (*2), and (3380-K)
Physical Disk drive	6GB (*3) 9GB (18GB)
Box Capacity (in RAID5/3390-3 emulation)	Max.363GB ; (2.838GB×128MODs) Max.408GB ; (2.838GB×144MODs)
Connection paths to Hosts	Max.32
Concurrent data transfer paths for Hosts	Max.32
Number of logical path addresses per Box	Max.512 (*4)
Number of Multi-Path Locks	Max.4096/LCU
New features (1) CVS=Virtual LVI (2) DCR=FlashAccess (3) HRC (4) HMRCF=Shadow Image (5) HODM (6) HMBR	 Available Available Available Available (Not Available) (Not Available)

(*1) Recommendation by performance reason.
(*2) 3390-9 emulation cannot be selected with 6GB drives.
(*3) Recommendation by performance reason
(*4) 512 Logical path addresses = 16 addresses/path × 32.

Copyright ©1998,1999, Hitachi, Ltd.

3.15.3 TPF trouble shooting method

Basically there is no difference between TPF environment and MVS for trouble shooting.

(a) To gather system error information by Syslog/EREP ...etc.
(b) To gather 7700E error information by SVP dump operation.
- Normal dump which contains TPF dump data also. (Refer SVP02-530)
(c) To send above data to T.S.C.

Copyright ©1998, Hitachi, Ltd.

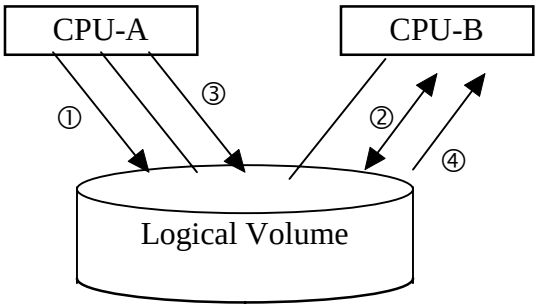
3.15.4 The differences of DASD-TPF(MPLF) vs DASD-MVS

(1) Data-exclusive method by MPLF function

MVS environments
(a) Logical volume(Device) is the unit of data-exclusive between several CPUs.
(b) “Device” is owned by one CPU during its processing(accessing), and “Device-busy” status is reported to another CPU’s accesses.
(c) “Device-end” status is used to notify the waiting CPUs
(d) when the device becomes free.

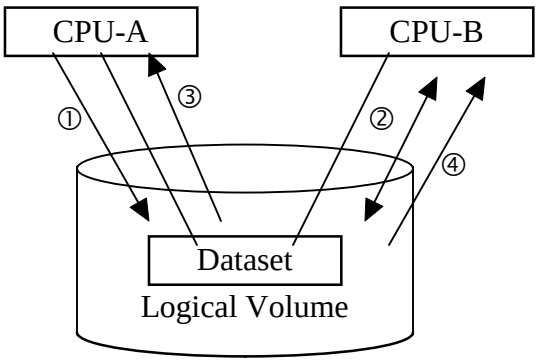
TPF environments
(a) Logical “Lock” is used for this purpose, instead of logical volume(device) of MVS.
(b) Most Read/Write CCWs have a unique: Prefix-CCW(Set Lock) to own the target lock.
And only when the request-lock is granted to, its CCW continues the following Read/Write processes.
DSB=”4C” is for granted / DSB=”0C” is for NOT-granted(wait).
(c) “Attention” status is used to notify the waiting CPUs when the lock becomes free.
(d) The relationship between Lock and Dataset is quite free.
Usually TPF users(customers) have their own definitions.

MVS environments



① Reserve/Read&Write Access by CPU-A (Successful).
② CPU-B’s trial is rejected by Device-busy (Failed).
③ Terminate its process and release the volume.
④ Free(Device-end) will be sent. CPU-B can use this volume.

TPF environments



① Set Lock/Read&Write process(*1) by CPU-A (Successful).
② CPU-B’s trial is rejected by Not-granted (failed).
③ Terminate with Unlock, by CPU-A.
④ Free(Attention) will be sent.(*2). CPU-B can use this Dataset.
(*1)Typical CCW chain:
- Set lock State(x27/order(x30));
- Read Subsystem Data(x3E);
- Tic;
- (ordinary CCW chain)
(*2)This report’s path/Address is usually different from above②.

Fig. 3.15.4-1 Environments of DASD-TPF and DASD-MVS

Copyright ©1998, Hitachi, Ltd.

(2) No path-group

MVS environments
(a) Each CPU establishes the Path-group on every DASD Online-devices, using the all connected paths.
(b) Channel and DASD (Control Unit) rotates the I/O service path to meet each occasion within this group.
(c) “Device-end” status can be reported through any-path of this group.

TPF environments
(a) TPF OS/CPU does not establish this Path-Group, even if its configuration has multiple-paths for DASD.
(b) But the Channel rotates the I/O request-path, within the connected paths. (Like old MVS way.)
(c) “Attention” report is restricted to one “Connect-Path” which has been defined during IPL (Vary-online) procedure.

(3) Connect Path/Device

(a) TPF system issues “Connect order” to define ;
- Lock tables on each DASD control-unit,
- Report path & Device for Attention interrupt.

(b) This order is code(x33) of Perform Subsystem Function (x27) command.
(c) This order is issued during the IPL process of each CPU.
(d) CPU (channel) only has the capability to change this path and device definition.

Table 3.15.4-1 Order-list of Perform Subsystem Function (x27) command

Order	Meaning
x22	Prepare to Read Lock Data
x30	Set Lock State
x31	Purge Lock
x32	Unlock
x33	Connect
x34	Disconnect

For detailed, please see the IBM RPQ manual;
“IBM 3990 Transaction Processing Facility Support RPQs” (GA32-0134-03)

Copyright ©1998, Hitachi, Ltd.

(4) Channel Re-drive function

MVS environments
(a) In general, the Channel selects the most proper path (in the Path-group) for each I/O request.
(b) In MVS environments, there is no this kind of function.

TPF environments
(a) In TPF environments,
to keep a fast IO response & IO request-order(fast-in-fast-out),
this kind of special function has been introduced. (Thus is our conjecture.)
(b) By the channel-monitor data,
Once IO request is rejected with Control-unit busy by DASD,
Sub-channel repeats a reconnect-trial to DASD (with some short interval),
until (1) to get-into DASD or (2) to reach the trial-count threshold
(in this case IO request is registered to some waiting Queue in the channel.)
(c) And once IO request is accepted by DASD control-unit,
next Control-unit judges this would be accepted or not using “Lock” status.

(5) Fixed Record-size

Dataset structure in DASD

In general, TPF software makes the following logical structure in DASDs.

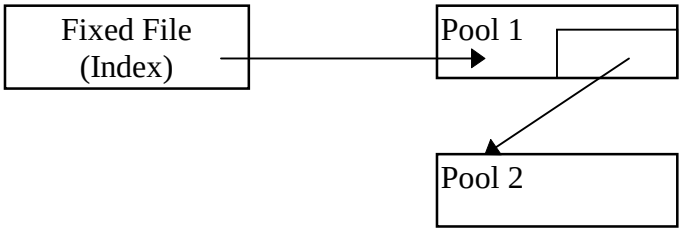


Fig. 3.15.4-2 Logical structure in DASDs

Table 3.15.4-2 Pool records Classification

Logical (usable) size	Physical size
381 Bytes	384 Bytes
1055	1056
4095	4096

There exist only three lengths for pool records.

Table 3.15.4-3 More detailed classification

381 Record	1055 Record	4095 Record
SLT (Small, Long Term)	LLT (Large, Long Term)	4LT (4KB, Long Term)
SST (Small, Short Term)	LST (Large, Short Term)	4ST (4KB, Short Term)
SDP (Small, Long Term, Duplicated)	LDP (Large, Long Term, Duplicated)	4DP (4KB, Long Term, Duplicated)

Copyright ©1998, Hitachi, Ltd.

(6) Prime/Dupe MODs pairs

(a) To improve Data-integrity of DASD,
TPF system often makes the Data-duplications
on different two DASD subsystems.
(b) The following Fig. Shows one example of this pairs.
Prime MOD(module)s and Dupe MODs are never located on
one-side of subsystem(spread to all subsystems).

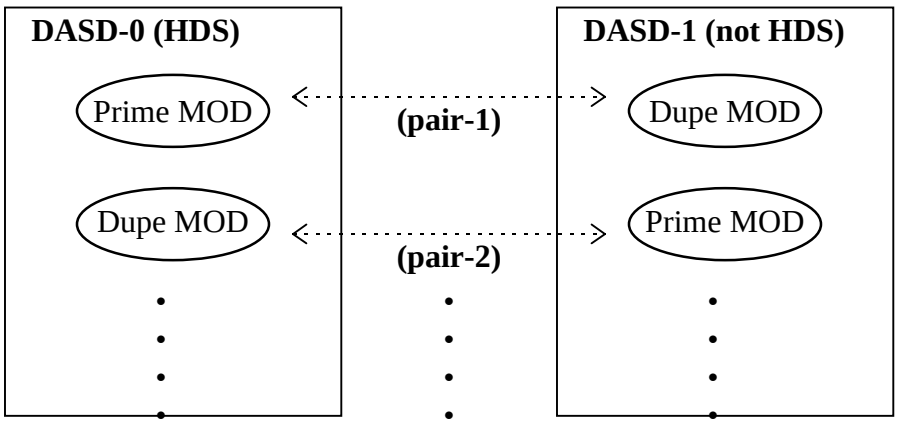

Fig. 3.15.4-3 Prime/Dupe MODs pairs

(7) Data Copy procedures

The Copy procedures are taken for the following purposes;
(a) To make a pair (To copy data from Prime MOD to Dupe),
(b) To recover the failed data (To copy the remaining data to the re-init MOD.)

There exist two ways to make a pair.
(a) AFC (All File Copy), and
(b) AMOD copy.

(a): In this copy process, the destination-drive of the copy keeps “Offline” status, and just after the completion of this copy, the source-drive is made “Offline” and the destination-drive is changed to “Online”. From the view-point of TPF software, there exists only one MOD, independent of copy process.

(b): In this copy, both source-drive and destination-drive are made “Online”.
TPF software can distinguish both drives, even if in the copy process.

3.15.5 Notices for HRC-option setting

<SVP operation>

(1) RCU Option (see SVP04-120)

- We strongly recommend to choose “No”-side in “PPRC support by host” column of “RCU Option” window.
- We strongly recommend to choose “Not Report”-side in “Service SIM of Remote Copy” column of “RCU Option” window.

(2) Pair Option (see SVP04-180)

- We strongly recommend to choose “Copy to R-VOL”-side in “CFW Data” column of “Pair Option” window.

(3) Suspend Pair (see SVP04-210)

- We strongly recommend not to activate (to keep blank) “SSB(F/M=FB)”-lone of “Suspend Pair” window.

<Host (TPF-OS) consideration>

In MVS-OS world, 7700E with HRC expects (requires) Customers to extend I/O Patrol Timer to prevent many MIHs from reporting.

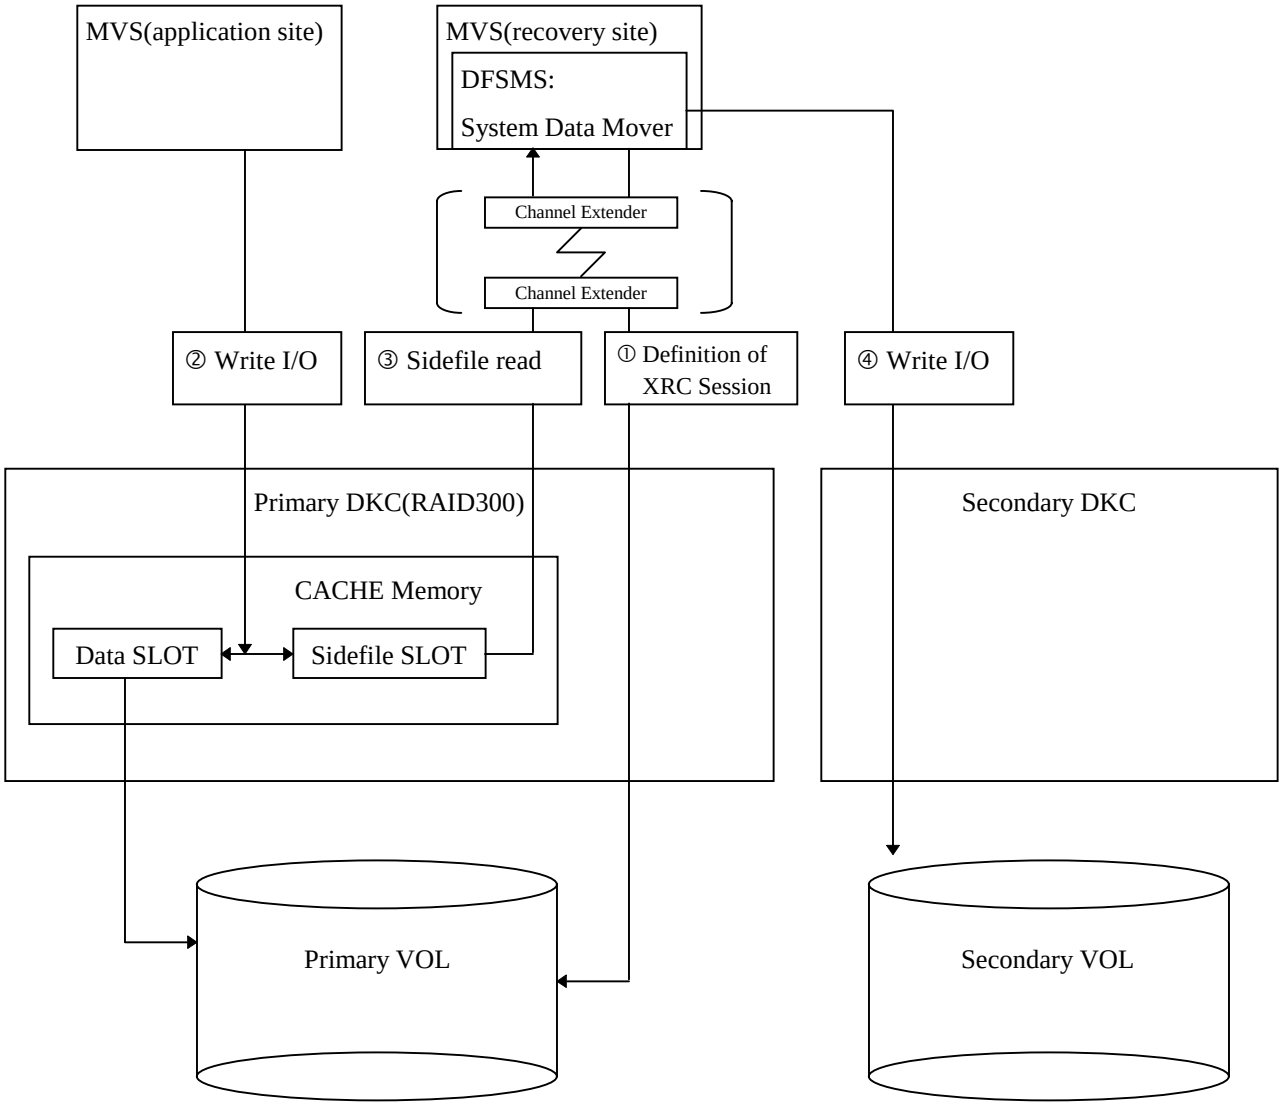
In TPF-OS world also, same consideration will be required, that is please discuss with the Customer to find the opportunity to extend “Stalled Module Queue” timer over 5 seconds.

Copyright ©1999, Hitachi, Ltd.

3.16 HXRC

3.16.1 An outline of HXRC

HXRC(Hitachi eXtended Remote Copy) function provides for data replication at distance in order to recover at a disaster.



- System Data Mover defines a XRC pair session.(①)
- When a write command is issued to primary volume from application site, primary DKC makes a sidefile data(replication) on cache memory.(②)
- System Data Mover reads a sidefile data non-synchronously at distance, and writes it to secondary volume.(③, ④)

Fig.3.16.1-1 An outline of HXRC

Copyright ©1999, Hitachi, Ltd.

3.16.2 HXRC Support Requirements

3.16.2.1 OS

(1) OS level
(a) MVS/ESA 4.3.0 or upper.
(b) DFSMS/MVS 1.1.0 or upper.

<Restriction of SMS 1.4 environment>
The Maximum number of HXRC pair per CU image is up to 128 under SMS 1.4 environment. CCA (Channel Connection Address) can be specified to 128 logical devices per CU images such '00' - '7F'. CCA address '80' - 'FF' for HXRC may be rejected by System Data Mover.

(2) Conditions of HXRC using
(a) The following conditions must be satisfied by OS before starting HXRC function,
• CACHE ON
• NVS ON
and must be CACHE ON status on DKC.
When CACHE OFF/NVS OFF commands are issued by OS or Cache malfunctions (includes 'Ref code=FFEE: Area temporary blocking) occur, HXRC function is stopped.

(b) I/O Patrol Value
(I) Without CHL Extender
• Current patrol time(more than 30sec).
(II) With CHL Extender
• More than 70sec.

(c) Session ID
• Up to 64Session ID's can be utilized per 1DKC for Concurrent Copy(CC) and HXRC.
• Up to 4Session ID's can be utilized per 1DKC for HXRC.
• Up to 16Session ID's can be utilized per 1VOL for Concurrent Copy and HXRC.
• Only 1Session ID can be utilized per 1VOL for HXRC.

<Specification of RAID300>
The maximum number of HXRC pair in the subsystem is up to 256.

(d) HRC/HODM
• HXRC cannot be used for the same volumes using HODM pair volumes.
• HODM cannot be used for the same volumes using HXRC pair volumes.
• HXRC must be for that volumes after deleting HODM pair volumes.

Copyright ©1999,2000, Hitachi, Ltd.

3.16.2.2 Hardware

(1) HXRC Support Hardware Specification.

Table 3.16.2.2-1 HXRC Support Hardware Specification

CU Type	3990-6/6E
DEV Type	3390-1/2/3/3R/9
DKC model	Primary:RAID300 Secondary:RAID300/RAID200HA/DKC80/DKC90
RAID level	RAID5/RAID1
Channel	ESCON

(2) CACHE SIZE
Cache capacity should be doubled from current cache size.
(The amount of sidefile data may occupy up to 60% of total cache capacity.)

3.16.2.3 Micro-program

(1) HXRC Support Micro-program Revision.

Table 3.16.2.3-1 HXRC Support Micro-program Revision

DKCMAIN	52-36-12-00/00 or upper
SVP	51-36-12/00 or upper

CNT extender version 4.9 or upper level code is recommended.

(2) HXRC support Modes

Table 3.16.2.3-2 HXRC support Modes

Mode	Description
Mode45	Sleep wait timer used to delay activation. Mode45 OFF : Activates sleep wait timer at 40% sidefile threshold. Mode45 ON : De-activates sleep wait timer at 40% sidefile threshold.
Mode59	Variable RECSET size performance improvement for CNT channel extenders. Mode59 OFF : Performance improvement de-activated (fixed RECSET size) Mode59 ON : Performance improvement activated (variable RECSET size)
Mode97	Variable sleep wait timer duration. Mode97 OFF : Sleep wait timer duration = 100ms at 40% sidefile threshold. Mode97 ON : Sleep wait timer duration = 10ms at 40% sidefile threshold.
Mode98	Selectable SCP or session cancel at 50% sidefile threshold. Mode98 OFF : SCP activates at 50% sidefile threshold. Mode98 ON : Forced session cancel at 50% sidefile threshold.
Mode118	Warning SIM reporting at 40% sidefile threshold. Mode118 OFF : Not report SIM. Mode118 ON : Reports SIM. (30sec interval over 40% sidefile threshold)

Copyright ©1999,2000, Hitachi, Ltd.

3.16.2.4 HXRC recommendations

(1) Recovery site CPU is the most ideal location for Data Mover.
(2) Data Mover's path should be utilized only to read sidefile.
(3) Subsystem configurations
- Cache capacity : Should be doubled from current cache size.
- Confirmation for Number of channel paths for system data mover (SDM)
- Confirmation for Work loads for the subsystem

(4) Utility device for primary volume
- Should be prepare for each XRC session.
- A low activity device should be selected as a Utility Device
- Utility Device should be specified at 1'st time before establishing pair volumes.

(5) System Data Mover (SDM)
- Confirmation for PTF levels
- No record found problem. : APAR # OW30183, OW33680
- Necessary tuning for SDM data set : Capacity, Geometry of the data set

(6) DB2
- Broken VSAM index file problem : APAR # II08859

(7) Others
- CPU MIPS : Enough for HXRC environment
- LINE CAPACITY : Enough for HXRC environment with channel extender.

Copyright ©1999, Hitachi, Ltd.

3.16.3 Online Maintenance while Concurrent Copy(CC)/HXRC using

(1) Availability of Installation and DE-installation.

Component	Maintenance Type	During initial copy		Established		Suspend	
		Primary	Secondary	Primary	Secondary	Primary	Secondary
HDD canister	Installation	*	x	*	x	*	x
	De-installation	*	x	*	x	*	x
Cache PCB	Installation	*	x	*	x	*	x
	De-installation	*	x	*	x	*	x
CHA	Installation	x	x	x	x	x	x
	De-installation	x	x	x	x	x	x
DKA	Installation	x	x	x	x	x	x
	De-installation	x	x	x	x	x	x

x: Maintenance is available.

*: When a maintenance operation is needed while CC/HXRC is using, I/O's for CC/HXRC pair volumes or CC/HXRC itself should be stopped before the maintenance operation.
If the maintenance operation must be done while CC/HXRC is using, you must confirm that the usage of Sidefile monitor less than 20% of total Cache capacity before you start the maintenance operation. Only when the usage of Sidefile monitor is less than 20% of total Cache capacity, you can proceed the maintenance operation.
Refer to "Monitoring" in the SVP SECTION about sidefile monitor.
Select the [Information] icon in the 'SVP' window.
Next select the [Monitor] menu in the 'Information' window and select [start....].
Next select the 'Sideflie' box in the 'Item' menu in the 'Monitoring' window and select [OK].

(2) Availability of the System tuning.
When the following System tuning operation is needed while CC/HXRC is using, CC/HXRC should be stopped before the System tuning operation.

- It is impossible to change the DKC No, SSID, or DKC Emulation type by System tuning operation while CC/HXRC is using.
- When the DRV emulation type of CC/HXRC pair volumes are 3390-3 or 3390-3R, it is impossible to change the emulation type between 3390-3 and 3390-3R by CHANGE EMULATION operation while CC/HXRC is using.

Copyright ©1999,2000, Hitachi, Ltd.

(3) Availability of the Replacement.

Component	Maintenance Type	During initial copy		Established		Suspend	
		Primary	Secondary	Primary	Secondary	Primary	Secondary
Logical Device	Blockade	**	**	**	**	**	**
	Recovery	**	**	**	**	**	**
	Format	**	**	**	**	**	**
	Verify	x	x	x	x	x	x
HDD canister	Replace	x	x	x	x	x	x
Cache PCB	Replace	*	x	*	x	*	x
CHA	Replace	x	x	x	x	x	x
DKA	Replace	x	x	x	x	x	x
LTM PCB	Replace	x	x	x	x	x	x

x: Maintenance is available

*: When a maintenance operation is needed while CC/HXRC is using, I/O's for CC/HXRC pair volumes or CC/HXRC itself should be stopped before the maintenance operation.
If the maintenance operation must be done while CC/HXRC is using, you must confirm that the usage of Sidefile monitor less than 20% of total Cache capacity before you the start maintenance operation. Only when the usage of Sidefile monitor is less than 20% of total Cache capacity, you can proceed the maintenance operation.
Refer to "Monitoring" in the SVP SECTION about Sidefile monitor.
Select the [Information] icon in the 'SVP' window.
Next select the [Monitor] menu in the 'Information' window and select [start....].
Next select the 'Sideflie' box in the 'Item' menu in the 'Monitoring' window and select [OK].

**: When a maintenance operation is needed while CC/HXRC is using, CC/HXRC should be stopped before the maintenance operation.

3.17 HRC Asynchronous

3.17.1 Components

Asynchronous mode is one of the update copy modes of the HRC volume pairs. The HRC asynchronous subsystem consists of the same components as HRC synchronous and HRC semi-synchronous with the following exceptions:

- A set of the HRC volume pairs named consistency group is introduced.
- Only 1-to-1 and n-to-1 (n≤4) configuration is supported
- For n-to-1 configuration, the XRC time-stamping capability is required.
- A communicating facility to transfer error information from the primary system to the secondary system is not required.

Note) In this document, the term n-to-m means that n-MCUs and m-RCUs are connected to each other to establish the HRC volume pairs. N and m is number of control units of physical unit bases, not of control unit image bases.

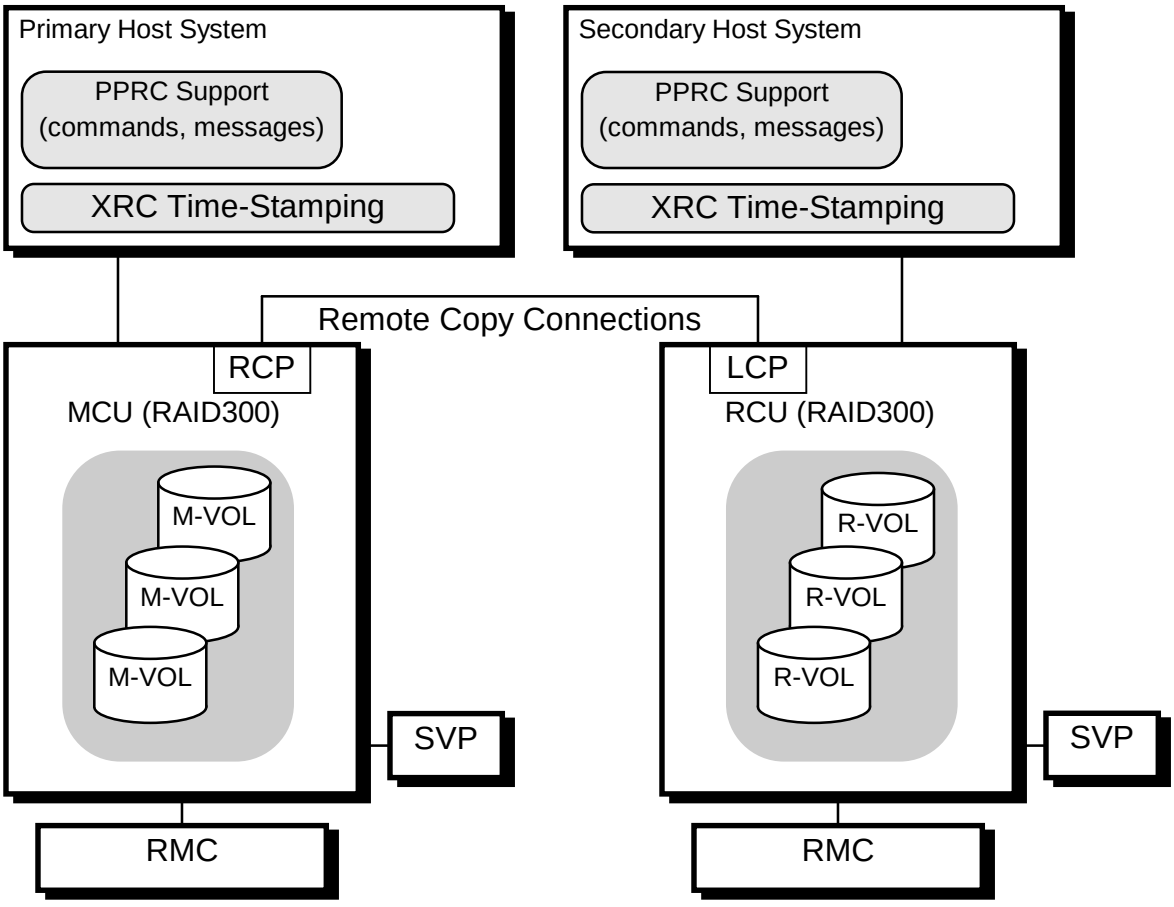

Fig. 3.17.1-1 HRC Asynchronous Subsystem Components

Copyright ©1999, Hitachi, Ltd.

(1) MCU and RCU

- Both MCU and RCU must be RAID300 or upper model.
- Maximum configuration is 4-to-1. For n-to-1 (n >1) configuration, XRC time-stamping capability is required.
- To use XRC time-stamping capability, control unit emulation must be 3990-6 basic or enhanced mode.
- Maximum number of control unit image pairings (established by Add RCU or ESTPATH) is 16.

(2) Consistency Group

- HRC asynchronous ensures update-sequence-consistency across several volume pairs. It also provides some group-based operations. A set of volume pairs treated by such group-based functions is called a consistency group.
- HRC asynchronous supports 16 consistency groups at maximum. Every HRC asynchronous volume pair belongs to one consistency group.

(3) PPRC Support

- Although HRC asynchronous is not fully compatible to PPRC, it can be controlled and monitored with PPRC host facilities, PPRC TSO commands, ICKDSF PPRC commands and some console messages. For this purpose, MVS/DFP 3.2.0 or higher level and ICKDSF release 16 or upper are available.
- Only fundamental facilities are available. Neither P/DAS SWAP nor CGROUP is supported.
- If the primary system (and the secondary system) consists of several CPU complexes, SYSPLEX timer must be installed for the common time reference.

(4) XRC Time-Stamping Capability

- In case of N-to-1 configuration, the XRC time-stamping capability requires to be installed in the primary host system. MVS/DFP 3.2.0 or higher level is required.
- In order to get benefit of time-stamping capability during copy-back process (pair establishment from the secondary to the primary subsystem), the XRC time-stamping capability recommends to be installed in the secondary system.
- If the primary system (and the secondary system) consists of several CPU complexes, SYSPLEX timer must be installed for common time reference.

Copyright ©1999, Hitachi, Ltd.

3.17.2 Consistency Group

(1) HRC Asynchronous Volume Pairs and Consistency Group

- Every HRC asynchronous volume pair belongs to one consistency group.
- When establishing the HRC asynchronous volume pair, an operator specifies the consistency group number that the volume pair will belong to with a new parameter of Add Pair and ESTPATH.
- The consistency group must be registered prior to pair establishment.

(2) Functions of Consistency Group Basis

(a) Ensuring Update Sequence Consistency

- The updated records are copied to the corresponding R-VOLs in the same order as the M-VOLs have been updated by the primary host systems.
- The update sequence consistency is ensured within a consistency group. The updated records of the different consistency groups may be copied in the different order from the original.

(b) Suspending Volumes Pairs (Error Level)

- When one R-VOLs is not updated correctly due to the failure, all the HRC asynchronous volume pairs will be suspended with keeping update sequence consistency.
- When establishing the HRC asynchronous volume pair, an operator specifies whether other volume pairs will be suspended together or not against the failure of the volume pair. A new parameter called **Error Level** is defined for this purpose.

Error Level = Group	When this volume pair is suspended due to the failure, all volume pairs in the same consistency group will be suspended together.
Error Level = Volume	Even if this volume pair is suspended due to the failure, other volume pairs in the same consistency group will not be suspended, as long as the failure prevent.

Copyright ©1999, Hitachi, Ltd.

(c) Providing the Consistency Time

The latest time stamp value of the update that has been successfully copied to the R-VOL is called a **consistency time**. The consistency time is a group basis indication. It means that all the updates performed before or at the consistency time have been successfully copied to the R-VOLs in the consistency group.

- The consistency time can be displayed with the following operations issued to the R-VOL of duplex or suspended state.
  - RMC (or SVP) Pair Status panel
  - PPRC CQUERY command
- At the R-VOLs in duplex state, the consistency time is a ticking value. Any R-VOL displays the consistency time in that instance. It can be used for feeling how long the R-VOLs are behind the M-VOLs.
- Whenever the volume pair is suspended, the consistency time of the R-VOL is frozen.
  - ① If the update sequence consistency between the R-VOL and other R-VOLs in the consistency group is ensured, the R-VOL indicates the latest consistency time of the consistency group.
  - ② Otherwise, the R-VOL indicates the latest time stamp value of the update that has been successfully copied to the R-VOL. It may be older than other R-VOLs because the consistency time of the consistency group is still ticking.
- If the R-VOL is in suspended state, the supplementary status that indicates whether the consistency time is of the consistency group (case (a) above) or the R-VOL (case (b) above) is also displayed.

Copyright ©1999, Hitachi, Ltd.

(d) Consistency Group Basis Operations

In order to make the disaster/failure recovery procedure simple, the following consistency group basis operations are provided.

• Operations at the RCU

① Deleting all suspended volume pairs except for inconsistent volume pairs
② Deleting all volume pairs regardless of the consistency among them
③ Suspending all volume pairs

• Operations at the MCU

① Suspending all volume pairs
② Deleting all volume pairs behind this unit (except for M-VOLs behind other MCU)
③ Resuming all suspended volume pairs behind this unit (except for M-VOLs behind other MCU)

(3) Configuration of the Consistency Group

(a) Disposition of the Volume Pairs

• All R-VOLs that belong to the same consistency group must be located behind one RCU.
• The M-VOLs that belong to in the same consistency group can be located behind up to 4 different MCUs.
• Up to 16 consistency groups can be established within one pair of MCU and RCU. The RCU supports up to 16 consistency groups.
• The R-VOLs of the different consistency groups can be located behind the different RCU.
• Up to 1,024 volume pairs can belong to one consistency group.

Copyright ©1999, Hitachi, Ltd.

(b) Primary Host Systems and Consistency Group

1) Primary host systems and timer type

- Every update I/O to the M-VOL of the same consistency group must be time-stamped by using common timer facility. Table 3.17.2-1 shows the relationship between the primary host system and available timer resource.
- When registering the consistency group, an operator must specify which timer resource should be used for the consistency group based functions.

Table 3.17.2-1 Primary host systems and timer resource

Primary Host System	Timer Resource	Notes on Configuration
MVS with the XRC time-stamping capability	System timer (CPU TOD clock)	• N-to-1 (N≤4) configuration is possible. • SYSPLEX timer must be installed if the primary system consists of the several CPU complexes.
Other main frame host systems	Local timer (MCU internal clock)	• Only 1-to-1 configuration allowed.
Open host systems		

2) Restrictions and notes on the primary host systems

- The primary host systems can not access the volume pairs of the same consistency group unless they have the common timer reference.
- The M-VOLs updated by the same primary host system can belong to the same or different consistency group if the M-VOLs have no requirement on update sequence consistency (i.e. they are updated independently of each other.) However it is recommended for them to belong to the different consistency groups because, for example, they might be suspended together against the failure
- Because of the same reason, the independent M-VOLs accessed by the independent primary host systems is recommended to belong to the different consistency groups, even if they can use common timer reference.

Copyright ©1999, Hitachi, Ltd.

3.17.3 HRC Asynchronous Theory of Operations

(1) Update Copy

The updates from the primary host systems and additional control information are queued in the cache storage of the MCU, and sent to the RCU independent of host I/O processes. The RCU stores the data and control information into the provisional spaces allocated in the cache storage. According to the time-stamp and the sequence information, the RCU promotes the updates in the provisional spaces the formal data of the R-VOLs in the same order as they have been performed at the MCU.

(a) Receiving Time-stamp Information

In case of the Timer Type of System specified, the MCU receives the time-stamp information as follows:

- When directed to establish the HRC asynchronous volume pair, the MCU reports the state-change-interrupt (SCI) to all the attached host systems. The host system issues a series of sense group commands to recognize what status of the device has changed. The MCU generates the response as if the device became a member of an XRC session. This response activates the XRC time-stamping capability if installed in the host systems.
- Once activated, MVS IOS routine attaches the time-stamp information (contents of time-of-day clock) to each I/O operation to read and write the device. The time-stamp information indicates when the corresponding update has been issued at the primary host system. It is transferred to the MCU at the beginning of each I/O operation.

(b) Creating Recordset

- When accepting the updates from the primary host systems, the MCU creates a set of information called a **recordset**. A recordset includes:

  ① updated record
  ② time-stamp information received
  ③ sequence number
  ④ record locations (device, cylinder, track and record number) and record length

- The **sequence number** is the number of recordsets the MCU has created for the consistency group. That is, all recordsets in each MCU and each consistency group are independently numbered.
- The recordset information other than the updated records is stored and queued into the exclusive spaces allocated in the cache storage.
- The updated records are stored as the host-dirty data and do not occupy the exclusive space until the following events happen before the recordset is sent to the RCU
  — The same record is updated again, or
  — The host-dirty status is removed by the de-staging process.
  When the above mentioned event happens, the MCU moves the updated records into an exclusive space, called **sidefile,** in the cache storage.

Copyright ©1999, Hitachi, Ltd.

(c) Sending Recordset to the RCU

- The MCU sends the recordset in a similar manner as HRC synchronous. That is, the MCU and RCP port act as the host processor channel and issue I/O operation, called Remote I/O(RIO), to the RCU.
- The RIO transfers the time-stamp information, the sequence number, the record locations and length, and the updated records in the FBA format (not in the CKD format) by one channel command, like HRC synchronous. However the parameter length and detailed specification of this channel command is different from HRC synchronous. Therefore the micro code of the store-and-forward type channel extender (i.e. Channelink and UltraNet of CNT corp.) should be upgraded to support the command.
- Unlike the recordset offloading of the XRC Data Mover, the MCU sends the recordset with directly specifying the device address of the R-VOL. The RIO independently activates each R-VOL. Furthermore, the MCU may send several recordsets by one RIO even if their sequence numbers are not contiguous to each other. Therefore the recordsets are usually sent in different order from their arrivals to the MCU.

(d) Storing Recordset into Sidefile Space

- The RCU stores the received recordsets into the spaces exclusively allocated in the cache storage. The exclusive space is called a sidefile. The updated records in the sidefile are not treated as the formal data. That is, the host I/O processes and the de-staging processes do not access the records in the sidefile at this time.
- The records in the sidefile will be promoted the formal data later. A term **settle** means to promote the records in the sidefile.
- The RCU also allocates exclusive spaces in the cache storage so that the sidefiles form a queue.
  - The RCU makes a queue per MCU and per consistency group.
  - This queue is not of the FIFO fashion. Each entry of the queue is previously assigned to each sequence number. The arrived recordsets are queued into the corresponding entries with indexed by their sequence number. The entries for the recordsets that do not arrive yet are left empty. As a result, the RCU lines up the recordsets in the order of their sequence number.

Copyright ©1999, Hitachi, Ltd.

(e) Selecting Recordset and Deciding Consistency Time

- The RCU selects the recordset to be settled with the following algorithm.

  ① Checks if there are the valid entries at the top of all the queues in the consistency group. If one of them is empty, the RCU waits for the entry.
  ② When all the top entries are filled with the valid sidefiles, the RCU selects one entry that has the smallest time-stamp. It can be settled.
  ③ Repeats step 1 and 2.

- Figure 3.17.3-1 shows an example. All the top entries are filled with the recordsets of S11/T3, S21/T2, S31/T1 and S41/T5. The RCU selects the recordset of S31/T1 to be settled because the T1 is the smallest time-stamp. Then the top entry S31/T1 is removed from the MCU3's queue. The S32 becomes the top but it is empty. The next recordset S11/T2 will be selected when recordset S32 arrives and its time-stamp is smaller than T2.

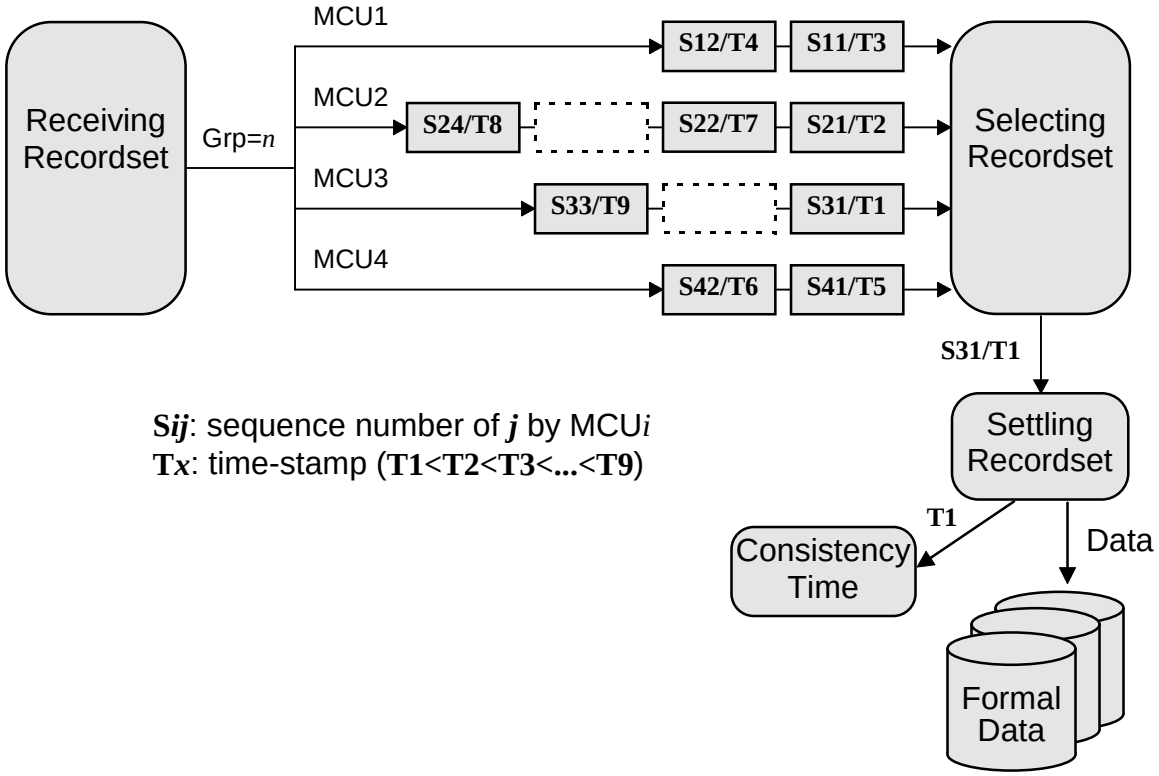

Figure 3.17.3-1 Example of Selecting Recordset at the RCU

Copyright ©1999, Hitachi, Ltd.

(f) Settling Recordset

- The recordset selected by the algorithm described in section(e) will be marked as host-dirty and treated as the formal data after that time. The time-stamp value of the recordset is promoted to the consistency time.
- The RCU settles the updated records in the recordset as follows:
  — If the corresponding track is not in cache storage (track-miss), the cache directory of the sidefile is changed to be the formal data. No data is moved.
  — If the corresponding track is in cache (track-hit), the updated records in the recordset are copied to the existing cached-track and the cache space for the sidefile is released.

3.17.4 MCU-RCU Communications to Maintain Asynchronous Copies

(1) Dummy Recordset

The RCU needs to receive the recordset continuously from all the MCUs even if the MCU does not have to create the new recordset.

- The MCU creates and sends a dummy recordset when it has received no update I/O in a second. The dummy recordset contains only the sequence number and the time-stamp information. Contents of the time-stamp information is generated by incrementing the largest time-stamp that the RCU has (the MCU reads it from the RCU before creating the dummy recordset) by one.
- The RCU receives the dummy recordset and puts it into the queue. It can help other recordsets being selected.

Another purpose of the dummy recordset is have the RCU be aware of the disaster. If the RCU can not receive any recordset in the predetermined duration (this time can be specified by Maximum Copy Delay Time parameter), the RCU regards such situation as the disaster and suspends all the HRC asynchronous volume pairs.

Due to these reasons, the MCU and RCU always need to communicate with each other once the HRC asynchronous volume pair established and not all the pairs have been suspended.

(2) Change-Status Recordset

When the volume pairs are suspended or deleted due to operations or failure, the update sequence consistency must be ensured. In order to meet this requirement, the negotiation on changing volume pair status is made by means of recordset. The recordset used for this purpose also has only the sequence number and the time-stamp information.

(3) PS OFF Notification Recordset

At the power-off sequence, the MCU creates and sends the recordset to notify of the power-off event. The recordset used for this purpose also has only the sequence number and the time-stamp information.

Copyright ©1999, Hitachi, Ltd.

3.17.5 Failure Detected by the RCU

(1) Pair Suspend by the RCU

Table 3.17.5-1 shows the failures detected by the RCU and the volume pairs to be suspended due to the failure.

Table 3.17.5-1 Volume Pairs to be Suspended by the RCU-detected Failure

Failures	Volume pairs to be suspended
The RCU could not settle the pending recordset or could not communicates with the MCU before the maximum copy delay time expired.	All pairs in the consistency group
The RCU could not receive the recordset successfully due to the hardware failure.	All pairs in the consistency group, or only the affected pair (depending on the failure)
The RCU detected the logical error while selecting the recordset to be settled.	All pairs in the consistency group
The RCU could not settle the recordset due to the hardware failure, the track condition, or the logical error.	All pairs in the consistency group, or only the affected pair (depending on the failure)

(2) Pair Suspended and Re-synchronization

For the HRC asynchronous volume pairs, both the MCU and RCU maintain the bit map for pair re-synchronization. When/after the volume pair(s) suspended, the cylinders that contain the following records are marked in the bit map as modified(to-be-copied later):

- The recordsets that have been created by the MCU but not sent the RCU yet. After marking the cylinders as modified, the recordsets are discarded.
- The recordset that have reached at the RCU but not settled yet. After marking the cylinders as modified, the recordsets are discarded.
- The records updated by the primary system after the volume pair(s) suspended

At the beginning of the pair re-synchronization, the contents of the RCU's bit map are sent to the MCU and merged into the MCU's bit map. The MCU performs the initial copy for the pair re-synchronization according to its bit map. That is, the cylinders that contain the lost recordset are re-synchronized at this time.

Copyright ©1999, Hitachi, Ltd.

3.17.6 Inflow Control for Sidefiles

- As described in section 3.17.4, both the MCU and RCU create the sidefiles for storing the recordsets. Since the sidefile is an exclusive space in the cache storage, both the MCU and RCU perform the inflow control to prevent the subsystem overload.
- Both the MCU and RCU use the threshold value specified with the RMC/SVP panel.

(1) Inflow Control by MCU

- When the amount of sidefiles reaches at the threshold, the MCU responds to the update I/Os from the primary system with the state-change-pending (SCP) or channel-command-retry request.
- If no recordset has been sent to the RCU after the specified time duration, the MCU will suspend all the volume pairs and reset the SCP condition in order to avoid the system being hung up.

(2) Inflow Control by RCU

- When the amount of sidefiles reached at the threshold, the RCU responds to the command that transfers the recordset from the MCU with the channel-command-retry request. Only the recordset of the sequence number necessary to continue settling the pending recordsets is accepted.
- If the recordset has not been settled after the specified time duration, the RCU will suspend all the volume pairs and reset the channel-command-retry condition in order to avoid the MCU being hung up.

Copyright ©1999, Hitachi, Ltd.

3.17.7 HRC Asynchronous Control Operations

This chapter describes the RMC (or SVP) operations for HRC asynchronous.

3.17.7.1 DKC Options

(1) *Async Option* - Modifying HRC Options on Physical Unit Basis

- Async Option panel provides the function to modify asynchronous options.
- These options are effective to entire physical control unit (i.e. all M-VOLs and R-VOLs behind the control unit.)
- These options can be modified when no asynchronous volume pair is established.
- These options may be modified before/after performing Port, Add RCU, and Add Group operations.

Table 3.17.7-1 Async Options on Physical Control Unit Basis

Option Name	Description
Pending Update Data Rate	• It specifies the amount of cache storage in percent that allows to be used for storing recordset (sidefile). • When the amount of cache storage for the recordset reaches the specified threshold, the MCU and RCU invokes its own inflow control as follows: — The MCU responds to the update I/Os from the primary system with the state-change-pending (SCP) or channel-command-retry request. — The RCU responds to the command that transfers recordset from the MCU with the channel-command- retry request. However the specific recordset that will help the RCU settle the pending recordset is still accepted. • Any percent between 30% and 70% can be specified with a unit of 10%. The default is 50%.
Offloading Timer	• It specifies how long the MCU can continue the inflow control described above. • The MCU stops the inflow control and suspends all asynchronous volume pairs after the specified time expires unless no recordset has been offloaded to the RCU. • Every minute between 1 to 20 and "None" can be specified. "None" is the default and means that the MCU never stops the inflow control.

Notice : If Pending Update Data Rate is modified when asynchronous volume pair is established, the host I/O timeout may occur.

Copyright ©1999, Hitachi, Ltd.

3.17.7.2 Registering/Monitoring/Deleting the Consistency Group

(1) *Add Group* - Registering Consistency Groups

- The consistency group can be registered with RMC (or SVP) attached to the MCU.
- The consistency group must be registered prior to the volume pair establishment.
- The consistency group has its own attributes and parameters, consistency group number, timer type, and others. They are specified when registered.
- The consistency group is registered in the RCU too. However it is not necessary to be specified. When the volume pair is established, the MCU directs the RCU to register the consistency group.

(a) Consistency Group Number

- The consistency group number is described with one digit of hexadecimal character.
- The volume pair control operations require the consistency group number as the parameter. The pair status displayed by Pair Status operation of RMC and CQUERY command also includes the consistency group number.

Copyright ©1999, Hitachi, Ltd.

(b) Timer Type

- The timer type must be specified out of System, Local and None when the consistency group is registered.

Table 3.17.7-2 Timer Type Attributes

Timer Type	Meaning
System	The system timer (CPU TOD clock) provided by the XRC time-stamping capability is used for controlling this consistency group.
Local	The local timer (*internal* TOD clock of this MCU) is used to for controlling this consistency group.
None	The system timer (CPU TOD clock) provided by the XRC time-stamping capability is used for controlling this consistency group. The R-VOLs in this consistency group can be located behind the different RCUs. *However the update sequence consistency across the RCUs is not ensured*. This timer type should be selected only when volume pairs are established from the original secondary to the original primary volumes (*copy back*).

- Table 3.17.7-3 shows the related configuration and timer type to be specified.

Table 3.17.7-3 Timer Types to Be Specified

Configuration			Timer type to be specified	
Host system	XRC time-stamping capability	MCU-to-RCU	For *P-to-S* copy (original direction)	For *S-to-P* copy (copy back)
Main frame	Installed	N-to-1 (n >1)	System	None
		1-to-1	System	System
	Not installed	1-to-1	Local	Local
Open systems	(unavailable)	1-to-1	Local	Local

Copyright ©1999, Hitachi, Ltd.

(c) Timeout Parameters

• The following parameters can be specified to modify the expiration time for the timeout event of the consistency group basis.

① Maximum copy delay time

Table 3.17.7-4 Maximum copy delay time to Be Specified

Name in the RMC panel	Time Out: Write Pending [min]
Available range	3 min. to 15 min or "None"(no time out event occurs)
Default	"None"
Description	It specifies the maximum delay allowed for asynchronous copy. Based on this parameter, the RCU will suspend all R-VOLs if following time out event occurs: • The RCU has received the updated data but it can not be settled in the specified time. • The RCU has had no communication from the MCU until the specified time expires

Note.) The RCU stores the updated data received into a *provisional* space of cache storage, and will make it available for use later. The term *settle* means to making it available for use.

② Maximum RCU-ready-wait time

Table 3.17.7-5 Maximum RCU-ready-wait time to Be Specified

Name in the RMC panel	Time Out: RCU Ready [min]
Available range	1 min. to 10 min or "None"(no wait)
Default	5 min.
Description	During the power-on-reset procedure, the MCU intends to communicate with the RCU and will suspend all the volume pairs if it can not communicate until the specified time expires.

Copyright ©1999, Hitachi, Ltd.

(2) *Delete Group* - Deleting Consistency Group Registration

- If no volume pair belongs to the consistency group, the group can be deleted.
- This operation is available only at the MCU. The registration to the RCU is automatically deleted, when the last volume pair in this group is deleted.
- In N-to-1 (N >1) configuration, deleting the consistency group does not affect the consistency group that has been registered in another MCU.

(3) *Group Option* - Modifying HRC Options on Group Basis

- This operation allows MCU to delete the consistency group currently registered.
- The Group Option can be operated only when no volume pair belongs to this group.

(4) *Group Status* - Displaying Consistency Group Status

- The options and the working status can be displayed on this panel.

Table 3.17.7-6 Consistency Group Status

Item	Contents	Displayed by:	
		MCU	RCU
Consistency group number	Consistency group number in one digit of hexadecimal character.	Yes	Yes
RCU serial number/SSID	Serial number and SSID of the RCU that belongs to this group.	Yes	No
Volume list	List of volumes that belong to this group and are behind this control unit.	Yes (*1)	Yes
Consistency time	Current consistency time of this group.	Yes (*2)	Yes
Timer type	Specified timer type of this group.	Yes	Yes
SEQCHK (*3)	At least one volume pair of this group has the SEQCHK status.	Yes (*2)	Yes
Maximum copy delay time	Specified maximum copy delay time.	Yes	Yes
Maximum RCU-ready-wait time	Specified maximum RCU-ready-wait time.	Yes	No

(*1) In N-to-1 (N >1) configuration, it does not include the M-VOLs behind other MCU.

(*2) The consistency time and SEQCHK status are decided by the RCU. The MCU displays these items after reading them from the RCU. If the MCU can not communicate due to communication failure, the latest contents are not displayed. Therefore these items should not be used for disaster recovery.

(*3) SEQCHK is one of the R-VOL statuses.

Copyright ©1999, Hitachi, Ltd.

3.17.7.3 Pair Status

- Suspending and Deleting state are newly defined to indicate the status in transition.
- Suspended by MCU powered-off is added as the caused of suspension.
- To indicate whether the update sequence consistency is kept or not, the *subsidiary pair status* (Group or Volume) and SEQCHK indicator are newly defined.

(1) Status in Transition - *Suspending* and *Deleting*

When suspending or deleting the HRC asynchronous volume pairs, the MCU and RCU intend to process all pending recordset before changing pair status. It takes longer time for the asynchronous volume pairs to change to suspended or simplex state than the synchronous volume pairs. Therefore adding to the conventional pair statuses (simplex, pending, duplex, suspended), two new statuses are introduced.

(a) Definitions and conditions of transition

Suspending This volume pair is *in transition from duplex or pending to suspended state*. When cause of suspension (failure or operation) is detected, all affected volume pairs change to suspending state. After completing suspension, they will automatically change to suspended state.

Deleting This volume pair is *in transition from duplex, pending or suspended to simplex state.* When accepting delete pair operation, all affected volume pairs change to deleting state. After completing delete pair operation, they will automatically change to simplex state.

(b) Indication of pair status

- Suspending and deleting statuses can be indicated *only* on RMC (or SVP) main control and pair status panels.
- For main frame host systems, these states are not indicated. Status in transition is treated as follows:
  - — In case of operations (suspend pair or delete pair), status is not changed until transition completes. After completing status transition, affected volume pairs are changed to suspended or simplex state.
  - — In case of failure, affected volume pairs are changed to suspended state when cause of suspension is detected.
  - — In any cases, the MCU or RCU report the state change interrupt (SCI) after completing status transition. IEA491E or IEA494I console messages appear on the system console at this time.

Copyright ©1999, Hitachi, Ltd.

(2) Suspended by MCU Powered-Off

When the MCU is being powered off, the MCU suspends all volume pairs behind it. The suspended volume pairs will automatically return to their original state (duplex or pending) when the MCU is powered-on again. During this suspension, the suspended R-VOLs indicate by MCU powered-off as the cause of suspension.

(a) Conditions of transition

- During power-off sequence, the MCU notifies the RCU of the power-off event. The RCU changes all related R-VOLs to suspended states and sets by MCU powered-off as the cause of suspension.
  - — Only R-VOLs which are in duplex or pending state are affected. The cause of suspension of the R-VOL that is already suspended is not changed.
  - — Only R-VOLs of which corresponding M-VOLs are behind the MCU are affected. The volume pairs between other MCU are not affected.

- During power-on sequence, the MCU notifies the RCU of the power-on event. The RCU changes all R-VOLs in suspended by MCU powered-off state to original (duplex or pending) state.

(b) Indication of pair status

- Only the RCU can indicate this cause of suspension.
- This cause of suspension is displayed as follows:
  - — RMC (or SVP) Main Control panel: OFF in the Sub column
  - — RMC (or SVP) Pair Status panel: Suspended (MCU PS OFF)
  - — PPRC CQUERY command: SUSPENDED(5) with the specific indicator in the serial number field

Copyright ©1999, Hitachi, Ltd.

(3) Consistency Status - *Group* or *Volume*

(a) Definition of the status

Group Update sequence consistency between this R-VOL and other R-VOLs in this consistency group is ensured. This R-VOL can be used for disaster recovery at the secondary system after deleting the HRC volume pair.
This status is indicated when:
— All volume pairs in this consistency group have been suspended due to the failure that affected the consistency group (not the specific volume pair.)
— The volume pair having Error Level = Group has been suspended due to the failure.
— This volume pair has been suspended by suspend pair operation with *Group* parameter.

Volume Probably this volume pair has been suspended alone. Update sequence consistency between this R-VOL and other R-VOLs in this consistency group is not ensured. This R-VOL can not be used for disaster recovery at the secondary system. This status is indicated when:
— This volume pair has Error Level = Volume and has been suspended due to the failure that did not affect entire group.
— This volume pair has been suspended by suspend pair operation with *Volume* parameter.

(b) Indication of the status

- Only the RCU can display this cause of suspension.
- This status has the meaning described above only when the R-VOL is in suspended state.
- This status is displayed as follows:
  — RMC (or SVP) Main Control panel: GRP or VOL in the Sub column
  — RMC (or SVP) Pair Status panel: GRP or VOL as “Suspended by:” item
  — PPRC CQUERY command: SUSPENDED(x) with the specific indicator in the serial number field

Copyright ©1999, Hitachi, Ltd.

(4) Alert for Non-Time-stamped Updates - *SEQCHK*

SEQCHK indicates that the volume pair has accepted some updates without time-stamp attached while the consistency group is specified to use system timer.

(a) Set/reset conditions

When the RCU is settling the updated data, the RCU turns this indicator on if the updated data is not time-stamped, otherwise turns this indicator off.

(b) Indication of this indicator

- Only the RCU can display this indicator.
- This status can be indicated unless the volume is in simplex status.
- This status is displayed as follows:
  - RMC (or SVP) Main Control panel: SEQ (on) or blank (off) in the SEQ column
  - RMC (or SVP) Pair Status panel: SEQCHK (on) or blank (off)
  - PPRC CQUERY command: The specific indicator in the serial number field

Copyright ©1999, Hitachi, Ltd.

3.17.7.4 Controlling Volume Pairs

- Basic operations to control/monitor the HRC asynchronous volume pairs are same as the HRC synchronous pairs. That is, at first the volume pairs to be operated must be selected on the main control panel, and then the operation and its parameters/options should be specified.
- For the HRC asynchronous volume pairs, some group basis operations are supported. Several volume pairs within the consistency group to which the selected volume belongs can be deleted, suspended, resumed by the group basis operations. For these operations, any volume pair within the consistency group may be selected.

(1) *Add Pair* - Establishing HRC Volume Pairs

- This operation has the MCU establish the HRC volume pair(s). Selected volumes will be the M-VOLs and the R-VOLs should be specified by the parameters.
- For asynchronous volume pairs, the MCU-RCU logical connection must be established and the consistency group must be registered prior to this operation.

(a) Basic parameters and pair options

The basic parameters and the pair options of Add Pair are described in and respectively. "Changed" column of these tables indicates the difference between HRC asynchronous and conventional HRC.

Table 3.17.7-7 Add Pair - Basic Parameters

Item	Parameters	Changed	Description
Pair configuration	- R-VOL - RCU	No	Specifies the serial number and SSID of the RCU and the logical device number of the R-VOL
Initial copy control	- Initial Copy - Priority	No	Specifies whether the initial copy for this volume pair is necessary ("Entire Volume") or not ("None") and its priority
Update copy mode	- Copy Mode	Yes	Specifies the update copy mote for this volume pair out of Synchronous, Semi-Synchronous and Asynchronous. For the asynchronous volume pair, specifies the consistency group number to which this volume pair will belong.

Copyright ©1999, Hitachi, Ltd.

Table 3.17.7-8 Add Pair/Resume Pair - Option Parameters

Option Name	Changed	For:	Description
Initial copy pace	No	Any	Specifies the initial copy pace.
Fence Level	No	Synch. Semi-synch.	Specifies the fence level out of "Data", "Status" and "Never" for synchronous and semi-synchronous volume pairs. This option is valid for the HRC synchronous and semi-synchronous volume pairs.
CFW data	No	Any	Specifies whether the CFW updates should be copied to the R-VOL or not.
DFW to R-VOL	No	HODM	Specifies the volume pair should be suspended when DFW is disabled/failed at the RCU. This option is valid only for HODM volume pairs.
Error Level	Yes (new)	Asynch.	Specifies whether all the volume pairs in the same consistency group should be suspended together or not when this volume pair is suspended. Group All the volume pairs group should be suspended together. Volume Only this volume pair may be suspended. This option is valid only for the HRC asynchronous volume pairs and the default is Group.
Pair Resume	Yes (new)	Asynch.	Specifies whether all the suspended volume pairs, which belong to the same consistency group and whose M-VOLs are behind this MCU, should be resumed together. Group All the volume pairs should be resumed together. Volume Only this volume pair may be resumed. This option is valid only for Resume Pair operation of the HRC asynchronous volume pairs and the default is Group (currently Volume).

Copyright ©1999, Hitachi, Ltd.

(b) End conditions

The Resume Pair operation with the Group option gets the normal end condition before the initial copy for each volume pair begins. If some unusual conditions (pinned tracks, correction-access status of the parity group, etc.) prevents the volume pair from being re-established, the volume pair would be still in suspended status. Therefor the result of this operation should be confirmed by referring to the actual pair status or the console messages that indicate pair status change.

(2) *Delete Pair* - Deleting HRC Volume Pairs

- In order to make the disaster recovery operations at the secondary subsystem simple, a new option that specifies the volume pairs to be deleted is supported (***Delete*** option).
- The pair status of the asynchronous volume pairs will be Deleting when the operation completes, and then Simplex after the internal process completes.

(a) Volume pairs to be deleted

Table 3.17.7-9 Delete Pair - Delete Option

Option Name	Operable at:		Description
	MCU	RCU	
Consistent Volumes	No	Yes	Specifies that the volume pairs that meet the following conditions should be deleted. — Belongs to the same consistency group as the selected volume pair and; — Is in Suspended status and; — Has the consistency status of Group. Other volume pairs than described above are not deleted. This is the default when operated at the RCU.
Group	Yes	Yes	Specifies that the all volume pairs (but volume pairs behind other MCU when operated at the MCU) in the same consistency group should be deleted.
Volume	Yes	Yes	Specifies that only selected volume pairs should be deleted. This is the default when operated at the MCU.

- This option is valid only when the asynchronous volume pair is selected.
- "Consistent Volumes" and "Group" can be specified when only one volume pair is selected.

Copyright ©1999, Hitachi, Ltd.

(b) Force option for asynchronous volume pairs

The Force option specifies that the volume pair should be deleted even if the MCU and RCU can not communicate with each other. For the asynchronous volume pairs, this option is still effective but can be specified with the Delete option of Group.

(c) End conditions

The Delete Pair operation for the asynchronous volume pairs gets the normal end condition when the operation is accepted by the MCU/RCU. The pair status of the volume pairs to be deleted are Deleting at this time. And then the pair status will be Simplex after the internal process (negotiation between the MCU and RCU) completes. Therefor the result of this operation should be confirmed by referring to the actual pair status or the console messages that indicate pair status change.

(d) Consistency time/status after deleted

Once the volume pair deleted, the consistency time/status of the volume pair will be reset. Therefor the consistency time/status should be memorized prior to this operation

Copyright ©1999, Hitachi, Ltd.

(3) *Suspend Pair* - Suspending HRC Volume Pairs

- A new option that specifies the volume pairs to be suspended is supported (Suspend option).
- The pair status of asynchronous volume pairs will be Suspending when the operation completes, and then Suspended after the internal process completes.

(a) Parameters and options

Table 3.17.7-10 Suspend Pair - Parameters and Options

Item Name		Operable at:		Description
		MCU	RCU	
SSB (F/M=FB)		Yes	Yes	Specifies that IEA494E console message should be generated.
Suspend Kind		-	-	Only "R-VOL" can be selected for the asynchronous volume pairs.
Suspend				Specifies the volume pairs to be suspended.
	Group	Yes	Yes	Specifies that all volume pairs in the same consistency group as the selected volume pair should be suspended together.
	Volume	Yes	Yes	Specifies that only the selected volume pair should be suspended.
Pending Update				Specifies how the pending recordset should be treated.
	Drain	Yes	Yes	Specifies that the volume pair(s) should be suspended after all pending recordset are settled. Refer to (3) in this section for notes on this option.
	Purge	Yes	Yes	Specified that that volume pair(s) should be suspended even if pending recordset remain. The pending recordset may be purged. If the MCU/RCU discard the pending recordset, the MCU/RCU marks the cylinders that contain discarded recordset as modified in its shared memory. The marked cylinders will be copied when the Resume Pair operated.

(b) Update sequence consistency

Regardless of the Pending Update parameter, the update sequence consistency across the volume pairs to be suspended is ensured. However, if some volume pairs have been suspended with the Volume option and other related volume pairs are updated after that, the update sequence consistency is not ensured.

Copyright ©1999, Hitachi, Ltd.

(c) Notes on Drain option

- If the Purge option specified, the volume pairs are suspend when the RCU accepts this operation. On the other hand, if the Drain option is specified, the volume pairs will be suspended when the RCU completes the steps described bellow.
  ① Accepts this operation and;
  ② Has finished settling all the pending recordsets and;
  ③ Completes the negotiation with all MCUs (reports ready-for-suspension to all the MCUs and receives their acknowledgements) without further recordset generated.

- Therefore, the procedures to get the R-VOLs whose contents are frozen at specific point in time relative to the application, are as follows
  ① Quiesce the application (Quiesce all update activity to the volume pairs) and;
  ② Perform the Suspend Pair operation with Drain option and;
  ③ Confirm that all volume pairs complete to be suspended and;
  ④ Restart the application.

- Time to disrupt the application (between 1 and 4 above) mainly depends on time for the RCU to follow steps (a) to (c) described above. That is, it depends on how many recordsets are pending and how much I/O workload the MCUs/RCU have. Since the RCU will break off above steps and forcibly suspend the volume pairs if time specified by the maximum copy delay time parameter expires, this parameter can help decide the expected disruption time.

(d) End conditions

The Suspend Pair operation for the asynchronous volume pairs gets the normal end condition when the operation is accepted by the MCU/RCU. The pair status of the volume pairs to be suspended are Suspending at this time. And then the pair status will be Suspended after the internal process (negotiation between the MCU and RCU) completes. Therefore the result of this operation should be confirmed by referring to the actual pair status or the console messages that indicate pair status change.

Copyright ©1999, Hitachi, Ltd.

(4) *Resume Pair* - Resuming HRC Volume Pairs

The Pair Resume option is newly supported. It specifies whether all suspended volume pairs, which belong to the same consistency group and whose M-VOLs are behind this MCU, should be resumed together or not. Refer to Table 3.17.7-8 for this option.

(5) *Pair Option* - Modifying HRC Options on Volume Pair Basis

Refer to Table 3.17.7-8 for the options on volume pair basis. The Error Level option can be changed regardless of the pair status (even if the volume pair is in Suspended state), but become effective at the next time of suspension.

(a) Modified items on Pair Status panel

Table 3.17.7-11 Pair Status - Modified Items on Pair Status Panel

Items	Indicated at:		Description
	MCU	RCU	
M-VOL and R-VOL	Yes	Yes	Indicates control unit image number and device number in form of "c:dd".
Pair Synchronized	Yes	Yes	Indicates the amount (%) of cylinders that are marked as modified in the bitmap for pair re-synchronization. Refer to (2) below for more detailed information.
Pair Status			Adding to the contents for the synchronous HRC volume pairs, the following are added for the asynchronous HRC volume pairs.
Suspending	Yes	Yes	Indicates that the volume pair is in transition state to Suspended.
Deleting	Yes	Yes	Indicates that the volume pair is in transition state to Simplex.
Suspended[MCU PS OFF]	No	Yes	Indicates that the volume pair has been suspended due to the power-off event of the MCU.

Copyright ©1999, Hitachi, Ltd.

(b) The Pair Synchronized indicator

- For the asynchronous volume pairs, both MCU and RCU maintain the bitmap for pair re-synchronization. The indicated percentage is calculated as follows.

— The M-VOL of Pending state indicates the remaining cylinders to be copied for pair re-synchronization.
— The R-VOL of Suspended state indicates the cylinders that contain the recordsets lost at the RCU (reached at the RCU but can not be settled before suspension).
— The M-VOL of Suspended state indicates the cylinders that contain;

① The tracks that have not copied yet by the initial copy and;
② The records updated by the primary system after suspension and;
③ The recordsets lost at the MCU (created in the MCU but can not be sent to the RCU before suspension) and;
④ The recordsets lost at the RCU.

The last item (d) is included as long as the MCU can get the information from the RCU. Otherwise, only items (a)-(c) are included. In this case, the item (d) will be included at the beginning of the pair resynchronization.

- This percentage is always calculated based on the total cylinders of the M-VOL (even if the R-VOL is larger than M-VOL).

Copyright ©1999, Hitachi, Ltd.

(c) Added items on Pair Status panel

Table 3.17.7-12 Pair Status - Added Items on Pair Status Panel

Items	Indicated at:		Description
	MCU	RCU	
C/T Group	Yes	Yes	Indicates the consistency group number to which this volume pair belongs.
C/T Type	Yes	Yes	Indicates the timer type that has been specified to control the consistency group. The displayed content is out of System, Local and None.
C/T	Yes (Note)	Yes	Indicates the consistency time of this volume pair in form of "mm/dd/yyyy hh:mm:ss.uuuuuu". (uuuuu: micro seconds)
SEQCHK	Yes (Note)	Yes	Indicates SEQCHK if the volume pair is in SEQCHK status. Otherwise it blanks.
Suspended by	No	Yes	Indicates the consistency status of the R-VOL when this volume pair is in Suspended status. Group The consistency between this R-VOL and other R-VOLs in the consistency group is ensured. Volume The consistency between this R-VOL and other R-VOLs in the consistency group is not ensured. The contents of this R-VOL may be behind other R-VOLs.

(Note) Only the RCU maintains the latest result and can display it. The result at the MCU may be behind the actual result because the MCU get the result from the RCU before displaying. Therefore the result at the MCU can be used *for monitoring the normal activities*, but can not for the disaster recovery at the RCU.

Copyright ©1999, Hitachi, Ltd.

(d) Added items

Table 3.17.7-13 Pair Status - Added Items on Pair Status Panel

Items	Indicated at:		Description
	MCU	RCU	
Grp (Lv)	Yes	Yes	Grp Indicates the consistency group number to which this volume pair belongs. (Lv) Indicates the Error Level of this volume pair, "Grp" for group or "Vol" for volume.
Sub	No	Yes	Indicates the consistency status or the others when the volume pair is in "suspended" state. GRP This R-VOL has the consistency status of Group. VOL This R-VOL has the consistency status of Volume. OFF This volume pair has been suspended due to the power-off event of the MCU.
Seq	No	Yes	Indicates SEQCHK if the volume pair is in SEQCHK status. Otherwise it blanks.

Copyright ©1999, Hitachi, Ltd.

3.17.7.5 Monitoring subsystem Statistics

(1) *Usage* - Displaying Remote I/O Statistics Information

Table 3.17.7-14 Usage - RIO Statistics in Async Copy Category

Item name	Unit	Description
Async IO count	—	Indicates the total number of RIO (Remote I/O) activities completed in a specified interval.
Total number of recordset	—	Indicates the total number of recordset sent to the RCU in a specified interval.
RCU command retries	—	Indicates the total number of RIO command retries requested by the RCU in a specified interval.
MCU command retries	—	Indicates the total number of channel command retries performed by the MCU in order to avoid cache slot conflict between the host I/O and RIO processes.
Average transfer rate	KB/sec.	Indicates the average data transfer rate of the recordset sent to the RCU in a specified interval.
Average RIO response	msec.	Indicates the average RIO response time in a specified interval.

(2) *Information/Monitor* - Displaying Subsystem Resource Usage

- The item named "Async Write Pending Data" is newly supported. It is displayed on the Information/Monitor panel of the SVP and recorded into monitor.dat file.
- "Async Write Pending Data" indicates the total amount of cache space in percent that store the pending recordset (sidefile).
- The conventional item "Sidefile" indicates the total usage of the sidefile for HXRC, Concurrent Copy and HRC asynchronous.

Copyright ©1999, Hitachi, Ltd.

3.17.8 Management/Recovery Procedures

3.17.8.1 Managing HRC Asynchronous Subsystems

(1) Checking on SEQCHK Status

- SEQCHK status would be indicated when the asynchronous volume pair in the consistency group with the timer type of System specified accepts the non-time-stamped updates from the primary system.
- SEQCHK status does not affect copy activities of HRC asynchronous and will be removed when the next time-stamped update is successfully copied to the R-VOL. However if the disaster happens before the next time-stamped update, the update sequence consistency between the R-VOL and other R-VOLs in the consistency group is not ensured. Therefor to make the disaster recovery more certain, the source of SEQCHK status should be detected and removed.
- Source of SEQCHK status to be suspected is as follows:
  — An application may issue the update I/Os with bypassing MVS standard I/O procedure.
  — An XRC time-stamping capability may not active at the primary system.
  — An Operating system of the primary system may not support the time-stamping capability.

(2) Checking on the Consistency Time

The consistency time is indicated as a part of pair status of the HRC asynchronous volume pairs. While the primary system continues to update the M-VOLs, the difference between the current time and the consistency time indicates how long the R-VOLs are behind the M-VOLs. The updates to the M-VOLs during this duration may be lost when the disaster happens

- If the disaster recovery design can not accept this delay, performance improvement by adding the remote copy resources (paths, cache amount, etc.) and/or reducing unnecessary I/O workload should be considered to get shorter delay.
- If this delay is close to the time specified by the Maximum Copy Delay Time parameter, the timeout failure may occur and the affected volume pair may be suspended due to the I/O workload fluctuations. The performance improvement described above and/or increasing this parameter setting should be considered.

Copyright ©1999, Hitachi, Ltd.

(3) Planned Outage of HRC Asynchronous Components

The MCU requires communication with the RCU even if it receives no update I/Os from the primary system. Suspending all the duplex pairs is necessary prior to the planned outage of the RCU.

(a) Planned outage of the MCU

- No special procedure is required for the asynchronous volume pairs. The MCU automatically suspends all volume pairs in Duplex/Pending state during the power-off sequence, and will remove the Suspended state at the power-on-reset sequence.
- Note that the volume pairs whose M-VOLs are behind the MCU will not be suspended. In N-to-1 configuration, the volume pairs behind other MCU(s) continue to be copied. If the full-consistent volume set requires to be kept during the planned outage, the procedures are as follows:

  ① Quiesce the applications.
  ② Perform Suspend Pair operation with Group and Purge (or Drain) option at the RCU.
  ③ Perform planned outage operation of the MCU(s).
  ④ After getting all MCUs ready to resume, perform Resume Pair operation at all MCUs.

(b) Planned outage of the RCU

- Suspending all volume pairs is required prior to the planned outage according to the followings:

  ① Suspend all volume pairs;
    1) Perform Suspended Pair operation at each MCU and;
    2) Confirm volume status with Pair Status operation.
  ② Perform planned outage operation of the RCU.
  ③ Get the RCU ready to resume.
  ④ Remove Suspended status from all volume pairs;
    1) Perform Resume Pair operation at each MCU and;
    2) Confirm volume status with Pair Status operation.

(Note) If step 1 above is not performed, the MCU detects the communication failure and suspend all affected volume pairs with generating SIM(s) and console message(s) that indicates the failure.

Copyright ©1999, Hitachi, Ltd.

(c) Planned outage of the components on the remote copy connection

The same restriction should be considered and the same procedures should be performed as the RCU for the components (channel extender, ESCON director, etc.) on the remote copy connection.

- Suspending all volume pairs is required prior to the planned outage according to the followings:

① Suspend all volume pairs;
   1) Perform Suspended Pair operation at each MCU and;
   2) Confirm volume pair status with Pair Status operation.
② Perform planned outage operation of the component.
③ Get the component ready to resume.
④ Remove Suspended status from all volume pairs;
   1) Perform Resume Pair operation at each MCU and;
   2) Confirm volume status with Pair Status operation.

(Note) If step 1 above is not performed, the MCU detects the communication failure and suspend all affected volume pairs with generating SIM(s) and console message(s) that indicates the failure.

(d) Planned outage of both MCU and RCU

- The MCU(s) must become not-ready first, and the RCU must be back before the MCU(s).

① Perform planned outage operation of the MCU(s).
② Perform planned outage of operation of the RCU.
③ Get the RCU ready to resume.
④ Get the MCU(s) ready to resume.

- Note that the MCU make all volume pairs suspended if it can not communicate with the RCU during the power-on-reset sequence. Therefor step 4 above should be started after completing step 3. If it is difficult to control due to some installation requirements (ex. Power-Control-Interface setting), consider using the Maximum RCU-ready-wait Time parameter.

(4) ICKDSF on the Asynchronous Volume Pairs

- ICKDSF activities involve write I/Os with device support authorization or diagnostic authorization instead of normal authorization. Since the MCU does not duplicate write I/Os with device support or diagnostic authorization, the HRC volume pairs must be suspended before running ICKDSF. The procedures to do are as follows:

① Perform Suspend Pair operation with Volume option at the MCU to suspend volume pair(s) for which ICKDSF will be performed.
② Perform ICKDSF.
③ Perform Resume Pair operation at the MCU.

Copyright ©1999, Hitachi, Ltd.

(5) Micro-program Exchange

No special procedure is required for the asynchronous volume pairs for the on-line micro-program exchange and the MCU's off-line micro-program exchange.
In the case of HRC Asynchronous components, Suspending all volume pairs is required prior to the RCU's off-line micro-program exchange.

① Suspend all volume pairs;
   1) Perform Suspended Pair operation at each MCU and;
   2) Confirm volume status with Pair Status operation.
② Perform micro-program exchange operation of the RCU.
③ Remove Suspended status from all volume pairs;
   1) Perform Resume Pair operation at each MCU and;
   2) Confirm volume status with Pair Status operation.

(Note) If step 1 above is not performed, the MCU detects the communication failure and suspend all affected volume pairs with generating SIM(s) and console message(s) that indicates the failure.

Copyright ©1999, Hitachi, Ltd.

3.17.8.2 Recovering from Pair Suspended

(1) Recovering from Pair Suspended - Suspended by the MCU

The cause of suspension and the recovery procedures are basically the same as HRC synchronous with exceptions that:

① The cache storage/shared memory of the one side (not both sides) may cause the HRC asynchronous volume pairs to be suspended.
② The MCU requires communicating with the RCU in power-on-reset sequence and suspends all the HRC asynchronous volume pairs if it can not do so.
③ The MCU suspends all the HRC asynchronous volume pairs if no recordset can be sent in the specified time period.

(2) Recovering from Pair Suspended - Suspended by the RCU

Adding to directed by the MCU, the RCU of HRC synchronous may detect the cause of suspension and suspended the failed volume pair(s) on its own initiative.

3.17.8.3 Disaster Recovery - Switching to the Secondary Subsystem

(1) Switching Procedures to the Secondary Subsystem

Basic procedures to switch to the secondary subsystem are as follows:

① Check pair status and memorize the consistency time of the R-VOLs.
② Make the R-VOLs simplex by performing Delete Pair operation.
③ Confirm that the R-VOLs have successfully been changed to simplex.
④ Perform IPL of the secondary system.
⑤ Perform the application restart procedure at the secondary system

(2) Suspending Volume Pairs due to the Disaster

If the RCU receives no communication with the MCU after the time specified by Maximum Copy Delay Time expires, the RCU regards this timeout event as a disaster and suspends all the HRC asynchronous volume pairs.

- Pair status of the R-VOLs normally become Suspended - Group.
- The latest time-stamp of the recordset that has been successfully settled is frozen and indicated as the consistency time of the R-VOLs.

Copyright ©1999, Hitachi, Ltd.

(3) Checking Volume Pair Status

- The R-VOLs of Suspended - Volume should not be used for the disaster recovery. Therefore Error Level of Group should be selected if the volume is essential to the disaster recovery.
- Delete Pair operation with Group option can make only the R-VOLs of Suspended - Group status. Therefore an operator seems to be able to skip this checking. However the volumes of Simplex status can not be distinguished form others after the R-VOLs in Suspended - Group status become Simplex by Delete Pair operation. Therefore at least the volumes in *Simplex* must be checked at this time.

Table 3.17.8-1 Checking R-VOL Status When Switching to the Secondary System

Pair status		Usable for recovery?	Description
Suspended	Group	Yes (*1)	Since the update sequence consistency across these R-VOLs is ensured at point in time indicated by the consistency time, these R-VOLs can be used for the disaster recovery at the secondary system. Note that some updates performed after the consistency time at the primary system may be lost.
Suspended	Volume	No	Since contents of this R-VOL may be behind other R-VOLs in the consistency group, this R-VOL should not be used for the disaster recovery if this volume requires the update sequence consistency with other volumes. Suspected reason for this status are as follows: — This R-VOL has been suspended due to the failure or Suspend Pair operation prior to the disaster. — This R-VOL was in pending status when the disaster happened. — The Error Level of Volume has been specified for this R-VOL and this R-VOL was suspended by the first symptom of the disaster.
Duplex Pending Simplex		No No No	This status does not usually take place in the disaster recovery procedure. This R-VOLs should not be used for the disaster recovery. *It should be especially noted that the volumes in simplex status can not be distinguished from others after deleted by Delete Pair operation.*

(*1) If SEQCHK status should be decided by the RCU using the XRC time-stamping capability, this R-VOL shall not be used for disaster recovery.

Copyright ©1999, Hitachi, Ltd.

(4) Memorizing the Consistency Time

The consistency time of the R-VOLs should be *memorized*. It could help the disaster recovery retrieve the lost updates.

- All the R-VOLs of Suspended - Group status indicate the same consistency time. Therefor any R-VOL of this status can represent the consistency time of the consistency group.
- Once Delete Pair operation performed, the R-VOL *never* indicates the consistency time again. Therefore the consistency time should be memorized before Delete Pair operation.

(5) Deleting Volume Pairs

By Delete Pair operation, the R-VOLs that are used for the disaster recovery should be changed to Simplex status.

- Group option of Delete Pair operation can make all the R-VOLs of Suspended - Group status Simplex. It would be helpful in reducing number of operations.
- Group option of Delete Pair operation does not change the pair status of the R-VOLs if they are other than Suspended - Group. It can prevent the inconsistent volumes from being used for the disaster recovery.

(6) Recovering the Lost Updates

HRC asynchronous provides *no* factory standard procedure to retrieve the lost updates.

- In order to detect and recreate lost updates, it is necessary for customers to check other current information, for example, data base log file that had been active at the primary system when disaster occurred. Note that the log file entries of most DBMS may be related to time-of-day clock information and the source of the consistency time is time-of-day clock of the primary system (when the timer type of System specified.).
- However such a detection/retrieval would take long time to do. The customers' disaster recovery scenario recommends to be designed to enable such a detection/retrieval *after* the application has been started at the secondary system.
- Maximum Copy Delay Time parameter of Add Group operation can control the maximum time duration during which the updates may be lost.

Copyright ©1999, Hitachi, Ltd.

3.17.8.4 Disaster Recovery - Switching Back to the Primary Subsystem

This section describes the procedures to switch back from the secondary system to the primary system. The basic concept and procedures are the same as HRC synchronous. After volume pairs establishment in the opposite direction, planned switching-back and volume pair establishment in the original direction are performed.

That is, the original R-VOLs are working as Simplex and the application is running on the secondary system by using the original R-VOLs. The original HRC asynchronous configuration/status should remain in the original MCU. In this section, the original MCU/M-VOLs and RCU/R-VOLs are called the primary subsystem and secondary subsystem respectively.

(1) Switching Back Procedures to the Primary Subsystem

(a) Make the primary subsystem and the communication facilities on the remote copy connection operable. Note that all the M-VOLs in the primary subsystem may be suspended since the original R-VOLs are now in Simplex status.

(b) Remove entire HRC asynchronous configuration remained in the *primary* subsystem:

① Make all the volume pairs Simplex by Delete Pair operation.
② Remove registration of the consistency group by Delete Group operation.
③ Remove MCU-RCU logical paths by Delete RCU operation.
④ Change the serial interface port to LCP mode.

(c) Establish HRC asynchronous in the *opposite* direction:

① Change the operating mode of the communication facilities in the opposite direction.
② Change the serial interface port of the secondary subsystem to RCP mode.
③ Register the consistency group at the secondary subsystem by Add Group operation.
④ Establish MCU-RCU path in the opposite direction at the secondary subsystem by Add RCU operation. The primary subsystem is now defined as the RCU.
⑤ Establish the HRC asynchronous volume pairs in the opposite direction. The volumes in primary and secondary subsystem are now defined as the R-VOLs and M-VOLs respectively. Note that Initial Copy of Entire Volume option must be specified.

(d) Quiesce the application at the secondary system.

(e) Confirm all the HRC asynchronous volume pairs are in Duplex status.

Copyright ©1999, Hitachi, Ltd.

(f) Remove entire HRC asynchronous configuration at the *secondary* subsystem:

① Make all the volume pairs Simplex by Delete Pair operation.
② Remove registration of the consistency group by Delete Group operation.
③ Remove MCU-RCU logical paths by Delete RCU operation.
④ Change the serial interface port to LCP mode.

(g) Establish HRC asynchronous in the original direction

① Change the operating mode of the communication facilities in opposite direction.
② Change the serial interface port of the primary subsystem to RCP mode.
③ Register the consistency group at the primary subsystem by Add Group operation.
④ Establish MCU-RCU path in opposite direction at the secondary subsystem by Add RCU operation. The secondary subsystem is now defined as the RCU.
⑤ Establish the HRC asynchronous volume pairs in the original direction. The volumes in primary and secondary subsystem are now defined as the M-VOLs and R-VOLs respectively. Note that Initial Copy of No Copy option may be specified.

(h) Make the primary subsystem online from the primary system and restart the application at the primary system.

(Note) Since the CNT channel extenders have the operating mode, they must be re-configured to change copy direction. The boxes (or nodes) to which the *current* MCU and RCU are connected must be set as channel-mode and device-mode respectively.

(2) Setting the Consistency Group for Switching Back

- For N-to-1 (N≥2) configuration, timer type of "None" muse be specified.
  - — None enables the consistency group across up to 4 RCUs to be established.
  - — However the update sequence consistency across the RCUs is not ensured.
- In 1-to-1 configuration, the update sequence consistency across all R-VOLs is ensured regardless of the timer type. However System is recommended if the secondary system can use the XRC time-stamping capability in order for the consistency time to be indicated.

Table 3.17.8-2 Timer Type for Switching Back

Original Configuration		Timer Time for Switching Back	
Number of MCU-RCU	Timer Type	XRC time-stamping capability at the secondary system?	
		Yes	No
N-to-1 (N≥2)	System	**None**	**None**
1-to-1	System	**System**	**None**
	Local	**Local**	**Local**

3.18 HIHSM(Hitachi internal Hierarchical Storage Management)

3.18.1 HIHSM Overview

This document describes the function of HIHSM (Hitachi internal Hierarchical Storage Management) that is one of program products.

RAID system can be constructed by several types of physical drive and two types of RAID level (RAID1 and RAID5).

This combination of the type of physical drive and the type of RAID level provides the system that cost and performance are optimized to user environment. However, it is difficult to get information about actual utilization of physical drives in the RAID system unlike other disk subsystems.

(1) HIHSM provides solution of the problem and supports decision of users to determine system construction as described below.
  (a) Load balancing of system resources.
  Unbalance of utilization of system resources makes performance worse. HIHSM supports decision of optimized allocation of logical volumes to physical drives.
  (b) Migration of logical volumes optimized to access patterns to physical drives.
  For instance, RAID5 is suitable to sequential access, and RAID1 of DF3F1 is suitable to random access that is required small response time. HIHSM shows types of access pattern to physical drives clearly, and supports migration of logical volumes to suit the access pattern.

(2) HIHSM consists of following subfunction to achieve above purposes. Users can refer utilization of system resources monitored by monitor function, decide reallocation plan by using estimate function, and reallocate the logical volumes by volume moving (migration) function.
  (a) Monitor function monitors and shows utilization of system resources.
  (b) Estimate function estimates utilization of parity groups after migration of logical volumes.
  (c) Volume moving (migration) function moves logical volumes to specified parity groups.
  (d) Preset function makes a migration plan from information that users preset, and moves the logical volumes by the migration plan automatically.

3.18.2 Hardware requirements

WP-102B or WP-132B or hardware that equal to above types is needed as DKA.
If this hardware is not installed, you could not install this “HIHSM” Program Product.

Copyright ©1999, Hitachi, Ltd.

3.18.3 Monitor function

(1) Start and end of monitoring
Monitoring starts in DKC by direction from HIHSM utility window. The monitoring continues until the direction of ending the monitoring from HIHSM utility window.

(2) Monitoring information
Monitor function monitors utilization of system resources described below.
(a) CHP utilization and DKP utilization
(b) FBUS utilization and MBUS utilization
(c) DRR utilization
(d) Parity group utilization: Disk utilization of parity groups. The used time of physical drives in a parity groups
(e) Parity group utilization of each logical volume: The used time of physical drives of synchronous and asynchronous access on each logical volume, averaged by the number of physical drives in the parity group. Parity group utilization means sum of utilization of each logical volume in the parity group.
Above information is collected from DKC to SVP once a day automatically, or by requiring from users. The collected information of 3 months is stored in the hard disk of SVP. When the amount of the information is over 3 months, the oldest information is overwritten by new information.

(3) Viewing monitored information
Users can specify term and kind of the information to see in HIHSM utility window. In HIHSM utility window, average value and maximum value of the utilization of system resources are shown. The CHP, DKP, FBUS, MBUS, and DRR utilization are shown in one window, and parity group utilization is shown in another window.

Users can see parity group utilization and parity group utilization of each logical volume by following. (1) View parity group utilization in HIHSM main window. (2) Select one parity group in the window to show the utilization of each logical volume in the parity group.

Monitored information can be outputted to FD. User can see the outputted information by HIHSM viewer tool. The environment in which Microsoft Excel97 can work is needed to view the information. Microsoft Excel97 is a registered trademark of Microsoft corporation.

Copyright ©1999, Hitachi, Ltd.

3.18.4 Estimate function

Estimate function estimates changes of parity group utilization and parity group utilization of each logical volume after migration of the logical volume to specified parity group. Estimate function estimates the changes from the monitored information.

Copyright ©1999, Hitachi, Ltd.

3.18.5 Volume moving (migration) function

Volume moving (migration) function moves data in logical volume (source volume) to physical location of another logical volume (destination volume). Users specify the volumes in HIHSM utility window.

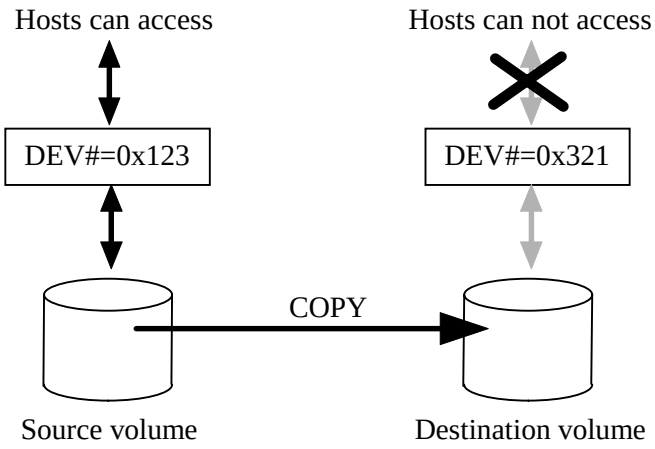

Fig. 3.18.5-1 Before moving

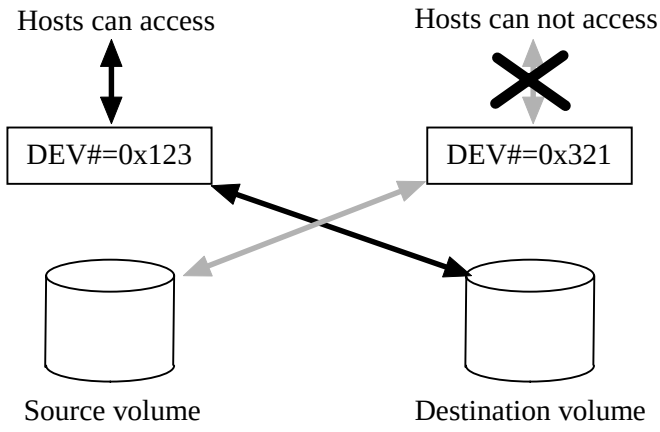

Fig. 3.18.5-2 After moving

(1) Volume moving function Overview

(a) Supported Volumes:

All types of emulation type supported by RAID except the following volumes.

- Volumes which are set as 3390-3A/B/C and so on
- Volumes which are set as Command Device
- Volumes which are used as HMRCF/HOMRCF pairs
- Volumes which are used as HRC/HORC pairs

Copyright ©1999, Hitachi, Ltd.

(b) Destination volumes:

Destination volumes must be specified to RESERVE in advance.
Users can specify the volumes to RESERVE by [Attribute] button in HIHSM utility window.
Hosts can not access the RESERVE volumes.
Users can confirm whether a volume is RESERVE or not by [Attribute] button in HIHSM utility window.
Notice: You cannot set the LUSE volumes as “Reserved”.

(c) Specifying Volumes:

Source volume and destination volume are specified by LDEV number.
An open volume also specified by one LDEV number. If the volumes are set as LUSE, you can specify by one LDEV number. HIHSM will migrate the LDEV which is one of a LUSE and its access is higher.

(d) Unit to moving:

One moving can be instructed by specifying one pair of volumes (LDEV).

(e) Moving of multi volumes:

Moving of volumes can be performed by repeating instruction about each volume.
Maximum 36 volumes can be accepted in the same time.
The maximum number of the sum of the HMRCF/HOMRCF total pairs and HIHSM migrating volume numbers is 64 or 512.
* In the case that the maximum number of HMRCF and HOMRCF pairs is 512.

(f) Abort moving:

Users can direct to abort the instructed moving before completion.
With aborting, the data in the destination volume is not guaranteed.
Users can direct to abort about each LDEV.

(g) Notice when the DKC is maintenance:

HIHSM sometimes fails the volume migration if the Cache or drive replacement installation or deinstallation is executed at the same time.

(2) Conditions for moving

Data moving is performed when all conditions about source volume and destination volume described bellow are satisfied.

(a) Both of the volumes have same emulation type.
(b) Both of the volumes have same size.
(c) There is no PIN data in the source volume.
(d) Both of the volumes are not blockade.
(e) Both of the volumes in same DKC.
(f) The volumes are not instructed to move already and not waiting to move.
(g) The volumes are not in the pair of volumes of HRC/HODM/HORC/HMRCF/HOMRCF.
Notice: After you set the HORC pair to “pairsplit -R”, the target volume of that HORC pair can be set as HIHSM’s reserved volume. If you operate HORC pairs, please be careful.
(h) The volumes are not HMRCF/HOMRCF’s reserved volumes.
(i) The volumes are not Command Device.
(j) The volumes are not set DCR.

(3) Viewing History

Users can see the history of volume moving (migration) by [History] button in HIHSM utility window.

Copyright ©1999, Hitachi, Ltd.

3.18.6 Decision of volume moving (migration)

HIHSM supports decision of users about disk system performance tuning by logical volume moving (migration). This section describes usage and points to notice about monitor function.

(1) Inspecting utilization of system resources
First of all, using monitoring function, a user investigates whether there exists overloaded resources, or imbalance of resource utilization. Then the user tunes resource utilization in the manner described in the following clause.

Note: due to average system resource utilization, there will be such a case as a portion of system performance will be negatively effected although total performance of a system will be improved. For example, if there exists RAID groups A and B of utilization 20% and 90% respectively, and if the utilization will become 55% and 55% if a logical volume residing in parity group B moves parity group A. Then response time of I/Os to parity group A will be increased while response time of I/Os and throughput to parity group B will be improved.

(2) Tuning FBUS/MBUS utilization
Since FBUSes and MBUSes are common resources in RAID300, migration of logical volumes does not improve system performance.

(3) Tuning CHP utilization
Migration of logical volumes does not improve CHP performance. Therefore if CHPs are overloaded on an average, the user should consider installation of new CHAs. And if the utilization of CHPs are imbalance, the user should consider that channel paths connecting to a CHA, which includes overloaded CHPs, is reconfigured into the connection to another CHA which includes CHPs of lower utilization.

Copyright ©1999, Hitachi, Ltd.

(4) Tuning DKP/DRR utilization

If utilization of DRRs or DKPs is in high average, the user should consider to install new DKAs and HDDs. After installation of DKAs and HDDs, logical volumes which had high traffic of write access (especially of sequential write access) should be migrated to a parity group in newly installed HDDs.

If utilization of each DKP are imbalance, the user should consider migration of logical volumes from current parity group deployed under a DKA pair of high utilization to one under a DKA pair of lower utilization. The estimate function cannot simulate the DKP utilization. Therefore this method should be applied under the prospect of large improvement. For example, there would be least improvement in case of slight difference of utilization of each DKP, or if DRRs are comparatively in high utilization.

(5) Tuning RAID group utilization

If parity groups are in high utilization, the user should consider to install new HDDs. After installation of HDDs, logical volume which had high traffic of I/Os should be migrated to a parity group in newly installed HDDs.

If utilization of each parity group are imbalance, the user should consider migration of logical volumes from current parity group of high utilization to the one of lower utilization.

These method should be applied under the prospect of large improvement. There would be least improvement in case of slight difference of utilization of each parity group, or if DRRs or DKPs are comparatively in high utilization.

When some kind of errors in the system, utilization of system resource can increase or be unbalanced.

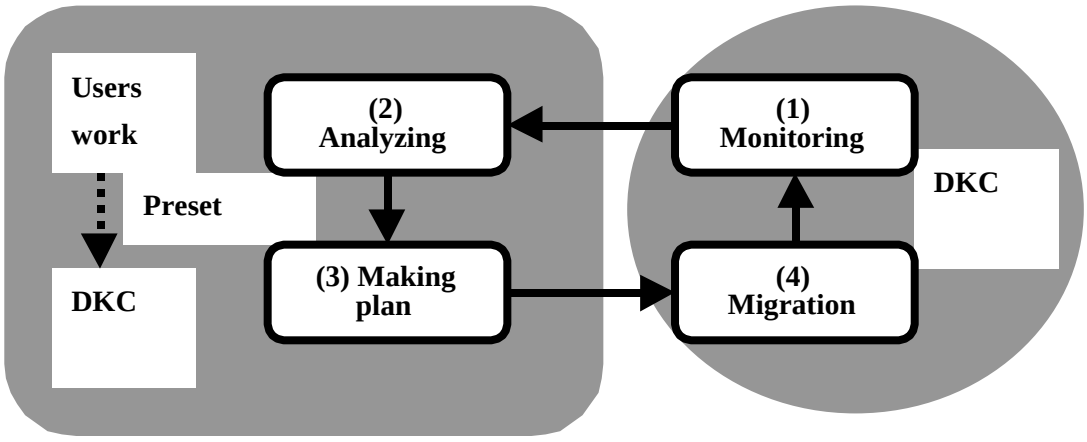
Copyright ©1999, Hitachi, Ltd.

3.18.7 Preset function

(1) Preset function Overview
Preset function provides typical tuning method of HIHSM based on parameters given by users, and performs tuning plan automatically.

(2) Overview of tuning
Tuning by HIHSM can be done by following steps repeatedly.
(a) Monitoring information
(b) Analyzing information
(c) Making volume migration plan (decision of volume migration)
(d) Moving volume (migration)
(a') Monitoring information again to confirm condition and effect of the performed tuning.

Preset function eases users' work by providing typical tuning method of HIHSM based on parameters given by users, and performs tuning plan automatically. When (b) Analyzing and (c) Making plan are done by users, it can make fine tuning.



Copyright ©1999, Hitachi, Ltd.

(3) Process of tuning by preset function

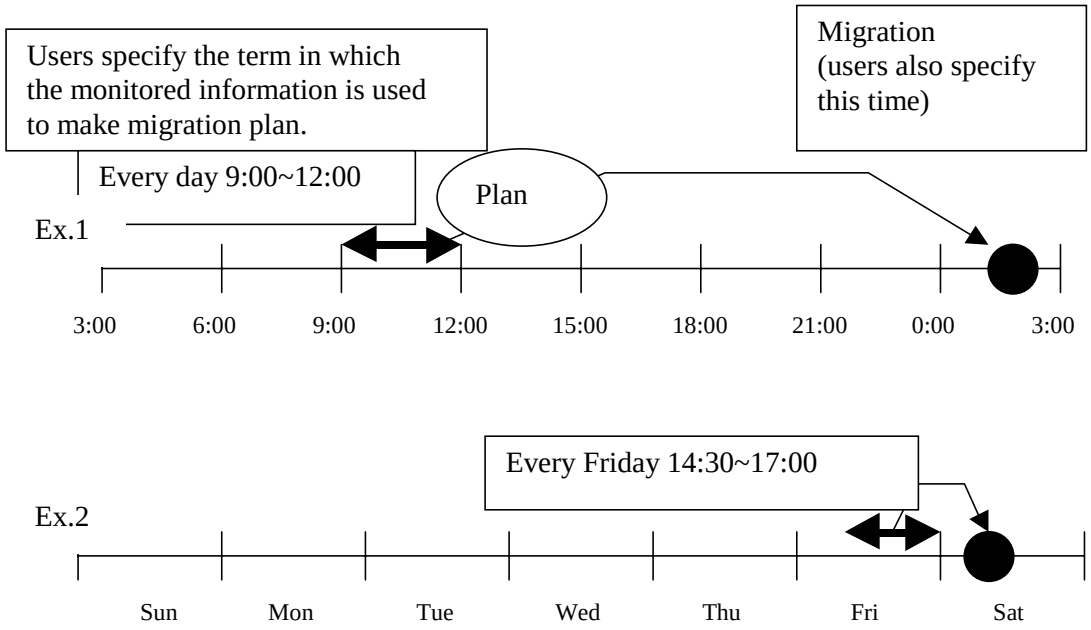
(a) Process of tuning by preset function

Preset function performs following two process.

- Making Plan: Detecting volumes that have problems by monitored information (disk utilization) and making plan of volume Migration
- Migration: Moving volume by the plan.

These two process are repeated by the cycle described above, and users give the cycle. In preset function, this cycle is supposed from one day to one week or several weeks.

Users can specify the term in which monitored information is used to make the plan from concern of users. For example, users can specify the highest load term in a day or in a week as the referred term to making plan.

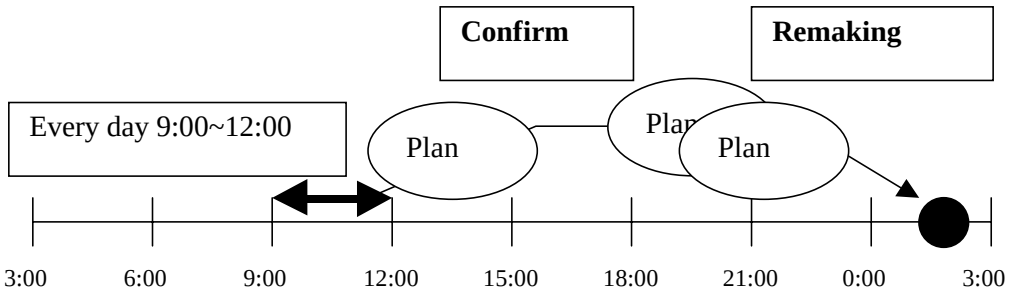


Copyright ©1999, Hitachi, Ltd.

(b) Confirm and remaking of plan by users

From making plan by preset function until migration, users can see the plan and delete it if needed.

From making plan by preset function until migration, users can remake the plan manually with changing parameters.



Copyright ©1999, Hitachi, Ltd.

(4) Making plan

(a) Tuning based on disk utilization

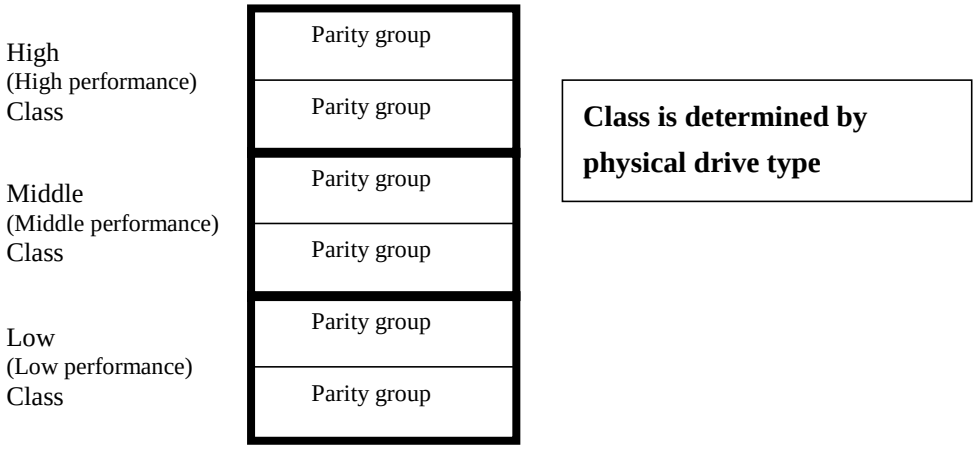
HIHSM monitors utilization of various system resources, but preset function uses disk utilization to make migration plan to solve disk neck as typical tuning method. Users should refer other information if needed.

Users also specified parameters for tuning based on disk utilization. Users should these parameters for their system (preset function provides default value for these parameters roughly).

(b) Hierarchy of parity groups and management by class

Parity groups in DKC have hierarchy by drive type and RAID type. HIHSM optimizes usage of this hierarchy. Preset function manages this hierarchy as class (parity group set).

Parity groups are divided into classes. The classes are ordered from high level (high performance) to low level (low performance). This classification is decided by performance of physical drive type of each parity group.



Preset function makes migration plan by the method described bellow. Preset function uses monitored information in the term that users specify to be referred to make the plan.

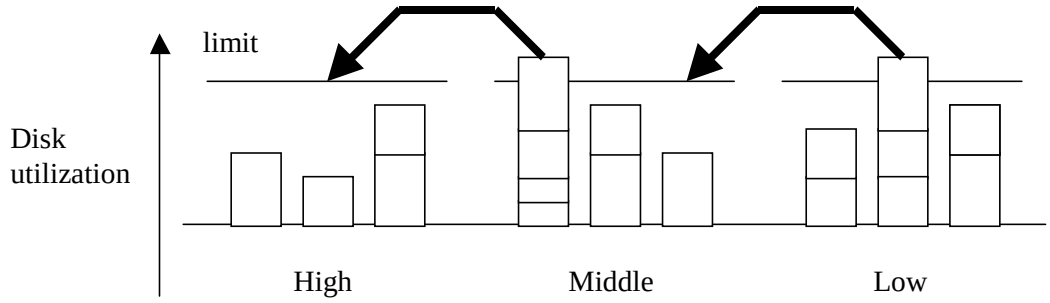
Copyright ©1999, Hitachi, Ltd.

(b-1) Management by maximum limit of disk utilization

Maximum limit of disk utilization (parity group utilization) is specified to each parity group. Users should specify this limit for their system. (HIHSM uses default value but you should set them.)

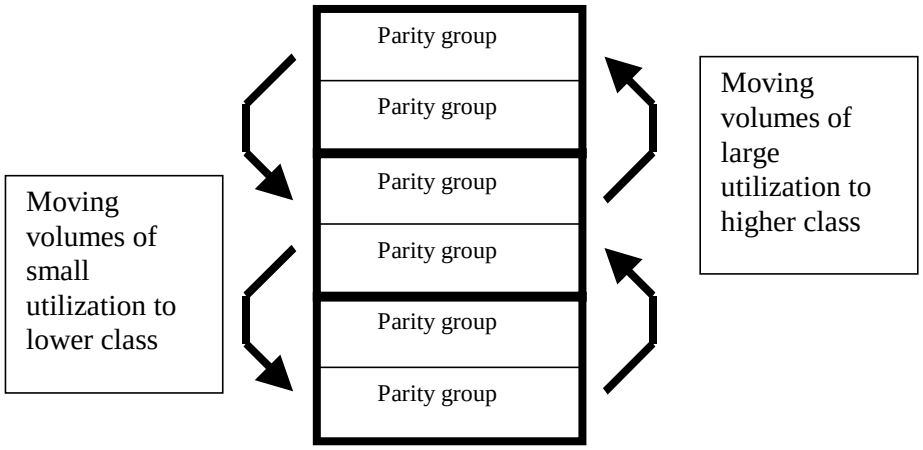
In parity groups that exceed this limit, preset function makes plan of moving volumes in this parity group from this parity groups to another parity group in higher class.

This avoids physical disk neck and provides load balancing of disk utilization.



(b-2) Selection of volumes to migration

In the migration plan described above, volumes of lager disk utilization are selected to be moved from the parity group that exceeds the limit to higher class. Moving lager utilization volumes to higher performance class is expected to makes large tuning effect. And lager utilization means lager amount of access from host, and this also makes large tuning effect. When the reserved (empty) volumes run short in the high class, volumes of smaller disk utilization are selected to be moved from higher class to lower class to make reserve volumes.



Preset function provides some criteria for you to select them, average of disk utilization, average of highest Nth value of disk utilization in the referred term, and a value considering sequential/random access pattern.

Copyright ©1999, Hitachi, Ltd.

(b-3) Specifying maximum limit of disk utilization by users

When same maximum limit of disk utilization described above is given to each class (parity group) classified by drive types, performance of each physical drive type makes performance of each class directly.

When the users specify the limit to each class with bias, users can make the difference of performance of classes lager or smaller.

Users can specify parity groups to fixed parity groups in which volumes do not be moved automatically. Preset function does not make a migration plan about fixed parity groups and volumes in the fixed parity groups.

(b-4) Notice for making plan

HIHSM can make these plan only on the following conditions.

- HIHSM can estimate the disk utilization against all migrated parity groups.
- The disk utilization rate of all migrated parity groups are not over the maximum rate. If the rate of one parity group is over. HIHSM could not make a plan.

(b-5) Notice for reference term

HIHSM could not use old information before the last volume migration in order to reduce the influence of performance by volume migration.

Therefore, HIHSM sometimes fails making a plan by lack of information.

(5) Moving (migration) by preset function

Preset function performs moving (migration) process once a day at time specified by users.

If there is a migration plan made by preset function at the time, volumes are moved by the plan.

Users can specify limit to moving to avoid overload by moving (data copy) process.

If the disk utilization of parity groups in which moving is started exceed the moving process limit, the moving in the parity group will be aborted.

Users can specify time limit to moving. If plan is not completed in the time limit, remain of plan will be executed in next day. If the new plan will be made until the next migration time, those remain plans will be deleted before making the plan.

4. Power-on Sequences

4.1 IMPL Sequence

The IMPL sequence, which is executed when power is turned on, is executed by the following four modules:

(1) Boot loader
The boot loader performs the minimum necessary amount of initializations after a ROM boot. Subsequently, the boot loader expands the local memory loader from flash memory into local memory and transfers control to the local memory loader.

(2) Local memory loader
The local memory loader loads the Real Time OS load modules into local memory. Subsequently, the local memory loader transfers control to Real Time OS.

(3) Real Time OS
Real Time OS is a root task that initializes the tables in local memory that are used for intertask communications. Real Time OS also tests the hardware resources.

(4) DKC task
When the DKC task is created, it executes initialization routines. It initializes the most part of the environment it uses. When the environment is established so that the DKC task can start scanning, it notifies the SVP of a power event log. Subsequently, the DKC task turns on the power to the physical drives and, when the logical drives get ready, notifies the host processor of an NRTR.

The control flow of IMPL processing is shown in Fig. 4.1.

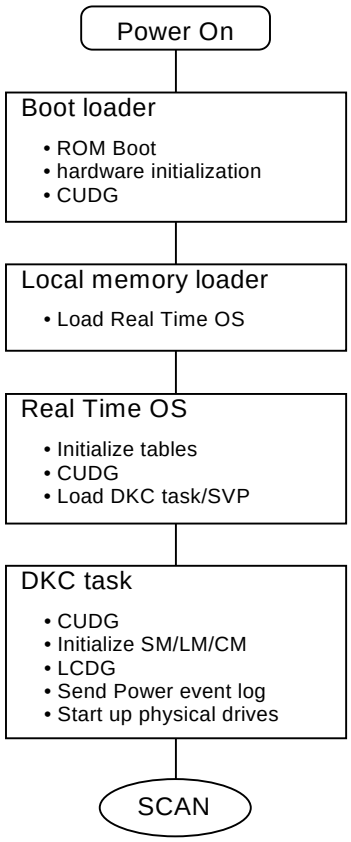

Fig. 4.1 IMPL Sequence

Copyright ©1997,1999, Hitachi, Ltd.

4.2 Drive Power-on Sequence

An overcurrent condition will occur if two or more drives are started at the same time. To preclude the overcurrent condition, DKUs are started at the power supply level, one at a time, at approximately 10 second intervals (32 DKUs at a time in the maximum configuration).

When the logical devices get ready as the result of the startup of the physical drives, the host processor is notified to that effect.

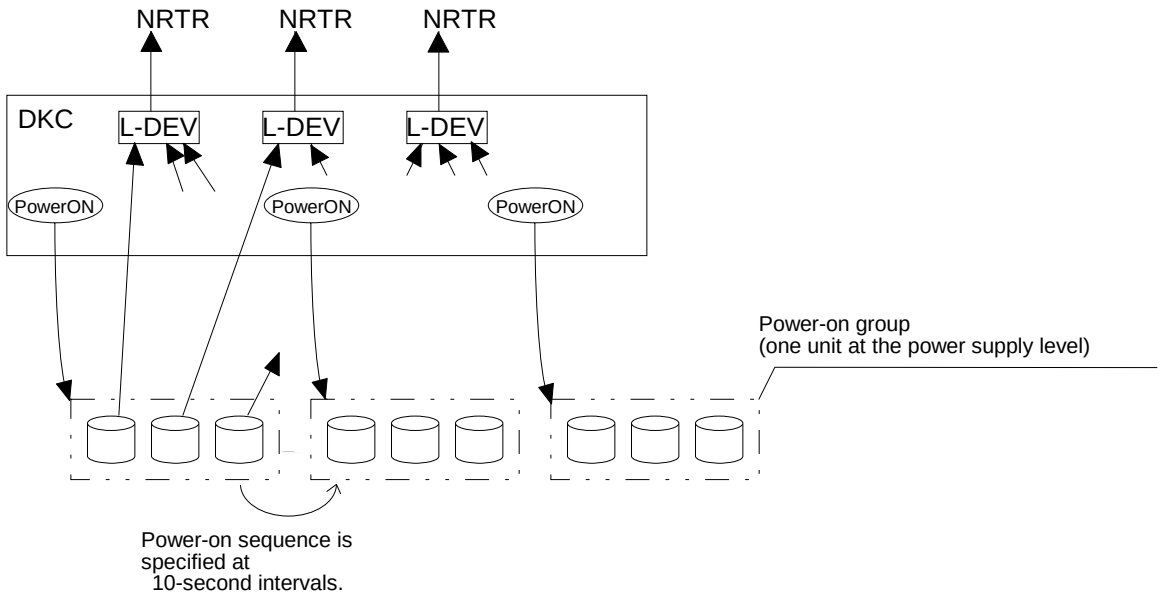

Fig. 4.2 Drive Power-on Sequence

Copyright ©1997,1998, Hitachi, Ltd.

4.3 Planned Stop

When a power-off is specified by a maintenance personnel, this subsystem checks for termination of tasks that are blocked or running on all logical devices. When all the tasks are terminated, this subsystem disables the CHL and executes emergency destaging. If a track for which destaging fails (pinned track) occurs, this subsystem stores the pin information in shared memory. Subsequently, this subsystem saves the pin information, which is used as hand-over information, in flash memory, sends Power Event Log to the SVP, and notifies the hardware of the grant to turn off the power.

The hardware turns off main power when power-off grants for all processors are presented.

5.2 Commands

This subsystem commands are classified into the following eight categories:

(1) Read commands
The read commands transfer data read from devices to channels.

(2) Write commands
The write commands transfer data from channels to devices.

(3) Search commands
The search commands follow a control command and logically search for target data.

(4) Control commands
The control commands include the seek commands that position the head at the specified cylinder and head positions. The SET SECTOR command that executes latency time processing, the LOCATE RECORD command that specifies the operation of the ECKD command, the SET FILE MASK commands that defines the permissible ranges for the write and seek operations, and the DEFINE EXTENT command that defines the permissible ranges for the write and seek operations and that defines the cache access mode.

(5) Sense commands
The sense commands transfer sense bytes and device specifications.

(6) Path control commands
The path control commands enable and disable the exclusive control of devices.

(7) TEST I/O command
The TEST I/O command transfers the specified device and its path state to a given channel in the form of DSBs.

(8) Subsystem commands
The subsystem commands include those which define cache control information in the DKCs and those which transfer cache-related information to channels.

Table.5.2 Command Summary(3/3)

Command Name			Command Code	
			Single Track	Multitrack
SUBSYSTEM commands	SET SUBSYSTEM MODE	(SET SUB MD)	87	
	PERFORM SUBSYSTEM FUNCTION	(PERF SUB FUNC)	27	
	READ SUBSYSTEM DATA	(RD SUB DATA)	3E	
	SENSE SUBSYSTEM STATUS	(SNS SUB STS)	54	
	READ MESSAGE ID	(RD MSG IDL)	4E	

Note 1: Command Reject, format 0, and message 1 are issued for commands that are not listed in this table.
Note 2: TEST I/O is a CPU instruction and cannot be specified directly. However, it appears as a command to the
interface.
Note 3: TIC is a type of command but runs only on a channel. It can never be visible to the interface.

GLOSSARY SECTION

Copyright ©1997, Hitachi, Ltd.

ACC (Action Code); Refer to the ACC section.

ADP (ADaPter); Hardware that connects the LCM to the CHA physically and logically. The ADP contains 256 MB of internal buffer.

AP; Short for Application Program.

BSA (BUS Adapter); Hardware that connects the PCBs, FBUS, and MBUS.

CACHE; Intermediate buffer between the channels and drives. CACHE has a maximum of 16 GB (8 GB x 2 areas) of capacity. It is available and controlled as two areas of cache (cache A and cache B). It is fully battery-backed (48 hours).

CHA(CHannel Adapter); Provides the channel interface control functions and intercache data transfer functions. It is used to convert the data format between CKD and FBA. The CHA contains an internal processor and 128 bytes of edit buffer memory.

CHA (Prog.); Is a channel command control layer that processors channel commands and controls cache and data transfer operations. It is located in the CHA. CHA Prog is recognized by the logical volume number and logical block number.

CHA PCB (CHannel Adapter PaCkage Board); A PCB used to connect to the host processor. There are two types of CHA PCBs, one for optical channels and the other for metal channels. The CHA PCB for optical channels is provided with the LCM in its optical link control unit.

CM (Cache Memory); Refer to 'CACHE'.

COLD; Status that the battery is off.

CPM; Short for Cache Port Master. (Cluster for mounting the Cache Box Cased for mounting more that 6 GB of Cache memory package for connecting Cache Box.)

CPS; Short for Cache Port Slave. (Cluster for mounting the Cache Box Cased for mounting more that 6 GB of Cache memory package for connecting Cache Box.)

Disruptive; Status that there is no I/O from the host (Off-line).

DKA (DisK Adapter); Provides the control functions for data transfer between drives and cache. The DKA contains DRR (Data Recover and Reconstruct) , a party generator circuit. It supports four SCSI buses and offers 64 KB of buffer for each SCSI bus. The DKA also has an internal processor.

DMA0; Controls the data transfer between the ADP and CACHE.

DMA1; Controls data transfer between the buffers in the DKA and CACHE.

DMA2; Controls data transfer between the buffers in the DKA and drives.

Copyright ©1997,1998, Hitachi, Ltd.

DMP (Disk Master Program); Is a RAID control layer and provides cache control, logical-to-physical address translation, and RAID control functions. DMP is located in the DKA. DMP is recognized by the logical volume number and logical blocked number.

DRIVE; Represents a SCSI drive whose internal data format is FBA (fixed length).

DSP (Disk Slave Program); Is a SCSI drive control layer and provides SCSI control, drive data transfer control, and parity control functions. It is located in the DKA . DSP is recognized by the physical volume number and LBA number.

ESC (Error Source Code); Refer to ACC section.

FBUS (Fast I/O BUS); Carries the data that is transferred between the adapter and cache. It is duplexed using two physical buses (H and L sides) each of which provides a data transfer rate of 200 MB per second. The L side bus is also used to access shared memory during interprocessor communication.

FM (Flush Memory); Each microprocessor has FM. FM is non-volatile memory which contains microcodes.

FPC (Failure Parts Code); Refer to the ACC section.

HOT; Status that the battery is on.

LCM (Link Control Module); Provides link control functions such as conversion of formats between optical and metal channel interfaces. The LCM contains an internal processor (LCP) and 2 KB of buffer memory.

LCP (Link Control Processor); Controls the optical links. LCP is identical to that which is used in the DKC90. LCP is located in the LCM.

LIVE INS; Short for Live Insertion, it is the signal cable for detecting hot-plugging.

LM (Local Memory); Each microprocessor has LM.

Main task; Consists of this subsystem control tasks (CHA Prog., DMP, DSP) and the SC kernel tasks that supervise the DKC control tasks. They switch the control tasks by making use of the SC kernel's task switching facility.

MBUS (Multi CPU BUS); Used to support interprocessor communication between the CHA Prog., DMPs, DSPs, and shared memory.

MFC (Main Failure Code); Refer to the ACC section.

Non-Disruptive; Status that there are some I/Os from the host (On-line).

Copyright ©1997,1998, Hitachi, Ltd.

RCHA; Short for RAID Channel Adapter, it is the name of a LSI in the CHA.

SBC (Sub BUS); A data bus in the DKA.

SCA (SCSI Adapter); Controls SCSI packets.

Shared memory; Stores the shared information about the subsystem and the cache control information (director names). This type of information is used for the exclusive control of the subsystem. Like CACHE , shared memory is controlled as two areas of memory and fully non-volatile (sustained for approximately 96 hours). The size of shared memory must be 16 MB for 1 GB of cache.

SM (Shared Memory); Refer to 'Shared memory'.

SMP; Shared Memory Port

SPC (SCSI Protocol Controller); A SCSI initiator that controls the SCSI devices.

SVP Communication tasks; Controls the communication with the SVP.

Real Time OS; A basic OS for controlling the RISC processor. Its primary tasks are to control and switch between the main tasks and SVP communication tasks.

1 Action Code Outline

Action Code (ACC) is made from SSB/SIM and shows possible failure parts from the log.
ACC consists of 4 bytes data. Up to 64 ACCs are generated in priority order and can point out max. 64 possible failure parts.
The way to get ACC is shown in following figure.
The procedure of parts replacement is shown in **REPLACE section** with WORK ID that consist in ACC.
The PCB name is shown in **LOCATION section**.

way to get	Kind of LOG data	
	Failure	Diagnosis
SVP Log display	SSB or SIM log	SSB or DIAG log
Remote function	SSB or SIM log	SSB log

(ACC is not created from SSB/DIAG log at presence.)

Copyright ©1997, Hitachi, Ltd.

2 Action Code Format

An ACC format is shown below.

0	1	2 3
WIC	PKC	PLC

WIC (Work Identified Code) : Shows a rough action to be taken.
(See ACC03-10)

PKC (Parts Kind Code) : Shows a possible failure part (function, performance).
(See ACC03-20 for WIC = 0X/1X)

PLC (Parts Location Code) : Shows a failure part location.

10108000	CHA-2V	↑	Performance Fibre CH (2MP)	↑		↑
10109000	CHA-2W	↑	Performance Fibre CH (2MP) (OPTION)	↑		↑
1010A000	CHA-2X	↑	Performance FIbre CH (2MP) (OPTION)	↑		↑
1010B000	CHA-2Y	↑	Performance Fibre CH (2MP) (OPTION)	↑		↑
10110000		The change to other type of Channel Adapter PCB is impossible.	The change to Fibre CH from Performance Fibre CH is impossible. It must be replaced with Performance Fibre CH.			
10118000		The change to other type of Channel Adapter PCB is impossible.	The change to Performance Fibre CH from Fibre CH is impossible because the microprogram does not support Performance Fibre CH. It must be replaced with Fibre CH.

1 Reference Code

A six-byte reference code (RC) is provided for a SIM (service information message) to identify an error and error section. The following shows 32 SIM bytes and reference codes.

Byte	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

2 Reference Codes

SIMs are roughly classified into two types: SIMs detected by the processor and SIMs detected by the SVP.

2.1 SIM Reference Codes Detected by the Processor

SIM Reference Codes Detected by the Processor (1/7)

Error		REF CODE 22	23	13	SIM 28	Level of error	Host report	Remarks
LCP/MCP error	LCM Hardware error	21	3Z	XY	F1	Moderate	Yes	X: CHA PCB# (*1) Y: LCP#/MCP#1 (*3) Z: LCP#/MCP#2 (*3)
	ADP permanent error	21	70	X0	F1	Moderate	Yes	X: CHA PCB# (*1)
	ADP temporary error	21	71	XY	F1	Service	No	X: CHA PCB# (*1) Y: LCP#/MCP#0 (*3)
	ADP blocking	21	72	XY	F1	Moderate	Yes	X: CHA PCB# (*1) Y: LCP#/MCP#0 (*3)
	AL_PA value conflict	21	90	XY	F1	Service	No	X: CHA PCB# (*1) Y: MP# in PCB
CHA Processor error	CHK1A threshold over	30	70	XY	F1	Service	No	X: CHA PCB# (*1) Y: MP# in PCB
	CHK1B threshold over	30	71	XY	F1	Service	No	X: CHA PCB# (*1) Y: MP# in PCB
	CHK3 threshold over	30	72	XY	F1	Service	No	X: CHA PCB# (*1) Y: MP# in PCB
	Processor blocking	30	73	XY	F1	Moderate	Yes	X: CHA PCB# (*1) Y: MP# in PCB
	FM threshold over	30	74	XY	F1	Service	No	X: CHA PCB# (*1) Y: MP# in PCB
	FM error	30	75	XY	F1	Moderate	Yes	X: CHA PCB# (*1) Y: MP# in PCB
	Incorrect SUM value of FM	30	76	XY	F1	(*27)	No	X: CHA PCB# (*1) Y: MP# in PCB
	LDEV blockade (Effect of processor blockade)	30	90	XY	F1	Serious	Yes	X: CHA PCB# (*1) Y: MP# in PCB
	CHF PCB exchange impossible (No PERFORMANCE FIBRE)	31	97	XY	F1	Service	No	X: CHA PCB# (*1) Y: MP# in PCB
	CHF PCB exchange impossible (No supported Micro-Program)	31	98	XY	F1	Service	No	X: CHA PCB# (*1) Y: MP# in PCB
	P/S OFF impossible	38	8F	00	F1	Moderate	No	
	P/S OFF impossible (Device reserved)	38	9F	00	F1	Moderate	No	
	Undefined Package is mounted	39	90	XY	F1	Moderate	No	X: CHA PCB# (*1,5) Y: MP# in PCB
	V-R or serial number is inconsistent	39	91	XY	F1	Moderate	No	X: CHA PCB# (*1) Y: MP# in PCB
	Replace failed	39	93	XY	F1	Moderate	No	X: CHA PCB# (*1) Y: MP# in PCB
	Micro-program version up	39	94	X0	F1	Service	No	X: MP version after replacing (*23)
	Micro-program version up impossible	39	95	XY	F1	Service	No	X: Present MP version (*23) Y: reason code (*13)
	Package type changed	39	96	XY	F1	Service	No	X: CHA PCB# (*1) Y: Change type# (*14)

Copyright ©1997,2000, Hitachi, Ltd.

SIM Reference Codes Detected by the Processor (2/7)

Error		REF CODE			SIM	Level of error	Host report	Remarks	
		22	23	13	28				
CHA Processor error	CHF PCB exchange impossible (No PERFORMANCE FIBRE)	39	97	XY	F1	Service	No	X: CHA PCB# Y: MP# in PCB	(*1)
	CHF PCB exchange impossible (No supported Micro-program)	39	98	XY	F1	Service	No	X: CHA PCB# Y: MP# in PCB	(*1)
	CHF PCB is exchanged to PERFORMANCE FIBRE	39	99	XY	F1	Service	No	X: CHA PCB# Y: MP# in PCB	(*1)
	CHT PCB exchange impossible (4GL ↔ 4GS)	39	9F	X0	F1	Moderate	No	X: CHA PCB#	(*1)

[Note] REF CODE = 3073

If a recoverable processor failure (Micro logical error, CHK-1A) occurs, SIM (REF CODE = 3073) is reported to HOST.

REF CODE = 3998

CHF PCB is 'PERFORMANCE FIBRE'. SIM message says 'cannot analyzed', because the version of the installed micro-program does not support 'PERFORMANCE FIBRE'.

You must replace this PCB by no 'PERFORMANCE FIBRE' CHF PCB.

REF CODE = 3999

After this, if you replace 'PERFORMANCE FIBRE' CHF PCB by no 'PERFORMANCE FIBRE' CHF PCB, you must follow 'Installation and De-Installation' procedure. Do not follow 'Replace' procedure.

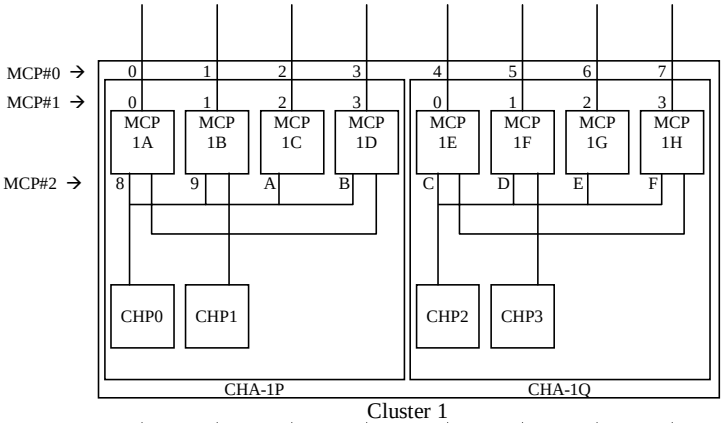
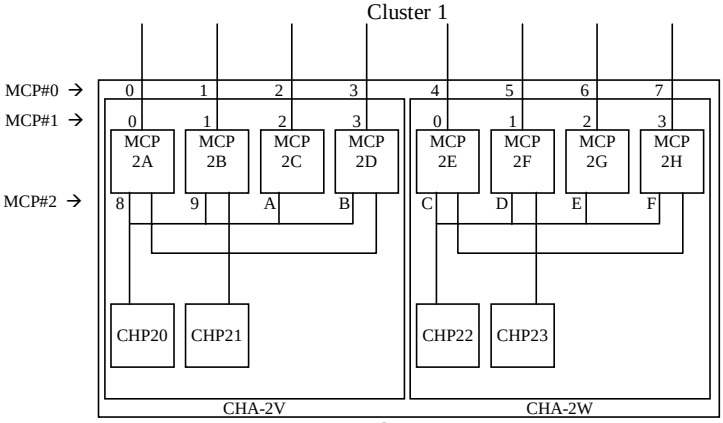
MCP #0: x‘0’ to x‘7’ indicates the MCP number.
MCP #1: x‘0’ to x‘3’ indicates the MCP number.
MCP #2: x‘8’ to x‘F’ indicates the MCP number.

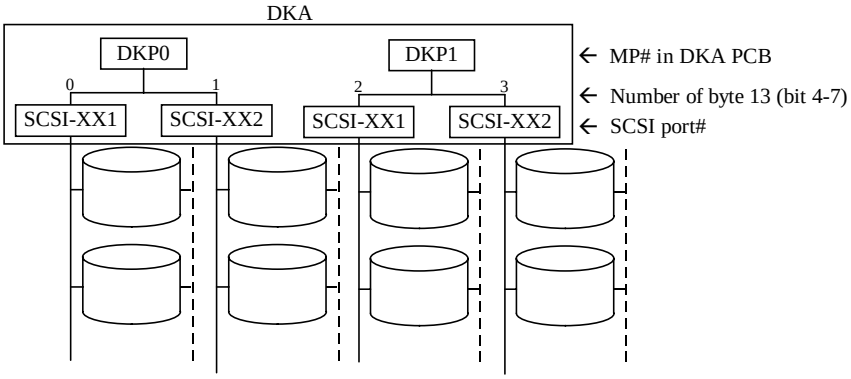


Cluster 1



Cluster 2

(*4) Port #: x‘0’ to x‘3’ indicates the SCSI port number. See the figure below.



(*5) The package that is not defined in the configuration information exists.
If it is prepared for new installation, it is necessary to do the new installation procedure.
Otherwise it should be pulled out by executing P/S off.

(*7) Isolate the error according to the procedure shown in TRBL05-170.

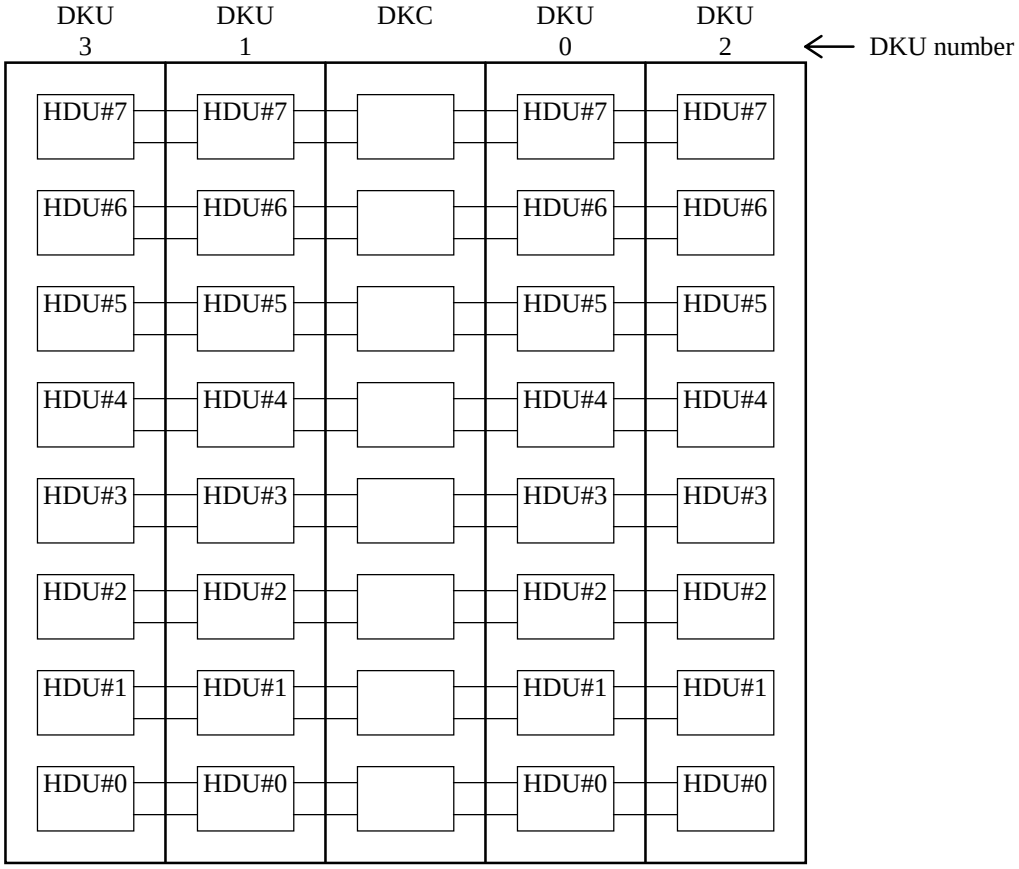
(*8) Recover the error according to the procedure shown in TRBL05-260.

(*10) Perform error isolation according to the procedure given in the two separate pages attached to TRBL05-280.

(*11) If memory module group (CMxx) is designated by FPC, that module may be isolated from associated SSBs. Isolate the memory module according to the procedure given in the page attached to TRBL05-290.

Copyright ©1997,1998, Hitachi, Ltd.

(*12) DKU#: x‘0’ to x‘3’ indicates DKU number. See the figure below.
HDU#: x‘0’ to x‘7’ indicates HDU number. See the figure below.



(*13) reason code
x‘0’ : Pinned data exist
x‘1’ : The shutdown of the power supply was occurred
x‘2’ : Invalid Version/Revision exists

(*15) Recover LDEVs according to the procedure shown in TRBL05-330.

Copyright ©1997,1998, Hitachi, Ltd.

(*16) Change pair status number
x'0': From simplex to duplex pending
x'1': From simplex to duplex
x'2': From pending duplex to duplex
x'3': From pending duplex to suspend
x'4': From duplex to suspend
x'5': From duplex to simplex
x'6': From pending duplex to simplex
x'7': From suspend to simplex
x'8': From suspend to duplex pending

(*17) You can suppress reporting the HRC/HODM Service SIM to the HOST by RCU Option operation (PPRC support by HOST and Service SIM of HRC/HODM).

- Service level SIM -

PPRC support by HOST	Service SIM or HRC/HODM	level of error	HRC	HODM
Yes	Report	DKC_SIM	Host Report	Host Report
		DEV_SIM	Not Host Report	Host Report
	Not Report	DKC_SIM	Not Host Report	Not Host Report
		DEV_SIM	Not Host Report	Not Host Report
No	Report	DKC_SIM	Host Report	Host Report
		DEV_SIM	Host Report	Host Report
	Not Report	DKC_SIM	Not Host Report	Not Host Report
		DEV_SIM	Not Host Report	Not Host Report

- Moderate or Serious level SIM -

PPRC support by HOST	level of error	HRC	HODM
Yes	DKC_SIM	Host Report	Host Report
	DEV_SIM	Not Host Report	Host Report
No	DKC_SIM	Host Report	Host Report
	DEV_SIM	Host Report	Host Report

(*18) Isolate the error according to the procedure shown in TRBL05-20.

(*19) SIMs which REF.CODE are D4DX, D4EX are reported in case of HODM.
In case of HRC, SIMs reported from RCU are reported to the host by MCU.

Severity Level	RC of reported SIM for HRC	RC of reported SIM for HODM
Acute or Serious	No modification	D4EX
Moderate	No modification	D4DX
Service (Not HRC SIM)	No modification	Not reported
Service (HRC SIM)	Not reported	Not reported

(*20) This temporary blocking is to recover the logical table on SM and be automatically recovered.

(*21) In case of the replacement of the cache memory PCB on the side having blocked SM (see REP01-140 work ID = RCA1), insert the removed cache memory PCB again.

(*22) The LDEV is blocked because of an error (inconsistency between data on the A and B sides) of configuration information stored in the SM. Recover the error following the instruction of the Technical Support Center.

(*23) X represents the X in a program version "?X-??-??/??".

Copyright ©1997,1998, Hitachi, Ltd.

(*24) Cache SIMM sizes of sides A and B are different because the replacement of the cache memory has been performed on one side only. Perform the replacement left referring to the description in the remark column.

(*25) Type of the lost information is reported according to the bit position. (There may be the case that two or more bits are set.)

(*26) Change pair status number
x'0': Accepted Suspend Pair operation
x'1': Accepted Delete Pair operation (The R-VOL is in suspended status)
x'2': Accepted Delete Pair operation (The R-VOL is in duplex status)
x'3': Accepted Delete Pair operation (The R-VOL is in pending duplex status)
x'4': Completed Suspend Pair operation
x'5': Completed Delete Pair operation

(*27) In the case that the error is detected in the area of ROM, the level of error is "Modetate" in other case "Service".

(*28) Volume Name Definition

	System (On SVP)	Open
Pair Volume	M-VOL	P-VOL
	R-VOL	S-VOL
HMRCF/HIHSM	T-VOL	S-VOL
	S-VOL	P-VOL

Copyright ©1998,2000, Hitachi, Ltd.

*21 Execute the following procedures according to the error code of initialization function which is shown in 5C-5Fth byte of the SSB with error code 3309. Also, the SSB is the relative log of SIM with the reference code 7900xx or 7901xx.

Code (4-bytes)	Procedures	Note
21000041	P/K Replace	Replace the package with another new one.
31000041	MP-Install	Execute it when the P/S OFF is executed with Shut Down Jumpers to install the micro-programs.
	① P/S OFF ② Pull out the Shut Down Jumpers ③ P/S ON	Execute them when you have forgotten to pull out Shut Down Jumpers in the normal P/S ON.
42000041	P/K Replace	Replace the package with another new one.
48000041	Refer to Note(1)	
55000041	P/K Replace	Replace the package with another new one.
56000041	① SVP Replace ② MP-Install ③ P/K Replace	Use the same package in ③.
others	① MP-Install ② P/K Replace	Use the same package in ②.

(P/K means a package.)

Copyright ©1997,1999, Hitachi, Ltd.

You never fail to make sure the installed micro program version and the each processor's status by displaying the status (Status display) after the above procedures was finished.
Then, for the micro program version, "Currently running Microprogram Version" and "Stored Microprogram Version per Processor" must be confirmed.

Reference address are as follows.

P/K Replace	REP01-140
SVP Replace	REP01-150 (Work ID : RT10)
MP-Install	MICRO-FC05-10
SSB with the error code 3309	SSBLOG05-2370

[Note(1)]: ① Confirm the PCB name of the package that is set now.
② In the case that the package is the same as the type of the package which you specified in the define configuration.
(a) MP-Install
(b) P/K Replace (Use the same package)
In the case that the package is not same as the type of the package that you specified in the define configuration information.
(a) MP-Install

Notes:

1. Range subject to the error
   (1) When byte 28 is x‘F1’ (DKC SIM)

   x‘0’: Not used
   x‘1’: Error range not known
   x‘2’: SP error
   x‘3’: CHL-I error
   x‘4’: Not affect performance
   x‘5’ to x‘F’: Not used

   (2) When byte 28 is x‘F2’ (CACHE SIM)

   x‘0’: Not used
   x‘1’: Error range not known
   x‘2’: Error between SP and CACHE
   x‘3’: CACHE error
   x‘4’: DC/FW error
   x‘5’: FW error
   x‘6’ to x‘F’: Not used

2. Range affected by repair
   (1) When byte 28 is x‘F1’ (DKC SIM)

   x‘0’: Not used
   x‘1’: Repair range not known
   x‘2’: Repair does not affect performance
   x‘3’: SP disabled during repair
   x‘4’: SSID disabled during repair
   x‘5’ to x‘F’: Not used

   (2) When byte 28 is x‘F2’ (CACHE SIM)

   x‘0’: Not used
   x‘1’: Repair range not known
   x‘2’: Repair does not affect performance
   x‘3’: CACHE error
   x‘4’: DC/FW error
   x‘5’: FW error
   x‘6’ to x‘F’: Not used

3. Level of error
   B‘00’: Service SIM
   B‘01’: Moderate SIM
   B‘10’: Serious SIM
   B‘11’: Acute SIM

4. Number of faulty SPs
   B‘0’: 1 SP
   B‘1’: 2 SPs

5. Number of SPs in SSID
   B‘0’: 2 SPs
   B‘1’: 4 SPs

6. Number of faulty SSIDs
   B‘0’: 1
   B‘1’: 2

7. Number of affected SSIDs
   B‘0’: 1
   B‘1’: 2

Copyright ©1997, Hitachi, Ltd.

8. Status
   B‘0’: Degeneration
   B‘1’: Stop

9. Resend SIM
   B‘0’: Unresent SIM
   B‘1’: Resent SIM

10. Hardware level
    Bit 0: ESCON hardware level

When bit 0 is 0:

- Bit 1: Not used
- Bits 2-3: Report storage path
- Bits 4-5: Number of channels per cluster
  - B‘00’ = 4
  - B‘01’ = 8
  - B‘10’ = Not used
  - B‘11’ = Not used
- Bit 6: NVS
  - B‘0’ = No NVS
  - B‘1’ = NVS provided
- Bit 7: Not used
- Bits 8-10: Cache size
  - 000: Non cache
  - 001: 256MB
  - 010: 512MB
  - 011: 768MB
  - 100: 1024MB
  - 101: 1280MB
  - 110: 1536MB
  - 111: Over 1536MB
- Bits 11-13: Cluster hardware level
- Bits 14-15: Cache/NVS hardware level

When bit 0 is 1:

- Bit 1: Not used
- Bits 2-3: Error storage path
- Bits 4-7: Number of channels per cluster
  - 0000: Metal = 4, ESCON = 0
  - 0001: Metal = 8, ESCON = 0
  - 0010: Metal = 4, ESCON = 2
  - 0100: Metal = 4, ESCON = 4
  - 0110: Metal = 0, ESCON = 2
  - 1000: Metal = 0, ESCON = 4
  - 1010: Metal = 0, ESCON = 8
  - 1100: Metal = 0, ESCON = 6
- Bit 8: Dual frame
  - 0: Dual frame
  - 1: Modular power
- Bits 9-11: Cache size
  - 000: Non cache
  - 001: 256MB
  - 010: 512MB
  - 011: 768MB
  - 100: 1024MB
  - 101: 1280MB
  - 110: 1536MB
  - 111: Over 1536MB
- Bits 12-13: Cluster hardware level
- Bits 14-15: Cache/NVS hardware level

11. Isolation code
    Byte 13 ≠ X‘00’ Bytes 22 and 23 are a symptom code.
    Byte 13 = X‘00’ Bytes 22 and 23 are an isolation code. This byte is byte 2 of the association code.

Copyright ©1997, Hitachi, Ltd.

12. SSB ID
    B‘0’ = SVP
    B‘1’ = SP

13. SVP ID
    B‘0’ = SVP1
    B‘1’ = SVP2

14. Symptom code
    See bytes 22 and 23 of the reference codes listed in Sections 2.1 and 2.2.

15. Logging and Message control
    Bit 0 - 3: Not used
    Bit 4 - 5: Logging
        B‘00’: Do not log
        B‘01’: Unconditional log
        B‘10’: Log only once
        B‘11’: Log only if persistent
    Bit 6 - 7: Operator message
        B‘00’: No message
        B‘01’: Unconditional message
        B‘10’: Send only once
        B‘11’: Send only if persistent

16. Service Message
    x‘1’: Action
    x‘C’: No action

1 Type of Messages Displayed by the SVP

Waiting for input

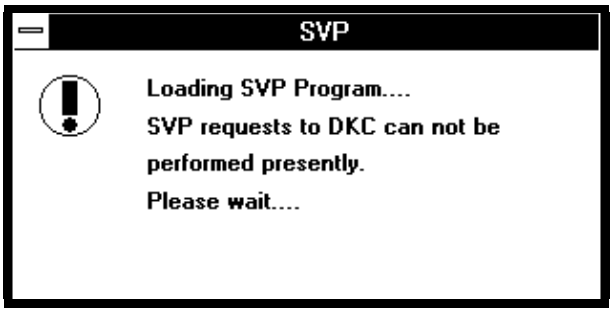
Information Message

Warning Message

Warning Message

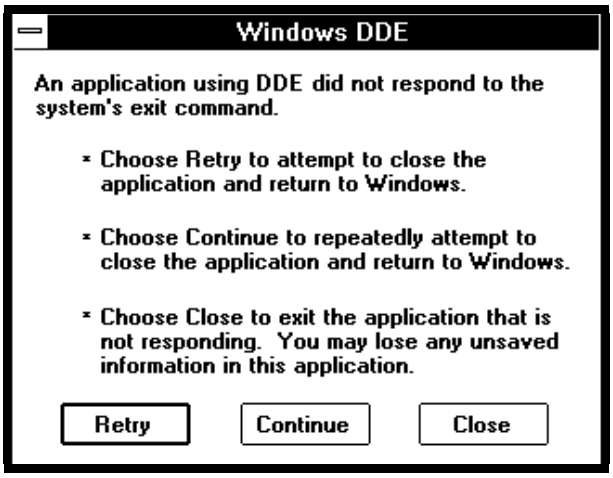
Copyright ©1997, Hitachi, Ltd.

2 Action by Warning Messages



[Explanation]; Communication between DKC and SVP is not available.

[Action]; Wait until this message is extinguished, then do a next operation.



[Explanation]; The application is already stopped.
This phenomenon sometimes occurs in the process of stopping a system.

[Action]; Select (CL) [Close], and reboot PC.

Copyright ©1997,1998, Hitachi, Ltd.

3 Recovery procedure for SVP failures

3.1 Types of SVP failures

① Display of “Syserr’s Clues” windows dialog box.
② Windows display hang up.
(1)Keyboard operation possible.
(2)Keyboard operation not possible.
③ Display of non windows error. (System error)

3.2 Recovery procedure based on type of failure.

See TRBL03-71

Copyright ©1997,1998, Hitachi, Ltd.

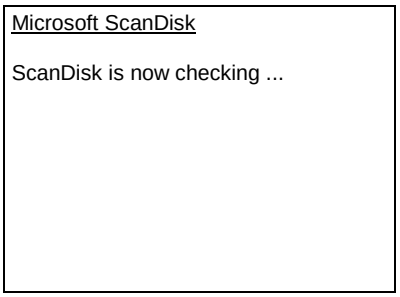
3.3 SVP HD Diagnosis

If SVP HD (Hard Drive) may be failed, do as following procedures.

(1) What is running?
a. See what is displayed.
If Windows is displayed, Go to (2).
If DOS prompt like “C:\” is displayed, Go to (3).

(2) Exit Windows (Stop SVP)
a. Select (CL) “Start button”.
b. Select (CL) “Shut Down”.
c. Select (CL) “Restart the computer in MS-DOS mode?”, and select (CL) [Yes].
d. Go to (3).

(3) SVP HD Diagnosis
a. Type the under-lined command and press Enter-key as following.
C: \>\DKC200\OTHERS\SVPHDDG
b. Watch the diagnosis messages displayed on the screen.
After the diagnosis, read messages, and do following action.



Diagnosis messages

Copyright ©1997,1998, Hitachi, Ltd.

Message	Explanation	Action
SVP HD TEST:NORMAL END	Diagnosis has completed.	Go to (4).
SVP HD TEST:PROBLEM HAS DETECTED	There are some problems in SVP HD.	Read following message.
SVP HD TEST:ABNORMAL END	Diagnosis has incompleted.	Read following message.
SVP HD TEST:SYNTAX ERROR	Diagnosis program may be destroyed.	Read following message.
SVP HD TEST:PROBLEM HAS FIXED	Diagnosis has repaired SVP HD.	Go to (4).
SVP HD TEST:ABORTED	Diagnosis has aborted by operator.	Read following message.
SVP HD TEST:FIX START	Diagnosis has launched to repair SVP HD.	Go to (3) b.
Do you want to try to fix SVP HD.[y,n]	Confirm your operation.	Press ‘y’ key to fix SVP HD. Press ‘n’ key not to fix SVP HD and to abort diagnosis.
Please turn off SVP and replace it.	SVP should be replaced.	Power off SVP. Replace SVP.

(4) Reboot SVP

a. Press 3 keys simultaneously —— Ctrl-key, Alt-key and Del-key —— to reboot SVP.

[End of SVP HD Diagnosis]

Copyright ©1997,1998, Hitachi, Ltd.

4 New type of message displayed by the SVP (Message ID)

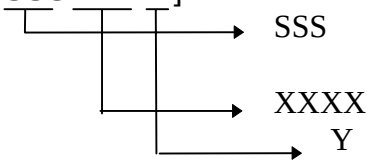
4.1 About Message ID

SVP added a message ID for each displayed message. (Some of them are not supported).
In this section, we described all message ID with the action. If SVP displays the message with ID number, please refer to the table to react.

4.2 Message ID format.

Message ID has a following format .

[Format] [SSSXXXXY] : Message Format



SSS : Application ID in which displayed the message was created.

XXXX : Message ID (Decimal number from 0000 to 9999)

Y : Kind of Message. There are 3 kinds as followed.
- I : Information,
- W: Warning / Error or important confirmation.
- E : Fatal Error

4.3 Note

(1) In this section, we use “%s” and “%d” strings in the messages.
These are the variable which will be determined in execution.
%s means a string variable.
%d means a numeric variable.

4.4 SVP Message ID Table

ID	Kind	Description
0001	**I**	Please insert CONFIG FD in FDD
	[Contents]	Set the CONFIG FD in the FDD.
	[Action]	Set the CONFIG FD.
0002	**W**	Error has occurred. Please insert correct FD.
	[Contents]	An error occurred. Set the correct FD.
	[Action]	Set the CONFIG FD.
0003	**I**	Reading the subsystem configuration data...
	[Contents]	Subsystem configuration information is being read.
	[Action]	Wait until the data reading is completed.
0004	**I**	Copying the subsystem configuration data...
	[Contents]	Subsystem configuration data is being copied.
	[Action]	Wait until the data copying is completed.
0005	**I**	\"Loading Configuration information from FD\" has been already performed successfully. Some operation cannot be performed again.
	[Contents]	The DKC replacement terminated normally. "FD to DKC" cannot be executed.
	[Action]	Do not execute "FD to DKC".
0006	**I**	Please remove FD and connect DKU to Controller. When completed, select[OK].
	[Contents]	Remove the FD and connect the DKU. After the connection is completed, select the [OK] button.
	[Action]	Remove the FD and connect the DKU.
0007	**I**	\"Save Configuration information to FD\" is completed. Please remove FD and turn of the subsystem. Wait until power is off. [READY LED at CE panel is off.]
	[Contents]	"DKC to FD" was completed. Remove the FD and power off the subsystem. Wait until the power is turned off.
	[Action]	Wait until the power is turned off.
0008	**I**	Input data dose not match.
	[Contents]	The input data does not agree.
	[Action]	Input the correct old DKC serial number, new DKC serial number, and system ID.

Copyright ©1997,1999, Hitachi, Ltd.

ID	Kind	Description
0009	**I**	Please execute \"Load Configuration information from FD\" in New DKC, without Configuration Old DKU to New DKC.
	[Contents]	Execute "FD to DKU" from the new DKC. The DKU, however, must not be connected.
	[Action]	Replace the DKC and execute "FD to DKU"
0010	**I**	Turn on the subsystem. Wait until power is on. [READY LED at CE Panel is on.]
	[Contents]	Turn on the power switch of the subsystem and wait until it becomes ready.
	[Action]	Power on the subsystem and wait until the DKC becomes ready.
0011	**W**	Please vary offline the connected channel paths. If does select OK.
	[Contents]	Check if the connected channel paths are already made off-line.
	[Action]	Check if the I/O is inactive, then select OK.
0012	**I**	DKU PATH INLINE is now running...
	[Contents]	DKU PATH INLINE is being executed.
	[Action]	Wait until DKU PATH INLINE is finished.
0013	**I**	This will end the DKU PATH INLINE.
	[Contents]	DKU PATH INLINE is now terminated.
	[Action]	None
0014	**W**	Timeout error has occurred. Please confirm the abnormal path with the status function and restore it first, then retry \"Load Configuration information from FD\".
	[Contents]	DKU PATH INLINE terminated abnormally. Confirm the abnormal path with the status function and recover it. Then reexecute "FD to DKC".
	[Action]	Confirm the abnormal path and recover it.
0015	**W**	Connection error has occurred. Please confirm the connection. Then Retry the operation.
	[Contents]	A connection error occurred during DKU PATH INLINE execution. Check the connection. Do you want to execute DKU PATH INLINE once again?
	[Action]	Check the connection, and select whether to reexecute DKU PATH INLINE.
0016	**W**	SVP did not execute DKU PATH INLINE to all installed DKAs. Please retry.
	[Contents]	PATH INLINE was not executed for all the installed DKAs. Re-execute it.
	[Action]	Re-execute it.

Copyright ©1997,1999, Hitachi, Ltd.

ID	Kind	Description
0017	**I**	Changing the subsystem configuration data... **[Contents]** Subsystem configuration data is being changed. **[Action]** Wait until the data change is completed.
0018	**W**	\"Load Configuration information from FD\" is completed. Please vary online the connected channel paths. Please check subsystem status with STATUS and log with INFORMATION. **[Contents]** "FD to DKC" has been completed. Check the subsystem status and log with STATUS and INFORMATION, respectively. **[Action]** Check the subsystem status and log.
0019	**W**	DKU error has occurred. Please confirm the abnormal part with the status function then restore it. **[Contents]** A DKU error occurred during DKU PATH INLINE execution. Confirm the abnormal section with the status function and recover it. **[Action]** Confirm the abnormal section of the DKU and recover it.
0020	**W**	Error has occurred. Please confirm the status function, then retry \"Load Configuration information from FD\". **[Contents]** An error occurred. Confirm the status function and reexecute "FD to DKC". **[Action]** Reexecute "FD to DKC".
0021	**E**	Configuration data has been broken. Please call Technical Support Center. **[Contents]** The configuration data is damaged. Please contact the Technical Support Center (TSC). **[Action]** Contact the Technical Support Center (TSC).
0022	**I**	In order to check the validity of this operation, please input following data. **[Contents]** Validity check of the serial number and SSID **[Action]** Input the serial number and SSID.
0023	**W**	Timeout error has occurred. Please confirm the abnormal part with the status function and restore it first. **[Contents]** The process terminated abnormally. Confirm the abnormal section with the status function and recover it. **[Action]** Confirm the abnormal section and recover it.
0024	**I**	Please Retry. (Error Code = %04X) **[Contents]** Request for HRC operation retry **[Action]** Repeat the process.

Copyright ©1997,1999, Hitachi, Ltd.

ID	Kind	Description
0025	**I**	Communication error has occurred between MCU and RCU. (Error Code = %04X)
	[Contents]	An error occurred during MCU-RCU communication or the MCU-RCU path is missing.
	[Action]	Check if the MCU-RCU path exists.
0026	**I**	You can't change the Remote Copy status. (Error Code = %04X)
	[Contents]	The Remote Copy status cannot be changed.
	[Action]	Dump?
0027	**I**	Invalid Serial Number of RCU. (Error Code = %04X)
	[Contents]	The serial number of the RCU is incorrect.
	[Action]	Confirm the serial number of the RCU and input the correct number again.
0028	**I**	There is a pair of Volume under the RCU.
	[Contents]	There is a volume pair under the RCU.
	[Action]	Retry after deleting the volume pair.
0029	**W**	Internal error has occurred. (Error Code = %04X)
	[Contents]	An internal error occurred.
	[Action]	Dump?
0030	**W**	The status of the cache under MCU is bud.
	[Contents]	The status of the cache placed under the control of the MCU is not correct.
	[Action]	Dump? Or replace?
0031	**W**	The status of the cache under RCU is bad.
	[Contents]	The status of the cache placed under the control of the RCU is not correct.
	[Action]	Dump? Or replace?
0032	**I**	The path between MCU and RCU established. (Error Code = %04X)
	[Contents]	The path between the MCU and RCU is not established.
	[Action]	Retry the operation after establishing the path.
0033	**W**	M-VOL has a pin track. (Error Code = %04X)
	[Contents]	There is an M-VOL pin slot.
	[Action]	Recover the pin and retry the operation.
0034	**W**	R-VOL has a Pin track. (Error Code = %04X)
	[Contents]	There is an R-VOL pin slot.
	[Action]	Recover the R-VOL pin and retry the operation.

Copyright ©1997,1998, Hitachi, Ltd.

ID	Kind	Description
0035	**W**	R-VOL is not usable. (Error Code = %04X) **[Contents]** The R-VOL cannot be used. **[Action]** Check the status of the R-VOL.
0036	**I**	R-VOL is reserved /R-VOL already established path group. (Error Code = %04X) **[Contents]** The R-VOL is reserved or the path group was already established. **[Action]** Retry the operation after checking the status of the R-VOL.
0037	**I**	Invalid track format. (Error Code = %04X) **[Contents]** The track format is incorrect. **[Action]** Retry the operation after checking the emulation type of the VOL.
0038	**I**	This volume has established pair. (Error Code = %04X) **[Contents]** The specified VOL is neither M-VOL nor R-VOL. **[Action]** Retry the operation after checking the VOL.
0039	**I**	Invalid RCU Serial Number./Invalid RCU SSID. (Error Code = %04X) **[Contents]** The serial number/SSID of the RCU is incorrect. **[Action]** Input the correct serial number/SSID of the RCU.
0040	**I**	Suspend mode is not for S-VOL. (Error Code = %04X) **[Contents]** When the suspend mode was specified for the R-VOL, that mode was not the S-VOL suspend mode. **[Action]** Retry the operation after checking if the suspend mode is specified correctly.
0041	**W**	Invalid R-VOL. (Error Code = %04X) **[Contents]** The R-VOL is incorrect. **[Action]** Check the status of the R-VOL.
0042	**W**	Timeout error has occurred. **[Contents]** A timeout error occurred. **[Action]** Check the status of the DKC and retry the operation.
0043	**I**	Invalid parameter. (Error Code = %04X) **[Contents]** The parameter is incorrect. **[Action]** Check the input data.
0044	**I**	Microcode don't support this function. (Error Code = %04X) **[Contents]** The MAIN microprogram does not support this function. **[Action]** Check the version number of the microcode.

Copyright ©1997, Hitachi, Ltd.

ID	Kind	Description
0045	**W**	Communication Error has occurred between SVP and SSVP. (Error Code =%04x)
	[Contents]	An error occurred in the communication between the SVP and SSVP.
	[Action]	Check the status of the SSVP.
0046	**I**	Communication busy. Please Retry later. (Error Code = %04X)
	[Contents]	Communication is busy.
	[Action]	Wait for a while, then retry the operation.
0047	**I**	There is no CU. (Error Code = %04X)
	[Contents]	The corresponding CU does not exist.
	[Action]	Check the input data.
0048	**I**	There is some path. (Error Code = %04X)
	[Contents]	There exists the same path.
	[Action]	Check the input data.
0049	**I**	The number of path is over high limit. (Error Code =%04X)
	[Contents]	The number of paths exceeds its maximum allowable value.
	[Action]	Check the operation.
0050	**I**	This path dose not exist. (Error Code = %04X)
	[Contents]	The specified path does not exist.
	[Action]	Check the input data.
0051	**I**	The number of path is under low limit. (Error Code = %04X)
	[Contents]	The number of paths is below its minimum allowable value.
	[Action]	Retry the operation after recovering the R-VOL pin.
0052	**I**	The CHA dose not support Remote Copy. (Error Code = %04X)
	[Contents]	The CHA does not support Remote Copy.
	[Action]	Please replace the CHA and retry.
0053	**W**	There are other blocking parts.
	[Contents]	There exists other blocked section.
	[Action]	Retry the operation after recovering the blocked section.
0054	**W**	Previously you should end the pair. Do you stop this process?
	[Contents]	Terminate the pair before executing maintenance. Do you want to terminate the process?
	[Action]	Select [Yes] to terminate the pair or [No] to contact the Technical Support Center.

	[Contents]	An error occurred during a compression process.
	[Action]	Reboot the PC. If the error cannot be recovered, replace the PC.
0247	**I**	File compression was canceled !
	[Contents]	The cancellation was executed during a compression process.
	[Action]	None
0248	**I**	Temporize files canceled !
	[Contents]	The cancellation was executed during a temporary file copy.
	[Action]	None
0249	**I**	Compression cancel error !!
	[Contents]	An error occurred because of the cancellation during a compression process.
	[Action]	Retry the operation. If the error cannot be recovered, reboot the PC.
0250	**I**	Copyright (C) 1995,1996,Hitachi,Ltd.
	[Contents]	Copyright indication.
	[Action]	None
0251	**I**	Cannot Set timer!!!
	[Contents]	Error in the PC.
	[Action]	Reboot the PC. If the error cannot be recovered, replace the PC.
0252	**I**	Please retry operation(Error Code = %04x).
	[Contents]	A mistake was found in the input data.
	[Action]	Retry the operation following the instruction of the message.
0253		Logical Path between the MCU and the RCU is not active(Error Code = %04x).
	[Contents]	An error occurred in the communication between the MCU and the RCU or there is no path provided between the MCU and the RCU.
	[Action]	Check the paths between the MCU and the RCU.
0254		The pair status of the M-VOL is not valid(Error Code = %04x).
	[Contents]	Status of the pair of the MVOL is invalid.
	[Action]	Check the pair status of the MVOL.

0255		The specified number of Path is less than the Minimum number of Paths on RCU Option screen(Error Code = %04x).
	[Contents]	Number of paths is less than the minimum value.
	[Action]	Check the setting of paths.
0256		The specified number of Path is less than the Minimum number of Paths on RCU Option screen as a result of communication error between MCU and RCU(Error Code = %04x).
	[Contents]	Number of paths is less than the minimum value due to a communication error between the MCU and the RCU.
	[Action]	Check the paths between the MCU and the RCU.
0257		The path could not be deleted due to communication error between MCU & RCU(Error Code = %04x).
	[Contents]	The path could not be deleted due to a communication error between the MCU and the RCU.
	[Action]	Check the paths between the MCU and the RCU.
0258		Parameter specified by Remote Copy operation is invalid(Error Code = %04x).
	[Contents]	The M-VOL status specified by the Remote Copy(HRC/HORC) operation is invalid (the inputted value is invalid).
	[Action]	Check the inputted value and operate once again.
0259		Parameter specified by HODM operation is invalid(Error Code = %04x).
	[Contents]	The M-VOL status specified by the HODM operation is invalid (the inputted value is invalid).
	[Action]	Check the inputted value and operate once again.
0260		The pair status of the R-VOL is not valid(Error Code = %04x).
	[Contents]	The R-VOL status is invalid (the inputted value is invalid).
	[Action]	Check the inputted value and operate once again.
0261		Invalid serial number or SSID of RCU(Error Code = %04x).
	[Contents]	The RCU production serial number is invalid.
	[Action]	Check the RCU production serial number and input it once again.
0262		Remote Copy is not supported under the DKC emulation type of the MCU(Error Code = %04x).
	[Contents]	The Remote Copy cannot be supported by the DKC emulation type set in the MCU.
	[Action]	Check the setting of the MCU.

0263		Specified RCU has some Remote Copy volume pair establish(Error Code = %04x).
	[Contents]	The specified RCU has some Remote Copy volume pairs.
	[Action]	Check the RCU volume pairs.
0264		Internal error occurred(Error Code = %04x).
	[Contents]	An internal error occurs.
	[Action]	Collect the dumps.
0265		Invalid number of path(Error Code = %04x).
	[Contents]	Number of paths is invalid.
	[Action]	Check the inputted value.
0266		Specified port of MCU is not RCP(Error Code = %04x).
	[Contents]	The SA-ID is invalid.
	[Action]	Check the inputted value.
0267		Invalid Destination Link Address(Error Code = %04x).
	[Contents]	Specified link address is not within the range from 00 to 03.
	[Action]	Check the inputted value.
0268		The specified logical path already exists(Error Code = %04x).
	[Contents]	Addresses of the SA-ID and Link are duplicate.
	[Action]	Check the inputted value.
0269		Too many RCUs(Allowed Four RCUs)(Error Code = %04x).
	[Contents]	Too many RCUs are set.
	[Action]	Check the setting.
0270		Path establishing is not complete(Error Code = %04x).
	[Contents]	Path generation failed partially.
	[Action]	Retry.
0271		Path establishing is failed(Error Code = %04x).
	[Contents]	Path generation failed completely.
	[Action]	Retry.
0272		Edited path is rejected because the specified path is the last path of some Remote Copy pair(Error Code = %04x).
	[Contents]	No operation can be performed because the specified path includes the last path of the Remote Copy.
	[Action]	Check the specified path once again.

0273		NVS status of MCU is not active(Error Code = %04x).
	[Contents]	Cache status under the MCU is incorrect.
	[Action]	Collect the dumps or execute the replacement.
0274		NVS status of RCU is not active(Error Code = %04x).
	[Contents]	Cache status under the RCU is incorrect.
	[Action]	Collect the dumps or execute the replacement.
0275		The logical paths between MCU and RCU are not established(Error Code = %04x).
	[Contents]	Paths between the MCU and the RCU are not established.
	[Action]	Establish the paths and then retry.
0276		Pinned track exist on the M-VOL(Error Code = %04x).
	[Contents]	There is a Pin slot in the M-VOL.
	[Action]	Recover the Pin and retry.
0277		Pinned track exist on the R-VOL(Error Code = %04x).
	[Contents]	There is a Pin slot in the R-VOL.
	[Action]	Repair the Pin of the R-VOL and then retry.
0278		M-VOL is not usable(Error Code = %04x).
	[Contents]	The M-VOL cannot be used.
	[Action]	Check the status of the M-VOL.
0279		The R-VOL is already used by other system(Error Code = %04x).
	[Contents]	The R-VOL is reserved or the path group has been established.
	[Action]	Check the status of the R-VOL and then retry.
0280		Remote Copy is not supported under the DKC emulation type of the M-VOL(Error Code = %04x).
	[Contents]	The Remote Copy cannot be supported by the DKC emulation type set in the M-VOL.
	[Action]	Check the status of the M-VOL.
0281		No more volume pair waiting for copy(Error Code = %04x).
	[Contents]	There is no pair waiting for execution.
	[Action]	Check the registered contents of the pairs and retry.
0282		Specified volume is not part of Remote Copy pair(Error Code = %04x).
	[Contents]	Specified pair is not Remote Copy pair.
	[Action]	Check the specified pair.

0283		Suspend operation is not valid for R-VOL(Error Code = %04x).
	[Contents]	Although the suspension instruction is issued to the R- VOL, no suspension instruction is issued to the S-VOL.
	[Action]	Check the suspension instruction and then retry.
0284		Invalid R-VOL(Error Code = %04x).
	[Contents]	The R-VOl is invalid.
	[Action]	Check the R-VOL status.
0285		Time out error has occurred(Error Code = %04x).
	[Contents]	Connection to the DKC from the remote PC was terminated abnormally.
	[Action]	Check the connection on the DKC side and operate once again.
0286		Invalid parameter(Error Code = %04x).
	[Contents]	Parameter is invalid.
	[Action]	Check the inputted value.
0287		Microcode does not support this function(Error Code = %04x).
	[Contents]	Main microcode does not support the function.
	[Action]	Check the version of the microcode.
0289		There is no CU(Error Code = %04x).
	[Contents]	There is no object CU.
	[Action]	Check the inputted value.
0290		There is a same path(Error Code = %04x).
	[Contents]	There is the same path.
	[Action]	Check the inputted value.
0291		The number of path is over high limit(Error Code = %04x).
	[Contents]	Number of paths is more than the upper limit.
	[Action]	Check the operation.
0292		The path does not exist(Error Code = %04x).
	[Contents]	The concerned path does not exist.
	[Action]	Check the specified path.
0293		The number of path is under low limit(Error Code = %04x).
	[Contents]	Number of paths is less than the lower limit.
	[Action]	Repair the Pin of the R-VOL and then retry.

0294		The CHA does not support Remote Copy(Error Code = %04x).
	[Contents]	The concerned CHA does not support Remote Copy.
	[Action]	Check the PCB of the CHA.
0295		There are other blocked parts(Error Code = %04x).
	[Contents]	There are other blocked sections.
	[Action]	Recover the blocked sections and then retry.
0296		Operation is rejected because of maintenance in progress(Error Code = %04x).
	[Contents]	Operation was rejected because the SVP was under the maintenance.
	[Action]	Close the ONLINE and INSTALL screen and then retry.
0297		Communication error has occurred between Console-SVP(Error Code = %04x).
	[Contents]	An error occurred in the communication between the console and the SVP.
	[Action]	Check the SVP status and the connection between the console and the SVP.
0298		Pending data exist on the port(Error Code = %04x).
	[Contents]	There is pending data on the port.
	[Action]	Retry.
0299		Port exchange error has occurred(Error Code = %04x).
	[Contents]	An error occurred during switching of the port.
	[Action]	Replace the concerned CHA.
0300		Invalid port type(Error Code = %04x).
	[Contents]	Port type is invalid.
	[Action]	Check the port status and retry.
0301		Logical paths exist on the port(Error Code = %04x).
	[Contents]	There are logical paths on the port.
	[Action]	Disperse them on the paths and retry.
0302		Specified number of Path is less than the Minimum Paths on RCU Option screen(Error Code = %04x).
	[Contents]	Specified number of paths is less than the minimum value.
	[Action]	Check the number of paths to be specified.

0303		Currently running microprogram version does not support the specified operation(Error Code = %04x).
	[Contents]	Microprogram version not support the concerned operation.
	[Action]	Check the microprogram version.
0304		Specified volume may be online from HOST(Error Code = %04x).
	[Contents]	The HODM cannot start because the subsystem is in online state with the host.
	[Action]	Switch the subsystem to the offline state and then operate.
0305		Warning!! R-VOL status change failed after M-VOL status change. Confirm R-VOL status(Error Code = %04x).
	[Contents]	Change of the R-VOL status failed.
	[Action]	Check the R-VOL status.
0306		HODM volume pair cannot be terminated because migration copy is in progress and the specified volume may be online from HOST(Error Code = %04x).
	[Contents]	The HODM cannot start because the subsystem is in online state with the host.
	[Action]	Switch the subsystem to the offline state and then operate.
0307		Specified R-VOL is still online from HOST(Error Code = %04x).
	[Contents]	Since the R-VOL is online with the host, the HOST cannot start.
	[Action]	Check if the R-VOL number is correct. If it is not correct, input the correct R-VOL number immediately. If it is correct, place the R-VOL offline from the host.
0308		Unknown Error Code(Error Code = %04x).
	[Contents]	An error which is not registered occurs.
	[Action]	Collect the dumps.
0309		Please exchange channel cable connecting.
	[Contents]	Exchange the connection of the channel cable.
	[Action]	Follow the message.
0310		Are you sure you want to exchange LCP/RCP ports? The concerned paths should be deleted before the operation.
	[Contents]	Do you want to exchange the LCP and the RCP ports? It is necessary to delete the connected paths before starting this operation.
	[Action]	Check that the connected paths have been deleted and then perform the operation.

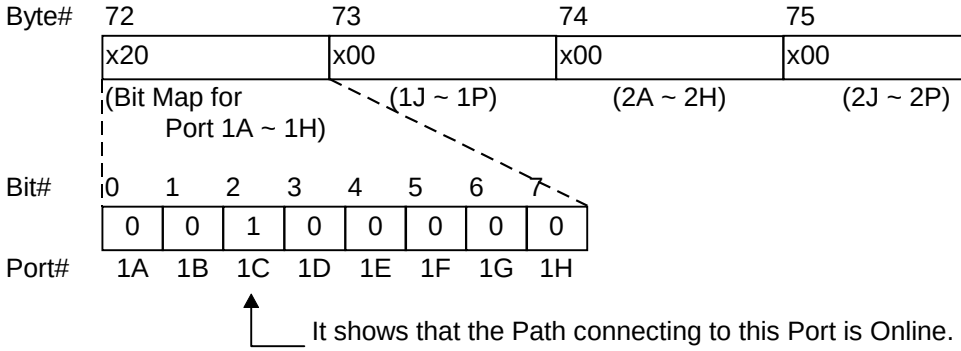
5. Error when operating HRC & HODM & HORC

Refer to chapter 4 on SVPMSG section for error codes.

[Procedure to trace the Online CHL route]

1. Analyze the SSB.LOG
   HRC2080I;The Specified R-VOL of HRC is still Online from the HOST.
   Check the SSB.LOG on SVP of the specified RCU. SSB containing F/M=0F, EC=C0CA on the specified R-VOL number should be logged.
   HRC2070W; The M-VOL of HODM is Online from the HOST.
   Check the SSB.LOG on SVP of the MCU. SSB containing F/M=0F, EC=C0A6 on the specified M-VOL should be logged.

   Both SSB are same format, from SSB byte72(0x48) though byte75(0x4B) show the Bit Map of Port indicating Online from the HOST. Each one bit corresponds to each port. It indicates the LCP Port on which the valid Path Group is established for this device.



2. Run DSF/ANALYZE-ALLCHPID to trace the Path Group ID of the Online route.
   2.1 In case that DKC Emulation Type is 3990-6 or 3990-6E.
   Run DSF/ANALYZE with ALLCHPID. The output shows the Path Group ID which is Online to the subsystem.

LOGICAL PATH		SYSTEM	FULL	SP FENCES	HOST PATH GROUP ID		
NUMBER	type	ADAPTER ID	ESCON LINK ADDRESS	0 1 2 3	CPU SERIAL#	CPU TYPE	CPU TIME STAMP
1	E	00	0101		XXXXXXX	YYYY	ZZZZZZZZ
2 - 32	N/E	00 - 01					
33	E	02	0200		XXXXXXX	YYYY	ZZZZZZZZ

   "SYSTEM ADAPTER ID" corresponds to the number of the CHL adapter port.
   (Ex; Port#1C is "02".)
   Trace the Path Group ID indicated the SYSTEM ADAPTER ID corresponding to the value on SSB LOG of EC=C0CA or C0A6.

[Action of the time out error “HRC2019W”]

When time out error “HRC2019W” may occur on remote copy operation, try to fined the cause of the time out and execute a recovery procedure.

(1) Hardware error
(2) Discontinuous of the pair status change procedure in the cause of high traffic condition

1. Recovery procedure for the hardware error
   When time out error occurs in the cause of the hardware error, the SIM and SSB has be created and reported to the HOST.
   In that case, repairing the failure part according to the Trouble Shooting Section, and please execute a remote copy operation again.

2. Recovery procedure for the discontinuous of the pair status change procedure
   When you does not fined out the SIM, please check the specified volume pair status on the Main Control Screen of the SVP.
   When pair status change to “Duplex” or “Pending Duplex”, you need not to execute a remote copy operation again. The operation has completed correctly.
   When pair status does not change to “Duplex” or “Pending Duplex”, it means that DCK discontinue the pair status change procedure in the cause of high traffic condition. You should be confirmed in it by SSBLOG (EC=C828, C410, C519) on SVP of the MCU. In that case, please execute a remote copy operation in the low traffic condition again.

6 Action according to the error code.

6.1 Abstract

There are three tables in this section, Table A, B, C.
Table A: Message ID and the table which you have to refer to. (Table B, C).
Table B: Detailed action by error codes which are displayed in the message box of SVP.
Table C: Detailed action by error codes which are displayed in the message box of SVP.
First, please refer to “First Action”.

6.2 First Action

Please check the message ID by referring to the table A. The table A is described the next table which you have to refer to(Table B, Table C.).
If you determine the one of the table, please refer to the next table to determine how to act.

Table A.

Message ID	Next table.
1115	Table B
1127	Table C
1128	Table C
1141	Table C
1142	Table C

6.3 Second Action

(1) Table B.

Table B.

Error code [vv]	Means	Action
1	Processing maintenance	Execute maintenance again after a few minutes.
2	Processing another maintenance	Execute maintenance again about 5 minutes.
3	Waiting master job time out	Execute maintenance again a few minutes.
7	Impossible to synchronize	Execute maintenance again after a few minutes. Still this error has occurred, then follow the “Recovery procedure when an error code is reported during bus maintenance” (TRBL05-440).
8	Some processor is transferring data	Execute maintenance again after a few minutes. If same message is displayed three time, execute the maintenance when the load of subsystem is low. Still this error has occurred, then follow the “Recovery procedure when an error code is reported during bus maintenance” (TRBL05-440).

Copyright ©1998,2000, Hitachi, Ltd.

(2) Table C.

Table C.

Error code [vv]	Means	Action
4	Bus no redundancy	Restore redundant bus. (SVP02-790) Execute maintenance again.
5	Waiting maintenance job time out	Power on subsystem, and maintenance again.
6	Impossible to maintenance from selected processor	Confirm the selected processor has blocked or not on status display. (SVP03-80, 85) If that has blocked, replace the PCB and maintenance again.
9	Impossible to hot line on	Follow the “Recovery procedure when an error code is reported during bus maintenance” (TRBL05-440).
a	Impossible to hot line off	Follow the “Recovery procedure when an error code is reported during bus maintenance” (TRBL05-440).
b	Impossible to change bus setting	Follow the “Recovery procedure when an error code is reported during bus maintenance” (TRBL05-440).
c	Some processor has NG at bus access test	Follow the “Recovery procedure when an error code is reported during bus maintenance” (TRBL05-440).
1000000	You cannot execute the maintenance operation because the collision of access to shared memory occurred during configuration change.	Please retry the maintenance operation after a while.
1000008	You cannot execute the maintenance operation because the process concerning configuration change is working	Please retry the maintenance operation after a while. • When you find “executing” status of “Copy Status” or “Logical Device Status” at Maintenance display (Status display), please confirm the end of the “executing” process and retry the maintenance operation. • Even if the process concerning cache or shared memory is working, the status is not displayed. So when there is no “executing” status at Maintenance display, please retry the maintenance operation after a while.
fffffffe	SVP logical error	Restore SVP (TRBL03-70), and maintenance again.
ffffffff	Communication time out	Check LAN cable. (TRBL05-70)

1 GENERAL

1.1 Product Outline and Features

The multiplatform optional feature can assign a partial or full of disk volume area of the DKC disk subsystem for the Open system hosts by installing SCSI channel adapter (CHS) packages and/or FIBRE channel adapter (CHF) packages to the disk controller (hereinafter called DKC). This function enables a use of high reliable and high performance disk subsystem realized by the DKC for a multiplatform or SCSI/FIBRE system environment. This also provides the customers with a flexible and optimized system construction capability for their system expansion and migration.

Some of the major features of this SCSI attachment option and FIBRE attachment option are listed below.

(1) HMRS (Hitachi Multiplatform Resource Sharing) function and SCSI and FIBRE interface connectivity

In addition to the conventional Channel interface (synchronous (METAL) or asynchronous (ESCON) channels), the SCSI-2, standard interface in the open systems, can be mounted in one controller.
At the same time fibre channel interface can be mounted in one controller. This enables multiplatform system users to share the high reliable and high performance resource realized by the DKC disk subsystem.

The SCSI interface is complied with ANSI SCSI-2, a standard interface for various peripheral devices for open systems. Thus, the DKC can be easily connected to various open-market SCSI host systems (e.g. Workstation servers and PC servers). The DKC can be also connected to open-market FIBRE host systems.

DKC310 can be connected to open system via SCSI interface and FIBRE interface by installing SCSI 8-port Adapter (DKC-F310I-8C) and Fibre 4-port Adapter (DKC-F310I-4F/DKC-F310I-4FE).
SCSI connectivity and FIBRE connectivity are provided as channel option of DKC310.
SCSI Adapter and FIBRE Adapter can be installed any CHA location of DKC310 and can be co-exist with any other channel adapters.

(2) Fast and concurrent data transmission
Data can be read and written at a maximum speed of 20M bytes/second with use of a WIDE SCSI and the Synchronous transfer. All of the SCSI ports can transfer data concurrently between the host.
Additionally, a maximum speed of 40MB/sec with use of a Ultra/WIDE SCSI transfer and all of the SCSI ports can transfer data concurrently too.
Data can be read and written at a maximum speed of 100M bytes/second with use of FIBRE interface.

Copyright ©1998, Hitachi, Ltd.

All of the FIBRE ports can transfer data concurrently too.

(3) All SCSI / All FIBRE / SCSI+FIBRE configuration
All SCSI configuration is allowed either with one CHS pair or two, three or full of four CHS pairs configuration.
All FIBRE configuration is also allowed either with one CHF pair or two, three or full of four CHF pairs configuration.
SCSI+FIBRE configuration is also allowed either with one CHS pair and one CHF pair or more than CHS or CHF.
These will provide more flexible use of the subsystem for open system environment.

(4) HMDE (Hitachi Multiplatform Data Exchange) support
By installing HMDE mto optional feature, data in the mainframe volumes can be read from open systems and write it into the open system volumes. Another way, by installing HMDE otm optional feature, data can be transferred from open system to mainframe.
This enables faster data transmission of data base files between mainframe and open systems than currently used means such as network transfer.
HMDE mto/otm feature is available through both SCSI and FIBRE adapters.

(5) HMBR (Hitachi Multiplatform Backup/Restore) support
By using HMBR optional feature, data in the open system can be managed by the backup systems and utilities provided in the mainframe systems. This enables a use of rich and high reliable and high performance backup systems of mainframe world to the open system environment.
HMBR feature is available through both SCSI and FIBRE adapters.

(6) Customer assets guarantee (Upgrading paths)
The SCSI and FIBRE attachment options allows on-site upgrading of already installed channel-type DKC systems owned by customers.

(7) High performance
The DKC has two independent areas of nonvolatile cache memory and this mechanism also applies to the SCSI and FIBRE attachment option. Thus, compared with a conventional disk array controller used for open systems and not having a cache, this disk subsystem has the following outstanding characteristics:

① Cache data management by LRU control
② Adoption of DFW (DASD Fast Write)
③ Write data duplexing
④ Nonvolatile cache

Copyright ©1998, Hitachi, Ltd.

(8) High availability

The DKC is fault-tolerant against even single point of failure in its components and can successively read and write data without stopping the system. This concept is also taken over to the SCSI and FIBRE attachment option, which ensures fault-tolerance against even single point of failure in its components, except the CHS and the CHF. Fault-tolerance against CHS and SCSI bus failures depends on the multi-path configuration support of the host system. Fault-tolerance against CHF and FIBRE cable failures depends on the multi-path configuration support of the host system too.

(9) High data reliability

The SCSI attachment option automatically creates and adds to host data a unique data guarantee code of eight bytes, which is then written together with the data onto the disk. The data guarantee code is checked automatically on the internal data bus of the DKC to prevent the occurrence of data errors due to array-specific data distribution or integration control. Thus, the reliability of the data improves.

The FIBRE attachment is just same.

(10) HORC (Hitachi Open Remote Copy) Support

HORC is a function to realize the duplication of open system data by connecting the two RAID300 subsystems or inside parts of a single RAID300 using the ESCON.

This function enables the construction of a backup system against disasters by means of the duplication of data including those of the host system or the two volumes containing identical data to be used for different purposes.

1.2 Basic Specifications

The basic specifications of the SCSI and FIBRE attachment are shown in Table 1-1.

Table 1-1 Basic specifications

Item		Specification
Host Channel	Max. # of Channels	32 (SCSI)
		16(FIBRE)
	Max. # of concurrent paths	32 (SCSI)
		16(FIBRE)
Data transfer		20MB/sec (Fast Wide SCSI)
		40MB/sec (Ultra SCSI)
		100MB/sec (Fibre)
RAID level		RAID5/RAID1
RAID configuration		RAID5 (6D+1P:9GB)
		RAID5 (3D+1P:18GB, 6GB,9GB,15GB,36GB)
		RAID1 (2D+2D:9GB, 18GB,6GB,15GB,36GB)
HDD		DK308/309/30A-90 (9GB)
		DK309/30A-180 (18GB)
		DK3F1/3F2-60 (6GB)
		DK3F2-90 (9GB)
		DK3F2-150 (15GB)
		DK30A-360 (36GB)
Max. disk capacity	DK308-90	1540GB (224Vol, OPEN-9)
	DK309-18	2888GB (420Vol, OPEN-9)
Cache capacity	minimum	256MB/1GB*1
	maximum	4GB/16GB*1
	additional unit	256MB/1GB*1

*1 : 64MB DRAM

1.3 Terminology

(1) Arbitrated Loop
A configuration that allows multiple ports to be connected serially.

(2) CHA
CHannel Adapter. A hardware package to connect with a channel interface.

(3) CHS
CHannel adapter for SCSI. A hardware package to connect with SCSI interface.

(4) CHF
CHannel adapter for FIBRE. A hardware package to connect with FIBRE interface.

(5) Command descriptor block (CDB)
A command block in SCSI interface used to send requests from the initiator to a target.

(6) Connect
A function that selects and connects the SCSI target device to be activated by the initiator.

(7) Disconnect
A function that causes the SCSI target device to release its SCSI bus. Execution of this function enters the SCSI bus into a BUS FREE phase.

(8) DKA
DisK Adapter. A hardware package which controls disk drives within a DKC.

(9) DKC
DisK Controller. A disk controller unit consisting of CHA, CHS, CHF, DKA, Cache and other components except DKU.

(10) DKU
DisK Unit. Disk drives units.

(11) Fabric
The entity which interconnects various N-Ports attached to it and is capable of routing frames.

(12) FAL
File Access Library: A program package and provided as a program product for HMDE.

(13) FCU
File Conversion Utility: A program package and provided together with FAL for HMDE.

(14) HMBR
Hitachi Multiplatform Backup/Restore.

Copyright ©1998, Hitachi, Ltd.

(15) HMDE
Hitachi Multiplatform Data Exchange.

(16) HMRS
Hitachi Multiplatform Resource Sharing.

(17) HA configuration
High Availability configuration

(18) Initiator
The SCSI device (usually, a host computer) that requests another SCSI device to operate.

(19) Logical unit (LU)
The logical unit of division of the subsystem data area accessible from SCSI interface.

(20) Logical unit number (LUN)
A three-bit code identifier for a logical unit. LUN0-7 can be assigned.

(21) Logical volume or logical device (LDEV)
The disk pack image, formed on an array disk, that is compatible with that of a 3390-3 in terms of cylinder and track quantities and the track capacity.

(22) PERFORMANCE FIBRE
DKC-F310I-4FE (Fibre 4-Port Adapter for Optical Cable). This package may be confirmed by Maintenance screen on SVP.

(23) Point-to-Point
A configuration that allows two ports to be connected serially.

(24) Reconnect
A function that the SCSI target device selects an initiator to continue operating after execution of the disconnect function.

(25) SCP
SCSI Control Processor. A SCSI interface protocol controller. Four SCPs are mounted on a CHS.

(26) SCSI device
Collectively refers to the host computer, peripheral control units, and intelligent peripherals that are connected to one SCSI bus.

(27) SCSI address
A unique address assigned to an SCSI device. Eight addresses 0 to 7 (for a WIDE SCSI, 0 to 15) can be assigned.

Copyright ©1998, Hitachi, Ltd.

(28) SCSI ID
A bit definition address for an SCSI address. This bit address is keyed to a data bus bit number.

(29) SCSI port
Means the hardware (connector) used to connect an SCSI bus to the DKC. The SCSI ports and SCPs mounted in the DKC will provided, one for one, and the quantity is four per CHS.

(30) Target
An SCSI device (usually, the DKC) that operates at the request of the initiator.

(31) VENDOR UNIQUE or VU
A manufacturer- or device-unique definable bit, byte, field, or code value.

Copyright ©1998, Hitachi, Ltd.

1.4 Notice about maintenance operations

1.4.1 Notice about SCSI maintenance operations

There are some notices about SCSI maintenance operations.

(1) When SCSI path configuration will be changed, SCSI I/O on the related SCSI port must be stopped before.
(2) When SCSI channel adapter or LDEV will be de-installed, the related SCSI path must be de-installed before.
(3) When SCSI channel adapter will be replaced, the related SCSI I/O must be stopped before.
(4) When micro-program will be changed, all SCSI I/O on the DKC must be stopped before, excepting another operation is instructed with HA configuration or CHS skip mode microprogram exchanging.

1.4.2 Notice about FIBRE maintenance operations

FIBRE maintenance operations should be done same as SCSI.

Copyright ©1998, Hitachi, Ltd.

2 Interface Specification

2.1 SCSI Physical Interface Specification

The physical interface specification supported for SCSI is shown in Table 2-1.

Table 2-1 SCSI Physical specification

No	Item	Specification
1	Interface type	- SCSI-2
2	Physical interface	- 68pin differential (single-end is not supported)
3	Transfer mode	- Fast/Wide SCSI - Ultra/Wide SCSI
4	External cable length *1	- Max. 20 m
5	Data transfer rate	- Max. 20 MB/s (Fast/Wide) - Max. 40 MB/s (Ultra/Wide)
6	Number of SCSI ports	- 4 ports per CHS *2
7	Parallel transfer	- Concurrent transfer for all SCSI ports

*1 : From the SCSI I/F connector on the DKC to other SCSI devices. Internal cable length within DKC (5 m) is excluded.

*2 : CHS pair packages must be installed regardless of an actually using number of SCSI ports.

Copyright ©1998, Hitachi, Ltd.

2.2 FIBRE Physical Interface Specification

The physical interface specification supported for FIBRE is shown in Table 2-2 and Table 2-3.

Table 2-2 FIBRE Physical specification

No.	Item		Specification	Remark
1	Host interface	Physical interface	Fibre Channel	FC-PH,FC-AL
		Logical interface	SCSI-3	FCP,FC-PLDA
			Fibre(Arbitrated Loop)	FC-AL
2	data transfer rate	optic fibre cable	100MB/S	-
3	cable length	optic single mode fibre	10km	Longwave laser
		optic multi mode fibre	500m	Shortwave laser
4	topology		FC-AL	-
5	service class		3	-
6	protocol		FCP	-
7	transfer code		8B/10B translate	-
8	# of hosts		31/Path	-
9	# of maximum LU		*1	-

*1 # of maximum LU depends on host's operating system. Refer 3.5.5 LU number expansion.

Table 2-3 FC I/F support level

No.	Item	I/F type	DKC310 support level
1	Optic cable type	Optical Type (Longwave)	supported
2		Optical Type(Shortwave)	supported
3		Copper Type	not supported
4	Optic I/F	OFC (Open Fibre Control)	not supported
5		Non-OFC	supported

Copyright ©1998,2000, Hitachi, Ltd.

3 CONFIGURATION

3.1 System Configurations

3.1.1 Multiplatform Configuration

The DKC can be connected to the SCSI bus as one of the target SCSI devices and can exchange data with a host via the SCSI bus. The DKC can be connected to the FIBRE cable as one of the devices and can exchange data with host via the FIBRE cable. The conventional Channel host systems can also be connected simultaneously with an SCSI bus and FIBRE cable. The possible system configurations with the SCSI attachment and FIBRE attachment are shown below.

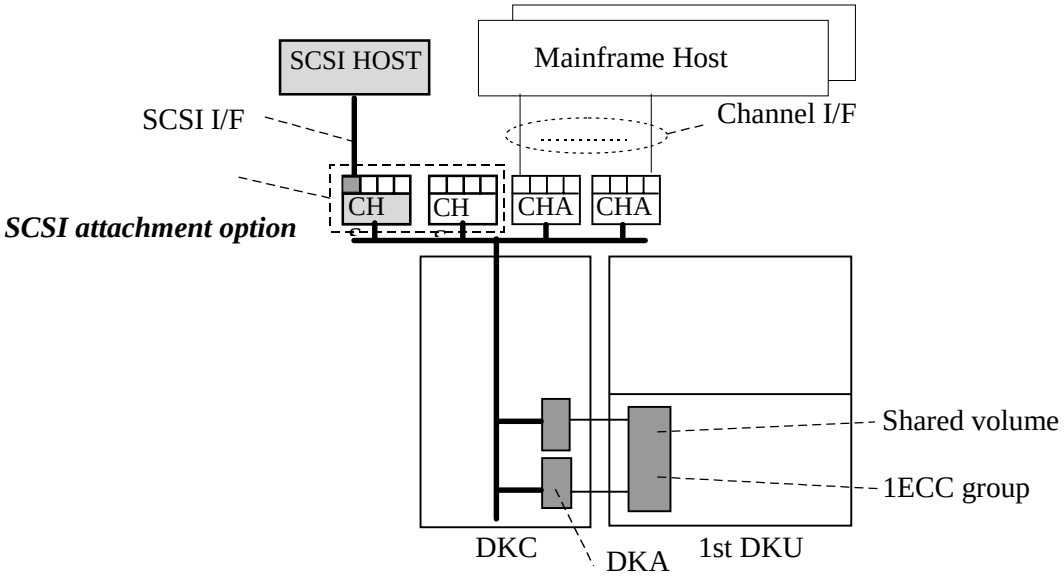

Figure 3-1 multiplatform configuration example

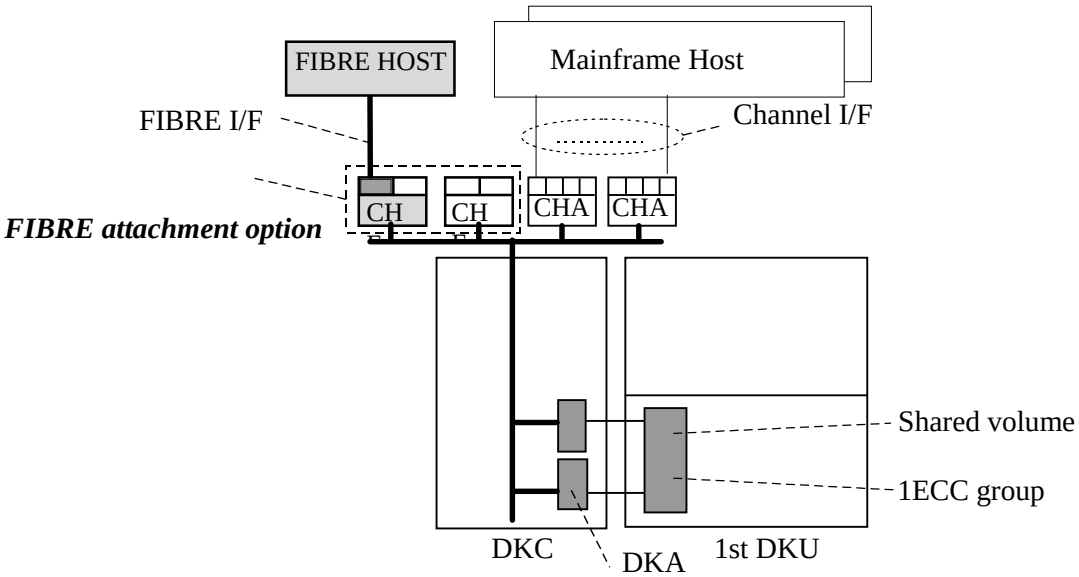

Figure 3-2 multiplatform configuration example

Copyright ©1998, Hitachi, Ltd.

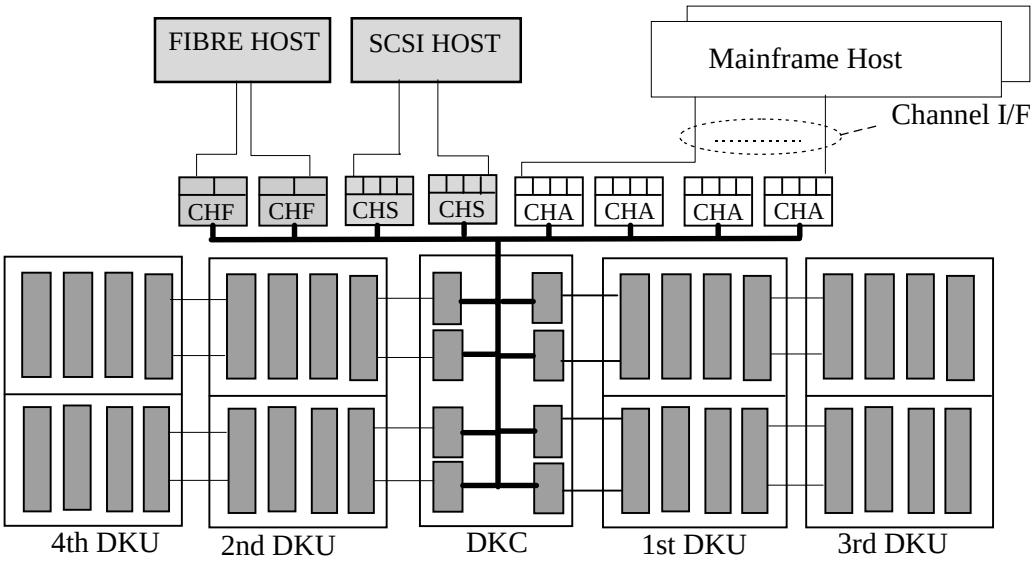

Figure 3-3 multiplatform configuration example

Copyright ©1998, Hitachi, Ltd.

3.1.2 All SCSI Configuration

The DKC can also be configured as the all SCSI interface equipment by installing only CHS adapters on it. The possible system configurations for the all SCSI configuration are shown below.

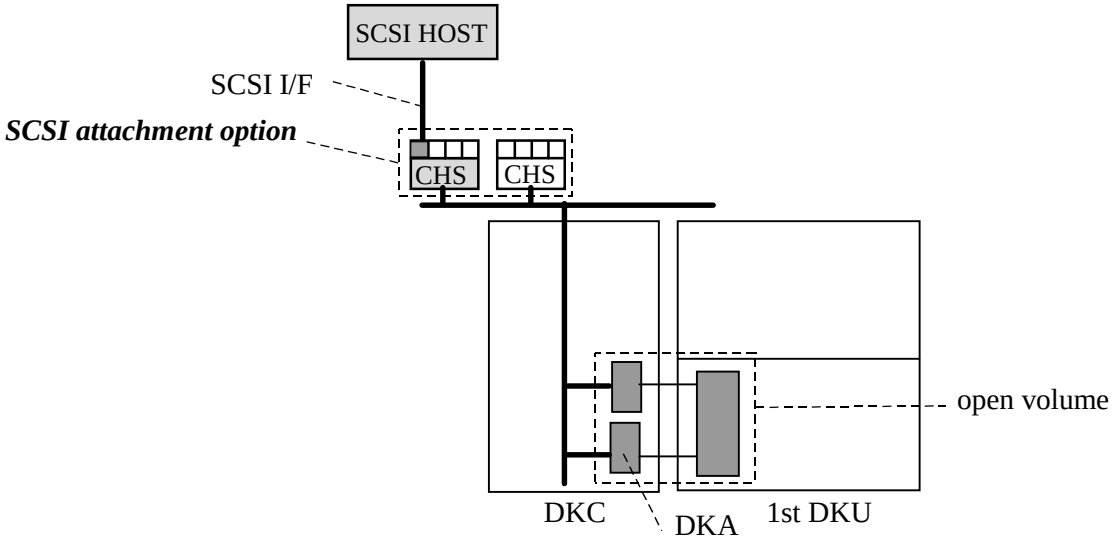

Figure 3-4 Minimum system configuration for All SCSI

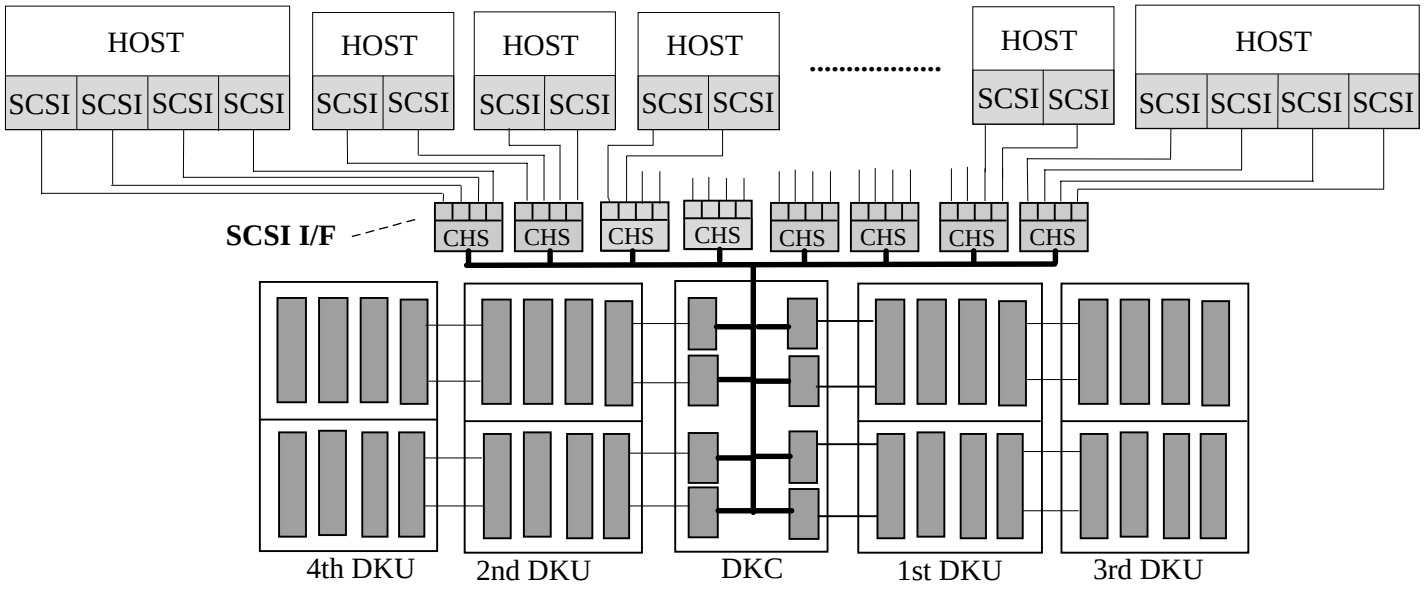

Figure 3-5 Maximum system configuration example for All SCSI

Copyright ©1998, Hitachi, Ltd.

3.1.3 All FIBRE Configuration

The DKC can also be configured as the all FIBRE interface equipment by installing only CHF adapters on it. The possible system configurations for the all FIBRE configuration are shown below.

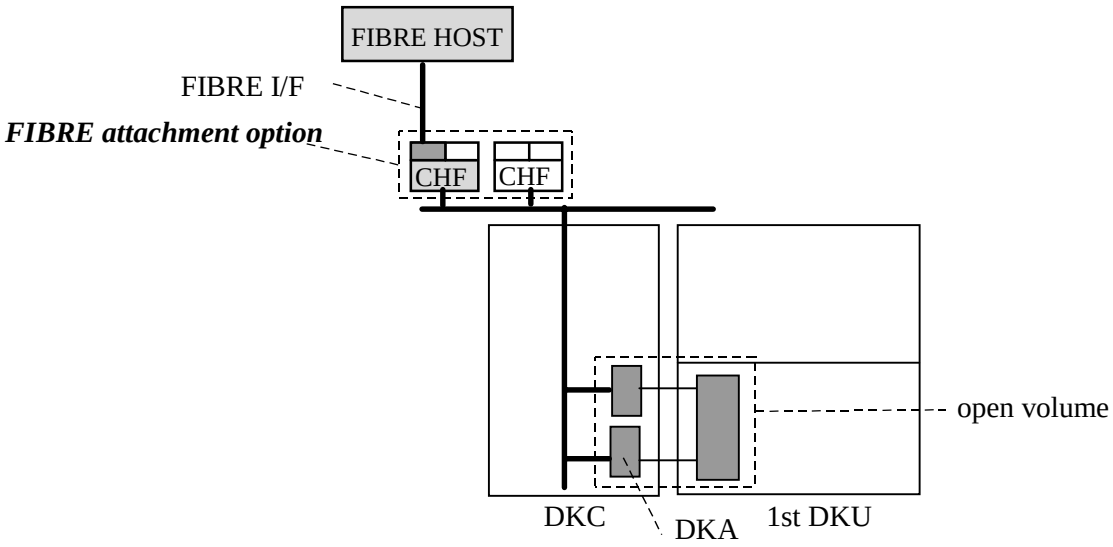

Figure 3-6 Minimum system configuration for All FIBRE

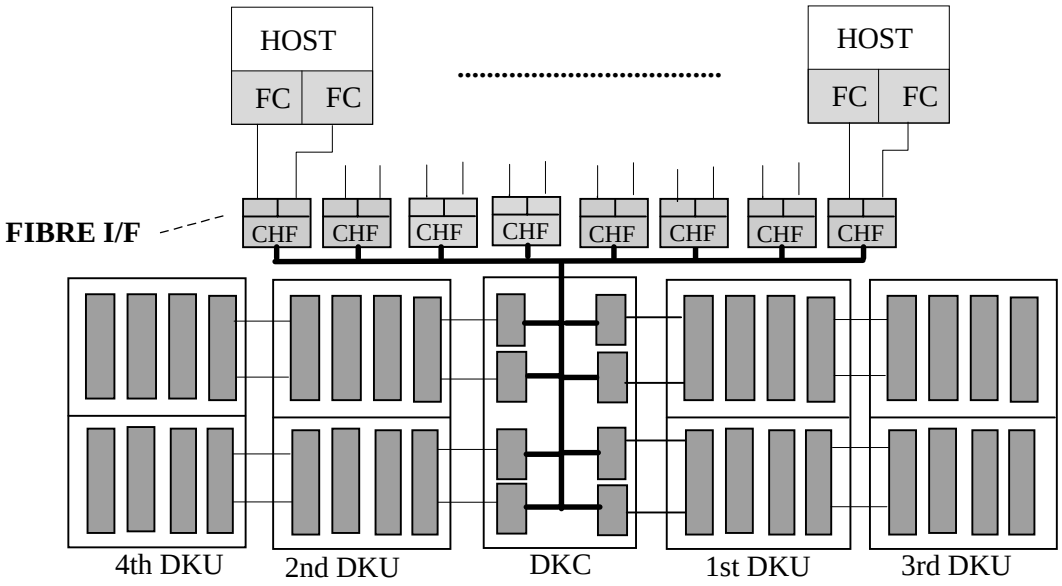

Figure 3-7 Maximum system configuration example for All FIBRE

Copyright ©1998, Hitachi, Ltd.

3.1.4 SCSI+FIBRE Configuration

The DKC can also be configured as the SCSI and FIBRE interface equipment by installing CHS and CHF adapters on it. The possible system configurations are shown below.

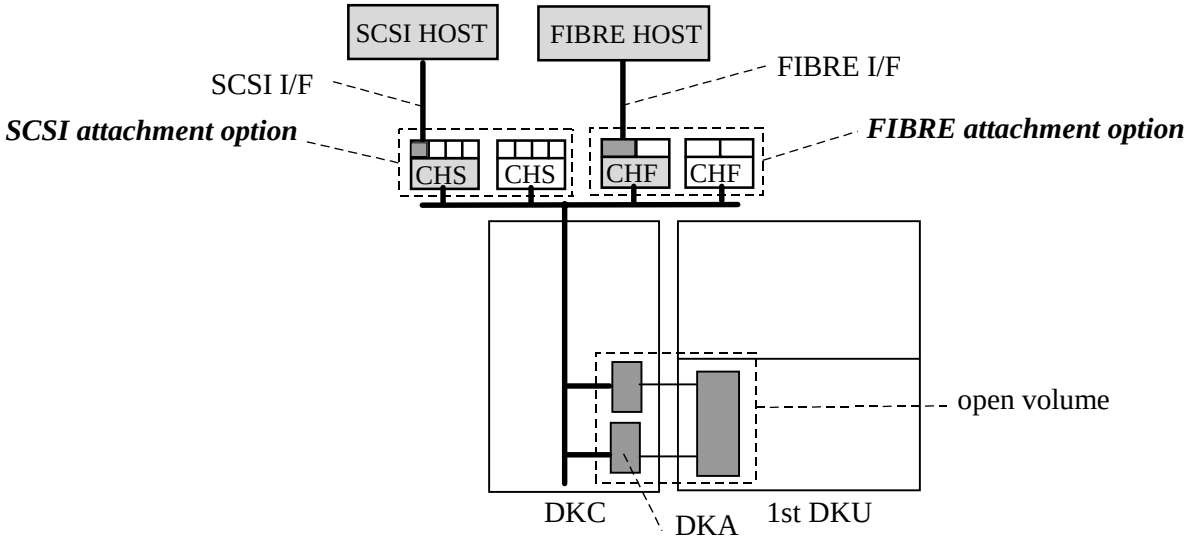

Figure 3-8 Minimum system configuration for SCSI+FIBRE

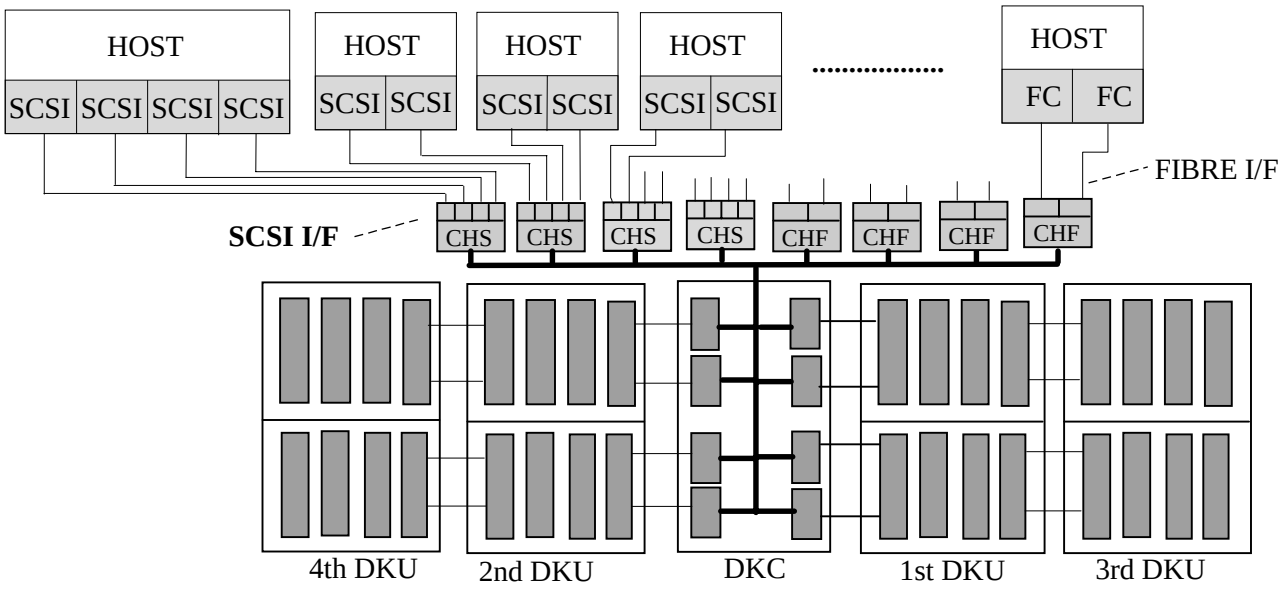

Figure 3-9 Maximum system configuration for SCSI+FIBRE

Copyright ©1998, Hitachi, Ltd.

3.2 Channel Configuration

The SCSI attachment adapter (CHS) package must be mounted in two-package unit.
The FIBRE attachment adapter (CHF) package must be mounted in two-package unit too.
A maximum eight packages including CHA and CHS and CHF can be installed in the DKC.
All CHS (I.e. all SCSI) configuration is also allowed.
All CHF (I.e. all FIBRE) configuration is also allowed.
Mix of CHS and CHF without CHA (I.e. SCSI + FIBRE) configuration is also allowed.
Four SCSI ports are mounted on a single CHS package.
Two FIBRE ports are mounted on a single CHF package.
The Example of available channel configuration is shown in Table 3-1.

Table 3-1 Example of available channel configuration

No.	Basic	Additional 1	Additional 2	Additional 3	Remark
1	CHA	CHS	-	-	Minimum multiplatform (SCSI)
2	CHA	CHF	-	-	Minimum multiplatform (FIBRE)
3	CHA	CHS	CHF	-	Multiplatform (SCSI+FIBRE)
4	CHS	-	-	-	Minimum All SCSI
5	CHF	-	-	-	Minimum All FIBRE
6	CHS	CHF	-	-	Minimum SCSI+FIBRE
7	CHS	CHS	CHS	CHS	Maximum All SCSI
8	CHF	CHF	CHF	CHF	Maximum All FIBRE
9	CHS	CHS	CHF	CHF	SCSI+FIBRE

CHS:SCSI adapter,CHF:FIBRE adapter,CHA:ESCON or METAL,-:empty

Copyright ©1998, Hitachi, Ltd.

3.3 SCSI Addressing

Each SCSI device connected to a SCSI BUS can set a unique SCSI-ID number within the range from 0 to 15 because a WIDE SCSI is supported in the DKC.

An addressing from the SCSI host to the SCSI volume in the DKC can be uniquely defined with a nexus between them. The nexus through the Initiator (host) SCSI-ID, the Target (CHS port) SCSI-ID, and LUN (Logical Unit Number) define the addressing and access path. Although the maximum number of LUNs assigned to a single Target SCSI-ID is limited to maximum eight in the SCSI, the DKC supports Multi-Target SCSI IDs in each CHS port so that the host can expand its addressing space by using its function.

The addressing configuration using the Multi-Target ID function is shown in the Figure 1-3-10.

3.3.1 Number of Hosts

The number of SCSI hosts (Initiator), i.e. a command issuing host per SCSI port, is limited to one in the DKC excepting HA configuration.
When the multiple hosts need to be connected to the DKC, they can use the multiple SCSI ports on the DKC.

3.3.2 Multi-Target ID

Each SCSI port on each CHS can independently set the Target SCSI-ID number. And, each SCSI port can have multiple SCSI ID numbers within the range from 0 to 15. It is also allowed that the different SCSI ports assign the same SCSI ID number, if not on the same SCSI cable.

3.3.3 LUN (Logical Unit Number)

Maximum eight LUNs from LUN0 to LUN7 can be assigned to each Target ID.

Copyright ©1998, Hitachi, Ltd.

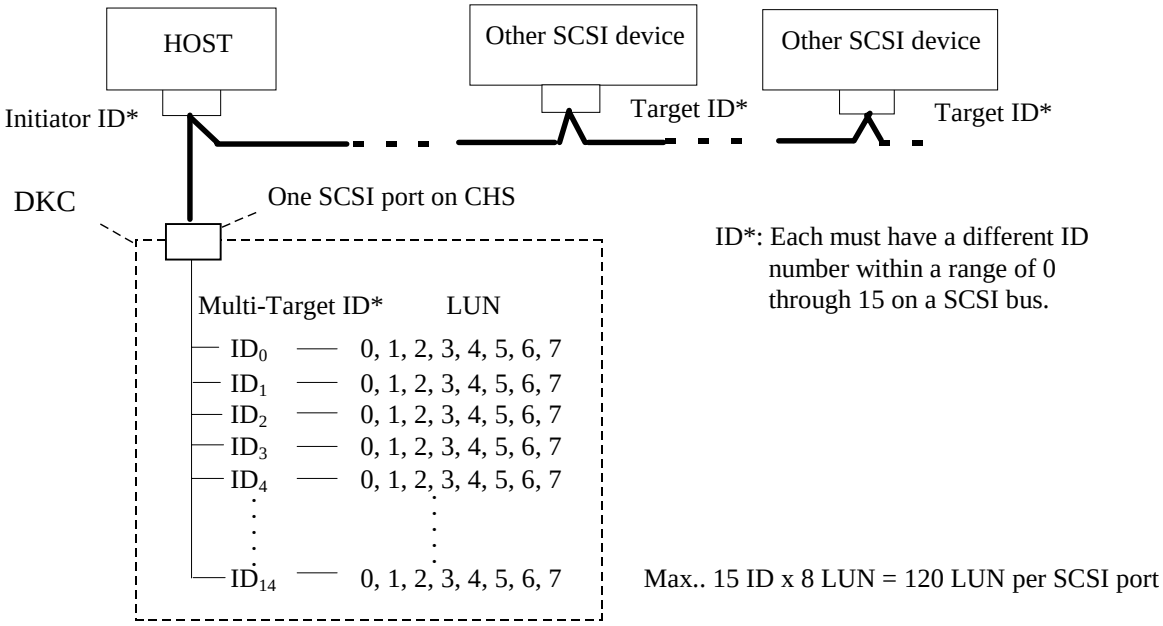

Figure 3-10 SCSI addressing configuration from Host

3.4 FIBRE Addressing

Each FIBRE device can be set a unique Port-ID number within the range from 1 to EF.

An addressing from the FIBRE host to the FIBRE volume in the DKC can be uniquely defined with a nexus between them. The nexus through the Initiator (host) ID, the Target (CHF port) ID, and LUN (Logical Unit Number) define the addressing and access path. The maximum number of LUNs assigned to a single Target SCSI-ID is limited to maximum eight.

The addressing configuration is shown in the Figure 3-11.

3.4.1 Number of Hosts

The number of FIBRE hosts (Initiator), i.e. a command issuing host per FIBRE port, is limited to one in the DKC excepting HA configuration.
When the multiple hosts need to be connected to the DKC, they can use the multiple FIBRE ports on the DKC.

Copyright ©1998, Hitachi, Ltd.

3.4.2 LUN (Logical Unit Number)

Maximum eight LUNs from LUN0 to LUN7 can be assigned to each FIBRE Port.

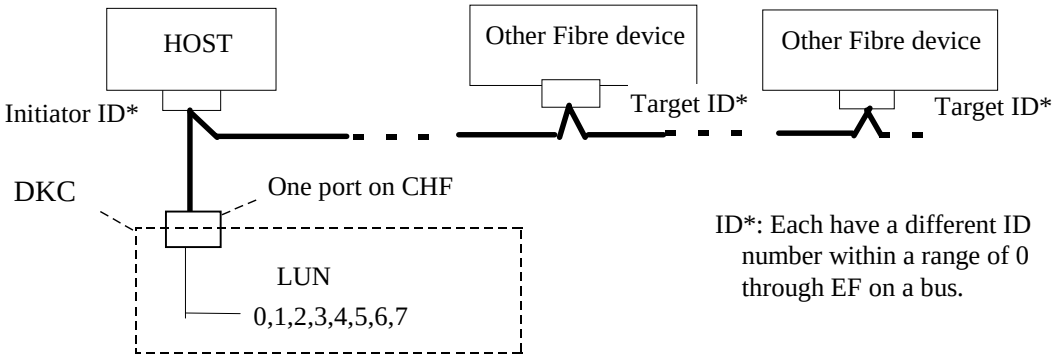

Figure 3-11 FIBRE addressing configuration from Host

3.4.3 PORT INFORMATION

A PORT address and the Topology can be set as PORT INFORMATION. The value of PORT address is EF and can be changed by user. Topology information is selected from “Fabric”, “FC-AL” or “Point to point”.

CAUTION

On the CHF, Host Mode must be set to “MODE 00”.

Copyright ©1998, Hitachi, Ltd.

3.5 Logical Unit

3.5.1 Logical Unit Specification

The specifications of Logical Units supported and accessible from Open system hosts are defined in the Table 3-2.

Table 3-2 LU specification (1/3)

No	Item		Specification				
1	Volume name		OPEN-3	OPEN-8	OPEN-9	3390-3A	3390-3B

3.5.2 Logical Unit Mapping of SCSI

Each volume name, such as OPEN-3, OPEN-8, OPEN-9, OPEN-K, 3390-3A, 3390-3B, 3390-3C, 3380-KA, 3380-KB or 3380-KC is also used as an emulation type name to be specified for each ECC group. When the emulation type is defined on an ECC group, Logical volumes (LDEVs) are automatically allocated on the ECC group from the specified LDEV#. After creating LDEVs, each SCSI address consisting of SCSI port address, SCSI ID# and LUNs can be mapped on any location of LDEV within DKC. This setting is performed by SVP operation or Remote Console operation (option).

This flexible LU and LDEV mapping scheme enables multiple paths setting to the same logical volume, so that the host system can configure a shared volume configuration such as a High Availability (HA) configuration. In the shared volume environment, however, some lock mechanism need to be provided by the host systems.

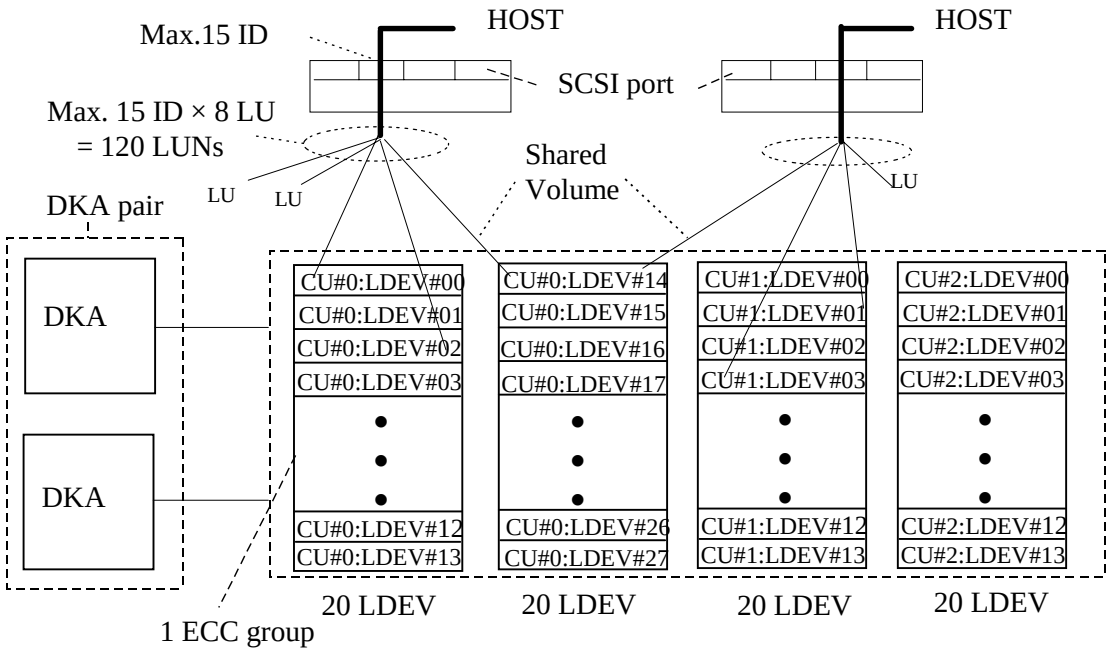

Figure 3-12 LDEV and LU mapping for SCSI volume

Copyright ©1998,1999, Hitachi, Ltd.

3.5.3 Logical Unit Mapping of FIBRE

Each volume name, such as OPEN-3, OPEN-8, OPEN-9, OPEN-K, 3390-3A, 3390-3B, 3390-3C, 3380-KA, 3380-KB or 3380-KC is also used as an emulation type name to be specified for each ECC group. When the emulation type is defined on an ECC group, Logical volumes (LDEVs) are automatically allocated on the ECC group from the specified LDEV#. After creating LDEVs, each LUN of FIBRE port can be mapped on any location of LDEV within DKC. This setting is performed by SVP operation or Remote Console operation (option).

This flexible LU and LDEV mapping scheme enables multiple paths setting to the same logical volume, so that the host system can configure a shared volume configuration such as a High Availability (HA) configuration. In the shared volume environment, however, some lock mechanism need to be provided by the host systems.

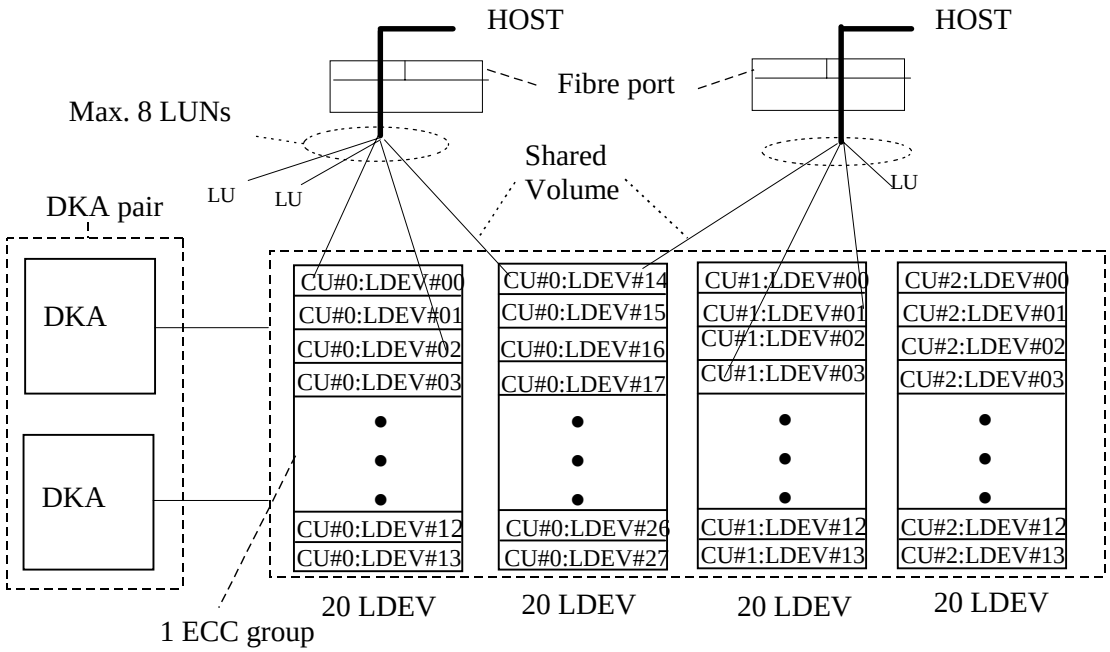

Figure 3-13 LDEV and LU mapping for FIBRE volume

Copyright ©1998,1999, Hitachi, Ltd.

3.5.4 LU size expansion

(1) Outline

This is a function to show the host the continuous LDEV of a volume exclusive for open system as a virtually large LU.

In the former configuration, one LU is one LDEV, but this expanding function can enlarge the LU size up to 265 GB by showing the host two or more continuous LDEVs as a single LU.

It was necessary to create many LUs to cover the entire capacity of a disk subsystem before, this function enables a small number of LUs to cover it from the viewpoint of host interface.

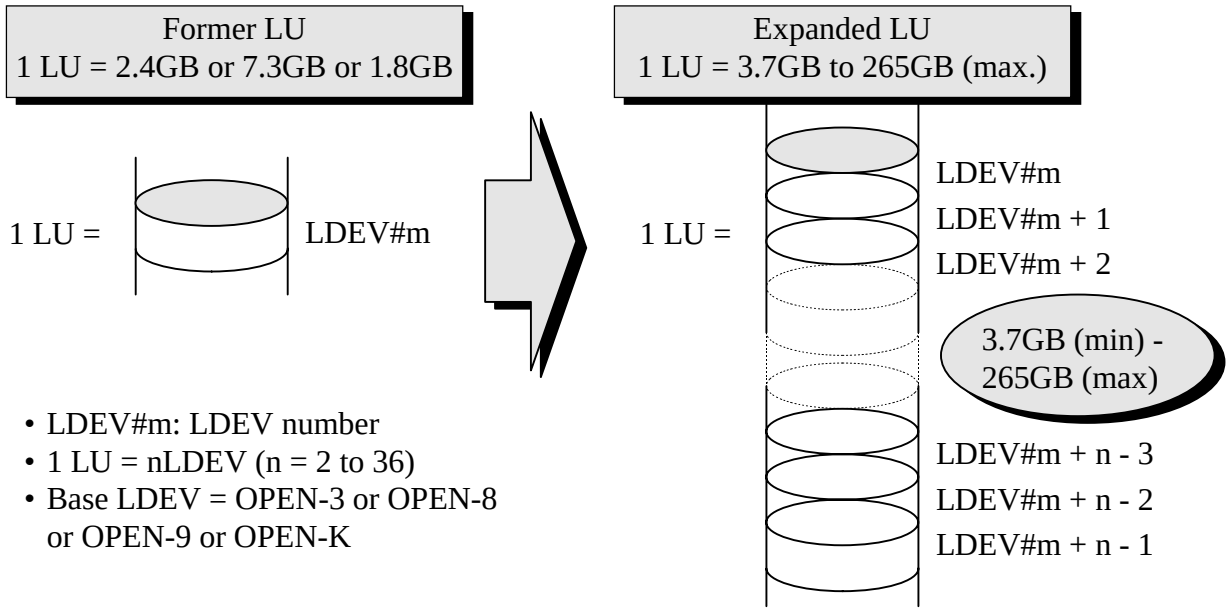

Figure 3-13-1 LU Size Expansion

(2) Specifications

Table 3-2-1 shows specifications for the LU expansion.

Table 3-2-1 LU Size Expansion Specification(1/2)

Base volume		OPEN-3	OPEN-8	OPEN-9	OPEN-K
LDEV Capacity		2.4GB	7.3GB	7.3GB	1.8GB
Number of connectable LDEVs		2 to 36 LDEV			
LU Capacity		4.9GB~88.5GB	14.7GB~264.4GB	14.7GB~265.8GB	3.7GB~67.7GB
Product name for responding to INQUIRY		OPEN-3×n	OPEN-8×n	OPEN-9×n	OPEN-K×n
Restrictions of connecting LDEV	Before 52-42-0X	• Connection is possible only when the LDEV numbers are arranged in order. If the LDEV numbers are not sequential, it cannot be specified as the same LU. • Connection of LDEVs with different CU numbers are impossible. • Connection of the LU size expansion with CV are impossible. • Connection of OPEN-8 volumes are impossible.			
	52-42-3X or later	• Connection of LDEVs with different CU numbers are impossible. • Connection of CV with different capacity are impossible. • Connection of OPEN-8 volumes are possible.			

n: Number of connected LDEVs

Copyright ©1999, Hitachi, Ltd.

Table 3-2-1 LU Size Expansion Specification(2/2)

Base volume		OPEN-3-CVS	OPEN-8-CVS	OPEN-9-CVS	OPEN-K-CVS
LDEV Capacity		35MB~2.3GB	35MB~6.9GB	35MB~7.0GB	35MB~1.7GB
Number of connectable LDEVs		2 to 36 LDEV			
LU Capacity		70MB~84.2GB	70MB~250.2GB	70MB~252.6GB	70MB~64.1GB
Product name for responding to INQUIRY		OPEN-3×n-CVS	OPEN-8×n-CVS	OPEN-9×n-CVS	OPEN-K×n-CVS
Restrictions of connecting LDEV	Before 52-42-0X	• Connection is possible only when the LDEV numbers are arranged in order. If the LDEV numbers are not sequential, it cannot be specified as the same LU. • Connection of LDEVs with different CU numbers are impossible. • Connection of the LU size expansion with CV are impossible. • Connection of OPEN-8-CVS volumes are impossible.			
	52-42-3X or later	• Connection of LDEVs with different CU numbers are impossible. • Connection of CV with different capacity are impossible. • Connection of OPEN-8-CVS volumes are possible.			

n: Number of connected LDEVs

(3) Effect and restrictions of LU expanding function

1) Effect

- The disk subsystem capacity can be covered with the fibre channel 2 paths.
- Restrictions of usable capacity owing to the number of the usable hosts is released.
  -Restriction of the host capacity (for example, up to 32 LUs for Windows NT)
  -Restriction of capacity owing to restriction of the number of LUs of the HA software
- The disk connection function on the host side such as VxVM becomes unnecessary.
- Effect of LU size extending with CV.
  -LU of optional size can be composed.
  -The load of PDEV can be dispersed by making CV which dispersed around ECC LUSE.
  -Performance can be improved by the multiplex frequency of LDEV increasing.

2) Restrictions

- Some OSs are slow in disk accesses handling large data and may not be usable depending on environment. (Example: AIX is slow in accesses handling data larger than 2GB.)
- The capacity need to be determined when necessary in a system designed to achieve a high-speed operation by making the LUs perform multiple operation.

Copyright ©1998,1999, Hitachi, Ltd.

(4) Notes on use

When the LU is expanded, the following restrictions are added to a case where no expansion is made, such as a change in capacity seen from the open host owing to the specification of the expansion.

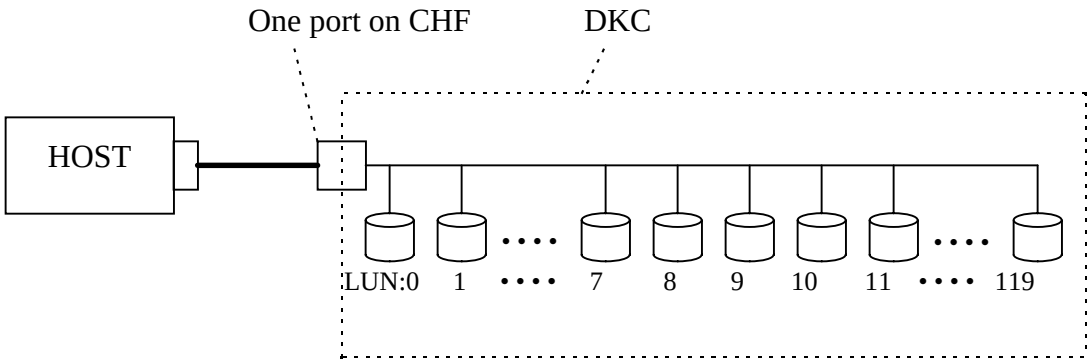
1) The LU size cannot be changed while the LU is being used by the host. When you want to change the LU size, the host must be rebooted once. If the LU size once set is to be changed, after shutting down the host, change the LU size, then start up the host again.
2) If an LU to being used or expanded LU is reconfigured in a new configuration or as a expanded LU, data used so far is lost.
   Perform physical replacement work of the disk including data backup, separation of the former LU, LU connection after the configuration change, and restoration of backup data.
3) When an LDEV in the LU is blocked, an LU blocking error does not occur unless an access is made to the blocked LDEV. When the access to the blocked LDEV is made, a blocking error occurs in the expanded LU.
4) The HMRS can use the LU whose LU size has been expanded. A volume with an expanded LU can be used by the HMBR, however, all the volumes need to be backed up and restored.
5) The maintenance procedure when an error such as an LDEV blocking occurs is the same as before. Check the LDEV status from the SVP and perform the maintenance considering the relation between the LDEV and the LU.

Copyright ©1998,1999, Hitachi, Ltd.

3.5.5 LU number expansion

(1) Outline

In this function, LUNs per one port of CHF can be identified until 119 in addition to usual LUN = 0 to 7 by a HOST.



(2) Notes on use

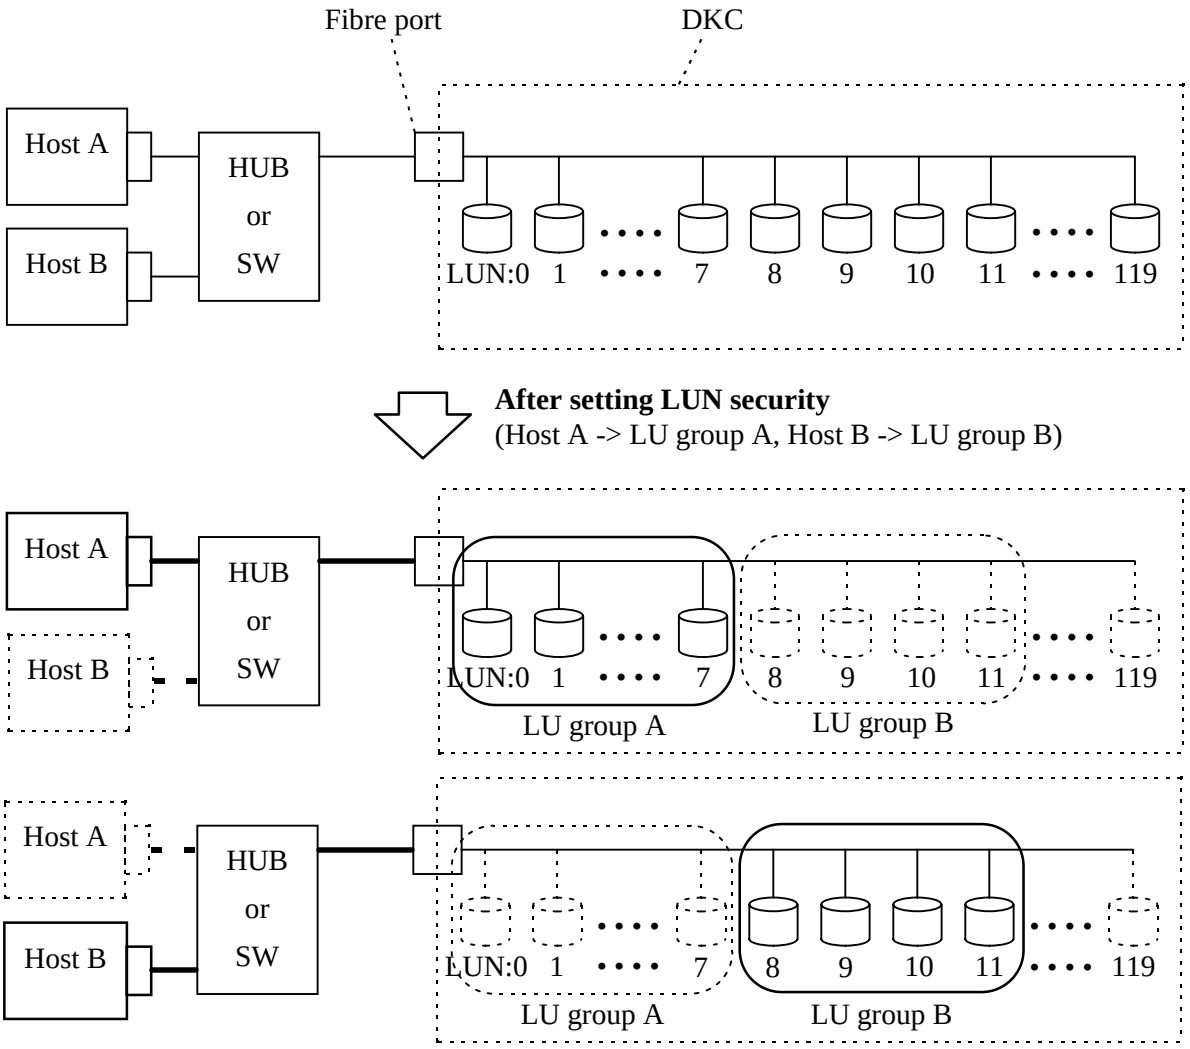
- This functionality is not available on the HOST that does not support numbers of LUN more than eight.
- LU number expansion and LU size expansion are exclusive to use on same port.

Copyright ©1998,1999, Hitachi, Ltd.

3.5.6 LUN Security

(1) Outline

This function can protect to access by the host server which are prohibited to access a LUN/LUNs which is assigned to SCSI path in Fibre port. Each port of host servers are distinguished by World Wide Name that is belong to each port. In the following example, the LU group A are accessible from the host server A and the LU group B are accessible from the host server B



(2) Notes on use

Different kind of platforms cannot connect to same port via switch or HUB. Because of the DKC cannot distinguish the a kind of the server.

Copyright ©1999,2000, Hitachi, Ltd.

3.5.7 Heterogeneous Platform support

(1) Outline

This function support SAN environment of Fibre connection via fabric switch.

(2) Supported Port

Platform	Solaris	Windows NT	
HBA	Jaycor	Emulex	Q-Logic
F-Port	OK	OK	NG
FL-Port	NG	NG	OK

(3) Supported HBA(Host Bus Adapter)

Supported HBA			
Platform	Solaris	Windows NT	
FC card	JAYCOR FC1063	Emulex	Q-Logic
Protocol chip	Tachyon	SuperFly	ISP2100
Specification	LUN 0-119 Fabric supported	LUN 0-31 Fabric supported	LUN 0-7 Fabric supported
Note	*1	—	—

*1) DKC310 do not support current SUN standard Fibre HBA.

3.6.2 Intermix Specification

Table 3-4 Intermix specification

No	Item	Intermix unit	Remark
1	LDEV intermix	ECC group	-
2	MF/OPEN LDEV intermix	ECC group	-
3	RAID1/RAID5 intermix	DKA pair	-
4	Same parity group PDEV intermix	ECC group	DK309-18(3D+1P) and DK3F1-6(3D+1P) can coexist under same DKA pair with ECC unit.
5	Different parity group PDEV intermix	DKA pair	DK308-90(6D+1P) and DK309-18(3D+1P) can not coexist under same DKA pair. DK308-90(6D+1P) and DK309-18(3D+1P) can coexist under the DKC with DKA pair unit.

(1) M/F and SCSI volume intermix
ECC group
It is allowed to allocate the mainframe volumes and SCSI volumes together under a same DKA pair.

(2) LDEV emulation type intermix
ECC group

(3) Drive intermix
Same parity group (3D+1P or 6D+1P) can coexist under same DKA pair by ECC group unit.
Different parity group such as 3D+1P and 6D+1P can coexist in one DKC by DKA pair unit.
Different parity group such as 3D+1P and 6D+1P cannot coexist under same DKA pair.

(4) RAID5/RAID1 intermix
DKA pair

Copyright ©1998, Hitachi, Ltd.

3.6.3 HMDE volume intermix within ECC group

3.6.3.1 HMDE volume intermix within ECC group

(1) The four types, 3390-3A/-3B/-3C/-3 (or 3390-3A/-3B/-3C/-3R), of emulated disk drives can coexist within one ECC group.
(2) The four types, 3380-KA/-KB/-KC/-K, of emulated disk drives can coexist within one ECC group.
(3) The type can be changed for each one volume within an ECC group.
(4) The type can be changed by the emulation type change function of the SVP.
(5) The emulation type change function allows any change of types among 3A, 3B, 3C, 3, and 3R (or among KA, KB, KC, and K).
(6) At "define configuration and install" or installation of disk drives, device definition and LDEV-FMT are performed in units of ECC group with any type of 3A, 3B, 3C, 3, and 3R (or any type of KA, KB, KC, and K). Afterwards the type is changed for each one volume if necessary.
When the type change is completed, all volumes are initialized (a VTOC is created for volumes) from the mainframe system.
(7) After the type change, data before the change is not assured.
After the type change, all volumes must be initialized (a VTOC must be created) from the mainframe system.
However, data is assured as before for type change between 3390-3 and 3390-3R, and if you want to assure the data, all volumes must not be initialized (a VTOC must not be created).
For type changes other than that between 3390-3 and 3390-3R, data is not assured.

3.6.3.2 Intermix with 3390-3R

(1) The 3390-3/-3A/-3B/-3C types can coexist within a subsystem.
Intermixing is allowed both within and beyond a 32-LDEV address boundary.
(2) The 3390-3R/-3A/-3B/-3C can coexist within a subsystem.
- An intermixture of the 3390-3R and any of 3390-3A/-3B/-3C is allowed in units of 32-LDEV address boundary (with the same type within each boundary). It is not allowed within a 32-LDEV address boundary because of the restriction on the mainframe system.
- An intermixture of the 3390-3A/-3B/-3C is allowed both within and in units of 32-LDEV address boundary.

(3) The 3390-3 and 3390-3R cannot coexist within a subsystem.
- When changing the type from 3390-3 to 3390-R and vice versa by the emulation type change function, since the 3390-3 and 3390-3R cannot coexist within a subsystem, the type must be changed not partially but totally.
The SVP reject partial change.
- The intermixture can be changed from that of the 3390-3/-3A/-3B/-3C to that of the 3390-3R/-3A/-3B/-3C (with an intermixture part of the 3390-3A/-3B/-3C remaining unchanged) and vice versa by the emulation type change function between 3390-3 and 3390-3R.

3.8 SCSI Volume Setting

3.8.1 Setting of SCSI Volume space

The SCSI volume setting is performed according to the following procedure either by using the SVP or Remote Console function (optional feature).

- SCSI logical volume (LDEV) space setting:

- Specify the disk area for the SCSI volume.
- Specify the RAID level.
- Select the LDEV type and P:L.
- LDEVs are assigned automatically.

3.8.2 SCSI ID and LUN setting

The SCSI IDs and LUNs can be set with the following procedure by using the SVP.

Refer to the INSTALLATION SECTION for more detailed procedures.

- SCSI ID and LUN setting:

- Select the CHS and SCSI port, and select the target SCSI ID to the port.
- Select the LUN for the selected ID, and select the CU# and LDEV# to be assigned to the LUN
- Repeat the above procedure as needed.

Note 1 : It is possible to refer to the setting contents of already being set on the SVP display.
Note 2 : The above setting can be done during on-line.
Note 3 : Duplicated access paths' setting from the different hosts to the same LDEV is allowed. This will provide a means to share the same volume among host computers. It is, however, the host responsibility to manage an exclusive control on the shared volume.

Copyright ©1998, Hitachi, Ltd.

3.9 FIBRE Volume Setting

3.9.1 Setting of FIBRE volume space

The procedure of FIBRE volume setting is same as SCSI LDEV space setting and performed either by using the SVP or Remote Console function (optional feature).

3.9.2 LUN setting

- LUN setting:

- Select the CHF, FIBRE port and the LUN, and select the CU# and LDEV# to be assigned to the LUN
- Repeat the above procedure as needed.

Note 1 : It is possible to refer to the setting contents of already being set on the SVP display.
Note 2 : The above setting can be done during on-line.
Note 3 : Duplicated access paths' setting from the different hosts to the same LDEV is allowed. This will provide a means to share the same volume among host computers. It is, however, the host responsibility to manage an exclusive control on the shared volume.

Refer to the INSTALLATION SECTION for more detailed procedures.

Copyright ©1998, Hitachi, Ltd.

4 CONTROL FUNCTION

4.1 Cache Usage

The DKC has two independent areas of non-volatile cache memory for the mainframe volumes. This mechanism also commonly applies to the SCSI volumes without any distinction. Thus, the high reliability and high performance realized by the following features can be commonly applied to the SCSI volumes.

① Cache data management by LRU control

Data that has been read out is stored into the cache and managed under LRU control. For upright transaction processing, therefore, a high cache hit ratio can be anticipated and a data-writing time reduced for improved system throughput.

② Adoption of DFW (DASD Fast Write)

At the same time that it writes data into the cache, the normal write command reports the end of the write operations to a host. Disk writing of the data is asynchronous with host access. The host, therefore, can execute the next process without waiting for the end of disk writing.

③ Write data duplexing

The same write data is stored into the two areas of cache provided in the DKC. Thus, loss of DFW data due to even one failure in the cache can be avoided.

④ Nonvolatile cache

The cache in the DKC is non-volatile by battery backup. Once data has been written into the cache, its non-volatility will maintain the data, even if a power interruption occurs. Under a standard system configuration having a fully charged battery pack, data is guaranteed for at least 48 hours.

Copyright ©1998, Hitachi, Ltd.

4.2 SCSI Command Multi-processing

4.2.1 Command Tag Queuing

The Command Tag Queuing function defined in SCSI specification is supported. This function allows each SCSI port on CHS to accept a multiple SCSI commands even for the same LUN. The DKC can process those queued commands in parallel because a LUN is composed of a multiple physical disk drives.

4.2.2 Concurrent data transfer

The four SCSI ports on a CHS can perform the host I/Os and data transfer with maximum 20 MB/sec by FAST/WIDE transfer and with maximum 40MB/sec by Ultra/WIDE transfer concurrently. This is also applied among the different CHSs.

Copyright ©1998, Hitachi, Ltd.

5 SCSI Commands

The DASD commands defined under the SCSI-2 standards and those supported by the DKC are listed in Table 5-1.

Table 5-1 SCSI-2 DASD commands and DKC-supported commands

Group	Op Code	Name of Command	Type	×:Supported	Remarks

6 HMDE (Hitachi Multiplatform Data Exchange)

6.1 Overview

The Hitachi Multiplatform Data Exchange (HMDE) optional feature provides a function to enable the SAM files of the mainframe to be accessed by the open system host by executing the File Access Library (FAL) program or File Conversion Utility (FCU) program installed in the open system host. Main frame files which can be accessed are limited to the SAM files only.
The FCU program has code conversion function between EBCDIC and ASCII.
The FAL has disclosed API and users can incorporate the FAL program directly into a user program.
This optional feature is supplied as a program product (P.P.) that consists of the following programs:

1) File Access Library program
- C language functions and a Header file for incorporation into a user program

2) File Conversion Utility program
- An execution-format utility program that contains the access library

The program product is supplied separately for each platform of the open system. Table 6-1 lists platforms supported for using the HMDE.

Table 6-1 Platforms supported

#	Platform supported	OS	Window System
1	SUN	Solaris 2.5, 2.6, 7	Motif 1.2
2	HP	HP-UX 10.2, 11.x	Motif 1.2
3	IBM	AIX 4.1.4 or 4.2 or 4.3	Motif 1.2
4	(Not specified)	WindowsNT4.0	MFC
5	DEC	Digital UNIX V4.0	Motif 1.2
6	NCR	UNIX SVR4 3.01	Motif 1.2
7	SEQUENT	DYNIX/ptx v 4.4.4	Motif 1.2

Note : Solaris 7 is available in DKCMAIN 52-42-45 or later.

Copyright ©1998,2000, Hitachi, Ltd.

6.2 Installation

(1) Installation of P.P.
For the method of installing the P.P. (containing FAL and FCU) and its detailed specifications, refer to the manual attached to the P.P.

(2) HMDE volume setting
Volumes whose emulation type is 3390-3A, 3390-3B, 3390-3C, 3380-KA, 3380-KB and 3380-KC can be used for the HMDE operations. In addition to being accessible as 3390-3 type volumes from the mainframe host in the same manner as before, the 3390-3B type volumes permit read-only access from the open system host.
The 3390-3A type volumes can be accessible as 3390-3 from the mainframe host and permit read and write access from the open system host. The 3390-3C can be read only accessible as 3390-3 from mainframe host and permit read and write access from the open system host. The 3390-3C permit create and update of VTOC.
The 3380-KB can be accessible as 3380-K from the mainframe host and permit read-only access from the open system host. The 3380-KA can be accessible as 3380-K from the mainframe host and permit read and write access from the open system host. The 3380-KC can be read-only accessible as 3380-K from mainframe host and permit read and write access from the open system host. The 3380-KC permit create and update of VTOC.

Table 6-2 HMDE volume specifications

#	Volume attribute	Emulation Type	Access right		Remarks
			Mainframe	Open system	
1	Mainframe volume	3390-3A	R/W	R/W	HMDE volume
2		3390-3B	R/W	R	HMDE volume
3		3390-3C	R	R/W	HMDE volume
4		3380-KA	R/W	R/W	HMDE volume
5		3380-KB	R/W	R	HMDE volume
6		3380-KC	R	R/W	HMDE volume
7	SCSI volume	OPEN-3	(Backup/Restore)	R/W	-
8		OPEN-8	(Backup/Restore)	R/W	-
9		OPEN-9	(Backup/Restore)	R/W	-
10		OPEN-K	(Backup/Restore)	R/W	-

The 3390-3A, 3390-3B, 3390-3C, 3380-KA, 3380-KB and 3380-KC type HMDE volumes can be set during initial installation or LDEV addition. To use volumes used by the mainframe and/or SCSI as the HMDE volumes they must be set as the HMDE volumes by removing the corresponding ECC group once and then adding them again.
This procedure is the same as the ordinary one for setting emulation type of another drive.

The drive emulation type can be changed between 3390-3 and 3390-3A and 3390-3B and 3390-3C by change emulation operation. It is same for 3380-K and 3380-KA and 3380-KB and 3380-KC.

Copyright ©1998,1999, Hitachi, Ltd.

(3) Setting from the open system host

- To access the HMDE volumes from the open system host, it is necessary to define connection to the open system host and to set an SCSI path. The method of defining the SCSI path for the open system host is the same as that of the ordinary SCSI path definition with the SVP.
- Refer to the manual attached to the P.P. for the method of setting the open system host to enable it to access the HMDE volumes. This setting operation requires labeling of the HMDE volumes, for example.

6.3 Notes on Use

Alike the ordinary mainframe volumes, the 3390-3B, 3390-3A, 3380-KB and 3380-KA type HMDE volumes can be accessed from the mainframe. The 3390-3C and 3380-KC type HMDE volumes can be read only accessed without VTOC area from the mainframe.
If the SCSI path are not defined for 3390-3A/B or 3380-KA/B, the volume can not be accessed from the open system host.

Copyright ©1999, Hitachi, Ltd.

7 HMBR (Hitachi Multiplatform Backup/Restore)

7.1 Overview

The Hitachi Multiplatform Backup/Restore (HMBR) optional feature provides a function to enable a mainframe host to backup a open system volume on the DKC disk subsystem by reading it by a volume unit. It also enables a mainframe host to restore the backup data onto the open system volume.

Any special additional software packages are not required to perform these functions on both mainframe host and open system host. Because, the DKC disk subsystem can convert the different data block format between open system (fixed block length data) and mainframe system (CKD format data).
The HMBR has the following features:

(1) Enabling mainframe host to backup open system data under the DKC Multiplatform disk subsystem by utilizing backup/restore programs, such as “DFHSM and DFDSS” or “DFSMShsm and DFSMSdss”, with a Logical Unit volume unit, and to restore it from the mainframe to the Logical Unit.

(2) Performing backup and restore with high data transfer rate of ESCON 17 MB/s between mainframe host and the DKC disk subsystem.

(3) Providing the open systems with powerful backup functions being used on mainframe systems, such as backup generation management, primary/secondary duplication management, and automatic backup control.

(4) Offering various backup media to the system, such as disk drives, magnetic tapes, or magnetic tape libraries.

Copyright ©1998, Hitachi, Ltd.

7.2 System Configuration

A system configuration example and functional overview are shown in the Fig. 7-1.

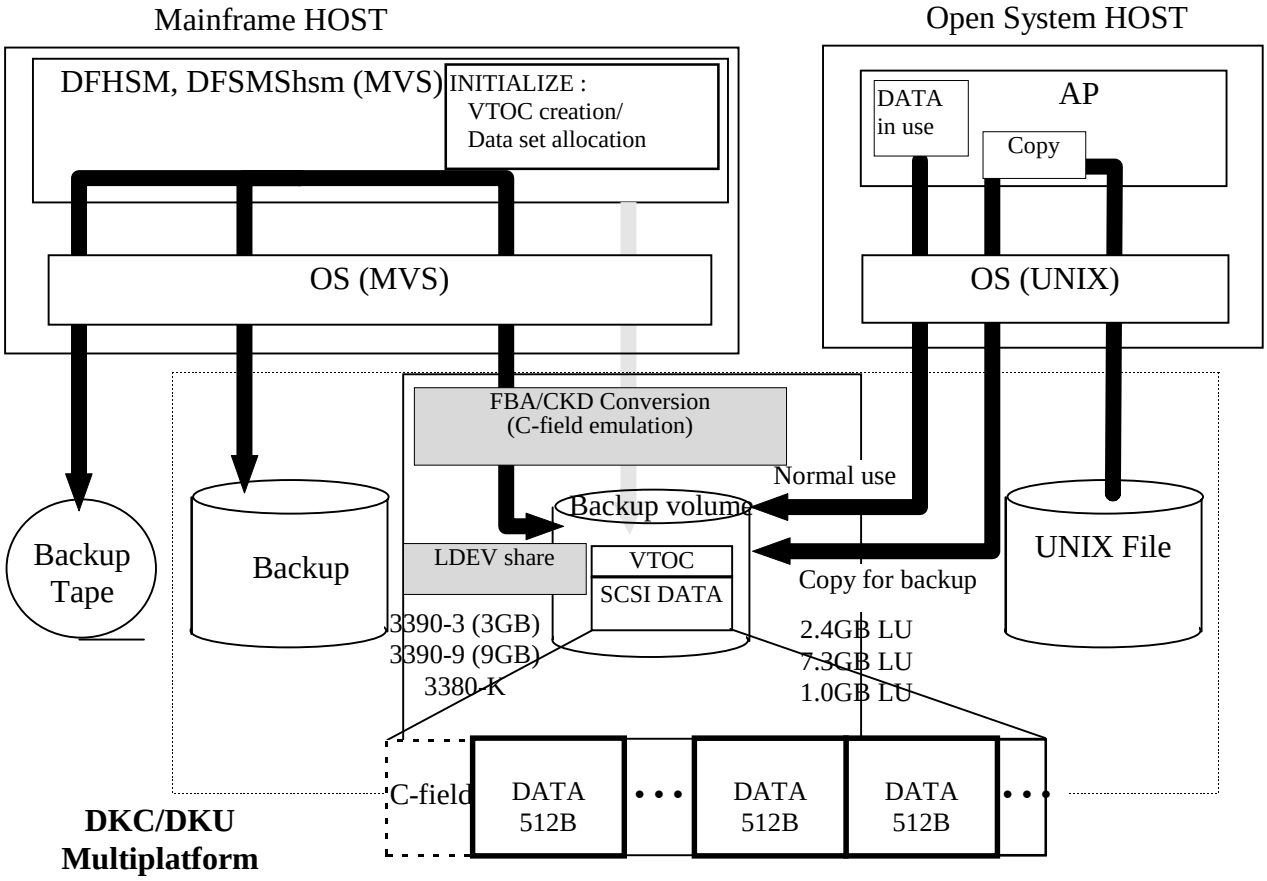

Fig. 7-1 System configuration example

Copyright ©1998, Hitachi, Ltd.

7.3 Basic Specification

The basic specification of HMBR is shown in the Table 7-1.

Table 7-1 Basic specification of HMBR

No	Item		Specification			Remarks
1	Attached system	Mainframe	MVS/ESA			
2		Open system	SUN (Solaris 2.5) or later HP (HP-UX 10.x) or later IBM (AIX 4.1.4) or later WindowsNT4.0 DEC (Digital UNIX V4.0) NCR (UNIX SVR4 3.01)			
3	Backup software	Mainframe	DFHSM, DFDSS DFSMShsm, DFSMSdss			
4	Device type	Mainframe	3390-3	3390-9	3380-K	
5		Open system	OPEN-3 (LUN=2.4GB)	OPEN-8/9 (LUN=7.3GB)	OPEN-K (LU=1.9GB)	
6	Maximum number of volumes for backup/restore		- As many Logical Units as specified for OPEN-3/9/K for Open system.			
7	Setup for backup volume		- By installing HMBR option (on SVP), all Logical Units defined as OPEN-3/8/9/K can be accessed from MVS - Refer to item #16 for restrictions to the access from MVS.			
8	Preparation before taking backup	VSN, VTOC creation	- DSF (INIT)			
9		Dataset allocation	- IEFBR14			
10	Backup method		- Volume full tracks dump by using DFDSS and DFSMSdss.			
11	VTOC format		- Standard VTOC. Note: Do not use SMS for backup volumes since Index VTOC is used in SMS.			
12	VTOC allocation		- Cylinder 0, Head 1 to 14 (fixed location)			
13	Data set allocated	# of data sets	- One/VOL	- Three/VOL	- One/VOL	
14		Extent	- Cylinder 1, Head 0 to User cylinder MAX.			
15	Restrictions for mainframe side utility programs		- Other utility programs than listed above are not allowed. - For Write type commands, other than those used by the above listed utility programs are rejected. (Only FORMAT WR with 16KB data length is allowed for write type command.) Read or Control type commands can be used. - Verify option is not allowed.			

Copyright ©1998,1999, Hitachi, Ltd.

7.4 Backup Volume Specification

1) Setup for Backup Volume
   Step-1 : Install the HMBR option to the DKC by using SVP. Refer to the option install procedure described in SVP section. (SVP05-10)
   Step-2 : By installing the option above, all the SCSI Logical Units (OPEN-3, OPEN-8, OPEN-9 and OPEN-K type), already installed or newly installed, will be ready to be used for backup/restore from the mainframe host.

   Note-1 Immediately after the HMBR option is de-installed, an access from the mainframe to OPEN-3, OPEN-8, OPEN-9 or OPEN-K will be rejected.
   Note-2 The Logical Unit and data stored on it, which has been used before installing HMBR option, can be used continuously for its original use and/or for backup/restore purpose.

2) Access to Backup Volume
   The specification applied to accessing the backup volume is shown in the Table 7-2.

Table 7-2 Specification of accessing the backup volume

No	Items	Specification
1	Volume type	- OPEN-3 (2.4GB), OPEN-8 (7.3GB), OPEN-9 (7.3GB), OPEN-K (1.9GB)
2	Access from Open system	- No restriction.
3	Access from mainframe host	- Possible to Read/Write as 3390-3 for OPEN-3 as 3390-9 for OPEN-8/9 and as 3380-K for OPEN-K. - For Write type commands, only the following command is allowed: - Format Write with data length of 16 KB. - Other write type commands are rejected.

7.5 Restriction

A method of backup and restore for WindowsNT system data is shown in the following.

(1) Backup
   (a) Delete drive letter to the Logical Units by Disk Administrator.
   (b) Re-allocate drive letter to the Logical Units by Disk Administrator.
   (c) Backup WindowsNT system data by mainframe host.
(2) Restore
   (a) Delete drive letter to the Logical Units by Disk Administrator.
   (b) Restore it from mainframe host to the Logical Units.
   (c) Re-allocate drive letter to the Logical Units by Disk Administrator.

Copyright ©1998,1999, Hitachi, Ltd.

8 SCSI HA Software Linkage Configuration in a Cluster Server Environment

When this subsystem is linked to High-Availability software (HA software) which implements dual-system operation for improved total system fault-tolerance and availability, the open system side can also achieve higher reliability on the system scale.

8.1 Example of System Configurations

(1) Hot-standby system configuration
The HA software minimizes system down time in the event of hardware or software failures and allows processing to be restarted or continued. The basic system takes a hot-standby (asymmetric) configuration, in which, as shown in the figure below, two hosts (an active host and a standby host) are connected via a monitoring communication line. In the hot-standby configuration, a complete dual system can be built by connecting the SCSI buses of the active and standby hosts to different CHS SCSI ports.

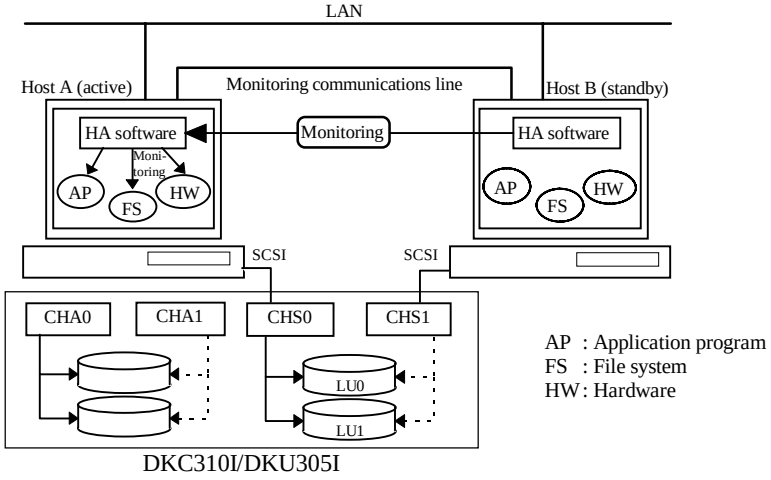

Figure 8-1 Hot-standby configuration

• The HA software under the hot-standby configuration operates in the following sequence:

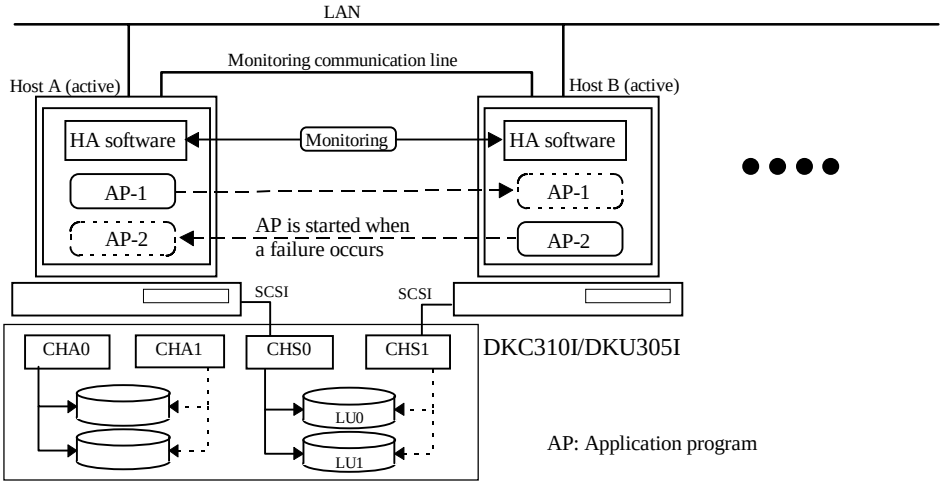
a. The HA software within the active host monitors the operational status of own system by using a monitoring agent and sends the results to the standby host through the monitoring communication line (this process is referred to as "heart beat transmission"). The HA software within the standby host monitors the operational status of the active host based on the received information.
b. If an error message is received from the active host or no message is received, the HA software of the standby host judges that a failure has occurred in the active host. As a result, it transfers management of the IP addresses, disks, and other common resources, to the standby host (this process is referred to as "fail-over").
c. The HA software starts the application program concerned within the standby host to take over the processing on behalf of the active host.

Copyright ©1998, Hitachi, Ltd.

- Use of the HA software allows a processing request from a client to be taken over. In the case of some specific application programs, however, it appears to the client as if the host that was processing the task has been rebooted due to the host switching. To ensure continued processing, therefore, a login to the application program within the host or sending of the processing request may need to be executed once again.

(2) Mutual standby system configuration

In addition to the hot-standby configuration described above, a mutual standby (symmetric) configuration can be used to allow two or more hosts to monitor each other. Since this subsystem has eight SCSI ports, it can, in particular, be applied to a large-scale cluster environment in which more than two hosts exist.



- In the mutual standby configuration, since both hosts operate as the active hosts, no resources exist that become unnecessary during normal processing. On the other hand, however, during a backup operation the disadvantages are caused that performance deteriorated and that the software configuration becomes complex.
- This subsystem is scheduled to support VERITAS Software FirstWatch, Hewlett-Packard MC/ServiceGuard, and IBM HACMP.

Copyright ©1998,1999, Hitachi, Ltd.

8.2 HA Software

This subsection describes about HA configuration with SCSI I/F and FIBRE I/F.
The following list shows alternate link and HA software for each hosts. It is necessary to set Host Mode by using SVP, when changing a host system.
The meaning of each mode are follows.

MODE 00 : standard mode (FAST)	MODE 10 : standard mode (ULTRA)
MODE 01 : I-7135 host mode (FAST)	MODE 11 : I-7135 host mode (ULTRA)
MODE 02 : NCR host mode (FAST)	MODE 12 : NCR host mode (ULTRA)
MODE 03 : Do not use.	MODE 13 : Do not use.
MODE 04 : Page 80h, 83h (FAST)	MODE 14 : Page 80h, 83h (ULTRA)
MODE 08 : HP host mode (FAST)	MODE 18 : HP host mode (ULTRA)
MODE 09 : VxVM-DMP mode (FAST)	MODE 19 : VxVM-DMP mode (ULTRA)

MODE 0C : PC Server host (Microsoft Cluster Server) mode (FAST)
MODE 1C : PC Server host (Microsoft Cluster Server) mode (ULTRA)
MODE 0A : Netware host mode (FAST)
MODE 1A : Netware host mode (ULTRA)
others : Reserved

Please see “SCSI I/F Configuration” (INST05-591 to INST05-599). Also see the operational manual for more detailed information about the alternate link and HA software.

Copyright ©1999, Hitachi, Ltd.

Table 8-1 Features of HA software (SCSI)

Host system	Sun	HP	IBM
OS	Solaris 2.5/2.6	HP-UX 10.2/11.0	AIX 4.1.4/4.2
Server	Ultra Enterprise series SPARC series	HP9000 server HITACHI9000V server	RS/6000
Maximum LUNs without I/O Path Switch	120LUN/path 1024LUN/RAID	120LUN/path 1024LUN/RAID	120LUN/path 1024LUN/RAID
Maximum LUNs with I/O Path Switch	120LUN/path 1024LUN/RAID	120LUN/path 1024LUN/RAID	21LUN/path 762LUN/RAID
Maximum concurrent active LUNs without LUSE volume	64LUN/path	64LUN/path	64LUN/path
Maximum concurrent active LUNs with LUSE volume	16LUSE LUN + 16nonLUSE LUN/path	16LUSE LUN + 16nonLUSE LUN/path	16LUSE LUN + 16nonLUSE LUN/path
Alternate Link (Host Mode)	—	Alternate-Link (MODE : 00/10 or 08/18) *2	I-7135 emulation (MODE : 01/11)
HA software	First Watch *1	MC/Service Guard *1 (MODE : 08/18) *2	HACMP *1

NCR	Sequent	PC server
SVR4	Dynix PTX	Windows NT 4.0
World Mark server	NUMA-Q	PC server
—	120LUN/path 1024LUN/RAID	120LUN/path 1024LUN/RAID
12LUN/path 192LUN/RAID	56LUN/path 168LUN/RAID 21LUN/server	120LUN/path 1024LUN/RAID
12LUN/path	64LUN/path	64LUN/path
12LUN/path	16LUSE LUN + 16nonLUSE LUN/path	16LUSE LUN + 16nonLUSE LUN/path
RDAC *1 *3 (MODE : 02/12)	MULTIPASS (MODE : 04/14)	—
—	Cluster Control S/W *1	Microsoft Cluster Server (MODE : 0C/1C) *4

*1 It is necessary to purchase these software in addition to the operating system.
*2 HOSTMODE 08 or 18 is available in DKCMAIN 52-40-xx or higher.
*3 RDAC must be installed to NCR server and HOSTMODE of related port must be set to 02 or 12 when DKC310 is connected to NCR.
Maximum concurrent active LUNs : Maximum number of LUNs which I/O jobs can be executed concurrently
*4 Apply this mode from DKCMAIN version of 52-42.

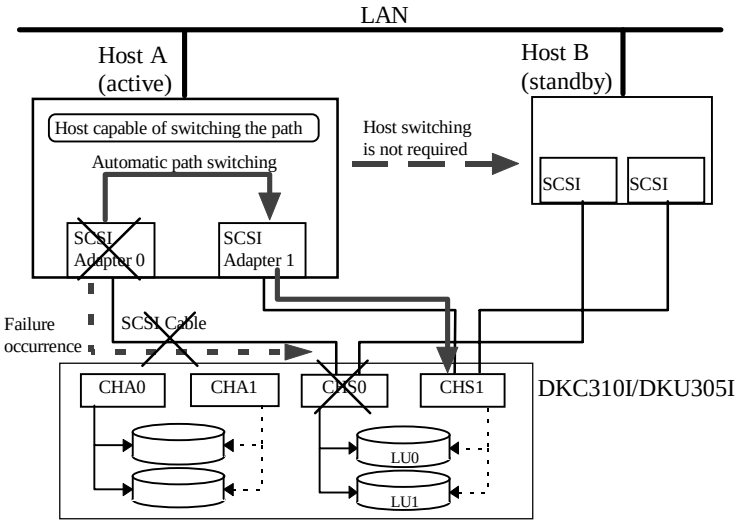
8.3 Configuration Using Host Path Switching Function

When the host is interlocked with the HA software and has a path switching capability, if a failure occurs in the SCSI adapter, SCSI cable, or DKC (SCSI ports and the CHS) that is being used, automatic path switching will take place as shown below.



The path switching function enables processing to be continued without host switching in the event of a failure in the SCSI adapter, SCSI cable, array controller, or other components.

Copyright ©1998, Hitachi, Ltd.

8.4 Procedures for online microprogram exchange and CHS/CHF replacement using alternate path

8.4.1 Outline

The alternate path function enables a microprogram exchange and a CHS/CHF replacement without stopping an I/O operation of the host connected to the CHS and CHF (that is, online exchange/replacement).

8.4.2 Prior confirmation of alternate path

An alternate path must be correctly established and the path switching must function at the time of exchange/replacement in order to exchange a microprogram or replace the CHS/CHF during online operation. Confirm the path state by asking an SE concerned or a customer.
See "Procedures for Confirming Alternate Path State and Recovering It" shown in Table 1.

8.4.3 Types of microprogram exchange

For HP-UX, Solaris, and Windows NT:	STOP SCSI mode
For AIX:	Alternate SCSI Path mode

8.4.4 Notes on the exchange/replacement executed on AIX

Concerning the microprogram exchange:	Manual transfer (host operation) of LDEV owner's right is required.
Concerning the CHS/CHF replacement:	Manual transfer (host operation) of LDEV owner's right may be required.

8.4.5 Restrictions

(1) Online exchange/replacement is possible only when the alternate path is correctly set.
(2) Online exchange/replacement is possible when both primary and alternate paths are normal. If the path state is abnormal, recover it to be normal, then perform the online exchange/replacement.
(3) An alternate path function cannot be used with respect to HMDE volume.
Disable I/Os to the HMDE volume concerned when exchanging a microprogram or replacing the CHS/CHF.
(4) Disable I/Os to the LDEV for which the alternate path is not set.
(5) The microprogram exchange on HP, SUN, or Windows NT is executed in the Stop SCSI mode and on AIX, in the Alternate SCSI Path mode. When HP, SUN, or Windows NT and AIX coexist on the same DKC, determine the mode to be either the Stop SCSI mode or the Alternate SCSI Path mode in which to exchange a microprogram, and disable I/Os of a platform in the other mode before exchanging a microprogram.
(6) In the case of the Dual Active configuration, a load may concentrate on one of the two paths during the microprogram exchange or CHS/CHF replacement. Take preventive measures against it such as to choose a period (time zone) when the host load is low to perform the online exchange/replacement.
(7) In the 7135 emulation mode, when the DKC power was turned off and then on, confirm the status of the 7135 controller using the "smit" command. If it is not ACTIVE, the "diag" command must be executed.

Table 1 Procedures for Confirming Alternate Path State and Recovering It (1 of 2)

No.	Platform	Alternate path state confirmation procedure	Recovery procedure
1	HP	Display and confirm the path states (Pstates) of all the devices (LUs) by the "vgdisplay-v" command. If "PV Name" is displayed as Alternate Link, the path has been switched to the alternate path.	Automatic recovery Display and confirm the path states (Pstates) of all the devices (LUs) by the "vgdisplay-v" command.
2	Sun	Display and confirm the path states (Pstates) of all the devices (LUs) by the "safemt-d all" command of SafePath. Perform one of the following operations depending on the path state. • Failed: The path is faulty. (Or, after the microprogram exchange or CHS/CHF replacement, the path concerned has not been recovered yet.) After recovery from the failure, check it again according to this procedure. • Other states (Active and Standby, or Downed): After recording this state, execute the microprogram exchange or CHS/CHF replacement. Note: If there is at least one failed path, do not execute the online microprogram exchange or CHS/CHF replacement. Be sure to execute the exchange or replacement after recovering the failure.	Step ①: Display and confirm the path state (Pstate) of each device (LU) by the "safemt-d all" command of SafePath. Perform one of the following operations depending on the path state. • Downed: The path has been recovered but is not used. Go to steps ② and ③ to make the path usable. • Active and Standby: The state is normal. Steps ② and ③ are not required (that is, end of the procedure). • Failed: The path is faulty. After the microprogram exchange or CHS/CHF replacement, execute the procedure again from step ① after the path is recovered. Or, recover the path failure, then execute the procedure again from step ①. Step ②: Make the path in the Downed state usable by the "safemt - r *n*" command. Format: safemt -r *n* *n* is the channel number (a number which follows "c" of the target "cnt0d0s0" in the Downed state). It is enough if the above is executed once for the same *n*. Step ③: Confirm that all the paths are in the Active or Standby state (initial state) by the "safemt -d all" command. If the path in the Downed state remains, execute the procedure again from step ②.

Copyright ©1998, Hitachi, Ltd.

Table 1 Procedures for Confirming Alternate Path State and Recovering It (2 of 2)

No.	Platform	Alternate path state confirmation procedure	Recovery procedure
3	Windows NT	Open the "SafePath Administrator" and confirm the path states of all the devices (LUs). Perform one of the following operations depending on the path state. • Active and Standby: The state is normal. After recording this state, execute the microprogram exchange or CHS/CHF replacement. • Failed: The path is faulty. (Or, the path concerned has not been recovered yet after the microprogram exchange or CHS/CHF replacement.) After recovering the failure, confirm the state again according to this procedure. • Other states: After returning the state to the Active and Standby, record the state, and execute the microprogram exchange or CHS/CHF replacement. Note: If there is at least one failed path, do not execute the online microprogram exchange or CHS/CHF replacement. Be sure to execute the exchange or replacement after recovering the failure.	Open the "SafePath Administrator" and perform the operation according to the following procedures. Step ①: Confirm the state of each path. Perform one of the following operations depending on the path state. • Active and Standby: The path has been recovered. Go to step ②. • Failed: The path is faulty. After the microprogram exchange or CHS/CHF replacement, execute the procedure again from step ① after the path is recovered. Or, recover the path failure, then execute the procedure again from step ①. Step ②: Select the Rebalance command (Rebalance in the Tools menu). With this, confirm that the state has returned as it was before the microprogram exchange or CHS/CHF replacement.
4	AIX	Confirm by the "smit" command using the "Device" - "Disk array" - "RAIDiant disk array" - "Disk array rooter configuration" - "List disk array rooter configuration" menu. If the state has been changed from "Active" to "Reset" and "Passive", a failure has occurred in the path.	Issue the "Diag" command, select resources which is in the Reset and Passive state from "Diagnostic Routines" - "System Verification" - "Diagnostic Selection" by the commands on the left and commit them.

Copyright ©1998, Hitachi, Ltd.

8.4.7 Exchange CHF for CHT

Procedure to exchange CHF for CHT in DKC is shown in the following.

<SUMMARY>
It is possible to exchange CHF for CHT by doing De-install of CHF in DKC, and doing Install CHT for the equal location.

Note
Because definition information of HORC, HOMRCF and LUN Security can not be collected backup data, write it down in a notes and so on.

<DETAILED PROCEDURE>
STEP1. Verify microprogram version and perform microprogram version up to 52-38-77 or later.
STEP2. Take the backup data of SCSI path definition information in HD of SVP.
Select the [OK] button in SCSI Path-LDEV Configuration window.
Select [OK] in response to the confirmation message “Do you want to make backup files SCSI path information?”

STEP3. Because definition information of HORC, HOMRCF and LUN Security can not be collected backup data, write it down in a notes and so on.

STEP4. Delete SCSI path definition of CHF that is exchanged for CHT. And you must not collect backup data of SCSI path definition information in HD and FD.

Note **The reason for not colecting the back-up in HD and FD.**
At this step backup data of SCSI path definition Information of STEP 2 is collected in HD and FD. And the substitute saving backup data in HD and FD would not be performed in order to preserve backup data in HD and FD. When you collect backup data, backup data of SCSI path definition Information in point of time which collect backup data.

Note **How to avoid to collect backup data**
1. Select [OK] in response to the confirmation message “Please insert config FD in FDD”.
2. Select [Cancel] in response to the confirmation message “Back up is failed. Please insert correct FD” without inserting config FD in FDD.

STEP5. Perform De-install for the CHF with leaving more than a pair of PCB (CHA, CHS, CHF, CHT). Because All PCB in DKC310 can not be performed De-install for. And you must not collect backup data of SCSI path definition information in HD and FD.

STEP6. Install the CHT to the location that the De-installed CHF was installed to. And you must not collect backup data of SCSI path definition information.

Copyright ©2000, Hitachi, Ltd.

STEP7. Restore SCSI path definition information in SCSI Path-LDEV Configuration window. And collect backup data in HD and FD.

STEP8. If definition information of HORC, HOMRCF and LUN Security are written down in a notes and so on, set up definitions of that by descriptions that definition information of HORC, HOMRCF and LUN Security are written down in.

<Example of exchanging CHF for CHT is following>

1. The case in which more than a pair of CHF and more than a pair of PCB (CHA, CHS, CHT) are installed in DKC310
   ① Performed De-install for more than two pair of CHF at once.
   ② Install number CHT equal to De-installed CHF to the location that the De-installed CHF was installed to at once.
2. The case in which more than two pair of CHF are installed in DKC310.
   ① Execute STEP1, STEP2 and STEP3.
   ② By leaving a pair of CHF, delete SCSI path definition of all other CHF. And perform De-install for that.
   ③ Install number CHT equal to De-installed CHF in ② to the location that the De-installed CHF was installed to at once.
   ④ Delete SCSI path definition of leaving a pair of CHF in ② and perform De-install for that.
   ⑤ Install a pair of CHT to the location that the pair of De-installed CHF in ④ was installed to.
   ⑥ Execute STEP7 and STEP8.

Note You must not collect backup data of SCSI path definition information in ② to ⑤.

3. The case in which only a pair of CHF is installed in DKC310, procedure is shown as following.
   ① Prepare a pair of dummy PCB (CHA, CHS, CHF, CHT).
   ② Execute STEP1, STEP2 and STEP3.
   ③ Install a pair of dummy PCB that is prepared in ① to empty location.
   ④ Delete SCSI path definition of the pair of CHF that is installed form beginning and perform De-install for it.
   ⑤ Install a pair of CHT to the location that the pair of De-installed CHF in ④ was installed to.
   ⑥ Perform De-installation for the pair of dummy PCB.
   ⑦ Execute STEP7 and STEP8.

Note You must not collect backup data of SCSI path definition information in ③ to ⑥.

Copyright ©2000, Hitachi, Ltd.

9. Multiplatform installation procedure

9.1 Product category

(1) Multiplatform : any configuration permitted.
CHA only,CHA+CHS,CHA+CHF,CHA+CHS+CHF,CHS only,CHF only,CHS+CHF

(2) Open only : open configuration permitted, mainframe configuration not permitted.
CHS only,CHF only,CHS+CHF

Table 9-1 Multiplatform product category

No	Product category	Configuration
1	Multiplatform	Channel only
2		CHA+CHS
3		CHA+CHF
4		CHA+CHS+CHF
5		SCSI only
6		FIBRE only
7		SCSI+FIBRE
8	Open only	SCSI only
9		FIBRE only
10		SCSI+FIBRE

(3) FD configuration

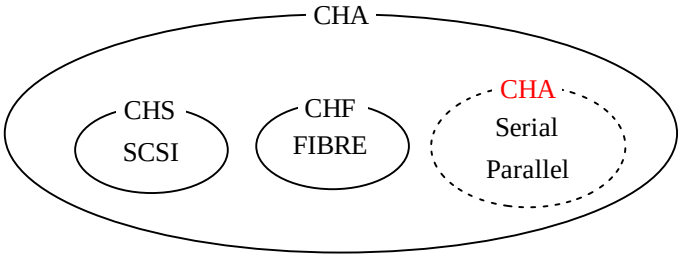
Table 9-2 FD configuration of Multiplatoform and Open only product

FD Kind	Multiplatform		Open only		
	# of FD	FD No.	difference	# of FD	FD No.
Setup installer	1	1	←	1	1
DKCMAIN	12	2-13	←	12	2-13
SVP	3	14-16	←	3	14-16
LCP/MCP/LCDG	1	17	←	1	17
CUDG4	1	18	←	1	18
DKU306/DKU308 /DKU309/DKU3F1	3	19-21	←	3	19-21
SSVP	1	22	←	1	22
RAM BOOT	1	23	←	1	23
CONFIG	1	24	Open only configuration support	1	24

Copyright ©1998, Hitachi, Ltd.

(4) Terminology

-CHS is abbreviation of CHA for SCSI and CHF is abbreviation of CHA for FIBRE.
-8 port SCSI adapter DKC-F310I-8C is one kind of channel option of DKC310.
-4 port FIBRE adapter DKC-F310I-4F is one kind of channel option of DKC310.
-8 port SCSI adapter is called as “CHA” or “CHS”.
-4 port FIBRE adapter is called as “CHA” or CHF“.
-“CHS” is used in this manual to point SCSI adapter especially.
-“CHF” is used in this manual to point FIBRE adapter especially.
-“CHA” is used for general term for channel adapter in this manual.
-“CHA” could be used to point ESCON or METAL mainframe channel adapter.



Copyright ©1998, Hitachi, Ltd.

(5) Note

(a) In most case, CHS and CHF will be blocked.
But if power events are reported for all installed PCBs, ignore and proceed with this procedure.
In new installation, the Disk Subsystem starts up with the configuration data stored on the FM of one representative MP. In this case, the configuration data of the representative MP may not equal to the physical configuration of the Disk Subsystem and some MPs might be blocked by PCB type unmatch and SIM Reference Code=ffe800 might be reported.
It is not problem but expected in Multiplatform new installation. If power events of all installed MPs are reported and SUB-SYSTEM ALARM LED is not lit, ignore MP being blocked and SIM Reference Code 3073xx, ffe800, ffe700 and proceed the procedure. The Define Configuration and Install procedure at step(34) will successfully complete and all installed MPs will become normal status.

(b) Don't forget to install RAID5 booster.
If RAID5 booster is not installed, WCHK1 might occer.
SSB EC=0008 will be reported one times per each blocked MP and SIM Reference Code=3992xx will be reported once per Disk Subsystem when RAID5 booster is not installed.

(c) DKC ready lamp control for CHS and/or CHF only configuration
-DKC ready lamp is lit at P/S on timing when all LDEV status become normal or correction access.
-DKC ready lamp will be lit after LDEV formatting for new installation.
-If some LDEV is blocked by some reason, DKC ready lamp will not be lit. Please recover the blocked LDEV at this case.
-DKC ready lamp turning off control is same as before. DKC ready lamp will not be off when LDEV become blocked.

9.3 Installation procedure

9.3.1 Kinds of installation

Table 9-3 Installation procedure

No	install category	product category	Base system	Target system	Procedure
	New installation	Multiplatform	-	CHA+CHS	See 9.3.3
			-	CHA+CHS+CHF	See 9.3.3
			-	CHA+CHF	See 9.3.3
		Open only	-	CHS	See 9.3.3
			-	CHF	See 9.3.3
			-	CHS+CHF	See 9.3.3
	Addition	Multiplatform	Mainframe only	CHS addition	See 9.3.2
			Mainframe only	CHF addition	See 9.3.2
			Mainframe only	CHS+CHF addition	See 9.3.2
			CHA+CHS	CHF addition	See 9.3.2
		Open only	CHS only	CHF addition	See 9.3.2

9.3.2 Addition of CHS or CHF

Installation procedure of CHS or CHF to existing Disk subsystem is shown below.

Step 1: Verify current microprogram version of the target Disk subsystem.
Step 2: Confirm correct microprogram version to be installed that supports CHS or CHF.
Step 3: Execute microprogram exchange according to the correct ECN.
Step 4: Install CHS or CHF.
Step 5: Install LDEV.
Step 6: Add SCSI path definition for CHS or CHF.
Step 7: Check the configuration, status and microprogram version of the Disk subsystem.
Step 8: Completion of work

Copyright ©1998, Hitachi, Ltd.

9.3.3 Multiplatform new installation

Multiplatform and Open only Subsystem can be installed by ordinary new installation procedure.
Go to page INST02-10 2.1 New Installation Procedure General Flow.

10 Note on ULTRA SCSI

DKC310 support ULTRA SCSI 40MB/sec data transfer. This section describes specification about ULTRA SCSI and how to use ULTRA SCSI transfer feature.

10.1 Condition

- DKC micro-program should support ULTRA SCSI. If not, micro-program should be changed.
- HOST MODE of SCSI port should be set to 0x1X by SVP to work the port in ULTRA mode.
- SCSI host should support ULTRA mode. Platform, operating system, SCSI host adapter, or some other setting should be suitable for ULTRA mode.

10.2 Micro-program level

DKCMAIN version	ULTRA SCSI
52-34-xx or lower	not supported
52-35-xx or higher	supported

10.3 Transfer mode by host and DKC SCSI port mode

host	DKC SCSI port	transfer mode
FAST	FAST	FAST
ULTRA	FAST	FAST
FAST	ULTRA	FAST
ULTRA	ULTRA	ULTRA

10.4 HOST MODE

- HOST MODE 0X : FAST transfer and emulation mode X
- HOST MODE 1X : ULTRA transfer and emulation mode X

Copyright ©1998, Hitachi, Ltd.

10.5 How to use ULTRA SCSI transfer feature

10.5.1 Procedure to use ULTRA SCSI

Step 1 : Confirm micro-program support ULTRA SCSI. If not, execute micro-program exchange to ULTRA SCSI support micro-program version.
Step 2 : Set HOST MODE of the SCSI port to ULTRA support mode 1X.
X should be determined by emulation mode.
Step 3 : Setup SCSI host for ULTRA transfer if necessary.

10.5.2 Example of ULTRA SCSI installation

(Example of Windows NT)

DKC	PC (Windows NT)
	Stop I/O and shutdown the PC.
Micro-program exchange HOST MODE set	
	Reboot PC. Set ULTRA mode by SCSI board utility. Restart I/O.

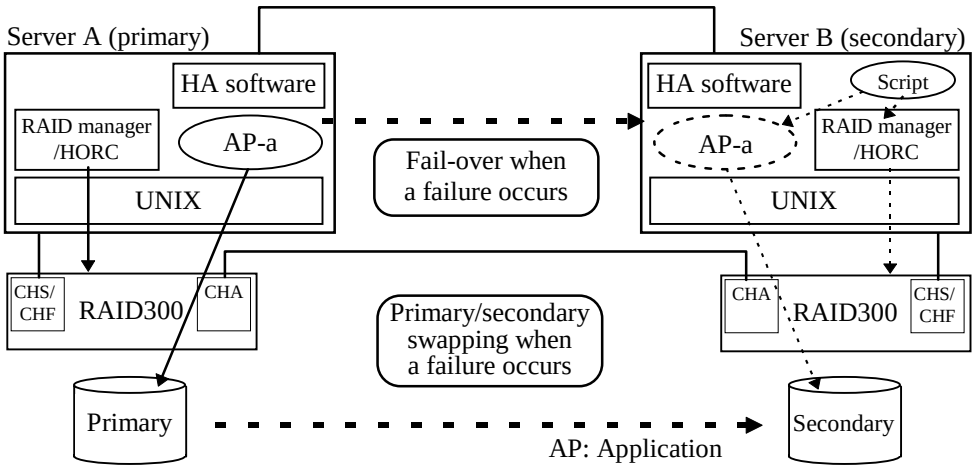
Copyright ©1998, Hitachi, Ltd.

11 HORC (Hitachi Open Remote Copy)

11.1 Overview

The Hitachi Open Remote Copy function can remotely duplicate data (volumes) under the control of the subsystem by directly connecting the two RAID300s. A backup system against disasters can be constructed by installing one of the two RAID300s at the main site and the other at the recovery site and configuring the HA cluster on the server side by means of the HA (High Availability) software. This function also enables the two volumes containing identical data to be used for different purposes by duplicating data (volumes) within the same RAID300 or between the two RAID300s and separating the volumes in a primary-and-secondary relation at any time.
An online database can be backed up or batch programs can be executed while the database is being accessed.
The HORC makes various settings and it controls operations by means of the RAID manager/HORC, which runs on the open system. The RAID manager/HORC provides various commands for user applications to control the HORC functions. Creation of a user shell script using these commands enables the HORC control being interlocked with server's fail-over executed by the HA software.

Outline of HORC Function and Example of Application to HA Configuration
(Hot Standby Configuration)



Copyright ©1998, Hitachi, Ltd.

11.2 Basic Specifications

Basic HORC specifications are shown below.

Basic Specifications of HORC

No.	Item	Description	Remarks
1	Host interface on open system side	Fast/Wide SCSI	
		Ultra/Wide SCSI	supporting for Win/NT only
		Fibre Channel	supporting for HP-UX, Solaris, Win/NT and AIX4.2
2	Supporting platform	HP-UX10.20, HP-UX11.0, Solaris2.5/2.6, AIX4.2, AIX4.3, Windows/NT 4.0, Digital UNIX V4.0 Dynix 4.4.4 Netware 4.11	
3	Connection between the CUs	ESCON	
4	Means for setting the paired LU	Command instruction from the RAID Manager/HORC	RAID Manager does not support for Netware
		Remote console	
		SVP	
5	Number of LUs capable of the duplicated writing	Maximum 1023 pairs	
6	LU size capable of the duplicated writing (The paired VOL must be the same DEV type.)	OPEN-3 (2.4GB)	
		OPEN-8 (7.3GB)	
		OPEN-9 (7.3GB)	
		LUSE	
		OPEN-K (1.8GB)	
		CVS Volume	
7	Duplicated writing mode	Synchronized	
8	Combination of the CUs	One-to-one correspondence N-to-one correspondence one-to-N correspondence	
9	Fence level	Data, Status, Never	Supports a function equivalent to the MF HRC.
10	Number of ESCON paths between the CUs	Maximum 4 paths per CU	
11	Multiple CUs support	Yes	For CU#0 through CU#3, HORC pairs can be created.
12	Control of the MF HRC and the open HRC in DKC mixture	Can be mixed	

Copyright ©1998,1999, Hitachi, Ltd.

(1) Means for setting the paired LU:
The following three means are provided.
- Command instruction from the RAID Manager/HORC
- Instruction from the remote console
- Instruction from the SVP

Not only the pairing but also a series of pair state changes are possible by using these three means. However, the user can use two means only: the command instruction from the RAID Manager/HORC and the instruction from the remote console.

(2) LU size capable of the duplicated writing:
OPEN-3, OPEN-8, OPEN-9 and LUSE are supported as the LU sizes capable of the duplicated writing. Provided that the paired VOL must be the same track format and same capacity.

(3) Fence level:
The HORC, alike the HRC, supports three types of fence level: Data, Status, and Never.

(4) Control of the HRC pairs and the HORC pairs mixture:
Control of the mixture of the HRC pairs and the HORC pairs is possible within the one DKC.

(5) R-VOL (secondary VOL) access:
① An RD access to the secondary VOL is permitted to accept the RD command issued to the label when the secondary server is started.
② In order to support the DataPlex function, write access to the secondary VOL is permitted on condition that the pair is being suspended.
Using the RAID Manager/HORC or SVP, you can indicate the permission of write operation to R-VOL. After this indication, if the server performs any write operation to R-VOL, in Pair Resync (Resume) operation all tracks on M-VOL will be copied to R-VOL.
If using SVP, the permission of write operation to R-VOL is executed by setting “R-VOL write Enable” on Suspend Pair display in the indication of R-VOL Suspend on MCU.
Also, you can confirm using RAID manager/HORC or SVP whether “R-VOL write Enable” on R-VOL is permitted or not.

(6) HMBR function for the HORC paired VOL
The HMBR function for the HORC pair is supported.
Note that restore from the mainframe for the HORC pair must be done after putting the pair state into the simplex state.
(This is because duplicated writing function on the main frame side for the OPEN VOL, which is in the pair state, does not exist)

Copyright ©1998,2000, Hitachi, Ltd.

◆Restrictions:

(1) Command device:

① The HORC provides users with a command to enable a state change and status display of the HORC pair from the server.

② Assign a special LUN called a command device so that the RAID300 can receive this pair state change and pair status display commands.

③ Users cannot use the command device. A command device with a capacity of 2.4GB within the subsystem cannot be used (when the OPEN3 is assigned as a command device). If you install the micro version supporting CVS function for Open volume, you can specify CVS volume as command device. In this case, the minimum capacity of command device is 36MB.

④ Use the SVP to specify the command device.

(2) Flashing updated data in the server

When the HORC is used as a DataPlex function, split the primary/secondary paired VOL. A Sync command or the like must be issued before splitting it and a file system buffer must be flashed when acquiring a backup from the secondary VOL. Thus, the latest backup can be acquired.

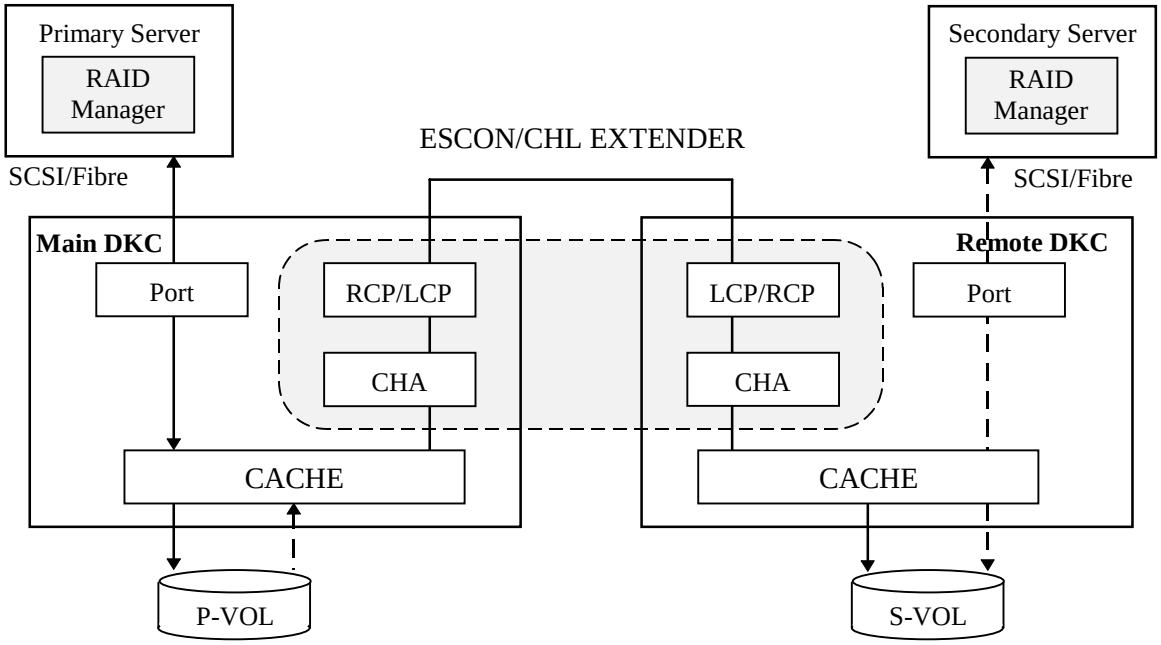
11.3 HORC Asynchronous

11.3.1 The outline of HORC ASYNC

- The asynchronous copy mode of HORC (HORC ASYNC) is supported in addition to HORC synchronous copy mode (HORC SYNC).
- The hardware for HORC ASYNC is the same as that for the existing HORC SYNC. Figure 1 shows the hardware for HORC ASYNC.
- In the same way as that of the HORC SYNC, various copying control is performed by use of the control logic micro-program of the MF ASYNC and the hardware configuration.
- To realize the asynchronous copying, a constituent element called consistency group is defined in the same way as that of the MF ASYNC.



Copyright ©2000, Hitachi, Ltd.

11.3.2 Product Specifications

Table 1 shows the product specifications summary.

Table11.3.2-1 Product Specifications

No.	Items	Contents	Remarks
1	Supported platforms	HP-UX WindowsNT Solaris AIX NetWare	RAID Manager is not supported for NetWare.
2	Host interface	SCSI/Fibre	Only Tachyon is available for Fibre interface.
3	Connection between MCU and RCU	ESCON, Channel extender	
4	The means of HORC pairs control	RAID Manager	
		Remote console	
		SVP	
5	The number of HORC pairs	Up to 1023 pairs	
6	Supported emulation types	OPEN-3	
		OPEN-9	
		OPEN-8	
		LUSE	
		OPEN-K	
		CVS	
7	Copy mode	SYNC, ASYNC	
8	Coexistence of M-VOL and R-VOL within a DKC	Yes	
9	The relation of MCU and RCU	1:1	
10	The number of connecting paths between MCU and RCU	up to 4 per CU	

(1) Consistency Group

- In the cases of the HORC and ASYNC, although a copying into the R-VOL is performed asynchronously with the host I/O, the consistency of the writing sequence extending over the multiple M-VOLs is assured (data written later will not be copied earlier). Further, a function for multiple pairs, such as that to suspend the multiple pairs retaining the consistency of the writing sequence when a failure occurs, is provided. A group of pairs which is an object to be controlled by the HORC and ASYNC like this is called a consistency group.
- The MCU and RCU support the multiple consistency groups. All the HORC and ASYNC pairs belong to one consistency group.
- The number of consistency groups is up to 16.

Copyright ©2000, Hitachi, Ltd.

(2) MCU and RCU
- The relation between the MCU and RCU is specified as 1:1. The relation of 1:1 means that one consistency group does not extend over the multiple MCUs or RCUs.
- Both the MCU and RCU must be the RAID300.

(3) The connections between MCU and RCU
- As the connection between the MCU and RCU, the ESCON direct connection (not longer than 43 km) and the extender connection (CNT Extender + communication line) are supported.
- The number of connecting paths between the MCU and RCU is up to four per CU.

(4) Host interface
- SCSI and fibre channel are supported. Concerning the fibre, Tachyon is supported.

(5) Supported emulation types
- The HORC ASYNC pairs can be created for OPEN-3, OPEN-9, OPEN-k, OPEN-8, LUSE, and CVS.
- Capacities of the M-VOL and R-VOL must be the same in the same way as that of the SYNC pairs.
- Any RAID level and the PDEV type are allowed.

(6) The number of pairs
- Up to 1023 pairs can be formed.

(7) Fence level
- The fence level existing in the current SYNC function does not exist in the ASYNC.
- In the case of the HORC ASYNC pair suspension, the same operation as that in the existing case of “Fence level = Never” is performed.

(8) Coexistence with the HORC SYNC functions
- The HORC SYNC function and the HORC ASYNC function can coexist in the MCU and RCU.
- The HORC ASYNC and SYNC cannot coexist for the same VOL.

(9) Coexistence with HOMRCF function
- Setting of the HOMRCF pair for the HORC ASYNC pair is possible on the conditions shown below.
- The main VOL of the HOMRCF can be set for the M-VOL and R-VOL of the HORC ASYNC pairs.
- When the HOMRCF is splitted, the M-VOL of the HORC ASYNC pair can be set for the remote VOL of the HOMRCF.

Copyright ©2000, Hitachi, Ltd.

(10) Coexistence with HRC ASYNC function

- Coexistence with the HRC ASYNC in the MCU and RCU is supported.
- However, it is necessary to use different consistency group for the HRC ASYNC pair and the HORC ASYNC pair respectively.
- The HRC ASYNC and HORC ASYNC can share the CU connection path in the same way as that of the current HORC SYNC. The side file is also shared.

12 Online LUN installation

12.1 Overview

Online LUN installation feature makes it enable to add LUNs to DKC310 SCSI ports or FIBRE ports while I/Os are still running.
Some host operations are required before the added volumes are recognized and become usable from SCSI or FIBRE host operating systems.

12.2 Specifications

(1) General

1) Onine LUN installation feature is supported for SCSI interface and FIBRE interface.
   Firefly, Superfly and Tachyon fibre adapter are available.
2) Online LUN installation is supported. Online LUN de-installation is not supported.
3) Online LUN installation can be used only for SCSI ports and FIBRE ports on which SCSI paths are already existing.
   Use normal disruptive SCSI path configuration change feature when SCSI port or FIBRE ports do not have any existing SCSI paths.
4) HOSTMODE of SCSI ports or FIBRE ports can not be changed by Online LUN installation feature.
   Use normal disruptive SCSI path configuration change feature to change or set HOSTMODE.
5) Online LUN installation can not be used for SCSI or FIBRE ports which have 04(SEQUENT HOST MODE) or 14(SEQUENT HOST MODE + Ultra SCSI) for their HOSTMODE.
6) Online LUN installation can be executed by SVP or by Remote Console.
7) Some operating systems require reboot operation to recognize the newly added volumes.
8) It may take about 30 seconds to complete Online LUN installation.
9) When new LDEVs should be installed for Online LUN installation, install the LDEVs by SVP first. Then add SCSI paths by Online LUN installation from SVP or Remote Console.

(2) Supported feature

Online LUN installation feature provides the next two features.

1) Add new LUNs under existing target ID. (for SCSI ports and FIBRE ports)
2) Add new target IDs and new LUNs. (for SCSI ports)

(3) Volume type support

Volume types supported Online LUN installation are the same as already supported ones.
In case of IBM-7135, there are next two restrictions.

1) Add only new target IDs. (Target ID=0, 1, 2, 3, 4, 5)
2) Do not add new LUNs under existing target ID.

Copyright ©1998,1999, Hitachi, Ltd.

(4) Platform support
Host Platforms supported for Online LUN installation are shown in Table 12-2.

Table 12-2 Platform support level.

Support level	SCSI	FIBRE
(A) Online LUN installation and Online LUN recognition.	Solaris, HP-UX, AIX, Digital UNIX, IBM-7135, UNIX SVR4	Solaris, HP-UX, AIX
(B) Online LUN installation only. Reboot is required before new LUN are recognized.	WindowsNT, OS/2, LINUX	WindowsNT, LINUX
(C) Online LUN installation is not supported. Host must be shutdown before installing LUNs and then must be rebooted.	—	—

12.3 Operations

(1) Operations

Step 1: If there is not existing SCSI path on the ports, use normal disruptive operation.

Step 2: Confirm whether or not the initiator platform of the SCSI port or FIBRE port supports Online LUN installation with Table 12-2.
Support (A),(B) -> Go to Step 3.
Not support (C) -> Use normal disruptive SCSI path configuration change.

Step 3: If HOSTMODE must be change, then use normal disruptive operation.
If not go to Step 4.

Step 4: If HOSTMODE of the SCSI or FIBRE port is 04 or 14, use normal disruptive operation. If not, go to Step 5.

Step 5: Execute Online LUN installation from SVP or from Remote Console.

Step 6: Confirm whether or not the initiator platform of the SCSI port or FIBRE port supports Online LUN recognition with Table 12-2.
Support (A) -> Execute online LUN recognition procedures in Table 12-3.
Not support (B) -> Reboot host and execute normal install procedure.

Copyright ©1998,2000, Hitachi, Ltd.

(2) Host operations
Host operations for Online LUN recognition are shown in Table 12-3.

Table 12-3 Online LUN recognition procedures outline for each platform

Platform	Online LUN recognition procedures
HP-UX	(1) **ioscan** (check device added after IPL) (2) **insf -e** (create device files)
Solaris	(1) **/usr/sbin/drvconfig** (2) **/usr/sbin/devlinks** (3) **/usr/sbin/disks** (4) **/usr/ucb/ucblinks**
AIX	(1) **Devices-Install/Configure Devices Added After IPL** By SMIT
Digital Unix	(1) **scsimgr -scan_all** (2) **sizer -n test** (test,test.devs. will be made on /tmp) (3) **cd /tmp** (change tmp directory) (4) **vi test.devs** (add /dev/ to head of test.devs file) (5) **chmod +x test.devs** (add executable attribute to test.devs file) (6) **cd /dev** (change dev directory) (7) **/tmp/test.devs**
UNIX SVR4	(1) **/user/sadm/sysadm/bin/mktable** (create device files) (2) **Start sysadm** (3) **Select Raid Manager** (4) **Select Redundant Path Manager** (5) **Select Maintain Path Configuration Tables** (6) **Select Rebuild RADC Configuration Tables**

Copyright ©1998,1999, Hitachi, Ltd.

13 Online LUN de-installation

13.1 Overview

Online LUN de-installation feature makes it enable to delete LUNs to DKC310 SCSI ports or FIBRE ports while I/Os are still running.

13.2 Specifications

(1) General

1) Online LUN de-installation feature is supported for SCSI interface and FIBRE interface. Firefly, Superfly and Tachyon fibre adapter are available.
2) Online LUN de-installation can be used only for SCSI ports or FIBRE ports on which SCSI paths are already existing.
3) HOST MODE of SCSI ports or FIBRE ports can not be changed by online LUN de-installation feature.
4) Online LUN de-installation can not be used for SCSI or FIBRE ports which have 04(SEQUENT HOST MODE), 14(SEQUENT HOST MODE+Ultra SCSI) for their HOST MODE.
5) Online LUN de-installation can be executed by SVP or by Remote Console.
6) It may takes about 30 seconds to complete Online LUN de-installation.
7) When LUNs should be de-installed for Online LUN de-installation,stop Host I/O of concerned LUNs.
8) If necessary , execute backup of concerned LUNs.
9) De-install concerned LUNs from HOST.
10) In case of AIX, release the reserve of concerned LUNs.
11) In case of HP-UX and UNIX SVR4, do not delete LUN=0 under existing target ID.

(Note)
If Online LUN de-installation should be done without stopping Host I/O, or releasing the reserve, it would have failed. Then stop HOST I/O or release the reserve of concerned LUNs and try again. If Online LUN de-installation would have failed after stopping Host I/O or releasing the reserve, there is possibility that health check command from HOST is issued. At that time, wait about three minutes and try again.

(2) Supported feature

Online LUN de-installation feature provides the next two features.

1) Delete LUNs under existing target ID. (for SCSI ports and FIBRE ports)
2) Delete existing target ID. (for SCSI ports)

In case of IBM-7135, there are next two restrictions.

1) Do not delete LUNs under existing target ID.
2) Delete a pair of target ID.

(3) Volume type support

Volume types supported for Online LUN de-installation are the same as already supported ones.

Copyright ©1999, Hitachi, Ltd.

(4) Platform support
Host platforms supported for Online LUN de-installation are shown in Table 13-1.

Table 13-1 Support platform

Platform	OS	SCSI	Fibre
HP	HP-UX	○	○
SUN	Solaris	○	○
RS/6000	AIX	○	○
PC	WindowsNT	×	×
DEC	Digital UNIX	○	×
NCR	UNIX SVR4	○	×
IBM-7135	AIX	○	○
SEQUENT	DYNIX/ptx	×	×
OS/2	WARP (Ver.4)	×	×
LINUX	Redhat	×	×

(example) ○: support, ×: not support

13.3 Operations

(1) Operations

Step 1: Confirm whether or not the initiator platform of the SCSI port or FIBRE port supports Online LUN de-installation with Table 13.
Support :Go to Step 2.
Not support :Use normal disruptive SCSI path configuration change.

Step 2: If HOST MODE must be changed, then use normal disruptive operation.
If not, go to Step 3.

Step 3: If HOST MODE of the SCSI or FIBRE port is 04 or 14 use normal disruptive operation. If not, go to Step 4.

Step 4: Stop Host I/O of concerned LUNs.

Step 5: If necessary, execute backup of concerned LUNs.

Step 6: De-install concerned LUNs form HOST.

Step 7: In case AIX, release the reserve of concerned LUNs.
If not, go to Step 8.

Step:8 Execute Online LUN de-installation from SVP or from Remote Console.

Copyright ©1999,2000, Hitachi, Ltd.

(2) Host operations
Host operations for LUN de-installation procedures are shown in Table 13-2.

Table 13-2 LUN de-installation procedures outline for each platform

Platform	LUN de-installation procedures
HP-UX	mount point:/01, volume group name:vg01 (1) **umount /01** (umount) (2) **vgchange -a n vg01** (deactive volume groups) (3) **vgexport /dev/vg01** (export volume groups)

SSD OPTIONAL FUNCTION SECTION

Copyright ©1998, Hitachi, Ltd.

SSD Optional Function

Two SSD options explained below are provided. The respective options can be set and used independently, and naturally, when both options are used together, the performance can be improved much more.

- Customized Volume Size (CVS) option which allows to set a free volume size and reducing occurrences of waiting for host I/O issues
- Dynamic Cache Residence (DCR) option which improves the data access performance by making data at addresses in the specified area resident in the DKC cache

1. Customized Volume Size (CVS) Option

1.1 Outline

As regards the main frame host, the multiplicity of an I/O request is restricted to one per volume because UCBs are mutually exclusive.
Therefore, when two or more files to which I/Os are applied frequently exist in the same volume, a contention for the logical volume occurs. If this occurs, the files mentioned above are stored separately in different logical volumes and an action is taken to avoid contention for access. (Or means to prevent I/Os from generation is required.)
However, the work for adjusting the file arrangement giving consideration to the accessing characteristic of the file will be a burden on users of the DKC and it is not welcomed by them.
To solve this problem, the Customized Volume Size (CVS) option is provided. (Hereinafter, it is abbreviated to CVS.)
The CVS provides a function for freely defining the logical volume size. By doing this, even in a storage system with the same capacity, the number of volumes can be increased easily. As a result, a file with a high I/O frequency can be easily allocated to an independent volume. That is to say, the trouble to consider a combination of stored files in a volume can be saved.

1.2 Features

- The contention for UCB in the main frame host can be avoided and the IOSQ time can be reduced.
- The capacity of the HDD can be fully used.
- By combining with the Dynamic Cache Residence (DCR) option, high performance equivalent to that of a semiconductor storage device can be realized.

Copyright ©1998, Hitachi, Ltd.

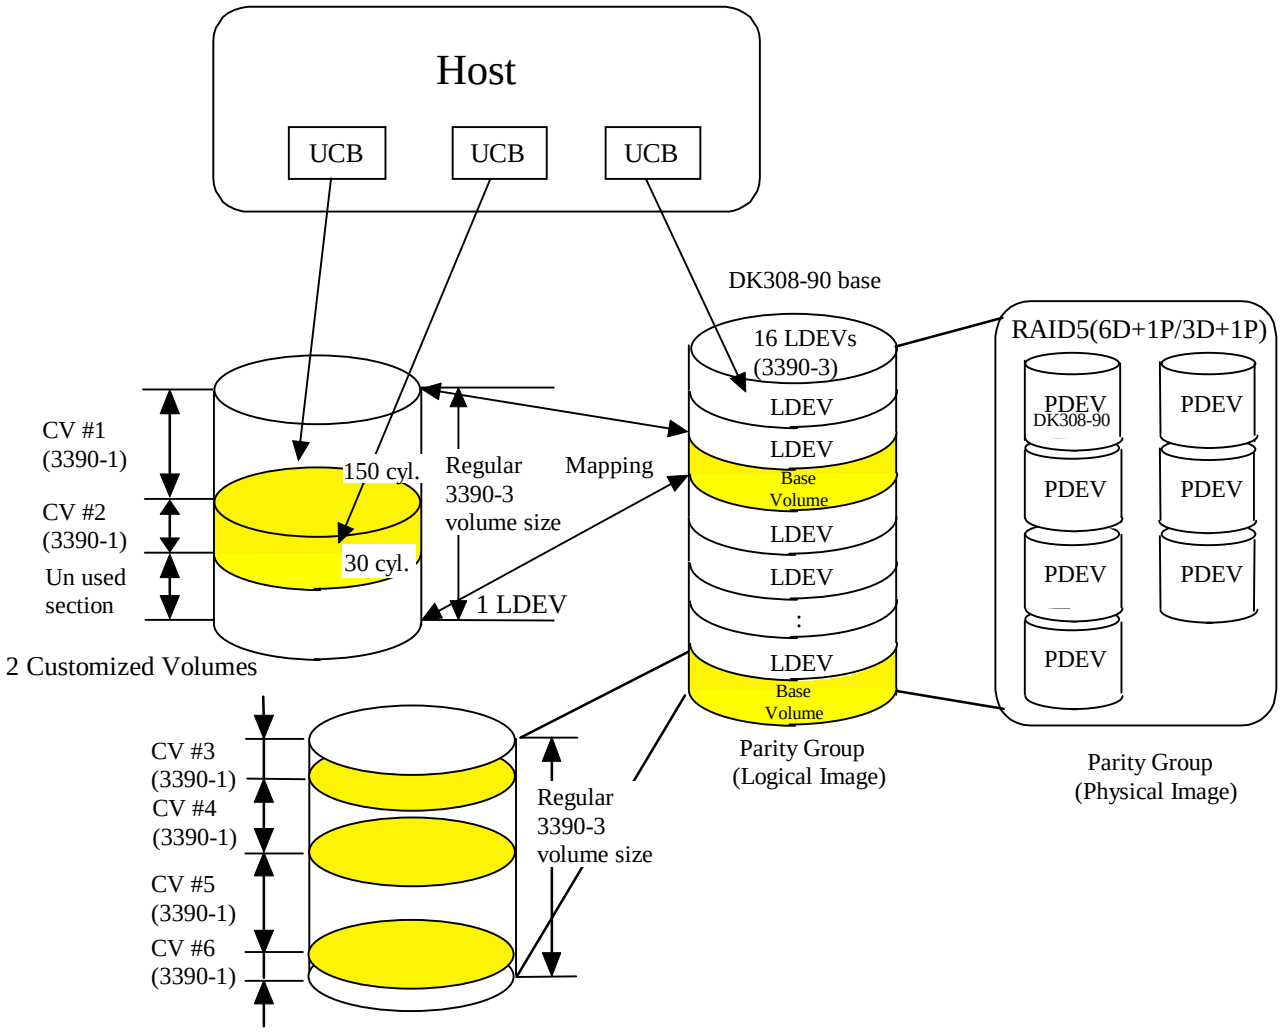

Fig. 1.1 Conceptual Diagram

Copyright ©1998, Hitachi, Ltd.

1.3 Specifications

The CVS option consists of a function to provide variable capacity volumes and a function to provide free arrangement of volumes on the HDD.

(a) Function to provide variable capacity volumes
This is a function for determining the capacity as specified by users in the same track format as that of a conventional volume.

(b) Emulation type intermix on the HDD
As regard the RAID200, the logical volume type in the parity group is restricted to the same type only. However, the CVS option enables different logical volume types to coexist.

Table 1.1 Specifications of the Function for Providing Variable Capacity Volumes

Item No.	Item	Description
1	Track format	3390 or 3380 track format
2	CV emulation type	3390-1/2/3/3R/9/3A/3B, 3380-K/J/E/KA/KB, OPEN-3/8/9/K
3	Maximum number of CVs on one HDD	64 CVs
4	Minimum size of CV	See note1
5	Maximum size of CV	9982 Cylinders(See note1)
6	Position on the disk where the CVs can be placed	Any position is allowable.
7	Emulation type intermix	Intermix of 3390-1/2/3/3A/3B and 9 is allowable. Intermix of 3380-K/J/E/KA and KB is allowable. Intermix of OPEN-3 and 8 and 9 is allowable. Intermix of OPEN-K is not allowable. Intermix of 3380-* and 3390-* is not allowable.

Note1:
(1) Mainframe volume
Number of physical cylinder allocated on HDD is calculated by following formula.
Physical mapping onto HDD =
User logical cylinders(A) + Additional control cylinder(B) + Adjustment(C)
where, (A) is specified value through SVP/RC, (B) is defined from below chart depending on emulation type.
Also (C) is adjustment so as to make (A) +(B)+(C) be even number.(either 1 or 0)

emulation type	3380-J	3380-E	3380-K	3390-1	3390-2	3390-3	3390-3R	3390-9
Minimum size of CV in cylinders	1	1	1	1	1	1	1	1
(B)	7	8	9	9	8	9	9	34

Copyright ©1998,1999, Hitachi, Ltd.

emulation type	3390-3A	3390-3B	3380-KA	3380-KB	OPEN-3	OPEN-8	OPEN-9	OPEN-K
Minimum size of CV in cylinders	11	1	1	1	50	50	50	50
(B)	9	9	9	9	10 (7.2 MByte)	36 (25.9 MByte)	36 (25.9 MByte)	9 (6.48 MByte)

Example: Physically allocated number of cylinders in case of 100 cylinders specified with 3390-3 is calculated below:

Physical mapping onto HDD = 100 (A) + 9 (B) + 1(C)

So number of cylinders physically allocated on HDD is equal 110.

(2) Open volume

You can set the data by Mbytes. And the Program will assign the actual value as the following expression. The typical values will be described in the table 1.2.

X = (your setting size) $\times$ 1024 $\div$ 720 (if there is remainder, add 1.)

Y = (X $\times$ 96 $\times$ 15 $\times$ 512) $\div$ 1024 $\div$ 1024

(note) X is a value of converting capacity specified by SVP or Remote Console into number of cylinders. Y is a value of converting value B into capacity (mega byte).

Table 1.2 CV capacity

Setting Size (Mbyte)	Actual size (Mbyte)	Note
35	35.15625	Minimum CV capacity
500	500.625	
1000	1000.546875	
1781	1781.015625	Maximum size of CV for OPEN-K
2000	2000.390625	
2340	2340	Maximum size of CV for OPEN-3
6982	6982.03125	Maximum size of CV for OPEN-8
7017	7017.1875	Maximum size of CV for OPEN-9

NOTICE

When you set HMDE volumes to customized volumes and reset them to the normal volume again, these volumes could not be set as HMDE volumes. Please refer to the following table.

Emulation Types for HMDE volumes	Emulation types after changing from Customized volume to normal volume
3390-3A	3390-3
3390-3B	
3380-KA	3380-K
3380-KB	

If you want to reset these volumes as HMDE, please call technical support center to set them to HMDE volumes by SVP.

1.4 Maintenance functions

Features of the maintenance functions of the CVS option is that they allow execution of not only the conventional maintenance operations instructed by the SVP but also the maintenance operations instructed from the remote console. (See Item Nos. 2 to 5 in Table 1.2.)
Unlike the conventional LDEV addition or reduction, the operation for the HDD is made unnecessary, so that the volumes can be operated from the remote console.

Table 1.4 Maintenance Function List

Item No.	Maintenance function	TSC	CE	User	Remarks
1	Concurrent addition or deletion of CVs at the time of addition or deinstallation of HDDs	—	✓	—	Same as the conventional addition or deinstallation of LDEVs
2	Addition of CVs only	✓	✓	✓	Addition of CVs in the free area
3	Conversion of normal volumes to CV	✓	✓	✓	
4	Conversion of CV to normal volumes	✓	✓	✓	
5	Deletion of CVs only	✓	✓	✓	Only the optional CVs are deleted and incorporated into the free area. No deinstallation of HDDs is involved.

2. Dynamic Cache Residence (DCR) Option

2.1 Outline

Because cache capacity is usually smaller than the total HDD capacity in RAID subsystem, cache cannot be keep all data at the same time which is stored whole HDDs in the subsystem.
Cache management control cache extent so as to be allocate more capacity to more frequently accessed data to enbed this gap by LRU algorithm.
By this control, data with a low access frequency is hard to remain in the cache, de-staged into HDDs, therefore the more frequent accesses to physical HDDs occur, decrease the access performance and unpredictable response time appear.
The DCR option provides a function for making data being resident on the cache and realize high access performance.

2.2 Features

- Feature of the DCR consist of two modes, one is called “PRIOrity mode(hereinafter,it is abbreviated to PRIO)” and the other “BIND mode(hereinafter,it is abbreviate to BIND)”.
PRIO is a basic mode(100% Read Hit) of this feature, which fits typical user needs and BIND is supplementary for special customer(100% Read/Write Hit. Replace SSD) needs.
- To use the DCR, addition of the cache memory is required for the service as a "DCR cache".

2.2.1 PRIO

[Processing]
- When a read command to the data which is assigned as DCR extent is issued and first meet “miss” in cache, the data is staged into cache by usual staging mechanism.
The data remains in the DCR cache permanently for future access to guarantee read-hit performance even after data is transferred to the host, regardless usually cache LRU management.
If a write command is issued to the data remaining in the cache in the way above, the data is updated with an out-of-DCR cache segment provided for write data duplication, and the data is de-staged into the HDD. Then the cache segment for write data duplication is returned to the out-of-DCR cache segment group.
In this case, new data is left in the cache extent together with old data.

[Performance impact]
- Theoretically, because above de-staging into HDD is processed by usual asynchronous de-staging mechanism, succeeding host access has a possibility to meet the same cache slot collision by locking both the host access and asynchronous de-staging process.
However in that case, by minimizing the collision time implemented in micro-code, performance impact will be neglectably small for usual customer jobs.
- In the case the subsystem cache becomes overloaded, a responding performance degradation occurs because the non-DCR cache segment must be used for the data assurance during a period between write data reception and de-staging operation completion.

Copyright ©1998, Hitachi, Ltd.

[Maximum DCR capacity]

- Addition of the "DCR cache" is required for the DCR, and a number of disk trucks equivalent to the capacity of the added "DCR cache" is the maximum number definable for the DCR. Besides, STR recommends to keep the standard cache capacity for the non-DCR portion as a minimum out-of-DCR cache, for example, 1.5GB for 360GB configuration or 2GB for 450GB configuration (see **"Disk capacity and number of necessary options" on page INST01-60**), to avoid considerable performance degradation for original data because of the newly installed DCR.
  To keep this rule, when the customer want to install DCR feature for the subsystem, he need to install additional cache capacity as a DCR area out of pre-defined standard cache capacity.
  On the other hand, maximum available cache capacity is 10GB, the maximum cache capacity for DCR should be 10GB minus standard cache capacity for that configuration,ex. Max. 8.5GB for DCR for 360GB configuration(85%), Max. 8GB for 540GB configuration(80%), etc..

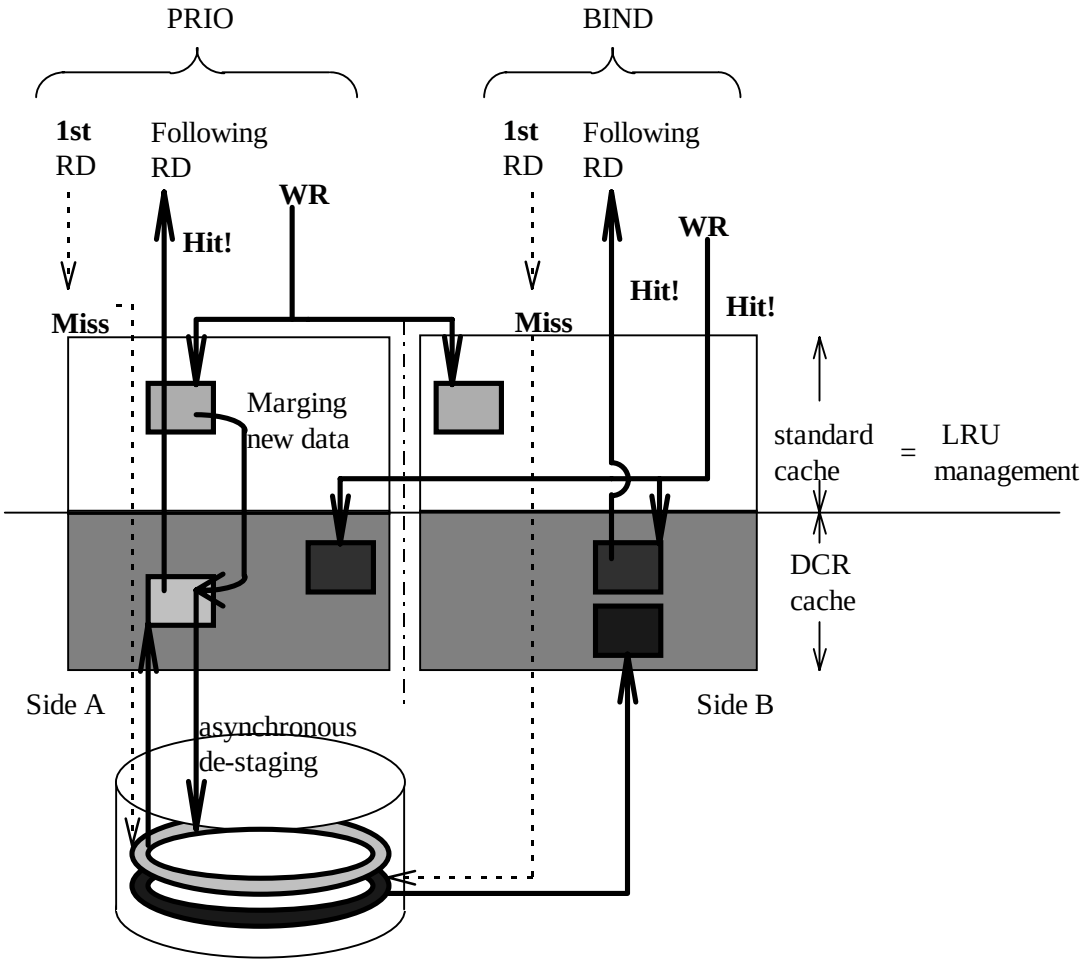

Fig. 2.1 Processing for DCR Extent

Copyright ©1998, Hitachi, Ltd.

2.2.2 BIND

[Processing]

- As described above, there is a possibility that a responding performance degradation occurs in the PRIO mode because of a collide slot lock between the host access and asynchronous de-staging process or a waiting for the cache segment to be empty caused by an overload of the subsystem cache.
  This is a negligibly small impact on the performance in the typical user environment, however, in some environments, if any, in which the performance is very critical and the maximum response time must be assured, the above factors to degrade the response may be the issues.

[Performance impact]

- In BIND, the difference for PRIO, not only read data but also being all write data for the assigned DCR extent are resident in cache, no de-stage process occurred by any write command. Thus, by protecting any asynchronous de-stage process for the DCR data, read operation become a perfectly hit process.
- However, as a compensation for the perfect hit performance, additional cache element is necessary in the DCR cache area in the BIND mode three times larger than (for RAID1, as large as) that in the PRIO mode.

[Maximum DCR capacity]

- To keep this rule, when the customer want to install DCR feature for the subsystem and install additional cache capacity as a DCR area out of pre-defined standard cache capacity, maximum available cache capacity is 33% of “10GB minus standard cache capacity for that configuration”, ex. Max. 8GB for DCR, 33% comes to 2GB for user data for 540GB configuration(20%), etc.. The rest 67% is reserved for following write operation.
  Further, this percentage of user area within total DCR area is depend on RAID configuration, 33% for RAID5 or 50% for RAID1 due to the cache allocate algorithm deference.

2.2.3 Assignment of DCR extent and guard logic

- Above two modes can be assigned for each DCR extent individually.
  For example, the user want to assign 1GB cache for PRIO and 256MB cache for BIND, Raid300 allocate the extents in additional cache area by 1GB for PRIO and 256MB times 3 equals 0.75GB for BIND. Total 1.75GB cache should be additionally installed. The user can assign repeatedly many DCR extents with choosing each mode for each extent. Say, 1GB for PRIO + 512MB for PRIO + 256MB for BIND + 128 for BIND comes to 2.6GB total DCR area necessary.
- SVP micro-code accept many extents allocation until the cumulative capacity for DCR does not allow the rest is over 512MB.
  In other words, RAID300 check that the rest cache capacity out of DCR is over 512MB by each DCR extent allocation, if the addition of DCR break the rest 512 MB boundary, SVP reject the allocation of DCR extents with an error message.
- From that point, the user theoretically can assign all cache capacity except 512MB for DCR regardless their configurations, STR strongly recommend the user should keep standard cache capacity out of DCR depend on the configuration according to the manuals by operation. Guard boundary by SVP is only 512MB for all configurations.
- For the outline and the setting operation procedure of the DCR cache, see page SSDOPT02-100.

2.3 Specifications

Table 2.1 Specifications of the Function

Item No.	Item	Description
1	Maximum number of areas to be made resident	For the PRIO and BIND modes together: 16 areas/logical volume 1024 areas/subsystem
2	Unit of area specified to be resident	Mainframe : 1 track, Open : logical block*2
3	Minimum/Maximum size of extent	1 track/logical volume size
4	Online change of resident area	Allowable (from the SVP and remote console)
5	Addition of cache capacity	Mandatory(Program Product: Charged with cache)
6	Maximum usable cache capacity*1 as DCR	Capacity of the cache memory added as the DCR cache The “standard cache capacity” must be ensured by the rule.

*1: Convert as follows:
For the 3390 emulation: 1 track = 64KB
For the 3380 emulation: 1 track = 48KB
For the OPEN-3/8/9/K emulation: 1 track = 48KB

*2: The case of open volume, the RMCMAIN program treats 96 blocks unit so that the input address will be changed as 96 blocks unit.

- Recommendation about DCR for OPEN volume OPEN-3, OPEN-9, OPEN-K:
  If DCR function is used for OPEN-3 or OPEN-8 or OPEN-9 or OPEN-K, whole volume should be specified for DCR.
  It is because file of open system does not correspond to RAID track structure.

2.4 Maintenance functions

Table 2.2 Maintenance Function List

Item No.	Maintenance operation	TSC	CE	User	Description
1	Addition of the DCR area	✓	✓	✓	• Adds the DCR area. • Unit of the area to be specified by the SVP is a track.
2	Deletion of the DCR area	✓	✓	✓	• Deletes the continuous DCR area.
3	Change of the DCR area	✓	✓	✓	• Changes the DCR area size.
4	Status display of the DCR area	✓	✓	✓	• Displays the specifications of the DCR area.
5	Addition and de-installation of the DCR cache	—	✓	—	• Because insertion and pulling off of the cache module into/from the DKC is required

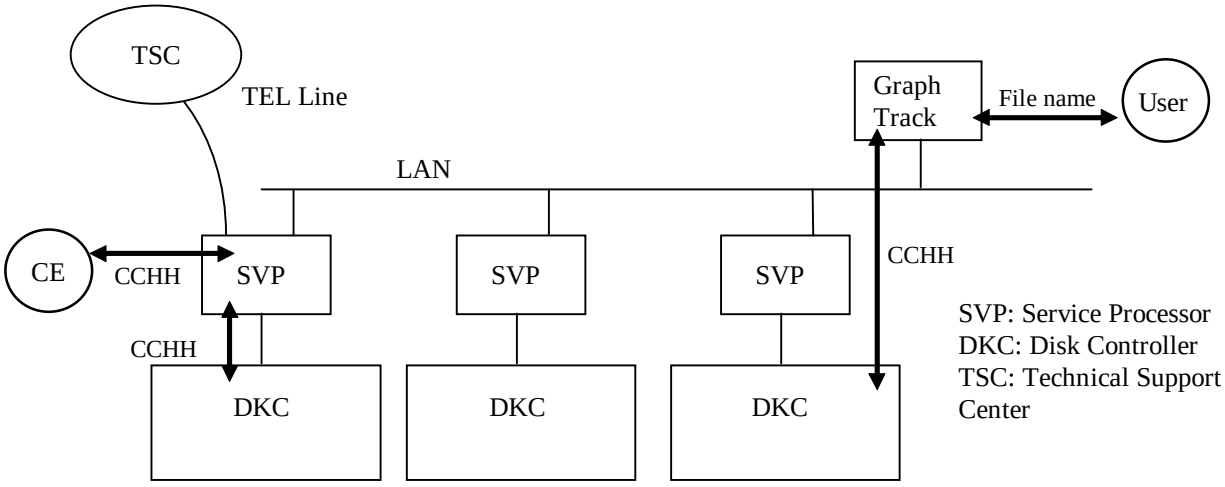

Figure 2.3 Maintenance Execution Route when DCR Is Used

Copyright ©1998, Hitachi, Ltd.

2.5 Notes on maintenance when DCR is used

When performing the following maintenance, it is attended with a temporary regression of the cache memory or shared memory. Since this regression disables retention of the cache capacity required for the DCR, the DCR function is automatically suppressed for a while until the maintenance is completed.
A service person is required to obtain an approval of a user before starting the maintenance because there is a high possibility that the DCR function suppression may result in a degradation of responding performance.

(1) Cache replacement
(2) Addition and de-installation of the cache (including addition and de-installation of the DCR cache)
(3) De-installation of the ECC Gr.
(4) Addition of the ECC Gr. and LDEV requiring addition of the SM because of the addition of the CU
(5) Addition and de-installation of the SM
(6) Cluster maintenance

2.6 Effects of DKC failures on DCR

The DCR function is automatically suppressed when any of the following failures occurs. The suppression continues until the regressed operation owning to the maintenance is canceled in the cases of Items (1) to (3) or continues until an automatic recovery of the shared memory by the microprogram is terminated normally in the case of Item (4).

(1) Cache failure
(2) Shared memory failure
(3) One-side cluster down
(4) One-side shared memory blockade (SIMRC = FFEE)

2.7 Automatic cancellation of DCR

The DCR setting of a volume to be de-installed by the functions of Deletion of CVs (LDEV), Conversion of CV to normal volume, and Conversion of normal volume to CV is automatically canceled as a part of the de-installation processing by the SVP microprogram.

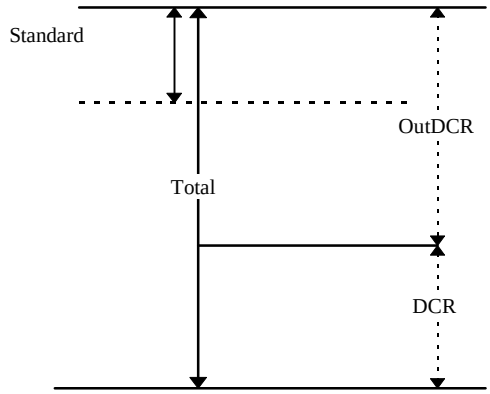
2.8 Explanation of DCR cache and procedure for setting operation

2.8.1 Explanation

- A cache module must be defined and installed for the DCR before using the DCR.
- The DCR extent can be set only for the defined "DCR cache capacity."
- The "out-of-DCR cache capacity" must be retained more than "standard cache capacity" which is defined in accordance with the disk capacity in order to assure the performance in the non-DCR area.
- Therefore, DCR extent definition more than "DCR cache capacity" is rejected according to the SVP guarding logic. Also, the "DCR cache capacity" definition lower than the minimum "standard cache capacity" (256 MB × 2) is also rejected.



Total : Equipment Cache capacity

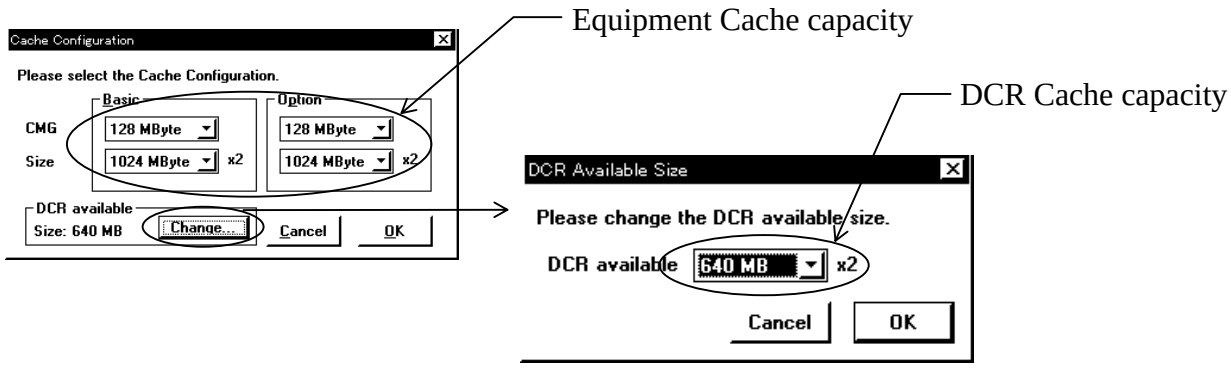
OutDCR : Out-Of-DCR Cache capacity

DCR : DCR cache capacity

Standard : Standard Cache capacity
(See:INST01-60 “Disk capacity and number of necessary options”)

2.8.2 Setting operation procedure

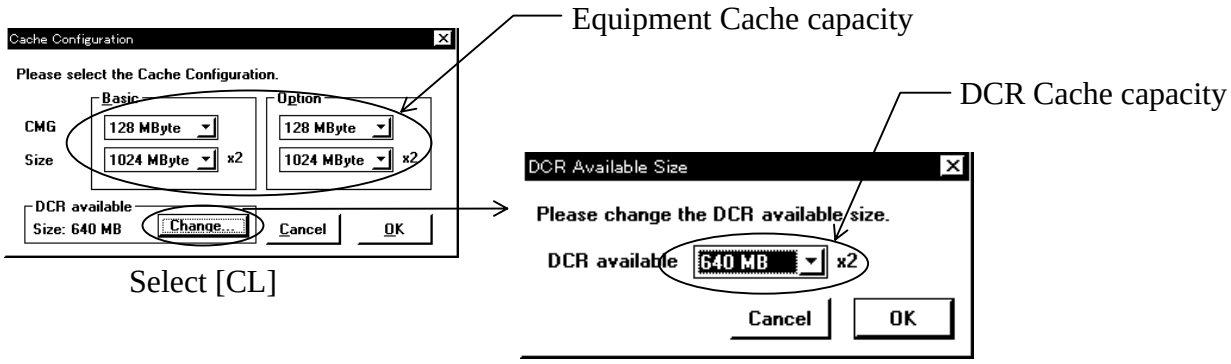
(1) Setting DCR cache capacity in Define Config & Install sequence
Set the DCR cache capacity in the equipment cache capacity.



Note :
- Set the DCR cache capacity so that it is less than the "equipment cache capacity minus standard cache capacity."

Copyright ©1998, Hitachi, Ltd.

(2) Adding operation of DCR cache capacity in cache addition sequence
When adding the cache, set the DCR cache capacity in the equipment cache capacity after the addition.

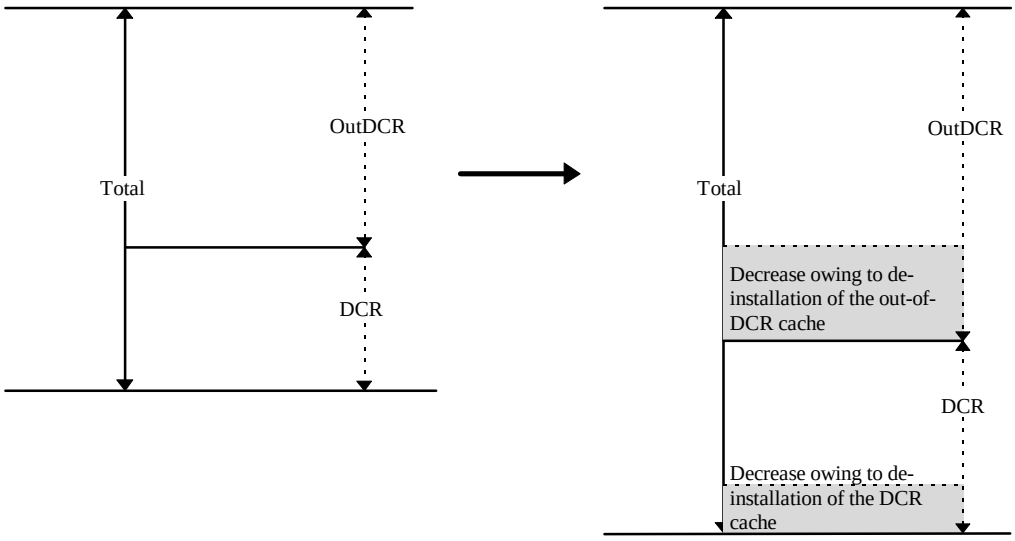


For example, to change a status with the cache of 512 MB × 2 installed and 256 MB × 2 of it set to the DCR cache to a status with the cache of 1.0 GB × 2 installed and 512 MB × 2 of it set to the DCR cache by adding the cache of 512 MB × 2,

① set the equipment cache capacity to 1.0 GB × 2 in the "Cache Configuration" dialog box, and

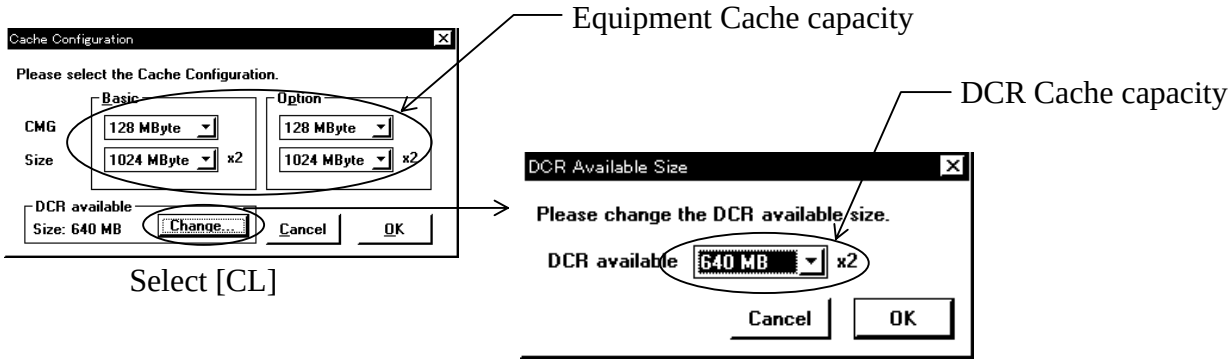
② press the "Change..." button to open the "DCR Available Size" dialog box and set the DCR cache capacity to 512 MB × 2.

The DCR cache capacity can be set up to the cache capacity to be added. In the above example, the DCR cache capacity can be set up to 768 MB × 2 by adding 512 MB × 2.



Copyright ©1998, Hitachi, Ltd.

(3) DCR cache capacity decreasing operation in cache de-installation sequence
When de-installing the cache, set a capacity to be left as the DCR cache in the equipment cache capacity.



For example, to change a status with the cache of 1.0 GB × 2 installed and 512 MB × 2 of it set to the DCR cache to a status with the cache of 512 MB × 2 installed and 256 MB × 2 of it set to the DCR cache by de-installing the cache of 512 MB × 2,

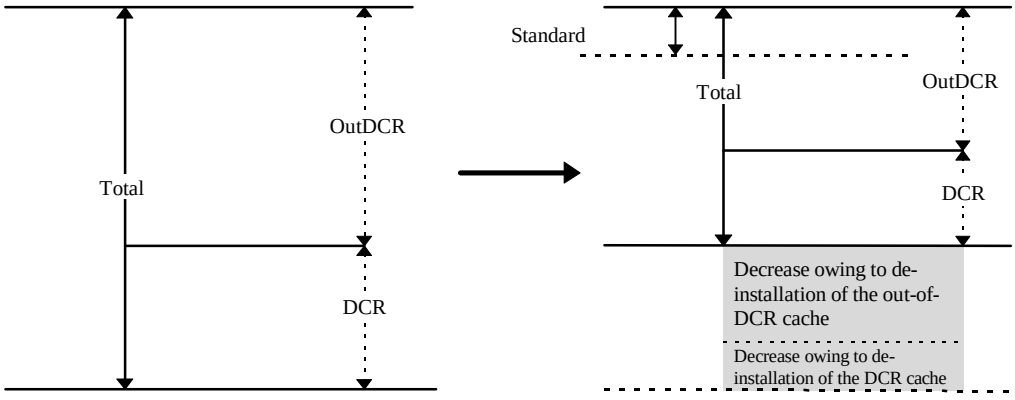
① set the equipment cache capacity to 512 MB × 2 in the "Cache Configuration" dialog box, and

② Press the "Change..." button to open the "DCR Available Size" dialog box and set the DCR cache capacity to 256 MB × 2.

The maximum decreasable capacity of the DCR cache is equal to the capacity of the installed cache to be de-installed. The maximum decreasable capacity of the DCR cache capacity in the above example is 512 MB × 2. As a result, the DCR cache capacity after the de-installation becomes 0 MB × 2.

Notes :

- In the case in which the de-installation of the DCR cache causes the capacity used by the DCR (see (i) on page SSDOPT02-130) actually defined as the DCR extent to be above the DCR cache capacity, the cache de-installing process is suspended by the SVP guarding logic. Before executing the DCR cache de-installation, cancel the DCR setting to decrease the actual capacity used by the DCR.
- It is required to avoid de-installation of the out-of-DCR cache which causes its capacity to be below the standard cache capacity.



Copyright ©1998, Hitachi, Ltd.

(i) The "cache capacity used by the DCR" actually used as the DCR extent is displayed on the DCR Configuration screen in [SVP] - [Install] - [Refer Configuration] for confirmation.

1 Outline

1.1 Abstract

Purpose of DKC swapping program is to enable user's LDEV/PDEV resources to be continuously used when the subsystem is switched from the RAID 200 to the RAID 300.
The DKCMAIN and the SVP provide functions to make the LDEV/PDEV information be handed over.

1.2 Measures to attain the purpose

Principle: DKC replacement procedures shall be used as basic procedures.
→ Information to be handed over is saved on an FD by the SVP of the former subsystem and installed by the SVP of the new subsystem.
However, since formats of the configuration information differ each other between those of the RAID 200 and the RAID 300, conversion is performed when powering on the subsystem.
<The point>

(a) The form used to hand over the configuration information is not the conventional one used for the DKC replacement but the one of the FM image.
The FM image is saved on an FD using the SVP.
→ The FD can be prepared using the RAID 200 version for the switching.

(b) The conversion of the configuration information is automatically performed when powering on the subsystem.

1.3 Old subsystem (RAID200) configuration restrictions.

No	Condition/restriction	Detail	Restriction guard
1	Subsystem configuration	Following system can perform DKCSWAP. • Mainframe (HA subsystem) • multi-platform • ALL SCSI * Cannot SWAP SC subsystem	Technical support operation.
2	STATUS of the RAID200	• All normal status. * The switching is not allowed if a failed part or a PIN exist.	If restriction is violated, DKCSWAP FD is not supported. SVP pre-check error will occur.
3	micro code level	• Micro code version must be changed to DKCSWAP version.	
4	HDD type	• HDD type must be DK308-90,DK309-90. * Switching is not allowed if DK306-45,DK308-45 exist.	
5	RAID level	• RAID level must be RAID-5,RAID-1,RAID-1/5 intermix. * Switching is not allowed if RAID0 exist.	
6	Cache configuration	• Cache capacity must be under 4GB. * Switching is not allowed if CPC exist.	
7	Emulation type	• Emulation type must be all 3390-3,all 3390-3R. * Switching is not allowed if 3390-3 and 33903R intermix exist.	

Copyright ©1998, Hitachi, Ltd.

1.4 NEW subsystem (RAID300) configuration restrictions

No	Condition/restriction	Detail	Restriction guard
1	A failed part, a Blocked Part status.	• CHA/DKA/Cache/Terminator/SM etc. must be all normal status. * LDEV/PDEV/SCSI can be Blocked.	Restriction is violated, SVP pre-check error will occur.
2	Cache capacity	• Cache capacity must be same as RAID200. • SH024-A must be installed.	
3	SM capacity	• SM capacity must be 256MB. • SH100-B must be installed.	
4	Number of CHA/DKA PCB and location	• Number of CHA/DKA PCB and location must be same as RAID200.	
5	Number of Channel and location	• Number of channel and location must be same as RAID200.	Restriction is violated, configuration information error will occur (SSB,SIM or blocked parts) . Configuration information must be checked by technical support.
6	Number of Cache PCB and location	• Number of Cache PCB and location must be same as RAID200.	

1.5 Restrictions of configuration expansion.[after swap RAID300 (DKC310+DKU205)]

No	Item	Restriction	reason
1	Connection of HDD	Can not connect DK3F1-60	DK3F1-60 is not allowed. (DK308-90,DK309-90 and DK309-18 is allowed)
2	HDD individual reset function	Not used	HDD individual reset function is allowed for DKU305 only.
3	Installation of DKU Box	Can connect DKU205 only	-

Copyright ©1998,1999, Hitachi, Ltd.

1.6 DKCSWAP Logical devices combination specification

DKC SWAP can be done for following Logical devices combination Table as shown below except underlined Logical device numbers.

Logical devices Combination Table (LDEVs/parity group) [DK30*-90]

			RAID-1		RAID-5	
			RAID200	RAID300	RAID200	RAID300
DKU Emulation Type	Main/ Frame Type	3390-1	8	8	**16**/24	24
		3390-2	4	4	**16**/24	24
		3390-3	**1/2**/3	3	16	16
		3390-3R	**1/2**/3	3	16	16
		3390-9	-	1	6	6
		3380-J	8	8	**16/24**/32	32
		3380-E	6	6	**16**/24	24
		3380-K	4	4	**16**/24	24
	SCSI Type	OPEN-3	-	7	20	20
		OPEN-9	-	2	7	7
		OPEN-K	-	9	-	20/28
		3390-3A	-	6	16	16
		3390-3B	-	6	16	16
		3390-3C	-	6	-	16
		3380-KA	-	8	**16**/24	24
		3380-KB	-	8	**16**/24	24
		3380-KC	-	8	-	24

ATTENTION: For Boldface LDEVs, DKC SWAP can not be done.

Copyright ©1998, Hitachi, Ltd.

1.7 Re-establishment item

The configuration information that re-establishment becomes necessary is as the following by "DKCSWAP".

No.	Item	Restriction
1	DKC serial No	"DKCSWAP" Before doing, a serial number is defined by "Define configuration & Installation".
2	RCP Definition	After "DKCSWAP" is carried out, all the channel adapters become "LCPs". Set it up again by "Change configuration".
3	SCSI path Definition	SCSI configuration information is initialized by DKCSWAP. A warning message is outputted when "Procedure of loading Configuration information to FD" is completed. Set it up again by "Change configuration".
4	HRC Definition	HRC configuration information is initialized by DKCSWAP. A warning message is outputted when "Procedure of loading Configuration information to FD" is completed. Set it up again by "Change configuration".
5	Additional Power Supply	The specification that "additional power supply" are increased is different with RAID200 and RAID300. Convert it into the proper establishment by "Change configuration".

1.8 The kind of reported SSB and SIM (Only when a SCSI cable and an environment monitor cable don't connect it.)

SIM CODE	contents	Note
ac50	HDU power off.	An influence by the un-connection of the SCSI cable.
bfxx	Environmental Error.	An influence by the un-connection of the environment monitor cable.
ffe7	Shared memory is volatilized.	An influence due to breaker Off/on.

Error Code	contents	Note
001d	From FM, to SM, micro-transfer practice	At the time of the Shared Memory volatile mode.
32cc	HDU power off.	An influence due to breaker Off/on.
a47c	A SCSI Cable cutout is removed.	
aec9	The status injustice of SPC interrupts.	
ae57	BUS DEVICE RESET	
ae5c	DRIVE LED NG.

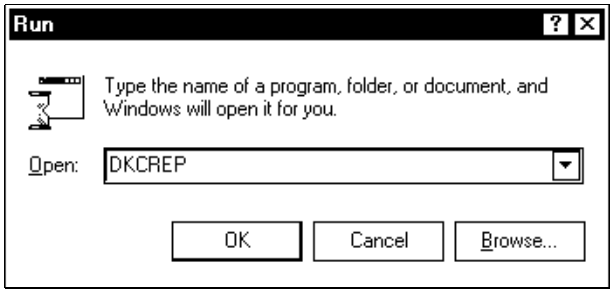
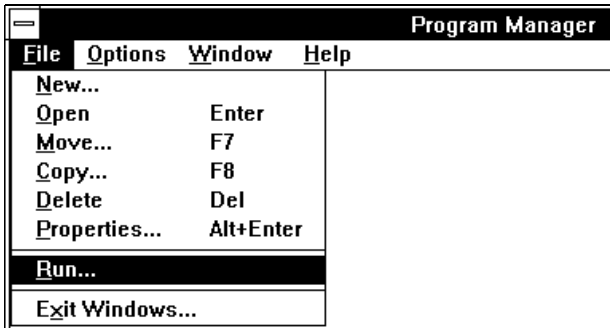
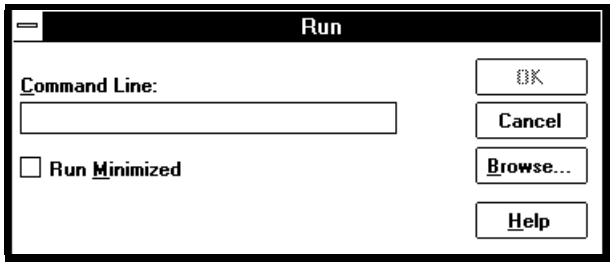
3 Procedure of saving Configuration Information to FD (used in old DKC)

(1) <Select the [Run] (in case of windows95)>
Select (CL) the [Run...] in the [Start button].
Input “c:\dkc200\mp\pc\DKCREP.EXE” in “OPEN” and select (CL) [OK].



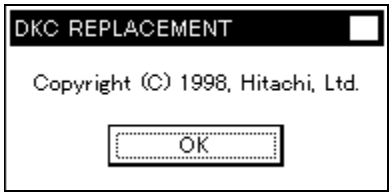
<in case of windows ver 3.1>
Select (CL) the [File] in the “Program Manager” window and select (DR) [Run...].
Input “c:\dkc200\mp\pc\DKCREP.EXE” in “Command Line” and select (CL) [OK].



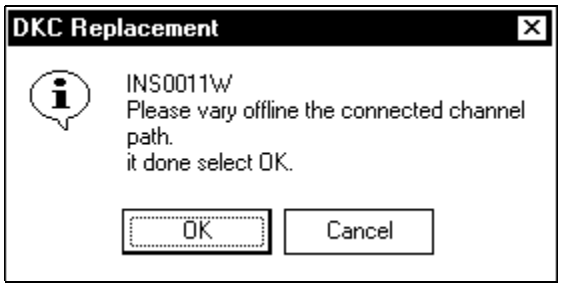


Copyright ©1998, Hitachi, Ltd.

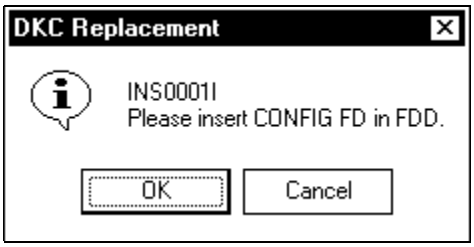
(2) Select (CL) [OK] in the “DKC REPLACEMENT” dialog box.



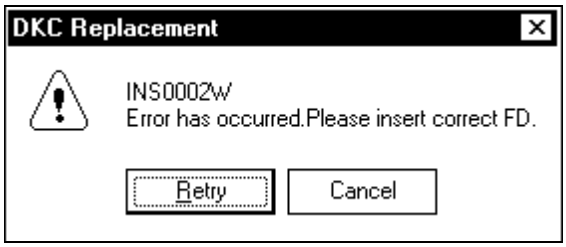
(3) Please vary offline the connected channel paths.
After you have done this operation, select (CL) [OK].



(4) Please insert CONFIG FD in FDD.
After select (CL) [OK].

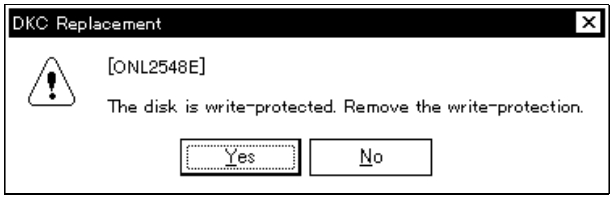


<Error Case>
Please insert correct FD.
After select (CL) [Retry].



Copyright ©1998, Hitachi, Ltd.

<Error Case>
Remove the write-protection of FD.
After select (CL) [Yes].

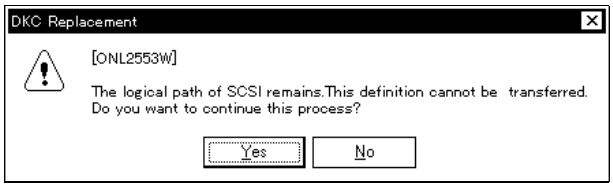


(5) “Checking subsystem...” is displayed.

<Error Case>
The function cannot be executed. Please subsystem configuration.

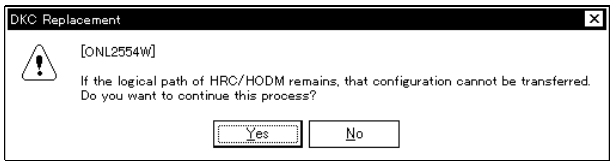
<Error Case>
The logical path of SCSI remains. This definition cannot be transferred.

If continue this process, the logical path of SCSI would be canceled.



(6)

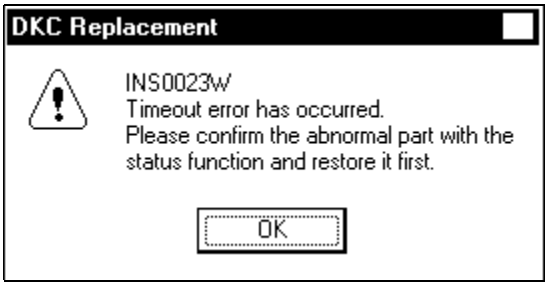
If the logical path of HRC/HODM remains, that configuration cannot be transferred.



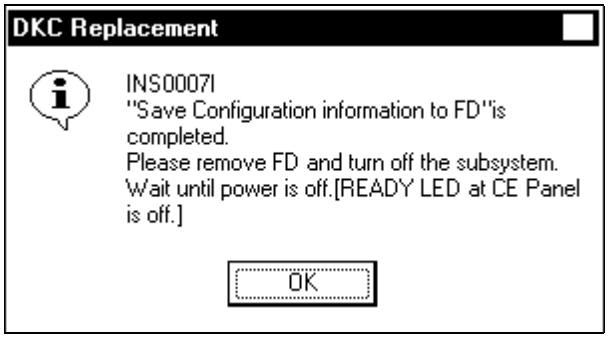
Copyright ©1998, Hitachi, Ltd.

(7) “Reading the subsystem configuration data...” is displayed.

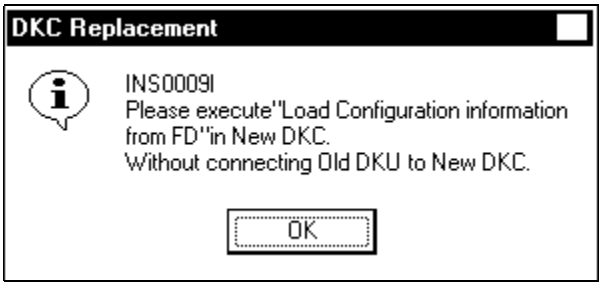
<Error Case>
Select (CL) [OK].
Please confirm the status function.



(8) Please remove FD and turn off the subsystem.
Wait until power is off.
After select (CL) [OK].



(9) Select (CL) [OK].
Note : Without connecting old DKU to new DKC.



Copyright ©1998, Hitachi, Ltd.

(10) Making a backup FD of Configuration information

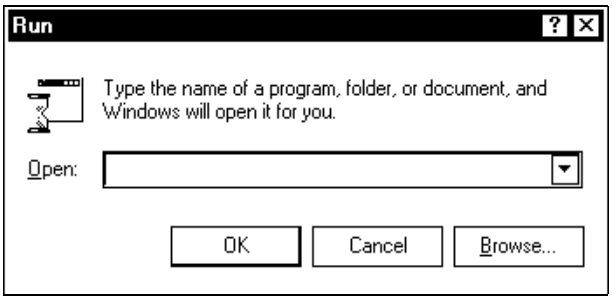
<In case of Windows95>

Select (CL) the [Run...] in the [Start] button.
Input “diskcopy a: a: /v” in “OPEN” and select (CL) [OK].

“Insert SOURCE diskette in drive A:
Press any key to continue...” is displayed.
Insert CONFIG FD in FDD and press any key.
Then, “Reading from source diskette...” will be displayed.

“Insert TARGET diskette in drive A:
Press any key to continue...” is displayed.
Then, insert a new FD in FDD and press any key.

“writing to target diskette...” is displayed.
When configuration copying is finished,
“Do you wish to another duplicate of this disk (Y/N)?” is displayed.
Press [n] key.

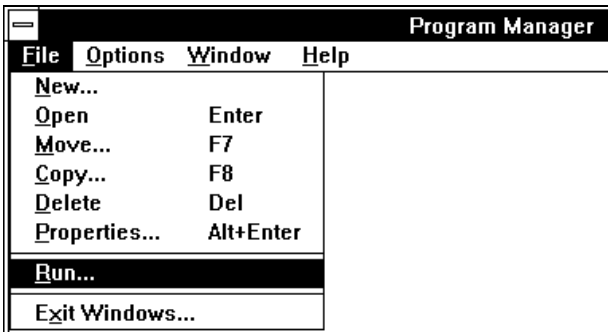


Then, “Copy another diskette (Y/N)?” is displayed.
Press [n] key.

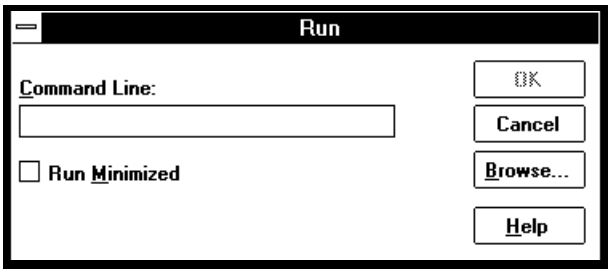
Close diskcopy window.

Copyright ©1998, Hitachi, Ltd.

<In case of Windows3.1>
Select (CL) the [File] in the 'Program Manager' window and select (DR) [Run...].
Input "diskcopy a: a: /v" in "Command Line" and select (CL) [OK].



"Insert SOURCE diskette in drive A:
Press any key to continue..." is displayed.
Insert CONFIG FD in FDD and press any key.
Then, "Reading from source diskette..." will be displayed.



"Insert TARGET diskette in drive A:
Press any key to continue..." is displayed.
Then, insert a new FD in FDD and press any key.

"writing to target diskette..." is displayed.
When configuration copying is finished,
"Do you wish to another duplicate of this disk (Y/N)?" is displayed.
Press [n] key.

Then, "Copy another diskette (Y/N)?" is displayed.
Press [n] key.

4 Machine Installation/De-installation Procedure

Flowchart

1. Power OFF of Disk Subsystem ---------- [DKCREP04-20 through 30]

↓

2. Disconnection of External Cable ---------- [DKCREP04-40 through 100]

↓

3. Disconnection of DKC
   - 3.1 Disconnection between DKC and First DKU -------- [DKCREP04-110 through 210]
   - 3.2 Disconnection between DKC and Second DKU----- [DKCREP04-220 through 310]

↓

4. Connection of New DKC
   - 4.1 Connection between DKC and First DKU ---------- [DKCREP04-320 through 460]
   - 4.2 Connection between DKC and Second DKU-------- [DKCREP04-470 through 550]

↓

5. Connection of External Cable---------- [DKCREP04-560 through 650]

↓

6. Power ON of Disk Subsystem ---------- [DKCREP04-660 through 680]

↓

7. Connection of SCSI and DKUMN Cables ---------- [DKCREP04-690 through 710]

4.1 Power OFF of Disk Subsystem

(1) Power off procedures are shown below. Refer to the details and start the operation.

a. [Case as custom engineer operates]

Turn the "REMOTE/LOCAL" switch on the CE panel PCB to "LOCAL".
Turn the "POWER ON/OFF" switch on the CE panel PCB to "OFF".

[Case as that operate from CPU]

Turn the "REMOTE/LOCAL" switch on the CE panel PCB to " REMOTE ".
Turn off the power supply from CPU.

Note : CE Panel has three types in difference of appearance.

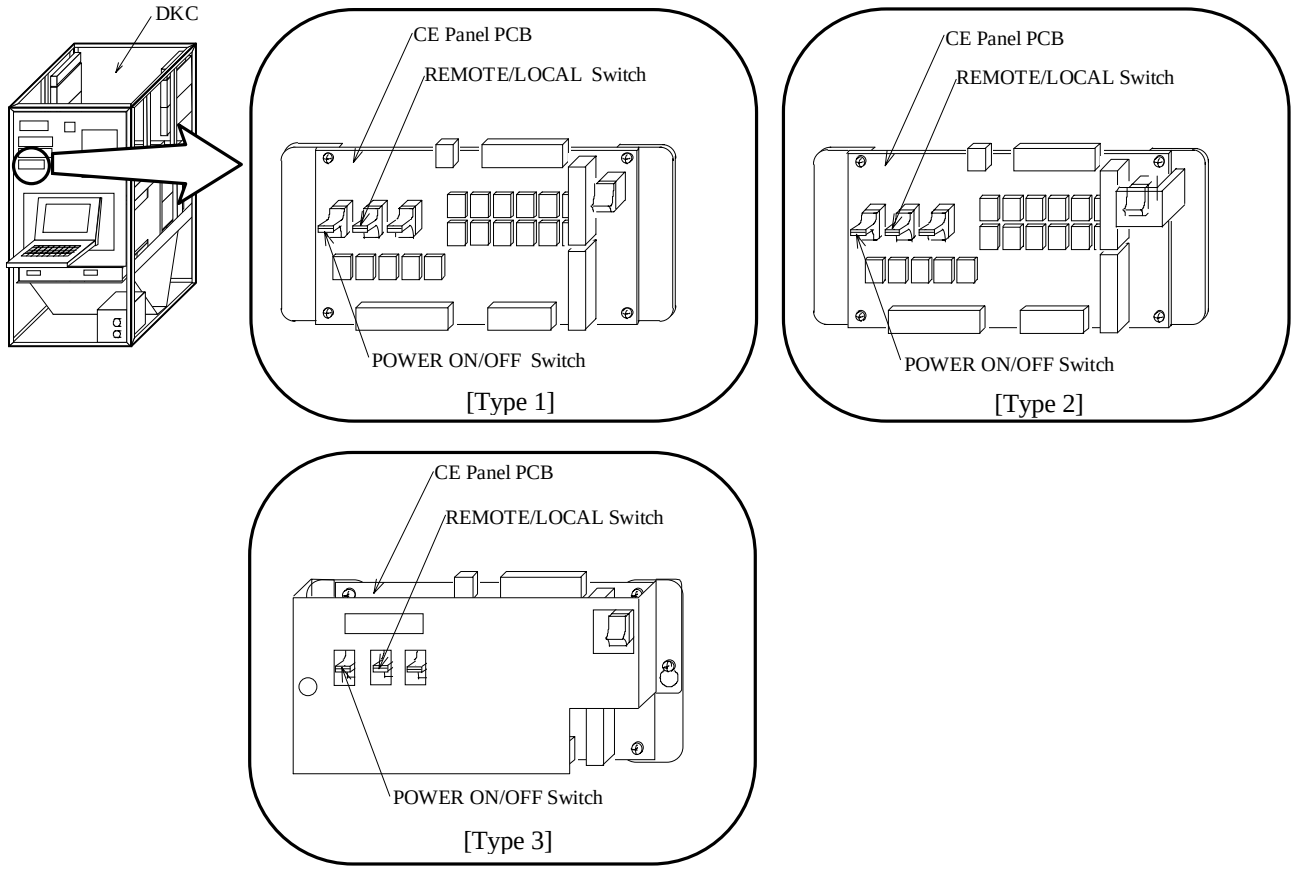

Fig. 4-1 CE Panel PCB

Copyright ©1998, Hitachi, Ltd.

b. Turn off the main circuit breaker at the AC Box on the Disk Unit.

Notice : Stop the SVP before turning off the circuit breaker in the location of AC BOX-R10. (See the SVP section)

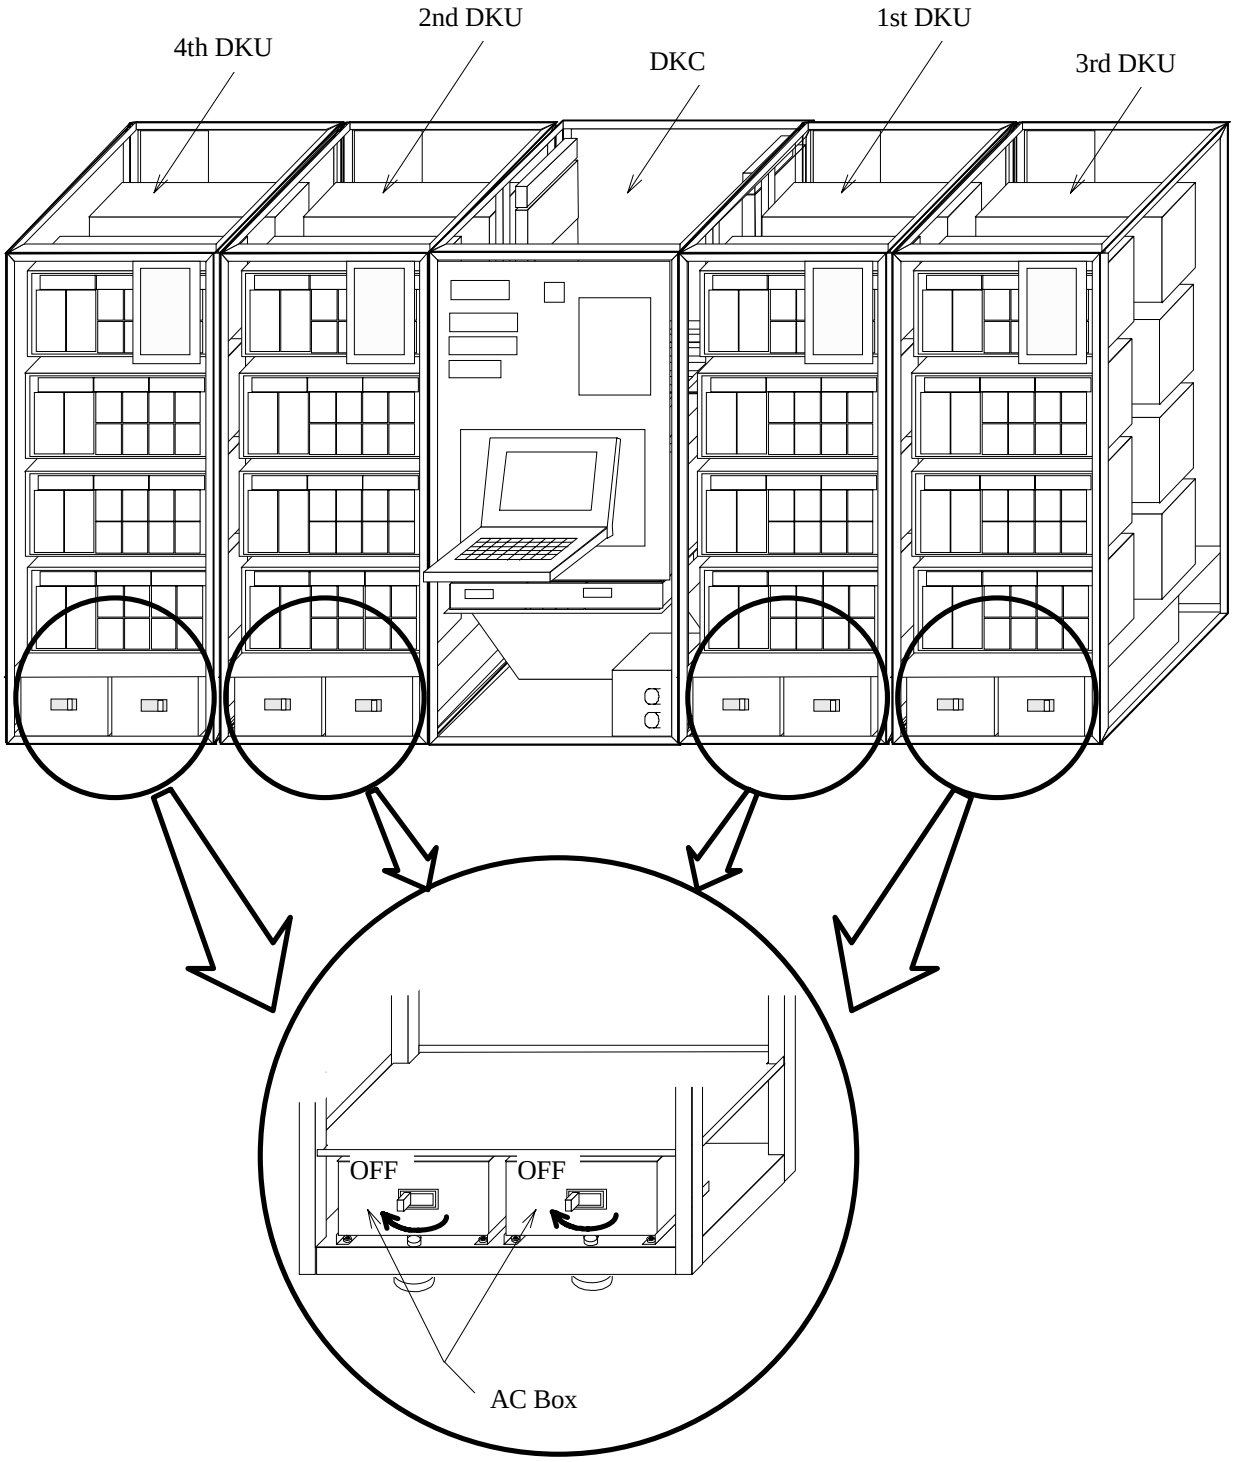

Fig. 4-2 Main Circuit Breaker on AC Box

c. Turn off the main circuit breaker at the distribution board that supplies DKU with a power.

4.2 Disconnection of External Cable

4.2.1 Disconnection of AC Cable

4.2.1.1 DKC210IU/DKU205IU

⚠ DANGER

The DKC and the first DKU commonly have Two Main Disconnect Devices (Two Main Breaker CB101s for Dual Power Lines) so that AC Power of the unit can be supplied from the separate power distribution board with Two Power Supply Cords. Similarly, each of the 2nd DKU, the 3rd DKU and, the 4th DKU also has Two Main Disconnect Devices.
Observe all instructions described in this manual before connecting the equipment to the power source and before servicing.

A. Connection of Power Supply Cord
The unit has two power supply cords with attachment plug type R&S 3760 or 3760PDG. Be sure to prepare the following socket receptacles and power cords between the power distribution board of the building and the attachment plugs for the unit.

Socket Receptacle : R&S 3754 or 3934
Power Cord : Type ST or equivalent, shielded type, with four min. #8 AWG conductors. Terminated at one end with an assembled on above socket receptacle cap.

B. Requirements to Branch Circuit
This unit relies on the building installation for protection of the internal components of the equipment. Each line (R/S/T line) should be protected by a short circuit protective device and by an overcurrent protective device rated 30 amp on building installation.
The protective device on building installation shall comply with the NEC requirements (or CEC requirements when installed in Canada), and if a protective device interrupts a conductor, it shall also interrupt all other supply conductors.
This protection is not required for the neutral line of this unit.

C. Disconnection from Power Supply
Each unit has Two Main Disconnect Device (Two Main Breaker CB101s for Dual Power Lines).
To remove all utility power from the unit, turn off both main disconnect device CB101s at the same time.

4.2.1.2 DKC210IE/DKU205IE

⚠ DANGER

The DKC and the first DKU commonly have Two Main Disconnect Devices (Two Main Breaker CB101s for Dual Power Lines) so that AC Power of the unit can be supplied from the separate power distribution board with Two Power Supply Cords. Similarly, each of the 2nd DKU, the 3rd DKU, and the 4th DKU also has Two Main Disconnect Devices.
Observe all instructions described in this manual before connecting the equipment to the power source and before servicing.

A. Connection of Power Supply Cord

The unit has two power supply cords. Be sure to prepare the following socket receptacles and power cords between the power distribution board of the building and the power cords for the unit.

Socket Receptacle : As shown in the following figure.
Power Cord : Type H07RN-F or equivalent, with five 6.0 mm 2 conductors. Terminated at one end with an assembled on above socket receptacle cap.

Be sure to connect a power cord to the distribution box as illustrated in the following figure. The wrong connection of neutral line may cause damages or fire of the equipment.
To reduce the risk of wrong connection, you should use approved type attachment plug and socket for power cord connection.
High leakage current may be caused between the power supply and this unit. To avoid an electric shock by high leakage current, perform the protective earth connection before the supply connections and disconnect it after the supply connections.

B. Requirements to Branch Circuit

This unit relies on the building installation for protection of the internal components of the equipment.
Each line (R/S/T line) should be protected by a short circuit protective device and by an overcurrent protective device rated 30 amp on building installation.
The protective device on building installation shall be comply with National Standards of the country where the units shall be installed, and if a protective device interrupts a conductor, it shall also interrupt all other supply conductors.
This protection is also required for the neutral line of this unit.

C. Disconnection from Power Supply

Each unit has Two Main Disconnect Device (Two Main Breaker CB101s for Dual Power Lines).
To remove all utility power from the unit, turn off both main disconnect device CB101s at the same time.

4.4 Connection of New DKC

4.4.1 Connection between DKC and First DKU

(1) Loosen the repeat binders which secure the DKUMN cables, the SCSI interface cables and the AC power cables for the Disk Controller.

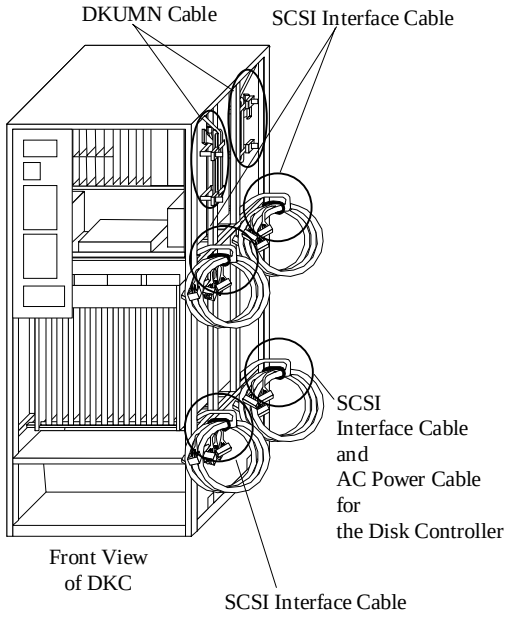

Fig. 4.4.1-1 Loose of repeat binders

Copyright ©1998, Hitachi, Ltd.

(2) Pass the DKUMN cables, the SCSI interface cables and the AC power cables for the Disk Controller through the First DKU frame. Refer to Fig. 4.4.1-2. Be extremely careful not to pinch the inter-frame cable when coupling the frames to each other.

Notice : Move the DKC and the DKU as being careful of floor cut.

a. Attach the DKC to First DKU.

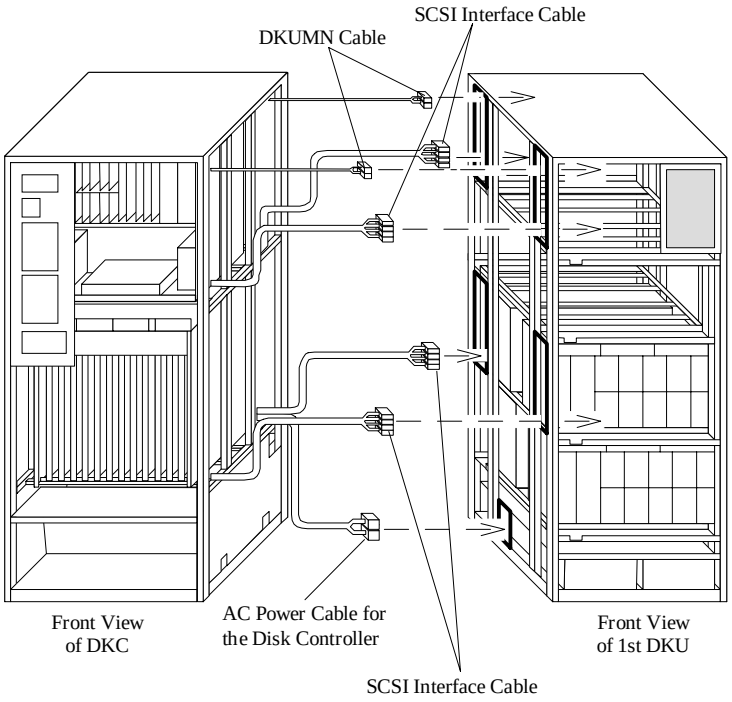

Fig. 4.4.1-2 Attachment of DKC

Copyright ©1998, Hitachi, Ltd.

(3) Install the DKC.

a. Lower the screw jacks until the frame is 57 mm (2.25 in.) from the floor before connecting the frames.

b. Level the device as shown on Fig. 4.4.1-3.

c. When adjusting the cabinet height, make sure that there is a clearance of approximately 2.5 mm (0.1 in.) between the casters and the floor.

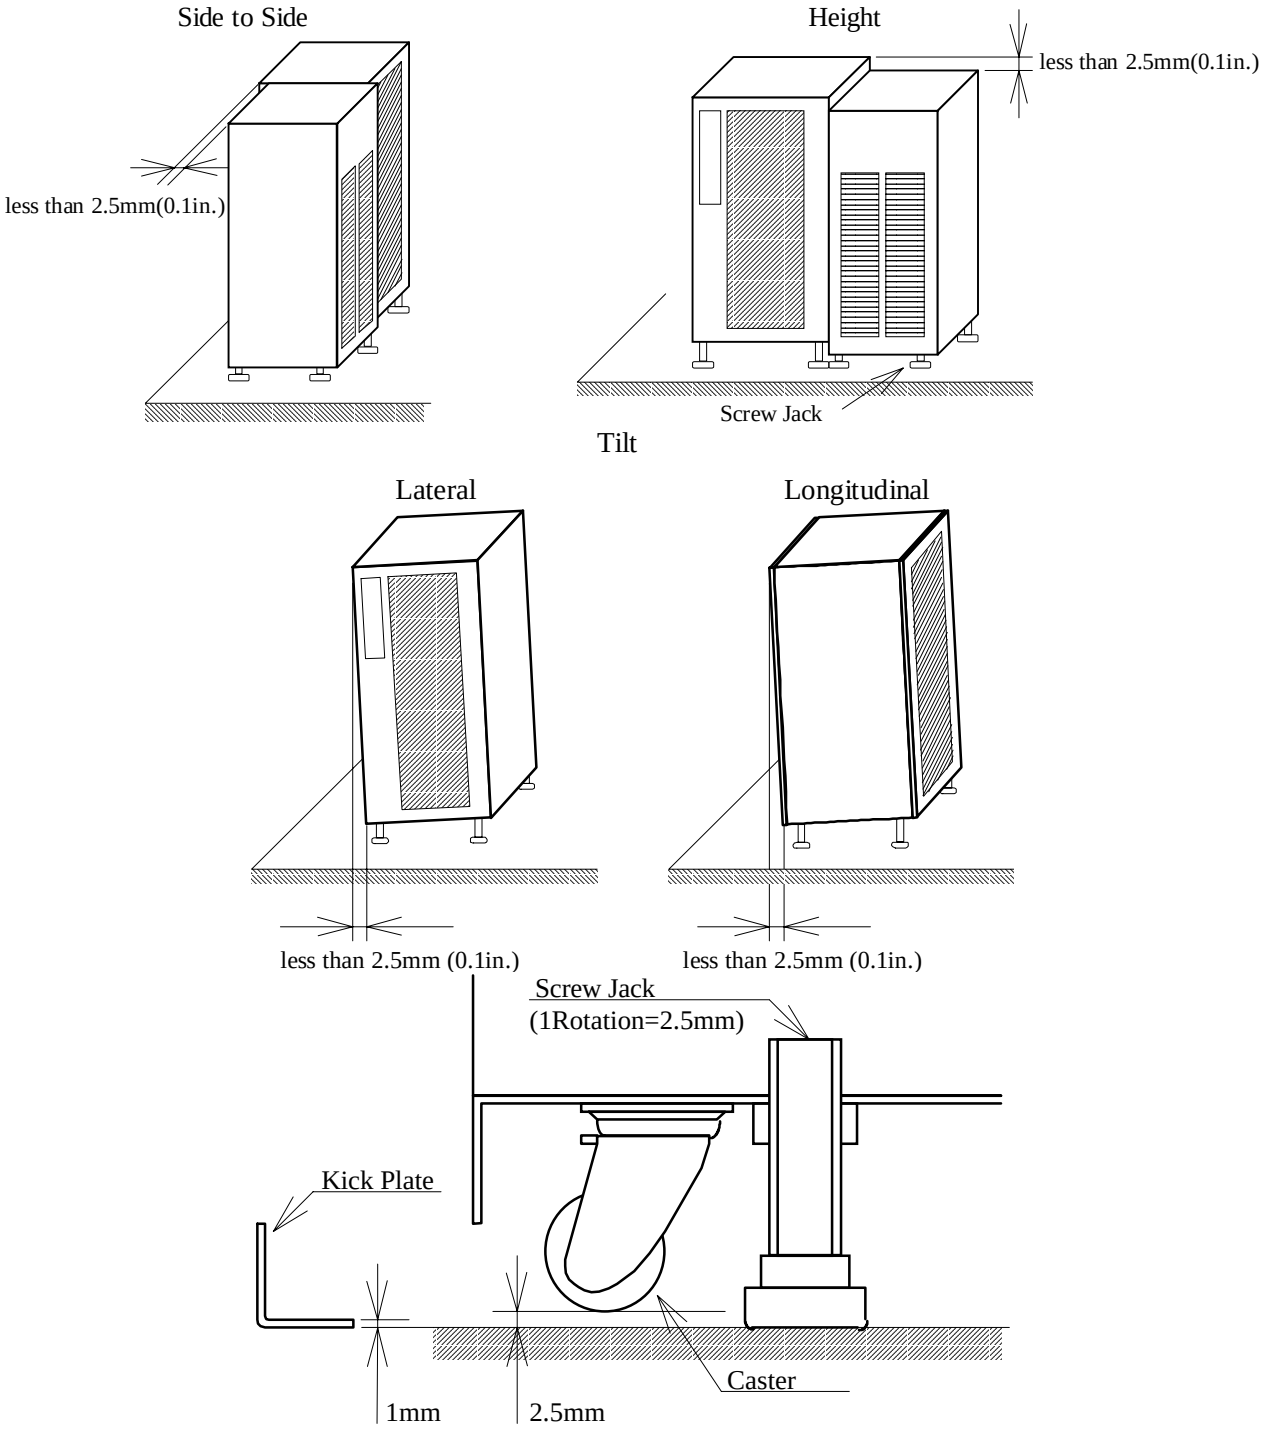

Fig. 4.4.1-3 Unit layout, Height, and Tilt

Copyright ©1998, Hitachi, Ltd.

(4) Connect the Connecting Bolt.

a. Loosen the four screws (M3) and the two screws (M4), remove the Front Logic Box Cover from the Disk Controller Unit.

b. Loosen the two screws (M3) and remove the cover (frame) 2.

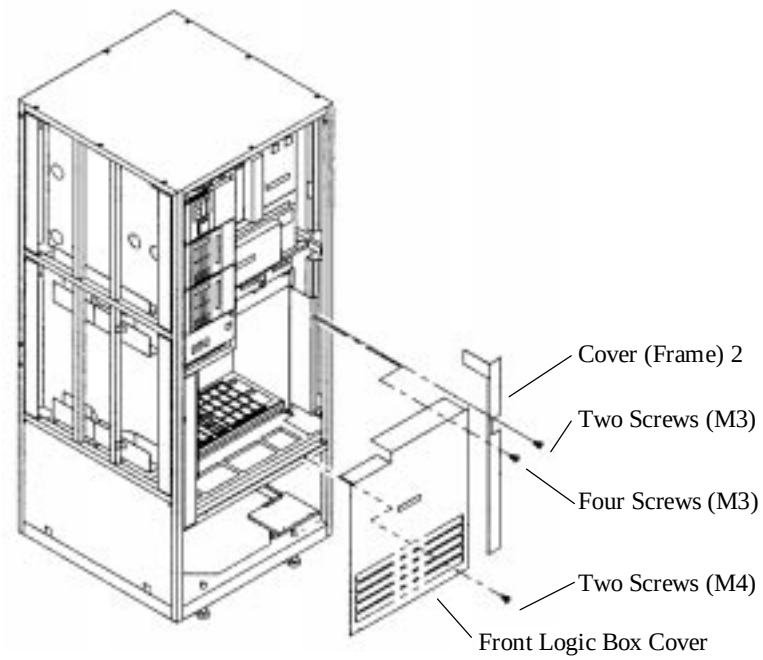

Fig. 4.4.1-4 Removal of Covers (DKC front side)

c. Loosen the four screws (M3) and the two screws (M4), remove the Rear Logic Box Cover.

d. Loosen the two screws (M3) and remove the cover (frame) 1.

(6) Attach the frame ground cable.

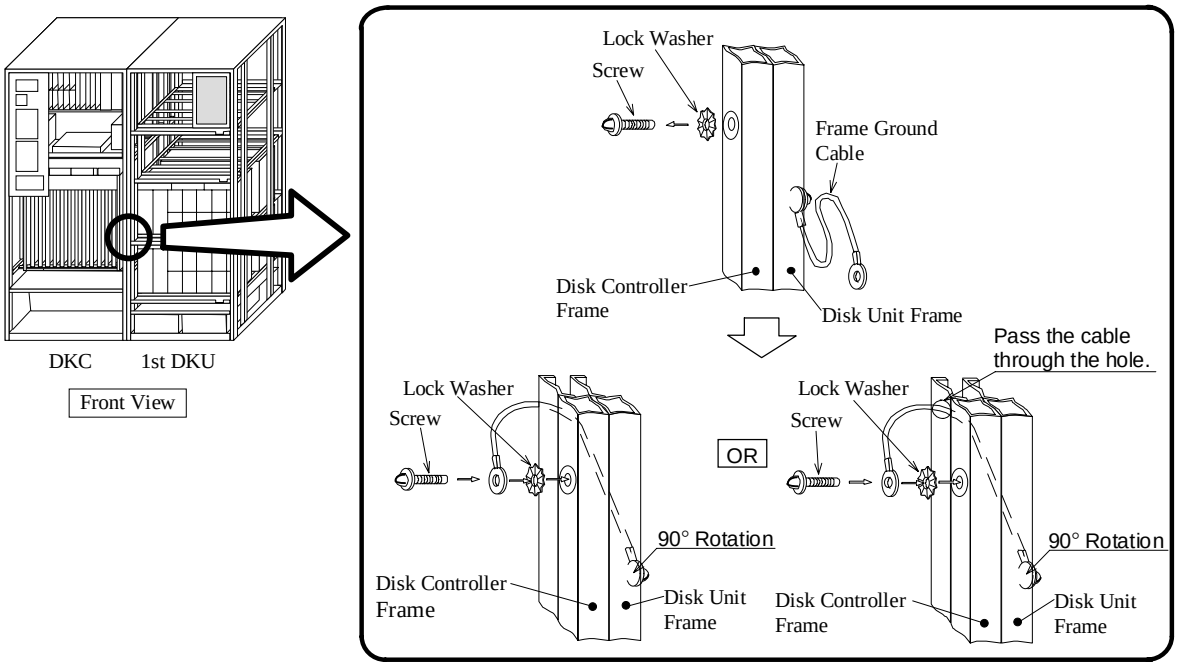

Fig. 4.4.1-9 Attachment of Frame Ground Cable

(7) Install the kick plate.

Notice : Contact the Kick Plate to the floor to prevent static electricity.

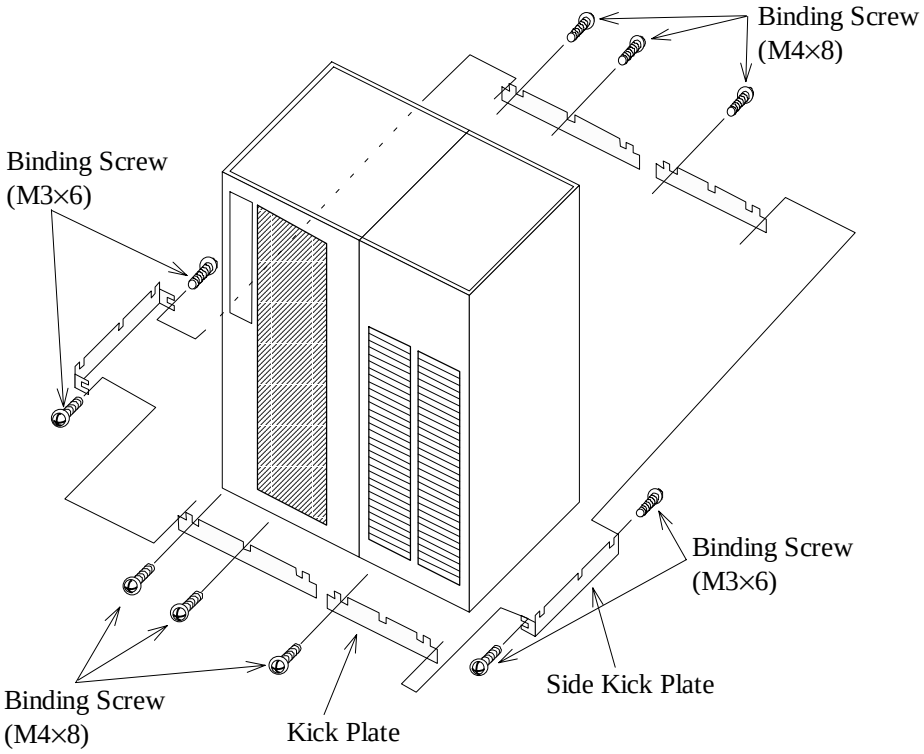

Fig. 4.4.1-10 Installation of Kick Plate

Copyright ©1998, Hitachi, Ltd.

(8) Remove the screw for transporting the movable rack.

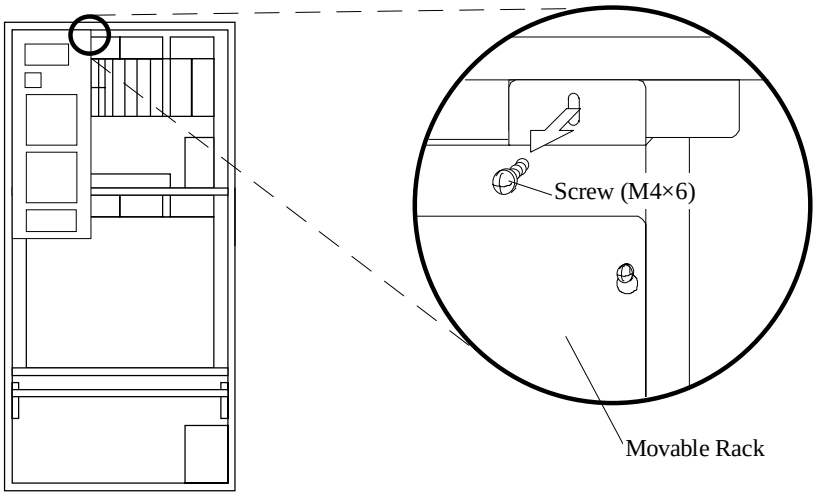

Fig. 4.4.1-11 Removal of Screw for Transporting the Movable Rack

Note : The screw for transporting the movable rack (screw M4×6) should be stored in the place of installation for future use in taking out and transporting the unit.

Copyright ©1998, Hitachi, Ltd.

(9) Installation of Switches and Jumper Plugs

Be sure to wear your wrist strap and attach to ground prior to performing the following work. This will insure that the IC and LSI on the PCB are protected from static electricity.

a. Install the jumper plugs in the CE PANEL PCB as indicated in the table below.

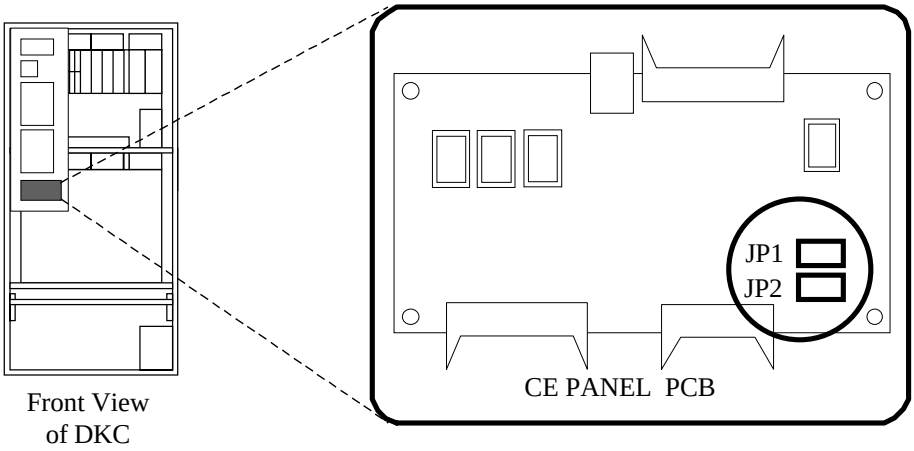

Fig. 4.4.1-12 Installation of Jumper Plugs in CE PANEL PCB

Table 4.4.1-1 Installation of Jumper Plugs in CE PANEL PCB

No.	Description	Installing status JP1 and JP2
1	When power is controlled from the host(at least one PCI cable attached to JP1-JP8 on PCI CONN PCB), set the jumpers as shown.	2	When power is not controlled from the host, no PCI cable attached to JP1-JP8 PCI CONN PCB or to disable the EPO of host, set the jumpers as shown.

4.5.1.2 DKC310IE/DKU205IE

⚠ DANGER

The DKC and the first DKU commonly have Two Main Disconnect Devices (Two Main Breaker CB101s for Dual Power Lines) so that AC Power of the unit can be supplied from the separate power distribution board with Two Power Supply Cords. Similarly, each of the 2nd DKU, the 3rd DKU, and the 4th DKU also has Two Main Disconnect Devices.
Observe all instructions described in this manual before connecting the equipment to the power source and before servicing.

A. Connection of Power Supply Cord

The unit has two power supply cords. Be sure to prepare the following socket receptacles and power cords between the power distribution board of the building and the power cords for the unit.

Socket Receptacle : As shown in the following figure.
Power Cord : Type H07RN-F or equivalent, with five 6.0 mm 2 conductors. Terminated at one end with an assembled on above socket receptacle cap.

Be sure to connect a power cord to the distribution box as illustrated in the following figure. The wrong connection of neutral line may cause damages or fire of the equipment.
To reduce the risk of wrong connection, you should use approved type attachment plug and socket for power cord connection.
High leakage current may be caused between the power supply and this unit. To avoid an electric shock by high leakage current, perform the protective earth connection before the supply connections and disconnect it after the supply connections.

B. Requirements to Branch Circuit

This unit relies on the building installation for protection of the internal components of the equipment. Each line (R/S/T line) should be protected by a short circuit protective device and by an overcurrent protective device rated 30 amp on building installation.
The protective device on building installation shall be comply with National Standards of the country where the units shall be installed, and if a protective device interrupts a conductor, it shall also interrupt all other supply conductors.
This protection is also required for the neutral line of this unit.

C. Disconnection from Power Supply

Each unit has Two Main Disconnect Device (Two Main Breaker CB101s for Dual Power Lines).
To remove all utility power from the unit, turn off both main disconnect device CB101s at the same time.

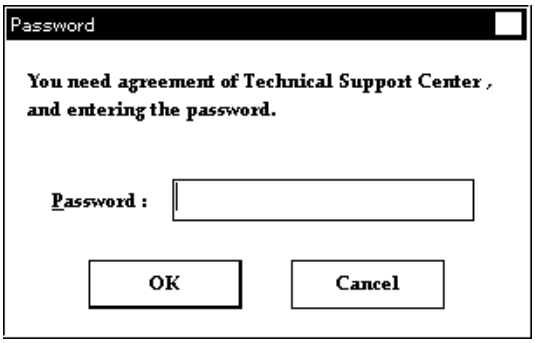
5 Procedure of loading Configuration information to FD (used in new DKC)

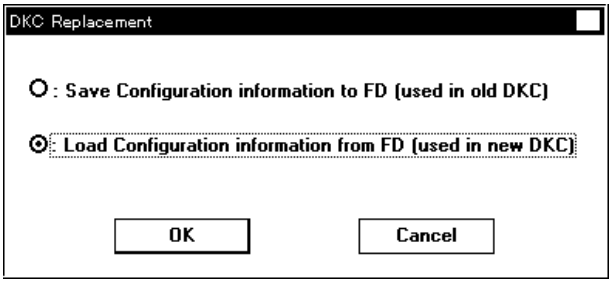
(1) Change the mode to [Swap Mode]
- Select “Shift” + “Ctrl” + “Alt” + “P”.
- Enter the password and select (CL) [OK].
- Select (CL) [Install].

(2) <DKC REPLACEMENT>
Select (CL) [DKC REPLACEMENT].

(3) Enter the password and select (CL) [OK].
Password is needed for this operation.
Please call Technical Support Center to obtain password and authorization.

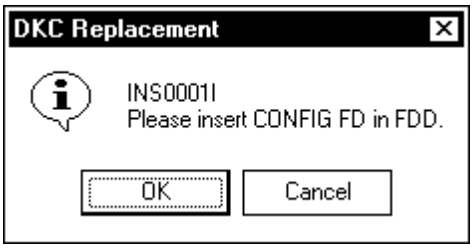


(4) Select (CL)
“Load Configuration information from FD (used in new DKC)” and select (CL) [OK] in the ‘DKC Replacement’ window.

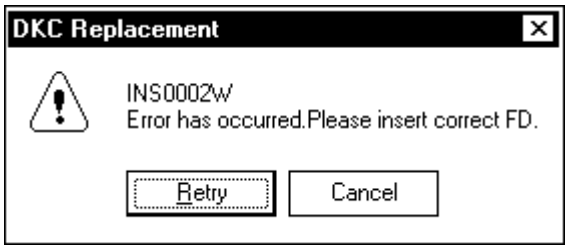


Copyright ©1998, Hitachi, Ltd.

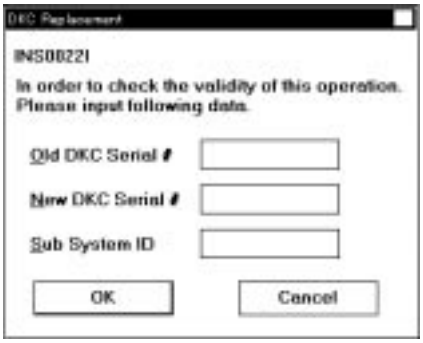
(5) Please insert CONFIG FD in FDD.
After select (CL) [OK].



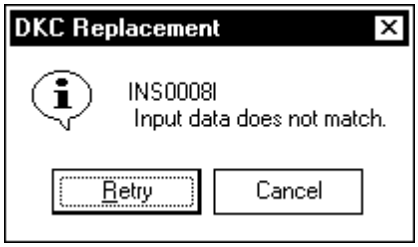
<Error case>
Please insert correct FD.
After select (CL) [Retry].



(6) Please input DKC serial# and SSID.
After select (CL) [OK].



<Error case>
Input data does not match.
Select (CL) [Retry].



Copyright ©1998, Hitachi, Ltd.

(7) “Checking Subsystem...” is displayed.

(8) <Micro program exchange>
“Now Reading subsystem configuration...” is displayed.

<Error case>
“ON exchanging a micro-program, An error has occurred. Processing is stopped.”

(9) “Executing internal P/S OFF and ON automatically...” is displayed.

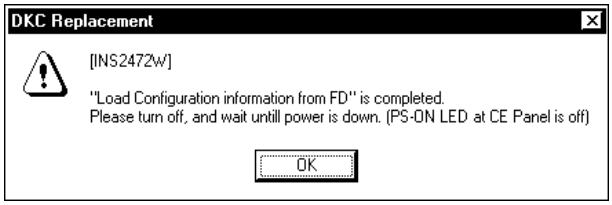
(10) “Now Down Loading...[***]” (*** : PCB location) is displayed.

Copyright ©1998, Hitachi, Ltd.

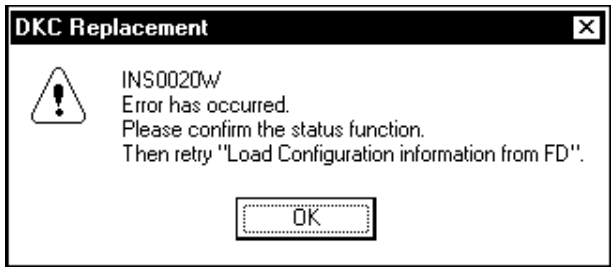
(11) “Now MP Rebooting... Group# n/N” is displayed.
All processors are recovered.

(12) “Reading subsystem configuration...” is displayed.

(13) Please turn off, and until power is down.
(PS-ON LED at CE Panel is off)
After you have done this operation, select (CL) [OK].



<Error case>
Select (CL) [OK].
Please confirm the status function.



(14) Close the ‘Install’ window.

7 DKC Change (DKC300 to DKC300)

7.1 Abstract

Purpose of DKC change is to enable user's LDEV/PDEV resources to be continuously used when the DKC is exchanged.

7.2 Measures to attain the purpose

Information to be handed over is saved on an FD by the SVP of the former subsystem and installed by the SVP of the new subsystem.

7.3 Old subsystem configuration restrictions

No.	Condition/restriction	Detail	Restriction guard
1	Subsystem configuration	Only for RAID300 subsystem	
2	STATUS of subsystem	• The switching is allowed even if a failed part or a PIN exist. • The switching is not allowed if a Correction copy or Drive copy is running. • The switching is not allowed if a Verify function is running. • Micro-code version must be changed to supported version.	If the restriction is violated, the FD is not supported. An SVP pre-check error will occur.
3	HDD type	• There is no restriction.	
4	RAID level	• There is no restriction.	
5	Cache configuration	• There is no restriction.	
6	Emulation type	• There is no restriction.	

Copyright ©1998, Hitachi, Ltd.

7.4 New subsystem configuration restrictions

No	Condition/restriction	Detail	Restriction guard
1	A failed part or a blocked part status.	• CHA/DKA/Cache/Terminator/SM, etc. must be all normal status. • LDEV/PDEV/SCSI can be Blocked.	If the restriction is violated, the FD is not supported. An SVP pre-check error will occur.
2	Cache configuration	• Cache capacity must be the same as that of the old subsystem. • Cache SIMM size and its location must be the same as those of the old subsystem.	Restriction is violated, configuration information error will occur (SSB, SIM or blocked parts). Configuration information must be checked by technical support.
3	SM configuration	• SM capacity must be the same as that of the old subsystem. • SM SIMM size and its location must be the same as those of the old subsystem.	
4	Number of CHA/DKA PCBs and their locations	• Number of CHA/DKA PCBs and their locations must be the same as those of the old subsystem.	
5	Number of Channels and their locations	• Number of channels and their locations must be the same as those of the old subsystem.	
6	Number of Cache PCBs and their locations	• Number of Cache PCBs and their locations must be the same as those of the old subsystem.	

7.5 Restrictions of configuration expansion

There are no restrictions.

7.6 The kind of reported SSB and SIM (Only when a SCSI cable and an environment monitor cable don't connect it.)

SIM CODE	contents	Note
ac50	HDU power off.	An influence by the un-connection of the SCSI cable.
bfxx	Environmental Error.	An influence by the un-connection of the environment monitor cable.
ffe7	Shared memory is volatilized.	An influence due to breaker Off/on.

Error Code	contents	Note
001d	From FM, to SM, micro-transfer practice	At the time of the Shared Memory volatile mode.
32cc	HDU power off.	An influence due to breaker Off/on.
a47c	A SCSI Cable cutout is removed.	
aec9	The status injustice of SPC interrupts.	
ae57	BUS DEVICE RESET	
ae5c	DRIVE LED NG.

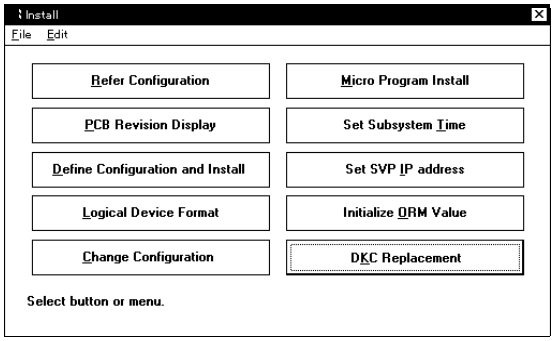
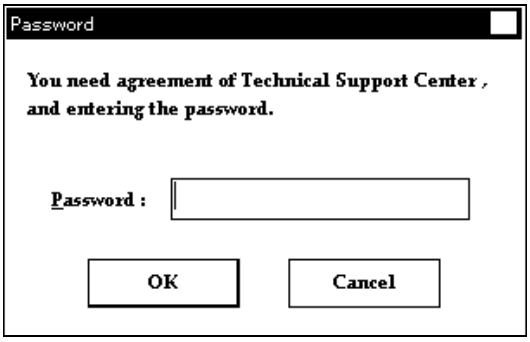
9 Procedure of saving configuration information to FD for DKC Change

(1) Change the mode to [Swap Mode].
- Select “Shift”+“Ctrl”+“Alt”+“P”.
- Enter the password and select [OK] (CL).
- Select [Install] (CL).

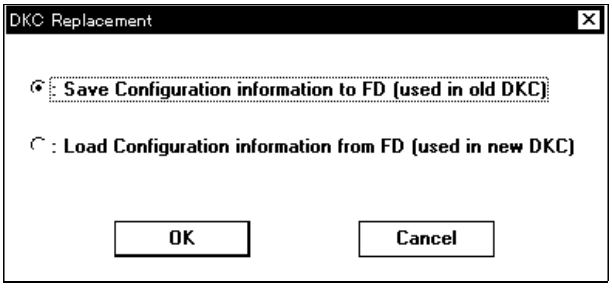
(2) <DKC REPLACEMENT>
Select (CL) [DKC REPLACEMENT].



(3) Enter the password and select [OK] (CL).
Password is needed for this operation.
Please call Technical Support Center to obtain password and authorization.

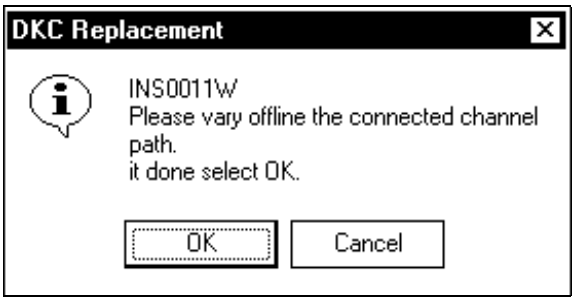


(4) Select (CL) “Save Configuration information to FD (used in old DKC)” and select (CL) [OK] in the [DKC Replacement] window.

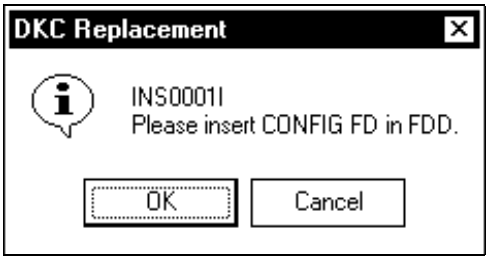


Copyright ©1998, Hitachi, Ltd.

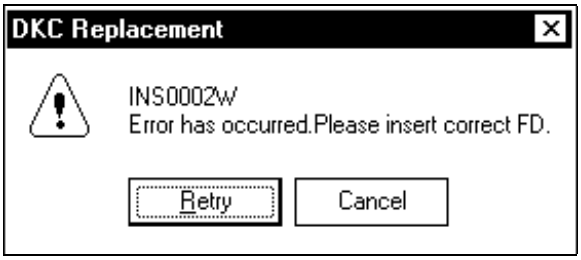
(5) Please vary connected channel paths offline.
After you have done this operation, select(CL) [OK].



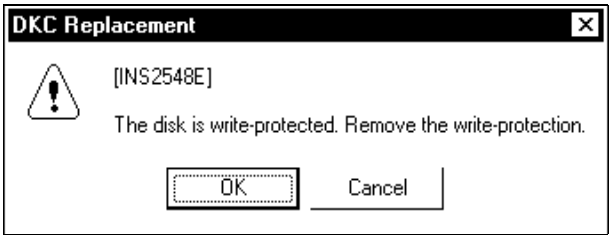
(6) Insert CONFIG FD in FDD.
Then select(CL) [OK].



<Error case>
Insert correct FD.
Then select(CL) [Retry].



<Error case>
Remove the write-protection.
Then select(CL) [OK].



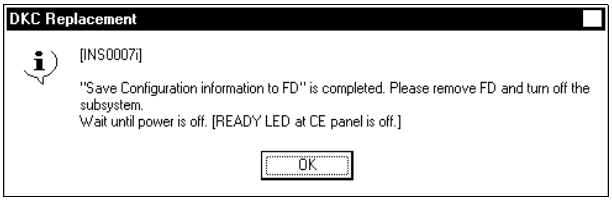
Copyright ©1998, Hitachi, Ltd.

(7) “Checking Subsystem...” is displayed.

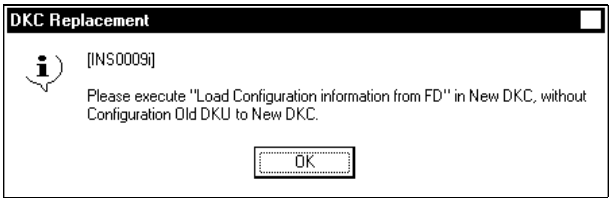
(8) “Reading the subsystem configuration data...”is displayed.

<Error case>
“Communication error has occurred.”
“Operation is rejected by DKC.”

(9) Remove FD and turn off the subsystem.
Wait until power is off.
Then select(CL) [OK].



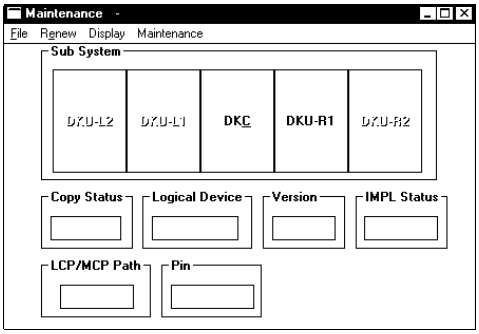
(10) Select(CL) [OK].
Note: Do not connect the old DKU to the new DKC.



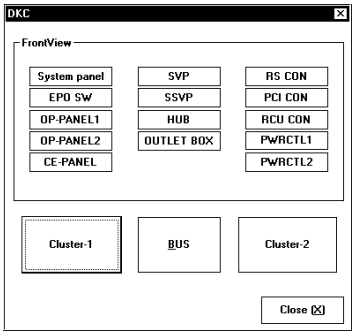
Copyright ©1998, Hitachi, Ltd.

10 Procedure of Micro-program replacement to SVP

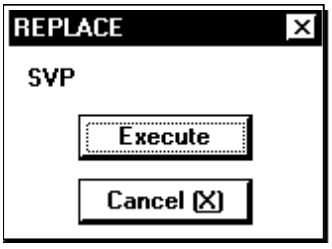
(1) <Maintenance window>
'Maintenance' window is displayed by 'Modify Mode'.
In the 'Maintenance' window, check and select (CL) [DKC] to be replaced.



(2) <Select [SVP] >
Select (CL) part [SVP] to be replaced from 'DKC'.

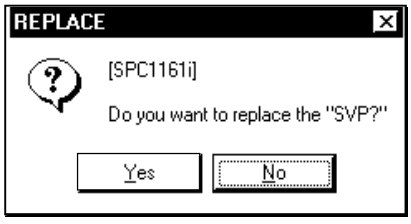


(3) <Execute>
Select (CL) [Execute].



NOTICE
When the screen prompting an operator to input a password in order to prevent a multiple maintenance, contact the technical support center to ask for an instruction.

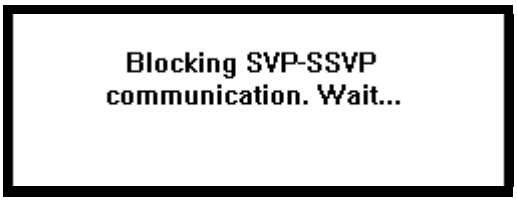
(4) <Check beginning of [SVP] Replacement>
Select (CL) [Yes] in response to "Do you want to replace the "SVP? "".



Copyright ©1999, Hitachi, Ltd.

(5) <Check the starting of [SVP] Replacement>
Select (CL) [OK] in response to the message shown on the right.

(6) The message “Blocking SVP-SSVP communication. Wait...” is displayed.



The message “Blocking DKC-SVP communication. Wait...” is displayed.

(7) The message “This will end SVP operation. Replace SVP after turning off.” is displayed. Select (CL) [OK], so SVP is turned off automatically.

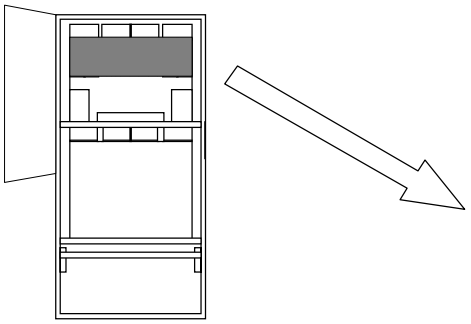
Copyright ©1999, Hitachi, Ltd.

(8) <Disconnect the RS232C cable>

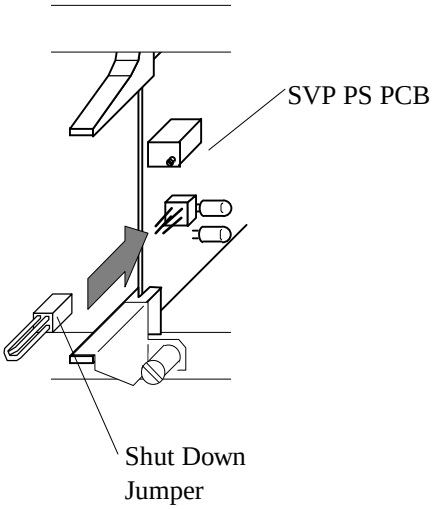
(8-1) Power Off SVP

① Insert the Shut Down Jumpers in SVPPS1 and SVPPS2.

② Wait for one minute.



Front View of DKC



Front PS Box

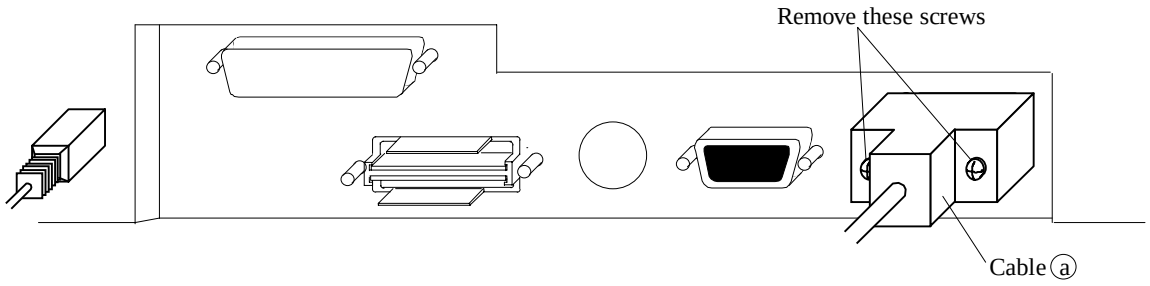
		SVP PS 2	BAT CTR 20	BAT CTR 21	BAT CTR 22						
		KL	JL	HL	GL						

(8-2) Disconnect the RS232C cable from the SVP

① Disconnect the ⓐ (RS232C cable) from the SVP



Rear View of SVP

(8-3) Remove the Shut Down Jumpers in SVPPS1 and SVPPS2.
(Power on SVP)

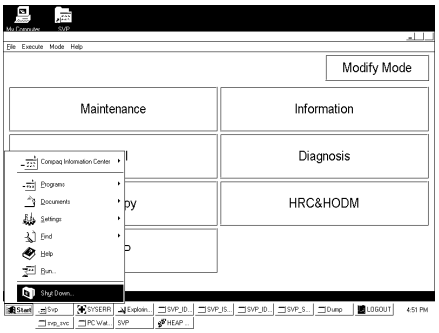
Copyright ©1999, Hitachi, Ltd.

(9) <Restart the computer in MS-DOS mode>

(9-1) <Shut Down Windows>

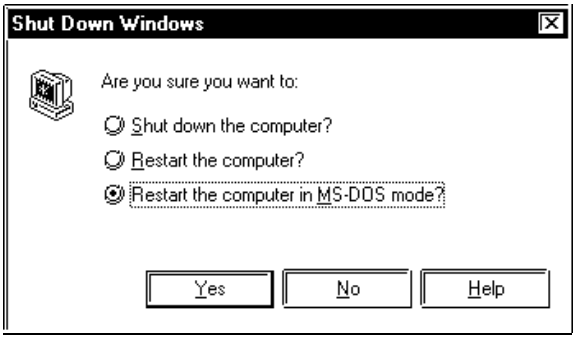
Select (CL) [Start].

Select (CL) [Shut Down].



(9-2) <Restart the computer in MS-DOS mode>

Select “Restart the computer in MS-DOS mode” from Shut Down Windows, and select (CL) [Yes] in response to “Are you sure you want to:”.



(10) <Installation of Micro-program>

NOTICE
Do not Micro-program replacement to SVP for 20 minutes after turning AC Power on.
The SSVP may power off and power on the SVP in order to recover.

① Insert the floppy disk of (1/24 or 1/31) into the FDD.
② Input “a:\setcopy.bat” in ‘DOS prompt’, and press the [Enter] key.
③ When the message “SET FD NO. (2/24 or 1/31)” is displayed, insert the floppy disk of (2/24 or 1/31) into the FDD and press the [Enter] Key.
④ Copy the remaining floppy disks ((3/24 or 3/31) through (24/24 or 31/31)) in succession in response to the displayed messages.
⑤ When the message “SET FD NO. (1/24 or 1/31)” is displayed, insert the floppy disk of (1/24 or 1/31) into the FDD and press the [Enter] key.
⑥ Remove the floppy disk of (1/24 or 1/31) from FDD.

(11) <Copy the SVP information to HD>

① Insert the floppy disk of (1/24 or 1/31) into the FDD.
② Input “a:\pcconf.bat” in ‘DOS prompt’ and press the [Enter] key.
③ The message “"pcconf" change START!!” is displayed, when the message “"pcconf" change END!!” is displayed, file copy, is complete.
④ Press the [Enter] key, and remove the floppy disk of (1/24 or 1/31) from the FDD.

Copyright ©1999, Hitachi, Ltd.

(12) <Reboot the SVP>

① Reboot the SVP by [Alt], [Ctrl], and [Del] keys simultaneously.

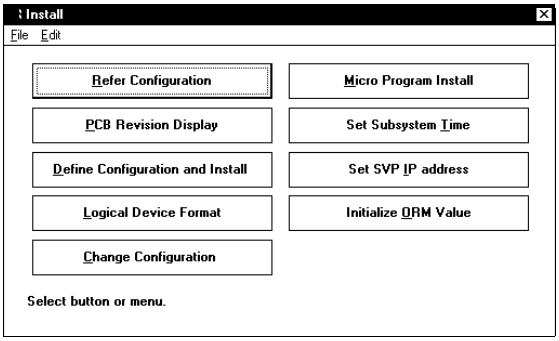
(13) <Set IP address of SVP>

(13-1) <Open [Install]>

Select (CL) [Install] from 'SVP'.

(13-2) <Select [Set Subsystem IP Address...]>

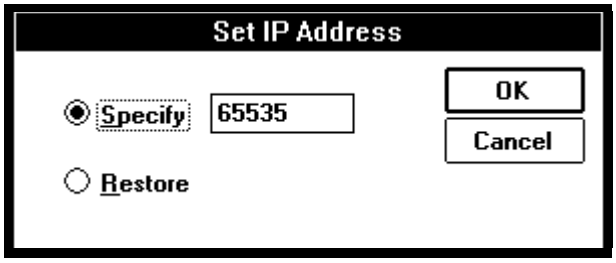
Select (CL) [Set Subsystem IP Address...] from 'Install'.



(13-3) <Set IP Address>

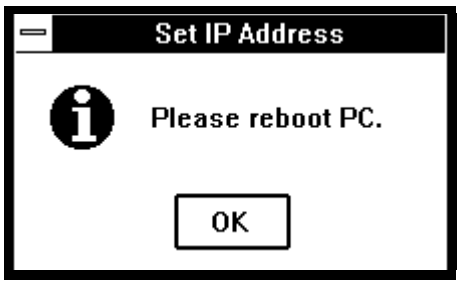
Select (CL) [Specify], Enter "Serial No.".

Select (CL) [OK].



(13-4) <Check SVP reboot>

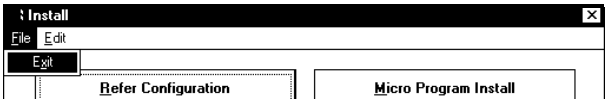
Select (CL) [OK].



(13-5) <Select [Exit]>

Select (CL) [File].

Select (CL) [Exit].



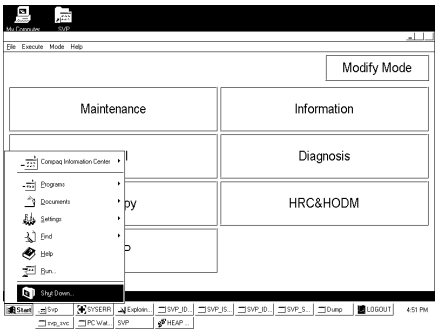
Copyright ©1999, Hitachi, Ltd.

(14) <Reboot the SVP>

(14-1) <Shut Down Windows>

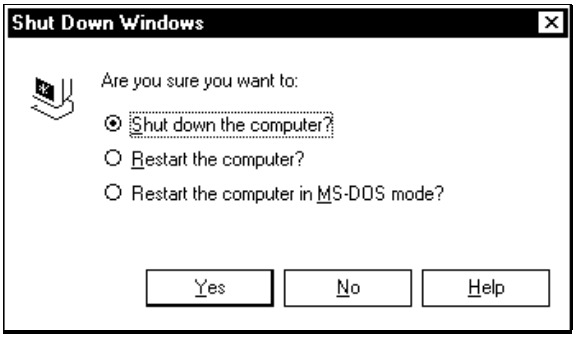
Select (CL) [Start].

Select (CL) [Shut Down].



(14-2) <Shut down the SVP>

Select (CL) “Shut down the computer?” from Shut Down Windows, and select (CL) [OK] in response to “Are you sure you want to:”.



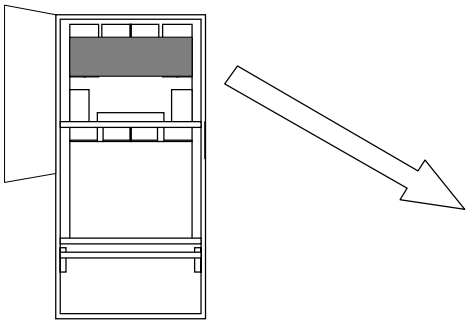
Copyright ©1999, Hitachi, Ltd.

(15) <Connect the RS232C cable>

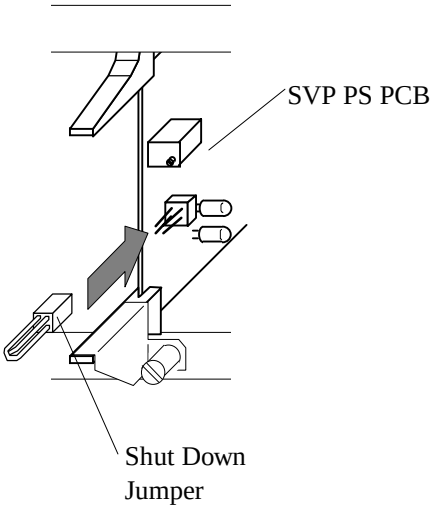
(15-1) Power Off SVP

① Insert the Shut Down Jumpers in SVPPS1 and SVPPS2.

② Wait for one minute.



Front View of DKC

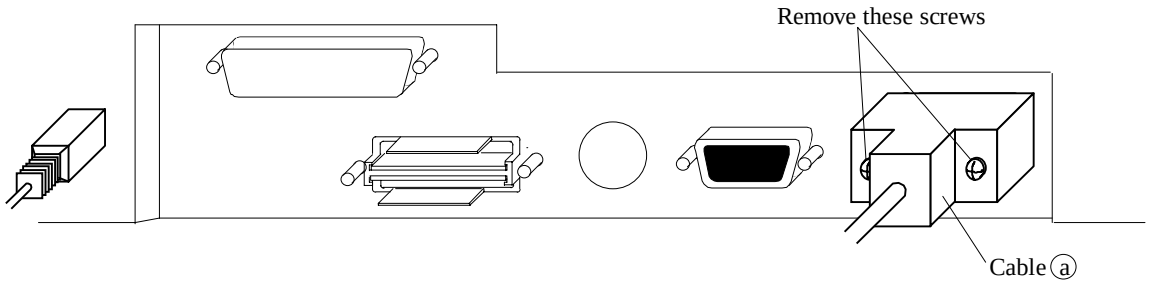


Front PS Box

N	L	KU	JU	HU	GU	F	E	D	C	B	A
MPS 10	MPS 11	SVP PS 1	BAT CTR 10	BAT CTR 11	BAT CTR 12	PWR CTR 1	SSVP	HUB	PWR CTR 2	MPS 20	MPS 21
		SVP PS 2	BAT CTR 20	BAT CTR 21	BAT CTR 22						
		KL	JL	HL	GL						

(15-2) Connect the RS232C cable from the SVP

① Connect the ⓐ (RS232C cable) from the SVP



Rear View of SVP

(15-3) Remove the Shut Down Jumpers in SVPPS1 and SVPPS2.
(Power on SVP)

Copyright ©1999, Hitachi, Ltd.

(16) <Load the Configuration from the SM to the SVP's HDD>

(16-1) <Open [Maintenance]>

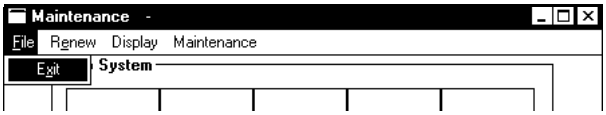
Wait a few minutes, message "Loading SVP Program... SVP requests to DKC can not be performed presently. Please wait..." will be extinguished.
Then select (CL) [Maintenance] form 'SVP'.

(16-2)

Check "Connection error occurred SVP-DKC." is not displayed.
If "Connection error occurred SVP-DKC" is displayed, see TRBL05-70.

(16-3) <Select [Exit]>

Select (CL) [File] from the "Maintenance".
Select (CL) [Exit].



(17) <SSVP Reset>

Press the "SSVP ALARM RESET" switch (see ㉚ on page LOCATION03-40).
Open the "Maintenance" window and wait until the initializing SSVP message ceases to be displayed (for about 15 minutes).

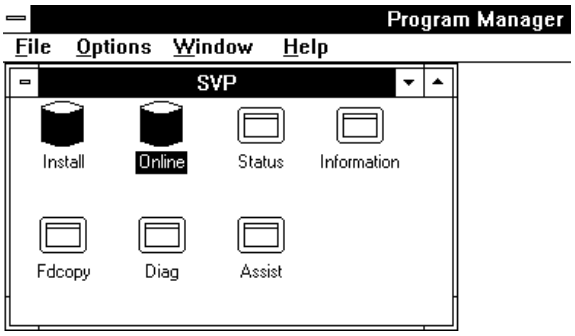
(18) <SIM Complete>

See SVP02-500.

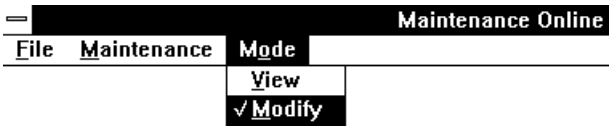
Copyright ©1999, Hitachi, Ltd.

11 Procedure of checking System Option Mode (RAID200)

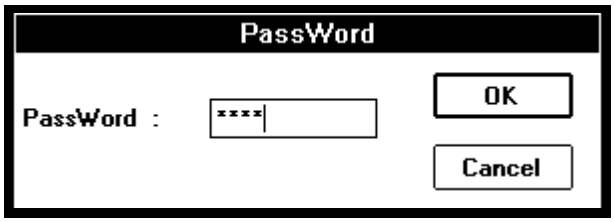
(1) Select (DC) the [Online] icon in the 'SVP' window.



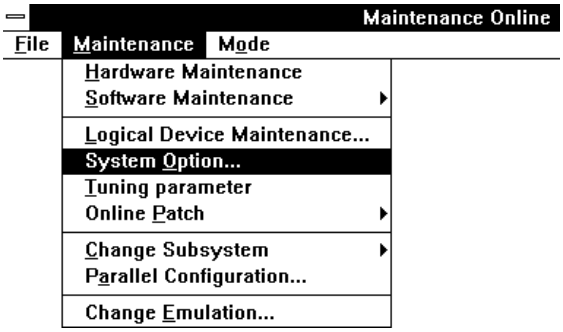
(2) Select (CL) the [Mode] menu in the 'Install' window and select (DR) [Modify].



(3) Put down the following keys at one to input in the password and. Select (CL) [OK].
"[CTL]", "[Shift]" and "[D]".

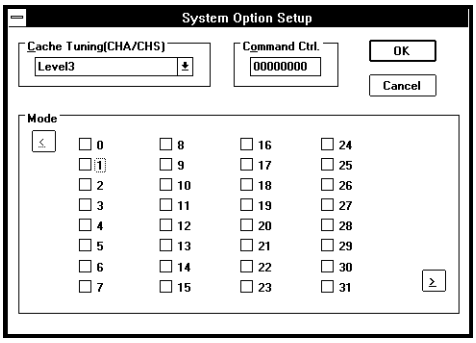


(4) Select (CL) the [Maintenance] menu in the 'Online' window and select (DR) [system Option].

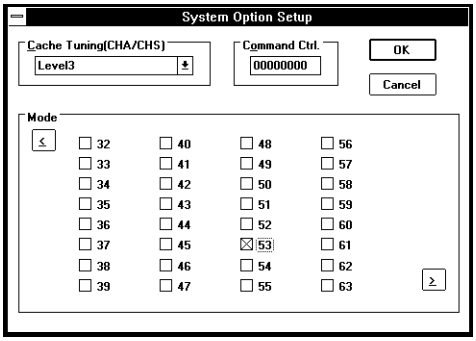


Copyright ©1999, Hitachi, Ltd.

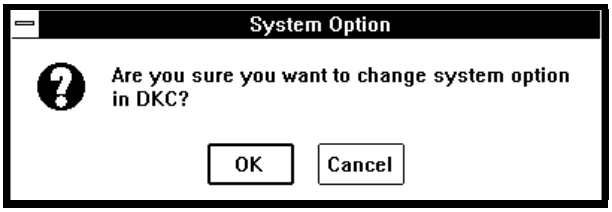
(5) Select (CL) [Up >].



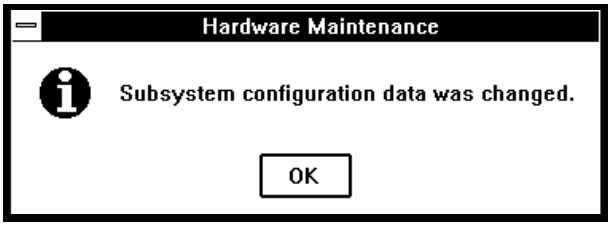
(6) Check whether the 'Mode 53' is being marked.
If 'mode 53' is being marked, remove the mark of 'mode 53', and select (CL) the [OK], to (7).
If 'mode 53' is not being marked, select (CL) the [Cancel], to (9).



(7) Select (CL) the [OK].

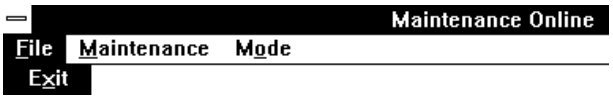


(8) System option setup finished after following the message is displayed with select (CL) the [OK].



Copyright ©1999, Hitachi, Ltd.

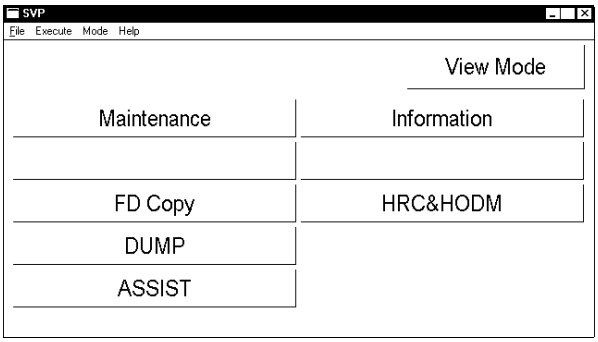
(9) Select (CL) the [File] menu in the ‘Online’ window and select (DR) [exit].
(Close Online window.)



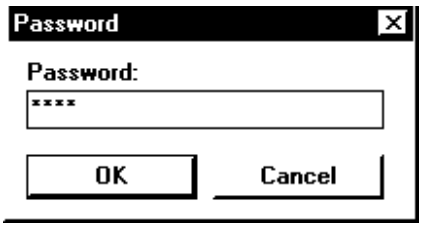
Copyright ©1999, Hitachi, Ltd.

12 Procedure of setting System Option Mode (RAID300)

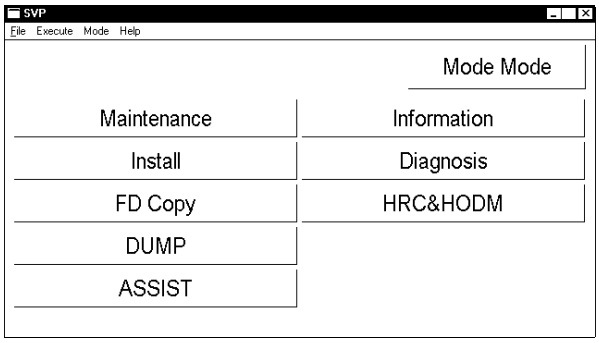
(1) Make it on the screen which shows SVP in the following.



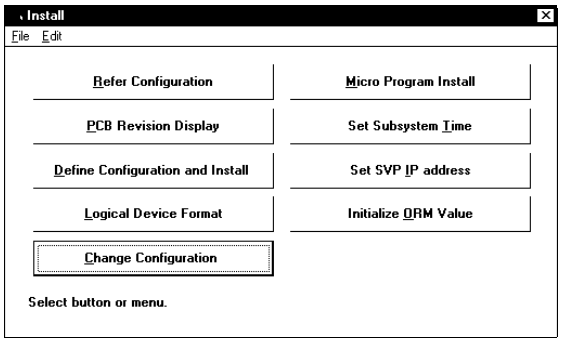
(2) Put down the following keys at one to input in the password and. Select (CL) [OK].
"[CTL]", "[Shift]" and "[D]".



(3) Select (CL) the [Install].

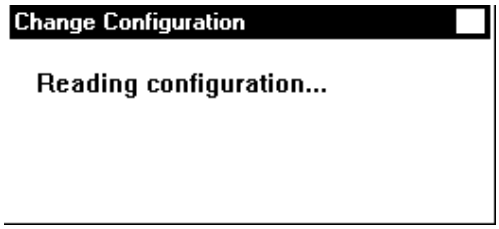


(4) Select (CL) the [Change Configuration].

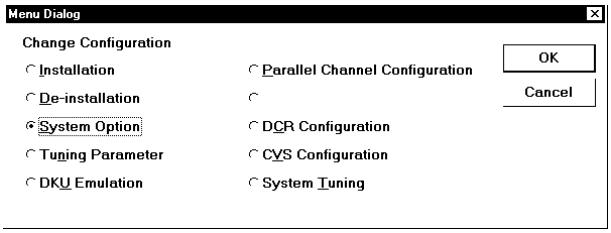


Copyright ©1999, Hitachi, Ltd.

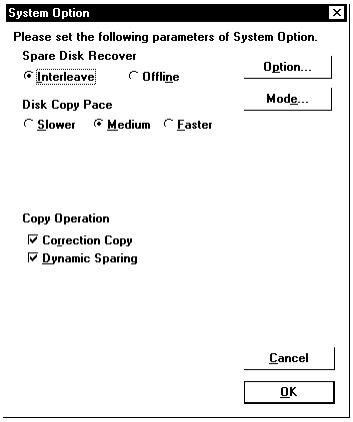
(5) “Reading configuration...” is displayed.



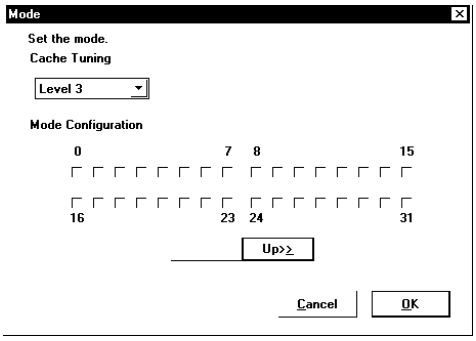
(6) Select (CL) the [System Option] and select (CL) [OK].



(7) Select (CL) the [Mode] and select (CL) [OK].

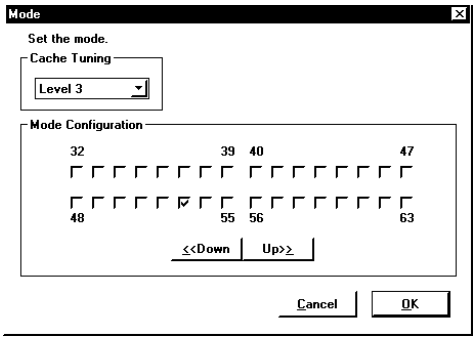


(8) Select (CL) the [Up>>].
the message is displayed with select (CL) the [OK].

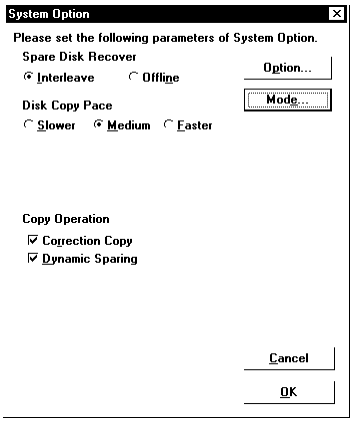


Copyright ©1999, Hitachi, Ltd.

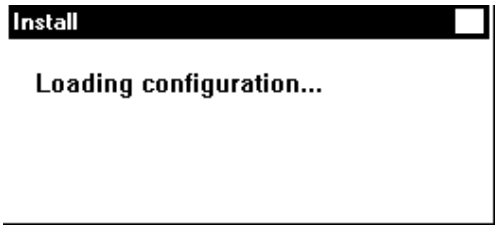
(9) Select (CL) the [Mode 53] and select (CL) [OK].



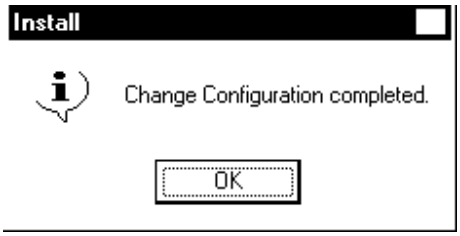
(10) Select (CL) [OK].



(11) “Loading configuration...” is displayed.

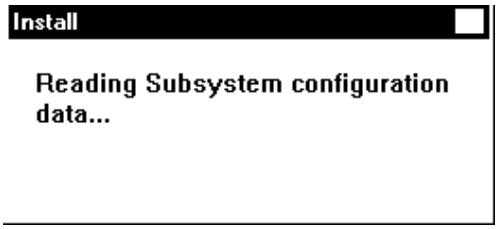


(12) “Change Configuration completed” is displayed.
Select (CL) [OK].



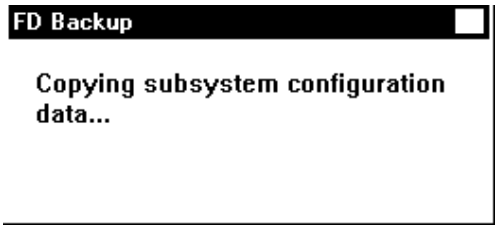
Copyright ©1999, Hitachi, Ltd.

(13) “Reading Subsystem configuration data...” is displayed.

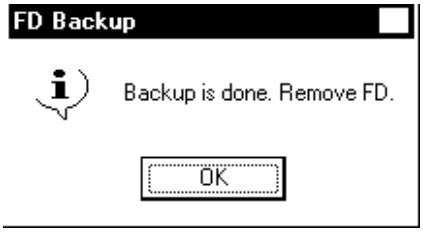


(14) “Please insert config FD in FDD.” is displayed.
Insert ‘RAID300 CONFIG FD’ in FDD, Select (CL) [OK].

(15) “Copying subsystem configuration data...” is displayed.



(16) “Backup is done, Remove FD.” is displayed.
Remove ‘RAID300 CONFIG FD’ from FDD,
Select (CL) [OK].



Copyright ©1999, Hitachi, Ltd.

(17) Check system Option (Mode 53).
Perform procedure (4) to (8).
Confirm that ‘Mode 53’ is being marked.
Select (CL) the [Cancel], Return to ‘System Option’ screen.
Select (CL) the [Cancel], Return to ‘Install’ screen.

(18) Close the ‘Install’ window, change view Mode.

Byte	Bit	Name	Description
0	0	Command reject	1. Invalid command was received 2. The sequence of commands is invalid 3. The number of bytes sent by a CONTROL command is insufficient or the value is invalid 4. A WRITE command that violates the file mask and search conditions was received. 5. A WRITE command was received when the R/W switch was set to READ. (In this case, bit 6 of byte 1 (write inhibit) also becomes "1".) 6. The WRITE SPECIAL HA command does not permit a short byte. 7. An attempt to write an Rn record to a defective track was made. 8. No link is established for a defective or alternate track. 9. The command issued in the LOCATE domain does not match the operation specified by the LOCATE command. 10. The operation specified by the LOCATE command has violated the file mask. 11. An attempt was made to access an alternate track beyond the user cylinder during multi-track operation in the LOCATE domain. (File protected (bit 5 of byte 1) is set at the same time.) 12. The status of the cache/device does not meet the requirement of the SET SUB MD/PERF SUB FUNC command
	1	Intervention required	1. The addressed device is not READY. 2. The DKU is in the CE mode. 3. The addressed device is not physically connected
	2	Busout check	The data or command transferred from the channel has a parity error.
	3	Device check	A malfunction was detected in the subsystem. Details are indicated in Bytes 7 to 31.
	4	Data check	1. A correctable read error was detected in the data read from the device. (Bit 1 of byte 2 ("correctable") is set at the same time. The information for correction is indicated in sense bytes 15 to 23.) 2. An uncorrectable read error was detected in the data read from the device. 3. The end by the PCI fetch mode is indicated. Bit 1 of byte 2 ("correctable") is set at the same time and restart displacement is guaranteed. Error displacement and error pattern are 0.
	5	Overrun	1. A response to a data request or reconnection request could not be received within the predetermined time on the parallel channel. This error is reported with F/M=0A. 2. No response was made or an invalid frame was received when the serial channel was in a data transfer sequence; so, retry was impossible. 3. Command retry (overrun) was requested from the channel, but retry was impossible. This error is reported with F/M=0A. 4. Termination of overrun was requested from the channel. This error is reported with F/M=0A. Note: This bit is set on if ten overruns have occurred through command retry including the format write command. (Permanent error (bit 0 of byte 1) is not set.) If a data overrun has occurred with a WRITE command, data transfer is aborted immediately and (00H) is written till the end of that record.
	6	Not used	Always 0
	7	Incomplete domain	This bit is set if a short domain has been detected during a write in asynchronous transfer. Environmental data present (bit 3 of byte 2) is also set to '1'.
1	0	Permanent error	Command retry failed.

Copyright ©1997, Hitachi, Ltd.

Byte	Bit	Name	Description
1	1	Invalid track format	1. An index was encountered during a data write. (A data write beyond the track capacity was made.) 2. An index marker was detected in the key or data field when the READ or SEARCH command (except SCH ID) was handling a record. 3. An updating write was attempted for a record with a different size from the record size specified in TLF of the LOCATE command or the block length of the DEF EXT command. 4. The length of the data field of R0 was not 8 bytes during WRITE TRK operation.
	2	End of cylinder	An attempt was made to perform track switching from the last track of the logical cylinder by a READ or SEARCH command with multi-track specification. (End of cylinder is not reported in the LOCATE domain.)
	3	Message to operator	This bit is set to display an error to the operator.
	4	No record found	1. Two index markers were detected in the same command chain without intervention of a WRITE or SENSE command or a read operation that handles the HA or data field. 2. The target record searched for by a LOCATE command could not be detected. Imprecise ending (bit 7 of byte 1) is also set at the same time.
	5	File protected	1. A SEEK command has violated the file mask or extent range. 2. A READ or SEARCH command with multi-track specification has violated the file mask or extent range. 3. An attempt was made to access an alternate track beyond the user cylinder during multi-track operation in the LOCATE domain. (Command reject (bit 0 of byte 0) is also set at the same time.) 4. Multi-track operation was tried directly to an alternate track in the asynchronous mode. 5. The track set is out of the extent specified for WRITE ANY/READ ANY. 6. The LOCATE RECORD/LOCATE RECORD EXTENDED domain is out of extent.
	6	Write inhibit	1. A WRITE command was received when the R/W switch was set to READ. (Bit 0 of byte 0 (command rejection) also becomes “1”.) 2. Indicates that the write prohibition status has been established by the DIAG CTL command. (Bit 3 of byte 0 (device check) is also set at the same time.)
	7	Imprecise ending	Indicates that the error indicated in the sense byte is due to a command before the command that reported the unit check. (abnormal end in the LOCATE domain) Bit 5 of byte 2 is also set at the same time.
2	0	Request inhibit write	Requests issuance of a DIAG CTL command that instructs prohibition of a write through the path to avoid an error from which the path cannot recover. (At the same time, the faulty section is set in byte 25 “program action code”.)
	1	Correctable	Indicates that bit 4 of sense byte 0 (data check) can be corrected. Restart displacement, error displacement, and error pattern are indicated in bytes 15 to 23.
	2	First log mode error	The number of occurrences of seek/data errors exceeded the threshold. (Bit 3 of byte 2 (environmental data present) is also set at the same time.)
	3	Environmen-tal data present	Indicates that this SSB is not due to the current CCW chain but it is the statistics to be reported from the DKC to the host. The statistics include log information and reset notification.
	4	Not used	Always 0
	5	Imprecise ending	Same as bit 7 of byte 1
	6	Not used	Always 0
	7	Not used	Always 0

20	SSID of self subsystem							
21								
22	Symptom code (x'0F0X' : X = message code) (Note 3)							
23								

(Note 1)

(1) Issued command information when F/M=02

B\b	0	1	2	3	4	5	6	7
9	SCH ID	SCH KEY	Locate, LC EXT	SK, SK CYL	RD IPL	RECAL	SUSP MPR	RD C
10	DIAG CTL	DIAG CTL (LOC DOM)	DEF EXT	SET FM	SET SUB MODE	SP C	WR CKD	WR R0
11	SET INTF ID	DIAG CTL (PRE REM)	0	Other command	RD C chaining	All byte match	LC domain	Erase execute
12	Pseud through	0	0	Allow WR KD	Allow WR D	Allow WR CKD	Allow WR R0	Allow WR HA

(2) Short byte flag when F/M=03

x'0040 0000'

(3) Mask information when F/M=05

Byte 9 : Mask for write control
- x'00' : Allow all write operation except WR HA, WR R0.
- x'40' : Inhibit all write operation.
- x'80' : Allow update write operation.
- x'C0' : Allow all write operation.

Byte 10 : Mask for seek control
- x'00' : Allow all seek commands and RECAL.
- x'08' : Allow SK CYL and SK HD only.
- x'10' : Allow SK HD only.
- x'18' : Inhibit all seek command and multi operation.

Byte 11 : Mask for access
- x'00' : Allow normal access.
- x'02' : Allow device support.
- x'04' : Allow diagnostic access.
- x '06' : Allow device support inhibit data check correction and retry.

Byte 12 : Not used

(4) Record address when other F/M
Byte 9 and 10 : Cylinder address
Byte 11 : Head address
Byte 12 : Record number

(Note 2) Bit 4-7 of byte 18 : Type of byte 19
x‘08’ : Byte 19 is cylinder address (high).
x‘09’ : Byte 19 is cylinder address (low).
x‘0A’ : Byte 19 is head address (high).
x‘0B’ : Byte 19 is head address (low).
x‘0C’ : Byte 19 is record number.
Byte 19 : One byte of CCHHR.

(Note 3) x‘2F00’ for dummy SENSE

Reason code list for Format 0, Message F (1/2)

Code	Reason
00	No messages
01	An attempt was made to make a cache usable but the cache was in the pending status.
02	Not used
03	An attempt was made to forcibly make a cache unusable but he cache was not holding destage completion.
04	An attempt was made to activate a CFW but the CFW was in the ending status.
05	An attempt was made to perform caching for a device but a cache was in the pending status.
06	An attempt was made to destage a track but an NVS was in the failed status.
07	An attempt was made to make an NVS unusable but the NVS was being initialized.
08	An attempt was made to halt or discarded caching/DFW for a device but the DFW of the device was in the ailed status.
09	An attempt was made to forcibly halt a DFW of a device but the device was not in the following status. • The DFW was in the pending status. • The DFW was in the failed status. • An NVS was failed. The data was in the NVS but not in the cache.
0A	An attempt was made to make an NVS usable but a DFW of a device was in the pending or failed status.
0B	An attempt was made to make an NVS usable but the NVS was in the pending status.
0C	An attempt was made to halt caching/DFW of a device when an NVS was failed but the data of the device was in the NVS but not in the cache.
0D	An NVS was requested by a command but the NVS was unusable.
0E	A cache was requested by a command but the cache was unusable.
0F	Not used
10-24	Not used
25	(TPF,RC) A SSM command (subcommand: Make Cache Unavailable to Subsystem) was received while a cache storage initialization procedure was underway.
26-27	Not used
28	(TPF,RC) A PSF command (Order: Prepare for Read Subsystem Data, Suborder: X‘05’) was received when cache was not available or pending.
29	The PSF command of specific blocking status setting order was issued from an interface having no path group.
2A	An attempt was made to make a path group having parallel and serial channels intermixed.
2B	A message buffer is full.
2C-2F	Not used

Copyright ©1997, Hitachi, Ltd.

Reason code list for Format 0, Message F (2/2)

Code	Reason
30	(TPF,RC) The cache partition indicated by PSF command (Order: Prepare for Read Subsystem Data) was not initialized.
31-34	Not used
35	SET GUARANTEED PATH sub-command was issued to a path in a fence.
36-39	Not used
3A	(TPF,RC) Read or Search or Write commands were received while 3380 Track Compatibility Mode.
3B-3E	Not used
3F	An attempt was made to execute the MAKE NVS AVAIL FOR SUB sub-command but the NVS was disabled because the 'enable/disable NVS capability' has been set to 'disable' in a VPD.
40	Not used
41	An ordinary command was issued to a device being reserved for media maintenance.
42-7F	Not used
80	A specific command was issued on an interface which has been in the specific command blocking status by the SET SPECIAL INTERCEPT CONDITION order of the PSF command.
81	An attention was reported to an interface which has been in the specific command blocking status by the SET SPECIAL INTERCEPT CONDITION order of the PSF command.
82-8F	Not used
90	(TPF,RC) 1. A Locate Record Extended command was received on a 3990 that have ESCON channel capability. 2. A PSF command (one of these orders: Establish Duplex Pair, Terminate Duplex Pair, Suspend Duplex Pair, or Direct I/O to One Device of the Duplex Pair) was received. 3. A PSF command (Order: Prepare for Read Subsystem Data, Suborder: X'04') was received. 4. A PSF command (one of these orders: Prepare for Read Subsystem Data, Set Lock State, Purge Lock, Unlock, Connect, or Disconnect) was received in the case of MPLF feature was not installed.
91	(TPF,MPLF)Specified MPLP had not been initialized and the cache was not in an available status.
92	(TPF,RC) A SSS command was rejected because additional pinned data still existed.
93	(TPF,MPLF) A cache storage control command was received when Disconnect order was in progress for any MPLP.
94	(TPF,RC) Destage Modified Tracks order was received while a scan of the cache for modified data is underway, which was initiated from the receipt of a prior Destage Modified Tracks order.
95	(TPF,MPLF) The attention message buffer was full when the order which has the potential of generating attention interrupt was received.
96-FF	Not used
