

Section 1 - LAN Switching

ine.com

Task 1.3

- Configure Layer 2 EtherChannels on the trunks links between switches as follows:
 - SW1 and SW2 must not use any negotiation protocols.
 - SW1 and SW3 should negotiate using a Cisco proprietary aggregation protocol. SW1 must initiate the aggregation request and SW3 must only be able to respond and NOT be able to initiate the aggregation.
 - SW3 and SW4 should negotiate using a standard aggregation protocol. SW4 must initiate the aggregation request and SW3 must only be able to respond and NOT be able to initiate the aggregation. If any new links are added in the future and there is a conflict in resolving the active links, SW4 must be the deciding switch.
