

Section 2 - Dial Plan

ine.com

Task 2.2

- INE has decided to provide Cube redundancy for inbound or outbound SIP calls. Provision this request as per the following requirements:
 - Configure R1 and R2 to provide application redundancy for voice services. Use interface Gi3 on each router as the failover interface to exchange keepalive and state data between the active and the standby device. Use 192.168.1.1/24 for R1 and 192.168.1.2/24 for R2.
 - Under normal operations, R1 should be the active node and R2 should be the standby.
 - You must use Group 1 as your redundant group ID.
 - The active node will use virtual IP address 11.102.64.150 for Gi1 and 157.26.1.150 for Gi2.
