# Task 1.7

- Configure R1 as the DHCP server for VLAN 250. Configure R2 to receive an IP address from this DHCP server. Configure SW2 port Gi1/0 as an access port and assign it to VLAN 250. R28 has been pre-configured as a rogue DHCP server. Ensure R2 does not receive an IP address from this rogue server but receives an IP address from the legitimate DHCP server R1. Your task is complete if R2 does not receive an IP address from the rogue server. Statically assign R2 interface Gi0/0 an IP address (100.0.1.2/24) before moving to the next task.
