NIZPG: Network Internal Zone Paging Group Number 1-4 are used for MIZP All 4 must be in the same node for MIZP to function.

UGN: User Group Number

TELN: Telephone Number

CNT: Number of Telephone Number

L-1 Lamp Check

General Description

This feature allows the Attendant, by pressing the LCHK key, to light all lamps and sound the ATTENDANT CONSOLE [A-3] buzzer.

Operating Procedure

1. Attendant presses the Position Busy key. The LED lights.
2. Attendant simultaneously presses the L5, L6, and SRC key in Position Busy.

   Note: For Desk Console.

3. All lamps will light.

Service Conditions

1. Every Lamp Field, including the BUSY LAMP FIELD - FLEXIBLE [B-2], will be lit upon pressing of the three keys located on the ATTENDANT CONSOLE [A-3].
2. The Console Lamp Test displays the digit “8” in each field of the digital display.
3. When the keys are released, all lamps and Digit Display Fields are immediately restored to normal.

Programming

No programming is required.

L-3 Line Lockout

General Description

This feature provides for the automatic release of a station from the common equipment when it has remained off-hook for longer than the usual interval before dialing. The system may be programmed to return a Howler Tone to the analog station in the line lock-out mode.

Operating Procedure

For Line Lock-out

1. User goes off-hook and receives Dial Tone.
2. After approximately 12 seconds, if the user has not initiated dialing, he receives Reorder Tone.
3. After 30 seconds of Reorder Tone, the station is automatically placed into the line lock-out state.
4. Upon replacing the handset, the station is released from the line lock-out state and operation returns to normal.

For Line Lock-out with Howler Tone

1. User goes off-hook and receives Dial Tone.
2. After approximately 12 seconds, if the user has not initiated dialing, he receives Reorder Tone.
3. After 30 seconds of Reorder Tone, a Howler Tone is sent to the station.
4. Upon replacing the handset, the station is released from the Howler Tone State and operation returns to normal.

Service Conditions

1. A station in the line lock-out state can neither receive nor originate calls.
2. This feature is provided on a system-wide basis.
3. The Attendant cannot activate any feature to a station in the line lock-out state.
4. After 30 seconds of Reorder Tone, the station is automatically placed into line lock-out, if the system is not provided with Howler Tone Service.
5. Howler Tone should not be used with OPX lines.
6. Howler Tone can be provided or denied on a system-wide basis.
7. Howler Tone is only sent to analog stations.
8. When using OFF-HOOK ALARM [O-6] (ASYD, SYS1, Index 168, Bit 4=1), Howler Tone cannot be sent to the Guest Room of the Hotel System.

Interactions

1. When the BUSY LAMP FIELD - FLEXIBLE (BLF) [B-2] feature is invoked, the associated station status lamp on the ATTENDANT CONSOLE [A-3] will flash, indicating the Telephone Number is in line lock-out.
2. CALL FORWARDING - DON'T ANSWER [C-2, 3]: A call cannot extend a lock-out station via CALL FORWARDING - DON'T ANSWER [C-3].
3. BUSY VERIFICATION [B-3]: Busy verification of a locked-out station results in Reorder Tone being heard by the Attendant.

4. NIGHT CONNECTION - FLEXIBLE/FIXED [N-1, 2] with TAS [T-8] feature not active: When the Night station is in a lock-out state, calls directed to the Night station will receive Ringback Tone. If the TAS [T-8] feature is active, calls are directed to the Night Bell.
5. CALL WAITING [C-12, 31]: Call Waiting cannot be activated on a station in lock-out. The calling party will receive Reorder Tone.
6. CALL HOLD [C-6]: From a Special Dial Tone State, line lock-out will occur if a user attempting to place a station on hold dials the CALL HOLD [C-6] access code and partially dials any number. The sequence prior to lock-out is: interdigit time-out for six seconds, Reorder Tone for 30 seconds, optional Howler Tone for 30 seconds. When the station in lock-out goes on-hook, it will be rung by the station on hold. The Busy Lamp Field will not flash
7. EXECUTIVE RIGHT-OF-WAY [E-1]: Reorder Tone will be returned to a calling party that is attempting Executive Override toward a station in lock-out.
8. THREE-WAY CALLING [T-2]: An attempt to establish a Three-Way Conference with a station in lock-out will result in the Reorder Tone being returned to the user making the attempt. The user can return to the station on hold by switch hook flashing.
9. With the following calls, when a user fails to hang up after the other party has disconnected, the station will be placed in a lock-out condition after a 30-second Reorder Tone (time-out), optional 30-second Howler Tone Warning (time-out):

    DIRECT INWARD DIALING (DID) call [D-8]
    STATION-TO-STATION CALLING call [S-11]
    Trunk-to-Station call
    Attendant-to-Station call
10. CALL BACK [C-1]: To activate Call Back, the user dials the appropriate access code after reaching a busy station. If the user fails to go on-hook within 30 seconds after receiving Service Set Tone, line lock-out will occur. The sequence prior to lock-out is: Service Set Tone for 30 seconds, Reorder Tone for 30 seconds, optional Howler Tone Warning for 30 seconds. Call Back cannot be activated toward a station in lock-out.
11. CALL WAITING - ORIGINATING [C-31]: If a user fails to complete dialing of the access code while attempting to activate CALL WAITING - ORIGINATING [C-31], line lock-out will occur.
12. A station in line lock-out will be restored to service when the user goes on-hook for 280 milliseconds or more.
13. MESSAGE REMINDER [M-19]: A Message Reminder cannot be sent to a station in line lock-out.
14. ATTENDANT NIGHT TRANSFER [A-19] is not available if the Night Transfer station is in Line lock-out. The caller will hear Ringback Tone then Reorder Tone.

Programming

ASYD - SYS1, Index 64, Bit 3 and Bit 4. When is Howler Tone sent? 00: Not sent. 01: Only once. 10: Every thirty seconds.

SYS1, Index 70, Bit 1. Does station in line lock-out flash at BLF? 0/1: Yes/No.

SYS1, Index 128. This timer determines how long a Register will be held up before the first digit is dialed. Assign 00H for default value of 12 seconds (RAM Data is 06H).

SYS1, Index 146. First Howler Tone is sent. Assign 00H for standard default setting of 30 seconds (RAM Data is 3FH), on analog ports.

L-5 Least Cost Routing - 3/6-Digit

General Description

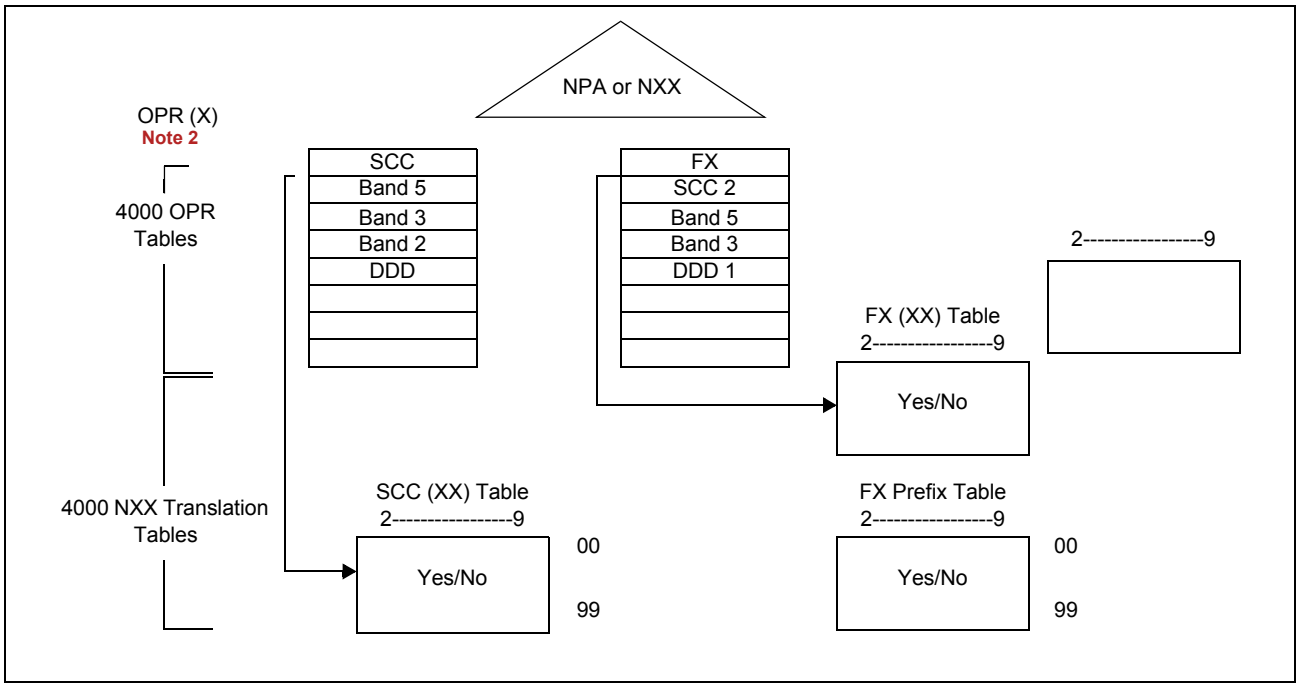
This feature allows the system to be programmed to route outgoing calls over the most economical facility (WATS, FX, DDD). Based on the Area Code and Office Code dialed (six-digit analyzing), the system examines the programming Tables and chooses the facilities in the order specified. Least Cost Routing (LCR) may also be performed on a Sender basis (LCRS).

Operating Procedure

1. Lift the handset. Receive Dial Tone.
2. Dial the trunk Access Code (usually "9"). Receive Second Dial Tone.
3. Dial the Area Code, Office Code and number.
4. The system automatically completes the call via the most economical route based on the programming tables.

Service Conditions

The following is a step-by-step explanation, which when reviewed in conjunction with the figure on the following page, will provide better insight as to how the system switch accomplishes LCR:



1. If dialing a Toll or Local Call (NPA-NXX-XXXX or NXX-XXXX), routing begins with translation of three-digit (NPA or NXX) area or Office Code. For specific numbers, this translation may result in the immediate selection of the three-digit routing patterns. If the number dialed is an NPA and six-digit translation is required, the NXX Code is verified in the SCC (XX) or the FX (XX) Table **Note 1**. If the NXX is not located in either Table, refer to Service Condition "3". There is a maximum of 4000 Outgoing Pattern Routing (OPR) Tables with a maximum of eight routes for selection.

   Note 1: a. SCC (XX) is the Special Common Carrier NXX Translation Table.
   b. FX (XX) is the FX NXX Translation Table.

2. First-choice Route option in an NPA Pattern will usually be a Specialized Common Carrier. If a trunk is available in this group, further digit translation will be required in order to determine whether the called number is served by the carrier. NXX digit translation will also be required in instances where a call is routed over a Tie or FX trunk. For these purposes, 4000 NXX Patterns are available.
3. In the case of Specialized Common Carriers, associated NXX Patterns will return either a Yes or a No answer to the switch, indicating whether or not the dialed number is within the designated service area of the selected SCC. If service is available, the switch will seize the trunk and complete the connection. If the no answer is returned, the switch searches for the next available trunk group.
4. Calls routed over FX trunk groups may require out-pulsing of prefix digit "1", depending on the NXX number dialed. For this purpose, another group of associated NXX Patterns may be used, operating on the same Yes/No principle. A Yes answer returned to the switch in this instance will result in prefix "1" being added automatically before sending digits to the Called Central Office.
5. Where the selected route is an FX trunk group, NXX translation may be used to either allow or disallow the connection. This is accomplished via Yes/No answers from a designated group of NXX Patterns, and enables calls to selected Central Office areas to be effectively restricted to only the most economical routes.

The routing method described provides some of the most flexible options available for call routing, and functions as a highly effective method of cost control. For details, see the following figure.

3/6-Digit Least Cost Routing Translation Table, Dialed Number 9-NPA-NXX-XXXX

Note 2: X = 1 to 4000

6. In certain cases, three and six-digit translation will provide sufficient information for identification of the service area. 4000 separate Outgoing Routing Patterns are available for this circumstance.
7. Up to eight trunk routes can be in each Outgoing Routing Pattern.
8. STATION MESSAGE DETAIL RECORDING (SMDR) [S-10] may be used in conjunction with LEAST COST ROUTING - 3/6-DIGIT. The route selected by the switch will be recorded by the SMDR unit.
9. Tie lines can be included in Route Patterns.
10. Application of NXX Patterns provides for inclusion of multiple common carriers serving different areas.
11. When a Tie trunk requiring an Off-net Connection to the Local Central Office is included as a Route option, the System can provide a 2.8-second prepause before sending out the Selecting Signal.
12. Senders (DP or DTMF) are provided with this feature for outpulsing.
13. Pre-translation function minimizes waiting time after dialing. After enough digits are collected to determine a route, the system starts outpulsing before the station completes dialing the entire number (LCR - SENDER).
14. If OUTGOING TRUNK QUEUING [O-2] is activated during LCR, all routes listed in the Outgoing Routing Pattern will be available to the queue, if one of these trunks becomes idle.
15. When LEAST COST ROUTING - 3/6-DIGIT is provided, the Attendant cannot pass Dial Tone to a station. The desired number must be dialed by the Attendant.
16. Stations having different Route Restriction Classes, but using the same LEAST COST ROUTING - 3/6-DIGIT Pattern, can be denied access to the last choice trunk routes in that pattern. Route Restriction Classes may be set up so that a station dialing an Area Code can use WATS, FX, and DDD, or only the WATS line, if such an arrangement is desired. This is a form of forced LCR.

17. NXX Patterns may be programmed to restrict all stations in the system from completing calls to specific NXX numbers over FX trunks.
18. The system will include the ability to detect a dialed DDD number and compare it with a DDD List Table to determine if the call is directed to a facility served by the trunk network. If the dialed number is found in the DDD List Table, a translation is provided to the seven-digit on-net number (ABC-XXXX) served by the Tie trunk. This allows an expensive Public Network Dialed Number to be trapped and automatically diverted to an available leased facility. If a Tie line is not available, the call will be routed as dialed.
19. The system is capable of converting a maximum of 24 receiving digits into a required 24-digit number entirely. Interdigit pauses can be inserted whenever necessary. This provides for an extremely flexible Numbering Plan for a complex network.
20. When deleting AOPR, this also deletes the ASDC Table using the OPR Pattern.
21. Advancing to Central Office Line is not available in the FCCS network.
22. The outgoing call using a trunk in the remote node via FCCS is available. Therefore, Route Restriction Class data must be identical in the FCCS network. For more detailed information, refer to the Data Programming Manual - FCCS.
23. ASDC is not applicable in the FCCS network.
24. When using this feature within an FCCS network, deleting AOPRL/AOPRN also deletes the ASDCL/ ASDCN Table using the OPR Pattern.
25. In case of LCRS feature, the system starts connecting and communication between the calling party and the called party without completing the maximum digits (MND) of destination number which is set in AMND from the calling party.
26. LCRS Call without completing the MND of AMND:
    a.) ARTI - Assign the parameter DCANS (CDN:54) as “1” to the objected Route.
    b.) ARTD - Assign the parameter OSGS (CDN:1) as “2” (Second Dial Tone) and LSG (CDN:15) as other than “12” (CCIS/ISDN) to the objected Route Class of outgoing trunk.
    c.) ASPA - For LCRS Flag Route, parameter Second Dial Tone = 1.
27. This feature is available:
    a.) when a call is directly originated from a station via LCRS.
    b.) when a station/trunk call, once placed on hold, is originated via LCRS.
    c.) when a trunk call is originated via LCRS (tandem connection).

Note: This feature is not available when the LCRS call from a Attendant Console or call made by Individual Trunk Access.

Interactions

1. AFRS and AMND Tables must correlate to each other. If dialing patterns listed in AFRS are not programmed in AMND, the calls will not go through. Also, if dialing patterns are not set in AFRS, including simple Local Calls, the calls will not go through.
2. LCR(S) provides only Route selection based on digits dialed and Route availability. Once a Route has been determined to be available because of dialed digits, Route Restriction Class will determine if this Route will be made available to the station. If denied and other routes are available, the same process will occur. If no other route is available, the user will hear a Reorder Tone.
3. In ARTD, CDN 9:TQ must be assigned for the LCR(S) Flag Route 31 if Trunk Queuing is to operate in conjunction with LCR(S).

Programming

STEP 1: **ASYD** - SYS1, Index 6, Bit 0. Should Special Sender Tone be sent to station when connected to a Sender? 0/1: No/Yes. (Optional)

SYS1, Index 6, Bit 2. Should Special Sender Tone be sent to the Attendant Console when connected to a Sender? 0/1: No/Yes. (Optional)

SYS1, Index 65. Assign the number of routes in the system.

SYS 2, Index 2, Bit 0. What is the sender type for an OG trunk connection to a station? 0/1: Dial Pulse/ Pushbutton. This data is valid only when CDN 2:ONSG of route data is assigned as data "3", PB/DP. 0

SYS2, Index 2, Bit 1. What is the sender type for an OG trunk to the Attendant Console? 0/1: Dial Pulse/ Pushbutton. This data is valid only when CDN 2:ONSG of route data is assigned as data "3", PB/DP.

STEP 2: **ARTD** - Assign the LCR(S) route as shown below. For uniformity, always use route 31 as the LCR(S) Flag route. In CDN 13:AC, include the LCR(S) Access Code in LCR(S) development.

Assign the LCR(S) Flag Route as shown below:

RT: 31

6-TCL	:1	7-L/T	:1	8-RLP	:2	9-TQ	:1	13-AC	:1

Note: To change the data for existing route (RT), initialize the circuit card.

STEP 3: **ATRK** - Assign Originating Register Trunks (ORT) to the system in a quantity calculated from expected traffic. Registers are located on Levels 0-3 of any 8RST circuit card.

Senders must be assigned to the system in a quantity calculated from expected traffic. Senders are located on Levels 4-7 of any 8RST circuit card.

RT: Route Number

Trunk Route Number

Intra-Office Route Number (901-931)

901-ATT 913-TCFT for ATT

902-ORT 915-Night ATT

903-IRT 916-MFCR

905-Sender 917-MFCS

909-DCFT 919 to 926-Modem

TK: Trunk Number

TN: Tenant Number

RSC: Route Restriction Class

SFC: Service Feature Restriction Class

For the outgoing trunks used in LCR(S), refer to those specific route access features.

STEP 4: **MBTK** - Assign the make idle status to all Register Sender trunks.

STEP 5: **ANPD** - Reserve a level, usually "9", for LCR or LCR (S) Access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. Number of Necessary Digits is one. Busy Lamp Field is not activated.

STEP 6: **ASPA** - Assign the LCR (S) Access Code, to the ACC field (usually "9"). For SRV (Kind of Service), assign SRV = "LCR: Least Cost Routing" or SRV = "LCRS: Register Sender LCR". Assign the LCR(S) Flag Route Number, usually "31", associated with this Access Code to the RT field. Assign Connection Indexes, CI = "N: Normal" and CI = "H: Hooking". For Second Dial Tone, assign the data as "1". If Procedure II is used for AUTHORIZATION CODE [A-20], assign the data as "1" to the AH parameter.

STEP 7: **ARNP** - Assign the Physical Route Number as defined in ARTD. Relate these routes to the LCR(S) Access Code by assigning the value, previously defined in ASPA [for SRV = "LCR: Least Cost Routing" / "LCRS: Register Sender LCR"] to the ACC field of ARNP. The LCR(S) Access Code is usually "9". The routes to be assigned will be those routes listed in the various OPRs of AOPR.

Note: These same routes may also be listed in ASPA for SRV = "OGC: Outgoing Call". In that case, these routes may also be available via Direct Dial Access Codes. In ARNP, these Access Codes are not assigned to implement the LCRS service. This digit code is the first digit used when assigning the ATDP Table.

STEP 8: **ARSC** - LCR(S) uses only Bothway or Outgoing Only routes. For these types of routes assign appropriate Restriction Data to Route Restriction Indexes 2 (PRI-2) and 3 (PRI-3). To allow, assign a Restriction Data of "1" (RES-1). To restrict, assign a Restriction Data of "0" (RES-0), or for Toll Restriction, assign a Restriction Data of "2" (RES-2). Toll Restriction will be applied to the available route as determined by the selection in LCR(S). Therefore, if a user dials a long distance number and is restricted from DDD Access (RRI-3 = 0) and the only available route is a DDD, the call will be denied. Toll Restriction acts upon the LCR(S) selection. Also, remember to allow Route 31, the LCR(S) Flag Route to all RSCs. Do not Toll Restrict the Flag Route.

STEP 9: **AMND** - Assign the Maximum Necessary Digit (MND) the system must translate for a correct route selection. List the following type of dialing sequences.

1 + DIALING (N = 2-9 P = 0 OR 1, X = 0-9)				
CALL TYPE	**DIGITS DIALED Note 3**	**DIGITS NEEDED**	**MND**	**TOLL**
Local Calls	9-NNX-XXXX	9-N	8	Local Code
Near Distant Calls (1+)	9-1-NNX-XXXX	9-1-NN	9	Toll Code
Long Distant Calls	9-1-NPA-NXX-XXXX	9-1-NP	12	Toll Code

Note 3: The digits underlined are to be listed in the DC parameter. Overseas or Operator-assisted Calls should be listed with an MND that equals the calculated number of necessary digits. Special dialing sequences such as 411 with an MND = 4 should also be listed.

WITHOUT 1 + DIALING (N = 2-9 P = 0 OR 1, X = 0-9)				
CALL TYPE	**DIGITS DIALED Note 4**	**DIGITS NEEDED**	**MND**	**TOLL**
Local Calls	9-NNX-XXXX	9-NN	8	Local Code
Long Distant Calls	9-NPA-NXX-XXXX	9-1-NP	11	Toll Code

Note 4: The digits underlined are to be listed in the DC parameter. Overseas or Operator-assisted Calls should be listed with an MND that equals the calculated number of necessary digits. Special dialing sequences such as 411 with an MND = 4 should also be listed.

STEP 10: **AFRS** - List the dialing patterns in groups that will be served by a specific sequence of routes. For example, consider the following dialing patterns: 9-1-617, 9-1-413, 9-1-207, 9-1-203, 9-1-603.

Each of these Area Codes exist in the Northeastern United States. From New York City, it may be determined that the least expensive way to place any of these calls is by a Band 1 WATS, then BAND 5 WATS, then DDD. This determination of routes is labeled as an Outgoing Route Selection Pattern Number or OPR. In AFRS, program the Tenant, Route Number [LCR(S) Flag Route, usually "31"], the Number Pattern Code (NPC) or dialing patterns, and the OPR to be chosen when these digits are dialed.

STEP 11: **AOPR** - AFRS designates the dialing sequence and the OPR to be selected. The AOPR defines the routes and in what order these routes will be selected. Assign the following:

TDPTN Number (TDPTN) - Time of Day Change Pattern Data can be applied to an OPR. Assign a value, from 0 to 7, that correlates to a predefined Time of Day Change Pattern Number assigned in the ATCP command (and which is to be applied to this OPR).

Note: If the Time of Day feature is not applicable, assign a value of "0" in the TDPTN field for this OPR.

OPR Number (OPR) - Outgoing Route Selection Pattern Number. Enter the OPR Number referenced in AFRS. OPR Numbers range from 0-4000.

Route Advance Number (RA) - Route Advancing Order. The order in which a Route will be selected (0-7). For the above example - RA 0 = Band 1, RA 1 = Band 5, RA 2 = DDD.

Note: Always build your OPR beginning with an RA of "0". Assign any subsequent Route Advances numerically.

Route Advance End Indication (E) - The last route in the Route Advance Group is indicated with data "0". All others are indicated with data "1" (more).

Route Number (RT) - External Route Number. The Physical Route Number to be selected as programmed in ARTD.

Skip Digits (SKIP) - The amount of digits to be skipped when translating the dialed digits as defined in the NPC parameter of the AFRS command. The SKIP value should, at a minimum, include the LCR(S) Access Code. For example, if ARTD is assigned as shown (CDN 13-AC = 1) and ASPA is assigned as shown [ACC = 9, SRV = "LCR: Least Cost Routing" / "LCRS: Register Sender LCR"], then assign "1" to skip the LCR(S) Access Code.

Note: The SKIP parameter removes the amount of digits defined from the beginning of the dial number.

Pattern Number Location (PNL) - If digits are to be added after translating the dialed digits in AFRS, assign a PNL (1-999). The digits to be added are programmed to the respective PNLs in AADC. If no digits are to be added, PNL = 0 should be assigned.

Note: Take into consideration the value entered in the SKIP parameter when assigning a PNL greater than "0".

Overflow Tone (OVFT) - If tone is required to be heard when an outgoing call is placed over the last route (RA) of an OPR, assign the data as "1". If tone is not required, assign the data as "0".

Note: When activating Call Forwarding - Don't Answer - Outside [C-74]/Call Forwarding - Don't Answer - CCIS [C-47]/Call Forwarding - PS Incoming Incomplete, the Overflow Tone is not provided.

Priority Restriction Class (PRSC) - If the Restriction Class, referred to in the AEFR command is required, assign PRSC using Classes 1-15. If it is not required, enter data "0".

STEP 12: **AADC** - If additional digits are required, assign the digits to Pattern Number Location (PNL) here. In the PNL field, assign a Pattern Number Location value from 1-999.

Note: This should be the same PNL Number that was assigned in AOPR. For the DC field assign the additional Digit Information. A maximum of 24 digits (0-9, #, *, P) can be assigned to each PNL. The digits entered in the DC field will be added in front of the dialed digits (with the exception of this field being used for the PFX parameter of the ASDC command).

STEP 13: **ASDC** - If six-digit translation is required, whereby both Area and Office Codes must be examined, this command must be used. If no assignment is made in this command, all NXXs are allowed. After an NXX is assigned as "allowed", all other NXXs will subsequently be denied. The Table becomes an Allow Table. Program each Office Code that is to be allowed with EFFECT = 1.

The number of NXXs to be either allowed or denied will determine the method of programming used. For example, if it is determined that only 555 is to be restricted from a Special Common Carrier, it is more desirable to allow all NXXs and restrict only this NXX. The method would be as follows:

To create a Deny Table assign the following:

Step a): For KIND (Kind of Selection), select either Prefix, FX-Foreign Exchange (PFX) or Special Common Carrier (SCC).

For Time of Day Change Pattern Number (TDPTN) enter a value, from 0-7 (this value should correlate to a predefined pattern already assigned in ATCP) that should also assigned to the applicable OPR in AOPR.

For Outgoing Route Selection Pattern Number (OPR), assign the number of the OPR that this table will serve.

For Route Advance Order (RA), enter a value (from 0-7) that specifies the route in AOPR, that this table will serve.

For OFFICE (Office Code), enter 555 for this example.

Next click 'GET'.

Continue by selecting 'ALL' for Office Code Flag (OFLG) and enter "1" for EFFECT.

Step a, allows all NXXs for the specified OPR and RA, thus making a Deny Table.

Step b): For KIND, TDPTN, OPR, RA, and OFFICE, enter the same data from "Step a".

Next click 'GET'.

Continue by selecting 'INPUT' for OFLG and enter "0" for EFFECT.

Note: Step b restricts 555 only.

When assigning for PFX, each NXX is assigned as the following:**Note 5**
EFFECT:0 = Does not require a prefix.
EFFECT:1 = Allow, with 1 + dialing **Note 6**
EFFECT:2 = Only for display.
When assigning for SCC, each NXX is assigned as the following:
EFFECT:0 = Restricted. The Office Code is not allowed (for the Area Code that is dialed) for the specified OPR and RA.
EFFECT:1 = Allowed. The Office Code is allowed (for the Area Code that is dialed) for the specified OPR and RA.
EFFECT:2 = Only for display.

Note 5: When PFX, EFFECT = 1 is assigned. Add the required digit in AADC.

Note 6: For this command to work, it is very important that the NPC field of the AFRS command be programmed correctly. The "OFFICE" parameter, in ASDC will be the next three digits after those assigned in AFRS.
See the example, below.
Example:AFRS RT 31 = 91214 OPR 1
ASDC checks next three digits: 91214 XXX XXXX

STEP 14: **ATCP** - A maximum of eight Time-of-Day Pattern changes (0-7) are available, whereby the system will refer to different OPR assignments as a function of time. As a result, different Routes will be listed per OPR and therefore different assignments in ASDC. Assign the following:
Times Setting
FROM: In Military Time, and in 30 minute increments, on the hour and half hour.
TO:
PATTERN NUMBER: 0-7

STEP 15: **ARTI** - Assignment of Trunk Application Data - Assign DCAN (CDN: 54) = 1 for Tie line routes that use LCRS, and require that call processing proceed, when digits received are less than AMND.

Note: This requires that ARTD, CDN-1 is not programmed as a "1" or "12" and CDN-15 is a "2". Step 15 is optional.

Note: To change the data for existing route (RT), initialize the circuit card.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ALRTN** - Assign this command to connect the Logical Route to the Physical Route.

STEP 2: **ARTDN** - Assign the Route Class Data to the Logical Route that is used for the LCR/LCRS Flag Route.

6-TCL: 1 7-L/T: 1 8-RLP: 2 9-TQ: 1 13-AC:1

Note: To change the data for existing route (RT), initialize the circuit card.

STEP 3: **ANPDL/ANPDN** - Reserve a level, usually "9", for LCR/LCRS access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. Number of Necessary Digits (NND) is "1" and Busy Lamp Field (BLF) is not activated.

STEP 4: **ASPAL/ASPAN** - Assign the LCR/LCRS Access Code. Access Code to the ACC field (usually "9"). For SRV (Kind of Service), assign SRV = "LCR: Least Cost Routing" or SRV = "LCRS: Register Sender LCR". Assign the Logical Route Number for the LCR(S) Flag Route, usually "31", that is associated with this Access Code to the RT field. Assign Connection Indexes, CI = "N: Normal" and CI = "H: Hooking". For Second Dial Tone, assign data as "1". If Procedure 2 is used for AUTHORIZATION CODE [A-20], assign the data as "1" to the AH parameter.

STEP 5: **ARNPL** - Assign the Logical Route Numbers as defined in ARTDN. Relate these routes to the LCR(S) Access Code by assigning the value, previously defined in ASPAL/ASPAN (for SRV = "LCR: Least Cost Routing") to the ACC field of ARNPL. The LCR/LCRS Access Code is usually "9". The routes to be assigned will be those routes listed in the various OPRs of AOPRL/AOPRN.

Note: These same routes may also be listed in ASPAL/ASPAN for SRV = "OGC: Outgoing Call". In that case, these routes may also be available via Direct Dial Access Code. In ARNPL, these Access Codes are not assigned to implement the LCRS service in this command.

STEP 6: **ARSCN** - Assign the Route Restriction Class for all the Logical Route Number.

STEP 7: **AFRSL/AFRSN** - Allocate the dial number necessary to determine the OPR used to select the routes.

STEP 8: **AOPRL/AOPRN** - AFRSL/AFRSN designates the dialing sequence and the OPR to be selected. The AOPRL/AOPRN defines the routes and in what order these routes will be selected. Assign the following:

TDPTN Number (TDPTN) - Time of Day Change Pattern Number. Time of Day Change Pattern data can be applied to an OPR. Assign a value, from 0 to 7, that correlates to a predefined Time of Day Change Pattern Number assigned in the ATCP command (and which is to be applied to this OPR).

Note: If the Time of Day feature is not applicable, assign a value of "0" in the TDPTN field for this OPR.

OPR Number (OPR) - Outgoing Route Selection Pattern Number. Enter the number referenced in AFRSL/AFRSN. OPR Numbers range from 0-4000.

Route Advance Number (RA - Route Advancing Order) - The order in which a route will be selected (0-7).

For example - RA 0 = Band 1, RA 1 = Band 5, RA 2 = DDD.

Note: Always build your OPR beginning with an RA of "0". Continue assigning subsequent Route Advances numerically.

Route Advance End Indication (E) - The last Route in the Route Advance Group is indicated with data "0" (Ended). All others are indicated with data "1" (more).

Logical Route Number (LGRT) - The Logical Route Number to be selected as programmed in ARTDN.

Skip Digits (SKIP) - The number of digits to be skipped from Dialed Numbers.

Pattern Number Location (PNL) - If digits are to be added after translating the dialed digits in AFRSL/AFRSN, assign a PNL (1-999). The digits to be added are programmed to the respective PNLs in the AADCL/AADCN commands. If no digits are to be added, "0" should be entered.

Overflow Tone (OVFT) - If tone is required to be heard when an outgoing call is placed over the last route (RA) of an OPR, assign the data as "1". If tone is not required, assign the data as "0".

Note: When activating Call Forwarding - Don't Answer - Outside [C-74]/Call Forwarding - Don't Answer - CCIS [C-47]/Call Forwarding - PS Incoming Incomplete, the Overflow Tone is not provided.

Priority Restriction Class (PRSC) - If the Restriction Class defined in AEFR is required, assign PRSC using Classes 1-15. If it is not required, enter data "0".

STEP 9: **AADCL/AADCN** - If the additional digits are required, assign the digits to Pattern Number Location (PNL) here. In the PNL field, assign a Pattern Number Location value from 1-999.

Note: This should be the same PNL Number that was assigned in AOPRL/AOPRN. For the DC field, assign the additional Digit Information. A maximum of 24 digits (0-9, #, *, P) can be assigned to each PNL. The digits entered in the DC field will be added in front of the dialed digits (with the exception of this field being used for the PFX parameter of the ASDC command).

STEP 10: **ASDCL/ASDCN** - If six-digit translation is required, whereby both Area and Office Codes must be examined, this command must be used. If no assignment is made in this command, all NXXs are allowed. After an NXX is assigned as "allowed", all other NXXs will subsequently be denied. The Table becomes an Allow Table. Program each Office Code that is to be allowed with EFFECT = 1.

The number of NXXs to be either allowed or denied will determine the method of programming used. For example, if it is determined that only 555 is to be restricted from a Special Common Carrier, it is more desirable to allow all NXXs and restrict only this NXX. The method would be as follows:

To create a Deny Table assign the following:

Step a: For KIND (Kind of Selection), select either Prefix, FX-Foreign Exchange (PFX) or Special Common Carrier (SCC).

For Time of Day Change Pattern Number (TDPTN) enter a value, from 0-7 (this value should correlate to a predefined pattern already assigned in ATCP) that is also assigned to the applicable OPR in

AOPRL/AOPRN.

For Outgoing Route Selection Pattern Number (OPR), assign the number of the OPR that this table will serve.

For Route Advance Order (RA), enter a value from 0-7 that specifies the route, in AOPRL/AOPRN, that this table will serve. For OFFICE (Office Code), enter 555 for this example.

Next click 'GET'.

Continue by selecting 'ALL' for Office Code Flag (OFLG) and enter "1" for EFFECT. Step a, allows all NXXs for the specified OPR and RA, thus making a Deny Table.

Step b: For KIND, TDPTN, OPR, RA, and OFFICE, enter the same data from Step a.

Next click 'GET'.

Continue by selecting 'INPUT' for OFLG and enter "0" for EFFECT.

Note: Step b restricts 555 only.

When assigning for PFX, each NXX is assigned as the following:

EFFECT:0 = Not require a prefix

EFFECT:1 = Allow, with 1 + dialing (system adds the 1) **Note 7**

EFFECT:2 = Not allowed.

When assigning for SCC, each NXX is assigned as the following

EFFECT:0 = Restricted. The Office Code is not allowed (for the Area Code that is dialed) for the specified OPR and RA.

EFFECT:1 = Allowed. The Office Code is allowed (for the Area Code that is dialed) for the specified OPR and RA.

EFFECT:2 = Only for display.

Note: When PFX, EFFECT = 1 is assigned. Add the required digit in AADCL/AADCN.

Note 7: For this command to work, it is very important that the NPC field of the AFRSL/AFRSN command be programmed correctly. The "OFFICE" parameter in ASDCL/ASDCN, will be the next three digits after those assigned in AFRS. See the example below.

Example: AFRSL/AFRSN RT 31 = 91214 OPR1

ASDCL/ASDCN checks next three digits:91214 XXX XXXX

Office

L-6 Last Number Called - Single-Line Station

General Description

When a station user originates a station-to-station call or an outgoing trunk call, but the call is not established, this feature allows the calling station to recall the same destination by dialing only a Special Code instead of dialing all the digits of the number.

Operating Procedure

1. Lift the handset. Receive Dial Tone.
2. Dial the desired Party's Number.
3. The call has not been established.
4. Busy Tone or Reorder Tone is heard.
5. Hang up.
6. Lift the handset. Receive Dial Tone.
7. Dial the LAST NUMBER CALL Access Code (a maximum of three digits).
8. The system will automatically redial the last number dialed from that station.

Service Conditions

1. The number of dial digits to which this service is applicable is 18 maximum.
2. Dialing any digits after going off-hook causes previously stored digits to be erased from memory and the new digits to be programmed into memory.
3. In a STEP CALL, the final combination of digits is stored in memory. For example, dial 201, 201 is busy. Dial 2, Station 202 rings. Station 202 is stored in the LAST NUMBER CALLED memory.
4. In CALL FORWARDING [C-2, 3, 5], CALL PICKUP - GROUP [C-7], and STATION HUNTING [S-7, 8, 9], the number stored is the number dialed (the number displayed in the INTERMEDIATE STATION NUMBER DISPLAY -D [I-10D]).
5. This feature can be activated when the station accesses STATION-TO-STATION CALLING [S-11] or station-to-trunk calling.
6. SPEED CALLING - SYSTEM [S-3], SPEED CALLING - STATION [S-21] (when the originating party is other than station), or SPEED CALLING - GROUP [S-23] numbers (abbreviated Digit Codes) can be stored in the LAST NUMBER CALLED memory.
7. An AUTHORIZATION CODE [A-20] will not be stored, and must be entered each time the LAST NUMBER CALLED is accessed.
8. When the station that has set the SPLIT CALL FORWARDING - ALL CALLS for an incoming call from an outside party is restricted from call origination according to data assignment in ASYD, SYS2, Index 6, Bit 4, both of the call originations to an internal station and an outside party by using this feature are restricted.

   For the station that has been set SPLIT CALL FORWARDING - ALL CALLS for station-to-station calls only:

   - Call origination to an internal station by using this feature is not available.
   - Call origination to an outside party by using this feature is available.

   For the station that has been set SPLIT CALL FORWARDING - ALL CALLS for outside calls only:

   - Call origination to an internal station by using this feature is not available.

- Call origination to an outside party by using this feature is not available.

9. Only when a station is vacant, last number redial can work.

Interactions

LAST NUMBER CALLED will operate for both internal and outgoing calls.

Programming

STEP 1: **ANPD** - Reserve a Number Level for Feature Access and Cancel. Select Normal Service (N), Hooking Service (H) or Busy Service (B) from the combo box for Connection Indexes. (applicable to any feature assigned to this level). Assign NND in accordance with a predetermined Numbering Plan.

STEP 2: **ASPA** - Assign an Access Code to LAST NUMBER CALLED, SID = 44. Assign Connection Status Index (CI) for "N: Normal" service.

STEP 3: **ASFC** - Assign the stations that will receive LAST NUMBER CALLED a Service Feature Restriction Class that allows SFI = 44 (Last Number Call Redial).

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS service varies depending on the node.

STEP 1: **ANPDL** - Reserve a Number Level for Feature Access and Cancel. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. (applicable to any feature assigned to this level). Assign NND in accordance with a predetermined Numbering Plan.

STEP 2: **ASPAL** - Assign an Access Code to LAST NUMBER CALLED, SID = 44. Assign Connection Status Index (CI) for "N: Normal" service.

L-6D Last Number Called -D

General Description

This feature allows the user of a Desktop terminal to store the last five numbers dialed, and to redial the numbers by pressing the Redial call. The Desktop terminal user can choose any destination out of the last five calls that have been stored in memory, thus enabling the user to place a call without redialing the full number.

Operating Procedure

How to check the Dialed Numbers stored in the memory (up to 5 destinations)

1. Press the REDIAL key on a Desktop terminal.
   a.) The Prime Line lights green.
   b.) The Speaker Lamp lights red.
   c.) Receive Dial Tone from the speaker with the following display on the Desktop terminal **Note 1**.

LNR [*] / SPD [_ _] - 1			
			811625643
MIC	FDB	FDN	>>>

Note 1: Redial Access Code (LNR [*]) can be changed by ASYD, SYS1, Index 384, Bit 3. For details, see Programming.

2. Press the REDIAL key on the Desktop terminal again.
   a.) Receive Dial Tone from the speaker with the following display on the Desktop terminal.

LNR [*] / SPD [_ _] - 2			
			25191
MIC	FDB	FDN	>>>

Note: The indication is changed in sequence by pressing the Redial key. Once the stored Telephone Number display reaches LNR[*] or LNR[#]/SPEED[_ _]-5, LNR[*] or LNR[#]/SPEED[_ _]-1 appears again by pressing Redial.

How to originate a call

1. Press the Redial key on a Desktop terminal.
   a.) The Prime Line lights green.
   b.) The Speaker Lamp lights red.
   c.) Receive Dial Tone from the speaker with the following display on the Desktop terminal.

LNR [*] / SPD [_ _] - 1			
			811625643
MIC	FDB	FDN	>>>

2. Repeat the above procedure until you reach your desired destination.

LNR [*] / SPD [_ _] - 4			
			82625191
MIC	FDB	FDN	>>>

3. Press "*" to originate your call while the desired destination is being displayed on the Dterm **Note 2**.
   a.) Receive Ringback Tone from the speaker with the following display on the Desktop terminal.

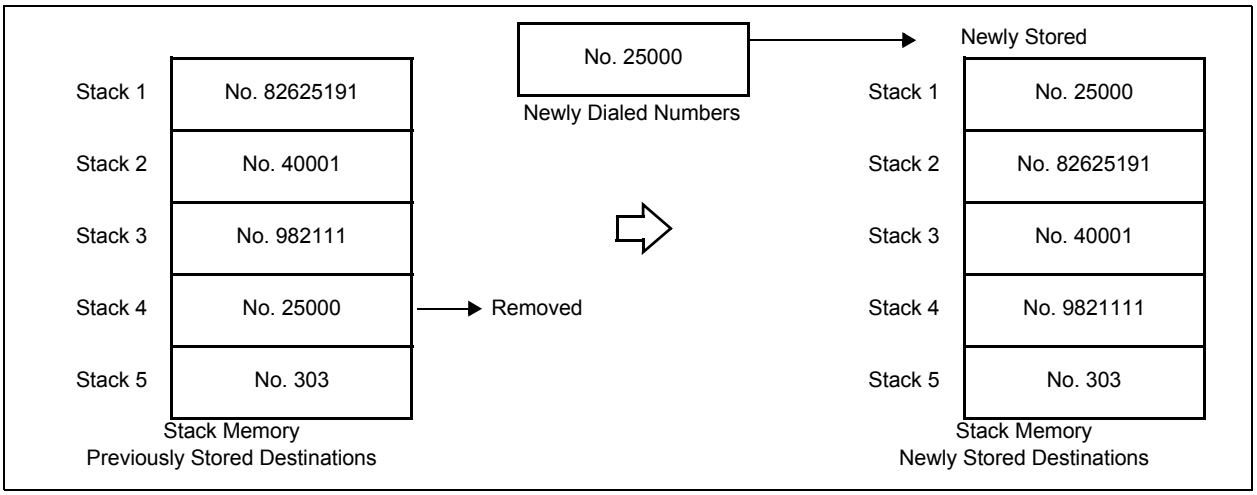
```
                    82625191
   10:24  AM  FRI  15
```

Note 2: "*" button can be changed by ASYD, SYS1, Index 384, Bit 3. For details, see Programming.

4. Lift the handset when the Called Party answers the call.
   a.) The Prime Line lights green.
   b.) The Speaker Lamp is OFF.

```
                    82625191
   10:24  AM  FRI  15
```

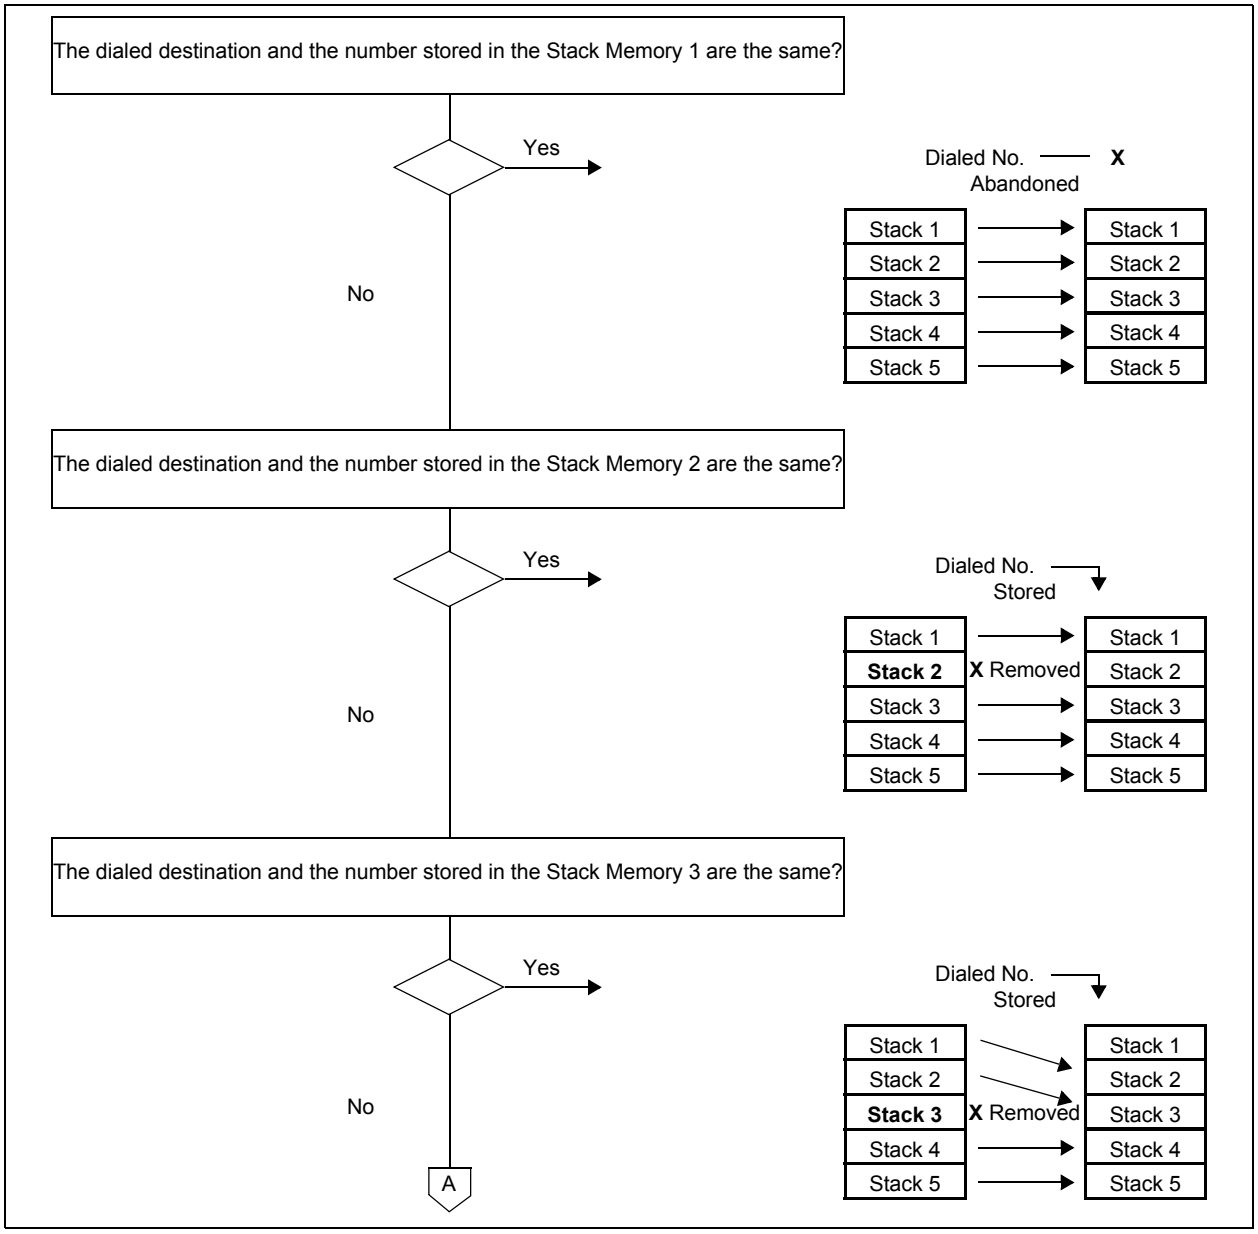
Service Conditions



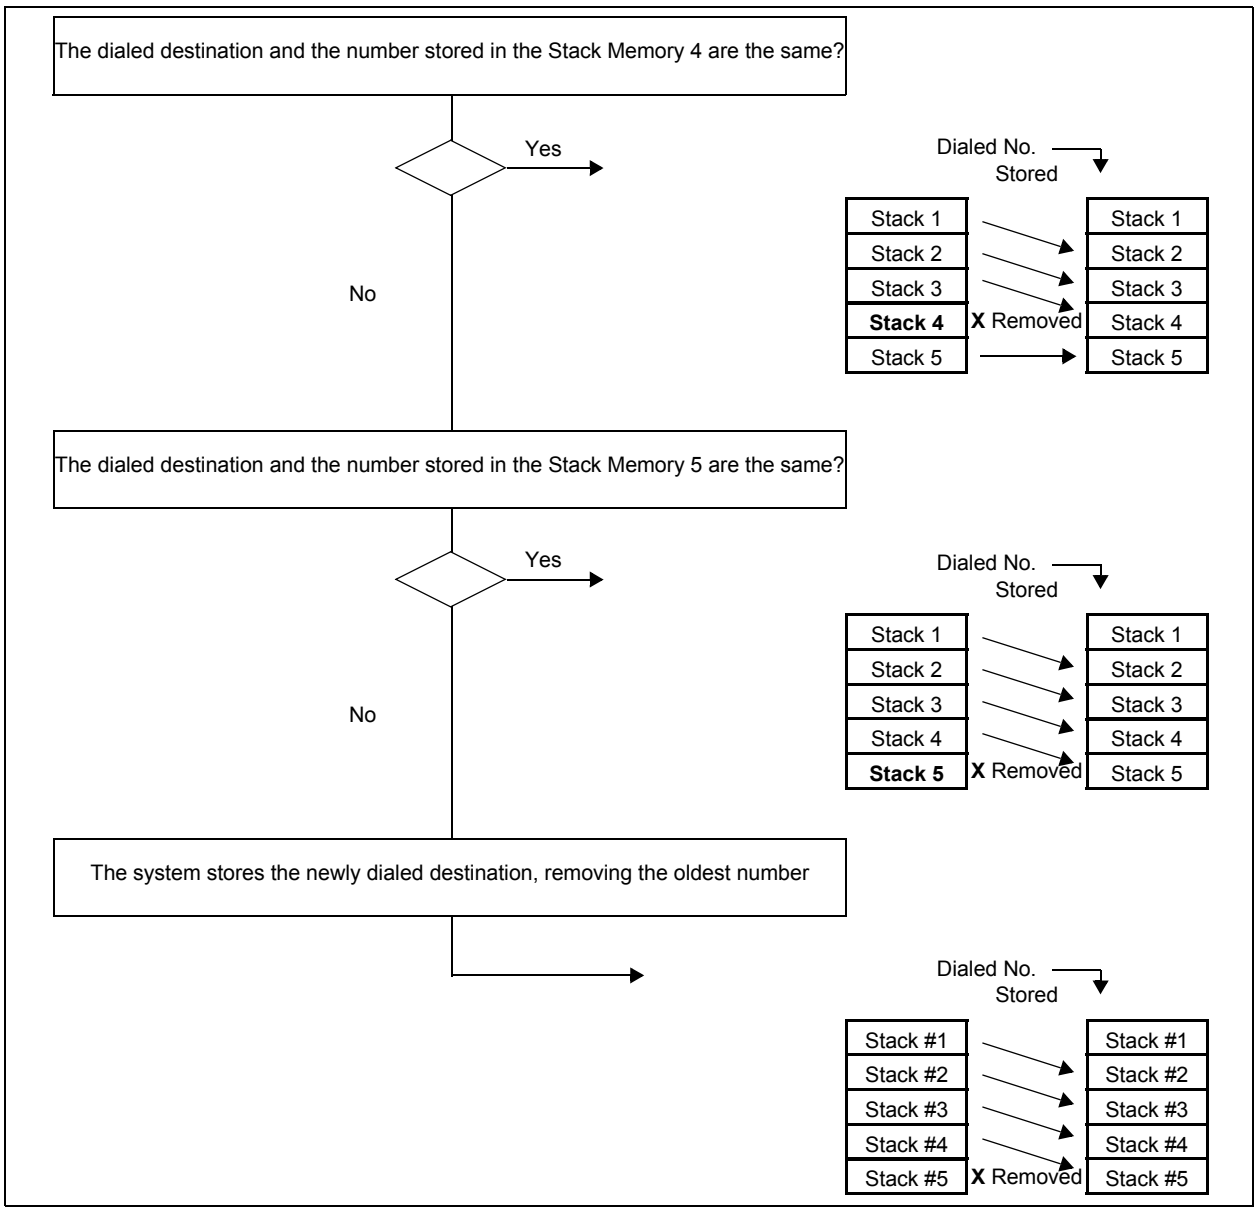
1. A maximum of five destinations can be stored.
2. The maximum digits of the destination is 32-digits.
3. When a Feature key has been assigned as Last Number Called, the Feature key also works as REDIAL key.
4. This feature is only effective when the Calling Party presses the REDIAL key while the Desktop terminal is in the off-hook or idle status.
5. When the REDIAL key is pressed, * or the REDIAL key must be pressed within 12 seconds. Otherwise, the Calling Party hears Reorder Tone.
6. The Calling Party can enter Abbreviated Codes after pressing the REDIAL key.
7. Any number entry (other than #) from a Desktop terminal after pressing the REDIAL key is recognized as Abbreviated Code (one or two digits) of SPEED CALLING - STATION.
8. A Desktop terminal can display the upper 16-digits among the stored 32 digits.
9. When any destination has not been stored in the system, which occurs after initialization of the circuit card, the Dterm displays no destination as shown below.

```
        LNR [*] / SPD [_ _] - 1

MIC          FDB          FDN          >>>
```



10. Only when a station is vacant, last number redial can work.



11. When a Dterm user dials the same destination that has already been stored in the system, the newly dialed destination is stored in the following manner:

12. The number dialed during the call can be stored as the LAST NUMBER CALLED - stock redial with a maximum of 32 digits.

13. If making an abbreviated call using the REDIAL key, the number dialed is not stored. Therefore, redialing through LAST NUMBER CALLED - stock redial is not available. A newly dialed destination is stored in accordance with the following flowchart:

14. When the following System Data (ASYDL/ASYDN, SYS1, Index 1257, Bit 2=1) is assigned, the Redial feature is performed for DT800/DT700/DT400/DT300 Series instead of this feature. For details of Redial feature, refer to Redial [R-60] in this manual.
15. While the Cordless Terminal (DT330 (12BT)) is used, when "*" button on the Bluetooth Handset is pressed after pressing the REDIAL key, the call is originated from the speakerphone on the Bluetooth Cradle.
16. To use this feature on the Bluetooth Handset of the Cordless Terminal (DT330 (12BT)), assign the LAST NUMBER CALLED Feature key (FKY=8) to the Line/Feature key between1-8 by using the AKYD command.

Programming

STEP 1: **ASYD** - SYS1, Index 384, Bit 3. Redial Access Code (LNR)
[When you assigned SYS1, Index 64, Bit 3=0 (for μ law countries)]
0/1 = "*" key / "#" key
[When you assigned SYS1, Index 64, Bit 3=1 (for A law countries)]
0/1 = "#" key / "*" key

STEP 2: **AKYD** - Assign a programmable Line/Feature key as the LAST NUMBER CALLED key, if necessary.
KYI: Service Index 1 (Feature Key)
FKY: 8 (Last Number Dialed)

STEP 3: **ASDT** - Assign a Desktop terminal with Telephone Equipment Class (TEC) 12.

L-7D Line Reconnect - Same-Line -D

General Description

This feature allows a user to disconnect a call and receive Dial Tone by pressing the RECALL key.

Operating Procedure

While a call is in progress

1. Press the RECALL key. Disconnect and receive Dial Tone on the same line.
2. User is ready to dial again.

Service Conditions

1. Conflicting features are: CALL TRANSFER - ALL CALLS [C-11], CONSULTATION HOLD - ALL CALLS [C-17] and CALL HOLD [C-6]. Pressing the RECALL key will result in reconnection of the held line.
2. System should be programmed to provide for first party release.
3. If the system is not programmed for first party release and programmed as calling, called, or both party release, a Release Guard is activated. If a party is not allowed to terminate a call and presses the RECALL key, that station remains connected to the original call.

Programming

ASYD - SYS1, Index 4, Bit 2 and Bit 3.
Releasing method for STATION-TO-STATION CALLING service

Bit 3	Bit 2 = Calling party release
0	0
Bit 3	Bit 2 = Called party release
0	1
Bit 3	Bit 2 = First party release
1	0
Bit 3	Bit 2 = Both party release
1	1

L-8D Line Reconnect - Other-Line -D

General Description

This feature allows a user to select another Line key without going on-hook.

Operating Procedure

While off-hook on the original line, press a Line key that is either idle or ringing. The user is disconnected from the original line and connected to the new line.

Service Conditions

1. LINE RECONNECT - OTHER-LINE -D cannot be used with a line currently in use, unless PRIVACY RELEASE [P-18] is in service (LED lit steady). LINE RECONNECT - OTHER-LINE -D can be used when the other line is on NON-EXCLUSIVE HOLD -D [N-7D].
2. System data programming should provide for first party release.

Programming

ASYD - SYS1, Index 4, Bit 2 and Bit 3.
Releasing method for STATION-TO-STATION CALLING service

Bit 3	Bit 2 = Calling party release
0	0
Bit 3	Bit 2 = Called party release
0	1
Bit 3	Bit 2 = First party release
1	0
Bit 3	Bit 2 = Both party release
1	1

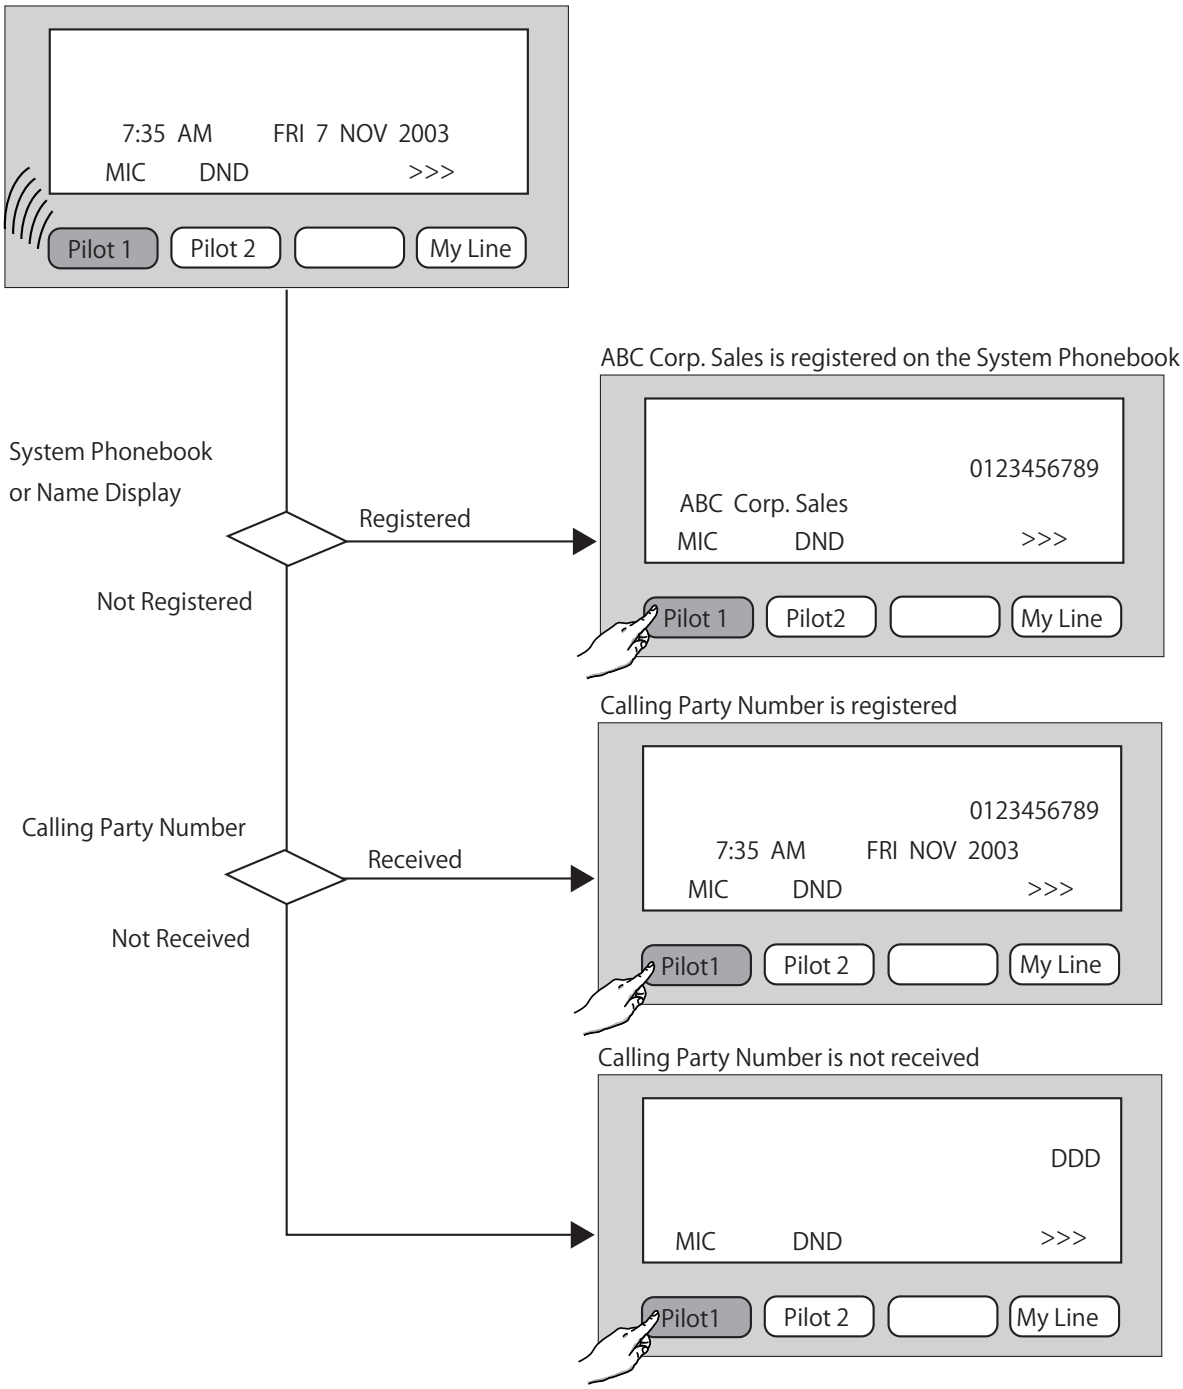
L-9D Line Pre-selection -D

General Description

This feature provides the station user with the ability to select an idle or ringing line before going off-hook.

<Line Pre-selection for Terminal Using Terminal Phonebook>
A Desktop terminal, if employing terminal phonebook, can preselect a ringing or held line as well as display the party's data registered on terminal phonebook. The display lasts while Line Pre-selection works, or 10 seconds.

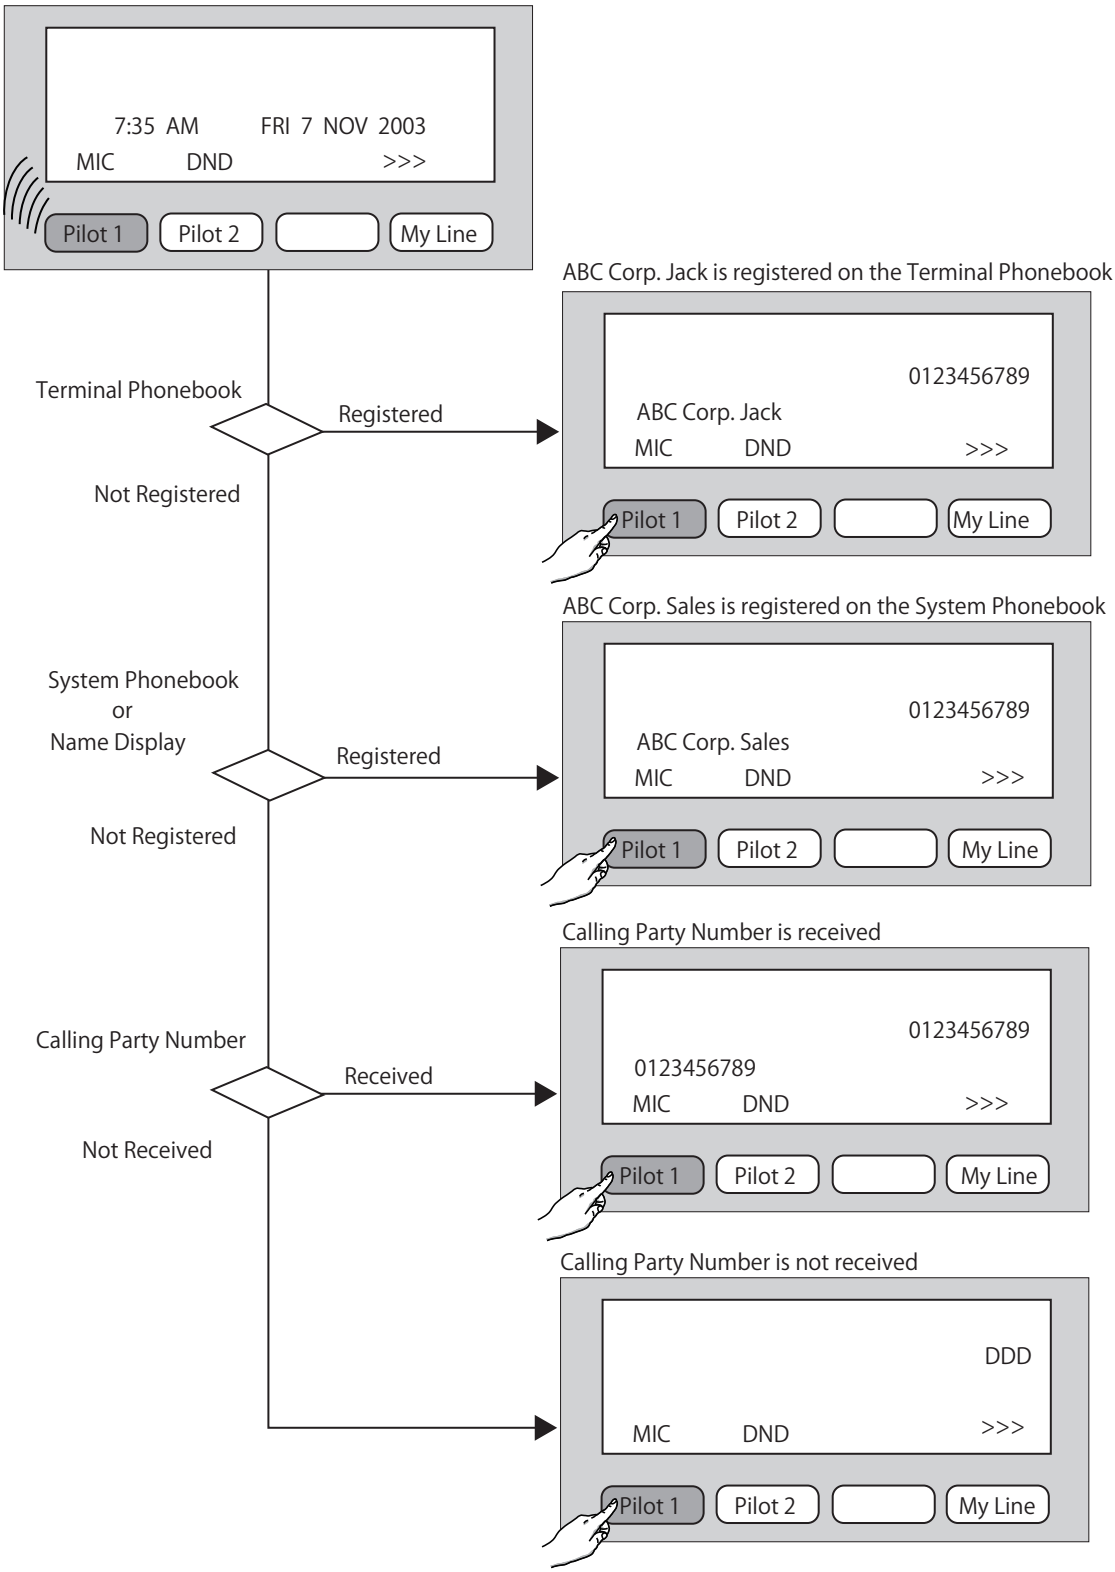
Operating Procedure



To originate

1. Press the desired Line key. Receive Dial Tone.
2. Dial the desired destination.

To answer



1. Press the Line key (ringing and flashing LED alerts incoming call).
2. Lift the handset or press the SPEAKER key. Answer the incoming call.

Example: Pre-selecting an incoming sub-line

Note: When DT800/DT700 Series is used for this feature, refer to the next page (Example: Pre-selecting an incoming sub-line (Terminal Phonebook is used)).

Example: Pre-selecting an incoming sub-line (Terminal Phonebook is used)

Note: Desktop terminals which have Terminal Phonebook built-in are only available for this feature.

Service Conditions

1. A Line key whose associate LED is lit steady cannot be interrupted by pressing its key, unless PRIVACY RELEASE is in service.
2. After the desired Line key is pressed, LINE PRESELECTION -D will remain in effect for 10 seconds. After 10 seconds, Line selection returns to the primary Line.

<Line Pre-selection for Terminal Using Terminal Phonebook>

1. After Line Pre-selection expires with displayed information (10 seconds), Prime Line information appears if Prime Line receives an incoming call.
2. A Desktop terminal with terminal phonebook displays a party's information for 10 seconds based on the following priority order: terminal phonebook; system phonebook; name display; caller ID.
3. Displayed information lasts for 10 seconds even if the party abandons the call or another terminal answers the call before Line Pre-selection expires.
4. A Desktop terminal does not display a party's information when pre-selecting a call from C.O. line which does not include the caller ID.
5. If you pre-select an idle line, displayed information of a party is cleared with the following exception: if Prime Line receives an incoming call, its information is displayed (only when the following data is set: ASYD, SYS1, Index 390, Bit 2=1: Caller ID display on the bottom line of LCD is in service). In this case, the corresponding data of system Phonebook or user name retrieved from the system is displayed, but not the data of the terminal phonebook.
6. After you pre-select an idle line on a Desktop terminal with terminal phonebook, if an incoming call arrives in the line within 10 seconds, the party's information is displayed (only when the following data is set: ASYD, SYS1, Index 390, Bit 2=1: Caller ID display on the bottom line of LCD is in service). In this case, the corresponding data of system Phonebook or user name retrieved from the system is displayed. Pre-select the line again to switch the display to data of terminal phonebook.

Programming

No programming is required. The following is only for displaying a party's data on a Desktop terminal with terminal phonebook.

Note: See [P-83] Phonebook to check the service conditions before assigning the following.

STEP 1: **ASYDL** - SYS1, Index 679, Bit 0=1 (Terminal phonebook display on Line Pre-selection is in service)
STEP 2: **ASFC** - SFC = 1-15, SFI = 247=1

L-10 LCR - Time Of Day Routing

General Description

This feature provides automatic routing of outgoing calls over alternative customer facilities, based on the Destination Code. The system will select the most economical route available at the time of connection. The pattern of alternate routing can be changed up to 8 times per day, based on a prearranged time schedule.

Operating Procedure

To operate

a.) Lift the handset. Receive Dial Tone.
b.) Dial the Trunk Access Code (usually "9"). Receive Second Dial Tone.
c.) Dial the Area Code, Office Code, and Subscriber Number.
d.) The system automatically completes the call via the most economical route available.

Service Conditions

1. A maximum of 8 patterns can be provided during a 24-hour interval for LCR - TIME OF DAY ROUTING.
2. Each pattern can be programmed at a maximum increment of 30 minutes.

Interactions

1. For each Time-of-Day Change, the entire AOPR and ASDC tables must be created. Caution should be exercised to use data memory economically.
2. LEAST-COST ROUTING-3/6 DIGIT [L-5] must first be provided.

Programming

STEP 1: **AOPR** - The AFRS command designates the dialing sequence and the OPR to be selected. The AOPR defines the routes and in what order these routes will be selected. Assign the following:

TDPTN - Time-of-Day Pattern Change. If for an AFRS assignment, different OPRs will be required as a function of time; designate 1-7 to which Time-of-Day Pattern Change Number (TDC NO) this OPR is assigned.

OPR No. (OPR) - Outgoing Pattern Route. The number referenced in AFRS, consisting of a series of routes to be chosen based on number dialed.

Route Advance Number (RA) - The order in which a route is selected. (0-7).

Route Advance End Display (E) - The last route in the Route Advance Group. Indicate last route with data "0".

Route Number (RT) - The Physical Route Number to be selected.

Skip Digits (SKIP) - The digits to be skipped when translating the dialed digits in AFRS. If ARTD is assigned as shown, at a minimum, always assign "1" to skip the LCR (S) Access Code.

Pattern Number Location (PNL) - If digits are to be added after translating the dialed digits in AFRS, go to the AADC command.

Overflow Tone (OVFT) - Assign if a tone is wanted for the Last Choice Route.

Priority Restriction Class (PRSC) - If this is required, assign PRSC here; classes 1-15.

STEP 2: **ASDC** - If 6-digit translation is required where both the Area and Office Codes must be examined, this command must be used. The system is automatically set as an Allow table. To create a Deny table, assign the following:

OFFICE: 0
EFFECT: 1
Program the type of route as PFX (Prefix, Foreign Exchange, FX) or as SCC (Special Common Carrier).
Choose TDC PTN, Time-of-Day Pattern. Go to ATCP.
Choose the OPR number this six-digit table will serve.
Choose the RA (Route Advance) Number to specify the route in the OPR.
When assigning for PFX, each NXX is assigned as the following:*
EFFECT: 0 = Allow, No 1 + dialing.
EFFECT: 1 = Allow with 1 + dialing (system adds the 1).
EFFECT: 2 = Not Allowed.
When assigning for SCC, each NXX is assigned as the following:
EFFECT: 0 = Restricted
EFFECT: 1 = Allowed
EFFECT: 2 = Not Used

Note: PFX, EFFECT: 1 is presently not available. Use the AADC command to add the required digits.

STEP 3: **ATCP** - A maximum of eight Time-of-Day Pattern changes (0-7) are available, whereby the system will refer to different OPR assignments as a function of time. As a result, different routes will be listed per OPR and will require different assignments in ASDC.
Assign the following:
Time Setting
TO:
FROM: (In military time, and only on the half hour and hour)
PATTERN NUMBER: (0-7).

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS service varies depending on the node.

STEP 1: **AOPRL** - The AFRS command designates the dialing sequence and the OPR to be selected. The AOPR defines the logical routes and in what order these logical routes will be selected. Assign the following:
TDPTN - Time-of-Day Pattern Change. If for an AFRS assignment, different OPRs will be required as a function of time; designate 1-7 to which Time-of-Day Pattern Change Number (TDC NO) this OPR is assigned.
OPR No. (OPR) - Outgoing Pattern Route. The number referenced in AFRS, consisting of a series of routes to be chosen based on number dialed.
Route Advance Number (RA) - The order in which a route is selected. (0-7).
Route Advance End Display (E) - The last route in the Route Advance Group. Indicate last route with data “0”.
Route Number (RT) - The Physical Route Number to be selected.

Skip Digits (SKIP) - The digits to be skipped when translating the dialed digits in AFRS. If ARTD is assigned as shown, at a minimum, always assign "1" to skip the LCR (S) Access Code.

Pattern Number Location (PNL) - If digits are to be added after translating the dialed digits in AFRS, go to the AADC command.

Overflow Tone (OVFT) - Assign if a tone is wanted for the Last Choice Route.

Priority Restriction Class (PRSC) - If this is required, assign PRSC here; classes 1-15.

STEP 2: **ATCPL** - A maximum of eight Time-of-Day Pattern changes (0-7) are available, whereby the system will refer to different OPR assignments as a function of time. As a result, different routes will be listed per OPR and will require different assignments in ASDC.

Assign the following:

Time Setting

TO:

FROM: (In military time, and only on the half hour and hour)

PATTERN NUMBER: (0-7).

L-11 Line Load Control - Attendant

General Description

This feature allows the Attendant to deny a preselected group of stations the ability to originate calls by activating a key. The sole intention of this feature is to temporarily restrict the least important internal stations from outward calling during an excessive traffic load or emergency conditions.

Operating Procedure

To activate from the ATTENDANT CONSOLE [A-3]

a.) Press a Loop key.
b.) Dial the LINE LOAD CONTROL Access Code. Receive Service Set Tone.
c.) Press the RELEASE key.

To cancel from the ATTENDANT CONSOLE [A-3]

a.) Press the Loop key.
b.) Dial the LINE LOAD CONTROL Cancel Code. Receive Service Set Tone.
c.) Press the RELEASE key.

Service Conditions

1. This feature is controlled entirely from the ATTENDANT CONSOLE [A-3].
2. Individual stations are programmed for this feature via CLASS OF SERVICE - INDIVIDUAL [C-15].
3. When LINE LOAD CONTROL [L-11, 20, 21] is set in the system, the message “LLC” will be output on the display of Attendant Console.
4. Incoming calls from a trunk can be restricted in system data (ASYD, SYS1, Index 59, Bit 0=1), regardless of Service Feature Restriction Class setting.
5. When LINE LOAD CONTROL is activated or canceled, a system message will be output via the PCPro.
6. When LINE LOAD CONTROL is activated, a single line station will receive Busy Tone [or “BUSY” is displayed on LCD for Dterm (no tone)] when going off-hook.
7. A station in LINE LOAD CONTROL [L-11, 20, 21] can receive incoming calls.
8. Incoming calls terminated via CCIS/ISDN trunks or MG-COT cannot be restricted. Incoming calls terminated via FCCS cannot be restricted as well.
9. The incoming calls from a PS Line or an SP Controlled SIP terminal accommodated on programmable Line/Feature key of Desktop terminal can not be restricted.
10. The visitor PS cannot be allowed to originate a call during Line Load Control because SFI = 16 cannot be assigned to the Service Feature Restriction Class of the visitor PS.
11. When SOFT PHONE - PS [S-158] or SOFT PHONE WLAN HANDSET [S-159] is activated, outgoing calls cannot be restricted by LINE LOAD CONTROL.
12. When SOFT PHONE WIRED-PHONE HANDSET [S-147] is activated, the restriction for outgoing calls must be assigned in CLASS OF SERVICE - INDIVIDUAL [C-15] of the wired telephone.
13. Restriction by LINE LOAD CONTROL will be executed within each LP unit.

Interactions

1. Calls in progress are not affected when this feature is activated.
2. This feature is implemented on a per-system basis.
3. Only the Attendant Console can activate this feature by seizing a loop and dialing the Feature Access Code. A designated key cannot be assigned at the Attendant Console to control this feature.
4. Access to the system data via the PCPro is allowed while LINE LOAD CONTROL is active.
5. STATION-TO-STATION CALLING [S-11] to affected stations is not allowed during LINE LOAD CONTROL.
6. HOTLINE [H-1] and HOUSE PHONE [H-2] connections become inoperative during LINE LOAD CONTROL.

Programming

STEP 1: **ASYD** - SYS1, Index 59, Bit 0. Should the system restrict incoming calls during LINE LOAD CONTROL? 0/1: No/Yes.

Note: Incoming Calls terminated to CCIS/ISDN Trunks or MG-COT cannot be restricted.

STEP 2: **ANPD** - Reserve a Number Level for Feature Access and Cancel. Select Normal Service (N), Hooking Service (H) or Busy Service (B) from the combo box for Connection Indexes. (applicable to any feature assigned to this Level). Assign NND in accordance with a predetermined Numbering Plan.

STEP 3: **ASPA** - Assign an Access Code to LINE LOAD CONTROL. Assign SRV = "SSCA: Service Code Appendix", SIDA = 46 for Line Load Control Start. Assign SRV = "SSCA: Service Code Appendix", SIDA = 47 for Line Load Control Cancel. Assign a Connection Index, CI = "N: Normal".

STEP 4: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 16 to the stations that will be unaffected by LINE LOAD CONTROL.

L-18 Long Line Trunk

General Description

This service allows accommodation of a station that has high loop resistance (long-line station). Long-line stations that have a maximum 1,500 ohms of loop resistance, including resistance of the telephone set, may be equipped by this feature.

Note: This feature is not available in North America and Australia.

Operating Procedure

No manual operation is required.

Service Conditions

1. Any number of long line stations may be used up to the total number of stations accommodated in the system.
2. PA-16LC BW or the equivalent is required for long line stations.
3. The following services are not available for long line stations:
   a.) MESSAGE WAITING LAMP
   b.) GROUND BUTTON ACCESS
   c.) Parallel (Branch) Connection
   d.) HOWLER TONE SENDING.
4. No compensation of speech level is provided for long line stations.

L-20 Line Load Control - Automatic

General Description

This feature allows the system to automatically deny a preselected group of stations the ability to originate calls. The sole intention of this feature is to temporarily restrict the least important internal stations from outward calling during an excessive traffic load or emergency conditions.

Operating Procedure

No manual operation is required.

Service Conditions

1. Individual stations are programmed for this feature via CLASS OF SERVICE - INDIVIDUAL [C-15].
2. When LINE LOAD CONTROL [L-11, 20, 21] is set in the system, the message "LLC" will be output on the display of Attendant Console.
3. Incoming calls from a trunk can be restricted in system data (ASYD, SYS1, Index 59, Bit 0=1), regardless of Service Feature Restriction Class setting.
4. When LINE LOAD CONTROL - AUTOMATIC [L-20] is activated or canceled, a system message will be output via the PCPro.
5. When LINE LOAD CONTROL is activated, a single line station will receive Busy Tone [or "BUSY" is displayed on LCD for Dterm (no tone)] when going off-hook.
6. A station in LINE LOAD CONTROL [L-11, 20, 21] can receive incoming calls.
7. Incoming calls terminated via CCIS/ISDN trunks or MG-COT cannot be restricted. Incoming calls terminated via FCCS cannot be restricted as well.
8. The incoming calls from a PS Line or an SP Controlled SIP terminal accommodated on programmable Line/Feature key of Desktop terminal can not be restricted.
9. The visitor PS cannot be allowed to originate a call during Line Load Control because SFI = 16 cannot be assigned to the Service Feature Restriction Class of the visitor PS.
10. When SOFT PHONE - PS [S-158] or SOFT PHONE WLAN HANDSET [S-159] is activated, outgoing calls cannot be restricted by LINE LOAD CONTROL.
11. When SOFT PHONE WIRED-PHONE HANDSET [S-147] is activated, the restriction for outgoing calls must be assigned in CLASS OF SERVICE - INDIVIDUAL [C-15] of the wired telephone.
12. Restriction by LINE LOAD CONTROL will be executed within each LP unit.

Programming

STEP 1: **ASYD** - SYS1, Index 56 and Index 57. Set LINE LOAD CONTROL-AUTOMATIC Execution (Index 56)/Execution cancel (Index 57) CPU Occupancy Rate. If no data is assigned, RAM Data 97% (Index 56) and 90% (Index 57) are used.

SYS1, Index 59, Bit 0. Incoming Trunk Call Restriction during LINE LOAD CONTROL 0/1: Not Required/Required

Note: Incoming Calls terminated to CCIS/ISDN Trunks or MG-COT cannot be restricted.

STEP 2: **ASFC** - Assign SFI = 16 to the Service Feature Restriction Class of the Stations that are to be able to originate calls during Line Load Control.

L-21 Line Load Control - Manual

General Description

This feature allows the PCPro to deny a preselected group of stations the ability to originate calls by activating a command key. The sole intention of this feature is to temporarily restrict the least important internal stations from outward calling during an excessive traffic load or emergency conditions.

Operating Procedure

The ALLC command is used to designate start and stop of LINE LOAD CONTROL - MANUAL [L-21].

Service Conditions

1. Individual stations are programmed for this feature via CLASS OF SERVICE - INDIVIDUAL [C-15].
2. When LINE LOAD CONTROL [L-11, 20, 21] is set in the system, the message “LLC” will be output on the display of Attendant Console.
3. Incoming calls from a trunk can be restricted in system data (ASYD, SYS1, Index 59, Bit 0=1), regardless of Service Feature Restriction Class setting.
4. When LINE LOAD CONTROL is activated, a single line station will receive Busy Tone [or “BUSY” is displayed on LCD for Dterm (no tone)] when going off-hook.
5. A station in LINE LOAD CONTROL [L-11, 20, 21] can receive incoming calls.
6. When LINE LOAD CONTROL - MANUAL [L-21] is activated or canceled, a system message will be output on the PCPro.
7. Incoming calls terminated via CCIS/ISDN trunks or MG-COT cannot be restricted. Incoming calls terminated via FCCS cannot be restricted as well.
8. Incoming calls from a PS Line or an SP Controlled SIP terminal accommodated on a programmable Line/ Feature key of a Desktop terminal cannot be restricted.
9. The visitor PS cannot be allowed to originate a call during Line Load Control because SFI = 16 cannot be assigned to the Service Feature Restriction Class of the visitor PS.
10. When SOFT PHONE - PS [S-158] or SOFT PHONE WLAN HANDSET [S-159] is activated, outgoing calls cannot be restricted by LINE LOAD CONTROL.
11. When SOFT PHONE WIRED-PHONE HANDSET [S-147] is activated, the restriction for outgoing calls must be assigned in CLASS OF SERVICE - INDIVIDUAL [C-15] of the wired telephone.
12. Restriction by LINE LOAD CONTROL will be executed within each LP unit.

Programming

STEP 1: **ASYD** - SYS1, Index 59, Bit 0. Incoming Trunk Call Restriction during LINE LOAD CONTROL 0/1: Not Required/Required.

STEP 2: **ASFC** - Assign SFI = 16 (Line Load Control) to the Service Feature Restriction Class of the stations that are to be able to originate calls during Line Load Control.

L-22 Line Fault Detection

General Description

This feature detects faulty conditions on exchange lines (Line Disconnection etc.), and indicates them as "Line Faults", restricting further seizure of the faulty line by other connections.

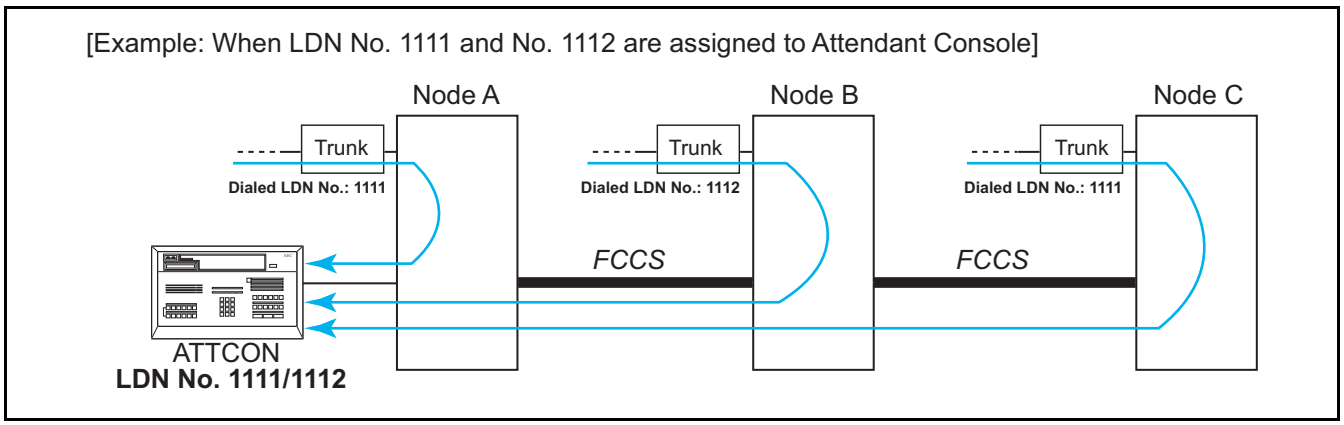
Note: This feature is only available in Australia.

Operating Procedure

No manual operation is required.

Service Conditions

1. A line fault may be detected on any exchange lines in any of the following cases:
   a.) Both Line A and Line B are short-circuited.
   b.) Line A is open.
   c.) Line B is open.
   d.) Connection of Line A and Line B is reversed.
2. If a line fault is detected on an exchange line in the idle state, the line fault lamp (yellow) on the package and the SUP lamp on the frame light up, and an appropriate message is output to the PCPro.
3. When the exchange line recovers from the line fault state, the line fault lamp goes off and the fault recovery message is output to the PCPro.
4. The SUP lamp on the frame should be turned off by means of either the RALM command or "ALM RST" key operation.
5. No exchange lines in the line fault state may be seized by new connections.



Programming

No programming is required for this feature.

L-24 Listed Directory Number

General Description

This feature allows Listed Directory Number display on the ATTENDANT CONSOLE [A-3] when the Attendant has answered a Listed Directory Number call.
In addition, this feature enables ATTENDANT CONSOLE to receive a Listed Directory Number (LDN) call, terminated at a remote node, via FCCS link.

Operating Procedure

1. Listed Directory Number (LDN) is dialed.
2. The Attendant at an ATTENDANT CONSOLE [A-3] answers the LDN call (DID, TIE).
   a.) The DEST lamp lights up.
   b.) The Listed Directory Number is displayed.
3. The Attendant presses the SRC key.
   a.) The DEST lamp goes out and the SRC lamp lights up.
   b.) The route/trunk number is displayed.

Service Conditions

1. This service is effective when the Attendant at an ATTENDANT CONSOLE [A-3] has answered a Listed Directory Number call.
2. If the Attendant presses the SRC key while the Listed Directory Number is displayed, the display changes to the calling party's route/trunk number. In this case, the Listed Directory Number of the call being handled at present cannot be displayed again.
3. While the Listed Directory Number is displayed, the Attendant can transfer the call to a desired station by entering the destination number on the keypad. In this case, the Listed Directory Number of the call being handled at present cannot be displayed again.
4. While the Listed Directory Number is displayed, the Attendant can place the present call on hold by pressing the HOLD key. In this case, the Listed Directory Number will not be displayed again when the Attendant returns to the call on hold.
5. While the Listed Directory Number is displayed, the Attendant can set CALL PARK [C-29] service. In this case, the Listed Directory Number of the call placed on CALL PARK [C-29] cannot be displayed again.
6. The LISTED DIRECTORY NUMBER should be assigned in system data.

<FCCS Conditions>

1. The user can program FPC of node with ATTCON, which receives LDN Calls, to each node by using ALDNN command.
2. When "LDN assigned by ALDN command" and "LDN assigned by ALDNN command" are mixed in a system, "LDN assigned by ALDNN command" takes precedence over "LDN assigned by ALDN command".
3. FPC of a Node which transmits Day/Night changeover information is determined by SYS1, Index 640, and the information is transmitted to a node of FPC designated by SYS1, Index 704.
4. When FCCS link between a node received a LDN call and a node with ATTCON is all busy, locked out, make busy or etc., the calling party receives Busy Tone.

Programming

STEP 1: **ASYD** - SYS1, Index 70, Bit 0. Called Number Display when Call Forwarding to ATTCON 0/1: Out/ In Service.

STEP 2: **ALDN** - Assign the LISTED DIRECTORY NUMBER.

TN:	Tenant Number (1-255)
LDN:	Enter the DID Number that is to terminate the call to the Attendant Console in the Day Mode (six digit maximum)
TYPE (Night Transfer Type):	Select a value from 0-3, using the following:
TYPE 0:	No Night Transfer is selected
TYPE 1:	"To Station" is selected. Enter a valid Station Number (six digit maximum). Specific Attendant Numbers assigned using the ASAT command cannot be used.
TYPE 2:	"To Outside" is selected. Enter the Outside Party Number (eight digit maximum).
TYPE 3:	"To ADC" is selected. Enter an Abbreviated Digit Code that has been predefined in the ASPD command (four digit maximum).

FCCS Programming

The following command assignments are required to use this feature via FCCS link.

STEP 1: **ASYDL** - SYS1, Index 640, Bit 0 to Bit 7. Assign FPC of a node which transmits Day/Night changeover information.

SYS1, Index 704 to Index 735. Assign FPC of a node which receives the Day/Night changeover information transmitted from the node assigned by SYS1, Index 640, Bit 0 to Bit 7 above.

STEP 2: **ANPDN** - Assign the first digit for Listed Directly Number (LDN).

TN: Tenant Number (1-255)

1stDC: 1st Digit Code (0-9,*,#)

CI: Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes.

NND: Number of Necessary Digits (max. 6 digits)

BLF: Busy Lamp Field Display Activated on ATT (0 = Out of Service/1 = In Service)

STEP 3: **ASPAN** - Assign the number of digit of Access Code for LDN.

TN: Tenant Number (1-255)

ACC: Access Code (maximum of 6 digits)

CI: Connection Status Index ("N: Normal"/"H: Hooking"/"B: Busy")

SRV: Kind of Service (Designate “TELN: Telephone Number”)

NND: Necessary Digits (1-16)

STEP 4: **ARTDN** - CDN 25 R/L (Attendant-Identification of Incoming Trunk Display) 0/1. Data “0”: TN, RT, TK display. Data “1”: Central Office Line Number Display (using ACOC).

STEP 5: **ALDNN** - Assign FPC of a node with Attendant Console which receives the LDN call by dialing the LDN.

TN: Tenant Number (1-255)

LDN: Listed Directory Number (maximum of 16 digits)

FPC: Fusion Point Code of the Node with Attendant Console which receives LDN calls

TYPE: Number Type of Night Mode destination number of LDN. (Designate “0” = No night transfer)

L-28 LDN Night Connection

General Description

This feature routes LISTED DIRECTORY NUMBER (LDN) calls to a preselected station when the system is in Night Mode.
In addition, this feature enables Attendant Console to forward terminated LDN calls to preprogrammed station via FCCS link in the FCCS network, also.

Operating Procedure

To answer LDN NIGHT CONNECTION calls (DID, TIE)

a.) An incoming LDN call in Night Mode is automatically routed to a preselected LDN NIGHT CONNECTION station within the system.
b.) The calling party receives Ringback Tone.
c.) The ringing signal is sent to the LDN NIGHT CONNECTION station.
d.) The LDN NIGHT CONNECTION station goes off-hook to answer the incoming call. If necessary, this station can transfer the incoming call to another station within the system using the CALL TRANSFER - ALL CALLS [C-11] feature.

Service Conditions

1. NIGHT CONNECTION - FIXED [N-1] and NIGHT CONNECTION - FLEXIBLE [N-2] take priority over this feature.
2. The destination station can be assigned on a LDN basis.
3. This feature is available for a maximum of 16 LDNs per tenant.
4. A data terminal cannot be used as a destination station for this feature.
5. The following features are not available for the destination station:

CALL FORWARDING - ALL CALLS - OUTSIDE	[C-28]
CALL FORWARDING - BUSY LINE - OUTSIDE	[C-60]
CALL FORWARDING - DON'T ANSWER - OUTSIDE	[C-74]

6. A UCD station can be assigned as the destination of LDN Night Connection or a transfer destination station of the CALL FORWARDING - ALL CALLS [C-5]/BUSY LINE [C-2], but queuing functions of UCD such as DELAY ANNOUNCEMENT - UCD [D-31] and CALL WAITING LAMP - UCD [D-76] are not available when all stations within the UCD Group are busy or CALL FORWARDING-ALL CALLS [C-2]/BUS LINE [C-11] to UCD Group station is set to the LDN Night Connection station.
7. When the destination station is busy, an incoming call is handled as follows: The call waits in queue. The status of the destination station is periodically checked. NIGHT CONNECTION OUTSIDE - SYSTEM [N-18] or TRUNK ANSWER FROM ANY STATION [T-8] is available when CALL FORWARDING - BUSY LINE [C-2] to the Attendant or CALL FORWARDING - BUSY LINE - OUTSIDE [C-60] has been assigned.
8. MISCELLANEOUS TRUNK RESTRICTION [M-3] is not available for this service.
9. NIGHT CONNECTION - FIXED [N-1] or TRUNK ANSWER FROM ANY STATION [T-8] is available while the destination station is in the following states:
   a.) LOCK OUT [L-3] make busy.
   b.) CALL FORWARDING - ALL CALLS [C-5] set to the Attendant.
   c.) CALL FORWARDING - ALL CALLS - OUTSIDE [C-28] set.

10. The LDN NIGHT CONNECTION station and the Attendant Console must be accommodated in the same node for the FCCS network.

<FCCS Conditions>

1. FPC of a node which transmits Day/Night changeover information is determined by SYS1, Index 640, and the information is transmitted to a node of FPC designated by SYS1, Index 704.
2. A station within the FCCS Network Console signed as forwarding destination for Night Mode (LDN NIGHT CONNECTION [L-28]).

Interactions

1. A maximum of 16 LDNs can be assigned per tenant, each with its own separate destination station. The same destination may also be used for all LDNs.
2. STATION HUNTING-CIRCULAR [S-7] and STATION HUNTING-TERMINAL [S-9] are valid from the Night Transfer destination station.
3. MULTIPLE CALL FORWARDING-ALL, BUSY, DON'T ANSWER [M-44, M-24, M-25] and MULTIPLE CALL FORWARDING-ALL, BUSY, DON'T ANSWER-CCIS [M-40, M-41, M-42] are valid from Night Transfer destination station.
4. An incoming DID call will get Busy Tone if the Night Transfer destination station is CALL FORWARDING-ALL [C-5] or CALL FORWARDING-BUSY LINE [C-2] to the Attendant, and TRUNK ANSWER FROM ANY STATION [T-8] is not service.
5. An incoming DID call will ring at the Night Transfer destination station if CALL FORWARDING-DON'T ANSWER [C-3] is set to the Attendant.
6. There is no restriction check for LDN NIGHT CONNECTION destination stations. The station can be totally restricted from receiving incoming calls and still receive LDN NIGHT CONNECTION calls.
7. If the Night Transfer destination station is busy, LDN calls will go into queue.
8. If the system is switched to Day Mode while LDN calls are in queue, only those calls that are in queue will be redirected to the Attendant. LDN calls that are ringing the Night Transfer destination station will continue to ring that station and will not be redirected to the Attendant.
9. If the Night Transfer destination station is in the Make Busy state (MBST Command = 1 for that station) or is in LINE LOCKOUT [L-3], the LDN call will go to TRUNK ANSWER FROM ANY STATION [T-8].
10. If the Night Transfer destination station (Station A) is in CALL FORWARDING-BUSY LINE [C-2] to Station B and both stations (Station A and Station B) are busy, the incoming LDN call will queue to both Station A and Station B, and will ring the first idle station.
11. If the Night Transfer destination (Station A) is in CALL FORWARDING-BUSY LINE [C-2] over CCIS to Station C in the remote office, and both Station A and Station C are busy, Busy Tone is returned to the incoming LDN calling party.
12. Incoming LDN calls to a Night Transfer destination station that has set CALL FORWARDING-ALL CALLS, BUSY LINE, DON'T ANSWER-CCIS [C-45, C-46, C-47] over CCIS to a busy UCD Group in the remote office will queue to that group, and will activate the CALL WAITING LAMP-UCD [C-76], if programmed.
13. The order of priority of forwarding features used when the system is Night Mode are as follows.

Higher Priority

Lower Priority

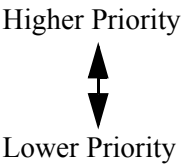
- NIGHT CONNECTION FLEXIBLE [N-2]
- NIGHT CONNECTION FIXED [N-1]
- LDN NIGHT CONNECTION [L-28]
- NIGHT CONNECTION-OUTSIDE-SYSTEM [N-17]
- TRUNK ANSWER FROM ANY STATION (TAS) [T-8]

Note: When forwarding destination for this feature is not assigned, Busy Tone is sent.

14. When assigning a forwarding destination number for Night Mode using ALDNN command, the maximum 16 digits can be programmed by using TYPE = 1 (Station Number) / 2 (DC).
    If the user requires digit number greater than 16 or more, assign an Abbreviated Digit Number (ADC) of the forwarding destination, preprogrammed by ASPD command, by using TYPE = 3 (Abbreviated Digit Number).
15. The user can assign different forwarding destination numbers (Telephone Number) to each LDN.

Note: The numbers of Telephone Number which can be programmed in a system is 65535 maximum.

16. Whether Special Transmission Tone is sent or not while number data is transmitted depends on SYS1, Index 6, Bit 0.
17. Forwarding destination terminal, available for this feature, is station or Voice Prompt System (VPS).
18. When using VPS as forwarding destination of this feature, the user programs voice information guidance number, recording service number or etc. In regard Numbering Plan for these service, refer to service condition of VPS.
19. Forwarding features except for the following are available for forwarding destination.
    - CALL FORWARDING-ALL CALLS [C-28] to Attendant Console
    - CALL FORWARDING-BUSY LINE [C-2] to Attendant Console
    - CALL FORWARDING-DON'T ANSWER [C-3] to Attendant Console
    - CALL FORWARDING-ALL CALLS-OUTSIDE [C-28]
    - CALL FORWARDING-BUSY LINE-OUTSIDE [C-60]
    - CALL FORWARDING-DON'T ANSWER-OUTSIDE [C-74]
    - CALL TRANSFER-ATTENDANT [C-10]
20. A route between Incoming Trunk received a LDN call and forwarding station for the LDN call is not restricted.
21. When STATION HUNTING-CIRCULAR [S-7], STATION HUNTING-TERMINAL [S-9] or UNIFORM CALL DISTRIBUTION (UCD) [U-1] is set to the forwarding destination, the hunting feature is available.
22. NIGHT CONNECTION FIXED [N-1] or TRUNK ANSWER FROM ANY STATION [T-8] is available while the destination is in the following states:
    - Forwarding destination is not assigned by ALDNN command.
    - CALL FORWARDING-BUSY LINE [C-2] to Attendant Console is set.
    - CALL FORWARDING-ALL CALLS [C-5] to Attendant Console is set.
    - CALL FORWARDING-INTERCEPT/ANNOUNCEMENT [C-25] is set.
    - CALL FORWARDING-BUSY LINE-OUTSIDE [C-28] is set.
    - CALL FORWARDING-ALL CALLS-OUTSIDE [C-60] is set.
    - FCCS link is all busy/make busy/rocked out.
    - Trunk/Route is all busy.
    - Toll is restricted.
    - Line is locked out.



Note: NIGHT CONNECTION FIXED [N-1] takes priority over TRUNK ANSWER FROM ANY STATION [T-8].

23. When forwarding destination (including CCIS line) is not set, busy or restricted, Busy Tone or Reorder Tone is sent.
24. LDN NIGHT CONNECTION [N-1] is available for connections shown in table below:

× : Possible – : Impossible		Outgoing		
		CCIS Trunk	DOD Trunk	MFC Trunk
Incoming	CCIS Trunk	×	×	×
	DID Trunk	×	×	×
	MFC Trunk	×	×	–

25. When forwarding destination is busy, the call is queued, and Ringback Tone is sent, however, if the call is terminated from MFC line, Reorder Tone is sent.
26. When a LDN call is placed in a queue because forwarding destination station is busy, system checks station state (idle/busy) at intervals of 12 seconds. After that if the destination station becomes idle state, the LDN call is connected.
27. When plural calls are queued in a forwarding destination station, the queued call may not connect the destination stations in termination order of call.
28. When system is changed from Night Mode to Day Mode, queued calls terminate to Attendant Console to make up for forwarding to destination.
29. When system is changed from Day Mode to Night Mode while a LDN call is terminating to Attendant Console, the LDN call is transferred to preprogrammed forwarding destination. If the LDN call cannot be transferred according to normal priority by restriction for the forwarding destination, one of the features below (**Note 1**) is used to process the LDN call. (The features in the list are in priority order with the highest priority at the top.)

- TRUNK ANSWER FROM ANY STATION [T-8]
- DELAY ANNOUNCEMENT-ATTENDANT [D-144]
- NIGHT CONNECTION-FIXED [N-1]

Note 1: When these features are not set, the LDN call is queued.

Programming

STEP 1: **ALDN** - Assign LDN number and its transfer destination.

TN: Tenant Number

LDN: Listed Directory Number (must match Station Numbering Plan)

Night Transfer:Y/N

If no, then LDN will only go to Attendant.

If yes, then the following parameters will be enabled:

TYPE: Night Transfer Type

1: Station Number

2: Outside (up to 8 digits)

3: ADC (when more than 8 digits are required)

STN: For Types 1 and 2.

For Type 1, assign Station Number here.

For Type 2, assign Access Code and Outside Number here.

(A CCIS remote office Station Number can be input here also).

ADC: For Type 3.

Input ADC number desired as assigned in the ASPD command.

STEP 2: **ACFR** - Assign TSFI: 2 (Night Connection-Fixed) to be allowed CCI: 1 (LDN). This allows LDN to go to night transfer destination. Assign TSFI: 5 (TAS) to be allowed CCI: 1 (LDN). This allows LDN to go to TRUNK ANSWER FROM ANY STATION [T-8]. Restrict if not using TAS.

FCCS Programming

The following command assignments are required to use this feature via FCCS link.

● When destination number is programmed by using TYPE = 1 (TELN) of ALDNN command.

STEP 1: **ASYDL** - SYS1, Index 640, Bit 0 to Bit 7. Assign FPC of a node which transmits Day/Night changeover information.

SYS1, Index 704 to Index 735. Assign FPC of a node which receives the Day/Night changeover information transmitted from the node assigned by SYS1, Index 640, Bit 0 to Bit 7 above.

STEP 2: **ANPDN** - Assign the first digit for Listed Directly Number (LDN) and forwarding destination.

TN: Tenant Number (1-255)

1stDC: 1st Digit Code (0-9,*,#)

CI: Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes.

NND: Number of Necessary Digits (max. 6 digits)

BLF: Busy Lamp Field Display Activated on ATT (0 = Out of Service/1 = In Service)

STEP 3: **ASPAN** - Assign the number of digit of Access Code for LDN and forwarding destination.

TN: Tenant Number (1-255)

ACC: Access Code (max. 6 digits)

CI: Connection Status Index (“N: Normal”/”H: Hooking”/”B: Busy”)

SRV: Kind of Service (Designate “TELN: Telephone Number”)

NND: Necessary Digits (1-16)

STEP 4: **ALGSN** - Assign Telephone Number to Night Mode destination number (Station Number).

a.) TYPE = 1 (When Line Equipment Numbers/Phantom Index is used to specify the Telephone

Number)
UGN: User Group Number (1-255)
TELN: Telephone Number (max. 16 digits)
FPC: Fusion Point Code of the designated LENS/PHIN
LENS/PHIN:Line Equipment Numbers of physical station

b.) TYPE = 2 (When Station Number is used to specify the Telephone Number)
UGN: User Group Number (1-255)
LDN: Listed Directory Number (max. 16 digits)
TN: Tenant Number (1-255)
STN: Station Number

STEP 5: **ALDNN** - Assign FPC of a node with Attendant Console which receives the LDN Call by dialing the LDN.
TN: Tenant Number (1-255)
LDN: Listed Directory Number (max. 16 digits)
FPC: Fusion Point Code of the node with Attendant Console which receives LDN Calls
TYPE: Number Type of Night Mode destination number of LDN. (Designate 1 = TELN.)
STN: Station Number of Forwarding Destination (max. 16 digits) or specific Attendant Console number assigned by ASAT command.

STEP 6: **ACFR** - Allow the Call Forwarding Restriction Class.
TN: Tenant Number (1-255)
TSFI: Transfer Service Feature Index (Assign 2 = Direct in Termination (Night only))
CCI: Call Category Index (Assign 1 = LDN (Central Office Line))
RES: Restriction Data (Assign 1 = Allowed)

● When destination number is programmed by using TYPE = 3 (ADC) of ALDNN command.

STEP 1: **ASYDL** - SYS1, Index 640, Bit 0 to Bit 7. Assign FPC of a node which transmits Day/Night changeover information.
SYS1, Index 704 to Index 735. Assign FPC of a node which receives the Day/Night changeover information transmitted from the node assigned by SYS1, Index 640, Bit 0 to Bit 7 above.

STEP 2: **ANPDN** - Assign the first digit for Listed Directly Number (LDN) and forwarding destination.
TN: Tenant Number (1-255)
1stDC: 1st Digit Code (0-9,*,#)
CI: Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes.
NND: Number of Necessary Digits (max. 6 digits)
BLF: Busy Lamp Field (0 = Out of Service/1 = In Service)

STEP 3: **ASPAN** - Assign the number of digit of Access Code for LDN and forwarding destination.
TN: Tenant Number (1-255)
ACC: Access Code (max. 6 digits)
CI: Connection Status Index (“N: Normal”/”H: Hooking”/”B: Busy”)
SRV: Kind of Service (Designate “TELN: Telephone Number”)
NND: Necessary Digits (1-16)

STEP 4: **ALGSN** - Assign Telephone Number to Night Mode destination number (Station Number).

a.) TYPE = 1 (When Line Equipment Numbers/Phantom Index is used to specify the Telephone Number.)
UGN: User Group Number (1-255)

TELN: Telephone Number (max. 16 digits)
FPC: Fusion Point Code of the designated LENS
LENS/PHIN: Line Equipment Numbers/Phantom Index of physical station

b.) TYPE = 2 (When Station Number is used to specify the Telephone Number.)
UGN: User Group Number (1-255)
LDN: Listed Directory Number (max. 16 digits)
TN: Tenant Number (1-255)
STN: Station Number

STEP 5: **ASPD** - Assign speed Calling Number to Abbreviated Digit Code (ADC).
TN: Tenant Number (1-255)
ADC: Abbreviated Digit Code (maximum of four digits)
CD: Desired Speed Calling Number (maximum of 24 digits)

Note: The user must be assigned this command at node which receives the LDN Call.

STEP 6: **ALDNN** - Assign FPC of a node with Attendant Console which receives the LDN Call by dialing the LDN.
TN: Tenant Number (1-255)
LDN: Listed Directory Number (max. 16 digits)
FPC: Fusion Point Code of the node with Attendant Console which receives LDN Calls
TYPE: Number Type of Night Mode destination number of LDN. Assign 3 (ADC).
ADC: Abbreviated Digit Code assigned by ASPF command.

STEP 7: **ACFR** - Allow the Call Forwarding Restriction Class.
TN: Tenant Number (1-255)
TSFI: Transfer Service Feature Index (Assign 2 = Direct in Termination (Night only))
CCI: Call Category Index (Assign 1 = LDN (Central Office Line))
RES: Restriction Data (Assign 1 = Allowed)

L-30 LDN Night Connection - Outside

General Description

This feature routes LISTED DIRECTORY NUMBER (LDN) calls to a preselected station outside the system when the system is in Night Mode.
In addition, this feature enables Attendant Console to transmit terminated LDN call to outside using outgoing trunk in the FCCS network.

Operating Procedure

To answer LDN NIGHT CONNECTION calls (DID, TIE)

1. An incoming LDN call in Night Mode is automatically routed to a preselected LDN NIGHT CONNECTION station outside the system.
2. The calling party receives Ringback Tone.
3. The ringing signal is sent out to the LDN NIGHT CONNECTION-OUTSIDE station.
4. The LDN NIGHT CONNECTION station answers the incoming call. If necessary, this station can transfer the incoming call to another station outside the system using the CALL TRANSFER - ALL CALLS [C-11] feature.

Service Conditions

1. NIGHT CONNECTION - FLEXIBLE [N-2] and NIGHT CONNECTION - FIXED [N-1] take priority over this feature.
2. The maximum number of digits in the destination number is 8. SPEED CALLING - SYSTEM [S-3] can be used when more than 8 digits are needed.
3. The destination station outside the system can be assigned on a LDN basis.
4. This feature is available for a maximum of 16 LDNs per tenant.
5. LDN NIGHT CONNECTION - OUTSIDE [L-30] will not route an incoming call on an MFC signaling trunk through another MFC signaling trunk.
6. NIGHT CONNECTION - FIXED [N-1] or TRUNK ANSWER FROM ANY STATION [T-8] is available while the destination station is in the following states:

MISCELLANEOUS TRUNK RESTRICTION	[M-3]
TOLL RESTRICTION - 3/6-DIGIT	[T-7]
Outgoing Trunk Busy	

FCCS Conditions

1. FPC of a node which transmits Day/Night changeover information is determined by SYS1, Index 640, and the information is transmitted to a node of FPC designated by SYS1, Index 704.

   Note: The numbers of Telephone Number which can be programmed in a system is 65535 maximum.

2. Outgoing trunk within the FCCS network can be assigned as forwarding destination for Night Mode (LDN NIGHT CONNECTION-OUTSIDE [L-30]).
3. The order of priority of forwarding features used when the system is Night Mode are as follows.

   Higher Priority
   ↕
   Lower Priority

   - NIGHT CONNECTION FLEXIBLE [N-2]
   - NIGHT CONNECTION FIXED [N-1]
   - LDN NIGHT CONNECTION [L-28]
   - NIGHT CONNECTION-OUTSIDE-SYSTEM [N-17]
   - TRUNK ANSWER FROM ANY STATION (TAS) [T-8]

   Note: When forwarding destination for this feature is not assigned, Busy Tone is sent.

4. When assigning a forwarding destination number for Night Mode using ALDNN command, the maximum 16 digits can be programmed by using TYPE = 1 (Station Number) / 2 (DC).
   If the user requires digit number greater than 16 or more, assign an Abbreviated Digit Number (ADC) of the forwarding destination, preprogrammed by ASPD command, by using TYPE = 3 (Abbreviated Digit Number).
5. The user can assign different forwarding destination numbers (Telephone Number) to each LDN.

   Note: The number of Telephone Numbers which can be programmed in a system is 65535 maximum.

6. The user must restrict tandem connection that release-guard signal cannot be detected by tandem-office.
7. Whether Special Transmission Tone is sent or not while number data is transmitted depends on SYS1, Index 6, Bit 0.
8. LDN call terminated from MFC Line cannot be forwarded to MFC line.
9. Forwarding features except for the following are available for forwarding destination.
   - CALL FORWARDING-ALL CALLS [C-28] to Attendant Console
   - CALL FORWARDING-BUSY LINE [C-2] to Attendant Console
   - CALL FORWARDING-DON'T ANSWER [C-3] to Attendant Console
   - CALL FORWARDING-ALL CALLS-OUTSIDE [C-28]
   - CALL FORWARDING-BUSY LINE-OUTSIDE [C-60]
   - CALL FORWARDING-DON'T ANSWER-OUTSIDE [C-74]
   - CALL TRANSFER-ATTENDANT [C-10]
10. NIGHT CONNECTION FIXED [N-1] or TRUNK ANSWER FROM ANY STATION [T-8] is available while the destination is in the following states:
    - Forwarding destination is not assigned by ALDNN command.
    - CALL FORWARDING-BUSY LINE [C-2] to Attendant Console is set.
    - CALL FORWARDING-ALL CALLS [C-5] to Attendant Console is set.
    - CALL FORWARDING-INTERCEPT/ANNOUNCEMENT [C-25] is set.
    - CALL FORWARDING-ALL CALLS-OUTSIDE [C-28] is set.

- CALL FORWARDING-BUSY LINE-OUTSIDE [C-60] is set.
- LDN call originated from MFC line is forwarded to MFC line.
- FCCS link is all busy/make-busy/rocked out.
- Trunk/Route is all busy.
- Toll is restricted.
- Line is locked out.

Note: NIGHT CONNECTION FIXED [N-1] takes priority over TRUNK ANSWER FROM ANY STATION [T-8].

11. When forwarding destination (including CCIS line) is not set, busy or restricted, Busy Tone or Reorder Tone is sent.
12. LDN NIGHT CONNECTION [N-1] is available for connections shown in table below:

× : Possible – : Impossible		Outgoing		
		CCIS Trunk	DOD Trunk	MFC Trunk
Incoming	CCIS Trunk	×	×	×
	DID Trunk	×	×	×
	MFC Trunk	×	×	–

13. When system is changed from Day Mode to Night Mode while a LDN call is terminating to Attendant Console, the LDN call is transferred to preprogrammed forwarding destination. If the LDN call cannot be transferred according to normal priority by restriction for the forwarding destination, one of the features below (**Note 1**) is used to process the LDN call. (The features in the list are in priority order with the highest priority at the top.)

- TRUNK ANSWER FROM ANY STATION [T-8] is provided.
- DELAY ANNOUNCEMENT-ATTENDANT [D-144] is provided.
- NIGHT CONNECTION-FIXED [N-1] is provided.

Higher Priority

Lower Priority

Note 1: When above feature is not set, the LDN call is queued.

Interactions

1. A maximum of 16 LDNs can be assigned per tenant; each with its own separate destination number.
2. If the outgoing route is busy or if the incoming LDN route is restricted from the outgoing destination route, the LDN calling party will receive Busy Tone or will go to TAS, if programmed.
3. If using TYPE: 3 ADC parameter in the ALDN command, the ADC must first be assigned in the ASPD command. TYPE: 3 must be used for Outside Numbers greater than eight digits.

Programming

STEP 1: **ALDN** - Assign LDN number and its transfer destination.

TN: Tenant Number

LDN: Listed Directory Number (must match Station Numbering Plan.)

Night Transfer: Y/N

If no, then LDN will only go to Attendant.

If yes, then the following parameters will be enabled:

TYPE: Night Transfer Type

1: Station Number

2: Outside (up to 8 digits)

3: ADC (when more than 8 digits are required)

STN: For Types 1 and 2.

For Type 1, assign Station Number here.

For Type 2, assign Access Code and Outside Number here.

(A CCIS remote office Station Number can be input here also.)

ADC: For Type 3.

Input ADC number desired as assigned in ASPD command.

STEP 2: **ASPD** - Assign an Access Code and Outside Number to an ADC (000-999). This step is required only if Access Code and Outside Number are greater than eight digits.

STEP 3: **ACFR** - Assign TSFI: 2 (Night Connection-Fixed) to be allowed CCI: 1 (LDN). This allows LDN to go to Night transfer destination. Assign TSFI: 5 (TAS) to be allowed CCI: 1 (LDN). This allows LDN to go to TRUNK ANSWER ANY STATION (TAS). Restrict if not using TAS.

STEP 4: **ARRC** - The Incoming Route of the LDN must allow Trunk-to-Trunk Connection to the outgoing destination route and to the LCR flag route; ARI-D-RES, Direct Connection.

FCCS Programming

The following command assignments are required to use this feature via FCCS link.

● When destination number is programmed by using TYPE = 2 (DC) of ALDNN command.

STEP 1: **ASYDL** - SYS1, Index 640, Bit 0 to Bit 7. Assign FPC of a Node which transmits Day/Night changeover information.

SYS1, Index 704 to Index 735. Assign FPC of a Node which receives the Day/Night changeover information transmitted from the Node assigned by SYS1, Index 640, Bit 0 to Bit 7 above.

STEP 2: **ANPDN** - Assign the first digit for Listed Directly Number (LDN) and forwarding destination.

TN: Tenant Number (1-255)

1stDC: 1st Digit Code (0-9,*,#)

CI: Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes.

NND: Number of Necessary Digits (maximum of 6 digits)

BLF: Busy Lamp Field Display Activated on ATT (0 = Out of Service/1 = In Service)

STEP 3: **ASPAN** - Assign the number of digit of Access Code for LDN and forwarding destination.

TN: Tenant Number (1-255)

ACC: Access Code (maximum of 6 digits)

CI: Connection Status Index (“N: Normal”/”H: Hooking”/”B: Busy”)

SRV: Kind of Service (Designate “TELN: Telephone Number” for LDN, “OGC: Outgoing Call”/ ”OGCA: Outgoing Call with route advance”/”LCRS: Register Sender LCR” for forwarding destination.)

NND: Necessary Digits (1-16)

STEP 4: **ALRTN** - Assign Logical Route Number to Physical Route Number.

LGRT: Logical Route Number (1-89)

FPC: Fusion Point Code (1-253)
RT: External Route Number (1-255)

STEP 5: **ALDNN** - Assign FPC of a Node with Attendant Console which receives the LDN call by dialing the LDN.
TN: Tenant Number (1-255)
LDN: Listed Directory Number (maximum of 16 digits)
FPC: Fusion Point Code of the node with Attendant Console which receives LDN calls
TYPE: Number Type of Night Mode destination number of LDN
(Designate DC (destination number including Access Code))
DC: Assign the Outside Destination Number including Access Code.

STEP 6: **ACFR** - Allow the Call Forwarding Restriction Class.
TN: Tenant Number (1-255)
TSFI: Transfer Service Feature Index (Assign 2 = Direct in Termination (Night only))
CCI: Call Category Index (Assign 1 = LDN (Central Office Line))
RES: Restriction Data (Assign 1 = Allowed)

● When destination number is programmed by using TYPE = 3 (ADC) of ALDNN command.

STEP 1: **ASYDL** - SYS1, Index 640, Bit 0 to Bit 7. Assign FPC of a Node which transmits Day/Night changeover information.
SYS1, Index 704 to Index 735. Assign FPC of a Node which receive the Day/Night changeover information transmitted from the Node assigned by SYS1, Index 640, Bit 0 to Bit 7 above.

STEP 2: **ANPDN** - Assign the first digit for Listed Directly Number (LDN) and forwarding destination.
TN: Tenant Number (1-255)
1stDC: 1st Digit Code (0-9,*,#)
CI: Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes.
NND: Number of Necessary Digits (max. 6 digits)
BLF: Busy Lamp Field Display Activated on ATT (0 = Out of Service/1 = In Service)

STEP 3: **ASPAN** - Assign the number of digit of Access Code for LDN and forwarding destination.
TN: Tenant Number (1-255)
ACC: Access Code (maximum of 6 digits)
CI: Connection Status Index (“N: Normal”/”H: Hooking”/”B: Busy”)
SRV: Kind of Service (Designate “TELN: Telephone Number” for LDN, “OGC: Outgoing Call”/ ”OGCA: Outgoing Call with route advance”/”LCRS: Register Sender LCR” for forwarding destination.)
NND: Necessary Digits (1-16)

STEP 4: **ALRTN** - Assign Logical Route Number to Physical Route Number.
LGRT: Logical Route Number (1-89)
FPC: Fusion Point Code (1-253)
RT: External Route Number (1-255)

STEP 5: **ASPD** - Assign Speed Calling Number to Abbreviated Digit Code (ADC).
TN: Tenant Number (1-255)
ADC: Abbreviated Digit Code (maximum of four digits)
CD: Desired Speed Calling Number (maximum of 24 digits)

Note: The user must be assigned this command at Node which receives the LDN call.

STEP 6: **ALDNN** - Assign FPC of a node with Attendant Console which receives the LDN call by dialing the LDN.

TN: Tenant Number (1-255)
LDN: Listed Directory Number (max. 16 digits)
FPC: Fusion Point Code of the node with Attendant Console which receives LDN calls
TYPE: Number Type of Night Mode destination number of LDN. Assign 3 (ADC).
ADC: Abbreviated Digit Code assigned by ASPF command

STEP 7: **ACFR** - Allow the Call Forwarding Restriction Class.

TN: Tenant Number (1-255)
TSFI: Transfer Service Feature Index (Assign 2 = Direct in Termination (Night only))
CCI: Call Category Index (Assign 1 = LDN (Central Office Line))
RES: Restriction Data (Assign 1 = Allowed)

L-52 Last Number Called - Attendant

General Description

This feature allows an operator to store the LAST NUMBER DIALED, and to place a station call or a trunk call from Attendant Console by dialing an access code of LAST NUMBER CALLED.

Note: This feature is not available in North America and Australia.

Operating Procedure

1. Press the LOOP key on the Attendant Console.
2. Dial the desired number and receive Ring Back Tone (RBT) or Busy Tone (BT)/Reorder Tone (ROT).
3. Press the CANCEL key to cancel the call.
4. Press the LOOP key and dial the access code for LAST NUMBER CALLED.

Service Conditions

1. This feature is available when the Attendant places a call via SPEED CALLING-SYSTEM [S-3]/ STATION [S-21]/LEAST COST ROUTING-3/6 DIGIT [L-5].
2. This feature is not available in following cases:
   a.) when the Attendant picks up a station/trunk call that was placed on hold.
   b.) when the Attendant places a call via Camp-On service.
   c.) when the called party has set CALL FORWARDING-ALL CALLS [C-5].
3. A maximum of 18 digits can be stored by this feature.
4. By this feature, the Attendant is connected to the party whose number was dialed last, regardless of the used Loop key. The dialed numbers cannot be stored on each Loop key.

Programming

STEP 1: **ASPA** - For SRV = "SSC: Service Code" SID = 44, assign the access code for LAST NUMBER CALLED.

STEP 2: **ASFC**- For the Attendant allowed LAST NUMBER CALLED, assign a Class of Service (SFC 0) that allows SFI 44.

L-53 Logged Out IP Station - Call Destination

General Description

This feature permits a call to an IP Station in logout state to be immediately forwarded to a predetermined Station, Attendant Console or Announcement Equipment. The forwarding destination can be set at each terminal in advance. The forwarding destination for this feature can also be assigned from the PCPro, on a tenant basis or on a route basis (**Note 1**).

Note 1: Data assignment on a route basis is available since FP95-114 V4 Issue 2.0.

To set LOGGED OUT IP STATION-CALL DESTINATION by Access Code

1. Lift the handset or press the SPEAKER key. Receive Dial Tone.
2. Dial the specific LOGGED OUT IP STATION-CALL DESTINATION Access Code; receive Special Dial Tone.
3. Dial the desired target number; receive Service Set Tone.
4. Replace the handset or press the SPEAKER key.

To cancel LOGGED OUT IP STATION-CALL DESTINATION by Access Code

1. Lift the handset or press the SPEAKER key. Receive Dial Tone.
2. Dial the specific LOGGED OUT IP STATION-CALL DESTINATION Cancel Code; receive Service Set Tone.
3. Replace the handset or press the SPEAKER key.

To set LOGGED OUT IP STATION-CALL DESTINATION by Feature (Soft) key

1. Lift the handset or press the SPEAKER key. Receive Dial Tone.
2. Press the specific LOGOUT IP STATION-CALL DESTINATION Feature key (Soft key); receive Special Dial Tone.
3. Dial the desired target Station Number; receive Service Set Tone. The LOGGED OUT IP STATION-CALL DESTINATION Feature key lights red. (Soft key; FDL is displayed on the LCD).
4. Replace the handset or press the SPEAKER key.

To verify LOGGED OUT IP STATION-CALL DESTINATION by Feature (Soft) key

1. Press LOGGED OUT IP STATION-CALL DESTINATION Feature key lighting red or press the Soft key.
2. Forwarding destination will display.

To cancel LOGGED OUT IP STATION-CALL DESTINATION by Feature (Soft) key

1.Lift the handset or press the SPEAKER key. Receive Dial Tone.
2.Press the specific LOGGED OUT IP STATION-CALL DESTINATION feature (Soft) key; receive Service Set Tone.
3.LOGGED OUT IP STATION-CALL DESTINATION lamp goes off (Soft key; FDL indication disappears on the LCD).
4. Replace the handset or press the SPEAKER key.

Service Conditions

1. "Logout Status" refers to the following status:
   1. Login prompt is displayed on the LCD.
   2. An error message is displayed on the LCD.
   3. Terminal is reset due to the LAN failure such as LAN cable disconnection.
   4. Terminal power fails.

2. This feature is available for the following terminals:
   - DtermIP
   - IP Enabled Dterm
   - Soft Phone
   - DtermIP INASET
   - Terminal connected to Analog MC/MC&MG-COT (only for the LAN failure)
3. There is no limitation to the number of Stations that could set LOGGED OUT IP STATION-CALL DESTINATION simultaneously.
4. This feature data can be assigned on a terminal basis, according to Service Feature Restriction Class.
5. This feature can be set from Sub Line. At this time, the Sub Line key on the operating terminal does not light (My Line key on the terminal associated with the Sub Line lights.)

   Note: The Sub Line cannot be a Virtual (TEC-18) station number.

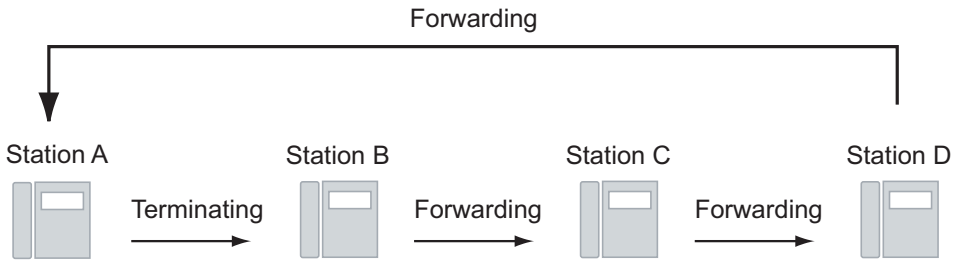
6. Announcement Access Code can be specified as the forwarding destination for this feature. At this time, the call can be routed to the Announcement Trunk.
7. When a call is directed to IP Station in Logout status, there are the following conditions:
   a.) When the following features are set at a terminal in addition to this feature, the priority order is shown below.
   Number Sharing (Sub-station is set as Forwarding Destination) > Logged Out IP Station > Call Destination > Call forwarding > All Calls > Uniform Call Distribution > Call Forwarding > Busy Line > Station Hunting > Do Not Disturb > Call Forwarding > Don't Answer
   b.) When both CALL FORWARDING - ALL CALLS [C-5] and LOGGED OUT IP STATION - CALL DESTINATION [L-53] are set at a terminal, the priority order of these two features can be determined according to Service Feature Restriction Class (SFC) of the Station.
   SFI 209 = 0: Logged Out IP Station-Call Destination > Call Forwarding - All Calls
   = 1: Call Forwarding - All Calls > Logged Out IP Station-Call Destination
   When this feature is not set:
   If CALL FORWARDING-ALL CALLS [C-5] is set, CALL FORWARDING-ALL CALLS [C-5] is activated.
   If CALL FORWARDING-ALL CALLS [C-5] is not set, the calling party hears RBT. (If the called line is assigned as a Multi Line of other Station, the call can be answered by using the appropriate Multi Line.
8. The forwarding destination for this feature can be assigned with the ACFO/ACFOL/ACFON command, on a tenant basis. At this time, the following conditions must be considered.
   a.) When this feature is set from both the terminal and PCPro, the setting from the terminal has precedence over the setting from the PCPro.
   b.) ACFO/ACFOL/ACFON command setting is effective only when FORWARDING-ALL CALLS [C-5] and this feature are not set at the terminal.
   c.) The feature data via DM, LDM and NDM can coexist in a System. (Priority: NDM > LDM > DM)

9. The forwarding destination for this feature can be assigned with ACFO/ACFOL/ACFON command on a route basis. For details, see CALL FORWARDING DESTINATION PER TRUNK ROUTE - INCOMING CALL [C-209].

   Note: Data assignment on a route basis is available since FP95-114 V4 Issue 2.0 (earlier than FP95-114 V4 Issue 2.0, the destination can be assigned with the ACFO/ACFOL/ACFON command on a tenant basis only).

10. If the IP terminal is placed to logout status due to the power failure or LAN cable disconnection while a call is terminated to the terminal, the calling party hears RBT. However, Call Forwarding-Don't Answer is set at the terminal, the call is transferred to another party.
11. While incoming to IP terminal, if power failure or LAN cable disconnection caused logout status, Calling Party continues to hear Ringback Tone (Note that CALL FORWARDING - DON'T ANSWER [C-3] has been activated, LOGGED OUT IP STATION-CALL DESTINATION service would be available).
12. LOGGED OUT IP STATION-CALL DESTINATION at routine diagnosis is not performed.
13. LOGGED OUT IP STATION-CALL DESTINATION data is backed up to the Flash Card at the routine diagnosis. For details, refer to the System Maintenance and Operation Guide.
14. When this feature is set from Sub Line, the terminal associated with the Sub Line cannot go into logout status while hearing Service Set Tone at the operating terminal.
15. When LOGGED OUT IP STATION-CALL DESTINATION is performed via CCIS, forwarding destination is accepted as CALL FORWARDING ALL CALLS [C-5]. For this reason, LCD displays CALL FORWARDING ALL CALLS message.
16. Assign the System Data (ASYDL, SYS1, Index 677, Bit 3=1), and press the LOGGED OUT IP STATION-CALL DESTINATION Feature key, a maximum of 16 digits Call Forwarding Information can be displayed.

    Note: This feature is only available for the terminal that can display 24 digits on LCD.



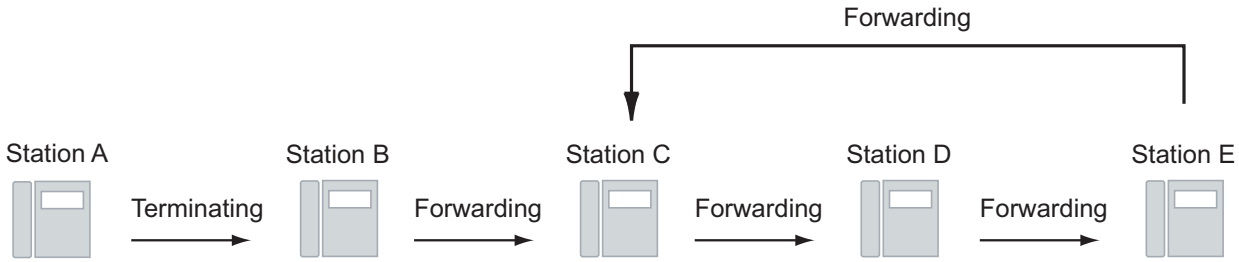
17. Multiple Call Forwarding - Busy Line/All Calls/Logout (Logged Out IP Station - Call Destination [L-53]) can be selected to use or not by ASYD command [SYS1, Index 69, Bit 7 (0/1 = Out of service/In service)].

    - When using Multiple Call Forwarding - Busy Line/All Calls/Logout.

      A maximum number of Multiple Call Forwarding - All Calls/Busy Line/Logout occurrences can be selected by ASYD command [SYS1, Index 5, Bit 1 to Bit 3].

      The following shows the call forwarding operation that is looped within the assigned number of Multiple Call Forwarding - Busy Line/All Calls/Logout occurrences.

< If target station is Station A. >



The call of Station A calls Station D. If Station D is busy, Station A hears a busy tone.

< If call forwarding is looped among Station B-D >

The call of Station A calls Station C. If Station C is busy, Station A hears a busy tone.

< If call forwarding is looped among Station C-E >

The call of Station A calls Station C. If Station C is busy, Station A hears a busy tone.

- When not using Multiple Call Forwarding - Busy Line/All Calls/Logout.

Depending on the call forwarding setting for destination terminal, the operation will change as follows.

Example: Call Forwarding Operation among Station A-D When Station A calls Station B

Station B sets	Station C sets	Operation
"Call Forwarding - All Calls [C-2]/Logged Out IP Station - Call Destination [L-53]" for Station C	"Call Forwarding - Busy Line [C-2]" for Station D	Station C is called.
"Call Forwarding - All Calls [C-2]/Logged Out IP Station - Call Destination [L-53]" for Station C	"Call Forwarding - All Calls [C-2]/Logged Out IP Station - Call Destination [L-53]" for Station D	Station D is called.
"Call Forwarding - Busy Line [C-2]" for Station C	"Call Forwarding - All Calls [C-2]/Logged Out IP Station - Call Destination [L-53]" for Station C	Station C is called.
"Call Forwarding - Busy Line [C-2]" for Station C	"Call Forwarding - Busy Line [C-2]" for Station D	Station A hears a busy tone.

18. Speed Calling number cannot be used for a destination number of a call forwarded by this feature.

Interactions

1. When a call is routed to IP Station via the following features, this feature can be activated.

Services (for Stations)	Services (for Attendant Console)
OFF - HOOK ALARM [O-6]	BLIND TRANSFER TO ATTENDANT [B-17]
BLIND TRANSFER TO STATION [B-18]	SERIAL CALL [S-15]
TIMED REMINDER [T-62]	Incoming Call via ATT
DIRECT IN TERMINATION [D-7]	STATION - TO - STATION CALLING - OPERATOR ASSISTANCE [S-12]
HOTLINE [H-1]	STEP CALL - ATT [S-13]
PRIORITY CALL [P-9]	ATTENDANT NIGHT TRANSFER [A-19]
STEP CALL [S-13]	
SERIAL CALL -D [S-127]	
DIRECT INWARD DIALING - REMOTE ACCESS TO SYSTEM / AUTOMATED ATTENDANT	
DSS CONSOLE [D-149]	

2. When UCD Member Station is placed in Logout status, the following conditions must be considered.
   a.) When this feature is individually set from Terminal:
   UCD Controlling Station: This feature can be activated.

Non-Controlling Station: When Calling Party dials Controlling Station Number, that Station is skipped in any UCD hunt.

b.) When this feature is not individually set from Terminal:
Both UCD Controlling Station and Non-Controlling Station are skipped in any UCD hunt.

3. When Station belonging to Station Hunting Group is placed in Logout status, the following conditions must be considered.

a.) When this feature is individually set from Terminal:
Pilot Station: This feature can be activated.
Non-Pilot Station: When Calling Party dials Pilot Station Number, that Station is bypassed. If the Station is the Lowest Priority Station, Calling Party hears Busy Tone.

b.) When this feature is not individually set from Terminal:
Both Pilot Station and Non-Pilot Station are bypassed.

4. SIP Handler Controlled SIP terminals are available. In the following situations, a SIP Handler Controlled SIP terminal becomes in logout state which is terminal state cannot be displayed in the IPAN or DISD command window. In the logout state, the SIP Handler Controlled SIP terminal cannot place or receive calls until it perform registration to the system.

- The Telephony Server does not receive REGISTER for updating Expire within the time of register expires. **Note 1**
- The Telephony Server receives Expire=0 as Expiration of REGISTER from the SIP Handler Controlled SIP terminal.
- Terminal is reset with the DISD command **Note 2**
- SIP Handler is initialized with the ADPM command **Note 2**
- System Initialization is executed with the SINZ command. **Note 2**

Note: System Message 33-S: IP PKG Failure is not output in either situation.

Note 1: 3600 seconds is set for the default. This data can be changed with the Register Expires parameter in the AUACL/AUACN command.

Note 2: To make the Standard SIP terminal in login state, the Standard SIP terminal needs to perform registration. The Standard SIP terminal performs registration at the timing of REGISTER update of the Standard SIP terminal so Standard SIP terminal cannot be used until REGISTER update after reset or initialization is executed by using the command.

Programming

STEP 1: **ASYD** - SYS1, Index 5, Bit 1 to Bit 3.
Maximum number of Multiple Call Forwarding - Busy Line/All Calls/Logout (Logged Out IP Station - Call Destination [L-53]).

Note: This data is valid only when SYS1, Index 69, Bit 7 is assigned as"1".

SYS1, Index 69, Bit 1; Send Short Tone when a Call Forward via CALL FORWARDING - ALL CALLS [C-5] service is answered. 0/1 = Not Required/Required
Bit 7; Multiple call service in MULTIPLE CALL FORWARDING - BUSY LINE [M-24] / ALL CALLS [M-44], LOGGED OUT IP STATION-CALL DESTINATION. 0/1 = Out/In Service
SYS1, Index 79, Bit 2; SPLIT CALL FORWARDING [S-99] service. 0/1 = Out/In Service

Note: Use the specific Access Code to assign and cancel LOGGED OUT IP STATION-CALL DESTINATION service (Refer to STEP 3:**ASPA**).

STEP 2: **ASYDL** - SYS1, Index 677, Bit 3.
Display a maximum of 16 digits Call Forwarding Information on LCD? 0/1 = No (default)/Yes.
SYS1, Index 959. Health Check cycle
00 Hex. = 60 seconds (default)
01-FE Hex. = 1-254 seconds
FF Hex. = Health Check stop
-between PHD and IP terminal: system data set value
-between MGC and PHD: system data set value×1.5

STEP 3: **ANPD** - Assign the minimum number of digits for each Access Code for LOGGED OUT IP STATION-CALL DESTINATION when you want to assign or cancel by Access Code.

STEP 4: **ASPA -** Assign the Access Code for LOGGED OUT IP STATION-CALL DESTINATION when you want to assign or cancel by Access Code.

(a) When SPLIT CALL FORWARDING [S-99] is not used (ASYD, SYS1, Index 79, Bit 2=0)
CI = "N: Normal" SRV = "SSCA: Service Code Appendix" SIDA = 136 (Assignment of LOGGED OUT IP STATION-CALL DESTINATION)
CI ="N: Normal" SRV = "SSCA: Service Code Appendix" SIDA = 137 (Cancel of LOGGED OUT IP STATION-CALL DESTINATION)

(b) When SPLIT CALL FORWARDING is used (ASYD, SYS1, Index 79, Bit 2=1)
CI = "N: Normal" SRV = "SSCA: Service Code Appendix" SIDA = 136 [Assignment of LOGGED OUT IP STATION-CALL DESTINATION (for Trunk)]
CI = "N: Normal" SRV = "SSCA: Service Code Appendix" SIDA = 137 [Cancel of LOGGED OUT IP STATION-CALL DESTINATION (for Trunk)]
CI = "N: Normal" SRV = "SSCA: Service Code Appendix" SIDA = 138 [Assignment of LOGGED OUT IP STATION-CALL DESTINATION (for Station)]
CI = "N: Normal" SRV = "SSCA: Service Code Appendix" SIDA = 139 [Cancel of LOGGED OUT IP STATION-CALL DESTINATION (for Station)]

STEP 5: **ASFC**
SFI:198 = 1 (LOGGED OUT IP STATION-CALL DESTINATION)
SFI 209: Assign as data "1" when CALL FORWARDING - ALL CALLS [C-5] has precedence over LOGGED OUT IP STATION-CALL DESTINATION [L-53].

STEP 6: **AKYD**

Assign this feature to a Function key on the Desktop terminal.

KYN: Key number(1-40)

KYN = 1 (Function Key)

FKY = 148 (LOGGED OUT IP STATION-CALL DESTINATION)

To use Soft Key, assign the ADSL command.

SN = 1

FKY = 148 (LOGGED OUT IP STATION-CALL DESTINATION)

STEP 7: **ACFO/ACFOL/ACFON** - Assign Forwarding Destination Number for this feature per Tenant basis.

TN: Tenant Number

CF: Select either of the following Call Forwarding features.

1 = Call Forwarding - Busy Line

2 = Call Forwarding - Don't Answer

3 = Call Forwarding - Intercept

4 = Night Connection Outside

5 = Logged Out IP Station - Call Destination

CFI: Specify the Call Forwarding Destination

1 = Attendant Console

2 = Station (for ACFO), TELN (for ACFOL/ACFON)

STN: Enter Station Number when assign "2" to "CFI" parameter. (for ACFO)

UGN: User Group Number (for ACFOL/ACFON)

TELN: Enter Telephone Number of Destination Station when assign "2" to "CFI" parameter. (for ACFOL/ACFON)

ADC: Enter Abbreviated Digit Code to the forwarded destination when "CF = Night Connection Outside" is selected.

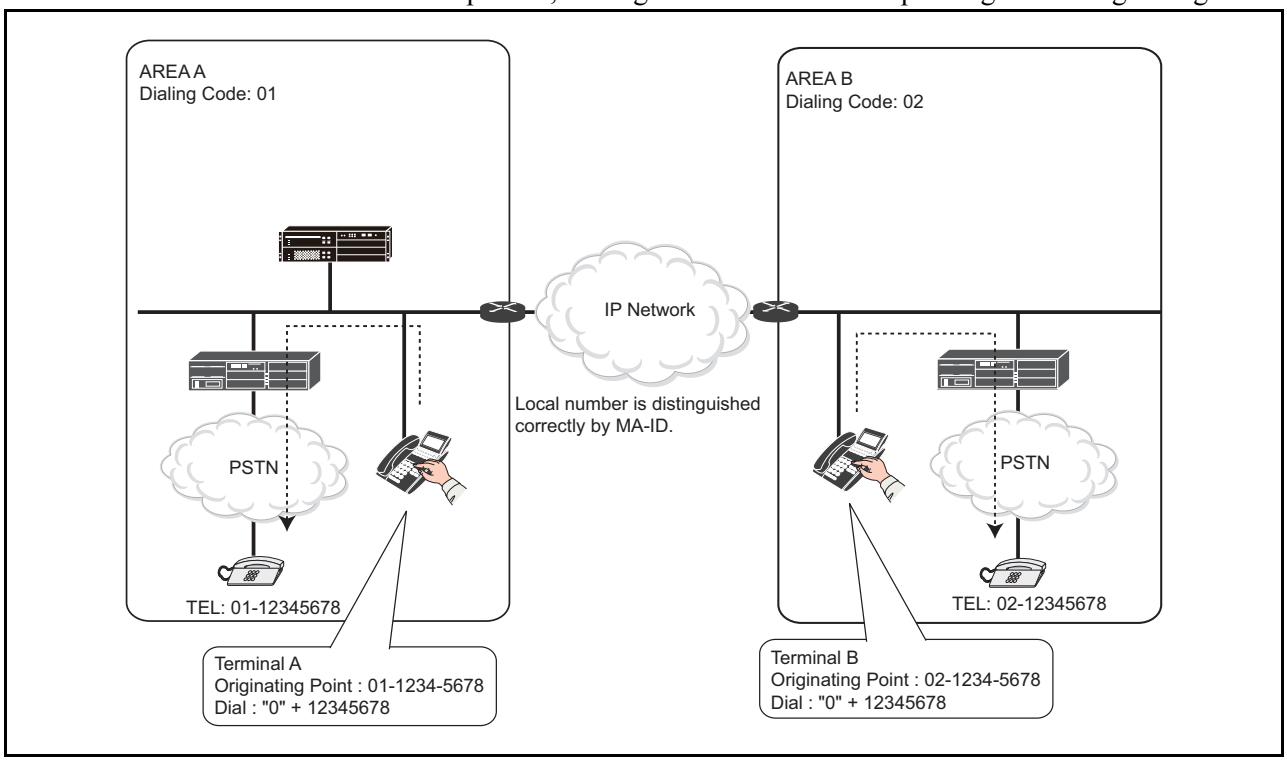
STEP 8: **ATNR** - Allow Tenant-to-Tenant Connection for this feature.

TRI = 1

STEP 9: **ASYD** - Assign the periodical backup data for this feature.

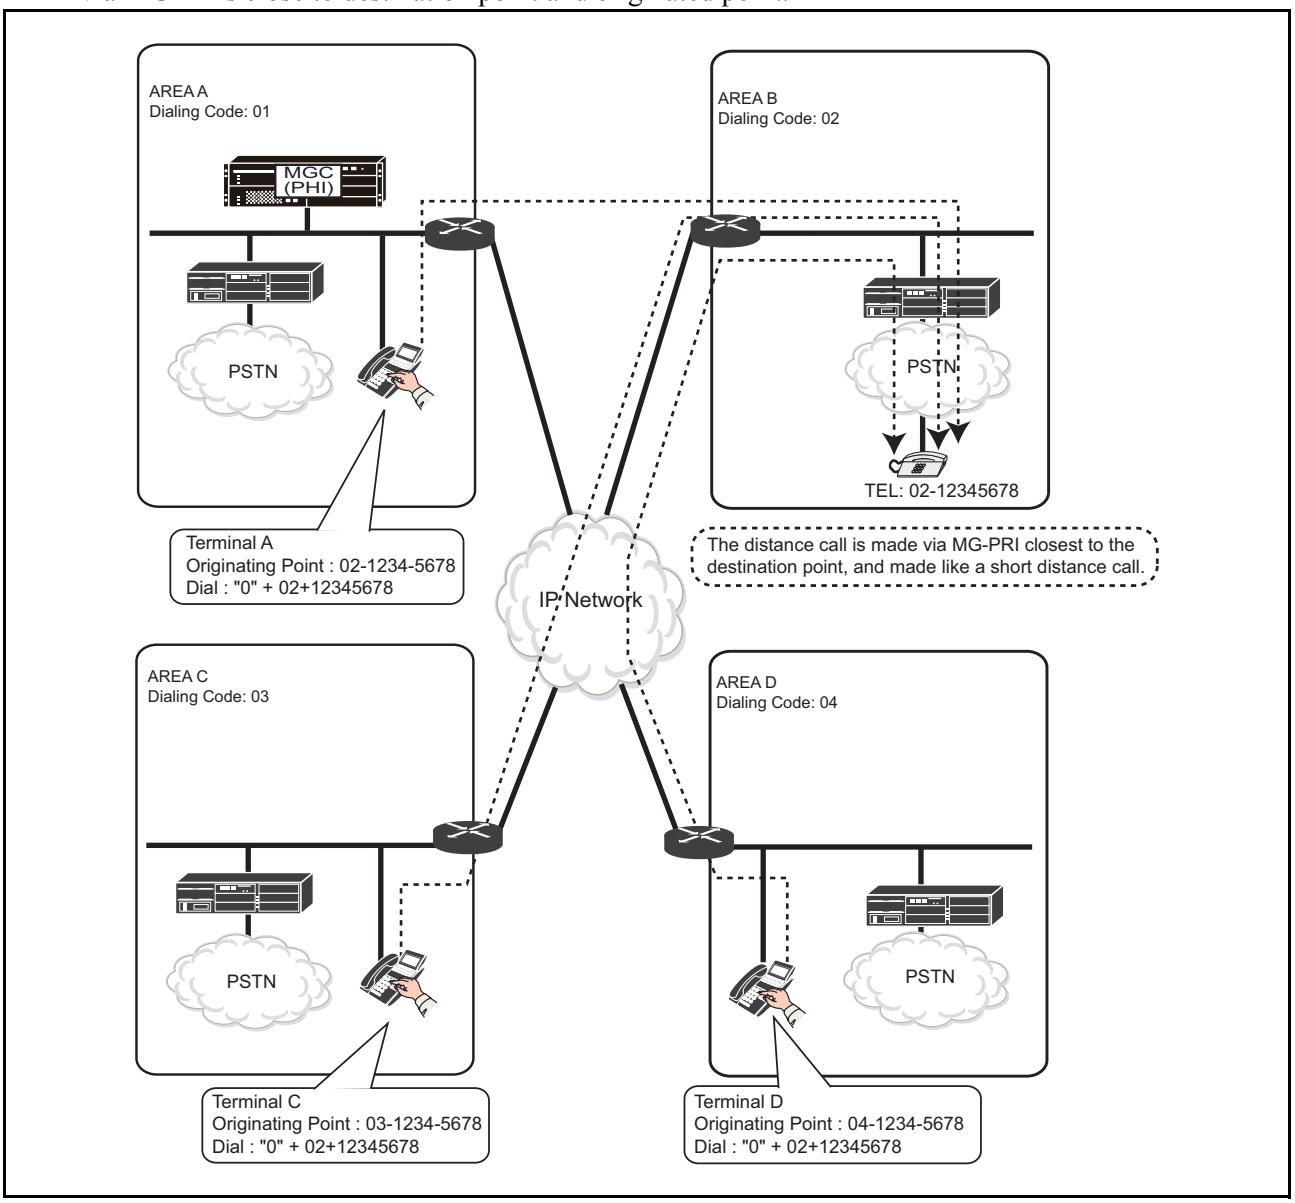
SYS1, Index 305, Bit 1=1 (Logged Out IP Station - Call Destination Data Save)

L-54 Least Cost Routing for MG-PRI



General Description

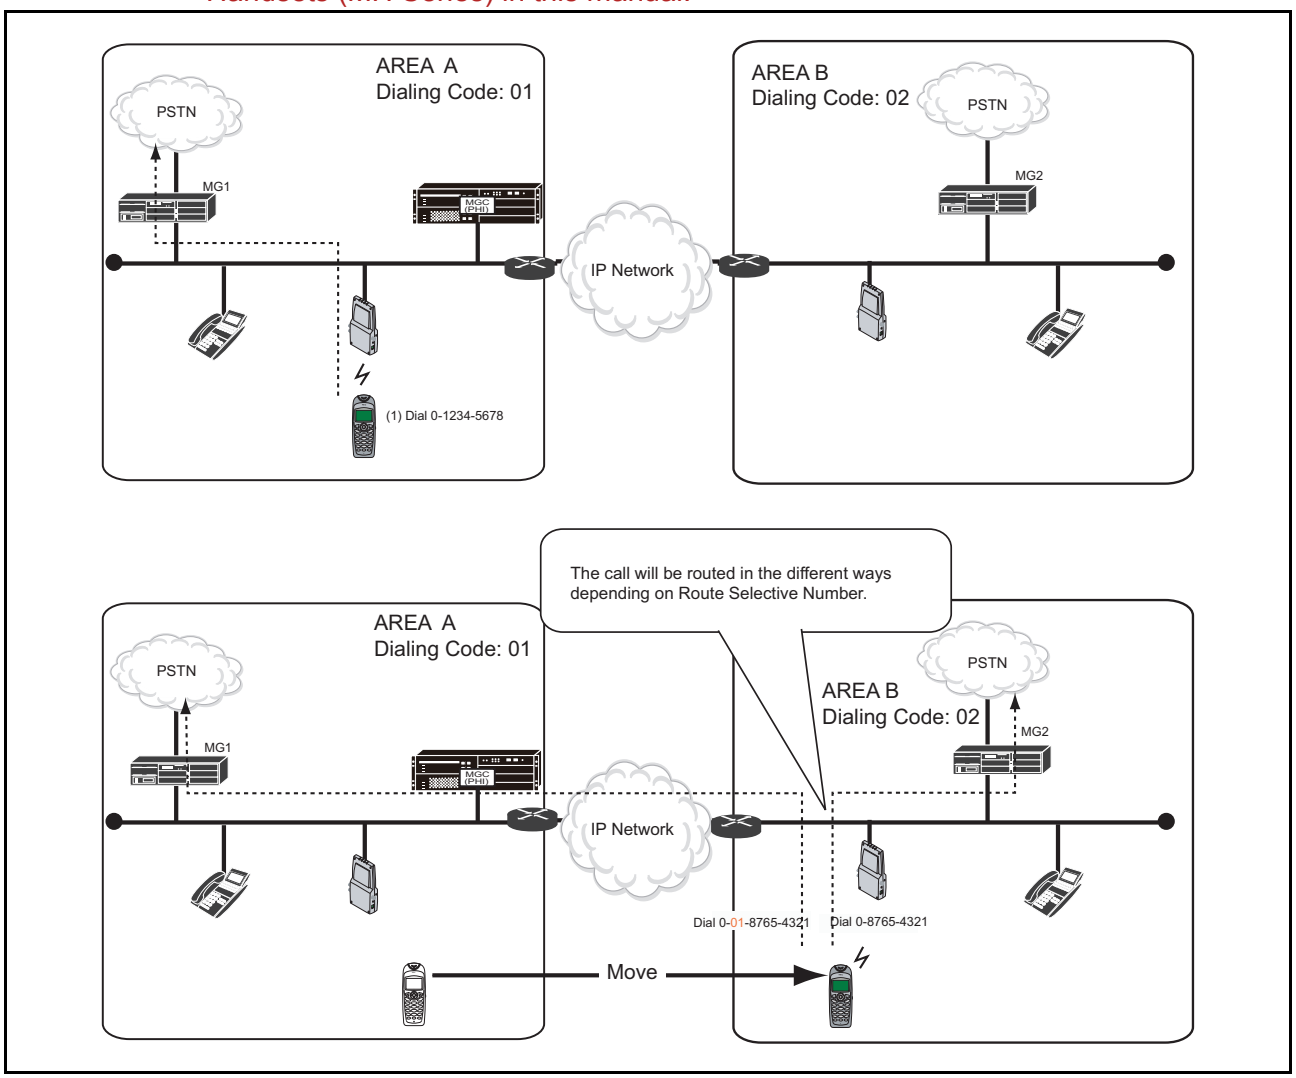
When multiple MG-PRIs are installed, this feature provides routing suitable for the network by using Message Area IDs added to the MG-PRIs. Once the network administrator registers MA-IDs, the routing can be managed.



MA-IDs can be assigned to Virtual Line. By assigning MA-ID to Virtual Line, a telephone number assigned to Virtual Line can be notified to the called party. For example, when the pilot number of a company is assigned to Virtual Line, this number can be notified to the called party by placing a call after seizing Virtual Line. This enables the called party to call back to the calling party through the pilot number.

The following figures show examples of using this feature:

- When local call is made from telephones, routing can be determined depending on the originating location.



- When outgoing call is made from telephones, cost-effective phone calls can be made through IP network via MG-PRIs close to destination point and originated point.

- When call is originated from SP Controlled SIP terminal (**Note 1**) even though the telephone is moved to another area, cost-effective phone calls can be made through IP network and PSTN via MG-PRIs close to destination point and originated point.
  When call is originated from the SIP Handler Controlled SIP terminal, if the telephone is moved to another area, the MA-ID needs to be changed with the following operations.

  a.) Set the MA-ID by the KIND=LENS parameter in the AMAA command.
  b.) Set the MA-ID by the Access Code.

Note 1: SP Controlled SIP terminals refers to SP Controlled Standard SIP terminals and WLAN Handsets (MH Series) in this manual.

Operating Procedure

Operating Procedure for My Line

<Setting MA-ID by Access Code>

STEP 1. Lift the handset (push monitor/speaker button).

STEP 2. Hear Dial Tone (DT).

STEP 3. Dial Access Code for MA-ID setting.

STEP 4. Hear Special Dial Tone (SPDT).

STEP 5. Dial MA-ID.

STEP 6. Hear Service Set Tone (SST).

STEP 7. Replace the handset (push monitor/speaker button).

<Setting/confirming MA-ID by the Line/Feature key or Soft key of Desktop terminal>

(a) Setting MA-ID

STEP 1. Lift the handset (push monitor/speaker button).

STEP 2. Hear Dial Tone (DT).

STEP 3. Press the Line/Feature key or Soft key for MA-ID setting.

STEP 4. Hear Special Dial Tone (SPDT).

STEP 5. Dial MA-ID.

STEP 6. Hear Service Set Tone (SST).

STEP 7. Replace the handset (push monitor/speaker button).

STEP 8. To make sure the settings, push assigned MA-ID button in Line/Feature keys or Soft keys. If the MA-ID setting has been completed, the LCD displays “MAID” (default) or characters that you registered with AFDD.

(b) Confirming MA-ID

STEP 1. Press Programmable Line/Feature key or Soft key for MA-ID confirmation.

STEP 2. MA-ID is displayed on the upper line of LCD like the following example.

	Setting MA-ID	Confirming MA-ID
Terminal with 16-character LCD	MAID SET MAIN OF	MAID MAIN OFFICE
Terminal with 24-character LCD	MAID SET MAIN OFFICE	MAID MAIN OFFICE

	Setting MA-ID		Confirming MA-ID	
When AMAIL/AMAIN command is not assigned	MAID SET	0001	MAID	0001

Operating Procedure for Virtual Line

<Setting MA-ID by Access Code>

STEP 1. Press Programmable Line/Feature key or Soft key to which Virtual Line is assigned.

STEP 2. Lift the handset (push monitor/speaker button).

STEP 3. Hear Dial Tone (DT).

STEP 4. Dial Access Code for MA-ID setting.

STEP 5. Hear Special Dial Tone (SPDT).

STEP 6. Dial MA-ID.

STEP 7. Hear Service Set Tone (SST).

STEP 8. Replace the handset (push monitor/speaker button).

<Setting/confirming MA-ID by the Line/Feature key or Soft key of Desktop terminal>

(a) Setting MA-ID

STEP 1. Press the Line/Feature key or Soft key to which Virtual Line is assigned.

STEP 2. Lift the handset (push monitor/speaker button).

STEP 3. Hear Dial Tone (DT).

STEP 4. Press the Line/Feature key or Soft key for MA-ID setting.

STEP 5. Hear Special Dial Tone (SPDT).

STEP 6. Dial MA-ID.

STEP 7. Hear Service Set Tone (SST).

STEP 8. Replace the handset (push monitor/speaker button).

(b) Confirming MA-ID

STEP 1. Press the Line/Feature key or Soft key to which Virtual Line is assigned.

STEP 2. Press the Line/Feature key or Soft key for MA-ID confirmation.

STEP 3. MA-ID is displayed on the upper line of LCD like the following example.

	Setting MA-ID	Confirming MA-ID
Terminal with 16-character LCD	MAID SET MAIN OF	MAID MAIN OFFICE
Terminal with 24-character LCD	MAID SET MAIN OFFICE	MAID MAIN OFFICE
When AMAIL/AMAIN command is not assigned	MAID SET 0001	MAID 0001

Service Conditions

1. This feature is available via FCCS network, under the following conditions:
   - Each MA-ID in the FCCS network must be unique.
   - The NDM data has precedence over the LDM data.
   - Each node controls the appropriate MA-ID independently. Thus, the backup of MA-ID must be performed on a node-by-node basis.
2. This feature is available when the originating system is LCR or LCRS.
3. Set each MA-ID to the trunk. When outgoing transfer has been established to a station, the call arriving in the station will be redirected by using route selection patterns according to the MA-ID.
4. A station/trunk that is not assigned MA-ID will perform according to the setting of default MA-ID (0000). Therefore, be sure to assign the Maximum Necessary Digits and route selection pattern for the default MA-ID (0000) in advance. Otherwise, a call origination from the station/trunk without MA-ID will be restricted.
5. MA-ID must be assigned to each station/trunk. Local call originating is performed by selecting the Maximum Necessary Digits and route selection patterns according to MA-ID assigned to the station/trunk.
6. Regardless of the location, station can perform local originating in the specific area.
7. When a station is moved to another area, the station can select previous route selection pattern or new route selection pattern.
8. MA-ID is determined from 0000 to 9999.
9. MA-ID can be selected by using the AMAA command, an Access Code, Line/Feature key or Soft key.
10. If MA-ID is changed while the following features are enabled, Maximum Necessary Digits and the route selection pattern is used according to the newly changed MA-ID:
    - Speed Calling-Station
    - Speed Calling-System
    - Hotline - Outside

- Hotline - CCIS
- Outgoing trunk call from Hotline Station
- Call Transfer
- Call Forwarding-Busy Line
- Call Forwarding-Don't Answer
- Call Forwarding-Logout

11. MA-ID setting is available for both My Line and Virtual Line. Refer to Operation Procedure for more information on MA-ID setting. **Note 2**

Note 2: When setting MA-ID, note the following:
- To assign MA-ID to My Line, assign a Service Feature Restriction Class (SFC) that allows SFI 213 = 1 (MA-ID setting) to the station by the ASFC/ASFCN command.
- Regarding Sub Lines, MA-ID can be assigned only to Virtual Line. MA-ID cannot be assigned to the other Sub Lines (My Line of other Desktop terminal, a Station Number of Single Line Telephone and a PS/SIP line).
- To assign MA-ID to Virtual Line, assign a Service Feature Restriction Class (SFC) that allows SFI 213 = 1 (MA-ID setting) to both My Line and Virtual Line by the ASFC/ASFCN command.

12. When Virtual Line is seized and MA-ID confirmation is performed by pushing a Line/Feature key or Soft key, MA-ID of Virtual Line appears on the LCD. Refer to Operation Procedure for more information on MA-ID confirming. **Note 3**

Note 3: If MA-ID is confirmed after seizing Sub Lines other than Virtual Line, MA-ID of My Line appears on the LCD.

13. Note the following when using the Multi Line services of Desktop terminals:

(a) When an outside call is made after seizing My Line or Sub Lines other than Virtual Line (My Line of another station, a Station Number of Single Line Telephone and a PS/SIP line) that are assigned to the Line/Feature key on the Desktop terminal and place an outside call, MA-ID of My Line is used to route the call.

(b) If an outside call is made after seizing Virtual Line that is assigned to the Line/Feature key on the Desktop terminal, MA-ID used to route the call differs depending on the combination of the data settings of SFI261 (Maximum Necessary Digits / Route Selection for using Virtual Line) for My Line and Virtual Line. Refer to the following table for more details.

		Virtual Line (SFI261)	
		0	1
My Line (SFI261)	0	MA-ID of My Line	MA-ID of My Line
	1	MA-ID of My Line	MA-ID of Virtual Line

14. When making a call by using Sub Lines including Virtual Line, a station number of My Line is assigned is output to SMDR as the calling party of the outgoing call.

    Note: The MA-ID of the network the My Line is assigned is also output to the SMDR when SMDR Multi Area ID via IP [S-144] is in service.

15. Note the following when using HOT LINE - OUTSIDE [H-9], HOT LINE - CCIS [H-12] or BROKERAGE HOT LINE - CCIS [B-10]:

    (a) If an outside call is made after seizing Virtual Line that is assigned to the Line/Feature key on the Desktop terminal (Hotline station), MA-ID used to route the call differs depending on the combination of the data settings of SFI261 (Maximum Necessary Digits / Route Selection for using Virtual Line) for My Line and Virtual Line. Refer to the following table for more details.

		Virtual Line (SFI261)	
		0	1
My Line (SFI261)	0	MA-ID of My Line	MA-ID of My Line
	1	MA-ID of My Line	MA-ID of Virtual Line

16. MA-ID can be backed up and verified by using the related commands (MEM_HDD/MEM_HDD_N) and Telephony Server Maintenance Menu. The MA-ID can be easily modified by terminal and the Telephony Server sides, which might lead to verification error. Therefore, the backup data should be synchronized with the existing one. For detailed information of Office Data Backup, refer to Operations and Maintenance Manual.

17. Using System Data diagnoses and backs up the MA-ID data periodically. The result is indicated in the system message (7-O/7-P).

18. If the MA-ID data is stored in the flash card, the data will be loaded in the system initialization.

19. In the case of using emergency call and special service call, an MG closest to the originating terminal will be used.

20. If MA-ID assigned to each network is changed by the AMAA command in operation, SP Controlled SIP terminals belonging to the network will be available after the Station registers re-location.

21. When an SP Controlled SIP terminal is unregistered, the MA-ID that it uses is reset to “0.”

22. MA-ID registration by the AMAA command is not necessary for SP Controlled SIP terminals.

23. When SP Controlled SIP terminal originates a call, the call will take a route by using a MA-ID, which the Station registered as a location.

24. SP Controlled SIP terminals cannot manage MA-IDs by Special Access Codes.

25. SIP Handler Controlled SIP terminals can manage MA-IDs by Special Access Codes but MA-ID cannot be confirmed.

26. To perform Call Forwarding feature of SP Controlled SIP terminal, which is assigned by the ACFS command, MA-ID (0000) is used as a default.

27. When SIP terminal is assigned as a destination point by other Stations, the MA-ID to be taken are as follows, depending on a type of the terminals:

Terminal Assigned Call Transfer	MA-ID
Telephone	MA-ID of a terminal that has transferred a call.
PS	MA-ID of CS with which PS transfers a call.
SP Controlled SIP terminal	MA-ID of a place in which SP Controlled SIP terminal used to register as its location.

28. When SP Controlled SIP terminal originates a call by abbreviated digit code, the call takes a route with predetermined MA-IDs.

29. When Call Forwarding Data has been saved/loaded by the backup commands (MEM_HDD, HDD_FDD) and Telephony Server Maintenance Menu, make sure the MA-IDs are saved/loaded.

30. When SP Controlled SIP terminal has been assigned the out line used for a destination point of Call Forwarding features, the SP Controlled SIP terminal transfers a call with MA-ID of a network where the station has registered at that time.

Interactions

1. When a Desktop terminal accommodating a line of SP Controlled SIP terminal makes an external call via the SIP line, routing is performed by using MA-ID of Desktop terminal My Line.

2. When SP Controlled SIP terminal accommodating a line of SP Controlled SIP terminal makes a call via the SIP line, routing is performed with MA-ID assigned to the location where SP Controlled SIP terminal has registered.

3. When a Desktop terminal accommodating a line of the SIP Handler Controlled SIP terminal makes a call, routing is performed with MA-ID of SIP Handler Controlled SIP terminal My Line.

4. When the SIP Handler Controlled SIP terminal is in Multi Line Mode and its My Line is used by a different terminal, MA-ID cannot be assigned to the SIP Handler Controlled SIP terminal by using an Access Code because this operation attempts to assign the MA-ID from the Sub Line on the SIP Handler Controlled SIP terminal.

5. When the SIP Handler Controlled SIP terminal is used, this feature does not work if KIND=Network is set through the AMAA command. SIP Handler Controlled SIP terminals need to have MA-ID assigned in the AMAA command by the KIND=LENS parameter.

Programming

STEP 1: **ASYDL** - Specify the applied object type to be modified tenant data
SYS1
Index 801, Bit 1=0/1 (per tenant/common)

STEP 2: **AMAIL/AMAIN** - Specify MA-ID and the area information

STEP 3: **AMAA** - Assign MA-ID allocation data.

KIND: Select LENS or Network.
LENS: Assigned to the originating.
Network: Assigned to a network.

In case of SP Controlled SIP terminal:
Select KIND=Network and assign MA-ID.

Note:

- MA-ID cannot be assigned to each SP Controlled SIP terminal.
- The MA-ID of KIND=Network is applied when the SP Controlled SIP terminal registers to the Telephony Server. If MA-ID is not assigned, MA-ID=0 is applied.
- If the MA-ID is modified with AMAA command for each network in operation, MA-ID of the SP Controlled SIP terminal in the network does not become effective until the SP Controlled SIP terminal registers to the Telephony Server.
- Even if KIND=Network is set for any equipment other than the SP Controlled SIP terminal, this feature cannot be used.
- Even if MA-ID is assigned to the station number of SP Controlled SIP terminal, the registration information is not displayed in the setting data of the AMAA command.

In case of PS:
Assign MA-ID to CS by selecting KIND=LENS and FUNCTION=CS.

In case of others:
Select KIND=LENS when assigning MA-ID.

STEP 4: **ANPD/ANPDN** - Specify a required minimum of the first digit of MA-ID Access Code.
Specify the appropriate items, which are used for the minimum number of digits needed to determine the service required to the first digit received (pre-translation).

STEP 5: **ASPA/ASPAN** - Specify the MA-ID access code (ACC)
CI="N: Normal"
SRV="SSCA: Service Code Appendix"
SIDA=142 (MA-ID Setting)

STEP 6: **ASFC/ASFCN** -Assign a Service Feature Restriction Class of the station.
Enable appropriate Service Feature Restriction Class (SFC) to take MA-ID Setting as follows:

SFC: Specify the Service Feature Restriction Class (1-15)
SFI 213=1 (MA-ID Setting)
RES=1 (MA-ID Setting is allowed)
SFI 261 (Maximum Necessary Digits / Route Selection for using Virtual Line) **Note 1**
RES=0/1 (MA-ID of My Line / MA-ID of Virtual Line)

Note 1: When Virtual Line is used, this data setting is required for both My Line and Virtual Line.

STEP 7: **AKYD** - Assign the function to the Programmable Line/Feature of IP terminals
KYI=1 (Line/Feature key)
FKY=151 (MA-ID Setting)

STEP 8: **ADSL** - Add the function to the Soft keys of IP terminals (Only when using a Soft key)
SKN: Specify the Soft Key Number (0~15)
SN=1 (DT connection when calling)
FKY=151 (MA-ID Setting)

STEP 9: **AFDD** - Specify the Soft key name displayed on LCD (Only when using a Soft key)
FKY=151 (MA-ID Setting)
DISP: Specify characters that will display on LCD (a maximum of 6 digits)
If you do not enter the MA-ID in DISP, the default value ("MAID") is set automatically.

STEP 10: **AMNDL** - Specify a required maximum of the digits for MA-ID and DC.
When activating LEAST COST ROUTING FOR MG-PRI [L-54] via FCCS network, this data must be assigned on a node-by-node basis.

Note: When the necessary data such as Destination Code and Maximum Necessary Digits Code has been already assigned, these data will be read out.

STEP 11: **ARNPL** - Specify the Reverse Numbering Plan Data for LDM

STEP 12: **AFRSL/AFRSN** - Specify an Outgoing Route Selection Number (OPR) **Note 2**
Specify the MA-ID and the appropriate items, which is used to select a route in trunk routes (LCR/LCRS) registered with flexible routes (Dummy Route) when the dialed number and MA-ID is used. The setting examples are described in **Examples of Data Settings**.

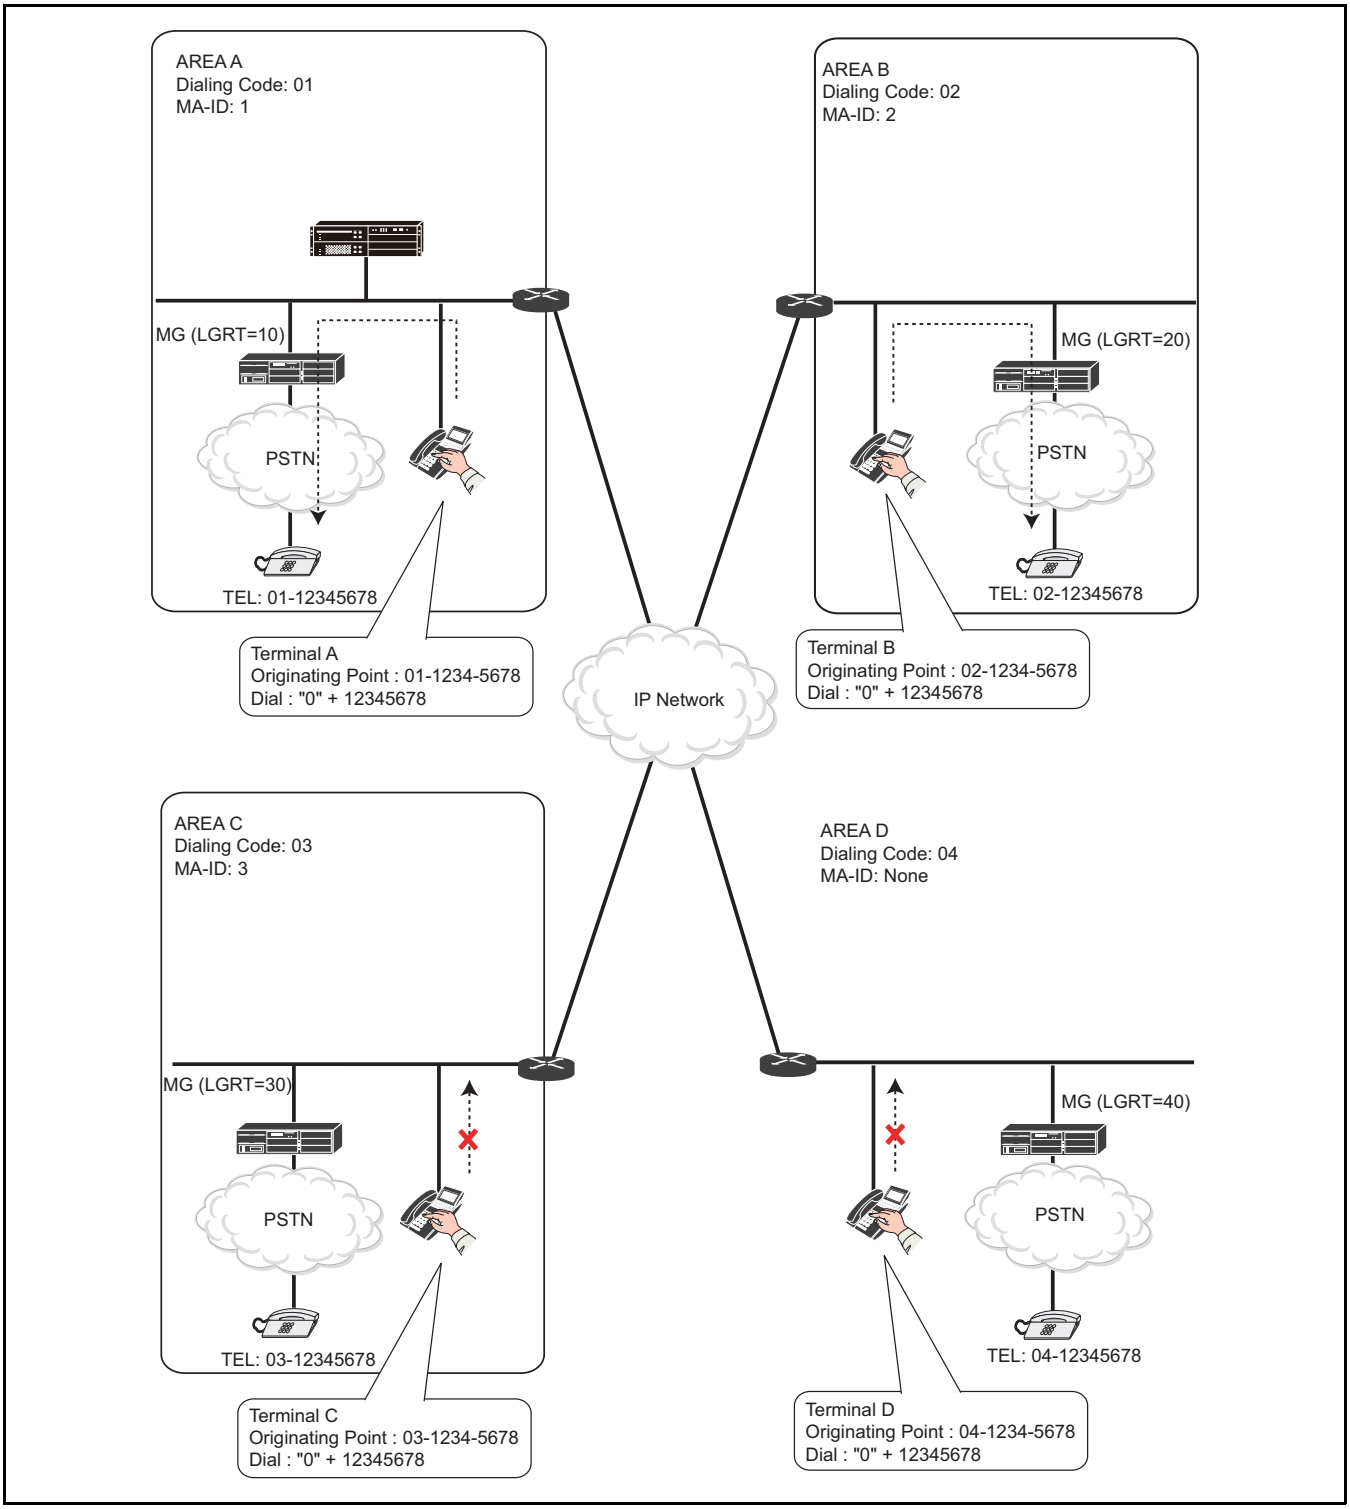
STEP 13: **AOPRL/AOPRN** - Specify routes and the condition for using the outgoing route selection patterns
Specify the appropriate items, which are used to determine the actual route priority and the conditions. The setting examples are described in **Examples of Data Settings**.

Note 2: By changing the system data, you can reduce the amount of registered data for the AFRSN command, and the office data consumption. For details, see 2.3 Reduction of Data Consumption of the AFRSN command, CHAPTER 5 DATA PROGRAMMING of Data Programming Manual - FCCS.

[Examples of Data Settings]

Setting routes varies depending on your network. The network administrator should consider the routes carefully and create the effective routes for the network by setting Tenant Number (TN), Logical Route Number (LGRT), Number Pattern Code (NPC), MA-ID, and Outgoing Route Selection Number (OPR). For more information, refer to the Command Manual.
The following shows two examples indicating how to work by setting these items.

1. In the case of adding MA-ID



STEP 1 The following are specified by AFRSL.

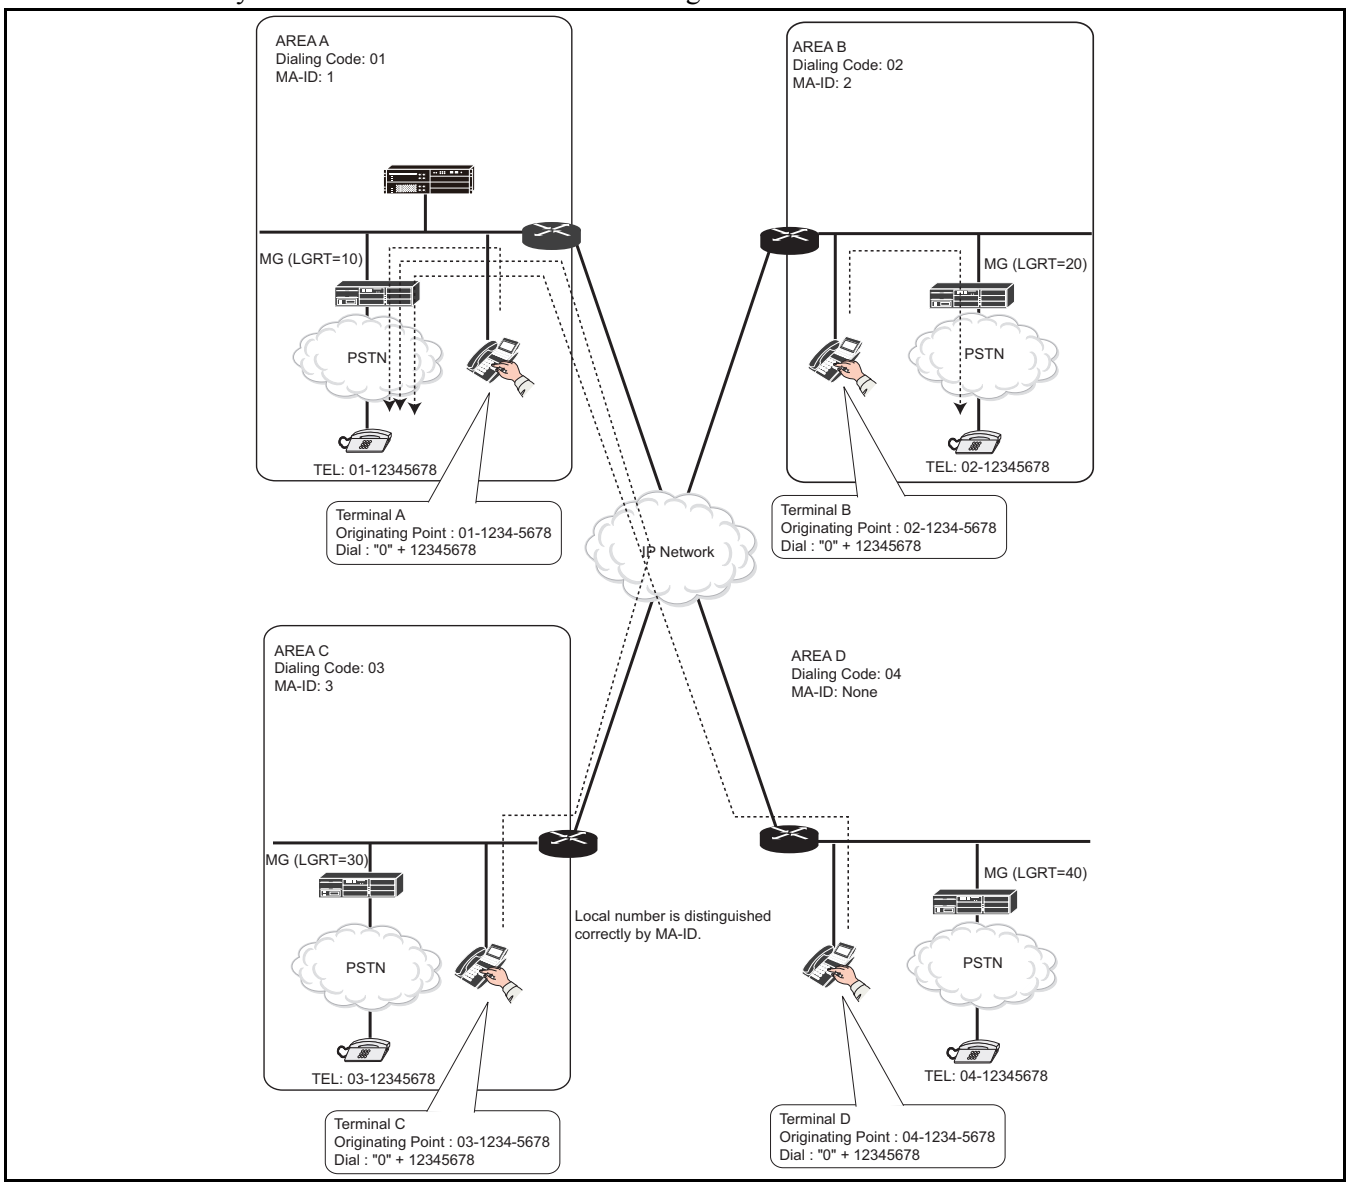
TN	LGRT	NPC	MA-ID	OPR
1	300	012	1	101
1	300	012	2	102

STEP 2 The following are specified by AOPRL.

OPR101→LGRT=10
OPR102→LGRT=20

RESULT When MA-IDs have been added to MGs, the call will be routed via the appropriate MG. In this case, terminals belonging to unknown MA-IDs or not belonging to any MA-ID will not be able to send any call.

2. In the case of default registration



STEP 1 The following are specified by AFRSL.

TN	LGRT	NPC	MA-ID	OPR
1	300	012	0 (Default)	100
1	300	012	2	102

STEP 2 The following are specified by AOPRL.

OPR100→LGRT=10
OPR102→LGRT=20

RESULT When default MA-ID (0000) has been added, the calls belonging to unknown MA-ID or not belonging to any MA-ID will be routed via MG having its default MA-ID.

L-55 Location Diversity

Location Diversity [L-55] is comprised of the following two services: FCCS Cluster and SR-MGC with FCCS Cluster. These services are explained under the following headings:

FCCS Cluster

General Description (FCCS Cluster)

Operating Procedure (FCCS Cluster)

Service Conditions (FCCS Cluster)

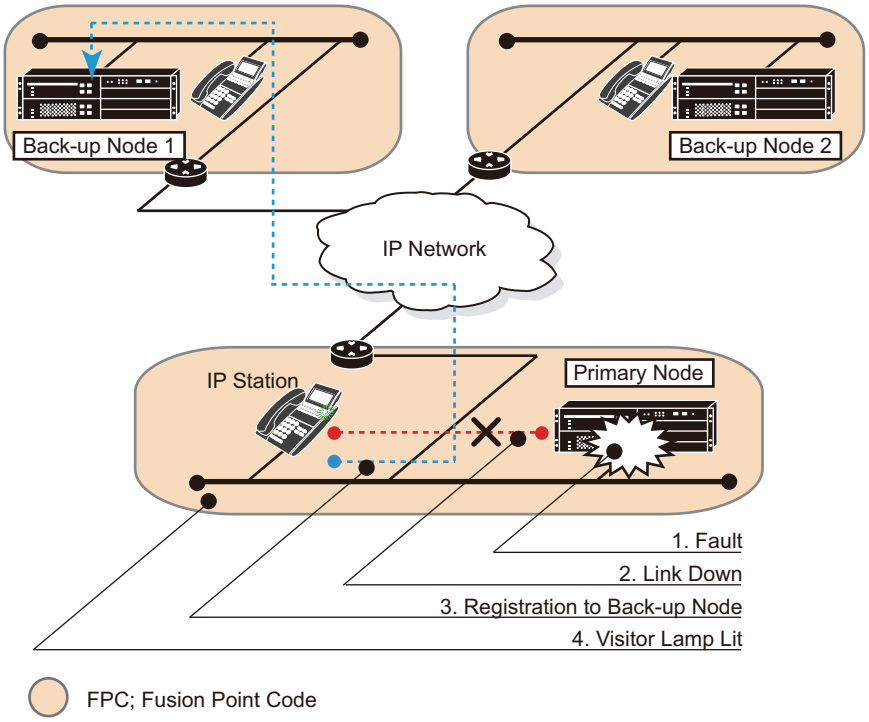
Programming (FCCS Cluster)

SR-MGC with FCCS Cluster

General Description (SR-MGC with FCCS Cluster)

Operating Procedure (SR-MGC with FCCS Cluster)

Service Conditions (SR-MGC with FCCS Cluster)



Programming (SR-MGC with FCCS Cluster)

FCCS Cluster

General Description (FCCS Cluster)

In the FCCS network, when a communication failure occurs between terminals (IP stations/equipment) and Primary Node, the terminals can automatically Re-register to a predetermined Backup Node. While the terminals are placed under the control of Backup Node, the terminals can operate as they were in Primary Node. By using MAC Authentication feature, the terminals automatically become operative after the Registration to Backup Node.

The following figure describes the outline of this feature.

After the terminals start to operate in Backup Node, the Backup Node monitors the connection status between Primary Node and the terminals periodically. When Primary Node recovers from a failure, terminals can go back to under the control of Primary Node according to the instruction from the Backup Node. The office data setting (AFCMN command) can decide on the timing of the recovery of the terminals (to Primary Node).

- When the connections between terminals and Primary Node are reestablished and the terminals become operative (Immediately)
- At designated times (By the office data setting)
- When the VISITOR key on each terminal is pressed or the terminal is reset by the operation (CBKS command, etc.) from PCPro (Manual operation)

Operating Procedure (FCCS Cluster)

<Connection Failure Between Terminals (IP stations/equipment) and Primary Node>

No manual operation is required.

- Terminals automatically re-register to Backup Node.
- The VISITOR key on the IP terminal (including Soft Phone) lights within eight seconds after the station completes the Registration process. **Note 1**, **Note 2**

  Note 1: For terminals operated in MAC Authentication mode only. For terminals operated in Login mode, Login screen is displayed.

  Note 2: If the VISITOR key is pressed while it lights green, the terminal will be reset. Note that Call Forwarding data, Login Password, Speed Dialing data and the status Message Waiting Lamp may be cleared after the reset of the terminal.

- When connection failure occurs between terminals and Primary Node, each terminal operates as follows:

Status of Terminal	Operation
Idle	After the terminal is reset, the terminal registers to Backup Node.
Busy	Call in progress can be maintained. After the call is completed (on-hook), the terminal is reset and registers to Backup Node. Trunk (MG) is restarted after a few minutes (from busy status), and then registers to Backup Node.
During Ringback Tone	Ringback Tone can be maintained. After a few minutes, the terminal is reset and registers to Backup Node. **Note 3**
During Ringing Tone	Incoming Call can be kept ringing. After a few minutes, the terminal is reset and registers to Backup Node.

Note 3: When Soft Phone (SIP) is used, after going on-hook, the terminal is reset and registers to Backup Node.

- The stations/equipment that can be rescued are as follows.

Terminal to be rescued by this feature	
Protocol mode	**Terminal**
Proprietary Protocol	DtermIP/IP Enabled Dterm
	Soft Phone [Proprietary Protocol]
	Analog 2MC
	MCMG [SCA-4LC2COTA/MG-4LC2COTA]
	MG(SIP)
	MG-COT Card [SCA-6COTA]
	MG-COT Card [SCA-6COTB/SCA-6COTC]
	UG50 (DLC) **Note 4**
	UG50 (LC) [Proprietary Protocol] **Note 4**
	UG50 (PRT 1.5M) [Proprietary Protocol] **Note 4**
	UG50 (PRT 2M) [Proprietary Protocol] **Note 4**
	UG50 (COT-TYPE1) **Note 4**
	UG50 (COT-TYPE2) [Proprietary Protocol] **Note 4**
	UG50-2MC
	UG50-24PRIA [Proprietary Protocol]
	UG50-30PRIA [Proprietary Protocol]
	UG50-4LC2COTA (COT)
	UG50-6COT [Proprietary Protocol]
SIP	DT800 Series
	DT700 Series
	DtermIP (SIP)
	8LC Card [SCA-8LCA/SCA-8LCA-EMEA/SCA-8LCC/SCA-8LCC-EMEA]
	Soft Phone (SIP)
	MG(BRI)
	MG-T1 (SIP) [SCA-24DTIA]
	MG-COT Card [SCA-6COTB/SCA-6COTC]

	UG50 (COT-TYPE2) [SIP] **Note 4**
	UG50-8LC
	UG50-24PRIA [SIP]
	UG50-30PRIA [SIP]
	UG50-6COT [SIP]

Note 4: Available from FP95 V4-114 Issue 2.0.

<Detection of Communication Fault>

If Health Check NG occurs between the terminal and the System, the terminal is reset under the following conditions. **Note 5**

- If the terminal sends Health Check packets to the System:
  The terminal is reset when the Health Check time-out occurs.
- If the System sends Health Check packets to the terminal:
  The terminal is reset when the terminal does not receive Health Check packets for a certain period of time.

Note 5: Health Check is performed using LAN1 port of the Telephony Server as the interface.

After the terminal is reset, it registers to Primary Node. If the terminal cannot register to Primary Node, it registers to Backup Node.

The following table shows the time required for terminals to fail over from Primary Node to Backup Node.

Terminal		Maximum time required for terminals to fail over from Primary Node to Backup Node (Note 6)
DT800/DT700 Series	SIP	7 min.
DtermIP	Proprietary Protocol	3 min. 45 sec
	SIP	7 min.
Soft Phone	Proprietary Protocol	3 min. 15 sec
	SIP	3 min. 45 sec
Analog 2MC		5 min.
8LC Card [SCA-8LCA/SCA-8LCA-EMEA/ SCA-8LCC/SCA-8LCC-EMEA]		4 min. 30 sec
MCMG [SCA-4LC2COTA/MG-4LC2COTA]		5 min. 45 sec
MG-COT [SCA-6COTA]		4 min. 45 sec
MG-COT [SCA-6COTB]	Proprietary Protocol	4 min. 45 sec
	SIP	4 min. 30 sec
MG-COT [SCA-6COTC]	Proprietary Protocol	4 min. 45 sec
	SIP	4 min. 30 sec
MG(BRI) [SCA-2BRIA/MG-2BRIA]		5 min.
MG(PRI) [SCA-24PRIA/MG-24PRIA]	Proprietary Protocol	4 min. 45 sec
	SIP	5 min.
MG(PRI) [SCA-30PRIA/MG-30PRIA]	Proprietary Protocol	4 min. 45 sec
	SIP	5 min.
MG-T1(SIP) [SCA-24DTIA]		5 min.
MG(SIP)		5 min.
UG50-2MC		3 min. 45 sec

Terminal		Maximum time required for terminals to fail over from Primary Node to Backup Node (Note 6)
UG50-8LC		4 min. 15 sec
UG50-24PRIA	Proprietary Protocol	3 min.
	SIP	4 min.
UG50-30PRIA	Proprietary Protocol	3 min.
	SIP	4 min.
UG50-4LC2COTA (COT)		3 min. 45 sec
UG50-6COT	Proprietary Protocol	3 min. 45 sec
	SIP	4 min. 15 sec
UG50 (DLC) Note 7		3 min. 45 sec
UG50 (LC) Note 7	Proprietary Protocol	3 min. 45 sec
	SIP	4 min. 15 sec
UG50 (PRT 1.5M) Note 7	Proprietary Protocol	3 min
	SIP	4 min
UG50 (PRT 2M) Note 7	Proprietary Protocol	3 min
	SIP	4 min
UG50 (COT-TYPE1) Note 7		3 min. 45 sec
UG50 (COT-TYPE2) Note 7	Proprietary Protocol	3 min. 45 sec
	SIP	4 min. 15 sec

Note 6: Time interval between the detection of a communication failure and the moment when the terminal sends Initial Setting Request to Backup Node.

Note 7: Available from FP95 V4-114 Issue 2.0.

<Connection Recovery Between terminals (IP stations/equipment) and Primary Node>

Note: When using IP terminal (including Soft Phone), assign the VISITOR key by the AUPKDN command in advance.

(a) When "After confirmation of connection establishment with the Home Node" is specified on AFCMN command:

No manual operation is required.

- The terminal is reset and automatically registers to Primary Node after the connection establishment is verified (as a result of connectivity check).

Note: The terminals operated in Login mode will not automatically go back to Primary Node. By pressing the VISITOR key while it flashes green, the terminal can register (Login screen is displayed) to Primary Node safely after the terminal is reset automatically.

- When connection failure between the terminal and Primary Node is recovered, the terminal operates as follows:

Status of Terminal	Operation
Idle	When the connection establishment is verified (as a result of connectivity check), the terminal is reset and registers to Primary Node.
Busy	Call in progress can be maintained. When the connection establishment is verified (as a result of connectivity check), the terminal is reset and registers to Primary Node after the call is completed (on-hook).
During Ringback Tone	Ringback Tone can be maintained. When the connection establishment is verified (as a result of connectivity check), the terminal is reset and registers to Primary Node after the terminal goes on-hook.
During Ringing Tone	Incoming Call can be kept ringing. When the connection establishment is verified (as a result of connectivity check), the terminal is reset and registers to Primary Node after the calling party goes on-hook.

Note: Trunks (such as MGs) will not be reset and register to Primary Node until all their channels become idle.

(b) When "After station data synchronization is completed" is specified on AFCMN command:

No manual operation is required.

- According to the time assigned to "Station data synchronization processing time" parameter on the AFCMN command, the terminal is reset and automatically registers to Primary Node after the connection establishment is verified and station data synchronization is completed (as a result of connectivity check).

Note: After the connection establishment is verified, the green LED of the VISITOR key on IP terminal (including Softphone) changes from "steady on" to "flashing". The terminals operated in Login mode will not automatically go back to Primary Node. By pressing the VISITOR key while it flashes green, the terminal can register (Login screen is displayed) to Primary Node safely after the terminal is reset. LAN1 is used for verifying the connection establishment between Primary Node and Backup Node or between Primary Node and the terminals.

- When a connection failure between the terminal and Primary Node is recovered, the terminal operates as follows:

Status of Terminal	Operation
Idle	When the connection establishment is verified (as a result of connectivity check), the terminal is reset and registers to Primary Node.

Status of Terminal	Operation
Busy	Call in progress can be maintained. When the connection establishment is verified (as a result of connectivity check), the terminal is reset and registers to Primary Node after the call is completed (on-hook).
During Ringback Tone	Ringback Tone can be maintained. When the connection establishment is verified (as a result of connectivity check), the terminal is reset and registers to Primary Node after the terminal goes on-hook.
During Ringing Tone	Incoming Call can be kept ringing. When the connection establishment is verified (as a result of connectivity check), the terminal is reset and registers to Primary Node after the calling party goes on-hook.

Note: Trunks (such as MGs) will not be reset and register to Primary Node until all their channels become idle.

(c) When "Only when [Visitor Indication] button is pressed" is specified on AFCMN command:

- For IP terminal (including Soft Phone):

  When the connection establishment between Primary Node and Backup Node can be verified (as a result of connectivity check), the status of the VISITOR key on IP terminal changes from "lighting green" to "flashing green". By pressing the VISITOR key while it flashes green, the terminal is reset and registers to Primary Node.

  Note: Be sure not to reset the terminal by [Visitor Indication] button or CBKS command until the [Visitor Indication] button flashes green. Otherwise, Terminal Data (Transfer Data, Login Password, One-touch Speed Dialing, and Message Waiting Lamp Status) may be lost.

- For terminals except for IP terminal:

  Terminals except for IP terminal can register to Primary Node after they are reset by using CBKS command, etc.

  Note: In the case of MC&MG-COT:
  If MC stations are specified on CBKS command, only Media Converter (MC) side will be reset. At this time, Media Gateway (MG) side will not be reset. To reset the entire MC&MG-COT, specify the appropriate route(s) on CBKS command.

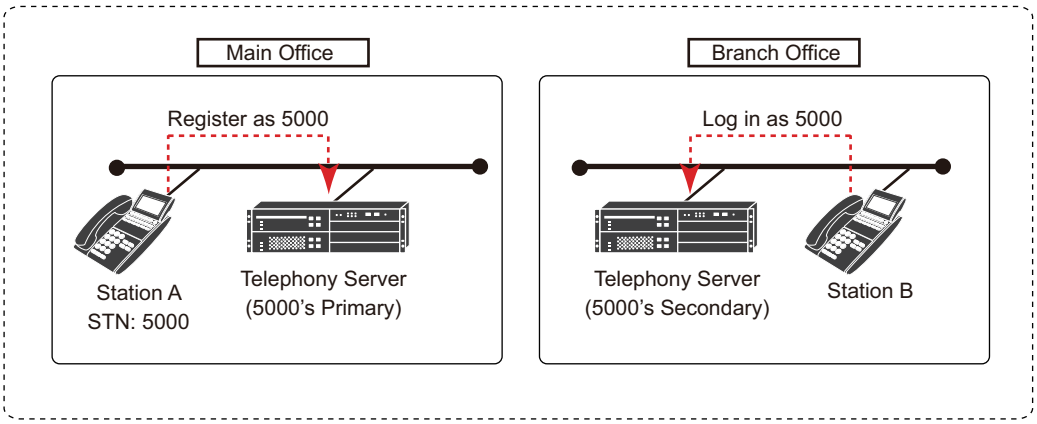
- When a connection failure between the terminal and Primary Node is recovered, the terminal operates as follows:

Status of Terminal	Recovery Method	Operation
Idle	Pressing the VISITOR key	Terminals register to Primary Node after they are reset.
	Using CBKS command	
Busy	Pressing the VISITOR key	Not Available.
	Using CBKS command	Call in progress will be disconnected. Terminals register to Primary Node after they are reset.
During Ringback Tone	Pressing the VISITOR key	Not Available.
	Using CBKS command	Outgoing Call will be disconnected. Terminals register to Primary Node after they are reset.
During Ringing Tone	Pressing the VISITOR key	Incoming Call will be disconnected. Terminals register to Primary Node after they are reset.
	Using CBKS command	

<Connectivity Check>

a.) When any terminal is registered in Backup Node, the node checks the connectivity with the terminals via Primary Node.

b.) When Primary Node recovers and the connectivity check succeeds continuously three times, the reset instruction will be sent to the terminals after the station data synchronization. **Note 8**



c.) LAN1 is used for the connectivity check.

d.) To complete connectivity check, about 10-15 minutes are required. Depends on the network condition, the number of accommodated devices, and the time setting of connectivity check, it may take longer to complete.

Note 8: Even if the station data synchronization after a connectivity check failed, the reset instruction will be sent to the terminals when the subsequent connectivity check succeeds continuously three times. In this case, the station data that has been set in Backup Node may be disabled after the terminals register to Primary Node.

<Example When Visitor Station Log On To The Secondary Node>

Even if Primary Telephony Server operates normally, a Visitor Station whose Station Number is assigned on Secondary Telephony Server can log into the Secondary Telephony Server by using its Station Number. For example, when a main office user has an IP station in the branch office Telephony Server, the user can log on to the branch office Telephony Server by using the own Station Number (5000) of the main office Station. At this time, user logs into the branch office Telephony Server as a Visitor Station. While the Station Number (5000) is used in Visitor mode, VISITOR key on the terminal at the main office flashes red (The Station Number (5000) cannot be used in main office).

Service Conditions (FCCS Cluster)

1. This feature is performed between systems that are set up with FCCS networks; therefore, the numbering plans (including station numbers) have to be made with NDM. Also, each feature performed between systems is restricted by conditions for FCCS network.
2. This feature is not available for OAI or ACD system.
3. To enable FCCS Cluster in Hotel system, see the Data Assignment for FCCS Cluster section in Data Programing Manual - Hotel.
4. FCCS Cluster is available for the following IP stations/equipment.

IP Station/Equipment		Firmware Version
DT800/DT700 Series	SIP	Available since the first version
DtermIP/IP Enabled Dterm	Proprietary Protocol	Version 2.06 or later
DtermIP (SIP)	SIP	Available since the first version (Version 1.00 or later)
DtermSP30	Proprietary Protocol	Version 5 or later
	SIP	Version 7 or later
Analog 2MC		SP-3753 2AMC PROG-B Issue 15 or later
8LC Card [SCA-8LCA/SCA-8LCA-EMEA]		SP-3893 8MC PROG-A Issue 1 or later
8LC Card [SCA-8LCC/SCA-8LCC-EMEA]		SP-3983 8MC PROG-B Issue 1 or later
MCMG Card [SCA-4LC2COTA]		SP-3927 MCMG PROG-B Issue 1 or later
MCMG Box [MG-4LC2COTA]		
MG-COT [SCA-6COTA]		SP-3875 6MGCOT PROG-A Issue 1 or later
MG-COT [SCA-6COTB]	Proprietary Protocol	SP-3948 6MGCOT PROG-A Issue 1 or later
	SIP	SP-3948 6MGCOT PROG-A Issue 1 or later
MG-COT [SCA-6COTC]	Proprietary Protocol	SP-3948 6MGCOT PROG-A Issue 1 or later
	SIP	SP-3948 6MGCOT PROG-A Issue 1 or later

UG50-6COT	Proprietary Protocol	Available since the first version
	SIP	Available since the first version

<When MAC Authentication Mode is used>

All the Nodes that are assigned by AUPDN (for Stations)/ALRTN (for Routes) must be set as destination IP addresses from each terminal (including obtaining IP address from DHCP server).

<When User Authentication (Login Mode) is used>

Login can be possible if any node assigned by office data has been registered to terminal. Terminals perform registration in the order of the setting on each terminal because they cannot obtain the destination IP address order information from the destination node. However, if a Node that is assigned as “Backup (Secondary or Tertiary)” in AUPDN is set as “Primary” in DRS setting of terminals, Visitor lamps on the terminals will light green because the terminals register to the Backup Node according to the assignment of AUPDN. Conversely, if a Node that is assigned as “Primary” in AUPDN is set as “Backup” in DRS setting of the terminals, the Visitor lamps on the terminals will not light because the terminals register to the Primary Node according to the assignment of AUPDN.

5. The following table shows FCCS Cluster operation when a failure occurs at the Primary Node where the following application ports are set to LAN1; DRS(REG), Internal PHE, Internal PHI-BRI, SR-MGC/NMS, Internal PHF, Internal PHI-PRI, and FCCS Cluster.

FCCS Cluster Operation - LAN1

Equipment supporting FCCS Cluster	Failure/Recovery Pattern	Operation at Failure/Recovery
<For Internal PHE> • Analog 2MC • MC&MG-COT (MC part) • UG50 (LC) [Proprietary Protocol] (**Note 10**) • UG50-IPG (Analog) • UG50-2MC • UG50-4LC2COTA (COT) (MC part)	LAN1 Failed	To be registered to backup node.
	LAN1 Recovered	To be registered to Primary Node.
	LAN2 Failed	To be registered to Primary Node. (No status change)
	LAN2 Recovered	To be registered to Primary Node. (No status change)
<For SP-PHD (SIP mode) > • SIP Multiple Line Terminal • Soft Phone [SIP]	LAN1 Failed	To be registered to backup node.
	LAN1 Recovered	To be registered to Primary Node.
	LAN2 Failed	To be registered to Primary Node. (No status change)
	LAN2 Recovered	To be registered to Primary Node. (No status change)

FCCS Cluster Operation - LAN1

Equipment supporting FCCS Cluster	Failure/Recovery Pattern	Operation at Failure/Recovery
<For SP-PHI (SIP mode) > • MG(BRI) [SIP] • MG(PRI) [SIP] • MG(6COT) [SIP] • 8LC • UG50 (PRT 1.5M)[SIP](**Note 10**) • UG50 (PRT 2M) [SIP](**Note 10**) • UG50-24PRIA [SIP] • UG50-30PRIA [SIP] • UG50-8LC • UG50-6COT [SIP] • UG50 (LC)[SIP](**Note 10**) • UG50(COT-TYPE2)[SIP](**Note 10**)	LAN1 Failed	To be registered to backup node.
	LAN1 Recovered	To be registered to Primary Node.
	LAN2 Failed	To be registered to Primary Node. (No status change)
	LAN2 Recovered	To be registered to Primary Node. (No status change)
<For SP-PHD (Proprietary Protocol mode) > • IP Terminal • Soft Phone [Proprietary Protocol] • UG50-IPG (Digital) • UG50 (DLC) (**Note 10**)	LAN1 Failed	To be registered to backup node.
	LAN1 Recovered	To be registered to Primary Node.
	LAN2 Failed	To be registered to Primary Node. (No status change)
	LAN2 Recovered	To be registered to Primary Node. (No status change)
<For SP-PHI (Proprietary Protocol mode) > • MC&MG(COT) [MG part] • MG(BRI) [Proprietary Protocol] • MG(6COT) [Proprietary Protocol] • UG50(COT-TYPE1/TYPE2)[Proprietary Protocol]) (**Note 10**) • UG50-4LC2COTA (COT) (MG part)	LAN1 Failed	To be registered to backup node.
	LAN1 Recovered	To be registered to Primary Node.
	LAN2 Failed	To be registered to Primary Node. (No status change)
	LAN2 Recovered	To be registered to Primary Node. (No status change)

FCCS Cluster Operation - LAN1

Equipment supporting FCCS Cluster	Failure/Recovery Pattern	Operation at Failure/Recovery
<For Internal PHI-BRI (Proprietary Protocol mode) > • MC&MG(COT) [MG part] • MG(BRI) [Proprietary Protocol] • MG(6COT) [Proprietary Protocol] • MG(SIP) • UG50(COT-TYPE1/TYPE2) [Proprietary Protocol] (**Note 10**) • UG50-4LC2COTA (COT) (MG part) • UG50-6COT [Proprietary Protocol]	LAN1 Failed	To be registered to backup node.
	LAN1 Recovered	To be registered to Primary Node.
	LAN2 Failed	To be registered to Primary Node. (No status change)
	LAN2 Recovered	To be registered to Primary Node. (No status change)
<For Internal PHI -PRI (Proprietary Protocol mode) > • MG(PRI) [Proprietary Protocol] • UG50 (PRT 1.5M)[Proprietary Protocol] (**Note 10**) • UG50 (PRT 2M)[Proprietary Protocol] (**Note 10**) • UG50-24PRIA[Proprietary Protocol] • UG50-30PRIA [Proprietary Protocol](**Note 11**)	LAN1 Failed	To be registered to backup node.
	LAN1 Recovered	To be registered to Primary Node.
	LAN2 Failed	To be registered to Primary Node. (No status change)
	LAN2 Recovered	To be registered to Primary Node. (No status change)

6. The following table shows FCCS Cluster operation when a failure occurs at the Primary Node where the following application ports are set to LAN2; DRS(REG), Internal PHE, Internal PHI-BRI, SR-MGC/NMS, Internal PHF, Internal PHI-PRI, and FCCS Cluster.

FCCS Cluster Operation - LAN2

Equipment supporting FCCS Cluster	Failure/Recovery Pattern	Operation at Failure/Recovery
<For Internal PHE> • Analog 2MC/MC&MG-COT (MC part) • UG50 (LC) [Proprietary Protocol] (**Note 10**) • UG50-IPG (Analog) • UG50-2MC • UG50-4LC2COTA (COT) (MC part)	LAN1 Failed	To be registered to Primary Node. (No status change) **Note 9**
	LAN1 Recovered	To be registered to Primary Node.
	LAN2 Failed	To be registered to backup node.
	LAN2 Recovered	To be registered to Primary Node.
<For SP-PHD (SIP mode) > • SIP Multiple Line Terminal • Soft Phone [SIP]	LAN1 Failed	To be registered to backup node.
	LAN1 Recovered	To be registered to Primary Node.
	LAN2 Failed	To be registered to backup node.
	LAN2 Recovered	To be registered to Primary Node.
<For SP-PHI (SIP mode) > • MG(BRI) [SIP] • MG(PRI) [SIP] • MG(6COT) [SIP] • 8LC • UG50 (PRT 1.5M)[SIP] (**Note 10**) • UG50 (PRT 2M)[SIP] (**Note 10**) • UG50-24PRIA [SIP]/UG50-30PRIA [SIP] • UG50-8LC • UG50-6COT [SIP] • UG50 (LC) [SIP] (**Note 10**)	LAN1 Failed	To be registered to backup node.
	LAN1 Recovered	To be registered to Primary Node.
	LAN2 Failed	To be registered to backup node.
	LAN2 Recovered	To be registered to Primary Node.

FCCS Cluster Operation - LAN2

Equipment supporting FCCS Cluster	Failure/Recovery Pattern	Operation at Failure/Recovery
<For SP-PHD (Proprietary Protocol mode) > • IP Terminal • Soft Phone [Proprietary Protocol] • UG50-IPG (Digital) • UG50 (DLC) (**Note 10**)	LAN1 Failed	To be registered to backup node.
	LAN1 Recovered	To be registered to Primary Node.
	LAN2 Failed	To be registered to backup node.
	LAN2 Recovered	To be registered to Primary Node.
<For SP-PHI (Proprietary Protocol mode) > • MC&MG(COT) [MG part] • MG(BRI) [Proprietary Protocol] • MG(6COT) [Proprietary Protocol] • UG50(COT-TYPE1/TYPE2) [Proprietary Protocol]) (**Note 10**) • UG50-4LC2COTA (COT) (MG part)	LAN1 Failed	To be registered to backup node.
	LAN1 Recovered	To be registered to Primary Node.
	LAN2 Failed	To be registered to backup node.
	LAN2 Recovered	To be registered to Primary Node.
<For Internal PHI-BRI (Proprietary Protocol mode) > • MC&MG(COT) [MG part] • MG(BRI) [Proprietary Protocol] • MG(6COT) [Proprietary Protocol] • MG(SIP) • UG50(COT-TYPE1/TYPE2)[Proprietary Protocol] (**Note 10**) • UG50-4LC2COTA (COT) (MG part) • UG50-6COT [Proprietary Protocol]	LAN1 Failed	To be registered to Primary Node. (No status change) **Note 9**
	LAN1 Recovered	To be registered to Primary Node.
	LAN2 Failed	To be registered to backup node.
	LAN2 Recovered	To be registered to Primary Node.

FCCS Cluster Operation - LAN2

Equipment supporting FCCS Cluster	Failure/Recovery Pattern	Operation at Failure/Recovery
<For Internal PHI -PRI (Proprietary Protocol mode) > • MG(PRI) [Proprietary Protocol] • UG50 (PRT 1.5M)[Proprietary Protocol] (**Note 10**) • UG50 (PRT 2M)[Proprietary Protocol] (**Note 10**) • UG50-24PRIA[Proprietary Protocol] • UG50-30PRIA[Proprietary Protocol] (**Note 11**)	LAN1 Failed	To be registered to Primary Node. (No status change) **Note 9**
	LAN1 Recovered	To be registered to Primary Node. (No status change)
	LAN2 Failed	To be registered to backup node.
	LAN2 Recovered	To be registered to Primary Node.

Note 9: When FCCS Cluster and SR-MGC coexist, which means that the office data for SR-MGC (the CMNT command) and SP Failure Detection valid (ASYDL, SYS1, Index 843, Bit 0=0, Bit 1=0) are assigned in Primary Node/backup node, the operation will change; to be registered to backup node.

Note 10: Available from FP95 V4-114 Issue 2.0.

7. For using this feature with SIP Multiple Line terminal that requires SIP terminal authentication, be sure to register to Primary Node at first. Otherwise, registration to backup node will not be available.
8. Ping signal needs to go through the Primary Node and the terminal when performing this feature. When using the Softphone on Windows XP SP2 with Windows Firewall enabled, the Ping return must be allowed by adding a check into the [Allow incoming echo request] checkbox by accessing [Control Panel] → [Windows Firewall] → [Advanced] tab → [ICMP] field.
9. For Location ID assignment, the same data has to be assigned to all nodes.
10. Master Node IP Address or Sub Master Node IP Address has to be assigned to each node by using the ACFMN command (Node Date Setting screen) before using this feature. Refer to the Command Manual for further details.

Note 11: UG50-24PRIA [Proprietary Protocol], UG50-30PRIA [Proprietary Protocol], UG50(PRT 1.5M) [Proprietary Protocol] and UG50(PRT 2M) [Proprietary Protocol] set the IP address of LAN1 as a registration destination. However, LAN2 is used for transmitting a call control signal after registration.

Note: To change Master Node IP address or Sub Master Node IP address, follow the procedure below. If you do not follow the procedure below, FCCS Cluster information of Backup Station/Route may be deleted and it may become impossible to make/receive a call.

(1) Make sure that no terminal registers to Backup Node.
(2) Assign ASYDN, SYS1, Index 963, Bit 1=0.
(3) Change Master Node IP address and Sub Master Node IP address.
(4) Assign ASYDN, SYS1, Index 963, Bit 1=1.

11. Route Sharing is not supported.
12. A total number of Primary Stations and Backup Stations cannot exceeds the amount of the system capacity license within each node. The maximum number of Stations and MGs (in total) using this feature is 32,000 within FCCS Network.
13. When using this feature, it is recommended to operate terminals in MAC Authentication mode. MAC data can be assigned to NDM from AMACN (directly) or each terminal (the password used for assigning MAC data to NDM from each terminal needs to be assigned on the DtermIP MAC Address Registration Password (NDM) screen of AFCMN).

    Note: MAC Authentication mode is not available for Soft Phone. Thus, Soft Phone does not support the encryption when using this feature.

14. If specifying "After confirmation of connection establishment with the Home Node" or "After station data synchronization is completed" on the Home Node monitoring interval screen of AFCMN command, Soft Phone does not register to Primary Node automatically because Soft Phone always operates in Login Mode. By pressing the VISITOR key, Soft Phone is reset and registers to Primary Node.

    - Virtual line moves together with the Master Station preassigned by AUPDN command. The call origination/termination from/to the virtual line accommodated within the IP station, is available only if Master station is accommodated under the same node. When the Master station and the virtual line are accommodated in different nodes, virtual line key of the terminal within other node will turn red to indicate that the call origination/termination from/to that line is restricted.

      Note: Be sure to assign the specified virtual line to a Feature key of the Master Station.

      Note: When the node previously registered is isolated (before the Master Station and virtual line move), in a situation which the Master node and Sub master node can not communicate, virtual line is only available within the isolated node (because the exchange of FCCS Cluster information is not available between the nodes). Button will be lit in red and call origination/termination will be restricted until Master node and Sub master node can communicate.

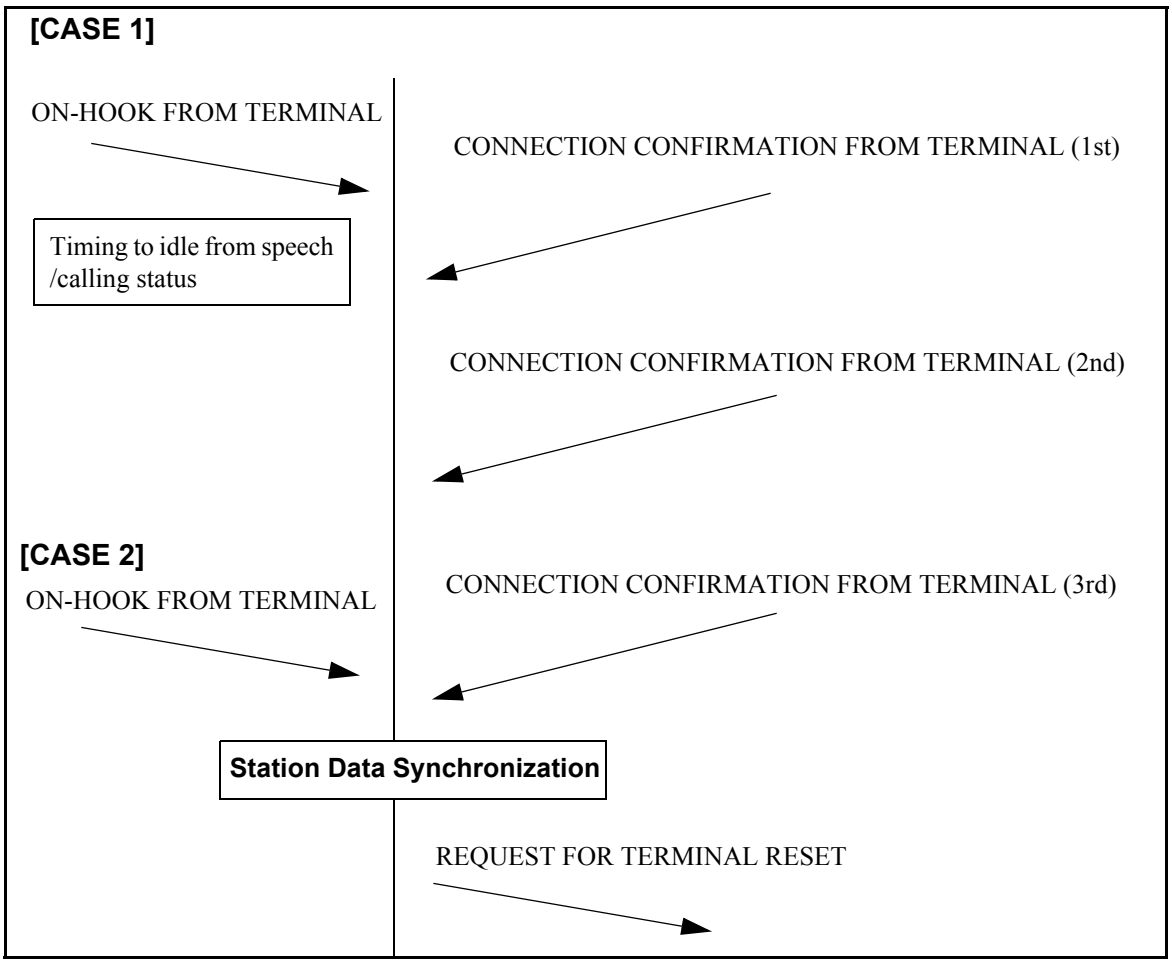
15. When the terminal within the station hunting group was recovered by the Backup Node, call hunting is still available if the call hunting group data was assigned toward the NDM. Call hunting data will be skipped if the data was assigned toward the Local Node (DM or LDM).
16. Boss-Secretary features are available only between terminals accommodated within the same node.
17. When the system message includes the information of physical number or the LENS, physical number and LENS information will be output with the information of Backup Node (The node which terminal has performed the registration).
18. As for Name Display feature, the existing data (ANDD) is displayed. Therefore, if you want to display the name display newly assigned with the user profile (AUPDN), it is essential to delete the existing data for name display first.
19. The billing information of terminal operating under the Backup Node is generated and output from the Backup Node.
20. MA-ID must be assigned individually towards the physical station and physical route of each node.
21. If Login is to be performed with MAC Authentication password assigned by the AFCMN command, the MAC address of the registering Station will be programmed into NDM. Assigned data can be confirmed by using the AMACN command.

22. When assigning the key data by using the AUPKDN command or key template of AKTDN, Multiple Line can be assigned over FCCS, but call origination/termination is available only when the Multiple Line is accommodated within the same node to which the terminal registered. If the terminal registered to other node, the Multiple Line key will be lit in red.

    The following explains the terminal status depending on the timing of Registration in "**Primary Node <-> Backup Node**".

    - Terminal Actions when terminals are registered to Backup Node from Primary Node

Idle	Speeching	Calling (Originating Call)	Called (Arrived Call)
Registered in Backup Node	Speeching Status continues. a calling is terminated by On-Hook, the terminal reset itself and register to Backup Node.	Calling Status (Originating Call) continues. A few minutes later, the terminal resets itself and register to Backup Node.	Called Status (Arrived Call) continues. A few minutes later, the terminal resets itself and register to Backup Node.



23. Settings for LOGGED OUT IP STATION - CALL DESTINATION [L-53] will be regulated while in Backup Node. In addition, if Primary Node fails, LOGGED OUT IP STATION - CALL DESTINATION [L-53] will not be available. LOGGED OUT IP STATION - CALL DESTINATION [L-53] will be available after Primary Node recovers from failure.
24. CALL FORWARDING-ALL CALLS [C-5] is not available if Primary Node fails and the terminal is not registered to a Backup Node. CALL FORWARDING-ALL CALLS [C-5] will be available after Primary Node recovers from failure or if the terminal is in registered status to a Backup Node.

- Terminal Actions when terminals are registered to Primary Node from Backup Node

Timing	Idle	Speeching	Calling (Originating Call)	Called (Arrived Call)	Remarks
Immediate	After connection confirmation (**Note 12**) is successfully completed, the terminal is registered to Primary Node by Terminal Reset.	Speeching Status continues. After calling is terminated (On-Hook) and connection confirmation (**Note 12**) is successfully completed, the terminal is registered to Primary Node by Terminal Reset.	Calling Status (Originating Call) continues. After calling is terminated (On-Hook) and connection confirmation (**Note 12**) is successfully completed, the terminal is registered to Primary Node by Terminal Reset.	Called Status (Arrived Call) continues. The status is changed into idle. After connection confirmation (**Note 12**) is successfully completed, the terminal is registered to Primary Node by Terminal Reset.	In the case of Media Gateways (Trunks), when all the channels are idle, the terminal is registered to Primary Node.
Specified-Time	Same as above				
Press VISITOR key on Terminal	Terminal is registered to Primary Node by Terminal Reset.	VISITOR key is not available during the speech. After the speech is terminated by On-Hook, it becomes available.	VISITOR key is not available. After the calling is terminated by On-Hook, it becomes available.	Terminal is registered to Primary Node by Terminal Reset. The calling status is changed to idle. (Calling process in Called Party side continues. A few minutes later, the line will be terminated.)	
Send Terminal Reset by using the CBKS/DISD Command	Terminal is registered to Primary Node by Terminal Reset.	Terminal is registered to Primary Node by Terminal Reset. The line will be disconnected. (Called Party is on line. A few minutes later, the line will be disconnected.)	Terminal is registered to Primary Node by Terminal Reset. The calling status is changed to idle. (Calling process in Called Party side continues. A few minutes later, the line will be disconnected.)	Terminal is registered to Primary Node by Terminal Reset. The calling status is changed to idle. (Calling process in Called Party side continues. A few minutes later, the line will be disconnected.)	

Note 12: When terminals registered in Backup Nodes exist in networks, the Backup Nodes perform "**Connection Confirmation**" to the appropriate terminals via their Primary Nodes. When the Primary Nodes are recovered, if connection is confirmed as alive in three consecutive times, data synchronization among Stations will be performed and then Terminal Reset will be transmitted to each terminal.

Note: An interval to perform Connection Confirmation
When you assign "60 minutes" for Home Node monitoring interval by the AFCMN command, a period between line disconnection to Terminal Reset sending will be approximately five minutes.
The following diagram shows the Connection Confirmation processing.

- When Station Data Synchronization ends in failure
Even though Station Data Synchronization ends in failure, if it later succeeds for three consecutive times, Terminal Reset signal will be sent to reset a terminal. A terminal receiving its signal will be reset and registered to the Primary Node. In this case, Station Data in Backup Node side will be discarded.

25. When this feature is performed with Analog MC, all the MC ports require User Profile Data assignment by the AUPDN command. If only a part of the MC channels is assigned, the rest (unregistered MC channels) will become unavailable. When this feature is not performed with Analog MC, data assignment by the AUPDN command is not required.
When IP Station Data have been assigned by the AISTL command, registration towards the nodes and use of registered MC channels become available. When this feature is performed with Analog MC, refer to "Sample of Data Assignment" in the FCCS Location Diversity part of the Data Programming Manual - FCCS.

    Note: When you assign the data for Analog MC by the AUPDN command and the AISTL command data has been assigned at the Home node, delete the AISTL data before assigning the AUPDN data.

26. When this feature is performed with MC&MG-COT, all MG trunks need to be registered by AMGIL command even though the trunks will not be used.
27. When you use the CBKS command to reset an MG(PRI), consider the following:

    When a check box for a B-Channel route is selected and the RESET button is clicked, the CBKS command automatically resets the selected B-Channel and the corresponding D-Channel routes, and vice versa.
    For this reason, if you select the check boxes for both B-Channel and D-Channel routes simultaneously and click the RESET button, "SP H/I Error" is returned for the channel that is processed later than the other. In that case, run the command again to see if the reset of both channels has been completed.

28. While IP station A is setting [C-1] Call Back on IP station B, if a changeover or switchback is executed for nodes, the operation will be as follows.

    <In the case of Changeover to Backup Node>

    The Call Back both on the IP station A and B will be canceled, and the node will be changed over to backup node.

    <In the case of Switchback to Primary Node>

    After the Primary Node is confirmed released, if the IP station B is being talking, the Call Back of IP station A will be canceled, and the node will be changed over to the Primary Node.

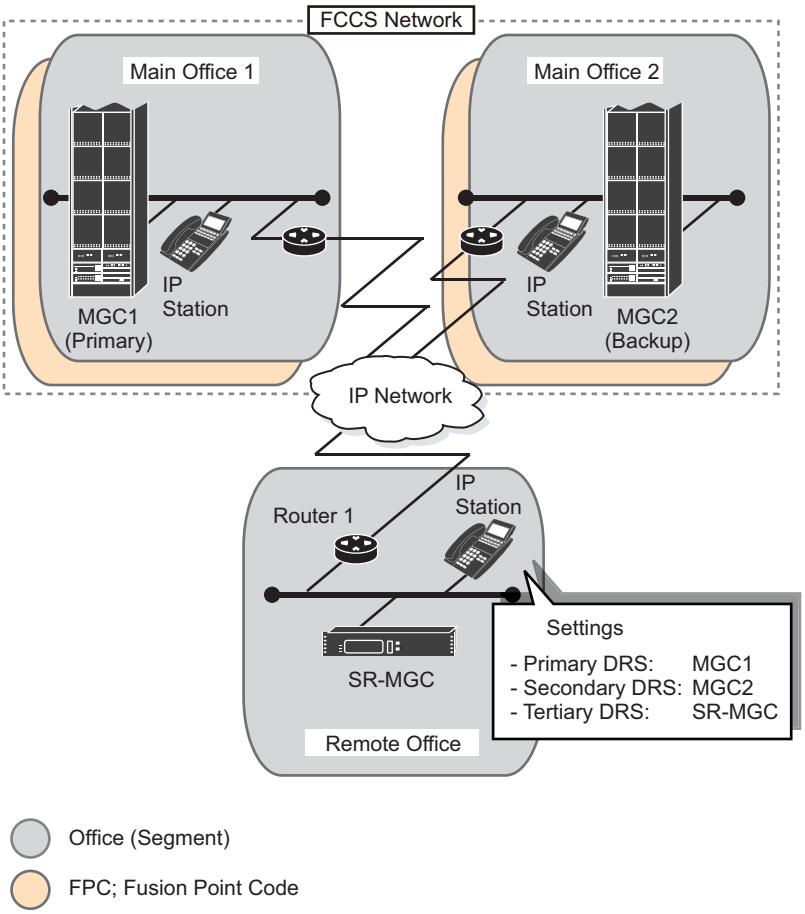
    When the call of IP station B is released after the Primary Node is confirmed released, if the Call Back is still being set on the IP station B, the node will be switchbacked to the Primary Node after executing the Call Back.

29. To know more details about the relationship between this feature and other features, refer to Interactions in this feature.
30. When IP Station Data have been assigned by the AISTL command, registration towards the nodes and use of registered MC channels become available. When this feature is performed with Analog MC, refer to “Sample of Data Assignment” in the FCCS Location Diversity part of the Data Programming Manual - FCCS. To know more details about the relationship between this feature and other features, refer to Interactions in this feature.
31. In system configuration that includes non-FCCS Cluster support terminals, SR-MGC is unable to replace the Backup Node in rescuing non-FCCS Cluster support terminals.
32. Even if the controlling station of Uniform Call Distribution [U-1] has been registered in backup node, the station number is available as the UCD pilot number. However, Call Waiting Lamp - UCD [C-76] and Delay Announcement -UCD [D-31] is unavailable at this time.
33. This feature is not supported in the UMGi/RNIP system.

Programming (FCCS Cluster)

For data programming of this feature, refer to the programming part of FCCS Cluster in the Data Programming Manual - FCCS.

SR-MGC with FCCS Cluster



General Description (SR-MGC with FCCS Cluster)

This feature is available in cooperation with SR-MGC, which is called “SR-MGC with FCCS Cluster”. When network failure occurs and causes connection failure between terminals and MGC (**Note 13**), in addition, if keeping terminals' connection with the FCCS Cluster feature is not available, SR-MGC will be activated.

For example, in the next figure, if Router 1 in Remote Office 1 is down, SR-MGC will have trouble communicating with MGC1 (Primary) and MGC2 (Backup). And then it soon realizes the managed-terminals' connections are not able to be kept by other MGCs, and the SR-MGC activates itself to keeping those connections alive.

The hardware installation and data assignment for the SR-MGC are described in the Peripheral Equipment Description. This section describes only Service Conditions specific to SR-MGC with FCCS Cluster.

Note 13: “MGC” used in this section indicates the Telephony Server.

When the SR-MGC is used in the network and a failure occurs, the registration of servers and terminals is changed as follows:

CAUSE	TERMINAL STATUS
MGC1 has network failure	Terminals in Remote Office 1 are registered to MGC2.
MGC1 and MGC2 have network failure	Terminals in Remote Office 1 are registered to SR-MGC.

Operating Procedure (SR-MGC with FCCS Cluster)

No manual operation is required.

Service Conditions (SR-MGC with FCCS Cluster)

The following are specific to SR-MGC with FCCS Cluster feature. For more information about the SR-MGC's Service Conditions including a list of IP devices/stations available for this feature, refer to Service Conditions of Survivable Remote MGC [S-141].

1. SR-MGC control (such as initializing, switching operating modes, office data copy, and automatic changeover) can be performed by using the CMNT command only from Primary MGC.
2. Terminal can be switchbacked from SR-MGC by assigning ASYDL, SYS1, Index 852, Bit 5: 0/1 = Manual/Automatic switchback. **Note 14**

Note 14: The SWITCHBACK means returning the terminal registration destination to the Telephony Server when the communication failure between the Telephony Server and SR-MGC is released.

- The switchback process in the case of automatic switchback [ASYDL, SYS1, Index 852, Bit 5=1].

  As soon as communication recovery between the Telephony Server and SR-MGC is detected on SR-MGC side, the terminal registered on SR-MGC will automatically be switchbacked to the Telephony Server at primary or backup node.

  [Conditions for Automatic Switchback]

  a.) When "1" is selected in Mode of the CMNT command:
  The switchback will be executed for the Telephony Server at primary or backup node that are released first.
  b.) When "2" is selected in Mode of the CMNT command:
  When SR-MGC detects communication recovery with the Telephony Server at Primary Node, and also communication status between the Telephony Server at Primary Node and pilot station is confirmed normal, the terminal registered on SR-MGC will automatically be switchbacked to the Telephony Server at Primary Node. If the Telephony Server at backup node is released first, the switchback will not be executed.

[Ongoing call check when the automatic switchback is executed]

a.) SR-MGC checks the ongoing call status and switchbacks the terminal not in busy status to the Telephony Server in turn.
b.) If the terminal has several channels, the terminal will forcibly be switchbacked to the Telephony Server when all the channels are released.

The switchback will be executed for the Telephony Server at primary or backup node that are released first.

- The switchback process in the case of manual switchback [ASYDL, SYS1, Index 852, Bit 5=0].

When the communication failure between the Telephony Server at Primary Node and SR-MGC is released, the terminal registered on SR-MGC can be switchbacked to the Telephony Server at Primary Node by executing CONDITION (To Standby mode with terminal reset) in [Change Operating] tab of CMNT command. If the Telephony Server at backup node is released first, the manual switchback cannot be executed.

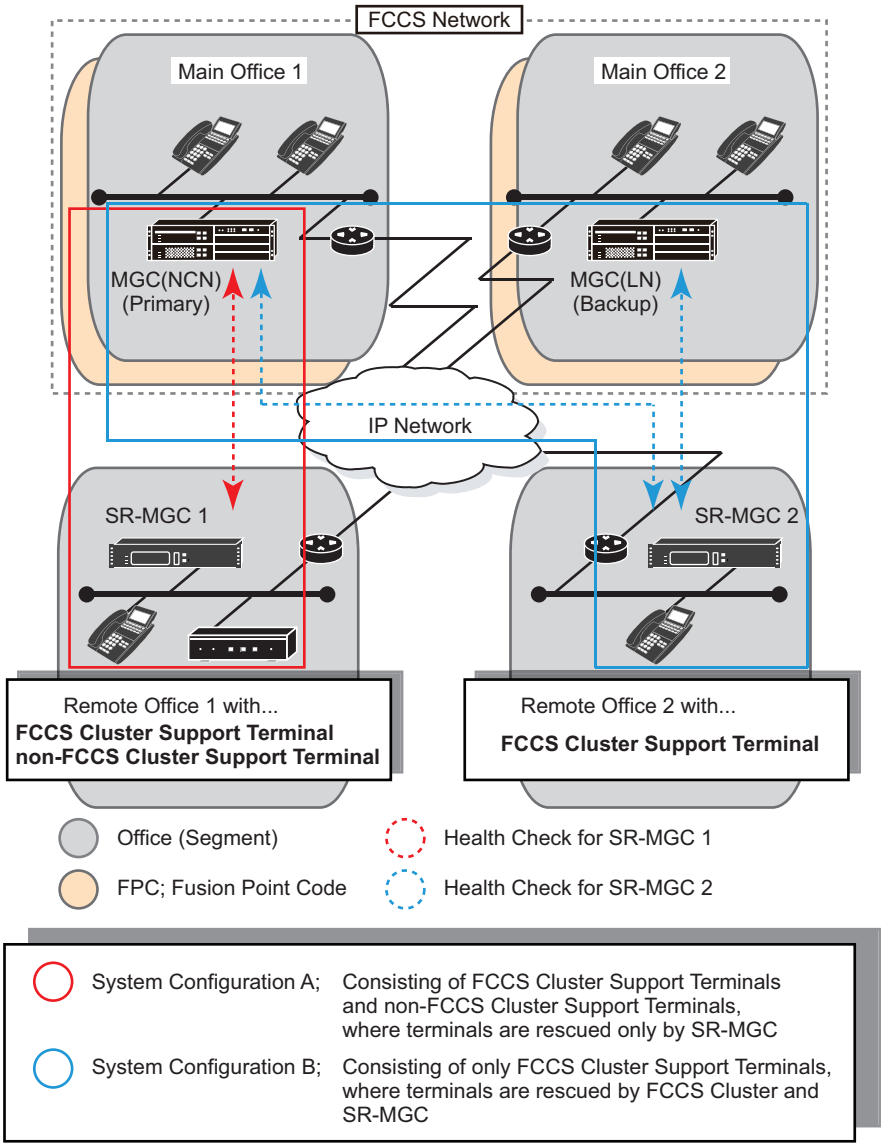
3. Network Time information can be obtained by Primary MGC only.
4. The state of SR-MGC changes to Operating Mode when:

- Primary Node and all of the Backup nodes have trouble communicating with its SR-MGC.
- A fault occurs in only one direction (To Operating mode). **Note 15**

Note 15: To enable the connectivity check (To Operating mode), the following system data setting is required.
- Identical value must be assigned in all the node. Assign 30 seconds or more as a value of Health Check cycle (ASYDL, SYS1, Index 850) and 5 seconds or more as a value of Health Check waiting time (ASYDL, SYS1, Index 851).
  Health Check cycle > Health Check waiting time × 2
- When changing the data for Health Check cycle (ASYDL, SYS1, Index 850), it should be changed according to the procedure explained in the note on ASYDL, SYS1, Index 850 in Command Manual.

5. Firmware Version of each terminal that can be used in an environment where FCCS Cluster and SR-MGC coexist is as follows.

IP Station/Equipment		Firmware Version
DT800/DT700 Series	SIP	All versions
DtermIP/IP Enabled Dterm	Proprietary Protocol	Version 2.00 or later
DtermIP (SIP)	SIP	Version 2.0.4.0 or later
Soft Client SP350	SIP	All versions
DtermSP30	Proprietary Protocol	All versions
	SIP	Version 7 or later
Analog 2MC		SP-3753 2AMC PROG-B Issue 8 or later
8LC Card [SCA-8LCA/SCA-8LCA-EMEA]		SP-3893 8MC PROG-A Issue 1
8LC Card [SCA-8LCC/SCA-8LCC-EMEA]		SP-3983 8MC PROG-B Issue 1
MCMG Card [SCA-4LC2COTA]		SP-3927 MCMG PROG-B Issue 1 or later
MCMG Box [MG-4LC2COTA]		
MG-COT [SCA-6COTA]		SP-3875 6MGCOT PROG-A Issue 1 or later
MG-COT [SCA-6COTB]	Proprietary Protocol	SP-3948 6MGCOT PROG-A Issue 1 or later
	SIP	SP-3948 6MGCOT PROG-A Issue 1 or later
MG-COT [SCA-6COTC]	Proprietary Protocol	SP-3948 6MGCOT PROG-A Issue 1 or later
	SIP	SP-3948 6MGCOT PROG-A Issue 1 or later
MG(BRI) Card [SCA-2BRIA]	SIP	SP-3826 BRI MG SIP BSC PROG-A Issue 1 or later
MG(BRI) Box [MG-2BRIA]		
MG-PRI/MG-PRA	Proprietary Protocol	SW-423 PRI MG PROGRAM-A Issue 1 or later
MG(PRI) Card [SCA-24PRIA]	Proprietary Protocol	All versions (SP-3884 MG PRI PROG-A Issue 1 or later)
	SIP	SP-3884 MG PRI PROG-A Issue 1 or later
MG(PRI) Box [MG-24PRIA]	Proprietary Protocol	All versions (SP-3884 MG PRI PROG-A Issue 1 or later)
	SIP	SP-3884 MG PRI PROG-A Issue 1 or later
MG(PRI) Card [SCA-30PRIA]	Proprietary Protocol	All versions (SP-3884 MG PRI PROG-A Issue 1 or later)
	SIP	SP-3884 MG PRI PROG-A Issue 1 or later
MG(PRI) Box [MG-30PRIA]	Proprietary Protocol	All versions (SP-3884 MG PRI PROG-A Issue 1 or later)
	SIP	SP-3884 MG PRI PROG-A Issue 1 or later
MG (SIP) 16	Proprietary Protocol	SP-3843 SIPMG PROG-B Issue 5 or later
MG (SIP) 16 [SCA-16SIP-MGA]	Proprietary Protocol	SP-3905 SIPMG (16) PROG-A Issue 2 or later
MG (SIP) 16 [MG-16SIP-MGA]		



IP Station/Equipment		Firmware Version
MG (SIP) 16 [SCA-16SIPMG(US)]	Proprietary Protocol	SP-3988 MGSIP (16) PROG-G Issue 1 or later
MG-SIP96	Proprietary Protocol	SP-3987 MGSIP PROG-B Issue 1 or later
MG-SIP128 [MG-128SIP-MGL-A]	Proprietary Protocol	SP-4089 MGSIP(MM) PROG-A Issue 1 or later
MG-SIP128 [MG-128SIPMGG-B/MG-128SIPMGG]	Proprietary Protocol	SP-4058 MGSIP PROG-J Issue 1 or later
		SP-4051 MGSIP PROG-G Issue 1 or later
MG-SIP128 [MG-128SIPMGJ-B/MG-128SIPMGJ]	Proprietary Protocol	SP-4032 MGSIP PROG-E Issue 1 or later
		SP-4060 MGSIP PROG-L Issue 1 or later
Software-based MG-SIP	Proprietary Protocol	SP-4080 MGSIPVM PROG-D Issue 1 or later
		SP-4078 MGSIPVM PROG-B Issue 1 or later
		SP-4085 MGSIPVM PROG-E Issue 1 or later
VS32	Proprietary Protocol	Not supported
	SIP	Not supported
UG50 (DLC)		UG50 software version 2.00 or later
UG50 (LC) [Proprietary Protocol]		UG50 software version 2.00 or later
UG50 (LC) [SIP]		UG50 software version 2.00 or later
UG50 (PRT 1.5M) [Proprietary Protocol]		UG50 software version 2.00 or later
UG50 (PRT 1.5M) [SIP]		UG50 software version 2.00 or later
UG50 (PRT 2M) [Proprietary Protocol]		UG50 software version 2.00 or later
UG50 (PRT 2M) [SIP]		UG50 software version 2.00 or later
UG50 (COT-TYPE1)		UG50 software version 2.00 or later
UG50 (COT-TYPE2) [Proprietary Protocol]		UG50 software version 2.00 or later
UG50 (COT-TYPE2) [SIP]		UG50 software version 2.00 or later
UG50 (PGT-TYPE1)		Not supported
UG50 (PGT-TYPE2) [Proprietary Protocol]		Not supported
UG50 (PGT-TYPE2) [SIP]		Not supported
UG50-IPG (Digital)		Not supported
UG50-IPG (Analog)		Not supported
UG50-2MC		Available since the first version
UG50-8LC		Available since the first version
UG50-24PRIA [Proprietary Protocol]		Available since the first version
UG50-24PRIA [SIP]		Available since the first version

IP Station/Equipment	Firmware Version
UG50-30PRIA [Proprietary Protocol]	Available since the first version
UG50-30PRIA [SIP]	Available since the first version
UG50-6COT [Proprietary Protocol]	Available since the first version
UG50-6COT [SIP]	Available since the first version
UG50-4LC2COTA (COT)	Available since the first version
UG50-4LC2COTA (PGT)	Not supported

6. When using SR-MGC with FCCS Cluster, the Primary Node and backup node are used as one system. Maximum of 256 SR-MGC can be accommodated to one system.
7. In environment where FCCS Cluster and SR-MGC coexist, SR-MGC is capable of rescuing equipment that supports FCCS Cluster.
8. When using FCCS Cluster with SR-MGC, if FCCS Cluster support terminals and non-FCCS Cluster support terminals coexist, a single SR-MGC is not capable of rescuing both types of terminals.
   If both types of terminals coexist, when building a FCCS Cluster/SR-MGC system, precautions are needed for operation. Depending on operation conditions, a non-FCCS Cluster support terminal may not be rescued by either FCCS Cluster or SR-MGC.
   See the following for the operation conditions in this environment.

[When Non-FCCS Cluster Support Terminals Coexist With FCCS Cluster support Terminals]

When using FCCS Cluster with SR-MGC, 2 types of system configurations must coexist, in regard to the different types of terminals (FCCS Cluster support terminal/non-FCCS Cluster support terminal, SR-MGC is capable of rescue /SR-MGC is incapable of rescue).

- System Configuration A: System rescue is performed only by SR-MGC
  When failure occurs in Primary Node, SR-MGC 1 rescues FCCS Cluster support terminals and non-FCCS Cluster support terminals.

  a.) System is normal: Primary Node (MGC(NCN)) manages the terminals.

  b.) Failure in Primary Node: SR-MGC 1 rescues FCCS Cluster support terminals and non-FCCS Cluster support terminals.

  c.) Failure in Primary & Backup Node: Terminals are already rescued by SR-MGC 1.

  *Health Check is provided only between SR-MGC 1 and MGC(NCN).

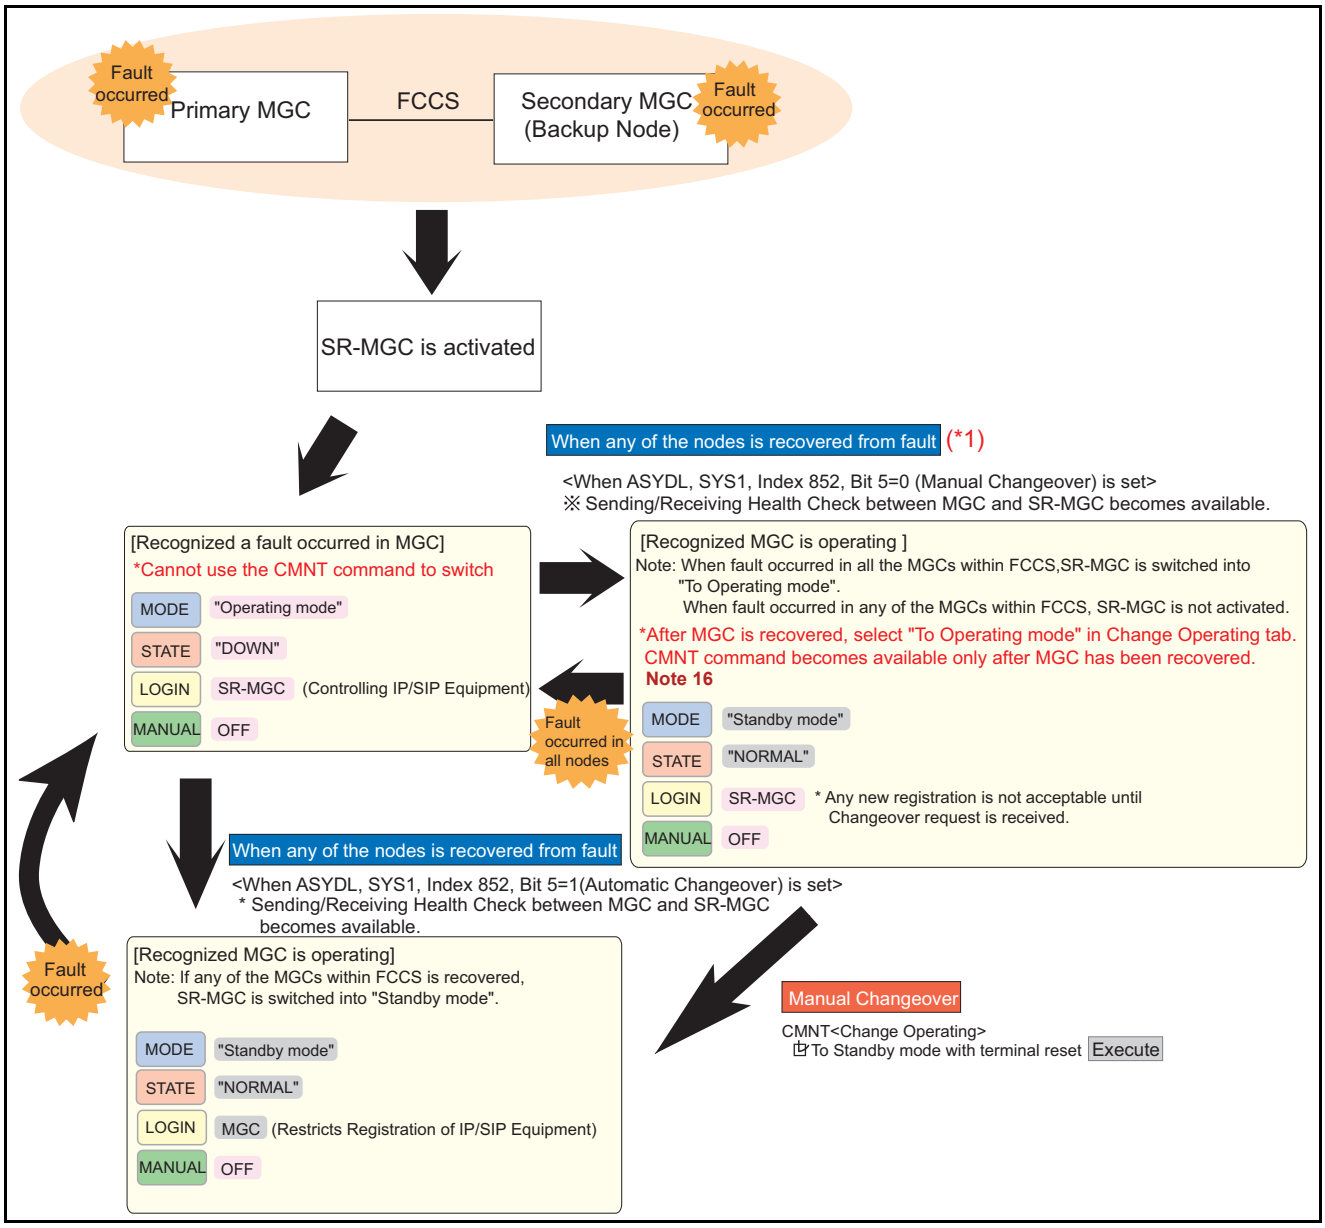
- System Configuration B: System rescue is performed by FCCS Cluster and SR-MGC
  When failure occurs in Primary Node and Backup Node, SR-MGC 2 rescues FCCS Cluster support terminals.

  a.) System is normal: Primary Node (MGC(NCN)) manages the terminals.

  b.) Failure in Primary Node: Backup Node (MGC(LN)) rescues FCCS Cluster support terminals.

  c.) Failure in Primary & Backup Node: SR-MGC 2 rescues FCCS Cluster support terminals.

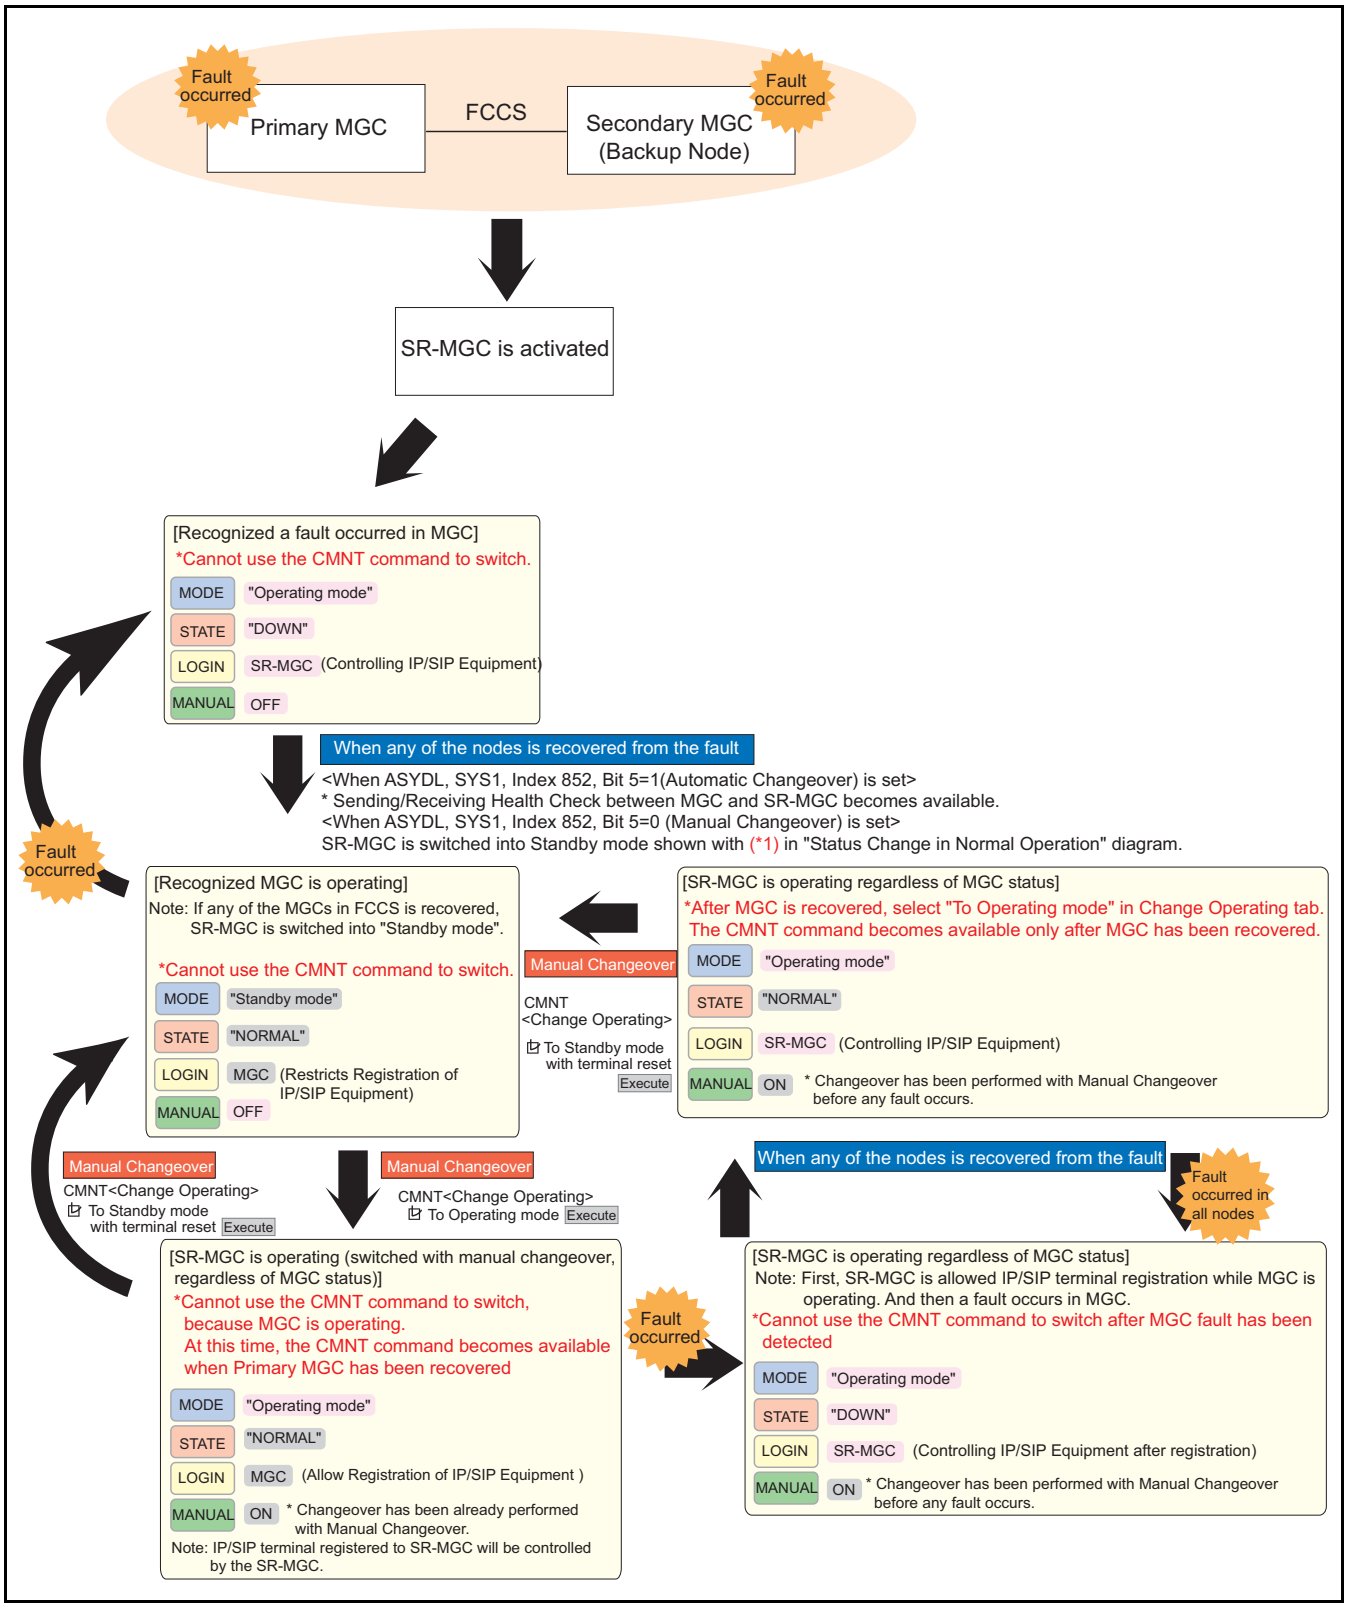
  *Health Check is provided between SR-MGC 2 and each FCCS Cluster Node.



9. When SR-MGC with FCCS Cluster is performed, the operating mode of SR-MGC will be greatly influenced by the communication status between MGC and SR-MGC and the settings of the CMNT command.

   Note: SR-MGC has the following two modes:
   Standby Mode: IP/SIP Equipment cannot register to SR-MGC
   Operating Mode: IP/SIP Equipment can register to SR-MGC
   If IP/SIP equipment registers to SR-MGC in Standby Mode, each equipment operates differently.

   The following are examples when Primary and Secondary MGCs are in Main Office.



- Status Change in Normal Operation

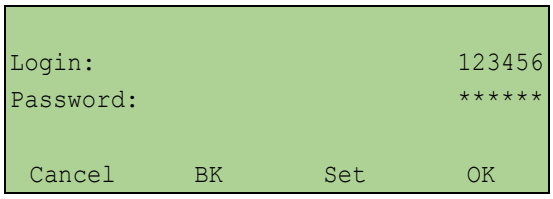
Note 16: Other than Primary MGC (such as Secondary MGC), the CMNT command is not available.

- Status Change in Test mode (Normally, SR-MGC's status is not changed in the following)

10. This feature is not supported in the UMGi/RNIP system.

Programming (SR-MGC with FCCS Cluster)

For data programming of this feature, refer to the programming part of [S-141] Survivable Remote MGC.



L-56 Login Code

General Description

This feature allows users to log in from IP terminals with Login Code which consists of an arbitrary number, instead of a Station Number, when Login Mode is in service.

Operating Procedure

Example: DtermIP display

STEP 1: Enter the assigned Login Code for "Login" on IP terminal.
STEP 2: Enter the same Login Code you entered in STEP 1 for "Password" on IP terminal. **Note 1**

Note: Password can be changed by terminal operations. For the procedure, refer to DtermIP [D-159] in Data Programming Manual - Business.

Note 1: When logging in from the terminal where the password has not been changed, enter Login Code for Password. If Password has already been changed before registering Login Code by this feature, the Password remains the same. In this case, enter the current Password.

Service Conditions

<Important Notices>

1. This feature is only available when a terminal operates in Login Mode.
2. Telephone Number needs to be assigned to the station using an arbitrary Login Code.
3. Login Code should be a unique number which differs from Station Number.

Example 1:
When the following Office Data is assigned,

	Station Number	Login Code
Station A	30000	50000
Station B	50000	Not assigned
Station C	70000	Not assigned

a.) If Login Code conflicts with an existing Station Number, the Login Code overrides the Station Number.

	If Entered in Login Field...	Login Availability
Station A	50000	Logged in as Station Number 30000
Station B	50000	Logged in as Station Number 30000 **Note 2**
Station C	70000	Logged in as Station Number 70000

Note 2: If Station A is not logged in, the user of Station B can log in as Station Number 30000.

b.) If another user logs in by entering a number which conflicts with the identifiers already in use, the new user will override the previous user.

	If Entered in Login Field...
Station A	50000
Station B	50000

In the above case, when Station A is logged in, Station B will override Station A if the user of Station B logs in by entering "50000" in the Login Field. When the Station B is logged in, Station A will override Station B if the user of Station A logs in by entering "50000" in the Login field.

Note: Make sure that terminals with Login Code do not mix with those without Login Code in the same system. Review an Office Data Setting, if necessary.

4. If Login Code has been assigned to a Station, the user cannot use the Station Number to log in.

Example:
When the following Office Data is assigned,

	Station Number	Login Code
Station A	30000	50000

the login availability for each Station is as follows.

	If Entered in Login Field...	Login Availability
Station A	50000	Logged in as Station Number 30000
Station A	30000	Not available

<Interactions with Other Features>

1. This feature is available for Dial Plan to Support IP Centrex Functionality [D-166]. Login Code should be a unique number which differs from station number.

   Example:
   When the following Office Data is assigned,

	Station Number	Private Number	Login Code
Station A	30000	10020000	90000
Station B	50000	90000	Not assigned
Station C	70000	30040000	Not assigned

   a.) If Login Code conflicts with an existing Private Number, the Login Code overrides the Private Number.

	If Entered in Login Field...	Login Availability
Station A	90000	Logged in as Private Number 10020000
Station B	90000	Logged in as Private Number 10020000**Note 3**
Station C	30040000	Logged in as Private Number 30040000

   Note 3: If Station A is not logged in, the user of Station B can log in as Private Number 10020000.

   b.) If another user logs in by entering a number which conflicts with the identifiers already in use, the new user will override previous user..

	If Entered in Login Field...
Station A	90000
Station B	90000

   In the above case, when Station A is logged in, Station B will override the Station A if the user of Station B logs in by entering “90000” in the Login Field. When the Station B is logged in, the Station A will override the Station B if the user of Station A logs in by entering “90000” in the Login Field.

   Note: Make sure that terminals with Login Code do not mix with those without Login Code in the same system. Review an Office Data Setting, if necessary.

2. If Login Code has been assigned to a Station, the user cannot use the Private Number to log in.

Example:
When the following Office Data is assigned,

	Station Number	Private Number	Login Code
Station A	30000	10020000	90000

the login availability for each Station is as follows.

	If Entered in Login Field...	Login Availability
Station A	90000	Logged in as Private Number 10020000
Station A	10020000	Not available

3. This feature is available for Location Diversity [L-55] as well as for login to Backup Node.
4. When MAC mode is in service, this feature is only available when a user logs in under Login Mode after logging out by pressing the LOGOUT key.
5. This feature is available for Terminal Remote Login [T-66] in an FCCS network.

Note: This feature is not available for Terminal Remote Login [T-66] in CCIS networks.

<Hardware/Software>

1. This feature is available for terminals where Login Mode is in service.
2. This feature is available for login to SR-MGC.
3. To enable a SIP Handler Controlled SIP terminal to log in to the system with the station number which has the Login Code setting, the Login Code needs to be added to the user name in the SIP Handler Controlled SIP terminal side setting.

<Interactions with Networks>

None.

<Conditions Specific to This Feature>

1. Available characters for Login Code are numerals (0-9) as well as “#” and “*” (maximum 16 digits).
2. One Login Code can only be assigned to one Station Number.
3. If the Telephone Number, which the Login Code is already registered for, is deleted by ALGSL/ALGSN command, the registered data of Login Code is also deleted.

<Other Conditions>

None.

Programming

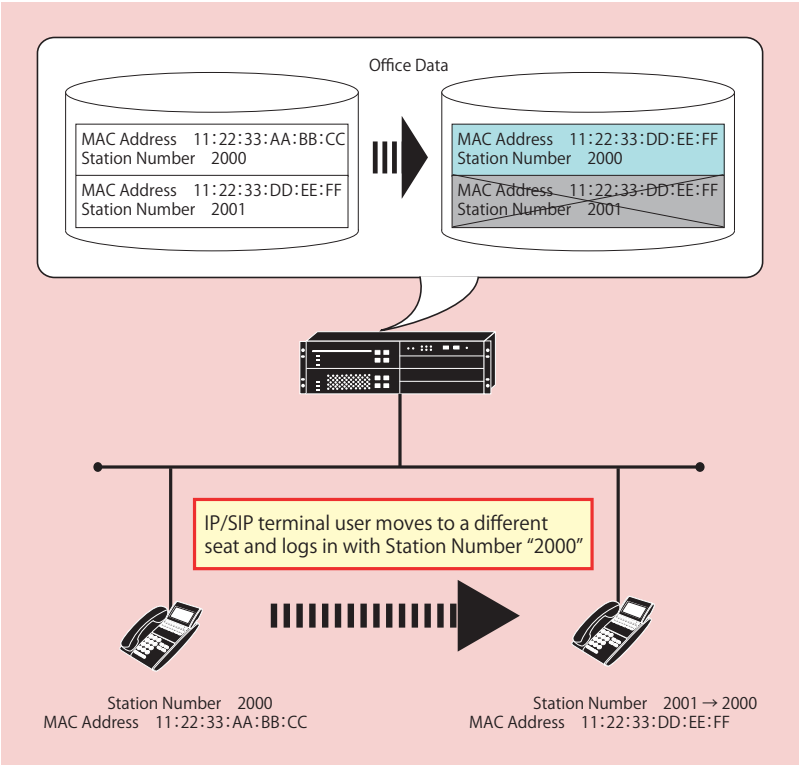
ALGCL/ALGCN - Login Code Data (LDM/NDM)

UGN: User Group Number [1 - 255]
TELN: Telephone Number [0 - 9, # and * (maximum 16 digits)]
LOGIN CODE: Arbitrary Login Code [0 - 9, # and * (maximum 16 digits)]

L-57 Last Login Info Retention

General Description

This feature allows IP terminal and SIP Multiple Line terminal (herein after referred to “IP/SIP terminal”) users to log in to any phone in free seating arrangements with their station number as the login User ID, and continue using the station number after an interruption due to power loss or terminal reset.
If the office data is backed up and restored, they can resume using their phones even after the system initialization while maintaining the last station number used.
For example, after transferring to another section of the company or changing seating arrangements, if an IP/SIP terminal user logs in to a different phone once, the terminal user does not have to log in subsequently even after the terminal reset occurs.



When the IP/SIP terminal user logs in using this feature, the following processes are handled inside of the system:

[Auto-Assignment of MAC Address Information]

When an IP/SIP terminal user enters a User ID and a Password, this process assigns a MAC address of login terminal to the office data.

[Auto-Deletion of existing MAC Address Information]

This process deletes an existing MAC address data when it is identical with a MAC address of login terminal. Also, modifies an existing station number data when it is identical with the login station number.

Operating Procedure

In the Login window, enter a User ID and a Password to log in.

Note: If the IP/SIP terminal has already been in the login state, select “Yes” when “Override?” is displayed in the LCD.

Service Conditions

<Important Notices>

None

<Interactions with Other Features>

1. When a Remote Node and a Local Node which are connected through the FCCS network due to Terminal Remote Login [T-66] use the same UGN number, specify whether to activate this feature with the system data (ASYDL/ASYDN, SYS1, Index 681, Bit 6).
   If the systems are connected through the CCIS network, this feature is not activated.
2. When Dial Plan to support IP Centrex Functionality [D-166] is in service, the availability of this feature depends on the conditions of the new seating position.

Moving Between Nodes	Moving Between UGNs	Last Login Info Retention [L-57]	Reason
No	No	Activated	Moving to a seat whose UGN is the same as before.
No	Yes	Not Activated **Note 1**	Moving to a seat whose UGN is different from before. **Note 3**
Yes	Yes	Not Activated **Note 1**	IP/SIP terminal performs registration to a Remote Node.
Yes	No	Previous Node: Activated **Note 2** Current Node: Not Activated	Moving to a seat whose UGN is the same as before.
			IP/SIP terminal user logs in to a Remote Node.

Note 1: The IP/SIP terminal user can log in but the MAC address is not updated. After the IP/SIP terminal restart or the system initialization, the IP/SIP terminal user needs to log in again.

Note 2: When there is no MAC address information, the MAC address information is input.

Note 3: When the IP/SIP terminal user logs in from a new seating position, it is regarded as an operation of override.

3. When a Physical Station Number is used for a User ID and a Password in the system using Physical Station Number Calling Restriction [P-87], this feature is not activated.

4. When a LN of Location Diversity [L-55] is set as Primary Node, note the following condition:

   If this feature is used when IP/SIP terminals are placed under the Secondary Node due to a failure in the Primary Node, the terminals cannot return to under the Primary Node after Primary Node recovers. To place the terminals back under the Primary Node, the following operations are required:

   - Assign the Primary Node IP address as Telephony Server IP address for the IP/SIP terminal configuration data.
   - Change the MAC address information back to the address before the failure occurs using the AMAC command.

5. The following table shows conditions of Auto-Assignment of MAC address information depending on the system data assignment (ASYDN, SYS1, Index 963, Bit 1: Location Diversity [L-55]).

Feature		Auto-Assignment of MAC Address Information	
Last Login Info Retention [L-57]	Location Diversity [L-55]	AMAC Command Data	AMACN Command Data
In Service	Out of Service	Supported	Supported
	In Service	Unsupported	Supported

Note: When both of Location Diversity [L-55] and Last Login Info Retention [L-57] are in service, the MAC address information remains if it is assigned by the AMAC command. Delete the MAC address information with the AMAC command.

6. When the registration destination of IP/SIP terminals is placed to SR-MGC, if the office data including MAC address has been copied into the SR-MGC, IP/SIP terminals start with the login station number.

<Hardware/Software>

1. When Soft Client SP350 is used, apply this feature with the system data (ASYDL/ASYDN, SYS1, Index 681, Bit 5=1).
2. This feature cannot be used with SIP Handler Controlled Standard SIP terminals.

<Interactions with Networks>

If IP/SIP terminal performs registration to the LN while a link between NCN and LN is disconnected in the FCCS system, MAC address is automatically assigned to the LDM but it is not assigned to the NDM. When the registration destination is changed to NCN or another LN, User ID and Password entries are required on the first login after the registration destination is changed.

<Conditions Specific to This Feature>

1. The following MAC address information is updated through this feature.
   - MAC address assigned with MAC Registration Password (LDM/NDM)
   - MAC address assigned with IP Terminal Automatic Assignment Function **Note 4**

- MAC address assigned with the AMAC/AMACN commands

Note 4: This condition is applied to the case where the checkbox for MAC address is registered is selected in the AEAAL command window.

2. When the following processes are in progress, this feature is not activated.

   - Office Data Backup with the MEM_HDD/MEM_HDD_N commands
   - Office Data Backup with the Routine Diagnosis
   - Broadcast of NDM
   - CPU Changeover

   In the case where this feature is not activated as mentioned above, IP/SIP terminal's registration can be restricted or allowed with the following system data.

   Index 681, Bit 4:
   Terminal's registration to the system when MAC address information update is failed = 0/1: Allow/Restrict

   Note: When IP/SIP terminal's registration to the system is restricted with specifying ASYDL/ASYDN, SYS1, Index 681, Bit 4=1 (Restrict), the following error messages or window are displayed in the LCD of IP/SIP terminal:

System State	IP Terminal	SIP Multiple Line Terminal
Office Data Backup is in progress with the Routine Diagnosis or the MEM_HDD/MEM_HDD_N commands	Unauthorized Retry Yes, No	Login Window is displayed.
	Resource Unavailable	Resource Unavailable
Broadcast of NDM is in progress	PH Unavailable	SIP Server Not Found
	Resource Unavailable	Resource Unavailable
CPU Changeover is in progress	PH Unavailable	SIP Server Not Found
	Resource Unavailable	Resource Unavailable

3. During Auto-Assignment of existing MAC address Information, all existing MAC address information related to the login station number is deleted from the office data.
4. One MAC address is set per station number in the office data.
5. After ASYDL/ASYDN, SYS1, Index 679, Bit 6 is changed from 1 (In Service) to 0 (Out of Service), MAC address information remains in the office data. Delete the remaining MAC address information from the PCPro through the AMAC/AMACN command.
6. If modification of MAC address is attempted from PCPro through the AMAC/AMACN command while a process of Auto-Assignment/Auto-Deletion is in progress, the operation from PCPro is failed. Then "Terminal busy" is displayed in the PCPro window.
7. After the IP/SIP terminal user logs in from the new seat position successfully, the LCD indication of IP/SIP terminal in the previous seat position changes as shown below:

   Connecting Window (LCD: Connecting...) → Login Window

8. In the system operating with Telephone Number, if the Numbering Plan consisting of Telephone Numbers overlaps with the one consisting of Physical Station Numbers, do not assign the same number mutually as a 1st Digit Code in the ANPD command.
Otherwise, when IP/SIP terminal user logs in with a Physical Station Number, the system behaves as the IP/SIP terminal user logs in with a Telephone Number. Then MAC address information is not updated.

   [Example] When the Numbering Plans are set as shown below:

   Numbering Plan Consisting of:
   - Physical Station Number: Four digits number begins with "2" or five digits number begins with "7"
   - Telephone Number: Four digits number begins with "2" or five digits number begins with "7"

Physical Station Number	Telephone Number	Example of Behavior
2000	72000	When IP/SIP terminal user logs in with Station No. 2000, the system regards as the IP/SIP terminal user logs in with Telephone No. 72000.
70000	2700	When IP/SIP terminal user logs in with Station No. 70000, the system regards as the IP/SIP terminal user logs in with Telephone No. 2700.

<Other Conditions>

None.

Programming

STEP 1: **ASYDL/ASYDN** (System Data (LDM/LDN))
SYS1
Index 679
Bit 6=1: Last Login Info Retention [L-57] is in service.
Index 681
Bit 4: Terminal's registration to the system when MAC address information update is failed
0/1: Allow/Restrict
Bit 5: Apply Last Login Info Retention [L-57] to Soft Phone (Soft Client SP350)
0/1: Not apply/Apply
Bit 6: Last Login Info Retention [L-57] with Terminal Remote Login (When Remote Node and Self Node connected via FCCS network have the same UGN number)
0/1: In Service/Out of Service

M-1 Meet-Me Paging

General Description

This feature allows a user dial access to paging equipment, and connects both parties automatically, after the Called Party has answered the page.

Operating Procedure

To page

1. Calling Station dials the Paging Access Code. Receives continuous Ringback Tone for one second.
2. Calling Station pages the desired party.
3. Calling Station remains off-hook or hangs up.

To answer

Called Party dials the Page Answer Code

1. NON-DELAY OPERATION

The party paged is immediately connected to the Calling Party.

2. DELAY OPERATION
   a.) The party paged receives Ringback Tone.
   b.) The Calling Station rings.
   c.) The Calling Station goes off-hook and is immediately connected to the paged Station.

Service Conditions

1. A maximum of six routes can be provided with Paging Trunks.
2. Paging equipment is customer provided.
3. One Paging Trunk will be assigned to each route.
4. Paging access and answer codes are assigned in System Data programming to correspond with each route.
5. The maximum number of digits that can be used as a Paging Access and/or Answer Code is 3.
6. The type of paging service provided on a system basis is programmed via the PCPro into the System database.
7. A page waiting to be answered is automatically canceled after a predetermined program duration. See VARIABLE TIMING PARAMETER [V-1] for other selectable timing choices.
8. The following can be used as a paging trunk interface:
   - COT Circuit Cards
   - MC&MG-COT (4LC2COT)
   - MG-COT (6COT)
   - UG50 (GCD-PGTA) **Note 1 Note 2**

   Note 1: UG50 (GCD-4COTA/B/C) cannot be used as a paging trunk interface.

   Note 2: Available from UG50 software version 2.00.
9. Loop signaling is the recommended signaling type. Refer to PAGING TRANSFER [P-10].

10. When receiving Paging Access Code from CCIS, only the Non-Delay operation is available (Delay operation is not available). Paging Answer and Paging Cancel operations via CCIS are not available. When the Station is paged via CCIS, the Station cannot answer/cancel the page.
11. The billing information is not output to the SMDR after using this feature.

Interactions

1. MEET-ME PAGING and PAGING ACCESS [P-1] can be provided simultaneously in the same system. In ARTD, CDN 6:TCL must be assigned as data "8" for MEET-ME PAGE, while PAGING ACCESS [P-1] routes may be assigned as data "11", General Page, or as data "1", DDD. Separate Access Codes for each feature are required. A MEET-ME PAGING answer and Cancel Code is required for each MEET-ME PAGING zone.
2. MEET-ME PAGING is limited to Stations and Attendant Consoles. Central Office Trunks or REMOTE ACCESS TO SYSTEM [R-2] Calls must have the Attendant Console or user perform the paging operation.
3. The Attendant Console cannot dial the MEET-ME PAGING answer codes
4. BUSY VERIFICATION [B-3] and EXECUTIVE RIGHT-OF WAY [E-1]: These features will be denied for a Connection that includes the Paging route.
5. DELAY OPERATION: Station A is connected to party B. Station A momentarily presses the switch hook and dials the MEET-ME PAGE Route Access Code. When connected to the page, Station A requests Station C to dial the MEET-ME PAGE Answer Code. Station A hangs up. When Station C dials the Answer Code, Station A is rung. Station C and Station A are connected. If Station A hangs up, Party B is connected to Station C. If Station A momentarily presses the switch hook, all three parties are connected together in a THREE-WAY CALLING [T-2] Connection. If Station C does not call the MEET-ME PAGE Answer Code after 30 seconds, Party B rings back to Station A.
6. NON-DELAY OPERATION: Station A is connected to Party B. Station A momentarily presses the switch hook and dials the MEET-ME PAGE Route Access Code. When connected to the page, Station A requests Station C to dial the MEET-ME PAGE Answer Code. Station A stays on the Trunk and is still voice-connected to the paging equipment. Station C dials the MEET-ME PAGE Answer Code. The Paging Trunk becomes idle. Station A is connected to Station C. If Station A hangs up, Party B is connected to Station C. If Station A momentarily presses the switch hook, all three parties are connected together in a THREE-WAY CALLING [T-2] Connection. There is no time-out period if Station C does not dial the MEET-ME PAGE Answer Code. Station A may press the switch hook to disconnect the page Trunk and reconnect to Party B. If desired, Station A may hang up and Station A will be recalled by Party B.
7. Stations allowed Priority Page, SFI = 57 (Priority Page), will come into the paging route, except when the Attendant Console is paging.
8. To answer MEET-ME PAGE, while connected to another party, CALL HOLD [C-6] must be used. THREE-WAY CALLING [T-2] is not allowed.

Programming

STEP 1: **ASYD** - SYS1, Index 73, Bit 0 and Bit 1.

For MEET-ME PAGE, non-Delay service, Bit 0=1, Bit 1=0.

For MEET-ME PAGE, Delay service, Bit 0=0, Bit 1=1.

For MEET-ME PAGE, Delay service with Call Transfer, Bit 0=1, Bit 1=1.

See PAGING TRANSFER [P-10].

SYS1, Index 73, Bit 3. Are PAGE Cancel Codes provided for each route? 0/1: Per route/Common to all routes.

SYS1, Index 74, Bit 0 to Bit 3. Assign the cancel timer for unanswered page.
Assign data 00H for 30 seconds.
(0-F + 1) x 30 = Cancel Timer.
SYS2, Index 1, Bit 0 and Bit 1. Consultation Hold allowed or denied. 00: Denied; 01: Originating and Terminating Calls allowed; Tandem Call Denied; 11: All calls allowed.

STEP 2: **ARTD** - Assign the Paging route as shown below:

RT:1

1-OSGS	:2	2-ONSG	:3	5-TF	:1	6-TCL	:8	7-L/T	:1
8-RLP	:2	15-LSG	:0/1						

Note: To change the data for existing route (RT), initialize the circuit card.

STEP 3: **ATRK** - Assign the LENS, Paging Trunk Route Number, Trunk Number, and Tenant Number.

STEP 4: **MBTK** - Assign the Make Idle status to the Paging Trunks.

STEP 5: **ANPD** - Reserve Levels for Trunk Access and for MEET-ME PAGE answer and Cancel Codes. Select the Trunk Access Level for a Connection Index (CI) of Normal Service (N) or Hooking Service (H) service. Number of necessary digits is usually one or two. Busy Lamp Field is not activated. If the MEET-ME PAGE answer and Cancel Codes reside in a Level reserved for features, then assign according to a predetermined Numbering Plan. If the MEET-ME PAGE answer and Cancel Codes reside in a separate Level, then select a CI of Normal Service (N) only. The number of necessary digits is usually two, and the Busy Lamp Field is OFF.

STEP 6: **ASPA** - For the MEET-ME PAGE route Access Code, assign the Access Code in the Level assigned in ANPD. Type of Service, SRV = "OGC: Outgoing Call" for Outgoing Trunks. Select CIs of "N: Normal" Service or "H: Hooking" Service. For the MEET-ME PAGE route answer and Cancel Codes, assign the Access Code in the Level assigned in ANPD. Type of Service, SRV = "PAGA: Paging Answer" and SRV = "PAGC: Paging Cancel". Assign the proper Route Number associated with this code. Assign for a CI of "N: Normal".

STEP 7: **ARSC** - For Stations allowed access to the paging routes, allow Route Restriction Index (RRI) 3 for the Route Restriction Classes (RSC) assigned to these Stations.

STEP 8: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 38 (Meet-Me Paging) to the Stations that will have MEET-ME PAGE. If Priority Page is used, allow SFI 57 (Priority Page).

STEP 9: **ARRC** - Allow Trunk-to-Trunk Connection between the paging route and the Incoming/Outgoing Route. Assign ARI-A-RES, via the Attendant Console. The Incoming/Outgoing Route would be the party being held at a Station, or Attendant Console wishing to speak to the party for whom the page is intended.

M-2 Miscellaneous Trunk Access

General Description

This feature provides access to all types of external and customer provided equipment/facilities, such as FX [F-2], WATS [W-1], CCSA [C-14], TIE LINE [T-3], and Exchange Network, along with DICTATION [D-3], PAGING [P-1], and CODE CALLING [C-21].

Operating Procedure

MISCELLANEOUS Trunk Access is accomplished via System Data programming at the PCPro.

Service Conditions

1. Access to these Trunk Groups is allowed or denied via CLASS OF SERVICE - INDIVIDUAL [C-15].
2. An Interface Circuit must be provided per Trunk required.

Interactions

If other features are being used (such as SMDR, toll restriction, and/or LCR (S)), refer to those feature descriptions, as other commands may be required that are not listed below.

Programming

STEP 1: **ARTD** - Refer to the Feature listing for the type of Trunk route to be accessed.

STEP 2: **ATRK** - Assign the LENS, Route Number, Trunk Number, and Tenant Number.

STEP 3: **MBTK** - Assign the Make Idle status to the Trunks.

STEP 4: **ANPD** - Assign a Level for Trunk Access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. Number of Necessary Digits is assigned according to a predetermined Numbering Plan. Busy Lamp Field is not activated.

STEP 5: **ASPA** - Assign the Access Code, as indicated, by the Level assigned in ANPD. Type of Service, SRV = “OGC: Outgoing Call” for Outgoing Trunks.

STEP 6: **ARSC** - Assign a Route Restriction Class (RSC) that is allowed in Route Restriction Indexes (RRI) 0, 1, 2 and 3 to the Station that is allowed access to these Trunks.

STEP 7: **ASDT** - Assign an RSC to the Stations that allow access to these Trunks.

M-3 Miscellaneous Trunk Restriction

General Description

This feature provides for certain Stations and certain dial-repeating TIE Trunks to be denied access to particular Trunk Groups, such as FX [F-2], WATS [W-1], CCSA [C-14], TIE LINE [T-3], Exchange Network, DICTATION [D-3] or PAGING [P-1].

Operating Procedure

MISCELLANEOUS TRUNK RESTRICTION is accomplished via System Data programming at the PCPro.

Service Conditions

1. Restricted call attempts can be either:
   a.) intercepted by the Attendant,
   b.) Reorder Tone can be initiated back to the originating Station user,
   c.) Station user can be connected to an announcement informing the user of the restricted call attempt, or
   d.) prompted for Authorization Code.
2. Station Line access to a given miscellaneous Trunk Group is controlled by assigning a Route Restriction Class (RSC) to each Line. There can be a maximum of 15 different RSCs (RSC1-15) per TENANT [T-12], each of which can be programmed to restrict an assigned Station from none, one, or more than one miscellaneous Trunk Group.
3. If the Station user's class of service allows outgoing route completion via the ATTENDANT CONSOLE [A-3], the Station user can dial “0” to reach the Attendant for completion of miscellaneous Trunk Calls.
4. The CALL TRANSFER - ALL CALLS [C-11] feature will operate as follows:
   a.) if the restricted Station is the controller, this Station cannot add a Trunk from which this Station is restricted.
   b.) if the restricted Station Line is not the controller, the controller cannot connect the restricted Station Line to a Trunk from which the Station is normally restricted.
5. Two Outgoing Trunk Group restriction tables are provided per system. The Direct Dial Access table is indexed when a Station user dials the Trunk Group Access Code and the ATTENDANT CONSOLE [A-3] table is indexed on Attendant completed calls. The restriction options per RSC can differ per table, thus allowing Attendant completion of Outgoing Calls for restricted Stations.
6. NIGHT SERVICE [N-1, 2]: Restrictions can be changed for a given Station when the system is switched to the Night mode of operation.
7. CALL TRANSFER - ALL CALLS [C-11]: If a restricted Station user calls another Station, the Called Station cannot use the CALL TRANSFER feature to connect the Calling Station to a Trunk Group to which the restricted Station is denied dial access. If transfer is attempted, the controlling Station is recalled.
8. TIE LINE ACCESS [T-3]: If the Station user accesses a TIE Trunk at a distant Office, access to Outside exchanges can only be controlled by the distant Office.

Interactions

If other services are being used (such as SMDR, toll restriction, and/or LCR (S)), refer to those feature descriptions, as other commands may be required that are not listed.

Programming

STEP 1: **ASYD** - SYS2, Index 1, Bit 4 and Bit 5. Should a restricted Station be routed to the Attendant Console or receive Reorder Tone?

Reorder Tone: Bit 4=0, Bit 5=0.

Attendant Console: Bit 4=1, Bit 5=0.

STEP 2: **ARSC** - Follow the procedure for [M-2] MISCELLANEOUS Trunk Access [M-2]. By assigning the ARSC command, restrict RSCs from receiving certain routes. RRI 3: RES must be "2" if call restriction to go to ATTCON. Then assign the restricted RSCs to Stations via the ASDT or ASCL command. When assigning the ARRC command, restrict Incoming TIE Lines from accessing certain routes.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

ARSCN - Follow the procedure for [M-2] MISCELLANEOUS Trunk Access [M-2]. By assigning the ARSC command, restrict RSCs from receiving certain routes. RRI 3: RES must be "2" if call restriction to go to ATTCON. Then assign the restricted RSCs to Stations via the ASDT or ASCL command. When assigning the ARRC command, restrict Incoming TIE Lines from accessing certain routes.

M-4 Multiple Console Operation

General Description

This feature allows one or more ATTENDANT CONSOLEs [A-3] to operate within the same system.

Operating Procedure

No manual operation is required.

Service Conditions

1. The maximum number of Consoles per PIR is 4.
2. The maximum number of Consoles allowable per system is 16.
3. Each Incoming Call is displayed on an ATTENDANT CONSOLE [A-3], whether idle or busy. If all Attendants are involved in processing calls when another Central Office Call arrives, the CALL WAITING LAMP [C-13] will light on all ATTENDANT CONSOLE [A-3]. This is a Switched Loop Attendant operation.
4. If one of the ATTENDANT CONSOLE [A-3] enters the night mode, all calls addressed to the Attendant will be directed to the other ATTENDANT CONSOLE [A-3]. However, the ATTENDANT CONSOLE [A-3] that has entered the night mode must complete processing of all calls already connected to it's Loops.
5. A Station can be connected to only one Attendant Loop at a time. Any attempt at establishing multiple Connections will result in Reorder Tone being sent to the Attendant.
6. INTER-POSITION TRANSFER [I-5] is used to transfer calls between ATTENDANT CONSOLE [A-3].
7. Two methods of operation are available for placing the system (or Tenant Group) into the night mode:
   a.) All ATTCON Change System Day to Night: When all ATTENDANT CONSOLE [A-3] press the Night key, the system (or associated TENANT [T-12]) enters the night mode. Night to Day: When one ATTENDANT CONSOLE [A-3] releases the Night key, the system (or associated TENANT [T-12]) enters the day mode.
   b.) Primary ATTCON Change System Day to Night: When the designated primary ATTENDANT CONSOLE [A-3] presses the Night key, the system (or associated TENANT [T-12]) enters the night mode. If an ATTENDANT CONSOLE [A-3] other than the primary Console presses the Night key, only that Console enters the night mode. Night to Day: When the primary ATTENDANT CONSOLE [A-3] releases the Night key, the system (or associated TENANT [T-12]) enters the day mode.
8. The automatic distribution of Attendant seeking calls is not provided (see Call Queuing). Any ATTENDANT CONSOLE [A-3] assigned to the same Tenant can answer a particular call; an exception is an INTER - POSITION TRANSFER [I-5] directed call.

Interactions

1. See ATTENDANT CONSOLE [A-3] for information regarding a single Attendant Console and system features provided to the Attendant Consoles. The Attendant Console must first be provided.
2. For each Tenant, only one type of Attendant Console system can be assigned, either normal or Primary Attendant Console system.
3. ASAT must be programmed for INTER-POSITION TRANSFER [I-5].

4. When more than one Attendant Console is installed, a Primary Attendant Console may be assigned (AMAT command). This Attendant Console will control the implementation of DAY/NIGHT CLASS OF SERVICE [D-15].
5. If the Primary Attendant places the system into Night mode, the Night LED on the other Consoles do not light.

Programming

STEP 1: **ASYD** - SYS1, Index 9. Assign the number of Attendant Consoles in the system. This provides information to the ASAT command.

SYS2, Index 2, Bit 2 to Bit 3. ATTCON Day/Night mode change is:

Bit 3	Bit 2	
0	0	= Not required (External Switch effective)
0	1	= by Primary Attendant Console
1	0	= by all Attendant Consoles

STEP 2: **ATRK** - To assign the Attendant Console: LENS = MG, and UNIT. The Line Group is always 20 and the Level is either 0 or 1. Assign as Route 901. Also assign a Service Feature Restriction Class (SFC 0) and a Route Restriction Class (RSC 0) to the Attendant Console.

STEP 3: **ASAT** - Assign a specific Attendant Number to the Attendant Console. See INDIVIDUAL ATTENDANT ACCESS [I-6].

STEP 4: **AMAT** - Assign one of the Attendant Consoles to serve as the Primary Attendant Console. This service is assigned on a Tenant basis. The Attendant Number will correspond to the Trunk Number of that specific Console.

STEP 5: **MBTK** - Make Idle the Attendant Console Trunk.

STEP 6: **ATNR** - Allow Tenant-to-Tenant Connection for Inter- and Intra-Tenant basis. Assign Tenant Restriction Index (TRI) 1 for Station-to-Station Calling; TRI 1 for Call Forwarding, TRI 3 for Call Forwarding set by the Attendant Console; TRI 4 for Incoming Calls to the Attendant Console.

STEP 7: **ASFC** - Allow SFC 0 to all needed features.

STEP 8: **ARSC** - Allow RSC 0 access to all routes via RRI 0, 1, 2 and 3.

M-7 Music On Hold

General Description

This feature allows a party to hear music while in the CALL HOLD [C-6], CALL TRANSFER [C-10, 11], or ATTENDANT CAMP-ON WITH TONE INDICATION [A-1] conditions. Two types of MUSIC-ON-HOLD (MOH) exists; internal MOH and external MOH.

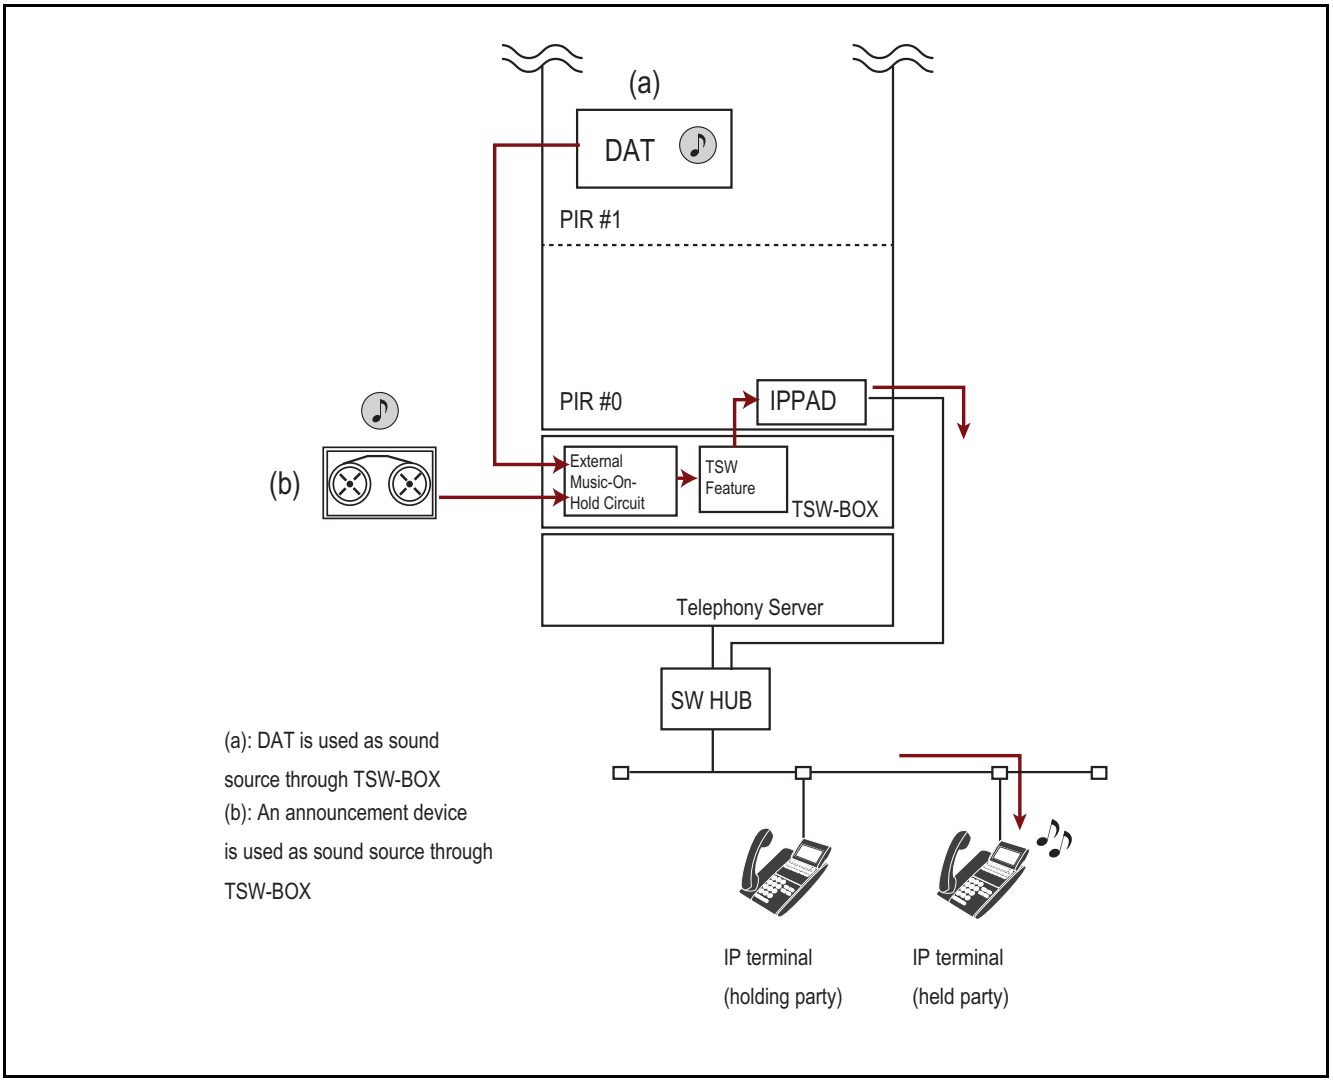
Operating Procedure

No manual operation is required for this software controlled feature.

Service Conditions

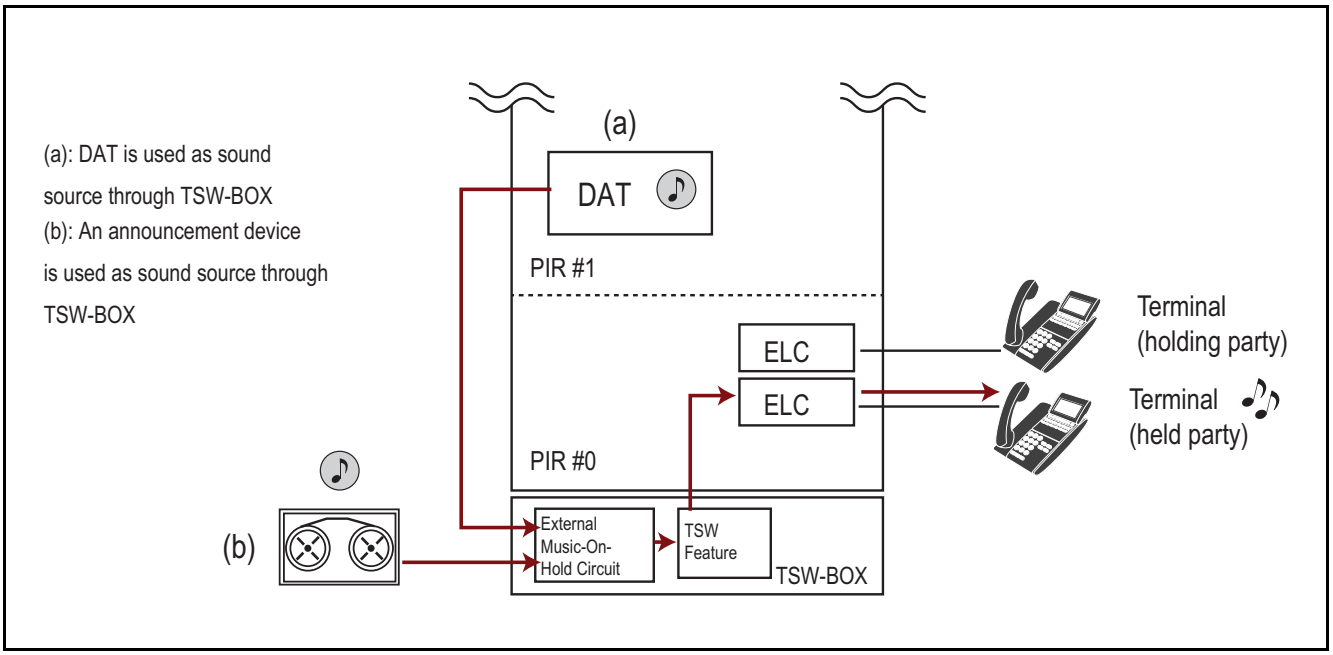
<Internal MUSIC-ON-HOLD Conditions>

1. The system is capable of supplying two switch-selectable music channels. Music is generated by 3 synthesizers included in the package.
2. If another music source (tuner, tape-deck, etc.) is desired, it must be customer provided.
3. The Held Call condition can be the result of:



ATTENDANT CAMP-ON WITH TONE INDICATION	[A-1]
CALL HOLD	[C-10]
CONSULTATION HOLD - ALL CALLS	[C-17]
SPLITTING	[S-4]
Attendant Hold	

4. Only one music source at a time, either customer-provided or internal, can be provided per system (system option).
5. ATTENDANT CONSOLE [A-3]: Attendant operations resulting in music to be provided to the Calling Party include the following:
   a.) The Calling Party or the remaining party (not talking with the Attendant) hears music, if the Attendant splits a call prior to completion or after answering an Attendant Recall.
   b.) When Incoming Calls to the Attendant are answered and the Attendant presses the HOLD key, the Held Party hears music.
   c.) When the Attendant camps on a call to a busy Station, the Calling Party is connected to music until the Called Party answers or the Attendant reenters the Switched Loop.
6. When a Station user in a two-party talking Connection switch hook flashes, the Second Party is placed on hold and is connected to music.
7. When activating this feature via the FCCS Network, when either the internal or the external source is used, it is recommended to set the source as the same MOH at each Node for the Node-to-Node Connection, since the Node that controls MOH varies depending on the connection pattern.
8. MG(BRI) cannot use external MOH. To use external MOH with MG(BRI), see EXTERNAL IP MUSIC-ON-HOLD in VS32 Conference Server [V-26].
9. To allow a SIP Handler Controlled SIP terminal to hear Internal Source MOH, enable MUSIC for IP-DTG Tone Send Control Bit through the AUACL/AUACN command.



<External MUSIC-ON-HOLD Conditions>

1. By using DAT card or BGM equipment, External MOH source is transmitted from the MUSIC connector (DSUB) to EMA card.
2. External MOH source is connected to DAT card or BGM equipment with the following cable:
   1-IMG: D15 ST-F CA-B (connecting to MUSIC connector on EMA card)
   4-IMG: D15 ST-F CA-B (connecting to MUSIC connector on backboard of PLO card)
3. IPPAD circuit card is required for IP terminals receiving External MOH. If IPPAD is not installed in the system or the card is in link block state such as out of the assigned port number, the IP terminal receives internal MOH.
4. Whenever using external MOH with IP terminal, the port on IPPAD circuit card is hunted for the Connection.
5. External MOH for IP terminal cannot be provided when PHC (Internal PHC) is used.
6. As for External Music source, the electrical resistance for output must be 8 ohm to connect the system. 8 ohm of the music source is a typical one in the input/output.

When Providing External MOH for IP Terminals

When Providing External MOH for Digital Terminals

<Conditions Specific to UMGi/RNIP System>

1. When using UMGi/RNIP System, this feature is available only for stations and trunks in the node connected to External MOH source such as DAT or Announcement Equipment.
2. When this feature is activated at IP Station (IP Enabled Dterm, DtermIP or Analog MC) via IPPAD circuit card, External MOH source must be connected to the node that accommodates the IPPAD.
3. (For 16-IMG System) When using 16-IMG System, this feature is available only for Stations and Trunks in the LMG connected to External MOH source such as DAT or Announcement Equipment.
4. (For 16-IMG System) When this feature is activated at IP Station (IP Enabled Dterm, DtermIP or Analog MC) via IPPAD Circuit Card, External MOH source must be connected to the LMG that accommodates the IPPAD.

Interactions

1. Two types of MUSIC ON HOLD (MOH) exist. Internal Source MOH and External Source MOH.

Programming

<Internal Source MOH>

ASYD - SYS1, Index 64, Bit 7, Is MUSIC-ON-HOLD in service? 0/1: No/Yes.

<External Source MOH (DAT)>

STEP 1: **ASYD** - SYS1, Index 64, Bit 7, Is MUSIC-ON-HOLD in service? 0/1: No/Yes.
STEP 2: **ASYDL** - SYS1, Index 810, Bit 2, IP terminals use External MUSIC-ON-HOLD? 0/1: No/Yes.
STEP 3: **ARTD** - Assign the Route Data of DAT card.
OSGS (CDN 1) = 2
ONSG (CDN 2) = 2
TF (CDN 5) = 3
TCL (CDN 6) = 4
L/T (CDN 7) = 1

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as circuit card, MG, or VS32.

STEP 4: **ATRK** - Assign the Trunk data of the DAT card.
STEP 5: **MBTK** - Cancel the make-busy of the DAT card.

M-11 Meet-Me Paging - Attendant

General Description

This feature allows an Attendant to hold an Incoming Call, page the Called Party, and connect the two after the Called Party has answered the page.

Operating Procedure

PROCEDURE 1:

To page

1. Place the Incoming Call on hold by pressing the HOLD key.
2. The Attendant seizes an Idle Loop.
3. The Attendant dials the Paging Access Code. Receives continuous Ringback Tone for one second.
4. The Attendant pages the desired Party.
5. The Attendant presses the RELEASE key.

To answer

1. The paged party dials the PAGE Answer Code. Receives Ringback Tone.
2. Ringing is heard at Console. After the call is answered (on Loop), the Attendant and paged party converse.
3. The Attendant presses the Loop of the held Outside Call.
4. The Attendant presses the RELEASE key to connect both parties.

PROCEDURE 2:

To page

1. The Attendant answers Incoming Call.
2. The Attendant dials the Paging Access Code. Receives one second of Ringback Tone.
3. The Attendant pages the desired party.
4. The Attendant presses the RELEASE key.

To answer

1. Paged party dials the PAGE Answer Code and is directly connected to the holding party.

   OR

2. Paged party dials the PAGE Answer Code and the Individual Attendant Number and receives Ringback Tone. The Attendant and the paged party converse. The Attendant presses the Loop key of the held Outside Call. The Attendant presses RELEASE key to connect both parties.

Service Conditions

1. If operating Procedure 2 is used, a maximum of six routes can be provided with Paging Trunks.
2. If Procedure 1 is used, the limitation of routes is based on the number of COT cards equipped.
3. Paging equipment is customer provided.
4. One Paging Trunk (COT) will be assigned to each route.
5. UG50 can be used as interface of Paging Trunk by using a PGT card (available for UG50 software version 2.00 or later). However, a COT card installed in UG50 cannot be used as an interface to the Paging Trunk. For details, see Peripheral Equipment Description (UG50).
6. If Procedure 2 is used, only one Held Call Waiting for a paged party can be held at a time at the Console.
7. Paging access and answer codes are assigned to correspond with each route.
8. The maximum number of digits that can be used as a PAGE Access and/or Answer Code is 3.

9. The type of Paging service provided on a system basis is programmed via the PCPro into the System database.
10. A Page waiting to be answered is automatically canceled after a predetermined programmed duration. See VARIABLE TIMING PARAMETERS [V-1] for selectable timing choices.
11. Loop signaling is the recommended signaling type.
    a.) Both MEET-ME PAGING and PAGING ACCESS [P-1] (loudspeaker - basic) can be provided in the same system.
    b.) A separate Access Code for MEET-ME PAGING and PAGING ACCESS [P-1] is required for the same Paging Zone.
    c.) A Paging Answer Code is required for each MEET-ME PAGING zone.
    d.) The maximum number of answer back ports is limited to the number of paging zones (20 max.). These answerback ports are used for RADIO PAGING [R-16] service also.
    e.) ALL ZONE PAGING [A-53] cannot be used with MEET-ME PAGING.
    f.) Paging over the loudspeaker system is limited to paging from a Station or an ATTENDANT CONSOLE [A-3]. Callers on Outside Central Office Trunks must make arrangements with an Attendant or a Station user to have paging performed.
    g.) Direct access (key) to paging from the ATTENDANT CONSOLE [A-3] is not available.
    h.) The Attendant cannot dial the paging answer codes.
12. CALL TRANSFER - ALL CALLS [C-11]: A user can flash and place a Second Party on hold, hear Special Dial Tone, and dial the Paging Access Code. The Paging Transfer (and use of loudspeaker paging system with a party on hold) is allowed, unless denied by the Class of Service of the Station user's Line.
13. Central Office Trunks are used as Interface Circuits to the Paging equipment.
14. BUSY VERIFICATION [B-3]: Busy Verification is denied on a Station Line that is connected to paging equipment. Attempts to busy-verify a Station Line will result in the Attendant hearing Reorder Tone.
15. ATTENDANT-CONTROLLED CONFERENCE [A-2]: When a Conference Call is established, an Attendant cannot connect the Conference Connection to paging loudspeakers.
16. CALL WAITING [C-12, 31]: A call is not allowed to wait on a Line that has accessed loudspeaker paging (making a page). The user hears Reorder Tone.
17. EXECUTIVE RIGHT-OF-WAY [E-1] is denied to a Station Line connected to loudspeaker paging. The user receives Reorder Tone.
18. ATTENDANT CAMP-ON [A-1] is not allowed on a line that has accessed loudspeaker paging. The Station user receives Reorder Tone.
19. THREE-WAY CALLING [T-2] is not allowed after the paged party has been connected to the originating Station.
20. Delayed or non-Delayed operation are the two methods for answer back, either can be selected.
    a.) Delayed Operation: The paging party goes on-hook to wait for the paged party to answer back.
    b.) Non Delayed Operation: The paging party remains off-hook to wait for the paged party to answer back.
21. The Paging Trunk remains in a busy state, while the paging party remains unanswered (the Paging Answer Code has not been dialed). The paging answer back state will be canceled after a programmable time-out period, if the Answer Code is not dialed within the prescribed interval, releasing the Paging Trunk and the paging party as well, if still in the off-hook mode.
22. Procedure 1 must have ASYD, SYS1, Index 73, Bit 7=1.

Interactions

1. MEET-ME PAGING and PAGING ACCESS [P-1] can be provided simultaneously in the same system.

ARTD, CDN 6:TCL must be assigned as data "8" for MEET-ME PAGE, while PAGING ACCESS routes may be assigned as data "11", General Page, or as data "1", DDD. Separate Access Codes for each feature is required. MEET-ME PAGING answer and Cancel Codes are required for each MEET-ME PAGING zone.

2. MEET-ME PAGING is limited to Stations and Attendant Consoles. Central Office Trunks, TIE LINE ACCESS [T-6] or REMOTE ACCESS TO SYSTEM [R-2] Calls must have the Attendant or Station user perform the Paging operation.
3. The Attendant Console cannot dial the MEET-ME PAGING answer codes.
4. BUSY VERIFICATION [B-3] and EXECUTIVE RIGHT OF WAY [E-1]: These features will be denied for a Connection, including the Paging route.
5. DELAY OPERATION: The Attendant Console is connected to party B.
   a.) The Attendant dials the MEET-ME PAGE Route Access Code. When connected to the Page Trunk, the Attendant requests Station C to dial the MEET-ME PAGE Answer Code. The Attendant presses the RELEASE key. When Station C dials the Answer Code, Party B is connected to Station C.
   OR
   b.) The Attendant presses the HOLD key, then seizes an Idle Loop and dials the MEET-ME PAGE Route Access Code. After the paging, the Attendant presses the RELEASE key. When Station C dials the Answer Code, Station C terminates to an Idle Loop key on the Attendant Console. The Attendant answers and places this call on hold, then sequentially presses the two held Loop keys. This connects the Attendant to the party connected to the first pressed Loop key. The Attendant can either press the TALK key, creating a THREE-WAY CALLING [T-2] Connection, or press the RELEASE key, allowing Party B and Station C to be connected. If Station C does not call the MEET-ME PAGE Answer Code within 30 seconds, Party B rings back to the Attendant Console. Normal operating indications are applied.
6. Stations and Attendant Consoles allowed Priority Page, SFI = 57 (Priority Paging), will barge into the Paging route, except when the Attendant Console is paging. An Access Code to Priority Page must be assigned in ASPA, SRV = "SSC: Service Code", SID 40, and assigned for a Connection Index of "N: Normal".
7. To answer the MEET-ME PAGE while connected to another party, CALL HOLD [C-6] must be used. THREE-WAY CALLING [T-2] is not allowed.

Programming

STEP 1: **ASYD** - SYS1, Index 73, Bit 0 and Bit 1.

For MEET-ME PAGE, assign non-Delay service, Bit 0=1, Bit 1=0.

For MEET-ME PAGE, assign Delay service, Bit 0=0, Bit 1=1.

For MEET-ME PAGE, assign Delay service with CALL TRANSFER, Bit 0=1, Bit 1=1. See PAGING TRANSFER [P-10].

Note: ASYD, SYS1, Index 73, Bit 0 and Bit 1 apply to MEET-ME PAGING Station.

SYS1, Index 73, Bit 3. Are PAGE Cancel Codes provided for each route? 0/1: Per route/Common to all routes.

SYS1, Index 73, Bit 7. Attendant Console operation, 0/1: Connect two parties directly when paged party dials PAGE Answer Code/Paged Party terminates on an idle Attendant Console Loop key, then the Attendant presses both Loop keys to connect the two parties.

After the call is answered (on Loop), the Attendant and Paged Party talk. The Attendant presses the

Loop key of the Held Party, then the Attendant presses RELEASE to connect both parties.

SYS1, Index 74, Bit 0 to Bit 3. Assign the cancel timer for unanswered page. Assign data 00H for 30 seconds.

(0-F + 1) x 30 = Cancel Timer.

STEP 2: **ARTD** - Assign the Paging route as shown below:

RT: 1

1-OSGS	:2	2-ONSG	:3	5-TF	:1	6-TCL	:8	7-L/T	:1
8-RLP	:2	15-LSG	:0/1						

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as circuit card, MG, or VS32.

STEP 3: **ATRK** - Assign the LENS, Paging Trunk Route Number, Trunk Number, and Tenant Number.

STEP 4: **MBTK** - Assign the Make Idle status to the Paging Trunks.

STEP 5: **ANPD** - Reserve Levels for Trunk Access and for PAGE answer and Cancel Codes. Select the Trunk Access Level Connection Indexes, CI = N, H; Normal Service (N) or Hooking Service (H). Number of Necessary Digits is usually one or 2. Busy Lamp Field is not activated. If the PAGE answer and Cancel Codes reside in a Level reserved for features, then assign according to a predetermined Numbering Plan. If the PAGE answer and Cancel Codes reside in a separate Level, then select a Connection Index (CI) of Normal Service (N) only. The Number of Necessary Digits is usually two, and the Busy Lamp Field is OFF.

STEP 6: **ASPA** - For the Page Trunk Access Code, assign the Access Code in the Level as assigned in ANPD above. Type of Service, SRV = "OGC: Outgoing Call" for Outgoing Trunks, Assign for Connection Indexes (CI) of "N: Normal" and "H: Hooking". For the Page Route answer and Cancel Codes, assign the Access Code in the Level assigned in ANPD. Type of Service, SRV = "PAGA: Paging Answer" and SRV = "PAGC: Paging Cancel". Assign the proper Route Number that is associated with this Code. Assign a Connection Index of "N: Normal".

STEP 7: **ARSC** - Allow access to the paging route to the RSC of the Attendant Console in Route Restriction Indexes (RRI) 2 and 3. To the RSC of the responding Station, allow access to the Incoming Trunk in RRI 0 and 1.

STEP 8: **ASFC** - Assign a Service Feature Restriction Class (SFC) that allows SFI 38 (Meet-Me Paging), MEET-ME PAGE to the Stations that will answer a MEET-ME PAGE.

STEP 9: **ARRC** - Allow Trunk-to-Trunk Connection between the Paging route and the Incoming/Outgoing Route. Assign for ARI-A-RES, via the Attendant Console. The Incoming/Outgoing Route would be the party being held at a Station or Attendant Console wishing to speak to the party for whom the MEET-ME PAGE is intended.

M-15 Maintenance Printout

General Description

The Telephony Server can provide a hard copy of real-time System Message via the System Printer.

Operating Procedure

Refer to the System Operations and Maintenance Manual.

Service Conditions

1. System Message printout: The system message will be printed automatically, and/or when the command is executed.

Interactions

1. The MAINTENANCE PRINTOUT as described will be assigned to Port 1.
2. For Automatic MAINTENANCE PRINTOUT via the PCPro, assign the PCPro port in System Data 1, Index 116 as data 42H. Assign the destination of System Messages in Index 39 as Port 0. Index 86, Bits 4 and 7 assigned as data "1".
3. Indexes 116 - 123, which were used for IOC port attribute data assignment, are assigned in the AIOC command.

Programming

STEP 1: **ASYD** - System Data 1, Index 38, Bits 0-7. Each Bit represents a corresponding I/O port. Designate by programming which port will accommodate a printer. Port 0, Bit 0 is always an PCPro.

System Data 1, Index 39, Bits 1-7. Each Bit represents a corresponding I/O port. Designate the destination of System Messages by programming which port will receive the Maintenance Printout. Port 0, Bit 0 is always a PCPro.

System Data 1, Index 86, Bit 4. Fault Information automatic printout of System Messages? 0/1: No/Yes.

System Data 1, Index 86, Bit 7. Are simplified or detailed System Messages required? 0/1: Simplified/Detailed.

System Data 1, Index 117-123. Each Index represents an I/O port. Program the following Bits:

0, 1, and 2.

001: Printer*

010: PCPro

Bit 7: Password Function 0/1:-/In Service.

STEP 2: **AIOC** - Assign SYMSCAN (System Message Scan Service) as "In Service" for all ports requiring Automatic System Message Printout. (Assign the data for IOC Port Number 0 when using LAN connection.)

Note: For a System Message Printer, assign these Bits only.

M-16 MFC - Incoming Call

General Description

This service feature allows an MFC incoming call from an MFC trunk to be terminated to a station or an Attendant.

Note: This feature is not available in North America and Australia.

Operating Procedure

No manual operation is required.

Service Conditions

1. This service feature supports the following types of MFC signaling system:
   a.) CCITT-R2 (NEC Standard) Type
   b.) Australia Type
   c.) Thailand Type
   d.) Venezuela Type
   e.) Korea Type
   f.) Singapore/Malaysia Type
   g.) Argentina/Philippines Type
   h.) Brazil Type (digital/analog)
   i.) Chile Type
   j.) Columbia Type
   k.) Mexico Type
   l.) Indonesia Type
   m.) India Type

2. DID incoming calls from MFC trunks can terminate to a station (DTMF, DP and Dterm) or an Attendant.
3. When calling the Attendant Console from MFC trunks, LISTED DIRECTORY NUMBER (LDN) [L-24] is dialed.
4. In case of TRUNK ANSWER FROM ANY STATION (TAS) [T-8] connection, if the called party is not restricted to TAS connection even if it is not registered in TAS, the backward signal “Called Party Idle” will be transmitted to the calling party.

5. When the called party is idle, the incoming call terminates as follows, according to the Group-II signals;
   For CCITT-R2, Korea, Australia, Thailand and Singapore Type

MFC SIGNAL TYPE	GROUP-2 SIGNAL	ROUTE DATA	SYSTEM OPERATION
CCITT-R2 (NEC Standard) Korea	Not Received	0C=0	G-A=6 is transmitted.
	Received	0C=1	G-B=6 transmitted. Call is terminated to the dialed station.

MFC SIGNAL TYPE	GROUP-2 SIGNAL	ROUTE DATA	SYSTEM OPERATION
Australia	1 (Operator) 8 (Overseas Operator)	TR=0	Call is terminated to the Attendant Console.
		TR=1	Call is terminated to the dialed station. **Note 1**
	Except 1 and 8	TR=0 or 1	
Thailand	1 (Toll Operator) 8 (International Operator) 9 (Data Terminal) 10 (Immediate Charge Info)	TR=0	Call is terminated to the Attendant Console.
		TR=1	Call is terminated to the dialed station. **Note 1**
	Except 1,8, 9 and 10	TR=0 or 1	
Singapore	1 (Toll Operator) 7 (Line Test Desk) 8 (International Operator) 9 (Call from Transit Exchange)	TR=0	Call is terminated to the Attendant Console.
		TR=1	Call is terminated to the dialed station. **Note 1**
	Except 1, 7, 8 and 9	TR=0 or 1	

Note 1: When the dialed station is in a STATION HUNTING [S-7, S-8, S-9] group or has set CALL FORWARDING [C-2, C-3, C-5, C-28, C-60, C-74], the incoming call follows the operations specified in each feature.

For Argentina, Chile, Columbia, Mexico, Venezuela, and India Type

When the called party is idle, the incoming call terminates to the dialed party, regardless of the Group-II signals. However, in case the dialed station belongs to a hunting group or has set Call Forwarding, the call follows the operation of each service.

For Brazil Type only

When the called party is idle and the Group-II signal is 1, 2, 4, or 6, the incoming call terminates to the dialed party. However, in case the dialed station belongs to a hunting group or has set Call Forwarding, the call follows the operation of each service. If the Group-II signal is 3, 5, 7, 8, 9, or 10, the call terminates to the Attendant Console in day mode, and to the night station in night mode, regardless of the dialed number.

For Venezuela Type only

When the Group-B signal is 1 (“Subscriber’s line free - change call party release”), the call is released when the calling party releases.

6. The Group-B signals to be sent out according to the called party’s status are as follows:

MFC SIGNAL TYPE / STATUS	CCITT-R2	AUST-RALIA	THAI-LAND	VENE-ZULEA	KOREA	SINGA-PORE/ Malaysia	ARGEN-TINA	CHILE	COLUM-BIA	MEXICO	INDO-NESIA	BRAZIL	INDIA
Idle (Charge)	6	1	1	6	6	1	6	6	6	1	1	1	6

MFC SIGNAL TYPE / STATUS	CCITT-R2	AUST-RALIA	THAI-LAND	VENE-ZULEA	KOREA	SINGA-PORE/ Malaysia	ARGEN-TINA	CHILE	COLUM-BIA	MEXICO	INDO-NESIA	BRAZIL	INDIA
Idle (Charge)-Change Calling Party Release	6	6	1	1	1	1	6	6	6	1	1	6	6
Idle (No Charge)	7	5	5	7	7	1	7	7	7	5	5	5	7
Busy	3	2	2	3	3	2	3	3	3	2	2	2	3
Dead Number/Dead Level	5	2	4	5	5	7	5	5	5	4	7	7	5
Congestion	4	2	4	4	4	4	4	4	4	4	4	4	4
Restriction	8	2	4	8	8	4	8	8	8	4	4	4	4
Lockout/Make Busy	8	2	4	8	8	4	8	8	8	4	8	4	4
LDN (Attendant)	6	1	1	6	6	1	6	6	6	1	1	1	6
Intercept to Attendant (called party restriction)	6	1	1	6	6	1	6	6	6	1	1	1	6
CALL FORWARDING-ALL CALLS [C-5] (to Attendant)	6	1	1	6	6	1	6	6	6	1	1	1	6
CALL FORWARDING-BUSY LINE [C-2] (to Attendant)	6	1	1	6	6	1	6	6	6	1	1	1	6
CALL FORWARDING-ALL CALLS-OUTSIDE [C-28]	6	1	1	6	6	1	6	6	6	1	1	1	6
Night Station	6	1	1	6	6	1	6	6	6	1	1	1	6
TAS Connection	6	1	1	6	6	1	6	6	6	1	1	1	6
Tandem Connection	6	1	1	6	6	1	6	6	6	1	–	1	6

7. Following service features are available for the incoming call from an MFC Trunk:
   - CALL FORWARDING-ALL CALLS [C-5]
   - CALL FORWARDING-BUSY LINE [C-2]
   - CALL FORWARDING-DON'T ANSWER [C-3]
   - CALL FORWARDING-INTERCEPT/ANNOUNCEMENT [C-25] (to a station/Attendant Console)
   - CALL FORWARDING-ALL CALLS-OUTSIDE (except for MFC to MFC) [C-28]
   - CALL FORWARDING-BUSY LINE-OUTSIDE (except for MFC to MFC) [C-60]
   - CALL PICKUP [C-7, 30]
   - CALL QUEUING [C-9]
   - CALL WAITING - TERMINATING [C-12]
   - DISTINCTIVE RINGING [D-10]
   - IMMEDIATE RINGING [I-1]
   - INCOMING CALL IDENTIFICATION [I-2]
   - LDN-NIGHT CONNECTION [L-28]
   - Multi Numbering
   - NIGHT CONNECTION [N-1, 2]
   - PEG COUNT [P-7]
   - REMOTE ACCESS TO SYSTEM [R-2]
   - STATION HUNTING-CIRCULAR [S-7]
   - STATION HUNTING-TERMINAL [S-9]

- STATION HUNTING-SECRETARIAL [S-8]
- TRUNK ANSWER FROM ANY STATION (TAS) [T-8]
- TENANT SERVICE [T-12]
- UNIFORM CALL DISTRIBUTION (UCD) [U-1]
- UNIFORM NUMBERING PLAN [U-4]

8. Optional hardware (MFC Register) is required for this service feature.
9. Incoming calls from the MFC trunks can terminate to the ACD pilot station. The call is handled in the same manner as the ACD incoming call from C.O. line/tie line.
10. When the MFC trunk call terminates to the ACD pilot station, the call can be transferred to the MFC trunk only via the transfer operation of the ACD position Attendant. (The call cannot be transferred to the MFC trunk by CCV programming.)
11. Malaysia Type only
    The services in Malaysia are based on the MFC signaling system in Singapore. When the system receives GII-7 signal from the MFC public exchange, the MFC DID incoming call terminates to the station designated by the GI Signal.

12. For Brazil Type only
    When the DID incoming call from the MFC trunk encounters called station busy, restricted, in make busy state, etc., the call can be transferred to the Attendant Console (when the system is in day mode) or the Night Transfer Station (night mode) in the same tenant as the called station, according to the data assignment. See the table for details.

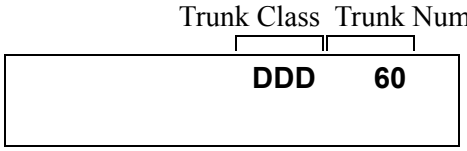
Called Station Status / ARTD Command	Not Activate Call Transfer to Attendant Console/Night Station		Activate Call Transfer to Attendant Console/Night Station	
	TR=0	TR=1	TR=0	TR=1
Idle (No answer)	System sends B1 signal. CALL FORWARDING-DON'T ANSWER [C-3] to the Attendant Console or the Night Station in the same tenant as the incoming trunk.	System sends B1 signal. Continuous ringing	System sends B1 signal. CALL FORWARDING-DON'T ANSWER [C-3] to the Attendant Console or the Night Station in the same tenant as the called station.	System sends B1 signal. Continuous ringing
Busy	System sends B1 signal. CALL FORWARDING-BUSY LINE [C-2] to the Attendant Console or the Night Station in the same tenant as the incoming trunk.	System sends B2 signal. Caller receives Busy Tone.	System sends B1 signal. CALL FORWARDING-BUSY LINE [C-2] to the Attendant Console or the Night Station in the same tenant as the called station.	System sends B2 signal. Caller receives Busy Tone.

Called Station Status / ARTD Command	Not Activate Call Transfer to Attendant Console/Night Station		Activate Call Transfer to Attendant Console/Night Station	
	TR=0	TR=1	TR=0	TR=1
Restricted from connection/In make busy state	System sends B1 signal. CALL FORWARDING INTERCEPT/ ANNOUNCEMENT [C-75] to the Attendant Console or the Night Station in the same tenant as the incoming trunk.	System sends B4 signal. Caller receives Reorder Tone.	System sends B1 signal. CALL FORWARDING INTERCEPT/ ANNOUNCEMENT [C-75] to the Attendant Console or the Night Station in the same tenant as the called station.	System sends B4 signal. Caller receives Reorder Tone.
Unallocated number (station not assigned)	System sends B1 signal. CALL FORWARDING INTERCEPT/ ANNOUNCEMENT [C-75] to the Attendant Console or the Night Station in the same tenant as the incoming trunk.	System sends B4 signal. Caller receives Reorder Tone.	System sends B1 signal. CALL FORWARDING INTERCEPT/ ANNOUNCEMENT [C-75] to the Attendant Console or the Night Station in the same tenant as the called station.	System sends B7 signal. Caller receives Reorder Tone.

Called Station Status / ARTD Command	Not Activate Call Transfer to Attendant Console/Night Station		Activate Call Transfer to Attendant Console/Night Station	
	TR=0	TR=1	TR=0	TR=1
Unallocated number (station not assigned)	System sends B4 signal. Caller receives Reorder Tone.	System sends B4 signal. Caller receives Reorder Tone.	System sends B1 signal. CALL FORWARDING INTERCEPT/ ANNOUNCEMENT [C-75] to the Attendant Console or the Night Station in the same tenant as the called station.	System sends B7 signal. Caller receives Reorder Tone.
Night Station busy	System sends B2 signal. Caller receives Busy Tone.	System sends B2 signal. Caller receives Busy Tone.	System sends B1 signal. The call is placed in a queue until the Night Station becomes idle.	Return to the status before Call Forwarding was activated. Caller receives Busy Tone.

Called Station Status / ARTD Command	Not Activate Call Transfer to Attendant Console/Night Station		Activate Call Transfer to Attendant Console/Night Station	
	TR=0	TR=1	TR=0	TR=1
GII-3, 5, 7~10 signal received	System sends B1 signal. CALL FORWARDING INTERCEPT/ ANNOUNCEMENT [C-75] to the Attendant Console or the Night Station in the same tenant as the incoming trunk.	Ring the station after sending B1 signal, irrespective of the G-II signal received.	System sends B1 signal. CALL FORWARDING INTERCEPT/ ANNOUNCEMENT [C-75] to the Attendant Console or the Night Station in the same tenant as the called station.	Ring the station after sending B1 signal, irrespective of the G-II signal received.

This service has priority over the following Night Transfer services, in the following order.



a.) NIGHT CONNECTION-FLEXIBLE [N-2]
b.) LDN NIGHT CONNECTION [L-28]
c.) NIGHT CONNECTION OUTSIDE-SYSTEM [N-17]
d.) TRUNK ANSWER FROM ANY STATION (TAS) [T-8]
e.) BUSY TONE CONNECTION

13. For all the Types except for Singapore/Malaysia Type.
When an MFC incoming call terminates to an OAI terminal (Dterm), the ANI (Automatic Number Identification) information received from the opposite office is sent to the OAI computer via Interface Processor by SMFN facility.
    a.) The ANI information is output when an MFC incoming call is terminated to the OAI terminal, and when the terminal user answers the call.
    b.) The calling number (max. 24 digits) is output as the ANI information.
    c.) When the ANI information is not requested, space (blank) is output to the ANI information area in the SMFN facility format.

14. For all the Types except for Singapore/Malaysia Type.
When an MFC DID incoming call terminates to the Attendant or a UCD station, the ANI (Automatic Number Identification) information received from the opposite office is output to MCI (Message Center Interface). The ANI information consists of category (1 digit) and the calling number (max. 31 digits). When the ANI information is not received, space (blank) is output to the ANI information area.

15. For all the Types except for Singapore/Malaysia Type.
When an MFC DID incoming call is terminated, the system can request the ANI (Automatic Number Identification) information. The ANI information consists of category (1 digit) and the calling number (max. 31 digits). The received ANI number is displayed on the Dterm LCD and output to the SMDR message.
    a.) Display on the Dterm LCD
    -Only the calling number is displayed.

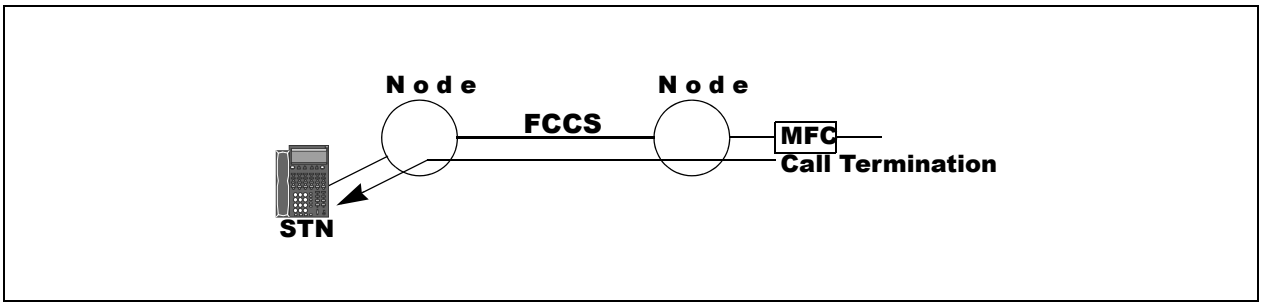
    -When the ANI information is not received, trunk class and number are displayed instead.

In case of the Dterm with 2 or 3-line LCD, the information is displayed on the upper line.

b.) SMDR message
- Both category (1 digit) and the calling number (31 digits) are output.
- When the ANI Information is not received, no data is output to the ANI information area.

c.) NAME DISPLAY-SYSTEM-CCIS [N-37] is not available.

16. For India Type only
Trunk release may be either "Calling party Release" or "First Party Release", according to the route data of the incoming route.



17. For India Type only
The ANI (Automatic Number Identification) information may be requested as follows:
a.) The ANI information is requested on a route basis.
Maximum 30 digits can be requested.

18. For Brazil Type only
When a collect call terminates to a station which is restricted from receiving the collect calls via MFC trunk, the signals notifying the restriction are sent to the office. There are two ways in activating this service, depending on the System Data, as follows:
a.) The backward signal "collect call blocking" is returned to the office.
b.) The signal "collect call blocking" is returned when the called station user answers the call. Reorder Tone is sent to the user.

For more details, refer to the System Data Design Manual.

19. "*" and "#" are available for the Group I (G-I) signal.

FCCS Conditions

a.) Both MFC Receiver and MFC Sender must be accommodated in each node.
b.) When a call is terminated from an MFC trunk in Node B to a station in Node A, MFC Receiver accommodated in Node B is used.
c.) When an MFC incoming call is terminated from an MFC trunk in Node B to a station in Node A, if the connection trunk cannot be used, the backward signal "Congestion" is sent.
d.) Be sure to assign the same data of MFC signaling system for each node.

1. Even if the Tenant service is provided between nodes in the FCCS network, an MFC DID call to an Attendant Console cannot be routed to the Attendant Console in the different node from the terminating trunk.
2. The ANI information is comprised as follows.
   For Indonesia Type only
   a.) When the assigned telephone number is 7 digits or less:
   ANI = Office Code + Telephone Number
   b.) When the assigned telephone number is 8 digits or more/not assigned.
   ANI = Office Code + Physical Station Number

   For the other countries
   a.) When MFC DOD call is originated from an Attendant Console:
   ANI = Office Code + LDN (Listed Directory Number)
   b.) When a call from an ACIS line is routed to an MFC trunk via tandem connection:
   ANI = Office Code of Tandem Office + LDN of Tandem Office
   c.) When a call from an CCIS line is routed to an MFC trunk via tandem connection:
   ANI = Office Code of Originating Office + Telephone Number/Individual ATT Number of Originating Office
   d.) When the system data to send LDN is assigned:
   ANI = Office Code + LDN
   e.) When the system data to send Physical Station Number is assigned:
   - When the assigned telephone number is 7 digits or less:
   ANI = Office Code + Telephone Number
   - When the assigned telephone number is 8 digits or more/not assigned:
   ANI = Office Code + Physical Station Number

NEC Standard (CCITT R-2) Type

Signal	Forward signal		Backward signal	
	G-I	G-II	G-A	G-B
1	Digit “1”	subscriber without priority	send next digit (n+1)	
2	Digit “2”	subscriber with priority	send last but one digit (n-1)	~~send special information tone~~
3	Digit “3”	maintenance equipment	address complete change-over to reception of G-II	subscriber’s line busy
4	Digit “4”		congestion in the national network	congestion, encountered after changeover from G-A to G-B
5	Digit “5”	operator	calling party category	unallocated number
6	Digit “6”	data transmission	address complete change set up speech condition	subscriber’s line free (charge)
7	Digit “7”	subscriber or operator without forward transfer facility	send last but two digits (n-2)	subscriber’s line free (no charge)
8	Digit “8”	data transmission	send last but three digits (n-3)	subscriber’s line out of order
9	Digit “9”	subscriber with priority		
10	Digit “0”	operator with forward transfer facility		
11	Digit “*”			
12	Digit “#”			
13 15				

abcd Signals transmitted and received

abcd Signals received

~~abcd~~ Signals not handled

Australia (Telecom) Type

Signal	Forward signal		Backward signal	
	G-I	G-II	G-A	G-B
1	Digit “1”	operator	send next digit (n+1)	called party idle
2	Digit “2”	subscriber or coin telephone	send first digit	called party busy
3	Digit “3”	test position	address complete change-over to reception of G-B	~~no line out before answer~~
4	Digit “4”	interception center or remote operation center	~~start DP 1st digit~~	~~congestion~~
5	Digit “5”	coin telephone	~~start DP 2nd digit~~	called party idle (no charge)
6	Digit “6”	data telephone	~~start DP 3rd digit~~	called party idle control NO time out before answer
7	Digit “7”	overseas subscriber	~~start DP 4th digit~~	~~called party idle, called party control no charge~~
8	Digit “8”	overseas operators	~~start DP 5th digit~~	~~called party interception~~
9	Digit “9”	subscriber	send calling party access info	~~send calling party access info~~

Programming

<<For MFC Incoming Connection (without Tandem Connection)>>

STEP 1: **ASYD -** System 1, Index 125, Bits 0 through 3. PAD control of the MFC Sender 0dB--14dB.
Bits 4 through 7. MFC Signaling System CCITT MFC-R2, Venezuela, Australia, Singapore, Thailand.
System 3, Index 10, Bits 0 through 3. Reception sensitivity level of the MFC Register - 28dBm-43dBm.

STEP 2: **ARTD -** Assign the following data to the route of the MFC line.
ONSG=0 and INSG=10
Assigns the parameter OC (originating category) depending of the use of the G-A signal of the backward signal.
OC=0: Originating category is not required.
OC=1: Backward signal G-A=3 (originating category request) is sent after receiving necessary selecting signal.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as circuit card, MG, or VS32.

STEP 3: **ATRK -** MFC line - Assigns the LENS data of each trunk.
MFC Register/Sender - Assigns the MFC Register/Sender for Incoming (RT=916) to the LENS of the PA-4MFCA circuit card. LV=0-3 can be assigned.

STEP 4: **ARSC -** Releases the connection restriction on the route of the MFC line and station.

STEP 5: **ASFC -** Assigns the backward signal (G-B) against the forward signal (G-II) for each SFC when the called party is idle.
SFI=59: No Charge
SFI=60: Called Party Release
Release between the Assignment of SFI=59,60 and the Backward Signal.

SPECIFICATION	SFI=59	SFI=60	BACKWARD SIGNAL	REMARKS
CCITT MFC-R2	0	0	G-B=6	
	1	0	G-B=7	
VENEZUELA	0	0	G-B=6	
AUSTRALIA	0	0	G-B=1	
	0	1	G-B=6	
	1	0	G-B=5	
SINGAPORE	0	0	G-B=1	
THAILAND	0	0	G-B=1	

Note: Combination of SFI=59 and 60 which are not in the table in each specification must be assigned.

<<For MFC Outgoing/Incoming Connection or MFC Incoming Connection (with Tandem Connection)>>

STEP 1: **ASYD -** System 1, Index 125, Bits 0 through 3. PAD control of the MFC Sender 0dB--14dB.
Bits 4 through 7. MFC Signaling System CCITT MFC-R2, Venezuela, Australia, Singapore, Thailand.
System 3, Index 10, Bits 0 through 3. Reception sensitivity level of the MFC Register - 28dBm-43dBm.

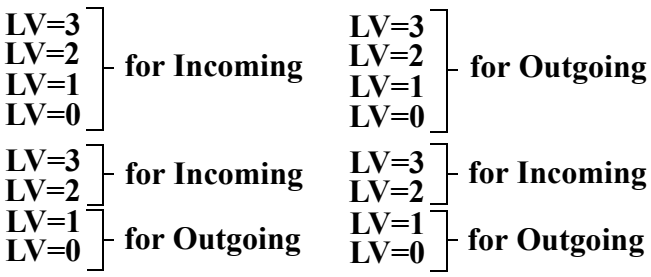
STEP 2: **ANPD -** Assigns the first digit of the MFC line access code.

STEP 3: **ASPA -** Assigns the LCR access code by providing a dummy route.

STEP 4: **AMND -** Assigns the maximum number of necessary digits to the Dial (Area/Office) Code.

STEP 5: **ARNP -** Assigns the access code to the route number. When multiple access code are present by alternative routing, set one of them.
MFC line - Assign the following data, depending on the Trunk type, as shown below.

Trunk Type	ONSG	INSG
OGT	10	0
ICT	0	10
BWT	10	10



Assign the parameter OC (originating category) depending on the use of the G-A signal of the backward signal.
OC=0: Originating category is not required.
OC=1: For terminating office, backward signal G-A=3 (originating category request) is sent after receiving necessary selecting signal. For originating office, forward signal G-II is sent after receiving backward signal G-A=3 (originating category request).

dummy route - Assign 1 at all times for the AC parameter of CDN 13. The route data of the dummy route is TCL=4, AC=1 and L/T=1. For the others, Assigns 0 in all cases.

STEP 6: **ATRK -** MFC line - Assigns the LENS data of each trunk.
MFC - Register/Sender - Assigns the following data to the LENS of the PA-4MFCA circuit card.
Note 2

RT=916: MFC Register/Sender for Incoming
RT=917: MFC Register/Sender for Outgoing

Note 2: As the use of the 4 circuit on the PA-4MFCA circuit card, only the following 4 patterns are available.

STEP 7: **AFRS -** Assigns the number Pattern Code (NPC) and Outgoing route selection pattern (OPR) to the dummy route.

STEP 8: **AOPR -** Assigns the route number including the alternative route to the outgoing route selection pattern (OPR). Assigns the number of skipped digits and pattern number location (PNL) to each route.

STEP 9: **ARSC -** Releases the dummy route and station connection restriction.

Releases the connection restriction on the route of the MFC line and station.

STEP 10: **ASFC -** Assigns the backward signal (G-B) against the forward signal (G-II) for each SFC when the called party is idle.

SFI=59: No Charge

SFI=60: Called Party Release

Relation between the Assignment of SFI=59, 60 and the Backward Signal.

SPECIFICATION	SFI = 59	SFI = 60	BACKWARD SIGNAL	REMARKS
CCITT MFC-R2	0	1	G-B=6	
	1	0	G-B=7	
VENEZUELA	0	0	G-B=6	
AUSTRALIA	0	0	G-B=1	
	0	1	G-B=6	
	1	0	G-B=5	
SINGAPORE	0	0	G-B=1	
THAILAND	0	0	G-B=1	

Note: Combination of SFI=59 and 60 which are not in the table in each specification must not be assigned.

STEP 11: **ARRC -** For Tandem Connection Service, Release incoming route and outgoing route connection restriction.

M-17 MFC - Outgoing Call

General Description

This service feature allows a station or an attendant to access a Central Office via MFC trunks.

Note: This feature is not available in North America and Australia.

Operating Procedure

No manual operation is required.

Service Conditions

1. This service feature supports the following types of MFC signaling system:
   a.) CCITT-R2 (NEC Standard) Type
   b.) Thailand Type
   c.) Venezuela Type
   d.) Korea Type
   e.) Argentina/Philippines Type
   f.) Mexico Type
   g.) Brazil Type (digital/analog)
   h.) Chile Type
   i.) Columbia Type
   j.) Indonesia Type
   k.) India Type
2. The numbering plan for outgoing calls via MFC trunks uses LCR or LCRS system.
3. Terminals supported for this service feature are DP telephone, DTMF telephone, Dterm and ATTENDANT CONSOLEs [A-3]. (For Indonesia Type, ATTENDANT CONSOLEs are not supported.)
4. This service feature is effective in the following status:
   a.) Direct dialing by a station (For Indonesia Type, available only in this status.)
   b.) CONSULTATION HOLD [C-17] on station
   c.) CONSULTATION HOLD [C-17] on trunk
   d.) Tandem Connection
   e.) Direct dialing by an Attendant
   f.) INDIVIDUAL TRUNK ACCESS [I-4] (not available using LCRS system)
   g.) NON-DELAY OPERATION [N-3]
   h.) Trunk to Trunk Connection via ATTENDANT CONSOLE [A-3]
5. CALL FORWARDING - DON'T ANSWER - OUTSIDE [C-74] to MFC trunk is not available (except for India Type).
6. Outgoing calls to MFC trunks by HOT LINE - OUTSIDE [H-9] are not available (except for India Type).
7. Outgoing calls to MFC trunks by TRUNK LINE APPEARANCE [T-23] are not available (except for India Type).
8. Outgoing calls to MFC trunks by OUTGOING TRUNK QUEUING - ATTENDANT [O-16] are not available (except for India Type).

9. DID calls from MFC trunks cannot be forwarded to MFC trunks by CALL FORWARDING - ALL CALLS - OUTSIDE [C-28] or CALL FORWARDING - BUSY LINE - OUTSIDE [C-60].
10. For CCITT-R2 and Korea Type
    Group-II signal from the Telephony Server is fixed to be "2 (Subscriber with Priority)."
    For Argentina, Brazil, Chile, Columbia, Venezuela, and India Type
    Group-II signal from the Telephony Server may be either 1 or 2, according to the Service Feature Restriction Class of the calling station.
    a.) Group-II = 1 (Subscriber without Priority)
    b.) Group-II = 2 (Subscriber with Priority)
11. For CCITT-R2, Korea, Argentina, Chile, Columbia, Venezuela, Mexico, Brazil and India Type
    When a Group-B signal = "7 (Subscriber's Line Free, No Charge)" is received, the call is not recorded in STATION MESSAGE DETAIL RECORDING [S-10].
12. Even if a Group-B signal = Subscriber's Line Busy is received, the calling party hears Busy Tone.
13. Even if a Group-B signal = "1 (Change Calling Party Release)" is received, trunk release pattern follows the system data programming.
    For Argentina, Philippines, Chile, Columbia, Korea, and Venezuela Type
    Even if a Group-B signal = "1 (Change Calling Party Release)" is received, trunk release may be either "Calling Party Release" or "First Party Release", according to the route data of the originating route.
14. For Argentina, Philippines, Brazil, Chile, Columbia, Mexico, and Venezuela Type
    When the A-1 ("Send Next Digit") signal is received as the backward signal to the last digit of the Group-1 signal, following conditions occur according to the system data.
    a.) End of Digit "G-I = 15" is sent out.
    b.) End of Digit "G-I = 15" is not sent out, but waits for the backward signal.
15. Following service features are available for the outgoing call to an MFC trunk:

    CALL HOLD [C-6]

    CALL FORWARDING - ALL CALLS - OUTSIDE [C-28]
    (except for forwarding to MFC trunks)

    CALL FORWARDING - BUSY LINE - OUTSIDE [C-60]
    (except for forwarding to MFC trunks)

    INCOMING CENTRAL OFFICE CALL TO TIE LINE CONNECTION [I-3]

    INDIVIDUAL TRUNK ACCESS [I-4]

    LAST NUMBER CALL [L-6, L-6D]

    LEAST COST ROUTING (LCR) - 3/6 - DIGIT [L-5]

    OUTGOING TRUNK QUEUING [O-2]

    OFF-HOOK QUEUING [O-7]

    PEG COUNT [P-7]

RESTRICTION FROM OUTGOING CALLS [R-4]

SPEED CALLING - SYSTEM [S-3]

SPEED CALLING - GROUP [S-23]

SPEED CALLING - STATION [S-21]

STATION MESSAGE DETAIL RECORDING [S-10]

STATION MESSAGE DETAIL RECORDING SYSTEM - PRINTOUT [S-48]

TOLL DENIAL/TOLL DIVERSION [T-6]

TOLL RESTRICTION - 3/6 - DIGIT [T-7]

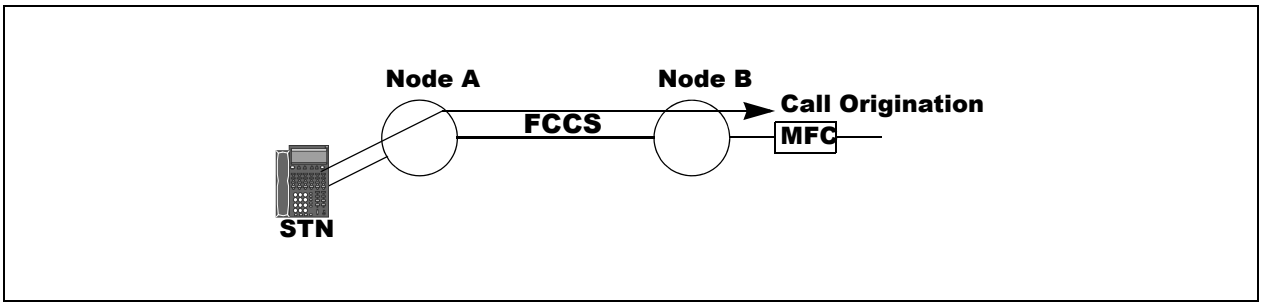
16. The following ANI (Automatic Number Identification) information is sent to the MFC trunks.
    a.) The contents of the information:
    1)Class (1 digit); sent as Calling Party Category (G-II)
    2)Calling Number (office code and telephone number, max. 12 digits).
    The office code is assigned on a tenant basis. For the telephone number, either of the following information can be selected on a tenant basis.
    - calling telephone number
    - listed directory number (LDN) assigned on a tenant basis

    For India Type only
    Class information is not sent.
    When Calling Number can be sent: "1" is sent.
    When Calling Number cannot be sent: "0" is sent

    b.) The information sent in case of the call origination from the Attendant is the listed directory number (LDN) assigned on a tenant basis.
    c.) As the Calling Number, the digits other than the number 0 to 9 will not be sent out (i.e., * and #).
    d.) It can be determined on a tenant basis whether to send the office code and the telephone number, or only the telephone number as the Calling Number.

17. The additional hardware (MFC Register) is required.

18. For India Type only
    Trunk release may be either "Calling Party Release" or "First Party Release", according to the route data of the originating route.
19. When LCRS system is used:
    a.) sending of "End of Digit":
    -when the A-3 ("address complete, changeover to reception of G-B") is received as the backward signal to the last digit of the G-I signal, the calling party class is sent out, and "End of Digit" is not sent out.
    -When the A-1 ("send next digit") is received as the backward signal to the last digit of the G-I



signal, “End of Digit” is sent out.

b.) sending of ANI information
-if ANI information is requested while sending the digits, the rest of the digits are sent out after the ANI information.
-if ANI information is requested while the digits are being received from the station, Attendant Console, or the incoming trunk, the rest of the digits are received after the ANI information.

20. For Indonesia Type only
In Indonesian network, the system is used as Satellite Office of LS. The system is in charge of shaded parts. Note that the system cannot be used as LS or TS.

21. “*” and “#” are available for the Group I (G-I) signal. Both “*” and “#” cannot be used for the “Timing Start”, if those digits are used as G-1 signal.

FCCS Conditions

a.) Both MFC Receiver and MFC Sender must be accommodated in each node.

b.) When an MFC DOD call is originated from a station in Node A through an MFC trunk in Node B via FCCS link, MFC Sender accommodated in Node A is used.

c.) Be sure to assign the same data of MFC signaling system for each node.

NEC Standard (CCITT R-2) Type

Signal	Forward signal		Backward signal	
	G-I	G-II	G-A	G-B
1	Digit "1"	subscriber without priority	send next digit (n+1)	
2	Digit "2"	subscriber with priority	send last but one digit (n-1)	~~send special information tone~~
3	Digit "3"	maintenance equipment	address complete change-over to reception of G-II	subscriber's line busy
4	Digit "4"		congestion in the national network	congestion, encountered after changeover from G-A to G-B
5	Digit "5"	operator	calling party category	unallocated number
6	Digit "6"	data transmission	address complete change set up speech condition	subscriber's line free (charge)
7	Digit "7"	subscriber or operator without forward transfer facility	send last but two digits (n-2)	subscriber's line free (no charge)

abcd Signals transmitted and received

abcd Signals received

Programming

<<For MFC Outgoing/Incoming Connection or MFC Incoming Connection (with Tandem Connection)>>

STEP 1: **ASYD -** System 1, Index 125, Bits 0 through 3. PAD control of the MFC Sender 0dB--14dB.
Bits 4 through 7. MFC Signaling System CCITT MFC-R2, Venezuela, Australia, Singapore, Thailand.
System 3, Index 10, Bits 0 through 3. Reception sensitivity level of the MFC Register - 28dBm-43dBm.

STEP 2: **ANPD -** Assigns the first digit of the MFC line access code.

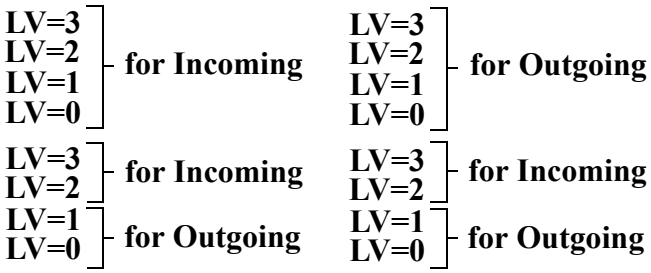
STEP 3: **ASPA -** Assigns the LCR access code by providing a dummy route.

STEP 4: **AMND -** Assigns the maximum number of necessary digits to the Dial (Area/Office) Code.

STEP 5: **ARTD -** Assigns the access code to the route number. When multiple access code are present by alternative routing, set one of them.
MFC line - Assign the following data, depending on the Trunk type, as shown below.

Trunk Type	ONSG	INSG
OGT	10	0
ICT	0	10
BWT	10	10

Assign the parameter OC (originating category) depending on the use of the G-A signal of the backward signal.
OC= 0: Originating category is not required.
OC=1: For terminating office, backward signal G-A=3 (originating category request) is sent after receiving necessary selecting signal. For originating office, forward signal G-II is sent after receiving backward signal G-A=3 (originating category request).



dummy route - Assign 1 at all times for the AC parameter of CDN 13. The route data of the dummy route is TCL=4, AC=1 and L/T=1. For the others, Assigns 0 in all cases.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as circuit card, MG, or VS32.

STEP 6: **ATRK -** MFC line - Assigns the LENS data of each trunk.
MFC - Register/Sender - Assigns the following data to the LENS of the PA-4MFCA circuit card.
Note 1

RT=916: MFC Register/Sender for Incoming
RT=917: MFC Register/Sender for Outgoing

Note 1: As the use of the 4 circuit on the PA-4MFCA circuit card, only the following 4 patterns are available.

STEP 7: **AFRS -** Assigns the number Pattern Code (NPC) and Outgoing route selection pattern (OPR) to the dummy route.

STEP 8: **AOPR -** Assigns the route number including the alternative route to the outgoing route selection pattern (OPR). Assigns the number of skipped digits and pattern number location (PNL) to each route.

STEP 9: **ARSC -** Releases the dummy route and station connection restriction.

Releases the connection restriction on the route of the MFC line and station.

STEP 10: **ASFC -** Assigns the backward signal (G-B) against the forward signal (G-II) for each SFC when the called party is idle.

SFI= 59: No Charge

SFI=60: Called Party Release

Relation between the Assignment of SFI=59,60 and the Backward Signal.

SPECIFICATION	SFI = 59	SFI = 60	BACKWARD SIGNAL	REMARKS
CCITT MFC-R2	0	1	G-B=6	
	1	0	G-B=7	
VENEZUELA	0	0	G-B=6	
AUSTRALIA	0	0	G-B=1	
	0	1	G-B=6	
	1	0	G-B=5	
SINGAPORE	0	0	G-B=1	
THAILAND	0	0	G-B=1	

Note: Combination of SFI=59 and 60 which are not in the table in each specification must not be assigned.

STEP 11: **ARRC -** For Tandem Connection Service, Release incoming route and outgoing route connection restriction.

M-19 Message Reminder

General Description

This feature allows a Single Line Telephone and a Desktop terminal to leave a MESSAGE REMINDER at the called Dterm set.

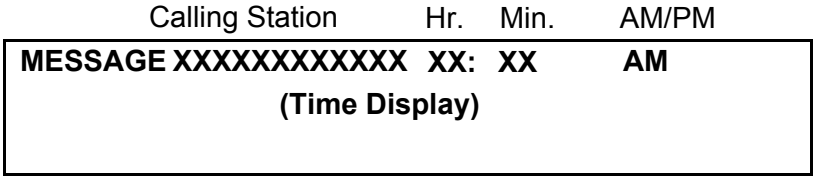
Operating Procedure

To send a message from a Desktop terminal

1. Dial the desired Desktop terminal station. Receive Ringback Tone or Busy Tone.
2. Press the MSG key. The LCD displays:

   and a Service Set Tone is heard.
3. At the Called Desktop terminal, the MSG LED will light to indicate a message has been set.

To send a message from a Single Line Telephone



1. Dial the desired internal Dterm Station. Receive Ringback Tone or Busy Tone.
2. Press switch hook. Receive Special Dial Tone.

   Note: The availability of special dial tone is changed depending on the combination of the Step Call - CCIS Restriction (ASYD: Sys 2, Index 6, Bit 2) and SHF method (ASYD: Sys 1, Index 68, Bit 0). Refer to Step Call - CCIS [S-59] in Data Programming Manual - CCIS for the detail.

3. Dial the MESSAGE REMINDER Access Code. Receive Service Set Tone.
4. At the Called Dterm, the MSG LED will light to indicate a message has been set.

To review messages

1. Press the MSG key while the key lights red.
2. The LCD displays:

3. To display the next message, press the MSG key again.

   Note: When the Station Number exceeds 12 digits, MSG is not displayed.

To return the message

1. MSG key lights red.
2. Select a target message by pressing the MSG key.
3. The message is displayed.
4. Lift the handset or press the SPEAKER key.

5. Press the MSG key again.

Service Conditions

When sending a message from a Single Line Telephone or Desktop terminal

1. This feature is available only when the called party is a Dterm set, which has the MSG key.
2. Messages can only be sent if the called station is in the idle or busy condition.
3. Messages cannot be sent while engaged in calling and recalling from CALL TRANSFER - ALL CALLS [C-11] and from CONSULTATION HOLD - ALL CALLS [C-17].
4. Messages can be displayed only when the station is on-hook.
5. A message may be cleared by displaying the message and pressing the "*" or "#" key on the called Desktop terminal's keypad. This is selected via System Data.
6. Messages are cleared when they are obtained via the MSG key.
7. A second message sent by the same calling telephone is registered as a second unique message. The same applies to the third and fourth messages.
8. Messages are sent to the forwarded-to station, which is set by CALL FORWARDING - ALL CALLS [C-5] or CALL FORWARDING - BUSY/DON'T ANSWER [C-2, 3].
9. A maximum of 32 digits can be saved at the called party.
10. To utilize the Telephone Number of the Calling Station, assign System Data 1, Index 641, Bit 0 = 1 by the ASYDN command.

When sending a message from a Desktop terminal

1. If a message is directed to a Desktop terminal that does not have the MESSAGE REMINDER feature, the Calling Station's LCD displays:

2. A maximum of four messages may be received at any one Desktop terminal. If a fifth message is attempted, the LCD will display:

3. Messages cannot be cleared by the Message Sender.
4. If a message is returned to an unattended station, the Telephone Number may be stored as a LAST NUMBER DIALED [L-6], SAVE AND REPEAT [S-24], or a new MESSAGE REMINDER may be sent.
5. Messages cannot be sent to a UCD [U-1] station when all stations in the UCD Group are busy.
6. Messages are sent to a dialed station when all stations in a Station Hunting (Circular) Group are busy.
7. The setting station in the FCCS network must provide Telephone Number for this feature.
8. Message (Telephone Number) is cleared by the circuit card initialization or the system initialization.
9. When a terminal logs out or performs re-registration, all messages stored in the terminal are cleared. To maintain the messages, enable PH Fixed Hunting method by assigning the system data (ASYDL, SYS1, Index 824, Bit 0 = 1).
10. Memory clear is necessary before reprogramming of station data and before using Follow Phone service.

When sending a message from a Single Line Telephone

1. If a message is directed to a Dterm that does not have the MSG key or a Single Line Telephone, the Calling

Station will hear Reorder Tone.

2. A maximum of four messages may be received at any one Dterm. If a fifth message is attempted, the Reorder Tone will be transmitted to the Calling Party.
3. In case the called Dterm station is in a Hunting Group, the message will be set to the first selected Station in the Hunting Group when- all Stations are busy. The message will be set to the ringing station in the Hunting Group when any station is idle.
4. When the call is in the UCD queue, the MESSAGE REMINDER service is not provided.

Interactions

1. If CALL WAITING-ORIGINATING [C-31] automatic operation is in service between two Desktop terminals, it will supersede MESSAGE REMINDER sending a message from Desktop terminal. If a third station calls and receives Busy Tone, MESSAGE REMINDER sending a message from Desktop terminal can be set.
2. A message cannot be sent from or to SIP Handler Controlled SIP terminals.

Programming

To send a message from a Desktop terminal

STEP 1: **ASYD** - System Data 1, Index 80, Bit 1. MESSAGE REMINDER Cancel key (for Desktop terminal) 0/1: "#" key / "*" key.

STEP 2: **AKYD** - Assign the Station according to the following parameters:

TN: 1
STN: Station Number
TP: Type of Desktop Terminal (0-3)
KYN: Key Number (1-40)
KYI: Service Index
0: Key Not Used
→ 1: Feature key
2: Multi Line key
KD: Not assigned for Feature key
FKY: Feature Key Number
→ FKY = 6, MESSAGE REMINDER

STEP 3: **ASFC** - With respect to SFC of the Stations that sets Message Reminder Service, cancel the restriction of SFI 53. (Message Reminder Service)

Note: Desktop terminals with a MESSAGE REMINDER key do not require the Service Feature Restriction Class assignment. Only single-line sets require the ASFC assignment.

To send a message from a Single Line Telephone

STEP 1: **ASYD** - System Data 1, Index 17, Bit 0.

Single Line Stations able to use VOICE CALL [V-2] and MESSAGE REMINDER features to a Dterm while hearing Ringback Tone? 0/1: Restricted/Allowed.

System Data 1, Index 80, Bit 1. Key for message cancel? 0/1: "#" key / "*" key.

STEP 2: **ASFC** - Assign the Single Line Stations a feature class that allows SFI: 53, Message Reminder.

STEP 3: **ANPD** - Reserve a Number Level for Feature Access. Select Normal Service (N), Hooking Service (H) or Busy Service (B) from the combo box for Connection Indexes. Assign NND in accordance with predetermined Numbering Plan.

STEP 4: **ASPA** - Assign an Access Code to Message Reminder; assign SRV = "SSCA: Service Code Appendix", SIDA = 42; assign CI = "H: Hooking and "B: Busy".

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ANPDL** - Reserve a Number Level for Feature Access. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. Assign NND in accordance with predetermined Numbering Plan.

STEP 2: **ASPAL** - Assign an Access Code to Message Reminder; assign SRV = "SSCA: Service Code Appendix", SIDA = 42; assign CI = "H: Hooking and "B: Busy".

M-20D Multiple Line Operation -D

General Description

This feature allows for the appearance of Multiple Lines on the Line/Feature keys of the Desktop terminal.

Note: For North America only - Multiple Lines Appearances are supported on an ACD set.

Operating Procedure

No manual operation is required.

Service Conditions

1. Three kinds of lines can appear on Desktop terminals:
   - MY Line (ML): This line is associated with the extension number assigned to the port on the Interface Circuit.
   - Prime Line (PL): This line is given priority for outgoing and Incoming Calls. The Prime Line is automatically seized when going off-hook.
   - Sub Line (SL): This line designates any other line appearing on a Desktop terminal. (The MY Line will serve as a Prime Line, unless differentiated in System Data programming).
2. If a feature is activated that can trigger an AUTOMATIC RECALL [A-8], only the Station being recalled will ring, and the associated line lamp will rapid wink. Other Desktop terminal Stations will display that line as busy.
3. All Sub Lines of a Desktop terminal must be located in the same Module Group as the Desktop terminal MY Line.
4. A Virtual Line (Software Line Appearance [S-33]), Single Line Telephone or Dterm can be assigned to the Sub Line.
5. CALL BACK [C-1] and OUTGOING TRUNK QUEUING -D [O-2] is available only from the My Line of a Desktop terminal.
6. In the calling, when Line key then Answer key are pressed on the system that does not have automatic calling, the Line key holds a call; the Answer key cannot respond to the calling.
7. For North America only - The additional appearance is not configured in the ACD. Therefore, it is not monitored for call progress events, and no information pertaining to call activity will be sent to an attached MIS system. MIS statistics of any kind will not be available on this line.
8. For North America only - ACD features such as “Auto Work on PBX line Ringing/Answer” will not be invoked by call activity on this line.
9. For North America only - Cannot suppress DT from being audible on Dterm stations equipped with a speaker when Multiple line appearances are assigned and ASYD Index 384 Bit 0=1, regardless if a speaker button is not assigned. Dial tone will be produced as a terminal function.
10. Restriction of Call Termination on My Line:
    A Desktop terminal can deny any Incoming Call to its My Line, when a call is made/received via one of its Sub Lines.

    Conditions:

    a.) Restricts a call to My Line only. (A call to Sub Line is not restricted.)
    b.) Available when the caller is a Station, TIE Line, Central Office Line or Attendant Console.
    c.) Available for a call as the destination of Call Forwarding - All Calls.
    d.) When the Original Call on the Sub Line is placed on hold:

• If the terminal is off–hook after placing the call to Sub Line on hold, a call to My Line is restricted.
• If the terminal goes on–hook while the call to Sub Line is still on hold, a call to My Line is not restricted.

11. If a call is terminated at your My Line while you are talking on or placing a call using a Sub Line, LCD does not display the information of the incoming call until you finish talking or placing the call.

Note: Note the following directions about LCD.

- *If you need to see incoming call information while you are talking or placing a call, assign ASYDL/ ASYDN, SYS1, Index 1248, Bit 4=1 (Mixed Display of Caller ID Display-Subline is enabled).*

Interactions

1. Sub Lines can belong to another Station, or be a virtual/software Line Appearance. Sub Lines will operate under the restrictions of the MY Line. Sub Lines must be located within the same Module Group as the MY Line when assigning ASYD, System Data 1, Index 321, Bit 0 as "0."
2. Multi Line service in the Inter-Module Group under the control of one LP is available when assigning ASYD, System Data 1, Index 321, Bit 0 as "1."
3. When SIP Handler Controlled SIP terminals are used, either of Single Line Mode or Multi Line Mode can be selected.
   a.) The following are conditions when Desktop terminal accommodates My Line and Sub Line of SIP Handler Controlled SIP terminals.

   - Desktop terminal can answer a call held by SIP Handler Controlled SIP terminals.
   - When all lines which a SIP Handler Controlled SIP terminal accommodates are used by Desktop terminals, the SIP Handler Controlled SIP terminal cannot place a call.
   - When Desktop terminal uses My Line or Sub Line of the SIP Handler Controlled SIP terminal and puts a call on hold, the SIP Handler Controlled SIP terminal cannot answer the held call.

   b.) The following are conditions when the SIP Handler Controlled SIP terminal is in Single Line Mode.

   - Only My Line can be used when a SIP Handler Controlled SIP terminal user places or receives a call.
   - Single Line Mode supports more features than Multi Line Mode does.

   c.) The following are conditions when the SIP Handler Controlled SIP terminal is in Multi Line Mode.

   - Two lines, My Line and Sub Line, can be used when the SIP Handler Controlled SIP terminal user places or receives a call. The SIP Handler Controlled SIP terminal cannot handle three or more lines.
   - My Line is selected preferentially while placing or receiving a call. If My Line is in use, Sub Line is selected. The SIP Handler Controlled SIP terminal user cannot select a line to place a call. Calling station number displayed on the destination station is either of My Line or Sub Line station number which is seized to place a call.

- The SIP Handler Controlled SIP terminal user cannot recognize which line receives a call.
- The SIP Handler Controlled SIP terminal Multi Line keys are not compliant with the Multiple Line data assigned by the AKYD command. The terminal user recognizes the first call arrives at the same line.
- Multi Line Mode supports more restricted features than Single Line Mode does.

Programming

STEP 1: **ASDT** - LENS equipped with a Desktop terminal Circuit Board must be assigned a Station Number and a Telephone Equipment Class (TEC) of 12.

STEP 2: **AKYD** - Assign a MY Line, a Prime Line, and various Sun Lines to the Desktop terminals.

→TN: 1
→STN: Station Number
TP: Type of Dterm 0/1:
→RING: Assign ringing to the entire phone
0: No Ringing, Day or Night.
1: Ring Day.
2: Ring Night.
3: Not Used.
4: Ring Day & Night, 30 second delay.
5: Ring Day & Night, 20 second delay.
6: Ring Day & Night, 10 second delay.
7: Ring Day & Night, no delay.PL TN STN:Prime Line Tenant and Station Number

7: Ring Day & Night, no delay.

M-23 Message Waiting Lamp Setting - Attendant

General Description

This feature permits an ATTENDANT CONSOLE [A-3] to set or cancel a Message Waiting indication on a Station provided with this feature.

Operating Procedure

To set a Message Waiting Indication

1. Press an Idle Loop key.
2. Dial the Message Waiting set Code (up to three digits). Receive Special Dial Tone.
3. Dial the Telephone Number. Receive Service Set Tone.
4. Message Waiting indication is set.
5. Press the RELEASE key to return to an idle condition.

To cancel a Message Waiting Indication

1. Press an Idle Loop key.
2. Dial the Message Waiting Cancel Code (up to three digits). Receive Special Dial Tone.
3. Dial the Telephone Number. Receive Service Set Tone.
4. Message Waiting indication is canceled.
5. Press the RELEASE key to return to an idle condition.

Service Conditions

1. The Message Waiting lamp on a Single Line Telephone or a Dterm will be lit when this feature is activated.
2. When Message Waiting is set to a Dterm Station, the LCD display indicates:

3. Message Waiting cannot be set when the ATTENDANT CONSOLE [A-3] is in a consultation condition with a Station or Trunk.
4. An Attendant attempting to set Message Waiting to a Station where Message Waiting has previously been set, will receive Busy Tone.
5. In a MULTIPLE CONSOLE OPERATION [M-4], if Message Waiting is set by one ATTENDANT CONSOLE [A-3], it can be canceled by another.
6. Message Waiting indications are cleared when the system is initialized.

7. When Call Indicator Lamp is controlled by MESSAGE WAITING LAMP SETTING - STATION [M-30], the tone and display indication of the Attendant Console and Call Indicator Lamp of the Station are as follows, depending on the status of the Station.

Status of Preassigned Station		Attendant Console			Call Indicator Lamp Status
		Operation	LCD	Type of Tone	
Unused Telephone Number Dead Level Restricted Station		Canceling	Telephone Number	Reorder Tone	
		Setting			
Call Indicator Lamp OFF	Idle Busy Lock Out Make Busy	Canceling	Telephone Number	Service Set Tone	OFF
		Setting			ON
Call Indicator Lamp OFF set from Attendant	Call Indicator Lamp ON set from Station	Canceling	Telephone Number	Service Set Tone	ON
		Setting			
Call Indicator Lamp ON set from Attendant	Call Indicator Lamp OFF set from Station	Canceling	Telephone Number	Service Set Tone	OFF
		Setting		Busy Tone	ON
	Call Indicator Lamp ON set from Station	Canceling	Telephone Number	Service Set Tone	ON
		Setting		Busy Tone	

Interactions

1. For MESSAGE WAITING LAMP SETTING-ATTENDANT, an 8DLC/16ELC card is required.
2. An external power source is required to light a lamp for a Single Line Telephone. The Dterm uses an 80 VDC power source. NEC stocks Lorain Model HSA3H, stock number 241440.
3. Only the Attendant can set and extinguish the Message Waiting Lamp.

Programming

STEP 1: **ANPD** - Reserve a Number Level for Feature Access and cancel. Select Normal Service (N), Hooking Service (H) or Busy Service (B) from the combo box for Connection Indexes. (applicable to any feature assigned to this Level). Assign NND in accordance with a predetermined Numbering Plan.

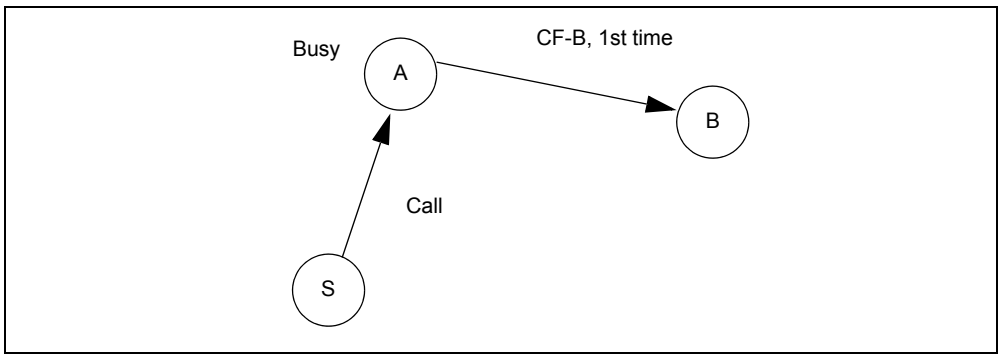
STEP 2: **ASPA** - Assign an Access Code to activate MESSAGE WAITING LAMP SETTING-ATTENDANT SRV = "SSCA: Service Code Appendix"; SIDA = 54 and to extinguish the MESSAGE WAITING LAMP SETTING-ATTENDANT SRV = "SSCA: Service Code Appendix"; SIDA = 55. Assign the Connection Status Index (CI) for "N: Normal" service.

STEP 3: **ASFC** - Assign a Service Feature Restriction Class that allows SFI = 74 to the Stations that will receive MESSAGE WAITING LAMP SETTING-ATTENDANT.

FCCS Programming

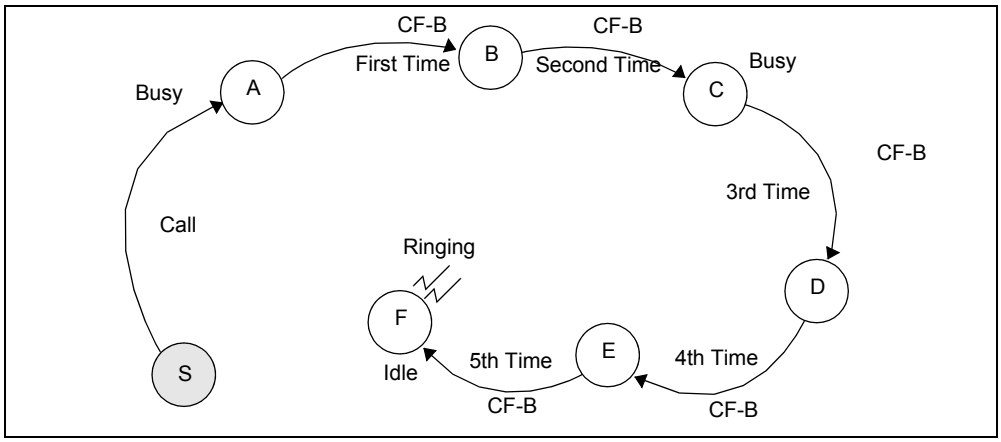
This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

STEP 1: **ANPDN** - Reserve a Number Level for Feature Access and cancel. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. (applicable to any feature assigned to this Level). Assign NND in accordance with a predetermined Numbering Plan.



STEP 2: **ASPAN** - Assign an Access Code to activate MESSAGE WAITING LAMP SETTING-ATTENDANT SRV = "SSCA: Service Code Appendix"; SIDA = 54 and to extinguish the MESSAGE WAITING LAMP SETTING-ATTENDANT SRV = "SSCA: Service Code Appendix"; SIDA = 55. Assign the Connection Status Index (CI) for "N: Normal" service.

M-24 Multiple Call Forwarding - Busy Line



General Description

This feature permits a call to a busy Station to be forwarded, a maximum of five times, to preprogrammed Idle Stations.

Existing CALL FORWARDING - BUSY LINE [C-2] service

MULTIPLE CALL FORWARDING - BUSY LINE [M-24] service

Operating Procedure

To set from an individual Station

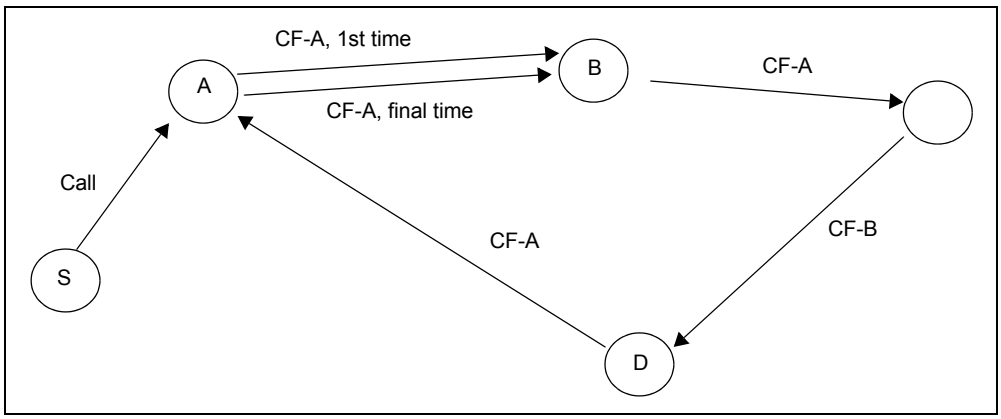
1. Lift the handset. Receive Dial Tone.
2. Dial the specific CALL FORWARDING - BUSY LINE Access Code. Receive Special Dial Tone.
3. Dial the desired Target Telephone Number. Receive Service Set Tone.

To cancel from an individual Station

1. Lift the handset. Receive Dial Tone.
2. Dial the specific CALL FORWARDING - BUSY LINE [C-2] Cancel Code; receive Service Set Tone.

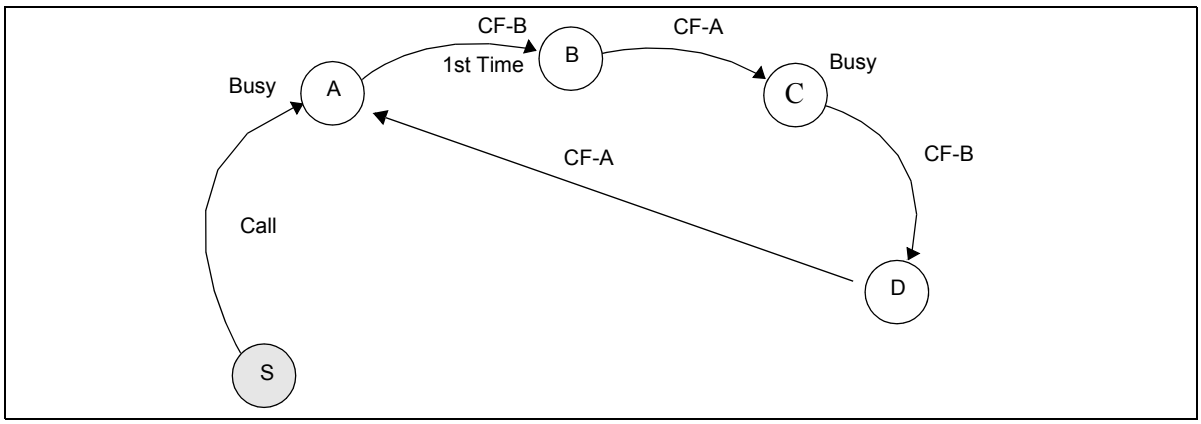
To set from the Attendant Console

1. Press an Idle Loop key.
2. Dial the CALL FORWARDING - BUSY LINE [C-2] Access Code. Receive Special Dial Tone.
3. Dial the TENANT SERVICE [T-12] Number (two or three digits).
4. Dial the Originating Telephone Number.



5. Dial the desired Target Telephone Number. Receive Service Set Tone.

To cancel from the Attendant console



1. Press an Idle Loop key.
2. Dial the CALL FORWARDING - BUSY LINE [C-2] Cancel Code. Receive Special Dial Tone.
3. Dial the TENANT SERVICE [T-12] Number (two or three digits).
4. Dial the Originating Telephone Number. Receive Service Set Tone.

Service Conditions

1. If the Called Station is busy and MULTIPLE CALL FORWARDING - BUSY LINE [M-24] is set at the Called Station, the call is forwarded to the designated Station.
2. A call cannot be forwarded more than five times, even if the fifth Station has CALL FORWARDING - BUSY LINE set.
3. A call cannot be forwarded to the originating Station.
4. If the call is forwarded back to the originally Called Station, or a Station that has already been forwarded to, Call Forwarding will end at that Station.
5. CALL FORWARDING - BUSY LINE [C-2] and CALL FORWARDING - ALL CALLS [C-5] combined:
   a.) Any combination of CALL FORWARDING - BUSY LINE [C-2] and CALL FORWARDING - ALL CALLS [C-5] may be made, up to a total of five forwards.
   b.) If the fifth forwarding destination is busy, the caller receives Busy Tone, and the call will not forward again.
   c.) If a forward destination is the Calling Station, the Calling Station will receive Busy Tone.
   d.) If a forwarding destination is the originally Called Station, and if the originally Called Station forwarded the call with CALL FORWARDING - ALL CALLS [C-5], the ultimate destination is the originally Called Station's CALL FORWARDING - ALL CALLS [C-5] destination.

   e.) If a forwarding destination is the originally Called Station, and if the originally Called Station forwarded the call with CALL FORWARDING - BUSY LINE, the ultimate destination is the originally Called Station.

f.) If the call is forwarded to a Station where it has previously been forwarded to, the call will end at that Station.

6. CALL FORWARDING - ALL CALLS [C-5], CALL FORWARDING - BUSY LINE [C-2] and CALL FORWARDING - DON'T ANSWER [C-3] combined:

a.) Although CALL FORWARDING - ALL CALLS [C-5] and CALL FORWARDING - BUSY LINE [C-2] and combinations of the two are limited to five forwards, when a forwarding sequence is divided by CALL FORWARDING - DON'T ANSWER [C-3], CALL FORWARDING - ALL CALLS [C-5] and CALL FORWARDING - BUSY LINE [C-2] can begin again (the only limit is five consecutive forwards).

7. Forwarding to an Attendant Console:

a.) If an Attendant Console is designated as the destination of CALL FORWARDING - ALL CALLS [C-5], the call is forwarded to the Attendant Console that handles the Tenant to which the Calling Station belongs.

b.) The Attendant Console key that lights when a call is forwarded to the Console depends on the forwarding status of the originally Called Station. The following table shows the key that will light (if the forwarding status of the originally Called Station is CALL FORWARDING - BUSY

[C-2], and the call is from a Station, then the BUSY key will light).

Forwarding Status Of Originally Called Station			
	Call Forward -All Calls	**Call Forward -Busy**	**Call Forward -Don't Answer**
Call From Station	ATND	BUSY	NANS
Call From Trunk	Depends on Trunk class	BUSY	NANS

c.) If the call is forwarded by CALL FORWARDING - DON'T ANSWER [C-3] at any point in a forward sequence, the NANS key on the Attendant Console will light, even if the call status of the originally Called Station is CALL FORWARDING - ALL CALLS [C-5] or CALL FORWARDING - BUSY LINE [C-2].

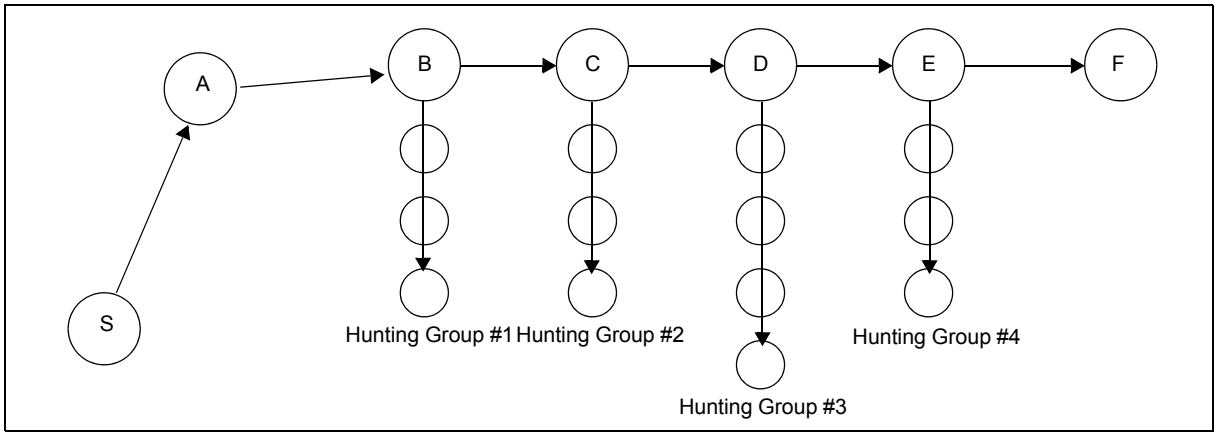
d.) Called Number Display is only provided if a call is forwarded to the Attendant Console by CALL FORWARDING - ALL CALLS [C-5], CALL FORWARDING - BUSY LINE [C-2], or by CALL FORWARDING - DON'T ANSWER [C-3].

8. Forwarding to a Dterm:

a.) The Calling Dterm's display will show the number of the Called Station on the left, and the number of the Station being rung on the right. The display on the ringing Dterm will show the number of the originally Called Station on the left, and the number of the Calling Station on the right.

b.) The forwarding status of the originally Called Station is shown on the far left of each Dterm's display: FDB for CALL FORWARDING - BUSY [C-2] or FDA for CALL FORWARDING - ALL CALLS [C-5].

9. UCD Groups:



a.) If the destination of CALL FORWARDING - ALL CALLS [C-5], CALL FORWARDING - BUSY [C-2], or CALL FORWARDING - DON'T ANSWER [C-3] is a UCD Group control Station, and CALL FORWARDING - ALL CALLS [C-5] is not set at that Station, the call will be forwarded according to UNIFORM CALL DISTRIBUTION [U-1] procedures.

b.) In the UCD procedure, if CALL FORWARDING - ALL CALLS [C-5] is set on a Station in the group, that Station is skipped.

10. Hunting:

a.) If the ultimate Destination Station is busy, or if some condition prevents the call from being forwarded, a busy line is selected, and a hunting check is performed.)

b.) If a call is forwarded several times by CALL FORWARDING - BUSY LINE [C-2] to Stations that are members of Hunting Groups, a hunting check is performed on the busy line closest to the Called Station or on the busy line closest to the ultimate destination. In the diagram below, a hunting check is performed on Hunt Groups 1 or 4. A hunting check is never performed on groups 2 or 3.

11. Busy Services such as EXECUTIVE RIGHT OF WAY [E-1], CALL BACK [C-1], etc.:
    a.) Busy service is provided to the busy line closest to the originally Called Station.
12. DIT, NIGHT CONNECTION - FIXED [N-1]:
    a.) For CALL FORWARDING - ALL CALLS [C-5] and CALL FORWARDING - BUSY LINE [C-2], a forward check is made up to 5 times by System Data.
    b.) In DIRECT-IN TERMINATION [D-7], if a line is busy, CALL FORWARDING - BUSY LINE [C-2] to the Attendant is not activated. Instead, the destination for the call can be specified by System Data:
    System Data 2 Index = 11
    Bit 7 = 0 - Call is routed to the Attendant Console.
    Bit 7 = 1 - Call is placed in queue until the Called Station becomes idle.
13. A Telephone Number must be set to the Call Forwarding Destination.
14. A call cannot be forwarded more than five times.
15. The number of times is assigned by System Data.
16. The OAI monitor number and the ACD pilot number cannot be assigned as the Call Forwarding target Telephone Number.

Interactions

1. If Access Codes for CALL FORWARDING-BUSY LINE [C-2] and CALL FORWARDING-DON'T ANSWER [C-3] are the same, only one key needs to be assigned in AKYD or ADSL, and only one Access Code needs to be assigned in ASPA.
2. When CALL WAITING [C-12], ATTENDANT CAMP-ON WITH TONE INDICATION [A-1], or CALL BACK [C-1] is directed toward Station A, with CALL FORWARDING-BUSY LINE [C-2] set to Station B, Station A will receive Call Waiting Tones when Station B is also busy.
3. A non-controlling UCD Station is allowed to activate CALL FORWARDING-BUSY LINE [C-2]. When this Station sets CALL FORWARDING-BUSY LINE [C-2], only directly-dialed calls to this Station are call forwarded.
4. If a controlling Station of a UCD Group sets CALL FORWARDING-BUSY LINE [C-2], forwarding will not take place. The Incoming Call will follow the UCD hunt.
5. If an Attendant attempts BUSY VERIFICATION [B-3] to Station A, which has CALL FORWARDING-BUSY LINE [C-2] set to Station B and Station B is busy, BUSY VERIFICATION [B-3] proceeds against Station B. If Station A has set CALL FORWARDING-BUSY LINE [C-2] to the Attendant Console, BUSY VERIFICATION [B-3] is allowed at Station A, if Station A is busy.

6. When CALL FORWARDING-BUSY LINE [C-2] is in effect, the activating Station may be used to originate calls.
7. When a Station is call forwarded, the Destination Station is recorded by STATION MESSAGE DETAIL RECORDING [S-10].

Programming

STEP 1: **ASYD** - System Data 1, Index 5, Bit 0. Are the Access Codes for CALL FORWARDING-BUSY LINE [C-2] and CALL FORWARDING-DON'T ANSWER [C-3] the same or separate? 0/1: Same/ Separate.

System Data 1, Index 5, Bits 3, 2, and 1. Maximum number of MULTIPLE CALL FORWARDING-ALL CALLS [M-44], -BUSY LINE [M-24] occurrences.)

Bit 3	Bit 2	Bit 1	MAXIMUM NUMBER OF JUMPS
0	0	0	1
0	0	1	1
0	1	0	2
0	1	1	3
1	0	0	4
1	0	1	5
1	1	0	5
1	1	1	5

System Data 1, Index 69, Bit 5. Station Hunting after CALL FORWARDING-BUSY LINE [C-2]. Data "0": Hunting takes place in forwarding Station's Group. Data "1": Hunting takes place in Destination Station's Group.

System Data 1, Index 69, Bit 7. MULTIPLE CALL FORWARDING-BUSY LINE, -ALL CALLS [M-44], in service? 0/1: No/Yes.

System Data 2, Index 6, Bit 1. Enable CALL FORWARDING-BUSY LINE [C-2] on a per Tenant basis.

STEP 2: **ANPD** - Reserve a Number Level for Feature Access and cancel. Select Normal Service (N), Hooking Service (H) or Busy Service (B) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan.

STEP 3: **ASPA** - Assign an Access Code to CALL FORWARDING-BUSY LINE [C-2] entry, SID = 10 and to CALL FORWARDING-BUSY LINE [C-2] cancel SID = 11. Assign a Connection Status Index (CI) for "N: Normal" service.

STEP 4: **ASFC** - Assign a Service Feature Restriction Class that allows SFI = 9 to the Stations that have CALL FORWARDING-BUSY LINE [C-2].

STEP 5: **AKYD** - For Dterm sets, CALL FORWARDING-ALL CALLS [C-5] may be assigned to a Line/ Feature key. Type:Function:CALL FORWARDING-BUSY LINE [1].

STEP 6: **ADSL** - Assign SN = 1 (Originating; DT Connection) and FKY = 1 (Call Forwarding - Busy Line; FDB).

This command is used for assigning the function to a Soft key.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

ASYDN - These data must be set to the NCN.

System Data 1, Index 69, Bit 7. Enable Multiple Call Forwarding-Busy Line/Don't Answer/All Calls. 0/1 = Out of Service/In Service. Index5, Bit 1-3. Assign the number of time for forwarding.

M-25 Multiple Call Forwarding - Don’t Answer

General Description

This feature permits a call to an unanswered Station to be forwarded, multiple times, to preprogrammed Idle Stations that do not have Call Forwarding set.

Operating Procedure

To set from an individual Station

1. Lift the handset. Receive Dial Tone.
2. Dial the specific CALL FORWARDING - DON'T ANSWER [C-3] Access Code. Receive Special Dial Tone.
3. Dial the desired target Telephone Number. Receive Service Set Tone.

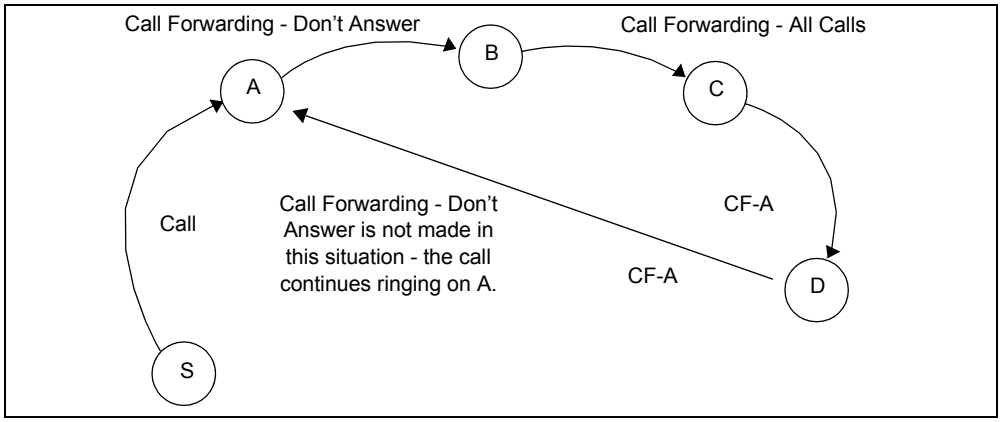
To cancel from an individual Station

1. Lift the handset. Receive Dial Tone.
2. Dial the specific CALL FORWARDING - DON'T ANSWER [C-3] Cancel Code. Receive Service Set Tone.

To set from the Attendant Console

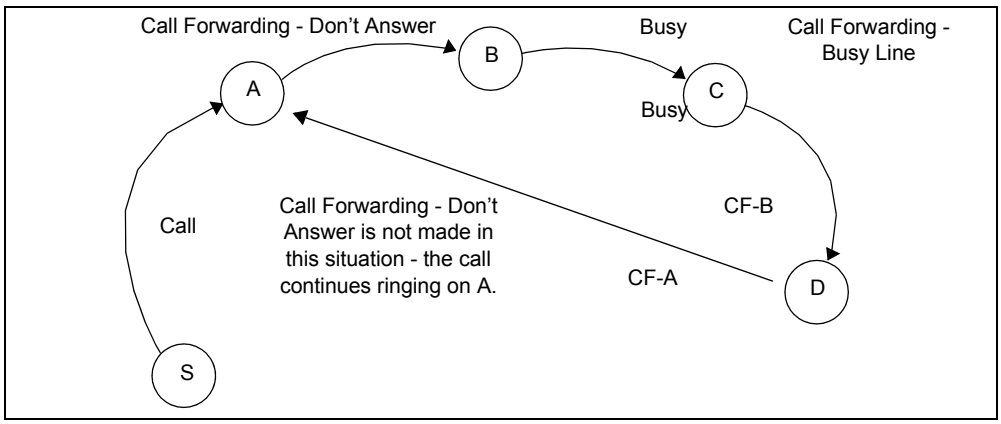
1. Press an Idle Loop key.
2. Dial the specific CALL FORWARDING - DON'T ANSWER [C-3] Access Code. Receive Special Dial Tone.
3. Dial the TENANT [T-12] number (two or three digits).
4. Dial the originating Telephone Number.
5. Dial the desired target Telephone Number. Receive Service Set Tone.

To cancel from the Attendant Console



1. Press an Idle Loop key.
2. Dial the specific CALL FORWARDING - DON'T ANSWER [C-3] Cancel Code. Receive Special Dial Tone.
3. Dial the TENANT SERVICE [T-12] Number (two or three digits).
4. Dial the originating Telephone Number. Receive Service Set Tone.

Service Conditions



1. If the Called Station does not answer and MULTIPLE CALL FORWARDING - DON'T ANSWER [M-25] is set at the Called Station, the call is forwarded to the designated Station.
2. There is no limit to the number of times a call can be forwarded by MULTIPLE CALL FORWARDING - DON'T ANSWER [M-25].
3. A call cannot be forwarded to the originating Station.
4. CALL FORWARDING - DON'T ANSWER [C-3], CALL FORWARDING - BUSY LINE [C-2] and CALL FORWARDING - ALL CALLS [C-5] combined:
   a.) After a CALL FORWARDING - DON'T ANSWER [C-3] forward has been made, up to five CALL FORWARDING - ALL CALLS [C-5] or CALL FORWARDING - BUSY LINE [C-2] forwards may be made.
   b.) If the fifth or last CALL FORWARDING - ALL CALLS [C-5] or CALL FORWARDING - BUSY LINE [C-2] destination after a CALL FORWARDING - DON'T ANSWER [C-3] is busy, the originally Called Station will continue ringing.

c.) If a Station has CALL FORWARDING - BUSY LINE [C-2] or CALL FORWARDING - ALL CALLS [C-5] to the originating Station set, the call will not be forwarded to the originating Station. The originally Called Station is rung.

d.) If the forwarding sequence, after a CALL FORWARDING - DON'T ANSWER [C-3] goes through several Stations with CALL FORWARDING - ALL CALLS [C-5] set and ends up at the original CALL FORWARDING - DON'T ANSWER [C-3] Station, CALL FORWARDING - DON'T ANSWER [C-3] is not activated.

e.) If the forwarding sequence, after a CALL FORWARDING - DON'T ANSWER [C-3] goes through several busy Stations with CALL FORWARDING - BUSY LINE [C-2] set and ends up at the original CALL FORWARDING - DON'T ANSWER [C-3] Station, CALL FORWARDING - DON'T ANSWER [C-3] is not activated.

5. If a call is transferred blind to a Station that is CALL FORWARDED - DON'T ANSWER [C-3] to another destination (internal or external), the call will not forward but will recall back to the transferee Station. This recall parameter is controlled by System Data.

6. Forwarding to an Attendant Console:

a.) If an Attendant Console is the destination of MULTIPLE CALL FORWARDING - DON'T ANSWER [M-25], the call is forwarded to the Attendant Console that handles the Tenant to which the CALL FORWARDING - DON'T ANSWER [C-3] Station belongs.

b.) The Attendant Console key that lights when a call is forwarded to the Console depends on the forwarding status of the originally Called Station (except in case c). The following table shows the key that will light (e.g., if the forwarding status of the originally Called Station is CALL

FORWARDING - BUSY LINE [C-2], and the call is from a Station, then the BUSY key will light).

Forwarding Status Of Originally Called Station			
	Call Forward -All Calls	**Call Forward -Busy**	**Call Forward -Don't Answer**
Call From Station	ATND	BUSY	NANS
Call From Trunk	Depends on Trunk class	BUSY	NANS

c.) If the call is forwarded by CALL FORWARDING - DON'T ANSWER [C-3] at any point in a forward sequence, the NANS key on the Attendant Console will light, even if the call status of the originally Called Station is CALL FORWARDING - ALL CALLS or CALL FORWARDING - BUSY LINE.

7. Forwarding to a Dterm:
   a.) The Calling Dterm's display will show the number of the Called Station on the left, and the number of the Station being rung on the right. The display on the ringing Dterm will show the number of the originally Called Station on the left, and the number of the Calling Station on the right.
   b.) The forwarding status of the originally Called Station is shown on the far left of each Dterm's display: FDB for CALL FORWARDING - BUSY LINE or FDA for CALL FORWARDING - ALL CALLS.
8. UCD Groups:
   a.) If the destination of a CALL FORWARDING - DON'T ANSWER [C-3] is a UCD Group control Station, the call will be forwarded into the UCD Group.
   b.) If the destination of a CALL FORWARDING - BUSY LINE [C-2] or a CALL FORWARDING - ALL CALLS [C-5] forward is a UCD Group control Station, the call will be forwarded into the UCD Group.
9. Hunting:
   a.) If the final Destination Station of a MULTIPLE CALL FORWARDING-DON'T ANSWER is a controlling Station in a STATION HUNTING-TERMINAL [S-9] or a member Station of a STATION HUNTING-CIRCULAR [S-7], then hunting will take place if that Destination Station is busy.
10. An Applications Floppy Disk is needed to permit the CALL FORWARDING-DON'T ANSWER [C-3] call to be transferred up to five times by CALL FORWARDING-ALL CALLS [C-5] and CALL FORWARDING-BUSY LINE [C-2].
11. For the FCCS Network, assign ASYDN System Data 1, Index 69, Bit 7 = 1 (MULTIPLE CALL FORWARDING-DON'T ANSWER is in service).
12. The OAI monitor number and the ACD pilot number cannot be assigned as the Call Forwarding target Telephone Number.

Interactions

1. If Access Codes for CALL FORWARDING-BUSY LINE [C-2] and CALL FORWARDING-DON'T ANSWER [C-3] are the same, only one key needs to be assigned in AKYD or ADSL, and only one Access Code needs to be assigned in ASPA.

2. Any UCD Station is allowed to activate CALL FORWARDING-DON'T ANSWER [C-3]. When this Station sets CALL FORWARDING-DON'T ANSWER [C-3], Calls directed to this Station through UCD hunting or directly-dialed will ring and then follow the destination of the CALL FORWARDING-DON'T ANSWER [C-3].
3. CALL FORWARDING-DON'T ANSWER [C-3] to an Attendant Console will not operate when the system is in Night mode. If ATTENDANT NIGHT TRANSFER [A-19] is provided, the call is forwarded to the night transfer Station.
4. If the CALL FORWARDING-DON'T ANSWER [C-3] target Station is a Dterm with DO NOT DISTURB [D-21D] activated, Call Forwarding is not activated. The forwarding Station will ring beyond the timer set in ASYD, System Data 1, Index 139.
5. When the CALL FORWARDING-DON'T ANSWER [C-3] feature is set from Station A to Station B, if Station A is idle and Station B is busy, Station A will ring beyond the timer set in ASYD, System Data 1, Index 139.
6. When a call is call forwarded, the Destination Station is recorded for STATION MESSAGE DETAIL RECORDING [S-10].

Programming

STEP 1: **ASYD** - System Data 1, Index 5, Bit 0. Access Codes for CALL FORWARDING-BUSY LINE [C-2] and CALL FORWARDING-DON'T ANSWER [C-3] are same or separate? 0/1: Same/Separate.

System Data 1, Index 69, Bit 2. Is a Short Tone set to alert person receiving the call that this is a CALL FORWARDING-DON'T ANSWER [C-3] Call? 0/1: No/Yes.

System Data 1, Index 69, Bit 7. MULTIPLE CALL FORWARDING-BUSY [M-24], -ALL CALLS [M-44], in service? 0/1: No/Yes.

System Data 1, Index 139. Assign the No-Answer timer for Station-to-Station, DID and TIE Line Calls. For 30 seconds, assign 00H (RAM Data is 3FH).

System Data 1, Index 141. Assign the No Answer timer for Incoming Calls via the Attendant Console. It will then be forwarded to the next Station according to the System Data 1, Index 145 timer. For 10 seconds, assign 00H. (RAM Data is 35H.)

System Data 2, Index 6, Bit 2. Enable CALL FORWARDING-DON'T ANSWER [C-3] on a per Tenant basis.

System Data 2, Index 6, Bit 7. Enable CALL FORWARDING-DON'T ANSWER [C-3] via Attendant Console.

STEP 2: **ANPD** - Reserve a Number Level for Feature Access and cancel. Select Normal Service (N), Hooking Service (H) or Busy Service (B) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan.

STEP 3: **ASPA** - Assign an Access Code to CALL FORWARDING-DON'T ANSWER [C-3] entry, SID = 12 and to CALL FORWARDING-DON'T ANSWER [C-3] cancel SID = 13. Assign Connection Status Index (CI) for "N: Normal" service.

STEP 4: **ASFC** - Assign the Stations to activate CALL FORWARDING-DON'T ANSWER [C-3] a Service Feature Restriction Class that allows SFI = 8.

STEP 5: **AKYD** - For Dterm sets, CALL FORWARDING-ALL CALLS [C-5] may be assigned to a programmable Line/Feature key. Assign Type:Function:CALL FORWARD-DON'T ANSWER [22].

STEP 6: **ADSL** - Assign SN = 1 (Originating; DT Connection) and FKY = 22 (Call Forwarding - Don't Answer; FDN).

This command is used for assigning the function to a Soft key.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

ASYDN - These data must be set to the NCN.

System Data 1 Index 69, Bit 7. Enable Multiple Call Forwarding-Busy Line/Don't Answer/All Calls. 0/1 = Out of Service/In Service

M-26 Message Center Interface

General Description

This feature provides an interface to an external CPU for Message Center information when a specific UCD [U-1] Group or ATTENDANT CONSOLE [A-3] is called. This interface allows external control of Call Indicator Lamp indications on equipped the SV9500 Stations. This feature also provides a socket interface (LAN interface) for Connection to an external LAN.

Note: Call Indicator Lamp on Desktop terminal is used as the Message Waiting Lamp.

The MESSAGE CENTER INTERFACE (MCI) can provide one of two modes of operation. These modes are described as Feature 1 and Feature 2. The functions of each feature are as follows:

Feature 1:

a.) Incoming Call information is sent to the MCI when an Attendant answers.
b.) Control of Call Indicator Lamp based on data from the external CPU.

Feature 2:

a.) Incoming Call information is sent to the MCI when a UCD Station is called.
b.) Dual Call Forwarding service is possible.
c.) Control of Call Indicator Lamp based on data from the external CPU.

Note: Feature 2 is not available when a Hotline Call terminates to a UCD Station.

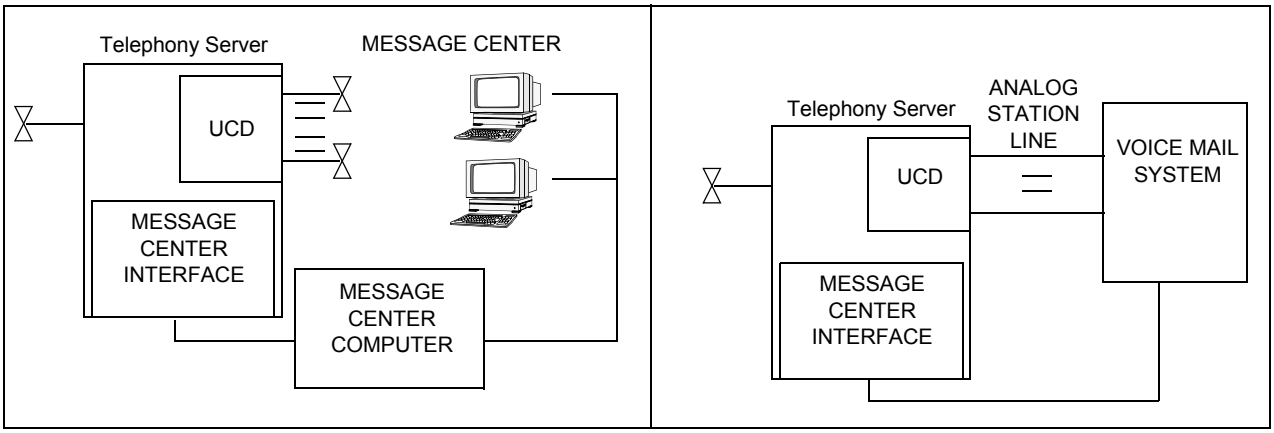
Feature 1

1. When the Attendant answers a call, the System transmits a call handling record to the MCI. The external CPU, based on the received data, will display a profile of the Station/Trunk being handled by the Attendant on the CRT.
2. Call Indicator Lamp control is based on data from the external CPU. Through the external CPU terminal, when information is registered, the Host/CPU system forwards Call Indicator Lamp control data according to the Call Indicator Lamp On/Off control information sent.
3. The System, upon receiving this control data from the MCI, will extinguish or illuminate the Call Indicator Lamp, depending on the subscriber displayed on the Attendant's monitor/display.
4. The Called Station will be able to receive a message from the Attendant by dialing “0”, or a computer terminal by entering an Identification Number.
5. The external CPU, upon receiving retrieved message information, will transmit a data record requesting the System to extinguish the Call Indicator Lamp of the corresponding Station.

Feature 2

1. This provides an interface to a Voice Mail System, or a Message Center Computer that is capable of sending Call Indicator Lamp control data to the System.
2. To perform the data transfer to the external CPU, a Station/Trunk is connected to a designated UCD [U-1] Group. The Stations of the UCD [U-1] Group are connected to the Voice Mail System/Message Center System in order to collect call Connection status of Call Indicator Lamp control information. The block diagram of this concept follows on the next page.
3. The System, upon receiving this control data from the MCI, extinguishes or illuminates the Call Indicator Lamp depending upon the information displayed on the Attendant's monitor/display.
4. The Called Station will be able to receive a message by dialing “0”, or by a computer terminal by entering an Identification Number.

5. The external CPU, upon receiving retrieved message information, will transmit a data record requesting the System to extinguish the Call Indicator Lamp of the corresponding Station.



Service Conditions

<RS-232C Interface Conditions>

1. The call type is sent to the external CPU via the MCI interface, this call record will pertain to the following services:

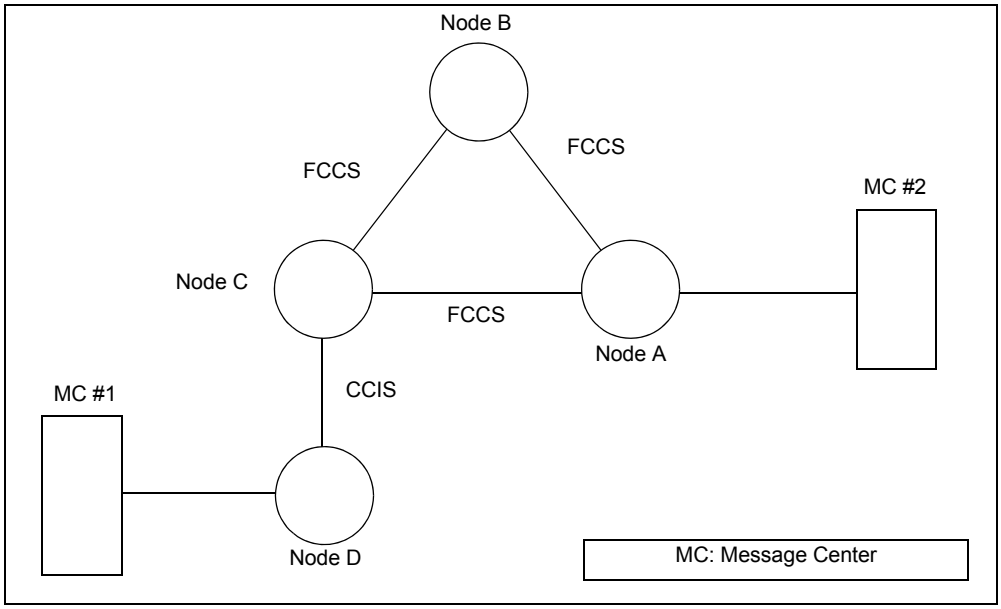
ATTENDANT CAMP-ON	[A-1]
AUTOMATIC RECALL	[A-8]
CALL FORWARDING - DON'T ANSWER	[C-3]
CALL FORWARDING - BUSY LINE	[C-2]
CALL FORWARDING - ALL CALLS	[C-5]
Call returned from Hold	
CALL TRANSFER - ALL CALLS **Note 1**	[C-11]
CENTRALIZED ATTENDANT SERVICE (CAS)	[C-20]
DIAL ACCESS TO ATTENDANT	[D-2]
DID to the Specific UCD Group	
DIT to the Specific UCD Group	
Intercept Call to the Attendant	
INTER-POSITION TRANSFER	[I-5]
LDN Call	
OFF-HOOK ALARM	[O-6]
Recall	
Recall from a Series Call	
Series Call Re-Entry	
Tandem Transferring/Hold Entry	

Note 1: Available for Inter-Office Station transfer calls only.

2. MESSAGE CENTER INTERFACE [M-26] can control the display of a Desktop terminal for Message Indication, Message Waiting in a Message Center application.
3. If an ATTENDANT CONSOLE [A-3] Calls a UCD [U-1] Group directly, for Feature 2, the System will not generate a call record to the MCI.

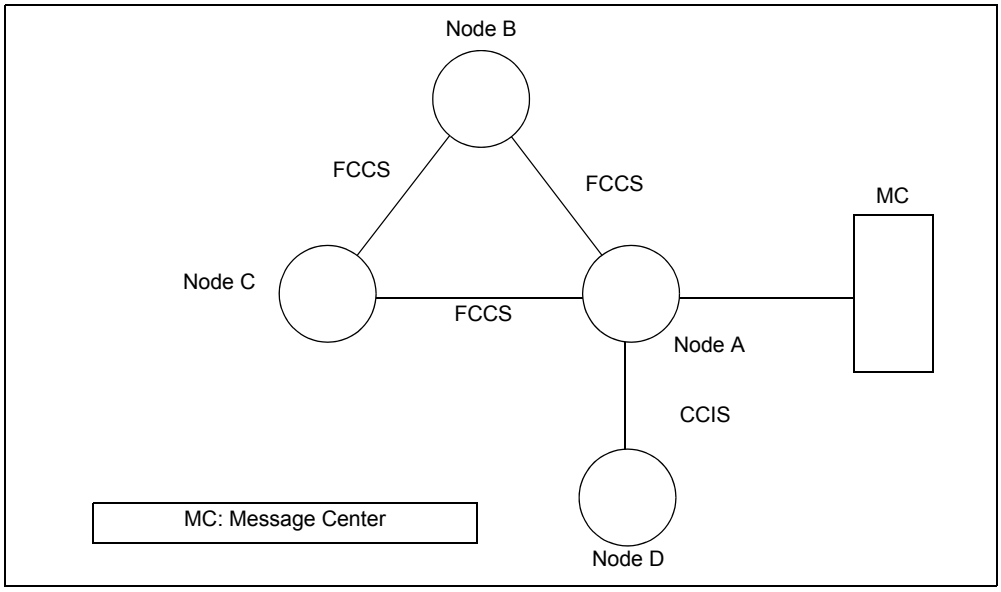
4. If the Host/CPU malfunctions and stops collecting call records, the System can store up to 32 call records. If the maximum of 32 call records is stored and a 33rd is generated, the system will write over the oldest stored record, thus giving the stack the most recently generated call records.
5. MCI data will not be output when a Hotline Station is terminated to a Station that is forwarded to a Voice Mail System.
6. It can be determined on a UCD Group basis whether to send the Incoming Call information of the call terminating to a Station in the UCD Group to the message center CPU. When OVERFLOW - UCD [O-7] is activated, the MCI operation of the overflow UCD Group is followed.
7. When the Calling Party number is received via the Central Office line/ISDN line/CCIS line, the number is sent to the MCI. The Calling Number is output to the additional MCI text format.
8. The maximum of 2 Message Centers (MC) per standalone system is available. When 2 MCs are connected to IOC, each MC information is transmitted to both of them. On condition that one of them is in the event of failure, another can transmit/receive the MC information.

FCCS Conditions



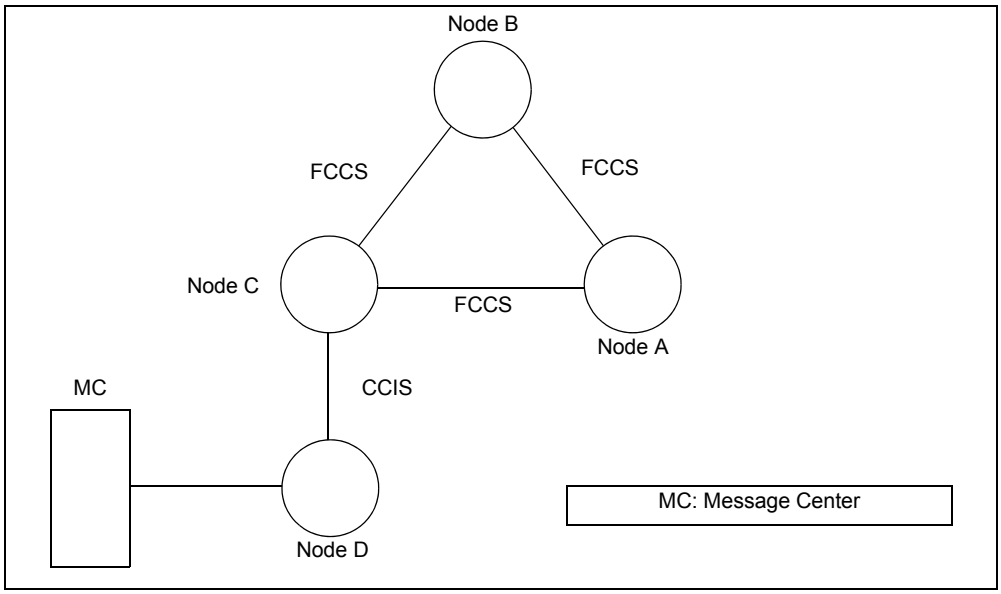
1. Station Number type (Physical Station Number or Telephone Number) to be output for MCI ICS format may be designated by the System Data.
2. Multiple Nodes within FCCS Network can accommodate the MC.
3. A maximum of two MCs per Node is available.
4. The MC Node can control the MWLs of all Station in a maximum of 32 Nodes.

SOCKET Interface (LAN interface) Conditions



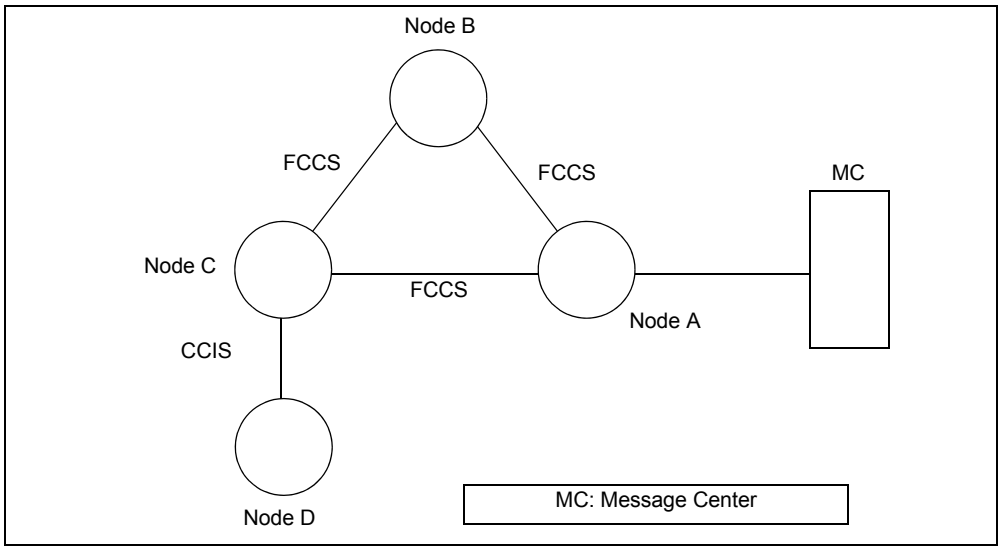
1. LAN interface and IOC interface cannot be used concurrently for MCI.
2. The socket interface will be used for transfer data to and from the Message Center connected to the LAN.
3. After the link has been released, it will always be the client which presents a link establishment request.
4. The MCI messages which are transferred via the LAN interface is IMX format messages only.
5. When 2 MCs are connected to LAN Interface, the MC information is transmitted to both MCs. When transmitting the MC information to lower number port only, assign ASYDL System Data 1 Index 833 Bit 2 = 1 (Single Output).

Interactions



1. In case a Message Center exists on each side of the FCCS Network and CCIS Network:
   a.) Message data will be transmitted to the MC on the side of the CCIS Network (in the figure below, MC 1), provided that a call from any of the FCCS Network Nodes (in the figure, Node A/B/C) terminates to an ATTCON/UCD Station of the non-FCCS Node (in the figure, Node D).
   b.) Message data will be transmitted to the MC on the side of the FCCS Network (in the figure below, MC 2), provided that a call from the non-FCCS Node (in the figure, Node D) terminates to the ATTCON/UCD Station of any of the FCCS Network Nodes (in the figure, Node A, B, C).

2. In case a Message Center is shared by both CCIS and FCCS Networks:
   a.) Message data will be transmitted to the shared MC (in the figure below, assumed to be connected to the FCCS Node A), given that a call from the CCIS Node (in the figure, Node D) terminates to the ATTCON/UCD Station of any of the FCCS Network Nodes (in the figure, Node A, B, C).
   b.) The shared Message Center also can let the Message Waiting Lamps for both FCCS and non-FCCS (CCIS) network Stations go ON and OFF to inform the telephone user of the message arrival.



3. In case the Message Center exists only on the side of CCIS network:
   a.) Message data will be transmitted to the offered MC (in the figure below, assumed to be connected to Node D), given that a call from any of the FCCS Network Nodes (in the figure, Node A/B/C) terminates to an ATTCON/UCD Station of the CCIS Node (in the figure, Node D).
   b.) The MC, though provided Outside the FCCS Network, can also control the Message Waiting Lamp for each Station on the FCCS Service link, as well as ON/OFF indication of the lamps for Stations on the CCIS link.

4. In case the Message Center exists only on the side of FCCS Network:
   a.) Message data will be transmitted to the offered MC (in the figure below, assumed to be connected to Node A), given that a call from the CCIS Node (in the figure, Node D) terminates to the ATTCON/UCD Station of any of the FCCS Network Nodes (in the figure, Node A, B, C).

b.) The MC, though provided only Inside the FCCS Network, can also control the Message Waiting Lamp for each Station on the CCIS link, as well as ON/OFF indication of the lamps for Stations within the FCCS link.

Programming

There are two procedures for the programming depending on used interface;

- <RS-232C Interface Programming>
- <SOCKET Interface (LAN interface) Programming>

<RS-232C Interface Programming>

STEP 1: **ASYD** - System Data 1, Index 28, Bits 0-4. Assign a Miscellaneous Timer Counter (MTC) used to calculate the message-sending Guard Timer for Message Center.

Timer = MTC x 128 milliseconds. Normally a Guard Timer is not required. If not required, assign data "0" to these Bits.

System Data 1, Index 28, Bit 5. Is Message Waiting Lamp setting from the Message Center to be used? 0/1: No/Yes.

System Data 1, Index 29, Bits 0-7. Assign which I/O port will act as the MESSAGE CENTER INTERFACE. Bit 0 = Not used; Bit 1 = Port 1; Bit 2 = Port 2; Bit 3 = Port 3; Bit 4 = Port 4; Bit 5 = Port 5; Bit 6 = Port 6; Bit 7 = Port 7, for a maximum of 2 ports.

System Data 1, Index 34, Bit 1 and 2. Parity check of RS-232C output code.

Bit1, Bit2 = "00"; no parity and output (parity bit fixed to "0").

System Data 1, Index 60, Bit 3. UCD Queuing must be required. Assign Bit 3 as data "0".

System Data 1, Index 70, Bit 0. Called Number Display on the Console for DID and TIE Line Calls must be enabled. Assign Bit 0 as data "1" when System Data 2, Index 6, Bit 7 is also enabled.

System Data 1, Index 78, Bit 0. CALLING NUMBER DISPLAY -D [C-24D] must be enabled. Assign Bit 0 as data "1".

System Data 1, Index 78, Bit 1. CALLING STATION STATUS DISPLAY -D [C-22D] must be enabled. Assign Bit 1 as data "1".

System Data 1, Index 244, Bit 2. MCI-CCIS output packet change for originating party's information when the last digit is "*" (This data is valid when the originating party is a station).
System Data 1, Index 370, Bit 1: MCI Office Code Elimination is required? 0/1:No/Yes
When "1" is set office code elimination in MCI output is in service (ARNP Route 0 is referred).

Note: This feature is available in North America and Australia.

System Data 1, Index 400, Bit 2: ANI (CLI in Australia) information is sent when a DID Incoming Call terminates to ATT or a UCD station? 0/1=No/ANI (CLI in Australia) information is sent to MCI.

Note: Index 116, Port 0 is assigned as data 02H, PCPro.

System Data 2, Index 6, Bit 0. Is MCI service with UCD Groups to be enabled? 0/1: No/Yes.
System Data 2, Index 7, Bit 1. Is MCI service for calls via the Attendant Console to be enabled? 0/1: No/Yes.
System Data 1, Index 214, Bit 5. Will eliminate office codes from J record, in expanded field.

Caution: Flagging will remove office codes from phone display.

Note: Flagging will not remove office codes from SMDR records.

Note: Do not flag Index 214, Bit 5, when Index 370, Bit 1=1, as it will cause double office code elimination.

System Data 1, Index 240, Bit 4. This bit defines the meaning of the Station Information in the office that has VMS/Host Computer within the CCIS Network. 0/1: Station Information = Office Code + Station Number/Station Information = Station Number

Note: Do not flag Index 240, Bit 4, when Index 370, Bit 1=1, as it will cause double office code elimination.

STEP 2: **ASYDL** - System Data 1, Index 833, Bit 0. Interface type for MCI is "0" = RS-232C interface.
System Data 1, Index 833, Bit 1. Text format for MCI. 0/1 = ICS/IMX format.
System Data 1, Index 833, Bit 4. Output the LDN number 0/1 = ICS/IMX format.
(Called Party Information Output on Call Type 30 when call was received on ATTCON)

Note: When more than 5 digits' Telephone Number is assigned, designate "1 = IMX format".

STEP 3: **AIOC** - Assign the function and attribute data of the IOC ports.

STEP 4: **ASHU/ASHUL** - Create a group of lines.

STEP 5: **AUCD** - Assign UCD-related data to transfer the call record to the UCD group to MCI.
MCI = 0 (The call record to the UCD group is transferred to MCI.)

<SOCKET Interface (LAN interface) Programming>

STEP 1: **ASYD** - System Data 1, Index 28, Bits 0-4. Assign a Miscellaneous Timer Counter (MTC) used to calculate the message-sending Guard Timer for Message Center.

Timer = MTC x 128 milliseconds. Normally a Guard Timer is not required. If not required, assign data "0" to these Bits.

System Data 1, Index 28, Bit 5. Is Message Waiting Lamp setting from the Message Center to be used? 0/1: No/Yes.

System Data 1, Index 29, Bits 0-7. Assign which I/O port will act as the MESSAGE CENTER INTERFACE. Bit 0 = Not used; Bit 1 = Port 1; Bit 2 = Port 2; Bit 3 = Port 3; Bit 4 = Port 4; Bit 5 = Port 5; Bit 6 = Port 6; Bit 7 = Port 7, for a maximum of 2 ports.

System Data 1, Index 60, Bit 3. UCD Queuing must be required. Assign Bit 3 as data "0".

System Data 1, Index 70, Bit 0. Called Number Display on the Console for DID and TIE Line Calls must be enabled. Assign Bit 0 as data "1" when System Data 2, Index 6, Bit 7 is also enabled.

System Data 1, Index 78, Bit 0. CALLING NUMBER DISPLAY -D [C-24D] must be enabled. Assign Bit 0 as data "1".

System Data 1, Index 78, Bit 1. CALLING STATION STATUS DISPLAY -D [C-22D] must be enabled. Assign Bit 1 as data "1".

System Data 1, Index 244, Bit 2. MCI-CCIS output packet change for originating party's information when the last digit is "*" (This data is valid when the originating party is a station).

System Data 1, Index 370, Bit 1: MCI Office Code Elimination is required? 0/1:No/Yes

When "1" is set office code elimination in MCI output is in service (ARNP Route 0 is referred).

Note: This feature is available in North America and Australia.

System Data 1, Index 400, Bit 2: ANI (CLI in Australia) information is sent when a DID Incoming Call terminates to ATT or a UCD station? 0/1=No/ANI (CLI in Australia) information is sent to MCI.

Note: Index 116, Port 0 is assigned as data 02H, PCPro.

System Data 2, Index 6, Bit 0. Is MCI service with UCD Groups to be enabled? 0/1: No/Yes.

System Data 2, Index 7, Bit 1. Is MCI service for calls via the Attendant Console to be enabled? 0/1: No/Yes.

System Data 1, Index 214, Bit 5. Will eliminate office codes from J record, in expanded field.

Caution: Flagging will remove office codes from phone display.

Note: Flagging will not remove office codes from SMDR records.

Note: Do not flag Index 214, Bit 5, when Index 370, Bit 1=1, as it will cause double office code elimination.

System Data 1, Index 240, Bit 4. This bit defines the meaning of the Station Information in the office that has VMS/Host Computer within the CCIS Network. 0/1: Station Information = Office Code + Station Number/Station Information = Station Number.

Note: Do not flag Index 240, Bit 4, when Index 370, Bit 1=1, as it will cause double office code elimination.

STEP 2: **ASYDL** - System Data 1, Index 529, Bits 0 and 1. Parity check method of SMDR/MCI with LAN interface.

Bit 1, Bit 0: 00 = Odd Parity (Default)
01 = Odd Parity
10 = Even Parity
11 = No Parity

System Data 1, Index 833, Bit 0. Interface type for MCI is "1" = LAN interface.

System Data 1, Index 833, Bit 1. Text format for is "1" = IMX format.

System Data 1, Index 833, Bit 2. Assignment of how to output the Message Center Information for LAN Connection.

0/1 = Dual output/Single Output

System Data 1, Index 833, Bit 4. Output the LDN number 0/1 = ICS/IMX format.

(Called Party Information Output on Call Type 30 when call was received on ATTCON)

Note: When more than 5 digits' Telephone Number is assigned, designate "1 = IMX format".

System Data 1, Index 834, Bit 0. 0/1 = MC0 for LAN is not mounted/mounted.
System Data 1, Index 834, Bit 1. 0/1 = MC1 for LAN is not mounted/mounted.

STEP 3: **ADTM** - Specify the Port Number used for each MCI within the range of 1024 to 65534. When "0" is set, the default value (60020) is automatically used.

STEP 4: **ASHU/ASHUL** - Create a group of lines.

STEP 5: **AUCD** - Assign UCD-related data to transfer the call record to the UCD group to MCI.
MCI = 0 (The call record to the UCD group is transferred to MCI.)

FCCS Programming

This data setting describes the additional FCCS Service data after the non-FCCS Service data has been programmed. Note that the data setting for FCCS Service varies depending on the Node.

STEP 1: **ASYDL**

System Data 1, Index 641 Bit 1. Designate output numbers for MCI ICS format.

0/1 = Physical (Station) number/Telephone Number

System Data 1, Index 832. Assign the FPC (Fusion Point Code) of the Node providing the MC.

STEP 2: **AMWF** **Note 2**

Assign FPC (Fusion Point Code) of the Node for being controlled the MWL on the Desktop terminal by the MC.

Note 2: Assign this data to the Node accommodating the MC.

STEP 3: **ASHUN** - Create a group of lines.

STEP 4: **AUCDN** - Assign UCD-related data to transfer the call record to the UCD group to MCI.

MCI = 0 (The call record to the UCD group is transferred to MCI.)

M-30 Message Waiting Lamp Setting - Station

General Description

This feature allows a Station to set/cancel a Message Waiting indication or lamp. Any Single Line Telephone or Desktop terminal can set/cancel Message Waiting indication to any Single Line Telephone equipped with a 90v neon lamp, or a Desktop terminal.

Note: Call Indicator Lamp on Desktop terminal is used as the Message Waiting Lamp.

Operating Procedure

For example:

Station 200: User's Station
Station 201: Message Agent*

Note: A Message Agent is a preassigned Station allowed to set/cancel a Message Waiting indication.

1. Station 200 sets Call Forwarding to Station 201.
2. An Incoming Call to Station 200 is call forwarded to Station 201.
3. Station 201 receives a message from the Calling Party.
4. Station 201 hangs up.
5. Station 201 sets the Message Waiting indication for Station 200. (Procedure 1)
6. Station 200 sees the Message Waiting indication.
7. Station 200 calls Station 201.
8. Station 200 receives the message from Station 201.
9. The call is terminated.
10. Station 201 cancels the Message Waiting indication for Station 200. (Procedure 2)

Procedure 1:

To set a Message Waiting Indication from a Single Line Telephone

1. Lift the handset. Receive Dial Tone.
2. Dial the Message Waiting Set Access Code (up to three digits). Receive Special Dial Tone.
3. Dial the desired Telephone Number. Receive Service Set Tone.
4. Message Waiting indication is set.

To set a Message Waiting Indication from a Desktop terminal or MY Line

1. Lift the handset or press the SPEAKER key. Receive Dial Tone.
2. Press the MESSAGE WAITING Set key. Receive Special Dial Tone.
3. Dial the desired Telephone Number. The LCD displays:

   Service Set Tone is heard.
4. Message Waiting indication is set.

Procedure 2:

To cancel a Message Waiting Indication from a Single Line Telephone

1. Lift the handset. Receive Dial Tone.
2. Dial the Message Waiting Cancel Access Code (up to three digits). Receive Special Dial Tone.
3. Dial the desired Telephone Number. Receive Service Set Tone.
4. Message Waiting indication is canceled.

To cancel a Message Waiting Indication from a Desktop terminal or MY Line

1. Lift the handset or press the SPEAKER key. Receive Dial Tone.
2. Press the MESSAGE WAITING Cancel key. Receive Special Dial Tone.
3. Dial the desired Telephone Number. The LCD displays, and Service Set Tone is heard.:

MW CANCEL **(Time Display)**

4. Message Waiting indication is canceled.

Service Conditions

1. Any number of Desktop terminal stations within the system can be assigned to activate this feature.
2. Any attempt to set Message Waiting to a Station that already has a Message Waiting indication will receive Busy Tone.
3. Each Station can cancel the Message Waiting indication.
4. This feature can be restricted by CLASS OF SERVICE - INDIVIDUAL [C-15].
5. Message Waiting for one Station of the network can be controlled from the ATTENDANT CONSOLE [A-3] and any other Station at the same time.
6. The Message Waiting indication on a Station appears as follows:

Type of Station Set	Condition
Single Line Telephone with MWL Desktop terminal series without display	Message Waiting Lamp is ON
Desktop terminal series with display	Display shows: **MW** **(Time Display)**

7. The LCD on the Desktop terminal station displays the following messages:

		LCD	
MESSAGE WAITING already set	SETTING	**MW BUSY** **(Time Display)**	Busy Tone
	CANCELLING	**MW CANCEL** **(Time Display)**	Service Set Tone

		LCD	
MESSAGE WAITING not set	SETTING	**MW SET** **(Time Display)**	Service Set Tone
Restricted Station, unused Telephone Number, Dead Level, restriction	SETTING	**MW REST** **(Time Display)**	Reorder Tone
	CANCELLING	**MW REST** **(Time Display)**	Reorder Tone

Interactions

1. For MESSAGE WAITING LAMP SETTING-STATION, the 8DLC/16ELC card is required.
2. An external power source is required to light a Single Line Telephone lamp. The non-display Desktop terminals use an 80 VDC power source. NEC stocks Lorain Model HSA3H.
3. The use of the following features has no effect on this feature. MESSAGE WAITING LAMP SETTING-STATION can still be set to a Station that has previously activated any of the following features:
   - DO NOT DISTURB -D [D-21D].
   - CALL BACK -D [C-1] set to Called Station.
   - CALL BACK -D [C-1] set from Called Station.
   - CALL FORWARDING-ALL CALLS [C-5] will not follow forwarding data.
   - CALL FORWARDING-DON'T ANSWER [C-3] will not follow forwarding data.
   - CALL FORWARDING-BUSY LINE [C-2] will not follow forwarding data.
4. When an Incoming Call is answered by the Sub Line Appearance on another Station, the following services may be activated either by the answering Station or by another Station towards the answering Station. These services will not interfere with the answering Station's ability to leave a Message Waiting indication.

PRIVACY -D	[P-14D]
CONSULTATION HOLD-ALL CALLS	[C-17]
ATTENDANT CAMP-ON WITH TONE INDICATION (set to answering Station)	[A-1]
CALL WAITING-ORIGINATING (set to answering Station)	[C-31]
CALL WAITING-ORIGINATING (set from answering Station)	[C-31]
THREE-WAY CALLING	[T-2]
NON-EXCLUSIVE HOLD -D	[N-7D]
EXCLUSIVE HOLD -D	[E-4D]
DUAL HOLD	[D-32]

5. Message Waiting can be set to yourself if you wish to leave yourself a reminder.
6. Numbering Plan data (ANPD and ASPA) is not required if only Digital Terminal sets use this feature.

Programming

STEP 1: **ANPD** - Reserve a Number Level for Feature Access and cancel. Select Normal Service (N), Hooking Service (H) or Busy Service (B) from the combo box for Connection Indexes. (applicable to any feature assigned to this Level). Assign NND in accordance with a predetermined Numbering Plan.

STEP 2: **ASPA** - Assign an Access Code for setting the Message Waiting Lamp. Set SRV = "SSCA: Service Code Appendix"; SIDA = 54. Cancel Message Waiting Lamp SRV = "SSCA: Service Code Appendix"; SIDA = 55. Assign Connection Status Index (CI) for "N: Normal" service.

STEP 3: **ASFC** - Assign a Service Feature Restriction Class that allows SFI = 74 and SFI = 82 to the Stations that receive the Message Waiting Lamp setting feature.

STEP 4: **AKYD** - Assign Message Waiting Lamp set feature to a Line/Feature key. Assign Type: Function: BOSS - SECRETARY MSG WAIT-SET [9] and a MESSAGE WAITING LAMP Cancel key, Type: Function: BOSS - SECRETARY MSG WAIT-CANCEL [11].

Assign SN = 1 (Originating; DT Connection) and FKY = 11 (Boss - Secretary - Message Waiting Lamp Control; Cancel).

STEP 5: **ADSL** - Assign SN = 1, 2, 3, 4, 5 and FKY = 9 (Boss-Secretary-Message Waiting Lamp Control; Set).

Assign SN = 1, 2, 3, 4, 5 and FKY = 11 (Boss-Secretary-Message Waiting Lamp Control; Cancel).

This command is used for assigning the function to each Soft key.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

STEP 1: **ANPDL** - Reserve a Number Level for Feature Access and cancel. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. (applicable to any feature assigned to this Level). Assign NND in accordance with a predetermined Numbering Plan.

STEP 2: **ASPAL** - Assign an Access Code for setting the Message Waiting Lamp. Set SRV = "SSCA: Service Code Appendix"; SIDA = 54. Cancel Message Waiting Lamp SRV = "SSCA: Service Code Appendix"; SIDA = 55. Assign Connection Status Index (CI) for "N: Normal" service.

M-44 Multiple Call Forwarding - All Calls

General Description

This feature permits a call to a CALL FORWARDING - ALL CALLS Station to be forwarded multiple times to a predesignated Idle Station.

Operating Procedure

To set and cancel from an individual Station using the same Access Code Note 1

- For setting:

1. Lift the handset. Receive Dial Tone.
2. Dial the CALL FORWARDING - ALL CALLS entry Access Code. Receive Special Dial Tone.
3. Dial the desired Forwarding Destination Number. Receive Service Set Tone.

- For cancellation:

1. Lift the handset. Receive Dial Tone.
2. Dial the CALL FORWARDING - ALL CALLS entry Access Code. Receive Special Dial Tone.

Note 1: Available from FP95-114 V4 Issue 2.0 with system data ASYDL, SYS1, Index 686, Bit 0= 1.

To set and cancel from an individual Station using different Access Codes

- For setting:

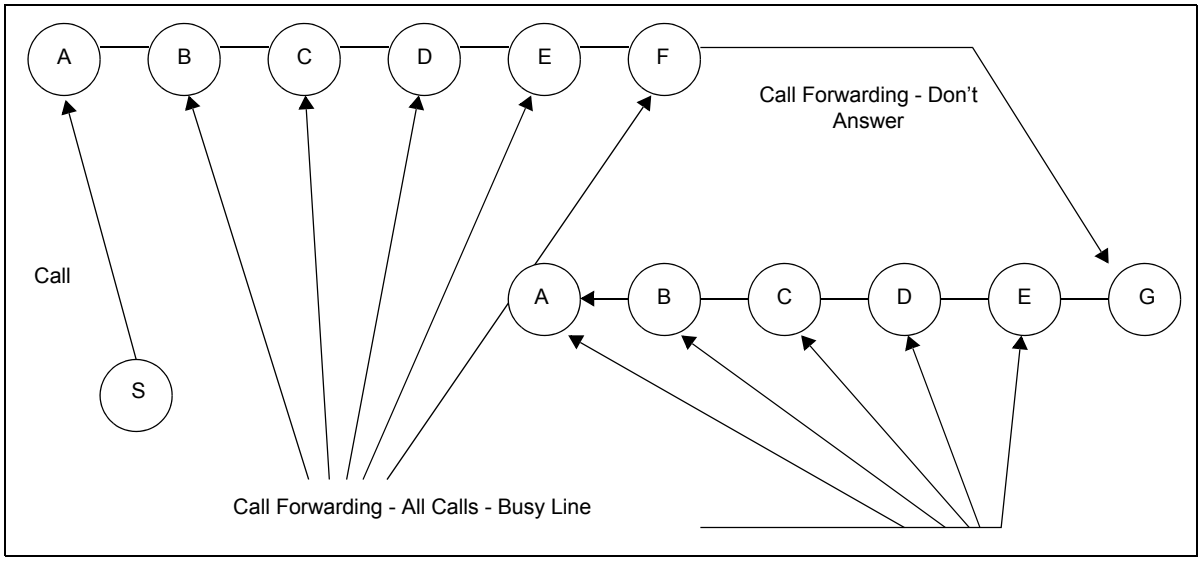
1. Lift the handset. Receive Dial Tone.
2. Dial the CALL FORWARDING - ALL CALLS entry Access Code. Receive Special Dial Tone.
3. Dial the desired Forwarding Destination Number. Receive Service Set Tone.

- For canceling:

1. Lift the handset. Receive Dial Tone.
2. Dial the CALL FORWARDING - ALL CALLS cancel Access Code. Receive Service Set Tone.

To set from the Attendant Console

1. Press an Idle Loop key.
2. Dial the CALL FORWARDING - ALL CALLS entry Access Code. Receive Special Dial Tone.
3. Dial the TENANT [T-12] number (two or three digits).
4. Dial the originating Telephone Number.
5. Dial the desired Forwarding Destination Number. Receive Service Set Tone.



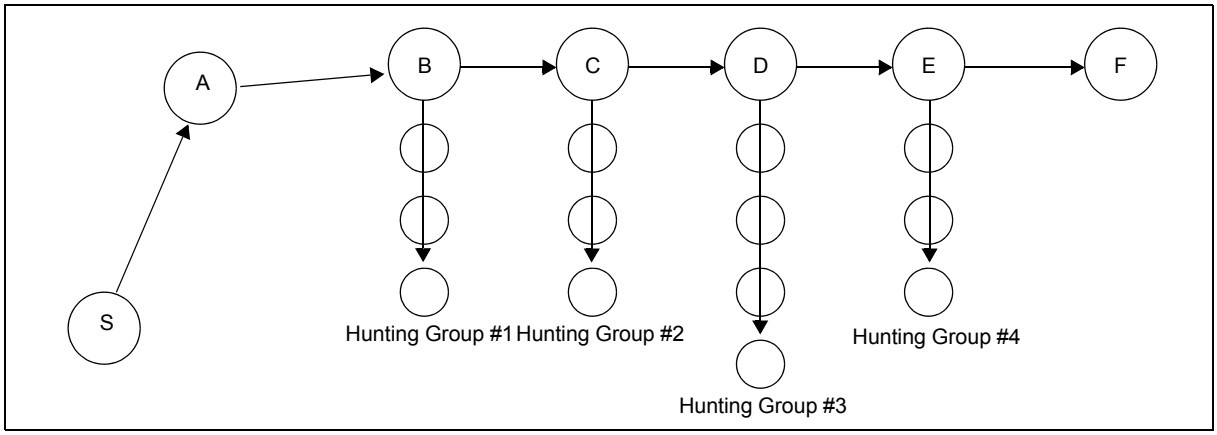
To cancel from the Attendant Console

1. Press an Idle Loop key.
2. Dial the CALL FORWARDING - ALL CALLS cancel Access Code. Receive Special Dial Tone.
3. Dial the TENANT [T-12] number (two or three digits).
4. Dial the originating Telephone Number. Receive Service Set Tone.

Service Conditions

1. If CALL FORWARDING - ALL CALLS [C-5] is set at the Called Station, the call is forwarded to a designated Station that has set CALL FORWARDING-ALL CALLS [C-5] or CALL FORWARDING-BUSY LINE [C-2].
2. A call can be forwarded up to five times, maximum, by MULTIPLE CALL FORWARDING - ALL CALLS [C-5], and only by the voice port of a Dterm, or by a Single Line Telephone.
3. A call will not forward any farther than the Station to where it has been forwarded to.
4. If a forward destination is busy, and if neither CALL FORWARDING - BUSY LINE [C-2] nor CALL FORWARDING - ALL CALLS [C-5] is set, the caller hears a Busy Tone.
5. If the originating Station is designated as the forward destination, the call will not be forwarded.
6. CALL FORWARDING - BUSY LINE [C-2] and CALL FORWARDING - ALL CALLS [C-5] combination:
   a.) A maximum of five forwarding operations can be performed by any combination of CALL FORWARDING-ALL CALLS [C-5] and CALL FORWARDING-BUSY LINE [C-2].
   b.) If the fifth forward destination is busy, the call will forward if CALL FORWARDING - DON'T ANSWER [C-3] is set. Otherwise, the caller will hear a Busy Tone.
   c.) If a sequence of CALL FORWARDING - ALL CALLS [C-5] and CALL FORWARDING - BUSY LINE [C-2] forwards the call back to the originating Station, the forward is not provided.
   d.) If a sequence of CALL FORWARDING - ALL CALLS [C-5] and CALL FORWARDING - BUSY LINE [C-2] forwards the call back to the originally Called Station, and if that Station forwards the call with CALL FORWARDING - BUSY LINE [C-2], the ultimate destination will be the originally Called Station. If, however, the originally Called Station forwards the call with CALL FORWARDING - ALL CALLS [C-5], the ultimate destination will be the Station it has designated as its CALL FORWARDING - ALL CALLS [C-5] destination.
   e.) If the call is forwarded back to the Station where it has been forwarded to, the CALL FORWARD will terminate at that Station.
7. CALL FORWARDING - ALL CALLS [C-5], CALL FORWARDING - BUSY LINE [C-2] and CALL FORWARDING - DON'T ANSWER [C-3] combination:

   Although CALL FORWARDING - ALL CALLS [C-5], CALL FORWARDING - BUSY LINE [C-2] and combinations of the two are limited to forwarding five times, when a sequence of forwards is divided by CALL FORWARDING - DON'T ANSWER [C-3], CALL FORWARDING - ALL CALLS [C-5] and CALL FORWARDING - BUSY LINE [C-3], forwards can begin again (the only limit is shown below).



8. Forwarding to an Attendant Console:
   a.) If an Attendant Console is designated as the destination of CALL FORWARDING - ALL CALLS [C-5], the call is forwarded to the Attendant Console handling the Tenant to which the Calling Station belongs.
   b.) The Attendant Console key that lights when a call is forwarded to the Console depends on the forwarding status of the originally Called Station (except in paragraph c). The following table shows the key that will light; e.g., the BUSY key will light, if the forwarding status of the originally Called Station is CALL FORWARDING - BUSY LINE [C-2], and the call is from a Station.

	Forwarding Status Of Originally Called Station		
	Call Forward -All Calls	**Call Forward -Busy**	**Call Forward -Don't Answer**
Call From Station	ATND	BUSY	NANS
Call From Trunk	Depends on Trunk class	BUSY	NANS

   c.) If the call is forwarded by CALL FORWARDING - DON'T ANSWER [C-3] at any point in a forwarding sequence, the NANS key on the Attendant Console will light, even if the call status of the originally Called Station is CALL FORWARDING - ALL CALLS or CALL FORWARDING - BUSY LINE.
   d.) Called Number Display is only provided if a call is forwarded to the Attendant Console by CALL FORWARDING - ALL CALLS [C-5] or by CALL FORWARDING - BUSY LINE [C-2].
9. Forwarding to a Dterm:
   a.) The Calling Dterm's display will show the number of the Called Station on the left, and the number of the Station being called on the right. The display on the ringing Dterm will show the number of the originally Called Station on the left, and the number of the Calling Station on the right.
   b.) The forward status of the originally Called Station is shown on the far left of each Dterm's display: FDB for CALL FORWARDING - BUSY LINE [C-2]; FDA for CALL FORWARDING - ALL CALLS [C-5].

10. UCD Groups:
    a.) If the destination of a CALL FORWARDING - ALL CALLS [C-5], CALL FORWARDING - BUSY LINE [C-2], or CALL FORWARDING - DON'T ANSWER [C-3] is a UNIFORM CALL DISTRIBUTION (UCD) [U-1] Group control Station, and CALL FORWARDING - ALL CALLS [C-5] is not set at that Station, the call will be forwarded according to UCD [U-1] procedures.
    b.) In the UCD procedure, if CALL FORWARDING - ALL CALLS [C-5] is set on a Station in the group, that Station is skipped.
11. Hunting:
    a.) If the final Destination Station is busy, or if some condition prevents the call from being forwarded, a busy line is selected, and a hunting check is performed.
    b.) If a call is forwarded by CALL FORWARDING - BUSY LINE [C-2] to Stations that are members of Hunting Groups, a hunting check is performed on the busy line closest to the Called Station, or on the busy line closest to the final forward destination. In the diagram below, a hunting check is performed on Hunt Groups 1 or 4. A hunting check is never performed on groups 2 or 3.

12. Busy Services, such as, EXECUTIVE RIGHT OF WAY [E-1], CALL BACK [C-1], etc.:
    a.) Busy service is provided to the busy line closest to the originally Called Station.
13. DIT, NIGHT CONNECTION - FIXED [N-1]:
    a.) For CALL FORWARDING - ALL CALLS [C-5] and CALL FORWARDING - BUSY LINE [C-2], a forwarding check is made up to 5 times by System Data.
    b.) If a line is busy in DIRECT-IN TERMINATION [D-7], CALL FORWARDING - BUSY LINE [C-2] to the Attendant is not activated. Instead, the destination for the call can be specified by System Data:
    System Data 2 Index = 11
    Bit 7 = 0 - Call is routed to the Attendant Console
    Bit 7 = 1 - Call is placed in queue until the Called Station becomes idle.
14. When activating this feature via FCCS, a Telephone Number must be set to the Call Forwarding Destination.
15. When activating this feature via FCCS, a call cannot be forwarded more than five times.
16. When activating this feature via FCCS, the number of times is assigned by System Data.
17. The OAI monitor number and the ACD pilot number cannot be assigned as the Call Forwarding target Telephone Number.

18. By registering the Multiple Call Forwarding - All Calls Access Code + the desired Forwarding Destination Number to the CF Setting button of a Line/Feature key on a Desktop terminal, it is possible to enable and disable MULTIPLE CALL FORWARDING - ALL CALLS [M-44] just by pressing the CF Setting button. For a detailed explanation, see CALL FORWARDING (CF) BUTTON - ONE TOUCH [C-208].

Note: CALL FORWARDING (CF) BUTTON - ONE TOUCH [C-208] is available from FP95-114 V4 Issue 2.0.

Interactions

1. Station users are unaccustomed to hearing Ringback Tone when responding to their own Station's ring. Be sure to inform users when providing Ringback Tone with MULTIPLE CALL FORWARDING-ALL CALLS in System Data 1, Index 69, Bit 1.
2. MULTIPLE CALL FORWARDING can only be activated from an Idle Station.
3. When CALL WAITING [C-12, 31] ATTENDANT CAMP-ON WITH TONE INDICATION [A-1], and CALL BACK [C-1] is directed toward Station A with CALL FORWARDING set to Station B, Station B will receive CALL WAITING tones.
4. When a Station in a STATION HUNTING [S-7, 8, 9] Group initiates MULTIPLE CALL FORWARDING-ALL CALLS, calls normally destined for this Station will not be received. The Hunt Group operates as if the Station were busy.
5. A non-controlling UCD Station is allowed to activate CALL FORWARDING [C-5]. With this Station call forwarded, only calls dialed directly to this Station are call forwarded. The member Station is removed from the UCD Group under the conditions of this Call Forwarding feature.
6. If an Attendant attempts BUSY VERIFICATION [B-3] to Station A, which has MULTIPLE CALL FORWARDING-ALL CALLS set to Station B, BUSY VERIFICATION proceeds as if the Attendant had attempted to verify Station B. If Station A has set MULTIPLE CALL FORWARDING-ALL CALLS to the Attendant Console [A-3], BUSY VERIFICATION [B-3] is allowed at Station A, if Station A is busy.
7. When MULTIPLE CALL FORWARDING-ALL CALLS is in effect, the activating Station may be used to originate calls. See System Data 2, Index 6, Bit 4.
8. When a Station is call forwarded, the Destination Station is recorded for STATION MESSAGE DETAIL RECORDING [S-10].
9. MULTIPLE CALL FORWARDING-ALL CALLS can be overridden, allowing Station B to initiate or transfer calls back to Station A.
10. STATION-TO-STATION CALLING [S-11] must be provided first.

Programming

STEP 1: **ASYD** - System Data 1, Index 4, Bit 6. One burst of ringing at forwarding Station when MULTIPLE CALL FORWARDING-ALL CALLS is in service? 0/1: No/Yes.

System Data 1, Index 69, Bit 1. A burst of Ringback Tone to alert the person receiving a call that this is a MULTIPLE CALL FORWARDING-ALL CALLS Call. In service? 0/1: No/Yes. Normally assigned as data "0".

System Data 1, Index 69, Bit 7. MULTIPLE CALL FORWARDING - BUSY LINE [M-24], - ALL CALLS [M-44], in service? 0/1: No/Yes.

System Data 2, Index 6, Bit 4. Enable Stations set for MULTIPLE CALL FORWARDING-ALL CALLS be allowed to use their phones normally. If data "0" is assigned, the Station will only be able to call the Attendant Console. Assign on a per Tenant basis.

STEP 2: **ASYDL/N** - SYS1, Index 686, Bit 0=1.
Disabling Call Forwarding - All Calls with entry Access Code is in service.

Note: Available from FP95-114 V4 Issue 2.0.

STEP 3: **ANPD** - Reserve a Number Level for Feature Access and cancel (**Note 2**). Select Normal Service (N), Hooking Service (H) or Busy Service (B) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan.

STEP 4: **ASPA** - Assign an Access Code to MULTIPLE CALL FORWARDING-ALL CALLS entry, SID = 8 and to MULTIPLE CALL FORWARDING-ALL CALLS cancel SID = 9 (**Note 2**). Assign a Connection Status Index (CI) for "N: Normal" service.

Note 2: When SYS1, Index 686, Bit 0=1 (Disabling Call Forwarding - All Calls with entry Access Code is in service), Call Forwarding - All calls cancel is not required because the cancellation can be performed with the entry Access Code.

STEP 5: **ASFC** - Assign the Stations to activate MULTIPLE CALL FORWARDING-ALL CALLS a Service Feature Restriction Class that allows SFI = 7.

STEP 6: **AKYD** - For Dterm sets, MULTIPLE CALL FORWARDING-ALL CALLS may be assigned to a Line/Feature key. AssignType:Function:CALL FORWARDING-ALL CALLS [2].

STEP 7: **ADSL** - SN = 1 (Originating; DT Connection) and FKY = 2 (Call Forwarding - All Calls; FDA).

This command is required only for assigning the function to each Soft key.

STEP 8: **ATNR** - Allow Tenant-to-Tenant Connection for Inter and Intra-Tenant Connections. Assign Tenant Restriction Index (TRI) = 1. For this feature to be set by the Attendant Console, assign Inter and Intra-Tenant Connection via the Attendant Console TRI = 3. Also allow TRI = 0, Station-to-Station Calling.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

ASYDN - These data must be set to the NCN.

System Data 1 Index 69, Bit 7. Enable Multiple Call Forwarding-Busy Line/Don't Answer/All Calls. 0/1 = Out of Service/In Service. Index5, Bit 1-3. Assign the number of time for forwarding.

M-47 Manual Signaling

General Description

This feature permits Desktop terminal users to send a one-second ring to a predetermined Station. The manual intercom SIGNAL key (SIG key) is operational at all times. An Intercom Call is not required. If the signaled Station is ringing from another call, the manual intercom signal will interrupt that ringing.

Operating Procedure

Press the SIG key. Send a one-second ring to the predetermined Station.

Service Conditions

1. When MANUAL SIGNALING is initiated by a Station user, this one-second ring takes priority over any other Incoming Call indications from the Multi Line Appearances.
2. Only Dterm can be assigned a manual SIG key.
3. One Destination Station can be assigned for manual signaling through the PCPro.
4. Stations that can signal each other must be assigned in the same Module Group. **Note 1**
5. A Station can manually signal one other Dterm.
6. MANUAL SIGNALING is an operation of MANUAL INTERCOM [A-30] and is used independently of the MANUAL INTERCOM [A-30] feature.

Note 1: This is also applied to FCCS Service.

Programming

STEP 1: **ASYD** - System Data 1, Index 59, Bit 7. Is AUTOMATIC/MANUAL INTERCOM [A-30] in service? 0/1: No/Yes.

STEP 2: **AICD** - For a Station to manually signal another Station, an AUTOMATIC/MANUAL INTERCOM [A-30] Group must be assigned. Bridge Call is not required. The maximum number of Stations per group may be assigned. Assign the intercom Station Number as the signaling Station and the signaling Station Number as the signaled Station.

MG: Module Group
G-ID: Group ID Number per MG
A/M: Automatic/Manual Signaling (0/1)
0: Automatic
→ 1: Manual
BCR: Bridge Call Restriction (0/1)
→ 0: Restricted
1: Allowed
TN: Tenant Number
→ ICM STN: Intercom Station Number
→ SIG STN: Signaling Station Number

STEP 3: **AKYD** - Assign to the Station an Intercom Line according to the following parameters:

TN: 1
STN: Station Number

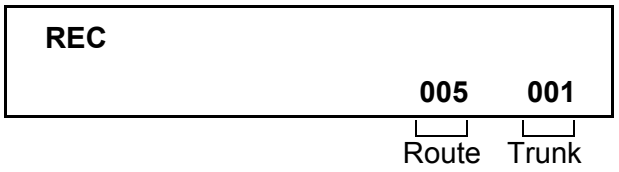
TP: Type of Dterm (0-3)
PRI: Form of Line Preference (0-3)
KYN: Key Number (1-40)
KYI: Service Index
0: Key Not Used
1: Feature key
→ 2: Multi Line key
KD: Kind of Line
0: Multi Line
→ 1: Intercom Line
2: DSS Console key
3: -
4: Multiple Line Appearance
→ ICM: Kind of Intercom
0: Automatic Intercom
1: Manual Intercom
2: Dial Intercom

If MANUAL SIGNALING is used, assign a programmable Line/Feature key as Type: Function: MANUAL SIGNALING KEY [60].

STEP 4: **ADSL** - Assign SN = 0, 1, 2, 3, 4, 5, 6, 7, 15 and FKY = 60 (Manual Signaling key; SIG).
This command is used only for assigning the function to each Soft key.

M-48 Multi Channel Recording - DAT

General Description



This feature allows a Station user to record a message to multiple Digital Announcement Trunks (DATs) in a single operation. The message recorded in a Trunk is automatically copied to other Trunks one after another.

Operating Procedure

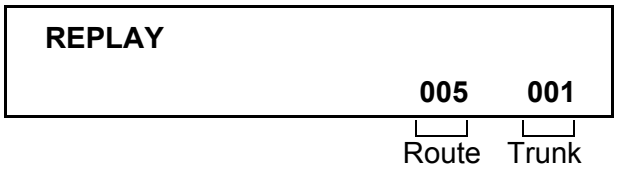
1. Recording by designating RT and TK
   a.) Lift a handset. Receive Dial Tone.
   b.) Dial the MULTI CHANNEL RECORDING (RECORDING) Access Code from the Station. Receive Special Dial Tone.

   c.) Enter three-digit Route Number and three-digit Trunk Number. The Special Dial Tone stops.

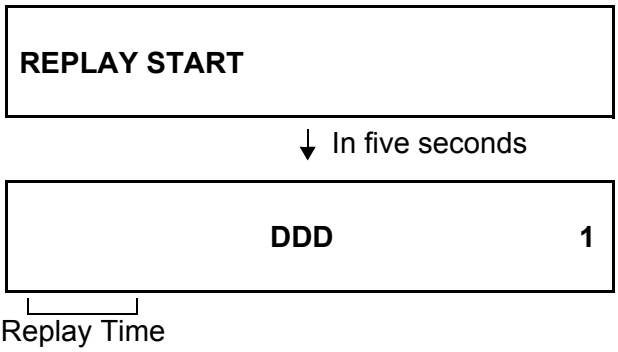
   Hear Service Set Tone when # is pressed. The Service Set Tone continues for three seconds.

   d.) Start your recording when the Service Set Tone is stopped.

   e.) Replace the handset to finish recording.



Note 1: The recording length is a multiple of 2 (= 2n seconds).

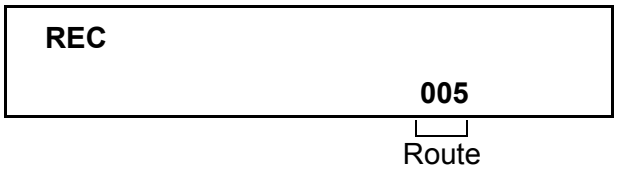


2. Playback by designating RT and TK
   a.) Lift a handset. Receive Dial Tone.
   b.) Dial the MULTI CHANNEL RECORDING (REPLAY) Access Code from the Station. Receive Special Dial Tone.

   c.) Enter three-digit Route Number and three-digit Trunk Number. The Special Dial Tone stops.

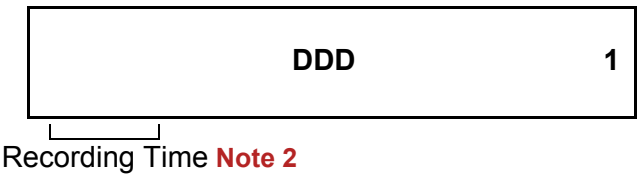
   d.) A recorded message of the designated Trunk is automatically played back.

   e.) Replace the handset to finish playback of the recorded message.

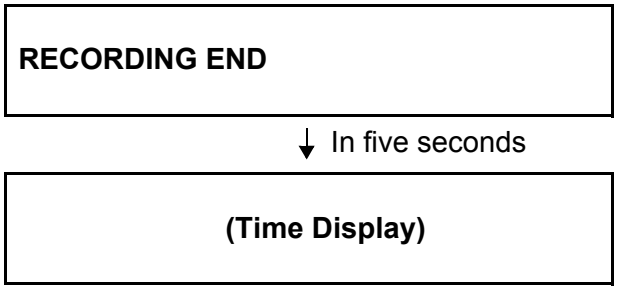


Note: Even though recording of a message has been finished, playback of the Trunk cannot be accepted until dubbing of the message to the remaining Trunks is complete.

3. Recording by designating RT
   (All Trunks within the designated route are recorded.)
   a.) Lift a handset. Receive Dial Tone.
   b.) Dial the MULTI CHANNEL RECORDING (RECORDING) Access Code from the Station. Receive Special Dial Tone.



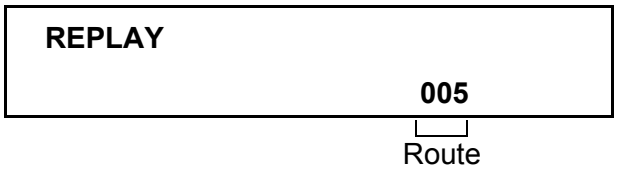
c.) Enter three-digit Route Number and press #; the Special Dial Tone stops.



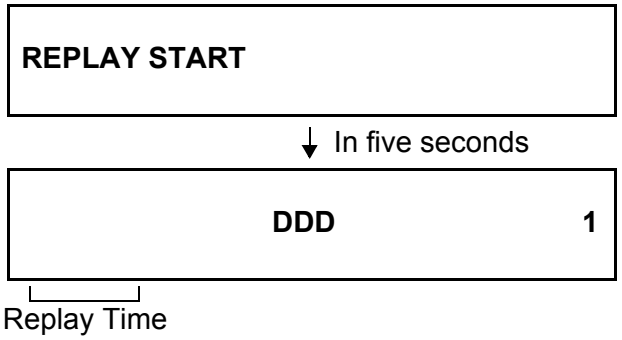
Hear Service Set Tone when # is pressed. The Service Set Tone continues for three seconds.

d.) Start your recording when the Service Set Tone stops.

e.) Replace the handset to finish recording.



Note 2: The recording length is a multiple of 2 (= 2n seconds).



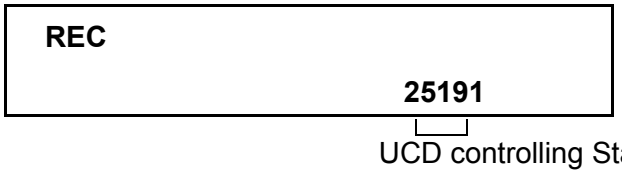
4. Playback by designating RT
   a.) Lift a handset. Receive Dial Tone.
   b.) Dial the MULTI CHANNEL RECORDING (REPLAY) Access Code from the Station. Receive Special Dial Tone.)

   c.) Enter Route Number and press #; the Special Dial Tone stops.

d.) A recorded message of the designated route is automatically played back.

e.) Replace the handset to finish playback of the recorded message.

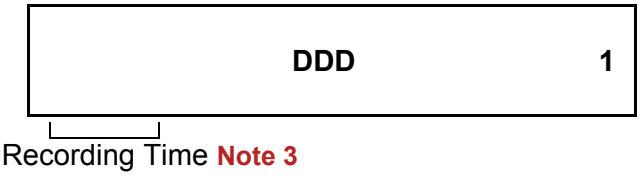
Note: Even though the recording of a message has been finished, playback of the Trunk cannot be accepted until dubbing of the message to the remaining Trunks is complete.



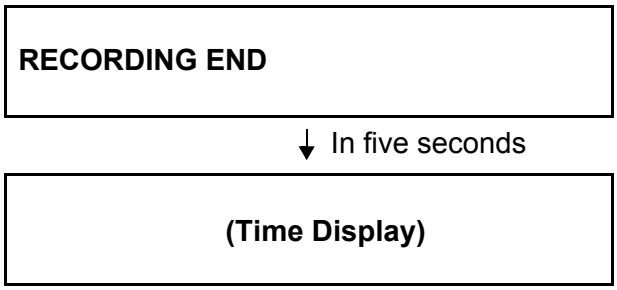
5. Recording of an announcement for a UCD Group

a.) Lift a handset. Receive Dial Tone.

b.) Dial the MULTI CHANNEL RECORDING (RECORDING) Access Code from the Station. Receive Special Dial Tone.



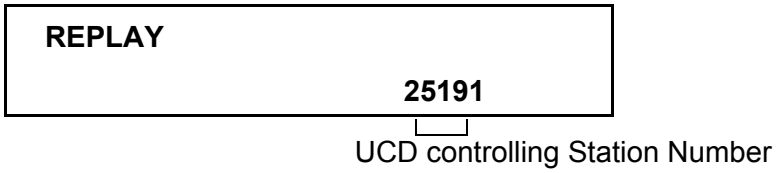
c.) Press * and enter the UCD controlling Station Number.



d.) Wait until you hear Service Set Tone. The waiting time depends upon Register Inter Digit Timer (normally six seconds).
The Service Set Tone continues for three seconds.

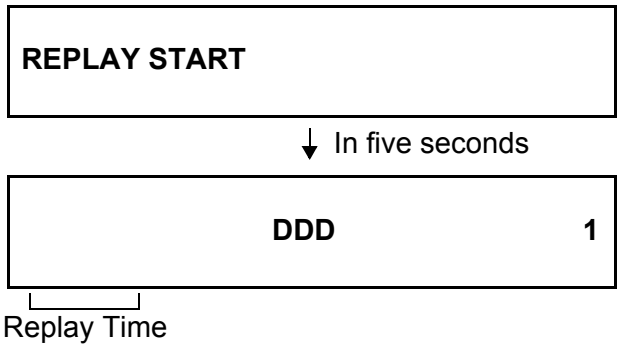
e.) Start your recording when the Service Set Tone stops.

f.) Replace the handset to finish recording.



Note: Programming of Delay Announcement-UCD[D-31] needs to be assigned when performing this operation.

Note 3: The recording length is a multiple of 2 (= 2n seconds).

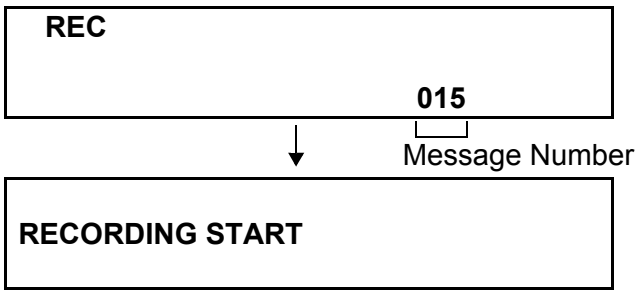


6. Playback of a message recorded for a UCD Group
   a.) Lift a handset. Receive Dial Tone.
   b.) Dial the MULTI CHANNEL RECORDING (REPLAY) Access Code from the Station. Receive Special Dial Tone.

   c.) Press * and enter the UCD controlling Station Number. The Special Dial Tone stops.

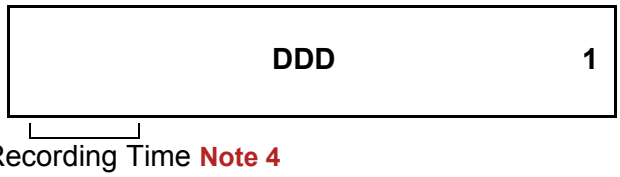
   d.) A recorded message of the designated UCD Group is automatically played back.

   e.) Replace the handset to finish playback of the recorded message.



Note: Even though the recording of a message has been finished, playback of the Trunk cannot be accepted until dubbing of the message to the remaining Trunks is complete.

Note: Programming of Delay Announcement-UCD[D-31] needs to be assigned when performing this operation.

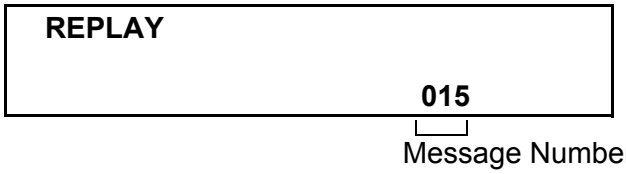


7. Recording of a message for ACD
   a.) Lift a handset. Receive Dial Tone.
   b.) Dial the MULTI CHANNEL RECORDING (RECORDING) Access Code from the Station. Receive Special Dial Tone.

   c.) Press # and enter the three-digit message number that has been assigned in the AADT command. Receive Service Set Tone. The Service Set Tone continues for three seconds.

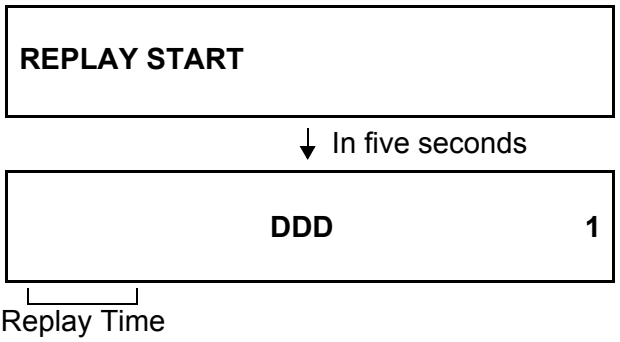
   d.) Start your recording when the Service Set Tone stops.

   e.) Replace the handset to finish recording.



Note 4: The recording length is a multiple of 2 (= 2n seconds).

8. Playback of a message for ACD
   a.) Lift a handset. Receive Dial Tone.
   b.) Dial the MULTI CHANNEL RECORDING (REPLAY) Access Code from the Station. Receive



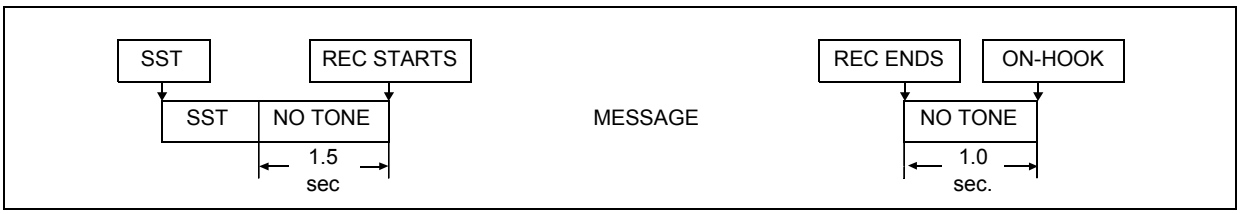
Special Dial Tone.

c.) Press # and enter the Message Number that has been assigned in the AADT command.

d.) A recorded message of the designated Message Number for ACD is automatically played back.

e.) Replace the handset to finish playback of the recorded message.

Note: Even though the recording of a message has been finished, playback of the Trunk cannot be accepted until dubbing of the message to the remaining Trunks is complete.



Service Conditions

1. Any entry of RT, TK, UCD Controlling Station, and Message Number that has not been assigned results in Reorder Tone (ROT) Connection.

   The values that each parameter can take fall into the ranges:

   RT: 001 - 999
   TK: 000 - 255
   Message Number: 001 - 058
2. The maximum recording length is 60 seconds (30 seconds in the case of UCD).
3. This feature is not effective for Trunks being dubbed or placed in busy status.
4. A Station user cannot record a message to a Trunk in which a recording/dubbing is being made.
5. When a Station user encounters that all Digital Announcement Trunk are busy, after dialing RT/TK/UCD Controlling Telephone Number/Message Number from the terminal, the Station user hears a Busy Tone.

6. After completion of dialing RT/TK/UCD Controlling Telephone Number/Message Number, a Station user hears the Service Set Tone. In this instance, if the designated Trunk is making a dub or being dubbed, the dubbing is stopped. Also, when the Station user goes on-hook during the Service Set Tone, the dubbing is also stopped.
7. A message is recorded in the following sequence. As illustrated below, 1.5 seconds after the Service Set Tone and one second before going on-hook are not recorded.

8. When recording messages to Announcement Trunk assigned to UCD group or playing its recorded message, programming of Delay Announcement-UCD[D-31] needs to be assigned.
9. When the system encounters a busy Trunk in an attempt to make a dubbing of the message to the remaining Trunks, the Trunk is retried after a 16 second interval. Each Trunk is attempted a maximum of 16 times. If the final attempt is rejected because of busy, no further dubbing attempts will be made.

10. Only the portion in which a message has been recorded is played back.
11. The dubbing time is calculated by the following equation: (Dubbing Time) = (Recording time + two seconds) x (Number of Trunk). Refer to the following table to obtain the approximate time for dubbing:

Dubbing Time Calculation

Recording Time	Number of Trunk					
	1	10	15	20	63	n
6 seconds	8	80	120	160	504	8n
16 seconds	18	180	270	360	1134	18n
30 seconds	32	320	480	640	2016	32n
46 seconds	48	480	720	960	3024	48n
60 seconds	62	620	930	1240	3906	62n

12. This feature is available to access a 4-DAT Trunk through FCCS link.
13. When the first Trunk (CNT1), assigned by AADT/AUDT command is busy, the user cannot record or play a message.

14. When a CH-DATA card is used, trunks can be registered to the second half of Levels (from Level 4 to Level 7). However, recording messages to trunks registered to these levels is not possible. To perform multi channel recording with a CH-DATA card, follow one of the operations below.

    - Perform 3. Recording by designating RT by registering trunks only from Level 0 to Level 3.
    - Perform 5. Recording of an announcement for a UCD Group by registering trunks only from Level 0 to Level 3.
    - Perform 7. Recording of a message for ACD by registering trunks only from Level 0 to Level 3.
    - After the recording in any of the operations above is completed, perform additional recording operations to trunks registered to the second half of Levels (from Level 4 to Level 7) with 1. Recording by designating RT and TK.

Programming

STEP 1: **ANPD** - Assign Number of Necessary Digits (NND) for the first digit of the Access Code of MULTI CHANNEL RECORDING.

STEP 2: **ASPA** - Assign Access Codes for the following Service Code Appendix (SSCA).

SRV "SSCA: Service Code Appendix"
SIDA 66 (= MULTI CHANNEL RECORDING <REC>)
68 (= MULTI CHANNEL RECORDING <RPY>)

STEP 3: **ASFC** - For this feature, Service Feature Restriction data must be entered on a Service Feature Restriction Class (SFC) basis.

SFI
87 (= MULTI CHANNEL RECORDING <REC>)
90 (= MULTI CHANNEL RECORDING <REPLAY>)

STEP 4: **ARTD** - Assign Route Class Data for Announcement as shown below.

RT: 1

1- OSGS:2	2-ONSG:3	5-TF:1	6-TCL:1	7-L/T:1	8-RLP:2
15-LSG:1	34-GUARD:1 **Note 5**		44-PRV:1		

Note: To change the data for existing route (RT), initialize the circuit card.

Note 5: When recording by designating route, GUARD must equal "1".

STEP 5: **ATRK** - Assign the Announcement Trunk data.

STEP 6: **MBTK** - Assign the Make Idle status to the Announcement Trunk.

STEP 7: **APAD** - Assign the PAD control data.

KIND
T (= Assignment of PAD data for dubbing)
S (= Assignment of PAD data for playback)

Note: When recording messages to Announcement Trunk assigned to UCD group or playing its recorded message, programming of Delay Announcement-UCD[D-31] needs to be assigned.

M-53 MFC - Incoming Call

General Description

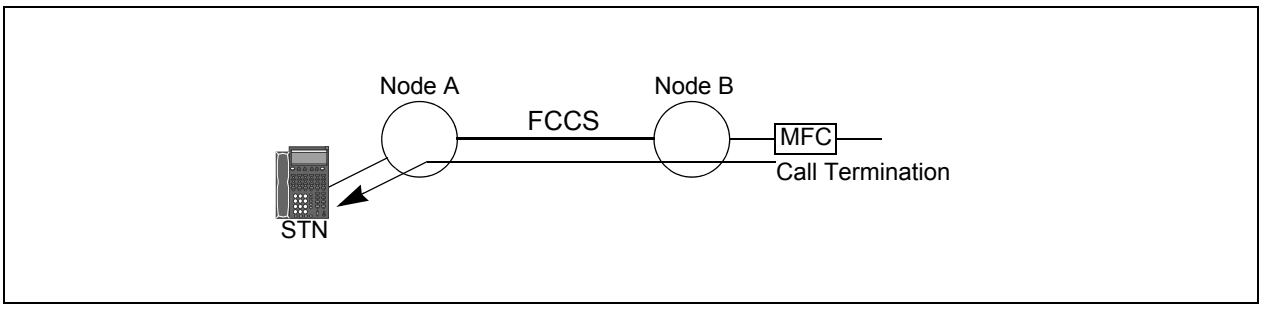
This feature allows an MFC incoming call from an MFC trunk to be terminated to a station or an Attendant.

Note: This feature is available in Australia only.

Operating Procedure

No manual operation is required.

Service Conditions



1. DID incoming calls from MFC trunks can terminate to a station (PB, DP and Dterm) or an Attendant.
2. When calling the attendant console from MFC trunks, LISTED DIRECTORY NUMBER (LDN) [L-24] is dialed.
3. CALL WAITING - TERMINATING [C-12] is not available when an incoming call from an MFC trunk is terminated.
4. In case the incoming call from MFC trunk has terminated to a station in the UCD [U-1] group, and that station is busy, UCD Queuing service is available.
5. In case of TRUNK ANSWER FROM ANY STATION (TAS) [T-8] connection, if the called party is not restricted to TAS connection even if it is not registered in TAS, backward signal “called party idle” (Group-B, signal B-1) will be transmitted to the calling party.
6. When a called party is idle, an incoming call is terminated as follows, according to the Group-2 signals:
   a.) If Group-2 signal is 1 (“operator”) or 8 (“overseas operator”) and the route information is TR=0, the call will be connected to the Attendant.
   b.) If Group-2 signal is other than 1 or 8, the call will be connected to the dialed called party. However, calls of LDN or Call Forwarding are terminated to the transfer destination. The call is released notwithstanding Group-B B-6 signal (“called party idle control”), when the calling party has been released.
7. The Group-B signals to be sent out according to the called party's status are as follows:

Called party idle (charge)	Group-B=1
LDN (ATT)	1
Intercept to ATT (Called Party REST)	1
CALL FORWARDING - ALL CALLS to ATT	1
CALL FORWARDING - BUSY LINE to ATT	1
Night station	1
Called party busy	2
Lock out/Make busy	2
Dead number	2

Congestion	2
Restriction	2
Called party idle (no charge)	5
Called party idle (charge)	5
Change calling party release	6
TAS connection	1

8. Following features are available for the incoming call from an MFC trunk:
    - CALL FORWARDING - ALL CALLS [C-5]
    - CALL FORWARDING - BUSY LINE [C-2]
    - CALL FORWARDING - DON'T ANSWER [C-3]
    - CALL FORWARDING - INTERCEPT/ANNOUNCEMENT [C-25]
    - (to a station/Attendant)
    - CALL PICKUP [C-7, 30]
    - CALL QUEUING [C-9]
    - DISTINCTIVE RINGING [D-10]
    - IMMEDIATE RINGING [I-1]
    - INCOMING CALL IDENTIFICATION [I-2]
    - LDN - NIGIT CONNECTION [L-28]
    - NIGHT CONNECTION [N-1, 2]
    - PEG COUNT [P-7]
    - REMOTE ACCESS TO SYSTEM [R-2]
    - STATION HUNTING - CIRCULAR [S-7]
    - STATION HUNTING - SECRETARIAL [S-8]
    - STATION HUNTING - TERMINAL [S-9]
    - TENANT SERVICE [T-12]
    - TRUNK ANSWER FROM ANY STATION (TAS) [T-8]
    - UNIFORM CALL DISTRIBUTION (UCD) [U-1]
    - UNIFORM NUMBERING PLAN [U-4]
    - Multi numbering

FCCS Conditions

1. Both MFC Receiver and MFC Sender must be accommodated in each node.

2. When a call is terminated from an MFC trunk in Node B to a station in Node A, MFC Receiver accommodated in Node B is used.
3. When an MFC incoming call is terminated from an MFC trunk in Node B to a station in Node A, if the connection trunk cannot be used, the backward signal "Congestion" is sent.
4. Be sure to assign the same data of MFC signaling system for each node.
5. Even if the Tenant service is provided between nodes in the FCCS network, an MFC DID call to an Attendant Console cannot be routed to the Attendant Console in the different node from the terminating trunk.
6. The ANI information is comprised as follows.
   a.) When MFC DOD call is originated from an Attendant Console:
   ANI = Office Code + LDN (Listed Directory Number)
   b.) When a call from an ACIS line is routed to an MFC trunk via tandem connection:
   ANI = Office Code of Tandem Office + LDN of Tandem Office
   c.) When a call from an CCIS line is routed to an MFC trunk via tandem connection:
   ANI = Office Code of Originating Office + Telephone Number/Individual ATT Number of Originating Office
   d.) When the system data to send LDN is assigned:
   ANI = Office Code + LDN
   e.) When the system data to send Physical Station Number is assigned:

   - When the assigned telephone number is 7 digits or less:
   ANI = Office Code + Telephone Number

   - When the assigned telephone number is 8 digits or more/not assigned:
   ANI = Office Code + Physical Station Number

Australia (Telecom) Specifications

Signal	Forward signal		Backward signal	
	G-1	G-2	G-A	G-B
1	Digit "1"	operator	send next digit (n + 1)	called party idle
2	Digit "2"	subscriber or coin telephone	send first digit	called party busy
3	Digit "3"	test position	address complete change-over to reception of G-B	no line out before answer
4	Digit "4"	interception center or remote operation center	start DP 1st digit	congestion
5	Digit "5"	coin telephone	start DP 2nd digit	called party idle (no charge)
6	Digit "6"	data telephone	start DP 3rd digit	called party idle control NO time out before answer
7	Digit "7"	overseas subscriber	start DP 4th digit	called party idle, called party control no charge

Australia (Telecom) Specifications

Signal	Forward signal		Backward signal	
	G-1	G-2	G-A	G-B
8	Digit “8”	overseas operators	start DP 5th digit	called party interception
9	Digit “9”	subscriber	send calling party access info	send calling party access info
10	Digit “10”	used by public subscriber	send previous digit MFC	
11 15

Programming

STEP 1: **ASYD -** System Data 1, Index 125, Bits 0 through 3 (Designation of PAD value)
This PAD value is used for adjusting transmission level of MFCS (=MFC Sender).

Input Data	PAD Value (dB)	Input Value	PAD Value (dB)	Remarks
0	0	4	-8	
1	-2	5	-10	
2	-4	6	-11.5	
3	-6	7	-14	

System Data 1, Index 125, Bits 4 through 7 (Type of MFC): Assign 1 (Australia (D1301G)).
System Data 3, Index 10, Bits 0 through 3 (Reception sensitivity level of the MFC Register)
System Data 3, Index 10,Bits7 (ACT): 0/1 = -38dbm (fixed)/depends on input data (Index 10, Bits 0 through 3)

T	Sensitivity Level (dbm)	T	Sensitivity Level (dbm)	Remarks
0	-28	8	-36	
1	-29	9	-37	
2	-30	A	-38	
3	-31	B	-39	
4	-32	C	-40	
5	-33	D	-41	
6	-34	E	-42	
7	-35	F	-43	

STEP 2: **ARTD -** Assign Route Data for MFC lines paying attention to the following CDNs.
<CDN2> ONSG (Outgoing Select Signal): 10 (=MFC)
<CDN4> INSG (Incoming Select Signal): 10 (=MFC)
<CDN23> TR (GII Signal Override (MFC)): 0/1 = -/ICPT by GII signal is not available. **Note 1**

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as circuit card, MG, or VS32.

Note 1: When TR is assigned as "1". the system does not execute ICPT transfer in accordance with Group-II signals/station status.

<CDN 24> OC (Originating Category Request): 0/1 = Out/In Service.
Assign 1 (When reception of Address Signals complete, the System is placed into the next status to receive Group-II signals).

STEP 3: **ASFC -** Assign Service Feature Restriction Class of calling parties.
SFI59 (No charge for IC Call (MFC)): 0/1: = -/No charge
SFI60 (Called party release for IC Call (MFC)): 0/1 = -/Called Party Release **Note 2**

Note 2: This data is used when Group-B signals are edited. When data is assigned in both SFI159 and SFI160, SFI159 has preference.

STEP 4: **ATRK -** Assign MFC Outgoing/Incoming trunks and MFC Receiver (=MFCR) and MFC Sender (MFCS).
MFCR: RT=916
MFCS: RT=917
The 4MFC circuit card (=PA-4MFCA), which can be used as both MFCR and MFCS, must be assigned in accordance with one of the following types.

- TYPE 1 - All four circuits are assigned as MFCR. (Assign MFCS on the other 4MFCA card.)
- TYPE 2 - All four circuits are assigned as MFCS. (Assign MFCS on the other 4MFCA card.)
- TYPE 3 - The first two circuits are assigned as MFCR. The remaining two circuits are assigned as MFCS.
- TYPE 4 - The first two circuits are assigned as MFCR. The remaining two circuits are assigned as MFCS.

M-59 MFC - Incoming Call To Tie Line

General Description

This service feature permits an incoming call from an MFC trunk to be terminated to a station on a distant Office which is connected by a TIE line.

Note: This feature is available in Australia only.

Operating Procedure

No manual operation is required.

Service Conditions

1. The numbering plan for outgoing calls from non-MFC trunks uses OGC, OGCA, LCR and LCRS system.
2. If a called number is the uniform number, the call will be connected to the station.
3. If the terminating station has set following service, tandem connection is activated.
   - CALL FORWARDING - ALL CALLS - OUTSIDE [C-28]
   - CALL FORWARDING - BUSY LINE - OUTSIDE [C-60]
4. If the terminating station has set the following service, tandem connection is not activated.
   - CALL FORWARDING - DON'T ANSWER - OUTSIDE [C-74]
5. If the call origination is restricted by TOLL DIVERSION [T-6], the call will be connected to the attendant console.
6. In case of restrictions other than item 4 above, backward signal “called party busy” (Group-B, signal B-2) will be transmitted to the terminating MFC trunk.
7. When the tandem connection is available, backward signal “called party idle” (Group-B, signal B-1) will be transmitted to the terminating MFC trunk.
8. OUTGOING TRUNK QUEUING [O-2] is not available for MFC-to-non-MFC connection.
9. The Group-B signals to be sent out according to the called party's status are as follows:

Intercept to Attendant (called party REST)	Group B = 1
Dead number	2
Congestion	2
Restriction	2
Tandem Connection	1
CALL FORWARDING - ALL CALLS - OUTSIDE	1

10. Following service features interact with MFC tandem connection.
    - CALL FORWARDING - ALL CALLS - OUTSIDE [C-28]
    - (MFC-to-MFC transfer not available)
    - CALL FORWARDING - BUSY LINE - OUTSIDE [C-60]
    - (MFC-to-MFC transfer not available)
    - CALL FORWARDING - DON'T ANSWER - OUTSIDE [C-74]
    - (MFC-to-MFC transfer not available)
    - CALL FORWARDING - INTERCEPT/ANNOUNCEMENT [C-25]

- (to station/Attendant)
- LDN NIGHT CONNECTION - OUTSIDE [L-30]
- PEG COUNT[P-7]
- TENANT SERVICE[T-12]
- TRUNK-TO-TRUNK CONNECTION [T-10]
- Multi numbering
- Restricted tandem connection

Australia (Telecom) Specifications

Signal	Forward signal		Backward signal	
	G-1	G-2	G-A	G-B
1	Digit “1”	operator	send next digit (n + 1)	called party idle
2	Digit “2”	subscriber or coin telephone	send first digit	called party busy
3	Digit “3”	test position	address complete change-over to reception of G-B	no line out before answer
4	Digit “4”	interception center or remote operation center	start DP 1st digit	congestion
5	Digit “5”	coin telephone	start DP 2nd digit	called party idle (no charge)
6	Digit “6”	data telephone	start DP 3rd digit	called party idle control NO time out before answer
7	Digit “7”	overseas subscriber	start DP 4th digit	called party idle, called party control no charge
8	Digit “8”	overseas operators	start DP 5th digit	called party interception
9	Digit “9”	subscriber	send calling party access info	send calling party access info
10	Digit “10”	used by public subscriber	send previous digit MFC	
11 15				

abcd Signals received

abcd Signals received and transmitted by Telephony Server.

~~abcd~~ Not handled

Programming

STEP 1: **ASYD -** System Data 1, Index 125, Bits 0 through 3 (Designation of PAD value): This PAD value is used for adjusting transmission level of MFCS (= MFC Sender).

Input Data	PAD Value (dB)	Input Data	PAD Value (dB)	Remarks
0	0	4	-8	
1	-2	5	-10	
2	-4	6	-11.5	
3	-6	7	-14	

System Data 1, Index 125, Bits 4 through 7 (Type of MFC): Assign 1 (Australia (D1301G)).

System Data 3, Index 10, Bits 0 through 3 (Designation of Sensitivity Level) (=T) of MFC Receiver)

System Data 3, Index 10, Bits 7 (ACT) 0/1 = -38dbm (fixed)/depends on input data (Index 10, Bits 0 through 3)

STEP 2: **ARTD -** Assign Route Data for MFC lines paying attention to the following CDNs.

<CDN2> ONSG (Outgoing Select Signal): 10 (=MFC)

<CDN4> INSG (Incoming Select Signal): 10 (=MFC)

<CDN23> TR (GII Signal Override (MFC)): 0/1 = -/ICPT by GII signal is not available. **Note 1**

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as circuit card, MG, or VS32.

Note 1: When TR is assigned as “1,” the system does not execute ICPT transfer in accordance with Group-II signals/station status.

<CDN 24> OC (Originating Category Request): 0/1 = Out/In Service.

Assign 1 (When reception of Address Signals complete, the System is placed into the next status to receive Group-II signals).

STEP 3: **ASFC -** Assign Service Feature Restriction Class of calling parties.

SFI59 (No charge for IC Call (MFC)): 0/1: = -/No charge

SFI60 (Called party release for IC Call (MFC)): 0/1 = -/Called Party Release **Note 2**

Note 2: This data is used when Group-B signals are edited. When data is assigned in both SFI159 and SFI160, SFI159 has preference.

STEP 4: **ATRK -** Assign MFC Outgoing/Incoming trunks and MFC Receiver (=MFCR) and MFC Sender (MFCS).

MFCR: RT=916

MFCS: RT=917

The 4MFC circuit card (=PA-4MFCA), which can be used as both MFCR and MFCS, must be assigned in accordance with one of the following types.

- TYPE 1 - All four circuits are assigned as MFCR. (Assign MFCS on the other 4MFCA card.)
- TYPE 2 - All four circuits are assigned as MFCS. (Assign MFCS on the other 4MFCA card.)
- TYPE 3 - The first two circuits are assigned as MFCR. The remaining two circuits are assigned as MFCS.
- TYPE 4 - The first two circuits are assigned as MFCR. The remaining two circuits are assigned as MFCS.

M-84 MF Signaling - DID

General Description

In the Associated Channel Interoffice Signaling system, this feature allows use of selective codes of Multi frequency (MF) signals.

MF - (ANSI) codes: A total of 15 codes are available by combining two out of six frequencies.

Code	CCITT/ BELL	0 (700Hz)	1 (900Hz)	2 (1100Hz)	4 (1300Hz)	7 (1500Hz)	K (1700Hz)
1	1	X	X				
2	2	X		X			
3	3		X	X			
4	4	X			X		
5	5		X		X		
6	6			X	X		
7	7	X				X	
8	8		X			X	
9	9			X		X	
10	0				X	X	
11	C_{11}	X					X
12	C_{12}		X				X
13	KP_1			X			X
14	KP_2				X		X
15	ST					X	X

Note: This feature is available in North America only.

Operating Procedure

No manual operation is required.

Service Conditions

1. When using MF signaling system, Least Cost Routing (LCR) or Register Sender LCR (LCRS) must be assigned.
2. Even when LCRS is assigned, digit outpulsing to the distant office is not started until all digits have been received when the signaling is MF. If there is DP or PB lines among alternate routes, an Outgoing Call may be originated by seizing a DP or PB line, even when the route advance sequence for that line is lower than MF lines. When the route advance sequence of MF to DP or PB is predetermined, LCR must be assigned in the Numbering Plan.
3. Unless otherwise specified, MP starting at termination of an Incoming Call will be activated upon receiving an ST signal.
4. Connection patterns to which MF signaling system can be applied are as follows:
   a.) Individual Call Origination by Station
   b.) Attendant-to-Attendant Connection
   c.) Individual Call Origination by Attendant
   d.) Call origination by Attendant via Station/Trunk
   e.) MF line Connection from CONSULTATION HOLD [C-17]
   f.) Call transfer to MF line via Call Forwarding.
5. Connection to the following services is not available:
   a.) Call origination services to MF lines, such as, OUTGOING TRUNK QUEUING
   b.) Call termination services from MF lines, such as, UCD [U-1]
   c.) Call Waiting, REMOTE ACCESS TO SYSTEM [R-2].
6. Assignment of MF signaling system or DP, PB signaling system can be determined on a per route basis.
7. 8RST card is required for performing this service.

Programming

STEP 1: **ASYD** - System 1, Index 234, Bit 0.
(0) No reverse-type Connection acknowledgment

STEP 2: **ANPD** - Assign the first digit of the MF line Access Code.

STEP 3: **ASPA** - Assign the LCR or LCR (S) Access Code by providing a dummy route.

STEP 4: **AMND** - Assign the maximum number of necessary digits to the Dial (Area/Office) Code.

STEP 5: **ARNP** - Assign the Access Code to the Route Number. When multiple Access Codes are present by alternative routing, set one of them.

STEP 6: **ARTD** - MF line- Assign the following data, depending on the Trunk type, as shown below:

Trunk Type	OSGS	ONSG	ISGS	INSG	LSG	Display
OGT	7	4	0	0	5	1
ICT	0	0	7	4	5	1
BWT	7	4	7	4	5	1

Dummy route-Assign 1 at all times for CDN 13:AC. The Route Data of the dummy route is TCL = 1, AC = 1 and L/T = 1.

For the others, assign 0 in all cases.

Assign the following Route Class Data to the route of the MF Line.
TCMN = 0, TCMC = 0, MFSP: MF Sending Speed.
KPST: Duration of KP sending,
KPPT: Pause after KP sending,
CNI: CNI Calling Number Identification format (= 1)
Assign CDN 22:CNI = 1.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as circuit card, MG, or VS32.

STEP 7: **ATRK** - MF line-Assign the LENS data of each Trunk.
MF Register/Sender-Assign the following data to the LENS of the 8RST card.
RT = 904: MF Register
RT = 905: Sender

STEP 8: **AFRS** - Assign the number Pattern Code (NPC) and Outgoing route selection pattern (OPR) to the dummy route.

STEP 9: **AOPR** - Assign the Route Number, including the Alternative Route to the outgoing route selection pattern (OPR). Assigns the number of skipped digits and pattern number location (PNL) to each route.

STEP 10: **ARSC** - Release the dummy route and Station Connection restriction.
Release the Connection restriction on the route of the MF line and Station.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ANPDL** - Assign the first digit of the MF line Access Code.

STEP 2: **ASPAL** - Assign the LCR or LCR (S) Access Code by providing a dummy route.

STEP 3: **ARNPL** - Assign the Access Code to the Route Number. When multiple Access Codes are present by alternative routing, set one of them.

STEP 4: **ARTDN** - MF line- Assign the following data, depending on the Trunk type, as shown below:

Trunk Type	OSGS	ONSG	ISGS	INSG	LSG	Display
OGT	7	4	0	0	5	1
ICT	0	0	7	4	5	1
BWT	7	4	7	4	5	1

Dummy route-Assign 1 at all times for CDN 13:AC. The Route Data of the dummy route is TCL = 1, AC = 1 and L/T = 1.

For the others, assign 0 in all cases.

Assign the following Route Class Data to the route of the MF Line.

TCMN = 0, TCMC = 0, MFSP: MF Sending Speed.

KPST: Duration of KP sending,

KPPT: Pause after KP sending,

CNI: CNI Calling Number Identification format (= 1)

Assign CDN 22:CNI = 1.

STEP 5: **AFRSL** - Assign the number Pattern Code (NPC) and Outgoing route selection pattern (OPR) to the dummy route.

STEP 6: **AOPRL** - Assign the Route Number, including the Alternative Route to the outgoing route selection pattern (OPR). Assigns the number of skipped digits and pattern number location (PNL) to each route.

STEP 7: **ARSCN** - Release the dummy route and Station Connection restriction.

Release the Connection restriction on the route of the MF line and Station.

M-85D Message Waiting Indication -D

General Description

This feature allows Message Waiting (MW) information to be displayed on the middle line (24 digits) of the LCD.

Operating Procedure

No manual operation is required.

Service Conditions

1. The LCD displays the following information, when MESSAGE WAITING INDICATION -D is activated:

Initial Display (Time Display)	**10:00 AM FRI 01 JAN 1999**
When controlled by MCI, Attendant or Station	**MW**

2. When this service is assigned to a Dterm with a One-line LCD, the service is not available, and the display remains unchanged.
3. This service can be controlled via PCPro command program.
4. This service is available only when OAI service is not available (System Data 1, Index 79, Bit 6 = 1). When OAI service is available (System Data 1, Index 79, Bit 6 = 0), the information cannot be displayed on the lower line of LCD, but will be displayed on the upper line.
5. While Message Waiting information control is being executed to a Dterm equipped with a Two-line LCD by this service, time information is not displayed on the LCD. When Message Waiting information control is canceled, the time information display is resumed.
6. For the FCCS Network, this feature is available for a Telephone Number having less than 7 digits.

Programming

STEP 1: **ASYD** - System Data 1, Index 79, Bit 6 = 1.

STEP 2: **AKYD** - Assign the following data to the Dterm that executes this service.
(MWD = 1: Message Waiting Indication in Service)

M-92 MFC - Tandem Switching

General Description

This service feature allows trunk-to-trunk connections relating to MFC signaling through the System, without the need for any Attendant assistance or control.

The following connection patterns are provided with this service feature:

- MFC Trunk to Non-MFC Trunk Connections
- Non-MFC Trunk to MFC Trunk Connections
- MFC Trunk to MFC Trunk Connections
- MFC Trunk to PHC Connections
- PHC to MFC Trunk Connections

Note: This feature is available for the countries indicated below.

Operating Procedure

No manual operation is required.

Service Conditions

MFC Trunk to Non-MFC Trunk Connections

1. This type of connection is supported by the following types of MFC signaling system:
   a.) CCITT-R2 (NEC Standard) Type
   b.) Australia Type
   c.) Thailand Type
   d.) Venezuela Type
   e.) Korea Type
   f.) Singapore/Malaysia Type
   g.) Argentina/Philippines Type
   h.) Mexico Type
   i.) Brazil Type (digital/analog)
   j.) Chile Type
   k.) Columbia Type
   l.) India Type

2. For CCITT-R2, Australia, Thailand, Korea, and Singapore Type
   Outgoing calls to non-MFC trunks use the LCR or LCRS system numbering plan.

   For Argentine, Brazil, Chile, Columbia, Mexico, Venezuela, and India Type
   Outgoing calls to non-MFC trunks use the LCR system numbering plan.
3. If the called number is the uniform number, the call will be connected to the corresponding station.
4. If the terminating station has set the following services, tandem connection is activated.
   CALL FORWARDING-ALL CALLS-OUTSIDE [C-28]
   CALL FORWARDING-BUSY LINE-OUTSIDE [C-60]
5. If the terminating station has set the following service, tandem connection is not activated.
   CALL FORWARDING-DON'T ANSWER-OUTSIDE [C-74]

6. If the call origination is restricted by TOLL DIVERSION [T-6], the call will be connected to the Attendant Console.
7. In case of restrictions other than item 5 above, Group-B signal relating to restrictions is transmitted to the terminating MFC trunk.
8. When the tandem connection is available, Group-B signal relating to Tandem Connection is transmitted to the terminating MFC trunk.
9. INTER-OFFICE OFF-HOOK QUEUING [I-11] is not available for MFC to non-MFC trunk connection.
10. The Group-B signals to be sent out according to the called party's status are as follows:

MFC SIGNAL TYPE / STATUS	CCITT-R2	AUSTRAL-IA	THAILAND	VENEZU-ELA	KOREA	SINGA-PORE	ARGEN-TINA/ Philippines	CHILE	COLUMBIA	MEXICO	INDIA
Dead Number	5	2	4	5	5	7	5	5	5	4	5
Congestion	4	2	4	4	4	4	4	4	4	4	4
Restriction	8	2	4	8	8	4	8	8	8	4	4
Intercept to Attendant (called party restriction)	6	1	1	6	6	1	6	6	6	1	6
CALL FORWARDING-ALL CALLS-OUTSIDE [C-28]	6	1	1	6	6	1	6	6	6	1	6
Tandem Connection	6	1	1	6	6	1	6	6	6	1	6

11. Following service features interact with MFC -to non-MFC trunk connection:
    CALL FORWARDING-ALL CALLS-OUTSIDE [C-28]
    CALL FORWARDING-BUSY LINE-OUTSIDE [C-60]
    CALL FORWARDING-DON'T ANSWER-OUTSIDE [C-74]
    CALL FORWARDING-INTERCEPT/ANNOUNCNEMENT [C-25]
    (to a station/Attendant Console)
    LDN-NIGHT CONNECTION-OUTSIDE [L-30]
    Multi Numbering
    PEG COUNT [P-7]
    Restricted Tandem Connection
    STATION MESSAGE DETAIL RECORDING [S-10]
    TENANT SERVICE [T-12]
    TOLL DENIAL/TOLL DIVERSION [T-6]
    TOLL RESTRICTION-3/6-DIGIT [T-7]
    TRUNK-TO-TRUNK CONNECTION [T-10]
    UNIFORM NUMBERING PLAN [U-4]
12. <u>For CCITT, Thailand, Venezuela, Korea, Argentina, Brazil, Chile, Columbia, Mexico Type</u>
    The ANI information sent to the MFC trunks is as follows:
    a.) when the calling party is an analog line: the number assigned at the tandem office.
    b.) when the calling party is a station/Attendant Console in the CCIS network: the RT number and the telephone number/individual Attendant Console number assigned at the calling office.
    c.) when the calling party is a trunk in the CCIS network: the number assigned at the tandem office.
13. The additional hardware (MFC Register Sender) is required for this feature.

14. In the following cases, the ANI (Automatic Number Identification) information received from the opposite office is sent to the OAI computer via Interface Processor by SMFN facility. The information is output when an MFC incoming call is terminated to the OAI terminal (Dterm), and when the terminal user answers the call. When the ANI information is not requested, space (blank) is output to the ANI information area in the SMFN facility format.
    a.) When a call is terminated from an MFC public exchange via CCIS line, the calling number (max. 16 digits) is output as the ANI information.
    b.) When a call terminated from an MFC public exchange is transferred to the OAI terminal in another office via CCIS line, the forwarding party number (max. 16 digits) is output.
15. When an MFC DID incoming call is terminated, the system can request the ANI (Automatic Number Identification) information. The ANI information consists of category (1 digit) and the calling number (max. 31 digits). The received ANI number is output to the SMDR message.
    c.) SMDR messages
    -When an MFC incoming call is terminated via CCIS line, the ANI information is output to SMDR of the tandem office as the billing information for the incoming call and for tandem connection.
    The ANI information from the MFC line is output to SMDR of the terminating office as billing information for the incoming call. However, only the calling number (max. 16 digits) is displayed; space is output for category area.
    -When an MFC incoming call is transferred to another office via CCIS line, the ANI information from the MFC line is output to SMDR of the tandem office, and the ANI information of the transferring station is output to SMDR of the terminating office. However, only the calling number (max. 16 digits) is displayed; space is output for category area.
    -When the ANI information is not received, no data is output to the ANI information area.
    d.) NAME DISPLAY-SYSTEM-CCIS [N-37] is not available.

Non-MFC Trunk to MFC Trunk Connections

1. This type of connection is supported by the following types of MFC signaling system:
    a.) CCITT-R2 (NEC Standard) Type
    b.) Venezuela Type
    c.) Korea Type
    d.) Thailand Type
    e.) Argentina/Philippines Type
    f.) Brazil Type (digital/analog)
    g.) Chile Type
    h.) Columbia Type
    i.) Mexico Type
    j.) India Type
2. Outgoing calls to MFC trunks use the LCR or LCRS system numbering plan.
3. If the terminating station has set following service, tandem connection is activated.
    CALL FORWARDING-ALL CALLS-OUTSIDE [C-28]
    CALL FORWARDING-BUSY LINE-OUTSIDE [C-60]
4. If the terminating station has set following service, tandem connection is not activated.
    CALL FORWARDING-DON'T ANSWER-OUTSIDE [C-74]
5. <u>For Mexico Type only</u>
    The Group-II signal transmitted to MFC trunk is fixed to be "2".

For Other Types

The Group-II signal transmitted to MFC trunk may be determined on an incoming route basis.

Group-II 1: Subscriber without Priority
2: Subscriber with Priority

When the calling party is a station user or an Attendant in a CCIS network, the Group-II signal sent to MFC trunk is determined according to the Service Feature Restriction Class of the originating station/Attendant.

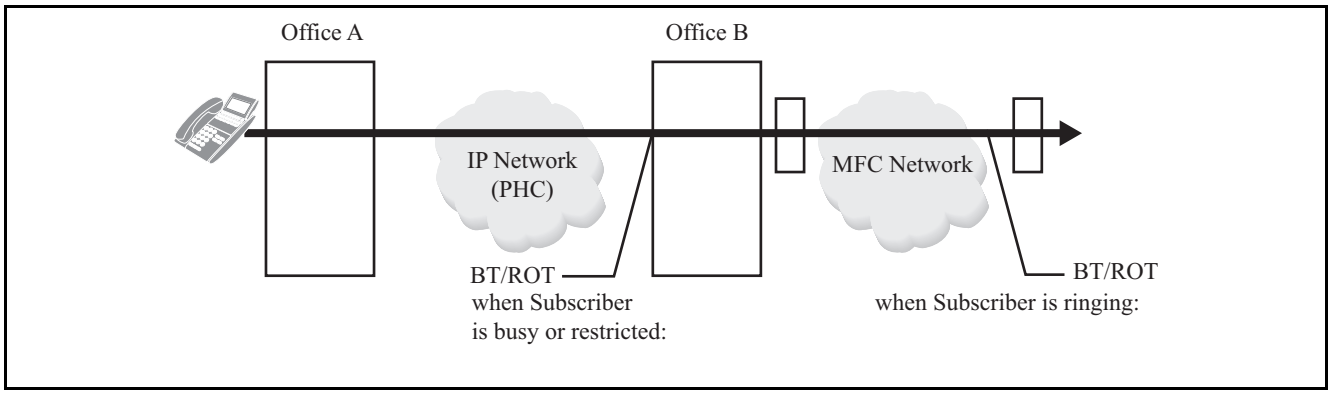
6. Even if a Group-B=Subscriber's Line Busy is received, the calling party hears Busy Tone.
7. Following service features interact with Non-MFC-to MFC trunk connection:
   CALL FORWARDING-ALL CALLS-OUTSIDE [C-28]
   CALL FORWARDING-BUSY LINE-OUTSIDE [C-60]
   INTER-OFFICE OFF-HOOK QUEUING [I-11]
   LDN-NIGHT CONNECTION-OUTSIDE [L-30]
   PEG COUNT [P-7]
   Restricted Tandem Connection
   STATION MESSAGE DETAIL RECORDING [S-10]
   TOLL DENIAL/TOLL DIVERSION [T-6]
   TOLL RESTRICTION-3/6-DIGIT [T-7]
   TRUNK-TO-TRUNK CONNECTION [T-10]
8. For India Type Only
   The ANI (Automatic Number Information) information sent to the MFC trunks is as follows:
   a.) When the calling party is a station/Attendant Console in the CCIS network:
   The office code of the originating office and the telephone number/individual Attendant Console number.
   b.) When the calling party is a station/Attendant Console in the tie line network: the office code of the tandem office and the Listed Directory number.

MFC Trunk to MFC Trunk Connections

1. This type of connection is supported by the following types of MFC signaling system:
   a.) CCITT-R2 (NEC Standard) Type
   b.) Venezuela Type
   c.) Korea Type
   d.) Thailand Type
   e.) Argentina/Philippines Type
   f.) Chile Type
   g.) Columbia Type
   h.) Mexico Type
   i.) India Type
2. Outgoing calls to MFC trunks use the LCR or LCRS system numbering plan.
3. If the terminating station has set following service, tandem connection is activated.
   CALL FORWARDING-DON'T ANSWER-OUTSIDE [C-74]
4. Abbreviated dialing from incoming MFC trunks to outgoing MFC trunks is not available.
5. When outgoing trunk routes composed of MFC trunk routes and non-MFC trunk routes configure ALTERNATE ROUTING [A-16] group, the MFC trunk routes have priority over the non-MFC trunk routes in tandem call routing.
6. Following service features interact with MFC-to-MFC trunk connection:

PEG COUNT [P-7]
Restricted Tandem Connection

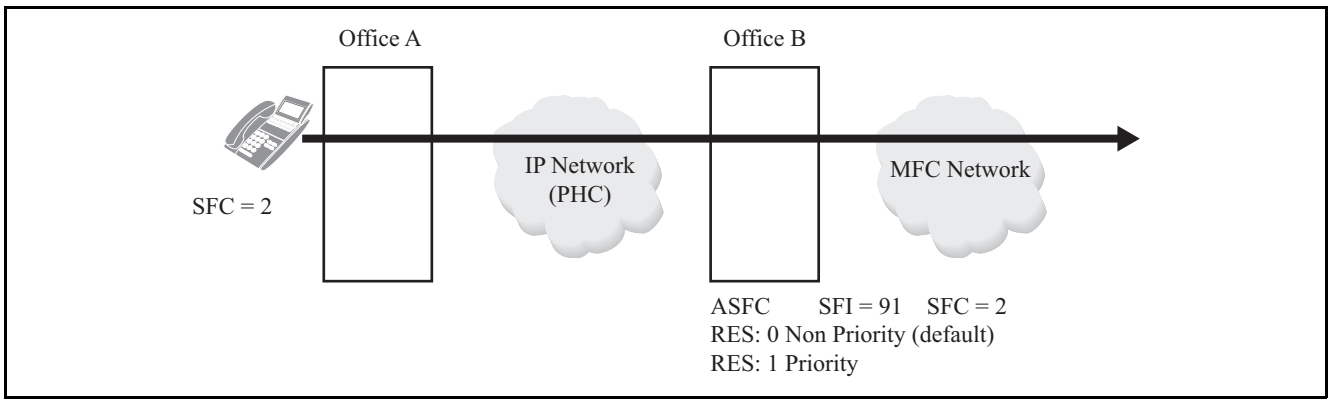
7. INTER-OFFICE OFF-HOOK QUEUING [I-11] is not available for MFC-to-MFC trunk connection.
8. In the following cases, the ANI (Automatic Number Identification) information received from the opposite office is sent to the OAI computer via Interface Processor by SMFN facility. The information is output when an MFC incoming call is terminated to the OAI terminal (Dterm), and when the terminal user answers the call. When the ANI information is not requested, space (blank) is output to the ANI information area in the SMFN facility format.
   a.) When a call is terminated from an MFC public exchange via MFC tie line, the calling number (max. 31 digits) is output as the ANI information.
   b.) When a call terminated from an MFC public exchange is transferred to the OAI terminal in another office via MFC tie line, one of the following is output depending upon the data assignment in the tandem office.
   - telephone number of the forwarding party
   - office code and telephone number
   - pilot number
   - space when no data is assigned.
9. When an MFC DID incoming call is terminated, the system can request the ANI (Automatic Number Identification) information. The ANI information consists of category (1 digit) and the calling number (max. 31 digits). The received ANI number is output to the SMDR message.
   a.) SMDR message
   -Both category (1 digit) and the calling number (max. 31 digits) are output.
   -When an MFC incoming call is terminated via MFC tie line, the ANI information is output to SMDR of the tandem office as the billing information for the incoming call and for tandem connection. The ANI information from the MFC line is output to SMDR of the terminating office as billing information for the incoming call.
   -When an MFC Incoming call is transferred to another office via MFC tie line, the ANI information from the MFC line is output to SMDR of the tandem office, and the ANI information of the transferring station is output to SMDR of the terminating office.
   -When the ANI information is not received, no data is output to the ANI information area.
   b.) NAME DISPLAY-SYSTEM-CCIS [N-37] is not available.
10. <u>For India Type only</u>
    Following services are not available in MFC-to-MFC connection:
    CALL FORWARDING - ALL CALLS - OUTSIDE [C-28]
    CALL FORWARDING - BUSY LINE - OUTSIDE [C-60]
11. "*" and "#" are available for the Group I (G-I) signal. Both "*" and "#" cannot be used for the "Timing Start", if those digits are used as G-1 signal.



MFC Trunk/PHC to PHC/MFC Trunk Connections

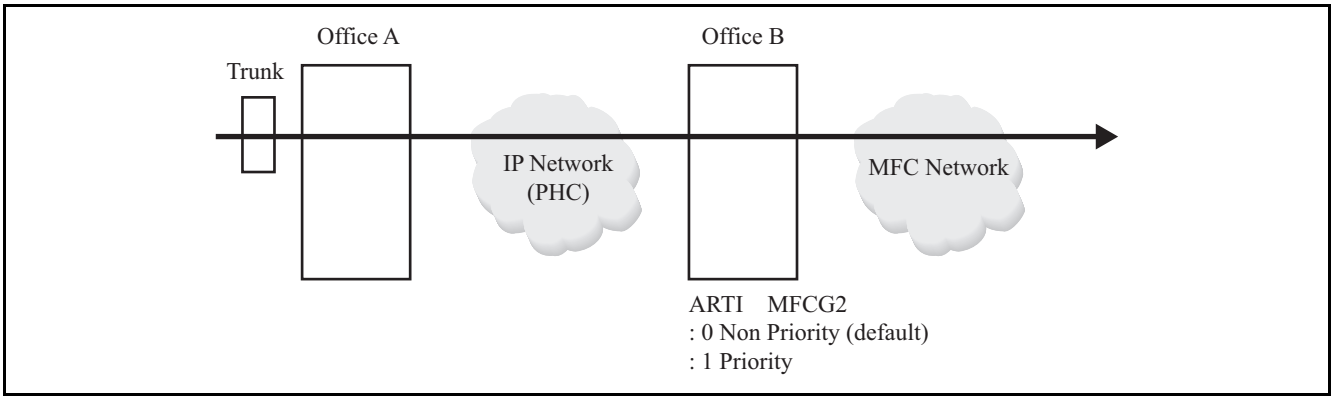
1. The following call forwarding features can be activated:
   - Call Forwarding - All Calls [C-5]
   - Call Forwarding - All Calls - Outside [C-28]
   - Call Forwarding - Busy Line [C-2]
   - Call Forwarding - Busy Line - Outside [C-60]
   - Logged Out IP Station - Call Destination [L-53]
   - Night Transfer
   - Night Connection - Flexible [N-2]
2. (**Tandem connection from MFC to PHC**)

a.) Basically, assign OC = 1 (ARTD) for MFC line. For some specifications, OC = 0 can be assigned.
b.) When OGT/CCS is seized by Tandem connection, the backward signal is returned to the originating office from the terminating office. As in the case of Tandem connection to CCIS, ACM/UBM signal received after the call origination to PHC is not reflected in the backward signal.
c.) The subscriber may hear Reorder Tone (ROT) after receiving Ringback Tone (RBT).
d.) When all routes are busy, queuing is not available. At this time, B4 (Congestion) signal is sent to the originating office.
e.) ANI information is transmitted to the called party. Category is not transmitted.

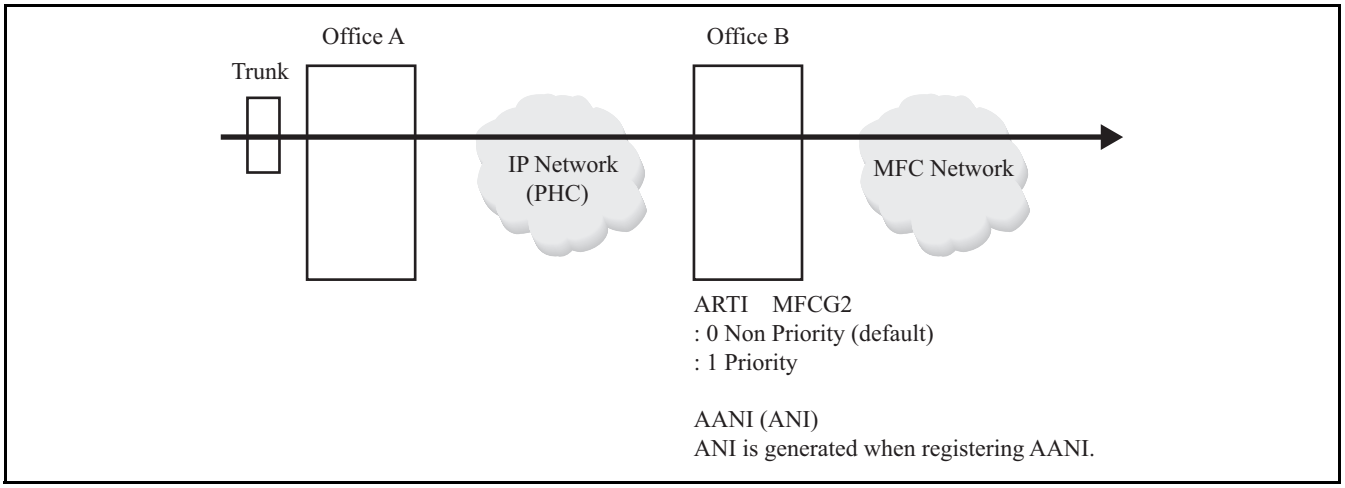


3. (**Tandem Connection from PHC to MFC**)

a.) When OGT/MFCS is seized by Tandem connection, ACM is returned to the originating office.
- Backward signal (Restrict, Busy) received after the call origination to MFC line is not reflected in the originating office.
- ROT (Reorder Tone) and BT (Busy Tone) are sent from Tandem office.



b.) ANI Information
- ANI information received from PHC can be transmitted. However if "#" or "*" is included in the calling number, ANI information cannot be transmitted.
- MFC Category is edited by Tandem office.



Example 1: When SFC data can be received:
Determines GII signal (Category) by SFC data in Tandem Office.

Example 2: When SFC data cannot be received:
Determines GII signal (Category) by MFCG2 (ARTI) of ICT in Tandem Office.

Example 3: When both SCF data and ANI information cannot be received:
When the calling party is trunk and ANI information cannot be received, Tandem Office determines GII signal (Category) and ANI generation.

4. The following table shows the availability of this feature in each country:

Country		DID (MFC-PHC Tandem)		DOD (PHC-MFC Tandem)
		OC = 0 (ARTD)	OC = 1 (ARTD)	
0	ITU-T	Available	Available	Available
1	Australia	**Note 1**	Available	Not Applicable
2	Thailand	**Note 1**	Available	Available
3	Venezuela	Available	Available	Available
4	Korea	Available	Available	Available
5	Singapore/Malaysia	**Note 1**	Available	Not Applicable
6	China	Not Applicable	Not Applicable	Not Applicable
7	Argentina/Philippines	Available	Available	Available
8	Indonesia	Not Applicable	Not Applicable	Not Applicable
9	Mexico	**Note 1**	Available	Available
10	Brazil	**Note 1**	Available	Not Applicable
11	Chile	Available	Available	Available
12	Colombia	Available	Available	Available
13	India	Available	Available	Available
14	Kuwait	**Note 1**	Available	Available

Note 1: Not Available (This feature doesn't support "A6: Address Complete, Change Setup Speech Conditions" of the backward signal.)

5. This feature is not available for the following specifications:
   - Chain Type
   - Australia Type [Direct Outward Dialing (DOD) to MFC is not available.]
   - Singapore Type [Direct Outward Dialing (DOD) to MFC not available.]
   - Malaysia Type [Direct Outward Dialing (DOD) to MFC not available.]
   - Indonesia Type [Call origination to MFC can be performed by station only]
6. For Australia/Thailand Type only
   <Tandem connection from MFC to PHC>
   GII signal (Subscriber with priority) has precedence over the signal (FW signal: GI) received from MFC when transferring to Attendant Console. To give a higher priority to Tandem connection to PHC, assign TR=1 (ARTD) for the route class of MFC line.
7. For Singapore/ Malaysia Type only
   <Tandem connection from MFC to PHC>
   GII signal (Subscriber with priority) has precedence over the signal (FW signal: GI) received from MFC when transferring to Attendant Console. To give a higher priority to Tandem connection to PHC, assign TR=1 (ARTD) for the route class of MFC line.

   When receiving collect calls of GII signal (International call: GII-9), assign TR=1 (ARTD) for the PHC route of Tandem connection. (To transfer to Attendant Console, assign TR=0)

8. For Brazil Type only
<Tandem connection from MFC to PHC>
GII signal (Subscriber with priority) has precedence over the signal (FW signal: GI) received from MFC when transferring to Attendant Console. To give a higher priority to Tandem connection to PHC, assign TR=1 (ARTD) for the route class of MFC line.

Collect Call Blocking is not available for PHC network.

9. For India Type only
<Tandem connection from PHC to MFC>
A maximum of 6 digits ANI can be output. Thus, the calling number must be within 6 digits.

10. This feature (Tandem connection) is available for a Remote Access to System [R2] call terminated form PHC or MFC.
11. Tandem connection via FCCS network is available.
12. When a call originated from MFC to PHC encounters the IP network failure, alternating routing to another trunk is available.

abcd Signals received

Note 9: Only when the category of Attendant is to be transmitted, GII-1 through GII-15 can be used.

Programming

When activating this feature via FCCS, use NDM command in NCN.

STEP 1: **ARRC/ARRCN** - Remove the restriction of the connection from MFC/PHC to PHC/MFC and Dummy Route.

STEP 2: **ASFC** - Assign the following Service Feature Restriction Class data if necessary.
SFI = 91 (MFC Outgoing Class of Service)
RES: 0 (Non priority)
RES: 1 (Priority)

Note: When SFC can be received through Tandem connection (from PHC to MFC), the Tandem office determines Category of GII signal by this data. When SFC cannot be received, Category of GII signal is determined by MFCG2 of ARTI/ARTIN.

STEP 3: **ARTI/ARTIN** - Assign the following Trunk Application data regarding to PHC route if necessary.
CDN 43 (MFCG2): 0 (Non priority)/1(Priority)

Note: When SCF cannot be received through Tandem connection, Category of GII signal is determined by this data.

STEP 4: **ARTD/ARTDN** - Assign the following Route Class data if necessary.
CDN: 23
TR: GII Signal Override
0: - / 1: ICPT Transfer by GII Signal is not performed.

Note: Assign this data according to each specification (Australia, Thailand, Singapore, Malaysia, and Brazil.

M-99 Multiple Music-on Hold

General Description

This feature allows the customer leeway to select an appropriate MUSIC ON HOLD [M-7] among a maximum of 64 kinds of music sources. Tenant Number of a Station user who places a call on hold and/or Route Number of a Held Trunk can be used as factors to select the type of MUSIC-ON-HOLD.

Operating Procedure

None.

Service Conditions

1. Maximum of 64 musics can be assigned.
2. The held party is not always connected at the beginning of the music.
3. This service is not available for approximately five minutes after the system initialization and the deletion of data by AHMS command.
4. When assigning Multiple Music-on-Hold Trunk to Group 21-23, change the setting of TSW key to "Disable CFT".
5. The music is assigned to correspond to the following data, in the following priority.
   a.) The tenant number of the station holding the call.
   b.) The route number of the held trunk.
   c.) Combination of the tenant number and the route number.

   The pattern c is not available when either pattern a or b is assigned. Note the following conditions:

   - When the music is assigned to correspond to the tenant number of the station holding the call (pattern a) or the route number of the held trunk (pattern b), the same tenant number or the route number cannot be used to assign the data using pattern c.
   - When the music is assigned using the data pattern c, in order to reassign the data for the same tenant number or the same route number using either pattern a or b, all the previously assigned data must be cleared.
6. When there is no data assigned for neither the route number nor the tenant number, MUSIC ON HOLD [M-7] is not activated.
7. DAT circuit card or BGM equipment can be used as an external music source.
8. VS32 cannot be used as an external music source.
9. When using DAT circuit card as an external music source, refer to Circuit Card Description to select the appropriate key setting.
10. When using DAT circuit card as an external music source, if the music is going to be changed, delete the data in the AHMS command before performing the change. After changing the music source, register the data with the AHMS command.
11. This feature is not available in P2P FCCS network. When using this feature in Legacy FCCS network, setting the data for this feature and for the external music source is required in each node.
12. Do not assign other service data to Group24-31 of unit 2 on each MG.

Programming

When MUSIC ON HOLD [M-7] and MULTIPLE MUSIC-ON HOLD [M-99] have not yet been assigned.
When MUSIC ON HOLD [M-7] data has already been assigned
When MULTIPLE MUSIC-ON HOLD [M-99] has already been assigned.

1. When MUSIC ON HOLD [M-7] and MULTIPLE MUSIC-ON HOLD [M-99] have not yet been assigned.

STEP 1: **ASYD** - System Data 1, Index 251, Bit 7: Multiple Music-on-Hold. Assign 1 (In service).
STEP 2: **ARTD** - Assign Route Data of Trunk (s) which is used for Multiple Music-on-Hold.

Note: To change the data for the existing route (RT), initialize or reboot the trunk device such as circuit card, MG, or VS32.

STEP 3: **ATRK** - Assign the Trunk data by entering LENS data.

Note: When using a **COT** trunk for this feature, change it to a state of MB=1 using the MBTK command and/or flipping the MB switch on the circuit card.

STEP 4: **AHMS** - Assign LENS data of the appropriate Trunk on a HMSC basis, then specify Extension Hold Music Data Kind.

Note: This procedure takes about five minutes before the changes are implemented.

Note: Both settings 1) and 2) are required.

1) Establish a link between the Tenant Number and the HMSC number.
TYPE: Select “Extended Hold Music”.
KIND: Select an Operation Kind from the following:
- Tenant Number of Holding Station
- Route Number of Held Trunk
- Tenant Number of Holding Station and Route Number of Held trunk
TN: Enter a Tenant Number (1-63) to which Holding Station belongs.
RT: Enter an Incoming Route Number (1-255).
HMSC: Specify an Extended Hold Music source (0-63).
Specified Music on Hold is sent to station: Place a checkmark in the checkbox to send the MOH for Station-to-Station call.

2) Establish a link between the HMSC number and the Trunk LENS that is used for the music source.
TYPE: Select “Sound Source LENS”.
HMSC: Specify an Extended Hold Music source (0-63).

Note: Assign the same HMSC number as in the TYPE: Extended Hold Music.

LENS: LENS of the Extended Hold Music source.

2. When MUSIC ON HOLD [M-7] data has already been assigned

Delete the data for MUSIC ON HOLD [M-7] and assign data for this feature.

To delete MUSIC ON HOLD [M-7] data:

STEP 1: **AHMS** -

1) Delete the entry linking the Tenant Number to the HMSC data:
TYPE: "Extended Hold Music".
KIND:
- Tenant Number of Holding Station
- Route Number of Held Trunk
- Tenant Number of Holding Station and Route Number of Held trunk
TN: Tenant Number (1-63) to which Holding Station belongs.
RT: Incoming Route Number (1-255).
HMSC: Extended Hold Music source (0-63).
Specified Music on Hold is sent to station: checkbox to send the MOH for Station-to-Station call.

2) Delete the HMSC data:
TYPE: "Sound Source LENS".
HMSC: Extended Hold Music source (0-63).
LENS: LENS of the Extended Hold Music source.

STEP 2: **ASYD** - System Data 1, Index 42, Bit 3: Trunk Hold Tone sending from Circuit #0 of DAT card. Assign 0.
STEP 3: Perform a system initialization

To assign data for this feature:

STEP 1: **ASYD** - System Data 1, Index 251, Bit 7: Multiple Music-on-Hold. Assign 1 (In service).
STEP 2: **AHMS** - Assign the Trunk LENS that is used for the music source to a HMSC number; then specify the KIND For the Extended Hold Music.

Note: This procedure takes about five minutes before the changes are implemented.

Note: Both settings 1) and 2) are required.

1) Establish a link between the Tenant Number and the HMSC number.
TYPE: Select "Extended Hold Music".
KIND: Select an Operation Kind from the following:
- Tenant Number of Holding Station
- Route Number of Held Trunk
- Tenant Number of Holding Station and Route Number of Held trunk
TN: Enter a Tenant Number (1-63) to which Holding Station belongs.
RT: Enter an Incoming Route Number (1-255).

HMSC: Specify an Extended Hold Music source (0-63).
Specified Music on Hold is sent to station: Place a check mark in the checkbox to send the MOH for Station-to-Station call.

2) Establish a link between the HMSC number and the Trunk LENS that is used for the music source.
TYPE: Select "Sound Source LENS".
HMSC: Specify an Extended Hold Music source (0-63).

Note: Assign the same HMSC number as in the TYPE: Extended Hold Music.

LENS: LENS of the Extended Hold Music source.

3. When MULTIPLE MUSIC-ON HOLD [M-99] has already been assigned.

Delete the data for this feature and then assign new data.

To delete data for this feature:

STEP 1: **AHMS** -

1) Delete the entry linking the Tenant Number to the HMSC data:
TYPE: "Extended Hold Music".
KIND:
- Tenant Number of Holding Station
- Route Number of Held Trunk
- Tenant Number of Holding Station and Route Number of Held trunk

TN: Tenant Number (1-63) to which Holding Station belongs.
RT: Incoming Route Number (1-255).
HMSC: Extended Hold Music source (0-63).
Specified Music on Hold is sent to station: checkbox to send the MOH for Station-to-Station call.

2) Delete the HMSC data:
TYPE: "Sound Source LENS".
HMSC: Extended Hold Music source (0-63).
LENS: LENS of the Extended Hold Music source.

To assign data for this feature:

STEP 1: **AHMS** - Assign the Trunk LENS that is used for the music source to a HMSC number; then specify the Kind for the Extended Hold Music.

Note: This procedure takes about five minutes before the changes are implemented.

Note: Both settings 1) and 2) are required.

1) Establish a link between the Tenant Number and the HMSC number.
TYPE: Select “Extended Hold Music”.
KIND: Select an Operation Kind from the following:
- Tenant Number of Holding Station
- Route Number of Held Trunk
- Tenant Number of Holding Station and Route Number of Held trunk

TN: Enter a Tenant Number (1-63) to which Holding Station belongs.
RT: Enter an Incoming Route Number (1-255).
HMSC: Specify an Extended Hold Music source (0-63).
Specified Music on Hold is sent to station: Place a checkmark in the checkbox to send the MOH for Station-to-Station call.

2) Establish a link between the HMSC number and the Trunk LENS that is used for the music source.
TYPE: Select “Sound Source LENS”.
HMSC: Specify an Extended Hold Music source (0-63).

Note: Assign the same HMSC number as in the TYPE: Extended Hold Music.

LENS: LENS of the Extended Hold Music source.

M-101 MF ANI to SMDR

General Description

This feature allows an office receiving ANI information by means of MF signal to output the information to the expanded SMDR area.

Note: This feature is available in North America only.

Operating Procedure

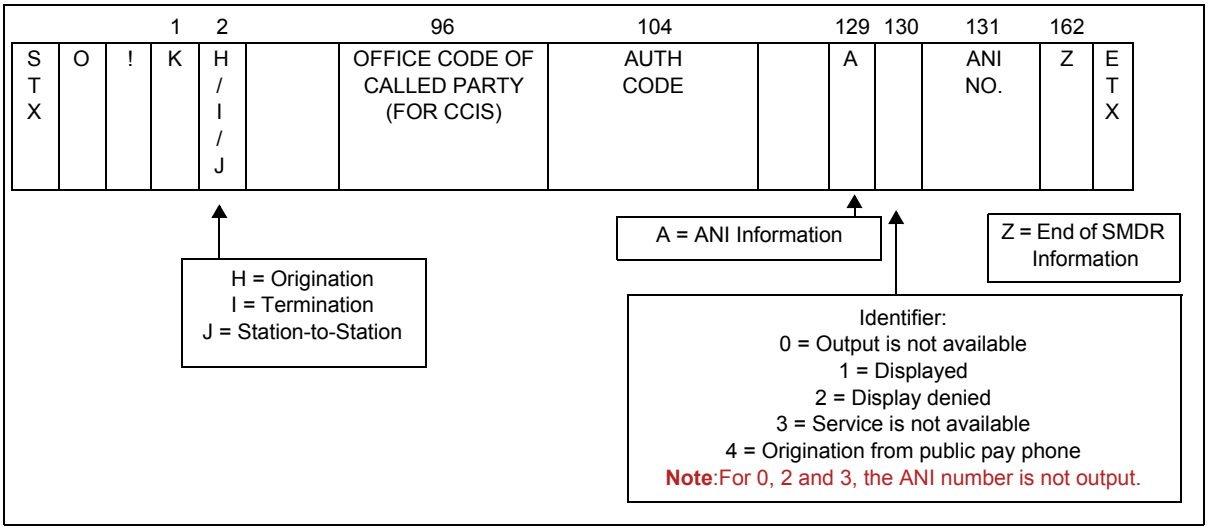
No manual operation is required.

Service Conditions

1. Output conditions are same as current conditions of MF ANI. (i.e., charging information for Incoming Calls is output only).
2. About the expanded output format, refer to SMDR OUTPUT EXPANSION-ANI/CPN [S-129].
3. When the tandem Connection is established through CCIS, the maximum digits of ANI information output to the SMDR port are 16.

Programming

Also see TRUNK LINE APPEARANCE [T-23] for information on how to accommodate Central Office line on a Line/Feature key.



STEP 1: **ASYD** - System Data 1, Index 241, Bit 4. 0/1 = No ANI output to SMDR/ANI output to SMDR.

System Data 1, Index 241, Bit 6. 0/1 = When the length of Caller ID exceeds the limit, only the former/latter part of data appears on the LCD.

System Data 1, Index 390, Bit 0. Caller ID Display Pattern on the LCD. 0/1 = Calling Number/Calling Name has priority.

System Data 1, Index 390, Bit 2. when using Dterm Two-line LCD, the lower LCD can be used for displaying Caller ID. 0/1 = Out/In service.

When Calling Number is output to SMDR, the following expanded format is used.

System Data 1, Index 288, Bit 5. Expanded SMDR Output for SMDR A Apparatus. 0/1 = Out/In Service.

System Data 1, Index 290, Bit 5. Expanded SMDR Output for SMDR B Apparatus. 0/1 = Out/In Service.

System Data 1, Index 292, Bit 5. Expanded SMDR Output for SMDR C Apparatus. 0/1 = Out/In Service.

System Data 1, Index 294, Bit 5. Expanded SMDR Output for SMDR D Apparatus. 0/1 = Out/In Service.

System Data 1, Index 296, Bit 0. Output of Calling Number (ANI Information). 0/1 = Out/In Service. Assign data "1".

System Data 1, Index 300, Bit 0. 0/1 = Billing information is sent to the Main Node in Expanded SMDR format if CENTRALIZED BILLING - CCIS [C-55].

STEP 2: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 14 to Stations allowed Station MESSAGE DETAIL RECORDING [S-10].

STEP 3: **ARTD** - Assign Route Class Data for the Central Office Trunk.

RT: 1
15-LSG :3 50-DPLY :1
When Calling Number is output to SMDR:
RT: 1
10-SMDR :1
Assign Route Class Expansion Data: CNI - 1. SVI: 1645 = 1

When My Line is Prime Line, CALL ID CHANGE DISPLAY Feature key is effective while terminating or in conversation.

When My Line is not Prime Line, CALL ID CHANGE DISPLAY Feature key is effective while in conversation.

However, Display Pattern returns to the original setting when answering, holding, or transferring the call.

STEP 4: **ATRK** - Assign Trunk data for the Central Office Trunk.

STEP 5: **MBTK** - Cancel the make busy of the Central Office Trunk.

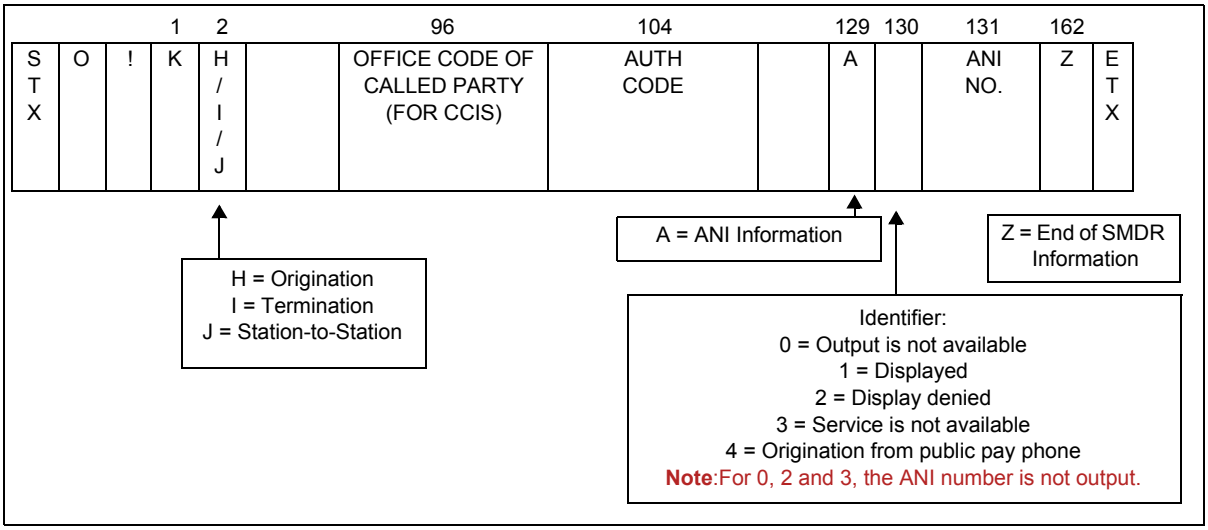
STEP 6: **AKYD** - Assign CALL ID CHANGE DISPLAY Feature key. Assign Type:Function:CALL ID CHANGE DISPLAY [113]. When CALL ID CHANGE DISPLAY Feature key is pressed, Display Pattern on the LCD assigned by ASYD command changes according to the conditions above.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ASYDL** - System Data 1, Index 576, Bit 0 = 1. Enable central SMDR polling method for FCCS.



System Data 1, Index 241, Bit 4. 0/1 = No ANI output to SMDR/ANI output to SMDR.

System Data 1, Index 241, Bit 6. 0/1 = When the length of Caller ID exceeds the limit, only the former/latter part of data appears on the LCD.

System Data 1, Index 390, Bit 0. Caller ID Display Pattern on the LCD. 0/1 = Calling Number/Calling Name has priority.

System Data 1, Index 390, Bit 2. when using Dterm Two-line LCD, the lower LCD can be used for displaying Caller ID. 0/1 = Out/In service.

When Calling Number is output to SMDR, the following expanded format is used.

System Data 1, Index 288, Bit 5. Expanded SMDR Output for SMDR A Apparatus. 0/1 = Out/In Service.

System Data 1, Index 290, Bit 5. Expanded SMDR Output for SMDR B Apparatus. 0/1 = Out/In Service.

System Data 1, Index 292, Bit 5. Expanded SMDR Output for SMDR C Apparatus. 0/1 = Out/In Service.

System Data 1, Index 294, Bit 5. Expanded SMDR Output for SMDR D Apparatus. 0/1 = Out/In Service.

System Data 1, Index 296, Bit 0. Output of Calling Number (ANI Information). 0/1 = Out/In Service. Assign data "1".

System Data 1, Index 300, Bit 0. 0/1 = Billing information is sent to the Main Node in Expanded SMDR format if CENTRALIZED BILLING - CCIS [C-55].

STEP 2: **ARTDN** - Assign Route Class Data for the Central Office Trunk.

RT: 1
15-LSG :3 50-DPLY :1

When Calling Number is output to SMDR:

RT: 1
10-SMDR :1

Assign Route Class Expansion Data: CNI - 1. SVI: 1645 = 1

When My Line is Prime Line, CALL ID CHANGE DISPLAY Feature key is effective while terminating or in conversation.

When My Line is not Prime Line, CALL ID CHANGE DISPLAY Feature key is effective while in conversation.

However, Display Pattern returns to the original setting when answering, holding, or transferring the call.

M-104 Message Waiting-Special Dial Tone

General Description

This feature allows the system to send Special Dial Tone when the handset is off-hook, indicating that Message Waiting has been set to the Station.

Note: This feature is not available in North America.

Operating Procedure

None.

Service Conditions

Even if this feature is set, normal Dial Tone is received when the CALL HOLD [C-6] Access Code is dialed.

Programming

STEP 1: **ASFC** - Assign a Service Feature Restriction Class that allows SFI = 142 to the Stations using MESSAGE WAITING-SPECIAL DIAL TONE.

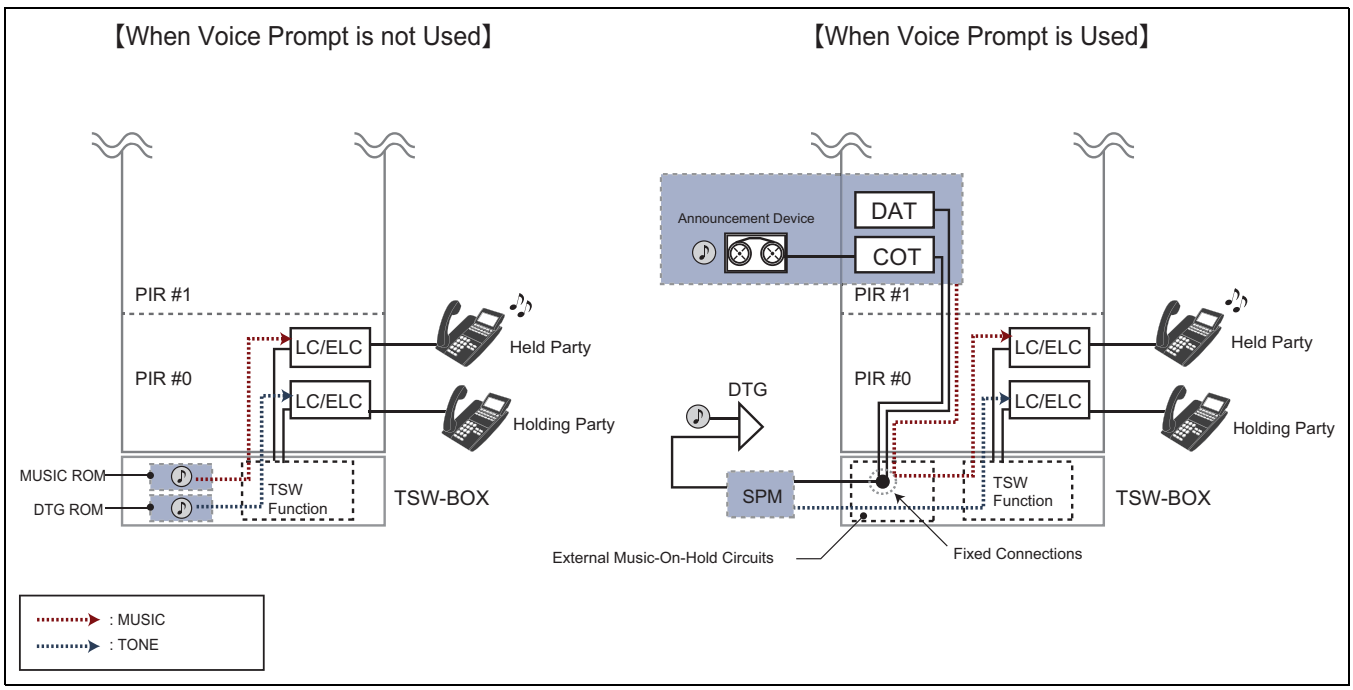
M-105 Multiple Music on Hold Source

General Description

This feature is programmed to let the system use the so-called "Voice Prompt" functions instead of the audible tone generally supplied from the Digital Tone Generator (DTG) or music ROM. When the system is equipped with an Announcement Trunk, such as DAT, COT or EMT, the user can activate this alternative tone provision service on condition that the announcement port and Speech Path Memory (SPM) in the following LENS are catenated by nailed-down Connections.

Note: This feature is not available in North America.

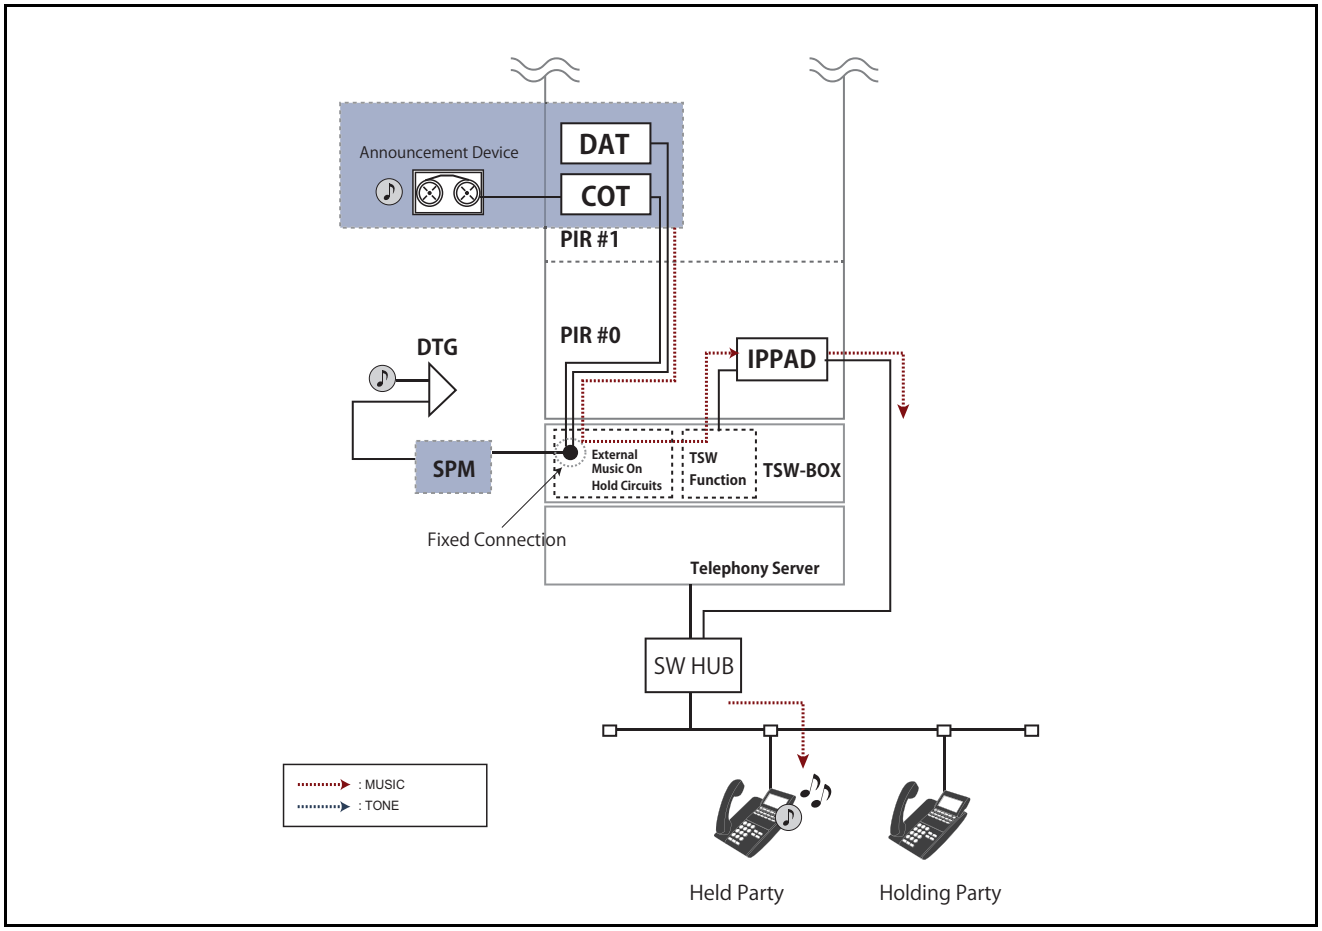
[Locations of Speech Path Memory]



MG = 00, Unit = 2, Group = 24, Level = 0~7
MG = 00, Unit = 2, Group = 25, Level = 0~7] SPM for TONE channel 16~31

MG = 00, Unit = 0, Group = 24, Level = 0~7
MG = 00, Unit = 0, Group = 25, Level = 0~7] SPM for TONE channel 00~15

MG = 01, Unit = 2, Group = 24, Level = 0~5
MG = 01, Unit = 2, Group = 25, Level = 0~7] SPM for MUSIC channel 16~29



MG = 01, Unit = 0, Group = 24, Level = 0~7
MG = 01, Unit = 0, Group = 25, Level = 0~7] SPM for MUSIC channel 00~15

As shown in the figure below, the TONE ROM accommodated on the TSW card generally contains the audible tone, and EMA/PLO card provide the Hold Tone (music). However, if a DAT/COT/EMT card is accommodated, the system can provide audible tone (Voice Prompt) by fixed Connection established between SPM and the card's Announcement Trunk(s).

IPPAD card is required for IP terminals receiving MOH from Multiple Music on Hold source. If IPPAD card is not installed in the system or the card is link block state such as out of the assigned port number, the IP terminal receives internal MOH.

When Providing Multiple Music On Hold Source to IP terminal

The following shows the tone kinds corresponding to the tone output channels #00-15

CH NO.	KIND OF TONE	REMARKS
00	Dial Tone (DT)	
01	Special Dial Tone (SPDT)	
02	Ringback Tone (RBT)	
03	Continuous Ringback Tone (CRBT)	
04	Busy Tone (BT)	
05	Reorder Tone (ROT)	
06	Service Set Tone (SST)	
07	Second Dial Tone (SDT)	
08	-	
09	Sender Transmitting Tone (SDTT)	
10	Call Waiting Ringback Tone (CWRBT)	
11	-	
12	-	

CH NO.	KIND OF TONE	REMARKS
13	Test Tone (TSTT)	
14	-	
15	-	

The following shows the music kinds corresponding to the MUSIC output channels #00-15.

CH NO.	KIND OF MUSIC	REMARKS
00	Music On Hold (MSC)	
01 ʃ 15	Not used	

Operating Procedure

No manual operations required.

Service Conditions

1. This feature is not available in North America.
2. For the activation of this feature, dedicated hardware, such as DAT/COT/EMT card, is required.
3. LENS (PIM/PIR) needs to be accommodated for SPM (Speech Path Memory). System capacity license software for more than three PIM/PIR is required.
4. Restriction of Announcement Machine Connection by Route Restriction Class (ARSC command) is not available.
5. After system initialization, it takes some specific time to complete the nailed-down Connection between the SPM and the designated Announcement Trunk(s). During the pending time, the Voice Prompt will not be activated (i.e. the service will only be effectuated on the strict condition that the Connection has been firmly established).
6. The system does not cover the Head Start function for announcement guidance.
7. This feature cannot be used with FCCS.

<Conditions for IP terminals>

8. TONE is not available for IP terminals.
9. Whenever using external MOH with IP terminal, the port on IPPAD is hunted for the Connection.
10. External MOH for IP terminal cannot be provided when PHC (Internal PHC) is used.

<Conditions Specific to MMG/UMGi/RNIP System>

1. External MOH can be provided only for Stations and Trunks in the LP accommodating Speech Path Memory (SPM).
2. When receiving External MOH at IP Stations (IP Enabled Dterm, DtermIP or Analog MC), both IPPAD circuit card and Speech Path Memory (SPM) must be accommodated in the same LP.

Interactions

This feature is not available for ISDN Trunk, ISDN terminal and PS.

Programming

STEP 1: **ASYD** - System Data 1, Index 60, Bit 4 = 1 (Nailed Down Connection is effective)

STEP 2: **ASYDL** - System Data 1, Index 642-649, Bit 0-7

Voice Prompt: Each channel's tone source data.

As shown in the table below, each Bit represents the TONE output channel (a total of 32ch). When "1" is set, the TONE source for the channel is specified as Announcement Trunk(s), such as DAT, COT, EMT (Voice Prompt). If the data is "0", the source will be the Tone ROM.

Index	b7	b6	b5	b4	b3	b2	b1	b0
642	ch7	ch6	ch5	ch4	ch3	ch2	ch1	ch0
643	ch15	ch14	ch13	ch12	ch11	ch10	ch9	ch8
644	ch23	ch22	ch21	ch20	ch19	ch18	ch17	ch16
645	ch31	ch30	ch29	ch28	ch27	ch26	ch25	ch24

0/1 = Tone ROM/SPM

Index	b7	b6	b5	b4	b3	b2	b1	b0
646	ch7	ch6	ch5	ch4	ch3	ch2	ch1	ch0
647	ch15	ch14	ch13	ch12	ch11	ch10	ch9	ch8
648	ch23	ch22	ch21	ch20	ch19	ch18	ch17	ch16
649			ch29	ch28	ch27	ch26	ch25	ch24

0/1 = MUSIC ROM/SPM

STEP 3: **ARTD** - Assign data on the route for Announcement Trunk(s) to be used for Voice Prompt functions. (The Announcement Trunk can be DAT, COT or EMT, etc.) Refer to the figure below.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as circuit card, MG, or VS32.

The data assignment for the Digital Announcement Trunk (DAT) is shown below as an example:

```
RT:1
1-OSGS  :2   2-ONSG  :0   3-ISGS  :0   4-INSG  :0   5-TF    :0
6-TCL   :4   7-L/T   :1   8-RLP   :0   9-TQ    :0   10-SMDR :0
11-TD   :0   12-DR   :0   13-AC   :0   14-TNT   :0   15-LSG  :0
16-SMDR2 :0  17-H/M  :0   18-MC   :0   19-EANI  :0   20-D    :0
21-MSB  :0   22-MSW  :0   23-TR   :0   24-OC    :0   25-R/L  :0
26-RSVD :0   27-TL   :0   28-ANS  :0   29-TELP  :0   30-PAD  :0
31-OGRL :0   32-ICRL :0   33-HD   :0   34-GUARD :0   31-WINK :0
36-VAD  :0   37-CLD  :0   38-FA   :0   39-BC    :0   40-TCM  :0
41-TDMQ :0   42-TPQ  :0   43-BT   :0   44-PRV   :0   45-A/D  :0
46-CW   :0   47-TPQ  :0   48-BL   :0   49-TRKS  :0   50-DPLY :0
51-ACD  :0   52-2W/4W :0  53-FAAT  :0   54-GW    :0
```

STEP 4: **ATRK** - Assign data on Announcement Trunk(s) to be used for Voice Prompt service.

STEP 5: **MBTK** - Let the Trunk(s) assigned in STEP 2 be workable for the Voice Prompt carrier. Cancel the Make-busy status applied to the Trunk(s) by assigning "0 (Make idle)" to the parameter "MB."

STEP 6: **AFCD** - Assign the data related to Fixed Connections between the Announcement Trunk(s) and the Speech Path Memory. LENS data for the Announcement Trunk is assigned in the LENS-A parameter and LENS data for the Speech Path Memory is assigned in the LENS-B parameter.

M-107 Message Audible Alert

(Series 8700 software feature)

General Description

Messages (like voice mail or message waiting lamp control) can be realized by MCI or digital voice integration. This feature with MCI is an adjunct to MESSAGE CENTER INTERFACE [M-26] and MESSAGE CENTER INTERFACE - CCIS [M-67], which provides normal voice mail service. When MCI or digital voice integration sends a new voice mail notification to a station, a chime (audible alert) information will also sent to the station.
Also, This feature with MCI lamp control on control is an adjunct to MESSAGE WAITING LAMP ON - ATTENDANT [M-23] and MESSAGE WAITING LAMP ON - STATION [M-30]. When a lamp on notification is sent to a station, a chime (audible alert) information will also send to the station. The station will have a light flash followed a chime after receiving the notification.

Note: This feature is available in North America only.

Operating Procedure

Normal voice mail operation procedure is same as MESSAGE CENTER INTERFACE [M-26], MESSAGE CENTER INTERFACE - CCIS [M-67] or digital voice integration. Normal Message Waiting Lamp on procedure is same as MESSAGE WAITING LAMP ON - ATTENDANT [M-23] or MESSAGE WAITING LAMP ON - STATION [M-30]. This feature can be controlled on a system basis or assigned to a Feature key or Access Code.

Service Conditions

1. The message audible alert key can be assigned by Feature key (AKYD), Soft key (ADSL) or Access Code (ANPD, ASPA).
2. If the ASYDL, System Data 1, Index 805, Bit 3 and Bit 4 is on, the Station will chime each time when it receives a new message notification.
3. If the ASYDL, System Data 1, Index 805, Bit 3 is on and Bit 4 is off, if message audible alert key is set on, the station will chime each time when it receives a message notification. If the key is set off, the Station will not chime.
4. If the ASYDL, System Data 1, Index 805, Bit 3 is off and Bit 4 is on, the Station will chime only one time when it receives multiple message notifications.
5. If the ASYDL, System Data 1, Index 805, Bit 3 is off and Bit 4 is off, if message audible alert key is set on, the Station will chime only one time when it receives multiple message notifications. If the key is set off, the Station will not chime.
6. The feature works for MCI, AD40 MCI and AD120, not for AD40 voice digital integration.
7. The message audible alert key is set or cancelled when a Station is at idle condition.
8. If the ASYDL, System Data 1, Index 805, Bit 4 is off and the message audible alert key on a Station is set on, then the administrator turn the SFC off, the key can not be cancelled and a restriction “RST” will be displayed. Resetting the circuit card will clear the message audible alert key.
9. Only one Feature key can be assigned per Dterm station for this feature. Multiple Feature key assignments have unpredicted results.
10. When the Station is busy, if it is a single line, it will lamp on without audible alert after the Station hangs up. It is also true for Dterms with MCI. But for Dterms with digital voice integration, it will lamp on with audible alert.

11. With outside power source (80V), a single line will chime (short ring burst-audible alert) with lamp on when a new message arrives it. Without outside power source, a single line will chime (short ring burst-audible alert) with when a new message arrives.
12. Firmware SP3295 or later version is needed for this feature work properly for Dterm Stations.
13. PA-16LC Cards that do not support Audible Alert when MW is ON: PA-16LCBY, PA-16LCBW, and PA-16LCBV.

Interactions

1. This feature is based on MESSAGE CENTER INTERFACE [M-26], MESSAGE CENTER INTERFACE - CCIS [M-67] and digital voice integration specification. All interactions related to them are effective for this feature.
2. This feature also supports tmm, fmm, hm, mci notification like vmm. When a Station receives those notifications, it will chime like vmm (voice mail).
3. When a Station receives a Waiting Lamp on from an Attendant [M-23] or a station [M-30], it will chime like vmm.

Programming

All programming in M-23, M-26, M-30, M-67or digital voice integration are applied on this feature. The following is added programming:

STEP 1: **ASYDL/ASYDN** - System Data 1, Index 805, Bit 3: 0/1 = Audible Alert for first message/Audible Alert for all messages.

System Data 1, Index 805, Bit 4: 0/1 = Audible Alert by SFC and FKY /Audible Alert for all Stations in the system.

STEP 2: **AKYD** - Assign Message Audible Alert key [149].

STEP 3: **ADSL** - Assign Message Audible Alert key [149].

STEP 4: **ASPA** - Assign an Access Code for set Message Audible Alert: SRV = “SSCA: Service Code Appendix”, SIDA = 140 and an Access code for cancel Message Audible Alert: SRV = “SSCA: Service Code Appendix”, SIDA = 141.

STEP 5: **ASFC** - Assign Service Feature Restriction Class of the Station.
SFI = 201 (Message Audible Alert)
RES = 1 (Allowed)

M-111 Media Gateway SIP

General Description

Media Gateway-Session Initiation Protocol is an interface that enables your system to build multi-service and reliable Voice over IP (VoIP) networks using Session Initiation Protocol (SIP) defined by IETF. SIP is an application-layer control protocol that can initiate call setup, routing, authentication and transferring other feature messages to endpoints.

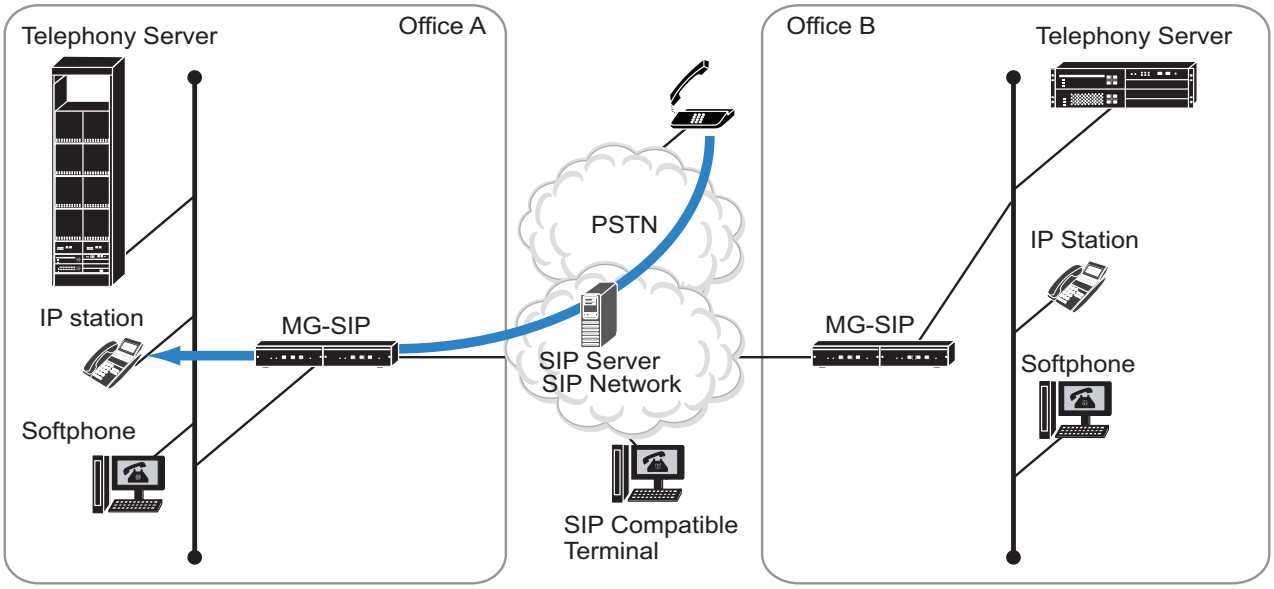
The MG-SIP supports the SIP standard terminals based on RFC3261. Thereby, the MG-SIP, which is controlled by Internal PHI-BRI of the Telephony Server, provides a full array of the call routing capabilities to maximize network performance in the packet voice network (SIP network). The MG-SIP provides the system with a flexible and cost-efficient network environment without wasting the accumulated assets of the NEC products.

"MG-SIP" refers to the following devices.

DEVICE TYPE		NUMBER OF USABLE CHANNELS Note 1	MG GROUP/MG NUMBER Note 3
MG-SIP128 [MG-128SIPMGL-A] Note 2		1-128ch	1-15
MG-SIP128 [MG-128SIPMGG-B/MG-128SIPMGG]			
MG-SIP96		1-96ch	1-4
MG-SIP16		1-16ch	1-4
MG-SIP16 [SCA-16SIPMGA/MG-16SIPMGA]			1-15
MG-SIP16 [SCA-16SIPMG(US)-B/SCA-16SIPMG(US)]			1-15
Software-based MG-SIP Note 4	SP-4085 MGSIPVM PROG-E Note 2	1-254ch Note 5	1-15
	SP-4078 MGSIPVM PROG-B	1-128ch	1-15

Note: Notice the following:
- Connection test with common carrier is required.
- For using MG-SIP TIE Line, MG-SIP128 [MG-128SIPMGJ-B/MG-128SIPMGJ] or Software-based MG-SIP [SP-4080 MGSIPVM PROG-D] is required. For details of MG-SIP TIE Line, refer to MG-SIP TIE Line [M-122].

Note 1: The number of usable channels varies depending on the connecting carrier.



Note 2: From FP95-114 V4 Issue 2.0, RTP encryption on Telephony Server network side is supported. RTP encryption on SIP network side is not supported. For details, see VOIP ENCRYPTION [V-27].

Note 3: MG Group is the group which is comprised of multiple MG-SIPs for alternate routing. Alternate routing can be executed between MG-SIPs registered to the same MG Group. For details, refer to Multiple Number Service (MG-SIP) [M-113].

Note 4: Notice the following:
- Available since FP95-112 V2.
- Software-based MG-SIP is a virtual machine installed in SV9500 (Software Model). See Software-based MG-SIP chapter in Software Model Peripheral Equipment Description.

Note 5: Available since FP95-114 V4.

The following illustration shows the system configuration when MG-SIP is accommodated.

Operating Procedure

None.

Service Conditions

1. Internal PHI-BRI is required to perform this feature. Internal PHI-BRI is built into the Telephony Server and it controls the Voice Procedure of the MG-SIP via TCP/IP.
2. The number of available Internal PHI-BRIs is one per system.

   Note: In UMGi system, the data assignment of Internal PHI-BRI is required per node (CCN/RN).
3. Virtual Trunk is registered to Physical PIR or Virtual PIR.

4. The maximum number of System Capacity is 6144 channels. The Maximum number of devices and channels per system is equivalent to the capacity of the system. The number of devices varies depending on the total accommodated channels. When 6144 channels are occupied only by MG-SIP, other devices cannot be connected. The following table shows the details on the accommodation limitations only for MG-SIP.

	Capacity of IP Components	Maximum Number of Simultaneous Connections	Maximum Number of Speech Channels	Maximum Number of Ports to be able to use
MG-SIP128	44 devices	1840 ch (460ch/LP) **Note 6**	5632 ch	6132 ch
MG-SIP96	60 devices		5760 ch	
MG-SIP16	188 devices		3008 ch	

Note 6: The maximum number of simultaneous speech channels available includes other ISDN channels.

Note: Notice the following:
- Software-based MG-SIP is an application for MG-SIP installed in the virtual machine. When using software-based MG-SIP, the number of devices and channels that can be accommodated in the system includes software-based MG-SIP channels.
- The number of accommodated capacity can be up to four times in the UMGi system.

5. Speech channel is established by Virtual trunk. When the MG-SIP Virtual Speech channels are registered to a HW (4-Group), channels other than Virtual Speech channels can not be registered to the same HW. To use more than 32-channels, register the channels per 32-channels from top channel on a HW. However, Virtual Speech channels are not required to register for a consecutive HWs.

6. Only Voice, FAX, Video, and DTMF (PB Signaling) can be established by connections via MG-SIP. This feature does not support Unrestricted digital, Modem connection, SIP Instant Message [S-151] etc.

Item	Specification	Note
Voice	G.711	64k [bps]: PCM μ-law/A-law
	G.729a	8k [bps]: CS-ACELP (Reduce complexity)
FAX **Note 8**	G.711 (PassThrough)	64k [bps]: PCM μ-law/A-law
	T.38	**Note 7**
Video **Note 9**	G.711	**Note 7**
	G.729a	
DTMF	G.711 (PassThrough)	
	Proprietary method	Toward the Telephony Server network
	RTP (RFC2833)	Toward the Telephony Server network and SIP network For DTMF Digits, Telephony Tones and Telephony Signals

Note 7: Supported from FP95-114 V4. The following MG-SIPs and firmwares are required:
- MG-SIP128 [MG-128SIPMGL-A]
- Software-based MG-SIP: SP-4085 MGSIPVM PROG-E Issue 1 or later

Note 8: For Fax data transmission using MG-SIP, see IP CONTROL-FAX [I-44] in this manual.

Note 9: For Video Call using MG-SIP, see VIDEO CALL [V-31] in this manual.

Note: Depending on the IP equipment or the condition of SIP network, some of the above conditions may not be available for MG-SIP.

Note: In case DTMF is sent via RFC2833, RTP Warning Tone may play back at the reception side.

<DTMF relay method>

DTMF relay method on the SIP network side is set by the configuration command "dtmf_mode" on the MG-SIP. DTMF relay method on the Telephony Server network side is automatically set according to the one on the MG-SIP network side, as follows.

DTMF relay system on the SIP network side	DTMF relay system on the Telephony Server network side	Remarks
RFC2833 (out-band)	Proprietary (out-band)	Conversions between "RTP (DTMF: RFC2833) packets on SIP network" and "UDP (DTMF: Proprietary) packets on Telephony Server network"
RFC2833 (out-band) **Note 10**, **Note 11**		When the setting of RFC2833 packet transparency is enabled, pass-through of "RTP (DTMF: RFC2833) packets on SIP network and Telephony Server network" are available. For details, refer to command section (set rfc2833_pass) of each MG-SIP in Peripheral Equipment Description (IP Devices).
G.711 PassThrough (in-band)		Conversions between "RTP packets on SIP network" and "RTP packets on Telephony Server network"

Note 10: The following MG-SIPs with firmware are required for RFC2833 packet transparency:
- MG-SIP16 [SCA-16SIPMG (US)-B/SCA-16SIPMG (US)]: SP-3988 MGSIP (16) PROG-G Issue 10 or later
- MG-SIP128 [MG-128SIPMGL-A]: SP-4089 MGSIP(MM) PROG-A Issue 1 or later
- Software-based MG-SIP: SP-4085 MGSIPVM PROG-E Issue 1 or later

Note 11: RFC2833 packet transparency is available only when the terminals on the Telephony Server network side and SIP network side support RFC2833.

7. MG-SIP makes a connection using SIP Server, which helps to create multi-location connection. SIP server can use Proxy Server and Registry Server. User Agent (UA) has been registered to SIP Server.
8. IP Masquerade feature can make a VoIP connection between Private IP Address and Global IP Address.

   IP Masquerade feature translates UDP and TCP Ports, thereby, it can connect multiple Private IP Addresses to single Global IP Address.

   No special equipment is necessary for performing IP Masquerade. However, the internet that may cause delay or does not guarantee bandwidth cannot be used (Only the operation on an intranet is guaranteed).
9. When third party SIP-based terminals (such as SIP Gateway, SIP terminal, SIP Server) are used in the SIP network, test these terminals in advance and make sure that they are available to use (also, if there is any related additional service that you want to use, confirm that is available). Note that the terminal cannot be managed as a station under the Telephony Server.
10. Tone and holding tone to SIP network is generated by MG-SIP. When MGC (Internal PHI-BRI) external holding tone is selected by ASYDL command, the information is provided via IPPAD card.

11. Caller ID will not be sent to the forwarding destination when a call is transferred toward the public SIP network by forwarding features such as Call Forwarding - Don't Answer [C-3], Call Forwarding - Busy Line [C-2], and Call Forwarding - All Calls [C-5].

    Note: When ISDN CLI WITH CALL FORWARDING OUTSIDE [I-50] feature is activated, it is possible to send Caller ID to SIP network. (Available in Australia only.)

12. A single route can be shared by multiple MG-SIPs (maximum 8 devices). For details, refer to MG-SIP Shared Route [M-123].
13. MG Registration Status can be displayed by using the DIMG command.
14. Transferring only Voice RTP Payload, MGC has no effect on the jitter-buffer size or Echo Canceller, which are controlled by the endpoint devices.
15. MG-SIP can receive incoming calls through AUTOMATED ATTENDANT [A-82]/REMOTE ACCESS TO SYSTEM [R-2] under the following conditions.
    a.) AUTOMATED ATTENDANT [A-82]/REMOTE ACCESS TO SYSTEM [R-2] may not work properly, depending on the system configuration of SV9500 network and the conditions for DTMF specifications in SIP network. **Note 12**
    The conditions of system configuration are as follows:

DTMF in SIP Network	Telephony Server	SR-MGC	System Configuration
Fax PassThrough	Available*	Unavailable	Set ARTI/ARTIN CDN77(RA_RT) = 1 (Register card is used). *PIR is required to use IPPAD. *IPPAD is required.
RFC2833	Available	Available	Set ARTI/ARTIN CDN77(RA_RT) = 0 (Virtual Register is used). *PIR is not required because Virtual Register is used.

    Note 12: The specifications for DTMF in SIP network varies, depending on the network carrier.

    b.) PB Receiver becomes invalid while receiving an announcement for AUTOMATED ATTENDANT [A-82]/REMOTE ACCESS TO SYSTEM [R-2].
    c.) After dialing a target telephone number, a beep may be heard before Ringback Tone (RBT), but it's not abnormal.

16. SERIAL CALL -D [S-127D] is not available for incoming call via MG-SIP.
17. MG-SIP does not support ring down feature.
18. To use VLAN feature of MG-SIP, connect switch supporting Port VLAN feature (Tag VLAN is not supported).
19. Alternate routing to PSTN line can be activated in the case of the following connection failure on IP network.
    - LAN cable failure on MG-SIP's LAN side (Telephony Server network) connector → Alternate routing is activated after health check time-out detection.

- Network failure between the Telephony Server and MG-SIP → Alternate routing is activated after health check time-out detection.
- MG-SIP failure (such as power-off, etc.) → Alternate routing is activated after health check time-out detection.
- LAN cable failure on MG-SIP's WAN side (SIP network) connector → Alternate routing is activated on detecting the cable failure.
- Network failure between MG-SIP and carrier's SIP server → Alternate routing is activated after originating connection time-out (6 seconds).
- MG-SIP receives error response from carrier's SIP server → Alternate routing is activated after receiving error response (400, 408, 481, 500, 503).
- All the available channels are busy or in make-busy state.

20. Designated Connection Test (PCPro) with the TOGC command is available for Media Gateway SIP.
21. MG-SIP supports Name Display service equivalent to CALLING NAME IDENTIFICATION PRESENTATION (CNIP)/CONNECTED NAME IDENTIFICATION PRESENTATION (CONP) [C-153]. For proper functioning of this feature, see service condition listed in CALLING NAME IDENTIFICATION PRESENTATION (CNIP)/CONNECTED NAME IDENTIFICATION PRESENTATION (CONP) [C-153] in Data Programming Manual - ISDN and the following.

(a) The following firmware is required for MG-SIP.

MG-SIP16 [SCA-16SIPMG(US)]	SP-3988 MGSIP (16) PROG-G Issue 2 or later
MG-SIP96	SP-3987 MGSIP PROG-B Issue 2 or later
MG-SIP128 [MG-128SIPMGL-A]	SP-4089 MGSIP(MM) PROG-A Issue 1 or later
MG-SIP128 [MG-128SIPMGG/ MG-128SIPMGG-B]	SP-4051 MGSIP PROG-G Issue 1 or later SP-4058 MGSIP PROG-J Issue 1 or later
Software-based MG-SIP	SP-4078 MGSIPVM PROG-B Issue 1 or later SP-4085 MGSIPVM PROG-E Issue 1 or later

(b) Configure the set cpn_pattern command to obtain cpn (calling party number) from the P-Asserted-Identity header, not from the Displayname field. If the set cpn_pattern command is not configured or the P-Asserted-Identity header is not added, the caller name is not available.

(c) When more than one P-Asserted-Identity header is added, this feature uses only the first header.

(d) The following single-byte alphanumerics (JIS8 code) are used as Name Display data. When double quotation marks (") and backward slash marks are used in the Displayname fields, these marks can be escaped (displayed) by putting a backward slash mark before them.

	2	3	4	5	6	7
0	a blank space	0	@	P	`	p
1	!	1	A	Q	a	q
2	“	2	B	R	b	r

	2	3	4	5	6	7
3	#	3	C	S	c	s
4	$	4	D	T	d	t
5	%	5	E	U	e	u
6	&	6	F	V	f	v
7	‘	7	G	W	g	w
8	(	8	H	X	h	x
9	)	9	I	Y	i	y
A	*	:	J	Z	j	z
B	+	;	K	[	k	{
C	,	<	L	¥	l	|
D	-	=	M	]	m	}
E	.	>	N	^	n	
F	/	?	O	_	o	

(e) Up to 16 characters can be displayed on the LCD. If a name has more than 16 characters, only the first 16 characters are displayed.

(f) In a network whose opposing point is MG-SIP, a destination number is not notified because “P-Asserted-Identity” header is not added.

(g) When messages received from the SIP network contains a “Privacy: id” header, the caller name is not available.

(h) This feature does not support “BusyName” notified when a called party is in busy state.

(i) Conditions for CALLING NAME IDENTIFICATION PRESENTATION (CNIP):

- CNIP supports “ini-INVITE” only.
- When Caller IDs are not notified, Name IDs are not provided regardless of the setting of the “set privacy pattern” command.
- To obtain the Displayname field as Name information, you need to select a method of obtaining cpn other than "Displayname" by the “set cpn pattern” command.

(j) Conditions for CONNECTED NAME IDENTIFICATION PRESENTATION (CONP):

- CONP supports “180 Ringing” and “200 OK” only.
- When 183 Session Progress (without SDP) arrives while the set 183rbt command is enabled, ALERT is transmitted, but the caller name is not available.

22. MG-SIP supports Route Advance service equivalent to ROUTE ADVANCE [R-6] and PRI/PRA FAILSAFE ROUTING [P-49/50]. When a call is originated via a MG-SIP and the system receives "503 Service Unavailable" from the SIP network, the call can take an alternate MG-SIP by these services. MG-SIP requires the following firmware.

MG-SIP16 [SCA-16SIPMG(US)]	SP-3988 MGSIP (16) PROG-G Issue 2 or later
MG-SIP96	SP-3987 MGSIP PROG-B Issue 2 or later
MG-SIP128 [MG-128SIPMGL-A]	SP-4089 MGSIP(MM) PROG-A Issue 1 or later
MG-SIP128 [MG-128SIPMGG]/ MG-SIP128 [MG-128SIPMGG-B]	SP-4051 MGSIP PROG-G Issue 1 or later SP-4058 MGSIP PROG-J Issue 1 or later
Software-based MG-SIP	SP-4078 MGSIPVM PROG-B Issue 1 or later SP-4085 MGSIPVM PROG-E Issue 1 or later

For proper functioning of this feature, see service condition listed in ROUTE ADVANCE [R-6] in Data Programming Manual - Business and PRI/PRA FAILSAFE ROUTING [P-49/50] in Data Programming Manual - ISDN.

23. When originating a tandem call to ACIS line via MG-SIP, if a destination station is busy, you can choose to hear Busy Tone (BT) or Ringback Tone (RBT) through the system data setting (ASYD, SYS1, Index 372, Bit 5). **Note 13**

Note 13: When Busy Tone (BT) is selected, billing is performed for the outgoing call.

24. When the Telephony Server side terminal releases during a conversation after a temporary communication failure between the Telephony Server and MG-SIP, MG-SIP may not send disconnection signals to the SIP network.
25. In this feature the system processes the timing of Guard Timer for Originating Call. Configure the settings for the timer via the system data (ASYD, SYS1, Index 474). Otherwise the settings are set to "256 milliseconds".
26. When a global IP Address of NAT is assigned to the MG-SIP, MG-SIP supports NAT. For the details, refer to command section (set nataddress) of each MG-SIP in Peripheral Equipment Description (IP Devices).

Note: The following firmware is required for MG-SIP:
- MG-SIP16 [SCA-16SIPMG (US)-B/SCA-16SIPMG (US)]: SP-3988 MGSIP (16) PROG-G Issue 10 or later
- MG-SIP128 [MG-128SIPMGL-A]: SP-4089 MGSIP(MM) PROG-A Issue 1 or later
- Software-based MG-SIP: SP-4085 MGSIPVM PROG-E Issue 1 or later

27. Feature Services available in the SIP network are described in page 1421.

<Tone Code by Countries>

MG-SIP plays Inband Tone by using Software Source. Tone Code by Countries is available under the following conditions.

(a) CODECs supported by TONE are: G.711μ-law, G.711A-law, and G.729a only.

(b) "No Tone" data is set to TONE data for other CODECs (G.723.1(5.3K) and G.723.1(6.3K)).

(c) CODECs supported by DTMF are: G.711μ-law, G.711A-law only.

(d) Music on Hold (MOH) is not supported.

(e) Short tone is not supported.

(f) Tone Code by Countries is available for the following services.
- Blind Transfer
- Calling to the tandem destination (Only in this case, Inband Tone RBT is sent to the station side.)
- Receiving REFER
- Automated Attendant

(g) Inband Tone of MG-SIP128 and software-based MG-SIP can be changed by using ASYDL, SYS1, Index 811.
- To change Tone Code by countries, the configuration command "set country_code" should be set to "0".

<Conditions Specific to UMGi/RNIP System>

Note the following when the Telephony Server type is UMGi/RNIP.

1. Because PHI-BRI function is installed in each Local Processor (LP) of the node, Internal PHI-BRI needs to be registered for each node that uses it.
2. Communication between PHI-BRI function and MG-SIP is performed via TCP/IP communication port of LP.
3. Virtual Trunk and Internal PHI-BRI must be assigned within the same node. Virtual Trunk cannot use Internal PHI-BRIs assigned to the other nodes.
4. Up to 460 speech channels, including other ISDN channels, can be used simultaneously per CCN/RN.
5. In additional dial-in via MG-SIP incoming, the virtual registers are seized in the range of the node whose speech channels have been registered. (A virtual register across nodes cannot be seized.) Unless the virtual registers cannot be seized in this way, the registers (Originating Register/Destination Register/Additional Dial-in PB Receiver) will be seized in the range of the node whose speech channels have been registered. If any register in the appropriate nodes cannot be seized in both ways, originating will receive busy.

Programming

Note: Be sure to assign the data in the following order.

STEP 1: **ASYD** - Assign System Data.
SYS1,
Index 64,
Bit 0 = 0/1 (μ-law/A-law for TSW) **Note 1**
Bit 7 = 1 (holding tone sending)
Index 186, Bit 6 = 1 (ISDN)
Index 187=00
Index 220, Bit 6=0 (ISDN is enabled)
Index 474 (Guard Timer for Originating Call)
Bit 0~3: MTC (Miscellaneous Timer Counter)
Bit 4~6: TC (Timer Class)
1: 64 ms period

Note 1: Note the following conditions when this system data is changed.
- This system data determines the compression method for the entire system. When this data is changed, the μ-law/A-law settings that are notified to other MG equipment are changed as well.
- You can specify either μ-law or A-law as the information which the Telephony Server informs MG-SIP128/96 and MG-SIP16 [SCA-16SIPMG(US)].
  For more information, refer to the configuration command for MG-SIP128/96 and MG-SIP16 [SCA-16SIPMG(US)] in Peripheral Equipment Description (IP Devices).

STEP 2: **ASYDL** - Assign the following:
SYS1, Index 810, Bit 2 = 0/1 [Internal Holding Tone (IP terminals)/External Holding Tone (EMA and PLO)] **Note 2**
SYS1, Index 880, Bit 1 = 1 (Internal PHI-PRI/BRI is available)
SYS1, Index 1144, Bit 6 = 1 (Codec Change function is in service) **Note 3**, **Note 4**

Note 2: If External music (2) is selected, refer to Music On Hold [M-7].

Note 3: This system data is available as follows:

MG-SIP16 [SCA-16SIPMG(US)]	SP-3988 MGSIP (16) PROG-G Issue 3 or later
MG-SIP96	SP-3987 MGSIP PROG-B Issue 3 or later
MG-SIP128 [MG-128SIPMGL-A]	Any version
MG-SIP128 [MG-128SIPMGG]/ MG-SIP128 [MG-128SIPMGG-B]	
Software-based MG-SIP	

Note 4: This system data is required to enable Codec Change function and G.711 Fax renegotiation in addition to a configuration command setting with "set codec_change" in the MG-SIP side. For more information, refer to the configuration command for MG-SIP128/96 and MG-SIP16 [SCA-16SIPMG(US)] in Peripheral Equipment Description (IP Devices) and for Software-based MG-SIP in Software Model Peripheral Equipment Description.

STEP 3: **ALOCL** - Assign ToS settings as follows:

Note: When a change has been made, it is necessary to initialize the Internal PHI-BRI module with the ADPM command.

TYPE: Select "Network Address".
IP ADDRESS: Specify the IP address (assign 0.0.0.0 when LOC-ID=0).
MASK BIT: Specify the Mask Bit (assign 32 when LOC-ID=0).
LOC-ID = 0
Setting Type of Signaling Packet Service: Specify the Quality of Service (IP PRECEDENCE/ DIFFSERV).

- When IP PRECEDENCE is selected
Specify its priority [0-7] and the type (LOW DELAY/THROUGH PUT/RELIABILITY/MIN COST).

- When DIFFSERV is selected
Specify its priority [0-63].

Note: LOC-ID=0 is essential to be assigned, however, assign other network's LOC-ID according to the configuration.

Note: One of the following is required to allow the changes to Setting Type of Signaling Packet Service data for already-operating equipment (such as PH and IP station) to take effect.

- Initialize the Internal PHI-BRI (Initialize the Internal PHI-BRI module with the ADPM command) or system
- Re-register the IP station

STEP 4: **ADTM** - Assign port numbers if necessary [default value = 64000].

Note: When you change the default port number with this command, you need to initialize the Internal PHI-BRI module with the ADPM command.

STEP 5: **ADPM** - Initialize the MGC (Internal PHI-BRI).
PH TYPE = Internal PHI (BRI)
Menu = Initialize

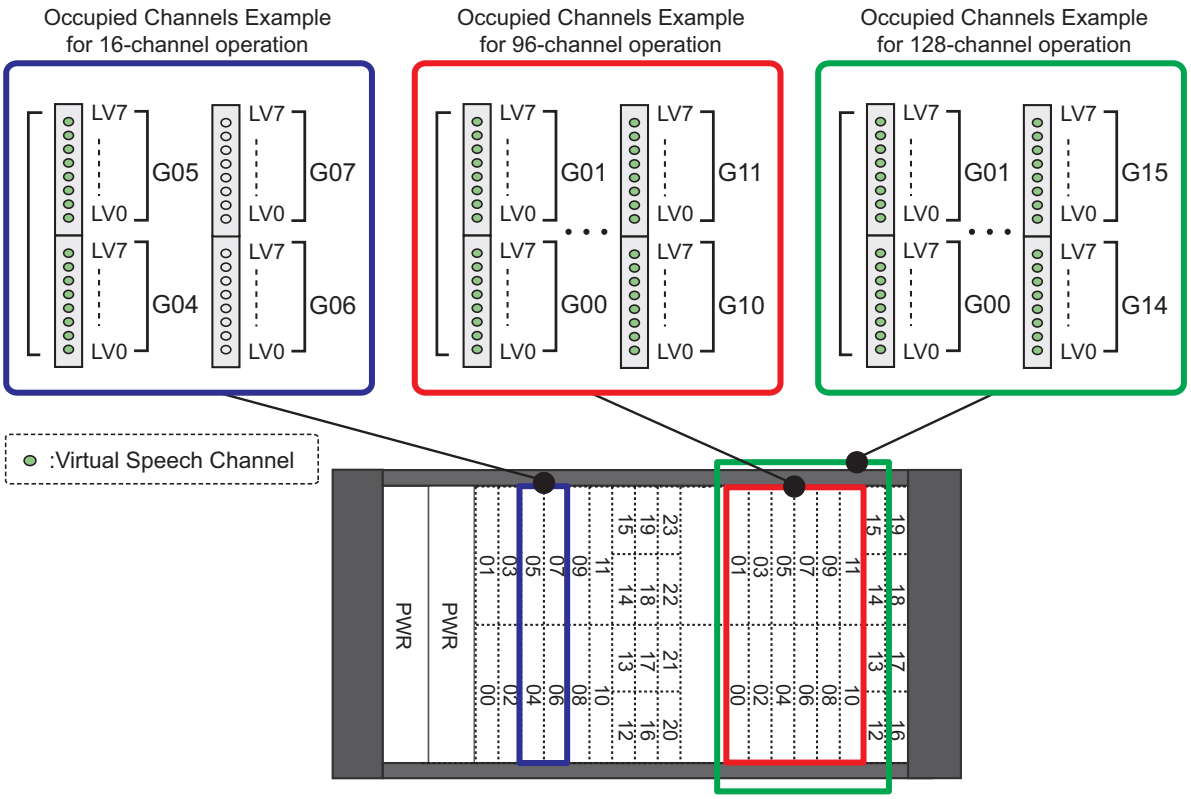
STEP 6: **ALIDL** - Specify the LENS (five digits) of Internal PHI-BRI.
PH LENS: Specify an even-numbered Group Number. The LENS can be allocated on either a Virtual PIR or a Physical PIR.
PH TYPE = Internal PHI
REGMAX: Specify the registration capacity (1-6144).

Note: When the total number of channels using PHI-BRI exceeds 256, increase the value of REGMAX.

STEP 7: **ARTD/ARTDN** - Specify the route class data on Virtual Speech Channel as follows. It is not necessary to register attributes for the Virtual Signaling Channel.

CDN2 (ONSG) = 2 (PB, 60 milliseconds Interruption, CCIS, or ISDN)
CDN4 (INSG) = 2 (PB, 60 milliseconds Interruption, or CCIS)
CDN5 (TF) = 3 [Bothway Trunk (BWT)]
CDN6 (TCL) = 1 (DDD Line)
CDN7 (L/T) = 1 (Trunk)
CDN8 (RLP) = 2 [First Party Release (either station or trunk side)]
CDN15 (LSG) = 12 [Speech Line (for CCIS or B-Channel of ISDN)]
CDN28 (ANS) = 1 (Answer signal is provided)
CDN30 (PAD) = 7 [PAD OFF(0db)]
CDN31 (OGRL) = 1 (224 milliseconds)
CDN32 (ICRL) = 1 (224 milliseconds)
CDN34 (GUARD) = 1 (512 milliseconds)
CDN45 (A/D) = 0 (Analog)
CDN49 (TRKS) = 0 (Select from the trunk which becomes idle first)
CDN50 (DPLY) = 1 (Caller ID display is enabled **Note 5**)
CDN60 (TC/EC) = 1 (Echo Canceller)
CDN65 (INT) = 10 [Q-Sig, (ETS 300 172)/IS-11572]
CDN66 (DC) = 1-15 (DID Addressing number)
Assign the CDN111(ADVPRA)=1 (ISDN PRI Failure Routing Service) to dummy route.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as MG-SIP.



Note 5: Up to 16 digits of a Caller ID can be shown on the display.

STEP 8: **ARTI** - Specify the application data for trunk.
CDN47: INTD = 2 (SIP)
CDN68: VIR = 2 (MG connection)
CDN77: RA_RT = 0/1 (Virtual Register is used/Register card is used)
Assign the following parameters for FAX use:
CDN71: FXD = 1 (IP FAX data is in service)
CDN72: FXJS (Jitter Buffer Size for IP FAX [1-30] × 10 ms) ex. Enter “15” for 150 ms.
CDN73: FXPT = 1 (Payload Type for IP FAX is G.711)
CDN74: FXPS (Payload Size for IP FAX [1-4] × 10 ms) ex. Enter “2” for 20 ms.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as MG-SIP.

STEP 9: **ATRK** - Specify trunk data on Virtual Speech Channel and Virtual Signaling Channel.
RT: Specify Route Number [1-255]
TK: Specify Trunk Number [1-255]
LENS: Specify Accommodated Location (Six digits)

Example: In the case of 128/96/16-channel operation using MG-SIP

Data Setting Example for 16-channel operation

Virtual Speech Channel

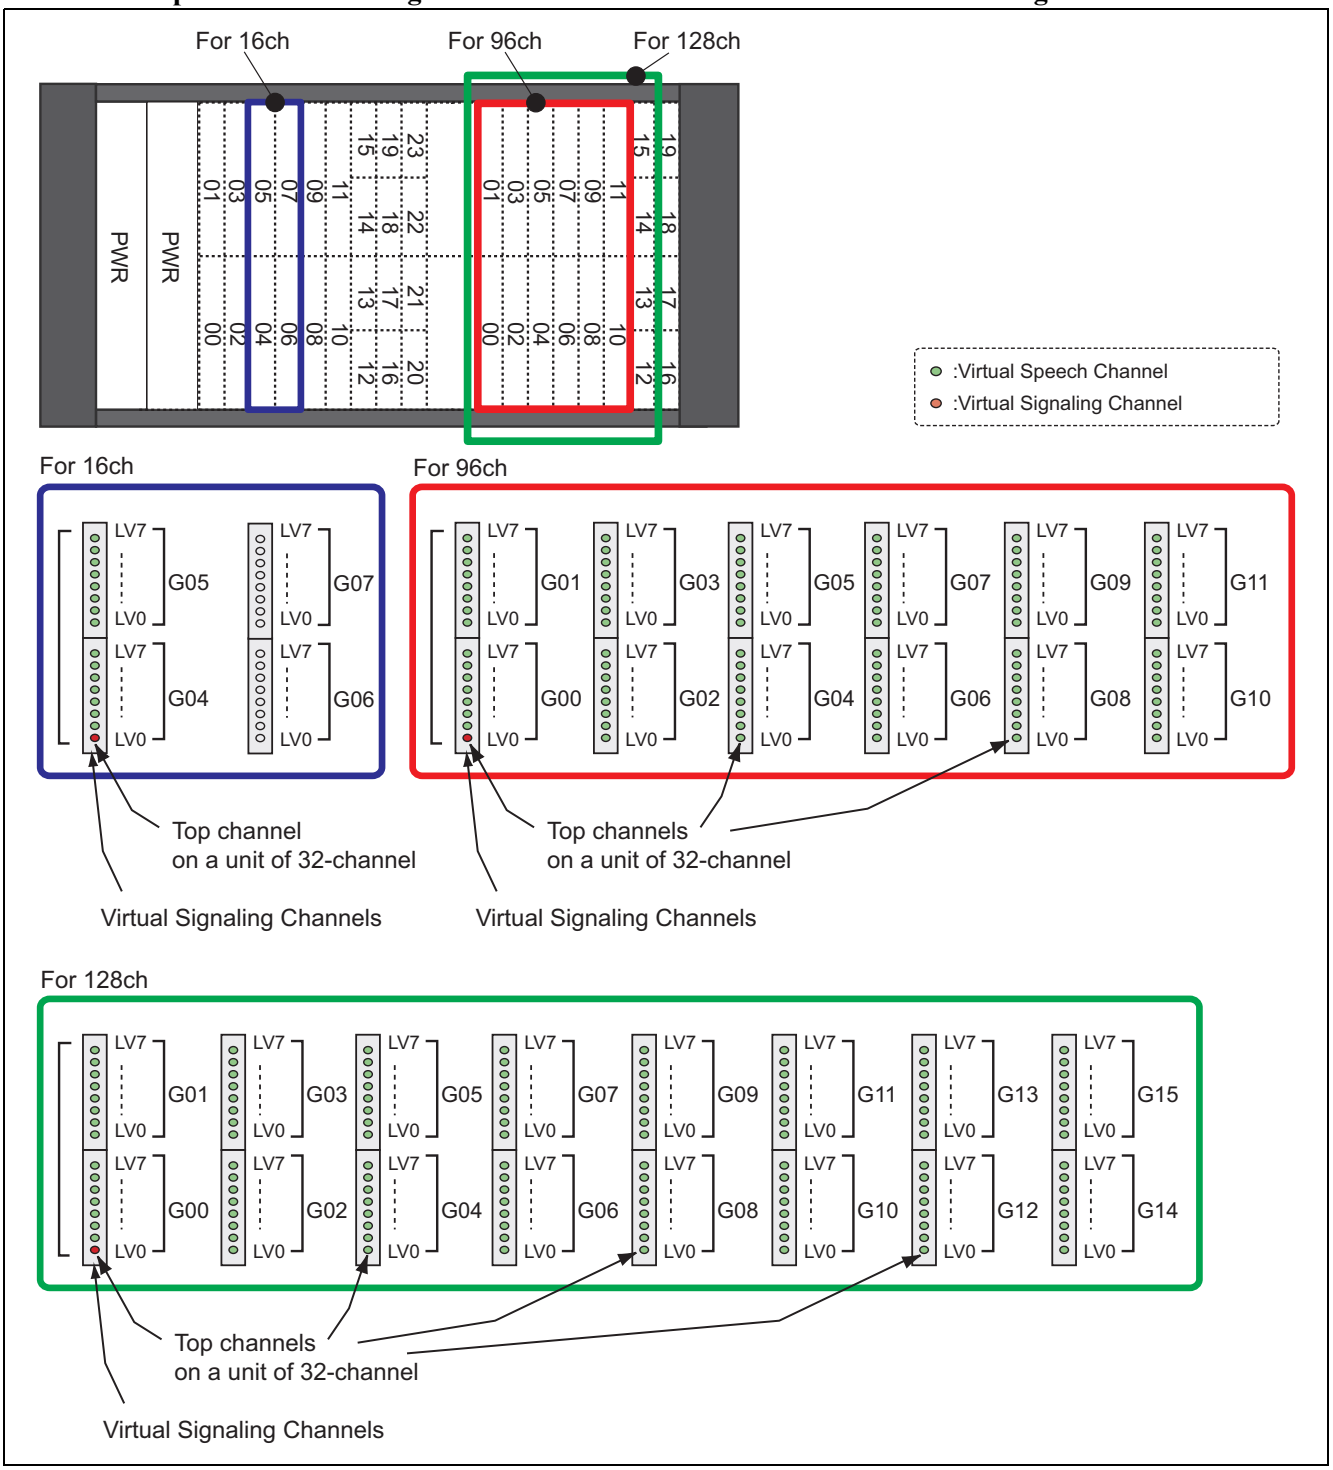
RT (1-255)	TK (1-255)	LENS			
		MG 00-07	U 0-3	G 00-23	LV 0-7
1 0	0 1	0 2	0	0 4	0
⋮	⋮	⋮	⋮	⋮	⋮
1 0	1 6	0 2	0	0 5	7

Data Setting Example for 96-channel operation

RT (1-255)	TK (1-255)	LENS			
		MG 00-07	U 0-3	G 00-23	LV 0-7
2 0	0 1	0 2	1	0 0	0
⋮	⋮	⋮	⋮	⋮	⋮
2 0	9 6	0 2	1	1 1	7

Data Setting Example for 128-channel operation

Virtual Speech Channel



RT (1-255)	TK (1-255)	LENS			
		MG 00-07	U 0-3	G 00-23	LV 0-7
2 0	0 1	0 2	1	0 0	0
⋮	⋮	⋮	⋮	⋮	⋮
2 0	1 2 8	0 2	1	1 5	7

Note: The conditions when this command is assigned are as follows.
- Be sure to register the virtual communication channel per four groups.
- Other than MG-SIP virtual communication channel cannot be registered for HW (4 group) that is registered one or more MG-SIP virtual communication channel.
- The virtual communication channel is assigned by using the AMGIL command.
- Do not assign the LENS that belongs to Even-numbered module group, Unit=0 and Group=0 to a trunk, because not supported by MG-SIP.

STEP 10: **ADPC** - Register Point Code on Virtual Speech Channel and Virtual Signaling Channel.
RT: Specify a Route Number [1-255]
PC: Specify unused Point Code, not Point Code used in SS7 [1-16383]

STEP 11: **ACSC** - Assign the top number of 32-channel LENS.
CSCG: Specify the CSC Group Number
GROUP: Specify the CIC Group Number
CCH: Specify the lead LENS of a unit.

Example: When bundling 128/96/16-channel with a unit of 32-channel using MG-SIP

For 16ch

CSCG	CICG	CCH		
		MG	U	G
130	1	02	0	04
	2	02	0	04
	3	02	0	04
	4	02	0	04
	5	02	0	04
	6	02	0	04
	7	02	0	04

For 96ch

CSCG	CICG	CCH		
		MG	U	G
130	1	02	1	00
	2	02	1	04
	3	02	1	08
	4	02	1	00
	5	02	1	00
	6	02	1	00
	7	02	1	00

For 128ch

CSCG	CICG	CCH		
		MG	U	G
130	1	02	1	00
	2	02	1	04
	3	02	1	08
	4	02	1	12
	5	02	1	00
	6	02	1	00
	7	02	1	00

STEP 12: **ACIC1** - Specify the accommodated location of Virtual Control Channel on Point Code as follows:
PC: Enter Point Code specified by ADPC
CSCG: Enter CSC group specified by ACSC

STEP 13: **ACIC2** - Specify the accommodated location of Virtual Control Channel on Point Code as follows:
PC: Enter Point Code specified by ADPC
CIC: Enter CSC numbers in sequential number
LENS: Enter accommodated locations of Speech Channel and B-Channel

STEP 14: **MBTK** - Cancel Make Busy of Virtual Speech Channel.
RT: Enter Route Number
TK: Enter Trunk Number
MB = 0 (Make idle)

STEP 15: **AMGIL** - Specify information regarding to MG-SIP as follows:
MG-ID: Enter MAC Address (6 bytes)
FUNCTION = Setting
KIND = SIP-MG
LINE = 0 (fixed)
CH = 0 (fixed)
LENS: Enter Basic Accommodated Location (the first number of HW)
Retry = 0
Setting Type of Signaling Packet Service: Specify QoS settings of Signaling that is used when Internal PHI-BRI connects MG-SIP.
Usable CH Number: Enter the number of channels to be used per MG-SIP (1-128).
Service of Authentication Exists: Select the check box if registration is required per number.
MG Group: Enter MG-SIP Group Number 1-15 to make an alternate route for redundancy configuration. **Note 6**
MG Number: Enter MG-SIP Number 1-15 belonging to the MG-SIP Group. **Note 6**

Note: Whether to use Service of Authentication is determined by the carrier's selected services. For more information about this feature, refer to Multiple Number Service (MG-SIP) [M-113].

Note: For MG-SIP16/MG-SIP16 [MG-16SIPMGA/SCA-16SIPMGA/SCA-16SIPMG(US)], 1-16 channels can be assigned.

Note 6: This parameter only appears if "Service of Authentication exists" check box is selected.

STEP 16: **AMGVL** - Register the voice control data when connecting to MG-SIP. If the settings are not specified by this command, the values assigned by the AIVCL command will be set automatically.
A RT: Specify Physical Route Number (MG-SIP).
TYPE: Select "Route Specified" or "Location ID Specified".
B LOC-ID: Displayed when TYPE = Location ID Specified. Specify Destination Location ID (Destination MG-SIP). **LOC-ID=0 must be set when IPPAD card is mounted.*
B RT: Displayed when TYPE = Route Specified is selected. Specify Physical Route Number (MG-SIP) in the case of tandem connection between MGs.
Setting Type of Voice Packet Service: Specify QoS settings of Voice Speech
TYPE: Displayed when the check box of "Setting of Payload" is ON. Specify Payload type. **G.711 and 20ms must be set for public SIP network.*
SIZE: Displayed when the check box of "Setting of Payload" is ON. Specify Payload size.

STEP 17: **ACNAL** - Assign the Calling Number Pattern (CNP) on an Access Code basis. **When this command is used, assign ARTD command CDN66 to DC=15.*

- Settings for a Call Originated to SIP Network
  Specify Calling Number Pattern against route for Call-ID Notification and Access Code.

  IC/OG = OG (Outgoing Call)
  RT: Enter External Route Number to be sent Call-ID Notification per Access Code.
  ACC: Enter Access Code.
  CNP: Enter Calling Number Pattern.

  Note: To modify CNP set by the ACNAL command, use the ACND command; ACNDN command cannot be used.

- Settings for a Call Arrived from SIP Network
  Specify Calling Number Pattern against route for Call-ID Notification and Access Code.

  IC/OG = IC (Incoming Call)
  RT: Enter External Route Number to be arrived.
  ACC: Enter Access Code.
  DC: Dialed Number Confirmation

STEP 18: **ACND** - Assign the data for number change to CNP has been specified by the ACNAL command
CNP: Calling Number Pattern
SKIP: Number of Skip Digits
ADD: Number of Digits of the Additional Number
DC: Additional Digit Information

STEP 19: **ACDD** - Change Digit Code according to DID Addressing.
DAY/NIGHT: Day/Night Mode
RT: Enter the B-Channel Route Number.
DC: Enter Number of digits for this DC must match the data in DC of the ARTD command.
CDC: Enter Change Digit Code [Maximum 24 digits]
AD: Enter Additional Dialing
XFR: Enable/Disable Transfer Service

STEP 20: After the registration has been completed, reset MG-SIP (ON→OFF→ON).

When using Name Display service equivalent to CALLING NAME IDENTIFICATION PRESENTATION (CNIP)/CONNECTED NAME IDENTIFICATION PRESENTATION (CONP) [C-153], the following data setting is required. To send Calling Party Information, the data setting on the ANDD command is required in addition to the following setting.

STEP 1: **ASYD** - Assign System Data.
SYS1,
Index 31=04
Index 78, Bit 3: 0/1(Station Number with Name Display on Desktop terminal is out of service/in service.)
Index 78, Bit 5=1 (Name Display Service is in service.)
Index 79, Bit 5: 0/1 (Name Display Enhance Service is out of service/in service.)
*When Index 78, Bit 3=1 and Bit 5=1:
0 = Called party's number
1 = Dialed number
Index 79, Bit 6=0 (OAI/ACD in service.)
Index 241, Bit 1: The number of digits displayed in Name Display service. 0/1 (8-digit/16-digit)
Index 390, Bit 0: Caller ID display pattern on the LCD (Top line). 0/1 (Calling Name/Calling Number has priority.)

STEP 2: **ARTD** - Assign route class data for the MG-SIP route.
CDN 6 (TCL) = 4 (Tie Line)
CDN 43 (BT) = 1 (Inter-office Busy Service is in service.)
CDN 50 (DPLY) = 1 (Caller ID display is enabled. **Note 7**)
CDN 98 (CI) = 0 (ISDN transmitting information is out of service.)
CDN 112 (IND) = 1 (Inter-office Name Display is in service.)

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as MG-SIP.

Note 7: Up to 16 digits of a Caller ID can be shown on the display.

When using Route Advance service equivalent to ROUTE ADVANCE [R-6] and PRI/PRA FAILSAFE ROUTING [P-49/50], the following data setting is required.

STEP 1: **ASYD** - Assign System Data.
SYS1,
Index 65: 01-FF (RT 1-255) Assign a maximum number of routes.
Index 368, Bit 2=1 (Allows alternate routing to CCIS line when a call to ISDN Network (first line) is not available.)

STEP 2: **ARTD** - Assign CDN 111 (ADVPRA) = 1 to enable ISDN PRI Failure Routing service. This data is assigned to dummy routes.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as MG-SIP.

STEP 3: **ANPD**
1stDC: The first digit of LCR Access Code.
CI: N (Normal Service) or H (Hooking Service)
NND: 1=Necessary (minimum) number of digits for Access Code.

STEP 4: **ASPA**
ACC: LCR Access Code.
CI= "N: Normal" or "H: Hooking"
SRV= "LCR: Least Cost Routing"/"LCRS: Register Sender LCR"
RT: Dummy Route Number.

STEP 5: **AFRS**
RT: Dummy Route Number.
NPC: Number Pattern Code.
OPR: Outgoing Route Selection Number.

STEP 6: **AOPR**
TDPTN: Time of Day Change Pattern.
OPR: OPR assigned by the AFRS command.
<1st Route>
RA: 0 (route seizure order)
E: 1 (More Route Advance assignments are required)
RT: MG-SIP route number which is seized first.
<2nd Route>
RA: 1 (route seizure order)
E: 1 (More Route Advance assignments are required)
RT: MG-SIP route number which is seized second.
<Last Route>
RA: 2 (route seizure order)
E: 0=Route advance ends (Last route)
RT: MG-SIP route number which is seized last.

When using Call-ID Notification service equivalent to ISDN CLI WITH CALL FORWARDING OUTSIDE [I-50], the following data setting is required.

STEP 1: **ARTI** - Assign Trunk Application Data to MG-SIP (Virtual Speech Channel) of Outgoing Route.
CDN: 78 CLICF = 1 (The calling number generated in own node is informed to SIP network.)

Note: While the feature is activated (ARTI CDN: 78 CLICF = 1), caller ID to SIP network from station call and call forward from station-to-station call (Call Transfer - All Calls, Blind Transfer to Attendant/Station and each call forwarding feature) are same condition.

STEP 2: **ASYD** - SYS1, Index 20, Bit7
Specify the billing party when calls are transmitted by Call Forwarding - Outside features.
0/1 = The originating station of the transferred call./The station that has set Call Forwarding.

To change Inband Tone of MG-SIP128 and software-based MG-SIP, the following data setting is required.

STEP 1: **ASYDL** - Assign System Data for LDM.
SYS1, Index 811, Bit 0-7 (Tone Code by countries.)

ASYDL SYS 1 INDEX 811			
TONE CODE	**Basic Tones**	**TONE CODE**	**EMEA Tones**
00	Not used **Note 8**	C8	Germany
01	Japan (default)	C9	Italy
02	North America	CA	Netherlands
03	Australia	CC	Denmark
04	Other countries	CD	Sweden
05	Hong Kong	D3	Spain
06	Malaysia	D4	Austria
07	Singapore	D5	Belgium
08	England	D6	England [For EMEA]
09	Mexico	D7	Greece
0A	Taiwan	D8	Switzerland
0B	New Zealand	D9	South Africa
0C	Korea	Other Values	Not used **Note 8**
0D	Brazil		
0E	China		
0F	Thailand		
10	Thailand (EGAT)		
11	Sri Lanka		

Note: To apply this change, assign the configuration command “set country_code” to “0”.

Note 8: When this Tone Code is assigned to “0” or “Not used”, and the configuration command “set country_code” is assigned to “0”, the tone is set as Japan (default).

- **OG/IC CALL FEATURES**

x: Available N: Not Available C: Conditionally available

Feature Name	Availability	Remarks
Direct-In Termination (DIT) [D-7]	N	
External Music On Hold	X	IPPAD card is required.
Multiple Music-on Hold [M-99]	X	IPPAD and DAT cards are required.
Distinctive Ringing [D-10]	X	Distinctive Ringing is available for an incoming call from the SIP network.
Internal Music On Hold	X	Music on Hold can be sent from the MG-SIP16 to the SIP network.
Alternate Routing [A-16]	X	SIP network can be specified as an alternate route.
Speed Calling - Station [S-21] Speed Calling - Group [S-23]	X	Available to access the SIP network by using this feature.
Direct Outward Dialing (DOD) [D-9]	X	Available to access the SIP network by dialing an Access Code + destination telephone number.
Speed Calling - System [S-3] Consecutive Speed Calling - System [C-62]	X	Available to access the SIP network by using this feature.
Toll Restriction - 3/6-Digit [T-7]	X	Available to restrict/allow Outgoing Calls to the SIP network according to specific area.
Outgoing Trunk Queuing [O-2]	X	Available when MG-SIP is in all-busy state.
Off-Hook Queuing [O-7]	X	Available when MG-SIP is in all-busy state.
Miscellaneous Trunk Restriction [M-3]	X	Call origination to SIP network can be restricted according to the Station's route restriction class.

- **ISDN FEATURES**

x: Available N: Not Available C: Conditionally available

Feature Name	Availability	Remarks
ISDN CLI with Call Forwarding Outside [I-50]	X	Available when connecting to the SIP network. **Note:** Available in Australia only.
SID to Network-Present [S-91]	X	Available to deliver SID to the SIP network. It is necessary to confirm specifications of the SID service.
SID to Network-Privacy [S-92]	C	Available to control the transfer of SID to the SIP network. It is necessary to confirm specifications of the SID service. **Note:** Available by using the configuration command (184toprivacy).

- **OTHER FEATURES**

x: Available N: Not Available C: Conditionally available

Feature Name	Availability	Remarks
Authorization Code [A-20]	X	Available to originate a call to the SIP network after temporarily changing the Station's class by this feature.
Account Code [A-18]	X	By dialing the Access Code + Account Code when Station originates a call to the SIP network, the appropriate account code can be added to the billing information.
Call Forwarding - Intercept / Announcement [C-25]	X	Available to route an incoming call from the SIP network to the Announcement trunk. IPPAD and DAT cards are required.
Call Park [C-29]	X	Available to park an incoming call from the SIP network.
Call Park Group [C-194]	X	Available for an incoming call from the SIP network.
Call Park Group -D [C-176D]	X	Available for an incoming call from the SIP network
Announcement Service [A-15]	X	Available to route an incoming call from the SIP network to the Announcement trunk. IPPAD and DAT cards are required.
Route Restriction - Announcement [R-27]	X	If call origination to the SIP network is restricted, an originated call to the SIP network is automatically routed to the Announcement trunk.
Uniform Call Distribution (UCD) [U-1]	X	Available to distribute an incoming call from the SIP network to a UCD Group.
Overflow - UCD [O-13]	X	An incoming call from the SIP network to a UCD Group can be transferred to an Overflow UCD Group when all Stations in the first UCD Group are busy.
Call Waiting Lamp - UCD [C-76]	X	An LED indication is available when an incoming call from the SIP network is waiting in the UCD Queue.
Delay Announcement - UCD [D-31]	X	An incoming call from the SIP network to a UCD Group can be transferred to the Announcement trunk when all Stations in the UCD Group are busy.
IP Control-FAX [I-44]	X	
Video Call [V-31]	X	

- **MULTI-FUNCTION TELEPHONE FEATURES**

x: Available N: Not Available C: Conditionally available

Feature Name	Availability	Remarks
Speed Calling - One Touch -D [S-26D]	X	A call can be originated to SIP network by using the Programmable Line/Feature key.
Call Forwarding - All Calls [C-5]	X	Available for an incoming call from the SIP network.
Elapsed Time Display -D [E-3D]	X	LCD display of the time elapsed is available while an Station is connected to the SIP network.
Call Pickup - Group [C-7] Selectable Station Call Pickup [S-137]	X	Available to pick up an incoming call from the SIP network.
Call Hold [C-6]	X	Available when connecting to the SIP network.
Three-Way Calling [T-2]	X	Available when connecting to the SIP network.
Exclusive Hold -D [E-4D]	X	Available when connecting to the SIP network.
Save And Repeat -D [S-24D]	X	Available when connecting to the SIP network.
Call Transfer - All Calls [C-11]	X	Available for the Station connected with the SIP network.
Serial Call -D [S-127]	N	
Call Forwarding - Don't Answer [C-3]	X	Available for an incoming call from the SIP network.
Non-exclusive Hold -D [N-7D]	X	Available when connecting to the SIP network.
Call Forwarding - Busy Line [C-2]	X	Available for an incoming call from the SIP network.
Tone Block [T-63]	X	Available when connecting to the SIP network.

- **STATION FEATURES**

x: Available N: Not Available C: Conditionally available

Feature Name	Availability	Remarks
Station-Controlled Conference [S-6]	X	Available when connecting to the SIP network.
Call Forwarding - All Calls - Outside [C-28]	X	SIP network can be specified as a forwarding destination.
Call Forwarding - Don't Answer - Outside [C-74]	X	SIP network can be specified as a forwarding destination.
Call Forwarding - Busy Line - Outside [C-60]	X	SIP network can be specified as a forwarding destination.
Blind Transfer To Station [B-18]	X	Available when connecting to the SIP network.
Call Waiting - Terminating [C-12] Call Waiting - Answer -D [C-27D] Call Waiting - Originating [C-31]	X	Available when connecting to the SIP network
Call Pickup - Direct [C-30]	X	Available to pick up an incoming call from the SIP network by dialing a CALL PICKUP - DIRECT code.
Split Call Forwarding [S-99]	X	Available for an incoming call from the SIP network and the other trunks.
Periodic Time Indication Tone [P-11]	X	Available to provide a Tone to the Station user who has made an Outgoing Call to the SIP network.
Boss - Secretary Override -D [B-5D] Boss - Secretary - Message Waiting Lamp Control [B-8] Boss - Secretary Transfer [B-11]	X	Available when connecting to the SIP network.
Call Forwarding - All Calls - Announcement [C-69]	X	Available to route an incoming call from the SIP network to the Announcement trunk.
Last Number Called - Single - Line Station [L-6]	X	Available when connecting to the SIP network.
Remote Call Forwarding Control [R-54]	X	Available to set/cancel the forwarding features from the SIP network.
Call Forwarding Intercept/Announcement [C-25]	X	Available for an incoming call from the SIP network.

- **OPERATIONS AND MAINTENANCE FEATURES**

x: Available N: Not Available C: Conditionally available

Feature Name	Availability	Remarks
Traffic Measurement	X	Available when connecting to the SIP network.
Individual Trunk Access [I-4]	X	
Individual Trunk Access (PCPro)	X	

- **NETWORK FEATURES**

x: Available N: Not Available C: Conditionally available

Feature Name	Availability	Remarks
Least Cost Routing - 3/6-Digit [L-5]	X	Alternating Routing to the SIP network via LCR is available.
Outgoing Trunk Busy Announcements [O-21]	X	When MG-SIP16 is in all-busy state, an originated call to the SIP network is automatically routed to the Announcement trunk.
Inter-Office Off-Hook Queuing [I-11]	X	Available when a call is routed from a different trunk to the SIP network via tandem connection.
Tandem Switching of TIE Trunks - 2/4-Wire [T-1]	X	Tandem connection from a different trunk to the SIP network is available.
LCR-Special Line Warning Tone	X	A Warning Tone can be sent to the Station user who has made an outgoing call to the SIP network.
Hotline - Outside [H-9]	X	Available to access the SIP network by using Hotline service.

- **IP SERVICE FEATURES**

x: Available N: Not Available C: Conditionally available

Feature Name	Availability	Remarks
Peer to Peer Bandwidth Control [P-75]	X	Available when connecting with the SIP network.
ToS Control	X	ToS value for RTP packets can be assigned.
Logged Out IP Station- Call Destination [L-53]	X	Available for an incoming call from the SIP network

- **ADDITIONAL FEATURES**

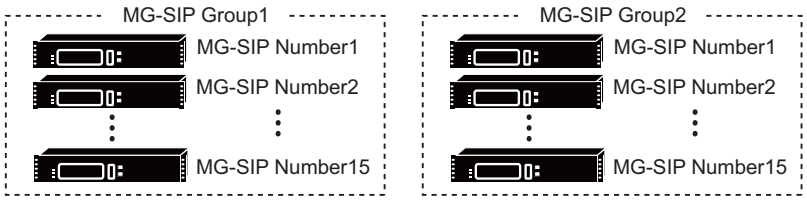
x: Available N: Not Available C: Conditionally available

Feature Name	Availability	Remarks
Alternating Routing when SIP network error occurs	X	Available when the SIP server sends back no response.
Alternating Routing when MG-SIP is all-busy	X	Alternate routing to another trunk is available.
SIP network fault management	X	Available to restrict a call origination to the SIP network when the system detects MG-SIP failure or LAN cable disconnection.
Tandem connection with COT included	X	It is necessary to confirm specifications of the SIP network side.

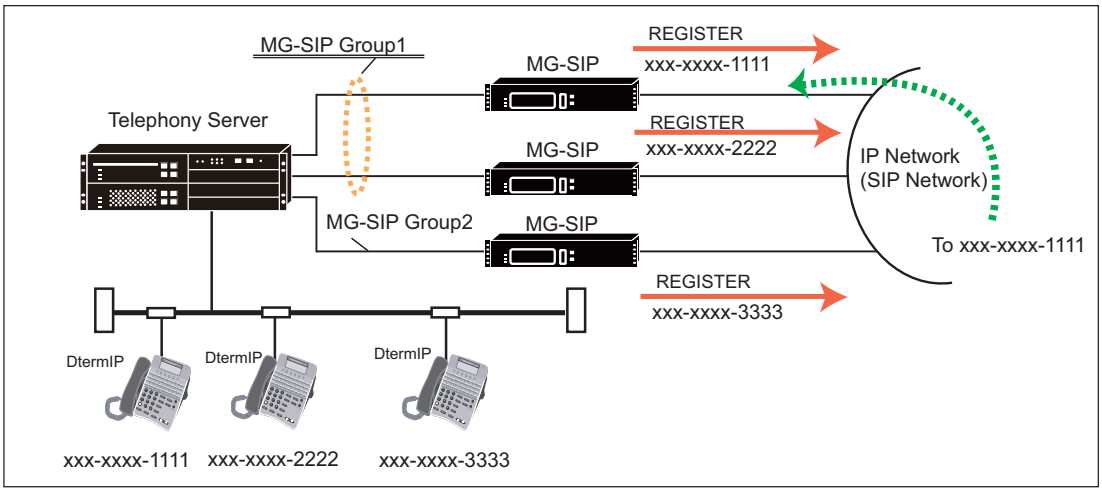
M-113 Multiple Number Service (MG-SIP)

General Description

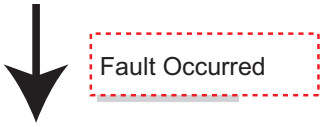
This feature allows MG-SIP to make Register Data (SIP-URI, User ID, Telephone Number, IP Address of Equipment and Password) per Telephone Number against SIP server. Thereby, MG-SIP is able to support multiple number service even if the SIP network (IP network) that MG-SIP connected does not support Dial-in/Hunting Features.



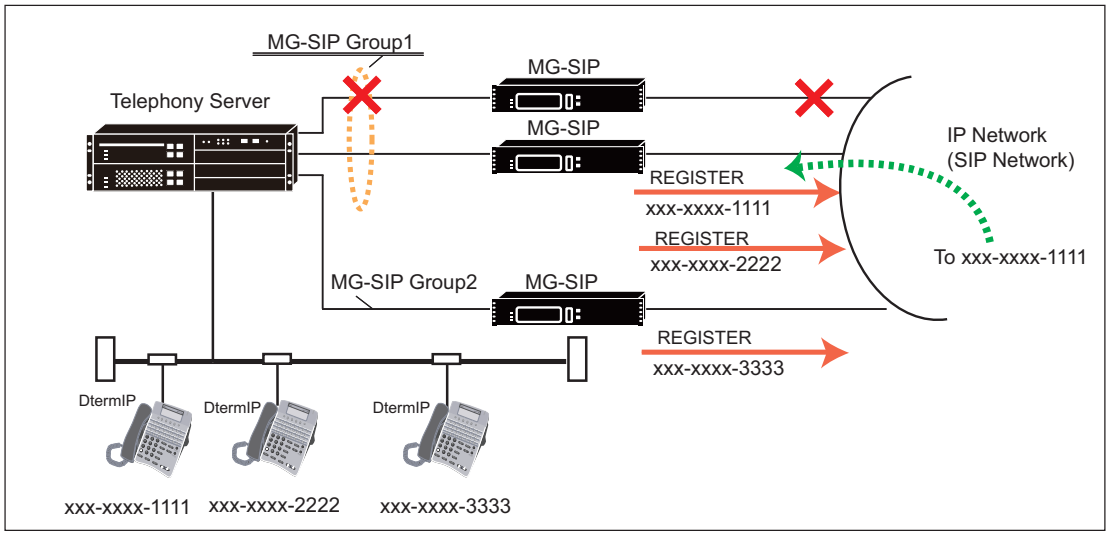
Operating Procedure



None.

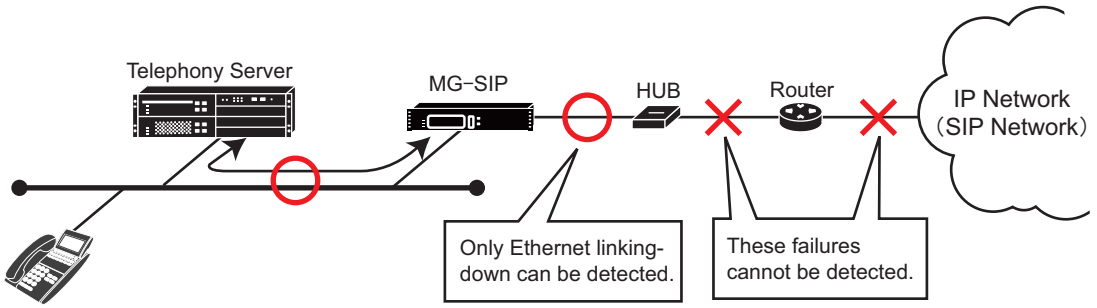


Service Conditions



1. To perform this feature, the following firmware or later are required for each MG-SIP.
   - Software-based MG-SIP: SP-4078, SP-4085
   - MG-SIP128 [MG-128SIPMGL-A]: SP-4089
   - MG-SIP128 [MG-128SIPMGG/MG-128SIPMGG-B]: SP-4051, SP-4058
   - MG-SIP96: SP-3987
   - MG-SIP16: SP-3843
   - MG-SIP16 [SCA-16SIPMGA/MG-16SIPMGA]: SP-3905
   - MG-SIP16 [SCA-16SIPMG(US)]: SP-3988
2. Up to 4000 can be specified per system for Register Data.

3. When making Redundancy Configuration, the system needs MG-SIP Group Number to make an alternative route. The following describes MG-SIP Group.



- The following MG-SIP can be assigned up to 15 per MG-SIP Group, and up to 15 Groups per system.

Software-based MG-SIP	Any version
MG-SIP128 [MG-128SIPMGL-A]	
MG-SIP128 [MG-128SIPMGG/ MG-128SIPMGG-B]	
MG-SIP16 [SCA-16SIPMGA/MG-16SIP-MGA]	SP-3905 MGSIP (16) PROG-A Issue 6 or later
MG-SIP16 [SCA-16SIPMG(US)]	SP-3988 MGSIP (16) PROG-G Issue 4 or later

- Up to 225 MG-SIPs (15 devices×15 groups) can be registered per system.
- To accommodate MG-SIPs, be careful for the total number of channels for each MG-SIP to be registered to one LP not to exceed the maximum number of simultaneous speech channels per LP (460 channels including ISDN channels).
  For example, when only MG-SIP16s are accommodated and all channels are registered, up to 112 MG-SIPs can be registered (up to 28 MG-SIPs can be registered to each LP).
  When the number of ISDN channels including MG-SIP registered to an LP exceeds the maximum simultaneous speech channels, simultaneous communication cannot be executed at all MG-SIPs registered to the LP.
- MG-SIP128/96/16 and software-based MG-SIP can coexist in the same group.
- If a network fault occurs, MG-SIP located on an alternative route sends Register Data.
- MG-SIPs belonging to a single MG-SIP Group must be accommodated in the same LP.

4. Up to 1,000 Register Data can be assigned per MG-SIP128/96 and software-based MG-SIP. Up to 100 Register Data per MG-SIP16.
5. When a failure occurs, a calls is re-routed to an alternative route within the same MG-SIP Group. Alternate routing is not available for outgoing calls made between MG-SIPs across different MG-SIP Groups.
6. When an MG-SIP Group has only a single MG-SIP number, alternate routing function is not available.
7. MG-SIP sends Register (performs authentication) when in the following conditions:
   - When MG-SIP is initialized
   - When an alternative route is taken
   - When a fault is recovered
   - When the user data are updated (add/delete)

8. Alternate route is available when a failure (Ethernet linking-down only) is detected in the SIP network or a communication failure occurs between the Telephony Server and MG-SIP.

Note: It takes 90 to 250 seconds to detect a communication failure between the Telephony Server and MG-SIP.

Note: In software-based MG-SIP, Ether link down in the SIP network is not detected.

9. Alternate routing of Register Data takes the following time.
The following table shows the time it takes to perform alternate routing of Register Data when the number of Register Data per MG-SIP is assigned to 16 and the Register sending cycle of MG-SIP is assigned to 1 second (default).

Note: The values in this table are given for reference only. The actual time depends on the carrier and the network that you use.

Alternate routing is available when:	The Number of Failed Devices in the same MG-SIP Group (Registering 15 MG-SIPs to an MG-SIP Group)			
	1 device	4 devices	8 devices	14 devices
Communication failure occurs between the Telephony Server and MG-SIP	About 160 sec.	About 200 sec.	About 240 sec.	About 420 sec.
MG-SIP requests alternate routing for Register data	About 35 sec.	About 100 sec.	About 200 sec.	About 300 sec.

10. During alternate routing of Register Data, if the destination MG-SIP is deleted by AMGIL command, the Register Data of both source and destination MG-SIPs become unavailable.
11. The Register Data associated with the MG-SIP that has never been online is not the target of alternate routing.
12. In an FCCS network, up to 15 MG-SIP Groups can be assigned to each node.
13. In an FCCS network, alternate routing is not available for outgoing calls made between MG-SIPs across different nodes (across different FPCs).

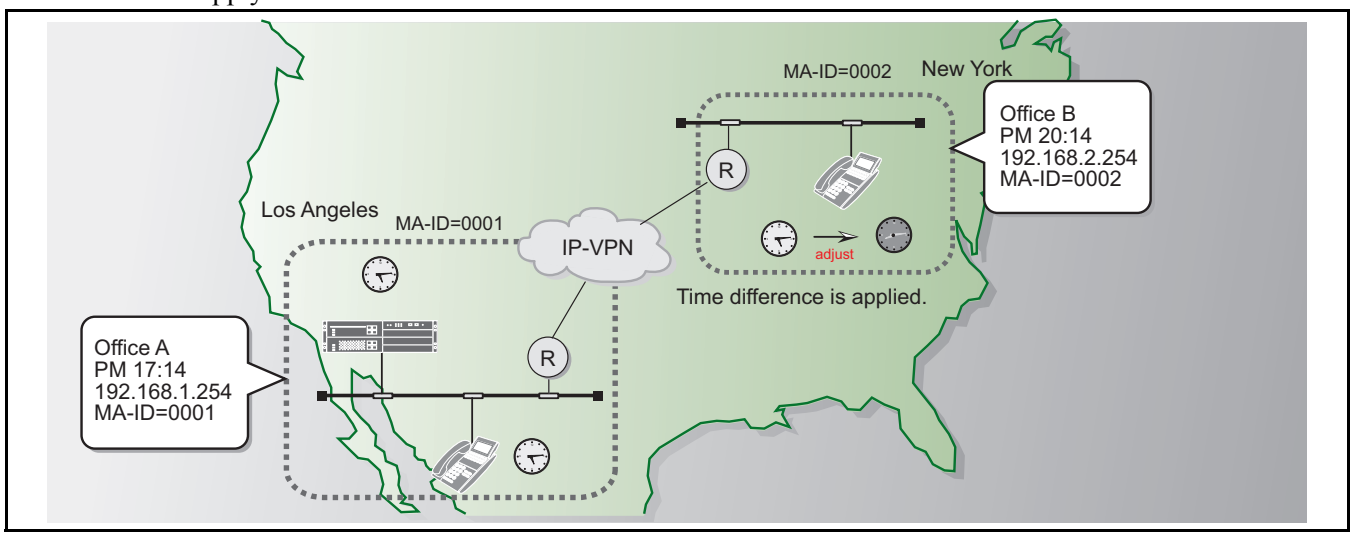
14. Alternate routing by Register is the feature that provides the alternate routing of an incoming call to MG-SIP. For alternate routing of an originating call, be sure to assign PRI/PRA FAILSAFE ROUTING [P-49/50]. For details, refer to PRI/PRA FAILSAFE ROUTING [P-49/50].
15. When the Telephony Server side terminal releases during a conversation after a temporary communication failure between the Telephony Server and MG-SIP, MG-SIP may not send disconnection signals to the SIP network.

Programming

Before setting this feature, it is required to set basic settings for MG-SIP. For more information about the MG-SIP settings, refer to MEDIA GATEWAY SIP [M-111].

STEP 1: **AMGIL** - Assign information regarding to MG-SIP as follows:
MG-ID: Enter MAC Address (six bytes)
FUNCTION = Setting
KIND = SIP-MG
LINE = 0 (fixed)
CH = 0 (fixed)
LENS: Enter Accommodated Location of Virtual Signaling Channel.
Retry = 0
Setting Type of Signaling Packet Service: Assign QoS settings of Signaling that is used when PHI connects MG-SIP.
Usable CH Number: Assign Channel Number 1-254. **Note 1**
Service of Authentication Exists: Select the box if a registration is required per number, and then assign the following:
- MG Group: Enter MG-SIP Group Number 1-15 to make an alternative route for redundancy configuration. **Note 2**
- MG Number: Enter MG-SIP Number 1-15 belonging to the MG-SIP Group. **Note 2**

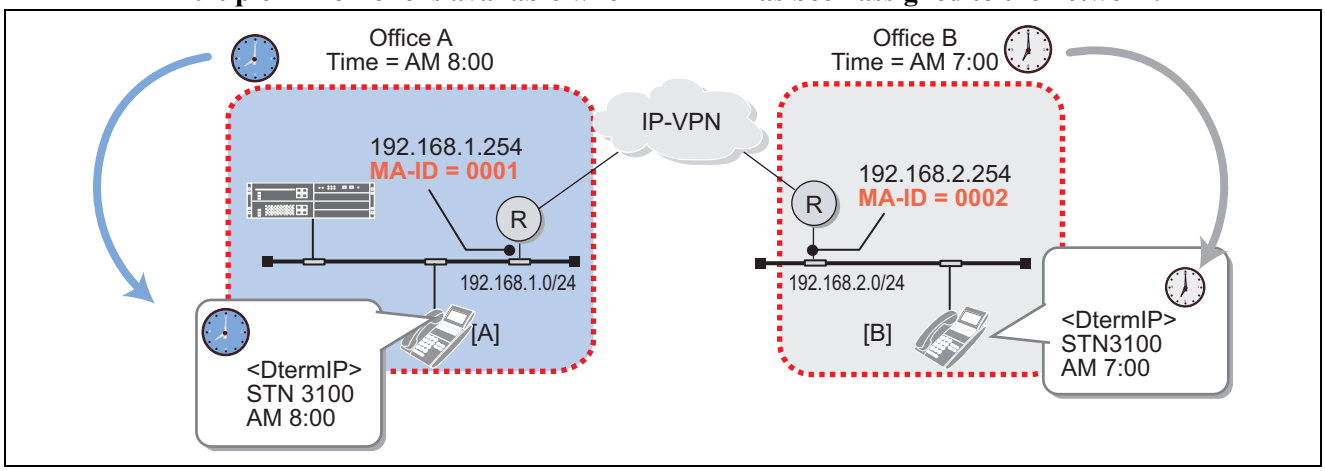
Note 1: The parameter range is limited by the number of usable channels of each type of MG-SIP. For an explanation, refer to the General Description section of MEDIA GATEWAY SIP [M-111].



Note 2: This parameter only appears if “Service of Authentication exists” check box is selected.

STEP 2: **ASRIL** - Assign the information per Telephone Number.
MG Group: Enter MG-SIP Group Number 1-15.
MG Number: Enter MG-SIP Number 1-15 belonging to the MG-SIP Group.
CNT (START-END): Specify a range of Register Data to be read out.
Register Data
CNT: Counter to manage Register Data
Calling Num: Telephone Number to be used in the SIP network
SIP URI: SIP URI to be used in the SIP network
UserID: User ID to be authenticated in the SIP network
Password: Password to be used in the SIP network
Reg: Enable/Disable settings for MG-SIP to be authenticated in the SIP network.

M-114 Multiple Time Zone



General Description

This feature allows DtermIP and DtermIP INASET users to adjust the date and time information on the LCD to the local time by using MA-ID data. When the above terminals are used over multiple time zones, the date and time information on the LCD can be automatically adjusted to the local time. If this feature is not used, the LCD of DtermIP and DtermIP INASET displays the date and time information of the Telephony Server. Note that this feature does not apply to other features that involve time information.

Note: For this feature, MA-ID must be assigned on a network basis.

Multiple Time Zone is available when MA-ID has been assigned to the network.

[A] STN 3100 logs in at Office A. The LCD of the DtermIP displays AM 8:00.

[B] STN 3100 logs out at Office A, and then STN 3100 logs in at Office B. In this instance, the LCD of the DtermIP displays AM 7:00 (Local Time of Office B).

Operating Procedure

No manual operation is required.

Service Conditions

1. This feature does not apply to other features that involves time information such as SMDR.
2. This feature applies to DtermIP and DtermIP INASET only.
3. This feature applies to time display information of the above terminals only.
4. The availability of this feature depends on ASYDL SYS1, Index 831, Bit 0.
5. This feature does not apply to SoftPhone since it uses the date and time information of the personal computer.
6. A maximum of 128 Network Areas can be used for this feature.
7. If there is any time difference in the FCCS network, assign the time difference data by using ATDF in advance and adjust the time by using ATIMN.
8. In an environment where two nodes are connected via FCCS, use AMAIL command to define the area information when one of the following cases applies:

    - When there is any time difference between two nodes
    - When only one node uses daylight saving service and the other node does not

9. When time difference data has been assigned to an MA-ID by using AMAIL/AMAIN, be sure to assign the MA-ID to the network by using AMAA.
10. If AMAA is used to assign an MA-ID that has not been assigned by AMAIL/AMAIN to the network, the MA-ID data cannot be assigned.
11. The date and time that are displayed on the LCD reflect the time difference and daylight saving time.
12. When the time difference data is changed by AMAIL/AMAIN while this service is used, the date and time information of terminals that are connected to the network of the corresponding MA-ID will also be changed.
13. MA-ID for the network must be assigned to all of the network.
14. When the Telephony Server is placed in daylight saving time mode, the date and time of all terminals will be automatically updated. However, if the Telephony Server is installed in node that does not apply daylight saving time, the date and time of terminals installed in a remote office will not be automatically updated even if the remote office applies daylight saving time.
15. The date and time will be updated at the time of terminal registration.
16. The date and time will be automatically updated once a day.
17. The date and time will be updated when those of the Telephony Server is changed by ATIM.
18. If daylight saving service has not been assigned at the Telephony Server, the time difference of daylight saving time cannot be assigned.
19. If the time zones use different daylight saving time, this feature cannot be used.

Note: Daylight saving time can be set only one per system (ATIM). This feature sets the time difference based on the date and time of the Telephony Server. For this reason, the correct date and time cannot be displayed on the LCD if the time zones use different daylight saving time.

Programming

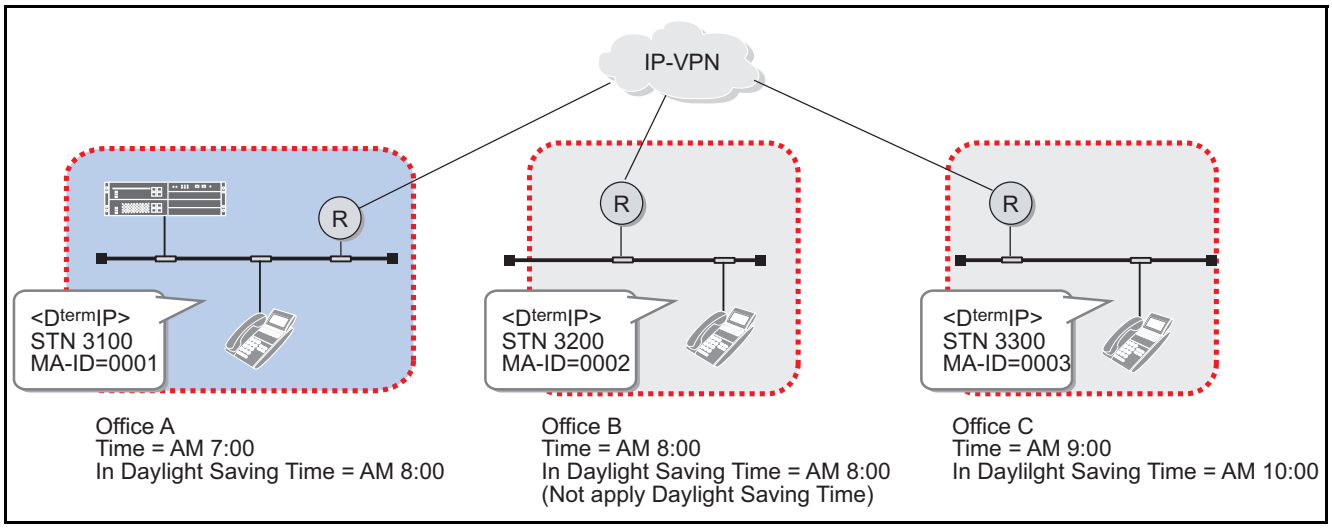
Note: It is assumed that date and time information have already been assigned by ATIM.

STEP 1: **ASYDL** - System Data 1, Index 831, Bit 0: Multiple Time Zone. Assign 1 (In Service).

STEP 2: **AMAIL** - Assign the following parameters.
MA-ID: Enter the Message Area ID [1-9999]
AREA NAME: Enter the Area Name (Maximum 16 letters)
MGC Time Zone: Select a time zone for the MGC from the list box.
MA-ID Time Zone: Select a time zone for the MA-ID from the list box.
Daylight Saving Time is automatically applied: Check this box when Daylight Saving Time is used (When checked, Daylight Saving Time is applied to the time zone of the user.)

STEP 3: **AMAA** - Assign the following parameters. Select Network in KIND.
TYPE: Select Individual.
FPC: Assign the Fusion Point Code.
IP ADDRESS: Assign the IP address of the terminal where MA-ID is assigned.
MASK BIT: Select Mask Bit. [1-31]
MA-ID: Enter the MA-ID that has been assigned by AMAIL/AMAIN. [1-9999] **Note 1**

Note 1: MA-ID=0 is used for deleting the data.

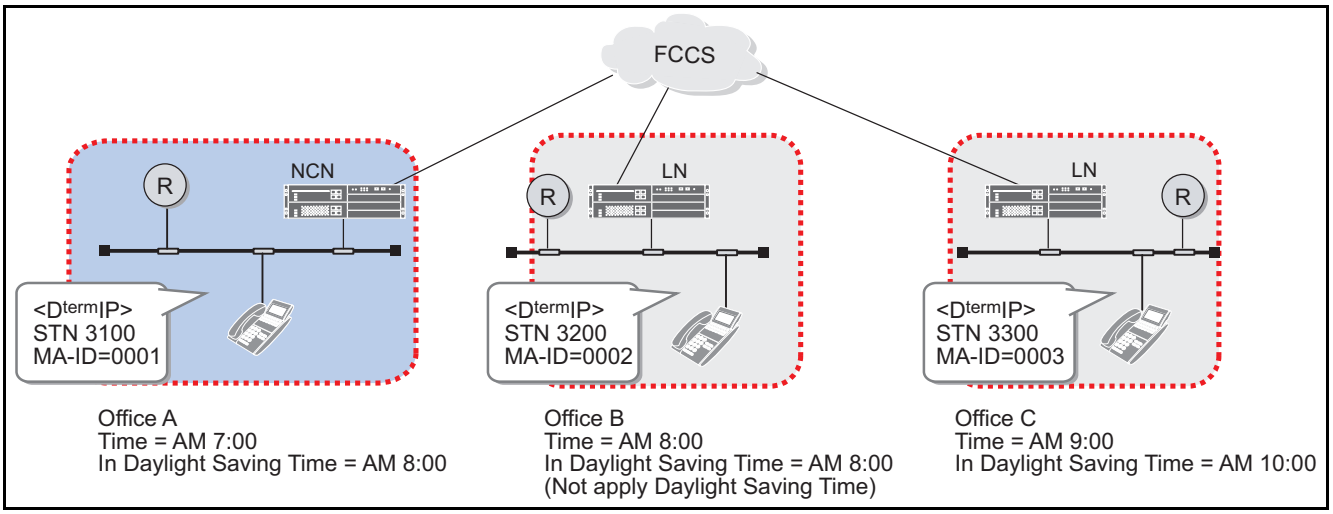


FCCS Programming

Use AMAIN command at STEP 2 in place of AMAIL command.

Reference:

The following shows a sample data assignment for this feature.

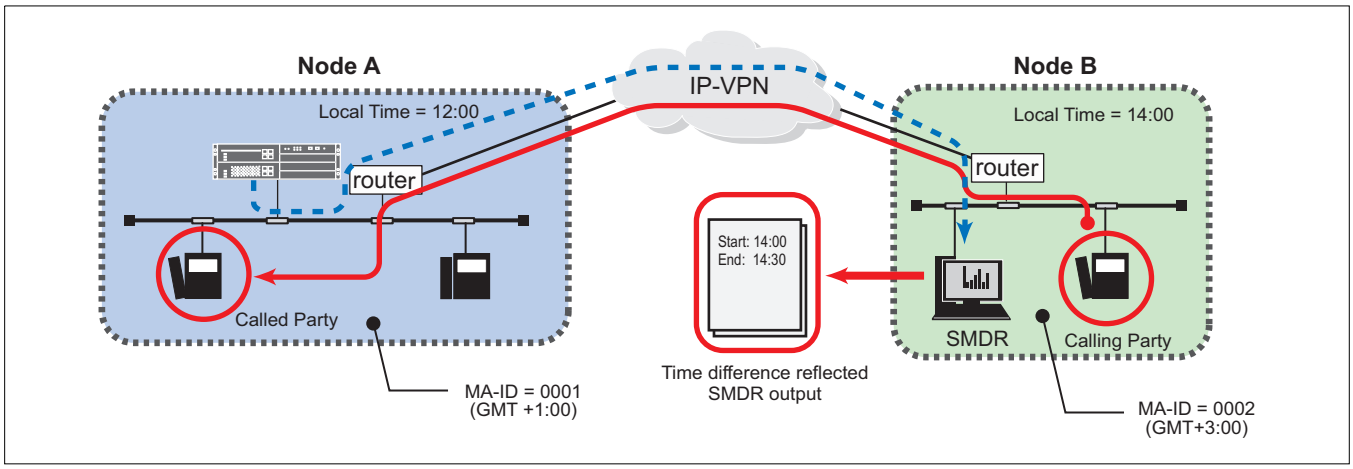


When AMAIL is used:

Time Difference Assignment Example (AMAIL)

Station Number	Time Zone of MGC	Time Zone of User	Check Box
3100	Office A	Office A	checked
3200		Office B	not checked
3300		Office C	checked

When AMAIN is used:



Time Difference Assignment Example (AMAIN)

Station Number	Time Zone of MGC	Time Zone of User	Check Box	Remarks
3100	Office A	Office A	checked	-
3200		Office B	not checked	When STN 3200 belongs to Office A
3200	Office C		not checked	When STN 3200 belongs to Office C
3300		Office C	checked	-

SMDR - Multiple Time Zone

General Description (for SMDR - Multiple Time Zone)

Based on [S-10] STATION MESSAGE DETAIL RECORDING (SMDR) and [S-144] SMDR MULTI AREA ID VIA IP, this feature allows the system to output SMDR information that takes into account time difference when a call is made over different time zones.

The following table shows basic formula for reflecting time difference.

Note: For more detailed information of time difference reflected SMDR output, see Reference 2 (SMDR Output Sample for SMDR - Multiple Time Zone) at the end of this feature description.

Call Start Time	=	Call Start Time in Telephony Server	+	Time Difference **Note 2**
Call End Time	=	Call End Time in Telephony Server	+	Time Difference **Note 2**
Trunk Arrival/Sending Time **Note 3**, **Note 4**, **Note 5**	=	Trunk Arrival/Sending Time in Telephony Server	+	Time Difference **Note 2**

Note 2: Time difference between the Telephony Server and the MA-ID to which the SMDR subject telephone user belongs.

Note 3: Trunk Arrival/Sending Time is included in SMDR information of SMDR for Incoming/Outgoing Trunk Calls.

Note 4: Trunk Arrival Time is available in EMEA from FP95-111 V1 and available in other countries from FP95-113 V3.

Note 5: Trunk Sending Time is available from FP95-113 V3.

Operating Procedure (for SMDR - Multiple Time Zone)

No manual operation is required.

Service Conditions (for SMDR - Multiple Time Zone)

1. The availability of this feature depends on ASYDL, System Data 1, Index 589 Bit 5 (SMDR - Multiple Time Zone).
2. This feature is available when both [S-144] SMDR MULTI AREA ID VIA IP and [M-114] MULTIPLE TIME ZONE are in service.
3. This feature is available for IP-based terminals of the Telephony Server.
4. For Soft Phone/Soft Phone (SIP), time information is displayed using that of the PC. For this reason, the PC time should be correctly set. If incorrect time is set for the PC, discrepancy may arise between the time of the Soft Phone and output SMDR information.
5. When this feature is used for a legacy terminal, the time information of the Telephony Server applies.
6. This feature is applied for Call Start Time, Call End Time, and Trunk Arrival/Sending Time of SMDR information.
7. When this feature is in service, Time Difference Reflected Call Time and MA-ID will be output in the following format.
   - KK message (Trunk Outgoing Billing: IMX format)
   - KL message (Trunk Incoming Billing: IMX format)
   - KM message (Station-to-Station Billing: IMX format)
8. When this feature is in service and SMDR is output in the following format, MA-ID will not be output. However, Time Difference Reflected Call Time will be output for Call Start Time and Call End Time:
   - KA/KH message (Trunk Outgoing Billing: standard/expanded format)
   - KE/KI message (Trunk Incoming Billing: standard/expanded format)
   - KB/KJ message (Station-to-Station Billing: standard/expanded format)
9. The following shows MA-ID Area information according to the call type:
   - Trunk Outgoing Billing: Time Difference of calling party's MA-ID Area information
   - Trunk Incoming Billing: Time Difference of called party's MA-ID Area information
   - Station-to-Station Billing: Time Difference of calling party's MA-ID Area information
10. This feature is available when billing subject party is one of the following:
    - Station
    - Attendant Console
    - Trunk
11. When this feature is in service, it applies to terminals or trunks that are connected to the Telephony Server.
12. MA-ID must be assigned for all networks that have Stations and/or Trunks.
13. If any 'MA-ID not assigned network' exists, the MA-ID of Stations and/or Trunks that belong to the network will be notified to SMDR as MA-ID = 0.
14. If MA-ID = 0, this feature becomes invalid. The system assumes that there is no time difference between the network and the Telephony Server.

15. If Time Difference data has not been assigned to MA-ID, the system assumes that there is no time difference between the network and the Telephony Server.
16. If the Time Difference data of MA-ID Area Information is modified during a call in progress, Time Difference Reflected Call Time will be edited by using the Time Difference data of MA-ID Area Information that had been set when the call is started.
17. When split billing is in service, MA-ID of the calling party of each SMDR record will be used.
18. When total billing is in service and billing subject party is set to transferring party by System Data, the MA-ID of the transferring party will be used.
19. When Three-Way Calling, 8-Party Conference (Meet Me/Progressive) is in service, MA-ID of the calling party of each SMDR record will be used.
20. When a trunk becomes billing subject party because of a direct tandem connection, MA-ID of the trunk will be used for outputting Time Difference Reflected Call Time.
21. When this service is used and SMDR is sent to Center Node of Centralized Billing - CCIS, the SMDR information that is sent from the Center Node does not contain the MA-ID. However, Time Difference Reflected Call Time will be output for Call Start Time and Call End Time.
22. When this service is used and the following message output is attempted, the MA-ID will not be output. However, Time Difference Reflected Call Time will be output as the time information.

    - CS Report
    - ETF (Call Event Transfer Facility) service in OAI

23. A maximum of 128 areas can be used for the network areas of Multiple Time Zone. The maximum numbers of areas is also 128 areas for this feature.
24. When RS-232C is used for SMDR interface, output format is shown below. Note that when using multiple ports, the format can be specified on a port basis by using System Data.

    - KA/KH/KK message (Trunk Outgoing Billing: standard/expanded/IMX format)
    - KE/KI/KL message (Trunk Incoming Billing: standard/expanded/IMX format)
    - KB/KJ/KM message (Station-to-Station Billing: standard/expanded/IMX format)

25. When LAN is used for SMDR interface, output format is shown below. Note that when using LAN interface, SMDR is output in IMX format only even if multiple ports are used for SMDR.

    - KK message (Trunk Outgoing Billing: IMX format)
    - KL message (Trunk Incoming Billing: IMX format)
    - KM message (Station-to-Station Billing: IMX format)

26. SMDR call base table will not be changed for this feature.

Interactions (for SMDR - Multiple Time Zone)

<[S-144] SMDR MULTI AREA ID VIA IP related Interactions>

1. This feature is available for MA-IDs that are assigned to network. Not available for MA-ID assigned to LENS.
2. A single MA-ID can be set to multiple networks. However multiple MA-IDs cannot be set to a single network.
3. When a call is made using a subline, the MA-ID of the phone will be output
4. When a call is made using a virtual line, the MA-ID of the phone will be output.
5. This feature can be valid irrespective of the availability of [S-144] SMDR MULTI AREA ID VIA IP. When [S-144] SMDR MULTI AREA ID VIA IP is in service, SMDR will be output only when a Station-to-Station call is made over different MA-ID networks.
6. The maximum number of terminals that can belong to a single MA-ID is the same as that of terminals that can be assigned within the network of the MA-ID.

<[M-144] MULTIPLE TIME ZONE related Interactions>

1. [M-144] MULTIPLE TIME ZONE is available for DtermIP, DtermIP(SIP), DtermIP INASET. Note that SMDR-Multiple Time Zone is available for equipment to which Multi Time Zone is not available (i.e. Analog MC).
2. When using daylight saving time, first enable it by ATIM command. In addition, set daylight saving time when assigning MA-ID.

<FCCS related Interactions>

1. When using this feature in FCCS network, be sure to assign MA-ID to all Telephony Servers and networks. If there is any area to which MA-ID has not been assigned, condition of (e) A call between different MA-IDs (when 'MA-ID not assigned network' exists) will be applied.
2. This feature is also valid in a Centralizing Billing - FCCS environment.

<Abandoned Call related Interactions>

1. If an incoming/outgoing trunk call is abandoned, when the call destination can be specified, the MA-ID of the destination will be used to output Time Difference Reflected Call Time.
2. In the above case, when the call destination can not be specified, the system assumes MA-ID=0, and the time of the Telephony Server will be used.
3. If the above case occurs when UCD or Station Hunting is used, the output will be as follows:
   When UCD/Station Hunting has been set between terminals which have different MA-ID, the MA-ID of the called station will be used to output Time Difference Reflected Call Time.

<Daylight Saving Time (DST) related Interactions>

1. When a call is established between the Telephony Server (without DST) and a remote node (with DST), Daylight Saving Time cannot be used. In this instance, the Telephony Server must be installed in a location where DST is used.
2. To use DST, the term (START and END) should be specified by ATIM command.
3. Only one DST can be set per system. For this reason, when the switchover to DST is not performed automatically, manual operation is required.

4. If DST is applied during a call in progress, the SMDR will be output using the DST-not-applied-time. Note that when split billing is in service, if a new SMDR record is created by some telephone operation such as call transfer, DST is applied for the new SMDR output.

<PS related Interactions>

1. If roaming occurs during the call in progress, the time difference of MA-ID of the area where the call started is used.

<SR-MGC related Interactions>

The following shows interactions when IP terminals attempt to log in to the SR-MGC in case of network failure.

1. MA-ID basis time difference represents time difference between the area and the Telephony Server. Any SMDR record that is made while the terminal logs in to the SR-MGC, Time Difference Reflected Call Time is used.
2. Between the Telephony Server and SR-MGC, clock synchronization is performed when the SR-MGC is activated or health check is attempted. When clock information has been changed at the Telephony Server, synchronization will not take place if the network is disconnected before attempting health check.

Programming (for SMDR - Multiple Time Zone)

STEP 1: Assign SMDR data referring to [S-10] SYSTEM MESSAGE DETAIL RECORDING (SMDR).

Note: When assigning SMDR data, ASYDL System Data 1, Index 589, Bit 5 (SMDR - Multiple Time Zone) must be set to 1 (= in service).

STEP 2: Assign MA-ID data referring to [S-144] SMDR MULTI AREA ID VIA IP.

Note: Skip AMAIL/AMAIN, AMAA data assignment. These should be assigned when assigning MULTIPLE TIME ZONE data.

STEP 3: Assign [M-114] MULTIPLE TIME ZONE data referring to Programming for Multiple Time Zone. **Note 6**, **Note 7**

Note 6: To delete the data, perform the above procedure in reverse order.

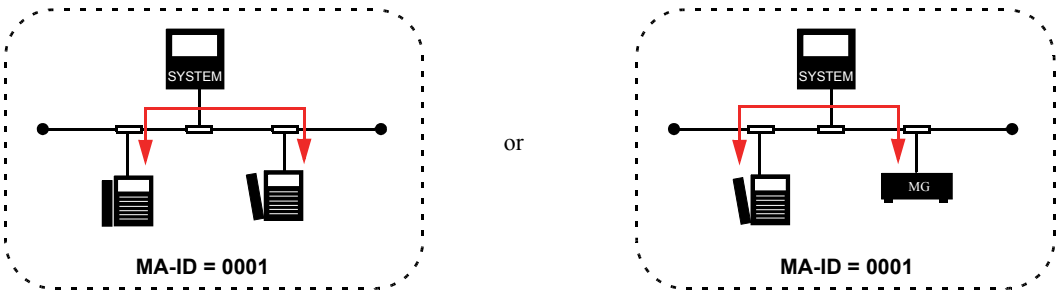
Note 7: To disable SMDR - Multiple Time Zone feature only, set ASYDL System Data 1, Index 589, Bit 5 (SMDR - Multiple Time Zone) to 0 (= out of service). Do not delete other data.

Reference 2 (SMDR Output Sample for SMDR - Multiple Time Zone)

This reference provides SMDR output samples under the following headings:

(a) A call within a same MA-ID area

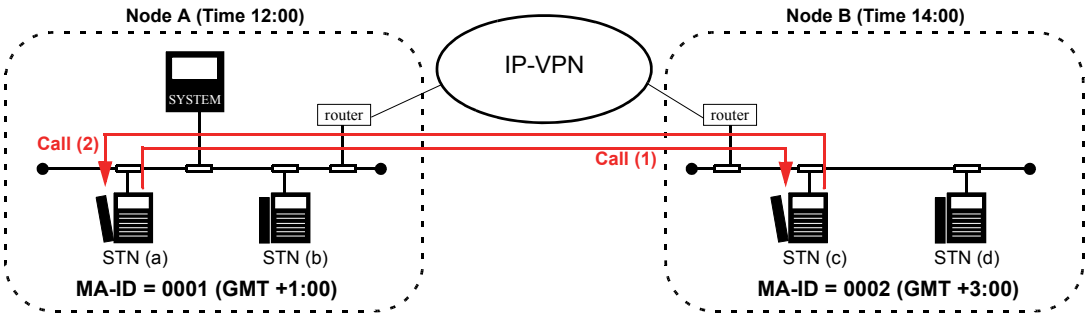
(b) A call between different MA-IDs (Station-to-Station Call)



(c) A call between different MA-IDs (Trunk Call)

(d) A call between different MA-IDs (when 'time difference not assigned MA-ID' exists)

(e) A call between different MA-IDs (when 'MA-ID not assigned network' exists)



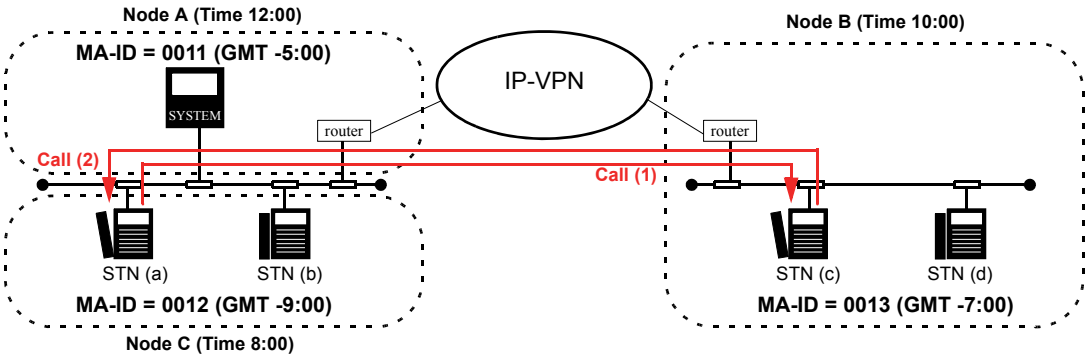
(f) A call within a same MA-ID area

In this case, no time adjustment will take place on the ground that the call is made within a same area.

(g) A call between different MA-IDs (Station-to-Station Call)

- Type 1

In this case, the SMDR output is as follows for a Station-to-Station Call between Station (a) and Station (c) during 12:00 - 12:30 (Node A Local Time).



SMDR output for Call (1): Call from STN (a) to STN (c)

```
Call Start Time:
  Call End Time:
```

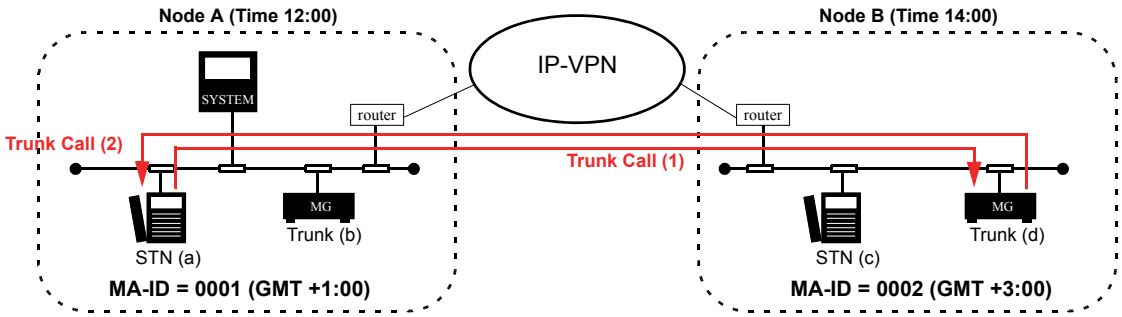
SMDR output for Call (2): Call from STN (c) to STN (a)

```
Call Start Time:
  Call End Time:
```

- Type 2

In this case, the SMDR output is as follows for a Station-to-Station Call between Station (a) and Station (c) during 12:00 - 12:30 (Node A Local Time).

SMDR output for Call (1): Call from STN (a) to STN (c)



```
Call Start Time:
  Call End Time:
```

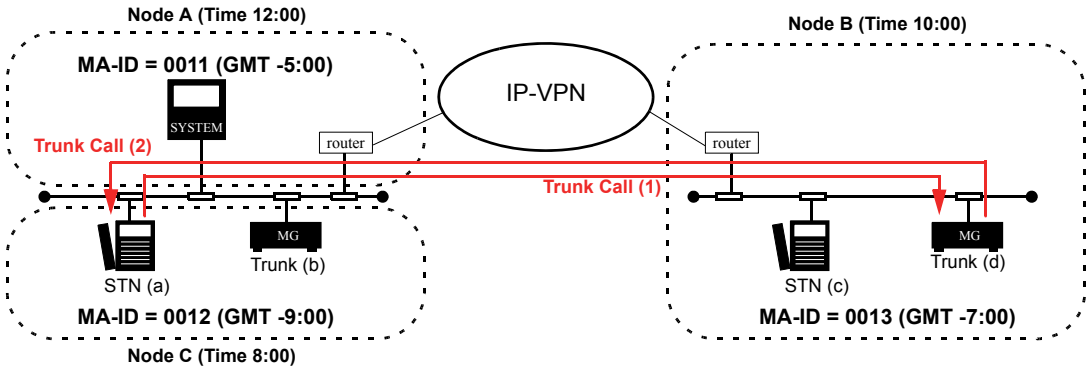
SMDR output for Call (2): Call from STN (c) to STN (a)

```
Call Start Time:
  Call End Time:
```

(h) A call between different MA-IDs (Trunk Call)

- Type 1

In this case, the SMDR output is as follows for a Trunk Call between Station (a) and Trunk (d) during 12:00 - 12:30 (Node A Local Time).



SMDR output for Trunk Call (1): Call from STN (a) to Trunk (d)

```
    Call Start Time:
      Call End Time:
```

SMDR output for Call (2): Call from Trunk (d) to STN (a)

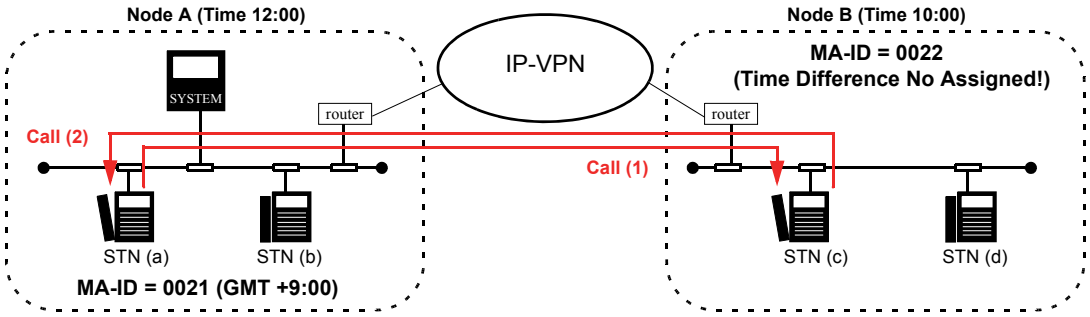
```
Trunk Arrival Time:
    Call Start Time:
      Call End Time:
```

- Type 2

In this case, the SMDR output is as follows for a Station-to-Station Call between Station (a) and Trunk (d) during 12:00 - 12:30 (Node A Local Time).

SMDR output for Trunk Call (1): Call from STN a to Trunk d

```
    Call Start Time:
      Call End Time:
```



SMDR output for Trunk Call (2): Call from Trunk d to STN a

```
Trunk Arrival Time:
    Call Start Time:
```

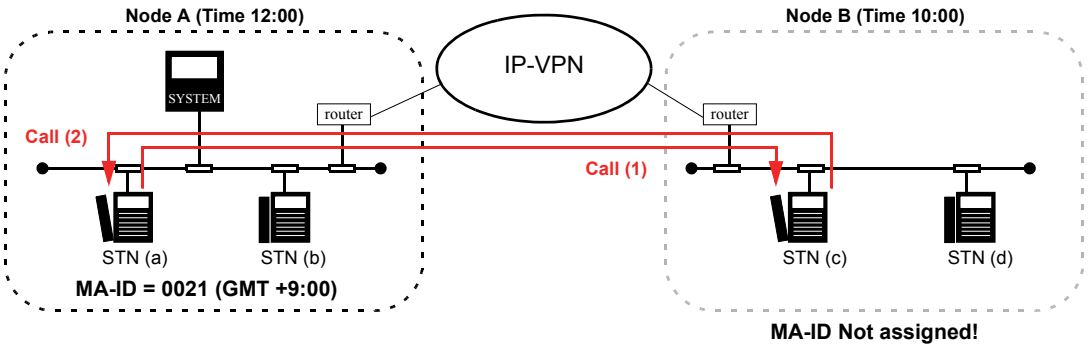
SMDR output for Trunk Call (2): Call from Trunk d to STN a

```
      Call End Time:
```

(i) A call between different MA-IDs (when 'time difference not assigned MA-ID' exists)

In this case, time difference data has not been assigned for MA-ID = 0022. Under this condition, the SMDR output is as follows for a Station-to-Station Call between STN (a) and STN (c) during 12:00 - 12:30 (Node A Local Time). **Note 8**

SMDR output for Call (1): Call from STN (a) to STN (c)



```
    Call Start Time:
      Call End Time:
```

SMDR output for Call (2): Call from STN (c) to STN (a)

```
    Call Start Time:
      Call End Time:
```

Note 8: If any network exists whose time difference data has not been assigned, the system assumes that there is no time difference between the Telephony Server and the network.

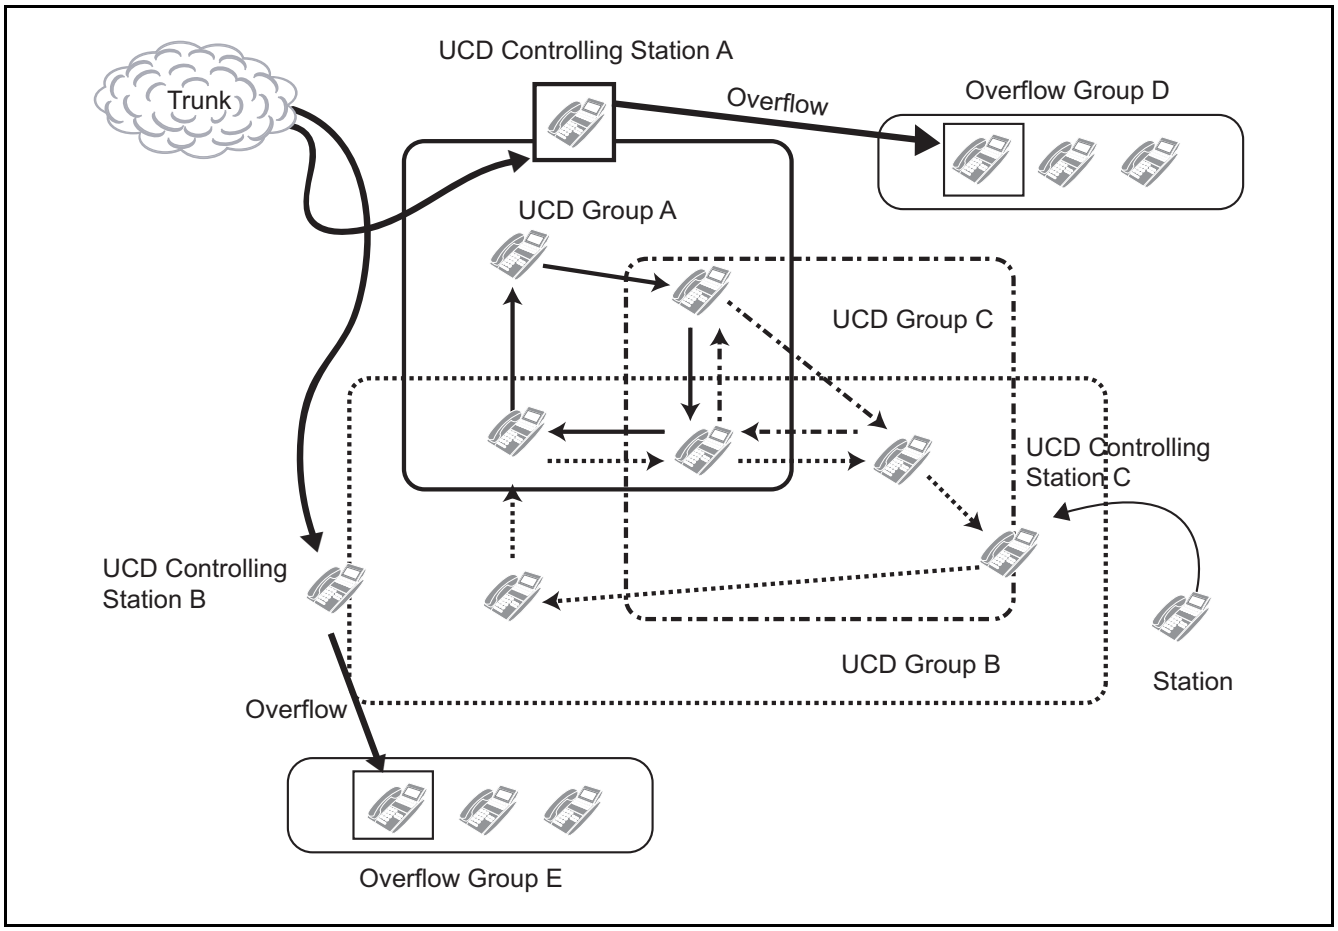
(j) A call between different MA-IDs (when 'MA-ID not assigned network' exists)

In this case, there is a network to which MA-ID has not been assigned. Under this condition, the SMDR output is as follows for a Station-to-Station Call between STN (a) and STN (c) during 12:00 - 12:30 (Node A Local Time). **Note 9**

SMDR output for Call (1): Call from STN (a) to STN (c)

```
Call Start Time:
  Call End Time:
```

SMDR output for Call (2): Call from STN (c) to STN (a)



```
Call Start Time:
  Call End Time:
```

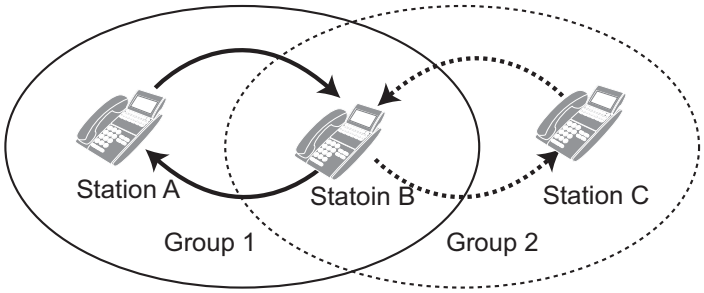
Note 9: If any network exists whose MA-ID data has not been assigned, the system assumes that there is no time difference between the Telephony Server and the network.

M-115 Multi Group Station - UCD

General Description

This feature allows a UCD Controlling Station/Non-controlling Station to belong to multiple UCD groups.

Operating Procedure



The operating procedure is the same as for UNIFORM CALL DISTRIBUTION (UCD) [U-1]. Refer to UNIFORM CALL DISTRIBUTION (UCD) [U-1].

Service Conditions

Service conditions of this feature is same as those of UNIFORM CALL DISTRIBUTION (UCD) [U-1]. The following shows additional service conditions specific to this feature.

1. This feature is available only in FCCS network. A Controlling Station/Non-controlling Station can belong to multiple UCD groups across a maximum of four nodes.
2. When UCD Group Station belongs to multiple groups, Call Waiting lamp supports only one Controlling Station. For Non-Controlling Station, Call Waiting lamp supports Stations in the UCD Group registered for the last time.

3. Traffic Measurement (UCD Peg Count) is available as usual.
4. Incoming calls are distributed among the member Stations in each UCD group. Load sharing for the Station which belongs to multiple UCD groups (Station B in the following figure) is not performed.

Station B may have twice the traffic volume of Station A and Station C.

5. Station that has already been assigned as a member of Station Hunting group (Circular/Terminal/Priority/ Priority with Switchback) cannot be assigned as a member of UCD group, and vice versa.
6. When a Station Number has already been assigned by ASHUN command, delete the ASHUN data, and then reassign the Station Number by ASHUEN command.
7. When using Location Diversity [L-55], the Telephone Number of User Profile Data must be assigned to the station by using ASHUEN command.

Programming

STEP 1: **ASYD** - System Data 1, Index 60 Bit 3. Selection of UCD Queuing:
0/1 = UCD Queuing is provided/Not provided
System Data 1, Index 70, Bit 6. Designation of Announcement Trunk used for Delay Announcement-UCD service: 0/1 = Common/Per UCD Group

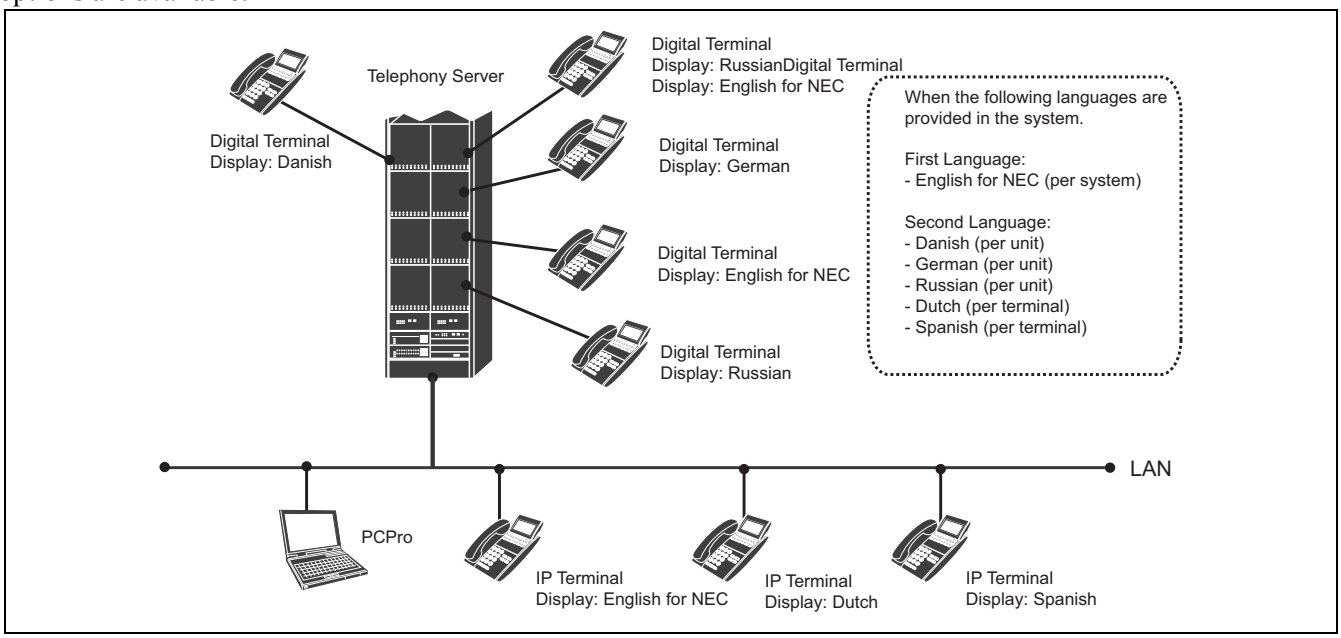
STEP 2: **ANPDN** - Assign and Number of Necessary Digits (NND) for the 1st Digit Code (1stDC) of Access Code for temporary leaving from UCD Group.

STEP 3: **ASPAN** - Assign Access Code for temporary leaving from UCD Group.
CI="N: Normal"
SRV="SSCA: Service Code Appendix"
SIDA= 50 (UCD Busy out; Entry)

CI="N: Normal"
SRV="SSCA: Service Code Appendix"
SIDA=51 (UCD Busy out; Cancel)

Note: When using a Line/Feature key:
AKYD (Dterm Key Data)
FKY: 19 (UCD Busy Out)

STEP 4: **ASHUEN** - Assign the UCD Group Hunting data.



UGN: User Group Number
TELN: Assign Telephone Number of Controlling Station.
Kind of Group 0: Multi Group Station - UCD
1: Multi-Boss/Multi-Secretary Group
[Station List in Group]
TELN: Telephone Number of UCD Member Station
FPC: Fusion Point Code to which Member Station belongs is displayed.

Note: When the Station Number has already assigned by ASHUN, delete the ASHUN data once, and then assign the Station Number by ASHUEN.

M-117 Multilingual Display

General Description

This feature allows the system to provide the display in a maximum of ten different languages per system from sixteen language selections on Digital terminal/IP terminal (Proprietary Protocol) and on SIP Multiple Line terminal. For IP Station, either of the provided languages can be specified per terminal. For Digital terminal, either of First Language set per system or Second Language set per Unit can be specified.
With Extension Languages configuration of OPTIONAL LANGUAGE PACK LOADING [O-42], more language options are available.

Operating Procedure

The operation procedure for language change with Soft key/Feature key is as follows.

To change language

1. Press the LANGUAGE CHANGE Feature key (LANG). The LCD displays menu and the language in use.
2. Press "#" key to select the language. When "#" is pressed once, the LCD displays First Language.
3. Press "#" key again to display Second Language. To display next language, press "#" key again.
4. Press "1" key to set the language.

To cancel language change operation

Press "0" key during the operation. Operation stops and LCD returns to idle state.

To display default language

Press "1" key when LCD displays menu.

Note: To display menu during the operation, press "*". To display menu from the idle state, press the LANGUAGE CHANGE Feature key (LANG).

Service Conditions

1. Up to ten different languages per system can be selected from the following for the Multilingual Display.

Language	Time and Date Display	DT300 Series (DT330) Menu Display Note 1
Japanese	Available	Available
English for NEC	Available	Available
Portuguese for NEC	Available	Available
Spanish for NEC	Available	Available
Canadian French for NEC	Available	Available
German	Available	Available
Italian	Available	Available
Dutch	Available	Available
Danish	Available	Available
Swedish	Available	Available
Greek	Available in English for NEC	Available in English for NEC
English	Available	Available
Portuguese	Available in Portuguese for NEC	Available in Portuguese for NEC
Spanish	Available in Spanish for NEC	Available in Spanish for NEC
French	Available in Canadian French for NEC	Available in Canadian French for NEC
Russian	Available	Available

Note: Other languages in addition to the above are available with the use of the OPTIONAL LANGUAGE PACK LOADING [O-42]. For details, refer to the "Optional Language Pack Loading [O-42]" in this manual.

Note 1: Bluetooth Handset of Cordless Terminal (DT330 (12BT)) can display only English and Japanese.

2. 24-hour display or 12-hour display can be selected as the Digital terminal time display format by data setting (ASYDL SYS1 Index 677 Bit 1).

Note: This service is available for Digital terminals only. IP Stations can provide only 12-hour display.

3. IP Station differs in its display depending on the kind of terminal. Day of the week and month display on the Dterm Series *i* and DT300 Series can be adjusted to that of the IP Station by data setting (ASYDL SYS1 Index 677 Bit 2).
   Types for the day of the week and month display are shown below:
   - Type 1: Display for Europe
   - Type 2: Standard
4. DtermIP INASET and Soft Phone are not supported.
5. Billing information display is not supported.
6. This feature does not support OAI, ACD or Hotel displays.
7. The following are the conditions when Russian is supported.
   a.) The following Desktop terminals are required to provide the display in Russian.
   - DTR-8D-1R TEL
   - DTR-16D-1R TEL
   - DTR-32D-1R TEL
   - DT300 Series

   b.) The display in Russian can be specified per system or per Unit.
   c.) IP Stations are not supported.
8. The Following shows the conditions for language change with Soft key/Feature key on the terminal.
   a.) Language change with Soft key/Feature key is available when Second Language is assigned by ASLG command. If the terminal is assigned only First Language, language cannot be changed.
   b.) Language change is available only for the languages assigned to the target terminal.
   c.) The LANGUAGE CHANGE Feature key is available when the terminal is in idle.
   d.) Language change operation is available even if a call terminates to the operating station. When the terminating call is answered, language operation is closed.
   e.) Although a call terminates to the language change operating station, operating display does not close. When language change operation is performed on the call terminating station, the language on the display is changed in the following timing.
   - Digital terminal
     The language on the display is changed after executing MBST command or initializing the corresponding ELC card.
   - IP Station
     The language on the display is changed by terminal initialization after call is finished. When initialization is failed, initialization is performed again after next call is finished.

   f.) When keys except Soft key, Dial key, and Feature key assigned as LANGUAGE CHANGE Feature key are pressed during the language change operation, the operation stops and starts to follow operation of the pressed key. When the FEATURE key and Dial key except “1” are pressed together, operation can be continued. Display does not change though ringer changes.
   g.) Language change display closes after no operation is performed for 30 seconds.
   h.) LCD is displayed in English during the language change operation regardless of the assigned language on the terminal.
   i.) Pressed Dial key during the language change operation is indicated for a moment.
   j.) If the LANGUAGE CHANGE Feature key is pressed during language change operation, the operation closes as well as pressing CANCEL key.
   k.) When the language change operation is performed, the Office Data back up from the Telephony Server Memory to the Telephony Server Flash Card is required by MEM_HDD command before Routine Diagnosis Program Start Time.

l.) When a terminal used as a handset for SOFT PHONE WIRED-PHONE HANDSET [S-147] is assigned the non-English language display with this service, the DtermSP30 connecting the terminal is still displayed in English.

m.) The language cannot be changed while back up the Office Data.When language change operation is performed on the backing up Office Data, the language change operation is closed and the terminal displays an error message.

n.) The terminals as which the corresponding ELC card is the same cannot set the language at the same time. When two terminals set the language at the same time, only one terminal can change the language. The other terminal is closed language operation and displays an error message.

9. After the kinds of language per system are changed, reboot SP. When Digital terminal is used, initialize the corresponding ELC card (by flipping its MB key OFF→ON→OFF).

10. The following are the conditions for Multilingual Display on a menu window of DT300 Series (DT330).

a.) Execute the initialization of ELC card after data assignment (by flipping its MB key OFF→ON→OFF).

b.) When ELC card fails to download data from the Telephony Server, a system message (33-F: PKG Download Failure Notification, kind of fault: ELCN-PKG Menu download failure for DT300) is output. (**Note 2**) In that case, the card that detected the failure should be reset manually, or initialized by executing make-busy and make-busy cancel operation with MBPM command. **Note 3**

c.) When a terminal fails to download data from ELC card, a system message (33-F: PKG Download Failure Notification, kind of fault: Menu download failure between ELCN-PKG and terminal) is output. (**Note 2**) In that case, the terminal that detected the failure should be reset manually, or initialized by executing make-busy and make-busy cancel operation with MBST command. **Note 3**

Note 2: System messages can be displayed on the screen of maintenance PC by executing DFTD command. For details of System messages, refer to Chapter 3 in Operations and Maintenance Manual.

Note 3: For details of maintenance commands, refer to Operations and Maintenance Manual.

11. To activate this feature, the following firmware is required on each equipment.

Equipment	Firmware	Remarks
PA-16ELCJ-B	SP-3887 16ELCJB PROG-K Issue 1 or later	
PA-16ELCN	SP-3956 16ELCN PROG-A Issue 1 or later	
	SP-3977 16ELCN PROG-B Issue 1 or later **Note 4**	To enable multilingual menu displays of DT300 Series (DT330)
PA-16ELCN-A	SP-4013 16ELCN-A PROG-A Issue 1 or later	
	SP-4034 16ELCN-A PROG-B Issue 1 or later	To enable multilingual menu displays of Cordless Terminal (DT330 (12BT))
CH-16ELCA	Any version	

Note 4: To use the OPTIONAL LANGUAGE PACK LOADING [O-42] feature on Dterm Series i, SP-3977 16ELCN PROG-B Issue 1 or later is needed.

Interactions

1. This feature is not effective for display that registered by system data such as ANDD, ADRTL, ADRTN, ACID, and AFDD.
2. When preset dialing is operated with setting of the specified language, Bluetooth Handset of Cordless Terminal (DT330 (12BT)) can display only up to 20 digits. Thus, the following messages in brackets (21 digits or more) cannot display on the Bluetooth Handset.

Language	Displayed Message
Portuguese for NEC	Introduzir Discar Nù (mero)
Spanish for NEC	Entrar Marcado Numer (o)
Canadian French for NEC	Entre Numero Compose (r)
Spanish	Introducir Numer Mar (car)

3. When a language other than Japanese is assigned as the displayed language, Bluetooth Handset of Cordless Terminal (DT330 (12BT)) displays in English.
4. When SIP Handler Controlled SIP terminal is used, Tone Region of IP-DTG can be selected with the ASLG command.
5. When SIP Handler Controlled SIP terminal is used, Display Language cannot be selected from the Telephony Server data assignment.

Programming

To activate Multilingual Display

STEP 1: **ASYDL** - System Data 1, Index 677, Bit 1. Specify the time display format of Digital terminal whether 12-hour display or 24-hour display.
0=12-hour display
1=24-hour display

Note: This service is available for Digital terminal only. IP Station can provide only 12-hour display.

System Data 1, Index 677, Bit 2. Specify the display type for day of the week and month in order to adjust display on the Digital terminal to that on the IP Station.
0=Type 1 (Display for Europe)
1=Type 2 (Standard)

Note: This data setting is available for Dterm Series i and DT300 Series.

STEP 2: (Optional) When using OPTIONAL LANGUAGE PACK LOADING [O-42], assign the following system data, and go to the next step:
ASYDL - System Data 1, Index 679, Bit 2: (Optional Language Pack Loading)=1 (in service)
System Data 1, Index 686, Bit 7: Setting for Azerbaijani/Turkish **Note 1**
0=Out of Service
1=In Service **Note 2**

Note 1: Available from FP95-114 V4 Issue 4.0.

Note 2: Assign 1 only if Azerbaijani/Turkish is used.

STEP 3: **ASLG** - Assign the language display.

Note: Azerbaijani/Turkish requires to set Russian as First Language and Azerbaijani/Turkish as Second Language.

a.) (Optional) If Extension Languages are used, set their Language numbers.

- **[EXTENSION] tab**

  Choose the desired language files from the [Select Language] list as Extension Languages, and assign Extension Language numbers [18-27] to each of them by entering the numbers in the [LANG NO] field of the [Select Language] list.

b.) Specify the First Language used per system.

- **[FIRST] tab -** Basic Data Setting

  First Language Data field
  LANG NO: Specify the First Language used per system. For the details of LANG NO, see <Language Number (LANG NO)>.

Note: This parameter is in conjunction with the system data [ASYD: SYS 1, Index 78, Bit 4 and Index 389, Bit 0-4].

Note: When the first language is changed from Japanese to language other than Japanese, the originating method of appropriate station will be in pre-line selected state.

Note: The first language can be assigned by the system data [ASYD: SYS 1, Index 389, Bit 0-4 (Display Language on Digital terminal LCD)] as well. Refer to “Command Manual” for the detail. The first language assigned last by ASLG or ASYD will be used.

c.) Specify the Second Language.

- **[SECOND] tab -** Second Language Data

  Second Language field: Select either of the radio buttons.
  System Setting
  Select Terminal

LANG NO: Specify the Second Language used per system or per terminal. For the details of LANG NO, see <Language Number (LANG NO)>.

d.) Specify the language used per terminal.

- **[TERMINAL] tab -** Terminal Data Setting

Line Number Type: Specify the radio button for Line Number Type.

- STN
  - TN START/END: Enter the appropriate range of Tenant Numbers.
  - STN START/END: Enter the appropriate range of Station Numbers.
  - KIND: Specify terminal kind.
- TELN(LDM)
  - UGN: User Group Number
  - TELN START/END: Enter the appropriate range of Telephone Numbers.
  - KIND: Specify terminal kind.

Change Data Type: Check the check box for "LANG".

- LANG: Specify the language. **Note 3**, **Note 4**, **Note 5**
- TONE: This feature is not used. **Note 6**

Note 3: When "System Setting" is registered in Second Language on SECOND tab, selecting "DTERMIP" in KIND makes "First Language" and "Second Language" selectable.

Note 4: When "Select Terminal" is registered in Second Language on SECOND tab, selecting "DTERMIP" in KIND makes "First Language" and "Language registered by SECOND tab" selectable.

Note 5: When "LEGACY" is selected in KIND, "First Language" or "Second Language" can be selected.

Note 6: For the detailed setting, refer to MULTIPLE TONE -D [M-119D].

e.) Specify the language used per Unit.

- **[UNIT] tab**

Select the Module Group Number and Unit Number, then specify languages used per Unit.

MG: Assign the Module Group Number of the node.

U: Assign the Unit Number of the node.

LANG: Specify the language used per Unit. For the details of LANG NO, see <Language Number (LANG NO)>.

STEP 4: **MEM_HDD** - Back up the data to the hard disk.

Direction Select: Choose "Memory to Hard Disk".

Data Type Select: Choose "Data Memory"

LP Select: Specify the LP Number.

To change language with Soft key

STEP 1: **ADSL** - Assign the LANGUAGE CHANGE to Soft key. SKP: 0-15 (Soft key Pattern) SN: 0 (Idle), SKN: 0-15 (Soft key number appears on the PCPro), FKY: 177 (LANGUAGE CHANGE key [LANG]).

STEP 2: **ADKS** - Assign the following to use a Soft key on the Desktop terminal for Multilingual Display.
TN: Tenant Number
STN: Station Number
SKP: 0-15 (Software Key Pattern assigned in STEP 1)
LKP: 1-3 (Location of Key Pattern)
PG: 0/1 (Soft key/Feature key is allocated for PAGE CHANGE key)

To change language with Feature key

STEP 1: **AKYD** - Assign to a Line/Feature key for Language Change key (LANG). KYI: 1 (Feature Key), FKY: 177 (Language Change Key [LANG]).

To delete

The deletion procedure is the reverse order of assigning the feature.

FCCS Programming

To activate Multilingual Display

STEP 1: **ASYDN** - System Data 1, Index 677, Bit 1. Specify the time display format of Digital terminal whether 12-hour display or 24-hour display. **Note 7**, **Note 8**
0=12-hour display
1=24-hour display

Note 7: This service is available for Digital terminal only. IP Station can provide only 12-hour display.

Note 8: This data needs to be assigned to each Local Node.

System Data 1, Index 677, Bit 2. Specify the display type for day of the week and month in order to adjust display on the Digital terminal to that on the IP Station. **Note 9**, **Note 10**
0=Type 1 (Display for Europe)
1=Type 2 (Standard)

Note 9: This data needs to be assigned to each Local Node.

Note 10: This data setting is available for Dterm Series i and DT300 Series.

STEP 2: (Optional) To use OPTIONAL LANGUAGE PACK LOADING [O-42], assign the following system data, and go to the next step:
ASYDN - System Data 1, Index 679, Bit 2 (Optional Language Pack Loading)=1 (in service)
System Data 1, Index 686, Bit 7: Setting for Azerbaijani/Turkish **Note 11**
0=Out of Service
1=In Service **Note 12**

Note 11: Available from FP95-114 V4 Issue 4.0.

Note 12: Assign 1 only if Azerbaijani/Turkish is used.

STEP 3: **ASLG -** Assign the language display.

Note: Azerbaijani/Turkish requires to set Russian as First Language and Azerbaijani/Turkish as Second Language.

a.) (Optional) If Extension Languages are used, set their Language numbers.

- **[EXTENSION] tab**

  Choose the desired language files from the [Select Language] list as Extension Languages, and assign Extension Language numbers [18-27] to each of them by entering the numbers in the [LANG NO] field of the [Select Language] list.

b.) Specify the First Language used per system.

- **[FIRST] tab -** Basic Data Setting

  First Language Data field
  LANG NO: Specify the First Language used per system. For the details of LANG NO, see <Language Number (LANG NO)>.

Note: This data needs to be assigned to each Local Node.

Note: This parameter is in conjunction with the system data [ASYD: SYS1, Index 78, Bit 4 and Index 389, Bit 0-4].

Note: When the first language is changed from Japanese to language other than Japanese, the originating method of appropriate station will be in pre-line selected state.

Note: The first language can be assigned by the system data [ASYD: SYS1, Index 389, Bit 0-4 (Display Language on Digital terminal LCD)] as well. Refer to “Command Manual” for the detail. The first language assigned last by ASLG or ASYD will be used.

c.) Specify the Second Language.

- **[SECOND] tab -** Second Language Data

  Second Language field: Select either of the radio buttons.
  System Setting
  Select Terminal
  LANG NO: Specify the Second Language used per system or per terminal. For the details of LANG NO, see <Language Number (LANG NO)>.

Note: This data needs to be assigned to each Local Node.

d.) Specify the language used per terminal.

- **[TERMINAL] tab -** Terminal Data Setting

  Line Number Type: Specify the radio button for Line Number Type.
  - STN
    TN START/END: Enter the appropriate range of Tenant Numbers.
    STN START/END: Enter the appropriate range of Station Numbers.
    KIND: Specify terminal kind.
  - TELN(NDM)
    FPC: Fusion Point Code
    UGN: User Group Number
    TELN START/END: Enter the appropriate range of Telephone Numbers.
    KIND: Specify terminal kind.

  Change Data Type: Check the check box for "LANG".
  - LANG: Specify the language. **Note 13**, **Note 14**, **Note 15**
  - TONE: This feature is not used. **Note 16**

Note 13: When "System Setting" is registered in Second Language on SECOND tab, selecting "DtermIP" in KIND makes "First Language" and "Second Language" selectable.

Note 14: When "Select Terminal" is registered in Second Language on SECOND tab, selecting "DtermIP" in KIND makes "First Language" and "Language registered by SECOND tab" selectable.

Note 15: When "Legacy" is selected in KIND, "First Language" or "Second Language" can be selected.

Note 16: For the detailed setting, refer to MULTIPLE TONE -D [M-119D].

e.) Specify the language used per Unit.

- **[UNIT] tab**

  Enter the Module Group Number and Unit Number, then specify languages used per Unit.
  MG: Assign the Module Group Number of the node respectively.
  U: Assign the Unit Number of the node respectively.
  LANG: Specify the language used per Unit. For the details of LANG NO, see <Language Number (LANG NO)>.

Note: This data needs to be assigned to each Local Node.

STEP 4: **MEM_HDD_N** - Back up the data to the hard disk.
Direction Select: Choose "Memory to Hard Disk".
Data Type Select: Choose "Data Memory"
LP Select: Specify the LP Number.

To delete

The deletion procedure is the reverse order of assigning the feature.

<LANGUAGE NUMBER (LANG NO)>
This table shows kind of Language for each LANG NO. For LANG NO, set the data according to this table.

LANGUAGE	LANG NO	LANGUAGE	LANG NO
Japanese	1	Danish	10
English for NEC	2	Swedish	11
Portuguese for NEC	3	Greek	12
Spanish for NEC	4	English	13
Canadian French for NEC	5	Portuguese	14
German	6	Spanish	15
Italian	7	French	16
Dutch	8	Russian	17
Not used	9	Extension Languages 1-10	18-27

M-118 Mobility Access

General Description

This feature allows users to use their mobile phones or home phones as a Station accommodated in the System. By using this feature, the users can access the Telephony Server's service features via any phone, anywhere, and at any time (even when they are out of office). This feature is software based and does not require any additional hardware.

Note: This feature is available in EMEA only.

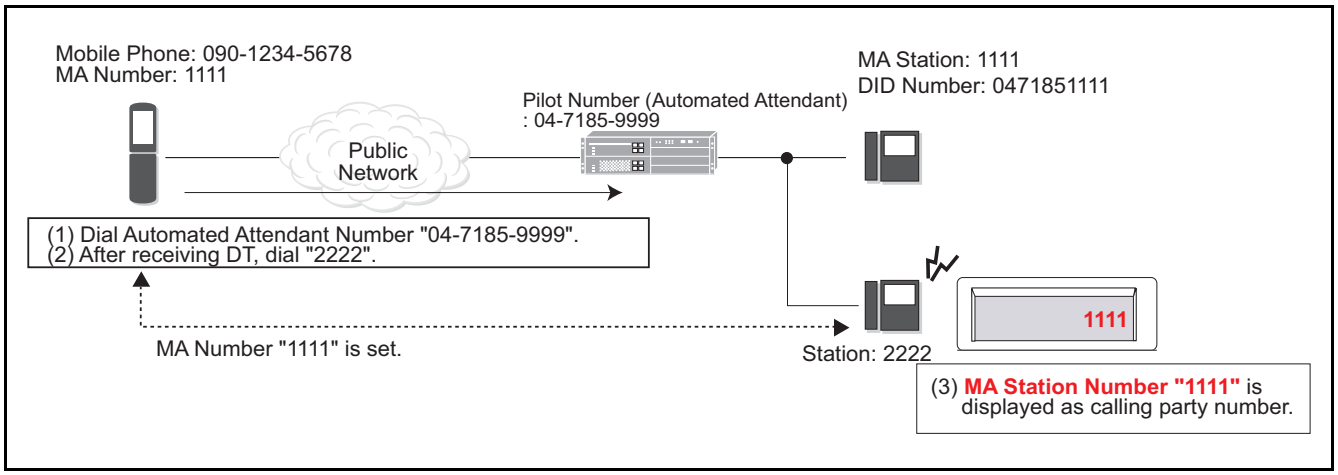
The following explains the terms used in this feature description.

Terms	Description
MA (Mobility Access) Number	Station Number that is given to outside-line telephone by this feature
Mobile Phone	Outside-line telephone having Mobility Access Number
Station	Telephone accommodated in the System
MA (Mobility Access) Station	Station to which Mobility Access data is set
Outside Party	Outside-line telephone having no Mobility Access Number
MA Mode	A Station operates in conjunction with a Mobile Phone
MA Termination	Call Termination from Mobile Phone
MA Call Forwarding	MA Station automatically forwards received calls to Mobile Terminal

DID Number for each MA Station is to be displayed. However, when DID Number for each MA Station is not set, the Telephony Server Pilot Number or Contract Line Number is displayed.

The following table shows the list of the number display patterns.

Making a call to Station (Mobile Phone ® Station)		
	Display	
Calling Party : Mobile Phone	Dialed Number	0471859999+2222
Called Party : Station	MA Station Number	1111
Making a call to outside party (Mobile Phone ® Outside party)		
	Display	
Calling Party : Mobile Phone	Dialed Number	0471859999+0+0678981234
Called Party : Outside telephone	DID Number of MA Station	0471851111
Receiving a call from Station (Station ® Mobile Phone)		
	Display	
Calling Party : Station	Dialed Number	1111
Called Party : Mobile Phone	DID Number of Calling Station	0471852222
Receiving a call from Outside Party (Outside party ® Mobile Phone)		
	Display	
Calling Party : Outside telephone	Dialed Number	0471851111
Called Party : Mobile Phone	DID Number of MA Station	0471851111
Receiving a call from another Mobile Phone (Mobile Phone ® Mobile Phone)		
	Display	
Calling Party : Outside telephone	Dialed Number	0471851111
Called Party : Mobile Phone	DID Number of MA Station	0471852222



Making a call to Station (Mobile Phone → Station)

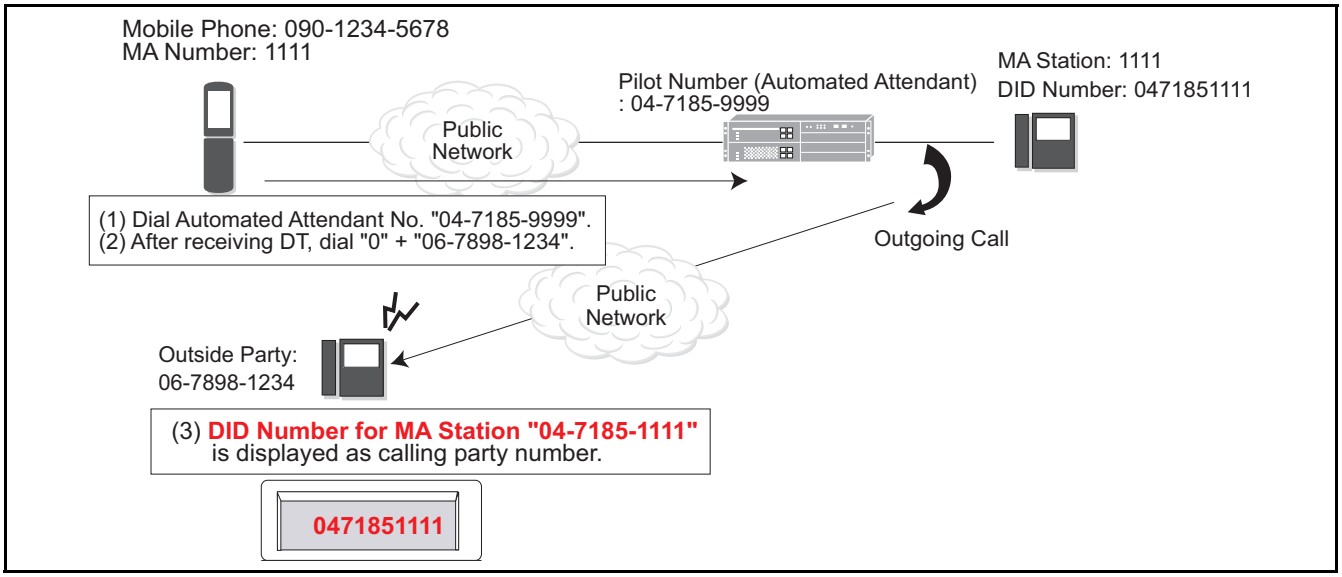
When a call is made from Mobile Phone to Station, Mobility Access Number is sent to the called Station.

<Example>

In the case of the Automated Attendant:

Step 1: Mobile Phone dials the Automated Attendant Number to connect to the system.
Step 2: After receiving DT (Dial Tone), dials Station Number “2222”.
Step 3: The called Station answers the call originated from Mobile Phone. **Mobility Access Number “1111”** is sent to the Station).

Making a call to outside party (Mobile Phone → Outside party):



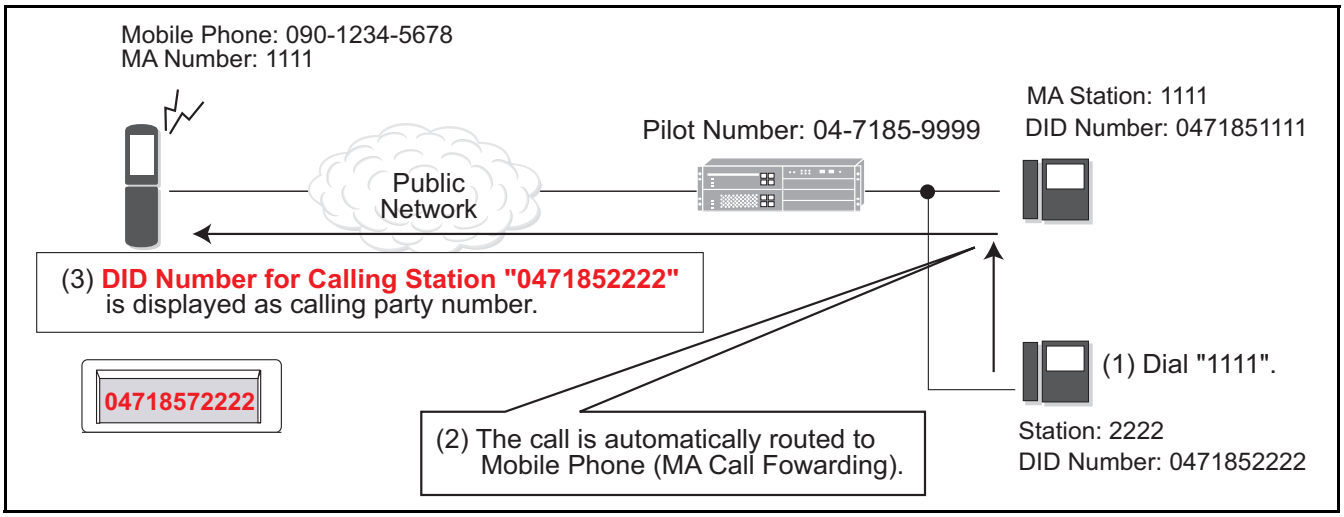
<Example>

In the case of the Automated Attendant:

Step 1: Mobile Phone dials the Automated Attendant Number to connect to the system.

Step 2: After receiving DT (Dial Tone), dials Outgoing Access Code + destination outside party's telephone number.

Step 3: The called outside party answers the call originated from Mobile Phone. **DID Number for MA Station "04-7185-1111"** is sent to the called party (See Figure).

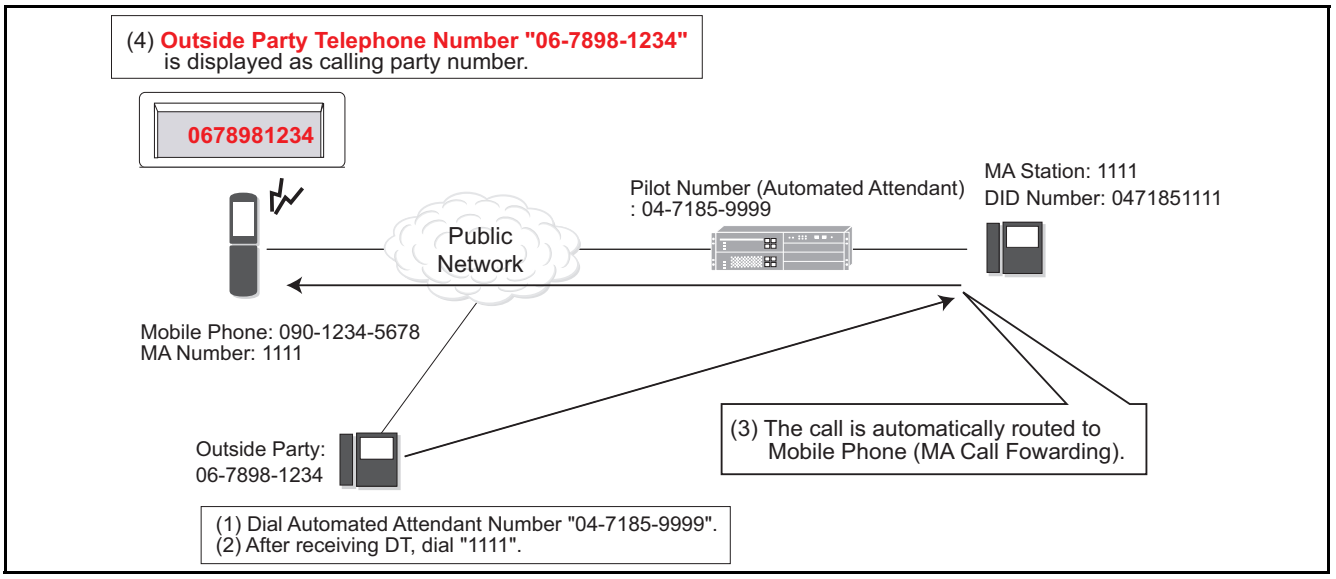


Receiving a call from Station (Station → Mobile Phone)

When an incoming call is terminated to MA Station, MA Station is not rung and the call is forwarded to Mobile Phone immediately. This is called “MA Call Forwarding”. In MA Call Forwarding, call forwarding process is hidden from the called party and it looks like a station call.

<Example>

Step 1: Station (2222) dials the MA Station Number “1111”.
Step 2: The call is automatically forwarded to the particular Mobile Phone (MA Call Forwarding).
Step 3: Mobile Phone answers the call. **DID Number for Calling Station “04-7185-2222”** is sent to Mobile Phone.



Receiving a call from Outside Party (Outside party → Mobile Phone)

When a call is made from outside party to MA Station, the call is automatically routed to the particular Mobile Phone (MA Call Forwarding). At this time, MA Station is not rung.

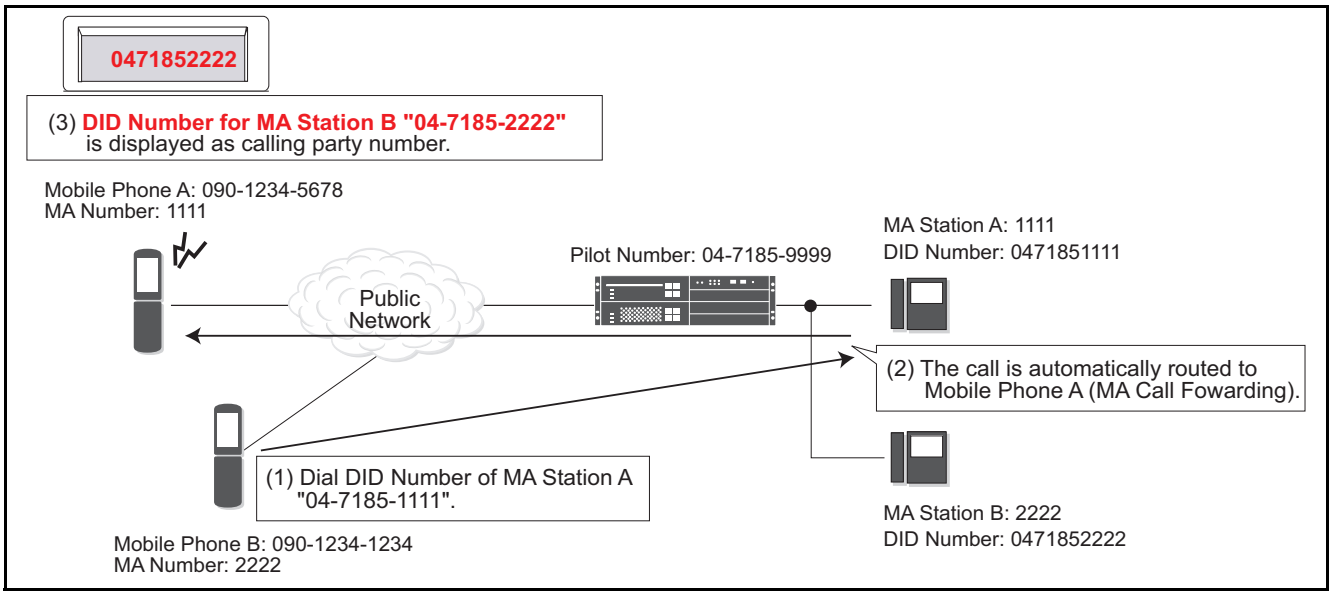
<Example>

In the case of the Automated Attendant:

Step 1: Outside party dials the Automated Attendant Number to connect to the system.
Step 2: After receiving DT (Dial Tone), dials Station Number of MA Station “1111”.
Step 3: The call is automatically forwarded to the particular Mobile Phone (MA Call Forwarding).
Step 4: Mobile Phone answers the call. **Outside Party Telephone Number “060-7898-1234”** is sent to Mobile Phone.

Receiving a call from another Mobile Phone (Mobile Phone → Mobile Phone)

When a call is made from another Mobile Phone to MA Station, the call is automatically routed to the particular Mobile Phone. At this time, MA Station is not rung.



<Example>

In the case of the Direct Inward Dialing (DID)

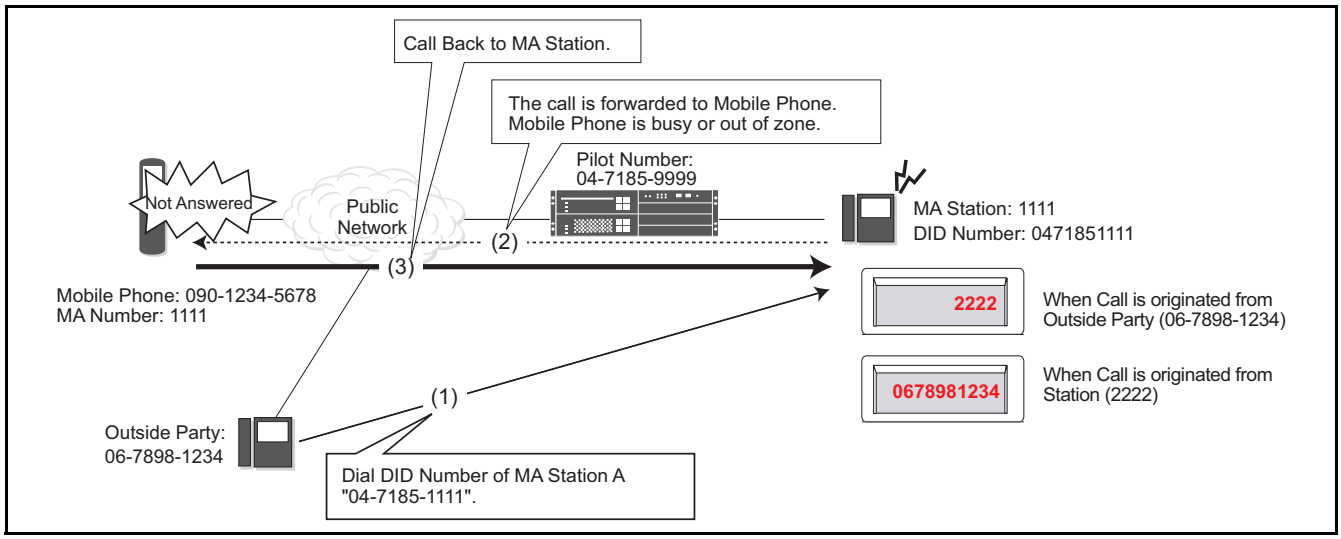
Step 1: Mobile Phone B dials DID Number of MA Station A.

Step 2: The call is automatically forwarded to Mobile Phone A. (MA Call Forwarding).

Step 3: Mobile Phone A answers the call. **DID Number for Calling Station "04-7185-2222"** is sent to Mobile Phone.

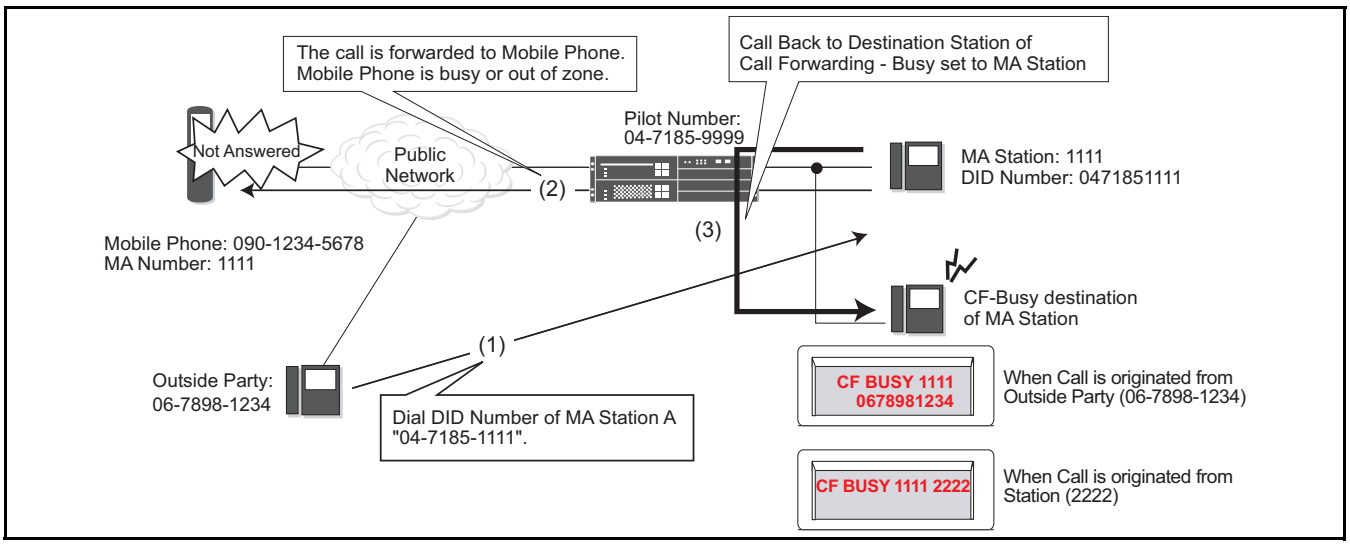
Call Back-Out of Zone:

When a call is forwarded to Mobile Phone from MA Station, the call may be disconnected according to the status of the Mobile Phone (busy or Out of Zone, etc.). In this case, if Service Feature Restriction Class that allows SFI 236 (Call Back-Out of Zone) is assigned to the MA Station, CALL BACK can be activated. The setting of ASYDL, SYS1, Index 1088, Bit 1 determines a destination of CALL BACK.



<Example>

(1) Outside party dials DID Number of MA Station.



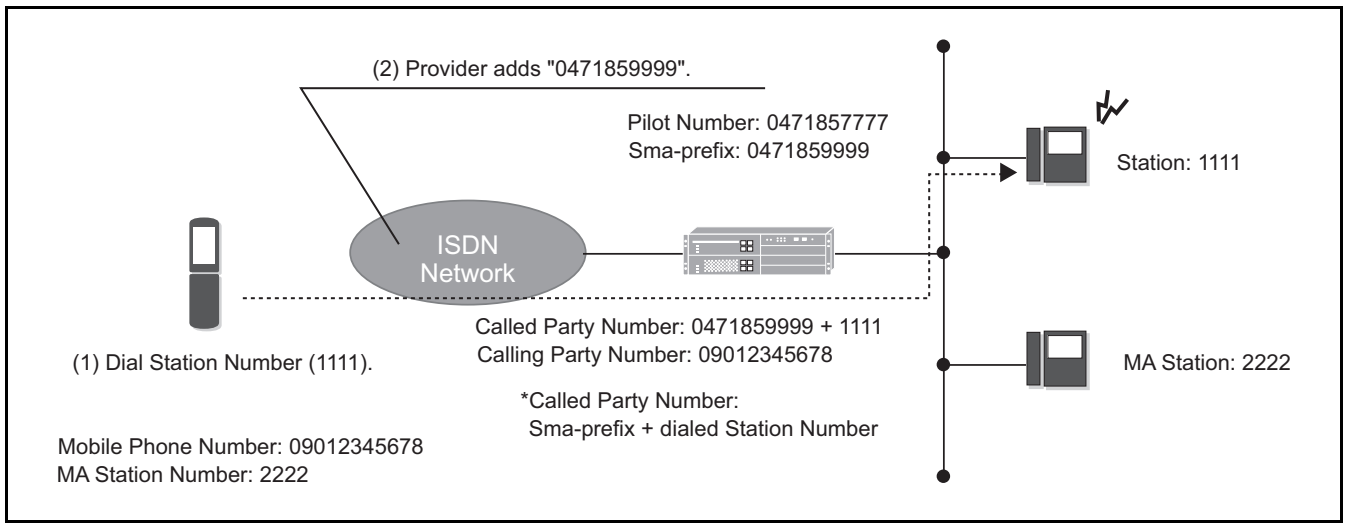
(2) The call is automatically forwarded to the particular Mobile Phone.

(3) Mobile Phone does not answer the call; the call is disconnected and a predetermined CALL BACK destination is rung.

- When ASYDL, SYS1, Index 1088, Bit 1 = 0: MA Station

- When ASYDL, SYS1, Index 1088, Bit 1 = 0: Destination Station of Call Forwarding - Busy Line set to MA Station.

En-block Access



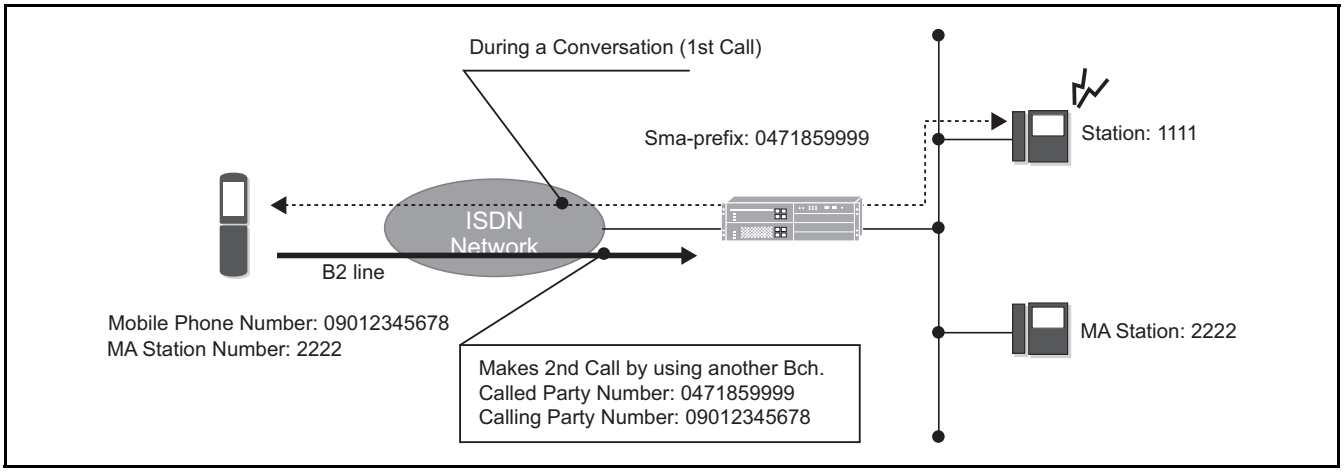
Mobile Phone can make a Station Call/Central Office Call/TIE Line Call by dialing provider specific number and destination telephone number, such as Station Number. Mobile Phone users can use their existing phone book when making these calls. It is required to ink a contract with provider to add sma-prefix.

<Example>

Step 1: Mobile Phone dials Station Number (1111).
Step 2: The originated call is routed to the System according to the following information:

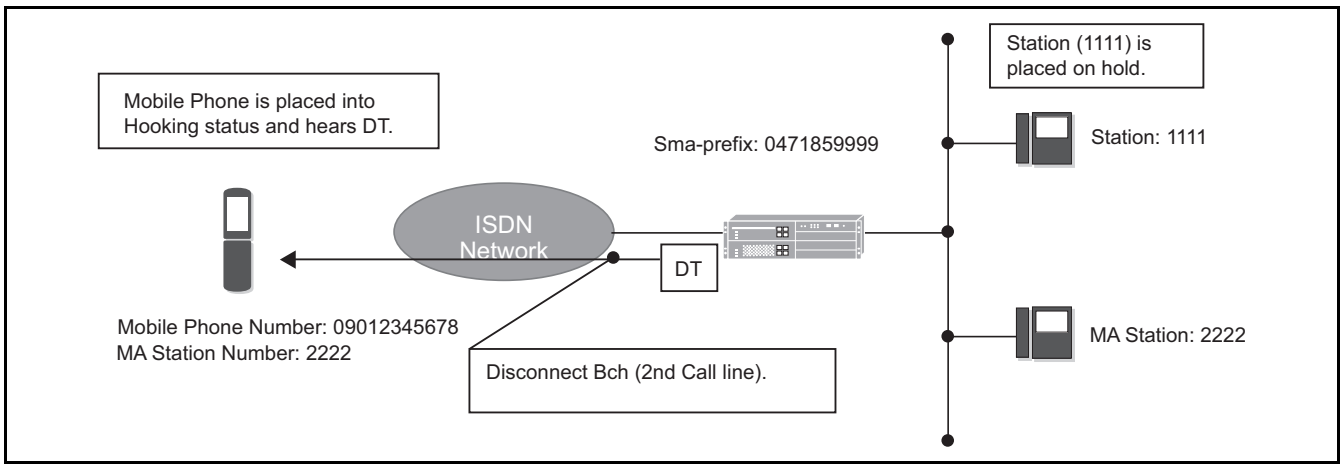
Called Party Number: sma-prefix (0471859999) + Station Number (1111).
Calling Party Number: Mobile Phone Number (09012345678)

Step 3: Station (1111) is rung.



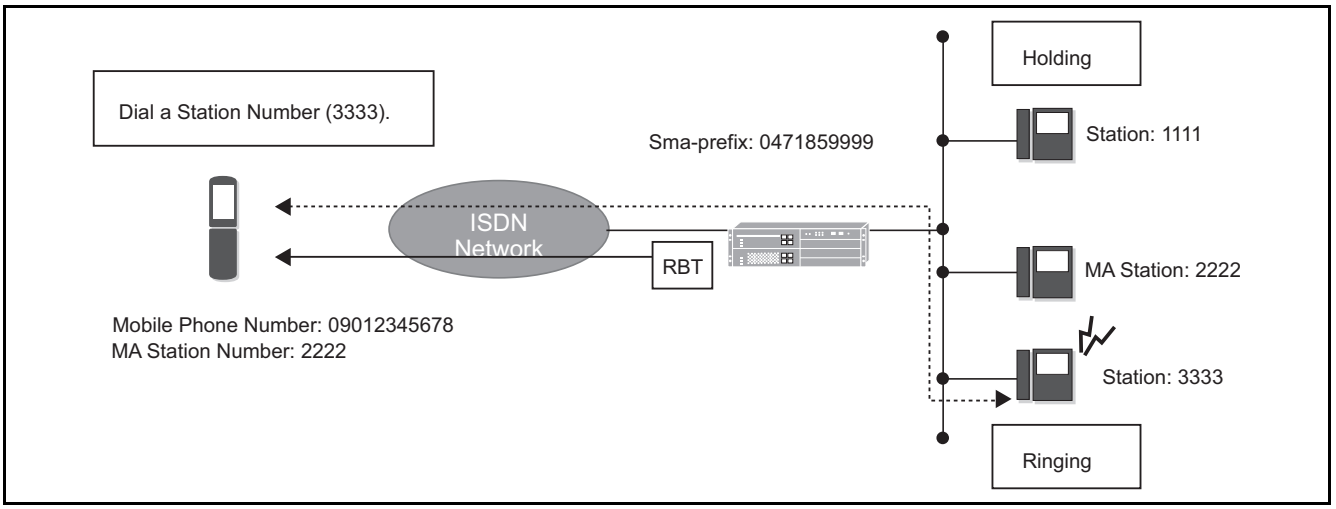
2nd Call

2nd Call service enables hooking on Mobile Phone.



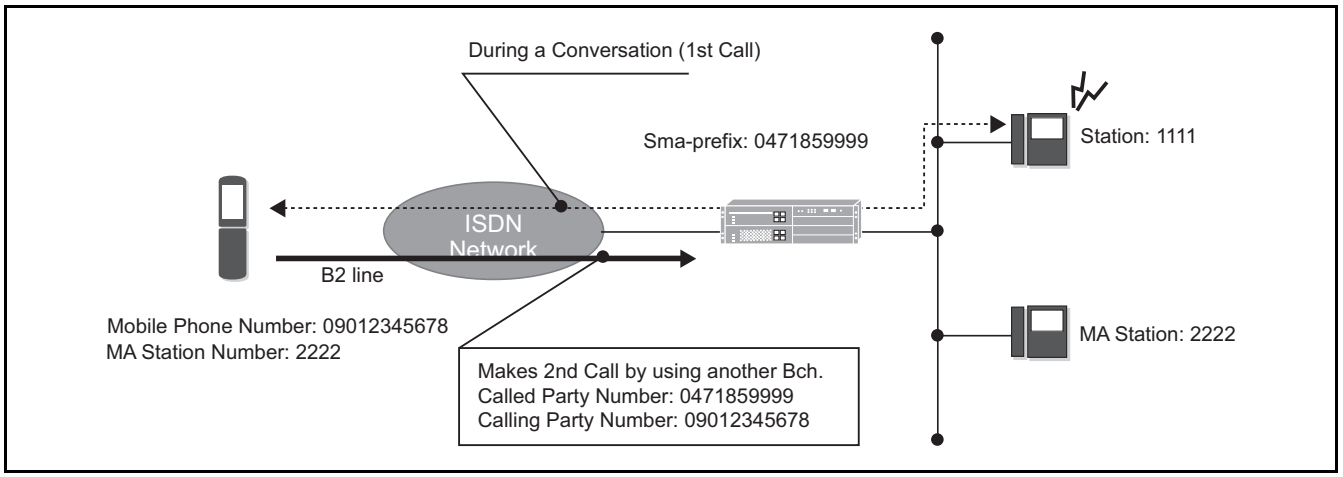
- **2nd Call without En-block Access**

<Example>

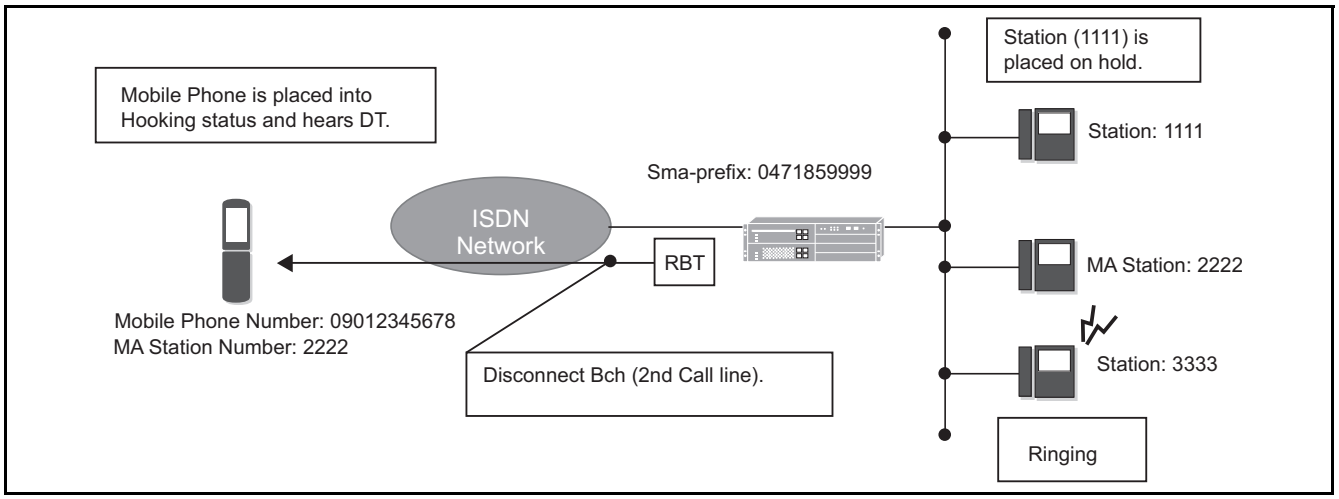


Step 1: While Mobile Phone is engaged in a two-party connection with a Station (1111), the Mobile Station makes another call (2nd Call) to sma-prefix by using B2 line.

Step 2: When the System confirms that 2nd Call is made, the Mobile Phone is placed into Hooking status and the Station (1111) is placed on hold. Dial Tone (DT) is sent to the Mobile Phone and the B2 line is disconnected.



Step 3: The Mobile Phone makes a Station Call/Central Office Call/TIE Line Call by dialing a number.



- **2nd Call with En-block Access**

<Example>

Step 1: While Mobile Phone is engaged in a Two-party Connection with Station (1111), the Mobile Station makes another call (2nd Call) to sma-prefix by using B2 line.

Step 2: If the System confirms that 2nd Call is made, the Mobile Phone is placed into Hooking status and the Station (1111) is placed on hold. The Mobile Phone makes a Station Call/ Central Office Call/TIE Line Call according to additional number included in destination party number (In the following figure, Station Number “3333” is dialed). The B2 line is disconnected.

Operating Procedure

This feature can be set/canceled/confirmed not only from PCPro (AMAD command) but from MA Station and Mobile Phone.

Operating Terminal of Mobility Access

Operating Terminal	Set		Cancel	
	Access Code	Feature/Soft key	Access Code	Feature/Soft key
MA Station	-	-	X	X
Mobile Phone	X	-	X	-

X: Available -: Not available

- Set Mobility Access feature from Mobile Phone (by using Access Code):

1. Dial the Automated Attendant/Remote Access Number to connect to the system. Receive Ringback Tone (RBT).
2. About six seconds later, receive Second Dial Tone (2nd DT).
3. Dial the Remote Call Forwarding Control Access Code. Receive Ringback Tone (RBT).
4. About six seconds later, receive Special Dial Tone (SPDT).
5. Dial the Station ID Code. Receive Special Dial Tone (SPDT).
6. Dial the target Station Number. Receive Dial Tone (DT).
7. Dial the Mobility Access Entry Code. Receive Service Set Tone (SST).
8. The LED of MOBILITY ACCESS Feature key on the Station flashes red. (In the case of Soft key, "MACC" flashes.).

Note: If Mobility Access data has already been set, the previous data will be overwritten with new one.

<Example of Operation>
Automated Attendant Number: 04-7185-7000
Remote Call Forwarding Control Access Code: 2999
Station ID Code: 111 (If the code is less than 10 digits, a "#" must be dialed as the last digit.)
Station Number: 2000
Mobility Access Entry Code: 153

When Announcement service is used:
04-7185-7000 → <Announcement> → <RBT> → <2nd DT> → 2999 → <RBT> → 111# → 2000 → 153

When Announcement service is not used:
04-7185-7000 → <RBT> → <2nd DT> → 2999 → <RBT> → 111# → 2000 → 153

- Cancel Mobility Access feature from Mobile Phone (by using Access Code):

1. Dial the Automated Attendant/Remote Access Number to connect to the system. Receive Ringback Tone (RBT).
2. About six seconds later, receive Second Dial Tone (2nd DT).
3. Dial the Remote Call Forwarding Control Access Code. Receive Ringback Tone (RBT).

4. About six seconds later, receive Special Dial Tone (SPDT).
5. Dial the Station ID Code. Receive Special Dial Tone (SPDT).
6. Dial the Mobility Access Number. Receive Dial Tone (DT).
7. Dial the Mobility Access Cancel Code. Receive Service Set Tone (SST).
8. The LED of the MOBILITY ACCESS Feature key on the Station goes off. (In the case of Soft key, "MACC" becomes steady.).

<Example of Operation>
Automated Attendant Number: 04-7185-7000
Remote Call Forwarding Control Access Code: 2999
Station ID Code: 111 (If the code is less than 10 digits, a "#" must be dialed as the last digit.)
Station Number: 2000
Mobility Access Cancel Code: 154

When Announcement service is used:
04-7185-7000 → <Announcement> → <RBT> → <2nd DT> → 2999 → <RBT> → 111# → 2000 → 154

When Announcement service is not used:
04-7185-7000 → <RBT> → <2nd DT> → 2999 → <RBT> → 111# → 2000 → 154

- Cancel Mobility Access feature from Station (by using Access Code):

1. Lift the handset or press the SPEAKER key. Receive Dial Tone (DT).
2. Dial the Mobility Access Cancel Code. Receive Service Set Tone (SST).
3. Replace the handset or press the SPEAKER key.

- Cancel Mobility Access feature from Station (by using Dterm Feature/Soft key):

1. Lift the handset or press the SPEAKER key. Receive Dial Tone (DT).
2. Press the MOBILITY ACCESS Feature key. Receive Service Set Tone (SST).
3. The LED of the MOBILITY ACCESS Feature key goes off. (In the case of Soft key, "MACC" becomes steady.).
4. Replace the handset or press the SPEAKER key.

- Confirm the registered Mobility Access feature data from Station (by using a Feature/Soft key):

1. Press the MOBILITY ACCESS Feature key (in the on-hook status).
2. Number of Mobile Phone (including OG Access Code) is displayed.

- To confirm the registered Mobility Access feature via PCPro command (AMAD)

1. Choose a data type in the TYPE parameter.
2. Enter each parameter, and then click "Get" button.

    - For NDM:
      Assign UGN and TELN.

- For LDM:
  Assign FPC, UGN and TELN.
- For STN:
  Assign FPC, TN and STN.

Note: For more details on each parameter setting, see the Programming section of this feature.

3. The registered MA service data (Mobile Phone Number, Trunk Access Code) appears.

- To set the Mobility Access feature via PCPro command (AMAD)

1. Choose a data type in the TYPE parameter.
2. Enter each parameter, and then click “Get” button.

- For NDM:
  Assign UGN and TELN.
- For LDM:
  Assign FPC, UGN and TELN.
- For STN:
  Assign FPC, TN and STN.

Note: For more details on each parameter setting, see the Programming section of this feature.

3. Enter Mobile Phone Number into the MA parameter.
4. Enter the number of digits for Trunk Access Code into the TACC parameter.
5. Click “Set” button.

- To cancel the Mobility Access feature via PCPro command (AMAD)

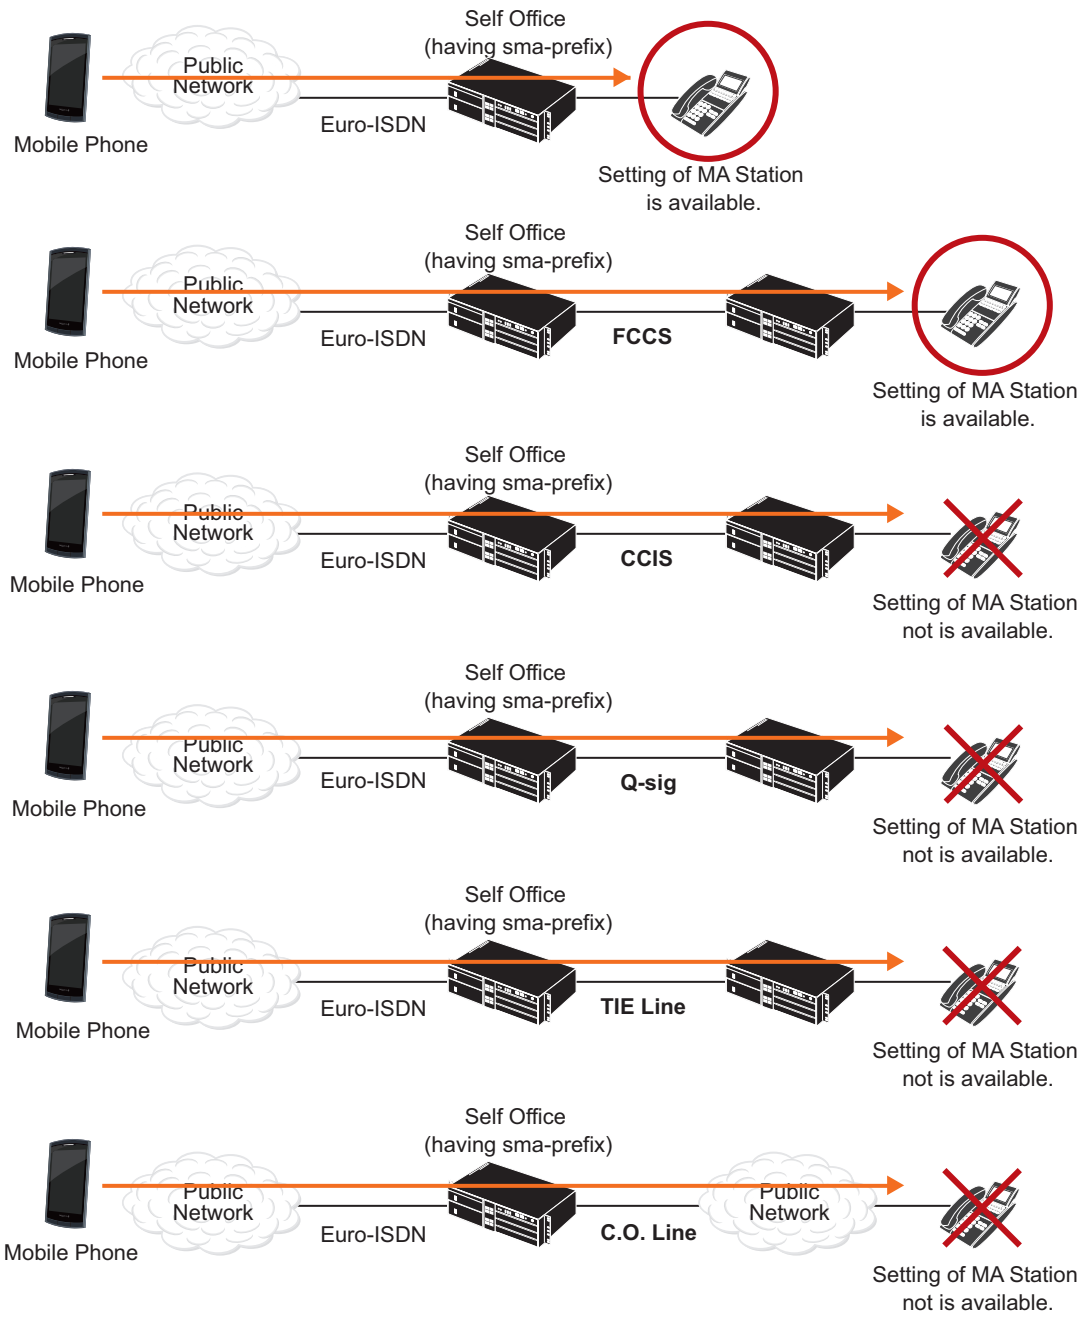
1. Choose a data type in the TYPE parameter.
2. Enter each parameter, and then click “Get” button.

- For NDM:
  Assign UGN and TELN.
- For LDM:
  Assign FPC, UGN and TELN.
- For STN:
  Assign FPC, TN and STN.

Note: For more details on each parameter setting, see the Programming section of this feature.

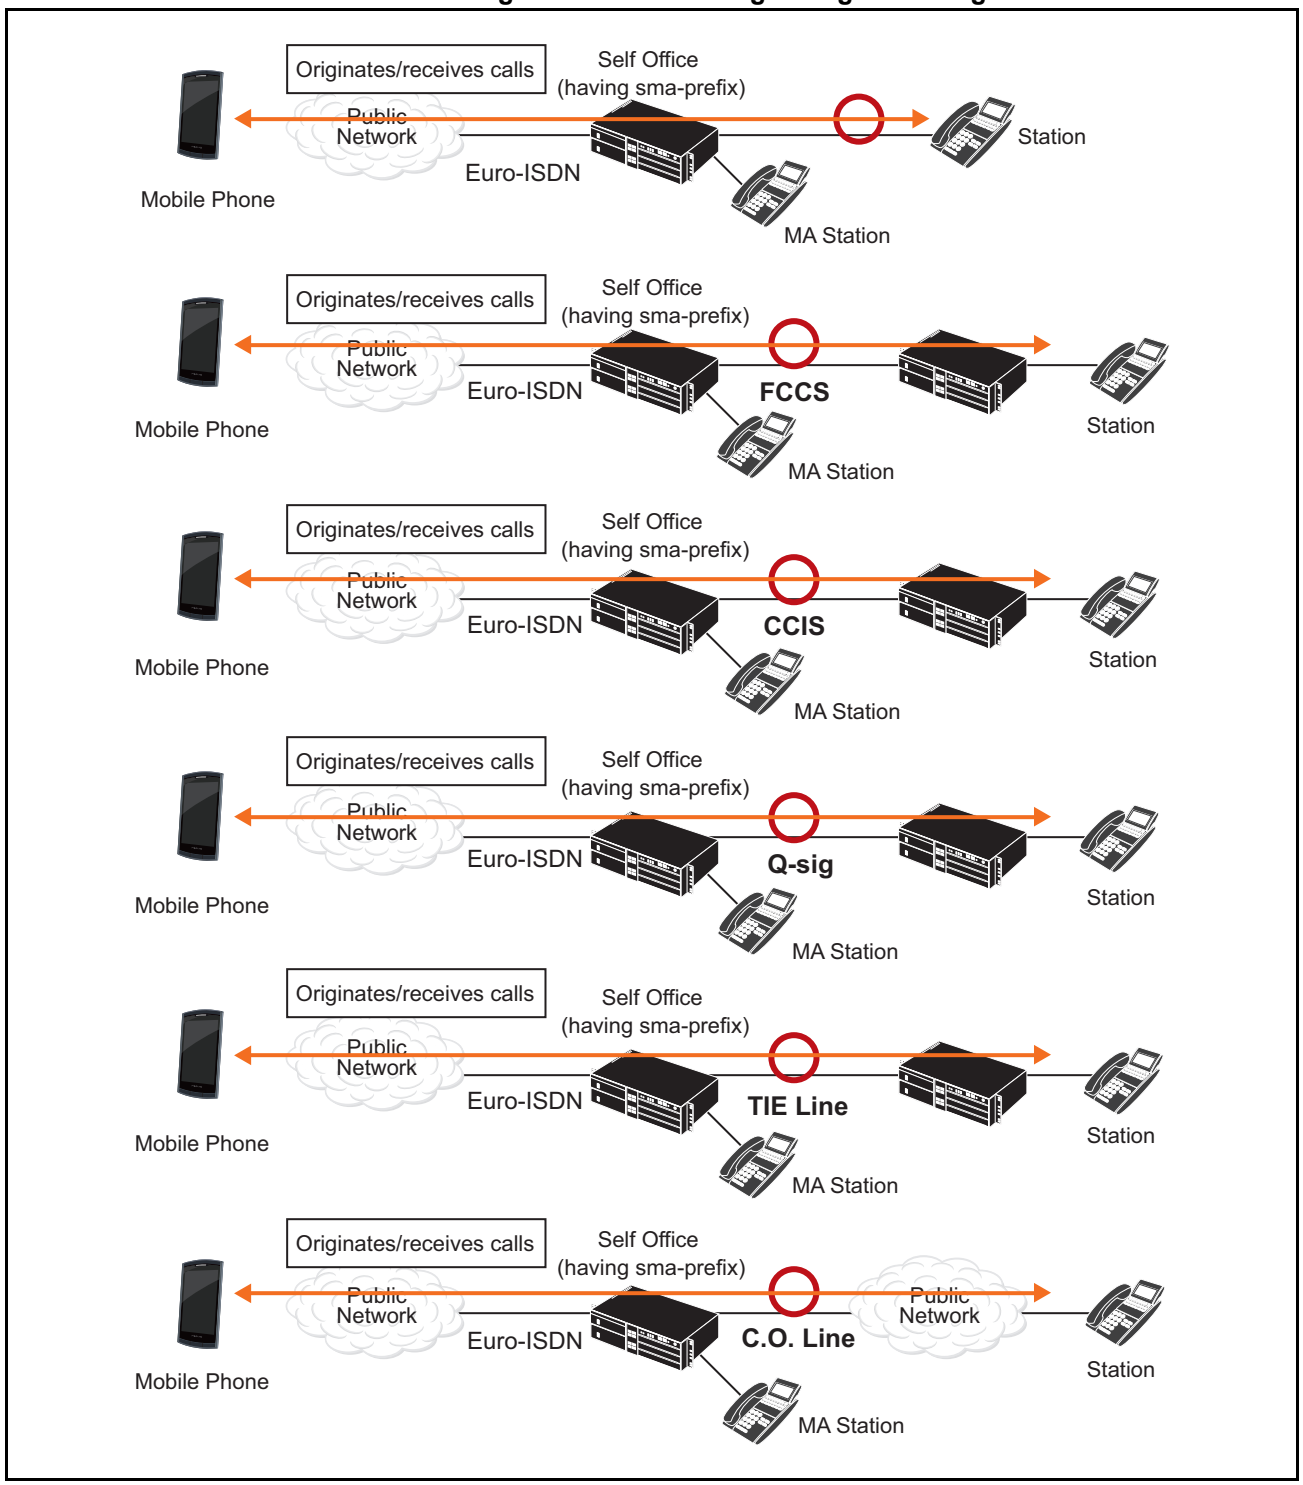
3. Check to see that MA feature has been set.
4. Click “Del” button.

Service Conditions



1. This feature can be set/canceled from Mobile Phone via Euro-ISDN (Transfer Rate: 64 Kbps, Bearer Capability: Speech or 3.1 kHz Audio) only. The following table shows the available network configuration for this feature.

	Self Office Note 1	via FCCS	via CCIS	via G-sig	via TIE line	via C.O. line
Setting of Mobility Access	X	X	N	N	N	N
Call to Mobile via MA Station	X	X	X	X	X	X
Incoming Call from Mobile	X	X	X	X	X	X



X: Available N: Not Available

Note 1: The office accommodating Euro-ISDN line with sma-prefix.

Network Configuration for Mobility Access Setting

Network Configuration for Call Originating/Receiving

2. Legacy Dterm, DtermIP and Analog telephone can be set as MAS Station. Standard SIP terminal, PS, Attendant Console and ISDN terminal cannot be set.
3. This feature is not available for Hotel/OAI/ACD System.

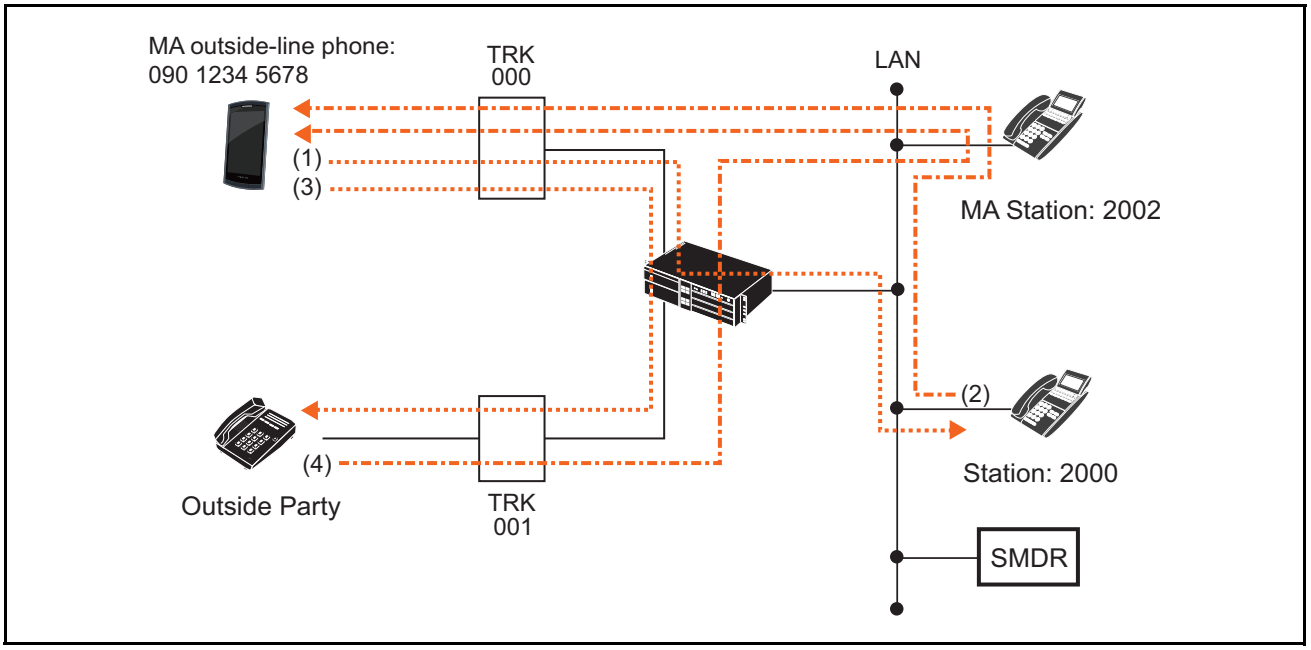
4. This feature is not available via FCCS link. In the FCCS network, this feature can be activated on a node basis. If Mobile Phone places a call to the other node Station, the call is handled as "Trunk Incoming Call", and the Station Number is not displayed on the called party.
5. A Mobility Access Number (Station) can be allocated to an outside party's number.
6. Up to 16,000 Stations can be set this feature.
7. A maximum number of digits for Mobility Access Number is 24.
8. To set/cancel this feature from Mobile Phone, the Mobile Phone needs to access the System via Automated Attendant [A-82]/Remote Access to System [R-2] feature.
9. Make the Reversed Number (ARNP) of incoming route coincide with Outgoing Access Code.
10. When using this feature, it is necessary to set the Station ID Code from the terminal. The following shows the conditions concerning the Station ID Code:
    a.) A maximum number of digits for the Station ID Code is 10.
    b.) When dialing the Station ID Code that is less than 10 digits, a "#" must be dialed as the last digit. If a "#" is not dialed, the dialed Station ID Code becomes invalid.
    c.) If the Station ID Code is not assigned, Station Number is applied by default.
    d.) The assigned Station ID Codes can be saved in Flash Card by PCPro operation or Call Forwarding Data Backup of periodical diagnostic function.
11. Backup of the Mobility Access data and the Station ID Code data is available by PCPro operation or Call Forwarding Data Backup of periodical diagnostic function. Therefore, they can be maintained even after the system initialization with office data loading.
12. Mobile Phone and carrier must support Caller ID Notification Service. If Caller ID Notification Service is disabled by the setting on the Mobile Phone, this feature does not work.
13. ISDN network must support Caller ID Notification Service.
14. When using Distinctive Ringing [D-10]:
    If an Mobile Phone places a call to a Station, Ringer Pattern for Internal Incoming Call is applied.
15. When a call is terminated to a Dterm Station from an Mobile Phone, the display on the Dterm LCD is as follows:

    - If this feature is valid, Mobility Access Number is displayed.
    - If this feature is invalid, the calling party number is displayed. If calling party number is not delivered from the network, incoming trunk type and trunk number are displayed.

16. Elapsed Time Display -D [E-3D] can be provided when a Station answers the call from an Mobile Phone.

17. When multiple call forwarding features are set to a Station:
The setting of SFI 209 and SFI 240 (ASFC command) determines priorities of Logged Out IP Station - Call Destination, Call Forwarding - All Calls and MA Call Forwarding. See the table below.

Call Forwarding features										
(1) Number Sharing (Sub-station is set as forwarding destination) **(2) Logged Out IP Station - Call Destination*** **(3) Call Forwarding - All Calls*** **(4) MA Call Forwarding*** (5) Uniform Call Distribution (UCD) (6) Call Forwarding - Busy Line (7) Station Hunting (8) Do Not Disturb -D (9) Call Forwarding - Don't Answer										
		High ←								→ Low
SFI 209 = 0	SFI 240 = 0	(1)	**(2)**	**(3)**	**(4)**	(5)	(6)	(7)	(8)	(9)
	SFI 240 = 1	(1)	**(4)**	**(2)**	**(3)**	(5)	(6)	(7)	(8)	(9)
SFI 209 = 1	SFI 240 = 0	(1)	**(3)**	**(2)**	**(4)**	(5)	(6)	(7)	(8)	(9)
	SFI 240 = 1	(1)	**(4)**	**(3)**	**(2)**	(5)	(6)	(7)	(8)	(9)



***Variable**

SFI 209 (Priorities of Logged Out IP Station - Call Destination and CF-All Calls)
RES 0 = Logged Out IP Station - Call Destination > CF-All Calls/1 = CF-All Calls > Logged Out IP Station - Call Destination

SFI 240 (Priorities of MA Transfer and Logged Out IP Station - Call Destination & CF-All Calls)
RES 0 = Logged Out IP Station - Call Destination & CF-All Calls > MA Transfer/1 = MA Transfer > Logged Out IP Station - Call Destination & CF-All Calls

18. If MA Station receives a call from the Station that is not allowed to place an outgoing call, the call is not forwarded to the Mobile Phone (restricted).
19. SMDR output information concerning this feature is as follows:

	Connection Pattern	SMDR Output
(1)	Mobile Phone makes a call to a Station	Trunk Incoming (TRK000 -> STN2000)
(2)	Mobile Phone receives a call from a Station	Trunk Outgoing (STN2000 -> TRK000) or Trunk Outgoing (STN2002 -> TRK000) * Depending on the System data assignment
(3)	Mobile Phone makes a call to an outside party	Tandem Outgoing (TRK000 -> TRK001)
(4)	Mobile Phone receives a call from an outside party	Tandem Outgoing (TRK001 -> TRK000)

20. Busy Lamp Field (BLF) display indicates the status of MA Station (not Mobile Phone). Therefore, if the target Mobile Phone is in busy state while the Busy Lamp Field (BLF) display indicates as "idle", Attendant Console hears Reorder Tone (ROT).
21. The following features cannot be used in conjunction with this feature because Mobile Phone can bypass the System and establish a call.

    - Busy Verification [B-3]
    - Call Back [C-1]
    - Call Forwarding - Busy Line [C-2]
    - Call Waiting - Terminating [C-12]
    - Executive Right-of-Way [E-1]

22. When Mobile Phone makes a call to Attendant Console, the call is terminated to the C.O. line key on the Attendant Console. In this case, Station Number of the MA Station is displayed on the Attendant Console's LCD.
23. If an analog telephone that is set as MA Station is called, Warning Tone (One Burst of Ringing) can be provided before the call is forwarded to the target Mobile Phone, depending on the system data assignment (ASYD, SYS1, Index 4, Bit 6).
24. The following shows the conditions concerning Call Back-Out of Zone:
    a.) Call Back-Out of Zone is available for the call to MA Station only.
    b.) Assign a Service Feature Restriction Class that allows SFI 236 to Stations allowed Call Back-Out of Zone.
    c.) Call Back-Out of Zone works only when receiving the following call disconnection reasons (DISC/REL/REL_COMP) from the counter office. If the other reasons are received, ROT/BT is sent to the calling party.

Indication Value (in decimal)	Description
17	Destination User busy
18	No Response from Destination User
19	Destination User does not answer the call during ringing
31	Other normal class
34	No line/channel available
41	Temporary fault

Note: If Mobile Phone is out of zone and the calling party is connected to announcement of carrier, the call is not forwarded because DISC/REL/REL_COMP is not received.

d.) Call Back-Out of Zone works only when MA Station receives the following calls. If any calls other than the following are reached to MA Station, ROT/BT is sent to the calling party.

- Station Call
- Incoming Call from an outside party
- Incoming Call from a Mobile Phone via Automated Attendant [A-82]/Remote Access to System [R-2]

e.) Even if Inband Tone is available, Call Back-Out of Zone works without connecting to Inband Tone.

f.) If it is impossible to call back to MA Station (line lockout state, etc.), ROT/BT is sent to the calling party.

g.) The destination of Call Back-Out of Zone can be determined by the following System data.
ASYDL, SYS1, Index 1088, Bit 1: 0/1 = MA Station/Destination Station of CF-Busy set to MA Station.

h.) A maximum number of Multiple Call Forwarding occurrences can be determined by the System data (ASYD, SYS1, Index 486, Bit 3-Bit 1).

b3	b2	b1		b3	b2	b1	
0	0	0	once	1	0	0	four times
0	0	1	once	1	0	1	five times
0	1	0	twice	1	1	0	five times
0	1	1	three times	1	1	1	five times

i.) In Call Back-Out of Zone, even if Service Display -D is available, forwarding information of multi-hops is not taken over.

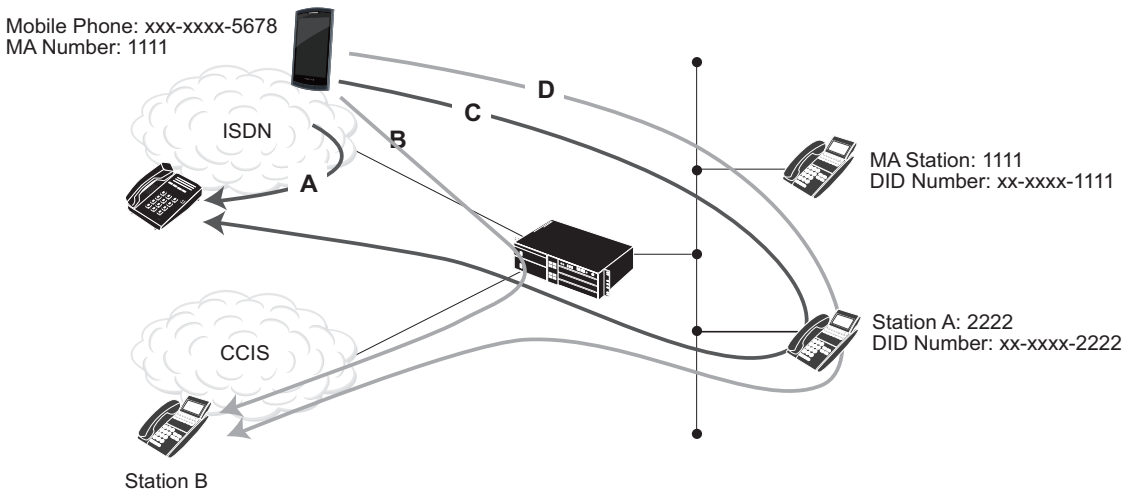
j.) When Call Back-Out of Zone is allowed, Camp-on service cannot be used.

25. A newly set MA License is required to activate this feature.
    a.) A lineup of MA Licenses includes the following:
    10/50/100/500/1000 Licenses
    b.) Licences can be added by using License Merge Software (addition method).
    c.) In a node, a maximum of 4,000 ports can be used for this feature.
    d.) In the FCCS network, a maximum of 16,000 ports can be used for this feature.
    e.) When assigning MA Station data, a license is required for each Mobile Terminal. The assigned license is released when MA setting data is canceled.
26. Station Classes which can be assigned to MA Station are TEC=1-4 (Analog Telephone) and TEC=12 (Dterm). MA Station does not support TEC=18 (Virtual Line Appearance), TEC=23 and 24 (ISDN Terminal) and TEC=28 (PHS).
27. If a MA Station is included in Station Hunting group, the MA Station is skipped in hunting.
28. Direct Inward Dialing (DID) [D-8] data is required to be set per Station for Calling Party Number information to be sent from the System.
29. If no data is set, the Telephony Server Pilot Number or Contract Line Number is notified when making/ receiving a call. Calling Party Number is transformed to Subscriber Number (Pilot Number) when it is notified to the Public network. (Status Display (reason#100: Invalid information element contents) is sent from the Public network.)
30. The following table shows the necessary number of the contracts for DID Number.

	Number of Contracts	Method
Number to access system	-	Automated Attendant
Number to be allocated to MA Station	The number of MA Stations (recommended)	Direct Inward Dialing (DID)

31. If the line for each Station cannot be prepared, the Telephony Server Pilot Number or Contract Line Number is notified.
32. Even if calling party encounters the restriction on the Outgoing Trunk Connection, call origination (MA Call Forwarding) to Mobile Phone is allowed. (MA Call Forwarding is handled as “Station Call”.) In this case, Billing Party is determined by the following System data.

    ASYD, SYS1, Index 20, Bit 7: 0/1 = Calling Party/ Transfer Operating Party (Determination of Billing Party for Call Forwarding service)

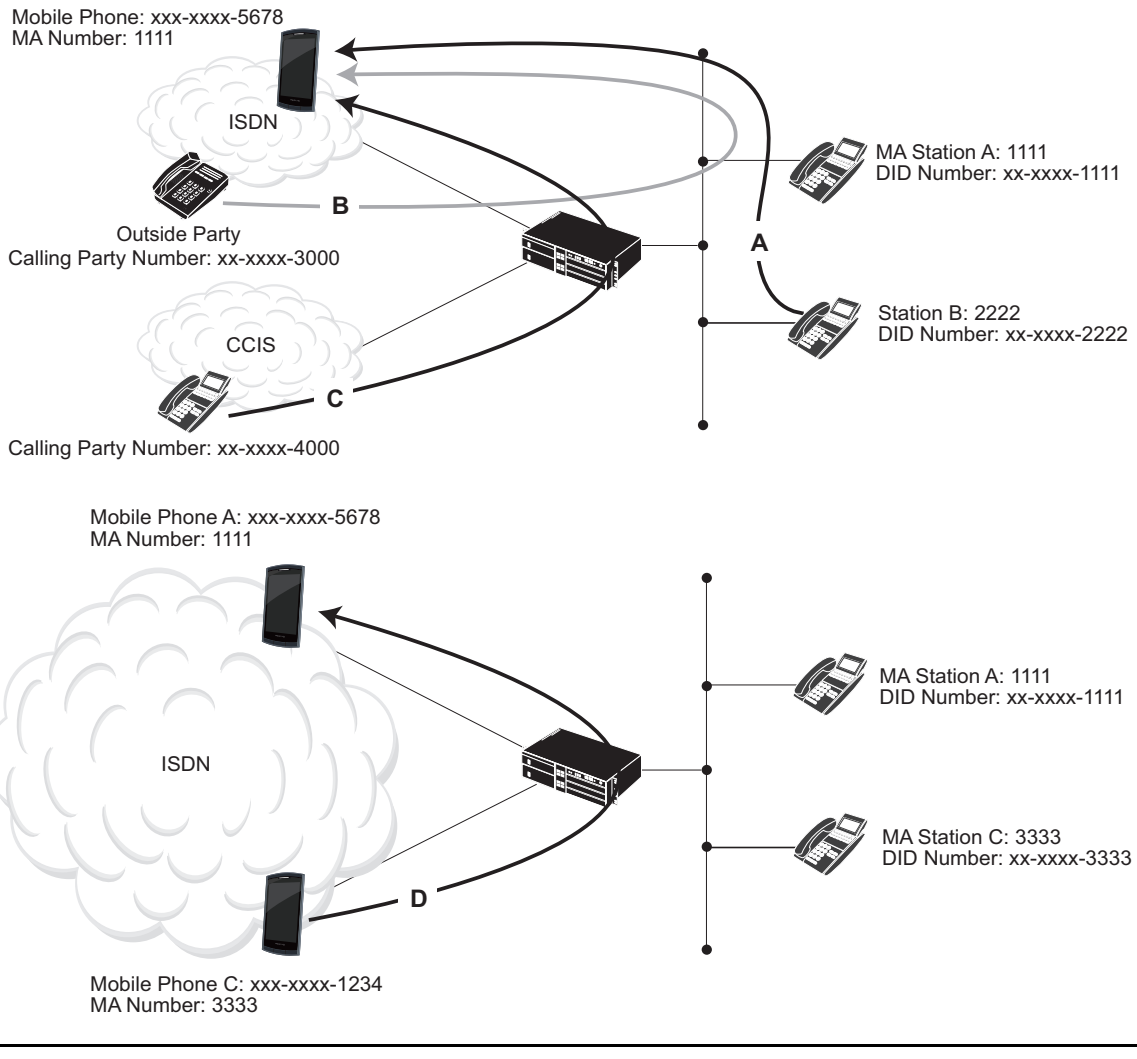


33. When making a call to outside line or CCIS by using MA function, Calling Party Number to be sent to the network varies according to the connection patterns.

Calling Party Number information for each connection pattern is shown in Table 1 and 2.

Calling Party Number to be Sent to the Network When Making a Call to Outside Line after MA Termination

	Connection Pattern	Calling Party Number Information
A	Call origination to outside line after MA Termination	Calling Party Number of MA Station = 0471851111
B	Call origination to CCIS after MA Termination	Calling Party is MA Station = 1111, and the Calling Party Number (telephone number of Mobile Phone) is not notified. DID Number of MA Station (1111) is notified.
C	Call origination to station after MA Termination –> Call transfer to outside line (destination station of Call Forwarding - All Calls/Busy/Don't Answer outside set to MA Station)	Calling Party Number of MA Station = 0471851111
D	Call origination to station after MA Termination –> Call transfer via CCIS	Calling Party is MA Station = 1111, and the Calling Party Number is not notified. Station Number of MA Station is notified.



Call Origination to Outside Line after MA Termination

Calling Party Number to be Sent to Mobile Phone by MA Call Forwarding

	Connection Pattern	Calling Party Number Information
A	MA Call Forwarding after call termination from Station	Calling Party Number of caller-side Station = 0345672222
B	MA Call Forwarding after call termination from Outside Line	Calling Party Number of MA Station = 0698763000
C	MA Call Forwarding after call termination from CCIS	Calling Party Number received from CCIS Counter Office = 0698764000
D	Call origination to Station after MA Termination -> MA Call Forwarding	Calling Party Number of caller-side MA Station = 0345672222

Call Origination to Mobile Phone by MA Call Forwarding

34. The following tables show service feature availability and conditions for this feature.

OG Call Features Availability

Code	Service Feature	To Mobile Phone	From Mobile Phone	Remarks
D-8	Direct Inward Dialing (DID)	-	-	
M-7	Music On Hold (External Music on Hold)	N	N	Call Hold from Mobile Phone varies depending on the carrier.
M-99	Multiple Music-on Hold	N	N	Call Hold from Mobile Phone varies depending on the carrier.

35. The following shows the conditions concerning the setting/canceling/confirming of this feature.
    a.) This feature can be set/canceled/confirmed via AMAD command.
    b.) This feature can be canceled/confirmed from MA Station. MA Station cannot set this feature.
    c.) The new setting from Mobile Phone/PCPro overwrites the existing setting. See the table below.

    • When Mobile Phone A has set Station B as its MA Station, Mobile Phone C tried to set Station B as its MA Station:

	Setting before overwriting		Setting after overwriting
Mobile Phone A	Setting with Station B		No Setting
Station B	Setting with Mobile Phone A	->	Setting with Mobile Phone C
Mobile Phone C	No Setting		Setting with Station B
Station D	No Setting		No Setting

- When Mobile Phone A has set Station B as its MA Station, Mobile Phone A tried to set Station D as its MA Station:

	Setting before overwriting		Setting after overwriting
Mobile Phone A	Setting with Station B		Setting with Station D
Station B	Setting with Mobile Phone A	->	No Setting
Mobile Phone C	No Setting		No Setting
Station D	No Setting		Setting with Mobile Phone A

- When Mobile Phone A has set Station B as its MA Station and Mobile Phone C has set Station D as its MA Station, Mobile Phone A tried to set Station D as its MA Station:

	Setting before overwriting		Setting after overwriting
Mobile Phone A	Setting with Station B		Setting with Station D
Station B	Setting with Mobile Phone A	->	No Setting
Mobile Phone C	Setting with Station D		No Setting
Station D	Setting with Mobile Phone C		Setting with Mobile Phone A

d.) This feature can be set/canceled only when MA Station is idle. This feature cannot be set/canceled when MA Station is busy or ringing, etc.
e.) This feature cannot be set/deleted from Mobile Phone and PCPro (AMAD command) during this feature call. Confirmation of this feature setting is available.
f.) This feature cannot be set with Uniform Numbering.
g.) Legacy Dterm, DtermIP and Analog telephone can be set as MA Station. Standard SIP terminal, PS, Attendant Console and ISDN terminal cannot be set.

36. The following shows the conditions concerning En-block Access.
a.) Only Station Number and outside line number can be used as Addition Number in En-block Access.
b.) The System determined whether or not the receiving call is En-block Access call by the presence or absence of Additional Number.
c.) En-block Access activates by receiving “Single Complete” information element.

		Single Complete Information Element	
		Yes	No
Additional Number	Yes	En-block Access	En-block Access by Inter Digit Timer time-out
	No	Automated Attendant/Remote Access to System	Automated Attendant/Remote Access to System

d.) Both Preset Dialing and Overlap Dialing are available in En-block Access.
e.) If the dialed Additional Number is not suited for the predetermined Numbering Plan, the number is handled as dead number or dead level.

f.) The form of the received Called Party Number must be one of the following:

sma-prefix + Station Number

sma-prefix + Number for placing a call to C.O. line

sma-prefix + Number for placing a call to TIE line

g.) Only the forms of Called Party Number and Called Party Number receiving supported by Euro-ISDN are available.
h.) Provider must add sma-prefix to Called Party Number automatically as Prefix by the special service setting of the domain.
i.) Even if a called party is in busy state, Call Back is not available.
j.) When ETSI ISDN ADDRESSING [E-32] Extended Addressing is enabled (ASYDL, SYS1, Index 1088, Bit 5=1), registering with the ACODL command is also required.
k.) The following tables show service feature availability for En-block Access.

Note: Access Codes cannot be used in En-block Access. The following features cannot be set/canceled from Mobile Phone. Any features other than the following are not available.

Multiple Line Terminal Features Availability

Code	Service Feature	Availability in En-block Access	Remarks
I-21	Internal Zone Paging	N	
O-2	Outgoing Trunk Queuing	N	
N-28	Name Display - System	N	User information is not displayed.
V-2	Voice Call	N	
C-5	Call Forwarding - All Calls	X	Call Forwarding set on Called Party is available.
D-11D	Do Not Disturb -D	X	Do Not Disturb set on Called Party is available.
E-1	Executive Right-of-Way	N	
C-1	Call Back	N	
C-3	Call Forwarding - Don't Answer	X	Call Forwarding set on Called Party is available.
C-2	Call Forwarding - Busy Line	X	Call Forwarding set on Called Party is available.

37. The following shows the conditions concerning 2nd Calling.
    a.) 2nd Call is available only when the line of 1st Call is in busy state.
    b.) 1st Call hears no tone until 2nd Call is terminated to the destination party. Therefore, time period of no tone status becomes longer in case of overlap dialing.
    c.) Provider must add sma-prefix to Called Party Number automatically as Prefix by the special service setting of the domain.
    d.) Mobile Phone must support two-line calling.
    e.) The form of the received Called Party Number must be one of the following:

        sma-prefix + Station Number

        sma-prefix + Number for placing a call to C.O. line

        sma-prefix + Number for placing a call to TIE line

        Note: Available Station Number: Physical Station Number in Self office and Telephone Number. Uniform Number is not available.
        Available Number for placing a call to C.O. line: Number for placing a LCR call to ISDN (Preset dialing).

    f.) One of hooking, retuning to two-party calling and calling party switching is available in 2nd Call.
    g.) Only the 2nd Call from Euro-ISDN line is available.

h.) 2nd Calling is available only when 1st Call is engaged in a conversation or consultation hold. Also, Mobile Phone must be engaged in a conversation with one of the available parties in the following table.

Party On the Other End	Availability
Euro-ISDN (Self Office/via FCCS)	X
ISDN Trunk (Self Office/via FCCS)	X
Qsig Trunk (Self Office/via FCCS)	X
Dterm (Self Office/via FCCS)	X
DtermIP (Property protocol) (Self Office/via FCCS)	X
DtermIP(SIP) (Self Office/via FCCS)	X
Analog Station (Self Office/via FCCS)	X
CCIS Trunk (Self Office/via FCCS)	N
Analog Trunk	N
PHS (Self Office/via FCCS)	N
Attendant Console (Self Office/via FCCS)	N
Standard SIP terminal (Self Office/via FCCS)	N
ISDN terminal (Self Office/via FCCS)	N
Other Trunks (Self Office/via FCCS)	N
Other Stations (Self Office/via FCCS)	N

×: Available N: Not Available

i.) The following parties are available as destination of 2nd Call.

Destination Party	Availability
Euro-ISDN (Self Office/via FCCS)	X
ISDN Trunk (Self Office/via FCCS)	X
Qsig Trunk (Self Office/via FCCS)	X
Dterm (Self Office/via FCCS)	X
DtermIP (Property protocol) (Self Office/via FCCS)	X
DtermIP(SIP) (Self Office/via FCCS)	X
Analog Station (Self Office/via FCCS)	X
CCIS Trunk (Self Office/via FCCS)	N
Analog Trunk	N
PHS (Self Office/via FCCS)	N
Attendant Console (Self Office/via FCCS)	N
Standard SIP terminal (Self Office/via FCCS)	N
ISDN terminal (Self Office/via FCCS)	N
Other Trunks (Self Office/via FCCS)	N
Other Stations (Self Office/via FCCS)	N

×: Available N: Not Available

Note: Hooking by 2nd Calling under the invalid conditions will be ignored.

j.) The related terminal can only press the RELEASE/CONF key.

k.) If Mobile phone (intermediate party) releases a call while it is in Consultation Hold state, the following occur:

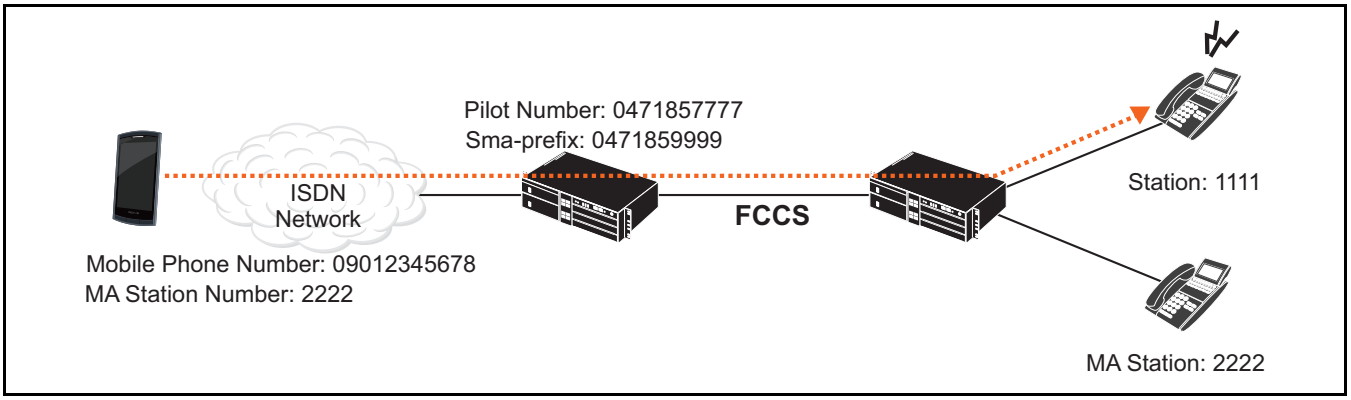
Before transfer destination party is rung: All calls are released

While transfer destination party is ringing: Blind Transfer

After transfer destination party answers: Call Transfer - All Calls

l.) If the number of digits of the dialed Additional Number (Station Number) is not enough to call the destination party, the Additional Number is discarded and DT (**Note 2**) is sent to the Calling Party. The Calling Party is prompted to redial the all digits of the required number.

Note 2: In this case, 2nd Call is not connected to Announcement Trunk. Also, when the destination party of 2nd Call is unused or busy, the call is not connected to Announcement Trunk.



m.) The following tables show service feature availability for 2nd Calling.

Note: Access Codes cannot be used in 2nd Calling. Any features other than the following are not available.

Code	Service Feature	Availability in En-block Access	Remarks
C-11	Call Transfer - All Calls	X	
B-18	Blind Transfer To Station	X	
T-2	Three-Way Calling	N	

×: Available N: Not Available

38. This feature is available via FCCS network.

a.) In Refresh function, MA Control Node (MA_NCN) and MA Local Node (MA_LN) update the Mobile Number registered in Common Memory (CM) at designated time to unify the Mobile Numbers among all nodes.
Refresh process is activated at the designated time and MA_NCN and MA_LN operate as follows:
MA_NCN:
Update the Mobility Numbers in the self-common memory.
Broadcast the updated Mobility Numbers to each MA_LN.
Each MA_LN updates its common memory.
MA_LN:
Transfer the Mobility Numbers to MA_NCN.
MA_NCN receives the Mobility Numbers from each MA_LN and broadcasts the Mobility Numbers to each MA_LN after updating the self-common memory.

b.) MA Control Node (MA_NCN) is designated by the following system data: ASYDN, System Data 1, Index 1058.

c.) Call origination/termination via this feature is available even while the communication with Control Node is interrupted.

d.) Assignment/deletion of this feature data is not available while the communication with Control Node is interrupted.

e.) For more details on the service conditions for FCCS network, see Data Programming Manual - FCCS.
f.) It takes approximately 90 seconds to update MA data after the system starts operating (depending on the load condition on the network.). MA feature cannot be activated until the update of MA data is completed.
g.) A maximum of 64 Mobility Numbers can be transferred/broadcast.
h.) If an error occurs while Mobility Numbers are being transferred from MA Local Node (MA_LN) to MA Control Node (MA_NCN), Mobility Numbers are re-transferred (until the transfer is completed successfully).
i.) This feature does not support Location Diversity [L-55].

39. The following are conditions only when Euro-ISDN trunk used as this feature is intermediate party. For other conditions, see the conditions of Three-Way Calling.
    a.) Three-Way Calling is available only when the CONF key on Desktop terminal is pressed.
    b.) Only the Dterm can establish a Three-Way Calling.
    c.) Three-Way Calling cannot be established when Conference Equipment, PS or ISDN terminal is included.
40. When ETSI ISDN ADDRESSING [E-32] is enabled, set the total number of trunk access code and international/national prefix number to six digits or less. If this total number exceeds seven digits, this feature is not available.

Note: This condition is valid not only when Extended Addressing (ASYDL, SYS1, Index 1088, Bit 5=1) is enabled, but also when Existing Addressing (ASYDL, SYS1, Index 1088, Bit 5=0) is enabled.

Programming

To use this feature, the data assignments of ETSI ISDN, Automated Attendant [A-82]/Remote Access to System [R-2], Station ID Code and Mobility Access are required.

Data Assignment for ETSI ISDN:

See ETSI ISDN DATA ASSIGNMENT in the Data Programming Manual - ISDN.

Data Assignment for Automated Attendant/Remote Access to System:

See Automated Attendant [A-82]/Remote Access to System [R-2].

Data Assignment for Station ID Code:

The following shows how to assign the Station ID Code data.

STEP 1: **ANPD** - Assign the minimum necessary number of digits for the first number of Station ID Number Entry Access Code.

TN:	Tenant Number
1stDC:	The first digit of service Access Code. (0-9, *, #)
CI:	Select Normal Service (N) from the combo box for Connection Indexes.
NND:	Number of Necessary Digits for the Access Code (up to 6 digits)
BLF:	Busy Lamp Field Display Activated on ATT (0/1 = Out of Service/In Service)

STEP 2: **ASPA** - Assign Station ID Number Entry Access Code.

TN:	Tenant Number
ACC:	Access Code for this feature (up to 6 digits)
CI:	Connection status Index = “N: Normal”
SRV:	Kind of Service = “SSCA: Service Code Appendix”
SIDA:	Service Index A = 100 (ID Number Entry)

STEP 3: **ARAC** - Assign the Remote Call Forwarding Control Access Code.

ICTN:	Tenant Number of Incoming Trunk
ACC:	Access Code (up to 5 digits)
R/M:	M (Manual Roaming)

STEP 4: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 143 to Stations that will use the Station ID Number Entry Access Code.

Data Assignment for Mobility Access:

The following shows how to assign the Mobility Access data.

STEP 1: **ANPD** - Assign the minimum necessary number of digits for the first number of Mobility Access Entry and Cancel Codes.

TN: Tenant Number
1stDC: The first digit of service Access Code. (0-9, *, #)
CI: Select Normal Service (N) from the combo box for Connection Indexes.
NND: Number of Necessary Digits for the Access Code (up to 6 digits)
BLF: Busy Lamp Field Display Activated on ATT (0/1 = Out of Service/In Service)

STEP 2: **ASPA** - Assign Mobility Access Entry and Cancel Codes.

(Mobility Access Entry Code)
TN: Tenant Number
ACC: Access Code for this feature (up to 6 digits)
CI: Connection status Index = "N: Normal"
SRV: Kind of Service = "SSCA: Service Code Appendix"
SIDA: Service Index A = 153 (Mobility Access Entry)

(Mobility Access Cancel Code)
TN: Tenant Number
ACC: Access Code for this feature (up to 6 digits)
CI: Connection status Index = "N: Normal"
SRV: Kind of Service = "SSCA: Service Code Appendix"
SIDA: Service Index A = 154 (Mobility Access Cancel)

STEP 3: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 234 to Stations that will use Mobility Access feature.

STEP 4: **AKYD** - Assign the key data for MOBILITY ACCESS on the Line/Feature key of Desktop terminal.

KYN: Key Number (1-40)
KYI: 1 (Function Key)
FKY: 167 (Mobility Access)

STEP 5: **ADSL** - Assign SN = 1 (Originating; DT Connection) and FKY = 167 (Mobility Access). This command needs to be assigned only when using Soft key.

Data Assignment for Call Back-Out of Zone:

Assign the following Call Back-Out of Zone data if required.

STEP 1: **ARTD** - For the route used for call origination, assign CDN 111: ADVPRA ISDN PRI Failure Routing Service, as data "1".

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or MG.

STEP 2: **ASFC** - For Stations allowed Call Back-Out of Zone, assign a Service Feature Restriction Class that allows SFI 236.

Data Assignment for En-block Access/2nd Call:

- Data Assignment for Automated Attendant/Remote Access to System

  See Automated Attendant [A-82]/Remote Access to System [R-2].

- Data Assignment for Called Party Number Digit

STEP 1: **ACODL** - Assign Country Code and Area Code, etc. per route. For more details, see ETSI ISDN Addressing [E-32] in Data Programming Manual - ISDN.

STEP 2: **ARTI/ARTIN** - (Assignment of Trunk Application Data)

CDN: 92 (EBDC) - Assign the number of digits for Called Party Number (except the number (Area Code and Local Code) assigned by ACODL command) per route.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as circuit card, MG, or VS32.

Mobility Access [M-118] via FCCS

This feature is available via FCCS network. To activate this feature via FCCS link, the following data assignment is required.

STEP 1: **ASYDN** - System Data 1, Index 1058: Assign FPC (1-253) of the Control Node (01 Hex- FD Hex).
System Data 1, Index 1059: Assign CM data periodic Refresh Time (Hour): 01-24 (using a decimal number)
System Data 1, Index 1060: Assign CM data periodic Refresh Time (Minute): 00-59 (using a decimal number)

Confirming/Setting/Canceling MA data from PCPro

The following shows how to confirm/set/cancel the MA data from the PCPro.

STEP 1: **AMAD** (Assignment of Mobility Access Data)

Note: Even if an incorrect MA Number is assigned, no error message is indicated (the assigned command data can be written into the system). However, in this case, this feature does not work properly.

- When TYPE= 1.Telephone Number(NDM)

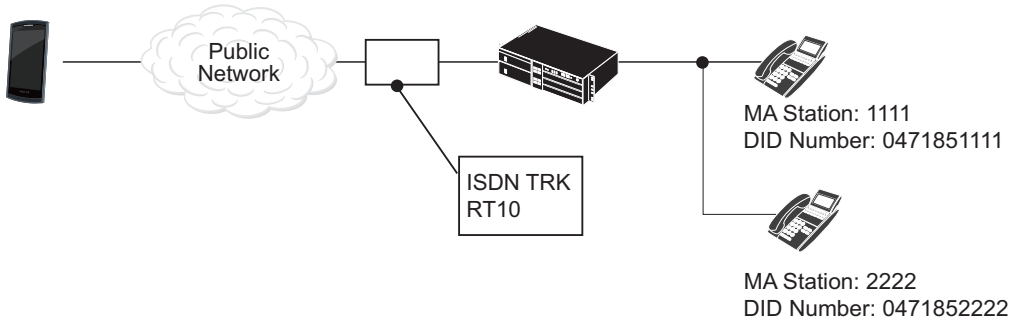
  UGN: User Group Number (1-255)
  TELN: Telephone Number of MA Station (Up to 16 digits)
  CFDM: Call Forwarding - Mobility Access Destination Number including Trunk Access Code [Up to 24 digits (0-9)]
  TACC: The number of digits for Trunk Access Code (1-6)
  MA Number: Mobile Phone Number not including Trunk Access Code is displayed.

- When TYPE= 2.Telephone Number(LDM)

  FPC: Fusion Point Code (1-253) **Note 3**
  UGN: User Group Number (1-255)
  TELN: Telephone Number of MA Station (Up to 16 digits)
  CFDM: Call Forwarding - Mobility Access Destination Number including Trunk Access Code [Up to 24 digits (0-9)]
  TACC: The number of digits for Trunk Access Code (1-6)
  MA Number: Mobile Phone Number not including Trunk Access Code is displayed.

- When TYPE= 3.Station Number

  FPC: Fusion Point Code (1-253) **Note 3**
  TN: Tenant Number
  STN: Station Number of MA Station
  CFDM: Call Forwarding - Mobility Access Destination Number including Trunk Access Code [Up to 24 digits (0-9)]
  TACC: The number of digits for Trunk Access Code (1-6)
  MA Number: Mobile Phone Number not including Trunk Access Code is displayed.



Note 3: This parameter is not displayed when Fusion Point Code (FPC) has not been assigned via System Data.

Direct Inward Dialing (DID)

STEP 1: **ARTD** - Assign the following data to the B-channel of DID line.

- Assign the number of digits to be converted into Station Number to the parameter DC (CDN=66). The number of digits for this DC value must correspond to the DC of ACDD command. The number of digits is counted from the last digit of the received DID number.
- Assign the Basic Data for ISDN. Refer to CHAPTER 3 BASIC DATA ASSIGNMENT FOR ISDNS in Data Programming Manual - ISDN.

Ex.)

Assign DC=4 to terminate a DID call (DID number: 0471-85-2222) to Station 1111. The last four digits for the received number are converted into Station Number.

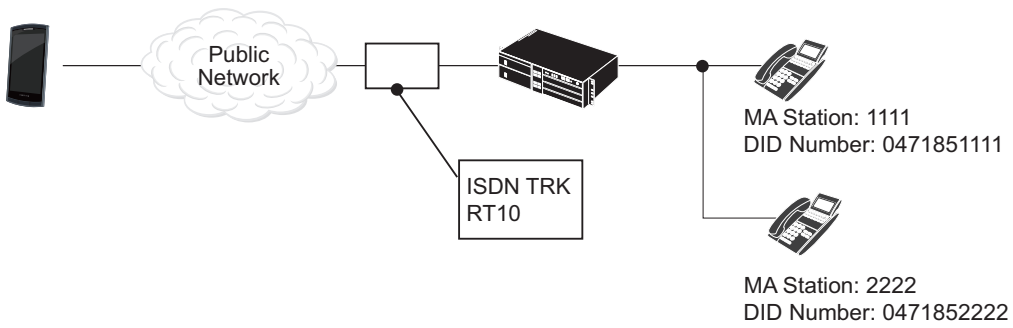
Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or MG.

STEP 2: **ACDD** - Assign the digits of the received DID number to be converted into Station Number.

Ex.) To terminate a DID call (DID number: 0471-85-1111) to Station Number 1111:

D/N = D, RT=10, DC=1111, AD = 0, XFR = 0

SID To Network-Present



Note: When two or more DID numbers are assigned to a station, the last DID number assigned will be delivered to the ISDN as SID (Station Identification Number). However, when the last DID number assigned has been deleted (even if the other number(s) is/are still in existence), any DID number is not transferred to the network (no SID is transferred to a destination). In this case, reassignment of the DID number(s) is necessary for sending SID to the network.

Note: If using Logical Route Number, assign the data by ACNPN and ACNDN command.

STEP 1: **ACNP** - Assign the Calling Number Pattern (CNP) to the route to be provided SID to Network-Present.
IC/OG = OG: Outgoing Call
RT: External Route Number used for SID to Network -Present
CNP: Calling Number Pattern
Enter a number within the range between 1 and 255.

STEP 2: **ACND** - Assign the following data to Calling Number Pattern (CNP) assigned in ACNP command.
CNP: Calling Number Pattern assigned in ACNP command.
SKIP: Number of Skip Digits from the SID.
ADD: Number of Digits of the Additional Number.
DC: Additional Digit Information

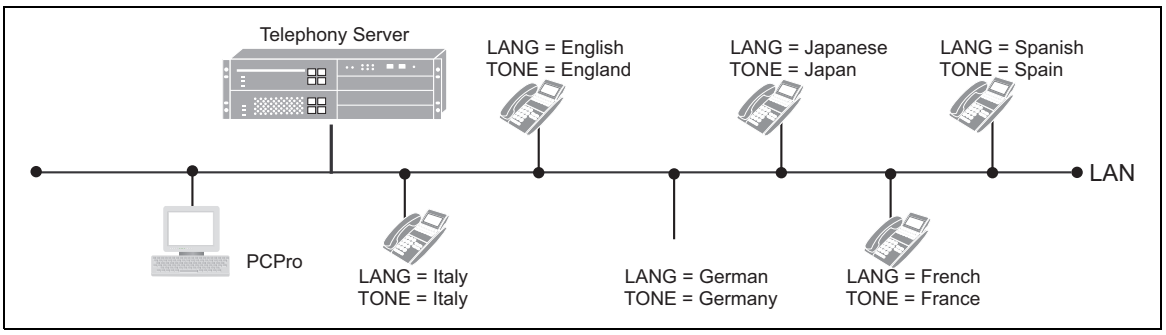
Ex.)

To send DID number (0471851111) of Station 1111 as Calling Party Number:
ACNP: OG: Outgoing Call, RT=10, CNP=2
ACND: CNP=2, SKIP=4, ADD=6, DC=0471851111

Change the destination of Call Back-Out of Zone

ASYDL - System Data 1, Index 1088, Bit 1: Specify the destination of Call Back-Out of Zone. 0/1 = MA Station/Destination Station of Call Forwarding - Busy Line set to MA Station.

Change the priority of MA Call Forwarding



ASFC - Assign Service Feature Restriction Class that allows SFI 240 (Change of the priority for MA Call Forwarding) to the Stations activating this service.

RES: 0 (Logged Out IP Station - Call Destination and Call Forwarding - All Calls > MA Call Forwarding)/1(MA Call Forwarding > Logged Out IP Station - Call Destination and Call Forwarding - All Calls)

M-119D Multiple Tone -D

General Description

This feature can specify the Country Code for tone setting. Country Code can be assigned per terminal by PCPro command.

Note: For information of Language Setting (LANG), refer to Multilingual Display [M-117].

Following shows the list of Country Code for tone setting.

Country Code		Country
Country Code for Basic Tone Setting	1	Japan
	2	North America
	3	Australia **Note 1**
	4	Other Countries
	5	Hong Kong
	6	Malaysia
	7	Singapore
	8	England
	9	Mexico
	10	Taiwan
	11	New Zealand
	12	Korea
	13	Brazil
	14	China
	15	Thailand
	16	Thailand (EGAT)
	17	Sri Lanka
	18-199	Not used

Country Code		Country
Country Code for EMEA Tone Setting	200	Germany
	201	Italy
	202	Netherlands
	203	Not used
	204	Denmark
	205	Sweden
	206-210	Not used
	211	Spain
	212	Austria
	213	Belgium
	214	England [For EMEA]
	215	Greece
	216	Switzerland
	217	South Africa
	218	Brazil
	219-255	Not used

Note 1: An Australian tone cannot be selected by the Multiple Tone function.

Operating Procedure

None

Service Conditions

1. When the tone setting is changed by the PCPro, initialization is executed for the changed terminals. And the data setting will be reflected.

   - Timing of Terminal Initialization by terminal status

Terminal Status	Terminal Initialization Timing
Idle	Executed when the tone data is changed.
Talking/Ringing	Executed when the call is finished.
During Call Origination/ Termination	If the terminal status changes to Talking or Ringing, the terminal is re-set at the end of the call.
	If the attempted call is abandoned at the time of call setup, the terminal is reset at the end of the next call.

- The effects after Terminal Initialization

Message Reminder	Message data will be deleted. (Lamp off)
REDIAL key on the Desktop terminal	Redial data will be deleted.

2. This feature is available for the following terminals.
   - DtermIP (Proprietary Protocol)
   - DtermIP (SIP) Version. 4.0.0.0
   - DT800 Series/DT700 Series
3. Soft Phone is not supported.
4. On MC-MG, Tone Setting should be assigned by the system data [ASYDL - Index 811].
5. When Configuration Setup is available on the terminal, specify Area ID as "Automatic". For Configuration Setup, refer to the Peripheral Equipment Description.
6. When Area ID is specified as "Automatic" and tone setting is not assigned, the tone setting will be specified as "Japan".
7. Available tone depends on the firmware and version of the terminal.
8. By assigning ASYDL/N, System Data 1, Index 677, Bit 5 = 1, this feature can be inactivated. System Initialization is necessary for changing this system data.
9. This service does not support the system to which Australian Tone for O/G Connection (ASYD, System Data 1, Index 6, Bit 3=1) is set.
10. This feature is not available for SR-MGC.

Programming

STEP 1: **ASYDL** - System Data 1, Index 677, Bit 5 (Multiple Tone -D). 0/1 = In service/Out of service.

STEP 2: **ASLG** - Specify the Tone Data used per system.

- **[FIRST] tab -** Basic Data Setting

  System Tone Data
  Enter the Country Code as Tone Number for Tone Setting. For the Country Code, refer to the General Description in this feature.

- **[TERMINAL] tab -** Terminal Data Setting

  Enter the range of the Tenant Numbers and Station Numbers, then specify the tone used per terminal.
  Line Number Type: Specify the radio button for Line Number Type: "STN" or "TELN(LDM)"
  Change Data Type: check the check box for "TONE".

◆ When "STN" is selected in [Line Number Type] field.

START/END TN:	Enter the appropriate range of Tenant Numbers.
START/END STN:	Enter the appropriate range of Station Numbers.
KIND:	Specify terminal kind.
TONE:	Enter the Country Code as Tone Number for Tone Setting. For the Country Code, refer to the General Description in this feature.

◆ When "TELN(LDM)" is selected in [Line Number Type] field.

UGN:	User Group Number
TELN START/END:	Enter the appropriate range of Telephone Numbers.
KIND:	Specify terminal kind.
TONE:	Enter the Country Code as Tone Number for Tone Setting. For the Country Code, refer to the General Description in this feature.

FCCS Programming

STEP 1: **ASYDN** - System Data 1, Index 677, Bit 5 (Multiple Tone -D). 0/1 = In service/Out of service.

STEP 2: **ASLG** - Specify the Tone Data used per system.

- **[FIRST] tab -** Basic Data Setting

  System Tone Data
  Enter the Country Code as Tone Number for Tone Setting. For the Country Code, refer to the General Description in this feature.

- **[TERMINAL] tab -** Terminal Data Setting

  Enter the range of the Tenant Numbers and Station Numbers, then specify the tone used per terminal.

Line Number Type:	Specify "TELN(NDM)" radio button for Line Number Type.
Change Data Type:	Check the check box for "TONE".
FPC:	Fusion Point Code
UGN:	User Group Number
TELN START/END:	Enter the appropriate range of Telephone Numbers.
KIND:	Specify terminal kind.
TONE:	Enter the Country Code as Tone Number for Tone Setting. For the Country Code, refer to the General Description in this feature.

M-120 Multi-Boss/Multi-Secretary

General Description

This feature enables multiple Secretaries to serve duties for one Boss as well as for one Secretary to serve duties for multiple Bosses.

See the following table for details on features.

Feature	Descriptions	Available for Market
BOSS ABSENT	When the Boss' Station has BOSS ABSENT set, all incoming calls for Boss' Station will arrive at the Secretary's Station by Slide Action. BOSS ABSENT can be set/canceled from a Secretary's Station.	All Countries
SECRETARY GROUPING	A Secretary's Station may belong to multiple Secretary Groups. Within a Secretary Group, Slide Action takes place.	All countries
SECRETARY ABSENT	If a Secretary is away from his or her desk, SECRETARY ABSENT can be set to that Secretary Station. During SECRETARY ABSENT, the Secretary Station gets skipped from Slide Action by all the Secretary Groups it belongs to.	All countries
ENTIRE SECRETARY GROUP IS BUSY	When the entire Secretary Group is busy, busy line features are assigned to Secretary 1 instead of the Boss' Station. Also, when the entire Secretary Group is busy, UCD Queuing is available through data setting.	All countries

Feature	Descriptions	Available for Market

MULTI-BOSS/MULTI-SECRETARY-ONE TOUCH	• Assigning a Sub Line as Boss' Line enables the Secretary's Station to display the Boss' status on the Boss' Line key.
	• Use of the Boss' Line key enables the Secretary to perform the following operations:
	  • Calling the Boss
	  • Answering the Boss' Call
	  • Overriding to the Boss' line
	  • Setting Call Waiting to the Boss' Station.
		All countries

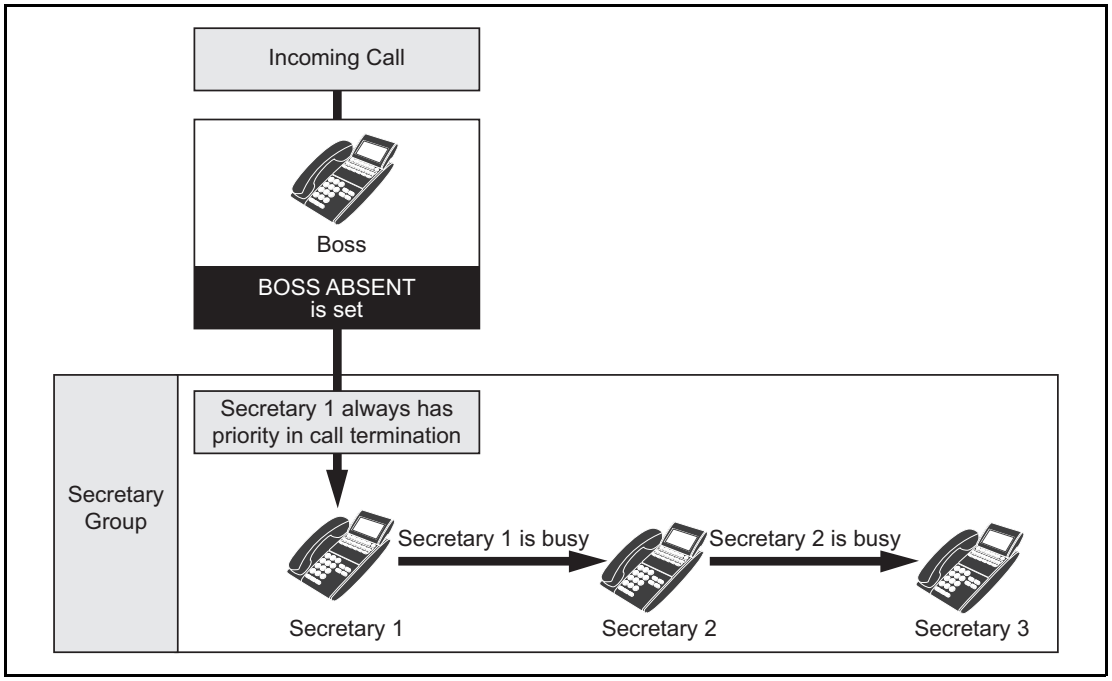
MULTI-BOSS/MULTI-SECRETARY AWAY PER BOSS	A Secretary's Station can temporarily leave its Secretary Group	All countries
GROUP NUMBER EXPANSION	The maximum number of Boss Secretary Groups that can be registered by ASHUEN per a node can be expanded from 63 to 255.	All countries
MULTI-BOSS/MULTI-SECRETARY OVERRIDING FROM A SECRETARY'S CALL FORWARDING DESTINATION	When a Boss' Station sets BOSS ABSENT and a Secretary's Station sets Call Forwarding features (**Note 1**, **Note 2**), an incoming call to Boss' Station is forwarded to the forwarding destination. The forwarding destination can place a call to the Boss' Station by Overriding.	EMEA only
MULTI-BOSS/MULTI-SECRETARY BOSS' CALL FORWARDING ACTIVATE	When a Boss' Station sets Call Forwarding features (**Note 3**) and BOSS ABSENT, the following operations are available. • An incoming call to the Boss' Station slides to a Secretary's Station. • When the Secretary's Station performs switch hook flash and dials the Boss' Station number after receiving the call with the Slide Action, the call is forwarded to a forwarding destination which the Boss' Station sets. • When the Secretary's Station sets Call Forwarding features (**Note 1**, **Note 2**), the call is forwarded to a forwarding destination which the Secretary's Station sets. When the forwarding destination performs switch hook flash and dials Boss' Station number after receiving the call, the call is forwarded to a forwarding destination which the Boss' Station sets.	EMEA only
MULTI-BOSS/MULTI-SECRETARY OVERRIDING FROM A STAND-IN SECRETARY	A Stand-In Secretary is a term referring to a forwarding destination of CALL FORWARDING - ALL CALLS [C-5]/CALL FORWARDING - DON'T ANSWER [C-3] which a Secretary sets. When a Boss' Station has BOSS ABSENT set, the Stand-In Secretary's Station can place a call to the Boss' Station by Overriding. Whether a call is forwarded from the Secretary's Station or not, the Stand-In Secretary's Station can make a call to the Boss' Station which has BOSS ABSENT set.	EMEA only

Feature	Descriptions	Available for Market
MULTI-BOSS/MULTI-SECRETARY MULTI LINE OPERATION	In the case that a Boss (or a Secretary) has two stations, a main station and a substitute station, when the main station line is assigned to a Sub Line of the substitute station, the substitute station can be operated as well as the main station by seizing the main line from the substitute station even if the substitute line does not belong to a Boss Secretary Group.	All countries

Note 1: Call Forwarding features set by the Secretary's Station mentioned here are:
- CALL FORWARDING - ALL CALLS [C-5]
- CALL FORWARDING - DON'T ANSWER [C-3]
- CALL FORWARDING - ALL CALLS - OUTSIDE [C-28]
- CALL FORWARDING - DON'T ANSWER - OUTSIDE [C-74]

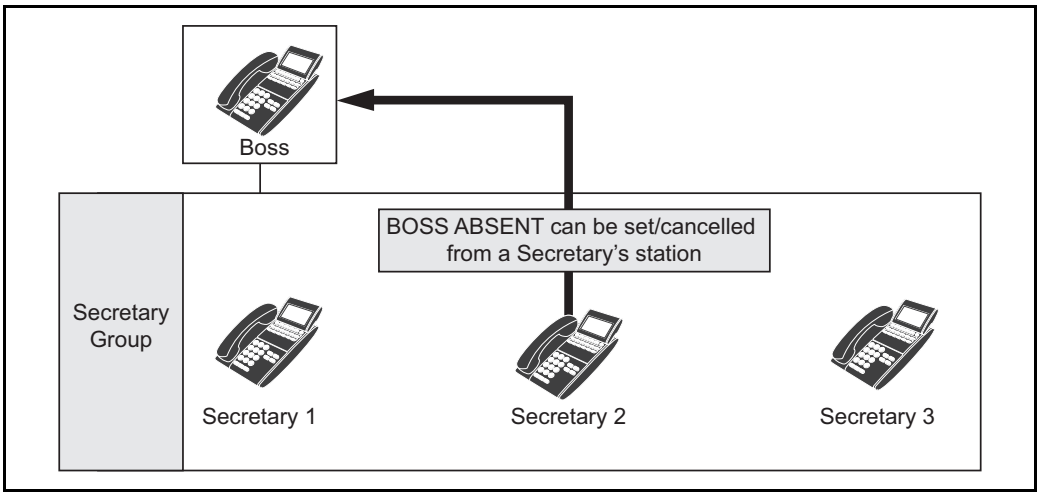
Note 2: CALL FORWARDING - ALL CALLS - OUTSIDE [C-28]/CALL FORWARDING - DON'T ANSWER - OUTSIDE [C-74] can be also set but the forwarding destination cannot place a call to the Boss' Station by Overriding.

Note 3: Call Forwarding features set by the Boss' Station mentioned here are:
- CALL FORWARDING - ALL CALLS [C-5]
- CALL FORWARDING - DON'T ANSWER [C-3]
- CALL FORWARDING - ALL CALLS - OUTSIDE [C-28]



CALL FORWARDING - DON'T ANSWER - OUTSIDE [C-74] cannot be used.

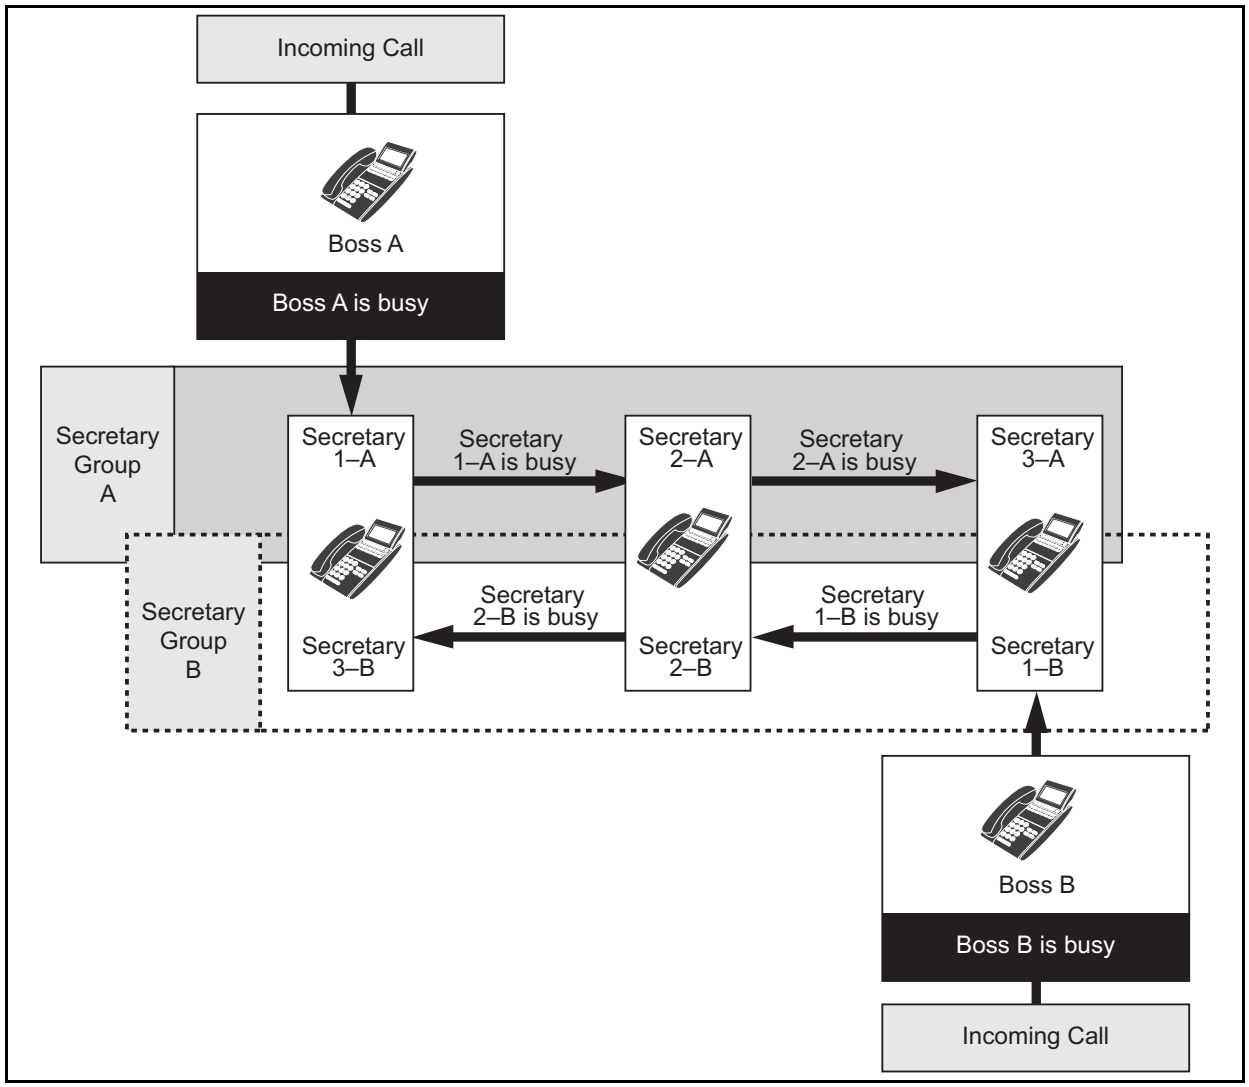
1. BOSS ABSENT



When the Boss' Station has BOSS ABSENT set, all incoming calls for Boss' Station will arrive at the Secretary's Station by Slide Action.

Note: Available for all countries.

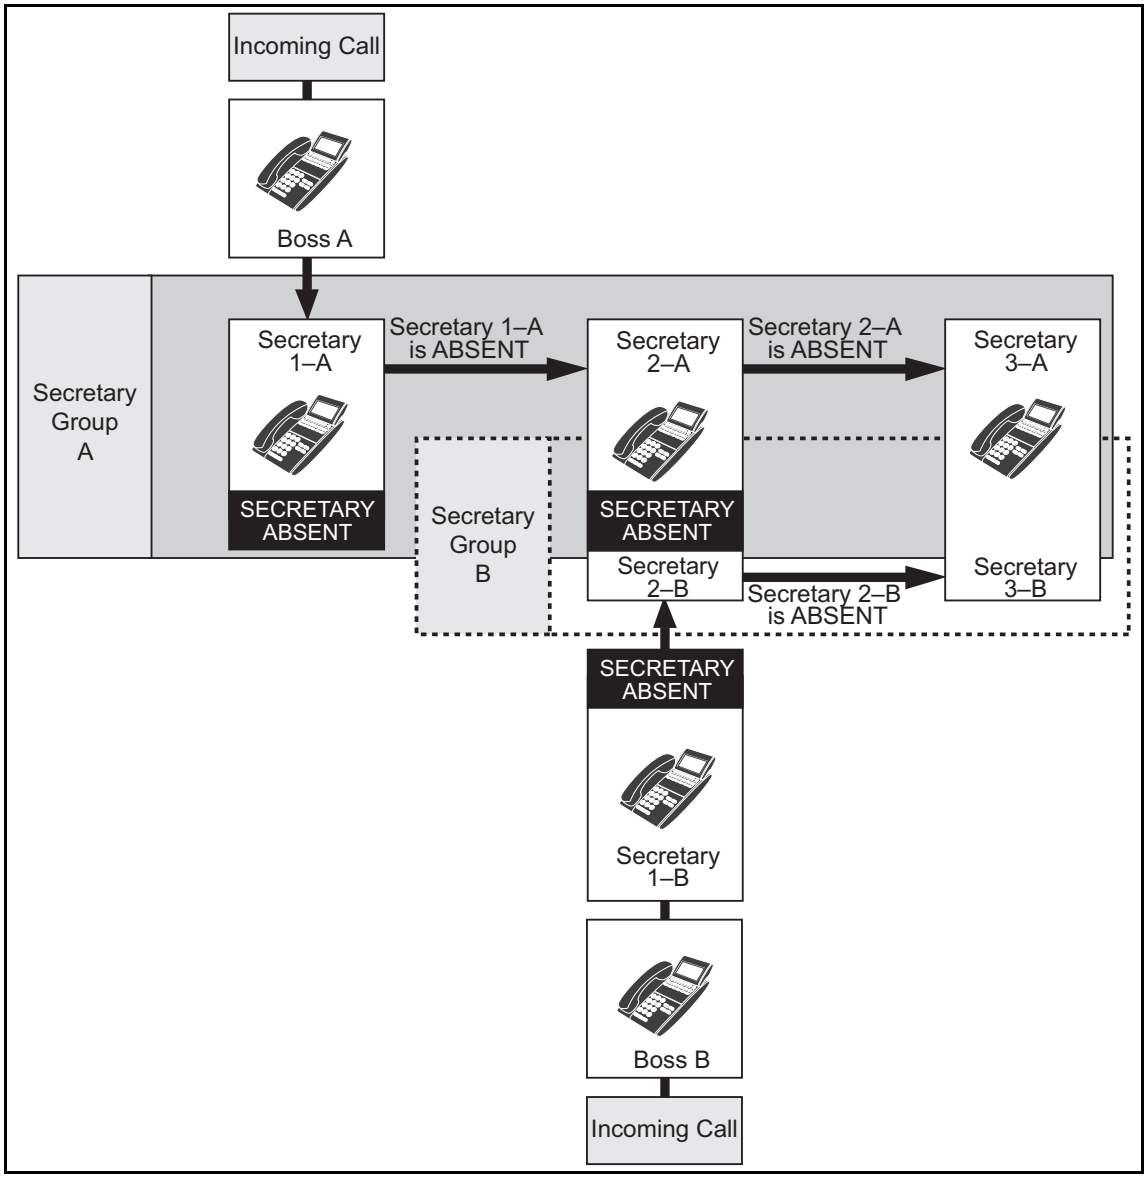
Note: Slide Action searches for an idle Secretary's Station where call termination is possible. The priority of the search is as follows: Secretary1→Secretary2→Secretary3. Priority of Slide Action is assigned in the order in which the Secretary's Station was registered through ASHUEN command.



BOSS ABSENT can be set/canceled from a Secretary's Station.

2. SECRETARY GROUPING

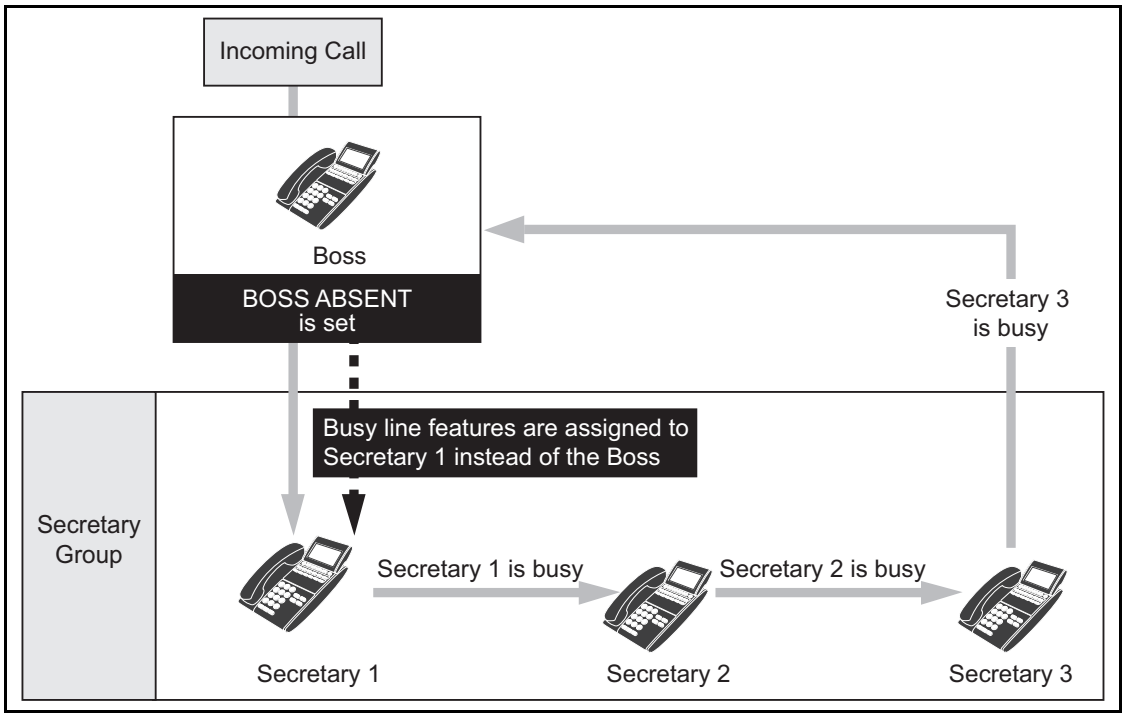
A Secretary's Station may belong to multiple Secretary Groups. Within a Secretary Group, Slide Action takes place.



Note: Available for all countries.

3. SECRETARY ABSENT

If a Secretary is away from his or her desk, SECRETARY ABSENT can be set to that Secretary Station. During SECRETARY ABSENT, the Secretary Station gets skipped from Slide Action by all the Secretary Groups it belongs to.

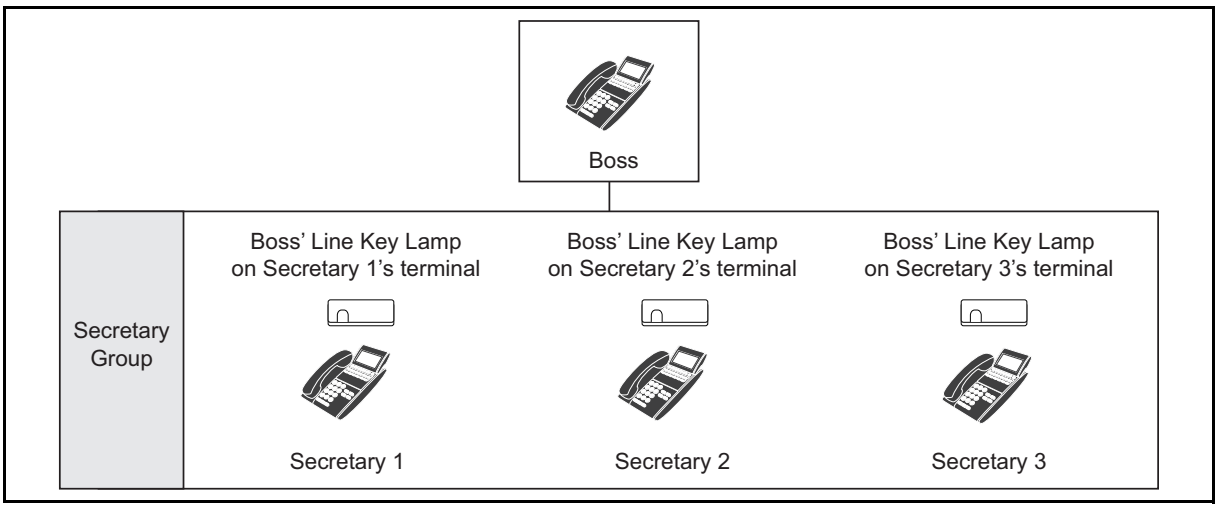


Note: Available for all countries.

4. ENTIRE SECRETARY GROUP IS BUSY

When the entire Secretary Group is busy, busy line features are assigned to Secretary 1 instead of the Boss' Station. Also, when the entire Secretary Group is busy, UCD Queuing is available through data setting.

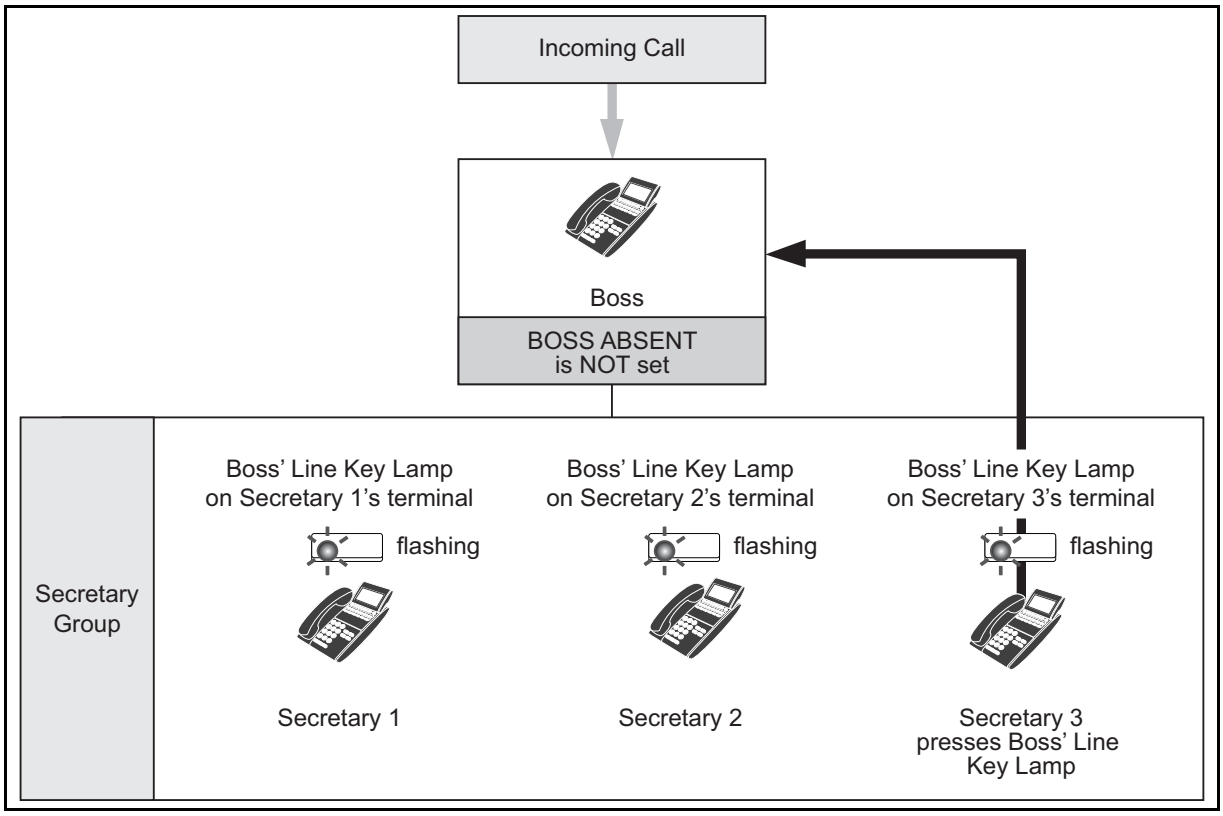
Note: Available for all countries.



5. MULTI-BOSS/MULTI-SECRETARY-ONE TOUCH

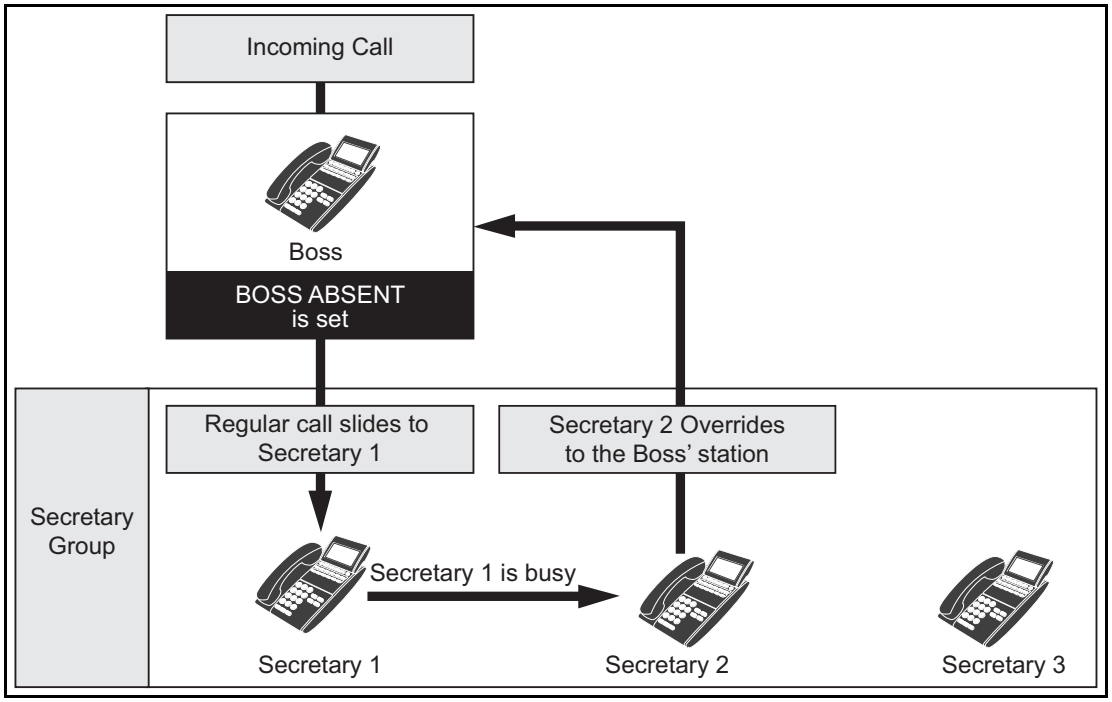
Note: Available for all countries.

5.1 Status Display of Boss' Terminal



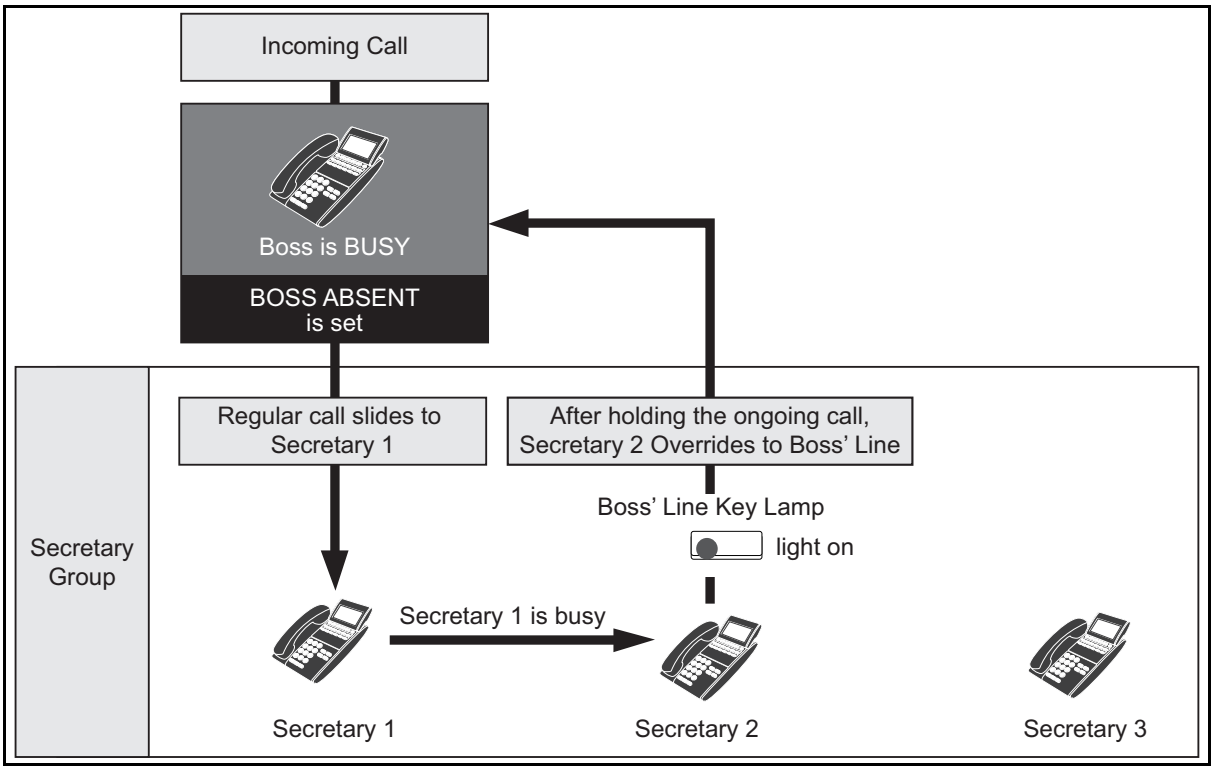
Assigning Boss' Line key as a Sub Line on the Secretary's Terminal enables status display of Boss' Terminal.

Status of Boss' Terminal	Status of Boss' Line Key Lamp on Secretary's Terminal
Busy	Light On
Idle	Light Off
Receiving a call	Flashing



5.2 Secretary's Terminal Answering Boss' Line Call

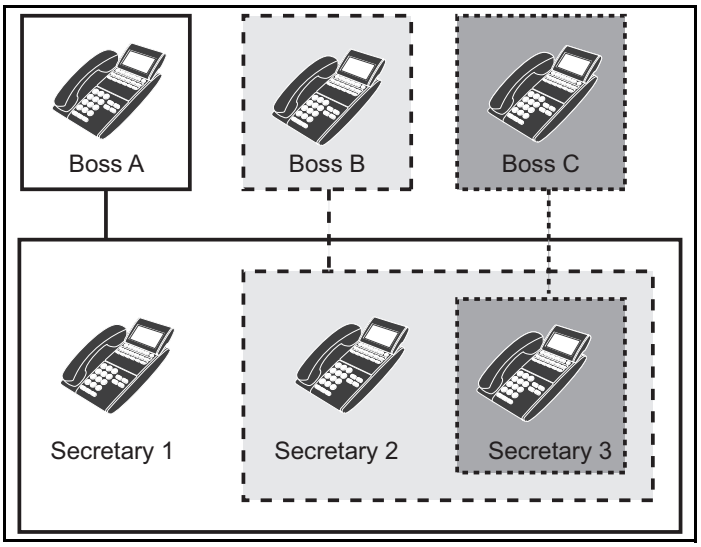
While the Boss' Terminal is receiving a call, the Secretary is able to answer that call by pressing the flashing Boss' Line key lamp.



5.3 Overriding from a Secretary's Station

When the Boss' Station has BOSS ABSENT set, all incoming calls to the Boss' Station will arrive at the Secretary's Station by Slide Action. The Secretary's Station can place a call to the Boss' Station by Overriding.

5.4 Overriding from a Busy Secretary's Station



When the Secretary's Terminal is busy, Overriding to the Boss' Station is possible after holding the ongoing call using Call Park.

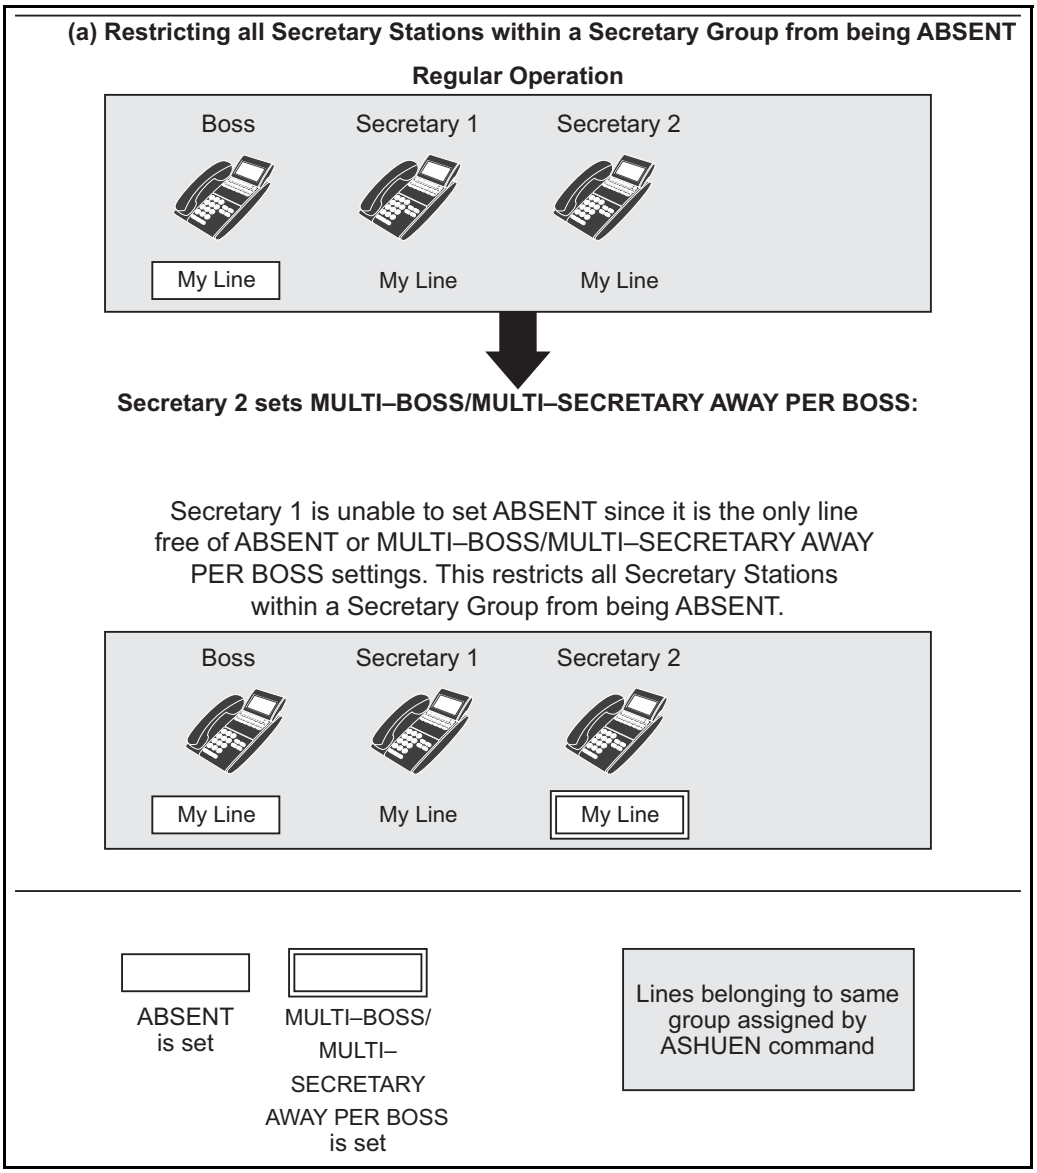
6. MULTI-BOSS/MULTI-SECRETARY AWAY PER BOSS

This feature enables a Secretary's Station to temporarily leaves its Secretary Group. In other words, a Secretary's Station with this feature assigned will be skipped from call termination.

Note: Available for all countries.

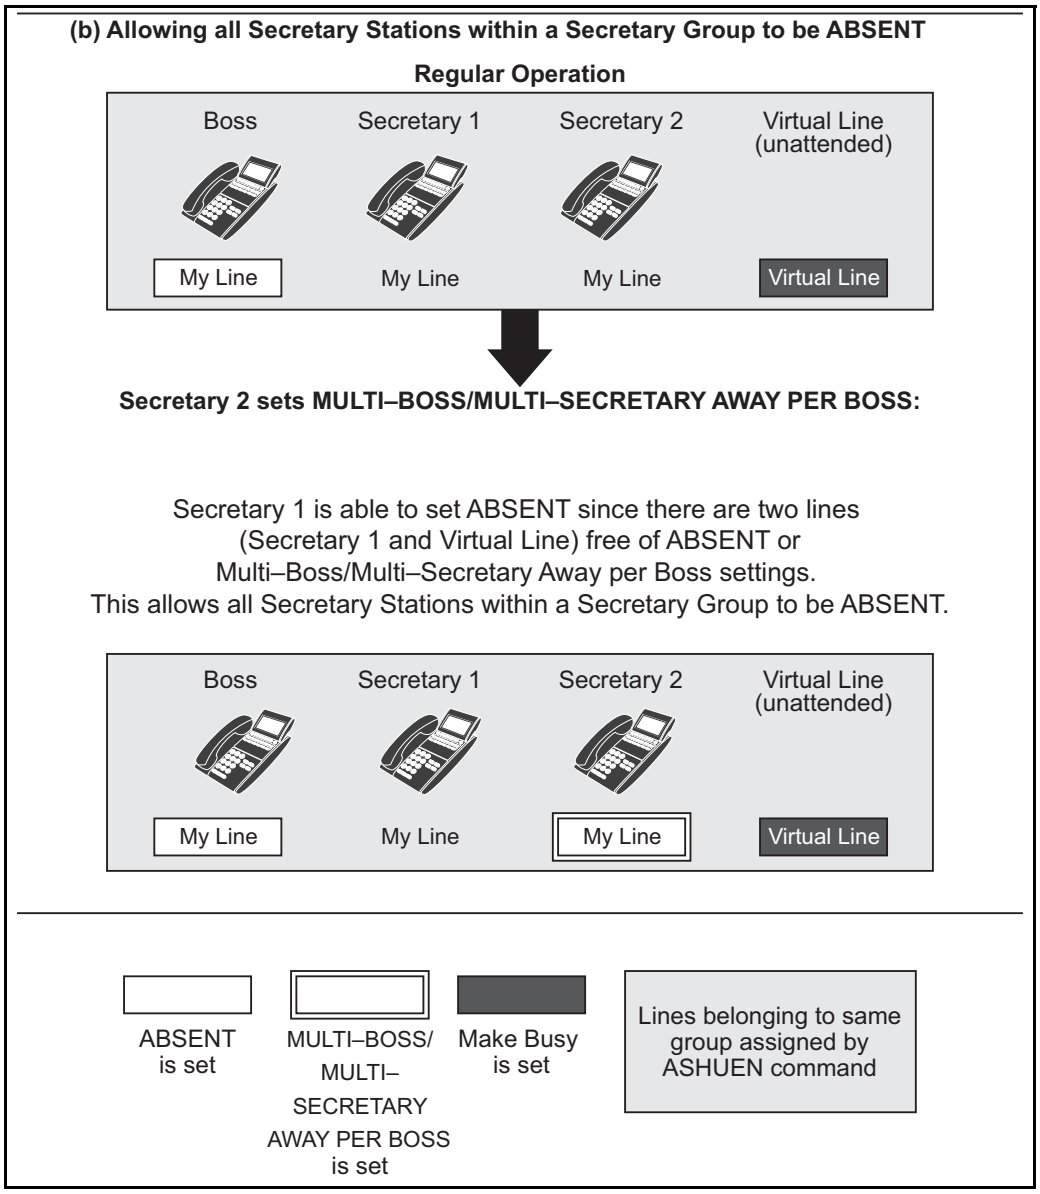
	Secretary 1	Secretary 2	Secretary 3
Boss A	Secretary 1	Secretary 2	Secretary 3
Boss B	Secretary 2	Secretary 3	—
Boss C	Secretary 3	—	—

Secretary 2 sets AWAY PER BOSS from Boss A's group



Secretary 2 returns to Boss A's group

	Secretary 1	Secretary 2	Secretary 3
Boss A	Secretary 1	—	Secretary 3
Boss B	Secretary 2	Secretary 3	—
Boss C	Secretary 3	—	—



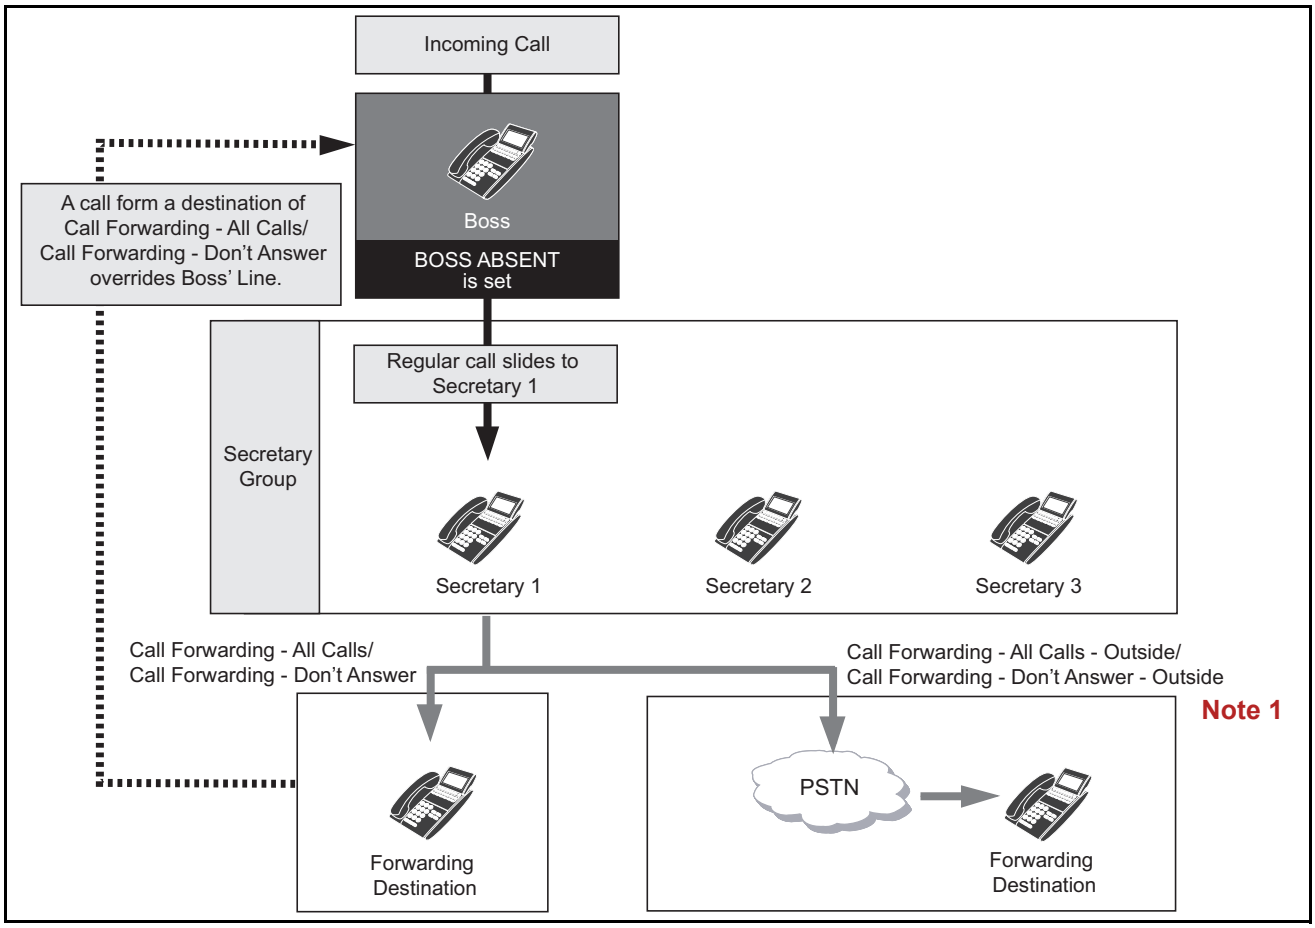
6.1 Allowing All Secretary Stations Within Secretary Group to be ABSENT

Combining MULTI-BOSS/MULTI-SECRETARY with MULTI-BOSS/MULTI-SECRETARY AWAY PER BOSS feature enables all Secretary Stations within a Secretary Group to be ABSENT. This feature applies to Stations with ABSENT set by MULTI-BOSS/MULTI-SECRETARY or MULTI-BOSS/MULTI-SECRETARY AWAY PER BOSS, regardless of its busy/idle status.

(a) Restricting all Secretary Stations within a Secretary Group from being ABSENT

(b) Allowing All Secretary Stations within a Secretary Group to be ABSENT

7. MULTI-BOSS/MULTI-SECRETARY OVERRIDING FROM A SECRETARY'S CALL FORWARDING DESTINATION



When a Secretary's Station has CALL FORWARDING - ALL CALLS [C-5]/CALL FORWARDING - ALL CALLS - OUTSIDE [C-28] set and a Boss' Station has BOSS ABSENT set, an incoming call to Boss' Station can be forwarded to another station which the Secretary's Station sets.

Note: Available for EMEA only.

Note: If this feature is out of service;

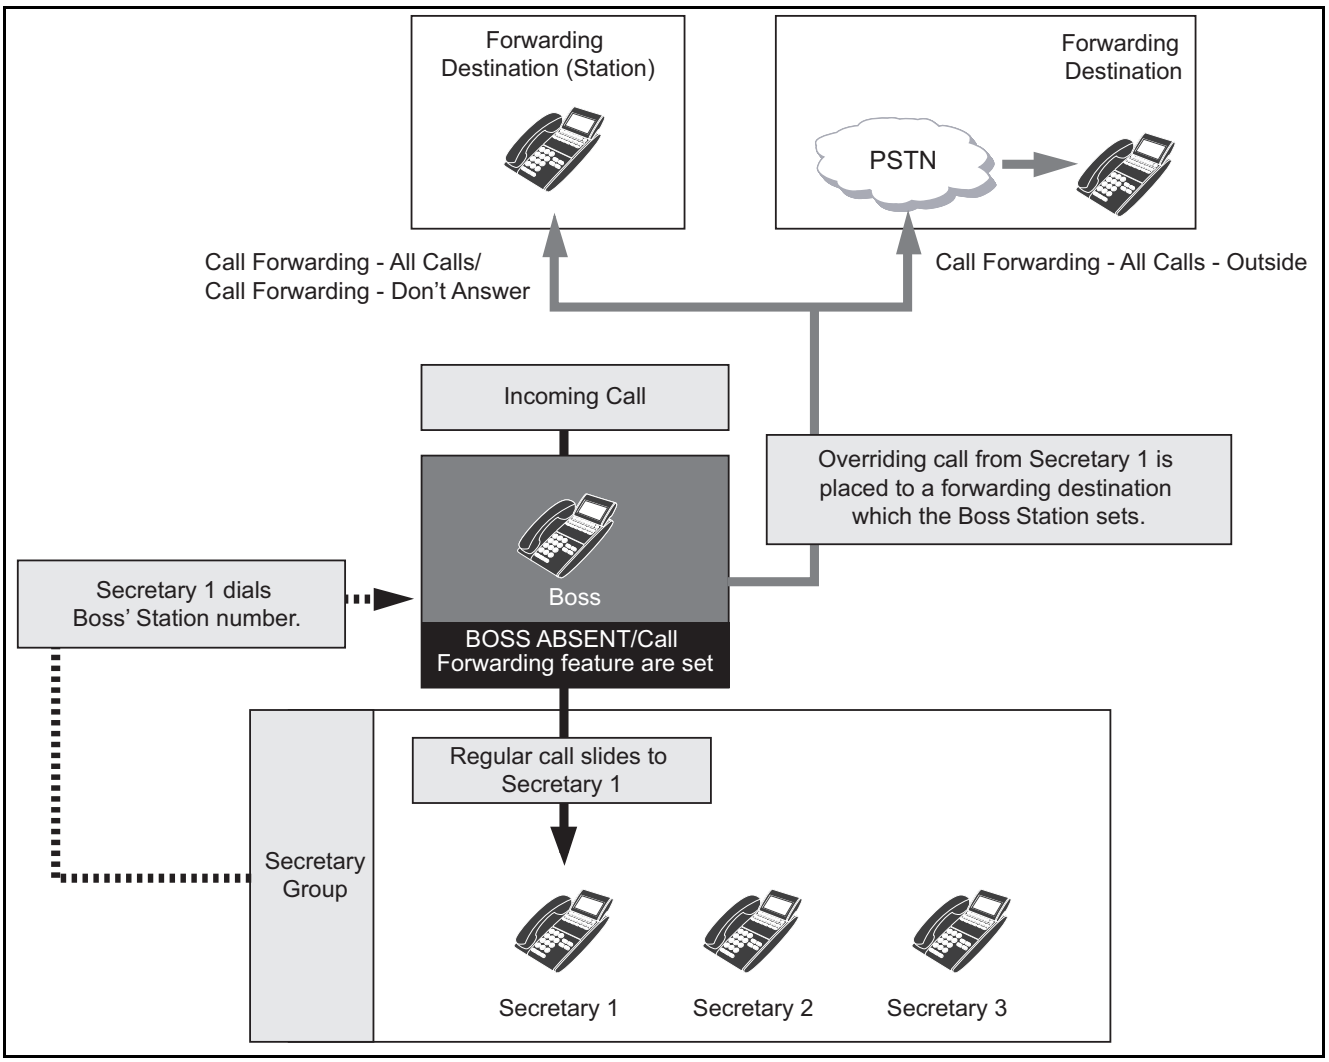
- CALL FORWARDING - ALL CALLS [C-5]/CALL FORWARDING - ALL CALLS - OUTSIDE [C-28] is not activated and the incoming call to Boss' Station slides to the low-order Secretary's Station.
- CALL FORWARDING -DON'T ANSWER [C-3]/CALL FORWARDING - DON'T ANSWER - OUTSIDE [C-74] is activated regardless of this feature. The incoming call to Boss' Station is forwarded to the forwarding destination without sliding to the low-order Secretary's Station.

In the case where Secretary's Station has CALL FORWARDING - ALL CALLS [C-5]/CALL FORWARDING -DON'T ANSWER [C-3], after the forwarding destination answers the call, the destination can place a call to the Boss' Station by Overriding even if the Boss' Station has BOSS ABSENT set.

Note 1: In the case where the Secretary's Station has CALL FORWARDING - ALL CALLS - OUTSIDE [C-28]/CALL FORWARDING - DON'T ANSWER - OUTSIDE [C-74] set, the forwarding destination cannot place a call to Boss' Station by Overriding. The call slides to the Secretary's Station and each Call Forwarding feature is activated again. When CALL FORWARDING - ALL CALLS - OUTSIDE [C-28] is activated, the call is forwarded to the destination again and the destination hears a Busy Tone. When CALL FORWARDING - DON'T ANSWER - OUTSIDE [C-74] is activated, the call is forwarded to the destination again and Don't Answer Timer is reset. Then the Secretary's Station is kept ringing.

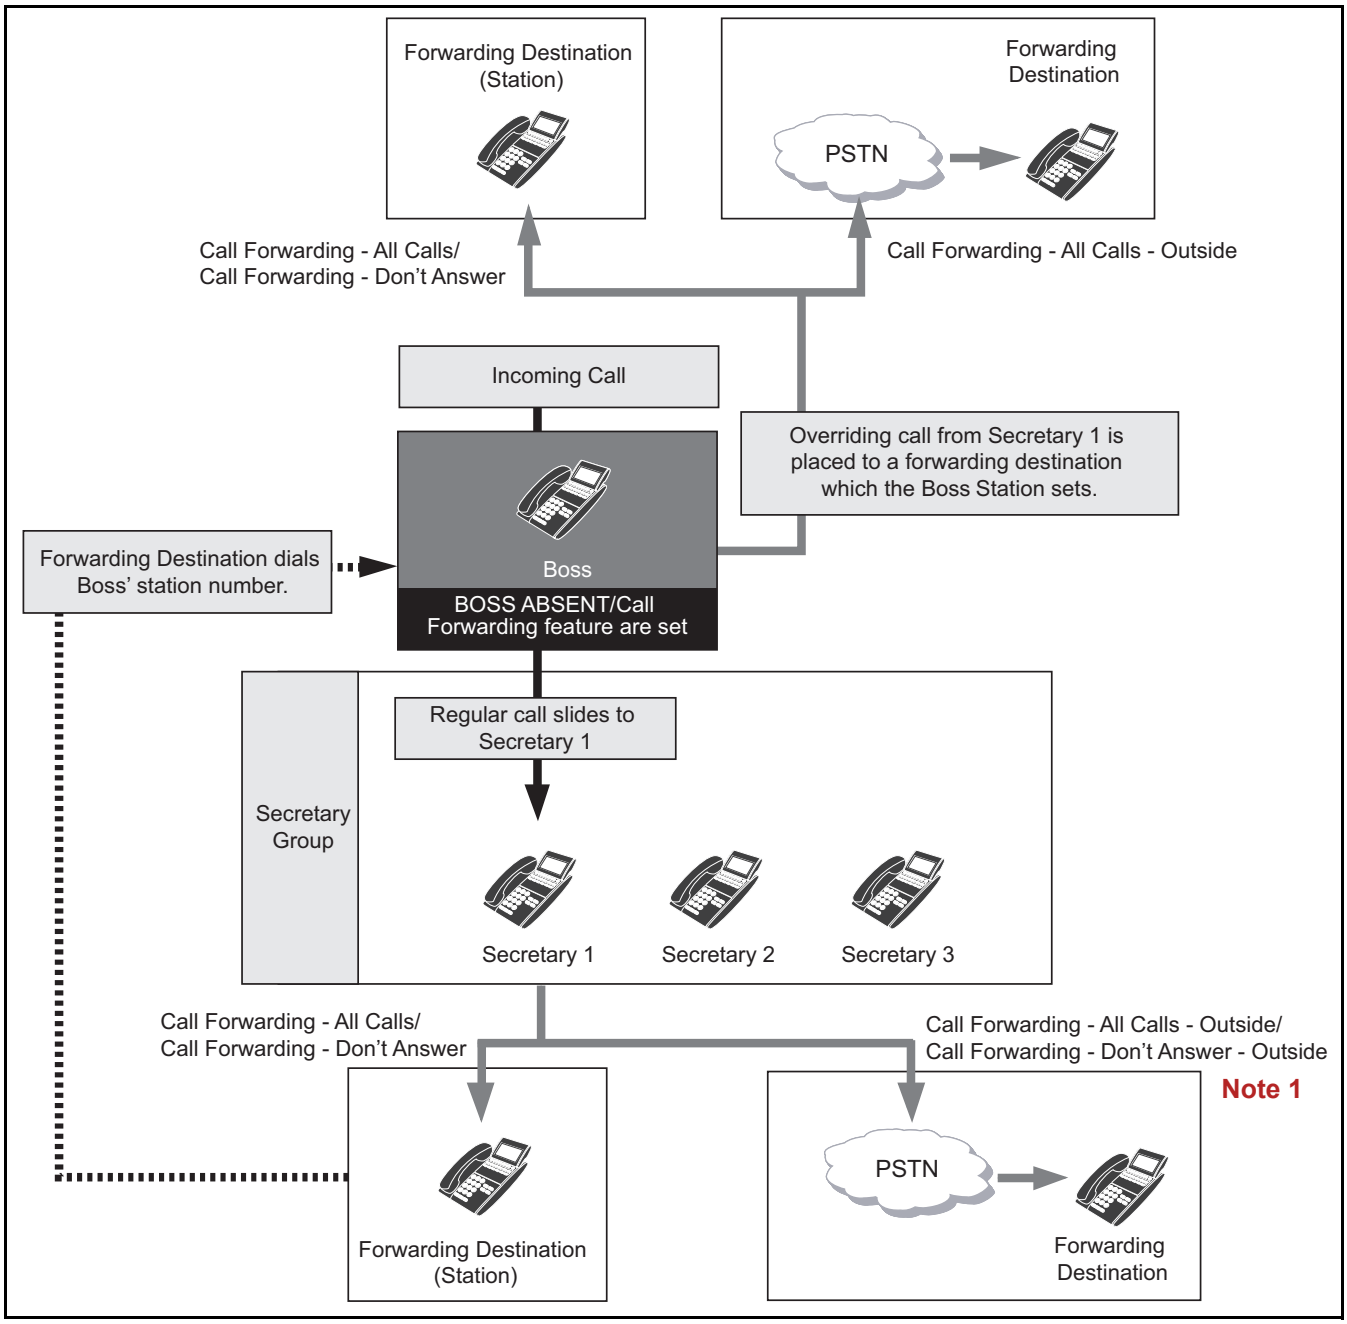
8. MULTI-BOSS/MULTI-SECRETARY BOSS' CALL FORWARDING ACTIVATE

When a Boss' Station has CALL FORWARDING - ALL CALLS [C-5]/CALL FORWARDING - DON'T ANSWER [C-3]/CALL FORWARDING - ALL CALLS - OUTSIDE [C-28]/CALL FORWARDING - DON'T ANSWER - OUTSIDE [C-74] set along with BOSS ABSENT, an incoming call to Boss' Station slides to a Secretary's Station.



Note: Available for EMEA only.

Note: If this feature is out of service;



- When Boss' Station has CALL FORWARDING - ALL CALLS [C-5]/CALL FORWARDING - ALL CALLS - OUTSIDE [C-28] set, the incoming call to the Boss' Station is forwarded to the forwarding destination regardless of BOSS ABSENT set.
- When Boss' Station has CALL FORWARDING -DON'T ANSWER [C-3]/CALL FORWARDING - DON'T ANSWER - OUTSIDE [C-74] set, the incoming call to Boss' Station slides to Secretary's Station.

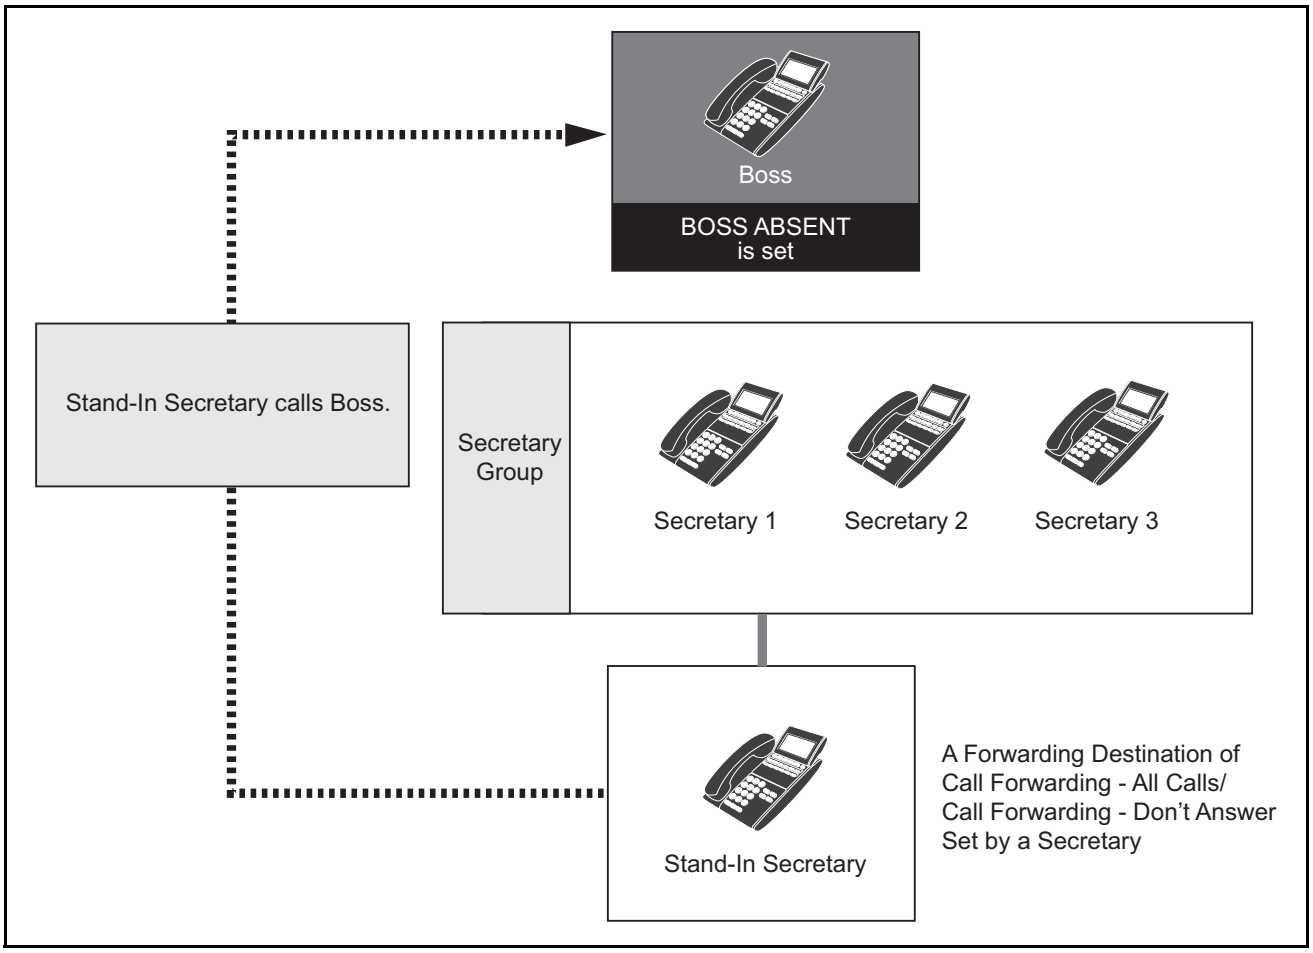
When the Secretary's Station answers the sliding call, performs switch hook flash and then dials the Boss' Station number, the call is forwarded to a forwarding destination which the Boss' Station sets.

Note: When the Boss' Station has CALL FORWARDING - DON'T ANSWER - OUTSIDE [C-74] set, incoming call to the Boss' Station slides to the Secretary's Station. Even if the Secretary's Station answers the sliding call, performs switch hook flash, rings the Boss' Station and the Boss' Station does not answer the call, CALL FORWARDING - DON'T ANSWER - OUTSIDE [C-74] is not activated and the Secretary's Station continues ringing the Boss' Station.

When a Secretary's Station has CALL FORWARDING - ALL CALLS [C-5]/CALL FORWARDING - DON'T ANSWER [C-3] set, the call can be forwarded to another station which the Secretary's Station sets. Then the forwarding destination performs switch hook flash and dials Boss' Station number. The call arrives at another forwarding destination which the Boss' Station sets.

Note 1: In the case where the Secretary's Station has CALL FORWARDING - ALL CALLS - OUTSIDE [C-28]/CALL FORWARDING - DON'T ANSWER - OUTSIDE [C-74] set, the forwarding destination cannot place a call to Boss' Station by Overriding. The call slides to the Secretary's Station and each Call Forwarding feature is activated again. When CALL FORWARDING - ALL CALLS - OUTSIDE [C-28] is activated, the call is forwarded to the destination again and the destination hears a Busy Tone. When CALL FORWARDING - DON'T ANSWER - OUTSIDE [C-74] is activated, the call is forwarded to the destination again and Don't Answer Timer is reset. Then the Secretary's Station is kept ringing.

9. MULTI-BOSS/MULTI-SECRETARY OVERRIDING FROM A STAND-IN SECRETARY

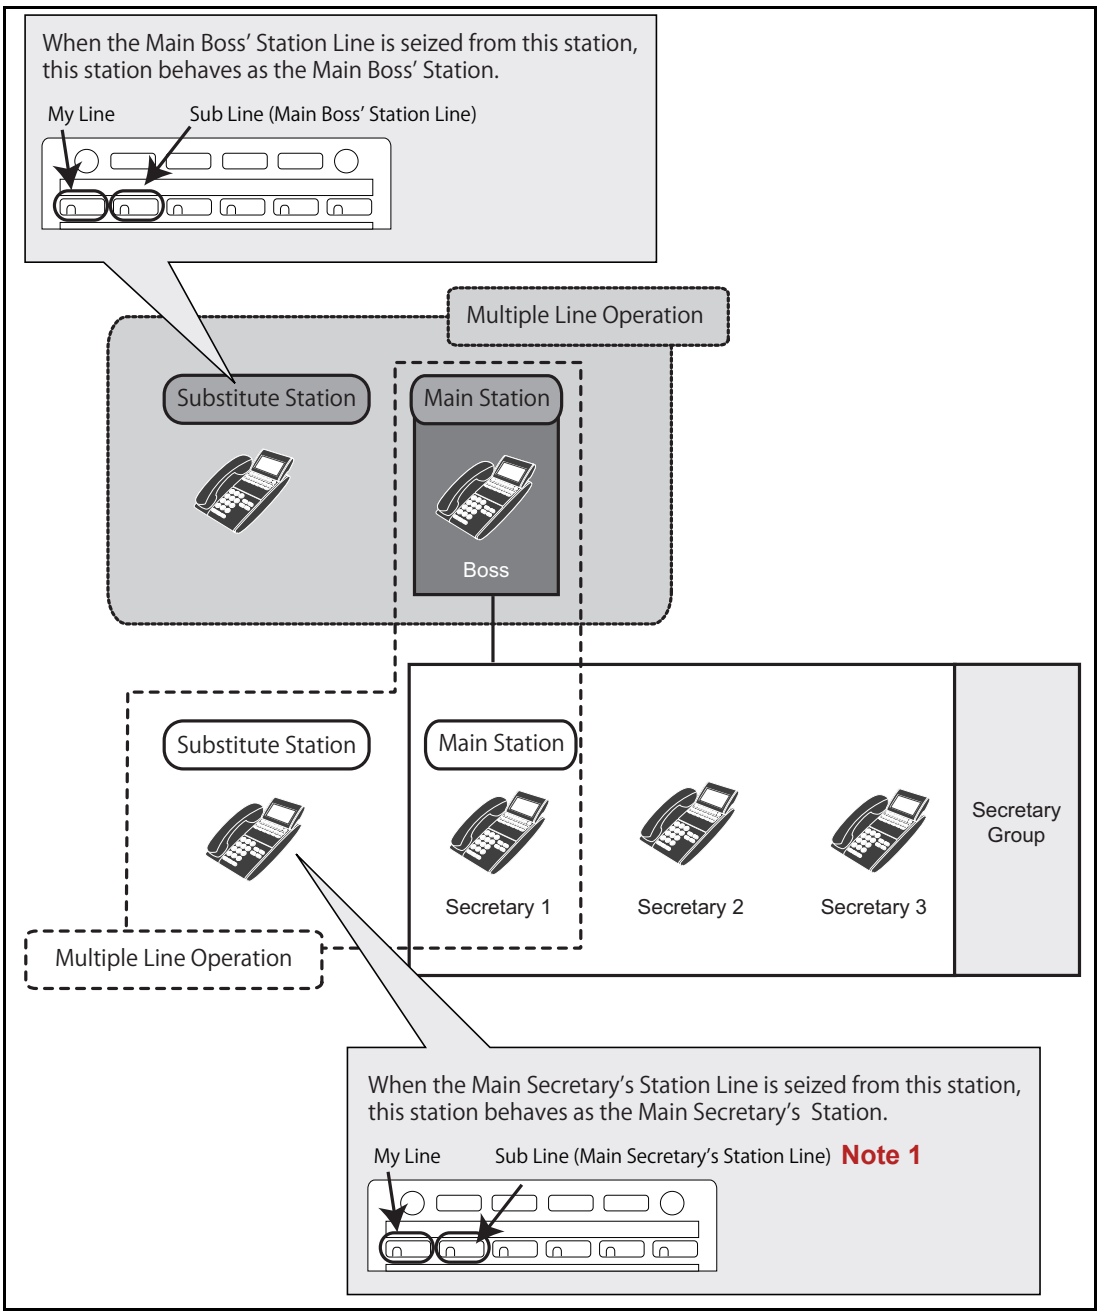


A Stand-In Secretary is a term referring to a forwarding destination station of CALL FORWARDING - ALL CALLS [C-5]/CALL FORWARDING - DON'T ANSWER [C-3] which a Secretary set. This feature is available only between terminals accommodated within the same node or nodes configuring the FCCS network. When a Boss' Station has BOSS ABSENT set, the Stand-In Secretary's Station can place a call to the Boss' Station by Overriding. Whether a call is forwarded from the Secretary's Station or not, the Stand-In Secretary's Station can make a call to the Boss' Station which has BOSS ABSENT set.

Note: Available for EMEA only.

Note: Up to seven Stand-In Secretary's Stations can be set per Boss Secretary group.

Note: If this feature is out of service;
When a Boss' Station has BOSS ABSENT set; a Secretary's Station has CALL FORWARDING - ALL CALLS [C-5]/CALL FORWARDING - DON'T ANSWER [C-3] set and a forwarding destination is a Stand-In Secretary's Station, an incoming call to Boss' Station slides to the Secretary's Station and it is forwarded to the Stand-In Secretary's Station. The Stand-In Secretary's Station cannot place a call to the Boss' Station. The call slides to the Secretary's Station.



When the Stand-In Secretary's Station rings the idle Boss' Station which has BOSS ABSENT set while talking on the phone with another station/trunk, the Stand-In Secretary's Station can also place a call to the Boss' Station by Overriding without sliding the call to the Secretary's Station.

10. MULTI-BOSS/MULTI-SECRETARY MULTI LINE OPERATION

In the case that a Boss (or a Secretary) has two stations, a main station and a substitute station, when the main station line is assigned to a Sub Line of the substitute station, the substitute station can be operated as well as the main station by seizing the main line from the substitute station even if the substitute line does not belong to a Boss Secretary Group.

Note: Available for all countries.

Note 1: To use MULTI-BOSS/MULTI-SECRETARY ONE TOUCH, assign also the Main Boss' Station Line as a Sub Line.

Operating Procedure

The following shows operating procedure for each feature.

Note: When MULTI-BOSS/MULTI-SECRETARY Multi Line Operation is in service, the following features can be operated not only from Main Boss' Station or Main Secretary's Station but also from a substitute station. Substitute station needs to seize a line of the Boss Station or Secretary Station to use the following features.

- BOSS ABSENT from a Boss' Station
- SECRETARY ABSENT from a Secretary's Station
- MULTI-BOSS/MULTI-SECRETARY-ONE TOUCH:
  - Secretary's Terminal Answering Boss' Line Call
  - Overriding from a Secretary's Station
  - Overriding from a Busy Secretary's Station
- MULTI-BOSS/MULTI-SECRETARY AWAY PER BOSS

1. Setting/Canceling BOSS ABSENT from a Boss' Station

- Setting Procedure

  a.) Setting by Access Code

  STEP 1: Lift Boss' Station's handset.
  As for Substitute Station, press the Main Boss' Station Line key and lift the handset.
  STEP 2: Receive Dial Tone (DT).
  STEP 3: Dial access code to set BOSS ABSENT.
  STEP 4: Receive Service Set Tone (SST): Absent key lamp on Boss' Station lights red.
  STEP 5: Hang up Boss' Station's handset.
  As for Substitute Station, hang up Substitute Station's handset.

  b.) Setting by Assigning Line/Feature key or Soft key

  STEP 1: Lift Boss' Station's handset.
  As for Substitute Station, press the Main Boss' Station Line key and lift the handset.
  STEP 2: Receive Dial Tone (DT).
  STEP 3: Press Line/Feature key or Soft key assigned to set BOSS ABSENT.
  STEP 4: Absent key lamp on Boss' Station lights red.
  STEP 5: Hang up Boss' Station's handset.
  As for Substitute Station, hang up Substitute Station's handset.

- Cancelling Procedure

  a.) Cancelling by Access Code

  STEP 1: Lift Boss' Station's handset.
  As for Substitute Station, press the Main Boss' Station Line key and lift the handset.
  STEP 2: Receive Dial Tone (DT).
  STEP 3: Dial access code to cancel BOSS ABSENT.

STEP 4: Receive Service Set Tone (SST): Absent key lamp on Boss' Station turns off.
STEP 5: Hang up Boss' Station's handset.
As for Substitute Station, hang up Substitute Station's handset.

b.) Canceling Using the Line/Feature key or Soft key

STEP 1: Lift Boss' Station's handset.
As for Substitute Station, press the Main Boss' Station Line key and lift the handset.
STEP 2: Receive Dial Tone (DT).
STEP 3: Press Line/Feature key or Soft key assigned to cancel BOSS ABSENT.
STEP 4: Absent key lamp on Boss' Station turns off.
STEP 5: Hang up Boss' Station's handset.
As for Substitute Station, hang up Substitute Station's handset.

2. Setting/Canceling BOSS ABSENT from a Secretary's Station

a.) Setting by Access Code

STEP 1: Lift Secretary's Station's handset.
As for Substitute Station, press the Main Secretary's Station Line key and lift the handset.
STEP 2: Receive Dial Tone (DT).
STEP 3: Dial access code to set BOSS ABSENT from the Secretary's Station.
STEP 4: Receive Special Dial Tone (SPDT).
STEP 5: Dial Boss' Station number.
STEP 6: Receive Service Set Tone (SST).
STEP 7: Hang up Secretary's Station's handset.
As for Substitute Station, hang up Substitute Station's handset.

b.) Cancelling by Access Code

STEP 1: Lift Secretary's Station's handset.
As for Substitute Station, press the Main Secretary's Station Line key and lift the handset.
STEP 2: Receive Dial Tone (DT).
STEP 3: Dial access code to cancel BOSS ABSENT from the Secretary's Station.
STEP 4: Receive Special Dial Tone (SPDT).
STEP 5: Dial Boss' Station number.
STEP 6: Receive Service Set Tone (SST).
STEP 7: Hang up Secretary's Station's handset.
As for Substitute Station, hang up Substitute Station's handset.

3. Setting/Canceling SECRETARY ABSENT from a Secretary's Station

- Setting Procedure

  a.) Setting by Access Code

  STEP 1: Lift Secretary's Station's handset.
  As for Substitute Station, press the Main Secretary's Station Line key and lift the handset.
  STEP 2: Receive Dial Tone (DT).
  STEP 3: Dial access code to set SECRETARY ABSENT.
  STEP 4: Receive Service Set Tone (SST): Absent key lamp on Secretary's Station lights red.
  STEP 5: Hang up Secretary's Station's handset.
  As for Substitute Station, hang up Substitute Station's handset.

  b.) Setting by Using the Line/Feature key or Soft key

  STEP 1: Press Secretary's Station's monitor/speaker button.
  As for Substitute Station, press the Main Secretary's Station Line key and lift the handset.
  STEP 2: Receive Dial Tone (DT).
  STEP 3: Press Line/Feature key or Soft key assigned to set SECRETARY ABSENT.
  STEP 4: Absent key lamp on Secretary's Station lights red.
  STEP 5: Press Secretary's Station's monitor/speaker button.
  As for Substitute Station, hang up Substitute Station's handset.

- Cancelling Procedure

  a.) Cancelling by Access Code

  STEP 1: Lift Secretary's Station's handset.
  As for Substitute Station, press the Main Secretary's Station Line key and lift the handset.
  STEP 2: Receive Dial Tone (DT).
  STEP 3: Dial access code to cancel SECRETARY ABSENT.
  STEP 4: Receive Service Set Tone (SST): Absent key lamp on Secretary's Station turns off.
  STEP 5: Hang up Secretary's Station's handset.
  As for Substitute Station, hang up Substitute Station's handset.

  b.) Canceling by Using the Line/Feature key or Soft key

  STEP 1: Press Secretary's Station's monitor/speaker button.
  As for Substitute Station, press the Main Secretary's Station Line key and lift the handset.
  STEP 2: Receive Dial Tone (DT).
  STEP 3: Press Line/Feature key or Soft key assigned to cancel SECRETARY ABSENT.
  STEP 4: Absent key lamp on Secretary's Station turns off.
  STEP 5: Press Secretary's Station's monitor/speaker button.
  As for Substitute Station, hang up Substitute Station's handset.

4. Operating Procedure for MULTI-BOSS/MULTI-SECRETARY-ONE TOUCH

4.1 Secretary's Terminal Answering Boss' Line Call

- Operation by Secretary's Station

STEP 1: An idle Secretary's Station presses the flashing Boss' Line key lamp, which indicates that the Boss' Station is receiving a call.
STEP 2: The call originating party and the Secretary are connected.
STEP 3: The above changes the Boss Station's status from busy to idle. **Note 1**

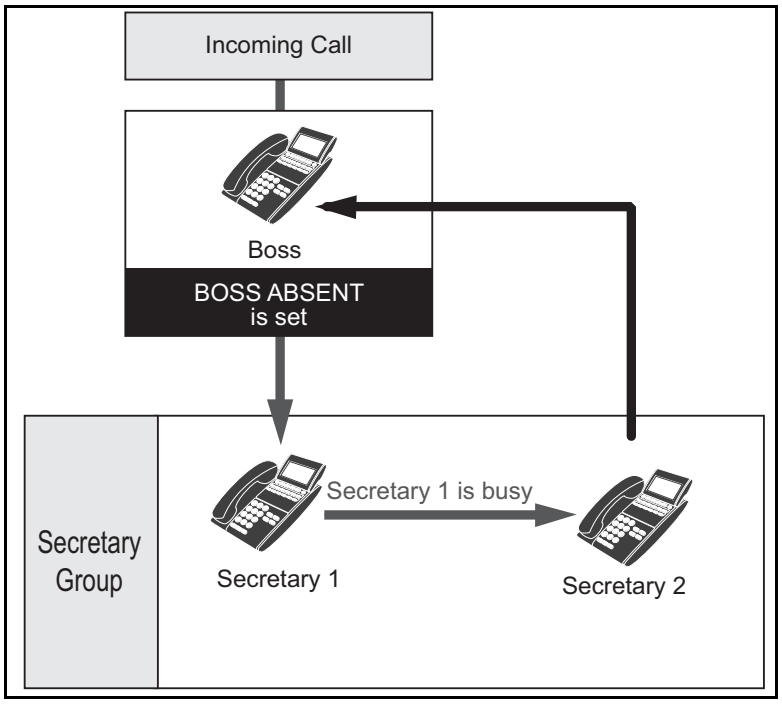
Note 1: If the Boss answers the call before the Secretary, it results in the Secretary's Station Overriding to the busy Boss' Station.

- Operation by Substitute Station

STEP 1: Substitute Station presses the flashing Main Boss' Line key lamp, which indicates that the Main Boss' Station is receiving a call.
STEP 2: Substitute Station goes off-hook. **Note 2**
STEP 3: The call originating party and Substitute Station are connected.

Note 2: You can skip off-hook operation to answer the call by setting ASYD Index 384 System Data 1 Bit 0=1.

- Operation by Substitute Station by Seizing Secretary's Station Line



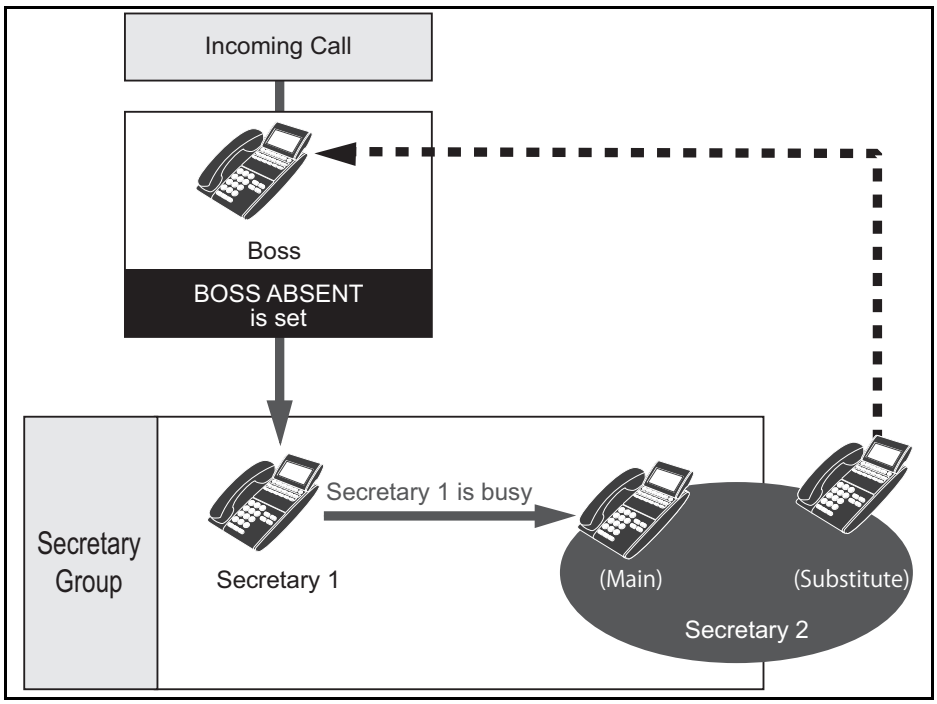
STEP 1: Substitute Station presses the Main Secretary's Station Line key and lifts the handset.
STEP 2: Substitute Station receives Dial Tone (DT).
STEP 3: Substitute Station presses the flashing Main Boss' Station Line key lamp, which indicates that the Main Boss' Station is receiving a call.
STEP 4: By seizing the Main Boss' Station Line, the call originating party and the Main Secretary's Station Line are connected.
STEP 5: The above changes the Main Boss Station's status from busy to idle. **Note 3**

Note 3: If the Main Boss answers the call before the call originating party and the Main Secretary's Station Line are connected, it results in the Substitute Station Overriding to the busy Boss' Station.

4.2 Overriding from a Secretary's Station

a.) Operation for Override: Override from the Call Forwarded Secretary's Station by Slide Action

- Operation by Secretary's Station 2



STEP 1: Secretary's Station 2 answers a call forwarded by Slide Action.

STEP 2: The Secretary's Station 2 presses the Boss' Line key:

- If the Boss' Station is in idle status, the Secretary's Station 2 calls the Boss' Station. The incoming call from the call originating party is put on hold.
- If the Boss' Station is in busy status (exception: call via an Attendant Console), Call Waiting is automatically set to the Boss' Station. In this case, Secretary 2 receives Service Set Tone (SST); the call originating party receives Ring Back Tone (RBT).

• Operation by Substitute Station

STEP 1: The Main Secretary's Station 2 receives a call forwarded by Slide Action.

STEP 2: Substitute Station presses the flashing Main Secretary's Station 2 Line key lamp and lift the handset.

STEP 3: The call originating party connects to the Substitute Station.

STEP 4: The Substitute Station presses the Boss' Line key:

- If the Boss' Station is in idle status, the Substitute Station calls the Boss' Station. The incoming call from the call originating party is put on hold.
- If the Boss' Station is in busy status (exception: call via an Attendant Console), Call Waiting is automatically set to the Boss' Station. In this case, Substitute Station receives Service Set Tone (SST); the call originating party receives Ring Back Tone (RBT).

b.) Operation for Override: Direct Override from the Secretary's Station

• Operation by Secretary's Station

STEP 1: An idle Secretary's Station presses the Boss' Line key:

- If the Boss' Station is in idle status, the idle Secretary's Station calls the Boss' Station.
- If the Boss' Station is in busy status (exception: call via an Attendant Console), the Secretary's call Overrides to the Boss' Station.

• Operation by Substitute Station

STEP 1: Substitute Station presses the Main Secretary's Station Line key and lift the handset.

STEP 2: Substitute Station receives Dial Tone (DT).

STEP 3: Substitute Station presses the Main Boss' Line key:

- If the Main Boss' Station is in idle status, the Substitute Station calls the Main Boss' Station.
- If the Main Boss' Station is in busy status (exception: call via an Attendant Console), the Substitute Station's call Overrides to the Main Boss' Station.

4.3 Overriding from a Busy Secretary's Station

a.) Overriding from a busy Secretary's Station

- Operation by Secretary's Station

STEP 1: A busy Secretary's Station confirms that the Boss' Line key lamp is on, indicating that the Boss' Station is busy.
STEP 2: Secretary's Station presses the CALL PARK Feature key (pre-assigned to a Line/Feature key) to put its ongoing call on hold.
STEP 3: Secretary's Station presses the Boss' Line key (lamp is on) to Override to the Boss' ongoing call.

- Operation by Substitute Station

STEP 1: Substitute Station is talking by using the Main Secretary's Line.
STEP 2: Substitute Station using the Main Secretary's Line presses the CALL PARK Feature key (pre-assigned to a Line/Feature key) to put its ongoing call on hold.
STEP 3: Substitute Station presses the Main Boss' Line key (lamp is on) to Override to the Main Boss' ongoing call.

b.) Secretary's Station/Substitute Station Resuming Communication with its Original Caller After Overriding

- Operation by Secretary's Station

STEP 1: Secretary finishes Overriding.
STEP 2: Secretary's line becomes idle.
STEP 3: Boss resumes communication with its original caller.
STEP 4: Secretary initiates a call, then presses the CALL PARK Feature key (pre-assigned to a Line/Feature key) to resume communication with its original caller.

- Operation by Substitute Station

STEP 1: Substitute Station finishes Overriding.
STEP 2: The Main Secretary's line becomes idle.
STEP 3: The Main Boss resumes communication with its original caller.
STEP 4: Substitute Station presses the Main Secretary's Line key and lift the handset.
STEP 5: Substitute Station receives Dial Tone (DT).
STEP 6: Substitute Station dials the Access Code to answer the parked call to resume communication with its original caller.

5. Operating Procedure for MULTI-BOSS/MULTI-SECRETARY AWAY PER BOSS

- Setting MULTI-BOSS/MULTI-SECRETARY AWAY PER BOSS

  LCD number indicates the Boss' number.

  STEP 1: Lift the Secretary's Station's handset.
  As for Substitute Station, press the Main Secretary's Station Line key and lift the handset.
  STEP 2: Receive Dial Tone (DT).
  STEP 3: Dial Access Code to enable SECRETARY AWAY PER BOSS.
  STEP 4: Receive Dial Tone (SPDT).
  STEP 5: Dial the desired Boss' Station number.
  STEP 6: Receive Service Set Tone (SST).
  STEP 7: Hang up Secretary's Station's handset.
  As for Substitute Station, hang up Substitute Station's handset.
  STEP 8: Information is displayed on the LCD.

When the display of maximum 16 digits of Call Forwarding Information on the LCD is unavailable.
(ASYDL, System Data 1, Index 677, Bit 3=0)

Display in 16x2 lines: Alphabet

O	U	T						1	2	3	4	5	6	7	8

Display in 24x3 lines: Alphabet

A	B	S	E	N	T											1	2	3	4	5	6	7	8

When the display of maximum 16 digits of Call Forwarding Information on the LCD is available.
(ASYDL, System Data 1, Index 677, Bit 3=1)

Display in 16x2 lines: Alphabet

O	U	T						1	2	3	4	5	6	7	8

Display in 24x3 lines: Alphabet

A	B	S	E	N	T			1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6

- Cancelling MULTI-BOSS/MULTI-SECRETARY AWAY PER BOSS

STEP 1: Lift the Secretary's Station's handset.
As for Substitute Station, press the Main Secretary's Station Line key and lift the handset.
STEP 2: Receive Dial Tone (DT).
STEP 3: Dial Access Code to disable SECRETARY AWAY PER BOSS.
STEP 4: Receive Dial Tone (SPDT).
STEP 5: Dial the desired Boss' Station number.
STEP 6: Receive Service Set Tone (SST).
STEP 7: Hang up Secretary's Station's handset.
As for Substitute Station, hang up Substitute Station's handset.
STEP 8: Information is displayed on the LCD.

When the display of maximum 16 digits of Call Forwarding Information on the LCD is unavailable.
(ASYDL, System Data 1, Index 677, Bit 3=0)

Display in 16x2 lines: Alphabet

I	N							1	2	3	4	5	6	7	8

Display in 24x3 lines: Alphabet

P	R	E	S	E	N	T									1	2	3	4	5	6	7	8

When the display of maximum 16 digits of Call Forwarding Information on the LCD is available.
(ASYDL, System Data 1, Index 677, Bit 3=1)

Display in 16x2 lines: Alphabet

I	N							1	2	3	4	5	6	7	8

Display in 24x3 lines: Alphabet

P	R	E	S	E	N	T		1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6

6. Operating Procedure to Allowing All Secretary Stations Within Secretary Group to be ABSENT

Setting Procedure

a.) Restricting All Secretary Stations within a Secretary Group from being ABSENT

STEP 1: STEP 1: Assign Telephone Number for Boss' Station and Secretary's Station using ASHUEN command.

b.) Allowing All Secretary Stations within a Secretary Group to be ABSENT

STEP 1: Assign Virtual Line to allow ABSENT using ASDT command.

STEP 2: Assign Telephone Number for Boss' Station, Secretary's Station and Virtual Line using ASHUEN command.

STEP 3: Assign Make Busy to Virtual Line using MBST command.

7. Operating Procedure for MULTI-BOSS/MULTI-SECRETARY OVERRIDING FROM A SECRETARY'S CALL FORWARDING DESTINATION

STEP 1: Secretary's Station sets CALL FORWARDING - ALL CALLS/CALL FORWARDING - DON'T ANSWER.

STEP 2: An incoming call to Boss' Station slides to Secretary's Station.

STEP 3: The call is forwarded to the destination which the Secretary's Station sets.

STEP 4: The forwarding destination answers the call.

STEP 5: The forwarding destination performs switch hook flash.

STEP 6: The forwarding destination dials the Boss' Station number.

Note: MULTI-BOSS/MULTI-SECRETARY Overriding from a Secretary's Call Forwarding Destination is available.

8. Operating Procedure for MULTI-BOSS/MULTI-SECRETARY BOSS' CALL FORWARDING ACTIVATE

STEP 1: Boss' Station sets CALL FORWARDING - ALL CALLS/CALL FORWARDING - DON'T ANSWER.

STEP 2: Secretary's Station answers a call arriving at Boss' Station and forwards it to the Boss' Station.

STEP 3: The call is forwarded to the destination which the Boss' Station sets.

9. Operating Procedure for MULTI-BOSS/MULTI-SECRETARY OVERRIDING FROM A STAND-IN SECRETARY

When a Stand-In Secretary's Station makes a call to Boss' Station by Overriding while any other lines are not connected

STEP 1: Secretary's Station sets a Stand-In Secretary's Station number as a destination of CALL FORWARDING - ALL CALLS/CALL FORWARDING - DON'T ANSWER.

STEP 2: Stand-In Secretary's Station rings Boss' Station which has BOSS ABSENT set. **Note 1**

When a Stand-In Secretary's Station makes a call to Boss' Station by Overriding while talking on the phone with another station/trunk

STEP 1: Secretary's Station sets a Stand-In Secretary's Station number as a destination of CALL FORWARDING - ALL CALLS/CALL FORWARDING - DON'T ANSWER.

STEP 2: Stand-In Secretary's Station performs switch hook flash while talking on the phone with another station/trunk, and then rings Boss' Station which has BOSS ABSENT set. **Note 1**

Note 1: The call does not slide to the next Secretary's Station but Stand-In Secretary's Station can talk with Boss' Station.

Service Conditions

1. Common Conditions

1. Terminals available for Boss'/Secretary's Terminal are the following:
   - Analog terminal (LC/MC)
   - Desktop terminal
   - DtermIP (Proprietary Protocol)
   - DtermIP (SIP)
   - Soft Phone
2. When a call arrives at a Boss'/Secretary's Station, the calling/called party's terminal's service name display (LCD) will indicate "UCD."

1.1 Programming Conditions

(a) This feature is available for Stations where Telephone Number is registered using the ALGSN command [Network Data Memory (NDM)].

Note: The maximum number of Secretary Groups combined with UCD Groups is fixed to 63 per node but can be expanded to 255 when using Group Number Expansion; the maximum number of stations within a Secretary Group is 21.

Note: When Group Number Expansion is used, if the Boss Secretary Group has already been registered, delete the existing Boss Secretary Group data and then reregister it by using ASHUEN command. Also, when reregistering, check the "Multi Boss Secretary Group" checkbox of ASHUEN command, by which ON (Boss Secretary Group)/OFF (UCD Group) is displayed per groups for ASHUEN and LSHUEN command. However, if not deleted and reregistered, it will be displayed as OFF (UCD Group) even if it is Boss Secretary Group.

(b) Boss' Station and Secretary's Station must be in the same node.

(c) Boss' Station may not be registered as a Secretary's Station.

(d) Secretary's Station may belong to multiple Secretary Groups. There is no limit to the number of Secretary Groups the Secretary's Station can belong to.

(e) The same Service Feature Restriction Class must be assigned to all Boss/Secretary Stations within a Secretary Group.

Note: For details on language display for the LCD, refer to MULTILINGUAL DISPLAY [M-117].

(f) If more than 255 groups are registered in the combination of Boss Secretary Group and UCD Group, an error window will appear.

(g) When the office data of Multi-Boss/Multi-Secretary is changed, it will takes about 30 seconds to reflect the change. Within this time, if a call is made/received by the Boss/Secretary station for which the data is changed, the former operation is applied for the station.

(h) When registering the Boss/Secretary Group in the ASHUEN command, be sure to check the "Multi Boss Secretary Group" checkbox.

(i) When listing up by using LSHUEN command, all of the UCD Groups and Boss Secretary Groups are output, and ON (Boss Secretary Group)/OFF (UCD Group) is displayed per groups.

(j) When a UCD Group has been registered by ASHU/ASHUL command, this feature is not available.

1.2 Interactions

(a) This feature is not available for Hotel/ACD systems.

(b) This feature does not correspond to OAI features. Do not assign this feature to an OAI terminal.

(c) Existing UCD features (OVERFLOW-UCD [O-13], CALL WAITING LAMP-UCD [C-76], DELAY ANNOUNCEMENT-UCD [D-31], UCD Peg count) are not available for terminals assigned as the Boss' or Secretary's Station.

(d) Soft Phone related services (SOFT PHONE WIRELESS HANDSET [S-145], SOFT PHONE WIRED-PHONE HANDSET [S-147] and SOFT PHONE WLAN HANDSET [S-159]) are not available for Boss'/Secretary's Station.

(e) Station Hunting services (Pilot, Circular, UCD) are not available for the Boss' or Secretary's Station. Any Station Hunting service previously assigned must be deleted prior to assigning this feature.

(f) Do not assign ASFC SFI=181 (No Hunting to Next Station in Group) to a Secretary's Station.

(g) Terminals assigned as Multi-Boss/Multi-Secretary Stations do not work in conjunction with existing Boss Secretary services such as BOSS-SECRETARY OVERRIDE [B-5D], BOSS-SECRETARY - MESSAGE WAITING LAMP CONTROL [B-8], and BOSS-SECRETARY TRANSFER [B-11].

(h) If a Secretary's Station assigned with multiple My Lines is busy, a call does not slide to the Sub Line within the same number, but will skip to the next Secretary Station.

(i) BROKERAGE-HOTLINE [B-6] is not available for terminals with this feature assigned.

(j) Do not assign DUAL STATION CALL [D-156] to a Boss' or Secretary's Station.

(k) In DIAL PLAN TO SUPPORT IP CENTREX FUNCTIONALITY [D-166], data cannot be assigned across different UGNs.

(l) When originating a call from a Secretary's Station, the number assigned to the seized line (My Line or Sub Line) will be displayed on the LCD.

(m) The order of priority is as follows when a Boss' Station has BOSS ABSENT set along with other call forwarding features:

Order of Priority when BOSS ABSENT is Set

Call Forwarding Features	
1. NUMBER SHARING [N-45] (When call forwarding is assigned to a sub-station)	High Priority
2. LOGGED OUT IP STATION-CALL DESTINATION [L-53] **Note 14**	
3. CALL FORWARDING-ALL CALLS [C-5] **Note 14**	
4. MOBILITY ACCESS (MA) [M-118] **Note 14**	
5. MULTI-BOSS/MULTI-SECRETARY [M-120]	
6. CALL FORWARDING-BUSY LINE [C-2]	
7. STATION HUNTING-TERMINAL [S-9]	
8. DO NOT DISTURB -D [D-11D]	
9. CALL FORWARDING-DON'T ANSWER [C-3]	Low Priority

Note 14: Order of priority may be changed by ASFC SFI=209.

2. Conditions to Set BOSS ABSENT

1. When the calling party dials the Boss' Station, the call arrives at the Secretary Group by Pilot service.
2. When the calling party dials the Secretary's Station Number, the call is received according to DIRECT-IN TERMINATION (DIT) [D-7].
3. If the Boss' line is busy and BOSS ABSENT is not set, incoming calls arrive at a Secretary's Station by Pilot service.
4. When a Secretary's Station has the following features set, that Station gets skipped from Slide Action:
   (a) Secretary's Station gets skipped from Slide Action unconditionally when the following features are set:
   - CALL FORWARDING-ALL CALLS [C-5]
   - LOGGED OUT IP STATION-CALL DESTINATION [L-53] **Note 4**
   - SECRETARY ABSENT
   - DO NOT DISTURB -D [D-11D]

   (b) Secretary's Station in busy status with CALL FORWARDING-BUSY LINE [C-2] assigned gets skipped from Slide Action.
5. If a call arrives at a Secretary's Station that has CALL FORWARDING-DON'T ANSWER [C-3] set, the call will be forwarded to the assigned destination. It is not possible to Override to the Boss other than from the forwarded Secretary's Station. Overriding to the Boss is unavailable in this case. Override is available, however, if the call forwarding destination is a Secretary's Station in the Boss' Secretary Group.
6. If none of the Secretary's Station within the Secretary Group is eligible for Slide Action (all lines are busy or all Secretaries have SECRETARY ABSENT set), the entire Secretary Group will be considered busy. **Note 5**
   (a) The following features are available when the entire Secretary Group is busy:
   - CALL BACK [C-1] : Secretary 1 is eligible for this feature.
   - STEP CALL [S-13] : After changing the last digits, the Boss' Station is recalled.
   - EXECUTIVE RIGHT-OF-WAY [E-1] : Secretary 1 is eligible for this feature.
   - CALL WAITING-TERMINATING [C-12] : Secretary 1 is eligible for this feature.

   (b) Busy line features will not be available if Secretary 1 has them restricted.
   (c) It is possible to assign Multi-Boss/Multi-Secretary queuing per system (usage is combined with UCD).
   - The maximum Multi-Boss/Multi-Secretary queuing slots per system are 640 (usage combined with UCD).
   - If incoming calls exceed the number of maximum possible number of queuing, queuing will not occur. The calling party will hear Busy Tone (BT).
   - During Multi-Boss/Multi-Secretary queuing, the calling party will hear Ringing Back Tone (RBT).
   - When the calling party is the Attendant Console, queuing will not occur. Attendant Console will hear Busy Tone (BT).
   - If the calling party has a held call, queuing will not occur. The calling party will hear Busy Tone (BT).
7. If BOSS ABSENT is set, the Boss' Desktop terminal's service name display (LCD) will indicate "BYO SET." **Note 6**
8. If BOSS ABSENT is not set, the Boss' Desktop terminal's service name display (LCD) will indicate "BYO CNCL." **Note 6**

9. Before deleting a Boss Secretary Group using the ASHUEN command, cancel the BOSS ABSENT set to the Boss' Station and the SECRETARY ABSENT set to the Secretary's Station.
10. Setting and canceling BOSS ABSENT are available through the Sub Line of the Substitute Station by the system data (ASYDL SYS1 Index 1089 Bit 6=0) setting.
    When BOSS ABSENT is set, the Sub Line Lamp of the Substitute Station does not light but My Line Lamp of the Main Boss' Station lights.
11. The following show behaviors when BOSS ABSENT is set/cancelled.

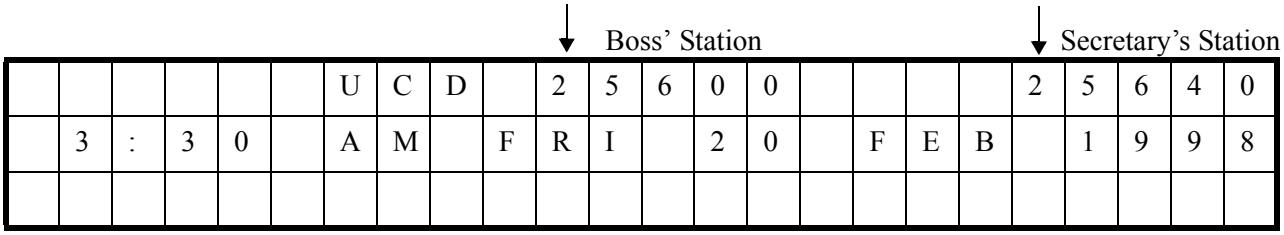
BOSS ABSENT is set/cancelled by seizing Main Boss' Station Line from Substitute Station:

Operation		When BOSS ABSENT Is Set/Cancelled
• Dial Access Code • Press pre-programmed Line/ Feature key or Soft key	Set	• "BYO SET" is displayed in the LCD of the Operating Station. • Service Set Tone (SST) is received when Access Code is used. • On the Main Boss' Station, the lamp of the BUSY OUT Feature key (FKY=19) turns on.
	Cancel	• "BYO CNCL" is displayed in the LCD of the Operating Station. • Service Set Tone (SST) is received when Access Code is used. • On the Main Boss' Station, the lamp of the BUSY OUT Feature key (FKY=19) turns off.

Note 4: All Stations in log out status get skipped from Slide Action regardless of set/cancel status for LOGGED OUT IP STATION-CALL DESTINATION [L-53] feature.

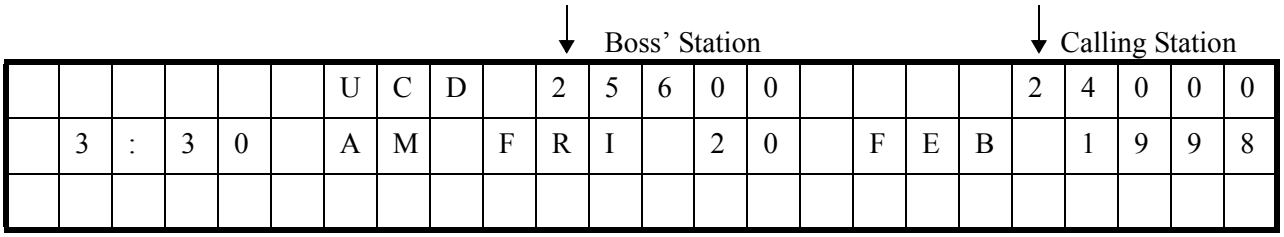
Note 5: Actions (for example: service settings, call initiation) vary for each feature depending on the state of Secretary 1 such as the Station's idle/busy status.

Note 6: BYO stands for "Busy Out."



3. Conditions to Set BOSS ABSENT From a Secretary's Station

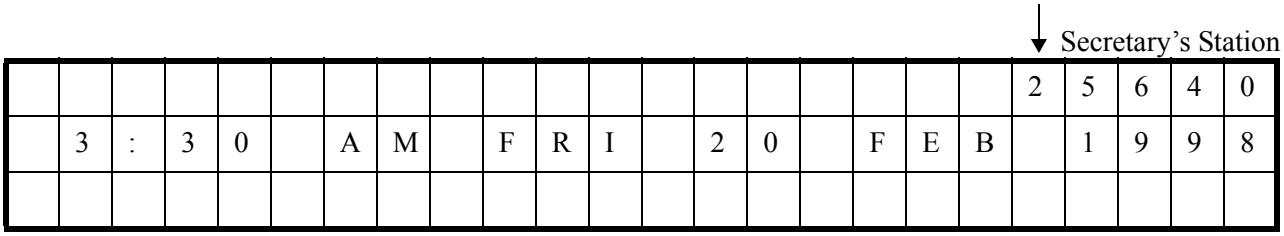
1. Only the Secretary's Station can set BOSS ABSENT to a Boss' Station. If a different type of Station attempts to set this feature, that Station will receive Reorder Tone (ROT).
2. Only the Boss' Station is qualified to be the destination for BOSS ABSENT. If the Secretary attempts to set a different type of Station to be the destination for this feature, the Secretary will receive Reorder Tone (ROT).
3. The Secretary is only enabled to set/cancel BOSS ABSENT to the Boss' Station associated with its Secretary Group. If the Secretary attempts to set BOSS ABSENT to a Boss' Station not associated with its Secretary Group, the Secretary will receive Reorder Tone (ROT).
4. Setting/cancelling BOSS ABSENT is only available while the Secretary's Station is idle.
5. If BOSS ABSENT is set to a Boss' Station where the service is already set, setting conditions remain the same. The Secretary conducting the setting receives Service Set Tone (SST).
6. If BOSS ABSENT is cancelled on a Boss' Station where the service is already cancelled, cancellation conditions remain the same. The Secretary conducting the setting receives Service Set Tone (SST).



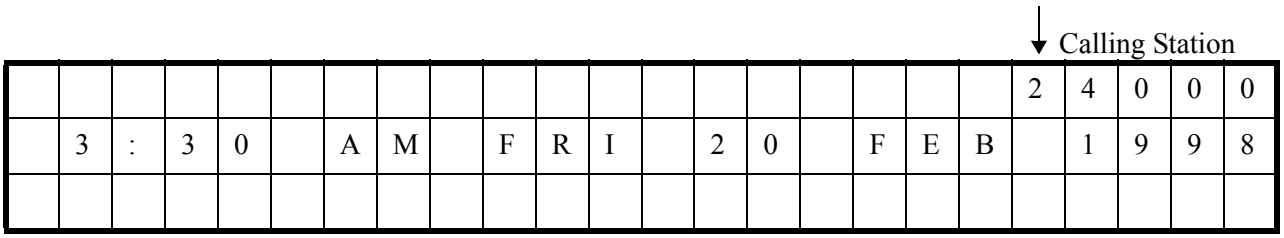
4. Service Name Display (LCD) When BOSS ABSENT is Set

1. Service name display (LCD) when a call to the Boss' Station arrives at the Secretary Group: **Note 3**

(a) Calling Station's LCD Indication



(b) Secretary's Station's LCD Indication



2. Service name display (LCD) when a call is made directly to the Secretary's Station: **Note 3**

(a) Calling Station's LCD Indication

(b) Secretary's Station's LCD Indication

Note 3: For details on changing the availability and position of the display, refer to the section entitled "Display (LCD) Indications" in this manual.

5. Conditions to Set SECRETARY ABSENT

1. Setting SECRETARY ABSENT with an Access Code is only available when the Secretary's Station is idle.
2. Setting SECRETARY ABSENT with a Line/Feature key is only available when the Secretary's Station is idle or engaged in a two-party call.
3. Cancelling SECRETARY ABSENT is only available when the Secretary's Station is idle.
4. When a Secretary Station belonging to multiple Secretary Groups sets/cancels SECRETARY ABSENT, the setting/cancelling will affect all Secretary Groups it belongs to. It is not possible to set/cancel SECRETARY ABSENT for an individual Secretary Group.
5. It is possible to make and receive a call using Secretary's Station number regardless of whether SECRETARY ABSENT is set or canceled.
6. When all Secretaries within a Secretary Group have SECRETARY ABSENT set, Group status will be the same as when all lines are busy.
7. While SECRETARY ABSENT is being set, the Secretary's Desktop terminal's service name display (LCD) will indicate "BYO SET." **Note 1**
8. While SECRETARY ABSENT is being canceled, the Secretary's Desktop terminal's service name display (LCD) will indicate "BYO CNCL." **Note 1**
9. Before deleting a Boss Secretary Group using the ASHUEN command, cancel the BOSS ABSENT set to the Boss' Station and the SECRETARY ABSENT set to the Secretary's Station.
10. Setting and canceling SECRETARY ABSENT are available through the Sub Line of the Substitute Station by the system data (ASYDL SYS1 Index 1089 Bit 6=0) setting.
    When SECRETARY ABSENT is set, the Sub Line Lamp of the Substitute Station does not light but My Line Lamp of the Main Secretary's Station lights.
11. The following show behaviors when SECRETARY ABSENT is set/canceled.

SECRETARY ABSENT is set/canceled by seizing Main Secretary's Station Line from Substitute Station:

Operation		When SECRETARY ABSENT Is Set/Cancelled
• Dial Access Code • Press pre-programmed Line/ Feature key or Soft key	Set	• "BYO SET" is displayed in the LCD of the Operating Station. • Service Set Tone (SST) is received when Access Code is used. • On the Main Secretary's Station, the lamp of the BUSY OUT Feature key (FKY=19) turns on.
	Cancel	• "BYO CNCL" is displayed in the LCD of the Operating Station. • Service Set Tone (SST) is received when Access Code is used. • On the Main Secretary's Station, the lamp of the BUSY OUT Feature key (FKY=19) turns off.

Note 1: BYO stands for "Busy Out."

6. Conditions for MULTI-BOSS/MULTI-SECRETARY-ONE TOUCH

6.1 Interactions

(a) The order of priority is as follows for Overriding when a Boss' Station has set other call forwarding features:

Order of Priority when a Call Overrides to a Boss' Station

Call Forwarding Features	
1. CW and EROW features to the Boss **Note 2**	High Priority
2. NUMBER SHARING [N-45] (When call forwarding is assigned to a sub-station)	
3. LOGGED OUT IP STATION-CALL DESTINATION [L-53] **Note 3**	
4. CALL FORWARDING-ALL CALLS [C-5] **Note 3**	
5. MOBILITY ACCESS (MA) [M-118] (MA CALL FORWARDING) **Note 3**	
6. CALL FORWARDING-BUSY LINE [C-2]	
7. STATION HUNTING-TERMINAL [S-9]	
8. DO NOT DISTURB -D [D-11D]	
9. CALL FORWARDING-DON'T ANSWER [C-3]	Low Priority

Note 2: Call Waiting (CW) and Executive-Right-Of-Way (EROW) indicates CW and EROW for Multi-Boss/Multi-Secretary Feature.
CW and EROW will be restricted when Multi-Boss/Multi-Secretary Feature is unavailable.

Note 3: Order of priority may be changed by ASFC SFI=209.

6.2 Conditions to Status Display of Boss' Terminal

(a) It is necessary to accommodate the Boss' Line as a Sub Line to the Secretary's Desktop terminal.

6.3 Conditions for Secretary's Terminal Answering Boss' Line Call

(a) It is necessary to accommodate the Boss' Line as a Sub Line to the Secretary's Desktop terminal.

(b) This feature is available only when the Secretary's Station is idle.

(c) When the Secretary's Station is busy, answer the Boss' line call through the following procedure:

STEP 1: Press the CALL PICKUP Feature key (pre-assigned to a Line/Feature key).
STEP 2: Press the flashing Boss' Line key.

(d) Office data assignment for CALL PICKUP-GROUP [C-7] is necessary since conditions of this feature are the same as those of general Call Pickup features. See CALL PICKUP-GROUP [C-7] for more information.

(e) An Overriding call from a Secretary's Station cannot be picked up by another Secretary's Station.

6.4 Conditions to Overriding from a Secretary's Station

(a) Only the Secretary's Station can Override to a Boss' Station.

(b) The destination for Secretary Override must be the Boss' Station associated with its Secretary Group.

(c) If the Secretary's Station has Executive Right-of-Way (Calling) restricted (ASFC SFI 3=restricted), when attempting to directly Override to a busy Boss' Station, the Secretary's Station will receive Reorder Tone (ROT).
- Pre-assign office data for Executive Right-of-Way.

(d) Override is restricted when the Boss' Station is in busy status due to reasons other than an ongoing call (exception: call via an Attendant Console).

(e) If a busy Secretary's Station presses the Boss' Line key to set Call Waiting, there will be no resulting operation if Call Waiting is restricted by office data settings. LCD will display the service as restricted.

(f) If Call Waiting is restricted by office data settings, the following Secretary will receive Reorder Tone (ROT):
A busy Secretary's Station is receiving Special Dial Tone (SPDT) after pressing the CALL FORWARDING Feature key. While receiving SPDT, the same Secretary presses the Boss' Line key to set Call Waiting.
- Pre-assign office data for Call Waiting.
- When forwarding a Station call, assign settings to allow Call Waiting-Originating (Calling) to that Station.
- When forwarding a trunk call, assign Call Waiting Service to that Route Class (CDN=46).

(g) MULTI-BOSS/MULTI-SECRETARY is the only feature that allows Override termination. If other call forwarding features are set, those features will function for an incoming call. The incoming call will be forwarded instead of Overriding.

6.5 Conditions for Overriding from a Busy Secretary's Station

(a) Office data assignment of EXECUTIVE RIGHT-OF-WAY [E-1] is necessary since conditions for Override are the same as those of general Override features. See EXECUTIVE RIGHT-OF-WAY [E-1] for more information.

(b) Pressing the CALL PARK DELUXE/RETRIEVE-1 Feature key (FKY=158: pre-assigned to a Line/Feature key) changes a busy Secretary Station's status to idle. Thus, when the Secretary's Station is busy, Override to the Boss' Station through the following procedure:

STEP 1: Press the CALL PARK DELUXE/RETRIEVE-1 Feature key (FKY=158: pre-assigned to a Line/Feature key).

STEP 2: Press the flashing Boss' Line key.

(c) Override to a busy Boss' Station is not available from a Stand-In Secretary's Station and a forwarding destination of MULTI-BOSS/MULTI-SECRETARY Overriding from a Secretary's Call For-

warding Destination while the Stand-In Secretary's Station and the forwarding destination are in busy state or holding another line.

6.6 List of Operations When Boss' Line Key is Pressed

(a) Boss' Line key is used for the following operations:
- Display of Boss' Line status
- Calling the Boss
- Answering the Boss' call
- Overriding to the Boss' Line
- Setting Call Waiting to the Boss' Station

(b) Only the Boss can seize the Boss' Line by pressing the Boss' Line key.

(c) Pressing the Boss' Line key from a terminal other than the Secretary's Terminal voids operations using the Boss' Line key.

(d) Refer to the following table for a list of operations when the Secretary presses the Boss' Line key in idle status.
- The following abbreviations are used in the table below.
  - CF-A= CALL FORWARDING-ALL CALLS
  - CF-B= CALL FORWARDING-BUSY LINE
  - CF-D= CALL FORWARDING-DON'T ANSWER

- "Sending DT" in Status of Secretary's Line (My Line) column includes:
  - state of receiving Dial Tone (DT).
  - state of not receiving DT during dialing.

List of Operations When Boss' Line Key is Pressed

Status of Secre-tary	Status of Secre-tary's Line (My Line)	Status of Boss	Status of Boss' Line Key Lamp	Status of CF Set to Boss' Station	Result of Operation
Idle	Idle/ Sending DT	Idle	Off	Not set	Boss is called using Secretary's My Line.
				CF-A	Call is routed to another Station using Secretary's My Line.
				CF-B	Call is forwarded to Boss' Station using Secretary's My Line.
				CF-D	After Boss is called using Secretary's My Line, predesignated Station is called.
Idle	Idle/ Sending DT	2-Party Call	On	Not set	Override
				CF-A	
				CF-B	
				CF-D	

List of Operations When Boss' Line Key is Pressed

Status of Secre-tary	Status of Secre-tary's Line (My Line)	Status of Boss	Status of Boss' Line Key Lamp	Status of CF Set to Boss' Station	Result of Operation
Idle	Idle/ Sending DT	Receiving Call	Flashing	Not set	Answer by Call Pickup using Secretary's My Line.
				CF-A	
				CF-B	
				CF-D	
Idle	Idle/ Sending DT	Busy (due to reasons other than above)	On/ Flashing	Not set	Restricted
				CF-A	
				CF-B	
				CF-D	
Idle	Other than Idle/ Sending DT	Idle	Off	Not set	No Operation
				CF-A	
				CF-B	
				CF-D	
Idle	Other than Idle/ Sending DT	2-Party Call	On	Not set	No Operation
				CF-A	
				CF-B	
				CF-D	
Idle	Other than Idle/ Sending DT	Receiving Call	Flashing	Not set	No Operation
				CF-A	
				CF-B	
				CF-D	
Idle	Other than Idle/ Sending DT	Busy (due to reasons other than above)	On/ Flashing	Not set	No Operation
				CF-A	
				CF-B	
				CF-D	

(e) Refer to the following table for a list of operations when the Secretary presses the Boss' Line key in call forwarded, hold or busy status.

- The following abbreviations are used in the table below.
  - CF-A= CALL FORWARDING-ALL CALLS

- CF-B= CALL FORWARDING-BUSY LINE
- CF-D= CALL FORWARDING-DON'T ANSWER

- Even if the Boss' Line key is flashing, it is impossible to pick up a call unless the Boss' Line is actually receiving a call.

- Conditions for Overriding and Answering by Call Pickup are the same as general Override features.

- "2-Party Call:" state of 2-Party Call (excluding connection to an Attendant Console) where it is possible to perform switch hook flash.
- Status of Secretary's Line (My Line) column:
  - "TRANSFER key pressed:" TRANSFER key is pressed during a 2-party call and Special Dial Tone is received.
  - "Idle due to Call Park:" the Secretary's line is idle after holding an ongoing call using Call Park.

List of Operations When Boss' Line Key is Pressed

Status of Secretary	Status of Secretary's Line (My Line)	Status of Boss	Display of Boss' Line Key	Status of CF Set to Boss' Station	Result of Operation
Transfer	2-Party Call	Idle	Off	Not set	Ongoing call to Secretary is held. Boss is called.
				CF-A	Ongoing call to Secretary is held. Call is routed to another Station.
				CF-B	Ongoing call to Secretary is held. Call is forwarded to Boss' Station.
				CF-D	Ongoing call to Secretary is held. After Boss is called, predesignated Station is called.
Transfer	2-Party Call	2-Party Call	ON	Not set	Call Waiting is set.
				CF-A	
				CF-B	
				CF-D	
Transfer	2-Party Call	Receiving Call	Flashing	Not set	No Operation

7. Conditions for MULTI-BOSS/MULTI-SECRETARY AWAY PER BOSS

7.1 Conditions

(a) This feature is unavailable for SOFT PHONE WIRED-PHONE HANDSET [S-147].

(b) The maximum number for registered Secretary Terminals per Boss is 21 terminals.

(c) This feature notifies the setting/cancelling status of MULTI-BOSS/ MULTI-SECRETARY AWAY PER BOSS by Service Set Facility Request (SSFR) or by Service Set Facility Notification (SSFN) from OAI.

(d) SECRETARY ABSENT has priority over AWAY PER BOSS when the Secretary is ABSENT from all Secretary Groups it belongs to.

(e) A Secretary can set MULTI-BOSS/MULTI-SECRETARY AWAY PER BOSS to a maximum of 10 Bosses.

(f) If initialization process is executed, the setting for this feature is cancelled.

(g) The setting status for this feature will be saved even if the Terminal is logged out.

(h) Even if the setting were executed using a Sub Line, the feature is set to My Line.

(i) If setting MULTI-BOSS/ MULTI-SECRETARY AWAY PER BOSS is unavailable, due to reasons such as the Secretary not belonging to the Boss' Secretary Group, the user hears Reorder Tone (ROT). The LCD will display an error message.

(j) If a Boss Group becomes non-existent, settings for MULTI-BOSS/ MULTI-SECRETARY AWAY PER BOSS assigned to that Boss becomes void.

(k) If MULTI-BOSS/ MULTI-SECRETARY AWAY PER BOSS is set to a Boss Group which already has that feature set, the user hears Reorder Tone (ROT). LCD will display an error message.

(l) If the cancelling procedure is executed for a Boss Group where MULTI-BOSS/ MULTI-SECRETARY AWAY PER BOSS is not set, the user hears Reorder Tone (ROT). LCD will display an error message.

(m) MULTI-BOSS/ MULTI-SECRETARY AWAY PER BOSS cannot be set to the last available terminal in a Boss Group. When attempted, the user hears Reorder Tone (ROT). LCD will display an error message.

7.2 Interactions

(a) MULTI-BOSS/ MULTI-SECRETARY AWAY PER BOSS is also available for Uniform Call Distribution (UCD) Group by dialing the access code and\ pilot (controlling) Station's number from the member Station. The maximum number of Stations within a UCD Group is 21.

8. Conditions for MULTI-BOSS/MULTI-SECRETARY OVERRIDING FROM A SECRETARY'S CALL FORWARDING DESTINATION

8.1 Conditions

(a) Stations including Standard SIP terminals are available to be used as a forwarding destination.

(b) When the Secretary's Station sets a station as a Call Forwarding destination, Overriding the Boss' Station line from a Secretary's Call Forwarding Destination is activated.
When the Secretary's Station sets a trunk line as a Call Forwarding destination, a call to Boss' Station slides to the Secretary's Station although the destination performs the Overriding operation after answering the call.

(c) When high-order Secretary's Stations have CALL FORWARDING - ALL CALLS [C-5]/CALL FORWARDING - DON'T ANSWER [C-3] set, a call does not slide to low-order Secretary's Stations.

(d) There is no limit to the number of Secretary's Stations which can have CALL FORWARDING - ALL CALLS [C-5]/CALL FORWARDING - DON'T ANSWER [C-3] set.

8.2 Interactions

(a) This feature supports only CALL FORWARDING - ALL CALLS [C-5]/CALL FORWARDING - DON'T ANSWER [C-3]. When a forwarding destination of CALL FORWARDING - BUSY LINE [C-2] answers a call and places the call to the Boss' Station, the call slides to the Secretary's Station.

(b) This feature cannot be used by a Secretary's Station which has SPLIT CALL FORWARDING [S-99] set.

(c) Calls cannot be placed to the Boss' Station in the following cases.

- An incoming call is forwarded to an unexpected destination which is not a forwarding destination of CALL FORWARDING - ALL CALLS [C-5]/CALL FORWARDING - DON'T ANSWER [C-3] set by the Secretary's Station due to MULTIPLE CALL FORWARDING - ALL CALLS [M-44].
- A forwarded incoming call is picked up with the Call Pickup features by an unexpected station which is not a forwarding destination of CALL FORWARDING - ALL CALLS [C-5]/CALL FORWARDING - DON'T ANSWER [C-3] set by the Secretary's Station.

- A forwarded incoming call is answered by an unexpected station which is not a forwarding destination of CALL FORWARDING - ALL CALLS [C-5]/CALL FORWARDING - DON'T ANSWER [C-3] set by the Secretary's Station due to UNIFORM CALL DISTRIBUTION (UCD) [U-1]/Station Hunting features.

(d) Do not set any other Call Forwarding features to a forwarding destination of CALL FORWARDING - ALL CALLS [C-5]/CALL FORWARDING - DON'T ANSWER [C-3] set by the Secretary's Station.

(e) Multi-Boss/Multi-Secretary queuing is not supported by a forwarding destination which the Secretary's Station sets.

(f) When a forwarding destination set by the Secretary's Station is Attendant Console/Night Attendant Console, this feature is not supported. The call placed by the forwarding destination to Boss' Station slides to the Secretary's Station.

(g) MULTI-BOSS/MULTI-SECRETARY-ONE TOUCH: Overriding from a Busy Secretary's Station is available only with Secretary's Stations. Overriding is unavailable from a forwarding destination while holding another line.

(h) When a forwarding destination of CALL FORWARDING - ALL CALLS [C-5] is in busy state or the forwarding destination has DO NOT DISTURB -D [D-11D] set, the Call Forwarding feature is not activated. An incoming call slides to the low-order Secretary's Station.

(i) When the Boss' Station is in busy state and activates BOSS ABSENT, an incoming call slides to the low-order Secretary's Station even if the high-order Secretary's Station has Call Forwarding features set.

(j) When the Boss' Station is in idle state and deactivates BOSS ABSENT, an incoming call arrives at the Boss' Station.

(k) The table shows behaviors depending on the forwarding destination of CALL FORWARDING - ALL CALLS [C-5] set by the Secretary's Station.

<table>
<tr><th>Forwarding Destination State</th><th>Boss Secretary Group which Forwarding Destination Belongs</th><th>Behavior</th></tr>
<tr><td>Boss' Station with BOSS ABSENT set</td><td rowspan="2">Same group as the Secretary's Station.</td><td rowspan="3">The Call Forwarding feature is inactivated.
The call slides to the low-order Secretary's Station in the same Boss Secretary Group.</td></tr>
<tr><td>Secretary's Station with SECRETARY ABSENT set</td></tr>
<tr><td>Boss' Station with BOSS ABSENT set</td><td>Different group from the Secretary's Station.</td></tr>
<tr><td>Secretary's Station with SECRETARY ABSENT set</td><td>Different group from the Secretary's Station.</td><td>Call Forwarding is activated.
The call is forwarded to the forwarding destination.</td></tr>
</table>

(l) The table shows behaviors when CALL FORWARDING - ALL CALLS [C-5]/CALL FORWARDING - DON'T ANSWER [C-3] is set to the Secretary's Station along with any of the following features. Also shows behaviors when the Secretary's Station becomes any of these states.

<table>
<tr><th rowspan="2">Features/State</th><th colspan="2">Behavior</th></tr>
<tr><th>When CALL FORWARDING - ALL CALLS [C-5] is Set</th><th>When CALL FORWARDING - DON'T ANSWER [C-3] is Set</th></tr>
<tr><td>MOBILITY ACCESS (MA) [M-118] (MA CALL FORWARDING)</td><td rowspan="3">CALL FORWARDING-ALL CALLS [C-5] is activated.</td><td rowspan="8">The call slides to a low-order Secretary's Station.</td></tr>
<tr><td>LOGGED OUT IP STATION - CALL DESTINATION [L-53] (Secretary's Station logs out.)</td></tr>
<tr><td>DO NOT DISTURB -D [D-11D]</td></tr>
<tr><td>UNIFORM CALL DISTRIBUTION (UCD) [U-1] (Busy Out)</td><td rowspan="3">The call slides to a low-order Secretary's Station.</td></tr>
<tr><td>MULTI-BOSS/MULTI-SECRETARY AWAY PER BOSS</td></tr>
<tr><td>Secretary’s Station is in lockout.</td></tr>
<tr><td>NUMBER SHARING [N-45]</td><td>CALL FORWARDING-ALL CALLS [C-5] is activated.</td></tr>
<tr><td>Secretary’s Station is in busy state</td><td>The call slides to a low-order Secretary's Station.</td></tr>
</table>

9. Conditions for MULTI-BOSS/MULTI-SECRETARY BOSS’ CALL FORWARDING ACTIVATE

9.1 Conditions

(a) Stations including Standard SIP terminals are available to be used as a forwarding destination.

(b) When a Secretary’s Station sets CALL FORWARDING - ALL CALLS [C-5]/CALL FORWARDING - DON'T ANSWER [C-3] and sets a station as a forwarding destination in the same office, terminating a call to Boss’ Station by Overriding is allowed (See “11. MULTI-BOSS/MULTI-SECRETARY Overriding from a Secretary’s Call Forwarding Destination”). When the Secretary’s Station sets a trunk line as a forwarding destination, terminating a call to Boss’ Station by Overriding is restricted.

(c) When the Boss’ Station has CALL FORWARDING - DON’T ANSWER - OUTSIDE [C-74] set, incoming call to the Boss’ Station slides to the Secretary’s Station. Even if the Secretary’s Station answers the sliding call, performs switch hook flash, rings the Boss’ Station and the Boss’ Station does not answer the call, CALL FORWARDING - DON’T ANSWER - OUTSIDE [C-74] is not activated and the Secretary’s Station continues ringing the Boss’ Station.

9.2 Interactions

(a) This feature cannot be used by a Boss' Station which has SPLIT CALL FORWARDING [S-99] set.

(b) Boss' Station needs to be in login status.

(c) The following shows the order of priority for Call Forwarding features in the Boss' Station when a Boss' Station has set the following features:

Note: Order of priority may be changed by the following data assignments.
- ASFC/ASFCN, SFI=209, RES=1
- (Priority of (3) Call Forwarding-All Calls > (2) Logged Out IP Station - Call Destination)
- ASFC/ASFCN, SFI=240, RES=1
- (Change of the priority for (4) MA Call Forwarding > (2) Logged Out IP Station - Call Destination/Call Forwarding-All Calls)

Order of Priority When BOSS ABSENT is Set
(MULTI-BOSS/MULTI-SECRETARY BOSS' CALL FORWARDING ACTIVATE is In Service)

- When a Third Party Places a Call to Boss' Station

Call Forwarding Features	
(1) NUMBER SHARING [N-45] (When call forwarding is assigned to a sub-station) (2) LOGGED OUT IP STATION-CALL DESTINATION [L-53] (6) MULTI-BOSS/MULTI-SECRETARY [M-120] **Note 4** (3) CALL FORWARDING-ALL CALLS [C-5] (4) MOBILITY ACCESS (MA) [M-118] (MA CALL FORWARDING) **Note 6** (5) SURVIVABLE REMOTE MGC [S-141] (Automatic Re-routing when SR-MGC is in Operating Mode) (7) UNIFORM CALL DISTRIBUTION (UCD) [U-1] (8) CALL FORWARDING-BUSY LINE [C-2] (9) STATION HUNTING-TERMINAL [S-9] (10) DO NOT DISTURB -D [D-11D] (11) CALL FORWARDING-DON'T ANSWER [C-3]	**High Priority**  **Low Priority**

- When Secretary's Station Places a Call to Boss' Station

Call Forwarding Features	
(1) NUMBER SHARING [N-45] (When call forwarding is assigned to a sub-station) (2) LOGGED OUT IP STATION-CALL DESTINATION [L-53] (3) CALL FORWARDING-ALL CALLS [C-5] **Note 5** (6) MULTI-BOSS/MULTI-SECRETARY [M-120] (4) MOBILITY ACCESS (MA) [M-118] (MA CALL FORWARDING) **Note 6** (5) SURVIVABLE REMOTE MGC [S-141] (Automatic Re-routing when SR-MGC is in Operating Mode) (7) UNIFORM CALL DISTRIBUTION (UCD) [U-1] (8) CALL FORWARDING-BUSY LINE [C-2] (9) STATION HUNTING-TERMINAL [S-9] (10) DO NOT DISTURB -D [D-11D] (11) CALL FORWARDING-DON'T ANSWER [C-3]	**High Priority** ↕ **Low Priority**

Note 4: When a third party places a call to the Boss' Station, CALL FORWARDING - ALL CALLS [C-5] set to the Boss' Station is not activated, but the call slides to the Secretary's Station according to MULTI-BOSS/MULTI-SECRETARY [M-120].

Note 5: When the Secretary's Station places a call to the Boss' Station, CALL FORWARDING - ALL CALLS [C-5] set to the Boss' Station is activated without Sliding Action.

Note 6: MOBILITY ACCESS (MA) [M-118] (MA CALL FORWARDING) is not activated when the Boss' Station receives an incoming call by DIRECT-IN TERMINATION (DIT) [D-7].

Order of Priority When BOSS ABSENT is Set
(MULTI-BOSS/MULTI-SECRETARY BOSS' CALL FORWARDING ACTIVATE is Out of Service)

Call Forwarding Features	
(1) NUMBER SHARING [N-45] (When call forwarding is assigned to a sub-station) (2) LOGGED OUT IP STATION-CALL DESTINATION [L-53] (3) CALL FORWARDING-ALL CALLS [C-5] (4) MOBILITY ACCESS (MA) [M-118] (MA CALL FORWARDING) **Note 6** (5) SURVIVABLE REMOTE MGC [S-141] (Automatic Re-routing when SR-MGC is in Operating Mode) (6) MULTI-BOSS/MULTI-SECRETARY [M-120] (7) UNIFORM CALL DISTRIBUTION (UCD) [U-1] (8) CALL FORWARDING-BUSY LINE [C-2] (9) STATION HUNTING-TERMINAL [S-9] (10) DO NOT DISTURB -D [D-11D] (11) CALL FORWARDING-DON'T ANSWER [C-3]	**High Priority** ↕ **Low Priority**

See the following table when the order of priority is changed by the ASFC/ASFCN SFI=209/240 Data Assignment.

Call Forwarding Features
(1) NUMBER SHARING [N-45] (When call forwarding is assigned to a sub-station)
(2) LOGGED OUT IP STATION-CALL DESTINATION [L-53]*
(3) CALL FORWARDING-ALL CALLS [C-5]*
(4) MOBILITY ACCESS (MA) [M-118] (MA CALL FORWARDING) **Note 6**
(5) SURVIVABLE REMOTE MGC [S-141] (Automatic Re-routing when SR-MGC is in Operating Mode)
(6) MULTI-BOSS/MULTI-SECRETARY [M-120]*
(7) UNIFORM CALL DISTRIBUTION (UCD) [U-1]
(8) CALL FORWARDING-BUSY LINE [C-2]
(9) STATION HUNTING-TERMINAL [S-9]
(10) DO NOT DISTURB -D [D-11D]
(11) CALL FORWARDING-DON'T ANSWER [C-3]

		Logout	(1)(4)**(6)(3)(2)**(5)(7)(9)(10)	(1)**(3)(2)**(4)(5)**(6)**(7)(9)(10)

Note 7: See the line of "Login" in the "Boss' Station Status" column when the Boss' Secretary Station is a non-IP terminal.

Note 8: When a third party places a call to the Boss' Station, CALL FORWARDING - ALL CALLS [C-5] set to the Boss' Station is not activated, but the call slides to the Secretary's Station according to MULTI-BOSS/MULTI-SECRETARY [M-120].
When the Secretary's Station places a call to the Boss' Station, CALL FORWARDING - ALL CALLS [C-5] set to the Boss' Station is activated without Sliding Action.

(i) Here shows a condition when a Boss' Station has CALL FORWARDING - ALL CALLS [C-5]/ CALL FORWARDING - DON'T ANSWER [C-3] set and the forwarding destination is another Boss' Station belonging to a different Boss Secretary Group.

When there are multiple Boss Secretary Groups in the following states:

[Group A]

- Member: Boss-A, Secretary 1-A, Secretary 2-A, Secretary 3-A, Stand-In Secretary-A
- Boss-A has CALL FORWARDING-ALL CALLS [C-5] set (Forwarding Destination: Boss-B).

[Group B]

- Member: Boss-B, Secretary 1-B, Secretary 2-B, Secretary 3-B
- Boss-B has BOSS ABSENT set.

Secretary 1-A/Stand-In Secretary-A places a call to the Boss-A, CALL FORWARDING-ALL CALLS [C-5] set to Boss-A is activated and the call is forwarded to Boss-B. The forwarded call to the Boss-B slides to the Secretary 1-B due to BOSS ABSENT set to Boss-B. **Note 9**

Note 9: When MULTI-BOSS/MULTI-SECRETARY Overriding from a Secretary's Call Forwarding Destination is in service, the call arrives at Secretary 1-B can be forwarded to a destination of CALL FORWARDING-ALL CALLS [C-5]/CALL FORWARDING - ALL CALLS - OUTSIDE [C-28] which the Secretary 1-B sets.

10. Conditions for MULTI-BOSS/MULTI-SECRETARY OVERRIDING FROM A STAND-IN SECRETARY

10.1 Conditions

(a) Up to seven (two by default) Stand-In Secretary's Stations per Boss Secretary group can be set by the system data assignment (ASYDL/ASYDN SYS1 Index 1089 Bit 0-2).

(b) Do not include a station accommodated in a different node in a Boss Secretary group.

10.2 Interactions

(a) This feature cannot be used by a Secretary's Station which has SPLIT CALL FORWARDING [S-99] set.

(b) Multi-Boss/Multi-Secretary queuing does not support Stand-In Secretary's Station.

(c) MULTI-BOSS/MULTI-SECRETARY-ONE TOUCH: Overriding from a Busy Secretary's Station is available for the Secretary's Station only. Overriding from a Stand-In Secretary's Station in a busy state is not available.

11. Conditions for MULTI-BOSS/MULTI-SECRETARY MULTI LINE OPERATION

11.1 Conditions

(a) To set BOSS or SECRETARY ABSENT by pressing a Line/Feature key or a Soft key after seizing the Main Boss' or the Main Secretary's Station Line on the Substitute Station, assign the key for UCD Busy Out (FKY=19) to a Line/Feature key or a Soft key of the Substitute Station.

(b) To enable the MULTI-BOSS/MULTI-SECRETARY-ONE TOUCH: Overriding from a Busy Secretary's Station feature by seizing the Main Secretary's Station Line from the Substitute Station, assign a Call Park Group Number (GPN) to the Substitute Station using the ACPSN command.

(c) Do not assign the Main Boss' Station Line to the Main Secretary's Station as a Prime Line.

11.2 Interactions

(a) This feature cannot be used in combination with PS Line Appearance on Dterm [P-71] and SIP Multiple Line Operation [S-160].

(b) Even if Boss Secretary Multi Line Operation is enabled, a Boss' Station Line cannot be seized from a Secretary's Station if the Boss and the Secretary belong to different Boss Secretary Groups.
If a Secretary presses a Boss' Line whose Boss belongs to a different Boss Secretary Group, key operation becomes invalid (there is no reaction).

Note: If a Secretary presses a Boss' Station Line whose Boss and the Secretary belong to the same Boss Secretary Group, MULTI-BOSS/MULTI-SECRETARY-ONE TOUCH is activated.

Hardware and Firmware Conditions

None

Programming

1. Common Programming

STEP 1: **ASYDL/ASYDN** - System Data 1, Index 1140, Bit 2 (Group Number Expansion for Multi Boss Secretary Group): 0/1 = Out of service/In service

STEP 2: **ASYD**-System Data 1, Index 60, Bit 3=0/1: UCD Queuing is provided/Not provided.
Select UCD queuing if necessary. **Note 1**

STEP 3: **ASHUEN [Network Data Memory (NDM)]**-Assign Telephone Number for Secretary Group.

UGN: User Group Number (1-255)
Assign "1" if Dial Plan to support IP Centrex Functionality is not used.

TELN: Telephone Number (maximum 16 digits)
Assign Telephone Number of Boss' Station. **Note 2**

Kind of Group 0: Multi Group Station - UCD
1: Multi-Boss/Multi-Secretary Group

[Station List in Group]

TELN: Telephone Number of UCD Member Station

FPC: Fusion Point Code (1-253)
FPC where each Station belongs is displayed.

Note 1: Refer to UCD Queuing service assignment regarding queuing features.

Note 2: Turn ON checkbox for "Multi Boss Secretary Group".

2. Programming for Boss' Station

STEP 1: **ASFC/ASFCN** - Allow Service Feature Restriction Class (SFC) for this feature.
SFI 252=1 (MULTI-BOSS/MULTI-SECRETARY)

STEP 2: **ANPD/ANPDN** - Assign the minimum number of digits that is required to the first digit received (pre-translation) to determine that the Access Code is for BOSS ABSENT.

STEP 3: **ASPA/ASPAN** - Assign Access Code to set BOSS ABSENT. **Note 1**

- CI="N: Normal"
  SRV="SSCA: Service Code Appendix"
  SIDA=50 (Set BOSS ABSENT)

- CI="N: Normal"
  SRV="SSCA: Service Code Appendix"
  SIDA=51 (Cancel BOSS ABSENT)

Note 1:
- To use the Line/Feature key:
  AKYD (Assignment of key data for Desktop Terminal)
  FKY=19 (Assign/Cancel UCD Busy Out)

- To use the Soft key:
  ADSL [Assignment of Desktop Terminal Soft key on LCD (LDM)]
  SN=0/4 (Line is idle/Line is busy)
  FKY=19 (Assign/Cancel UCD Busy Out)

3. Programming for Secretary's Station

STEP 1: **ASFC/ASFCN** - Allow Service Feature Restriction Class (SFC) for this feature.
SFI 252=1 (MULTI-BOSS/MULTI-SECRETARY)

STEP 2: **ANPD/ANPDN** - Assign the minimum number of digits that is required to the first digit received (pre-translation) to determine that the Access Code is to set SECRETARY ABSENT or BOSS ABSENT from Secretary's Station.

STEP 3: **ASPA/ASPAN**

Assign Access Code for SECRETARY ABSENT. **Note 1**

- CI="N: Normal"
  SRV="SSCA: Service Code Appendix"
  SIDA=50 (Set SECRETARY ABSENT)

- CI="N: Normal"
  SRV="SSCA: Service Code Appendix"
  SIDA=51 (Cancel SECRETARY ABSENT)

Assign Access Code for BOSS ABSENT from Secretary's Station.

- CI="N: Normal"
  SRV="SSCA: Service Code Appendix"
  SIDA=164 Set BOSS ABSENT from Secretary's Station

- CI="N: Normal"
  SRV="SSCA: Service Code Appendix"
  SIDA=165 Cancel BOSS ABSENT from Secretary's Station

Note 1:
- To use the Line/Feature key:
  AKYD (Assignment of Key Data for Desktop Terminal)
  FKY=19 (Assign/Cancel UCD Busy Out)

- To use the Soft key:
  ADSL [Assignment of Desktop Terminal Soft key on LCD (LDM)]
  SN=0/4 (Line is idle/Line is busy)
  FKY=19 (Assign/Cancel UCD Busy Out)

4. Programming for MULTI-BOSS/MULTI-SECRETARY-ONE TOUCH

STEP 1: **AKYD/AKYD_T** - Assign Key Data for Desktop terminal.

- This command assigns Boss' Station number in addition to My Line for Secretary's Station's multi-line.
- Assigning another Secretary's line as a multi-line is also possible.
- The above assumes that the Telephone Numbers for Boss' Station and Secretary's Station are pre-assigned.

STEP 2: **ASHUEN [Network Data Memory (NDM)]**-Assign Telephone Number for Secretary Group.

UGN: User Group Number (1-255)
Assign "1" if Dial Plan to support IP Centrex Functionality is not used.

TELN: Telephone Number (maximum 16 digits)
Assign Telephone Number of Boss' Station. **Note 1**

Kind of Group 0: Multi Group Station - UCD
1: Multi-Boss/Multi-Secretary Group

[Station List in Group]

TELN: Telephone Number of UCD Member Station

FPC: Fusion Point Code (1-253)
FPC where each Station belongs is displayed.

STEP 3: **ASYDL/ASYDN** - System Data 1, Index 1140, Bit 1=1: Assignment of Boss Line to Secretary Terminal's Sub Line enabled. **Note 2**, **Note 3**

Note 1: Turn ON checkbox for "Multi Boss Secretary Group."

Note 2: When executing Direct Call Pickup, Override and Call Waiting features using the Boss' Line key, refer to each feature entry regarding office data settings such as system data or SFI. Assign if necessary.

Note 3: Keep in mind the following when assigning office data for Call Waiting features:

- When Call Forwarding a Station call, allow Service Feature Restriction Class (SFC) for Call Waiting-Originating (Calling) to that Station.
- When Call Forwarding a trunk call, allow Call Waiting to its route class (CDN=46).

4.1 Overriding from a Secretary's Station

STEP 1: **ASFC/ASFCN** - Allow Service Feature Restriction Class (SFC) for this feature.

- Allow Service Feature Restriction Class (SFC) for Overriding.
  - Assignment for Boss' Station:
    SFI 4=1 [Executive Right-of-Way (Called)]
  - Assignment for Secretary's Station:
    SFI 3=1 [Executive Right-of-Way (Calling)]
- Allow Service Feature Restriction Class (SFC) for Call Park Deluxe feature.
  - Assignment for Secretary's Station:
    SFI 220=1 (Call Park Deluxe Entry)
  - Assignment for Station being Call "Parked:"
    SFI 68=1 (Call Park-Called)

STEP 2: **AKYD** - Assign Key Data for Desktop terminal.
- Assignment for Secretary's Station:
  FKY=158 (Call Park Deluxe-Hold/Retrieve-1)

STEP 3: **ASCS/ACPSL/ACPSN** - Assignment of Call Park Deluxe Group for Data Memory.

STN: Enter the Secretary's Station number.
GPN: Assignment of Call Park Group Number.
If one GPN is assigned per Secretary, the Line/Feature Key number for every Secretary's Desktop terminal can be unified to "158."

STEP 4: **ASYD** - System Data 1, Index 142: Assign Automatic Recall Timer for Call Park Deluxe service.
When "0" (default) is assigned, the timer is set to 500 seconds.

4.2 Overriding from a Busy Secretary's Station

To use this feature, assign the same data as "4.1 Overriding from a Secretary's Station"

4.3 Secretary's Terminal Answering Boss' Line Call

STEP 1: **ASFC/ASFCN** - Allow Service Feature Restriction Class (SFC) for Direct Call Pickup.
- Assignment for Secretary's Station:
  SFI 29=1 (Direct Call Pickup)

4.4 Call Waiting

STEP 1: **ASFC/ASFCN** - Allow Service Feature Restriction Class (SFC) for Call Waiting-Originating.
- Assignment for Boss' Station:
  SFI 6=1 [Call Waiting Originating (Called)]
  SFI 11=1 (Data Line Security)
- Assignment for Station communicating with the Secretary's Station:
  SFI 5=1 [Call Waiting Originating (Calling)]

STEP 2: **ARTD/ARTDN** - Assign Route Class Data.
- Assignment for Station communicating with the Secretary's Station:
  Parameter CDN=46
  CW=1 (Call Waiting= In Service)

5. Programming for MULTI-BOSS/MULTI-SECRETARY AWAY PER BOSS

Setting MULTI-BOSS/MULTI-SECRETARY AWAY PER BOSS

STEP 1: Pre-assign data settings for MULTI-BOSS/ MULTI-SECRETARY.

STEP 2: **ASYDL/ASYDN** - System Data 1, Index 1088, Bit 4=1: MULTI-BOSS/MULTI-SECRETARY AWAY PER BOSS enabled.

STEP 3: **ANPD/ANPDN** - Assign Numbering Plan.
This command assigns the minimum number of digits needed to determine the service (Telephone Number) that is required by the first digit received (pre-translation).

STEP 4: **ASPA/ASPAN** - Assign Special Access Code.
- CI="N: Normal"
  SRV="SSCA: Service Code Appendix"
  SIDA=166 (MULTI-BOSS/ MULTI-SECRETARY AWAY PER BOSS=Set)

- CI="N: Normal"
  SRV="SSCA: Service Code Appendix"
  SIDA=167 (MULTI-BOSS/ MULTI-SECRETARY AWAY PER BOSS=Cancel)

Canceling MULTI-BOSS/MULTI-SECRETARY AWAY PER BOSS

STEP 1: Delete data by executing the above setting process in reverse order.

STEP 2: Delete data for MULTI-BOSS/ MULTI-SECRETARY.

6. Programming for MULTI-BOSS/MULTI-SECRETARY OVERRIDING FROM A SECRETARY'S CALL FORWARDING DESTINATION

STEP 1: Pre-assign data settings for MULTI-BOSS/ MULTI-SECRETARY.

STEP 2: **ASYDL/ASYDN** - System Data 1, Index 1089, Bit 4=1: MULTI-BOSS/MULTI-SECRETARY Overriding from a Secretary's Call Forwarding Destination is in service.

7. Programming for MULTI-BOSS/MULTI-SECRETARY BOSS' CALL FORWARDING ACTIVATE

STEP 1: Pre-assign data settings for MULTI-BOSS/ MULTI-SECRETARY.

STEP 2: **ASYDL/ASYDN** - System Data 1, Index 1089, Bit 5=1: MULTI-BOSS/MULTI-SECRETARY Boss' Call Forwarding Activate is in service.

8. Programming for MULTI-BOSS/MULTI-SECRETARY OVERRIDING FROM A STAND-IN SECRETARY

STEP 1: Pre-assign data settings for MULTI-BOSS/ MULTI-SECRETARY.

STEP 2: **ASYDL/ASYDN** - System Data 1, Index 1089,

Bit 3=1:
MULTI-BOSS/MULTI-SECRETARY Overriding from a Stand-In Secretary is in service.

Bit 0-2:
Specify the number of Stand-In Secretary's Stations to be used with MULTI-BOSS/ MULTI-SECRETARY Overriding from a Stand-In Secretary **Note 1**

BIT2	BIT1	BIT0	Stand-In Secretaries
0	0	0	Secretaries 1 - 2 (Default)
0	0	1	
0	1	0	
0	1	1	Secretaries 1 - 3
1	0	0	Secretaries 1 - 4
1	0	1	Secretaries 1 - 5
1	1	0	Secretaries 1 - 6
1	1	1	Secretaries 1 - 7

Note 1: This data is valid when ASYDL/ASYDN, System Data 1, Index 1089 Bit 3=1 is set.

9. Programming for MULTI-BOSS/MULTI-SECRETARY MULTI LINE OPERATION

STEP 1: Pre-assign data settings for MULTI-BOSS/ MULTI-SECRETARY.

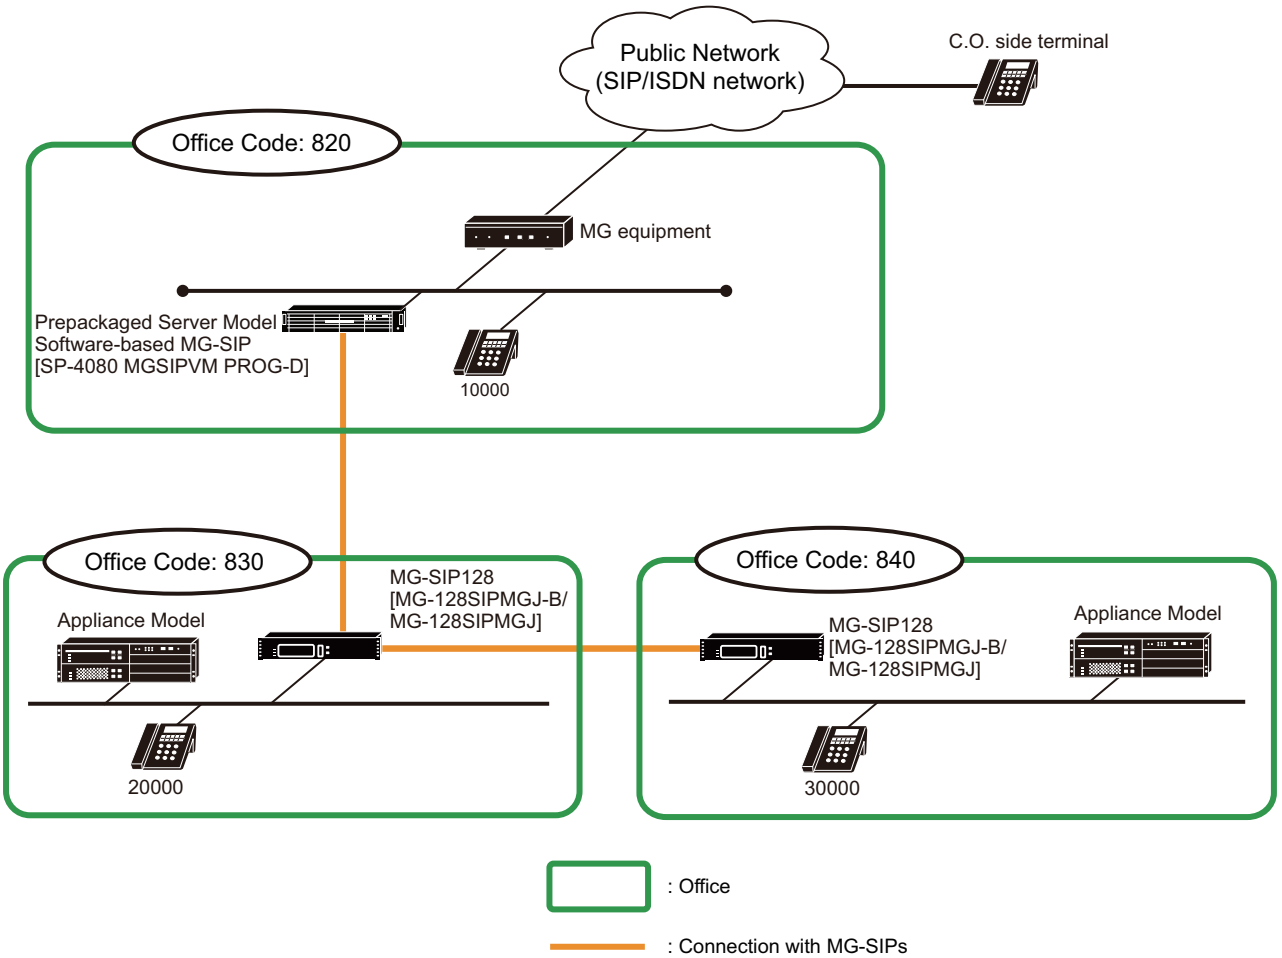
STEP 2: Pre-assign data settings for the Main Boss' Station number or/and the Main Secretary's Station number to Multi Line of Substitute Station. **Note 1**, **Note 2**

STEP 3: **ASYDL/ASYDN** - System Data 1, Index 1089, Bit 6=0:
MULTI-BOSS/MULTI-SECRETARY Multi Line Operation is in service.

Note 1: To use the Line/Feature key, assign the key data of the Substitute Station:
AKYD (Assignment of Key Data for Desktop Terminal)
FKY=19 (Assign/Cancel UCD Busy Out)

Note 2: To use the Soft key, assign the key data of the Substitute Station:
ADSL [Assignment of Desktop Terminal Soft key on LCD (LDM)]
SN=0/4 (Line is idle/Line is busy)
FKY=19 (Assign/Cancel UCD Busy Out)

M-122 MG-SIP TIE Line



General Description

This feature allows multiple offices to be connected by TIE Line through MG-SIPs.
With this feature, user information of the incoming C.O. calls can be shared with all offices that are connected with MG-SIP TIE Line.

Note: For using this feature, MG-SIP128 [MG-128SIPMGJ-B/MG-128SIPMGJ] or Software-based MG-SIP [SP-4080 MGSIPVM PROG-D] is required.

Note: Note the following terms in this context.

- A C.O. line refers to PSTN (ISDN/SIP network) in this feature.
- A SIP network refers to a network connected with MG-SIPs that is available for TIE Line in this feature.
- MG-SIP refers to MG-128SIPMGJ-B/MG-128SIPMGJ or Software-based MG-SIP [SP-4080 MGSIPVM PROG-D] in this feature.

Operating Procedure

None.

Service Conditions

<Important Notice>

1. The MG-SIP128 [MG-128SIPMGJ-B/MG-128SIPMGJ] or Software-based MG-SIP [SP-4080 MG-SIPVM PROG-D] where this feature is enabled cannot connect to PSTN and SIP server. For using this feature, be sure to use an MG-SIP128 [MG-128SIPMGJ-B/MG-128SIPMGJ] or Software-based MG-SIP [SP-4080 MGSIPVM PROG-D] as an opposite device.
2. This feature does not support ETSI OVERLAP SENDING AND RECEIVING [E-35] from ISDN network.

<Interactions with Other Features>

1. This feature cannot be used with SIP Register or Addressing/COLP feature of ETSI ISDN ADDRESSING [E-32].
2. This feature can be used with MG-SIP Shared Route [M-123]. However, both MG-SIP128 [MG-128SIP-MGJ-B/MG-128SIPMGJ] and MG-SIP connected to C.O. line cannot be registered for the same single route.
3. This feature can be used with Call-ID Notification on SMFN for SIP. However, when autonomous alternate routing by MG-SIP is used with MG-SIP Multipoint feature, Call-ID is not changed.
4. From FP95-114 V4 Issue 2.0, RTP encryption on Telephony Server network side is supported. RTP encryption on SIP network side is not supported. For details, see VOIP ENCRYPTION [V-27].

<Hardware/Software>

1. For using this feature, MG-SIP128 [MG-128SIPMGJ-B/MG-128SIPMGJ] is required.
2. This feature supports incoming call from only the following C.O. trunks.
    - MG(BRI)
    - MG(PRI)
    - MG(SIP)
    - BRT
    - PRT

<Interactions with Networks>

1. This feature does not support the tandem connection or call forwarding with TIE Lines (such as CCIS) other than TIE Line via MG-SIP.
2. Consider the following when making a tandem connection from MG-SIP TIE Line to an external trunk (ISDN).
   a.) When ARTI/ARTIN INBAND (CDN:29)=0 (In-band information is relayed):
   When a station user attempts to transfer a call to an external trunk and then performs transfer switchback operation while hearing audible sound such as In-band Busy Tone or announcement, the station user may continue to hear the audible sound even after the transfer switchback.
   b.) When ARTI/ARTIN INBAND (CDN:29)=1 (In-band information is not relayed):
   Since In-band tone such as Busy Tone or announcement from a public network becomes difficult to be transmitted to MG-SIP TIE Line, the calling party may not hear the announcement from the public network.

<Conditions Specific to This Feature>

1. Internal PHI-BRI is essential to perform this feature. Internal PHI-BRI is built into the Telephony Server and controls the Voice Procedure of the MG-SIP via TCP/IP.
2. The number of available Internal PHI-BRIs is one per system.
   Note: In UMGi system, the data assignment of Internal PHI-BRI is required per node (CCN/RN).
3. Virtual Trunk can be registered to Physical PIR or Virtual PIR.
4. The maximum number of MG-SIP an accommodated per system and available channels are as follows. However, note that a maximum number of simultaneous speech channels available per LP, including other ISDN channels, is 460.

DEVICE TYPE	MAXIMUM ACCOMMODATION PER SYSTEM		
	1 LPs	4 LPs	Channels per system
MG-SIP	11 devices	44 devices	6144 channels

Note: The maximum number of devices and channels per system is equivalent to capacity of the system. The number of devices varies depending on the total accommodated channels.

Note: When 6144 channels are occupied only by MG-SIP, other devices cannot be connected.

5. Only Voice, FAX, DTMF (PB Signaling) communication can be established by connections via MG-SIP. This feature does not support Unrestricted digital, Modem connection, SIP Instant Message [S-151] etc.

ITEM	SPECIFICATION	NOTE
Voice	G.711	64k [bps]: PCM μ-law/A-law
FAX	G.711 (PassThrough)	64k [bps]: PCM μ-law
DTMF	G.711 (PassThrough)	
	Proprietary method	Toward the Telephony Server network
	RTP (RFC2833)	Toward SIP network For DTMF Digits, Telephony Tones and Telephony Signals

Note: Depending on IP equipment or conditions of SIP network, the above conditions may not be applied for MG-SIP.

Note: Be sure to use G.711 for voice CODEC.

Note: When DTMF is sent via RFC2833, RTP Warning Tone may play back to the reception side.

Note: DTMF relay method on the SIP network side is set by the configuration command "dtmf_mode" on the MG-SIP. DTMF relay method on the Telephony Server network side is automatically set according to the one on the MG-SIP network side, as follows.

DTMF relay system on the SIP network side	DTMF relay system on the Telephony Server network side	Remarks
RFC2833 (out-band)	Proprietary (out-band)	Conversions between "RTP (DTMF: RFC2833) packets on SIP network" and "UDP (DTMF: Proprietary) packets on Telephony Server network"
G.711 PassThrough (in-band)	G.711 PassThrough (in-band)	Conversions between "RTP packets on SIP network" and "RTP packets on Telephony Server network"

6. Additional services (such as REFER) on the SIP procedure are not provided in this system.
7. Tone and holding tone to SIP network is generated by MG-SIP. When MGC (Internal PHI-BRI) external holding tone is selected by the ASYDL command, the information is provided via IPPAD card.
8. A single route can be shared by multiple MG-SIPs (maximum 2 devices). For details, refer to MG-SIP Shared Route [M-123].
9. MG Registration Status can be displayed by using the DIMG command.
10. Because MGC transfers only Voice RTP Payload, it is not concerned for Jitter-Buffer Control, Echo Canceler and PAD Control. The connection is controlled by end points.

11. MG-SIP can receive incoming calls through AUTOMATED ATTENDANT [A-82]/REMOTE ACCESS TO SYSTEM [R-2] under the following conditions.

    - AUTOMATED ATTENDANT [A-82]/REMOTE ACCESS TO SYSTEM [R-2] may not work properly, depending on the system configuration of the SV9500 network and the conditions for DTMF specifications in SIP network. (**Note 1**)
      The conditions of system configuration are as follows:

DTMF in SIP Network	Telephony Server	SR-MGC	System Configuration
Fax PassThrough	Available*	Unavailable	Set ARTI/ARTIN CDN77(RA_RT) = 1 (Register card is used). *PIR is required to use IPPAD. *IPPAD is required.
RFC2833	Available	Available	Set ARTI/ARTIN CDN77(RA_RT) = 0 (Virtual Register is used). *PIR is not required because Virtual Register is used.

Note 1: The specifications for DTMF in a SIP network vary depending on a carrier.

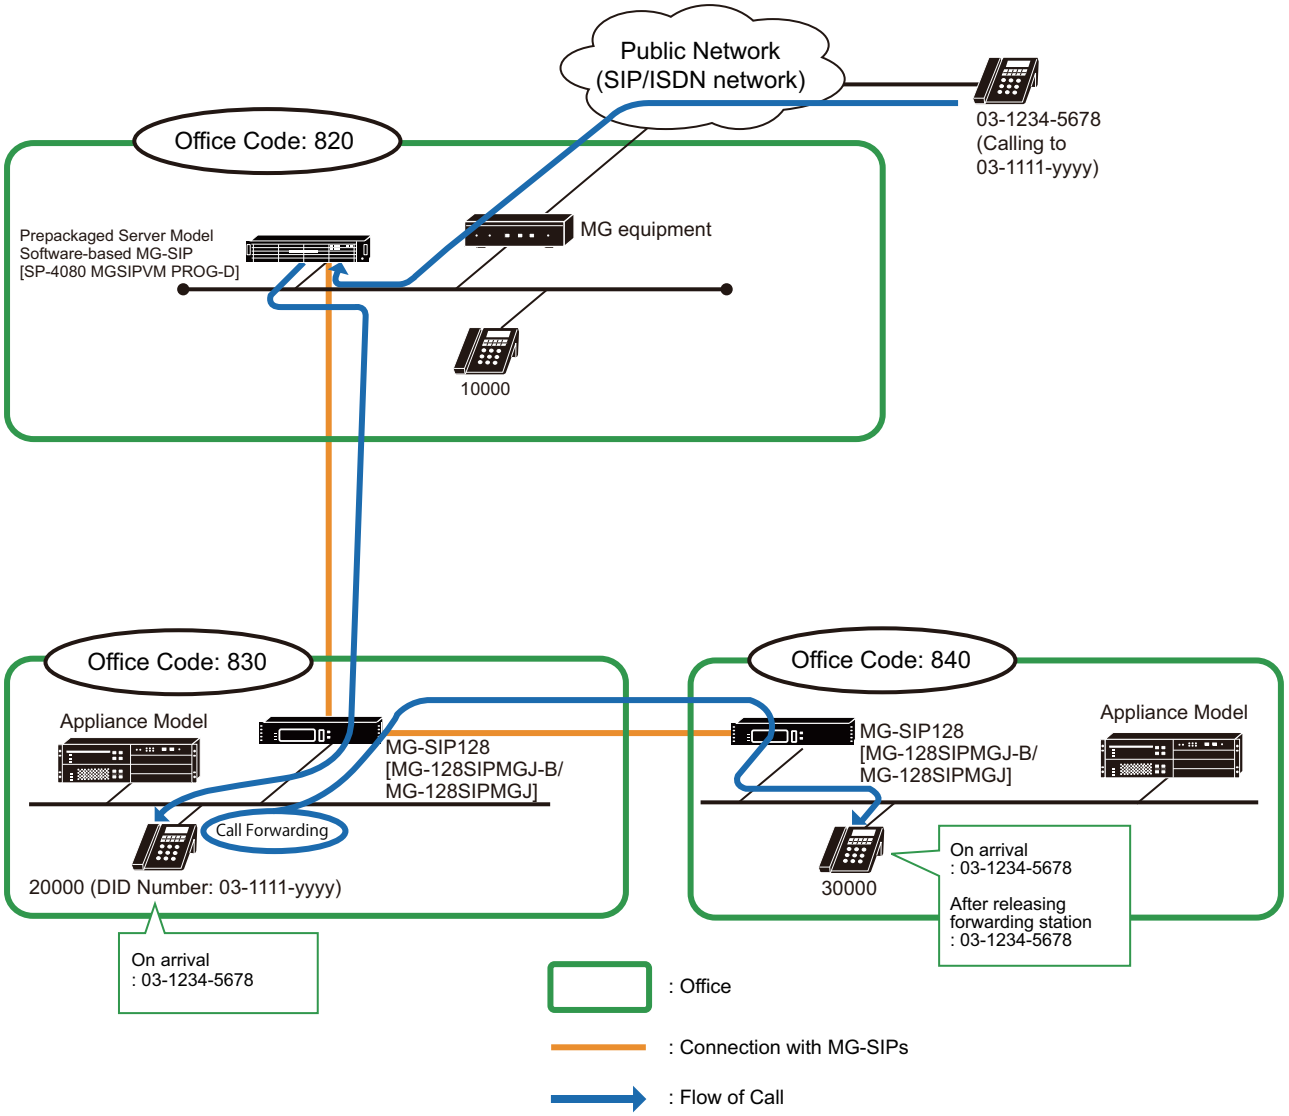
    - PB Receiver becomes invalid while receiving an announcement for AUTOMATED ATTENDANT [A-82]/REMOTE ACCESS TO SYSTEM [R-2].
    - After dialing a target telephone number, a beep may be heard before Ringback Tone (RBT), but it's not abnormal.

12. SERIAL CALL -D [S-127D] is not available for incoming call via MG-SIP.
13. MG-SIP does not support ring down feature.
14. To use VLAN feature of MG-SIP, connect switch supporting Port VLAN feature (Tag VLAN is not supported).
15. To use FAX communication feature of MG-SIP, specify the FAX settings by the ARTI/ARTIN command. The FAX communication has limitations as follows:
    * For details, refer to Command Manual.

    - FAX communication can be established only when G.711 is assigned to payload for Voice and FAX.
    - FAX communication can be established only when Payload Sizes for Voice and FAX are the same.
    - To establish FAX communication with SIP network via MG-SIP, be sure to assign G.711 as Payload Type for all the FAX accommodated in the system.

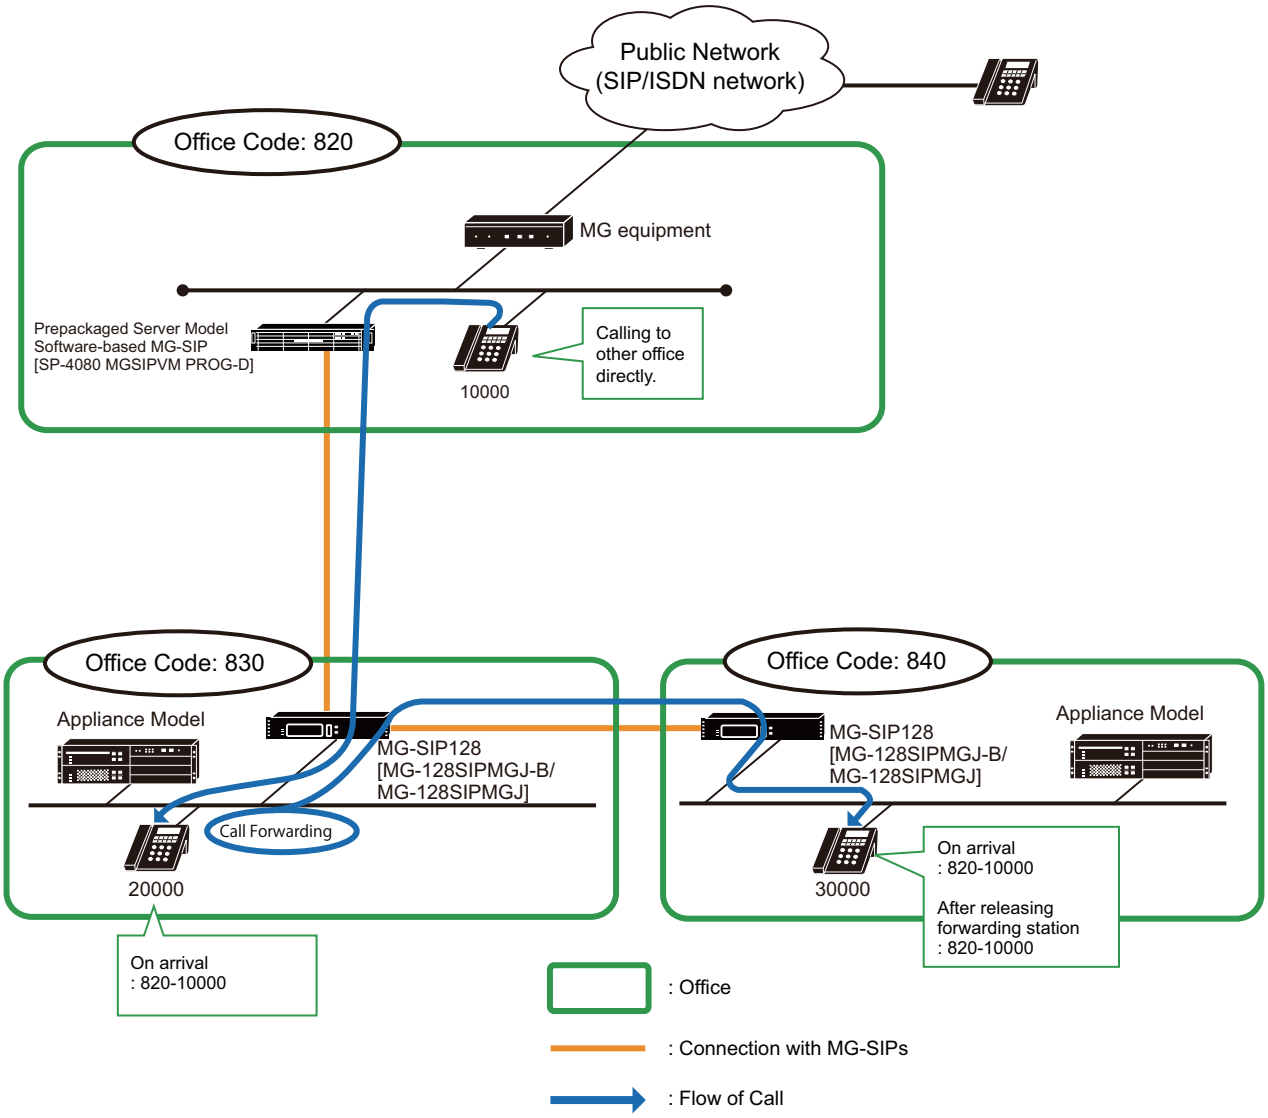
16. When connection failure on IP network occurs, alternate routing to PSTN line can be activated. However, because user information cannot be notified, this feature is not supported.
17. MG-SIP supports Individual Trunk Access [I-4] (through both Access Code and PCPro).
18. When the Telephony Server side terminal releases during a conversation after a temporary communication failure between the Telephony Server and MG-SIP, MG-SIP may not send disconnection signals to the SIP network.

19. Speech channel is established by Virtual trunk. When the MG-SIP Virtual Speech channels are registered to a HW (4-Group), channels other than Virtual Speech channels can not be registered to the same HW. To use more than 32-channels, register the channels per 32-channels from top channel on a HW. However, Virtual Speech channels are not required to register for a consecutive HWs.
20. This feature does not support the routing protocol.
21. The following figures show the conditions of the display content on LCD when a call is received.



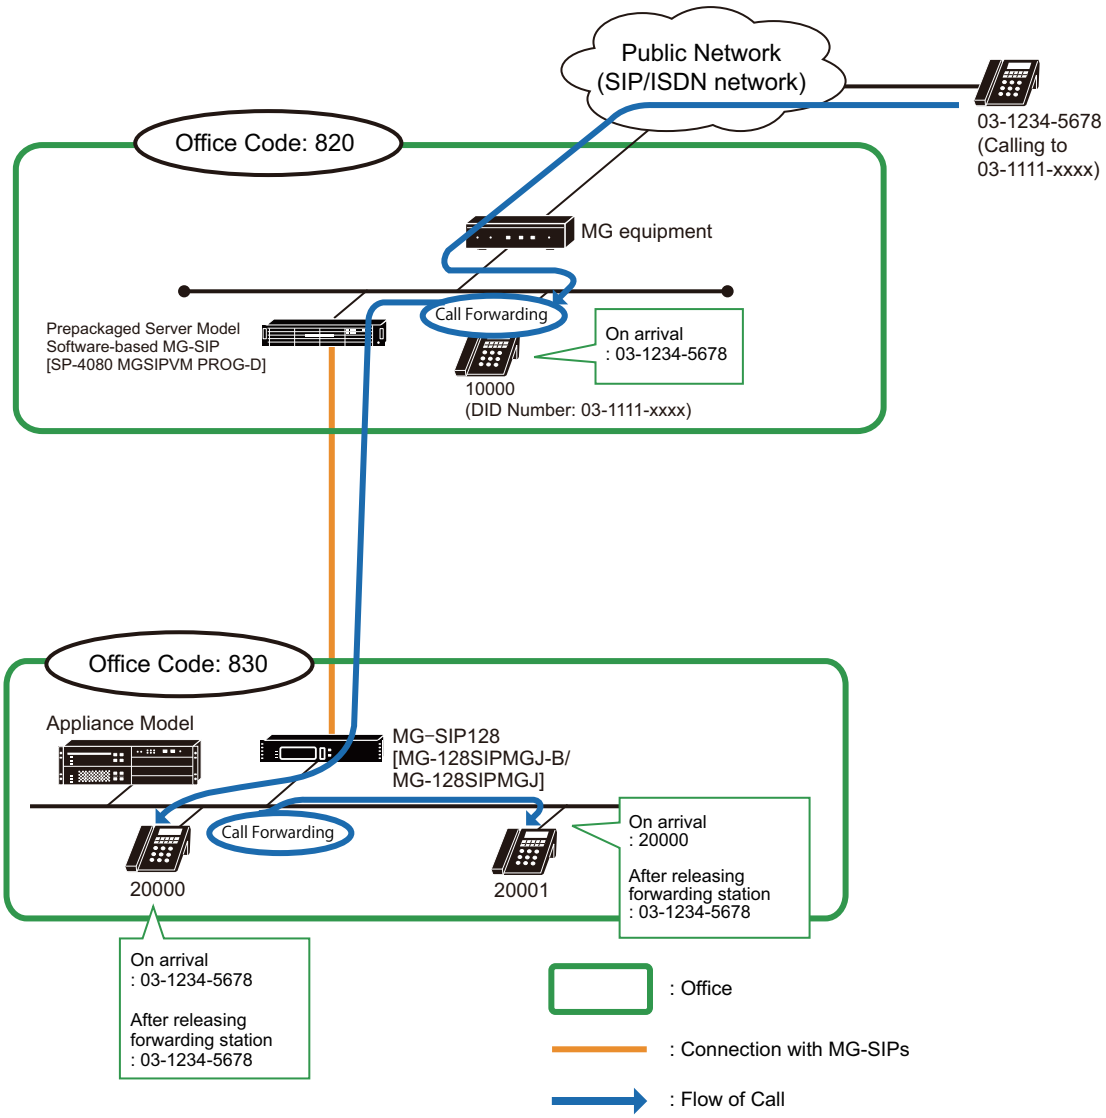
(a) Terminating a C.O. call

When an incoming C.O. call is forwarded to other office, even before a forwarding station releases the call, the Caller ID received from the C.O. line is displayed on the received terminal.



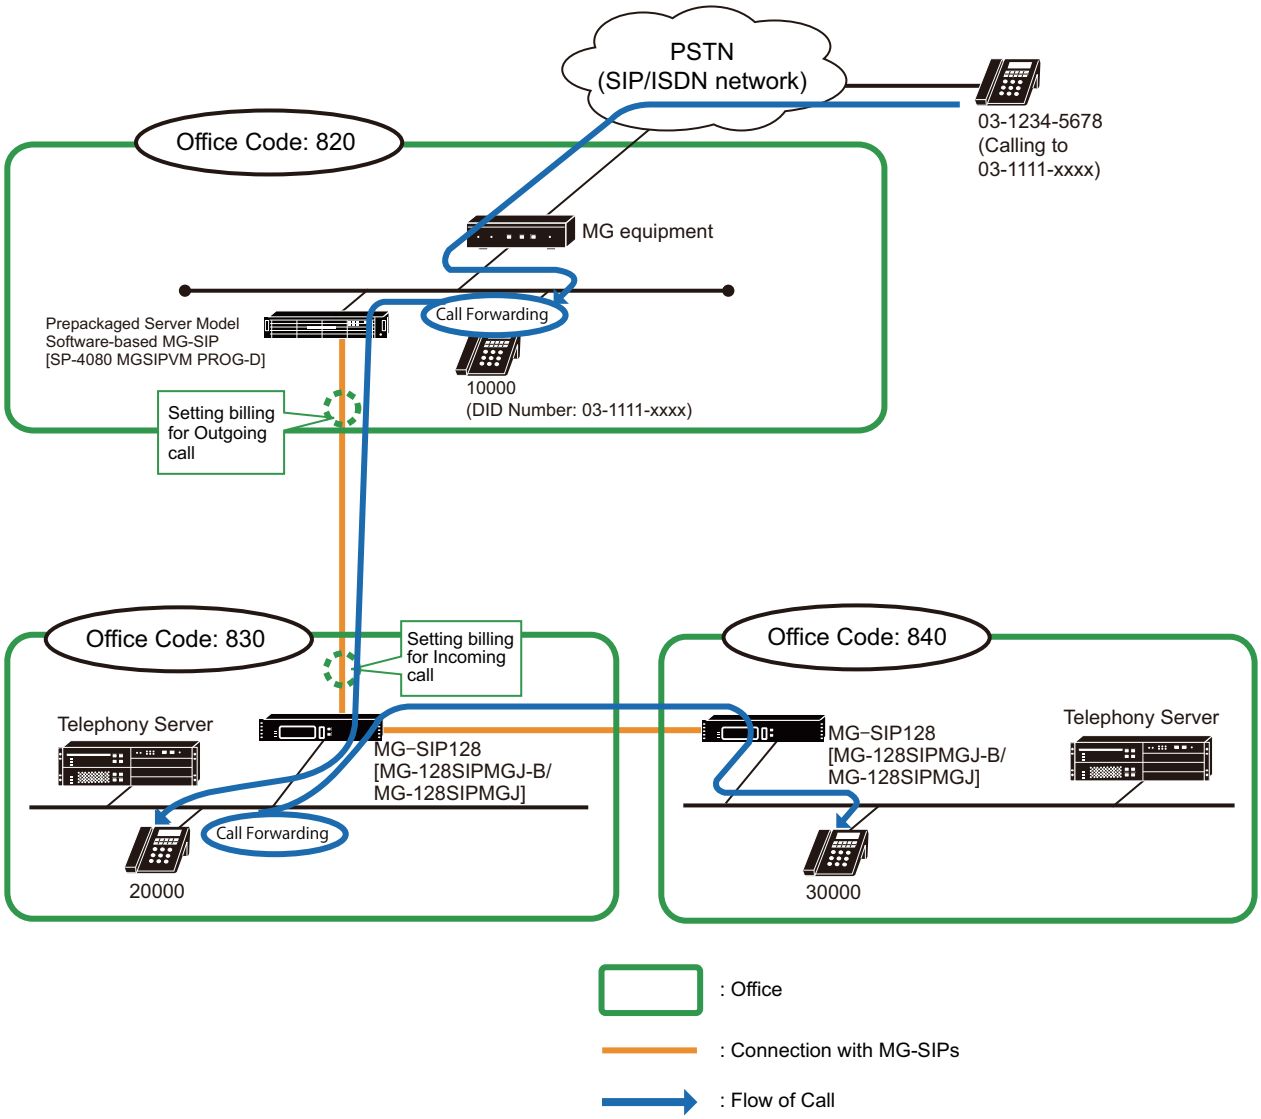
(b) Terminating a C.O. tandem call

When a C.O. tandem call is forwarded to other office, even before released the call by a forwarding station, the Caller ID received from C.O. line is displayed on the received terminal.



(c) Terminating a station call

When a call is originated from a station to opposite office, “Office Code + Station Number” is set as the Caller ID, and displayed on LCD. If the call is forwarded to another office, operations (a) or (b) on the previous pages apply.



(d) Terminating a C.O. call (Call Forwarding to a terminal within its own office)

When a call is forwarded to a terminal within the same office, the forwarding station number is displayed on LCD at the time of termination.

22. Because of above Service Condition 21. for LCD, when billing is set to MG-SIP for TIE Line, the number in the displayed billing information is as follows.

- Example when holding a C.O. call

(a) Billing for Incoming Call

- Holding a C.O. call

  Caller ID received from C.O. line (“03-1234-5678” in above figure), and not a forwarding station number (“10000” in above figure), is notified. Thus, the Caller ID “03-1234-5678” received from C.O. line is displayed in the billing information for incoming call.

- Holding a station call

  The held station number, other than a forwarding station number, is notified. Thus, the held station number is displayed in the billing information for incoming call.

  Note: Be sure to note the following conditions.
  - The forwarding station number is not displayed in the billing information.
  - Whether you actually talk with the terminal having the notified number or not, the number is displayed to the billing information.

(b) Billing for Outgoing Call

This feature does not have effect on Billing for Outgoing Call.

23. Because of the above Service Condition 21. for LCD, when billing is set for MG-SIP TIE Line, applications that display Call History cannot display the forwarding station number.
24. When an attendant console originates a call to the opposite office by using this feature, "OPE" is not displayed on the LCD of the called station. Instead, the LCD shows either the specific Attendant Number if it has been configured, or "TIE" if not.
25. When a tandem connection for other office is used with MG-SIP TIE Line, the Caller ID received from C.O. line is notified to the destination office.
26. If a C.O. call whose Caller ID is unknown is forwarded, the forwarding station number (Office Code + station number) is displayed on the destination station.
27. In this feature the system processes the timing of Guard Timer for Originating Call. Configure the settings for the timer via the system data (ASYD, SYS1, Index 474). Otherwise the settings are set to "256 ms".

<Tone Code by Countries>

MG-SIP128 plays Inband Tone by using Software Source. Tone Code by Countries is available under the following conditions.

(a) CODECs supported by TONE are: G.711μ-law/A-law only. MG-SIP does not support G.729a.

(b) "No Tone" data is set to TONE data for other CODECs (G.723.1(5.3K) and G.723.1(6.3K)).

(c) CODECs supported by DTMF are: G.711μ-law/A-law only.

(d) Music on Hold (MOH) is not supported.

(e) Short tone is not supported.

(f) This feature is available for the following services.
- Blind Transfer
- Calling to the tandem destination (Only in this case, Inband Tone RBT is sent to the station side.)
- Receiving REFER
- Automated Attendant

(g) Inband Tone of MG-SIP can be changed by using ASYDL, SYS1, Index 811.

- To change Inband Tone of MG-SIP128 is available when the configuration command "set country_code" is set to "0".

<Interactions with Other Features>

None.

Programming

<Programming of MG-SIP>

Note: To use Multipoint Feature, be sure to set MG-SIP side. For details of Multipoint Feature, see "Multipoint Feature" in Peripheral Equipment Description (IP Devices).

Note: Be sure to assign the data in the following order.

STEP 1: **ASYD** - Assign System Data.
SYS1,
Index 64,
Bit 0 = 0/1 (μ-law/A-law for TSW) **Note 8**, **Note 9**
Bit 7 = 1 (holding tone sending)
Index 186, Bit 6 = 1 (ISDN)
Index 187=00
Index 220, Bit 6=0 (ISDN is enabled)
Index 474 (Guard Timer for Originating Call)
Bit 0~3: MTC (Miscellaneous Timer Counter)
Bit 4~6: TC (Timer Class)
1: 64 ms period

Note 8: You can specify either μ-law or A-law as the information which the Telephony Server informs MG-SIP.

Note 9: This data setting is influenced to the entire system.

STEP 2: **ASYDL** - Assign the following:
System Data 1 Index 810 Bit 2 = 0/1 [Internal Holding Tone (IP terminals)/External Holding Tone (EMA and PLO)] **Note 10**
System Data 1 Index 880 Bit 1 = 1 (Internal PHI-PRI/BRI is available)

Note 10: If External music (2) is selected, refer to Music On Hold [M-7].

STEP 3: **ASYDL/ASYDN** - Assignment of System Data into LDM/NDM.
SYS1 Index 1145 Bit 4=1 (C.O. call Information during using MG-SIP TIE Line is stored)

STEP 4: **ALOCL** - Assign ToS settings as follows:

Note: When a change has been made, it is necessary to initialize the Internal PHI-BRI module with the ADPM command.

TYPE: Select "Network Address".
IP Address: Specify the IP address (assign 0.0.0.0 when LOC-ID=0).
MASK BIT: Specify the Mask Bit (assign 32 when LOC-ID=0).

LOC-ID = 0
Setting Type of Signaling Packet Service: Specify the Quality of Service (IP PRECEDENCE/ DIFFSERV).

- When DIFFSERV is selected
Specify its priority [0-7] and the type (LOW DELAY/THROUGH PUT/RELIABILITY/MIN COST).

- When Diffserv is selected
Specify its priority [0-63].

Note: LOC-ID=0 is essential to be assigned, however, assign other network's LOC-ID according to the configuration.

Note: One of the following is required to allow the changes to Setting Type of Signaling Packet Service data for already-operating equipment (such as PH and IP station) to take effect.
- Initialize the Internal PHI-BRI (Initialize the Internal PHI-BRI module with the ADPM command) or system
- Re-register the IP station

STEP 5: **ADTM** - Assign port numbers if necessary [default value = 64000].

Note: When you change the default port number with this command, you need to initialize the Internal PHI-BRI module with the ADPM command.

STEP 6: **ADPM** - Initialize the MGC (Internal PHI-BRI).
PH TYPE = Internal PHI (BRI)
Menu = Initialize

STEP 7: **ALIDL** - Specify the LENS (five digits) of Internal PHI-BRI.
PH LENS: Specify an even-numbered Group Number. The LENS can be allocated on either a Virtual PIR or a Physical PIR.
PH TYPE = Internal PHI
REGMAX: Specify the registration capacity (1-6144).

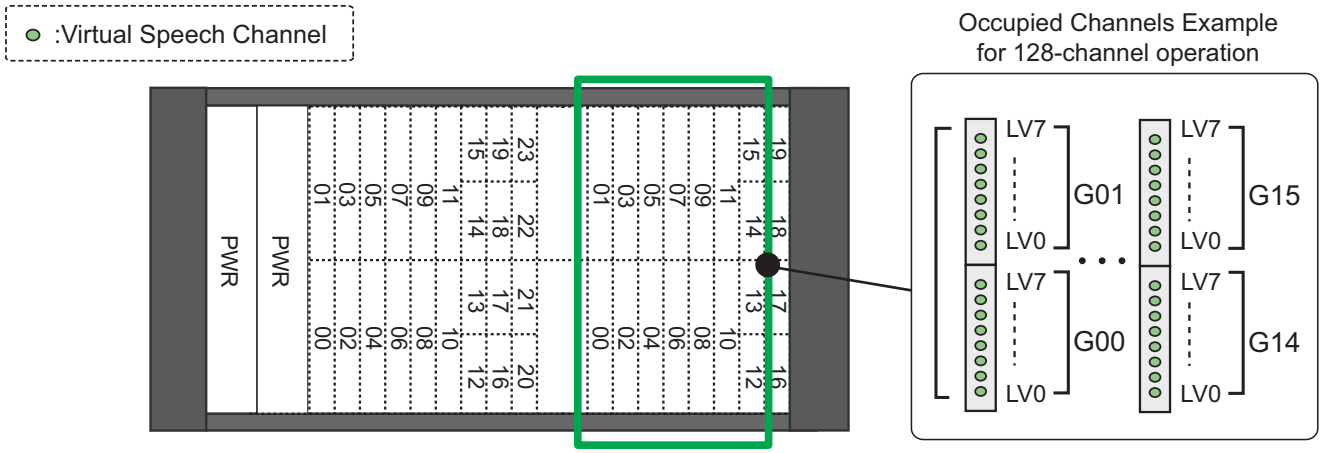
Note: When the total number of channels using PHI exceeds 256, increase the value of REGMAX.

STEP 8: **ARTD/ARTDN** - Assignment of Route Class Data.

Note: Assign MG-SIP template data with Template Feature.

Assign Route Class Data of MG-SIP for TIE Line.
TCL (CDN:6) =4 (Tie Line)
DC (CDN:66) =15 (Dialed Number Confirmation is set to all digits.)

Note: When changing this data for the existing route, be sure to reboot MG-SIP.



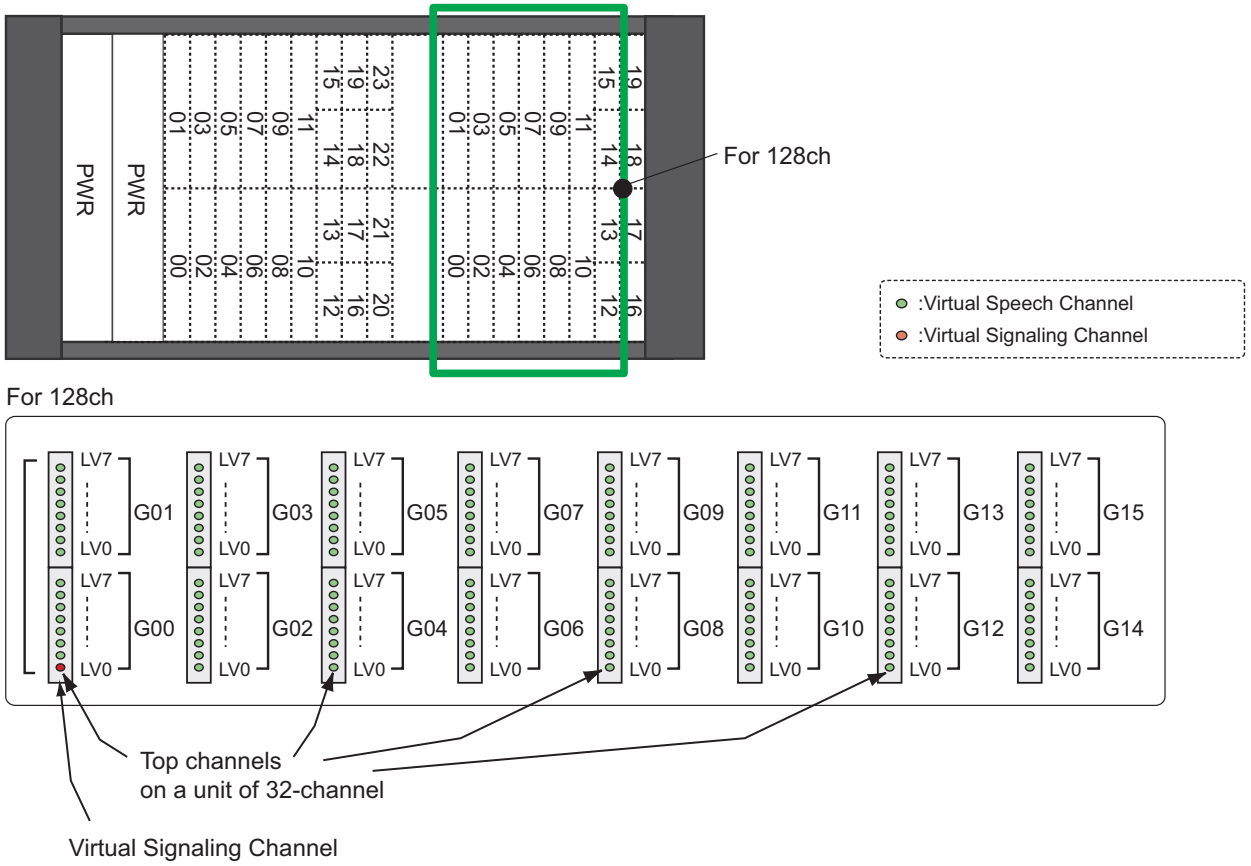
Note: Assign the CDN111(ADVPRA)=1 (ISDN PRI Failure Routing Service) to dummy route.

STEP 9: **ARTI/ARTIN** - Assignment of Trunk Application Data.
Assign Trunk Application Data of MG-SIP for TIE Line.
CDN47: INTD = 2 (SIP)
CDN68: VIR = 2 (MG connection)
CDN77: RA_RT = 0/1 (Virtual Register is used/Register card is used)
CDN96: MGSIPSV =3: Additional service for TIE Line Connection
Assign the following parameters for FAX use:
CDN71: FXD = 1 (IP FAX data is in service)
CDN72: FXJS (Jitter Buffer Size for IP FAX [1-30] × 10 ms) ex. Enter "15" for 150 ms.
CDN73: FXPT = 1 (Payload Type for IP FAX is G.711)
CDN74: FXPS (Payload Size for IP FAX [1-4] × 10 ms) ex. Enter "2" for 20 ms.

Note: When changing this data for the existing route, be sure to reboot MG-SIP.

STEP 10: **ATRK** - Specify trunk data on Virtual Speech Channel and Virtual Signaling Channel.
RT: Specify Route Number [1-255]
TK: Specify Trunk Number [1-255]
LENS: Specify Accommodated Location (Six digits)

Example: In the case of 128-channel operation using MG-SIP128



Data Setting Example for 128-channel operation

	RT (1-255)	TK (1-255)	LENS MG 00-07	LENS U 0-3	LENS G 00-23	LENS LV 0-7
Virtual Speech Channel	1 0	0 1	0 2	1	0 0	0
	⋮	⋮	⋮	⋮	⋮	⋮
	1 0	1 2 8	0 2	1	1 5	7

STEP 11: **ADPC** - Register Point Code on Virtual Speech Channel and Virtual Signaling Channel.
RT: Specify a Route Number [1-255]
PC: Specify unused Point Code, not Point Code used in SS7 [1-16383]

STEP 12: **ACSC** - Assign the top number of 32-channel LENS.
CSCG: Specify the CSC Group Number
GROUP: Specify the CIC Group Number
CCH: Specify the top LENS of a unit.

Example: When bundling 128-channel with a unit of 32-channel using MG-SIP128

STEP 13: **ACIC1** - Specify the accommodated location of Virtual Control Channel on Point Code as follows:
PC: Enter Point Code specified by ADPC
CSCG: Enter CSC group specified by ACSC

STEP 14: **ACIC2** - Specify the accommodated location of Virtual Control Channel on Point Code as follows:
PC: Enter Point Code specified by ADPC
CIC: Enter CSC numbers in sequential number
LENS: Enter accommodated locations of Speech Channel and B-Channel

STEP 15: **MBTK** - Cancel Make Busy of Virtual Speech Channel.
RT: Enter Route Number
TK: Enter Trunk Number
MB = 0 (Make idle)

STEP 16: **AMGIL** - Specify information regarding to MG-SIP128 as follows:
MG-ID: Enter MAC Address (6 bytes)
FUNCTION = Setting
KIND = SIP-MG
LINE = 0 (fixed)
CH = 0 (fixed)
LENS: Enter Basic Accommodated Location (the first number of HW)
Retry = 0
Setting Type of Signaling Packet Service: Specify QoS settings of Signaling that is used when Internal

PHI-BRI connects MG-SIP128.
Usable CH Number: Enter the number of channels to be used per MG-SIP128 (1-128).
Service of Authentication Exists: Clear the check box.

STEP 17: **AMGVL** - Register the voice control data when connecting to MG-SIP128. If the settings are not specified by this command, the values assigned by the AIVCL command will be set automatically.
A RT: Specify Physical Route Number (MG-SIP128).
B LOC-ID: Displayed when TYPE = Location ID Specified. Specify Destination Location ID (Destination MG-SIP128). **LOC-ID=0 must be set when IPPAD card is mounted.*
B RT: Displayed when TYPE = Route Specified is selected. Specify Physical Route Number (MG-SIP128) in the case of tandem connection between MGs.
Setting Type of Voice Packet Service: Specify QoS settings of Voice Speech
TYPE: Displayed when the check box of "Setting of Payload" is ON. Specify Payload type.
SIZE: Displayed when the check box of "Setting of Payload" is ON. Specify Payload size.

STEP 18: **ANPD/ANPDL/ANPDN** - Assign the minimum number of digits needed to determine the service required to the first digit received.
TN: Specify a Tenant Number.
1stDC: Specify the first digit of service access code.
CI: Choose a Connection Status Index.
NND: Specify the minimum necessary number of digits for each Access Code.

STEP 19: **ASPA/ASPAL/ASPAN** - Define the Access Codes for each opposite office.
TN: Specify a Tenant Number
ACC: Specify an Access Code. [Maximum 6 digits]
CI: Choose a Connection Status Index.
SRV = LCR (Least Cost Routing)
LGRT: Specify a Dummy Route Number.

STEP 20: **AFRS/AFRSL/AFRSN** - Assign a Number Pattern Code (NPC) and Outgoing Route Selection Number (OPR) to the Dummy Route.
TN: Specify a Tenant Number.
RT: Specify a Dummy Route Number.
NPC: Define a Number Pattern Code. [Maximum 16 digits]
OPR: Define an Outgoing Route Selection Number. [0-4000]

STEP 21: **AOPR/AOPRL/AOPRN** - Assign an LCR/LCRS routing pattern for each Outgoing Route Selection Pattern Routing (OPR) number.
TDPTN: Specify a Time of Day Change Pattern Number. [0-7]
OPR: Specify an Outgoing Route Selection Number. [0-4000]
RA: Specify the Route Advancing Order. [0-7]
E: Specify Route Advancing End Indication. [0/1] **Note 11**
RT: Specify an Outside Route Number. [1-255]
SKIP: Specify the number of digits to be skipped from dialed numbers. **Note 12**
PNL: Specify a Pattern Number Location. [0-999]

Note 11: Be sure to assign 0 at the last RA.

Note 12: If an Access Code is to be removed from the dialed number before the call is sent out, specify the number of digits of the Access Code for SKIP. Otherwise, incorrect number will be passed to the MG-SIP. When the Multi-Point connection is enabled on the MG-SIP, change the setting on the MG-SIP, accordingly.

STEP 22: **AMND**/**AMNDL/AMNDN** - Specify the number of maximum necessary digits for a Destination Code (DC).
TN: Specify a Tenant Number
DC: Specify a Destination Code. [Maximum 10 digits]
MND: Specify maximum necessary digits for the DC. [1-24]

STEP 23: **ARNP/ARNPL/ARNPN** - Assign an Access Code (ACC) to be used for Self Office Identification Code and each individual routing.
RT: Specify a Route Number. [0-255]
ACC: Specify an Access Code. [Maximum 4 digits]

Note: For an Open Numbering network, the following data should be assigned:
RT = 0
ACC: The Office Code of the self office (including ACC for the originating call)

Note: All Offices within an Open Numbering network must have an Office Code with the same number of digits.

STEP 24: **ACNAL** - Assign the Calling Number Pattern (CNP) on an Access Code basis. **When this command is used, assign ARTD command CDN66 to DC=15.*

- Settings for a Call Originated to SIP Network
  Specify Calling Number Pattern against route for Caller ID Notification and Access Code.

  IC/OG = OG (Outgoing Call)
  RT: Enter External Route Number to be sent Caller ID Notification per Access Code.
  ACC: Enter Access Code.
  CNP: Enter Calling Number Pattern.

  Note: To modify CNP set by the ACNAL command, use the ACND command; ACNDN command cannot be used.

- Settings for a Call Arrived from SIP Network
  Specify Calling Number Pattern against route for Caller ID Notification and Access Code.

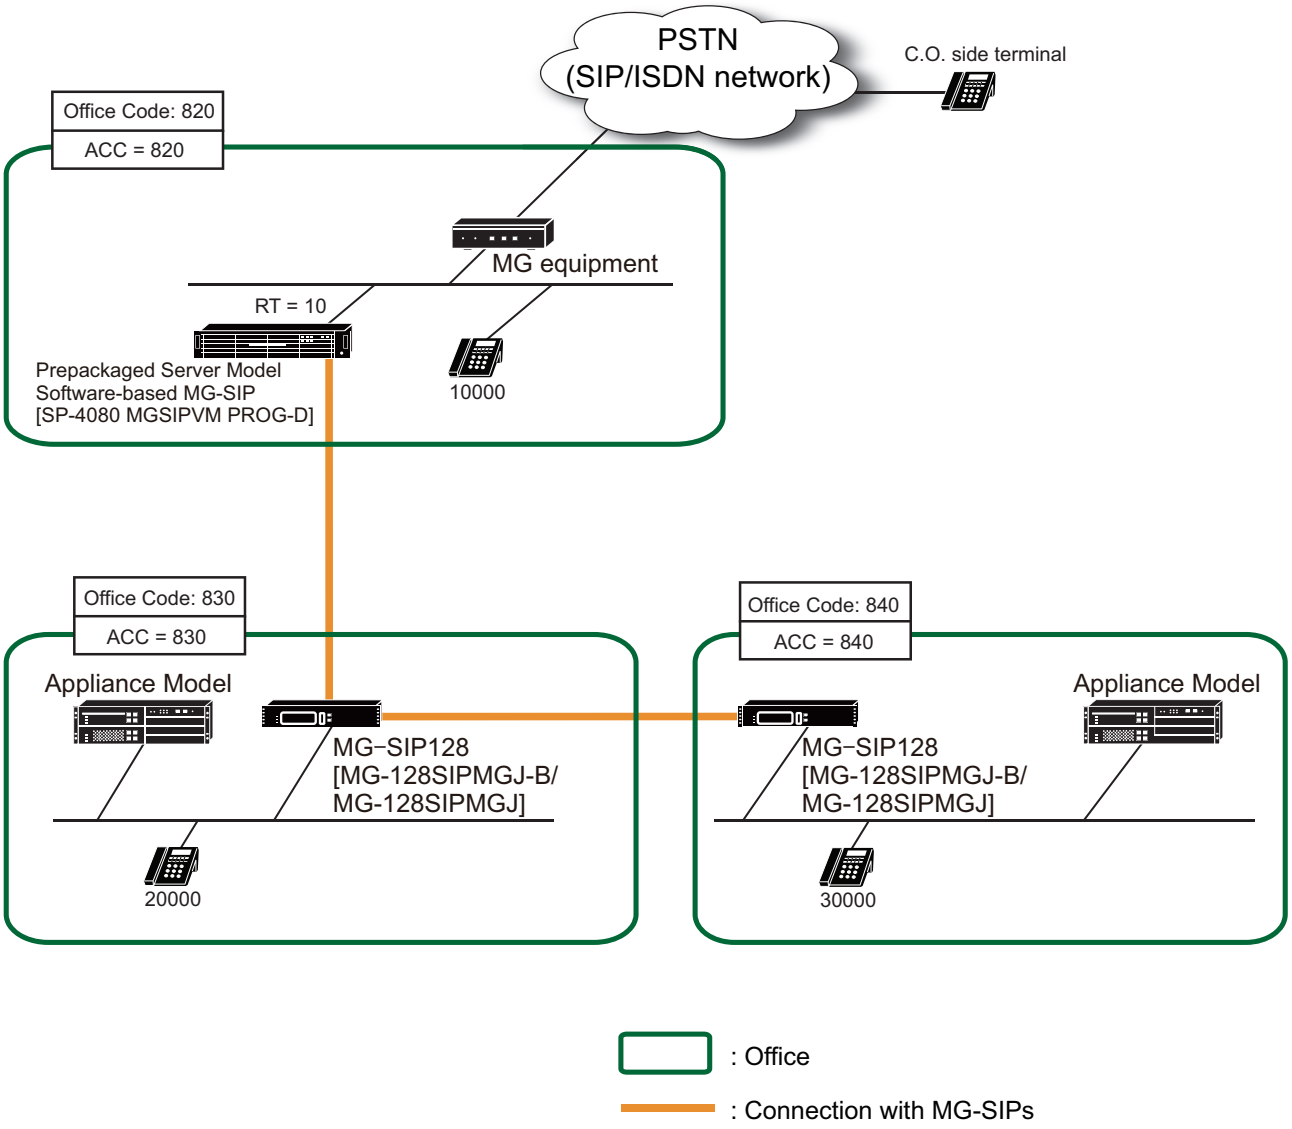
  IC/OG = IC (Incoming Call)
  RT: Enter External Route Number to be arrived.
  ACC: Enter Access Code.
  DC: Dialed Number Confirmation

STEP 25: **ACND** - Assign the data for number change to CNP has been specified by the ACNAL command
CNP: Calling Number Pattern
SKIP: Number of Skip Digits
ADD: Number of Digits of the Additional Number
DC: Additional Digit Information

STEP 26: **ACDD** - Change Digit Code according to DID Addressing.
DAY/NIGHT: Day/Night Mode
RT: Enter the B-Channel Route Number.
DC: Enter Number of digits for this DC must match the data in DC of the ARTD command.
CDC: Enter Change Digit Code [Maximum 24 digits]
AD: Enter Additional Dialing
XFR: Enable/Disable Transfer Service

STEP 27: After the registration has been completed, reset MG-SIP128 (ON→OFF→ON).

To change Inband Tone of MG-SIP128, the following data setting is required.



STEP 1: **ASYDL** - Assign System Data into Local DM (LDM).
SYS1, Index 811 Bit 0-7 (Tone Code by countries.)

ASYDL SYS 1 INDEX 811			
TONE CODE	**Basic Tones**	**TONE CODE**	**EMEA Tones**
00	Not used **Note 13**	C8	Germany
01	Japan (default)	C9	Italy
02	North America	CA	Netherlands
03	Australia	CC	Denmark
04	Other countries	CD	Sweden
05	Hong Kong	D3	Spain
06	Malaysia	D4	Austria
07	Singapore	D5	Belgium
08	England	D6	England [For EMEA]
09	Mexico	D7	Greece
0A	Taiwan	D8	Switzerland
0B	New Zealand	D9	South Africa
0C	Korea	Other Values	Not used **Note 13**
0D	Brazil		
0E	China		
0F	Thailand		
10	Thailand (EGAT)		
11	Sri Lanka		

Note: To apply this change, assign the configuration command “set country_code” to “0”.

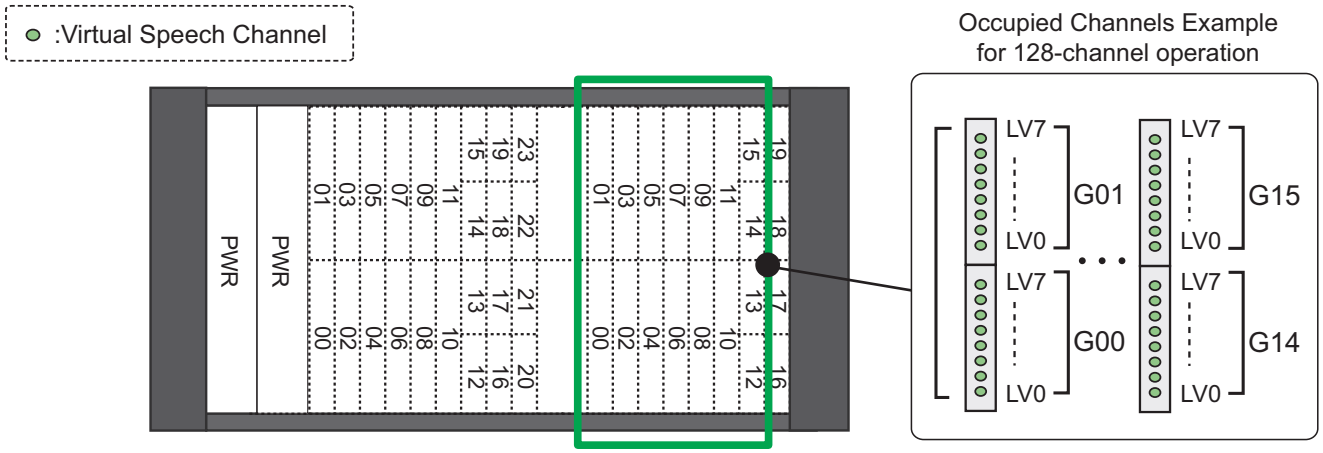
Note 13: When this Tone Code is assigned to “0” or “Not used”, and the configuration command “set country_code” is assigned to “0”, the tone is set as Japan (default).

[Example of Setup]
As an example, the following procedure describes how to configure this feature at the office with Office Code 820 shown in the figure below:

Note: This procedure assumes that basic configuration of Office Data is already completed.

STEP 1: **ASYDL/ASYDN** - Assign System Data.
SYS1 Index 1145 Bit 4=1 (C.O. call Information during using MG-SIP TIE Line is stored)

STEP 2: **ARTD/ARTDN** - Assignment of Route Class Data.
Assign Route Class Data of MG-SIP for TIE Line.
RT = 10
TCL (CDN:6) = 4 (Tie Line)
DC (CDN:66) =15 (Dialed Number Confirmation is set to all digits)



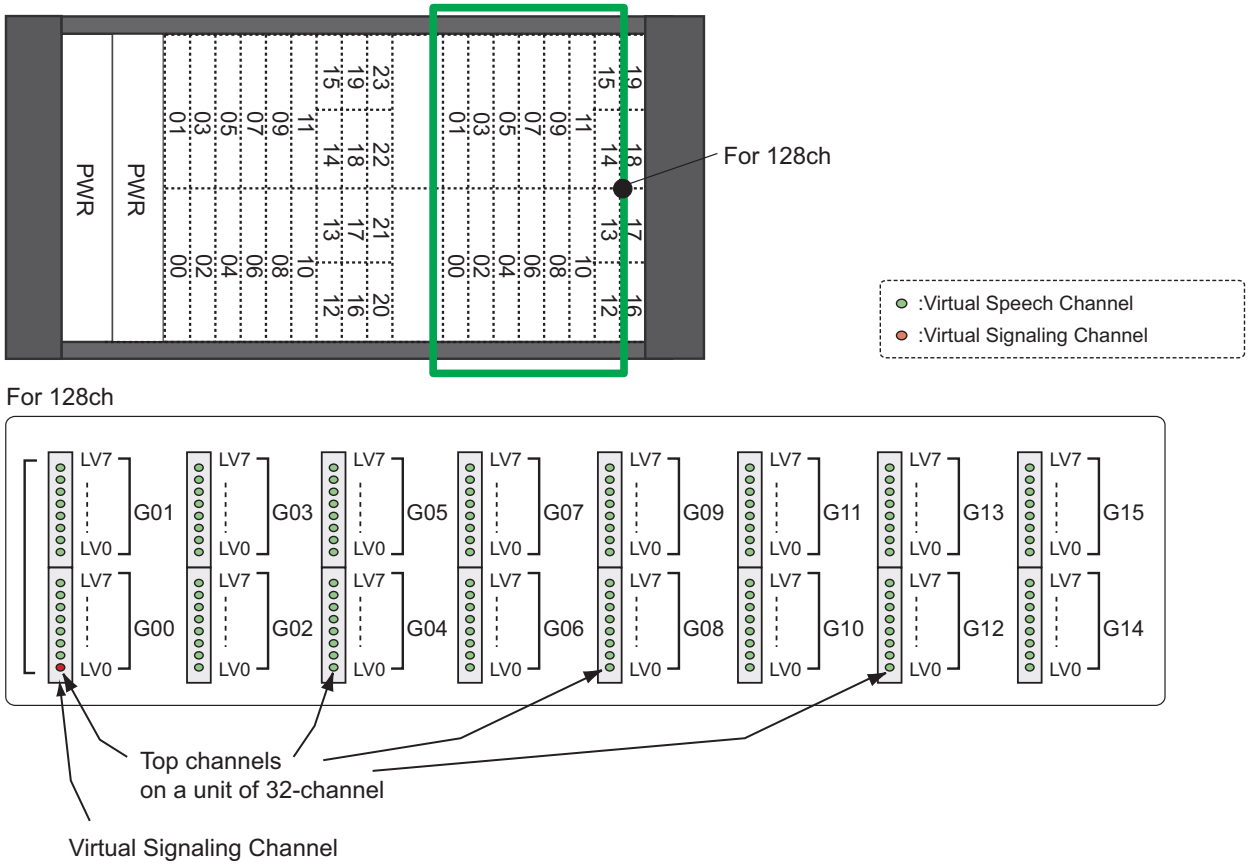
Note: When changing this data for the existing route, be sure to reboot MG-SIP.

STEP 3: **ARTI/ARTIN** - Assignment of Trunk Application Data.
Assign Trunk Application Data of MG-SIP for TIE Line.
RT = 10
CDN 47: INTD = 2 (SIP)
CDN 68: VIR = 2 (MG connection)
CDN 77: RA_RT = 0/1 (Virtual Register is used/Register card is used)
CDN 96: MGSIPSV = 3 (Additional service for TIE Line Connection)

Note: When changing this data for the existing route, be sure to reboot MG-SIP.

STEP 4: **ATRK** - Specify trunk data on Virtual Speech Channel and Virtual Signaling Channel.
RT = 10
TK: 1-128
LENS: 021000-021157

Example: In the case of 128-channel operation using MG-SIP128



Data Setting Example for 128-channel operation

	RT (1-255)	TK (1-255)	LENS MG 00-07	LENS U 0-3	LENS G 00-23	LENS LV 0-7
Virtual Speech Channel	10	01	02	1	00	0
	⋮	⋮	⋮	⋮	⋮	⋮
	10	128	02	1	15	7

STEP 5: **ADPC** - Register Point Code on Virtual Speech Channel and Virtual Signaling Channel.
RT = 10
PC = 10

STEP 6: **ACSC** - Assign the top number of 32-channel LENS.
CSCG = 130
GROUP: 0-7
CCH: 02100, 02104, 02108, 02112

Example: When bundling 128-channel with a unit of 32-channel using MG-SIP128

CSCG	CICG	CCH		
		MG 00-07	**U** 0-3	**G** **00-23**
130	0	02	1	00
	1	02	1	04
	2	02	1	08
	3	02	1	12
	4	02	1	00
	5	02	1	00
	6	02	1	00
	7	02	1	00

STEP 7: **ACIC1** - Specify the accommodated location of Virtual Control Channel on Point Code as follows:
PC = 10
CSCG = 130

STEP 8: **ACIC2** - Specify the accommodated location of Virtual Control Channel on Point Code as follows:
PC = 10
CIC: 1-128
LENS: 021000-021157

STEP 9: **MBTK** - Cancel Make Busy of Virtual Speech Channel.
RT: Enter Route Number
TK: Enter Trunk Number
MB = 0 (Make idle)

STEP 10: **AMGIL** - Specify information regarding to MG-SIP128 as follows:
MG-ID: Enter MAC Address (6 bytes)
FUNCTION = Setting
KIND = SIP-MG
LINE = 0 (fixed)
CH = 0 (fixed)
LENS = 021000
Retry = 0
Setting Type of Signaling Packet Service: Specify QoS settings of Signaling that is used when Internal PHI-BRI connects MG-SIP128.
Usable CH Number: Enter the number of channels to be used per MG-SIP128 (1-128).
Service of Authentication Exists: Clear the check box.

STEP 11: **ANPD/ANPDL/ANPDN** - Assign the minimum number of digits needed to determine the service required to the first digit received.
TN = 1
1stDC = 8
CI = N or H
NND = 3

STEP 12: **ASPA/ASPAL/ASPAN** - Define the Access Codes for each opposite office.
[For Office Code 830]
TN = 1
ACC = 830
CI = N (Normal) or H (Hooking)
SRV = LCR (Least Cost Routing)
LGRT = 255 (Dummy Route)

[For Office Code 840]
TN = 1
ACC = 840
CI = N (Normal) or H (Hooking)
SRV = LCR (Least Cost Routing)
LGRT = 255 (Dummy Route)

STEP 13: **AFRS/AFRSL/AFRSN** - Assign a Number Pattern Code (NPC) and Outgoing Route Selection

[For Office Code 830]
TN = 1
RT = 255
NPC = 830
OPR = 1

[For Office Code 840]
TN = 1
RT = 255
NPC = 840
OPR = 2

STEP 14: **AOPR/AOPRL/AOPRN** - Assign an LCR/LCRS routing pattern for each Outgoing Route Selection Pattern Routing (OPR) number.

[For Office Code 830]
TDPTN = 0
OPR = 1
RA = 0
E = 0
RT = 10
SKIP = 3 **Note 14**
PNL = 0

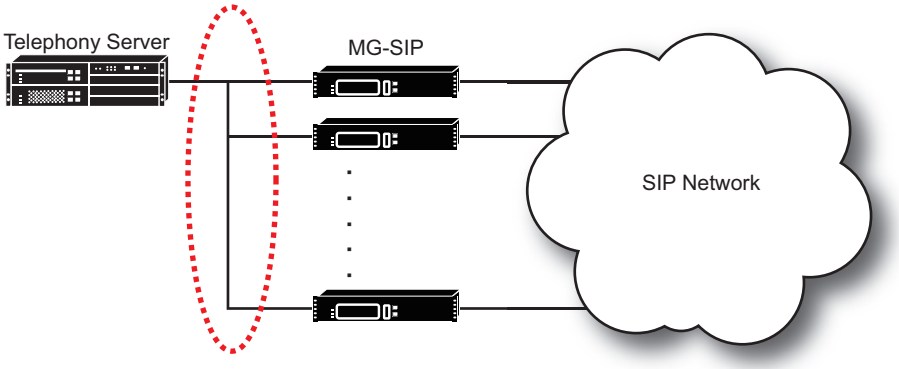
[For Office Code 840]
TDPTN = 0
OPR = 2
RA = 0
E = 0
RT = 10
SKIP = 3 **Note 14**
PNL = 0

Note 14: If an Access Code is to be removed from the dialed number before the call is sent out, specify the number of digits of the Access Code for SKIP. Otherwise, incorrect number will be passed to the MG-SIP. When the Multi-Point connection is enabled on the MG-SIP, change the setting on the MG-SIP, accordingly.

STEP 15: **AMND/AMNDL/AMNDN** - Specify the number of maximum necessary digits for a Destination Code (DC).
[For Office Code 830]
TN = 1
DC = 830
MND = 8

[For Office Code 840]
TN = 1
DC = 840
MND = 8

STEP 16: **ARNP/ARNPL/ARNPN** - Assign an Access Code (ACC) to be used for Self Office Identification Code and each individual routing.
Since the network is an Open Numbering network, assign values as follows: **Note 15**, **Note 16**
RT = 0
ACC = 820
Assign an ACC to the external trunk route number.
RT = 10
ACC = 820



Note 15: For an Open Numbering network, the following data should be assigned:
RT = 0
ACC: The Office Code of the self office (including ACC for the originating call)

Note 16: All Offices within an Open Numbering network must have an Office Code with the same number of digits.

M-123 MG-SIP Shared Route

General Description

With this feature, up to eight MG-SIP devices can share a single route (RT).

Multiple MG-SIP devices are registered to a single route (RT).

Operating Procedure

None.

Service Conditions

<Important Notice>

To make an existing route shared with multiple devices, perform the data settings, and reboot the MG-SIP devices.
To reboot an MG-SIP device, follow any of below steps:

- Delete the configure data by the AMGIL command, and assign again.
- Turn off the power of the MG-SIP device, and then turn on again.
- Execute “reboot” in MG-SIP configuration mode.

<Interactions with Other Features>

None.

<Hardware/Software>

None.

<Interactions with Networks>

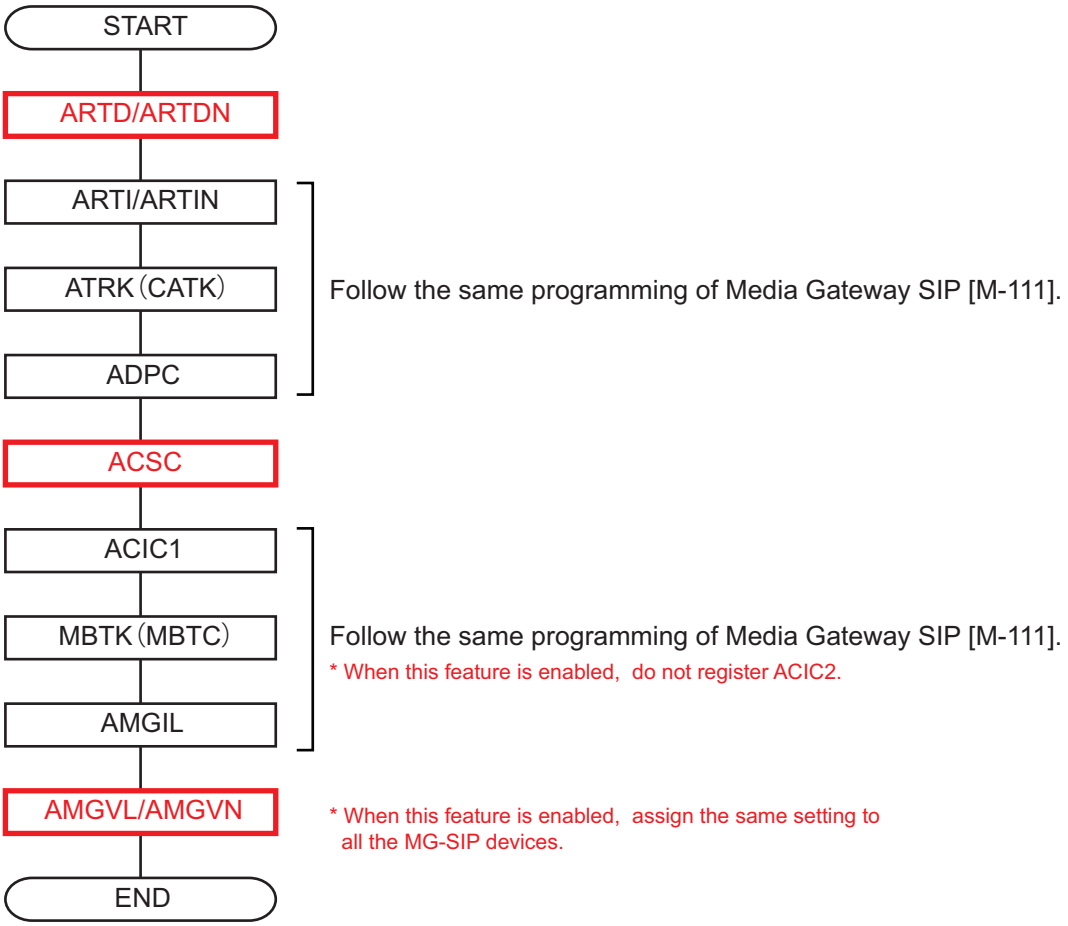
None.

<Conditions Specific to This Feature>

1. Accommodate all MG-SIP devices sharing a same route to a single LP.
2. The maximum number of simultaneous speech channels that can be controlled by a single LP is 460 including other ISDN channels.
3. The number of MG-SIPs that can share the same route is as follows.

DEVICES	MAXIMUM NUMBER OF MG-SIPS SHARING THE SAME ROUTE	NUMBER OF USABLE CHANNELS
Software-based MG-SIP	2 devices	255 channels **Note 1**
MG-SIP128 [MG-128SIPMGL-A]		
MG-SIP128 [MG-128SIPMGG-B/ MG-128SIPMGG]		
MG-SIP128 [MG-128SIPMGJ-B/ MG-128SIPMGJ]		
MG-SIP96	2 devices	192 channels
MG-SIP16	8 devices	128 channels
MG-SIP16 [SCA-16SIPMGA/MG-16SIPMGA]		
MG-SIP16 [SCA-16SIPMG (US)]		

Note 1: Because trunk numbers per route can be assigned 1-255, the maximum number of channels that can be shared by the same route is 255.

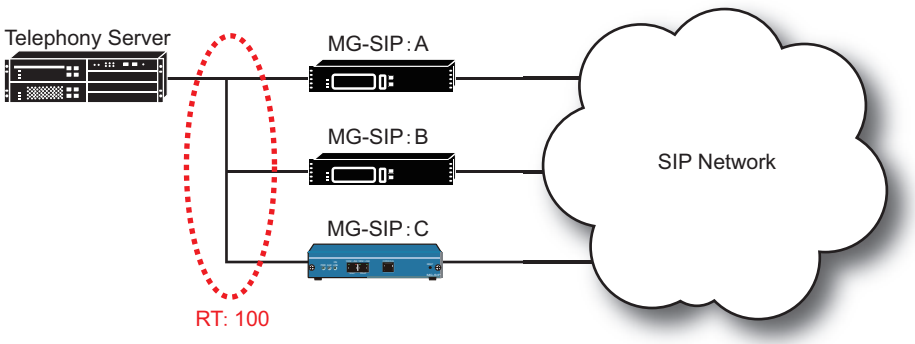


4. Multiple carriers cannot coexist in the same route.
5. Assign the same CODEC to MG-SIPs sharing the same route.
6. Billing Information is output per route. When one route is shared by multiple MG-SIPs, Billing Information cannot be output per MG-SIP device.

<Other Conditions>

None.

Programming



Be sure to assign the data in the following order. The following figure in red shows the required programming for this feature after assigning the programming of Media Gateway SIP [M-111].

Registering a new MG-SIP device with MG-SIP Shared Route

The programming that the MG-SIP is registered with MG-SIP Shared Route is described as follows.

<Configuration Example>

DEVICES		NUMBER OF USABLE CHANNELS	LENS		
			LEAD LENS1	LEAD LENS2	LEAD LENS3
A	MG-SIP96	96ch	020040 (Dch)	020080	020120
B	MG-SIP96	96ch	020160 (Dch)	021040	021080
C	MG-SIP16	8ch	022040 (Dch)	-	-

Note: Following are the system commands that differ from the programming when MG-SIP Route Sharing is not used. For details of the common programming, refer to Media Gateway SIP [M-111].

STEP 1: **ARTD/ARTDN** - Assignment of Route Class Data for DM/NDM.
Assign the following Route Sharing Data for RT: 100.
CDN115 (CMRT)=1 (MG-SIP Shared Route is enabled)

STEP 2: **ACSC** - Assignment of CSC Data.
Assign the lead LENS of MG-SIP by 32-channels (by Highway Block) to even-numbered CSC Group, and the LENS of Virtual Signal Channel to odd-numbered CSC Group.
CSCG: CSC Group Number (even numbers between 130-255 and odd numbers next to them)
GROUP: CIC Group Number
CCH: Lead LENS by 32-channels for even-numbered CSCG
LENS of Virtual Signal Channel for odd-numbered CSCG

<Example of ACSC command assignment>
Assign the lead LENS of MG-SIP by 32-channels to even-numbered CSC Group. Set the LENS of Virtual Signal Channel to the lead CIC Group Number (CICG) of each MG-SIP.

CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signal Channel (CCH)				Corresponding MG-SIP
		MG 00-07	U 0-3	G 00-23	LV 0-7	
130	0	02	0	04	0	A
	1	02	0	08	0	
	2	02	0	12	0	
	3	02	0	16	0	B
	4	02	1	04	0	
	5	02	1	08	0	
	6	02	2	04	0	C
	7	02	0	04	0	**Note 1**

Next, assign the LENS of Virtual Signal Channel to the next CSC Group Number.

CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signal Channel (CCH)				Corresponding MG-SIP
		MG 00-07	U 0-3	G 00-23	LV 0-7	
131	0	02	0	04	0	A
	1	02	0	04	0	
	2	02	0	04	0	
	3	02	0	16	0	B
	4	02	0	16	0	
	5	02	0	16	0	
	6	02	2	04	0	C
	7	02	0	04	0	**Note 1**

Note 1: Assign the same data as CICG=0 to extra CIC Group Number (CICG).

STEP 3: **AMGVL/AMGVN** - Assignment of Media Gateway Voice Control Data for LDM/NDM

Assign Voice Control data when connecting to IP station or MG.

Note: Assign the same data to MG-SIPs for MG-SIP Shared Route.

A RT: Physical Route Number of Virtual Speech Channel of a destination MG.

Type of destination devices:

TYPE: Select “Route Specified” or “Location ID Specified”.

B LOC-ID: Displayed when TYPE = Location ID Specified. Select the Location ID of a destination IP station.

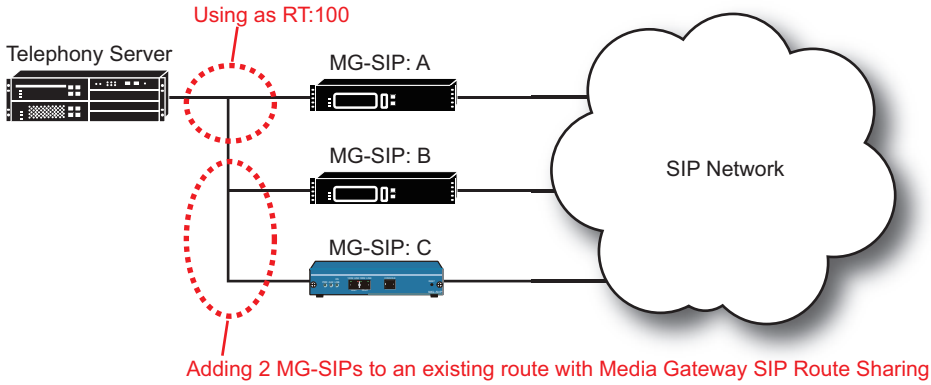
B RT (accommodating MG): Displayed when TYPE = Route Specified is selected. Select the Physical Route Number of Virtual Speech Channel of a destination MG

Note: When IPPAD Card is accommodated, assign LOC-ID to 0.

Setting Type of Voice Packet Service: Data setting of ToS (Type of Service) field for Voice Packet used by MG

Setting of Payload: Click this check box for specifying the following.

TYPE: Select the Payload Type.



SIZE: Select the Payload Size.

Note: When connecting to the public SIP network, be sure to assign G.711 20 ms.

Change from an existing route to a shared route with MG-SIP Shared Route

To share an existing route:

<Configuration Example>

DEVICES		NUMBER OF USABLE CHANNELS	LENS		
			LEAD LENS1	LEAD LENS2	LEAD LENS3
A	MG-SIP96	96ch	020040 (Dch)	020080	020120
B	MG-SIP96	96ch	020160 (Dch)	021040	021080
C	MG-SIP16	8ch	022040 (Dch)	-	-

Note: Here describes the system commands that differ from the programming when MG-SIP Route Sharing is not used. For details of the common programming, refer to Media Gateway SIP [M-111].

STEP 1: **MBTK/MBTC** - Make-Busy of Trunk/Trunk-Continuous
Assign Make Busy (Bothway) (MB=2) to the trunk used by MG-SIP: A.

STEP 2: **ARTD/ARTDN** - Assignment of Route Class Data
Assign the following Route Sharing Data for RT: 100.
CDN115 (CMRT)=1 (MG-SIP Shared Route is enabled)

STEP 3: **ACSC** - Assignment of CSC Data.
Assign the lead LENS of MG-SIP by 32-channels to even-numbered CSC Group, and the LENS of Virtual Signal Channel to odd-numbered CSC Group.
CSCG: CSC Group Number (even numbers between 130-255 and odd numbers next to them)
GROUP: CIC Group Number
CCH: Lead LENS by 32-channels for even-numbered CSCG
LENS of Virtual Signal Channel for odd-numbered CSCG

<Example of ACSC command assignment>
Assign the lead LENS of MG-SIP by 32-channels to even-numbered CSC Group.

- Before this data assignment

CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signal Channel (CCH)				Corresponding MG-SIP
		MG 00-07	U 0-3	G 00-23	LV 0-7	
130	0	02	0	04	0	A
	1	02	0	08	0	
	2	02	0	12	0	
	3	02	0	04	0	Note 2
	4	02	0	04	0	
	5	02	0	04	0	
	6	02	0	04	0	
	7	02	0	04	0	

- After this data assignment

CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signal Channel (CCH)				Corresponding MG-SIP
		MG 00-07	U 0-3	G 00-23	LV 0-7	
130	0	02	0	04	0	A
	1	02	0	08	0	
	2	02	0	12	0	
	3	02	0	16	0	B
	4	02	1	04	0	
	5	02	1	08	0	
	6	02	2	04	0	C
	7	02	2	04	0	Note 2

Next, assign the LENS of Virtual Signal Channel to the next CSC Group Number.

- Before this data assignment

CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signal Channel (CCH)				Corresponding MG-SIP
		MG 00-07	U 0-3	G 00-23	LV 0-7	
131	No data					

- After this data assignment

CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signal Channel (CCH)				Corresponding MG-SIP
		MG 00-07	U 0-3	G 00-23	LV 0-7	
131	0	02	0	04	0	A
	1	02	0	04	0	
	2	02	0	04	0	
	3	02	0	16	0	B
	4	02	0	16	0	
	5	02	0	16	0	
	6	02	2	04	0	C
	7	02	0	04	0	**Note 2**

Note 2: Assign the same data as CICG=0 to extra CIC Group Number (CICG).

STEP 4: **AMGIL** - Assignment of Media Gateway Information for LDM
Assign the data of MG-SIP: B/C.
Delete and reassign the data of MG-SIP: A.

Note: Be sure to reboot the MG-SIP after this data assignment.

STEP 5: **MBTK/MBTC** - Make-Busy of Trunk/Trunk-Continuous
Cancel the make busy status of the trunk (MG=0).

STEP 6: **ACIC2** - Assignment of CIC Code Data 2
When using Route Sharing, ACIC2 command is not required to assign. Delete the unnecessary data assigned before using Route Sharing.

M-124 My Line Number Display -D

General Description

This feature allows an idle terminal of DT800 Series / DT700 Series / DT400 Series / DT300 Series to display information about the My Line of the terminal (Name and Number) on the LCD. The contents of the display can be changed as listed below by configuring the System Data (ASYDL/ASYDN, SYS1, Indexes 682 and 683).

- Switching the contents of the default display for the line information.

  Four patterns are available: [Name + Number], [Number only], [Name only] and [No display].

- Selecting a line to display the line information.
- Selecting between My Line and Prime Line to display the line information when a terminal is idle.
- Selecting the order of precedence between System Phone Book (APBKN command) and Name Display (ANDD command) to display the registered information when a terminal is receiving Dial Tone (DT) or idle.
- Selecting the display method between "[Number]" (Enclose the number in brackets) and ": Number" (Insert a: colon before the number).
- Selecting the number of characters and the digit number to display.

  When "[Number]" is selected as a number display method, select between [Name 12 characters + Number 10 digits] and [Name 16 characters + Number 6 digits].

  When ": Number" is selected as a number display method, select between [Name 12 characters + Number 11 digits] and [Name 16 characters + Number 7 digits].

- Select whether or not to flash the contents of the display when originating a call.

Below is an example of the display.

[Name + Number]

Name Display [1234567890]

[Number Only] **Note 1**

[1234567890123456]

[Name Only]

Name Display

Note 1: In the case of selecting [Number only], ": Number" (Insert a colon ":" before a number) settings become invalid and only a number will be displayed regardless of the settings. The same condition applies when a terminal is receiving Dial Tone (DT) or idle.

Operating Procedure

Note: The pattern of switching the LCD screen displays is in the order of [Name+ Number]-[Number only]-[Name only]-[No display]. After [No display], it returns to [Name + Number].

- Switch the LCD display with the Soft key or the Feature key.

  The line information shown on the LCD screen display can be switched by pressing the Soft key or the Feature key.

- Switch the LCD screen display with an access code.

1. Lift the handset.
2. Receive the Dial Tone (DT).
3. Dial the access code for switching the screen display of the line information.
4. Receive the Service Set Tone (SST).
5. Place the handset down.

Service Conditions

<Important Notice>

1. This feature is available for DT800 Series/DT700 Series/DT400 Series/DT300 Series.

   Note: This feature is not available for terminals without the LCD screen display.

2. If you use a Digital terminal, CH-16ELCA card is also required.

3. If you change the System Data (ASYDL/ASYDN, SYS1, Indexes 682 and 683) related to this feature, or My Line information being shown on the LCD screen display, the changes will be reflected in the data within 90 seconds.

   Note: The System Data change (except ASYDL/ASYDN, SYS1, Index 682, Bit 0) can be reflected by an off-hook operation as well.

<Interactions with Other Features>

1. The order of precedence in the case of competing with other features is shown below.

2ND LINE (1ST LINE Note 2)	3RD LINE (2ND LINE Note 2)	PRECEDENCE
Help	Help	High
Timer	Timer	
History	History	
OAI	OAI	
Steady	Steady	
Data	Prime Line	
Prime Line	Sub Line	
Sub Line	Extended Steady	
Message	My Line	
My Line	Time	
Blank	-	Low

Note 2: In the case of DT310 6-button type and DT710 6-button type

2. The line information is displayed on the Multi-line telephone side while SOFT PHONE WIRED-PHONE HANDSET [S-147] is being used. When originating a call, the line information is displayed on the soft phone with OFF-HOOK LINE NUMBER DISPLAY-D [O-37D] and on the Multi-line telephone with this feature.

3. The My Line display at time of originating a call will be shown as below if OFF-HOOK LINE NUMBER DISPLAY-D [O-37D] is in use.

[Name + Number]

AAAAA 1234567890

[Number Only]

12345678901

[Name Only]

AAA BBBBBB

4. During Remote Login operation, this feature works according to the data settings on the destination node. For example, if a terminal of Node B logs in to Node A, this feature works by using the data settings on Node A, not on Node B.

5. When Line Pre-selection is in service, the selected line information will be displayed after pressing the Line key. (approx. for 10 seconds)

6. When using OFF-Hook Line Number Display service, regardless of the System Data settings for My line display location “M” or “P” will be displayed at the end of a number.

7. OAI/ACD is not supported.

<Hardware/Software>

If Cordless Terminal (DT430/DT330 (12BT)) is used, only 16 digits are displayed. You can perform a display change operation for this terminal between number only and no display.

<Interactions with Networks>

None.

<Conditions Specific to This Feature>

1. The parameter “NAME” of the ANDD command is displayed as the Name information on the display of the line information.

2. If the Name information has not been set, the display will be shown as follows.

[Name + Number]

Only the number will be displayed.

[1234567890]

[Name Only]

Nothing will be displayed. (Same as the “No display” settings)

3. The key for switching the display for the line information is only valid when the terminal is idle.

4. If the entire Name or the Number of the line information cannot fit in the display, it will display from the start of the Name or the Number.

5. The line information will not be displayed upon originating a call if [No Display] has been selected for the line information. OFF-HOOK LINE NUMBER DISPLAY-D [O-37D] will not operate.

6. Below are examples of a case when the full Name or the Number cannot be displayed.

- If there is any space in the name row of Name Information, the rest of the displayed name after space will be displayed as space. If no space used in the name row, the digits set in the System Data (ASYDL/N, SYS1, Index 682, Bit 6) will be fully displayed from the front.

  Example: Name (with space) [AAAAA BBBBBBB] Number [1234567890]

AAAAA	[1234567890]

  Example: Name (No space) [AAAAABBBBBBCCC] Number[1234567890]

AAAAABBBBBBB	[1234567890]

- If the number is cut off halfway, "*"will be displayed at the end of the displayed number.

  Example: Name [AAA BBBBB] Number [1234567890123456]

AAA BBBBBBB	[123456789*]

7. If the terminal is set to display the line information of Prime Line, when you select a line other than Prime Line and dial the access code, the selected line information is displayed for a given length of time (within 90 seconds).
8. If a terminal is initialized, the display items for the line information will be back to the default settings. The default settings can be configured via the System Data (ASYDL/ASYDN, SYS1, Index 682, Bits 1 and 2).
9. The name of System Phone Book (APBKN command) will not be displayed for the UGN line that is different from the terminal. However, if Name Display (ANDD command) is registered, this command will be valid instead. For example, if Line B of UGN=2 is registered to a Sub Line of Terminal A of UGN=1, the name of Name Display will be shown instead of the name of System Phone Book when Terminal A selects Line B (Line Pre-selection).

<Other Conditions>

None.

Programming

STEP 1: **ASYD** (Assignment of System Data)

SYS1

Index 389

Bit 7=1 (Off-Hook Line Number Display-D is in service)

STEP 2: **ASYDL/ ASYDN** (Assignment of System Data into Local LDM/NDM)

SYS1

Index 682

Bit 0=1 (Line Information Display valid when a terminal is idle)

Bits 1 and 2: The contents of default display of the line information

The default display will be shown as follows according to the each bit settings.

Display Item	Bit 1	Bit 2
Name+ Number	0	0
Number (16 digits)	1	0
Name (24 characters)	0	1
No Display	1	1

Bit 3: The line used for the display of the line information

0/1:My Line/ Prime Line

Bit 4: Name information prioritized to be used for the display of the line information.

0/1:System Phone Book (APBKN command)/ Name Display (ANDD command)

Bit 5: The display format for an idle terminal.

0/1:[Number] (The number in brackets) /: Number (":" before the number)

Bit 6: When selecting Name+ Number for the default display of the line information.

The displayed digit number will be shown as follows according to the settings of Bit 5.

<Bit 5=0, The number in brackets>

0/1: Name 12 characters + Number 10 digits/ Name 16 characters + Number 6 digits

<Bit 5=1, ":" before the number>

0/1: Name 12 characters + Number 11 digits/ Name 16 characters+ Number 7 digits.

Bit 7: Setting for flashing the line information when originating a call.

0/1: No flash/ Flash

Index 683

Bits 6 and 7: The row to display the line information

The displayed row will be as follows according to the terminal to be set.

<DT830/DT750/DT730/DT710 (8-button type)>

Bit 6=0, Bit 7=0: 2nd line

Bit 6=1, Bit 7=0: 3rd line

<DT430/DT330/DT310 (6-button type)/DT710 (6-button type)>

Bit 6=0, Bit 7=0: 1st line

Bit 6=1, Bit 7=0: 2nd line

STEP 3: **AKYD** (Assignment of Key Data for Dterm)
KYN: Key Number
KYI=1 (Function Key)
FKY=193 (Line Information Change Display)

STEP 4: **ADSL/ADSLN** (Assignment of Dterm Soft Key on LCD)
SN=0 (Idle)
FKY=193 (Line Information Change Display)

Note: If switching displays by an access code, use the following commands instead of the AKYD command.

STEP 5: **ANPD/ANPDL/ANPDN** (Assignment of Numbering Plan Data)

Assign the minimum number of digits needed to determine the service required to the first digit received.

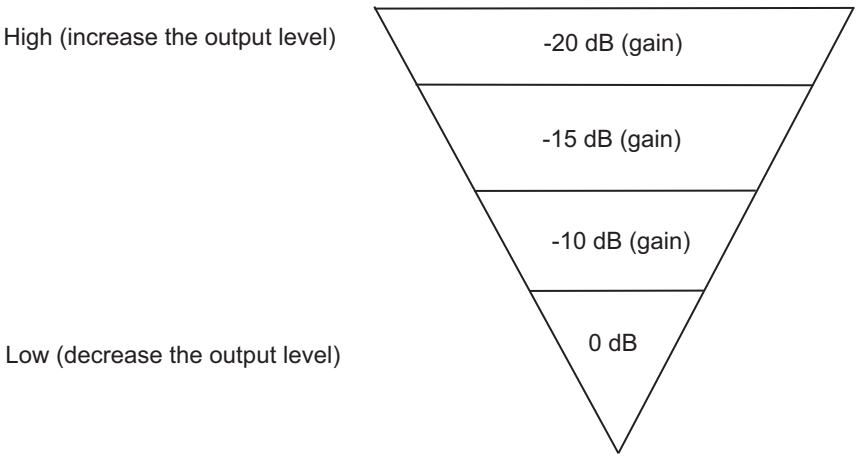
STEP 6: **ASPA/ ASPAL/ ASPAN** (Assignment of Special Access Code)
CI=N
SRV=SSCA
SIDA=171 (Line Information Change Display)

M-125 MG External Music-On-Hold

General Description

This feature enables Music-On-Hold to be played to outside callers not only from the Telephony Server but also from an external audio source or an MG internal audio source on an MG device basis.
MG External Music-On-Hold (MOH) is sent when a station places a trunk call on hold during a conversation through an MG.

Operating Procedure



None

Service Conditions

1. This feature is available for the following devices:

   Note: Not available for UG50.

   - MG (BRI)
   - MG (PRI) [SIP]
   - MC&MG-COT
   - MG-6COT
2. This feature is available only when **Music-On-Hold** is enabled (ASYD SYS1 Index 64 Bit 7=1).
3. Use a cable compatible with a 3.5 φ mini-jack (monaural type) to connect audio equipment used for external Music-On-Hold and the MG device.
4. To prevent damage from an external excessive input signal, you should pay careful attention to the output of the external Music-On-Hold equipment. Start with low output level, and then gradually increase it.
5. You can control the sound level of external Music-On-Hold by changing the output level or the input gain while monitoring the audio level on the opposite telephone via ISDN. The output level can be adjusted manually on the device, and the input gain can be adjusted with the AMGIL command from PCPro.
6. Gain adjustment can be selected from four patterns; “0 dB”, “-10 dB (gain)”, “-15 dB (gain)” and “-20 dB (gain)”. See the diagram below.

7. Input impedance from external Music-On-Hold equipment must be within the range of 8Ω to 50kΩ at all times. Do not exceed this range.
8. Induction noise may occur depending on external Music-On-Hold equipment if the equipment and FG on the MG device are not earthed.
9. With this feature, a hold tone can be selected for each MG device with the AMGIL command. This setting overrides the system data settings of External Music-On-Hold (ASYDL SYS1 Index 810 Bit 2:0/1, for IP terminals). If hold tone setting is not configured with the AMGIL command, it will be selected in accordance with the settings of External Music-On-Hold for IP terminals.

Selecting Audio Source of Music-On-Hold

Settings per MG (AMGIL command)	External Music-On-Hold for IP Terminals (ASYDL SYS1 Index 810 Bit 2)	Audio Source of Selected Music-On-Hold
No Setting	Internal Music-On-Hold (IP terminal) (=0)	MG External Music-On-Hold (MG Internal Music-On-Hold 1 is used if External Music-On-Hold equipment is not connected)
	External Music-On-Hold (EMA/PLO) (=1)	Telephony Server External Music-On-Hold In the case of IPPAD PKG not used, the order of precedence to operate is as follows: (1) MG External Music-On-Hold (2) MG Internal Music-On-Hold 1
External Music-On-Hold	- (Regardless of settings)	MG External Music-On-Hold (MG Internal Music-On-Hold 1 is used if External Music-On-Hold equipment is not connected)
Internal Music-On-Hold 1		MG Internal Music-On-Hold 1
Internal Music-On-Hold 2		MG Internal Music-On-Hold 2

10. With Telephony Server External Music-On-Hold configured, if external Music-On-Hold equipment cannot be used, e.g. IPPAD circuit card not available or all busy, MG External Music-On-Hold will be activated instead.
11. If external Music-On-Hold equipment is not connected to AUX on an MG device when MG External Music-On-Hold is selected, Internal Music-On-Hold 1 will be selected instead by the MG device. However, MG External Music-On-Hold can be selected when external Music-On-Hold equipment is connected afterward.
12. Either Telephony Server Music-On-Hold (Extended Hold Music and External Music-On-Hold) or MG External Music-On-Hold can be chosen as a hold tone used on each MG device. Note that Telephony Server External Music-On-Hold, Extended Hold Music, and Multiple Music-On-Hold Source cannot be used in combination.
13. When MG External Music-On-Hold is selected, the gain value of External Music-On-Hold input can be configured per MG device with the AMGIL command. Note that the input value range is different from the gain value for the input value. Follow the conditions of MG devices.
14. For service conditions for UG50, see “Conditions and Limitations” in Peripheral Equipment Description (UG50).

Programming

STEP 1: **ASYD** - Assignment of System Data

SYS1

Index 64

Bit 7=1 (Music-on-Hold in service)

STEP 2: **ASYDL** - Assignment of System Data for LDM

SYS1
Index 810
Bit 2: External Music-on-Hold service for IP terminal. (In the case of MG External Music-on-hold used)
0/1=(Internal Music-on-hold for IP terminal/External Music-on-hold for EMA/PLO)

Note: Conditions for this command.
- This command is only available when Music-on-hold is not configured with the AMGIL command.
- For more information on selecting External Music-on-hold, see “M-7 Music On Hold” in Data Programming Manual - Business.

STEP 3: **AMGIL** - Assignment of Media Gateway Information for LDM

Register information of each MG (Media Gateway).

(a) In the case of MG (BRI) [Proprietary Protocol]

MG-ID: Assign the MAC address of MG (6 bytes)

FUNCTION: Select the function type of MG settings.

KIND: Select ISDN Trunk (BRI)

LINE=0/1 (ISDN Line Setting)

CH=0/1 (Channel B1/ Channel B2) **Note 2**

LENS: Allocate the LENS of Virtual Speech Channel. **Note 3**

Setting Type of Signaling Packet Service:
MG Signaling Channel QoS setting (ToS value used by MG (BRI) for signal control)

Music On Hold Exists:

Music On Hold= External Music On Hold/Internal Music On Hold1/Internal Music On Hold2

External Music On Hold Input Gain Adjustment [0-15]

0: 0 dB (gain)
1: -10 dB (gain)
2: -15 dB (gain)
3: -20 dB (gain)
4-15: Not used

Emergency Telephone= Automatically Cancel (default)/ Manually Cancel

<When FUNCTION =RESET>

ACTION AFTER RESET

= Startup with operation mode (default)/ Startup with emergency telephone mode

Note 2: Ensure that settings for both CH0 and 1 are configured. Do not register just CH0 (even number level) or CH1 (add 1 to the LENS of CH0) only.

Note 3: Before registration, check to ensure that the ATRK command data has been entered.

(b) In the case of MG (BRI) [SIP]

MG-ID: Assign the MAC address of MG (6 bytes)

FUNCTION: Select the function type of MG settings.

KIND: Select ISDN Trunk (BRI) [SIP]

LINE=0/1 (ISDN Line Setting)

CH=0/1 (Channel B1/ Channel B2) **Note 3**

LENS: Allocate the LENS of Virtual Speech Channel. **Note 4**

Setting Type of Signaling Packet Service:
MG Signaling Channel QoS setting (ToS value used by MG (BRI) for signal control)

Music On Hold Exists:

Music On Hold= External Music On Hold/Internal Music On Hold1/Internal Music On Hold2

External Music On Hold Input Gain Adjustment [0-15]

0: 0 dB (gain)
1: -10 dB (gain)
2: -15 dB (gain)
3: -20 dB (gain)
4-15: Not used

Emergency Telephone= Automatically Cancel (default)/ Manually Cancel

<When FUNCTION =RESET>

ACTION AFTER RESET

= Startup with operation mode (default)/ Startup with emergency telephone mode

Note 3: Ensure that settings for both CH0 and 1 are configured. Do not register just CH0 (even number level) or CH1 (add 1 to the LENS of CH0) only.

Note 4: Before registration, check to ensure that the ATRK command data has been entered.

(c) In the case of MG (PRI) [SIP]

MG-ID: Assign the MAC address of MG (6 bytes)

KIND: Select ISDN Trunk (PRI 1.5M) [SIP]/ISDN Trunk (PRI 2M) [SIP]

UG50 Multi-Slot Mode: Select this check box if registering UG50 in Multi-slot mode.

FUNCTION: Select the function type of MG settings.

LINE=0 (fixed)

CH=0 (fixed)

LENS: Allocate the head channel of HW (Highway Block) where Virtual Signal Channel is assigned.

Setting Type of Signaling Packet Service:
MG Signaling Channel QoS setting (ToS value used by MG (PRI) for signal control)

Music On Hold Exists:

Music On Hold= External Music On Hold/Internal Music On Hold1/Internal Music On Hold2

External Music On Hold Input Gain Adjustment [0-15]

Country Code: Select an appropriate country code

Law of A/D Conversion: Appropriate method is displayed according to Country Code.

(d) In the case of MC&MG-COT

Note: The device will be reset when a registration/deletion is executed with this command during operation.

MG-ID: Assign the MAC address of MC&MG-COT (6 bytes)

KIND: Select MC-MG (COT)

UG50 Multi-Slot Mode: Select this check box if registering UG50 in Multi-slot mode.

FUNCTION: Select the function type of MG settings.

LINE=0/1 (MG Line Number)

CH=0 (fixed)

LENS: Allocate the LENS of Virtual Speech Channel.

Setting Type of Signaling Packet Service:
MC&MG-COT Signaling Channel QoS setting (ToS value used by MC&MG-COT for signal control.

Music On Hold Exists:

Music On Hold= External Music On Hold/Internal Music On Hold1/ Internal Music On Hold2

External Music On Hold Input Gain Adjustment [0-15]

0: 0 dB (gain)
1: -10 dB (gain)
2: -15 dB (gain)
3: -20 dB (gain)
4-15: Not used

Country Code: Select an appropriate country code

Law of A/D Conversion: Appropriate method is displayed according to Country Code.

PB Receive Complete Timing of Dial-In [0-15]

False Answer Timing [0-15]

(e) In the case of MG-6COT

Note: The device will be reset when a registration/deletion is executed with this command during operation.

MG-ID: Assign the MAC address of MG-6COT (6 bytes)

KIND: Select MG (6COT)/MG (6COT) [SIP]

UG50 Multi-Slot Mode: Select this check box if registering UG50 in Multi-slot mode.

FUNCTION: Select the function type of MG settings.

LENS Setting: Allocate the LENS of Virtual Speech Channel.

LINE=0-5 (MG Line Number)

CH=0 (fixed)

Setting Type of Signaling Packet Service:
MG-6COT Signaling Channel QoS setting (ToS value used by MG-6COT for signal control.)

Music On Hold Exists:

Music On Hold= External Music On Hold/Internal Music On Hold1/Internal Music On Hold2

External Music On Hold Input Gain Adjustment [0-15]

0: 0 dB (gain)
1: -10 dB (gain)
2: -15 dB (gain)
3: -20 dB (gain)
4-15: Not used

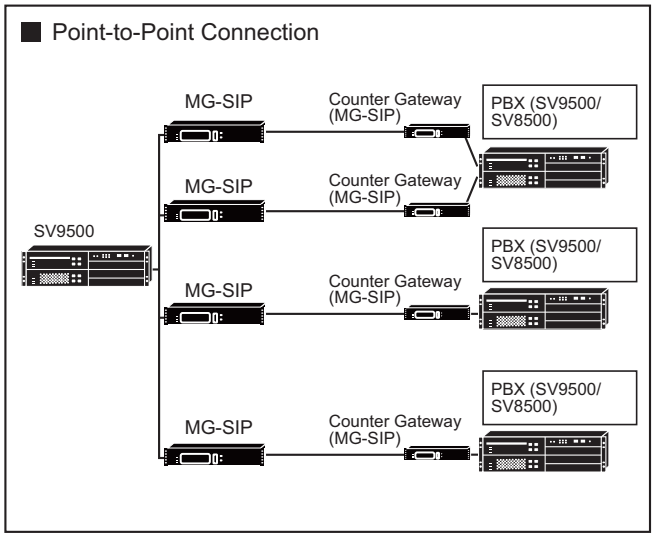
Country Code: Select an appropriate country code

Law of A/D Conversion: Appropriate method is displayed according to Country Code.

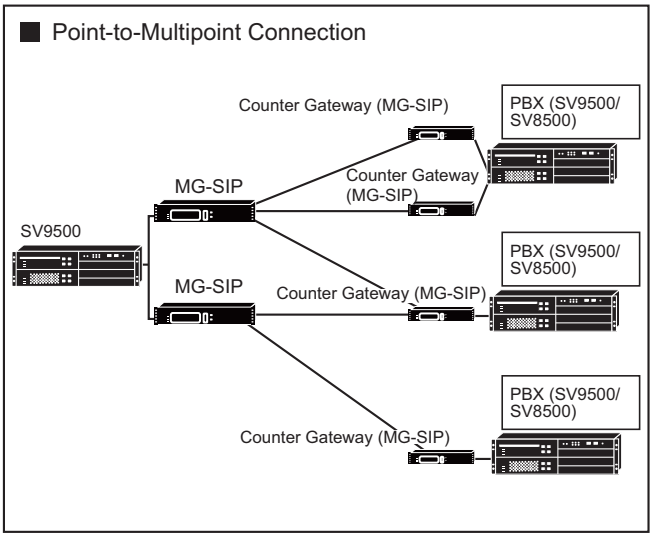
PB Receive Complete Timing of Dial-In [0-15]

False Answer Timing [0-15]

M-126 MG-SIP TIE Line Point-to-Multipoint Connection



General Description



This feature enables Point-to-Multipoint Connection on MG-SIP TIE Line.

Note: This feature is available since FP95-113 V3.

Note: The definitions of the terms used in this feature shall be as follows:

Point-to-Point Connection:	One MG-SIP can be connected to only a single counter gateway. This connection supports, as a counter gateway, only MG-SIPs controlled by SV9500/SV8500 or the SIP gateway devices controlled by SV9300.
Point-to-Multipoint Connection:	One MG-SIP can be connected to multiple counter gateways. Also, multiple MG-SIPs can be connected to multiple counter gateways. This connection supports, as a counter gateway, only MG-SIPs controlled by SV9500/SV8500 or the SIP gateway devices controlled by SV9300.

To implement Point-to-Multipoint Connection, the following features must be configured:

Feature Name	Descriptions
MG-SIP TIE Line Path Splitting [M-127]	A single MG-SIP can be connected to multiple counter gateways.

Feature Name	Descriptions
MG-SIP TIE Line Failure Detection Per Path [M-128]	MG-SIP periodically sends keep-alive packets to each path to verify that the connection is valid. If MG-SIP detects a communication failure or recovery, it sends a failure notification to Telephony Server.
MG-SIP TIE Line Loop Detection [M-129]	When a call routed via MG-SIP loops through nodes, the call termination is restricted.

Operating Procedure

None.

Service Conditions

<Important Notices>

1. This feature is available only for MG-SIP TIE Line. For details on MG-SIP TIE Line, see MG-SIP TIE LINE [M-122] and MG-SIP128 [MG-128SIPMGJ-B/MG-128SIPMGJ] in Peripheral Equipment Description (IP Devices).

<Interactions with Other Features>

None.

<Hardware/Software>

1. This feature is available for MG-128SIPMGJ-B with firmware versions SP-4060 MGSIP PROG-L Issue 3 or later.

<Interactions with Networks>

None.

<Conditions Specific to This Feature>

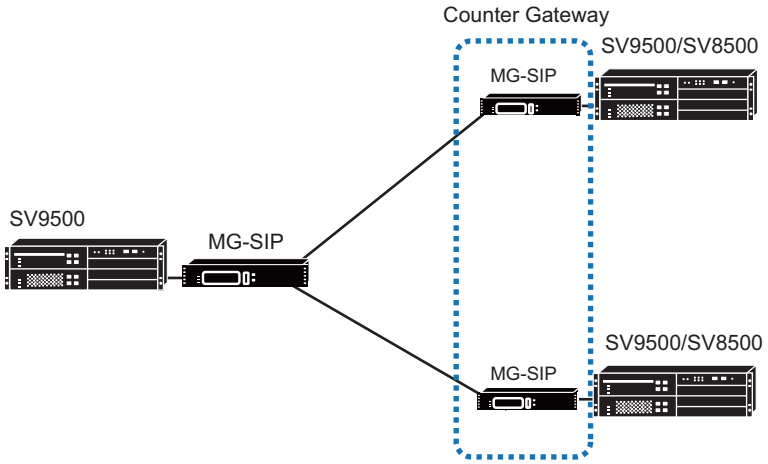
1. The service conditions for MG-SIP TIE LINE [M-122] also apply to this feature.
2. This feature cannot be used with the Multipoint feature on MG-SIP. When using this feature, disable the Multipoint feature with the configuration command on MG-SIP.

<Other Conditions>

None.

Programming

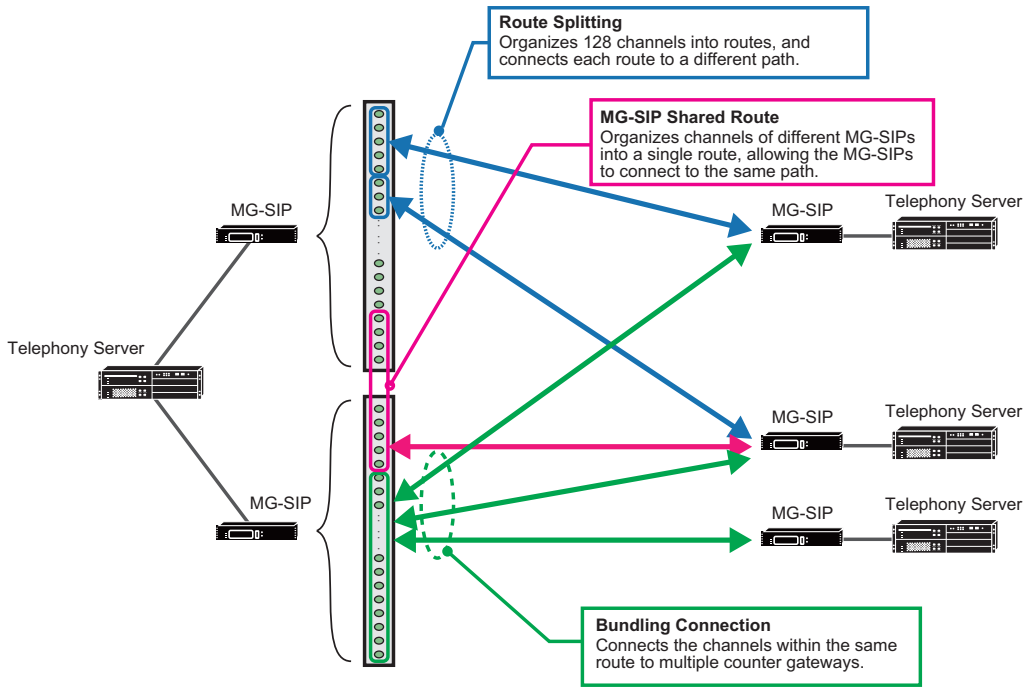
For data assignments of each feature, see the following:



- MG-SIP TIE LINE PATH SPLITTING [M-127]
- MG-SIP TIE LINE FAILURE DETECTION PER PATH [M-128]
- MG-SIP TIE LINE LOOP DETECTION [M-129]

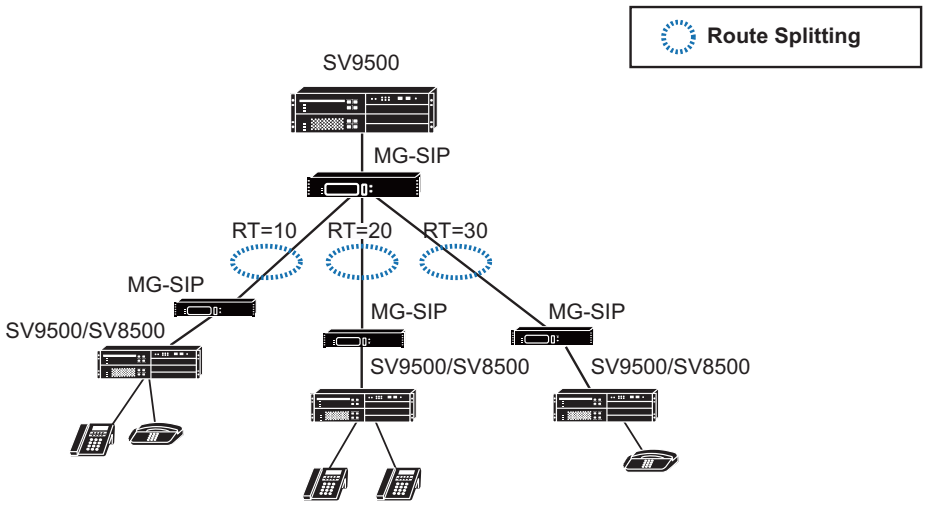
M-127 MG-SIP TIE Line Path Splitting

General Description



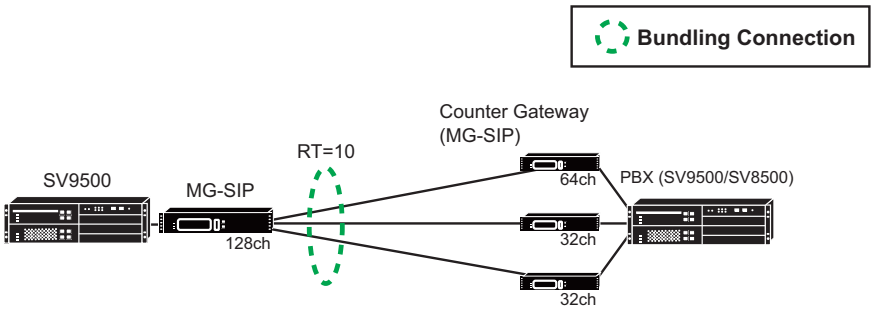
A single MG-SIP can be connected to multiple counter gateways.

Note: This feature is available since FP95-113 V3.



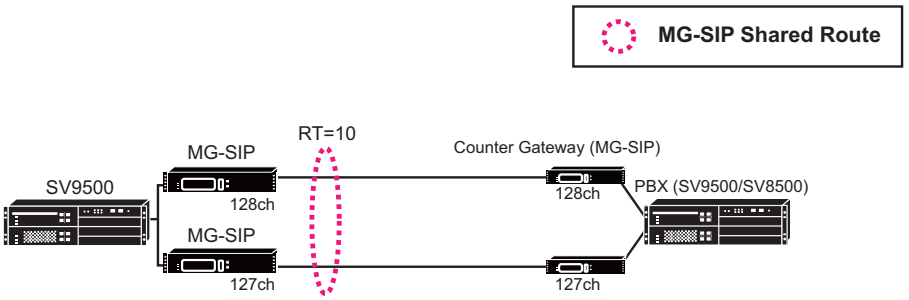
By combining the following functions, speech channels in an MG-SIP or between MG-SIPs can be changed flexibly according to the operating condition.

	Features	Descriptions	Remarks
1	Route Splitting	One MG-SIP can connect to multiple external routes and counter gateways.	
2	Bundling Connection	One MG-SIP can connect to the multiple gateways in the same counter office.	
3	MG-SIP Shared Route	Multiple MG-SIPs can share the same external route.	
4	Combination of Route Splitting and Bundling Connection	One MG-SIP can connect to multiple counter gateways in different external routes.	Combination of 1 and 2
5	Combination of Route Splitting and MG-SIP Shared Route	Some of the external routes used in Route Splitting can be shared by multiple MG-SIPs.	Combination of 1 and 3
6	Combination of Bundling Connection and MG-SIP Shared Route	Some of the external routes used in Bundling Connection can be shared by multiple MG-SIPs.	Combination of 2 and 3
7	Combination of Route Splitting, Bundling Connection and MG-SIP Shared Route	Some of the external routes used in Route Splitting and Bundling Connection can be shared by multiple MG-SIPs.	Combination of 1, 2 and 3



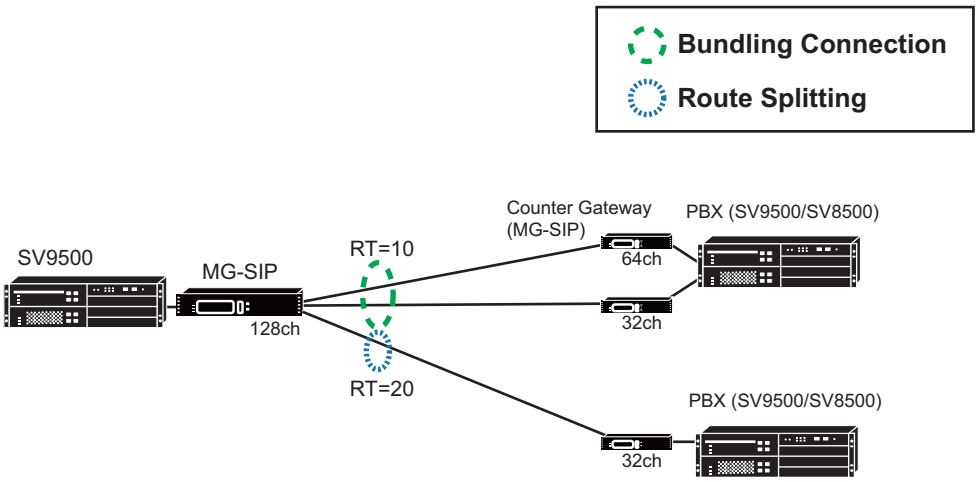
Route Splitting

One MG-SIP can connect to multiple offices.



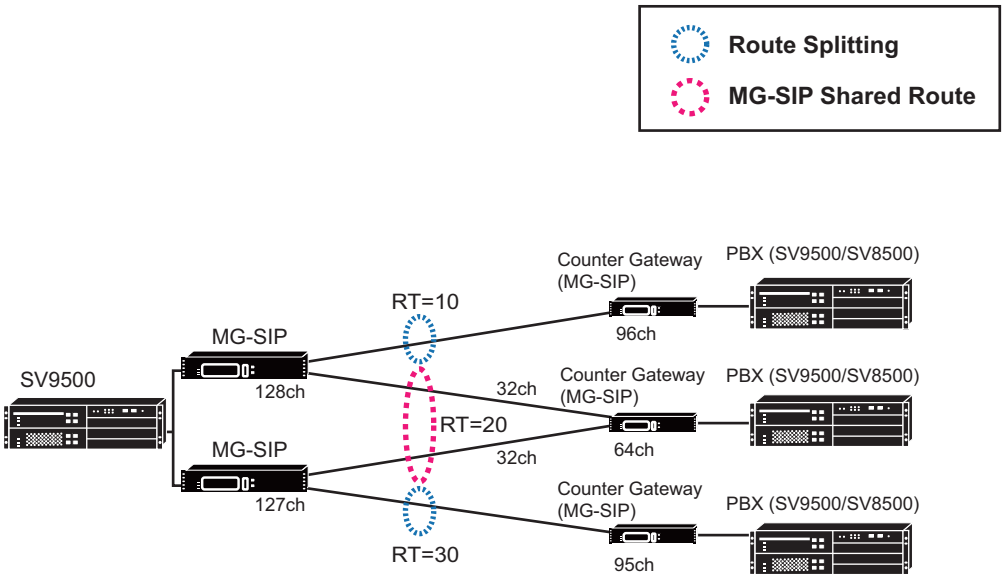
Bundling Connection

One MG-SIP can connect to multiple gateways in the same counter office.



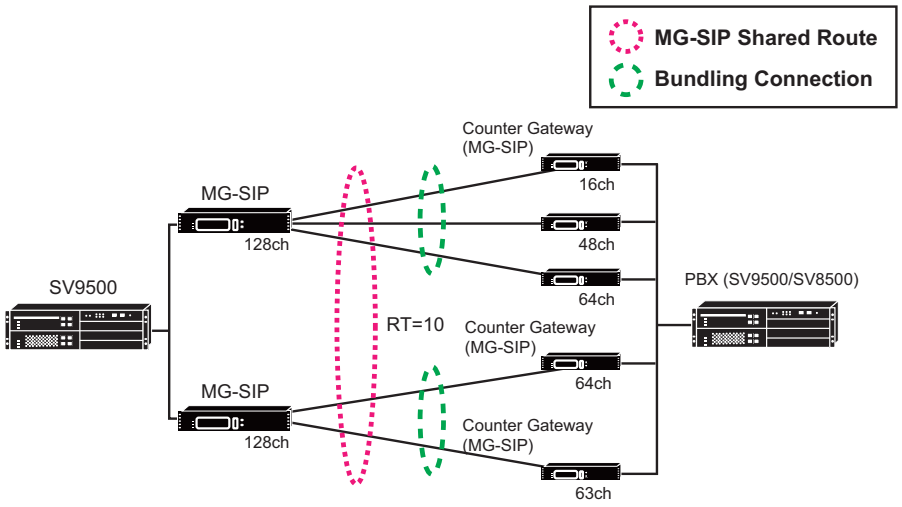
MG-SIP Shared Route

Multiple MG-SIPs can share the same external routes. For more details on MG-SIP Shared Route, see MG-SIP SHARED ROUTE [M-123].



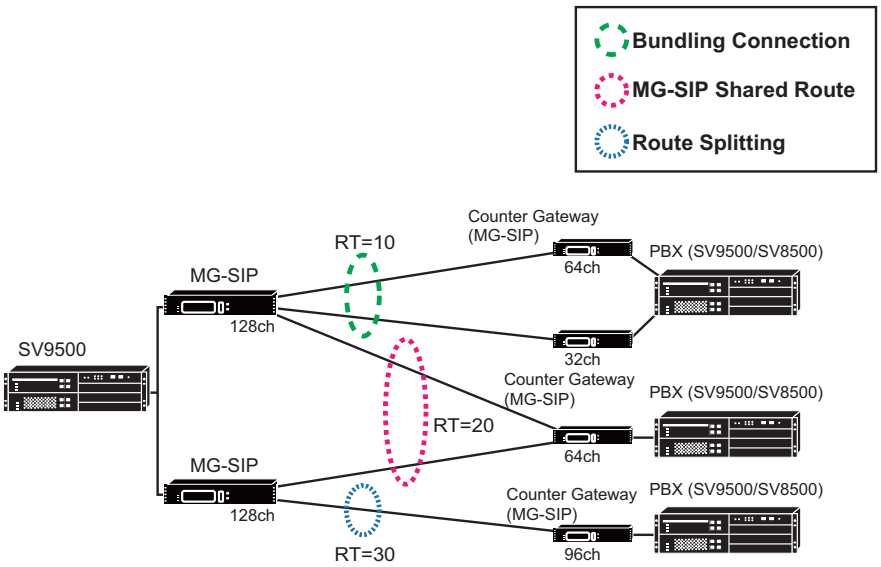
Combination of Route Splitting and Bundling Connections

One MG-SIP can use both Route Splitting and Bundling Connection at the same time.



Combination of Route Splitting and MG-SIP Shared Route

One MG-SIP can use both Route Splitting and MG-SIP Shared Route at the same time.



Combination of Bundling Connection and MG-SIP Shared Route

One MG-SIP can use both Bundling Connection and MG-SIP Shared Route at the same time.

Combination of Route Splitting, Bundling Connection and MG-SIP Shared Route

One MG-SIP can use Route Splitting, Bundling Connection and MG-SIP Shared Route at the same time.

Operating Procedure

None.

Service Conditions

<Important Notices>

1. To use this feature, destination information needs to be assigned to Path ID of the AMGIL command per counter SIP gateway. A maximum of 32 Path IDs (1 - 255) can be assigned per MG-SIP.
2. Make sure that Usable CH Number of the AMGIL command is set to 128ch even when number of the registered trunks is less than 128ch. If you set the Usable CH Number to less than 128 and later register additional trunks to exceed the previously set limit value, you need to restart the MG-SIP.
3. Restart of the MG-SIP is not required if the increase in the number of routes/trunks or paths has no effect on the ACSC command.
4. Up to 62 MG-SIPs can be accommodated in a system due to the restriction of CSC Group (CSCG) of the ACSC command (range from 130 to 254).
5. When path data is changed, reset the path with the AMGIL command for the changes to take effect.
6. When the office data for Path Splitting is assigned through the AMGIL command, MG-SIPs that do not support Path Splitting cannot perform the registration with that office data. When MG-SIPs supporting Path Splitting register to the system without Path Splitting office data, they have Point-to-Point connection.
7. The LENS data for virtual signaling channels which has been set through the AMGIL command must not be deleted by the ATRK command during the operation. To delete the LENS data, make the MG-SIP in an unusable state, then delete the trunk data by the ATRK command.
8. Do not set the ACIC2 command data when using this service. When the command data has already been set, be sure to delete it.
9. When using this service, enable MG-SIP TIE Line Path Splitting through the configuration command *set mp_mode* on the MG-SIP.

<Interactions with Other Features>

1. Designated trunk connection assigned by the TOGC command is available, but INDIVIDUAL TRUNK ACCESS [I-4] is not available.

<Hardware/Software>

1. This service is available for MG-128SIPMGJ-B with firmware versions SP-4060 MGSIP PROG-L Issue 3 or later.
2. This feature supports as a counter gateway the following MG-SIPs:

    - MG-128SIPMGJ/MG-128SIPMGJ-B of SV9500/SV8500 (including SV9500/SV8500 that does not support this feature. Also, there is not any firmware condition regarding the counter gateway MG-SIP).
    - SIP gateway devices controlled by SV9300.

<Conditions Specific to This Feature>

1. When a single MG-SIP connects to multiple counter gateways, the maximum number of simultaneous speeches depends on that of the MG-SIP. In the case of MG-128SIPMGJ-B, the maximum number of simultaneous speeches is 128 channels.
2. A single MG-SIP can connect to a maximum of 32 counter gateways.
3. Route can be assigned on a per counter gateway basis. Up to 32 routes are available for a single MG-SIP.
4. All the trunks used by a single MG-SIP need to be accommodated in the same LP.

5. Multiple external routes can be assigned in a highway (four groups). In this case, trunks to use must be assigned to continuous channels necessary for the counter gateway. When an external route does not fit within one highway (four groups), the trunks must be split across multiple highways. (the remaining trunks need to be assigned from the beginning of another group).

   Note: When an already registered trunk is deleted during the operation, the trunk cannot be used to make/receive a call any more. A path to which trunks are not assigned continuously becomes unusable after the registration or the reset of the path.

6. A maximum number of simultaneous speeches between an MG-SIP and a counter gateway depends on the value of the CH parameter in List of Path Data of the AMGIL command. This value must be the same as the number of channels on the counter gateway. When the number of speech channels on the MG-SIP is larger than number of speech channels on the counter gateway, make some trunks on the MG-SIP busy to adjust the number of the channels.
7. When deleting path data, make sure that all the trunks to be deleted are idle. Access the MBTK command and select "2: Make Busy (Bothway)" for the MB parameter to place the trunks in make busy state.
8. A route can be shared by up to two MG-SIPs. A maximum of 255 channels can be used with the same route because up to 255 trunk numbers can be assigned to a route.
9. MG-SIPs sharing a route by using MG-SIP SHARED ROUTE [M-123] need to be assigned in the same LP.
10. When two MG-SIPs connect to the same counter gateway with MG-SIP SHARAED ROUTE [M-123], the gateway must support Bundling Connection.
11. The same IP address cannot be assigned to multiple paths.
12. After path data of MG-SIPs is created or deleted with the AMGIL command during the operation, the MG-SIPs must be restarted and perform re-registration.
13. Path data registered in Telephony Server (AMGIL path data) and registered in MG-SIP will be monitored at a prescribed period (at about 50 second intervals). When difference exists between them, the system message 35-N will be issued and the corresponding path will be busy. In this case, assign path data again through the AMGIL command or reset the path.

    Note: Monitoring of path data is suspended during the registration/deletion/reset of the AMGIL path data. After the process, the monitoring is resumed.

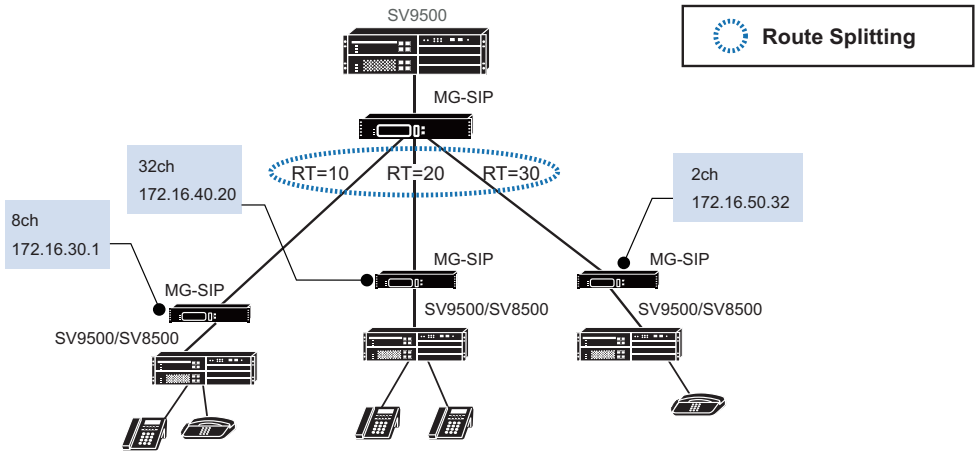
14. Note the following points when adding the AMGIL path data for an MG-SIP which has been already operated.

    - When path data on MG-SIP is successfully registered:

      System message 35-M will be issued.
      If you use the DIMG command (View Type = Media Gateway Information) to verify registration status, it displays:
      - a path number in the Path ID field
      - "Operating" as the line status in the ISDN Status field

    - When registration of path data on MG-SIP failed:

      According to the condition of "13", the system message 35-N will be issued.
      If you use the DIMG command (View Type = Media Gateway Information) to verify registration status, it displays:
      - no path number in the Path ID field
      - "Trouble of remote factor" as the line status in the ISDN Status field



<Other Conditions>

None.

Programming

Route Splitting

Office data settings for Route Splitting are as follows:

STEP 1: **ASYD**
SYS1,
Index 64, Bit 7 = 1 (Music-on-Hold service is in service)
Index 186, Bit 6 = 1 (ISDN is in service)
Index 187 = 00
Index 220, Bit 6 = 0 (ISDN service is in service)
Index 474 (Guard Timer for Originating Call (MTC × TC)
Bit 0-3: MTC (Miscellaneous Timer Counter)
Bit 4-6: TC (Timer Counter) = 1 (64 ms period)

STEP 2: **ASYDL**
SYS1
Index 810, Bit 2 = 0/1 [Internal Holding Tone (IP terminals)/External Holding Tone (EMA and PLO)] **Note 1**
Index 880, Bit 1 = 1 (Internal PHI-PRI/BRI is enabled)

Note 1: When External music is used, see MUSIC ON HOLD [M-7].

STEP 3: **ASYDL/ASYDN** - SYS1, Index 1145, Bit 4 = 1 (Stores C.O. call Information collected during operation of the MG-SIP TIE Line feature.)

STEP 4: **ALOCL** - Assign ToS settings for Internal PHI-BRI. When assigning ToS, be sure to assign LOC-ID = 0.

TYPE: Select “Network Address”.
IP ADDRESS: 0.0.0.0
MASK BIT: 32
NETWORK ADDRESS: Display only.
LOC-ID: 0
Setting Type of Signaling Packet Service: Assign ToS value to control MG-SIP through the Internal PHI-BRI. Click the check box to ON when data setting for Type of Service (ToS) field is required. When this check box remains OFF, the default value is applied.
IP PRECEDENCE/DIFFSERV: Choose either IP PRECEDENCE or DIFFSERV.
Priority (PRECEDENCE /DSCP)
- When IP PRECEDENCE is selected
Specify its priority [0-7] and the type (LOW DELAY/THROUGH PUT/RELIABILITY/MIN COST).
- When DIFFSERV is selected
Specify its priority [0-63].

Note: One of the following is required to allow the changes to Setting Type of Signaling Packet Service data for already-operating equipment (such as PH and IP station) to take effect.
- Initialize the Internal PHI-BRI (Initialize the Internal PHI-BRI module with the ADPM command) or system.
- Re-register the IP station.

STEP 5: **ADTM** - Assign port numbers if necessary (default value = 64000).

Note: When you change the default port number with this command, you need to initialize the Internal PHI-BRI module with the ADPM command.

STEP 6: **ADPM** - Assign ToS settings for Internal PHI-BRI. When assigning ToS, be sure to assign LOC-ID = 0.
PH TYPE = Internal PHI (BRI)
Menu = Initialize

Note: When MG-BRI or other MG-SIPs are used, they are also initialized.

STEP 7: **ALIDL** - Specify the LENS (five digits) of Internal PHI-BRI.
PH LENS: Specify an even-numbered Group Number. The LENS can be allocated on either a Virtual PIR or a Physical PIR.
PH TYPE = Internal PHI
REGMAX: Specify the registration capacity (1-6144).

Note: When the total number of channels using PHI-BRI exceeds 256, increase the value of REGMAX.

STEP 8: **ARTD/ARTDN** - Specify the route class data on Virtual Speech Channel as follows. It is not necessary to register attributes for the Virtual Signaling Channel.
CDN6: TCL = 1 (DDD Line)
CDN65: INT = 10 [Q-Sig, (ETS 300 172)/IS-11572]
CDN66: DC = 1-15 (DID Addressing number)
CDN115: CMRT = 1 (Single route number used by multiple ISDN trunks/MG-SIPs)
Assign the CDN111(ADVPRA) = 1 (ISDN PRI Failure Routing Service) to dummy route.

Note: To change the data for existing route (RT), initialize or reboot the MG-SIP.

STEP 9: **ARTI/ARTIN** - Specify the application data for trunk.
CDN47: INTD = 2 (SIP)

CDN68: VIR = 2 (MG connection)

CDN77: RA_RT (Register type (MG-SIP) = 0 (Virtual Register)/1 (Register card)

Note: When Automated Attendant service is used with MG-SIP while RST card and IPPAD card are accommodated in the system, set the RA_RT parameter to 1.

CDN96: MGSIPSV = 3 (TIE Line connection)

Assign the following parameters for FAX use:

CDN71: FXD = 1 (IP FAX data is in service)

CDN72: FXJS (Jitter Buffer Size for IP FAX [1-30]×10 ms) ex. Enter "15" for 150 ms.

CDN73: FXPT = 1 (Payload Type for IP FAX is G.711)

CDN74: FXPS (Payload Size for IP FAX [1-4]×10 ms) ex. Enter "2" for 20 ms.

Note: To change the data for existing route (RT), initialize or reboot the MG-SIP.

STEP 10: **ATRK** - Specify trunk data on Virtual Speech Channel and Virtual Signaling Channel.

RT: Specify Route Number [1-255]

TK: Specify Trunk Number [1-255]

LENS: Specify Accommodated Location (Six digits)

Register routes/trunks/channels to use for each path.

Path for MG-SIP	Number of Channels	Route Number	LENS	
			Highway 1	Highway 2
Path A	8	10	020040 - 020047	-
Path B	32	20	020050 - 020077	020160 - 020167
Path C	2	30	-	020170 - 020171
Total	42	-	-	-

Note: When using this command, consider the following:

- Virtual speech channels for each path must be assigned to continuous channels from the first channel of a highway group. When all the channels cannot fit within one highway and need to be split across multiple highway groups, assign remaining channels from the beginning of the next group.
- Only MG-SIP virtual communication channel can be registered for HW (4 group) with at least one MG-SIP virtual communication channel already registered.
- Do not assign the LENS that belongs to Even-numbered module group, Unit=0 and Group=0 to a trunk, because they are not supported by MG-SIP.

STEP 11: **ADPC** - Assign Point Code to Virtual Speech Channel. On the office data, a vacant number is used for a Point Code. For more details, see the Command Manual.

RT: Specify an external route number.

PC: Specify a vacant Point Code (Point Code used by Common Line/ISDN cannot be used).

Note: Assign the same Point Code to all the routes registered by the ATRK command.

STEP 12: **ACSC** - Assign the first channel of 32 channels (a highway) LENS to the even-numbered CSC group, and LENS of Virtual Signaling Channels to the odd-numbered CSC group.

Note: Assigning LENS of Virtual Signaling Channels to odd-numbered CSC group makes any setting with the ACIC2 command unnecessary.

CSCG: Specify the CSC Group Number (even numbers from 130 to 255 and odd number continuous with them)

GROUP: Specify the CIC Group Number
CCH: Specify the first channel of 32-channel LENS for even-numbered CSCG and Virtual Signaling LENS for odd-numbered CSCG.

<Example of Data Settings>

CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signaling Channel (CCH)			Remarks
		MG 00-07	U 0-3	G 00-23	
130	0	02	0	4	Path A/B
	1	02	0	16	Path B/C
	2	02	0	4	**Note 2**
	3	02	0	4	**Note 2**
	4	02	0	4	**Note 2**
	5	02	0	4	**Note 2**
	6	02	0	4	**Note 2**
	7	02	0	4	**Note 2**

Note 2: Apply the same settings as CICG=0 to the remaining CIC Group Numbers (CICG).

In the next step, assign LENS of Virtual Signaling Channel to the next CSCG (greater by one than the last CSCG).

Note: When your system contains a single MG-SIP, assign the same LENS to all the numbers.

CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signaling Channel (CCH)			Remarks
		MG 00-07	U 0-3	G 00-23	
131	0	02	0	4	
	1	02	0	4	
	2	02	0	4	
	3	02	0	4	
	4	02	0	4	
	5	02	0	4	
	6	02	0	4	
	7	02	0	4	

STEP 13: **ACIC1** - Specify LENS of Virtual Signaling Channel on Point Code as follows:
PC: Enter Point Code specified by ADPC.
CSCG: Enter CSC group specified by ACSC.

STEP 14: **MBTK** - Cancel Make Busy of Virtual Speech Channel.

STEP 15: **AMGIL** - Assign the data regarding MG-SIP as follows:

MG-ID: Enter MAC Address (six bytes) of MG-SIP. * Enter the Telephony Server side (LAN side) MAC address.

FUNCTION = Setting

KIND = SIP-MG

LINE = 0 (fixed)

CH = 0 (fixed)

LENS: Enter the accommodated location of Virtual Signaling Channel (the first number of HW).

Retry = 0

Setting Type of Signaling Packet Service: Specify QoS settings of Signaling that is used when Internal PHI-BRI connects MG-SIP.

Usable CH Number: Enter the number of channels to be used per MG-SIP (1-128).

Note: Be sure to set 128ch (fixed) when this feature (MG-SIP TIE Line Path Splitting) is used.

Service of Authentication Exists: Unchecked

Setting of Path Data

Note: When the Set button of the command is pressed while this check box is OFF, all the registered Path data is cleared.

Note: Assign the following data as you have created with the ATRK command. Assign the counter IP address and port number according to the settings of counter gateway.

List of Path Data

INDEX: Index of Path data (1-32)

Select: Choose the check box for the path to be registered.

Note: When the Set button of the command is pressed while the check box for the already registered path is OFF, the path data is cleared.

Path ID: Identification Number of Path (1-255)

RT: External Route Number (1-255)

* Enter the route number (route number of Virtual Speech Channel for MG-SIP assigned by the ATRK command) to be assigned to this path.

LGRT: Logical Route Number (display only)

TK: Trunk Number (1-255)

* Enter the first trunk number of the trunks (trunk number of Virtual Speech Channel for MG-SIP assigned by the ATRK command) to be assigned to this path.

CH: Enter the number of MG-SIP channels to be assigned to this path.

IP Ver: IP Address Version = 1 (IPv4)

GW IP: Enter an IP address of the counter gateway (0.0.0.1-255.255.255.254).

GW PORT: Enter a port number of the counter gateway (1024-65535).

FLT: Gateway Fault Detection Capability (0/1)

* To enable MG-SIP Fault Detection per Path, set this parameter to 1 (Enable).

<Example of AMGIL Command Settings>

Path of MG-SIP	Select	Path ID	RT	LGRT	TK	CH	IP Ver	GW IP	GW PORT	FLT
Path A	ON	1	10	10	1	8	IPv4	172.16.30.1	5060	Enable
Path B	ON	2	20	20	1	32	IPv4	172.16.40.20	5060	Enable
Path C	ON	3	30	30	1	2	IPv4	172.16.50.32	5060	Enable

STEP 16: **AMGVL**- Register the voice control data when connecting to MG-SIP. If this command data is not assigned, the values assigned by the AIVCL command will be set automatically.
A RT: Specify an external route number of MG-SIP Virtual Speech Channel Route Number.
TYPE: Select “Route Specified” or “Location ID Specified”.
B RT: Specify an external route number of MG-SIP to be connected.
B LOC-ID: Specify a Location ID to which IP stations to be connected belong (Normal setting).
* When IPPAD is accommodated in your system, assign LOC-ID=0.
Setting Type of Voice Packet Service: Specify QoS settings of Voice Speech
TYPE: Displayed when the check box of “Setting of Payload” is ON. Specify Payload type. *G.711 and 20ms must be set for public SIP network.
SIZE: Displayed when the check box of “Setting of Payload” is ON. Specify Payload size.

STEP 17: **ANPD/ANPDL/ANPDN**- Assign the minimum number of digits needed to determine the service required to the first digit received.
TN: Specify a Tenant Number.
1stDC: Specify the first digit of service access code.
CI: Choose a Connection Status Index.
NND: Specify the minimum necessary number of digits for each Access Code.

STEP 18: **ASPA/ASPAL/ASPAN**- Define the Access Codes for each counter office.
TN: Specify a Tenant Number
ACC: Specify an Access Code. [Maximum 6 digits]
CI: Choose a Connection Status Index.
SRV = LCR (Least Cost Routing)
RT or LGRT: Specify a Dummy Route Number.

STEP 19: **AFRS/AFRSL/AFRSN**- Assign a Number Pattern Code (NPC) and Outgoing Route Selection Number (OPR) to the Dummy Route.
TN: Specify a Tenant Number.
RT or LGRT: Specify a Dummy Route Number.
NPC: Define a Number Pattern Code. (maximum 16 digits)
OPR: Define an Outgoing Route Selection Number. (0-4000)

STEP 20: **AOPR/AOPRL/AOPRN**- Assign Virtual Speech Channels to each Outgoing Route Selection Pattern Routing (OPR) number.
TDPTN: Specify a Time of Day Change Pattern Number. (0-7)

OPR: Specify an Outgoing Route Selection Number. (0-4000)
RA: Specify the Route Advancing Order. (0-7)
E: Specify Route Advancing End Indication. (0/1)
RT or LGRT: Specify an Outside Route Number. (1-255)
SKIP: Specify the number of digits to be skipped from dialed numbers. (0-24) **Note 3**
PNL: Specify a Pattern Number Location. (0-999)

Note 3: If an Access Code is to be removed from the dialed number before the call is sent out, specify the number of digits of the Access Code for SKIP. Otherwise, incorrect number will be passed to the MG-SIP. When the Multi-Point connection is enabled on the MG-SIP, change the setting on the MG-SIP, accordingly.

STEP 21: **AMND/AMNDL/AMNDN**- AMND/AMNDL/AMNDN - Specify the number of maximum necessary digits for a Destination Code (DC).
TN: Specify a Tenant Number
DC: Specify a Destination Code. (Maximum 10 digits)
MND: Specify maximum necessary digits for the DC. (1-24)

STEP 22: **ARNP/ARNPL/ARNPN**- Assign an Access Code (ACC) to be used for Self Office Identification Code and each individual routing.
RT or LGRT: Specify a Route Number. (0-255)
ACC: Specify an Access Code. (Maximum 4 digits)

Note: For an Open Numbering network, the following data should be assigned: RT = 0 ACC: The Office Code of the self office (including ACC for the originating call)

Note: All Offices within an Open Numbering network must have an Office Code with the same number of digits.

STEP 23: **ACNAL**- Assign the Calling Number Pattern (CNP) on an Access Code basis. *When this command is used, assign ARTD command CDN66 to DC = 15.

- Settings for a Call Originated to SIP Network
  Specify Calling Number Pattern for Access Code of the gateway to connect to by adding information about the route for which Caller ID Notification is required.

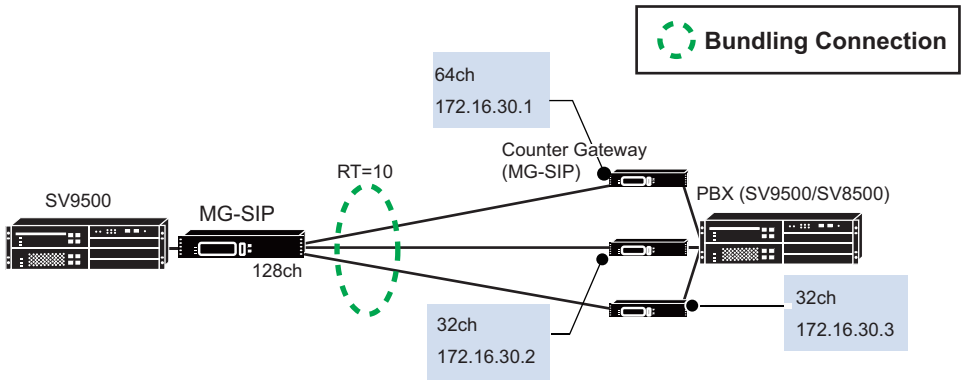
  IC/OG = OG (Outgoing Call)
  RT: Enter External Route Number for which Caller ID Notification is required per Access Code.
  ACC: Enter Access Code (up to 16 digits).
  CNP: Enter Calling Number Pattern (a number from 1 to 255).

  Note: To modify CNP set by the ACNAL command, use the ACND command; ACNDN command cannot be used.

- Settings for a Call Arriving from SIP Network
  Specify Dialed Number Confirmation for Access Code by adding information about the route for inbound DID calls.

  IC/OG = IC (Incoming Call)
  RT: Enter External Route Number to be arrived.
  ACC: Enter Access Code (up to 16 digits).

DC: Dialed Number Confirmation (1-8)



STEP 24: **ACND**- Assign the data for number change to CNP that has been specified by the ACNAL/ACNP command.
CNP: Calling Number Pattern
SKIP: Number of Skip Digits
ADD: Number of Digits of the Additional Number
DC: Additional Digit Information

STEP 25: **ACDD**- Change Digit Code according to DID Addressing.
DAY/NIGHT: Day/Night Mode
RT: Enter the B-Channel Route Number.
DC: Digit string in the dialed number to be replaced with a string specified in CDC. **Note 4**
CDC: Enter Change Digit Code (Maximum 24 digits)
AD: Enter Additional Dialing
XFR: Enable/Disable Transfer Service

Note 4: Enter the same value (number of digits) as that of DC of the ACNAL command. When the ACNAL command is not used, the value assigned to the DC of the ARTD command is applied.

Bundling Connection

Office data settings for Bundling Connection are as follows:

* The following shows only the differences from the office data settings for Route Splitting.

STEP 1: **ATRK**- Assign trunk data on Virtual Speech Channel.
RT: Specify Route Number (1-255).
TK: Specify Trunk Number (1-255).
LENS: Specify Accommodated Location (six digits).

Register routes/trunks/channels to use for each path.

Path for MG-SIP	Number of Channels	Route Number	LENS			
			Highway 1	Highway 2	Highway 3	Highway 4
Path A	64	10	021000 - 021037	021080-021117	-	-
Path B	32	10	-	-	022000-022037	-
Path C	32	10	-	-	-	023200-023237
Total	128	-	-	-	-	-

Note: When using this command, consider the following:

- Virtual speech channels for each path must be assigned to continuous channels from the first channel of a highway group. When all the channels cannot fit within one highway and need to be split across multiple highway groups, assign remaining channels from the beginning of the next group.
- Only than MG-SIP virtual communication channel can be registered for HW (4 group) with at least one MG-SIP virtual communication channel already registered.
- Do not assign the LENS that belongs to Even-numbered module group, Unit=0 and Group=0 to a trunk, because they are not supported by MG-SIP.

STEP 2: **ACSC** - Assign the first channel of 32 channels (a highway) LENS to the even-numbered CSC group, and LENS of Virtual Signaling Channel to the odd-numbered CSC group.
CSCG: Specify the CSC Group Number (even numbers from 130 to 255 and odd number continuous with them)

GROUP: Specify the CIC Group Number
CCH: Specify the first channel of 32-channel LENS for even-numbered CSCG and Virtual Signaling LENS for odd-numbered CSCG.

<Example of Data Settings>
Even-numbered CSCG for MG-SIP: the first LENS of 32-channels
The top of CICG for MG-SIP: LENS of Virtual Signaling Channel

CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signaling Channel (CCH)			Remarks
		MG 00-07	U 0-3	G 00-23	
130	0	02	1	0	Path A
	1	02	1	8	
	2	02	2	0	Path B
	3	02	3	20	Path C
	4	02	1	0	**Note 5**
	5	02	1	0	**Note 5**
	6	02	1	0	**Note 5**
	7	02	1	0	**Note 5**

Note 5: Apply the same settings as CICG=0 to the remaining CIC Group Numbers (CICG).

In the next step, assign LENS of Virtual Signaling Channel to the next CSCG (greater by one than the last CSCG).

Note: When your system contains a single MG-SIP, assign the same LENS to all the numbers.

CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signaling Channel (CCH)			Remarks
		MG 00-07	U 0-3	G 00-23	
131	0	02	1	0	
	1	02	1	0	
	2	02	1	0	
	3	02	1	0	
	4	02	1	0	
	5	02	1	0	
	6	02	1	0	
	7	02	1	0	

STEP 3: **AMGIL** - Assign the data regarding MG-SIP as follows:

MG-ID: Enter MAC Address (six bytes) of MG-SIP. * Enter the Telephony Server side (LAN side) MAC address.

FUNCTION = Setting

KIND = SIP-MG

LINE = 0 (fixed)

CH = 0 (fixed)

LENS: Enter the accommodated location of Virtual Signaling Channel (the first number of HW).

Retry = 0

Setting Type of Signaling Packet Service: Specify QoS settings of Signaling that is used when Internal PHI-BRI connects MG-SIP.

Usable CH Number: Enter the number of channels to be used per MG-SIP (1-128).

Note: Be sure to set 128ch (fixed) when this feature (MG-SIP TIE Line Path Splitting) is used.

Service of Authentication Exists: Unchecked

Setting of Path Data

Note: When the Set button of the command is pressed is pressed while this check box is OFF, all the registered Path data is cleared.

Note: Assign the following data as you have created with the ATRK command. Assign the counter IP address and port number according to the settings of counter gateway.

List of Path Data

INDEX: Index of Path data (1-32)

Select: Choose the check box for the path to be registered.

Note: When the Set button of the command is pressed while the check box for the already registered path is OFF, the path data is cleared.

Path ID: Identification Number of Path (1-255)

RT: External Route Number (1-255)

* Enter the route number (route number of Virtual Speech Channel for MG-SIP assigned by the ATRK command) to be assigned to this path.

LGRT: Logical Route Number (display only)

TK: Trunk Number (1-255)

* Enter the first trunk number of the trunks (trunk number of Virtual Speech Channel for MG-SIP assigned by the ATRK command) to be assigned to this path.

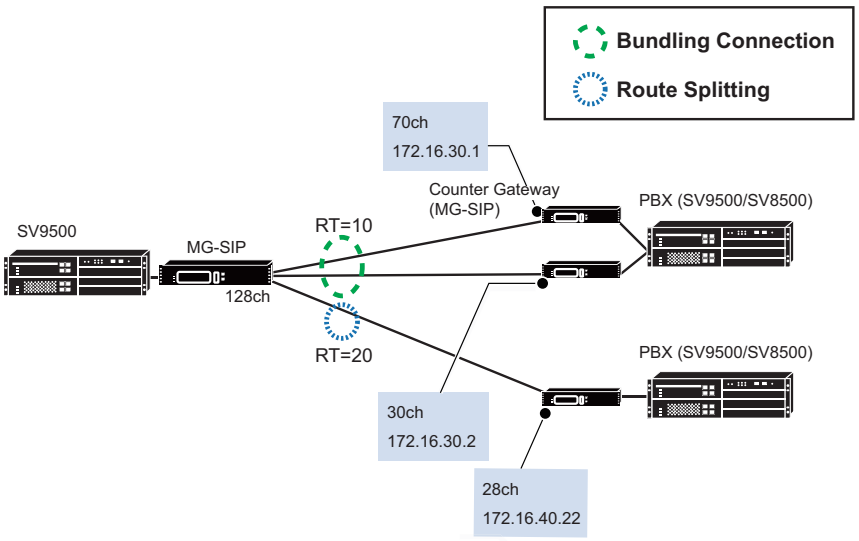
CH: Enter the number of MG-SIP channels to be assigned to this path.

IP Ver: IP Address Version = 1 (IPv4)

GW IP: Enter an IP address of the counter gateway (0.0.0.1-255.255.255.254).

GW PORT: Enter a port number of the counter gateway (1024-65535).

FLT: Gateway Fault Detection Capability (0/1)



* To enable MG-SIP Fault Detection per Path, set this parameter to 1 (Enable).

<Example of AMGIL Command Settings>

Path of MG-SIP	Select	Path ID	RT	LGRT	TK	CH	IP Ver	GW IP	GW PORT	FLT
Path A	ON	1	10	10	1	64	IPv4	172.16.30.1	5060	Enable
Path B	ON	2	10	10	65	32	IPv4	172.16.30.2	5060	Enable
Path C	ON	3	10	10	97	32	IPv4	172.16.30.3	5060	Enable

Combination of Route Splitting and Bundling Connection

Office data settings for Combination of Route Splitting and Bundling Connection are as follows:

* The following shows only the differences from the office data settings for Route Splitting.

STEP 1: **ATRK**- Assign trunk data on Virtual Speech Channel.
RT: Specify Route Number (1-255).
TK: Specify Trunk Number (1-255).
LENS: Specify Accommodated Location (six digits).

Register routes/trunks/channels to use for each path.

Path for MG-SIP	Number of Channels	Route Number	LENS			
			Highway 1	Highway 2	Highway 3	Highway 4
Path A	70	10	020040- 020077	020160-020197	020080-020085	-
Path B	30	10	-	-	020086-020117	020200-020203
Path C	28	20	-	-	-	020204-020237
Total	128	-	-	-	-	-

Note: When using this command, consider the following:
- Virtual speech channels for each path must be assigned to continuous channels from the first channel of a highway group. When all the channels cannot fit within one highway and need to be split across multiple highway groups, assign remaining channels from the beginning of the next group.
- Only MG-SIP virtual communication channel can be registered for HW (4 group) with at least one MG-SIP virtual communication channel already registered.
- Do not assign the LENS that belongs to Even-numbered module group, Unit=0 and Group=0 to a trunk, because they are not supported by MG-SIP.

STEP 2: **ADPC** - Assign Point Code to Virtual Speech Channel. On the office data, a vacant number is used for a Point Code. For more details, see the Command Manual.

RT: Specify an external route number.

PC: Specify a vacant Point Code (Point Code used by CCIS/ISDN cannot be used).

Note: Assign the same Point Code to all the routes registered by the ATRK command.

STEP 3: **ACSC** - Assign the first channel of 32 channels (a highway) LENS to the even-numbered CSC group, and LENS of Virtual Signaling Channel to the odd-numbered CSC group.

CSCG: Specify the CSC Group Number (even numbers from 130 to 255 and odd number continuous with them)

GROUP: Specify the CIC Group Number

CCH: Specify the first channel of 32-channel LENS for even-numbered CSCG and Virtual Signaling LENS for odd-numbered CSCG.

<Example of Data Settings>

Even-numbered CSCG for MG-SIP: the first LENS of 32-channels

The top of CICG for MG-SIP: LENS of Virtual Signaling Channel

CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signaling Channel (CCH)			Remarks
		MG 00-07	U 0-3	G 00-23	
130	0	02	0	4	Path A
	1	02	0	16	
	2	02	0	8	Path A/B
	3	02	0	20	Path B/C
	4	02	0	4	**Note 6**
	5	02	0	4	**Note 6**
	6	02	0	4	**Note 6**
	7	02	0	4	**Note 6**

Note 6: Apply the same settings as CICG=0 to the remaining CIC Group Numbers (CICG).

In the next step, assign LENS of Virtual Signaling Channel to the next CSCG (greater by one than the last CSCG).

Note: When your system contains a single MG-SIP, assign the same LENS to all the numbers.

CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signaling Channel (CCH)			Remarks
		MG 00-07	U 0-3	G 00-23	
131	0	02	0	4	
	1	02	0	4	
	2	02	0	4	
	3	02	0	4	
	4	02	0	4	
	5	02	0	4	
	6	02	0	4	
	7	02	0	4	

STEP 4: **AMGIL** - Assign the data regarding to MG-SIP as follows:

MG-ID: Enter MAC Address (six bytes) of MG-SIP. *Enter the Telephony Server side (LAN side) MAC address.

FUNCTION = Setting

KIND = SIP-MG

LINE = 0 (fixed)

CH = 0 (fixed)

LENS: Enter the accommodated location of Virtual Signaling Channel (the first number of HW).

Retry = 0

Setting Type of Signaling Packet Service: Specify QoS settings of Signaling that is used when Internal PHI-BRI connects MG-SIP.

Usable CH Number: Enter the number of channels to be used per MG-SIP (1-128).

Note: Be sure to set 128ch (fixed) when this feature (MG-SIP TIE Line Path Splitting) is used.

Service of Authentication Exists: Unchecked

Setting of Path Data

Note: When the Set button of the command is pressed while this check box is OFF, all the registered Path data is cleared.

Note: Assign the following data as you have created with the ATRK command. Assign the counter IP address and port number according to the settings of counter gateway.

List of Path Data

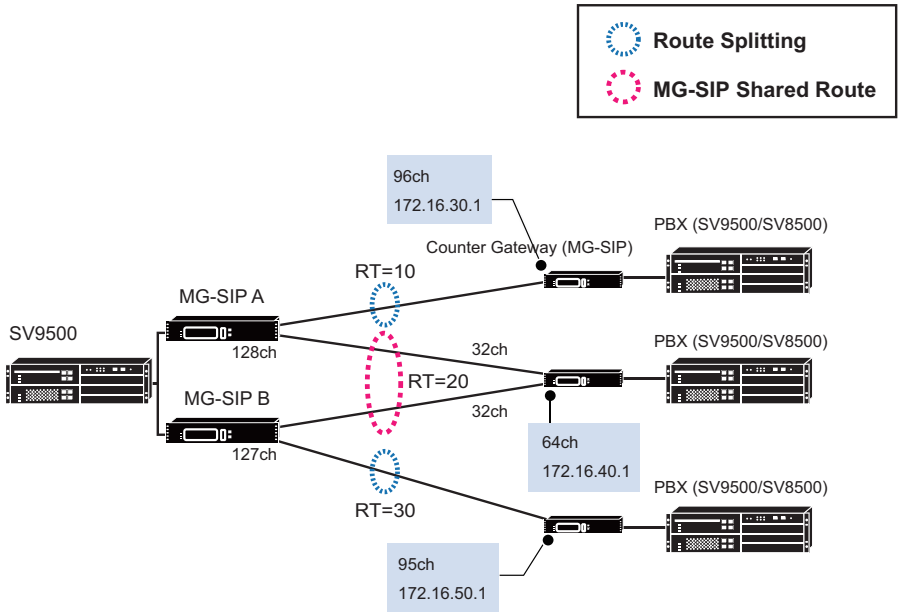
INDEX: Index of Path data (1-32)

Select: Choose the check box for the path to be registered.

Note: When the Set button of the command is pressed while the check box for the already registered path is OFF, the path data is cleared.

Path ID: Identification Number of Path (1-255)

RT: External Route Number (1-255)



* Enter the route number (route number of Virtual Speech Channel for MG-SIP assigned by the ATRK command) to be assigned to this path.
LGRT: Logical Route Number (display only)
TK: Trunk Number (1-255)
* Enter the first trunk number of the trunks (trunk number of Virtual Speech Channel for MG-SIP assigned by the ATRK command) to be assigned to this path.
CH: Enter the number of MG-SIP channels to be assigned to this path.
IP Ver: IP Address Version = 1 (IPv4)
GW IP: Enter an IP address of the counter gateway (0.0.0.1-255.255.255.254).
GW PORT: Enter a port number of the counter gateway (1024-65535).
FLT: Gateway Fault Detection Capability (0/1)
* To enable MG-SIP Fault Detection per Path, set this parameter to 1 (Enable).

<Example of AMGIL Command Settings>

Path of MG-SIP	Select	Path ID	RT	LGRT	TK	CH	IP Ver	GW IP	GW PORT	FLT
Path A	ON	1	10	10	1	70	IPv4	172.16.30.1	5060	Enable
Path B	ON	2	10	10	71	30	IPv4	172.16.30.2	5060	Enable
Path C	ON	3	20	20	1	28	IPv4	172.16.40.22	5060	Enable

Combination of MG-SIP Shared Route and Route Splitting

Office data settings for Combination of MG-SIP Shared Route and Route Splitting are as follows:

* The following shows only the differences from the office data settings for Route Splitting.

STEP 1: **ATRK**- Assign trunk data on Virtual Speech Channel.
RT: Specify Route Number (1-255).
TK: Specify Trunk Number (1-255).
LENS: Specify Accommodated Location (six digits).

Register routes/trunks/channels to use for each path.

	Path for MG-SIP	Number of Channels	Route Number	LENS			
				Highway 1	Highway 2	Highway 3	Highway 4
MG-SIP A	Path A	96	10	030000-030037	030040-030077	030080-030117	-
	Path B	32	20	-	-	-	021000-021037
MG-SIP B	Path B	32	20	021040-021077	-	-	-
	Path C	95	30	-	022000-022037	022040-022077	022080-022116

Note: When using this command, consider the following:

- Virtual speech channels for each path must be assigned to continuous channels from the first channel of a highway group. When all the channels cannot fit within one highway and need to be split across multiple highway groups, assign remaining channels from the beginning of the next group.
- Only MG-SIP virtual communication channel can be registered for HW (4 group) with at least one MG-SIP virtual communication channel already registered.
- Do not assign the LENS that belongs to Even-numbered module group, Unit=0 and Group=0 to a trunk, because they are not supported by MG-SIP.

STEP 2: **ACSC** - Assign the first channel of 32 channels (a highway) LENS to the even-numbered CSC group, and LENS of Virtual Signaling Channel to the odd-numbered CSC group.

CSCG: Specify the CSC Group Number (even numbers from 130 to 255 and odd number continuous with them)

GROUP: Specify the CIC Group Number

CCH: Specify the first channel of 32-channel LENS for even-numbered CSCG and Virtual Signaling LENS for odd-numbered CSCG.

<Example of Data Settings>

Even-numbered CSCG for MG-SIP: the first LENS of 32-channels

The top of CICG for MG-SIP: LENS of Virtual Signaling Channel

CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signaling Channel (CCH)			Remarks
		MG 00-07	U 0-3	G 00-23	
130	0	03	0	0	Path A
	1	03	0	4	
	2	03	0	8	
	3	02	1	0	Path B
	4	02	1	4	
	5	02	2	0	Path C
	6	02	2	4	
	7	02	2	8	

In the next step, assign LENS of Virtual Signaling Channel to the next CSCG (greater by one than the last CSCG).

CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signaling Channel (CCH)			Remarks
		MG 00-07	U 0-3	G 00-23	
131	0	03	0	0	MG-SIP A
	1	03	0	0	
	2	03	0	0	
	3	03	0	0	
	4	02	1	4	MG-SIP B
	5	02	1	4	
	6	02	1	4	
	7	02	1	4	

STEP 3: **AMGIL** - Assign the data regarding MG-SIP A and MG-SIP B respectively as follows:

MG-ID: Enter MAC Address (six bytes) of MG-SIP. * Enter the Telephony Server side (LAN side) MAC address.

FUNCTION = Setting

KIND = SIP-MG

LINE = 0 (fixed)

CH = 0 (fixed)

LENS: Enter the accommodated location of Virtual Signaling Channel (the first number of HW).

Retry = 0

Setting Type of Signaling Packet Service: Specify QoS settings of Signaling that is used when Internal PHI-BRI connects MG-SIP.

Usable CH Number: Enter the number of channels to be used per MG-SIP (1-128).

Note: Be sure to set 128ch (fixed) when this feature (MG-SIP TIE Line Path Splitting) is used.

Service of Authentication Exists: Unchecked

Setting of Path Data

Note: When the Set button of the command is pressed while this check box is OFF, all the registered Path data is cleared.

Note: Assign the following data as you have created with the ATRK command. Assign the counter IP address and port number according to the settings of counter gateway.

List of Path Data

INDEX: Index of Path data (1-32)

Select: Choose the check box for the path to be registered.

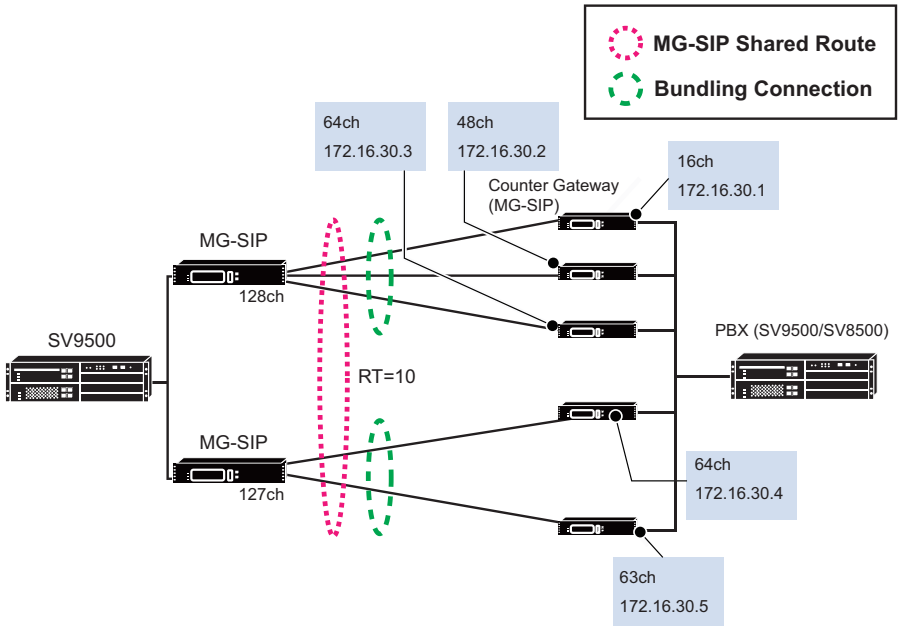
Note: When the Set button of the command is pressed while the check box for the already registered path is OFF, the path data is cleared.

Path ID: Identification Number of Path (1-255)

RT: External Route Number (1-255)

* Enter the route number (route number of Virtual Speech Channel for MG-SIP assigned by the ATRK command) to be assigned to this path.
LGRT: Logical Route Number (display only)
TK: Trunk Number (1-255)
* Enter the first trunk number of the trunks (trunk number of Virtual Speech Channel for MG-SIP assigned by the ATRK command) to be assigned to this path.
CH: Enter the number of MG-SIP channels to be assigned to this path.
IP Ver: IP Address Version = 1 (IPv4)
GW IP: Enter an IP address of the counter gateway (0.0.0.1-255.255.255.254).
GW PORT: Enter a port number of the counter gateway (1024-65535).
FLT: Gateway Fault Detection Capability (0/1)
* To enable MG-SIP Fault Detection per Path, set this parameter to 1 (Enable).

<Example of AMGIL Command Settings for **MG-SIP A**>



Path of MG-SIP	Select	Path ID	RT	LGRT	TK	CH	IP Ver	GW IP	GW PORT	FLT
Path A	ON	1	10	10	1	96	IPv4	172.16.30.1	5060	Enable
Path B	ON	2	20	20	1	32	IPv4	172.16.40.1	5060	Enable

<Example of AMGIL Command Settings for **MG-SIP B**>

Path of MG-SIP	Select	Path ID	RT	LGRT	TK	CH	IP Ver	GW IP	GW PORT	FLT
Path B	ON	1	20	20	33	32	IPv4	172.16.40.1	5060	Enable
Path C	ON	2	30	30	1	95	IPv4	172.16.50.1	5060	Enable

Combination of MG-SIP Shared Route and Bundling Connection

Office data settings for Combination of MG-SIP Shared Route and Bundling Connection are as follows:

* The following shows only the differences from the office data settings for Route Splitting.

STEP 1: **ATRK**- Assign trunk data on Virtual Speech Channel.
RT: Specify Route Number (1-255).
TK: Specify Trunk Number (1-255).
LENS: Specify Accommodated Location (six digits).

Register routes/trunks/channels to use for each path.

	Path for MG-SIP	Number of Channels	Route Number	LENS			
				Highway 1	Highway 2	Highway 3	Highway 4
MG-SIP A	Path A	16	10	020040-020057	-	-	-
	Path B	48	10	020060-020077	020080-020117	-	-
	Path C	64	10	-	-	020120-020157	020160-020197
MG-SIP B	Path D	64	10	021000-021037	021040-021077	-	-
	Path E	63	10	-	-	021080-021117	021120-021156

Note: When using this command, consider the following:

- Virtual speech channels for each path must be assigned to continuous channels from the first channel of a highway group. When all the channels cannot fit within one highway and need to be split across multiple highway groups, assign remaining channels from the beginning of the next group.
- Only MG-SIP virtual communication channel can be registered for HW (4 group) with at least one MG-SIP virtual communication channel already registered.
- Do not assign the LENS that belongs to Even-numbered module group, Unit=0 and Group=0 to a trunk, because they are not supported by MG-SIP.

STEP 2: **ACSC** - Assign the first channel of 32 channels (a highway) LENS to the even-numbered CSC group, and LENS of Virtual Signaling Channel to the odd-numbered CSC group.

CSCG: Specify the CSC Group Number (even numbers from 130 to 255 and odd number continuous with them)

GROUP: Specify the CIC Group Number

CCH: Specify the first channel of 32-channel LENS for even-numbered CSCG and Virtual Signaling LENS for odd-numbered CSCG.

<Example of Data Settings>

Even-numbered CSCG for MG-SIP: the first LENS of 32-channels

The top of CICG for MG-SIP: LENS of Virtual Signaling Channel

CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signaling Channel (CCH)			Remarks
		MG 00-07	U 0-3	G 00-23	
130	0	02	0	4	Path A/B
	1	02	0	8	Path B
	2	02	0	12	Path C
	3	02	0	16	
	4	02	1	0	Path D
	5	02	1	4	
	6	02	1	8	Path E
	7	02	1	12	

In the next step, assign LENS of Virtual Signaling Channel to the next CSCG (greater by one than the last CSCG).

CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signaling Channel (CCH)			Remarks
		MG 00-07	U 0-3	G 00-23	
131	0	02	0	4	MG-SIP A
	1	02	0	4	
	2	02	0	4	
	3	02	0	4	
	4	02	1	0	MG-SIP B
	5	02	1	0	
	6	02	1	0	
	7	02	1	0	

STEP 3: **AMGIL** - Assign the data regarding MG-SIP A and MG-SIP B respectively as follows:

MG-ID: Enter MAC Address (six bytes) of MG-SIP. * Enter the Telephony Server side (LAN side) MAC address.

FUNCTION = Setting

KIND = SIP-MG

LINE = 0 (fixed)

CH = 0 (fixed)

LENS: Enter the accommodated location of Virtual Signaling Channel (the first number of HW).

Retry = 0

Setting Type of Signaling Packet Service: Specify QoS settings of Signaling that is used when Internal PHI-BRI connects MG-SIP.

Usable CH Number: Enter the number of channels to be used per MG-SIP (1-128).

Note: Be sure to set 128ch (fixed) when this feature (MG-SIP TIE Line Path Splitting) is used.

Service of Authentication Exists: Unchecked

Setting of Path Data

Note: When the Set button of the command is pressed while this check box is OFF, all the registered Path data is cleared.

Note: Assign the following data as you have created with the ATRK command. Assign the counter IP address and port number according to the settings of counter gateway.

List of Path Data

INDEX: Index of Path data (1-32)

Select: Choose the check box for the path to be registered.

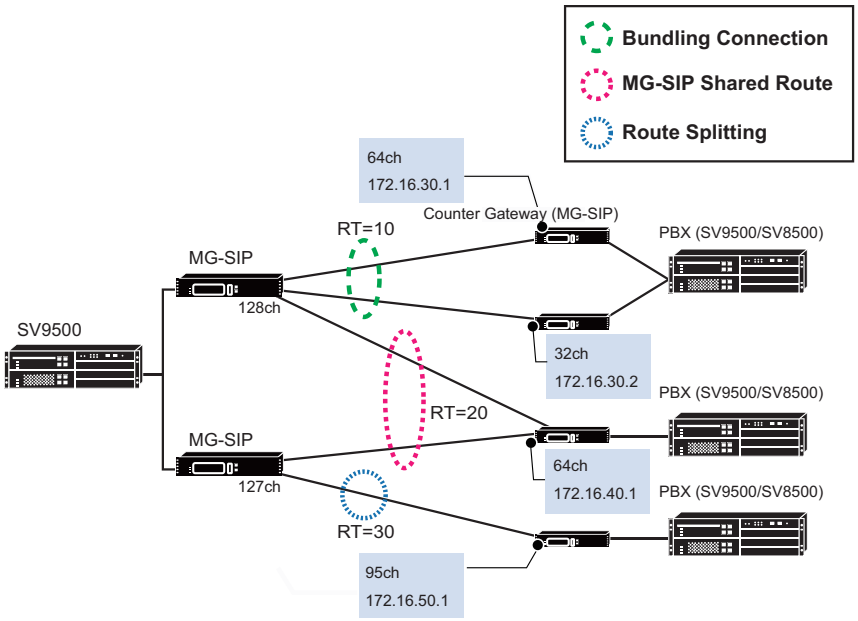
Note: When the Set button of the command is pressed while the check box for the already registered path is OFF, the path data is cleared.

Path ID: Identification Number of Path (1-255)

RT: External Route Number (1-255)

* Enter the route number (route number of Virtual Speech Channel for MG-SIP assigned by the ATRK command) to be assigned to this path.
LGRT: Logical Route Number (display only)
TK: Trunk Number (1-255)
* Enter the first trunk number of the trunks (trunk number of Virtual Speech Channel for MG-SIP assigned by the ATRK command) to be assigned to this path.
CH: Enter the number of MG-SIP channels to be assigned to this path.
IP Ver: IP Address Version = 1 (IPv4)
GW IP: Enter an IP address of the counter gateway (0.0.0.1-255.255.255.254).
GW PORT: Enter a port number of the counter gateway (1024-65535).
FLT: Gateway Fault Detection Capability (0/1)
* To enable MG-SIP Fault Detection per Path, set this parameter to 1 (Enable).

<Example of AMGIL Command Settings for **MG-SIP A**>



Path of MG-SIP	Select	Path ID	RT	LGRT	TK	CH	IP Ver	GW IP	GW PORT	FLT

Combination of MG-SIP Shared Route, Route Splitting and Bundling Connection

Office data settings for Combination of MG-SIP Shared Route, Route Splitting and Bundling Connection are as follows:

* The following shows only the differences from the office data settings for Route Splitting.

STEP 1: **ATRK**- Assign trunk data on Virtual Speech Channel.
RT: Specify Route Number (1-255).
TK: Specify Trunk Number (1-255).
LENS: Specify Accommodated Location (six digits).

Register routes/trunks/channels to use for each path.

	Path for MG-SIP	Number of Channels	Route Number	LENS			
				Highway 1	Highway 2	Highway 3	Highway 4
MG-SIP A	Path A	64	10	020040-020077	020080-020117	-	-
	Path B	32	10	-	-	020120-020157	-
	Path C	32	20	-	-	-	020160-020197
MG-SIP B	Path D	32	20	021000-021037	-	-	-
	Path E	95	30	-	021040-021077	021080-021117	021120-021156

Note: When using this command, consider the following:

- Virtual speech channels for each path must be assigned to continuous channels from the first channel of a highway group. When all the channels cannot fit within one highway and need to be split across multiple highway groups, assign remaining channels from the beginning of the next group.
- Only MG-SIP virtual communication channel can be registered for HW (4 group) with at least one MG-SIP virtual communication channel already registered.
- Do not assign the LENS that belongs to Even-numbered module group, Unit=0 and Group=0 to a trunk, because they are not supported by MG-SIP.

STEP 2: **ACSC** - Assign the first channel of 32 channels (a highway) LENS to the even-numbered CSC group, and LENS of Virtual Signaling Channel to the odd-numbered CSC group.

CSCG: Specify the CSC Group Number (even numbers from 130 to 255 and odd number continuous with them)

GROUP: Specify the CIC Group Number

CCH: Specify the first channel of 32-channel LENS for even-numbered CSCG and Virtual Signaling LENS for odd-numbered CSCG.

<Example of Data Settings>

Even-numbered CSCG for MG-SIP: the first LENS of 32-channels

The top of CICG for MG-SIP: LENS of Virtual Signaling Channel

CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signaling Channel (CCH)			Remarks
		MG 00-07	U 0-3	G 00-23	
130	0	02	0	4	Path A
	1	02	0	8	
	2	02	0	12	Path B
	3	02	0	16	Path C
	4	02	1	0	Path D
	5	02	1	4	Path E
	6	02	1	8	
	7	02	1	12	

In the next step, assign LENS of Virtual Signaling Channel to the next CSCG (greater by one than the last CSCG).

CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signaling Channel (CCH)			Remarks
		MG 00-07	U 0-3	G 00-23	
131	0	02	0	4	MG-SIP A
	1	02	0	4	
	2	02	0	4	
	3	02	0	4	
	4	02	1	0	MG-SIP B
	5	02	1	0	
	6	02	1	0	
	7	02	1	0	

STEP 3: **AMGIL** - Assign the data regarding MG-SIP A and MG-SIP B respectively as follows:

MG-ID: Enter MAC Address (six bytes) of MG-SIP. * Enter the Telephony Server side (LAN side) MAC address.

FUNCTION = Setting

KIND = SIP-MG

LINE = 0 (fixed)

CH = 0 (fixed)

LENS: Enter the accommodated location of Virtual Signaling Channel (the first number of HW).

Retry = 0

Setting Type of Signaling Packet Service: Specify QoS settings of Signaling that is used when Internal PHI-BRI connects MG-SIP.

Usable CH Number: Enter the number of channels to be used per MG-SIP (1-128).

Note: Be sure to set 128ch (fixed) when this feature (MG-SIP TIE Line Path Splitting) is used.

Service of Authentication Exists: Unchecked

Setting of Path Data

Note: When the Set button of the command is pressed while this check box is OFF, all the registered Path data is cleared.

Note: Assign the following data as you have created with the ATRK command. Assign the counter IP address and port number according to the settings of counter gateway.

List of Path Data

INDEX: Index of Path data (1-32)

Select: Choose the check box for the path to be registered.

Note: When the Set button of the command is pressed while the check box for the already registered path is OFF, the path data is cleared.

Path ID: Identification Number of Path (1-255)

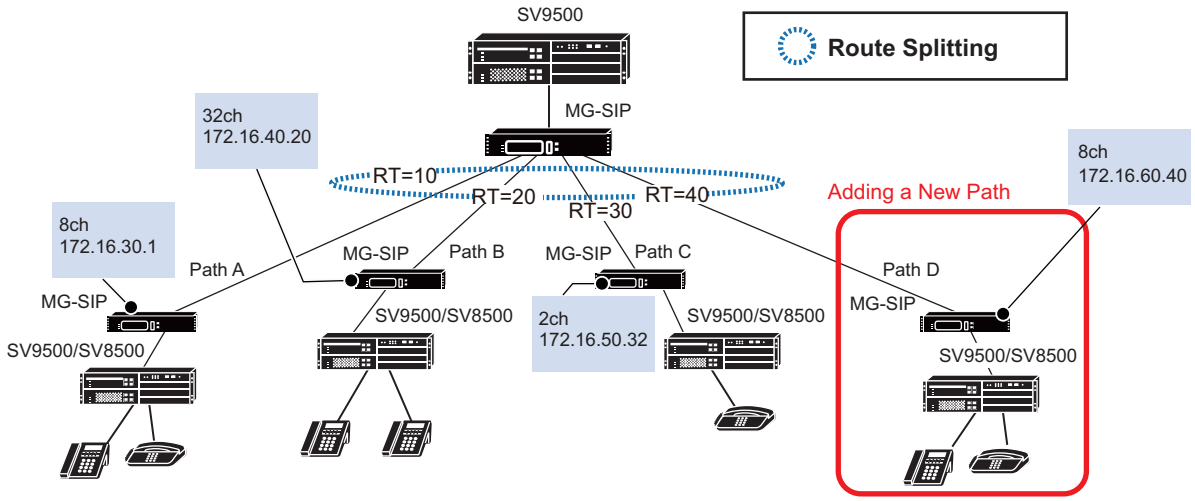
RT: External Route Number (1-255)

* Enter the route number (route number of Virtual Speech Channel for MG-SIP assigned by the ATRK command) to be assigned to this path.
LGRT: Logical Route Number (display only)
TK: Trunk Number (1-255)
* Enter the first trunk number of the trunks (trunk number of Virtual Speech Channel for MG-SIP assigned by the ATRK command) to be assigned to this path.
CH: Enter the number of MG-SIP channels to be assigned to this path.
IP Ver: IP Address Version = 1 (IPv4)
GW IP: Enter an IP address of the counter gateway (0.0.0.1-255.255.255.254).
GW PORT: Enter a port number of the counter gateway (1024-65535).
FLT: Gateway Fault Detection Capability (0/1)
* To enable MG-SIP Fault Detection per Path, set this parameter to 1 (Enable).

<Example of AMGIL Command Settings for **MG-SIP A**>

Path of MG-SIP	Select	Path ID	RT	LGRT	TK	CH	IP Ver	GW IP	GW PORT	FLT
Path A	ON	1	10	10	1	64	IPv4	172.16.30.1	5060	Enable
Path B	ON	2	10	10	65	32	IPv4	172.16.30.2	5060	Enable
Path C	ON	3	20	20	1	32	IPv4	172.16.40.1	5060	Enable

<Example of AMGIL Command Settings for **MG-SIP B**>



Path of MG-SIP	Select	Path ID	RT	LGRT	TK	CH	IP Ver	GW IP	GW PORT	FLT
Path D	ON	1	20	20	33	32	IPv4	172.16.40.1	5060	Enable
Path E	ON	2	30	30	1	95	IPv4	172.16.50.1	5060	Enable

Example of Data Settings for MG-SIP TIE Line Path Splitting

The following shows some examples of the office data settings when registering or deleting path information during an operation.

Example 1: Adding New Path and Trunk to Registered Highway

- In the case that a reset of MG-SIP is not required:

STEP 1: **ARTD/ARTDN**- Assign a new route (RT=40) for Path D.

STEP 2: **ARTI/ARTIN**- Assign a new route (RT=40) for Path D.

STEP 3: **ATRK**- Assign a new trunk for Path D.

Path for MG-SIP	Route Number	Trunk Number	Number of Channels	LENS			
				Highway 1	Highway 2	Highway 3	Highway 4
Path A	10	1-8	8	020040-020047	-	-	-
Path B	20	1-32	32	020050-020077	020160-020167	-	-
Path C	30	1-2	2	-	020170-020171	-	-
Path D	40	1-8	8	-	020180-020187	-	-

STEP 4: **ACSC** - The setting of this command data is not required to be changed because the trunk of Path D can be accommodated within the LENS of CIC Group 1.

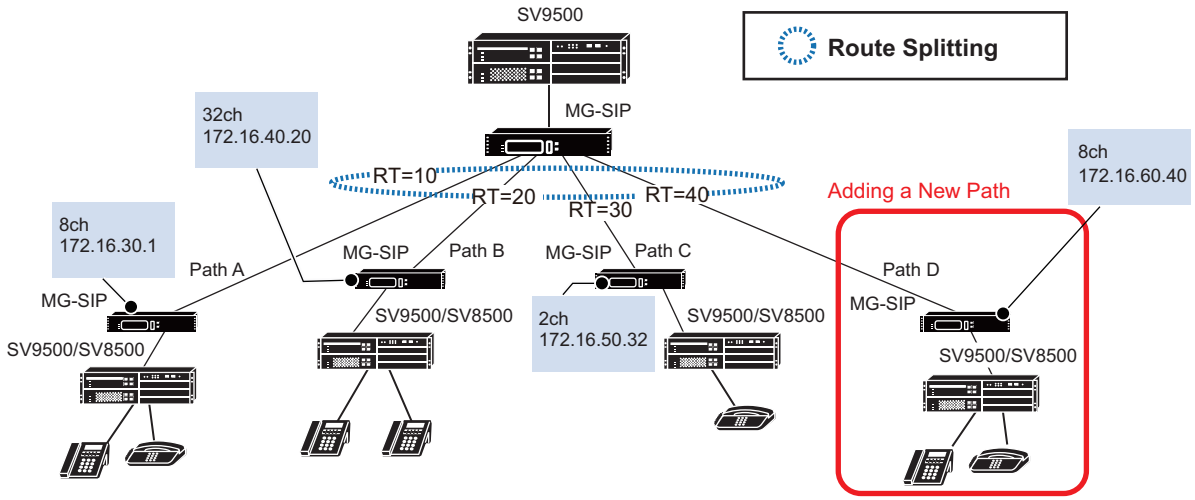
CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signaling Channel (CCH)			Remarks
		MG 00-07	U 0-3	G 00-23	
130	0	02	0	4	used for Path A/B
	1	02	0	16	used for Path B/C -> used for Path B/C/D
	2	02	0	4	Note 7
	3	02	0	4	
	4	02	0	4	
	5	02	0	4	
	6	02	0	4	
	7	02	0	4	

Note 7: Apply the same settings as CICG=0 to the remaining CIC Group Numbers (CICG).

STEP 5: **ADPC**- Assign the same PC as RT=10/20/30 for RT=40.

STEP 6: **MBTK**- Cancel Make-busy for RT=40/TK=1-8.

STEP 7: **AMGIL**- Assign path information data of Path D.



Path of MG-SIP	Select	Path ID	RT	LGRT	TK	CH	IP Ver	GW IP	GW PORT	FLT
Path A	ON	1	10	10	1	8	IPv4	172.16.30.1	5060	Enable
Path B	ON	2	20	20	1	32	IPv4	172.16.40.20	5060	Enable
Path C	ON	3	30	30	1	2	IPv4	172.16.50.32	5060	Enable
Path D	ON	4	40	40	1	8	IPv4	172.16.60.40	5060	Enable

Note: The reset of MG-SIP is not required.

STEP 8: **AMGIL**- Reset Path D.
MG-ID: MAC address of MG-SIP (six bytes)
* Enter MAC address of Telephony Server side (LAN side).
FUNCTION: Reset
Reset Type: PATH (Reset Automatically Select)
The check box for Path D is automatically selected.

Example 2: Adding New Path and Trunk to Unregistered Highway

- In the case that a reset of MG-SIP is required:

STEP 1: **ARTD/ARTDN**- Assign a new route (RT = 40) for Path D.

STEP 2: **ARTI/ARTIN**- Assign a new route (RT = 40) for Path D.

STEP 3: **ATRK**- Assign a new trunk for Path D.

Path for MG-SIP	Route Number	Trunk Number	Number of Channels	LENS			
				Highway 1	Highway 2	Highway 3	Highway 4
Path A	10	1-8	8	020040-020047	-	-	-
Path B	20	1-32	32	020050-020077	020160-020167	-	-
Path C	30	1-2	2	-	020170-020171	-	-
Path D	40	1-8	8	-	-	020080-020088	-

STEP 4: **MBTK**- For each trunk of RT = 10, RT = 20 and RT = 30, select "2: Make Busy (Bothway)" from the MB drop-down list box.

Note: Make sure that all the channels are placed in the idle state, then go to the next step.

STEP 5: **AMGIL**- Delete the registration of MG-SIP.

Note: When the registration of MG-SIP is deleted, the associated path information will also be deleted.

Note: After the registration of MG-SIP is deleted, MG-SIP will be reset.

STEP 6: **ACSC** - The setting of this command data is not required to be changed because the trunk of Path D can be accommodated within the LENS of CIC Group 2.

<Before the change>

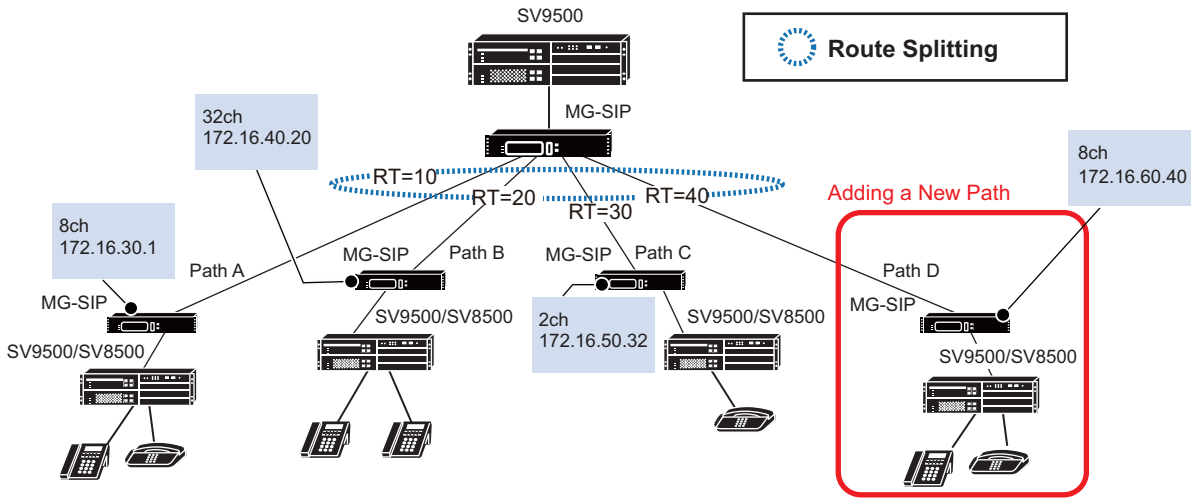
CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signaling Channel (CCH)			Remarks
		MG 00-07	U 0-3	G 00-23	
130	0	02	0	4	used for Path A/B
	1	02	0	16	used for Path B/C
	2	02	0	4	Note 8
	3	02	0	4	
	4	02	0	4	
	5	02	0	4	
	6	02	0	4	
	7	02	0	4	

<After the change>

CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signaling Channel (CCH)			Remarks
		MG 00-07	U 0-3	G 00-23	
130	0	02	0	4	used for Path A/B
	1	02	0	16	used for Path B/C
	2	02	0	8	used for Path D
	3	02	0	4	Note 8
	4	02	0	4	
	5	02	0	4	
	6	02	0	4	
	7	02	0	4	

Note 8: Apply the same settings as CICG=0 to the remaining CIC Group Numbers (CICG).

STEP 7: **MBTK**- Cancel Make-busy for all the trunks of RT=10/20/30.



STEP 8: **ADPC**- Assign the same PC as RT=10/20/30 for RT=40.

STEP 9: **MBTK**- Cancel Make-busy for RT=40/TK=1-8.

STEP 10: **AMGIL**- Enter MAC address of MG-SIP and then enter LENS of MG-SIP Virtual Signaling Channel (LENS=020000).
Assign path data of Path D in addition to Path A, Path B and Path C (the same data as it was before the deletion).

Path of MG-SIP	Select	Path ID	RT	LGRT	TK	CH	IP Ver	GW IP	GW PORT	FLT
Path A	ON	1	10	10	1	8	IPv4	172.16.30.1	5060	Enable
Path B	ON	2	20	20	1	32	IPv4	172.16.40.20	5060	Enable
Path C	ON	3	30	30	1	2	IPv4	172.16.50.32	5060	Enable
Path D	ON	4	40	40	1	8	IPv4	172.16.60.40	5060	Enable

Example 3: When Avoiding Reset of MG-SIP in Example 2

<Preconditions>

- LENS needs to be assigned through the ACSC command.
- When a new path or trunk is added to a new highway, the data changing of the ACSC command can be omitted by preliminarily assigning LENS.

CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signaling Channel (CCH)			Remarks
		MG 00-07	U 0-3	G 00-23	
130	0	02	0	4	used for Path A/B
	1	02	0	16	used for Path B/C
	2	02	0	8	preliminarily assigned **Note 9**
	3	02	0	12	preliminarily assigned **Note 9**
	4	02	0	4	**Note 10**
	5	02	0	4	**Note 10**
	6	02	0	4	**Note 10**
	7	02	0	4	**Note 10**

Note 9: Assign only the virtual channels of the appropriate MG-SIP to the preliminarily assigned highway (no terminal other than the MG-SIP can be assigned to the highway).

Note 10: Apply the same settings as CICG=0 to the remaining CIC Group Numbers (CICG).

STEP 1: **ARTD/ARTDN**- Assign a new route (RT=40) for Path D.

STEP 2: **ARTI/ARTIN**- Assign a new route (RT=40) for Path D.

STEP 3: **ATRK**- Assign a new trunk for Path D.

Path for MG-SIP	Route Number	Trunk Number	Number of Channels	LENS			
				Highway 1	Highway 2	Highway 3	Highway 4
Path A	10	1-8	8	020040-020047	-	-	-
Path B	20	1-32	32	020050-020077	020160-020167	-	-
Path C	30	1-2	2	-	020170-020171	-	-
Path D	40	1-8	8	-	-	020080-020087	-

STEP 4: **ACSC**- The setting of this command data is not required to be changed because the trunk of Path D can be accommodated within the LENS of CIC Group 2.

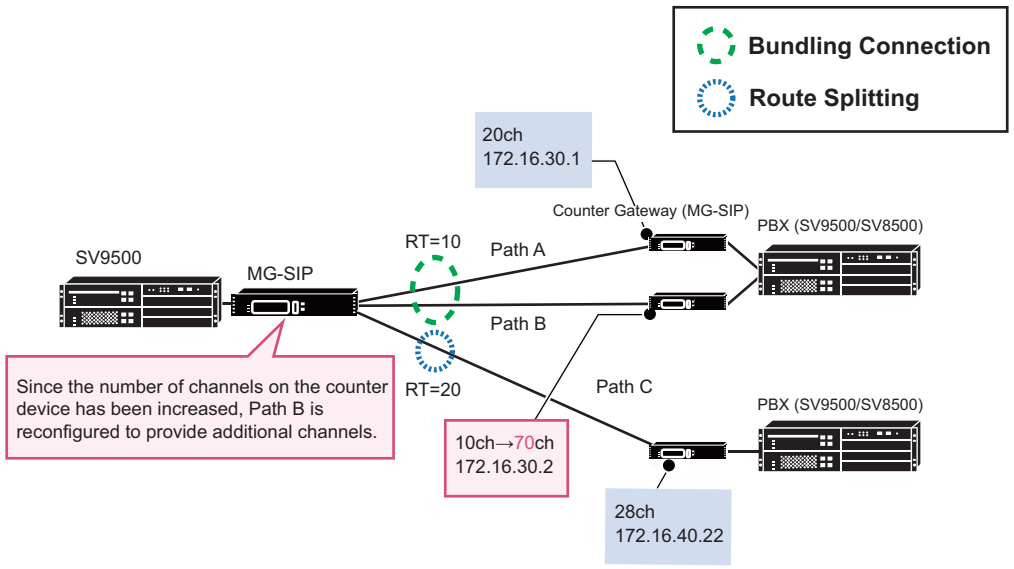
CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signaling Channel (CCH)			Remarks
		MG 00-07	U 0-3	G 00-23	
130	0	02	0	4	used for Path A/B
	1	02	0	16	used for Path B/C
	2	02	0	8	preliminarily assigned-> used for Path D
	3	02	0	12	preliminarily assigned
	4	02	0	4	**Note 11**
	5	02	0	4	**Note 11**
	6	02	0	4	**Note 11**
	7	02	0	4	**Note 11**

Note 11: Apply the same settings as CICG=0 to the remaining CIC Group Numbers (CICG).

STEP 5: **ADPC**- Assign the same PC as RT=10/20/30 for RT=40.

STEP 6: **MBTK**- Cancel Make-busy for RT=40/TK=1-8.

STEP 7: **AMGIL**- Assign path information data of Path D.



Path of MG-SIP	Select	Path ID	RT	LGRT	TK	CH	IP Ver	GW IP	GW PORT	FLT
Path A	ON	1	10	10	1	8	IPv4	172.16.30.1	5060	Enable
Path B	ON	2	20	20	1	32	IPv4	172.16.40.20	5060	Enable
Path C	ON	3	30	30	1	2	IPv4	172.16.50.32	5060	Enable
Path D	ON	4	40	40	1	8	IPv4	172.16.60.40	5060	Enable

Note: The reset of MG-SIP is not required.

STEP 8: **AMGIL**- Reset Path D.
MG-ID: MAC address of MG-SIP (six bytes)
* Enter MAC address of Telephony Server side (LAN side).
FUNCTION: Reset
Reset Type: PATH (Reset Automatically Select)
The check box for Path D is automatically selected.

Example 4: Changing the Number of Channels for a Path

- In the case that a reset of MG-SIP is required:

STEP 1: **MBTK**- For each trunk of RT = 10 and RT = 20, select "2: Make Busy (Bothway)" from the MB drop-down list box.

Note: Make sure that all the channels are placed in the idle state, then go to the next step.

STEP 2: **AMGIL**- Delete the registration of MG-SIP.

Note: When the registration of MG-SIP is deleted, the associated path information will also be deleted.

Note: After the registration of MG-SIP is deleted, MG-SIP will be reset.

STEP 3: **ATRK**

Delete the trunk for Path B (RT=10, TK=21-30).

Path for MG-SIP	Route Number	Trunk Number	Number of Channels	LENS			
				Highway 1	Highway 2	Highway 3	Highway 4
Path A	10	1-20	20	020040-020063	-	-	-
Path B	10	21-30	10	020064-020075	-	-	-
Path C	20	1-28	28	020076-020077	020080-020111	-	-

Note: Since a deleted speech channel changes to an unused state, the channel can be used as the new path if the channel is within a range of the appropriate speech channels. For more details, see Example 8: Adding New Path and Trunk to Speech Channel deleted in Examples 4 and 5.

Assign a new trunk for Path B (RT=10, TK=31-100).

Path for MG-SIP	Route Number	Trunk Number	Number of Channels	LENS			
				Highway 1	Highway 2	Highway 3	Highway 4
Path A	10	1-20	20	020040-020063	-	-	-
Path C	20	1-28	28	020076-020077	020080-020111	-	-
Path B	10	31-100	70	-	020112-020117	020120-020157	020160-020197

STEP 4: **ACSC** - Delete the already registered CSC Group information and assign LENS of the highway used for the trunk of Path D to unused CIC Groups 2 and 3.

<Before the change>

CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signaling Channel (CCH)			Remarks
		MG 00-07	U 0-3	G 00-23	
130	0	02	0	4	used for Path A/B/C
	1	02	0	8	used for Path C

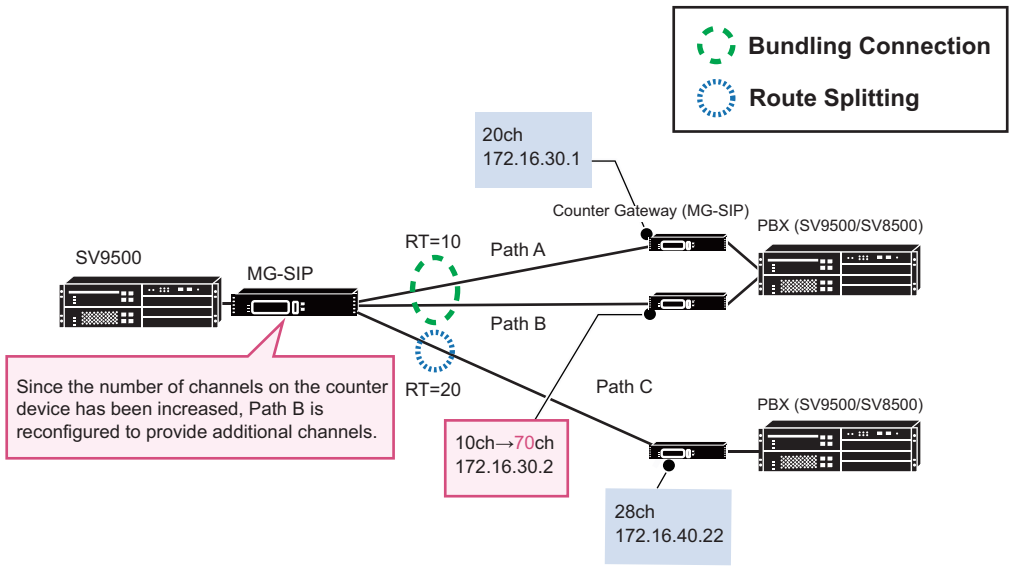
	5	02	0	4	
	6	02	0	4	
	7	02	0	4	

<After the change>

CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signaling Channel (CCH)			Remarks
		MG 00-07	U 0-3	G 00-23	
130	0	02	0	4	used for Path A/B/C -> used for Path A/C
	1	02	0	8	used for Path C -> used for Path B/C
	2	02	0	12	used for Path B
	3	02	0	16	used for Path B
	4	02	0	4	Note 12
	5	02	0	4	
	6	02	0	4	
	7	02	0	4	

Note 12: Apply the same settings as CICG=0 to the remaining CIC Group Numbers (CICG).



STEP 5: **MBTK**- Cancel Make-busy for all the trunks of RT = 10 and RT = 20.

STEP 6: **AMGIL**- Enter MAC address of MG-SIP and then enter LENS of MG-SIP Virtual Signaling Channel (LENS=020040).
Assign path data of Path B in addition to Path A and Path C (the same data as it was before the deletion).

Path of MG-SIP	Select	Path ID	RT	LGRT	TK	CH	IP Ver	GW IP	GW PORT	FLT
Path A	ON	1	10	10	1	20	IPv4	172.16.30.1	5060	Enable
Path B	ON	2	10	10	31	70	IPv4	172.16.30.2	5060	Enable
Path C	ON	3	20	20	1	28	IPv4	172.16.40.22	5060	Enable

Example 5: Changing the Number of Channels for a Path, Avoiding Reset of MG-SIP

- In the case that a reset of MG-SIP is not required:

<Preconditions>

- LENS needs to be assigned through the ACSC command.
- When adding a new path or trunk to a new highway, the data changing of the ACSC command can be omitted by preliminarily assigning LENS.

CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signaling Channel (CCH)			Remarks
		MG 00-07	U 0-3	G 00-23	
130	0	02	0	4	used for Path A/B/C
	1	02	0	8	used for Path C
	2	02	0	12	preliminarily assigned **Note 13**
	3	02	0	16	preliminarily assigned **Note 13**
	4	02	0	4	**Note 14**
	5	02	0	4	**Note 14**
	6	02	0	4	**Note 14**
	7	02	0	4	**Note 14**

Note 13: Assign only the virtual channels of the appropriate MG-SIP to the preliminarily assigned highway (no other than the MG-SIP can be assigned to the highway).

Note 14: Apply the same settings as CICG=0 to the remaining CIC Group Numbers (CICG).

STEP 1: **MBTK**- For each trunk of RT = 10, select "2: Make Busy (Bothway)" from the MB drop-down list box.

Note: Make sure that all the channels are placed in the idle state, then go to the next step.

STEP 2: **AMGIL**- Delete the path information of Path B.

Delete the path information of Path B.

Clear the Select check box of Path B to be deleted. Path B data will be deleted by clicking the SET button while the Select check boxes of the other paths (Path A and Path C) are ON.

Path of MG-SIP	Select	Path ID	RT	TK	CH	GW IP	GW PORT
Path A	ON	1	10	1	20	172.16.30.1	5060
Path B	OFF	2	10	21	10	172.16.30.2	5060
Path C	ON	3	20	1	28	172.16.40.22	5060

STEP 3: **ATRK**

Delete the trunk for Path B (RT=10, TK=21-30).

Path for MG-SIP	Route Number	Trunk Number	Number of Channels	LENS			
				Highway 1	Highway 2	Highway 3	Highway 4
Path A	10	1-20	20	020040-020063	-	-	-
Path B	10	21-30	10	020064-020075	-	-	-
Path C	20	1-28	28	020076-020077	020080-020111	-	-

Note: Since a deleted speech channel changes to a unused state, the channel can be used as the new path if the channel is within a range of the appropriate speech channels. For more details, see Example 8: Adding New Path and Trunk to Speech Channel deleted in Examples 4 and 5.

Assign a new trunk for Path B (RT=10, TK=31-100).

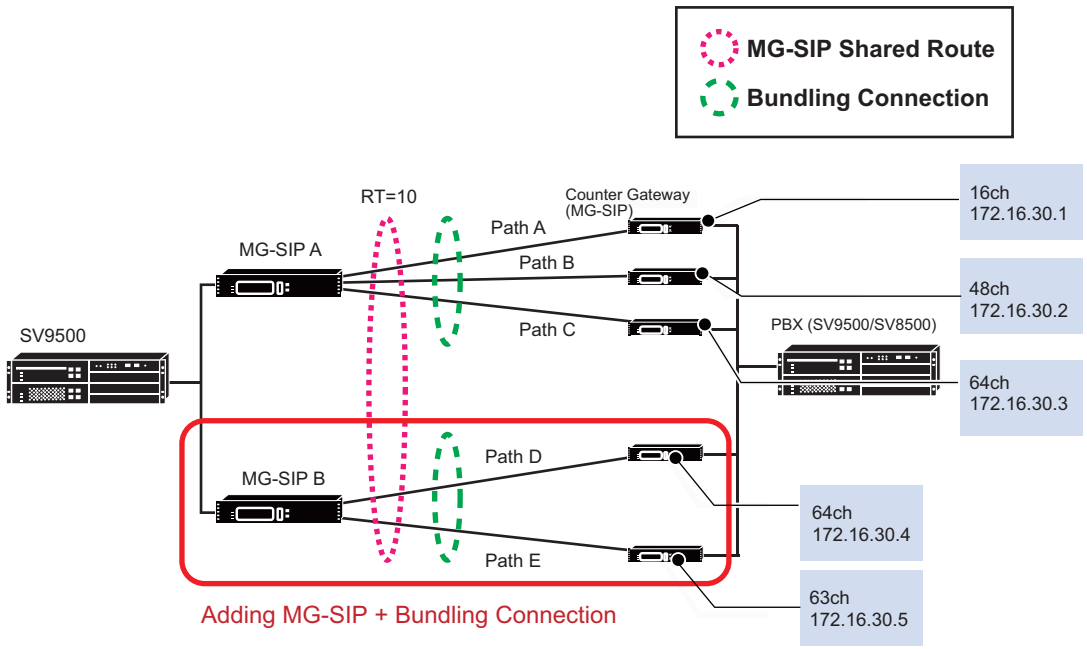
Path for MG-SIP	Route Number	Trunk Number	Number of Channels	LENS			
				Highway 1	Highway 2	Highway 3	Highway 4
Path A	10	1-20	20	020040-020063	-	-	-
Path C	20	1-28	28	020076-020077	020080-020111	-	-
Path B	10	31-100	70	-	020112-020117	020120-020157	020160-020197

STEP 4: **ACSC**- The setting of this command data is not required to be changed because the trunk of Path B can be accommodated within the LENS of CIC Groups 1, 2 and 3.

CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signaling Channel (CCH)			Remarks
		MG 00-07	U 0-3	G 00-23	
130	0	02	0	4	used for Path A/B/C -> used for Path A/C
	1	02	0	8	used for Path C -> used for Path B/C
	2	02	0	12	preliminarily assigned -> used for Path B
	3	02	0	16	preliminarily assigned -> used for Path B
	4	02	0	4	**Note 15**
	5	02	0	4	**Note 15**
	6	02	0	4	**Note 15**
	7	02	0	4	**Note 15**

Note 15: Apply the same settings as CICG=0 to the remaining CIC Group Numbers (CICG).

STEP 5: **MBTK**- Cancel Make-busy for all the trunks of RT = 10.



STEP 6: **AMGIL**- Assign the path information for Path B.

Path of MG-SIP	Select	Path ID	RT	LGRT	TK	CH	IP Ver	GW IP	GW PORT	FLT
Path A	ON	1	10	10	1	20	IPv4	172.16.30.1	5060	Enable
Path C	ON	3	20	20	1	28	IPv4	172.16.40.22	5060	Enable
Path B	ON	2	10	10	31	70	IPv4	172.16.30.2	5060	Enable

Note: The reset of MG-SIP is not required.

STEP 7: **AMGIL**- Reset Path B.
MG-ID: MAC address of MG-SIP (six bytes)
* Enter MAC address of Telephony Server side (LAN side).
FUNCTION: Reset
Reset Type: PATH (Reset Automatically Select)
The check box for Path B is automatically selected.

Example 6: Adding an MG-SIP

STEP 1: **ATRK**

Assign the trunk for Path D and Path E (RT=10).

MG-SIP	Path for MG-SIP	Number of Channels	LENS			
			Highway 1	Highway 2	Highway 3	Highway 4
MG-SIP A	Path A	16	020040 - 020057	-	-	-
	Path B	48	020060- 020077	020080- 020117	-	-
	Path C	64	-	-	020120 - 020157	020160 - 020197
MG-SIP B	Path D	64	021000 - 021037	021040 - 021077	-	-
	Path E	63	-	-	021080 - 021117	021120 - 021156

STEP 2: **MBTK**- For each trunk of RT = 10, select "2: Make Busy (Bothway)" from the MB drop-down list box.

Note: Make sure that all the channels are placed in the idle state, then go to the next step.

STEP 3: **AMGIL**- Delete the registration data of MG-SIP A.

Note: When the registration of MG-SIP is deleted, the associated path information will also be deleted.

Note: After the registration of MG-SIP is deleted, MG-SIP will be reset.

STEP 4: **ACSC** - Delete the already registered CSC Group information and assign LENS of the highway used for the trunk of Path D and Path E to unused CIC Groups 4 to 7.

<Before the change>

CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signaling Channel (CCH)			Remarks
		MG 00-07	U 0-3	G 00-23	
130	0	02	0	4	MG-SIP A
	1	02	0	8	
	2	02	0	12	
	3	02	0	16	
	4	02	0	4	Note 16
	5	02	0	4	Note 16
	6	02	0	4	Note 16
	7	02	0	4	Note 16

<After the change>

CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signaling Channel (CCH)			Remarks
		MG 00-07	U 0-3	G 00-23	
130	0	02	0	4	MG-SIP A
	1	02	0	8	
	2	02	0	12	
	3	02	0	16	
	4	02	1	0	MG-SIP B
	5	02	1	4	
	6	02	1	8	
	7	02	1	12	

In the next step, delete the next CSCG (greater by one than the last CSCG).
Then assign LENS of MG-SIP B Virtual Signaling Channel to the same CIC Group Number as that changed in the even-numbered CSC Group (CSCG).

<Before the change>

CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signaling Channel (CCH)			Remarks
		MG 00-07	U 0-3	G 00-23	
131	0	02	0	4	MG-SIP A

	4	02	0	4	Note 16
	5	02	0	4	
	6	02	0	4	
	7	02	0	4	

<After the change>

CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signaling Channel (CCH)			Remarks
		MG 00-07	U 0-3	G 00-23	
131	0	02	0	4	MG-SIP A
	1	02	0	4	
	2	02	0	4	
	3	02	0	4	
	4	02	1	0	MG-SIP B
	5	02	1	0	
	6	02	1	0	
	7	02	1	0	

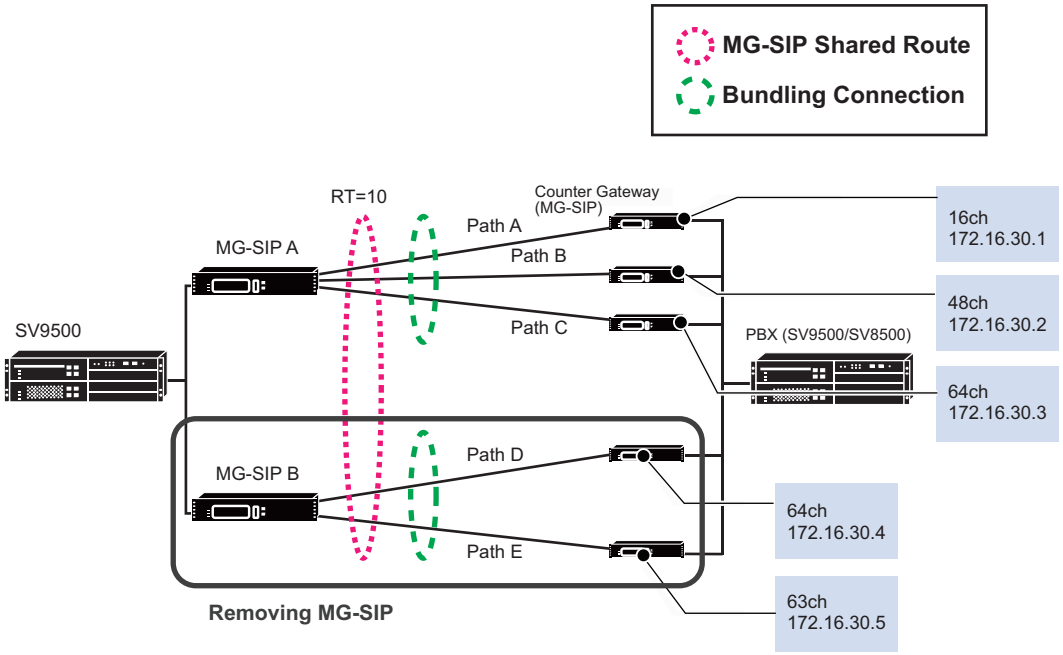
Note 16: Apply the same settings as CICG=0 to the remaining CIC Group Numbers (CICG).

STEP 5: **MBTK**- Cancel Make-busy for all the trunks of RT = 10.

STEP 6: **AMGIL**

Enter MAC address of MG-SIP A and then enter LENS of MG-SIP Virtual Signaling Channel (LENS=020040).

Assign path data of Path A/B/C for MG-SIP A (the same data as it was before the deletion).



Path of MG-SIP	Select	Path ID	RT	LGRT	TK	CH	IP Ver	GW IP	GW PORT	FLT
Path A	ON	1	10	10	1	16	IPv4	172.16.30.1	5060	Enable
Path B	ON	2	10	10	17	48	IPv4	172.16.30.2	5060	Enable
Path C	ON	3	10	10	65	64	IPv4	172.16.30.3	5060	Enable

Then, enter MAC address of MG-SIP B and then enter LENS of MG-SIP Virtual Signaling Channel (LENS=021000).

Assign path data of Path D/E for MG-SIP B.

Path of MG-SIP	Select	Path ID	RT	LGRT	TK	CH	IP Ver	GW IP	GW PORT	FLT
Path D	ON	1	10	10	129	64	IPv4	172.16.30.4	5060	Enable
Path E	ON	2	10	10	193	63	IPv4	172.16.30.5	5060	Enable

Example 7: Remove an MG-SIP

STEP 1: **MBTK**- For each trunk of RT = 10, select "2: Make Busy (Bothway)" from the MB drop-down list box.

Note: Make sure that all the channels are placed in the idle state, then go to the next step.

STEP 2: **AMGIL**- Delete the registration data of MG-SIP A and MG-SIP B.

Note: When the registration of MG-SIP is deleted, the associated path information will also be deleted.

Note: After the registration of MG-SIP is deleted, MG-SIP will be reset.

STEP 3: **ACSC** - Delete the already registered CSC Group information (even-numbered CSCG) and assign the LENS (same as that of CIC Group Number 0) of CIC Group Numbers 4 to 7.

<Before the change>

CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signaling Channel (CCH)			Remarks
		MG 00-07	U 0-3	G 00-23	
130	0	02	0	4	MG-SIP A
	1	02	0	8	
	2	02	0	12	
	3	02	0	16	
	4	02	1	0	MG-SIP B
	5	02	1	4	
	6	02	1	8	
	7	02	1	12	

<After the change>

CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signaling Channel (CCH)			Remarks
		MG 00-07	U 0-3	G 00-23	
130	0	02	0	4	MG-SIP A
	1	02	0	8	
	2	02	0	12	
	3	02	0	16	
	4	02	0	4	Note 17
	5	02	0	4	
	6	02	0	4	
	7	02	0	4	

In the next step, delete the next CSCG (greater by one than the last CSCG).
Assign LENS of MG-SIP B Virtual Signaling Channel to the same CIC Group Number as that changed in the even-numbered CSC Group (CSCG).

<Before the change>

CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signaling Channel (CCH)			Remarks

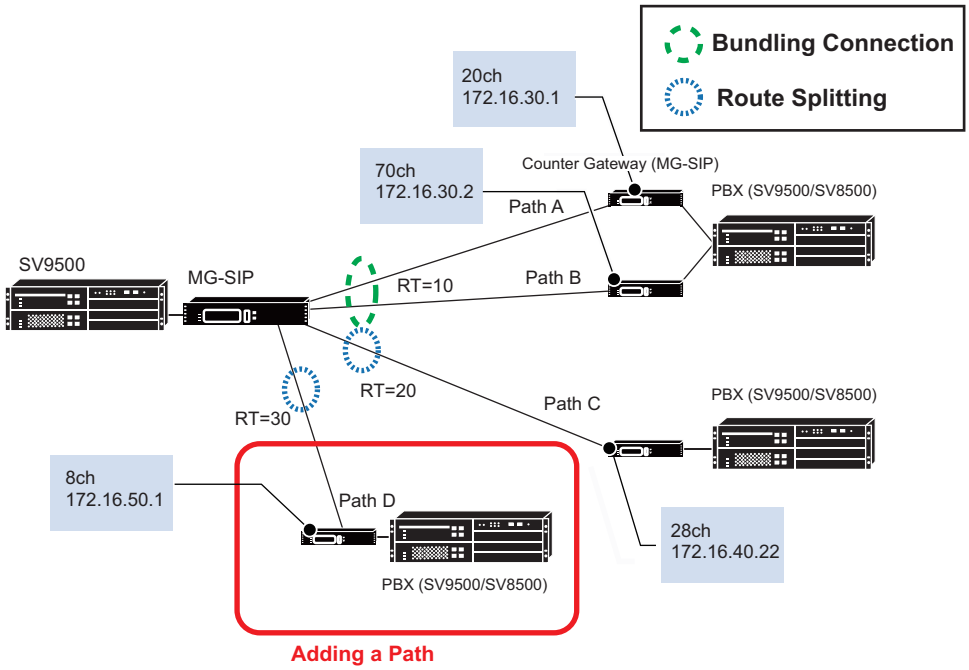
	6	02	0	4	
	7	02	0	4	

Note 17: Apply the same settings as CICG=0 to the remaining CIC Group Numbers (CICG).

STEP 4: **MBTK**- Cancel Make-busy for all the trunks of RT = 10.

STEP 5: **ATRK** - Delete the trunk for Path D and Path E.



MG-SIP	Path for MG-SIP	Number of Channels	LENS			
			Highway 1	Highway 2	Highway 3	Highway 4
MG-SIP A	Path A	16	020040 - 020057	-	-	-
	Path B	48	020060- 020077	020080- 020117	-	-
	Path C	64	-	-	020120 - 020157	020160 - 020197
MG-SIP B	Path D	-	-	-	-	-
	Path E	-	-	-	-	-

STEP 6: **AMGIL** - Enter MAC address of MG-SIP A and then enter LENS of MG-SIP Virtual Signaling Channel (LENS=020040).

Assign path data of Path A/B/C for MG-SIP A (the same data as it was before the deletion).

Path of MG-SIP	Select	Path ID	RT	LGRT	TK	CH	IP Ver	GW IP	GW PORT	FLT
Path A	ON	1	10	10	1	16	IPv4	172.16.30.1	5060	Enable
Path B	ON	2	10	10	17	48	IPv4	172.16.30.2	5060	Enable
Path C	ON	3	10	10	65	64	IPv4	172.16.30.3	5060	Enable

Example 8: Adding New Path and Trunk to Speech Channel deleted in Examples 4 and 5

STEP 1: **ARTD/ARTDN**- Assign a new route for Path D.

STEP 2: **ARTI/ARTIN**- Assign a new route for Path D.

STEP 3: **ATRK**- Assign a new trunk for Path D.

Path for MG-SIP	Route Number	Trunk Number	Number of Channels	LENS			
				Highway 1	Highway 2	Highway 3	Highway 4
Path A	10	1-20	20	020040-020063	-	-	-
Path D	30	1-8	8	020064-020073	-	-	-
Path B	10	31-100	70	-	020112-020117	020120-020157	020160-020197
Path C	20	1-28	28	020076-020077	020080-020111	-	-

STEP 4: **ACSC**- The setting of this command data is not required to be changed because the trunk of Path D can be accommodated within the LENS of CIC Group 1.

CSC Group Number (CSCG)	CIC Group Number (CICG)	LENS of Signaling Channel (CCH)			Remarks
		MG 00-07	U 0-3	G 00-23	
130	0	02	0	4	used for Path A/C-> used for Path A/C/D
	1	02	0	8	used for Path B/C
	2	02	0	12	used for Path B
	3	02	0	16	used for Path B
	4	02	0	4	**Note 18**
	5	02	0	4	**Note 18**
	6	02	0	4	**Note 18**
	7	02	0	4	**Note 18**

Note 18: Apply the same settings as CICG=0 to the remaining CIC Group Numbers (CICG).

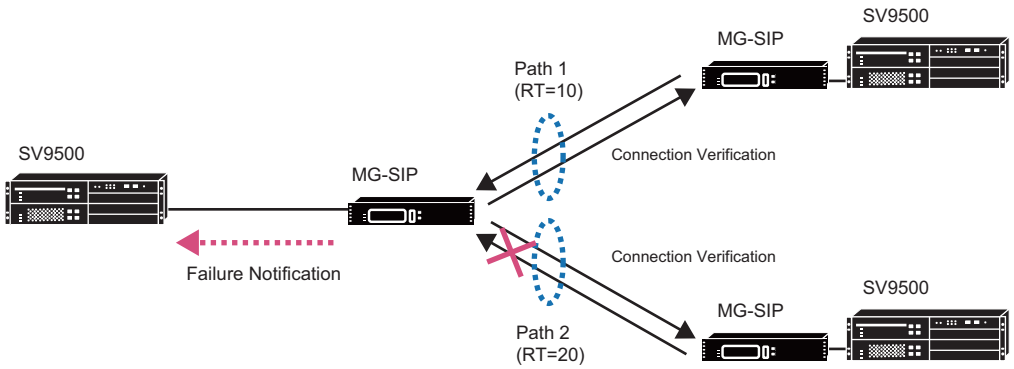
STEP 5: **ADPC**- Assign the same PC as RT=10/20 for RT=30.

STEP 6: **MBTK**- Cancel Make-busy for RT=30/TK=1-8.

STEP 7: **AMGIL**- Assign path information data of Path D.

Path of MG-SIP	Select	Path ID	RT	LGRT	TK	CH	IP Ver	GW IP	GW PORT	FLT
Path A	ON	1	10	10	1	20	IPv4	172.16.30.1	5060	Enable
Path B	ON	2	10	10	31	70	IPv4	172.16.30.2	5060	Enable
Path C	ON	3	20	20	1	2	IPv4	172.16.40.22	5060	Enable
Path D	ON	4	30	30	1	8	IPv4	172.16.50.1	5060	Enable

Note: The reset of MG-SIP is not required.



STEP 8: **AMGIL**- Reset Path D.
MG-ID: MAC address of MG-SIP (six bytes)
* Enter MAC address of Telephony Server side (LAN side).
FUNCTION: Reset
Reset Type: PATH (Reset Automatically Select)
The check box for Path D is automatically selected.

M-128 MG-SIP TIE Line Failure Detection Per Path

General Description

MG-SIP periodically sends keep-alive packets to each path to verify that the connection is valid. If MG-SIP detects a communication failure or recovery, it sends a failure notification to Telephony Server.
Telephony Server generates a system message after receiving a failure notification, then sets or cancels the make-busy status on the appropriate trunk.

Note: This feature is available since FP95-113 V3.

Operating Procedure

None.

Service Conditions

<Important Notices>

1. To use this feature, MG-SIP TIE LINE PATH SPLITTING [M-127] needs to be correctly set and to work properly.
2. When this feature is changed to valid or invalid, the corresponding paths become unavailable. After the change, reset the paths through the AMGIL command to make the paths available. In this case, the reset of MG-SIP is not required.
3. To use this feature, enable this feature with the set options command on MG-SIP and set health check interval.

<Interactions with Other Features>

None.

<Hardware/Software>

1. This service is available for MG-128SIPMGJ-B with firmware versions SP-4060 MGSIP PROG-L Issue 3 or later.

<Interactions with Networks>

None.

<Conditions Specific to This Feature>

1. Telephony Server generates a system message after receiving a failure notification from MG-SIP, then sets or cancel the make-busy status on the appropriate path (channel).
2. When a communication failure is detected, busy calls are released. When a call is originated to a path, where a failure is detected, in the period between the occurrence and detection of a failure, the call can be routed to an alternate route by PRI/PRA FAILSAFE ROUTING [P-49/50].
3. When Telephony Server was informed of communication failure in a path and has not yet been notified of the path's recovery, the Telephony Server blocks calls from the path.
4. Telephony Server generates the following system messages when receiving notification of a communication failure or recovery.

Time to Generate	System Message
Failure of Communication	35-L: IP EQUIPMENT NETWORK FAILURE WARNING (MEDIA GATEWAY)
Recovery of Communication	35-M: IP EQUIPMENT NETWORK RESTORE (MEDIA GATEWAY)

5. Telephony Server can simultaneously generate a maximum of 64 system messages. When Telephony Server needs to generate 65 or more system messages simultaneously, the 65th and following messages may not be generated.
   Example:
   When a failure occurs during communication between a gateway and an MG-SIP in an office where MG-SIP TIE LINE FAILURE DETECTION PER PATH [M-128] is enabled on 65 or more paths, MG-SIP detects the communication failures in all the paths and notifies Telephony Server about it. Due to the limit amount of simultaneous system message output, however, the Telephony Server can generate only 64 copies of the system message "35-L: IP EQUIPMENT NETWORK FAILURE WARNING (MEDIA GATEWAY)" at a time, leaving out the rest of the information about the failure.

<Other Conditions>

None.

Programming

* The following is explained under the presumption that the data settings for MG-SIP TIE LINE [M-122] have been completed.

STEP 1: **AMGIL** - Assign the data regarding to MG-SIP as follows:
MG-ID: Enter MAC Address (six bytes) of MG-SIP. * Enter the Telephony Server side (LAN side) MAC address.
FUNCTION = Setting
KIND = SIP-MG

LINE = 0 (fixed)
CH = 0 (fixed)
LENS: Enter the accommodated location of Virtual Signaling Channel (the first number of HW).
Retry = 0
Setting Type of Signaling Packet Service: Specify QoS settings of Signaling that is used when Internal PHI-BRI connects MG-SIP.
Usable CH Number: Enter the number of channels to be used per MG-SIP (1-128).

Note: Be sure to set 128ch (fixed) when this feature (MG-SIP TIE Line Path Splitting) is used.

Service of Authentication Exists: Unchecked
Setting of Path Data

Note: When the Set button of the command is pressed while this check box is OFF, all the registered Path data is cleared.

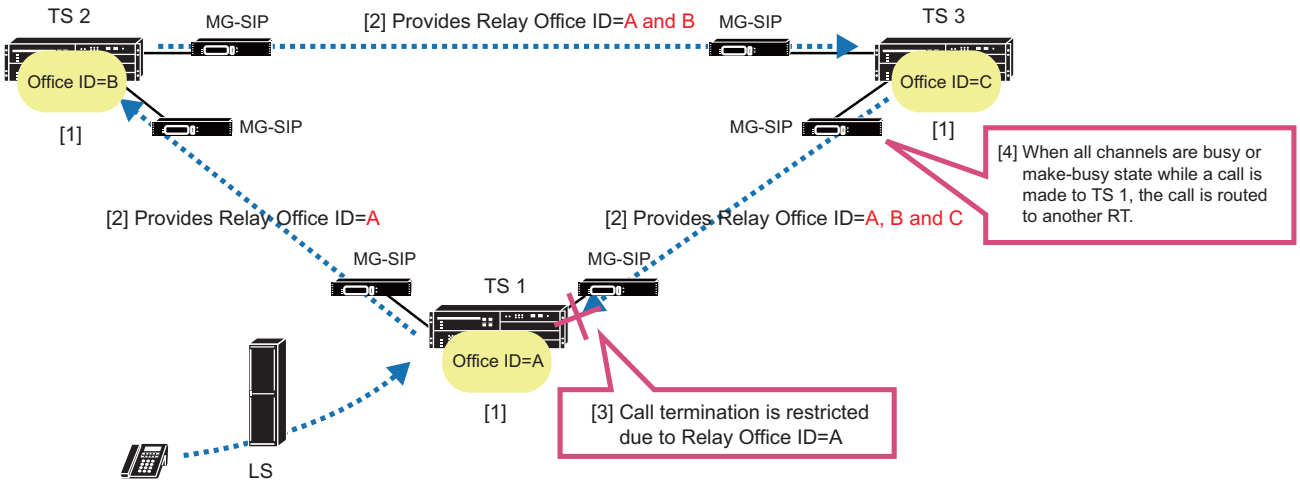
List of Path Data

INDEX: Index of Path data (1-32)
Select: Choose the check box for the path to be registered.

Note: When the Set button of the command is pressed while the check box for the already registered path is OFF, the path data is cleared.

Path ID: Identification Number of Path (1-255)
RT: External Route Number (1-255)
* Enter the route number (route number of Virtual Speech Channel for MG-SIP assigned by the ATRK command) to be assigned to this path.
LGRT: Logical Route Number (display only)
TK: Trunk Number (1-255)
* Enter the first trunk number of the trunks (trunk number of Virtual Speech Channel for MG-SIP assigned by the ATRK command) to be assigned to this path.
CH: Enter the number of MG-SIP channels to be assigned to this path.
IP Ver: IP Address Version = 1 (IPv4)
GW IP: Enter an IP address of the counter gateway (0.0.0.1-255.255.255.254).
GW PORT: Enter a port number of the counter gateway (1024-65535).
FLT: Gateway Fault Detection Capability (0/1)
* To enable MG-SIP Fault Detection per Path, set this parameter to 1 (Enable).

<Example of AMGIL Command Settings>



Path of MG-SIP	Select	Path ID	RT	LGRT	TK	CH	IP Ver	GW IP	GW PORT	FLT
Path A	ON	1	10	10	1	64	IPv4	172.16.30.1	5060	Enable
Path B	ON	2	10	10	65	32	IPv4	172.16.30.2	5060	Enable
Path C	ON	3	10	10	97	32	IPv4	172.16.40.1	5060	Disable

M-129 MG-SIP TIE Line Loop Detection

General Description

When a call routed via MG-SIP loops through nodes, the call termination is restricted.

Note: This feature is available since FP95-113 V3.

1. TS (Transit Switch) office checks the Relay Office ID when receiving a call from an office enabling Loop Detection.
2. When a call is originated from TS office to a tandem office, TS office notifies the tandem office about the Relay Office ID (received Relay Office ID + Self Office ID).
3. TS office checks the received Relay Office ID. When the TS's self Office ID is included in the Relay Office ID, the TS office restricts call originations.

   Note: Since the restriction of call terminations by Loop Detection is executed without analyzing incoming call numbers, station calls in the appropriate TS office and incoming calls routed to LS (Local Switch) stations via the TS office are restricted.
4. When a tandem call is restricted by Loop Detection, the call can be routed to an alternate route by PRI/PRA FAILSAFE ROUTING [P-49/50] (ASYDL/ASYDN SYS1, Index 1356, Bit 0 = 1).

Operating Procedure

None.

Service Conditions

<Important Notices>

None.

<Interactions with Other Features>

1. Call Transfer-All Calls / Blind Transfer / Call Forwarding - Don't Answer:
   When a station transfers an incoming call from an MG-SIP route enabling Loop Detection to another MG-SIP route also enabling Loop Detection, only the Office ID of the relay station is sent to the transfer destination office. The office of the relay station may not send the Relay Office ID received at the arrival of the incoming call to the destination office.
2. Call Forwarding - All Calls / Call Forwarding - Busy Line / Call Forwarding - Logout / Call Forwarding - PS Incoming Incomplete:
   When a call from an MG-SIP (the first MG-SIP) route enabling Loop Detection is forwarded to another MG-SIP (the second MG-SIP) route also enabling Loop Detection, the Relay Office ID received by the first MG-SIP office can be sent to the second MG-SIP office.
3. When a call is originated from MG-SIP through CCIS ALTERNATE ROUTING - BACKUP [C-178] or PRI/PRA FAILSAFE ROUTING [P-49/50], the Relay Office's information can be sent to the destination office.

<Hardware/Software>

1. This service is available for MG-128SIPMGJ-B with firmware versions SP-4060 MGSIP PROG-L Issue 3 or later.

<Interactions with Networks>

1. In an FCCS network, the same ID for Loop Detection must be set for all the node in the network (ASYDL/ASYDN, SYS1, Index 1355).

<Conditions Specific to This Feature>

1. Up to 32 Relay Office IDs can be registered.
2. This feature is only available for calls via routes with MG-SIP TIE Line Loop Detection enabled. If a call uses a route not supporting the feature, information of Relay offices will be reset.
3. When Loop Detection service is enabled (Self Office ID is set by the ASYDL/ASYDN. SYS1, Index 1355), if a call, after having passed through more than 31 relay offices, comes from an MG-SIP, Telephony Server blocks the call regardless of whether or not a loop is detected.
4. An error response (482 Loop Detected) is transmitted to the originating office of MG-SIP TIE Line call. When a call is routed to an alternate route by PRI/PRA FAILSAFE ROUTING [P-49/50], however, the other error response is issued according to the result of the alternating action.

<Other Conditions>

None.

Programming

* The following is required to be set for TS office.

* The following is explained under the presumption that the data settings for MG-SIP TIE LINE [M-122] have been completed.

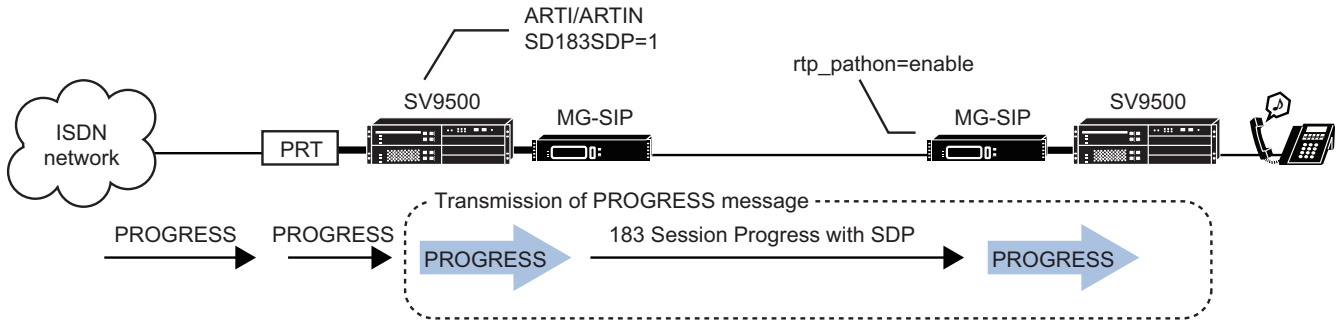
STEP 1: **ASYDL/ASYDN**

SYS1, Index 1355: Assign an ID for Loop Detection (1-255). **Note 1**, **Note 2**

Note 1: When "0" is assigned, this feature becomes disabled.

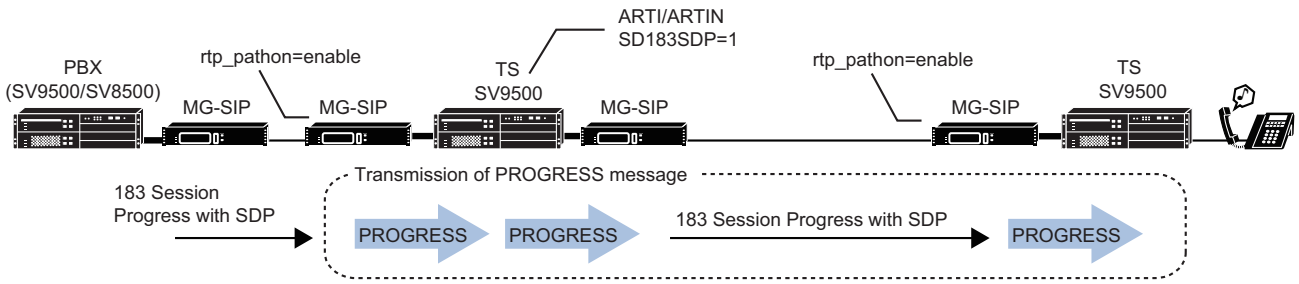
Note 2: In an FCCS network, the same ID must be set for all the nodes in the network.

SYS1, Index 1356, Bit 0=1 (Alternate routing is available)



STEP 2: **ARTI/ARTIN** - Assign Trunk Application Data of MG-SIP for TIE Line.

Loop (CDN:107)=1 (Loop Detection is enabled)



M-130 MG-SIP TIE Line In-band Tone

General Description

In a tandem connection from MG-SIP TIE Line to an external trunk (ISDN line, etc.), an in-band tone (counter office audible sound) such as announcement from the external trunk can be provided by transmitting the PROGRESS message received from the external trunk to MG-SIP. In-band tone can also be provided in a tandem connection to ACIS line (2 Mbps digital interface / ODT) by sending the PROGRESS message to MG-SIP.

Also when an MG-SIP receives 183 Session Progress with SDP from a counter SIP gateway, the MG-SIP sends the PROGRES message to Telephony Server and the PROGRESS message can be provided to another MG-SIP which has received the message.

Note: This feature is available since FP95-113 V3.

Operating Procedure

None.

Service Conditions

<Important Notices>

1. Both of the following settings are required to use this feature.
   a.) Set “enable” for the MG-SIP configuration command “set rtp_pathon”.

Note: This setting is required for an outlet-side MG-SIP which receives 183 Session Progress with SDP and sends the PROGRESS message.

b.) For a route of an inlet-side MG-SIP which hears an in-band tone, assign "1" to the SD183SDP (CDN: 108) parameter of the ARTI/ARTIN command.

Note: Note the following:

- When a counter MG-SIP/SIP gateway of the inlet-side MG-SIP does not support 183 Session Progress with SDP even if this setting is enabled, the inlet-side MG-SIP cannot send the announcement to the tandem destination.
- When a counter device of the inlet-side MG-SIP is an MG-SIP, set "enable" for the configuration command "set rtp_pathon" on the counter MG-SIP.

<Interactions with Other Features>

1. A calling party can hear an in-band tone also by setting ASYD, SYS1, Index 372, Bit 5=1 (Return message for a tandem call to ACIS line via MG-SIP=200 OK). However, when a station user attempts to transfer a call to an external trunk and then performs transfer switchback operation while hearing audible sound such as an in-band busy tone or announcement, the station user may continue to hear the audible sound even after the transfer switchback. For this reason, NEC recommends the following settings.

   ASYD, SYS1 Index 372, Bit 5=0

   ARTI/ARTIN SDN183SDP (CDN: 108)=1

<Hardware/Software>

1. MG-SIP supporting MG-SIP TIE Line is required.

<Interactions with Networks>

1. This feature is available only for tandem connections. The following trunks can be used as a destination trunk of MG-SIP.

   - ACIS line (2 Mbps digital interface/ODT)
   - PRT
   - BRT
   - MG-PRI/UG50-PRT/UG50-MG-PRT
   - MG-BRI
   - MG-SIP **Note 1**

   Note 1: MG-SIP is available only when the configuration command "set rtp_pathon" is enabled on it.

<Conditions Specific to This Feature>

1. Route Number of the MG-SIP to which you do not want to send an in-band tone should be set separately from the MG-SIP TIE Line route.

<Other Conditions>

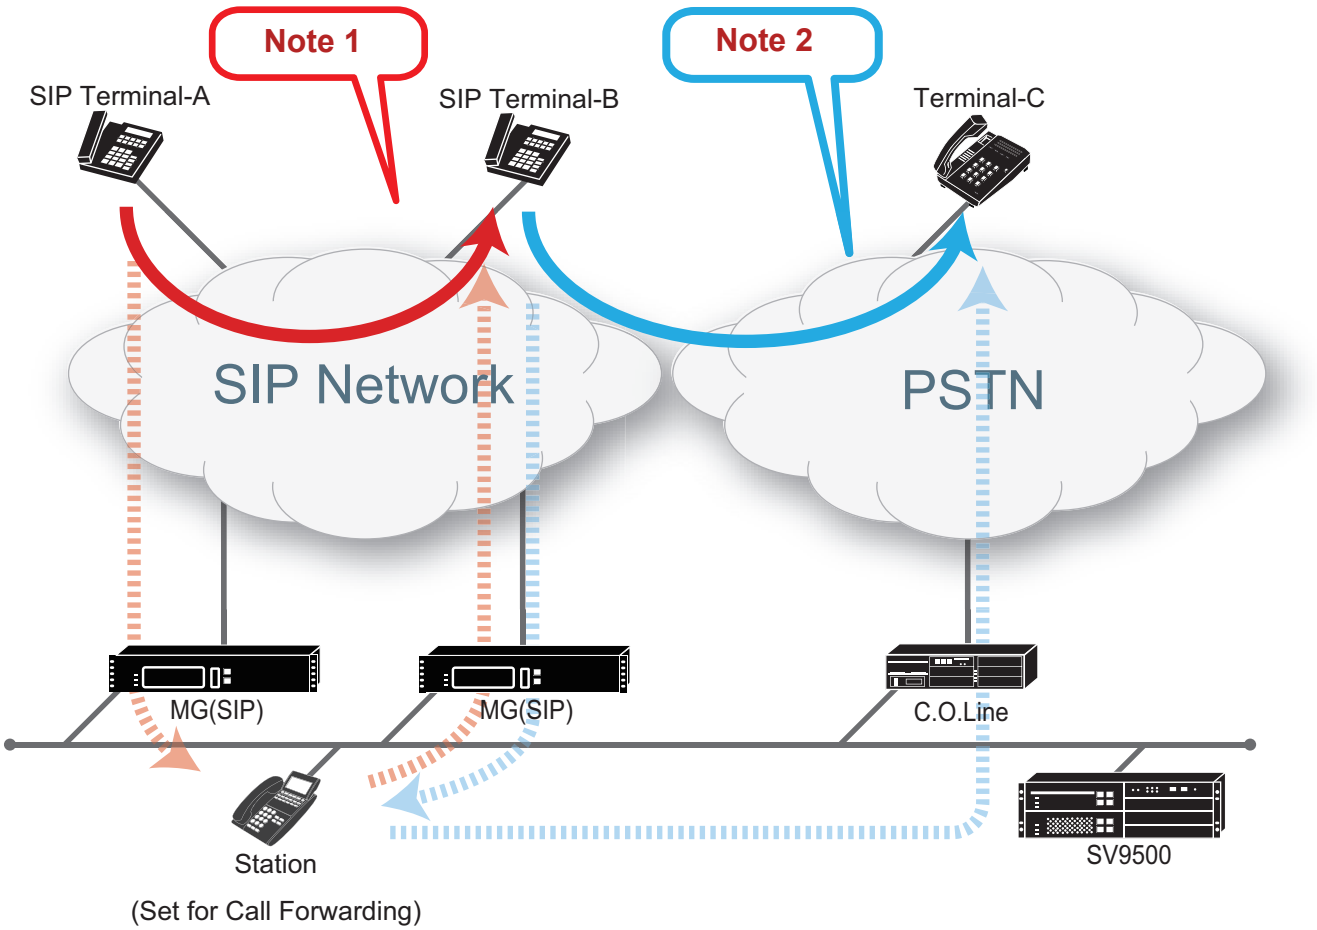
None.

Programming

* The following is explained under presumption that the data settings for MG-SIP TIE LINE [M-122] have been completed.

STEP 1: **ARTI/ARTIN** - Set the following data to the virtual speech channel route (incoming route) of the MG-SIP which transmits the PROGRESS message on a tandem connection from a MG-SIP TIE Line to an external trunk.
SD183SDP (CDN:108) = 1 (MG-SIP TIE Line In-band Tone is enabled) **Note 2**

Note 2: This feature is available only for MG-SIP TIE Line.



M-131 MG-SIP Call Forward - Moved Temporarily Redirect

General Description

When a SIP call comes through an MG-SIP to a station configured for Call Forwarding, this feature enables the MG-SIP to send a Call Forwarding destination with the 302 Moved Temporarily SIP response (compliant with RFC3261) back to the call originator.
While free from the need for control of the speech channel with the MG-SIP, the Telephony Server releases the channel, helping to make more efficient use of resources.

Note: Note the following:

- This feature is available since FP95-114 V4 and for New Zealand only.
- Terminals on the SIP Network side require connection tests of NEC.

Note 1: Redirecting SIP terminal-A to SIP terminal-B without MG-SIPs.

Note 2: Redirecting SIP terminal-B to Terminal-C without C.O.Line.

Operating Procedure

None.

Service Conditions

<Important Notice>

1. When an incoming call is from an MG-SIP connected to SIP networks in which call redirection using 302 Moved Temporarily is supported and the C.O. line number is assigned to the Call Forwarding destination, this feature is available.
2. This feature can be used in conjunction with the following services. If it is used with other services, trunks of MG-SIPs are not released.
    - CALL FORWARDING - ALL CALLS - OUTSIDE [C-28]
    - CALL FORWARDING - BUSY LINE - OUTSIDE [C-60]
    - CALL FORWARDING - DON'T ANSWER - OUTSIDE [C-74]
    - LOGGED OUT IP STATION - CALL DESTINATION [L-53]
    - CALL FORWARDING PS INCOMING CALL INCOMPLETE [C-155]
    - SPLIT CALL FORWARDING [S-99]
3. After the Telephony Server releases the speech path, the caller action depends on the SIP specification.

<Interactions with Other Features>

1. This feature does not work when a call is transferred via an MG-SIP after being processed by the Telephony Server.
2. When the forwarding destination is busy, the call is established on Multi-hop routing if they are assigned.
3. Peg Counts do not record event occurrences after call redirection with 302 Moved Temporarily SIP response. They count only event occurrences for calls that are forwarded through CALL FORWARDING - DON'T ANSWER.
4. The billing system does not provide any information about calls after being redirected with 302 Moved Temporarily SIP response. It generates information only about incoming calls forwarded through CALL FORWARDING - DON'T ANSWER, in which case these calls are recorded as incomplete calls.

<Hardware/Software>

1. This feature is only available for the following MG-SIPs.
    - MG-SIP16 [SCA-16SIPMG(US)-B/SCA-16SIPMG(US)]
      : SP-3988 MGSIP(16) PROG-G Issue 10 or later
    - MG-SIP128 [MG-128SIPMGL-A]
      : SP-4089 MGSIP(MM) PROG-A Issue 1 or later
    - Software-based MG-SIP
      : SP-4085 MGSIPVM PROG-E Issue 1 or later

<Interactions with Networks>

1. This feature can be used in conjunction with the FCCS services. However, it does not work with the CCIS services.

<Conditions Specific to This Feature>

1. For the destination route, the parameter TCL (CDN: 6) of ARTD/ARTDN commands as "1" (DDD Lines) is required.
2. The notification of the added/deleted Access Code number by using the following commands in the forwarding destination numbers is given to the call originator. Since the notified number is used by the call originator for redirecting, Access Code should be assigned the number of redirecting available.
   - AOPR/AOPRL/AOPRN
   - AADC/AADCL/AADCN
3. When all routes for forwarding destination are busy, this feature works. The following uses LCR Alternate Routing as an example:

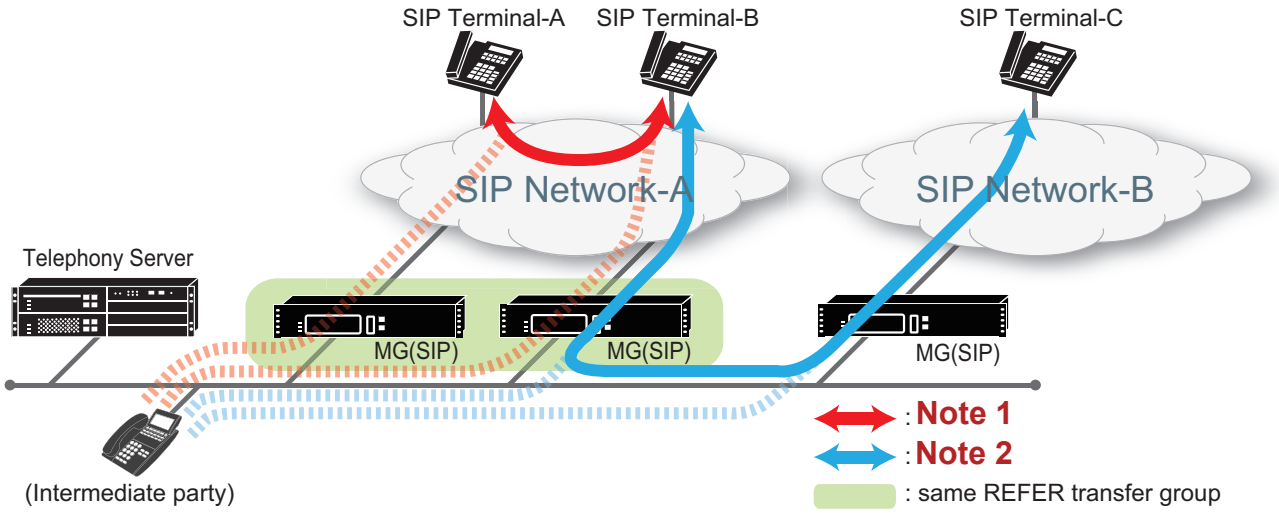
	First Routing		Second Routing		Result
Ex.1	C.O. Line A	Idle	C.O. Line B	Idle	Redirect with Access Code of C.O. Line A
Ex.2	C.O. Line A	All Busy	C.O. Line B	Idle	
Ex.3	C.O. Line A	All Busy	TIE Line B	Idle	
Ex.4	TIE Line A	Idle	C.O. Line B	Idle	Call Forwarding to TIE Line A without Redirect
Ex.5	TIE Line A	All Busy	C.O. Line B	Idle	Redirect with Access Code of C.O. Line B (because the last destination is C.O. Line.) **Note 3**
Ex.6	TIE Line A	All Busy	C.O. Line B	All Busy	

Note 3: The second routing is routed via Public Network in case of Ex.5 and Ex.6.

4. When the forwarding destination is restricted by the office data, this feature does not work.
5. The call forwarding features provided by a telephone terminal (such as a Standard SIP terminal) are not supported.

Programming

ARTI/ARTIN - Enable MG-SIP CALL FORWARD - MOVED TEMPORARILY REDIRECT feature.
CDN111 : 302REDIRECT
0 : Out of service
1 : In service



M-132 MG-SIP REFER Based Transfer

General Description

This feature uses the SIP REFER method based on RFC3515 to release the speech channel on a tandem call between MG-SIPs with the same REFER transfer group number, and thereby provides efficient handling of trunks of MG-SIP.

Note: Note the following:

- This feature is available since FP95-114 V4.
- This feature is available in North America, Australia and New Zealand.
- Terminals on the SIP Network side require connection tests of NEC.

Note 1: A call is established between SIP terminal-A and SIP terminal-B without MG-SIPs.

Note 2: A call is established between SIP terminal-B and SIP terminal-C with MG-SIPs because they are not in the same REFER transfer group.

Operating Procedure

None.

Service Conditions

<Important Notice>

1. This feature is available for following firmware version:

   - MG-128SIPMGL-A : SP-4089 MGSIP(MM) PROG-A
   - Software-based MG-SIP : SP-4085 MGSIPVM PROG-E

   Note: This feature requires the configuration of the MG-SIP. For setting details, see the following manuals.

MG-128SIPMGL-A	MG-SIP128 [MG-128SIPMGL-A]: CHAPTER 2 in Peripheral Equipment Description (IP Devices)
Software-based MGSIP	SOFTWARE-BASED MG-SIP: CHAPTER 2 in Software Model Peripheral Equipment Description

2. This feature works with a tandem connection between MG-SIPs with the same REFER transfer group number.
3. This feature is used when performing CALL TRANSFER - ALL CALLS [C-11], BLIND TRANSFER TO ATTENDANT [B-17], and BLIND TRANSFER TO STATION [B-18]. When performing other transfer, trunks of MG-SIPs are not released.
4. The SIP-compatible equipment in the SIP network side requires the following:

   - For call originator equipment (Receiving REFER request from MG-SIP)
     Processing the REFER and INVITE (Replaces) requests are required.
   - For transferred destination equipment (Receiving INVITE (Replaces) request from SIP network)
     Processing the INVITE (Replaces) request is required.

<Interactions with Other Features>

1. This feature does not work when an intermediate party terminal (a party that transfers the call) is as follows:
   - Attendant console
   - ISDN terminal
2. This feature does not work when a tandem call between MG-SIPs is established after CCIS link is reconnected.
3. When the Telephony Server receives a RELCOM message from an MG-SIP after switching a speech path, billing system and Peg Count terminate the counting.
4. Billing system does not count a call which has been completed by REFER transfer.
5. This feature does not work when an intermediate party drops out of the Three-Party Conference and the call backs to the two-way connection.

<Hardware/Software>

None.

<Interactions with Networks>

1. On the connection via FCCS network, only FCCS Networking via IP (Peer-to-Peer) is supported. FCCS Networking via DTI (DTI FCCS) is not supported.

<Conditions Specific to This Feature>

1. Enabling the REFER/NOTIFY function by using the `set sip_tel_service` command is required.
2. The speech channel is not released during the Ringing state after completion of Blind Transfer by REFER. The transferred call is switched only after the call is established (a called party answers) between a call originator and a called party.
3. The result of the path switching depends on the SIP specification (REFER/NOTIFY/INVITE (Replaces)). If the path switching fails, a tandem call continues without release of the channels.
4. The speech path is switched by using one or two MG-SIPs only when the path connects between MG-SIPs of forwarding and forwarding destination equipment.

Programming

ARTI/ARTIN - Assign the same REFER transfer group number to both MG-SIPs on tandem connection.
CDN109 : REF_GRP = 1 to 7 (REFER transfer group)
0 : REFER Transfer is out of service.
1 to 7 : REFER transfer group

N-1 Night Connection - Fixed

General Description

This feature routes calls normally directed to the ATTENDANT CONSOLE [A-3] to a preselected common Station within the system when the Night Mode has been entered.

Operating Procedure

To answer NIGHT CONNECTION Calls

1. The Incoming Calls to the ATTENDANT CONSOLE [A-3] in the night mode are automatically transferred to a preselected NIGHT CONNECTION - FIXED Station.
2. Calling Party hears Ringback Tone.
3. Ring signal is sent to the NIGHT CONNECTION - FIXED Station.
4. NIGHT CONNECTION - FIXED Station goes off-hook to answer the Incoming Call. If necessary, this Station can transfer the Incoming Call to another Station within the system, using CALL TRANSFER - ALL CALLS [C-11] feature.

Service Conditions

1. Calls that are being processed or are in the hold state when the night mode is entered, continue being processed or held after the mode changeover has been completed.
2. If the NIGHT CONNECTION - FIXED Station, to which an Incoming Call has been directed is busy, the Calling Party will hear Ringback Tone until the Station becomes idle.
3. This feature may be provided with NIGHT CONNECTION - FLEXIBLE [N-2] and TRUNK ANSWER FROM ANY Station [T-8] in the same system.
4. If the NIGHT CONNECTION - FIXED Station is set for CALL FORWARDING - ALL CALLS [C-5], Incoming Central Office Trunk Calls terminated to that Station will be forwarded to the designated Station.
5. Programmed NIGHT CONNECTION - FIXED Stations can use CALL HOLD [C-6], CALL TRANSFER [C-10, 11] and THREE-WAY CALLING [T-2] provided these features are programmed into its CLASS OF SERVICE - INDIVIDUAL [C-15].
6. Only Ringdown (COT) Incoming Calls will be routed to NIGHT CONNECTION - FIXED Stations.
7. If an Incoming Call has terminated to a NIGHT CONNECTION - FIXED, and if the Station is busy or in LINE LOCKOUT [L-3], the call will be forwarded to the TRUNK ANSWER FROM ANY STATION (TAS) [T-8] unit, if equipped.
8. When activating this feature within an FCCS Network, the different destination for Central Office Incoming Calls (Ringdown) cannot be set at each Tenant Group.

Interactions

1. The Night Station is assigned to each Trunk, and the same NIGHT CONNECTION - FIXED [N-1] can be assigned to several Trunks.
2. All Trunks to be terminated at the NIGHT CONNECTION - FIXED Station must be programmed in ACSI. Refer to DIRECT-IN TERMINATION [D-7] for more information on DITs.
3. The system must enter Night mode. Refer to ATTENDANT CONSOLE [A-3] and DAY/NIGHT CLASS OF SERVICE [D-15].
4. The Attendant Console must first be provided.

5. When the NIGHT CONNECTION - FLEXIBLE [N-2] feature is provided, assignments can be made by the ATTENDANT CONSOLE [A-3] or NIGHT CONNECTION - FIXED Station by use of the CALL FORWARDING - ALL CALLS [C-5] feature.
6. CALL FORWARDING - BUSY LINE/DON'T ANSWER [C-2, 3]: A Night Station user can activate the CALL FORWARDING - BUSY LINE/DON'T ANSWER [C-2, 3] feature if available to the user. A call ringing at an idle NIGHT CONNECTION - FIXED Station rings for 30 seconds before forwarding. A call forwarded from a busy NIGHT CONNECTION - FIXED Station rings normally at the designated Station. A Station-to-Attendant Call cannot be forwarded to a NIGHT CONNECTION - FIXED Station. An Incoming Trunk Call forwarded from an idle unanswered NIGHT CONNECTION - FIXED Station alerts the designated Station with distinctive ringing.
7. CALL WAITING [C-12, 13]: Call Waiting Tones are not directed to a busy NIGHT CONNECTION - FIXED Station. When the Night Station user goes on-hook, ringing is returned if a call is waiting.
8. CALL TRANSFER - ALL CALLS [C-11]: When the NIGHT CONNECTION feature is active, the CALL TRANSFER - ALL CALLS [C-11] feature is always enabled, regardless of the Class of Service of the Station on which this feature is enabled.
9. STATION MESSAGE DETAIL RECORDING (SMDR) [S-10]: The SMDR records contain Night Service Calls. The SMDR Call record includes the Station Number answering the call.
10. Incoming Restricted Line: When this feature or NIGHT CONNECTION -FLEXIBLE [N-2] is active, the line Class of Service restrictions can be automatically changed when the system is in the Night mode, to allow a Station normally restricted during the day to receive Incoming Calls.
11. NIGHT CONNECTION - FIXED [N-1]: Arrangements are provided to route calls normally directed to the Attendant, to a preselected Station Line within the system when Night service is activated. In addition, Incoming Calls from specific non-Direct Inward Dialing (DID) exchange network Trunks can be programmed to route to specific Station Lines. The routings are provided on a fixed basis via the PCPro. TRUNK ANSWER FROM ANY STATION (TAS) [T-8], when available, may also be provided for Night Calls not assigned to Night Stations. Assignments can be made per Incoming Trunk.
12. When CALL FORWARDING - ALL CALLS [C-5] or CALL FORWARDING - BUSY LINE/DON'T ANSWER [C-2, 3] is provided, and the Station is busy, Call Forwarding is implemented on the Station Line. If the Station is in a HUNT GROUP [S-7, 8, 9], Call Forwarding will take place prior to the Station hunting feature or UCD [U-1].
13. CALL QUEUING [C-9]: Incoming Trunk Calls to the Night Connection Station will queue on a First In/ First Out basis.
14. CLASS OF SERVICE - INDIVIDUAL [C-15]: Night Connection Station's class of service should be constructed to allow access to the routes and features required to complete the tasks of the Night Connection Station.
15. DIRECT INWARD DIALING [D-8]: Only Listed Directory Number DID Calls (as assigned in the ALDN command) will be directed to the Night Connection Station. All DID Trunks must be programmed to the Night Connection Station via the ACSI command.
16. When system is in the Night mode of operation, Incoming Calls are directed in the following order:

NIGHT CONNECTION - FLEXIBLE	[N-2]
NIGHT CONNECTION - FIXED	[N-1]
TAS	[T-8]

17. When this feature is enabled, the Day/Night switching feature of DAY-NIGHT MODE STATUS -D - II [D-164D - II] is not available.
    On the other hand, the Day/Night mode status display feature of DAY-NIGHT MODE STATUS -D - II [D-164D - II] is available.
18. This feature is not available when DAY-NIGHT MODE STATUS -D - II [D-164D - II] is enabled.

Programming

STEP 1: **ASYD** - System Data 1, Index 147. DIT supervisory timer for a busy Station. How often will the CPU look at the Idle/Busy status of the Station for rerouting the DIT Call to the destination? Always leave this Index as 00H.

For NIGHT CONNECTION-FIXED Only.

STEP 2: **ACSI** - Assign External Route Number, Trunk Number, Connection Service Index of "4" for NIGHT CONNECTION-FIXED, and the Tenant Number and Station Number to serve as the NIGHT CONNECTION-FIXED Station.

STEP 3: **ACFR** - Allow a Transfer Service Feature Index of 2, NIGHT CONNECTION-FIXED, for the types of Incoming Calls listed in Call Class Index (CCI).

STEP 4: **ALDN** - Assign the following data:

TN: TN number
LDN: LDN number
TYPE 1: "To Station"
TYPE 2: "To Outside
TYPE 3: "To ADC"
DC: Destination Code (used when Type = 2)
ADC: Abbreviated Digit Code (used when Type = 3)

STEP 5: **ASPD** - Necessary when using ADC.

TN: Tenant Number
ADC: Abbreviated Digit Code
CD: Called Number

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

Note: The following data should also be set in addition to the above-mentioned commands. The command to be set to the Node accommodating the COT: ASYD/ACFR.

ACSIL - This command must be assigned to the Node accommodating the COT. Assign External Route Number/Logical Route Number (RT/LGRT), Trunk Number (TK), and Connection Service Index (CSI) = 4 for DIT activated in Night mode. Then assign the User Group Number (UGN) and Telephone Number (TELN) to serve as the NIGHT CONNECTION - FIXED Station.

N-2 Night Connection - Flexible

General Description

This feature provides arrangements to Route Calls, usually directed to the ATTENDANT CONSOLE [A-3], instead to a preselected Station on a flexible, assignable basis within the system, when the Night Mode has been entered.

Operating Procedure

1. Answering the operation is the same as that for NIGHT CONNECTION - FIXED [N-1].
2. Each evening, before placing the ATTENDANT CONSOLE [A-3] into the Night Connection mode, the Attendant programs CALL FORWARDING - ALL CALLS [C-5] from the fixed NIGHT CONNECTION - FIXED Station to the desired Station.

Service Conditions

1. The NIGHT CONNECTION - FLEXIBLE Station may be programmed from either the ATTENDANT CONSOLE [A-3] or the NIGHT CONNECTION - FIXED [N-1] Station. Refer to CALL FORWARDING - ALL CALLS [C-5] for details.
2. NIGHT CONNECTION - FLEXIBLE: Arrangements are provided to Route Calls, normally directed to the Attendant, to a preselected Station Line within the system when Night service is activated. Additionally, Incoming Calls from specific non-DID exchange network Trunks can be arranged to route to the specific Station Line. The routings can be assigned on a flexible basis by the Attendant or NIGHT FIXED Station by use of the Call Forwarding feature and remain in effect until changed. For this feature to function, a NIGHT CONNECTION - FIXED Telephone Number must be assigned to the Trunk via the PCPro. In the event of a power failure, the assignments are not lost. The TAS [T-8] answering capability is provided for Night Calls not assigned to Night Stations.
3. When activating this feature within an FCCS Network, the different destination for Central Office Incoming Calls (Ringdown) cannot be set at each Tenant Group.

Interactions

1. When this feature is enabled, the Day/Night switching feature of DAY-NIGHT MODE STATUS -D - II [D-164D - II] is not available.
   On the other hand, the Day/Night mode status display feature of DAY-NIGHT MODE STATUS -D - II [D-164D - II] is available.
2. This feature is not available when DAY-NIGHT MODE STATUS -D - II [D-164D - II] is enabled.

Programming

STEP 1: **ACSI** - NIGHT CONNECTION-FLEXIBLE is a combination of CALL FORWARDING-ALL CALLS [C-5] and NIGHT CONNECTION-FIXED [N-1] features.

STEP 2: **ASFC** - CLASS OF SERVICE-INDIVIDUAL [C-15]: The Station chosen as the Night Connection-Flexible Station should be assigned a CLASS OF SERVICE-INDIVIDUAL [C-15] capable of performing the Night Station functions.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

ACSIL - This command must be assigned to the Node accommodating the COT. Assign External Route Number/Logical Route Number (RT/LGRT), Trunk Number (TK), and Connection Service Index (CSI) = 4 for DIT activated in Night mode. Then assign the User Group Number (UGN) and Telephone Number (TELN) to serve as the DIT Station.

N-3 Non-delay Operation

General Description

This feature allows the ATTENDANT CONSOLE [A-3] to place any Calling Party on hold, dialing the call, and connecting the Calling and Called Parties.

Operating Procedure

To operate

1. The Attendant answers an Operator Call by pressing the ANSWER or ATND key.
2. Press the START key.
3. Dial the exchange network Access Code.
4. Dial the desired Telephone Number.
5. Press the RELEASE key.
6. The parties are connected.

Service Conditions

1. The Attendant may terminate the Connection either before or after the Called Station answers.
2. There is no AUTOMATIC RECALL [A-8] for Station-to-Trunk and Trunk-to-Trunk Calls when the Called Party does not answer.
3. If the Station is restricted, the Attendant will receive a Reorder Tone when attempting to establish a Central Office Connection.
4. When the PASSING DIAL TONE [P-2] feature is provided, and the Attendant has accessed an Outgoing Trunk, the call may be released from the ATTENDANT CONSOLE [A-3], and the user is allowed to complete dialing.
5. This feature allows the Attendant to place an Outgoing Call for a Station user who reached the Attendant via a dial “0” call without requiring the Station user to hang up.
6. The Attendant can dial the Called Number for the Station user, or using the PASSING DIAL TONE [P-2] feature, allow the Station user to complete the dialing.
7. A call can be transferred to a Trunk in the Remote Node via FCCS link.
8. When an Attendant Console receives a release signal including inband information from C.O. line (ISDN trunk or MC&MG-COT/MG-COT), the release timing of the ISDN trunk (or MC&MG-COT/MG-COT) differs depending on whether the Calling Party is released from the connection or placed on hold.

    - When an Attendant Console receives a release signal from C.O. line after the Calling Party releases the connection, the Attendant Console hears inband information such as a Reorder Tone (ROT). Then, the ISDN trunk (or MC&MG-COT/MG-COT) is released when the Attendant Console presses the RELEASE key or receives a release signal indicating the end of inband information after 30 seconds.

    - When an Attendant Console receives the release signal from C.O. line before the Calling Party releases the connection, the ISDN trunk (or MC&MG-COT/MG-COT) is released upon the reception of the release signal.

Interactions

1. The Attendant Console can seize the Dial Tone and dial an outgoing number for any Station in the system. The Attendant Console cannot pass an unrestricted Dial Tone to any Station. See PASSING DIAL TONE [P-2] for more information.
2. The Attendant Console must first be provided.

Programming

STEP 1: **ARSC** - Construct a Route Restriction Class (RSC) that will allow outgoing access to various routes using the Route Restriction Index (RRI) 2 through the Attendant Console.

STEP 2: **ASDT** - Assign a Route Restriction Class (RSC) that allows outgoing access to the various routes via the Attendant Console to the Station.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

ARSCN - Construct a Route Restriction Class (RSC) that will allow outgoing access to various routes using the Route Restriction Index (RRI) 2 through the Attendant Console.

N-7D Non-exclusive Hold -D

General Description

This feature permits a Desktop terminal user to HOLD a call in progress. To retrieve a Held Call, press the flashing line key on a Desktop terminal.

Note: Executable from any Desktop terminal with the multi-line appearance of the station that put the call on hold.

Hold Fixation Mode is also available for retrieving a Held Call. Using this feature, a Held Call can be retrieved by simply lifting the handset or pressing the HOLD key on the Desktop terminal. When DT750 is operating in XML Fixed mode, use this feature.

Note: Executable only from the Desktop terminal that placed the call on hold.

Operating Procedure

To place a call on HOLD,

1. While a call is in progress with an office line, a tie line, or a station line, press the HOLD key.

To retrieve the Held Call,

1. Press the Line key (flashing) to retrieve a call.
2. Retrieve the Held Call.

- In Hold Fixation Mode;

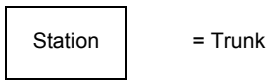
1. Lift the handset if it is on hook, or press the HOLD key on a Desktop terminal if the handset is off-hook.
2. Retrieve the Held Call.

To answer the Automatic Recall [A-8],

1. When an Automatic Recall Timer expires, the Desktop terminal which put the call on hold is recalled.
2. Press the Line key (flashing) to retrieve a call.
3. Retrieve the Held Call.

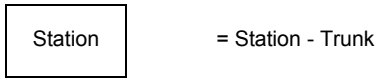
- In Hold Fixation Mode;

1. When an Automatic Recall Timer expires, the Desktop terminal which put the call on hold is recalled.
2. Press the HOLD key on a Desktop terminal, or lift the handset.
3. Retrieve the Held Call.



Service Conditions

1. Any Desktop terminal displaying the Held Line can seize the Held Call.
2. AUTOMATIC RECALL [A-8] is directed only to the Station that placed the call on Hold.
3. The Station initiating HOLD will receive a distinctive I-HOLD INDICATION [I-7D].
4. A two-party Hold is available when a Desktop terminal is engaged in a Three-party Conference with a Station and/or Trunk. An EXECUTIVE RIGHT-OF-WAY [E-1] Call cannot activate a two-party Hold.
5. When two parties are put on Hold, features such as EXECUTIVE RIGHT-OF-WAY [E-1], ATTENDANT OVERRIDE [A-7], CALL WAITING - ORIGINATING [C-31], CALL WAITING - TERMINATING [C-12], BUSY VERIFICATION [B-3] and ATTENDANT CAMP-ON [A-1], cannot be activated to the busy line.
6. The two held parties remain connected and can talk to each other. MUSIC ON HOLD [M-7] is not activated.



7. The two held parties cannot be placed on EXCLUSIVE HOLD [E-3D] by the Desktop terminal user.
8. If one of the two held parties is released from the Connection, MUSIC ON HOLD [M-7] will be activated on the remaining Connection. When the holding party returns to the Connection, a two-party Connection is established.
9. If the Sub Line Appearance placed in the NON-EXCLUSIVE HOLD condition is assigned to a Single Line Telephone, the Single Line Telephone can retrieve the Held Call by lifting the handset.
10. This feature operates when the Desktop terminal Station has been put in CONSULTATION HOLD by the other party.
11. This feature is available when a Station is in the following states, where "=" means a path and "-" means music on hold:
    a.) when a Station has a path to another Station:

    b.) when a Station has a path to a Trunk:

    c.) when a Station has a path to a Station that has a Trunk held by MUSIC ON HOLD [M-7] for CONSULTATION HOLD - ALL CALLS [C-17]:

    d.) when a Station has a path to a Station that has a Station held by MUSIC ON HOLD [M-7] for CONSULTATION HOLD - ALL CALLS [C-17]:

    e.) when a Station has a path to two Trunks at one time for THREE-WAY CALLING [T-2]:

    f.) when a Station has a path to a Trunk and a Station at one time for THREE-WAY CALLING [T-2]:

12. This feature is not available when a Station is in the following states:
    a.) when a Station has a path to a Trunk and a Trunk held by MUSIC ON HOLD [M-7] for CONSULTATION HOLD - ALL CALLS [C-17]:

    b.) when a Station has a path to two Stations at one time for THREE-WAY CALLING [T-2]:

13. This service is available when a call with a station or a trunk is in progress; a call cannot be placed on HOLD while it is ringing, or talking with a console.
14. When both CALL PARK GROUP - D [C-176] and this service are assigned, CALL PARK GROUP - D has the higher priority.

15. When the held party is an IP terminal and the connection with the party is disconnected due to the accidents such as network failure or unplugging of cables, the lamp of the Line key on the Desktop terminal that held the call keeps flashing. If a user of this Desktop terminal tries to retrieve the call in this condition, dial tone is heard and the lamp of the Line key will stop flashing and turn on.

- Conditions for Hold Fixation Mode;

1. If a call terminates at a Sub Line while My Line is using this service, the call cannot be answered; likewise, if a call terminates at My Line while a Sub Line is using this service, the call cannot be answered.
2. When a station puts a call on HOLD using this service, it cannot perform any other operations than answering the Held Call (pressing the HOLD key on the Desktop terminal or lifting the handset).
3. This service is available with conference call (8/16/32 parties), but not with THREE-WAY CALLING [T-2].
4. It takes about a second from lifting the handset to seizing the call.
5. CALL HOLD [C-6] and this service can be used at the same time.
6. EXCLUSIVE HOLD-D [E-4D] and this service cannot be used at the same time.
7. When collaborating with softphones, this service is not available.
8. To assign this service while the system is in operation, perform the following operations after data setting.
    - IP Terminals: Re-registration
    - Legacy Terminals: Initialization of ELC circuit cards
9. This service is available at the following terminals.

IP Station		Digital Terminal
IP Terminal	SIP Terminal	
DtermIP (Proprietary Protocol)	DtermIP (SIP)	Dterm Series *i*
	DT800/DT700 Series	DT400/DT300 Series

10. One of the ELC cards listed below is required for this feature.

ELC Card	Firmware Requirements
CH-16ELCA	SP-4035 16ELCA PROG-A Version 1 or later.
PA-16ELCN	SP-3956 16ELCN PROG-A Version 1 or later.
PA-16ELCN-A	SP-4013 16ELCN-A PROG-A Version 1 or later.

Programming

STEP 1: **ASYD** - System Data 1, Index 144. Recall timer for NON-EXCLUSIVE HOLD. Assign data 00H for 30 seconds. ROM default data is 3FH.

System Data 2, Index 12, Bit 0. Is Automatic Recall Ringing for NON-EXCLUSIVE HOLD provided on a per Tenant basis? 0/1: Yes/No.

- In Hold Fixation Mode;

STEP 1: **ASFC** (Service Feature Restriction Class Data) - SFC: 0-15, SFI=254 (Hold Fixation Mode), RES=1 (Telephone call by the hold key during holding.)

STEP 2: **ASYD** - System Data 1, Index 64, Bit 7. Music-on-Hold Service. 0/1 = Out of service/In service.

System Data 1, Index 144. Recall timer for NON-EXCLUSIVE HOLD. Assign data 00H for 30 seconds. ROM default data is 3FH.

System Data 2, Index 12, Bit 0. Is Automatic Recall Ringing for NON-EXCLUSIVE HOLD provided on a per Tenant basis? 0/1: Yes/No.=1.

N-8D Non-square Line Assignment -D

General Description

This feature allows the specific keys on the Desktop terminal set to be freely assigned as Line keys or as Feature keys. These assignments are done on a per-Station basis.

Operating Procedure

Key designations are assigned via the PCPro.

Service Conditions

Programming one feature to more than one key will not provide enhanced service. For example, two MSG keys will not provide a Dterm set with eight message memories. See MESSAGE REMINDER [M-19].

Programming

STEP 1: **ASDT** - LENS equipped with a Desktop terminal Circuit Board must be assigned a Station Number and a Telephone Equipment Class (TEC) of 12.

STEP 2: **AKYD** - Assign a MY Line, a Prime Line, and various Sub Lines to the Dterms.

→TN: 1

→STN: Station Number

TP: Type of Dterm 0/1:

→RING: Assign ringing to the entire phone

0: No Ringing, Day or Night.
1: Ring Day.
2: Ring Night.
3: Not Used.
4: Ring Day & Night, 30 second delay.
5: Ring Day & Night, 20 second delay.
6: Ring Day & Night, 10 second delay.
7: Ring Day & Night, no delay.

PL TN STN:Prime Line Tenant and Station Number

KYN: Key Number (1-40)

KYI: Service Index

0: Key Not Used
1: Feature Key
→ 2: Multi Line Key

KD: Not assigned for Feature Key

TN STN:Tenant Number and Station Number of Multi Line

RG: Ringing Assignment per Multi Line Appearance
0: No Ringing, Day or Night.
1: Ring Day.
2: Ring Night.
3: Not Used.
4: Ring Day & Night, 30 second delay.
5: Ring Day & Night, 20 second delay.
6: Ring Day & Night, 10 second delay.
7: Ring Day & Night, no delay.

Any combination of available System Station Numbers may be assigned to the keys of the Desktop terminal instruments. There are no restrictions on order of Multi Line Appearance. Line Appearances may be arranged in any fashion, provided they are located within the same Module Group.

N-17 Night Connection Outside - System

General Description

This is a night transfer service on a system basis, enabling a ring-down or LDN Call to be transferred to a preselected Station Outside the System when night mode has been set.

Operating Procedure

1. The Attendant sets night mode. (Night key, PB, Handset Extraction, MB).
2. A ring-down or LDN Call terminates from a Trunk.
3. The call is transferred to the Outside Party in accordance with NIGHT CONNECTION OUTSIDE - System Data.

Service Conditions

1. The priority of this service is higher than TRUNK ANSWER FROM ANY Station (TAS) [T-8] service but lower than DIRECT-IN TERMINATION (DIT) [D-7] and NIGHT CONNECTION - FIXED [N-1] services. Thus, if DIT [D-7] and NIGHT CONNECTION - FIXED [N-1] are set, this service is not activated.
2. If the terminating side is a ring-down Trunk, a Release Signal cannot be received after communication is established. Therefore, the Trunk to which the call is transferred must be capable of sending back a Release Signal.
3. Tandem restriction is applied to this feature.
4. This service cannot be used in combination with CONSECUTIVE SPEED CALLING [C-62] service.
5. The Call Transfer Destination can be fixed on a per Tenant basis.

FCCS Conditions

1. This feature is available via FCCS. An Incoming Trunk Call (Ring-down or LDN Call) can be transferred to a preselected Outside Party via FCCS link.
2. This service is available for the Incoming Trunk Call (Ring-down or LDN Call).
3. The feature data via DM, LDM and NDM can coexist in a system. However, data registered on NDM has top priority. Data registered on LDM has precedence over data registered on DM. (Priority: NDM → LDM → DM)
4. When using this feature via FCCS link, only one Call Transfer destination can be registered, in a system.

Programming

STEP 1: **ASYD** - System Data 1, Index 77, Bit 0, DAY/NIGHT mode Changeover via handset jack 0/1: Not Required/Required.

STEP 2: **ALDN** - Assign LDN, allow night transfer, assign TYPE = 3, and the ADC number assigned in ASPD.

STEP 3: **ASPD** - Assign Abbreviated Digit Code (ADC) and Access Code to the dialed (000-999). This step is required only if the Access Code and Outside Number are greater than eight digits.

STEP 4: **ACFO** - Assign Call Forwarding Data, CF = 4: Night Connection, and the ADC assigned in ASPD.

STEP 5: **ARRC** - Allowing Incoming Route to outgoing route. Use Alternative Route Index (ARI-D-RES) for Direct Connection. Three possible restrictions (RES) may be assigned: data "0" = Connection is restricted; data "1" = Connection is allowed; or data "2" = toll restriction is required. For NIGHT CONNECTION-OUTSIDE-SYSTEM, toll restriction is not required.

STEP 6: **ACFR** - Assign Transfer Service Feature Index (TSFI) = 2: Direct In Termination Night Only, to be allowed CCI: 1 (LDN). This allows LDN to go to Night transfer destination. Assign TSFI: 5 (TAS) to be allowed CCI: 1 (LDN). This allows LDN to go to TRUNK ANSWER ANY STATION (TAS).

FCCS Programming

This feature is available via FCCS link. Data assignment shown below is required.

STEP 1: **ASYD** - System Data 1, Index 77, Bit 0, DAY/NIGHT mode Changeover via handset jack 0/1: Not Required/Required.

STEP 2: **ALDNN**- Assign LDN, allow night transfer, assign TYPE = 3, and the ADC number assigned in ASPD.

STEP 3: **ASPD** - Assign Abbreviated Digit Code (ADC) and Access Code to the dialed (000-999). This step is required only if the Access Code and Outside Number are greater than eight digits.

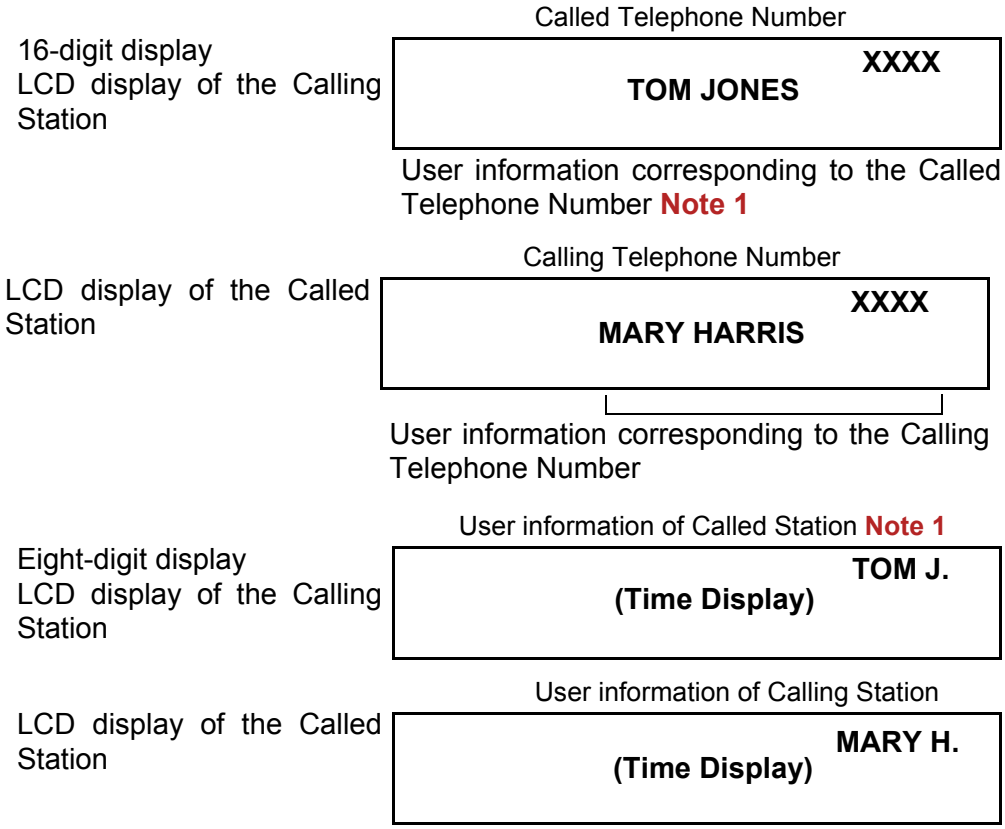
STEP 4: **ACFOL/ACFON** - User Group Number, UGN = 1 (Fixed), Call Forwarding Service, CF = 4 (Night Connection Outside), Abbreviated Digit Codes, ADC: Assign the abbreviated digit codes (ADC) and the speed dial number that are assigned by the ASPD command.

STEP 5: **ARRCN** - Allowing Incoming Route to outgoing route. Use Alternative Route Index (ARI-D-RES) for Direct Connection. Three possible restrictions (RES) may be assigned: data “0” = Connection is restricted; data “1” = Connection is allowed; or data “2” = toll restriction is required. For NIGHT CONNECTION-OUTSIDE-SYSTEM, toll restriction is not required.

STEP 6: **ACFR** - Assign Transfer Service Feature Index (TSFI) = 2: Direct In Termination Night Only, to be allowed CCI: 1 (LDN). This allows LDN to go to Night transfer destination. Assign TSFI: 5 (TAS) to be allowed CCI: 1 (LDN). This allows LDN to go to TRUNK ANSWER ANY STATION (TAS).

N-28 Name Display - System

General Description



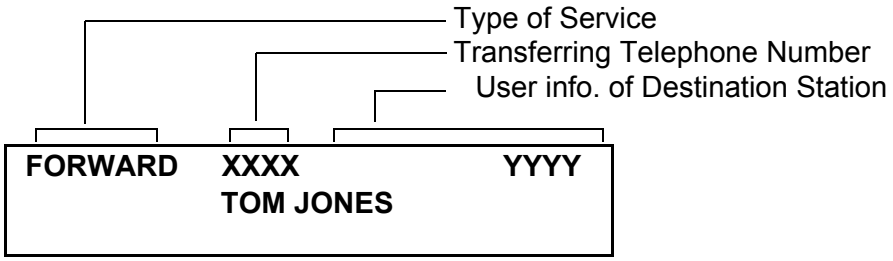
This feature allows a Desktop terminal with LCD display to indicate the user information corresponding to the Calling Telephone Number while engaged in STATION-TO-STATION CALLING [S-11].

Operating Procedure

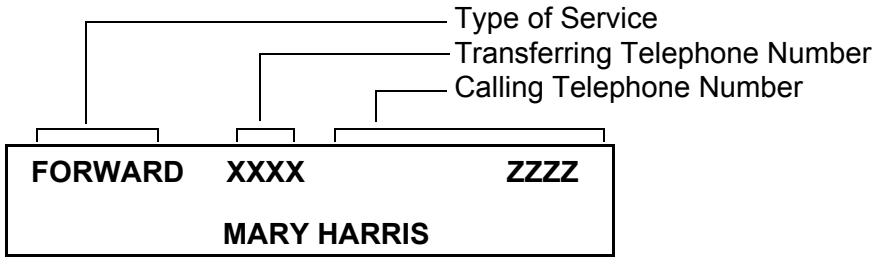
Examples of LCD display are shown below.

Note: These examples below are only for Desktop Terminals and DESKCON.

1. When originating a Station-to-Station Call:

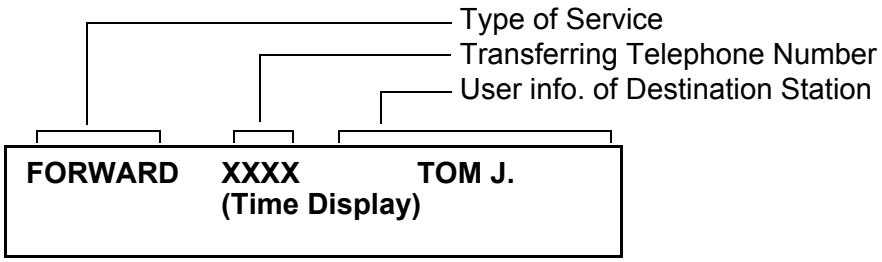


Note: The user information on the LCD flashes until the call is answered.

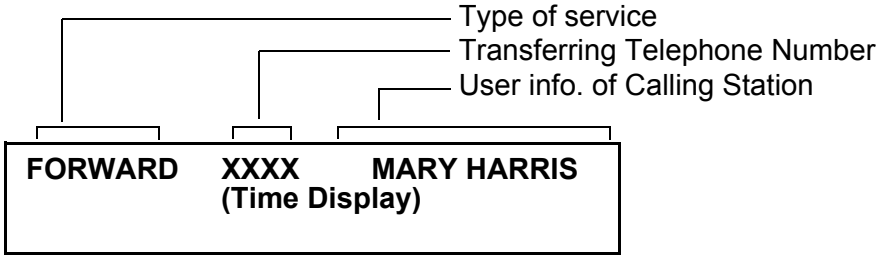


Note 1: When the called party is busy or restricting incoming calls, the called user name is generally not displayed on the calling party's LCD.

2. When a Station Call has been forwarded to another Station by CALL FORWARDING - ALL CALLS [C-5]/ BUSY LINE [C-2]/DON'T ANSWER [C-3]:



16-digit display
LCD display of the Calling Station



LCD display of the Destination Station

Eight-digit display
LCD display of the Calling Station

LCD display of the Destination Station

Note: The user information on the LCD flashes until the call is answered.

3. When both the Calling/Called Station are released from a Station-to-Station Call, the LCD of the Calling/ Called Station displays:

Service Conditions

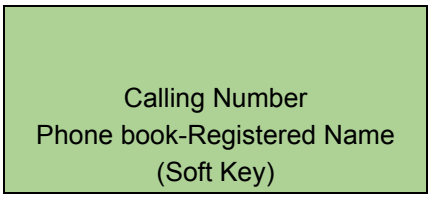
1. This service is available when either of the Calling/Called Station is a Desktop terminal, with an LCD display.
2. By this service, ASCII character data can be displayed.
3. User information corresponding to the Telephone Number that can be displayed on the LCD is a maximum of 16 digits. The information displayed may consist of upper case letters, numeric characters, and most keyboard symbols.
4. Do not use both NAME DISPLAY assigned by the ANDD command and the one assigned by OAI Service (FLF) at same time. When NAME DISPLAY is assigned by the OAI Service (FLF), NAME DISPLAY using the ANDD command cannot be assigned.
5. Eight-digit display or 16-digit display is selectable by System Data, but cannot be used concurrently.
6. 16-digit display:
   a.) When ASYD, System Data 1, Index 390, Bit 2 is 0, the following occurs:

   - User information is displayed for My Line only.
   - User information cannot be displayed for Multi Line that specifies an identical Station Number for the Prime Line.

   b.) User information is displayed on the middle line of LCD, beginning on the 9th segment from the left. When the information is less than 16 digits, the unused segments are left blank. The information cannot be displayed on the upper line of LCD.
7. Eight-digit display of Desktop terminal:
   a.) User information is displayed on the upper line of LCD, beginning on the 17th segment from the left. When the information is less than eight digits, the unused segments are left blank.
8. If the Station has no name programmed for Name Display Service, the Telephone Number is repeated in the name field.
9. User information will not be guaranteed when 16-digit display service is changed to 8-digit display service.
10. When Telephone Number has been changed to a new one, the Telephone Number and user information to be displayed cannot be guaranteed. Therefore, System Data assignment must be properly managed.
11. User information may be assigned to all Sub Lines of a Desktop terminal.
12. The Name Display data stored on the hard disk is loaded to the memory at the time of system initialization (including power on) or when the Office Data load initialization is requested by PCPro command or the keys on the TOPU.
13. The Name Display data is backed up to the hard disk at the time of routine diagnosis.
14. If there is a difference between the contact name registered on the Phonebook of the Desktop terminal and the user name registered on the system by the ANDD command, the contact name on the Desktop terminal will be prioritized to display.
15. When the number of digits displayed in the Name Display Service is set to 16 digits by ASYD, System Data 1, Index 241, b1=1, the unused segments between the end of the name information to the 16th digit will be complemented with spaces if the name information registered on the system by the ANDD command is less than 16 digits.
16. When the number of digits displayed in the Name Display Service is set to 16 digits by ASYD, System Data 1, Index 241, b1=1 and the Calling number has priority for Caller ID display pattern on the LCD by ASYD, System Data 1, Index 390, b0=1, the name information with an asterisk (*) indicated on the 8th digit position will be displayed.

17. When Calling Name has priority to be displayed on the LCD (set by ASYD, System Data 1, Index 390, b0=0), and the Telephone Number has more than eight digits, the LCD displays Calling Number and intermediate number sequentially. To avoid this, set the data as follows;

    - Make the Telephone Number seven digits.
    - Do not display the intermediate number.



18. When the telephone number of outgoing call, incoming call, and ongoing call have been registered to the Phonebook of the Desktop terminal [DT820/DT750/DT830/DT730/DT830G/DT730G], the contact name registered to the Phonebook will be displayed. If the number has not been registered to the Phonebook of the Desktop terminal, or if the Desktop terminal does not have a Phonebook [DT710], the information about number and name provided by the system is displayed on the same line of the LCD where registered information is displayed.

    (a) The opposite party name can be displayed in the following four patterns by setting the system data [ASYDL - Sys 1, Index 673].

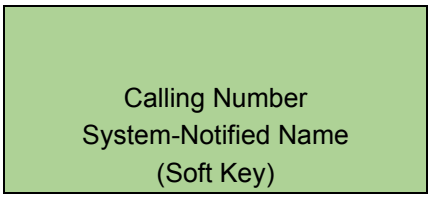
    Note: The DT820/DT710 that uses a three-lines in LCD including one line for the Soft key displays the name information in one line higher than that of the DT750/DT830/DT730/DT830G/DT730G.

    - Pattern 1: ASYDL - Sys 1, Index 673, Bit 1=0, and Bit 0=0.

      The contact name registered to the Desktop terminal Phonebook is displayed on the third line on the LCD of the DT750/DT830/DT730/DT830G/DT730G and on the second line on the LCD of the DT820/DT710.

    - Pattern 2: ASYDL - Sys 1, Index 673, Bit 1=0 and Bit 0=1.

      The contact name registered to the Desktop terminal Phonebook is displayed on the second line on the LCD of the DT750/DT830/DT730/DT830G/DT730G and on the first-line on the LCD of the DT820/DT710.



- Pattern 3: ASYDL - Sys 1, Index 673, Bit 1=1 and Bit 0=0.

  The contact name registered to the Desktop terminal Phonebook is displayed on the fourth line on the LCD of the DT750/DT830/DT730/DT830G/DT730G and on the third line on the LCD of the DT820/DT710.

- Pattern 4: ASYDL - Sys 1, Index 673, Bit 1=1 and Bit 0=1.

  The contact name registered to the Desktop terminal Phonebook is not displayed.

(b) Contact name registered to the Terminal Phonebook is preferentially displayed over the user name retrieved from the system. However, in rare cases, if there is a discrepancy between user name from the system and contact name in the Terminal Phonebook, the user name may be briefly shown prior to the display of the contact name.

(c) When the pattern 3 is set to display the name information, the soft key cannot be used regardless of the Desktop terminal state.

(d) The maximum digits to display the system-provided name information is as follows.

- Opposite Party Number: Maximum 24 digits

  Note: Depending on the setting of the system data [ASYD - Sys 1, Index 241, Bit 6], either the beginning or the end of the exceeding digits will be deleted.

- Opposite Party Name: Maximum 24 characters (single-byte)/12 characters (two-byte)

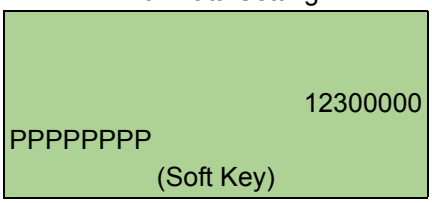
(e) When Subline is set as Prime Line, Calling Number may differ from Name (e.g. having an incoming call on Subline while receiving a call on My Line). Set My Line to the Prime Line.

(f) The opposite party information provided by the system is displayed on other lines than the Phonebook-registered name (contact name) described on (a) is displayed. As the system gives this information to My Line only, not to Subline, My Line and Subline display different information on LCD.

When a call arrives, the caller information is provided for My line. When a call is answered, the caller information is provided for the line that answers the call. Depending on the data setting, two kinds of name information may be displayed, or the number may not be displayed at all.

The following are the display patterns for each data setting for DT750/DT830/DT730/DT830G/DT730G.

Note: The system-provided name information means the [NAME] registered on the system Phonebook by the APBKN command, Name Display service by the ANDD command, and the [NAME] registered on the ACID command.



[Incoming Trunk Call]

- When the caller number and caller name are retrieved from the system.

  PPPPPPPP: Contact name registered to the Terminal Phonebook
  NNNNNNNN: Data assigned with name display service (ANDD)

  Pattern 1: ASYDL - Sys 1, Index 673, Bit 1=0 and Bit 0=0. [The contact name of the Terminal Phonebook is displayed on the third line on the LCD of the DT750/DT830/DT730/DT830G/DT730G]

  With Data Setting

  Without Data Setting

  Pattern 2: ASYDL - Sys 1, Index 673, Bit 1=0 and Bit 0=1. [The contact name of the Terminal Phonebook is displayed on the second line on the LCD of the DT750/DT830/DT730/DT830G/DT730G]

  With Data Setting

  Without Data Setting

  Pattern 3: ASYDL - Sys 1, Index 673, Bit 1=1 and Bit 0=0. [The contact name of the Terminal Phonebook is displayed on the fourth line on the LCD of the DT750/DT830/DT730/DT830G/DT730G]

  With Data Setting

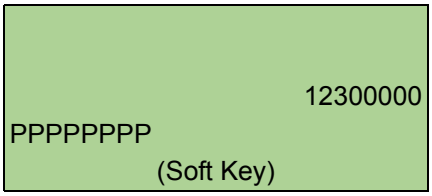
  Without Data Setting

  Pattern 4: ASYDL - Sys 1, Index 673, Bit 1=1 and Bit 0=1. [The contact name of the Terminal Phonebook is not displayed.

With Data Setting

Without Data Setting

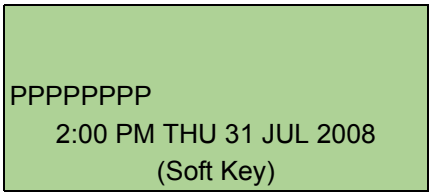


- When only the caller number is retrieved from the system.

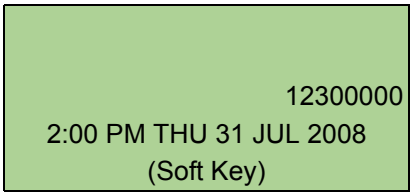
  PPPPPPPP: Contact name registered to the Terminal Phonebook
  NNNNNNNN: Data assigned with name display service (ANDD)

  Pattern 1: ASYDL - Sys 1, Index 673, Bit 1=0 and Bit 0=0. [The contact name of the Terminal Phonebook is displayed on the third line on the LCD of the DT750/DT830/DT730/ DT830G/DT730G]

With Data Setting

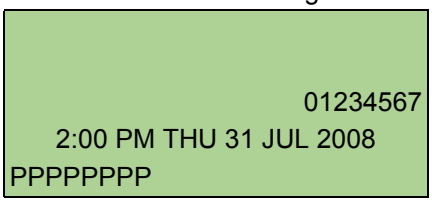


Without Data Setting

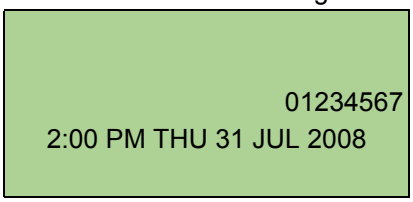


Pattern 2: ASYDL - Sys 1, Index 673, Bit 1=0 and Bit 0=1. [The contact name of the Terminal Phonebook is displayed on the second line on the LCD of the DT750/DT730/DT730G]

With Data Setting

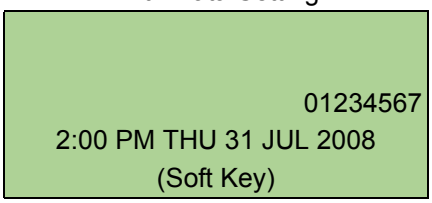


Without Data Setting

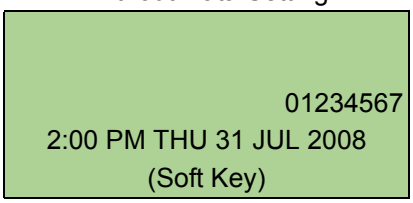


Pattern 3: ASYDL - Sys 1, Index 673, Bit 1=1 and Bit 0=0. [The contact name of the Terminal Phonebook is displayed on the fourth line on the LCD of the DT750/DT830/DT730/ DT830G/DT730G]

With Data Setting



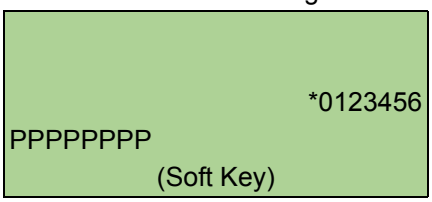
Without Data Setting



Pattern 4: ASYDL - Sys 1, Index 673, Bit 1=1 and Bit 0=1. [The contact name of the Terminal Phonebook is not displayed.]

With Data Setting

Without Data Setting



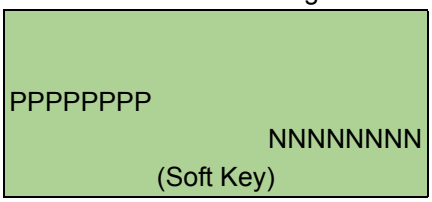
<Incoming Trunk Call from Outside>

- When the caller number and caller name are retrieved from the system with the system data [ASYD - Index 390, Bit 0=0].

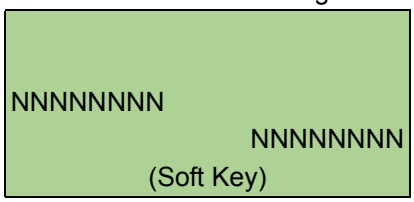
  PPPPPPPP: Contact name registered to the Terminal Phonebook
  NNNNNNNN: Caller ID (ACID)

  Pattern 1: ASYDL - Sys 1, Index 673, Bit 1=0 and Bit 0=0. [The contact name of the Terminal Phonebook is displayed on the third line on the LCD of the DT750/DT830/DT730/DT830G/DT730G]

With Data Setting

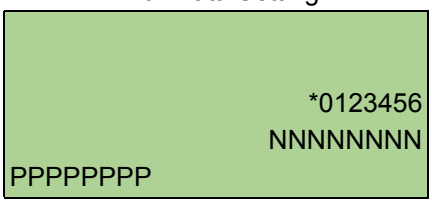


Without Data Setting

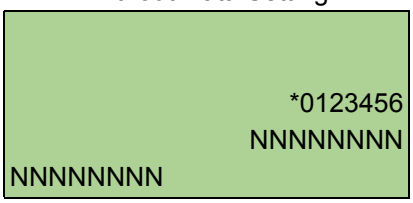


Pattern 2: ASYDL - Sys 1, Index 673, Bit 1=0 and Bit 0=1. [The contact name of the Terminal Phonebook is displayed on the second line on the LCD of the DT750/DT830/DT730/DT830G/DT730G]

With Data Setting

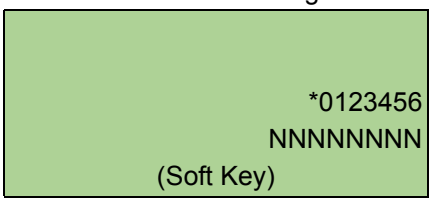


Without Data Setting

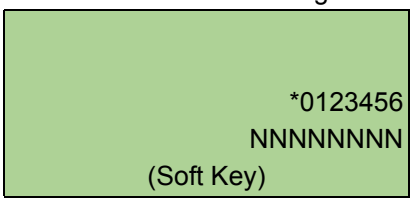


Pattern 3: ASYDL - Sys 1, Index 673, Bit 1=1 and Bit 0=0. [The contact name of the Terminal Phonebook is displayed on the fourth line on the LCD of the DT750/DT830/DT730/DT830G/DT730G]

With Data Setting



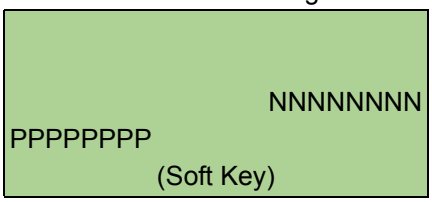
Without Data Setting



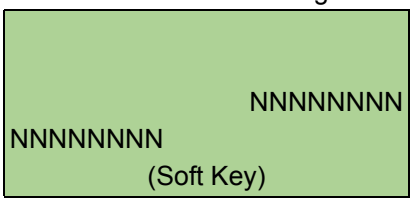
Pattern 4: ASYDL - Sys 1, Index 673, Bit 1=1 and Bit 0=1. [The contact name of the Terminal Phonebook is not displayed.]

With Data Setting

Without Data Setting



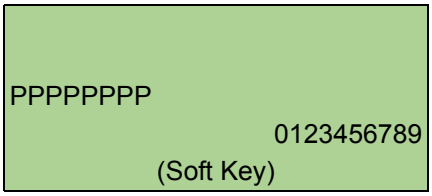
- When the caller number and caller name are retrieved from the system with the system data [ASYD - Index 390, Bit 0=1].



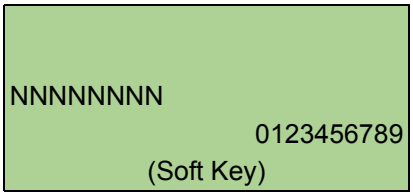
PPPPPPPP: Contact name registered on the Terminal Phonebook
NNNNNNNN: Caller ID (ACID)

Pattern 1: ASYDL - Sys 1, Index 673, Bit 1=0 and Bit 0=0. [The contact name of the Terminal Phonebook is displayed on the third line on the LCD of the DT750/DT830/DT730/DT830G/DT730G]

With Data Setting

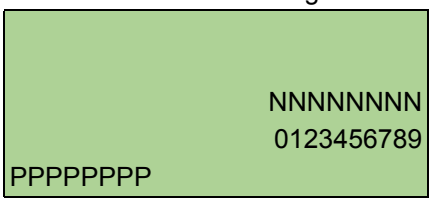


Without Data Setting

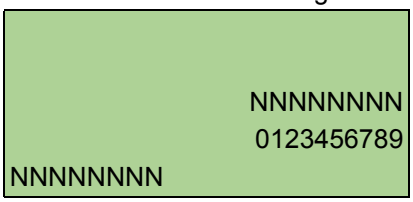


Pattern 2: ASYDL - Sys 1, Index 673, Bit 1=0 and Bit 0=1. [The contact name of the Terminal Phonebook is displayed on the second line on the LCD of the DT750/DT830/DT730/DT830G/DT730G]

With Data Setting

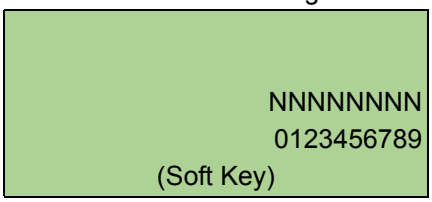


Without Data Setting

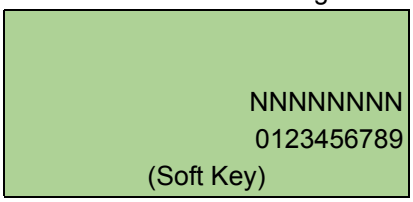


Pattern 3: ASYDL - Sys 1, Index 673, Bit 1=1 and Bit 0=0. [The contact name of the Terminal Phonebook is displayed on the fourth line on the LCD of the DT750/DT830/DT730/DT830G/DT730G]

With Data Setting



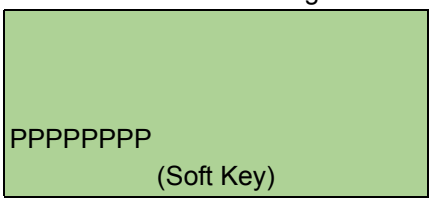
Without Data Setting



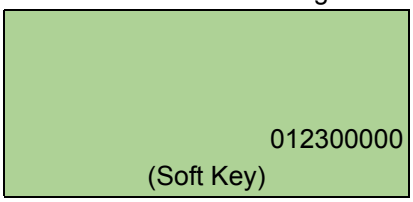
Pattern 4: ASYDL - Sys 1, Index 673, Bit 1=1 and Bit 0=1. [The contact name of the Terminal Phonebook is not displayed.]

With Data Setting

Without Data Setting



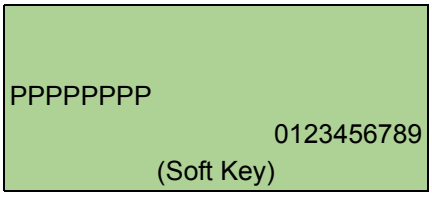
- When only the caller number is retrieved from the system with the system data [ASYD - Index 390, Bit 0=0/1].



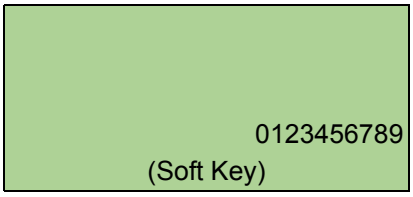
PPPPPPPP: Contact name registered on the Terminal Phonebook
NNNNNNNN: Caller ID (ACID)

Pattern 1: ASYDL - Sys 1, Index 673, Bit 1=0 and Bit 0=0. [The contact name of the Terminal Phonebook is displayed on the third line on the LCD of the DT750/DT830/DT730/DT830G/DT730G]

With Data Setting

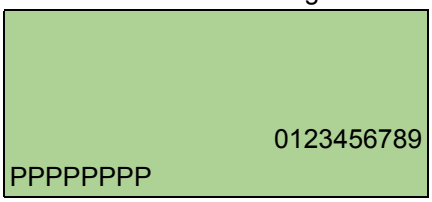


Without Data Setting

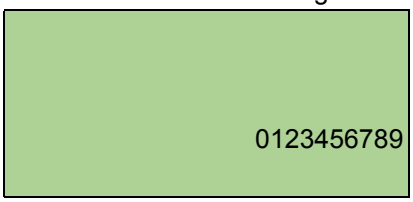


Pattern 2: ASYDL - Sys 1, Index 673, Bit 1=0 and Bit 0=1. [The contact name of the Terminal Phonebook is displayed on the second line on the LCD of the DT750/DT830/DT730/DT830G/DT730G]

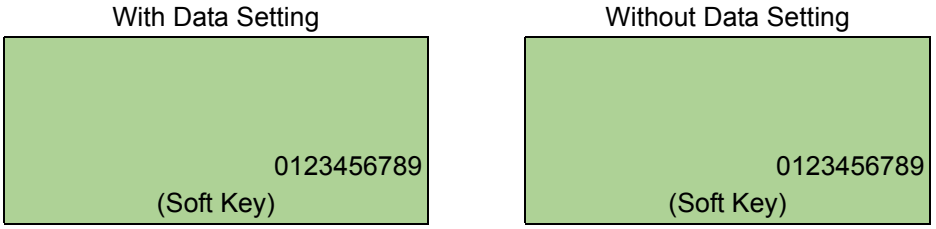
With Data Setting



Without Data Setting



Pattern 3: ASYDL - Sys 1, Index 673, Bit 1=1 and Bit 0=0. [The contact name of the Terminal Phonebook is displayed on the fourth line on the LCD of the DT750/DT830/DT730/DT830G/DT730G]



With Data Setting

Without Data Setting

Pattern 4: ASYDL - Sys 1, Index 673, Bit 1=1 and Bit 0=1. [The contact name of the Terminal Phonebook is not displayed.]

19. If a destination number is registered in the Terminal Phonebook, the registered name corresponding to the number is displayed while placing outgoing calls (hears Ringback Tone), receiving incoming calls (hears ring tone), or talking. When the status of a call while talking changes to any other status such as a call on hold, the name display is no longer available. However, in case the name display information sent from the system has been given at this time, the name is displayed.
20. When a station call coming directly from the calling party (not transferred) encounters a busy, no-answer condition due to call restriction, or lockout, the called party's name is generally NOT displayed on the calling party's LCD (**Note 2**); when a calling party manually transfers a station/trunk call, the name of the destination is displayed on its LCD.

Note 2: Despite this, some terminals (calling party) may display the called party's name.

21. When a call arrives at a SIP Handler Controlled SIP terminal which supports RFC3325 and RFC5876, Calling Name can be displayed on the SIP Handler Controlled SIP terminal (in the INVITE request message, Name Display information is given in the display-name field of the From header). However, when the connected party is changed by the transferring operation or shifting from a three-way call into a two-way call due to the disconnect of one of the three parties, the display of the connected party information depends on the standard SIP terminal. For the conditions of the display, refer to SIP HANDLER - SIP TERMINAL [S-167] of Data Programming Manual - Business.
22. Name information assigned with the NAME parameter of the ANDD command is displayed on the SIP Handler Controlled SIP terminal. Only Name Display information containing symbols and alphanumeric characters can be notified.

Programming

[For using Name Display Service]

STEP 1: **ASYD** - System Data 1, Index 78, Bit 3. Station Number with Name Display 0/1=No/Yes (only used with eight-digit display)
System Data 1, Index 78, Bit 5. Name Display Service
0/1: Out/In Service. Assign 1 (In Service).
System Data 1, Index 79, Bit 5. Name Display Enhance Service
0/1: Shows the name of the calling person on the answered phone/Shows time and date on the answered phone
System Data 1, Index 79, Bit 6, OAI Service 0/1: In Service/Out. Assign 0 (OAI is in service).
System Data 1, Index 241, Bit 1, The Number of digits displayed in Name Display Service 0/1: eight digits/16 digits
System Data 1, Index 390, Bit 2, Caller ID display on the bottom line of Desktop terminal LCD for Multiple Line
0/1: display on the bottom line (Multiple Line is not used) / display on the bottom line (Multiple Line is used)

Note: ASYD - System Data 1, Index 31. CM capacity is 04 or 06 (hexadecimal).

STEP 2: **ANDD** - Assign user's information to Station Number.

[For displaying the contact name registered to the Phonebook of DT800 Series/DT700 Series]

STEP 1: **ASYDL** - System Data 1, Index 673, Bit 0-1 (Display Location of User Information).

- In the case of DT750/DT830/DT730 Series

Bit 1	Bit 0	Description
0	0	Third Line (Recommended)
0	1	Second Line
1	0	Fourth Line
1	1	Not to display

- In the case of DT820/DT710

Bit 1	Bit 0	Description
0	0	Second Line (Recommended)
0	1	First Line
1	0	Third Line

Bit 1	Bit 0	Description
1	1	Not to display

[For using Name Display Service on the Soft Phone]

STEP 1: **ASYD** - System Data 1, Index 390, Bit 0=1 (Calling Number has priority on the Soft Phone Display)
STEP 2: **ASYDL** - System Data 1, Index 673, Bit 0-1 (Display Location of User Information)

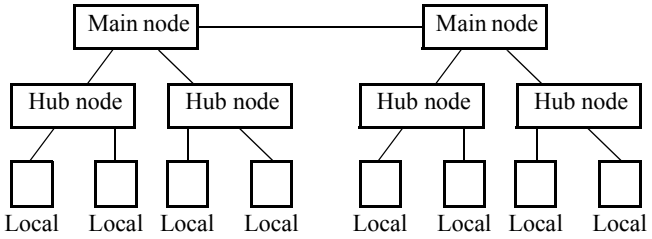
Bit 1	Bit 0	Description
1	0	Third Line
1	1	Not to display

Note: Note the following to use Name Display Service on the Soft Phone.
- Name Display information is not stored in the call history.
- Only Number Display information is stored in the call history. If a calling number registered in the Soft Phone directory is received, calling name corresponding to the received number appears on the display.
- Name Display information consists of only numerics,"*" and "#" is not supported.
- When a calling number sent from the system as a display information exceeds 16 digits, the 17th or later characters are not stored in the incoming call history.

N-41 Network Night Switching

General Description

This feature allows the Attendant Console in a Main node to operate not only station calls from the intra - offices but also calls from all nodes belonging to Main node as a Centralized Attendant.
The Attendant Console in a Hub node is normally invalid (Night mode). When backup is required because of line cutting, etc., it may be valid (Day mode) and may operate all incoming calls terminating to Attendant Consoles within the Hub node including its own office as a Centralized Attendant there.



Note: This feature is available in Australia only.

Operating Procedure

Refer to "How to Operate Attendant Console".

Service Conditions

1. Network configuration is shown below:

2. Working modes of each node are as below:
   a.) Main Day mode
   b.) Hub Night/Day mode
   c.) Local Night mode
3. Usually all incoming calls like ATND/LDN/CF calls, to Attendant Consoles in each node are handled by the Attendant Console in a Main node. However, when the Attendant Console in a Hub node is in Day mode, intra-office ATND/LDN/CF calls and incoming calls from Local Nodes are handled by the Attendant Console not in the Main node but in the Hub node.

Node / Call	Hub node (Night mode)			Hub node (Day mode)			Incoming call
	Main	Hub	Local	Main	Hub	Local	
ATND	Main ATT	Main ATT	Main ATT	Main ATT	Hub ATT	Hub ATT	ATND
LDN	Main ATT	Main ATT	Main ATT	Main ATT	Hub ATT	Hub ATT	LDN
CF-ATT	Main ATT	Main ATT	Main ATT	Main ATT	Hub ATT	Hub ATT	ATND

4. All incoming calls to the Attendant Console in a Local and Hub node are usually provided with above conditions.

Interactions

When the emergency mode is set, incoming calls are transacted according to EMERGENCY SYSTEM CONTROL [E-22] service. For further details, refer to EMERGENCY SYSTEM CONTROL.

O-1 On-line Maintenance

General Description

This feature permits maintenance routines to be performed on the System without affecting normal system operation.

Operating Procedure

Refer to the “Command Manual” and “Operations and Maintenance Manual”.

Service Conditions

1. The following maintenance functions may be performed while the system is ON-LINE:
   a.) Generic Program and Operating Memory testing
   b.) Fault Contents Display and Diagnosis
   c.) System/Office Data Entry and Change
   d.) Traffic Measurement
   e.) Testing facilities of Outside Trunks is provided as an option
   f.) PEG COUNT [P-7] display

Interactions

1. PCPro must first be provided. For details of PCPro, refer to PCPro Setup Guide.
2. Verify all cable Connections.

Programming

Refer to the “Command Manual” and “Operations and Maintenance Manual”.

O-2 Outgoing Trunk Queuing

General Description

This feature allows a station user to dial a specified Access Code or press Line/Feature key and enter a first-in, first-out queue, when encountering a Trunk busy signal. As soon as an OUTGOING TRUNK becomes available, stations in the queue will be called back on a first-come, first-served basis.

Operating Procedure

When LEAST COST ROUTING - 3/6-DIGIT [L-5] is not provided:

1. Dial the Trunk Access Code and receive Busy Tone.
2. Press the switch hook and receive Special Dial Tone.
3. Dial the OUTGOING TRUNK QUEUING (OGQ) Access Code and receive Service Set Tone.
4. Replace the handset.

When LEAST COST ROUTING - 3/6-DIGIT [L-5] is provided:

1. Dial the Trunk Access Code and receive the Dial Tone.
2. Dial the desired number and receive Busy Tone.
3. Press the switch hook and receive Special Dial Tone.
4. Dial the OGQ Access Code and receive Service Set Tone.
5. Replace the handset.

<The following procedures are applied for Desktop terminals only.>

When LEAST COST ROUTING - 3/6-DIGIT [L-5] is not provided:

1. Dial the Trunk Access Code. Receive Busy Tone.
2. Press the CALL BACK key. Receive Service Set Tone. The LCD displays:

3. Replace the handset.
4. When the Trunk becomes idle, the station will be rung.

When LEAST COST ROUTING - 3/6-DIGIT [L-5] is provided:

1. Dial the Trunk Access Code. Receive the Dial Tone.
2. Dial the desired number. Receive Busy Tone. The LCD displays:

3. Press the CALL BACK key. Receive Service Set Tone. The LCD displays:

4. Replace the handset.

5. When the Trunk becomes idle, the station will be rung. Once connected to the Trunk, the system automatically redials the number.

Service Conditions

1. The following table shows connection availability of this feature.

X: Service available N: Service not available

Calling Party	Outgoing Trunk (OGT)			Remarks
	COT Trunk	CCIS Trunk	ISDN Trunk	
Analog Terminal	X	X	X	
Attendant Console	N	N	N	
ISDN Terminal	N	N	X	
Desktop Terminal **Note 1**	X	X	X	

Note 1: This service is not available for Outgoing Calls from Sub Line.

2. After an OUTGOING TRUNK becomes available, the user's station will ring for 30 seconds. If not answered within that time, the station will automatically be dropped from the queue.
3. When this feature is used in conjunction with SPEED CALLING [S-3, 21, 23], or LEAST COST ROUTING [L-5], where a Sender is involved, the Sender will automatically dial out the Called Subscriber Number when the handset is lifted.
4. If the user wishes to remove himself from the queue prior to being rung, the specified Cancellation Code must be dialed.
5. Individual stations may only initiate one Outgoing Trunk queue at a time. Subsequent attempts will result in a Reorder Tone.
6. Stations may be restricted from using this feature in CLASS OF SERVICE - INDIVIDUAL [C-15].

Note: The Class Of Service for OFF-HOOK QUEUING [O-7] is different from the Class Of Service for OUTGOING TRUNK QUEUING [O-2]. Both services are mutually exclusive.

7. This feature is not available for an ATTENDANT CONSOLE [A-3].
8. The maximum number of simultaneous OGQs per system:

   1 IMG: 64 calls
   4 IMG: 256 calls

   The queue slots are used commonly by OFF-HOOK QUEUING [O-7], INTER-OFFICE OFF-HOOK QUEUING [I-11], and OGQ [O-2, 16].
9. CALL PICKUP - GROUP [C-7] cannot be used to answer a call directed to another station using OGQ.
10. OGQ is common to all Central Office Trunk Groups (COT, TIE, FX, WATS, etc.) in the system.
11. OGQ Call back will return to the originating station, not the CALL FORWARDING [C-2, 3, 5] terminating station.
12. OGQ is denied to a station Line when the CALL BACK [C-1] or CALL HOLD [C-6] feature is already activated.
13. The Attendant cannot CAMP-ON [A-1] a call to a station that has activated OGQ.
14. If a station user goes on-hook within six to eight seconds after encountering all Trunks busy, OUTGOING TRUNK QUEUING can be set automatically to the station.
15. The station is set for OGQ for a minimum of 30 seconds to one hour, maximum. This time is adjustable through the System Data. After this time, OGQ will be canceled automatically.

16. ACCOUNT CODE [A-18] and FORCED ACCOUNT CODE [F-7] information can be recorded on STATION MESSAGE DETAIL RECORDING (SMDR) [S-10], when used in conjunction with OGQ.
17. This feature can be activated when using a Trunk in the Remote Node via FCCS link.

Example: *Node A and Node B are in an FCCS network.*

- *Although a station belonging to Node A tried to call outside using a trunk belonging to Node B, all the trunks are busy. The call can be in the queue using this feature.*

18. The maximum number of the OGQs stations is 1,024 within the FCCS Network (NCN can manage a maximum of 1,024 calls).
19. OGQ data is transmitted to and stored in the Network Control Node (NCN). Therefore, all the OGQ data will be cleared by the system initialization of the NCN.
20. When the access to the NCN is impossible (system down or cable disconnection or any trouble has happened), the user cannot set or cancel OGQ data. (After dialing the Access Code or pressing the Feature keys for set/cancel OGQ, the user hears the Reorder Tone.)
21. When the Trunk becomes idle status after the NCN is recovered, the call in the queue will be called back, if data has not been cleared. If data has been cleared, the call is canceled automatically.

<The following conditions are applied for Desktop terminals only.>

1. To cancel the OUTGOING TRUNK QUEUING from a Desktop terminal, go off-hook and press CALL BACK key. The LCD displays:

OGQ CANCEL
(Time Display)

The user will hear Service Set Tone.

2. OUTGOING TRUNK QUEUING and CALL BACK [C-1] are mutually exclusive.
3. OUTGOING TRUNK QUEUING is only available from the MY Line of a Desktop terminal.

Interactions

1. Dial pad operation for Dterm sets may be used. A FLASH BUTTON [F-3D] must be programmed to a programmable Line/Feature key.
2. OGQ-AUTOMATIC may operate with either same or separate Access Codes. If the Automatic option is chosen, Service Set Tone will be sent when encountering an all Trunks busy situation. No dial pad operation will be required.
3. When testing OGQ, at least one Trunk of the Trunk Group being tested must be engaged in a station-to-Trunk or Trunk-to-Trunk Connection. Use of the MB key only on the Trunk circuit card will not allow OGQ to test and operate correctly.
4. Do not disable continuous Service Set Tone by changing System Data 1, Index 42, Bit 7 to data “1”. This changes “Continuous” Service Set Tone to “burst” Special Dial Tone, and Special Dial Tone to Burst Special Dial Tone, followed by Continuous Dial Tone. This will also disable TANDEM OFF-HOOK QUEUING.
5. This feature is not available for forwarding calls with Call Forwarding-Don't Answer-Outside [C-74].
6. This feature is not available for forwarding calls with Split Call Forwarding - All Calls (for trunk), Split Call Forwarding - Busy Line (for trunk), or Split Call Forwarding - Don't Answer (for trunk).
7. To operate this feature from a SIP Handler Controlled SIP terminal, perform the one digit dial hooking operation while hearing Busy Tone (BT) and dial the access code for this feature. To hear Busy Tone (BT), enable IP-DTG with the AUACL/AUACN command.

Programming

STEP 1: **ASYD** - System Data 1, Index 68, Bit 3. Enables automatic cancel timer, as set in System Data 1, Index 159. 0/1: -/Enable.

System Data 1, Index 159. OGQ release timer. Standard data of 00H for 30 minutes may be assigned. (RAM Data of 3C (hexadecimal) provides for 30 minutes).

System Data 2, Index 4, Bit 0. Should the Access Code for CALL BACK and OGQ be the same? 0/1: No/Yes. Usually assign data "1". Assign on a per Tenant basis.

System Data 2, Index 4, Bit 1. Enable Automatic OGQ? 0/1: No/Yes. Assign on a per Tenant basis. Automatic operation eliminates the need to access via dial pad.

System Data 2, Index 4, Bit 2. Enable OFF-HOOK OGQ for the Attendant Console? 0/1: No/Yes. Assign on a per Tenant basis. (See OUTGOING TRUNK QUEUING-ATTENDANT [O-14].)

System Data 1, Index 139, timer for the recall ringing.

STEP 2: **ANPD** - Reserve a Number Level for Service Feature Access and cancel. Select Normal Service (N), Hooking Service (H) or Busy Service (B) from the combo box for Connection Indexes. (applicable to any feature assigned to this Level). Assign NND in accordance with a predetermined Numbering Plan.

STEP 3: **ASPA** - If System Data 2, Index 4, Bit 0 is assigned for separate Access Codes, assign an Access Code to OGQ, SRV = "SSC: Service Code", SID = 19, and to OGQ cancel, SRV = "SSC: Service Code", SID = 20. Assign SID = 19 for a Connection Index of "B: Busy" and SID = 20 for a Connection Index of "N: Normal". If the Access Codes are the same, either the Access Codes for OGQ or the Access Codes for CALL BACK may be assigned.

STEP 4: **ASFC** - If Access Codes are separate, assign a Service Feature Restriction Class that allows SFI 1 (Outgoing Trunk Queuing) to stations that will have OGQ. If Access Codes are the same, assign an SFC that allows SFI 1, or SFI 1 and SFI 2.

STEP 5: **ARTD** - Routes (including the dummy route) to be used for OGQ must be flagged in CDN 9:TQ, Trunk Queuing Service. Always allow queuing to Route 31, the LCR (S) flag route.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as circuit card or MG.

STEP 6: **AKYD** - Desktop terminal - set the following data to assign CALL BACK key and a FLASH button.

KYI = 1: Function Key.
FKY = 5: For a CALL BACK key
FKY = 21: For a FLASH Button

STEP 7: **ADSL** - SN = 6 (Trunk is Busy) and FKY = 5 (Call Back; CB).

This command is used for assigning the function to each Soft key.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ALRTN** - Assign this command to connect the Logical Route to the Physical Route.

STEP 2: **ASYDN** - These data must be assigned to the NCN.

System Data 1, Index 41:Designate the Trunk Queuing Override Timer

Index 68, Bit 3: Enables automatic cancel timer

0/1: -/Automatic cancel timer is Available

Index 159: Designate Automatic Cancel Timer

STEP 3: **ASPAN** - These data must be assigned to the NCN.

TN: Tenant Number

ACC: Access number

CI: "B: Busy" (for Entry), "N: Normal" (for Cancel)

SRV: "SSC: Service Code"

SID: 19 = OG Queuing-Entry

CI: "N: Normal"

SID: 20 = OG Queuing-Cancel

STEP 4: **ANPDN** - These data must be assigned to the NCN.

TN: Tenant

1stDC: 1st Digit

CI: Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes.

NND: Number of Necessary Digits

BLF: Busy Lamp Field Display Activated on ATT

STEP 5: **ARTDN** - These data must be assigned to the NCN.

LGRT: Logical Route Number

Assign CDN 9:TQ, Trunk Queuing Service = 1

Note: The current data should also be set in addition to the above-mentioned commands.
The command to be set to the Node that accommodates the Trunk: ARTD
The commands to be set to all the Nodes: ASFC, AKYD
For Desktop terminals, the command to be set to all the Nodes are ASFC, AKYD, ASPA.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as circuit card or MG.

O-6 Off-Hook Alarm

General Description

This feature allows a station user to call the Attendant or a predetermined station by simply staying OFF-HOOK. The Calling Number is automatically displayed at the ATTENDANT CONSOLE [A-3] or a Desktop terminal with LCD display.

Operating Procedure

To operate

1. Lift the handset and stay off-hook.
2. After a predetermined time elapses (2 to 30 sec.), the call will terminate at the ATTENDANT CONSOLE [A-3] or the predetermined station.
3. The calling Telephone Number will be displayed at the ATTENDANT CONSOLE [A-3] or Desktop terminal when answered.

Service Conditions

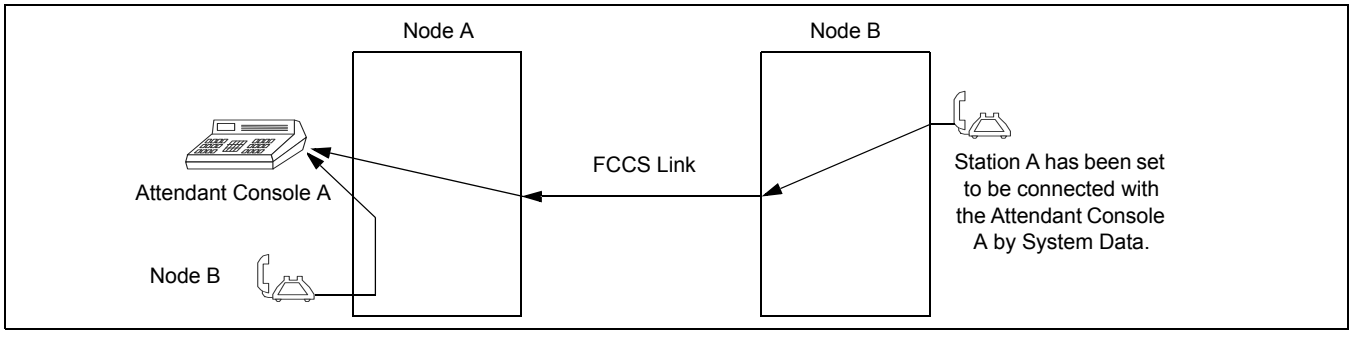
1. Predetermined timing interval is programmable through the PCPro (2 to 30 seconds).
2. In the night mode, an OFF-HOOK ALARM call directed to the ATTENDANT CONSOLE [A-3] will not terminate at the ATTENDANT NIGHT TRANSFER [A-19] predetermined night station. The caller will receive a Reorder Tone.
3. A station will be assigned as a member of an OFF-HOOK ALARM Group and will be connected to the predetermined stations that are assigned for each Off-Hook Group.
4. When the OFF-HOOK ALARM call designating station uses Telephone Number (TELN):
   Maximum number of OFF-HOOK ALARM Group is 255 per Tenant Group.
   When the OFF-HOOK ALARM call designating station uses Physical Station Number (STN):
   Maximum number of OFF-HOOK ALARM Group is 7 per Tenant Group.

   Note: There is no limit on the number of stations which belong to an OFF-HOOK ALARM Group.

5. A designating station for OFF-HOOK ALARM can be assigned to each OFF-HOOK ALARM Group. A Group Number must be assigned to all the member stations to be included in the Group.
6. The station assigned as a terminating station of each OFF-HOOK ALARM Group can be a member of a HUNTING GROUP [S-7, 8, 9].
7. This service is programmed via System Data. Stations may be restricted from using this feature in CLASS OF SERVICE - INDIVIDUAL [C-15].
8. The ATTENDANT CONSOLE [A-3] can answer by pressing the EMG key, which must be assigned by the PCPro. Using the ANSWER key will not give priority to the OFF-HOOK ALARM call.
9. The predetermined target station can set CALL FORWARDING - ALL CALLS [C-5] and CALL FORWARDING - BUSY LINE [C-2].
10. When the predetermined station is busy, the OFF-HOOK ALARM call receives Ringback Tone until the station becomes idle. When the predetermined designating station is in the LINE LOCKOUT [L-3] status or make busy status, the OFF-HOOK ALARM call receives the Reorder Tone (ROT).
11. This feature cannot be applied while in CONSULTATION HOLD - ALL CALLS [C-17] or CALL HOLD [C-6] mode.

12. When an OFF-HOOK ALARM call is directed to a Pilot station of a UCD [U-1] Group, queuing is not available when all the stations within the group are busy.
13. The designating station for OFF-HOOK ALARM must be the Desktop terminal. When the designating station has set CALL FORWARDING-ALL CALLS [C-5], the Call Forwarding target station must also be the Desktop terminal. When the designating station is a member of a HUNTING GROUP [S-7, 8, 9], all stations within the Hunt Group must also be the Desktop terminal.
14. An OFF-HOOK ALARM call cannot be originated from the ISDN terminal. The ISDN terminal and PS cannot be assigned as a designating station of the OFF-HOOK ALARM call.
15. The predetermined target station for ATTENDANT NIGHT TRANSFER [A-19] and PRIORITY CALL [P-9] can be assigned as the designating station for OFF-HOOK ALARM [O-6].
16. The ringing tone provided when the designating station receives an OFF-HOOK ALARM call is the same as that of station call.
17. When the designating station receives an OFF-HOOK ALARM call, "ALARM", the designating station displays the number of the calling station with the handset lifted on its LCD.

[For North America only]



18. This feature allows a station user to call the Attendant or a predetermined station by simply not completing a call and staying off-hook after dialing some digits. The following conditions must be considered.
    a.) All numbers (0-9, *, #) must be defined in ANPD/ANPDL/ANPDN for this feature to work correctly.
    b.) This feature is mutually exclusive with Automatic return to Idle Desktop terminal.

Example: A station user goes off-hook and dials only a partial number.
1. Station 1000 goes off hook and dials 10.
2. 1 is defined in ANPD as four digits and is in ASPA as STN.
3. After Inter digit timer expires (ASYD, System Data 1, Index 129 Bit 0-3) the call is routed to the proper off hook alarm destination. **Note 1**

Note 1: This destination is determined by the programming shown later in this section.

FCCS Conditions

1. This feature can also be activated when a station and the called party belong to different Nodes.
2. If a station belongs to the Node that has an Attendant Console, the station is connected with the Attendant Console. If a station belongs to the Node that does not have an Attendant Console, the station is connected with the specified Attendant Console in the Remote Node according to the System Data assigned. See the figure below.

3. The OFF-HOOK ALARM call can be terminated at the predetermined station/Attendant Console in the different node via FCCS link.
4. The feature data via DM, LDM and NDM can coexist in a system. However, data registered on NDM has top priority. Data registered on LDM has precedence over data registered on DM. (Priority: NDM → LDM → DM)

Interactions

1. A total of seven OFF-HOOK ALARM Groups per Tenant may be assigned to the system, if the termination point is a station. Any station not assigned in ASGD will go to Reorder Tone after the Register Prepause timer (ASYD, System Data 1, Index 128) expires. If the termination point is the Attendant Console, all stations in the Tenant will terminate to the Attendant Console.
2. ASAT cannot be used to construct different OFF-HOOK ALARM Groups terminating to specific Attendant Consoles. If the Tenant is equipped with more than one Attendant Console, OFF-HOOK ALARM calls will be directed to all Consoles with the OFF-HOOK ALARM keys programmed in AAKP.
3. The following features will function on the terminating calls to a predetermined station:

CALL PICKUP	[C-7]
CALL TRANSFER	[C-11]
CALL HOLD	[C-6]
CALL FORWARDING	[C-5A]

4. No tone is provided on CALL WAITING-TERMINATING [C-12].
5. This feature works also when a SIP Handler Controlled SIP terminal is a destination of a station in off-hook state.
6. This feature is not activated on the SIP Handler Controlled SIP terminal even after a predetermined time elapses.

Programming

STEP 1: **ASYD** - System Data 1, Index 128, Bits 0-3. Register Prepause timer. After the timer expires, the station assigned to an OFF-HOOK ALARM Group will ring at the terminating Attendant Console or station. Leave Index 128 as 00H for normal operation.

System Data 1, Index 168, Bit 4. Enable OFF-HOOK ALARM? 0/1: No/Yes.

System Data 1, Index 168, Bit 5. Is the terminating point for OFF-HOOK ALARM an Attendant Console or Station? 0/1: Attendant Console/Station. If Attendant Console is chosen, go to AAKP command. If station is chosen, go to the ASID and ASGD commands.

STEP 2: **ASID** - This command defines the purpose of the Special Incoming Group, and is used in conjunction with ASGD. Assign the following:

TN: Tenant Number
F: Function Number (0-7)
0: OFF-HOOK ALARM
GN: Group Number (1-7).
S/A: Special Incoming Equipment
S: Station
A: Attendant Console
SSTN: Special Station Number

STEP 3: **ASGD** - This command defines what stations belong to the Special Incoming Group. Assign the following:

TN: Tenant Number
STN: Station Number
F: Function Number (0-7)
0: Off-Hook Alarm
GN: Group Number (1-7)

STEP 4: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 30 to stations that will have OFF-HOOK ALARM.

STEP 5: **AAKP** - Assign the Attendant Console Key Pattern. The ATN: Attendant Number (TRK Number for RTE 901); KYN = 1-6; and FUNC = 2. (The Console must be in Night mode to assign this command.)

[For North America only]

This feature allows a station user to call the Attendant or a predetermined station by simply not completing a call and staying off-hook after dialing some digits. The following data programming is required in addition to the above.

STEP 1: **ASFC** - Assign Service Feature Restriction Class of the station.

SFI = 203 (OFF-HOOK ALARM for Inter-digit time-out)
RES = 1 (Allowed)

STEP 2: **ANPD/ANPDL/ANPDN**- Define all number groups (0-9, *, #).

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

ASYDL - This data must be set to all the Nodes.
System Data 1, Index 640, assign the Fusion Point Code (FPC) of the Node providing the Attendant Console. **Note 2**

Note 2: Assign the Self FPC at the Terminating Node.
The following data should also be set in addition to the above-mentioned commands.
The commands to be set to the Node that accommodates the Attendant Console:
AAKP, ACFR (when the destination is the Night ATT: ATNR)
The commands to be set to all the Nodes: ASYD, ASFC

-The following data setting is required when the OFF-HOOK ALARM call terminates to a station in the Remote Node via FCCS.

(When entering data on NDM)

STEP 1: **ASYD** - The same data must be assigned to all Nodes.
System Data 1, Index 128, Bits 0-3. Register Prepause timer. After the time expires, the station assigned to an OFF-HOOK ALARM Group will ring at the terminating Attendant Console or station. Leave Index 128 as 00H for normal operation.
System Data 1, Index 168, Bit 4. Enable OFF-HOOK ALARM? 0/1: No/Yes.
System Data 1, Index 168, Bit 5. Assign data "1" (station is the designation of OFF-HOOK ALARM call).

STEP 2: **ASIDN** - This command defines the purpose of the Special Incoming Group and is used in conjunction with the ASGDN command. Assign the following:
TN: Tenant Number
F: Function Number. Assign "0 (OFF-Hook Alarm)".
GN: Group Number (1-255)
S/A: Special Incoming Equipment. Assign "S" (Telephone Number (of the station)).
STELN: Telephone Number of Special Station Number

STEP 3: **ASGDN** - This command defines the stations belonging to the Special Incoming Group. Assign the following:
UGN: User Group Number
STELN: Telephone Number of the station
F: Function Number. Assign "0 (OFF-Hook Alarm)".
GN: Group Number (1-255)

STEP 4: **ASFC** - The same data must be assigned to all Nodes.
Assign a Service Feature Restriction Class that allows SFI 30 to stations that will have OFF-HOOK ALARM.

(When entering data on LDM)

STEP 1: **ASYD** - The same data must be assigned to all Nodes.

System Data 1, Index 128, Bits 0-3. Register Prepause timer. After the time expires, the station assigned to an OFF-HOOK ALARM Group will ring at the terminating Attendant Console or station. Leave Index 128 as 00H for normal operation.

System Data 1, Index 168, Bit 4. Enable OFF-HOOK ALARM? 0/1: No/Yes.

System Data 1, Index 168, Bit 5. Assign data "1" (station is the designation of OFF-HOOK ALARM call).

STEP 2: **ASIDL** - This command defines the purpose of the Special Incoming Group and is used in conjunction with the ASGDL command. Assign the following:

TN: Tenant Number

F: Function Number. Assign "0 (OFF-Hook Alarm)".

GN: Group Number (1-255)

S/A: Special Incoming Equipment. Assign "S" (Telephone Number (of the station)).

STELN: Telephone Number of Special Station Number

STEP 3: **ASGDL** - This command defines the stations belonging to the Special Incoming Group. Assign the following:

UGN: User Group Number

STELN: Telephone Number of the station

F: Function Number. Assign "0 (OFF-Hook Alarm)".

GN: Group Number (1-255)

STEP 4: **ASFC** - The same data must be assigned to all Nodes.

Assign a Service Feature Restriction Class that allows SFI 30 to stations that will have OFF-HOOK ALARM.

O-7 Off-Hook Queuing

General Description

This service allows a Station user, upon encountering a Trunk-busy condition, to remain off-hook and automatically enter a first-in, first-out queue. As soon as an Outgoing Trunk becomes available, the switch connects the next call to this Trunk.

Operating Procedure

To operate

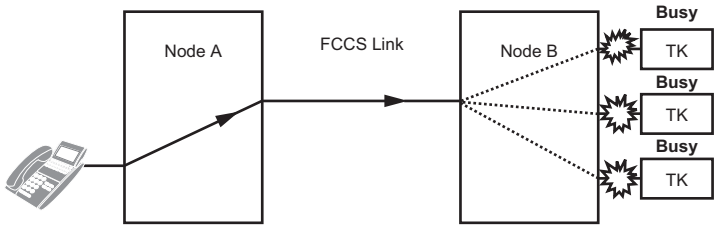
1. Lift the handset. Receive a Dial Tone.
2. Dial the Outgoing Call Access Code and the desired number (LCR access).
3. The System determines that no Trunks are available and places the call in an available queue slot.
4. The caller receives Service Set Tone. Remains off-hook and waits.
5. When a Trunk becomes available, the Dialed Number is automatically sent forward.

Service Conditions

1. The following table shows connection availability of this feature.

X: Service available N: Service not available

Calling Party	Outgoing Trunk (OGT)			Remarks
	COT Trunk	CCIS Trunk	ISDN Trunk	
Analog Terminal	X	X	X	
Attendant Console	X	X	X	
Attendant Console (from Station)	X	X	X	
Attendant Console (from Trunk)	X	X	X	
ISDN Terminal	N	N	X	
Desktop Terminal **Note 1**	X	X	X	



Note 1: This service is not available for Outgoing Calls from Sub Line.

2. This feature is usually used in conjunction with LEAST COST ROUTING - 3/6-DIGIT [L-5].
3. The maximum number of simultaneous OFF-HOOK QUEUEs per system:
   1 IMG: 64 calls
   4 IMG: 256 calls
4. The queue slots are used commonly by OFF-HOOK QUEUING, OUTGOING TRUNK QUEUING [O-2] and INTER-OFFICE OFF-HOOK QUEUING [I-11].
5. If no queue slots are available, the Station user will receive Busy Tone.
6. Route Class of the LCR can give the choice of the OFF-HOOK QUEUING.
7. CLASS OF SERVICE - INDIVIDUAL [C-15] is applied for each Station. This class of service is different from the class of service for OUTGOING TRUNK QUEUING [O-2]. Both services are mutually exclusive.
8. When automatic outgoing queuing (on-hook queuing) is in service (Tenant basis), OFF-HOOK QUEUING service is not effective.

9. ACCOUNT CODE [A-18] and FORCED ACCOUNT CODE [F-7] information can be recorded on STATION MESSAGE DETAIL RECORDING (SMDR) [S-10], when used in conjunction with OFF-HOOK QUEUING.
10. This feature can also be activated when using a Trunk in the Remote Node via FCCS link.

Example: *Node A and Node B are in an FCCS network.*

- *Although a station belonging to Node A tried to call outside using a trunk belonging to Node B, all the trunks are busy. The call can be in the queue using this feature.*

11. The maximum of number of the OGQ Stations is 1,024 within the FCCS Network (NCN can manage a maximum of 1,024 calls).
12. OGQ data is transmitted to and stored in the Network Control Node (NCN). Therefore, all the OGQ data will be cleared by the system initialization of the NCN.
13. When the access to the NCN is impossible (system down, cable disconnection or trouble has occurred), the user cannot set or cancel OGQ data. (After dialing the Access Code or pressing the Feature keys for set/cancel OGQ, the user hears the Reorder Tone.)
14. When the Trunk becomes idle status after the NCN is recovered, the call in the queue will be called back, if data has not been cleared. If data has been cleared, the call is canceled automatically.

Interactions

1. UNIVERSAL SENDER [U-3] must first be provided.
2. The System attempts Trunk seizure every four seconds until the Connection has been completed.
3. LEAST-COST ROUTING-3/6 DIGIT [L-5] information will be applied to these attempts. Therefore, OUTGOING TRUNK QUEUING will be set against all routes in the Outgoing Routing Pattern (OPR).
4. If all queuing memory slots are in use, the Station user will receive a Trunk Busy Signal.
5. The time a call may remain in queue is unlimited.
6. The following features cannot be activated toward the busy Station: CALL WAITING - ORIGINATING [C-31], CALL WAITING - TERMINATING [C-12], ATTENDANT CAMP-ON WITH TONE INDICATION [A-1], BUSY VERIFICATION [B-3] and EXECUTIVE RIGHT-OF-WAY [E-1].
7. Do not disable constant Service Set Tone by changing System Data 1, Index 42, Bit 7 to data “1”. This changes constant Service Set Tone to burst Special Dial Tone, and Special Dial Tone to burst Special Dial Tone, followed by constant Dial Tone. This will also disable TANDEM OFF-HOOK QUEUING.
8. When testing OGQ, at least one Trunk of the Trunk Group being tested must be engaged in a Station-to-Trunk or Trunk-to-Trunk Connection. Use of the MB key on the circuit card will not allow OGQ to test and operate properly.
9. This feature is not available for forwarding calls with Call Forwarding-Don't Answer-Outside [C-74].

10. This feature is not available for forwarding calls with Call Forwarding - All Calls/Split Call Forwarding - All Calls (for trunk), Call Forwarding - Busy Line/Split Call Forwarding - Busy Line (for trunk), or Call Forwarding - Don't Answer/Split Call Forwarding - Don't Answer (for trunk).

Programming

STEP 1: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 21 to Stations that will have OFF-HOOK QUEUING.

STEP 2: **ARTD** - A dummy route must be flagged in CDN 9:TQ. Also allow OUTGOING TRUNK QUEUING to the LCR(s) flag route.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as circuit card or MG.

FCCS Programming

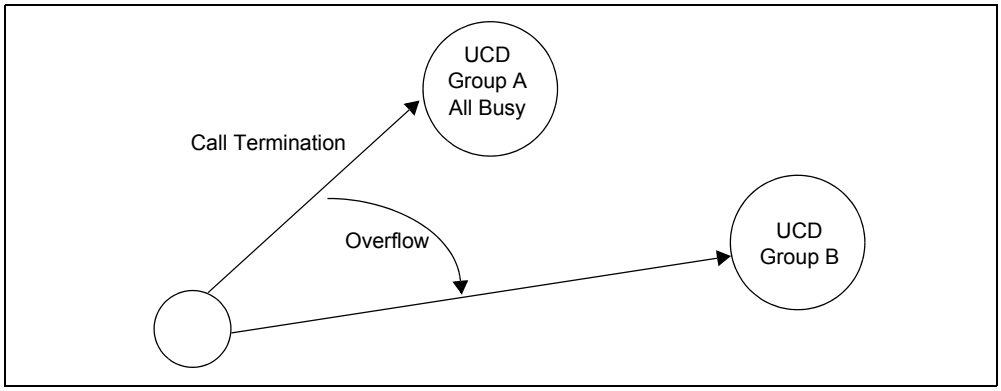
This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ALRTN** - Assign this command to connect the Logical Route to the Physical Route.

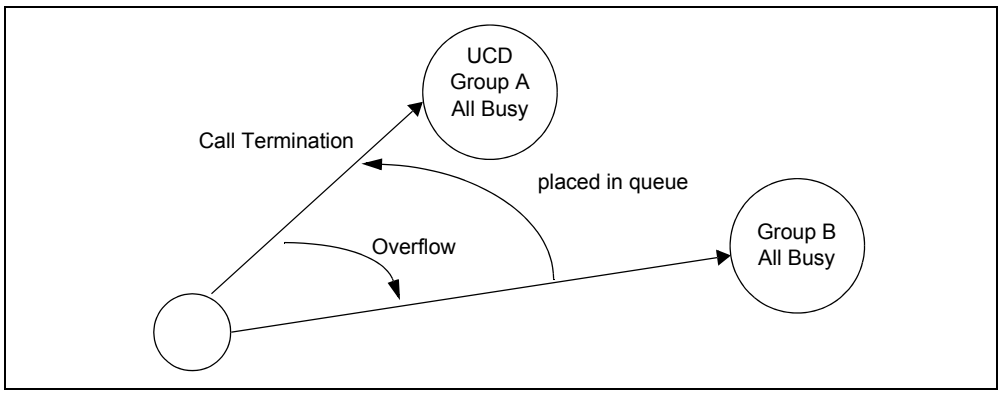
Note: The following data should also be set in addition to the above-mentioned commands.
The command to be set to the Node accommodating the Trunk: ARTD
The commands to be set to all the Nodes: ASYD, ASFC

STEP 2: **ASYDN** - This data must be assigned to the NCN. System Data 1, Index 41: Designate the Trunk Queuing Override Timer.



STEP 3: **ASPAN** - This data must be assigned to the NCN.

TN: Tenant Number
ACC: Access Number
CI: “B: Busy” (for Entry), “N: Normal” (for Cancel)
SRV: “SSC: Service Code”
SID: 19 - OG Queuing - Entry
CI: “N: Normal”
SID: 20 = OG Queuing - Cancel

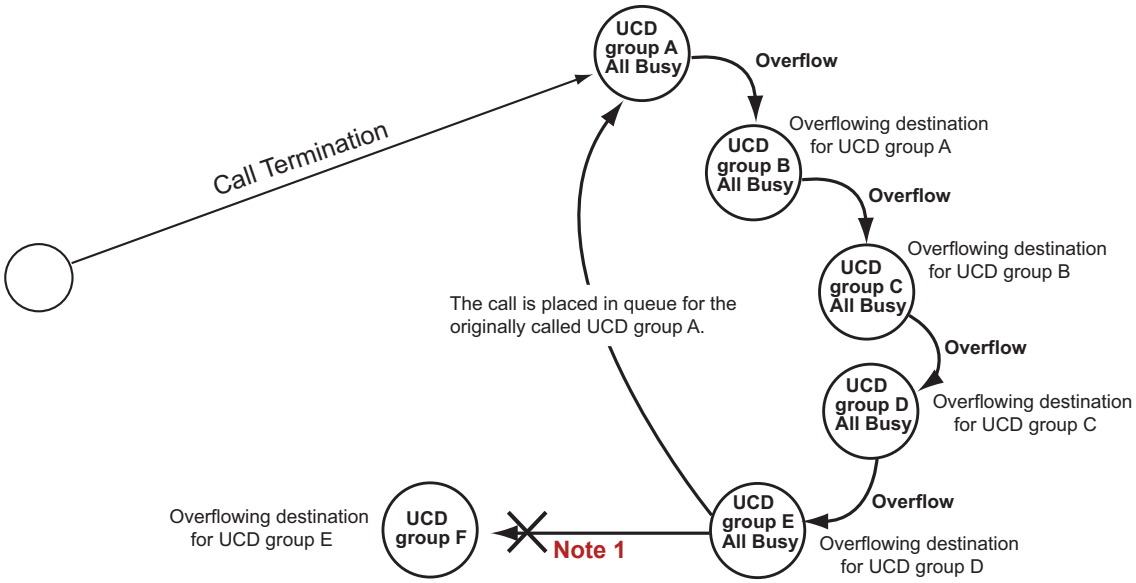


O-13 Overflow - UCD

General Description

1. When a call has terminated to UCD [U-1] Group A, and the Incoming Call has encountered all Stations busy in Group A, the call is transferred to UCD [U-1] Group B, if Group B is registered as the OVERFLOW-UCD destination.

2. If all Stations are busy in Group B, then the call is placed in queue for the originally called UCD [U-1] Group (Group A).



Operating Procedure

No manual operation is required.

Service Conditions

1. An OVERFLOW Group must be a UCD [U-1] Group.
2. One OVERFLOW Group can be provided for one UCD [U-1] Group.
3. An Originating UCD Group will only Overflow to its Overflow UCD Group one time. If the Overflow UCD Group is busy and the call is placed into the Originating UCD Group's queue, the Originating UCD Group will not attempt an Overflow a second time.
4. An OVERFLOW Group cannot be registered into a queue.

5. A call can overflow a maximum of four times at the maximum by using this feature. If overflowing destinations are all busy, the call is queued into original group (depending on System Data).
For details, refer to the figure below.

Note 1: The call cannot be overflowed more than 5 times.

6. UCD OVERFLOW data can be programmed in Local Data Memory (LDM).
7. The overflowing destination which can be assigned to UCD Group is as follows:

UCD Group (that is busy)		Overflowing Destination
• UCD Group assigned by ASHU command	→	UCD Group designated by AUOG command
• UCD Group assigned by ASHUL command	→	UCD Group designated by AUOGL command
• UCD Group assigned by ASHUN command	→	UCD Group designated by AUOGN command

8. This feature can be activated via FCCS.
9. When using the FCCS Network, the number type (Telephone Number or Physical Station Number) for the Station assignment must be the same between the originally Called Group and the Forwarded Group.
10. After PS has been assigned to the destination UCD group, if a call from the PS cannot connected to the group due to busy status, the call will receive Busy Tone.
11. When using Location Diversity [L-55], the Telephone Number of User Profile Data must be assigned to the station by using AUOGN command.

Interactions

1. ALL UNIFORM CALL DISTRIBUTION [U-1] interactions apply to the UCD Overflow Group. The Incoming Overflow Call is handled in the same way as a regular Incoming Call. If both UCD Groups are busy, the call will queue at Group A.
2. Do not set ASFC, SFI 252=1 (Multi-Boss/Multi-Secretary is in service) to stations belonging to UCD groups.

Programming

STEP 1: **ASYD** - System Data 1, Index 60, Bit 3: UCD Queuing in service. 0/1 = Yes/No

STEP 2: **ASHU/ASHUL** - Assign the required data for the UCD Group:

TN/UGN: Tenant Number/User Group Number
STN/TELN: Station Number/Telephone Number
[Station List in Group]
STN/TELN: Station Number/Telephone Number

STEP 3: **ANPD** - Reserve a Number Level for Feature Access. Select Normal Service (N), Hooking Service (H) or Busy Service (B) from the combo box for Connection Indexes. (if applicable to any feature in this Level). Assign NND in accordance with a predetermined Numbering Plan.

STEP 4: **ASPA** - Assign an Access Code to UNIFORM CALL DISTRIBUTION [U-1], SRV = "SSCA: Service Code Appendix", SIDA = 50 Busy Set, SRV = "SSCA: Service Code Appendix", SIDA = 51 Busy Cancel. Connection Status CI = "N: Normal".

STEP 5: **AUOG/AUOGL** - Assign the UCD OVERFLOW data via this command. Assign the following:

TN-A, STN-A/UGN-A, TELN-A: Tenant Number and Station Number/User Group Number and Telephone Number that belong to a UCD Group.

TN-B, STN-B/UGN-B, TELN-B: Tenant Number and Station Number/User Group Number and Telephone Number of a member Station in a UCD Group to be hunted in the case where the UCD Group designated by TN-A and STN-A happens to be busy.

TRANSLATION: When UCD Group A is busy, calls will overflow to UCD Group B.

STEP 6: **AKYD** - To a programmable Line/Feature key on the UCD Stations (when the Stations are Dterms), assign FKY = 19-UCD Busy Out.

STEP 7: **ADSL** - Assign UCDBO key; Assign SN = 0 (Idle), 3 (Called Station Busy) and FKY = 19 (UCD Busy Out).

This command is required for assigning a function to each Soft key.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ASYDN** - This data must be assigned to the NCN. System Data 1, Index 60, Bit 3: 0/1 = UCD Queuing is used/not used

STEP 2: **AUOGN** - This data must be assigned to the NCN. Assign the UCD OVERFLOW data via this command.

UGN-A: User Group Number belonging to a UCD Group
TELN-A: Telephone Number belonging to a UCD Group
UGN-B: User Group Number of Overflow Destination
TELN-B: Telephone Number of Overflow Destination

O-14 Operator Monitoring

General Description

When an exchange or a TIE Line Incoming Call has terminated to the Attendant position and the Attendant has connected the caller to the requested Station, this feature allows the Attendant to monitor the call by depressing the "MON" (Optional) key on the Console.

Note: This feature is only available in Australia.

Operating Procedure

1. The Attendant at the Attendant position answers an exchange or a TIE Line Incoming Call.
2. The Attendant dials the requested Station Number.
3. The Called Station answers.
4. The Attendant depressing the "MON" (Optional) key on the Console.
5. The Attendant enters the monitor state.

Service Conditions

1. This feature is available in Australia only.
2. This service can be activated for Connections established between an external Calling Party and an internal Called Station via the Attendant position.
3. The Attendant in the monitor state is not allowed to reenter the Connection.
4. The Attendant may end monitoring by depressing the RELEASE key.
5. While the call is being monitored by the Attendant, no hooking services can be performed at the Called Station.
6. The Attendant cannot perform any other services for the Connection during monitoring.
7. This feature cannot be activated for Inter-Office CCIS.

Programming

STEP 1: **ASYD**

- SYSTEM DATA1

< Index6 >

Bit 4-6 (ATT CON Key Arrangement Pattern): Assign 2 Hexadecimal (for Australia).

STEP 2: **ASFC** - Assign Service Feature Restriction Class of the Station.

SFI = 49 (Operator Monitoring)

RES = 1 (Allowed)

O-15 Overlapping

General Description

This feature allows the Attendant at an Attendant position to originate a call to a Station or to an external line (exchange or TIE) and hold it in the monitor mode before or after the Called Party answers, thus allowing another call to be handled.

Note: This feature is only available in Australia.

Operating Procedure

1. Overlapping while the Called Party is being rung
   a.) The Attendant originates a call to a Station or external line (exchange or TIE).
   b.) Ringback Tone is sent to the Attendant.
   c.) When the Attendant depresses the "OL" (Optional) key, the call is held in monitor mode.
   d.) By depressing a Loop key before or after the Called Party answers, the Attendant reenters the Connection.
2. Overlapping while speech is in progress
   a.) The Attendant originates a call to a Station or external line (exchange or TIE), and the Called Party answers.
   b.) When the Attendant depresses the "OL" key, the call is held in monitor mode.
   c.) The Attendant reenters the Connection by depressing a Loop key.
   d.) If the Called Party is released while being held, the Loop is opened and enters the idle state.

Service Conditions

1. This feature is available in Australia only.
2. This feature is effective only for Two-party Connections established between an Attendant and a Station or external line party.
3. Regardless of whether the Called Party answers or not, the Attendant can reenter the Connection or set the service again.
4. An Attendant position can set this feature to only one call at a time.
5. No MUSIC ON HOLD [M-7] is sent to the party who is placed on hold while call is in progress.
6. The Attendant cannot reenter the Held Call while handling another call.
7. This feature is assignable on a Tenant basis.
8. When the call in progress is held by the Attendant using this service, SHF operations at the held side become ineffective, and no further services can be performed for the Held Call.
9. This feature will not be counted as SERVICE FEATURE PEG COUNT [S-27].
10. In the OVERLAPPING state, MB lamp of the Trunk for OVERLAPPING will be illuminated.
    (The MB lamp will remain illuminated thereafter.)
    To turn off the lamp:
    1) On/Off of "MB" key of the Trunk
    2) System initialization
    3) LP initialization
11. When mounting Trunks for OVERLAPPING (8COTBF), the mounting slot is fixed in the conventional unit.

12. There will be no output of message for the Message Center Interface (MCI).
13. The billing for a call answered while OVERLAPPING will be charged to the ATTENDANT CONSOLE [A-3].
14. This feature is not available for Inter-Office CCIS.

Programming

STEP 1: **ASYD**

- SYSTEM DATA1

< Index 6 >

Bit 6 (ATT CON Key Arrangement Pattern) : $\frac{b6}{0}\ \frac{b5}{1}\ \frac{b4}{0}$ (For Australia)

- SYSTEM DATA 2

< Index 15 >

Bit 0 (Overlapping Service): 0/1 = Out/In service

Assign 1.

STEP 2: **ATRK** - Assign Overlapping Trunk (PA-8COT BF) data.

RT (Route Number): xxx

TK (Trunk Number): xxx

LENS (Line Equipment Numbers) : MG U G LV

xx x xx 0
xx x xx 1 } **Note 1**

Note 1: As an Overlapping Trunk, No.0 and No.1 circuits of the PA-8COT BF circuit card can be used.

STEP 3: **MBTK** - Assign Make Idle status to the Overlapping Trunk.

RT: xxx

TK: xxx

MB: 0 (= idle)

STEP 4: **ATRK** - Delete Trunk data of the Attendant Console which is to be equipped with Overlapping feature.

If the Attendant Console is to be newly installed, skip this STEP4. **Note 2**

RT: 901 (= Attendant Console)

TK: xxx

LENS: xxx200/xxx201

TN: xx

Note 2: Place both circuits of the ATI Card to Busy status before deleting data of the Attendant Console.

STEP 5: **ATRK** - Assign Trunk data of the Attendant Console data.

RT: 901 (= Attendant Console)

TK: xxx

LENS: xxx200/xxx201

TN: xx

STEP 6: **MBTK** - Assign Make Idle status to the newly assigned Trunk in the ATRK command.

O-16 Outgoing Trunk Queuing - Attendant

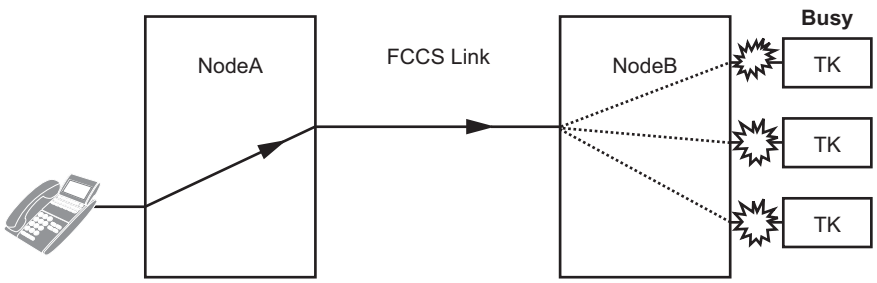
General Description

This feature allows an ATTENDANT CONSOLE [A-3], upon encountering a Trunk busy condition, to remain Off-Hook and automatically enter a first-in, first-out queue. As soon as an Outgoing Trunk becomes available, the switch connects the next call to that Trunk.

Operating Procedure

To operate

1. Dial the Access Code and the desired number.
2. When no Trunks are available, the call automatically enters an available queue slot.
3. The Attendant receives Service Set Tone; remains off-hook and waits.
4. When a Trunk becomes available, the Dialed Number is automatically sent forward.



Service Conditions

1. This feature is used with LEAST COST ROUTING - 3/6-DIGIT [L-5].
2. The maximum number of Stations or ATTENDANT CONSOLEs [A-3] that may use OFF-HOOK QUEUING [O-7] simultaneously is 256 per system.
3. The queue slots are shared by OFF-HOOK QUEUING [O-7], OUTGOING TRUNK QUEUING (OGQ) [O-2, 12D, 16] and INTER-OFFICE OFF-HOOK QUEUING [I-11].
4. If no queue slots are available, the ATTENDANT CONSOLE [A-3] will receive Busy Tone.
5. CLASS OF SERVICE - INDIVIDUAL [C-15] is applied to each ATTENDANT CONSOLE [A-3]. (RSC 0 and SFC 0 are reserved for ATTENDANT CONSOLE [A-3].)
6. OFF-HOOK QUEUING is utilized for this feature.

<FCCS Conditions>

1. This feature can also be activated when using a Trunk in the Remote Node via FCCS Link.

Example:
Node A and Node B are in a FCCS Network.
Although a station belonging to Node A tried to call outside using a trunk belonging to Node B, all the trunks are busy.
The call can be in the queue using this feature.

2. The maximum of number for the OGQ Station is 1,024 within the FCCS Network (NCN can manage a maximum of 1,024 calls).

3. OGQ data is transmitted to and stored in the Network Control Node (NCN). Therefore, all the OGQ data will be cleared by the system initialization of the NCN.
4. When the access to the NCN is impossible (system down or the cable disconnection or any trouble has been happened), the user can not set or cancel OGQ data. (After dialing the Access Code or pressing the Function keys for set/cancel OGQ, the user hears the Reorder Tone.)
5. If data has not been cleared after the NCN is recovered, the call in the queue will be called back when a Trunk becomes idle status. If data has been cleared, the call is canceled automatically.

Programming

STEP 1: **ASYD** - System Data 2, Index 4, Bit 2: Off-Hook OGQ for Attendant 0/1: Out/In Service.

STEP 2: **ASFC** - Assign 1 (= Allowed) in SFI21 (= Off-Hook OGQ) for SFC0.

FCCS Programming

This data setting is required when FCCS Service data is added to Non-FCCS Service data. Note that the data setting for FCCS Service varies depending on the Node.

STEP 1: **ASYDN** - This data must be assigned to the NCN.
System Data 1, Index 41: Designate the Trunk Queuing Override Timer

STEP 2: **ASPAN** - These data must be assigned to the NCN.

TN: Tenant Number
ACC: Access number
CI: "B: Busy" (for Entry), "N: Normal" (for Cancel)
SRV: "SSC: Service Code"
SID: 19 = OG Queuing-Entry
CI: "N: Normal"
SID: 20 = OG Queuing-Cancel

Note: The following data should also be set in addition to the above-mentioned commands.
- The command to be set to the Node accommodating the Trunk
  ARTD
- The commands to be set to all the Nodes
  ASYD, ASFC

O-21 Outgoing Trunk Busy Announcements

General Description

This feature permits a Station-originated call, upon encountering a Trunk busy signal, to be automatically routed to a recorded announcement informing the caller that all Outgoing Trunks are busy.

Note: When using this feature with VS32, see VS32 Conference Server [V-26].

Operating Procedure

No manual operation is required after this feature has been programmed in System Data.

Service Conditions

1. This feature is available when a Station-originated call or tandem call encounters a busy condition.
2. MISCELLANEOUS TRUNK RESTRICTION [M-2] is also available for this feature.
3. The Announcement Machine can be provided on a per Tenant basis.
4. The availability of this feature cannot be determined for each Outgoing Trunk Route.
5. The other services activated by an Outgoing Trunk-busy condition are executed prior to this service, for example:

OFF-HOOK QUEUING	[O-7]
OUTGOING TRUNK QUEUING	[O-2]
ROUTE ADVANCE	[R-6]

6. This feature is not available when a Call Origination is impossible because of a Sender-busy condition, even though there are idle Trunks.
7. This feature is available when a call using STATION-TO-STATION CALLING [S-11] is transferred by CALL FORWARDING - ALL CALLS - OUTSIDE [C-28] or CALL FORWARDING - BUSY LINE - OUTSIDE [C-60] and encounters busy Outgoing Trunks.
8. This feature is available when a Station Calling on a DIRECT INWARD DIALING [D-8] or a TIE Line is transferred by CALL FORWARDING - ALL CALLS - OUTSIDE [C-28] or CALL FORWARDING - BUSY LINE - OUTSIDE [C-60] and encounters busy Outgoing Trunks.
9. This feature is not available when a call is transferred by CALL FORWARDING - DON'T ANSWER - OUTSIDE [C-74] and encounters busy Outgoing Trunks.
10. This feature requires one of the following hardware alternatives:
    a.) Central Office Trunk (COT) or 2W E&M Trunk (TLT) and an Announcement Machine
    b.) Digital Announcement Trunk (DAT).
11. This feature is not available for DIT CALL FORWARDING-OUTSIDE.
12. This feature is only available to a Trunk in the same Node within the FCCS Network.
13. This feature is not available for Incoming Routes of CCIS.

Programming

STEP 1: **AAED** - Assign Announcement Equipment Number = 4, and Multiple Connection = 0 are programmed.

STEP 2: **ARSC** - Set Route Restriction Class to allow RES = 1 for Announcement Trunk.

STEP 3: **ARRC** - Assign Alternative Route Restriction to allow or disallow the DID or TIE Line Route to the Announcement Route.

O-37D Off-Hook Line Number Display -D

General Description

This feature permits the Dterm LCD to display the Calling Telephone Number/Trunk Number when the Dterm user originates a call by pressing a Line key or using TRUNK LINE APPEARANCE [T-23] service.

Operating Procedure

1. When a call is originated by pressing the Line key:
   - In the on-hook status; the LCD displays:

   In the idle status and no display.
   - In the off-hook status; the LCD displays:

   Selected line number is displayed.
   - When dialing the one digit ("3"); the LCD displays:

   Selected line number is cleared and Dialed Number is displayed.
2. When a call is originated by using TRUNK LINE APPEARANCE service; the LCD displays:
   - In the on-hook status:

   In the idle status and no display.
   - In the off-hook status:

   Selected Trunk Number is displayed.
   - When dialing the one digit ("0"); the LCD displays:

   Selected Trunk Number is cleared and Dialed Number is displayed.

Service Conditions

1. This service is provided when off-hook. In the preselect status, this is not provided.
2. This service is not provided when a call is originated by using HOTLINE [H-1] service.
3. In case a call is originated by using TRUNK LINE APPEARANCE service, the connected Trunk Number is displayed.
4. If the Trunk Number is not assigned, the LCD doesn't display.
5. The maximum digits of the displayed Trunk Number is 4.
6. The display position of the selected line/Trunk Number may be changed by System Data as below:

a.)

b.)

c.)

Programming

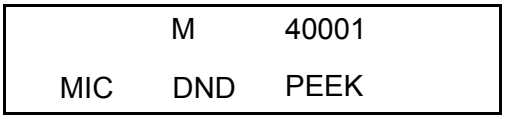
ASYD - System Data 1, Index 389, Bits 5 and 6. Location of Off-Hook Line Number Display on the Dterm.

00: Right side (Standard Setting)
01: Center
10: Left side
11: -

System Data 1, Index 389, Bit 7. Off-Hook Line Number Display -D. 0/1 = Out/In Service. Assign data "1".

O-41D Off-Hook Line Number Display -D (US)

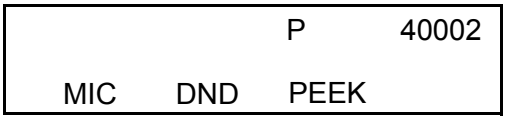
General Description



This is an enhancement to OFF-HOOK LINE NUMBER DISPLAY -D [O-37D]. In addition to the display of the Station Number, this feature will insert a letter to designate the My Line or Prime Line.

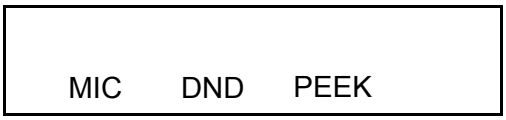
Note: This feature is available in North America only.

Operating Procedure



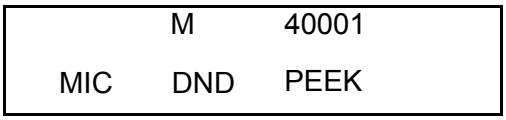
- My Line key selected with line number display in center

1. A Desktop terminal station presses the SPEAKER key or handset off hook.
2. LCD displays the My Line or Prime Line number and the letter “M”.



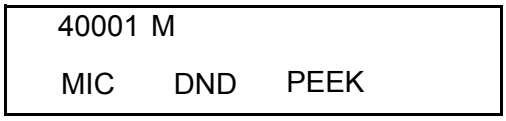
- Prime Line key selected with line number right display

1. A Dterm Station presses the SPEAKER key or handset off hook.
2. Prime Line is selected
3. LCD displays the Prime Line number and the letter “P”.

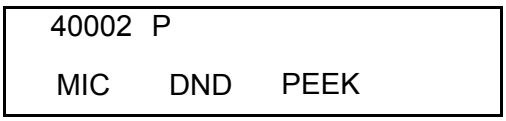


- Idle Condition

1. In the idle status no display.

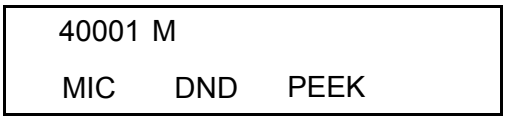


- My Line and Prime Line not split with line number display in center



- My Line key selected with line number left display

1. A Desktop terminal station presses the SPEAKER key or handset off hook.
2. LCD displays the My Line or Prime Line number and the letter “M”.



- Prime Line key selected with line number left display

1. A Desktop terminal station presses the SPEAKER key or handset off hook.
2. Prime Line is selected.
3. LCD displays the Prime Line number and the letter “P”.

- My Line and Prime Line not split with line number left display

Service Conditions

1. OFF-HOOK LINE NUMBER DISPLAY -D [O-37D] must be allowed.
2. Sub Lines, other than the Prime Line, will not be designated by a letter.
3. The maximum Station Number length that can be used with My Line Designator is five digits. If the maximum length is exceeded the designation letter will not be displayed.
4. This feature is only available for Dterm.
5. Wireless terminals are not supported for this feature.
6. The letter designator, “M/P” is not assignable.
7. Letter designation is not provided for SOFTWARE MULTIPLE MY LINE APPEARANCE [S-143].
8. This service is not provided for Hotel systems.

Interactions

1. This service is provided when off-hook. In the pre-select status, this is not provided.
2. This service is not provided when a call is originated by using HOTLINE [H-1].
3. The display position of the selected line may be changed by System Data as below.

Programming

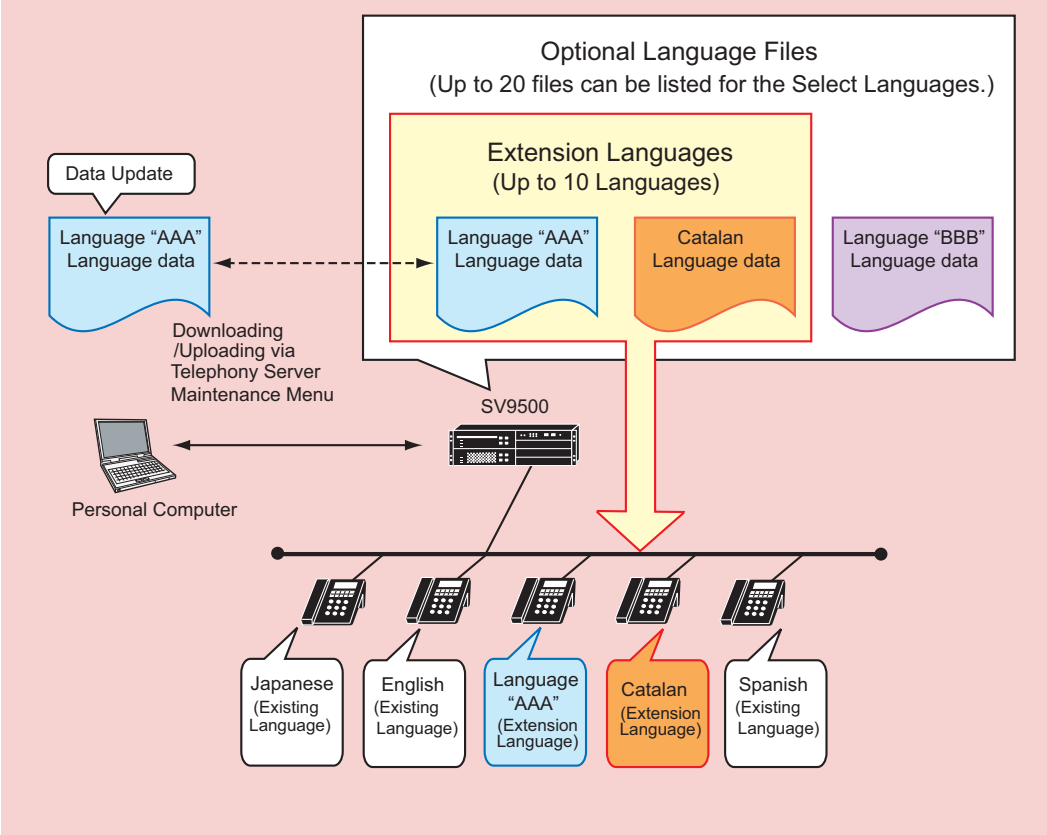
ASYD - System Data 1, Index 389, Bits 5 and 6. Location of Off-Hook Line Number Display on the Dterm.

00: Right side (Standard Setting)

01: Center

10: Left side

11: -



System Data 1, Index 389, Bit 7. Off-Hook Line Number Display -D. 0/1 = Out/In Service. Assign data "1".

ASFC - For Stations to use OFF-HOOK LINE NUMBER DISPLAY -D (US), assign 1 to a Class of Service that allows SFI 235 (My Line Designator).

O-42 Optional Language Pack Loading

General Description

Optional Language Pack Loading offers a quick and easy way to provide additional language options for the telephony network. A maximum of 20 language files can be included in the Select Language list of the system, from which you can select up to 10 to configure the Extension Languages for daily use.
Languages specified for the Extension Languages, as well as the existing languages used in the MULTILINGUAL DISPLAY [M-117] feature, are available in the entire system or on the individual Desktop terminals. You can also easily add or modify the data of the Optional Language files from a personal computer via the Telephony Server Maintenance Menu. To add a new option, simply create and upload the desired language file to SV9500; to modify the data, download and edit the target data then upload it to SV9500.

Operating Procedure

No manual operation is required.

Service Conditions

1. For hardware requirements for the Optional Language Pack Loading feature, refer to MULTILINGUAL DISPLAY [M-117]. The requirements specific to Extension Languages are as follows:
   a.) In the case of DT700 Series, terminals with firmware version 3.0.0.0 or later are supported. (Downloading language files is required.).
   b.) Desktop terminals on which Extension Languages are used must support the corresponding character code. If not, some characters cannot be displayed correctly.
   c.) To support Chinese on Digital Terminal, the following firmware is required.

Equipment		Firmware	Remarks
Terminal	DT330 (DTL-32D-1P)	V2.50 or later	Font version of the terminal must be V2.00 or later.
Circuit Card	CH-16ELCA	Any version	

   d.) The available terminals for using Azerbaijani/Turkish are as follows:
   - DT830G (with firmware version 5.1.1.0 or later)
   - DT830 (with firmware version 5.1.1.0 or later)
   - DT820 (with firmware version 3.1.1.0 or later)

   Note: When using other than the terminals above, some characters cannot be displayed correctly.

2. To use this feature, system data (ASYDL, SYS1, Index 679, Bit 2=1) must be assigned.
3. A maximum of 10 languages can be specified as the Extension Languages.
4. By using this feature, Optional Language files can be newly created. For details of creating or editing Optional Language files, refer to Management in this service.
5. To use a language specified as Extension Language, data assignment with the ASLG command or configuration on a Desktop terminal is required.
6. Some texts are presented in NEC English or the First Language instead of the specified Extension Language when:

   - The Optional Language Pack Loading feature is disabled while the Extension Language is being used.
   - The language data in use is deleted.
   - There are flaws in the data of the Extension Language.

   In this case, specify another language by using the ASLG command or assigning Office data to the Desktop terminal.

7. Data specified on the [EXTENSION] tab of the ASLG command screen is saved in SV9500 in a format different from that of Office Data. Even if Office Data is not saved or another Office data is uploaded, the data of the Extension Languages is retained.
8. Regardless of the settings of system data (ASYDL, SYS1, Index 679, Bit 2=1), if there are data of Extension Languages assigned, when the Telephony Server is started, the data is loaded (read from the [EXTENSION] tab of the ASLG command). However, if the system data is set to out of service (ASYDL, SYS1, Index 679, Bit 2=0), the Extension Language number from the [EXTENSION] tab of the ASLG command cannot be set.

9. Any changes such as adding, editing or removing data in the Extension Languages require restarting the SV9500. When these changes are made using a Desktop terminal, initialization of ELC card is needed.
10. The language to be displayed on the configuration menu of a DT800 Series/DT700 Series terminal is basically a language specified for <Details of Data Class 1-4 Menu Language Number>. However, the use of some languages requires menu download. In this case, when the specified language is not loaded to the Desktop terminal, English is displayed instead. To use a language other than English, select one through "menu" → "Setting" → "User Setting" → "Display" → "Language."

    Note: For languages available on DT800 Series/DT700 Series terminals, refer to <Details of Data Class 1-4 Menu Language Number>.

11. The LCD of IP terminal (Proprietary Protocol) displays date/weekday using a character set specified for the Menu Language Number (Kind 1: Language Data, Data No.4: Menu Language Number), based on the user's Desktop terminal date/weekday (not SV9500 date/weekday). If the character set specified from the SV9500 is not available on the Desktop terminal, date/weekday is displayed in English instead.
12. Extension Languages with Terminal Character Codes other than nec-code (Kana and alphanumeric characters) or ascii (ASCII character set) cannot be specified for the First Language, but must be specified for the Second Language. These character codes include sjis (Shift JIS), nec-code-rus (Cyrillic), euc-cn (Simplified Chinese), and big5 (Traditional Chinese).
13. The conditions for using Azerbaijani and Turkish are as follows:

    Note: These languages are available:
    - from FP95-114 V4 Issue 4.0
    - only for EMEA

    a.) Azerbaijani/Turkish must be used solely for the whole system, it cannot be used in conjunction with other languages including all nodes.

    b.) Assign data with PCPro version 7.1.0 or later. Also, PCPro requires a setting before assigning data. In the PCPro main menu, select "Settings" → "Accept Extensional Characters for"→ "Turkish" (restarting PCPro is required after performing this setting).
    Azerbaijani/Turkish can be used by the following commands. To see the available characters, refer to the Main Menu section of PCPro Window Layout chapter of PCPro Setup Manual.
    - ANDD
    - ANDD_T
    - APBKN
    - AUPDN

    c.) If Azerbaijani/Turkish is used in NAME DISPLAY - SYSTEM [N-28] and PHONEBOOK [P-83] (System Phonebook), assign ASYDL/ASYDN, SYS1, Index 686, Bit 7=1.

    d.) Azerbaijani/Turkish requires in the ASLG command to set Russian as first language and Azerbaijani/Turkish as second language.

    e.) To display on a terminal LCD in Azerbaijani/Turkish, the following steps on the terminal side are also required.
        1. Open the [7.Character Code] menu ([3.Character Code] in case of DT820) by selecting [0.Config] → [3.Maintenance Settings] → [4.Adjust].
        2. Select [1: Eastern Europe].
        3. Save it and exit the menu.

Interactions

1. When using system or features that employ multiple nodes in the network, set all the nodes with the same Extension Language data. Desktop terminals follow the settings of Extension Language implemented in the node to which they register.
2. Changes made in language data with the ASLG command (including the addition or deletion of Extension Language files) are not automatically reflected in SR-MGC. You must manually update the SR-MGC by following the steps outlined below. For detailed procedure, see 1. Download/Upload/Deletion of Language Files.

   Step 1: Download the following data from the SV9500:
   - All language data in the SV9500
     (.txt files in the pattern of "<language name>_<file version>.txt" - for example, "Catalan_0001.txt")
   - Information file of Extension Languages
     (File name: exlang_info)

   Step 2: Upload the data you downloaded in the previous step to the SR-MGC.

   Step 3: In the SINZ command, select **System Initialize** for **Process Kind Select**, and initialize the SR-MGC.

   Note: Data assignment of Extension Languages with the ASLG command is not available on the SR-MGC side.

Programming

For the data assignment to use Optional Language Pack Loading, refer to "Programming" of MULTILINGUAL DISPLAY [M-117].

Management

1. Download/Upload/Deletion of Language Files

This section explains how to download/upload language files (.txt files) between SV9500 and a personal computer by using the Telephony Server Maintenance Menu. Relevant information regarding these procedures is also provided.

1.1 Understanding Optional Language File

Sample files of Optional Language are installed in SV9500 by a setup program on the installation DVD/CD. To update the Optional Language files, use the Telephony Server Maintenance Menu or to download the desired language file from SV9500 for editing the data with a text editor (including Microsoft® Office Excel®), and then upload back.

Note: For details on editing of Optional Language files, see "2. Creation/Editing of Optional Language Data."

1.2 Downloading

The following data can be obtained by downloading from SV9500.

- All Optional Language files stored in the SV9500

  (“<language name>_<file version>.txt” - for example, “Catalan_0001.txt”)

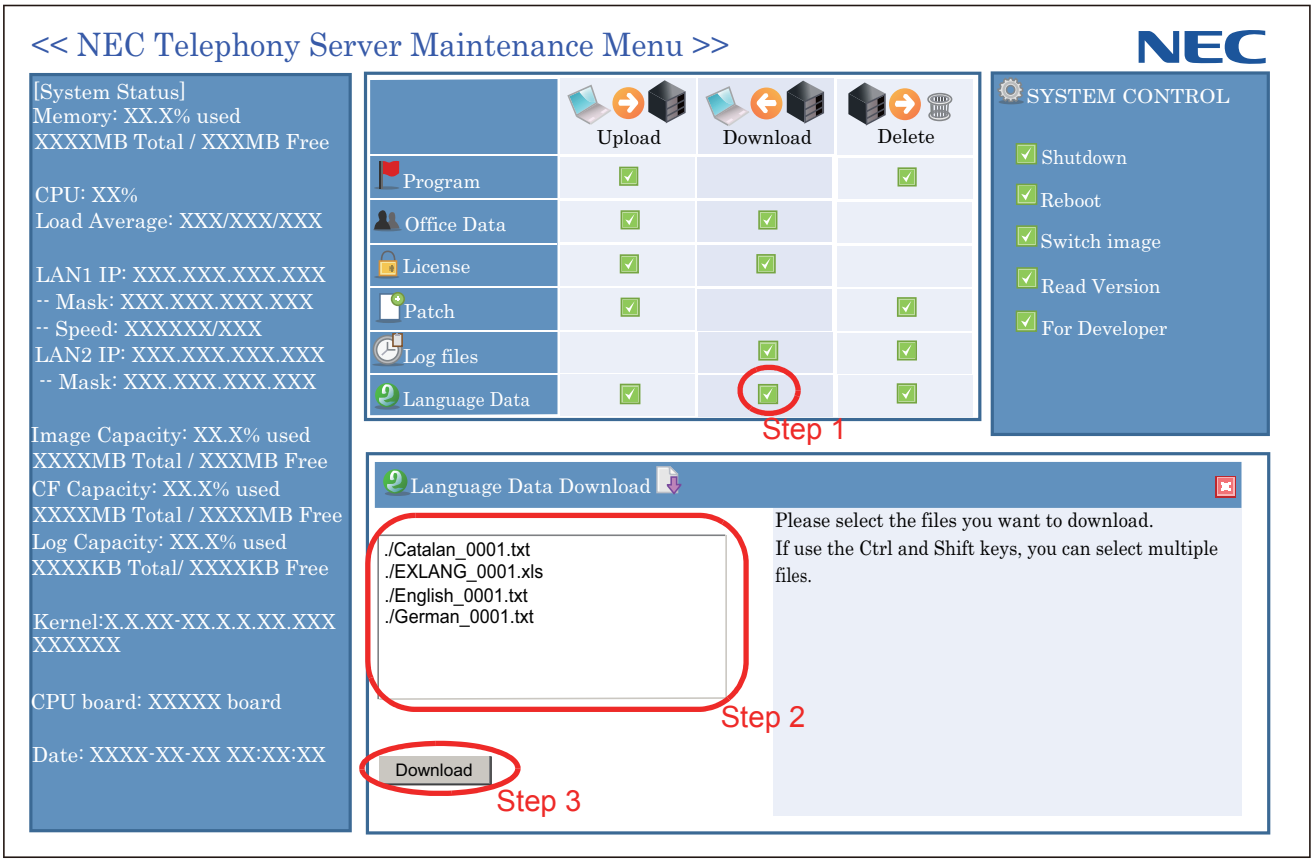
- Information file of Extension Languages **Note 1**

  (File name: exlang_info)

- Sample files of Optional Language in Excel format (for example, “Exlang_0001.xls”)

  (An Optional Language file can be created by saving an Excel spreadsheet in Tab Separated Values (TSV) format.)

Note 1: Note the following conditions for Information file of Extension Languages.
- This file exists only when it is used by the ASLG command and the Optional Language Pack Loading feature is already in use.
- The data of Optional Language file can be backed up by downloading the related language files and Information file to the maintenance console. The saved Optional Language files can be restored by uploading them with the Information file back to the SV9500. To make the change effective, restart the SV9500 (or access the SINZ command and execute [Program Load & Office Data Load & System Initialize] on PCPro) or reconfigure it with the ASLG command.



1.3 Working with Optional Language File via Telephony Server Maintenance Menu

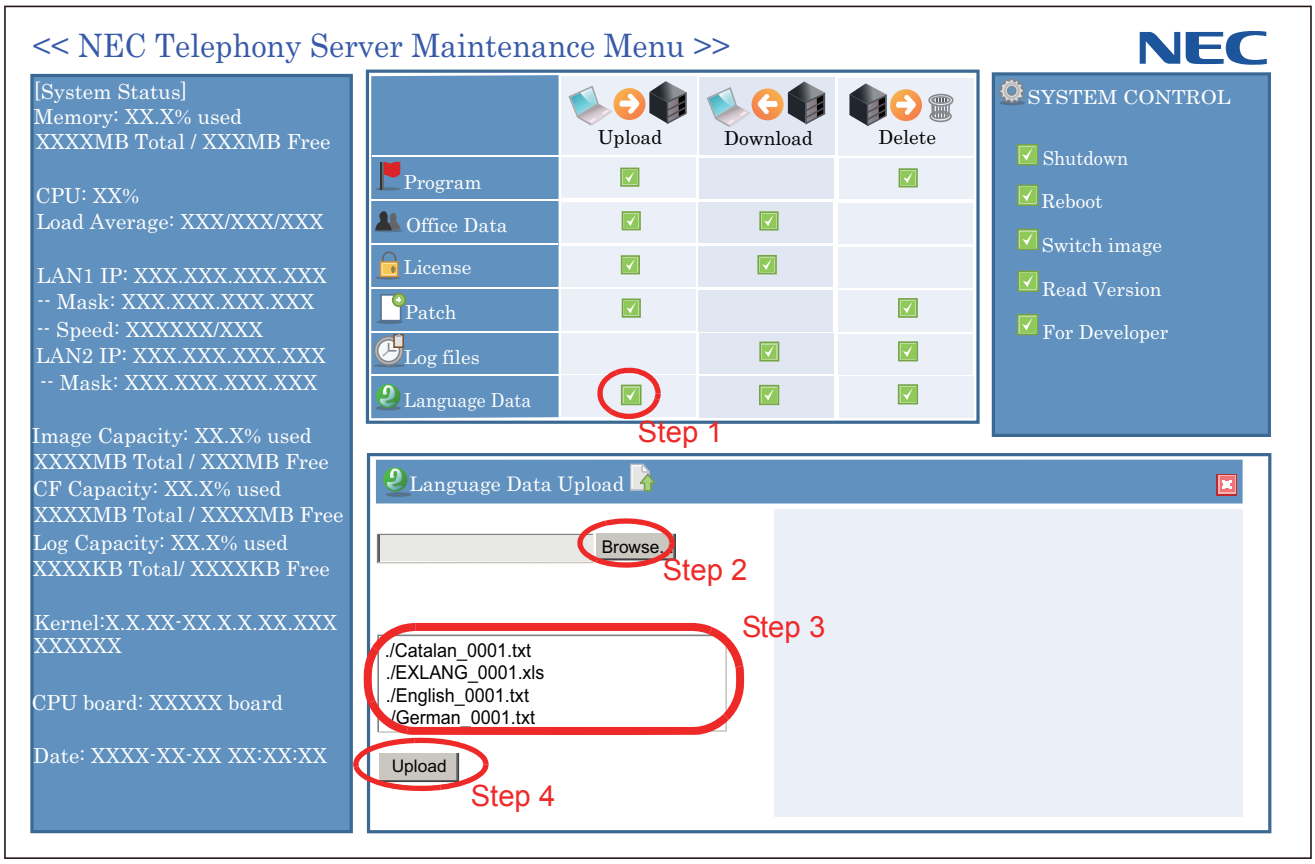
Telephony Server Maintenance Menu provides the following functionality:

Functionality	Description
Download of language files	Downloads language files from SV9500 to the personal computer.
Upload of language files	Uploads language files from the personal computer to SV9500.
Deletion of language files from SV9500	Removes language files from SV9500.

<Download of Language Files>

The following is the procedure for downloading language files from SV9500.

STEP 1: On Telephony Server Maintenance Menu, select the check box in the [Download] column of the [Language Data] row.
The [Language Data Download] window opens.



STEP 2: In the [Language Data Download] window, click the desired language file.

STEP 3: Click the [Download] button.
A dialog box appears.

STEP 4: Choose [Save As] in the open dialog box and save the language file in the appropriate folder.

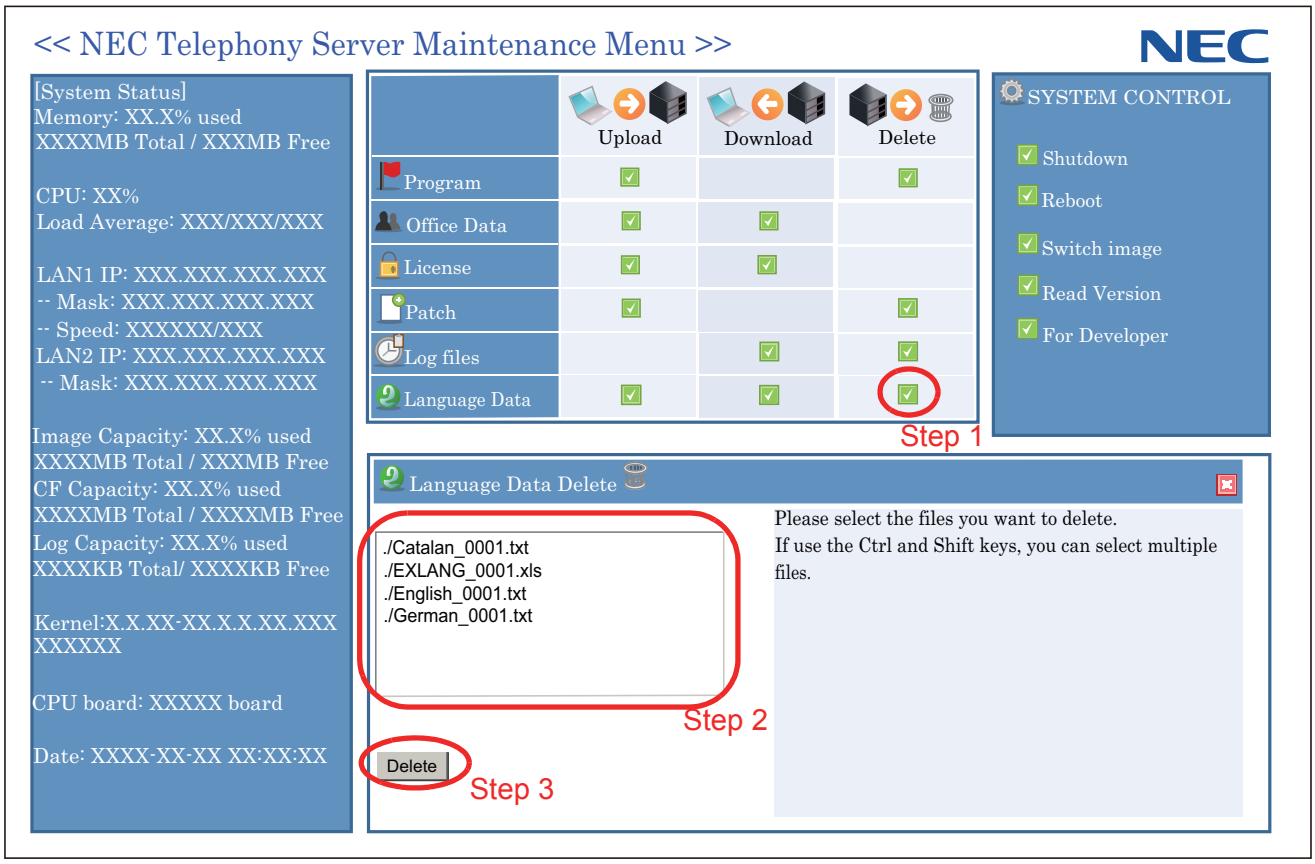
<Upload of Language Files>

The following is the procedure for uploading language files to SV9500.

STEP 1: On Telephony Server Maintenance Menu, select the check box in the [Upload] column of the [Language Data] row.
The [Language Data Upload] window opens.

STEP 2: In the [Language Data Upload] window, click the [Browse] button.
A dialog box appears.

STEP 3: In the open dialog box, select the desired language file and choose [Open].



STEP 4: Click the [Upload] button.
When the upload process is completed, a message appears, showing "Operation successfully completed."

STEP 5: Click [OK].

Note: Uploading Optional Language files to SV9500 requires the setting on the [EXTENSION] tab of the ASLG command. Any changes made in an Optional Language file will not take effect until the process is complete.

<Deletion of Language Files from SV9500>

The following is the procedure for deleting language files from SV9500.

STEP 1: On Telephony Server Maintenance Menu, select the check box in the [Delete] column of the [Language Data] row.
The [Language Data Delete] window opens.

STEP 2: In the [Language Data Delete] window, click the desired file.

STEP 3: Click the [Delete] button.
A confirmation message appears, asking “Are you sure you want to delete?”

STEP 4: Click [OK].
A message appears, showing “Operation successfully completed.”

STEP 5: Click [OK].

Note: If all language files are deleted, the data of the Optional Language Pack Loading return to their original state after installation.

2. Creation/Editing of Optional Language Data

This section explains how to create and edit language files used for the Optional Language Pack Loading feature.

2.1 Creating/Editing Optional Language Data

The following is the outline of the entire procedure:

STEP 1: Obtaining language files

When creating Optional Language files, download Sample files of Optional Language in Excel format (for example, Exlang_0001.xls), following the instructions given in "1. Download/Upload/Deletion of Language Files."

When editing the existing Optional Language files, download the desired.txt files.

STEP 2: Creating/Editing Optional Language files

Create or edit Optional Language files by referring to "2.2 Conditions of Optional Language Data" and "2.3 Information about Optional Language Data."

STEP 3: Saving the created/changed Optional Language files

Save the created or changed Optional Language files referring to "2.4 Creating Optional Language Data from Excel."

STEP 4: Uploading language files to SV9500

Upload the language files to the SV9500, following the instructions given in "1. Download/Upload/Deletion of Language Files."

2.2 Conditions of Optional Language Data

1. The Optional Language files must be in Tab Separated Values (TSV) format. (The file extension is '.txt'.) To create a new Optional Language file, use a Sample file of Optional Language, which has been installed in SV9500 by a setup program on the installation DVD/CD.

   Note: When the Optional Language file is updated, increase the version number of the file.

2. Text in an Optional Language file is represented in ASCII (including nec-code and nec-code-rus) or sjis based on the Terminal Character Code in language data. If text contains characters not representable in the specified character set, the characters are displayed as question marks on the LCD of a Desktop terminal.

   Note: For available character codes, refer to <Details of Data Class 1-4 Menu Language Number>.

3. Do not use blank spaces in the file name of Optional Language file.
   (Example)
   Unusable: Exlang 0001.txt
   Usable: Exlang_0001.txt
4. In this feature, character set in language data is automatically encoded. However, a character set consisting of very few characters may not be encoded correctly. In this case, enter the characters of the source character set in the comment field of the language data.
5. Multiple character codes cannot be specified for the same Optional Language data.

2.3 Information about Optional Language Data

<Data in Optional Language File>

Optional Language files are created in Tab Separated Values (TSV) format, which can be edited with Microsoft® Office Excel® (hereinafter referred to as Excel) or text editor. The following is an example of Excel file format.

Field	Editing	Description
No	N	Data class number. e.g. 1 = Language_Data, 2 = Call_kind_display, 3 = Display_Data_4
Data Kind	X	Data class name. e.g. Language Data, Call_kind display, Display Data
Data No	N	Serial number within a data class.
Data Name	X	Data name. e.g. Direct Distance Dialed, Foreign Exchange
Size	N	Maximum data size.
Display Data	X	Text to be displayed. • Data to be interpreted as binary values should be entered in hexadecimal notation by adding 0x as the prefix of the number. • Text of multi-byte characters must be left-aligned.

X: Available N: Not Available

<Example of Optional Language File>

The following are examples of language files (of Catalan) in Excel format and in Tab Separated Values (TSV) format, respectively:

- Excel file

Kind	Kind Name	Data Number	Data Name	Size	Display Data										
1	Language Data	0	Language Number	4	0	0	0	2							
1	Language Data	1	Language Name **Note 1**	16	C	a	t	a	l	a	n				
1	Language Data	2	Language Version	4	0	0	0	1							
1	Language Data	3	Character Code	1	0x00										
1	Language Data	4	Menu Language Number	1	0x13										
2	Call kind display	0	Nop	4											
2	Call kind display	1	Direct Distance Dialed	4	D	D	D								
2	Call kind display	2	Foreign Exchange	4	F	X									

Note 1: Use only alphanumeric characters.

- Text file in TSV format

Kind (t) Kind Name (t) Data Number (t) Data Name (t) Size (t) Display Data

1 (t) Language Information (t) 0 (t) Language_Number (t) 4 (t) 0 (t) 0 (t) 0 (t) 2

1 (t) Language Information (t) 1 (t) Language_Name (t)16 (t) C (t) a (t) t (t) a (t) l (t) a (t) n

1 (t) Language Information (t) 2 (t) Language_Version (t) 4 (t) 0 (t) 0 (t) 0 (t) 1

1 (t) Language Information (t) 3 (t) Character_Code (t) 1 (t) 0x01

1 (t) Language Information (t) 4 (t) Menu Language Number1 (t) 1 (t) 0x12

2 (t) Call_kind_display (t) 0 (t) Nop (t) 4

2 (t) Call_kind_display (t) 1 (t) Direct_Distance_Dialed (t) 4 (t) D (t) D (t) D (t)

2 (t) Call_kind_display (t) 2 (t) Foreign_Exchange (t) 4 (t) F (t) X

Note: "(t)" in the above image means a tab separating each field.

<Details of Data Class 1-4 Menu Language Number>

Data class "1: Language Data" of the language file contains information on Optional Language settings. The details of each parameter are presented below:

No.	Data No.	Description
1	0	Language Number [0000 - 9999] Identifier (ID) of Optional Languages. Specify the number corresponding to the target Optional Language. If the desired language is not listed, select an available number from 1000 through 9999.
		0000 = - (Not available.) 0001 = English 0002 = Catalan 0003 - 000E = Reserved. 000F = Azerbaijani 0010 - 0999 = Reserved. 1000 - 9999 = User-defined.
1	1	Language Name (the name of Optional Language.) Specify the Optional Language name, which is displayed in the ASLG command window.
1	2	Language Version [0000 - 9999] When the Optional Language file is updated, increase the version number of the file, which is also displayed in the ASLG command window.
1	3	Terminal Character Code [0x00 - 0xFF] Specify the character code, using the following binary values (in hexadecimal format by adding 0x as the prefix of the number.) 0x00 = nec-code (Kana and alphanumeric characters) 0x01 = nec-code-rus (Cyrillic and alphanumeric characters) **Note 1** 0x02 = ascii (ASCII character set) 0x03 = sjis (Shift JIS character set) 0x04 = unicode (Reserved for Unicode) **Note 2** 0x05 = euc-cn (GB2312) (Simplified Chinese characters) 0x06 = big5 (Traditional Chinese characters) 0x07 - 0xFF = Reserved. **Note:1** Assign this data for Azerbaijani/Turkish. **Note:2** Not available.

<table>
<tr><th>No.</th><th>Data No.</th><th colspan="2">Description</th></tr>
<tr><td rowspan="2">1</td><td rowspan="2">4</td><td colspan="2">Menu Language Number [0x00 - 0xFF]
Specify the menu language number, using the following binary values (in hexadecimal format by adding 0x as the prefix of the number.)

Note: Specify the number corresponding to the languages displayed on the menu screen of DT800/DT700 Series. If the applicable language is not listed, choose “0x00 = English.”</td></tr>
<tr><td>0x00 = English
0x01 = Portuguese
0x02 = Spanish

</table>

<Call History Display for Answered/Unanswered Call>

The following is the procedure for setting Call History to be displayed on LCD. Call History Display data for answered calls and unanswered calls can be set separately. Specify “52: Call History” as data class of the language file when you set Call History Display data. The procedure for setting the display data differs according to whether “52: Call History” is specified or not.

- When data class “52: Call History” is specified

  Set characters to be displayed on LCD for Data Number “0: Answered” and “1: Missed”.

- When data class “52: Call History” is not specified

  Set the following for Data Kind“52”.

  [LCD display for answered call]

  Kind 52
  Kind Name: Call History
  Data Number: 0
  Data Name: Answered
  Size: 8
  Display Data: Text to be displayed (“Answered” in the example below)

[LCD display for unanswered call]

Kind: 52
Kind Name: Call History
Data Number: 1
Data Name: Missed
Size: 8
Display Data: Text to be displayed (“Missed” in the example below)

The following are examples of language files in Excel format and in Tab Separated Values (TSV) format, respectively:

- Excel file

Kind	Kind Name	Data Number	Data Name	Size	Display Data										
:	:	:	:												
51	Softkey Display for Call History (Default)	0	Softkey(<<<)	6	<	<	<								
51	Softkey Display for Call History (Default)	1	Softkey(<<<)	6	>	>	>								
51	Softkey Display for Call History (Default)	2	Softkey(DELETE)	6	E	S	B	O	R	R					
51	Softkey Display for Call History (Default)	3	Softkey(END)	6		F	0x13								
52	Call History	0	Answered	8	A	n	s	w	e	r	e	d			
52	Call History	1	Missed	8	M	i	s	s	e	d					

Note: Add data class “Call History” to Kind “52” of HELP Data Kind worksheet. Some cells of sample files of Optional Language in Excel format (for example, Exlang_0001.xls) may be protected. When creating a language file, cancellation of protection for worksheet is necessary before editing the language file. To cancel the protection, click on Tools-Protection-Protect Sheet. After editing the file, protect the worksheet again.

- Text file in TSV format

```
Kind (t) Kind Name (t) Data Number (t) Data Name (t) Size (t) Display Data
:
51 (t) Softkey Display for Call History (Default) (t) 0 (t) Softkey (<<<) (t) 6 (t)  (t) < (t) < (t) <
51 (t) Softkey Display for Call History (Default) (t) 1 (t) Softkey (>>>) (t) 6 (t)  (t) > (t) > (t) >
51 (t) Softkey Display for Call History (Default) (t) 2 (t) Softkey (DELETE) (t) 6 (t) E (t) S (t) B (t) O (t) R (t) R
```

51 (t) Softkey Display for Call History (Default) (t) 3 (t) Softkey (END) (t) 6 (t) F (t) 0x13

52 (t) Call History (t) 0 (t) Answered (t) 8 (t)

52 (t) Call History (t) 1 (t) Missed (t) 8 (t)

Note: "(t)" in the above image means a tab separating each field.

2.4 Creating Optional Language Data from Excel

An Optional Language file can be created by saving an excel spreadsheet of Optional Language Sample file in Tab Separated Values (TSV) format (*.txt) or Unicode format (*.txt).

<Optional Language File Creation>

- From the Excel menu, click [File] → [Save As] to display [Save As] dialog box, and choose a file type, either tab-separated file format or Unicode format.
- The file name must be 16 alphanumeric characters (including underscore(_)) or less.

  For example, <language name>_<version>.txt (Catalan_0001.txt)

- Rename the file by changing the file name or version number.

Note: If you update an Optional Language file without changing its name, the new information may not be reflected.

3. Example of Procedures for Multilingual Display with Extension Languages

This section describes the steps for:

- Adding Extension Language Files
- Updating Extension Language File (Customized Language File)
- Updating Extension Language File (Sample Language File)

3.1 Adding Extension Language Files

The following is an example of procedure to add two new Extension Language files, Catalan and English2. In this example, assume that English2 is a customized file from a sample language file (English).

Note: The following steps (STEP 1: to STEP 3:) are required only when a existing system is upgraded. You can begin with STEP 4:, If the system version remains the same.

STEP 1: Initialization of a Compact Flash (CF) card
Initialize a CF card, referring to Appliance Model Installation Manual.

Note: Back up the data of CF card if necessary.

STEP 2: Installation of the program through Telephony Server Maintenance Menu
Install the program on Telephony Server Maintenance Menu, referring to Appliance Model Installation Manual.

STEP 3: Restarting the system from Telephony Server Maintenance Menu
[1] Access Telephony Server Maintenance Menu.
[2] From [System Control], select [Shutdown] or [Reboot].
If you select [Shutdown], turn on the power of the system after shutdown.

STEP 4: Transferring language data from the CF card to a personal computer
Use Telephony Server Maintenance Menu to transfer language data from CF card to the personal computer.
Fore more information, refer to <Download of Language Files> in "1.3 Working with Optional Language File via Telephony Server Maintenance Menu."

STEP 5: Editing the language data
Use Excel or text editor to edit language data.
Fore more information, refer to "2. Creation/Editing of Optional Language Data".
- Catalan: Catalan_0002.txt
- English2: English2_001.txt **Note 1**

Note 1: If you add English2 (English2_001.txt) to Extension Language, text is presented in mixed case. However, on terminals under IPG/UG50, month and day do not appear in mixed case.

STEP 6: Transferring the language data from the personal computer to the CF card

Use Telephony Server Maintenance Menu to transfer language data from the personal computer to CF card.

Fore more information, refer to <Upload of Language Files> in "1.3 Working with Optional Language File via Telephony Server Maintenance Menu."

STEP 7: Assignment of the following Office Data

[1] ASYDL/ASYDN SYS1 Index 679 Bit 2=1.

[2] Click the [EXTENSION] tab on the ASLG command and click the [Get] button.
Specify an Extension Language and click the [Set] button.

[3] Click the [FIRST] tab and specify a first language to be used in the system.

Note: Extension Languages with Terminal Character Codes other than nec-code (Kana and alphanumeric characters) or ascii (ASCII character set) cannot be specified for the First Language, but must be specified for the Second Language. These character codes include sjis (Shift JIS), nec-code-rus (Cyrillic), euc-cn (Simplified Chinese), and big5 (Traditional Chinese).

[4] Click the [SECOND] tab and specify the setting.
Second Language field: Select "Select Terminal".
LANG NO: Specify a language number for second language.

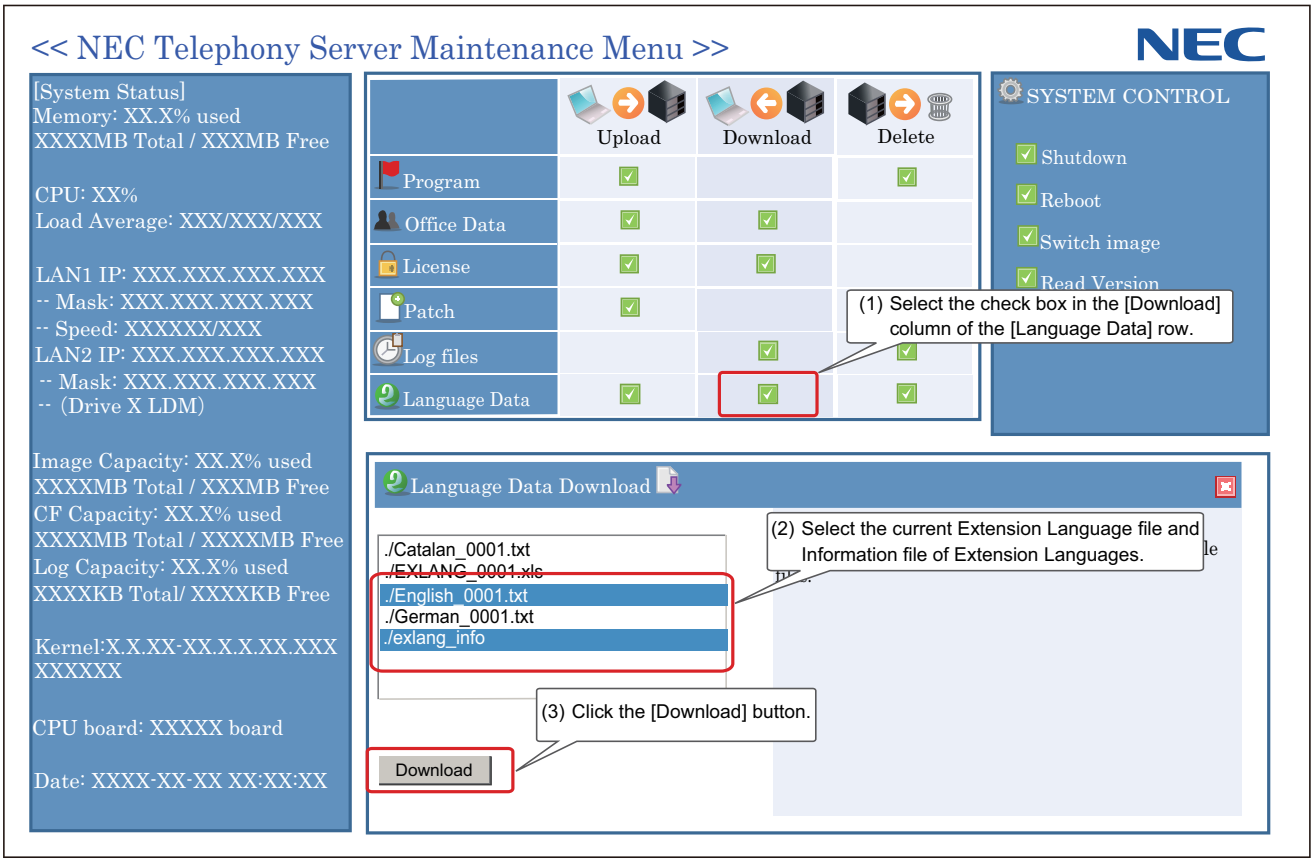
[5] Click the [TERMINAL] tab and [Unit] tab and specify each setting.

STEP 8: Backing up the Office Data

Back up the Data Memory with the MEM_HDD/HDD_MEM_N command.
Direction Select: MEM->HDD
Data Type Select: Data Memory

STEP 9: Initialization of SV9500 to apply the changes

Select "System Initialize" on the [TYPE] tab of the SINZ/SINZN command.



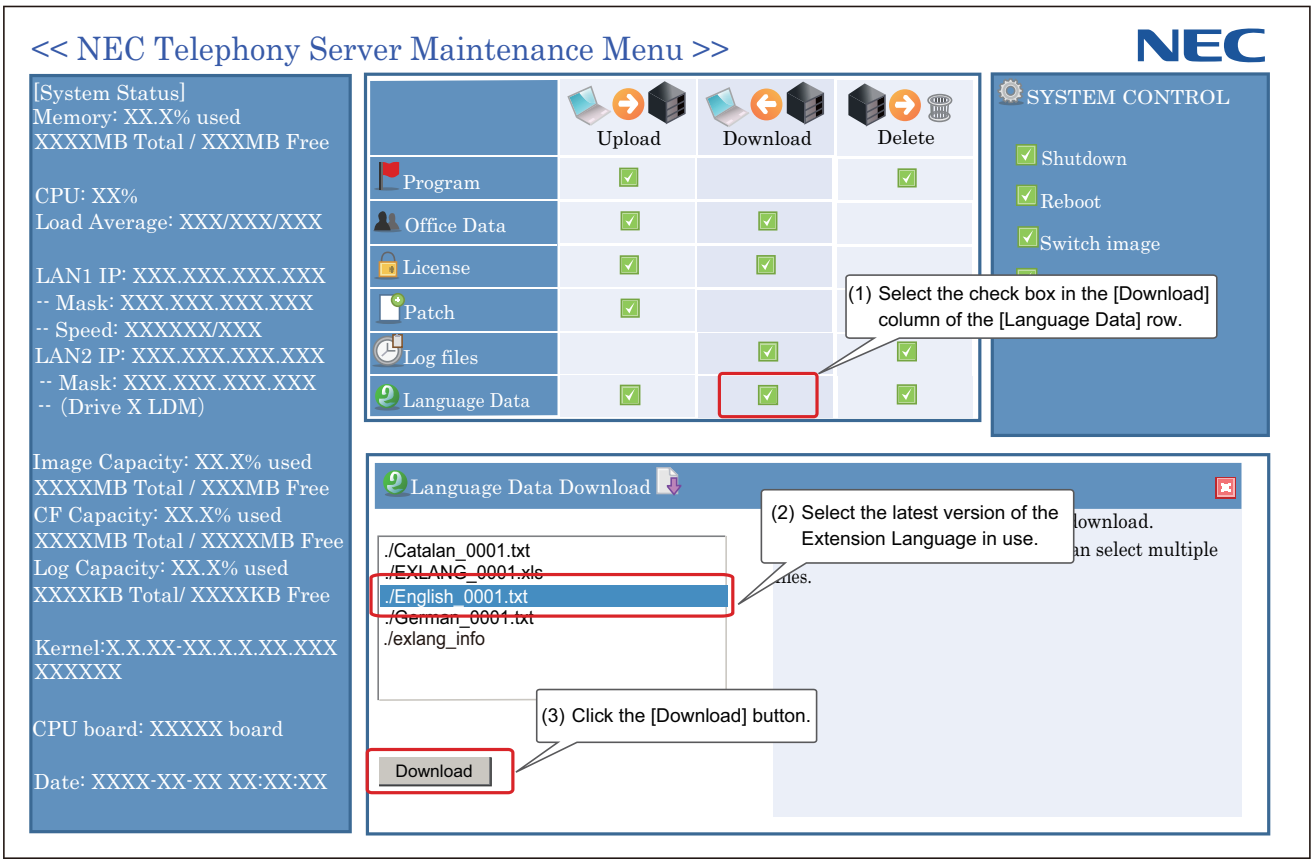
3.2 Updating Extension Language File (Customized Language File)

The following is an example of procedure to update a customized language file with the latest data. In this example, assume that English2 is modified from a Sample Language file (English).

Note: If you want to update a sample language file, see "3.3 Updating Extension Language File (Sample Language File)."

STEP 1: Creating a current language data backup prior to program update

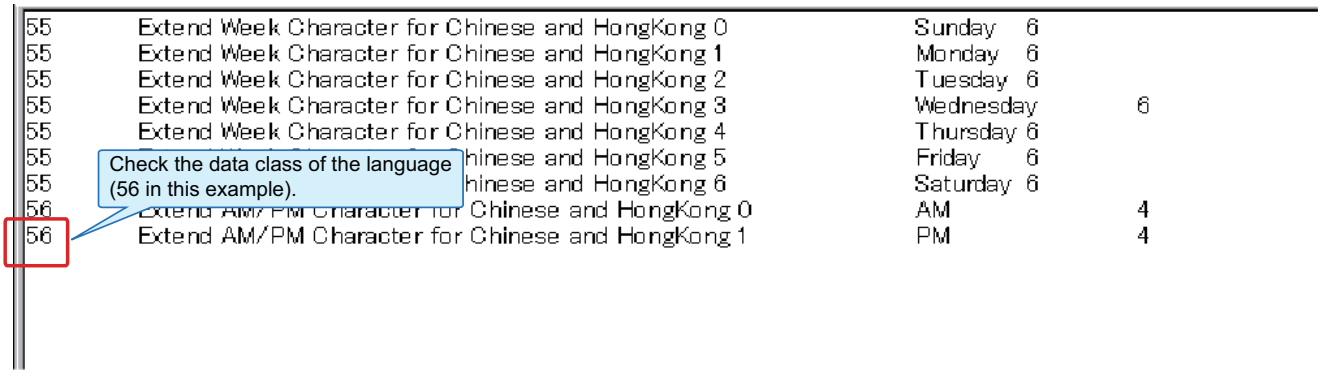
By referring to "1. Download/Upload/Deletion of Language Files," download the current Extension Language file (English_0001.txt) and Information file of Extension Languages (exlang_info).



STEP 2: Downloading the latest Extension Language file after the program update

After updating the program, download the latest version of the Extension Language in use (English_0001.txt).

If necessary, download a Sample file of Optional Language in Excel format (EXLANG_0001.xls), and create new language data by referring to "2.4 Creating Optional Language Data from Excel."

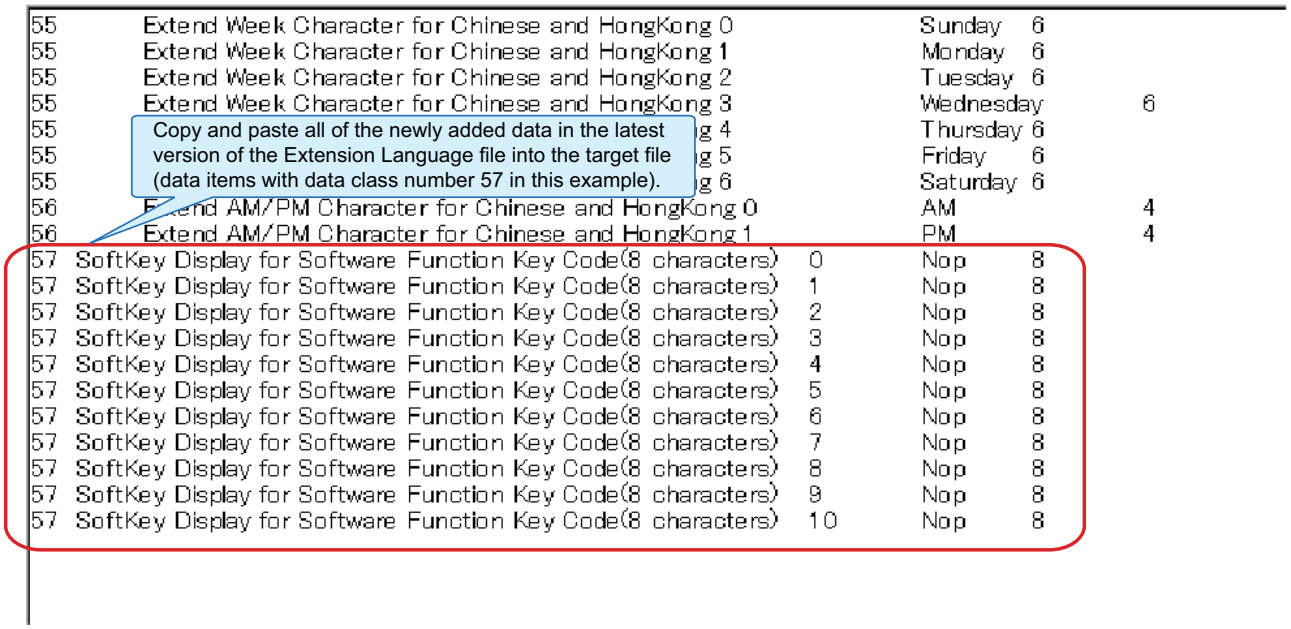


Note: Be careful not to overwrite the backup of the language file created in Step 1.

STEP 3: Checking the data class of the language in the last line of the current Extension Language file

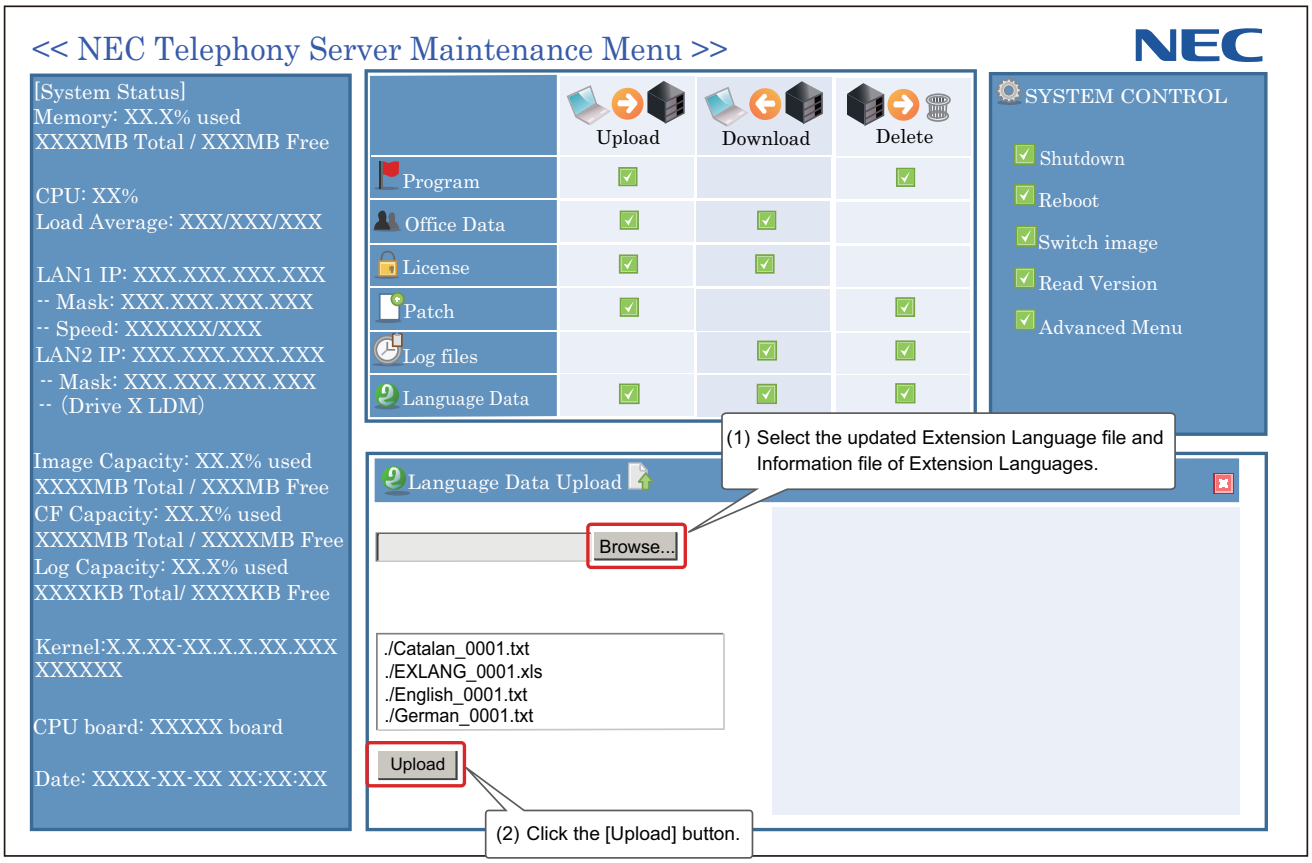
[1] Open the backup of the current Extension Language file with a text editor, and scroll down to the last line.

[2] Write down or memorize the data class number of the last line (in the leftmost column of the line).



STEP 4: Updating the current Extension Language file with new information

[1] Duplicate the backup of the current Extension Language file and save it in a different folder. The duplicated file is the target file to which the update is to be applied.



[2] Open the latest Extension Language file (English_0001.txt) with a text editor.

[3] Copy and paste all of the newly added data in the latest version of the Extension Language file into the target file, then save it.

STEP 5: Uploading the updated Extension Language file

Upload the updated Extension Language file (target file) and the Information file of Extension Languages (exlang_info) to the SV9500.

STEP 6: Verifying the integrity of the Extension Language settings

[1] Log in to the SV9500 through PCPro.

[2] Go to the ASLG command, then select the [EXTENSION] tab.

[3] Click the [Get] button, and verify that no errors exist.

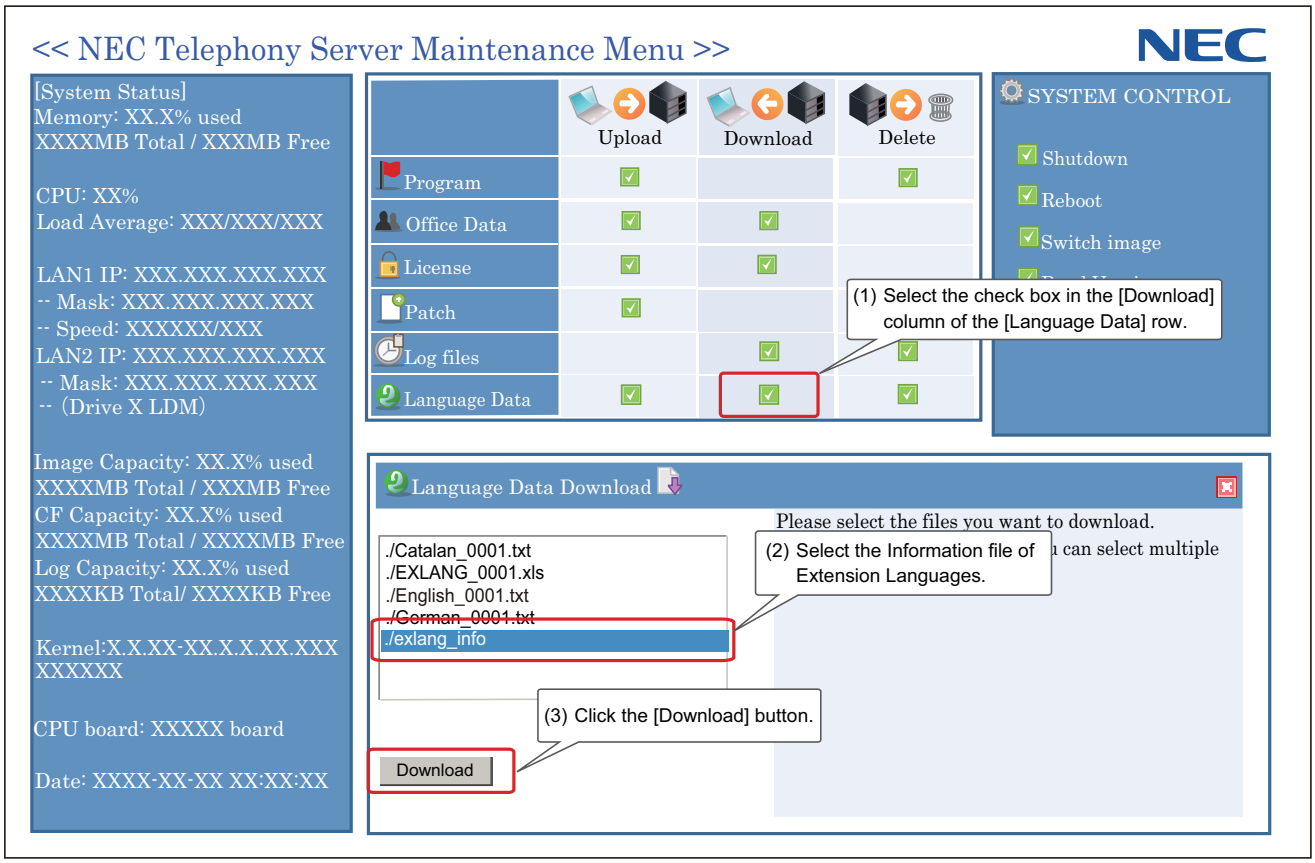
Note: System initialization is required to make changes to Extension Language data effective. The changes do not take effect when the modified data is uploaded to SV9500.

STEP 7: Verifying the validity of the update

[1] From PCPro, initialize the SV9500 (System Initialize) with the SINZ command to reflect the changes.

[2] After the system initialization, log in to the SV9500 through PCPro.

[3] Repeat the process in Step 6, in order to verify that the update has been applied successfully.



3.3 Updating Extension Language File (Sample Language File)

The following is an example of procedure to update a Sample Language file with the latest data.

Note: If you want to update a customized language file, see "3.2 Updating Extension Language File (Customized Language File)."

STEP 1: Creating a current language data backup prior to program update

By referring to "1. Download/Upload/Deletion of Language Files," download the current Information file of Extension Languages (exlang_info).

STEP 2: Uploading the Information file of Extension Languages after the program update

After updating the program, upload the Information file of Extension Languages (exlang_info) to the SV9500.

STEP 3: Verifying the integrity of the Extension Language settings

[1] Log in to the SV9500 through PCPro.

[2] Go to the ASLG command, then select the [EXTENSION] tab.

[3] Click the [Get] button, and verify that no errors exist.

Note: System initialization is required to make changes to Extension Language data effective. The changes do not take effect when the modified data is uploaded to SV9500.

STEP 4: Verifying the validity of the update

[1] From PCPro, initialize the SV9500 (System Initialize) with the SINZ command to reflect the changes.

[2] After the system initialization, log in to the SV9500 through PCPro.

[3] Repeat the process in Step 3, in order to verify that the update has been applied successfully.

P-1 Paging Access

General Description

This feature provides both ATTENDANT CONSOLE [A-3] and Station users with dial access to PAGING equipment so that they can page anyone over the speaker. PAGING equipment is configured as the Paging Trunk and connected using an interface.

Operating Procedure

To operate

1. Go off-hook. Receive Dial Tone.
2. Dial the Paging Access Code. Receive Ringback Tone for several seconds.
3. Connection to Paging equipment is established.
4. Page anyone over the speaker.
   - Non-delay operation → Wait with holding the handset
   - Delay operation → Hang up and wait

To answer

1. The called someone lifts the handset of any station, and receives Dial Tone.
2. Dial the Access Code of Paging Answer.
   - Non-delay operation → Immediately connected to the calling party.
   - Delay operation → Connected to the calling party after hearing Ringback Tone.

Service Conditions

1. Amplifiers and speakers must be customer provided.
2. One Trunk Circuit is required for each Paging Access.
3. Where TENANT SERVICE [T-12] is provided, separate Access Codes and hardware should be provided for each Tenant.
4. Maximum Paging Access Code is six digits.
5. ALL ZONE PAGING [A-53]: If the system provides Multi Zone Paging with a separate direct Access Code assigned for each area, Stations or Attendants can use All Zone Paging by dialing a special Access Code common for all Paging systems.
6. PRIORITY PAGING [P-30]: A predetermined Station or the Attendant can preempt a Paging Trunk that is connected to any Station.
7. Loop signaling is the recommended signaling type.
8. The following can be used as a paging trunk interface:

   - COT Circuit Cards
   - TLT Circuit Cards
   - MC&MG-COT (4LC2COT)
   - MG-COT (6COT)
   - UG50 (GCD-PGTA) **Note 1 Note 2**

   Note 1: UG50 (GCD-4COTA/B/C) cannot be used as a paging trunk interface.

Note 2: Available from UG50 software version 2.00.

9. PAGING ACCESS [P-1], PAGING TRANSFER [P-10] and RADIO PAGING [R-16] are provided to the paging Station and the paged Station in FCCS Nodes.
10. When PAGING ACCESS [P-1]/PAGING TRANSFER [P-10]/RADIO PAGING [R-16] service is set to a Station in the Remote Node or the PAGING ACCESS [P-1]/PAGING TRANSFER [P-10]/RADIO PAGING [R-16] call is answered from the Remote Node via FCCS link:
    a.) the Logical Route Number should be applied to each physical route that provides the service.
    b.) the restriction of Route-to-Route Connection between FCCS Nodes should be released.
11. The same paging route cannot be used by another Station while the paged Station does not answer the page activated using the route. However, the paging activation is automatically cleared when the call is not answered within a predetermined time.
12. When using a FCCS network:
    a.) In case of setting the office data with LDM, a maximum of six routes per node can be provided with paging trunks, however, this service cannot be used between nodes.
    b.) In case of setting the office data with NDM, a maximum of six routes per FCCS network can be provided with paging trunks. Also, in a FCCS network, the maximum number of concurrent paging for PAGING ACCESS, RADIO PAGING [R-16] and PAGING TRANSFER [P-10] is 20.
13. A user can page one Station at a time.
14. Follow the conditions below to use this feature with MC&MG-COT.
    a.) Radio Paging feature is not supported.
    b.) One Paging Trunk is used per MC&MG-COT equipment.
    c.) MG (COT) side accommodates speech signal to LINE0/MG0, and activation signal (loop activation) to LINE1/MG1.
    d.) The power for activation signal is not supplied from MC&MG-COT.
    e.) C.O. line interface cannot be accommodated when MC&MG-COT is used by Paging features. However, MC function can be used to connect analog telephone to TEL2/MC2 and TEL3/MC3. Do not use TEL0/MC0 and TEL1/MC1. When PFT is activated, TEL0/MC0 and TEL1/MC1 are connected to LINE0/MG0 and LINE1/MG1.
15. Follow the conditions below to use this feature with MG-COT [SCA-6COTA]/MG-COT [SCA-6COTB]/ MG-COT [SCA-6COTC].
    a.) Radio Paging feature is not supported.
    b.) One Paging Trunk is used per MCMG/MG-COT.
    c.) MCMG/MG-COT accommodates speech signal to MG0, and activation signal (loop activation) to MG1.
    d.) The power for activation signal is not supplied from MCMG/MG-COT.
    e.) MCMG's MG2-MG6 connectors and MG-COT's MG2-MG5 connectors can be used for ordinary analog C.O. line interface even when the MCMG/MG-COT is used as a Paging Trunk. Assign the Paging Trunk data by ATRK command different from the C.O. trunk data.
16. MEET-ME PAGING [M-1, 11] and PAGING ACCESS [P-1] can be provided simultaneously in the same system.
17. To directly answer PAGING ACCESS [P-1] by the Attendant Console, the Paged party should use the INDIVIDUAL ATTENDANT ACCESS [I-4] feature.
18. Paging is limited to Stations or Attendant Consoles. Other parties (Central Office Trunks Calls) must have the Attendant Console or Station user perform the Paging operation.

19. BUSY VERIFICATION [B-3], EXECUTIVE RIGHT OF WAY [E-1]: These features will be denied if the Paging route has been assigned for Privacy. Verify the data in the Assignment of Route Data command, ARTD, CDN 44:PRV. If CDN 6:TCL is assigned as data "8", CDN 44:PRV is not required.
20. For simple PAGING ACCESS [P-1], assignments in ASFC are not required. Refer directly to the other Paging features, such as PAGING TRANSFER [P-10].
21. The Attendant can dial the PRIORITY PAGING [P-30] Access Code and release a Station.
22. When disconnecting from a Paging Trunk, the Trunk becomes idle immediately.
23. Paging is possible from a CONSULTATION HOLD [C-17]. Station A places Party B on soft hold and dials the Access Code to the Paging Trunk. A momentary pressing of the switch hook disconnects the Paging Trunk immediately and reconnects Party B to Station A.
24. CALL HOLD [C-6]: A Paging Trunk cannot be placed on Call hold.
25. BUSY is displayed on the Dterm LCD display when the Paging Trunk is busy. Reorder Tone is returned.
26. If PRIORITY PAGING [P-30] is used with PAGING ACCESS [P-1]; ARTD, CDN 6 must be assigned as data "8", Page with Ringback Tone. System Data 1, Index 73 affects the operation of Page routes assigned Page with Ringback Tone. Therefore, if PRIORITY PAGING [P-30] is used with PAGING ACCESS [P-1], then MEET-ME PAGE [M-1, 11] and PAGING TRANSFER [P-10] are not available to the system.
27. PRIORITY PAGE [P-30] access will not disconnect an Attendant Console engaged in a Paging Trunk Connection.
28. This feature cannot be used with LOCATION DIVERSITY [L-55].

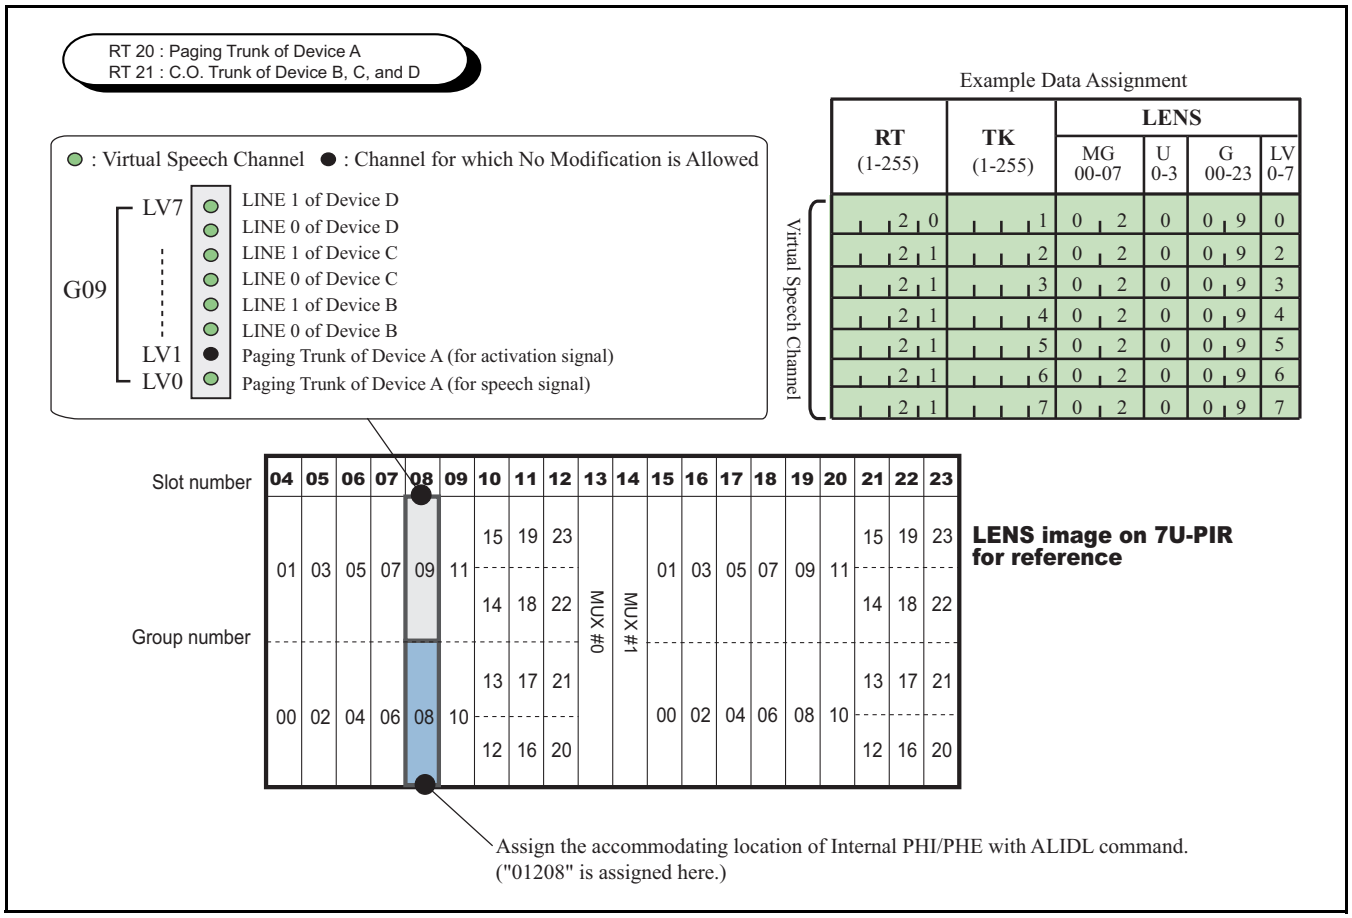
Programming

Note: For UG50 programming, see Peripheral Equipment Description (UG50) manual.

<When COT Circuit Card is used for Paging Trunk>

STEP 1: **ASYD** - System Data 1, Index 73, Bits 0 and 1. For PAGING function only, assign data "00".

STEP 2: **ARTD** - Assign the Paging route as shown below:



RT: 1

1-OSGS	:2	2-ONSG	:3	4-INSG	:3	5-TF	:1	6-TCL	:8
7-L/T	:1	8-RLP	:2	15-LSG	:0/1	44-PRV	:1		

Note: To change the data for existing route (RT), initialize the circuit card.

STEP 3: **ATRK** - Assign the LENS, Paging Trunk Route Number, Trunk Number, and Tenant Number.

Example: ATRK data assignment when COT card is used for Paging Trunk

STEP 4: **MBTK** - Assign the Make Idle status to the Paging Trunks.

STEP 5: **ANPD** - Assign a Level for Trunk Access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. Assign the Number of Necessary Digits according to a predetermined Numbering Plan. Busy Lamp Field is not activated.

STEP 6: **ASPA** - Assign the PAGE ACCESS Code. Type of Service, SRV = "OGC: Outgoing Call". Assign the correct Route Number associated with this Access Code. Assign Connection Indexes, CI = "N: Normal", "H: Hooking".

STEP 7: **ARSC** - Assign to the Station that is allowed access to Paging Trunks a Route Restriction Class (RSC) that is allowed these routes in Route Restriction Indexes (RRI) 2 and 3.

STEP 8: **ASFC** - Assign Station to receive PAGING TRANSFER a Service Feature Restriction Class that allows SFI = 38. This allows a Station to dial PAGE answer codes.

<When MC&MG-COT is used for Paging Trunk>

The following steps assume that the basic setup has already been done on the MC&MG-COT.

STEP 1: **ASYD** - System Data 1

Index 73, Bit 1 and Bit 0: 00 = No answer, 01 = No delay, 10 = Delay, 11 = Delay with Paging Transfer **Note 3**

Index 74, Bit 0-3: Cancel Timer for unanswered Paging

Note 3: Delay with Paging Transfer is applied for the Paging Access on Attendant Console when 01, 10, or 11 is assigned in Index 73, Bit 0 & 1.

Note: Be sure to assign LENS to each LMG accommodates virtual speech/signal channel in 16-IMG system.

STEP 2: **ASTD** - State Translation Data

STM = 2, STS = 2 (Outgoing call to C.O. line or Tie line after holding COT) is set to ST = 1.

STM = 2, STS = 3 (Outgoing call to C.O. line after holding Station or Tie line) is set to ST = 1 (allowed).

STEP 3: **ANPD/ANPDL** - Numbering Plan Data. Assign the minimum number of digits to the first digit of Access Code for Paging Access and Paging Answer.

STEP 4: **ASPA/ASPAL** - Special Access Code.

SRV = "OGC: Outgoing Call," assign the route number to the Access Code of Paging Access.

SRV = "PAGA: Paging Answer," assign the route number to the Access Code of Paging Answer.

SRV = "PAGC: Paging Cancel," assign the route number to the Access Code of Paging Cancel.

STEP 5: **ARSC** - Route Restriction Class. Release the restriction of Paging Trunk access on stations, RRI-2 and RRI-3 to be allowed.

STEP 6: **ARRC** - Alternate Route Restriction Data. Release the restriction of Paging Trunk access on incoming trunk.

STEP 7: **ASFC** - Service Feature Restriction Class. Assign the Service Feature Restriction Class of Paging Answer. SFI 38 (Meet-Me Paging) is allowed.

STEP 8: **ARTD** - Route Class Data. Assign the following route class data to the Paging Trunk route.

CDN 1: OSGS (Signal Interface for Outgoing) = 2 (Second Dial Tone)

CDN 6: TCL (Trunk Class) = 8 (Paging)

In addition to the basic data of Paging Trunk, the following data assignment is required:

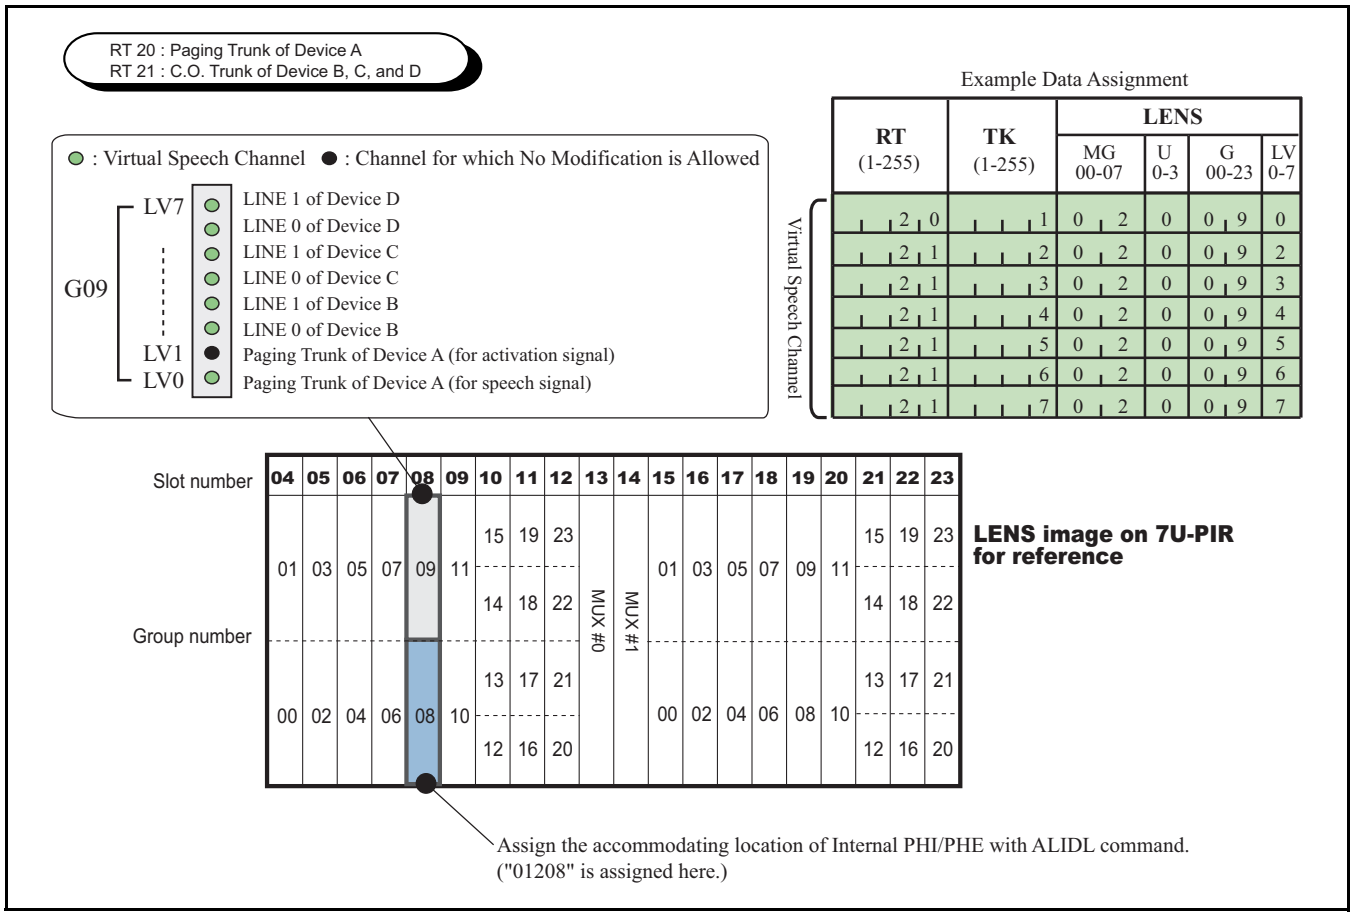
CDN 60: TC/EC = 1 (Echo Canceller is available)

CDN 114: DCH = 1 (Channel integration is available)

CDN 125: MGCOT = 1 (MG-COT is available)

Note: To change the data for existing route (RT), reboot the MG.

STEP 9: **ARTI** - Trunk Application Data. Assign the application data to Paging Trunk route.
CDN 68: VIR = 2 (MG connection)



Note: To change the data for existing route (RT), reboot the MG.

STEP 10: **ATRK** - Trunk Data. Assign the Paging Trunk. Be sure to assign the LENS of Paging Trunk to even numbered LV.

Note: Please note the following important points:

- Be sure to assign the LENS of Paging Trunk on LV0.
- Do not assign the Paging Trunk data to even-numbered Module Group, Unit=0, and Group=0. MC&MG-COT cannot use this LENS.
- Do not assign the trunk data of other MG devices.
- Do not assign anything to LV1, LV6, and LV7.
- Make sure not to assign the Route Number (RT) duplicating the MG-COT route.
- The first two channels of an MC&MG-COT card can be used for a Paging Trunk. In this case, these channels cannot be connected to C.O. lines.

Example: ATRK data assignment when MC&MG-COT is used for Paging Trunk

STEP 11: **MBTK** - Trunk Make Busy. Release the make-busy state of the Paging Trunk, specifying the route number and the trunk number.

STEP 12: **AMGIL** - Media Gateway Information. Assign the MC&MG-COT related data.

MG-ID: MAC address of MC&MG-COT

KIND: MC-MG(COT)

UG50 Multi-Slot Mode: Select this check box if registering UG50 in Multi-slot mode.

LINE: Fixed to 0. **Note 4**

CH: Fixed to 0.

LENS: Mounting location of Paging Trunk (even numbered LV). **Note 5**

Setting Type of Signaling Packet Service: QoS setting for the signal route of MG-COT (ToS value for signal control)

Music On Hold Exists: No setting

Country Code: Select the country name

Law of A/D Conversion: μ-law/A-law **Note 6**

PB Receive Complete Timing of Dial-In [0-15]: Fixed to 0.

False Answer Timing: Fixed to 0.

Note 4: Make sure that the ATRK data has already been assigned before assigning the LENS data by AMGIL command. (Be sure to assign the trunk data in the order of ATRK → AMGIL.)

Note 5: Please note the following important points:
- LENS:000000 is not available for the users.
- Make sure that the LENS list in this command includes the data that you specified with the ATRK command in the previous step.
- Of the first two channels for the Paging Trunk, do not assign C.O. trunk data to the one with the larger channel number (CH=1) with the AMGIL command.

Note 6: Recommended Law of A/D conversion type is displayed according to the selected country code.)

<When MG-COT [SCA-6COTA]/MG-COT [SCA-6COTB]/MG-COT [SCA-6COTC] is used for Paging Trunk>

The following steps assume that the basic setup has already been done on the MG-COT [SCA-6COTA]/MG-COT [SCA-6COTB]/MG-COT [SCA-6COTC].

STEP 1: **ASYD** - System Data 1

Index 73, Bit 1 and Bit 0: 00 = No answer, 01 = No delay, 10 = Delay, 11 = Delay with Paging Transfer **Note 7**

Index 74, Bit 0-3: Cancel Timer for unanswered Paging

Note 7: Delay with Paging Transfer is applied for the Paging Access on Attendant Console when 01, 10, or 11 is assigned in Index 73, Bit 0 & 1.

Note: Be sure to assign LENS to each (LMG accommodates virtual speech/signal) channel in 16-IMG system.

STEP 2: **ASTD** - State Translation Data

STM = 2, STS = 2 (Outgoing call to C.O. line or Tie line after holding COT) is set to ST = 1.

STM = 2, STS = 3 (Outgoing call to C.O. line after holding Station or Tie line) is set to ST = 1 (allowed).

STEP 3: **ANPD/ANPDL** - Numbering Plan Data. Assign the minimum number of digits to the first digit of Access Code for Paging Access and Paging Answer.

STEP 4: **ASPA/ASPAL** - Special Access Code.
SRV = "OGC: Outgoing Call," assign the route number to the Access Code of Paging Access.
SRV = "PAGA: Paging Answer," assign the route number to the Access Code of Paging Answer.
SRV = "PAGC: Paging Cancel," assign the route number to the Access Code of Paging Cancel.

STEP 5: **ARSC** - Route Restriction Class. Release the restriction of Paging Trunk access on stations, RRI-2 and RRI-3 to be allowed.

STEP 6: **ARRC** - Alternate Route Restriction Data. Release the restriction of Paging Trunk access on incoming trunk.

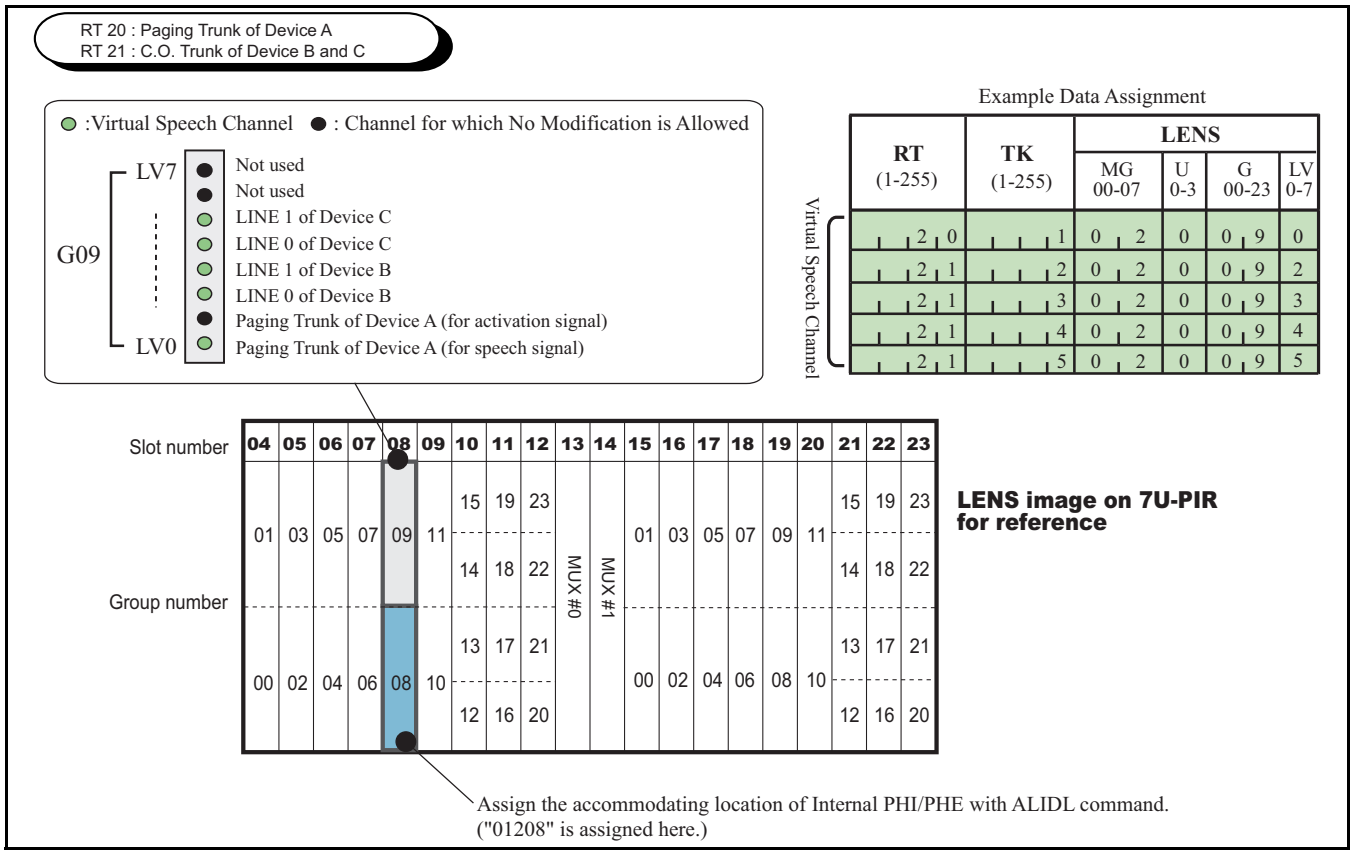
STEP 7: **ASFC** - Service Feature Restriction Class. Assign the Service Feature Restriction Class of Paging Answer. SFI 38 (Meet-Me Paging) is allowed.

STEP 8: **ARTD** - Route Class Data. Assign the following route class data to the Paging Trunk route.
CDN 1: OSGS (Signal Interface for Outgoing) = 2 (Second Dial Tone)
CDN 6: TCL (Trunk Class) = 8 (Paging)

In addition to the basic data of Paging Trunk, the following data assignment is required:
CDN 60: TC/EC = 1 (Echo Canceller is available)
CDN 114: DCH = 1 (Channel integration is available)
CDN 125: MGCOT = 1 (MG-COT is available)

Note: To change the data for existing route (RT), reboot the MG.

STEP 9: **ARTI** - Trunk Application Data. Assign the application data to Paging Trunk route.
CDN 68: VIR = 2 (MG connection)



Note: To change the data for existing route (RT), reboot the MG.

STEP 10: **ATRK** - Trunk Data. Assign the Paging Trunk. Be sure to assign the LENS of Paging Trunk to even numbered LV.

Note: Please note the following important points:

- Be sure to assign the LENS of Paging Trunk on LV0.
- Do not assign the Paging Trunk data to even-numbered Module Group, Unit=0, and Group=0. MG-COT cannot use this LENS.
- Do not assign the trunk data of other MG devices.
- Do not assign anything to LV1, LV6, and LV7.
- Make sure not to assign the Route Number (RT) duplicating the MG-COT route.
- The first two channels of an MG-COT card can be used for a Paging Trunk. In this case, these channels cannot be connected to C.O. lines.

Example: ATRK data assignment when MG-COT is used for Paging Trunk

STEP 11: **MBTK** - Trunk Make Busy. Release the make-busy state of the Paging Trunk, specifying the route number and the trunk number.

STEP 12: **AMGIL** - Media Gateway Information. Assign the MCMG/MG-COT related data.

MG-ID: MAC address of MCMG/MG-COT

KIND: MG(6COT)/MG(6COT) [SIP]

UG50 Multi-Slot Mode: Select this check box if registering UG50 in Multi-slot mode.

LINE: 0 (Click the check box of "LINE0" to ON)

CH: Fixed to 0.

LENS: Mounting location of Paging Trunk (5 digits). **Note 8**

Setting Type of Signaling Packet Service: QoS setting for the signal route of MCMG/MG-COT (ToS value for signal control)

Music On Hold Exists: No setting

Country Code: Select the country name **Note 9**

Law of A/D Conversion: μ-law/A-law **Note 10**, **Note 11**

PB Receive Complete Timing of Dial-In [0-15]: Fixed to 0.

False Answer Timing: Fixed to 0.

Note 8: Please note the following important points:
- LENS:000000 is not available for the users.
- Make sure that the LENS list in this command includes the data that you specified with the ATRK command in the previous step.
- Of the first two channels for the Paging Trunk, do not assign C.O. trunk data to the one with the larger channel number (CH=1) with the AMGIL command.

Note 9: For MG-COT [SCA-6COTB], assign "U.K".

Note 10: Recommended Law of A/D conversion type is displayed according to the selected country code.

Note 11: For MG-COT [SCA-6COTB], assign "A-law".

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ALRTN** - Assign this command to connect the Logical Route to the Physical Route.

STEP 2: **ASYDN** - System Data 1, Index 73, Bits 0 and 1. For PAGING function only, assign data "00".

STEP 3: **ARTDN** - Assign the Paging Route as shown below:

RT: 1

1-OSGS	:2	2-ONSG	:3	4-INSG	:3	5-TF	:1	6-TCL	:8
7-L/T	:1	8-RLP	:2	15-LSG	:0/1	44-PRV	:1		

Note: To change the data for existing route (RT), initialize the circuit card.

STEP 4: **ATRKN** - Assign the LENS, Paging Trunk Route Number, Trunk Number, and Tenant Number.

STEP 5: **MBTKN** - Assign the Make Idle status to the Paging Trunks.

STEP 6: **ANPDN** - Assign a Level for Trunk Access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. Assign the Number of Necessary Digits according to a predetermined Numbering Plan. Busy Lamp Field is not activated.

STEP 7: **ASPAN** - Assign the PAGE ACCESS Code. Type of Service, SRV = "OGC: Outgoing Call". Assign the correct Route Number associated with this Access Code. Assign Connection Indexes, CI = "N: Normal", "H: Hooking".

STEP 8: **ARSCN** - Assign to the Station that is allowed access to Paging Trunks a Route Restriction Class (RSC) that is allowed these Routes in Route Restriction Indexes (RRI) 2 and 3.

When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

P-2 Passing Dial Tone

General Description

This feature allows the Attendant to PASS DIAL TONE to a restricted Station user, enabling that user to place a call that would normally be restricted.

Operating Procedure

1. Restricted user dials Attendant.
2. Attendant presses the ANSWER or ATND key. Tenant Number, Trunk Route Restriction Class and Telephone Number are displayed.
3. Obtain call details.
4. Dial central office Access Code. Tenant Number, and Trunk Identification Number are displayed.
5. Press the RELEASE key. User hears Dial Tone.
6. User places the call.

Service Conditions

1. This feature permits PASSING DIAL TONE to restricted and unrestricted Stations only by the Attendant.
2. When LEAST COST ROUTING - 3/6-DIGIT [L-5] is provided in the system, the Attendant cannot pass Dial Tone. The call must be completed via the ATTENDANT CONSOLE [A-3].
3. TOLL RESTRICTION [T-7] is activated via system programming for the PASSING DIAL TONE feature.
4. The PASSING DIAL TONE feature is limited by the number of Trunks that can be accessed by the Attendant and the Class of Service restrictions of the Station.
5. Restriction from Outgoing Calls: This feature can be overridden by the use of the PASSING DIAL TONE feature.
6. The Attendant is allowed to pass Dial Tone to any Station that has a class of service that allows normal direct dial access capabilities to the Trunk Group seized by the Attendant.
7. Any non-restricted Station can dial through over the selected Outgoing Trunk. The type of address signals sent to the called location are determined by the Trunk Route Class Data.
8. Where STATION MESSAGE DETAIL RECORDING (SMDR) [S-10] is provided, through-dialed calls are charged to the Calling Station Line.
9. This feature is available when the Numbering Plan for Call Origination is Outgoing Call (OGC) or Outgoing Call Alternative (OGCA), and the answer-back signal is the Second Dial Tone.
10. When placing Outside Calls, activation of the TOLL RESTRICTION - 3/6-DIGIT [T-7] is determined by System Data of the Calling Station on a Tenant basis.
11. If TOLL RESTRICTION- 3/6-DIGIT [T-7] is not activated via System Data, neither the three-digit Area Code nor the six-digit Area and Office Code are restricted.
12. If TOLL RESTRICTION- 3/6-DIGIT [T-7] is activated via System Data, the call will be restricted when the Calling Party dials the restricted Area Code.
13. This service can not be used for Peer-to-Peer FCCS.
14. After dialing central office Access Code such as 9, the operator must release the line before DEST lamp comes on.

Interactions

1. Any Station that is restricted from a route may receive access to that route by the Attendant Console. A Station that is toll restricted will NOT be able to place calls to destinations normally restricted by having the Attendant Console pass Dial Tone. The same ATDP tables will apply to that Station. The Attendant Console must dial the number for the Station when that Station is toll restricted. See NON-DELAY OPERATION [N-3].
2. The associated programming that should be examined is ATTENDANT CONSOLE [A-3], TOLL DENIAL/TOLL DIVERSION [T-7], TOLL RESTRICTION-3/6 DIGIT [T-8], LEAST-COST ROUTING-3/6 DIGIT [L-5], CLASS OF SERVICE-INDIVIDUAL [C-17], and the various Trunk Access features.
3. NIGHT CONNECTION FIXED/FLEXIBLE [N-1, 2]: The NIGHT CONNECTION FIXED/FLEXIBLE Stations cannot pass Dial Tone to another Station.
4. ATTENDANT NIGHT TRANSFER [A-19]: The ATTENDANT NIGHT TRANSFER Station cannot pass Dial Tone to another Station.
5. When LEAST-COST ROUTING-3/6 DIGIT [L-5] is programmed, the ATDP tables will be affected. During feature operation, the Attendant will dial the route Access Code and then release Dial Tone to the Station. Because that route is assigned in ARNP tables against the LCR (S) Access Codes, the ATDP tables must also use the LCR (S) Access Code. For example, the Attendant dials 81 and releases. The Station dials 1-516-753-7526. ATDP must be programmed as DC: 9151 and TDI: 1, allowed; not as DC: 81151. (ARNP for the route in this example is assigned with the Access Code = 9.)

Programming

STEP 1: **ASYD** - System Data 2, Index 15, Bit 3. Toll restriction on an Outgoing Call placed by PASSING DIAL TONE. 0/1: Valid/Invalid.

STEP 2: **ARSC** - Construct a Route Restriction Class (RSC) that will allow outgoing access to the various routes via Route Restriction Index (RRI) 2, via the Attendant Console. Be sure to assign RRI 3 as data "0 or 2", Connection restricted.

STEP 3: **ASDT** - Assign to the Station a Route Restriction Class (RSC) that allows outgoing access to the various routes via the Attendant Console.

STEP 4: **ATDP** - For those Route Restriction Classes that will receive Dial Tone from the Attendant Console, construct allow tables. The system does not pass the RSC of the Attendant Console to the restricted Station. It bypasses the RRI 3 restriction and instructs the system to look at the ATDP tables for that RSC and govern Connections accordingly.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ALRTN** - Assign this command to connect the Logical Route to the Physical Route.

STEP 2: **ASYDN** - System Data 2, Index 15, Bit 3. Toll Restriction on an Outgoing Call placed by PASSING DIAL TONE. 0/1: Valid/Invalid.

STEP 3: **ARSCN** - Construct a Route Restriction Class (RSC) that will allow outgoing access to the various Routes via Route Restriction Index (RRI) 2, via the Attendant Console. Be sure to assign RRI 3 as data "0 or 2", Connection restricted.

STEP 4: **ASDTN** - Assign to the Station a Route Restriction Class (RSC) that allows outgoing access to the various Routes via the Attendant Console.

STEP 5: **ATDPN** - For those Route Restriction Classes that will receive Dial Tone from the Attendant Console, construct allow Tables. The system does not pass the RSC of the Attendant Console to the restricted Station. It bypasses the RRI 3 restriction and instructs the system to look at the ATDP Tables for that RSC and govern Connections accordingly.

P-3 Power Failure Transfer

General Description

This feature provides for certain specified Trunks to be automatically connected to designated Stations in the event of a loss of AC power. It is normally used when the system is not equipped with reserve power.

Station Application

Operation is automatic if there is loss of input power to the system.

Service Conditions

1. If the Central Office is wired Ground Start, Stations must be equipped with ground buttons to complete calls over the exchange network.
2. Power failure Station Lines should not be wired to common bells. These require Outside power sources and will not operate.
3. Type of telephone set (DP or DTMF) connected to Central Office Line via POWER FAILURE TRANSFER shall correspond to the signaling system of the Central Office.
4. The maximum number of POWER FAILURE TRANSFER Circuits per PIR is 24 (12 circuits per package).
5. The Power Failure Trunk (PFT) and associated Central Office Trunk should be in the same PIR.
6. When the POWER FAILURE TRANSFER feature is activated, telephone service is limited to Incoming Calls and/or Outgoing Calls via the serving Central Office. DID Calls cannot be received.
7. This feature is available with the combination of COT and Analog Telephone/Desktop terminal with PFT adapter.
8. All calls in progress and/or established calls are lost when a POWER FAILURE TRANSFER occurs. When commercial power is restored, the System is automatically reinitialized. Back-up service is provided via the HDD unit to retain the following features:

CALL FORWARDING	[C-2, C-3, C-5]
SPEED CALLING - GROUP	[S-23]
SPEED CALLING - STATION	[S-21]
NAME DISPLAY DATA	[N-28]

Interactions

1. A PFT circuit card is required.
2. The POWER FAILURE TRANSFER Station and Central Office Trunk must be on the same Module Group.
3. When power is lost and the POWER FAILURE TRANSFER (PFT) feature is activated, telephone service is limited to Incoming and Outgoing Calls via the predesignated PFT Stations.
4. DID service will be lost, as this service is dependent on the operational status of Incoming Register Trunks (IRTs).
5. When power is lost, all calls (Station-to-Station and Station-to-Trunk) are lost. When power is restored, PFT Calls will stay up until manually disconnected by the participants. Service to the PFT Stations is then restored to normal.

Programming

STEP 1: **ASYD** - System Data 1, Index 77, Bits 4 and 5. Specify a module in which PFT card is mounted.

STEP 2: **AUNT** - Specify the information on the PFT circuit card accommodated in. System initialization is required to make it effective.
MG: Specify the MG number of PFT.
TYPE=2 (PFT Circuit Card)
PKG=1 (Mounted)

To delete

The deletion procedure is the reverse order of assigning the feature.

P-4 Pushbutton Calling

General Description

This feature permits Station users to originate calls using Pushbutton Telephones and also allows Dterm Stations the ability to control external devices requiring DTMF Signals to initiate or perform functions (e.g., Code-A-Phone, Conference Unit, etc.).

Operating Procedure

1. The Station users press pushbuttons corresponding to the desired numbers.
   OR
2. After a Connection is established between a Dterm Station and a Station or Trunk port with an external device attached, the Dterm user may press the keypad or SPEED CALLING BUTTONS - ONE TOUCH -D [S-26D] key to transmit DTMF Signals to control the external device.

Service Conditions

1. If DTMF lines from the Central Office are not available, then the PUSHBUTTON-TO-ROTARY CONVERSION [P-6] feature must be provided.
2. Rotary and Pushbutton instruments may be used simultaneously with PUSHBUTTON CALLING.
3. Timing for the DTMF Signals can be set from 0.128 to 2.048 seconds via system commands on a system-wide basis.
4. DTMF frequency combinations are as follows:

Low - High	1,209Hz	1,336Hz	1,477Hz
697Hz	1	2	3
770Hz	4	5	6
852Hz	7	8	9
941Hz	*	0	#

Interactions

1. Each 8RST circuit card contains eight Register and eight Sender Circuits. Each Register Circuit can accept either Pushbutton or rotary dial pulses. The senders can transmit Pushbutton or dial pulse signals and are also used with the ATTENDANT CONSOLE [A-3], LEAST-COST ROUTING-3/6 DIGIT [L-5], SPEED CALLING-SYSTEM, STATION, GROUP [S-3, 21, 23], OUTGOING TRUNK QUEUING [O-2], OFF-HOOK QUEUING [O-7], and PUSHBUTTON-TO-ROTARY CONVERSION [P-6].
2. Register Circuits are located on the first four Levels (0-3) and Sender Circuits are located on the last four Levels (4-7) of the 8RST circuit card.

Programming

STEP 1: **ASYD** - System Data 1, Index 128. Register Prepause Timer. How long the Register waits for the first digit. Normally assign data 00H for 12 seconds.

System Data 1, Index 129. Register Inter-digit Timer. How long the Register waits between digits. Normally assign data 00H for six seconds.

System Data 2, Index 2, Bit 0. Type of Sender Signal for Station? 0/1: DP/PB. Assign as appropriate. (This data will only be used if the ARTD Data of a specific route is assigned as DP/PB.)

System Data 3, Index 11. Normally assign data 00H for 128 milliseconds.

STEP 2: **ASDT** - Assign Dterm, Single Line Stations, a Telephone Equipment Class (TEC) of 2; Pushbutton (PB), TEC = 3, or Dial-Pulse/ Pushbutton (DP/PB).

STEP 3: **ATRK** - Assign Originating Register Trunks (ORT) to the system in a quantity calculated from expected traffic. Registers are located on Levels 0-3 of any 8RST circuit card.

Also, senders must be assigned to the system in a quantity calculated from expected traffic. Senders are located on Levels 4-7 of any 8RST circuit card.

RT: Route Number

Trunk Route Number

Intra-office Route Number (901-931)

901-ATT 912-ORT for ATT
902-ORT 913-TCFT for ATT
903-IRT 915- Night ATT
905-Sender 916-MFCR
909-DCFT 917-MFCS
919 to 926-Modem

TK: Trunk Number
TN: Tenant Number
RSC: Route Restriction Class
SFC: Service Feature Restriction Class

STEP 4: **ARTD** - Routes must be assigned as either PB, DP, or DP/PB. CDN 2:ONSG, Type of Outgoing Signal Selection (ONSG) is assigned to each route as data “1”, DP; data “2”, PB; or data “3”, DP/PB.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or MG.

P-5 Pushbutton Calling - Attendant Only

General Description

This feature permits an Attendant to place all calls over DTMF Signaling lines from a Pushbutton keypad on the ATTENDANT CONSOLE [A-3].

Operating Procedure

Attendant presses the Pushbutton keypad to dial.

Service Conditions

1. This feature requires that all Central Office Trunks and TIE Trunk terminals accept Pushbutton signaling (DTMF).
2. PUSHBUTTON CALLING - ATTENDANT ONLY may be added to the system without providing PUSHBUTTON CALLING [P-4] capability to other Stations.

Interactions

The Attendant Console must first be provided.

Programming

STEP 1: **ASYD** - System Data 1, Index 128. Register Prepause Timer. How long the Register waits for the first digit. Normally assign data 00H for 12 seconds.

System Data 1, Index 134. Register Inter-digit Timer for the Attendant Console. How long the Register waits between digits. Normally assign data 00H for four seconds.

System Data 2, Index 2, Bit 1. Sender signal for Attendant Console is DP/PB? 0/1: DP/PB. Assign as appropriate.

STEP 2: **ATRK** - Assign Originating Register Trunks (ORT) to the Attendant Console (optional). Registers are located on Levels 0-3 of any 8RST circuit card.

Also, senders must be assigned to the system in a quantity calculated from expected traffic.

RT: Route Number

Trunk Route Number

Intra-office Route Number (901-931)

901-ATT	912-ORT for ATT
902-ORT	913-TCFT for ATT
903-IRT	915- Night ATT
905-Sender	916-MFCR
909-DCFT	917-MFCS
	919 to 926-Modem

TK: Trunk Number

TN: Tenant Number

RSC: Route Restriction Class

SFC: Service Feature Restriction Class

STEP 3: **ARTD** - Routes must be assigned as either PB, DP, or DP/PB. CDN 2:ONSG, Type of Outgoing Signal Selection, is assigned to each route as data “1”, DP; data “2”, PB; or data “3”, DP/PB.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or MG.

P-6 Pushbutton to Rotary Conversion

General Description

This feature allows DTMF telephones to be used when DTMF Signaling is not provided or are not available from the Central Office and/or TIE Line.

Operating Procedure

Station users dial the desired Telephone Numbers.

Service Conditions

1. PUSHBUTTON TO ROTARY CONVERSION is software controlled on a per Trunk Route basis.
2. See UNIVERSAL SENDER [U-3] for reference.
3. When the following combination of data settings are assigned, the PB Station cannot originate a call:

   ASDT - TEC = 3 (DP/PB) Station data for the Calling Station
   ASPA - SSC = "OGC: Outgoing Call"/"OGCA: Outgoing Call with route advance"
   ARTD - CDN1: OSGS = 2 (Second Dial Tone)
   CDN2: ONSG = 2 (PB, 60 msec. Interruption or CCIS No.7)

Interactions

1. Each 8RST circuit card contains four Register and four Sender Circuits. Each Register Circuit can accept either pushbutton or rotary dial pulses. The senders can outpulse pushbutton or dial pulse signals and are used with the ATTENDANT CONSOLE [A-3], LEAST-COST ROUTING-3/6 DIGIT [L-5], SPEED CALLING-SYSTEM, STATION, GROUP [S-3, 21, 23], OUTGOING TRUNK QUEUING [O-2], OFF-HOOK QUEUING [O-7], and PUSHBUTTON-TO-ROTARY CONVERSION.
2. Register Circuits are located on the first four Levels (0-3), and Sender Circuits are located on the last four Levels (4-7) of the 8RST circuit card.
3. Each Register may be assigned as either an outgoing or an Incoming Register. Incoming Calls have priority over Outgoing Calls. Thus, a Register programmed as outgoing may serve as an Incoming Register when none are available. However, an Incoming Register will never serve as an Outgoing Register.

Programming

STEP 1: **ASYD** - System Data 2, Index 2, Bit 0. Sender signal for Station is DP/PB? 0/1: DP/PB. Always assign as data "0". Assign on a per Tenant basis. This Bit takes priority when ARTD, CDN 2:ONSG is assigned as data "3", DP/PB.

STEP 2: **ASDT** - Assign Single Line Stations a Telephone Equipment Class (TEC) of Pushbutton (PB) TEC = 2 or dial pulse/pushbutton (DP/PB), TEC = 3.

STEP 3: **ATRK** - Assign Originating Register Trunks (ORT) to the system in a quantity calculated from expected traffic. Registers are located on Levels 0-3 of any 8RST circuit card.

Also, senders must be assigned to the system in a quantity calculated from expected traffic. Senders are located on Levels 4-7 of any 8RST circuit card.

RT: Route Number

Trunk Route Number

Intra-office Route Number (901-931)

901-ATT
902-ORT 913-TCFT for ATT
903-IRT 915- Night ATT
905-Sender 916-MFCR
909-DCFT 917-MFCS
919 to 926-Modem

TK: Trunk Number
TN: Tenant Number
RSC: Route Restriction Class
SFC: Service Feature Restriction Class

STEP 4: **ARTD** - Outgoing routes must be assigned as DP or DP/PB. Flag CDN 2:ONSG as data "1", DP or data "3", DP/PB.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or MG.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

ARTDN - Outgoing routes must be assigned as DP or DP/PB. Flag CDN 2:ONSG as data "1", DP or data "3", DP/PB.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or MG.

P-7 Peg Count

General Description

This feature permits traffic studies and traffic analysis information to be accessed from the PCPro and to be printed out.

Operating Procedure

Please refer to TRAFFIC MANAGEMENT of CHAPTER 2 in the Operation and Maintenance Manual.

Service Conditions

1. This feature can be used for FCCS Network. For details, refer to the Operations and Maintenance Guide.
2. All information required for this feature is registered at the PCPro.
3. The following information is obtainable:
    - STATION PEG COUNT
    - ATT PEG COUNT
    - ROUTE PEG COUNT
    - SERVICE PEG COUNT
    - UCD ROUTE PEG COUNT
    - UCD GROUP PEG COUNT
    - UCD STATION PEG COUNT
    - ATT ANSWERING PEG COUNT
    - CS PEG COUNT
    - CONNECTION ROUTE PEG COUNT
    - IP SERVICE PEG COUNT
    - SIP TERMINAL PEG COUNT
4. The above information may be registered and canceled as required.
5. The measurement information output (to hard disk of the maintenance console used for PCPro) cycle can be any period of time ranging from 30 minutes to 120 minutes (in 10-minute increments), as required.
6. Terminal traffic is not available for PS, WLAN Handset and Standard SIP terminal.
7. Traffic measurement duration time is designated for more than one hour. If the traffic measurement duration time is not designated, the measurement is performed indefinitely until a stop command is entered on the PCPro.

Peg Count	Telephony Server
Station Peg Count	TN = 1-255
Route Peg Count	RT = 1-255
ATT Peg Count - Incoming	TN = 1-255
ATT Peg Count - Answer	ATT = 1-16

8. The following shows the condition of SIP Terminal Peg Count.
   a.) This service is available for SIP terminals supported by SP CONTROLLED SIP TERMINAL [S-168] only. For the details, refer to SP CONTROLLED SIP TERMINAL [S-168].
   b.) When SIP Wireless Terminal Backup [S-154] is used in the system, Traffic Measurement is performed for the present active side SP. Traffic Measurement for the standby side SP cannot be performed. When the situation of active side/standby side is changed, the Traffic Measurement target is also changed to the SP switched as active side.
   c.) When packet loss is occurred, the traffic data is not counted.
   d.) When the active side SP is switched, the traffic data is not counted even if sending and receiving the Keep Alive messages are failed between the SP Controlled SIP terminal and SP.
   e.) The system takes over peg count data during the system initialization (Non Load Initialization). However, system does not take over the peg count data to SR-MGC.
   f.) When traffic measurements of SIP terminals are performed with other traffic measurements, all traffics are measured in the same time. For the details, refer to the following table.

×: Available –: Not available

Type of Traffic Measurement	Measurement target items	SP Controlled Standard SIP Terminal	WLAN Handset	PS	Digital Terminal
Type 1 Terminal Traffic Data	Traffic data for LENS	× Note 1	× Note 1	× Note 2	×

	SIP extension terminal digest attestation failure	×	×	–	–
	Talk band all speaking frequency	×	×	–	–
	SIP extension terminal cut keep alive failure	×	×	–	–

Note 1: Counted in the virtual speech channel of SIP server.

Note 2: Counted in the LENS of CS/ZT.

9. For more information, refer to TRAFFIC MANAGEMENT of CHAPTER 2 in the Operation and Maintenance Manual.

Interactions

1. If the system is reset, traffic measurement requests are no longer in service.
2. Do not set ASFC, SFI 252=1 (Multi-Boss/Multi-Secretary is in service) to stations belonging to UCD groups when using UCD GROUP/Station/Route PEG COUNT.

Programming

Please refer to TRAFFIC MANAGEMENT of CHAPTER 2 in the Operation and Maintenance Manual.

P-9 Priority Call

General Description

This feature allows the ATTENDANT CONSOLE [A-3] to answer various types of calls in the order of their priority. A special type of call can be handled prior to a regular call, at the Attendant's discretion.

Operating Procedure

To operate

1. Lift the handset and receive Dial Tone.
2. Dial the PRIORITY CALL number, then wait for the Attendant to answer.

Note: PRIORITY CALL will terminate on a designated key on the ATTENDANT CONSOLE [A-3].

Service Conditions

1. The PRIORITY CALL must be answered via a designated key in order to gain a priority capability. The keys must be assigned by the PCPro.
2. A PRIORITY CALL will not be picked up first, by pressing the ANSWER key, if other calls are waiting.
3. A PRIORITY CALL cannot be initiated while in CONSULTATION HOLD - ALL CALLS [C-17] or CALL HOLD [C-6].
4. In the night mode, a PRIORITY CALL will terminate at the predetermined Station.
5. The Calling Station obtains this feature via CLASS OF SERVICE - INDIVIDUAL [C-15].
6. A Station, instead of the ATTENDANT CONSOLE [A-3], can be the destination of a PRIORITY CALL in the day mode.
7. If the PRIORITY CALL encounters the Destination Station busy, the call will wait for the Station to become idle. Ringback Tone will be heard while the caller is waiting.
8. Three Levels of PRIORITY CALLs can be assigned.
9. When the destination is a Station, the originating Stations should be assigned as a member of a PRIORITY CALL Group.
10. The terminating Station of each group can be a member of a HUNTING GROUP [S-7, 8, 9].
11. The terminating Station can set CALL FORWARDING - ALL CALLS [C-5] and CALL FORWARDING - BUSY LINE [C-2].
12. The terminating Station for ATTENDANT NIGHT TRANSFER [A-19] and/or OFF-HOOK ALARM [O-6] can be assigned as the terminating Station of a PRIORITY CALL.
13. If the destination Dterm is busy (and not the pilot number of a UCD Group), when a Priority Call is placed, Ringback Tone is returned to the Calling Party rather than Busy Tone, and the Calling Party is placed in queue.
14. When a UCD [U-1] Station is assigned as the destination of PRIORITY CALL, queuing function of UCD is not available when all the Stations within the UCD Group are busy.
15. The Destination Station for the Priority Call must be the Dterm. When the Destination Station is set CALL FORWARDING-ALL CALLS [C-5], the Call Forwarding target Station must also be the Dterm. When the Destination Station is a member of a HUNTING GROUP [S-7, 8, 9], all Stations within the Hunt Group must also be the Dterm.

16. The maximum number of PRIORITY CALL Groups is 255 per the Level of Priority Call(s) (Priority Call 1, 2, 3).
17. An ISDN terminal user cannot use this feature.

FCCS Conditions

1. The Fusion Point Code (FPC) of the Node which accommodates the Called Attendant Console must be assigned after System Data assignment.
2. The Priority Call can be terminated at a predetermined Station in the Remote Node via FCCS link.
3. When the Access Code which is assigned by the ASPAN command is dialed, the data programmed in the ASGDN and the ASIDN command is applied. When the Access Code which is assigned by the ASPAL command is dialed, the data programmed in the ASGDL and the ASIDL commands is applied. When the Access Code which is assigned by the ASPA command is dialed, the data programmed in the ASGD and the ASID commands is applied.

Interactions

1. If the destination Dterm is busy when a Priority Call is placed, Ringback Tone is returned to the Calling Party rather than a Busy Tone, and the Calling Party is placed in queue.
2. A Warning Tone is not provided at the Called Dterm while a Priority Call is in progress.
3. If the destination of a Priority Call is the Attendant Console, the Priority Call does not transfer to the ATTENDANT NIGHT TRANSFER [A-19] Station when the system goes into Night mode.
4. A PRIORITY CALL will not be forwarded to Outside.

Programming

STEP 1: **ASYD** - System Data 1, Index 168, Bit 6. Where will Priority Call terminate? 0/1: Attendant Console/ Station. If Attendant Console (0), go to Step 2, AAKP command.

System Data 2, Indexes 8 and 9. If the call will terminate to the Attendant Console, assign if the call will be pegged for CALL WAITING LAMP [C-13].

STEP 2: **AAKP** - Assignment of Attendant Console Key Pattern. The ATN: Attendant Number (TRK Number for RTE 901); KYN = 1-6, and FUNC = 3, Priority Call 1; FUNC = 4, Priority Call 2; FUNC = 5, Priority Call 3. This command is not required if the Priority Call terminates at a Station.

STEP 3: **ANPD** - Reserve a Numbering Plan Level for Feature Access. Select Normal Service (N) from the combo box for Connection Indexes. Assign NND in accordance with the predetermined Numbering Plan.

STEP 4: **ASPA** - For SRV = "SSC: Service Code", SID = 37, Priority Call 1; SID = 38, Priority Call 2; SID = 39, Priority Call 3; assign the Access Code. Assign for CI of "N: Normal".

STEP 5: **ASID** - This command defines the purpose of the Special Incoming Group and is used in conjunction with the ASGD command. Assign the following:

TN: Tenant Number
F: Function Number (0-7)
4: Priority Call 1
5: Priority Call 2
6: Priority Call 3
GN: Group Number (1-7),
S/A: Special Incoming Equipment
S: Station
A: Attendant Console
SSTN: Special Station Number

STEP 6: **ASGD** - This command defines the Stations belonging to the Special Incoming Group. When the point of termination is a Station, assign the following:

TN: Tenant Number
STN: Station Number
F: Function Number (0-7)
4: Priority Call 1
5: Priority Call 2
6: Priority Call 3
GN: Group Number (1-7)

STEP 7: **ASFC** - Service Feature Index (SFI) 54-Priority Call 1. SFI 55-Priority Call 2. SFI 56-Priority Call 3. Assign a Service Feature Restriction Class to Stations that allow one or all of the SFIs above, depending on system configuration.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ASPAL** - This data must be set to the Node calling the Attendant.
Assign the FPC of the Node which accommodates the Called Attendant Console. This must be assigned after designating SID = 37, 38, 39.

The following data setting is required when a Priority Call is routed to a predetermined Station in the Remote Node via FCCS links.

(When entering data on NDM)
STEP 1: **ASYD** - The same data must be assigned to all Nodes.
System Data 1, Index 168, Bit 6. Assign data "1" (Station is the destination of Priority Call in the day mode.)
STEP 2: **ANPDN** - Reserve a Numbering Plan Level for Feature Access. Select Normal Service (N) from the combo box for Connection Indexes. Assign NND in accordance with the predetermined Numbering Plan.
STEP 3: **ASPAN** - For SRV = "SSC: Service Code", SID = 37, Priority Call 1; SID = 38, Priority Call 2; SID = 39, Priority Call 3; assign the Access Code. Assign for CI of "N: Normal".
STEP 4: **ASIDN** - This command defines the purpose of the Special Incoming Group and is used in conjunction with the ASGDN command. Assign the following:

TN:	Tenant Number
F:	Function Number (0-7)
4:	Priority Call 1
5:	Priority Call 2
6:	Priority Call 3
GN:	Group Number (1-255)
S/A:	Special Incoming Equipment. Assign "S" (Telephone Number (of the Station)).
STELN:	Telephone Number of the Special Station

STEP 5: **ASGDN** - This command defines the Stations belonging to the Special Incoming Group. When the point of termination is a Station, assign the following:

UGN:	User Group Number
STELN:	Telephone Number of the Station
F:	Function Number (0-7)
4:	Priority Call 1
5:	Priority Call 2
6:	Priority Call 3
GN:	Group Number (1-255)

STEP 6: **ASFC** - The same data must be assigned to all Nodes.
Service Feature Index (SFI) 54-Priority Call 1. SFI 55-Priority Call 2. SFI 56-Priority Call 3. Assign a Service Feature Restriction Class to Stations that allow one or all of the SFIs above, depending on system configuration.

(When entering data on LDM)
STEP 1: **ASYD** - The same data must be assigned to all Nodes.
System Data 1, Index 168, Bit 6. Assign data "1" (Station is the destination of Priority Call in the day

mode.)

STEP 2: **ANPDL** - Reserve a Numbering Plan Level for Feature Access. Select Normal Service (N) from the combo box for Connection Indexes. Assign NND in accordance with the predetermined Numbering Plan.

STEP 3: **ASPAL** - For SRV = "SSC: Service Code", SID = 37, Priority Call 1; SID = 38, Priority Call 2; SID = 39, Priority Call 3; assign the Access Code. Assign for CI of "N: Normal".

STEP 4: **ASIDL** - This command defines the purpose of the Special Incoming Group and is used in conjunction with the ASGDL command. Assign the following:

TN: Tenant Number
F: Function Number (0-7)
4: Priority Call 1
5: Priority Call 2
6: Priority Call 3
GN: Group Number (1-255)
S/A: Special Incoming Equipment. Assign "S" (Telephone Number (of the Station)).
STELN: Telephone Number of the Special Station

STEP 5: **ASGDL** - This command defines the Stations belonging to the Special Incoming Group. When the point of termination is a Station, assign the following:

UGN: User Group Number
STELN: Telephone Number of the Station
F: Function Number (0-7)
4: Priority Call 1
5: Priority Call 2
6: Priority Call 3
GN: Group Number (1-255)

STEP 6: **ASFC** - The same data must be assigned to all Nodes.

Service Feature Index (SFI) 54-Priority Call 1. SFI 55-Priority Call 2. SFI 56-Priority Call 3. Assign a Service Feature Restriction Class to Stations that allow one or all of the SFIs above, depending on system configuration.

P-10 Paging Transfer

General Description

Station users can page anyone over the speaker after holding a station/trunk call to transfer. PAGING equipment is configured as the Paging Trunk and connected using an interface.

Operating Procedure

While a Station user is engaged in a call

1. Switch hook flash or press the TRANSFER key (on Desktop terminal). Receive Special Dial Tone.
2. Dial the Paging Access Code. Receive continuous Ringback Tone for approximately one second.
3. Page the desired party.

There are three paging options

1. NON-DELAY SYSTEM: The party paged is immediately connected to the paging Station when the paged party dials the Paging Answer Access Code.
2. DELAY SYSTEM: The paging Station user replaces the handset after the page; the paged party dials the Paging Answer Access Code. The paging Station rings, and the paged Station receives Ringback Tone. After the paging Station user lifts the handset, the paging and paged Stations are connected.
3. PAGING TRANSFER SUPERVISION: The paging Station user replaces the handset after the page. By dialing the Paging Answer Access Code, the paged party is directly connected to the party on hold.

For Non-Delay and Delay systems

1. When a paging Station replaces the handset after talking with the paged party, the Held Party is directly connected to the paged party.

Service Conditions

1. PAGING TRANSFER service can be selected according to System Data assignment:
   a.) Non-Delay system
   b.) Delay and Non-Delay system
   c.) PAGING TRANSFER Supervision
2. Paging Trunks can be provided for a maximum of six routes.
3. When a paging route has been accessed and is not answered within a predetermined time, the paging activation is automatically cleared.
4. The following can be used as a paging trunk interface:

   - COT Circuit Cards
   - TLT Circuit Cards
   - MC&MG-COT (4LC2COT)
   - MG-COT (6COT)
   - UG50 (GCD-PGTA) **Note 1 Note 2**

   Note 1: UG50 (GCD-4COTA/B/C) cannot be used as a paging trunk interface.

   Note 2: Available from UG50 software version 2.00.

5. Loop signaling is the recommended signaling type.
6. When the Attendant Console activates the service, the conditions are as follows:
   a.) An Attendant Console user can connect the paged party with the Calling Party the same way as PAGING TRANSFER SUPERVISION only (see Operating Procedure).
   b.) If the paged party answers the page before the Attendant Console releases the Loop, the Attendant Console is called from the paged party as an Operator Call. In this case, the Attendant Console can connect the paged party with the Held Party (Calling Party) in the procedure below:
      - Press the CANCEL key to release the Loop to be used for the page.
      - Answer the Operator Call and press the HOLD key to hold the Loop.
      - Press the Loop key holding the Calling Party to be back to the original Connection and perform the normal operation for Attendant Console Loop-to-Loop Connection (see MEET-ME PAGING [M-3] for details) to connect the two parties.
7. When using this feature via the FCCS network, PAGING ACCESS [P-1], PAGING TRANSFER [P-10] and RADIO PAGING [R-16] are provided to the paging Station and the paged Station in FCCS Nodes.
8. When using this feature via the FCCS Network, when PAGING ACCESS [P-1]/PAGING TRANSFER [P-10]/RADIO PAGING [R-16] service is set to a Station in the Remote Node or the PAGING ACCESS [P-1]/PAGING TRANSFER [P-10]/RADIO PAGING [R-16] Call is answered from the Remote Node via FCCS link:
   a.) the Logical Route Number should be applied to each physical route that is provided the service.
   b.) the restriction of Route-to-Route Connection between FCCS Nodes should be released.
9. When using this feature via the FCCS Network, the same paging route cannot be used by another Station while the paged Station does not answer the page activated using the route. However, the paging activation is automatically cleared when the call is not answered within a predetermined time.
10. When using this feature via the FCCS Network, a user can page one Station at a time.
11. When using this feature via the FCCS network:
   a.) In case of setting the office data with LDM, a maximum of six routes per node can be provided with paging trunks, however, this service cannot be used between nodes.
   b.) In case of setting the office data with NDM, a maximum of six routes per FCCS network can be provided with paging trunks. Also, in a FCCS network, the maximum number of concurrent paging for PAGING ACCESS[P-1], RADIO PAGING [R-16] and PAGING TRANSFER [P-10] is 20.
12. Follow the conditions below to use this feature by MC&MG-COT equipment.
   a.) Radio Paging feature is not supported.
   b.) One Paging Trunk is used per MC&MG-COT equipment.
   c.) MG (COT) side accommodates speech signal to LINE0/MG0, and activation signal (loop activation) to LINE1/MG1.
   d.) The power for activation signal is not supplied from MC&MG-COT.
   e.) C.O. line interface cannot be accommodated when MC&MG-COT is used by Paging features. However, MC function can be used to connect analog telephone to TEL2/MC2 and TEL3/MC3. Do not use TEL0/MC0 and TEL1/MC1. When PFT is activated, TEL0/MC0 and TEL1/MC1 are connected to LINE0/MG0 and LINE1/MG1.
13. Follow the conditions below to use this feature by MG-COT [SCA-6COTA]/MG-COT [SCA-6COTB]/ MG-COT [SCA-6COTC].
   a.) Radio Paging feature is not supported.
   b.) One Paging Trunk is used per MCMG/MG-COT.
   c.) MCMG/MG-COT accommodates speech signal to MG0, and activation signal (loop activation) to MG1.

d.) The power for activation signal is not supplied from MCMG/MG-COT.
e.) MCMG's MG2~MG6 connectors and MG-COT's MG2~MG5 connectors can be used for ordinary analog C.O. line interface even when the MCMG/MG-COT is used as a Paging Trunk. Assign the Paging Trunk data by ATRK command different from the C.O. trunk data.

Interactions

1. PAGING TRANSFER (MEET-ME PAGING) and PAGING ACCESS [P-1] can be provided simultaneously in the same system. Separate Access Codes for each service is required. A MEET-ME PAGING Answer Code is required for each MEET-ME PAGING zone.
2. Paging is limited to Stations or Attendant Consoles. Other parties (Central Office Trunk Calls) must have the Attendant Console or Station user perform the paging operation.
3. The Attendant cannot dial the MEET-ME PAGING answer codes.
4. BUSY VERIFICATION [B-3], EXECUTIVE RIGHT OF WAY [E-1]: These features will be denied to Paging routes assigned in CDN 6:TCL as data "8", Page with Ringback Tone.
5. PAGING TRANSFER OPERATION: Station A is connected to Party B. Station A momentarily presses the switch hook or presses the TRANSFER key (if Dterm phone) and then dials the PAGING TRANSFER (MEET-ME PAGE) route Access Code. When connected to the page, Station A requests Station C to dial the MEET-ME PAGE Answer Code. Station A hangs up. When Station C dials the Answer Code, Party B is connected to Station C. Station A is removed from the Connection.
6. If Station C does not call the MEET-ME PAGE Answer Code after 30 seconds, Party B rings back to Station A. This timer can be changed by ASYD System Data 1 Index 74 Bit 0-3.
7. Stations allowed Priority Page, SFI = 57, will barge into the paging route, except when the Attendant Console is paging.
8. To answer PAGING TRANSFER while connected to another party, CALL HOLD [C-6] must be used. THREE-WAY CALLING [T-2] may not be established.
9. A Station must be assigned a Route Restriction Class that allows access to the routes involved in the PAGING TRANSFER.

Programming

Note: For UG50 programming, see Peripheral Equipment Description (UG50) manual.

<When COT Circuit Card is used for Paging Trunk>

STEP 1: **ASYD** - System Data 1, Index 73, Bits 0 and 1:

For MEET-ME PAGE, Non-Delay service, Bit 0=1, Bit 1=0.

For MEET-ME PAGE, Delay service, Bit 0=0, Bit 1=1.

For MEET-ME PAGE, Delay service with Call Transfer, Bit 0=1, Bit 1=1.

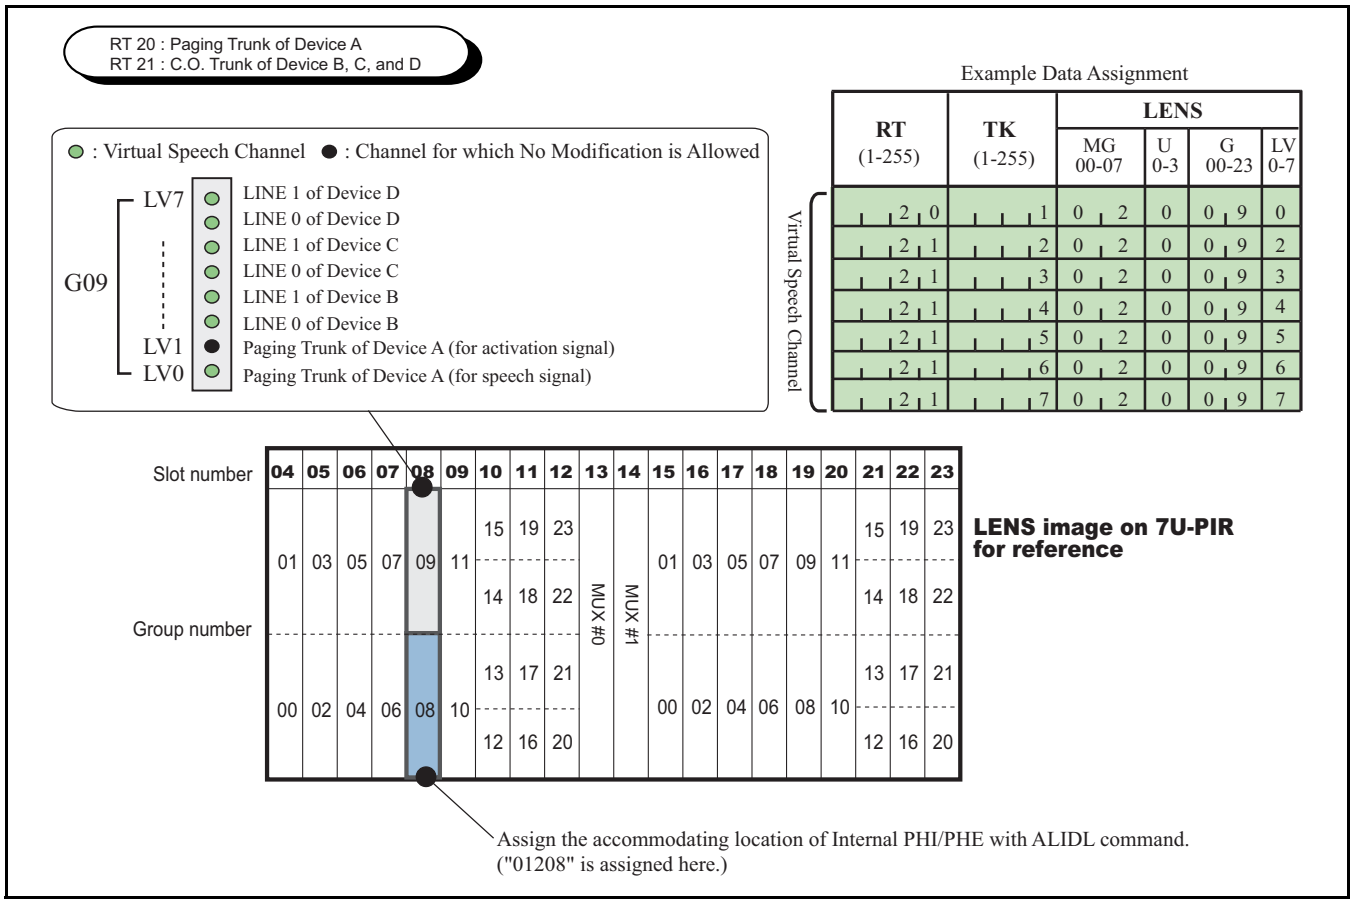
System Data 1, Index 73, Bit 3. Are PAGE Cancel Codes provided for each route? 0/1: Per route/ Common to all routes.

System Data 1, Index 74, Bits 0 and 3. Assign the cancel timer for unanswered page. Assign data 00H for 30 seconds.

(0-F + 1) x 30 = Cancel Timer.

System Data 2, Index 1, Bits 0 and 1. Consultation Hold allowed or denied. 00: Denied; 01: Originating and Terminating Calls allowed; Tandem Call Denied; 11: All calls allowed.

STEP 2: **ARTD** - Assign the paging route as shown below:



RT: 1

1-OSGS	:2	2-ONSG	:3	5-TF	:1	6-TCL	:8	7-L/T	:1
8-RLP	:2	15-LSG	:1						

Note: To change the data for existing route (RT), initialize the circuit card.

STEP 3: **ATRK** - Assign the LENS, Paging Trunk Route Number, Trunk Number, and Tenant Number.

Example: ATRK data assignment when COT card is used for Paging Trunk

STEP 4: **MBTK** - Assign the Make Idle status to the Paging Trunks.

STEP 5: **ANPD** - Reserve Levels for Trunk Access and for PAGE Answer and Cancel Codes. Select the Trunk Access Level for a Connection Index (CI) of Normal Service (N) or Hooking Service (H). Number of Necessary Digits is usually one or two (maximum of three digits). Busy Lamp Field is not activated.

If the PAGE Answer and Cancel Codes reside in a Level reserved for features, then assign according to a predetermined Numbering Plan. If the PAGE Answer and Cancel Codes reside in a separate Level, then select a CI of Normal Service (N) only. The number of Necessary Digits is usually two, and the Busy Lamp Field is OFF.

STEP 6: **ASPA** - Assign Paging Route Access Code. Type of Service, SRV = “OGC: Outgoing Call”. Assign the proper Route Number that is associated with this Paging Trunk Access Code. Assign for CI = “N: Normal” and “H: Hooking”.

Assign the PAGE answer and cancel Access Code. Type of Service, SRV = "PAGA: Paging Answer" and SRV = "PAGC: Paging Cancel". Assign the proper Route Number that is associated with this Access Code. Assign for CI = "N: Normal".

STEP 7: **ARSC** - Allow RRI: 2 and 3 access to this route for the RSCs assigned to Stations given access to the paging routes. Allow RRI: 0 and 1 on the Incoming Route to be transferred to the RSCs given access to the page answer.

STEP 8: **ASFC** - Assign Station to receive PAGING TRANSFER a Service Feature Restriction Class that allows SFI = 38. This allows a Station to dial PAGE answer codes.

<When MC&MG-COT is used for Paging Trunk>

The following steps assume that the basic setup has already been done on the MC&MG-COT.

STEP 1: **ASYD** - System Data 1

Index73, Bit 1 and Bit 0: 00=No answer, 01=No delay, 10=Delay, 11=Delay with Paging Transfer **Note 3**

Index74, Bit 0-3: Cancel Timer for unanswered Paging

Note 3: Delay with Paging Transfer is applied for the Paging Access on Attendant Console when 01, 10, or 11 is assigned in Index 73, Bit 0 & 1.

Note: Be sure to assign LENS to each LMG accommodates virtual speech/signal channel in 16-IMG system.

STEP 2: **ASTD** - State Translation Data

STM=2, STS=2 (Outgoing call to C.O. line or Tie line after holding COT) is set to ST=1.

STM=2, STS=3 (Outgoing call to C.O. line after holding Station or Tie line) is set to ST=1 (allowed).

STEP 3: **ANPD/ANPDL** - Numbering Plan Data. Assign the minimum number of digits to the first digit of Access Code for Paging Access and Paging Answer.

STEP 4: **ASPA/ASPAL** - Special Access Code.

SRV="OGC: Outgoing Call", assign the route number to the Access Code of Paging Access.

SRV="PAGA: Paging Answer", assign the route number to the Access Code of Paging Answer.

SRV="PAGC: Paging Cancel", assign the route number to the Access Code of Paging Cancel.

STEP 5: **ARSC** - Route Restriction Class. Release the restriction of Paging Trunk access on stations, RRI-2 and RRI-3 to be allowed.

STEP 6: **ARRC** - Alternate Route Restriction Data. Release the restriction of Paging Trunk access on incoming trunk.

STEP 7: **ASFC** - Service Feature Restriction Class. Assign the Service Feature Restriction Class of Paging Answer. SFI 38 (Meet-Me Paging) is allowed.

STEP 8: **ARTD** - Route Class Data. Assign the following route class data to the Paging Trunk route.

CDN 1: OSGS (Signal Interface for Outgoing) = 2 (Second Dial Tone)

CDN 6: TCL (Trunk Class) = 8 (Paging)

In addition to the basic data of Paging Trunk, the following data assignment is required:

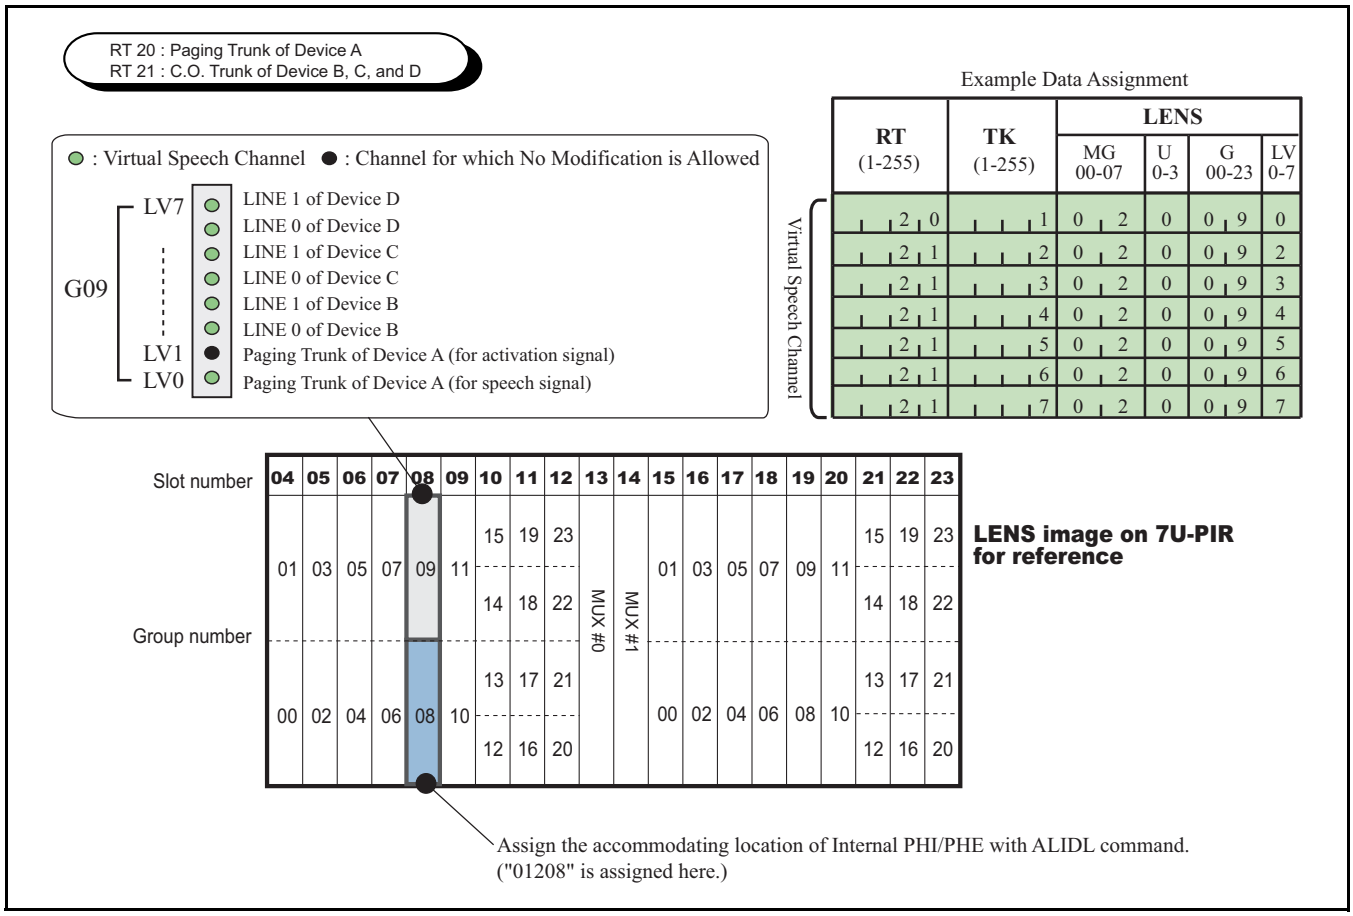
CDN 60: TC/EC=1 (Echo Canceller is available)

CDN 114: DCH=1 (Channel integration is available)

CDN 125: MGCOT=1 (MG-COT is available)

Note: To change the data for existing route (RT), reboot the MG.

STEP 9: **ARTI** - Trunk Application Data. Assign the application data to Paging Trunk route.
CDN 68: VIR=2 (MG connection)



Note: To change the data for existing route (RT), reboot the MG.

STEP 10: **ATRK** - Trunk Data. Assign the Paging Trunk. Be sure to assign the LENS of Paging Trunk to even numbered LV.

Note: Please note the following important points:

- Be sure to assign the LENS of Paging Trunk on LV0.
- Do not assign the Paging Trunk data to even-numbered Module Group, Unit=0, and Group=0. MC&MG-COT cannot use this LENS.
- Do not assign the trunk data of other MG devices.
- Do not assign anything to LV1, LV6, and LV7.
- Make sure not to assign the Route Number (RT) duplicating the MG-COT route.
- The first two channels of an MC&MG-COT card can be used for a Paging Trunk. In this case, these channels cannot be connected to C.O. lines.

Example: ATRK data assignment when MC&MG-COT is used for Paging Trunk

STEP 11: **MBTK** - Trunk Make Busy. Release the make-busy state of the Paging Trunk, specifying the route number and the trunk number.

STEP 12: **AMGIL** - Media Gateway Information. Assign the MC&MG-COT related data.

MG-ID: MAC address of MC&MG-COT

KIND: MC-MG(COT)

UG50 Multi-Slot Mode: Select this check box if registering UG50 in Multi-slot mode.

LINE: Fixed to 0. **Note 4**

CH: Fixed to 0.

LENS: Mounting location of Paging Trunk (even numbered LV). **Note 5**

Setting Type of Signaling Packet Service: QoS setting for the signal route of MG-COTMG-COT (ToS value for signal control)

Music On Hold Exists: No setting

Country Code: Select the country name

Law of A/D Conversion: μ-law/A-law **Note 6**

PB Receive Complete Timing of Dial-In [0-15]: Fixed to 0.

False Answer Timing: Fixed to 0.

Note 4: Make sure that the ATRK data has already been assigned before assigning the LENS data by AMGIL command. (Be sure to assign the trunk data in the order of ATRK → AMGIL.)

Note 5: Please note the following important points:
- LENS:000000 is not available for the users.
- Make sure that the LENS list in this command includes the data that you specified with the ATRK command in the previous step.
- Of the first two channels for the Paging Trunk, do not assign C.O. trunk data to the one with the larger channel number (CH=1) with the AMGIL command.

Note 6: Recommended Law of A/D conversion type is displayed according to the selected country code.

<When MG-COT [SCA-6COTA]/MG-COT [SCA-6COTB]/MG-COT [SCA-6COTC] is used for Paging Trunk>

The following steps assume that the basic setup has already been done on the MG-COT [SCA-6COTA]/MG-COT [SCA-6COTB]/MG-COT [SCA-6COTC].

STEP 1: **ASYD** - System Data 1
Index73, Bit 1 and Bit 0: 00=No answer, 01=No delay, 10=Delay, 11=Delay with Paging Transfer **Note 7**
Index74, Bit 0-3: Cancel Timer for unanswered Paging

Note 7: Delay with Paging Transfer is applied for the Paging Access on Attendant Console when 01, 10, or 11 is assigned in Index 73, Bit 0 & 1.

Note: Be sure to assign LENS to each (LMG accommodates virtual speech/signal) channel in 16-IMG system.

STEP 2: **ASTD** - State Translation Data
STM=2, STS=2 (Outgoing call to C.O. line or Tie line after holding COT) is set to ST=1.
STM=2, STS=3 (Outgoing call to C.O. line after holding Station or Tie line) is set to ST=1 (allowed).

STEP 3: **ANPD/ANPDL** - Numbering Plan Data. Assign the minimum number of digits to the first digit of Access Code for Paging Access and Paging Answer.

STEP 4: **ASPA/ASPAL** - Special Access Code.
SRV="OGC: Outgoing Call", assign the route number to the Access Code of Paging Access.
SRV="PAGA: Paging Answer", assign the route number to the Access Code of Paging Answer.
SRV="PAGC: Paging Cancel", assign the route number to the Access Code of Paging Cancel.

STEP 5: **ARSC** - Route Restriction Class. Allow RRI-2 and RRI-3 by releasing the restriction of Paging Trunk access on stations.

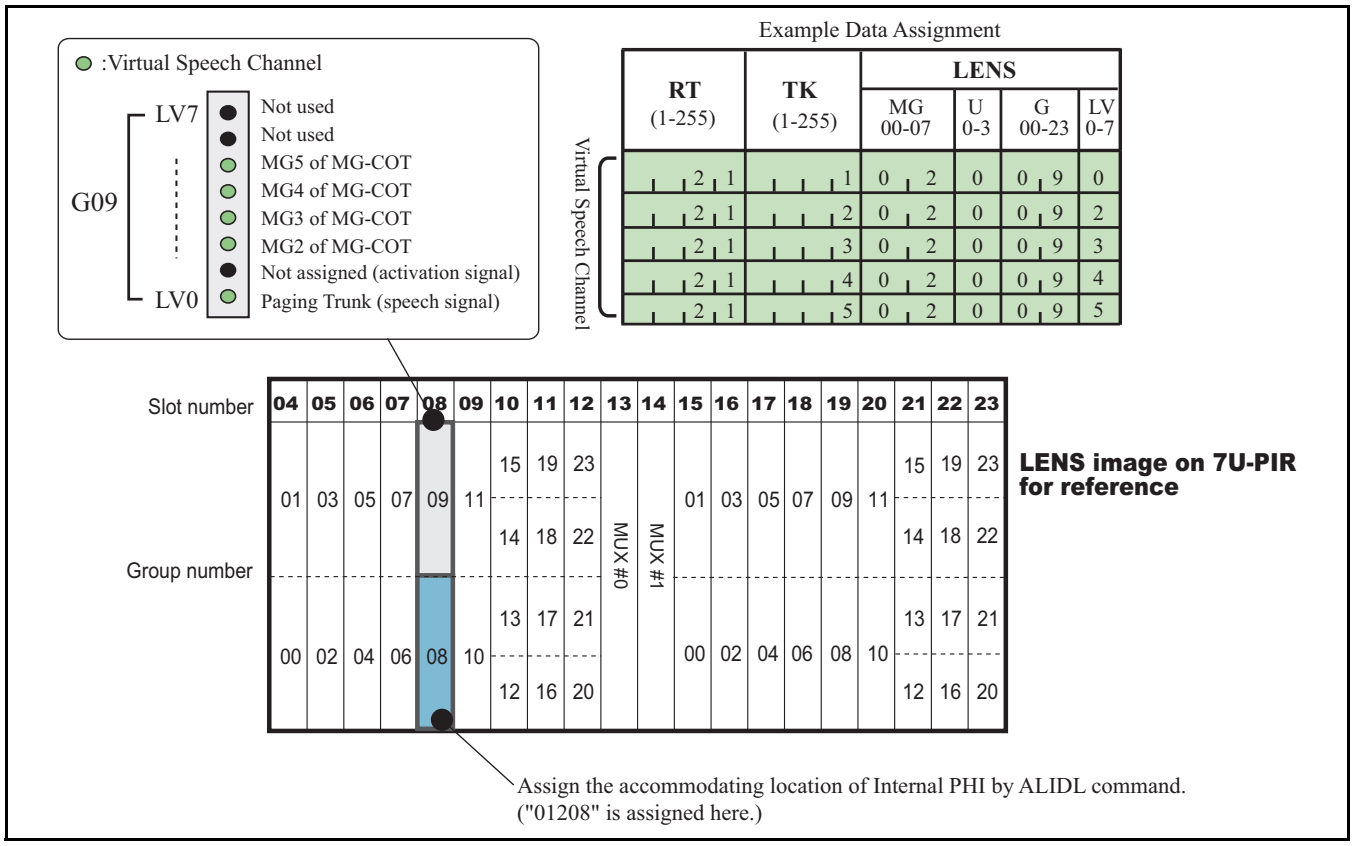
STEP 6: **ARRC** - Alternate Route Restriction Data. Release the restriction of Paging Trunk access on incoming trunk.

STEP 7: **ASFC** - Service Feature Restriction Class. Assign the Service Feature Restriction Class of Paging Answer. SFI 38 (Meet-Me Paging) is allowed.

STEP 8: **ARTD** - Route Class Data. Assign the following route class data to the Paging Trunk route.
CDN 1: OSGS (Signal Interface for Outgoing) = 2 (Second Dial Tone)
CDN 6: TCL (Trunk Class) = 8 (Paging)

In addition to the basic data of Paging Trunk, the following data assignment is required:
CDN 60: TC/EC=1 (Echo Canceller is available)
CDN 114: DCH=1 (Channel integration is available)
CDN 125: MGCOT=1 (MG-COT is available)

Note: To change the data for existing route (RT), reboot the MG.



STEP 9: **ARTI** - Trunk Application Data. Assign the application data to Paging Trunk route.
CDN 68: VIR=2 (MG connection)

Note: To change the data for existing route (RT), reboot the MG.

STEP 10: **ATRK** - Trunk Data. Assign the Paging Trunk.

Note: Please note the following important points:
- Be sure to assign the LENS of Paging Trunk on LV0.
- Do not assign the Paging Trunk data to even-numbered Module Group, Unit=0, and Group=0. MG-COT cannot use this LENS.
- Do not assign the trunk data of other MG devices.
- Do not assign anything to LV1, LV6, and LV7.
- Make sure not to assign the Route Number (RT) duplicating the MG-COT route.

Example of ATRK Data Assignment (when MG-COT is used for Paging Trunk)

STEP 11: **MBTK** - Trunk Make Busy. Release the make-busy state of the Paging Trunk, specifying the route number and the trunk number.

STEP 12: **AMGIL** - Media Gateway Information. Assign the MCMG/MG-COT related data.

MG-ID: MAC address of MCMG/MG-COT

KIND: MG(6COT)/MG(6COT) [SIP]

UG50 Multi-Slot Mode: Select this check box if registering UG50 in Multi-slot mode.

LINE: 0 (Click the check box of "LINE0" to ON.)

CH: Fixed to 0.

LENS: Mounting location of Paging Trunk (five digits). *Make sure the LENS data has already been assigned by ATRK command.

Setting Type of Signaling Packet Service: QoS setting for the signal route of MCMG/MG-COT (ToS value for signal control)

Music On Hold Exists: No setting

Country Code: Select the country name

Law of A/D Conversion: μ-law/A-law **Note 8**

PB Receive Complete Timing of Dial-In [0-15]: Fixed to 0.

False Answer Timing: Fixed to 0.

Note 8: Recommended Law of A/D conversion type is displayed according to the selected country code.)

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

Note: The current command data shown is set to all Nodes using the service: ASTD, ARTD, ATRK, ASFC

STEP 1: **ALRTN** - This data must be assigned to the NCN. Assign the Logical Route Number to the physical route.

STEP 2: **ANPDN** - This data must be assigned to the NCN. Reserve a Number Level for Service Feature Access and cancel.

STEP 3: **ASPAN** - This data must be assigned to the NCN. Assign the Access Code for Paging Transfer.

STEP 4: **ARSCN** - This data must be assigned to the NCN. Release the restriction between the Announcement Trunk and the Station.

STEP 5: **ARRCN** - This data must be assigned to the NCN. Release the restriction between the terminating Trunk and the Announcement Trunk.

P-11 Periodic Time Indication Tone

General Description

This feature provides a Tone every 180 seconds, if required, to the Station user who has made an Outgoing Call.

Operating Procedure

No manual operation is required.

Service Conditions

1. This feature is programmed on a per Trunk Route basis using the PCPro.
2. The PERIODIC TIME INDICATION TONE is 80 ms in duration and is sent every 180 seconds. See VARIABLE TIMING PARAMETERS [V-1] for other programming time periods.
3. This feature is only available for Station users who have placed Outgoing Calls to a Central Office line or to a TIE Line.
4. Incoming Calls or Outgoing Calls initiated by the Attendant will not have this feature.
5. When the Station user activates SPECIAL DIAL TONE after the Outgoing Call mode, this feature will be canceled automatically.
6. When the Station user activates the following features after the Outgoing Calls to a Central Office line or to a TIE Line, this feature will be canceled automatically:

ATTENDANT CAMP-ON WITH TONE INDICATION	[A-1]
ATTENDANT OVERRIDE	[A-7]
BOSS - SECRETARY OVERRIDE -D	[B-5D]
BUSY VERIFICATION	[B-3]
CALL HOLD	[C-6]
CALL TRANSFER	[C-10, C-11]
CALL WAITING - ORIGINATING	[C-31]
CALL WAITING - TERMINATING	[C-12]
CONSULTATION HOLD - ALL CALLS	[C-17]
DATA PRIVACY ON DEMAND	[D-17]
EXCLUSIVE HOLD -D	[E-4D]
EXECUTIVE RIGHT-OF-WAY	[E-1]
NON-EXCLUSIVE HOLD -D	[N-7D]
OFF-HOOK QUEUING	[O-7]
OUTGOING TRUNK QUEUING	[O-2]
PRIVACY RELEASE	[P-18]
THREE-WAY CALLING	[T-2]
VOICE CALL	[V-2]

Interactions

1. The timers set in System Data 1, Indexes 137 and 138 are approximate. Expect errors of ± 40 seconds. Keeping track of time for this service is a very low priority for the CPU.
2. PERIODIC TIME INDICATION TONE is used for Outgoing Connections only.

Programming

STEP 1: **ASYD** - System Data 1, Index 137. This timer sets the interval when the first tone will be sent to the Station. Assign 00H for 3 minutes.

System Data 1, Index 138. This timer sets the period between the first and second tones and all other subsequent tones. Assign 00H for 3 minutes.

STEP 2: **ARTD** - Assign CDN 29:TELP. Flag the routes with which the tone will operate.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as circuit card or MG.

STEP 3: **ASFC** - Assign to Stations that receive PERIODIC TIME INDICATION TONE a Service Feature Restriction Class that allows SFI 11 and SFI 33.

P-13D Prime Line Pickup -D

General Description

This feature allows a Dterm Station user to originate or answer a call from the line designated as the Primary Line by going off-hook. It is unnecessary to press the associated Line Key.

Operating Procedure

Lift the handset or press the SPEAKER Key. Receive Dial Tone.

Service Conditions

1. One Prime Line per Station is allowed.
2. Unless otherwise programmed, the MY Line is also the Prime Line.

Interactions

1. If no data is assigned via AKYD, the MY Line will serve as the default Prime Line. If any data is assigned in AKYD, a Prime Line must be assigned, even if the MY Line and Prime Line will be the same Telephone Number.
2. The Prime Line may be different than the MY Line. When they are different, the following features will not operate for the Prime Line: CALL BACK [C-1], CALL PARK [C-29], DO NOT DISTURB [D-21D], and OUTGOING TRUNK QUEUING [O-2]. CALL FORWARDING [C-2, 3, 5, 28] features may be set by the Attendant.
3. CLASS OF SERVICE-INDIVIDUAL [C-15]. The Prime Line will operate according to the CLASS OF SERVICE-INDIVIDUAL of the MY Line.
4. STATION MESSAGE DETAIL RECORDING [S-10]. All calls originated by the Prime Line will be recorded against the MY Line.
5. TOLL RESTRICTION-3/6 DIGIT [T-7]. The Prime Line will operate according to the restrictions of the MY Line.

Programming

AKYD - Assign the Station according to the following parameters:

TN: 1

STN: Station Number

TP: Type of Dterm (0-3)

PL ST, STN: Prime Line Tenant and Station

KYN: Key Number (1-40)

KYI: Service Index

- 0: Key Not Used
- 1: Feature Key
- 2: Multi Line Key

KD: 0

TN: Tenant

STN: Station Number

RG: Ringing Assignment per Multi Line Appearance

- 0: No Ringing.
- 1: Ringing in Day Mode Only.
- 2: Ringing in Night Mode Only.
- 3: Not Used
- 4: Ringing in Day and Night Mode - 30 second delay.
- 5: Ringing in Day and Night Mode - 20 second delay.
- 6: Ringing in Day and Night Mode - 10 second delay.
- 7: Ringing in Day and Night Mode.

P-14D Privacy -D

General Description

This feature allows a Desktop terminal to establish privacy so that no Station can interrupt a call via EXECUTIVE RIGHT-OF- WAY [E-1].

Operating Procedure

Note: Be careful not to set Do Not Disturb feature by pressing the DND key in on-hook status.

To Set:

(While a conversation is in progress)

1. While a conversation is in progress:
2. Press the DND key. The associated LED flashes red.
3. The user carries on the conversation. This feature prevents interruptions for the duration of the call.

(Before making a call)

1. Go off-hook, receive Dial Tone.
2. Press the DO NOT DISTURB (DND) key. The associated LED flashes red. The LCD displays:

PRIVACY SET **(Time Display)**

3. Dial the desired telephone number.
4. A call is established when a called party answers. This feature prevents interruptions for the duration of the call.

To Cancel:

1. While a conversation is in progress (The associated LED flashes red.):
2. Press the DND key. The associated LED goes out. **Note 1**
3. This feature is canceled.

Note 1: When the call is completed, this feature is automatically canceled by going on-hook.

Service Conditions

1. Privacy remains in effect while the Desktop terminal is in use with the feature activated. Override to either party is denied.
2. If the DND key is pressed before the conversation is concluded, PRIVACY -D is released. The LCD displays:

PRIVACY CANCEL **(Time Display)**

3. If the DND key is pressed with the Station on-hook, the DND -D [D-21D] feature has been activated. Calls can be made with DND [D-21D] activated. DND [D-21D] will not deny EXECUTIVE RIGHT- OF-WAY [E-1].
4. The PRIVACY -D feature may be activated or deactivated in any conversation as often as desired.
5. PRIVACY -D denies the following features:

ATTENDANT CAMP-ON WITH TONE INDICATION	[A-1]
ATTENDANT OVERRIDE	[A-7]
BOSS - SECRETARY OVERRIDE -D	[B-5D]
BUSY VERIFICATION	[B-3]
CALL WAITING - ORIGINATING	[C-31]
CALL WAITING - TERMINATING	[C-12]
EXECUTIVE RIGHT-OF-WAY	[E-1]

Programming

STEP 1: **AKYD** - The Desktop terminals are not equipped with a DND key. If required, assign the Station according to the following parameters.

TN: 1
STN: Station Number
TP: Type of Dterm (0-3)
KYN: Key Number (1-40)
KYI: Service Index
0: Key Not Used
1: Feature Key
2: Multi Line Key
KD: Not assigned for Feature Key
FKY: Feature Key Number
FKY = 50, DO NOT DISTURB

STEP 2: **ADSL** - Assign DND key; SN = 1, 2, 3, 4, 5, 6, 7, 15 and FKY = 50 (Do Not Disturb).
This command is required for assigning a function to each Soft key.

P-15D Privacy On All Lines -D

General Description

This feature restricts Dterm users from pressing a Busy Line Button and entering a conversation, which can occur with 1A2 key Telephones without Exclusion Circuits.

Operating Procedure

No manual operation is required.

Service Conditions

1. A Dterm Station user cannot seize the Prime Line if it is busy.
2. LINE PRESELECTION [L-9D] is denied if the selected line is busy.
3. PRIVACY RELEASE [P-18] overrides this feature.

Programming

No programming is required.

P-18 Privacy Release

General Description

This feature allows multiple Stations (maximum of six) accommodated in the same Multi Line Group to override a Dterm already engaged in communication. Also, by key operation of the Desktop terminal already engaged in communication (maximum of 8-Party Communication), overriding from other Stations in the same Multi Line Group can be restricted.

Operating Procedure

To activate PRIVACY RELEASE using the "P-RLS" key

Procedure 1

1. While engaged in a call with a station or trunk on line 201, Station B depresses the "P-RLS" key. The LED of the line 201 on other Dterms of the multi-line group flash. The LCD of Station B displays (for 5 seconds):

The P-RLS LED lights.

2. Station A may either:
   a.) depress the line 201 key, then lift the handset or depress the "SPEAKER" key.
   b.) lift the handset or depress the "SPEAKER" key, receive Dial Tone, then depress line 201 key.
3. THREE-WAY CALLING [T-2] is established. (Three parties receive the interrupting tone.)
4. Line 201 LED of Stations A and B flash, indicating I-USE [I-8], and that of other stations in the multi-line group light. The LCDs of Stations A, B, and the third party display:

The P-RLS LED on Station B goes off.

Procedure 2

1. While engaged in a call with a station or trunk on line 201, Station B depresses the "P-RLS" key. The LED of the line 201 on other Dterms of the multi-line group flash. The LCD of Station B displays (for 5 seconds):

The P-RLS LED lights.

2. Station A (single line) lifts the handset.
3. THREE-WAY CALLING [T-2] is established. (Three parties receive the interrupting tone.)
   Line 201 LED of Station B flashes, indicating I-USE [I-8], and that of other stations in the multi-line group light. The LCD of Station B displays:

The P-RLS LED goes off.

Procedure 3

1. While Station B is engaged in a call on line 201, Station A (Dterm) depresses line 201 key.
2. Station A lifts the handset or depresses the "SPEAKER" key.
3. If Station B has not depressed the "P-RLS" key yet, and if bridge call is available by depressing the "P-RLS" key, the LCD of Station A displays:

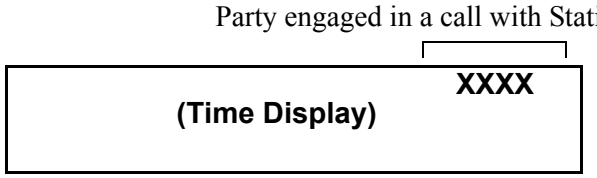
The LCD of Station B displays (for 5 seconds):

4. If Station B depresses the "P-RLS" key, THREE-WAY CALLING [T-2] is established. Three parties receive the interrupting tone, and the LCDs display:

The line 201 LED on Stations A and B flash.

Procedure 4

1. While Station B is engaged in a call on line 201, Station A (single line) lifts the handset; receives the Busy Tone.
2. If Station B has not depressed the "P-RLS" key yet, and if bridge call is available by depressing the "P-RLS" key, the LCD of Station B displays (for 5 seconds):



3. If Station B depresses the "P-RLS" key, THREE-WAY CALLING [T-2] is established. Three parties receive the interrupting tone, and the LCDs display:

To activate PRIVACY RELEASE using the "PRIVACY" key.

Procedure 1

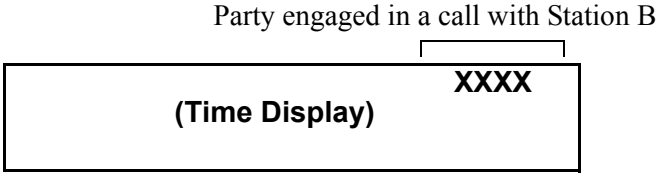
1. While Station B is engaged in a call on line 201, Station A depresses line 201 key. The LCD of Station A displays (for 10 seconds):

2. Station A lifts the handset or depresses "SPEAKER" key. THREE-WAY CALLING [T-2] is established. Three parties receive interrupting tone, and the LCDs display:

The line 201 LEDs of Stations A and B flash, indicating I-USE [I-8].

3. By the same operation, a four-party call can be established. In this case, the fourth party receives the Ringback Tone after lifting the handset or depressing the "SPEAKER" key (step 2 above), and the LCD displays:

4. To establish a multiple-party call (max. 8), follow the steps 1 through 3 above. Note, that the last overriding party receives the Call Waiting Ringback Tone instead of the Ringback Tone (step 3).



Procedure 2

1. While engaged in a call on line 201, Station B depresses the PRIVACY key. The LCD displays (for 5 seconds):

The PRIVACY LED lights.

2. Station A depresses the line 201 key. The LCD of Station A displays (for 10 seconds):

3. Station A lifts the handset or depresses the SPEAKER key. The LCD displays:

4. Station B depresses the PRIVACY key again. The LCDs of Stations A and B display:

The PRIVACY LED on Station B goes off.

5. By the same operation, a four-party call can be established. In this case, the fourth party receives the Ringback Tone after the PRIVACY key is depressed (step 4 above), and the LCD displays:

Then, a conference call is established.

6. To establish a multiple-party call (max. 8), follow the steps 1 through 5 above. Note, that the last overriding party receives the Call Waiting Ringback Tone instead of the Ringback Tone (step 5).

Procedure 3

1. While Station B is engaged in a call on line 201, Station A (single line) lifts the handset.
2. THREE-WAY CALLING [T-2] is established. Three parties receive the interrupting tone, and the LCD of Station B displays:

CONF **(Time Display)**

Procedure 4

1. While engaged in a call on line 201, Station B depresses the PRIVACY key. The LCD displays (for 5 seconds):

PRIVACY SET **(Time Display)**

The PRIVACY LED lights.

2. Station A (single line) lifts the handset; receives the Busy Tone.
3. Station B depresses the PRIVACY key.
4. THREE-WAY CALLING [T-2] is established. Three parties receive the interrupting tone, and the LCD of Station B displays:

CONF **(Time Display)**

The PRIVACY LED goes off.

Procedure 5

1. While Stations B to I are engaged in an eight-party call on lines 201 and 210, Station A depresses line 201 key. The LCD displays for 10 seconds:

CONF REST **(Time Display)**

Service Conditions

1. PRIVACY RELEASE is available for a Dterm connected to a Station or Trunk.
2. PRIVACY RELEASE is not available when one of the Stations in communication is a single line.
3. Single Line Stations cannot bridge into the busy Connection.
4. This feature is available when the PRIVACY key is pressed to establish PRIVACY RELEASE.
5. A Station has to be in one of the following states to set PRIVACY by pressing the PRIVACY key or the P-RLS key:
   a.) Connected to Station or Trunk,
   b.) Engaged in a maximum Seven-party Call.

   PRIVACY cannot be set when the overriding party has already received Ringback Tone.
6. PRIVACY RELEASE is available anytime by pressing the PRIVACY key or re-pressing P-RLS key. Also, PRIVACY will be released automatically when the Station that has set PRIVACY is released from the call.
7. PRIVACY RELEASE can be established even if the Dterm has activated the DO NOT DISTURB [D-21D] or DATA PRIVACY ON DEMAND [D-17] feature.
8. When the party (Station or Trunk) engaged in a call with the overridden party in PRIVACY RELEASE is released, and when multiple Stations are connected to the same line, PRIVACY RELEASE cannot be activated to any other Stations.
9. When a Multiple-party Call is established by an 8-Party Conference Trunk, the first overridden party can set/cancel Privacy to the Conference Trunk by key operation.
10. When a Station tries to bridge into a call and presses the Line Appearance, and when PRIVACY RELEASE is not available because of the lack of an 8-Party Conference Trunk, the LCD displays as follows, indicating that PRIVACY RELEASE is not available:

    CONF REST
    (Time Display)

11. PRIVACY RELEASE is not available when another Station is in the process of entering a Multiple-party Call (when receiving Ringback Tone). The Station will not receive any tone, and the LCD displays:

    CONF REST
    (Time Display)

12. When the Station engaged in communication with the overridden party is released in the process of entering a Multiple-party Call, the other Stations engaged in a call on the same line will not be released. In this case, the last overriding Station will be connected to an 8-Party Conference Trunk, but after that, EXECUTIVE RIGHT-OF-WAY [E-1] will not be available.

13. The overriding party's LCD display after pressing the Line Appearance of a busy Station is shown below:

Overriding party's terminal status	Overriding party's line status		
	Privacy Release available	Privacy Release not available	
		Conference Trunk Blocked	Not Engaged In Two-party Call
Idle		-	CONF REST
Call Waiting status	CONF	-	CONF RST
Busy	CONF	After disconnecting the busy Station, CONF REST is displayed and the status will be Call Waiting	CONF REST

Note: The Called Telephone Number is displayed even when Privacy is set.

14. PRIVACY RELEASE is available after any of the following operations is performed by the overriding Station:
    a.) The Station user presses the Line Appearance of a busy Station, goes off-hook or presses the SPEAKER key.
    b.) While connected to a Station/Attendant/OG Trunk/IC Trunk, the Station user presses the Line Appearance of a busy Station. (The call in progress will be disconnected.)
    c.) While engaged in THREE-WAY CALLING [T-2], the Station user presses the Line Appearance of a busy Station. The Stations, except the one that has pressed the Line Appearance, will be in a Two-party Connection.
    d.) The Station user presses the Line Appearance of a busy Station while hearing Dial Tone, Ringback Tone, Busy Tone, or Reorder Tone.
    e.) While answering a VOICE CALL [V-2], the Station user presses the Line Appearance of a busy Station. The call in progress will be disconnected.
    f.) While engaged in a Multiple-party Call, the Station user presses the Line Appearance of a busy Station.
    g.) While engaged in calling a Station by INTERCOM [I-9] Call or Intercom Bridge Call, the Station presses the Line Appearance of busy Station.
    h.) After placing a call on CONSULTATION HOLD [H-17], the Station originates a call to a Station or Trunk and then presses the Line Appearance of a busy Station.
15. The following features cannot be activated by any Station in a Multiple-party Call:

CALL TRANSFER-ALL CALLS	[C-11]
CALL HOLD	[C-6]
CONSULTATION HOLD-ALL CALLS	[C-17]
DATA PRIVACY ON DEMAND	[D-17]
NON-EXCLUSIVE HOLD	[N-7D]
EXCLUSIVE HOLD	[E-4D]

16. The following features are restricted to all Stations in a Multiple-party Call:

ATTENDANT CAMP-ON WITH TONE INDICATION	[A-1]
ATTENDANT OVERRIDE	[A-7]
BOSS - SECRETARY OVERRIDE -D	[B-5D]
CALL WAITING-ORIGINATING	[C-31]

CALL WAITING-TERMINATING	[C-12]
EXECUTIVE RIGHT-OF-WAY	[E-1]
MESSAGE REMINDER	[M-19]

Designated Trunk seizure by Attendant

17. 8-Party Conference Trunk assignments are as follows:
    a.) For all ports of the 8-Party Conference Trunk, any Telephone Number of up to 16 digits can be assigned. Also, a phantom number can be assigned to Port 0 (L = 0).
    b.) Ports 1 through 7 (L = 1-7) in the same Conference Trunk must be grouped in the same Circular Hunting Group.
    c.) When only one 8-Party Conference Trunk is available for a Tenant, the Telephone Number or phantom number of Port 0 (L = 0) should be assigned to System Data as the Trunk seizure number. When several Trunks (maximum of 20) are available, the Telephone Number or phantom number of Port 0 (L = 0) in one of the Trunks should be assigned as the Trunk seizure number.
18. 8-Party Conference Trunk seizure:
    a.) When only one Trunk is available for a Tenant, the Trunk cannot be seized unless all of the eight ports of the Trunk (where Trunk seizure number corresponding to the Tenant is assigned) are in idle status.
    b.) When multiple Trunks are available for a Tenant, the Trunk in which all of the eight ports in the Hunting Group (pilot Telephone Number = Trunk seizure number corresponding to the Tenant) are in an idle state, is hunted and seized.
    c.) If an 8-Party Conference Trunk seizure number corresponding to the Tenant is not assigned, the following method of Trunk seizure is also available:
        i.) The Trunk that contains Port 0, whose Telephone Number or phantom number is AB (A = number determined by System Data, B = the last number of the overridden Telephone Number), and all of the eight ports in an idle state are seized.
        ii.) If a Hunting Group (pilot Telephone Number = AB) is assigned among the first Ports of multiple Trunks, the Trunk in the Group where all of the eight ports are in an idle state is hunted and seized.
19. When ASYD, System Data 1, Index 384, Bit 0=0:
    Station B and C are engaged in a Two-party Connection. If Station A presses the Line Appearance for Station B or C, Station A display shows Station Number of B or C; however, this feature cannot be activated.
20. If Multiple Lines are programed beyond different Module Groups, Privacy Release is not available.

Programming

STEP 1: **ASYD** - System Data 1, Index 17, Bit 2. Is PRIVACY RELEASE service to be enabled? 0/1: No/Yes. Assign data 1.

System Data 1, Index 17, Bit 3. Is an Interrupt tone for PRIVACY RELEASE to be enabled? 0/1: No/Yes.

System Data 1, Index 17, Bit 6. Is Line Privacy Expansion service to be enabled? 0/1: No/Yes. Assign data 1.

System Data 1, Index 17, Bit 7, Bridge Call 0/1: Privacy/Non-Privacy Operation.

System Data 2, Index 7, Bits 4-7. Assign the first digit of the phantom Station Number that will be used in creating a STATION HUNTING-CIRCULAR [S-7] Group. The phantom Station Number is assigned to the first port of the 8-Party Conference card. (This first digit must also be designated as a Level used for Stations in ANPD and ASPA.)

System Data 1, Index 241, Bit 5=1 for single line terminals.

STEP 2: **ANPD** - Reserve two Number Levels for Station Access. One of these Number Levels will be for regular Station Numbers and the other will be for the Phantom Stations. This is the same number as assigned previously in System Data 2, Index 7, BITs 4-7.

STEP 3: **ASPA** - For the desired Station Number, assign SRV = STN (Station). Assign Connection Indexes (CI) of "N: Normal" and "H: Hooking".

STEP 4: **ASDT** - Assign Station data to each port of the CFT card.

STEP 5: **AKYD** - Assign FKI = 1, and Feature key Privacy Release [48] to a programmable Line/Feature key.

STEP 6: **ADSL** - Assign P-RLS key; Assign SN = 4 (Communication in Progress) and Feature key Privacy Release [48].

This command is used for assigning a function to each Soft key.

STEP 7: **APHN** - Assign Station Numbers to the CFT card Port 0 Station Numbers. A maximum of five phantom numbers can be assigned to a Port Station Number.

STEP 8: **ASHC** - Assign the Stations of the CFT card that are located on Levels 1-7 to a STATION HUNTING-CIRCULAR [S-7] Group. Assign the Stations associated with the two CFT cards, located on Level 0, to a STATION HUNTING-CIRCULAR [S-7] Group. (When it is necessary to proceed to Step 8 and farther, this data setting is not necessary.)

STEP 9: **ALPE** - Assign the Station Number or phantom number that is assigned to Port 0 of the CFT card.When two or more CFT cards are used in the same Tenant, assign the Station Number or phantom number that is assigned to Port 0 of any CFT cards.

STEP 10: **ASHP** or **ASHU** - When two or more CFT cards are used in the same Tenant, assign the Station Number or the phantom number that has been assigned to Port 0 of CFT card as STATION HUNTING-PILOT [S-9] Group or UCD [U-1] Group. In this case, the Station Number assigned by ALPE is used as the pilot number.

P-23 Periodic Warning Tone

General Description

This feature allows a Periodic Warning Tone to be sent to the station which is overridden, as one of the System audible tones.

Note: This feature is not available in North America and Australia.

Operating Procedure

No manual operation is required.

Service Conditions

1. Following origination of a Periodic Warning Tone is available:
   - Three bursts of 192 ms ON/OFF.
   - The repetition period is between 4 and 30 seconds and can be adjusted in two-seconds steps.
2. The periodic warning tone can be used for the following feature:
   - BUSY VERIFICATION [B-3]
   - ATTENDANT OVERRIDE [A-7]
   - EXECUTIVE RIGHT OF WAY [E-1]

Programming

STEP 1: **ASYD** - System Data 1, Index 59, Bit 5. Warning Tone Type: 0/1 = 2 Burst/3Burst
Bit 6: Sending Periodic Warning Tone for Override services (0/1 = Yes/No)
System Data 1, Index 158. Assigns the Periodic Warning Tone Timer. **Note 1**

Note 1: This data is common to Busy Verification, Execute Right of Way and Attendant Override.

P-24 Preset Conference

General Description

This service is one of the conference facilities that uses the Digital Conference Trunk of the System. This service enables the conference leader to simultaneously call conferees that have been designated beforehand, and to hold the conference by automatically dialing the Feature Access Code for a PRESET CONFERENCE up to 7 conferees for 8-Party Conference by PA-CFTW or 7/15/31 conferees for 8/16/32-Party Conference with PA-CFTV or CH-CFTA.

Note: This feature is not available in North America and Australia.

Operating Procedure

Calling a conference:

1. Dial the Feature Access Code (1-5 digits) for PRESET CONFERENCE.
2. Predesignated conferees (a maximum of 7, 15, or 31) will be called simultaneously and automatically. Receive Ringback Tone during that time.
3. When the first conferee answers, Ringback Tone stops and the conference call mode is entered. Ringing will continue to the conferees who do not answer.
4. The conferees who answer will enter the conference call one by one.

Specified two-party call with a conferee:

1. The conference leader can enter a two-party call mode with a conferee from the conference call mode by dialing the conferee's number (1 to 7/15/31).
2. Other conferees enter the conference call mode excluding the conference leader.

Forced release of a conferee:

1. The conference leader can make forced release of a conferee who is in two-party mode by dialing "#" from the two-party call mode.
2. After forced release, the conference leader returns to the conference if the remaining conferees are in conference mode. If all the remaining conferees have released, the conference leader releases.

Release of the conference call:

1. When one conferee who is in conference mode releases, the remaining conference leader will continue in the conference mode.
2. When the conference leader releases from the conference mode, all the conferees will be released.
3. When all the conferees release, the conference leader will be released.

Service Conditions

1. Calling a conference can be performed from a DTMF station of Dterm station.
2. Conferees need to be assigned from the PCPro. Conferees can register a maximum of seven lines from among DP lines, PB lines, Dterm lines, or outside lines (Central Office Lines and Tie Lines).
3. When a Central Office Line conferee participates in a conference, forced release by the conference leader is necessary because the conference trunk line does not release even if that conferee releases.
4. When a Central Office Line is registered as a conferee, it may happen that Ringback Tone or Busy Tone intrudes during the conference.
5. One Conference package is required for each PRESET CONFERENCE.

6. In case this features is utilized for the purpose of an emergency call (e.g. fire report) to some designated destinations, Central Office Lines are not recommended as the destinations (conferees) since the calling party may not know how to handle this function (i.e. forced release).
7. This feature is not available for external trunks which cannot detect an answering signal.
8. For external trunks which cannot detect a release signal, restrict the connection to conference port.
9. This feature is not available through CCIS/ISDN (including Q-SIG line and Dp Channel TIE line) trunks.

Programming

- When the called party is a station:

STEP 1: **ASYD** - Assign System Data, SYS1.
Index 20, Bit 6=0 (Line Circuit Reverse Relay Control when Reorder Tone is connected to a station.)

STEP 2: **ANPD** - Assigns the minimum necessary number of digits for the first number of the station number for Conference Port.

STEP 3: **ASPA** - Assigns the 1st Digit and NND of Conference Port.

STEP 4: **ASDT** - Assign the following data for Conference Ports.
STN: Station Number (Conference Port Number)
LENS: Line Equipment Numbers for Conference Port **Note 1**
TEC: Telephone Equipment Class
For Conference Leader. 1, 2, 3, 12
For Conference..... 14 (Hot Line)
SFC: Service Feature Restriction Class
RSC: Route Restriction Class

Note 1: Conference Leader's Level (LV) must be assigned "0".

STEP 5: **ASFC** - Assigns the SFC (Service Feature Restriction Class) of each Conference Port.
SFI 12 (Speed Calling - System): 0/1 = Out/In Service
SFI 14 (SMDS-Trunk Base): 0/1 = Out/In Service
SFI 19 (Speed Calling - Station/Group): 0/1 = Out/In Service
SFI 27 (Account Code/Authorization Code): 0/1 = Out/In Service
SFI 32 (Indicates Line Circuit Reverse Relay Control): This data must be assigned "1."
SFI 33 (Periodic Time Indication Tone): 0/1 = Out/In Service
SFI 50 (OFF Premise Extension): This data must be assigned "1".
SFI 58 (SMDS-Station to Station Call): 0/1 = Out/In Service
SFI 71 (Indicates Distinctive Dial Tone): This data must be assigned "1." **Note 2**
SFI 72 (Called Station Hooking Restriction): This data must be assigned "1".
SFI 80 (Conference Port): This data must be assigned "1".
Other SFIs must be assigned "0".

Note 2: This is assigned to the Conferee ports.

STEP 6: **ARSC** - Assigns RSC (Route Restriction Class) of each Conference Port.

Note: RRI 0 (IC via ATTCON) and RRI 1 (IC Directly) must be assigned "0".

STEP 7: **AHLS** - Assigns the called party to each Conferee Port.
HOT TN: Hotline Tenant Number (Conference Port Tenant Number)
HOT STN: Hotline Station Number (Conference Port Number)
TYPE: Connection Type **Note 3**
CON TN: Destination Tenant Number
CON STN: Destination Station Number

Note 3: This data must be assigned "1" (Station).

- When the called party is an outside party:

STEP 1: **ASYD** - Assign System Data, SYS1.
Index 20, Bit 6=0 (Line Circuit Reverse Relay Control when Reorder Tone is connected to a station.)
STEP 2: **ANPD** - Assigns the minimum necessary number of digits for the first number of the station number for Conference Port.
STEP 3: **ASPA** - Assigns the 1st Digit and NND of Conference Port.
STEP 4: **ASDT** - Assign the following data for Conference Ports.
STN: Station Number (Conference Port Number)
LENS: Line Equipment Numbers for Conference Port **Note 4**
TEC: Telephone Equipment Class
For Conference Leader.... 1, 2, 3, 12
For Conference..... 14 (Hotline)
SFC: Service Feature Restriction Class
RSC: Route Restriction Class

Note 4: Conference Leader's Level (LV) must be assigned "0."

STEP 5: **ASFC** - Assigns the SFC (Service Feature Restriction Class) of each Conference Port.
SFI 12 (Speed Calling - System): 0/1 = Out/In Service
SFI 14 (SMDS-Trunk Base): 0/1 = Out/In Service
SFI 19 (Speed Calling - Station/Group): 0/1 = Out/In Service
SFI 27 (Account Code/Authorization Code): 0/1 = Out/In Service
SFI 32 (Indicates Line Circuit Reverse Relay Control): This data must be assigned "1."
SFI 33 (Periodic Time Indication Tone): 0/1 = Out/In Service
SFI 50 (OFF Premise Extension): This data must be assigned "1".
SFI 58 (SMDS-Station to Station Call): 0/1 = Out/In Service
SFI 71 (Indicates Distinctive Dial Tone): This data must be assigned "1." **Note 5**
SFI 72 (Called Station Hooking Restriction): This data must be assigned "1".
SFI 80 (Conference Port): This data must be assigned "1".
Other SFIs must be assigned "0".

Note 5: This is assigned to the Conferee ports.

STEP 6: **ARSC** - Assigns RSC (Route Restriction Class) of each Conference Port.

Note: RRI 0 (IC via ATTCON) and RRI 1 (IC Directly) must be assigned “0”. And release the restriction between the Conference Port Outgoing Route (at RRI 3).

STEP 7: **ASPD** - Assigns the Abbreviated Digit Code to the called party.

STEP 8: **AHLS** - Assigns the called party to each Conferee Port.

HOT TN: Hotline Tenant Number (Conference Port Tenant Number)

HOT STN: Hotline Station Number (Conference Port Number)

TYPE: Connection Type

This data must be assigned “2” (Outside party (ADC)).

CON ADC: Speed Calling Code of Called Party.

P-25 Protection from Abnormal Dialing

General Description

This service offers the following protection features to prevent the Telephony Server station with Toll restriction from
originating a Central Office call by abnormal dialing:

1. Total digit count
2. Restart of Register (DP/DTMF Receiver)
3. Rejection of receiving DP signal from DTMF telephone

Note: This feature is not available in North America and Australia.

Operating Procedure

When abnormal dialing is performed, Reorder Tone will be sent to the station.

Service Conditions

The System has the following features for protection against abnormal dialing:

1. Total Digit Count
   Restriction of origination is imposed when the number of digits received exceeds the number predetermined by the system data. This prevents abnormal dialing by "Central Office Access Code + Hooking", "Central Office Access Code + X" etc. when there is a delay in receiving Dial Tone from the Central Office exchange, and when the length of the delay is irregular.
   When a station dials the digits exceeding the restricted number of digits, the System immediately generates Reorder Tone to the station.
2. Restart of Register
   When the Central Office exchange is slow to send Dial Tone, but the length of the delay is relatively stable and short, abnormal dialing by "Central Office Access Code + X" etc. is prevented by restarting register using time-out of seizure guard timer.
3. Rejection of receiving DP signal from DTMF telephone
   This method prevents improper origination by dialing the area code by DTMF after sending a DP signal from a DTMF station once the link has been established.
4. This feature is available for the station which holds the other station.

Programming

STEP 1: **ASYD** - System Data 1, Index 43, Bit 7. Restriction for Dialing more than the maximum of necessary digits (as assigned via command AMND) 0/1 = Not Required/Required

System Data 1, Index 135. Assigns the Seizure Guard Timer for Restart of Register.

STEP 2: **AMND** - Assign the Maximum Necessary Digits to Destination Code.

STEP 3: **ASDT** - Assigns the "TEC = 2 (PB Station)" to the PB Station.

P-26 Protection from C.O. Dial Tone Delay

General Description

This service allows extend the Register Prepose Timer up to 62 sec. in order to originate from the Telephony Server to an other exchange with a long Dial Tone delay.
This service also extend the Sender Prepose Timer up to 8 sec. to permit speed calling from a station to an other exchange with a long Dial Tone delay.

Note: This feature is not available in North America and Australia.

Operating Procedure

No manual operation is required.

Service Conditions

1. The Prepose Timer and Sender Prepose Timer are set by the system data.
2. The Sender Prepose Timer is effective only for the origination by sender connection such as speed calling on a trunk line using a Second Dial Tone.

P-30 Priority Paging

General Description

This feature allows a Station or an ATTENDANT CONSOLE [A-3] to make a PRIORITY PAGING [P-30] access when a Paging Call cannot normally be originated because another Paging Call is in progress or is waiting for an answer. ATTCON and Station can page anyone over the speaker connected to MC&MG-COT equipment, overriding other party's paging in progress.
PAGING equipment is configured as the Paging Trunk and connected using an interface.

Operating Procedure

Paging Access from a Station

1. The Paging Station goes off-hook. Hear Dial Tone.
2. The Station dials the PRIORITY PAGING [P-30] Access Code. Hear Dial Tone once again.
3. The Station dials the paging Access Code. Hear continuous Ringback Tone for several seconds.
4. The Station performs paging.

Paging Access from the Attendant Console

1. The Attendant presses the Loop key for an available Loop.
2. The Attendant dials the PRIORITY PAGING [P-30] Access Code.
3. The Attendant dials the paging Access Code; hears continuous Ringback Tone for several seconds.
4. The Attendant performs paging.

Service Conditions

1. A PRIORITY PAGING [P-30] access is allowed from a Station or from the ATTENDANT CONSOLE [A-3].
2. This feature is not priority radio paging for use with a Radio Paging Access service.
3. A PRIORITY PAGING access cannot be made from a Station or the ATTENDANT CONSOLE [A-3] which is waiting for an answer to another Paging Call.
4. PRIORITY PAGING Access Code + ALL ZONE PAGING [A-53] Access Code dialing is possible. However, even if this dialing method is used, the PRIORITY PAGING [P-30] function is not activated when the line is busy. It operates in the same way as ALL ZONE PAGING [A-53] Access Code dialing.
5. While a Paging Trunk forced release or Paging Memory clearing is being processed, the caller (Station operator) who activated the PRIORITY PAGING [P-30] access hears continuous Ringback Tone (for about 5 - 19 seconds).
6. If all Paging Trunks are busy, the Paging Trunk forcibly released is Trunk No. 1.
7. If Paging Trunk No. 1 is not equipped or the package is in Make Busy state, the caller (Station or operator) hears Reorder Tone. If Soft MB or Circuit MB is active, Paging Trunk No. 1 is seized.
8. If all Paging Trunks are busy and Paging Trunk No. 1 is being used at the ATTENDANT CONSOLE [A-3], Paging Trunk No. 1 is not forcibly released. In this case, the caller (Station or operator) hears Reorder Tone.
9. Multiple priority paging to the same route is possible.
10. If all Paging Memory being used by PRIORITY PAGING is in use, a PRIORITY PAGING Call to a different route is not forcibly cleared.
11. If all Paging Memory being used by PRIORITY PAGING Calls to a different route, the Paging Memory is not forcibly cleared. In this case, the caller (Station or Attendant) hears Reorder Tone.

12. Forced release of a Paging Trunk is processed so that the Station connected with that specific Paging Trunk is regarded as having released. Therefore, after the forced release of the Paging Trunk, the state of the Station is as follows:
    a.) if there is a call on hold: Dial Tone Connection
    b.) if there is no call on hold: Recall (Calling Only)
    (Answering - Non-Delay)
    Dial Tone Connection (Answering - Delay basis)
    (Paging Transfer)
13. Going on-hook by the Station after Dial Tone Connection will result in Recall. As the Paging Memory becomes free after this Recall, a PRIORITY PAGING Call can be originated.
14. Forced clearance of the Paging Memory is processed as a time-out of a Paging Call awaiting answer. Therefore, after the forced Paging Memory clearance, the state of the Station is as follows:
    a.) if there is no call on hold: Same as before clearance
    b.) if there is a call on hold: Recall **Note 1**

    Note 1: If a Recall cannot be made because of a busy line, etc., the Paging Memory is not cleared until the line is released and Recall is possible.

15. The following can be used as a paging trunk interface:

    - COT Circuit Cards
    - TLT Circuit Cards
    - MC&MG-COT (4LC2COT)
    - MG-COT (6COT)
    - UG50 (GCD-PGTA) **Note 2 Note 3**

    Note 2: UG50 (GCD-4COTA/B/C) cannot be used as a paging trunk interface.

    Note 3: Available from UG50 software version 2.00.

16. Loop signaling is the recommended signaling type.
17. Follow the conditions below to use this feature by MC&MG-COT equipment.
    a.) Radio Paging feature is not supported.
    b.) One Paging Trunk is used per MC&MG-COT equipment.
    c.) MG (COT) side accommodates speech signal to LINE0/MG0, and activation signal (loop activation) to LINE1/MG1.
    d.) The power for activation signal is not supplied from MC&MG-COT.
    e.) C.O. line interface cannot be accommodated when MC&MG-COT is used by Paging features. However, MC function can be used to connect analog telephone to TEL2/MC2 and TEL3/MC3. Do not use TEL0/MC0 and TEL1/MC1. When PFT is activated, TEL0/MC0 and TEL1/MC1 are connected to LINE0/MG0 and LINE1/MG1.
18. Follow the conditions below to use this feature by MG-COT [SCA-6COTA]/MG-COT [SCA-6COTB]/ MG-COT [SCA-6COTC].
    a.) Radio Paging feature is not supported.
    b.) One Paging Trunk is used per MCMG/MG-COT.

c.) MCMG/MG-COT accommodates speech signal to MG0, and activation signal (loop activation) to MG1.
d.) The power for activation signal is not supplied from MCMG/MG-COT.
e.) MCMG's MG2~MG6 connectors and MG-COT's MG2~MG5 connectors can be used for ordinary analog C.O. line interface even when the MCMG/MG-COT is used as a Paging Trunk. Assign the Paging Trunk data by ATRK command different from the C.O. trunk data.

Programming

Note: For UG50 programming, see Peripheral Equipment Description (UG50) manual.

<When COT Circuit Card is used for Paging Trunk>

STEP 1: **ASYD** - System Data 1, Index 73, Bits 0 and 1. For PAGING function only, assign data "00".

STEP 2: **ARTD** - Assign the Paging route as shown below:

RT: 1

1-OSGS	:2	2-ONSG	:3	4-INSG	:3	5-TF	:1	6-TCL	:8
7-L/T	:1	8-RLP	:2	15-LSG	:0/1	44-PRV	:1		

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or MG.

STEP 3: **ATRK** - Assign the LENS, Paging Trunk Route Number, Trunk Number, and Tenant Number.

STEP 4: **MBTK** - Assign the Make Idle status to the Paging Trunks.

STEP 5: **ANPD** - Assign a Level for Trunk Access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. Assign the Number of Necessary Digits according to a predetermined Numbering Plan. Busy Lamp Field is not activated.

STEP 6: **ASPA** - Assign the PAGE Access Code. Type of Service, SRV = "OGC: Outgoing Call". Assign the proper Route Number associated with this Access Code. Assign Connection Indexes, CI = "N: Normal", "H: Hooking".

STEP 7: **ARSC** - Assign to the Station that is allowed access to Paging Trunks a Route Restriction Class (RSC) that is allowed these routes in Route Restriction Indexes (RRI) 2 and 3.

STEP 8: **ASFC** - Allow SFI = 57, Priority Page, to the Service Feature Restriction Class of Stations allowed this feature.

STEP 9: **ASPA** - Assign an Access Code for SRV = "SSC: Service Code", SID = 40 (Priority Page).

<When MC&MG-COT is used for Paging Trunk>

The following steps assume that the basic setup has already been done on the MC&MG-COT.

STEP 1: **ASYD** - System Data 1

Index 186, Bit 6: 1 = MG in ISDN is available
Index 187: Fixed to 00.
Index 73, Bit 1 and Bit 0: Fixed to 00 for Priority Paging.
Index 74, Bit 0-3: Cancel Timer for unanswered Paging.

Note: Be sure to assign LENS to each LMG accommodates virtual speech/signal channel in 16-IMG system.

STEP 2: **ASTD** - State Translation Data
STM=2, STS=2 (Outgoing call to C.O. line or Tie line after holding COT) is set to ST=1.
STM=2, STS=3 (Outgoing call to C.O. line after holding Station or Tie line) is set to ST=1 (allowed).

STEP 3: **ANPD/ANPDL** - Numbering Plan Data. Assign the minimum number of digits to the first digit of Access Code for Paging Access and Paging Answer.

STEP 4: **ASPA/ASPAL** - Special Access Code.
SRV="OGC: Outgoing Call", assign the route number to the Access Code of Paging Access.
SRV="PAGA: Paging Answer", assign the route number to the Access Code of Paging Answer.
SRV="PAGC: Paging Cancel", assign the route number to the Access Code of Paging Cancel.
SRV="SSC: Service Code", SID=40 (Priority Paging)

STEP 5: **ARSC** - Route Restriction Class. Release the restriction of Paging Trunk access on stations, RRI-2 and RRI-3 to be allowed.

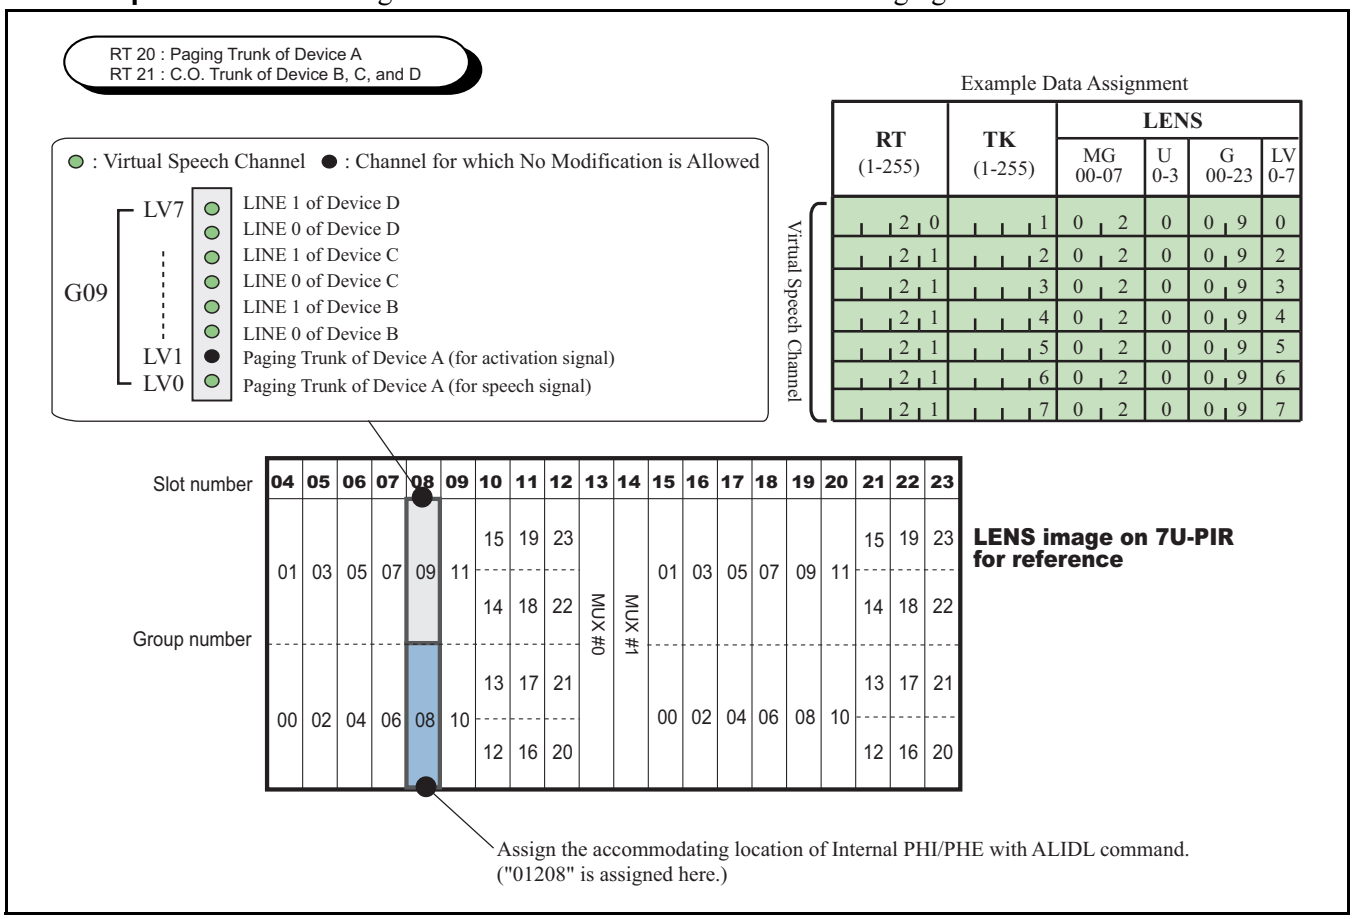
STEP 6: **ARRC** - Alternate Route Restriction Data. Release the restriction of Paging Trunk access on incoming trunk.

STEP 7: **ASFC** - Service Feature Restriction Class. Assign the Service Feature Restriction Class of Paging Answer. SFI 38 (Meet-Me Paging) is allowed.

STEP 8: **ARTD** - Route Class Data. Assign the following route class data to the Paging Trunk route.
CDN 1: OSGS (Signal Interface for Outgoing) = 2 (Second Dial Tone)
CDN 6: TCL (Trunk Class) = 8 (Paging)

In addition to the basic paging data shown on the former page.
CDN 44: PRV=1 (Line Trunk Privacy is available)
CDN 60: TC/EC=1 (Echo Canceller is available)
CDN 114: DCH=1 (Channel integration is available)
CDN 125: MGCOT=1 (MG-COT is available)

Note: To change the data for existing route (RT), reboot the MG.



STEP 9: **ARTI** - Trunk Application Data. Assign the application data to Paging Trunk route.
CDN 68: VIR=2 (MG connection)

Note: To change the data for existing route (RT), reboot the MG.

STEP 10: **ATRK** - Trunk Data. Assign the Paging Trunk. Be sure to assign the LENS of Paging Trunk to even numbered LV.

Note: Please note the following important points:
- Be sure to assign the LENS of Paging Trunk on LV0.
- Do not assign the Paging Trunk data to even-numbered Module Group, Unit=0, and Group=0. MC&MG-COT cannot use this LENS.
- Do not assign the trunk data of other MG devices.
- Do not assign anything to LV1, LV6, and LV7.
- Make sure not to assign the Route Number (RT) duplicating the MG-COT route.
- The first two channels of an MC&MG-COT card can be used for a Paging Trunk. In this case, these channels cannot be connected to C.O. lines.

Example: ATRK data assignment when MC&MG-COT is used for Paging Trunk

STEP 11: **MBTK** - Trunk Make Busy. Release the make-busy state of the Paging Trunk, specifying the route number and the trunk number.

STEP 12: **AMGIL** - Media Gateway Information. Assign the MC&MG-COT related data.

MG-ID: MAC address of MC&MG-COT

KIND: MC-MG(COT)

UG50 Multi-Slot Mode: Select this check box if registering UG50 in Multi-slot mode.

LINE: Fixed to 0. **Note 4**

CH: Fixed to 0.

LENS: Mounting location of Paging Trunk (even numbered LV).

Setting Type of Signaling Packet Service: QoS setting for the signal route of MG-COT (ToS value for signal control)

Music On Hold Exists: No setting

Country Code: Select the country name

Law of A/D Conversion: μ-law/A-law **Note 5**

PB Receive Complete Timing of Dial-In [0-15]: Fixed to 0.

False Answer Timing: Fixed to 0.

Note 4: Make sure that the ATRK data has already been assigned before assigning the LENS data by AMGIL command. (Be sure to assign the trunk data in the order of ATRK → AMGIL.)

Note 5: Recommended Law of A/D conversion type is displayed according to the selected country code.

<When MG-COT [SCA-6COTA]/MG-COT [SCA-6COTB]/MG-COT [SCA-6COTC] is used for Paging Trunk>

The following steps assume that the basic setup has already been done on the MG-COT [SCA-6COTA]/MG-COT [SCA-6COTB]/MG-COT [SCA-6COTC].

STEP 1: **ASYD** - System Data 1
Index 73, Bit 1 and Bit 0: Fixed to 00 for Priority Paging.
Index 74, Bit 0-3: Cancel Timer for unanswered Paging

Note: Be sure to assign LENS to each (LMG accommodates virtual speech/signal) channel in 16-IMG system.

STEP 2: **ASTD** - State Translation Data
STM=2, STS=2 (Outgoing call to C.O. line or Tie line after holding COT) is set to ST=1.
STM=2, STS=3 (Outgoing call to C.O. line after holding Station or Tie line) is set to ST=1 (allowed).

STEP 3: **ANPD/ANPDL** - Numbering Plan Data. Assign the minimum number of digits to the first digit of Access Code for Paging Access and Paging Answer.

STEP 4: **ASPA/ASPAL** - Special Access Code.
SRV="OGC: Outgoing Call", assign the route number to the Access Code of Paging Access.
SRV="PAGA: Paging Answer", assign the route number to the Access Code of Paging Answer.
SRV="PAGC: Paging Cancel", assign the route number to the Access Code of Paging Cancel.
SRV="SSC: Service Code", SID=40 (Priority Paging)

STEP 5: **ARSC** - Route Restriction Class. Release the restriction of Paging Trunk access on stations, RRI-2 and RRI-3 to be allowed.

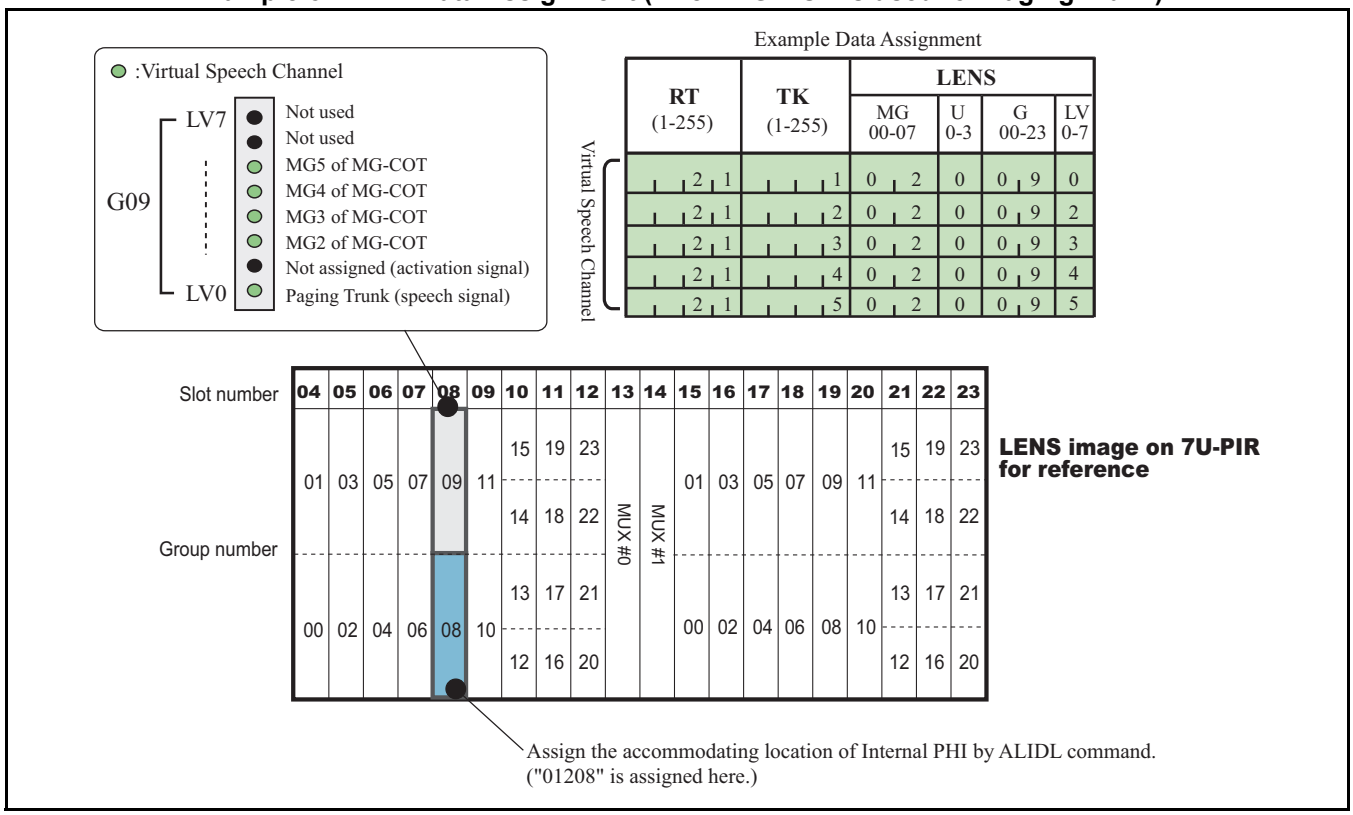
STEP 6: **ARRC** - Alternate Route Restriction Data. Release the restriction of Paging Trunk access on incoming trunk.

STEP 7: **ASFC** - Service Feature Restriction Class. Assign the Service Feature Restriction Class of Paging Answer and Priority Paging. SFI 38 (Meet-Me Paging) and SFI 57 (Priority Paging) is allowed.

STEP 8: **ARTD** - Route Class Data. Assign the following route class data to the Paging Trunk route.
CDN 1: OSGS (Signal Interface for Outgoing) = 2 (Second Dial Tone)
CDN 6: TCL (Trunk Class) = 8 (Paging)

In addition to the basic paging data shown on the former page.
CDN 44: PRV=1 (Line Trunk Privacy is available)
CDN 60: TC/EC=1 (Echo Canceller is available)
CDN 114: DCH=1 (Channel integration is available)
CDN 125: MGCOT=1 (MG-COT is available)

Note: To change the data for existing route (RT), initialize the circuit card.



STEP 9: **ARTI** - Trunk Application Data. Assign the application data to Paging Trunk route.
CDN 68: VIR=2 (MG connection)

STEP 10: **ATRK** - Trunk Data. Assign the Paging Trunk.

Note: Please note the following important points:

- Be sure to assign the LENS of Paging Trunk on LV0.
- Do not assign the Paging Trunk data to even-numbered Module Group, Unit=0, and Group=0. MG-COT cannot use this LENS.
- Do not assign the trunk data of other MG devices.
- Do not assign anything to LV1, LV6, and LV7.
- Make sure not to assign the Route Number (RT) duplicating the MG-COT route.

Example of ATRK Data Assignment (when MG-COT is used for Paging Trunk)

STEP 11: **MBTK** - Trunk Make Busy. Release the make-busy state of the Paging Trunk, specifying the route number and the trunk number.

STEP 12: **AMGIL** - Media Gateway Information. Assign the MCMG/MG-COT related data.
MG-ID: MAC address of MCMG/MG-COT
KIND: MG(6COT)/MG(6COT) [SIP]
UG50 Multi-Slot Mode: Select this check box if registering UG50 in Multi-slot mode.
LINE: Fixed to 0.
CH: Fixed to 0.
LENS: Mounting location of Paging Trunk (even numbered LV).
Setting Type of Signaling Packet Service: QoS setting for the signal route of MCMG/MG-COT (ToS value for signal control)
Music On Hold Exists: No setting
Country Code: Select the country name
Law of A/D Conversion: μ-law/A-law **Note 6**
PB Receive Complete Timing of Dial-In: Fixed to 0.
False Answer Timing: Fixed to 0.

Note 6: Recommended Law of A/D conversion type is displayed according to the selected country code.

P-57 Pad Lock

General Description

This feature temporarily restricts telephones from making unauthorized calls by dialing special Access Code when Station users are away from their seats. In addition, the Station user can assign the desired Route Restriction Class (RSC) from the Station.

(only for the Countries except North America)
The Station user can assign his/her own PAD LOCK ID Code, in place of Authorization Code.

Note: This feature is not available in Australia.

Operating Procedure

<For North America>
To set from the Station

1. Lift the handset and receive DT (Dial Tone).
2. Dial PAD LOCK Access Code receive SST (Service Set Tone) or no tone.
3. Dial Authorization Code and receive DT (Dial Tone). PAD Lock is set.
4. Replace the handset.

To cancel from the Station

1. Lift the handset and receive DT (Dial Tone).
2. Dial PAD LOCK Cancel Code and receive SPDT (Special Dial Tone).
3. Dial Authorization Code and receive SST (Service Set Tone).
4. Replace the handset.

To assign the desired RSC from the Station (only for LEAST COST ROUTING [L-5] Calls)

1. Lift the handset and receive DT (Dial Tone).
2. Enter the number to be called.
3. If an Authorization Code is required, the caller will receive SST (Service Set Tone).
4. Enter the Authorization Code. PAD Lock is set.

To restore the RSC form the Station

1. Lift the handset and receive DT (Dial Tone).
2. Dial PAD LOCK Cancel Code and receive SPDT (Special Dial Tone).
3. Dial Authorization Code and receive SST (Service Set Tone).
4. Replace the handset.

Note: For security purposes, the PAD LOCK ID codes (PAD Lock Access Code and Unlock Access Code) can be eliminated by setting ASFC: SFI 137 (Authorization Code Display Elimination) = 1. For details, see Authorization Code Display Elimination [A-99].

<For the Countries except North America>
To set from the Station

1. Lift the handset and receive DT (Dial Tone).
2. Dial PAD LOCK Access Code and receive SST (Service Set Tone) or no tone.
3. Dial Authorization Code and receive DT (Dial Tone) again. PAD LOCK is set.
4. Replace the handset.

To cancel from Station

1. Lift the handset and receive DT (Dial Tone).
2. Dial UNLOCK Access Code and receive SPDT (Special Dial Tone).
3. Dial Authorization Code and receive SST (Service Set Tone).
4. Replace the handset.

To assign the desired RSC from the Station (only for LEAST COST ROUTING [L-5] calls)

1. Lift the handset and receive DT (Dial Tone).
2. Dial the number to be called.
3. If an Authorization Code is required, the caller will receive SST (Service Set Tone).
4. Dial the Authorization Code. PAD Lock is set.

To restore the RSC from the Station

1. Lift the handset and receive DT (Dial Tone).
2. Dial UNLOCK Access Code and receive SPDT (Special Dial Tone).
3. Dial Authorization Code and receive SST (Service Set Tone).
4. Replace the handset.

Setting PAD LOCK ID Code

1. Lift the handset and receive DT (Dial Tone).
2. Dial the Access Code for setting PAD LOCK ID Code and receive SPDT (Special Dial Tone).
3. Dial the desired PAD LOCK ID Code and receive DT (Dial Tone).
4. Dial the PAD LOCK ID Code again and receive SST (Service Set Tone).
5. Dial the desired Route Restriction Class (01-15 / 00) and receive SST (Service Set Tone).

Canceling PAD LOCK ID Code

1. Lift the handset and receive DT (Dial Tone).
2. Dial the Access Code for canceling PAD LOCK ID Code and receive SPDT (Special Dial Tone).
3. Dial the PAD LOCK ID Code and receive SPDT (Special Dial Tone).
4. Dial the PAD LOCK ID Code again and receive SST (Service Set Tone).

Changing PAD LOCK ID Code

1. Lift the handset and receive DT (Dial Tone).
2. Dial the Access Code for setting PAD LOCK ID Code and receive SPDT (Special Dial Tone).
3. Dial the old PAD LOCK ID Code and receive SPDT (Special Dial Tone).
4. Dial the desired PAD LOCK ID Code and receive DT (Dial Tone).
5. Dial the PAD LOCK ID Code again and receive SST (Service Set Tone).
6. Dial the desired Route Restriction Class (01-15 / 00) and receive SST (Service Set Tone).

Setting PAD LOCK

1. Lift the handset and receive DT (Dial Tone).
2. Dial the Access Code for setting PAD LOCK and receive SST (Service Set Tone) or no tone.
3. Dial your own ID Code and receive DT (Dial Tone). PAD Lock is set.

Canceling PAD LOCK

1. Lift the handset and receive DT (Dial Tone).
2. Dial the Access Code for canceling PAD LOCK and receive SST (Service Set Tone) or no tone.
3. Dial your own ID Code and receive SST (Service Set Tone).

To assign the desired RSC from the Station by using the PAD Lock ID Code (only for LEAST COST ROUTING [L-5] Calls)

1. Lift the handset and receive DT (Dial Tone).

2. Enter the number to be called.
3. If an Authorization Code is required, the caller will receive SST (Service Set Tone).
4. Enter your own ID Code instead of an Authorization Code. PAD LOCK is set.

To restore the RSC from the Station by using the PAD Lock ID Code (only for LEAST COST ROUTING [L-5] Calls)

1. Lift the handset and receive DT (Dial Tone).
2. Dial UNLOCK Access Code and receive SPDT (Special Dial Tone).
3. Dial your own ID Code and receive SST (Service Set Tone).
4. Replace the handset.

Note: For security purposes, the PAD LOCK ID codes (PAD Lock Access Code and Unlock Access Code) can be eliminated by setting ASFC: SFI 137 (Authorization Code Display Elimination) = 1. For details, see Authorization Code Display Elimination [A-99].

Service Conditions

1. Stations in Pad Lock status are able to place Station-to-Station Calls and Outgoing Calls using Attendant assisted Calling.
2. If the Station under Pad Lock status dials a Central Office line Access Code, the Station is rerouted to Reorder Tone, the Attendant Console or a recorded announcement depending on to RSC.

   [Example]

   - When Toll Calls are restricted, Toll Denial/Toll Diversion [T-6] can be in service.
   - When Call Originations are restricted, Route Restriction - Announcement [R-27] can be in service.

3. In PAD LOCK status, when trunk calls are received, stations will receive Reorder Tone or, on a Tenant basis, can be assigned to transfer to the Attendant Console.
   When the Attendant Console receives calls transferred from Stations in PAD LOCK status, Call Forwarding - Intercept / Announcement [C-25] can be in service.
4. PAD LOCK status will continue unless it is canceled.
5. Stations are assigned this feature via Class of Service.
6. This feature is set/canceled from the Station only. The Attendant Console cannot set or cancel this feature.
7. If a Dterm is in PAD LOCK status, the My Line and Sub Line are restricted.
8. When the Station in PAD LOCK status attempts to set PAD LOCK again, it is connected to Reorder Tone (RST/REST is displayed on the Dterm).
9. Conversion of Service Feature Restriction Class is not available.
10. SFC class for PAD LOCK is set to My Line even when the SFC was set against Sub Line.
11. The Authorization Code [A-20] feature cannot be applied to the Station, that is already placed in PAD LOCK status. If an Authorization Code is dialed despite this, ROT is returned to the Station (and “RST” is displayed on the LCD, if the Station is Dterm).

(only for the countries except North America)

12. PAD LOCK ID Code is available only for Stations (Single Line Telephone, Dterm, ISDN terminal).
13. PAD LOCK ID Code can be set on a Station basis.
14. The list of PAD LOCK ID codes cannot be output.
15. PAD LOCK ID Code data is saved by the PCPro command or the routine diagnosis program for saving Call Forwarding data.

16. PAD LOCK ID codes cannot be output to SMDR.
17. When PAD LOCK using PAD LOCK ID Code is in service, if the PAD LOCK ID Code is not assigned to a Station, PAD LOCK using Authorization Code is available for the Station.
18. PAD LOCK ID Code assigned from the Station can be deleted by using RPID command.

Interactions

PAD LOCK ID codes are shared with passwords for "DtermIP Login Function". For more details, please refer to Interactions of [D-159] DtermIP.

Programming

STEP 1: **ASYD** - System Data 1, Index 4, Bit 4. Temporary Class Conversion. Assign as data **"**1.**"** Assign the data associated with Authorization Code service.

<To Send No Tone after dialing the Access Code for PAD LOCK>

System Data 1, Index 43, Bit 2. Assign as data **"**0**"** (Out of Service).

<To Send SST after dialing the Access Code for PAD LOCK>

System Data 1, Index 43, Bit 2. Assign as data **"**1**"** (In Service). Index 42, Bit 7. Assign as data **"**0**"** (Standard [SST: Continuous, SPDT: Burst]).

<To Send EPN Tone after dialing the Access Code for PAD LOCK> For North America Only

System Data 1, Index 43, Bit 2. Assign as data "1" (In Service). Index 42, Bit 7. Assign as data "1" (EPN Tone).

System Data 1, Index 93, Bit 6. Separate or Common Tenant Data Table development for AMND command. 0/1 = Separate/Common. Assign 0.

STEP 2: **ASPA** - For SRV = "SSC: Service Code", SID = 42, assign the Access Code for Dial Access to lock. For SRV = "SSCA: Service Code Appendix", SIDA = 85, assign the Access Code for Dial Access to unlock.

(only for the countries except North America)

For SRV = "SSCA: Service Code Appendix", SIDA = 104, assign the Access Code for setting PAD LOCK ID Code. For SRV = "SSCA: Service Code Appendix", SIDA = 105, assign the Access Code for canceling PAD LOCK ID Code.

STEP 3: **ASFC** - For Stations allowed Authorization Code (PAD LOCK), assign a Class of Service that allows SFI 27 (Authorization Code), and assign a Class of Service that allows SFI 125 (PAD LOCK).

(only for the countries except North America)

For Stations allowed PAD LOCK using PAD LOCK ID Code, assign a Class of Service that allows SFI 154.

STEP 4: **AMND** - For Tenant 0, assign the Destination Code (DC) as the first digit of Authorization Code and Maximum Necessary Digits (MND) of Authorization Code.

STEP 5: **AATC** - Assign the TN, Digit Code (DC), the Authorization Code Restriction (ACR) as data **"**1**"**, and Service Feature Restriction Class (SFC) and Route Restriction Class (RSC).

(only for the countries except North America)

For PAD LOCK using PAD LOCK ID Code, this data assignment is not required.

(only for the countries except North America)

This command is used to delete the assigned PAD LOCK ID Code.

RPID - Delete the assigned PAD LOCK ID Code.

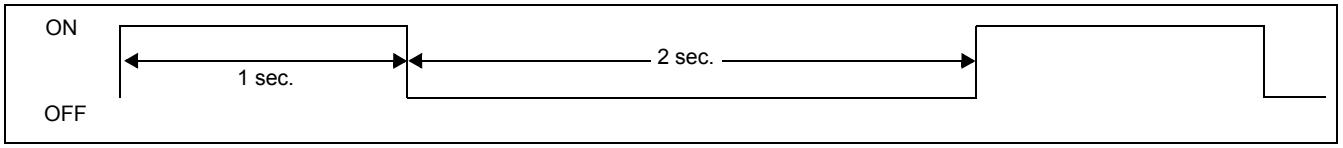
TN: Tenant Number

STN: Station Number

P-59 Personal Ringer

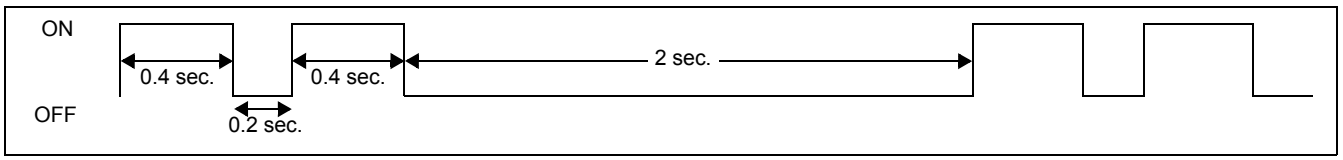
General Description

This feature provides another ringer pattern for the Call Terminating to the personal number and allows the station user to distinguish the Called Number upon hearing ringing.
Ringer patterns are as follows:



Note: For the definition of terms related to ringer patterns, see DISTINCTIVE RINGING [D-10].

(1) Ringer Pattern 0: Used for an incoming call from a central office line

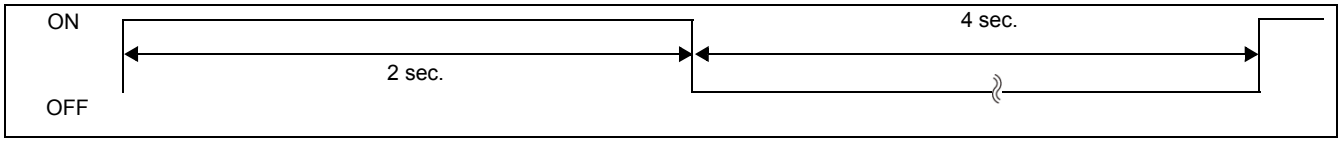


Recommended Setting of Ringer Pattern 0

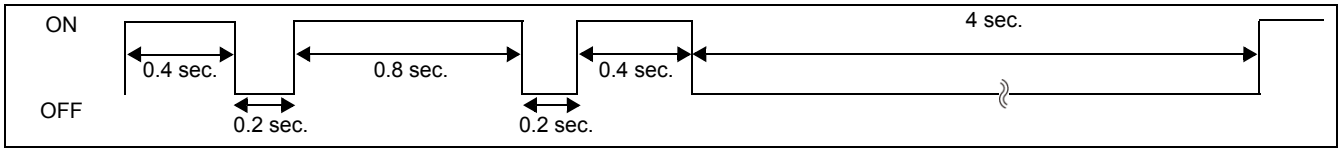
System Data	Description	Recommended Value
ASYD, System data 3, Index 0	Duration of the Ring Cycle (timer value for ringer used for incoming trunk calls)	21 (Hex)
ASYD, System data 3, Index 3, Bit 0	Multiple Ringings per Ringing Period for Ringer Pattern 0	Bit 0 = 0 (Disabled)

<Recommended Ring Cycle>

<Ring Cycle When Multiple Ringings per Ringing Period is Enabled
(ASYD, System Data 3, Index 3, Bit 0 = 1)>



(2) Ringer Pattern 1: Used for an incoming call from a station or TIE Line Trunk to the pilot number.

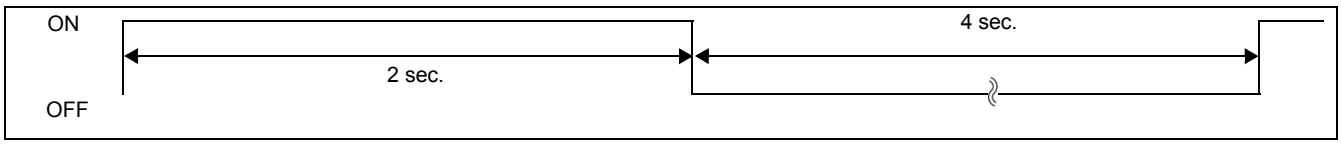


Recommended Setting of Ringer Pattern 1

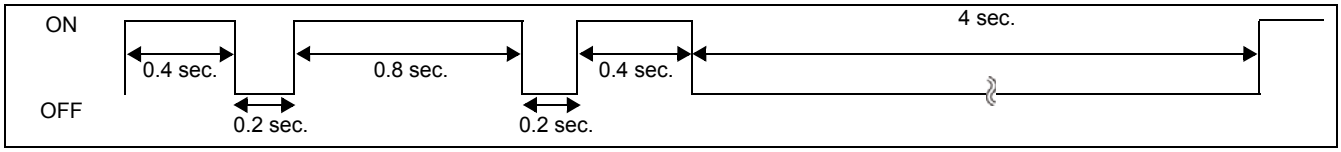
System Data	Description	Recommended Value
ASYD, System data 3, Index 1	Duration of the Ring Cycle (timer value for ringer used for station calls)	42 (Hex)
ASYD, System data 3, Index 3, Bit 1	Multiple Ringings per Ringing Period for Ringer Pattern 1	Bit 1 = 0 (Disabled)

<Recommended Ring Cycle>

<Ring Cycle When Multiple Ringings per Ringing Period is Enabled
(ASYD, System Data 3, Index 3, Bit 1 = 1)>



(3) Ringer Pattern 5: Used for an incoming call from a station or TIE line trunk to the Personal Number, CALL BACK [C-1], OUTGOING TRUNK QUEUING [O-2], Priority Ringing in CALL WAITING [C-12], AUTOMATIC/MANUAL INTERCOM [A-30], and DIAL INTERCOM [D-87].



Recommended Setting of Ringer Pattern 5

System Data	Description	Recommended Value
ASYD, System data 3, Index 7	Duration of the Ring Cycle (timer value for ringer for Call Back, OG Trunk Queuing, Priority Ringing in Call Waiting, Auto/Manual Intercom, and Dial Intercom)	42 (Hex)
ASYD, System data 3, Index 3, Bit 5	Multiple Ringings per Ringing Period for Ringer Pattern 5	Bit 5 = 0 (Disabled)

<Recommended Ring Cycle>

<Ring Cycle When Multiple Ringings per Ringing Period is Enabled
(ASYD, System Data 3, Index 3, Bit 5 = 1)>

Operating Procedure

No manual operation is required.

Service Conditions

1. When a station/TIE line incoming call is forwarded with an operator/station assistance, ringer pattern is determined according to Service Feature Restriction Class of the forwarded station.
2. When a My Line of another Desktop terminal is assigned to a Sub Line, Ringer Pattern 5 is used for station/ TIE Line Incoming Calls to the Sub Line. Accordingly, ringer of the Sub Line must be set to OFF with the AKYD command. (Assign 0 to the parameter RG.)
3. This feature is available for Desktop terminals (i.e. not available for an analog station or Virtual Line).
4. Ringer Pattern 0 is used for central office line incoming calls regardless of this feature.
5. SFI-148 (Personal Ringer) has precedence over the DT700/DT800 Ringing Tone configured on the terminal.

Interactions

1. Even if a station/TIE line incoming call is forwarded by STATION HUNTING - TERMINAL [S-9]/ STATION HUNTING - CIRCULAR [S-7] or UNIFORM CALL DISTRIBUTION [U-1], ringer pattern is determined according to Service Feature Restriction Class of the forwarded station.
2. The ringer pattern options provided by this feature are not available on telephones connected to UG50, where those patterns are translated into corresponding ringer patterns. For details, see Peripheral Equipment Description (UG50), Chapter 1, “Limitations on Voice and Tone.”

Programming

STEP 1: **ASYD** - System Data 1, Index 417, Bit 0: Recall Ringer Pattern for CALL BACK [C-1], CALL WAITING - ORIGINATING [C-31], and OUTGOING TRUNK QUEUING [O-2]. 0/1 = Ringer Pattern 5/Ringer Pattern 1.

System Data 3, Index 0. Duration of the Ring Cycle (Timer Value) used for Ringer Pattern 0.

System Data 3, Index 1. Duration of the Ring Cycle (Timer Value) used for Ringer Pattern 1.

System Data 3, Index 3. Multiple Ringings per Ringing Period

Bit 0: 2 Ringings (0.4 seconds-ON, 0.2 seconds-OFF, 0.4 seconds-ON) per Ringing Period for Ringer Pattern 0. 0/1 = Disabled/Enabled.

Bit 1: 3 Ringings (0.4 seconds-ON, 0.2 seconds-OFF, 0.8 seconds-ON, 0.2 seconds-OFF, 0.4 seconds-ON) per Ringing Period for Ringer Pattern 1. 0/1 = Disabled/Enabled.

Bit 5: 3 Ringings (0.4 seconds-ON, 0.2 seconds-OFF, 0.8 seconds-ON, 0.2 seconds-OFF, 0.4 seconds-ON) per Ringing Period for Ringer Pattern 5. 0/1 = Disabled/Enabled.

System Data 3, Index 7. Duration of the Ring Cycle (Timer Value) used for Ringer Pattern 5.

Note: For information on how to customize the Ringer Pattern, refer to Command Manual.

Note: When the System Data listed above is changed, circuit card (ELC) initialization is required.

STEP 2: **ASDT** - Assign station data of the Desktop terminal using this service.

STEP 3: **ASFC** - Assign Service Feature Restriction Class (SFC) that allows SFI = 148 (Personal Ringer) to the Desktop terminals using this service.

STEP 4: **AKYD** - When assigning a My Line of another Desktop terminal to a Sub Line on your Desktop terminal, turn off the ringer of the Sub Line by setting the parameter RG to 0.

P-60 Privacy Release - Single Line

General Description

When a single line station user is engaged in a call (station or trunk), and when the same single line is assigned as a Sub Line of a Desktop terminal, this feature allows the Dterm user to enter the connection by depressing the Sub Line key, resulting in the three-party call.

Note: This feature is not available in North America and Australia.

Operating Procedure

To activate this feature:

1. The single line station user is engaged in a call.
2. The Dterm user lifts the handset or depresses the SPEAKER key; receives Dial Tone.
3. The Dterm user depresses the sub-line key where the single line is assigned. Camp-On Tone is sent to the single line and the station/trunk engaged in a call.
4. Three-party call is established.

Service Conditions

1. Only up to three-party call can be established.
2. This feature is available depending on the station service class of the single line station.
3. This feature is not available when the single line station user is engaged in a call with the Attendant.

Programming

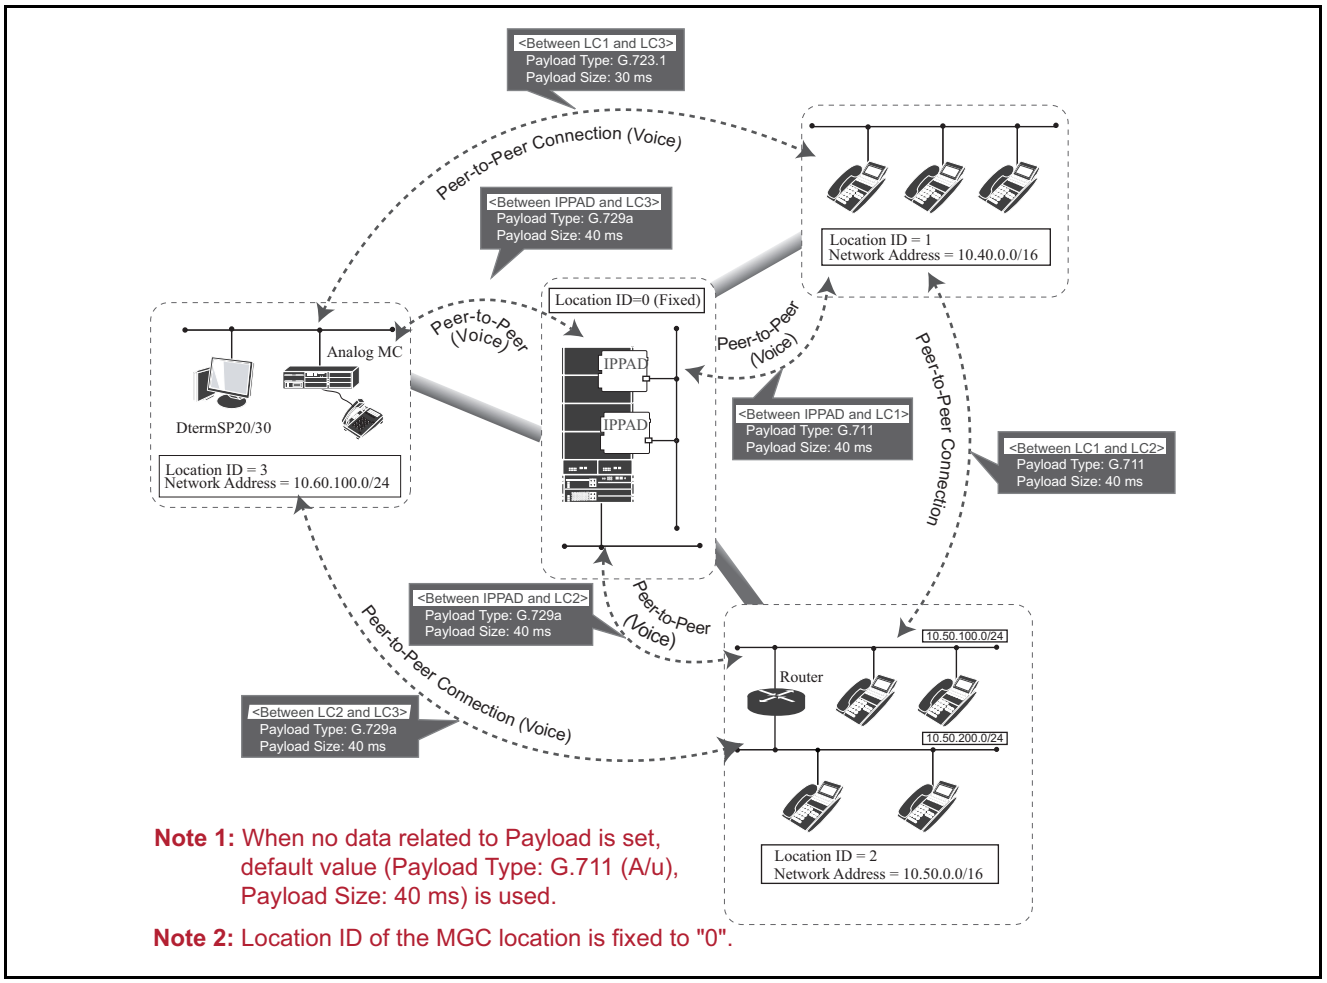
STEP 1: **ASYD** - System Data 1, Index 17, Bit 2. 0/1 = Privacy Release is not provided/provided.
System Data 1, Index 17, Bit 3. Does Privacy Release Warning Tone send? 0/1 = No/Yes.
System Data 1, Index 17, Bit 7. Kind of key assigned to a Line/Feature key or Soft key on the Desktop terminal. **Note 1**
0 = P-RLS key (When this key is pressed, Privacy Release is activated.)
1 = DND key (When this key is pressed, Privacy is activated.)

Note 1: This bit is valid when assigning System Data 1, Index 17, Bit 2 = 1 (Privacy Release is provided).

STEP 2: **AKYD** - Assign Privacy Release key or DND key to a Line/Feature key on the Desktop terminal.
KYI = 1, FKY = 48 (Privacy Release) or FKY = 50 [Do not Disturb (DND)]

STEP 3: **ASFC** - Assign Service Feature Restriction Class that allows SFI = 158 (Privacy Release - Single Line) to a single line telephone using this feature.

P-75 Peer to Peer Bandwidth Control



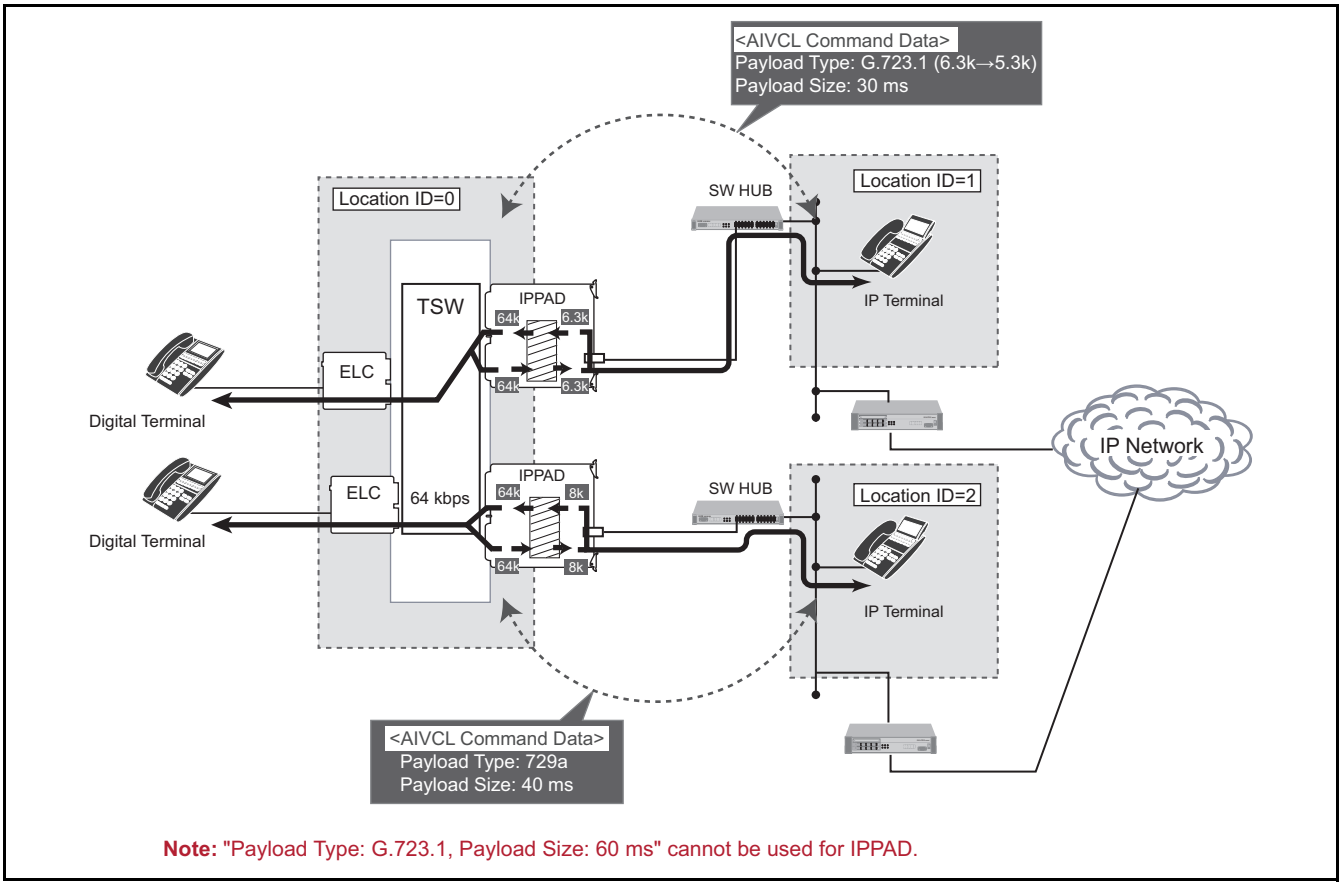
General Description

This feature controls the bandwidth for speech signal to prevent network congestion and decline in voice quality. Also, this feature allows the System to manage the bandwidth value in use statistically. When a call is originated or terminated, the system automatically determines whether sufficient bandwidth can be reserved or not.

Bandwidth Control for Virtual Line is available. This enhancement enables the specific Station in the location to use a different bandwidth by assigning a Location ID to the Station Number individually. (Hereinafter called "Virtual Line Bandwidth Control")

Note: Location is a group of equipment accommodated to Telephony Server, which is divided by network address unit. This is a basic unit for performing LAN management (ToS control, Bandwidth control, VLAN). Each location requires an unique ID, which is called Location ID (LOC-ID).

Bandwidth Control



Note 1: When no data related to Payload is set, default value (Payload Type: G.711 (A/u), Payload Size: 40 ms) is used.

Note 2: Location ID of the MGC location is fixed to "0".

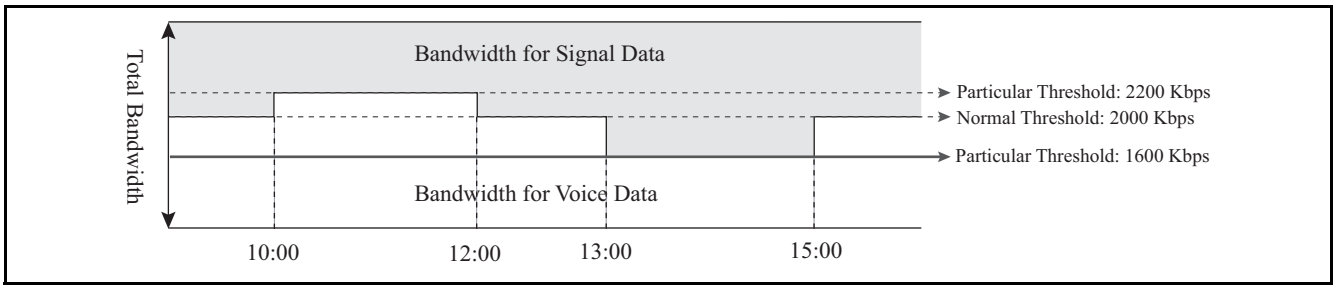
Bandwidth Control for IPPAD

Voice compression function is performed between the IPPAD card and IP terminals. IPPAD receives “uncompressed” PCM signal from the System, and compresses the received signal on the card. The compressed signal is sent to the IP terminals. (See the figure below)

Bandwidth Control for IPPAD

Note: "Payload Type: G.723.1, Payload Size: 60 ms" cannot be used for IPPAD.

The system can manage the bandwidth in use according to the Office Data setting. This will allow the system to determine whether sufficient bandwidth can be reserved or not for a Call Origination/Termination. If there is not enough bandwidth for the call, the system restricts the Call Origination/Termination. By restricting the bandwidth used for voice over IP, the system can prevent congestions and deterioration of the voice quality. Also, the system can maintain the bandwidth for other data communications and minimize influence to network.

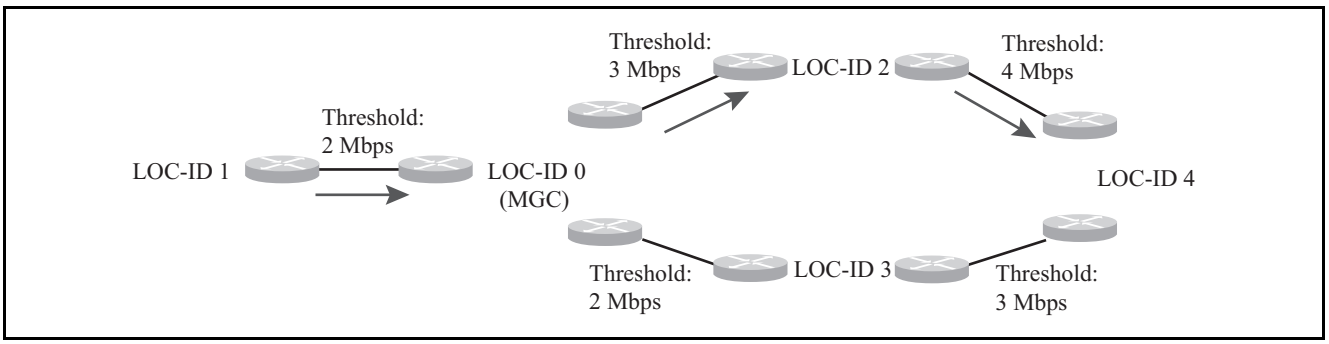


Bandwidth Threshold Value

Bandwidth threshold value is determined with consideration given to the bandwidth of network and the load on signal data. The load on signal data is increased/decreased depending on the time. The threshold value that is applied only for specified time zone should be set, in addition to the Normal threshold value.

Example: Normal Bandwidth: 2000 Kbps

Particular Bandwidth during 10:00 - 12:00: 2200 Kbps



Particular Bandwidth during 13:00 - 15:00: 1600 Kbps

Bandwidth-determination

When a call is originated or answered, the system automatically determines whether sufficient bandwidth can be reserved or not. If there is not enough bandwidth for the call, the system restricts the Call Origination/Termination (treated as busy condition).

Example: Call between LOC-ID 1 and LOC-ID 4

Example of Threshold Programming

A LOC-ID	B LOC-ID	Threshold Value
LOC-ID = 0	LOC-ID = 1	2 Mbps
LOC-ID = 0	LOC-ID = 2	3 Mbps
LOC-ID = 0	LOC-ID = 3	2 Mbps
LOC-ID = 2	LOC-ID = 4	4 Mbps
LOC-ID = 3	LOC-ID = 4	3 Mbps

Example of Routing Table

	B LOC-ID = 0	B LOC-ID = 1	B LOC-ID = 2	B LOC-ID = 3	B LOC-ID = 4
B LOC-ID = 0		(Adjacent)	(Adjacent)	(Adjacent)	LOC-ID = 2
B LOC-ID = 1			LOC-ID = 0	LOC-ID = 0	LOC-ID = 0, 2
B LOC-ID = 2				LOC-ID = 4	(Adjacent)
B LOC-ID = 3					(Adjacent)
B LOC-ID = 4					

How to determine:

1. Reads the relay Locations between Location 1 and 4 from the routing table.
   (LOC-ID = 1) - (LOC-ID = 0) - (LOC-ID = 2) - (LOC-ID = 4)
2. Reads all the threshold values assigned between each Locations.
3. Compares the threshold values with the actual used bandwidth between each Locations, and then determine whether sufficient bandwidth can be reserved or not.

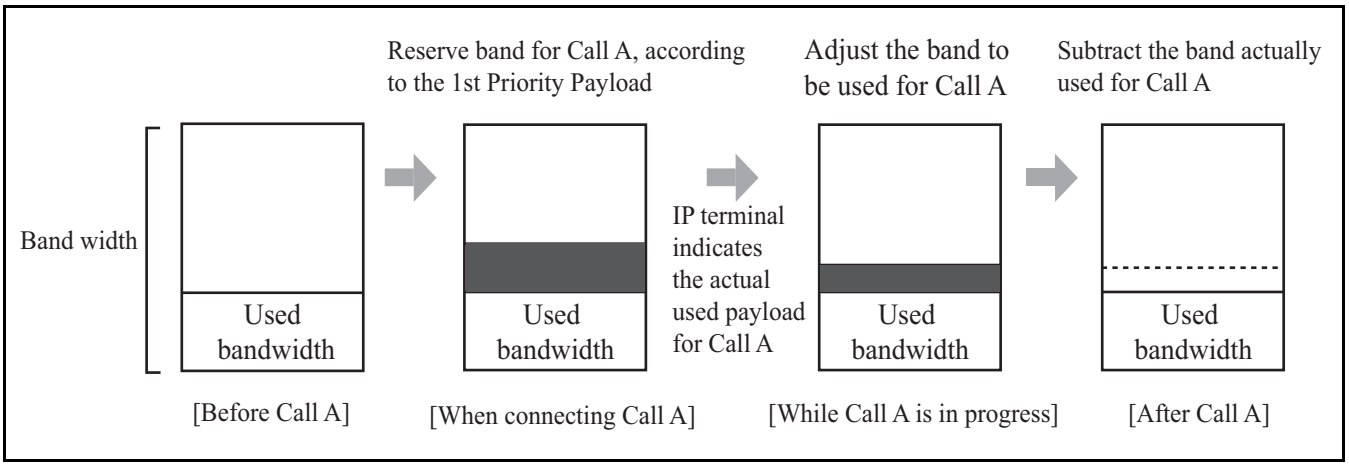
	Actual Used Bandwidth	Threshold Value		
between LOC-ID 1 and LOC-ID 0:	2 Mbps	2 Mbps	→	Not Enough
between LOC-ID 0 and LOC-ID 2:	2 Mbps	3 Mbps	→	Enough
between LOC-ID 2 and LOC ID 4:	1.5 Mbps	4 Mbps	→	Enough

4. The call is restricted because there is not enough bandwidth between LOC-ID 1 and LOC-ID 0. (When there is not enough bandwidth even at a Location, the call is restricted.)

Operating Procedure

None

Service Conditions



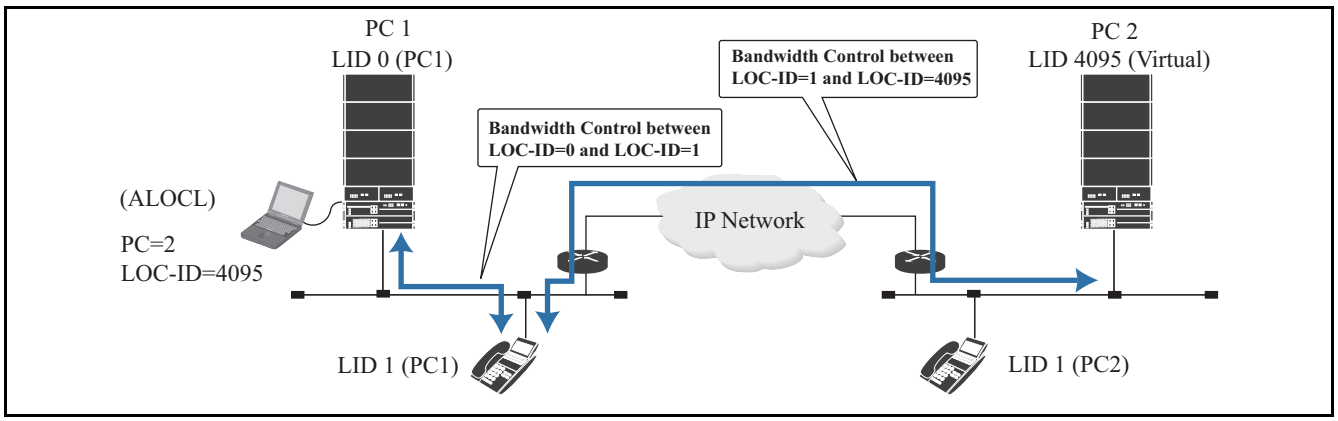
1. This feature is applied for DtermIP, Analog MC, Soft Phone, IPPAD, MG, etc.
2. When Bandwidth Control is applied for IPPAD, be sure to use all the IPPAD cards with voice compression function in the system.

   Note: In FCCS via IP and CCIS via IP network, mount IPPAD card corresponding to voice compression function in every node.

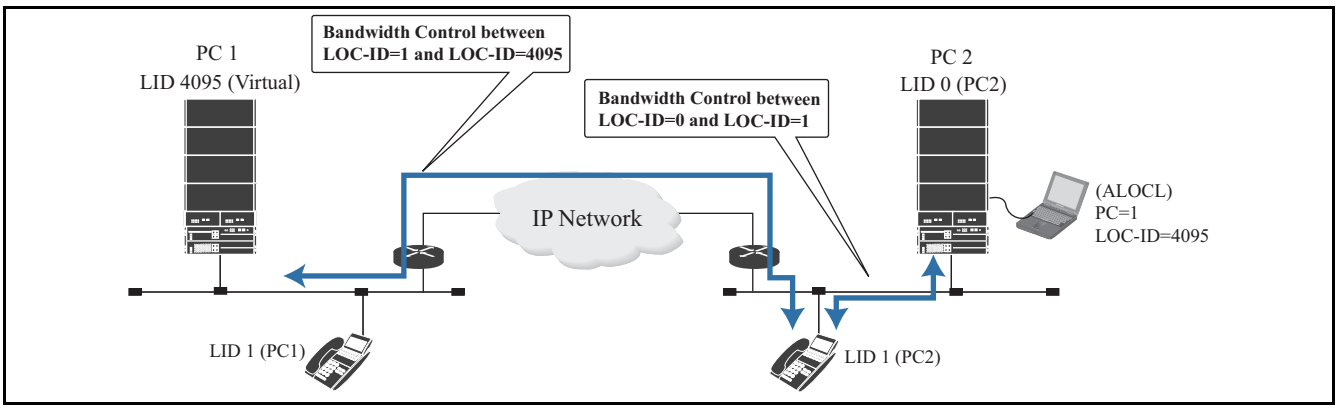
3. This feature is only applied to the IP terminals which belong to the Location.
4. This feature is applied to static routing network only. If a route other than that has been assigned by office data is used, accurate bandwidth control cannot be made. For this reason, bandwidth control cannot be applied to dynamic routing network, where routing data is dynamically changed.
5. This feature is applied to IP terminals accommodated in an MGC. It is not applied to IP terminals accommodated in different MGCs, where two terminals are directly connected via LAN (PHC).
6. This feature is not applied between IP terminals that belong to the same Location ID.
7. Bandwidth Control by this feature is not available when:
   - A call is answered (available only when a call is originated or terminated)
   - The originating terminal is assigned with Preclude From Bandwidth Restriction (SFI = 199 in ASFC command)
   - A call is established without originating. (For example, Blind Transfer to Station [B-17], Blind Transfer to Attendant [B-18], Call Transfer - All Calls [C-11], Three-Way Calling [T-2] and when getting back from Call Hold)
8. In the following cases, the bandwidth may exceed the threshold value.
   - When answering a call after the bandwidth is used up to the threshold value while ringing
   - When the bandwidth is used up to the threshold value and the bandwidth in active use became larger than the reserved value in consequence of negotiation
   - If the threshold value shifts to a smaller value than the actual bandwidth value in a certain time zone assigned for Particular bandwidth
   - When the threshold value assigned is smaller than the actual bandwidth value by office data

- When connected without restriction while the bandwidth is used up to the threshold value

9. The number of hops (from one Location ID to another) is up to 16 steps.
10. The number of adjacent locations is up to 1024 patterns.
11. When the bandwidth exceeds the threshold value, call origination and termination are restricted.
12. Assign a Service Feature Restriction Class that allows SFI = 199 to the Stations that are granted the ability to originate/terminate the call even when the bandwidth restriction is applied.
13. If bandwidth is not enough, a call origination is restricted.
14. Checking for available bandwidth is performed only for My Line. The Sub Line is not checked. The call can reach the destination even if the bandwidth of the Sub Line is not enough.
15. If there is shortage of the bandwidth when connecting external Music-On-Hold, the built-in Music-On-Hold of the terminal is used.
16. This feature is not applied to bandwidth used by IP Trunk (Not restricted).
17. The following explains how to control the bandwidth to be used:



18. The following values are used for the add-subtract method of bandwidth:
[Amount of bandwidth to be used for a call per compression method, packer transmission cycle (full duplex communication: Ether, IP, UDP RTP header)]



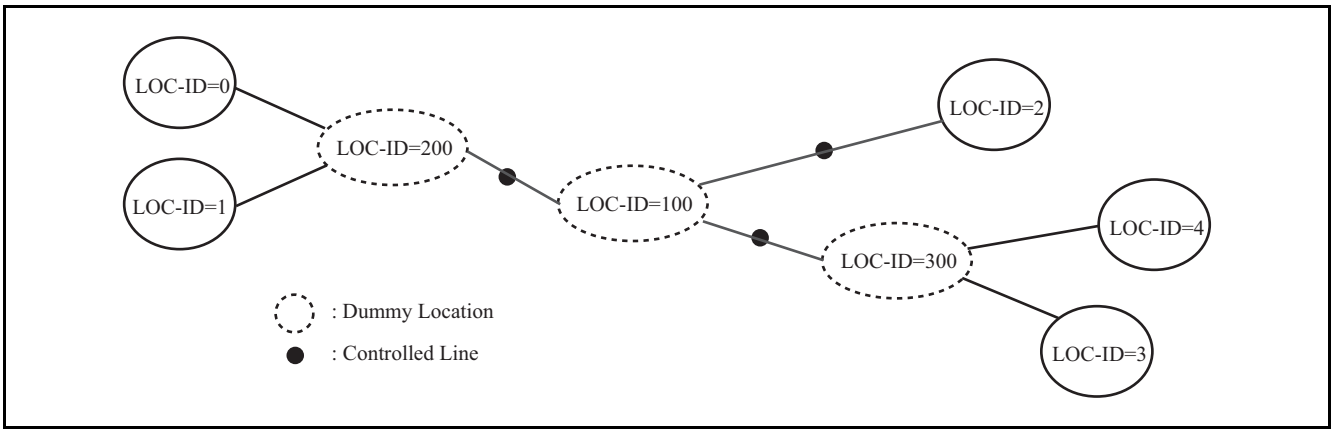
Compressing Method (Payload Type)	Packet Transmission Cycle				
	10 ms	20 ms	30 ms	40 ms	60 ms
G.711 (64Kbps)	112.0 (Kbps)	88.0 (Kbps)	80.0 (Kbps)	76.0 (Kbps)	-
G.729a (8Kbps)	56.0 (Kbps)	32.0 (Kbps)	24.0 (Kbps)	20.0 (Kbps)	-
G.723.1 (5.3Kbps→6.3Kbps)	-	-	21.3 (Kbps)	-	13.3 (Kbps)
G.723.1 (6.3Kbps→5.3Kbps)	-	-	22.3 (Kbps)	-	14.3 (Kbps)
G.711 (FAX)	112.0 (Kbps)	88.0 (Kbps)	80.0 (Kbps)	76.0 (Kbps)	-
G.726 (FAX)	80.0 (Kbps)	56.0 (Kbps)	48.0 (Kbps)	44.0 (Kbps)	-
G.722	-	88.0 (Kbps)	-	76.0 (Kbps)	-
AMR-NB	-	37.2 (Kbps)	-	25.0 (Kbps)	-
AMR-WB	-	48.8 (Kbps)	-	36.6 (Kbps)	-
G.711 μ law (FEC)	-	163.2 (Kbps)	-	145.6 (Kbps)	-
G.711 A law (FEC)	-	163.2 (Kbps)	-	145.6 (Kbps)	-

G.729a (FEC)	-	51.2 (Kbps)	-	33.6 (Kbps)	-
G.722 (FEC)	-	163.2 (Kbps)	-	145.6 (Kbps)	-
AMR-NB (FEC)	-	61.6 (Kbps)	-	43.6 (Kbps)	-
AMR-WB (FEC)	-	84.8 (Kbps)	-	66.8 (Kbps)	-
T.30 (FAX)	13.6 (Kbps) (Packet Transmission Cycle is not specified.)				

19. Some types of PS save the incoming call history data even when the call termination to the PS is restricted due to the shortage of bandwidth.
20. By allocating Location ID to the destination PC (Point Code), the system can control bandwidth for the call established via PHC. For details, refer to the figure below.
    a.) When allocating LID 4095 to PC 2 (destination PC) in the PC 1 Office data, PC 1 Office can manage the bandwidth in the following area.

    b.) When allocating LOC-ID=4095 to PC 1 (destination PC) in the PC 2 Office data, PC 2 Office can manage the bandwidth in the following area.

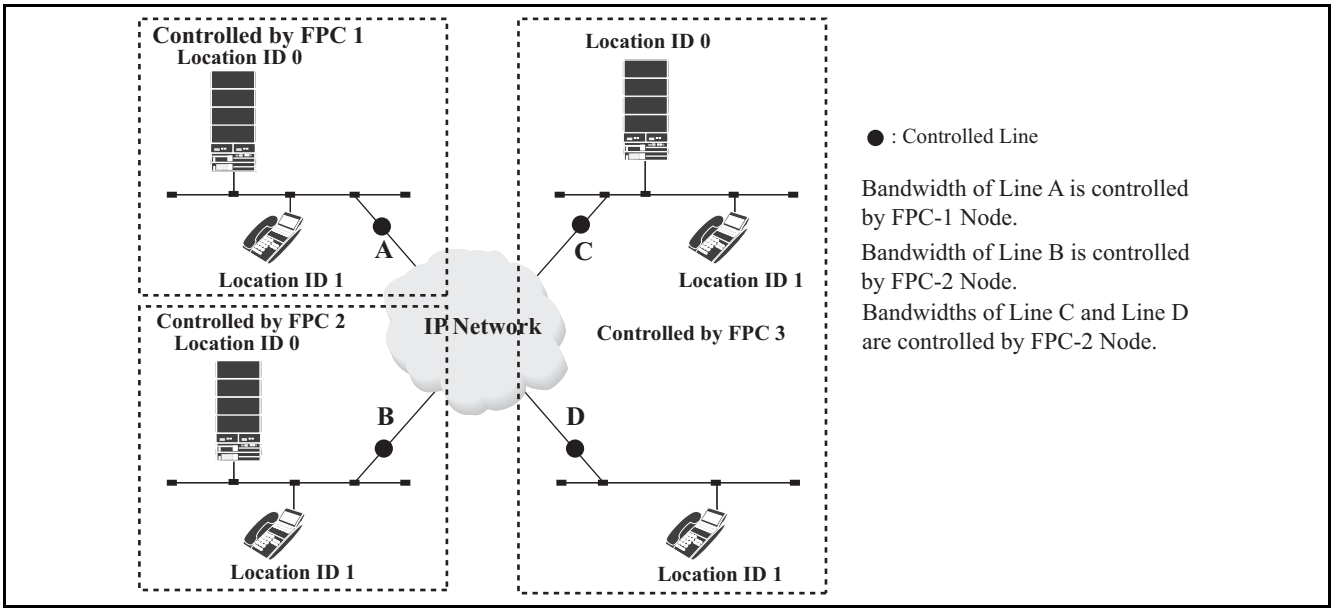
- PC 2 office manages the bandwidth between LID 0 (PC2) and LID 1 (PC2), LID 1 (PC2) and LID 4095 (PC1).
  If there is not enough bandwidth between these LIDs, PC 2 office sends the “Busy” signal to PC 1 office.
- PC 1 office manages the bandwidth between LID 0 (PC1) and LID 1 (PC1), LID 1 (PC1) and LID 4095 (PC2).
  If there is not enough bandwidth between these LIDs, the call origination is restricted.



If a call is originated to the terminal belonging to LID 0 in PC 2 from the terminal belonging to LID 0 in PC1.

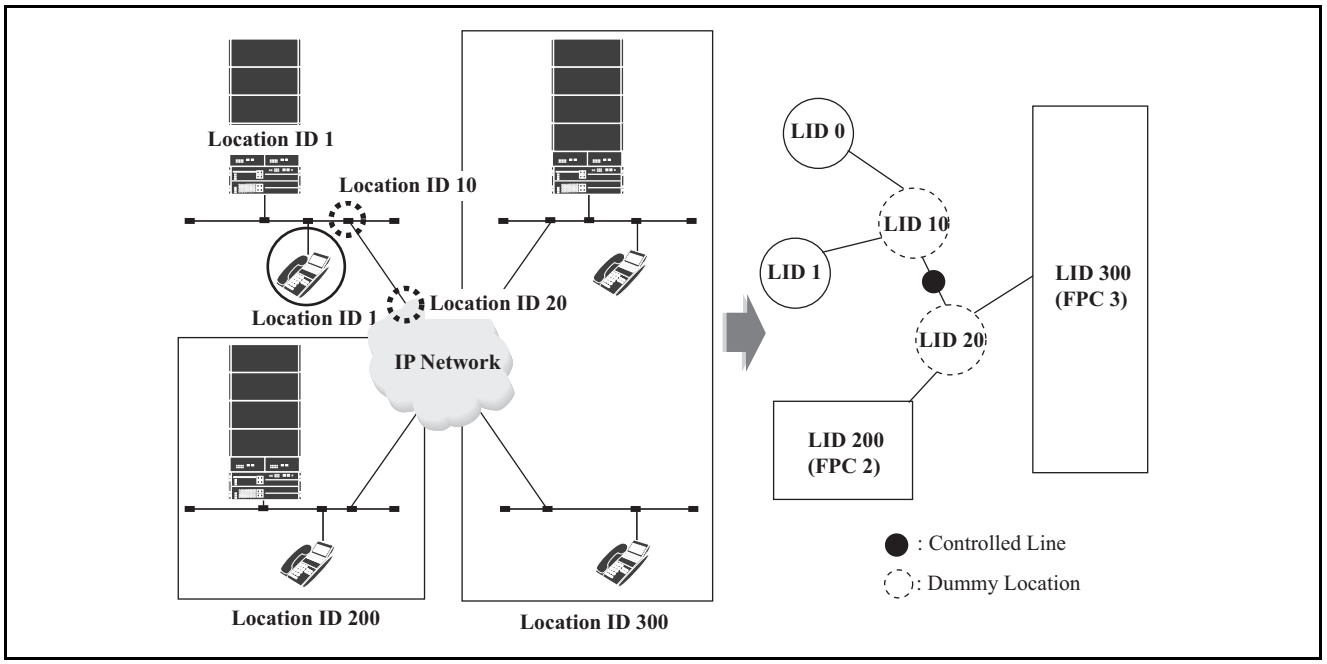
21. (**Dummy Location**) When network routes branched off in multiple directions, it is available to combine these routes into one by assigning Dummy Location as a branch point. Also, when multiple Locations exist in a single network, these Locations can be combined into one by allocating a Dummy Location between the network and another one.

- LOC-ID = 0 and LOC-ID 1 can be combined into one as LOC-ID = 200 (Dummy Location) because they exist in the same network.
- LOC-ID = 3 and LOC-ID 4 also can be combined into one as LOC-ID = 300 (Dummy Location) because they exist in the same network.
- LOC-ID = 100 (Dummy Location) can be allocated to a branch point between LOC-ID = 200, LOC-ID = 300 and LOC-ID = 2.



Therefore, the configuration of Location IDs is as follows:

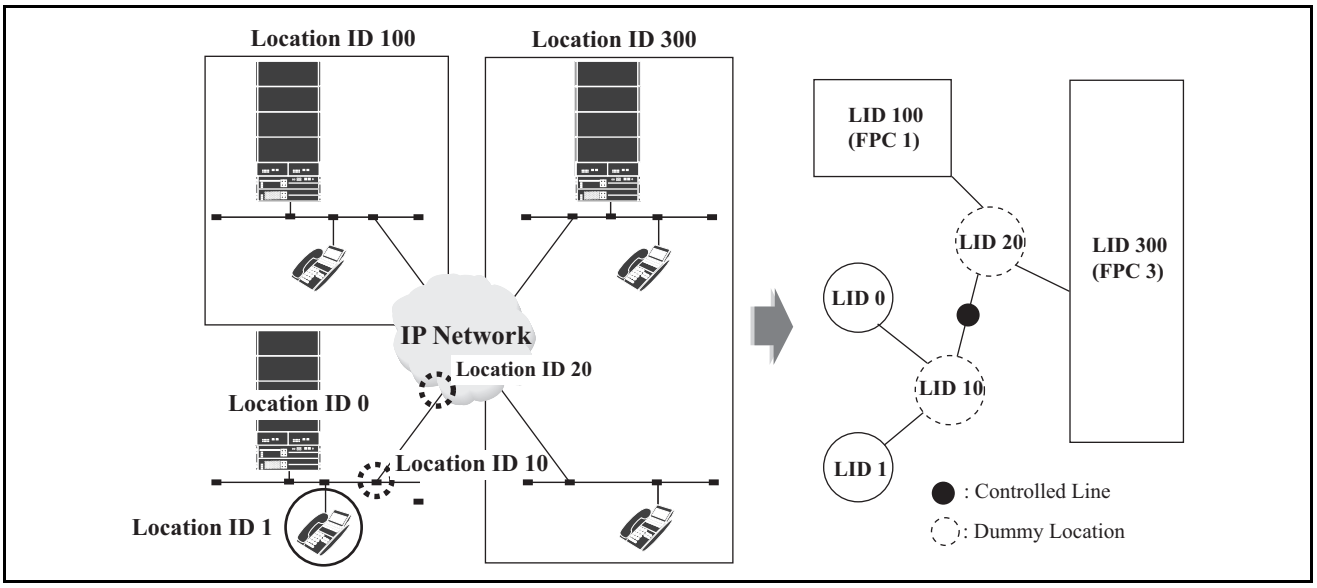
Note: For the example data programming of Dummy Location, refer to the Programming section.



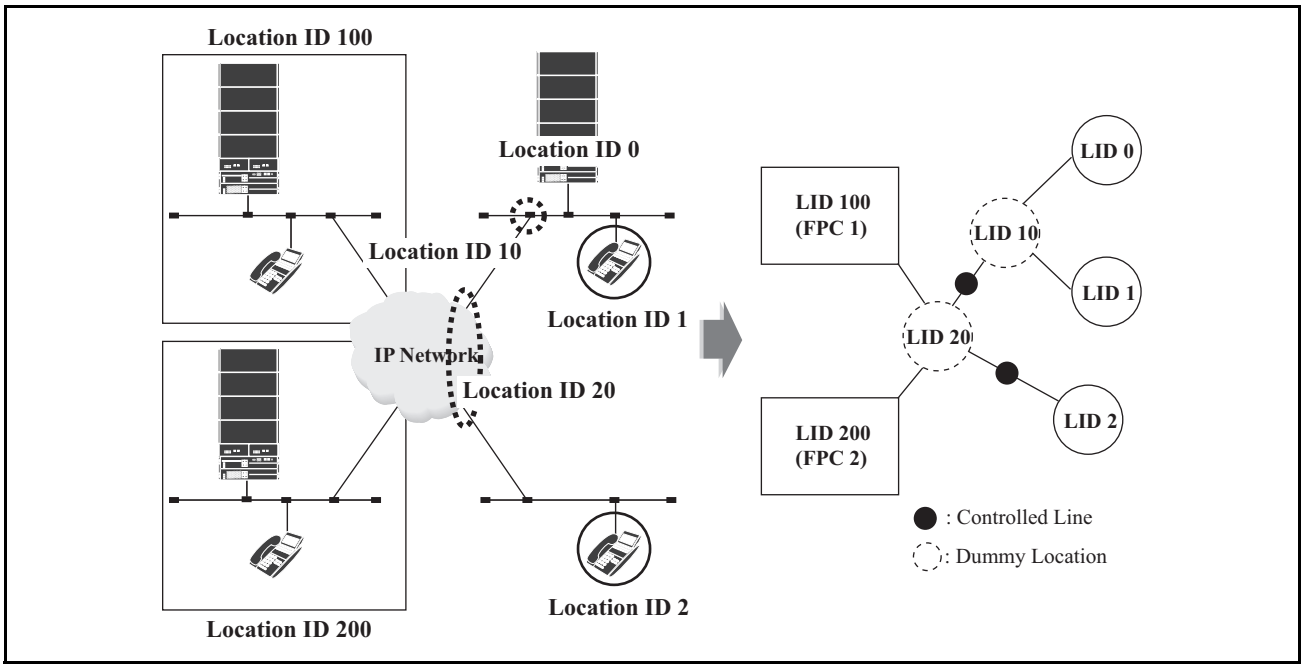
22. A single Location ID can be allocated to multiple network addresses. In the following cases, the data programming (Location configuration) can be simplified.
    a.) When using different payloads in a single network:
    Example:
    172.16.253.1 /124: Location ID 1 [Saving bandwidth → Assigns G.729a, 40ms (20 Kbps)]
    172.16.253.128/197: Location ID 2 [Improving sound quality → Assigns G.711, 40ms (80 Kbps)]
    172.16.253.198 /254: Location ID 1 [Saving bandwidth → Assigns G.729a, 40ms (20 Kbps)]

23. Bandwidth control in a FCCS network is available by allocating Location ID to Fusion Point Code (FPC). The following figure shows the case where controlling bandwidths of the lines between the IP network and each node in a star-topology network.

Note: By allocating a Location ID to each FPC (Fusion Point Code), each node can control the bandwidth individually.



<Location IDs assigned in FPC 1>



- Location ID 200 is assigned to FPC 2.
- Location 300 is assigned to FPC 3.
- Dummy Locations (Location IDs 10 and 20) are assigned as branch points.

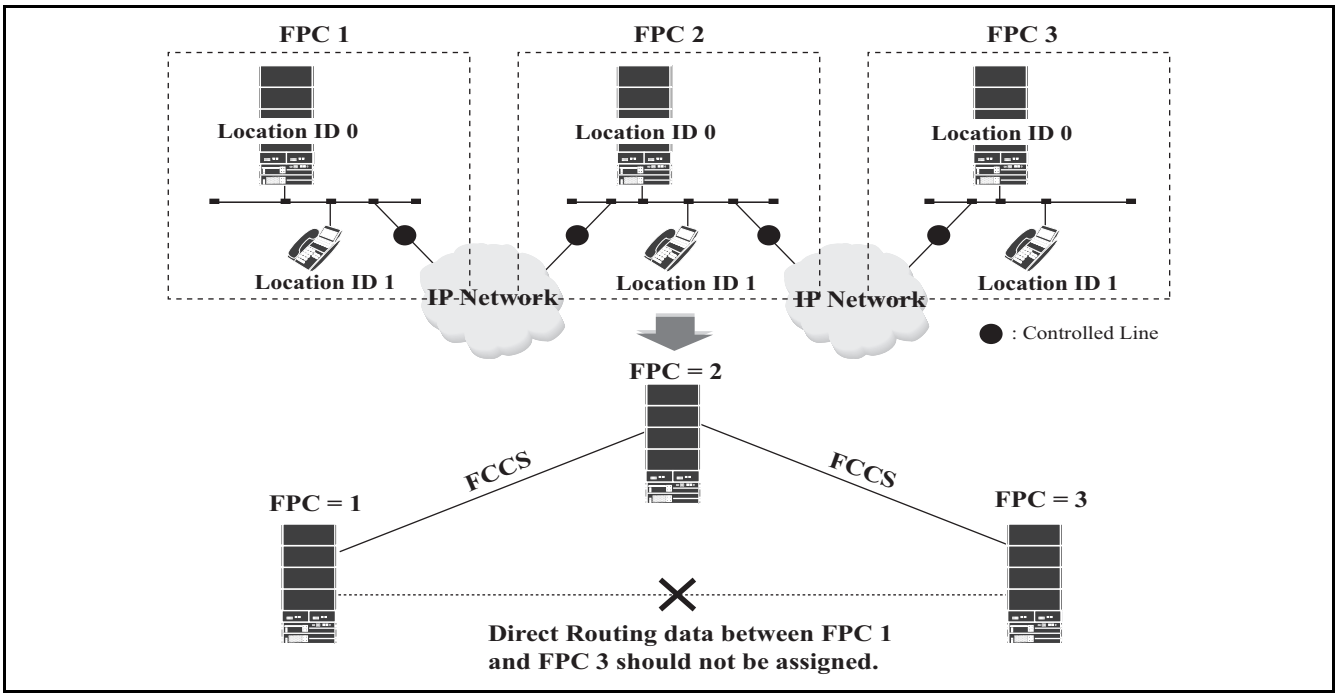
By configuring the locations and routing tables as shown in the above figure, all calls from FPC 1 to FPC 2 and 3 are pass through the line between Dummy Locations 10 and 20. Thus, the threshold value can be assigned to the line between Nodes A and B to control the bandwidth of the line.

<Location IDs assigned in FPC 2>

<**Location IDs assigned in FPC 3**>

Bandwidth Check at the time of call origination is performed by the following procedure.

Example: In the case where Terminal A in LID 1 of FPC 2 originates a call to Terminal B in LID 3 of FPC 3.



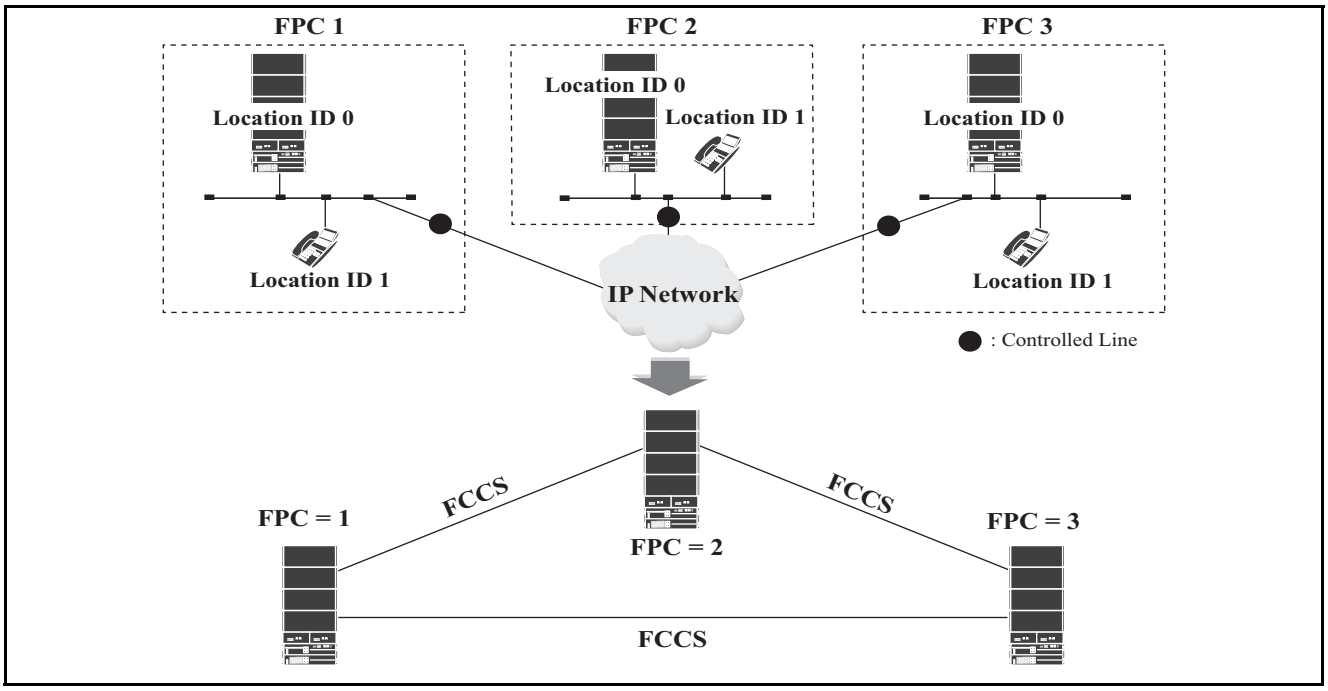
- FPC 2 (Originating Node) retrieves the route from LID 1 to LID 300.
  result: LID 1 → LID 10 → LID 20 → LID 30
- FPC 2 checks the bandwidth of each line between LID 1 and LID 10, LID 10 and LID 20, LID 20 and LID 30.
  If adequate bandwidth is not available, the call origination is restricted.
  If adequate bandwidth is available, FPC 2 sends call setup message to FPC 3.
- FPC 3 (Terminating Node) retrieves the route from LID 200 (FPC 2) to LID 2.
  result: LID 200 → LID 20 → LID 2
- FPC 3 checks the bandwidth of each line between LID 200 and LID 20, LID 20 and LID 2.
  If adequate bandwidth is not available, the call origination is restricted.
  If adequate bandwidth is available, the call origination begins.

- **Conditions**

When using this feature via FCCS network, the following conditions must be considered:

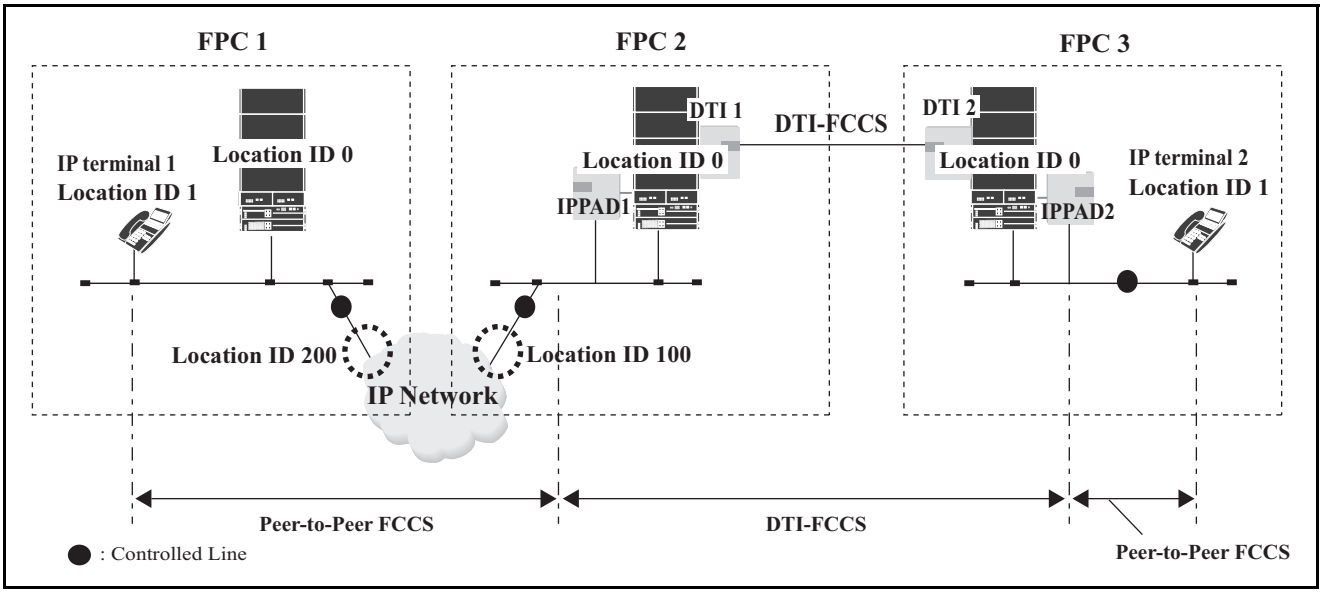
a.) The alternate routing due to bandwidth shortage is counted as one of the 8 allowed alternate routing.
b.) When multiple Locations use the same line, the data programming of the bandwidth control can be simplified by using the Dummy Location.
c.) As shown in the following figure, if multiple IP networks exist between FPC 1 and FPC 3, the connection route data between FPC 1 and FPC 3 should be assigned as Tandem Connection.

Example 1: Network configuration to be assigned as Tandem Connection



The following bandwidth control is performed for a call between Terminal A in LID 1 of FPC 1 and Terminal B in LID 1 of FPC 3.

- FPC 1: Bandwidth control of Line A.
- FPC 2: Bandwidth control of Lines B and C.
- FPC 3: Bandwidth control of Line D.



In the above network configuration, even if the direct FCCS routing data between FPC 1 and FPC 3 is assigned, the bandwidth control is not available for Lines B and C controlled by FPC 2. To control the bandwidth of Lines B and C, the connection data between FPC 1 and FPC 3 must be assigned as Tandem Connection (A connection between FPC 1 and FPC 3 is established via FPC 2).

On the other hand, as shown in the following figure, if FPC 1 and FPC 3 are connected via a single IP network, the connection route data between FPC 1 and FPC 3 should not be assigned as Tandem Connection.

Example 2: Network configuration not to be assigned as Tandem Connection

d.) Even if DTI-FCCS and Peer-to-Peer FCCS coexist in a network, no particular consideration is required. The following is an example of the network configuration including both DTI-FCCS and Peer-to-Peer FCCS.

FPC	Switch Control	Connection Method	Bandwidth Control
1	IP terminal 1- IPPAD 1	Peer-to-Peer connection	Location ID 1 - 200

FPC	Switch Control	Connection Method	Bandwidth Control
2	IP terminal 1- IPPAD 1	Peer-to-Peer connection	Location ID 100 - 0
	IPPAD 1 - DTI 1	DTI connection	None
3	IPPAD 1 - DTI 1	DTI connection	None
	IPPAD 2 - IP terminal 2	Peer-to-Peer connection	Location ID 1 - 1

<Conditions for Virtual Line Bandwidth Control>

1. This feature is only available for Desktop terminals and Virtual Lines (ASDT/AISTL TEC = 12/18).
2. The conditions when this feature is enabled for the Station Number of Virtual Line or Sub Line are listed below.
   a.) The bandwidth between the Location ID assigned for the Called Station Number and the Location ID assigned for the Calling Party is controlled when a call is terminated to Virtual Line or Sub Line. The Location ID of the Calling Party is assigned to the following.
   - The Calling Station which originated a call to the Virtual Line or Sub Line
   - Incoming Trunk **Note 1**
   - PC (Point Code) of the connected party when the incoming call is established via PHC
   - FPC (Fusion Point Code) of the connected party when the incoming call is established via Peer-to-Peer FCCS

   b.) The Location ID assigned for the Desktop terminal which operated a call origination is used for Virtual Line Bandwidth Control when a call is originated from Virtual Line or Sub Line. However, when a call is originated via PHC or via Peer-to-Peer FCCS, the Location ID assigned for each Node is used as is conventionally done.

   c.) For the Bandwidth Control when an incoming call to a Virtual Line or Sub Line is answered, the Location ID of the Desktop terminal which answered the incoming call is used.

   Note 1: When using a conventional trunk, Location ID = 0 (for the System) is assigned. When using MG, the Location ID assigned for MG is used.

3. When this feature is enabled for My Line, the Location ID assigned for the Station Number takes the priority when conflicted with the Location ID assignment for Network Address.

Programming

STEP 1: **ALOCL** - Assign the Location ID data.
TYPE: Select either "Network Address", "PC", "FPC" or "STN".

Note: When using this feature via Peer-to-Peer FCCS, allocate Location ID to all Node FPCs (except Self Node FPC) in the network.

- When selecting "Network Address":
  IP ADDRESS: Assign the IP Address. For the Telephony Server (i.e. IPPAD), assign "0.0.0.0."
  MASK BIT: Assign the MASK BIT in the range 1-31 except when IP ADDRESS 0.0.0.0 is determined. When IP ADDRESS = 0.0.0.0, MASK BIT = 32 is automatically assigned.
  LOC-ID: Assign any number in the range 0-4095, associated with the IP address assigned in the IP ADDRESS parameter. When 0.0.0.0 is assigned in the IP ADDRESS parameter, LOC-ID is automatically set to "0" (the value cannot be changed).
- When selecting "PC":
  PC: Assign the Destination Point Code.
  LOC-ID: Assign any number in the range 1-4095.
- When selecting "FPC":
  FPC: Assign Fusion Point Code (1-253).
  LOC-ID: Assign any number in the range 1-4095.
- When selecting "STN":
  TN: Assign Tenant Number (1-63).
  STN: Assign Station Number (maximum of five digits for Business)
  LOC-ID: Assign any number in the range 1-4095.

Note: LOC-ID = 0 is predetermined to the location ID of the Telephony Server.

STEP 2: **AIVCL/AIVCN** - Assign the IP service Voice Control data. **When using this feature via Peer-to-Peer FCCS, assign AIVCN data to the NCN. AIVCN data has precedence over AIVCL data.**
for AIVCL:
A LOC-ID: Location ID of the self-Location. (0-4095)
B LOC-ID: Location ID of the target Location. (0-4095)
for AIVCN:
A FPC: Fusion Point Code of the self-Location. (1-253)
A LOC-ID: Location ID of the self-Location. (0-4095)
B FPC: Fusion Point Code of the target Location. (1-253)
B: LOC-ID: Location ID of the target Location. (0-4095)

Note: Only the Location ID corresponding to the network address can be assigned on the AIVCL/AIVCN. The Location IDs corresponding to PC or FPC cannot be assigned.

[Setting of Jitter Buffer]

Select the "Setting of Jitter Buffer" check box to assign the following Jitter Buffer data.

Note: If the check box is not checked, the default settings (JB MIN = 1 (10ms), JB MAX = 30 (300ms)) will be provided.

JB MIN: Jitter Buffer minimum value

JB MAX: Jitter Buffer maximum value

[Setting of Payload]

Select the "Setting of Payload" check box to assign the following payload data.

PRI1-PRI4: Select a payload type (TYPE) and payload size (SIZE) in order of precedence (PRI1(high) → PRI4 (low))

TYPE (Payload Type):

- G.711
- G.729a
- G.723.1 (5.3K → 6.3K)
- G.723.1 (6.3K → 5.3K)
- G.722 **Note 2**, **Note 3**
- AMR-NB **Note 2**
- AMR-WB **Note 2**
- G.711 μ law (FEC) **Note 2**, **Note 4**
- G.711 A law (FEC) **Note 2**, **Note 4**
- G.729a (FEC) **Note 2**, **Note 4**
- G.722 (FEC) **Note 2**, **Note 4**
- AMR-NB (FEC) **Note 2**, **Note 4**
- AMR-WB (FEC) **Note 2**, **Note 4**

Note 2: These payload types are available for DtermSP30 Version 15. These data are effective only for the connection between DtermSP30s Version 15.

Note 3: Payload type G.722 is effective for the following connections in addition to the connection between DtermSP30s Version 15:

- The connection between DT700 Series (DT730/DT730G/DT750)
- The connection between DtermSP30 Version 15 and DT700 Series (DT730/DT730G/DT750)

Note 4: When a payload type with "FEC" is selected, the data that is not transmitted correctly because of packet loss or bit error can be corrected according to the redundant data by the method of Forward Error Correction (FEC).

SIZE (Payload Size):

- 10ms
- 20ms
- 30ms
- 40ms
- 60ms

Note: For available payload type/payload size, refer to the Payload Setting Available for each IP Equipment section in Chapter 3 of System Description.

Note: When no payload type and size are specified, the values assigned via System data (ASYDL, System Data 1, Index 819, Bits 0 - 3 and 4 - 7) are automatically applied.

Note: If payload type G.711 is specified to more than two priorities in PRI 1 through PRI 4, assign different payload size to each priority.
- When payload types G.723.1 (5.3K → 6.3K) and G.723.1 (6.3K → 5.3K) are to be assigned on the same terminal, specify the same value to the payload size of both types.
- It is not necessary to assign the payload type/size to all priorities. Specifying the first priority only is allowed.

The following are required to activate Bandwidth Control feature.
The following data setting are required when allocating Location ID to the destination PC to control the bandwidth for the call via PHC.

STEP 3: **ASFC** - Assign the following SFI to grant an exception to the bandwidth restriction.
SFI = 199 (Bandwidth Restriction)
RES = 1 (Restriction is not applied)

STEP 4: **ABNDL** - Assign bandwidth control data such as routing table, bandwidth threshold value.

a.) Enter the Location ID.
START LOC-ID: Enter LOC-ID of Calling Party (0-4095)
END LOC-ID: Enter LOC-ID of Called Party (0-4095)

<Routing table> Field

b.) Press the Get button to display the routing table between the specified locations.
c.) Enter the data in the routing table.
1st - 15th LOC-ID: Enter LOC-ID which relays START LOC-ID and END LOC-ID.
When START LOC and END LOC are adjacent to each other, leave the routing table blank.
d.) The routing table is set by pressing "Set."
e.) By pressing "Disp", Bandwidth border data on a location-location basis can be displayed in Bandwidth border data field (on the right of the window).
Data: Display the existence information of bandwidth border data on a location-location basis.
O/X (Bandwidth border data is existing/not existing)

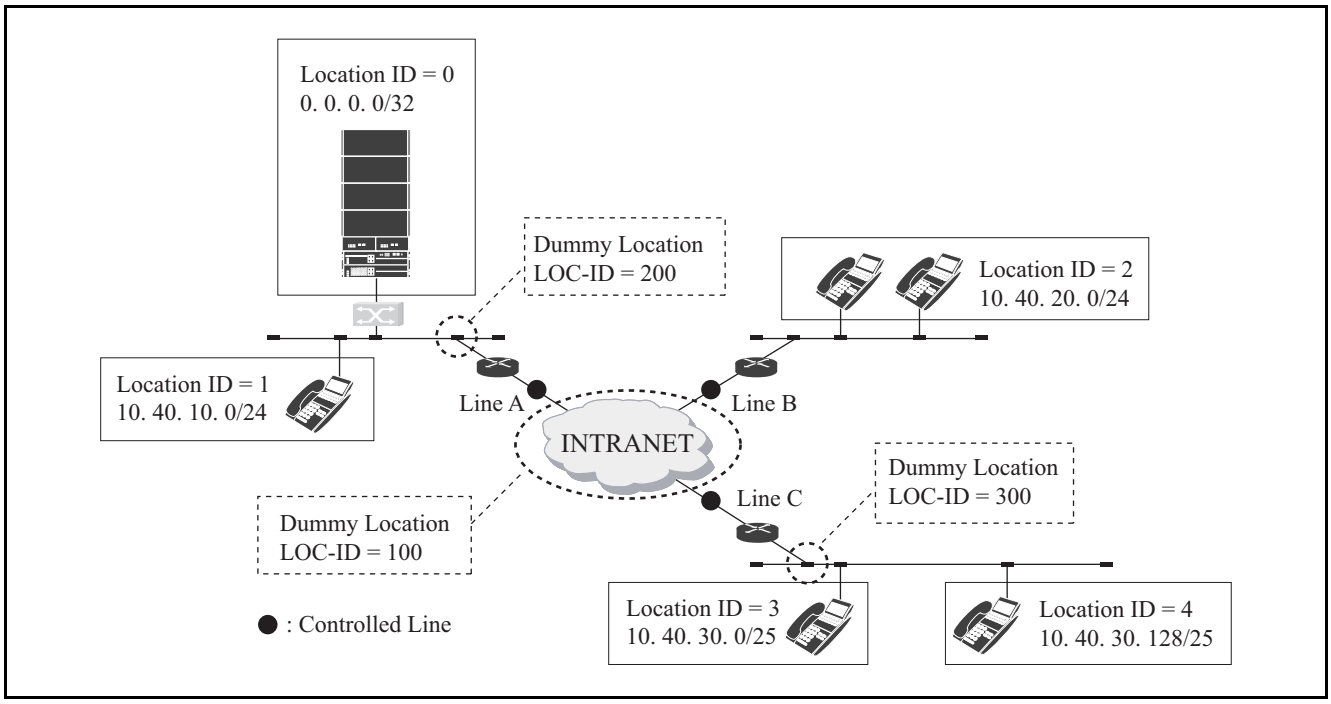
<Bandwidth border data> Field

f.) Assign the bandwidth border values.
LOC-ID: Indicates locations whose bandwidth border values are displayed below.

<Normal bandwidth data> -This value is applied for 24 hours -
Assign the following data related to Normal Bandwidth
Limit value (Kbps): Assign maximum value of Normal bandwidth. (1-16777215)
Warning value (Kbps): Assign warning value of Normal bandwidth. (1-16777215) At this value, system message "36-G/36-H" is issued as a warning.
Alarm: System message "36-I/36-J" output 0/1 = Provided/not provided

<Particular bandwidth data> -*This value is applied only for specified time zone. A maximum of 10* time zone patterns can be assigned -
Assign the following data related to Particular Bandwidth
Time zone: Time zone to which the specified bandwidth value is applied Assign the value 00:00~23:59 format.

Note: Do not assign duplicate time zone.



Note: Do not assign time zone across 00:00. (Ex. 23:00~01:00 is not allowed.)

Limit value (Kbps): Assign maximum value of Particular bandwidth. (1-16777215)
Warning value (Kbps): Assign warning value of Particular bandwidth. (1-16777215) At this value, system message "36-G/36-H" is issued as a warning.
Alarm: System message "36-I/36-J" output 0/1 = Provided/not provided

g.) By pressing the Set button, the values are set.

h.) By pressing the Disp button between locations whose bandwidth border data has not been assigned, assign the bandwidth border data one by one. If the bandwidth border data is not required, this procedure is not necessary.

<Example Data Programming 1: Star-topology Network (Stand-alone)>

1. ALOCL

	IP Address	LOC-ID
1	0. 0. 0. 0/32	0
2	10. 40. 10. 0/24	1
3	10. 40. 20. 0/24	2

15	2	0	3	1	G. 711, 40ms

3. ABNDL (Routing Table)

	START LOC-ID	1st - 15th LOC-ID	END LOC-ID
1	0	100	20
2	1	100	20

Bandwidth Threshold Value

	LOC-ID A	LOC-ID B	Threshold Value	Remarks
1	20	100	1520 Kbps	Line A

Data Programming in Node B (FPC=2)

1. ALOCL

	IP Address	LOC-ID
1	0. 0. 0. 0/32	0
2	10. 41. 10. 0/24	1
	FPC (Fusion Point Code)	LOC-ID
3	1	10
4	3	30

2. ABNDL (Routing Table)

	START LOC-ID	1st - 15th LOC-ID	END LOC-ID
1	0	200	10
2	0	300	30
3	1	200	10
4	1	300	30
5	10	200 - 300	30

Bandwidth Threshold Value

	LOC-ID A	LOC-ID B	Threshold Value	Remarks
1	10	200	1140 Kbps	Line B
2	30	100	760 Kbps	Line C

Data Programming in Node C (FPC=3)

1. ALOCL

	IP Address	LOC-ID
1	0. 0. 0. 0/32	0
2	10. 42. 10. 0/24	1
	FPC (Fusion Point Code)	LOC-ID
3	20	20

2. ABNDL (Routing Table)

	START LOC-ID	1st - 15th LOC-ID	END LOC-ID
1	0	400	20
2	1	400	20

Bandwidth Threshold Value

	LOC-ID A	LOC-ID B	Threshold Value	Remarks
1	20	400	1140 Kbps	Line B

<Example Payload Data Programming>

It is necessary to harmonize the IP voice control data such as payload from end to end. For this reason, the payload data among Peer-to-Peer FCCS network must be harmonized from end to end (not according to the relay routes).

[NDM Data Assignment (AIVCN)]

- FPC = 1, LOC-ID = 0 - FPC = 2, LOC-ID = 0
- FPC = 1, LOC-ID = 0 - FPC = 2, LOC-ID = 1
- FPC = 1, LOC-ID = 1 - FPC = 2, LOC-ID = 0
- FPC = 1, LOC-ID = 1 - FPC = 2, LOC-ID = 1

[ABNDL Data Programming in Node A]

Routing Table:

- LOC-ID = 0 → LOC-ID = 10 → LOC-ID = 200
- LOC-ID = 1 → LOC-ID = 10 → LOC-ID = 200

Threshold:

- LOC-ID = 10-200: xx (Kbps)

[ABNDL Data Programming in Node B]

Routing Table:

- LOC-ID = 0 → LOC-ID = 20 → LOC-ID = 100
- LOC-ID = 1 → LOC-ID = 20 → LOC-ID = 100

Threshold:

- LOC-ID = 20-200: xx (Kbps)

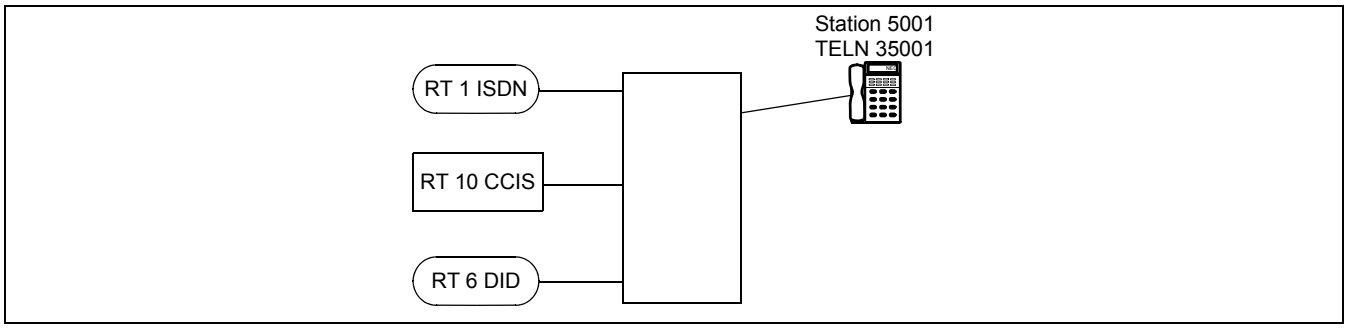
P-77 Phantom Number Distinctive Ringing - Single Line
(Series 8800 software feature)

General Description

This feature allows Incoming Calls to a Phantom Number to ring with a Distinctive Ringing Pattern, allowing a user to determine if the call is for them by the Ringing Pattern.

Note: This feature is available in North America only.

Operating Procedure



There will be no change in the Operating Procedure for the user.

Environment

- APHN has Station 5001.
  1 - 5088: Ringer Pattern 0
  2 - 5089: Ringer Pattern 6
  3 - 5090: Ringer Pattern 7
  4 - 5091: Ringer Pattern 1
  5 - 5092: Ringer Pattern 1
- APHNN TELN has 35001.
  1 - 35088: Ringer Pattern 0
  2 - 35089: Ringer Pattern 6
  3 - 35090: Ringer Pattern 7
  4 - 35091: Ringer Pattern 1
  5 - 35092: Ringer Pattern 1
  6 - 35093: Ringer Pattern 1
  7 - 35094: Ringer Pattern 1
  8 - 35095: Ringer Pattern 1
  9 - 35096: Ringer Pattern 1
  10 - 35097: Ringer Pattern 1
  11 - 35098: Ringer Pattern 1
  12 - 35099: Ringer Pattern 1
  13 - 35100: Ringer Pattern 1
  14 - 35101: Ringer Pattern 1
  15 - 35102: Ringer Pattern 1
  16 - 35103: Ringer Pattern 1

These Phantom Numbers can be either four digits or five digits for ISDN, CCIS and DID. They can also be a maximum of six digits for APHN, and a maximum of 16 digits for APHNN.

Example of operation

ISDN Case

- Route 1 dials 972-233-5001.
  This call rings with Pattern 1.
- Route 1 dials 972-233-5088.
  This call rings with Pattern 0.
- Route 1 dials 972-233-5089.
  This call rings with Pattern 6.
- Route 1 dials 972-233-5091.
  This call rings with Pattern 7.
- Route 1 dials 972-233-5092 ~ 972-233-5103.
  This call rings with Pattern 1.

CCIS Case

- Route 10 dials 35001.
  This call rings with Pattern 1.
- Route 10 dials 35088.
  This call rings with Pattern 0.
- Route 10 dials 35089.
  This call rings with Pattern 6.
- Route 10 dials 35090.
  This call rings with Pattern 7.
- Route 10 dials 35091 ~ 35103.
  This call rings with Pattern 1.

DID case

- Route 1 dials 972-233-5001.
  This call rings with Pattern 1.
- Route 1 dials 972-233-5088.
  This call rings with Pattern 0.
- Route 1 dials 972-233-5089.
  This call rings with Pattern 6.
- Route 1 dials 972-233-5091.
  This call rings with Pattern 7.
- Route 1 dials 972-233-5092 ~ 972-233-5103.
  This call rings with Pattern 1.

Service Conditions

1. These patterns cannot be changed from the data that follows:
   a.) Phantom Number 1 in the Phantom List: Ringer Pattern 0
   b.) Phantom Number 2 in the Phantom List: Ringer Pattern 6
   c.) Phantom Number 3 in the Phantom List: Ringer Pattern 7
   d.) Phantom Number 4-5 (for Station Dial) or 4-16 (NDM) in the Phantom List: Ringer Pattern 1
2. Calls to the main station Number will ring with Pattern 1.
3. This feature is mutually exclusive with Personal Ringer (SFI 148).
4. If both features are on, Personal Ringer will have higher priority.
5. This feature is mutually exclusive with Distinctive Ringing - Caller ID.
6. This feature is only available for Incoming Trunks, such as ISDN, CCIS, DID.
7. The Phantom Number in Station Dial Phantom Call is not available for a FCCS Call and Internal Call.
8. This feature is only available for a Single Line (Analog Phone).
9. This feature is only for Station Dial (the maximum amount of Phantom Numbers for one station is five) and NDM (the maximum amount of Phantom Numbers for one station is 16). This feature is not available for LDM.
10. This feature cannot be used with Distinctive Ringing or Distinctive Ringing for Toll Calls.
11. This feature cannot be used with Distinctive Ringing Priority List.
12. After the Ringer Timers are changed in System Data 3, the line package must be reset before the new Ringer Timers will go in to effect.
13. Phantom Numbers 4 and 5 may ring as Pattern 1.
14. The Ringer Patterns 0, 6, and 7 may begin with one burst of Caller ID ring.
15. This feature works with Call Transfer - Terminating, Call Transfer - Attendant and Three-way Calling.
16. This feature does not work with Call Forwarding.
17. If Phantom Number Distinctive Ringing - Single Line, Distinctive Ringing List and Distinctive Ringing for Toll Call are active at same time, and the Called Number is a Phantom Number, the highest priority is Phantom Number Distinctive Ringing - Single Line, then Distinctive Ringing List, then Distinctive Ringing for Toll Call.

Programming

To assign

STEP 1: **ASYD** - Assignment of System Data. See the Command Manual for details on Distinctive Ringing Patterns assigned in System Data 3 Indexes.

STEP 2: **ASFC** - Assign of Service Feature Restriction Class.

TN: X
SFC: X
SFI: 193 must be set to "1" for this service to be in effect.

STEP 3: **APHN/N** - Assign the Phantom Numbers to the main station. For APHN, five Phantom Numbers can be assigned. For example, 5088, 5089, 5090, 5091, 5092.
For APHNN, 16 Phantom Numbers can be assigned. For example, 35088, 35089, 35090, 35091, 35092, 35093, 35094, 35095, 35096, 35097, 35098, 35099, 35100, 35101, 35102, 35103.

To delete

STEP 1: **APHN/N** - Delete the Phantom Numbers of the main station. For APHN, five Phantom Numbers can be deleted. For example, 5088, 5089, 5090, 5091, 5092.
For APHNN, 16 Phantom Numbers can be deleted. For example, 35088, 35089, 35090, 35091, 35092, 35093, 35094, 35095, 35096, 35097, 35098, 35099, 35100, 35101, 35102, 35103.

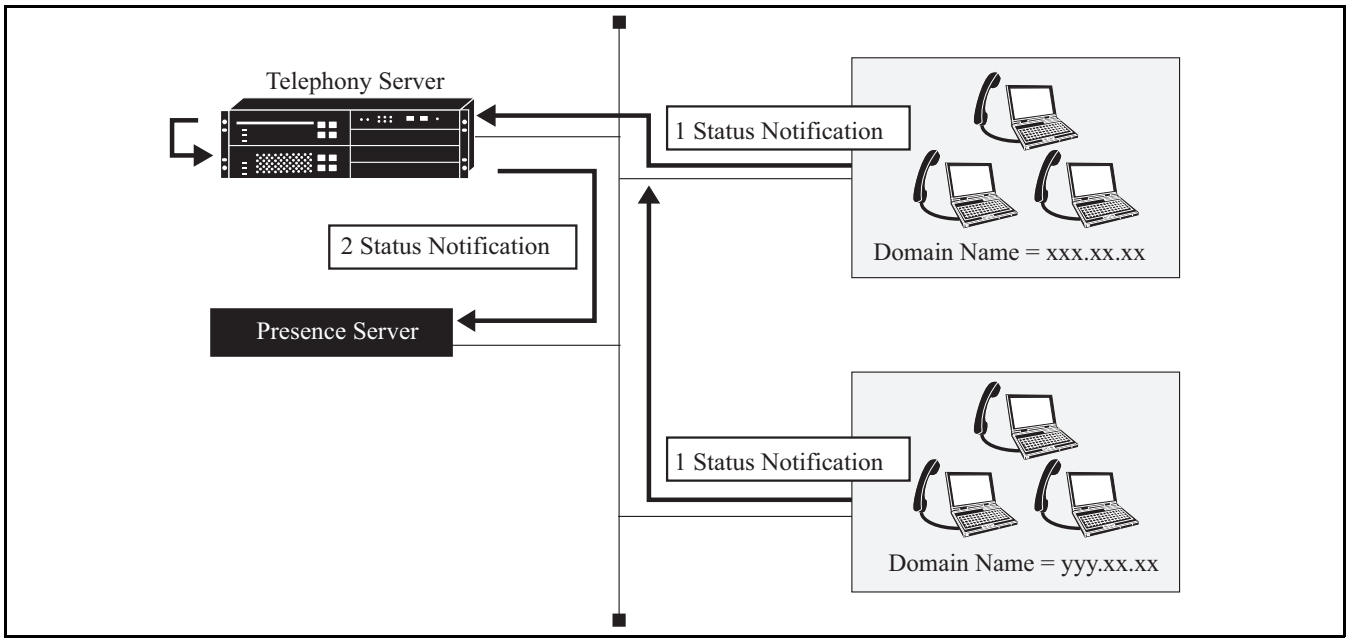
STEP 2: **ASFC** - Assignment of Service Feature Restriction Class.

TN: X

SFC: X

SFI: 193 must be set to "0" for this service to be removed.

STEP 3: **ASYD** - Assignment of System Data. See the Command Manual for details on Distinctive Ringing Patterns assigned in System Data 3 Indexes.



P-78 Presence

General Description

This feature allows SIP terminals to display the current status of the target party controlled by Presence Server on their LCDs or screens. By knowing the current status of the target party before making a call, the SIP terminal's user can choose the most suitable communication tool for each target party.

Telephony Server supports the following services:

- For Soft Phone (SIP):
  Controls the domain name, IP address and port number of Presence Server that notifies the status of Soft Phone (SIP), on a terminal basis.
- For WLAN Handset (MH Series):
  Controls the IP address and port number of Presence Server that notifies the status of WLAN Handset (MH Series), on an SP basis.
- Sends login (when Registration process is completed) and logout (when the terminal is logged out or Health Check NG is detected) information for each SIP terminal to Presence Server specified by TP.

Operating Procedure

No manual operation is required.

Service Conditions

1. This feature is available for the following SIP terminals supporting Presence service.

   - Soft Phone (SIP) **Note 1**
   - WLAN Handset (MH Series)

   Note 1: When using this feature with Soft Phone (Proprietary Protocol), the status display for other terminals cannot be updated automatically. Therefore, it is necessary to update the status display manually. Also, Presence Server must support the Proprietary Protocol (no particular data programming is required). For details, see the manual for Presence Server.

2. This feature requires a Presence Server.
3. A maximum of 128 characters (single-byte alphanumeric) can be used as a domain name.
4. One domain name cannot be shared among multiple Presence Servers.
5. In FCCS network, a maximum of 1020 domain names can be used.
6. If any data described in the Programming section is changed, applicable terminals need to be reset.

<For Soft Phone (SIP) only>

1. It is necessary to assign the Telephone Number (TELN) of Soft Phone (SIP).
2. IP address and port number of the SIP Presence Server are set per domain name. Also, one Presence Server can be specified by multiple domain names. In this case, SIP Presence Server must support multiple domain names.
3. When the existing data assigned on the INDEX parameter of ADNIN command is changed, the applicable Soft Phone needs to be reset to enable the new data.
4. Microsoft® XML Version 3.0 or later is required for the Soft Phone's PC to communicate with Presence Server. It has already been installed if Internet Explorer 6.0 is installed or Windows® XP is used on the PC. If it is necessary to install it, use Microsoft® XML Version 3.0 application software supplied with Soft Phone install CD-ROM or download it from the official home page of Microsoft®.
5. Soft Phone uses its Prime Line Number to access to a Presence Server. Thus, the same Prime Line Number cannot be assigned to multiple Soft Phones.
6. This feature is available for Soft Phones using Soft Phone Wired Phone Handset [S-147] or Soft Phone WLAN Handset [S-159]. Soft Phones in logout status are treated as "absence."
7. It is necessary to reboot the applicable SIP terminals when changing the Presence Server's IP address.
8. When replacing hardware for the Presence Server, Maintenance Personnel must perform operations in the following order: **Note 2**
   a. Startup the new Presence Server.
   b. Verify that the new Presence Server is connected to the network.
   c. Perform data assignment to the new Presence Server.
   d. Shutdown the old Presence Server.

   Note 2: If the Maintenance Personnel does not perform operations in the above order, it may become necessary to reboot the Telephony Server and the Presence Server.

<For WLAN Handset (MH Series) only>

IP address and port number of Presence Server are assigned on a SP basis. Multiple Presence Servers cannot be used for a SP.

Programming

Note: If any of the following data is changed, applicable SIP terminals needs to be reset.

Note: For detailed information on each command, refer to Command Manuals.

<Programming for Soft Phone (SIP)>

STEP 1: **ASDIN** - Assign IP address and port Number of the Presence Server corresponding to the assigned domain name.

STEP 2: **ALGSN** - Assign the Telephone Number of Soft Phone (SIP).

STEP 3: **ADNIN** - Allocate the Index of domain name assigned on ASDIN to UGN and TELN assigned on ALGSN.

<Programming for WLAN Handset (MH Series)>

ASSDL/ASSDN - Assign IP address and port Number of the Presence Server on the PRESENCE SERVER tab.

P-83 Phonebook

General Description

This feature offers the phonebook function used on a station basis or a system basis. During the call origination using Phonebook, name and dial number registered in Phonebook which corresponds to the number dialed by users are displayed. During the call termination, name and dial number registered in Phonebook which corresponds to the calling party number are displayed. There are four types of Phonebook: Local Phonebook, System Phonebook, phonebook on telephone terminal (hereinafter called Terminal Phonebook) and Corporate Phonebook.

- **Local Phonebook**

  Local Phonebook is used on a station basis. Data is managed per station number and can be modified or registered as a new entry by operation from telephone terminal. Up to 100 registrations are available per station. Up to 32 digits can be registered for each dial number. Up to 24 characters can be registered for each name. For stand alone system, Local Phonebooks of 4000 stations can be used. For FCCS system, Local Phonebooks of 4000 stations can be used per Node.

- **System Phonebook**

  System Phonebook is used on a system basis. Data can be modified or registered as a new entry with Maintenance Console (PCPro). Up to 12000 registrations (**Note 1**) are available per FCCS system or per stand alone system.

  Note 1: For FP95-112 V2 or later, up to 60000 registrations are available by System Data (ASYDL/ASYDN, Index 683, Bit 4=1).

  Up to 32 digits can be registered for each dial number. Up to 24 characters can be registered for each name. For FP95-112 V2 or later, the data can be registered separately per UGN with System Data (ASYDL/ASYDN, Index 1136, Bit 0).

  Note: If you change the system data while using the terminal, delete the phonebook data and register it again after changing the system data.

<For DT820/DT710, the following features are not available.>

- **Terminal Phonebook (indicated as Personal Directory on the terminal LCD)**

  Terminal Phonebook is installed with telephone terminal.This phonebook is available in DT830G/DT830/DT700 Series. Up to 12000 registrations are available per FCCS system or per stand alone system. Up to 32 digits can be registered for each dial number. Up to 24 characters can be registered for each name.

- **Corporate Phonebook**

  Corporate Phonebook is created with XML application and controlled by the external XML server. This phonebook is shared in the entire system. Please ask the system integrator about details of the Corporate Phonebook application on external XML server.

Operating Procedure

For operating procedure, refer to the related User's Guide.

Service Conditions

<Important Notices>

1. The following Phonebook types can be specified by ASFC/ASFCN command.

Kind of Phonebook	ASFC/N SFI Data
Local Phonebook	ASFC/N SFI:245 = 1
System Phonebook	ASFC/N SFI:246 = 1
Terminal Phonebook **Note 2**	ASFC/N SFI:247 = 1

Note 2: When SFI 247 (Terminal Phonebook) setting is changed;
DT830G/DT830/DT700 Series terminals require to request re-registration. (Make-busy and make-busy cancel operation by MBST command is also available.)
Data change does not turn effective without re-registration.

2. Each terminal can use the following phonebooks in combination;

	Local Phonebook	System Phonebook
Terminal Phonebook	Not supported	Supported

Note: Terminal Phonebook can be used in combination with Local Phonebook through the entire system; however, Terminal Phonebook cannot be used in combination with Local Phonebook in one terminal.
When SFI 247=1 (Terminal Phonebook is allowed) and SFI 245=1 (Local Phonebook is allowed) are assigned, SFI 247=1 takes priority and Terminal Phonebook is effective.

Note: The following shows the priorities to display the name when a called party receives a call.
Terminal Phonebook > Local Phonebook > System Phonebook

3. As Terminal Phonebook is not supported in DT820/DT400 Series/DT300 Series and DT710, only the Local and System Phonebook are available for those terminals.
When SFI 247=1 (Terminal Phonebook) is selected on DT820/DT400 Series/DT300 Series and DT710, only the System Phonebook can be used.
Available Phonebook type depends on the SFI 247 (Terminal Phonebook) setting;

SFI 247	DT710 (2-button type)/ DT410 (2-button type)/ DT310 (2-button/12-button type)	DT820/ DT710 (6-button type)/ DT430/DT330/ DT410 (6-button type)/ DT310 (6-button type)/	DT830G/DT730G/ DT830/DT730/ DT750
0	Not supported	Local Phonebook/System Phonebook	Local Phonebook/System Phonebook
1	Not supported	System Phonebook	Terminal Phonebook/System Phonebook

*This table shows the conditions when SFI 245=1 (Local Phonebook is allowed) and SFI 246=1 (System Phonebook is allowed) are assigned.

4. When the same dial numbers or the same names are registered to Phonebook, the following conditions are applied.

	Same Name, Different Dial Number Name: abc, Number: 123 Name: abc, Number: 345	**Different Name, Same Dial Number** Name: abc, Number: 123 Name: def, Number: 123	**Same Name, Same Dial Number** Name: abc, Number: 123 Name: abc, Number: 123
Local Phonebook	Supported	Supported **Note 4**	Supported
System Phonebook	Supported **Note 3**	Not supported	Not supported

Note 3: Up to 20 different dial numbers can be registered with the same name.

Note 4: For the following situation, there may be difference in the displayed name between “A call is originated using Phonebook” and “the originating station returns to the former line.” It is because the system searches Local Phonebook database for the number again when the originating station returns to the former line.

A call is originated using Phonebook -> the line is engaged in the call -> the originating station performs operation of Call Forwarding and Call Hold -> the originating station returns to the former line

5. When terminals other than DT830G/DT830/DT700 Series/DT400 Series/DT300 Series are used, they work in Dterm Series i mode. So SFI 247 (Terminal Phonebook) setting takes no effect.
6. When the name search is executed by entering a few characters in the beginning of the name on the Desktop terminal LCD, the matched name with entered characters is displayed at first.
Then the display shows other names in the Phonebook database by pressing UP and DOWN key.

<Example> Searching the database for the name includes **“**TOU**”** when the following four names are in the database.

ABIKO
Shinbashi
→TOUHOKU
chiba

- “TOUHOKU” shown above with the arrow appears on the display as the search results of “TOU”.
- When DOWN key is pressed once while “TOUHOKU” is on the display, “chiba” appears.
When DOWN key is pressed twice while “TOUHOKU” is on the display, “ABIKO”, which is at the top of the database, appears.

- When UP key is pressed while “TOUHOKU” is on the display, “Shinbashi” appears.
  When UP key is pressed three times while “TOUHOKU” is on the display, “chiba”, which is at the last of the database, appears.

  Note: The order of names in the database changes depending on whether distinguishing between upper case and lower case characters. The above explains the example when ASYDL System data 1 Index 677 Bit 7=0 (Distinction between upper case and lower case characters is in service) is assigned.

7. Searching database method whether this feature distinguishes between upper case and lower case characters while searching database for a name can be specified by system data (ASYDL System data 1 Index 677 Bit 7). The searching database method depends on the setting of ASYDL System data 1 Index 677 Bit 7 at the time APBKN data assignment is finished. If APBKN data is assigned and the Administrator wants to change the searching method by changing ASYDL System data 1 Index 677 Bit 7, the APBKN entries must first be deleted before changing ASYDL System data 1 Index 677 Bit 7. APBKN entries must then be reentered to follow the new search method.

   - ASYDL System data 1 Index 677 Bit 7=0 (Distinction between upper case and lower case characters is in service.)

     <Example> ABIKO
     Shinbashi
     →TOUHOKU
     chiba

     * Upper case and lower case are distinguished as different character strings. Upper case has priority over lower case.

   - ASYDL System data 1 Index 677 Bit 7=1 (Distinction between upper case and lower case characters is out of service.)

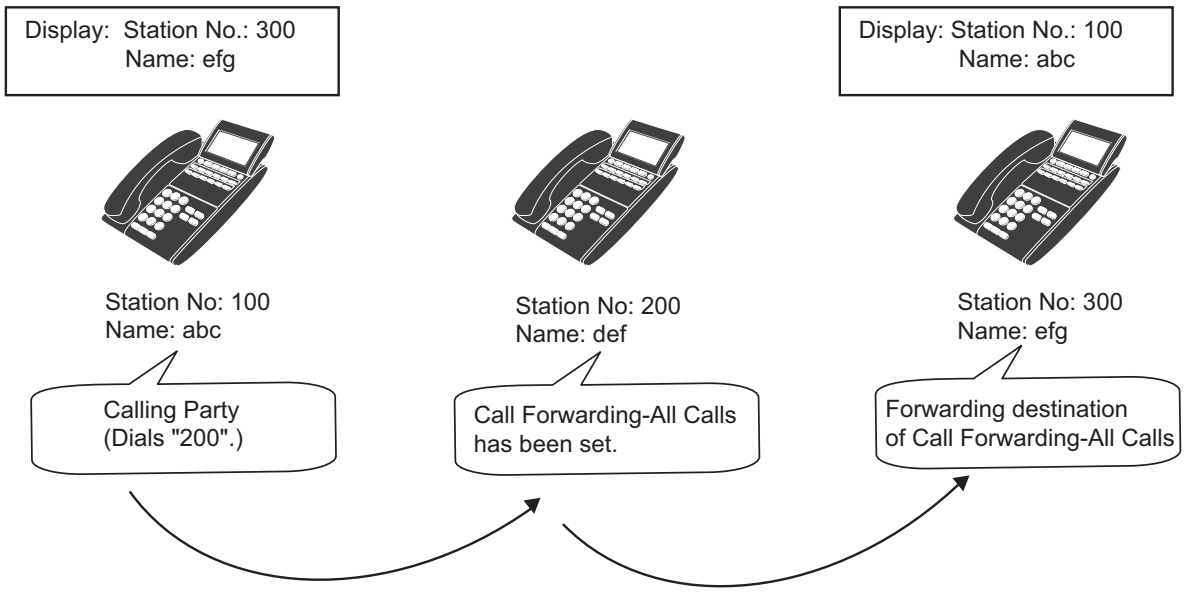
     <Example> ABIKO
     chiba
     Shinbashi
     TOUHOKU

     * Upper case and lower case are not distinguished as different character strings.

8. Hooking or a pause cannot be registered in a dial number.
9. When Abbreviated Call Codes using Speed Calling - Station, Group, or System features are registered in the Phonebook, a call cannot be originated by dialing these codes.
10. When a call rings on a PS line of a DT800/DT700/DT400/DT300 Series where the PS line is accommodated as a Sub Line, the calling party name registered in the Phonebook is not displayed until the call is answered.
11. If you register 60000 phonebook entries, sufficient memory is required. Therefore, execute DDMO command to check the free size area of the data memory in NDM, and change the System Data (ASYDL/ASYDN SYS1 Index 514/Index 957) if required. **Note 5**, **Note 6**

Note 5: If the NDM is insufficient, registration error occurs.

Note 6: To register 10000 phonebook entries, 0.7MB (713KB) of free disk space is required. When the data memory in NDM is about 2.0 MB (2048KB), you can register up to 28700 (2048 divided by 713 equals 2.87) entries.



<Interactions with Other Features>

1. Backup of Local Phonebook and System Phonebook data is available by executing maintenance commands and periodical diagnosis.
2. PHONEBOOK [P-83] cannot be used when SOFT PHONE WLAN HANDSET [S-159] or SOFT PHONE WIRED-PHONE HANDSET [S-147] is activated, key operation is not effective.
3. The following shows whether Phonebook is supported by SR-MGC and FCCS Cluster.

	SR-MGC	FCCS Cluster
Local Phonebook	Not supported	Not supported
System Phonebook	Supported	Supported **Note 7**

Note 7: FCCS Cluster is supported when data is assigned to Backup node in advance.

4. When Call Forwarding feature is set to the originally called station, calling number is searched from Phonebook of forwarding destination.

5. Name display by Phonebook is not supported when the forwarding destination of the following Call Forwarding features is out side of Self Office.
   - Call Forwarding - All Calls [C-5]
   - Call Forwarding - Busy Line [C-2]
   - Call Forwarding - Don't Answer [C-3]
   - Call Forwarding - Logout
   - Call Forwarding - PS Incoming Incomplete [C-155]

6. Searching Phonebook database for the name is not available if called party number is not received from counter office when the call is originated to out side of Self Office by HOTLINE [H-1].
7. When the same dial numbers are registered to both NAME DISPLAY-SYSTEM [N-28] (ANDD command) and Phonebook, the data registered to Phonebook takes priority.
8. It is possible to change the indication location of the name and number information notified from the system on DT700 Series LCD. For the detailed information, refer to NAME DISPLAY-SYSTEM [N-28].
9. Display of Phonebook takes priority over CALLING PARTY NUMBER-NAME ASSIGNMENT AND DISPLAY [C-157].
10. For the information about Phonebook for Hotel System, refer to PHONEBOOK FOR HOTEL [P-85].
11. When the number of digits of the dialed number is less than the maximum necessary digits (values assigned to MND parameter of AMND/AMNDL/AMNDN), the call is originated after a predetermined prepause timer assigned by ASYD, SYS 1, Index 128 Bits 0-3 (default: 12 seconds) expires.
12. This feature does not support OAI or ACD system.

<Hardware/Software>

1. Desktop terminals (except for Softphone) equipped with Soft key function are required.
2. To activate PHONEBOOK [P-83] on DT800 Series/DT700 Series/DT400 Series/DT300 Series equipped with the cursor key or Menu key, Phonebook can be activated by pressing the cursor key, Menu key, Feature key or Soft key.

   Note: In the cases of DT820/DT710 6-button type and DT410/DT310 6-button type, cursor key, Feature key or Soft key is available to activate the feature. This feature cannot be activated by Menu key on DT820/DT710 6-button type and DT410/DT310 6-button type.

3. To use this feature, one of the following cards is required:

   - ELC card mounted in 7U-PIR
   - PA-16ELCN-A in DT300 Series mode
   - PA-16ELCN in DT300 Series mode

4. The key operation for Speed Calling-One Touch takes no effect while the Phonebook is displayed on a LCD of a terminal.

<Interactions with Networks>

1. Display pattern of calling name and calling number for incoming Trunk Calls can be changed by system data (ASYD, System Data 1, Index 390, Bit 0). For incoming Station Calls, the pattern cannot be changed.

   - Example when name display takes priority; the beginning of number is displayed:

     Name “Suzuki Taro (Japan-Chiba-Abiko)”, Number “047156789012345678901234567 8”

     0471567*
     Suzuki Taro (Japan-Chiba*

- Example when number display takes priority; the beginning of number is displayed:

  Name "Suzuki Taro (Japan-Chiba-Abiko)", Number "047156789012345678901234567 8"

  Suzuki *
  047156789012345678901 23*

2. The prefix (the access number of terminated route) can be included to the dial number registered in Phonebook data. When the prefix is included, be sure to match the prefix with the number assigned in "to add the access code of incoming route" by ACNP and ACND command. For the data assignment, refer to Programming.
3. Adding prefix operation using "Prfi" key in Phonebook data display is available only once. To retry the operation, cancel the assigned prefix by pressing "Cnl" key then restart adding prefix operation.
4. Up to 10 digits can be added as a prefix.
5. When the prefix is added, up to 32 digits including the prefix can be sent as dial number of Phonebook data.

- Example of display before prefix is added:

  Name "Suzuki Taro(Japan-Chiba)", Number "047156789012345678901234567890 12"

- Example of display after prefix is added:

  Name "Suzuki Taro(Japan-Chiba)", Number "047156789012345678901234567890 12"

<Conditions Specific to This Feature>

1. Display of character types are small (lower case) and large (upper case).
2. "0-9", "*" and "#" can be used for numeric input.
3. A blank space is also distinguished while searching database for a name.

4. Even if there is a blank space (0×20) at the end of input name for the name registration, the name is registered without the blank space. For the name registration of System Phonebook assigned by APBKN command, the blank space is not deleted when there is a blank space at the end of input name.
5. When a call is terminated to a line of a terminal being engaged in Phonebook operation, the operation is continued. If the terminal answers the call, Phonebook operation is canceled and the terminal is engaged in the call. When the call is finished, the terminal becomes the state Phonebook operation is canceled.
6. Phonebook operation is available only from the terminal in idle state. Phonebook operation is not effective while the terminal in a call or in the Headset Mode.
7. Phonebook operation will be exited in midstream by pressing “Exit” key and “Pbook” key. When “Cnl” key is pressed, the display returns to previous display.
8. If a calling party number of the terminated call is registered to both of System Phonebook or Local Phonebook, registered data to Local Phonebook takes priority.
9. When the incoming call is terminated to Sub line, if a station set the terminated line as Prime line, the data for name display and number display will be searched from Phonebook of a station which the terminated line is set as My line. However, if the call is answered, the data for name display and number display will be searched from Phonebook of the answering station.
10. If there are two stations (Station A and B) both with the same line appearance when Multiple Line Operation -D [M-20D] is activated, on Station A the terminated line being its Prime Line and on Station B the terminated line being its My Line, the name display on the stations will be as shown below:
    * In this case, Station B uses Local Phonebook only.

    - Station A (the incoming call terminates to Prime Line of this station):
      While ringing state, the station displays the name as found in the phonebook of Station B.
      After the station goes off-hook, the name then is updated to display the name from the phonebook of Station A.

    - Station B (the incoming call terminates to My Line of this station):
      The station displays the name searched from the phonebook of Station B.

11. The first entry of Phonebook data is displayed when the call is originated/terminated by dialing the number.
12. When the REDIAL key is pressed while displaying Phonebook data, the dial number assigned to redial key is displayed for 10 seconds or so.
13. When “SP (blank space)” is input during name registration, edit or search by telephone terminal key operation, “_ (underscore)” is displayed though it is recognized as “SP (blank space)” in data programming. Because of that, “_ (underscore)” is not displayed if “SP (blank space)” is input by APBKN command.
14. When digit key is pressed during phonebook operation, the pressed number is not displayed.
15. Pressing the SPEED CALLING ONE-TOUCH key while displaying phonebook data, the key operation for Speed Calling-One Touch takes no effect on DT800/DT700/DT400/DT300 Series.
16. Even though System Phonebook and Terminal Phonebook are set as out of service (ASFC SFI: 246=0/ SFI: 247=0), the parameters under [Directory] menu will be displayed on the terminal’s configuration menu regardless of SFI: 246/SFI: 247 data setting.
17. Phonebook information can be displayed in 4-line with a DT830G/DT830/DT700 Series terminal that has 4-line (except the line for icon display) LCD. By displaying Phonebook information in 4-line, you can see the name and the number in the search result display or the deletion confirmation display, whereas in 3-line, you can only see the name.

If you wish to display Phonebook in 3-line as before, assign the system data (ASYDL, SYS1, Index 681, Bit 1=1).

Note: The search result with 4-line display is only available for Local Phonebook and System Phonebook. Deletion confirmation with 4-line display is only available for Local Phonebook.

<Conditions Specific to UMGi/RNIP System>

1. Local Phone Book is not available for an RN in survival mode.

<Other Conditions>

1. Conditions specific to Local Phonebook are as follows.
   a.) Local Phonebook data is stored on a LENS basis.
   b.) For available input characters, numbers, and marks of Local Phonebook data, refer to the character code <Character Code> on page 1912.
   c.) Input characters, numbers, and marks cannot be modified from the middle of the string array. they need to be deleted from the ending and modified by inputting again.
   d.) When this feature is activated, be sure to execute the routine diagnosis program and back up the Local Phonebook data periodically by ASYD System Data 1 Index 306 data assignment.
   e.) Data registration to Local Phonebook is not available during Local Phonebook data backup. The display shows “Entry NG (Data Backup).”
   f.) Local Phonebook data can be saved and verified between flash card and PCPro using Telephony Server Maintenance Menu. For more information, refer to Operations and Maintenance Manual.
   g.) Local Phonebook data can be copied and verified between Drive C and Drive B by specifying “Office Data” in Data Type Select field by the HDD_HDD/HDD_HDD_N command. For more information, refer to Operations and Maintenance Manual.
2. Conditions specific to System Phonebook are as follows.
   a.) System Phonebook data can be edited by Maintenance command. The data cannot be edited from the terminal.
   b.) The following characters, numbers, and marks can be used for System Phonebook.

   A-Z, a-z, 0-9, !, ?, -, +, %, &, /, (,), =, ., ,, :, ", ', ;, *, #, @, [,], SP (blank space)

   À, Á, Â, Ã, Ä, Å, Æ, Ç, É, Ê, Ñ, Ö, Ü, ß, à, á, â, ä, å, æ, ç, è, é ,ê, ë,
   ì, í, î, ï, ñ, ò, ó, ô, õ, ö, ù, ú, û, ü, ¿, ¡

   Note: õ is displayed in capital letter. There is no small letter for this character available.

   c.) Special characters such as characters having an umlaut can be input in NAME field of APBKN/CPBKN command on PCPro by changing input language with the function of Operating Systems. To change input language, refer to the manuals provided by each OS.

<Conditions Specific to combination of Call History and Phonebook>

Available: × Not available: N Not supported: –

Kind of Phonebook	DT400/DT300 Series Note 9			DT800/DT700 Series					DtermIP/ DtermSIP with LCD
	DT430 / DT330	DT410/DT310		DT750	DT830/ DT730/ DT830G/ DT730G	DT820	DT710		
		6-button type	2-button/ 12-button type				6-button type	2-button type	
Local Phonebook (ASFC/N SFI:245)	×	×	–	×	×	×	×	–	×
System Phonebook (ASFC/N SFI:246)	×	×	–	×	×	×	×	–	×
Terminal Phonebook (ASFC/N SFI:247) Note 8	N	N	N	×	×	–	N	N	N
Corporate Phonebook	N	N	N	×	×	–	N	N	N
Terminal Call History (outgoing call history/incoming call history)	×	N	N	×	×	–	N	N	N
Call History	×	×	–	×	×	×	×	–	N

Note: Phonebook can be used in combination with Call History on DT830G/DT830/DT700 Series/ DT400 Series/DT300 Series terminals only.

Note 8: When SFI 247 (Terminal Phonebook) setting is changed; DT830G/DT830/DT700 Series telephone terminals require to request re-registration. (Make-busy and make-busy cancel operation by MBST command is also available.) Data change does not turn effective without re-registration.

Note 9: The condition in this table applies to the terminals working in DT400 Series/DT300 Series Mode. Phonebook does not support the terminals working in Dterm Series i Mode.

1. Terminated numbers can be registered from Call History to Local Phonebook on DT830G/DT830/DT700 Series.

   Note: On telephone terminals before DT830G/DT830/DT700 Series/DT400 Series/DT300 Series, Call History and Local Phonebook are not interlocked, so incoming numbers cannot be registered from Call History to Local Phonebook.

   Note: For the information of phonebook entry to Terminal Phonebook using Terminal Call History, refer to the related manuals of DT830G/DT830/DT700 Series.
2. When an incoming call terminates on the accommodating line while registering from Call History to Local Phonebook, the station can keep phonebook operation while ringing. When the incoming call is answered, the connection is established and phonebook operation is canceled. After releasing the call, the LCD shows empty display (not back to incoming call history display).
3. Call History can store up to 32 digits of dial number and 16 characters of name. On the other hand, Local Phonebook can store up to 32 digits of dial number and 24 characters of name. Therefore, all the digits of numbers stored in Call History can be saved to Local Phonebook.
4. The entry from Call History to Local Phonebook is every time dealt with a new data addition. So the existing data in Local Phonebook is not edited even when the name is listed in the Call History.
5. As DT400 Series/DT300 Series (DT400/DT310) 2-button/12-button type and DT700 Series (DT710) 2-button type (without LCD) cannot use Call History [C-195], phonebook entry from Call History to Local Phonebook is not available.
6. For DT800/DT700 Series, you can add a prefix before the displayed number when originating a call by Terminal Phonebook. For DT400 Series/DT300 Series, prefix function is not supported.

   Note: For using prefix function, register the prefix with user setting on the terminal beforehand. For details, refer to the related manuals of DT800 Series/DT700 Series.

7. The following types of data entry are not supported:

   - From Call History to Terminal Phonebook
   - From Terminal Call History to Local Phonebook

8. In registering operation from Call History to Local Phonebook, the LCD cannot go back to Call History indication from phonebook entry by the CNL key.
9. When the combination of Call History and Terminal Phonebook is used, “Pbook” Soft key does not appear on Call History display.
10. The priority order to display the name on incoming call termination and call history is as follows.

High Priority

Low Priority

- Registered name on the selected phonebook (Local Phonebook/Terminal Phonebook)
- Registered name on System Phonebook
- Registered name assigned by Name Display feature (ANDD) and Caller ID feature (ACID)

Note: In the following cases, contact names are not displayed in the above priority order.
- The combination of Terminal Phonebook and Call History is used:
- Contact name of priority order I is not displayed. Contact name of priority order II or priority order III is displayed.
- The combination of Local Phonebook and Terminal Call History when ASYDL, System data 1, Index 673 Bit 4=0 is assigned (inform only Calling Number to call history):
- Contact name is not displayed as the call history.
- The combination of Terminal Phonebook and Terminal Call History when ASYDL, System data 1, Index 673 Bit 4=0 is assigned (inform only Calling Number to call history):
- Contact name of the priority order II and III are not displayed as the call history.

Programming

STEP 1: **ASYD** - Assign the system data.

<Assignment of periodical Local Phonebook data backup>

System Data 1
- Index 86, Bit 0 = 1 (System Message [7-0] is registered when no errors are detected by the Routine Diagnosis Program)
- Index 86, Bit 1 = 1 (System Message [7-P] is registered when an error is detected by the Routine Diagnosis Program)
- Index 87 (Routine Diagnosis Program Start Time [Hour data])
- Index 88 (Routine Diagnosis Program Start Time [Minute data])
- Index 90, Bit 1 = 1 (Backup Call Forwarding and Individual Speed Data to HDD)
- Index 306, Bit 0 = 1 (Local Phonebook data is saved) **Note 10**

<Assignment of prior data for telephone terminal display>

System Data 1
- Index 241, Bit 6 (Assign the data when the length of Caller ID exceeds the limit.) 0/1: Only the former/latter part of data appears on the LCD.
- Index 390, Bit 0 (Assign the prior data to display.) 0/1: Assigned Name/Calling Number

<Assignment of Caller ID display on the bottom line of telephone terminal>

System Data 1
- Index 390, Bit 2 = 1 (Caller ID display on the bottom line of telephone terminal LCD is in service.)

Note 10: ASYD, System Data 1, Index 306 is activated when System Data 1, Index 90, Bit 1=1 is set.

STEP 2: **ASYDL** - System Data 1, Index 683, Bit 4 = 0/1 (the maximum number of registration data for System Phonebook (12000 entries/60000 entries)).

Note: For an FCCS network, assign this system data with the ASYDN command.

Assign the system data to set Display location of contact name registered to the Desktop terminal Phonebook.

System Data 1
- Index 673, Bit 0-1

- In the case of DT750/DT830/DT730 Series

Bit 1	Bit 0	Description
0	0	Third Line
0	1	Second Line
1	0	Fourth Line
1	1	Not to display

- In the case of DT820/DT710

Bit 1	Bit 0	Description
0	0	Second Line
0	1	First Line
1	0	Third Line
1	1	Not to display

Note: To set similar indication location to DT400 Series/DT300 Series, set "Not to display."

Assign the system data for the distinction between upper case and lower case characters while searching the database for the name.
System Data 1
- Index 677, Bit 7 = 0/1 (Distinction between upper case and lower case characters is in service/out of service.) **Note 11**

Note 11: If APBKN data is assigned and the Administrator wants to change the searching method by changing ASYDL System data 1 Index 677 Bit 7, the APBKN entries must first be deleted before changing ASYDL System data 1 Index 677 Bit 7. APBKN entries must then be reentered to follow the new search method.

Assign the system data to choose the number of lines you wish to display on an LCD for Phonebook.
System Data 1
- Index 681, Bit 1 = 0/1 (4 lines/3 lines)

Note: For an FCCS network, assign this system data with the ASYDN command.

Assign the system data to set UGN data separation.
System Data 1
- Index 1136, Bit 0 = 0/1 (Individual/Common)

Note: For an FCCS network, assign this system data with the ASYDN command.

STEP 3: **ASFC** - For Stations allowed Phonebook, assign a Class of Service that allows the following.
SFI 245 (Local Phonebook) **Note 12**
SFI 246 (System Phonebook)
SFI 247 (Terminal Phonebook) **Note 13**

Note 12: When SFI 247=1 (Terminal Phonebook is allowed) and SFI 245=1 (Local Phonebook is allowed) are assigned, SFI 247 takes priority and Terminal Phonebook is effective.

Note 13: Re-registration of terminal, circuit card initialization and system initialization are required after changing data assignment.

STEP 4: **ADSL** - To activate Phonebook by the Soft key, assign Soft key as Phonebook key.

SN: 0 (Idle)
FKY: 180 (Phonebook)

STEP 5: **ADKS** - Register each Soft key pattern data to the desired telephone terminal. (This command data is necessary when using a Soft key as Phonebook key.)
TN: Tenant Number
STN: Station Number
SKP: 1-15 (Soft Key Pattern assigned by ADSL)
LKP: 1-3 (Line Key Pattern)
PG: 0/1 (Page Scroll key allocation)

STEP 6: **AKYD** - To activate Phonebook by the programmable Line/Feature key, assign the programmable Line/Feature key as Phonebook key.
TN: Tenant Number
STN: Station Number
KYN: Key Number (1-40)
KYI: 1 (Function Key)
FKY: 180 (Phonebook)

STEP 7: **ACNP** - Assign Calling Number Pattern to add the access code of incoming route.
IC/OG = IC: Incoming Call (Calling Party Recognition)
RT: External Route Number of incoming trunk.
CNP: Calling Number Pattern.
Enter a number within the range between 1 and 255.

STEP 8: **ACND** - Assign Calling Number Data to add the access code of incoming route.
CNP: Calling Number Pattern assigned in ACNP command [1-255]
SKIP: Number of Skip Digits
ADD: Number of Digits of the Additional Number [0-24]
DC: Additional Digit Information [Maximum 24 digits]

<Local Phonebook data deletion/copy/move>

CLPB - Control of Local Phone Book
Select Process Type and Parameter Type, and read out by pressing Get button or input the appropriate data. Then execute the process by pressing Execute button.

Process Type:
Local Phonebook data delete
Local Phonebook data copy **Note 14**
Local Phonebook data move **Note 14**, **Note 15**
Parameter Type:
STN: Select to delete/copy/move the data for specified Physical Station Number.
TELN(LDM): Select to delete/copy/move the data for specified Telephone Number (LDM).

TELN(NDM): Select to delete/copy/move the data for specified Telephone Number (NDM).
LENS: Select to delete/copy/move the data for specified Line Equipment Numbers.

Readout or input data:
TN: Tenant Number
STN: Physical Station Number (0-9, #, * [Maximum 6 digits])
UGN: User Group Number (1-255)
TELN(LDM): Telephone Number (0-9, #, * [Maximum 16 digits])
TELN(NDM): Telephone Number (0-9, #, * [Maximum 16 digits])
LENS: Line Equipment Numbers
Phonebook Data Num: Number of Local Phonebook Data (0-100) is displayed.

Note 14: "Phonebook data copy" and "Phonebook data move" are not available if Phonebook data exists in the destination.

Note 15: If "Local Phonebook data move" is executed, all of originally moved data will be cleared.

<System Phonebook editing>

APBKN - Assign System Phonebook data.
<To register the name and the dial number as a new entry>
TYPE: SPECIFY
TN: Tenant Number
UGN: User Group Number
NAME: Name to register [Maximum 24 characters] **Note 16**, **Note 17**
Click Get button to read out the existing information.
INPUT DC: Dial number to register [Maximum 32 digits] **Note 17**, **Note 18**, **Note 19**
After inputting the all data, click Set button.

<To edit the dial number of the existing name>
TYPE: SEARCH
TN: Tenant Number
UGN: User Group Number
SEARCH NAME: Name [Maximum 24 characters] **Note 20**, **Note 21**
After inputting the name, click Get button.

NAME: Existing name searched by SEARCH NAME [Maximum 24 characters]
INPUT DC: Dial number to register [Maximum 32 digits] **Note 17**, **Note 18**, **Note 19**
After inputting the all data, click Set button.

Note 16: Do not leave a blank space at the end of name.

Note 17: Do not register a name or a dial number if the same name or the dial number has been already registered.

Note 18: Up to 20 dial numbers (DC) can be registered in each name.

Note 19: After inputting the dial number in INPUT DC field, press “List Add” button. The number will be added to the list of DC.

Note 20: Execute SEARCH NAME in order to find the existing name from the System Phonebook database. Name search is available by a few characters in the beginning of the name if it is matched. Also the first entry of database is displayed if name search is executed without data input in this field.

Note 21: Do not leave a blank space at the 24th character position.

<Batch Assignment of System Phonebook data>

System Phone Book data can be assigned/deleted in a lump by CPBKN command with drawing up text format database. For the details, refer to Operations and Maintenance Manual.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, this command replace the non-network command (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

STEP 1: **ADSLN** - Assign Phonebook Soft key.
SN: 0 (Idle)
FKY: 180 (Phonebook)

STEP 2: **ASFCN** - For Stations allowed Phonebook, assign a Class of Service that allows the following.
SFI 245 (Local Phonebook) **Note 22**
SFI 246 (System Phonebook)
SFI 247 (Terminal Phonebook) **Note 22**

Note 22: When SFI 247=1 (Terminal Phonebook is allowed) and SFI 245=1 (Local Phonebook is allowed) are assigned, SFI 247 takes priority and Terminal Phonebook is effective.

<Character Code for Local Phonebook Display>

Available input characters, numbers, and marks for Local Phonebook are shown in the following tables.

Character type: Capital

Digit Code	1	2	3	4	5	6	7	8	9	0	*	#
Characters	.	A	D	G	J	M	P	T	W	SP	*	#
	,	B	E	H	K	N	Q	U	X	0		
	:	C	F	I	L	O	R	V	Y			
	!	À	É	4	5	Ñ	S	Ü	Z			
	?	Á	Ê			Ö	ß	8	9			
	-	Â	3			6	7					
	+	Ã										
	%	Ä										
	&	Å										
	/	Æ										
	(	Ç										
	)	2										
	=											
	¿											
	¡											
	1											

SP: Blank space

Character type: Small

Digit Code	1	2	3	4	5	6	7	8	9	0	*	#
Characters	.	a	d	g	j	m	p	t	w	SP	*	#
	,	b	e	h	k	n	q	u	x	0		
	:	c	f	i	l	o	r	v	y			
	!	à	è	ì	5	ñ	s	ù	z			
	?	á	é	í		ò	ß	ú	9			
	-	â	ê	î		ó	7	û				
	+	ä	ë	ï		ô		ü				
	%	å	3	4		Õ		8				
	&	æ				ö						
	/	ç				6						
	(	2										
	)											
	=											
	¿											
	¡											
	1											

SP: Blank space

Note: õ is displayed in capital letter. There is no small letter for this character available.

P-84 Preventative Maintenance Notification

General Description

This feature notifies the date of the periodical parts which should be replaced in the System Message.

Operating Procedure

Refer to Operations and Maintenance Manual.

Service Conditions

Refer to Operations and Maintenance Manual.

Programming

Refer to Operations and Maintenance Manual.

P-87 Physical Station Number Calling Restriction

General Description

Making a call to a Physical Station Number can be restricted by system data when a Telephone Number is assigned to a destination besides a Physical Station Number. This restriction prevents a calling party from establishing a connection with a wrong destination in an office where Physical Station Numbers and Telephone Numbers coexist.

<Example of Connection Establishment with Wrong Destination>

If a calling party dials an unregistered Telephone Number "2000" when the following data are set, a call arrives at Station A whose Physical Station Number is "200." As a result, the calling party establishes a connection with a wrong called party.

- Station A

  AISTL: STN = 200

  ALGSN: TELN = 2001

- Numbering Plan Data

  ANPD: 1stDC = 2, NND = 3

  ASPA: ACC = 2, SRV = STN

  ANPDN: 1stDC = 2, NND = 4

  ASPAN: ACC = 2, SRV = TELN

  * Telephone Number "2000" is unregistered.

Operating Procedure

No manual operation is required.

Service Conditions

<Important Notices>

1. To activate this service, Telephone Numbers are required for all stations.
2. Numbering Plan data for Physical Station Numbers assigned by such as the ANPD and ASPA commands are required even when this feature is enabled.
3. When a Physical Station Number and a Telephone Number are identical, the Physical Station Number is not restricted.

<Interactions with Other Features>

1. Calls which are not typical two-way calls are also restricted when they are dialed with Physical Station Numbers.

   Example:

   - Dialing a forwarding destination number during operations of Blind Transfer

- Ringing third party to establish a three-way call
- Dialing a forwarding destination number when Call Forwarding features such as Call Forwarding - All Calls [C-5], Call Forwarding - Busy Line [C-2], Call Forwarding - Don't Answer [C-3], Call Forwarding - PS Incoming Incomplete [C-155], and Logged Out IP Station - Call Destination [L-53] are active.
- Dialing a destination number using Automated Attendant [A-82]/Remote Access To System [R-2]
- Answering a held call on a station which belongs to Call Park Group
- Picking up a call directed to another station

When a Physical Station Number is dialed, it is equivalent to dialing an unassigned station number. So, when you use intercept features such as Call Forwarding - Intercept/Announcement [C-25] and Call Forwarding - Intercept - CCIS [C-48], those features are activated.

2. When Physical Station Numbers are assigned to the SPEED CALLING ONE-TOUCH keys, re-assignments of Telephone Numbers are required to those keys.
3. When destination numbers for Speed Calling - Station [S-21] are Physical Station Numbers, re-assignments of Telephone Numbers are required.
4. When Physical Station Numbers are registered to Terminal Phone Book or System Phone Book, re-assignments of Telephone Numbers are required.
5. This feature is also applied to Physical Station Numbers specified for sending Instant Messages.
6. When this feature is in service, Monitor Numbers assigned by the AMNO command cannot be used. The Monitor Numbers need to be assigned by the AMNOL/AMNON commands.
7. To output the billing information with SMDR, specify Telephone Numbers as numbers to be output. (ASYDL, System Data 1, Index 641, Bit 0=1)
8. To use MCI, specify Telephone Numbers as numbers to be output. (ASYDL, System Data 1, Index 641, Bit 1=1)
9. Assignments of Telephone Numbers are required for the following numbers.
   - Individual Attendant Number
   - Station Number used for Conference port for Multiple-Party Conference (PRESET, MEET-ME, PROGRESSIVE, or Add-On) using VS32
   - Station Number used for Conference port for Preset Conference and Add-On Conference using CFT card
10. When this feature is in service, using the ACSIL/ACSIN command is recommended to set the data for Direct-In Termination (DIT) [D-7]. An incoming call can arrive at a destination if the destination number is a Physical Station Number even when it is set by using the ACSI command.
11. When this feature is in service, using the AHLSN command is recommended to set the data for Hotline [H-1]. An incoming call can arrive at a destination if the destination number is a Physical Station Number even when it is set by using the AHLS command.
12. When this feature is in service, using the AHLSN command is recommended to set the data for Brokerage - Hotline [B-6]/Brokerage Hotline - Outside [B-12]. An incoming call can arrive at a destination if the destination number is a Physical Station Number even when it is set using the AHLS command.

13. Even if this feature is in service, Group Number set using the ADGN command can receive a call when a calling party dials the Group Number.
14. This feature cannot be used in the Hotel system.

<Hardware/Software>

1. When this feature is in service, you need to use a Telephone Number to log in to an IP terminal, a SIP Multiline terminal and a Soft Phone (Proprietary Protocol mode/SIP mode). Login will be failed when you use a Physical Station Number.

<Interactions with Networks>

None.

<Conditions Specific to This Feature>

1. Telephone Numbers are required for all stations although you can still set/get Physical Station Numbers through PCPro commands. So be sure to set Telephone Numbers for all stations to activate this feature.

   Examples of Assignment Requiring Telephone Numbers:

   - Assignment of Station Data by the ASDT command
   - Assignment of Key Data for Desktop terminal by the AKYD command
   - Assignment of Station Hunting Group - Circular by the ASHC command
   - Assignment of Call Forwarding Data by the ACFO command

2. You need to use Telephone Numbers for some parameters of the following commands.

   - Assignment of Call Forwarding Station Data by the ACFS/ACFS_T command

     Set a Call Forwarding Destination Number (CFD) with a Telephone Number.

   - Assignment of Change Digit Code for Dial in Service by the ACDD/ACDDL/ACDDN command

     Set a Change Digit Code (CDC) with a Telephone Number when a station number is set as a destination of incoming Direct Inward Dialing (DID) call.

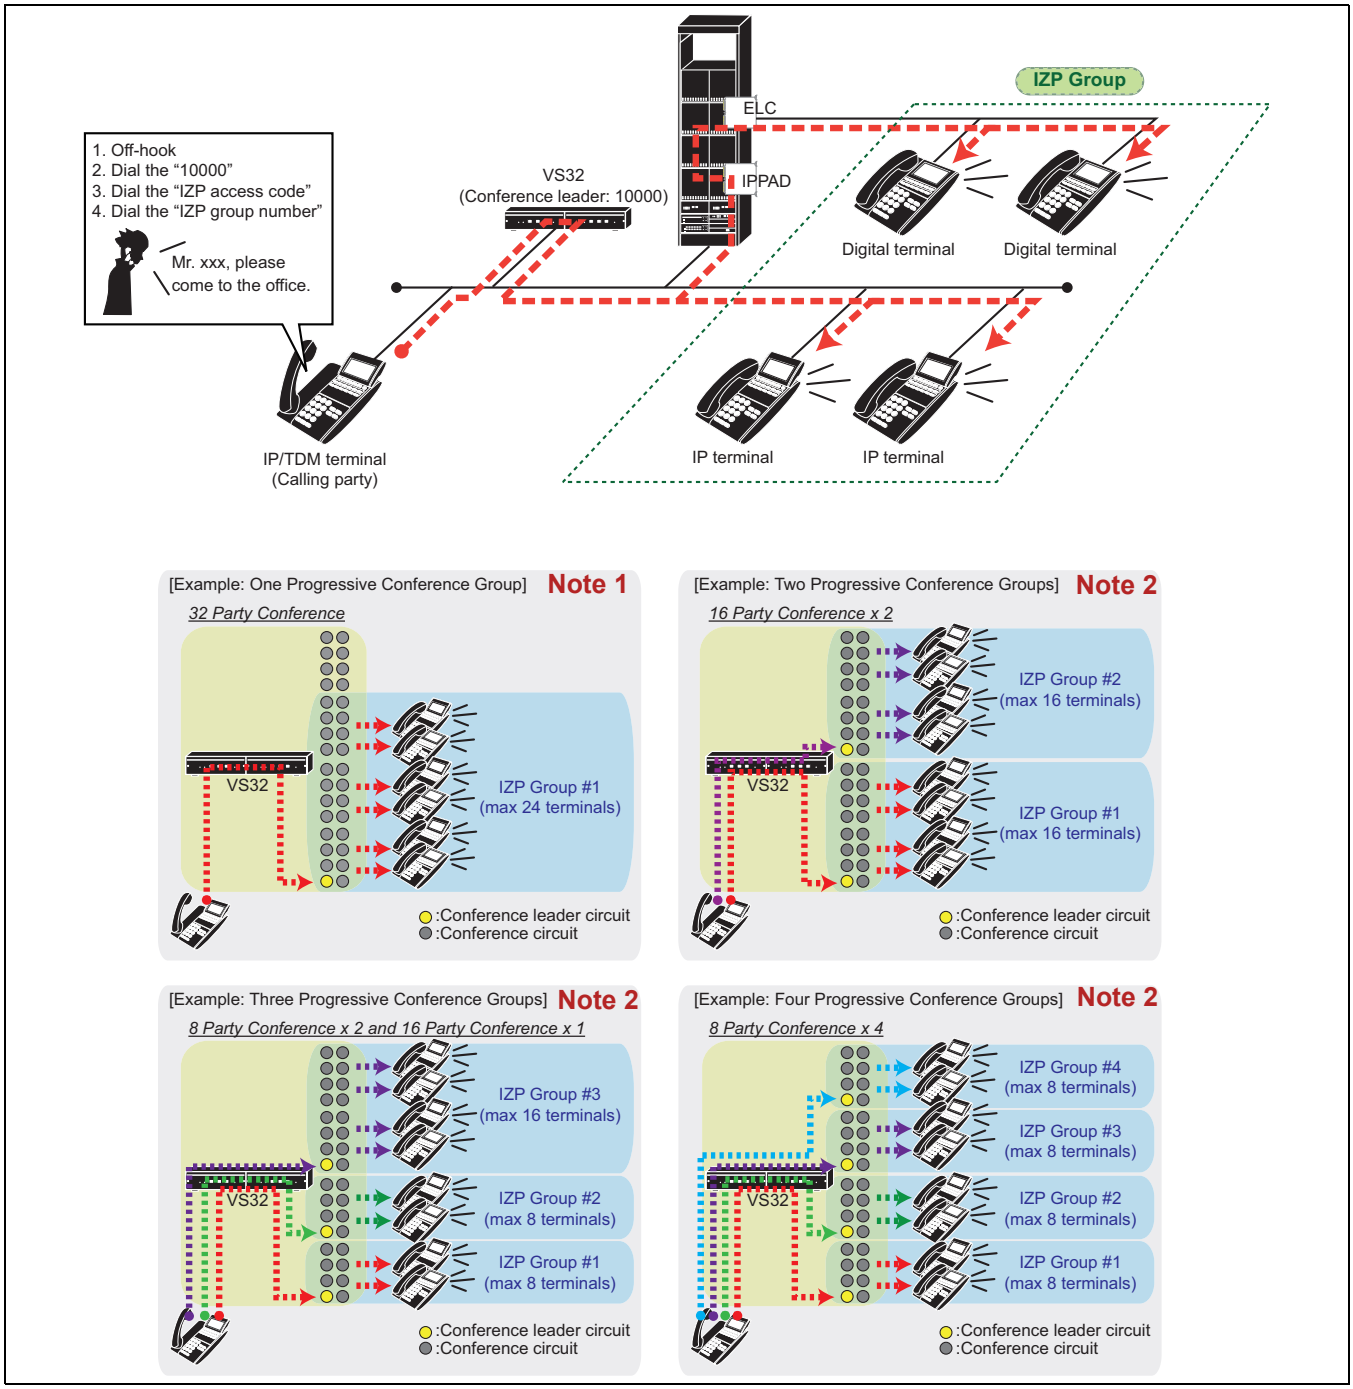
   - Assignment of MAC address of IP Enabled Dterm for LDM by the AMAC command

     Select TELN for TYPE and set a Telephone Number (TELN).

3. When this feature is in service, a MAC address cannot be set by specifying a Physical Station Number (STN) of an IP terminal. Set the MAC address by specifying a Telephone Number (TELN).

<Other Conditions>

None.



Programming

STEP 1: **ASYDL/ASYDN** - System Data 1, Index 1144, Bit 0=1 (Physical Station Number Calling Restriction is in service)

P-89 Progressive Paging - VS32

General Description

This feature uses INTERNAL ZONE PAGING [I-21] in conjunction with the progressive conference feature of VS32 CONFERENCE SERVER [V-26] to provide up to 8, 16 or 24 Desktop terminals in a paging group.

Note 1: When using 32 Party Progressive Conference group with this feature, you are still limited to a maximum of 24 simultaneous voice sessions, regardless if all 32 channels are assigned or not.

Note 2: If you are using multiple VS32 Progressive Conference groups for IZP, the Conference Leader (Pilot Number) of each conference can be assigned in a Hunt Group (separate from the Conferee ports). This allows the calling party to call one Pilot Number and have the PBX hunt for an idle VS32 Progressive Conference; otherwise the calling party must call the Pilot Numbers of each Progressive Conference individually until an idle group is found. Generally the hunt group would consist of Conference Groups of the same size.

Operating Procedure

To originate

1. Lift the handset. Receive Dial Tone.
2. Initiate a call to the Progressive Conference pilot number on the VS32.
3. Dial the IZP Access Code and the IZP Group Number.
4. Announce the call over the built-in speakers on the Desktop terminals in the PROGRESSIVE PAGING - VS32 Group.

To answer

1. Press the Answer Key or the Line Key.
2. If the Line Key was pressed, go off-hook on the handset or press the Speaker key.

Note: The Answer Key can be used if Line Preference Service via AKYD is in service (ASYD Command, System Data 1, Index 79, Bit 0= 1.)

<Conditions for this Feature>

1. Up to a maximum of 24 stations (IP and TDM) are supported in a group.
2. A VS32 can have multiple Progressive Conference groups. Depending on assignment, the maximum number of paged stations may differ (still cannot exceed 24 in one IZP Group). IZP member assignments by the AIZP command may need to be limited to 8/16/24 parties.
3. A two-way call is established on the VS32 after a paging call is answered. All conference ports are occupied until the 2 way call is released and the Conference Leader's extension is released.
4. When Progressive Conference is used, * and # cannot be used as an Access Code for Internal Zone Paging.
5. There must be an IP-PAD channel available for every Digital terminal assigned in an IZP Group or the Conference Leader will hear a busy tone after dialing the IZP Group Number (even if the IP Stations are idle).
6. The VS32 Conference Ports must be assigned to a higher numbered LENS than any of the IP Stations that use this feature. Also, the LENS must be consecutive and normally begins with Level-0 of the Line Group.
7. The My Line and Prime Line must be the same Station Number in AKYD for this feature to operate correctly (for paged stations). Therefore, a TEC-18 or a TEC-3 is not supported as a Prime Line with this feature.

<Interactions with Other Features>

1. All Service Conditions of the progressive conference feature of VS32 CONFERENCE SERVER [V-26] and INTERNAL ZONE PAGING [I-21] are applicable.

2. Do not assign INTERNAL ZONE PAGING – MULTI-ZONE [I-49] when using this feature.
3. This feature is not supported with Off-Hook Suppression (set in the AKYD command, parameter S=1).
4. Headset Mode is not compatible with this feature.
5. Due to the Prime Line and the Off-Hook Suppression limitations, ACD Positions are not supported.
6. Using one VS32 Progressive Conference to add stations belonging to separate Zone Intercom Groups is not supported.
7. Conference Leader port can be a member of a Pilot Hunt Group.
8. The IZP Key from AKYD (FKY85) cannot be used with this feature.

<Hardware/Software>

1. This feature is supported on the VS32 in Proprietary Protocol Mode only.

<Programming Related Conditions>

1. When IP stations are used, assign System Data 1, Index 679, Bit 1= 1 (Multiple Session for SIP Multiple Line Terminals: In Service). After the setting, a re-registration must be performed.
2. The answer method of a paging call is determined by ASYD System Data 1, Index 388, Bit 4.
3. Voice codec of each paging channel must be the same single codec, so paged terminals should accept common codec. Location ID/Codec setting should be considered.
4. Stations belonging to IZP Groups that use this feature must be allowed SFI 145 (Internal Zone Paging Answer) to avoid potential phone lock-ups.
5. The STN registered with the AIVSL command registers a dummy station with a unused extension number to invite the paged extension.

Interactions

When a Station answers a Voice Call using this feature, the call becomes Station-to-Station Connection Status. Accordingly, various hooking services are available.

Programming

Before starting this programming, assign the data for INTERNAL ZONE PAGING [I-21] and the progressive conference feature of VS32 CONFERENCE SERVER [V-26].

STEP 1: **ASYD** - System Data 1, Index 27, Bit 0-3: Tone Kind

Note that the following data is available when SFI 71 = 1 in the ASFC command.

DATA	TONE	DATA	TONE
0	Dial Tone (DT)	8	-
1	Special Dial Tone (SPDT)	9	Sender Transmitting Tone (SDTT)
2	Ringing Back Tone (RBT)	A	Call Waiting Ringing Back Tone (CWRBT)
3	Consecutive Ringing Back Tone (CRBT)	B	-
4	Busy Tone (BT)	C	-
5	Reorder Tone (ROT)	D	-
6	Service Set Tone (SST)	E	-
7	Second Dial Tone (SDT)	F	-

STEP 2: **ASYD** - System Data 1, Index 79, Bit 0: 0/1 = Line Preference Service via AKYD Out of service/In service.
System Data 1, Index 321, Bit 7: 0/1 = Voice Call Chime 4 chime/1 chime.
System Data 1, Index 388, Bit 4: 0/1= Answer the INTERNAL ZONE PAGING call by pressing Prime Line key after going off-hook/by going off-hook.

STEP 3: **ASYDL** - System Data 1, Index 679, Bit 1: 1 (Multiple Session for SIP Multiple Line Terminals: In Service). **Note 3**
System Data 1, Index 804, Bit 3 (Designation of the maximum digit number of INTERNAL ZONE PAGING Group Number) 0/1 = two/three digits.

STEP 4: **ASFC** - Assign the following SFI to the SFC for the VS32 Progressive Conferee Ports:
SFI 32 = 1: Line Circuit Reverse Relay Control
SFI 71 = 1: Distinctive Dial Tone
SFI 72 = 1: Called Station Switch Hook Flash Restriction
SFI 221 = 1: Stop MOH during 8/16/32 Party Conference Calls
SFI 134: IZP Calling (for stations originating an IZP)

Assign the following SFI to the SFC for stations that are to be called (those stations belonging to the IZP Groups):
SFI 145: IZP Answer (for stations answering an IZP via VS32 Progressive Conference).

Assign the following SFI to the SFC for stations that allowed to initiate a VS32 Progressive Conference and also to SFC for the Pilot Number(s) used for the VS32 Progressive Conference:
SFI 134: IZP Calling (for stations originating an IZP).

STEP 5: **AIVSL** - Assign VS32 Conference Server Related Data. **Note 4**

VS-ID: Assign the MAC Address of VS32.
CH: Assign the VS32 Conference Server channel number **Note 5**
KIND: Choose 8-party conference, 16-party conference, or 32-party conference.
CONF KIND = PROGRESSIVE
TN: Tenant number
STN: Station number
LENS: Line equipment numbers
TEC = 2 (indicates PB)
RSC: Assign Route Restriction Class other than ordinary extensions use.
SFC: Assign Service Feature Restriction Class other than ordinary extensions use.

STEP 6: Set the type of Station Hunting for Conference Leader port by using either of the following commands:
ASHP - Set the type of Station Hunting to Pilot.
ASHC - Set the type of Station Hunting to Circular.

STEP 7: **ANPD** - Reserve a Number Level for Feature Access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. Assign NND according to the predetermined Numbering Plan.

STEP 8: **ASPA** - Assign the Access Code for INTERNAL ZONE PAGING, SRV = "SSCA: Service Code Appendix", SIDA = 98. Connection Status Indexes for "N: Normal", and "H: Hooking" services.

STEP 9: **AIZP** - Assign INTERNAL ZONE PAGING Group Data.
IZPG: Assign IZP Group from 1 - 99. **Note 6**
IZPSTN: Enter the TDM Station Numbers and/or IP Station Numbers that are to be called via the VS32 Progressive Conference.

Note 3: Only when IP stations are used. After the setting, a re-registration must be performed.

Note 4: Because SIP mode is not supported, make sure that the box to select SIP mode (Use SIP Data) is unmarked.

Note 5: In the case of 8-party conference, assign the extension number to the VS32 Conference Server channel listed below:
CH#0 (Conference leader port) and CH#1 through #7 (Conferee port).
CH#8 (Conference leader port) and CH#9 through #15 (Conferee port).
CH#16 (Conference leader port) and CH#17 through #23 (Conferee port).
CH#24 (Conference leader port) and CH#25 through #31 (Conferee port).
In the case of 16-party conference, assign the extension number to the VS32 Conference Server channel listed below:
CH#0 (Conference leader port) and CH#1 through #15 (Conferee port).
CH#16 (Conference leader port) and CH#17 through #31 (Conferee port).
In the case of 32-party conference, assign the extension number to the VS32 Conference Server channel listed below:
CH#0 (Conference leader port) and CH#1 through #31 (Conferee port).

Note 6: Generally do not assign Groups1 to 4 because those are used for Multi-Zone Intercom; which is not supported with this feature.

P-90 Preference Setting - Multi-Line Telephone with PCPro

General Description

This feature adds another method for setting preferences on Desktop terminals other than using a combination of the Feature key and some other keys such as the digit keys, the Answer key, and the Originate key on each terminal. Previously, preferences on a Desktop terminal could only be set terminal by terminal, but with this feature, the settings can also be changed/deleted effectively from Telephony Server.

Note: This feature is available since FP95-114 V4 Issue 2.0.

Operating Procedure

None.

Service Conditions

<Important Notices>

1. When preference settings on an operating Desktop terminal are changed or deleted with the ATIFD command, the settings that were assigned to the terminal by a user with a combination of the Feature key and some other keys are overwritten, and the terminal is reset automatically.
2. After setting Desktop terminal preferences with the ATIFD command, execute the MEM_HDD/ MEM_HDD_N command to save the settings as One Touch Speed Calling for DtermIP.

<Interactions with Other Features>

1. To use Dynamic Dial Pad or Preset Dial, System Data assignment is required. For details, see SELECTIVE DIALING [S-162].
2. LOCATION DIVERSITY [L-55] is not supported.

<Hardware/Software>

1. This feature is available on the following Desktop terminals:
   - IP terminals
   - SIP Multiple Line terminals
2. Terminals from DT800/DT700 Series connected to DSS Console should operate under the following conditions:
   a.) The preference settings of a terminal that is paired with DSS Console become effective. Therefore, the settings of this feature to a station number of DSS Console are not used.

Note: When a terminal logs in to a station number of DSS Console, the preference settings of the DSS Console become effective. Therefore, the settings of this feature to a station number of a terminal are not used.

b.) When preference settings assigned to a station number of DSS Console are changed with the ATIFD command, the terminal that is paired with the DSS Console would be reset. LINE BUSY is displayed on the terminal.

<Interactions with Networks>

1. In the FCCS network, it is not possible to list up the data from all nodes at once. The Listup command (LTIFD) operates in the following ways:
   a.) On a Network Control Node, only the data of designated FPC is listed.
   b.) On a Local Node, only the data of self-node is listed.
2. In the FCCS network, login to a Network Control Node is required to register/delete data with Telephone Number (NDM) to a terminal in other node.

<Conditions Specific to This Feature>

1. After preference settings of a terminal are changed with the ATIFD command, if its user adds further changes to the terminal with a combination of the Feature key and some other keys, the settings assigned with the ATIFD command will be overwritten.
2. If preference settings of a Desktop terminal are deleted with the ATIFD command, the terminal goes back to its default state.
3. Any changes made with the ATIFD command are reflected after the resetting of the terminal.
4. Terminals are automatically reset after changing the preference settings with the ATIFD command. Conditions for terminal reset are the same with those for the AKYD command.

   Note: If the ATIFD command is executed to a Desktop terminal which is being used at that moment (originating, speaking, or receiving a My Line call), the terminal is reset after it becomes NOT BUSY.
   Terminals that are being switched to a headset (lamp is ON) are not automatically reset. After assigning the data, reset the terminal manually or use the DISD command.

5. The Feature key + the digit key 4 can change both sending and receiving volume settings of a handset at a time. With the ATIFD command, these volumes must be set separately.
6. Some of the values that can be assigned with the ATIFD command become invalid on some terminals. See the following table for the correspondence of functions and terminals.

X: Valid N: Invalid

Function	Terminal Operation	IP Terminal	SIP Multiple Line Terminal
Sidetone	Feature key + digit key 0	X	X
Microphone	Feature key + digit key 1	X	X
Handset Receiving Volume	Feature key + digit key 2/4	X	X

X: Valid N: Invalid

Function	Terminal Operation	IP Terminal	SIP Multiple Line Terminal
Handset Sending Volume	Feature key + digit key 4	X	X
Ringing Tone	Feature key + digit key 3	X	N
Hands-Free	Feature key + digit key 5/6	X	X
Call Indicator Lamp	Feature key + digit key 7	X	X
Dynamic Dial Pad	Feature key + digit key 8	X	X
Preset Dial	Feature key + digit key 8	X	X
Answer Preset	Feature key + Answer key	X	X
Originate Preset	Feature key + Originate key	X	X

7. If you need to program more than one Desktop terminal, use the QuickPro.

   Note: For details, see 5. Procedures to Create/Register Data, Chapter 7 IP QuickPro of PC-Pro Setup Manual.

8. When a terminal is taken over by a backup node (Geo Redundant Node/Survivable Remote Node/SR-MGC) in a Geographic Redundancy system, the terminal operates with the data that was reflected through office data copy. **Note 1 Note 2**

   Note 1: For details about office data copy, see “Office data copy” in Chapter 7, Operation and maintenance in Geographic Redundancy Configuration Manual.

   Note 2: It is possible to change the settings with the ATIFD command from a PCPro that logged in to a backup node.

<Conditions Specific to UMGi System>

There are the following conditions for UMGi system.

1. Operate from a PCPro that logged in to CCN. This feature is not available from a PCPro that logged in to an RN.
2. CCN manages preference settings that are changed with the ATIFD command or with operations conducted from a terminal that is accommodated in an RN in the normal mode.
   To retain the settings, execute the MEM_HDD command from a PCPro that logged in to CCN, and select One Touch Speed Calling for DtermIP and save.
3. Using the ATIFD command to change preference settings of terminals that are accommodated in RNs is available only when they are in the normal mode. **Note 1**

   Note 1: CCN can set preference settings on terminals accommodated in an RN that is in the survival mode, but the settings are not reflected to the terminals until they register to the RN operating in the normal mode.

4. It is possible to change preference settings from a terminal accommodated in an RN that is in the survival mode. However if the RN changes from the survival mode to the normal mode, and the terminal re-registers to the system, the preference settings go back to the state that CCN retains (the state before RN changed to the survival mode, or the state that was set with the ATIFD command whilst in the survival mode.)

<Other Conditions>

None.

Programming

STEP 1: **ATIFD** - Assignment of Individual Function Data for Terminal
Assign individual function data to a terminal.

(a) In the case where a station number is to be selected:

Station Number Type: STN (Station Number)
TN: Tenant Number (1-63)
STN: Station Number (Up to 6 digits)

[Function List]
Sidetone: 0/1=ON (Default)/OFF
Microphone: 0/1=OFF (Default)/ON
Handset Receiving Volume: 0/1=Small (Default)/Large
Handset Sending Volume: 0/1=Small (Default)/Large
Ringing Tone: 1-10=Ringing Tone 1(Default), Ringing Tone 2-10
Hands-Free: 0/1=OFF (Default)/ON **Note 1**
Call Indicator Lamp: 0/1=ON (Default)/OFF
Dynamic Dial Pad: 0/1=OFF (Default)/ON **Note 2**
Preset Dial: 0/1=OFF (Default)/ON **Note 3**
Answer Preset: 0/1=OFF (Default)/ON
Originate Preset: 0/1=OFF (Default)/ON

(b) In the case where a telephone number (LDM) is to be selected:

Station Number Type: TELN (LDM)
UGN: User Group Number
TELN: Telephone Number (16 digits maximum)
TN: Tenant Number (Display only)
STN: Station Number (Display only)

[Function List]

Sidetone: 0/1=ON (Default)/OFF
Microphone: 0/1=OFF (Default)/ON
Handset Receiving Volume: 0/1=Small (Default)/Large
Handset Sending Volume: 0/1=Small (Default)/Large
Ringing Tone: 1-10=Ringing Tone 1(Default), Ringing Tone 2-10
Hands-Free: 0/1=OFF/ON **Note 1**
Call Indicator Lamp: 0/1=ON (Default)/OFF
Dynamic Dial Pad: 0/1=OFF (Default)/ON **Note 2**
Preset Dial: 0/1=OFF (Default)/ON **Note 3**
Answer Preset: 0/1=OFF (Default)/ON
Originate Preset: 0/1=OFF (Default)/ON

(c) In the case where a telephone number (NDM) is to be selected:

Station Number Type:	TELN (NDM)
UGN:	User Group Number
TELN:	Telephone Number (16 digits maximum)
FPC:	Fusion Point Code (Display only)
TN:	Tenant Number (Display only)
STN:	Station Number (Display only)

[Function List]

Sidetone: 0/1=ON (Default)/OFF
Microphone: 0/1=OFF (Default)/ON
Handset Receiving Volume: 0/1=Small (Default)/Large
Handset Sending Volume: 0/1=Small (Default)/Large
Ringing Tone: 1-10=Ringing Tone 1(Default), Ringing Tone 2-10
Hands-Free: 0/1=OFF (Default)/ON **Note 1**
Call Indicator Lamp: 0/1=ON (Default)/OFF
Dynamic Dial Pad: 0/1=OFF (Default)/ON **Note 2**
Preset Dial: 0/1=OFF (Default)/ON **Note 3**
Answer Preset: 0/1=OFF (Default)/ON
Originate Preset: 0/1=OFF (Default)/ON

Note 1: To use Hands-Free, set Microphone to 1 (ON).

Note 2: To enable Dynamic Dial Pad, assign System Data (ASYD, SYS1, Index 384, Bit 6=1), and set Preset Dial to 0 (OFF).

Note 3: To enable Preset Dial, assign System Data (ASYD, SYS1, Index 1256, Bit 1=1), and set Dynamic Dial Pad to 0 (OFF).

STEP 2: **MEM_HDD/MEM_HDD_N** - Data Control Between Memory and HDD/Data Control Between Memory and HDD for Fusion Network
Back up the data assigned with the ATIFD command to the hard disk.
Direction Select: Memory to Hard Disk
Data Type Select: One Touch Speed Calling for DtermIP

<To delete the setting>

STEP 1: **ATIFD** - Assignment of Individual Function Data for Terminal
Delete individual function data of a terminal.
STEP 2: **MEM_HDD/MEM_HDD_N** - Data Control Between Memory and HDD/Data Control Between Memory and HDD for Fusion Network
Back up the data assigned with the ATIFD command to the hard disk.
Direction Select: Memory to Hard Disk
Data Type Select: One Touch Speed Calling for DtermIP

Q-9 Quick Transfer VMM
(Series 8800 software feature)

General Description

This feature permits a Desktop terminal or Attendant Console to quickly transfers a call to another station's call Forwarding - Don't Answer destination.

Note: This feature is available in North America only.

Operating Procedure

To quickly transfer a call to another Station's Call Forwarding - Don't Answer destination from a Dterm:

1. Receive a call and answer.
2. Press the TRANSFER key. Dial the second telephone number.
3. Receive Ringback Tone and press the CALL REDIRECT key.
4. The second telephone stops ringing and the call is forwarded to its Call Forwarding - Don't Answer destination. If the destination is VMM, the call is forwarded to its VMM.

To quickly originate a call to another Station's Call Forwarding - Don't Answer destination from a Dterm:

1. Dial the Station Number.
2. Receive Ringback Tone and press the CALL REDIRECT key.
3. The second telephone stops ringing and the call is forwarded to its Call Forwarding - Don't Answer destination. If the destination is VMM, the call is forwarded to its VMM.

To quickly transfer a call to a Station's Call Forwarding - Don't Answer destination from an Attendant Console:

1. Receive a call and answer.
2. Dial the second telephone number.
3. Receive Ringback Tone and press the START key.
4. The second telephone stops ringing and the call is forwarded to its Call Forwarding - Don't Answer destination. If the destination is VMM, the call is forwarded to its VMM.

Service Conditions

1. Quick transfer VMM can be performed by a Dterm or a Attendant Console.
2. Refer to the service conditions and limitations of CALL REDIRECT [C-173].
3. This feature also works for multiple hop Call Forwarding - Don't Answers.
   a.) The Quick Transfer VMM key must be pressed for each multiple forward.
4. Quick Transfer VMM does not support a direct call from an Attendant Console to a Station and then using Quick Transfer VMM.
   a.) For the Attendant Console to use Quick Transfer VMM it must have a held party.
5. This feature uses the normal Call Forwarding - Don't Answer call processing for a call when the Function key is pressed.
   a.) If the call would not forward after the timer was completed it will not forward for Quick Transfer VMM either.
   b.) Refer to CALL FORWARDING - DON'T ANSWER [C-3], CALL FORWARDING DON'T ANSWER - OUTSIDE [C-74] for service conditions and limitations.

Programming

STEP 1: **ASYDL** - System Data 1, Index 803, Bit 5: 0/1 = CFD with hold party is not available for Attendant Console/CFD with hold party is available for Attendant Console

STEP 2: **AKYD** - Assign Call Redirect key.
KYI: 1 FKY: 132

STEP 3: **ADSL** - Assign Call Redirect Soft key.
SKP: 0 SN: 2 FKY: 132

R-2 Remote Access to System

General Description

This feature allows a user Outside the System to access the system via an exchange Network Connection without Attendant or Station assistance. The Outside user may originate calls over any or all of facilities, such as WATS, FX, TIE Line or CCSA.

When a wrong Code is received from a Station/Trunk, detailed information on the unauthorized user is output as System Message [26-M] Toll Fraud Report.

Operating Procedure

To operate, using AUTHORIZATION CODE [A-20]/FORCED ACCOUNT CODE [F-7]

1. Lift the handset. Receive Dial Tone.
2. Dial the Remote Access number to connect to the System. Receive Ringback Tone through public network.
3. If there is an Announcement Service, an announcement will be heard. Receive Dial Tone.
4. Dial the AUTHORIZATION CODE/FORCED ACCOUNT CODE. Receive Dial Tone.
5. Dial the desired Telephone Number. Hear Ringback Tone.
6. The Called Party answers.

To operate without using AUTHORIZATION CODE [A-20] / FORCED ACCOUNT CODE [F-7]

1. Lift the handset. Receive Dial Tone.
2. Dial the Remote Access number to connect to the System. Receive Ringback Tone through the public network.
3. Receive Dial Tone.
4. Dial the desired Telephone Number. Hear Ringback Tone.
5. The Called Party answers.

Service Conditions

1. When a call terminates from a TIE Line, this feature is available by dialing a specific Telephone Number.
2. After a call terminates to AUTOMATED ATTENDANT [A-82], AUTHORIZATION CODE [A-20] and FORCED ACCOUNT CODE [F-7] services are available.
3. AUTHORIZATION CODE [A-20] is predetermined on a system basis. Refer to AUTHORIZATION CODE [A-20] for more information.
4. Announcement Service is not provided when AUTHORIZATION CODE [A-20] service is not available.
5. Until the call is connected to an Announcement Trunk, Ringback Tone is heard.
6. Announcement Trunks are to be used for Single Connections only. Announcement Service is not available when the Announcement Trunks are all busy or are not provided. (The caller receives Dial Tone.)
7. When a call terminates to the Called Station, the following services are available:

CALL FORWARDING - ALL CALLS	[C-5]
CALL FORWARDING - BUSY LINE	[C-2]
UCD	[U-1]
CALL WAITING	

8. The second announcement is not provided to the ISDN Trunk.
9. The announcement is provided for a maximum of 30 seconds. Therefore, the message recording should be completed within 30 seconds.

Interactions

1. When using the Authorization Code in conjunction with REMOTE ACCESS TO SYSTEM [R-2], consider the following points:

   - Authorization Codes will not be recorded in SMDR. System Data 2, Index 3, Bit 5 is the only difference between Forced Account Code and Authorization Code. This Bit determines where the dialed Code will appear in SMDR. When assigned as Authorization Code, those digits will not appear in SMDR for this feature.

   - The FORCED ACCOUNT CODE [F-7] feature is available even when some type of access is restricted by the Authorization Code Restriction option.

   - If you want to set a tandem connection restriction, do not use the ARRC command but use the AATC and ARSC commands, as follows:

     - In the AATC command, define Authorization Code Restriction by setting the ACR option to "Restricted" and specifying Route Restriction Class (RSC).

     - In the ARSC command, assign route restriction information to the Route Restriction Class you specified above.

   - When you set the ACR option to "Allowed," an Authorization Code removes access restrictions on the user, regardless of the setting of the ARSC or ARRC command.

2. The additional step of the ARAC command, for DID Trunks does not eliminate the need for Forced Account Code assignments. In addition, Remote Access to System [R-2] via DID requires the use of Forced Account Codes [F-7].
3. The System recognizes a momentary pressing of the switch hook as a disconnect by the remote party. Therefore, all features activated via a Connection Index of Hooking (H) are not available to the REMOTE ACCESS TO SYSTEM feature user. A remote access user may participate in a feature that requires a switch hook flash generated by an internal Station.
4. STATION MESSAGE DETAIL RECORDING (SMDR) [S-10]-REMOTE ACCESS TO SYSTEM Outgoing Calls are recorded in SMDR. The field in the SMDR report that lists the Calling Station will list the route and Trunk Number.
5. SPEED CALLING SYSTEM [S-3] and SPEED CALLING-STATION/INDIVIDUAL [S-21, 23] may not be accessed via REMOTE ACCESS TO SYSTEM [R-2].
6. If the REMOTE ACCESS TO SYSTEM feature is used to Call Stations internal to the system, allow in ARSC the Incoming Remote Access route to the RSCs of the Station that may be called.
7. See AUTHORIZATION CODES [A-20] for Check/Sum method assignments.

Programming

STEP 1: **ASYD** - System Data 1, Index 43, Bit 0. Is Authorization Code required with REMOTE ACCESS TO SYSTEM? 0/1: Yes/No. If this is assigned as data "1", then no assignment in AATC and AMND is required.

System Data 1, Index 243. Timer Counter of the forced release for a Tandem Connection to the Trunk not providing Answer signal. (Data 00H = 64 seconds.)

System Data 2, Index 3, Bit 5 must be assigned as data "1", FORCED ACCOUNT CODE [F-7].

System Data 1, Index 91, Bits 2 and 3 must be assigned as data "0" (all system messages are output).

System Data 1, Index 435, Bit 4: Enable Toll Fraud Report. 0/1: Out of Service/In Service. Assign data as "1" if 26-M system Message are required.

STEP 2: **AATC** - Define an Authorization Code for a Tenant and determine what type of access is allowed or restricted by the code:

TN: Tenant Number

DC: Authorization Code

ACR: Authorization Code Restriction

Choose "Restricted" or "Allowed" based on application. If you want to keep some functionality access restricted, choose "Restricted" and specify the following parameters:

RSC: Route Restriction Class **Note 1**

SFC: Service Feature Class **Note 1**

The remote access line will be route restricted accordingly. The SFC parameter is not operational.

Note 1: Only available when "Restricted" is chosen for the ACR parameter.

STEP 3: **ARTD** - Assign the Remote Access route as shown below:

Central Office TRUNK:

RT: 1

3-ISGS	:1	4-INSG	:2/3	5-TF	:2	6-TCL	:1	7-L/T	:1
8-RLP	:2	10-SMDR	:0/1	38-FA	:1				

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or MG.

DIRECT INWARD DIAL (WINK START):

RT: 1

3-ISGS	:7	4-INSG	:2/3	5-TF	:2	6-TCL	:1/4	7-L/T	:1
8-RLP	:2	10-SMDR	:0/1	15-LSG	:8	38-FA	:1		

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or MG.

STEP 4: **AMND** - For Tenant 0, assign the Destination Code (DC) as the first digit of all Forced Account Codes and the Maximum Necessary Digits (MND) of the Authorization Code. The MND value will include the digits added by the Check Sum method. (Only required if AATC is assigned.)

STEP 5: **ATRK** - Assign the LENS, Remote Access Trunk Route Number, Trunk Number, and Tenant Number.

STEP 6: **MBTK** - Assign the Make Idle status to the REMOTE ACCESS TO SYSTEM Trunks.

STEP 7: **ACSI** - Assign External Route Number, Trunk Number, and Connection Service Index (CSI) = 5, Remote Access to Node, Incoming DDD Ringdown Trunks are automatically connected as a Remote Access Trunk. They do not use ARAC Access Codes.

STEP 8: **ARAC** - This command is used when a TIE Line or DID line will serve as a Remote Access to the Telephony Server line. A DID Call will pulse into the system with digits that resemble a Station Number. That Station Number is assigned as the REMOTE ACCESS TO SYSTEM Access Code.

STEP 9: **ARRC** - Allow Trunk-to-Trunk Connection between the Remote Access route and to those outgoing routes this feature will access. Assign using ARI-D-RES, Direct Connection.

STEP 10: **ACFR** - Allow the types of Incoming Calls listed in the Call Class Index (CCI) LDN, CCSA, that will be connected to Remote Access. REMOTE ACCESS TO SYSTEM is Transfer Service Feature Index (TSFI) number 7.

STEP 11: **ASTD** - Assign the state translation data: STM = 4, SYS = 0, ST = 1 (Remote Access to System is in Service).

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

STEP 1: **ARTDN** - Assign the Remote Access route as shown below:

Central Office TRUNK:

RT: 1

3-ISGS	:1	4-INSG	:2/3	5-TF	:2	6-TCL	:1	7-L/T	:1
8-RLP	:2	10-SMDR	:0/1	38-FA	:1				

DIRECT INWARD DIAL (WINK START):

RT: 1

3-ISGS	:7	4-INSG	:2/3	5-TF	:2	6-TCL	:1/4	7-L/T	:1
8-RLP	:2	10-SMDR	:0/1	15-LSG	:8	38-FA	:1		

STEP 2: **ARRCN** - Allow Trunk-to-Trunk Connection between the Remote Access route and to those outgoing routes this feature will access. Assign using ARI-D-RES, Direct Connection.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

R-3 Reserve Power

General Description

This feature provides a system with a backup power supply, functioning from a battery source, in the event of a commercial power failure.

Operating Procedure

Power is automatically supplied to the System in the event of a commercial power failure.

Service Conditions

1. Batteries should be installed separate from the System.
2. Batteries and chargers are not NEC supplied.
3. No interruption of the System operation will occur during switch-over from commercial to battery power.
4. Duration of battery operation is a direct function of the capacity of batteries equipped.

Programming

No programming is required.

R-4 Restriction from Outgoing Calls

General Description

This feature automatically denies preselected Station Lines within the System the ability to place Outgoing Calls and/or certain miscellaneous Trunk Calls without Attendant assistance.

Operating Procedure

Operation is fully automatic that the restricted Stations will receive Reorder Tone upon attempting to place a restricted call.

Service Conditions

1. This feature is programmable via System Data programming from the PCPro.
2. Non-restricted Stations within the system can CALL TRANSFER - ALL CALLS [C-11] Outgoing Calls to the Stations restricted by this feature.
3. Only the Attendant can permit the restricted Stations to place Outgoing Calls via either of the following features:

   PASSING DIAL TONE [P-2]
   NON-DELAY OPERATION [N-3]
4. Refer to CLASS OF SERVICE - INDIVIDUAL [C-15] and DAY/NIGHT CLASS OF SERVICE [D-15] for further details.
5. Station Line access to a given Trunk Group is controlled by assigning a Route Restriction Class (RSC) to each line. There can be a maximum of 15 different RSCs (RSC1 - 15) per system, each of which can be programmed to restrict an assigned Station from none, one, or more than one Trunk Group.
6. Two outgoing Trunk Group restriction tables are provided per system. The Direct Dial Access table is indexed when a Station user dials the Trunk Group Access Code and the ATTENDANT CONSOLE [A-3] table is indexed on Attendant completed calls. The restriction options per RSC can differ per table, thus, allowing Attendant completion of Outgoing Calls for the restricted Stations.
7. CALL TRANSFER - ALL CALLS [C-11]: If a restricted Station user calls another Station, the Called Station cannot use the Call Transfer feature to connect the Calling Station to a Trunk Group to which the Calling Station is restricted from Outgoing Calls. If transfer is attempted, the controlling Station is recalled.
8. TIE LINE ACCESS [T-3]: If the Station user accesses a TIE Trunk to a distant Office, access to the public exchange network can only be controlled by the distant Office.
9. THREE-WAY CALLING [T-2]: If a restricted Station user calls another Station, the Called Station cannot add-on an Outside exchange party via a Trunk Group in which the Calling Station is restricted from Outgoing Calls. An attempt to add-on (SHF) will be ignored.
10. NIGHT SERVICE: Restrictions can be changed for a given Station when the system is switched to the night mode of operation.

Interactions

1. Transferring restrictions may not be desired for a restricted Station.
2. CALL TRANSFER-ALL CALLS [C-11]: Station A is allowed access to outgoing on Route 1. Station B is restricted access for outgoing on Route 1 via RRIs 2 and 3. The unrestricted Station A makes an Outgoing Call on route 1 and cannot use the CALL TRANSFER-ALL CALLS feature to connect Station B to Route 1. If CALL TRANSFER-ALL CALLS is attempted, Station A is immediately recalled.
3. CONSULTATION HOLD [C-17]: Station A may consult with Station B when Route 1 is on Soft Hold.
4. THREE-WAY CALLING [T-2]: Station A cannot include restricted Station B in a Tree-Way Calling Connection with Route 1.
5. DAY/NIGHT CLASS OF SERVICE [D-15]: Restricted Station B may be allowed access to Route 1 when the system is placed in the NIGHT mode. See DAY/NIGHT CLASS OF SERVICE [D-15].
6. RESTRICTION FROM OUTGOING CALLS are constructed on a per-route restriction basis. Two Route Restriction Indexes are constructed: RRI 2, Outgoing Calls via the Attendant Console and RRI 3, Outgoing Calls via Direct Dial Access.

Programming

STEP 1: **ASYD** - System Data 1, Index 75. Should the following commands be developed for Day/Night? 0/1: No/Yes.

Bit 0- Develop ARSC command for Day/Night?

Bit 3- Develop ATDP command for Day/Night?

System Data 2, Index 1, Bits 4 and 5. Should a Toll-Restricted Station be routed to the Attendant Console or receive Reorder Tone?

Reorder Tone: Bit 4 = “0”, Bit 5 = “0”.

Attendant Console: Bit 4 = “0”, Bit 5 = “0”.

STEP 2: **ARSC** - Sixteen different Route Restriction Classes may be constructed to either allow, deny, or toll restrict access to the various routes of the system. Assign the RSC using Route Restriction Indexes 2 (outgoing via the Attendant Console) and 3 (Outgoing Direct).

STEP 3: **ASDT** - Assign Tenant Number, Station Number, LENS, and the Telephone Equipment Class (TEC) to the Station. This is used in regular Business systems. The Service Feature Restriction Class (SFC) and Route Restriction Class (RSC) are also assigned to the telephone.

TN: Tenant Number
STN: Station Number
LENS: Line Equipment Numbers (6 digits)
TEC: Telephone Class (1-31)
1: DP (10 PPS)
2: PB
3: DP/PB
12: Dterm
13: Data terminal Via Dterm
14: Hotline
15: CAS Line
16: Data Terminal Via Data Module
18: Virtual Circuit
23: ISDN Terminal
27: Eight Conference Equipment
RSC: Route Restriction Class (0-15) for assignment of RSC, ARSC command.
SFC: Service Feature Restriction Class (0-15) for assignment of SFC, ASFC command.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

ARSCN - Sixteen different Route Restriction Classes may be constructed to either allow, deny, or toll restrict access to the various routes of the system. Assign the RSC using Route Restriction Indexes 2 (outgoing via the Attendant Console) and 3 (Outgoing Direct).

R-5 Rotary Dial Calling

General Description

This feature permits Station users to originate calls over rotary or pushbutton lines using Rotary Dial telephones.

Operating Procedure

Users dial rotary telephones in the normal fashion.

Service Conditions

1. Rotary Dial telephones installed should be Industry Standard 10 PPS instruments.
2. Pushbutton instruments may be used in conjunction with ROTARY DIAL CALLING.
3. It is possible to provide only the ATTENDANT CONSOLE [A-3] with Pushbutton Calling, while all other Stations are assigned ROTARY DIAL CALLING. Refer to PUSHBUTTON CALLING - ATTENDANT ONLY [P-5] for further details.
4. If ROTARY DIAL CALLING is assigned to a line, only Rotary Dial sets can be used on that line.
5. POWER FAILURE TRANSFER [P-3]: Rotary Dial telephones must be used as POWER FAILURE TRANSFER [P-3] Stations if the serving central office facility is not arranged for Pushbutton Calling. A Ground Start button on the Station set is required if the central office facility uses Ground Start signaling.

Interactions

1. Rotary-to-Pushbutton conversion may be accomplished by assigning data “2” for CDN 2:ONSG in ARTD; or assigning data “1” in ASYD, System Data 2, Index 1, Bit 0, and assigning CDN 2:ONSG as data “3”, DP/PB.
2. See UNIVERSAL SENDER [U-3] for Sender programming.
3. ROTARY DIAL CALLING may be accomplished via an extension of PUSH-BUTTON CALLING [P-4] if a Telephone Equipment Class of 3 has been programmed.
4. The * or # symbols cannot be used as feature activation codes with ROTARY DIAL CALLING.
5. The Originating Registers Trunks (Route 902) can accept both rotary and Pushbutton Signals (a separate Register Group is not required).

Programming

STEP 1: **ASYD** - System Data 2, Index 2, Bit 0. Sender Signal for Station is DP only/PB? 0/1: DP only/PB only. This Bit is operative only when ARTD CDN 2:ONSG is assigned as data "3", DP/PB. Assign data "0".

STEP 2: **ASDT** - Assign Single Line Stations a Telephone Equipment Class (TEC) as rotary (DP) TEC = 1; or dial pulse/pushbutton (DP/PB), TEC = 3. Dterm sets are always pushbutton.

STEP 3: **ATRK** - Assign Originating Register Trunks (ORT) to the system in a quantity calculated from expected traffic. Registers are located on Levels 0-3 of any 8RST circuit card.

Also, senders must be assigned to the system in a quantity calculated from expected traffic. Senders are located on Levels 4-7 of any 8RST circuit card.

RT: Route Number

Trunk Route Number

Intra-office Route Number (901-931)

901 - ATT	912 - ORT for ATT
902 - ORT	913 - TCFT for ATT
903 - IRT	915 - Night ATT
905 - Sender	916 - MFCR
909 - DCFT	917 - MFCS
	919 to 926 - Modem

TK: Trunk Number

TN: Tenant Number

RSC: Route Restriction Class

SFC: Service Feature Restriction Class

STEP 4: **ARTD** - Routes must be assigned as either PB, DP, or DP/PB. Flag CDN 2:ONSG as data "1", DP, or data "3", DP/PB.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or MG.

R-6 Route Advance

General Description

This feature automatically routes Outgoing Calls over alternate facilities when the first-choice Trunk Group is busy. User selects the first-choice route by dialing the corresponding Access Code, and the equipment then advances through Alternate Trunk Groups only if the first choice is busy.

Operating Procedure

No manual operation is required.

Service Conditions

1. No indication is provided to a Station user as to whether the call is routed over first-choice or subsequent choice facilities.
2. STATION MESSAGE DETAIL RECORDING SYSTEM [S-10] may be used in conjunction with this feature.
3. Only Trunks of the same type may be programmed for ROUTE ADVANCE.
4. Careful consideration should be given to the use of FX Trunks as an alternate facility. These lines require outpulsing of digits for long distance which the user may not dial, because he will not know he is connected to such a facility.
5. The maximum number of routes to be included in a single Route Advance Group is 15.
6. The total number of routes that can be contained in all ROUTE ADVANCE Groups is 31.
7. The same route can be included in two or more Alternative Groups.
8. The maximum number of Trunks to be included in a route is 255.
9. No Code conversion capability is provided with ROUTE ADVANCE; therefore, the exact digits (after the Access Code) the user dials will be sent over the selected Trunk, regardless of the Trunk Group used. The user will not know what Trunk Group is selected; therefore, only those Trunk Groups that accept the same dialing format may be assigned to a given Route Advance Group.
10. ROUTE ADVANCE occurs only when the dialed Code accesses the first-choice Trunk Group in the ROUTE ADVANCE list.
11. In most cases, FX Trunk Groups to a Foreign Numbering Plan Area do not require the dialing of the FNPA Area Code. Therefore, these FX Trunks may not be used in the same ROUTE ADVANCE list with local exchange or WATS Trunks.
12. TIE Lines cannot be assigned to a ROUTE ADVANCE list that includes Central Office, FX, or WATS Trunk Groups.
13. The dialing party may be either a Station Line, ATTENDANT CONSOLE [A-3], or a TIE Trunk Line.
14. When using the FCCS Network, the Outgoing Call using a Trunk in the Remote Node is available. Therefore, Route Restriction class data must be identical in the FCCS Network. For more detailed information, see the Data Programming Manual - FCCS.
15. MG (COT) is not available for OGC/OGCA. For MG (COT), use LCR Access Code.
16. This feature can be activated via MG-SIP128/96/16. When using this feature with MG-SIP128/96/16, see service condition listed in MEDIA GATEWAY SIP [M-111] in this manual and PRI/PRA FAILSAFE ROUTING [P-49/50] in Data Programming Manual - ISDN.

Interactions

1. When OUTGOING TRUNK QUEUING [O-2] is assigned with the ROUTE ADVANCE feature, if all Trunk Groups in one ROUTE ADVANCE list are busy, the call queues on the first-choice Trunk Group. Each time the system checks for an available Trunk, only the first-choice Trunk Group is scanned; if a Trunk is not available, the call remains in queue.
2. TOLL RESTRICTION - 3/6 DIGIT [T-6] may be used in conjunction with ROUTE ADVANCE. Only routes of the same type may be used in ROUTE ADVANCE. Two differently labeled Central Office Trunks, such as, DDD and WATS may be in the same group.
3. There is no digit translation available for this feature. The dialed digits must be usable by whatever route is available.
4. This feature is available for a Station activating CONSULTATION HOLD [C-17]. However, in the following cases, ROUTE ADVANCE is not activated, and the Station user receives Reorder Tone:
   a.) when either the first-choice Trunk Group or Alternate Trunk Group is restricted by TOLL DENIAL [T-6].
   b.) when both the first-choice Trunk Group and Alternate Trunk Group are busy or restricted by TOLL DENIAL [T-6].
5. ROUTE ADVANCE is not activated on PAGING TRANSFER [P-10] or RADIO PAGING [R-16] routes. Therefore, the caller receives Reorder Tone when the first Trunk Group is busy or restricted by TOLL DENIAL [T-6].

Programming

STEP 1: **ASYD** - System Data 1, Index 65, Assign the number of routes that will be used in the system.

STEP 2: **ANPD** - Reserve a Number Level for Trunk Access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. The Number of Necessary Digits should be one or two, depending on Numbering Plan. BLF should be Off.

STEP 3: **ASPA** - Assign the Service SRV = “OGCA: Outgoing Call with route advance”. Assign the Access Code to the lead Route Number to be seized. In the desired order, program the routes to be selected when the first choice route is busy. Count = the total number of routes in the Route Advance Group, including the first-choice route.

STEP 4: **ARSC** - Prepare a Route Restriction Class (RSC) that will allow access to all of the desired routes in the Route Advance Group for RRI 2 and RRI 3. Assign the RSC to the Stations that are allowed to access the Route Advance Group.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

Note: For more detailed information, see the Data Programming Manual - FCCS.

STEP 1: **ASYDL** - System Data 1, Index 800. Assign the Tenant table development.

STEP 2: **ANPDL** - Reserve a Number Level for Trunk Access.

STEP 3: **ASPAL** - Assign SRV = “OGCA: Outgoing Call with route advance” and the Access Code to the lead Logical Route Number to be seized.

STEP 4: **ARSCN** - Assign the RSC to the Stations that are allowed to access the Route Advance Group.

R-16 Radio Paging

General Description

This feature allows Station users dialing access to customer-owned RADIO PAGING equipment and to selectively tone or voice/tone alert individuals carrying pocket RADIO PAGING receivers. The paged party may be connected to the paging party by going to the nearest telephone and dialing a unique Answer-back Code.

Operating Procedure

To page

1. Paging Station user dials the RADIO PAGING Access Code. Receives an acknowledgment tone from the radio equipment.
2. Paging Station user dials the Radio Number of desired party. Receives Ringback Tone from the radio equipment.
3. Paging Station user hangs up and waits for an answer signal.

To answer

- Using OGC Access Code, a paging Station accesses Radio Paging equipment whether or not the automatic answer function is provided. (System Data 1, Index 73, Bit 4 = 1 or 0.)

  1. Paged party dials the RADIO PAGING Answer Code.
  2. Paged party receives Special Dial Tone.
  3. Paged party dials his own individual Radio (beeper) Number.
  4. Paged Station is rung. The paged party receives Ringback Tone.

     Note: This operation is not available when assigning System Data 1, Index 73, Bit 4 = 1. Only Non-Delay operation is available.

  5. Paging Station is connected to the paged party.

- Using LCR/LCRS Access Code, a paging Station accesses Radio Paging equipment providing the automatic answer function. (System Data 1, Index 73, Bit 4 = 1.)

  1. Paged party dials the Paging Station Number/Individual Attendant Number which is displayed on the radio pager (beeper).
  2. Paging Station/Attendant is rung; paged party receives Ringback Tone.
  3. Paging Station/Attendant is connected to paged party.

Service Conditions

1. RADIO PAGING equipment is customer provided; refer to the manufacturer's description for the following specifications:
   a.) types of tones
   b.) capability of receiving individual Radio Numbers
   c.) capability to call the addressed Radio Terminal
   d.) maximum number of Stations that can be assigned individual radio access numbers.
2. A maximum of three digits can be assigned as access and answer codes.
3. The maximum number of digits assigned as individual Radio Numbers is three.
4. ATTENDANT CONSOLE [A-3] Attendants can activate this feature.

5. A Station that has the CALL HOLD [C-6] feature activated cannot use RADIO PAGING.
6. The maximum number of RADIO PAGING answer zones is six.
7. The maximum number of routes that can be assigned RADIO PAGING is six.
8. If the paging Station user has failed to hang up within a predetermined, programmable time interval (after activation), the Paging Connection is forcibly released.
9. If the paged party does not answer within 30 seconds, the System will automatically page that party again. If the paged party does not answer the second page within 30 seconds, the paging request will be canceled from memory. (See VARIABLE TIMING PARAMETERS [V-1]).
10. The following can be used as a paging trunk interface:
    - COT Circuit Cards
    - TLT Circuit Cards
11. Loop signaling is the recommended signaling type.
12. PAGING ACCESS [P-1], PAGING TRANSFER [P-10] and RADIO PAGING [R-16] are provided to the paging Station and the paged Station in FCCS Nodes.
13. When PAGING ACCESS [P-1]/PAGING TRANSFER [P-10]/RADIO PAGING [R-16] service is set to a Station in the Remote Node or the PAGING ACCESS [P-1]/PAGING TRANSFER [P-10]/RADIO PAGING [R-16] Call is answered from the Remote Node via FCCS link:
    a.) the Logical Route Number should be applied to each physical route that is provided the service.
    b.) the restriction of Route-to-Route Connection between FCCS Nodes should be released.
14. The same paging route cannot be used by another Station while the paged Station does not answer the page activated using the route. However, the paging activation is automatically cleared when the call is not answered within a predetermined time.
15. A user can page one Station at a time.
16. When using a FCCS network:
    a.) In case of setting the office data with LDM, a maximum of six routes per node can be provided with paging trunks, however, this service cannot be used between nodes.
    b.) In case of setting the office data with NDM, a maximum of six routes per FCCS network can be provided with paging trunks. Also, in a FCCS network, the maximum number of concurrent paging for PAGING ACCESS [P-1], PAGING TRANSFER [P-10] and RADIO PAGING [R-16] is 20.

Interactions

1. If the range of the radio page transmitter exceeds the physical limits of the System, an Incoming Central Office Call acting as a response to a Radio Page cannot be connected in Loop-to-Loop procedures. The paging party must disconnect, and the Attendant must extend the paged party's Central Office Call.
2. RADIO PAGING and PAGING ACCESS [P-1] can be provided simultaneously in the same system. Separate Access Codes for each feature are required. A RADIO PAGING Answer Code is required for each Radio Paging zone.
3. RADIO PAGING is limited to Stations or Attendant Consoles. Other parties (Central Office Trunk Calls) must have the Attendant or Station user perform the paging operation.
4. The Attendant cannot dial the RADIO PAGING answer codes.
5. BUSY VERIFICATION [B-3], EXECUTIVE RIGHT OF WAY [E-1]: These features will be denied when connected to the Radio Paging route.
6. Radio Page Answer will not follow any hunting on forwarding that the paging Station has set.

Programming

STEP 1: **ASYD** - System Data 1, Index 73, Bit 2. Is the beeper number transmitted via the RADIO PAGING equipment a two or three-digit number? 0/1: two digits/three digits.

System Data 1, Index 73, Bit 4. Radio Paging - Station Number/Individual ATT Number is automatically sent? 0/1: No/Yes.

System Data 1, Index 73, Bit 5. If the paged party doesn't respond, should the system resend the beeper number? 0/1: Yes/No. This also doubles the effective timing in System Data 1, Index 74, Bits 4-7.

System Data 1, Index 74, Bits 4-7. Recall timer for radio page. If the paged party does not respond by the first time out, the paged party is called again and the time out is repeated.

(N + 1) x 30 = Time Out

N = a hexadecimal value set in Bits 4-7.

If the paged party doesn't respond by the same period of time after the second page, the page is canceled.

System Data 1, Index 244, Bit 0. Answer by Radio Paging Answer Code. 0/1: Out/In Service. Note that this Bit is valid when System Data 1, Index 73, Bit 4 is 1 (Station Number/Individual ATT Number is automatically sent).

STEP 2: **ARTD** - Assign the Radio Paging route as shown below:

RT: 1

1-OSGS	: 2	2-ONSG	: 3	5-TF	: 1	6-TCL	: 12	7-L/T	: 1
8-RLP	: 2	9-TQ	: 1	15-LSG	: 0/1				

Note: To change the data for existing route (RT), initialize the circuit card.

STEP 3: **ATRK** - Assign the LENS, Paging Trunk Route Number, Trunk Number, and Tenant Number.

STEP 4: **MBTK** - Assign the Make Idle status to the Paging Trunks.

STEP 5: **ANPD** - Reserve a Level for Trunk Access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. Number of Necessary Digits is usually one or two. Busy Lamp Field is not activated. Reserve a Level for RADIO PAGE Answer and Cancel Codes. Assign for Normal Service (N). Number of Necessary Digits is usually 2. Busy Lamp Field is not activated.

STEP 6: **ASPA** - Assign the RADIO PAGE Access Code. Type of Service, SRV = "OGC: Outgoing Call" or SRV = "LCR: Least Cost Routing" / "LCRS: Register Sender LCR" (available only when ASYD, System Data 1, Index 73, Bit 4 is "1"). Assign the proper Route Number that is associated with this Access Code. Assign for "N: Normal" and "H: Hooking".

Assign the Access Code in the Level reserved in ANPD above. Type of Service, SRV = PAGA (Paging Answer) and SRV = PAGC (Paging Cancel). Assign the proper Route Number that is associated with this route. Assign for a Connection Index of Normal (N).

STEP 7: **AMND** - Assign necessary maximum number of digits for Radio Paging Access and Answer. Note that MND includes the digits of Radio Number. (MND = digits of RADIO PAGING Access/Answer Code + digits of Radio Number)

STEP 8: **ARSC** - Allow RRI: 2 and 3 access to this route for the RSCs assigned to the Stations that will be given access to the paging routes.

STEP 9: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 37 to Stations that will have RADIO PAGING answer capability.

STEP 10: **ASAT** - Assign the Individual Attendant Number, if necessary.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

Note: The current command data shown is set to all Nodes using the service: ASTD, ARTD, ATRK, ASFC

STEP 1: **ALRTN** - This data must be assigned to the NCN. Assign the Logical Route Number to the physical route.

STEP 2: **ANPDN** - This data must be assigned to the NCN. Reserve a Number Level for Service Feature Access and cancel.

STEP 3: **ASPAN** - This data must be assigned to the NCN. Assign the Access Code for Paging Transfer.

STEP 4: **ARSCN** - This data must be assigned to the NCN. Release the restriction between the Announcement Trunk and the Station.

STEP 5: **ARRCN** - This data must be assigned to the NCN. Release the restriction between the terminating Trunk and the Announcement Trunk.

R-20 Restriction from Outgoing Calls - Attendant

General Description

This service permits Attendant Consoles to disable key operation by setting the Night key of each console. When this service is implemented, all origination and termination operations at the relevant Attendant Console will be disabled regardless of whether the system is in Day Mode or Night Mode.

Note: This feature is not available in North America and Australia.

Operating Procedure

To disable key operation of an Attendant Console:

1. Set the Night key of the Attendant Console to ON.

To effectuate key operation of an Attendant Console:

1. Set the Night key of the Attendant Console to OFF.

Service Conditions

1. Implementation of this feature can be selected for each system by the system data.
   When this service is not used, key operation is effective with the Night key set to ON.
2. When this service is implemented, an Attendant Console with the Night key set to ON cannot originate or answer the call even if the system is in Day Mode.

R-23 Reverted Call Metering

General Description

When the Attendant has placed a call requested by a Station to an external (exchange or TIE) line, a display of the Station Number and billing information (Metering Count) is provided on the Console after the call has ended.

Note: This feature is available in Australia only.

Operating Procedure

1. **Reverted Call Service Setting**
   a.) Non-Delay Operation
   - The Attendant answers a call from a Station.
   - The Attendant places a call as requested by the Station user.
   - The Attendant depresses the "RC" (Optional) key after the called distant office answers.

   b.) Delay Operation
   - The Attendant answers a call from a Station.
   - The Station user is released.
   - The Attendant places a call as requested by the Station user.
   - The Attendant calls the Station user after the called distant office answers.
   - The Attendant depresses the "RC" key either before or after the Station user answers.

2. **Answering Reverted Call Recall**
   a.) A reverted call ends and the distant office is released.
   b.) The Attendant depresses either the "SC/RC" (SERIAL CALL RECALL) or the "ANSWER" key when "RC" incoming is indicated.
   c.) When the Attendant answers, the Station Number is indicated in the display area as well as the SRC indication.
   d.) When the Attendant depresses the "DEST" key, the indication changes from "SRC" to "DEST" and the metering count value is displayed in the display area.
   e.) By operating the "SRC/DEST" key, the Attendant has a choice of display between the Station Number and the metering count value.
   f.) The Attendant may use either the "RELEASE" or the "CANCEL" key to be released.

Service Conditions

1. This feature is available in Australia only.
2. This feature is effective only for Outgoing Calls placed to external lines via the Attendant. Note, however, that it cannot be set for a call that is terminated to the Attendant by means of CALL FORWARDING - INTERCEPT/DON'T ANSWER/BUSY LINE [C-18, 3, 2] or RECALL.
3. This service is not effective for Outgoing Calls placed to CCIS line via the Attendant.
4. The feature is actually set when the Attendant presses the "SC/RC" key, that is, after the called distant office answers in the case of NON-DELAY OPERATION [N-3] or the Calling Station answers upon being called back by the Attendant in the case of DELAY OPERATION [D-20].
5. As soon as this feature is set for the call, the established Connection is released from the Loop and all hooking services become effective at the Station.
6. Once this feature is set, it cannot be canceled.

7. In a NON-DELAY OPERATION [N-3], if the Attendant presses the “SC/RC” key before the called distant office answers, RBT is sent to the Calling Station and the ATTENDANT CONSOLE [A-3] enters the idle state.
8. When this feature is set in the manner described in 5 above, if the Calling Station party is released before the Called Party answers, no recall will be made to the Attendant.
9. In a DELAY OPERATION [D-20], if the Attendant presses the “SC/RC” key before the Station answers, RBT is sent to the Called Party at the distant office and the ATTENDANT CONSOLE [A-3] enters the idle state.
10. In a DELAY OPERATION [D-20] performing Non-delay mode service setting, the Attendant is not released from the Loop until the Calling Station answers, provided that the associated System Data is set to “Loop Release” (System Data 2 Index 2 Bit 5 = 1). In this case, the Attendant cannot reenter the Connection before the Station party answers, though the service once set remains.
11. CALL PICK-UP service cannot be used upon answering a call for which the REVERTED CALL METERING [R-23] service is set in the Non-Delay setting mode.
12. CALL FORWARDING-DON'T ANSWER [C-3] cannot be set for any call to which REVERTED CALL METERING [R-23] is set in the Non-Delay setting mode.
13. Recall Incoming Connection is indicated to the Attendant by means of an “SC/RC” lamp and buzzer indication after the distant office is released.
14. Either the “SC/RC” answer key or the “ANSWER” key is used by the Attendant to answer a REVERTED CALL METERING Recall Incoming.
15. REVERTED CALL METERING recall service is performed in the normal way in the event that the system switches from Day mode to Night mode after the service is set.
16. The metering count information is indicated as a number of up to four digits. Any count value exceeding 9999 will be displayed in the overflow indication mode.
17. The metering count value indicates “0” in any of the following circumstances:
    a.) The Calling Station is not granted this billing facility.
    b.) The called office is not granted this billing facility.
    c.) Connection is made over a line to which metering pulses are not sent out.
18. Even if the call is transferred to another Station by the Station party who originally requested the call, the same Station Number remains displayed regardless of the billing system (Total/Separate).
19. In the case of the separate billing system also, the metering count value is the total number of pulses counted.

Programming

STEP 1: **ASYD**

- SYSTEM DATA1

< Index6 >

Bit 6 (ATT CON Key Arrangement Pattern): Assign 2 Hexadecimal.

< Index186 >

Bit 4 (Serial Call-Loop Release): 0/1 = Out/In Service.

- SYSTEM DATA2

< Index15 >

Bit 6-7 (Reverted Call Metering Service): 00/01 = Out/In Service.

Assign 01.

R-27 Route Restriction - Announcement

General Description

This feature permits a Station-originated Call, dialed to a restricted outgoing number, to be automatically routed to a recorded announcement informing the caller that the Dialed Number is restricted. (TOLL RESTRICTION [T-7])

Operating Procedure

No manual operation is required after this feature has been programmed in System Data.

Service Conditions

1. This feature is available when a Station-originated Call encounters a restriction.
2. Access to the announcement of this feature is restricted by MISCELLANEOUS TRUNK RESTRICTION [M-3].
3. The Announcement Machine can be provided on a per Tenant basis.
4. The availability of this service cannot be determined for each Originating Route.
5. TOLL DIVERSION [T-6] takes precedence over this feature.
6. Digital Announcement Trunk (DAT) and the Calling Station must be accommodated in the same Node within the FCCS Network.

Programming

STEP 1: **ASYD** - System Data 2, Index 1, Bit 4, 5. Toll Restriction (disposition of Restricted Call) Assign Bits 4 and 5 as "0".

STEP 2: **AAED** - Equipment type 7 = Outgoing Route Restriction Announcement

Also see ANNOUNCEMENT SERVICE [A-59] for programming of announcement and MISCELLANEOUS TRUNK RESTRICTION [M-3] for Trunk restriction programming.

R-37 RS-464A PAD

General Description

This service is for changing the current PAD control system for the lines and external Trunks to a PAD control system which conforms to the RS-464A specification.

Note: This feature is available in North America only.

The following table outlines the comparison between the current PAD control and the RS-464A PAD control.

Calling Terminal	Called Terminal	RS-464A PAD Control	The Current PAD Control
ONS	ONS	6dB PAD ON	5dB PAD ON
ONS	OPS	3dB PAD ON	PAD OFF (0dB)
OPS	ONS	3dB PAD ON	PAD OFF (0dB)
OPS	OPS	PAD OFF (0dB)	PAD OFF (0dB)
ONS	ATT	6dB PAD ON	PAD OFF (0dB)
OPS	ATT	3dB PAD ON	PAD OFF (0dB)
ONS	Trunk	Data assigned to ARTD, PAD	Data assigned to ARTD, PAD
OPS	Trunk	Data assigned to ARTD, PAD2	Data assigned to ARTD, PAD
ATT	Trunk	Data assigned to ARTD, PAD	Data assigned to ARTD, PAD

Note: ONS: Line interface to On-Premises Line (General Telephone)
OPS: Line interface to Off-Premises Line (Long Line Telephone)

When using the 24CCT/24PRT, APAD and ARTD, PAD 2 are ignored when switch settings are set to ARTD fixed, and PAD patterns 1 and 2 are selectable by switch settings.

Note: In the following tables, -db indicates a decrease in volume Level; +db indicates an increase in volume.

PAD PATTERN 2			PAD PATTERN 2			PAD PATTERN 2		
16 COTBE with SFI 50 = 0			16 COTBE with SFI 50 = 1			16 COTBE with APAD Setting		
ARTD PAD	Transmit PAD	Receive PAD	ARTD PAD 2	Transmit PAD	Receive PAD	APAD Setting	Transmit PAD	Receive PAD
0	0db	0db	0	ARTD	PAD	1	0db	0db
1	0db	0db	1	0db	0db	2	-3db	-3db
2	-3db	-3db	2	-3db	-3db	3	-6db	-6db
3	-6db	-6db	3	-6db	-6db	4	0db	+6db
4	0db	+6db	4	0db	+6db	5	Unused	Unused
5	0db	0db	5	0db	0db	15	Pad Off	Pad Off
6	Unused	Unused	6	Unused	Unused			
7	0db	0db	7	0db	0db			

TLT (DID) with SFI 50 = 0			TLT (DID) with SFI 50 = 1			TLT (DID) with APAD Setting		
ARTD PAD	Transmit PAD	Receive PAD	ARTD PAD 2	Transmit PAD	Receive PAD	APAD Setting	Transmit PAD	Receive PAD
0	0db	0db	0	ARTD	PAD	1	-3db	-3db
1	-3db	-3db	1	-3db	-3db	2	-6db	-6db
2	-6db	-6db	2	-6db	-6db	3	-6db	+6db
3	-6db	+6db	3	-6db	+6db	4	0db	+6db
4	0db	+6db	4	0db	+6db	5	Unused	Unused
5	0db	0db	5	0db	0db	15	Pad Off	Pad Off
6	Unused	Unused	6	Unused	Unused			
7	0db	0db	7	0db	0db			

In 4 Wire E+M Mode, the TLT can set PAD values using switch settings and ARTD and APAD values.

In the following table, P0 and P1 are assigned by setting ARTD to a value of 0, CDN 30:PAD and setting values by using Switch 1 (P0) and Switch 2 (P1). P2 and P3 are assigned by setting ARTD/APAD to a value of 5, and PAD values are set by using Switch 3 positions 1, 2, 3 and 4 (P2) and positions 5, 6, 7 and 8 (P3).

TLT (2W E+M) with SFI 50 = 0			TLT (2W E+M) with SFI 50 = 1			TLT (2W E+M) with APAD Setting		
ARTD PAD	Transmit PAD	Receive PAD	ARTD PAD 2	Transmit PAD	Receive PAD	APAD Setting	Transmit PAD	Receive PAD
0	0db	0db	0	ARTD	PAD	1	-3db	-3db

Operating Procedure

The following Connections are performed:

STATION-TO-STATION CONNECTION
STATION-TO-ATT CONNECTION
CONNECTION VIA ATT
OUTGOING Central Office LINE CONNECTION FROM STATION
OUTGOING Central Office LINE CONNECTION FROM ATT

Service Conditions

1. RS-464A PAD control is performed for lines and external Trunks.
2. ONS (General Telephone) and OPS (Long Line Telephone) are identified by the SFC of the Station concerned.
3. An Attendant Console is regarded as an ONS. The Attendant Console will follow the PAD values assigned in ARTD.
4. If PAD data is assigned by APAD command, this data overrides other PAD data assigned by ARTD.
5. PAD settings for the TLT can be set using ARTD/APAD or a combination of switch settings and ARTD/APAD.
6. This service is used for each of the following Connections:
   STATION-TO-STATION CONNECTION
   STATION-TO-ATT CONNECTION
   CONNECTION VIA ATT
   OUTGOING Central Office LINE CONNECTION FROM STATION
   OUTGOING Central Office LINE CONNECTION FROM ATT
7. If the impedance of the Trunk does not match the impedance setting on the Trunk, the PAD values will not match the values in the previous tables.

Programming

Assignment of Telephone:

STEP 1: **ASDT** - Assign the Station data.

STEP 2: **ASFC** - Assign either ONS or OPS to the SFC of the Station.
SFI = 50, RES: 0/1 = ONS (General Telephone) /OPS (Long Line Telephone)
Stations that have SFI 50 in ASFC set to a 0, will follow the PAD setting in PAD 2 of ARTD.
Stations that have SFI 50 in ASFC set to a 1 will follow the PAD set in PAD 2. PAD 2 settings override the values set in PAD.

STEP 3: **ASYD** - System 1, Index 4, Bit 6 affects Station-to-Station Calls only. (0 = 6dB, 1 = 0dB)

Assignment of External Trunk:

STEP 1: **ARTD** - Assign Route Class Data for the Route Number of the External Trunk.
When assigning Route Class Data, assign PAD control data between ONS and External Trunk to CDN 30:PAD or CDN 32:PAD2.
Assign expansion Route Class Data for the Route Number of the External Trunk.
When assigning expansion Route Class Data, assign PAD control data between OPS and External Trunk to PAD2 (CDN 32).
When PAD 2 is not assigned, the value assigned in PAD will be used.

Note: To change the data for existing route (RT), initialize the circuit card.

STEP 2: **ATRK** - Assign Trunk data of External Trunk.

STEP 3: **MBTK** - Cancel the make-busy of the External Trunk assigning by ATRK.

STEP 4: **APAD** - Assign the PAD control data for Tandem Connection, Station-to-Trunk Connections, and Outgoing/Incoming Connection. When assigning APAD for Station-to-Station Connections, the OGPAD parameter has no effect when assigned (only the ICPAD parameter is used).

R-49 Ringer Mute

General Description

This feature allows a Station user to stop ringing by pressing the associated Feature key on the Desktop terminal.

Note: This feature is not available in Australia.

Operating Procedure

To operate

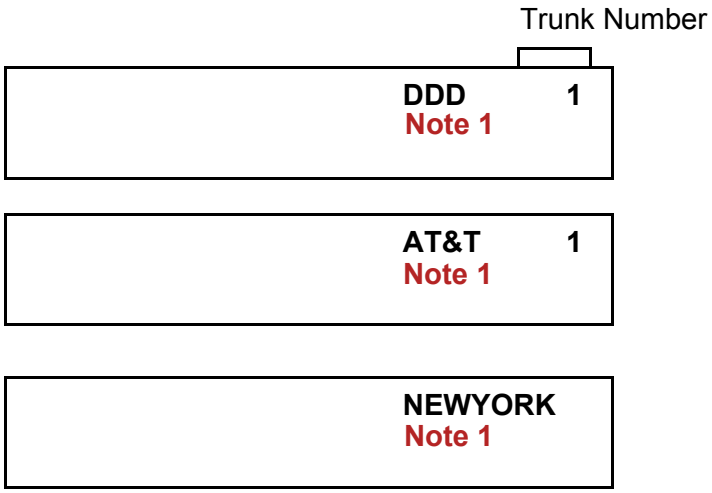
1. The Desktop terminal user presses the RINGER MUTE key. The ringing is muted and the LED of the key lights. RING OFF is displayed for three seconds.
2. The Desktop terminal user presses the RINGER MUTE key again. The ringing is recovered and the LED of the key is turned off. RING ON is displayed for three seconds.

Service Conditions

1. The Feature key for Ringer Mute must be assigned to the Desktop terminal.
2. Ringer Mute which has been set becomes ineffective upon system initialization, individual initialization of LP or initialization of PM.
3. While this service is activated, ringing for Call Back is not provided as well.
4. This service has no effect on the status of DO NOT DISTURB [D-11] service. For example:
   a.) When Do Not Disturb is set, the Station is in the Do Not Disturb status.
   b.) When Ringer Mute is set, the Station is in the Do Not Disturb and Ringer Mute status.
   c.) When Do Not Disturb is reset, the Station is in the Ringer Mute status.
5. When this service is activated, ringing for any call is muted.
6. If a Station user presses the RINGER MUTE key while a call is terminating, ringer for this call will be muted.
7. (Condition for DtermIP) Ringer Mute needs to be set each time the registration of DtermIP is performed. By assigning "1" to ASYDL, SYS 1, Index 824, Bit 0, DtermIP can maintain the Ringer Mute setting even after the Registration.
8. While this service is activated on SIP Multiple Line terminals, a particular tone is generated instead of the ringing for Call Hold and Call Back, etc.
9. The setting of ASYD, SYS1, Index 448, Bit 3 is also available for non-ACD-agent-position Desktop terminals in the Do Not Disturb or Ringer mute mode when receiving a line call.

Programming

STEP 1: **AKYD** - For Desktop terminal sets, RINGER MUTE may be assigned to a programmable Line/Feature key. Assign Type:Function:RING MUTE [117].



STEP 2: **ADSL** - Assign SN = 0 (Idle) and FKY = 117 (Ringer Mute: RG-OF).
This command is used for assigning the function to each Soft key.

R-51 Route Name Display

General Description

This feature allows a user to assign a desired Trunk type for a route by the System Data. The assigned Trunk type (maximum of 4 or 8 digits) is displayed on the upper line of Dterm LCD.

- Four-digit display

- Eight-digit display

Note 1: Trunk type can be changed by System Data.

Operating Procedure

No manual operation is required.

Service Conditions

1. Trunk types are assigned a maximum of 4 or 8 digits (depending on System Data) using ASCII characters.
2. The Trunk type assigned by this feature is not displayed when a call terminates from the ISDN Trunk or when a Station is connected to the call from/to the ISDN Trunk.
3. The Trunk type assigned by this feature is displayed only when a call terminates to a Station or when a Station is connected to the call. In case of the call through a CCIS line, the assigned Trunk type is not displayed. If a Station is connected to the Trunk user through the CCIS, ROM data corresponding to the Trunk Class of the route is displayed. If a Station is connected to a Station belonging to a different office within the CCIS network, the Telephone Number of the opposite Station is displayed.
4. The Trunk type assigned by this feature cannot be displayed at the I-terminal and PCS.
5. This feature is not applicable to the Attendant Console.
6. The current Caller ID Services and Calling Party Number - Name Assignment and Display [C-157] service have priority over this feature.
7. When a call terminates from the Trunk which has been assigned the Central Office line number, the LCD display is as shown below:

- Four-digit display

ABCD: Trunk type assigned by this feature.
123: Trunk Number preassigned.

- Eight-digit display

ABCDEFGH: Trunk type assigned by this feature.

8. This feature is available when the Dterm user presses the call terminating Sub Line. This feature is also available when the user presses the held Sub Line after holding a call using the HOLD Key.
9. For data assignment to each of NDM (Network Data Memory) and LDM (Local Data Memory), different commands can be used. However, the data in NDM has a priority. The logical route must be assigned to NDM, and the physical route must be assigned to LDM.

Programming / FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ASYDL** - System Data 1, Index 512, FPC of the Self Node.
System Data 1, Index 513, LDM usage.
System Data 1, Index 514, NDM usage.

Note: This data is required for the FCCS Network.

STEP 2: **ADRTN/ADRTL** - Assign the Route Name data on a route basis.
LGRT/RT: Logical Route or Physical Route Number
TYPE: A maximum digit for the Route Name data
1/2 = four digits / eight digits
DISP: Displayed Data

Note: When the system is used within an FCCS Network, assign the Logical Route Number via LGRT parameter of ADRTN. When the system is not used within an FCCS Network, assign the Physical Route Number via RT parameter of ADRTL. ADRTN command data has priority over the ADRTL command data. Route Name data programmed by ADRTN is displayed at all FCCS Nodes in the network.

R-54 Remote Call Forwarding Control

General Description

This feature allows a Station user to set/cancel the following forwarding features from the target Station by dialing the identification (ID) Code preset for the forwarding Station.

- CALL FORWARDING - ALL CALLS [C-5]
- CALL FORWARDING - BUSY LINE [C-2]
- CALL FORWARDING - DON'T ANSWER [C-3]
- SPLIT CALL FORWARDING [S-99]

These forwarding features can also be set/canceled from an Outside Station via Central Office/TIE Line.

Operating Procedure

To set Station ID Code of the Forwarding Station

1. Lift the handset. Receive Dial Tone.
2. Dial the Access Code for setting Station ID Code. Receive Special Dial Tone.
3. Dial the desired Station ID Code (a maximum of ten digits). Receive Service Set Tone. **Note 1**, **Note 2**

Note 1: Dial a desired Station ID Code (in the range of 1-10 digits). If the number of digits for Station ID Code is less than 10, dial "#" after the Station ID Code. Dialing "#" implies the completion of Station ID Code.
"#" or "*" can be used as a character which indicate the completion of Station ID Code (according to the setting of system data).

Note 2: When Inter digit timer expires, the dialed number becomes invalid (the user hears ROT).

To cancel Station ID Code of the Forwarding Station

1. Lift the handset. Receive Dial Tone.
2. Dial the Access Code for setting Station ID Code. Receive Special Dial Tone.
3. Dial "#" or "*". Receive Service Set Tone. **Note 3**

Note 3: The system data (ASYDL/ASYDN, Index 895, Bit 4) determines whether to use "#" or "*" as a character which indicates the completion of Station ID Codes.

To set from the Target Station

1. Lift the handset. Receive Dial Tone.
2. Dial the Remote Call Forwarding Control Access Code.

The following shows examples of how Remote Call Forwarding Control Access Code is dialed.

1234: Remote Call Forwarding Control Access Code
5678: Automated Attendant Number/Remote Access Number

- Dial Remote Call Forwarding Control Access Code to forward a call from a party in the same node.

  Example: 1234

- Dial Trunk Access Code for accessing the forwarding node + office code of the forwarding node + Remote Call Forwarding Control Access Code to forward a call from a party in a different node via TIE line

  Example: 8-26-1234

- Access the forwarding system using REMOTE ACCESS TO SYSTEM [R-2]/AUTOMATED ATTENDANT [A-82] and then dial Remote Call Forwarding Control Access Code to forward a call from a party via an analog C.O. line or ISDN line.

  Example 1 (with announcement): 0471-85-5678 → <Announcement (RBT → 2nd DT)> → 1234
  Example 2 (without announcement): 0471-85-5678 → (RBT) → (2nd DT) → 1234

- Access the forwarding system using REMOTE ACCESS TO SYSTEM [R-2]/AUTOMATED ATTENDANT [A-82] and then dial Remote Call Forwarding Control Access Code to forward a call from a party via Dp Channel TIE line, Q-SIG line, or SIP network.

  Example: 8-26-5678 → (RBT) → (2nd DT) → 1234

3. Receive Ringback Tone. About six seconds after, receive Special Dial Tone.
4. Dial the forwarding Station ID Code. Receive Special Dial Tone.
5. Dial the Forwarding Station Number. Receive Dial Tone.
6. Dial the Access Code or press the Feature key for setting the desired forwarding feature. Receive Special Dial Tone.
7. Dial the Target Station Number (A maximum of 12 digits). Receive Service Set Tone.

To cancel from the Forwarding Station

1. Lift the handset. Receive Dial Tone.
2. Dial the Cancel Code or press the Feature key for canceling the forwarding feature. Receive Service Set Tone.

To cancel from the Target Station

(This procedure can also be applied when canceling the forwarding feature which has set at the Forwarding Station.)

1. Lift the handset. Receive Dial Tone.
2. Dial the Remote Call Forwarding Control Access Code.

   The following shows examples of how Remote Call Forwarding Control Access Code is dialed.

   1234: Remote Call Forwarding Control Access Code
   5678: Automated Attendant Number/Remote Access Number

   - Dial Remote Call Forwarding Control Access Code to forward a call from a party in the same node.

     Example: 1234

   - Dial Trunk Access Code for accessing the forwarding node + office code of the forwarding node + Remote Call Forwarding Control Access Code to forward a call from a party in a different node via TIE line

     Example: 8-26-1234

- Access the forwarding system using REMOTE ACCESS TO SYSTEM [R-2]/AUTOMATED ATTENDANT [A-82] and then dial Remote Call Forwarding Control Access Code to forward a call from a party via an analog C.O. line or ISDN line.

  Example 1 (with announcement): 0471-85-5678 → <Announcement (RBT → 2nd DT)> → 1234
  Example 2 (without announcement): 0471-85-5678 → (RBT) → (2nd DT) → 1234

- Access the forwarding system using REMOTE ACCESS TO SYSTEM [R-2]/AUTOMATED ATTENDANT [A-82] and then dial Remote Call Forwarding Control Access Code to forward a call from a party via Dp Channel TIE line, Q-SIG line, or SIP network.

  Example: 8-26-5678 → (RBT) → (2nd DT) → 1234

3. Receive Ringback Tone. About six seconds after, receive Special Dial Tone.
4. Dial the Forwarding Station ID Code. Receive Special Dial Tone.
5. Dial the Forwarding Station Number. Receive Dial Tone.
6. Dial the Cancel Code or press the Feature key for canceling the forwarding feature. Receive Service Set Tone.

Service Conditions

1. ID Code entry is restricted when the button "#" is not pressed as the last digit.
2. When setting a new ID Code, the previous ID Code is automatically erased.
3. The list of ID codes cannot be output.
4. ID Code data is saved by the PCPro command or the routine diagnosis program for saving Call Forwarding data.
5. Each target Station must be a PB (DTMF) telephone.
6. This feature is restricted when:
   - a wrong ID Code is dialed from the Target Station.
   - the forwarding features from the designated Station are restricted by Service Feature Restriction Class.
7. When changing a target Station Number, the former setting must be canceled in advance.
8. When the forwarding Station is in one of the following conditions, this service cannot be activated.
   - Busy
   - Lockout
   - Make Busy
   - Not assigned
   - Logout (IP Station)
9. The target Station must not have any other call placed on hold when setting this feature.
10. When this feature is set from an Outside Station, DID [D-7] Connection is required.
11. This feature can be activated via REMOTE ACCESS TO SYSTEM [R-2] or AUTOMATED ATTENDANT [A-82].

    Note: To forward a call via SIP network, analog C.O.line Dp Channel TIE line, or Q-SIG line, use REMOTE ACCESS TO SYSTEM [R-2]/AUTOMATED ATTENDANT [A-82] to access the system accommodating the forwarding station.
12. This feature can be set from IP Station to IP Station. However the following are not available:
    - from non-IP Station to IP Station
    - from Trunk to IP Station

13. The following shows service conditions concerning Station ID Code.
    a.) Up to 10 digits (0-9) can be dialed as a Station ID Code.
    b.) If the number of digits for Station ID Code is less than 10, dial "#" or "*" after the Station ID Code. Dialing "#" implies the completion of Station ID Code. (**Note 4**) If Inter digit timer expires before dialing "#" or "*", this feature is restricted.

    Note 4: "#" or "*" can be used as a character which indicate the completion of Station ID Code (according to the setting of system data).

    c.) Station ID Codes cannot be displayed or listed by PCPro. Therefore, user needs to manage their Station ID Codes by themselves.
    d.) While CALL FORWARDING I'M HERE is being set, the dialed numbers are not displayed on the terminal (displayed as "****"). However, while Station ID Codes are being set, the user can choose to hide or show them by setting of SFI 137 (ASFC/ASFCN).
    e.) Station ID Codes are shared between this feature and REMOTE CALL FORWARDING CONTROL [R-54]
    f.) Even if User Authentication is enabled (ASFC/ASFCN SFI 243=1), this feature can be set without dialing Station ID Code if no Station ID Code is set in advance.

Programming

STEP 1: **ASYD** - System Data 1, Index 79, Bit 2. Split Call Forwarding.
0/1 = Out/In Service. Assign data "1".

STEP 2: **ASYDL** - System Data 1, Index 895, Bit 4. Determines whether to use **"#"** or **"*"** as a character which indicates the completion of Station ID Codes.
0/1 = "#" is used as a character which indicates the completion of Station ID Codes/"*" is used as a character which indicates the completion of Station ID Codes.

STEP 3: **ARTD** - Assign Route Class Data of the Trunk for SPLIT CALL FORWARDING.
CDN: 68 (SCF) = 1

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as circuit card or MG.

STEP 4: **ANPD** - Reserve Number Levels for each forwarding feature, ID Number Entry Access Code, and REMOTE CALL FORWARDING CONTROL Access Codes. Select Normal Service for Connection Index to each Number Level. Assign NND according to the predetermined Numbering Plan.

STEP 5: **ASPA/ASPAL** -Assign the Access Codes for the following features.

TN: Tenant Number
ACC: Access Code
SRV: "STN: Station Number" (MANUAL ROAMING)
SRV: "SSC: Service Code"
SID: 8 (Split Call Forwarding - All Calls set)
9 (Split Call Forwarding - All Calls cancel)
10 (Split Call Forwarding - Busy Line set)
11 (Split Call Forwarding - Busy Line cancel)

12 (Split Call Forwarding - Don't Answer set)
13 (Split Call Forwarding - Don't Answer cancel)

SRV: "SSCA: Service Code Appendix"

SIDA: 86 (Call Forwarding - All Calls set)
87 (Call Forwarding - Busy Line set)
88 (Call Forwarding - Don't Answer set)
89 (Call Forwarding - All Calls cancel)
90 (Call Forwarding - Busy Line cancel)
91 (Call Forwarding - Don't Answer cancel)
100 (ID Number Entry)

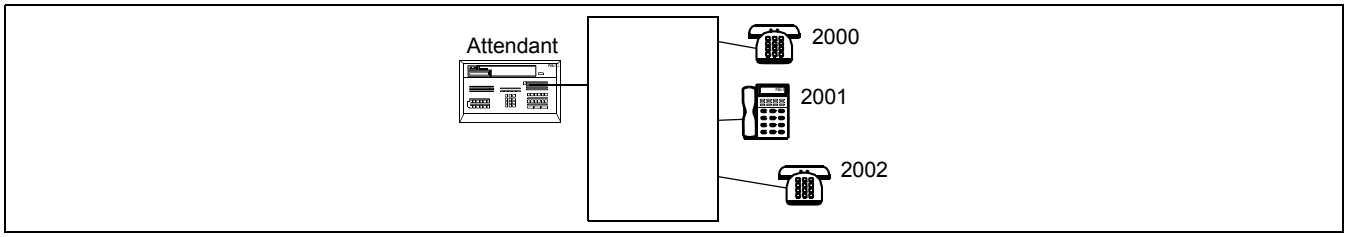
STEP 6: **ARAC** -Assign the REMOTE CALL FORWARDING CONTROL Access Code.

ICTN: Tenant Number of Incoming Trunk
ACC: Access Code (Max. 5 digits)
R/M: M (MANUAL ROAMING)

STEP 7: **ASFC** -Assign a Service Feature Restriction Class that allows the following SFIs to the Stations that will activate REMOTE CALL FORWARDING CONTROL.

SFI: 7 (Call Forwarding - All Calls/Split Call Forwarding - All Calls)
SFI: 8 (Call Forwarding - Busy Line/Split Call Forwarding - Busy Line)
SFI: 9 (Call Forwarding - Don't Answer/Split Call Forwarding - Don't Answer)
SFI: 137 (Authorization Code Display Elimination)
SFI: 143 (ID Number Entry)

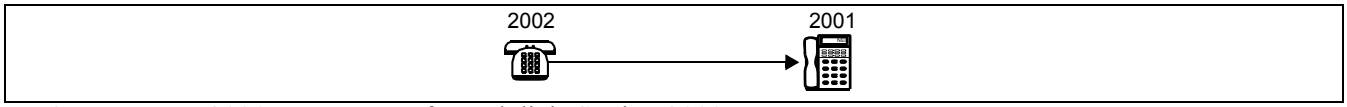
R-55 Remote Call Hold



(Series 8400 software feature)

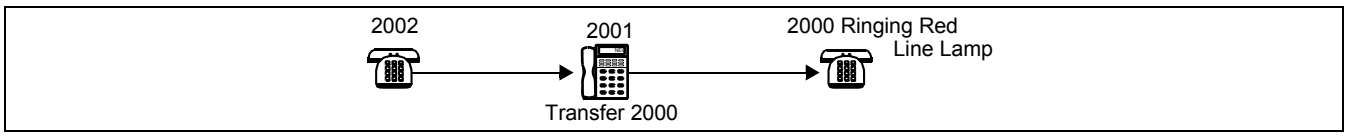
General Description

This feature provides the ability for a Desktop terminal or the Attendant Console to place a call on hold (Remote Hold), at another Desktop terminal or Virtual Extension. The original call that is placed on Remote Hold can be from an Internal Station or Trunk.

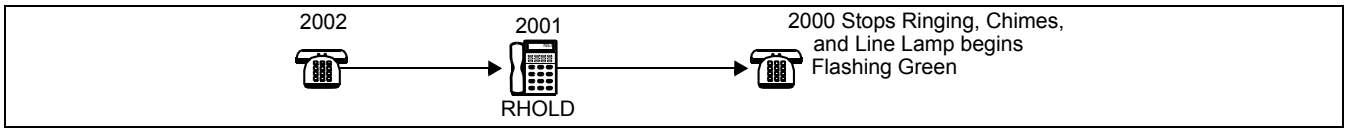


Note: This feature is available in North America only.

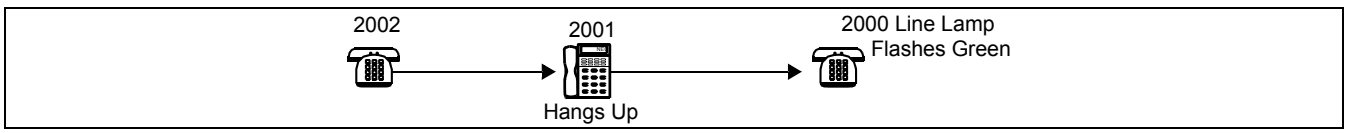
Operating Procedure



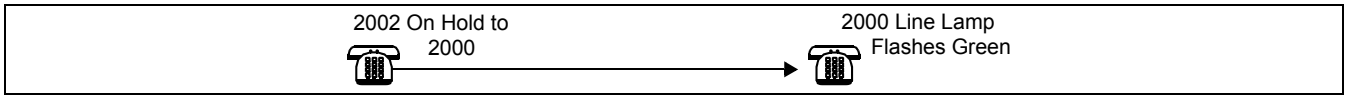
Desktop Terminal Procedure



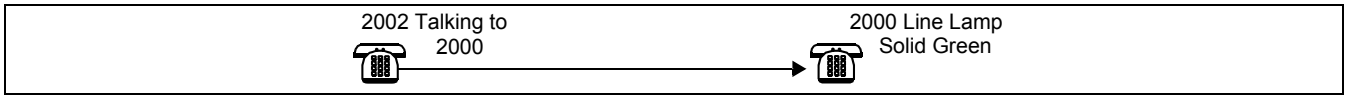
1. Station 2001 receives a call from Station 2002.



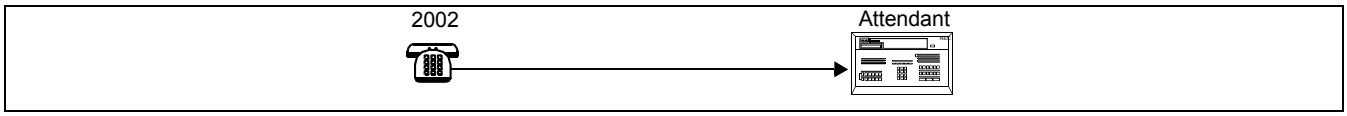
2. User at 2001 presses transfer and dials Station 2000.
3. Station 2000 begins to ring.



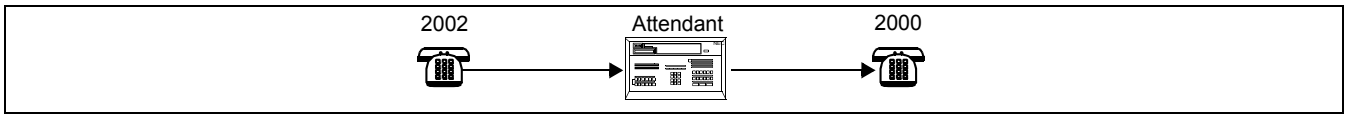
4. User at 2001 presses the REMOTE HOLD Key.



5. Station 2001 receives Service Set Tone and display shows HOLD 2000.
6. Station 2002 is placed in held state to 2000, a chime is sent to 2000 over the speaker, and the line lamp flashes green.
7. Station 2001 releases.

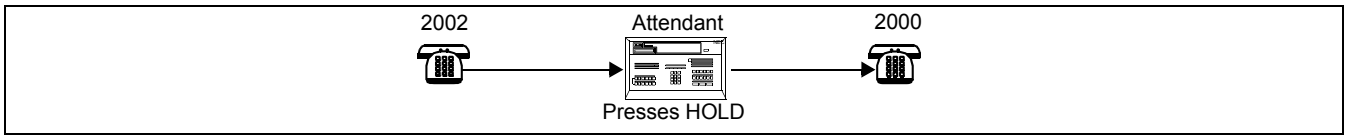


8. User can answer the call on 2000 by pressing the Line Key and going off-hook.

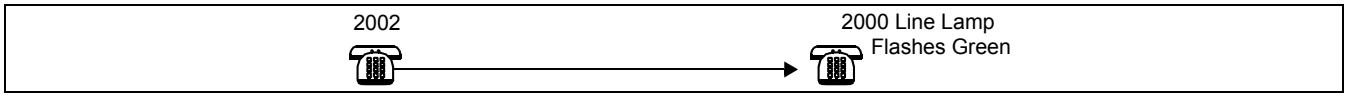


9. Normal line lamp functions now.

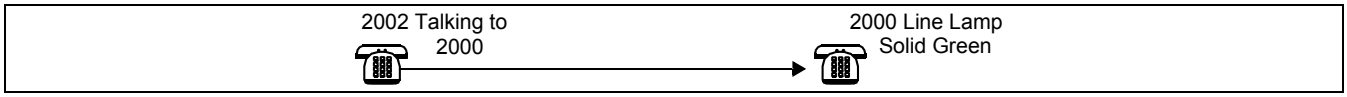
Attendant Console Procedure



1. Attendant Console 0 receives a call from Station 2002.



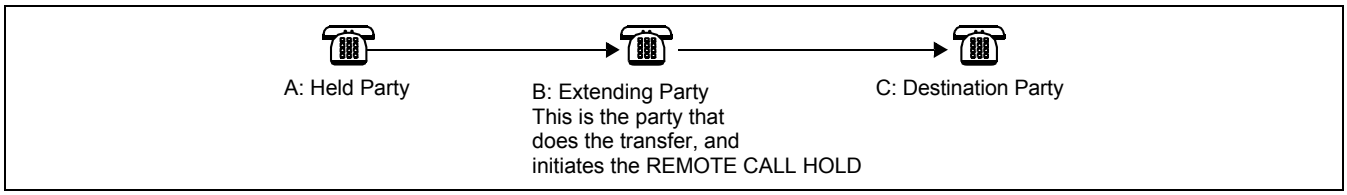
2. Attendant extends the call to 2000 by dialing 2000.



3. Station 2000 begins to ring.
4. Attendant presses the HOLD Key.

5. Station 2002 is placed in held state to Station 2000 and a chime is sent to 2000 over the speaker.
6. Attendant returns to is released and returns to idle state.
7. User can answer the call on 2000 by pressing the Line Key and going off-hook.

Trunk Call Procedure



The Trunk Call procedure is the same as the procedure for the Attendant Console, but the Trunk Party will have no indication of being on hold, other than music on hold, if provided.

Service Conditions

1. The Destination (Target) of this service must be a Desktop terminal (TEC 12) or Virtual (TEC 18) Station. The destination cannot be a Trunk, Wireless Terminal, Attendant Console, Analog Station or any other type of Terminal/Connection.
2. Activation of this feature can only be from a Desktop terminal or the Attendant Console.
3. The Originating Party of the call to the party that will set REMOTE CALL HOLD may be a Station or External Trunk.
4. This feature will be set to the Ringing Party (not the Dialed Party). If Call Forwarding or Station Hunting occur, the call will be placed on hold on the Station that it is currently ringing on, not the originally dialed Station.
5. Remote Call Hold does not function over CCIS.
6. When this service is set by a Desktop terminal (after ASYDL System Data 1, Index 666, Bits 0-6 is set), the REMOTE CALL HOLD's timer will attempt to call the Station that set the feature if the timer expires.
   a.) If that Station is busy or in a state that will not allow the call to return the call, it will continue to hold at the Destination Station. The timer will be reset so the call can attempt another recall after the timer times out again. This will continue until the Calling Party disconnects.
   b.) If the Station that sets this feature is in DND when the Recall Timer expires, the call will override DND and chime the Recalled Party. This is referred to as DND Override on Recall Service.
7. When this service is set by the Attendant Console (after ASYDL System Data 1, Index 665, Bits 0-3 is set), (TC * 8 seconds) the REMOTE CALL HOLD's timer will attempt to call the Attendant Console if the timer expires.
   a.) This timer may be set to a maximum of 120 seconds (two minutes).
   b.) If ASYD System Data 1, Index 177, Bit 7 (Att Multiple Recall Service) = 1 (in service), Trunk Calls that are placed on remote hold from the Console will recall to all Consoles on the NANS Key. When this recall takes place, the call is released from the destination of the REMOTE CALL HOLD. Station Calls will recall to a Loop Key of the Attendant that placed the call on REMOTE CALL HOLD. Attendant Multiple Recall Service is not valid when a Station Call is remote held (these calls will function the same as if ASYD System Data 1, Index 177, Bit 7 = 0).
8. If ASYD System Data 1, Index 177, Bit 7 (Att Multiple Recall Service) is = 0 (out of service), all calls that are placed on REMOTE CALL HOLD will recall on a Loop Key of the Attendant that placed the call on remote hold.
   a.) If the ATT is in Night mode or position busy, the recall will override and ring on a Loop Key.
   b.) If the Destination Station answers the call before the Attendant, the Attendant will be released and the destination is connected to the Held Party.
   c.) This recall can be answered by pressing the corresponding Loop Key.
   d.) The Loop Key on the DESKCON will flash green until the Destination Party answers. When the destination answers, the Loop Key will change to solid green.
   e.) This call will remain on hold to the destination of the Remote Hold, but the line lamp will change from flashing green to flashing red.
   f.) If the Attendant presses the DEST Key, the Calling Party is placed in a Consultation Hold. If the Hold Key is pressed, the call will be placed back on REMOTE CALL HOLD. If the Cancel Key is pressed, the Destination Station becomes idle. If the Release Key is pressed, the call is transferred to the Destination Station with no change in the Destination Stations indication.
   g.) If the SRC Key is pressed, the ATT will be connected back to the Calling Party, with no change in the Destination Station.
9. When this service is activated, an audible chime indication is given to the My Line of the Remote Party, if the Remote Party is talking on a Sub Line, the chime is still sent.

a.) The My Line Lamp of the Held Party flashes green at 240 pulses per minute (ppm).
b.) All other Line Appearances of the LENS associated with the My Line of the Held Party (and on other Desktop terminals), will flash red at 60 ppm. These Line Appearances do not receive the audible chime.
c.) After the call is answered, normal line lamp control will be in place.

10. This feature cannot be used directly with Call Hold Conference.
    a.) The REMOTE CALL HOLD must be answered before it can be used with CALL HOLD CONFERENCE.
11. This feature cannot be used from the Console if Split Hold is in service (ASYD System Data 1, Index 161, Bit 3 = 1). These features are mutually exclusive.
12. This feature is not available from a Night Attendant Console.
13. Usage matrix for REMOTE CALL HOLD:

	A: HELD PARTY	B: EXTENDING PARTY	C: DESTINATION PARTY
ALLOWED	Analog station, Desktop terminal, External trunk (COT, ISDN, TIE Line, CCIS), PHS	Desktop terminal (with RHold key), Attendant	Desktop terminal (TEC 12), Virtual (TEC 18)
NOT ALLOWED	Attendant, ISDN Terminal	Analog station, PHS, ISDN Terminal	Analog station, PHS, ISDN Terminal, Attendant

Programming

Remote Hold Recall Timer for Station
STEP 1: **ASYDL** - System Data 1, Index 666, Bits 0-3 MTC/Bits 4-6 TC/MTC * TC = Timer Data

Remote Hold Recall Timer for Attendant
STEP 1: **ASYDL** - System Data 1, Index 665, Bits 0-3 MTC/eight seconds * MTC = Timer Data
STEP 2: **AKYD** - Assign Feature Key RHOLD [133] to a Function Key.
STEP 3: **ADSL** - Assign Feature Key RHOLD [133] to Soft Key Pattern for State 15.

R-57D Ringing Line Pickup -D

General Description

This feature allows Desktop terminal users to answer Incoming Calls to a Sub Line by going Off-Hook or pressing Answer Key. Line Preference data is to be set through PCPro (AKYD).

Operating Procedure

To set Answer pre-Setting Mode

1. Press FEATURE Key.
2. Press ANSWER Key.
3. ANSWER Key lights red.

To cancel Answer pre-Setting Mode

1. Press FEATURE Key.
2. Press ANSWER Key.
3. ANSWER Key is extinguished.

Service Conditions

1. This feature is available for Desktop terminals.
2. This feature can be activated only when ASYD, System Data 1, Index 79, Bit 0 = 1. Stations must be placed in Answer pre-Setting Mode in advance.
3. When Answer pre-Setting Mode is set, ANSWER Key lights red.
4. When an Incoming Call terminates to Station accommodated in the following circuit cards, ANSWER Key is extinguished (Default) or flashes red according to the System Data setting (ASYD, System Data 1 Index 385, Bit 3).

    - SP-3656 16 ELCJB PROG-E Issue 1A or later **Note 1**
    - SP-3752 16 ELCJB PROG-F Issue 1A or later

    Note 1: (Only for SP-3656 16 ELCJB PROG-E Issue 1A) When Incoming Calls terminate to Station accommodated in this circuit card, ANSWER Key always flashes red.

5. When answering Incoming Calls, ANSWER Key rights green (Default) or red according to the System Data setting (ASYD, System Data 1 Index 385, Bit 0).
6. Line Preference data for each Station is to be set by AKYD.

Programming

STEP 1: **ASYD** - System Data 1, Index 79, Bit 0. Assign as data "1" (Line Preference Service via AKYD 0/1 = Out/In Service).
System Data 1, Index 385, Bit 0. Answer Key Lamp Indication for answering incoming call. 0/1 =Lights Green/Red
System Data 1, Index 385, Bit 3. Answer Key Lamp Indication for call termination. 0/1 = Extinguished/Flash Red

Note: Initialize the ELC circuit card (by flipping its MB key OFF → ON → OFF) for the change to take effect.

STEP 2: **AKYD** - Assign Ringing Line Preference data according to the following parameters.
TN: Tenant Number
STN: Station Number
LN PRE: Line Preference Assign "1" (Line Preference data is to be set according to ANS and ORG.
ANS: Line Preference for Answer Key.
This data is only available in case of LN PRE=1.
0=Incoming Line Preference (in the order of Key arrangement)
1=Incoming Line Preference (in the order of Key arrangement)
2=Ringing Line Preference

R-58 RTP Information Output

This feature consists of the following functions:

- Call/Fault Log Collection

  (a) Call Log Collection

  - A history (includes call time, opponent, IP address, MAC address, and voice quality) per call is collected and output.
  - If a user claims against voice quality, information related to the claims can be extracted from call log to confirm and investigate its cause.

    <For Call Log Filter feature> **Note 1**

    Filtering the call logs on the Telephony Server side, the logs are more specified and help in investigating the cause for claims or fault. The following filters are available:

    - Station Filter Setting
      Output the filtered call logs by using the specified settings such as station number and its type.
    - RTP Warning Tone **Note 2**
      Output the filtered call logs that generated RTP Warning Tone.
    - Received RTP Packet Loss **Note 2**
      Output the filtered call logs of RTP Packet Loss with a count that is greater than or equal to the threshold value.

    Note 1: This feature is available since FP95-114 V4.

    Note 2: These settings are not affected by Station Filter Setting.

  (b) Fault Log Collection

  - When an event such as autonomous reset occurs on terminals, the system outputs reset factor, its time. If it caused due to packet fault, sending/receiving times, and retransmitted times, which will be collected for cause investigation.
  - If a user claims against voice quality, information related to the claims can be extracted from call log to confirm and investigate its cause.

- RTP Warning Tone

  Playback and Cancel of RTP packet communication error tone (hereinafter also called as “RTP warning tone”).

  (a) RTP Warning Tone Playback

  When the RTP packet loss reaching the predetermined threshold and the terminal cannot play back a voice due to delay of the network or packet loss during the conversation, RTP Warning Tone is generated to indicate poor voice quality.

(b) RTP Warning Tone Cancel

RTP Warning Tone can be canceled by assigning the system data. No warning tone is heard in case of RTP packet communication error when it is canceled.

- DTMF Control

Playback and Cancel of DTMF tone sending to the destination party.

- This function can choose whether to send or cancel the DTMF tone sent to the destination terminal during the conversation. More comfortable call is available by canceling the DTMF tone to be heard when the dial pad of opposite party is pressed. DTMF signal tone can be canceled on a system basis.

Call/Fault Log Collection

General Description

This function outputs log information such as the causes of poor voice quality and abnormal status of IP devices. By this feature network administrator can determine the exact cause for the problem. Call/Fault Log Collection function can be output by using SNMP Manager and PCPro.

Operating Procedure

To operate the Call/Fault Log output

1. When SNMP Manager is used
   See SNMP [S-148] in Data Programming Manual - Business.
2. When PCPro is used
   See EVLOG command described in Operations and Maintenance Manual.

To display the Call/Fault Log as system message on PCPro

1. To display the log as system message on PCPro, set ASYDL, SYS1, Index 996, Bit 2=1. For more detailed information about the system messages, refer to system messages described in Operations and Maintenance Manual.

For Terminal Claim Notification:

1. See TERMINAL CLAIM HANDLING [T-65] in Data Programming Manual - Business.

Service Conditions

1. Call Log Collection
   a.) Station Number, IP Address, MAC Address and Location ID are read out from the database of the system. And call time (start and end time), communication opponent, number of received/sent RTP, and number of received RTP NG are read out from the stations.
   b.) To report all of the information collected, connect PCPro to read out data from memory in advance or set destination point for the SNMP Manager in advance.
   c.) When a Station originates a trunk call and abandons the call while it is ringing, the call log information is output. However, if the abandoned call occurs while a Station calls another Station without using a trunk, the call log information is not output.
   d.) Note the following for Call Log Filter:
      (1) This feature is available only when the system data is available (ASYDL, SYS1, Index 999, Bit 3=1 (**Note 3**)) and one or more filtering is set by the ACLFL command.

      Note 3: After enabling this system data, the following are available by using the ACL-FL command:
      - Start/stop the Call Log Collection
      - Enable/disable the SNMP output
      - Configuration of filter settings

      (2) This feature does not work for Fault Log.

(3) Supported IP devices for the each filtering (Station Filter Setting/RTP Warning Tone/ Received RTP Packet Loss) is as follows:

X: Available for the Filter N: Not available for the Filter

IP Device	Station Filter Setting	RTP Warning Tone	Received RTP Packet Loss
IP station (TEC=12)	X	X **Note 4**	X **Note 4**
IP station (except TEC=12)	N	X **Note 4**	X **Note 4**
MG	N	X **Note 4**	X **Note 4**
Other than the above (such as VS-32)	N	X **Note 4**	X **Note 4**

Note 4: For the supported version, see the table of IP Device Call Information Output Feature For Telephony Server.

(4) Station Filter Setting works only for the following IP devices that are set as an IP station (TEC=12) by AISTL command.

Note: SIP Handler controlled SIP terminal is not supported.

(5) The conditions of the filtered log output are as follows:

- Station Filter Setting works for the call log that is sent from an available station to the Telephony Server after the call.
- Both settings of Station Filter Setting and Fault Kind are not affected by each other. When both of them are set by the ACLFL command, each filtered result is output.
- When Call Log Collect is set to START/STOP by the ACLFL command, the call log is not output if the setting is done to a call in progress.
  When Call Log Collect is set to START before the call and filtering data is set on the call by the ACLFL command, the log is output if the filtering condition is suitable.
- When the connection between Telephony Server and IP terminals/devices is disconnected, the log is not output.

(6) When the IP station data for the IP terminal that specified by Station Filter Setting is deleted by the AISTL command, the setting of Station Filter Setting is not available.

(7) As the ACLFL command data synchronizes with some system data in the ASYDL command, this feature does not work if the synchronized system data is changed accidentally by the ASYDL command.

Note: For the synchronized system data, see the ACLFL command in Command Manual.

(8) When making a call with a terminal accommodating Multiple Lines, My Line is used for Station Filter Setting.

(9) LOCATION DIVERSITY [L-55] is not supported with this feature.

(10) When using Geographic Redundancy, note the following conditions for the log output location:
- In spite of Operating mode or Standby mode, the log is output on the node that controls the station.
- When the connection between Telephony Server and IP terminals/equipment is disconnected during the Transition to Operating, the log is not output.

(11) When using UMGi (**Note 5**), note the following conditions for the log output location
- The log that is generated by CCN or RN in normal mode is output on the CCN side.
- The log that is generated by RN in survival mode is not output.
- When the connection between CCN/RN and IP terminals/equipment is disconnected during the normal/survival mode switchover, the log is not output.

Note 5: When using Geographic Redundancy with UMGi, note the following conditions for the log output location:
- The log that is generated by CCN (Operating/Standby mode) is output on the node that controls the station.
- The log that is generated by RN (Normal/Operating mode) is output on the CCN (Operating mode) side.
- The log that is generated by RN (Survival/Operating mode) or RN (Survival/Standby mode) is not output.
- When the connection between CCN/RN and IP terminals/equipment is disconnected during the Transition to Operating, the log is not output.

2. Fault Log Information Collection
   a.) The times of read-out number can be determined such as once a day or certain period of a day.
   b.) The read-out process per terminal is completed within 15 seconds as a default. When several read-out processes are required to proceed in a large amount of information, the maximum of consecutive times can be determined in the system.
   c.) Other than periodical read-out process, a log will be read out when each terminal has registered.
   d.) To report all of the information collected, connect PCPro to read out data from memory in advance or set destination point for the SNMP Manager in advance.
   e.) If a trouble (such as WDT alarm and power failure) that cannot make any log occurs, its fault log cannot be stored as well.

3. Devices supporting Call log and Fault log information collection function are as follows:

Call Log and Fault Log Information Collection

Name of the IP Equipment		Supported firmware version
DT830/DT830G		Ver. 3.0.0.0 or later
DT820		Available since the first version
DT700 Series		Available since the first version
DtermIP	Proprietary Protocol (Including 16LD)	Ver. 02.80 or later
	SIP	Ver. 3.0.0.0 or later
IP Enabled Dterm		Ver. 02.80 or later
DtermIP INASET (240G/320GC)		Ver. 02.80 or later

Name of the IP Equipment		Supported firmware version
Soft Client SP350		Available since the first version
DtermSP30	Proprietary Protocol	Ver. 6.0.0.0 or later
	SIP	Ver. 9.0.0.11 or later

4. When the IP devices send the call log to the Telephony Server, the supported firmware version and each feature activity of IP devices as follows:

IP Device Call Information Output Feature For Telephony Server

X: Applicable N: Not Applicable

IP Device			Supported Firmware Version	Call Log Output	RTP Warning Tone Notification	Received RTP Packet Loss Count Notification
DT830/DT830G			Ver. 3.0.0.0 or later	X	X	X
DT820			Available since the first version	X	X	X
DT700 Series			Available since the first version	X	X	X
IP Enabled Dterm			Ver. 2.82 or later	X	X	X
DtermIP			Ver. 2.81 or later	X	X	X
DtermIP (SIP)			Ver. 3.0.7.0 or later	X	N Note 9	X
Soft Client SP350			Available since the first version	X	X	X
DtermSP30	Proprietary Protocol		Ver. 6.3.0.4 or later	X	X	X
	SIP		Ver. 11.0.0.0 or later	X	N Note 9	X
Analog MC			SP-3753 2AMC PROG-B Issue 12 or later	X	X	X
8LC Card	SCA-8LCA		SP-3893 8MC PROG-A Issue 2 or later	X	X	X
	SCA-8LCC		SP-3893 8MC PROG-B Issue 1 or later	X	X	X
MG (PRI) Card/Box [SCA-24PRIA/MG-24PRIA]		Proprietary Protocol	SP-3884 MG PRI PROG-A Issue 1 or later	X	X	X
		SIP	SP-3884 MG PRI PROG-A Issue 5 or later	X	X	X
MG (PRI) Card/Box [SCA-30PRIA/MG-30PRIA]		Proprietary Protocol	SP-3884 MG PRI PROG-A Issue 1 or later	X	X	X
		SIP	SP-3884 MG PRI PROG-A Issue 5 or later	X	X	X

IP Device			Supported Firmware Version	Call Log Output	RTP Warning Tone Notification	Received RTP Packet Loss Count Notification
MG (BRI) Card/Box [SCA-2BRIA/SCA-2BRIA-B/ MG-2BRIA]		SIP	SP-3826 BRI MG SIP BSC PROG-A Issue 1 or later	X	X	X
MCMG Card [SCA-4LC2COTA]			SP-3778 MCMG PROG-A Issue 8 or later	X	X	X
MCMG Box [MG-4LC2COTA]			SP-3927 MCMG PROG-B Issue 1 or later	X	X	X
MG-COT [SCA-6COTA]			SP-3875 6MGCOT PROG-A Issue 2 or later	X	X	X
MG-COT [SCA-6COTC]			SP-3948 6MGCOT PROG-A Issue 1 or later	X	X	X
MG (SIP)	Software-based MG-SIP **Note 6**		Available since the first version	X	N **Note 9**	X
	MG-SIP128 [MG-128SIPMGL-A] **Note 7**		Available since the first version	X	N **Note 9**	X
	MG-SIP128 [MG-128SIPMGG-B/ MG-128SIPMGG]		Available since the first version	X	N **Note 9**	X
	MG-SIP128 [MG-128SIPMGJ-B/ MG-128SIPMGJ]		Available since the first version	X	N **Note 9**	X
	MG-SIP96		SP-3987 MGSIP PROG-B Issue 3 or later	X	N **Note 9**	X
	MG-SIP16 Card/Box [SCA-16SIPMGA/MG-16SIP-MGA]		Available since the first version	X	N **Note 9**	X
VS32	Software-based VS32	Proprietary Protocol	Available since the first version	X	N **Note 9**	X
	VS-32 (Dual) Card [SCA-VS32VA/MG-VS32VA] VS-32 (Dual) Box [MG-VS32VA]	Proprietary Protocol	SP-3891 CA-VS32 PROG-A Issue 1 or later	X	N **Note 9**	X
		SIP	SP-3891 CA-VS32 PROG-A Issue 3 or later	X	N **Note 9**	X
IPPAD PKG	PA-32IPDA		SP-3835 IPPAD2 PROGRAM-A Issue 3 or later	X	N **Note 9**	X
	PA-32IPDB		SP-3835 IPPAD2 PROGRAM-A Issue 1 or later	X	N **Note 9**	X
	CH-IPDA		Available since the first version	X	N **Note 9**	X
UG50 **Note 8**			Available since the first version	X	X	X
Standard SIP terminal			It depends on the terminal.			

Note 6: For SP-4085, collected data is only voice RTP payload. Video is not supported.

Note 7: Collected data is only voice RTP payload. Video is not supported.

Note 8: Available only for IPG mode in DLC function. Refer to the Peripheral Equipment Description (UG50) for detailed conditions for UG50.

Note 9: Not applicable because the terminal outputs only “0.”

Programming

STEP 1: **ASYDL** - SYS1, Index 996
Bit 0: 0/1=None/Call Log Collection is enabled. **Note 10**
Bit 1: 0/1=None/Call Log SNMP Output is enabled. **Note 10**, **Note 11**, **Note 12**
Bit 2: 0/1=None/Fault Log Output is enabled. **Note 13**
Bit 3: 0/1=Fault Log read-out process immediately after registry is enabled./None
Bit 4: 0/1=Fault Log is read out once a day/periodically
Bit 5: 0/1=None/Fault log is read out periodically.

Note 10: As the filtering is configured by using the ACLFL command if Call Log Filter is enabled, this setting is not required.

Note 11: This is available when SYS1, Index 996, Bit 0=1.

Note 12: When call log is output via SNMP, refer to SNMP [S-148] in Data Programming Manual - Business.

Note 13: A system message containing fault log occurred immediately after registry is output regardless of this bit. To stop the system message output, set SYS1, Index 996, Bit 3=1.

- SYS1, Index 997: Cycle of fault log readout
00H: 30 seconds
01H-FFH: 1-255 (× 15 seconds)

- SYS1, Index 998: A maximum of consecutive times to read out fault log
00H: Eight times
01H-FFH: 1-255 (times)

- SYS1, Index 999: Call Log Filter function **Note 14**
Bit 3: 0/1=Disable/Enable

Note 14: Available since FP95-114 V4. When using Call Log Filter, assign “1” (Enable).

STEP 2: **ACLFL** - Assign Call Log Filter control data according to the following parameters.

Note: Available since FP95-114 V4.

FPC: Input the Fusion Point Code of the target node. **Note 15**

Note 15: This parameter is displayed only when logging in to NCN.

Setting Kind: Select Common Setting or Station Filter Setting.

<Common Setting>
Call Log Collect: Select Stop or Start for Call Log collection.
Output Call Log to SNMP: Call Log is output to SNMP when placing a check mark on this check box to ON. **Note 16**

Note 16: When this parameter is enabled, SNMP configuration is required. For details, refer to SNMP [S-148] in Data Programming Manual - Business.

Fault Kind

RTP Warning Tone: When choosing this check box, Call Log that generated an RTP warning tone is output in spite of Station Filter Setting.

Received RTP Packet Loss: When choosing this check box, Call Log that generated Received RTP Packet loss times over than the specified threshold is output in spite of Station Filter Setting.

Threshold: Specify the times for over the threshold value of Received RTP Packet Loss.

<Station Filtering Setting>

Station Number Type: Select TELN(NDM), TELN(LDM) or STN.

UGN (START/END): Specify the range of user group number. **Note 17**

TELN (START/END): Specify the range of telephone number. **Note 17**

TN (START/END): Specify the range of tenant. **Note 18**

STN (START/END): Specify the range of station number. **Note 18**

Note 17: These parameters are displayed when “TELN(NDM)” or “TELN(LDM)” is selected for Station Number Type.

Note 18: These parameters are displayed when “STN” is selected for Station Number Type.

<Station Data List>

Setting: Select the check box to ON for filtering station.

Note: When filtering for all of getting stations, place a check mark on “All Filter Setting” check box to ON.

RTP Warning Tone

General Description

This function generates an audible alarm when the packet loss rate reaches a threshold value of 20% with a duration of at least three seconds. The alarm, an intermittent dual tone consisting of 770 Hz and 1663 Hz sinusoids (DTMF tone for key B), makes five short beeps (five beeps per second, each with 120 ms duration and a 100 ms pause in between).

Packet loss is checked every one second. If RTP packet loss continues, the Warning Tone will be generated in 10 seconds after the first one.

RTP Packet Loss Alarm

RTP Packet Loss Check Period		1 second
RTP Alarm Conditions	Received RTP Packet Loss Threshold	20% of expected packets
	Reported Packet Loss Interval	3 seconds or more
	Time Between Warning Tone Beeps	10 seconds
Alarm Tone	Alarm Sound Pattern	5 short beeps per second
	Tone Duration	120 ms
	Tone Pause	100 ms

Operating Procedure

No operation is required.

Service Conditions

<Important Notice>

1. RTP warning tone can be played back or canceled by the setting of system data (ASYDL SYS1, Index 831, Bit 5).

   Note: For IP devices such as MG and MC, the setting of system data (ASYDL, SYS1, Index 831, Bit 5) will not be reflected. Therefore, the setting of MG/MC is required. For details, refer to the command section (SET WARNING_TONE) of each MG/MC in Peripheral Equipment Description - IP Devices.

   Note: The setting will be valid for the next call after it is set.

2. To play back or cancel the RTP warning tone can be chosen to follow the system data setting or to follow the setting of the each terminal individually.
   - Automatic: Follow the setting of system data setting (ASYDL, SYS1, Index 831, Bit 5).
   - ON: Play back the RTP warning tone. (Does not follow the setting of the system data)
   - OFF: Does not play back the RTP warning tone (Does not follow the setting of the system data).

   Note: For the setting for each terminal, see the following:
   - DT830 Series
     "RTP Alarm" for Configuration Setup of DT830 Series in Chapter 3 of Peripheral Equipment Description - Multi-Line Telephone
   - DT820 Series
     "RTP Alarm" for Configuration Setup of DT820 Series in Chapter 3 of Peripheral Equipment Description - Multi-Line Telephone
   - DT700 Series
     "RTP Alarm" for Configuration Setup of DT700 Series in Chapter 3 of Peripheral Equipment Description - Multi-Line Telephone
   - DtermIP/IP Enabled Dterm
     "How to Switch DTMF/RTP Alarm ON and OFF" for Configuration Setup of DtermIP/IP Enabled Dterm in Chapter 3 of Peripheral Equipment Description - Multi-Line Telephone
   - DtermIP (SIP)
     "How to Switch DTMF/RTP Alarm ON and OFF" for Configuration Setup of DtermIP (SIP) in Chapter 3 of Peripheral Equipment Description - Multi-Line Telephone
   - Softphone
     The operation manual attached to the Softphone

3. RTP warning tone is generated by DTMF as dial information. When a user is engaged in a call and an opposite party presses any key during the conversation, another tone will be generated by DTMF as dial information. Then, the user might be confused between the RTP warning tone and another DTMF tone. To avoid this, disable the DTMF tone used for RTP warning tone so that the user can distinguish it from the DTMF tones used for other purposes such as dial information. For more information, see " DTMF Control".

<Hardware/Software>

1. The firmware version of terminal needs to support this function to perform it. The playback/cancel of the RTP warning tone depends on terminal when it does not support this function.
2. Terminals/equipment supporting RTP warning tone playback function are as follows:

RTP Warning Tone Playback

Name of the IP Equipment		Supported firmware version
DT830/DT830G		Ver. 3.0.0.0 or later
DT820		Available since the first version
DT700 Series		Available since the first version
DtermIP	Proprietary Protocol	Ver. 2.08 or later
	SIP	Ver. 3.0.0.0 or later
IP Enabled Dterm		Ver. 2.04 or later
Soft Client SP350		Available since the first version
DtermSP30	Proprietary Protocol	Ver. 6.3.0.4 or later
	SIP	Ver. 9.0.0.11 or later
8LC Card [SCA-8LCA] 8LC Card [SCA-8LCA-EMEA] **Note 19**		SP-3893 8MC PROG-A Issue 2
MCMG Card [SCA-4LC2COTA] MCMG Box [MG-4LC2COTA] **Note 19**		SP-3778 MCMG PROG-A Issue 5.0 or later SP-3927 MCMG PROG-B Issue 1.0 or later
MG-T1(SIP) [SCA-24DTIA] **Note 19**		Available since the first version
MG(PRI) Card [SCA-24PRIA] MG(PRI) Box [MG-24PRIA]	Proprietary Protocol	SP-3884 MG PRI PROG-A Issue 1.0 or later
	SIP	SP-3884 MG PRI PROG-A Issue 5.0 or later
MG(PRI) Card [SCA-30PRIA] MG(PRI) Box [MG-30PRIA]	Proprietary Protocol	SP-3884 MG PRI PROG-A Issue 1.0 or later
	SIP	SP-3884 MG PRI PROG-A Issue 5.0 or later
MG(BRI) Card [SCA-2BRIA] MG(BRI) Box [MG-2BRIA] **Note 19**	SIP	SP-3826 BRI MG SIP BSC PROG-A Issue 1.0 or later
UG50 **Note 20**		Any version

Note: DtermIP INASET (240G/320GC), VS32, IPPAD and MG(SIP) do not support “RTP Warning Tone Playback.”

Note: Analog MC is not supported. However, UG50-2MC and UG50-8LC support “RTP Warning Tone Playback.”

Note 19: This function is set “enabled” as default.

Note 20: Refer to the Peripheral Equipment Description (UG50) for detailed conditions for UG50.

3. Terminals/equipment supporting cancel of RTP warning tone function are as follows:

RTP Warning Tone Cancel

Name of the IP Equipment		Supported firmware version Note 21
DT830/DT830G		Ver. 3.0.0.0 or later
DT820		Available since the first version
DT700 Series		Available since the first version
DtermIP	Proprietary Protocol	Ver. 3.00 or later
	SIP	Ver. 3.0.0.0 or later
IP Enabled Dterm		Ver. 3.06 or later
Soft Client SP350		Available since the first version
DtermSP30	Proprietary Protocol	Ver. 9.0.0.11 or later
	SIP	Ver. 9.0.0.11 or later
8LC Card [SCA-8LCA] Note 22		SP-3893 8MC PROG-A Issue 2
MCMG Card [SCA-4LC2COTA] MCMG Box [MG-4LC2COTA] Note 22		SP-3778 MCMG PROG-A Issue 5.0 or later SP-3927 MCMG PROG-B Issue 1.0 or later
MG-T1(SIP) [SCA-24DTIA]		Available since the first version
MG(PRI) Card [SCA-24PRIA] MG(PRI) Box [MG-24PRIA] Note 24	Proprietary Protocol	SP-3884 MG PRI PROG-A Issue 1.0 or later
	SIP	SP-3884 MG PRI PROG-A Issue 5.0 or later
MG(PRI) Card [SCA-30PRIA] MG(PRI) Box [MG-30PRIA] Note 24	Proprietary Protocol	SP-3884 MG PRI PROG-A Issue 1.0 or later
	SIP	SP-3884 MG PRI PROG-A Issue 5.0 or later
MG(BRI) Card [SCA-2BRIA] MG(BRI) Box [MG-2BRIA] Note 23	SIP	SP-3826 BRI MG SIP BSC PROG-A Issue 1.0 or later
UG50 Note 25		Not supported

Note 21: The setting of RTP warning tone is different for each terminal/device.

Note 22: This function is set “enable” as default. Only this function can be set “disable”.

Note 23: This function is set “enable” as default. When this function is disabled, the sound of other functions that give a beep though handset are disabled as well.

Note 24: This function is set “disable” as default. When this function is disabled, the sound of other functions that give a beep though handset are disabled as well.

Note 25: Refer to the Peripheral Equipment Description (UG50) for detailed conditions for UG50.

Programming

ASYDL - SYS1, Index 831 (RTP warning tone), Bit 5: 0/1=Play back the warning tone/Cancel the warning tone.

Note: For the terminals except IP terminal, Softphone and SIP Multiple Line terminal, the warning tone cannot be canceled if this system data is assigned as “1”.

DTMF Control

General Description

This function enables/disables DTMF tone to the opposite party. When RTP warning tone is enabled, the opposite party might be confused with RTP warning tone when hearing it. To avoid this, disable DTMF tone used for RTP warning tone so that the users can distinguish it form DTMF tones used for other purposes such as dial information. It also provides the user with more comfortable conversation.

Operating Procedure

No operation is required.

Service Conditions

1. Terminal firmware version needs to support the canceling function to disable the DTMF tone. Otherwise, it will be unconditionally played back. Terminals supporting cancel of DTMF sending function are as follows:

DTMF Sending Cancel

Name of the IP Equipment		Supported firmware version
DT830/DT830G		Ver. 3.0.0.0 or later
DT820		Available since the first version
DT700 Series		Available since the first version
DtermIP	Proprietary Protocol	Ver. 3.00 or later
	SIP	Ver. 3.0.0.0 or later
IP Enabled Dterm		Ver. 3.06 or later
Soft Client SP350		Available since the first version
DtermSP30	Proprietary Protocol	Ver. 9.0.0.11 or later
	SIP	Ver. 9.0.0.11 or later

Note: MG(PRI/BRI/COT), 8LC Card, VS32 (SIP mode) and IPPAD do not support this function. Refer to the Peripheral Equipment Description (UG50) for detailed conditions for UG50.

2. Playback/Cancel of DTMF tone to the destination party can be assigned with the SFI:225 of ASFC command.
3. The setting will be valid for the next communication after it is set.
4. To play back or cancel the DTMF tone can be chosen to follow the ASFC command data setting or to follow the setting of the each terminal individually.
   - Automatic: Follow the setting of ASFC command data setting (SFI: 225).
   - ON: Play back the DTMF tone. (Does not follow the setting of the ASFC command)
   - OFF: Does not play back the DTMF tone (Does not follow the setting of the ASFC command).

Note: For the setting for each terminal, see the following:
- DT830 Series
  "RTP Alarm" for Configuration Setup of DT830 Series in Chapter 3 of Peripheral Equipment Description - Multi-Line Telephone

- DT820 Series
  “RTP Alarm” for Configuration Setup of DT820 Series in Chapter 3 of Peripheral Equipment Description - Multi-Line Telephone
- DT700 Series

  “How to Switch DTMF/RTP Alarm ON and OFF” for Configuration Setup of DtermIP (SIP) in Chapter 3 of Peripheral Equipment Description - Multi-Line Telephone
- Softphone
  The operation manual attached to the Softphone

5. DTMF tone cannot be canceled for IPPAD, MG (PRI/BRI/COT), 8LC Card, and VS32 (SIP mode). DTMF tone is unconditionally played back for these equipments.

Programming

STEP 1: **ASYD**

- SYS1, Index 75, Bit 1 (Service Feature Restriction Class Data [ASFC/ASFCN command])
 0/1=Common or Separate Day/Night Data Tables

- SYS1, Index 93, Bit 0 (Service Feature Restriction Class Data [ASFC/ASFCN command])
 0/1=Separate or Common Tenant Data table development

STEP 2: **ASFC/ASFCN**

Assign data below to the station class that specifies DTMF signal tone playback.
SFC: Service Feature Restriction Class (1-15)
SFI = 225 (DTMF tone playback)
RES= 0 (DTMF tone playback is canceled)/1 (DTMF tone playback)

R-60 Redial

General Description

This feature allows the user of each DT800 Series/DT700 Series/DT400 Series/DT300 Series to redial the last 20 dialed numbers stored in the memory.

Operating Procedure

How to redial the dialed numbers stored in the memory

1. Press the Last Number Called key or the Redial key.
2. Press the cursor key (Up/Down) or the Soft key (Up/Down) for displaying the dialed number for redialing by changing the display on an LCD as follows.

   No.1 → No.2 → No.3 →...No.18 → No.19 → No.20 → No.1 → No.2...

No.1	The last dialed number
No.2	The number dialed 2-times ago
No.3	The number dialed 3-times ago
.	.
.	.
.	.
No.18	The number dialed 18-times ago
No.19	The number dialed 19-times ago
No.20	The number dialed 20-times ago

3. Go off-hook, or press the Speaker key/the OK key in the center of the cursor key.
4. The designated destination number is dialed automatically. Then, the calling station hears the Ringback Tone (RBT).

Note: Note for the following conditions when redialing.
- After pressing the Redial key, the dialing keys are disabled.
- When no dialed number is stored, “No list” is displayed for 10 seconds.

How to delete one dialed number stored in the memory

1. Press the Last Number Called key or the Redial key.
2. Press the cursor key (Up/Down) or the Soft key (Up/Down) for displaying the dialed number for deleting by changing display on an LCD as follows.

   No.1 → No.2 → No.3 →...No.18 → No.19 → No.20 → No.1 → No.2...

No.1	The last dialed number
No.2	The number dialed 2-times ago
No.3	The number dialed 3-times ago
.	.
.	.
.	.
No.18	The number dialed 18-times ago
No.19	The number dialed 19-times ago
No.20	The number dialed 20-times ago

3. Press the Delete key.
4. Press the One key for deleting the displayed number. After the number is deleted, the next dialed number is displayed.

How to delete all dialed numbers stored in the memory

1. Press the Last Number Called key or the Redial key.
2. Press the Delete key.
3. Press the All key for deleting the stored numbers. After the dialed number history is deleted, “No list” is displayed for 10 seconds.

Service Conditions

<Important Notices>

1. This feature is available only for DT800/DT700/DT400/DT300 Series assigned the System Data (ASYDL/ASYDN SYS1 Index 1257 Bit 2=1). For DT800/DT700/DT400/DT300 Series assigned the System Data (ASYDL/ASYDN SYS1 Index 1257 Bit 2=0), and Desktop terminals other than DT800/DT700/DT400/DT300 Series, Last Number Called is enabled. For details of Last Number Called, refer to Last Number Called -D [L-6D] in this manual.

   Note: When the System Data (ASYDL/ASYDN SYS1 Index 1257 Bit 2) is changed, each terminal needs to be restarted.

2. When the System Data (ASYDL SYS1 Index 673 Bit 1=1, Bit 0=0) is assigned, and the display location of User Information is set to the position where Soft key function is displayed, the Redial key becomes disabled.

<Interactions with Other Features>

1. When a Feature Key is assigned as the Last Number Called key, the Feature key also works as the Redial key.
2. Call origination by using Speed Calling feature with the Last Number Called key or the Redial key is unavailable. To use Speed Calling feature, be sure to disable this feature.

3. The dialed numbers cannot be registered for System Phone Book and Terminal Phone Book by using this feature

<Hardware/Software>

This feature is only available for DT800/DT700/DT400/DT300 Series. For terminals other than DT800/DT700/DT400/DT300 Series, refer to Last Number Called -D [L-6D] in this manual.

<Interactions with Networks>

None

<Conditions Specific to This Feature>

1. A maximum of 20 destinations can be stored.

   Note: A maximum of 5 destinations can be stored by using Last Number Called -D [L-6D].

2. A maximum of 32 digits (the destination number + the number dialed during the call) can be stored (including “pause”).
3. The number dialed during the call can be stored with a maximum of 32 digits (the destination number + the number dialed during the call).
4. When the Last Number Called key or the Redial key is pressed in an idle state, DT800/DT700/DT400/DT300 Series displays the stored dialed numbers.
5. After pressing the Last Number Called key or the Redial key, DT800/DT700/DT400/DT300 Series displays the first 24 digits of a stored dialed number of 32 digits.
6. To finish displaying the stored dialed numbers, press the on of the following keys.

   - The Last Number Called key or the Redial key **Note 1**
   - The Exit key
   - The End key on the Soft key

   Note 1: The left button of the cursor key is disabled.

7. When a DT800/DT700/DT400/DT300 Series user dials the same destination that has already been stored in the system, the newly dialed number is stored in the following manner:

8. While DT800/DT700/DT400/DT300 Series displays the dialed numbers, LCD contrast cannot be operated by the cursor keys (Up/Down).
9. When receiving the following calls while displaying the dialed numbers, DT800/DT700/DT400/DT300 Series finishes displaying the dialed numbers, and displays a call indication.
   - A call for Prime Line
   - A call for the line during line-pre-selection
10. When making a call from DT800/DT700/DT400/DT300 Series during displaying the dialed numbers, even if you may hear Dial Tone, there is no problem with the operation of DT800/DT700/DT400/DT300 Series.

<Other Conditions>

None

Programming

STEP 1: **ASYDL/ASYDN** - Assignment of System Data (LDM/NDM)
SYS1 Index 1257 Bit 2 = 1 (Type of outgoing call history used by DT800/DT700/DT400/DT300 Series: Redial [R-60])

Note: When this System Data is changed, each terminal needs to be restarted.

Note: For details of Last Number Called when this System Data is assigned to “0” (Last Number Called -D [L-6D]), refer to Last Number Called -D [L-6D] in this manual.

R-61 Retention of Customized Terminal Settings

General Description

This feature allows Desktop terminals to start up with a preassigned terminal setting pattern, such as Receiver Volume, Ringer Tone Volume, LCD Contrast and Handset/Headset Switching, after system initialization or terminal re-registration. A maximum of eight options (seven Customized Terminal Setting Patterns and one Default Terminal Setting Pattern) can be preassigned through the PCPro.

Operating Procedure

None.

Service Conditions

<Important Notices>

1. When the system started up while this feature is disabled (ASYDL/ASYDN SYS1 Index 1248 Bit 3=0): If the setting of the system data is changed (ASYDL/ASYDN SYS1 Index 1248 Bit 3=1) during operation, system initialization or Internal PHE module initialization with the ADPM command is required for the change to take effect.

   Note: When Internal PHE initialization is executed, all other devices controlled by Internal PHE are also initialized.

2. When the system started up while this feature is enabled (ASYDL/ASYDN SYS1 Index 1248 Bit 3=1): If the setting of the system data is changed during the operation, the new setting is applied to each terminal which performs a registration after the data change. The setting on the each terminal is determined according to the state of the data setting at the time of terminal registration.

   Note: The setting of the terminal which performs a registration before the system data change is not reflected.

3. Be sure to assign (enable) the system data below. If disabled, receiver volume for Desktop terminal returns to the default after going on-hook/off-hook or switching headset/handset mode.

   ASYD, System Data1, Index 384, Bit 5=1: Retains Handset/Headset receiver volume changed during a call (after the call is released).

<Interactions with Other Features>

None

<Hardware/Software>

1. This feature is available for DtermIP (Dterm Series i) and DT800/DT700 Series.

   Note: LCD contrast of terminal with color LCD such as DT750 and DT730G (12/24CG) cannot be set by this feature.

2. When using a DT700 Series terminal (except DT730G) with a firmware version earlier than V5.0.3.0, do not start the terminal with Headset enabled for a Customized Terminal Setting Pattern. If you do so, no operation will be possible on the terminal.

Note: Manual Handset/Headset switching on the currently operating terminal does not affect the functionality.

<Interactions with Networks>

None

<Conditions Specific to This Feature>

1. When this feature is enabled, the terminals to which no Customized Terminal Setting Pattern is assigned start up with Default Terminal Setting Pattern. If Default Terminal Setting Pattern data is also not assigned, the terminals start up with the factory default settings.
2. A maximum of seven Customized Terminal Setting Patterns (eight options including a Default Terminal Setting Pattern) can be preassigned through the PCPro.
3. When terminal settings are changed by key operations on the terminal while logged on to the system, the settings return to Customized Terminal Setting Pattern assigned through the PCPro/QuickPro after system initialization or terminal re-registration.
4. When Customized Terminal Setting Pattern assigned to a terminal or setting values of the Customized Terminal Setting Pattern are changed through the PCPro/QuickPro while the terminal is logging on to the system, the changes take effect after the terminal re-registration.
5. When a terminal is in the following status, the terminal starts up with the setting that Handset is used even if Headset is chosen in Customized Terminal Setting Pattern.
   - Headset key is not registered on the terminal.
   - "S=0" is assigned by AKYD command.
6. If the status of a DtermIP (Dterm Series i) meets all the following conditions, the DtermIP user may momentarily hear DT from the headset on re-registration.
   - "S=0" is assigned by the AKYD command.
   - Headset is not chosen in Customized Terminal Setting Pattern.
   - Headset is connected to the terminal.
   - Headset key is not registered on the terminal.

<Other Conditions>

When this feature is disabled (ASYDL/ASYDN SYS1 Index 1248 Bit 3=0), customized settings of a Desktop terminal are not retained after the terminal is turned off and comes to a complete stop or when a long time has elapsed since its last logout. The Desktop terminal operates with default settings on the next start-up or login.

Programming

STEP 1: **ASYD** - System Data 1, Index 384, Bit 5. Set to 1 to retain Handset/Headset receiver volume for Desktop terminal changed during a call (after the call is released).

STEP 2: **ASYDL** - System Data 1, Index 678, Bit 0. Set to 0 to retain the setting of handset receiver volume changed during a call.

STEP 3: **ASYDL/ASYDN** - System Data 1, Index 1248, Bit 3. Set to 1 to enable RETENTION OF CUSTOMIZED TERMINAL SETTINGS [R-61].

STEP 4: Assign detailed information on Customized Terminal Setting for each pattern.

Note: When the following data settings are changed, terminal re-registration is required to enable the new settings.

ASYDL/ASYDN

System Data 1, Index 1264, Bits 0-3: Receiver Volume Setting for **Customized Terminal Setting Pattern 1**.

Bits				Volume Level (dB)	Scale on LCD	Remarks

Note: For details on setting of each bit, see “Index 1264.”

System Data 1, Index 1271
Bits 0-3: LCD Contrast Setting for **Customized Terminal Setting Pattern 4**.

Note: For details on setting of each bit, see “Index 1265.”

Bit 4: Handset/Headset Switching for **Customized Terminal Setting Pattern 4**.
0/1=Handset/Headset

System Data 1, Index 1272
Bits 0-3: Receiver Volume Setting for **Customized Terminal Setting Pattern 5**.
Bits 4-7: Ringer Tone Volume Setting for **Customized Terminal Setting Pattern 5**.

Note: For details on setting of each bit, see “Index 1264.”

System Data 1, Index 1273
Bits 0-3: LCD Contrast Setting for **Customized Terminal Setting Pattern 5**.

Note: For details on setting of each bit, see “Index 1265.”

Bit 4: Handset/Headset Switching for **Customized Terminal Setting Pattern 5**.
0/1=Handset/Headset

System Data 1, Index 1274
Bits 0-3: Receiver Volume Setting for **Customized Terminal Setting Pattern 6**.
Bits 4-7: Ringer Tone Volume Setting for **Customized Terminal Setting Pattern 6**.

Note: For details on setting of each bit, see “Index 1264.”

System Data 1, Index 1275
Bits 0-3: LCD Contrast Setting for **Customized Terminal Setting Pattern 6**.

Note: For details on setting of each bit, see “Index 1265.”

Bit 4: Handset/Headset Switching for **Customized Terminal Setting Pattern 6**.
0/1=Handset/Headset

System Data 1, Index 1276
Bits 0-3: Receiver Volume Setting for **Customized Terminal Setting Pattern 7**.
Bits 4-7: Ringer Tone Volume Setting for **Customized Terminal Setting Pattern 7**.

Note: For details on setting of each bit, see “Index 1264.”

System Data 1, Index 1277
Bits 0-3: LCD Contrast Setting for **Customized Terminal Setting Pattern 7**.

Note: For details on setting of each bit, see “Index 1265.”

Bit 4: Handset/Headset Switching for **Customized Terminal Setting Pattern 7**.
0/1=Handset/Headset

System Data 1, Index 1278
Bits 0-3: Receiver Volume Setting for **Default Terminal Setting Pattern.**
Bits 4-7: Ringer Tone Volume Setting for **Default Terminal Setting Pattern**.

Note: For details on setting of each bit, see “Index 1264.”

System Data 1, Index 1279
Bits 0-3: LCD Contrast Setting for **Default Terminal Setting Pattern.**

Note: For details on setting of each bit, see “Index 1265.”

Bit 4: Handset/Headset Switching for **Default Terminal Setting Pattern**.
0/1=Handset/Headset

STEP 5: **ASGD** - Assign Customized Terminal Pattern Number to each Station.

TN: Tenant Number

STN: Station Number

F: Function Number =7 (Retention of Customized Terminal Settings)

GN: Customized Terminal Pattern Number (1-7)

GN=1: Applies the settings of ASYDL/ASYDN, System Data 1, Indexes 1264 and 1265.

GN=2: Applies the settings of ASYDL/ASYDN, System Data 1, Indexes 1266 and 1267

GN=3: Applies the settings of ASYDL/ASYDN, System Data 1, Indexes 1268 and 1269

GN=4: Applies the settings of ASYDL/ASYDN, System Data 1, Indexes 1270 and 1271

GN=5: Applies the settings of ASYDL/ASYDN, System Data 1, Indexes 1272 and 1273

GN=6: Applies the settings of ASYDL/ASYDN, System Data 1, Indexes 1274 and 1275

GN=7: Applies the settings of ASYDL/ASYDN, System Data 1, Indexes 1276 and 1277

Note: For setting of the GN parameter, consider the following.

- Terminal re-registration is required for this data change to take effect.
- When no data is set for the GN parameter, the setting s of ASYDL/ASYDN, System Data 1, Indexes 1278 and 1279 is applied.

R-62 Ring Volume in Headset Mode

General Description

When a Desktop terminal in the Headset Mode receives an incoming call, Ringer Tone Volume from a speaker of the Desktop terminal is adjusted to 20 dB lower than the actual volume setting. However, this feature enables to apply the actual volume setting to a Desktop terminal in the Headset Mode **Note 1**.

Note 1: The term "Headset Mode" refers to the condition that a Headset is activated by pressing the Handset/Headset key, and a Desktop terminal user hears tone such as Dial Tone (DT), Ring-back Tone (RBT) or Reorder Tone (ROT), or line selection is still not performed (AKYD, S = 1: (Off-hook suppression is restricted)).

Operating Procedure

1. Press the cursor key (Up/Down) and adjust Ringer Tone Volume when a Desktop terminal that uses the Handset (the lamp of the Handset/Headset key is off) and is in idle status receives a call (Dial Tone is heard). **Note 2**
2. Press the Handset/Headset key and switch to the Headset (the Handset/Headset key lamp turns on).
3. When the Desktop terminal is in the Headset Mode, Ringer Tone Volume adjusted in the Operating Procedure 1 is used for the incoming call to the lines assigned to the Desktop terminal.

Note 2: This Ringer Tone Volume setting is for the normal use of the Desktop terminal. By this feature, this setting becomes available also for the Desktop terminal in the Headset Mode.

Service Conditions

<Important Notices>

1. When a change is made to the data setting of ASFC/ASFCN SFI263 (Ringer Tone Volume of Desktop Terminal in Headset Mode), re-registration of the Desktop terminal using this feature is required to reflect the new setting.

<Interactions with Other Features>

1. When using this feature, Ringer Tone Volume for the Headset Mode is subject to Ringer Tone Volume setting of the Desktop terminal in idle status. If Ringer Tone Volume setting of the Desktop terminal in idle status is changed by other features (for example, assigning ASYDL, SYS1, Index 678, bit 0 = 0 (retaining the setting of handset receiver volume changed during a call)), this feature is subject to the newly changed setting.
2. When using Location Diversity [L-55] with this feature, the Desktop terminal is subject to the data setting of the node to which the Desktop terminal is registered.

<Hardware/Software>

1. This feature is released for DT800/DT700 Series. Use the terminals with the following firmware versions.

Terminals	Firmware Version	Remarks
DT750	V5.0.3.0 or later	-
DT730		
DT730G (24CG/24DG)	V1.0.1.0 or later	
DT710	not supported	This feature is not supported by DT710/DT770G because they cannot be connected to a Headset.
DT770G		
DT830	V3.0.0.0 or later	-
DT830G		

<Interactions with Networks>

None

<Conditions Specific to This Feature>

1. When a Desktop terminal user is on the 1st call using a Handset and the 2nd call arrives at another line, this feature does not work during the following situations:

   - a Desktop terminal is receiving a call
   - a Desktop terminal user is hearing tones

   In these situations, Ringer Tone Volume becomes 20 dB lower than the actual volume setting.
2. Ringer Tone Volume cannot be adjusted while talking on a Headset or hearing tones with a Headset. In this situation, only the Receiver Volume can be adjusted. However, Ringer Tone can be muted in this situation by pressing Off Hook Ringing key (assigned by AKYD FKY = 123) or Ringer Mute key (assigned by AKYD FKY = 117).

<Other Conditions>

None

Programming

STEP 1: **ASFC/ASFCN**- Assign a Service Feature Restriction Class

SFC: 0 - 15 (Service Feature Restriction Class)

D/N: D/N (Day/Night Mode)

TN: Tenant Number

SFI: 263 = 1 (Enable Ring Volume in Headset Mode feature; Ringer Tone Volume is not adjusted to 20 dB lower than the actual Ringer Tone Volume.) **Note 3**

Note 3: To reflect the new setting, re-registration of the Desktop terminal using this feature is required.

R-63 Real-Time Call Information on Softphone

General Description

This feature enables the telephony server to send information about the opposite party and call records to softphones in real time by using an interface similar to that used for SIP Multiple Line terminals.
To implement this feature, you must configure the system settings to allow the softphones to receive the following information:

- Opposite party information
  Allow opposite party information to be passed to softphones.
- Call record information
  Decide whether calls picked up by non-ring station are classified as an answered call or a missed call.

Operating Procedure

No manual operation is required.

Service Conditions

<Common Conditions>

1. When the system is configured to enable integration between a softphone and a PS/WLAN Handset/wired phone (Soft Phone - PS [S-158]/Soft Phone WLAN Handset [S-159]/Soft Phone Wired-Phone Handset [S-147]), if a call comes in to a PS/WLAN Handset/wired phone during the temporary release of the softphone integration and is abandoned before being answered, the call is not recorded in the call log of the softphone.

   Note: In the above case, if the call is answered on the softphone, the call record is stored in the call log of the softphone.

2. When you retrieve a parked call, the call is recorded in the incoming call log (not in the outgoing call log) of your softphone.
3. When a call ringing terminal A is picked up by terminal B, the call is recorded as an answered call on terminal B. It depends on the system data (ASYDL/ASYDN SYS1 Index 681 Bit 2) whether the call is recorded as a missed call or an answered call on terminal A. This preference setting also applies to the terminal rung with Internal Zone Paging [I-21] or DUAL STATION CALL [D-156].
4. The Real-Time Call Information on Softphone feature is available for Soft Client SP350 R6.0.0.0 or later.

<Conditions for Opposite Party Information>

1. Opposite party information is sent to your softphone when:

   - An incoming call terminates to My Line of your station if the same number as My Line is assigned to its Prime Line.
   - You answer an incoming call or a held call by pressing a Line key on the station with Terminal Phonebook Display on Line Pre-selection enabled (ASYDL SYS1 Index 679 Bit 0 = 1).
   - You start a telephone conversation.

- You place a call.

2. A maximum of 24 digits can be sent for each caller ID. If the length of a caller ID exceeds the limit, the telephony server truncates it based on the system data setting (ASYD SYS1 Index 241 Bit 6), and sends it to the softphone without adding a truncation symbol (asterisk).

<Conditions for Call Record Information>

1. Call record information is sent to your softphone when:

   - You answer an incoming call.
   - An incoming call is abandoned before you answer it.
   - An incoming call is picked up by a non-ring station.
   - You retrieve a held or parked call.
   - You pick up a call ringing on another station.

2. The following two types of call records are sent to softphones.

   - Answered calls
   - Missed calls

3. A maximum of 24 digits can be sent for each caller ID. If the length of a caller ID exceeds the limit, the telephony server truncates it based on the system data setting (ASYD SYS1 Index 241 Bit 6), and sends it to the softphone without adding a truncation symbol (asterisk).
4. When My Line of Station A is accommodated on a Sub Line of Station B, if Station B answers a call placed to Station A by pressing the corresponding Sub Line key, the call record is sent to both Station A and Station B.
5. When a call is answered through Call Pickup, the call record is sent to both stations which the call is originally placed to and which the call is answered on.
6. When a call below is answered, the call record is not sent to the answering station:

   - Calls terminating directly at a particular station instead of a line (for example, DID calls)

7. When a transferred call terminates, calling number sent as call record information is as follows:

   - Call Transfer - All Calls [C-11]:

     The number of Intermediate station (the first terminal to receive the call)

   - Blind Transfer To Attendant [B-17]/Blind Transfer To Station [B-18]:

     The number of originally calling station

<Other Conditions>

When a softphone and a DT800/DT700 Series terminal are functioning as an integrated unit, opposite party information and call record information are sent to both phones.

Programming

STEP 1: **ASYD**- System Data 1, Index 241, Bit 6. (Truncation of Caller ID exceeding the display on the LCD)
0/1: Only the former/latter part of data appears on the LCD

STEP 2: **ASYDL/ASYDN** - System Data 1, Index 678, Bit 1. Set to 1 to enable notification of opposite party information to softphones.

Note: To apply the changes, initialize the system.

STEP 3: **ASYDL/ASYDN** - System Data 1, Index 681, Bit 2. (Preference for classifying calls picked up by non-ring station as an answered call or a missed call)
0/1: Answered call/Missed call.

S-1 Single-Digit Station Calling

General Description

This feature allows the assignment of single digits for Station Numbers.

Operating Procedure

To operate

1. Lift the handset. Receive Dial Tone.
2. Dial the Single-digit (preprogrammed) Telephone Number.
3. The desired service station will be rung.

Service Conditions

1. The single-digit number must be different from the first digit of:
   a.) Trunk Access Codes
   b.) Service Feature Access Codes
   c.) Other Telephone Numbers
2. Timing start is not available with this feature.

Interactions

For each station with single-digit access, an entire Number Level is eliminated. Do not plan to have more than one or two such phones in a system.

Programming

STEP 1: **ASYD** - System Data 1, Index 16, Bit 0. Assign this Bit as data "1" enabling single-digit Station Numbers.

STEP 2: **ANPD** - Reserve a Number Level for station access. Assign an NND = 1, and BLF is ON.

STEP 3: **ASPA** - For the desired Station Number assign SRV = "STN: Station Number". NND is not required. Assign Connection Indexes (CI) of "N: Normal" and "H: Hooking".

STEP 4: **ASDT** - Assign the Station Number to a specific station within the system.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ANPDN** - Reserve a Number Level for station access. Assign an NND = 1, and BLF is ON.

STEP 2: **ASPAN** - For the desired Station Number assign SRV = "TELN: Telephone Number". NND is not required. Assign Connection Indexes (CI) of "N: Normal" and "H: Hooking".

STEP 3: **ALGSN** - Assign Type = 2 / UGN1
TELN = Station Number/Telephone Number
FPC = "x"
Tenant and Station assigned by ASDT.

S-2 Special Dial Tone

General Description

This feature provides a distinctive Dial Tone to a Station user after the switch hook has been pressed, enabling the user to activate a specific feature.

Operating Procedure

To operate

1. While connected with the first party, Station user presses the switch hook. Receives SPECIAL DIAL TONE.
2. User may activate a feature, such as:

CALL HOLD	[C-6]
CALL TRANSFER-ALL CALLS	[C-11]

Service Conditions

1. SPECIAL DIAL TONE rating is 350/440 Hz at 240 IPM.
2. If dialing is not initiated within 12 seconds after receiving SPECIAL DIAL TONE, Reorder Tone will be sent to the Station. If the Station has not gone back on hook or initiated dialing after 30 seconds of Reorder Tone, the Station will be placed in the LINE LOCKOUT [L-3] mode.
3. If a Station user attempts CALL FORWARDING - ALL CALLS [C-5], -BUSY LINE [C-2] - DON'T ANSWER [C-3], etc., SPECIAL DIAL TONE will be sent to that Station after Access Code dialing.

Interactions

1. No other programming is required. This tone is generated for all momentary pressing of the Hooking feature applications.
2. LINE LOCKOUT [L-3]: SPECIAL DIAL TONE is sent for 12 seconds, Reorder Tone for 30 seconds, followed by Line Lockout.

Programming

ASYD - System Data 1, Index 42, Bit 7. Is SPECIAL DIAL TONE continuous or a burst? 0/1: Continuous/Burst. Leave as Data 0. System Data 2, Index 1, Bit 0 and 1. Assign as data "1" for both Bits to provide CONSULTATION HOLD capability on a per Tenant basis.

System Data 3, Index 2. Assign data 91H for Normal (N) and Hooking (H) values.

S-3 Speed Calling - System

General Description

This feature allows a Desktop terminal user or ATTENDANT CONSOLE [A-3] to call frequently Dialed Numbers using fewer digits (Abbreviated Call Codes) than would normally be required.

Operating Procedure

To originate a call using Access Code

1. Lift handset. Receive Dial Tone,
2. Dial SPEED CALLING - SYSTEM Access Code (maximum three digits).
3. Dial Abbreviated Call Code (maximum of four digits).
4. Call is completed.

<The following procedure is applied for Desktop terminals only.>

To originate a call using Line/Feature Key or Directory Key

1. Lift the handset or press the SPEAKER key. Receive Dial Tone.
2. Press the SPEED CALLING-SYSTEM (SPEED-SYS) Key or Directory Key. **Note 1 Note 2**
3. Dial the Abbreviated Call Code (maximum of four digits). The LCD displays:

Abbreviated Call Code

Note 1: Directory Key is available for Dterm Series i. For detailed information on the operation, refer to the related User's Guide.

Note 2: If the Desktop terminal does not have the SPEED-SYS Key, dial the SPEED CALLING-SYSTEM Access Code, then the Abbreviated Call Code.

Service Conditions

1. SPEED CALLING - SYSTEM codes programmed into System Data are accessible by all Stations with a CLASS OF SERVICE - INDIVIDUAL [C-15] permitting SPEED CALLING - SYSTEM.
2. Each Abbreviated Call Code can store a maximum of 24 digits, including Access Codes and pauses.
3. SPEED CALLING - SYSTEM numbers are programmed via System Data entry from the PCPro.
4. Stations may be denied access to SPEED CALLING - SYSTEM via CLASS OF SERVICE [C-15] assignment in System Data. SPEED CALLING may also be allowed or denied on either a Station or Tenant-wide basis.
5. TOLL DENIAL/TOLL DIVERSION [T-6] and TOLL RESTRICTION-3/6-DIGIT [T-7] may or may not be applied to SPEED CALLING - SYSTEM, as desired.
6. LEAST-COST ROUTING-3/6-DIGIT [L-5] may be provided via SPEED CALLING - SYSTEM access.
7. If the Station is restricted from dialing Outside via programming, the Station can still access SPEED CALLING - SYSTEM.
8. A maximum of 10,000 codes can be assigned per System.

9. The Outgoing Call using a Trunk in the Remote Node is applied to this feature.
10. When this feature is activated by dialing the Speed Calling - System Feature Access Code + the Abbreviated Call Code, only the Speed Calling-System Feature Access Code and the Abbreviated Call Code are displayed on the LCD of the Desktop terminal.

<The following conditions are applied for Desktop terminals only.>

1. When assigning the Access Code to Line/Feature Key, Abbreviated Call Code must be set at two to four digits.
2. When outgoing dialing with this feature, Speed Calling Number can be displayed on the LCD instead of Speed Calling-System Feature Access Code and the Abbreviated Call Code by ASYDL command (ASYDL SYS 1 Index 673 bit 6=1). The following conditions are about this feature.

   Note: This feature is available only with outgoing call (LCR/LCRS/OGC/OGCA).

   a.) When you register the Abbreviated Call Codes as a Forwarding Destination with Speed Calling Number Display on Desktop terminal service, only SPEED CALLING - SYSTEM Access Code and Abbreviated Code are displayed on LCD. Speed Calling Number is not displayed.
   b.) Although Speed Calling Number Display on Desktop terminal service is available, SPEED CALLING-SYSTEM Access Code and Abbreviated Code are displayed on LCD as a dialed numbers memory, not Speed Calling Number.
   c.) When Speed Calling Number Display on Desktop terminal service is available, the number is displayed within 16 digits. More than 16 digits number is displayed as only the first 16 digits.
   d.) This feature is available only while calling the party. If the LCD is re-displayed with other feature such as Name Display-OAI-CCIS or the called party is being busy, this feature is not available.
   e.) When you use this feature, register the Speed Calling Number correctly in ASPD command. If the last digit part of number is not registered, Speed Calling Number is not displayed.
   (When calling “8-26-70000” with the use of this service, you may register “826” as a Speed Calling Number. In this case, press the Access Code and Abbreviated Code, and dial “70000”.
   At the time you call “7”, Speed Calling Number display becomes invalid.)
   f.) While calling with this feature, if you press the Abbreviated Call Codes, Speed Calling Number is not displayed.

Interactions

1. FORCED ACCOUNT CODES [F-7] and AUTHORIZATION CODES [A-20] cannot be programmed for use via the SPEED CALLING-SYSTEM.
2. Pauses are programmable from the PCPro using the “P” Key of the Keyboard. Pauses consume one digit of the available 24 digits. A pause lasts for about 3 seconds. A pause cannot be added directly after an LCR Access Code. A pause cannot be added to ISDN, or CCIS Calls.

   Note: A pause to MG-COT Calls can be added. In this case, a pause lasts about three seconds.

   Note: Registered pauses will not be activated when originating a call to ISDN Lines or to Analog Lines via MG-COT.

3. TOLL DIVERSION/TOLL DENIAL [T-6] and TOLL RESTRICTION 3/6 DIGIT [T-7] will interact with this feature if SPEED CALLING-SYSTEM is toll restricted.

4. Special Dial Tone may be returned after dialing SPEED CALLING-SYSTEM if AUTHORIZATION CODES [A-20] are operational in the system and Toll Restriction applies to SPEED CALLING-SYSTEM.
5. See SPEED CALLING OVERRIDE-SYSTEM [S-61].

Programming

STEP 1: **ASYD** - System Data 2, Index 1, Bit 7. Does TOLL RESTRICTION [T-7] apply to SPEED CALLING-SYSTEM? 0/1: No/Yes.

STEP 2: **<For Desktop terminal only>**
ASYDL - System Data 1, Index 673, bit 6. Speed Calling Number Display Service on Desktop terminal (Outgoing Call only) 0/1=Out/In Service

STEP 3: **ANPD** - Reserve a Number Level for Feature Access. Select Normal Service (N), Hooking Service (H) or Busy Service (B) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan.

STEP 4: **ASPA** - Assigning an Access Code to SPEED CALLING-SYSTEM, assign SRV = "SSC: Service Code", SID = 15. Program for "N: Normal" and "H: Hooking". NND = Access Code plus Abbreviated Digit Code (ADC). NND1 = Abbreviated Digit Code (ADC). See ASPD.

Example: 6 + 010 1 digit + 3 digits = NND = 4.

STEP 5: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 12 to Stations that will have SPEED CALLING-SYSTEM.

STEP 6: **ASPD** - Enter Tenant Number (TN), Abbreviated Digit Code (ADC), and the Called Number (CD) to be sent. Include the Access Code of the route in the CD.

STEP 7: **AKYD** - Assign SPEED CALLING to Desktop terminal key. Assign FKY15 to the Desktop terminal key.

STEP 8: **ADSL** - Assign S-SPD Key; Assign SN = 1 (Originating; DT Connection) and FKY = 15 (Speed Calling - System).

This command is used for assigning a function to each Soft Key.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ANPDL** - Reserve a Number Level for Feature Access. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan.

STEP 2: **ASPAL** - Assigning an Access Code to SPEED CALLING-SYSTEM, assign SRV = "SSC: Service Code", SID = 15. Program for "N: Normal". NND = Access Code plus Abbreviated Digit Code (ADC). See ASPD.

Example: 6 + 010 1 digit + 3 digits = NND = 4.

S-4 Splitting

General Description

This feature allows the ATTENDANT CONSOLE [A-3] to speak privately with one party on an Attendant-handled Connection without the other party overhearing.

Operating Procedure

To speak with the Called Party only

1. Dial the desired Telephone Number.
2. Station class/Telephone Number is displayed.
3. Wait for the party to answer.

To speak with the Calling Party only

1. Press the SRC Key.
2. Trunk Group/Number is displayed.
3. Proceed with the conversation.

To return to the Called Party

1. Press the DEST Key.
2. Station class/number displayed.

To speak with both parties

1. Press the TALK Key.

To release from the Attendant Console

1. Press the RELEASE Key.

To disconnect all parties involved in a THREE-WAY CONFERENCE [T-2]

1. Press the DEST Key.
2. Press the CANCEL Key twice.

Service Conditions

1. The ATTENDANT CONSOLE [A-3] may alternate between the Called and Calling Parties, and THREE-WAY CONFERENCE [T-2], as desired.
2. If SERIAL CALL [S-15] is provided, the call is automatically split when the ATTENDANT presses the Loop Key to answer a recall initiated by a Station user.
3. The SPLITTING feature is a standard Attendant feature.
4. SPLITTING is automatic when the Attendant begins call completion or answers a recall.
5. SPLITTING is manual when the SRC, DEST, or TALK Key is pressed on the ATTENDANT CONSOLE [A-3].
6. If a Station is engaged in a SERIAL CALL [S-15] with an Outside Party and LOCKOUT [A-5] is not provided (optional), upon pressing the associated Loop Key, will bridge on the existing Connection, and SPLITTING is not provided.

Interactions

1. The ATTENDANT CONSOLE [A-3] must first be provided.
2. If Conference Calling is required, THREE-WAY CALLING [T-2] must first be provided.

Programming

No programming is required.

S-4D Splitting -D

General Description

This feature allows a Dterm user to alternately converse between two separate parties while one party is connected and one party remains on hold. The Station user uses the TRANSFER button to alternate conversations between the two parties.

Operating Procedure

While a conversation is in progress

1. Press the TRANSFER Key. Hear Special Dial Tone.
2. Dial the new number. The first party is held, the Second Party answers.
3. Press the TRANSFER Key. Return to the first party; the Second Party is held.
4. Repeat as often as needed.

Service Conditions

THREE-WAY CALLING [T-2] may be established at any time by pressing the CONF Key.

Interactions

1. SPLITTING is inherent to the system and is operated by using the TRANSFER Key.
2. The Conference Trunk is only required when a Three-way Connection is desired.

Programming

STEP 1: **ASYD** - System Data-2, Index 1, Bits 0 and 1. Consultation Hold allowed or denied. 00: Denied; 01: Originating and Terminating Calls allowed, Tandem Call Denied; 11: All calls allowed. Assign data "11".

System Data 2, Index 6, Bit 2. Leave as data "0" to enable the CALL TRANSFER-ALL CALLS [C-11] feature.

STEP 2: **ATRK** - Assign these LENS as Route 909, Digital Conference Trunk. LENS consists of the following:

XX	X	XX	X
Module Group	Unit	Group	Level

Group and Level numbers for the Digital Conference Trunk are 210, 213, 216, 221, 224, 227, 232, and 235.

STEP 3: **MBTK** - Make idle the Digital Conference Trunk.

S-6 Station-Controlled Conference

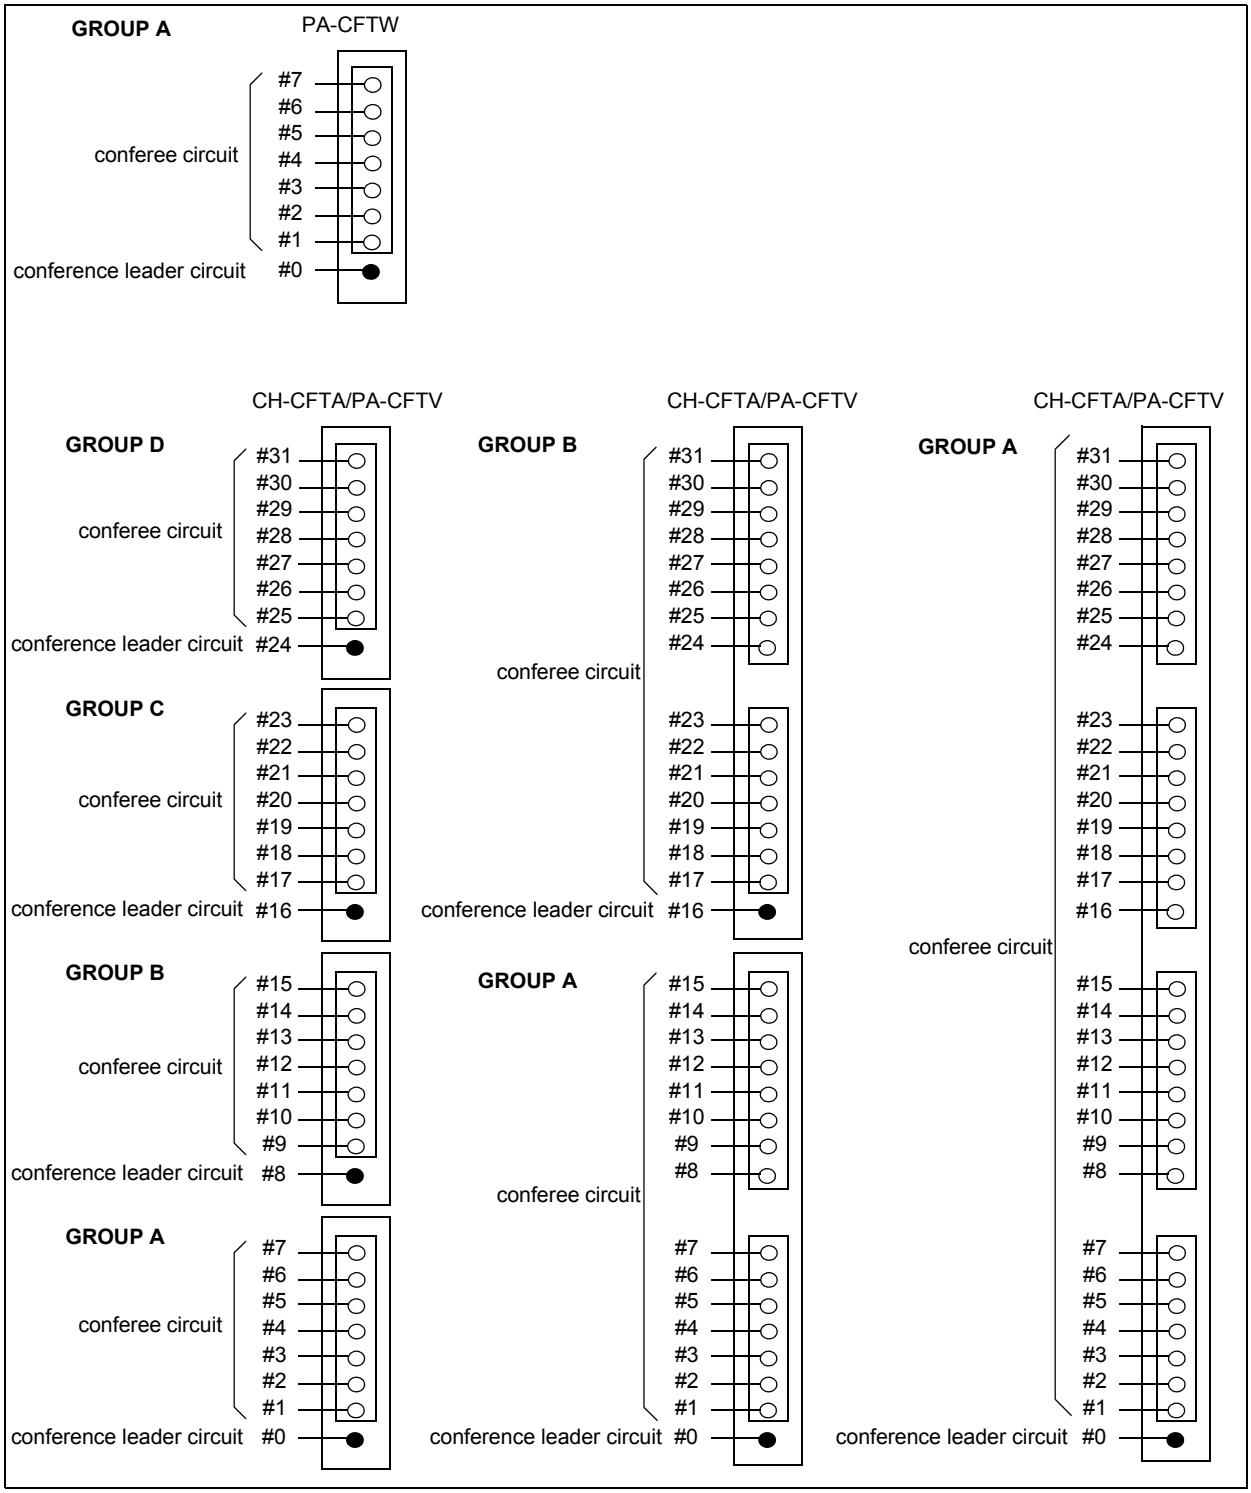
General Description

This feature allows a Station user to establish a Conference. The Conference may be any combination of Stations and/or Trunks (inside and outside parties). The number of conferee per conference group varies depending on the Conference Trunk (CFT) as shown below:

CFT	NUMBER OF CONFEREES (including conference leader)
PA-CFTW	8-party × 2 groups
PA-CFTV	8-party × 4 groups
	16-party × 2 groups
	32-party × 1 group
CH-CFTA	8-party × 4 groups
	16-party × 2 groups
	32-party × 1 group

Operating Procedure

Procedure 1 (MEET-ME CONFERENCE)



1. Station user wishing to establish the Conference (Conference Leader) calls each party desired and advises them of the Conference.
2. All Stations then call the Conference Telephone Number, and the Conference Leader Calls the special Conference number for the leader.
3. Conference Connection is automatic.
4. The Conference Leader may dial "0" to lock out additional parties.
5. If the Conference Leader connected to the Conference Circuit dials digit "#", all Conferees will be disconnected. Otherwise, the Conference is terminated only after all parties have hung up.
6. To release from a Conference Circuit individually, a Station user hangs up. The remaining Conferees may continue without interruption.

Procedure 2

1. Conference Leader dials the Conference Telephone Number on the Conference; Conference Circuit automatically answers.
2. Conference Leader makes a Switch Hook Flash (SHF).
3. Conference Leader dials the Telephone Number of conferee; receive Ringback Tone.
4. The conferee answers.
5. Conference Leader hangs up; the conferee is connected to the Conference Circuit (port 1).
6. Conference Leader sequentially calls all desired parties (up to 7, 15, or 31 parties) and connects them to the other Conferee Circuits (port 2 to 7/15/31).
7. Conference Leader dials the Conference Telephone Number on the Conference again.
8. Conference Leader may dial "0" to lock out additional parties.
9. If Conference Leader connected to the Conference Circuit dials digit "#", all Conferees will be disconnected. Otherwise, the Conference is terminated only after all parties have hung up.
10. To release from a Conference Circuit individually, the Station user hangs up. The remaining Conferees may continue without interruption.

Service Conditions

1. The Station connected to port #0 of PA-CFTW, and port #0/#8/#16/#24 of CH-CFTA/PA-CFTV becomes the Conference Leader.

2. While the Conference Unit provides for amplification, the condition of Central Office Connections will affect Conference transmission.

3. Each Conference Unit provides up to an/four 8-Party Conference, two 16-Party Conference, or 32-Party Conference.
4. Conference Unit extension numbers should be placed in a STATION HUNTING [S-7, 8, 9] Group with only the pilot numbers published.
5. Override services, such as, BUSY VERIFICATION [B-3], ATTENDANT OVERRIDE [A-7], or EXECUTIVE RIGHT-OF-WAY [E-1] are denied on a Conference Call.
6. You can disconnect the conference call by going on-hook.
7. When a Conferee exits the conference call, the other members may hear Reorder Tone (ROT) for a short time.
8. While a Desktop terminal is connected to one of conference ports in a conference trunk, if a DSS key where a station number for another conference port is assigned is pressed by mistake, the call is transferred to the conference port whose station number is assigned to the DSS Key. Even after the Desktop terminal is released, the connection between these conference ports is retained, and the conference trunk becomes unavailable.
   To prevent this, do not assign station numbers for conference ports on any DSS keys.

   Note: When assigning station numbers for conference ports on DSS keys is required for any operational reasons, set different tenant numbers to a Desktop terminal and a conference trunk respectively, and restrict TRI=0 (station within OGTN calls to a station within TMTN) in the ATNR command for tenants where the conference ports belong.

Programming

STEP 1: **ASYD** - Assign System Data, SYS1.
Index 20, Bit 6=0 (Line Circuit Reverse Relay Control when Reorder Tone is connected to a station/trunk.)
Index 64, Bit 0: Assign the compression method (0/1 = μ-law/A-law)

STEP 2: **ANPD** - A Number Level must be reserved for Station Numbering Plan. In an existing system, a Station Level will already be established. If a vacant Level does exist, it may be used to create two or three digit Station Numbering. For example:
TN: 1 DC: 3 CI: Select Normal Service (N), Hooking Service (H) or Busy Service (B) from the combo box for Connection Indexes.NND: 1BLF: 1-On

STEP 3: **ASPA** - For the desired Station Numbering assign SRV = “STN: Station Number”. For example:
ACC: 3
CI: “N: Normal”, “H: Hooking”, “B: Busy”
SRV = “STN: Station Number”

STEP 4: **ASDT** - Assign all ports of the CH-CFTA/PA-CFTW/PA-CFTV as DP/PB Stations; TEC = 3. Based on the example data assignments in ANPD, the Station Numbers will reside in Level 3.

Example data assignments. (CH-CFTA located in PIR 0, Unit=1, Group = 00):

CH-CFTA Port	LENS	Station Number	TEC	SFC	RSC	Remarks
0	001000	3200	3	1	1	Conference Leader
1	001001	3201	3	1	1	Conference Participant Ports
2	001002	3202	3	1	1	
3	001003	3203	3	1	1	
↓	↓	↓	↓	↓	↓	
28	001034	3228	3	1	1	
29	001035	3229	3	1	1	
30	001036	3230	3	1	1	
31	001037	3231	3	1	1	

STEP 5: **ASHP** - Set the type of Station Hunting to “Pilot” for stations connected to conferee ports on the CH-CFTA/PA-CFTW/PA-CFTV card.

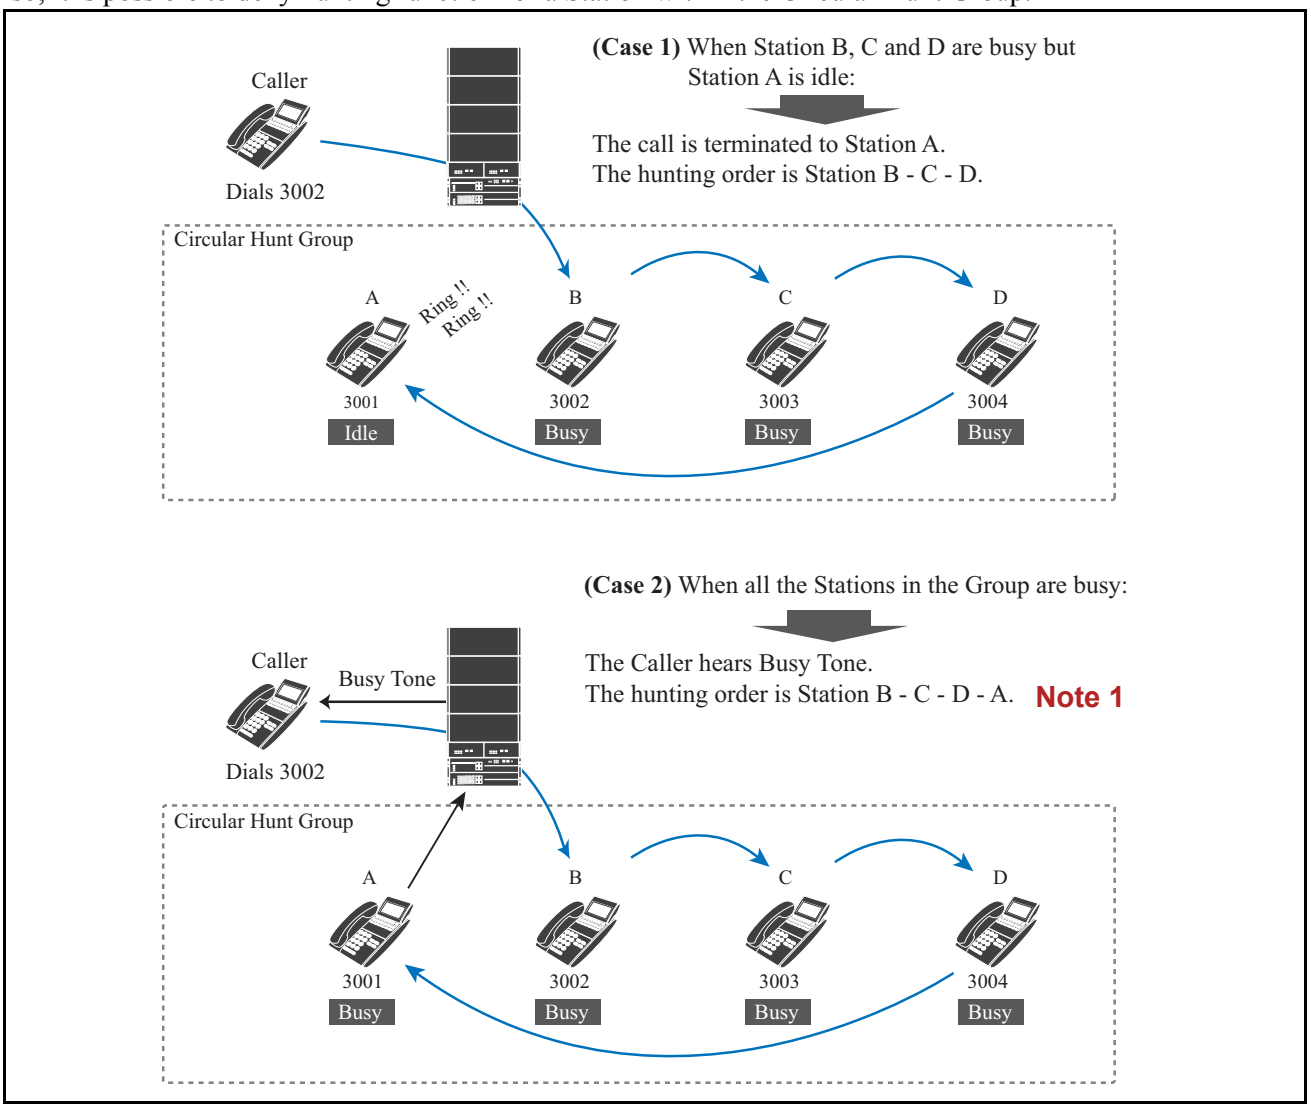
Example (CH-CFTA): Levels 1-7 (all the conferees ports)

TN: 1
STN: 3201
CNT: 7
STN: 3202, 3203, 3204, 3205, 3206, 3207... 3221

In this example, Ext. 3201 is the Pilot number of the Conference Bridge. Do not assign the Conference Leader to this group. Before or after all Conference participants are connected to the CFT, the Conference Leader directly calls the Conference Leader Port; for this example Ext. 3200.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, the AAED command is replaced by the AAEDN command). Note that the data setting for FCCS Service varies depending on the node.



STEP 1: **ALGSN** - Assign a Telephone Number to the entry of the physical station data created with the ASDT command.

STEP 2: **ASHPN** - Set the type of Station Hunting to “Pilot for NDM” for stations connected to conferee ports on the CH-CFTA/PA-CFTW/PA-CFTV card.

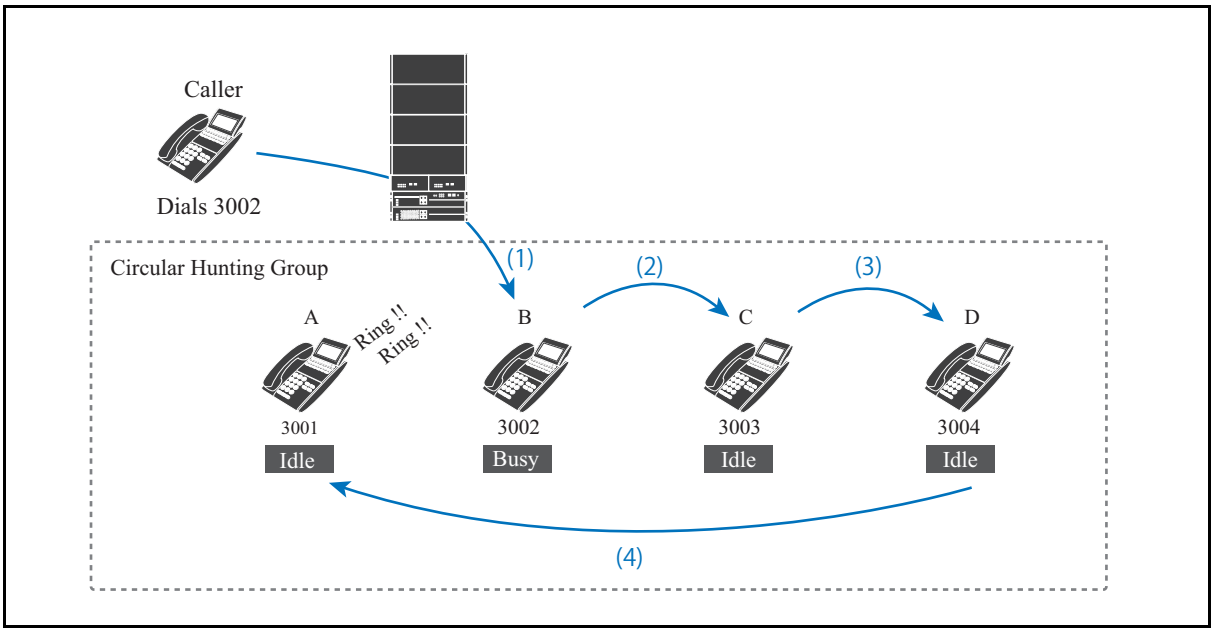
S-7 Station Hunting - Circular

General Description

This feature permits a call directed to a Busy Station of a Circular Hunt Group to be automatically forwarded to other Stations within the Hunt Group, in a programmed order. The call arrives to one of the Stations of the group and, if it is in a busy state, the call is transferred to the next Station in the programmed order until it finds an idle Station that rings. For example, as illustrated in the following figure, if a call is placed to Station B and Station B is busy, the call is forwarded to Station C and so on. If all Stations are busy, the caller hears Busy Tone.
Also, it is possible to deny hunting function for a Station within the Circular Hunt Group.

Note 1: If a secretarial Station is assigned for the Circular Hunt Group and all the Stations in the Circular Hunt Group are busy, the call is forwarded to the secretarial Station. For the secretarial Station, see STATION HUNTING - SECRETARIAL [S-8].

Note: In this feature, Busy means the Station cannot receive a call (because of reasons such as talking, receiving other call, do not disturb being set).



- TRANSFER OF UNANSWERED CALLS IN A HUNT GROUP

When the caller dials a Station in the Circular Hunt Group, the call arrives to a Station within the Circular Hunt Group, and the Station does not reply within a programmed period of time, the call can be transferred to another idle Station.

Note: Transfer of unanswered calls is available from FP95-114 V4 Issue 4.0.

As for the transfer of an unanswered call in a Circular Hunt Group, the figure below gives an example for the transfer pattern with the following steps.

1. A call is made to Station B.
2. Station B is busy, the call is transferred to the first idle station in the hunting order (Station C).
3. The call remains unanswered within a programmed period of time and is transferred to the next idle Station in the hunting order (Station D).
4. The call remains unanswered within a programmed period of time and is transferred to the next idle Station in the hunting order (Station A).

Note: In the example above, if all the Stations enter in a busy state, the call is transferred to a Secretarial Station if it has been set. For the Secretarial Station, see STATION HUNTING - SECRETARIAL [S-8].

Operating Procedure

No manual operation is required.

Service Conditions

<Important Notices>

1. Station Number can belong to one Hunt Group only, it cannot belong to another Hunt Group including that for STATION HUNTING - CIRCULAR [S-7], STATION HUNTING - TERMINAL [S-9], STATION HUNTING - PRIORITY [S-138], STATION HUNTING - PRIORITY WITH SWITCHBACK [S-139] or UNIFORM CALL DISTRIBUTION (UCD) [U-1].
2. A station can be assigned to a different Hunt Group by the Physical Station Number (DM) and the Telephone Number (LDM or NDM). For that reason, a Station already assigned to a Hunt Group that uses Physical Station Number (DM) can be also assigned to other Hunt Group that uses the Telephone Number (LDM or NDM). Also, when a Physical Station Number (DM) and Telephone Number (LDM or NDM) are identical, priority is attached to the Telephone Number (LDM or NDM). However, it is not possible to assign the same Physical Station Number or the same Telephone Number to more than one Hunt Group.

<Interactions with Other Features>

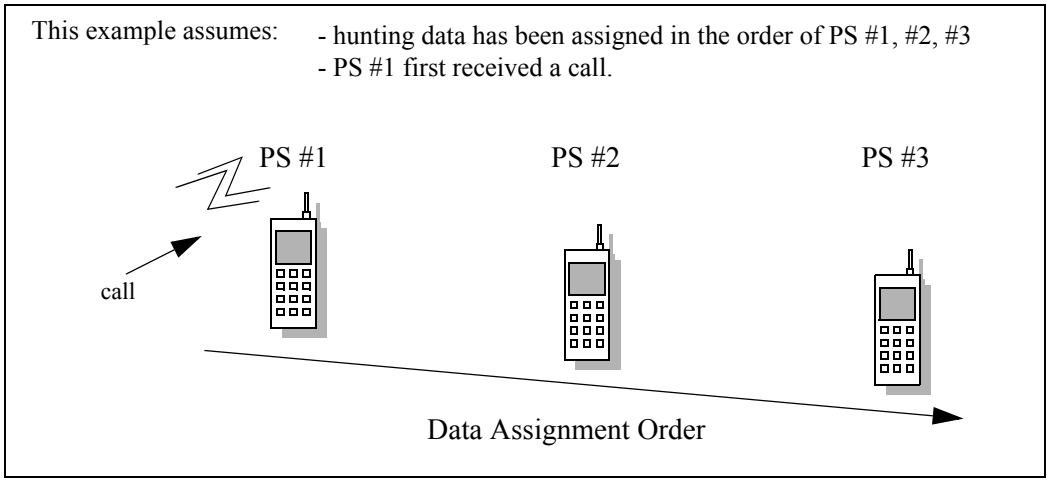
1. If the Station of a Hunt Group is in the following states or the following features are set in the Station of a Hunt Group, the following occurs.

   - **A**: The feature is activated and the call is forwarded.
   - **S**: The Station is skipped.

Feature/State	Direct Call to the Station	Call Transfered to the Station in the Hunting
CALL FORWARDING - ALL CALLS [C-5]	**A** Note 2	**S**
DO NOT DISTURB [D-11]	**S**	**S**
BUSY STATION	**S**	**S**
BUSY STATION + CALL FORWARDING - BUSY LINE [C-2]	**A** Note 2, Note 3	**S**
BUSY STATION + CALL FORWARDING - BUSY LINE [C-2] set with the ACFO/ACFOL/ACFON command (on a tenant/route basis)	**S**	**S**
LOGGED OUT STATION	**S**	**S**
LOGGED OUT STATION + LOGGED OUT IP STATION - CALL DESTINATION [L-53]	**A**	**S**
LOGGED OUT STATION + LOGGED OUT IP STATION - CALL DESTINATION [L-53] set with the ACFO/ACFOL/ACFON command (on a tenant/route basis)	**S**	**S**

Note 2: If CALL FORWARDING - OVERRIDE [C-26] is set to the forwarding destination, the call forwarding overriding from the forwarding destination to the Station of the Hunt Group will hunt if the Station of the Hunt Group is busy.

Note 3: When a call to a station in a Hunt Group is forwarded by CALL FORWARDING - BUSY LINE [C-2] and the forwarded party (also a member of another Hunt Group) is also busy, the resultant hunt target can be designated from the forwarding side Hunt Group or the forwarded side Hunt Group. This can be specified with ASYD/ASYDN SYS1 Index 69 Bit 5.



2. A Phantom Number can be assigned to the Station of a Hunt Group. However, when a caller dials the Phantom Number, hunting does not occur for the Station that receives the call.
3. Recall to a Station in the Hunt Group from the following features will not hunt:
   - CALL BACK [C-1]
   - CALL HOLD [C-6]
   - OUTGOING TRUNK QUEUING [O-2]

- PAGING TRANSFER [P-10]

4. For STATION MESSAGE DETAIL RECORDING [S-10] the number recorded is the Station Number where the call actually terminates.
5. HOTLINE [H-1] cannot be assigned to the Station of a Hunt Group.

<Hardware/Software>

1. A call from ATTENDANT CONSOLE [A-3] will not hunt.
2. The conditions when using PS are as follows:
   a.) If a call terminates to a PS in the Hunt Group while the PS is Out of Zone or its power is OFF, whether the call is processed as PS Out of Zone or hunting is executed is determined by System Data (ASYDL, SYS 1, Index 688, b0). When using this feature in an FCCS environment, assign the same data value to the system data in each node.
   b.) When hunting is selected in the system data, the caller hears no tone until the hunted PS answers. Total length of no tone is obtained by the following.
      - Time for Detecting Out of Zone (Maximum eight seconds) × Number of Hunting
   c.) When a Desk Console operator dials the number of PS that belongs a Hunt Group, the hunting is not available if the PS is Out of Zone.
   d.) When receiving an analog PSTN incoming call while all PSs in the Hunt Group are Out of Zone, the call processing will be stopped after detecting Out of Zone of the last PS in the Hunt Group. At this time, the calling party will receive RBT when the call is a Direct In Termination call. If Automated Attendant is used, the calling party will receive ROT after No Tone. Note that the call cannot be terminated to the destination even if the PS returns to the zone during RBT.
   e.) When receiving an ISDN incoming call while all PSs in the Hunt Group are Out of Zone, hunting starts after calling up the destination. However, timeout will occur at Central Office side, resulting in ROT connection (hunting is not available).
   f.) If all Stations in the Hunt Group are busy or PS Out of Zone, the call can be forwarded a Station in the group. The station is called secretarial Station. The caller hears Busy Tone if the secretarial Station is also busy.
   g.) A PS can be assigned as a secretarial Station.
   h.) If a PS assigned as a secretarial Station is placed in Out of Zone, the caller hears Busy Tone.
   i.) A PS in the Hunt Group can set PS Out of Zone - Call Forwarding. When the PS has been set as able of hunting, the incoming call will be forwarded only if the call cannot terminate to any stations in the group. When the PS has not been set as able of hunting the call can be forwarded only if the PS is directly called.
   j.) When a PS in the Hunt Group performs roaming, the PS is skipped. However, the PS is a station that receives the call directly, it will be roaming call termination.
   k.) If a PS receiving a call turns to Out of Zone, this may cause a network failure. In this case, the caller hears Busy Tone.
   l.) The following shows call processing when Out of Zone or busy is involved for this feature.

When Hunting is selected (ASYDL, SYS1, INDEX 688, Bit 0 = 0)

PS #1	PS #2	PS #3	Processing
Out of Zone (Forwarding has been set)	Out of Zone	Out of Zone	After calling up PS #1, PS #2, PS #3, the forwarding destination is called.
Out of Zone (Forwarding has not been set)			After calling up PS #1, PS #2, PS #3, the caller receives ROT or Automatic Announcement Called PS Out of Zone.
Busy	Out of Zone	Out of Zone	After calling up PS #2 and PS #3, the caller receives Busy Tone.
Busy	Busy	Out of Zone	After calling up PS #3, the caller receives Busy Tone.

When Out of Zone Processing is selected (ASYDL, SYS 1, INDEX 688, Bit 0 = 1)

PS #1	PS #2	PS #3	Processing
Out of Zone (Forwarding has been set)	Out of Zone	Out of Zone	After calling up PS #1, the forwarding destination is called.
Out of Zone (Forwarding has not been set)			After calling up PS #1, the caller receives ROT or Automatic Announcement Called PS Out of Zone.
Busy	Out of Zone	Out of Zone	After calling up PS #2, the caller receives Busy Tone.
Busy	Busy	Out of Zone	After calling up PS #3, the caller receives Busy Tone.

<Conditions Specific to This Feature>

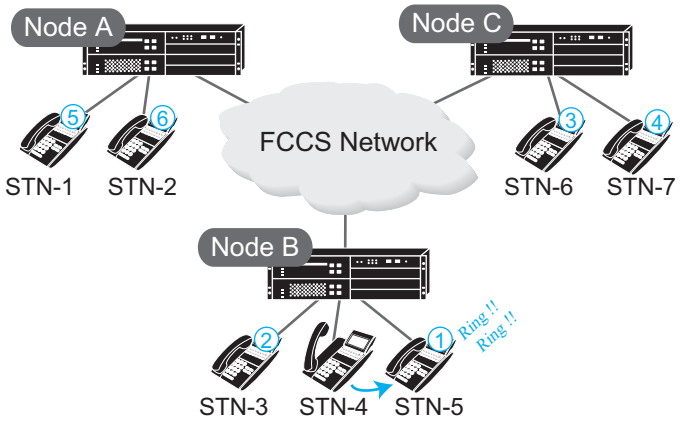
1. The maximum number of Stations per group is 100. The feature is usable with all Stations and there is no limit on the allowable number of Hunt Groups within a system.

2. This feature enables a Station within Hunt Group to deny hunting function for an Incoming Call originated from Station (including PS) (ASFC/ASFCN SFI 181 =1). The service conditions are as follows:
   a.) When CALL FORWARDING-DON'T ANSWER [C-5] is set, a call to the Station is forwarded according to their service condition.
   b.) When CALL FORWARDING-BUSY LINE [C-2] is set, a call to the Station is forwarded according to their service condition.
   c.) A call to the Phantom Number assigned to the Station will not hunt.
   d.) External Trunk (such as DDD (TCL = 1)/FX (TCL = 2)/WATS (TCL = 3), etc) is not available.

3. The conditions for the transfer of unanswered calls in a Hunt Group feature are as follows: **Note 4**

Note 4: Available from FP95-114 V4 Issue 4.0.

   a.) The feature is only possible for Hunt Groups with data assigned via Telephone Numbers (LDM or NDM).
   b.) Be aware that if there is a value set in Timer Value of No Answer Timer set in the ADAI command for a Station in the group it will have priority over the value set with ASYDL/ASYDN, SYS1 Index 1396. If no value is set for ADAI command or ASYDL/ASYDN, SYS1 Index 1396, other Timer Value of No Answer Timer (ASYD SYS1, Indexes 139, 140, 141, 247) will be used.
   c.) The display of a Station receiving an incoming call transfer based on this feature will be the same as in the case of CALL FORWARDING - DON'T ANSWER [C-3]. Also, in the case of other external devices, it will be treated in the same way.



d.) If other unanswered calls transfer features are set in a Station of this feature group, those other unanswered calls transfer features have priority over the transfer of unanswered calls in a Hunt Group feature.

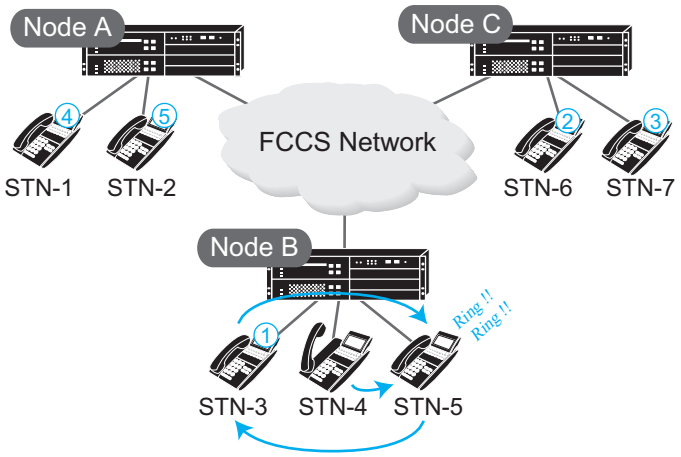
Priority Order	Transfer of Unanswered Calls in a Hunt Group Feature	
	Out of Service	In Service
1	CALL FORWARDING - DON'T ANSWER [C-3]	CALL FORWARDING - DON'T ANSWER [C-3]
2	-	CALL FORWARDING - BUSY LINE [C-2] **Note 5**
3	-	TRANSFER OF UNANSWERED CALLS IN A HUNT GROUP
4	CALL FORWARD BY SERVICE FEATURE CLASS [C-172]	CALL FORWARD BY SERVICE FEATURE CLASS [C-172]
5	CALL FORWARDING - DON'T ANSWER [C-3] set with the ACFO/ACFOL/ACFON command (on a tenant/route basis)	CALL FORWARDING - DON'T ANSWER [C-3] set with the ACFO/ACFOL/ACFON command (on a tenant/route basis)

Note 5: The Station with the incoming call is treated as Busy Station and the call is transfered.

FCCS Conditions

1. When activating this feature between nodes via FCCS, use only Hunt Groups assigned with Telephone Number (NDM).
2. Stations in up to four different nodes can be assigned to a Hunt Group.
   When the Hunt Group includes more than one node, the [Group by FPC] button of ASHCN must be used to set the order of the nodes in the Hunt Group. Without this node order grouping assignment, data cannot be assigned.
3. When Stations belonging to different nodes are assigned to a Hunt Group, the assigned order of the Stations and the actual order of the hunting may be different. The below explains the hunting order following an FCCS operations example.
   a.) Hunting takes place inside the node of the Station that first received the call (Node B).
   b.) In the case that not all the Stations inside the node (Node B) of the Station that first received the call are busy, hunting takes place inside the node (Node B) of the Station that first received the call.
   c.) In the case that all the Stations inside the node (Node B) of the Station that first received the call are busy, hunting takes place in the next node (Node C) of the office data order.

	Node A		Node B			Node C	
	STN-1	STN-2	STN-3	STN-4 Note 6	STN-5	STN-6	STN-7
Assigned Hunting order by the office data	1	2	3	4	5	6	7
Actual Hunting order	5	6	2	(Busy)	1 (Ringing)	3	4



Note 6: This is the Station that first receives the call.

Note: The below explains the hunting order following an FCCS operations example when the transfer of unanswered calls in a Hunt Group is used.

a.) Hunting and transfer of unanswered calls takes place inside the node of the Station that first received the call (Node B).

b.) In the case that not all the Stations inside the node (Node B) of the Station that first received the call are busy, hunting and transfer of unanswered calls takes place inside the node (Node B) of the Station that first received the call.

c.) In the case that all the Stations inside the node (Node B) of the Station that first received the call are busy, hunting and transfer of unanswered calls takes place in the next node (Node C) of the office data order.

	Node A		Node B			Node C	
	STN-1	STN-2	STN-3	STN-4 Note 7	STN-5	STN-6	STN-7
Assigned Hunting order by the office data	1	2	3	4	5	6	7
Actual Hunting order (incoming call)	4	5	1	(Busy)	(Ringing)	2	3
Actual Hunting order (transfer 1)	4	5	(Ringing)	(Busy)	1	2	3
Actual Hunting order (transfer 2)	4	5	1	(Busy)	(Ringing)	2	3

Note 7: This is the Station that first receives the call.

4. The Incoming Call terminated between nodes via FCCS to a Station in the Hunt Group programmed by the Physical Station Number, is not hunted.

Programming

<When using Physical Station Numbers for creating the Hunt Group>

STEP 1: **ASYD** - Assign the following system data.
System Data 1, Index 69, Bit 5: Hunt Group when transferred party is busy (Station Hunting after Call Forwarding.-Busy Line):
0 = Hunt in Transferring Party's Hunt Group
1 = Hunt in Transferred Party's Hunt Group

STEP 2: **ASHC** - Assign the required data for the Hunt Group.
TN: Tenant Number
STN: Physical Station Number **Note 9**
SECRETARY STN:Physical Station Number of the Secretarial Station **Note 8**
[Station List in Group]
STN: Physical Station Numbers of the Stations included in the Hunt Group. **Note 9**

Note: Assignment of Numbers to a Circular Hunt Group may be in any order.

Note 8: If secretarial Station is used, assign the Physical Station Number of the Station used as such secretarial Station.

Note 9: Do not enter Phantom Number.

STEP 3: **ASFC** - (Optional) Assign the following Service Feature Restriction when hunting must be denied.
SFI 181 =1 (No Hunting to next station in group)

<When using Telephone Numbers for creating the Hunt Group>

Note: The following programming supposes that Telephone Numbers have been already assigned and does not include such data settings.

STEP 1: **ASYD/ASYDN** - Assign the following system data.
System Data 1, Index 69, Bit 5: Hunt Group when transferred party is busy (Station Hunting after C.F.-Busy Line):
0 = Hunt in Transferring Party's Hunt Group
1 = Hunt in Transferred Party's Hunt Group

STEP 2: **ASYDL** - (Optional) Assign the following System Data.
System Data 1, Index 688, Bit 0. Specify whether hunting is activated or not if the called PS is Out of Zone.
0 = Hunting
1 = PS Out of Zone processing

Note: Assign this data if PS is used in the Hunt Group.

STEP 3: **ASHCL/ASHCN** - Assign the required data for the Hunt Group.
UGN: User Group Number
TELN: Telephone Number in the Hunt Group **Note 11**
SECRETARY TELN:Secretary Telephone Number **Note 10**
[Station List in Group]
TELN: Telephone Numbers of the Stations included in the group. **Note 11**

Note: Assignment of Numbers to a Circular Hunt Group may be in any order.

Note 10: If secretarial Station is used, assign the Telephone Number of the Station used as such secretarial Station.

Note 11: Do not enter Phantom Number.

STEP 4: **ASFCN** - (Optional) Assign the following Service Feature Restriction when hunting must be denied.
SFI 181 =1 (No Hunting to next station in group)

<When activating the transfer of unanswered calls in a Circular Hunt Group> Note 12

STEP 5: **ASYD** - Assign the following System Data.
System Data 1, Index 69, Bit 0= 1 (No Recall, or execution of Call Forwarding –Don't Answer (when CF – Don't Answer is set at the transfer destination station)).
System Data 1, Index 69, Bit 1 (Send short tone when a call forwarded via CF – All Calls/Logout service is answered.)
0 = Not Required
1 = Required
System Data 2, Index 6, Bit 7 (CF-Don't Answer service when Attendant Console transfers call before

called station answers)
0 = Out of service (Recall to Attendant Console)
1 = In service

STEP 6: **ASYDL/ASYDN** - Assign the following System Data.
System Data 1, Index 1395, Bit 1=1 (transfer of unanswered calls in a Circular Hunt Group in service). **Note 12**
System Data 1, Index 1396= set the no answer timer for the transfer of unanswered calls in a Hunt Group. **Note 12**
Bit 0 - 3: 1 - F= MTC
Bit 4 - 6: 0 - 7= TC
TC: Timer Class, MTC: Miscellaneous Timer Counter
TC = 0: -
1: -
2: -
3: 2 seconds
4: 30 seconds
5: -
6: -
7: -

Note: Default value for this data is HEX 00 (data is not set). If data is not set, other Timer Value of No Answer Timer (ASYD SYS1, Indexes 139, 140, 141, 247) will be used.

Note: Do not assign "0" for MTC value when TC = 3 or 4.

Note: Assigned time will be used for all the Hunt Groups to which is available (Circular, Terminal, Priority), it cannot be set separately according to the type of Hunt Group.

Note: The time will be used for the transfer of unanswered calls regardless of whether transfer of unanswered calls in a Circular Hunt Group is in service or not.

Note 12: Available from FP95-114 V4 Issue 4.0.

STEP 7: **ASFC/ASFCN** - Assign the following Service Feature Restrictions.
SFI 8=1 (Call Forwarding-Don't Answer allowed).
SFI 103 (Assignment of No Answer Timer for Blind Transfer to Station/Blind Transfer to Attendant) **Note 13**
0 = Restricted (settings in ASYD, System Data 1, Index 140)
1 = Allowed (settings in ASYD, System Data 1, Index 247)
SFI 104 (Processing when the transferred station does not answer for a predetermined period of time in Blind Transfer) **Note 14**
0 = Transferred station continuously rings
1 = The transferred call is forwarded when Call Forwarding-Don't Answer is assigned at the transferred station and no-answer timer expires

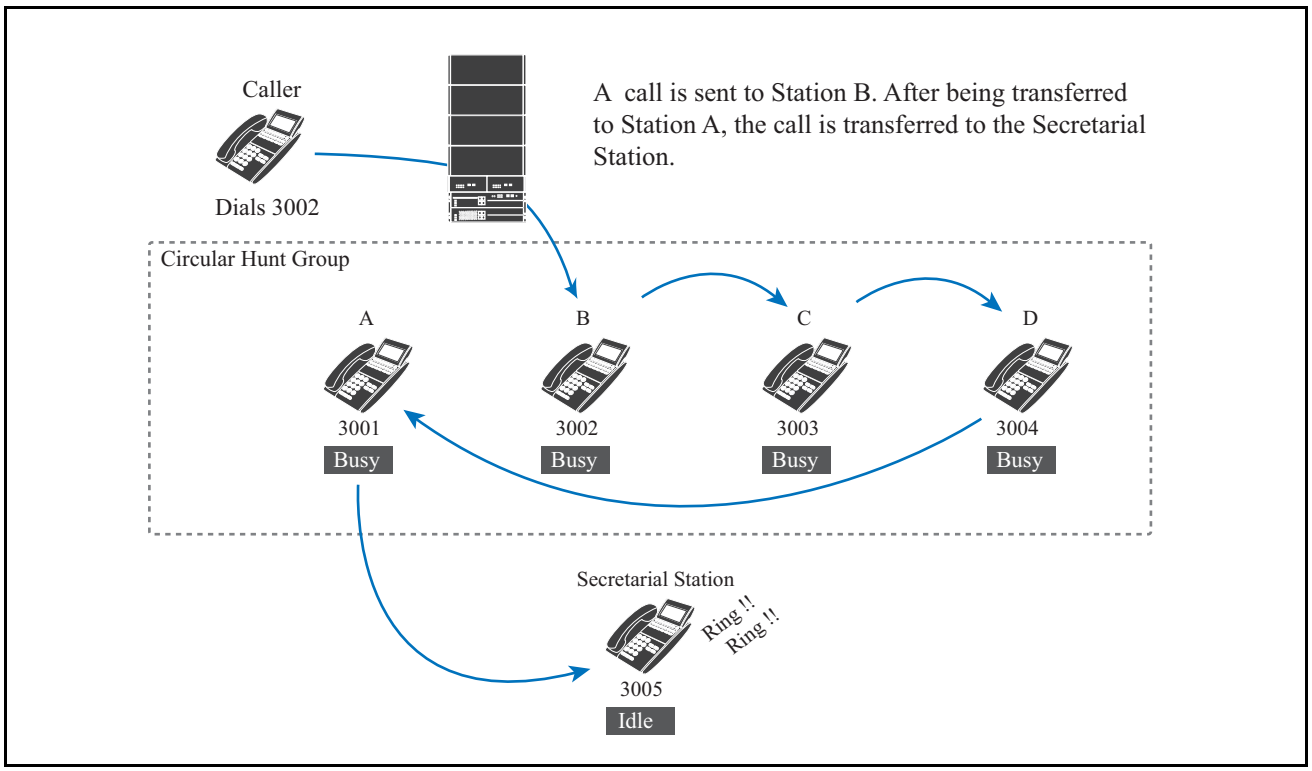
Note 13: The time set for a Station with ASYDL/ASYDN System Data 1, Index 1396 (no answer timer for the transfer of unanswered calls in a Hunt Group) will be given priority.

Note 14: Set to 1 if the terminal in the Hunt Group is the destination of BLIND TRANSFER TO STATION [B-18].

STEP 8: **ATNR** - Assign the following Tenant Restriction Class.
TRI 0=1 (Station within OGTN calls to a station within TMTN allowed).
TRI 1=1 (Station within OGTN sets Call Forwarding-All Calls / Busy Line / Don't Answer/Logout to a station within TMTN allowed).

STEP 9: **ACFR/ACFRN** - Assign the following Call Forwarding Restriction:
CCI 8=1 (Call Forwarding-Don't Answer allowed).

S-8 Station Hunting - Secretarial



General Description

This feature, when all the Stations in the Hunt Group are busy, allows to the call of a Hunt Group to be hunted by one Station outside the Hunt Group. This Station is called the secretarial Station. If all the Stations in the Hunt Group and the secretarial Station are busy, the caller hears Busy Tone. The types of Hunt Groups that can use a secretarial Station are as follows:

- STATION HUNTING - CIRCULAR [S-7]
- STATION HUNTING - TERMINAL [S-9]
- STATION HUNTING - PRIORITY [S-138]
- STATION HUNTING - PRIORITY WITH SWITCHBACK [S-139]

Note: This feature is not a Boss - Secretary feature.

The following is an example of a secretarial Station used in a Circular Hunt Group.

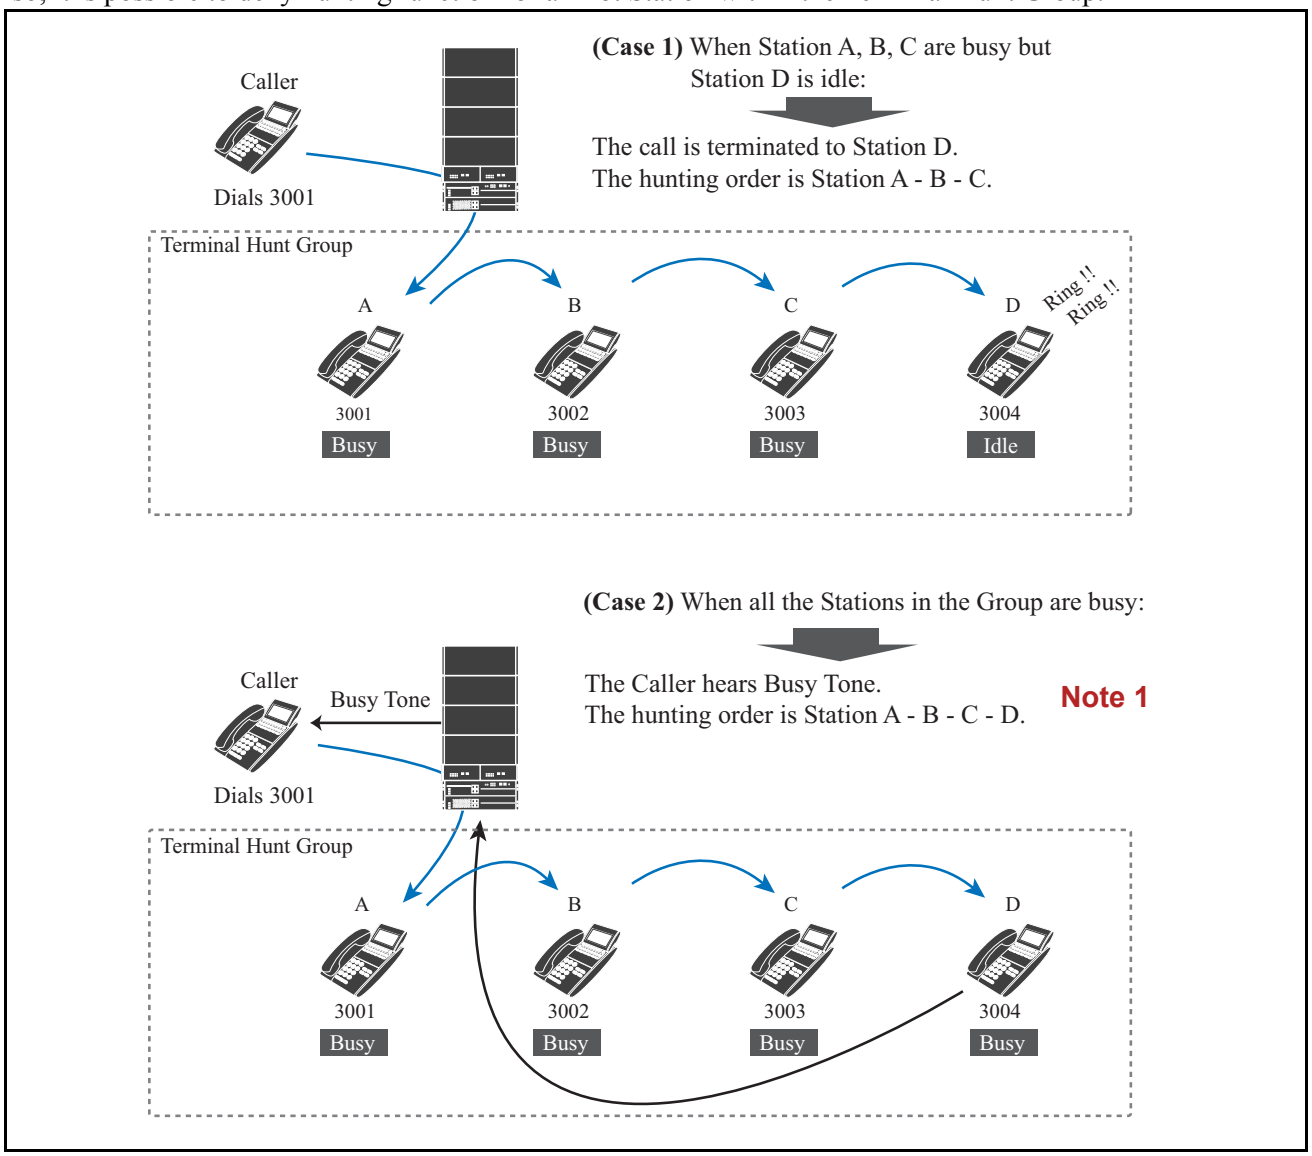
Operating Procedure

No manual operation is required.

Service Conditions

1. A Hunt Group (Terminal, Circular, Priority, Switchback) may have one secretarial Station. A Station already assigned to a Hunt Group cannot be assigned as the secretarial Station outside the Hunt Group.
2. The secretarial Station can be shared with multiple Hunt Groups.

3. The maximum number of secretarial Stations that can be assigned per system differs depending of using the Physical Station Number (DM) or the Telephone Number (LDM or NDM).
    - Physical Station Number (DM): 256 secretarial Stations
    - Telephone Number (LDM or NDM): 4,096 secretarial Stations
4. The secretarial Station is not counted as one of the 100 allowed Stations per Hunt Group.
5. As the Hunt Groups can be created with the Physical Station Number (DM) or the Telephone Number (LDM or NDM), the secretarial Station must be respectively assigned with the Physical Station Number (DM) or the Telephone Number (LDM or NDM).



Programming

See STATION HUNTING-CIRCULAR [S-7], STATION HUNTING-TERMINAL [S-9], STATION HUNTING - PRIORITY [S-138], STATION HUNTING - PRIORITY WITH SWITCHBACK [S-139]. These types of Station hunting use secretarial Stations.

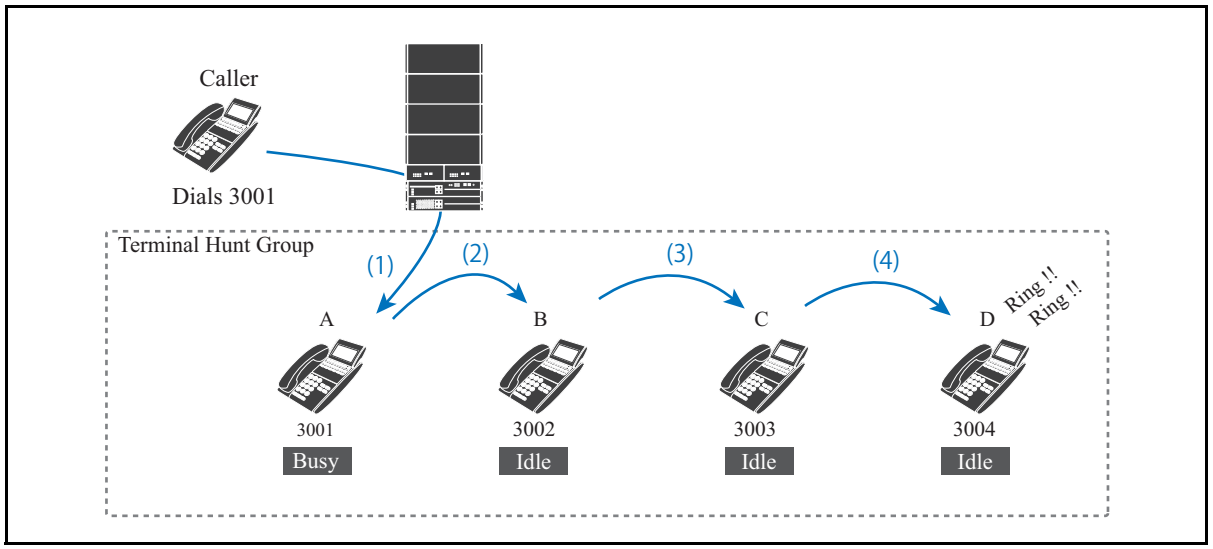
S-9 Station Hunting - Terminal

General Description

This feature permits a call to be processed automatically through a Terminal Hunt Group of busy Stations, in a programmed order. The call arrives to a specific Station of the group (the Pilot Station) and, if it is in a busy state, the call is transferred to the next Station in the programmed order until it finds an idle Station that rings. For example, as illustrated in the following figure, if a call is placed to Pilot Station A and Station A is busy, the call is forwarded to Station B and so on. If all Stations are busy, the caller hears Busy Tone.
Also, it is possible to deny hunting function for a Pilot Station within the Terminal Hunt Group.

Note 1: If a secretarial Station is assigned for the Hunt Group, the call is forwarded to the secretarial Station. For the secretarial Station, see STATION HUNTING - SECRETARIAL [S-8].

Note: In this feature, Busy means the Station cannot receive a call (because of reasons such as talking, receiving other call, do not disturb being set).



- TRANSFER OF UNANSWERED CALLS IN A HUNT GROUP

When the caller dials the Pilot Station in the Terminal Hunt Group, the call arrives to a Station within the Terminal Hunt Group, and the Station does not reply within a programmed period of time, the call can be transferred again to another idle Station.

Note: Transfer of unanswered calls is available from FP95-114 V4 Issue 4.0.

As for the transfer of an unanswered call in a Terminal Hunt Group, the figure below gives an example for the transfer pattern with the following steps.

1. A call is made to the Pilot Station (Station A).
2. Station A is busy, the call is transferred to the first idle station in the hunting order (Station B).
3. The call remains unanswered within a programmed period of time and is transferred to the next idle Station in the hunting order (Station C).
4. The call remains unanswered within a programmed period of time and is transferred to the next idle Station in the hunting order (Station D).

Note: In the example above, the call may be transferred to a secretarial Station if it has been set. For the secretarial Station, see STATION HUNTING - SECRETARIAL [S-8].

Operating Procedure

No manual operation is required.

Service Conditions

<Important Notices>

1. Station Number can belong to one Hunt Group only, it cannot belong to another Hunt Group including that for STATION HUNTING - CIRCULAR [S-7], STATION HUNTING - TERMINAL [S-9], STATION HUNTING - PRIORITY [S-138], STATION HUNTING - PRIORITY WITH SWITCHBACK [S-139] or UNIFORM CALL DISTRIBUTION (UCD) [U-1].
2. A station can be assigned to a different Hunt Group by the Physical Station Number (DM) and the Telephone Number (LDM or NDM). For that reason, a Station already assigned to a Hunt Group that uses Physical Station Number (DM) can be also assigned to other Hunt Group that uses the Telephone Number (LDM or NDM). Also, when a Physical Station Number (DM) and Telephone Number (LDM or NDM) are identical, priority is attached to the Telephone Number (LDM or NDM). However, it is not possible to assign the same Physical Station Number or the same Telephone Number to more than one Hunt Group.

<Interactions with Other Services>

1. If the Station of a Hunt Group is in the following states or the following features are set in the Station of a Hunt Group, the following occurs.

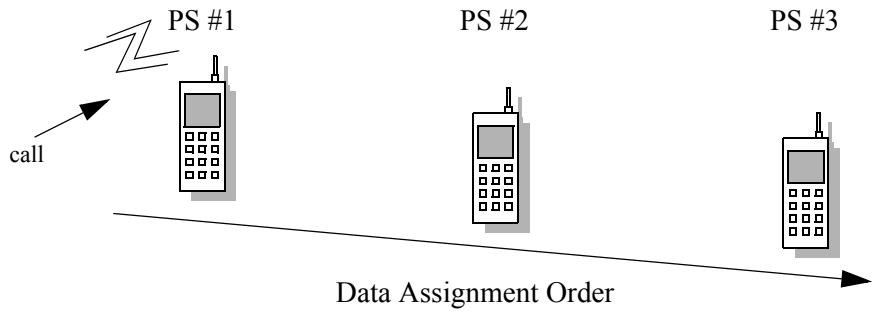
   - **A**: The feature is activated and the call is forwarded.
   - **S**: The Station is skipped.

Feature/State	Direct Call to the Pilot Station	Call Transfered to the Station in the Hunting
CALL FORWARDING - ALL CALLS [C-5]	**A** Note 2	**S**
DO NOT DISTURB [D-11]	**S**	**S**
BUSY STATION	**S**	**S**
BUSY STATION + CALL FORWARDING - BUSY LINE [C-2]	**A** Note 2, Note 3	**S**
BUSY STATION + CALL FORWARDING - BUSY LINE [C-2] set with the ACFO/ACFOL/ACFON command (on a tenant/route basis)	**S**	**S**
LOGGED OUT STATION	**S**	**S**
LOGGED OUT STATION + LOGGED OUT IP STATION - CALL DESTINATION [L-53]	**A**	**S**
LOGGED OUT STATION + LOGGED OUT IP STATION - CALL DESTINATION [L-53] set with the ACFO/ACFOL/ACFON command (on a tenant/route basis)	**S**	**S**

Note 2: If CALL FORWARDING- OVERRIDE [C-26] is set in the transfer destination of Pilot Station, the call forwarding overriding from the forwarding destination to the Station of the Hunt Group will hunt if the Station of the Hunt Group is busy.

Note 3: When a call to a station in a Hunt Group is forwarded by CALL FORWARDING - BUSY LINE [C-2] and the forwarded party (also a member of another Hunt Group) is also busy, the resultant hunt target can be designated from the forwarding side Hunt Group or the forwarded side Hunt Group. This can be specified with ASYD/ASYDN SYS1 Index 69 Bit 5.

2. A Phantom Number can be assigned to the Pilot Station of a Hunt Group. However, when a caller dials the Phantom Number, hunting does not occur for the Station that receives the call.
3. Recall to a Station in the Hunt Group from the following features will not hunt:
   - CALL BACK [C-1]
   - CALL HOLD [C-6]
   - OUTGOING TRUNK QUEUING [O-2]



- PAGING TRANSFER [P-10]

4. For STATION MESSAGE DETAIL RECORDING [S-10] the number recorded is the Station Number where the call actually terminates.
5. HOTLINE [H-1] cannot be assigned to the Station of a Hunt Group.

<Hardware/Software>

1. A call from ATTENDANT CONSOLE [A-3] will not hunt.
2. The conditions when using PS are as follows:
   a.) If a call terminates to a PS in the Hunt Group while the PS is Out of Zone or its power is OFF, whether the call is processed as PS Out of Zone or hunting is executed is determined by System Data (ASYDL, SYS 1, Index 688, b0). When using this feature in an FCCS environment, assign the same data value to the system data in each node.
   b.) When hunting is selected in the system data, the caller hears no tone until the hunted PS answers. Total length of no tone is obtained by the following.
      - Time for Detecting Out of Zone (Maximum eight seconds) × Number of Hunting
   c.) When a Desk Console operator dials the number of PS that belongs a Hunt Group, the hunting is not available if the PS is Out of Zone.
   d.) When receiving an analog PSTN incoming call while all PSs in the Hunt Group are Out of Zone, the call processing will be stopped after detecting Out of Zone of the last PS in the Hunt Group. At this time, the calling party will receive RBT when the call is a Direct In Termination call. If Automated Attendant is used, the calling party will receive ROT after No Tone. Note that the call cannot be terminated to the destination even if the PS returns to the zone during RBT.
   e.) When receiving an ISDN incoming call while all PSs in the Hunt Group are Out of Zone, hunting starts after calling up the destination. However, timeout will occur at Central Office side, resulting in ROT connection (hunting is not available).
   f.) If all Stations in the Hunt Group are busy or PS Out of Zone, the call can be forwarded a Station in the group. The station is called secretarial Station. The caller hears Busy Tone if the secretarial Station is also busy.
   g.) A PS can be assigned as a secretarial Station.
   h.) If a PS assigned as a secretarial Station is placed in Out of Zone, the caller hears Busy Tone.
   i.) A PS in the Hunt Group can set PS Out of Zone - Call Forwarding. When the PS has been set as Pilot Station, the incoming call will be forwarded only if the call cannot terminate to any stations in the group. When the PS has not been set as Pilot Station can be forwarded only if the PS is directly called.
   j.) When a PS in the Hunt Group performs roaming, the PS is skipped. However, the PS is a station that receives the call directly, it will be roaming call termination.
   k.) If a PS receiving a call turns to Out of Zone, this may cause a network failure. In this case, the caller hears Busy Tone.
   l.) The following shows call processing when Out of Zone or busy is involved for this feature.

This example assumes: - hunting data has been assigned in the order of PS #1, #2, #3
- PS #1 first received a call.

When Hunting is selected (ASYDL, SYS1, INDEX 688, Bit 0 = 0)

PS #1	PS #2	PS #3	Processing
Out of Zone (Forwarding has been set)	Out of Zone	Out of Zone	After calling up PS #1, PS #2, PS #3, the forwarding destination is called.
Out of Zone (Forwarding has not been set)			After calling up PS #1, PS #2, PS #3, the caller receives ROT or Automatic Announcement Called PS Out of Zone.
Busy	Out of Zone	Out of Zone	After calling up PS #2 and PS #3, the caller receives Busy Tone.
Busy	Busy	Out of Zone	After calling up PS #3, the caller receives Busy Tone.

When Out of Zone Processing is selected (ASYDL, SYS 1, INDEX 688, Bit 0 = 1)

PS #1	PS #2	PS #3	Processing
Out of Zone (Forwarding has been set)	Out of Zone	Out of Zone	After calling up PS #1, the forwarding destination is called.
Out of Zone (Forwarding has not been set)			After calling up PS #1, the caller receives ROT or Automatic Announcement Called PS Out of Zone.
Busy	Out of Zone	Out of Zone	After calling up PS #2, the caller receives Busy Tone.
Busy	Busy	Out of Zone	After calling up PS #3, the caller receives Busy Tone.

<Conditions Specific to This Feature>

1. The Pilot Station is the first Station programmed in the ASHP/ASHPN/ASPHN command.
2. Only calls to the Pilot Station will cause the hunting sequence to operate. Calls to busy Stations, other than the Pilot Station, will receive a Busy Tone.

3. The maximum number of Stations per group is 100. The feature is usable with all Stations and there is no limit on the allowable number of Hunt Groups within a system.
4. This feature enables a Pilot Station within Hunt Group to deny hunting function for an Incoming Call originated from Station (including PS) (ASFC/ASFCN SFI 181 =1). The service conditions are as follows:
   a.) When CALL FORWARDING-DON'T ANSWER [C-5] is set, a call to the Pilot Station is forwarded according to their service condition.
   b.) When CALL FORWARDING-BUSY LINE [C-2] is set, a call to the Pilot Station is forwarded according to their service condition.
   c.) A call to the Phantom Number assigned to the Station will not hunt.
   d.) External Trunk (such as DDD (TCL = 1)/FX (TCL = 2)/WATS (TCL = 3), etc) is not available.

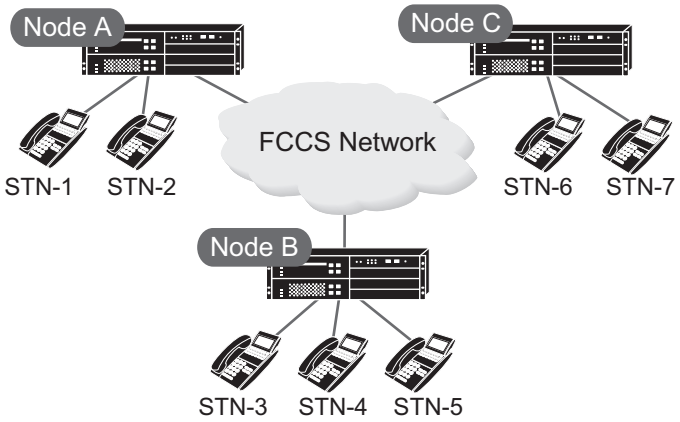
5. The conditions for the transfer of unanswered calls in a Hunt Group feature are as follows: **Note 4**

Note 4: Available from FP95-114 V4 Issue 4.0.

   a.) The feature is only possible for Hunt Groups with data assigned via Telephone Numbers (NDM or NDM).
   b.) The feature will be activated only for calls to the Pilot Station. Calls to other Stations of the Hunt Group will not be transferred.
   c.) Be aware that if there is a value set in Timer Value of No Answer Timer set in the ADAI command for a Station in the group it will have priority over the value set with ASYDL/ASYDN, SYS1 Index 1396. If no value is set for ADAI command or ASYDL/ASYDN, SYS1 Index 1396, other Timer Value of No Answer Timer (ASYD SYS1, Indexes 139, 140, 141, 247) will be used.
   d.) The display of a Station receiving an incoming call transfer based on this feature will be the same as in the case of CALL FORWARDING - DON'T ANSWER [C-3]. Also, in the case of other external devices, it will be treated in the same way.

e.) If other unanswered calls transfer features are set in a Station of this feature group, those other unanswered calls transfer features have priority over the transfer of unanswered calls in a Hunt Group feature.

Priority Order	Transfer of Unanswered Calls in a Hunt Group Feature	
	Out of Service	In Service
1	CALL FORWARDING - DON'T ANSWER [C-3]	CALL FORWARDING - DON'T ANSWER [C-3]
2	-	CALL FORWARDING - BUSY LINE [C-2] **Note 5**
3	-	TRANSFER OF UNANSWERED CALLS IN A HUNT GROUP
4	CALL FORWARD BY SERVICE FEATURE CLASS [C-172]	CALL FORWARD BY SERVICE FEATURE CLASS [C-172]
5	CALL FORWARDING - DON'T ANSWER [C-3] set with the ACFO/ACFOL/ACFON command (on a tenant/route basis)	CALL FORWARDING - DON'T ANSWER [C-3] set with the ACFO/ACFOL/ACFON command (on a tenant/route basis)

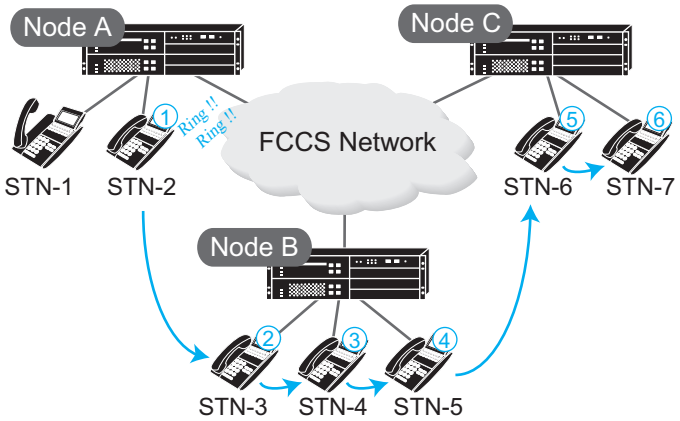


Note 5: The Station with the incoming call is treated as Busy Station and the call is transfered.

f.) When using this feature, do not include in the Hunt Group the following type of terminals except as the Pilot Station:

- PS
- SP Controlled SIP terminal

FCCS Conditions



1. When activating this feature between nodes via FCCS, use only Hunt Groups assigned with Telephone Number (NDM).
2. Stations in up to four different nodes can be assigned to a Hunt Group.
   When the Hunt Group includes more than one node, the [Group by FPC] button of ASHPN must be used to set the order of the nodes in the Hunt Group. Without this node order grouping assignment, data cannot be assigned.
3. The Hunting order when the Hunt Group is created across more than one Node is as follows.

	Node A		Node B			Node C	
	STN-1 Note 6	STN-2	STN-3	STN-4	STN-5	STN-6	STN-7
Assigned Hunting order by the office data	1	2	3	4	5	6	7
Actual Hunting order	(Busy)	1	2	3	4	5	6

Note 6: This is the Pilot Station.

Note: The following is the hunting order in the case of the transfer of unanswered calls in a Hunt Group.

	Node A		Node B			Node C	
	STN-1 Note 7	STN-2	STN-3	STN-4	STN-5	STN-6	STN-7
Assigned Hunting order by the office data	1	2	3	4	5	6	7
Actual Hunting order	(Busy)	1 (Ringing)	2	3	4	5	6

Note 7: This is the Pilot Station.

4. The Incoming Call terminated between nodes via FCCS to a Station in the Hunt Group programmed by the Physical Station Number, is not hunted.

Programming

<When using Physical Station Numbers for creating the Hunt Group>

STEP 1: **ASYD** - Assign the following system data.
System Data 1, Index69, Bit 5: Hunt Group when transferred party is busy (Station Hunting after C.F.-Busy Line):
0 = Hunt in Transferring Party's Hunt Group
1 = Hunt in Transferred Party's Hunt Group

STEP 2: **ASHP** - Assign the required data for the Group.
TN: Tenant Number
STN: Physical Station Number **Note 9**
SECRETARY STN:Physical Station Number of the Secretarial Station **Note 8**
[Station List in Group]
STN: Physical Station Numbers of the Stations included in the Hunt Group. **Note 9**

Note: Assignment of Numbers to a Hunt Group may be in any order.

Note 8: If secretarial Station is used, assign the Physical Station Number of the Station used as such secretarial Station.

Note 9: Do not enter Phantom Number.

STEP 3: **ASFC** - (Optional) Assign the following Service Feature Restriction when hunting must be denied.
SFI 181 =1 (No Hunting to next station in group)

<When using Telephone Numbers for creating the Hunt Group>

Note: The following programming supposes that Telephone Numbers have been already assigned and does not include such data settings.

STEP 1: **ASYD/ASYDN** - Assign the following system data.
System Data 1, Index69, Bit 5: Hunt Group when transferred party is busy (Station Hunting after Call Forward - Busy Line):
0 = Hunt in Transferring Party's Group
1 = Hunt in Transferred Party's Group

STEP 2: **ASYDL** - (Optional) Assign the following System Data.
System Data 1, Index 688, Bit 0. Specify whether hunting is activated or not if the called PS is Out of Zone.
0 = Hunting
1 = PS Out of Zone processing

Note: Assign this data if PS is used in the Hunt Group.

STEP 3: **ASHPL/ASHPN** - Assign the required data for the Hunt Group.
Assign the Hunt Group using Telephone Number.
UGN: User Group Number
TELN: Telephone Number in the Hunt Group **Note 10**
SECRETARY TELN:Secretary Telephone Number **Note 11**
[Station List in Group]
TELN: Telephone Numbers of the Stations included in the group. **Note 10**

Note: Assignment of Numbers to a Hunt Group may be in any order.

Note 10: Do not enter Phantom Number.

Note 11: If secretarial Station is used, assign the Telephone Number of the Station used as such secretarial Station.

STEP 4: **ASFCN** - (Optional) Assign the following Service Feature Restriction when hunting must be denied.
SFI 181 =1 (No Hunting to next station in group)

<When activating the transfer of unanswered calls in a Terminal Hunt Group> Note 12

STEP 5: **ASYD** - Assign the following System Data.
System Data 1, Index 69, Bit 0= 1 (No Recall, or execution of Call Forwarding –Don't Answer (when CF – Don't Answer is set at the transfer destination station)).
System Data 1, Index 69, Bit 1 (Send short tone when a call forwarded via CF – All Calls/Logout service is answered.)
0 = Not Required
1 = Required
System Data 2, Index 6, Bit 7 (CF-Don't Answer service when Attendant Console transfers call before

called station answers)
0 = Out of service (Recall to Attendant Console)
1 = In service

STEP 6: **ASYDL/ASYDN** - Assign System Data 1, Index 1395, Bit 0=1 (transfer of unanswered calls in a Terminal Hunt Group in service). **Note 12**
System Data 1, Index 1396= set the no answer timer for the transfer of unanswered calls in a Hunt Group. **Note 12**
Bit 0 - 3: 1 - F= MTC
Bit 4 - 6: 0 - 7= TC
TC: Timer Class, MTC: Miscellaneous Timer Counter
TC = 0: -
1: -
2: -
3: 2 seconds
4: 30 seconds
5: -
6: -
7: -

Note: Default value for this data is HEX 00 (data is not set). If data is not set, other Timer Value of No Answer Timer (ASYD SYS1, Indexes 139, 140, 141, 247) will be used.

Note: Do not assign "0" for MTC value when TC = 3 or 4.

Note: Assigned time will be used for all the Hunt Groups to which is available (Circular, Terminal, Priority), it cannot be set separately according to the type of Hunt Group.

Note: The time will be used for the transfer of unanswered calls regardless of whether transfer of unanswered calls in a Terminal Hunt Group is in service or not.

Note 12: Available from FP95-114 V4 Issue 4.0.

STEP 7: **ASFC/ASFCN** - Assign the following Service Feature Restrictions:
SFI 8=1 (Call Forwarding-Don't Answer allowed).
SFI 103 (Assignment of No Answer Timer for Blind Transfer to Station/Blind Transfer to Attendant) **Note 13**
0 = Restricted (settings in ASYD, System Data 1, Index 140)
1 = Allowed (settings in ASYD, System Data 1, Index 247)
SFI 104 (Processing when the transferred station does not answer for a predetermined period of time in Blind Transfer) **Note 14**
0 = Transferred station continuously rings
1 = The transferred call is forwarded when Call Forwarding-Don't Answer is assigned at the transferred station and no-answer timer expires

Note 13: The time set for a Station with ASYDL/ASYDN System Data 1, Index 1396 (no answer timer for the transfer of unanswered calls in a Hunt Group) will be given priority.

Note 14: Set to 1 if the terminal in the Hunt Group is the destination of BLIND TRANSFER TO STATION [B-18].

STEP 8: **ATNR** - Assign the following Tenant Restriction Class.
TRI 0=1 (Station within OGTN calls to a station within TMTN allowed).
TRI 1=1 (Station within OGTN sets Call Forwarding-All Calls / Busy Line / Don't Answer/Logout to a station within TMTN allowed).

STEP 9: **ACFR/ACFRN** - Assign the following Call Forwarding Restriction.
CCI 8=1 (Call Forwarding-Don't Answer allowed).

S-10 Station Message Detail Recording (SMDR)

General Description

This feature provides a call record for all outgoing Station to Trunk Calls and Incoming Trunk to Station Calls. When the system is equipped with this feature, an RS232C output port or a SOCKET interface (LAN) is provided, permitting interface with a customer-owned computer system. All output is in the ASCII format, and includes the following:

- Calling Telephone Number
- Dialed Number (maximum of 24 digits)
- Route Number
- Start of call time
- Disconnect time
- Year, month and date
- Condition (Attendant handled, transfer, etc.)
- ACCOUNT CODE [A-18] (10 digits maximum)
- AUTHORIZATION CODE [A-28] (10 digits maximum)
- FORCED ACCOUNT CODE [F-7]

[Additional FCCS Format]

- Called Party Type (Attendant Console/Station)
- Call Start/Call end time (millisecond)
- Call metering
- FPC/User Group/Telephone Number (Calling Party)
- FPC/User Group/Telephone Number (Called Party)
- FPC of the node providing the route for the call
- Logical Route Number
- FPC of the node providing the first-choice route
- First-choice Logical Route Number
- Trunk arrival/sending time and Abandoned Call Information (for Incoming /Outgoing Call)

[Station-to-Station Basis SMDR]

SMDR can be output for Station-to-Station Calls by assigning data.

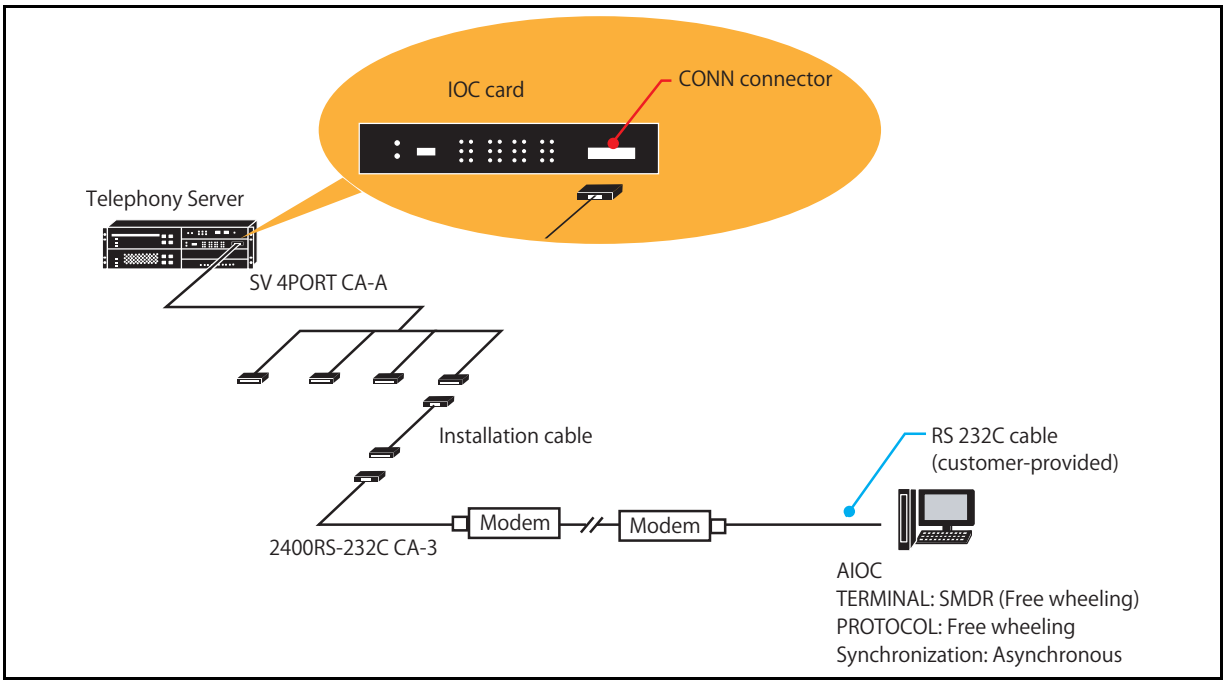
[SMDR by MA-ID via IP Network]

Multi Area ID (MA-ID) can be assigned on a network basis for identifying the location. Then, SMDR can be output for calls over IP network when MA-ID of both parties are not identical. For more information, see SMDR MULTI AREA ID VIA IP [S-144].

[SMDR - Multiple Time Zone]

SMDR output that takes into account time difference when a call is made over different time zones is available. For more information, see [M-114] MULTIPLE TIME ZONE.

Note: SMDR (Station Message Detail Record) collectively means billing information and service. When connecting to SMDR system, simultaneous use of LAN and RS-232C connection is not available in a single node.



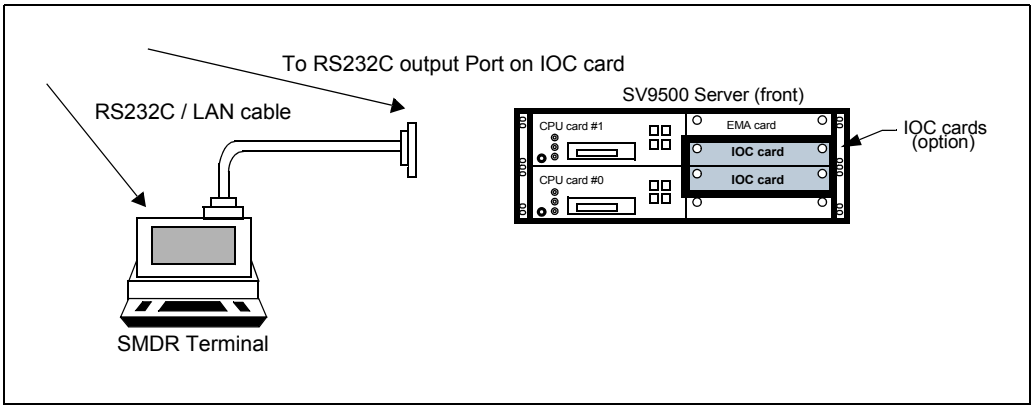
Operating Procedure

No manual operation is required. Call record outputs are produced automatically.

Service Conditions

<RS232C Interface Conditions>

1. When you use the SMDR system with a RS-232C interface, be aware of the following:
   - When connecting to the SMDR system, simultaneous use of LAN and RS-232C connection is not available in a single node.
   - When you change the interface for the SMDR system (from RS-232C to LAN and vice versa), all the data collected in the Telephony Server is erased. Therefore, before performing such operation, output all the collected data to the SMDR system.
2. SMDR information facilitates analysis of Trunk traffic and can be readily applied for cost allocation or billing purposes.
3. SMDR may be programmed to record either all Outgoing Calls or only Toll Calls, depending upon user requirements.
4. Both Incomplete and Abandoned Calls will be discarded by the SMDR.
5. When ROUTE ADVANCE [R-6] or LEAST COST ROUTING (LCR) - 3/6-DIGIT [L-5] is provided with the system, SMDR will record the Route Number selected.
6. The maximum number of digits dialed cannot exceed 24.
7. When customer-owned computer equipment is connected via RS232C interface, SMDR information will be transmitted directly to the computer as each call record is completed.
8. If the Outgoing Call is directed to a Trunk that cannot give Answer Supervision from the Central Office, the start of call time is 18 seconds after the last digit is dialed. This timer value is set on the System Data.
9. If the distance between the system and the processing computer exceeds 50 feet (15 meters), an asynchronous modem should be used.



10. RS232C Interface specifications:

Synchronization	Asynchronous
Data Speed	300, 600, 1200, 2400, 4800, 9600bps
Code	ASCII 7-Bit + parity Bit
Maximum Distance	50 ft. (15m) without modem

11. Supervision on the status of the external RS232C terminal is not performed.
12. FORCED ACCOUNT CODE [F-7] can be recorded on SMDR, for INWATS and Central Office Incoming Calls, when used in conjunction with the REMOTE ACCESS TO SYSTEM [R-2] feature.
13. FORCED ACCOUNT CODE [F-7] cannot be registered on SMDR if the Incoming REMOTE ACCESS TO SYSTEM [R-2] Calls are terminated to Stations via night service or DID [D-8].
14. For REMOTE ACCESS TO SYSTEM [R-2] Tandem Connections, the FORCED ACCOUNT CODE [F-7] is registered for Outgoing Trunks only.
15. The PBX can accommodate up to 7 active ports or 4 redundant ports. Additional hardware is required.
16. AUTHORIZATION CODE [A-20] can be recorded on SMDR.
17. The maximum number of simultaneous calls can be stored in the system memory (active calls) is 47,000. When a call is completed, the record is sent to the output device and is removed from memory.
18. If an overflow occurs, calls are allowed to complete and are not recorded.
19. ATTENDANT-CONTROLLED CONFERENCE [A-2]: If the Attendant adds a Trunk to the Conference, the Attendant Conference line terminal is recorded.
20. LEAST COST ROUTING - 3/6-DIGIT [L-5]: The Calling Party can dial an ACCOUNT CODE [A-18] before the LCR Access Code. The Called Number is recorded (as modified for sending).
21. If an ACCOUNT CODE [A-18] is dialed, the maximum digits of the Called Number is 22.
22. CENTRALIZED ATTENDANT SERVICE (CAS) [C-20]: The SMDR record is provided for calls extended outward by a CAS Attendant.
23. DIRECT INWARD DIALING (DID) Trunk Calls [D-8]: If the call is to the Attendant, the Attendant can input an ACCOUNT CODE [A-18] before extending the call.
24. INDIVIDUAL Trunk Access [I-4]: The Attendant cannot dial in an SMDR account Code before using direct Trunk selection.
25. Incoming TIE Trunk Calls: If an Incoming Call to the Attendant is extended, the Attendant can input an ACCOUNT CODE [A-18].
26. SERIAL CALL [S-15]: The duration of the total call is recorded on the last Station Call.
27. STATION HUNTING [S-7, 8, 9]: The hunted-to Station is recorded in the Called Number field.
28. TANDEM TIE TRUNK [T-1] Calls: The Calling Number is the Incoming Trunk Route plus Trunk Number; the Called Number is the number dialed.
29. UNIFORM CALL DISTRIBUTION (UCD) [U-1]: The Calling Number is the Incoming Trunk Route plus Trunk Number. If the call is to a Station, the Station answering the number is recorded as the Dialed Number.
30. On an Incoming Trunk Call to the Attendant, the Attendant Call record will start upon answering and complete when the Attendant releases. A Station Call record will start when the Attendant releases and complete when the Station goes on-hook. If required, a Station record will not be generated if the Station does not answer.
31. A system option is available to allow or restrict call completion in the case where a failure occurs in transmitting SMDR data from the processor to the I/O port.

32. Additional hardware is required.

33. When either of the 2 parties goes On-Hook (or presses Transfer Key, Hold Key, Answer Key, Over Key) during Station-to-Station Calling [S-11], output of the billing information will be completed.
34. In a CCIS environment if a node has a PHC and IPTRK coexisting that node cannot be the centralize point for call accounting.
35. SMDR data can be output via LAN cable.
36. A maximum of four SMDR apparatuses per node are available.
37. It is normal operation that ACC and ANI data is sent to SMDR if ACNP is assigned.
38. The LAN and RS232C interfaces cannot be used simultaneously for connecting SMDR equipment in the same node.

<FCCS Conditions>

1. Call Time specification:
    - The base for Call Start Time and Call End Time is the time in the Calling Party-side node.
    - In case there is time difference between each node, related time difference data, based on the UCT (Universal Coordinated Time) standard, should be written in Network Data Memory (NDM) by using the ATDF command.
    - Because billing information gathering is performed in the Called Party-side node, the Call Start Time in the originating node is determined in a way the deduction of time between Calling and Called Party nodes is added or subtracted to/from the Called Party-side time. (If there is no time difference data in any [both] of the nodes, the Call Start Time is specified automatically by that in the Called Party-side node.)
    - A counter, not the clock providing the current time, is used for Call End Time calculation. The calculation method is as follows:

    a.) Call Start Time (by using the clock) and the current counter value are registered to the Call Base Table, soon after a Line Connection is established.
    b.) Upon the call completion, the deduction between the counter value shown in a.) and that renewed during the call exchange is calculated.
    c.) The deduction is transformed to a time (hour, minute, second, millisecond) format.
    d.) The transformed time is added to the Call Start Time registered in a.)-End.
        - The counter-based time is renewed in every 16.384 milliseconds.

2. The maximum number of calls available for concurrent storage in the system memory (active calls) is:

System Type	Maximum Buffer Capacity for Storing SMDR
IMG/MMG system	47,000 calls / System
UMGi/RNIP system	47,000 calls / 1 Node
UMG system	47,000 calls / 1 LMG

Note: The same buffer memory is used for storing Centralized Billing data and Billing of calls that are made in the center node.

Note: The upper limit of polling buffer rate can be specified by ASYDL, SYS 1, Index 586. When the value has not been set, default 00 (Hex) = 50% will be applied.

3. When the center node stores the billing information of calls that are made in itself, the center node checks the number of completed calls in all nodes on a CCIS/FCCS network including itself. The system message "6-O (SMDR Output Buffer Overflow Alarm message)" and "6-P (SMDR Output Buffer Overflow Release)" are issued if SMDR output buffer in the center node is in the following conditions:

   "6-O" is issued when:

   - SMDR output buffer is not overflowing, and
   - SMDR output buffer usage rate exceeds the value assigned to ASYD, SYS1, Index 249.

   "6-P" is issued when:

   - SMDR output buffer is overflowing, and
   - SMDR output buffer usage rate is less than the value assigned to ASYD, SYS1, Index 250.

   Even if the SMDR output buffer usage rate in the center node exceeds the value assigned to ASYD, SYS1, Index 249 due to polling Local Nodes, the system message "6-O" is not issued if there are no billing information of calls made in the center node afterwards.

4. If an overflow occurs, calls are allowed to complete but are not recorded.
5. To output the FCCS-related billing data, the external SMDR terminal should be compatible also with the IMX text format patterns.
6. When a Station originates an outgoing Trunk Call using a Trunk in the Remote Node (the Station and the Trunk belong to an FCCS Network), the billing information for the Station to Trunk Connection is not recorded.
7. Because the FCCS Service achieves a completely fused link between multiple distant nodes, Intra-Station Connections and Node-to-Node Connections are theoretically considered identical.
8. When a Line Connection is established on the FCCS, the billing data concerned is collected fully in the Called Station-side node, not in the Calling Station side. The collected data is then transmitted to the SMDR terminal as the call finishes.
9. Multiple Center Nodes can be assigned on a FCCS Network for centralized billing purposes.
10. Transmission of call base table with 264 bytes.
11. When the user performs system changeover (using MBR Key, CMOD command or etc.), system massages (26-V, 26-W) are displayed. However, there are no defective conditions.

12. The figures on the following pages show the Service Conditions of Polling Method and the sample data assignment, focusing on when CCIS links are involved.
13. SMDR data assignment is required for all nodes in the FCCS network when using Centralized Billing - FCCS feature. (See Example 9 for the sample data assignment.)
14. SMDR data will be stored in a node whose incoming trunks received the data.
15. When SMDR equipment is not connected to the Center Node, polling is failed from a Center Node to a Local Node. If the Center Node is a Local Node used by Centralized Billing - CCIS [C-55], polling is available.
16. After the Center Node receives billing information from a Local Node, it returns ACK to the Local Node. If the Local Node fails to receive ACK due to a network failure, the Local Node sends billing information again. Therefore the billing information is output redundantly.

Example 1

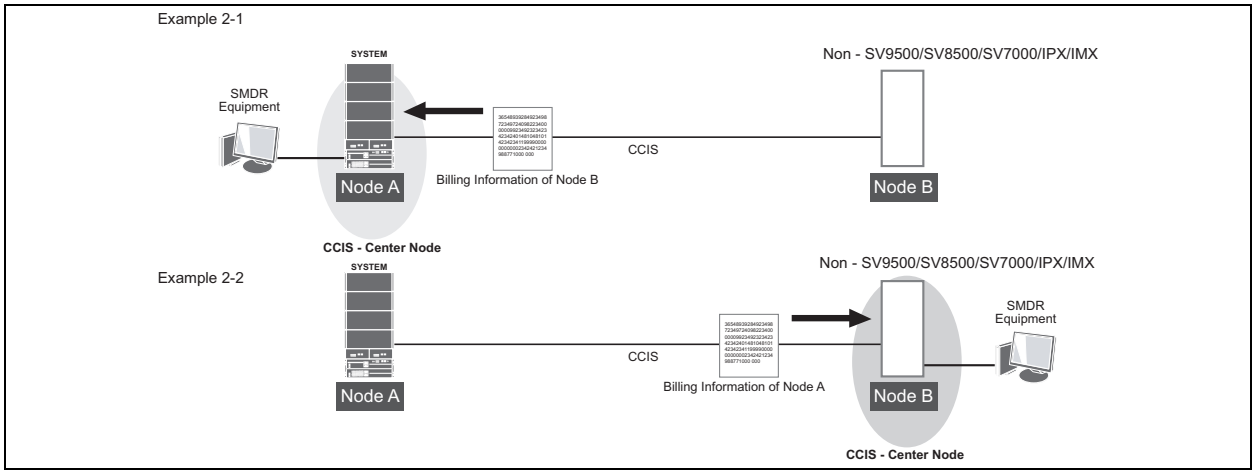
- Node A (FCCS - Center Node) collects the billing information of Nodes B and C via FCCS using the polling method.

[Common Data]

ASYD	System Data 1	Indexes 32, 34	
	System Data 2	Index 3	
ASYDL	System Data 1	Index 576 b0 = 1	

[Node A]

ASYD	System Data 1	Index 288	Assign when RS-232C output is used.
ASYDL	System Data 1	Index 576	Assign Bit 2 = 1 (when using LAN interface for SMDR)
		Index 577	Assign 00H.
		Index 578	Assign when LAN output is used.(Bit 4 **Note 1** of each Index)
		Index 608	Assign Node B and Node C.



Note 1: When using LAN Interface for SMDR, a TCP/IP LAN Address, Subnet Mask Address, and Gateway Address must be assigned to the Active CPU. Use either ASYDL, Sys-1, Indexes 515 through 526 to assign these addresses or the ADTM command.

[Node B, Node C]

ASYD	System Data 1	Indexes 288 - 295	Assign all 00H.
ASYDL	System Data 1	Index 577	Assign the FPC of Node A.
		Index 578 - 581	Assign all 00H.

Example 2

- The following shows an example of Centralized Billing - CCIS when non-SV9500/SV8500/SV7000/IPX/IMX is used.

Example 2-1

[Common Data]

ASYD	System Data 1	Indexes 32, 34	
	System Data 2	Index 3	

[Node A]

ASYD	System Data 1	Index 180	Assign the PC of Node A.
		Index 182	Assign 00H.
		Index 288	Assign when RS-232C output is used.
ASYDL	System Data 1	Index 576	Assign Bit 2 = 1 (when using LAN interface for SMDR)
		Index 578	Assign when LAN output is used. (Bit 4 **Note 2** of each Index)

Note 2: When using LAN Interface for SMDR, a TCP/IP LAN Address, Subnet Mask Address, and Gateway Address must be assigned to the Active CPU. Use either ASYDL, Sys-1, Indexes 515 through 526 to assign these addresses or the ADTM command.

[Node B]

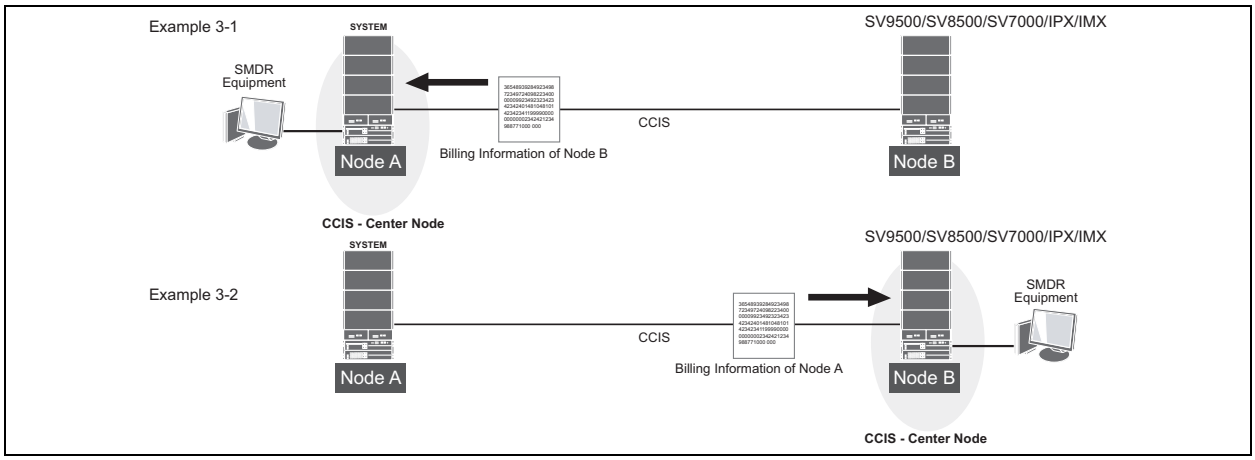
ASYD	System Data 1	Index 180	Assign the PC of Node B.
		Index 182	Assign the PC of Node A.
		Indexes 288 - 295	Assign all 00H.

Example 2-2

[Common Data]

ASYD	System Data 1	Indexes 32, 34	
	System Data 2	Index 3	

[Node A]



ASYD	System Data 1	Index 180	Assign the PC of Node A.
		Index 182	Assign the PC of Node B.
		Indexes 288 - 295	Assign all 00H.
ASYDL	System Data 1	Index 578	Assign all 00H.

[Node B]

ASYD	System Data 1	Index 180	Assign the PC of Node B.
		Indexes 288	Assign when RS-232C output is used.

Example 3

- The following shows an example of Centralized Billing - CCIS when SV9500/SV8500/SV7000/IPX/IMX is not used.

Example 3-1

[Common Data]

ASYD	System Data 1	Indexes 32, 34	
	System Data 2	Index 3	
ASYDL	System Data 1	Index 576	Assign Bit 2 = 1 (when using LAN interface for SMDR)

[Node A]

ASYD	System Data 1	Index 180	Assign the PC of Node A.
		Index 182	Assign 00H.
		Index 288	Assign when RS-232C output is used.
ASYDL	System Data 1	Index 578	Assign when LAN output is used. (Bit 4 **Note 3** of each Index)

Note 3: When using LAN Interface for SMDR, a TCP/IP LAN Address, Subnet Mask Address, and Gateway Address must be assigned to the Active CPU. Use either ASYDL, SYS1, Indexes 515 through 526 to assign these addresses or the ADTM command.

[Node B]

ASYD	System Data 1	Index 180	Assign the PC of Node B.
		Index 182	Assign the PC of Node A.
		Indexes 288 - 295	Assign all 00H.
ASYDL	System Data 1	Index 578	Assign all 00H.

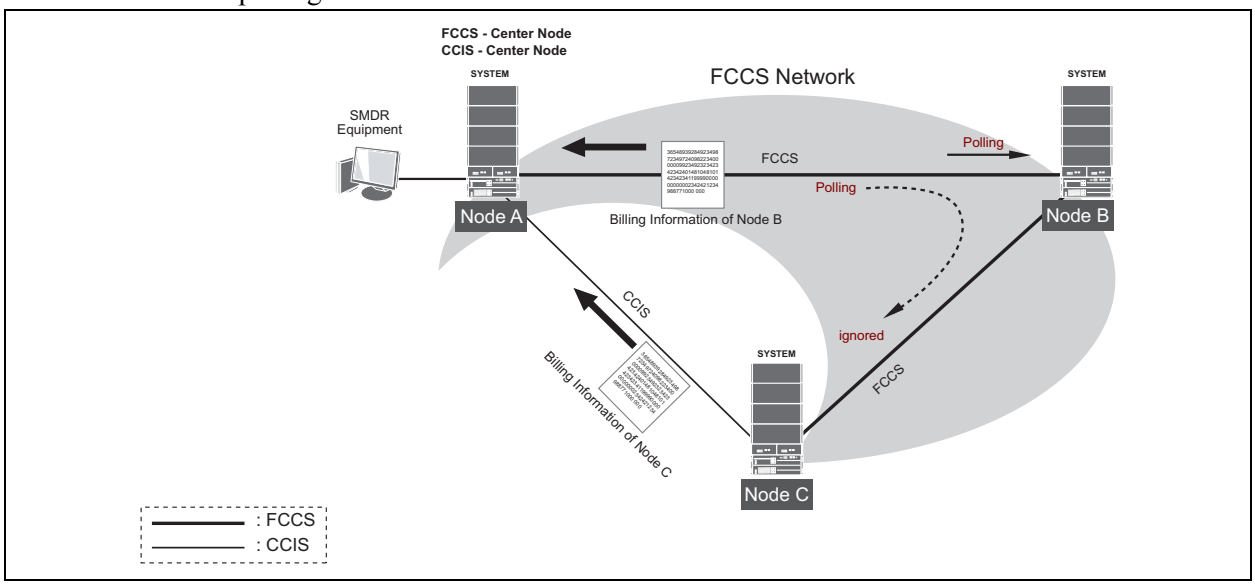
Example 3-2

[Common Data]

ASYD	System Data 1	Indexes 32, 34	
	System Data 2	Index 3	
ASYDL	System Data 1	Index 576	Assign Bit 2 = 1 (when using LAN interface for SMDR)

[Node A]

ASYD	System Data 1	Index 180	Assign the PC of Node A.
		Index 182	Assign the PC of Node B.
		Indexes 288 - 295	Assign all 00H.
ASYDL	System Data 1	Index 578	Assign all 00H.



[Node B]

ASYD	System Data 1	Index 180	Assign the PC of Node B.
		Index 182	Assign 00H.
		Index 288	Assign when RS-232C output is used.
ASYDL	System Data 1	Index 578	Assign when LAN output is used. (Bit 4 **Note 4** of each Index)

Note 4: When using LAN Interface for SMDR, a TCP/IP LAN Address, Subnet Mask Address, and Gateway Address must be assigned to the Active CPU. Use either ASYDL, SYS1, Indexes 515 through 526 to assign these addresses or the ADTM command.

Example 4

- Node A tries to collect the billing information of Node B and Node C via FCCS, using the polling method (Node A cannot collect the billing information of Node C via FCCS).
- Node C sends the billing information via CCIS, ignoring polling from Node A.
- Node C deletes the Point Code (CCIS) of Node A for centralized billing data when required to send billing information for polling from Node A.

[Common Data]

ASYD	System Data 1	Indexes 32, 34
	System Data 2	Index 3

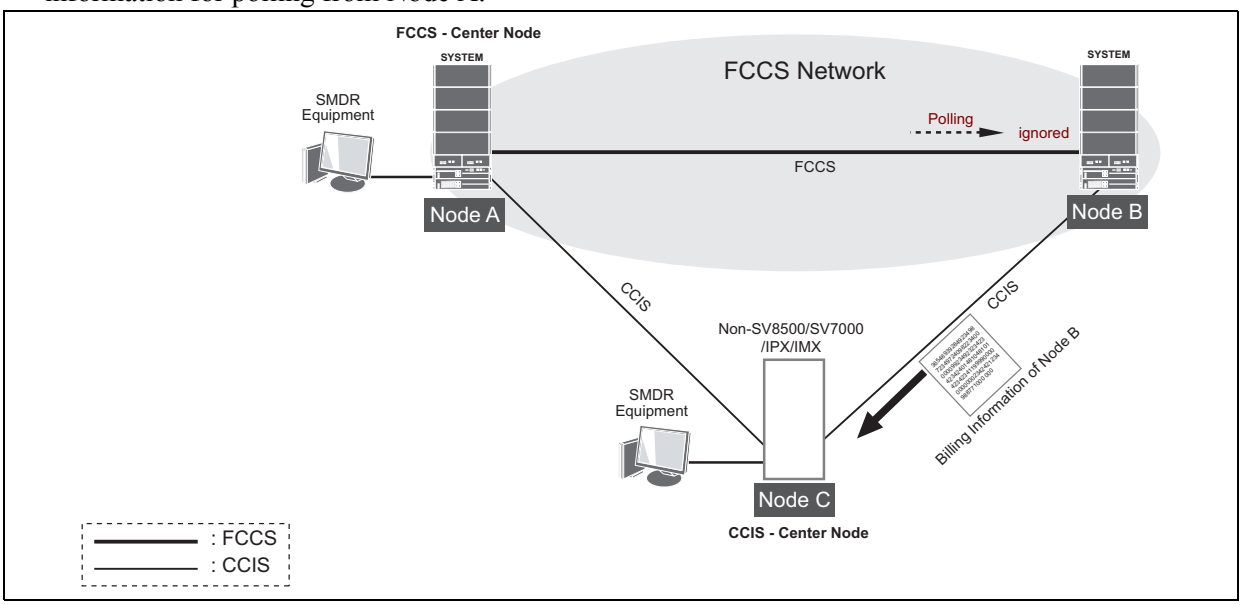
[Node A]

ASYD	System Data 1	Index 180	Assign the PC of Node A.
		Index 288	Assign when RS-232C output is used.
ASYDL	System Data 1	Index 576	Assign Bit 0 for Centralized FCCS SMDR In Service.

Index 576	Assign Bit 2 = 1 (when using LAN interface for SMDR)
Index 577	Assign 00H.
Index 578	Assign when LAN output is used. (Bit 4 **Note 5** of each Index)
Index 608	Assign Node B.

Note 5: When using LAN Interface for SMDR, a TCP/IP LAN Address, Subnet Mask Address, and Gateway Address must be assigned to the Active CPU. Use either ASYDL, SYS1, Indexes 515 through 526 to assign these addresses or the ADTM command.

[Node B]



ASYD	System Data 1	Indexes 288 - 295	Assign all 00H.
ASYDL	System Data 1	Index 576	Assign 01H.
		Index 577	Assign the FPC of Node A.
		Indexes 578 - 581	Assign all 00H.

[Node C]

ASYD	System Data 1	Index 180	Assign the PC of Node C.
		Index 182	Assign the PC of Node A.
		Indexes 288 - 295	Assign all 00H.
ASYDL	System Data 1	Index 576	Assign Bit 2 = 1 (when using LAN interface for SMDR)
		Index 577	Assign 00H.
		Indexes 578 - 581	Assign all 00H.

Example 5

- Node A tries to collect the billing information of Node B via FCCS, using the polling method (Node A cannot collect the billing information of Node B via FCCS).
- Node B sends the billing information via CCIS, ignoring polling from Node A.
- Node B deletes the Point Code (CCIS) of Node C for centralized billing data when required to send billing information for polling from Node A.

[Common Data]

ASYD	System Data 1	Indexes 32, 34
	System Data 2	Index 3

ASYDL	System Data 1	Index 576	Assign Bit 2 = 1, when using LAN interface for SMDR.

[Node A]

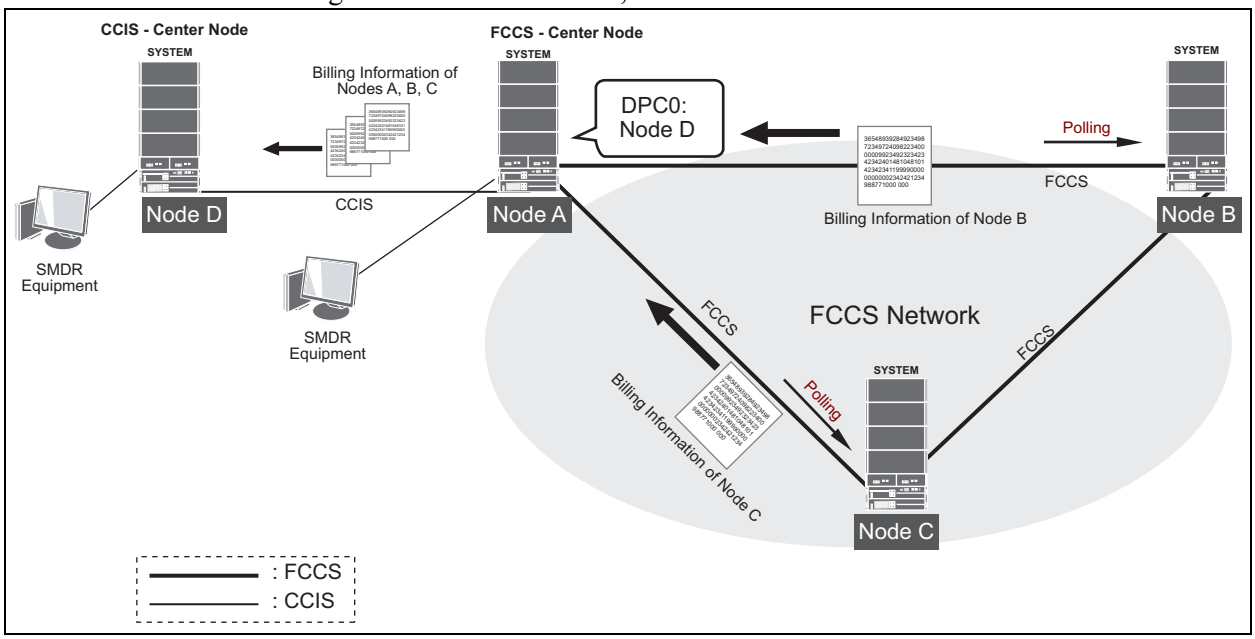
ASYD	System Data 1	Index 180	Assign the PC of Node A.
		Index 288	Assign when RS-232C output is used.
ASYDL	System Data 1	Index 577	Assign 00H.
		Index 578	Assign when LAN output is used. (Bit 4 **Note 6** of each Index)

Note 6: When using LAN Interface for SMDR, a TCP/IP LAN Address, Subnet Mask Address, and Gateway Address must be assigned to the Active CPU. Use either ASYDL, SYS1, Indexes 515 through 526 to assign these addresses or the ADTM command.

[Node B]

ASYD	System Data 1	Index 180	Assign the PC of Node B.
		Index 182	Assign the PC of Node C.
		Indexes 288 - 295	Assign all 00H.
ASYDL	System Data 1	Index 577	Assign 00H.
		Indexes 578 - 581	Assign all 00H.

[Node C]



ASYD	System Data 1	Index 180	Assign the PC of Node C.
		Indexes 288 - 295	Assign when RS-232C output is used.
ASYDL	System Data 1	Index 578	Assign when LAN output is used. (Bit 4 **Note 7** of each Index)

Note 7: When using LAN Interface for SMDR, a TCP/IP LAN Address, Subnet Mask Address, and Gateway Address must be assigned to the Active CPU. Use either ASYDL, SYS1, Indexes 515 through 526 to assign these addresses or the ADTM command.

Example 6

- Node A collects the billing information of Node B and Node C via FCCS, using the polling method.

- Node A sends the billing information of Node A, Node B and Node C to Node D.

[Common Data]

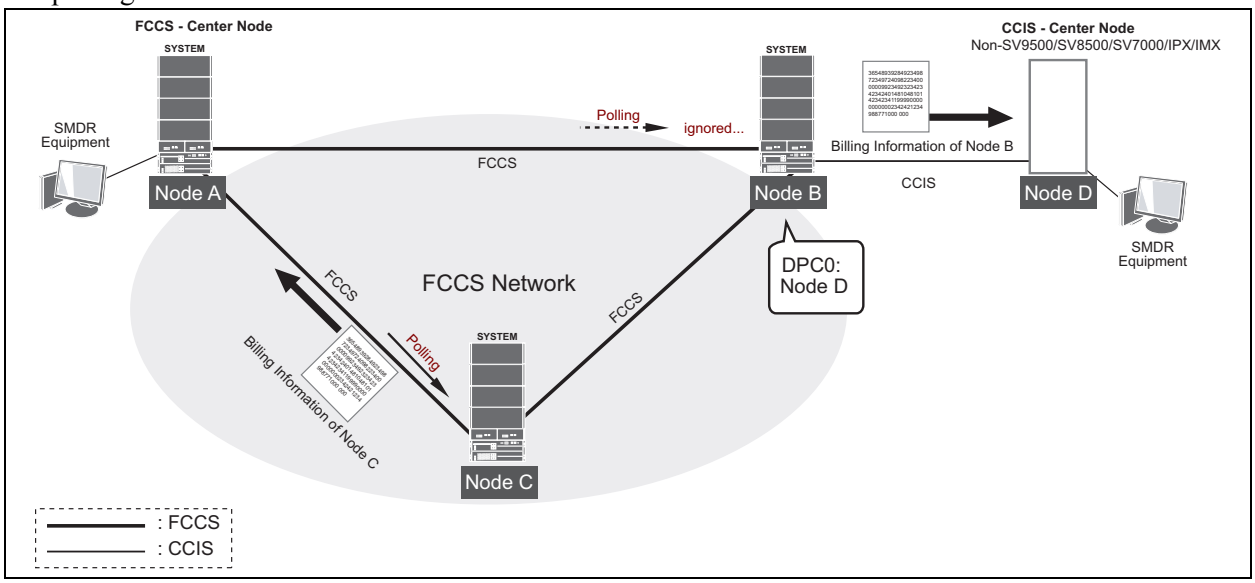
ASYD	System Data 1	Indexes 32, 34	
	System Data 2	Index 3	

[Node A]

ASYD	System Data 1	Index 180	Assign the PC of Node A.
		Index 182	Assign the PC of Node D.
		Index 288	Assign when RS-232C output is used.
ASYDL	System Data 1	Index 576	Assign Bit 0 = 1 for Centralized FCCS SMDR In Service.
		Index 576	Assign Bit 2 = 1 (When using LAN interface for SMDR)
		Index 577	Assign 00H.
		Index 578	Assign when LAN output is used. (Bit 4 **Note 8** of each Index)
		Index 608	Assign Node B and Node C.

Note 8: When using LAN Interface for SMDR, a TCP/IP LAN Address, Subnet Mask Address, and Gateway Address must be assigned to the Active CPU. Use either ASYDL, SYS1, Indexes 515 through 526 to assign these addresses or the ADTM command.

[Node B and Node C]



ASYD	System Data 1	Indexes 288 - 295	Assign all 00H.
ASYDL	System Data 1	Index 576	Assign 01H.
		Index 577	Assign the FPC of Node A.
		Indexes 578 - 581	Assign all 00H.

[Node D]

ASYD	System Data 1	Index 180	Assign the PC of Node D.
		Index 288	Assign when RS-232C output is used.

Example 7

- Node A collects the billing information of Node B and Node C via FCCS, using the polling method (Billing information of Node B cannot be collected).
- Node B sends the billing information to Node D via CCIS, ignoring polling from Node A.
- Node B deletes the Point Code (CCIS) for Node D when Node B wants to send billing information for polling from Node A.

[Common Data]

ASYD	System Data 1	Indexes 32, 34	
	System Data 2	Index 3	

[Node A]

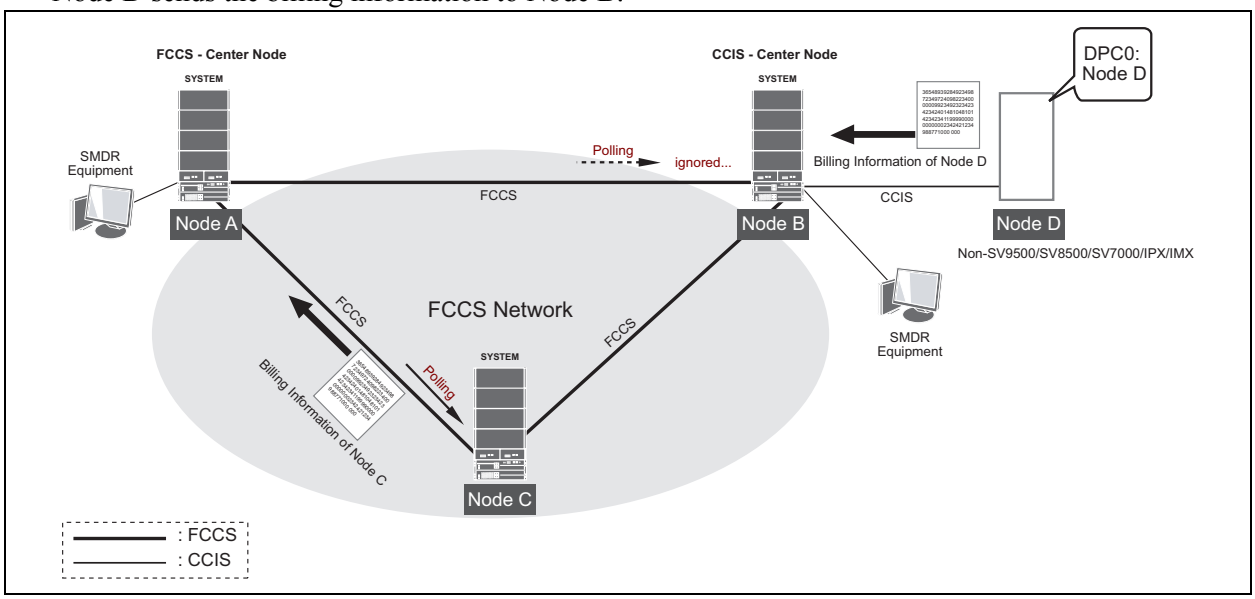
ASYD	System Data 1	Index 288	Assign when RS-232C output is used
ASYDL	System Data 1	Index 576	Assign Bit 0 = 1 for Centralized FCCS SMDR In Service.
		Index 576	Assign Bit 2 = 1 (when using LAN interface for SMDR)
		Index 577	Assign 00H.
		Index 578	Assign when LAN output is used. (Bit 4 **Note 9** of each Index)
		Index 608	Assign Node C.

Note 9: When using LAN Interface for SMDR, a TCP/IP LAN Address, Subnet Mask Address, and Gateway Address must be assigned to the Active CPU. Use either ASYDL, SYS1, Indexes 515 through 526 to assign these addresses or the ADTM command.

[Node B]

ASYD	System Data 1	Index 180	Assign the PC of Node B
		Index 182	Assign the PC of Node D
		Indexes 288 - 295	Assign all 00H.
ASYDL	System Data 1	Index 576	Assign 00H.
		Index 577	Assign 00H.
		Indexes 578 - 581	Assign all 00H.

[Node C]



ASYD	System Data 1	Indexes 288 - 295	Assign all 00H.
ASYDL	System Data 1	Index 576	Assign 01H
		Index 577	Assign the FPC of Node A.
		Indexes 578 - 581	Assign all 00H.

[Node D]

ASYD	System Data 1	Index 180	Assign the PC of Node D.
		Index 288	Assign when RS-232C output is used.

Example 8

- Node A collects the billing information of Node B, Node C and Node D, which are stored in Node B by polling method.
- Node D sends the billing information to Node B.

[Common Data]

ASYD	System Data 1	Indexes 32, 34
	System Data 2	Index 3

[Node A]

ASYD	System Data 1	Index 288	Assign when RS-232C output is used.
ASYDL	System Data 1	Index 576	Assign Bit 0 = 1 for Centralized FCCS SMDR In Service.
		Index 576	Assign Bit 2 = 1 (when using LAN interface for SMDR)
		Index 577	Assign 00H.
		Index 578	Assign when LAN output is used. (Bit 4 **Note 10** of each Index)
		Index 608	Assign Node B and Node C.

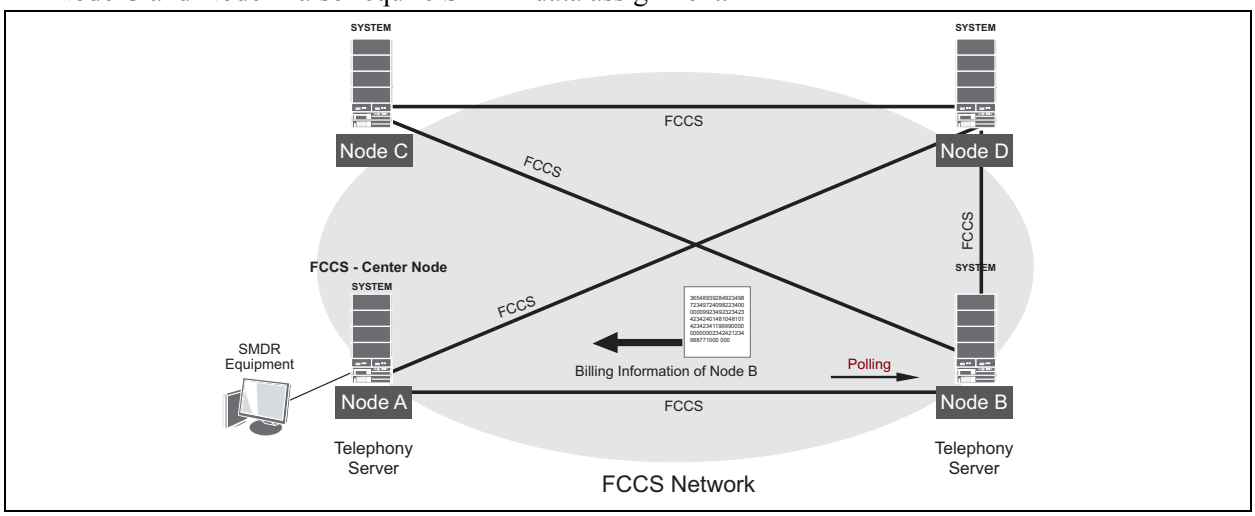
Note 10: When using LAN Interface for SMDR, a TCP/IP LAN Address, Subnet Mask Address, and Gateway Address must be assigned to the Active CPU. Use either ASYDL, SYS1, Indexes 515 through 526 to assign these addresses or the ADTM command.

[Node B]

ASYD	System Data 1	Index 180	Assign the PC of Node B
		Index 288	Assign when RS-232C output is used.
ASYDL	System Data 1	Index 576	Assign Bit 0 = 1 for Centralized FCCS SMDR In Service.
		Index 576	Assign Bit 2 = 1, when using LAN interface for SMDR.
		Index 577	Assign the FPC of Node A.
		Indexes 578 - 581	Assign when LAN output is used. (Bit 4 **Note 11** of each Index).

Note 11: When using LAN Interface for SMDR, a TCP/IP LAN Address, Subnet Mask Address, and Gateway Address must be assigned to the Active CPU. Use either ASYDL, SYS1, Indexes 515 through 526 to assign these addresses or the ADTM command.

[Node C]



ASYD	System Data 1	Indexes 288 - 295	Assign all 00H.
ASYDL	System Data 1	Index 576	Assign 01H
		Index 577	Assign the FPC of Node A.
		Indexes 578 - 581	Assign all 00H.

[Node D]

ASYD	System Data 1	Index 180	Assign the PC of Node D.
		Index 182	Assign the PC of Node B.
		Indexes 288 - 295	Assign all 00H.

Example 9

- Node A collects the billing information of Node B and the Self Node.
- Node C and Node D also require SMDR data assignment.

[Common Data]

ASYD	System Data 1	Indexes 32, 34	
	System Data 2	Index 3	
ASYDN		Index 583	Assign 00H.

[Node A]

ASYD	System Data 1	Index 288	Assign when RS-232C output is used.
ASYDL	System Data 1	Index 576	Assign Bit 0 = 1 for Centralized FCCS SMDR In Service.
		Index 576	Assign Bit 2 = 1 (when using LAN interface for SMDR)

		Index 577	Assign 00H.
		Index 578	Assign when LAN output is used. (Bit 4 **Note 12** of each Index)
		Index 608	Assign Node B.

Note 12: When using LAN Interface for SMDR, a TCP/IP LAN Address, Subnet Mask Address, and Gateway Address must be assigned to the Active CPU. Use either ASYDL, SYS1, Indexes 515 through 526 to assign these addresses or the ADTM command.

[Node B]

ASYD	System Data 1	Indexes 288 - 295	Assign all 00H.
ASYDL	System Data 1	Index 576	Assign 01H
		Index 577	Assign the FPC of Node A.
		Indexes 578 - 581	Assign all 00H.

[Node C and Node D]

ASYD	System Data 1	Indexes 288 - 295	Assign all 00H.
ASYDL	System Data 1	Index 576	Assign 00H
		Index 577	Assign 00H.
		Indexes 578 - 581	Assign all 00H.

<SOCKET Interface (LAN Interface) Conditions>

1. When you use the SMDR system with a LAN interface, be aware of the following:
   - When connecting to the SMDR system, simultaneous use of LAN and RS-232C connection is not available in a single node.
   - When you change the interface for the SMDR system (from LAN to RS-232C and vice versa), all the data collected in the Telephony Server is erased. Therefore, before performing such operation, output all the collected data to the SMDR system.
2. SMDR data can be output via LAN cable.
3. A maximum of four SMDR apparatuses per node are available.
4. When providing this feature with LAN interface, IMX text format must be designated by the ASYDL command (System Data 1, Index 578-581, Bit 0).
5. The LAN and RS232C interfaces cannot be used simultaneously for connecting SMDR equipment in the same node.

<Relocation Condition for SMDR>

When relocating SMDR equipment to another node, reassign the billing information-related data. The relocation conditions are shown below.

1. Make sure there is no billing information in each node from the Center Node before changing the SMDR location. (make sure billing information is output to the SMDR by sending test signal.)
2. Exact billing information may not be output to SMDR while changing the SMDR location.
3. When removing the SMDR equipment from the Center Node, first delete all of the billing information-related data, and also when connecting the SMDR to new-Center Node, the user must, first of all, assign appropriate billing information-related data.

4. Assign the Fusion Point Code (FPC) of the new-Center Node to all nodes including the previous Center Node by ASYDL (System Data 1 Index 577).

<Trunk Arrival/Sending Time and Abandoned Call Information (for Incoming/Outgoing Trunk Call)>

The following information on Incoming/Outgoing Trunk Call can be output to SMDR:

- Trunk Sending Time (when an outgoing trunk call is sent from the trunk) **Note 13**
- Abandoned Call as billing information for outgoing trunk call **Note 13**
- Trunk Arrival Time (when an incoming trunk call is terminated to the terminal) **Note 14**
- Abandoned Call as billing information for incoming trunk call **Note 14**.

Note: Answered call and abandoned call are defined for this feature as follows:

- Answered Incoming Trunk Call:
  Calling party releases the call after sending answer signal to the incoming trunk.
  Call transferred to Announcement trunk by [C-25] Call Forwarding - Intercept/Announcement/[C-69] Call Forwarding - All Calls - Announcement/[O-21] Outgoing Trunk Busy Announcements/[S-106] Slumber Time - Do Not Disturb (routed to Announcement Trunk) is counted as answered call.
  Call disconnected by [A-28] Automatic Announcement - Disconnected PS Out of Zone is counted as answered call (until the PS is in out of zone state).
- Answered Outgoing Trunk Call:
  Calling party seizes a trunk and releases the call after receiving answer signal to the outgoing trunk.
- Abandoned Incoming Trunk Call:
  Calling party releases the call before sending answer signal to the incoming trunk.
- Abandoned Outgoing Trunk Call:
  Calling party seizes a trunk and releases the call before receiving answer signal to the outgoing trunk.

Note 13: Available from FP95-113 V3.

Note 14: Available in EMEA from FP95-111 V1 and available in other countries from FP95-113 V3.

1. By using Trunk Arrival/Sending Time information, SMDR can calculate the ringing time (the time elapsed between Trunk Arrival/Sending and Call Start). The calculation method is as follows:

   - In the case of Answered Incoming Trunk Call:

     Ringing Time = Call Start Time - Trunk Arrival Time

   - In the case of Abandoned Incoming Trunk Call:

     Ringing Time = Call End Time (Ringing stop time) - Trunk Arrival Time

- In the case of Answered Outgoing Trunk Call:

  Ringing Time = Call Start Time - Trunk Sending Time

- In the case of Abandoned Outgoing Trunk Call:

  Ringing Time = Call End Time (Ringing stop time) - Trunk Sending Time

Examples:

- In the case of Answered Incoming Trunk Call:

Trunk Arrival Time	2015/12/01	15:30:02:000
Call Start Time	2015/12/01	15:30:24:500
Call End Time	2015/12/01	15:35:15:500

- In the case of Abandoned Incoming Trunk Call:

Trunk Arrival Time	2015/12/01	15:30:02:200
Call Start Time	Blank (**Note 15**)	
Call End Time	2015/12/01	15:30:57:500

- In the case of Answered Outgoing Trunk Call:

Trunk Sending Time	2015/12/01	15:30:02:000
Call Start Time	2015/12/01	15:30:24:500
Call End Time	2015/12/01	15:35:15:500

- In the case of Abandoned Outgoing Trunk Call:

Trunk Sending Time	2015/12/01	15:30:02:200
Call Start Time	Blank (**Note 15**)	
Call End Time	2015/12/01	15:30:57:500

Note 15: A call is considered abandoned when the Call Start Time is blank and there is an entry for Call End Time.

2. Incoming and outgoing billing information messages must be activated to respectively output Trunk Arrival Time and Abandoned Incoming Call information and Trunk Sending Time and Abandoned Outgoing Call information. Data cannot be output with station to station billing information messages.
3. Trunk Arrival/Sending Time and Abandoned Call information can be provided when a call from or to C.O. line is terminated to or sent from Station, Attendant Console or trunk.
4. Trunk Arrival/Sending Time and Abandoned Call information can be provided on a route basis.
5. Called Party Number information on Incoming Abandoned Call is as follows:
   a.) When called Station or Attendant Console can be identified, its number is output.
   b.) When called Station cannot be identified ([T-23D] Trunk Line Appearance -D, etc.), the following information is output:

   ORIG: 0 (Station)
   Tenant: Tenant Information of Incoming Trunk
   Called Party Number: Blank (Called Party cannot be identified)

c.) When called Attendant Console cannot be identified ([D-114] Delay Announcement - Attendant, [A-55] Automatic Change of Night Service, Ring-down termination or [S-106] Slumber Time - Do Not Disturb (routed to Attendant Console), etc.), the following information is output:

ORIG: 1 (Attendant Console)
Tenant: Tenant Information of Incoming Trunk
Called Party Number: Blank (Called Party cannot be identified)

d.) When [A-82] Automated Attendant/[R-2] Remote Access to System call is abandoned while the Calling Party Number is dialed, the following information is output:

ORIG: 0 (Station)
Tenant: Tenant Information of Incoming Trunk
Called Party Number: Blank (Called Party cannot be identified)

e.) When an incoming call is forwarded by the following features, the forwarding destination number is output as the Called Party Number:

[C-5] Call Forwarding - All Calls
[C-2] Call Forwarding - Busy Line
[L-53] Logged Out IP Station - Call Destination
[C-103] Calling Party Recognition Service (Call Forwarding-All Calls/Busy Line)

f.) When an incoming call is forwarded by the following features, the number of the party that set the forwarding destination is output as Called Party Number. Even when the call is forwarded to second hop forwarding destination, the first forwarding source number is output.

[C-3] Call Forwarding - Don't Answer
[C-103] Calling Party Recognition Service (Don't Answer)
[C-74] Call Forwarding - Don't Answer - Outside
[C-47] Call Forwarding - Don't Answer - CCIS
[C-155] Call Forwarding PS Incoming Call Incomplete

g.) When an incoming call is forwarded by the following features, the trunk number that is used for the forwarding feature is output as Called Party Number.

[C-28] Call Forwarding - All Calls - Outside
[C-45] Call Forwarding - All Calls - CCIS
[C-60] Call Forwarding - Busy Line - Outside
[C-46] Call Forwarding - Busy Line - CCIS
[T-1] Tandem Switching of TIE Trunks - 2/4-Wire

h.) When an incoming call is forwarded by the following features, Blank is output as Called Party Number.

Unused Number/Dead Level Number-Announcement

i.) For features activated while in busy state such Transfer-All Calls and Blind Transfer, billing information on abandoned call is not provided.

j.) When a multiline terminal receives a call to a subline/virtual line, the subline/virtual line number is used for called party information.

k.) When a PS/SIP line is set to a Line/Feature key of the Desktop terminal as a subline by PS Line

Appearance on Dterm [P-71] and the Desktop terminal receives a call to the PS/SIP line, the PS/SIP line number is used for called party information.

6. Calling Party Number information on Outgoing Abandoned Call is as follows:
   a.) The number of the station or Attendant Console that seized the trunk is displayed. For stations, the information is displayed as follows:

   ORIG: 0 (Station)
   Tenant: Tenant Information of Outgoing Trunk
   Calling Party Number: The station that makes the call

   For attendant consoles, the information is displayed as follows:

   ORIG: 1 (Attendant Console)
   Tenant: Tenant Information of Outgoing Trunk
   Calling Party Number: The Attendant Console that makes the call

   b.) In the following features, when ASYD, SYS1, Index 20, Bit 7=0, the billing party is the originator of the transferred call. When Bit 7=1, the billing party is the station that has set the feature.

   [C-28] Call Forwarding - All Calls - Outside
   [[C-60] Call Forwarding - Busy Line - Outside
   [C-74] Call Forwarding - Don't Answer - Outside
   [L-53] Logged Out IP Station - Call Destination

   c.) When a multiline terminal seizes a trunk using a subline/virtual line, the my line number is used for calling party information.
   d.) When a PS/SIP line is set to a Line/Feature key of a Desktop terminal as a subline by PS Line Appearance on Dterm [P-71] and the Desktop terminal seizes a trunk with the PS/SIP line, the PS/SIP line number is used for called party information.
7. In the following cases, billing information of the terminal receiving the call is not output to SMDR (Forwarding feature is not set): **Note 16**

   - Target terminal is busy
   - Target terminal is unassigned terminal **Note 17**
   - Connection between target terminal and incoming trunk is restricted **Note 17**
   - Target terminal is in Do Not Disturb mode
   - Target terminal is logged out
   - Register is busy **Note 18**

Note 16: If a forwarding feature such as Call Forwarding - All Calls/Busy/Don't Answer is set for the terminal receiving the call, the specific billing information output conditions of the feature are applied.

Note 17: When ASYD, SYS1, Index 7, Bit 5 = 1:
If unassigned number or restricted number is dialed, the following information is output:
- ORIG: 0 (Station)
- Tenant: Tenant Information of Incoming Trunk
- Called Party Number: Blank (Called Party cannot be identified)

Note 18: Only for features that use the register for incoming calls.

8. In the following cases, billing information of the terminal sending the call is not output to SMDR (Forwarding feature is not set): **Note 19**
   - The seized trunk is busy
   - Connection between the terminal and incoming trunk is restricted
   - Target terminal is busy
   - Target terminal is logged out
   - Target terminal is in Do Not Disturb mode
   - Target terminal is unassigned terminal

   Note 19: If a forwarding feature such as Call Forwarding - All Calls/Busy/Don't Answer is set for the target terminal, the specific billing information output conditions of the feature are applied.

9. In the case of a tandem connection, both Incoming and Outgoing Abandoned Calls information is output.
10. When total billing is used, if a call is abandoned after being transferred via blind transfer, the following call information is provided:
    a.) In an outgoing/incoming trunk call of terminal B, terminal A transfers the call to terminal C (connected with external line), but terminal B abandons the call before terminal C answers the call.
    - Call information between terminal B and the trunk is output as an answered call
    - Call information between terminal C and the trunk is output as an abandoned call

    b.) In an outgoing/incoming trunk call of terminal B, terminal A transfers the call to terminal C (connected with extension line), but terminal B abandons the call before terminal C answers the call.
    - Call information between terminal A and the trunk is output as an answered call

11. When split billing is used, if a call is abandoned after being transferred via blind transfer, the following call information is provided:
    a.) In an outgoing/incoming trunk call of terminal B, terminal A transfers the call to terminal C (connected with external line), but terminal B abandons the call before terminal C answers the call.
    - Call information between terminal A and the trunk is output as an answered call
    - Call information between terminal B and the trunk is output as an answered call
    - Call information between terminal C and the trunk is output as an abandoned call

    b.) In an outgoing/incoming trunk call of terminal B, terminal A transfers the call to terminal C

(connected with extension line), but terminal B abandons the call before terminal C answers the call.

- Call information between terminal A and the trunk is output as an answered call

12. In an Incoming Abandoned Call, neither the MA-ID of both the sender and the receiver is output.
13. The relationship between the time until occurrence of billing buffer overflow and the number of incoming/outgoing calls (Answered Call and Abandoned Call) per one hour is as follows:

5,000 calls/hour → 9.40 hours
10,000 calls/hour → 4.70 hours
15,000 calls/hour → 3.13 hours
20,000 calls/hour → 2.35 hours
20,000 calls/hour → 1.88 hours
30,000 calls/hour → 1.56 hours
*billing buffer: 47, 000 calls

14. As in the following, if Split Billing is applied, the same value is output as Trunk Arrival Time for the conversations between "Trunk C and Terminal A" and "Trunk C and Terminal B".
    1.) An Incoming Trunk C Call is terminated to terminal A.
    2.) Trunk C and terminal A are engaged in a two-way conversation.
    3.) Trunk C is placed on hold, and the call is transferred to terminal B from terminal A.
    4.) Terminal A goes on-hook. trunk and terminal B are engaged in a two-way conversation. (Billing Information for the conversation between trunk C and terminal A is output.)
    5.) Conversation between trunk C and terminal B ends. (Billing Information for the conversation between trunk C and terminal B is output.)
15. When using Centralized Billing - CCIS feature, Trunk Arrival/Sending Time and Abandoned Call Information of Local Node is not sent to Center node.
16. Incoming Abandoned Call information is not output for the following features:
    [S-15] Serial Call
    [S-52] Serial Call - CCIS
17. When a call is established or released while in the following states, Trunk Arrival Time is not output:

- UCD Queuing
- Delay Announcement - UCD
- Overflow - UCD
- Call Waiting

18. The following shows the output availability of billing information on Incoming/Outgoing Abandoned Call:

Feature Name	Abandoned Call			
	Outgoing Call		Incoming Call	
	Output of Billing Information	Calling Party Number	Output of Billing Information	Called Party Number
ISDN Features				
[D-123] Direct Inward Dialing (DID) Addressing	-	-	×	Called Party
[C-104] Calling Party Recognition Service (Direct-In Termination [DIT])	-	-	×	Called Party
[C-103] Calling Party Recognition Service (CF-All Calls)	-	-	×	Forwarding Destination Terminal
[C-103] Calling Party Recognition Service (CF-Busy Line)	-	-	×	Forwarding Destination Terminal
[C-103] Calling Party Recognition Service (CF-Don't Answer)	-	-	×	Terminal that has been set as forwarding destination
PCS/PHS Features				
[P-71] PS Line Appearance on Dterm	× Note 20	The My Line of the Desktop terminal that accommodates the PS line	×	PS
[A-129] Automatic Announcement - Called PS Out of Zone	-	-	×	PS
[C-155] Call Forwarding PS Incoming Call Incomplete	-	-	×	PS
[A-128] Automatic Announcement - Disconnected PS Out of Zone	-	-	Answered Call	PS
Incoming Call Features				
[D-8] Direct Inward Dialing (DID)	-	-	×	Called Party
[R-2/A-82] Remote Access to System/Automated Attendant	-	-	×	Called Party
[D-7] Direct-In Termination (DIT)	-	-	×	Called Party
[T-23D] Trunk Line Appearance-D	-	-	×	Blank

Feature Name	Abandoned Call			
	Outgoing Call		Incoming Call	
	Output of Billing Information	Calling Party Number	Output of Billing Information	Called Party Number
[S-106] Slumber Time - Do Not Disturb (routed to Attendant Console)	-	-	×	Blank
[S-106] Slumber Time - Do Not Disturb (routed to Announcement Trunk)	-	-	Answered Call	Announce-ment Trunk
Outgoing Call Features				
[O-2] Outgoing Trunk Queuing **Note 21**	×	Calling Party	-	-

Feature Name	Abandoned Call			
	Outgoing Call		Incoming Call	
	Output of Billing Information	Calling Party Number	Output of Billing Information	Called Party Number
[B-18 Blind Transfer to Station] **Note 24**	×	Transfer party	-	-
Desktop Terminal Features				
Multiline **Note 25**	×	The My Line of the Desktop terminal that accommodates the Virtual Line/Sub Line line	-	-
Network Features				
[T-1] Tandem Switching of TIE Trunks - 2/4-Wire	×	Calling party	×	Trunk
[O-21] Outgoing Trunk Busy Announcements	-	-	Answered Call	Announce-ment Trunk
[F-41] Flexible Network Re-routing **Note 26**	×	Calling party	-	-
IP Features				
[L-53]Logged Out IP Station - Call Destination	× **Note 27**	Calling party/ Service set-ting party	×	Destination Terminal

Note 20: In case the call is abandoned after the PS line accommodated in the Desktop terminal is seized and the call is sent from the trunk.

Note 21: When a call is abandoned after a trunk becomes idle and is used to send the call.

Note 22: When a call is abandoned while waiting in the first UCD queue:

Note 23: In case the call is abandoned after the transfer terminal seizes a trunk and the call is sent.
When ASYD, SYS1, Index 20, Bit 7=0, the billing party is the originator of the transferred call. When Bit 7=1, the billing party is the station that has set the feature.

Note 24: In case the call is abandoned after the transfer to an external line is performed.

Note 25: In case the call is abandoned after the Sub Line/Virtual Line accommodated in the Desktop terminal is seized and the call is sent from the trunk.

Note 26: In case the call is abandoned after a network failure is detected and an external call based on the automatic rerouting is performed.

Note 27: When the call is abandoned after the transfer terminal seizes a trunk and sends the call. When ASYD, SYS 1, Index 20, Bit 7= 0, the billing party is the originator of the transferred call. When Bit 7= 1, the billing party is the station that has set the feature.

<SMDR for Trunk Calls Made Using Access Code with Variation in Number of Digits>

The destination number of an outgoing call recorded in SMDR is either the actual number dialed by the user or the number sent by the system. This is basically determined by the System Data (ASYD, System Data 1, Index 32, Bit 6). In the case of an outgoing trunk call via an Access Code, when there is a variation in the number of digits of Access Codes, which of the two is shown on SMDR is determined by the factors listed below:

- System Data (ASYD, System Data 1, Index 32, Bit 6)
- The necessary number of digits for Access Codes (the value specified for the NND parameter of the ANPD command)
- The number of digits of Access Code (the number of digits of the value specified for the ACC parameter of the ASPA command)

The following shows how these factors affect the destination number information to be recorded in SMDR (where "N" represents the value specified for the NND parameter of the ANPD command, and "A" for the number of digits of the value specified for the ACC parameter of the ASPA command):

(a) When N is less than A

ASYD SYS 1, Index 32	ARTD/ARTDN CDN 121: CONV = 0 (Converted Number)	ARTD/ARTDN CDN 121: CONV = 1 (Dialed Number)
Bit 6 = 0 (Number sent by system)	Access Code **Note 28** + Number sent to the trunk **Note 29**	Access Code **Note 28** + Number sent to the trunk **Note 29**
Bit 6 = 1 (Number dialed by user)	Actual number dialed by user	Actual number dialed by user

Note 28: When an Access Code is set to be included in the destination number of an outgoing call recorded in SMDR(ASYD, System Data 1, Index 32, Bit 5 = 1), the system recognizes the first N digits of the dialed number as an Access Code (where N is the value specified by the NND parameter of the ANPD, ANPDL or ANPDN command).

Note 29: Additional Digit Information (DC), if any, followed by a string obtained by deleting the first x digits from the dialed number (where x is the value specified for the SKIP parameter of the AOPR, AOPRL or AOPRN command).

Example

Case Where User Dials “1#1 58059”

ANPD (1stDC = 1, NND = 2), ASPA (ACC = 1#1), AOPR (SKIP = 3, PNL ≠ 0), AADC (DC = 99)			
		ARTD/ARTDN CDN 121: CONV = 0 (Converted Number)	ARTD/ARTDN CDN 121: CONV = 1 (Dialed Number)
ASYD SYS 1, Index 32	Bit 6 = 0 (Number sent by system)	1# 99 58059	1# 99 58059
	Bit 6 = 1 (Number dialed by user)	1#1 58059	1#1 58059

(b) When N is greater than or equal to A

		ARTD/ARTDN CDN 121: CONV = 0 (Converted Number)	ARTD/ARTDN CDN 121: CONV = 1 (Dialed Number)
ASYD SYS 1, Index 32	Bit 6 = 0 (Number sent by system)	Access Code **Note 30** + Number sent to the trunk **Note 31**	Actual number dialed by user
	Bit 6 = 1 (Number dialed by user)	Actual number dialed by user	Actual number dialed by user

Note 30: When an Access Code is set to be included in the destination number of an outgoing call recorded in SMDR(ASYD, System Data 1, Index 32, Bit 5 = 1), the system recognizes the first N digits of the dialed number as an Access Code (where N is the value specified by the NND parameter of the ANPD, ANPDL or ANPDN command).

Note 31: Additional Digit Information (DC), if any, followed by a string obtained by deleting the first x digits from the dialed number (where x is the value specified for the SKIP parameter of the AOPR, AOPRL or AOPRN command).

Example 1

Case Where User Dials "1# 58059"

ANPD (1stDC = 1, NND = 2), ASPA (ACC = 1#), AOPR (SKIP = 2, PNL ≠ 0), AADC (DC = 99)			
		ARTD/ARTDN CDN 121: CONV = 0 (Converted Number)	ARTD/ARTDN CDN 121: CONV = 1 (Dialed Number)
ASYD SYS 1, Index 32	Bit 6 = 0 (Number sent by system)	1# 99 58059	1# 58059
	Bit 6 = 1 (Number dialed by user)	1# 58059	1# 58059

Example 2

Case Where User Dials "1#1 58059"

ANPD (1stDC = 1, NND = 3), ASPA (ACC = 1#1), AOPR (SKIP = 3, PNL ≠ 0), AADC (DC = 99)			
		ARTD/ARTDN CDN 121: CONV = 0 (Converted Number)	ARTD/ARTDN CDN 121: CONV = 1 (Dialed Number)
ASYD SYS 1, Index 32	Bit 6 = 0 (Number sent by system)	1#1 99 58059	1#1 58059
	Bit 6 = 1 (Number dialed by user)	1#1 58059	1#1 58059

Example 3

Case Where User Dials "1# 58059"

ANPD (1stDC = 1, NND =3), ASPA (ACC = 1#), AOPR (SKIP = 2, PNL ≠ 0), AADC (DC = 99)			
		ARTD/ARTDN CDN 121: CONV = 0 (Converted Number)	ARTD/ARTDN CDN 121: CONV = 1 (Dialed Number)
ASYD SYS 1, Index 32	Bit 6 = 0 (Number sent by system)	1#5 99 58059	1# 58059
	Bit 6 = 1 (Number dialed by user)	1# 58059	1# 58059

Interactions

1. If LCR(S) is provided, the LCR(S) Access Code is listed in ARNP. If an outgoing route is not used in LCR(S), then list the OGCA Access Code in ARNP.
2. To test SMDR output, it is recommended that a serial printer, breakout box, or a TCP/IP based tool be used to determine if the system is sending data.
3. CALL TRANSFER-ALL CALLS [C-11]: Either the first Station, last Station, or split billing is allowed with SMDR. Split billing provides a separate call record for both before and after a Call Transfer.
4. ATTENDANT CAMP-ON WITH TONE INDICATION [A-1]: The Called Station Number is recorded for Incoming Central Office Calls via the Attendant Console (RRI 2 of ARSC). To record the time a Destination Station is on a call, split billing or last Station billing is required. With split billing, the time the Attendant Console is on the call is separated from the time the Destination Station is on the call. For last Station billing, the Destination Station is charged with the entire time of Connection.
5. LEAST-COST ROUTING-3/6-DIGIT [L-5]: SMDR will record the digits sent rather than the digits dialed.
6. The Destination Station is recorded on SMDR for the following features:

CALL FORWARDING	[C-2, 3, 5]
CALL PICKUP	[C-7, 30]

   Note: CALL PICKUP - GROUP [C-7] and CALL PICKUP - DIRECT [C-30]: When a billing after transfer over different MA-IDs is in service (ASYDL, SYS 1, Index 589, Bit 3 = 1), the SMDR record is created.

7. CALL FORWARDING-INTERCEPT [C-25]: An Incoming Trunk Call responds to Call Forwarding-Intercept to the Attendant Console. SMDR records the call as if it is a direct call to the Attendant Console.
8. NIGHT CONNECTION-FIXED/FLEXIBLE [N-1, 2]: Calls terminated to these Stations are recorded on SMDR.
9. OUTGOING TRUNK QUEUING [O-2]: SMDR records the Outgoing Call when the system recalls the user and the digits are sent, not when the Trunk is queued.
10. REMOTE ACCESS TO SYSTEM [R-2]: The Incoming Route and Trunk Number is recorded as the Calling Party. If FORCED ACCOUNT CODE [F-7] is used, it will be recorded on SMDR. REMOTE ACCESS TO SYSTEM via a DID will not record FORCED ACCOUNT CODE on SMDR.
11. TRUNK-TO-TRUNK CONNECTION [T-10] and TIE LINE ACCESS [T-3]: SMDR records an Incoming TIE Line that uses TRUNK-TO-TRUNK CONNECTION to make an Outgoing Call. The TIE Line Route and Trunk Number is recorded as the Calling Party. The outgoing route is programmed for SMDR in ARTD, not the Incoming TIE Line Route.
12. CALL WAITING-TERMINATING [C-12]: SMDR will begin recording the call when the call is answered, not when a Call Waiting Tone is heard.

Programming

STEP 1: **ASYD** - System Data 1, Index 20, Bit 7. Charging to a call transferred by CALL FORWARDING-OUTSIDE Service 0/1: Charging is made to the caller of the Transferred Call / charging is made to the Station that has set CALL FORWARDING-OUTSIDE service.

System Data 1, Index 32
Bit 1 = 1 (records Tenant information)
Bit 2 = 1 (records route information)
Bit 5 = 1 (records Route Access Code)
Bit 6: 0/1 (records Number Sent/Number Dialed as SMDR Called Party Number Registration Type)
Note 32
Bit 7 = 1 (enables SMDR service)

Note 32: Please consider the following:

- In the case of an outgoing call made using a Speed Calling feature or a Last Number Called feature, the number sent by the Telephony Server is recorded as the SMDR destination number even if Bit 6 is set to 1.
- For the SMDR destination number in the case where there is a variation in the number of digits of Access Codes, see "<SMDR for Trunk Calls Made Using Access Code with Variation in Number of Digits>."

System Data 1, Index 33. Assign this Index for Split Billing. When Split Billing is used, assign 00H. When Total Billing is used, Bits 3 and 4 represent the following:

ASYD System Data 1, Index 33		
Bit 4	**Bit 3**	**Telephone Subject to Total Billing**
0	0	Telephone called first (regardless of calling party kind)
0	1	Telephone called last (regardless of calling party kind)
1 (**Note 33**)	0	First telephone after the call has been handled by ATT
1 (**Note 33**)	1	Telephone called last (regardless of calling party kind)

Note 33: When Bit 4 is set, the intermediate ATT information will be output to SMDR.

Bit 5 must be assigned as data "1" to provide total billing for Incoming Calls.
Bit 6 must be assigned as data "1" to provide total billing for Outgoing Calls.

Note: When using Split Billing, if an outgoing call is made via ISDN, billing information will not be displayed.

Note: When using Split Billing, the following condition must be considered.
When a Station transfers the trunk call to Attendant Console via BLIND TRANSFER [B-18], Total Billing for Incoming Call to the answered Station is output to SMDR.

System Data 1, Index 34. Assign data 01H or 21H. Bit 0 enables RS-232C transmission.
Bit 0: SMDR RS-232 C Output. 0/1 = Out of Service/In Service

Bit 1 and 2: Parity check of RS-232C Output. Bit 1=0, Bit 2=0 means no parity (parity bit fixed to "0").
Bit 5: Specify whether or not to send a converted number to the SMDR. 0/1 = Original Number is sent. / Converted Number (the first 6 digits) is sent.

Note: If you choose to send a converted number, the maximum length of the dial code output in the outgoing call record will be limited to 18 digits. If the number of digits dialed exceeds 18, the first 18 digits will be displayed as the dial number, and the remaining digits will be displayed as the first 6 digits of a converted number. If you do not want the converted number to be added to the dial code, set ASYDL System Data 1, Index 1245, Bit 6=1.

System Data 1, Index 58, Bit 7. Is the Specific Attendant Number, assigned by ASAT/ASATN command output to SMDR terminal? 0/1: No/Yes.

Note: When the Originating Point Code (OPC) is assigned by System Data 1 Index 180 and 181 and Attendant Console originates the call, the Specific Attendant Number is output even if System Data 1 Index 58 Bit 7 = 0.

System Data 1, Index 95. Maximum Buffer Capacity for Storing SMDR (RS-232C)
Bit 0-3: 0-9 (10-minute basis)
Bit 4-7: 0-9 (100-minute basis)

Note: Used for SMDR by RS-232C only. When 00H is assigned, 180 minutes (= 3hours) will be applied. 10-990 minutes (=16.5hours) can be assigned for billing by 10-minutes basis.

System Data 1, Index 157. Outgoing Trunk, Soft Hold Timer. The point in time when the system will recognize an Outgoing Call as answered. Default is 18 seconds. Because of interaction with momentary pressing of the hook-switch, this data may be reassigned as 31H for two seconds. Take the SMDR aspect into consideration when reassigning this data.

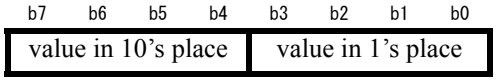
System Data 1, Index 174, Bit 5. SMDR output method in CCIS/ISDN tandem node. Specify the information n type of calling party in the outgoing call via CCIS (Calling Party Number in ISDN). (0/1 = Station Number/Route Number and Trunk Number of Incoming Trunk)

Note: In CCIS Network, the number is limited to six digits including the node number of RT=0 in the ARNP command.

Note: Set Bit 5 when using IS-11572/Dp Channel so that billing may be processed by using Route Number of Incoming Trunk. If 0 is assigned in this instance, billing will not applied correctly on the ground that the Calling Party Number cannot be referred to.

Note: If 0 is assigned for this data, when [T-1] Tandem Switching of TIE Trunks - 2/4-Wire is used in CCIS network, the billing information output at tandem node will be changed depending on the System Data - ASYD, Sys 1, Index 241, Bit 6. (Process to be executed when the length of Caller ID exceeds the limits)

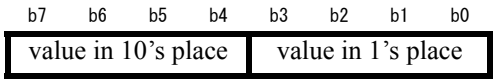
[Example]



When Calling Party Number is 123456789 and limited to 8 digits:

In the case of Index 241, bit 6 =0, the calling party number will be set as 1234567*. (8 digits will be displayed including * that indicates that there is an information not being displayed. The six digits from the top digit will be output as the billing information. (123456))

In the case of Index 241, bit 6=1, the calling party number will be set as *3456789. (8 digits will be displayed including * that indicates that there is an information not being displayed. The six digits from the top digit will be output as the billing information. (*34567))



System Data 1, Index 249. SMDR output buffer usage rate to *output* Alarm Message (default = 80%)
Bit 0-3: value in the 1's place of buffer usage rate (0 - 9)
Bit 4-7: value in the 10's place of buffer usage rate (0 - 9)

Usage Rate to output Alarm Message:

System Data 1, Index 250. SMDR output buffer usage rate to *clear* Alarm Message (default = 50%)
Bit 0-3: value in the 1's place of buffer usage rate (0 - 9)
Bit 4-7: value in the 10's place of buffer usage rate (0 - 9)

Usage Rate to clear Alarm Message:

System Data 1, Indexes 288-295 (Required for SMDR by RS-232C only)
Designation of the attributes of the SMDR.
SMDR output port will be designated. For this designation, the attributes of the terminal that outputs the detail call information should have been designated by Indexes 117-123. (Assigned by the AIOC command.)
Also for detecting a fault of the SMDR, set the SMDR fault detect timer.
Index 288 = Charging information port of SMDR A.
Bit 4: IOC Equipment Number (0/1 = No.0/No.1)
Bit 5: Expanded SMDR Output (0/1 = Out/In Service)
Index 289 = SMDR fault detect timer of SMDR A. **Note 34**, **Note 35**
Bit 0-3: Fault detection timer of SMDR A Value for the first digit (minutes)
Bit 4-7: Fault detection timer of SMDR A Value for the second digit (minutes)
Index 290 = Charging information port of SMDR B.

Bit 4: IOC Equipment Number (0/1 = No.0/No.1)
Bit 5: Expanded SMDR Output (0/1 = Out/In Service)
Index 291 = SMDR fault detect timer of SMDR B. **Note 34**, **Note 35**
Bit 0-3: Fault detection timer of SMDR B Value for the first digit (minutes)
Bit 4-7: Fault detection timer of SMDR B Value for the second digit (minutes)
Index 292 = Charging information port of SMDR C.
Bit 4: IOC Equipment Number (0/1 = No.0/No.1)
Bit 5: Expanded SMDR Output (0/1 = Out/In Service)
Index 293 = SMDR fault detect timer of SMDR C. **Note 34**, **Note 35**
Bit 0-3: Fault detection timer of SMDR C Value for the first digit (minutes)
Bit 4-7: Fault detection timer of SMDR C Value for the second digit (minutes)
Index 294 = Charging information port of SMDR D.
Bit 4: IOC Equipment Number (0/1 = No.0/No.1)
Bit 5: Expanded SMDR Output (0/1 = Out/In Service)
Index 295 = SMDR fault detect timer of SMDR D. **Note 34**, **Note 35**
Bit 0-3: Fault detection timer of SMDR D Value for the first digit (minutes)
Bit 4-7: Fault detection timer of SMDR D Value for the second digit (minutes)

Note 34: (0-9) HEX is used only. (A-F) HEX is not used. If (A-F) HEX is assigned for bit 0-3 and bit 4-7, SMDR fault cannot be detected.

Note 35: In the case of 00 HEX (default), system message will not be output for SMDR fault.

System Data 2, Index 3. Bit 0 enables SMDR registration per Tenant.
System Data 2, Index 3. Optional assignments for Station-to-Station Connection.
Bit 5: Code Type (0/1 = Authorization/Forced Account) assign as "1" for Authorization Code to be present in SMDR.
Bit 7: Station-to-Station SMDR in service (0/1 = No/Yes)
System Data 1, Index 18, Bit 4. To enable the output of Trunk Arrival Time and Abandoned Call information, Assign as "1".

STEP 2: **ASYDL -** System Data 1, Index 576

Bit 0: Centralized Billing-FCCS (Polling Method): 0/1 = Not/To be provided. Required both for Center Node and each Local Node.

Bit 1: SMDR for Station to Station Connections in a Self Node 0/1 = output/not output **Note 36**

Bit 2: SMDR Interface Type 0/1 = RS-232C interface is used/LAN interface is used.

System Data 1, Index 577.

Fusion Point Code (FPC) of Center Node.

Provided that "1" is flagging in Bit 0 of Index 576 (System Data 1), let every Local Node recognize its belonging Center Node for centralized billing-FCCS. Assign data on Center Node FPC at each Local Node. Given this data, the Local Nodes can acknowledge the SMDR polling only from the Center Node specified here (the polling from other parties will be ignored).

At the Center Node, assign 00H.

System Data 1, Index 578-581, Bit 0. Assign correct data (0/1) for regulation of output text format pattern for centralized billing-FCCS. Index 578 corresponds to SMDR A, 579 to SMDR B, 580 to SMDR C and 581 to SMDR D. **Note 37** The pattern to be adopted will be:

Bit 0 = 0: ICS text format.

Bit 0 = 1: IMX format.

System Data 1, Index 582, Bit 0-3. Assign the number of nodes to be polled at once.

0000 = 1 0001 = 1 0010 = 2 0011 = 3 0100 = 4 0101 = 5
0110 = 6 0111 = 7 1000 = 8 1111 = 8 **Note 38**

Note 36: This data is valid when the data is assigned at System Data 1, Index 512.

Note 37: The same billing information can be output to a maximum of four pieces of SMDR equipment.

Note 38: For the numbers more than 8, assign the data value as 8.

System Data 1, Index 583, Bit 0-2. The timing for FCCS billing data transmission from the node that accommodates the Outgoing Trunk or the node that accommodates the Called Station to the node that accommodates the Calling Party (Valid when System Data 1, Index583, Bit 7 = 0 in ASYDN).

Bit 2 1 0
0 0 0 = eight seconds
0 0 1 = two seconds
0 1 0 = four seconds
0 1 1 = six seconds
Bit 2 1 0
1 0 0 = eight seconds
1 0 1 = 10 seconds
1 1 0 = 12 seconds
1 1 1 = 14 seconds

System Data 1, Index 608-639.

Fusion Point Code (FPC) of SMDR polling destination.

After the Center Node (multiple CN: possible on a network) is assigned for centralized billing-FCCS, let the Center Node recognize its polling destination (specified by the FPC), referring to the table below. In the table, each Bit represents Fusion Point Code ranging from 1 to 253. When "1" is set, the FPC is specified as the polling destination.

Index	b7	b6	b5	b4	b3	b2	b1	b0
608	7	6	5	4	3	2	1	-
609	15	14	13	2	11	10	9	8

639	-	-	253	252	251	250	249	248

System Data 1, Index 641,
Bit 0: Type of the Station Number for the ICS text format.
0/1 = Physical Station Number/Telephone Number.

Note: If the Telephone Number is within 6 digits, the Telephone Number will be output.

Bit 3: Kind of the Route Number for the ICS text format.
0/1 = Physical Route Number/Logical Route Number.
System Data 1, Index 529, Bit 0-1: Assign the methods of parity check

00 = Odd Parity (Default)
01 = Odd Parity
10 = Even Parity
11 = No Parity check

System Data 1, Index 576, Bit 2: SMDR Interface Type 0/1 = RS-232C interface is used/LAN interface is used.
System Data 1, Index 578-581, Bit 4:Assign the usage of the SMDR.
Index 578, Bit 4: 0/1 = SMDR A is not used/used
Index 579, Bit 4: 0/1 = SMDR B is not used/used
Index 580, Bit 4: 0/1 = SMDR C is not used/used
Index 581, Bit 4: 0/1 = SMDR D is not used/used
Index 588, Bit 0: Output station number of transferring party to SMDR as originating party in Blind Transfer 0/1 = Out of service/In service

Note: For setting billing information for Outgoing Trunk Sending Time and Abandoned Call for Outgoing Trunk Call set Bit 0=1 for indexes 578, 579, 580 and 581 (available from FP95-113 V3).

Note: This data is valid when ASYD SYS1, Index 20, Bit 7=1 and Index 33=60 or 68 HEX. is assigned.

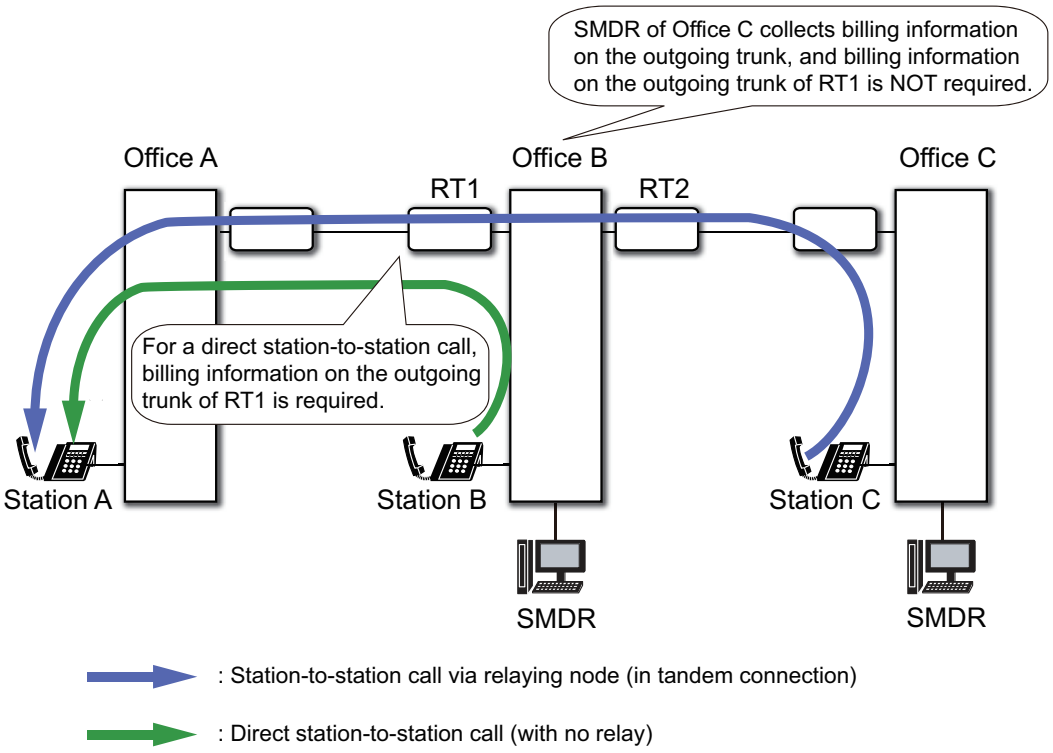
STEP 3: **ASYDN** - This data should be set "0" for ASYDL, System Data 1, Index 583, Bit 0-2. Index 583, Bit 7.
The node for saving FCCS billing data:
0 = The Node accommodating the Calling Party
1 = The Node accommodating the Outgoing Trunk or the Called Station

STEP 4: **AIOC** - Assign the function and attribute data of the IOC ports.
This data is required when using RS-232C interface, not necessary when using LAN interface.

STEP 5: **ADTM** - Specify the Port Number used for SMDR within the range of 1024 to 65534. When "0" is set, the default value (60010) is automatically used.

STEP 6: **ARTD** - CDN 10: SMDR. Enable outgoing routes to be included for SMDR registration.
CDN 16: SMDR2. Assign Detail Billing Information data. For details, see Command Manual.

Note: To enable Billing for Incoming Call, assign 1 to CDN16 (SMDR2).



Note: When assigning Logical Route, use ARTDN command.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as circuit card or MG.

CDN 56: SMDR3. Detailed billing for outgoing in tandem connection.
0/1 = Required/Not required.

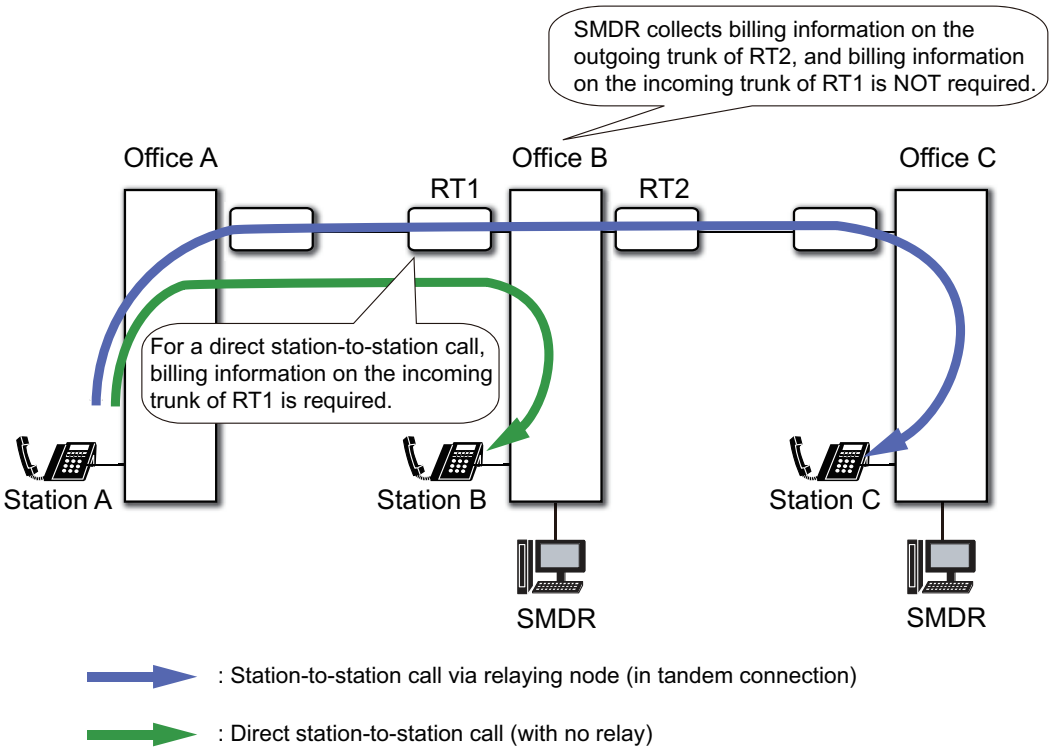
Note: Make this setting for the incoming route (ICRT) at the relaying node. For details, see <Case Where Detailed Billing for Outgoing in Tandem Connection is Not Required (CDN 56 = 1)>.

<Case Where Detailed Billing for Outgoing in Tandem Connection is Not Required (CDN 56 = 1)>

In the network shown above, Office B functions as a tandem switch. Office A has no SMDR.

When Station C places a call to Station A, the SMDR of Office C collects billing information on the outgoing trunk. Therefore, billing information on the outgoing trunk of RT1 is not required.

When Station B places a call to Station A, the billing information on the outgoing trunk of RT1 is required since Office A has no SMDR.



By assigning the Route Class data (ARTD, CDN56: SMDR3 = 1) to the incoming trunk of RT2, you can program the system so that the SMDR of Office B gathers billing information on RT1 only when the outgoing call is originated from a station in Office B.

CDN 69: SMDR4. Detailed billing for incoming in tandem connection.

0/1 = Required/Not required.

Note: Make this setting for the outgoing route (OGRT) at the relaying node. For details, see <Case Where Detailed Billing for Incoming in Tandem Connection is Not Required (CDN 69 = 1)>.

<Case Where Detailed Billing for Incoming in Tandem Connection is Not Required (CDN 69 = 1)>

In the network shown above, Office B functions as a tandem switch. Office A has no SMDR.

When Station A places a call to Station C, the SMDR of Office B collects billing information on the outgoing trunk of RT2. Therefore, billing information on the incoming trunk of RT1 is not required.

When Station A places a call to Station B, the billing information on the incoming trunk of RT1 is required since Office A has no SMDR.

By assigning the Route Class data (ARTD, CDN69: SMDR4 = 1) to the outgoing trunk of RT2, you can program the system so that the SMDR of Office B gathers billing information on RT1 only when the incoming call terminates to a station in Office B.

STEP 7: **ARTI** - To enable the output of Trunk Arrival/Sending Time and Abandoned Call information (for Incoming/Outgoing Trunk Call), assign CDN 90 (SMDS5) = 1.

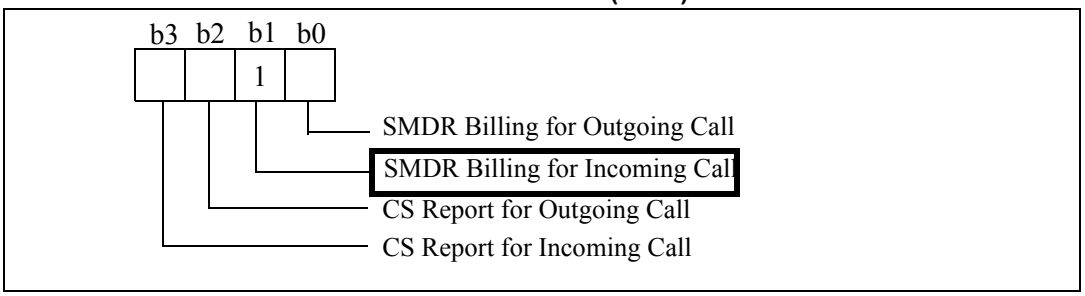
Note: When assigning Logical Route, use ARTIN command.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as circuit card or MG.

Note: Also, to enable this feature, it is necessary to enable SMDR billing for incoming/outgoing call by the data setting. The following tables and figure show the office data setting pattern for Incoming/Outgoing Call Billing:

Data Setting of Billing for Incoming Call, Abandoned Incoming Call and Trunk Arrival Time

ARTD/ARTDN CDN 16 (SMDR2) Bit 0	ARTI/ARTIN CDN 90 (SMDS5)	ASFC SFI 14 (System Message Detail Recording (SMDR) - Trunk Basis)	
		1 (Allowed)	0 (Restricted)
1	1	Billing for Incoming Call Abandoned Incoming Call Trunk Arrival Time	Not Output
1	0	Billing for Incoming Call	Not Output
0	1	Not Output	Not Output
0	0	Not Output	Not Output



Note: For countries other than EMEA:

- This feature is available since FP95-113 V3.
- This feature cannot be used in conjunction with CS Report.

Note: For EMEA market:

- This feature is available since FP95-111 V1.
- This feature can be used in conjunction with CS Report until FP95-112 V2. (From FP95-113 V3 they cannot be used at the same time.)
  Until FP95-112 V2, when CS Report is in service, the setting value of CSMDS (CDN70) is enabled. In that case, note the following:
  - *When no ARTI/ARTIN data is set or CSMDS (CDN70) bits 0-3= 0 or CSMDS (CDN70) bit 1= 1, Billing for Incoming Call is enabled.*
  - *To disable Billing for Incoming Call, set CSMDS (CDN70) bit 1 to "0" and bit 0 or bits 2-3 to "1".*

CDN: 70 CSMDS (ARTI)

Data Setting of Billing for Outgoing Call, Abandoned Outgoing Call and Trunk Sending Time

ARTD/ARTDN CDN 10 (SMDR1)	ARTI/ARTIN CDN 90 (SMDS5)	ASFC SFI 14 (System Message Detail Recording (SMDR) - Trunk Basis)	
		1 (Allowed)	0 (Restricted)
1	1	Billing for Outgoing Call Abandoned Outgoing Call Trunk Sending Time	Not Output
1	0	Billing for Outgoing Call	Not Output
0	1	Not Output	Not Output
0	0	Not Output	Not Output

Note: This feature is available since FP95-113 V3.

Note: This feature cannot be used in conjunction with CS Report.

STEP 8: **ASFC** - Assign data "1" to SFI 14 of a Service Feature Restriction Class to all traffics (Trunk Basis). Assign data "1" to SFI 58 of a Service Feature Restriction Class to all traffics of which is to be registered on SMDR (STN to STN Basis).

Note: The setting enables all traffics to be billing targets. If an unnecessary SMDR data is output, please discard it at the SMDR terminal.

STEP 9: **ARNP** - For the routes flagged for SMDR in ARTD, list the Route Number and the Outgoing Trunk Access Code or Outgoing Trunk Advance Access Code here. If LCR(S) is used, list the route numbers and the LCR(S) Access Code.

STEP 10: **AMND/AMNDL** - Assign the number of digits the Register is to receive for every dialing Code. List the Toll Number ID Data Code for the system to distinguish the Toll Dialing patterns for SMDR registration. The dialing Code listings are identical for LCR(S). Refer to the AMND descriptions for LCR-3/6-DIGIT [L-5] and TOLL RESTRICTION-3/6-DIGIT [T-7].

Note: Toll/Local data is used when ARTD CDN16 (SMDR2) Bit 1 = 1, where SMDR is output for an Outgoing Toll Calls only.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ALRTN** - Assign this command to connect the Logical Route to the Physical Route.

STEP 2: **ATDF** - Assign time difference data if the time between the nodes and the UCT (Universal Coordinated Time) may not be identical on a FCCS Network. The assigned data (time difference margin [Plus/Minus, Hour, Minute] between each FPC and the UCT) is to be written in Network Data Memory (NDM) of the Network Control Node (NCN).

Programming for Centralized Billing - FCCS (Polling Method)

STEP 1: **ASYDL** - System Data 1, Index 529, Bits 0 and 1. Set a parity check type (Odd/Even/Non)

Bit 1	Bit 0	Parity Check Type
0	0	Odd Parity (Default)
0	1	Odd Parity
1	0	Even Parity
1	1	Non Parity

System Data 1, Index 576,
Bit 0 = 1 (FCCS Centralized Billing Service (Polling Method) is in service.
Bit 2 = 0/1 (SMDR Interface Type: RS232C/LAN). **Note 39**

Note 39: Set an appropriate interface type (RS232C/LAN) for SMDR equipment that is installed at Center Node only. This bit is not required for Local Node when no SMDR equipment is installed at the Local Node.

System Data 1, Index 577, Bits 0 - 7. Set FPC as follows.

Node	Data for Index 577
Center Node	00 [Hex]
Local Node	Assign FPC of Center Node in hexadecimal (01-FD [Hex]).

System Data 1, Index 578, Bit 0 and Bit 4. Assign data for SMDR A
Bit 0 = 0/1 (ICS format/IMX format)
Bit 4 = 0/1 (SMDR A with LAN interface is not used/used)

System Data 1, Index 579, Bit 0 and Bit 4. Assign data for SMDR B
Bit 0 = 0/1 (ICS format/IMX format)
Bit 4 = 0/1 (SMDR B with LAN interface is not used/used)

System Data 1, Index 580, Bit 0 and Bit 4. Assign data for SMDR C
Bit 0 = 0/1 (ICS format/IMX format)
Bit 4 = 0/1 (SMDR C with LAN interface is not used/used)

System Data 1, Index 581, Bit 0 and Bit 4. Assign data for SMDR D
Bit 0 = 0/1 (ICS format/IMX format)
Bit 4 = 0/1 (SMDR D with LAN interface is not used/used)

System Data 1, Index 582, Bits 0-3. Assign the number of nodes to be polled in a polling. When default value is used, polling is performed to one node at each polling.

Bit 3	Bit 2	Bit 1	Bit 0	Number of Nodes to be polled
0	0	0	0	1 node
0	0	0	1	1 node
0	0	1	0	2 nodes
0	0	1	1	3 nodes
0	1	0	0	4 nodes
0	1	0	1	5 nodes
0	1	1	0	6 nodes
0	1	1	1	7 nodes
1	0	0	0	8 nodes
|	|	|	|	
1	1	1	1	

System Data 1, Index 583, Bits 0-2. Assign the cycle to send billing data to the node which accommodates the calling station. The billing data is sent from node which accommodates the originating trunk (Outgoing Call SMDR) or the called station (Station-to-Station SMDR).

Bit 2	Bit 1	Bit 0	Cycle to Send
0	0	0	8 seconds
0	0	1	2 seconds
0	1	0	4 seconds
0	1	1	6 seconds
1	0	0	8 seconds
1	0	1	10 seconds
1	1	0	12 seconds
1	1	1	14 seconds

Note: By default, the data is transmitted every 8 seconds.

System Data 1, Index 585, Bits 0-7. Modify the polling cycle between nodes at the Center Node if required. The default cycle (2 seconds) can be modified in one of the following cases to avoid buffer overflow at Local Node:

- FCCS network consists of many Local Nodes
- Local Node is specified as a Main Node of Centralized Billing - CCIS

Bit 2	Bit 1	Bit 0	Cycle to Send
0	0	0	8 seconds
0	0	1	2 seconds
0	1	0	4 seconds
0	1	1	6 seconds
1	0	0	8 seconds
1	0	1	10 seconds
1	1	0	12 seconds
1	1	1	14 seconds

System Data 1, Index 586, Bits 0-7. Modify the upper limit of polling buffer usage rate (01% - 99%) if required. The default value is 50%. If the usage rate exceeds this value, polling will not be performed.

b7	b6	b5	b4	b3	b2	b1	b0
Tens				Unit			

Note: When the Centralized Billing Office cannot receive any billing information for 20 seconds, billing information created at local offices is not to be sent to the Centralized Billing Office. In this case, when there is no other destination for a local office to output the billing information than the Centralized Billing Office-CCIS, the information will be deleted. As long as this incapability of sending information persists, the transmission status is to be checked in order from the oldest.

Note: This setting applies to “No.7 Centralized Billing -CCIS”, “Centralized Billing -FCCS”, and “CS Report [for UMGi/RNIP system] [C-149]”.

System Data 1, Indexes 608-639. Assign FPCs of nodes that are polled by Center Node.

System Data 1, Index 641 Output Number and Route Number designation that is applied for SMDR - ICS format only.
Bit 0 = 0/1 (Station Number/Telephone Number)
Bit 4 = 0/1 (Physical Route Number/Logical Route Number)

Note: If the number of digits of Telephone Number is within 6 digits, the Telephone Number will be output when Bit 0 = 1.

STEP 2: **ASYDN** - System Data 1, Index 583 Bit 7. Specify node to which SMDR data should be stored.
0/1 = (Node accommodating the calling party/Node accommodating the outgoing trunk or the called party)

Note: Be sure to assign Bit 7= 1 when the SMDR terminal is not connected to the Local Node in order to collect the billing information quickly.

S-11 Station-to-Station Calling

General Description

This feature permits any Station user to directly dial another Station within the system without operator assistance.

Operating Procedure

To operate

1. Lift the handset. Receive Dial Tone.
2. Dial the desired Telephone Number.

Service Conditions

1. If the Called Station is off-hook, the originating Station receives a Busy Tone. Otherwise, the Called Station will ring and the caller will hear a Ringback Tone.
2. If the Called Station remains unanswered for longer than a preset interval, the call will not be transferred to the ATTENDANT CONSOLE [A-3], unless CALL FORWARDING-DON'T ANSWER [C-3] is provided.
3. If the Called Station is busy, the call will not be transferred to the Attendant Console, unless CALL FORWARDING-BUSY LINE [C-2] is provided.
4. Station-to-Station Calling between TENANTs [T-12], will not be restricted, unless programming for such restriction is entered in System Data.
5. The maximum number of digits per Telephone Number is 16.
6. The same Telephone Numbers cannot be duplicated in different TENANT SERVICE [T-12] Groups.
7. Calling Party Release/Called Party Release/Both Party Release/First Party Release can be selected on a system basis.
8. The following features, if activated, may result in the Calling Station user to be connected to a Station other than the dialed Station:

CALL FORWARDING - ALL CALLS/BUSY/DON'T ANSWER	[C-5, 2, 3]
CALL PICKUP	[C-7, 30]
STATION HUNTING	[S-7, S-8, S-9]
UCD	[U-1]

9. When HOTLINE [H-1] service is provided, the Calling Station user automatically connects to a preset number by going off-hook. The preset number may be another Station, an Attendant, or an Outside Party.
10. When the Calling Station user dials an unassigned Telephone Number, the call will be routed to Reorder Tone or Announcement (option).
11. An option per Station Line is available to eliminate the STATION 5dB PAD [S-62].

Interactions

1. The ATNR command is required for all Station-to-Station Calling.
2. The normal 5 dB PAD loss inserted for Station-to-Station Calling may be eliminated on a per-Station basis. For these Stations, assign a Service Feature Restriction Class that allows SFI 50, Removal of 5dB pad for Off-Premises Extensions (OPX).

Programming

STEP 1: **ASYD** - System Data 1, Index 4, Bits 2 and 3. Assign data "10" for First-Party Release.

STEP 2: **ATNR** - Assign for Tenant Restriction Index (TRI) 0. This Index allows for Station-to-Station Calling between the same Tenant and between different Tenants.

DAY/NIGHT: Day/Night Mode
- D: Day Mode
- N: Night Mode

OGTN: Originating Tenant

TMTN: Terminating Tenant

TRI: Tenant Restriction Index (0-15)

RES: Restriction Data
- 0: Restricted
- 1: Allowed

TRI: Tenant Restriction Index
- 0: Allows Intra and Inter-Tenant Station Calls. Allow call within Tenant.
- 1: Allows CALL FORWARDING-ALL CALLS, -DON'T ANSWER, and -BUSY LINE on an Intra and Inter-Tenant basis. Allow this feature within Self-Tenant.
- 2: Allows or restricts Incoming Calls via the Night Attendant Console from Tenant to Tenant. This allows the Tenant, as assigned to a Trunk, to be terminated to a Tenant, as assigned to a Station.
- 3: Allows the CALL FORWARDING-ALL CALLS, DON'T ANSWER, and BUSY LINE on an Intra and Inter-Tenant basis, as when set by the Attendant Console.
- 4: Allows or restricts Incoming Calls to the Attendant Console on a per Tenant basis. Thus, an Attendant may handle calls only for a specific Tenant.
- 5: Day/Night Mode Change Restriction.
- 6: Not used
- 7: Not used

S-12 Station-to-Station Calling - Operator Assistance

General Description

This feature allows a Station user to call another Station within the System, with the assistance of the ATTENDANT CONSOLE [A-3] operator.

Operating Procedure

To operate

1. Lift the handset. Receive Dial Tone.
2. Dial the operator Access Code (normally “0”).
3. Relay the desired Telephone Number to the Attendant.
4. The Attendant dials the Telephone Number. The Called Party Station rings and the Attendant presses the RELEASE Key.
5. Calling and Called Parties are connected when the Called Station answers the call.

Service Conditions

1. The Attendant may drop out of the Connection before or after the Called Party has answered.
2. If the Called Station does not answer within 30 seconds, AUTOMATIC RECALL [A-8] will be activated. The Recall Timer length is set in System Data.
3. Using this feature, the Attendant may connect the Calling Party to a fully-restricted Station.
4. STATION-TO-STATION CALLING-OPERATOR ASSISTANCE between TENANTs [T-2] will not be restricted, unless such a restriction is programmed in System Data.
5. The Fusion Point Code of the Node which accommodates the Called Attendant Console must be assigned after System Data assignment.

Interactions

1. The ATNR command is required for all Station-to-Station Calling.
2. The normal 5 dB PAD loss inserted for Station-to-Station Calling may be eliminated on a per-Station basis. For these Stations, assign a Service Feature Restriction Class that allows SFI 50 [Off-Premise Extension (No Howler/No Pad Control)], Removal of 5dB pad for Off-Premises Extensions (OPX).
3. The Attendant Console must first be provided.
4. ATTENDANT CAMP-ON WITH TONE INDICATION [A-1]: The Attendant cannot Camp-On a Station-to-Station Call.

Programming

STEP 1: **ASYD** - System Data 1, Index 4, Bits 2 and 3. Assign data "10" for First-Party Release.

STEP 2: **ATNR** - Assign for Tenant Restriction Index (TRI) 0. This Index allows for STATION-TO-STATION CALLING between the same Tenant and between different Tenants. The Tenant, in which the Attendant resides, must also be allowed STATION-TO-STATION CALLING to assist in placing the call.

D/N: Day/Night Mode
- Day Mode
- Night Mode

OGTN: Originating Tenant

TMTN: Terminating Tenant

TRI: Tenant Restriction Index (0-15)

RES: Restriction Data

0: Restricted

1: Allowed

S-13 Step Call

General Description

This feature allows the Attendant or Station user, upon calling a busy Station, to call an Idle Station by dialing an additional digit. This feature will operate only if the number of the Idle Station is identical to that of the busy Station in all respects, except the last digit.

Operating Procedure

To operate

1. The dialed Station (220) is busy.
2. Dial "5" (or any digit between 0 and 9).
3. If Station 225 is idle, the call will be connected there.

Service Conditions

1. This feature can be provided for all Stations and the Attendant Console(s).
2. STEP CALLING can be in any order, 0-9 or 9-0.
3. If the second selected Station is also busy, STEP CALLING can continue until a Station rings.
4. If a Station is set for any type of CALL FORWARDING (ALL CALLS, BUSY LINE NO ANSWER [C-2, 3, 5]), the Call Forwarding will take effect.
5. CALL FORWARDING - ALL CALLS/BUSY LINE [C-2, 5]: The activation of a Call Forwarding feature by the Called Station can cause a STEP CALL to be completed to a Station other than the dialed Station.
6. CONSULTATION HOLD - ALL CALLS [C-17]: STEP CALL can be activated when a Busy Tone is returned on a Consultation Hold attempt.
7. The STEP CALL feature is not operational for Trunk Incoming Calls to the SV9500 Stations.

   Note: STM:2 and STS:6 should be assigned as 1 by ASTD command, to restrict Step Call on DID.

8. A STEP CALL to a Station in LINE LOCKOUT [L-3] or maintenance busy state will result in a Reorder Tone.
9. This feature can be activated between an IP terminal and a SIP terminal (a SIP Multiple Line terminal, a Soft Phone (SIP), a WLAN Handset (MH Series) and a SIP Handler Controlled SIP terminal), under the following conditions:
   - From IP terminal to SIP terminal: Available
   - From SIP terminal to IP terminal: Not available
   - From SIP terminal to SIP terminal: Not available

Interactions

1. A STEP CALL can search through an entire group to find an Idle Station.
2. CALL FORWARDING [C-2, 3, 5]: STEP CALL will respond according to the numbering scheme of the dialed Station. Station A (7526) Call Forwards his phone to Station B (7128). Station B is busy. The Calling Station dials 7526 and receives Busy Tone. The Calling Station then dials 2. The call terminates at 7522.

3. CONSULTATION HOLD-ALL CALLS [C-17]: STEP CALL can be used when encountering a busy Station via CONSULTATION HOLD.
4. LINE LOCKOUT [L-3]: A STEP CALL to a Station in LINE LOCKOUT [L-3] results in Reorder Tone. Another digit can be dialed to reach an Idle Station.
5. When STEP CALL [S-13] is used after LAST NUMBER CALL [L-6, 6D] service with the Access Code, the destination of STEP CALL is changed depending on the Access Code of the LAST NUMBER CALLED [L-6, 6D] service because the System recognizes the Access Code of LAST NUMBER CALLED as the Telephone Number. In other words, the target number for STEP CALL is not the Telephone Number dialed before LAST NUMBER CALLED, but the number dialed as the LAST NUMBER CALLED Access Code. For example:
   a.) Station A places a call to Station B (4000) by dialing "300", which is the Access Code of LAST NUMBER CALLED.
   b.) Station A hears Busy Tone since Station B is busy.
   c.) Station A dials "1" using STEP CALL.
   d.) The System recognizes that "301" is dialed.
6. System data that enables to receive digits when the destination is in busy (ASYDL, SYS1, Index1382 Bit 0 = 0) is required to use this feature through SIP Handler Controlled SIP terminals.
7. A Step Call through a TIE Line is available, except when a TIE Line call to a PS/SP Controlled SIP terminal is forwarded to a busy station via CALL FORWARDING PS INCOMING CALL INCOMPLETE [C-155].

Programming

STEP 1: **ASYD** - System Data 1, Index 59, Bit 2. DID Busy Condition 0/1: No Tone/Busy Tone (Assign 1)

STEP 2: **ASTD** - STM 2, STS 6, ST 1 to restrict DID step call.

S-15 Serial Call

General Description

This feature allows the Attendant to arrange for a recall from a Station before releasing a Central Office Call to that Station. When the Station subsequently disconnects from the call, the Central Office party automatically rings back to the Attendant.

Operating Procedure

1. Answer the Incoming Central Office Call.
2. Extend the call to the desired Station.
3. Press the SERIAL CALL (SC) Key. The HOLD Lamp corresponding to the Loop will light.
4. The Called Station and Incoming Station are connected.
5. The Called Station hangs up. The HOLD Lamp (and the ATND Lamp) on the Attendant Console flash at 60 IPM. If the Attendant position is available, an audible indication will be provided.
6. Press the associated Loop Key to return to the Incoming Calling Party.

Service Conditions

1. This feature is effective only for Incoming Calls from external Trunks.
2. If the Attendant enters a Loop that is already set up for SERIAL CALL, the service is automatically canceled.
3. SERIAL CALL (SC) is not provided for Station-to-Station Calling.
4. SERIAL CALL can be provided on a per Tenant basis.
5. SERIAL CALLING is allowed when a Station is involved in an ATTENDANT CONTROLLED CONFERENCE [A-2].
6. STATION MESSAGE DETAIL RECORDING (SMDR) [S-10]: The duration of the total call is recorded on the last Station Call.
7. When the ATTENDANT LOCKOUT [A-5] feature is provided, the Attendant cannot reenter the Connection without being recalled.
8. This feature is not applicable for Tandem Connections.
9. In the Loop Release system, once this service is set, the Attendant position enters the idle state, and the established call is released from the Loop, enabling all hooking services at the extension side. ASYD, System Data 1, Index 186, Bit 4 = 1.
10. The Attendant sets this service by pressing the SC Key when the extension user answers.
11. It is not possible to release this service once it is set.
12. If the operator presses the SC Key before the called extension answers (Non-Delay mode service setting), the external Calling Party receives a Ringback Tone, and the Attendant position enters the idle state.
13. In the Non-Delay mode service, setting the extension Loop release does not occur until the Called Extension answers, even though the Loop Release system is specified by the System Data setting (System Data 2 Index 2 Bit 4 = 1). The operator is allowed to reenter the Connection before the extension answers, though the SERIAL CALL service remains set.
14. CALL PICKUP GROUP [C-7] feature can be used for answering a call handled by the operator in the Non-Delay service setting mode.
15. CALL FORWARDING-DON'T ANSWER [C-3] feature cannot be used if SERIAL CALL is set.

16. SERIAL CALL termination is indicated to the Attendant by means of the HOLD or SC/RC lamp and buzzer indication. Ringback Tone is sent to the external Calling Party up to the time the Attendant answers the indicated Serial Call.
17. SC termination indication goes off if the external Calling Party is released before the Attendant answers the indicated Serial Call (in case of TIE Line Connection).
18. Either the SC/RC Key or the ANSWER Key is used to answer a Serial Call if ASYD System Data 1, Index 186, Bit 4 is "1".
19. SERIAL CALL service is automatically released when the operator answers the indicated Serial Call.
20. The Day-To-Night mode change does not interrupt the indication of Serial Call Termination.
21. Attendant supervision of a SERIAL CALL on the ATTENDANT CONSOLE [A-3] is provided via the Loop status lamps. After an Incoming Trunk Call is extended to a Station and the Called Station goes on-hook, the Attendant is alerted by the flashing HOLD indicator lamp.
22. The following features are denied toward a line or Trunk involved in a SERIAL CALL if ASYD, System Data 1, Index 186, Bit 4 = 0:

ATTENDANT CAMP-ON WITH TONE INDICATION	[A-1]
ATTENDANT OVERRIDE	[A-7]
BUSY VERIFICATION	[B-3]
BOSS - SECRETARY OVERRIDE -D	[B-6D]
CALL HOLD	[C-6, 6D]
CALL WAITING - ORIGINATING	[C-31]
CALL WAITING - TERMINATING	[C-12]
EXECUTIVE RIGHT-OF-WAY	[E-1, 1D]

23. When CALL WAITING - TERMINATING [C-12], CALL WAITING - ORIGINATING [C-31], Attendant Camp-On, or Attendant Camp-On - CCIS is set to the Station already engaged in a SERIAL CALL, the following conditions occur:
    a.) If the Station answers the Overriding Call, the party formerly engaged in the SERIAL CALL is placed on hold. When the Station releases and does not return to the Held Call, the Attendant is recalled.
    b.) If the Station does not answer the Overriding Call, Call Waiting or Attendant Camp-On is activated.
24. When a call is directed to Attendant Console from CCIS Trunk:
    If the Incoming Trunk is released due to the reason such as call transfer to the Calling Party, etc., this feature is canceled.

Interactions

1. Features requiring the switch hook to be flashed are available. These include CALL TRANSFER-ALL CALLS [C-11], CALL PICKUP [C-7, 30], CONSULTATION HOLD [C-17], and CALL HOLD [C-6] if ASYD System Data 1, Index 186, Bit 4 is "1".
2. EXECUTIVE RIGHT-OF-WAY [E-1], BUSY VERIFICATION [B-3], and ATTENDANT OVERRIDE [A-7] are available towards a Station/Trunk involved in a Serial Call, if ASYD System Data 1, Index 186, Bit 4 is "1".
3. If a Serial Call is transferred to a second Station, when the second Station hangs up, the Serial Call will return to the Attendant Console if ASYD, System Data 1, Index 186, Bit 4 is "1".

Note: The SC (Serial Call) Key is the Key right of the DEST Key. The SC/RC (Serial Call Recall) Key replaces the CCSA Key if ASYD System Data 1, Index 186, Bit 4 is "1".

Programming

ASYD - System Data 1, Index 186, Bit 4. Serial Call Loop Release 0/1: OUT/In Service When data "1" is assigned, CCSA Calls will not ring the ATT. In this case, change ARTD CDN 6:TCL from CCSA to DDD Line, TIE Line, etc.

System Data 2, Index 7, Bit 2. Is SERIAL CALL to be enabled on a per Tenant basis? 0/1: No/Yes.

System Data 1, Index 43, Bit 4. Is Attendant able to reenter Loop of Serial Call? 0/1: No/Yes.

S-19 Single-Digit Feature Code

General Description

This feature allows the system to be programmed so that features used most frequently may be accessed by dialing a single digit.

Operating Procedure

To access a desired feature, refer to the Operating Procedure section of that particular Feature Description.

Service Conditions

1. When accessing SINGLE-DIGIT FEATURE CODEs, consideration must be given to the overall Numbering Plan of the particular system, unless timing start has been provided.
2. Timing start is not available with this feature.

Interactions

1. For each feature with one-digit access, an entire Number Level is eliminated. Do not plan to have more than one or two such features in a system.
2. The corresponding feature Cancel Code does not have to be a single digit.
3. TRUNK ANSWER ANY STATION [T-8], SPEED CALLING-SYSTEM [S-3], and DIAL ACCESS TO THE ATTENDANT [D-2] are three applications for SINGLE-DIGIT FEATURE CODE.
4. The digit "*" or "#" can be used as the first digit of a Trunk Access Code and can be used as a Feature Access Code.

Programming

STEP 1: **ANPD** - Reserve a Number Level for Feature Access. Select Normal Service (N), Hooking Service (H) or Busy Service (B) from the combo box for Connection Indexes. (applicable to any feature assigned to this Level). Assign NND in accordance with a predetermined Numbering Plan. BLF is not in service.

STEP 2: **ASPA** - Assign the Tenant and Access Code for the desired feature. Assign Connection Indexes, CI = "N: Normal", "H: Hooking" and/or "B: Busy". Assign the SRV = "SSC: Service Code" or "SSCA: Service Code Appendix", and Service Feature Index SID or SIDA for the required feature.

STEP 3: **ASFC** - Assign to the Stations to receive this feature an SFC that allows the corresponding SFI.

S-21 Speed Calling - Station

General Description

This feature allows a Station user to dial certain frequently-called exchange network numbers using fewer digits (Abbreviated Call Codes) than normally required. Using this feature, a Station user can establish his own abbreviated codes.

Operating Procedure

To operate

1. Lift handset or press SPEAKER Key. Receive Dial Tone.
2. Dial SPEED CALLING. Enter Access Code (one to three digits). **Note 1**
3. Dial the Abbreviated Call Code (one to three digits). Call is completed.

To set, using the Primary Station only

1. Lift handset. Receive Dial Tone.
2. Dial SPEED CALLING. Enter Feature Access Code (one or two digits). **Note 1**
3. Dial the Abbreviated Call Code (one to three digits). At this point no tone is returned.
4. Dial the destination telephone number. A brief pause will occur before receiving Service Set Tone.

Note 1: If one digit Code is used, the format must be 00 to 99.

To operate from a Desktop terminal

1. Press the REDIAL Key. Receive Dial Tone. The LCD displays:

2. Press the desired Call Code. The call is completed.

Service Conditions

1. SPEED CALLING-STATION codes are programmed into RAM memory per Local Processor.
2. Each Abbreviated Call Code can store a maximum of 24 digits, including Access Codes and pauses.
3. A maximum of 100 Stations per Module Group can be equipped with SPEED CALLING-STATION.
4. **<Speed Calling - Station>**
   100 Memory Blocks per Module Group are assigned for Speed Calling. A maximum of 10 numbers can be stored in each Memory Block. This allows for a total of 1,000 numbers per Module Group.
   <Expanded Speed Calling - Station>
   A maximum of 1400 Memory Blocks can be assigned per LP. A maximum of 10 numbers can be stored in each Memory Block. This allows for a total of 14,000 numbers per LP.
5. Each Station can be assigned 10 memory blocks for Speed Calling; therefore, it can be programmed for 10 ~ 100 numbers per MG. In Expanded Speed Calling, each station can be programmed for 140 ~1400 numbers per LP.
6. TOLL DENIAL/TOLL DIVERSION [T-6] and TOLL RESTRICTION-3/6-DIGIT [T-7] may or may not be applied to SPEED CALLING, as desired.
7. LEAST-COST ROUTING-3/6-DIGIT [L-5] may be provided via SPEED CALLING-STATION access.

8. Each user of an individual Station equipped with this feature can program a personal Speed Calling Numbers, via the Single Line Telephone.
9. If SPEED CALLING-STATION is assigned to a Local Processor, SPEED CALLING-GROUP [S-23] shares the same memory tables. Therefore, careful consideration should be given when programming.
10. When outgoing dialing with this feature, Speed Calling Number can be displayed on the LCD instead of Speed Calling-System Feature Access Code and the Abbreviated Call Code by ASYDL command (ASYDL SYS 1 Index 673 bit 6=1). The following conditions are about this feature.

    Note: This feature is available only with outgoing call (LCR/LCRS/OGC/OGCA).

    a.) When you register the Abbreviated Call Codes as a Forwarding Destination with Speed Calling Number Display on Dterm service, only SPEED CALLING - SYSTEM Access Code and Abbreviated Code are displayed on LCD. Speed Calling Number is not displayed.
    b.) Although Speed Calling Number Display on Dterm service is available, SPEED CALLING-SYSTEM Access Code and Abbreviated Code are displayed on LCD as a dialed numbers memory, not Speed Calling Number.
    c.) When Speed Calling Number Display on Dterm service is available, the number is displayed within 16 digits. More than 16 digits number is displayed as only the first 16 digits.
    d.) This feature is available only while calling the party. If the LCD is re-displayed with other service such as Name Display-OAI-CCIS or the called party is being busy, this feature is not available.
    e.) When you use this feature, register the Speed Calling Number correctly in ASPD command. If the last digit part of number is not registered, Speed Calling Number is not displayed.
    (When calling "8-26-70000" with the use of this service, you may register "826" as a Speed Calling Number. In this case, press the Access Code and Abbreviated Code, and dial "70000". At the time you call "7", Speed Calling Number display becomes invalid.)
    f.) While calling with this feature, if you press the abbreviated call codes, Speed Calling Number is not displayed.
11. SPEED CALLING-STATION data will be retained in memory, even if the system is reinitialized or in the event of a power failure, by means of a hard disk for a system.
12. A pause may be programmed, using the "*****" Key of a PB pad. This will take one of the 24 digits available. Rotary type phones cannot store a pause. A pause lasts about 3 seconds. A pause cannot be added to ISDN, or CCIS Calls.

    Note: A pause to MG-COT Calls can be added. In this case, a pause lasts about three seconds.

    Note: Registered pauses will not be activated when originating a call to ISDN Lines or to Analog Lines via MG-COT.

13. It is not necessary to erase a stored number in order to store another number. The second number replaces the first.
14. When a caller places a call via Outgoing Call Alternative (OGCA), and when the first outgoing route and the Station setting SPEED CALLING - STATION are restricted, this service cannot be set. In this case, the service can be set via the following procedure:
    a.) assign a dummy route.
    b.) clear the restriction between the dummy route and all the Stations.
    c.) assign the dummy route as the first route of OGCA.

15. When this feature is activated by pressing the REDIAL Key, only the Abbreviated Call Code is displayed on the LCD of the Dterm. Expanded Speed Calling - Station cannot be activated by the REDIAL Key.
16. When this feature is activated by dialing the Speed Calling Feature Access Code + the Abbreviated Call Code, only the Speed Calling Feature Access Code and the Abbreviated Call Code are displayed on the LCD of the Dterm.
17. After switch hook flash, station user cannot originate a call by Abbreviated Call Code. However, this is available from attendant console.
18. Speed Calling - Station can be activated from ISDN terminals. However, Expanded Speed Calling - Station cannot be activated from ISDN terminals.

Interactions

1. Blocks are not assigned sequentially (1-100), but are assigned as a quantity of blocks in the AISA command. These quantities will never exceed the value of 10.
2. If one block is assigned, the Abbreviated Call Code will be digits 0-9. If two blocks are assigned, the Abbreviated Call Code will be digits 00 - 19. If three blocks are assigned, the Abbreviated Call Code will be digits 00 - 29, and so on, to a maximum of 10 blocks with Abbreviated Call Codes 00 - 99.
3. Only the Primary Station will be allowed to use the SPEED CALLING-ASSIGN Access Code. When assigning the abbreviated SPEED CALLING Access Code and number, a delay of six to eight seconds will occur until Service Set Tone is returned.
4. Only those Stations assigned as Secondary Stations are considered to be members of the SPEED CALLING-GROUP.
5. Stations of a Speed Calling - Group (Individual) must be in the same Module Group (MG). Error 0238, “MG number of MY Line/Primary Station mismatch” is displayed.
   Stations of an Expanded Speed Calling - Group (Individual) must be in the same LP.
6. SPEED CALLING-INDIVIDUAL requires the assignment of senders, route 905. See UNIVERSAL SENDER [U-3].
7. OUTGOING TRUNK QUEUING [O-2]. This feature may be used with SPEED CALLING-INDIVIDUAL (GROUP) if all Trunks are busy.
8. ROUTE ADVANCE [R-6] and LEAST-COST ROUTING-3/6 DIGIT [L-5] may be used with this feature. The ASPA Access Code to either ROUTE ADVANCE [R-6] or LEAST-COST ROUTING-3/6 DIGIT [L-5] will be stored in the memory of the SPEED CALLING-GROUP number.
9. To set/modify this feature setting from a SIP Handler Controlled SIP terminal, dial all required digits: SPEED CALLING Setting Access Code, Abbreviated Call Code, and Call Origination Access Code with the destination station number.
   To place a call from the SIP Handler Controlled SIP terminal, dial the entire Access Code and Abbreviated Call Code.

Programming

STEP 1: **ASYD** - System Data 2, Index 1, Bit 3. Does TOLL RESTRICTION apply to SPEED CALLING-STATION? 0/1: Yes/No. (If yes, refer to TOLL RESTRICTION-3/6 DIGIT [T-10]).

STEP 2: **ASYDL** - System Data 1, Index 673, bit 6. Speed Calling Number Display Service on Dterm (Outgoing Call only) 0/1=Out/In Service

STEP 3: **ANPD** - Reserve a Number Level for Feature Access. Select Normal Service (N), Hooking Service (H) or Busy Service (B) from the combo box for Connection Indexes. (applicable to any feature assigned to this Level). Assign NND in accordance with a predetermined Numbering Plan.

STEP 4: **ASPA** - Two Access Codes must be assigned for this feature.

For the individual Station Speed Calling Number assignment, assign the Tenant and Access Code (ACC). Assign for a Connection Index of "N: Normal". For SRV = "SSC: Service Code", assign SID 14.

For individual Station Speed Calling Access, assign the Tenant and Access Code (ACC). Assign for a Connection Index of "N: Normal". For SRV = "SSC: Service Code", assign SID 21.

For the Expanded Speed Calling Number assignment, assign the Tenant and Access Code (ACC). Assign for a Connection Index of "N: Normal". For SRV = "SSCA: Service Code Appendix", assign SIDA 134.

For the Expanded Speed Calling Access, assign the Tenant and Access Code (ACC). Assign for a Connection Index of "N: Normal". For SRV = "SSCA: Service Code Appendix", assign SIDA 135.

STEP 5: **ASFC** - For Stations allowed this feature, assign a Service Feature Restriction Class that allows SFI 19 (Speed Calling - Station/Group). If necessary, assign a Service Feature Restriction Class that allows SFI 197 (Expanded Speed Calling - Station/Group).

STEP 6: **AISA** - Program the Tenant, Station, type of Station, and the number of SPEED CALLING blocks to be assigned to the Primary Station.

TN: Tenant Number
STN: Station Number
MST/SLV: Primary/Secondary
1: MST (Master Station)
2: SLV (Slave Station)
BLOCK: Number of Blocks
MST STN: When assigning SLV (Secondary) Station, assign the MST (Primary) Station Number.

STEP 7: **AIEA** - Program the Tenant, Station, Type of Station, and the number of Expanded Speed Calling blocks to be assigned to the MST Station.

STN: Station Number
STATION TYPE = 1: MST (Master Station)
BLOCK: Number of Blocks (1-10)
When assigning secondary station;
STN: Station Number
STATION TYPE = 2: SLV (Slave Station)
MST STN: MST (Primary) Station Number

STEP 8: **AKYD** - Assign Feature Key Speed Calling - Station/Group [26]. If necessary, assign Feature Key Expanded Speed Calling - Station/Group [146].

STEP 9: **ADSL** - Assign G_SPD Key; Assign SN = 1 (Originating; DT Connection) and FKY = 26 (Speed Calling Station/Group)/FKY = 146 (Expanded Speed Calling Station/Group).

This command is used for assigning a function to each Soft Key.

STEP 10: **AISD** - This command is used to assign, delete, and display the destination number of Speed Calling.

STEP 11: **AIED** - This command is used to assign, delete, and display the destination number of Expanded Speed Calling.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ANPDL** - Reserve a Number Level for Feature Access. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. (applicable to any feature assigned to this Level). Assign NND in accordance with a predetermined Numbering Plan.

STEP 2: **ASPAL** - Two Access Codes must be assigned for this feature.

For the individual Station Speed Calling Number assignment, assign the Tenant and Access Code (ACC). Assign for a Connection Index of "N: Normal". For SRV = "SSC: Service Code", assign SID 14.

For individual Station Speed Calling Access, assign the Tenant and Access Code (ACC). Assign for a Connection Index of "N: Normal". For SRV = "SSC: Service Code", assign SID 21.

For the Expanded Speed Calling Number assignment, assign the Tenant and Access Code (ACC). Assign for a Connection Index of "N: Normal". For SRV = "SSCA: Service Code Appendix", assign SIDA 134.

For the Expanded Speed Calling Access, assign the Tenant and Access Code (ACC). Assign for a Connection Index of "N: Normal". For SRV = "SSCA: Service Code Appendix", assign SIDA 135.

S-23 Speed Calling - Group

General Description

This feature allows a Station user to share a set of common Speed Calling Numbers with other Station users in the group.

Operating Procedure

To record

1. Lift handset or press SPEAKER Key. Receive Dial Tone.
2. Dial the SPEED CALLING Access Code (one to three digits).
3. Dial the Abbreviated Call Code (one to three digits) and the called exchange network numbers. Receive Service Set Tone.

Note 1: If one digit code is used, the format must be 00 to 99.

To operate

1. Lift handset. Receive Dial Tone.
2. Dial the SPEED CALLING Feature Access Code.
3. Dial the Abbreviated Call Code (one or two digits).
4. Call is completed.

To operate from a Dterm

1. Press the REDIAL Key. Receive Dial Tone. The LCD displays:

2. Press the desired Call Code. The call is completed.

Service Conditions

1. **<Speed Calling - Group>**
   A maximum of 100 Memory Blocks per Module Group can be equipped for SPEED CALLING-GROUP. A maximum of ten Speed Calling Numbers per Memory Block can be assigned. This allows for a total of 1,000 numbers per Module Group.
   <Expanded Speed Calling - Group>
   A maximum of 1400 Memory Blocks can be assigned per LP. A maximum of 10 numbers can be stored in each Memory Block. This allows for a total of 14,000 numbers per LP.
2. A Primary Station will be assigned memory blocks, and associate Stations in that group are assigned as Secondary Stations. The Primary Station will have the capability to program 10 memory blocks commonly used as Speed Calling Numbers for that group; therefore, a group can consist of 100 Speed Calling Numbers maximum.
3. Each Abbreviated Call Code can store a maximum of 24 digits, including Access Codes and pauses.
4. A Station can be assigned as a Primary Station for only one group.
5. There is no limit to the number of Secondary Stations that may be assigned to one group.
6. Secondary Stations and their associated Primary Station must belong to the same Module Group.
7. A Secondary Station can only be assigned to one Primary Group.

8. TOLL DENIAL/TOLL DIVERSION [T-6] and TOLL RESTRICTION-3/6-DIGIT [T-7] may or may not be applied to Speed Calling, as desired.
9. LEAST-COST ROUTING-3/6-DIGIT [L-5] may be provided via Speed Calling access.
10. SPEED CALLING-GROUP and SPEED CALLING-STATION [S-21] use the same block of memory tables.
11. SPEED CALLING-GROUP data remains, even if the system is reinitialized or there is a power failure.
12. A pause may be programmed using the "*" button of a PB pad. This will take one of the 24 digits available. Rotary type phones cannot store a pause. A pause lasts about 3 seconds. A pause cannot be added to an ISDN or CCIS Call.

    Note: A pause to MG-COT Calls can be added. In this case, a pause lasts about three seconds.

    Note: Registered pauses will not be activated when originating a call to ISDN Lines or to Analog Lines via MG-COT.

13. Stations can be added or removed from a group only via PCPro.
14. When a caller places a call via Outgoing Call Alternative (OGCA), and when the first outgoing route and the Station setting SPEED CALLING - GROUP are restricted, this service cannot be set. In this case, the service can be set via the following procedure:
    a.) Assign a dummy route.
    b.) Clear the restriction between the dummy route and all the Stations.
    c.) Assign the dummy route as the first route of OGCA.
15. When this feature is activated by pressing the REDIAL Key, only the Abbreviated Call Code is displayed on the LCD of the Dterm. Expanded Speed Calling - Group cannot be activated by the REDIAL Key.
16. When this feature is activated by dialing the Speed Calling Feature Access Code + the Abbreviated Call Code, only the Speed Calling Feature Access Code and the Abbreviated Call Code are displayed on the LCD of the Dterm.
17. After switch hook flash, station user cannot originate a call by Abbreviated Call Code. However, this is available from attendant console.
18. Speed Calling - Group can be activated from ISDN terminals. However, Expanded Speed Calling - Group cannot be activated from ISDN terminals.

Interactions

1. Blocks are not assigned sequentially (1-100), but are assigned as a quantity of blocks in the AISA command. These quantities will never exceed the value of 10.
2. If one block is assigned, the Abbreviated Call Code will be digits 0-9. If two blocks are assigned, the Abbreviated Call Code will be digits 00-19. If three blocks are assigned, the Abbreviated Call Code will be digits 00-29, and so on, to a maximum of 10 blocks with Abbreviated Call Codes 00-99.
3. Only the Primary Station will be allowed access to the SPEED CALLING-ASSIGN Access Code.
4. Only those Stations assigned as Secondary Stations are considered to be members of the SPEED CALLING-GROUP.
5. Stations of a Speed Calling - Group must be in the same Module Group (MG).
   Stations of an Expanded Speed Calling - Group must be in the same LP.
6. SPEED CALLING-GROUP requires the assignment of senders, route 905. See UNIVERSAL SENDER [U-3].

7. OUTGOING TRUNK QUEUING [O-2]: This feature may be used with SPEED CALLING GROUP if all Trunks are busy.
8. ROUTE ADVANCE [R-6] and LEAST-COST ROUTING-3/6 DIGIT [L-5] may be used with this feature. The ASPA Access Code to either ROUTE ADVANCE [R-6] or LEAST-COST ROUTING-3/6 DIGIT [L-5] will be stored in the memory of the SPEED CALLING-GROUP number.

Programming

STEP 1: **ASYD** - System Data 2, Index 1, Bit 3. Does TOLL RESTRICTION apply to SPEED CALLING-STATION? 0/1: Yes/No. (If yes, refer to TOLL RESTRICTION-3/6 DIGIT [T-10]).

STEP 2: **ANPD** - Reserve a Number Level for Feature Access. Select Normal Service (N), Hooking Service (H) or Busy Service (B) from the combo box for Connection Indexes. (applicable to any feature assigned to this Level). Assign NND as "2". This should be in accordance with a predetermined Numbering Plan.

STEP 3: **ASPA** - Two Access Codes must be assigned for this feature. For the Speed Calling Number assignment, assign the Tenant and Access Code (ACC). Assign a Connection Index of "N: Normal". For SRV = "SSC: Service Code", assign SID 14. (Available only to the Primary Station.)

For the Speed Calling Access, assign the Tenant and Access Code (ACC). Assign a Connection Index of "N: Normal". For SRV = "SSC: Service Code", assign SID21.

For the Expanded Speed Calling Number assignment, assign the Tenant and Access Code (ACC). Assign for a Connection Index of "N: Normal". For SRV = "SSCA: Service Code Appendix", assign SIDA 134. (Available only to the Primary Station.)

For the Expanded Speed Calling Access, assign the Tenant and Access Code (ACC). Assign for a Connection Index of "N: Normal". For SRV = "SSCA: Service Code Appendix", assign SIDA 135.

STEP 4: **ASFC** - For Stations allowed this feature, assign a Service Feature Restriction Class that allows SFI 19 (Speed Calling - Station/Group). If necessary, assign a Service Feature Restriction Class that allows SFI 197 (Expanded Speed Calling - Station/Group).

STEP 5: **AISA** - Program the Tenant, Station, type of Station, and the number of Speed Calling blocks to be assigned to the Primary Station.

TN: Tenant Number
STN: Station Number
MST/SLV: Primary/Secondary
1: MST (Master Station)
2: SLV (Slave Station)
BLOCK: Number of Blocks
MST STN: When assigning SLV (Secondary) Station, assign the MST (Primary) Station Number.

STEP 6: **AIEA** - Program the Tenant, Station, Type of Station, and the number of Expanded Speed Calling blocks to be assigned to the MST Station.

STN: Station Number
STATION TYPE = 1: MST (Master Station)
BLOCK: Number of Blocks (1-10)
When assigning secondary station;
STN: Station Number
STATION TYPE = 2: SLV (Slave Station)
MST STN: MST (Primary) Station Number

STEP 7: **AKYD** - Assign Feature Key Speed Calling - Station/Group [26]. If necessary, assign Feature Key

Expanded Speed Calling - Station/Group [146].

STEP 8: **ADSL** - Assign G_SPD Key; Assign SN = 1 (Originating; DT Connection) and FKY = 26 (Speed Calling Station/Group)/FKY = 146 (Expanded Speed Calling Station/Group).

This command is used for assigning a function to each Soft Key.

STEP 9: **AISD** - This command is used to assign, delete, and display the destination number of Speed Calling.

STEP 10: **AIED** - This command is used to assign, delete, and display the destination number of Expanded Speed Calling.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ANPDL** - Reserve a Number Level for Feature Access. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. (applicable to any feature assigned to this Level). Assign NND as "2". This should be in accordance with a predetermined Numbering Plan.

STEP 2: **ASPAL** - Two Access Codes must be assigned for this feature. For the Speed Calling Number assignment, assign the Tenant and Access Code (ACC). Assign a Connection Index of "N: Normal". For SRV = "SSC: Service Code", assign SID 14. (Available only to the Primary Station.)

For the Speed Calling Access, assign the Tenant and Access Code (ACC). Assign a Connection Index of Normal (N). For SRV = "SSC: Service Code", assign SID21.

For the Expanded Speed Calling Number assignment, assign the Tenant and Access Code (ACC). Assign for a Connection Index of "N: Normal". For SRV = "SSCA: Service Code Appendix", assign SIDA 134.

For the Expanded Speed Calling Access, assign the Tenant and Access Code (ACC). Assign for a Connection Index of "N: Normal". For SRV = "SSCA: Service Code Appendix", assign SIDA 135.

S-24D Save And Repeat -D

General Description

This feature allows you to save the phone number you just dialed in your Desktop terminal. This feature also allows you to retain the calling phone number from a station or an analog PSTN, ISDN, or CCIS trunk.

Operating Procedure

1. Go off-hook, seize any idle line, and dial a number.
2. When the number has been dialed, press the SAVE AND REPEAT (S&R) Feature Key. The Dialed Number is stored for future use. The associated LED lights. The LCD displays:

Example: Saved Local Number

S&R	**9NX-XXXX**
(Time Display)	

Note: Dialed number displays up to 16 digits when monitoring. However, 32 digits can actually be stored in memory.

3. To access this number later, go off-hook, receive Dial Tone, and press the S&R Key; the saved number is dialed.

Service Conditions

1. One number per Station can be saved.
2. The save function may be set at any time after the number has been dialed and before going on-hook.
3. It is not necessary to erase a saved number in order to save another. The second number replaces the first.
4. A Desktop terminal user may save the number of an Incoming Call, if the call originates at a Station in the system.
5. If necessary, dialing can be added after a repeat operation.
6. To monitor the saved digits, press the S&R Key while idle. The saved digits will be displayed on the LCD.
7. If the LED associated with S&R goes out, the memory is erased. The S&R Key must be pressed again, using the above procedure, to retain the original memory.
8. Up to 32 digits can be saved.

Note: When dialed digits exceed 33 digits, only the first 32 digits of all dialed digits are saved.

9. When digits are dialed during the line is engaged in a call, those digits, Calling Number + dialed digits during the line is engaged in a call, are saved up to 32 digits.
10. When originating a call out of the office by pressing the call origination button (such as function keys):
    - A maximum of 16 digits can be stored in memory.
    - If the called party does not answer it, this feature cannot be registered correctly.
11. To memorize the Telephone Number (TELN) of the Calling Station (versus the Physical Number), assign ASYDL, System Data 1, Index 641, Bit 0 as data “1”.
    Caution: *This bit is also used for SMDR, use care when assigning the data.*

12. You can save the caller ID information if available from an analog PSTN, ISDN, or CCIS trunk. For further information on how to save the caller ID, refer to the description regarding the manual saving of calling number in CALL RETURN [C-151].
13. The SAVE AND REPEAT - D feature is not available for ACD calls.

Interactions

AKYD is assigned after ASDT is assigned. Assign a LENS as TEC 12.

Programming

STEP 1: **AKYD** - Assign the Desktop terminal according to the following parameters:

TN: 1
STN: Station Number
TP: Type of Desktop Terminal (0-3)
KYN: Key Number (1-40)
KYI: Service Index
0: Key Not Used
1: Feature Key
2: Multi Line Key
KD: Not assigned for Feature Key
FKY: Feature Key Number
FKY: = 7 (Save and Repeat)

STEP 2: **ADSL** - Assign SN = 0, 1, 2, 3, 4, 5, 6 and FKY = 7 (Save and Repeat).
This command is used for assigning a function to each Soft Key.

S-25D Service Display -D

General Description

This feature generates LCD displays corresponding to the various features as they are initiated.

Operating Procedure

Each display is automatically generated when a feature is initiated.

Service Conditions

1. Each display is controlled by System Data and is produced accordingly. The service display may be allowed or denied in System Data on a per-system basis.
2. The contrast on the LCD Display Panel is controlled by two buttons on the top front of the Dterm. Press the right (UP) button for a darker image or the left (DOWN) button for a lighter image.
3. The LCD will display one of the features being used.

TRANSFER - CALL TRANSFER	[C-11]
PICKUP - CALL PICKUP	[C-7]
CF ALL - CALL FORWARDING - ALL CALLS	[C-5]
CF BUSY - CALL FORWARDING - BUSY LINE	[C-2]
CF NANS - CALL FORWARDING- DON'T ANSWER	[C-3]
HUNTING - STATION HUNTING	[S-7,8,9]
UCD UNIFORM CALL DISTRIBUTION	[U-1]

4. For a Transferred Call, the LCD displays:

	Transferring Station	Transferred Station
TRANSFER	**XXXX**	**XXXX**
	(Time Display)	

Note: When the Telephone Number of the Transferring/Transferred Station exceeds 8 digits, the last 8 digits are displayed. However, a maximum of a 16-digit transferred Telephone Number can be displayed on the middle line of the LCD, depending on System Data.

Programming

ASYD - System Data 1, Index 78, Bit 1. Is SERVICE DISPLAY in service? 0/1: No/Yes.

S-26D Speed Calling - One Touch -D

General Description

This feature allows Desktop terminal users to dial Telephone Numbers by pressing a Single Key. It is also available to transfer calls to the specified destination by pressing a single Key. Up to 12/24 numbers may be programmed by the Desktop terminal station user.

Operating Procedure

To program (when using SPD setting key)

Note: This procedure is not available for Softphone.

1. Press the SPD setting key
2. Press the SPEED CALLING-ONE TOUCH button when the operation guide appears on the LCD. If the phone number is registered in the terminal, press “Edit” button to change the phone number.
3. Press the desired phone number to dial.
4. Press “SET” key.

To program (when using Feature Key)

1. Press the Feature Key.
2. Press the SPEED CALLING-ONE TOUCH button.
3. Dial the desired number.
4. Press the Feature Key again.
5. Display will show SPEED SET.

Note: The page-change function works as follows: If the Page button is not lit, Page 0 Speed Dial memory is being programmed. (This is the same memory that would be used if the Page feature were not being used.) To program Page 1, press the FEATURE, the SPEED CALLING-ONE TOUCH button, the desired number, and the Feature Key again. Use of the Page feature allows twice the number of equipped speed buttons to be used.

Note: On a Desktop terminal where outgoing call from the Prime Line is restricted with key data (AKYD, S = 1), the following steps are also available:
(1) Press the SPEED CALLING-ONE TOUCH button.
(2) Dial the desired number.
(3) Press the SPEED CALLING-ONE TOUCH button again to complete the setting.

To verify

- Press the Feature Button and the desired SPEED CALLING - ONE TOUCH button: The first 16 characters is displayed.

To use

- **To originate a call**

1. Press the SPEED CALLING-ONE TOUCH button. The call will complete.

- **To transfer a call using the following:**
  - SPEED CALLING-ONE TOUCH button
  - Line/Feature Key programmed as SPEED CALLING-ONE TOUCH Key

1. Press Transfer button during speech. LCD displays “TRANSFER.”
2. Press the following:
   - SPEED CALLING-ONE TOUCH button
   - Line/Feature Key programmed as SPEED CALLING-ONE TOUCH Key
   The button/key above must be programmed with the desired station number. **Note 1**
3. Hang up the call. The call will be transferred.

Note 1: Step 1 may be omitted if “Transfer” button, pause and the desired station number are programmed in the one-touch button.

Service Conditions

1. A maximum of 32 (2 × 16) SPEED CALLING - ONE TOUCH Keys (FKY = 49) can be programmed to the programmable Line/Feature Key of a Desktop terminal with a PAGE Key (FKY = 55). The setting of key pattern can be assigned by ADKS command. For details, see ADKS command in Command Manual.
2. A programmable Line/Feature Key is used for the SPEED CALLING - ONE TOUCH Keys.

   Note: For using the programmable Line/Feature Key, assign the SPEED CALLING - ONE TOUCH Keys by using AKYD command. A maximum of 16 SPEED CALLING - ONE TOUCH Keys (FKY = 49) can be programmed to any Key number (KYN) in consecutive order. if assigning 1 in LKP parameter of ADKS command (16 Line/Feature buttons + DSS keys) or ADKS command is not assigned, My Line number is required to be assigned on a Line/Feature Key. Therefore, SEED CALLING ONE TOUCH Keys can be programmed up to 30 (2 × 15).

3. A stored number may have up to 32 digits.
4. Numbers from 0 to 9, #, *, pauses and hooking can be registered in a dial number.
5. Only the first 16 digits are displayed on the LCD.
6. SPEED CALLING-ONE TOUCH numbers may only be stored while the Desktop terminal is idle.
7. Storing a SPEED CALLING-ONE TOUCH number erases the previously stored number.
8. After dialing the new number, the user must press the SPEED CALLING-ONE TOUCH Key before the LCD displays the time. If the LCD displays the time before the user presses the Key, the number has not been stored. The LCD displays SPEED SET when the number has been stored.
9. Pressing the RECALL Key while programming a SPEED CALLING-ONE TOUCH number inserts a pause. A dash (“-”) is displayed on the LCD.
10. Pressing the RECALL Key as the first digit of a SPEED CALLING-ONE TOUCH numbers inserts a flash entry. A “!” is displayed on the LCD.

11. If a VOICE CALL [V-2] feature is programmed, VOICE CALL initiation can be programmed onto a SPEED CALLING-ONE TOUCH Key. The user dials the number and then presses the TRANSFER Key when programming SPEED CALLING. The LCD will display "V" after the number. Pressing the SPEED CALLING-ONE TOUCH Key initiates an automatic Voice Call to the programmed Station.
12. FLASH ENTRY and VOICE CALL features may be combined on a SPEED CALLING-ONE TOUCH Key to activate an automatic voice-announce transfer. To program, press the SPEED CALLING-ONE TOUCH Key, press the RECALL Key, dial the number, press the TRANSFER Key, then press the SPEED CALLING-ONE TOUCH Key.
13. A PAGE CHANGEOVER Key must be assigned to a programmable Line/Feature Key to activate the second page of SPEED CALLING-ONE TOUCH numbers.
14. VOICE CALL-CCIS [V-7] cannot be activated via this feature.
15. When you program the SPEED CALLING-ONE TOUCH Key using SPD setting key, the following condition must be considered.
    a.) Press any key of the Exit, SPD setting, or Cancel keys to quit the programming operation of the SPEED CALLING-ONE TOUCH Key. If you press a key which is not related to the programming operation, the function assigned to the key is executed.
    b.) When you have an incoming call on the accommodated line while programming the SPEED CALLING-ONE TOUCH Key, you can continue with the programming if you do not answer the call. However, if you answer the call, the conversation will be started and the programming operation will be canceled.
    c.) If you press another SPEED CALLING-ONE TOUCH Key while programming a key for this feature, the number already assigned to the SPEED CALLING-ONE TOUCH Key will be dialed.
    d.) You cannot edit the SPEED CALLING-ONE TOUCH numbers from MA4000 while programming the SPEED CALLING-ONE TOUCH Key.
    e.) When collaboration with Softphone is in operation, if the target station is programming the SPEED CALLING-ONE TOUCH Key, the key operation from the Softphone is not available. **Note 2**

Note 2: If SPEED CALLING-ONE TOUCH Key is programmed on the Softphone, the key name will not be displayed.

16. The same SPEED CALLING - ONE TOUCH Key (FKY = 49) is programmed to the programmable Line/ Feature Key for every 16 keys. Therefore, when the same SPEED CALLING - ONE TOUCH Key is programmed to another key number by AKYD command, the One-Touch Speed Calling data will be inherited to the another key number. The allocation of SPEED CALLING - ONE TOUCH Key is as follows.

Example: KYN 1 and KYN 17 are the same SPEED CALLING - ONE TOUCH Key.
Therefore, when the SPEED CALLING - ONE TOUCH Key assigned on KYN 1 shifts the location to KYN 17, the One-Touch Speed Calling number of KYN 1 will be inherited to KYN 17.

SPEED CALLING - ONE TOUCH Key	KEY NUMBER	
No.1	KYN 1	KYN 17
No.2	KYN 2	KYN 18
No.3	KYN 3	KYN 19
No.4	KYN 4	KYN 20
No.5	KYN 5	KYN 21
No.6	KYN 6	KYN 22
No.7	KYN 7	KYN 23
No.8	KYN 8	KYN 24
No.9	KYN 9	KYN 25
No.10	KYN 10	KYN 26
No.11	KYN 11	KYN 27
No.12	KYN 12	KYN 28
No.13	KYN 13	KYN 29
No.14	KYN 14	KYN 30
No.15	KYN 15	KYN 31
No.16	KYN 16	KYN 32

17. To program the SPEED CALLING - ONE TOUCH Key (FKY = 49) to another key number or delete the SPEED CALLING - ONE TOUCH Key by AKYD command, back up the One-Touch Speed Calling data by BOSD command, and load the backup data after the terminal reregistration.
18. When using MA4000, assign the system data (ASYD, SYS1, Index 386, Bit 1 = 1).

Interactions

1. The PAGE CHANGEOVER Key is useful for changing the page of Feature Keys programmed as SPEED CALLING - ONE TOUCH (AKYD, FKY = 49) or the Feature Key programmed as Call Forwarding/Split Call Forwarding.
2. The Page Changeover function can be activated from any condition (Idle, Busy, Conference, etc.).

3. When assigning SPEED CALLING-ONE TOUCH Numbers to Desktop terminal, if a previous number was not assigned to a particular SPEED CALLING-ONE TOUCH button, the display will not change when that particular button is pressed for programming (it will appear that nothing has happened; the middle portion of the LCD display will continue to display the date and time). Once a number is entered, it will be displayed on the upper portion of the LCD display.
4. The same SPEED CALLING-ONE TOUCH buttons are used for Page 0 and Page 1 numbers. The PAGE CHANGE-OVER Key determines which page is selected.
5. There is no deletion of SPEED CALLING-ONE TOUCH numbers. Previously assigned numbers can only be overwritten.
6. SPEED CALLING-ONE TOUCH may be used to store FORCED ACCOUNT CODES [F-7] and AUTHORIZATION CODES [A-20]. Other forms of Speed Calling may not be used for FORCED ACCOUNT CODES [F-7] and AUTHORIZATION CODES [A-20].
7. When SPEED CALLING-ONE TOUCH is used on a programmable Line/Feature Key, only eight digits may be stored.
8. When using a Desktop terminal, SPEED CALLING - ONE TOUCH can be programmed to any Keys in consecutive order. A maximum of 16 one touch Keys per LENS are allowable.
9. No more than three pauses can be entered in a row.
10. If Abbreviated Call Codes using Speed Calling - Station, Group, or System features are registered in the SPEED CALLING-ONE TOUCH Key, the registered pauses will not be activated when originating a call to ISDN Lines or to Analog Lines via MG-COT.

Programming

No programming is required for the 12 existing SPEED CALLING-ONE TOUCH Keys for the Desktop terminal.

For the detail of backup for One-Touch Speed calling data, see “Backup for One-Touch Speed Calling Data” in Chapter 2 of Operations and Maintenance Manual.

In order to activate the second page of SPEED CALLING-ONE TOUCH numbers, the following must be programmed:

AKYD - Assign a PAGE CHANGEOVER Key to a programmable Line/Feature Key on the Desktop terminal. Assign Type:Function:PAGE [55].

If a SPEED CALLING-ONE TOUCH button is to be used on a programmable Line/Feature Key, complete the following:

Assign Type:Function:SPEED CALL-ONE TOUCH [49].

S-27 Service Feature Peg Count

General Description

This feature provides a statistical usage report on various features, generated at the PCPro. This report will provide the Communications Manager with detailed users' habits and planning data for the communications system.

Operating Procedure

Refer to TRAFFIC MANAGEMENT of CHAPTER 2 in the Operation and Maintenance Manual.

Service Conditions

The number of attempts to invoke the following features will be reported through the PCPro:

1. CALL HOLD [C-6] count: Number of times CALL HOLD Code is dialed by Stations for which the feature is allowed.
2. CALL BACK [C-1] count: Number of times CALL BACK set Code is dialed by Stations for which the feature is allowed.
3. CALL BACK [C-1] cancel count: Number of times CALL BACK is canceled by Stations that have set the feature.
4. EXECUTIVE RIGHT-OF-WAY [E-1] count: Number of times the EXECUTIVE RIGHT-OF-WAY Code is dialed by Stations for which the feature is allowed.
5. CALL WAITING-ORIGINATING [C-31] count: Number of times the Access Code for CALL WAITING-ORIGINATING is dialed by Stations for which the service is allowed.
6. CALL WAITING-TERMINATING [C-12] count: Number of times CALL WAITING-TERMINATING is set to Stations for which the feature is allowed.
7. CALL PICKUP-GROUP [C-7] count: Number of times the CALL PICKUP-GROUP Code is dialed by Stations for which the feature is allowed.
8. CALL PICKUP-DIRECT [C-30] count: Number of times the CALL PICKUP-DIRECT Code is dialed by Stations for which the feature is allowed.
9. CALL FORWARDING-ALL CALLS [C-5] entry count: Number of times a destination number is entered for CALL FORWARDING-ALL CALLS by Stations for which the feature is allowed.
10. CALL FORWARDING-ALL CALLS [C-5] cancel count: Number of times the CALL FORWARDING-ALL CALLS Cancel Code is dialed by Stations for which the feature is allowed.
11. CALL FORWARDING-BUSY LINE [C-2] entry count: Number of times a destination number is entered for CALL FORWARDING-BUSY LINE by Stations for which the feature is allowed.
12. CALL FORWARDING-BUSY LINE [C-2] cancel count: Number of times the CALL FORWARDING-BUSY LINE Cancel Code is dialed by Stations for which the feature is allowed.
13. CALL FORWARDING-DON'T ANSWER [C-3] entry count: Number of times a destination number is entered for CALL FORWARDING-DON'T ANSWER by Stations for which the feature is allowed.
14. CALL FORWARDING-DON'T ANSWER [C-3] cancel count: Number of times the CALL FORWARDING-DON'T ANSWER Cancel Code is dialed by Stations for which the feature is allowed.
15. SPEED CALLING ACCESS-SYSTEM [S-3] count: Number of times a fixed abbreviated number is dialed by Stations for which the feature is allowed.
16. SPEED CALLING ACCESS-STATION [S-21] count: Number of times a variable abbreviated number is dialed by the Stations for which the feature is allowed.

17. SPEED CALLING ACCESS-GROUP [S-23] count: Number of times a variable abbreviated number is registered by Stations for which the feature is allowed.
18. TRUNK ANSWER FROM ANY STATION (TAS) [T-8] count: Number of times the TAS Answer Code is dialed by Stations for which the feature is allowed.
19. OFF-HOOK QUEUING [O-7] count: Number of times an extension accesses an Outgoing Trunk via OFF-HOOK QUEUING after initially encountering a condition where all Outgoing Trunks are busy. The extension must actually access a Trunk in order for the count to be incremented.
20. ON-HOOK OUTGOING QUEUING-ENTRY [O-2] count: Number of times an extension accesses the ON-HOOK OUTGOING QUEUING feature by dialing access or going on-hook (if automatic queuing is provided) after initially encountering a condition where all Outgoing Trunks are busy. The count will be incremented each time the feature is accessed, even if the queuing request is canceled before a Trunk is accessed.
21. ON-HOOK OUTGOING QUEUING [O-2] cancel count: Number of times ON-HOOK QUEUING is canceled by dialing the Cancel Code.
22. CONSULTATION HOLD-ALL CALLS [C-17] count: Number of times CONSULTATION HOLD is executed.
23. CALL TRANSFER-ALL CALLS [C-11] count: Number of times a call is transferred to another extension before the Called Party answers, without Attendant involvement. A call originated internally or from the Outside will be registered in the count.
24. THREE-WAY CALLING [T-2] count: Number of times THREE-WAY CALLING occurs without Attendant assistance.
25. The maximum Tenant Number Counting SERVICE FEATURE PEG COUNT is 63 Tenants.

Note: Additional hardware is required.

Programming

STEP 1: **ASYD**

System Data 1, Index 47, Bit 0. Unit of Traffic Measurement: 0/1 = CCS/Erlang
System Data 1, Index 47, Bit 7. Are traffic measurements required? 0/1: No/Yes

STEP 2: **ATRF/ATRFN** - Assignment of Traffic Measurement Order (CM03)

TYPE: 6: Service Peg Count

PORT: Port number where Traffic Data is to be output.

INTERVAL(min):

Output Interval must be assigned in units of 10 minutes (range of between 30-120 minutes), or data "0" must be assigned, which is the instruction for assigning output time.

Start TIME, End TIME:

Assign the traffic measurement time period between Start TIME and End TIME longer than an hour. Also, if the measurement should be executed throughout a day, assign the same data in both Start TIME and End TIME parameters.

Output TIME:This data entry is valid only when INTERVAL(min)=0.

STEP 3: **DTF201/DTF201N** - Display of Traffic Data 2

For more information, refer to TRAFFIC MANAGEMENT of CHAPTER 2 in the Operation and Maintenance Manual.

S-31 Supervisory Call

General Description

An attendant console can monitor the state of a call after a central office line or TIE line is connected to a station. The console operator can enter into the monitored call if necessary.

Operating Procedure

1. Receive an incoming call from a trunk.
2. Dial the forwarding destination station number.
3. After the station answers the call, press the Talk (three-way conference) key to start a three-way call with the central office line/TIE line and the station.
4. Press SVC (Supervisory Call Set Key) to release the three-way call and enter into a Supervisory Call state.
5. In the case of a call back due to the hooking from the monitored station:
   Line lamp for Supervisory Call starts flashing, and Tone Ringer rings. Answer by pressing the Loop (line) key (Supervisory Call is released).
6. In the case of entering into the monitored call:
   Press the appropriate Loop (line) key to return to a three-way call with Supervisory Call being released.

Service Conditions

<Important Notice>

1. If a station user performs a hooking operation while Supervisory Call is on, it recalls. Therefore, all hooking services except for recalling such as CALL TRANSFER-ALL CALLS [C-11] will be invalid.

<Interactions with Other Features>

1. This service is also used for NON-DELAY OPERATION [N-3].
2. With NON-DELAY OPERATION [N-3], an operator cannot set Supervisory Call before the called party on the external line answers. (In this case, by pressing the Release key the operator can leave and the connection between the station and the called party remains.)

<Hardware/Software>

1. If the called station is PS, Supervisory Call cannot be set before PS answers.
2. When connecting to an ISDN terminal, Supervisory Call cannot be set before the called ISDN terminal answers. (Blind Transfer is not also allowed)

<Interactions with Networks>

1. This service is also valid when using an ISDN Trunk/ISDN terminal as a central office line/station.

<Conditions Specific to This Feature>

None.

<Others>

None.

Programming

STEP 1: **ASYD**

System Data 2

Index 7, Bit=3

Assign as data “1” to enable this service (Supervisory Call).

S-33 Software Line Appearance

General Description

This feature permits ports that do not physically exist to be used as Sub Lines on Dterm Stations. Ports normally reserved on a Dterm for data Stations only, can be assigned as a SOFTWARE LINE APPEARANCE. Additionally, 64 software ports have been added to a Port Interface Module. The 64 software-assigned ports can be assigned as Virtual Line Appearances on Dterm Stations. The use of the data ports and the 64 software-assigned ports conserve valuable hardware for Stations and Trunks.

Operating Procedure

Call Origination via a SOFTWARE LINE APPEARANCE on a Dterm

1. Press the Software Line Appearance Key, then either press the SPEAKER Key or lift the handset.
2. Upon hearing Dial Tone, dial the desired number.

Calling a SOFTWARE LINE APPEARANCE from a Station/Trunk/Attendant Console

1. The Calling Party dials the Telephone Number of the SOFTWARE LINE APPEARANCE.
2. Any Dterm accommodating the SOFTWARE LINE APPEARANCE will receive ringing and have an Incoming Lamp Display. The Dterm Station user presses the Line Key and goes off-hook to answer the Incoming Call.

Service Conditions

1. When using a SOFTWARE LINE APPEARANCE assigned to a data port (TEC:12), Call Origination from that Line Appearance can be made if the card is mounted in that slot.
2. A mix of data ports and Sub Lines can be assigned on a Dterm package.
3. All Sub Lines of Dterms must be located in the same Local Processor as the MY Line of that Dterm.
4. A SOFTWARE LINE APPEARANCE cannot be assigned as a Hotline Station, but can be assigned as a BROKERAGE - HOTLINE [B-12] Station.
5. A SOFTWARE LINE APPEARANCE cannot activate:

CALL BACK	[C-1]
OUTGOING TRUNK QUEUING	[O-2]
NAILED-DOWN CONNECTION	[N-9]

6. When activating CALL PICKUP-GROUP [C-7], the Sub Line will pick up calls assigned to the CALL PICKUP-GROUP of the MY Line of the Dterm on which the Sub Line appears.
7. When accessing or entering SPEED CALLING [S-2] Group/Station data, a SOFTWARE LINE APPEARANCE will enter or access the SPEED CALLING [S-2] Group/Station data of the MY Line of the Dterm on which the Sub Line appears.
8. The STATION MESSAGE DETAIL RECORDING (SMDR) [S-10] of the SOFTWARE LINE APPEARANCE Call activity will be recorded as the MY Line Call activity.
9. The SOFTWARE LINE APPEARANCE cannot be the Called Station of the following features:

VOICE CALL	[V-2]
MESSAGE REMINDER	[M-22D]
BOSS - SECRETARY OVERRIDE	[B-5]

10. Station PEG COUNT [P-7] data will be recorded for SOFTWARE LINE APPEARANCEs as a MY Line of the Dterm.
11. If the DO NOT DISTURB D [D-11D] Key is activated by the SOFTWARE LINE APPEARANCE, ringing will not be sent to the port of the MY Line of the Dterm.

Programming

STEP 1: **ASDT** - Assign the Station as a TEC = 18 for a Virtual Circuit. The Line Equipment Numbers (LENS) of a SOFTWARE LINE APPEARANCE will exist in Groups 24-31.

STEP 2: **AKYD** - This command assigns for Dterms the SOFTWARE LINE APPEARANCE to a programmable Line/Feature Key.

TN: 1

STN: Station Number

TP: Type of Dterm (0-3)

PL TN STN: Prime Line Tenant and Station Number

KYN: Key Number (1-40)

KYI: Service Index

- 0: Key Not Used
- 1: Feature Key
- 2: Multi Line Key

KD: Not assigned for Feature Key

TN STN: Tenant Number and Station Number of SOFTWARE LINE APPEARANCE.

RG: Ringing Assignment per Multi Line Appearance

- 0: No Ringing.
- 1: Ringing in Day Mode Only.
- 2: Ringing in Night Mode Only.
- 3: Not Used
- 4: Ringing in Day and Night Mode - 30 second delay.
- 5: Ringing in Day and Night Mode - 20 second delay.
- 6: Ringing in Day and Night Mode - 10 second delay.
- 7: Ringing in Day and Night Mode.

S-46 Sender/Mark - Out Signal

General Description

This feature is an additional function for use when the Telephony Server station originates a call to a sender line by the register-sender method. This service allows the station user to originate the dial number for the above type of origination when dialing service code etc. after receiving Dial Tone or information.

Note: This feature is not available in North America and Australia.

Operating Procedure

Sender/Mark-out Signal origination:

1. Dial the access code for the relevant line.
2. Dial the desired party's number.
3. Dial the service code after receiving Dial Tone or information from the receiving end.
4. Receive Ringback Tone from the receiving end.

Service Conditions

1. Origination by this feature is possible from a DTMF telephone, DP telephone of Dterm.
2. A maximum of 10 service code digits may be originated by this feature.
3. When the signaling system is DTMF, a 4-wire trunk is required for interface.
4. Service code is included in the Speed Calling code when Speed Calling is set. In this case, manual dialing will not be performed.
5. When the following service are in progress, consecutive dialing cannot be performed:
   a.) After origination by Speed Calling [S-3, S-21, S-23]
   b.) Outgoing/Trunk Queuing [O-2]
   c.) Individual Trunk Access [I-4]
   d.) CCITT No. 7 CCIS
   e.) MFC signaling

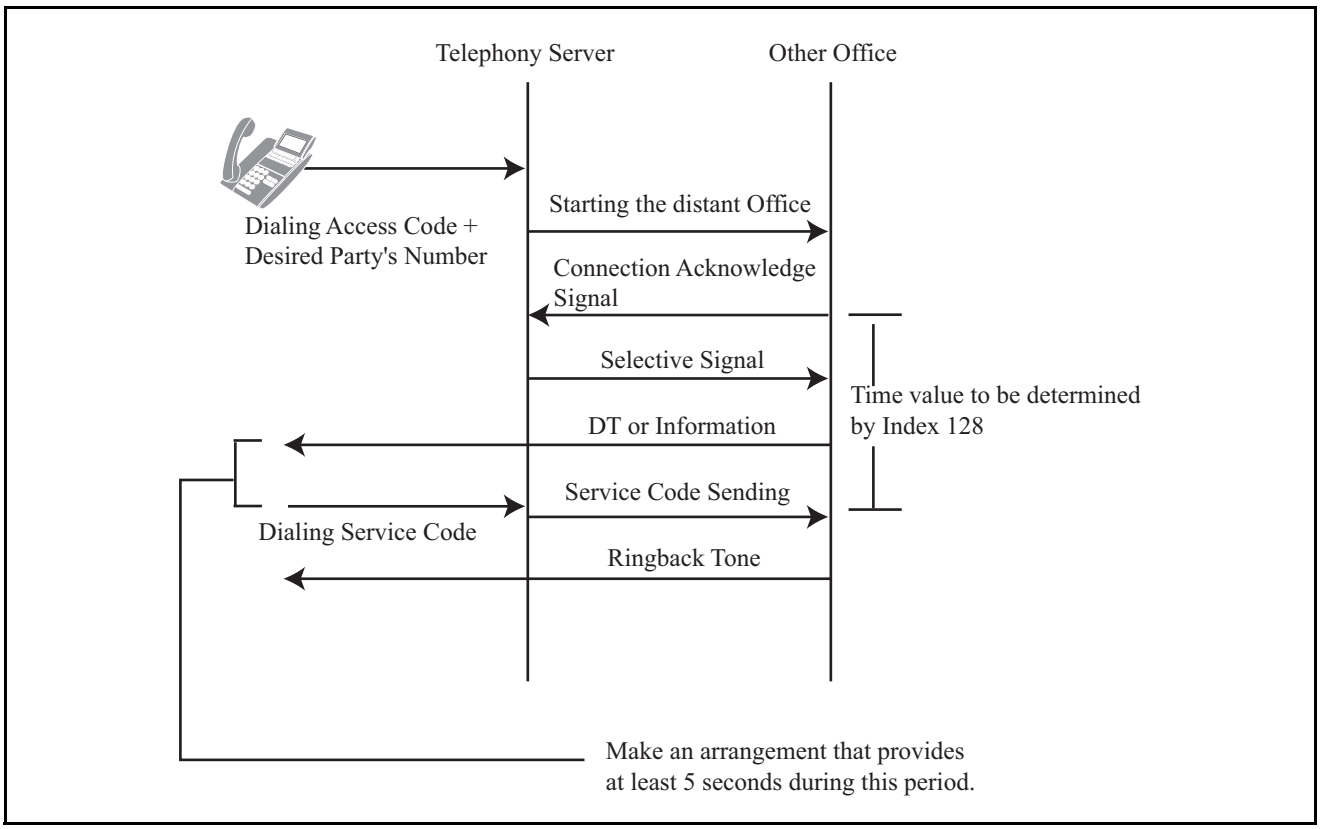
Programming

STEP 1: **ASYD** - System Data 1. Index 128. Assign the timer value for the period from receiving connection acknowledgement signal from the distant office till dialing of the service code.

STEP 2: **ANPD** - Assigns minimum necessary number of digits for the first number of the LCR/LCRS access code.

STEP 3: **ASPA** - Assign the LCR/LCRS access code by providing a dummy route.

STEP 4: **AMND** - Assign the maximum number of necessary digits to the Dial (Area/Office) Code.



Note: Assign the total number of digits of Destination Code including Access Code and those of Service Code to parameter MND.

STEP 5: **ACDN** - Assign the number of digits of Service Code.
TN: Tenant Number
DC: Destination Code (Assign the same value as that of DC for AMND)
CDN: Number of digits of Service Code.

STEP 6: **ARTD** - Assign various items of route data to the route number.
Assign the dummy route. Assign 1 at all times for the AC parameter of CDN 13.
The route data of the dummy route is TCL = 4, AC =1, and L/T = 1. For the others, assign 0 in all cases.
For the route to which service code can be sent out, assign CD = 1.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or MG.

STEP 7: **ATRK** - Assign the LENS data of each trunk.
STEP 8: **MBTK** - Release these trunks make busy.
STEP 9: **AFRS** - Assign the Number Pattern Code (NPC) and Outgoing Route Selection Pattern (OPR) to the dummy route.
STEP 10: **AOPR** - Assign the route number including the alternative route to the Outgoing Route Selection Pattern (OPR). Assign the number of skipped digits and Pattern Number Location (PNL) to each route.
STEP 11: **ASDC** - Perform validity/invalidity and near distance toll judge for the Office Code using FX, WATS and the other patterns, and select a suitable pattern.
STEP 12: **ARSC** - Release the dummy route and station connection restriction.

S-48 Station Message Detail Recording - Printout

General Description

The SMDR printout feature is one of the SMDR facilities of the System.
This service provides automatic printer output of the following SMDR information on all Central Office originations, both DOD calls from stations and attendant - handled Central Office origination calls. This feature is available for a printer that is connected via an RS-232C interface.

- Calling telephone number (a maximum of six digits)
- Dialed number (a maximum of 11 digits)
- Start time of call (month, date, hour, minute, second)
- Call duration (a maximum of six digits representing seconds)

Note: This feature is not available in North America and Australia.

Operating Procedure

No manual operation is required.

Service Conditions

1. Two types of call charge start timing can be selected by the system data programming:
   a.) The point when polarity reversal of the Central Office exchange is made, when the called party answers.
   b.) A predetermined time after sending the called party number, when polarity reversal cannot be made from the Central Office exchange.
2. Contents of the printout are as follows:

- In case of call origination

1) CALLING
   STN XXXXX: Origination from station No. XXXXX.
   ATT XX: Origination from attendant console No. XX.
   RT XX: Origination from trunk (origination from route No. XX).
2) ATT*: "*" is printed when the call is handled by attendant.
3) ORIGINATING TIME
   XX,XX XX:XX,XX: Call start time-month, date hour:minute, second are printed.
4) DURATION XXXXXX: Time from call start to end is shown in seconds. (a maximum of six digits; if the time exceeds 1,000,000 seconds, "999,999" is printed.)
5) CALLED NUMBER
   XXXXXXXXXXX: Dialed number is printed (a maximum of 12 digits).
6) C.O. COUNT XXXXXX: Metering count is printed when metering pulse is sent from Central Office "0" is printed if there is no metering pulse (a maximum of four digits, if the value exceeds 10,000, "9,999" is printed).
7) C.O. CHARGE
   XXXXXXX: Product of count and charging unit (set by system data) will be printed when metering pulse is sent from Central Office "0" will be displayed when there is no metering pulse.

- In case of call termination

  1) CALLING
     STN XXXXX: Shows the terminating station.
  5) CALLED NUMBER
     XXXXXXXXXXX: "INCOMING" is printed.

  As for 2), 3), 4), 6), 7), see the "In case of call origination" above.

3. The interface between the Telephony Server and printer is as follows:
   a.) Electrical specification: RS232C (Asynchronous)
   b.) Protocol: Freewheeling
4. SMDR traffic that can be handled by this service is a maximum of 5200 calls per hour (9600 bps).
5. Commercial AC power is used for printer's power source.
6. The distance between printer and the Telephony Server is 15m maximum.
7. Additional hardware is required for this service.
8. The SMDR information that can be stored in case of the printer failure (power failure, paper out), the line failure is as follows:
   1 IMG: 28,000 calls
   2-4 IMG: 47,000 calls
   UMGi: 47,000 calls per CCN/RN
9. The SMDR information is stored for the period of time determined in the system data. After the determined time, the data is erased.
10. The data on the Account Code, Authorization Code, and the Forced Account Code is not printed.
11. The page number is printed from 1 to 255. After page 255, page 1 comes again.
12. This service is not available when AP is accommodated.
13. In case of CCIS centralized Billing System service, the SMDR information of the remote office can be printed out at the central office, however, the calling telephone number and the billing number is not printed out.
14. The ISDN billing information is not printed out.

Programming

STEP 1: **ASYD** - Assign appropriate data in the following indexes.

System Data 1
<Index 32>
b1 (Tenant Data for SMDR): 0/1 = Not Recorded/Recorded
b2 (Selected Route Information): 0/1 = Access Code/Selected Route
b7 (SMDR): 0/1 Out/In Service
<Index 33>

b4	b3	Telephone subject to Total Billing
0	0	Telephone which is called first.
0	1	Telephone which is called last.
1	0	First Telephone after the call has been handled by ATT.
1	1	Last Telephone after the call has been handled by ATT.

b5 (Billing for transferred Incoming Call) 0/1 = Split/Total Billing
b6 (Billing for transferred Outgoing Call) 0/1 = Split/Total Billing

<Index 34>
b0 (SMDR RS-232C Output) 0/1 = Out/In Service
<Index 36>
b0-b7 (Call Record Information Output Port Designation for SMDR-Printout)
Each bit corresponds to the port number of IOC Card. (For example, bit 3 → port 3)

Note: Even if multiple ports are designated as output ports, the SMDR information appears from the port which has the smallest number.

<Index 38>
b0-b7 (Printer Accommodation Designation)
Each bit corresponds to the port number of IOC Card. (For example, bit 3 → port 3)
<Index 44>
b1-b7 (Call Charge Rate per count of Metering Pulse)
The Call Charge Rate ranges from 1 to 127. When no data is assigned here, the default data (=10) is used as Call Charge Rate. The Call Charge is calculated as follows.
C.O. Charge = C.O. Count × Call Charge Rate (default data = 10)
<Index 95>
b0-b7 (SMDR RS-232C Variable Timer)
The System stores SMDR information, when the SMDR information cannot be output for some reasons. (For example, a failure occurred at the terminal device.)

System Data 2
<Index 3>
b0 (SMDR service on a Tenant basis) 0/1 = Out/In Service
b7 (SMDR <STN-STN> service on a Tenant basis) 0/1 = Out/In Service

STEP 2: **AIOC** - Assign appropriate data in the following parameters.
PORT No.: 0-7 (Enter the same port No. which has been assigned in Index 36.)
TERMINAL: PRINTER
SPEED: Assign appropriate data which conforms to protocol of the printer.
PARITY BIT: Assign appropriate data which conforms to protocol of the printer.
CHARACTER BIT: Assign appropriate data which conforms to protocol of the printer.

STEP 3: **ASFC** - Remove restriction of the desired features.
SFI 14 (Station Message Detail Recording System <SMDR> - Trunk Basis) 0/1 = Out/In Service
SFI 58 (Station Message Detail Recording System <SMDR> - for station-to-station call) 0/1 = Out/In Service

Note: The setting enables all traffics to be billing targets. If an unnecessary SMDR data is output, please discard it at the SMDR terminal.

STEP 4: **ARTD** - Assign route data related to SMDR.
CDN 10 (SMDR) 0/1 = Out/In Service for this route
CDN 16 (SMDR2) Assign detailed billing data referring to the table below.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or MG.

INPUT DATA / CONTENTS		0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
b0	0-Detailed billing is not required for incoming calls.	×		×		×		×									
	1-Detailed billing is required for incoming calls.		×		×		×		×								
b1	0-Detailed billing is required for toll and local outgoing calls.	×	×			×	×										
	1-Detailed billing is required only for toll local outgoing calls.			×	×			×	×								
b2,3	0-

S-61 Speed Calling Override - System

General Description

This feature allows numbers programmed for SPEED CALLING to be available to Stations on a system-wide basis, determined by Service Feature Restriction Class (SFC). For example, SPEED CALLING-SYSTEM [S-3] numbers, available to Stations that are not restricted, can be made available to Stations that are restricted.

Operating Procedure

To operate

1. Lift the handset (includes SPEAKER Key operation on Dterm). Listen for Dial Tone.
2. Dial the SPEED CALLING-SYSTEM [S-3] Access Code (maximum three digits).
3. Dial the Abbreviated Code (maximum four digits).
4. If the Station is allowed this call, the call is completed. If not, the Station will hear a Reorder Tone.

To operate from a Dterm

1. Press the REDIAL Key. Receive Dial Tone. The LCD displays:

LNR [*] / SPD [_ _]
(Time Display)

2. Press the desired Call Code.
3. If the Station is allowed this call, the call is completed. If not, the Station will hear a Reorder Tone.

Service Conditions

1. This feature cannot be used on an Outgoing Call which uses OUTGOING TRUNK QUEUING [O-2].
2. This service can be used in combination with CONSECUTIVE SPEED CALLING - SYSTEM [C-62].
3. This feature cannot be used in MFC signaling.
4. This feature cannot be used if the Calling Station is holding another line.
5. This Attendant Console cannot use this feature.
6. SPEED CALLING-SYSTEM [S-3] must first be provided.
7. When this feature is activated by pressing the REDIAL Key, only the Abbreviated Call Code is displayed on the LCD of the Dterm.
   When this feature is activated by dialing the Speed Calling-System Feature Access Code + the Abbreviated Call Code, only the Speed Calling-System Feature Access Code and the Abbreviated Call Code are displayed on the LCD of the Dterm.
8. Restriction is done via the ARSC/ARSCN command.

Interactions

1. SPEED CALLING-SYSTEM [S-3] must first be provided.
2. FORCED ACCOUNT CODES [F-7] and AUTHORIZATION CODES [A-20] cannot be programmed for use via SPEED CALLING-SYSTEM [S-3].
3. Pauses are programmable from the PCPro, using the “P” Key. Pauses consume one digit of the 24 digits available. A pause lasts for about 3 seconds. A pause cannot be added to ISDN, or CCIS Calls.

Note: A pause to MG-COT Calls can be added. In this case, a pause lasts about three seconds.

Note: Registered pauses will not be activated when originating a call to ISDN Lines or to Analog Lines via MG-COT.

4. TOLL DIVERSION/TOLL DENIAL [T-6] and TOLL RESTRICTION 3/6 DIGIT [T-7] will not interact with this feature if a Station is allowed access to an ADC via Service Feature Restriction Class.
5. AUTHORIZATION CODES [A-20] are never required to complete a call.

Programming

STEP 1: **ASYD** - System Data 2, Index 1, Bit 6. Is SPEED CALLING OVERRIDE-SYSTEM to be enabled? 0/1: No/Yes. System Data 2, Index 1, Bit 7. Toll Restriction for SPEED CALLING-SYSTEM [S-3]. Assign data "0".

STEP 2: **ANPD** - Reserve a Number Level for Feature Access. Select Normal Service (N), Hooking Service (H) or Busy Service (B) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan.

STEP 3: **ASPA** - Assigning an Access Code to SPEED CALLING-SYSTEM [S-3], assign SRV = "SSC: Service Code", SID = 15. Program for "N: Normal". NND = Access Code plus Abbreviated Digit Code (ADC). NND1 = Abbreviated Digit Code (ADC). See ASPD.

Example: 6 + 010

1 digit + 3digits = NND = 4

STEP 4: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 12 to Stations that will have SPEED CALLING-SYSTEM [S-3].

STEP 5: **ASPD** - Enter Tenant Number (TN), Abbreviated Digit Code (ADC), and Called Number (CD). Include the Access Code of the route in the CD.

STEP 6: **AABD** - Assign the Tenant (TN); and the Abbreviated Speed Calling Code, ADC; as assigned in the ASPD command. Assign the Service Feature Restriction Class (SFC) and Restriction Data (RES).

RES 0: Connection is restricted.

RES 1: Connection is allowed.

STEP 7: **AKYD** - Assign SPEED CALLING-SYSTEM [S-3] to a programmable Line/Feature Key. Assign Type:Function:SPEED CALLING-SYSTEM [15].

STEP 8: **ADSL** - Assign S_SPD Key; Assign SN = 1 (Originating; DT Connection) and FKY = 15 (Speed Calling - System). This command is used for assigning a function to each Soft Key.

S-62 Station 5db PAD

General Description

This feature allows a Single Line Station user to be affected by the 5db loss through the system on Station-to-Station Calls.

Operating Procedure

No manual operation is required for this software control feature.

Service Conditions

1. STATION 5db PAD [S-62] is inserted only for intra-office, two-way, Station-to-Station Connections.
2. STATION 5db PAD is inserted into the Called Party of the Station.
3. STATION 5db PAD (both Stations) is not inserted by the Class of Service Feature Restriction Class and/or telephone class when a Station is talking to an Off-Premise Station (OPX).

Programming

ASYD - System Data 1, Index 4, Bit 5, 5db PAD on Single Line Stations? 0/1: Yes/No

S-64 Serial Call - Loop Release

General Description

This feature allows an ATTENDANT CONSOLE [A-3] Loop Key to become available after setting SERIAL CALL [S-15].

Operating Procedure

To operate

1. The Attendant answers an Incoming Central Office Call.
2. The Attendant extends the call to the desired Station, and the desired Station answers.
3. The Attendant presses the SC Key. The Loop is now available for another call.
4. The Called Station and the Incoming Call are connected.
5. The Called Station hangs up. The CCSA lamp on the ATTENDANT CONSOLE flashes, indicating Incoming Call IDENTIFICATION. If the Attendant position is available, an audible indication will be provided.
6. The Attendant presses the CCSA Key or ANSWER Key to return to the Incoming Calling Party.

Service Conditions

1. This feature is available only for Incoming Central Office Trunk Calls.
2. The Attendant can set SC/RC by pressing the SC Key after answering the Station.
3. The Station can switch hook flash after setting SERIAL CALL-Loop RELEASE.
4. It is not permitted to cancel SERIAL CALL-Loop RELEASE before recall.
5. The Attendant Loop will be maintained until the Station is answered, even if the SC Key is pressed. In this case, the following features are not available:

CALL PICK-UP	[C-7, 30]
CALL FORWARDING-DON'T ANSWER	[C-3]

6. SERIAL CALL [S-15] recalling indication continues, even if the system status is changed from Day Mode to Night Mode.
7. When this service is available, the ATTENDANT CONSOLE [A-3] cannot have a CCSA Key.
8. When CALL WAITING-TERMINATING, CALL WAITING-ORIGINATING, ATTENDANT CAMP-ON WITH TONE INDICATION or ATTENDANT CAMP-ON - CCIS is set to the Station already engaged in SERIAL CALL, the following conditions occur:
   a.) If the Station answers the Overriding Call, the previous party engaged in SC is placed on hold. If the Station releases and does not return to the Held Call, the Attendant is recalled.
   b.) If the Station does not answer the Overriding Call, Call Waiting or Attendant Camp-On is activated.
9. When using the CCSA Key on the DESK CONSOLE, an additional module is required.

Programming

ASYD - System Data 1, Index 186, Bit 4 SERIAL CALL-Loop RELEASE 0/1: Out (CCSA Key) /In Service (No CCSA Key)

System Data 2, Index 2, Bit 5. Serial Call service for ATT: 0/1: Out/In service.

System Data 2, Index 7, Bit 2. SERIAL CALL-Loop RELEASE. 0/1: Out/In service.

See SERIAL CALL S-15.

S-65 Short Break Hooking

General Description

This feature enables a Station user using a PB telephone with hooking button, which sends out break pulses to perform all the available hooking services by using this button.

Note: This feature is available in Australia only.

Operating Procedure

The Station user using a PB telephone with the hooking button simply presses the hooking button to perform an available hooking service.

Service Conditions

1. This feature is available in Australia only.
2. The hooking button facility is enabled when the telephone class is assigned as “PB” (TEC = 2).
3. All DP signals are invalid during Call Origination from a PB Telephone (TEC = 2).
4. If Ground Button for Switch Hook Flash is specified as valid in the System Data (System Data 1, Index 68, Bit 6 = 1), the hooking button becomes invalid.

Programming

ASDT - Assign the Station data.
TEC (Telephone Equipment Class) = 2 (PB)

S-99 Split Call Forwarding

General Description

This feature allows a Station to set two different target Stations for CALL FORWARDING-ALL CALLS (FORWARD)/BUSY LINE (FORWARD-BY)/DON'T ANSWER (FORWARD-DA), depending on whether the Incoming Call is from an internal Station or an Outside Party (Central Office TIE, DID, etc.).

Operating Procedure

To operate

1. Station A sets or is set for CALL FORWARDING-ALL CALLS (**Note 1**)/BUSY LINE/DON'T ANSWER. Station B is set as the transfer destination for an Incoming Call from a Station. Station C is set as the transfer destination for an Incoming Call from an Outside Party.
2. An Incoming Call from a Station terminates to Station A. The call is transferred to Station B. **Note 2**
3. An Incoming Call from an Outside Party terminates to Station A. **Note 3**
4. The call is transferred to Station C. **Note 2**

Note 1: From FP95-114 V4 Issue 2.0, CALL FORWARDING - ALL CALLS can be canceled with the entry Access Code (ASYDL/N SYS1, Index 686, Bit 0= 1).

Note 2: For the transfer procedure, refer to the Operation Procedure of CALL FORWARDING-ALL CALLS [C-5], CALL FORWARDING-BUSY LINE [C-2], or CALL FORWARDING-DON'T ANSWER [C-3].

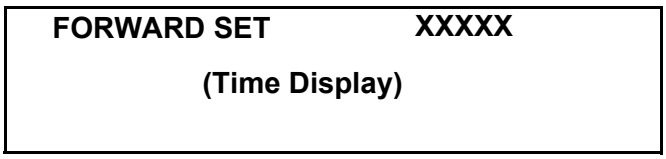
Note 3: The call may be transferred to Station B (transfer destination for an Incoming Call from a Station), depending on the Route Class Data [ARTD, CDN 68:SCF] of the Trunk involved.

To set SPLIT CALL FORWARDING using an Access Code

To set Call Forwarding from an individual Station (Single Line Telephone)

1. Setting Call Forwarding for an Incoming Call from a Station:
   a.) Lift the handset. Receive Dial Tone.
   b.) Dial the Access Code for FORWARD, FORWARD-BY, or FORWARD-DA for an Incoming Call from a Station. Receive Special Dial Tone.
   c.) Dial the number of the desired target Station; receive Service Set Tone.
   d.) Replace the handset.
2. Setting Call Forwarding for an Incoming Call from an Outside Party:
   a.) Lift the handset. Receive Dial Tone.
   b.) Dial the Access Code for FORWARD, FORWARD-BY, or FORWARD-DA for an Incoming Call from an Outside Party. Receive Special Dial Tone.
   c.) Dial the number of the desired target Station. Receive Service Set Tone.
   d.) Replace the handset.

To cancel Call Forwarding from an individual Station (Single Line Telephone)



1. Canceling Call Forwarding for an Incoming Call from a Station:
   a.) Lift the handset. Receive Dial Tone.
   b.) Dial the Cancel Code for FORWARD, FORWARD-BY, or FORWARD-DA for an Incoming Call from a Station. Receive Special Set Dial Tone.

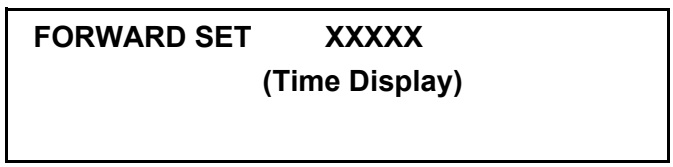
c.) Replace the handset.

2. Canceling Call Forwarding for an Incoming Call from an Outside Party:
   a.) Lift the handset. Receive Dial Tone.
   b.) Dial the Cancel Code for FORWARD, FORWARD-BY, or FORWARD-DA for an Incoming Call from an Outside Party. Receive Special Set Tone.
   c.) Replace the handset.

To set SPLIT CALL FORWARDING using Dterm Feature Key
To set Call Forwarding from an individual Station (Dterm)

1. Setting Call Forwarding for an Incoming Call from a Station:
   a.) Confirm that the PAGE* (One-touch changeover) lamp is ON. If the lamp is OFF, turn the lamp on by pressing the PAGE Key.
   b.) Lift the handset or press the SPEAKER Key. Receive Dial Tone.
   c.) Press the FORWARD, FORWARD-BY, or FORWARD-DA Key. Receive Special Dial Tone.
   d.) Dial the number of the desired target Station. Receive Service Set Tone. The following is displayed on the LCD, when the destination is a Station:

When the destination is an ATTENDANT CONSOLE, the Dterm displays:



When the destination is an Outside Trunk, The Dterm displays:

The FORWARD, FORWARD-BY, or FORWARD-DA lamp turns on.

   e.) Replace the handset or press the SPEAKER Key. *PAGE Feature Key is a paging button for SPEED DIALING - One-Touch -D [S-26D], (FKY = 55).

2. To set Call Forwarding for an Incoming Call from an Outside Party:
   a.) Confirm that the PAGE (One-Touch Changeover) lamp is OFF. If the lamp is ON, turn the lamp off by pressing the PAGE Key.
   b.) Lift the handset or press the SPEAKER Key. Receive Dial Tone.
   c.) Press the FORWARD, FORWARD-BY, or FORWARD-DA Key. Receive Special Dial Tone.
   d.) Dial the number of the desired target Station. Receive Service Set Tone. The following is displayed on the LCD when the destination is a Station:

When the destination is an Attendant Console, the LCD displays:

```
FWD SET OPR
          (Time Display)
```

When the destination is an Outside Trunk, the Dterm displays:

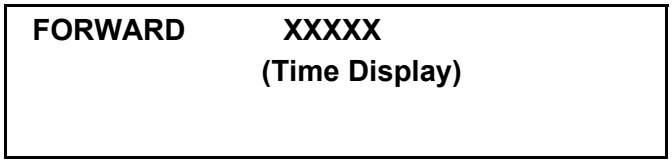
```
FORWARD SET      XXXXX
          (Time Display)
```

To cancel Call Forwarding from an individual Station (Dterm)

1. Cancelling Call Forwarding for an Incoming Call from a Station:
   a.) Confirm that the PAGE (One-Touch Changeover) lamp is ON. If the lamp is OFF, turn the lamp on by pressing the PAGE Key.
   b.) Lift the handset or press the SPEAKER Key. Receive Service Set Tone.
   c.) Press the FORWARD, FORWARD-BY, or FORWARD-DA Key. Receive Service Set Tone. The LCD displays:

```
FORWARD CANCEL
          (Time Display)
```

   The FORWARD, FORWARD-BY, or FORWARD-DA lamp turns off.
   d.) Replace the handset or press the SPEAKER Key.
2. Cancelling Call forwarding for an Incoming Call from an Outside Party:
   a.) Confirm that the PAGE lamp is OFF. If the lamp is ON, turn the lamp off by pressing the PAGE Key.
   b.) Lift the handset or press the SPEAKER Key. Receive Dial Tone.
   c.) Press the FORWARD, FORWARD-BY, or FORWARD-DA Key. Receive Service Set Tone. The LCD displays:

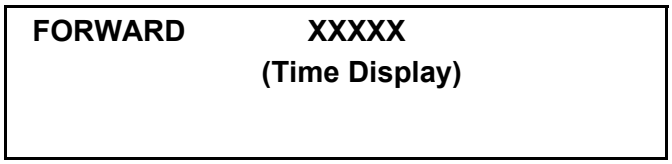


```
FORWARD CANCEL
          (Time Display)
```

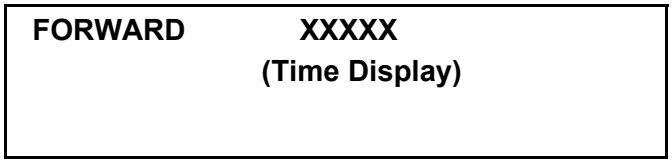
   Also, the FORWARD, FORWARD-BY, or FORWARD-DA lamp turns off.
   d.) Replace the handset or press the SPEAKER Key.

To monitor the assigned data using the Dterm Feature Key

1. To monitor the assigned data for calls from Incoming Trunks (Outside):
   a.) Confirm that the LED of the PAGE Feature Key on the Dterm is not illuminated. (If it is illuminated, press PAGE Key to turn it off.)
   b.) While the Dterm is in the idle state (on-hook), press the CALL FORWARDING - ALL CALLS/ BUSY LINE or DON'T ANSWER Feature Key.



When the destination is a Station, the Dterm displays:



When the destination is an ATTENDANT CONSOLE, the Dterm displays:

When the destination is an Outside Trunk, the Dterm displays:

2. To monitor the assigned data for Station-to-Station Calls:
   a.) Confirm that the PAGE Key LED on the Dterm is illuminated. (If it is not illuminated, press the PAGE Key to turn it on.)
   b.) While the Dterm is in the idle state (on-hook), press the CALL FORWARDING - ALL CALLS/ BUSY LINE or DON'T ANSWER Feature Key.
   When the destination is a Station, the Dterm displays:

When the destination is an ATTENDANT CONSOLE, the Dterm displays:

To set Call Forwarding from the Attendant Console

1. Setting Call Forwarding for an Incoming Call from a Station:
   a.) Press an Idle Loop Key and dial the FORWARD, FORWARD-BY, or FORWARD-DA Access Code for an Incoming Call from a Station. Receive Special Dial Tone.
   b.) Dial the Tenant Number (two digits) of the originating Station, the originating Telephone Number, and the desired target Telephone Number. Receive Service Set Tone.
   c.) Press the RELEASE Key.
2. Setting Call Forwarding for an Incoming Call from an Outside Party:
   a.) Press an Idle Loop Key and dial the FORWARD, FORWARD-BY, or FORWARD-DA Access Code for an Incoming Call from an Outside Party. Receive Special Dial Tone.
   b.) Dial the Tenant Number (two digits) of the originating Station, the originating Telephone Number, and the desired target Telephone Number. Receive Service Set Tone.

c.) Press the RELEASE Key.

To cancel Call Forwarding from the Attendant Console

1. Cancelling Call Forwarding for an Incoming Call from a Station:
   a.) Press an Idle Loop Key and dial the Cancel Code for FORWARD, FORWARD-BY, or FORWARD-DA for an Incoming Call from a Station. Receive Special Dial Tone.
   b.) Dial the Tenant Number (two digits) of the originating Station and the originating Telephone Number.
   c.) Press the RELEASE Key; receive Service Set Tone.
2. Cancelling Call Forwarding for an Incoming Call from an Outside Party:
   a.) Press an Idle Loop Key and dial the FORWARD, FORWARD-BY, or FORWARD-DA Access Code for an Incoming Call from an Outside Party. Receive Special Dial Tone.
   b.) Dial the Tenant Number (two digits) of the originating Station and the originating Telephone Number. Receive Service Set Tone.
   c.) Press the RELEASE Key.

Service Conditions

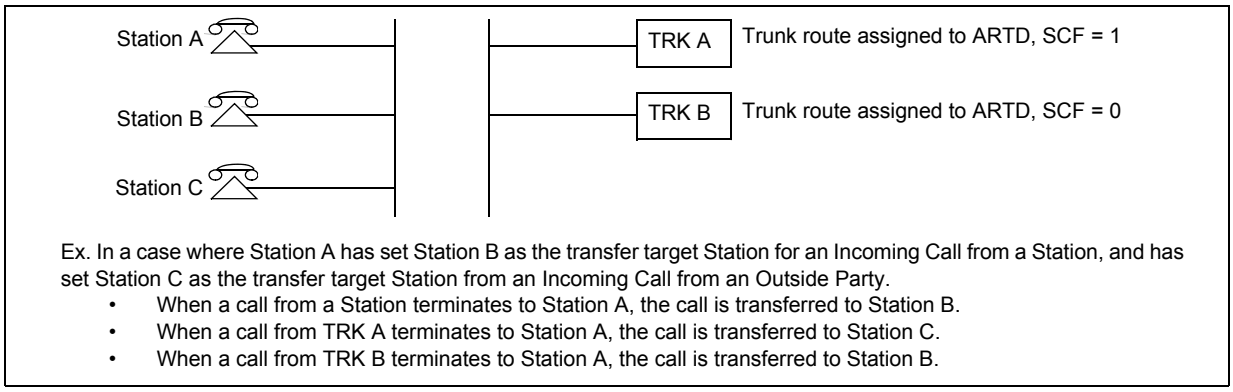
1. The same Station can be set as the transfer target Station for an Incoming Call from an Outside Party and/or from a Station.
2. For an Incoming Call from a Trunk, whether Call Forwarding destination for an Incoming Call from a Station or for an Incoming Call from an Outside Party is to be used can be designated on each Incoming Route basis. (According to ARTD command, CDN 68:SCF, data.)
3. When an Incoming Call from a Trunk is handled via the Attendant/Station, the destination of Call Forwarding is selected according to the Route Data of the Incoming Trunk (as assigned by ARTD command, CDN 68:SCF).
4. Enter Route Class Data by assigning "1" to CDN 68 (SCF) of the ARTD command, for all the routes that are used to forward incoming trunk calls with CALL FORWARDING - ALL CALLS [C-5], CALL FORWARDING-BUSY LINE [C-2], or CALL FORWARDING-DON'T ANSWER [C-3].
5. Call Forwarding table to be referred to for incoming call is determined by System Data, ARTD (CDN68) and Incoming Call Type as shown below.

   Table 1: forwarding destination assigned in SID=8, 10, 12 of ASPA command
   Table 2: forwarding destination assigned in SIDA=86, 87, 88 of ASPA command

SYSTEM DATA	INCOMING CALL TYPE		
	FROM STATION/ATT	FROM C.O. / TIE LINE	
		ARTD SCF = 0	ARTD SCF = 1
SYS1, Index 79, Bit 2 = 0 Split Call Forwarding is Out of Service	Table 1	Table 1	Table 1
SYS1, Index 79, Bit 2 = 1 Split Call Forwarding is In Service	Table 2	Table 2	Table 1

6. When enabling Split Call Forwarding for the first time from the disabled state, consider the following:

   - To forward trunk calls (C.O./Tie Line) by using Split Call Forwarding



You can use the existing call forwarding data (for CALL FORWARDING-ALL CALLS [C-5], CALL FORWARDING-BUSY LINE [C-2], and CALL FORWARDING-DON'T ANSWER [C-3]).

- To forward station calls by using Split Call Forwarding

  Create data for forwarding station calls by setting SIDA = 86, 87, or 88 of the ASPA command.

Note: As shown in item 5. above, when CDN68 (SCF) of the ARTD command is set to "1," the data in Call Forwarding Table 1 is always used to forward incoming trunk calls whether Split Call Forwarding is enabled or not. Therefore, the existing call forwarding data for incoming trunk calls is still available after the status of this feature is changed (enabled or disabled).
However, in the case of station calls, different Call Forwarding Tables are used, depending on the status of this feature. Thus, if you enable this feature for the first time from the disabled state, you need to create data for forwarding station calls.

7. This service is invalid on Call Forwarding by the system. (Call Forwarding by the ACFO command.)
8. Multiple Call Forwarding is available for those Stations where SPLIT CALL FORWARDING has been set.
9. This service can be set from the Attendant Console.

Ex. In a case where Station A has set Station B as the transfer target Station for an Incoming Call from a Station, and has set Station C as the transfer target Station from an Incoming Call from an Outside Party.

- When a call from a Station terminates to Station A, the call is transferred to Station B.
- When a call from TRK A terminates to Station A, the call is transferred to Station C.
- When a call from TRK B terminates to Station A, the call is transferred to Station B.

10. Indication of SPLIT CALL FORWARDING (ALL CALLS/BUSY LINE/DON'T ANSWER) feature can be accomplished only if the Service Feature Restriction Class and Access Codes are assigned correctly.
11. This feature is available for Stations where CALL FORWARDING services are available by CLASS OF SERVICE.
12. Multiple Call Forwarding is available for those Stations where SPLIT CALL FORWARDING has been set.
13. In the UCD procedure, if SPLIT CALL FORWARDING - ALL CALLS (either for Station-to-Station or Incoming Trunk) is set on a Station in the group, that Station is skipped.
14. If SPLIT CALL FORWARDING is set on a Station in the Hunting Group (STATION HUNTING - CIRCULAR [C-7], - TERMINAL [S-9], that Station is skipped in hunting. However, if the Station has set SPLIT CALL FORWARDING for Station-to-Station Calls only, the Station is hunted for Incoming Calls from Outside. If the Station has set SPLIT CALL FORWARDING for Outside Calls only, the Station is hunted for Station Calls.

15. In this feature, consultation calls (associated with CALL TRANSFER - ALL CALLS [C-11] or BLIND TRANSFER TO STATION [B-18]) are forwarded to the appropriate destination according to whether the original call placed on hold is from a trunk or a station.
16. This service cannot be activated concurrently with CALL FORWARDING - I'M HERE [C-81].
17. A user (via a Station or an Attendant Console) can assign a maximum of 24-digit forwarding Station Number including the Trunk Access Code.
18. A Dterm can display only the first 8 digits of forwarding number on the LCD, even though 24-digit number is assigned.
19. This feature is not available for ISDN terminals.
20. By registering the Call Forwarding - All Calls Access Code + the desired Announcement Trunk Access Code to the CF Setting button of a Line/Feature key on a Desktop terminal, it is possible to enable and disable the settings just by pressing the CF Setting button. For a detailed explanation, see CALL FORWARDING (CF) BUTTON - ONE TOUCH [C-208].

Note: CALL FORWARDING (CF) BUTTON - ONE TOUCH [C-208] is available from FP95-114 V4 Issue 2.0.

Programming

STEP 1: **ASYD** - System Data 1, Index 4, Bit 6. 0/1 = When a call terminates to a terminal that Call Forwarding-All Calls is set, one burst ringing is not sent/sent.

System Data 1, Index 5, Bit 0. 0/1 = Access Code for Call Forwarding-Busy Line and Don't Answer is same/separate.

System Data 1, Index 5, Bit 1-3. Maximum number of Multi-hops for Call Forwarding-All Calls and Busy Line. Note that this setting is valid when "System Data 1, Index 69, Bit 7 = 1" is assigned.

Bit 3	Bit 2	Bit 1	Maximum Number of Multi-hops
0	0	0	Once
0	0	1	Once
0	1	0	Twice
0	1	1	Three times
1	0	0	Four times
1	0	1	Five times
1	1	0	Five times
1	1	1	Five times

System Data 1, Index 69, Bit 7. Multiple Call Forwarding-Busy Line/All Calls: 0/1 = Out/In service.

System Data 1, Index 79, Bit 2 = 1. Split Call Forwarding Service: 0/1 = Out/In service.

System Data 1, Index 248, Bit 7. 0/1 = When going off-hook at Station that Call Forwarding-All Calls is set, Special Dial Tone (SPDT) is not sent/sent.

System Data 2, Index 6, Bit 4. Call Origination Restriction for Station that Call Forwarding-All Calls is set: 0/1 = Restricted/Not restricted. Note that this data is not effective when Split Call Forwarding is set.

STEP 2: **ASYDL/N** - SYS1, Index 686, Bit 0=1.
Disabling Call Forwarding - All Calls with entry Access Code is in service.

Note: Available from FP95-114 V4 Issue 2.0.

STEP 3: **ANPD** - Assign the minimum necessary number of digits for the first number of the Access Code for Split Call Forwarding.

STEP 4: **ASPA** - Assign the Access Code for Split Call Forwarding-All Calls.

CI = "N: Normal", SRV = "SSC: Service Code", SID = 8: Split Call Forwarding-All Calls (for Central Office/TIE): Entry.

CI = "N: Normal", SRV = "SSC: Service Code", SID = 9: Split Call Forwarding-All Calls (for Central Office/TIE): Cancel. **Note 4**

CI = "N: Normal", SRV = "SSC: Service Code", SID = 10: Split Call Forwarding-Busy Line (for Central Office/TIE): Entry.

CI = "N: Normal", SRV = "SSC: Service Code", SID = 11: Split Call Forwarding-Busy Line (for Central Office/TIE): Cancel.

CI = "N: Normal", SRV = "SSC: Service Code", SID = 12: Split Call Forwarding-Don't Answer (for Central Office/TIE): Entry.

CI = "N: Normal", SRV = "SSC: Service Code", SID = 13: Split Call Forwarding-Don't Answer (for Central Office/TIE): Cancel.

CI = "N: Normal", SRV = "SSCA: Service Code Appendix", SIDA = 86: Split Call Forwarding-All Calls (for Station): Entry.

CI = "N: Normal", SRV = "SSCA: Service Code Appendix", SIDA = 87: Split Call Forwarding-Busy Line (for Station): Entry.

CI = "N: Normal", SRV = "SSCA: Service Code Appendix", SIDA = 88: Split Call Forwarding-Don't Answer (for Station): Entry.

CI = "N: Normal", SRV = "SSCA: Service Code Appendix", SIDA = 89: Split Call Forwarding-All Calls (for Station): Cancel. **Note 4**

CI = "N: Normal", SRV = "SSCA: Service Code Appendix", SIDA = 90: Split Call Forwarding-Busy Line (for Station): Cancel.

CI = "N: Normal", SRV = "SSCA: Service Code Appendix", SIDA = 91: Split Call Forwarding-Don't Answer (for Station): Cancel.

Note 4: When SYS1, Index 686, Bit 0=1 (Disabling Call Forwarding - All Calls with entry Access Code is in service), Call Forwarding - All Calls cancel is not required because the cancellation can be performed with the entry Access Code.

STEP 5: **AKYD** - Assign the following data to the Line/Feature Keys of the Dterm when this feature is provided from a Dterm:

Type: Function:CALL FORWARDING-BUSY LINE [1]

Type: Function:CALL FORWARDING-ALL CALLS [2]

Type: Function:CALL FORWARD-DON'T ANSWER [22]

Type: Function:PAGE [55]

STEP 6: **ADSL** - Assign the following soft Keys:

SN = 1, FKY = 1: Call Forwarding - Busy Line (FDB)

SN = 1, FKY = 2: Call Forwarding - All Calls (FDA)

SN = 1, FKY = 22: Call Forwarding - Don't Answer (FDN)

SN = 1, FKY = 55: Call Forwarding - One - Touch Changeover (PAGE)

This command is used for assigning a function to each Soft Key.

STEP 7: **ASFC** - Allows Call Forwarding-All Calls (SFI = 7), Call Forwarding-Busy Line (SFI = 9), or Call Forwarding-Don't Answer (SFI = 8) to the SFC of the Station.

STEP 8: **ARTD** - Assign Route Data to the route of the Trunks which validates C.F.-All Calls, C.F.-Busy Line or C.F.-Don't Answer for an Incoming Call from an Outside Party. CDN 68:SCF = 1)

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as circuit card or MG.

STEP 9: **ACFS** - This feature can be set by this command.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ALRTN** - Assign this command to connect the Logical Route to the Physical Route.

STEP 2: **ARTDN** - Assign Route Data to the route of the Trunks which validates Call Forwarding - All Calls, Call Forwarding - Busy Line or Call Forwarding - Don't Answer for an Incoming Call from an Outside Party. CDN 68:SCF = 1)

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as circuit card or MG.

S-106 Slumber Time - Do Not Disturb

General Description

This service allows a slumber time for up to four times per day on a Station Group basis. During the slumber time, all Stations in the group concerned are placed into "Do Not Disturb" mode; and Incoming Calls (Station/DID/DIT) are routed to the Attendant or an Announcement Machine.

Operating Procedure

No manual operation is required.

Service Conditions

1. The Stations for which this feature is set are determined by the Telephone Number of the group preassigned by the MAINTENANCE ADMINISTRATION TERMINAL (PCPro) and Slumber Time data, not by the Service Feature Restriction Class.
2. This feature cannot be set for Data Terminals.
3. This feature cannot be set for Night Stations. (NIGHT CONNECTION [N-1] [N-2] take precedence over SLUMBER TIME - DO NOT DISTURB.)
4. There can be up to seven Slumber Time Groups per system. There is no limitation to the number of Stations that can be assigned to one group.
5. A maximum of four Slumber Time assignments can be made for one Slumber Time Group. When setting more than one assignment, assure that the Times do not overlap each other. Also, a transfer destination can be assigned on each Slumber Time Data basis.
6. A Station cannot be assigned to more than one Slumber Time Group.
7. A Night Transfer Station cannot be assigned to a Slumber Time Group.
8. During Slumber Time, Incoming Calls (Station/DID/DIT) are routed to an Attendant Console or Announcement Machine. When an Attendant Console is designated as the transfer destination, the transfer call is terminated to the ICPT Key on the Attendant Console. When an Announcement Machine is designated as the transfer destination but is not assigned in data by AAED command, the caller receives a Busy Tone (BT).
9. An Announcement Machine with one channel can be connected to each Station Group. When connecting several Station Groups to an Announcement Machine, all groups must be assigned to the same single route and Trunk.
10. Call transfer to a Station in Slumber time mode after holding the call by CONSULTATION HOLD [C-17] is possible only when an Attendant Console is designated as the transfer destination. (The call is transferred to the Attendant Console.) If the Announcement Machine is designated as the transfer destination, the Transfer Call is routed to Reorder Tone (ROT) Connection.
11. The caller is not always connected to the announcement from its beginning.
12. Call origination is available during Slumber Time.
13. Station Group or time is changed, assigned, or canceled by PCPro command.
14. There is no external indication showing Slumber Time set.
15. Any of the following services take precedence over the Slumber Time service:

CALL FORWARDING-ALL CALLS	[C-5]
CALL FORWARDING-BUSY LINE	[C-2]
STATION HUNTING	[S-7, 9]
UNIFORM CALL DISTRIBUTION	[U-1]
DO NOT DISTURB -D	[D-11D]

16. CALL BACK [C-1] and CALL WAITING-ORIGINATING [C-31] can be set from a Slumber Time Station.
17. Each of the following services is restricted to a Slumber Time Station:

CALL WAITING-ORIGINATING	[C-31]
CALL BACK	[C-1]
EXECUTIVE RIGHT-OF-WAY	[E-1]

18. Each of the following terminals can access to a Slumber Time Station during a Slumber Time. (Slumber Time Override Service):
    - Attendant Console
    - Station (when SFI 107 is set to 1 in the ASFC command)
    - Trunk (when CDN109 (SLOV) is set to 1 in the ARTD command)
19. The Announcement Machine uses DAT card and VS32.

Note: In case of using VS32, apart from this feature service conditions, also service conditions of VS32 apply. For detailed explanations, see 4. Service Conditions for Announcement of the Service Conditions section in VS32 CONFERENCE SERVER [V-26].

20. To provide this service in the FCCS Network, all the Nodes in the network must be assigned the same Group Number.
21. Errors of time data are about + 1 minute.
22. This service is not available for Incoming Calls from Q-sig/IS-11572 line/MG-SIP.

Programming

Note: In case of using VS32, see 3. Data Programming for Announcement of the Programming section in VS32 CONFERENCE SERVER [V-26].

STEP 1: **ASLU1** - Assign Slumber Time Group.
TN = Tenant Number
STN = Station Number
G = 1-7: Slumber Time Group Number

STEP 2: **ASLU2** - Assign Slumber Time Data
G = 1-7: Slumber Time Group Number
CNT = Count of Assigned Transfer Destination/Time Data
TFR = 1/2: Transfer to Attendant/Announcement
FROM = Slumber Time Start Time
TO = Slumber Time End Time **Note 1**

] Assign as many data as assigned by CNT

Note 1: If the slumber service is required 24 hours a day, enter the same time data in to both the FROM HOUR/FROM MINUTE parameters and TO HOUR/TO MINUTE parameters.

STEP 3: **ASFC** - Assign the service feature restriction class.
SFI 107 = 0 (Slumber Time is effective)
However, in the case you want to enable incoming calls even during Slumber Time, set the following service feature restriction class of calling terminals.
SFI 107 = 1 (Slumber Time Override is effective)

STEP 4: **ARTD** - Assign the Route Class Data Route Number of the Announcement Trunk and the following Route Class Data.
CDN 109 (SLOV) = 0 (Slumber Time Override Out of Service)
However, in the case you want to enable incoming calls even during Slumber Time, set the following Route Class Data of incoming trunk.
CDN 109 (SLOV) = 1 (Slumber Time Override in Service)

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as circuit card or MG.

STEP 5: **ATRK** - Assign the Trunk data of the Announcement Machine. **Note 2**

STEP 6: **MBTK** - Cancel the make-busy of the Announcement Trunk assigned by ATRK. **Note 2**

STEP 7: **AAED** - Assign the data of the Announcement Machine as shown below: **Note 2**

EQP = 36: Announcement Machine for Slumber Time Group 1
37: Announcement Machine for Slumber Time Group 2
38: Announcement Machine for Slumber Time Group 3
39: Announcement Machine for Slumber Time Group 4
40: Announcement Machine for Slumber Time Group 5
41: Announcement Machine for Slumber Time Group 6
42: Announcement Machine for Slumber Time Group 7

C = Connection time: Disconnected in 30 seconds/connected until caller releases the Station (= 0/1)

R = RBT TRANSMISSION: RBT transmission/No RBT transmission (= 0/1)

A = Call is answered directly/call is extended to an answering device.

M = 1: Multiple Connection

RT = When using a One-channel Announcement Machine by more than one Slumber

TK = Time Group, assign the same data.

Note 2: The data is to be assigned only when Announcement Machine is designated as the transfer destination.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

STEP 1: **ALRTN** - Assign this command to connect the Logical Route to the Physical Route.

STEP 2: The Station to use the service is registered by Physical Station Number in ASLU1 command.

STEP 3: The identical ASLU2 data should be programmed at all FCCS Nodes.
By assigning the data, this service is available for the Incoming Calls to be dialed Telephone Number.

S-127D Serial Call -D

General Description

This feature allows the Dterm user to set SERIAL CALL to the central office line/TIE Line Call and extend the call to the desired Station/Trunk. When the communication with the desired party ends, the announcement instructing the caller to dial the next desired party number is sent out. The caller, by following the instructions, can be connected to a number of destinations without hanging up.

Note: This feature is not available in Australia.

Operating Procedure

To operate

1. The Dterm user answers the Incoming Central Office Line/TIE Line Call.
2. The caller requests SERIAL CALL, and the Dterm user presses the SERIAL CALL Key.
3. The caller tells the desired Station/Trunk Number to the Dterm user. The Dterm user extends the call to the desired Station/Trunk using Consultation Hold.
4. When the conversation ends, the caller receives the announcement requesting the caller to dial the next Telephone/Trunk Number.
5. The caller dials the desired Station/Trunk Number. When the Called Party answers, communication can begin.
6. When the conversation ends, the caller receives the announcement requesting the caller to dial the next Telephone/Trunk Number. The caller may successively dial the desired Telephone/Trunk Number.

Note: For the Dterm equipped with a 24-digit LCD, the 16 digits on the left side of the LCD is used for the service set/cancel indication. The 8-digit space on the right side is blank.

Service Conditions

1. Whether to activate this service can be determined on a system basis, but not on a Tenant or Incoming Route basis. Therefore, it is not available to activate this service for each Incoming Route.
2. SERIAL CALL can be set only for the Incoming Central Office Line, TIE Line, and ISDN Line. It cannot be set for the Station or the Outgoing Trunk.
3. The Station that can set/cancel SERIAL CALL is the Dterm with the SERIAL CALL Key. In case of the Incoming Call from a Ringdown Trunk, the call has to be transferred from the Attendant to the Dterm, or the Dterm should be previously designated as the Direct-In Termination Station.
4. The Dterm may set/cancel SERIAL CALL by pressing the SERIAL CALL Key any time while engaged in a call with the Incoming Trunk Party. (The LCD indicates set (SERIAL SET)/cancel (SERIAL CANCEL) for five seconds for every attempt, and the SERIAL CALL Key lights red while SERIAL CALL is set.) However, the Dterm user must not have any other calls when using this service (i.e. this service cannot be used together with CALL TRANSFER-ALL CALLS [C-11], CONSULTATION HOLD-ALL CALLS [C-17], CALL WAITING-TERMINATING [C-12], etc.).
5. The caller can call the Station, central office line, TIE Line, or the Attendant successively by activating SERIAL CALL.
6. When the call terminates on the Central Office Line/TIE Line in the Multi Line and the Called Station answers, the SERIAL CALL Key lights red. However, in case the Dterm user answers by CALL PICKUP - GROUP [C-7]/CALL PICKUP - DIRECT [C-30], it does not light.

7. If SERIAL CALL is not set to the Incoming Trunk, the caller is not connected to the announcement when the conversation with the first party ends (after being placed on Consultation Hold), but receives Reorder Tone.
8. This service is available to the Incoming Route where AUTOMATED ATTENDANT [A-82] or REMOTE ACCESS TO SYSTEM [R-2] are set.
9. When the Registers are all busy when Serial Call is attempted, the caller receives Reorder Tone.
10. Whether to send the announcement can be determined on a system basis. If the announcement is not sent, the caller receives Dial Tone. Both the first and the second announcement is connected in Single Connection, and the caller receives no tone until the announcement is sent.
11. When Serial Call is attempted, and the caller encounters all Announcement Trunks busy or when there is no Announcement Trunk, the caller receives Dial Tone.
12. The caller can dial the desired Telephone/Trunk Number during the announcement.
13. This service is provided only when the caller uses the DTMF telephone.
14. The caller is connected to the announcement when the caller is engaged in a Two-party Connection with the Station, Central Office Line, TIE Line, or the Attendant and then the Station, Central Office Line, TIE Line or the Attendant releases.
15. If the caller does not dial any number after the announcement, the caller receives no tone until the Register prepause timer expires.
16. In case the Register prepause timer expires after the announcement, whether to recall to the operator Dterm user or to release the call automatically can be selected on a system basis.
17. When recalling to the Dterm, whether to end or continue this setting can be selected by System Data. However, in case the Central Office Trunk works with Loop Start system (Route Data LSG = 0), release cannot be detected; therefore, when recall to the Dterm, this setting is ended. If this setting is ended, the Dterm user can press the SERIAL CALL Key again and reset.

    * Recall to the Dterm is activated with the following steps and ringing is according to the ringer pattern 5 ASYD System Data 3 Index 7.

    a.) In case the Dterm setting SERIAL CALL is free, the destination is the set line and only the Dterm is called. If the set line is accommodated in the other Dterm Multi Line, the other Dterm becomes busy status (lights in red) and CALL FORWARDING – ALL CALLS [C-5] and FORWARDING - DON'T ANSWER [C-3] is not available. When the set line is the My Line of the Dterm, the LCD displays RECALL. (Ordinary transaction for recall to the Dterm user)

    b.) In case the Dterm setting SERIAL CALL is busy, another free line among the Dterms is selected by the same transaction as ordinary Serial Calling. Therefore, CALL FORWARDING - ALL CALLS [C-5], CALL FORWARDING - BUSY LINE [C-2] and STATION HUNTING - CIRCULAR [S-7] are available, and the LCD on the Dterm which is selected as a Prime Line indicates RECALL.
    CALL FORWARDING - DON'T ANSWER [C-3] is not available. In case to end the setting is selected at item 18, the Central Office Line/TIE Line is released. (Reorder Tone is sent out); in case to continue is selected, dialing of the next number is allowed. (Dial tone is sent out.)
18. Conditions for restriction are as follows:
    a.) When the dead number or the Dead Level is dialed (even if the dead number announcement data is assigned, the call is not connected to this announcement, but it is recognized as a Redial Call. If the second announcement data is assigned [AAED EQP = 35], this announcement has priority).
    b.) In case of inter digit timer time-out while the Telephone Number is dialed.
    c.) When the Called Station does not answer for 30 seconds (if CALL FORWARDING - DON'T ANSWER [C-3] is set, the call is forwarded.)

d.) When the Called Station is busy (if CALL FORWARDING - BUSY LINE [C-2] is set, the call is forwarded.)

e.) When the Connection is restricted
- when the Telephone Number where the Connection with the Central Office Line/TIE Line is restricted is dialed.
- when the Access Code dialing for Trunk Call Origination is restricted.
- when the Access Code is dialed for Trunk Call Origination, and inter digit timer expires before the Call Originating Route is determined, resulting in restriction.
- when the Outgoing Trunks are all busy (if Tandem Trunk Queuing service is set, the service is activated.)

19. After the second announcement is sent out, whether to allow dialing of the next number or to release the call automatically can be selected on a system basis.
20. The announcement can be repeated and have different durations depending on the Key setting of the Announcement Trunk (CH-DATA or PA-4DATB-A). The Announcement Trunk should always be connected in Single Connection. For a detailed explanation see CHAPTER 3 CARDS IN 7U-PIR and CHAPTER 4 CARDS IN 8U-PIR in the Circuit Card Description manual.

	SETTING	STANDARD SETTING
CH-DATA	SW82-1 to SW82-2 (64-second mode, 128-second mode, 256-second mode, 512-second mode)	SW26-1 to SW26-8 (ON/OFF= played once/repeated continuously)
PA-4DATB-A	SW5-1 to SW5-2 (When SP-702: 16-second mode, 32-second mode, 60-second mode) (When SP-882: 64-second mode, 128-second mode, 240-second mode)	SW6-1 to SW6-4 (ON/OFF= played once/repeated continuously)

21. When the caller attempts Trunk Call Origination by this service and encounters restriction, the class change service via Authorization Code dialing is not available.
22. The following services are denied toward a line or Trunk involved in Serial Call:

CALL FORWARDING - ALL CALLS	[C-5]
CALL FORWARDING - BUSY LINE	[C-2]
CALL FORWARDING - DON'T ANSWER	[C-3]
CALL PICKUP - DIRECT	[C-30]
CALL PICKUP - GROUP	[C-7]
CALL WAITING - ORIGINATING	[C-31]
CALL WAITING - TERMINATING	[C-12]
STATION HUNTING - CIRCULAR	[S-7]
STATION HUNTING - SECRETARIAL	[S-8]
STATION HUNTING - TERMINAL	[S-9]

23. When the Called Station via Serial Call is busy, STEP CALL [S-13] is not available.
24. When the call is extended to a Trunk, the call is charged to the Incoming Trunk (the caller).
25. This feature is not available when receiving calls from MG (Media Gateway) trunk.

Programming

STEP 1: **ASYD** - System data 1, Index 007, Bit 5 = 0/1: when dialing a vacant Level, Unused Number, Timeout, Recall, or Restricted Connection, the caller will be (0) able to redial / (1) disconnected.
System data 1, Index 435, Bit 0 = 0/1: Serial Call in service No/Yes.
System data 1, Index 435, Bit 1 = 0/1: after pre-pause timer, recall/disconnect.
System data 1, Index 435, Bit 2 = 0/1: when recalling, the service will end/continue.

STEP 2: **AKYD** - FKY 84 = Serial Call.

STEP 3: **ADSL** - Assign SCALL Key; Assign SN = 4 (Communication in Progress) and FKY = 84 (Serial Call).
This command is used for assigning a function to each Soft Key.

STEP 4: **AAED** - EQP 34 (Auto Attendant first announcement)

Duration of Connection:	Disconnect in 30 seconds
Do not Send RBT:	Set to ON
Send Answer Signal:	Set to ON
Multiple Connection:	Set to OFF

EQP 35 (Auto Attendant second announcement)

Duration of Connection:	Disconnect in 30 seconds
Do not Send RBT:	Set to ON
Send Answer Signal:	Set to ON
Multiple Connection:	Set to OFF

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **AAEDN**

- EQP 34 (Auto Attendant first announcement)
  Equipment Kind = DAT / Announcement Machine.
  Duration of Connection = Disconnect in 30 seconds.
  Check the Do Not Send RBT box.
  Check the Send Answer Signal box.
  Multiple Connections = Multiple.

- EQP 35 (Auto Attendant second announcement)
  Duration of Connection = Disconnect in 30 seconds.
  Check the Do Not Send RBT box.
  Check the Send Answer Signal box.
  Multiple Connections = Multiple.

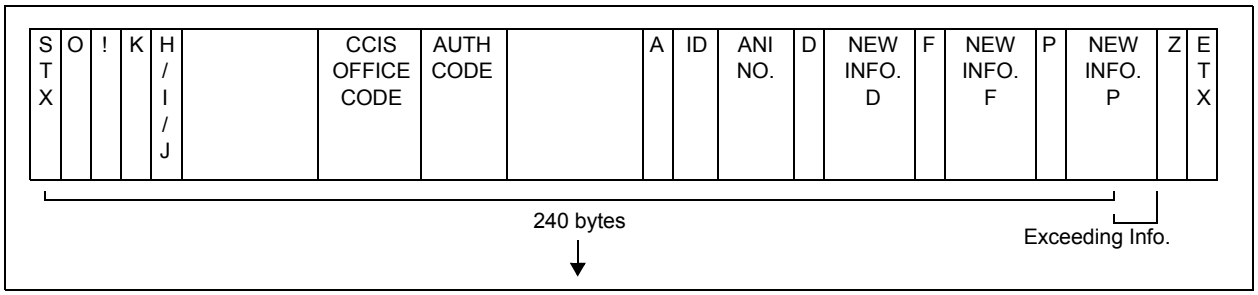
STEP 2: **AAEDN** - EQP 34 (Auto Attendant first announcement) C = 0, R = 1, A = 1, M = 0.
EQP 35 (Auto Attendant second announcement) C = 0, R = 1, A = 1, M = 0.

S-129 SMDR Output Expansion - ANI/CPN

General Description

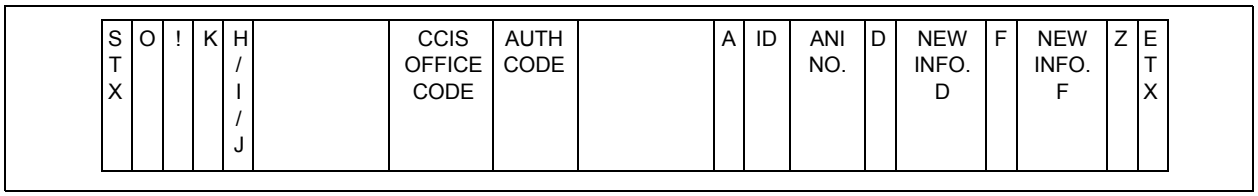
This feature expands SMDR information output, by which Calling Numbers from Central Office may be output to the expanded area.

Note: This feature is available in North America only.



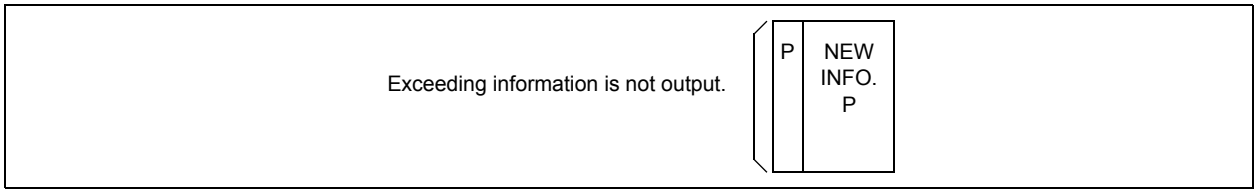
Operating Procedure

No manual operation is required.



Service Conditions

1. When the expanded area information is used, SMDR equipment must corresponds to the expanded output format.
2. Users may assign 24 kinds of output information (maximum 240 bytes) combined as they like. Information exceeding 240 bytes is not output from the beginning.



When current information + ANI information (A) + new information D + F + P:

Output information:

No output information:

3. Multi output and dual output are available. (If dual output is assigned, it is possible that the formats are different at each port depending on System Data [e.g. expanded output is available/not available]).

4. Regarding the ANI information identifier, the numbers 0, 2, 3, 4 and 5 are output only when the information is sent from Central Office.

   Note: Meanings of ANI information identifier numbers:
   0 = Not output
   1 = Display
   2 = Not display
   3 = Not provide service
   4 = Outgoing Central Office Call
   5 = Service Condition

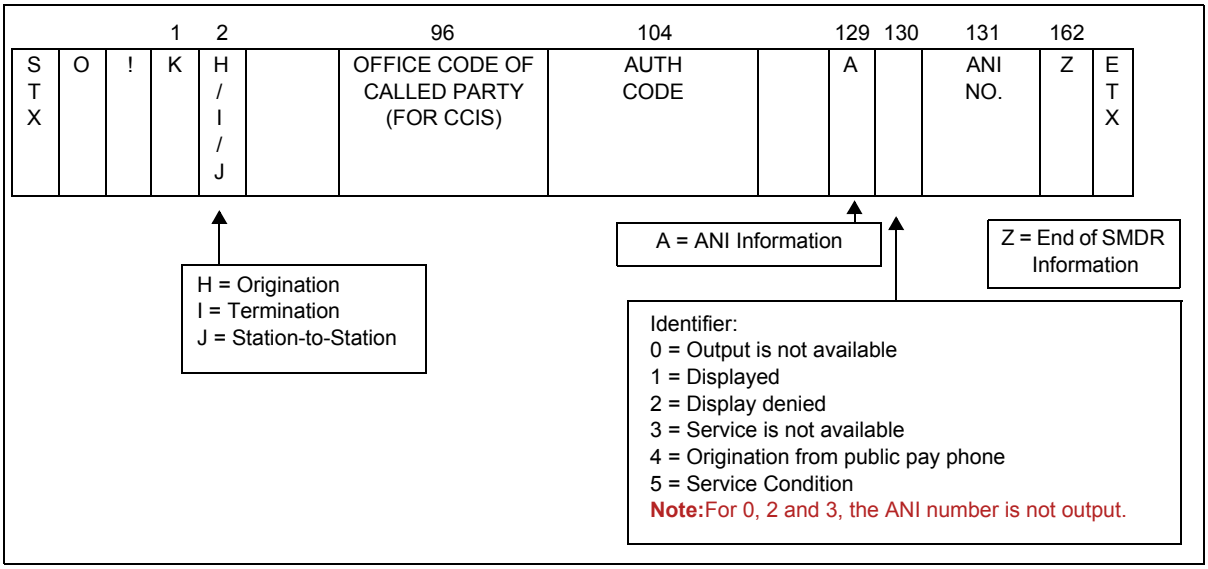
5. When an office receiving a Calling Number from Central Office extends the call to another office through CCIS and charging is performed at the extended office, the maximum Calling Number is 16 digits. However, only when ANI information identifier sent from Central Office is 1 (Display), the Calling Number is output.
6. This service is available when using CENTRALIZED BILLING – CCIS [C-55]. (A main office receives charging information from its remote office as it received. However, if the main office makes this service invalid, the information in the expanded area is not output but transferred by using current identifiers (outgoing: KA, incoming: KE, both Station: KB).

   The following is the table showing relationship between a main office and a remote office when remote charging is established.

Transfer Format From A Remote Office / Output Format From A Main Office	Current Transfer Format	Expanded Transfer Format By Activating This Service
This service is activated.	Expanded area information ID is output only. Information is output in space.	Information is output in the expanded format according to System Data of the main office. In case information required to be output at a main office is not in the transfer format from a remote office, information is output same as the current transfer format.
This service is not activated.	Information is output in the current format.	Information in the expanded area is not output but transferred in the current format.

7. This service is not supported in offices performing remote charging.

Programming



Also see TRUNK LINE APPEARANCE [T-23] for information on how to accommodate Central Office line on a Dterm Line/Feature Key.

STEP 1: **ASYD** - System Data 1, Index 241, Bit 6. 0/1 = When the length of Caller ID exceeds the limit, only the former/latter part of data appears on the LCD.

System Data 1, Index 390, Bit 0. Caller ID Display Pattern on the LCD. 0/1 = Calling Number/Calling Name has priority.

System Data 1, Index 390, Bit 2. when using Dterm Two-line LCD, the lower LCD can be used for displaying Caller ID. 0/1 = Out/In service.

When Calling Number is output to SMDR, the following expanded format is used:

System Data 1, Index 288, Bit 5. Expanded SMDR Output for SMDR A Apparatus. 0/1 = Out/In Service.

System Data 1, Index 290, Bit 5. Expanded SMDR Output for SMDR B Apparatus. 0/1 = Out/In Service.

System Data 1, Index 292, Bit 5. Expanded SMDR Output for SMDR C Apparatus. 0/1 = Out/In Service.

System Data 1, Index 294, Bit 5. Expanded SMDR Output for SMDR D Apparatus. 0/1 = Out/In Service.

System Data 1, Index 296, Bit 0. Output of Calling Number (ANI Information). 0/1 = Out/In Service. Assign data "1".

System Data 1, Index 300, Bit 0. 0/1 = Billing information is sent to the Main Node in Expanded SMDR format if CENTRALIZED BILLING - CCIS [C-55].

STEP 2: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 14 to Stations allowed STATION MESSAGE DETAIL RECORDING [S-10]. SFI 58: SMDR for Station to Station

Note: The setting enables all traffics to be billing targets. If an unnecessary SMDR data is output, please discard it at the SMDR terminal.

STEP 3: **ARTD** - Assign Route Class Data for the Central Office Trunk.

15-LSG :3 50-DPLY :1

When Calling Number is output to SMDR:

10-SMDR :1

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as circuit card, MG, or VS32.

STEP 4: **ATRK** - Assign Trunk data for the Central Office Trunk.

STEP 5: **MBTK** - Cancel the make busy of the Central Office Trunk.

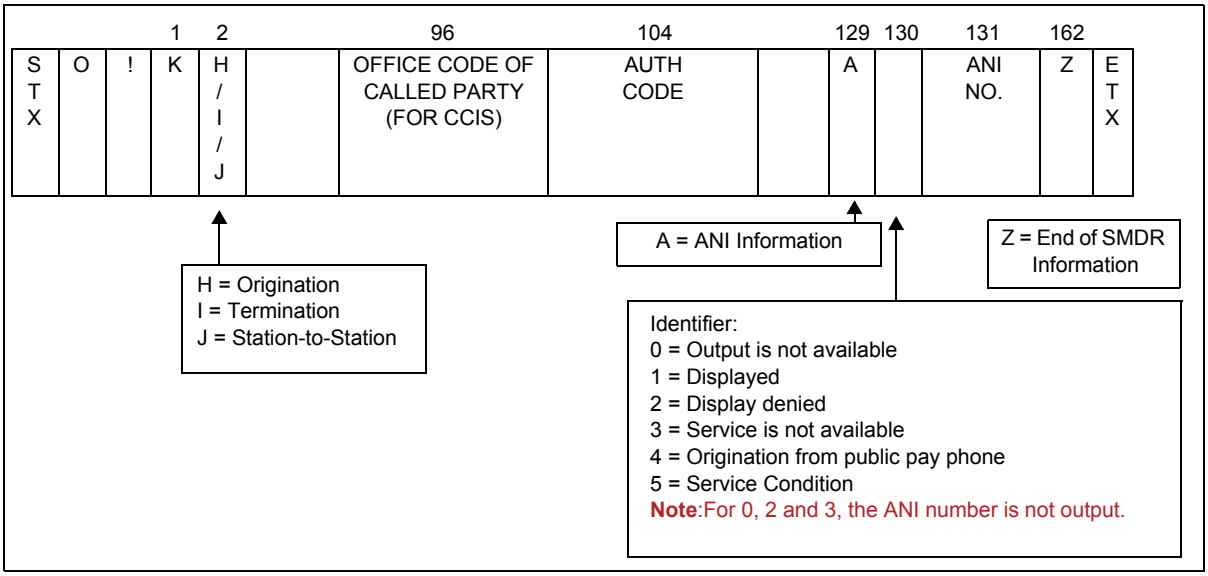
STEP 6: **AKYD** - Assign Call Id Change Display Key. Assign Type:Function:Call ID Change Display [113]. When Call Id Change Display Key is pressed, Display Pattern on the LCD assigned by ASYD command changes according to the conditions below:

When My Line is Prime Line, Call Id Change Display Key is effective while terminating or in conversation.

When My Line is not Prime Line, Call Id Change Display Key is effective while in conversation.

However, Display Pattern returns to the original setting when answering, holding, or transferring the call.

FCCS Programming



This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

STEP 1: **ASYD** - System Data 1, Index 241, Bit 6. 0/1 = When the length of Caller ID exceeds the limit, only the former/latter part of data appears on the LCD.

System Data 1, Index 390, Bit 0. Caller ID Display Pattern on the LCD. 0/1 = Calling Number/Calling Name has priority.

System Data 1, Index 390, Bit 2. when using Dterm Two-line LCD, the lower LCD can be used for displaying Caller ID. 0/1 = Out/In service.

When Calling Number is output to SMDR, the following expanded format is used:

System Data 1, Index 288, Bit 5. Expanded SMDR Output for SMDR A Apparatus. 0/1 = Out/In Service.

System Data 1, Index 290, Bit 5. Expanded SMDR Output for SMDR B Apparatus. 0/1 = Out/In Service.

System Data 1, Index 292, Bit 5. Expanded SMDR Output for SMDR C Apparatus. 0/1 = Out/In Service.

System Data 1, Index 294, Bit 5. Expanded SMDR Output for SMDR D Apparatus. 0/1 = Out/In Service.

System Data 1, Index 296, Bit 0. Output of Calling Number (ANI Information). 0/1 = Out/In Service. Assign data "1".

System Data 1, Index 300, Bit 0. 0/1 = -/Billing information is sent to the Main Node in Expanded SMDR format if CENTRALIZED BILLING - CCIS [C-55].

STEP 2: **ASYDL** - System Data 1, Index 578-581, Bit 0.

STEP 3: **ARTDN** - Assign Route Class Data for the Central Office Trunk.

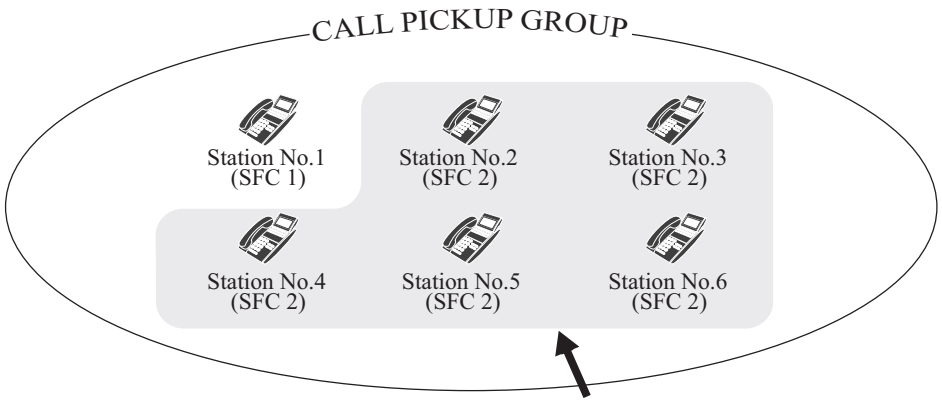
15-LSG :3 50-DPLY :1

When Calling Number is output to SMDR:

10-SMDR :1

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as circuit card, MG, or VS32.

S-137 Selectable Station Call Pickup

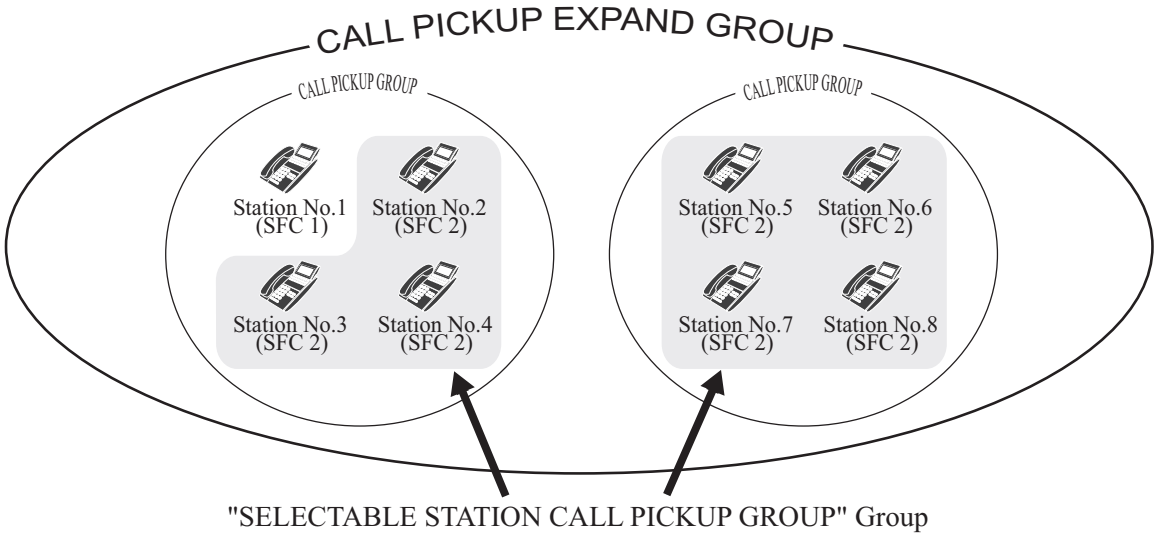


General Description

This feature enables the Station/PS user to pick up the Incoming Call to Station, which are not specified by Service Feature Restriction Class (SFC) data, within Call Pickup Group/Call Pickup Expand Group by dialing Selectable Station Call Pickup/Selectable Station Call Pickup Group Access Code. Incoming Call to pre-specified Stations/PSs cannot be picked up. The figure below shows an example of the feature.

Example: Call Pickup Group

- An incoming call to Station No.1 can be picked up by Station No.2-No.6 using Selectable Station Call Pickup Access Code.
- Incoming calls to Station No.2-No.6 cannot be picked up by all stations using Selectable Station Call Pickup Access Code.



SFC
SFC 1: SFI 183 = 0
SFC 2: SFI 183 = 1

Example: Call Pickup Expand Group

- An incoming call to Station No.1 can be picked up by Station No.2-No.8 using Selectable Station Call Pickup Group Access Code.
- Incoming calls to Station No.2-No.6 cannot be picked up by all stations using Selectable Station Call Pickup Group Access Code.

SFC
SFC 1: SFI 183 = 0
SFC 2: SFI 183 = 1

Operating Procedure

To pick up an Incoming Call by Dialing Access Code

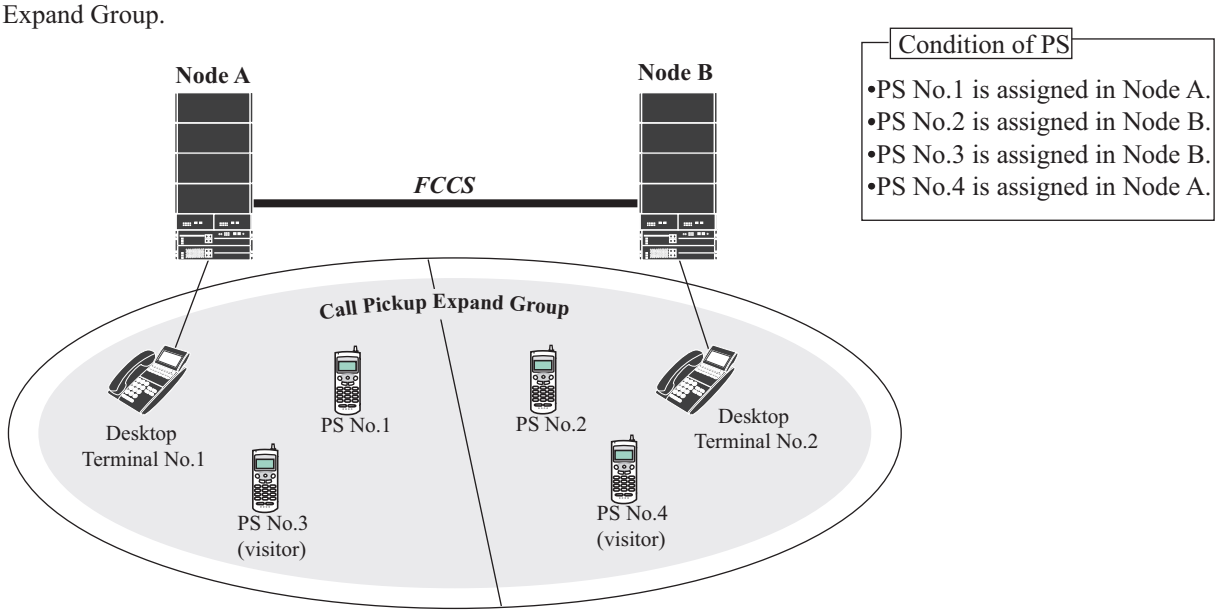
1. A Station within the Call Pickup Group/Call Pickup Expand Group rings.
2. Lift the handset (receive Dial Tone).
3. Dial the Access Code for Selectable Station Call Pickup/Selectable Station Call Pickup Group.
4. The call is connected to the Station.

To pick up an Incoming Call by Pressing Function Key

1. A Station within the Call Pickup Group/Call Pickup Expand Group rings.
2. Press speaker/monitor button (receive Dial Tone).
3. Press Function Key that Access Code for Selectable Station Call Pickup/Selectable Station Call Pickup Group is programmed.
4. The call is connected to the Station.

To pickup an Incoming Call by preset dialing (Only PS)

1. A Station within the Call Pickup Group rings.
2. Dial Access Code for Selectable Station Call Pickup/Selectable Station Call Pickup Group.
3. The call is connected to the Station.



Service Conditions

1. For Service Conditions of Call Pickup Group and Call Pickup Expand Group, refer to Call Pickup Group [C-7].
2. Access Code for Selectable Call Pickup [S-137] and Access Code for Call Pickup Group [C-7] are not identical.
3. When dialing the Access Code for the feature while an Incoming Call is terminating to a Station that "SFI183 = 1" is assigned, Reorder Tone is send. If Access Code for Call Pickup Group [C-7] is dialed, the Incoming Call can be picked up.
4. Call Pickup Group [C-7] and Selectable Station Call Pickup [S-137] can be set to a single Call Pickup Group assigned by ACPG/ACPGL/ACPGN command.

FCCS Conditions

In FCCS Network, the Station/PS cannot pick up a call to PS in visitor Node by this feature. For more details, refer to figure below.

Example:
When Desktop Terminal No.1, Desktop Terminal No.2, and PS No.1 through No.4 are registered in Call Pickup Expand Group.

A Call to PS No.3 and PS No.4 are not picked up by terminal in Call Pickup Expand Group using Selectable Station Call Pickup Group Access Code. Details about other terminals are shown in table below:

Terminating Station	Operating Station					
	Desktop Terminal No.1	Desktop Terminal No.2	PS No.1	PS No.2	PS No.3 (visitor)	PS No.4 (visitor)
Desktop Terminal No.1		×	×	×	×	×
Desktop Terminal No.2	×		×	×	×	×
PS No.1	×	×		×	×	×
PS No.2	×	×	×		×	×
PS No.3 (visitor)	–	–	–	–		–
PS No.4 (visitor)	–	–	–	–	–	

× : Picked up – : Not Picked up

Interactions

1. When this feature is used for Call Pickup Expand Group, dial Access Code for Selectable Station Call Pickup Group.
2. Service Feature Index (SFI) is shared between Call Pickup Group and Call Pickup Expanded Group.
3. Peg count for the feature is counted as Call Pickup Group [C-7].

Programming

- Assignment for Selectable Station Call Pickup

STEP 1: **ANPD/ANPDL** - Reserve a Number Level for Feature Access and cancel.

TN: Tenant Number

1stDC: The first digit of service Access Code. (0-9, *, #)

CI: Select Normal Service (N), Hooking Service (H) or Busy Service (B) from the combo box for Connection Indexes.

NND: Number of Necessary Digits for service Access Code (max. 6-digit)

BLF: Busy Lamp Field Display Activated on ATT (0/1 = Out of Service/In Service)

STEP 2: **ASPA/ASPAL** - Assign an Access Code for this feature.

TN: Tenant Number

ACC: Access Code for this feature (max. 6-digit)

CI: Connection status Index =”N: Normal”

SRV: Kind of Service = “SSCA: Service Code Appendix”

SIDA: Service Index A = 120 (Selectable Station Call Pickup)

STEP 3: **ASFC** - Assign the service feature restriction class of this feature. Stations, assigned the data, cannot be picked up by Access Code for this feature.

D/N: Day/Night Mode

TN: Tenant Number

SFI: Service Feature Index = 183 (Selectable Station Call Pickup)

Res: Restriction Data = 1 (Allowed)

STEP 4: **ACPG/ACPGL** - Register Station Number to make a Call Pickup Group.

TN/UGN: Tenant Number/User Group Number (1-255)

STN/TELN: Station Number/Telephone Number

CNT: Number of Stations to be registered to the Call Pickup Group. (max. 100 Stations)

STEP 5: **AKYD** - Optional. Assign a programmable Line/Feature Key as a Selectable Station Call Pickup Group.

STN: Station Number

KYN: Key Number

KYI: Service Condition = 1 (Function Key)

FKY: Feature Key Code = 136 (Selectable Station Call Pickup)

STEP 6: **ADSL** -Optional (only Desktop terminal). Assign a programmable Soft Key as a Selectable Station Call Pickup.

SN: Status Number = 1 (Originating (DT Connection))

FKY: Function Key Data = 136 (Selectable Station Call Pickup)

- Assignment for Selectable Station Call Pickup Group

STEP 1: **ANPD/ANPDL** - Reserve a Number Level for Feature Access and cancel.

TN: Tenant Number

1stDC: The first digit of service Access Code. (0-9, *, #)

CI: Select Normal Service (N), Hooking Service (H) or Busy Service (B) from the combo box for Connection Indexes.

NND: Number of Necessary Digits for service Access Code (max. 6-digit)

BLF: Busy Lamp Field Display Activated on ATT (0/1 = Out of Service/In Service)

STEP 2: **ASPA/ASPAL** - Assign an Access Code for this feature.
TN: Tenant Number
ACC: Access Code for this feature (max. 6-digit)
CI: Connection status Index = "N: Normal"
SRV: Kind of Service = "SSCA: Service Code Appendix"
SIDA: Service Index A = 121 (Selectable Station Call Pickup Group)

STEP 3: **ASFC** -Assign the service feature restriction class of this feature. Stations, assigned the data, cannot be picked up by Access Code for this feature.
D/N: Day/Night Mode
TN: Tenant Number
SFI: Service Feature Index = 183 (Selectable Station Call Pickup Group)
Res: Restriction Data = 1 (Allowed)

STEP 4: **ACPE/ACPEL** - Register Station/Telephone Number to make a Call Pickup Expand Group.
TN/UGN: Tenant Number/User Group Number (1-255)
STN/TELN: Station Number/Telephone Number
CNT: Number of Stations to be registered to the Call Pickup Expand Group. (max. 100 Stations)

STEP 5: **AKYD** -Optional. Assign a programmable Line/Feature Key as a Selectable Station Call Pickup Group.
STN: Station Number
KYN: Key Number
KYI: Service Condition = 1 (Function Key)
FKY: Feature Key Code = 137 (Selectable Station Call Pickup Group)

STEP 6: **ADSL** -Optional (only Desktop terminal). Assign a programmable Soft Key as a Selectable Station Call Pickup Group.
SN: Status Number = 1 (Originating (DT Connection))
FKY: Function Key Data = 137 (Selectable Station Call Pickup Group)

FCCS Programming

- Assignment for Selectable Station Call Pickup

STEP 1: **ANPDN** - Reserve a Number Level for Feature Access and cancel.
TN: Tenant Number
1stDC: The first digit of service Access Code. (0-9, *, #)
CI: Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes.
NND: Number of Necessary Digits for service Access Code (max. 6-digit)
BLF: Busy Lamp Field Display Activated on ATT (0/1 = Out of Service/In Service)

STEP 2: **ASPAN** - Assign an Access Code for this feature.
TN: Tenant Number
ACC: Access Code for this feature (max. 6-digit)
CI: Connection status Index = "N: Normal"
SRV: Kind of Service = "SSCA: Service Code Appendix"
SIDA: Service Index A = 120 (Selectable Station Call Pickup)

STEP 3: **ASFC** - Assign the service feature restriction class of this feature. Stations, assigned the data, cannot be picked up by Access Code for this feature.
D/N: Day/Night Mode
TN: Tenant Number
SFI: Service Feature Index = 183 (Selectable Station Call Pickup)
Res: Restriction Data = 1 (Allowed)

STEP 4: **ACPGN** - Register Station Number to make a Call Pickup Group.
UGN: User Group Number (1-255)
TELN: Telephone Number
CNT: Number of Stations to be registered to the Call Pickup Group. (max. 100 Stations)

STEP 5: **AKYD** - Optional. Assign a programmable Line/Feature Key as a Selectable Station Call Pickup.
STN: Station Number
KYN: Key Number
KYI: Service Condition = 1 (Function Key)
FKY: Feature Key Code = 136 (Selectable Station Call Pickup)

STEP 6: **ADSL** - Optional (only Desktop terminal). Assign a programmable Soft Key as a Selectable Station Call Pickup.
SN: Status Number = 1 (Originating (DT Connection))
FKY: Function Key Data = 136 (Selectable Station Call Pickup)

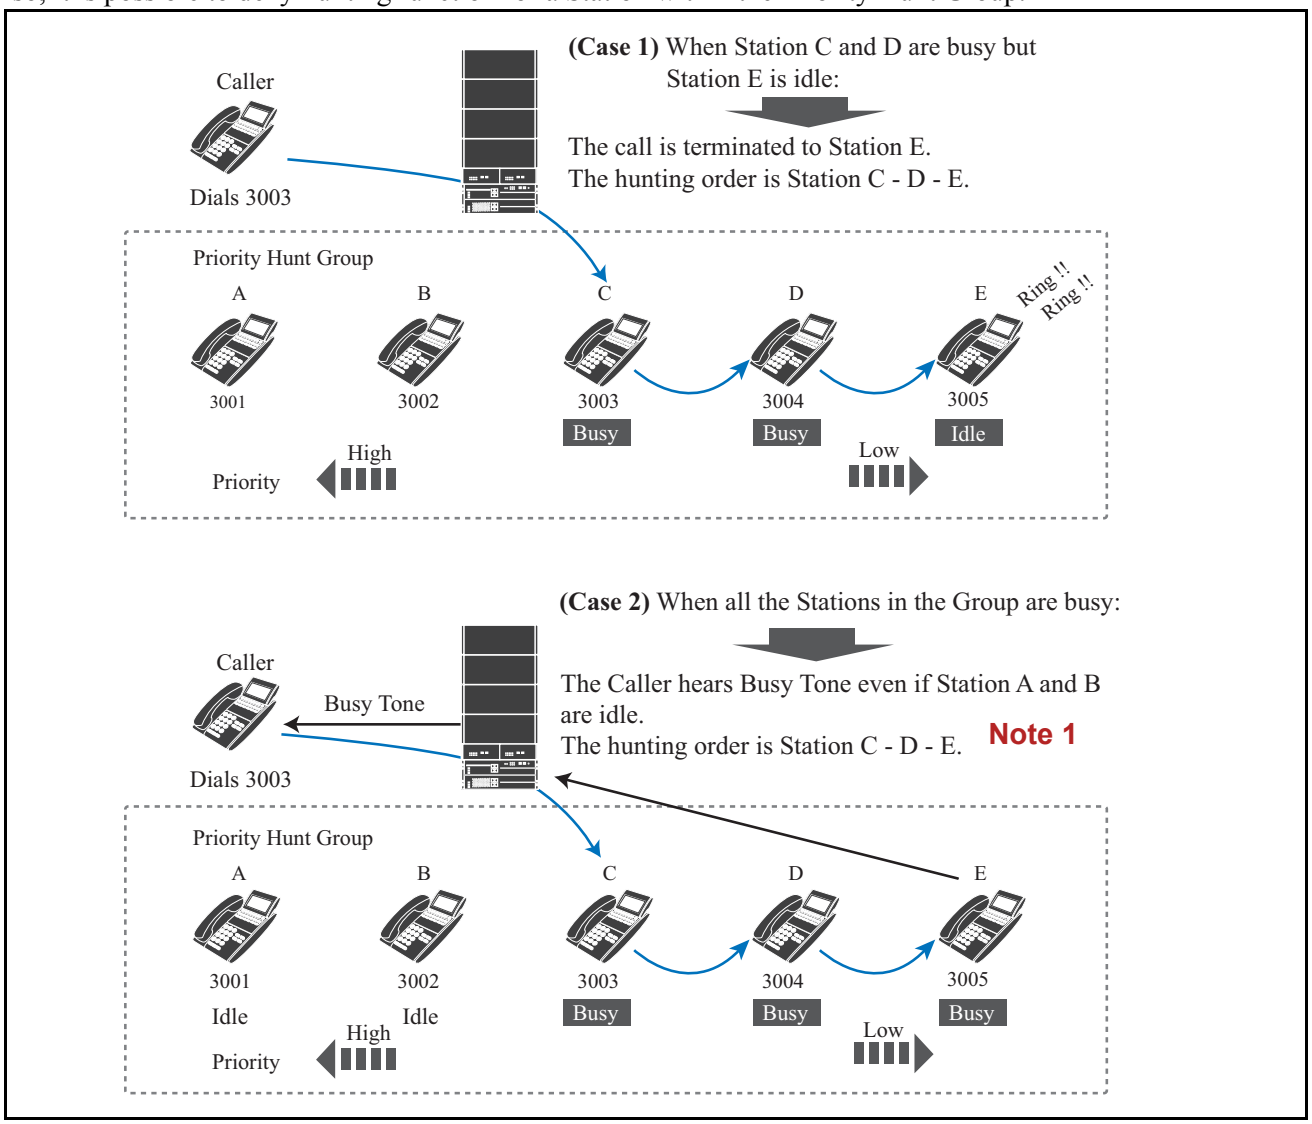
- Assignment for Selectable Station Call Pickup Group

STEP 1: **ANPDN** - Reserve a Number Level for Feature Access and cancel.
TN: Tenant Number
1stDC: The first digit of service Access Code. (0-9, *, #)
CI: Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes.
NND: Number of Necessary Digits for service Access Code (max. 6-digit)
BLF: Busy Lamp Field Display Activated on ATT (0/1 = Out of Service/In Service)

STEP 2: **ASPAN** - Assign an Access Code for this feature.
TN: Tenant Number
ACC: Access Code for this feature (max. 6-digit)
CI: Connection status Index = "N: Normal"
SRV: Kind of Service = "SSCA: Service Code Appendix"
SIDA: Service Index A = 121 (Selectable Station Call Pickup Group)

STEP 3: **ASFC** - Assign the service feature restriction class of this feature. Stations, assigned the data, cannot be picked up by Access Code for this feature.
D/N: Day/Night Mode
TN: Tenant Number
SFI: Service Feature Index = 183 (Selectable Station Call Pickup)
Res: Restriction Data = 1 (Allowed)

STEP 4: **ACPEN** - Register Telephone Number to make a Call Pickup Expand Group.
UGN: User Group Number (1-255)
TELN: Telephone Number
CNT: Number of Stations to be registered to the Call Pickup Expand Group. (max. 100 Stations)



STEP 5: **AKYD** - Optional. Assign a programmable Line/Feature Key as a Selectable Station Call Pickup Group.
STN: Station Number
KYN: Key Number
KYI: Service Condition = 1 (Function Key)
FKY: Feature Key Code = 137 (Selectable Station Call Pickup Group)

STEP 6: **ADSL** - Optional (only Desktop terminal). Assign a programmable Soft Key as a Selectable Station Call Pickup Group.
SN: Status Number = 1 (Originating (DT Connection))
FKY: Function Key Data = 137 (Selectable Station Call Pickup Group)

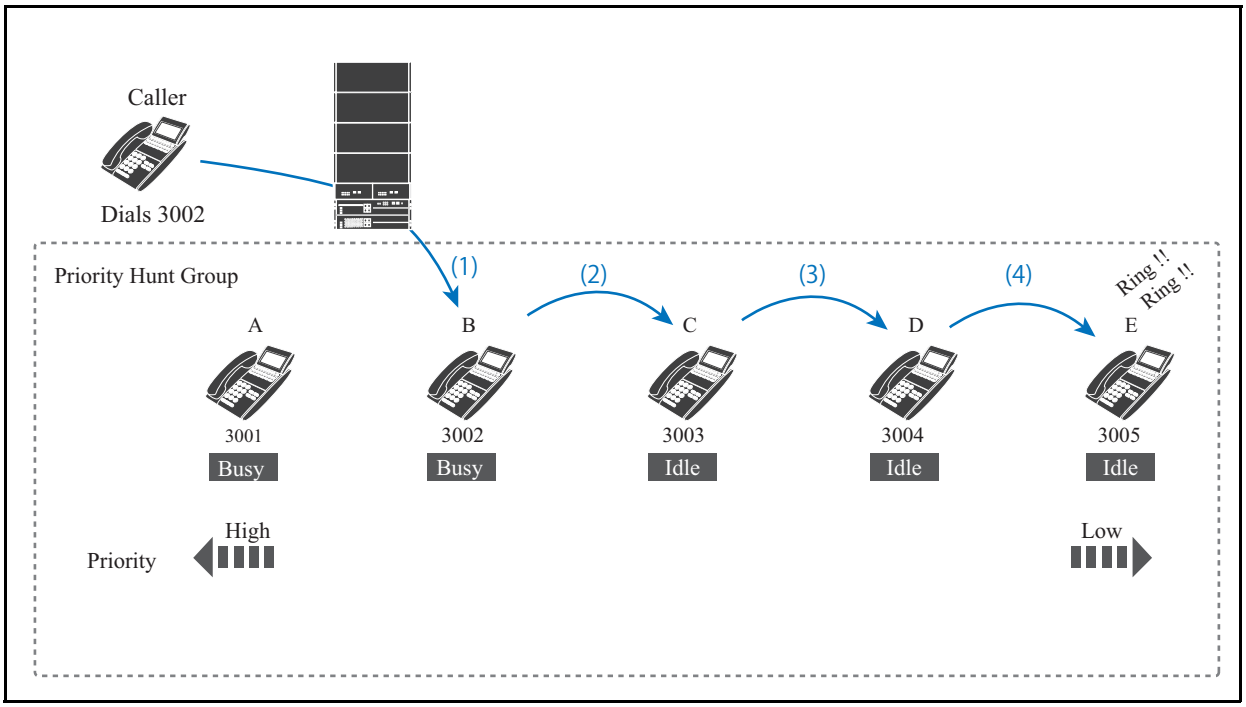
S-138 Station Hunting - Priority

General Description

This feature permits a call directed to a Busy Station of a Priority Hunt Group to be automatically forwarded to other Stations within the Hunt Group, in a programmed order. The call arrives to the busy Station of the group and is forwarded from Higher Priority Stations to Lower Priority Stations until it finds an idle Station that rings. When the Lowest Priority station is also busy, the caller receives Busy Tone. For example, as illustrated in the following figure, if a call is placed to Station C and Station C is busy, the call is forwarded to Station D and so on, in sequence. If Station E (Lowest Priority Station) is busy, the call receives Busy Tone.
Also, it is possible to deny hunting function for a Station within the Priority Hunt Group.

Note 1: If a secretarial Station is assigned for the Hunt Group, the call is forwarded to the secretarial Station. For the secretarial Station, see STATION HUNTING - SECRETARIAL [S-8].

Note: In this feature, Busy means the Station cannot receive a call (because of reasons such as talking, receiving other call, do not disturb being set).



- TRANSFER OF UNANSWERED CALLS IN A HUNT GROUP

When the caller dials a Station in the Priority Hunt Group, the call arrives to a Station within the Priority Hunt Group, and the Station does not reply within a programmed period of time, the call can be transferred again to another idle Station.

Note: Transfer of unanswered calls is available from FP95-114 V4 Issue 4.0.

As for the transfer of an unanswered call in a Priority Hunt Group, the figure below gives an example for the transfer pattern with the following steps.

1. A call is made to Station B.
2. Station B is busy, the call is transferred to the first idle station in the hunting order (Station C).
3. The call remains unanswered within a programmed period of time and is transferred to the next idle Station in the hunting order (Station D).
4. The call remains unanswered within a programmed period of time and is transferred to the next idle Station in the hunting order (Station E).

Note: In the example above, the call may be transferred to a secretarial Station if it has been set. For the secretarial Station, see STATION HUNTING - SECRETARIAL [S-8].

Operating Procedure

No manual operation is required.

Service Conditions

<Important Notices>

1. Station Number can belong to one Hunt Group only, it cannot belong to another Hunt Group including that for STATION HUNTING - CIRCULAR [S-7], STATION HUNTING - TERMINAL [S-9], STATION HUNTING - PRIORITY [S-138], STATION HUNTING - PRIORITY WITH SWITCHBACK [S-139] or UNIFORM CALL DISTRIBUTION (UCD) [U-1].
2. A station can be assigned by the Telephone Number (LDM or NDM). However, it is not possible to assign the same Telephone Number to more than one Hunt Group.

<Interactions with Other Services>

1. If the Station of a Hunt Group is in the following states or the following features are set in the Station of a Hunt Group, the following occurs.

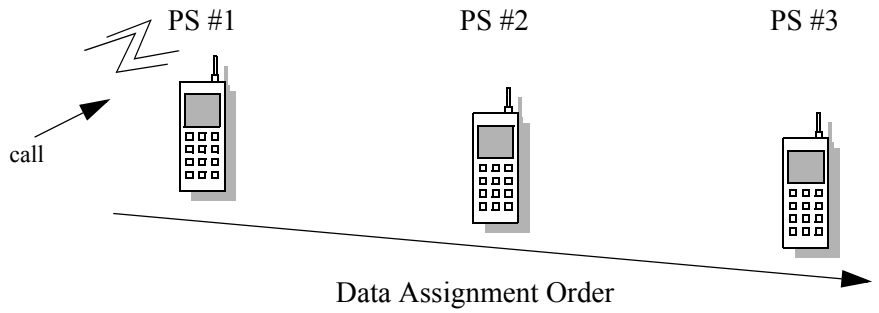
   - **A**: The feature is activated and the call is forwarded.
   - **S**: The Station is skipped.

Feature/State	Direct Call to the Station	Call Transfered to the Station in the Hunting
CALL FORWARDING - ALL CALLS [C-5]	**A** Note 2	**S**
DO NOT DISTURB [D-11]	**S**	**S**
BUSY STATION	**S**	**S**
BUSY STATION + CALL FORWARDING - BUSY LINE [C-2]	**A** Note 2, Note 3	**S**
BUSY STATION + CALL FORWARDING - BUSY LINE [C-2] set with the ACFO/ACFOL/ACFON command (on a tenant/route basis)	**S**	**S**
LOGGED OUT STATION	**S**	**S**
LOGGED OUT STATION + LOGGED OUT IP STATION - CALL DESTINATION [L-53]	**A**	**S**
LOGGED OUT STATION + LOGGED OUT IP STATION - CALL DESTINATION [L-53] set with the ACFO/ACFOL/ACFON command (on a tenant/route basis)	**S**	**S**

Note 2: If CALL FORWARDING - OVERRIDE [C-26] is set to the forwarding destination, the call forwarding overriding from the forwarding destination to the Station of the Hunt Group will hunt if the Station of the Hunt Group is busy.

Note 3: When a call to a station in a Hunt Group is forwarded by CALL FORWARDING - BUSY LINE [C-2] and the forwarded party (also a member of another Hunt Group) is also busy, the resultant hunt target can be designated from the forwarding side Hunt Group or the forwarded side Hunt Group. This can be specified with ASYD/ASYDN SYS1 Index 69 Bit 5.

2. A Phantom Number can be assigned to the Station of a Hunt Group. However, when a caller dials the Phantom Number, hunting does not occur for the Station that receives the call.
3. Recall to a Station in the Hunt Group from the following features will not hunt:
   - CALL BACK [C-1]
   - CALL HOLD [C-6]



- OUTGOING TRUNK QUEUING [O-2]
- PAGING TRANSFER [P-10]

4. For STATION MESSAGE DETAIL RECORDING [S-10] the number recorded is the Station Number where the call actually terminates.
5. HOTLINE [H-1] cannot be assigned to the Station of a Hunt Group.

<Hardware/Software>

1. A call from ATTENDANT CONSOLE [A-3] will not hunt.
2. The conditions when using PS are as follows:
   a.) If a call terminates to a PS in the Hunt Group while the PS is Out of Zone or its power is OFF, whether the call is processed as PS Out of Zone or hunting is executed is determined by System Data (ASYDL, SYS 1, Index 688, b0). When using this feature in an FCCS environment, assign the same data value to the system data in each node.
   b.) When hunting is selected in the system data, the caller hears no tone until the hunted PS answers. Total length of no tone is obtained by the following.
      - Time for Detecting Out of Zone (Maximum eight seconds) × Number of Hunting
   c.) When a Desk Console operator dials the number of PS that belongs a Hunt Group, the hunting is not available if the PS is Out of Zone.
   d.) When receiving an analog PSTN incoming call while all PSs in the Hunt Group are Out of Zone, the call processing will be stopped after detecting Out of Zone of the last PS in the Hunt Group. At this time, the calling party will receive RBT when the call is a Direct In Termination call. If Automated Attendant is used, the calling party will receive ROT after No Tone. Note that the call cannot be terminated to the destination even if the PS returns to the zone during RBT.
   e.) When receiving an ISDN incoming call while all PSs in the Hunt Group are Out of Zone, hunting starts after calling up the destination. However, timeout will occur at Central Office side, resulting in ROT connection (hunting is not available).
   f.) If all Stations in the Hunt Group are busy or PS Out of Zone, the call can be forwarded a Station in the group. The station is called secretarial Station. The caller hears Busy Tone if the secretarial Station is also busy.
   g.) A PS can be assigned as a secretarial Station.
   h.) If a PS assigned as a secretarial Station is placed in Out of Zone, the caller hears Busy Tone.
   i.) A PS in the Hunt Group can set PS Out of Zone - Call Forwarding. When the PS has been set as able of hunting, the incoming call will be forwarded only if the call cannot terminate to any stations in the group. When the PS has not been set as able of hunting the call can be forwarded only if the PS is directly called.
   j.) When a PS in the Hunt Group performs roaming, the PS is skipped. However, the PS is a station that receives the call directly, it will be roaming call termination.
   k.) If a PS receiving a call turns to Out of Zone, this may cause a network failure. In this case, the caller hears Busy Tone.
   l.) The following shows call processing when Out of Zone or busy is involved for this feature.

This example assumes: - hunting data has been assigned in the order of PS #1, #2, #3
- PS #1 first received a call.

When Hunting is selected (ASYDL, SYS1, INDEX 688, Bit 0 = 0)

PS #1	PS #2	PS #3	Processing
Out of Zone (Forwarding has been set)	Out of Zone	Out of Zone	After calling up PS #1, PS #2, PS #3, the forwarding destination is called.
Out of Zone (Forwarding has not been set)			After calling up PS #1, PS #2, PS #3, the caller receives ROT or Automatic Announcement Called PS Out of Zone.
Busy	Out of Zone	Out of Zone	After calling up PS #2 and PS #3, the caller receives Busy Tone.
Busy	Busy	Out of Zone	After calling up PS #3, the caller receives Busy Tone.

When Out of Zone Processing is selected (ASYDL, SYS 1, INDEX 688, Bit 0 = 1)

PS #1	PS #2	PS #3	Processing
Out of Zone (Forwarding has been set)	Out of Zone	Out of Zone	After calling up PS #1, the forwarding destination is called.
Out of Zone (Forwarding has not been set)			After calling up PS #1, the caller receives ROT or Automatic Announcement Called PS Out of Zone.
Busy	Out of Zone	Out of Zone	After calling up PS #2, the caller receives Busy Tone.
Busy	Busy	Out of Zone	After calling up PS #3, the caller receives Busy Tone.

<Conditions Specific to This Feature>

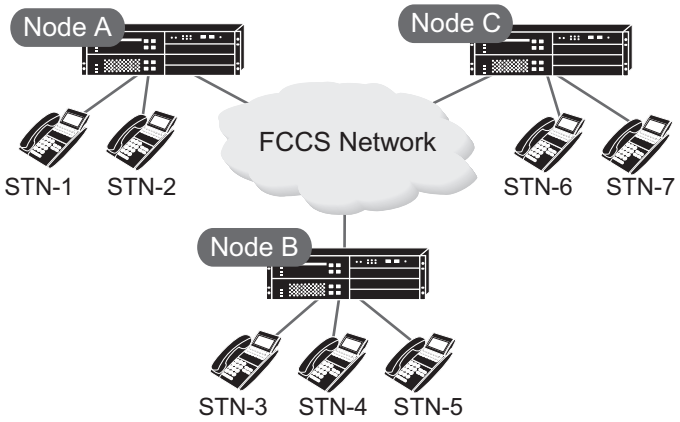
1. The maximum number of Stations per group is 100. The feature is usable with all Stations and there is no limit on the allowable number of Hunt Groups within a system.

2. This feature enables a Station within Hunt Group to deny hunting function for an Incoming Call originated from Station (including PS) (ASFC/ASFCN SFI 181 =1). The service conditions are as follows:
   a.) When CALL FORWARDING-DON'T ANSWER [C-5] is set, a call to the Station is forwarded according to their service condition.
   b.) When CALL FORWARDING-BUSY LINE [C-2] is set, a call to the Station is forwarded according to their service condition.
   c.) A call to the Phantom Number assigned to the Station will not hunt.
   d.) External Trunk (such as DDD (TCL = 1)/FX (TCL = 2)/WATS (TCL = 3), etc) is not available.

3. The conditions for the transfer of unanswered calls in a Hunt Group feature are as follows: **Note 4**

Note 4: Available from FP95-114 V4 Issue 4.0.

   a.) The feature is only possible for Hunt Groups with data assigned via Telephone Numbers (LDM or NDM).
   b.) Be aware that if there is a value set in Timer Value of No Answer Timer set in the ADAI command for a Station in the group it will have priority over the value set with ASYDL/ASYDN, SYS1 Index 1396. If no value is set for ADAI command or ASYDL/ASYDN, SYS1 Index 1396, other Timer Value of No Answer Timer (ASYD SYS1, Indexes 139, 140, 141, 247) will be used.
   c.) The display of a Station receiving an incoming call transfer based on this feature will be the same as in the case of CALL FORWARDING - DON'T ANSWER [C-3]. Also, in the case of other external devices, it will be treated in the same way.

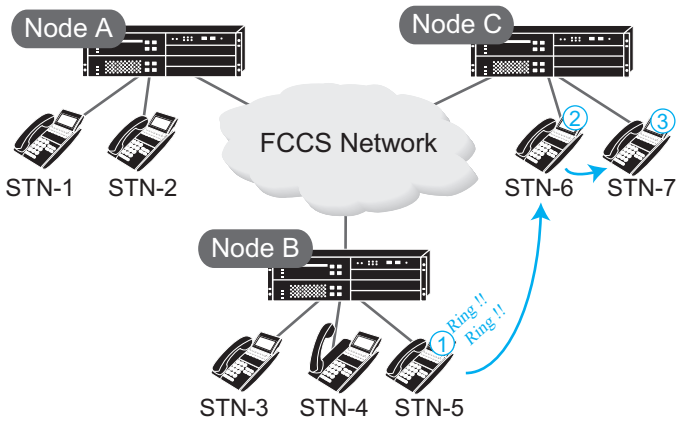


d.) If other unanswered calls transfer features are set in a Station of this feature group, those other unanswered calls transfer features have priority over the transfer of unanswered calls in a Hunt Group feature.

Priority Order	Transfer of Unanswered Calls in a Hunt Group Feature	
	Out of Service	In Service
1	CALL FORWARDING - DON'T ANSWER [C-3]	CALL FORWARDING - DON'T ANSWER [C-3]
2	-	CALL FORWARDING - BUSY LINE [C-2] **Note 5**
3	-	TRANSFER OF UNANSWERED CALLS IN A HUNT GROUP
4	CALL FORWARD BY SERVICE FEATURE CLASS [C-172]	CALL FORWARD BY SERVICE FEATURE CLASS [C-172]
5	CALL FORWARDING - DON'T ANSWER [C-3] set with the ACFO/ACFOL/ACFON command (on a tenant/route basis)	CALL FORWARDING - DON'T ANSWER [C-3] set with the ACFO/ACFOL/ACFON command (on a tenant/route basis)

Note 5: The Station with the incoming call is treated as Busy Station and the call is transfered.

FCCS Conditions



1. When activating this feature between nodes via FCCS, use only Hunt Groups assigned with Telephone Number (NDM).
2. Stations in up to four different nodes can be assigned to a Hunt Group.
   When the Hunt Group includes more than one node, the [Group by FPC] button of ASHTN must be used to set the order of the nodes in the Hunt Group. Without this node order grouping assignment, data cannot be assigned.
3. The Hunting order when the Hunt Group is created across more than one Node is as follows.

	Node A		Node B			Node C	
	STN-1	STN-2	STN-3	STN-4 Note 6	STN-5	STN-6	STN-7
Assigned Hunting order by the office data	1	2	3	4	5	6	7
Actual Hunting order	-	-	-	(Busy)	1	2	3

Note 6: This is the Station that first receives the call.

Note: The following is the hunting order in the case of the transfer of unanswered calls in a Hunt Group.

	Node A		Node B			Node C	
	STN-1	STN-2	STN-3	STN-4 Note 7	STN-5	STN-6	STN-7
Assigned Hunting order by the office data	1	2	3	4	5	6	7
Actual Hunting order	-	-	-	(Busy)	1 (Ringing)	2	3

Note 7: This is the Station that first receives the call.

4. The Incoming Call terminated between nodes via FCCS to a Station in the Hunt Group programmed by the Physical Station Number, is not hunted.

Programming

Note: The following programming supposes that Telephone Numbers have been already assigned and does not include such data settings.

STEP 1: **ASYD/ASYDN** - Assign the following System Data.
System Data 1, Index 69, Bit 5. Resultant Hunt when the Target Party is also busy after CALL FORWARDING - Busy Line [C-2].
0 = Hunt in Called Party's Hunt Group
1 = Hunt in Target Party's Hunt Group

STEP 2: **ASYDL** - (Optional) Assign the following System Data.
System Data 1, Index 688, Bit 0. Specify whether hunting is activated or not if the called PS is Out of Zone.
0 = Hunting
1 = PS Out of Zone processing

Note: Assign this data if PS is used in the Hunt Group.

STEP 3: **ASHTL/ASHTN** - Assign Hunt Group data.
UGN: User Group Number
TELN: Telephone Number in the Hunt Group. **Note 9**
SECRETARY TELN: Telephone Number of a secretarial Station **Note 8**
[Station List in Group]
TELN: Enter the Telephone Number of Stations in the Hunt Group. **Note 9**

Note: Assignment of Numbers to a Priority Hunt Group may be in any order.

Note 8: If secretarial Station is used, assign the Telephone Number of the Station used as such secretarial Station.

Note 9: Do not enter Phantom Number.

STEP 4: **ASFCN** - (Optional) Assign the following Service Feature Restriction when hunting must be denied.
SFI 181 =1 (No Hunting to next station in group)

<When activating the transfer of unanswered calls in a Priority Hunt Group> Note 10

STEP 5: **ASYD** - Assign the following System Data.
System Data 1, Index 69, Bit 0= 1 (No Recall, or execution of Call Forwarding –Don't Answer (when CF – Don't Answer is set at the transfer destination station)).
System Data 1, Index 69, Bit 1 (Send short tone when a call forwarded via CF – All Calls/Logout service is answered.)
0 = Not Required
1 = Required
System Data 2, Index 6, Bit 7 (CF-Don't Answer service when Attendant Console transfers call before called station answers)

0 = Out of service (Recall to Attendant Console)
1 = In service

STEP 6: **ASYDL/ASYDN** - Assign the following System Data.
System Data 1, Index 1395, Bit 2=1 (transfer of unanswered calls in a Priority Hunt Group in service). **Note 10**
System Data 1, Index 1396= set the no answer timer for the transfer of unanswered calls in a Hunt Group. **Note 10**
Bit 0 - 3: 1 - F= MTC
Bit 4 - 6: 0 - 7= TC
TC: Timer Class, MTC: Miscellaneous Timer Counter
TC = 0: -
1: -
2: -
3: 2 seconds
4: 30 seconds
5: -
6: -
7: -

Note: Default value for this data is HEX 00 (data is not set). If data is not set, other Timer Value of No Answer Timer (ASYD SYS1, Indexes 139, 140, 141, 247) will be used.

Note: Do not assign "0" for MTC value when TC = 3 or 4.

Note: Assigned time will be used for all the Hunt Groups to which is available (Circular, Terminal, Priority), it cannot be set separately according to the type of Hunt Group.

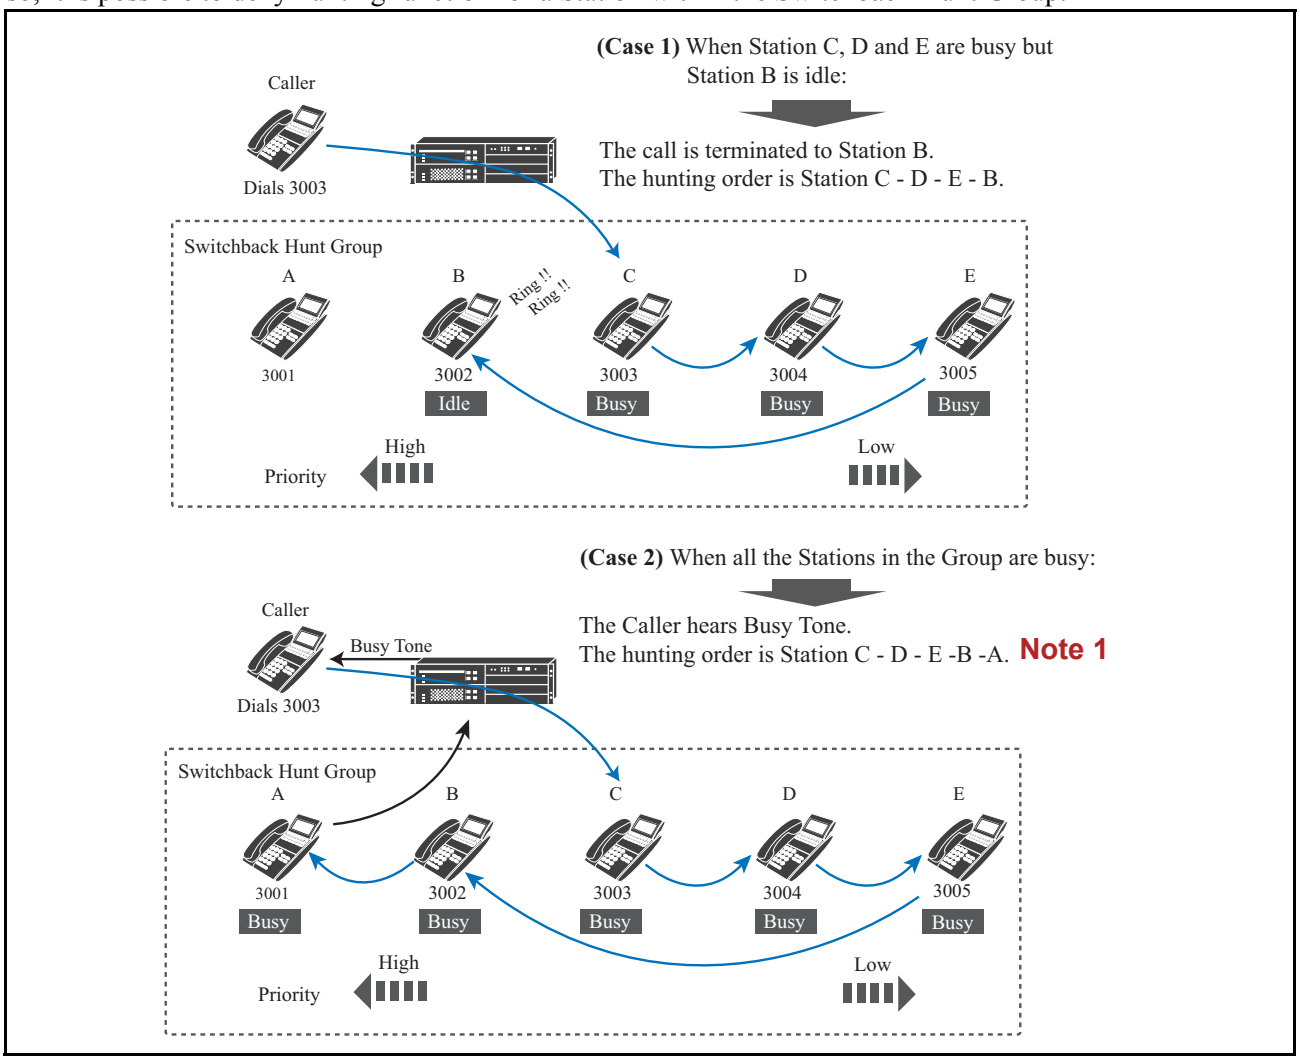
Note: The time will be used for the transfer of unanswered calls regardless of whether transfer of unanswered calls in a Priority Hunt Group is in service or not.

Note 10: Available from FP95-114 V4 Issue 4.0.

STEP 7: **ASFC/ASFCN** - Assign the following Service Feature Restrictions.
SFI 8=1 (Call Forwarding-Don't Answer allowed).
SFI 103 (Assignment of No Answer Timer for Blind Transfer to Station/Blind Transfer to Attendant) **Note 11**
0 = Restricted (settings in ASYD, System Data 1, Index 140)
1 = Allowed (settings in ASYD, System Data 1, Index 247)
SFI 104 (Processing when the transferred station does not answer for a predetermined period of time in Blind Transfer) **Note 12**
0 = Transferred station continuously rings
1 = The transferred call is forwarded when Call Forwarding-Don't Answer is assigned at the transferred station and no-answer timer expires

Note 11: The time set for a Station with ASYDL/ASYDN System Data 1, Index 1396 (no answer timer for the transfer of unanswered calls in a Hunt Group) will be given priority.

Note 12: Set to 1 if the terminal in the Hunt Group is the destination of BLIND TRANSFER TO STATION [B-18].



STEP 8: **ATNR** - Assign the following Tenant Restriction Class.
TRI 0=1 (Station within OGTN calls to a station within TMTN allowed).
TRI 1=1 (Station within OGTN sets Call Forwarding-All Calls / Busy Line / Don't Answer/Logout to a station within TMTN allowed).

STEP 9: **ACFR/ACFRN** - Assign the following Call Forwarding Restriction:
CCI 8=1 (Call Forwarding-Don't Answer allowed).

S-139 Station Hunting - Priority with Switchback

General Description

This feature permits a call directed to a Busy Station of a Switchback Hunt Group to be automatically forwarded to other Stations within the Hunt Group, in a programmed order. The call arrives to the busy Station of the group and is forwarded from Higher Priority Stations to Lower Priority Stations until it finds an idle Station that rings. For example, as illustrated in the following figure, if a call is placed to Station C and Station C is busy, the call is forwarded to Station D and so on, in sequence. If Station E (the Lowest Priority Station) is busy, the call is forwarded to Station B and then the call is processed from Lower Priority Station to High Priority Station. If Station A (the Highest Priority Station) is busy, the caller receives Busy Tone. However, if a secretarial Station is assigned for the group, the call is forwarded to the secretarial Station.
Also, it is possible to deny hunting function for a Station within the Switchback Hunt Group.

Note 1: If a secretarial Station is assigned for the Hunt Group, the call is forwarded to the secretarial Station. For the Secretarial Station, see STATION HUNTING - SECRETARIAL [S-8].

Note: In this feature, Busy means the Station cannot receive a call (because of reasons such as talking, receiving other call, do not disturb being set).

Operating Procedure

No manual operation is required.

Service Conditions

<Important Notices>

1. Station Number can belong to one Hunt Group only, it cannot belong to another Hunt Group including that for STATION HUNTING - CIRCULAR [S-7], STATION HUNTING - TERMINAL [S-9], STATION HUNTING - PRIORITY [S-138], STATION HUNTING - PRIORITY WITH SWITCHBACK [S-139] or UNIFORM CALL DISTRIBUTION (UCD) [U-1].
2. A station can be assigned by the Telephone Number (LDM or NDM). However, it is not possible to assign the same Telephone Number to more than one Hunt Group.

<Interactions with Other Services>

1. If the Station of a Hunt Group is in the following states or the following features are set in the Station of a Hunt Group, the following occurs.

   - **A**: The feature is activated and the call is forwarded.
   - **S**: The Station is skipped.

Feature/State	Direct Call to the Station	Call Transfered to the Station in the Hunting
CALL FORWARDING - ALL CALLS [C-5]	**A** Note 2	**S**
DO NOT DISTURB [D-11]	**S**	**S**
BUSY STATION	**S**	**S**
BUSY STATION + CALL FORWARDING - BUSY LINE [C-2]	**A** Note 2, Note 3	**S**
BUSY STATION + CALL FORWARDING - BUSY LINE [C-2] set with the ACFO/ACFOL/ACFON command (on a tenant/route basis)	**S**	**S**
LOGGED OUT STATION	**S**	**S**
LOGGED OUT STATION + LOGGED OUT IP STATION - CALL DESTINATION [L-53]	**A**	**S**
LOGGED OUT STATION + LOGGED OUT IP STATION - CALL DESTINATION [L-53] set with the ACFO/ACFOL/ACFON command (on a tenant/route basis)	**S**	**S**

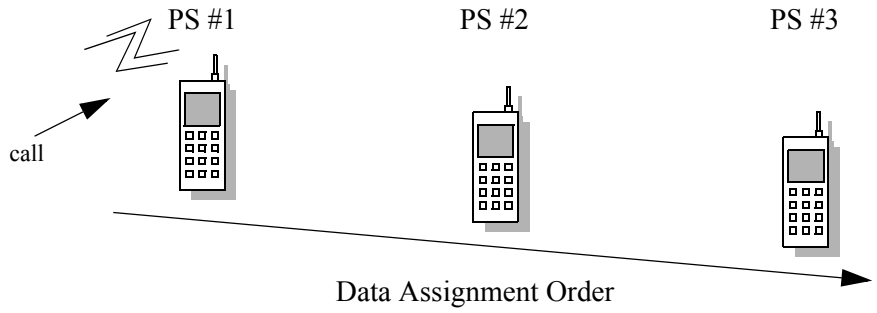
Note 2: If CALL FORWARDING - OVERRIDE [C-26] is set to the forwarding destination, the call forwarding overriding from the forwarding destination to the Station of the Hunt Group will hunt if the Station of the Hunt Group is busy.

Note 3: When a call to a station in a Hunt Group is forwarded by CALL FORWARDING - BUSY LINE [C-2] and the forwarded party (also a member of another Hunt Group) is also busy, the resultant hunt target can be designated from the forwarding side Hunt Group or the forwarded side Hunt Group. This can be specified with ASYD/ASYDN SYS1 Index 69 Bit 5.

2. A Phantom Number can be assigned to the Station of a Hunt Group. However, when a caller dials the Phantom Number, hunting does not occur for the Station that receives the call.
3. Recall to a Station in the Hunt Group from the following features will not hunt:
    - CALL BACK [C-1]
    - CALL HOLD [C-6]
    - OUTGOING TRUNK QUEUING [O-2]
    - PAGING TRANSFER [P-10]
4. For STATION MESSAGE DETAIL RECORDING [S-10] the number recorded is the Station Number where the call actually terminates.
5. HOTLINE [H-1] cannot be assigned to the Station of a Hunt Group.

<Hardware/Software>

1. A call from ATTENDANT CONSOLE [A-3] will not hunt.
2. The conditions when using PS are as follows:
    a.) If a call terminates to a PS in the Hunt Group while the PS is Out of Zone or its power is OFF, whether the call is processed as PS Out of Zone or hunting is executed is determined by System Data (ASYDL, SYS 1, Index 688, b0). When using this feature in an FCCS environment, assign the same data value to the system data in each node.
    b.) When hunting is selected in the system data, the caller hears no tone until the hunted PS answers. Total length of no tone is obtained by the following.
        - Time for Detecting Out of Zone (Maximum eight seconds) × Number of Hunting
    c.) When a Desk Console operator dials the number of PS that belongs a Hunt Group, the hunting is not available if the PS is Out of Zone.
    d.) When receiving an analog PSTN incoming call while all PSs in the Hunt Group are Out of Zone, the call processing will be stopped after detecting Out of Zone of the last PS in the Hunt Group. At this time, the calling party will receive RBT when the call is a Direct In Termination call. If Automated Attendant is used, the calling party will receive ROT after No Tone. Note that the call cannot be terminated to the destination even if the PS returns to the zone during RBT.
    e.) When receiving an ISDN incoming call while all PSs in the Hunt Group are Out of Zone, hunting starts after calling up the destination. However, timeout will occur at Central Office side, resulting in ROT connection (hunting is not available).
    f.) If all Stations in the Hunt Group are busy or PS Out of Zone, the call can be forwarded a Station in the group. The station is called secretarial Station. The caller hears Busy Tone if the secretarial Station is also busy.
    g.) A PS can be assigned as a secretarial Station.
    h.) If a PS assigned as a secretarial Station is placed in Out of Zone, the caller hears Busy Tone.



i.) A PS in the Hunt Group can set PS Out of Zone - Call Forwarding. When the PS has been set as able of hunting, the incoming call will be forwarded only if the call cannot terminate to any stations in the group. When the PS has not been set as able of hunting the call can be forwarded only if the PS is directly called.

j.) When a PS in the Hunt Group performs roaming, the PS is skipped. However, the PS is a station that receives the call directly, it will be roaming call termination.

k.) If a PS receiving a call turns to Out of Zone, this may cause a network failure. In this case, the caller hears Busy Tone.

l.) The following shows call processing when Out of Zone or busy is involved for this feature.

This example assumes: - hunting data has been assigned in the order of PS #1, #2, #3
- PS #1 first received a call.

When Hunting is selected (ASYDL, SYS1, INDEX 688, Bit 0 = 0)

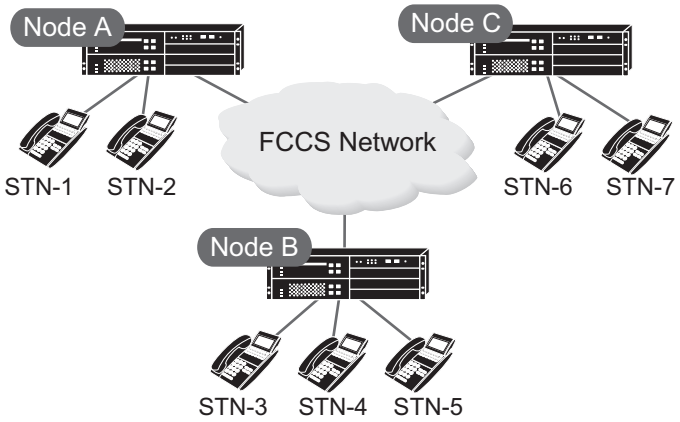
PS #1	PS #2	PS #3	Processing
Out of Zone (Forwarding has been set)	Out of Zone	Out of Zone	After calling up PS #1, PS #2, PS #3, the forwarding destination is called.
Out of Zone (Forwarding has not been set)			After calling up PS #1, PS #2, PS #3, the caller receives ROT or Automatic Announcement Called PS Out of Zone.
Busy	Out of Zone	Out of Zone	After calling up PS #2 and PS #3, the caller receives Busy Tone.
Busy	Busy	Out of Zone	After calling up PS #3, the caller receives Busy Tone.

When Out of Zone Processing is selected (ASYDL, SYS 1, INDEX 688, Bit 0 = 1)

PS #1	PS #2	PS #3	Processing
Out of Zone (Forwarding has been set)	Out of Zone	Out of Zone	After calling up PS #1, the forwarding destination is called.
Out of Zone (Forwarding has not been set)			After calling up PS #1, the caller receives ROT or Automatic Announcement Called PS Out of Zone.
Busy	Out of Zone	Out of Zone	After calling up PS #2, the caller receives Busy Tone.

PS #1	PS #2	PS #3	Processing
Busy	Busy	Out of Zone	After calling up PS #3, the caller receives Busy Tone.

<Conditions Specific to This Feature>



1. Transfer of unanswered calls in a Hunt Group is not available for this feature.

Note: Transfer of unanswered calls in Hunt Group is available for the following features:
- STATION HUNTING - CIRCULAR [S-7]
- STATION HUNTING - TERMINAL [S-9]
- STATION HUNTING - PRIORITY [S-138]

2. The maximum number of Stations per group is 100. The feature is usable with all Stations and there is no limit on the allowable number of Hunt Groups within a system.
3. This feature enables a Station within Hunt Group to deny hunting function for an Incoming Call originated from Station (including PS) (ASFC/ASFCN SFI 181 =1). The service conditions are as follows:
   a.) When CALL FORWARDING-DON'T ANSWER [C-5] is set, a call to the Station is forwarded according to their service condition.
   b.) When CALL FORWARDING-BUSY LINE [C-2] is set, a call to the Station is forwarded according to their service condition.
   c.) A call to the Phantom Number assigned to the Station will not hunt.
   d.) External Trunk (such as DDD (TCL = 1)/FX (TCL = 2)/WATS (TCL = 3), etc) is not available.

FCCS Conditions

1. When activating this feature between nodes via FCCS, use only Hunt Groups assigned with Telephone Number (NDM).
2. Stations in up to four different nodes can be assigned to a Hunt Group.
   When the Hunt Group includes more than one node, the [Group by FPC] button of ASHSN must be used to set the order of the nodes in the Hunt Group. Without this node order grouping assignment, data cannot be assigned.
3. The Hunting order when the Hunt Group is created across more than one Node is as follows.

	Node A		Node B			Node C	
	STN-1	STN-2	STN-3	STN-4 Note 4	STN-5	STN-6	STN-7
Assigned Hunting order by the office data	1	2	3	4	5	6	7
Actual Hunting order	6	5	4	(Busy)	1	2	3

Note 4: This is the Station that first receives the call.

4. The Incoming Call terminated between nodes via FCCS to a Station in the Hunt Group programmed by the Physical Station Number, is not hunted.

Programming

Note: The following programming supposes that Telephone Numbers have been already assigned and does not include such data settings.

STEP 1: **ASYD/ASYDN** - Assign the following System Data.
System Data 1, Index 69, Bit 5. Resultant Hunt when the Target Party is also busy after CALL FORWARDING - Busy Line [C-2].
0 = Hunt in Called Party's Hunt Group
1 = Hunt in Target Party's Hunt Group

STEP 2: **ASYDL** - (Optional) Assign the following System Data.
System Data 1, Index 688, Bit 0. Specify whether hunting is activated or not if the called PS is Out of Zone.
0 = Hunting
1 = PS Out of Zone processing

Note: Assign this data if PS is used in the Hunt Group.

STEP 3: **ASHSL/ASHSN** - Assign Hunt Group data.
UGN: User Group Number
TELN: Telephone Number in the Hunt Group.**Note 6**
SECRETARY TELN: Telephone Number of a secretarial Station **Note 5**
[Station List in Group]
TELN: Enter the Telephone Number of Stations in the Hunt Group **Note 6**

Note: Assignment of Numbers to a Switchback Hunt Group may be in any order.

Note 5: If secretarial Station is used, assign the Telephone Number of the Station used as such secretarial Station.

Note 6: Do not enter Phantom Number.

STEP 4: **ASFCN** - (Optional) Assign the following Service Feature Restriction when hunting must be denied.
SFI 181 =1 (No Hunting to next station in group)

S-140D Side Tone On/Off -D

General Description

This feature allows a Desktop terminal to switch Side Tone ON and OFF (**Note 1**). In addition, Side Tone volume value can be controlled by the system data settings with PCPro.

Note 1: Using PREFERENCE SETTING - MULTI-LINE TELEPHONE WITH PCPRO [P-90] allows PC-Pro to change the Side Tone volume value of each terminal (Available since FP95-114 V4 Issue 2.0).

Operating Procedure

1. Press the Feature key + digit key 0. (Side Tone ON to OFF)
2. Press the Feature key + digit key 0. (Side Tone OFF to ON)

Note: The state of Side Tone (ON/OFF) is displayed on the upper line of the Desktop terminal's LCD by pressing Feature key + digit key 0.

Service Conditions

1. The following table shows the desktop terminals' support status for Side Tone On/Off and volume value change:

X: Available N: Not available C: Conditionally Available

	Side Tone On/Off	Side Tone Volume Value	
		Change with ASYDL Note 2	Change with Terminal Configuration
DT800/DT700	X	X	N Note 3
DT400/DT300	X	X	N
DtermIP (Proprietary Protocol)	C Note 6	N	N
DtermIP (SIP)	N	N	X Note 4
IP terminal and Digital terminal other than above	C Note 7	N Note 5	N Note 5

Note 2: Assignment of Side Tone volume value is possible by using ASYDL, SYS1, Index 1256, Bits 4, 5 and 6 in PCPro.

Note 3: The Side Tone volume value assigned in terminal configuration is not reflected.

Note 4: For the terminal configuration, refer to Peripheral Equipment Description (Multi-Line Telephone) - Chapter 3 IP Station - Configuration Setup - DtermIP (SIP) - Audio & Visual Settings - Audio Settings - Sidetone Volume.

Note 5: When Side Tone is ON, the Side Tone volume value is fixed at -30 dB.

Note 6: Supported only for IP Enabled Dterm and DtermIP INASET.

Note 7: It depends on the terminals.

2. Once the Side Tone setting (Side Tone ON/OFF) is set at each terminal by pressing Feature key + digit key 0, the setting is maintained even if the insertion and extraction of Modular Cable, ELC circuit card initialization or system initialization is occurred.

   Note: The Side Tone setting (Side Tone ON/OFF) at each terminal is cleared as the following timing:

   Digital terminal : Change the location of the ELC circuit card.

   IP terminal : Program version of Telephony Server is updated. However, if the system data backup is performed before the update, the data is maintained.

3. When changing Side Tone volume value during system operation, perform the following to enable the new data:
   - DT800/DT700 Series: Initialize the system.
   - DT400/DT300 Series: Initialize the ELC circuit card

4. (For Digital terminal) To activate this feature, the following firmware is required to be equipped on the ELC card.

Circuit Card	Firmware
PA-16ELCJ-B	SP-3655 16ELCJB PROG-D or later
PA-16ELCN	
PA-16ELCN-A	
CH-16ELCA	

Programming

[For Side Tone volume value change]

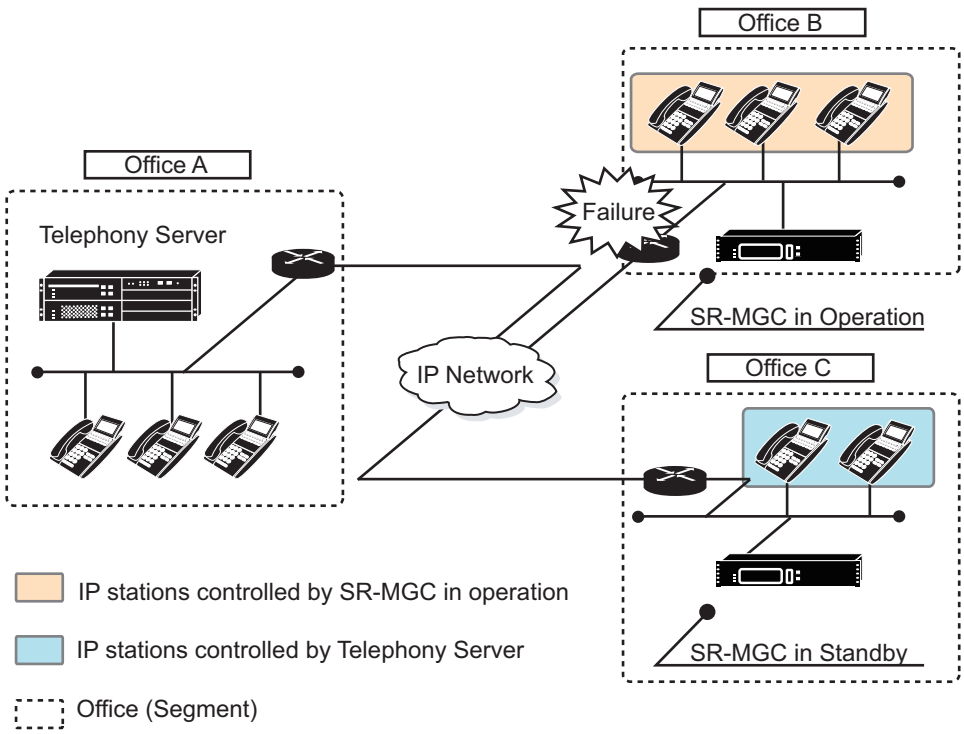
ASYDL–SYS1, Index 1256, Bit 7: 1 = Side Tone volume is enabled.
Bits 6, 5 and 4: Assign applicable data.

System Data			Volume Value [dB]
Bit 6	Bit 5	Bit 4	
0	0	0	-54 (Minimum Value) **Note 8**
0	0	1	-48
0	1	0	-42
0	1	1	-36
1	0	0	-30
1	0	1	-24
1	1	0	-18
1	1	1	-12 (Maximum Value)

Note 8: This is default value.

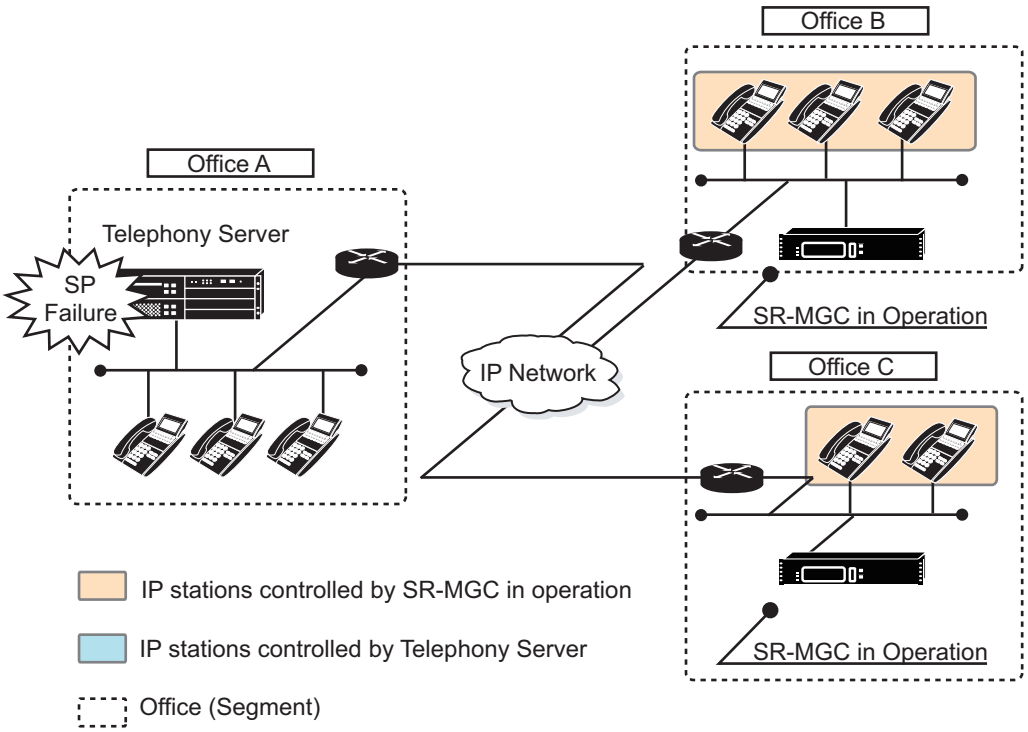
S-141 Survivable Remote MGC

General Description



• Basic Functionality

Survivable Remote MGC (SR-MGC) is placed in a remote office to manage calls for SIP/IP terminals and trunk calls to/from PSTN via MG in the case of a network failure or the Telephony Server (hereinafter called "MGC") breakdown in the main office. In normal state, SR-MGC operates in Standby mode under monitoring of the main office MGC. Once the MGC cannot accept the registration of SIP/IP terminals in remote office, the operation is handed over to the SR-MGC. When the main office MGC recovers, the SR-MGC switches back the network equipment to the control of the MGC and it returns to Standby mode.



The hardware installation for the SR-MGC is described in the Peripheral Equipment Description (IP Devices). This describes Operation Procedure, Service Conditions, and Data Assignments for SR-MGC.

Note: Here we call the Telephony Server an MGC as mentioned, as well as all IP terminals and devices to be rescued by an SR-MGC just terminals for convenience.

In Case of Network Failure

In Case of SP Failure

When the terminals cannot be controlled by the Telephony Server of the main office because of a network failure or a failure in the SP part of the server, the SR-MGC in the remote office takes control of the assigned terminals. The SR-MGC periodically check the controlled terminals and, if it is possible to give back the control of the terminals to the main office Telephony Server, the SR-MGC indicates it to the terminals. The timing for giving back the control can be decided among several options depending on the data settings:

- When the communication with the main office Telephony Server is restored.
- When the terminals are reset with the visitor key or a maintenance console.
- When busy terminals exceed the period set for a forcible switch back.

In case of a failure in the SP part of the server, the automatic reboot because of a time out of health checks is performed only for the terminals controlled by the SP part of the server. Furthermore, during the SP failure, the registration of terminals in the server is restricted only for SP controlled terminals and such terminals are registered to the SR-MGC.

• Flexible Network Re-routing

This feature is useful when the Telephony Server or network failure occurs, and one of the nodes in a network is switched over to operation by SR-MGC, unable to connect to the opposite node via IP network. By assigning forwarding data to a trunk line in advance between the nodes, re-routing is automatically activated via a public network. Thus, this feature provides a connectivity equal to that could be attained by the Telephony Server via SR-MGC installed at each node.
For more detailed information about the feature, refer to "Flexible Network Re-routing [F-41]" in this manual.

• Visitor Key Procedures

When a terminal whose Visitor key has been assigned is registered in an SR-MGC as the backup MGC, the terminal is capable of switchback to primary MGC (set on the terminal side) by using the Visitor key as follows:

Note: If the system data (ASYDL, SYS1, Index 846, Bit 4 = 1) is assigned, the terminal registered in an SR-MGC cannot perform terminal reset by the Visitor key.

- When Visitor key is set to Function key

  [1] Make sure an appropriate Function key lights red and SR-MGC controls the terminal.

  [2] Push the Function key.

  [3] Make sure the Function key light is off and Primary MGC (set on the terminal side) controls the terminal.

- When Visitor key is set to the Soft key

  [1] Make sure VISIT display on an appropriate Soft key is flashing and SR-MGC controls the terminal.

  [2] Push the Soft key.

  [3] Make sure the Soft key light is on and Primary MGC (set on the terminal side) controls the terminal.

Service Conditions

Service Conditions are described in the following, consisting of several parts.

<Important Notices>

1. SR-MGC series is capable of rescuing the following equipment, depending on the system conditions.

   × : Available
   N : Not Available
   – : Not Applicable

Type of Equipment		Conditions				
IP Station/ Device	Protocol mode	Port Note 2	FCCS Cluster Note 3	No Encryption	Encryption	Detailed Information of Equipment
DT800 Series	SIP	Note 2	×	×	× Note 4	DT830/DT830G/DT820

Note 1: Soft Phone described here indicates one that is not being used with Softphone Wired Phone Handset [S-147].

Note 2: The maximum number of ports/stations that SR-MGC can rescue varies depending on the SR-MGC series.

Capacity of Each SR-MGC Port

SR-MGC Series	Number of Ports to be Rescued
SR-MGC50P PROG-Vxx	50
SR-MGC100P PROG-Vxx	100
SR-MGC200P PROG-Vxx	200
SR-MGC500P PROG-Vxx	500
SR-MGC1000P PROG-Vxx	1,000
SR-MGC2000P PROG-Vxx	2,000

** The port/station capacity of this software is fixed. To expand port/station capacity of SR-MGC, it is necessary to purchase new software (CF Card).*

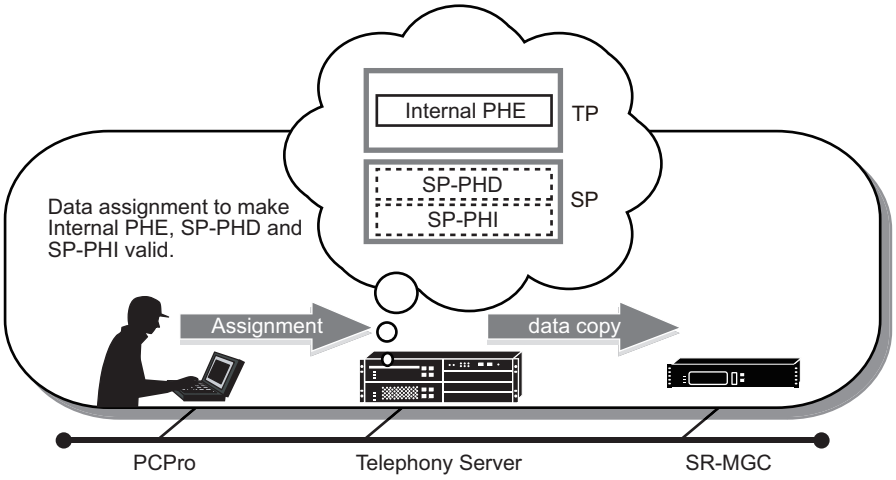
** Use "Number of Ports to be Rescued" for Stations, MC, MG and VS32.*

Note 3: This item represents "SR-MGC with FCCS Cluster" feature. For the information about this feature, refer to "SR-MGC with FCCS Cluster" in this manual.

Note 4: SR-MGC supports VoIP Encryption [V-27] as in the case of MGC.

Note 5: SP350 can be rescued during failure when encryption is available.

Note 6: DtermSP30 is not applicable for this feature.



Note 7: Some types of SP Controlled SIP terminals cannot be retrieved. Contact your authorized NEC Sales Representative for more information about SP Controlled SIP terminals.

Note 8: Available from FP95-114 V4 Issue 2.0.

Note 9: Equipment available for RTP encryption are: MG-128SIPMGL-A, MG-128SIPMGJ-B/MG-128SIPMGJ, and Software-based MG (SIP). Available from FP95-114 V4 Issue 2.0.

2. The software issue of SR-MGC must be same or higher than that of the Telephony Server.
3. Minor Version Upgrade of SR-MGC can be executed remotely with the CMNT command. For details on Remote Version Upgrade, refer to "SR-MGC(E) [SN8178 MGCEV-B]/SR-MGC(E) [SN8178 MGCEV-A]" - "Remote Version Upgrade" in the Peripheral Equipment Description (IP Devices).
4. LAN1 port of the Telephony Server is used as the interface for the communication (Health Check) between SR-MGC and MGC, so communication failure/recovery is detected based on the LAN1 condition.

5. SR-MGC retrieves PH functions from MGC. Therefore, PHs used by SR-MGC need to be valid in MGC. As the figure below shows, data assignment on MGC is necessary to make Internal PHE, SP-PHD and SP-PHI valid.

Note: SR-MGC supports VoIP Encryption [V-27]. The devices/stations can continue to execute the encryption feature, even if they are rescued by SR-MGC.

6. Terminals' switchback (**Note 1**) from SR-MGC can be determined by using the ASYDL SYS1 Index 852 Bit 5.

Note 1: Switchback means to return the registration destination of the terminals to MGC from SR-MGC after communication between SR-MGC and MGC (LAN1 of the Telephony Server) is recovered.

A.) When **Automatic Switchback** (ASYDL SYS1 Index 852 Bit 5=1) is selected

<Factors of switchback>

(a) When "1" is selected in Changeover/Recover Mode in the CMNT command, SR-MGC makes the terminal register to MGC when the SR-MGC detects the recovery of the MGC.

(b) When "2" is selected in Changeover/Recover Mode in the CMNT command, SR-MGC makes the terminal register to MGC when the SR-MGC detects the normality of communication between SR-MGC and MGC, MGC and Pilot terminal. **Note 1**, **Note 2**, **Note 3**

Note 1: WLAN Handset (MH250) cannot be specified as a pilot terminal. If no terminal registers to SR-MGC except WLAN Handset (MH250), SR-MGC makes the terminal register to MGC when the SR-MGC detects the recovery of the MGC, as in the case of Mode 1 (MGC does not execute "ping" to check the connectivity).

Note 2: Pilot terminal is specified as follows:

LOC-ID Selection / Terminal Selection	ASYDL SYS1 Index 846 Bit 1=0	ASYDL SYS1 Index 846 Bit 1=1
ASYDL SYS1 Index 846 Bit 0=0	Search terminals registered in SR-MGC, and select a terminal accommodated in the smallest number of accommodated location.	Search terminals registered in SR-MGC by LOC-ID, and select a terminal accommodated in the smallest number of accommodated location.
ASYDL SYS1 Index 846 Bit 0=1	Search terminals connected to MGs registered in SR-MGC, and select a terminal accommodated in the smallest number of accommodated location.	Search terminals connected to MGs registered in SR-MGC by LOC-ID, and select a terminal accommodated in the smallest number of accommodated location.

Note 3: Put both of LAN1 and LAN2 IP addresses in the same segment in order to make this mode available.

<Terminal conditions when switchback is executed>

(a) SR-MGC checks the status of the terminals, if its status is released, the SR-MGC switches the terminal back to MGC. SR-MGC switches multiple-channel terminal back to MGC when all the channels are released.

(b) In multiple-channel terminals, SR-MGC switches the terminal back to MGC when all the channels in the terminal are released.

(c) If the terminals in busy exceed a certain period (determined by ASYDL SYS1 Index 847 **Note 4**, **Note 5**, **Note 7**), SR-MGC forcibly switches them back to MGC. In IP terminal except for Soft Phone and SIP Multiple Line terminal, from 3 minutes before forcible switchback, alarm tone that indicating terminal reset will be executed as soon as transmitted to the terminals per minute. **Note 8**

Note 4: When ASYDL SYS1 Index 847 Bits0-3 are set to "F", forcible switchback is not executed while the active calls remain.

Note 5: An SR-MGC may not execute forcible switchback to maintain terminal's states:

- An SR-MGC maintains following PHS's calls: an originating call (when a PHS user is hearing ringback tone); an ongoing call between PHSes under control of an IPBS.
- An SR-MGC maintains following WLAN Handset (MH Series)'s calls: an originating call (when a WLAN Handset user is hearing ringback tone); an ongoing call between WLAN Handsets.
- An SR-MGC maintains an ongoing call between a WLAN Handset and a PHS under control of an IPBS.
- An SR-MGC maintains the state of MC part on an MC&MG-COT if all of three conditions (device, firmware version, state) are true.

Device	Firmware Version	State
MG-4LC2COTA	Earlier than SP-3778 MCMG PROG-A Issue 13	Having an off-hook terminal. **Note 6**
	SP-3778 MCMG PROG-A Issue 13 or later	Having an ongoing call.
SCA-4LC2COTA	SP-3778 MCMG PROG-A Issue 1 or later	Having an ongoing call.
UG50 (COT-TYPE1)	Any version	Having an ongoing call.
UG50 (COT-TYPE2)	Any version	Having an ongoing call.
UG50-4LC2COTA (COT)	Any version	Having an ongoing call.
UG50-6COT	Any version	Having an ongoing call.
UG50 (PGT-TYPE1)	UG50 software version 2.00 or later	Having an ongoing call.
UG50 (PGT-TYPE2)	UG50 software version 2.00 or later	Having an ongoing call.
UG50-4LC2COTA (PGT)	UG50 software version 2.00 or later	Having an ongoing call.

Note 6: "Off-hook terminal" is a terminal which you are manipulating for a conversation including dialing, hearing ringback tone and conversation itself.

Note 7: When the switchback target product is Analog 2MC or VS32, and all channels are not vacant, the forcible switchback may not be executed immediately even though the set time of the forcible switchback passes. It requires one minute at the maximum from the set time of the forcible switch back to starting of its execution.

Note 8: Alarm before forcible switchback (ASYDL, SYS1, Index 847, Bit 4=1) supports IP terminal except for Soft Phone and SIP Multiple Line terminal only.

B.) When **Manual Switchback** (ASYDL SYS1 Index 852 Bit 5=0) is selected

<Factors of switchback>

(a) After the MGC is recovered, the terminal can be switched back by using the CMNT command (Condition in the Setting tab). Also, assigning Visitor key to terminals provides the terminal users with manual switchback.

<Terminal conditions when switchback is executed>

(b) Manual switchover by the CMNT command makes the terminals register to MGC regardless of its status (busy/unbusy).

7. After the office data assignment, you need to set an SR-MGC's IP address on each terminal. Set the SR-MGC's IP address as the DRS of the terminal.

- Set IP address of SR-MGC for the following:

  IP terminals including Soft Phone (Proprietary Protocol mode)
  Analog 2MC
  VS32 (Proprietary Protocol mode)
  MG(PRI) (Proprietary Protocol mode)
  MC&MG-COT
  MG(SIP)
  MG-COT (Proprietary Protocol mode)

- Set IP address (or URL) of SR-MGC for the following:

  SIP Multiple Line terminal
  Soft Phone (SIP mode)
  WLAN Handset (MH Series)
  8LC Card
  MG(BRI) Card/Box
  MG(PRI) (SIP mode)
  VS32(Dual) (SIP mode)
  MG-COT (SIP mode)
  MG-T1(SIP)

Note: Protocol mode (Proprietary Protocol mode/SIP mode) is added at the end of each IP device/station name whose required IP address varies depending on its protocol mode.

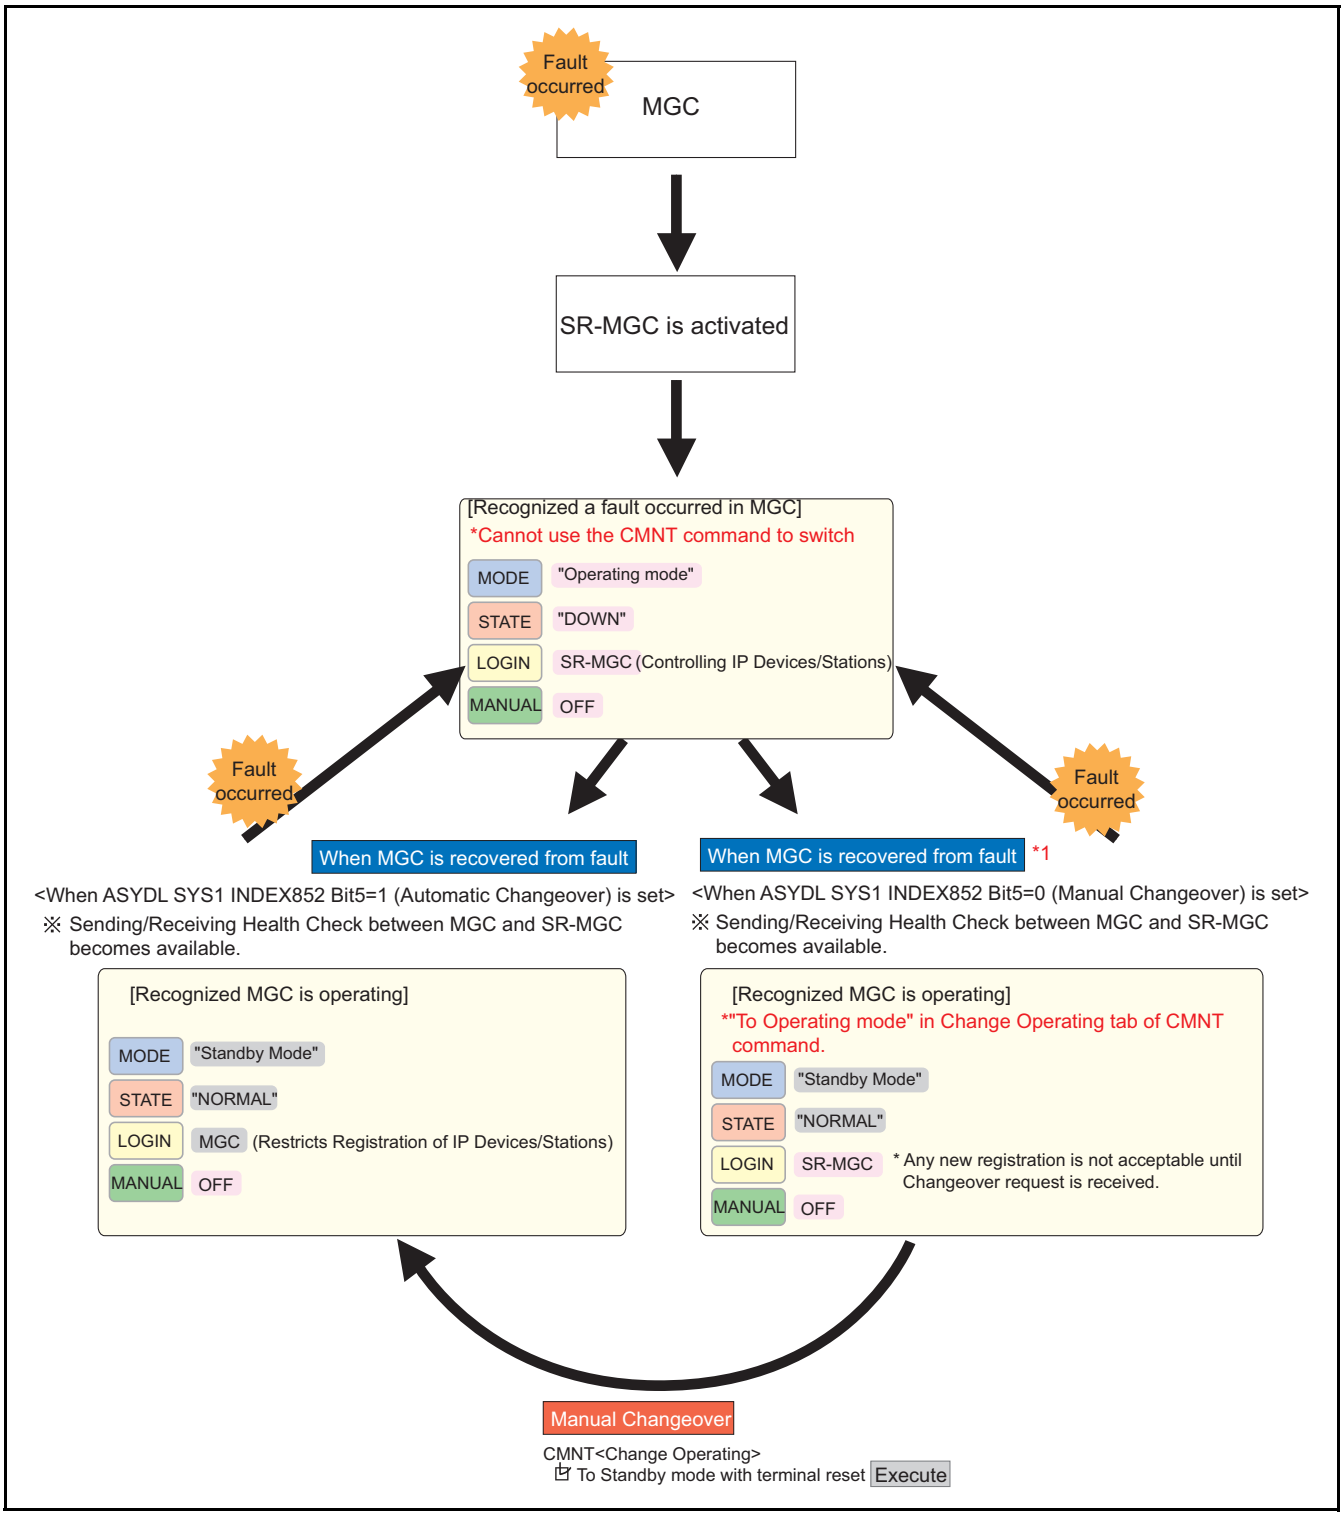
8. The Operating mode (**Note 9**) of SR-MGC will be greatly influenced by the communication status between MGC and SR-MGC and the settings of the CMNT command.

Note 9: SR-MGC has the following two modes:
Standby Mode: IP devices/stations cannot register to SR-MGC
Operating Mode: IP devices/stations can register to SR-MGC
If IP devices/stations register to SR-MGC in Standby Mode, each equipment operates differently.

The following explains the status change of SR-MGC by the CMNT command.

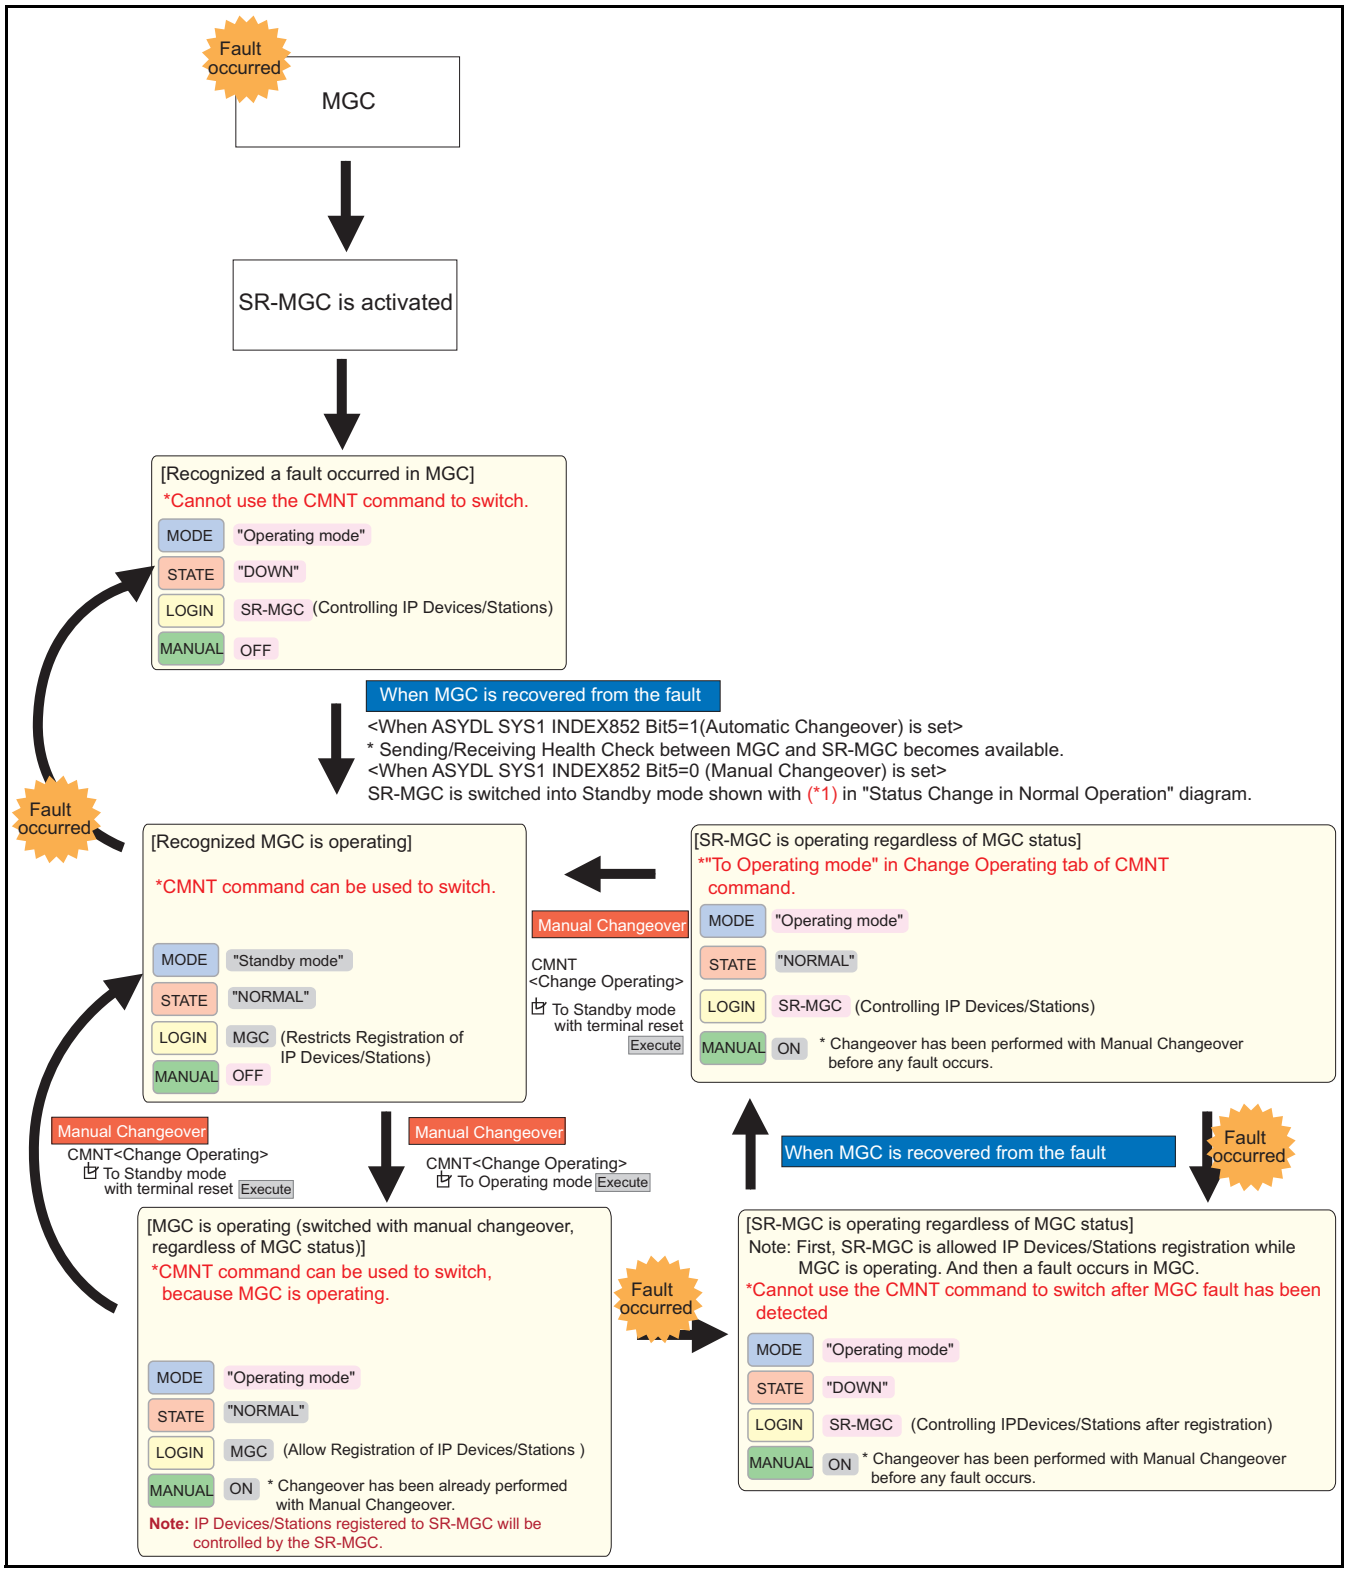
【Explanatory Note】

[ ]/( ) : Indicates Status of SR-MGC



MODE
Indicates SR-MGC allows/restricts the registration of IP devices/stations.
"Standby Mode" : IP devices/stations cannot register to SR-MGC
"Operating Mode" : IP devices/stations can register to SR-MGC

STATE
Status of MGC
"NORMAL" : MGC is normally operating
"DOWN" : Fault occurred in MGC



LOGIN
Destination where IP devices/stations register
MGC : Registered in MGC
SR-MGC : Registered in SR-MGC

MANUAL
Status of Operating Change by Manual Changeover (CMNT command)
ON : "To Operating mode" is performed
OFF : "To Operating mode" is not performed

- Status Change in Normal Operation

- Status Change in Test mode (Normally, SR-MGC's status is not changed in the following

9. The following table shows how IP equipment (a terminal or device) operates when the equipment switches its registration destination from an MGC to an SR-MGC or vice versa, which depends on the equipment kind and its state:

Note: The table applies when an opposite terminal is a station, and the station does not stop sending or receiving RTP packets nor abandon an originating or terminating call.

Note: If forcible switchback (ASYDL SYS1 Index 847 Bits 0-3) is enabled, an SR-MGC forcibly switches equipment back to the Telephony Server after the predetermined period of time expires regardless of the following. About operations of IP equipment regarding Call Retention, refer to "Operation of IP Equipment/Terminals When a Fault Occurs During a Conversation" in INTRODUCTION of Peripheral Equipment Description.

a.) If a communication failure occurs between IP equipment and an MGC while the MGC is operating (Switch from an MGC to an SR-MGC):

Equipment State / Equipment Kind	During Conversation	During Ringback Tone	During Ringing Tone
IP terminal Soft Phone (Proprietary Protocol)	The terminal maintains an ongoing call; after you disconnect the call by on-hook, the terminal resets itself to register to an SR-MGC.	After ringback tone lasts for two or three minutes, an IP terminal resets itself to register to an SR-MGC.	After ringing tone lasts for two or three minutes, an IP terminal resets itself to register to an SR-MGC.
SIP Multiple Line terminal		After ringback tone lasts for two to six minutes, a SIP Multiple Line terminal resets itself to register to an SR-MGC.	After ringing tone lasts for two to six minutes, a SIP terminal resets itself to register to an SR-MGC.
Soft Phone (SIP)		After ringback tone lasts for a while, a Soft Phone (SIP) discards the call to register to an SR-MGC.	
WLAN Handset (MH250)		After ringback tone lasts for a minute or two, a WLAN Handset resets itself to register to an SR-MGC.	After ringing tone lasts for five minutes, a WLAN Handset resets itself to register to an SR-MGC.

Equipment State / Equipment Kind	During Conversation	During Ringback Tone	During Ringing Tone
MC&MG-COT: **- SCA-4LC2COTA** **- MG-4LC2COTA**	The device maintains an ongoing call; after you disconnect the call by on-hook, the device resets itself to register to an SR-MGC.	After ringback tone lasts for two to four minutes, an MC&MG-COT resets itself to register to an SR-MGC.	After ringing tone lasts for two to four minutes, the device resets itself to register to an SR-MGC.
Analog 2MC	After a few minutes, an Analog 2MC resets itself to register to an SR-MGC.	After ringback tone lasts for two to four minutes, an Analog 2MC resets itself to register to an SR-MGC.	
8LC Card	An 8LC Card maintains an ongoing call; after you disconnect the call by on-hook, the 8LC Card resets itself to register to an SR-MGC.	After ringback tone lasts for a while, an 8LC Card discards the call and resets itself to register to an SR-MGC.	
IPG Digital Note 1	After a minute or two, the call is disconnected. An IPG resets itself to register to an SR-MGC in a few minutes.	After ringback tone lasts for about a few minutes, an IPG resets itself to register to an SR-MGC. (DT connection when off-hook)	After ringing tone lasts for two to three minutes, the device resets itself to register to an SR-MGC.
IPG Analog	After two or three minutes, the call is disconnected by an IPG reset. It will be registered to a SR-MGC by on-hook in a few minutes.	After ringback tone lasts for about a few minutes, an IPG resets itself. It will be registered to an SR-MGC by on-hook.	
UG50 (Multi-slot mode) • UG50 (DLC)	After a minute or two, the call is disconnected. the UG50 resets itself to register to an SR-MGC in a few minutes.	After ringback tone lasts for about a few minutes, the UG50 resets itself to register to an SR-MGC. (DT connection when off-hook)	
UG50 (Multi-slot mode) • UG50 (LC) [Proprietary] • UG50 (LC) [SIP]	The UG50 maintains an ongoing call; after you disconnect the call by on-hook, the UG50 resets itself to register to an SR-MGC.	After ringback tone lasts for a while, the UG50 discards the call and resets itself to register to an SR-MGC.	After ringing tone lasts for two to four minutes, the UG50 resets itself to register to an SR-MGC.
UG50 (IPG mode) • UG50-IPG (Digital)	After a minute or two, the call is disconnected. the UG50 resets itself to register to an SR-MGC in a few minutes.	After ringback tone lasts for about a few minutes, the UG50 resets itself to register to an SR-MGC. (DT connection when off-hook)	After ringing tone lasts for two to three minutes, the UG50 resets itself to register to an SR-MGC.

Equipment State / Equipment Kind	During Conversation	During Ringback Tone	During Ringing Tone
UG50 (IPG mode) • UG50-IPG (Analog)	The UG50 maintains an ongoing call; after you disconnect the call by on-hook, the UG50 resets itself to register to an SR-MGC.	After ringback tone lasts for a while, the UG50 discards the call and resets itself to register to an SR-MGC.	After ringing tone lasts for two to four minutes, the UG50 resets itself to register to an SR-MGC.
UG50 (Retrofit mode) • UG50-2MC • UG50-8LC • UG50-4LC2COTA (COT) • UG50-4LC2COTA (PGT)			

Note 1: IPG Analog resets itself to perform re-registration after two to three minutes, regardless of the set time before forcible switchback is executed (ASYDL SYS1 Index 847 Bit 0~3).

b.) If the system recovers from a communication failure between IP equipment and an MGC: (Switchback from SR-MGC to MGC) with the following system data set:

ASYDL SYS1 Index 852 Bit 5=1: Automatic Switchback

Equipment State / Equipment Kind	During Conversation	During Ringback Tone	During Ringing Tone
IP terminal **Soft Phone (Proprietary Protocol)**	The terminal maintains an ongoing call; after you disconnect the call, it takes a few minutes for the terminal to register to the Telephony Server.	**If you abandon the call before connected:** After ringback tone lasts for a few minutes, the terminal registers to the Telephony Server. **If the call connects to a peer:** The terminal maintains the ongoing call; after you disconnect the call, it takes a few minutes for the terminal to register to the Telephony Server.	**If you abandon the call without answering:** Ringing tone lasts; if the calling party disconnects the call by on-hook, it takes a few minutes for the terminal/device to register to the Telephony Server. **If you answer the call:** The terminal/device maintains the ongoing call; after you disconnect the call, it takes a few minutes for the terminal/device to register to the Telephony Server.
SIP Multiple Line terminal			
Soft Phone (SIP)			
WLAN Handset (MH250)			
MC&MG-COT: **- SCA-4LC2COTA** **- MG-4LC2COTA**	The device maintains an ongoing call; after you disconnect the call, the device registers to the Telephony Server.	Ringback tone lasts until you go on-hook; the device registers to the Telephony Server.	
Analog 2MC			
8LC Card			

ASYDL SYS1 Index 852 Bit 5=1: Automatic Switchback

Equipment State / Equipment Kind	During Conversation	During Ringback Tone	During Ringing Tone
IPG Digital	IPG maintains a call until the set forcible switchback time executes (5mins x (1~14)). IPG resets itself and will be registered to the Telephony Server by on-hook.	Ringback tone lasts until the set forcible switchback time executes (5mins x (1~14)). IPG resets itself to register to the Telephony Server. (DT connection when off-hook)	Ringing tone lasts until the set forcible switchback time executes (5mins x (1~14)). IPG resets itself to register to the Telephony Server.
IPG Analog Note 1	After two or three minutes, the call is disconnected by an IPG reset. It will be registered to the Telephony Server by on-hook in a few minutes.	After ringback tone lasts for about a few minutes, IPG resets itself. It will be registered to the Telephony Server by on-hook.	After ringing tone lasts for two to three minutes, the device resets itself to register to the Telephony Server.
UG50 (Multi-slot mode) • UG50 (DLC)	The UG50 maintains a call until the set forcible switchback time executes (5mins x (1~14)). The UG50 resets itself and will be registered to the Telephony Server by on-hook.	Ringback tone lasts until the set forcible switchback time executes (5mins x (1~14)). The UG50 resets itself to register to the Telephony Server. (DT connection when off-hook)	Ringing tone lasts until the set forcible switchback time executes (5mins x (1~14)). The UG50 resets itself to register to the Telephony Server.
UG50 (Multi-slot mode) • UG50 (LC) [Proprietary] • UG50 (LC) [SIP]	The device maintains an ongoing call; after you disconnect the call, the device registers to the Telephony Server.	Ringback tone lasts until you go on-hook; the device registers to the Telephony Server.	**If you abandon the call without answering:** Ringing tone lasts; if the calling party disconnects the call by on-hook, it takes a few minutes for the terminal/device to register to the Telephony Server. **If you answer the call:** The terminal/device maintains the ongoing call; after you disconnect the call, it takes a few minutes for the terminal/device to register to the Telephony Server.
UG50 (IPG mode) • UG50-IPG (Digital)	UG50 maintains a call until the set forcible switchback time executes (5mins x (1~14)). The UG50 resets itself and will be registered to the Telephony Server by on-hook.	Ringback tone lasts until the set forcible switchback time executes (5mins x (1~14)). The UG50 resets itself to register to the Telephony Server. (DT connection when off-hook)	Ringing tone lasts until the set forcible switchback time executes (5mins x (1~14)). The UG50 resets itself to register to the Telephony Server.

c.) If the terminal operating under SR-MGC presses Visitor key

Terminal Reset by Visitor Key	Status of Terminal			
	Idle	During Conversation	During Ringback Tone	During Ringing Tone
ASYDL SYS 1 Index 846 Bit 4=0	Key operation is available	Key operation is Not available	Key operation is Not available	Key operation is Not available
ASYDL SYS 1 Index 846 Bit 4=1	Key operation is Not available	Key operation is Not available	Key operation is Not available	Key operation is Not available

d.) If switchback is performed during call termination to MC&MG-COT that is controlled by SR-MGC, the incoming call scenario will be as follows depending on Incoming Signal Interface of the channel used for the call.

MC&MG-COT: Incoming Signal Interface	Call Scenario
Ring Down	SR-MGC will not retain the incoming call, executing switchback. Note that if other channel (including an MC channel) is in use, the call will be retained.
Other than Ring Down	SR-MGC will retain the incoming call.

<Interactions with Other Features>

1. While SR-MGC is in operating mode, the billing information is stored in the remote office where the SR-MGC is located. When MGC is recovered, billing information accumulated until that time is transferred to the recovered MGC. The billing information can be stored up to 47,000 calls.

2. Features that need to group terminals, such as Multi-Line and Station Hunting, might not be available, depending on the system configuration.

3. SR-MGC does not support Hotel, CCIS over IP, FCCS, and Attendant Console features.

4. ACD and OAI services are available with SR-MGC.

5. To check the status of terminal registration on SR-MGC, use DISD command. Also, DISD command is used to send Soft Reset packets to the SR-MGC. For details on DISD command, refer to Operations and Maintenance Guide.

6. A program upload from the maintenance PC to the CF card in the SR-MGC is available via FTP. (Login account of SR-MGC must be registered in advance to use this function. See "Office Data Management via FTP" in Operations and Maintenance Guide for detailed procedure of program uploading.) Be sure to initialize the SR-MGC by using the CMNT command after updating the program.

7. If new SIP equipment performs Terminal Authentication using a one-time password, backup memory data by MEM_HDD/MEM_HDD_N command. After the backup of memory data, copy the office data to SR-MGC by using CMNT command or periodical diagnostic function. If the information on Terminal Authentication is not reflected on MGC, the SIP equipment cannot be rescued.

8. SIP Terminal Authentication [S-152] is supported in this feature. SR-MGC can rescue operating SIP terminals that have already completed SIP Terminal Authentication [S-152] with MGC (Telephony Server). To rescue SIP terminals with SR-MGC, save the Office Data including data related to SIP Terminal Authentication feature by MEM_HDD command. And then copy it into SR-MGC by CMNT command.

9. SR-MGC has supported VoIP Encryption [V-27].

10. When Softphone using Soft Phone Wired Phone Handset/Soft Phone Wireless Handset moves to SR-MGC, the following conditions must be considered. The conditions differ according to the software version of Softphone.

    Even if the Softphone moves to SR-MGC, the setting of "DRS Host Name or IP Address (Secondary/3rd/4th)" on the DtermSP30 (Proprietary Protocol) DRS Setting or "VoIP Host Name (2/3/4)" on the DtermSP30 (SIP) VoIP Setting (DtermSP30 Configuration Utility) is enabled. However, do not set the DRS Host Name of SR-MGC to "DRS Host Name or IP Address (Secondary/3rd/4th)" on the DtermSP30 (Proprietary Protocol) DRS Setting or "VoIP Host Name (2/3/4)" on the DtermSP30 (SIP) VoIP Setting because Soft Phone Wired Phone Handset/Soft Phone Wireless Handset might be activated incorrectly in SR-MGC. For the conditions of FCCS Cluster, see Location Diversity [L-55].

11. If Automatic Switchback is performed while a wired telephone which is being used as handset of Soft Phone by Soft Phone Wired-Phone Handset [S-147] is engaged in a call, the connection can be maintained and the Soft Phone can return to the main office MGC.

<Hardware/Software>

1. A maximum of 256 units of SR-MGC can be installed in a system.
2. External FTP server must be provided with 8GB or more free space for the hard disk.
3. The FTP Client feature of SR-MGC is operated in the Passive Mode. Use an external FTP server which supports the Passive Mode. Furthermore, set the Time to Stop the Program Copy late enough to complete the Program Copy. It takes about 2 hours in minimum to complete the Program Copy.

   Note: Passive Mode is an FTP connection mode which sends a connection request from the client to the server for data communication once again after the client is connected to the server.

4. Free space of 2 GB or more is required for the CF card of SR-MGC to execute a Program Copy. Otherwise, the Program Copy may fail.

   Note: Check the free space of a CF card in the System Status display area of Telephony Server Maintenance Menu.

5. When a communication error occurs:
   IP terminal becomes available to use in approximately 2 to 4 minutes.
   SIP Multiple Line terminal becomes available to use in approximately 2 to 7 minutes.

6. After an SR-MGC is powered on but has not been setup, or after its IP address is changed (**Note 2**) needs to communicate with the MGC for a Health Check.

   Note 2: Changing an SR-MGC IP address is only for the purpose of setting the SR-MGC back to default, so that it can be re-installed.

7. SR-MGC requires VS32 when terminals belonging to the SR-MGC use voice conference features such as Conference and Announcement.

8. This feature supports WLAN Handset (MH250) under the following conditions:
   a.) In a system with Location Diversity [L-55], SR-MGC cannot rescue WLAN Handsets (MH250).
   b.) Backup memory data by using MEM_HDD/MEM_HDD_N command after changing password of WLAN Handset (MH250). After the backup of memory data, copy the office data to SR-MGC by using CMNT command or periodical diagnostic function. If the password change is not reflected on MGC, WLAN Handset (MH250) cannot be rescued.

9. The following describe the setting of LAN interface for the applications (**Note 3**) communicating with SR-MGC from the Telephony Server side.

   To communicate with SR-MGC, the Telephony Server uses the specified LAN interface. By default, LAN1 interface is used for the applications communicating with SR-MGC (**Note 4**). This communication includes Health Check between the Telephony Server and SR-MGC. Therefore, a failure occurred on the LAN2 port cannot be notified to SR-MGC.

Note 3: The applications communicating with SR-MGC refer to all applications, i.e., Health Check, SMDR, Office Data Copy, DRS and Internal PHx.

Note 4: OS version upgrading function uses LAN1 for performing the program copy, regardless of the setting of LAN interface for the applications used by SR-MGC.

10. Only LAN1 interface can be used for communicating with the Telephony Server. LAN2 interface cannot be selected.
11. The operation of SR-MGC that performs Health Check between the Telephony Server and SR-MGC by using LAN1 of the Telephony Server varies depending on the status of the LAN interfaces.

    *By default, a rescue by SR-MGC is not performed for the failure occurred on LAN2 only. Also, the IP equipment that is generally operated by LAN2 is not rescued by SR-MGC when a failure occurred on LAN1 only.

Relationship between LANs Conditions and SR-MGC Operations

LAN Port		Rescue by SR-MGC	Remarks
LAN1	LAN2		
Normal	Normal	-	
Normal	Failure	NOT Available	
Failure	Normal	Available	IP equipment using LAN2 can be also rescued by the office data setting. Refer to the system data (Changeover to SR-MGC is performed on both LAN1 and LAN2 sides of Telephony Server: ASYDL, SYS1, Index 846, bit 2).
Failure	Failure	Available	

12. When the IP equipment (MG(PRI) [Proprietary Protocol]/ UG50 (PRT 1.5M) [Proprietary Protocol]/ UG50(PRT 2M) [Proprietary Protocol]/ UG50-24PRIA[Proprietary Protocol]/UG50-30PRIA[Proprietary Protocol]) to be rescued by SR-MGC uses LAN2 port, the IP equipment must be assigned the same Location ID (LOC-ID) as the SR-MGC. SR-MGC does not rescue IP equipment that is assigned different Location ID. However, by the office data setting, the IP equipment using LAN2 can be switched to the operation by SR-MGC. If the following conditions are met, the equipment using LAN2 also can be rescued by SR-MGC by assigning the system data (ASYDL, SYS1, Index846, bit 2 = 1):
    - LAN1/LAN2 of the Telephony Server is assigned to different segments (IP addresses)
    - LOC-IDs are assigned per SR-MGC

    Assign ASYDL, SYS1, Index846, bit 2 = 0 if the above conditions cannot be met.

    Note: If installing SR-MGC onto the system where LAN2 accommodates MG(PRI) in Proprietary Protocol mode and LAN1 accommodates other IP equipment, pay close attention to the office data assignment and the system environments/conditions. Due to an incorrect office data setting or operating status of SR-MGC, MG(PRI) in Proprietary Protocol mode may suddenly become unavailable.

13. When assigning "2" to Changeover/Recover Mode in CMNT command, it is required to put both of LAN1 and LAN2 IP addresses in the same segment.

Note: If installing SR-MGC on a location where both of LAN1 and LAN2 are used by IP devices/stations to be rescued, special attention must be paid to the system - data, circumstances, conditions. Some factors related to them may cause IP devices/stations using LAN2 (MG(PRI) in Proprietary Protocol mode) to stop operating suddenly.

<Interactions with Networks>

1. SR-MGC cannot be used as a node for CCIS over IP or FCCS network. Therefore, only terminals under the same SR-MGC (including connections via Media Gateways) can communicate with each other.

<Conditions Specific to This Feature>

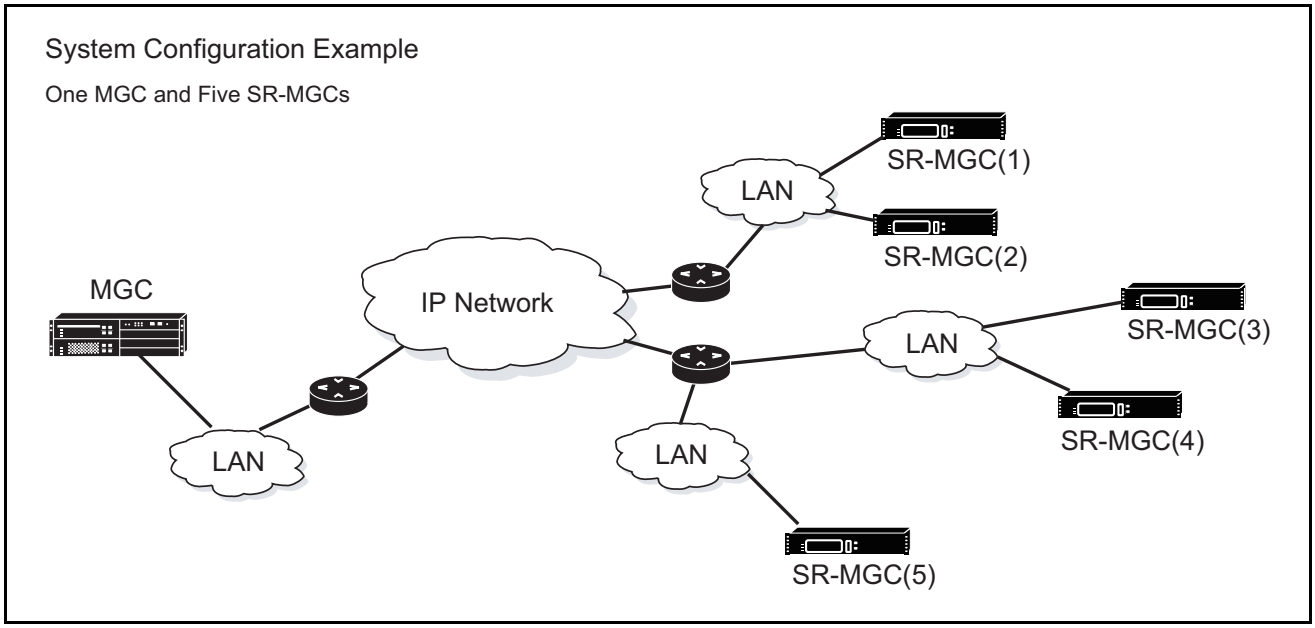
1. Assign IP address of LAN1 (ACT) as Telephony Server's address on SR-MGC, which is set by AIPA command.

2. When initially starting up an SR-MGC, other than the following commands necessary for startup are restricted until an MGC finishes a first office data copy toward the SR-MGC: AIPA, ATIM, ASPC, MEM_HDD, SINZ.

3. SR-MGC automatically assigns an IP address as Internal PH to itself.

4. A call can be retained even if a fault occurs during the conversation. For the detail of call retention function that each terminals have individually, see "Operation of IP Equipment/Terminals when a Fault Occurs during a Conversation" in Chapter 3 IP Equipment of System Description.

5. Health check from MGC to SR-MGC is performed routinely by assigning the System Data (ASYDL, SYS1, Index 850, Index 851) in the MGC. If the SR-MGC does not receive Health Check packets for a certain period, the SR-MGC assumes the MGC might be down, and it changes to operating mode in order to rescue the MGC equipment.



Note: Note the following conditions:
- It is recommended to assign at least 30 seconds (default) for Health Check cycle when 200 or more SR-MGC units are set for a MGC (Telephony Server).
- To change the health check data with the ASYDL, SYS1, Index 850, follow the procedure explained in Command Manual. For details, see the note on ASYDL, SYS1, Index 850 in Command Manual.

6. Office data of MGC and SR-MGC can be reflected by using the following: **Note 6**

(a) To reflect office data automatically

Office data is automatically transmitted to SR-MGC after all the items have been completed through periodical diagnosis.

- Example for Automatic Office Data Update of SR-MGCs after Periodical Diagnosis

The following table shows scheduling for automatic office data update of SR-MGCs in the above case by setting ASYDL, SYS1, Index 844.

ASYDL SYS1 INDEX 844	Day						Description
	1st	2nd	3rd	4th	5th	6th	
5	SR-MGC (1),(2),(3), (4),(5)	SR-MGC (1),(2),(3), (4),(5)	SR-MGC (1),(2),(3), (4),(5)	SR-MGC (1),(2),(3), (4),(5)	SR-MGC (1),(2),(3), (4),(5)	SR-MGC (1),(2),(3), (4),(5)	Every SR-MGC is updated every day. (All five SR-MGCs are updated every day.)
4	SR-MGC (1),(2),(3), (4)	SR-MGC (5)	SR-MGC (1),(2),(3), (4)	SR-MGC (5)	SR-MGC (1),(2),(3), (4)	SR-MGC (5)	Every SR-MGC is updated once two days. (Four SR-MGCs are updated on the first day, and the rest on the second day.)
3	SR-MGC (1),(2),(3)	SR-MGC (4),(5)	SR-MGC (1),(2),(3)	SR-MGC (4),(5)	SR-MGC (1),(2),(3)	SR-MGC (4),(5)	Every SR-MGC is updated once two days. (Three SR-MGCs are updated on the first day, and the rest on the second day.)
2	SR-MGC (1),(2)	SR-MGC (3),(4)	SR-MGC (5)	SR-MGC (1),(2)	SR-MGC (3),(4)	SR-MGC (5)	Every SR-MGC is updated once three days. (Two SR-MGCs are updated on the first day, another two on the second day, and the rest on the third day.)
1	SR-MGC (1)	SR-MGC (2)	SR-MGC (3)	SR-MGC (4)	SR-MGC (5)	SR-MGC (1)	Every SR-MGC is updated once five days. (Only one SR-MGC is updated each day.)
0	-	-	-	-	-	-	No SR-MGCs are updated.

Note: Time required for office data copying depends on office data volume, transmission line capacity and copy method. When setting Automatic Office Data Update of SR-MGCs, allow enough time for office data copying, based on the measured copy time taken for the setup.

(b) To reflect office data immediately

Using the CMNT command transmits the office data immediately.

Note: The following table shows whether or not office data is available to copy to the SR-MGC.

X: Available N: Not Available

Data Type	SR-MGC
Data Memory	X
Name Display	X
Wireless Call Forwarding	X
Call Forwarding	X
Speed Dialing	X
User Assign Key	X
Number Sharing	X
ACD Data Memory	X
Call Block	X
ICB (**Note 3**) and DR	X
Expanded Speed Calling (Not used)	(Not used)
Call Forwarding-Logout	X
One Touch Speed Calling Data for DtermIP	X
SPD Name Data	X
H.323 Terminal Call Transfer (Not used)	(Not used)
Message Area ID Data	X
SR-MGC Data **Note 4**	N
SIP Terminal Call Transfer **Note 5**	X
Mobile Service Data	X
Day/Night Data **Note 3**	N
Local Phone book Data	N
Soft Switch Data	N

Note 3: Available only for North America.

Note 4: This item is generated only on SR-MGC.

Note 5: SIP Terminal Call Transfer indicates the transfer information of SP Controlled SIP terminal.

Note: The following conditions must be considered when performing office data copy.

- Do not log in to SR-MGC by PCPro when performing office data copy.
- Do not perform any PCPro operations other than CMNT command to the Telephony Server during office data copy. The PCPro operation such as login/logoff can cause a copy failure.
- Functions other than the Refresh button and the File Control tab cannot be used during office data copy. Office data copy may not be executed concurrently as well (CMNT command can only be executed one at a time).
- When using the manual copy function of CMNT command, it must be completed before the office data copy of the periodic Health Check starts. The manual copy function is canceled when the periodic Health Check starts. Once the office data copy was canceled, it would not be performed on that day regardless of ASYDL, SYS1, Indexes 844 and 845 settings.
- * To work around the above problem, assign data FF HEX to both ASYD SYS1 Index 87 and Index 88 to stop the periodic Health Check program before starting the manual office data copy.
- During office data copy, another tab in the CMNT command is not available. Also, another office data copy process is not available: you cannot open more than one CMNT command window.
- In a dual configuration system, if system changeover is performed during office data copy, the copy fails.
- If you abort office data copy, data in the SR-MGC will not be updated: the existing data will be used.
- If a failure occurs over a network between an MGC and the SR-MGC, data in the SR-MGC will not be updated: the existing data will be used.
- Do not execute CMNT command with a PCPro-installed PC while executing office data copy with another one.

Note 6: The following must be considered.

- MGC office data transmission to SR-MGC must be performed at least once 29 days.
  If more than 29 days has elapsed since the last SR-MGC data update, a system message, 10-A: System Activation Report (SUP), is output. The request notice will continue to be sent every day until a new update is made, and vary depending on the time SR-MGC has left not updated, as shown below:
  For more than 29 days and less than 45 days → 10-A: System Activation Report (SUP)
  For more than 44 days and less than 60 days → 10-B: System Activation Report (MN)
  For 60 days or more → 10-C: System Activation Report (MJ)
  If you want to stop the message without copying office data to SR-MGCs, use the CMNT command and execute the initialization of the SR-MGC on the Initialize Tab.

7. SR-MGC starts its operation when a breakdown of MGC or a network failure occurs. **Note 7**

Note 7: LAN1 on the Telephony Server is used as the interface for Health Check between MGC and SR-MGC. It means that a failure only on LAN2 does not activate SR-MGC because Health Check is performed normally as long as LAN1 can communicate with SR-MGC.

8. Program Copy can be executed from the File Control tab. The conditions for Program Copy are as follows:

   (a) Do not perform any PCPro operations other than CMNT command (such as login/logoff of PCPro) to the Telephony Server or SR-MGC during office data copy.

   (b) When the Stop button is pressed during the manual program copy process, the process is canceled before it is completed, and the temporary file is discarded.

   (c) When the manual program copy process is still running at the time assigned with Appoint Stop Time, the process is canceled.

9. "Program update" function provides program upgrade within same version. The following are conditions for program update.

   Note: Execute the Program Copy/Program Switch from the File Control tab when updating the program.

   a.) All of the following requirements must be satisfied between MGC (copy source) and a SR-MGC (copy destination).

   - Using the same version of MAIN program.
   - Using the same version of BASE system.
   - Using the same issue number for the BASE system including digits after the decimal point.

   b.) During the program update process, MGC does not perform office data copy after periodic Health Check, which means no office data copy on the day.

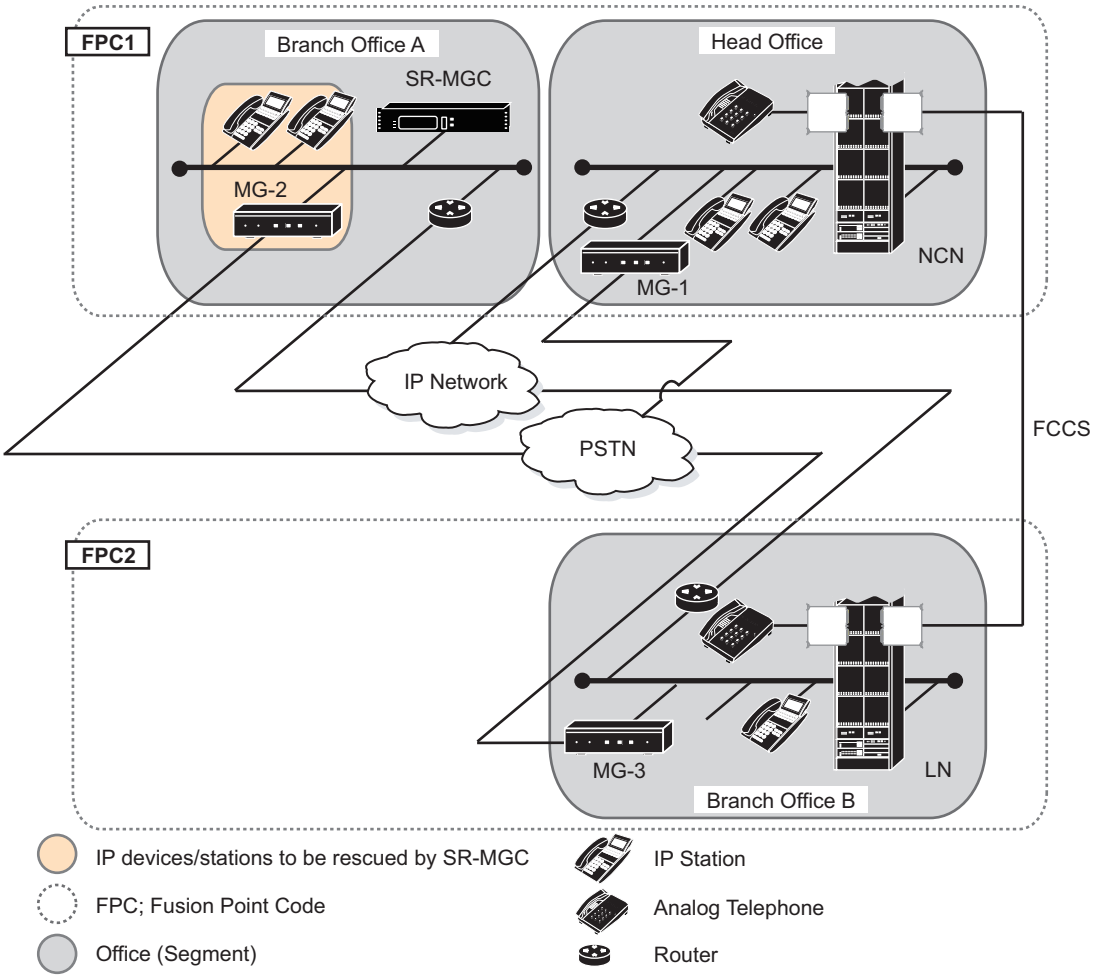
   c.) During office data copy process after periodic Health Check, program update is not available.

   d.) For details on the program to be updated, see CMNT command in the Operations and Maintenance Manual.

<Conditions Specific to SR-MGC and FCCS>

The following explains SR-MGC conditions when FCCS network is involved.

SR-MGC Coverage Area (Example 1)



In the following configuration, the SR-MGC can back up IP terminals on LAN of Branch Office A only. Other IP terminals cannot be backed up by the SR-MGC.

System Configuration:

- Head Office and Branch Office B are connected via FCCS.
- SR-MGC that corresponds to NCN is installed in Branch Office A. **Note 8**
- In normal case, IP terminals in Branch Office A are controlled by NCN that is installed in Head Office.

Note 8: In an FCCS network, each node, which was previously called the Telephony Server, may be referred to as NCN or LN. NCN is an abbreviation of Network Control Node that is the main node in an FCCS network. LN is an abbreviation of Local Node which are nodes other than NCN in the FCCS network. For more information, refer to the Data Programming Manual - FCCS.

SR-MGC in FCCS Network - Example 1

IP Terminal Operationability in FCCS Nodes - Example 1

No.	Calling Party	Called Party	Calling Party Operationability	Called Party Operationability
1	Terminals in Head Office	Terminals in Office A	Receives RBT.	Cannot be called.
2	Terminals in Office A			Can be called.
3	Terminals in Office B			Cannot be called.
4	Terminals in Office A	IP Terminals in Head Office		
5		Non-IP Terminals in Head Office	Receives ROT with 'RST' indication on the LCD.	
6		IP Terminals in Office B	Receives ROT without indication on the LCD.	
7		Non-IP Terminals in Office B		

Note: When LOGGED OUT IP STATION - CALL DESTINATION has been set, the call is forwarded in the case of items 1, 3, 4.

Note: Items 6 and 7 are the same status such as an FCCS link-all-busy is encountered.

MG Operationability (When all MGs are operating by FCCS Nodes (NCN/LN)) - Example 1

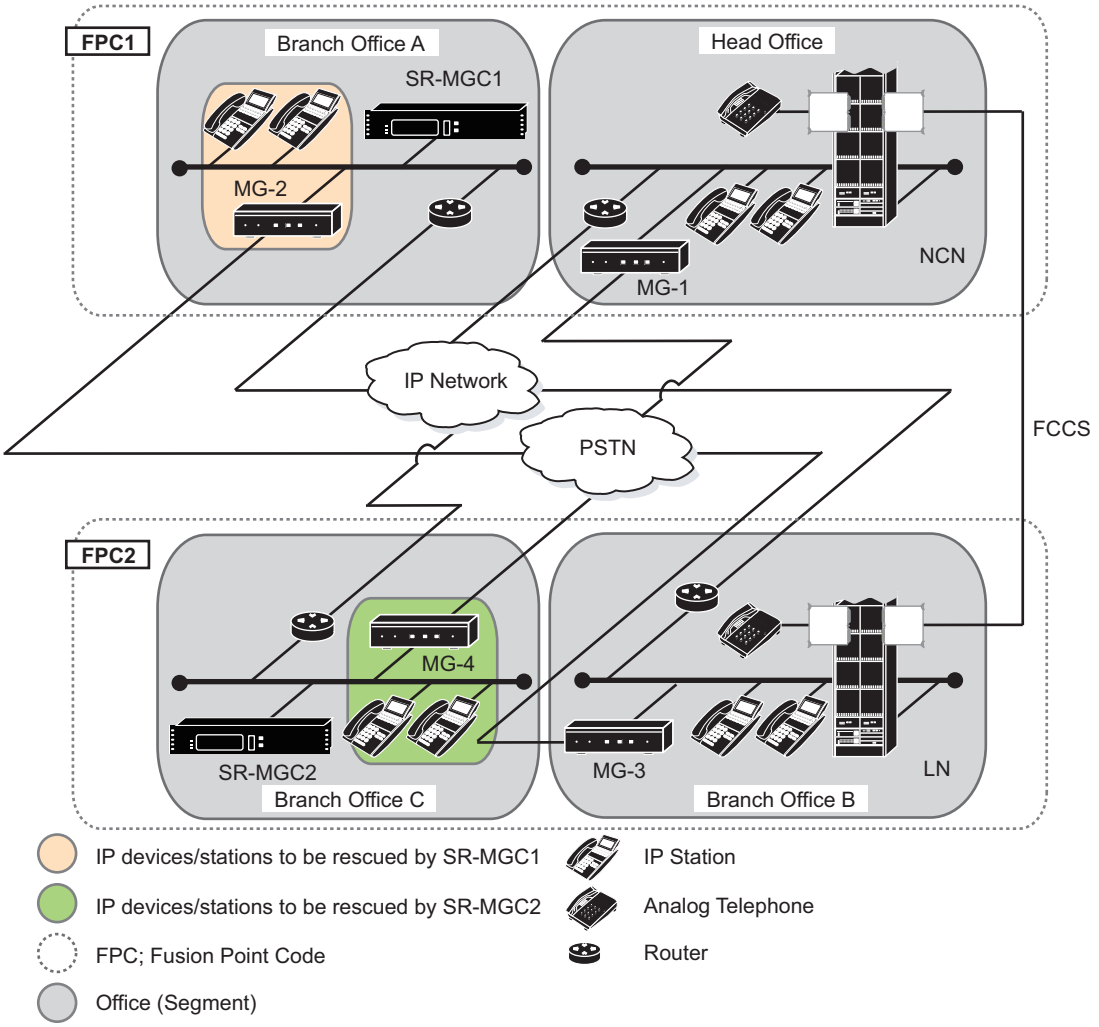
No.	Calling Party	Available MGs for Making Outgoing Calls		
1	Terminals in Head Office	MG-1	MG-2	MG-3
2	Terminals in Office A	MG-1	MG-2	MG-3
3	Terminals in Office B	MG-1	MG-2	MG-3

Note: Shaded Media Gateways (MGs) are available.

MG Operationability (When MG-2 is operating by SR-MGC) - Example 1

No.	Calling Party	Available MGs for Making Outgoing Calls		
1	Terminals in Head Office	MG-1	MG-2 (Not Available)	MG-3
2	Terminals in Office A	MG-1 (Not Available)	MG-2	MG-3 (Not Available)
3	Terminals in Office B	MG-1	MG-2 (Not Available)	MG-3

Note: Media Gateways (MGs) are available. MGs cannot be used from the office.



SR-MGC Coverage Area (Example 2)

In the following configuration, SR-MGC1 can back up IP terminals on LAN of Branch Office A and SR-MGC2 can back up IP terminals on LAN of Branch Office C only. Other IP terminals cannot be backed up by these SR-MGCs.

System Configuration

- Head Office and Branch Office B is connected via FCCS.
- SR-MGC1 that corresponds to NCN is installed in Branch Office A and SR-MGC2 that corresponds to LN is installed in Branch Office C.
- In normal status, IP terminals in Branch Office A are controlled by NCN and IP terminals in Branch Office C are controlled by LN.

SR-MGC in FCCS Network - Example 2

IP Terminal Operationability in FCCS Nodes - Example 2

No.	Calling Party	Called Party	Calling Party Operationability	Called Party Operationability
1	Terminals in Head Office (Terminals in Office B)	Terminals in Office A (Terminals in Office C)	Receives RBT.	Cannot be called.
2	Terminals in Office A (Terminals in Office C)			Can be called.
3	Terminals in Office B (Terminals in Head Office)			Cannot be called.
4	Terminals in Office A (Terminals in Office C)	Terminals in Head Office (Terminals in Office B) (IP Terminals)		
5	Terminals in Office A (Terminals in Office C)	Terminals in Head Office (Terminals in Office B) (Non-IP Terminals)	Receives ROT with 'RST' indication on the LCD.	
6		Terminals in Office B (Terminals in Head Office) (IP Terminals)	Receives ROT without indication on the LCD.	
7		Terminals in Office B (Terminals in Head Office) (Non-IP Terminals)		
8		Terminals in Office C (Terminals in Office A)		

Note: When LOGGED OUT IP STATION - CALL DESTINATION has been set, the call is forwarded in the case of 1, 3, and 4.

Note: Items 6, 7 and 8 are the same status such as an FCCS link-all-busy is encountered.

MG Operationability (When all MGs are operating by FCCS Nodes (NCN/LN)) - Example 2

No.	Calling Party	Available MGs for Making Outgoing Calls			
1	Terminals in Head Office	MG-1	MG-2	MG-3	MG-4
2	Terminals in Office A	MG-1	MG-2	MG-3	MG-4
3	Terminals in Office B	MG-1	MG-2	MG-3	MG-4
4	Terminals in Office C	MG-1	MG-2	MG-3	MG-4

Note: Shaded MGs are available.

MG Operationability (When MG-2 is operating by SR-MGC) - Example 2

No.	Calling Party	Available MGs for Making Outgoing Calls			
1	Terminals in Head Office	MG-1	MG-2 (Not Available)	MG-3	MG-4
2	Terminals in Office A	MG-1 (Not Available)	MG-2	MG-3 (Not Available)	MG-4 (Not Available)
3	Terminals in Office B	MG-1	MG-2 (Not Available)	MG-3	MG-4
4	Terminals in Office C	MG-1	MG-2 (Not Available)	MG-3	MG-4

Note: Shaded MGs are available. Unshaded MGs cannot be used from the office.

MG Operationability (When MG-4 is operating by SR-MGC) - Example 2

No.	Calling Party	Available MGs for Making Outgoing Calls			
1	Terminals in Head Office	MG-1	MG-2	MG-3	MG-4 (Not Available)
2	Terminals in Office A	MG-1	MG-2	MG-3	MG-4 (Not Available)
3	Terminals in Office B	MG-1	MG-2	MG-3	MG-4 (Not Available)
4	Terminals in Office C	MG-1 (Not Available)	MG-2 (Not Available)	MG-3 (Not Available)	MG-4

Note: Shaded MGs are available. Unshaded MGs cannot be used from the office.

MG Operationability (When MG-2 and MG-4 are operating by SR-MGCs) - Example 2

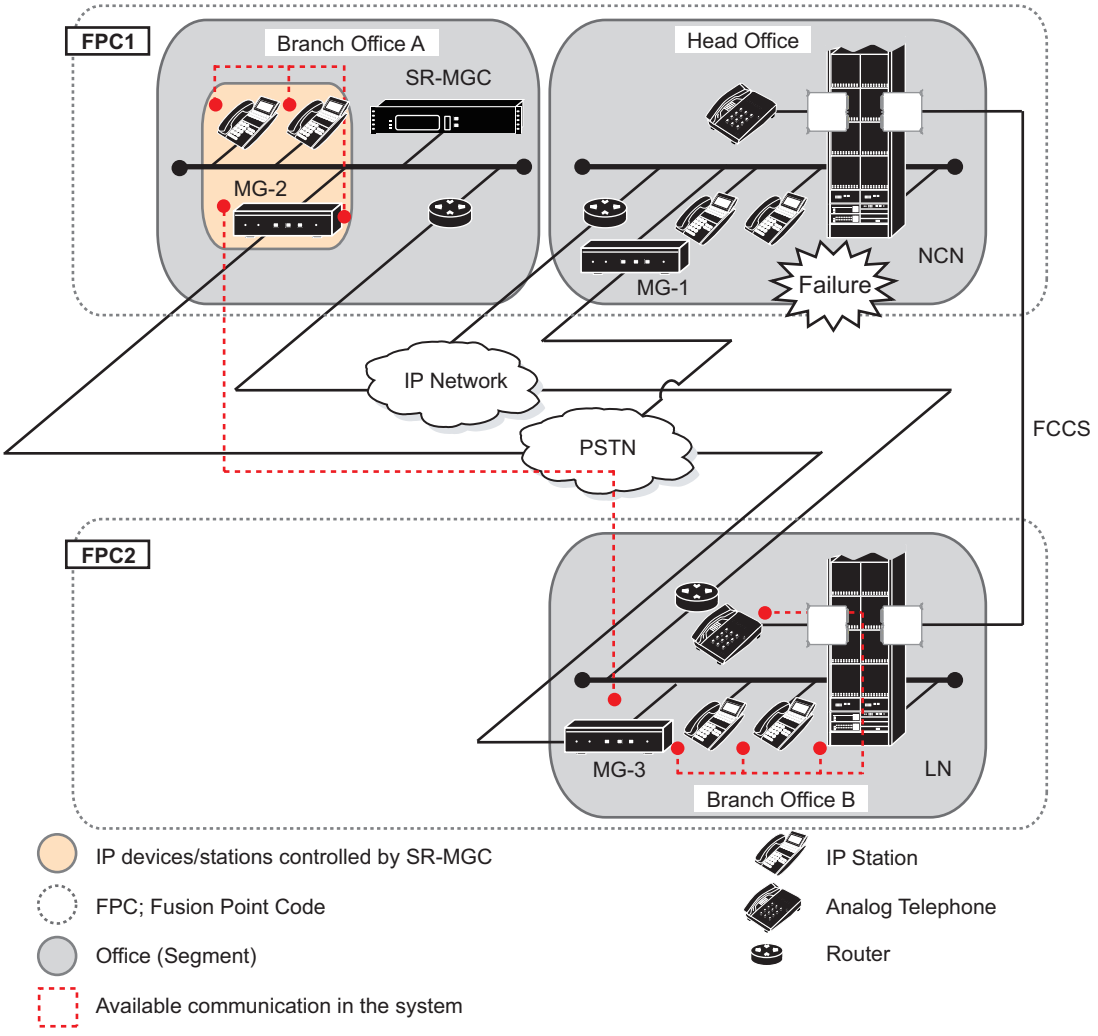
No.	Calling Party	Available MGs for Making Outgoing Calls			
1	Terminals in Head Office	MG-1	MG-2 (Not Available)	MG-3	MG-4 (Not Available)
2	Terminals in Office A	MG-1 (Not Available)	MG-2	MG-3 (Not Available)	MG-4 (Not Available)
3	Terminals in Office B	MG-1	MG-2 (Not Available)	MG-3	MG-4 (Not Available)
4	Terminals in Office C	MG-1 (Not Available)	MG-2 (Not Available)	MG-3 (Not Available)	MG-4

Note: Shaded MGs are available. Unshaded MGs cannot be used from the office.

SR-MGC Behavior in case of FCCS Node / Network Failure

In Case of NCN Failure

If a failure occurs in the NCN, it affects the system as follows:



(1) FCCS calls cannot be made between IP devices/stations registered to SR-MGC and ones in FPC2. **Note 9**

(2) Calls can be made between IP devices/stations registered to SR-MGC.

(3) Calls can be made between IP devices/stations registered to SR-MGC and ones in FPC2 via MG.

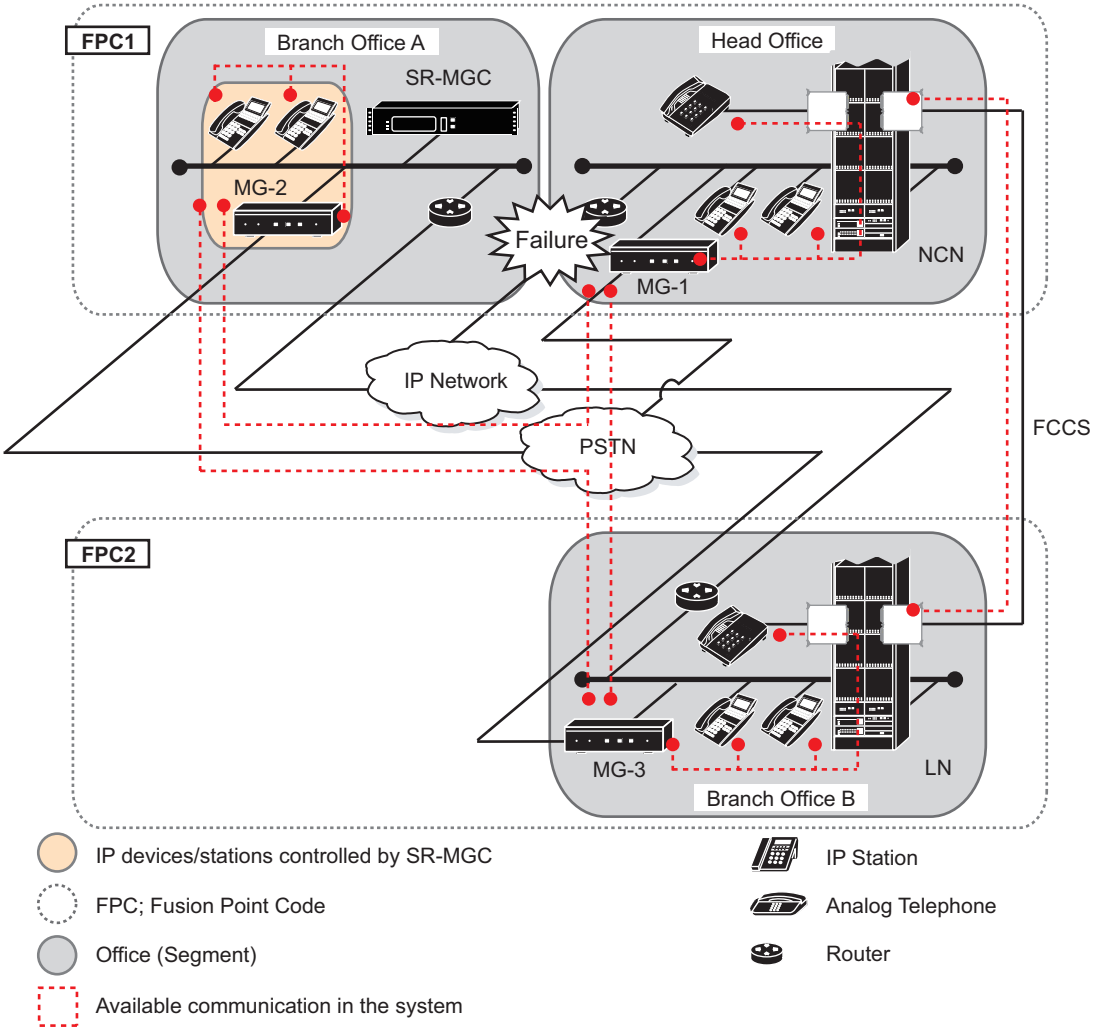
Note 9: By using Automatic Re-routing when SR-MGC is in Operating Mode, calls can be automatically rerouted from SR-MGC to FPC2 via MGs.

SR-MGC Behavior in case of NCN Failure

In Case of Network Failure in Head Office

If a failure occurs on network (access to WAN) in Head Office, it affects the system as follows:

(1) FCCS calls cannot be made between IP devices/stations registered to SR-MGC and ones in FPC2. **Note 10**



(2) Calls can be made between IP devices/stations registered to SR-MGC.

(3) FCCS calls can be made between NCN and LN.

(4) Calls can be made via MG.

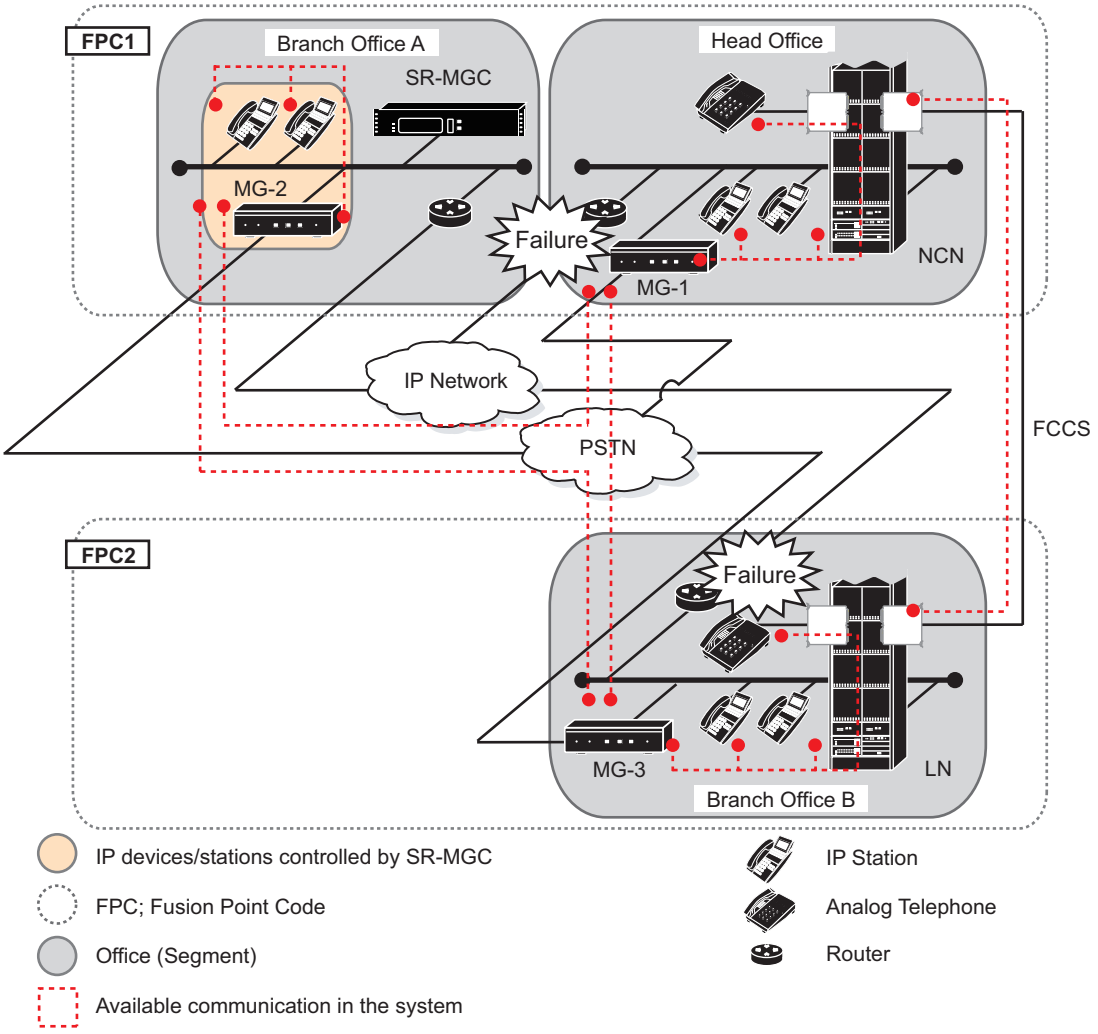
Note 10: By using Automatic Re-routing when SR-MGC is in Operating Mode, calls can be automatically rerouted from SR-MGC to FPC2 via MGs.

SR-MGC Behavior in case of Network Failure in Head Office

In Case of Network Failure in both Nodes - NCN and LN

If a failure occurs on network (access to WAN) in both Head Office and Branch Office B, it affects the system as follows:

(1) FCCS calls cannot be made between IP devices/stations registered to SR-MGC and ones in FPC2. **Note 11**



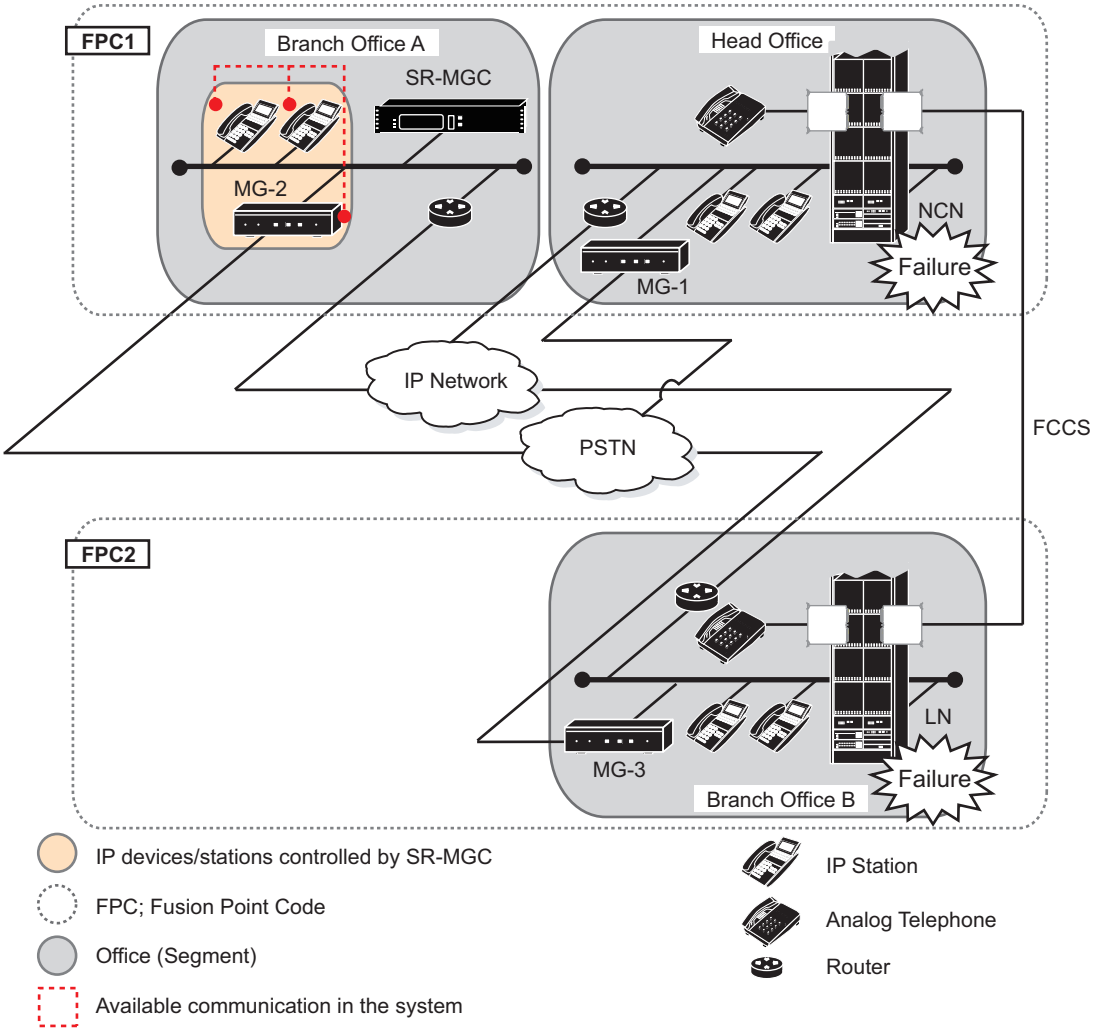
(2) Calls can be made between IP devices/stations registered to SR-MGC.

(3) FCCS calls can be made between NCN and LN.

(4) Calls can be made via MG.

Note 11: By using Automatic Re-routing when SR-MGC is in Operating Mode, calls can be automatically rerouted from SR-MGC to FPC2 via MGs.

SR-MGC Behavior in case of Network Failure in both Nodes



In Case of Node Failure in both FCCS Nodes - NCN and LN (Example 1)

If a failure occurs in both FCCS nodes - NCN and LN, it affects the system as follows:

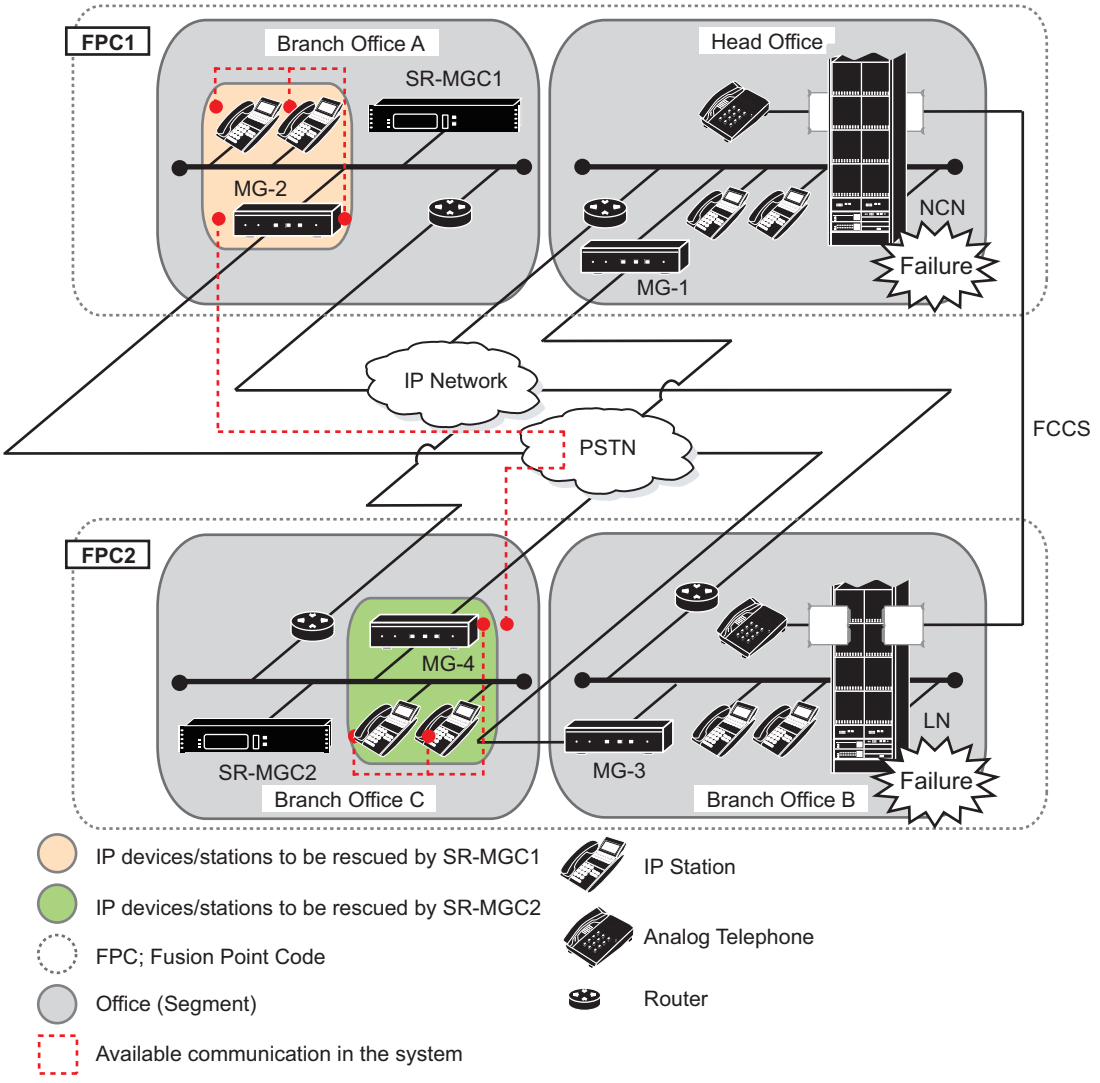
(1) Calls can be made between IP devices/stations registered to SR-MGC.

(2) FCCS calls cannot be made between FPC1 and FPC2.

SR-MGC Behavior in case of Node Failure in both FCCS Nodes (Example 1)

In Case of Node Failure in both FCCS Nodes - NCN and LN (Example 2)

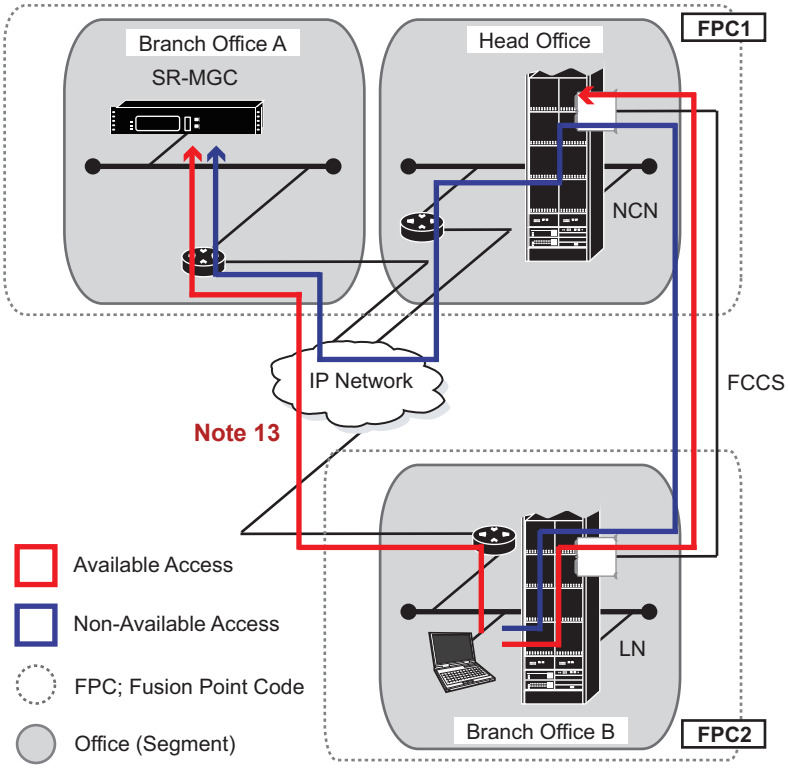
If a failure occurs in both FCCS nodes - NCN and LN, it affects the system as follows:



(1) Calls can be made between IP devices/stations registered to each SR-MGC.

(2) Calls can be made between IP devices/stations registered to SR-MGC1 and SR-MGC2 via MGs. **Note 12**

(3) FCCS calls cannot be made between FPC1 and FPC2.



Note 12: By using Automatic Re-routing when SR-MGC is in Operating Mode, calls can be automatically rerouted from SR-MGC1 to SR-MGC2 via MGs.

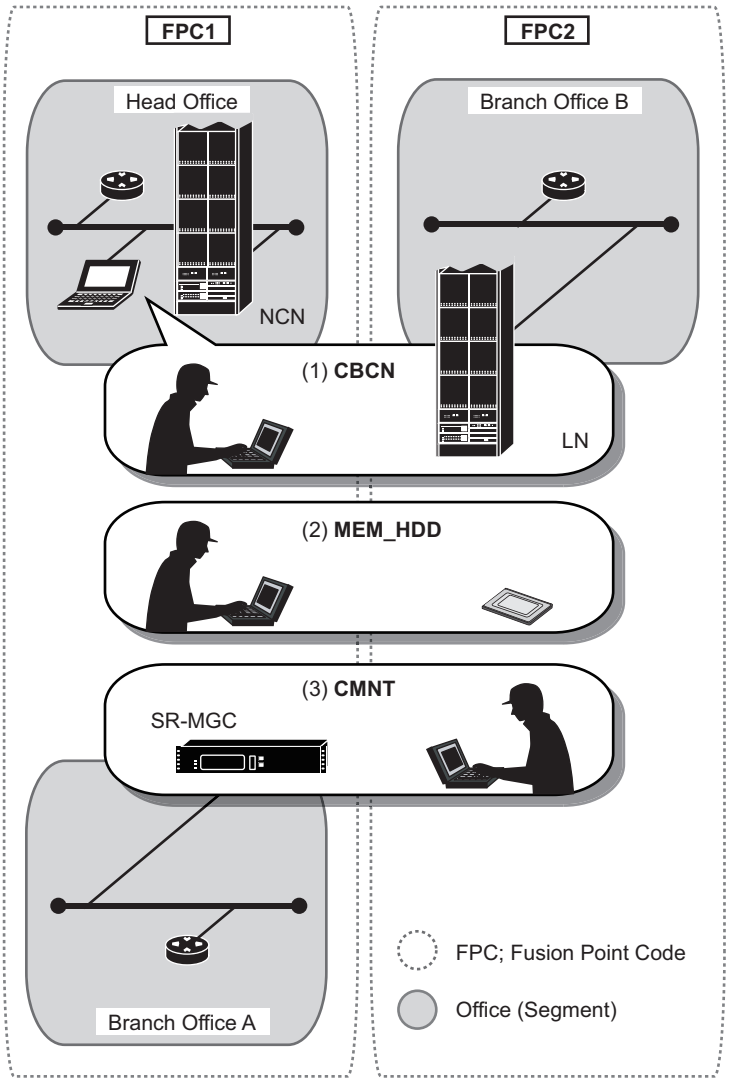
SR-MGC Behavior in case of Node Failure in both FCCS Nodes (Example 2)

In order to do maintenance work, maintenance personnel are required to log in to the system. NCN can be accessed from Branch Office B via FCCS as shown below. However, login to the SR-MGC cannot be done in the same way. The personnel must directly log in to the SR-MGC by specifying the IP address of the SR-MGC from the PC.

Login to SR-MGC

Note 13: Maintenance personnel can gain access to the SR-MGC by specifying the IP address of the SR-MGC.

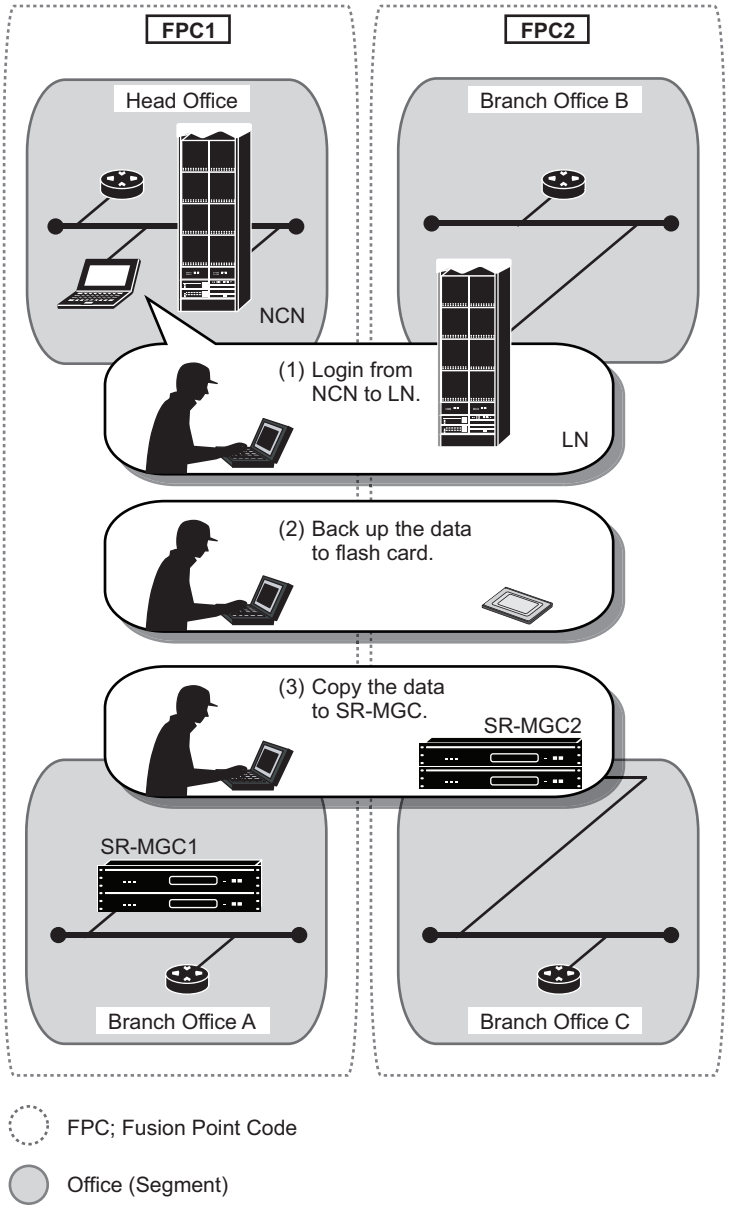
Broadcast Control



When performing the broadcast of NDM by using CBCN command between NCN and LN, the contents of the NDM are not reflected to SR-MGC. To reflect the data to the SR-MGC, perform the following steps:

STEP 1: Perform the broadcast of NDM by using CBCN command.

STEP 2: Back up the office data to the flash card using MEM_HDD command at NCN.

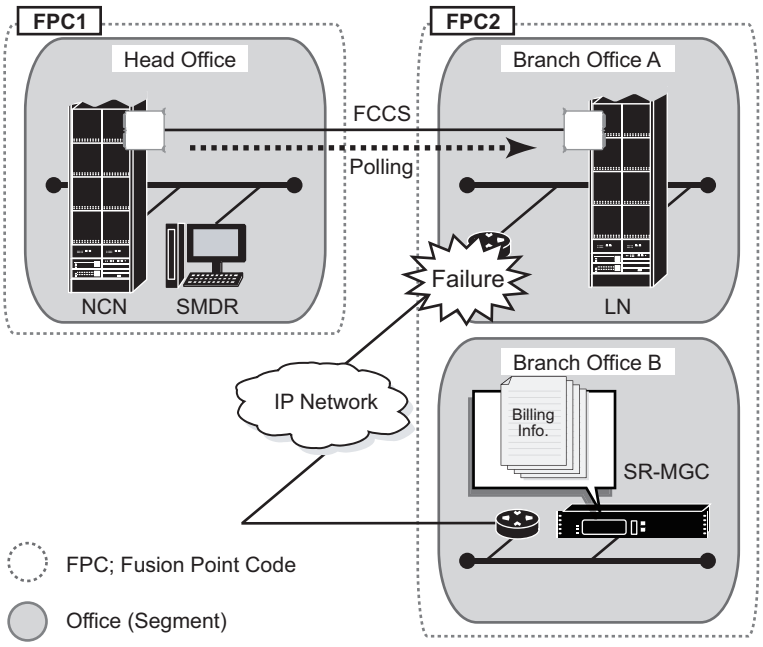


STEP 3: Perform "Office Data Copy" by using CMNT command at the NCN.

Broadcast Control (Example 1)

If login from NCN to LN is available, Office Data Copy from LN to SR-MGC2 installed in Branch Office B (FPC2) is available.

Broadcast Control (Example 2)



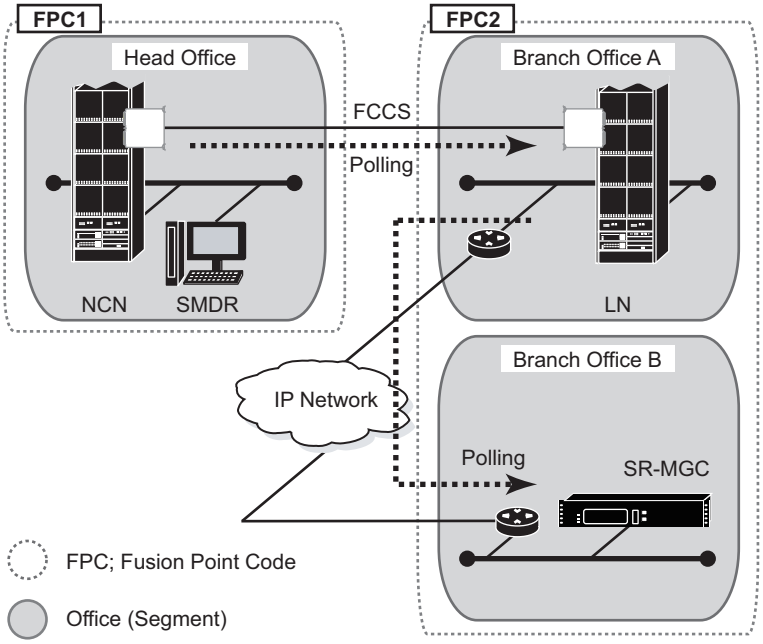
CENTRALIZED BILLING in a System with SR-MGC and FCCS

When LN to which SR-MGC is Registered is Failed

If SR-MGC starts operating, billing information is stored in the SR-MGC.

- A maximum of 47,000 calls can be recorded. If the number of records exceeds the maximum, the subsequent call records will be discarded.
- NCN keeps on polling LN regardless of the status of LN as conforming to the specifications of FCCS CENTRALIZED BILLING.
- NCN does not perform polling of SR-MGC for FCCS CENTRALIZED BILLING.

FCCS CENTRALIZED BILLING when LN is Failed

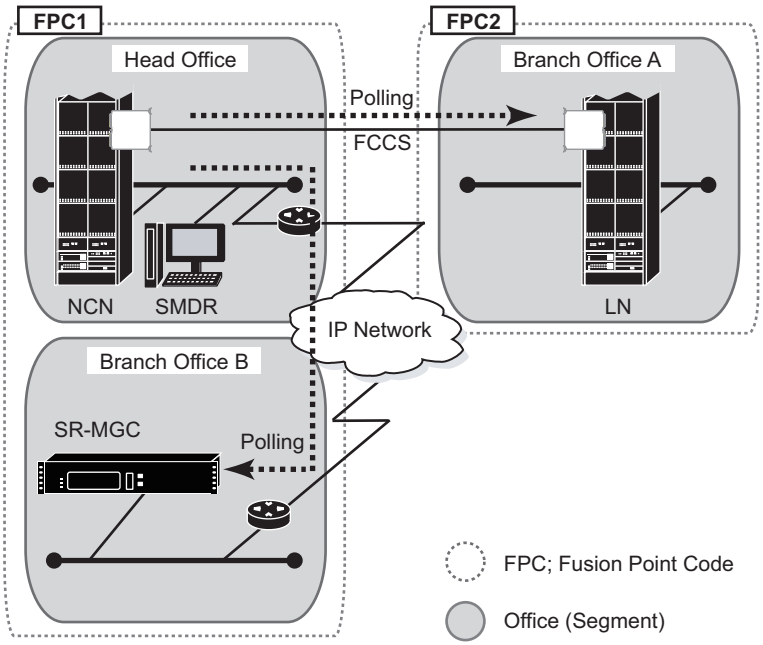


When LN is Recovered

When LN recovers, it starts polling of SR-MGC after receiving reply Health Check packets from the SR-MGC.

- A maximum of four units of information per polling can be exchanged between LN and SR-MGC.
- FCCS CENTRALIZED BILLING is executed by NCN even if the polling is performed between LN and SR-MGC.
- LN does not poll SR-MGC if the total amount of billing information exceeds the upper limit specified by ASYDL, SYS1, Index 586. When the value goes down below the limit, the polling will be resumed.

FCCS CENTRALIZED BILLING when LN is Recovered

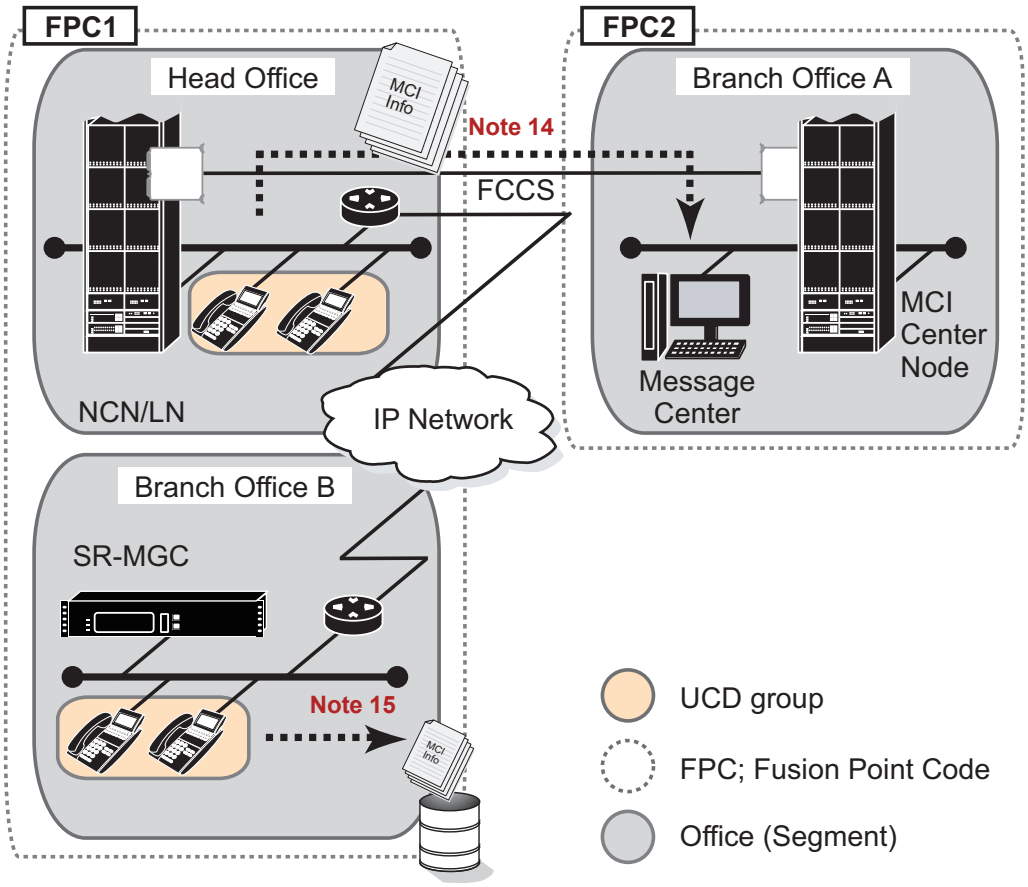


FCCS Centralized Billing when SR-MGC is installed in NCN

When SR-MGC is installed in NCN, it polls LN (polling for FCCS CENTRALIZED BILLING) and SR-MGC.

- NCN stops polling SR-MGC and LN (polling for FCCS Centralized Billing) if the total amount of billing information exceeds the upper limit specified by ASYDL, SYS1, Index 586. When the value goes down below the limit, the polling will be resumed.
- Priority is considered between the polling for FCCS CENTRALIZED BILLING and the polling for LN in the current specifications.

FCCS Centralized Billing when NCN is Failed



FCCS Message Center Interface (MCI) Features

FCCS MCI features are available when both FCCS nodes (Node 1 and Node 2) are in normal operation.

- MCI information created while the SR-MGC is in operation will be discarded.

FCCS MCI Features

Note: Either node in Head Office or Branch Office A can be NCN/LN.

Note 14: Head Office node information is sent to Branch Office A node that is specified as MCI Center Node.

Note 15: MCI information created while the SR-MGC is in operation will be discarded.

NCN and SR-MGC

Conditions for SR-MGC that backs up an NCN

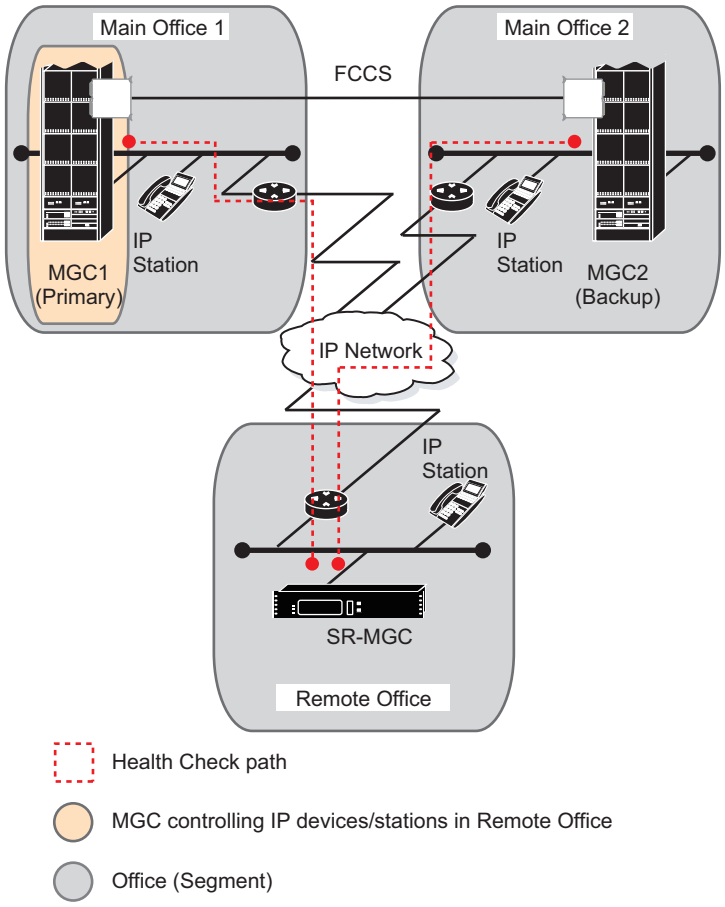
The following is not available:

- SR-MGC cannot be used as an NCN even if the SR-MGC is placed into operation to back up the NCN.
- SR-MGC cannot change NDM-related office data.
- SR-MGC cannot perform Broadcast Control over LNs.

Others Conditions

- The basic operation of SR-MGC does not differ depending on the node (NCN or LN) to be backed up.
- The LM issue of SR-MGC is not necessary to be adjusted to an node even if the node is an FCCS node.

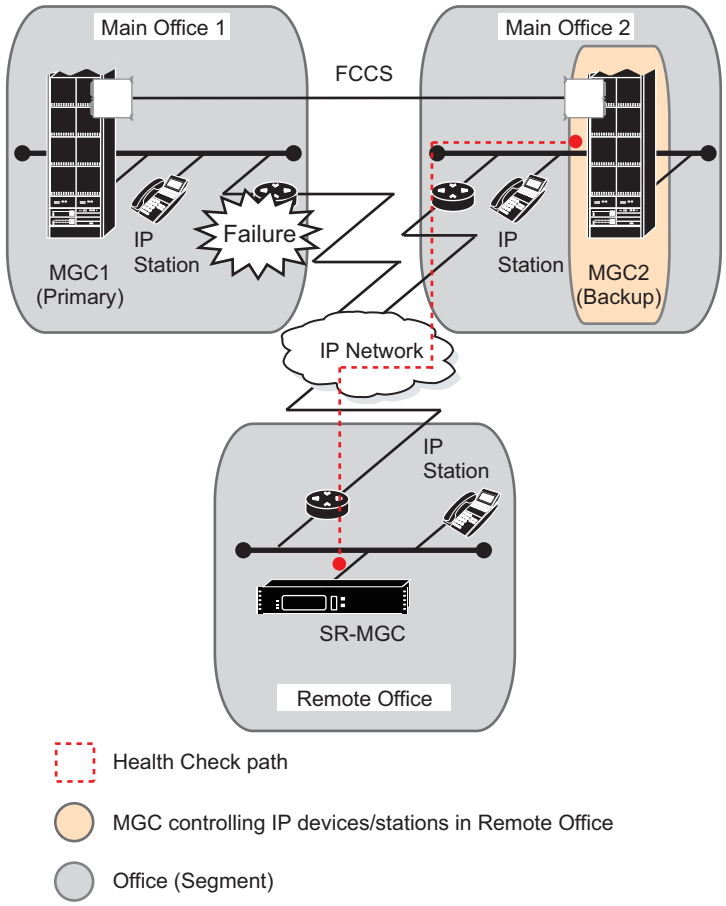
<Conditions on SR-MGC with FCCS CLUSTER>



The following explains conditions on SR-MGC using the SR-MGC with FCCS Cluster. In this case, SR-MGC routinely checks the MGCs used in FCCS CLUSTER by Health Check. If a failure occurs in the network, SR-MGC starts to operate and keep the terminal's connections. The settings are as follows:

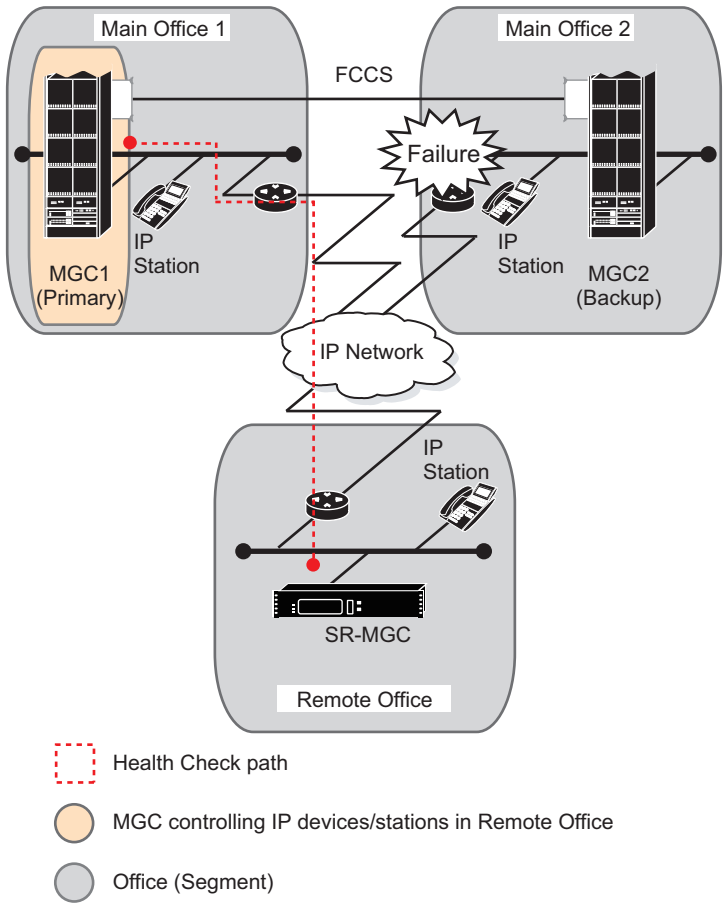
SETTINGS		
SR-MGC	Primary	MGC1
	Backup	MGC2
Terminals in Remote Office	Primary DRS	MGC1
	Secondary DRS	MGC2
	Tertiary DRS	SR-MGC

Note: "MGC" represents the Telephony Server here.



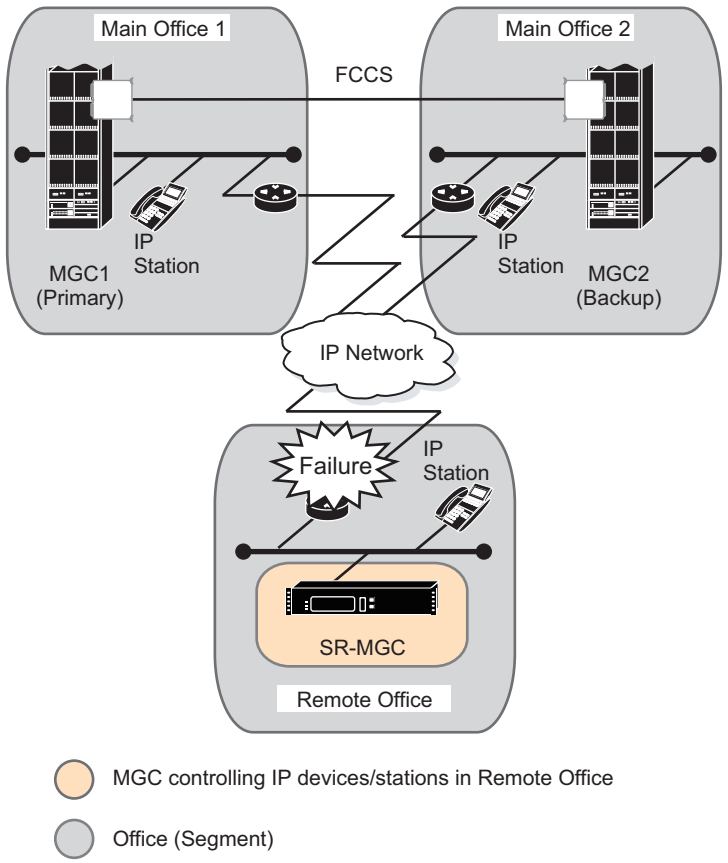
Normal Conditions

Note: Both MGC1 and MGC2 transmit Health Check request to SR-MGC in Remote Office. The SR-MGC sends back the Health Check responses to them.



When network failure occurs in the Main Office 1

OFFICE NAME	EQUIPMENT	STATUS
Remote Office	SR-MGC	SR-MGC determines network failure might occur in Main Office 1 because of no Health Check request from MGC1. However, the request is transmitted from MGC2 that is the backup. Therefore, SR-MGC1 is not activated and it remains Standby mode.
	Terminals	The terminals register to MGC 2 by using FCCS Cluster feature.



When network failure occurs in the Main Office 2

OFFICE NAME	EQUIPMENT	STATUS
Remote Office	SR-MGC	SR-MGC determines network failure might occur in Main Office 2 because of no Health Check request from MGC2. However, the request is transmitted from MGC1 that is the primary. Therefore, SR-MGC is not activated and it remains Standby mode.
	Terminals	The terminals are controlled by MGC 1 as usual.

When network failure occurs in the Remote Office 1

OFFICE NAME	EQUIPMENT	STATUS
Remote Office	SR-MGC	SR-MGC determines network failure might occur because of no Health Check request from MGC1 and MGC2. Therefore, SR-MGC changes its state to active mode to rescue the terminals in the Remote Office.
	Terminals	The terminals register to the SR-MGC.

<Conditions Specific to UMGi/RNIP System>

When UMGi/RNIP system is used as MGC, Remote Call Forwarding (RCF) Data cannot be used in SR-MGC; SR-MGC will be activated without receiving RCF data for PHS/PCS.

Register the MPH office data in the CCN or RN where are accommodated the terminals to be controlled by SR-MGC.

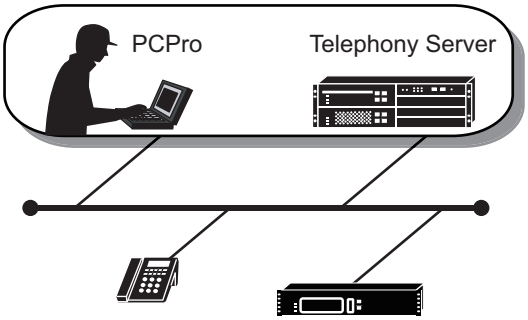
<Other Conditions>

None.

Programming

Perform the data settings on the Telephony Server (MGC) in main office. The Telephony Server (MGC) is required to recognize the SR-MGC in remote office by assigning the IP address, office name, and system data for Health Check. This explains each of those procedures as follows:

Data Assignment on the Telephony Server (MGC)



Data Assignment on SR-MGC

Data Assignment on Terminals

Data Assignment on the Telephony Server (MGC)

This item explains the procedures for setting up the Telephony Server (MGC). Log in to the Telephony Server (MGC) by PCPro and take the following procedures.

Note: We recommend to back up the data within this section to the CF card. Use the MEM_HDD command to back up the data. Configure the target data to be backed up according to your specification. Do not select “SR-MGC” in the Data Type Select.

[1] Use the **ASYDL** command

System Data 1

Index 843: Assign the settings for SP down detection mode.

bit 0-1: Detection mode for SP down

0/1=Detects when all SP-PHDs and SP-PHIs are down/Not detect when all SP-PHDs and SP-PHIs are down.

bit 5-7: The number of counts, which is recognized as SP down.

0: Two counts is applied
1-7: The number of counts

Indexes 844 and 845: Assign the number of SR-MGCs to which office data copy is executed per day.

Index 846: Determine the way of finding a pilot terminal (bits 0 and 1), range of LAN interface for changeover (bit 2) and enable /disable terminal reset function of the terminal registered in SR-MGC (bit 4).

bit 0: Specify a pilot terminal for connectivity check (PING), which can trigger switchback. **Note 1**

0/1=None/Search for Media Gateway

bit 1: Specify a pilot terminal for connectivity check (PING), which can trigger switchback. **Note 1**

0/1=None/Search for the terminals by LOC-ID

bit 2: Changeover to SR-MGC is performed on both LAN1 and LAN2 sides of the Telephony Server. **Note 2**

0=Only on LAN interface used by SR-MGC/NMS application port

1=On both LAN interfaces

bit 4: Enable/Disable Visitor key of terminals

0/1=None/Terminals registered in SR-MGC are able to perform terminal reset by using the Visitor key.

If the Telephony Server (MGC) is configured redundant, the decision as to which the Telephony Server (MGC) (MGC#0 or MGC#1) data will be copied depends on the following data assignment. However, Active-side data is always copied with the faster copy method regardless of this setting.

bit 7: Method of specifying the Telephony Server (MGC) when copying the office data.

0/1=MGC#0 **Note 3**/Active-side MGC **Note 4**

Note 1: This is available when Mode in the CMNT command is set to 2.

Note 2: Assign 1 for enabling the rescue by SR-MGC when a failure occurred only on LAN1 while MG(PRI) in Proprietary Protocol mode is operated on LAN2 port. The following conditions are required to enable this data setting:
- LAN1/LAN2 of the Telephony Server is assigned to different segments (IP addresses)
- LOC-IDs are assigned per SR-MGC

Assign 0 if the above conditions cannot be met. Otherwise, MG(PRI) in Proprietary Protocol mode may become unavailable due to the system conditions, such as during construction periods.

Note 3: When MGC#0 is down, MGC#1 is specified.

Note 4: Even if the data files in MGC#0 and MGC#1 are identical, the different time stamps may be written into the data files because Standby-side MGC data is backed up after the backup of the Active-side MGC data. Therefore, the office data copy after the system changeover is available for the data files with different time stamps even if the data files are not updated.

Index 847: Assign a time to execute forceful changeover against terminals.

bit 0-3: Timer Counter for forceful switchover

0: 70 minutes (default)
1-E: time assigned at intervals of 5 minutes
F: Forceful switchover is not executed while the active calls remain.

bit 4: Alarm is sent before forceful switchover is executed

0/1=Not alarmed/Alarmed per minute

bit 6: SR-MGC office data copy method

0/1 = Auto/Fixed to the existing method

Index 850: Assign SR-MGC Health Check cycle. **Note 5**, **Note 6**

00 HEX. = 30 seconds (default)
01 ~ 0F HEX. = 15 seconds (Not allowed to set)
10~ FE HEX. = 16 ~ 254 seconds

Note 5: It is recommended to set SR-MGC Health Check cycle for the default value (30 seconds) or more when more than 200 units of SR-MGC are assigned to the Telephony Server.

Note 6: To change the health check data with the ASYDL, SYS1, Index 850, follow the procedure explained in Command Manual. For details, see the note on ASYDL, SYS1, Index 850 in Command Manual.

Index 851: Assign Time-out to receive Health Check response. **Note 7**

00 HEX. = 5 seconds (default)
01 ~ 05 HEX. = 5 seconds
06 ~ FE HEX. = 6 ~ 254 seconds

Note 7: Be sure not to assign the Time-out timer exceeding the value of Health Check cycle assigned by ASYDL, SYS1, Index 850 (except when FF HEX. is assigned).

Index 852: Assign Error detection between the Telephony Server (MGC) and SR-MGC.

bits0-3: Determine the number of times of Health Check error to consider the communication failure between MGC and SR-MGC.

00 HEX. = Twice (default)
01 ~ 02 HEX. = Twice
03 ~ 0F HEX. = 3 ~ 15 times

Note: When changing the default value (twice), be sure to assign an identical value (the number of times of Health Check error) to all the nodes.

bit 4: System Message output for [10-F] Communication Failure and [10-G] Communication Recovery between MGC and SR-MGC.

0/1 = Out of service/In service

bit 5: IP terminal registration changeover from SR-MGC to the Telephony Server (MGC).

0/1= Manual/Automatic changeover

Indexes 853 and 854. Assign Port Number of SR-MGC Health Check (receiving side). **Note 8**, **Note 9**
Index 855. Assign CBT polling cycle from MGC to SR-MGC for SMDR Information management.

00 = 5 seconds (default)
01 ~ FF = 1 ~ 255 seconds

Indexes 856 and 857. Assign Port Number of SR-MGC Health Check (sending side). **Note 8**
Indexes 858 and 859. Assign Port Number of SMDR Information (receiving side). **Note 8**
Indexes 860 and 861.Assign Port Number of SMDR Information (sending side). **Note 8**
Index 862. Assign a cycle to check whether the SMDR information is stored on SR-MGC.

Note 8: Use **ADTM** command when changing the Default Port Number.

Note 9: The Port Number assigned by Indexes 853 and 854 must correspond to the system data in both the Telephony Server (MGC) and SR-MGC.

[2] Use the **ASYD** command

System Data 1, Indexes 87 and 88. Assign the time to perform the routine diagnosis.

[3] Use the **CMNT** command

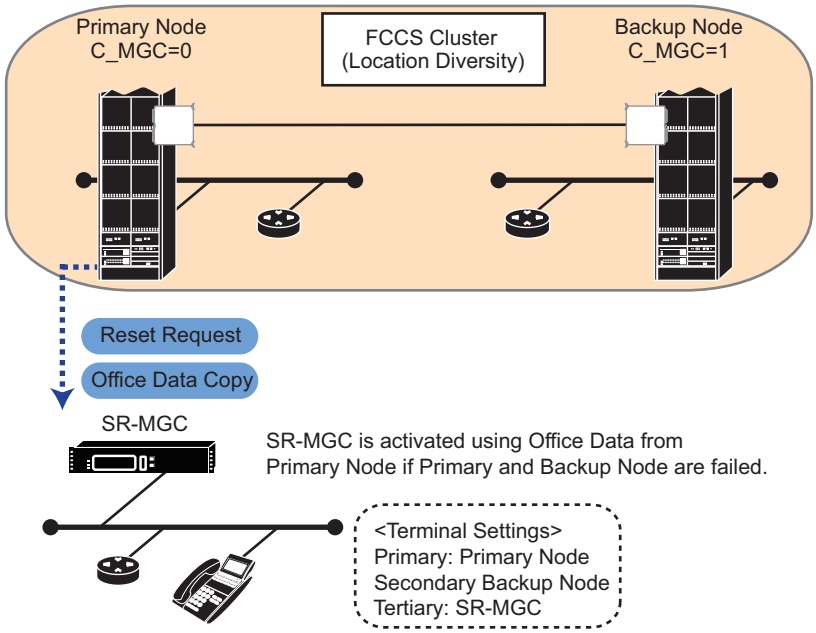
Assign the SR-MGC data such as IP address, and office name.

<Setting Tab>

MGC No. [0-255]
Specify the SR-MGC number in the target remote office.
Office Name [Maximum 20 characters]
Enter the office name for corresponding with the MGC Number.
LP No. [0/4/8/12/16/20/24/28] **Note 10**
Select the corresponding Local Processor (LP) Number.

Note 10: This parameter is required when the remote office is configured by UMGi system.

IP Address
Enter the IP Address of SR-MGC.
Mode
This mode determines the timing when the changeover to SR-MGC is executed.



1= Automatically switched to SR-MGC operation when communication failure has been detected between the Telephony Server (MGC) and SR-MGC.
Automatically switched back to the Telephony Server (MGC) operation when communication recovery has been detected between the Telephony Server (MGC) and SR-MGC.
In FCCS Cluster network, if SR-MGC detects normality of communication between SR-MGC and Primary node or SR-MGC and Backup nodes, SR-MGC will switch the rescued terminals back to the recovered node.

2= Automatically switched to SR-MGC operation when communication failure has been detected between the Telephony Server (MGC) and SR-MGC.
Automatically switched back to the Telephony Server (MGC) operation when communication recovery between the Telephony Server (MGC) and SR-MGC, and normality of communication between the Telephony Server (MGC) and a selected terminal have been detected.
In FCCS Cluster network, if SR-MGC detects normality of communication between SR-MGC and Primary node, Primary node and a selected terminal, SR-MGC will switch the rescued terminals back to the Primary node.

C_MGC
Select an Operating Mode for SR-MGC. Set “1” in the Backup node side if SR-MGC is used with FCCS Cluster feature (SR-MGC with FCCS Cluster). **Note 11**
Note that this parameter is displayed only when LOCATION DIVERSITY feature is provided.
0= Normal Operation
Office data in the Telephony Server (MGC) can be copied to the SR-MGC.

1= This option must be selected in the Backup node when the SR-MGC is used with FCCS Cluster (SR-MGC with FCCS Cluster)
Office data in the Telephony Server (MGC) cannot be copied into SR-MGC.

Note 11: The following is an example using C_MGC when SR-MGC is used with FCCS Cluster feature.

<Initialize Tab>

Initialization of SR-MGC can be activated on this tab.
Click either of the radio buttons and press the Execute button to execute initialization on the target SR-MGC.

KIND: Specify the SR-MGC which will be activated for initialization.
Click either of the radio buttons and press the Execute button to execute initialization on the target SR-MGC.

Individual: Specify the MGC Number when this button is selected.
MGC No.: Enter a unique MGC Number. **Note 12**

ALL: Select this button to execute the initialization on all the SR-MGCs in the network.
MGC Kind Select: Select “SR-MGC”. **Note 13**

Note 12: Do not specify the operating SR-MGC.

Note 13: The SR-MGCs which are selected by “ALL” of “KIND” are the Standby mode SR-MGCs only.

<Change Operating Tab>

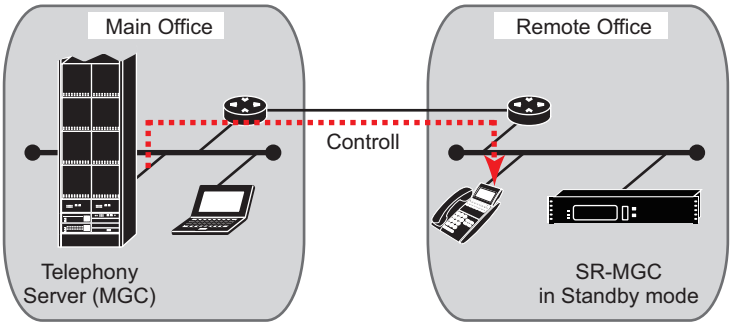
MGC Kind Select: Select “SR-MGC”.

FUNC: “Change Operating” is displayed in gray (fixed).

CONDITION: Conditions in SR-MGC can be selected. **Note 14**, **Note 15**, **Note 16**

To Operating mode: Switches SR-MGC to Operating mode
To Standby mode with terminal reset: Switches SR-MGC to Standby mode

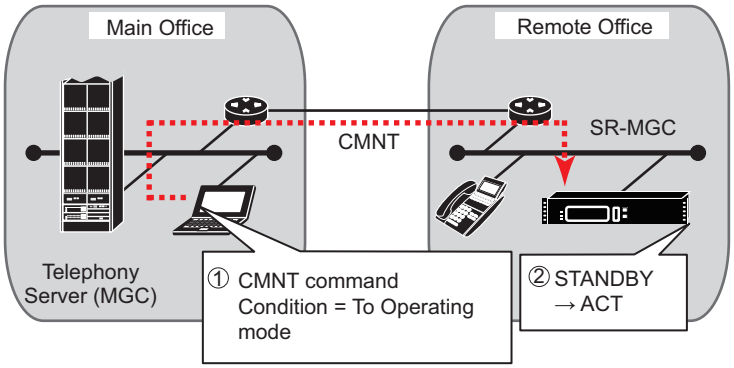
KIND: Specify the SR-MGC, which will be activated if the Telephony Server (MGC) is failed.



Individual: Specify the number of SR-MGC.
MGC No.: Enter a unique MGC Number.
ALL: Specify all the SR-MGCs.

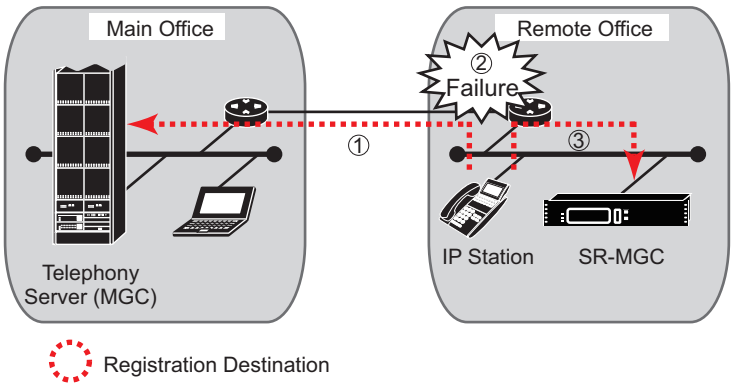
Note 14: This parameter forcibly switches SR-MGC into Operating mode from Standby mode, which means SR-MGC allows terminals to register to SR-MGC. This parameter does not switch all the terminals registered in the Telephony Server (MGC) to SR-MGC.

Note 15: After the mode of SR-MGC has been switched by this parameter, the SR-MGC will be in Operating mode. To switch the SR-MGC into Standby mode, use “To Standby mode with terminal reset”. Note that the ASYDL settings (ASYDL SYS1 Index 852 Bit 5:IP terminal registration changeover) are not valid to this operation. When SR-MGC enters Standby mode, the Telephony Server (MGC) starts to operate.



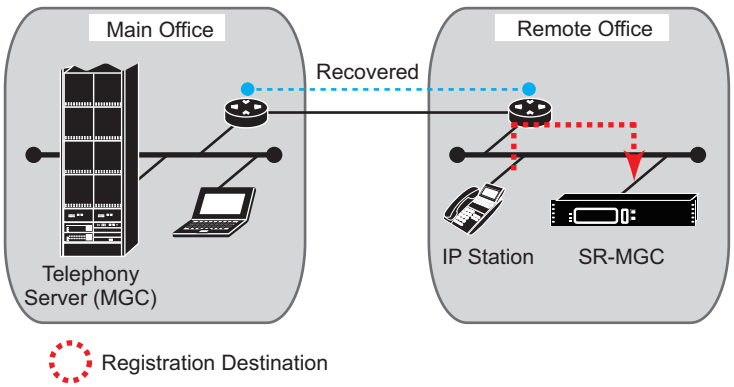
Note 16: The following are examples of using these parameters. If you use SR-MGC with FCCS Cluster (C_MGC = 1), see also the Service Conditions in SR-MGC with FCCS Cluster part of LOCATION DIVERSITY[L-55] in the Data Programming Manual - Business.

The Telephony Server (MGC) is located in Main Office, and SR-MGC is located in Remote Office. Terminals in Remote Office are controlled by the Telephony Server (MGC).



1. When “To Operating mode” is selected in CONDITION

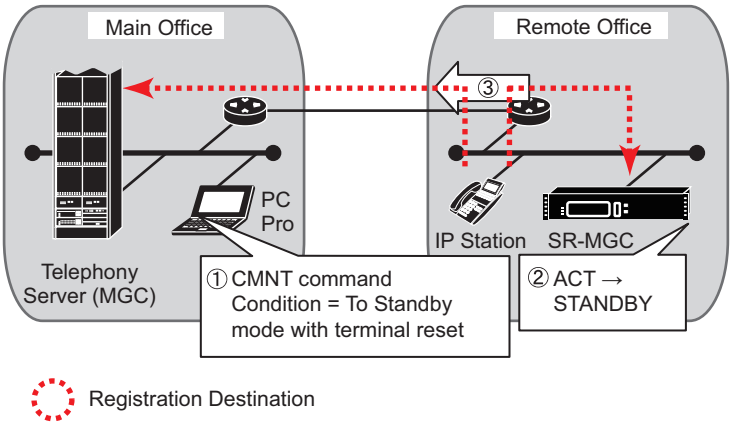
SR-MGC is switched into Operating mode. All the terminals registered in the Telephony Server (MGC) are allowed to register to SR-MGC, regardless of network conditions. Note that it takes one cycle of Health Check time (30 seconds at default) to send a request.



2. When fault occurs

When terminals located in Remote Office detect the network failure, Terminal Reset is performed and then the terminals re-register to SR-MGC.

3. When the Telephony Server (MGC) is recovered



Even though the Telephony Server (MGC) is recovered from network failure, the setting (To Operating mode in CONDITION) keeps SR-MGC operating and controlling the terminals. (Terminal Reset will not be performed.)

Even when network fault and fault recovery often occur, the terminals are available using SR-MGC.

4. Back to normal operation

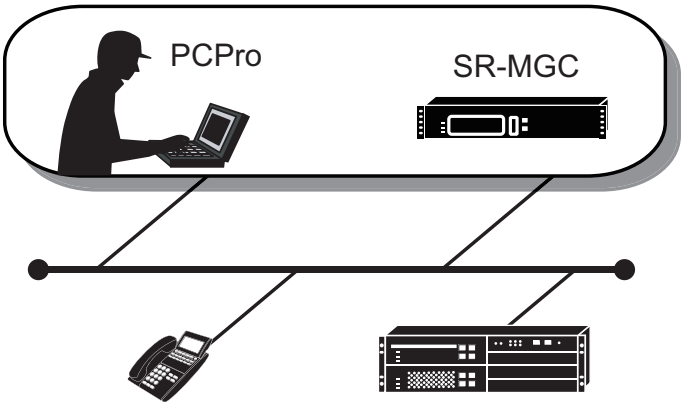
Select "To Standby mode with terminal reset" to switch SR-MGC into Standby mode, which sends Terminal Reset causing the terminals to re-register to the Telephony Server (MGC).

1. Use the **AKYD** command (Option)

   Assign the Visitor feature to the Line/Feature Key of the terminal, which makes it re-register to Primary Telephony Server (MGC).
   KYI=1 (Function Key)
   FKY:156 (Visitor)

2. Use the **ADSL** command (Option)

   Assign the Visitor feature to the Soft key of the terminal, which makes it re-register to Primary Telephony Server (MGC).
   SN=0 (Status Display)
   FKY=156 (Visitor)



3. Use the **MEM_HDD** command

   Back up the office data into the Flash card in Telephony Server (MGC)

Note: Do not select SR-MGC in the Data Type Select.

Data Assignment on SR-MGC

This item explains the procedures for setting up SR-MGC. Log in to SR-MGC by PCPro.

[1] Use the **AIPA** command

Assign initial setting data including an IP address and transmitting speed on the SR-MGC.

<IP Address Setting Tab>

IP Address: Specify an SR-MGC's address.
Subnet Mask: Specify a subnet mask for the preceding address.
Default Gateway: Specify a router's address by which the SR-MGC's packets are routed.
MGC IP Address: Specify an MGC's (Telephony Server's) address to which the SR-MGC belongs. **Note 1**, **Note 2**

Note 1: Specify a LAN1 address (ACT) of the MGC.

Note 2: When UMGi/RNIP system is used, specify a LAN1 address (ACT) of the CCN.

<NIC Setting Tab>

Speed: Specify transmitting speed between the SR-MGC and a connected network device.
Duplex Mode: Specify a duplex mode between the SR-MGC and a connected network device. **Note 3**

Note 3: The setting is necessary only when specifying Fixed 10Mbps or Fixed 100Mbps in Speed.

[2] Use the **ATIM** command

Assign clock information on the SR-MGC.

<Date & Time Tab>

DATE: Specify a current date: Year/Month/Day.
DAY: Displays a day of the week depending on the preceding date.
TIME: Specify a current clock, 00:00 through 23:59.
Time Zone: Specify a time zone to which the SR-MGC belongs, GMT-13:00 through GMT+14:00.

<Daylight Savings Time Tab>

START/END
KIND: Select either of Date or Day.

[When selecting Date in KIND]

- Every Year: Checking it eliminates the following Year field.
- Month
- Day: Specify a day of the month.
- Year
- Hour
- Minute

[When selecting Day in KIND]

- Every Year: Checking it eliminates the following Year field.
- Month
- Day: Specify a day of the week.
- Year
- Hour
- Minute

[3] Use the **ASPC** command

Assign a SIP server ID on the SR-MGC.

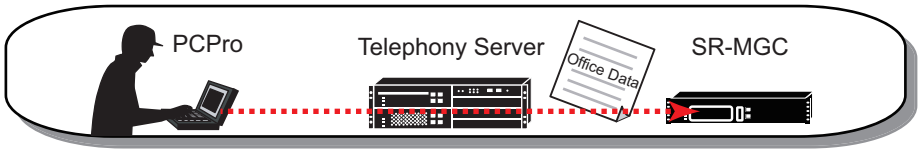
Note: Perform the following only.

<SIP server ID>

System: Select System-0 (fixed).
Input Mode: Select Standard.
Function: Select SIP Server.
SIP Server ID: Specify a SIP server ID of the SR-MGC, 1 through 127. **Note 4**

Note 4: Enter the same value as a SIP server ID assigned on the MGC with the ASSDN/L command.

[4] Use the **MEM_HDD** command



Back up the data set in the SR-MGC: select Memory to Hard Disk in Direction Select; check Data Memory and SR-MGC Data in Data Type Select.

Note: Perform Office Data Load & System Initialize with the SINZ command to enable data you assigned with the AIPA command.

[5] Copy Office Data by using the **CMNT** command

Log in to the Telephony Server (MGC) by PCPro and copy Office Data from the Telephony Server (MGC) to SR-MGC. Do not turn off the power of the SR-MGC during the Office Data copy. **Note 5**, **Note 6**

CMNT command provides SR-MGC with File Control tab. You can use this tab to copy a program in MGC to a SR-MGC after the program in MGC had been updated as is in the same version.
Execute CMNT command with PCPro; select "Program Copy" in PROCESS TYPE and a SR-MGC number in the grid; click the Execute button.

Note 5: When the Break button is pressed during office data copy, the operation is cut off after the currently copying file is completely copied. However, when DM/LDM/NDM copy is executed, the operation is cut off after all the DM/LDM/NDM files are copied.
File copy operation takes about two minutes per file. (The time varies depending on the connection status of the network.)

Note 6: If you power off the SR-MGC during the office data copy, check the data as follows:
STEP1: Use CMNT command to check the normality of communication between SR-MGC and the Telephony Server (MGC).
STEP2: If the status of the communication is normal, copy the Office Data into SR-MGC. If the communication is not established, set network settings of SR-MGC, and then copy the Office Data into SR-MGC.
When none of the above is performed at the situation, it is not guaranteed that SR-MGC operates normally.

<File Control Tab>

PROCESS TYPE: Processing type
Select the processing type to be executed.

- Office Data Copy & Load: Copies and loads the Office Data.
- Program Copy: Copies the program.
- Program Switch: Switches the program. **Note 7**

Note 7: Do not turn off SR-MGC during the program switch process. SR-MGC will not start up after it is turned off.

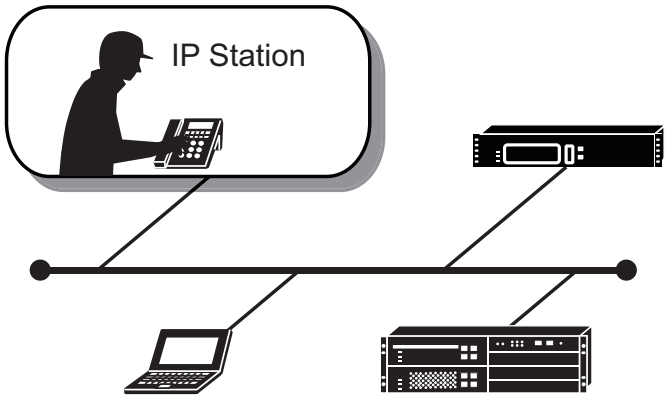
Appoint Stop Time **Note 8**
Check this box when the program copy needs to be stopped at the specified time.

- Time: Time to Stop the Program Copy [00:00-23:59]
  Specify the time to stop the program copy.

Restrict Concurrent Number **Note 8**
Check this box to restrict the number of SR-MGCs to allow concurrent copying.

- Concurrent Number: Parallel Copy Number [1-255]
  Specify the number of SR-MGCs to allow concurrent copying.

Note 8: This parameter is only displayed in the case of PROCESS TYPE = Program Copy is set.



Select MGC No.
Select target SR-MGC to execute the process such as selected with the PROCESS TYPE parameter such as Office Data Copy & Load, Program Copy or Program Switch.

- Specifying SR-MGC:
  Specify the target SR-MGC number (0-255), the box of specified SR-MGC number is displayed in yellow. And then click the Execute button.
  To undo specifying SR-MGC, click the box again.
- All SR-MGC (en bloc specifying):
  Click the Select All button to execute office data or program copy to all the SR-MGCs in the network.

Note: Do not perform any PCPro operations other than CMNT command during office data copy. The PCPro operation such as login/logoff can cause a copy failure.

Data Assignment on Terminals

After SR-MGC and the Telephony Server (MGC) have been installed, the settings of each terminal are necessary to use the SR-MGC. The following must be assigned by each terminal.

- In the case of DtermIP(SIP)

[1] Select “2. SIP Settings” on the main menu.
[2] Select “2. Server Address & URI”.
[3] Select a server type and enter an IP Address (or URL) of SR-MGC.
[4] Select “OK”, and then select “Save” on the main menu.

- In the case of DtermIP(Proprietary Protocol)

[1] Select “3. BackUp-DRS Address” on the main menu.
[2] Select a server type and enter an IP Address of SR-MGC.
[3] Select “OK”, and then select “Save” on the main menu.

If Visitor key is set to your terminal, the terminal will be the following conditions when registered in SR-MGC.

<Line/Feature Key>
The key lights steadily

<Soft key>
The key flashes (red).

Under the above conditions, pushing the Visitor key will switch the terminal back to the Telephony Server (MGC).

S-143 Software Multiple My Line Appearance

General Description

This feature permits a Desktop terminal user to assign the same My Line numbers to the Sub Lines, which will be able to originate and terminate a call by the Sub Lines while another call is being originated or terminated by the My Line. A Sub Line assigned to the same My Line number is mentioned as the Same Number Sub Line afterwards.

Operating Procedure

To make a call using the Same Number Sub Line

1. When making a call, press a Sub Line key you have registered as the Same Number Sub Line. LCD on the called terminal displays the My Line number of the originating terminal.

To receive an incoming call on the Same Number Sub Line

1. When an incoming call arrives at a Sub Line you have registered as the Same Number Sub Line while your are talking, hold the in-progress call and press the Sub Line key.

Service Conditions

1. When this feature is activated with the PA-16ELCJ-B/PA-16ELCN/PA-16ELCN-A card, the following hardware setting is required.

   - SW10-1:
     ON: Previous LP-PM interface
     OFF: New LP-PM interface (When inter-frame multiple My line is used)

   - SW10-2= Fixed to OFF

2. When this feature is activated with the PA-16ELCJ-B/PA-16ELCN card, the following firmware is required.

   SP-3514 16ELCJB PROG-B or later (Firmware) / SP-3956 16ELCN PROG-A or later (Firmware)

3. The maximum number of Same Number Sub Line per Desktop terminal is four lines. When multiple Sub Lines have been registered on a terminal, the incoming call arrives at them in a sequential order.
4. The Same Number Sub Line can be registered to G24-31.
5. Uniform Call Distribution (UCD):
   a.) If the Desktop terminal belongs to NDM/LDM, UCD call distribution is available on My Line only.
   b.) If the Desktop terminal belongs to DM, UCD call distribution is available on My Line and all the Same Number Sub Lines. **Note 1**

   Note 1: If the Desktop terminal belongs to DM, the following must be considered. To work around the following, the Desktop terminal must belong to NDM/LDM.
   - A maximum of 100 Stations can be included in a Group.
   - Same Number Sub Line is counted as a Station.
   - If My Line and all the Same Number Sub Lines are busy, incoming calls are forwarded to other Station in the Group.

6. When the Desktop terminal (My Line) accommodating the Same Number Sub Line is included in a Station Hunting Group:
   a.) If the Desktop terminal belongs to NDM/LDM, Station Hunting - Terminal/Circular/Priority/Priority with Switchback is available on My Line only. **Note 2**

   Note 2: If the Desktop terminal (My Line) accommodating the Same Number Sub Line is assigned as a Pilot Station, incoming call is forwarded to the next Station in the Group when My Line and all the Same Number Sub Lines are busy.

   b.) If the Desktop terminal belongs to DM, Station Hunting features are available on My Line and all the Same Number Sub Lines. **Note 3**

   Note 3: If the Desktop terminal belongs to DM, the following must be considered.
   - A maximum of 100 Stations can be included in a Group.
   - Same Number Sub Line is counted as a Station.
   - For Station Hunting - Terminal/Circular:
     Incoming Calls are forwarded to the next Station when My Line and all the Same Number Sub Lines are busy.
     For Station Hunting - Priority/Priority with Switchback:
     Not available (Station Hunting - Priority/Priority with Switchback feature is originally activated via Telephone Number only)

7. When the service is provided to Desktop terminal in a group of Call Pickup

   When the Desktop terminal picks up a Station from the group
   a.) The call can be taken by using My Line and Sub Line.

   When the Desktop terminal is hunted by a Station from the group
   a.) When the Desktop terminal belongs to NDM/LDM, the call can be answered by using only My Line.
   b.) When the Desktop terminal belongs to DM, the call can be answered by using My Line and Sub Lines.
8. Camp-On from other Stations can be set to My Line, and the settings can be specified by the My Line. (Not Sub Line)
9. Name Display is supported on the Same Number Sub Line.
10. When a call with phantom number arrives at a Desktop terminal, if the My Line is being busy, the call will be transferred to the Same Number Sub Line.
11. When Call Forwarding has been set to the My Line, the Call Forwarding will be taken preferentially.

12. Transfer settings can be specified only to My Line. The actions are as follows:
    a.) Call Forwarding-All Calls: All the incoming call are transferred.
    b.) Call Forwarding-Busy Line: A call is transferred when all the lines are busy.
    c.) Call Forwarding-Don't Answer: All the incoming call are transferred.
13. 8/16-party conference with the My Line and the Same Number Sub Lines cannot be made.
14. Override
    a.) When another Station overrides a Station using this feature only the My Line can be taken by the call (The Same Number Sub Line cannot be taken.)
    b.) When a Station using this feature overrides another station, the My Line or the Same Number Sub Line either can be used to call it.
15. The Same Number Sub Line can be selected by Line Preference.
16. BLF lamp lights on when all of the My Line and the Same Number Sub Line are occupied.
17. In Hotel system, this feature is available for Administration Stations.
18. OAI/ACD System does not support this feature.
19. RSC and SFC of the Same Number Sub Lines are the same as those of My Line.
20. Same Number Sub Lines can be assigned to My Line only. It cannot be assigned to another Desktop terminal's Sub Line.
21. In Call Back service, only My Line can be registered to two-type extension that can specify the call back or can be specified as the target extension.
22. This feature is available via FCCS network.
23. The same number Sub Line can be assigned only to the Line/Feature Keys of the Desktop terminal. DSS Console is not available.

Interactions

1. Interactions are listed on the next page. These features are available in station-to-station speech.

SERVICE CONDITIONS WITH OTHER SERVICE

Note 4: Although the settings are unavailable, an incoming call is transferred to the destination set by My Line.
Note 5: Interrupting another extension is available but interrupted by another extension is not available.
Note 6: If both of the two extensions in My Line are in idle, they can be called at the same time.
Note 7: Not available by using the access code. Use a Line/Feature key (FKY=116).
Note 8: If My Line, which has set Do Not Disturb-D, is in busy status, incoming calls terminate to Same Number Subline.
Note 9: Do not assign the same Telephone Number used for Physical Station Number of My Line to other Stations.

Programming

STEP 1: **AKYD** - Assign the Station according to the following parameters:

TN: Tenant Number

STN: Station Number

PRI: Priority Of Answering Call [0-4]

PL TN: Prime Line Tenant

PL STN: Prime Line Station Number

S = 0

MWD: Message Waiting Data Display Selection

0: MW data display on the top line

1: MW data display on the bottom line

LN PRE:Line Preference For Speaker Button [0-3]

0: Prime Line pickup

1: Customize (Line Preference data are to be set for the other buttons)

SPK: Line Preference For Speaker Button [0-3]

0: Prime Line Preference

1: Idle Line Preference

2: Incoming Line Preference

3: Ringing Line Preference

ANS: Line Preference For Answer Button [0-2]

0: Prime Line Preference

1: Incoming Line Preference

2: Ringing Line Preference

ORG: Line Preference For Originating Button

0: Prime Line Preference

1: Idle Line Preference

TP: Type of Desktop Terminal

DATA	Dterm300 Series	Dterm Series *i*
0	2/6/12–button type	4/8/16–button type
1	24–button type with Add on Module	32-button type with Add on Module
2	2/6/12–button type + FLEX keys	4/8/16–button type + FLEX keys
3	24–button type with Add on Module + FLEX keys	32-button type with Add on Module + FLEX Keys

KYN: Key Number [1-40]

KYI: Service Index=2 (Multi Line Key)

KD: Line Kind

0: Line

1: Intercom
2: DSS Key
3: Not Used
4: Same Number Sub Line

Tenant Number of Multi-Line

When KYI = 2, the tenant assignment of the Multiple My Line Appearance must be the same tenant as the Prime line.

When KD = 4, the tenant same with the extension number is registered (Not Available)

MultipleLine EN:Accommodated Location of the Same Number Sub Line.

This parameters is valid when KD = 4.

STEP 2: **ASFC** - Assign the service feature restriction class of this feature.

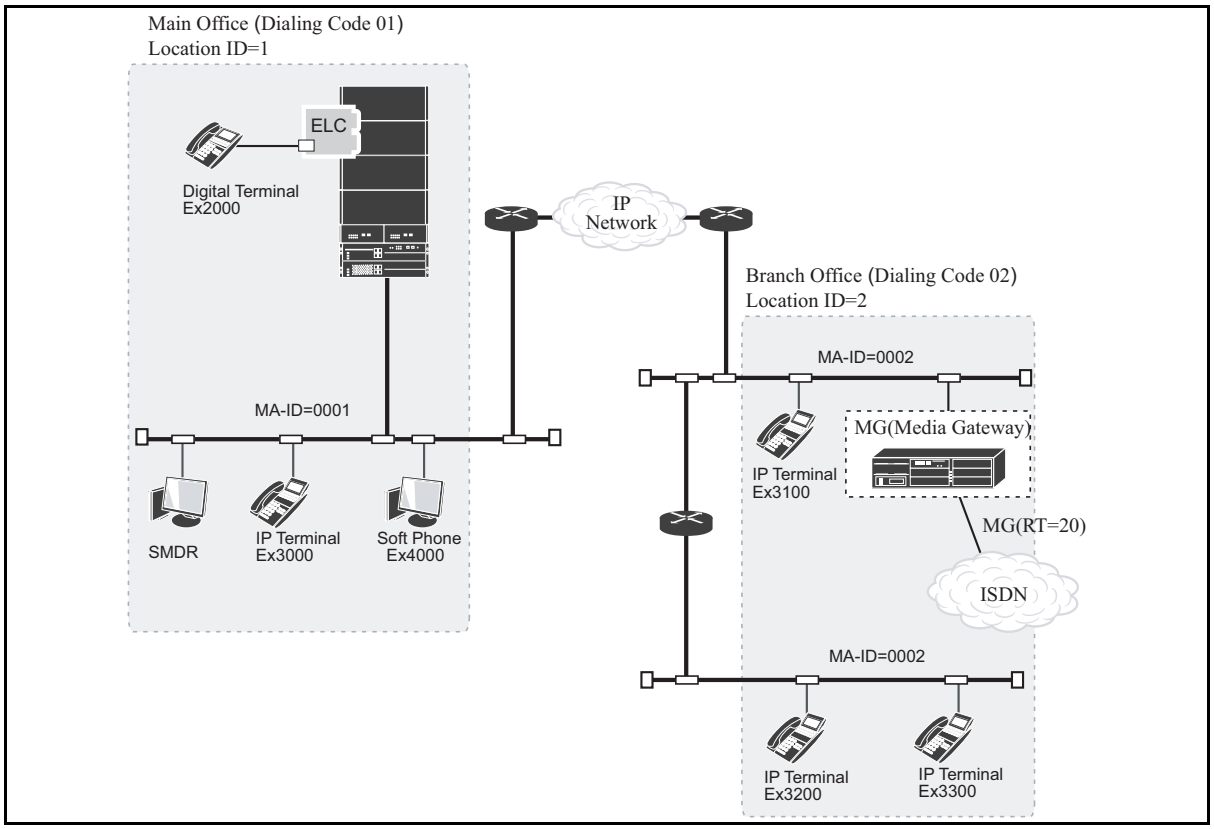
D/N: Day/Night Mode

TN: Tenant Number [1-63]

SFI: Service Feature Index = 212 (Software Multiple My Line Appearance)

SFC: Service Feature Restriction Class [0-15]

RES: Restriction Data



0: Restricted

1: Allowed

S-144 SMDR Multi Area ID via IP

General Description

This feature allows the system to record the billing information that terminal user makes a call via Media Gateway (MG). To perform this feature, each terminal must have an identification called MA-ID. This MA-ID is actually assigned to each location connected via IP network by using AMAA command. When the terminal in the network calls a party, it sends the location-assigned ID as the MA-ID so that the Station Detail Recording System (SMDR) can figure it out as the billing information. This feature is available when multiple Layer 3 networks are managed in the network. Note that MA-ID must be assigned to each location (called a Base) connecting IP network.

In IP network, assigning the MA-ID to each Base can create the billing information over the IP network. However, Station-to-Station SMDR is invalid, a speech between the same MA-ID terminals does not record any information.

- In the case that Extensions 2000 and 3000 call Extension 3100 having MA-ID=0002, the following are recorded after the call is terminated:

  (a) Extension 3000: MA-ID=0001 (assigned to a network that Extension 3000 belongs) and MA-ID=0002 (assigned to a network that Extension 3100 belongs) are recorded.

  (b) Extension 2000: MA-ID=0001 (assigned to a network that the Telephony Server belongs) and MA-ID=0002 (assigned to a network that Extension 3100 belongs) are recorded.

- In the case that Extension 3000 performs a trunk outgoing call (MG RT=20), MA-ID=0001 (assigned to a network that the Extension 3000 belongs) and MA-ID=0002 (assigned to a network that MG belongs) are recorded after the call is terminated.

Service Conditions

<Important Notices>

1. This feature requires the MA-ID assigned to each network segment.
2. All the network segment that contains the extensions and the trunks must be assigned MA-ID.
3. An unregistered network sends 0 as MA-ID to SMDR.
4. All network segments that have Stations and/or Trunks require to assign the MA-ID. If MA-ID is not assigned, MA-ID = 0 is recorded in SMDR when the terminal hangs up.
5. The same MA-ID can be assigned to multiple network segments.
6. Multiple MA-IDs cannot be assigned to one network segment.

<Interactions with Other Features>

1. A telephone using Sub Line sends its MA-ID.
2. When a call is made using a Sub Line or Virtual Line, the MA-ID of the My Line is passed.
3. When Centralized Billing-CCIS is used, MA-IDs are not recorded in SMDR.
4. In Hotel System, the billing information (including MA-ID) is not provided as [14-X] message to Property Management System (PMS).
5. MA-IDs are not included in a CS report.
6. The MA-ID is not added to a Status Monitor Facility Notification message (SMFN) of OAI.

<Hardware/Software>

1. This feature is valid in the SMDR of IMX format.
2. Non-IP terminal sends the network MA-ID that the Telephony Server connects.
   Note that network MA-ID is assigned to network via an external LAN by AMAA command.
3. PS sends the MA-ID of hunted CS.

<Interactions with Networks>

1. This feature is valid when multiple Layer 3 networks exists.
2. When the location of a terminal is changed (i.e from Head Office to Branch Office), the MA-ID of the current location is recorded in SMDR.
3. An FCCS network requires the MA-ID added to the SMDR text (ASYDL, SYS1, Index 589, B0=1).
4. A unified SFC table should be used in an FCCS Network.
5. When this feature is applied to an FCCS network, MA-ID must be assigned to all nodes and the network.

<Conditions Specific to This Feature>

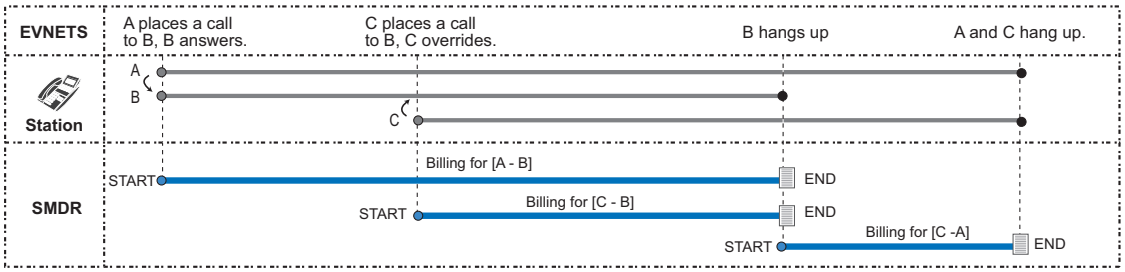
1. An IP terminal MA-ID to be sent is an MA-ID assigned to a network where the IP terminal belongs.
2. This feature creates an SMDR record only for a Station-to-Station call between different offices (with different MA-IDs) via IP network.
3. By assigning system data (ASYDL, SYS 1, Index 589, Bit 3 = 1), SMDR output is provided when an ongoing call is transferred to another terminal that has a different MA-ID. Depending on terminal operations and the system data, billing is performed as follows.

OPERATION		When INDEX 589 Bit 3 = 0	When INDEX 589 Bit 3 = 1
Release while Talking		Billing ends.	• Billing ends.
Hold		Billing ends.	• Billing continues.
Transferring Operation (e.g. hooking)		Billing ends.	• Billing continues.
Blind Transfer	Intermediate Station Releases	No Billing	• Billing for the Original Call ends.
	Transfer Destination Answers	No Billing	• Billing for the previous party and the Transfer Destination starts.
	Intermediate Station Answers to Recall	No Billing	• Billing for the Original Call starts.
Call Transfer	Transfer Destination Answers	No Billing	• Billing for the Original Call continues. • Billing for the Intermediate Station and Transfer Destination starts.
	Intermediate Station Releases	No Billing	• Billing for the previous parties ends. • Billing for the Intermediate Station and Transfer Destination ends. • Billing for the previous party and the Transfer Destination starts.
Call Transfer is canceled.		No Billing	• Billing continues.

Note: Intermediate Station indicates the station that transferred the call. Original Call indicates the telephone call before the call transfer.

4. The following are conditions for billing after transferring a call over IP by assigning a system data (ASYDL, SYS1, Index 589, Bit 3 =1).

   - Split billing is applied for generating SMDR after transferring a call.
   - When a call is placed on hold by Call Park or by a Station having Multiple Line, SMDR continues for the first-answered station if the call is retrieved from other terminal.



5. When a call from Station A is placed on hold by Station B and Call Park has been set, the SMDR is generated as follows when the held call is retrieved by Station C that belongs to the same Call Park Group.

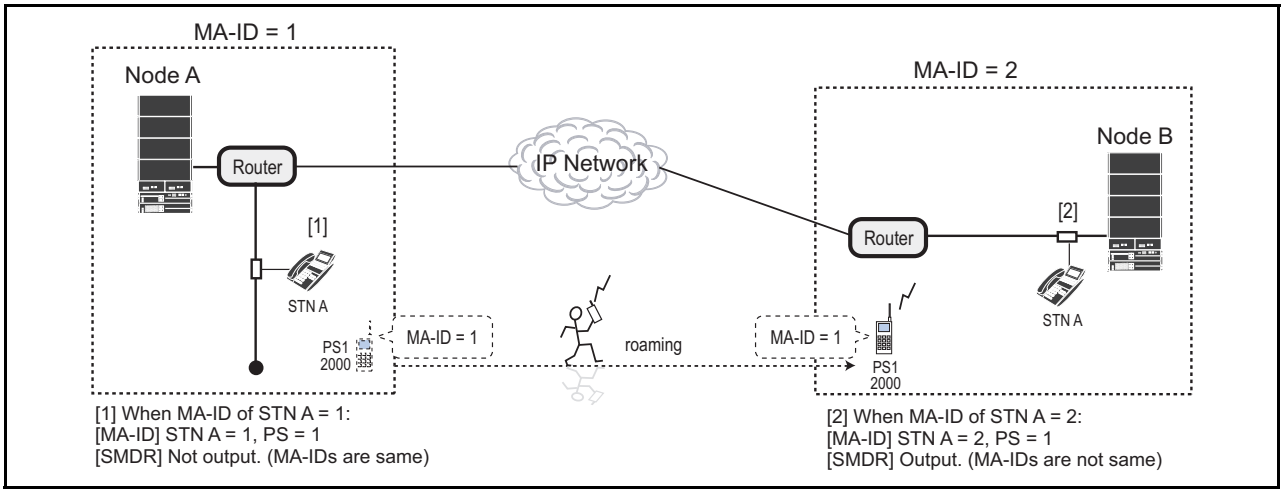
OPERATION	SMDR
Station C retrieves the held call.	Billing output for: Stations A (Calling Party) and B (Called Party)

OPERATION	SMDR
Stations A and C talking, and one of the parties hangs up.	Billing output for: Stations A (Calling Party) and C (Called Party)

6. When a call is transferred by Blind Transfer, the billing starts after the intermediation station is released. If the Intermediate Station is recalled because Transfer Destination does not answer to the transferred call, the billing for the original call will start from when the intermediation station answers to the recall.
7. When a station is recalled by Call Hold, the billing starts when the station is recalled.
8. When an ongoing call changes to Three-party Conference, the previous billing continues for Two-way calling.
9. When a Three-way Calling is established by Executive Right-Of-Way, new billing starts for the overriding party and the overridden party. The billing for original Two-way call continues.
10. When a Tree-way Calling is established by Executive Right-Of-Way, and if the overridden party hangs up, the following two SMDR texts are output. (A) Billing for the overridden party and the original opposite party, (B) Billing for the overridden party and the overriding party. In addition, new billing starts for the original opposite party and the overriding party.

The following shows time chart for issuing SMDR information.

11. When eight-party conference is established, the billing is generated as follows.



<Add-On>

OPERATION	Calling Party	Called Party
Conference Leader	Conference Leader's Number	8-party Conference Pilot Number
Conferees	Conference Leader's Number	Conferee's Number

<Meet-Me>

OPERATION	Calling Party	Called Party
Conferees	Conferee's Number	Conference Telephone Number

12. When a PS performs roaming while talking, the MA-ID used when the PS started talking is applied to the billing information.

13. In the offices not using Call Transfer Event Facility (ETF) that the OAI system uses, set ASYD, SYS1, Index 19, Bit 5=0. Unless, the SMDR information will not be output.
14. When using Station-to-Station SMDR, the billing from the PS in visitor node will be tallied by the account code (home node number and PS station number).

<Other Conditions>

None.

Programming

This section explains the data programming related to this feature. For data assignment of SMDR, refer to Station Message Detail Recording (SMDR) [S-10].

STEP 1: **ASYD** - Assign whether SMDR Station-to-Station connection data is output.
SYS 2, Index 3, Bit 7 = 0/1 (Not required/Required)

Note: To record the billing information in the Station-to-Station call via IP network, assign Bit 7 = 1 (SMDR Station-to-Station connection data is output.)

STEP 2: **ASYDL** - Assign the Extension according to the following parameters:
SYS 1, Index 578 - 581, Bit 4 = 1 (IMX format)
SYS 1, Index 589,
Bit 0 = 1 (MA-ID is added to SMDR text.)
Bit 3 = 0/1 (Billing after transfer over different MA-IDs is out of service/in service)
Index 801 Bit 1= 0/1 (Tenant/Share)

STEP 3: **AMAIL** - Assign the Area information.
MA-ID: Charged Area ID [1-9999 (0 is used to clear a MA-ID)]
AREA NAME: Charged Area Name (Maximum 16 digits)

STEP 4: **AMAA** - Assign the MA-ID information to Network ID.
KIND = Network
Type = Individual
IP ADDRESS: Enter the appropriate IP Address
MASK BIT: Select Mask Bit. [1-31]
Network Address: Assign the Network Address.
MA-ID: Assign Charged Area ID [1-9999 (0 is used to clear a MA-ID)]

STEP 5: **ASFC** - To record the billing information in the Station-to-Station call via IP network, assign the service feature restriction class of this feature.
SFC: Service Feature Restriction Class [0-15]
SFI: Service Feature Index 58 = 0 (Station-to-Station SMDR is restricted.)
SFI: Service Feature Index 219 = 1 (Station-to-Station SMDR via IP is allowed.)

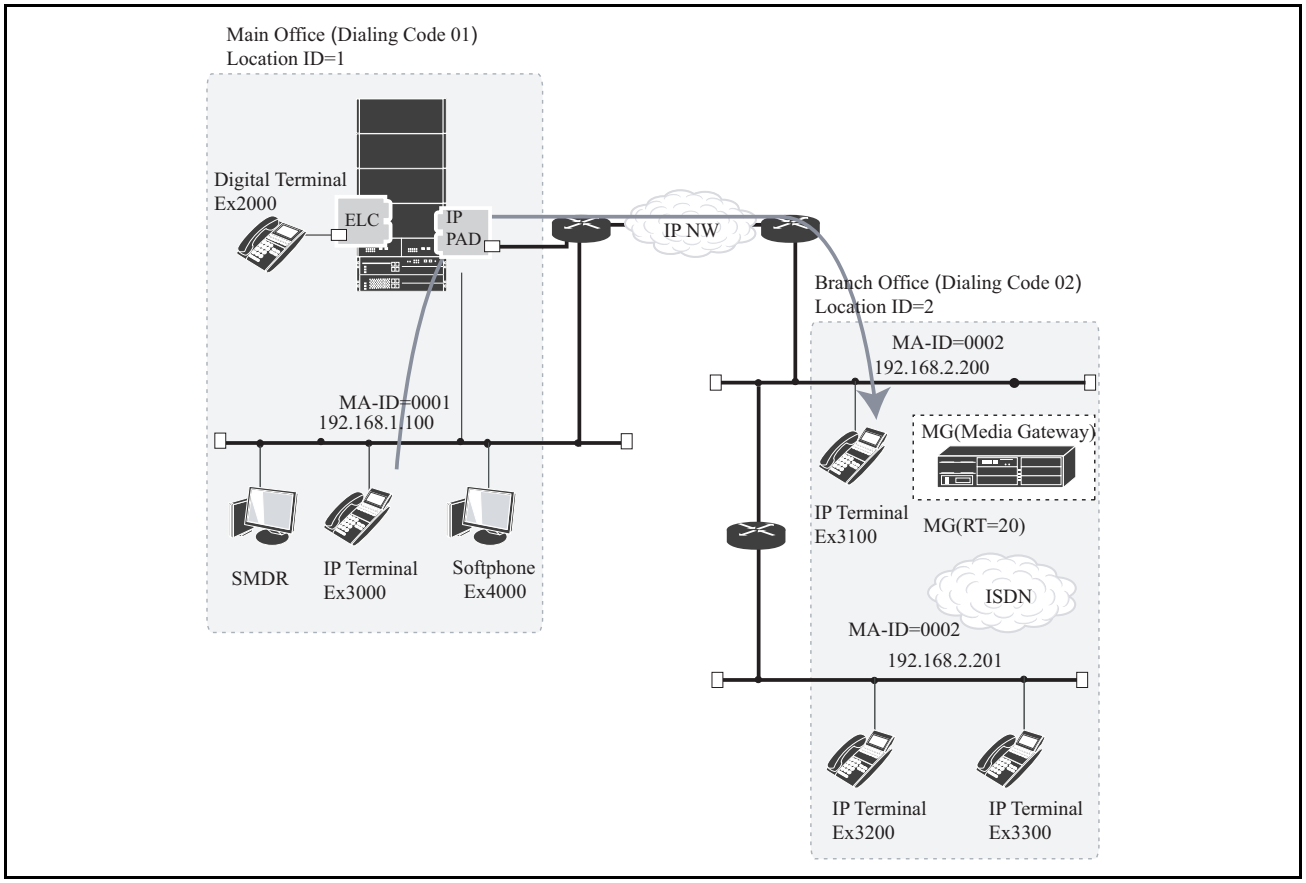
FCCS Programming

This section explains the data programming related to this feature. For data assignment of SMDR, refer to Station Message Detail Recording (SMDR) [S-10].

STEP 1: **ASYD** - Assign whether output of SMDR Station-to-Station connection data is not required or required.
SYS 2, Index 3, Bit 7 = 0/1 (Not required/Required)

Note: To record the billing information in the Station-to-Station call via IP network, assign Bit 7 = 1 (SMDR Station-to-Station connection data is output.)

STEP 2: **ASYDL** - Assign the Extension according to the following parameters:
SYS 1, Index 578 - 581, Bit 4 = 1 (IMX format)
SYS 1, Index 589,
Bit 0 = 1 (MA-ID is added to SMDR text.)
Bit 1 = 1 (P2P FCCS SMDR is valid)
Bit 3 = 0/1 (Billing after transfer over different MA-IDs is out of service/in service)



STEP 3: **AMAIN** - Assign the Area information.
MA-ID: Charged Area ID [1-9999 (0 is used to clear a MA-ID)]
AREA NAME: Charged Area Name (Maximum 16 digits)

STEP 4: **AMAA** - Assign the MA-ID information to Network ID.
KIND = Network
Type = Individual
IP ADDRESS: Enter the appropriate IP Address
MASK BIT: Select Mask Bit. [1-31]
Network Address: Assign the Network Address.
MA-ID: Assign Charged Area ID [1-9999 (0 is used to clear a MA-ID)]

STEP 5: **ASFCN** - To record the billing information in the Station-to-Station call via IP network, assign the service feature restriction class of this feature.
SFC: Service Feature Restriction Class [0-15]
SFI: Service Feature Index 58 = 0 (Station-to-Station SMDR is restricted.)
SFI: Service Feature Index 219 = 1 (Station-to-Station SMDR via IP is allowed.)

<AN EXAMPLE OF NETWORK SETTINGS>

The following shows an example in the case that Extension 3000 having MA-ID=0001 connects the Extension 3100 having MA-ID=0002.

STEP 1: Assign the following by using the ASYD command.
SYS 2, Index 3, Bit 7 = 1 (SMDR Station-to-Station connection data is output.)

STEP 2: Assign the following by using the ASYDL command.
SYS 1, Index 589
Bit 0 = 1 (MA-ID is added to SMDR text.)
Bit 3= 0/1 (Billing after transfer over different MA-IDs is out of service/in service)

STEP 3: Assign the following by using the AMAIL command.

- Main Office
  MA-ID = 0001
  AREA NAME = New York
- Branch Office
  MA-ID = 0002
  AREA NAME = Tokyo

STEP 4: Assign the following by using the AMAA command.

- Main Office

  KIND = Network
  Type = Individual
  IP ADDRESS = 10.168.1.100
  MASK BIT = 24 (255.255.255.0)
  Network Address = 10.168.1.0
  MA-ID = 0001

- Branch Office

  KIND = Network
  Type = Individual
  IP ADDRESS = 10.168.2.200
  MASK BIT = 24 (255.255.255.0)
  Network Address = 10.168.2.0
  MA-ID = 0002

STEP 5: Assign the following by using the ASFC command.
SFC: Service Feature Restriction Class [0-15]
SFI: Service Feature Index 58 = 0/1 (Station-to-Station SMDR Call is restricted/allowed.)
SFI: Service Feature Index 219 = 0/1 (Station-to-Station SMDR via IP is restricted/allowed.)

S-147 Soft Phone Wired-Phone Handset

General Description

This feature allows Soft Phone users to use a wired telephone (analog wired telephone/Desktop terminal) as handset of Soft Phone.

Operating Procedure

To originate calls

To originate a call from the wired telephone

1. Lift the handset of wired telephone.
2. Hear Dial Tone.
3. Dial the destination number.
4. Hear RBT through the handset of wired telephone.

To originate a call from Soft Phone after off-hooking the wired telephone

1. Lift the handset of wired telephone.
2. Hear Dial Tone.
3. Dial the destination number from the Soft Phone (The address book of the Soft Phone also can be used when dialing).
4. Hear RBT through the handset of wired telephone.

To originate a call from Soft Phone by dialing the destination number

- **When the Soft Phone is connecting with an analog wired telephone.**

1. Press Speaker button of the Soft Phone.
2. Dial destination number from the Soft Phone.
3. Hear RBT through the analog wired telephone handset.

- **When the Soft Phone is connecting with Desktop terminal**

1. Press Speaker button of the Soft Phone.
2. Hear DT from the speaker of Desktop terminal.
3. Dial destination number from the Soft Phone.
4. Hear RBT from the speaker of Desktop terminal.
5. Lift the Desktop terminal handset.
6. Hear RBT from the handset.

To originate a call from Soft Phone dialing with its address book

- **When the Soft Phone is connecting with analog phone.**

1. Click the destination number in the address book of the Soft Phone.
2. Lift the analog wired telephone handset.
3. Hear RBT through the handset.

- **When the Soft Phone is connecting with Desktop terminal**

1. Click the destination number in the address book of the Soft Phone.
2. Hear DT from the speaker of Desktop terminal.
3. Lift the Desktop terminal handset.
4. Hear RBT from the handset.

To receive a call

- **To receive calls with the wired telephone (Analog wired telephone/Desktop terminal)**

1. Receive a call with the wired telephone/Soft Phone.
2. Lift the handset of wired telephone.

Note: When the Soft Phone is connecting with analog wired telephones, pressing Speaker button is not effective.

Note: When the Soft Phone is connecting with Desktop terminal, intended party's voice can be heard through the speaker of Desktop terminal by pressing Speaker button of the Soft Phone.

- **To receive calls with other sub lines than lines of the wired telephone connecting with the Soft Phone.**

1. Receive a call with other lines than lines of the wired telephone connecting with the Soft Phone.
2. Press the line of the Soft Phone receiving the call.
3. Lift the handset of wired telephone.

Note: Above steps [(2) and (3)] can be done in reverse order.

Note: When the line receiving a call is pressed while the Soft Phone is connecting with analog wired telephone, the line of the analog wired telephone blinks. In this case, lift the handset in order to perform Call Pickup.

Note: When the Soft Phone is connecting with Desktop terminal, sub line can receive calls as usual.

To hold calls

Parking calls when Call Park data is already registered

- **Call Park with Hold button**

1. Press the Call Park button on the Desktop terminal /Soft Phone during the call (Intended party hears Hold Tone).
2. Call Park Group-D lump (Call Park Group-D Feature Key) on Line/Feature button of the Soft Phone blinks. Then, hear SST.
3. Hang up the handset of wired telephone.

- **Call Park using the Access Code**

1. Hook during the call (Intended party hears Hold Tone).

2. Hear SPDT.
3. Press Access Code of Call Park Group: Hold.
4. When Call Park Group-D lump on Line/Feature button of the Soft Phone blinks, hear SST (When "1" of Call Park Group-D is blinking, it means the Park Number is 1).
5. Hang up the handset of wired telephone.

Holding and answering calls when Call Park data is already registered

- **Holding and answering calls with Call Park key**

1. Lift the handset of wired telephone.
2. Press the blinking Call Park key (Call Park Group-D Feature Key).

Note: Above steps [(1) and (2)] can be done in reverse order.

- **Holding and answering calls with Access Code.**

1. Lift the handset of the wired telephone.
2. Press the Access Code of Call Park Group: Retrieval.
3. Hear SPDT.
4. Press the Park Number (When Call Park Group-D is blinking while holding a call, it means the Park Number is 1).
5. Start answering the parked call.Then, Call Park Group-D lump goes out.

- **Holding and answering calls through sublines as usual when Call Park data is not registered**

Note: This feature is available only when the Soft Phone is connecting with Desktop terminal. When it is connecting with analog wired telephone, this feature is not available.

- **Holding**

1. Press Hold button of the Soft Phone or Desktop terminal during conversation (Intended party hears Hold Tone).
2. Held Subline of Soft Phone or Desktop terminal blinks.
3. Hang up the handset of the wired telephone.

- **Answering and holding**

1. Lift the handset of the wired telephone.
2. Press the held subline of Soft Phone or Desktop terminal.

To use handsets

- **Using the handset of Soft Phone.**

1. Press Handset Switch key not lighting out on Soft Phone.
2. Handset Switch key starts lighting redly.

- **Using the wired telephone (analog wired telephone/Desktop terminal) as a handset of the Soft Phone**

1. Press Handset Switch key lighting out redly on Soft Phone.
2. Handset Switch key stops lighting.

Service Conditions

1. The terminal that can be used as a handset varies depending on the version of DtermSP30.

	DtermSP30 (Ver.2) (Proprietary Protocol)	DtermSP30 (Ver.4) (Proprietary Protocol)	DtermSP30 (Ver.7 or later) (Proprietary Protocol/SIP) and Soft Client SP350
Analog Telephone	N	N	X
DT400 Series/DT300 Series/Dterm/DtermIP/IP Enabled Dterm	N	N	X
DT800 Series/DT700 Series/DtermIP(SIP)	N	N	X
PHS	N	X	X
Wireless Handset (MH Series)	N	N	X

2. When the data for Soft Phone Wired-Phone Handset is registered, My Line to the Soft phone is restricted. Moreover, Prime Line of the Soft Phone must be set as the station number of the wired telephone connecting with.
3. When the data for Soft Phone Wired-Phone Handset is registered, the wired telephone functions as the handset of the Soft Phone every time the Soft Phone registers. However the Soft Phone or the wired telephone is being used (originating a call/a call is in progress), this feature between the wired telephone and the Soft Phone are canceled. After the call is released and the Handset Switch key is pushed, the wired telephone functions and Soft Phone are registered again.
4. Register Handset Switch key registered by AKYD command only to the Soft Phone. Note that the Handset Switch key is invalid when it is registered to Desktop terminal connecting with.
5. Type of wired telephones available to be connected with the Soft Phone are analog wired telephones (including terminals connected with Analog MC/MC&MG -COT) and Desktop terminal.
6. This feature requires to register Telephone Numbers (ALGSL/ALGSN).
7. When answering Sub Lines accommodated on the Multi Line of Soft Phone, it is required to set SFI 29 (Direct Call Pickup) to 1 using the ASFC/ASFCN command.
8. When an analog phone is connecting with the Soft Phone, calls cannot be originated or answered as far as the analog telephone handset is hanged up.
9. When an analog phone is connecting with the Soft Phone, the analog phone can receive calls if it is in on-hook state while the Soft Phone is calling or dialing.
10. Soft Phone and Desktop terminal to be connected together must belong to a same Sub Line. Moreover, do not accommodate My Line of the Soft Phone as other terminals' line.
11. When the connected wired telephone is in use, any soft phone dial key operation cannot send PB to intended party.
12. Once the data to connect the wired telephone and the Soft Phone is registered, Call Transfer data used for My line of the Soft Phone becomes invalid and the Call Transfer data registered to My line of the connected wired telephone becomes valid.

13. When ASYDL/ASYDN, System Data 1, Index 679, Bit 4 is assigned as "0" while CALL PARK GROUP -D [C-176D] feature is enabled, the wired telephone and the Soft Phone to be connected together and extensions assigned to the same group number must belong to the same MG.
14. When the Soft Phone is connecting with an analog wired telephone, Hold button of Desktop terminal becomes valid only if the data for Call Park using Hold button of Desktop terminal is registered.
15. When the Soft Phone is connecting with an analog wired telephone, Call Park Group-D with Hold button can be only handled with Soft Phone. Press the Call Park Hold Key blinking on Soft Phone and lift the handset of the analog telephone.
16. When calling by Soft Phone operation, it uses LCR/LCRS method.
17. When the handset of the connected wired telephone is off the hook, the Soft Phone cannot retrieve the call even if its speaker button is pressed.
18. When connecting IP terminals (terminals connected with DtermIP and Analog MC/MC&MG-COT) and Soft Phone together and use them, make sure that the IP terminals are logged in at first before using the Soft Phone. Moreover, in the case there is any IP terminal logged out, press Handset Switch key to cancel Soft Phone Wired-Phone Handset before using the Soft Phone, or log out the Soft Phone in order to use it.
19. When the IP terminal is used as the handset for this feature, the IP terminal is automatically specified as the handset whenever registration of IP terminal is performed. Even if the Handset Switch is applied, the IP terminal becomes the handset of Soft Phone when registration of IP terminal is performed.
20. Assign the same SFC and RSC to the Soft Phone and the wired telephone connecting with the Soft Phone.
21. This feature cannot be used for OAI/ACD system.
22. This feature cannot be used for Hotel system.

    Note: DT770G supports this feature for Hotel system.

23. When performing Speed Calling-System/Station, only wired telephone can be registered with AISA or AIEA (Soft Phone and wired telephone must be registered to the same Secondary Station).
24. When Soft Phone is using its handset and Soft Phone Wired-Phone Handset is not in use, the following features are not available from the Soft Phone:

    - Outgoing Trunk Queuing
    - Call Back
    - Camp-On Busy
    - Call Back Automatic Cancel
    - Call back-CCIS

25. When the Soft Phone is connecting with analog phones, the following features are not available from the Soft Phone:

    - Timed Reminder
    - Call Forwarding - All Calls - Announcement

26. In using Off-Hook Alarm, analog wired telephones cannot be assigned to specific lines of destination connected to.

27. In the case of answering Call Park and Call Park Group done by the Soft Phone operation with other terminals while Soft Phone Wired-Phone Handset is not in use, use Access Code and My line of the Soft Phone. Moreover, Line Number needs to be registered to My Line of Soft Phone in order to use Call Park.
28. UCD Call Waiting lamp does not light even when it is registered to the Soft Phone connected with.
29. If the intended party is using the Soft Phone connecting with analog wired telephone, the following features are not available:

    - Voice Call
    - Internal Zone Paging
    - Brokerage-Hotline

30. The following features are counted for wired telephone:

    - Service Feature Peg Count
    - Traffic Measurement
    - CS Report

31. Billing is charged for the wired telephone when using the following features:

    - Forced Account Code
    - Station Message Detail Recording (STN to STN)
    - Centralized Billing (NMS)
    - Station Message Detail Recording
    - Centered Billing-FCCS

32. Extensions having Number Display function cannot be accommodated to Multi Line. Therefore, they cannot be connected with Soft Phone.
33. MAC Authentication mode is not available for Soft Phone. However, when the terminal that is used for Soft Phone Telephone Handset is IP terminal or a station connected to Analog MC/MC&MG(COT), MAC Authentication mode is available.
34. Soft Phone is available to be used for VLAN with Windows or external devices.
35. In using UMG, both the Soft Phone and the wired telephone connecting together in Soft Phone Wired Phone Handset need to belong to a same LMG.
36. The following are conditions in terms of Calling Party Number-Name Assignment and Display, Redial, and Stack Number Called-D.

    - Numbers originated from Soft Phone are recorded in Call logs.
    - Numbers originated from wired telephones to stations are recorded in Call logs.
    - Numbers originated from a wired telephone to Trunks may not be recorded in Call logs.
    - Numbers originated from a wired telephone when Soft Phone Wired-Phone Handset is not in use are not recorded in Call logs. However, numbers originated from Soft Phone are recorded.

- Other kind of conditions, such as condition in receiving calls, are the same with conditions of Soft Phone not connected with wired telephones in Soft Phone Wired-Phone Handset.

37. In this feature, when assigning Call Pickup-Group and Expanded Call Pickup-Group data, you need to assign Station Number of Wired Phone only.
38. Refer to **Available Function Key List for Soft Phone Wired-Phone Handset** to know available Function Keys in using Soft Phone Wired-Phone Handset.
39. When Soft Phone Wireless Handset is used, Call Forwarding-All Calls is not canceled even if Call Forwarding-All Calls Automatic Canceled has been assigned by ASYD.
40. This feature is not available for a call via PHC with CCIS over IP.
41. In order to answer calls held by Call Park Group-D with analog telephones, the following needs to be registered.

    - CI=H, N (Retrieve only)
    - SRV=SSCA
    - SIDA=124 (Call Park Group -D: Hold)
    - SIDA=125 (Call Park Group -D: Retrieve)

<Conditions Specific to UMGi/RNIP System>

In using UMGi/RNIP system, both the Soft Phone and the wired telephone connecting together in Soft Phone Wired-Phone Handset need to belong to a same node.

Programming

The following programming steps are explained on the premise that the data for wired telephone and that of Soft Phone are already registered. (Refer to “Assignment of Basic Office Data” in Chapter 2 of “Data Programming Manual” to know how to configure office data for wired telephone.) Moreover, Extension Numbers assigned by ASDT and Soft Phone number assigned by AISTL need to be assigned as Telephone Numbers by ALGSL/ALGSN. (In using the Telephony Server, use ALGSN for this purpose.)
In order to perform Call Park Group-D, assign the office data for Call Park Group-D with Hold button (**Note 1**). For detail information, refer to Data Programming Manual when using the Telephony Server.

Note 1: The following explains required conditions for assigning the data for Call Park Group-D with Hold button.

- When assigning Group Number to each extension using ADGN, My line of the wired telephone and that of Soft Phone need to be registered to ADGN.
- When registering Call Park Group-D Feature Keys to Line/Feature button with AKYD, Call Park Group-D Keys need to be assigned to Soft Phone.
- In order to hold calls from Sub Line with Desktop terminal connecting with Soft Phone in Soft Phone Wired-Phone Handset, it is not necessary to configure the data for Call Park Group-D.

When using standalone configuration

STEP 1: **ASCL** (Station Class Data) - Assign the same Station Class to both Wired Phone and Soft Phone.

Note: When the Station Classes of the Soft Phone and the Wired Phone are different, some operations of this feature may not be performed from the Soft Phone.

Read Station Class Data of Wired Phone.

TN: Tenant Number
STN: Station Number of Wired Phone
TEC=12 (Dterm)
RSC: Route Restriction Class [0-15]
SFC: Service Feature Restriction Class [0-15]

For Soft Phone, assign the same Station Class as that of Wired Phone.

TN: Tenant Number
STN: Station Number of Soft Phone
TEC=12 (Dterm)
RSC: Route Restriction Class [0-15] (Same as RSC of Wired Phone)
SFC: Service Feature Restriction Class [0-15] (Same as SFC of the Wired Phone)

STEP 2: **AKYD** - Assign the PS/Wired-Station Number to the Prime Line of Soft Phone.

PL TN: Prime Line Tenant Number
PL STN: Prime Line Station Number
KYN: Key Number
KYI = 2 (Multiline)
Multi Line TN: Multi Line Tenant Number
Multi Line Station: Multi Line Station Number

Assign Handset Switch button to a function button of the Soft Phone when required.

KYN: Key Number
KYI = 1 (Function Key)
FKY = 157 (Handset Switch)

If Wired Phone is a Desktop terminal, assign Sub Lines accommodated on the Wired Phone to Soft Phone as well.

KYN: Key Number (1-40)
KYI=2 (Multiline)
Multi Line TN: Tenant Number of Multi Line accommodated on Wired Phone
Multi Line STN: Station Number of Multi Line accommodated on Wired Phone

STEP 3: **APJSL** - Assign the relationship between the My Line of Soft Phone and the PS.

UGN : PS/wired telephone User Group Number
TELN : PS/wired telephone Telephone Number
S_UGN : Soft Phone User Group Number
S_TELN : Soft Phone Telephone Number
SUBLF : Sub Line Flag (Whether to use Address Book via Soft Phone's Sub Line)
0/1 = Not used (default)/ used

When using FCCS

STEP 1: **ASCL/ASCL_T** (Station Class Data)

Assign the same Station Class to both Wired Phone and Soft Phone.

> **Note:** When the Station Classes of the Soft Phone and the Wired Phone are different, some operations of this feature may not be performed from Soft Phone.

Read Station Class Data of Wired Phone.

UGN: User Group Number
TELN: Telephone Number of Wired Phone
FPC: Fusion Point Code
TN: Tenant Number
STN: Station Number of Wired Phone
TEC=12 (Dterm)
RSC: Route Restriction Class [0-15]
SFC: Service Feature Restriction Class [0-15]

For Soft Phone, assign the same Station Class as that of Wired Phone.

UGN: User Group Number
TELN: Telephone Number of Soft Phone
TN: Tenant Number
STN: Station Number of Soft Phone
TEC=12 (Dterm)
RSC: Route Restriction Class [0-15] (Same as RSC of Wired Phone)
SFC: Service Feature Restriction Class [0-15] (Same as SFC of Wired Phone)

STEP 2: **AKYD** - Assign the Wired-Phone Station Number to the Prime Line of Soft Phone.

PL TN: Prime Line Tenant Number
PL STN: Prime Line Station Number
KYN: Key Number
KYI = 2 (Multiline)
Multi Line TN: Tenant Number of Multi Line accommodated on Wired Phone
Multi Line Station: Station Number of Multi Line accommodated on Wired Phone.

Assign Handset Switch button to a function button of the Soft Phone when required.

KYN: Key Number
KYI = 1 (Function Key)
FKY = 157 (Handset Switch)

If Wired Phone is a Desktop terminal, assign the Sub Lines accommodated on the Wired Phone to Soft Phone as well.

KYN: Key Number (1-40)
KYI=2 (MultiLine)
Multi Line TN: Tenant Number of Multi Line accommodated on Wired Phone
Multi Line STN: Station Number of Multi Line accommodated on Wired Phone

STEP 3: **APJSN** - Assign the relationship between the My Line of Soft Phone and the PS/Wired Phone.

UGN : PS/wired telephone User Group Number

TELN : PS/wired telephone Telephone Number
S_UGN : Soft Phone User Group Number
S_TELN : Soft Phone Telephone Number
SUBLF : Sub Line Flag (Whether to use Address Book via Soft Phone‘s Sub Line)
0/1 = Not used (default) /used

Data Assignments for Other Services

There are two types of services: services that need to be assigned for Wired Phone only, and services that need to be assigned for both Wired Phone and Soft Phone.

(a) Services that need to be assigned for Wired Phone only.

- Incoming Call services:
  A variety of Station Hunting services or UNIFORM CALL DISTRIBUTION (UCD) [U-1]
- Call Pickup services:
  CALL PICKUP-GROUP [C-7] and Expanded Call Pickup-Group
- Setting/Canceling of CF services:
  CALL FORWARDINFG-ALL CALLS [C-5], CALL FORWARDING -BUSY LINE [C-2], CALL FORWARDING-DON’T ANSWER [M-25] and LOGGED OUT IP STATION-CALL DESTINATION [L-53]

(b) Services that need to be assigned for both Wired Phone and Soft Phone. **Note 3**

- Multi Line Accommodation:
  For Soft Phone, assign the same Station Class as that of Wired Phone.
- CALL PARK GROUP-D [C-176D]:
  Wired Phone and Soft Phone must be assigned to the same Group of the same MG.
- LEAST COST ROUTING FOR MG-PRI [L-54] (MA-ID) (Assignment of AMAA is needed for Soft Phone.)
- Other services:
  Assign required data for Wired Phone and Soft Phone.

Note 3: When the service data is not assigned for Soft Phone, you may not operate the service from Soft Phone (even while Wired Phone is not used as the handset of Soft Phone).

Available Function Key List for Soft Phone Wired-Phone Handset

(X : **available,** N : **not available,** – : **not used)**

FKY	Service Feature	Analog Telephone	Desktop Terminal
1	Call Forwarding - Busy Line	X	X
2	Call Forwarding - All Calls	X	X

Note 4: Soft Phone operation is not effective when Soft Phone Wired-Phone Handset is not in use.

Note 5: Originating calls by Redial button is unavailable when ASYD SYS1 Index 388 Bit 0=1.

Note 6: When Analog telephone is connecting with Soft Phone, this function only applies if Non-Exclusive Hold / Exclusive Hold (Hold) is registered to its connecting Soft Phone for the analog telephone to work.

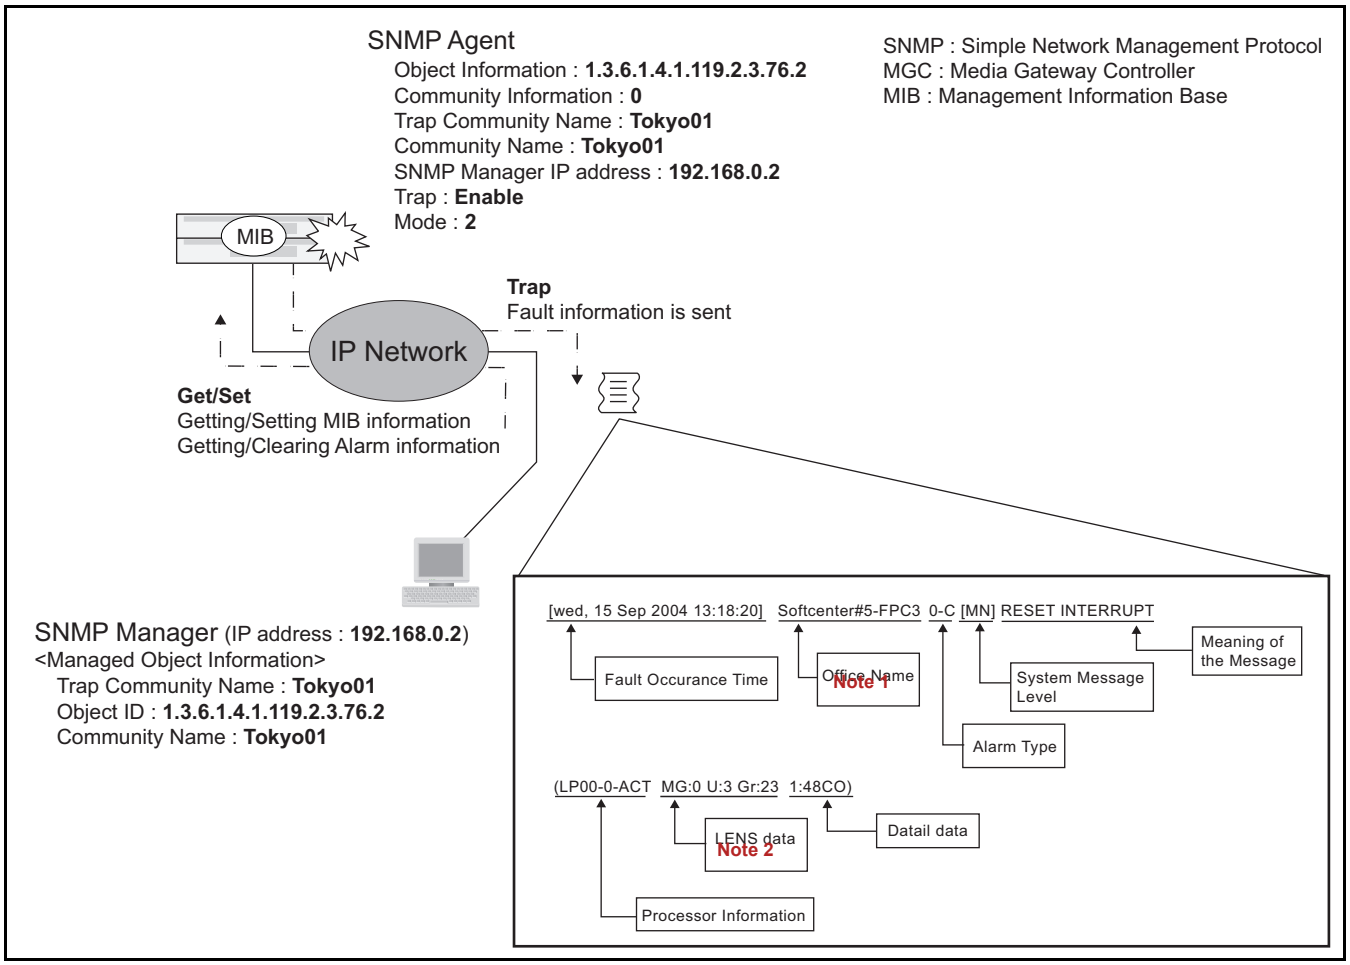
Note 7: Keys of Desktop terminal connecting with Soft Phone are available to be used.

Note 8: When Soft phone is connecting with analog phone, calling party is always displayed as “Restricted”. Moreover, even when the analog phone is receiving calls and the FKY is pressed to enable Do Not Disturb at the same time, the analog phone keeps on ringing.

Note 9: If this function is applied while Soft Phone and its connecting wired telephone belong to different LPs, only lamp on the operated telephone indicates that the function is applied.

Note 10: Operated telephone‘s ring tone is disabled.

Note 11: This feature is only available when calls are made between the operated wired telephone and IP terminal or terminals connecting with Analog MC or MC&MG-COT.

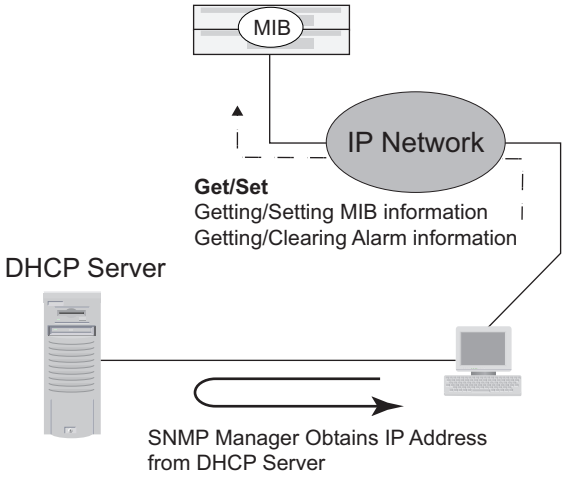


S-148 SNMP

General Description

SNMP, one of network management protocols defined by IETF, transfers and controls information on the TCP/IP basis between the SNMP manager and the SNMP agent. Generally, SNMP management software such as HP Open View and CiscoWorks needs to be installed in the SNMP manager, and operated to monitor the agents. On the other side, the SNMP agent collects network information and stores it as Management Information Base (MIB), which the SNMP manager can control. This system supports MIB-II based on RFC1158 and RFC1213. This setting provides the following functions:

- SNMP manager gets/sets MIB information of SNMP agent.
- SNMP manager monitors/clears the alarms for SNMP agent.
- SNMP agent sends trap (fault information) to SNMP manager.



Other than standard MIB-II, the system supports NEC-specific MIB. The system configuration is shown below.

Note 1: Office Name is displayed only when ASYDL SYS1 Index 963 bit 5=1.

Note 2: LENS for MJ and MN Alarms are displayed when ASYDL SYS1 Index963 bit 4=1. For more information, refer to page 2286.

You can disable the checking of IP address of SNMP manager, which is necessary for accessing the SNMP information, by specifying "1.1.1.1" as an IP address of the SNMP manager when you cannot use a specific IP address of SNMP manager due to network conditions, such as when using DHCP.

Supports MIB information listed below. (TARP format is pursuant to SNMP v1.)

1. Function: GET

- Alarm Lamp Status
- MAJOR Lamp Status
- MINOR Lamp Status
- CPU Usage
- Basic System Setting
- Ready status Flag of Readout a Traffic
- Status of data setting for the Traffic Measurement
- Terminal Traffic
- Route Traffic
- Peg Count (Station)
- Peg Count (Att.)
- Peg Count (Route)
- Peg Count (Service)
- Peg Count (IP Service)
- Peg Count (Connection Route)
- Peg Count (UCD Route)
- Peg Count (UCD Group)
- Peg Count (UCD Station)
- Peg Count (Att. Answering)
- Peg Count (CS)
- Connection Route Traffic (Connection Route)
- IP Service Traffic (IP Service) **Note 1**
- Status of Circuit Card
- Status of Port
- Registration Information **Note 2**

Note 1: This item is available only with the IP Trunk circuit card (16 IPTC). It is not available with the Peer-to-Peer FCCS or Peer-to-Peer CCIS network.

Note 2: The following registration information can be obtained. The information is the same as the one which can be readout by DPHL command.

- LENS
- Maximum number of registration
- Number of registered terminal
- Number of terminal logged-in.
- Specified number of control stations
- MPH LENS
- MPH ID

2. **Function: GETNEXT**
    - CPU Usage
    - Ready status Flag of Readout a Traffic
    - Status of data setting for the Traffic Measurement
    - Terminal Traffic
    - Route Traffic
    - Peg Count (Station)
    - Peg Count (Att.)
    - Peg Count (Route)
    - Peg Count (Service)
    - Peg Count (IP Service)
    - Peg Count (Connection Route)
    - Peg Count (UCD Route)
    - Peg Count (UCD Group)
    - Peg Count (UCD Station)
    - Peg Count (Att. Answering)
    - Peg Count (CS)
    - Connection Route Peg Count
    - Connection Route Traffic (Connection Route)
    - IP Service Traffic (IP Service) **Note 1**
    - Status of Card
    - Status of Port
    - Registration Information
3. **Function: SET**
    - Clear of Alarm Lamp
    - Setting of Traffic Measurement
    - Clear the Ready Status flag of Readout a Traffic
    - Set/Release for Station Make Busy
    - Set/Release for Trunk Make Busy
4. **Function: TRAP**
    - Error Message Detail (Output all lamp information)
    - Traffic Measurement Ready Notification
    - RTP statistical information
    - Terminal Claim Handling
    - Error Message Detail (Output each lamp information individually)
        - *MAJOR Alarm*
        - *MINOR Alarm*
        - *SUPERVISORY Alarm*
        - *NO Alarm*

Note 1: This item is available only with the IP Trunk circuit card (16 IPTC). It is not available with the Peer-to-Peer FCCS or Peer-to-Peer CCIS network.

Service Conditions

1. When one of the following condition exists, the trap can be discarded due to the UDP that is a connection-less protocol.
   -When the SNMP manager is not activated
   -When the network is congested
   -When the line fault occurs between the Telephony Server and SNMP manager
2. When performing the traffic measurement by the SNMP manager, it is necessary to set the traffic measurement time interval from the SNMP manager. (The traffic measurement order cannot be invoked by using ATRF command when the traffic measurement is set from SNMP manager.)
3. When invoking the traffic measurement order, use the tool or command you used for setting. For example, use SNMP manager when you set the traffic measurement order from SNMP manager and ATRF command when you set from ATRF command.
4. When setting the traffic measurement time interval from the SNMP manager, it is available to set a shorter time interval than the time interval set via ATRF command.
5. To clear the traffic measurement from the SNMP manager, set 0 to Measurement Interval.
6. This service can output fault messages to multiple devices such as PCPro, E-mail and SNMP (Trap) simultaneously.
7. Message Filtering Feature is available. (**Note 2**) Message can be filtered and distributed with condition, such as Alarm higher then SUP to be reported to SNMP Manager. Alarm higher than MINOR to be reported to E-mail, etc. Information can be output depending on the alarm kind.

   Note 2: When message filtering has been set, the following restriction will be placed for 6-A (System Failure) message: 6-A turns on MN lamp of the system, however it will be output as a Non-Alarm.

8. System Message detail output of TRAP Notice can inform LENS as text data to the alarm grade MJ and MN. The table below lists the System Message to inform the LENS as text data.

SYSTEM MESSAGE	MJ	MN
1-S: Module Group Down Failure	√	
3-B: C-Level Infinite Loop (Permanent)		√
3-D: Lock-Up Failure (Permanent)		√
4-S: MUX Ready Failure		√
4-T: Both MUX Ready Failure		√
6-B: RGU & Howler Failure		√
15-B: VPS Failure (Permanent)		√
23-Y: MUX Clock Failure		√
23-Z: Both MUX Clock Failure		√
35-D: SP Failure		√

9. When you modified SNMP settings by ADTM command, TCP/IP Module Non Load initialization is required. When SNMP service is executed, ADTM command displays “SNMP initialization done” through Retrieve Information - Log Information Read.

10. Specify physical route numbers to observe the route traffic and route peg count by using SNMP manager. If the logical route number and physical route number of each route are the same, the traffic measurement is properly performed by SNMP manager. However, if the logical route number of another physical route is the same as the physical route number of the target route, the traffic measurement for the target route is not properly performed. For example, if the assumption is made that you perform the traffic measurement for Route A (in FPC 1) whose physical route number is 70. In this case, if FPC 5 has Route B whose logical route number is 70, you cannot perform the traffic measurement for the target route (Route A).

Programming

This section does not explain the procedures for installing the management software for SNMP managers. Refer to your SNMP product manual for the installation procedures.

<SNMP Settings>

The following enables the SNMP manager to manage the SNMP agent as shown in figure above.

STEP 1: **ASYD** - Assign the following data:

-SYS1 Index 86 Bit 4 (Storing System Messages associated with an SNMP Trap)

0: The System Messages associated with an SNMP Trap are stored until manually deleted via PCPro.

1: The System Messages associated with an SNMP Trap are not stored.

Note: Consider the following.

- When this bit is set to zero:
  Up to 512 System Messages are stored on the Telephony Server. When the limit is reached, subsequent System Messages are discarded and the corresponding SNMP trap will not be sent.
- When this bit is set to 1:
  Since no System Messages is stored on the Telephony Server, SNMP trap output will not fail because of the System Message overflow.

-SYS1 Index 86 Bit 7 = 1 (System Message detailed output is ON)

**Assign this bit to display the LENS as text data for System Message SNMP Trap Notice.*

STEP 2: **ASYDL** - Assign the following data:

- SYS1 Index 963 Bit 4 (LENS Display for System Message SNMP Trap Notice)
  - 0: Not Display
  - 1: Display
- SYS1 Index 963 Bit 5 (Office Name Display for System Message SNMP Trap Notice.) **Note 1**
  - 0: Not Display
  - 1: Display

Note 1: The following shows trap examples for SYS1 Index 963 Bit 5.

0: Not Display

Frame Length: 141 bytes
Community: public
OID: .1.3.6.1.4.1.119.2.3.76.2.2

- SYS1 Index 963 Bit 6 (Specific Trap Type for System Message SNMP Trap Notice) **Note 2**

0: Specific Trap Type to be the Lamp Kind

Specific Trap Type	Lamp Kind
1	MJ Lamp
2	MN Lamp
3	SUP Lamp
4	No Lamp

1: Specific Trap Type to be the Fault Code kind

Specific Number XXYY (Decimal)
XX: Value between 00-37
(Indicates the Top two digits of Fault Code.)
YY: Value between 1-26
(Indicates the alphabet of Fault Code)

<Example1>: Reset Interrupt fault

Fault Code: = 0 - C
Specific Number = 3 (0 × 100 + 3)

<Example2>: System Initialization

Fault Code: = 7 - B
Specific Number = 702 (7 × 100 + 2)

Note 2: The following shows trap examples for SYS1 Index 963 Bit 6.

0: Specific Trap Type to be the Lamp Kind

Frame Length: 163 bytes
Community: public
OID: .1.3.6.1.4.1.119.2.3.76.2.2
Address: 172.16.2.2
sysUpTime: 0 days, 04:07:30
Generic: 6 - Enterprise Specific
Specific: 4
OID: .1.3.6.1.4.1.119.2.3.76.2.2.1.0
ASN1 Type: Octet String 0x04 (4)
Value: [Mon, 28 Feb 2005 13:53:50] NEC(A) HEAD OFF N301 7-K PM MB KEY TURN ON (LP00-0-ACT 1:EB)

1: Specific Trap Type to be the Fault Code Kind

Frame Length: 164 bytes
Community: public
OID: .1.3.6.1.4.1.119.2.3.76.2.2
Address: 172.16.2.2
sysUpTime: 0 days, 04:10:54
Generic: 6 - Enterprise Specific
Specific: 711
OID: .1.3.6.1.4.1.119.2.3.76.2.2.1.0
ASN1 Type: Octet String 0x04 (4)
Value: [Mon, 28 Feb 2005 13:57:20] NEC(A) HEAD OFF N301 7-K PM MB KEY TURN ON (LP00-0-ACT 1:EB)

<Specific Number Calculation>
Specific Number XXYY (Decimal)
Example for message: 7-K (Fault Code) PM MB KEY TURN ON (Fault Description)
XX: Value between 00 and 37 (Indicates the first two digits of Faule Code.)
The above message has value 7 in Specific Number.
YY: Value between 1 and 26 (Indicates the numeric position of Fault Code in alphabet)
The above message has letter K (11th place in alphabet) in Specific Number.
Therefore, Specific Number = 7 × 100 + 11 = 711

-SYS1 Index 963 Bit 7 (Output method selection for Object ID when sending System Message Trap)
Note 3

0: Fix to 1.3.6.1.4.119.2.3.76.2.2.1.0
1: Divide Alarm lamp into below 4 kinds.

MJ Lamp:	1. 3. 6. 1. 4. 119. 2. 3. 76. 2. 7. 1. 0
MN Lamp:	1. 3. 6. 1. 4. 119. 2. 3. 76. 2. 7. 2. 0
SUP Lamp:	1. 3. 6. 1. 4. 119. 2. 3. 76. 2. 7. 3. 0
No Lamp:	1. 3. 6. 1. 4. 119. 2. 3. 76. 2. 7. 4. 0

Note 3: The following shows trap examples for SYS1 Index 963 Bit 7.

0: Fix to 1.3.6.1.4.119.2.3.76.2.2.1.0

Frame Length: 170 bytes
Community: public
OID: .1.3.6.1.4.1.119.2.3.76.2.2
Address: 172.16.2.2
sysUpTime: 0 days, 05:03:57
Generic: 6 - Enterprise Specific
Specific: 419
OID: .1.3.6.1.4.1.119.2.3.76.2.2.1.0

-SYS1 Index964 Bit 2 and Bit 3 (SNMP Output)

Bit 3	Bit 2	SNMP Trap Output
0	0	All messages will be output (Default)
0	1	Supervisory lamp or higher
1	0	Minor lamp or higher
1	1	Major lamp

STEP 3: **ADTM** - Select the Options tab for LAN2, then select Configure SNMP.

SNMP Activation: **Yes**
System Description: **SYS01**
Object ID: **1.3.6.1.4.1.119.2.3.76.2** fixed
Contact Address: Specify the contact name (maximum 64 characters).
System Name: Enter the System Name (maximum 64 characters).
Location: Specify the physical location where the system is configured (maximum 63 characters).
Trap: **Enable**
Community Name: **Tokyo01** **Note 4**
IP Address of SNMP Manager: **192.168.0.2** **Note 5**
Mode: **WRITING ALLOWED**
Trap Community Name: **Tokyo01** (Community transferred traps) **Note 4**
IP Address of SNMP Manager: **192.168.0.2** (IP address to be transferred traps)
Agent Address: Optional. Assign when the agent address of the trap packet needs to be different from own address.

Note 4: These parameters can be used only alphanumeric characters and underscore (“_”).

Note 5: You can disable the checking of IP address of SNMP manager, which is necessary for accessing the SNMP information, by specifying "1.1.1.1" as an IP address of the SNMP manager when you cannot use a specific IP address of SNMP manager due to network conditions, such as when using DHCP.

Note: After setting the above data, execute the restart of TCP/IP Module by TCP/IP Module Control window of ADTM command.

STEP 4: Register/Confirm the following data on the SNMP manager that manages the PBX (SNMP agent).

Note: The following information in SNMP manager is one of examples. Input necessary data according to middle ware installed in the SNMP manager.

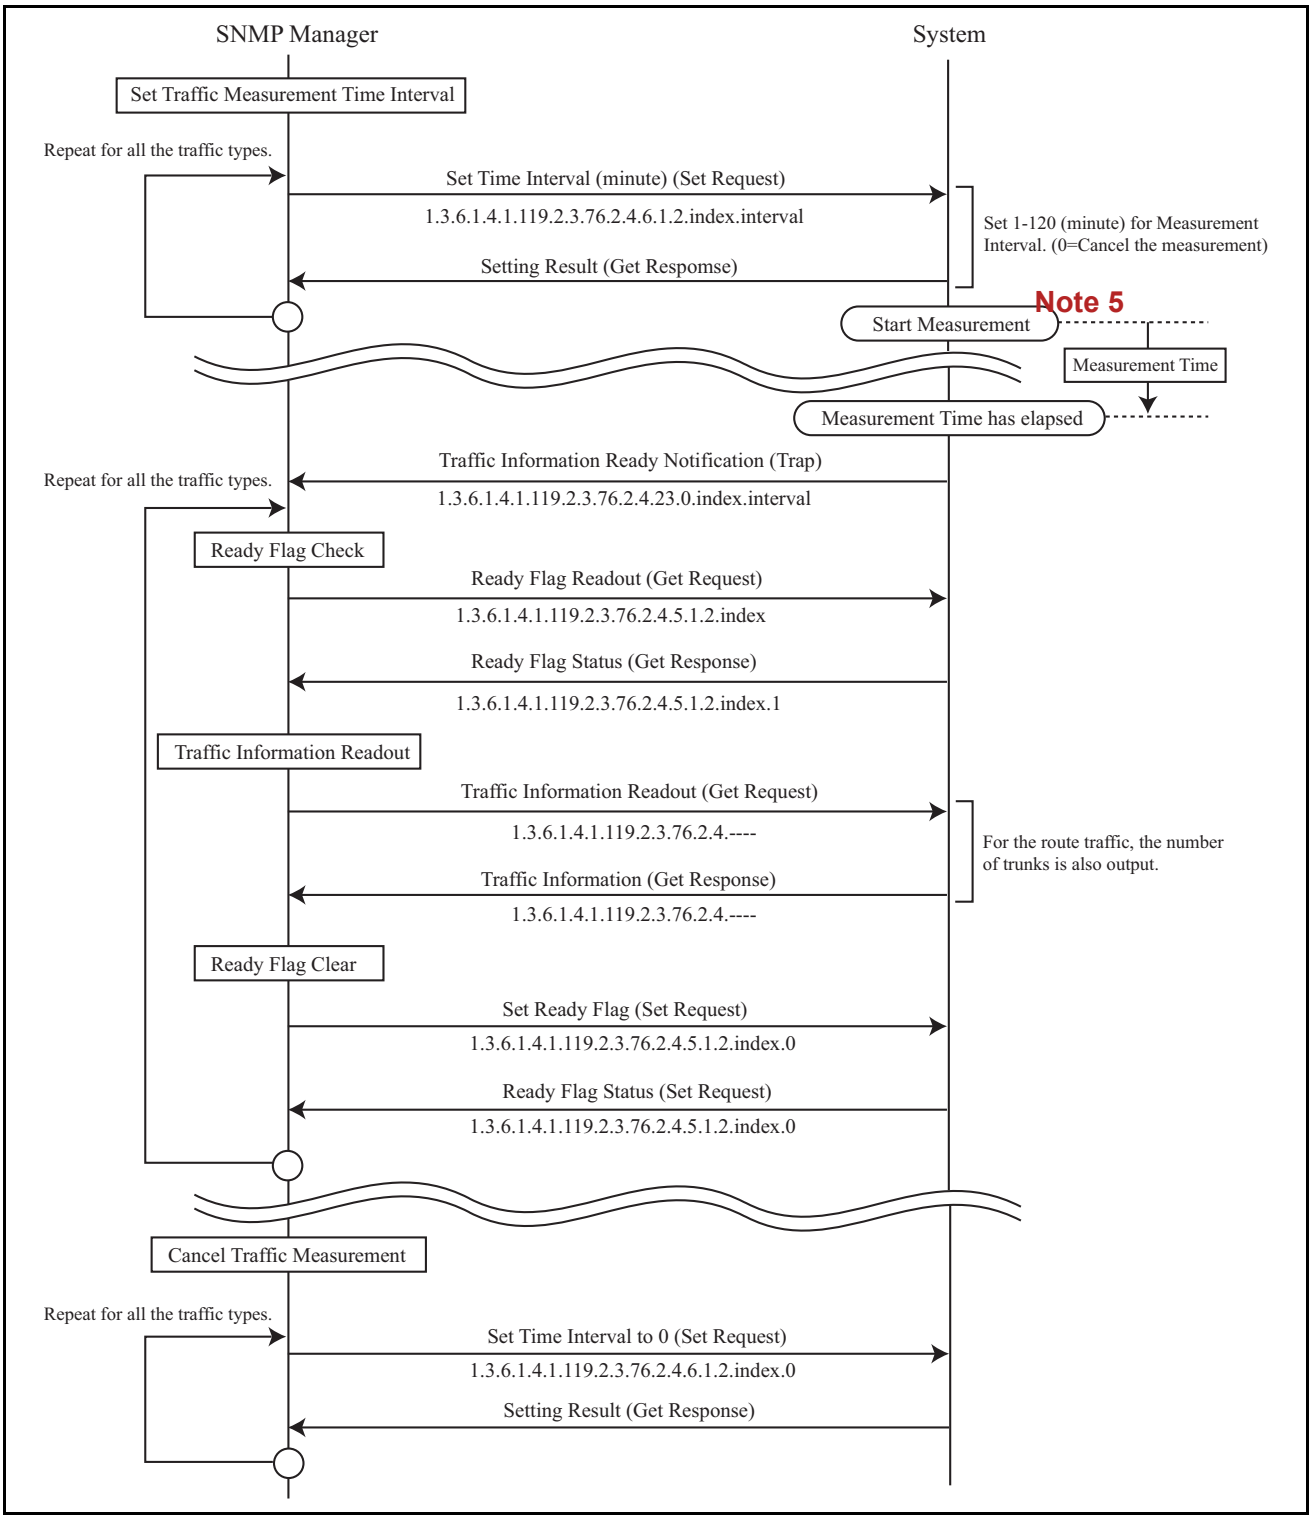
Community name:**Tokyo01**

Registering the data shown above enables SNMP managers to manage SNMP agents.

<Details of ADTM Command>

The following table shows the field details of the ADTM command.

FIELD NAME		ATTRIBUTES	OPTIONS	DESCRIPTION
SNMP Activation	Activate SNMP	Required	Yes	SNMP service is activated
			No	SNMP service is not activated
System Group Information	System Description		-	Equipment information (maximum 128 characters)
	Object ID	Not Required	-	1.3.6.1.4.1.119.2.3.76.2 fixed
System, SNMP Group Information	Contact Address	Optional	-	Contact address (maximum 64 characters)
	System Name		-	Equipment name (maximum 64 characters)
	Location		-	Physical location for equipment (maximum 63 characters)
	Trap		Enable	Generate traps
			Disable	Not generate traps
Community Information **Note 1**	Community Name	Required	-	Community name (maximum 25 characters) **Note 3**
	IP Address of SNMP Manager		-	IP address for SNMP manager **Note 4**
	Mode		READ ONLY	Reading only by SNMP Manager
			WRITING ALLOWED	Reading and Writing by SNMP Manager
Trap Information **Note 2**	Trap Community Name	Optional	-	Community name sent traps (maximum 25 characters) **Note 3**
	IP Address of SNMP Manager		-	IP address to which sends traps
	Agent Address		-	



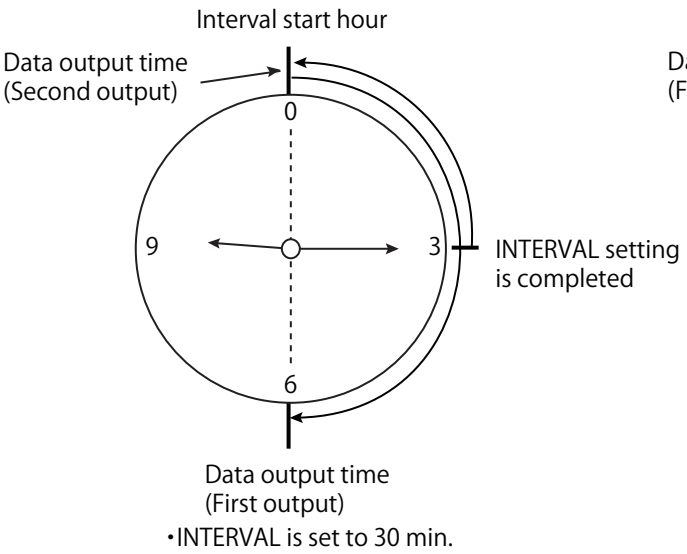
Note 1: Up to four SNMP managers can be created on the Community Information. Creating one SNMP manager requires three attributes (Community name, IP address, and Mode). When the SNMP manager is created, the activation is required by using TCP/IP module control.

Note 2: Up to four trap destinations can be created on the Trap Information. Creating one destination requires three attributes (Trap community name, IP address, and Agent address). If the Agent address is not determined, the main body's address will be used. When the trap destination is created, the activation is required by using TCP/IP module control.

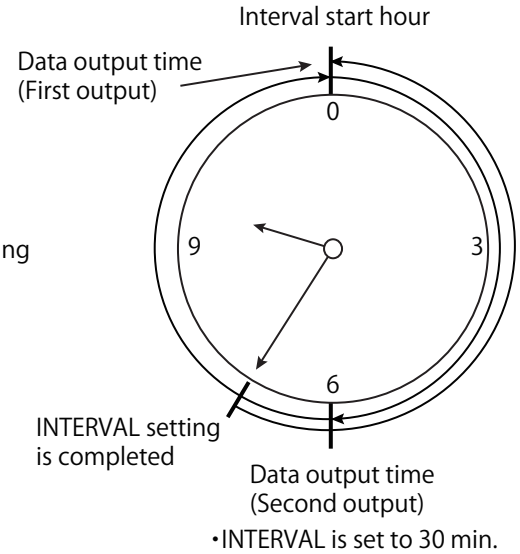
Note 3: These parameters can use only alphanumeric characters and underscore ("_").

Note 4: You can disable the checking of IP address of SNMP manager, which is necessary for accessing the SNMP information, by specifying "1.1.1.1" as an IP address of the SNMP manager when you cannot use a specific IP address of SNMP manager due to network conditions, such as when using DHCP.

STEP 5: The following shows the Traffic Measurement procedure of SNMP:



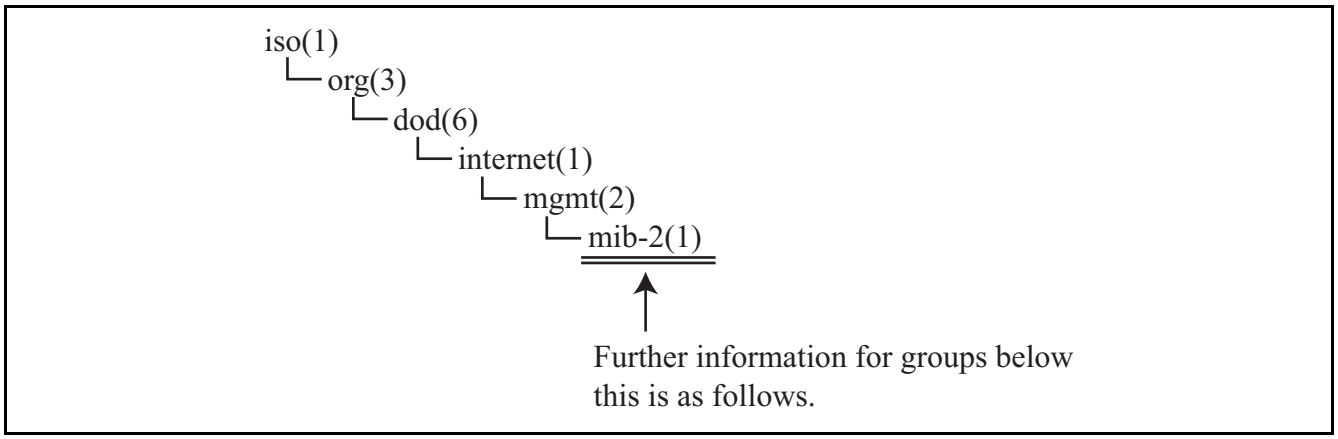
Note 5: Basically, the first output of data is provided when the time set for INTERVAL has elapsed since the Interval start hour, the time the INTERVAL setting is completed, which is represented with hours only.
For example, if you have completed setting INTERVAL to 30 minutes at 9:15, the Interval start hour is 9:00, and the data is generated at 9:30. (See Example 1.)



However, when INTERVAL setting is not completed before the first interval has elapsed, the output is generated when another interval has passed.

For example, if you have completed setting INTERVAL to 30 minutes at 9:35, the Interval start hour is 9:00, and the data is generated at 10:00. (See Example 2.)

Example 1



Example 2

<MIB Information>

MIB information can be loaded or cleared by using the SNMP manager (only with TP side). MIB information used in the Telephony Server is listed below.

Internet standard MIB (RFC compliance)

[Information for groups below mib-2]

[system(1) group]

sysDescr(1)
sysObjectID(2)
sysUpTime(3)

Object ID for NEC Private MIB information

CONTENTS		OBJECT ID	GET	SET	TRAP
Alarm Group		1.3.6.1.4.1.119.2.3.76.2.1	-	-	-
	Lamp Status and Lamp Clear of Telephony Server	**Request** Lamp Status and Lamp Clear of Telephony Server (ipxLampStatusClear) 1.3.6.1.4.1.119 2.3.76.2.1.1.0 **Response** **<Input data for SET>** When you execute SET request, all lamps of the Telephony Server will be cleared. **<Output data for GET>** The lighting status of Major/Minor lamp is indicated as follows in integer. 0=Both Major lamp and Minor lamp are turned off 1=Major or Minor lamp is lighting	x	x	-
	Status of the Major Alarm Lamp	**Request** Status of the Major Alarm Lamp (ipxMajorLampStatus) 1.3.6.1.4.1. 119 2.3.76.2.1.2.0 **Response** The lighting status of Major lamp is indicated as follows in integer. 0=Major lamp is turned off 1=Major lamp is lighting	x	-	-
	Status of the Minor Alarm Lamp	**Request** Status of the Minor Alarm Lamp (ipxMinorLampStatus) 1.3.6.1.4.1. 119 2.3.76.2.1.3.0 **Response** The lighting status of Minor lamp is indicated as follows in integer. 0=Minor lamp is turned off 1=Minor lamp is lighting	x	-	-

CONTENTS			OBJECT ID	GET	SET	TRAP
Alarm Group	Status of the Supervisor Alarm Lamp		**Request** Status of the Supervisor Alarm Lamp (ipxSupervisorLampStatus) 1.3.6.1.4.1.119.2.3.76.2.1.4.0 **Response** The lighting status of Supervisor lamp is indicated as follows in integer. 0=Not available 1=Supervisor lamp is turned off 2=Supervisor lamp is lighting	x	-	-
Failure Message			1.3.6.1.4.1.119.2.3.76.2.2	-	-	-
	Failure Message Type		1.3.6.1.4.1.119.2.3.76.2.2.0	-	-	x
		Major Alarm	There is no specific operating instructions for this trap. However, when the failure message is generated, the object ID, “1.3.6.1.4.1.119.2.3.76.2.2.0.1”, is sent to SNMP Manager. Character strings of the failure notification are indicated (maximum 255 characters).	-	-	x
		Minor Alarm	There is no specific operating instructions for this trap. However, when the failure message is generated, the object ID, “1.3.6.1.4.1.119.2.3.76.2.2.0.2”, is sent to SNMP Manager. Character strings of the failure notification are indicated (maximum 255 characters).	-	-	x
		Supervisor Alarm	There is no specific operating instructions for this trap. However, when the failure message is generated, the object ID, “1.3.6.1.4.1.119.2.3.76.2.2.0.3”, is sent to SNMP Manager. Character strings of the failure notification are indicated (maximum 255 characters).	-	-	x
		No Alarm	There is no specific operating instructions for this trap. However, when the failure message is generated, the object ID, “1.3.6.1.4.1.119.2.3.76.2.2.0.4”, is sent to SNMP Manager. Character strings of the failure notification are indicated (maximum 255 characters).	-	-	x
	Description of the Failure Message		There is no specific operating instructions for this trap. However, when the failure message is generated, the object ID, “1.3.6.1.4.1.119.2.3.76.2.2.1.0”, is sent to SNMP Manager. Character strings of the failure notification are indicated (maximum 255 characters).	-	-	x

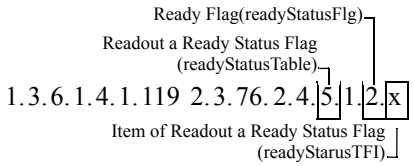
Response
Response data is an integer (0~99).
[For UMGi System]
When using Multiple Processor System, specifies the CPU Number according to the following table.
<table><tr><th>Node</th><th>IMG</th><th>Processor</th><th>CPU</th></tr><tr><td>CCN</td><td>IMG0</td><td>LP00</td><td>48</td></tr><tr><td></td><td>IMG1</td><td>-</td><td>52</td></tr><tr><td></td><td>IMG2</td><td>-</td><td>56</td></tr><tr><td></td><td>IMG3</td><td>-</td><td>60</td></tr><tr><td>RN</td><td>IMG4</td><td>LP08</td><td>64</td></tr><tr><td></td><td>IMG5</td><td>-</td><td>68</td></tr><tr><td></td><td>IMG6</td><td>LP12</td><td>72</td></tr><tr><td></td><td>IMG7</td><td>-</td><td>76</td></tr><tr><td></td><td>IMG8</td><td>LP16</td><td>80</td></tr><tr><td></td><td>IMG9</td><td>-</td><td>84</td></tr><tr><td></td><td>IMG10</td><td>LP20</td><td>88</td></tr><tr><td></td><td>IMG11</td><td>-</td><td>92</td></tr><tr><td></td><td>IMG12</td><td>LP24</td><td>96</td></tr><tr><td></td><td>IMG13</td><td>-</td><td>100</td></tr><tr><td></td><td>IMG14</td><td>LP28</td><td>104</td></tr><tr><td></td><td>IMG15</td><td>-</td><td>108</td></tr></table></td><td>x</td><td>-</td><td>-</td></tr>
</table>



<table>
<tr><th colspan="3">CONTENTS</th><th>OBJECT ID</th><th>GET</th><th>SET</th><th>TRAP</th></tr>
<tr><td>CPU Group</td><td>CPU Usage</td><td>CPU Usage (10 minutes average per day)</td><td>Request
CPU Usage 1 day (cpuUsage1day)
1.3.6.1.4.1.119 2.3.76.2.3.1.1.3.0
CPU Number (cpuNumber)

Response
Response data is octet strings (288 octets).
Data of two octets times 144 is indicated by corresponding data indication from “00:00” to “23:50”.

1st Octet 2nd Octet
0:00 XX YY =XX.YY
0:10
0:20
|
23:30
23:40
23:50

The first two octets, xx, is the BCD indicating numbers within the range from 00 to 99. The latter octets, yy, is the BCD indicating numbers within the range from 0.00 to 0.99.</td><td>x</td><td>-</td><td>-</td></tr>
</table>

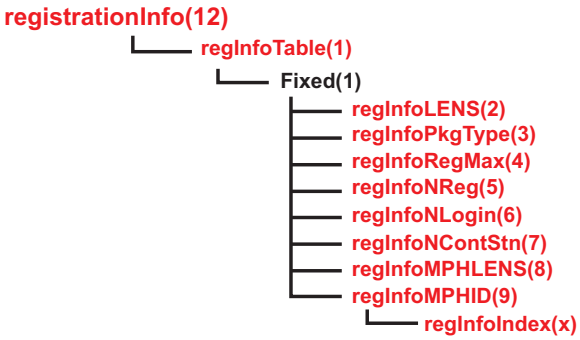
MIB tree and description of [systemMessage(7)]

System Message

	systemMessage(7)	
	systemMessageMajorData(1)	Trap of system message (major alarm)
	systemMessageMinorData(2)	Trap of system message (minor alarm)
	systemMessageSupervisorData(3)	Trap of system message (supervisory alarm)
	systemMessageNoAlarmData(4)	Trap of system message (no alarm)



[About the Specific Number within the Trap Message.]

Please refer to for this information.

Note: “pbx.ipx” indicates the object ID “1.3.6.1.4.1.119.2.3.76.2”.

MIB tree and description of [registrationInfo(12)]

Registration information group

	registrationInfo(12)	Registration information group
	regInfoTable(1)	Registration information table
	regInfoLENS(2)	LENS readout
	regInfoPkgType(3)	Circuit card type readout
	regInfoRegMax(4)	Number of maximum registration readout
	regInfoNReg(5)	Number of current registration readout
	regInfoNLogin(6)	Number of current Login readout
	regInfoNContStn(7)	Specified number of control station readout
	regInfoMPHLENS(8)	MPH accommodated location readout
	regInfoMPHID(9)	MPH ID readout
	regInfoIndex(x)	Index number

[Request]: pbx.ipx.12.1.1.2.x

[Response]:
Output the LENS related to index number in ASCII strings. Value “NULL” will be output when no LENS is related to index.
<Output Example>:

02 . 0 . 12 . 0
MG(dot)U(dot)G(dot)L

[Request]: pbx.ipx.12.1.1.3.x

[Response]:
Circuit card type will be output in ASCII strings. Value “noSuchName” will be output when no LENS is related to index.
<Output Example>:

IPPAD
Internal PHI
Internal PHE

[Request]: pbx.ipx.12.1.1.4.x
[Response]:
Number of maximum registration will be output in integer.
Value “noSuchName” will be output when no LENS is related to index.

[Request]: pbx.ipx.12.1.1.5.x
[Response]:
Number of current registration will be output in integer.
Value “noSuchName” will be output when no LENS is related to index.

[Request]: pbx.ipx.12.1.1.6.x
[Response]:
Number of current Login will be output in integer.
Value “noSuchName” will be output when no LENS is related to index.

[Request]: pbx.ipx.12.1.1.7.x
[Response]:
Specified number of control station will be output in integer.
Value “noSuchName” will be output when no LENS is related to index.

[Request]: pbx.ipx.12.1.1.8.x
[Response]:
MPH accommodated location related to index number will be output in ASCII strings.
Value “noSuchName” will be output when no LENS is related to index.

[Request]: pbx.ipx.12.1.1.9.x
[Response]:
MPH ID will be output in integer.
Value “noSuchName” will be output when no LENS is related to index.

Note: “pbx.ipx” indicates the object ID “1.3.6.1.4.1.119.2.3.76.2”.

1. About the Circuit Card Status Readout

a.) Response Information of the Circuit Card Type Readout

The following circuit card type information is output in ASCII format (a maximum of 32 characters). When the circuit card type cannot be identified, "-"(hyphen) is displayed.

ASCII Character	Description
LC	Analog Line circuit card
TRK	Trunk circuit card
RS	Register/Sender circuit card
ATT	Attendant Console circuit card
DLC	DLC circuit card
PWR	7U-PIR Power Unit/8U-PIR Power circuit card
DCFT	DCFT circuit card
MFTL	MFTL (MLCB) circuit card
SMI	SMI circuit card
MDMT	MDMT circuit card
DLMX	DLMX circuit card

b.) Response Information of the Circuit Card Status Readout

The following circuit card status information is output in ASCII format (a maximum of 16 characters).

ASCII Character	Description
Idle	One or more than one port in the group is idle.
OffLine	No circuit card is mounted or circuit card is make-busy.
MB	Circuit card in the group is make-busy or soft make-busy.
Busy	All the ports in the group are in use.

2. About the Port Status Readout

a.) Response Information of the Port Status Readout

The following port status information is output in ASCII format (a maximum of 16 characters).

ASCII Character	Description
Idle	Idle
MB	Make-busy
Busy	In use.
LockOut	Locked out

b.) Response Information of the Port Data Readout

The following port information is output in ASCII format (a maximum of 256 characters). The output information varies according to route (internal/external), connection route, and station. The port information includes the multiple parameters, and each parameter is separated with a comma.

<External Trunk>

First Parameter: "Trunk"
Second Parameter: External Route Number (1-899)

Note: Displays the Logical route number assigned towards the outer office (external) route. Displays the Physical route when no Logical route is assigned.

Third Parameter: Trunk Number (1-255)
Fourth Parameter: Trunk/Signal Type

The following Trunk/Signal Type information is output in ASCII format.

Note: When the Trunk/Signal Type cannot be identified, "unknown" is displayed.

ASCII Character	Description
Loop Start COT	Loop COT
Ground Start COT	Ground Start (North America)
CDH COT	CDH (North America)
Caller ID COT	Call ID (Loop)
Loop Start Tie Line	Loop TIE
E&M Tie Line	E&M TIE
DX Tie Line	DX TIE
24 V4 Tie Line	24V TIE
Loop DID	Loop DID
NTT Loop DID	Central Office Line, NTT Loop DID
EMD (Iran)	EMD (Iran)
Russia	Russia Trunk
Digital Voice	Digital Trunk (Voice)
Digital Signal	Digital Trunk (Signal)
Nurse Call	Nurse Call Trunk
Toll	Terminal Toll
CAS	CAS Trunk
Paging	Paging Trunk
Radio Paging	Pager Paging
Paging Transfer	TIE Line Paging
Emergency Recording	Emergency Call

<Internal Trunk>

First Parameter: Internal Trunk Type

Note: Outputs the strings according to list of internal office route in ASCII format. When the Internal Trunk type cannot be identified, “unknown” is displayed.

Second Parameter: Route Number (901-947)
Third Parameter: Trunk Number (1-255)

The following Internal Trunk Type information is output in ASCII format.

ASCII Character	Description
Attendant Console	Attendant Console
Originating Register	Originating Register Trunk
Incoming Register	Incoming Register Trunk
MF Register	Register for MF
Sender	Sender Trunk DP/PB
PB Receiver	PB Receiver for Automated Attendant
Amp Pool	Amplifier Pool Trunk
Register/Sender	Sender/Register Trunk
Three-way Conference	Three-party Conference Trunk
Six-way Conference	Six-party Conference Trunk
Extended Internal Device	Other Station Device
Originating Register for ATTCON	Originating Register Trunk (Attendant Console)
Three-way Conference for ATTCON	Three-party Conference Trunk (Attendant Console)
Announcement	Announcement Trunk
Night Attendant Console	Night Attendant Console
MFC Receiver	MFC Receiver
MFC Sender	MFC Sender
Master Telephone	Master Telephone
Modem19	Modem19
Modem20	Modem20
Modem21	Modem21
Modem22	Modem22
Modem23	Modem23
Modem24	Modem24
Modem25	Modem25
Modem26	Modem26
CCS Sender	CCS Sender
CCS Register	CCS Register
Data Signaling	Data Signal
Rate Adaptation	Rate Adaptation
terminal of conference trunks	Conference Trunk Terminal

<Connection Trunk>

First Parameter: "C-Trunk"
Second Parameter: Connection Route Number (1-1023)
Third Parameter: Connection Trunk Number (1-4095)
Fourth Parameter: Trunk/Signal Type

Note: Outputs the strings according to list of Trunk/Signal kind in ASCII format. When the Trunk/Signal kind cannot be identified, "unknown" is displayed.

<Station>

First Parameter: Terminal Type
Second Parameter: User Group Number (1-255)
Third Parameter: Parameter Tenant Number (1-255)
Forth Parameter: Station Number [1-16 digits (0-9, *, #)]

Note: Outputs the strings according to list of Terminal kind in ASCII format. When the Terminal kind cannot be identified, “unknown” is displayed.

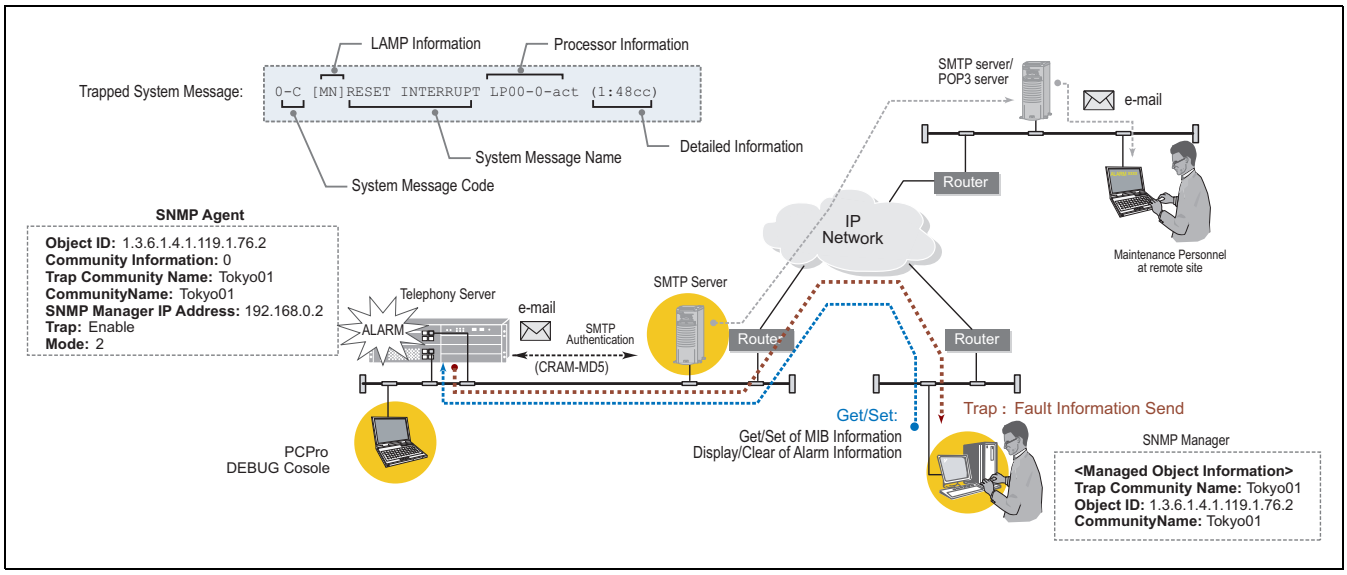
The following Terminal Type information is output in ASCII format.

ASCII Character	Description
DP10	Single Line Telephone DP (10pps)
PB	Single Line Telephone PB
DP/PB	Single Line Telephone DP/PB
DP20	Single Line Telephone DP (20pps)
DP10(Room)	Not Used
PB(Room)	Not Used
DP/PB(Room)	Not Used
DP20(Room)	Not Used
House Phone (Admin)	Not Used
House Phone (Guest)	Not Used
Voice Mail	Not Used
Digital Phone	Dterm (Dterm: Voice Port)
Digital Phone (Data)	Data Terminal (Dterm: Data Port)
Hotline	Hotline
CAS Line	CAS Line
Data Module	Data Terminal via Data Module
Bridge Phone	Not Used
Virtual	Virtual Line Appearance (for Dterm Multi-Line)
Text Mail	Text Mail
Packet Switching	Packet Switching
ACD	ACD
Emulator	Emulator
ISDN Terminal (TEI Auto)	ISDN Terminal
ISDN Terminal (TEI Fixed)	Not Used
VPS	Not Used
8-party Conference	Eight Conference Equipment
PHS	Not Used

<PH Kind>

First Parameter: PH Kind

Note: Outputs the strings according to list of PH kind in ASCII format. When the PH kind cannot be identified, “invalid PH” is displayed.



The following Terminal Type information is output in ASCII format.

ASCII Character	Description
IPPAD	IPPAD
Internal PHE	Internal PHE
Internal PHC	Internal PHC

S-150 System Message Report

General Description

This feature allows the Telephony Server to send system messages that are created in the system by an e-mail notification to the e-mail address specified in advance.
By using this feature, maintenance personnel can obtain fault information of the system from the remote site. SMTP authentication (by CRAM-MD5) is also supported for e-mail notification. If required, *message filtering* function can be used. This filter can select system messages to be output according to the alarm lamp grade. When not specified, all system messages will be output. In addition, system messages can be sent not only to SMTP Server but to PCPro and SNMP Manager as well. For more detailed information on System Message Report by SNMP manager, refer to [S-148] SNMP of this manual.

Operating Procedure

No manual operation is required.

Service Conditions

Note: Refer to the service conditions for [S-148] SNMP of this manual as well.

1. Buffer size for message output is 4 k bytes. Therefore a maximum of 4 k bytes messages (approximately, 100 messages) can be stored even if mail server fails. However, if the buffer overflow occurs, the oldest message will be deleted first.
2. DFTD command can read out both new and old messages.
3. As an SMTP authentication algorithm, Challenge/Response Authentication Mechanism-MD5 (CRAM-MD5) only is provided. Other authentication algorithm such as Digest-MD5, PLAIN are not supported.
4. When message filtering has been set, the following restriction will be placed for 6-A (System Failure) message: 6-A turns on MN lamp of the system, however it will be output as a Non-Alarm.
5. TCP port number of SMTP Server used for e-mail notification is set to 25. Assign the System Data to modify the port number for SMTP Server.

6. System messages cannot be output to System Message Printer when this service is enabled. When both services are enabled by the system data assignment, the data assignment for [S-150] System Message Report takes precedence.
7. It takes a maximum of 64 seconds for changes in the settings of System Message Report to take effect after clicking the SET button on the ADTM command window. Until then, the old settings are used to send system messages via e-mail.

Programming

STEP 1: **ASYDL** - Assign the following data:

[SMTP Authentication for E-mail]

When SMTP authentication is required, assign the following.

SYS 1, Index 963 Bit 0=1 (CRAM-MD5 Authentication is performed to communicate with mail server.)

[Message Filtering]

When using System Message Report Filtering function, set the following data. The default data output all system messages.

SYS 1, Index 964 Bit 0~5

System Message Report Filtering function for SMTP Server (e-mail):

Bit 1	Bit 0		
0	0	=	All messages will be output
0	1	=	Supervisory lamp messages or higher will be output
1	0	=	Minor lamp messages or higher will be output
1	1	=	Major lamp messages will be output

System Message Report Filtering function for SNMP Manager:

Bit 3	Bit 2		
0	0	=	All messages will be output
0	1	=	Supervisory lamp messages or higher will be output
1	0	=	Minor lamp messages or higher will be output
1	1	=	Major lamp messages will be output

System Message Report Filtering function for EVLOG command Console:

Bit 5	Bit 4		
0	0	=	All messages will be output
0	1	=	Supervisory lamp messages or higher will be output
1	0	=	Minor lamp messages or higher will be output
1	1	=	Major lamp messages will be output

[E-mail Notification to Message Submission Agent]

When sending system messages to an E-mail reception server (Message Submission Agent) with an authentication function, TCP port number for SMTP Server must be assigned with hexadecimal in the following system data.

SYS 1, Index 1309 (the upper bytes for TCP port number in HEX)
SYS 1, Index 1310 (the lower bytes for TCP port number in HEX)

<Example>

The data assignment shown below is an example for setting the port number as 587 (in decimal) which is recommended by RFC 2476.

SYS 1, Index 1309 = 02
SYS 1, Index 1310 = 4B

STEP 2: **ADTM - Assign data for TCP/IP module data.**

[SNMP Manager]

Assign the required data referring to Programming of SNMP [S-148] STEP 3.

[SMTP Server (e-mail)]

Select “LAN2” from “Select LAN Interface”.
Select “Options” tab → “System Message E-mail Output”.
Select “Mail Server/Address to Reply” from “Data to Assign” and assign the following data.

IP Address of Mail Server: Enter the IP address of the mail server.

Host Name of MGC: Enter the host name of MGC (A maximum of eight characters).

Address to Reply: Enter the mail address to replay (A maximum of 64 characters).

Maximum Text Size [0 - 1024]: Specify the maximum size of sending data.

Difference from GMT: Select the time difference from GMT in the combo box.

E-Mail Fault Message: Select this to send fault messages.

When SMTP Authentication is required, also assign the following:

User Name (A maximum of 15 characters)

Password (A maximum of 15 characters)

S-151 SIP Instant Message

General Description

This feature enables to exchange Instant Messages between a Soft Phone (SIP) and a WLAN Handset (MH Series).

Operating Procedure

Refer to User's Guide of each terminal.

Service Conditions

1. Instant Message can be sent/received between the following terminals:
   - Soft Phone (SIP)
   - WLAN Handset (MH Series)

   Note: Soft Phone (Proprietary Protocol) is not available for this feature.

2. A maximum number of characters that can be sent in an Instant Message is as shown below. For more information on other terminals, refer to the related manuals.

Soft Phone (SIP)	300 (single-byte alphanumeric)
WLAN Handset (MH Series)	300 (single-byte alphanumeric)

3. Instant Message can be sent/received via FCCS/CCIS network.
4. Instant Message cannot be sent/received via Central Office Line including MG(SIP).
5. Instant Message can be sent/received regardless the state of the terminal (idle or busy), but it depends on the operating condition of each terminal.
6. Instant Message cannot be sent to the terminal that has not performed REGISTRATION.
7. Sending/receiving of Instant Messages cannot be restricted by the office data assignment.
8. The following shows the conditions when using SOFT PHONE WLAN HANDSET [S-159]/SOFT PHONE WIRED-PHONE HANDSET [S-147]:

   - Instant Message can be sent to the Softphone by specifying the Station Number of the PS/wired telephone. **Note 1**

     Note 1: When using SOFT PHONE WLAN HANDSET [S-159]/SOFT PHONE WIRED-PHONE HANDSET [S-147], Instant Message cannot be sent by specifying the Station Number of the Softphone.

   - If Instant Message is sent from the Softphone to other SIP terminal, the Station Number of the PS/wired telephone is notified as the Calling Party Number.

9. The following shows the conditions for sending Instant Messages to both SIP terminal and Softphone when using WLAN Handset (MH Series) as the handset of Soft Phone (SIP):

- By assigning system data (ASYDL, SYS1, Index 691, Bit 2 = 1), Instant Message can be sent both Soft Phone (SIP) and WLAN Handset (MH Series). **Note 2**

  Note 2: When using WLAN Handset (MH Series) as the handset of Soft Phone (SIP), Instant Message cannot be sent by specifying the Station Number of the Soft-phone.

- When each of receiving station (WLAN Handset (MH Series) or Soft Phone (SIP)) can receive Instant Message, "Receive OK" message is displayed on originating station.

- If both of receiving stations (WLAN Handset (MH Series) and Soft Phone (SIP)) cannot receive Instant Message, the error reason will be displayed on the originating station. **Note 3**

  Note 3: There are some terminals which cannot display error reason.

- If Instant Message is sent from Soft Phone (SIP) to the other SIP terminals, the station number of WLAN Handset (MH Series) will be displayed as the originating station number. Therefore, when the other SIP terminal sends Instant Message, the destination will be WLAN Handset (MH Series). **Note 4**

  Note 4: By assigning system data (ASYDL, SYS1, Index 691, Bit 2 = 1), Instant Message will be sent to both of call originating stations (WLAN Handset (MH Series) and Soft Phone (SIP)).

10. The following shows the conditions when using DIAL PLAN TO SUPPORT IP CENTREX FUNCTIONALITY [D-166]:

    - When sending Instant Message to a Station in other UGN, specify "Private Number + Telephone Number" as the destination number.

    - When sending Instant Message to a Station in the same UGN, specify the Station Number or Telephone Number only as the destination number.

    - When sending Instant Message, "Private Number + Telephone Number" is notified as the Calling Party Number.

11. If Instant Message is sent to the Station that sets Call Forwarding - All Calls or Call Forwarding PS Incoming Call Incomplete, the Instant Message cannot be transferred. The Instant Message is sent to the specified Station only.
12. Even if Instant Message is sent to a Station within the Hunting Group, it can be sent to the specified Station only.
13. Even if Station sets DO NOT DISTURB [D-11], the Station cannot deny the incoming Instant Message. DO NOT DISTURB [D-11] is not available for Instant Message.
14. NUMBER SHARING [N-45] is not available for Instant Message.

    - To send Instant Massage to a main station, Station Number of the main station must be specified.

    - To send Instant Message to a sub-station, Station Number of the sub-station must be specified.

    - If Instant Message is sent from a sub-station, the other party's LCD displays not main station number, but the sub-station number.

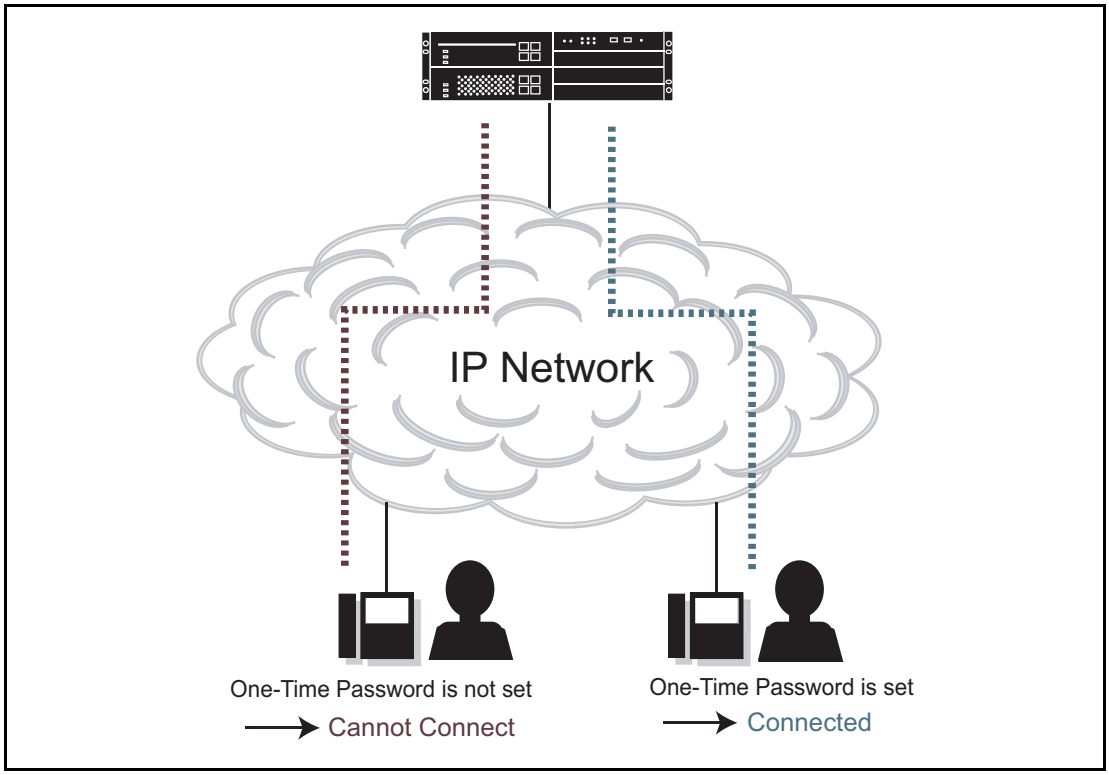
15. The following shows the conditions when this feature is activated via CCIS link:
    a.) To exchange an Instant Message via CCIS network, the UDP Port Number "3456" and "5060" are used. Therefore, it is necessary to unblock these UDP ports over the network.
    b.) Even If an Instant Message is exchanged via the existing CCIS network (non-peer-to-peer connection), IP connection between each node is required.
    c.) When FCCS link and CCIS link coexist in a network, the following condition must be considered:
        - A maximum of 64 nodes can be included in the network.
        - When connecting multiple FCCS networks to a CCIS link, a unique FPC must be assigned to each node.
    d.) When using this feature in the CCIS Opened Numbering network, the following conditions must be considered:
        - CCIS route to a counter office must be selected for the primary route.
        - Instant Message destination number must include Access Code, Office Number and Station Number.
        - Do not assign Change Digit Code to CCIS route on the called side by using the ACDD command. Leave the data intact and use its result for analysis.
    e.) This feature uses User Datagram Protocol (UDP) communication to exchange an Instant Message via CCIS network (not CCIS message). Therefore, even if CCIS route is blocked, Instant Message can be sent/received via CCIS network.
    f.) By assigning the system data (ASYDL, SYS 1, Index 691, Bit 2 = 1), Instant Message can be sent both WLAN Handset (MH Series) and Soft Phone (SIP) in these conditions as follows.
        - Peer to Peer connection of CCIS network
        - Legacy connection of CCIS network
        - Peer to Peer connection of FCCS network

Programming

ASYDL - System Data 1, Index 691, Bit 2
Assign the destination of Instant Message.
0: WLAN Handset (MH Series) only.
1: WLAN Handset (MH Series) and Soft Phone (SIP).

When using this feature via CCIS link, the specific data assignment is required for any SIP terminals (Soft Phone (SIP) and WLAN Handset (MH Series)). For details on the necessary data, see Soft Phone [S-155].

Note: The specific data described in "Softphone Internodes IP Address Resolution over CCIS/FCCS" is not required when using this feature via FCCS link only.



S-152 SIP Terminal Authentication

General Description

This feature provides SIP terminals/equipment with authentic method using one-time password in order not to allow malicious access. Because the one-time password is a disposable password that can be used only one time, using the password makes it difficult for unauthorized person to sneak into the network. A one-time password in the system becomes invalid when the available period is expired. For example, with terminals, the procedure for this feature proceeds with the system in the following steps:

- Assign a one-time password on the system.
- Assign a one-time password on the terminal.
- Start up the terminal, which transmits a one-time password.
- Terminal Authentication, which verifies the one-time password and the MAC Address information, is performed between the system and the terminal.
- If those procedures are completed successfully, the system allows the terminal to log on to the network.

If this feature is used with “VoIP Encryption” feature, and then VoIP Encryptions for RTP data and signaling data are initiated with Advanced Encryption Standard (AES) modes (128-bit length), it makes data more secured, preventing third party from tapping data flowing over the IP network. For more information about the SIP settings of Media Gateways, refer to the appropriate MG part of the Peripheral Equipment Description.

Operating Procedure

In the case of DtermIP (SIP)

1. Select “2.SIP Setting” → “7.Encryption” → “1.Authentication Mode”.
2. Select “2.Enable” and press the soft key below OK indication.
3. Select “2.SIP Setting” → “7.Encryption” → “2.One Time Password”.
4. Enter a one-time password and press the soft key below OK indication.
5. Back to main menu, and press the soft key below Save indication.
6. Select “2.SIP Setting” → “7.Encryption” → “3.Authentication Status”.
7. Make sure the status indicates Acceptable on the screen.

Service Conditions

1. After Terminal Authentication using a one-time password has been completed normally, back up the data of Data Memory by the MEM_HDD command using Data Type for One Touch Speed Calling for DtermIP.
2. When SR-MGC is used in the system, copy the office data into the SR-MGC (such as using the CMNT command) after backing up the data with the MEM_HDD command. For more information, refer to “Survivable Remote MGC [S-141]”. Thereby, SIP terminals that have completed SIP terminal Authentication become able to be rescued by the SR-MGC.
3. If the authentication data saved in an TP and a terminal are different, SIP Terminal Authentication needs to be performed again.
4. If you switch an TP to logged on, SIP Terminal Authentication has to be completed with the target TP before you switch it.
5. When specifying the Server IP Address for SIP terminals/equipment to connect to the network through SIP Terminal Authentication, use the IP address of the Telephony Server configured for the authentication.
6. To make one-time password valid, the system routinely verifies its data. While the verification is being performed, assigning or deleting Terminal Authentication cannot be executed. If the proceeding is failed because operations are executed during the verification, wait for a minute until the verification is completed.
7. When using SIP Terminal Authentication in the Telephony Server, accommodate PHDs/PHIs compatible with the feature into the system. Non-compatible PHDs/PHIs and compatible PHDs/PHIs cannot be mounted into the same system.
8. When this feature is performed, VoIP Encryption [V-27] is automatically enabled for security. In this case, if NAT is located between Terminals and SP, the encryption should be applied to a part of data. (ASYDL SYS1 Index 831 Bit 3=0)
9. When using SIP Terminal Authentication, use the terminal compatible with the feature.

10. When using MAC Authentication mode, SIP terminals perform SIP Terminal Authentication with SP; therefore, you have to specify a one-time password. For more information, see the following:

MAC Authentication Mode

	ASYDL INDEX 831 SYS1 Bit 4=1		ASYDL INDEX 831 SYS1 Bit 4=0	
	Terminal Registration Mode ON	**Terminal Registration Mode OFF**	**Terminal Registration Mode ON**	**Terminal Registration Mode OFF**
One-time password is matched between terminals and systems.	Registration is OK. →VoIP Encryption is enabled. **Note 1**	Login screen displays and asks a user to register in the system. →VoIP Encryption is disabled.	Registration is OK. →VoIP Encryption is enabled. **Note 1**	Registration is OK. →VoIP Encryption is disabled.
One-time password is Not matched between terminals and systems.	Registration NG Authentication is failed.	Login screen displays and asks a user to register in the system. →VoIP Encryption is disabled.	Registration NG Authentication is failed.	Registration is OK. →VoIP Encryption is disabled.
One-time password is Not assigned by ASECL.	Registration NG Register Timeout	Login screen displays and asks a user to register in the system. →VoIP Encryption is disabled.	Registration NG Register Timeout	Registration is OK. →VoIP Encryption is disabled.

Note 1: "Encryption is enabled" means when it is listed as Certified Terminal in the ASECL command.

11. When using Login mode, SIP terminals do not perform SIP Terminal Authentication with SP; therefore, you don't have to specify a one-time password. For more information, see the following:

Login Mode

	ASYDL INDEX 831 SYS1 Bit 4=1		ASYDL INDEX 831 SYS1 Bit 4=0	
	Terminal Registration Mode ON	**Terminal Registration Mode OFF**	**Terminal Registration Mode ON**	**Terminal Registration Mode OFF**
One-time password is matched between terminals and systems.	Registration is OK. →VoIP Encryption is enabled. **Note 2**	Login screen displays and asks a user to register in the system. →VoIP Encryption is disabled.	Registration is OK. →VoIP Encryption is enabled. **Note 2**	Registration is OK. →VoIP Encryption is disabled.

Login Mode

	ASYDL INDEX 831 SYS1 Bit 4=1		ASYDL INDEX 831 SYS1 Bit 4=0	
	Terminal Registration Mode ON	Terminal Registration Mode OFF	Terminal Registration Mode ON	Terminal Registration Mode OFF
One-time password is Not matched between terminals and systems.	Registration NG Authentication is failed.	Login screen displays and asks a user to register in the system. →VoIP Encryption is disabled.	Registration NG Authentication is failed.	Registration is OK. →VoIP Encryption is disabled.
One-time password is Not assigned by ASECL.	Registration NG Register Timeout	Login screen displays and asks a user to register in the system. →VoIP Encryption is disabled.	Registration NG Register Timeout	Registration is OK. →VoIP Encryption is disabled.

Note 2: "Encryption is enabled" means when it is listed as Certified Terminal in the ASECL command.

12. The following equipment are compatible with the Terminal Authentication.

AVAILABLE EQUIPMENT	AVAILABLE FIRMWARE VERSION
MG(BRI) Card [SCA-2BRIA] MG(BRI) Box [MG-2BRIA]	SP-3826 Issue 1.0 or later
MG(PRI) Card [SCA-24PRIA] MG(PRI) Box [MG-24PRIA] **Note 3**	SP-3884 Issue 5A or later
MG(PRI) Card [SCA-30PRIA] MG(PRI) Box [MG-30PRIA] **Note 3**	
UG50 (PRT 1.5M) [SIP]	Any version
UG50 (PRT 2M) [SIP]	
UG50-24PRIA [SIP]	
UG50-30PRIA [SIP]	
MG-COT [SCA-6COTB] **Note 3**	SP-3948 6MGCOT PROG-A Issue 1 or later
MG-COT [SCA-6COTC] **Note 3**	SP-3948 6MGCOT PROG-A Issue 1 or later
UG50 (COT-TYPE2) [SIP]	Any version
UG50-6COT [SIP]	

AVAILABLE EQUIPMENT	AVAILABLE FIRMWARE VERSION
UG50 (PGT-TYPE2) [SIP]	Software version 2.00 or later
MG-T1(SIP) Card [SCA-24DTIA]	SP-3926 MG DTI PROG-A Issue 1A or later
8LC Card [SCA-8LCA/SCA-8LCA-EMEA]	SP-3893 8MC PROG-A Issue 1 or later
8LC Card [SCA-8LCC/SCA-8LCC-EMEA]	SP-3983 8MC PROG-B Issue 1 or later
UG50 (LC) [SIP]	Any version
UG50-8LC	
DtermIP (SIP)	1.4.3.0 or later
DT700 Series	2.2.0.0 or later
DT800 Series	3.0.0.0 or later

Note: To save ASECL data to Flash Card, use MEM_HDD command. Select “One-Touch Speed Calling for Dterm IP”.

Note 3: This feature can be performed when the equipment described are in SIP mode.

13. When this feature is used, Terminal Remote Login [T-66] cannot be performed.
14. Refer to the UG50 Installation Guide for detailed conditions for UG50.

Programming

STEP 1: **ASYDL** - System Data 1, Index 831, Bit 3: Assign the data to determine whether NAT is used/NAT is used or not.

System Data 1, Index 831, Bit 4: 0/1 (Terminal Authentication is disabled/enabled)

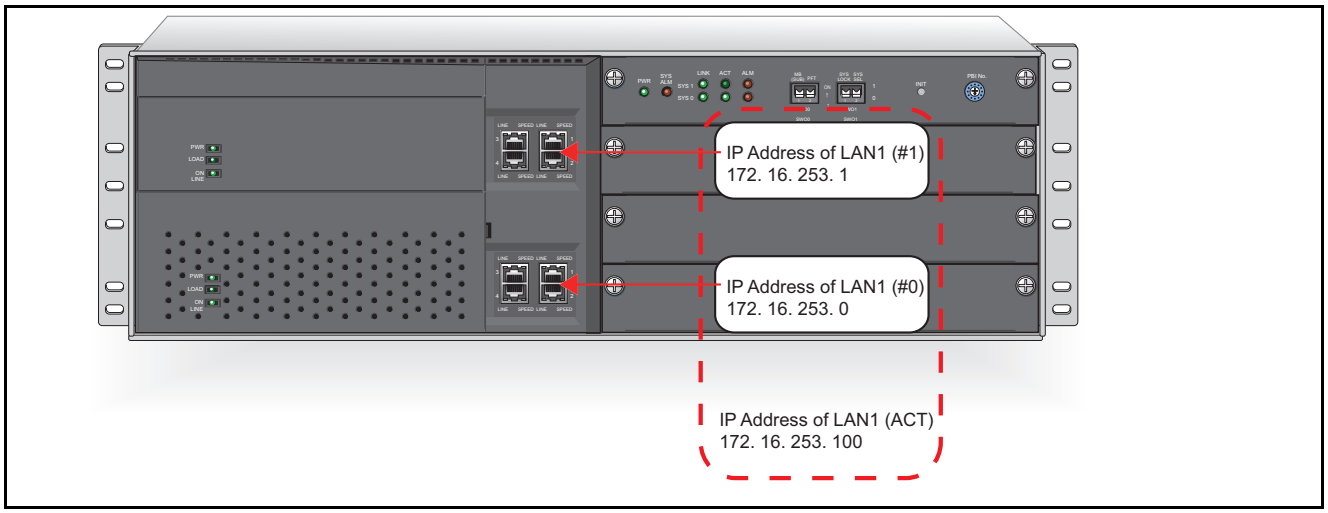
Note: Regardless of this bit, the Terminal Authentication procedure by SIP terminal will be required if VoIP encryption [V-27] is enabled on the SIP terminal.

STEP 2: **ASECL** - Assignment of Security Data (LDM)

Assign one-time password and its available period. Click the Authentication Registration tab to assign the following data:

One-Time Password: Assign one-time password for authentication registration with 4 to 10 digits. (0-9, *, # can be used).

Available Period: Specify an available period for one-time password (indefinite/a minute to 7days).



Note: Note the following conditions for a one-time password:

- A one-time password becomes invalid when an available period is expired or the system is initialized.
- For security purpose, you are recommended to specify an available period for the one-time password.
- When a one-time password and its available period are set, backup them by selecting “One Touch Speed Calling for DtermIP” in the Data Type Select parameter of the MEM_HDD/MEM_HDD_N command.

S-154 SIP Wireless Terminal Backup

General Description

When CPU card is set in redundancy configuration, the IP address of both LAN1 (#0) and LAN1 (#1) can be integrated. By specifying the IP address of LAN1 (ACT) as the IP address of REGISTER destination from each SIP terminals, in normal operation, LAN1 (#0) controls the SIP terminals. If a failure occurs in the LAN1 (#0), SIP terminals can originate or receive a call by using LAN1 (#1). Therefore, it increases the reliability of communication.

Operating Procedure

No manual operation is required.

Service Conditions

1. This feature is available under the conditions of each SIP Terminal in addition to the following conditions. For details on the conditions of each SIP Terminal, refer to SP CONTROLLED SIP TERMINAL [S-168].
2. This feature supports the following terminals:
   - WLAN Handset (MH Series)
   - SP Controlled Standard SIP terminal
3. Be sure to assign the pair SIP server ID assigned for the SIP redundancy configuration, by using ASSDL/ ASSDN command.
4. When using this feature, the IP address of LAN1 (ACT) must be specified as REGISTER destination IP address from each terminal. Do not use the IP address of LAN1 (#0)/LAN1 (#1).
5. The IP address of LAN1 (ACT) can be shared between two LAN1s only [LAN1 (#0)/LAN1 (#1)].
6. LAN1 (#0)/LAN1 (#1)/LAN1 (ACT) need to be placed in the same segment (broadcast domain).
7. LAN1 (STBY) does not accept the SIP Request from each SIP Terminals.

8. All REGISTER information on LAN1 (#0) and LAN1 (#1) is copied from LAN1 (ACT) to LAN1 (STBY). All REGISTER information will be held after the system changeover.
   a.) When LAN1 (ACT) is shifted to Standby mode, all REGISTER information of new LAN1 (ACT) is copied to new LAN1 (STBY).
   b.) When system changeover occurs during the copying process, REGISTER information may not be copied properly (REGISTER information copying will be completed within about 2 minutes).
   c.) When a failure occurs in both LAN1 (ACT) and LAN1 (STBY), REGISTER information will be cleared. If the information is cleared, each SIP Terminals must REGISTER again.
9. The same data must be assigned on the PRESENCE SERVER tab of ASSDL/ASSDN command for both LAN1 (#0) and LAN1 (#1). If the different PRESENCE SERVER data is assigned between the LAN1s, the operation of the Presence server after the system changeover is not ensured.
10. The same domain cannot be set to the both LAN1s. However, the domain set to either of LAN1 (#0) or LAN1 (#1) affects both of them.
11. Addition/Deletion of the domain data on ASSDL/ASSDN command affects both LAN1 (#0) and LAN1 (#1).
12. The same number of speech channels must be set to LAN1 (#0) and LAN1 (#1).
13. If a failure occurs in the LAN1 (ACT), the LAN1 (STBY) starts operating in Active mode within 60 seconds.
14. If “Pair SIP Server ID” assigned on ASSDL/ASSDN command differs from “The other side SIP server ID”, “501 Not Implemented” is sent to the SIP terminal as a reply to the REGISTER request.
15. “Pair SIP Server ID” on ASSDL/ASSDN command cannot be changed during operation.
16. The following explains how to change “Pair SIP Server ID” on ASSDL/ASSDN command and the information of the redundant partner.
    (1) Select “SIP Server” in “Function” box by the ASPC command, and press Get button.
    (2) Blank “SIP Server ID” box and press Set button.
    (3) Change “Pair SIP Server ID” on ASSDL/ASSDN command.
    (4) Set your SIP server ID to “SIP Server ID” on the ASPC command.
17. Both LAN1 (#0) and LAN1 (#1) require the domain setting on ASSDL/ASSDN. If all actual domains are assigned for one LAN1, at least one dummy domain must be assigned for the other LAN1.
18. The same DETAIL data on BASE DATA tab of ASSDL/ASSDN command must be assigned in LAN1 (#0) and LAN1 (#1).
19. When SIP terminal data is changed or deleted and either of LAN1 [LAN1 (#0) or LAN1 (#1)] does not respond it, a warning message is displayed.
20. When the system changeover occurs, new LAN1 (ACT) sends “Gratuitous APR Packet” message to SIP terminals. Some SIP terminals cannot respond to this message immediately. These SIP terminals are required to be reset.
21. Manual system changeover can be executed by using the CMOD command. (“SP mode Change” on the COSSL/COSSN command is unavailable.)
22. Even if a failure occurs in the LAN1 (ACT) and the system changeover is executed, the calls in progress are maintained, except in the following cases: **Note 1**, **Note 2**

    - SIP Terminal releases the call.
    - Button operation such as Switch Hook Flash is performed.
    - The party on the other end releases the call.

- Call Holding Timer expires.

Note 1: Only when a call is in 2-party talking, the call will be held.

Note 2: The conversation between the SIP terminals accommodated in the same LAN1 is maintained even if the timer expires or the timer is disabled.

23. If the called party is using a terminal not available for this feature, the call will not be maintained if a failure occurs and the system changeover is executed again.
24. If a failure occurs in the LAN1 (ACT) while a SIP Terminal is engaged in a call and the SIP Terminal hands over after the system changeover is accomplished, the call is disconnected.

Programming

STEP 1: Office Data Setting (Setting in the LAN1)

(1) **ASDIL/ASDIN** - SIP Domain Name Index Data

Assign the domain name to be used for SIP service. For details, refer to Initial data setting for WLAN Handset (MH Series) and SP Controlled SIP terminal in Chapter 5 of the Appliance Model Installation Manual.

(2) **ASSDL/ASSDN** - SIP Server Operation Data

Assign SIP Server ID of the redundant partner LAN1. For details, refer to Initial data setting for WLAN Handset (MH Series) and SP Controlled SIP terminal in the Appliance Model Installation Manual.

<REDUNDANCY tab>
Pair SIP Server ID: Assign SIP Server ID of the redundant partner LAN1 (1-127).

(3) **ASYDL/ASYDN** - System Data

System Data1, Index701, Bit 0~5: SIP telephone call holding timer **Note 3**
01 Hex~3d Hex (Setting value x 9 minutes)
00 Hex (Default) = 63 minutes
Bit 6~7: SIP telephone call holding canceling
01 Hex = Invalid the call holding
00 Hex (Default) = Valid the call holding

Note 3: Timer range: Setting time + 9 minutes

STEP 2: Setting on Each Terminal

When using this feature, set the IP address of LAN1 (ACT) as REGISTER destination IP address from each terminal. For details on setting of REGISTER destination IP address, refer to the related User's Guide.

S-155 Soft Phone

General Description

A Softphone is an application enables the user's personal computer to be used as a multi function telephone set. This section provides information on following service features using a Softphone. For details on a Softphone itself, refer to the User Guide.

- SOFT PHONE WLAN HANDSET [S-159]/SOFT PHONE - PS [S-158]

  This feature allows Softphone users to use the PS/WLAN Handset (MH Series) as the handset of the Softphone. For details on this feature, SOFT PHONE WLAN HANDSET [S-159]/SOFT PHONE - PS [S-158].

- SOFT PHONE WIRED-PHONE HANDSET [S-147]

  This feature allows Softphone users to use a wired telephone (analog wired telephone/Desktop terminal) as a handset of a Softphone. For details on this feature, SOFT PHONE WIRED-PHONE HANDSET [S-147].

- Softphone Password Change

  This feature allows Softphone users to change the Login Password in a Softphone screen.

- Softphone Internodes IP Address Resolution over CCIS/FCCS

  A Softphone can obtain an IP address of a Softphone accommodated in another FCCS/CCIS network so that it can send an Instant Message and perform the application sharing function such as Video Conference.

- Softphone - Other Party Information Readout

  This feature allows the system to send the information about the connected party (IP address and telephone number) as a response to inquiry from the Softphone. By using this feature, Softphone can receive the information of the following connected parties.

  Party using Sub Line

  Party engaged in a Three-party Conference

  Party engaged in a 8/16/32-party Conference

Operating Procedure

<Softphone Password Change>

1. Register to the system.
2. Start up the Password Change tool, and then enter the current password and new password. For more detailed information, see the User Guide.

<Softphone Inter-node IP Address Resolution over CCIS/FCCS>

To send an Instant Message

- In the case of FCCS or CCIS closed numbering network

  Enter a Station Number on the Short Message Destination, which is described as "To:". When the IP address of the destination Softphone is retrieved, an Instant Message is transmitted.

- In the case of CCIS opened numbering network

  Enter "Access Code" + "Office Number" + "Station Number" on the Short Message Destination, which is described as "To:". When the IP address of the destination Softphone is retrieved, an Instant Message is transmitted.

To perform the application sharing function

While keeping connection alive on the Softphone or the terminal in conjunction with the Softphone. Click the Application Sharing button.

<Softphone - Other Party Information Readout>

None.

Service Conditions

<Common Conditions>

1. Be sure to assign the following key data to a Programmable Feature key/Flex key of a Softphone.
   - SPEAKER key (When the Flex key data has been changed)
   - LOGOUT key
2. When using Softphone Wireless Handset/Softphone Wired-Phone Handset, the line of the terminal to be used as a handset of Softphone must be assigned as Prime Line. When using ACD service, ACD line must be used as Prime Line. At all other times, My Line must be assigned as Prime Line.
3. When using a Softphone, the following data needs to be assigned.
   a.) Before using a Softphone, be sure to assign the following data by ADKS command.

   LKP=3 (ALL Line/Feature buttons)

   b.) Before using Name Display service, be sure to assign the following system data.

   ASYD, System Data 1, Index 241, Bit 1 = 1 (The Number of digits displayed in Name Display Service is 16.)

c.) To use the Call Forward Settings Panel of a Softphone, the following data needs to be assigned by AKYD command.

FKY 1 (Call Forwarding - Busy Line), 2 (Call Forwarding - All Calls), 22 (Call Forwarding - Don't Answer) and 148 (Call Forwarding - Logout)

4. Distinctive Ringing [D-10] is not available for Softphones. Softphones support only the standard ringing pattern.
5. When using a Softphone as an ACD terminal:
   a.) The RELEASE key must be assigned to a programmable Feature key/Flex key of Softphone.
   b.) To get Calling Party Number of ACD incoming call, the received ANI Number (Calling Party Number) needs to be displayed at the beginning of the Connection Displays - ACD [C-199A].

Note: Soft Client SP350 in R3 or earlier cannot be used as an ACD terminal.

<Softphone Password Change>

1. This feature is available for SP30 with Software Version 13.0.0.0 or later.
2. Enter Station Number as password for first time login.
3. The number of significant digits for the password is 4 through 10. The password can includes "0-9", "*" and "#". Also, it is necessary to make the number of digits for the password coincide with MND assigned on AMND/AMNDL/AMNDN command.
4. Login Password can be changed when a Softphone has registered to the System.
5. Registered Login Passwords are stored in the memory of the system.
6. Login Password cannot be deleted from a Softphone. The RDPD command is used to delete the registered password.
7. The following shows the conditions concerning synchronization of Login Password between the nodes:

   In the case of FCCS Cluster: Login Passwords are synchronized when the office data is updated.

   In the case of SR-MGC: Login Passwords are synchronized when the office data is copied after the periodical diagnostic.

<Softphone Inter-node IP Address Resolution over CCIS/FCCS>

1. This feature uses a 3456 port (UDP). Therefore, it is necessary to unblock the port over the network.
2. In DtermSP30, self-node's office number in Numbering Plan must be correctly assigned by using DtermSP30Config.
3. This feature can be performed other than peer-to-peer connection of FCCS/CCIS network. However, its network must include IP connection for the feature.
4. This feature requires the following firmware:
   - DtermSP30: Version 9 or later
5. On the condition of opened numbering network set up in Common Channel Signaling system, the restrictions are as follows:
   a.) CCIS route to the destination office must be programmed as the first choice of the AOPR/AOPRL/AOPRN table.
   b.) The called party number transmitting to the destination office must include all digits dialed (an Access Code, an Office Number, and a Station Number).
   c.) A uniform numbering must be assigned to the destination office.
   d.) For originating office, a uniform numbering including the self-node identification code for CCIS

(RT=0 in the ARNP command) must be assigned correctly.

e.) Change Digit Code to CCIS route on the called party (the ACDD command) cannot be programmed. Leave the data intact and use the result for analysis.

f.) Communication with CCIS message is not used for this feature, however, a UDP (Port Number:3456) connection between MGCs is needed for this feature to perform.

<Softphone - Other Party Information Readout>

1. This feature is available when ASYDL/ASYDN, System Data 1, Index 863, Bit 2 = 1.
2. This feature supports only the connected parties engaged in a Two-party Call or a Conference Call.
3. This feature is available through FCCS or CCIS network.
4. This feature is not available in the UMGi system.
5. The conditions concerning to 8/16/32-party Conference are shown below.
   a.) When using CFT card, this feature supports 8-Party Conference only. When using VS32 Conference Server, this feature supports all the conferences (8/16/32-Party Conference).
   b.) When 8/16/32-party Conference (MEET-ME) includes a conferee transferred by hooking operation through 3-party Conference:
      - the parties on the 8/16/32-party Conference cannot receive the information about the party connected with the transferred party of the 3-party Conference.
      - intermediate party and transferred party of 3-party Conference can only receive the information about the party connected with the member of the 3-party Conference.
   c.) When performing 8-Party Conference with CFT card in the FCCS network, assign "SFI 72 = 1" (ASFC/ASFCN command) at all the connected nodes. **Note 1**

      Note 1: It is recommended to use ASFCN command.

6. To activate this feature, firmware 15.0.0.0 or later version is required to be equipped on DtermSP30.

<Conditions Specific to UMGi/RNIP System>

1. In a UMGi system, this feature cannot be used in a RN in survival mode that has soft phones registered.
2. In a RNIP/UMGi system, this feature cannot be used when a failure occurs in the CCN.
3. In UMG system, this feature cannot be used when a failure occurs in CMG.

Programming

For details on the Station data setting of a Softphone, see “IP Station Data” in Chapter 2 of this manual.

<Softphone Password Change>

- Assignment of Login Password Data

STEP 1: **ASYD** - System Data 1, Index 93, Bit 6 = 0 (Separate tables)
STEP 2: **ASFC/ASFCN** - Assign a Service Feature Restriction Class that allows SFI 186, to the Stations used for “DtermIP Login function”. Data must be “0”.
STEP 3: **AMND/AMNDL/AMNDN** - Assign the MND data for the passwords.
TN: 0
DC: Destination Code (Assign the 1st digit (“0-9”, “#”, “*”) of all passwords.)
MND: Maximum Necessary Digits (Assign the MND of passwords.)
TOLL: Local Code
AN: Out of service
RATE: 0
A/D: Analog

- Deletion of Login Password

STEP 1: **RDPD** - Delete the registered password if necessary.
TYPE: Choose either STN or TELN.

- When TYPE = STN:

TN: Tenant Number
STN: Station Number (Physical Number)

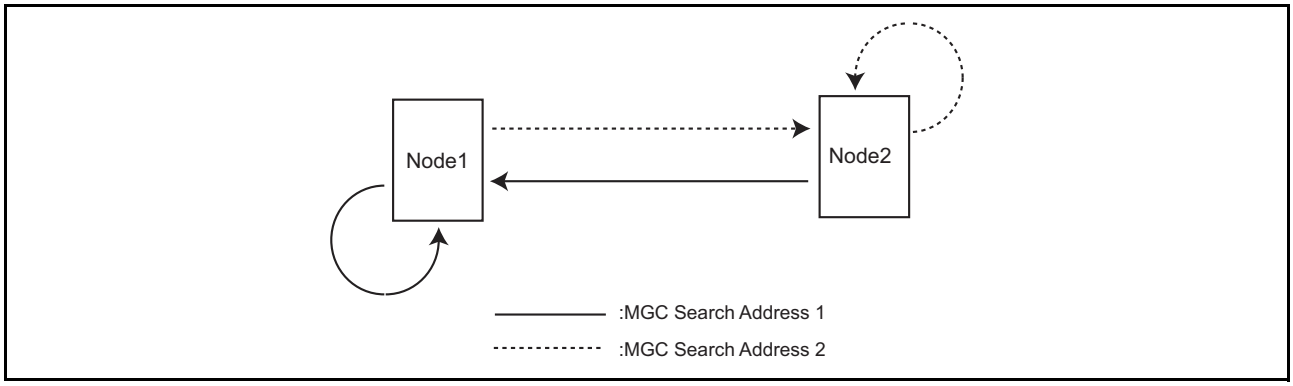
- When TYPE = TELN:

UGN: User Group Number
TELN: Telephone Number

- Back up Login Password to the hard disk

STEP 2: **MEM_HDD** - Back up the passwords to the hard disk.
Direction Select: Choose “Memory to Hard Disk”.
Data Type Select: Choose “Call Forwarding.”
LP Select: Specify the LP Number.

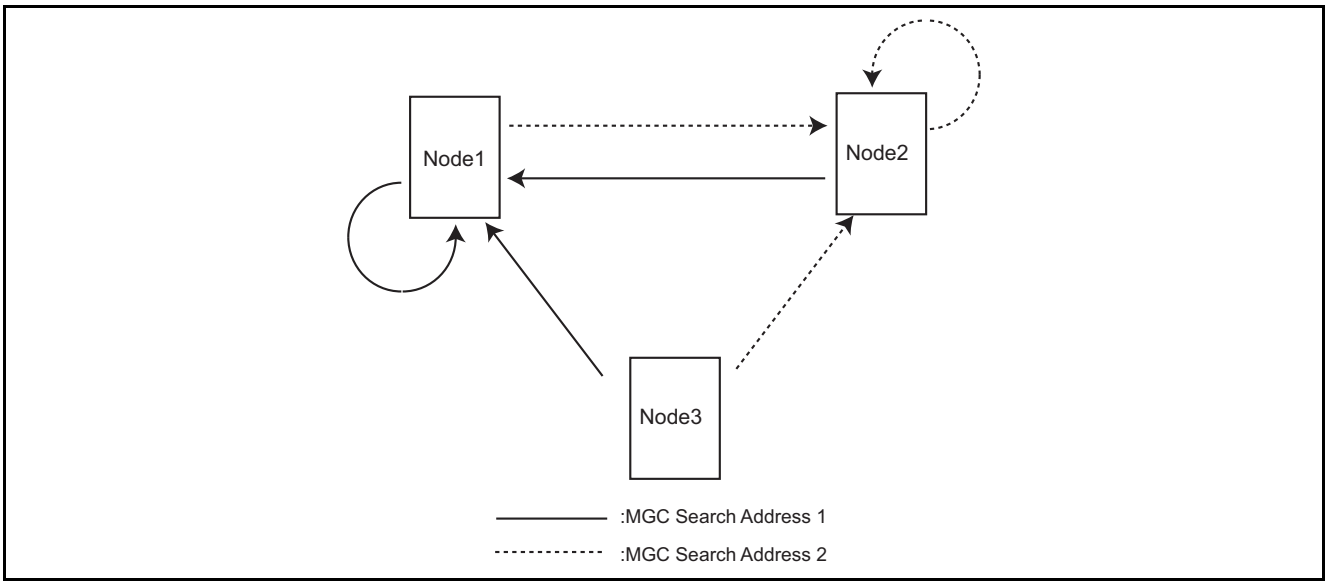
<Softphone Inter-node IP Address Resolution over CCIS/FCCS>



STEP 1: **ADTM** - Assign this MGC Search Address. **Note 2**, **Note 3**

Select the Option tab and the Registration Service, and then click the Execute button. On the screen, Enter MGC Search Address 1 and MGC Search Address 2. These items are assigned in the following:

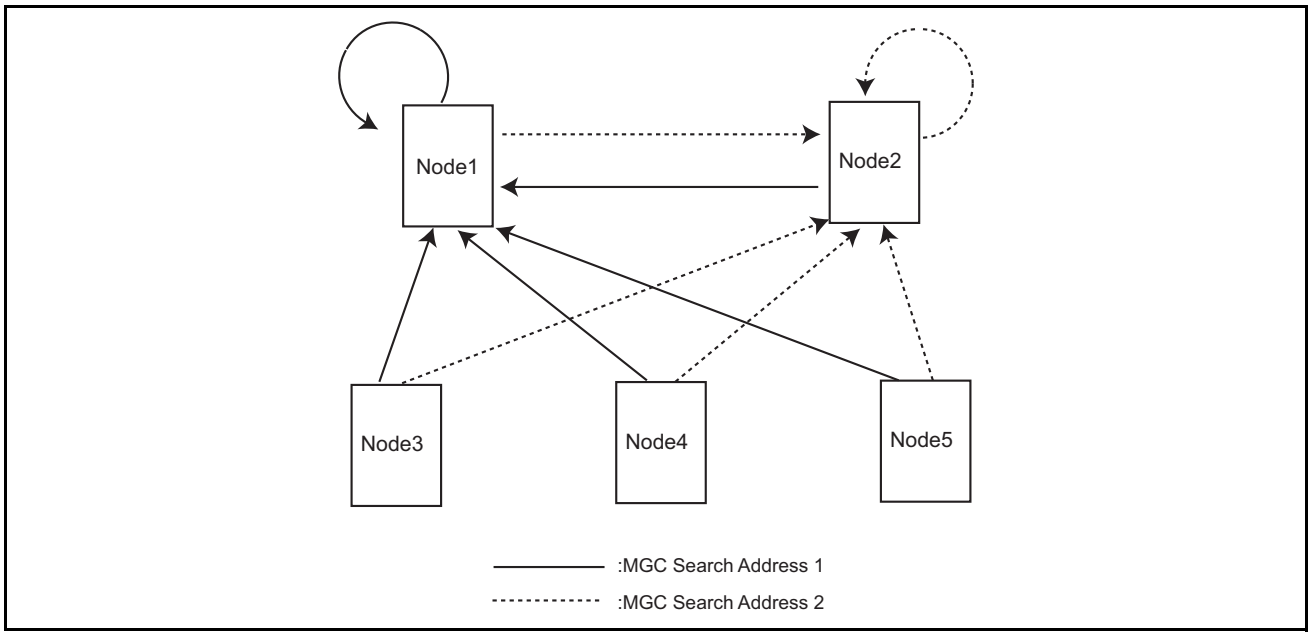
Note 2: Assign the same IP address (ACT) that has been assigned in the “REG” parameter of “Configure Application Port” under “Options” tab in the same node.



Note 3: Either the IP address of LAN1 (ACT) or LAN2 (ACT) can be chosen as the MGC Search Address. Note, however, that LAN2 is used when the existing IPX/SV7000 network is migrated to the SV9500 network. For more details about migration, refer to “Migration Guide”. In the following examples, LAN1 is used.

- Two nodes constitute a network

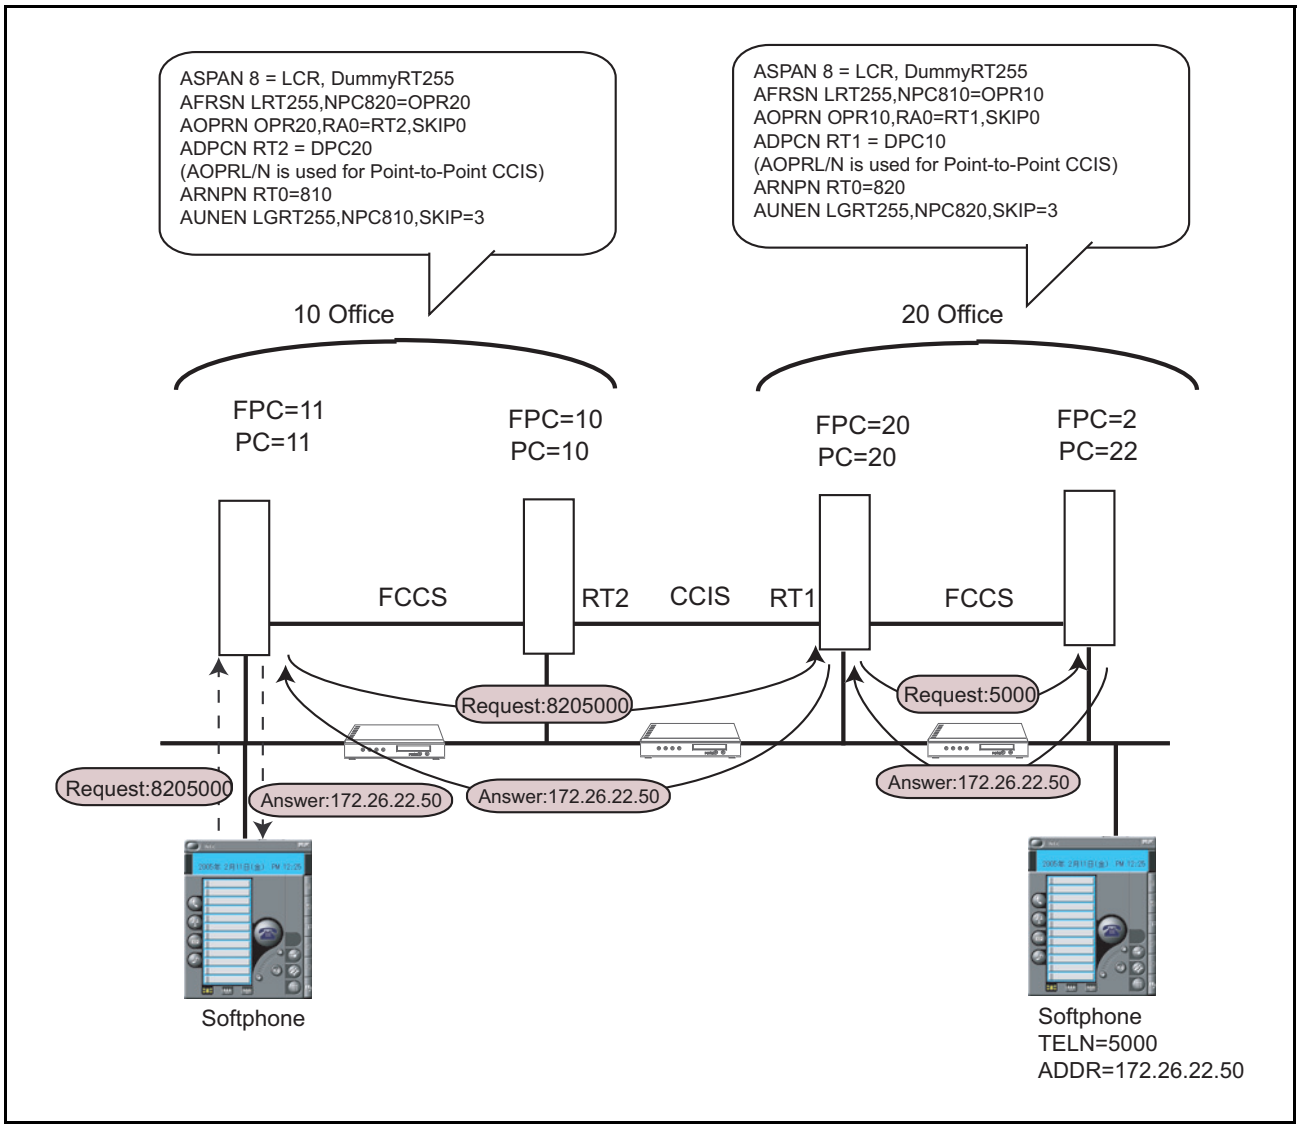
NODE	MGC SERCH ADDRESS1	MGC SERCH ADDRESS2
Node 1	IP Address of Node 1 (self node) (IP Address of LAN1 (ACT))	IP Address of Node 2 (IP Address of LAN1 (ACT))
Node 2	IP Address of Node 1 (IP Address of LAN1 (ACT))	IP Address of Node 2 (self node) (IP Address of LAN1 (ACT))



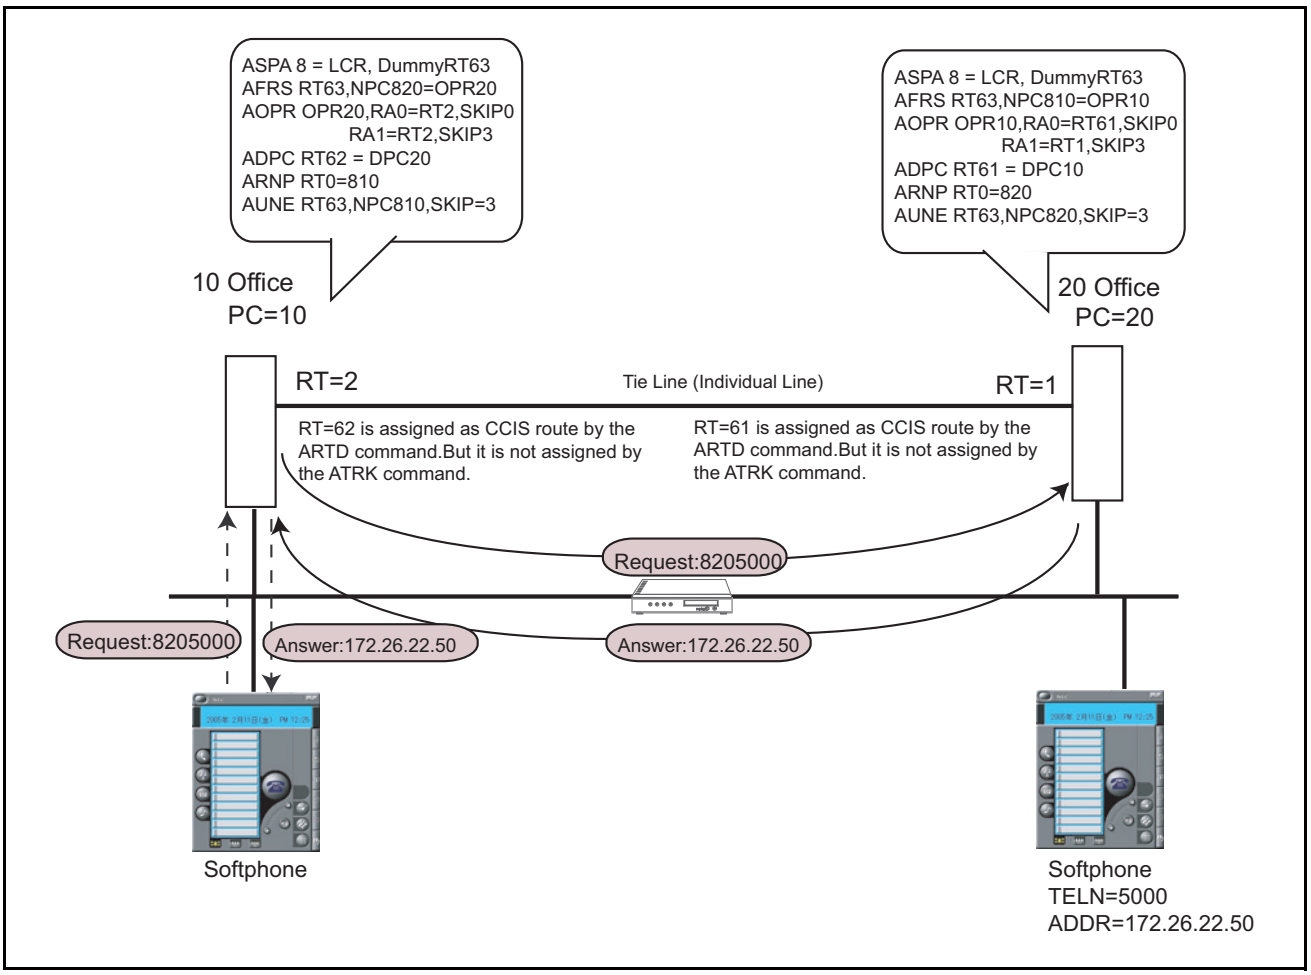
- Three nodes constitute a network

NODE	MGC SERCH ADDRESS1	MGC SERCH ADDRESS2
Node 1	IP Address of Node 1 (self node) (IP Address of LAN1 (ACT))	IP Address of Node 2 (IP Address of LAN1 (ACT))
Node 2	IP Address of Node 1 (IP Address of LAN1 (ACT))	IP Address of Node 2 (self node) (IP Address of LAN1 (ACT))
Node 3	IP Address of Node 1 (IP Address of LAN1 (ACT))	IP Address of Node 2 (IP Address of LAN1 (ACT))

- More than three nodes constitute a network



In the case that more than three nodes constitute a network, the same pattern can be applied.



NODE	MGC SERCH ADDRESS1	MGC SERCH ADDRESS2
Node 1	IP Address of Node 1 (self node) (IP Address of LAN1 (ACT))	IP Address of Node 2 (IP Address of LAN1 (ACT))
Node 2	IP Address of Node 1 (IP Address of LAN1 (ACT))	IP Address of Node 2 (self node) (IP Address of LAN1 (ACT))
Node 3	IP Address of Node 1 (IP Address of LAN1 (ACT))	IP Address of Node 2 (IP Address of LAN1 (ACT))
Node 4	IP Address of Node 1 (IP Address of LAN1 (ACT))	IP Address of Node 2 (IP Address of LAN1 (ACT))
Node 5	IP Address of Node 1 (IP Address of LAN1 (ACT))	IP Address of Node 2 (IP Address of LAN1 (ACT))

The following is examples of the network configuration using this feature.

- When FCCS and CCIS networks coexist

- When Tie line using individual line is used

<Softphone - Other Party Information Readout>

STEP 1: **ASYDL/ASYDN** - System Data 1, Index 863, Bit 2. Softphone - Other Party Information Readout. 0/1 = Out of service/In service

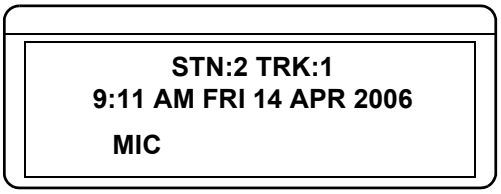
STEP 2: **ASFC/ASFCN** - When performing 8-Party Conference with CFT card in the FCCS network, the data setting shown below is required at all the nodes. In this case, it is recommended to assign the data by ASFCN command.

SFI = 72 (Called Station Switch Hook Flash Restriction)

RES = 1 (Allowed)

S-157 Selective Disconnect 8 Party Conference

General Description



This feature will allow a conference attendee (or leader) to use a Feature key to display each party in the conference. Once the party is displayed the user can press the DISC key to drop the party or the CONFERENCE DISPLAY Feature key to move to the next party.
This feature functions with the following conference types:
ADD-ON CONFERENCE 8 PARTY [A-121]
CALL HOLD CONFERENCE 8 PARTY
ASSISTED CONFERENCE 8 PARTY [A-143]

This feature works in conjunction with the CONSULTATION HOLD RELEASE [C-169] function, the last party displayed using the CONFERENCE DISPLAY Feature key becomes the party to be dropped by the DISC key.

Note: This feature is available in North America only.

Operating Procedure

During a normal 8 party Add-on Conference the display of the Desktop terminal will show the user the number of station and trunks currently connected in the conference.
Example:

When the CONFERENCE DISPLAY Feature key is pressed the LCD will display a conference attendee. Each subsequent press of the CONFERENCE DISPLAY Feature key will display a different attendee, until all attendees have been displayed. (See Fig 1-1)

In Fig 1-1, an illustration of Dterm series *i* is used as an example.

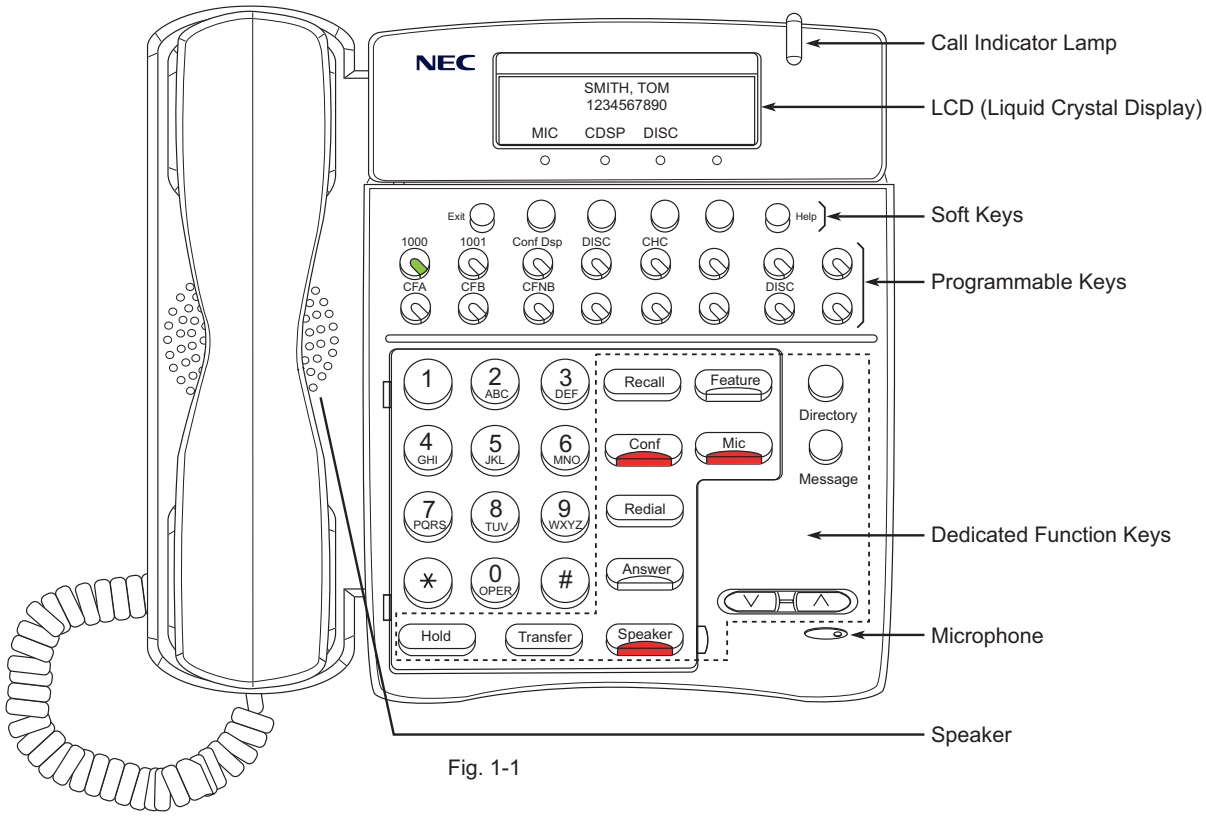


Fig. 1-1

To Disconnect a Party During a Conference. (See Fig. 1-1)

1. Press the CONFERENCE DISPLAY Feature key, until the party to be dropped is displayed.
2. Press the DISC key to drop the party.

Service Conditions

1. All the other Add-on Conference 8 Party [A-121] service conditions apply.
2. This feature is not available for Meet Me conference or Progressive conference.
   a.) It functions on Add-on Conference 8 Party [A-121], Call Hold Conference 8 Party and Assisted Conference 8 Party [A-143].
3. The CONFERENCE DISPLAY Feature key in not available for 3 party Conferences. (RT 909)
4. The disconnect key will only disconnect a single party.
   a.) Once the disconnect key is used it can not be used again by that user until the user:
   - Adds a new party to the Conference. (Last party Drop)
   - Uses the CONFERENCE DISPLAY Feature Key Again. (Selective Drop)
5. All latest Firmware and Flash for the 8CFT and 32CFTV card must be used.
   a.) SP-3654 must be 04.00 or above.

b.) SP-1114 must be 2A or above.

6. The CONFERENCE DISPLAY Feature Key will only function in an Add-on Conference 8 Party [A-121], Assisted Conference 8 Party [A-143], or Call Hold Conference 8 Party.
7. The conference leader (Port 0) can not be dropped by this feature.
   a.) The leader will be displayed in the conference, but will not be dropped.
   b.) A user can use the DISC key to disconnect its own port if they are not the leader of the conference.
   c.) If a trunk becomes the conference leader because the original station released this trunk will not be able to be released by the DISC key from any other station on the conference.
8. During Conference Display the conference attendee is displayed for 10 seconds.
   a.) After 10 seconds the display is changed back to normal.
   b.) If the DISC key is pressed the last party displayed will be dropped. (Even if the display has timed out)
9. The number / name displayed for the conference attendee is based off availability.
   a.) For Outgoing calls

   - The dialed number is displayed. (Example: 91234567890 9 is LCR access code - 1234567890 is the number)
   - ACID can be assigned to associate an outgoing number to name, but the access code must be included in the assignment. (New and only for this feature)
   - For internal Station calls the ANDD name and the station number will be displayed.
   - If no name is available by ACID command UNKNOWN NAME is displayed for the name.

   b.) For incoming calls

   - The number is based off ANI of the Route and Trunk. (Example: 1234567890 would be displayed if ANI was received off an ISDN Route.)
   - If no ANI is available the number display will be blank.
   - If ISDN Incoming Name is available it will be displayed. (See ISDN Programming Manual)
   - ACID can be used to assign a name to an incoming number if ISDN name service is not available. (see ISDN Programming manual)
   - If no name is available UNKNOWN NAME will be displayed.

Interactions

1. OAI SCF and SMFR/SMFN is not supported on the 8 party conferences.
2. The CONFERENCE DISPLAY Feature key can be assigned to a Soft key pattern, but must be assigned in the normal connected state. The Soft key may not be available in all states displayed.
3. PHS/WLAN Handset (MH Series)/SIP Handler Controlled Standard SIP terminals can attend a conference.
4. Disconnecting a party during a conference is available by operations only from Desktop terminals.
5. SP Controlled Standard SIP terminals are not supported with this feature.

Programming

All normal Programming for Add-on Conference 8 Party [A-121] apply plus the below steps.

STEP 1: **ASYDL** - System Data 1, Index 803, Bit 1 = 1 Consultation Hold Release in-service
System Data 1, Index 803, Bit 2 = 1 Operations are valid for stations in an 8-Party Add On Conference.

STEP 2: **ASFC -** SFI 131 Add-On Conference - 8-Party (must be assigned to stations that are allowed to use the DISC key when in an 8-Party state).

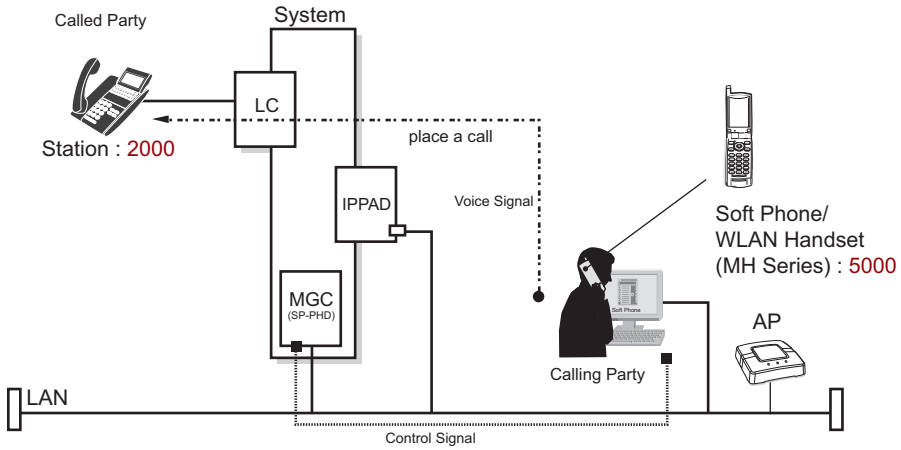
STEP 3: **AKYD** - FKY 131 Disconnect Key, FKY 179 Conference Display Key

STEP 4: **ACID** Only needed to assign a name to an outgoing number if required.
The Access code must be included in the CID.
Type = 3, CID = Dialed Number including Access code (9), SRV3 = 3, NAME = Name to display.

S-159 Soft Phone WLAN Handset

General Description

This feature allows a Soft Phone user to use the WLAN Handset (MH Series) as the handset of the Soft Phone. The user can select a handset (Soft Phone Handset or WLAN Handset (MH Series)) by pressing the Handset Switch key on the Soft Phone.



Example:

Operating Procedure

Operating procedures for the following configurations are explained here.

Example:

Call Origination

- Call Origination (Goes off-hook from the WLAN Handset (MH Series) before dialing)
  - (1) Go off-hook from the WLAN Handset (MH Series).
  - (2) Dial the destination number from the WLAN Handset (MH Series) or Soft Phone. - Address Book also can be used.
- Call Origination (Dials before going off-hook from the WLAN Handset (MH Series))
  - (1) Press the Speaker button on the Soft Phone.
  - (2) Dial the destination number from the Soft Phone.- Address Book also can be used.
  - (3) Go off-hook from the WLAN Handset (MH Series).

Call Termination

- Call Termination to the WLAN Handset (MH Series) Line on the Soft Phone
  (1) WLAN Handset (MH Series) or Soft Phone rings.
  (2) Go off-hook from the WLAN Handset (MH Series).
- Call Termination to Sub Line on the Soft Phone
  (1) Sub Line on the Soft Phone rings.
  (2) Click the Sub Line on the Soft Phone, and then go off-hook from the WLAN Handset (MH Series).
  The call can be picked up.

  Note: The call can be picked up also by going off-hook from the WLAN Handset (MH Series) before clicking the Sub Line on the Soft Phone.

Call Park from the Soft Phone

- To Park a Call
  (1) Press the Hold button on the Soft Phone while talking with a destination.
  (2) The call is parked and the Call Park lamp flashes on the Function Key.
  (3) Hear Service Set Tone.
  (4) Go off-hook from the WLAN Handset (MH Series).
- To Retrieve the Parked Call
  (1) Go off-hook from the WLAN Handset (MH Series).
  (2) Press the Call Park button on the Soft Phone.

  Note: The Parked Call can be retrieved also by pressing the Call Park button on the Soft Phone before going off-hook from the WLAN Handset (MH Series).

Service Conditions

1. The terminal that can be used as a handset varies depending on the version of Soft Phone.

	DtermSP30 (Ver.2) (Proprietary Protocol)	DtermSP30 (Ver.4) (Proprietary Protocol)	DtermSP30 (Ver.7 or later) (Proprietary Protocol/SIP) Soft Client SP350
Analog Telephone	N	N	×
Dterm/DtermIP/IP Enabled Dterm	N	N	×
DtermIP(SIP)	N	N	×
WLAN Handset (MH Series)	N	N	×

2. In principle, when assigning WLAN Handset (MH Series) data, use the NDM commands (FPC=1).

3. Call origination is available from the WLAN Handset (MH Series) or Soft Phone by dialing a desired number. Call origination by the Address Book on Soft Phone is also available.

4. This feature can be set/canceled by pressing the Handset Switch key provided on the Soft Phone. Note that the Handset Switch key is invalid while the Soft Phone or WLAN Handset (MH Series) is engaged (Call Termination / Call Origination / Talking).

5. When a Soft Phone using this feature receives an incoming call, the call is answered by the WLAN Handset (MH Series). If the WLAN Handset (MH Series) moves out of zone, Automatic Announcement - Called PS out of Zone/Call Forwarding - PS Incoming Incomplete is applied or ROT is heard.
   If a Soft Phone received an ISDN incoming call, the caller hears RBT.
   If the WLAN Handset (MH Series) moves out of zone, the above features will be applied or ROT will be heard.
   When PS out of zone occurs while the Handset Switch is applied, the calling party hears RBT.

6. While the WLAN Handset (MH Series) is talking by this feature, HOLD, TRANSFER, CONF can be set from the WLAN Handset (MH Series) or Soft Phone.

7. When a call terminates on a Sub Line, it can be answered from the WLAN Handset (MH Series). If this is required, set SFI 29 (Direct Call Pickup) to 1 by ASFC for WLAN Handset (MH Series) and Soft Phone.

8. When this feature has been set the following is restricted:

   - Using the handset of PC in which Soft Phone is installed while the WLAN Handset (MH Series) is engaged in call.

   - Call Origination from/Call Termination to My Line of Soft Phone.

9. When this feature has been set, the WLAN Handset (MH Series) is automatically specified as the handset whenever registration is performed. Even if the Handset Switch is applied, the WLAN Handset (MH Series) becomes the handset of Soft Phone when registration is performed. If Soft Phone registration is per-

formed while the WLAN Handset (MH Series) is placing a call or talking, key operation will not be accepted from the Soft Phone. (**Note 1**) The key operation will be available when the WLAN Handset (MH Series) releases the call.

Note 1: The unacceptable key status is same as that of the WLAN Handset (MH Series) placing a call or talking. However, following keys are excepted:

Function key of Last Number Call: When this key is pressed, the number is displayed on the LCD. However the dial number is unavailable to place a call.

Function key of Logout: This key is acceptable, except pressing after following keys;
- Function key of Last Number Call
- Function key of Speaker
- Function key of Prime Line

10. When this feature is used, the WLAN Handset (MH Series) user requires to go off-hook to place a call.

11. A Soft Phone user cannot retrieve the parked call by pressing the Park key when the user is engaged in call.

12. When assigning Call Pickup Group / Call Pickup Expand data not using Telephone Number, be sure to assign the WLAN Handset (MH Series) Station Number and My Line Number of the Soft Phone by using ACPG / ACPE commands.

13. In the following cases, when the user goes off-hook from the WLAN Handset (MH Series), ROT is heard:

    - WLAN Handset (MH Series) user presses the Call Park Key - the call is parked.

    - The parked call is retrieved by other terminal or the held party releases the call.

14. When assigning the APGN/ADGN command for Call Park Group while this feature is enabled, WLAN Handset (MH Series) Station Number and My Line Number of the Soft Phone must be assigned to the same group. Also, when ASYDL/ASYDN, System Data 1, Index 679, Bit 4 is assigned as “0”, The MG of WLAN Handset (MH Series) Station Number and MG of My Line Number of the Soft Phone must be the same.

15. This feature cannot be used for Hotel / OAI / ACD system.

16. There may be cases where operations while using this feature cannot be recorded in Call Logs. This is also the case when using Redial or Last Number Called -D.

17. When Soft Phone WLAN Handset is used, Call Forwarding - All Calls is not canceled even if Call Forwarding - All Calls Automatic Canceled has been assigned by ASYD command.

18. If Application Sharing function such as White Board is activated while in conversation, the Hold button of Soft Phone cannot be used until the conversation is completed.

19. When using this feature, it is available to retrieve only the held call via Call Park Group -D.

20. This feature is not available for a call via PHC.

21. When a WLAN Handset (MH Series) uses this feature, the WLAN Handset (MH Series) user can place a call on hold by using Call Park access codes. The data programming is required for Call Park.

22. When the handset is WLAN Handset (MH Series), the WLAN Handset (MH Series) cannot answer the held call on the Sub Line on Soft Phone.

23. Soft Phone WLAN Handset is available when the talking WLAN Handset (MH Series) moves among FCCS offices.

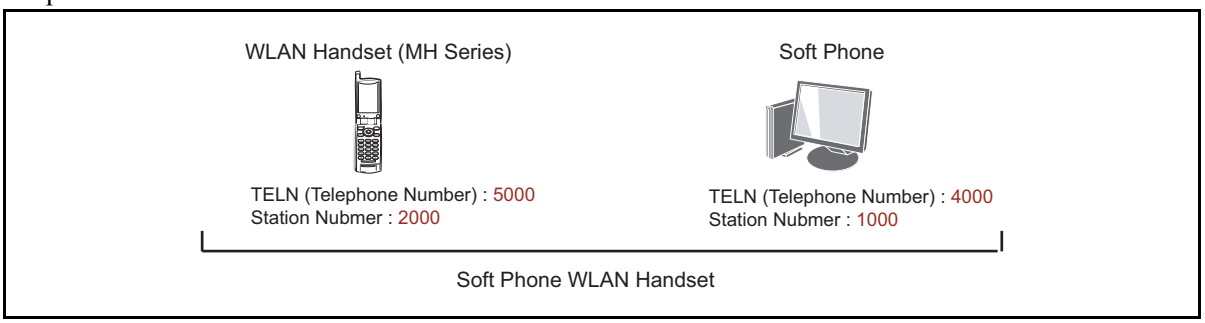
24. Both of WLAN Handset (MH Series) and Soft Phone can release the call when WLAN Handset (MH Series) is used as a handset.

25. When PRESET DIALING from WLAN Handset (MH Series) is executed in the state that number is left on the LCD of Soft Phone connected with WLAN Handset (MH Series), WLAN Handset (MH Series) will receive ROT or Dead Number Announcement.

26. A maximum of 256 units per MG can be assigned for MG (Module Group) of WLAN Handset (MH Series) Line Appearance data (APLAML/APLAMN).

27. When a call is transferred by switch hook operation on a WLAN Handset (MH Series), the transferred call must be retrieved by switch hook flash operation on the WLAN Handset (MH Series). On this occasion, if the transferred call is retrieved by switch hook flash operation on the Soft Phone, a difference of connection status indications will occur between the WLAN Handset (MH Series) and the Soft Phone. **Note 2**

28. When a call is transferred by switch hook operation on a Soft Phone, the transferred call must be retrieved by switch hook flash operation on the Soft Phone. On this occasion, if the transferred call is retrieved by switch hook flash operation on the WLAN Handset (MH Series), a difference of connection status indications will occur between the WLAN Handset (MH Series) and the Soft Phone. **Note 2**



29. Call Park number cannot be displayed on the LCD of WLAN Handset (MH Series).

30. In this feature, when assigning Call Pickup-Group and Expanded Call Pickup-Group data, you only need to assign station number of WLAN Handset.

Note 2: The LCD on WLAN Handset (MH Series) may indicate that it is in the process of transferring while in a conversation, and vice versa.

The following shows the example condition for each terminal. Assign the data referring to the example condition. In case of this example, Station Number used for call origination or termination will be “5000”.

Example condition:

When using standalone configuration

STEP 1: **ASYD** (Assignment of System Data)
System data 1, Index 390, bit 2 = 1. Allow the Caller ID display on the bottom line of Dterm LCD in service.

STEP 2: **ASCL** (Station Class Data) - Assign the same Station Class to both WLAN Handset and Soft Phone.

Note: When the Station Classes of the WLAN Handset and the Soft Phone are different, some operations of this feature may not be performed from the Soft Phone.

Read Station Class Data of WLAN Handset.
TN: Tenant Number
STN: 2000 (Station Number of WLAN Handset)
TEC=28 (PS)
RSC: Route Restriction Class [0-15]
SFC: Service Feature Restriction Class [0-15]

For Soft Phone, assign the same Station Class as that of WLAN Handset.
TN: Tenant Number
STN: 1000 (Station Number of Soft Phone)
TEC=12 (Dterm)
RSC: Route Restriction Class [0-15] (Same as RSC of WLAN Handset.)
SFC: Service Feature Restriction Class [0-15] (Same as SFC of the WLAN Handset)

STEP 3: **APLAMN** (Assignment of PS Line Appearance Module - Group for NDM)

Assign the MG of Soft Phone that accommodates WLAN Handset (MH Series) Line as a Sub Line to Telephone Number of the WLAN Handset (MH Series).
UGN: User Group Number
TELN: Telephone Number of the WLAN Handset (MH Series)
Local Module Group

[In case of the example condition]
UGN: User Group Number
TELN: 5000
Local Module Group

Note: Although this parameter allows the system to register an MG automatically by pressing the Set button without specifying the MG, do not register in this way here. It is because MG assigned in this way conflicts with MG registered Soft Phone for this feature.

Note: When the number of unit is more than 256 per MG, assign the unit also to the MG Number 02-07.

STEP 4: **AKYD** (Assignment of Key Data for Dterm)

Assign the WLAN Handset (MH Series) Station Number to the Prime Line of Soft Phone.
PL TN: Prime Line Tenant Number
PL STN: Prime Line Station Number (Station Number of WLAN Handset (MH Series))
S = 0 (Without OFF-HOOK suppression)
KYN: Key Number
KYI = 2 (Multiline)
Multi Line TN: Multi Line Tenant Number
Multi Line STN: Multi Line Station Number (Station Number of WLAN Handset (MH Series))
KYN: Key Number
KYI = 2 (Multiline)
Multi Line TN: Multi Line Tenant Number
Multi Line STN: Multi Line Station Number (Station Number of Soft Phone)

STEP 5: **APJSN** (Assignment of PS Join Soft Phone for NDM)

Assign the relationship between the My Line of Soft Phone and WLAN Handset (MH Series).
UGN : WLAN Handset (MH Series) User Group Number
TELN : WLAN Handset (MH Series) Telephone Number
S_UGN : Soft Phone User Group Number
S_TELN : Soft Phone Telephone Number

[In case of the example condition]
UGN : WLAN Handset (MH Series) User Group Number
TELN : 5000 (Telephone Number of WLAN Handset (MH Series))
S_UGN : Soft Phone User Group Number
S_TELN : 4000 (Telephone Number of Soft Phone)

When using FCCS

STEP 1: **ASYD** (Assignment of System Data)
System data 1, Index 390, bit 2 = 1. Allow the Caller ID display on the bottom line of Dterm LCD in service.

STEP 2: **ASCL/ASCL_T** (Station Class Data)

Assign the same Station Class to both WLAN Handset and Soft Phone.

Note: When the Station Classes of the Soft Phone and the WLAN Handset are different, some operations of this feature may not be performed from Soft Phone.

Read Station Class Data of WLAN Handset.
UGN: User Group Number
TELN: 5000 (Telephone Number of WLAN Handset)
FPC: Fusion Point Code
TN: Tenant Number
STN: 2000 (Station Number of WLAN Handset)
TEC=28 (PS)
RSC: Route Restriction Class [0-15]
SFC: Service Feature Restriction Class [0-15]

For Soft phone, assign the same Station Class as that of WLAN Handset.
UGN: User Group Number
TELN: 4000 (Telephone Number of Soft Phone)
TN: Tenant Number
STN: 1000 (Station Number of Soft Phone)
TEC=12 (Dterm)
RSC: Route Restriction Class [0-15] (Same as RSC of WLAN Handset.)
SFC: Service Feature Restriction Class [0-15] (Same as SFC of WLAN Handset.)

STEP 3: **APLAMN** (Assignment of PS Line Appearance Module - Group for NDM)

Assign the MG of Soft Phone that accommodates WLAN Handset (MH Series) Line as a Sub Line to Telephone Number of the WLAN Handset (MH Series).
UGN: User Group Number
TELN: Telephone Number of the WLAN Handset (MH Series)
Local Module Group

[In case of the example condition]
UGN: User Group Number
TELN: 5000
Local Module Group

Note: Although this parameter allows the system to register an MG automatically by pressing the Set button without specifying the MG, do not register in this way here. It is because MG assigned in this way conflicts with MG registered Soft Phone for this feature.

Note: When the number of unit is more than 256 per MG, assign the unit also to the MG Number 02-07.

STEP 4: **AKYD** (Assignment of Key Data for Dterm)

Assign the WLAN Handset (MH Series) Station Number to the Prime Line of Soft Phone.
PL TN: Prime Line Tenant Number
PL STN: Prime Line Station Number (Station Number of WLAN Handset (MH Series))
S = 0 (Without OFF-HOOK suppression)
KYN: Key Number

KYI = 2 (Multiline)
Multi Line TN: Multi Line Tenant Number
Multi Line STN: Multi Line Station Number (Station Number of WLAN Handset (MH Series))
KYN: Key Number
KYI = 2 (Multiline)
Multi Line TN: Multi Line Tenant Number
Multi Line STN: Multi Line Station Number (Station Number of Soft Phone)

[In case of the example condition]
PL TN: Prime Line Tenant Number
PL STN: 2000 (Station Number of WLAN Handset (MH Series))
S = 0 (Without OFF-HOOK suppression)
KYN: 1-32
KYI = 2 (Multiline)
Multi Line TN: Multi Line Tenant Number
Multi Line STN: 2000 (Station Number of WLAN Handset (MH Series))
KYN: 1-32
KYI = 2 (Multiline)
Multi Line TN: Multi Line Tenant Number
Multi Line STN: 1000 (Station Number of Soft Phone)

Assign Handset Switch button to a function button of Soft Phone when required.
KYN: Key Number
KYI = 1 (Function Key)
FKY = 157 (Handset Switch)

STEP 5: **APJSN** (Assignment of PS Join Soft Phone for NDM)

Assign the relationship between the My Line of Soft Phone and WLAN Handset (MH Series).

UGN	: WLAN Handset (MH Series) User Group Number
TELN	: WLAN Handset (MH Series) Telephone Number
S_UGN	: Soft Phone User Group Number
S_TELN	: Soft Phone Telephone Number

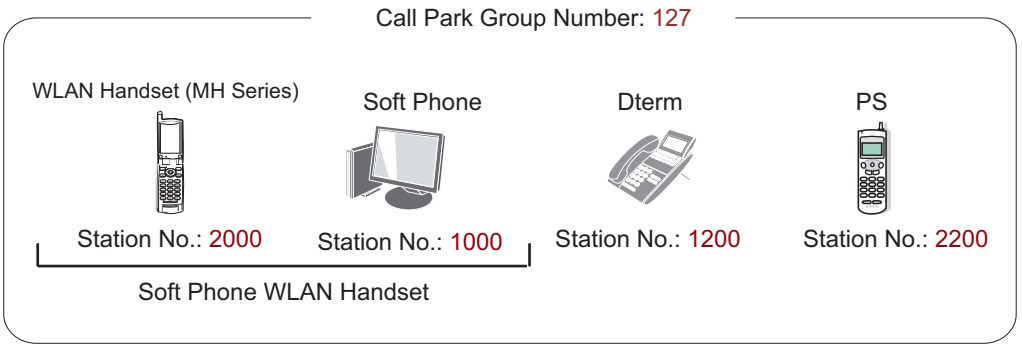
[In case of the example condition]

UGN	: WLAN Handset (MH Series) User Group Number
TELN	: 5000 (Telephone Number of WLAN Handset (MH Series))
S_UGN	: Soft Phone User Group Number
S_TELN	: 4000 (Telephone Number of Soft Phone)

Data Assignments for Other Services

There are two types of services: services that need to be assigned for only WLAN Handset, and services that need to be assigned for both WLAN Handset and Soft Phone.

(a) Services that need to be assigned for only WLAN Handset.
- Incoming Call services:
  A variety of Station Hunting services or UNIFORM CALL DISTRIBUTION (UCD) [U-1]
- Call Pickup services:
  CALL PICKUP-GROUP [C-7] and Expand Call Pickup-Group
- Setting/Canceling of CF services:
  CALL FOWRARDINFG-ALL CALLS [C-5], CALL FORWARDING -BUSY LINE [C-2], CALL FORWARDING-DON'T ANSWER [M-25] and LOGGED OUT IP STATION-CALL DESTINATION [L-53]
- SP Controlled SIP Terminal On Hold (Assignment of ASPA/ASPAL/ASPAN SRV=SSCA SIDA=119 is needed.)



(b) Services that need to be assigned for both WLAN Handset and Soft Phone. **Note 3**
- CALL PARK GROUP-D [C-176D]:
  WLAN Handset and Soft Phone must be assigned to the same group of the same MG.
- LEAST COST ROUTING FOR MG-PRI [L-54] (MA-ID) (Assignment of AMAA is needed for Soft Phone.)
- Other services:
  Assign required data for WLAN Handset and Soft Phone.

Note 3: When the service data is not assigned for Soft Phone, you may not operate the services from Soft Phone (even while WLAN Handset is not used as the handset of Soft Phone).

- When using Call Park

  Following shows the example condition when using Call Park. Assign the data referring to the example condition. For the basic data programming and conditions of Call Park, see Call Park in this guide and Call Park [C-29] in Data Programming Manual - Business.

  Example condition:

Note: Suppose that Softphone (Station No.: 1000) and Dterm (Station No.: 1200) are registered to MG (Module Group) 3.

Parameter	Terminal				
	Soft Phone WLAN Handset		Dterm (1200)	WLAN Hand-set (MH Series) (2200)	GROUP NO (127)
	WLAN Hand-set (MH Series) (2000)	Soft Phone (1000)			
ADGN	-	GROUP NO: 127	GROUP NO: 127	-	-
APGN	MG: 03 GROUP NO: 127 STN: 2000	-	-	MG: 03 GROUP NO: 127 STN: 2200	-
APGS	-	-	-	-	MG: 03 GROUP NO: 127 STN: 1000

STEP 1: **ASFC** (Assignment of Service Feature Restriction Class)
SFI=67: Call Park-Access and Answer
SFI=68: Call Park-Called
RES=1 (Allowed)

STEP 2: **AKYD** (Assignment of Key Data for Dterm)

Assign Call Park Group -D Key. Assign FKY 75-82 to the Soft Phone key.

Note: When only one Call Park Group Key is assigned, assign FKY 75 to the Dterm Key. When more than one Call Park Group Key is assigned, FKY 75 must be assigned first, and then FKY 76, FKY 77, and continuing through the remaining FKY 78 - FKY 85.

STEP 3: **ASYDL/ASYDN** (Assignment of System Data for LDM/NDM)

The following data setting is required when enabling Call Park Group across MGs/IMGs.

System Data 1, Index 679, bit 4 = 1 (Enable Call Park Group -D across MGs/IMGs)

Note: Delete all existing data assigned through the APGS, APGN and ADGN commands in advance.

STEP 4: **ADGN** (Assignment of Dterm Group Number)

Assign a group number to a station number of the Soft Phone using this feature and to other station numbers to be assigned to the same group. The group number must be the same as the one assigned by the APGN command.

STN: Station Number
GROUP NO: Group Number (127-255)

[In case of the example condition]
STN: 1000, 1200
GROUP NO: 127

Note: When ASYDL/ASYDN, System Data 1, Index 679, Bit 4 is assigned as “0”, each group must consist of stations belonging to the same Module Group (MG).

STEP 5: **APGN** (Assignment of PHS Group Number)

Assign MG and a group number to the WLAN Handset (MH Series) Station Numbers to be assigned to the same group. MG must be the same as the that of Soft Phone using this feature. The group number must be the same as the one assigned by the APGN command.

TN: Tenant number
PS STN: WLAN Handset (MH Series) Station Number
MG: Module Group Number (00-07)
GROUP NO: Group Number (127-255)

[In case of the example condition]
TN: Tenant number
PS STN: 2000, 2200
MG: 03
GROUP NO: 127

STEP 6: **APGS** (Assignment of PHS Group Number Control Station)

Assign a station number of the Desktop terminal that are desired to be added to the same MG and GROUP NO as the PS station numbers assigned by the APGN command.

MG: Module Group Number (00-07)

GROUP NO: Group Number (127-255)
TN: Tenant number
STN: Station Number

[In case of the example condition]
MG: 03
GROUP NO: 127
TN: Tenant number
STN: 1000

S-160 SIP Multiple Line Operation

General Description

This feature allows SIP Multiple Line terminals to accommodate multiple lines other than My Line (i.e. Sub Lines) on the programmable Line/Feature keys. In Multiple Line group, a station can answer the call directed to other member's My Line by using Sub Line.

Operating Procedure

Operation procedure on each service feature is the same as the DtermIP terminal's.

Service Conditions

1. The time information assigned by ATIM/ATIMN/ANTPL is applied to SIP Multiple Line terminals.
2. Conditions for using SIP Multiple Line terminals in OAI/ACD system are:
   - OAI system supports SIP Multiple Line terminals.
   - ACD system supports DT800/DT700 Series only.
3. See "Payload Setting Available for each IP Equipment" in Chapter 3 IP Equipment of System Description. for the applicable payload type on SIP Multiple Line terminal.
4. Feature List shows the service features supported on SIP Multiple Line terminal.
5. For the configuration settings on SIP Multiple Line terminal, see Peripheral Equipment Description (Multi-Line Telephone).

6. Do not set User ID and password for login from the configuration menu of SIP Multiple Line terminal when you use MAC Authentication to log in to the SIP Multiple Line terminal. If both the AMAC command data and the configuration menu data (User ID and password for login) of SIP Multiple Line terminal are set, the setting of the configuration menu has higher priority than that of the AMAC command when you log in to the SIP Multiple Line terminal.
7. The following table shows the availability of functions by pressing the Feature key and the digit keys on SIP Multiple Line terminals. **Note 1**

Digit Key	Function	Availability
0	Sidetone ON ⇔ OFF	X
1	Microphone ON ⇔ OFF **Note 2**	X
2	Handset receiving volume setting **Note 3**	N
3	Ringing Tone setting **Note 3**	N
4	Sending/Receiving volume control	N
5	Hands-Free ON **Note 4**	N
6	Hands-Free OFF **Note 4**	N
7	Call Indicator Lamp ON ⇔ OFF	X
8	Dynamic Dial Pad/Preset Dial ON ⇔ OFF **Note 5**, **Note 6**	X

Note 1: From FP95-114 V4 Issue 2.0, these functions can be set with the ATIFD command instead of using the Feature key and the digit keys. For details, refer to PREFERENCE SETTING - MULTI-LINE TELEPHONE WITH PCPRO [P-90].

Note 2: For DT800/DT700 Series and DtermIP (SIP), “MIC: ON ⇔ OFF” function by pressing the Feature key + the digit key 1 also switches “MIC ON” and “MIC OFF” display on the LCD in addition to the MIC LED indication ON/OFF switching.

Note 3: The function equivalent to this can be set from the configuration settings on terminal.

Note 4: For DT800/DT700 Series and DtermIP (SIP), Hands Free setting (used/not used) is in conjunction with the setting of “MIC: ON ⇔ OFF” function by pressing the Feature key + the digit key 1.

Note 5: Dynamic Dial Pad and Preset Dial ON cannot be activated simultaneously.

Note 6: For using this function, the assignment of system data is required. For the details, refer to Selective Dialing [S-162].

- For DT800/DT700 Series, the setting procedure on terminal is as follows.

  [Config] → [3. Maintenance Settings] → [4. Adjust] → [1. Audio] → [3. Receive Bias]

  Note: For the details, refer to Peripheral Equipment Description (Multi-Line Telephone) - Chapter 3 IP Station - Configuration Setup.

- For DtermIP(SIP), the setting procedure on terminal is as follows.

  [3.Audio&Visual Settings] → [31.Audio Settings] → [315.Receive Bias]

  Note: For the details, refer to Peripheral Equipment Description (Multi-Line Telephone) - Chapter 3 IP Station - Configuration Setup.

- For DT800/DT700 Series, the setting procedure on terminal is as follows.

  [Config] → [5. Setting] → [1. User Setting] → [1. Incoming Call]

  Note: For the details, refer to Peripheral Equipment Description (Multi-Line Telephone) - Chapter 3 IP Station - Configuration Setup.

- For DtermIP(SIP), the setting procedure on terminal is as follows.

  [3.Audio&Visual Settings] → [31.Audio Settings] → [317.Ring Settings]

  Note: For the details, refer to Peripheral Equipment Description (Multi-Line Telephone) - Chapter 3 IP Station - Configuration Setup.

8. When the PH Fixed Hunting feature is enabled (ASYDL, System Data 1, Index 824, Bit 0 = 1), SIP Multiple Line terminals are brought under the control of the same PHD every time they log in. In this case, the last settings of the following PHD-managed features are retained on the SIP Multiple Line terminals even after the re-registration to the PHD: **Note 7**
   a.) Lamp indication on SIP Multiple Line terminals
   b.) Call features below:

   - Message Reminder [M-19]
   - Last Number Call -D [L-6D]
   - Save and Repeat -D [S-24D]
   - Call Return [C-151]

   Note 7: The last settings are not retained when system data is added or changed with the following commands before re-registration:
   ADKS/AKYD/ASCL/ASCL_T/ASTN/MBLE/MBST/MBST_T

<Conditions for DtermIP (SIP)>

1. DtermIP (SIP) cannot assign alternative IP address as a subordinate connection in the case of DHCP connection failure on starting up.
2. DtermIP (SIP) does not support the payload type G.723.1.
3. Online Monitoring feature supports the speech information display on LCD by holding down the HELP key for over one second. For more details, refer to "Online Monitoring Feature of DtermIP (SIP)" in Peripheral Equipment Description.

<Conditions for DT800/DT700 Series>

1. As DT800/DT700 Series terminal does not have a REDIAL and CONF keys, allocate these functions to any Line/Feature key or Soft key if required.
2. Service features available to DT800/DT700 Series terminal are equivalent to DtermIP (SIP).
3. Online Monitoring feature supports the speech information display on LCD by holding down the HELP key for over one second. For more details, refer to "Online Monitoring" for DT800/DT700 Series in Peripheral Equipment Description.

Interactions

Multiple Line can accommodate stations and virtual lines connected beyond different Module Groups (Expanded Multiple Line Operation [E-26D]). Up to 512 stations can accommodate one SIP Multiple Line station on their Multiple Line. In the same LP (ex. MG00 and MG01), the number of accommodation is not limited. For more details, see Expanded Multiple Line Operation [E-26D].**Note 8**

Note 8: This feature is available when using two or more PIRs and mounting them into different LPs.

Programming

Before starting the station data programming below, initial data setting for connecting TP and SP (MPH setting) is required. See Appliance Model Installation Manual - Chapter 6 System Startup - Additional information on System Startup - Initial Data Assignment.

STEP 1: **ASYD** - Assign the system data.

SYS1 Index 321 Bit 0: Multiple Line operation beyond different Module Groups.
0/1 = Restricted/Allowed

Note: Assign this bit to 1 (Allowed) to use Expanded Multiple Line Operation [E-26D].

STEP 2: **ASYDL** - Assign the system data (LDM).

SYS1, Index 1248, Bit 2: Auto-login through MAC Authentication when the login screen of SIP Multi Line terminal remains displayed for five minutes. **Note 9**, **Note 10**
0/1: Unavailable/Available

Note 9: If you assign "0" to this bit, SIP Multi Line terminal continues to display the login screen until you perform the login operation manually.

Note 10: If you assign "1" to this bit, SIP Multi Line terminal whose station number is assigned to AMAC command automatically logs in to the system through MAC Authentication after the login screen remains displayed for five minutes assigned by AMAC command when you do not operate for 5 minutes on login screen in SIP Multiple Line.

Note: System initialization is required when you change this system data.

STEP 3: **ANPD** - Assign the 1st DC of Station Number and the total digits of Station Number.

STEP 4: **ASPA** - Assign the Access Code of Station Number using the 1stDC specified by ANPD.

TN:	Tenant Number
ACC:	Access Code (maximum 6 digits)
CI:	"N: Normal"/"H: Hooking"
SRV:	"STN: Station Number"

STEP 5: **AISTL** - Assign the IP Station data of each SIP Multiple Line station.

TN:	Tenant Number (1-63)
IP STN:	Station Number of SIP Multiple Line terminal (maximum 5 digits)
KIND:	SIP MultiLine TEL
TEC:	Telephone Equipment Class (12 = Dterm)
RSC:	Route Restriction Class (0-15)
SFC:	Service Feature Restriction Class (0-15)
LENS:	Allocate the SIP Multiple Line terminal to vacant virtual LENS on which station/trunk is not mounted. (SIP Multiple Line terminal cannot overwrite the already registered station/trunk.)

Note: When accommodating the Multiple Line on a SIP Multiple Line terminal's Line/Feature Key by using a software line, first assign the software line data by ASDT (assign SIP Multiple Line terminal's My Line data by AISTL), then allocate the software line to the SIP Multiple Line terminal's Line/Feature key by AKYD.

STEP 6: **AKYD** - Assign My Line, other Multiple Line, and desired function to each Line/Feature key on SIP Multiple Line terminal.

S-162 Selective Dialing

General Description

This feature allows a user to make an outgoing call from a Desktop terminal with the several patterns of operating procedure.

- Dynamic Dial Pad

  Allows a user to make an outgoing call by dialing the desired station number (Digit keys 0 - 9, *, and #) without pressing the SPEAKER key or going off-hook.

- Preset Dial

  Allows a user to make an outgoing call by pressing the SPEAKER key or going off-hook after dialing the desired station number (Digit keys 0 - 9, *, and #).

To Set This Feature From Terminal

- When only Dynamic Dial Pad is activated;
  (ASYD, System Data 1, Index 384 Bit 6=1/ASYDL, System Data 1, Index 1256 Bit 1=0)

1. Press the FEATURE key + 8.
2. Dynamic Dial Pad is set when “DirectDialPad ON” appears on the top of LCD.

- When only Preset Dial is activated;
  (ASYD, System Data 1, Index 384 Bit 6=0/ASYDL, System Data 1, Index 1256 Bit 1=1)

1. Press the FEATURE key + 8.
2. Preset Dial is set when “Preset Dial ON” appears on the top of LCD.

- When both Dynamic Dial Pad and Preset Dial are activated;
  (ASYD, System Data 1, Index 384 Bit 6=1/ASYDL, System Data 1, Index 1256 Bit 1=1)

1. Press the FEATURE key + 8.
2. Dynamic Dial Pad is set when “Dial Mode:Direct” appears on the top of LCD. **Note 1**
3. Press the FEATURE key + 8 again.
4. Preset Dial is set when “Dial Mode:Preset” appears on the top of LCD. **Note 1**

Note 1: Every time the FEATURE key + 8 are pressed, Dial Mode on the top of LCD switches in the order of “Dial Mode:Normal” → “Dial Mode:Direct” → “Dial Mode:Preset”.

To Originate a Call

- Origination with Dynamic Dial Pad

  Dial the desired station number by pressing the Digit keys. The dialed numbers appear on the top of LCD. Pressing the SPEAKER key or going off-hook is not necessary.

- Origination with Preset Dial (ASYD, System Data 1, Index 384, Bit 0 =1)

1. Dial the desired station number by pressing the Digit keys. The dialed numbers appear on the top of LCD.
2. Press the SPEAKER key or go off-hook.

- Origination with Preset Dial (ASYD, System Data 1, Index 384, Bit 0 =0)

1. Dial the desired station number by pressing the Digit keys. The dialed numbers appear on the top of LCD.
2. Press the originating Line key.
3. Go off-hook.

To Cancel Originating Call with Preset Dial

Originating call operation is canceled by the following Soft key operation;

- Press EXIT key or CANCEL key. **Note 2**
- Press CLEAR key when only one digit is dialed. **Note 3**, **Note 4**

Note 2: By pressing the HOLD key on the Bluetooth Handset, you can cancel the call.

Note 3: When the dialed number is two digits or more, dialed number is deleted one digit every time CLEAR key (Soft key or Flex key) is pressed.

Note 4: By pressing the TRANSFER key on the Bluetooth Handset of the Cordless Terminal (DT330 (12BT)), you can cancel the call, or delete one digit from dialed numbers.

To Cancel This Feature From Terminal

- When only Dynamic Dial Pad is activated;
  (ASYD, System Data 1, Index 384 Bit 6=1/ASYDL, System Data 1, Index 1256 Bit 1=0)

1. Press the FEATURE key + 8.
2. Dynamic Dial Pad is canceled when “DirectDialPadOFF” appears on the top of LCD.

- When only Preset Dial is activated;
  (ASYD, System Data 1, Index 384 Bit 6= 0/ASYDL, System Data 1, Index 1256 Bit 1=1).

1. Press the FEATURE key + 8.
2. Preset Dial is canceled when “Preset Dial OFF” appears on the top of LCD.

- When both Dynamic Dial Pad and Preset Dial are activated;
  (ASYD, System Data 1, Index 384 Bit 6 =1/ASYDL, System Data 1, Index 1256 Bit 1=1)

1. Press the FEATURE key + 8 until “Dial Mode:Normal” appears on the top of LCD.
2. Both Dynamic Dial Pad and Preset Dial are canceled when “Dial Mode:Normal” appears on the top of LCD. **Note 5**

Note 5: Every time the FEATURE key + 8 are pressed, Dial Mode on the top of LCD switches in the order of “Dial Mode:Normal” → “Dial Mode:Direct” → “Dial Mode:Preset”.

Service Conditions

1. Once this feature is set at each terminal by pressing the FEATURE key + 8, the setting is maintained even

if the insertion and extraction of Modular Cable, re-registration of IP Station, ELC circuit card initialization and system initialization are performed.

2. When System is updated, this feature setting from each terminal is cleared.
3. To activate this feature with Digital Terminal, the following firmware is required to be equipped on the ELC circuit card.

Circuit Card	Firmware	Remark
PA-16 ELCJ-B	SP-3655 16ELCJB PROG-D	-
	SP-3656 16ELCJB PROG-E	
	SP-3752 16ELCJB PROG-F	
CH-16ELCA	SP-4035 16ELCA PROG-A Issue 1 or later	-
PA-16ELCN	SP-3977 16ELCN PROG-B Issue 1 or later	To enable Preset Dial
PA-16ELCN-A **Note 6**	SP-4013 16ELCN-A PROG-A Issue 1 or later	

Note 6: Cordless Terminal (DT330 (12BT)) is available when SP-4034 16ELCN-A PROG-B Issue1 or later is used.

4. Preset Dial only works when the Terminal Mode Setting of Switch 11 (SW11 5-6) on ELC circuit card is set to ON/ON (Standard Setting). For details on the switch settings of the circuit cards, see sections related to ELC cards in Chapter 3 of the Circuit Card Description.

Conditions applied to Dynamic Dial Pad only

1. The following operations are required when the System Data (ASYD, System Data 1, Index 384 Bit 6=1) is assigned while the system is operating.

   - Digital Terminal: Circuit card initialization of the appropriate ELC circuit card
   - IP Stations: Re-registration by any one IP Station accommodated in SP-PHD

2. This feature is available when the Prime Line is idle, whether or not a call is terminating to the Sub Line.
3. This feature is not available when:
   - a call terminates to a Prime Line.
   - the station presses the SPEAKER key or goes off-hook.
   - the line LED for Prime Line lights or flashes.
4. This feature is not available from an Analog Terminal connected to an APR.
5. When ASYD, System Data 1, Index 384, Bit 0 =1, the following conditions must be considered.
   a.) In case both Prime Line and Sub Line are idle:
   - When dialing the desired station number, this feature call is originated from Prime Line.
   - When dialing the desired station number after pressing a Prime Line key, this feature call is originated from Prime Line.
   - When dialing the desired station number after pressing a Sub Line key, this feature call is originated from Sub Line.

   b.) In case a call terminates to Prime Line and Sub Line is idle:
   - When dialing the desired station number, this feature cannot be activated.
   - When dialing the desired station number after pressing a Prime Line key, this feature cannot be activated.

- When dialing the desired station number after pressing a Sub Line key, this feature cannot be activated.

c.) In case Prime Line is idle and a call terminates to Sub Line:
- When dialing the desired station number, this feature call is originated from Prime Line.
- When dialing the desired station number after pressing a Prime Line key, this feature call is originated from Prime Line.
- When dialing the desired station number after pressing a Sub Line key, Incoming call to Sub Line is answered.

6. IP Stations cannot be placed in Configuration Mode while this feature is set. To enter this mode, clear the Dynamic Dial Pad setting by pressing the FEATURE key + 8.
7. The conditions of this feature when using the Cordless Terminal (DT330 (12BT)) are as follows.

- When this feature is executed from the Bluetooth Handset, the call is originated from the speakerphone on the Bluetooth Cradle.

- While the Bluetooth Cradle displays Incoming/Outgoing call history, because dialing numbers cannot be entered on the Bluetooth Handset, Dynamic Dial Pad cannot be executed from the Bluetooth Handset.

Conditions applied to Preset Dial only

1. The following operations are required when the System Data (ASYDL, System Data 1, Index 1256 Bit 1=1) is assigned while the system is operating.

- Digital Terminal: Circuit card initialization of the appropriate ELC circuit card

- IP Stations: System Initialization

2. Preset Dial cannot be used when SOFT PHONE WIRED-PHONE HANDSET [S-147] is in active.
3. In the case of re-registration by IP stations when LOCATION DIVERSITY [L-55], SR-MGC [S-144] or Remote Node over IP is in active, the latest backup of One-Touch Speed Calling for DtermIP data will be maintained as the data set to each terminal by pressing the FEATURE key + 8.
4. This feature cannot be used with terminals that do not support Soft keys such as DT300 Series (DT310) 2/12-button type and DT700 Series (DT710) 2-button type and Softphone.
5. LCD does not display the name stored in the database of PHONEBOOK [P-83] during the Preset Dial operation. The name will be displayed after the call is originated.
6. Preset Dial operation cannot be made a shift to the phone book registration.
7. DIALED NUMBER PRIVACY MODE [D-165] cannot be used when Preset Dial is in active.
8. If Preset Dial is used to dial digits after Service Code (SSC), such as setting Call Forwarding feature with access code, only SSC can be sent. Even if SSC + digits are dialed, digits after SSC cannot be sent.
9. When station data that is deleted once is assigned again to the newly-mounted terminal without changing the mounting location, data set to each terminal by pressing the FEATURE key + 8 will be carried on to new terminal in each mounting location.
10. Preset Dial operation is available only when the terminal is in idle state. The operation is not available if the terminal is engaged in a call.
11. Pauses cannot be used, so digits sent after the called party answers cannot be assigned.
12. Dialed number should consist of up to 32 digits. The dialed number is invalid if the digits of number exceed 32 digits.

13. When a call terminates to the line on the terminal engaged in Preset Dial operation, the operation will not be interrupted until the call is answered. When the call is answered, the line will be engaged in the call.
14. During Preset Dial operation, key operations, such as a Feature key operation, will be invalid if they are not related to Preset Dial. In the case of pressing the REDIAL key, redialed number will be displayed until the called party is rung.
15. When call origination is not performed normally such as because seizing the register is failed, call origination history may not be stored.
16. When the number of digits of the dialed number is less than the maximum necessary digits (values assigned to MND parameter of AMND/AMNDL/AMNDN), the call is originated after a predetermined prepause timer assigned by ASYD, SYS 1, Index 128 bits 0-3 (default: 12 seconds) expires.
17. Outgoing call from Incoming/Outgoing call history is not available while using Preset Dial from the Bluetooth Cradle of Cordless Terminal (DT330 (12BT)).

Programming

STEP 1: **ASYD** - System Data 1, Index 384, Bit 6. Assign this bit as data "1" to enable Dynamic Dial Pad.
Note 7, **Note 8**

STEP 2: **ASYDL** - System Data 1, Index 1256, Bit 1. Assign this bit as data "1" to enable Preset Dial.
Note 8

Note 7: In the case of Dynamic Dial Pad, any one IP Station accommodated in SP-PHD must perform registration for this data change to take effect.

Note 8: When "Office Data Load & System Initialize" or "Program & Office Data Load & System Initialize" is selected on SINZ command, the following operations are required to retain the office data:
1. Boot MEM_HDD command.
2. Select "One-Touch Speed Calling for DtermIP."
3. Execute MEM_HDD command and retain the office data.

S-165 Security Control Setup

General Description

This feature allows you to enable/disable the Security button (**Note 1**). This button starts up the Security mode (**Note 2**) with one touch. The following three schemes are available for the control of the Security button with System Data assignment.

Note 1: On the DT700 Series (DT750/DT730G/DT730) terminals, the Security button is located next to the upper left corner of the LCD. On the DT800 Series (DT830G/DT830) terminals, a Line/Feature key can be programmed as the Security button. For details of the Line/Feature key data, see "Programming."

Note 2: Security mode restricts access to service features and configurations provided by the Telephony Server. For further details, see Peripheral Equipment Description (Multi-Line Telephone) - Chapter 3 IP Station - Configuration Setup - DT800/DT700 Series - Configuration Data Setting Procedure - Security Mode.

(a) Security button invalidation on a system basis **Note 4**

Disables the Security button on all DT800/DT700 Series terminals under the control of the system.

(b) Security button validation on a system basis **Note 4**

Enables the Security button on all DT800/DT700 Series terminals under the control of the system.

(c) Security button control on an individual terminal basis

Enables/Disables the Security button on each terminal by using IP Phone Manager. **Note 5**, **Note 6**, **Note 7**

Note 4: See "Programming" of this feature for details on the data setting of Security button control on a system basis.

Note 5: IP Phone Manager is an application tool for configuration of Desktop terminals. To enable/disable the Security button, set the Lock Mode according to "4.5.3 Security Lock" in the manual of IP Phone Manager. When connecting a Desktop terminal with IP Phone Manager, make sure the port numbers match. You can set the port number on the phone side by selecting [0. Config] - [6. Application Setting] - [2. IPM Self Port].

Note 6: The Security button cannot be enabled by using the IP Phone Manager when the Security button invalidation is set on a system basis. If you try to do this, incorrect information on Security Lock status may be temporarily displayed on the terminal LCD, but it disappears in several seconds.

Note 7: If the Security button is disabled through the IP Phone Manager while the Security button validation is set on a system basis, it will remain disabled until the restart of terminal. After the restart, the Security button will be enabled.

[Notes on Terminal Behavior during the Security Lock]

- In the Security mode, the Security Lock disables the following operation on the terminal: call origination, answer, handset's on-hook/off-hook, and Line/Feature key operation.
- Although an incoming call can terminate to the terminal when the Security Lock is on, the call cannot be answered without releasing the Security Lock.

Operating Procedure

None on the terminal. For more information on operation in the Security mode, see Peripheral Equipment Description (Multi-Line Telephone) - Chapter 3 IP Station - Configuration Setup - DT800/DT700 Series - Configuration Data Setting Procedure - Security Mode.

Service Conditions

<Important Notices>

1. When the security control setting is changed by system data assignment, a restart is required for each terminal; if not, the data change will not be reflected. For details on the system data, see the Programming section in this service.
2. The security status (i.e. Security Lock ON/OFF) on a terminal is maintained after the terminal is restarted.
3. When setting the Security button through the IP Phone Manager, use "Security button control on an individual terminal basis" mode. While in "Security button invalidation on a system basis" mode, the setting to enable the Security button via IP Phone Manager is invalidated. While in "Security button validation on a system basis" mode, the setting to disable the Security button via IP Phone Manager is validated after the re-registration of the terminal.
4. To enable the disabled Security button, use one of the following methods:

   - From [Config] menu on a terminal

     Administrator's menu [Config] → "3.Maintenance Settings" → "3.Data Clear" → "1.Factory Value" or "2.Terminal Data" **Note 8**

   - By Web Programming

     [Maintenance Settings] → [Data Clear] → [Factory Value] or [Terminal Data] **Note 8**

   - By IP Phone Manager **Note 9**

     [DataReset] → [IP Phone Setting]

Note 8: When "1. Factory Value" is selected, all of the data will be reset to the factory default value.
When "2. Terminal Data" is selected, terminal data setting such as IP address, Server Address, data assignment for incoming call, ongoing call, and display will be set to the default data.

Note 9: See manuals for IP Phone Manager for more information.

<Interactions with Other Features>

1. When DT800/DT700 Series terminals re-register to the SR-MGC or the Backup Node of Location Diversity [L-55], the system data setting related to the Security control setting in Primary Node should be the same with the data in Backup Node. If not, the terminals act differently after the node switching because terminal behavior depends on the System Data setting on the node which they re-register to.
2. Even if the Security Lock is enabled, terminal user can originate an emergency call to a pre-assigned number by off-hooking the handset. The Security Lock is released after the emergency call origination.
3. It is possible to make a VOICE CALL [V-2] if the destination terminal is in the Security Lock status. In this case, you can talk over the microphone (MIC) if the called party has set the Security Lock with the MIC turned on. However, other operations (such as making or answering a call, using Feature keys, and going on/off hook with a handset) are restricted on the locked terminal.

<Hardware/Software>

This feature is available for the following terminals and firmware.

DT830/DT830G: FW3.0.0.0 or later

DT750/DT730: FW3.0.0.0 or later

DT730G: FW1.0.0.0 or later

Note: This feature is not available for DT710 terminals because they do not have the Security button.

<Interactions with Networks>

None

<Conditions Specific to This Feature>

1. Security control status is not managed in relation to each station number by the system, but stored on an individual DT800/DT700 Series terminal. When moving DT800/DT700 Series terminals to another system, initialize them in advance.
2. Once the Security Lock is enabled on a DT800/DT700 Series terminal, an incoming call can terminate to the terminal, but users cannot answer the call because the terminal is locked. To answer the call, release the Security Lock.

<Other Conditions>

None

Programming

Security button invalidation on a system basis

STEP 1: **ASYDL/ASYDN** - System Data 1, Index 1256, Bit 3 = 1 (Security button invalidation on a system basis)

Note: Changes made with this command are only effective after restarting the terminal.

STEP 2: **AKYD/AKYD_T** - Assign the following data to the Line/Feature Keys of the Desktop terminal.

Note: This step is only required for DT800 Series terminals.

Note: Most of the parameters for the AKYD command are the same as those for the AKYD_T command, with some exceptions such as TN and STN. Parameters TN and STN of the AKYD command correspond to UGN and TELN of the AKYD_T command, respectively.

TN: Tenant Number (1-63)
STN: Station Number (max. 5 digits)
KYN: Key Number (1-24)
KYI = 0 (Key is not used)
FKY = 197 (Security)

Note: Changes made with this command are only effective after restarting the terminal.

Security button validation on a system basis

STEP 1: **ASYDL/ASYDN** - System Data 1, Index 1256, Bit 3 = 0 (Security button validation in accordance with the setting of ASYDL/ASYDN SYS1 Index 1257 Bit 1)
- System Data 1, Index 1257, Bit 1 = 1 (Security button validation on a system basis)

Note: Changes made with this command are only effective after restarting the terminal.

STEP 2: **AKYD/AKYD_T** - Assign the following data to the Line/Feature Keys of the Desktop terminal.

Note: This step is only required for DT800 Series terminals.

Note: Most of the parameters for the AKYD command are the same as those for the AKYD_T command, with some exceptions such as TN and STN. Parameters TN and STN of the AKYD command correspond to UGN and TELN of the AKYD_T command, respectively.

TN: Tenant Number (1-63)
STN: Station Number (max. 5 digits)
KYN: Key Number (1-24)
KYI = 1 (Function Key)
FKY = 197 (Security)

Note: Changes made with this command are only effective after restarting the terminal.

Security button control on an individual terminal basis

ASYDL/ASYDN - System Data 1, Index 1256, Bit 3 = 0 (Security button validation in accordance with the setting of ASYDL/ASYDN SYS1 Index 1257 Bit 1)
- System Data 1, Index 1257, Bit 1 = 0 (Security button control on an individual terminal basis)

Note: Changes made with this command are only effective after restarting the terminal.

S-166 Software Digital Tone Generator

General Description

Software Digital Tone Generator (hereinafter called "IP-DTG") enables SIP Handler Controlled SIP terminals to receive PBX tones without using an external Digital Tone Generator.

WARNING **After changing the system data (ASYDL, SYS1, Index 1353, Bit 1) for Software Digital Tone Generator (IP-DTG), System Initialization is required.**

Operating Procedure

None

Service Conditions

<Important Notices>

None

<Interactions with Other Features>

1. Connections between the IP-DTG and SIP Handler Controlled SIP terminals cannot be restricted by PEER TO PEER BANDWIDTH CONTROL [P-75]. Adjust the value for MAX_CONN: Maximum Number of Concurrent Connections through the ALIDL command.
2. Collecting Communication Log and Fault Log are not available using RTP INFORMATION OUTPUT [R-58].

<Hardware/Software>

None

<Interactions with Networks>

None

<Conditions Specific to This Feature>

1. A SIP Handler Controlled SIP terminal cannot receive a short tone.
2. 256 terminals can be connected concurrently per system by default.

Note: When the number of the concurrent connection exceeds the limit in each node, local tones generated by the terminal are received or the terminal is released depending on services.

3. Available payload type and size are as follows.

Payload Type	Payload Size
G.711μ-law	20 ms
	40 ms
G.711A-law	20 ms
	40 ms
G.729a **Note 1**	20 ms
	40 ms

Note 1: Available since FP95-114 V4.

Note: For G.711, the codec is determined according to the system data (ASYD, SYS1, Index 64, Bit 0: μ-law/A-law for TSW).
SIP Handler Controlled SIP terminal also needs to support G.711μ-law and A-law. When the codec of IP-DTG does not match with the payload type used by the SIP Handler Controlled SIP terminal, the SIP Handler Controlled SIP terminal is released.

4. Tones assigned with Tone Code (ASYD, SYS1, Index 811) is used for IP-DTG. When a Tone Number is assigned to a Station Number by the ASLG command, tones for each Station Number can be specified on a country basis.
5. DTMF signal detection is available by RFC2833 but In-Band DTMF signal detection is not supported. When SIP Handler Controlled SIP terminal is connected to IP-DTG, while receiving a Special Dial Tone (SPDT) or a Busy Tone (BT), the Telephony Server services become available by detecting DTMF signals of RFC2833 received from the SIP terminal and sending them to the TP part through SIP Handler.
6. When the system is a dual-CPU system, IP-DTG in the ACT side system is used.
7. System Changeover is available while SIP Handler Controlled SIP terminal's receiving tones from IP-DTG. After System Changeover, SIP Handler Controlled SIP terminal keeps receiving the tone from IP-DTG in the former ACT side system. From the next tone, the SIP Handler Controlled SIP terminal receives from IP-DTG in the new ACT side system.
8. Generating a music resource is available as Music-on-Hold. When an external music resource is set, it is preferentially generated.

   Note: Using external music resources is recommended. Hold tones tends to be heard longer, and then it can weigh on CPU occupancy in the Telephony Server and bandwidth of LAN.

9. Minuet is generated as Music-on-Hold.

<Conditions Specific to UMGi/RNIP System>

1. 256 terminals can be connected concurrently per node by default.

   Note: When the number of the concurrent connections for each node (CCN/RNs) exceeds the limit, no tone is received depending on services.

2. IP-DTG data assignment is required per node which accommodates the SIP Handler Controlled SIP terminal.
3. A SIP Handler Controlled SIP terminal and controlling SIP Handler must belong to the same node, then the SIP Handler Controlled SIP terminal will receive tones.
   When the SIP Handler Controlled SIP terminal and controlling SIP Handler belong to different nodes, the SIP Handler Controlled SIP terminal does not receive tones.

<Other Conditions>

IP-DTG performs the registration to TP part and then it is controlled through the Internal PHE.

Programming

To generate the internal music resource for Music-on-Hold, the data assignment for User Agent Class Data is required. For details, refer to SIP HANDLER - STANDARD SIP TERMINAL [S-167].

STEP 1: **ASYD** - System Data 1, Index 64, Bit 0: 0/1=G.711μ-law/G.711A-law

STEP 2: **ASYDL** - Assign the system data.
System Data 1
Index 811, Bit 0-7: Assign Tone Code by countries.
Index 1353, Bit 1=1: Enable Software Digital Tone Generator (IP-DTG).

STEP 3: **ALIDL** - Specify the LENS of IP-DTG.
PH LENS: Specify an even-numbered Group Number. **Note 2**
PH TYPE: Select IP-DTG.
DTG-ID: IP-DTG Identification Number [1-16]
Single-CPU System: Assign DTG-ID = 1 (fixed)
Dual-CPU System: Assign DTG-ID = 1 and 2 (fixed)
For UMGi/RNIP System, refer to the following table:

IP-DTG to be Assigned

PBI No. (LP No.)	CPU Side	IP-DTG
0x30 (0)	#0	1
	#1	2
0x38(4)	#0	3
	#1	4
0x40 (8)	#0	5
	#1	6
0x48(12)	#0	7
	#1	8
0x50(16)	#0	9
	#1	10
0x58(20)	#0	11
	#1	12

IP-DTG to be Assigned

PBI No. (LP No.)	CPU Side	IP-DTG
0x60(24)	#0	13
	#1	14
0x68(28)	#0	15
	#1	16

MAX_CONN: Maximum Number of Concurrent Connection [1-4095 (default: 256)] **Note 3**, **Note 4**

Note: To change the PH LENS or DTG-ID value, delete the existing PH LENS or DTG-ID value first.

Note: If the existing PH LENS or DTG-ID value is deleted, tones from the deleted IP-DTG stops and the SIP Handler Controlled SIP terminal will not receive tones.

Note 2: The LENS can be allocated on either a Virtual PIR or a Physical PIR except for LENS with Group No. 24-31. As for physical PIR, set the data to a vacant slot.
For the PH LENS parameter in UMGi/RNIP System, specify the available Group Number which belongs to LENS in the node corresponding to DTG-ID.

Note 3: Assign the Maximum Number of Concurrent Connections per IP-DTG. For this data assignment, consider the available bandwidth between the Telephony Server (LAN1) and the SIP Handler Controlled SIP terminal.

Payload Size		Transmission Capacity
G.711	20 ms	88 Kbps
	40 ms	76 Kbps
G.729a **Note 5**	20 ms	32 Kbps
	40 ms	20 Kbps

Note 4: The MAX_CONN value can be changed without deleting the existing value. When the changed value is lower than the existing number of concurrent connections, concurrent connections are retained but new connections are restricted until concurrent connections become fewer than the changed value.

Note 5: Available since FP95-114 V4.

STEP 4: **ALOCL** - Assign the Location ID data.

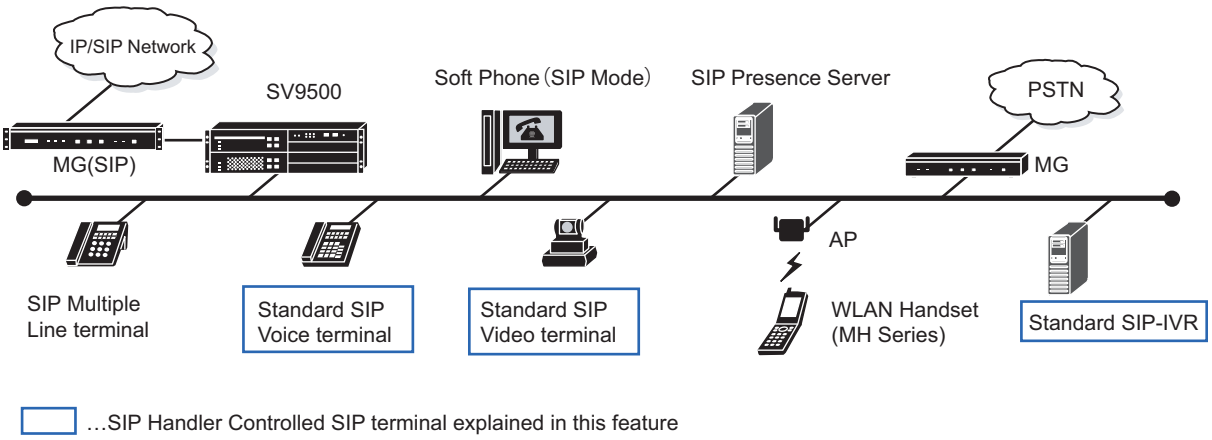
To assign the payload data for RTP packets sent from the IP-DTG, allocate Location ID to an IP address (**Note 6**) used by the IP-DTG.

Note 6: Assign the following IP addresses:
Single-CPU System:Assign LAN1 IP address (ACT)
Dual-CPU System:Assign LAN1 IP address (System-0)/LAN1 IP address (System-1)

Note: Setting of Type of Service (Signaling Packet) data is not applied to the IP-DTG.

STEP 5: **AIVCL** - Assign the IP service voice control data.

Assign the payload data used between the IP-DTG and the SIP Handler Controlled SIP terminal.



Note: Note the following:

- When assigning the payload data, be sure to include payload type: G.711/G.729a and payload size: 20 ms or 40 ms. If no data is set for this command, payload type: G.711 and payload size: 40 ms are applied.
- Data settings other than payload data are not applied to the SIP Handler Controlled SIP terminal.

S-167 SIP Handler - SIP Terminal

General Description

This feature allows the system to accommodate the SIP terminals mentioned below as stations by controlling them through the SIP Handler inside the Telephony Server. The SIP terminals can establish an interconnection with another Telephony Server Station such as a Desktop terminal, and use various Telephony Server services.

- **Standard SIP Voice Terminal (Note 1, Note 2)**
  Standard SIP voice terminal (third-party product) is based on IETF RFC3261 and Internet-Drafts. Standard SIP voice terminals support basic call services and PBX supplementary services.
- **Standard SIP Video Terminal (Note 1, Note 2)**
  Standard SIP video terminal (third-party product) is based on IETF RFC3261 and Internet-Drafts.
- **Standard SIP-IVR**
  Standard SIP-IVR is based on IETF RFC3261 and controlled by SIP Handler. This device supports typical Telephony Server features and can be used under the UCD and ACD environment.

Note 1: Note that a connection test is required when using a Standard SIP Voice/Video terminal (3rd party product).

Note 2: When using a Standard SIP terminal with LCD (3rd party product), the information displayed on the LCD depends on the specifications of terminal being used.

Control Method of SIP Terminal

SIP terminals can be controlled with the methods listed below.

- SP Controlled **Note 3**
- SIP Handler Controlled

When using SIP terminals, the available services differ according to the control method to be used. Decide which method to use referring to the Feature List included at the beginning of this manual.
SIP Handler Controlled SIP terminal is recommended if SP Controlled SIP terminal is not necessary.

Advantages of SP Controlled Standard SIP Terminal	Advantages of SIP Handler Controlled SIP Terminal
The following features are available with SP Controlled SIP terminal. • Call Forwarding-PS Incoming Incomplete [C-155] • Automatic Announcement-Called PS Out of Zone [A-129] • SIP Instant Messages **Note:** The above features are unavailable with SIP Handler Controlled SIP terminals.	The following features are available with SIP Handler Controlled SIP terminal. These are enhanced features in comparison to SP Controlled SIP terminal features. • Various PBX services which have been enriched by enabling PBX tones to be received through IP-DTG • Enriched OAI service • Enriched Hotel service • Improved maintainability (Detailed data setting by User Agent/ the reduction of the number of occupied LENS) • Ongoing call retention during the CPU changeover

Note 3: For details of this method, refer to SP CONTROLLED SIP TERMINAL [S-168].

User Agent Class

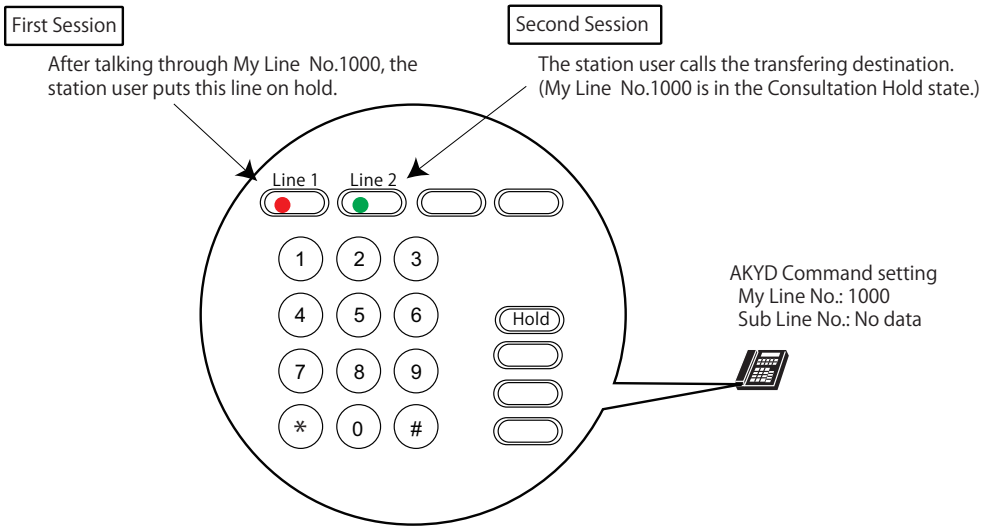
SIP messages and sequences vary depending on the Standard SIP terminal type with each manufacturer. To adjust those differences, detailed operation data can be assigned per Standard SIP terminal type by using the User Agent Class data assigned with the AUACL/AUACN command.

When User Agent information notified by a SIP Handler Controlled SIP terminal contains User Agent Information assigned with the AUACL/AUACN command (partial match), the Standard SIP terminal is controlled according to the detailed operation data as a terminal that belongs to a User Agent Class corresponding to the SIP Handler Controlled SIP terminal.

By assigning detailed operation data per User Agent Information, each SIP Handler Controlled SIP terminal can be controlled without changing the office data even if a terminal user logs in to a different type of the SIP Handler Controlled SIP terminal through the same login Telephone Number.

Also the User Agent Class data can be assigned to Telephone Number with the ADSDL/ADSDN command. The User Agent Class is decided according to a login Telephone Number regardless of the User Agent Information given by the SIP Handler Controlled SIP terminal.

Single Line Mode and Multi Line Mode



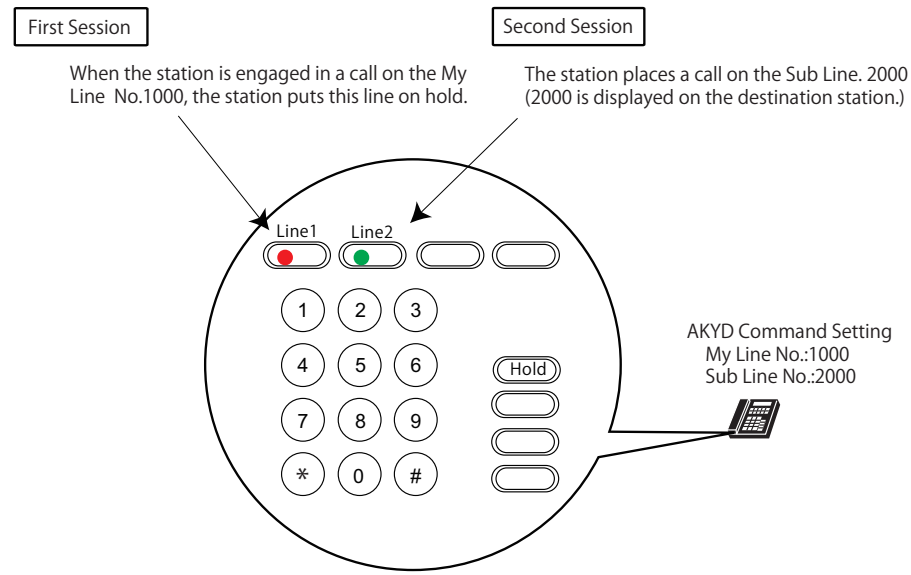
When SIP Handler Controlled SIP terminal allows multiple sessions of calls, the Standard SIP terminal can work on Single Line Mode or Multi Line Mode. Either mode can be selected with the AUACL/AUACN command.

Note: Multi Line Mode is only available for guest station in the Hotel system.

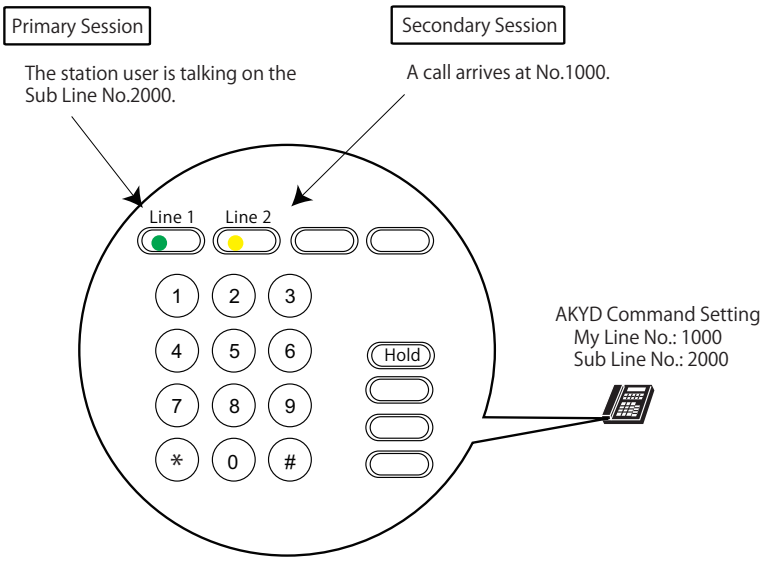
- **Single Line Mode**

  SIP Handler controls the Standard SIP terminal only using My Line. When a Standard SIP terminal user talks with a destination station and puts the call on hold in the first session, and then the Standard SIP terminal user places another call in the second session, the second session is processed as an event of Call Transfer operation.

Example 1: When the station is engaged in a call on the Line 1, the station puts the line on hold, and then the station places another call from the Line 2.



- **Multi Line Mode**



A Standard SIP terminal can accommodate the lines of the other Standard SIP terminals or Desktop terminals as Sub Line. On Multi Line Mode, multiple sessions are in progress, the SIP Handler controls the Standard SIP terminal by binding each session and line state. When a Standard SIP terminal user puts an ongoing line (the first session) on hold, another call arrival at a different line is treated as the second session which is different from the ongoing call in the first session.

Multi Line Mode also refers to a state in which the Standard SIP terminal performs registration through a Telephone Number and performs multiple sessions. The following cases are not included: A Standard SIP terminal performs multiple sessions by registrations through multiple Telephone Numbers.

Example 1: When the station is engaged in a call on the Line 1, the station puts the line on hold, and then the station places another call from the Line 2.

Example 2: While the station user is answering a call on the Sub Line No. 2000, another call arrives at the My Line No.1000. (From Example 1, My Line key and Sub Line key are switched.)

Operating Procedure

None

Service Conditions

<Important Notices>

1. The following typical SIP services are not supported:
   - Presence
   - Instant Message
2. A maximum of 4000 Standard SIP terminals are controllable per system.

<Interactions with Other Features>

1. SR-MGC is not supported.
2. RTP cannot be encrypted.
3. SIP messages can use UDP or TCP.

   Note: TCP is available from FP95-114 V4.

4. Control signal (SIP messages) can be encrypted. For the detail of SIP messages encryption, refer to SIP Handler - SIP Terminal Support for TLS Encryption [S-169].

   Note: Encryption of Control signal (SIP messages) is supported since FP95-114 V4.

5. In case of using TCP for communication with the Internal SIP Handler, the following applies:
   a.) Besides SIP messages, TCP is used for the session information exchange of terminals (proprietary protocol) (**Note 4**) as used in VIDEO CALL [V-31] and IP CONTROL-FAX [I-44].
   The maximum number of simultaneous connections of both SIP messages and session information exchanges is 1000 connections (including two or more connections between the same devices). When 1000 connections are established and a new connection is going to be established, the oldest connection is disconnected and the new connection is established.
   b.) A TCP connection is disconnected if the following time passes without packets being sent or received.
   - SIP Signaling (client connection): 185 seconds
   - SIP Signaling (server connection): 190 seconds
   - Session information exchanges (client connection): 25 seconds
   - Session information exchanges (server connection): 30 seconds

   Note: Depending of the condition “a.)” a connection may be disconnected before the maximum time of inactivity.

   c.) The only Protocol Handler that can use TCP is the Internal SIP Handler. Other PHs as SP-PHD, SP-PHI, SP controller, etc cannot use TCP.
   d.) When TCP is used for SIP signaling, set the terminal to TCP use before performing a REGISTER.

e.) If the transport protocol is defined in the REGISTER, that protocol is used regardless of the setting of AUACN/L (CDN:22).

Note: Transport protocol as defined in the transport parameter of the Contact header of the REGISTER request.

f.) For a CPU using dual configuration, the TCP connections are disconnected when there is a system changeover. However, since the connections are reconnected where needed after the system changeover, call control is not affected.

g.) When using TCP, make sure that all the terminals employed support TCP. Refer to the manual of each terminal for the TCP settings.

Note 4: Session information exchange of terminals (proprietary protocol) means the media information exchange (SDP information) between the terminals and the SIP Handler on the Telephony Server when using VIDEO CALL [V-31] and IP Control-FAX [I-44].

6. T.38 Fax Communication is supported from FP95-114 V4. See IP CONTROL-FAX [I-44] for an explanation.
7. The following are the conditions when a SIP Handler Controlled SIP terminal performs registration to the Telephony Server which is equipped with SIP Handler.
   a.) Log in to the terminal with a Telephone Number. Station Number cannot be used to log in to the terminal.
   b.) The terminal cannot be logged in with MAC Authentication Mode.
   c.) Login Password is used as the password for Digest Authentication during REGISTER process.
   d.) Assign Login Password with the ASPW command.
   e.) A maximum of ten digits can be entered for Login Password. A password can contain 0-9, * and #.
   f.) A SIP Handler Controlled SIP terminal cannot perform registration to the system with a station number which has already been used by another terminal such as an IP terminal, a SIP Multiline terminal or another SIP Handler Controlled SIP terminal.
   The SIP Handler Controlled SIP terminal overrides the registration of the existing terminal using the same station number and then the overridden terminal becomes inoperative. The SIP Handler Controlled SIP terminal can be overridden by the other terminal, but the SIP Handler Controlled SIP terminal overrides the terminal again after the periodical REGISTER information update.
   g.) Do not set a password from the SIP Handler Controlled SIP terminal using the access code.
   h.) Data assignment of a login password is in common with that of an IP terminal or a SIP Multiline terminal. To enable a SIP Handler Controlled SIP terminal to log in to the system without changing the login station number after the IP terminal or the SIP Multiline terminal modifies the login password with an access code, use the modified password.
8. When an IP address of a Standard SIP terminal is changed through DHCP, the Telephony Server treats the REGISTER with the changed IP address as Overriding.
9. In the following conditions, the SIP Handler Controlled SIP terminal goes into a logout state in which the terminal state cannot be displayed in the IPAN or DISD command window. In the logout state, the SIP Handler Controlled SIP terminal cannot place or receive calls until it performs registration to the system.
   - The Telephony Server does not receive REGISTER for updating Expire from the SIP Handler Controlled SIP terminal within the time of register expires (**Note 5**).
   - The Telephony Server receives Expire=0 as Expiration of REGISTER from the SIP Handler Controlled SIP terminal.

- The SIP Handler Controlled SIP terminal is reset with the DISD command **Note 6**
- The SIP Handler is initialized with the ADPM command **Note 6**
- The system is initialized with the SINZ command **Note 6**

Note: System Message 33-S: IP PKG Failure is not output in any of above conditions.

Note 5: 3600 seconds is set for the default. This data can be changed with the Register Expires parameter in the AUACL/AUACN command.

Note 6: To go into the login state, a Standard SIP terminal needs to perform registration. The Standard SIP terminal performs registration at the timing of its REGISTER update. So the Standard SIP terminal cannot be used until the REGISTER update after reset or initialization is executed by using the command.

10. Wireless Standard SIP terminal cannot be used for Out of Zone features such as Call Forwarding PS Incoming Call Incomplete [C-155] and Automatic Announcement - Called PS Out of Zone [A-129].
11. When a Standard SIP terminal puts a call on hold while receiving a Special Dial Tone (SPDT) or a Busy Tone (BT), the state in which a call normally cannot be held, the call turns into a hold state. After cancelling the call hold state, the terminal receives the tone again.
12. When a Standard SIP terminal puts a call on hold while receiving a Special Dial Tone (SPDT) or a Busy Tone (BT), the terminal, depending on its type, may go into a talking state such as displaying the duration of the call.
13. The following are conditions of Caller ID and Name Display when a Standard SIP terminal receives a call.
    a.) In the INVITE request message, Name Display information is given in the display-name field of the From header.
    b.) When there is no calling party number information, “Anonymous” is given as the calling party number information.
    c.) For a standard SIP terminal which supports RFC3325 and RFC5876, the connected party name and number can be displayed with the setting of the “Notice of Connected Number” parameter of the AUACL/AUACN command. For other terminals, when the connected party is changed by the transferring operation or shifting from a three-way call into a two-way call due to the disconnect of one party, the destination name and number cannot be shown.
    d.) Only name display information containing symbols and alphanumeric characters can be displayed.

    Note: To enable calling name and number display, the Name Display parameter setting is required through the AUACL/AUACN command.

14. When a SIP Handler Controlled SIP terminal forwards a call and the Call Forwarded destination does not answer yet, including while hearing a Busy Tone (BT) from the IP-DTG or a Ringback Tone (ROT), the LCD on the Standard SIP terminal may become a talking state such as displaying the duration of the call.
15. SIP Handler Controlled SIP terminals support Three-Way Calling features using CFT or VS32 but they cannot receive Three-Way Calling Tones (Add-On Ticker) for Three-Way Calling features.

    Standard SIP terminals do not support Three-Way Calling features which are established using the audio mixing function of Standard SIP terminals.

16. The following are conditions for a call on hold.
    a.) When a Standard SIP terminal puts a call on hold, the system behaves the same as pressing the HOLD key on a Desktop terminal.
    b.) An incoming call to a SIP Handler Controlled SIP terminal can be answered by a Desktop terminal when it accommodates a line of the Standard SIP terminal as Multiple Line, but the Standard SIP terminal cannot answer a call held by the Desktop terminal even if the call is an incoming call to My Line of the Standard SIP terminal.
    c.) When a SIP Handler Controlled SIP terminal does not answer a call on hold and the destination side recall timer expires, the Standard SIP terminal can be recalled automatically with the following system data assignment (the data assignment is in common with that of a Desktop terminal).
        - ASYD, SYS1, Index 144: Automatic Hold Recall Timer
        - ASYD, SYS2, Index 12 Bit 0=0: Automatic Recall Ringer - Non-Exclusive Hold is required
    d.) Do not set the Hold Fixation Mode (ASFC, SFI 254) to Allowed (RES=1). If it is allowed, Standard SIP terminals cannot answer calls after putting them on hold. Keep the Hold Fixation Mode restricted (RES=0).
    e.) When a SIP Handler Controlled SIP terminal releases a call after it puts the call on hold, the destination station does not call back the SIP Handler Controlled SIP terminal. The destination stations is released.
17. When a destination station releases a call while talking, the SIP Handler Controlled SIP terminal receives a Reorder Tone (ROT) generated by IP-DTG. After a certain period of time (**Note 7**), the SIP Handler Controlled SIP terminal is released or the receiving tone changes to a Busy Tone (BT) generated by the local side.

    Note 7: The period of time is based on Miscellaneous Timer Counter set by ASYD, SYS1, Index 401, Bit 0-3 (the data assignment is in common with that of Desktop terminal). A Standard SIP terminal does not depend on the value set by ASFC, SFI 136: Automatic Idle Return.

18. The IP-DTG cannot be used in the following reasons;
    - There is no data assignment for IP-DTG.
    - The maximum IP-DTG concurrent connections is exceeded.
    - Registration of IP-DTG is not completed.
    - IP-DTG tones are disabled by the AUACL/AUACN command.

Standard SIP terminals receive the following tones;

IP-DTG Tones	When IP-DTG Cannot Be Used
• Special Dial Tone (SPDT) • Service Set Tone (SST)	Standard SIP terminals receive no tone.
• Ring the destination station • the destination station releases the call • the destination puts the call on hold	Standard SIP terminals receive tones generated by the local side.

Behaviors when the destination station releases the call depends on the terminal specification.

19. The following table shows conditions for Call Hold/Call Transfer/Three Way Call.

<table>
<tr><th colspan="2" rowspan="2">Feature/Terminal Behavior</th><th colspan="2">In the Consultation Hold state, Second Call is on hold/Intermediate Station is not released (AUACL/N: Hold 2nd Call = 0)</th><th colspan="2">In the Consultation Hold state, Second Call is on hold/Intermediate Station is released (AUACL/N: Hold 2nd Call = 1)</th></tr>
<tr><th>Consultation Hold Release is disabled (AKYD: No DISCONNECT Feature key is set).</th><th>Consultation Hold Release is enabled (AKYD: DISCONNECT Feature key is set).</th><th>Consultation Hold Release is disabled (AKYD: No DISCONNECT Feature key is set).</th><th>Consultation Hold Release is enabled (AKYD: DISCONNECT Feature key is set).</th></tr>
<tr><td colspan="2">Attempting to put a call on hold even if it is unavailable.</td><td colspan="2">• A call is assumed to be on hold.
• Available to response the call again.
• Receiving RTP is continued.
Note 8</td><td colspan="2">• A call is assumed to be on hold.
• Available to response the call again.
• Receiving RTP is continued.
Note 8</td></tr>
<tr><td colspan="2">When the first call is on hold, put the ongoing second call on hold.</td><td>• A call is assumed to be on hold.
• Destination of the second call receives no tone or RTP warning tone.
Note 8</td><td>• The second call is released.
• The first call is on hold (Due to responding the first call, behavior is equivalent of the Consultation Hold Release state)</td><td colspan="2">Call Transfer - All Calls [C-11] / Consultation Hold - All Calls [C-17]</td></tr>
<tr><td rowspan="3">Call Transfer - All Calls [C-11] / Consultation Hold - All Calls [C-17]</td><td>Through the first call being on hold, BYE (Disconnection) message is received.</td><td colspan="2">Call Transfer - All Calls [C-11] / Consultation Hold - All Calls [C-17]</td><td colspan="2">Call Transfer - All Calls [C-11] / Consultation Hold - All Calls [C-17]</td></tr>
<tr><td>While talking through the second call, BYE (Disconnection) message is received.</td><td>Call Transfer - All Calls [C-11] / Consultation Hold - All Calls [C-17]</td><td>• The second call is released.
• The first call is on hold (Behavior is equivalent of the Consultation Hold Release state due to responding the first call)</td><td>Call Transfer - All Calls [C-11] / Consultation Hold - All Calls [C-17]</td><td>• The second call is released.
• The first call is on hold (Behavior is equivalent of the Consultation Hold Release state due to responding the first call)</td></tr>

Three Way Calling with CFT trunk/VS32		Three Way Calling		Three Way Calling	
Three Way Calling (Failed)	The second call is released. The first call is ongoing. Seizing Conference trunks (CFT/VS32) is failed.	• The second call is on hold. • The first call is ongoing. (Behavior is equivalent of switching the destination during the Consultation Hold state. The state in the terminal side may not be matched)	• The second call is released. • The first call is ongoing. (Behavior is equivalent of switching the destination during the Consultation Hold Release)	• The second call is on hold. • The first call is ongoing. (Behavior is equivalent of switching the destination during the Consultation Hold state. The state in the terminal side may not be matched)	• The second call is released. • The first call is ongoing. (Behavior is equivalent of switching the destination during the Consultation Hold Release)

Note 8: When CDN9: Reject Unacceptable reINVITE=1 (Reject (488)) is assigned with the AUACL/AUACN command, the state goes into:
Send 488 response, No state transition. Sending/Receiving RTP is continued.

20. Connected party number and Name display information (including Guest name of Hotel Service) can be provided for a standard SIP terminal which supports RFC3325 and RFC5876. The conditions for the notification of Destination number information are as follows:

    a.) The call number and name of the connected party are set in the P-Asserted-Identity header and sent to a standard SIP terminal. The following table shows the timing for the notification of connected party information.

Terminal Operation/ Events	Server Provides Connected Party Information When	Frequency
• Outgoing call from a standard SIP terminal • Hold/transfer and other services operation	• 18x Provisional response (180 Ringing/183 Session Progress etc.) is sent for initial INVITE sent from a standard SIP terminal	Each time (Resends the 18x response to the standard SIP terminal and updates the connected party information when the call is connected to another terminal before its destination answers.)
	• 200 OK Successful response is sent for INVITE/re-INVITE sent from a standard SIP terminal	Each time
	• UPDATE request is sent after sending 200 OK Successful response for INVITE request sent from a standard SIP terminal	When the connected terminal is changed

Terminal Operation/ Events	Server Provides Connected Party Information When	Frequency
• Incoming call to a standard SIP terminal • The connected terminal is changed by hold/transfer and other services operation	• Initial INVITE is sent to standard SIP terminal	Each time
	• UPDATE request after receiving 200 OK/18x Successful response is sent for INVITE request sent to standard SIP terminal	When the connected terminal is changed
	• reINVITE request is sent to standard SIP terminal	Each time

b.) When a call is placed or transferred to a standard SIP terminal, if there is no calling party number information, "Anonymous" is given as the calling party number information.

c.) Only Name display information containing symbols and alphanumeric characters can be notified.

d.) When a call is placed from a standard SIP terminal to a destination which is set to transfer calls to another terminal, Number information and Name display information on the LCD of the standard SIP terminal is not changed until it hears RBT.

e.) When a standard SIP terminal user is transferred to a terminal which denies UPDATE request in INVITE session, the connected party information is not available to the user. In this case, the connected party number and name on the LCD are not updated.

f.) A change in the state of a call affects the connected party information displayed on the LCD.

1) The information about the last party you talked with is displayed on the LCD of your standard SIP terminal when:

• Another party is added to the call, establishing a three-way call.

• You are connected to Attendant console, Announcement Trunk, Analog C.O. line, or Analog Tie Line and ACIS, while ringing or talking on the phone.

2) The information about the opposite party you are talking is displayed on the LCD of your standard SIP terminal when one of the parties in a three-way call is disconnected.

g.) When a caller is blind-transferred to a standard SIP terminal, caller number and name information are displayed when the intermediate party releases the call if ASYDL, SYS1, Index 1382, Bit 5 is set to 1. If Bit 5 is set to 0, the information is displayed when the standard SIP terminal answers the call. (data setting available from FP95-114 V4. Prior to that, the information is displayed only when the standard SIP terminal answer the call.)

Note: To provide Destination number information, Notice of Connected Number parameter setting is required through the AUACL/AUACN command.

Note: To notify the connected party of Name display information, Name Display parameter setting is required through the AUACL/AUACN command.

Multi Line Mode (only for guest station in the Hotel system)

Feature/Terminal Behavior		Sending 200OK (AUACL/N command: Reject Unacceptable reINVITE=0)
Attempting to put a call on hold even if it is unavailable.		• A call is assumed to be on hold. • Available to response the call again. • Receiving RTP is continued. **Note 9**
While the first call being on hold, putting the second call on hold.		Both of the first call and the second call are on hold.
Call Transfer - All Calls [C-11] / Consultation Hold - All Calls [C-17]	Through the first call being on hold, BYE (Disconnection) message is received.	All calls are released.
	While talking through the second call, BYE (Disconnection) message is received.	• The second call is released. • The first call is on hold. (Behavior is equivalent of Consultation Hold Release due to the first call is answered)
	While calling through the second call, REFER message is received.	Send 488 response to REFER message. Subordinate behaviors are depending on each terminal specification. (When the terminal sends a CANCEL message to the second call and then answers the first call, the behavior is equivalent of Consultation Hold Release)
Blind Transfer To Station [B-18] / Blind Transfer To Attendant [B-17]	While calling the second call, BYE (Disconnection) message is received through the first call being on hold.	All calls are released.
	After putting the first call on hold, REFER message is received.	Blind Transfer To Station [B-18] / Blind Transfer To Attendant [B-17]
Blind Transfer To Station [B-18] / Blind Transfer To Attendant [B-17] (REFER method)	While calling the second call, REFER message is received	Send 488 response to REFER message. Subordinate behaviors are depending on each terminal specification. (When the terminal sends a CANCEL message to the second call and then answers the first call, the behavior is equivalent of Consultation Hold Release)
Three Way Calling	With CFT trunk/VS32	• If Call Hold Conference set with the AKYD command, Three Way Calling is in service. • If not, the second call is released and the first call is ongoing. (Behavior is equivalent of Consultation Hold Release)
Three Way Calling (Failed)	The second call is released. The first call is ongoing. Seizing Conference trunks (CFT/VS32) is failed.	• If Call Hold Conference set with the AKYD command, the first call is ongoing. At the same time, the second call is released and the destination of second call calls back. • If not, the second call is released and the first call is ongoing. (Behavior is equivalent of Consultation Hold Release)

Note 9: When CDN9: Reject Unacceptable reINVITE=1 (Reject (488)) is assigned with the AUACL/AUACN command, the state goes into:
Send 488 response, No state transition. Sending/Receiving RTP is continued.

21. To use Busy Line features, it is necessary for the Standard SIP terminal to receive a Busy Tone (BT) from IP-DTG.
22. When a SIP Handler Controlled SIP terminal in Single Line mode performs CALL TRANSFER - All CALLS [C-11] and the connection with the transfer destination is released by the following operations, the SIP Handler Controlled SIP terminal (intermediate station) cannot automatically return to the original call with the first party (transferred party):

    - the transfer destination answers the transferred call and then releases the call
    - Call Transfer is canceled by the SIP Handler Controlled SIP terminal while the transfer destination is ringing

    In this case, the first party is remains on hold. The SIP Handler Controlled SIP terminal (intermediate station) can return to the call with the first party by canceling the hold state. (Depending on the type of the SIP Handler Controlled SIP terminal, the call hold state may be canceled automatically.)

23. When calling to an external line where parameter 2nd DT is set to other than 0 with the ASPA/ASPAL/ASPAN command, the dial tone (DT) will be heard momentarily. To avoid this, execute the AUACL/AUACN command as follows:

    - When 2nd DT is set to 1: Execute the AUACL/AUACN command with the parameter CDN12 TONE[0] bit 7=0 (Disable SDT).

    Note: If changing the setting from the default value, change to 7E from FE.

24. When the SIP Handler Controlled SIP terminal on the system assigned one digit dialing instead of Switch Hook Flash (ASYD, SYS1, Index 70, Bit 4=1) is used, it is available to use only while the terminal is receiving a busy tone. To use this feature, the setting for receiving digits operation (ASYDL, SYS1, Index 1382, Bit 0=1) is required.

    Note: The one digit dialing feature is not available while talking on the SIP Handler Controlled SIP terminal.

<Hardware/Software>

1. The following table shows conditions and notification method of available DTMF signals.

DTMF Signal Notification Method	Conditions
SIP INFO Method	1. DTMF signals can be sent to equipment connecting to the Telephony Server except for the following: • Standard SIP terminals controlled by SP CONTROLLED SIP TERMINAL [S-168] • SIP Handler Controlled SIP terminals which do not support SIP-INFO method. 2. Operations of various features provided by the Telephony Server are available. 3. 0-9, * and # of DTMF signals can be made transparent (A-D, Flash cannot be made). 4. When DTMF signals in NEC Proprietary Protocol Mode are received from a destination, DTMF signals are converted with the SIP-INFO method as shown below and sent to SIP Handler Controlled SIP terminals. 0 - 9 → "0"- "9" * → "10" # → "11" **Note:** * and # can be changed by the AUACL/AUACN command data assignment. * → "*" # → "#" 5. When DTMF signals in NEC Proprietary Protocol Mode are received from a destination, DTMF signals are converted as shown below and sent to SIP Handler Controlled SIP terminals. "0" - "9" → 0 - 9 "10" → * "*" → * "11" → # "#" → #
RFC2833	1. DTMF transparency is available only between terminals corresponding to RFC2833. 2. Telephony Server services are available by using IP-DTG.
In-band Signaling	1. DTMF transparency is available between all IP equipment. 2. Telephony Server services are unavailable.

Note: To enable Telephony Sever services, using SIP INFO Method or RFC2833 is needed. Confirm the specifications of your Standard SIP terminal and specify DTMF Signal Notification Method on the terminal side data setting if required (SIP INFO Method is recommended due to equipment which allows sending and receiving DTMF and conditions for operating features). At this time, use only one DTMF Signal Notification Method. Do not mix up several DTMF Signal Notification Methods. If multiple types of methods are sent, it may cause malfunction.

2. For an IP equipment/Control Module that performs calls with a SIP Handler Controlled SIP terminal, use the latest firmware (or more specifically, software) available. With old firmware (IP equipment with its firmware not updated as in use of the SV7000/NEAX2400), audio connections may not be possible. In case of trying to connect IP equipment that has an old firmware with a SIP Handler Controlled SIP terminal, the call will be released at the start of the Call Time with the IP equipment. IP equipment whose firmware does not allow connectivity, the firmware revisions that do are as listed below.

Equipment Type	No.	Equipment	Sales Name	Firmware	Issue
Terminal	1	Dterm Series i with IP adapter	IP-R UNIT		2.01
	2	DtermIP	ITR-32D-1x		2.00
	3		ITR-8D-1x		2.06
	4	DtermIP INA-SET	ITR-LC-1x		1.10
	5	DtermSP30	DTERM SP30 CE	SC-3299 DTERM SP30-R4	4.0.0.0
	6		DTERM SP30 AE	SC-3196 DTERM SP30	2.1.0.0
MC/MG	1	Analog MC **Note 10**	SN8029 MC2A-A	SP-3629 2AMC PROG-A	Unsupported
	2		SN8029 MC2A-B	SP-3753 2AMC PROG-B	1A
	3		SN8029 MC2A-C	SP-3753 2AMC PROG-B	25A
	4	MG(BRI)	MG-2BRI-AA	SP-3709 BRI MG BSC PROG-A	1
	5	MG(PRI) **Note 10**	SN8023 MG2M-xx	SW-437 PRI MG PROGRAM-B	2B
	6		SN8032 MG15M-xx	SW-423 PRI MG PROGRAM-A	2B
IP-PAD	1	IP-PAD Card	SPA-32IPPAD	SW-425 IPPAD PROGRAM-A	7
	2		SPA-32IPPAD-B	SW-428 IPPAD PROGRAM-B	8
	3		SPA-32IPPAD-C	SW-435 IPPAD PROGRAM-C	5
	4		SPA-32IPPAD-D	SW-439 IPPAD PROGRAM-D	1

Note 10: UG50 is not included.

3. When a call is placed from a SIP Handler Controlled SIP terminal, the information given in the display-name field of the From header cannot be used as the Name Display information.
4. Controlling SIP Handler Controlled SIP terminal is unavailable through SIP Proxy Server.
5. A SIP Handler Controlled SIP terminal corresponding to session timer (RFC4028) cannot make a Call Retention if it is not able to communicate with the Telephony Server during the call. The call will be released from the terminal side with its session timer monitor.

6. In case of using MWI (Message Waiting Lamp control (RFC3842)), the expire value SUBSCRIBE that notifies the SIP Handler Controlled SIP terminal to the Telephony Server will need more than 120 seconds. If needed, setup the terminal.
7. When you lift the handset (before originating the call) of the SIP Handler Controlled SIP terminal, the terminal state enters into an idle mode in the Telephony Server side. In such mode, its behaviors when an incoming call arrives at a SIP Handler Controlled Standard terminal are determined by the specifications of the terminal.
8. In the case of a Standard SIP terminal with a local call hold tone, when the audio connections are switched, the local call hold tone will be audible for a moment.

<Interactions with Networks>

SIP Handler Controlled Standard SIP terminals cannot be used in a network where Peer-to-Peer CCIS and DTI-FCCS coexist and each node is connected in tandem.

<Conditions Specific to This Feature>

1. SIP Handler Controlled SIP terminals can receive tones through the IP-DTG without using external devices.

   Note: The IP-DTG does not support short tones (Call Waiting tone).

2. SP Controlled SIP terminals and SIP Handler Controlled SIP terminals can be mixed in a system.
3. The SIP Handler uses LAN1 IP address2 (ACT) by default (**Note 11**); however, you can implement Standard SIP terminals without setting the IP Address2 (ACT) if you use the ADTM command to configure SIP Handler's LAN interface to use IP address (ACT).
   Despite this, it is recommended using IP Address2 (ACT) for this feature.

   Note 11: If the settings of Internal SIP Handler's LAN port, Application port or IP address2 (ACT), are changed with the ADTM command while the Internal SIP Handler is in operation, TCP/IP Module must be initialized. (In the case of IP address2 (ACT), TCP/IP Module is automatically initialized.)
   After initialization of TCP/IP Module is completed, use the ADPM command to initialize the Internal SIP Handler.

   Note: If a SIP Handler Controlled SIP terminal uses LAN1 IP Address2 (ACT), it cannot share SIP Server port used for sending or receiving SIP messages with a SP Controlled Standard SIP terminal. Destination Telephony Server port number needs to be changed to a port number that differs from 5060 (for example, 55060) in the SIP Handler Controlled SIP terminal side.

4. A maximum of 16 digits can be used as a Station Number (Telephone Number).
5. To use the SIP terminal, the client license for the SIP terminal is required. The number of client licenses is shared by SP Controlled and SIP Handler Controlled SIP terminals. When the system accommodates both types of SIP terminals, licenses are required for the total sum of the SIP terminals.
6. SIP terminals cannot use characters to select a destination for dialing (0-9, #, * only).
7. DTMF tones may not be sent, depending on the combination of terminal.

8. When DTMF is sent from the terminal as voice data, a call using compressed codec except for G.711 is not guaranteed.
9. Each Station Number (or Telephone Number) is set as the default password of the SIP terminal in the system. The password can be modified with the ASPW command. The RDPD command can be also used to delete the password. After modification of the password, modify the password in the SIP terminal configuration data and perform the registration to the system such as turning the SIP terminal OFF/ON.
10. A SIP terminal can accommodate other Desktop terminal's line as Sub Line.
11. Desired values of Type of Service (ToS) can be set to SIP messages sent from the system with the ALOCL command. The ToS values apply to LOC-ID=0 (System).
12. The registration status of SIP Handler Controlled SIP terminals can be checked through the DISD command. Also registration information of a specified SIP Handler Controlled SIP terminal can be cleared but soft RST packets cannot be sent to the SIP terminals in the registration state. For more information about the DISD command, refer to Operations and Maintenance Manual.
13. During the CPU changeover, ongoing calls are maintained and Telephony Server services are available.
14. Standard SIP terminals can be accommodated in Virtual/Physical PIRs.
15. The following are conditions for SIP Handler Controlled SIP terminals in Single Line Mode.

    (a) The SIP Handler controls Standard SIP terminals using only the My Line. When a Standard SIP terminal user talks with a destination station and puts the call on hold in the first session, and then the Standard SIP terminal user places another call in the second session, the second session is processed as an event of Call Transfer operation.

    (b) Even if another station's line is set to Login Telephone Number of a Standard SIP terminal as Sub Line using the AKYD command, placing and receiving a call are unavailable through Sub Line.

    (c) Another Standard SIP terminal or a Desktop terminal can accommodate My Line of a Standard SIP terminal in Single Line Mode as Sub Line.
16. The following are conditions for Standard SIP terminals in Multiline Mode.

    (a) Set the Sub Line data to the Login Telephone Number of Standard SIP terminal using the AKYD command. When Sub Line data is not set with the AKYD command, the Standard SIP terminal behaves as a terminal in Single Line Mode even if Multiline Mode is specified with the AUACL/AUACN command.

    (b) A secondary line used for placing or receiving a call cannot be selected. My Line takes priority to be seized when a call is placed. Incoming calls give the appearance that they arrive at the same line on the Standard SIP terminal regardless of arriving at My Line or Sub Line.

    (c) An idle line on the Standard SIP terminal is selected automatically and the station number of the seized line is displayed on the destination station in the following cases:

    - After talking with a destination station, the Standard SIP terminal user puts the call on hold in the first session, and then places another call in the second session.
    - When the Standard SIP terminal user places a call while a line is used by the other terminal due to Multiple Line Operation.

    (d) Up to two lines including My Line can be controlled by the Telephony Server. It is available to use the lowest number of line assigned for the KYN parameter of the AKYD command except for the My Line. The Standard SIP terminal needs to support concurrent multiple sessions.

(e) Multiple Line Mode enables a Standard SIP terminal to accept multiple calls. Single Line Mode enables Standard SIP terminals to use more features than Multiple Line Mode.

(f) To replace a SSG released in the North American market, select Multiple Line Mode to make the Standard SIP terminals compatible.

(g) In case of a conference that uses Call Hold Conference processing, when the 1st call is on hold and its calling timer goes out, this 1st call, which is called without being able to carry out any conference action, becomes the 2nd call which is maintaining the conversation. Because of that, to carry out a conference operation, after putting the 1st call on hold, it is necessary to carry out such conference operation within the time frame specified with the Automatic Hold Recall Timer (ASYD, SYS1, Index 144) for the Desktop terminal (only for guest station in the Hotel system).

Note: When the Standard SIP terminal does not support concurrent multiple sessions, set the Standard SIP terminal in Single Line Mode (default setting).

17. Telephony Server does not check the domain name given by a Standard SIP terminal. Set any domain name to the Standard SIP terminal (normally, set the IP Address for the destination of registration).
18. The conditions of incoming calls to a SIP Handler Controlled SIP terminal are as follows:

(a) In case of an incoming call to a SIP Handler Controlled SIP terminal that has not been registered at the Telephony Server, the caller hears a Ringback Tone (RBT).

(b) If the communication between the Telephony Server and the SIP Handler Controlled SIP terminal is lost while receiving a call, the caller hears a Ringback Tone (RBT) continuously.

(c) If the SIP Handler Controlled SIP terminal continues on a receiving call state for 3 minutes and during that time the message for updating the receiving call state (180 Ringing) is not notified from the SIP Handler Controlled SIP terminal, the incoming call is canceled. However, the caller hears a Ringback Tone (RBT) continuously.

(d) Even if an error response is sent from a SIP Handler Controlled SIP terminal, the caller hears a Ringback Tone (RBT) continuously.

(e) If a SIP Handler Controlled SIP terminal is released while receiving a call, it will not receive the incoming call again after the releasing. The caller can make an incoming call to the SIP Handler Controlled SIP terminal by releasing and sending again the call. While the caller continues calling, callings from the SIP Handler Controlled SIP terminal will be restricted.

Note: If a SIP Handler Controlled SIP terminal is released while receiving a call, the following may have occurred:

- A SIP Handler Controlled SIP terminal is started with the POWER ON button or is restarted while receiving a call
- A SIP Handler Controlled SIP terminal is released after a temporary communication disconnection with the Telephony Server while receiving a call.
- If the incoming call is canceled based on the receiving call state not being updated (without a 180 Ringing notification).
- The SIP Handler Controlled SIP terminal sent back an Error Reply to the incoming call.

(f) When a caller releases a call while calling a SIP Handler Controlled SIP terminal, if the Telephony Server cannot receive a response from the SIP Handler Controlled SIP terminal due to communication failures, the SIP Handler Controlled SIP terminal rings continuously and does not become an idle state. However, when the response is not notified from the SIP Handler Controlled SIP terminal for 3 minutes or more, the receiving call state is canceled and then the SIP Handler Controlled SIP terminal becomes an idle state.

19. When a call is placed to a Standard SIP terminal which does not perform registration to the Telephony Server, the caller receives a Ringback Tone (RBT).
20. QoS data cannot be set to packets sent from a Standard SIP terminal such as SIP messages and RTP.
21. When a line allowing a Standard SIP terminal to use is accommodated to another terminal and in use, the Standard SIP terminal cannot place a call. The Standard SIP terminal is released or receives a Busy Tone (BT).
22. A call put on hold from the SIP Handler Controlled SIP terminal using the Call Hold operation cannot be retrieved by the Telephony Server.
    Because of that, when the SIP Handler Controlled SIP terminal puts the call on hold using the call hold operation (usually, the call hold operation is disabled) after the opposite party of the SIP Handler Controlled SIP terminal puts the call on hold, due to the AUACL/N Command (CDN9: Reject Unacceptable reINVITE=0: Not Reject (200OK)) data setting, the SIP Handler Controlled SIP terminal goes into an assumed on hold state. In such state, if the calling party tries to maintain a call using the switch hook flash operation, it will not be possible.
    The opposite party which performs the switch hook flash hears no tones, RTP Warning Tone or Reorder Tone (ROT). With the retrieval operation of the SIP Handler Controlled SIP terminal, it will be possible to maintain a call again.
23. The call will be released if all the payloads do not match (payload type supported by the SIP Handler Controlled SIP terminal, payload type supported by intended party and payload type specified with the ALOCL/AIVCL command).
24. Handover (the movement of a phone engaged in communication between WI-FI access points), which requires IP address modifications, is not supported.

<Conditions Specific to UMGi/RNIP System>

1. In an UMGi system, all the nodes can accommodate Standard SIP terminals.
2. In a RNIP system, from FP95-112 V2, only the CCN can accommodate Standard SIP terminals.
3. The maximum number of speech channels is 4000 channels per CCN/RN. As for the UMGi/RNIP system designed for high-traffic networks, the maximum number of speech channels is 3000 channels per node. The maximum number of the speech channels may not be used depending on the assignment conditions of other terminals' station data or trunk data.
4. The following data assignment is required for each node to which Login Telephone Number of Standard SIP terminals are assigned:
   SIP Handler, LAN1 IP Address 2 (ACT), and IP-DTG
5. As a Registration Server, assign the LAN1 IP Address 2 of the node which includes the LENS applicable to the Telephone Number used for the Standard SIP terminal's login.

<Conditions Specific to Video Support>

This enhancement is to enable Video calls only between SIP phones under same SIP handler.

Note: This conditions are for Video calls until FP95-113 V3. For Video calls from FP95-114 V4, see VIDEO CALL [V-31].

When voice path is connected, voice payload information is exchanged by a proprietary method with the existing SIP handler. However, Video media information is referred directly from the received SDP information from the opposite terminal under same SIP handler in the exchange SDP.

When AUACL/N-CDN3 (INVITE with SDP) is 1 (on), SV9500 inserts Video media information that originator offers on the dummy SDP of INVITE/reINVITE request.

1. Video codec cannot be setup/changed by Office data. Please refer to (6) about how Video code is selected.
2. Conditions for AUACL/N CDN3 (INVITE with SDP) setting
   a.) In case CDN3 is 0 (off):
   Terminal receiving a call cannot know if it is a video call since INVITE/reINVITE doesn't include video SDP.
   b.) In case CDN3 is 1 (On):
   Terminal receiving a call receives Video SDP of INVITE/reINVITE request.
   c.) When the originator is under the same SIP handler, the SV9500 inserts only payload information the SV9500 supports (Refer to (6)) in the incoming SDP among payload information that the originator offers. If the originator offers multiple video payload information, the SV9500 inserts multiple codecs and the received terminal selects one among them. So, terminal receiving a call can know if originator wants to have video or not.

   However, there is condition for CDN3 is ON.

   "C=" IP address field is set a dummy IP (=SV9500 IP) in the session description.
   Voice is G.711 only.

   Note: If AVICL sets any codec except G.711, when the terminal answers a call, the call is released.

   RTP port of Video media description is a dummy port like voice case.

   Note: It is not the port number that originator offers.

   d.) After the terminal answers a call, reINVITE is sent to change connection to correct destination from dummy IP/Port. If terminal changes RTP port number when it receives a call or when it sends in reINVITE, connection cannot be done. This is the same as Voice - Cannot accept port-number change within same INVITE session.
3. It is only possible to have video between SIP terminals under same SIP handler.

   Video is not supported between FCCS systems, between UMGi's nodes, between P2P-CCIS, between external trunks like MG-SIP, between SP-controlled SIP or between any combinations of these.
4. Supported video codecs are as follows:

   - H261
   - H263
   - H264

- MP4V-ES

If the terminal doesn't send any of the above codecs in the SDP offer, the SDP answer from the SV9500 won't include video payload. Video payload information exchange cannot be guaranteed.

5. Internal SIP handler uses the below method for the reply SDP answer after receiving SDP offer from terminal in both cases of incoming, outgoing call. So, Internal SIP handler picks one Video payload type & codec by below logic and sends it in the SDP answer to the originator & destination. (SIP handler picks actual payload type will be used)

   Note: In case AUACL/N CDN3 is 0. (In case CDN3 is 1, destination side picks codec)

   Payload type priority follows the order of the list of video payload ("m" line of video media) in SDP which originator offers.

   When re-connection by reINVITE, order of list of video payload that originator offers within reINVITE transaction will get priority.

   However, if the SV9500 doesn't know the originator or destination (NOTE), prioritize video codec using the list of the terminal that has higher extension-LENS location request.

   Note: By Recall, etc., both source and destination will become UAC transaction of initial INVITE.

6. Cannot control video payload bandwidth. Only voice bandwidth can be controlled.
7. During a call, media information change cannot be supported. If the terminal does, the Internal SIP Handler cannot support.

   However, if process is relegated to the terminal side, there won't be any issue.

   Example: Switch video call to Voice only call

   If the terminal just stops sending/receiving Video UDP, then it is okay without processing reINVITE or UPDATE.
8. C= connection IP, a= received mode (sendonly, etc) are set as session description above "m" line. These are NOT written under media description ("m" line).
9. Terminal proprietary media control information cannot be transparent.

   Content-Type: application/media_control+xml

   >> INFO message by Polycom-VVX1500
   Content-Type: application/media_control+xml cannot be transferred.

10. Video conferencing is not available without external Video conferencing equipment.

<Other Conditions>

1. To use Standard SIP-IVR in the ACD system, refer to Hot Split - ACD [H-31A] in the Data Programming Manual - ACD.
2. To use SIP Handler Controlled SIP terminals in the OAI system, refer to SIP Handler Controlled SIP terminal in OAI System in the Data Programming Manual - OAI.

Programming

Note: The following shows assignment for Station Data and Password for Digest Authentication. Assign the following data after the initial data assignment and IP-DTG data assignment.

- For the initial data assignment, refer to 2.1.3 “If using SIP Handler Controlled SIP Voice Terminal and SIP Video Terminal” in Chapter 6 System Startup - Additional Information on System Startup - Initial Data Assignment in Appliance Model Installation Manual.
- For the IP-DTG data assignment, refer to SOFTWARE DIGITAL TONE GENERATOR [S-166].

<Station Data Assignment>

To register SIP terminal data

Before this data assignment, complete the Numbering Plan Data assignment for Station Numbers and Telephone Numbers with the ANPD/ASPA/ASPAN commands.

STEP 1: **ASYDL** - Assign the following system data.

System Data 1

Index 803, Bit 1: 1 (Consultation Hold Release is in service.)

Index 880, Bit 5: 1 (Internal SIP Handler enabled.)

Index 1382, Bit 0: Receiving digits operation of the SIP Handler Controlled SIP terminal when a called station is busy (while receiving a Busy Tone (BT) generated by IP-DTG).

0=Step Call

1=Going switch hook flash (Receiving a Special Dial Tone (SPDT))

Bit 1: Digest Authentication when the SIP Handler Controlled SIP terminal performs registration

0=In Service (default)

1=Out of Service

Note: When Bit 1=1 (Out of Service) is selected, pressing any digit key while hearing a Busy Tone (BT) enables operations of features in the Busy state.

Bit 5: Change of the Number and Name display information while the SIP Handler Controlled SIP terminal is being called **Note 7**

0=Out of Service

1=In Service

Note 7: Note the following:

- This setting is for terminals that are set to 1 (Enable) in Notice of Connected Number of the AUACL/N command.
- When a caller is blind-transferred to a SIP Handler Controlled SIP Terminal, the timing for displaying the caller information can be set to the moment when the intermediate party is disconnected from the call by setting this data to 1. (In the case of setting to 0, the caller information is displayed when the call is answered by the SIP Handler Controlled SIP Terminal.)
- Available from FP95-114 V4.

Index 1394, Bit 0 and 1: Select transport protocol for session information exchange of SIP devices. **Note 8 Note 9**

Transport Protocol	Bit 0	Bit 1
AUTO **Note 10**	0	0
TCP **Note 11**	1	0
UDP	0	1

Note 8: If FCCS system is used, set these bits in the ASYDN to ensure that all nodes have the same settings.

Note 9: Regarding systems where there are session information exchanges between the SIP handlers of more than one Telephony Server, this setting is valid only for FCCS system and UMGi system. In other combinations, UDP is used.

Note 10: With this setting the packets are sent using UDP, but if the size exceeds 1400 bytes TCP is automatically used.

Note 11: If there is the risk of packet fragmentation when using UDP, set to TCP.

Index 1408, Bit 0: Use TCP for SIP Messages.
0=Disabled
1=Enabled

Note: If this setting is changed, Internal SIP Handler needs to be initialized with the ADPM, ADTM or SINZ command.

Note: Available since FP95-114 V4.

STEP 2: **AUACL/AUACN** - Assignment of the User Agent Class Data for LDM/NDM
Assign User Agent Classes and their class data corresponding to User Agents for the SIP Handler-controlled Standard SIP terminals.

STEP 3: **AISTL** - Assign IP Station data.
TN: Tenant Number
IP STN: IP Station Number (Maximum 5 digits)
KIND: DtermIP
TEC=12: Dterm
RSC: Route Restriction Class (0-15)
SFC: Service Feature Restriction Class (0-15)
LENS: Line Equipment Numbers

STEP 4: **AKYD** - Assign IP Station data for the SIP Handler Controlled SIP terminal.

To use a Standard SIP terminal assigned as Multi Line Mode through the AUACL/AUACN command (only for guest station in the Hotel system).

TN: Tenant Number
STN: Station Number (Maximum 5 digits)
PRI=0
PL TN: Prime Line Tenant Number
PL STN: Prime Line Station Number
S=0: OG from Prime Line is not restricted
MWD=0: MW data display on the top line
LN PRE=0: Standard data of Line Preference
TP=0: 4/8/16-button type Desktop terminal
KYN1
    KYI=2: Multi-line
    KD=0: Line
    TN: My Line Tenant Number
    STN: My Line Station Number
    RG: Ring Information for My Line
KYN2
    KYI=2: Multi-line
    KD=0: Line
    TN: Multi-line (such as Virtual Line) Tenant Number
    STN: Multi-line (such as Virtual Line) Station Number
    RG: Ring Information for Each Line

To use a Standard SIP terminal assigned as Single Line Mode through the AUACL/AUACN command

TN: Tenant Number
STN: Station Number (Maximum 5 digits)
PRI=0
PL TN: Prime Line Tenant Number
PL STN: Prime Line Station Number
S=0: OG from Prime Line is not restricted
MWD=0: MW data display on the top line
LN PRE=0: Standard data of Line Preference
TP=0: 4/8/16-button type Desktop terminal
KYN1
    KYI=2: Multi-line
    KD=0: Line
    TN: My Line Tenant Number
    STN: My Line Station Number
    RG: Ring Information for My Line
KYN2
    KYI=1: Function Key
    FKY=131: Disconnect Key

Note: To use a Standard SIP terminal in Multi Line Mode, the DISCONNECT Feature key is not required.

To use Attended Transfer and Three-Way Conference with a Standard SIP terminal assigned as Multiline Mode through the AUACL/AUACN command (only for guest station in the Hotel system).
KYN3
KYI=1: Function Key
FKY=116: Call Hold Conference
To use Call Redirect [C-173] (For North America Only)
KYN4
KYI=1: Function Key
FKY=132: Redirect

Note: When INVITE is sent to the Standard SIP terminal and 603 (Decline) is received from the Standard SIP terminal, CALL REDIRECT [C-173] is activated.

Note: Data assignment with this command is used for internal processing of the Telephony Server. This data assignment is not the key data assignment for Standard SIP terminals.

STEP 5: **ALGSL/ALGSN** - Assign a Telephone Number to a Station Number used for the Standard SIP terminal.

Note: Telephone Number assignment is required for SIP Handler Controlled SIP terminals.

Assign the following data if required.

STEP 6: **ASFC** - For Stations allowed Attended Transfer and Three-Way Conference, assign a Class of Service that allows SFI=75: Call Hold Conference (only for guest station in the Hotel system).
D/N
SFI=75: Call Hold Conference
SFC: Service Restriction Class
RES: Restriction Data

STEP 7: **ASLG** - Specify the Tone Data used per system.
[FIRST] tab - Basic Data Setting
IP-DTG generates tones compliant with the Country Code assigned with the system data.
[TERMINAL] tab - Terminal Data Setting
By the following data assignment, tones from IP-DTG to Standard SIP terminal can be specified on a Tenant Number/Station Number basis.
Change Data Type: Check the check box for “TONE”.
KIND: Specify terminal kind.

Note: SIP Handler Controlled SIP terminal can use the language data compliant with specified tones only.

STEP 8: **ADSDL/ADSDN** - Assign detailed data for the Telephone Number used for the Standard SIP terminal.
UGN: User Group Number
TELN: Telephone Number
KIND: Kind of User Agent (User Agent of Terminal/User Agent of System)
TYPE: Type of User Agent (System Default/User Agent Class)
UAN: User Agent Class Number

Note: Assign this data when you use the fixed User Agent Class setting to the login Telephone Number regardless of User Agent Information given by SIP Handler Controlled SIP terminal.
This data setting is not required when you use the User Agent Class according to the User Agent Information given by SIP Handler Controlled SIP terminal.

STEP 9: **ALOCL** - Assign the IP location ID data
Assign Location ID data of the Standard SIP terminal when Peer to Peer Bandwidth Control [P-75] is used.

Note: Data setting for Setting of Type of Service (Signaling Packet) is not applied to a SIP Handler Controlled SIP terminal.

STEP 10: **AIVCL** - Assign the Payload data between IP location IDs of the SIP Handler Controlled SIP terminal and connecting IP equipment. Confirm the specification of Standard SIP terminal before this data assignment.

Note: Setting of Jitter Buffer and Setting Type of Voice Packet Service are not applied to a SIP Handler Controlled SIP terminal.

Note: Data other than Payload data is not applied to a SIP Handler Controlled SIP terminal.

Note: For Setting of Payload, including the settings of Type=G.711 and Size=20ms is recommended.

STEP 11: **ALIDL** - Assign the mounting location of the Internal SIP Handler and IP-DTG.
PH LENS: Assign the MG, Unit, LG of an open line group for use by Internal SIP Handler
PH Type=Internal SIP Handler
REGMAX=4095

To delete SIP terminal data

The deletion procedure is the reverse order of assigning the feature.

<Setting Password for Digest Authentication>

STEP 1: **ASPW** - Assign the password for Standard SIP terminal.
TYPE: Select the type of data memory (either LDM or NDM) storing the Telephone Number.
UGN: User Group Number
TELN: Assign Telephone Number of SIP terminal.
Current Password: Asterisks (*) are always displayed if the old password data exists. **Note 12**
New Password: Enter the new password (maximum 10 digits). **Note 13**
New Password Confirmation: Enter the new password again.

Note: The following need to be noted:
- When this data is not set, the Telephone Number of each terminal is used by default.
- After setting the password, back up the office data by using the MEM_HDD command Data Type: Call Forwarding.
- The assigned password can be deleted by using the RDPD command.

Note 12: The assigned password is indicated with 16 asterisks (*) regardless of the actual password digits.

Note 13: The TELN (telephone number) of IP terminals/SIP Multiple Line terminals/SIP Handler Controlled SIP terminal can also be assigned up to 10 digits.

<Video Data Assignment>

Note: This video data assignment is for Video calls until FP95-113 V3. For Video calls from FP95-114 V4, see VIDEO CALL [V-31].

STEP 1: **ASYDL** - Assign the following system data.
System Data 1
Index 880, Bit 5: 1 (Internal SIP Handler enabled)
Index 1353, Bit 1: 1 (Software Digital Tone Generator (IP-DTG) enabled) **Note 14**
Index 1382, Bit 1: Digest Authentication when the SIP Handler Controlled SIP terminal performs registration
0=In Service (default)
1=Out of Service
Index 1382, Bit 2: 1 (Internal SIP Handler Video enabled)

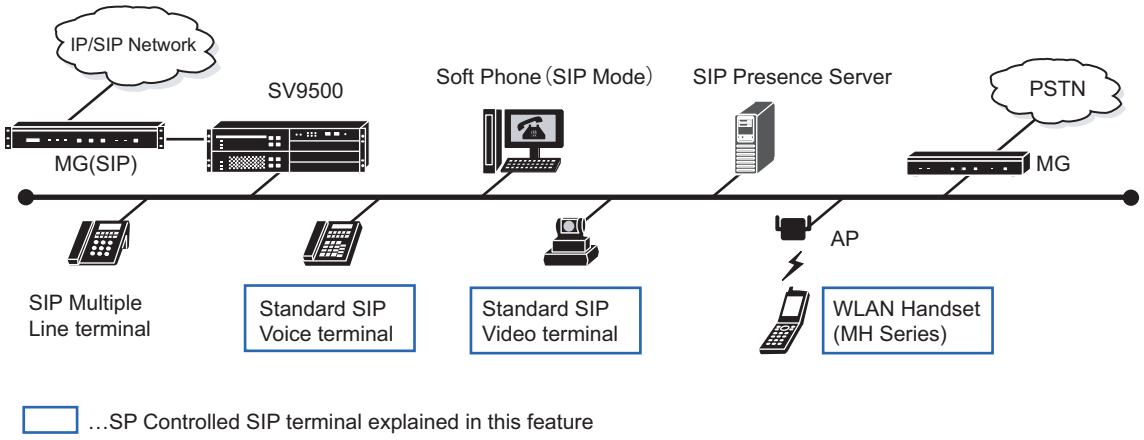
Note 14: System initialization is necessary when this data is set.

STEP 2: **ADTM** - Assign IP address 2.
Select Lan1
Add IP address 2

STEP 3: **ALIDL** - Assign PH lens.
Add PH lens for PH type Internal SIP handler
Add PH lens for PH type IP-DTG

STEP 4: **AISTL -** Assign SIP stations with Video capability.

STEP 5: **ALGSL -** Assign Stations programmed in AISTL**.**



STEP 6: **AUACL -** Assign the following.
Function: User Agent Class Setting
Type: System default
Kind: System default setting

CDN 3: Send INVITE with SDP (In case CDN3 is 1, destination side picks codec)
CDN 4: Hold Method
CDN 12: Tone [2] = FE
CDN 13: Tone [1] = 3F

S-168 SP Controlled SIP Terminal

General Description

This feature allows the system to accommodate the SIP terminals mentioned below as stations by controlling them through the SP part and the Internal PHE inside of the Telephony Server. The SIP terminals can establish an interconnection with another Telephony Server Station such as a Desktop terminal, and use various Telephony Server services.

- **Standard SIP Voice Terminal (Note 1, Note 2)**
  Standard SIP voice terminal (third-party product) is based on IETF RFC3261 and Internet-Drafts. Standard SIP voice terminal supports basic call services and PBX supplementary services.

- **Standard SIP Video Terminal (Note 1, Note 2)**
  Standard SIP video terminal (third-party product) is based on IETF RFC3261 and Internet-Drafts. Standard SIP video terminal supports video codecs, and performs the video conferences.

- **WLAN Handset (MH Series)**
  Based on IETF RFC3261 and an Internet-Draft, it has the original functions of NEC and also the functions of a built-in PHS terminal. It supports various Telephony Server features equivalent to those of a built-in PHS terminal.

Note 1: Note that a connection test is required when using a Standard SIP Voice/Video terminal (third-party product).

Note 2: When using a Standard SIP terminal with LCD (third-party product), the information displayed on the LCD depends on the specifications of the terminal being used.

Note: Although the Call Forwarding feature can be set using Preset Dialing (Special Access Code + Call Forwarding Destination Number), the user cannot hear Service Set Tone (SST).

Control Method of SIP Terminal

SIP terminals can be controlled with the methods listed below.

- SP Controlled
- SIP Handler Controlled

When using SIP terminals, the available services differ according to the control method to be used. Decide which method to use referring to the Feature List included at the beginning of this manual.
SIP Handler Controlled SIP terminal is recommended if SP Controlled SIP terminal is not necessary.

Advantages of SP Controlled SIP Terminal	Advantages of SIP Handler Controlled SIP Terminal
The following features are available with SP Controlled SIP terminal. • CALL FORWARDING-PS INCOMING INCOMPLETE [C-155] • AUTOMATIC ANNOUNCEMENT-CALLED PS OUT OF ZONE [A-129] • SIP Instant Messages **Note:** The above features are unavailable with SIP Handler Controlled SIP terminals.	The following features are available with a SIP Handler Controlled SIP terminal. These are enhanced features in comparison to an SP Controlled SIP terminal features. • Various PBX services which have been enriched by enabling PBX tones to be received through IP-DTG • Enriched OAI service • Enriched Hotel service • Improved maintainability (Detailed data setting by User Agent/reduction of the number of occupied LENS) • Ongoing call retention during the CPU changeover

Operating Procedure

None.

Service Conditions

1. SP Controlled SIP terminals and SIP Handler Controlled SIP terminals can be mixed in a system.
2. An SP Controlled SIP terminal uses LAN1 IP address (ACT).
3. The Station Number (Telephone Number) of a SIP terminal is up to 12 digits in default setting ("*" and "#" cannot be used).

   Note: An up to 16 digits Station Number is available for a SIP terminal depending on the system data setting (ASYDL/ASYDN SYS1 Index 702 Bit 0).

4. The maximum number of speech channels (1200 channels) may not be available depending on the assignment conditions of other terminals' station data or trunk data. 1200 SIP speech channels will require 1600 vacant LENS positions in the system.

   Note: The maximum number of SIP terminal speech channels that can be assigned to each LP (Local Partition) is 402. Therefore, if you assign 1200 SIP terminal speech channels, 3 LPs (Virtual MG=02-07) are used.
   Only when using SIP WIRELESS TERMINAL BACKUP [S-154], 804 channels can be assigned in each LP per SP.
   Single: 402 channels per LP (1200 channels per system)
   Dual: 804 channels per LP (2400 channels per system)

   Note: If any of the following are accommodated in a LP, the maximum number of SIP terminal speech channels per LP (402 channels) becomes smaller.

   - CS
   - ISDN terminal
   - PRI/BRI (including MG)

   SIP Speech channels share common memory with CS, ISDN terminal, and PRI/BRI (including MG). So to prevent capacity related issues, try to avoid assigning these devices in LP's containing large amounts of SIP Speech channels.

   Note: When assigning station data of SIP terminal and PS, Virtual LENS (MG=26-31) are automatically used as SIP terminal and PS accommodated locations. Therefore, if a system accommodates both SIP terminals and PSs, their total number must be 4000 or less.

5. To use a SIP terminal, the client license for the SIP terminal is required. The number of client licenses is shared by SP Controlled and SIP Handler Controlled SIP terminals. When the system accommodates both types of SIP terminals, licenses are required for the total sum of the SIP terminals.
6. SIP terminals cannot use characters to select a destination for dialing (0-9, #, * only).
7. Depending on the combination of the terminal, DTMF tones may not be sent.
8. When DTMF is sent from the terminal as voice data, a call using compressed codec (except for G.711) cannot be guaranteed.
9. Each Station Number (or Telephone Number) is set as the default password of a SIP terminal in the system. The password can be modified with the ASPW command. The RDPD command can be also used to delete the password. After modification of the password, modify the password in the SIP terminal configuration data and re-register the SIP terminal by turning off/on the power.

10. A SIP terminal can accommodate other Desktop terminal's line as Sub Line.
11. The desired values of Type of Service (ToS) can be set to SIP messages sent from the system with the ALOCL command. The ToS values apply to LOC-ID = 0 (System).
12. The registration status of SIP terminals can be checked through the DISD command. Also soft RST packets can be sent to SIP terminals in registered state. For more information about the DISD command, refer to Operations and Maintenance Manual.
13. Standard SIP terminals support only Preset Dialing. Overlap Dialing is not supported.
14. A SIP terminal uses Digest Authentication under the following conditions:

Setting on the PCPro		Authentication	
The terminal authentication per call is omitted (ASSDL/ASSDN)	NO DIGEST AUTHENTICATION (ASPTL/ASPTN)	REGISTER Method	For Initial INVITE Method
No check	No check	Supported	Supported
Check	No check	Supported	Not Supported
No check	Check	Not Supported	Not Supported
Check	Check	Not Supported	Not Supported

15. If the REGISTER information becomes invalid due to an un-REGISTER from the terminal or the REGISTER expiration, the SIP terminal can not be used. For example, the calls in progress are released on a mandatory basis. In this case, it is necessary to re-register the SIP terminal by turning off/on the power.
16. When the Telephony Server is turned off/on, restarting the SIP terminal is also required.
17. When the REGISTER request from the SIP terminal is accepted by the SP, the internal clock of the SP is sent from the SP to the SIP terminal. Some SIP terminals synchronize their internal clocks to the SP's internal clock. Thus, it is necessary to keep the SP's internal clock accurately.
18. This feature is not available for:
    - Hotel service
    - ACD service
    - OAI service **Note 3**

    Note 3: Only WLAN Handsets (MH Series) can be used in the OAI system.

19. The SP does not have Redirect Server function.
20. When a SIP terminal performs a switchhook flash, the prepause timer value is approximately three minutes as a standard.
21. When a SIP terminal or SIP server is in the following state, it is treated as in the case of Out of Zone.
    - SIP terminal is turned off.
    - Communication between a SIP terminal and SIP server is down due to a network error or other reasons (including in the case where a wireless terminal moves out of an AP's area).
    - Virtual Speech channels of SIP server in ACT mode are all busy.
22. To use the SIP telephone, the client license for the SIP terminal is required.
23. Each SIP terminal uses its Telephone Number (TELN) as a password by default.
24. Even if the system is rebooted, the SP does not notify SIP terminal any SIP terminal under its control. Therefore, the SIP terminal cannot be used until it is registered again.

25. When a SIP terminal's line on Desktop terminal is held, held SIP terminal can retrieve it by performing Preset Dialing or Overlap Dialing. In the case of a SIP terminal which supports only Preset Dialing dummy number, it can retrieve the held call. The Telephony Server does not need to assign this dummy number. (i.e. Telephony Server ignores any numbers which are dialed by preset dialing.)
26. SP Controlled Standard SIP terminals cannot be used in a network where Peer-to-Peer CCIS and DTI-FCCS coexist and each node is connected in tandem.
27. In an FCCS network, perform the required setting to use the virtual speech channels of the node to which the SIP terminal is registered.

<Conditions for WLAN Handset (MH Series)>

1. Instant Messages can be sent/received among multiple domains.
2. Instant Messages can be sent/received between WLAN Handsets (MH Series) by specifying each SIP address.

<Conditions for SP Controlled Standard SIP (Voice/Video) Terminal>

1. A Standard SIP terminal is disconnected from the system in the following cases:
   - Connecting party disconnects during a call
   - Dialed party is busy
   - Dialed number is restricted

   In these cases, the Standard SIP terminal hears a local tone such as Busy Tone (BT) or Reorder Tone (RT), or becomes idle.
2. A Standard SIP terminal cannot hear tones such as Second Dial Tone (SDT), Special Dial Tone (SPDT) or Service Set Tone (SST). Therefore, depending on the service, Standard SIP terminal is not allowed to dial. In this case, the terminal is disconnected immediately. **Note 4**

   Note 4: Call Back (Calling Party), Executive Right-of-Way (Calling Party), Privacy (Called Party), Call Waiting (Calling Party), Call Waiting (Called Party), Call Park Set and Answer
3. When a party connected to a Standard SIP terminal performs a Blind Transfer, the Standard SIP terminal continues to hear local hold tone until the third party answers.
4. Even if a Standard SIP terminal is transferred and the connecting party is changed, the system does not display the new connecting party's number on the Standard SIP terminal's LCD.
5. When a Standard SIP terminal transfers a call and goes on-hook before the forwarding destination answers, the held party itself calls the forwarding destination. In this case, if the held party is a Standard SIP terminal, the held Standard SIP terminal continues to hear a local hold tone until the destination answers.
6. A Standard SIP terminal enables Call Hold features supporting RFC3264 a=sendonly method and supporting RFC2543 c=0 method. You can select either of those methods on a terminal basis with the ASPTL/ASPTN commands.

<Conditions for SP Controlled Standard SIP Video Terminal only>

The following describes additional conditions particular to a Standard SIP Video terminal.

1. Standard SIP Video terminal user can answer the incoming call by voice only.
2. The following shows the codec to be used for the video connection.

G.711μ-law64K	G.711A-law64K	G.723.1 (6.3K)	G.722-64K	G.728
G.729	Unrestricted Digital	MP4A-LATM	G.722.1	H.263 **Note 5**
H.261 **Note 5**	H.264 **Note 5**	MP4V-ES **Note 5**		

Note 5: Codec for Video Call

3. Video Call can be placed on hold and transferred (Attended Transfer only). Blind Transfer is not available for Video Call.
4. If a Standard SIP Video terminal transfers an original Video Call to other Video terminal and goes on-hook before the transferred call (second call) is answered, both original call and second call are released.
5. If a Standard SIP Video terminal in the Video connection is recalled, the terminal is temporarily placed in the voice connection.
6. When a Standard SIP Video terminal attempts to transfer a call, the Video terminal should complete the transferring operation within 10 seconds after holding the call.
7. If a Standard SIP Video terminal fails to transfer a held call, retrieve the held call and then perform holding and transferring operation again.
8. If a Standard SIP Video terminal makes a call to the terminal that does not support a video function, voice connection is established between the two parties.
9. The line of a Standard SIP Video terminal can be accommodated to other telephones' Sub Line (Desktop terminal). In this case, the video connection cannot be performed via Sub Line.
10. The Video terminal supporting multipoint conference must send REGISTER information of all the conferees' Station Number to the Telephony Server.
11. Bandwidth Control is not available for the Video call.

<Conditions Specific to UMGi/RNIP System>

1. Only the CCN can accommodate Standard SIP terminals.

Programming

In addition to the following data settings, the initial data for the system (system configuration data, Internal PHE data, etc.) is required to be set. For details on the initial data settings, refer to "Initial Data Assignment" in Chapter 6 System Startup of Appliance Model Installation Manual.

Note: In an FCCS network, assign the following station data for the node to which the speech channels are set.

STEP 1: **ASYD** - Assign the following system data.
System Data 1
Index 30 = 06 Hex (Assign the mounting capacity of Data Memory (DM))
Index 186, Bit 6 = 1 (CCIS is enabled) **Note 6**
Index 220, Bit 6 = 0 (ISDN is enabled) **Note 6**

Note 6: Although CCIS and ISDN services must be enabled by the system data here, the optional software for CCIS and ISDN is not required when CCIS and ISDN services are not used.

System Data, Index 420, Bit 0 = 1 (Access code using pre-set dialing is enabled)

STEP 2: **ASYDL/ASYDN** - Assign the following system data.

ASYDL
- System Data 1, Index 700

Assign the SIP Terminal SHF Prepause Timer.
The timer value setting is [MTC × TC] seconds. **Note 7**

Note 7: When this data is 00 HEX, the timer value is automatically set to about 3 minutes.

bit 0-3 (MTC: 1-F)
bit 4-6 (TC)

b6	b5	b4	
0	0	0	: Not used
0	0	1	: Not used
0	1	0	: Not used
0	1	1	: Not used
1	0	0	: 30 seconds
1	0	1	: Not used
1	1	0	: Not used
1	1	1	: Not used

bit 7 = 0/1 (SIP Terminal SHF Prepause Timer: In service/Out of service)

ASYDL/ASYDN

- System Data 1, Index 702, Bit 0=1 (More than 12 digits (16 digits at the maximum) of Telephone Number is available for a SIP terminal) **Note 8**

- System Data 1, Index 702, Bit 5=1 (Digest Authentication is in service when a response from a Standard SIP terminal does not include "qop" parameter.) **Note 9**, **Note 10**, **Note 11**

Note 8: Assign this system data to register more than 12 digits of Telephone Number to SIP terminals. Leave this bit to 0 (default setting) when it is not required. Use ASYDN command in FCCS network.

Note 9: This system data is necessary for Standard SIP terminals based on RFC2617.
When the system sends a 401 or a 407 request during a Standard SIP terminal's registration or call origination and receives a response from the terminal without the "qop" parameter which is used to decide the Digest Authentication method, the terminal fails Digest Authentication.
To avoid this situation, this system data enables the Standard SIP terminal to use Digest Authentication if the system receives a response without "qop" parameter from the terminal.

Note 10: This system data is available when you select TYPE=1 in the TERMINAL (Terminal Data) field of ASPTL/ASPTN command.

Note 11: This system data becomes valid after you reset the SP with the COSSN command. Follow this procedure to reset the SP:
[1] Click the REDUNDANCY tab. Then type SIP server ID and FPC of the target SP.
[2] Click the Get button to get the information of the specified SP.
[3] Click the Reset button to reset the specified SP.
[4] Click OK.

STEP 3: **ASDIL/ASDIN** - Assign SIP domain name index data. For more details on this command, refer to Chapter 5 of Appliance Model Installation Manual and Command Manual.

SIP Server ID: display only (SIP server ID assigned by ASSDL/ASSDN is displayed).

Domain Name: Enter a desired domain name [Max 128 characters (alphanumeric characters, a dot, a hyphen)].

STEP 4: **ASSDL/ASSDN** - Assign the SIP server operating data. For more details on this command, refer to Chapter 5 of Appliance Model Installation Manual and Command Manual.

FPC: Enter the Fusion Point Code (1-253). (ASSDN only)

SIP Server ID: Enter the SIP Server ID within the range of 1-127. Note that this ID must be assigned as *SP SIP-ID* when performing setup of SP.
Note 12

Note 12: If the value 128 or more has been assigned as SIP Server IDs, it is necessary to read out the assigned SIP Server IDs and delete them. Assign SIP Sever IDs again, within the range of 1-127.

<BASE DATA tab>

CHANNEL: Assign the number of SIP terminal speech channels (3-1200)

NAME: Assign the SIP Server Name (Max. 16 characters). Note that this name must be assigned again as *SP hostname* when performing setup of SP.
TN: Tenant Number
LENS: Assign the range of LENS of SP. **Note 13**

Note 13: Specify the virtual speech channels (physical PIR or virtual PIR) having no station or trunk data. It is not available to overwrite the existing station or trunk data.

<BASE tab>
(DETAIL): Click each checkbox if required.
The terminal authentication per call is omitted: Default is OFF (this setting blocks connections attempted by unauthorized terminal.)
Change in SIP Server port number: Only the default value (5060) can be used. **Note 14**

Note 14: Do not change the default port number.

<DOMAIN tab>
This tab is used for assigning domain names that are managed by a specified SP. Select the domain name(s) assigned by ASDIL/ASDIN. Although the SP can manage multiple domains, a domain cannot be managed by multiple SPs.

EDIT DOMAIN: Select the domain name to add.
DOMAIN LIST: All the domains allowed to connect are listed.

<REDUNDANCY tab>
This tab is used for assigning the redundant partner SP ID. For more details, refer to SIP WIRELESS TERMINAL BACKUP [S-154]

Pair SIP Server ID: Assign SIP Server ID of the redundant partner SP (1-127).

STEP 5: **ASPO** - Assign SIP terminal operation data.
TN: Tenant Number
STN: Physical Station Number (a maximum of 5 digits)
RSC: Route Restriction Class, 1- 15 (class grouping on Outgoing/Incoming Call Restriction, specified by ARSC command)
SFC: Service Feature Restriction Class, 1 - 15 (class grouping on allowed/denied service features, specified by ASFC)
PHIN: Virtual LENS of the SIP Terminal is displayed.
PS NO: Display internal identification number (HEX)
**(NEC engineer use)*

STEP 6: **ASPTL/ASPTN** - Assign SIP Terminal Data.
UGN: User Group Number **Note 15**
TELN: Telephone Number (a maximum of 12 digits) **Note 16**

Note 15: When using DIAL PLAN TO SUPPORT IP CENTREX FUNCTIONALITY [D-166], User Group Number (UGN) can be assigned in the range of 1 to 255. SIP terminals (WLAN Handset (MH Series), Standard SIP Voice Terminal and Standard SIP Video terminal) can use DIAL PLAN TO SUPPORT IP CENTREX FUNCTIONALITY [D-166].

Note 16: An up to 16 digits Telephone Number can be registered when ASYDL/ASYDN SYS1 Index 702 bit 0=1 is assigned. To turn off the data of ASYDL/ASYDN SYS1 Index 702 bit 0=1, you need to delete the SIP terminal data assigned when ASYDL/ASYDN SYS1 Index 702 bit 0=1 is set.
When this data is changed, re-registration of SIP terminals is required. If SIP WIRELESS TERMINAL BACKUP [S-154] is activated, re-registration is not required.

BASE (Base Data)

FPC:	Fusion Point Code (1-253) - only for ASPTN
TN:	Tenant Number
STN:	Physical Station Number assigned by ASPO
P-NO:	"Access Code + Office Code" assigned by AUPVN + "Telephone Number" of SIP Terminal is displayed. **Note 17**, **Note 18**

Note 17: This parameter is displayed on ASPTN only. This parameter is used for DIAL PLAN TO SUPPORT IP CENTREX FUNCTIONALITY [D-166]. For a WLAN Handset (MH Series), it is necessary to set "Private Number" + "Domain" as SIP address from each terminal.

Note 18: Access Code + Office Code + Telephone Number assigned by AUPVN is not displayed in the following conditions:
- When ASYDL/ASYDN SYS1 Index 702 bit 0=1 (More than 12 digits of Telephone Number is available for SIP terminal) is assigned.
- When reading out the data assigned before enabling DIAL PLAN TO SUPPORT IP CENTREX FUNCTIONALITY [D-166].

TERMINAL (Terminal Data)

TYPE:	For Standard SIP Voice Terminal or Standard SIP Video terminal, select "TYPE1". For Wireless Handset (MH Series), select "TYPE3".
DOMAIN INDEX: DOMAIN NAME:	Select a domain index and a domain name which the SIP terminal belongs to. In an FCCS network, select the domain name of SIP server of the node to which the ASPO command data is set. When the domain name is not input, only index of domain name is displayed.

[DETAIL]
Selectable parameters in each TYPE will appear in DETAIL field as shown below when TYPE is set:

When TYPE=TYPE 1 is set	When TYPE=TYPE 2 is set	When TYPE=TYPE 3 is set
• NO DIGEST AUTHENTICATION • WIRELESS • SOFTPHONE • VIDEO TERMINAL • INVITE with SDP • When secondary call is disconnected, held call remains on hold • RTP Relay BOX (*Not used) • MWI (RFC3842) • SESSION TIMER • SENDONLY • Nurse Call Display • Distinctive Ringing • When the notification error occurs in SET or DEL process, then continue processing without displaying a confirmation dialog.	• NO DIGEST AUTHENTICATION • WIRELESS • SOFTPHONE • VIDEO TERMINAL • Nurse Call Display • IP-IVR • DNIS on FROM field of INVITE • When the notification error occurs in SET or DEL process, then continue processing without displaying a confirmation dialog.	• NO DIGEST AUTHENTICATION • WIRELESS • SOFTPHONE • VIDEO TERMINAL • MWI (Extension header method) • When the notification error occurs in SET or DEL process, then continue processing without displaying a confirmation dialog.

NO DIGEST AUTHENTICATION: Mark the checkbox if the terminal does not support Digest Authentication.

WIRELESS: Mark the checkbox when a WLAN Handset (MH Series) is used.

SOFTPHONE: Mark the checkbox when using SOFT PHONE WLAN HANDSET [S-159] or SOFT PHONE WIRED-PHONE HANDSET [S-147].

VIDEO TERMINAL: Mark the checkbox when Standard SIP Video terminal is used.

MWI (Extension header method): Mark the checkbox when a WLAN Handset (MH Series) is used. (This parameter is valid only when TYPE = TYPE3.)

MWI (RFC3842): Mark the checkbox when Standard SIP Voice Terminal or Standard SIP Video terminal is used.

INVITE with SDP: Select the check box if the terminal does not support INVITE without SDP. (The terminal must support re-INVITE without SDP.) When the check box is selected, a dummy SDP will be added to the initial INVITE from the Telephony Server. (This parameter is valid only when TYPE=TYPE1.)

When secondary call is disconnected, held call remains on hold:	Select the check box if CONSULTATION HOLD RELEASE [C-169] (when terminal A transfers a held call (terminal B) to terminal C, terminal B remains in hold state even when terminal A and terminal C are disconnected) is used with Standard SIP terminal. (This parameter is valid only when TYPE=TYPE1.)
SENDONLY:	Select the checkbox when your Standard SIP terminal enables Call Hold features supporting RFC3264 a=sendonly method. When this parameter is not selected, Standard SIP terminal performs Call Hold features supporting RFC2543 c=0 method. (This parameter is valid only when TYPE=TYPE1.)
Nurse Call Display	Not used. (This parameter is valid when TYPE=TYPE1 or TYPE2.)
IP-IVR	Not used. (This parameter is valid when TYPE=TYPE2.)
DNIS on FROM field of INVITE	Not used. (This parameter is valid when TYPE=TYPE2.)
Distinctive Ringing:	Select the check box if Distinctive Ringing is used. (This parameter is valid only when TYPE=TYPE1.)
When the notification error occurs in SET or DEL process, then continue processing without displaying a confirmation dialog.:	When this check box is selected, the SET or DEL process continues without displaying a confirmation dialog even if the notification error is received from the SIP server. (This parameter is valid when TYPE=TYPE1, TYPE2 or TYPE3.)

Note: Normal operation of the terminal is not guaranteed if the Type and Detail parameters are incorrectly assigned.

Note: If the data on the TERMINAL tab is changed, the SP receives notification about the data change. If the SP cannot receive the notification for some reason, the disparity between the actual Office data and information on the SP is created. At this time, the terminal is required to re-register.

STEP 7: **ASFC** - Assign a Service Feature Restriction Class that restricts (RES=0) the following SFIs to the Standard SIP terminal Station.

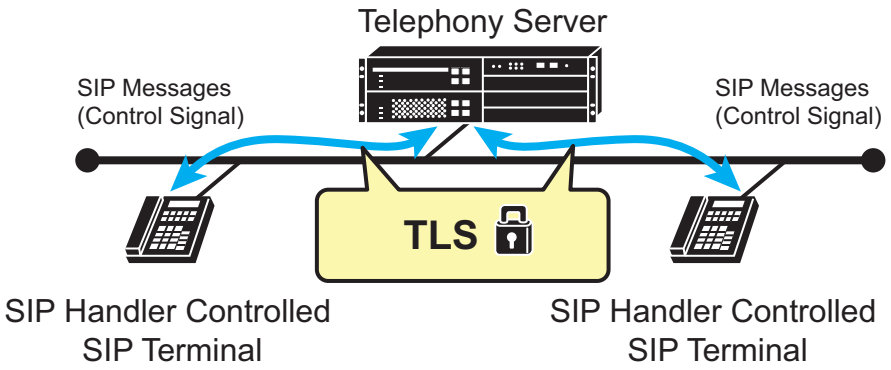
SFI 4: Executive Right-of-Way (Called)
SFI 5: Call Waiting-Originating (Calling)
SFI 6: Call Waiting-Originating (Called)
SFI 67: Call Park-Access and Answer

The following explains how to assign the passwords for SP Controlled SIP terminals.

ASPW - Assign the password for SIP terminal.

TYPE:	Select the type of data memory (either LDM or NDM) storing the Telephone Number.
UGN:	User Group Number
TELN:	Assign Telephone Number of SIP terminal.
Current Password:	Asterisks (*) are always displayed if the old password data exists **Note 19**.
New Password:	Enter the new password (maximum 16 digits) **Note 20**.
New Password Confirmation:	Enter the new password again.

Note 19: The assigned password is indicated with 16 asterisks (*) regardless of the actual password digits.



Note 20: The TELN (telephone number) of IP terminals/SIP Multiple Line terminals can be assigned up to 10 digits.

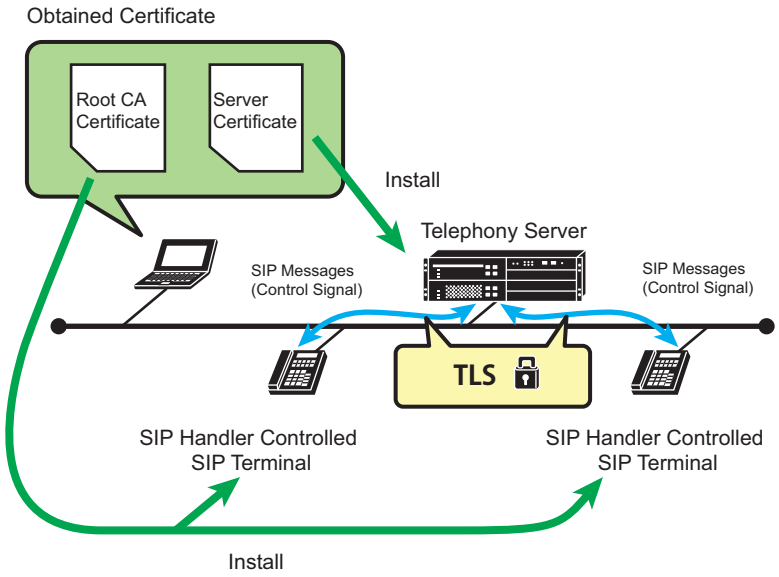
S-169 SIP Handler - SIP Terminal Support for TLS Encryption

General Description

This feature provides the encryption feature for SIP messages on the network between SIP Handler Controlled SIP terminal and Telephony Server. This way, telephone tapping and SIP message falsification by a third person can be prevented.

Note: This feature is available since FP95-114 V4.

Operating Procedure



When SIP Handler Controlled SIP terminal accesses the Telephony Server, a certificate file is required to confirm an identification of the Telephony Server. For using the certificate file, the user requires a public key certificate (the certificate issued by the certificate authority) or a self signed certificate (the certificate created by the user.) The maintenance personnel is required to install the certificate the user obtained.

The installation directories for each certificate are as follows:

- Server certificate: Install the certificate to the Telephony Server.
- Root CA certificate: Install the certificate to the SIP Handler Controlled SIP terminal. **Note 1**

Note 1: When the certificate is installed on the SIP Handler Controlled SIP terminal beforehand, this installation is not required.

With the installation of the certificate, data going through the network between Telephony Server and SIP Handler Controlled SIP terminal is encrypted by TLS and the network information will be protected.

1. Precaution for obtaining the certificate

This procedure is done by the user. The precautions when the user obtains a certificate are as follows.

(a) Public Key Certificate and Self Signed Certificate

- Available file format for server certificate is PEM format only.
- Be sure to prepare the server certificate in combination with server secret key. **Note 2**

Note 2: To combine the server certificate and server secret key, edit the certificate file as follows using text editor.

```
-----BEGIN RSA PRIVATE KEY-----
(The contents of server secret key)
-----END RSA PRIVATE KEY-----

-----BEGIN CERTIFICATE-----
(The contents of server certificate)
-----END CERTIFICATE-----
```

- A server secret key encrypted with a password is not available. When creating a server secret key, do not set password. If the password is set to the server secret key, decrypt the password and combine the server secret key with the server certificate.

- When the certificate has expired, server identification is disabled and the communication between Telephony Server and SIP Handler Controlled SIP terminal is disabled. In that case, the following procedure is required.

Expired Certificate	Counter Measures
Root CA Certificate	• Obtain the client CA certificate and install the certificate file to the SIP Handler Controlled SIP terminal. • Reissue the server certificate and install the certificate file to Telephony Server.
Server Certificate	• Reissue the server certificate and install the certificate file to Telephony Server.

- When creating server certificate, assign the IP address of SIP Handler Controlled SIP terminal to the Common Name.

(b) Public Key Certificate

When you order the issue of server certificate to the public certification authority, intermediate certificate may be issued with the server certificate depending on the certification authority. In that case, be sure to prepare the server certificate which is combined with intermediate certificate. **Note 3**

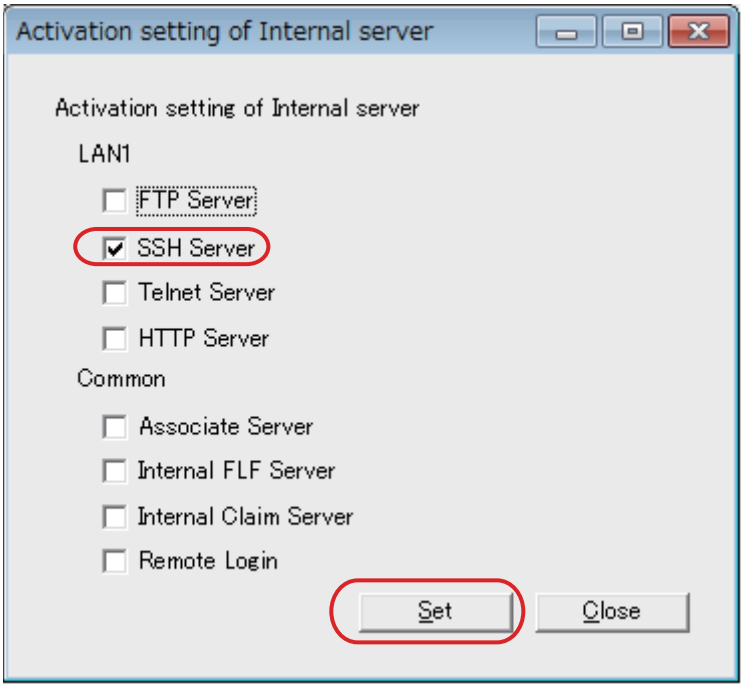
Note 3: To combine the server certificate and intermediate certificate, edit the certificate file as follows using text editor. The order of certificate is placed from low assurance level to high assurance level on certificate chain.

```
-----BEGIN CERTIFICATE-----
(The contents of server certificate)
-----END CERTIFICATE-----

-----BEGIN CERTIFICATE-----
(The contents of intermediate certificate)
-----END CERTIFICATE-----
```

(c) Self Signed Certificate

- When using self signed certificate, specify the validity date of certificate while creating self signed certificate and server certificate.
- When creating self signed certificate, you can decide to set or not set a password of secret key for client authentication. If the password is set to the self signed certificate, enter the password when you make a signature to the self signed certificate or Certificate Signing Request (CSR).



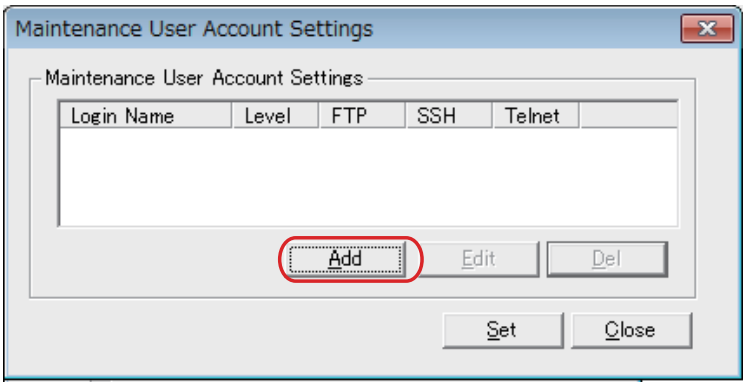
2. Installation Procedure of Server Certificate

This procedure is done by maintenance personnel.

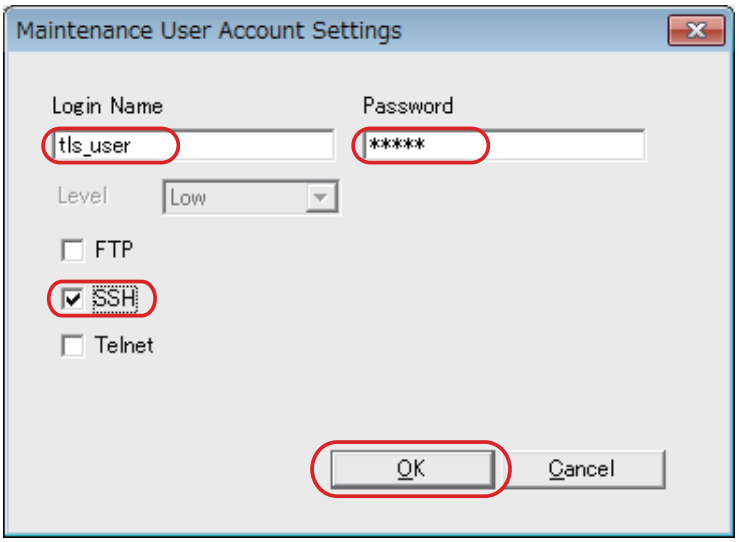
STEP 1: Startup SSH server.

Activate the internal SSH server in the Telephony server.

1. Execute ADTM command on PCPro.
2. Choose “LAN1” on “Select LAN Interface” and Click “Get”.
3. Select the Options tab and then select “Activation setting of Internal server” from maintenance tab, and click “Execute”.
4. Select the checkbox of “SSH Server”, and click “Set”.



STEP 2: Set the account of maintenance personnel of Telephony Server.



Create the Maintenance User Account for SSH.

1. Execute ADTM command on PCPro.
2. Select “LAN1” on “Select LAN Interface” and Click “Get”.
3. Select the Options tab and then select “Maintenance User Account Settings” from maintenance tab, and click “Execute”.

4. Click “Add”. When using the account already created, click “Edit”.

5. Enter login name and password, and select the checkbox of “SSH”. Then click “OK”.

6. Click “Set”.

STEP 3: Install the server certificate from the maintenance PC to the Telephony Server.

Install the server certificate saved on the local folder of maintenance PC to the Telephony Server using SCP client or SFTP client.

1. On the maintenance PC, login to the Telephony Server using SCP client or SFTP client. The login name and password are same as the login name and password of maintenance personnel on STEP 2.

2. Change the file name of server certificate saved on the local folder of maintenance PC to “sv9500certificate.pem” and put the certificate files (/mnt/CF/tls/certs) on the folder of Telephony Server.

3. Installation Procedure of Root CA Certificate

Install root CA certificate to SIP Handler Controlled SIP terminal. This procedure is for maintenance personnel. For the details of Installation procedure, refer to the each manual of SIP Handler Controlled SIP terminal.

Note: When you obtained public key certificate from a reliable certificate authority, when the root CA certificate is already preinstalled on the SIP Handler Controlled SIP terminal, this installation is not required.

Service Conditions

<Important Notices>

1. When using this feature, SIP Handler Controlled SIP terminal is required to support TCP. For the details, see SIP HANDLER - SIP TERMINAL [S-167] in this manual.

<Interactions with Other Features>

1. This feature cannot be used in collaboration with VoIP Encryption [V-27].
2. This feature does not support Location Diversity [L-55].

<Hardware/Software>

1. This feature is available only for SIP Handler Controlled SIP terminal with the following conditions:
   - The terminal supports the feature of TLS 1.2.
   - TLS feature is set to “enabled” on the configuration setting of the terminal.
2. The applicable TLS protocol version is TLS 1.2. Also, the following cipher suites are available for the Telephony Server.

Cipher Suites
TLS_RSA_WITH_AES_128_CBC_SHA **Note 4**
TLS_RSA_WITH_AES_256_CBC_SHA
TLS_RSA_WITH_AES_128_CBC_SHA256
TLS_RSA_WITH_AES_256_CBC_SHA256

Note 4: The required cipher suites of TLS1.2. defined in RFC5246.

3. The feature does not support SRTP. Therefore, be sure not to set SRTP to enable on the configuration setting of the terminal.
4. SR-MGC is not supported for this feature.

<Interactions with Networks>

None.

<Conditions Specific to This Feature>

1. For using this feature, install a server certificate in the Telephony Server. Also, a root CA certificate synchronized with server certificate is required to be installed in SIP Handler Controlled SIP terminal.
2. After the server certificate is installed in the Telephony Server again, execute program Non-Load Initialization of Internal SIP Handler. If Non-Load Initialization is not executed, the old server certificate (before installed) will be used.

3. When server certificate has expired, the Telephony Server does not restore the disconnection of TLS and conversation. However, registration of SIP terminal will be disabled. When validity date is updated, install the server certificate one more time.
4. For dual configuration, install a server certificate to the Telephony Server both system #0 and system #1. For the other following features and systems, is required to be installed different server certificate for each node.

   - Geographic Redundancy feature
   - Geographic Redundancy-enabled UMGi system
   - UMGi system

5. For TLS connection, IP address of LAN1 ACT2 on the Telephony Server and port number 5061 are used as default setting. Also, IP address of LAN1 on the Telephony Server and port number 55061 are used. The LAN interface and port number can be changed by "Configure Application Port" of ADTM command. When the data setting is changed, initialize the SIP Handler Controlled SIP terminal.
6. In this feature, only server side is authenticated by TLS connection. The TLS handshake protocol is established by TLS connection request (Client Hello (**Note 5**)) from SIP Handler Controlled SIP terminal to Telephony Server side. From the Telephony Server, a certificate request will never be sent to the terminal side.

   Note 5: TLS handshake protocol signal is defined by RFC2246.
7. The maximum number of TCP connections between Telephony Server and SIP Handler Controlled SIP terminal are 1000 by adding up the number of TLS connection and non TLS connection.
8. Change the maximum number of TLS connection (ASYDL, SYS1, Index 1418, Bit 0-3) after installing the server certificate to the Telephony Server.
9. When the number of TLS connection reaches the maximum number of TLS connections, Telephony Server will not accept a new TLS connection request in spite of the setting of maximum number of new TCP connection (ASYDL, SYS1, Index 1418, Bit 0-3).
10. When the maximum number of TLS connection is over, the registration of SIP Handler Controlled SIP terminal for TLS connection is disabled.
11. The specified port (TLS) by ADTM command is used for TLS connection only. Non TLS connection is not available.
12. When a no-communication state continues beyond the time which is assigned by the system data (ASYDL, SYS 1, Index 1421, Bit 0-3), Telephony Server sends TCP Keep Alive to the SIP Handler Controlled SIP terminal to monitor the state of TLS. When the Telephony Server does not receive the response of TCP Keep Alive from SIP Handler Controlled SIP terminal, sending retry is executed to the terminal up to 9 times until the response returns for the time interval set in the system data (ASYDL, SYS 1, Index 1421, Bit 4-7). If the terminal does not send the response after 9 times sending retry, the Telephony Server disconnects the TLS connection (When default value is assigned, the Telephony Server will be disconnected after 69 seconds (60 seconds + (one second x 9 seconds)).
13. When the TLS connection of SIP Handler Controlled SIP terminal has been disconnected, the terminal cannot originate/receive a call until the terminal performs reregistration to the Internal SIP Handler of the node that accommodates the terminal. The conditions required for reregistration are as follows:
    a.) On state of monitoring of TLS, when the response from SIP Handler Controlled SIP terminal has been lost.
    b.) By the Service Conditions of SIP Handler - SIP Terminal [S-167], when the terminal reregistration is required or the TCP connection has been disconnected.

Note 6: For details, refer to SIP Handler - SIP terminal [S-167] in this manual.

c.) By the Service Conditions of UMGi system and Geographic Redundancy feature, when the terminal reregistration is required or the TCP connection has been disconnected.

Note 7: For details of Service Conditions of Geographic Redundancy, refer to 8. Geographic-Redundancy-Enabled UMGi System in Chapter 2 Service Conditions of Geographic Redundancy Configuration Manual. For details of Service Conditions of UMGi, refer to 6. Conditions in Chapter 1 General of UMGi Configuration and Maintenance Guide.

14. When the CPU changeover is executed, TLS connections will be disconnected. However, the control signal from the Telephony Server cannot be transmitted. Then, the Telephony Server does not disconnect the conversation. the operation of SIP terminal after TLS disconnection depends on the specification of the terminal.
15. When the maximum number of TCP connection (ASYDL, SYS1, Index 1418, Bit 0-3) is changed while the TLS connection or non TLS connection is established, the already established session of TLS connection or non TLS connection will not be disconnected. If the rate of connection number has been changed, the initialization of Internal SIP Handler is required.
16. Only control signals between Telephony Server and SIP Handler Controlled SIP terminal supporting TLS are encrypted by TLS connection.
17. When Internal SIP Handler has been initialized, the connection of all terminals which are controlled by Internal SIP Handler will be disconnected.

<Others>

None.

Programming

STEP 1: **ASYDL** - Assign the following system data.

System Data 1

Index 1408, Bit 0=1 (TCP connection for SIP message is enabled)

Note: When this data is changed, each of following procedures is required:

- Initialization of Internal SIP Handler with the ADPM command
- Initialization of TCP/IP Module with ADTM command
- System Initialization with SINZ command

Index 1418, Bit 0-3: In the maximum number of TCP connection for SIP message, set the maximum number of TLS connection by percentage.

0-10=Setting value x 10% (0-100%)

11-15=100%

Note: When assigning the data, the following conditions are required:

- Install server certificate before changing this data.
- Assign a rate number which is larger than the number of the terminals supported TLS for TLS connection.

- When 0% is assigned, TLS connection is not available. When 100% is assigned, only TLS connection is available.
- The maximum number of TCP connection is 1000. Therefore, when the value is assigned as “1 (10%)”, the maximum number of TLS connections is 100.

Index 1421, Bit 0-3: Assign the time to send TCP Keep Alive for the first time on the TLS connection in 10 seconds units.

0=60 seconds (default)

1-15=Setting value × 10 seconds (10-150 seconds)

As an example, when the value “1” is assigned, TCP Keep Alive will be sent to SIP Handler Controlled SIP terminal after a no-communication state continues for 10 seconds.

Note: Default setting is recommended.

Bit 4-7: Assign the sending interval of TCP Keep Alive on the TLS connection in one seconds units.

0=1 second (default)

1-15=Setting value × 1 seconds (1-15 seconds)

Note: When assigning the data, the following conditions are required:

- TCP Keep Alive sending retry is executed to the terminal up to 9 times until a response is returned for the time interval assigned in this command. The number of retry times cannot be changed.
- Default setting is recommended.

STEP 2: **ADTM** - Assignment of Data for TCP/IP Module

Assign the port number of TLS (TCP Server) for Internal SIP Handler, when using default port number, this setting is not required. When “0” is assigned, the setting value will be as follows.

<Options Tab>

Configure Application Port

Internal SIP Handler

TLS (TCP Server): 55061 (LAN1)/5061 (LAN1 (ACT2))

Note: The port number assigned in ADTM command will be set to the setting of system data (ASYDL, SYS1, Index 1419 and Index 1420).

T-1 Tandem Switching of TIE Trunks - 2/4-Wire

General Description

This feature allows Trunk-to-Trunk Connections through the switching system, without the need for any Attendant assistance or control. The major use of this feature is in association with the Dial Tandem TIE Line Network to allow TIE Line Connections and Incoming TIE Line Calls automatic access to, and completion of, local Central Office Calls.

Operating Procedure

To operate

1. Lift the handset. Receive Dial Tone from the distant office.
2. Dial the TIE Trunk Access Code. Receive Dial Tone from the System.
3. Dial another TIE Trunk Access Code.

OR

1. Dial the Central Office Access Code. Receive Dial Tone from the other distant System or local Central Office.
2. Dial an extension number of the distant System.

OR

1. Dial the Central Office exchange number (local or toll).

Service Conditions

1. When using a Two-wire application, there may be an appreciable decrease in transmission decibel Levels.
2. When using a 4-wire application, an TLT circuit card is required for every four TIE Lines. This circuit card provides amplification/attenuation so that the desired transmitting and receiving Levels can be maintained, providing the overall Tandem system with transparency.
3. When TIE Trunks are busy, the Calling Station will receive Busy Tone.
4. Each Incoming TIE Trunk may have various restrictions for TIE-to-Central Office Calling.
5. Careful consideration should be given to Access Code Numbering Plans to avoid unnecessary loss of Access Codes and Code duplication within the same system.
6. Tandem switching can also be accomplished via the ATTENDANT CONSOLE [A-3].
7. There is no limitation to the allowable number of Tandem Switching Connections.
8. This feature can also be activated when using a Trunk in the Remote Node via FCCS link. For more detailed information, see the Data Programming Manual - FCCS.

Interactions

1. The Connection described is a user Outside the system connected to an Incoming TIE Line to an Outgoing TIE Line. TRUNK-TO-TRUNK CONNECTION [T-10] is established by either the Attendant Console or a Station user and is connected to two Outgoing Trunks.
2. TOLL DENIAL [T-6]: If TOLL DENIAL is applied to an Incoming TIE Trunk Group, the Calling Station user is routed to Reorder Tone if an attempt is made to dial-access a Toll Call.
3. Incoming dial repeating TIE Trunks (Second Dial Tone) can connect to the following types of Outgoing Trunks:
   a.) Dial repeating TIE Trunk (Second Dial Tone)
   b.) Senderized TIE Trunk

c.) Central Office Trunk
d.) FX Trunk
e.) WATS Trunk
f.) CCSA Trunk

4. STATION MESSAGE DETAIL RECORDING (SMDR) [S-10]: On Tandem Connections, the Incoming TIE Trunk Group Route Number and Outgoing Trunk Number are recorded.
5. Two Outgoing Trunk Group restriction tables are provided per system. The Direct Dial Access table is indexed when a distant Station user dials the Trunk Group Access Code, and the ATTENDANT CONSOLE [A-3] table is indexed on Attendant completed calls.

Programming

STEP 1: **ARTD** - Assign the TIE Line routes as shown below:

BOTHWAY TIE-LINES:
RT: 1

1-OSGS	:2	2-ONSG	:3	3-ISGS	:2	4-INSG	:3	5-TF	:3
6-TCL	:4	7-L/T	:1	8-RLP	:2	15-LSG	:5		

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as circuit card, MG, or VS32.

STEP 2: **ATRK** - Assign the LENS, TIE Line Route Number, Trunk Number, and Tenant Number.

STEP 3: **MBTK** - Assign the Make Idle status to the TIE Line Trunks.

STEP 4: **ANPD** - Reserve a Number Level for Trunk Access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan. Busy Lamp Field is not activated.

STEP 5: **ASPA** - Assign the Access Code as assigned in ANPD above. Select “N: Normal” Service or “H: Hooking” Service from the combo box for Connection Indexes. Type of Service, SRV = “OGC: Outgoing Call” for Outgoing Trunk. Assign the Route Number associated with this Access Code.

STEP 6: **ARRC** - Assign to the system Trunk-to-Trunk Connection. Use Alternative Route Index (ARI-D-RES) for Direct Connection. Three possible Restrictions may be assigned; data “0”, Connection is Restricted; data “1”, Connection is Allowed; or data “2”, Toll Restriction is required. For TANDEM SWITCHING OF TIE TRUNKS-2/4 WIRE, TOLL RESTRICTION is not required.

STEP 7: **APAD** - Assign any Pad data that may be required for desired quality of service. (Optional, see TIE LINE CONNECTION WITH PAD CONTROL [T-5]).

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

STEP 1: **ARTDN** - Assign the TIE Line routes as shown below:

BOTHWAY TIE-LINES:

RT: 1

1-OSGS	:2	2-ONSG	:3	3-ISGS	:2	4-INSG	:3	5-TF	:3
6-TCL	:4	7-L/T	:1	8-RLP	:2	15-LSG	:5		

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as circuit card, MG, or VS32.

STEP 2: **ANPDL** - Reserve a Number Level for Trunk Access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes.Assign NND in accordance with a predetermined Numbering Plan. Busy Lamp Field is not activated.

STEP 3: **ASPAL** - Assign the Access Code as assigned in ANPD above. Assign Connection Indexes, CI = “N: Normal” and “H: Hooking”. Type of Service, SRV = “OGC: Outgoing Call” for Outgoing Trunk. Assign the Route Number associated with this Access Code.

STEP 4: **ARRCN** - Assign to the system Trunk-to-Trunk Connection. Use Alternative Route Index (ARI-D-RES) for Direct Connection. Three possible Restrictions may be assigned; data “0”, Connection is Restricted; data “1”, Connection is Allowed; or data “2”, Toll Restriction is required. For TANDEM SWITCHING OF TIE TRUNKS-2/4 WIRE, TOLL RESTRICTION is not required.

STEP 5: **APADN** - Assign any Pad data that may be required for desired quality of service. (Optional, see TIE LINE CONNECTION WITH PAD CONTROL [T-5]).

T-2 Three-Way Calling

General Description

This feature enables any Station user, including Desktop terminal user, to establish a Three-Way Call by connecting an additional party to an already existing conversation.

Even if the additional party (Desktop terminal) holds the call, Three-Way Call may be established. (This service is called Consultation Hold.)

Operating Procedure

Using switch hook flash

Procedure 1

1. Perform switch hook flash. First party is placed on Consultation Hold. Receive Special Dial Tone.
2. Dial the desired number. Receive answer.
3. Announce the Conference and perform switch hook flash again.
4. Three-Way Call is now established.

Procedure 2

1. While connected with the first party, perform switch hook flash. Receive Special Dial Tone. The first party is placed on hold.
2. Dial the additional party (Desktop terminal). Receive Ringback Tone.
3. The additional party answers. Consultation Hold-All Calls state has been entered.
4. The additional party presses the HOLD key. The call in progress is held.
5. Perform switch hook flash and return to the first party.
6. The additional party or another Desktop terminal in the same Multi Line Group answers the Held Call.
7. Three-Way Call is established.

<The following procedures are applied for Desktop terminals only.>

Using CONF key

Procedure 1

1. Press the TRANSFER key. Receive Special Dial Tone. The first party is placed on hold.
2. Dial the desired number. Receive answer.
3. Announce the Conference and press the CONF key.
4. Three-Way Call is now established. The LCD displays:

Procedure 2 (Hold on Consultation Hold)

1. While connected with the first party, press the TRANSFER key (Desktop terminal). Receive Special Dial Tone. The first party is placed on hold.
2. Dial the additional party (Desktop terminal). Receive Ringback Tone.
3. The additional party answers. Consultation Hold-All Calls state has been entered.

4. The additional party presses the HOLD key (Desktop terminal). The call in progress is held.
5. Press the CONF key and return to the first party.
6. The additional party or another Desktop terminal in the same Multi Line Group answers the Held Call.
7. Three-Way Call is established.

Service Conditions

1. The originating party may hang up at any time. The remaining two parties will not be disconnected if assigned as such in system programming.
2. This feature may be activated during any call.
3. This feature is available for the following combination of parties:
   Station*-Station-Station
   Station*-Station-Central Office Line
   Station*-Station-TIE Line
   Station*-Central Office Line-TIE Line
   Station*-Central Office Line-Central Office Line **Note 1**
   Station*-TIE Line-TIE Line
   * The originating party for this feature must be a Station (including a PS).

   Note 1: This combination is only available when using a Trunk that can detect the Release Signal from the Central Office Line.

4. The maximum number of simultaneous Three-Way Calls is dependent on the quantity of Digital Conference Trunks within the system. One Digital Conference Trunk circuit card can handle eight simultaneous Three-Way Calls.
5. Three-Way Calling feature is not restricted by the line class of service assigned to the user's line; thus, a fully restricted Station can transfer a call to another Station or the Attendant.
6. This feature can be activated via PHC (Internal PHC) under the following conditions:
   a.) Any operation other than Call Hold and Call Release cannot be performed during Three-Way Calling via PHC.
   b.) If there are not enough available ports on IPPAD when the CONF key is pressed, Three-Way Calling cannot be established. (For example, up to three ports are required when using an IP Station.) **Note 2**
   c.) An additional party cannot perform switch hook flash during Three-Way Calling.
   d.) On a Three-Way Call where all parties are connected to each other by CCIS Networking via IP through PHC, if one of the parties places the call on hold, the other two will hear no Music On Hold tone. When the party returns to the original call, the other two will hear an Override tone.
   e.) On a Three-Way Call among users A, B, and C, where user A is connected to users B and C via DTI FCCS and users B and C are connected to each other by CCIS Networking via IP through PHC, if user A places the call on hold, the other two will hear Music On Hold tone.
   f.) When Call Hold is released during Three-Way Calling via VS32, Override tone is not provided.

   Note 2: IPPAD is not required for a communication among only IP equipment (without the intervention of Legacy equipment).

7. By assigning system data (ASYDL, SYS 1, Index 830, Bit 5 = 1), Three-Way Calling Tone (Add-On Ticker) can be sent when Three-Way Calling is established.

Note: This system data (ASYDL, SYS 1, Index 830, Bit 5 = 0) works in a different way, depending on following countries:
Austria
: Three-Way Calling Tone (Add-On Ticker) is sent at a cycle of four seconds.
EMEA except for Austria
: Three-Way Calling Tone (Add-On Ticker) is sent at a cycle of 32 seconds.
North America and Australia
: Three-Way Calling Tone is not sent.

The following are the service conditions of Three-Way Calling Tone (Add-On Ticker).

a.) Three-Way Calling Tone (Add-On Ticker) can be sent when Three-Way Calling is established by the following operations.

- Performing switch hook flash
- Pressing the CONF key of Dterm/DtermIP/DT Series
- Pressing the CONF key of Attendant Console

b.) Three-Way Calling Tone (Add-On Ticker) can be sent to all the parties in Three-Way Calling.
c.) This feature does not support Three-Way Calling created by OAI or Hotel feature.
d.) Three-Way Calling Tone (Add-On Ticker) supports the following MGs.

Product Name	F/W Product Name	Remarks
MG(BRI) [MG-2BRIA]	SP-3826 BRI MG SIP BSC PROG-A Issue 2 or later	–
MG(BRI) [SCA-2BRIA]		
MG(PRI) (1.5M) [MG-24PRIA]	SP-3884 MG PRI PROG-A Issue 3 or later	SIP is supported for 5A or later.
MG(PRI) (1.5M) [SCA-24PRIA]		
MG(PRI) (2M) [MG-30PRIA]		
MG(PRI) (2M) [SCA-30PRIA]		
MCMG [MG-4LC2COTA]	SP-3778 MCMG PROG-A Issue 1 or later SP-3927 MCMG PROG-B Issue 1 or later **Note 3**	–
MCMG [SCA-4LC2COTA]		
MG-COT Card [SCA-6COTA]	SP-3875 6MGCOT PROG-A Issue 1 or later **Note 3**	North America is supported.
MG-COT Card [SCA-6COTB]	SP-3948 6MGCOT PROG-A Issue 1 or later	EMEA is supported.
MG-COT Card [SCA-6COTC]	SP-3948 6MGCOT PROG-A Issue 1 or later **Note 3**	North America is supported.

Product Name	F/W Product Name	Remarks
UG50 (PRT 1.5M)	Any version	–
UG50 (PRT 2M)		
UG50-24PRIA		
UG50-30PRIA		
UG50 (COT-TYPE1)		
UG50 (COT-TYPE2)		
UG50-4LC2COTA (COT)		
UG50-6COT		

Note 3: EMEA is not supported.

e.) Three-Way Calling Tone (Add-On Ticker) is not transmitted to the operator and terminal connected via PHC.

f.) This feature is not available for MG(BRI) Card [SCA-2BRIA]/MG(BRI) Box [MG-2BRIA]/ MG(BRI) [SCA-2BRIA-B].

g.) The following table shows the specifications of Three-Way Calling Tone (Add-On Ticker).

Country	Frequencies	Cadence	Time Slot
America	425 Hz-3 dBm	80ms-on/80ms-off/80ms-on/off	DTG TS = 3
Australia	425 Hz-3 dBm	80ms-on/80ms-off/80ms-on/off	DTG TS = 3
Netherlands	425 Hz-3 dBm	10 times 32ms-on/480ms-off: Repeating every 32s	DTG TS = 3
Belgium	425 Hz-3 dBm	5 times 32ms-on/480ms-off: Repeating every 32s	DTG TS = 3
Sweden	1400 Hz-27 dBm	352ms-on,off: Repeating every 32s	DTG TS = 3
UK	425 Hz-3 dBm	2 times 32ms-on/352ms-off: Repeating every 4s	DTG TS = 3
Germany	425 Hz-3 dBm	10 times 32ms-on/480ms-off: Repeating every 32s	DTG TS = 3
Austria	425 Hz-3 dBm	4 times 32ms-on/960ms-off: Repeating every 4s	DTG TS = 3
Denmark	425 Hz-3 dBm	2 times 32ms-on/480ms-off: Repeating every 32s	DTG TS = 3
Swiss	425 Hz-23 dBm	448ms-on: Repeating every 32s	DTG TS = 3
Spain	425 Hz-3 dBm	5 times 32ms-on/480ms-off: Repeating every 32s	DTG TS = 3
Greece	950 Hz-13 dBm	480ms-on, off: Repeating every 32s	DTG TS = 3
Italy	425 Hz-3dBm	10 times 32ms-on/480ms-off: Repeating every 32s	DTG TS = 3

8. If any one party places a Three-Way Call in progress on Call Hold, the other two parties cannot activate Call Hold.
9. When a Three-Party Conference includes an external trunk (C.O. Line or TIE Line), the station which has changed from hold status to Three-Party Conference status cannot be placed on hold again.

10. When a Three-Party Conference Trunk (CFT) has no vacancy, a Three-Party Conference cannot be established. In this case, the connected party switches every time the CONF key is pressed, and the other party will be on hold.

When the Consultation Hold service is used:

1. Service Feature Restriction Class of Stations may be assigned at each Station.
2. This service is not available when Three-Way Calling has been established.
3. After the originating party performs switch hook flash, the party can only go on-hook and perform switch hook flash. The party in conversation can only operate on-hook.
4. This service is not available when the Transferred Call is held by CALL HOLD and so on.
5. When the additional party answers the Held Call, whether to send Override Tone or not depends on the originating party's Service Feature Restriction Class.
6. The Conference Trunk (CFT) function is required for the Node which accommodates the originating party of the Three-Way Call within the FCCS Network.
7. Three-Way Calling can also be established when using the Trunk belonging to the Remote Node within the FCCS Network.

<The following conditions are applied for Desktop terminals only.>

1. The following LCD display patterns exist when a Three-Way Call is established on a Desktop terminal:

   - Pattern 1: Originating party is in conversation with the additional party before a Three-Way Call is established.

     a.) Originating party (Station A) is in conversation with the first party (Station B).
     b.) Station A performs switch hook flash. Additional party (Station C) is dialed. Conversation is established with Station C.
     c.) Station A presses CONF key. Station A/B/C displays "CONF" on its LCD.

   - Pattern 2: Originating party is in conversation with the first party before a Three-Way Call is established.

     a.) Originating party (Station A) is in conversation with the first party (Station B).
     b.) Station A performs switch hook flash. Additional party (Station C) is dialed. Conversation is established with Station C.
     c.) Station A presses TRANSFER key. Station C is placed on hold. Station A and Station B is in conversation.
     d.) Station A presses CONF key. Station A displays "CONF" on its LCD. Station B/C displays "CNF" on its LCD.

Interactions

1. A Station in an established Three-Way Call cannot perform switch hook flash to activate a feature. The flash disconnects the last party connected.
2. All Three-Way Calls are protected by privacy. No more than three ports can be bridged together at one time, unless PRIVACY RELEASE [P-18] is being used.
3. If a Three-Way Call includes two Trunks and the Station hangs up, the Trunks will be released, unless the Trunks are allowed TRUNK-TO-TRUNK CONNECTION [T-10] via the ARRC command, ARI D-RES.
4. SP Controlled SIP terminals do not support Three-Way Calling features using CFT or VS32 unless brought into the Three-way call by another station.

   SIP Handler Controlled SIP terminals support Three-Way Calling features using CFT or VS32 but they cannot receive Three-Way Calling Tones (Add-On Ticker) for Three-Way Calling features.
   SIP Handler Controlled SIP terminals do not support Three-Way Calling features which is established using the audio mixing function of the SIP Handler Controlled SIP terminals.

Programming

STEP 1: **ASYD**-SYS 2, Index 1, Bits 0 and 1. Consultation Hold allowed or denied. 00: Denied; 01: Originating and Terminating Calls allowed, Tandem Call Denied; 10: Only Terminating Calls Allowed; 11: All calls allowed.

SYS 2, Index 6, Bit 2. This Bit remains as data "0." CALL TRANSFER-ALL CALLS [C-11].

SYS 2, Index 6, Bit 3. Enable add-on ability. This Bit remains as data "0" to allow Three-Way Calling.

SYS 3, Index 2. Assign data 91H for Normal (N), Hooking (H) values.

STEP 2: **ASYDL**-Assign System Data

SYS 1, Index 830, Bit 5: This system data works in a different way, depending on following countries:

- When Bit 5 = 0

  Austria
  : Three-Way Calling Tone (Add-On Ticker) is sent at a cycle of four seconds.
  EMEA except for Austria
  : Three-Way Calling Tone (Add-On Ticker) is sent at a cycle of 32 seconds.
  North America and Australia
  : Three-Way Calling Tone is not sent.

- When Bit 5 = 1

  Three-Way Calling Tone (Add-On Ticker) is sent only once when Three-Way Calling is established.

SYS 1, Index 811, Bits 0-7: Specify the country code for IP terminal Tone. For more information about the country code, refer to Command Manual.

STEP 3: **ATRK**-Assign LENS as Route 909, Digital Conference Trunk. The LENS consists of the following:

XX	X	XX	X
Module Group	Unit	Group	Level

Group and Level numbers for the Digital Conference Trunk-210, 213, 216, 221, 224, 227, 232, 235.

STEP 4: **MBTK**-Make idle the Digital Conference Trunk

STEP 5: **ARRC**-Allow trunk-to-trunk connection between any two routes that may be used in Three-Way Calling. Assign these routes for ARI A-RES: This Connection is for a Station and two Trunks ARI D-RES. If the originating party hangs up, the remaining two parties will stay connected.

IC RT: Incoming External Route Number

OG RT: Outgoing External Route Number

ARI A-RES = 1: Alternate routing is Allowed

ARI D-RES = 1: Alternate routing is Allowed

STEP 6: **ARSC**-The Route Restriction Class must be created to allow the Station access to the involved routes.

STEP 7: **ASFC**-When Consultation Hold Enhancement is used, assign each Station Service Feature Restriction Class (SFC) that allows SFI 138 (Consultation Hold Enhancement) and SFI 140 [Send Warning Tone (Three-Way Calling)].

<**For Desktop terminals**>

STEP 8: **AKYD**-Assign a Feature key that provides CAS SHF on the Desktop terminal.
KYI: 1
FKY: 17

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node. **Note 1**

STEP 1: **ALRTN**-Assign this command to connect the Logical Route to the Physical Route.

STEP 2: **ARRCN**-Allow for Trunk-to-Trunk Connections between any two routes that may be used in Three-Way Calling. Assign these routes for ARI A-RES: This Connection is for a Station and two Trunks ARI D-RES. If the originating party hangs up, the remaining two parties will stay connected.

STEP 3: **ARSCN**-The Route Restriction Class must be constructed to allow the Station access to the involved routes.

Note 1: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

T-3 TIE Line Access

General Description

This feature allows any Station user dial access to a TIE Line.

Operating Procedure

1. Lift the handset. Receive Dial Tone.
2. Dial the TIE LINE ACCESS Code. Receive Dial Tone from the distant System.
3. Dial the desired extension number.

Service Conditions

1. TIE LINE ACCESS may be denied to individual Stations via CLASS OF SERVICE-INDIVIDUAL [C-15].
2. The System is equipped with either automatic or dial-repeating TIE Trunks.
3. When a power failure occurs at the local System (without reserve power backup), all TIE Trunk Connections are lost.
4. Each TIE Line Group can be programmed for DP or DTMF address signaling Incoming and/or Outgoing.
5. TOLL DENIAL [T-6]: The Calling Station user is routed to Reorder Tone if an attempt is made to dial-access a call.
6. The System can be equipped with Senderized TIE Trunks. Immediate start, delay, or wink start signaling is available.
7. When a Trunk Group Access Code is dialed by a user, the TIE Trunk Group is used to index a Trunk Group restriction table to determine if the call attempt is allowed. For each outgoing Trunk Group, the following restriction options can be assigned per RSC:
   a.) Indicates the TIE Trunk is not allowed access to the Trunk Group dialed.
   b.) Indicates the TIE Trunk is allowed access (unrestricted).
   c.) Indicates the Station is allowed access but is restricted from making 0/1 toll calls or is Code (three-digit, six-digit) restricted.
8. Two Outgoing Trunk Group restriction tables are provided per system. The Direct Dial Access table is indexed when a Station user dials the Trunk Group Access Code and the ATTENDANT CONSOLE [A-3] table is indexed on Attendant completed calls. The restriction options per RSC can differ per table, allowing Attendant completion of Outgoing Calls for restricted Stations.
9. DTMF cannot be received on an Incoming TIE Line Call when the Signal Interface for Incoming Route Data is set for Immediate Start.

Interactions

1. For Senderized TIE Lines, see UNIVERSAL SENDER [U-3]. The ANND command must be programmed for Senderized TIE Lines (normally for 4(OGC)).
2. If other services, such as STATION MESSAGE DETAIL RECORDING (SMDR) [S-10] and LEAST-COST ROUTING-3/6 DIGIT [L-5] are to be used in conjunction with this feature, the AMND command must be programmed. Go to the ASTP and AOSP command, if digit translation is required.
3. MISCELLANEOUS TRUNK RESTRICTION [M-3]: Restrictions to TIE Trunks are determined by the Route Service Class (RSC) assigned to the Station.

Programming

STEP 1: **ARTD** - Assign the TIE Line routes as shown below:

BOTHWAY LINES:

RT: 1

1-OSGS	:2/7	2-ONSG	:3	3-ISGS	:2/7	4-INSG	:3	5-TF	:3
6-TCL	:4	7-L/T	:1	8-RLP	:2	13-AC	:1	15-LSG	:5
28-ANS	:1	30-PAD	:7						

Note: To change the data for existing route (RT), initialize the circuit card.

STEP 2: **ATRK** - Assign the LENS, TIE Line Route Number, Trunk Number, and Tenant Number.

STEP 3: **MBTK** - Assign the Make Idle status to the TIE Line Trunks.

STEP 4: **ANPD** - Assign a Number Level for Trunk Access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. Number of Necessary Digits is usually one or two. Busy Lamp Field is not activated.

STEP 5: **ASPA** - Assign the Access Code as assigned in ANPD above. Assign Connection Indexes, CI = "N* Normal" or "H: Hooking". Type of Service, SRV = "OGC: Outgoing Call" for Outgoing Trunk. Assign the Route Number associated with this Access Code.

STEP 6: **ARSC** - The Route Restriction Class must be constructed to allow the Station access to the involved routes.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

STEP 1: **ARTDN** - Assign the TIE Line routes as shown below:

BOTHWAY LINES:

RT: 1

1-OSGS	:2/7	2-ONSG	:3	3-ISGS	:2/7	4-INSG	:3	5-TF	:3
6-TCL	:4	7-L/T	:1	8-RLP	:2	13-AC	:1	15-LSG	:5
28-ANS	:1	30-PAD	:7						

STEP 2: **ANPDL** - Assign a Number Level for Trunk Access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes.Number of Necessary Digits is usually one or two. Busy Lamp Field is not activated.

STEP 3: **ASPAL** - Assign the Access Code as assigned in ANPD above. Assign Connection Indexes, CI = "N* Normal" or "H: Hooking". Type of Service, SRV = "OGC: Outgoing Call" for Outgoing Trunk. Assign the Route Number associated with this Access Code.

STEP 4: **ARSCN** - The Route Restriction Class must be constructed to allow the Station access to the involved routes.

T-5 TIE Line Connection With Pad Control

General Description

This feature provides a switchable transmission pad on TIE Trunks that allows Tandem Connections. Necessary pad control is activated to protect against echo.

Note: For PAD value settings toward IP equipment, see the PAD/EC Control IP/PHC Support section in Chapter 2 of this manual.

Operating Procedure

No manual operation is required.

Service Conditions

1. Pad Control (2dB) will automatically be switched in for the following Connections:
   a.) TIE Line-to-Station
   b.) Station-to-TIE Trunk/CCSA
   c.) CCSA-to-Station
   d.) TIE Line-to-Attendant
   e.) CCSA-to-Attendant
   f.) Attendant-to-TIE Trunk/CCSA
2. Pad Control (2dB) will not be switched in for the following Connections:
   a.) TIE Line-to-Central Office Trunk/TIE/CCSA
   b.) CCSA-to-Central Office Trunk/TIE/CCSA
   c.) Central Office Trunk-to-TIE/CCSA
   d.) THREE-WAY CALLING [T-2] used in conjunction with TRUNK-TO-TRUNK CONNECTION [T-10]
3. The 4W E&M Trunk/DTI [D-16] provides PAD CONTROL (0,2,4,8,12,16dB) so that the desired transmitting and receiving Levels can be maintained, providing the overall Tandem system with transparency.

Interactions

1. If volume on the DTI is too loud, assign CDN 30:Pad (ARTD) as data “2”.
2. The TLT card provides four Two-wire DID, CCSA, and TIE Line Circuit Access. These circuits may be set for Loop or E&M signaling depending on the specific card. The card contains switchable transmission pads that are switched in or out via software command.
3. The TLT card provides four 4-wire TIE Line Circuits. These circuits may be set for E&M signaling. The card contains switchable transmission pads that are switched in or out via software.

Programming

STEP 1: **ARTD** - Assign the TIE Line routes as shown below:

BOTHWAY LINES:

RT: 1

1-OSGS	:2	2-ONSG	:3	3-ISGS	:2	4-INSG	:3	5-TF	:3
6-TCL	:4	7-L/T	:1	8-RLP	:2	15-LSG	:5		

Pad control is programmed in CDN 30:Pad. For DTI circuit cards, assign data "7", otherwise assign data "0".

Note: To change the data for existing route (RT), initialize the circuit card.

STEP 2: **APAD** - Assign the Pad data required for the Tandem Connection. Assign the following:

KIND: Kind of Connection
T: Tandem Connection
ICRT: Incoming Route Number
OGRT: Outgoing Route Number
SFC: Service Feature Restriction Class ⟶ [Not Used]
IC PAD: Incoming PAD Data (1-15)
OG PAD: Outgoing PAD Data (1-15)
RT: Route Number ⟶ [Not Used]

PAD DATA: See PAD DATA configuration for each card in the Circuit Card Description manual.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

STEP 1: **ARTDN** - Assign the TIE Line routes as shown below:

BOTHWAY LINES:

RT: 1

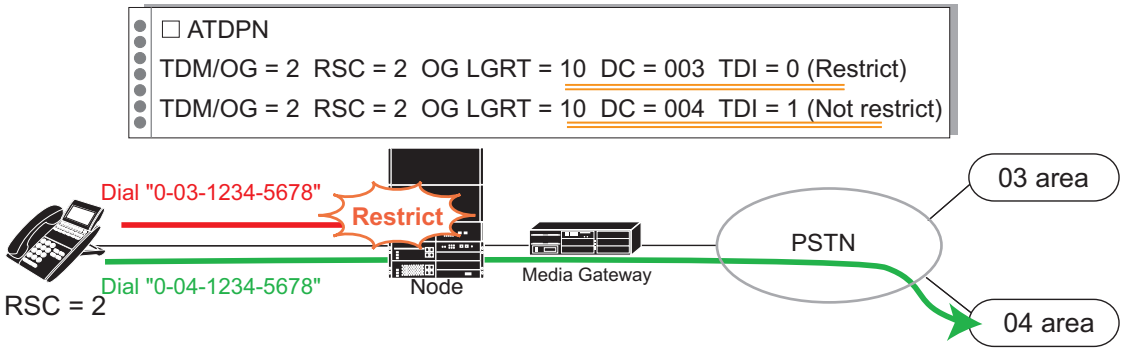
1-OSGS	:2	2-ONSG	:3	3-ISGS	:2	4-INSG	:3	5-TF	:3
6-TCL	:4	7-L/T	:1	8-RLP	:2	15-LSG	:5		

Pad control is programmed in CDN 30:Pad. For DTI circuit cards, assign data "7", otherwise assign data "0".

STEP 2: **APADN** - Assign the Pad data required for the Tandem Connection. Assign the following:

KIND: Kind of Connection
T: Tandem Connection
ICRT: Incoming Route Number
OGRT: Outgoing Route Number
SFC: Service Feature Restriction Class ⟶ [Not Used]
IC PAD: Incoming PAD Data (1-15)
OG PAD: Outgoing PAD Data (1-15)
RT: Route Number ⟶ [Not Used]

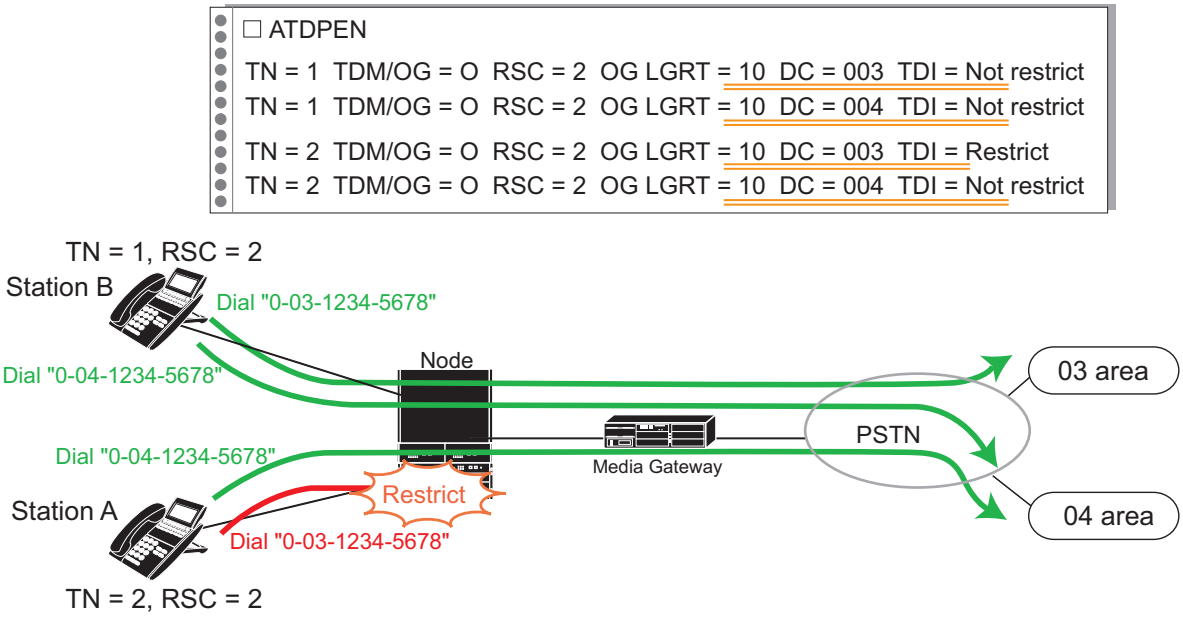
PAD DATA: See PAD DATA configuration for each card in the Circuit Card Description manual.



T-6 Toll Denial/Toll Diversion

General Description

This feature prohibits Station users from placing Long Distance Calls over a specific group of Trunks. Restricted calls are routed to either an ATTENDANT CONSOLE [A-3] (diversion) or to an intercept tone (denial).
Toll calls can be restricted on the basis of Tenant Number (TN) of originating station/incoming trunk by ATDPEL/ATDPEN command, combining the Route Restriction Class (RSC) setting. See the examples below:



<e.g.1> Toll call restriction by RSC (with ATDP/ATDPL/ATDPN command)

When restricting outside calls to 03 area from the Station with RSC = 2:

<e.g.2> Toll call restriction by RSC for each TN (with ATDPEL/ATDPEN command)

When restricting outside calls to 03 area from the station with RSC = 2 and TN = 2 (Station A):

When the stations with the same Route Restriction Class (RSC = 2 is set to both Station A and Station B) dial the same destination, Station B (TN = 1) can originate outside calls to 03 area while Station A (TN = 2) is restricted.

Operating Procedure

No manual operation is required after this feature is programmed into office data.

Service Conditions

1. TOLL DENIAL/TOLL DIVERSION is the industry-standard 0/1 type.
2. Immediately after dialing any Area Code with a second digit of "0" or "1", the user is restricted.
3. Restriction may be programmed to give the Station user a busy signal or to divert the user to the Attendant Console.
4. This feature may be applied to all types of Trunks (DDD, FX, WATS), provided the same restrictions apply to all Trunks of the same type.
5. This feature is applied to individual Stations on a route-restriction basis.
6. The 0/1 Toll Denial and Toll Diversion feature cannot be used together for the same Tenant.
7. The 0/1 Toll Denial and Toll Diversion feature is assigned on a per line (RSC) Class of Service and/or per-Incoming TIE Trunk Group basis. The feature, when provided, is applicable on a per Trunk Group basis.

Conditions for Tenant Number (TN) based TOLL DENIAL/TOLL DIVERSION

1. TOLL DENIAL/TOLL DIVERSION is applied to individual stations by the setting of Tenant Number (TN), Route Restriction Class (RSC), and outgoing trunk.
2. When toll call from station is restricted by Route Restriction Class (RSC),
   - Toll call restriction can be released on the basis of Tenant Number (TN) and Destination Code (DC) by using ATDPEL/ATDPEN command.
   - Toll call by Speed Dialing is restricted/allowed by Service Feature Restriction Class (SFC).
3. Toll call in tandem connection is restricted on the basis of Tenant Number (TN) and Destination Code (DC) by using ATDPEL/ATDPEN command.
4. This feature supports the outgoing calls of LCR/LCRS. Therefore, toll call from the restricted station is denied after dialing all the digits.
5. Toll call from Sub Line is restricted by the TN of My Line.
6. The ACD and Hotel systems do not support this feature.
7. The OAI system supports this feature only for station-to-outgoing-trunk calls. To configure the OAI system to restrict specific outgoing calls (**Note 1**), use the ARSC and ATDP commands (or ARSCN and ATDPL/ADTPN). For details, see "SCF Restriction" in Data Programming Manual - OAI.

   Note 1: The ARRC/ARRCN or ATDPEL/ATDPEN command cannot be used for this purpose.

8. Toll call from visitor PS (roaming in other node) is restricted by the TN and RSC assigned for visitor PS number on the visitor node.
9. Be sure to assign a same value to TN and UGN when Dial Plan to Support IP Centrex Functionality [D-166] is used.
10. ATDPEL/ATDPEN command does not support Toll Restriction - 3/6-Digit [T-7] and operator call to outside.

11. The following commands work in the priority order below:

ATDPEL/ATDPEN	1	high
ATDPN	2	↑
ATDPL	3	
ATDP	4	low

12. When toll call is restricted to each tenant of originating station/incoming trunk, use ATDPEL command for the nodes without FPC setting, and use ATDPEN command for the nodes with FPC setting.
13. When a trunk call is manually transferred from a station to an outside party using trunk tandem connection, parameters used to implement a routing restriction policy depend on the System Data (ASYDL/ASYDN, SYS1, Index 1393, Bit 5).

Note: The System Data (ASYDL/ASYDN, SYS1, Index 1393, Bit 5) is available since FP95-113 V3.

Interactions

1. TOLL DENIAL/DIVERSION is applicable only to RES 2 when assigning routes via Route Restriction Index (RRI) 3.
2. LEAST-COST ROUTING-3/6 DIGIT [L-5]: For LCR(S) applications, allow the LCR Flag Route. The route chosen via AOPR will then be governed by the RSC of the Station. If the Station is toll-restricted from the route, TOLL DENIAL/DIVERSION will be applied.
3. TOLL DENIAL and TOLL DIVERSION cannot be used simultaneously in the same Tenant.
4. ROUTE ADVANCE [R-6]: Station A dials a Toll Call by accessing route 1. Route 1 is busy and advances to route 2. Station A is restricted from making this call on route 2.
5. PASSING DIAL TONE [P-2]: The Attendant Console cannot use the PASSING DIAL TONE [P-2] feature to allow a toll restricted Station to dial a restricted number.
6. In System Data 1, Index 135, a seizure guard timer exists to protect the system from individuals who attempt to defeat TOLL RESTRICTION/TOLL DIVERSION with rapid dialing. Leave as data “00” for a default value of one second (RAM Data is 1FH).
7. A Station uses the OGC direct dial access to a route. The Station is restricted via RES 0: Connection Restricted. The Station receives Reorder Tone.
8. This feature is not available for the Attendant Console.

Programming

STEP 1: **ASYD** - System Data 1, Index 75. Should the following commands be developed for Day/Night: 0/1: No/Yes. See DAY/NIGHT CLASS OF SERVICE [D-15] for details.

Bit 0- Develop ARSC/ARSCN command for Day/Night?

Bit 3- Develop ATDP/ATDPL/ATDPN command for Day/Night?

System Data 2, Index 1, Bits 4 and 5. If TOLL DENIAL is required, assign these Bits as data “00”. If TOLL DIVERSION is required, assign these Bits as “01”. Calls are then diverted to the Attendant Console. Assigned on a per Tenant basis.

STEP 2: **ARSC** - Assign Route Restriction Classes. When these are assigned to Stations, classes will determine whether or not a Station will be allowed access to a specific route or specific dialing sequence. See TOLL RESTRICTION-3/6 DIGIT [T-7]. Assign the following:

DAY/NIGHT: Day/Night Mode

D: Day Mode
N: Night Mode

TN: Tenant Number
RT: Route Number
RSC: Route Restriction Class
RRI: Route Restriction Index
0: IC Restriction via Attendant Console (DDD, etc.)
1: IC Restriction Direct Connection (DID, etc.)
2: OG Restriction via Attendant Console
3: OG Restriction Direct Connection (DDD, etc.)

RES: Restriction Data
0: Connection is Restricted
1: Connection is Allowed
2: Connection is Toll Restricted (See TOLL RESTRICTION-3/6-DIGIT [T-7])

STEP 3: **ASDT** - When assigning the data to specific Stations, assign the correct RSC to each Station.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ALRTN** - Assign this command to connect the Logical Route to the Physical Route.

STEP 2: **ASYDL** - Index 640, assign FPC of the Attendant Console for Toll Diversion

STEP 3: **ARSCN** - Assign Route Restriction Classes. When these are assigned to Stations, classes will determine whether or not a Station will be allowed access to a specific route or specific dialing sequence. See TOLL RESTRICTION-3/6 DIGIT [T-7]. Assign the following:

DAY/NIGHT: Day/Night Mode
D: Day Mode
N: Night Mode

TN: Tenant Number
RT: Route Number
RSC: Route Restriction Class
RRI: Route Restriction Index
0: IC Restriction via Attendant Console (DDD, etc.)
1: IC Restriction Direct Connection (DID, etc.)
2: OG Restriction via Attendant Console
3: OG Restriction Direct Connection (DDD, etc.)

RES: Restriction Data
0: Connection is Restricted
1: Connection is Allowed
2: Connection is Toll Restricted (See TOLL RESTRICTION-3/6-DIGIT [T-7])

<Programming for Tenant based TOLL DENIAL/TOLL DIVERSION>

STEP 1: **ASYD** - System Data 2

Index 1 b4 and b5: Connection pattern for Toll Restriction
b5 = 0, b4 = 0: TOLL DENIAL (Reorder Tone connection)
b5 = 0, b4 = 1: TOLL DIVERSION (Terminated to Attendant Console)
b6: Speed Calling overrides Toll Restriction (on SFC base).
0/1 = Out of service/In service **Note 2**

Note 2: When this system data is assigned to 1 = In service, stations with TOLL DENIAL/TOLL DIVERSION can originate toll calls using Speed Calling assigned by AABD command.

STEP 2: **ASYDL/ASYDN** - System Data 1

Index 802 b1: Tenant data table development for ATDPEL/ATDPEN. 0/1 = Tenant base/Common **Note 3**, **Note 4**

Index 1393 b5: Tandem connection control for manual trunk-to-trunk call transfer via station **Note 5**
0 = Control based on ARI A-RES, RRI = 3 and ARI D-RES
- For manual call transfer to another trunk:
Restriction Data for Alternative Route Index (ARI A-RES) of the ARRC/ARRCN command and Route Restriction Index 3 (RRI = 3) of the ARSC/ARSCN command
- For drop of the transferring party from the call:
Restriction Data for Alternative Route Index (ARI D-RES) of the ARRC/ARRCN command

1 = Control based on ARI A-RES
- For manual call transfer to another trunk:
Restriction Data for Alternative Route Index (ARI A-RES) of the ARRC/ARRCN command
- For drop of the transferring party from the call:
Restriction Data for Alternative Route Index (ARI A-RES) of the ARRC/ARRCN command

b6: Tandem connection for manual trunk-to-trunk call transfer when the ARI A-RES parameter of the ARRCN command is set to 2 (Toll Restriction is required) in the following cases: **Note 5**
- ASYDL/ASYDN, SYS1, Index 1393, b5 = 0
- Manual trunk-to-trunk call transfer via an attendant

0/1 = Allowed/Restricted

Note 3: When assigning toll call restriction data by ATDPEN command, be sure to assign the same data on Network Control Node (NCN) and Local Node (LN).

Note 4: When ASYDL/ASYDN, SYS1, Index 802, Bit 1 = 1 (Tenant data table is common) is assigned, TN = 1 is always applied in ATDPEL/ATDPEN command even when other Tenant is selected.

Note 5: Available since FP95-113 V3.

STEP 3: **ASYDL** - System Data 1

Index 1121 b0: Day/Night data table for ATDPEL/ATDPEN.
0/1 = Common/Separate **Note 6**, **Note 7**
b1: Day/Night data table for ATDPEL/ATDPEN in tandem connection.
0/1 = Common/Separate **Note 6**, **Note 7**

Note 6: When assigning toll call restriction data by ATDPEN command, be sure to assign the same data on Network Control Node (NCN) and Local Node (LN).

Note 7: When Day/Night data table is assigned to 0 = Common, D/N = D (Day) is always applied in ATDPEL/ATDPEN command even when N (Night) is selected.

STEP 4: **ASYDN** - System Data 1

Index 800 b6: Tenant data table for ARSCN command in NDM.
0/1 = Tenant base/Common

STEP 5: **AMND/AMNDL/AMNDN** - Maximum Necessary Digits Data. Assign MND to Destination Code. **Assign on each node.*

TN: Tenant Number
DC: Destination Code (= Access Code + Area/Office Code)
MND: Maximum Necessary Digits to DC
TOLL: Local Code/Toll Code
AN: Out of service/Account Number
RATE: 0 (fixed)
A/D: Type of destination party: Analog/Digital

STEP 6: **ARSC/ARSCN** - Route Restriction Class Data. Whether to restrict toll call is determined for RSC and TN of station.

DAY/NIGHT: D/N = Day Mode/Night Mode
TN: Tenant Number
RT: Route Number
RSC: Route Restriction Class
RRI: Route Restriction Index
0: IC Restriction via Attendant Console (DDD, etc.)
1: IC Restriction Direct Connection (DID, etc.)
2: OG Restriction via Attendant Console
3: OG Restriction Direct Connection (DDD, etc.)
RES: Restriction Data
0: Connection is restricted
1: Connection is allowed
2: Toll connection is restricted **Note 8**

Note 8: When RES = 2 is assigned, toll calls from the stations with the specified RSC are restricted.

STEP 7: **ARRC/ARRCN** - Alternative Route Restriction. Assign toll call restriction data between incoming route and outgoing route. **Assign to configure tandem connection.*

Note: In the ARRCN command, use "IC LGRT" and "OG LGRT" in place of "IC RT" and "OG RT" respectively.

IC RT / IC LGRT: External route number of incoming route
OG RT / OG LGRT: External route number of outgoing route
ARI A-RES: 2 = Toll Restriction is required **Note 9**, **Note 10**
ARI D-RES: 2 = Toll Restriction is required **Note 11**

Note 9: This option of the ARI A-RES parameter is only available in the ARRCN command. Select the option when the System Data (ASYDL/ASYDN, SYS1, Index 1393, Bit 5) is set to 1.

Note 10: This option is available since FP95-113 V3.

Note 11: Even when ARI D-RES = 2 is assigned, toll call in tandem connection is not restricted unless restriction data is assigned by ATDPEL/ATDPEN command.

STEP 8: **ATDPEL/ATDPEN** - Expanded Toll Call Restriction data. Toll call is to be restricted/allowed depending on Destination Code and Tenant Number.

TN: Tenant Number of originating station/incoming trunk [1-63]
TDM/OG: TDM = Tandem Connection **Note 12**, **Note 13**
OG = Outgoing Connection **Note 14**
D/N: Day Mode/Night Mode
RSC: Route Restriction Class of originating station [1-15] **Required when OG is selected.*
IC RT/LGRT: Incoming Route Number [1-255/1-899] **Required when TDM is selected.* **Note 15**
OG RT/LGRT: Outgoing Route Number [1-255/1-899] **Note 15**
DC: Destination Code [Maximum 24 digits] **Note 16**
TDI: Restriction Data [Connection is restricted/allowed] **Select either of the radio button.*

Note 12: To make Tandem Connection effective, assign the alternative route restriction to ARI D-RES = 2 (Toll Connection is restricted) by ARRC command.

Note 13: When TDM (Tandem Connection) is selected, D/N mode cannot be separately assigned. Irrespective of D/N mode setting, restriction data for tandem connection is registered as common data.

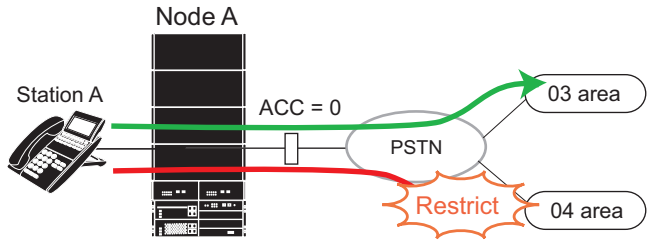
Note 14: To make OG (Outgoing Connection) effective, assign RES = 2 (Toll Connection is restricted) by ARSC command.

Note 15: Assign IC LGRT and OG LGRT when ATDPEN command is used. Use ATDPEL command for the nodes without FPC setting, and use ATDPEN command for the nodes with FPC setting.

Note 16: When toll call is to be restricted in the node where all digits are sent out for LCR/LCRS dialing, in DC parameter of ATDPEL/ATDPEN command, add the ACC of ARNP command before the sending digits (the ACC corresponds to the NND of ANPD). Be sure to assign equal or more digits of NND for the ACC by ARNP command.

STEP 9: **AABD** - Speed Calling Restriction Data. Release restriction of outgoing toll call origination by dialing Speed Calling on a SFC basis.

ADC: Abbreviated Digit Code of Speed Calling [Maximum 4 digits]



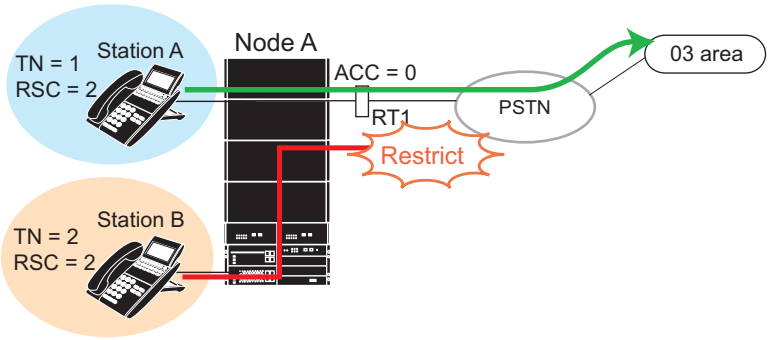
SFC: Service Feature Restriction Class [1-15]

RES: Restriction Data. 0/1 = Connection is restricted/allowed

<Data Programming examples>

a. TOLL DENIAL/TOLL DIVERSION to Outgoing Connection

The following example shows the data programming on Node A to allow Station A (RSC = 2) to originate a toll call only to 03 area:

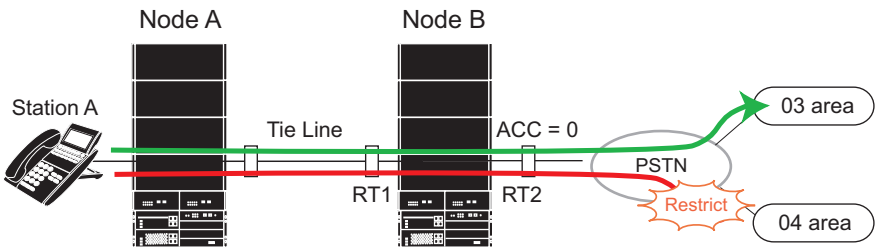


[Data assignment on Node A]

ANPD	1st = 0 NND = 1
ASPA	ACC = 0 SRV = "LCR: Least Cost Routing"
ARNP	RT = RT1 ACC = 0
ARSC	RT = RT1 RSC = 2 RES = 2: Toll connection is restricted
ATDP	TDM/OG = O: Outgoing Connection RSC = 2 OG RT = RT1 DC = 003: Reverse number of external route 0 + Area Code 03 TDI = 1: Connection is Allowed **Note:** Enter the information such as Destination Area Code (DC) about outgoing Toll connections that are allowed. Other outgoing Toll connections are restricted.

*When ATDPEL/ATDPEN is used

The following example shows the data programming on Node A to restrict toll calls from Station A (TN = 1, RSC = 2) to 03 area only and block all toll calls from Station B (TN = 2, RSC = 2):

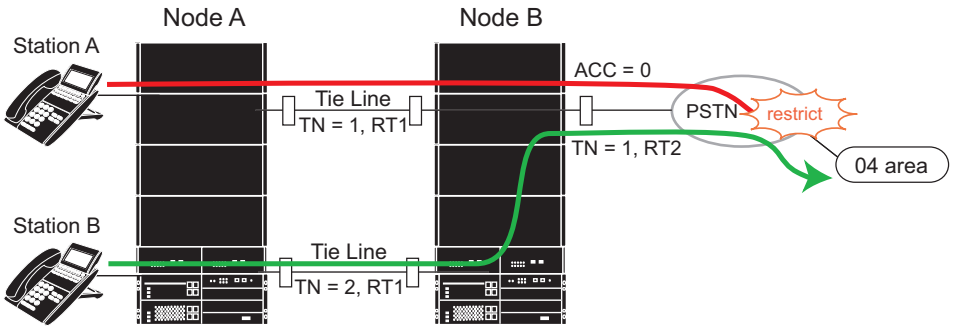


[Data assignment on Node A]

ATDPEL/ATDPEN	TN = 1: Tenant Number of originating trunk TDM/OG = OG: Outgoing Connection RSC = 2 OG LGRT = RT1 DC = 003: Reverse number of external route 0 + Area Code 03 TDI = Connection is Allowed **Note:** Enter the information such as Destination Area Code (DC) about outgoing Toll connections that are allowed. Other outgoing Toll connections are restricted.

b. TOLL DENIAL/TOLL DIVERSION on Intermediate Node in Tandem Connection

The following example shows the data programming on Node B (intermediate node in tandem connection) to prohibit Station A from placing toll calls to 04 area via a tie line. In this case, use the ATDP command to enter the information such as Destination Area Code (DC) about outgoing Toll connections that are restricted.

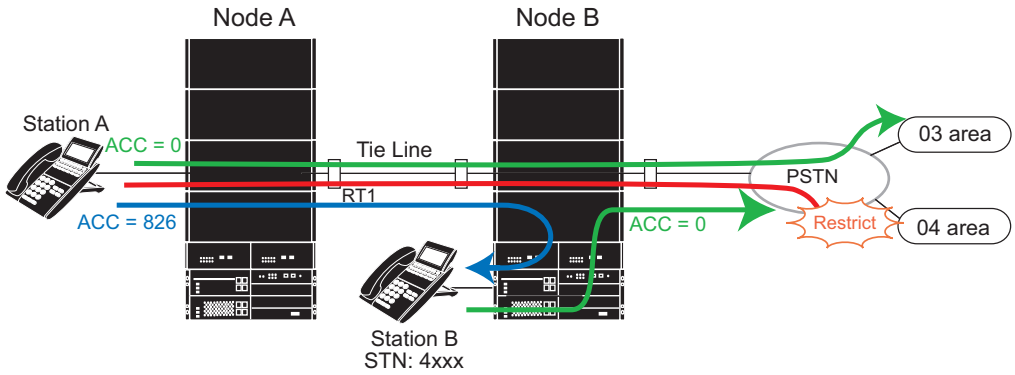


[Data assignment on Node B]

ANPD	1st = 0 NND = 1
ASPA	ACC = 0 SRV = "LCR: Least Cost Routing"
ARNP	RT = RT2 ACC = 0
ARRC	IC RT = RT1 OG RT = RT2 ARI D-RES = 2: Toll Restriction is required
ATDP	TDM/OG = T: Tandem Connection IC RT = RT1 OG RT = RT2 DC = 004: Reverse number of external route 0 + Area Code 04 TDI = 0: Connection is Restricted **Note:** Enter the information such as Destination Area Code (DC) about tandem Toll connections that are restricted. Other tandem Toll connections are allowed.

*When ATDPEL/ATDPEN is used

The following example shows the data programming on Node B (intermediate node in tandem connection) to block outgoing toll calls from Station A to 04 area via a tie line (TN = 1, RT = 1) only.



FROM/TO	DIALING NUMBER	TOLL CALL
From stations in Node A to 04 area via Node B using the trunk of TN = 1 and RT = RT1	0-04-xxxxxxxx	Restricted
From stations in Node A to 04 area via Node B using the trunk of TN = 2 and RT = RT1	0-04-xxxxxxxx	Allowed

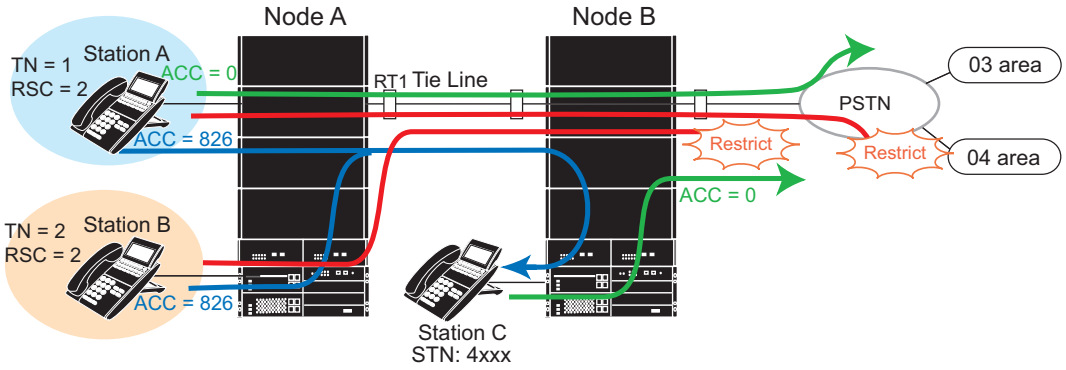
[Data assignment on Node B]

ATDPEL/ATDPEN	TN = 1: Tenant Number of incoming trunk TDM/OG = TDM: Tandem Connection IC LGRT = RT1 OG LGRT = RT2 DC = 004: Reverse number of external route 0 + Area Code 04 TDI = Connection is Restricted **Note:** Enter the information such as Destination Area Code (DC) about tandem Toll connections that are restricted. Other tandem Toll connections are allowed.

c. TOLL DENIAL/TOLL DIVERSION on Originating Node in Tandem Connection

The following example shows the data programming on Node A (originating node in tandem connection) to prohibit Station A from placing toll calls via a tie line, except to 03 area. In this case, use the ARSC command to enter restriction data for each Route Restriction Class and use the ATDP command to enter the information such as Destination Area Code (DC) about outgoing Toll connections that are allowed.

FROM/TO	DIALING NUMBER	CALL ORIGINATION
From stations in Node A to stations in Node B	826-4xxxx	Allowed
From stations in Node A to 03 area via Node B	0-03-xxxxxxxx	Allowed
From stations in Node A to 04 area via Node B	0-04-xxxxxxxx	Restricted
From stations in Node B to PSTN line	0 + toll code + xxxxxxxx	Allowed



[Data assignment on Node A]

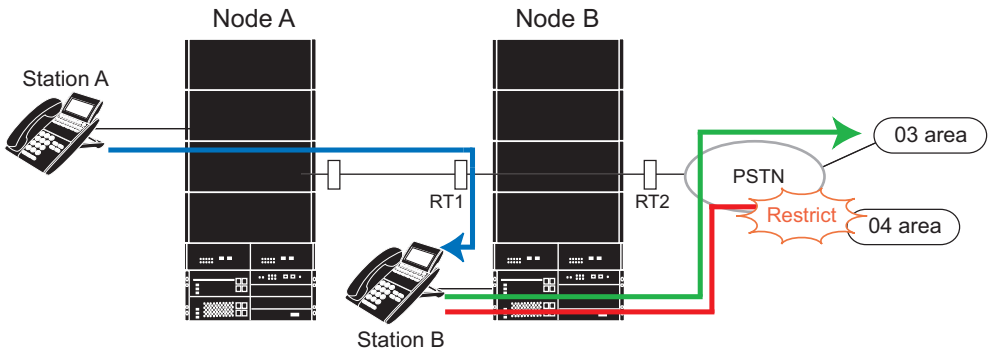
ANPD	1st = 8, NND = 3 1st = 0, NND = 1
ASPA	ACC = 826, SRV = "LCR: Least Cost Routing" ACC = 0, SRV = "LCR: Least Cost Routing"
AFRS	NPC = 826, OPR = 826 NPC = 0, OPR = 0
AOPR	OPR = 826, SKIP = 3 OPR = 0, SKIP = 0
ARNP	<To set ACC of C.O. line> RT = RT1, ACC = 0 <To set ACC of tie line> RT = RT1, ACC = 826

ARSC	RT = RT1 RSC = 2 RES = 2: Toll connection is restricted
ATDP	TDM/OG = O: Outgoing Connection RSC = 2 OG RT = RT1 <When ACC to C.O. line is set in ARNP> DC = 0003: Reverse Number 0+ ACC 0 + Area Code 03 <When ACC to tie line is set in ARNP> DC = 826003: Reverse Number 826 + ACC 0 + Area Code 03 **Underlined numbers are the digits to be sent.* TDI = 1: Connection is Allowed **Note:** Enter the information such as Destination Area Code (DC) about outgoing Toll connections that are allowed. Other outgoing Toll connections are restricted.

*When ATDPEL/ATDPEN is used

The following example shows the data programming on Node A (originating node in tandem connection) to block outgoing toll calls from stations in Node A via a tie line, except for toll calls from Station A (TN = 1, RSC = 2) via a tie line to 03 area.

FROM/TO	DIALING NUMBER	CALL ORIGINATION
From Station A (TN = 1, RSC = 2) in Node A to 03 area via Node B	0-03-xxxxxxxx	Allowed
From Station B (TN = 2, RSC = 2) in Node A to 03 area via Node B	0-03-xxxxxxxx	Restricted
From Stations in Node A to 04 area via Node B	0-04-xxxxxxxx	Restricted
From stations in Node A to stations in Node B	826-4xxxx	Allowed
From stations in Node B to PSTN line	0 + toll code + xxxxxxxx	Allowed



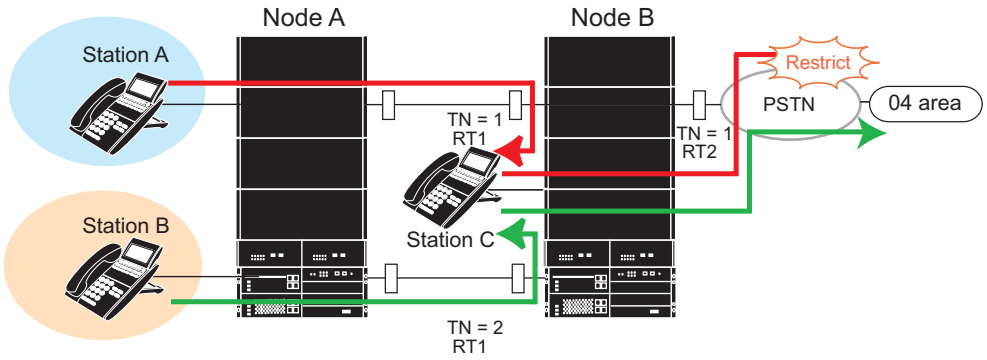
[Data assignment on Node A]

ATDPEL/ATDPEN	TN = 1 TDM/OG = OG: Outgoing Connection RSC = 2 OG LGRT = RT1 <When ACC to C.O. line is set in ARNP> DC = 0003: Reverse Number 0+ ACC 0 + Area Code 03 <When ACC to tie line is set in ARNP> DC = 826003: Reverse Number 826 + ACC 0 + Area Code 03 **Underlined numbers are the digits to be sent.* TDI = Connection is Allowed **Note:** Enter the information such as Destination Area Code (DC) about outgoing Toll connections that are allowed. Other outgoing Toll connections are restricted.

d. TOLL DENIAL/TOLL DIVERSION of Trunk to Trunk (Tandem) Connections via Attendant Console or Station

- When ASYDL/ASYDN, SYS1, Index 1393, Bit 5 = 0:
  Tandem connection control based on ARI A-RES, RRI = 3 and ARI D-RES for manual trunk-to-trunk call transfer via station

The following example shows the data programming on Node B (intermediate node in tandem connection) to prohibit Station B (RSC = 2) from transferring calls from Station A to 04 area. In this case, use the ATDP command to enter the information such as Destination Area Code (DC) about outgoing Toll connections that are allowed.

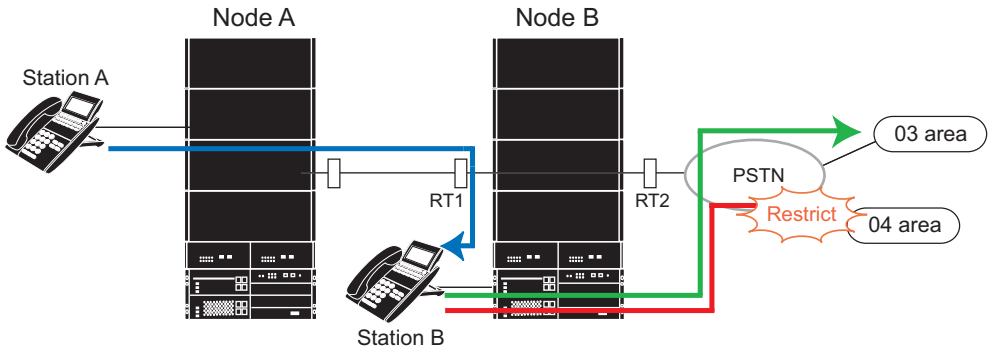


[Data assignment on Node B]

ASYDL/ASYDN	SYS 1, Index 1393, Bit 5 = 0
ANPD	1st = 0 NND = 1
ASPA	ACC = 0 SRV = "LCR: Least Cost Routing"
ARNP	RT = RT2 ACC = 0
ARSC	RT = RT2 RSC = 2 RES = 1: Toll connection is allowed
ARRC	IC RT = RT1 OG RT = RT2 ARI A-RES = 1: Alternate routing is Allowed ARI D-RES = 1: Alternate routing is Allowed
ATDP	TDM/OG = O: Outgoing Connection RSC = 2 OG RT = RT1 DC = 003: Reverse number of external route 0 + Area Code 03 TDI = 1: Connection is Allowed **Note:** Enter the information such as Destination Area Code (DC) about outgoing Toll connections that are allowed. Other outgoing Toll connections are restricted.

*When ATDPEL/ATDPEN is used

The following example shows the data programming on Node B (intermediate node in tandem connection) to prohibit Station C (RSC = 2) from transferring calls from Station A via Tenant 1 (TN = 1) of Route 1 (RT = 1) to 04 area, while allowing Station C to transfer calls from Station B via Tenant 2 (TN = 2) of Route 1 (RT = 1) to the area.



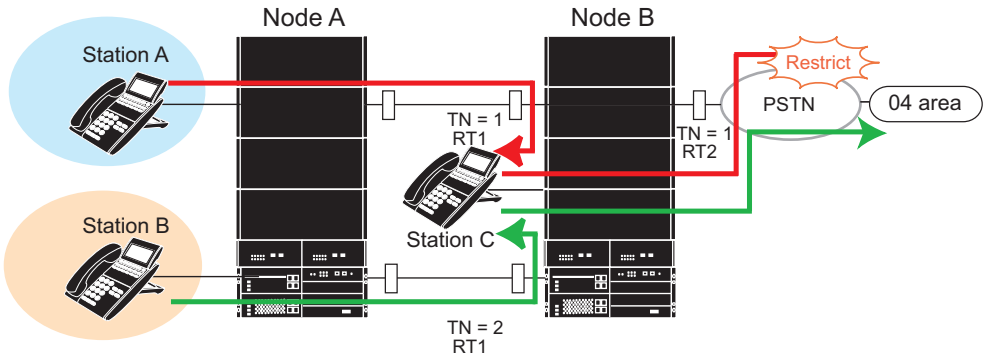
FROM/TO	DIALING NUMBER	TOLL CALL
From stations in Node A to 04 area via Node B using the trunk of TN = 1 and RT = RT1	0-04-xxxxxxxx	Restricted
From stations in Node A to 04 area via Node B using the trunk of TN = 2 and RT = RT1	0-04-xxxxxxxx	Allowed

[Data assignment on Node B]

ASYDL/ASYDN	SYS 1, Index 1393, Bit 5 = 0
ATDPEL/ATDPEN	TN = 1: Tenant Number of incoming trunk TDM/OG = OG: Outgoing Connection RSC = 2 OG LGRT = RT2 DC = 004: Reverse number of external route 0 + Area Code 04 TDI = Connection is Allowed **Note:** Enter the information such as Destination Area Code (DC) about tandem Toll connections that are allowed. Other tandem Toll connections are restricted.

- When ASYDL/ASYDN, SYS1, Index 1393, Bit 5 = 1: **Note 17**
  Tandem connection control based on ARI A-RES for manual trunk-to-trunk call transfer via station

The following example shows the data programming on Node B (intermediate node in tandem connection) to prohibit Station B from transferring calls from Station A to 04 area. In this case, use the ATDP command to enter the information such as Destination Area Code (DC) about outgoing Toll connections that are restricted.



[Data assignment on Node B]

ASYDL/ASYDN	SYS 1, Index 1393, Bit 5 = 1
ANPD	1st = 0 NND = 1
ASPA	ACC = 0 SRV = "LCR: Least Cost Routing"
ARNP	RT = RT2 ACC = 0
ARRCN	IC LGRT = RT1 OG LGRT = RT2 ARI A-RES = 2: Toll Restriction is required.
ATDP	TDM/OG = T: Tandem Connection IC RT = RT1 OG RT = RT2 DC = 004: Reverse number of external route 0 + Area Code 04 TDI = 0: Connection is Restricted **Note:** Enter the information such as Destination Area Code (DC) about outgoing Toll connections that are restricted. Other outgoing Toll connections are allowed.

Note 17: Available since FP95-113 V3.

*When ATDPEL/ATDPEN is used

The following example shows the data programming on Node B (intermediate node in tandem connection) to prohibit Station C from transferring calls from Station A via Tenant 1 (TN = 1) of Route 1 (RT = 1) to 04 area, while allowing Station C to transfer calls from Station B via Tenant 2 (TN = 2) of Route 1 (RT = 1) to the area.

FROM/TO	DIALING NUMBER	TOLL CALL
From stations in Node A to 04 area via Node B using the trunk of TN = 1 and RT = RT1	0-04-xxxxxxxx	Restricted
From stations in Node A to 04 area via Node B using the trunk of TN = 2 and RT = RT1	0-04-xxxxxxxx	Allowed

[Data assignment on Node B]

ASYDL/ASYDN	SYS 1, Index 1393, Bit 5 = 1
ATDPEL/ATDPEN	TN = 1: Tenant Number of incoming trunk TDM/OG = TDM: Tandem Connection IC LGRT = RT1 OG LGRT = RT2 DC = 004: Reverse number of external route 0 + Area Code 04 TDI = Connection is Restricted **Note:** Enter the information such as Destination Area Code (DC) about tandem Toll connections that are restricted. Other tandem Toll connections are allowed.

T-7 Toll Restriction - 3/6-Digit

General Description

This feature allows the System to be programmed to restrict Outgoing Calls according to specific area and/or central office codes. This restriction is controlled on the basis of a three-digit Area Code or a six-digit combination area and Office Code Numbering Plan.

Operating Procedure

No manual operation is required.

Service Conditions

1. The programmed restriction pattern may consist of either codes to be allowed or codes that are to be denied.
2. This feature is assigned on a CLASS OF SERVICE-INDIVIDUAL [C-15] basis.
3. When a Toll Call is denied, Reorder Tone will be returned to the Calling Party. If desired, the Calling Party can be routed to the Attendant Console. See TOLL DENIAL/TOLL DIVERSION [T-6] for further details.
4. The Outgoing Call using a Trunk in the Remote Node via FCCS link is available. Therefore, Route Restriction class data must be identical in the FCCS Network. For more detailed information, see the Data Programming Manual - FCCS.

Interactions

1. When Toll Restriction is specified in ARRC, all the possible dialing-patterns must be assigned in ATDP. If office codes within an Area Code do not need to be restricted, allow the Area Code only. Always provide the system with the most economical configuration of digits when constructing TOLL RESTRICTION tables.
2. In the ARRC command, ARI-A-RES must be programmed to allow two Trunks and a Station in a Conference. ARI-D-RES is programmed if the two Trunks are to remain connected after the Station drops off, or if TOLL RESTRICTION applies to a direct Trunk-to-Trunk Connection, such as TIE Line to DDD.
3. ROUTE ADVANCE [R-6]: Station A dials a Toll Call by accessing route 1. Route 1 is busy and advances to route 2. Station A is restricted from making this call on route 2. The call will be restricted.
4. PASSING DIAL TONE [P-2]: The Attendant cannot use PASSING DIAL TONE [P-2] to allow a toll-restricted Station from using a restricted route.
5. OUTGOING TRUNK QUEUING [O-2]: When a Station is restricted from all other routes, a Station user may queue a Trunk to complete a call over unrestricted routes.
6. LEAST-COST ROUTING-3/6-DIGIT [L-5]: Translations in AFRS must be such that the digits dialed in the Trunk-to-Trunk Connection would be recognizable in terms of choosing a route. If a route cannot be chosen, TOLL RESTRICTION 3/6 DIGIT cannot be applied.
7. When using the FCCS Network, the Outgoing Call using a Trunk in the Remote Node is available. Therefore, Route Restriction class data must be identical in the FCCS Network. For more detailed information, see the Data Programming Manual - FCCS.

Programming

N + Dialing				
Call Type	**Digits Dialed**	**Digits Needed**	**MND**	**Toll**
Local Calls	9-NNX-XXXX	9-N	8	Local Code
Near Distance Calls	9-1-NNX-XXXX	9-1-NN	9	Toll Code
Long Distance Calls	9-1-NPA-NXX-XXXX	9-1-NP	12	Toll Code

Without N + Dialing				
Call Type	**Digits Dialed**	**Digits Needed**	**MND**	**Toll**
Local Calls	9-NNX-XXXX	9-N	8	Local Code
Long Distance Calls	9-NPA-NXX-XXXX	9-NP	11	Toll Code

Note: The digits underlined are to be listed in the DC (Digit Code) parameter.
Overseas or Operator-assisted Calls should be listed with an MND equal to the calculated number of required digits. Special dialing sequences, such as, “911” with an MND = 4 should also be listed.
N = 2-9, P = 0 or 1, X = 0-9

STEP 1: **ATDP** - This command is used with the AARP command. It designates the digit codes that will be allowed, denied, or toll-restricted. These codes are designated by Route Restriction Class. The Number of Necessary Digits data is used to specify where a 3 or 6-digit translation should begin. The digits to be examined for 3 or 6-digit translation are listed in AARP. Assign the following:

D/N: Day/Night Mode
- 1: Day Mode
- 2: Night Mode

TDM/OG: Tandem Connection/Outgoing Connection
- 1: T (Tandem Connection) **Note 1**
- 2: O (Outgoing Connection)

IC RT: Incoming Route Number (Tandem Connection Only)

RSC: Restriction Class (0-15)

OG RT: Outgoing Route Number

DC: Destination (Area) Code (Maximum of 11 digits)

TDI: Restriction Data *
- 0: Connection is Restricted
- 1: Connection is Allowed
- 2: 3/6 Digit Toll Restriction [Go to AARP]
- 3: Central Office Operator Call 9 + 0.

NND: Number of Necessary Digits (Used only when TDI = 2).

Note 1: If assigning TDM/OG=T (Tandem Connection), data cannot be assigned for the Day and Night modes separately. In this case, the assigned data is used for both Day and Night modes regardless of the setting of DAY/NIGHT parameter.

Note: *TDI 4 may appear when the digits input under the DC parameter are incorrect. The switch is looking for more digits.

STEP 2: **ASYD** - System Data 1, Index 75. Should the following commands be developed for Day/Night? 0/1: No/Yes. See DAY/NIGHT CLASS OF SERVICE [D-15] for more details.

Bit 0- Develop ARSC command for Day/Night?

Bit 3- Develop ATDP command for Day/Night?

System Data 2, Index 1, Bit 3. Does TOLL RESTRICTION apply to SPEED CALLING-STATION [S-21]? 0/1: Yes/No.

System Data 2, Index 1, Bits 4 and 5. If TOLL DENIAL (Busy Tone) is required, assign these Bits as data "00". If TOLL DIVERSION (to Attendant) is required, assign these Bits as "01".

System Data 2, Index 1, Bit 7. Does TOLL RESTRICTION apply to SPEED CALLING-SYSTEM [S-3]? 0/1: Yes/No.

STEP 3: **ARSC** - Assign Route Restriction Classes. When these are assigned to Stations, classes will determine whether or not a Station will be allowed access to a specific route or specific dialing sequence. Assign the following:

DAY/NIGHT: Day/Night Mode
- D: Day Mode
- N: Night Mode

TN: Tenant Number

RT: Route Number

RSC: Route Restriction Class

RRI: Route Restriction Index
- 0: IC Restriction via Attendant Console (DDD, etc.)
- 1: IC Restriction Direct Connection (DID, etc.)
- 2: OG Restriction via Attendant Console
- 3: OG Restriction Direct Connection (DDD, etc.)

RES: Restriction Data
- 0: Connection is Restricted
- 1: Connection is Allowed
- 2: Connection is Toll Restricted

STEP 4: **AMND** - This command indicates the total number of digits to expect, based on the first digits dialed. A "9" + a Local Call will equal 8 digits; "9" + "1" + an Area Code Call will equal 12 digits. Assign the dialed digits information and the corresponding Maximum Necessary Digits (MND) data. Choose either Local Code or Toll Code for the Toll Code Identification (TOLL) parameter.

STEP 5: **AARP** - This command is used to designate digits translated for three digit and six digit restriction. In ATDP, a digit code is listed. The system will examine these digits and if the Restriction Code TDI is assigned as data "2" Toll Restriction, the program will do two operations. The first operation will examine the NND value. If NND is "6", then the AARP information will apply to the sixth digit dialed. For example, assume 9-1-301-555-1212 is dialed. AARP will look at the sixth digit dialed for translation. Translation will begin with 555.

Assign the following:

OGRT: Outgoing Route Number

RSC: Route Restriction Class

FLAG:
- 1: Three Digits
- 2: Six Digits

DC: 555
RES: Restriction Data
0: Restricted
1: Allowed

Note: Only three digits or six digits may be entered for the DC parameter of this command.

TOLL RESTRICTION EXAMPLES:

Several examples of the use of TOLL RESTRICTION are listed below:

RSC 1: Allow local only.
RSC 2: Allow local plus Area Codes 718, 212, 201, and 914.
RSC 3: Allow local plus Area Codes 718, 212, and 201; and office codes 239, 465, and 798 only within Area Code 914.
RSC 4: Allow local plus all Area Codes except 808, 213, 408, and 714.
RSC 5: Allow local plus all Area Codes, but restrict Office Code 976 within each Area Code.

To simplify the examples, only one route, (route 1, DDD) will be used. There will be no difference between Day and Night restrictions. 1 + dialing is assumed with an LCR Access Code of "9".

Example 1 - RSC 1 Assignment (Allow local only)

ATDP Command-
TDM/OG: 2 (O: Outgoing Connection)
D/N: 1 (Day Mode)
OG RT: 1 RSC: 1
DC: 92 TDI: 1 (Connection is Allowed)

Repeat these same assignments for Digit Codes "93" through "99" to allow all local office codes.

Notice that assignments for digit codes "90" and "91", which cover Operator Calls and all 1 + Area Code Calls, are not assigned. Digit Codes not assigned are automatically restricted.

AARP Command-
Not Required. This command is only required when TDI = 2 is assigned in ATDP.

Example 2 - RSC 2 Assignment
(Allow local plus Area Codes 718, 212, 201, and 914)

ATDP Command-
TDM/OG: 2 (O: Outgoing Connection)
D/N: 1 (Day Mode)
OG RT: 1 RSC: 2
DC: 92 TDI: 1 (Connection is Allowed)

Repeat these same assignments for Digit Codes "93" through "99" to allow all local office codes.

To allow Area Codes 718, 212, 201, and 914, repeat the ATDP command for the following Digit Codes:

DC: 91718 TDI: 1 (Connection is Allowed)
DC: 91212 TDI: 1 (Connection is Allowed)
DC: 91201 TDI: 1 (Connection is Allowed)
DC: 91914 TDI: 1 (Connection is Allowed)

This allows these specific Area Codes.

Area Codes not assigned are automatically restricted.

AARP Command-
Not Required.

Example 3 - RSC 3 Assignment
(Allowed local plus Area Codes 718, 212, and 201; and office codes 239, 465, and 798 only within Area Code 914.)
ATDP Command-
TDM/OG: 2 (O: Outgoing Connection)
D/N: 1 (Day Mode)
OG RT: 1 RSC: 3
DC: 92 TDI: 1(Connection is Allowed)
Repeat these same assignments for Digit Codes "93" through "99" to allow all local office codes.
To allow Area Codes 718, 212, and 201, repeat the ATDP command for the following Digit Codes:
DC: 91718 TDI: 1 (Connection is Allowed)
DC: 91212 TDI: 1 (Connection is Allowed)
DC: 91201 TDI: 1 (Connection is Allowed)
To allow office codes 239, 465, and 798 within Area Code 914, assign the ATDP command as follows:
TDM/OG: 2 (O: Outgoing Connection)
D/N: 1 (Day Mode)
OG RT: 1 RSC: 3
DC: 91914 TDI: 2 (Go to AARP Command)
NND: 6 (Begin restriction after 91914, i.e; the 6th digit dialed.)
AARP Command-
OGRT: 1 RSC: 3
FLAG: 1 DC: 239 RES: 1 (Connection is Allowed)
Repeat these same assignments for the following Digit Codes:
OGRT: 1 RSC: 3 FLAG: 1 DC: 465 RES: 1
OGRT: 1 RSC: 3 FLAG: 1 DC: 798 RES: 1
This allows office codes 239, 465, and 798 within Area Code 914. All other office codes are automatically restricted.

Note: This method of assignment allows office codes 239, 465, and 798 to any Area Code that is assigned as TDI = 2 in ATDP. For example, if the assignment for Area Code 718 was changed from TDI = 1 (allowed) to TDI = 2, then the office codes 239, 465, and 798 would also be allowed for Area Code 718.

If different Office Codes are to be allowed in the 718 Area Code (for example 623 and 567), then the assignments for Area Codes 914 and 718 must be made as follows:
ATDP Command-
TDM/OG: 2 (O: Outgoing Connection)
D/N: 1 (Day Mode)
RSC: 3 OG RT:1
DC: 919 TDI: 2 (Go to AARP Command)
NND: 3
TDM/OG: 2 (O: Outgoing Connection)
D/N: 1 (Day Mode)
RSC: 3 OGRT: 1
DC: 917 TDI: 2 (Go to AARP Command)

NND: 3

This tells the system to check AARP tables for restrictions for all Area Codes beginning with 9 and 7.

AARP Command-

OGRT: 1 RSC: 3 FLAG: 2
DC: 914239 RES: 1 (Connection is Allowed)
DC: 914465 RES: 1 (Connection is Allowed)
DC: 914798 RES: 1 (Connection is Allowed)
OGRT: 1 RSC: 3 FLAG: 2
DC: 718623 RES: 1 (Connection is Allowed)
DC: 718567 RES: 1 (Connection is Allowed)

This allows just these office codes within these particular Area Codes. All other area codes beginning with "7" or "9" are also restricted. At this point, if allowing Area Code 714 is desired, assign AARP as follows:

AARP Command-

OGRT: 1 RSC: 3 FLAG: 1
DC: 714 RES: 1 (Connection is Allowed)

Example 4 - RSC 4 Assignment

(Allow local plus all Area Codes except 808, 213, 408, and 714)

ATDP Command-

TDM/OG: 2 (O: Outgoing Connection)
D/N: 1 (Day Mode)
OG RT: 1 RSC: 4
DC: 92 TDI: 1 (Connection is Allowed)

Repeat these same assignments for Digit Codes "93" through "99" to allow all local office codes.

TDM/OG: 2 (O: Outgoing Connection)
D/N: 1 (Day Mode)
OG RT: 1 RSC: 4
DC: 912 TDI: 2 (Go to AARP Command)
NND: 3
DC: 913 TDI: 2 (Go to AARP Command)
DC: 914 TDI: 2 (Go to AARP Command)
\\\ (Through)
DC: 919 TDI: 2 (Go to AARP Command)

This tells the system to check AARP tables for all restrictions for Area Codes.

AARP Command-

OGRT: 1 RSC: 4 FLAG: 1 DC: 808 RES: 0*
OGRT: 1 RSC: 4 FLAG: 1 DC: 213 RES: 0*
OGRT: 1 RSC: 4 FLAG: 1 DC: 408 RES: 0*
OGRT: 1 RSC: 4 FLAG: 1 DC: 714 RES: 0*
OGRT: 1 RSC: 4 FLAG: 2 DC: 000000 RES: 1**

*This assignment restricts the Area Codes listed.

**DC: 000000" indicates all other Destination Codes except those already assigned Destination Codes.

RES: Restriction Data: (0/1)

0: Not assigned Area Codes are restricted
1: Not assigned Area Codes are allowed.

The above assignment allows all other dialing patterns (Area Codes) except 808, 213, 408 and 714.

Example 5 - RSC 5 Assignment
(Allow local plus all Area Codes, but restricted from Office Code 976 within each Area Code)

ATDP Command-

TDM/OG: 2 (O: Outgoing Connection)
D/N: 1 (Day Mode)
OG RT: 1 RSC: 5
DC: 92 TDI: 1 (Connection is Allowed)

Repeat these same assignments for Digit Codes "93" through "99" to allow all local office codes.

TDM/OG: 2 (O: Outgoing Connection)
D/N: 1 (Day Mode)
OG RT: 1 RSC: 5
DC: 912 TDI: 2 (Go to AARP Command)
NND: 6
DC: 913 TDI: 2 NND: 6
(Go to AARP Command)
DC: 914 TDI: 2 NND: 6
(Go to AARP Command)
\\\ (Through) \\\
DC: 919 TDI: 2 NND: 6
(Go to AARP Command)

This tells the system to check AARP tables for all restrictions for Area Codes.

AARP Command-

OGRT: 1 RSC: 5 FLAG: 1 DC: 976
RES: 0 (Restricted)
OGRT: 1 RSC: 5 FLAG: 1 DC: 000000
RES: 1 (Allowed)

This will restrict Office Code 976 and allow every other Office Code.

STEP 6: **ARRC** - Provide Trunk-to-Trunk Connection capabilities according to the requirements of the system. The applicable Trunk-to-Trunk Connections will be those provided by parameter ARI-D-RES Direct Connection; for example, REMOTE ACCESS TO THE SYSTEM [R-2] and TANDEM SWITCHING OF TIE TRUNKS-2/4 WIRE [T-1].

ICRT: Incoming Route Number
OGRT: Outgoing Route Number
ARI-A-RES: This allows/restricts Trunk-to-Trunk and Tandem Connection via the Attendant Console.

0: Alternate routing is Restricted
1: Alternate routing is Allowed

ARI-D-RES: This allows/restricts Trunk-to-Trunk and Tandem Connections via direct-dial access from a Station.

0: Alternate routing is Restricted
1: Alternate routing is Allowed

2: Toll Restriction is Required

STEP 7: **ATDP** - When TOLL RESTRICTION is required for Trunk-to-Trunk Connections, ATDP will provide all the digit information. Therefore, up to 11 digits may be listed as being allowed for a specific Trunk-to-Trunk Connection. TDI = 2 should not be assigned because AARP cannot be used for Tandem Connections.

Example 6 - Trunk-to-Trunk Connection

Allow all Local Calls

ATDP Command-

TDM/OG: 1 (T: Tandem Connection)

IC RT: Route 2 OG RT: 1

DC: 92 TDI: 1 (Connection is Allowed)

Repeat these same assignments for Digit Codes “93” through “99” to allow all local office codes.

Notice that assignments for digit codes “90” and “91”, which cover Operator Calls and all 1 + Area Code Calls, are not assigned. Digit Codes not assigned are automatically restricted.

Example 7 - Trunk-to-Trunk Connection

Allow Limited Area Codes

ATDP Command-

TDM/OG: 1 (T: Tandem Connection)

IC RT: Route 2 OG RT:1

DC: 92 TDI: 1 (Connection is Allowed)

Repeat these same assignments for Digit Codes “93” through “99” to allow all local office codes.

To allow Area Codes 718, 212, 201, and 914 repeat the ATDP command for the following Digit Codes:

DC: 91718 TDI: 1(Allow)

DC: 91212 TDI: 1(Allow)

DC: 91201 TDI: 1(Allow)

DC: 91914 TDI: 1(Allow)

This allows these specific Area Codes.

All the Area Codes which are not assigned are automatically restricted.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

Note: For more detailed information, see the Data Programming Manual - FCCS.

STEP 1: **ARSCN** - Assign the route restriction class.

STEP 2: **ATDPL/ATDPN** - Assign the digit codes to be allowed or denied access, or toll-restricted.

T-8 Trunk Answer from Any Station (TAS)

General Description

This feature allows any Station (except one with incoming restrictions) to answer Incoming Calls when the system is in Night Mode. Incoming Exchange Network Calls will activate a common alert (TAS) signal at the customer's premises. By dialing a specified Code, any Station may answer the call and then extend it to any other Station using CALL TRANSFER-ALL CALLS [C-11].

Operating Procedure

To operate

1. TAS signal (bell, buzzer, etc.) sounds.
2. Lift the handset. Receive Dial Tone.
3. Dial the specified TAS Access Code.
4. Connection to Incoming Call is completed.

Service Conditions

1. An Incoming Call that terminates in the Night mode will have the following priority:
   a.) NIGHT CONNECTION-FLEXIBLE [N-2]
   b.) NIGHT CONNECTION-FIXED [N-1]
   c.) TRUNK ANSWER FROM ANY STATION (TAS) [T-8]
2. TAS indication will be activated for the following Incoming Calls:
   a.) Listed Directory Number
   b.) Foreign Exchange
   c.) WATS
   d.) CCSA
3. All Consoles assigned to handle calls for a particular group of Stations (whether or not they belong to the same TENANT [T-12]) must have NIGHT CONNECTION [N-1,2] set before this feature will be activated.
4. The TAS indicator can be provided on a per Tenant basis.
5. The TAS indicator must be locally-provided.
6. This feature is sometimes referred to as Universal Night Answer (UNA).
7. Individual Stations may be denied access to this feature via CLASS OF SERVICE-INDIVIDUAL [C-15].
8. If the system has changed to Day mode while a TAS Call is being indicated, the ATTENDANT CONSOLE [A-3] can be connected to this call.
9. Only one TAS per Tenant can be assigned as the TAS signaling port.

Interactions

1. For TAS to operate, an ATI circuit card is required, and the system must be in the Night mode, depending on the type of Attendant Console system that is in service. Exercise care when setting the resistance value via switch settings on the ATI circuit card.
2. TENANT SERVICE [T-12]: Only one TAS Circuit may be assigned per Tenant.
3. NIGHT CONNECTION-FIXED/FLEXIBLE [N-1, 2]: TAS can be used in conjunction with NIGHT CONNECTION-FIXED/FLEXIBLE [N-1, 2]. When the Night Connection Station(s) is busy, Incoming Calls are directed to TAS.

4. CALL TRANSFER-ALL CALLS [C-11]: A Station answering a call via the TAS feature will have access to the transfer feature.
5. CENTRALIZED ATTENDANT SERVICE (CAS) [C-20]: TAS may be installed at either the Main site only or at both the Main and Satellite sites. Operations at either site are the same as TAS installed in a non-CAS system. The Satellite system must have a means of placing the system into Night mode. This would require an ATI circuit card connected to a Night switch.
6. CALL FORWARDING - ALL CALLS [C-5] / BUSY LINE [C-2]: When a Direct Inward Dialing (DID) Call terminates to a Station setting CALL FORWARDING - ALL CALLS [C-5] or BUSY LINE [C-2] to the Attendant, the call can be answered using the TAS feature.
7. CLASS OF SERVICE-INDIVIDUAL [C-15]: Stations must be allowed access to TAS via Service Feature Restriction Class. The Station Route Restriction Class will either allow or deny Connection to Incoming Central Office Calls via TAS.
8. DAY/NIGHT CLASS OF SERVICE [D-15]: A CLASS OF SERVICE-INDIVIDUAL [C-15] change that occurs when the system goes into Night mode may allow a Station to answer Incoming Trunk Calls that are restricted to that Station in Day mode.
9. HOUSE PHONE [H-2], INDIVIDUAL ATTENDANT ACCESS [I-6], STATION-TO-STATION CALLING-OPERATOR ASSISTANCE [S-12], and ATTENDANT NIGHT TRANSFER [A-19]: These calls will not be directed to TAS when the system is in Night mode.
10. CONSULTATION HOLD [C-17]: TAS cannot be accessed via CONSULTATION HOLD.
11. TRUNK ANSWER ANY STATION will not default if other provisions are not made to answer Incoming Calls when the system is in Night mode. See the ACFR command.
12. The type of Attendant Console system used determines how the system will enter into the Night mode. See System Data 2, Index 2, Bits 2 and 3.
13. A Station user receives a Reorder Tone after dialing the TAS Access Code if one or more of the following applies:
    a.) Station Line is inward restricted.
    b.) Station Line is fully restricted.
    c.) Station is restricted from the TAS Access Code.
    d.) Station has a party on Hold.
    e.) Another Station has answered the TAS Call and no other calls are in the TAS queue.
14. Incoming Calls remain in the TAS queue until answered from a Station or until abandoned by the far end.
15. When this feature is in service and NIGHT CONNECTION - FIXED [N-1] is activated in the 4-IMG system, a Night Station needs to be set using an external key box connected to an NCU card.

Programming

STEP 1: **ASYD** - System Data 1, Index 68, Bit 2. Type of TAS ringing; 0/1: Interrupted/Continuous.

System Data 1, Index 77, Bit 0. Is Day/Night change accomplished by removing Attendant Console handset? 0/1: No/Yes.

System Data 1, Index 229, Bit 3. Day/night change system message printout. 0/1: No/Yes.

STEP 2: **ANPD** - Reserve a Number Level for Feature Access. Select Normal Service (N), Hooking Service (H) or Busy Service (B) from the combo box for Connection Indexes. (applicable to any feature assigned to this Level). Assign NND in accordance with a predetermined Numbering Plan.

STEP 3: **ASPA** - Assign an Access Code to TRUNK ANSWER FROM ANY STATION, SRV = "SSC: Service Code", SID = 16 TAS. Connection Index of CI = “N: Normal”.

STEP 4: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 13 for the Station to receive TRUNK ANSWER FROM ANY STATION.

STEP 5: **ACFR** - Allow a Transfer Service Feature Index of 5, TAS to the listed types of Incoming Calls to be answered by TAS. The Call Class Indexes (CCI) will correspond to ARTD, CDN 6:TCL; Trunk Class parameter.

CCI: 1-LDN
2-DDD2
3-DDD3
4-TIE LINE
5-DDD4

STEP 6: **ATAS** - Assign the TAS Circuit to the TN, MG, PIR, and the Circuit Number: 0/1; based on the Circuit Location. TAS CKT # = Attendant Console CKT #.

T-9 Trunk Group Busy Lamp

General Description

This feature provides the ATTENDANT CONSOLE [A-3] with a visual indication when all Trunks in a particular Trunk Group are busy (LDN, WATS, FX, DOD, CCSA, TIE or Special Trunks). Assignment of the TGBLs is made using the PCPro.

Operating Procedure

No manual operation is required.

Service Conditions

1. The ATTENDANT CONSOLE [A-3] must have a designated TRUNK GROUP BUSY LAMP (TGBL) section.
2. This feature may be used on Trunk Groups consisting of WATS, TIE, FX, and special Trunks.
3. Ten TGBLs are available on each Attendant Console.
4. Trunk Group Warning to indicate when a preset number of Trunks in a group is busy is not provided.
5. Trunk Groups cannot be combined to light a common TGBL.
6. A maximum of 10 Trunks including LD and TIE are displayed on an Attendant Console.
7. Desk Console cannot be used to activate this feature.

Interactions

1. ATTENDANT CONSOLE [A-3] number is the equivalent to the Trunk Number when assigning the Attendant Console Route 901 in ATRK.
2. The ATRK command must be assigned before the ATGL command. If ATRK is not assigned first, ERROR: 0245, “ATTENDANT CONSOLE [A-3] not assigned yet”, will be indicated.

Programming

STEP 1: **ASYD** - System Data 1, Index 9. Assign the number of ATTENDANT CONSOLE [A-3] to be used in the system.

STEP 2: **ATRK** - Assign Route 901 to the Attendant Console.

STEP 3: **ARTD** - Assign Route Data for each Trunk Group that will be represented by a Trunk Group Busy Lamp.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or MG.

STEP 4: **ATRK** - Assign Trunks to the routes assigned in ATRK.

STEP 5: **MBTK** - Make idle the Trunks that are assigned, including the ATTENDANT CONSOLE [A-3].

STEP 6: **ASYD** - System Data 1, Index 15, Bits 0-3. In hexadecimal, assign how many TGBLs are in service, to a maximum of 10 lamps. Assign 0AH.

STEP 7: **ATGL** - Assign the ATTENDANT CONSOLE [A-3] number, the TGBL number (1-10), and the Route Number(s) to be associated with the TGBL.

T-10 Trunk-to-Trunk Connection

General Description

This feature provides any Station user with the ability to Conference together either two Central Office Calls or a Central Office and TIE Line Call.

Operating Procedure

To operate

1. Place Incoming Caller on hold.
2. Receive Special Dial Tone.
3. Dial the desired Central Office or TIE Access Code.
4. Receive Second Dial Tone.
5. Dial the desired number. Receive answer.
6. Announce the Conference and momentarily press the switch hook again.
7. The original party is now included in Connection.

Service Conditions

1. The originating party may hang up at any time. The additional two parties will not be disconnected.
2. This feature may be restricted to individual Stations via System Data.
3. In the case of Outgoing Calls on Trunks with no Answer Supervision, this feature may be activated only after 18 seconds have elapsed since the last digit was dialed. This timer is programmable in System Data.
4. In the case of Outgoing Calls on Trunks with Answer Supervision, this feature may be activated as soon as the Called Party answers.
5. A Station user may hang up after completing a TRUNK-TO-TRUNK CONNECTION without affecting the Connection of the two Outside Parties, provided that:
   a.) One Trunk is incoming and the other is outgoing.
   b.) Both Trunks are Ground Start.
   c.) Station users wait a programmed time interval after dialing an Outside Line before hanging up.
6. If the originating party encounters a no-answer or busy signal when trying to Conference a Third Party, the originating party switch hook flashes and is reconnected to the Held Call.
7. This feature is inoperative when Release Signal is not provided from the distant end.

Interactions

1. For direct Trunk-to-Trunk Connection, see TANDEM SWITCHING OF TIE TRUNKS-2/4-WIRE [T-1].
2. If a THREE-WAY CALLING [T-2] Connection includes two Trunks, then when the Station hangs up, the Trunk will release, unless the Trunks are allowed TRUNK-TO-TRUNK CONNECTION via the ARRC command, ARI-D-RES.

Programming

STEP 1: **ASYD** - System Data 1, Index 156. The timer value for non-Senderized Trunks between seizure and when a switch hook flash is possible. Default is 30 seconds.Without SMDR, it is recommended to change it to two seconds. Program 31H.

System Data 1, Index 157. The timer value for Senderized Trunks between seizure and when a switch

hook flash is possible. Default is 18 seconds. Without SMDR, it is recommended to change it to two seconds. Program 31H. (See STATION MESSAGE DETAIL RECORDING [S-10]).

System Data 2, Index 1, Bits 0 and 1. CONSULTATION HOLD. Assign data "11" for CONSULTATION HOLD service on Originating, Terminating, and Tandem Calls.

System Data 2, Index 6, Bit 2. This Bit remains as data "0". CALL TRANSFER-ALL CALLS [C-11].

System Data 2, Index 6, Bit 3. Enable add-on Station. This Bit remains as data "0" for THREE-WAY CALLING [T-2].

System Data 3, Index 2. Assign data 91H for normal switch hook flash values.

STEP 2: **ARSC** - Stations allowed to establish TRUNK-TO-TRUNK CONNECTION must be provided access to routes that have been allowed TRUNK-TO-TRUNK CONNECTION in the ARRC command.

STEP 3: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 10 to Stations that will have CALL HOLD [C-6].

STEP 4: **ATRK** - Assign these LENS as Route 909, Digital Conference Trunk. LENS consist of the following:

XX	X	XX	X
Module Group	Unit	Group	Level

Group and Level numbers for the Digital Conference Trunk are 210, 213, 216, 221, 224, 227, 232, and 235.

STEP 5: **ARRC** - Routes that will be allowed TRUNK-TO-TRUNK CONNECTION must be allowed here for ARI-A-RES.

ICRT: Incoming Route Number

OGRT: Outgoing Route Number

ARI A-RES: This allows/restricts Trunk-to-Trunk (Tandem) Connection via the Attendant Console and Stations.

ARI D-RES: This allows/restricts Trunk-to-Trunk (Tandem) Connections via Direct Dial access from a Station and Trunks.

0: Alternate routing is restricted

1: Alternate routing is allowed

2: Toll Restricted

When ARI-D-RES is needed for a direct dial TRUNK-TO-TRUNK CONNECTION, refer to the specific application within this document for the programming steps. Such applications include REMOTE ACCESS TO SYSTEM [P-75], TANDEM SWITCHING OF TIE TRUNKS-2/4-WIRE [T-1], INCOMING CENTRAL OFFICE TO TIE LINE CONNECTION [I-3], and TOLL RESTRICTION-3/6-DIGIT [T-7].

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ARSCN** - Stations allowed to establish TRUNK-TO-TRUNK CONNECTION must be provided access to routes that have been allowed TRUNK-TO-TRUNK CONNECTION in the ARRC command.

STEP 2: **ARRCN** - Routes that will be allowed TRUNK-TO-TRUNK CONNECTION must be allowed here for ARI-A-RES.

ICRT: Incoming Route Number

OGRT: Outgoing Route Number

ARI A-RES: This allows/restricts Trunk-to-Trunk Tandem) Connection via the Attendant Console and Stations.

ARI D-RES: This allows/restricts Trunk-to-Trunk (Tandem) Connections via Direct Dial access from a Station and Trunks.

0: Alternate routing is restricted

1: Alternate routing is allowed

2: Toll Restricted

When ARI-D-RES is needed for a direct dial TRUNK-TO-TRUNK CONNECTION, refer to the specific application within this document for the programming steps. Such applications include REMOTE ACCESS TO SYSTEM [P-75], TANDEM SWITCHING OF TIE TRUNKS-2/4-WIRE [T-1], INCOMING CENTRAL OFFICE TO TIE LINE CONNECTION [I-3], and TOLL RESTRICTION-3/6-DIGIT [T-7].

T-12 Tenant Service

General Description

This feature provides for more than one organization (Tenant) to share the same System. Through system programming, each organization may be restricted to its own Central Office Trunks, ATTENDANT CONSOLEs [A-3], and extension links. In addition, Incoming Calls are directed to the specific organization (Tenant).

Operating Procedure

No manual operation is required.

Service Conditions

1. An Attendant Console is normally provided for each Tenant. However, when required, a single common Console may be shared by two or more Tenants.
2. Inter-Office Calling between Tenants may or may not be restricted, depending on System Data.
3. Different Tenants may share a common group of Trunks, where required.
4. When a Tenant Station dials “0” (Operator Call Code), it will be connected to that Tenant’s Console.
5. Different Tenants cannot use the same Numbering Plan.
6. The same Telephone Numbers cannot be assigned among different Tenants (for example, Stations numbered 2XXX can be associated with only one Tenant).
7. STATION-TO-STATION [S-11], CALL TRANSFER [C-11] THREE-WAY CALLING [T-2], TAS [T-8] and CALL FORWARDING [C-2, 3, 5] Calls between Tenants can be restricted or allowed.
8. SMDR [S-10] includes Tenant identification.
9. The same Access Code can be assigned among Tenants for service features (for example, CALL HOLD [C-6], CALL BACK [C-1], CALL PICKUP - GROUP [C-7], CALL FORWARDING - ALL CALLS [C-5], SPEED CALLING [S-3], TAS [T-8], etc.).
10. The Telephony Server can provide TENANT SERVICE [T-12] to a maximum of 63 Tenants.
11. Tenant Numbers should be allocated on a network basis for the FCCS Network.

Interactions

1. To provide TENANT SERVICE, features need not be separated. Whenever possible, keep features common to use data memory as economically as possible. When commands are separated, they must be programmed for each Tenant accommodated in System Data 2.
2. FORCED ACCOUNT CODES [F-7] and AUTHORIZATION CODES [A-20] do not require separate Tenant service for AMND, System Data 1, Index 93, Bit 6.
3. Each Tenant may have its own Attendant Console(s), unless that number exceeds system capacity; for example, five Tenants in a two-PIR configuration. The number of Consoles per Tenant is not limited by programming but is limited by the system configuration.
4. Different Tenants may or may not share the same Central Office Trunks. Termination of a Trunk is a function of the ARSC command. DID Trunks can be assigned to any Tenant. However, the Listed Directory Number, as assigned in the ALDN command, determines where the call terminates. If the Incoming LDN digits are assigned to Tenant 2, the call terminates to the Tenant 2 Attendant Console, even if the digits come on a Tenant 1 Trunk.

5. CALL FORWARDING [C-2, 3, 5]: When a Station Call forwards to the Attendant Console, the call will go to the originating Station's Attendant Console, as assigned by the Tenant parameter of the ATRK command.
6. CLASS OF SERVICE-INDIVIDUAL [C-15]: Refer to the programming section. This feature affects the construction of all classes of service.

Programming

STEP 1: **ASYD** - System Data 1, Index 8. Assign the number of Tenants that the system will serve, in hexadecimal format.

System Data 1, Indexes 92, 93, and 94. The Bits of these Indexes allow for either common or separate Tenant assignments for other specific commands. The following Bits represent the following commands. Assign as follows; 0/1: Separate/Common.

Index 92
Bit 0, All of ASYD, System Data 2
Bit 1, ASPA, AASP, AGSP
Bit 2, ANPD, AANP, AGNP
Bit 3, ALDN, ASDT and ASAT (Must be assigned as data "1".)
Bit 4, ARSC
Bit 5, ACFR
Index 93
Bit 0, ASFC
Bit 1, ACFO
Bit 2, ATAS
Bit 3, ASPD
Bit 4, ASTP and AFRS (O.G.Connection)
Bit 5, ASTP and AFRS (I.C.Connection)
Bit 6, AMND
Bit 7, AAED
Index 94
Bit 0, ATNR
Bit 1, AEFR (EPN only)
Bit 2, APCR
Bit 3, AATC, ASPS
Bit 4, ASPF
Bit 5, ADNR
Bit 6, ASCR
Bit 7, ASID, ATCR
Bit 2, APCR. (EPN Only)

STEP 2: **ATNR** - Assign the appropriate Tenant restrictions.

D/N: Day/Night Mode
- Day Mode
- Night Mode

OGTN: Originating Tenant
TMTN: Terminating Tenant

TRI: Tenant Restriction Index (0-15) **Note 1**
RES: Restriction Data (0/1)
0: Restricted
1: Allowed

Note: Data can be entered on a Day/Night basis if specified in ASYD, System Data 1, Index 75, Bit 2 = 1.

Note 1: Assigning data "1" (allow) to a TRI Index is not all that is required for a call to be completed between Tenants. Each Tenant must also have a Numbering Plan defined that allows for the Station Numbers in the other "allowed" Tenants to be dialed.

Assignment of Tenant Restriction Class
TRI: Tenant Restriction Index
0: Allows intra and inter-Tenant Station Calls. Allow calls within Self-Tenant.
1: Allows CALL FORWARDING-ALL CALLS, DON'T ANSWER, BUSY LINE on an intra and inter-Tenant basis. Allow this feature within Self-Tenant.
2: Allows or restricts Incoming Calls, via the Night Attendant Console, from Tenant to Tenant. This allows the Tenant, as assigned to a Trunk, to be terminated to a Tenant, as assigned to a Station.
3: Allows the CALL FORWARDING-ALL CALLS, DON'T ANSWER, and BUSY LINE on an intra and inter-Tenant basis as when set by the Attendant Console.
4: Allows or restricts Incoming Calls to the Attendant Console on a per Tenant basis. Thus, an Attendant Console may handle calls only for a specific Tenant.
5: Day/Night Mode Change Restriction is not used in North America.
6: Not Used.
7: Incoming Call of the Trunk within OGTN terminates to a Station within TMTN (in the case of MFC signaling only).
8-15: Not Used.

STEP 3: **ATRK** - Assign the Attendant Consoles to receive Incoming Trunks according to Tenant. The TN parameter will determine which specific Tenants this Attendant Console will handle. Example: In a three-Tenant system, the Attendant Console will handle Tenants 1 and 3. Assign the following:

RT: 901 TK: 1
LENS: 000200
CNT: 2 1 TN: 1 RSC: 0
CNT: 2 2 TN: 3 SFC: 0

STEP 4: **MBTK** - Make idle the Attendant Console Trunks.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

ASYDL/ASYDN - The Bits of these Indexes allow for either common or Separate Tenant assignments for other specific commands. 0/1 = Separate/Common

System Data 1, Index 800

Bit 0: ALGNL/ALGNN, ALGSL/ALGSN
Bit 1: ASPAL/ASPAN **Note 2**
Bit 2: ANPDL/ANPDN
Bit 3: APCNL/APCNN
Bit 4: AFRSL/AFRSN, AUNEL/AUNEN
Bit 5: ASTPL/ASTPN
Bit 6: ARSCN **Note 3**
Bit 7: AAEDL/AAEDN

Note 2: This data cannot be changed when any data is assigned in ASPAL or ASPAN command.

Note 3: Valid with ASYDN command only.

Index 801

Bit 1: AMNDL

Index 802

Bit 0: AHSPL/AHSPN
Bit 1: ATDPEL/ATDPWN
Bit 2: AINDL

T-18 Time Display

General Description

This feature provides a digital time display on the Attendant Console.

Operating Procedure

The time is constantly displayed in the time display area of the Attendant Console.

Service Conditions

1. The time is displayed according to the built-in clock of the Attendant Console.
2. The built-in clock of the Attendant Console is independent of the clock in the Telephony Server.

Programming

Above the time display is an area marked ADJUST, with two openings: One labeled “H” (hours) and the other labeled “M” (minutes). Using a pointed object that will fit into the opening, gently press the appropriate ADJUST button (H or M) until the correct Hour or Minute is displayed.

Interactions

Upon initial installation, it may take up to 30 minutes for clock back-up power reserve to charge. Once the charging process is complete, the clock adjustments can be made.

T-18D Time Display -D

General Description

This feature provides a digital time display on a Desktop terminal's LCD. Also, the time display pattern can be changed by system data assignment. The following table shows an example of time display pattern.

Time Display Pattern	
12 hour	**24 hour**
10:30 PM WED 6 NOV 2013	22:30 WED 6 NOV

Operating Procedure

No manual operation is required.

Service Conditions

1. The time display pattern can be changed for DT800/DT700/DT400/DT300 Series only. For other terminals, the time display pattern cannot be changed (fixed to default display pattern).
2. When the DT400/DT300 terminals are accommodated to IPG (Digital) or UG50, time display pattern cannot be changed (fixed to default display pattern).
3. The following ELC card with firmware is required for changing the time display pattern of DT400/DT300 Series.

ELC Card	Firmware Requirements
CH-16ELCA	SP-4035 16ELCA PROG-A Version 1 or later

4. In FCCS network, when you change the time indication format (AM12:00 or AM0:00) for LCD, log in to the system and assign the system data (ASYDL, System Data 1, Index 1256, Bit 0) to each node. For details, refer to Programming.

   Note: ASYDN command is not supported for the setting of time indication format.

5. The time is displayed according to the clock in the system and is set via the PCPro.
6. The time will not be displayed when a Desktop terminal is set for a second line MESSAGE WAITING INDICATION -D [M-85D] and MW/VMM is displayed.
7. While NAME DISPLAY - SYSTEM [N-28], NAME DISPLAY - SYSTEM - CCIS [N-37], or NAME DISPLAY WITHOUT - OAI - CCIS [N-37] 16-digit display is activated on the Desktop terminal with Two-line LCD display, the time is not displayed. When both the Calling/Called Station are released from a Station-to-Station Call, the LCD of the Calling/Called Station returns to the TIME DISPLAY.

Interactions

1. Only the Desktop terminal with display has the TIME DISPLAY feature capability.
2. The calendar and time must be adjust via ATIM command.

Programming

STEP 1: **ASYDL/ASYDN** - System Data 1, Index 1249, Bit 0-3. When you assign the other parameters than the parameters shown below, the Display Pattern of the terminal will be 0.

Note: The data assignment of Desktop terminal is also required for this feature. For details, refer to 5. Desktop Terminal Data in Chapter 2 of this manual.

Pattern Number	Bit				Time Display Format	Example Display
	b3	b2	b1	b0		
0 (Default)	0	0	0	0	12 hour	10:30 AM WED 6 NOV 2013
1	0	0	0	1		6 NOV WED 10:30 AM
2	0	0	1	0		10:30 AM NOV 6 WED
3	0	0	1	1		11-6 WED 10:30 AM
4	0	1	0	0		10:30 AM WED 6 NOV
5	0	1	0	1	24 hour	6 NOV WED 10:30
6	0	1	1	0		10:30 NOV 6 WED
7	0	1	1	1		11-6 WED 10:30
8	1	0	0	0		10:30 WED 6 NOV

Note: When you assign the parameters except the above table, the pattern number is specified as “0 (Default)”.

Note: Available for DT800/DT700/DT400/DT300 Series only.

Note: After this system data assignment, the following operations are required.
- Digital terminal: Initializing a corresponding ELC card.
- SIP terminal: Restarting the terminal after 30 second is elapsed.

STEP 2: **ASYDL** - System Data 1, Index 1256, Bit 0.
Assign this command to specify the Time Display Format.
0/1 = AM12:00 (midnight)/AM0:00 (midnight).

Bit	12 hour	24 hour
0	AM 12:00	24:00
1	AM 0:00	0:00

Note: Available for DT800/DT700/DT400/DT300 Series only.

Note: After this system data assignment, the following operations are required.
- Digital terminal: Initializing corresponding ELC card.
- SIP terminal: Restarting the terminal after 30 second is elapsed.

Note: In FCCS network, be sure to assign this system data to each node.

T-23 Trunk Line Appearance

General Description

This feature allows a Desktop terminal user to directly access a Central Office Trunk or TIE Line without dialing an Access Code. Incoming Calls can also be answered at the TRUNK LINE APPEARANCE [T-23].

Operating Procedure

To access an Outgoing Trunk

1. Press the TRUNK LINE APPEARANCE Feature key.
2. Lift the handset or press the SPEAKER key. Central Office or distant System Dial Tone will be heard.
3. Dial the destination number.

To answer an Incoming Call from the TRUNK LINE APPEARANCE

1. Ringing and an LED indication alert the Desktop terminal user of the Incoming Call.
2. Press the TRUNK LINE APPEARANCE Feature key.
3. Lift the handset or press the SPEAKER key.
4. Answer the Incoming Call.

Service Conditions

1. A TRUNK LINE APPEARANCE can be accommodated on Desktop terminals, and 24/40-button Add-On Modules.
2. A TRUNK LINE APPEARANCE can be assigned as a SOFTWARE LINE APPEARANCE [S-33].
3. A TRUNK LINE APPEARANCE can be assigned in a Circular or Pilot Hunt Group.
4. A TRUNK LINE APPEARANCE is available for destination offices that can receive DP/PB signals.
5. CALL FORWARDING-ALL CALLS [C-5], CALL FORWARDING-BUSY LINE [C-2] and CALL FORWARDING-DON'T ANSWER [C-3] can be set at the Attendant Console for a TRUNK LINE APPEARANCE assigned to a Virtual Line Appearance or an unused data port.
6. A TRUNK LINE APPEARANCE can receive Incoming Calls from internal Stations, DID, DIT, or TIE Line Trunks.
7. When a call is originated with the RECALL key and the Trunk is busy, the call is in the queue waiting to seize the idle Trunk. If no Dial Tone has been found for two seconds, the Calling Party hears a Busy Tone (if the idle Trunk is found within two seconds, the Station is connected to the idle Trunk).
8. When TRUNK LINE APPEARANCE is used for the DP line, program two seconds or less for outgoing inhibit timing after Trunk release (ARTD CND 34: GUARD = 1-3).
9. This feature is not supported with MC&MG-COT/MG-COT/UG50.

Interactions

1. For Incoming Calls, the Trunk must be assigned as a DIRECT-IN TERMINATION [D-7] Trunk.
2. The Trunk may still be seized by other Stations or the ATTENDANT CONSOLE if the route is not isolated from other features such as LEAST-COST ROUTING-3/6 DIGIT [L-6] or ROUTE ADVANCE [R-6].

3. The Trunk may be selected by INDIVIDUAL Trunk Access [I-4]. If accessed, the Desktop terminal will not have a lit LED for busy condition, as would occur when a Trunk is seized in a 1A2 Key system. If the user of TRUNK LINE APPEARANCE goes off hook to seize the Trunk, Busy Tone is returned. The LCD displays:

BUSY
(Time Display)

4. TRUNK LINE APPEARANCE and HOTLINE-OUTSIDE [H-9] are mutually exclusive. Both features require the AHLS command, and the same Station cannot be provided with two Hotline features.

Programming

STEP 1: **ASDT** - Assign the Station with the TRUNK LINE APPEARANCE as a Virtual Line (TEC = 18).

TN: Tenant Number
STN: Station Number
LENS: Line Equipment Numbers (6 digits)
TEC: Telephone Class (1-31)
- 1: DP (10 PPS)
- 2: PB
- 3: DP/PB
- 12: Dterm
- 13: Data Terminal Via Dterm
- 14: Hotline
- 15: CAS Line
- 16: Data Terminal Via Data Module
- 18: Virtual Circuit
- 23: ISDN Terminal
- 27: Eight Conference Equipment

RSC: Route Restriction Class (0-15)
For assignment of RSC, ARSC command.
SFC: Service Feature Restriction Class (0-15)
For assignment of SFC, ASFC command.

STEP 2: **ARTD** - Assign the route of the TRUNK LINE APPEARANCE as a ground-start, ring-down Trunk.

RT: 1

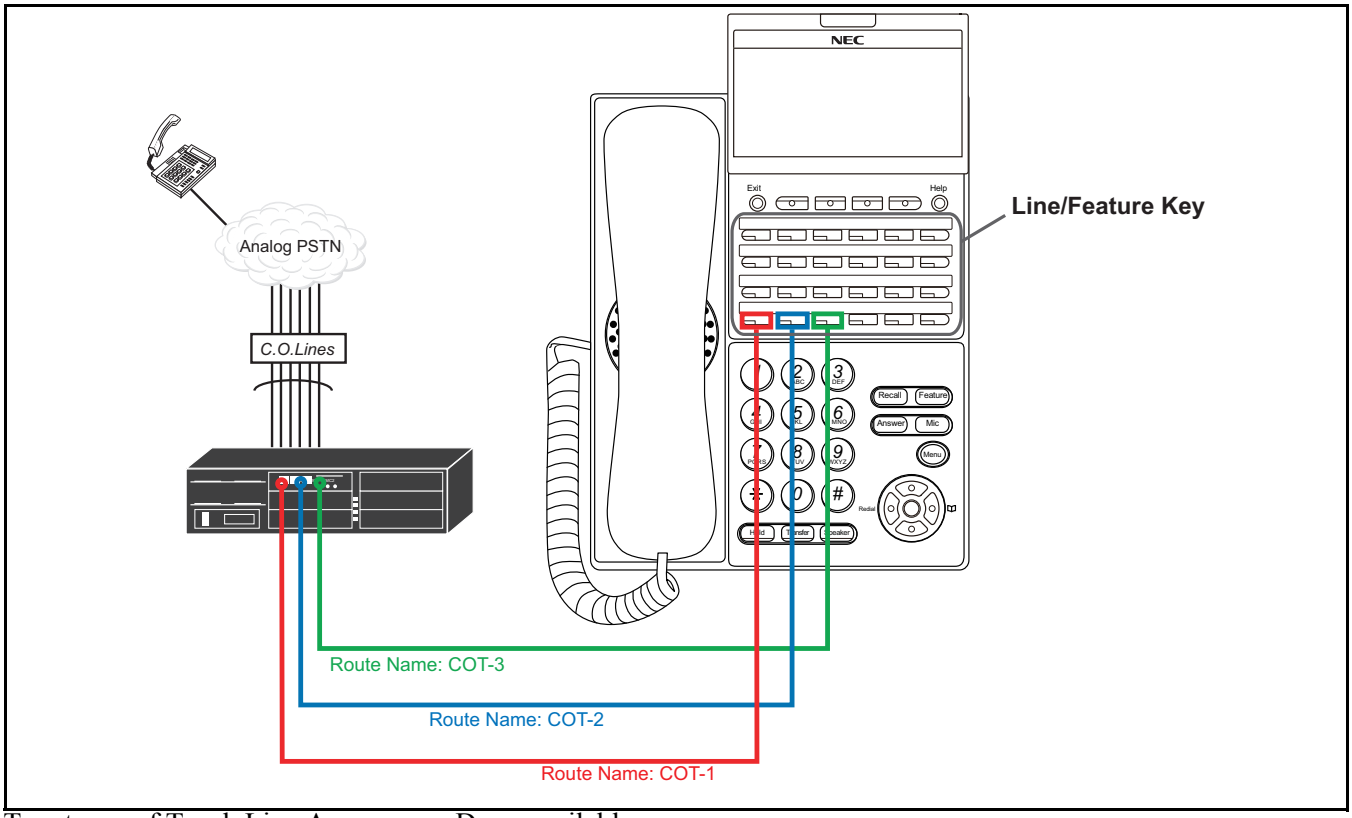
1-OSGS	:2	2-ONSG	:3	3-ISGS	:1	4-INSG	:3	5-TF	:1/3
6-TCL	:1	7-L/T	:1	8-RLP	:2	15-LSG	:1	44-PRV	:1

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or MG.

STEP 3: **ATRK** - Assign the LENS, Route Number, Trunk Number, and Tenant Number. Assign one or more Trunks to a specific route used to be connected as a TRUNK LINE APPEARANCE.

STEP 4: **MBTK** - Assign the make idle status to the Trunks.

STEP 5: **ASFC** - Assign a Service Feature Restriction Class that allows Brokerage Hotline (SFI 36) to the Stations to receive TRUNK LINE APPEARANCE.



STEP 6: **AHLS** - Assign the following parameters for the Station with the TRUNK LINE APPEARANCE:

HOT TN: Hotline Tenant Number.
HOT STN: Hotline Station Number with the TRUNK LINE APPEARANCE.
TYPE: For TRUNK LINE APPEARANCE, assign Type 3.
CON RT: Assign the TRUNK LINE APPEARANCE Route.
CON TK: Assign the TRUNK LINE APPEARANCE Trunk.

T-23D Trunk Line Appearance -D

General Description

This feature allows a IP Station user to answer incoming calls from a C.O. line by pressing the corresponding Line key.

Two types of Trunk Line Appearance-D are available:

<1-C.O. line to 1-Line key on IP Station>
Connecting a C.O. line to a Line key of IP Station one-to-one (shown in the example figure above).

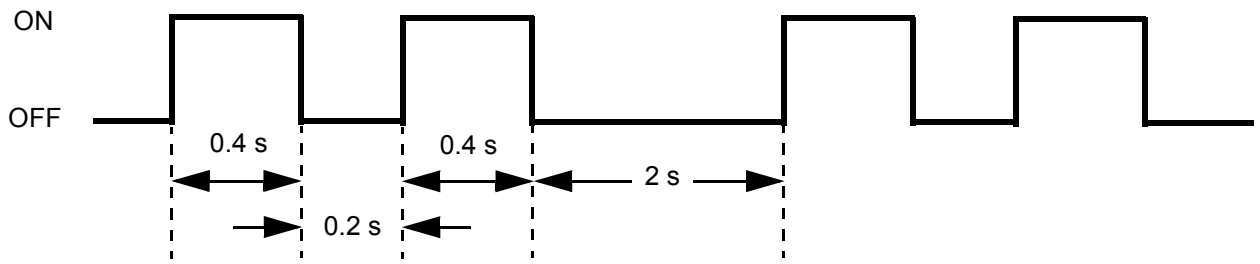
<1-C.O. line to Line key on Multiple IP Stations>
Sharing a C.O. line allocated to multiple IP Stations. User can originate/answer a call with SPEAKER/ANSWER key control on IP Station.

Operating Procedure

To answer an Incoming Call on IP Station

1. Message Waiting Lamp indication informs the IP Station user of the Incoming Call.
2. Lift the handset or press the SPEAKER key.
3. Press the TRUNK LINE APPEARANCE-D Feature key.
4. Answer the Incoming Call from C.O. line.

Service Conditions



1. MC&MG-COT/MG-COT/UG50 is required for this feature. Available firmware version is:
   - MG-COT [SCA-6COTA]: SP-3875 6MGCOT PROG-A
   - MG-COT [SCA-6COTB] (Proprietary Protocol): SP-3948 6MGCOT PROG-A **Note 1**
   - MG-COT [SCA-6COTC] (Proprietary Protocol): SP-3948 6MGCOT PROG-A **Note 1**
   - MG-COT [SCA-6COTB] (SIP): SP-3948 6MGCOT PROG-A **Note 1**
   - MG-COT [SCA-6COTC] (SIP): SP-3948 6MGCOT PROG-A **Note 1**
   - MCMG [SCA-4LC2COTA/MG-4LC2COTA]: SP-3778 MCMG PROG-A
     SP-3927 MCMG PROG-B
   - UG50 (COT-TYPE1): No condition
   - UG50 (COT-TYPE2): No condition
   - UG50-4LC2COTA (COT): No condition
   - UG50-6COT: No condition

   Refer to Peripheral Equipment Description (IP Devices/UG50) for the data assignment of each MG.

   Note 1: Firmware SP-3948 6MGCOT PROG-A Issue 1.0.0.0 version or later is required.

2. When using MC&MG-COT for this feature, assign the highest priority to a route through MC&MG-COT for LCR.
3. System data assignment for Trunk Answer from Any Station (TAS) is required for this feature, but the TAS service is not activated.
4. Whether the Trunk Answer from Any Station (TAS) feature is available or not is determined by the Service Feature Restriction Class (SFC: 34) setting to each station.
5. When Trunk Line Appearance-D station does not answer the incoming call and Call Forwarding-Don't Answer is activated, the LCD on the IP Station does not display to inform the execution of call forwarding.
6. Analog C.O. line corresponding to PB signal is only applicable.
7. IP Stations must assign a My Line to a Line/Feature key beforehand.
8. All the virtual lines of C.O. trunk, except My Line, can be assigned as Trunk Line Appearance-D lines on one IP station. (e.g. On 16-button IP station, a maximum of 15 lines can be accommodated as Trunk Line Appearance-D. The remaining one line is the My Line.)
9. Up to 128 of C.O. lines can be accommodated as Trunk Line Appearance-D per system.
10. Distinctive Ringing is not activated when incoming call terminates. A Ringer Pattern is only one below.

Ringing

11. Analog Telephone cannot answer the incoming call of Trunk Line Appearance-D.
12. When IP Station answers and holds the incoming call of Trunk Line Appearance-D, Analog Telephone station cannot answer the held call. IP stations belong to multiple-line group can answer the held call.
13. Call termination is informed to the user only by the Message Waiting Lamp indication on IP Station.
14. This feature is not applied to the outside call via ISDN line.
15. To send out Hooking signal to the destination party, assign the Route Class data of COT route to HKS=1.
16. When originating a call, IP station hears dummy tone from its' own system. Assign the dummy tone by the 2nd DT parameter of ASPA command.

    ASPA 2nd DT: 0: -
    Second DT is not sent.
    1: 2nd DT
    Second DT is sent.
17. Numbering plan data for the call origination via COT must be assigned by the LCR setting of ASPA command.
18. Trunk Line Appearance-D station and the corresponding trunk are basically accommodated in the same module group. When Trunk Line Appearance-D station and the trunk are accommodated in the different module groups (**Note 2**), set ASYD, SYS 1, Index 321, Bit 0 = 1 (available for Desktop terminal only).

Note 2: In that case, the module groups must be in the same LP.

Interactions

When conventional COT circuit card is used, Trunk Line Appearance [T-23] is applied.

Programming

Make sure the data setting for MC&MG-COT/MG-COT/UG50 is completed before starting the following data assignment. When MC&MG-COT is used, perform steps outlined in <MC&MG-COT Configuration for LCR>. Otherwise, proceed with Step 8 in <Settings Common to MC&MG-COT, MG-COT and UG50>.

<MC&MG-COT Configuration for LCR>
For details about the parameters of each command, see the Programming section of LEAST COST ROUTING - 3/6 DIGIT [L-5].

STEP 1: **ANPD/ANPDL/ANPDN** - Assign an access code for LCR service, defining the first digit and the number of digits.

STEP 2: **ASPA/ASPAL/ASPAN** - Enter a dummy route number in the External Route Number (RT) field of the External Route Number Data for the LCR access code.

STEP 3: **AFRS/AFRSL/AFRSN** - Define a Number Pattern Code (NPC **Note 3**) and an Outgoing Route Selection Number (OPR) for the dummy route you specified in the previous step. OPR is used to map a dialed NPC to the route pattern for LCR.

Note 3: Make sure that NPC includes the LCR access code.

STEP 4: **AOPR/AOPRL/AOPRN** - For each OPR you defined in the previous step, specify availability hours by using the Time of Day Change Pattern Number (TDPTN) parameter and priority by using the Route Advancing Order (RA) parameter.

Note: Assign the highest priority to a route through MC&MG-COT for LCR.

STEP 5: **AADC/AADCL/AADCN** - If additional digit information is required, assign a DC additional number (not including the access code for LCR) to each Pattern Number Location (PNL).

STEP 6: **AMND/AMNDL** - Specify the maximum number of digits to be received by the Originating Register Trunk (ORT) circuit for each Destination Code (DC).

STEP 7: **ARNP/ARNPL** - Assign an access code for each individual route.

<Settings Common to MC&MG-COT, MG-COT and UG50>

STEP 8: **ASYD** - Assign the system data related to Trunk Answer from Any Station (TAS).
SYS1, Index 72, Bit 2. Tone pattern to be sent out to stations on Exclusive Hold/Non-Exclusive Hold.
0/1=Dial Tone (DT)/Service Set Tone (SST)
SYS2, Index 11, Bit 6. 0/1=Trunk Answer from Any Station (TAS) is Out of service/In Service.
STS2, Index 12, Bit 0. 0/1=Automatic Recall Ringer is required for Non-Exclusive Hold/Not required.
STS2, Index 12, Bit 1. 0/1=Automatic Recall Ringer is required for Exclusive Hold/Not required.

STEP 9: **ASFC** - Assign a Service Feature Restriction Class to allow the following feature to the stations of Trunk Line Appearance-D.
SFI 34=1 (Trunk Answer from Any Station (TAS))
SFI 35=1 (Exclusive Hold, Non-Exclusive Hold)

STEP 10: **ACFR** - Assign Call Forwarding Restriction data for Trunk Line Appearance-D.
TSFI=2 (Direct in Termination (Night only))
CCI=1 (C.O. Line)
RES=1 (Transfer service is allowed)

STEP 11: **ARTD** - Assign the route class data of the Trunk Line Appearance-D trunk.
RT: C.O. trunk of MG-COT/UG50 Card/MCMG Card
37-CLD=1 (Trunk Answer from Any Station (TAS) is in service)
67-HKS=1 (Hooking Service is in service) **Required to send out Hooking signal to outside party.*
114-DCH:=1 (Channel Integration is ON)
125-MG COT=1 (Available)

Note: To change the data for existing route (RT), reboot the MG.

STEP 12: **ARTI** - Assign Trunk Application Data.
68-VIR=2 (MG Connection)

Note: To change the data for existing route (RT), reboot the MG.

STEP 13: **AMGIL** - Assignment of Media Gateway Information.
Refer to the Peripheral Equipment Description for details.

STEP 14: **ATRK** - Assign the LENS, Route Number, and Trunk Number. Assign one or more Trunks to a specific route used to be connected as Trunk Line Appearance-D.

STEP 15: **MBTK** - Release the make busy state of Trunk Line Appearance-D trunks.

STEP 16: **ACOC** - Assign the C.O. line code (COC) to the External Route Number and Trunk Number of each Trunk Line Appearance-D trunk. This code is dialed to answer the held C.O. line.

STEP 17: **ARSC** - Assign the Route Restriction Class (RSC) to allow the connection between the C.O. line route and the Route Class of Trunk Line Appearance-D stations.

STEP 18: **ASDT** - Assign the Station Number of Trunk Line Appearance-D as a Virtual Line (TEC=18).
STN: Station Number of Virtual station

LENS: Line Equipment Numbers (six digits). Virtual Line can be accommodated to Group 24-31.
TEC: Telephone Class. TEC=18 (Virtual Circuit)
Assign the My Line of DtermIP station.
TEC: Telephone Class. TEC=12 (Dterm)
*RSC and SFC data for Virtual Line can be skipped.

STEP 19: **AKYD** - Assign the Virtual Line and My Line on the Line/Feature keys of DtermIP.
KYI=2 (Multiple Line) for both Virtual Line and My Line.
RG (Ringing information)=7 for Virtual Line.

Note: Be sure to assign the My Line as “Prime Line.”

STEP 20: **ACSI** - Assign the Virtual Line (Virtual Station Number) to be connected to when incoming call terminates from the C.O. line.
CSI=2 (Virtual Line Termination)

STEP 21: **AMKD** - Assign the C.O. trunk route and the Trunk Number to the Virtual Line (Virtual Station Number) of Trunk Line Appearance-D.
STN: Station Number of Virtual station
KYN: Key Number of Trunk Line Appearance-D. Fixed to KYN=1.
MTN: Trunk Line Appearance Number. Fixed to MTN=0.
KYI: Select 1=C.O. trunk.

Note: To originate a call from a station by this feature using MCMG/MG-COT/UG50, LCR/LCRS data (ANPD, ASPA, AFRS, AOPR, AMND, ARNP) needs to be set to MCMG/MG-COT/UG50.

T-28 Trunk-to-Trunk Third-Party Cancellation

General Description

This feature allows a Station to cancel an active Trunk-to-Trunk Connection (during a Three-way-Connection) and return to the Original Call.

Operating Procedure

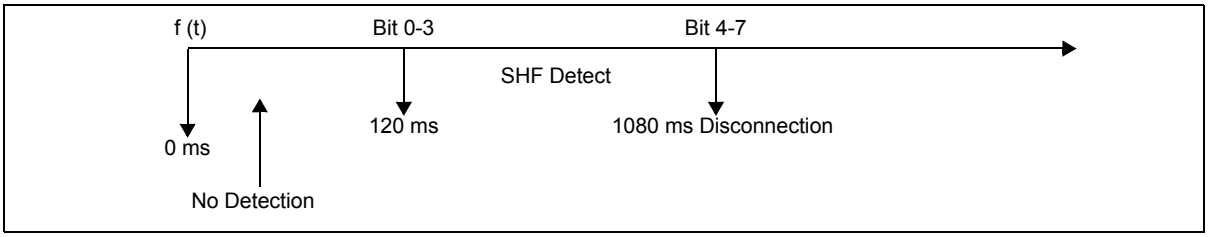
If a Station is presently engaged in a call with another Station or with a Trunk Party

1. Switch hook flash. Receive Special Dial Tone.
2. Dial a Trunk Access Code and the number for the desired Third Party. The Called Party is rung.
3. Switch hook flash to establish a Three-way Connection.
4. Switch hook flash to release the Trunk. The Station returns to the original call.

Service Conditions

1. The Third Party that can be canceled by this feature is an Outgoing Trunk seized by an outgoing access from CONSULTATION HOLD-ALL CALLS [C-17].
2. If a Broker's Call has been activated by a Dterm, the following restrictions apply:
   a.) In the case of CONSULTATION HOLD-ALL CALLS [C-17] outgoing (Station hold), the Third Party can be canceled as follows: Engaged in Station-to-Station Call ⟶ Three-Way Connection ⟶ Switch hook.
   b.) The Third Party cannot be canceled by the following sequence: Engaged in Station-to-Trunk Call ⟶ Three-Way Connection ⟶ Switch hook.
   c.) This restriction does not apply to CONSULTATION HOLD-ALL CALLS [C-17] outgoing (Trunk hold).

Programming



ASYD - System Data 1, Index 156. Trunk Soft Hold Timer A, used with Second Dial Tone Trunks. Assign data 00H for 30 seconds. (Data 31H may be used for a value of two seconds if CALL TRANSFER-ALL CALLS [C-11] is to be used immediately after connecting to the Trunk.) This is the time between Trunk Connection and when switch hook flash is allowed on a non-Senderized Trunk Connection.

System Data 1, Index 157. Trunk Soft Hold Timer A, used with Senderized Trunks. Assign data 00H for a value of 18 seconds. (Data 31H may be used for a value of two seconds, if CALL TRANSFER-ALL CALLS [C-11] is to be used immediately after connecting to the Trunk.). This is the time between Trunk Connection and when switch hook flash is allowed on a Senderized Trunk Connection. It is also used to determine when SMDR billing will begin.

System Data 2, Index 1, Bits 0 and 1. CONSULTATION HOLD allowed or denied? 00: Denied; 01: Originating and Terminating Calls allowed, Tandem Call denied; 11: All calls allowed. Normally assign data "11".

System Data 3, Index 2, Bits 0-3. switch hook flash starts timer. To calculate this value: (1 ~ FH) x 120 msec = Timer.

System Data 3, Index 2, Bits 4-7. Switch hook flash ends timer. To calculate this value: (1 ~ FH) x 120 msec = Timer. For both beginning and ending timers, assign 91H for 120 - 1080 msec.

T-62 Timed Reminder

General Description

This feature allows a Station user to set a Timed Reminder Call from the Station. The system calls up the Station at the designated time. When the Station answers the call, the Station user hears a message or Music-On-Hold.

Operating Procedure

To set a Timed Reminder Call

1. Lift a handset. Receive Dial Tone.
2. Dial the Timed Reminder (SET) Access Code.
3. Designate your desired time by dialing four digits. (for example, 16:30 → 1630)
4. Hear Service Set Tone or a recorded message which indicates the Timed Reminder Call has been set.
5. Hang up.

To cancel a preset Timed Reminder Call

1. Lift the hand set. Receive Dial Tone.
2. Dial the Timed Reminder (CANCEL) Access Code.
3. Hear Service Set Tone or a recorded message which indicates the Timed Reminder Call has been canceled.
4. Hang up.

To answer a Timed Reminder Call

1. A Station which has been set Timed Reminder starts ringing at the predetermined time.
2. Lift the handset.
3. Hear Music-On-Hold or a recorded message which indicates this call is a Timed Reminder Call.
4. Hang up.

Service Conditions

1. In the following cases, the Station user attempting to set/cancel this service receives Reorder Tone:
   a.) when SFI 41 of the service class is 0,
   b.) when CALL FORWARDING - ALL CALLS [C-5] is set.
2. The wake-up times are to be set at five-minute intervals. For example, if the user dials 1004, the wake-up time will be set at 10:00 a.m.
3. 500 Stations per Local Processor can be set for a single wake-up period. If the 500 Stations maximum is exceeded, the system will automatically set the wake-up time five minutes earlier (to the maximum of 75 minutes).
4. The wake-up time entered latest has the priority over the ones entered previously.
5. The no answer timer for the Wake-up Call is 30 seconds. After the no answer timer expires, no retry is performed.

   Note: No Answer Time is variable.(ASYD SYS 1 Index 139)

6. If the link block, etc. occurs while being recalled, no retry is performed.
7. When the Station is busy or lockout while being recalled, the Station is recalled three minutes after. This retry is repeated three times.

8. When CALL FORWARDING - BUSY LINE is set to the Station setting wake-up, the destination is recalled (except when the destination is not the Station Line, the Station setting wake-up is recalled). When the destination is busy, no retry is performed.
9. When the Announcement Trunk is blocked, the user receives music.
10. When the Timed Reminder Cancel Code is dialed, the user hears Service Set Tone or the announcement even when the service is not set.

Programming

STEP 1: **ASYD** - System Data 1, Index 139. No Answer Timer for Call Back. Assign 00H. (RAM Data is 3FH = 30 seconds.)

System Data 1, Index 162, Bits 6 and 7 tone type when a Timed Reminder Call is answered.

b7	b6	b7	b6
0	0 = Music-On-Hold	0	1 = Announcement

Note: When Music-On-Hold is selected, STEPs 4 through 8 are not required.

System Data 1, Index 163, Bit 7. Start time for Timed Reminder/Wake Up Call 0/1 = On time / 5min. earlier the appointed time.

System Data 1, Index 169, Bits 4. through 7. Maximum advancing time for Timed Reminder Calls, which becomes effective when the number of Stations which have appointed the same time exceeds the threshold value (maximum 500 STNs per LP or CPU). This value is set as follows.

5x N (min.) N ranges 0 to F (Hex).

STEP 2: **ASFC** - Allow this feature to proper Service Feature Restriction Classes (SFI 41). 0/1 = Restricted / Allowed

STEP 3: **ASPA** - Assign the following two Access Codes for this feature.

Timed Reminder (SET):SRV = "SSC: Service Code", SID = 48

Timed Reminder (CANCEL):SRV = "SSC: Service Code", SID = 49

STEP 4: **ARTD** - Assign Route Data for Announcement Trunk(s).

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as circuit card or VS32.

STEP 5: **ATRK** - Assign Trunk data for the Announcement Trunk(s).

STEP 6: **MBTK** - Make idle the assigned Trunk(s).

STEP 7: **ARSC** - Allow the Connection between the assigned Trunk(s) and Stations.

STEP 8: **AAED** - Assign Announcement Equipment data.

EQP = 16 (Timed Reminder Set-up Message)

EQP = 18 (Timed Reminder Cancel Message)

EQP = 22 (Timed Reminder/Wake Up Call Message for Announcement Trunk)

C: Duration of Connection

0/1: Disconnect in 30 seconds / The connection is held until the station releases.

R: Sending Ringback Tone

0/1: To be sent / Not to be sent

A: Answer Signal Sending

0/1: No answer from in coming Trunk / Answer from Incoming Trunk

M: Multiple Connection

0/1: Single / Multiple Connection

RT: Route Number TK: Trunk Number

Standard programming is as follows:

C = 1, R = 1, A = 0, M = 1

T-63 Tone Block

General Description

This feature allows the user of a Station (via analog adapter) or an Analog Station (PB) to restrict any call. This prevents interruption of data transmission, before the Connection.

Note: This feature is not available in Australia.

Operating Procedure

To set the service

1. Lift the handset. Receive the Dial Tone.
2. Dial the Access Code of "Data Privacy on Demand; Entry".
3. Hear the Special Dial Tone or the Dial Tone (depending on the System Data).
4. Dial the desired phone number.
5. The Called Party answers.

Note: This service may also be set during communication by performing a switch hook flash.

To cancel the service
When the operating user cancels this service during the communication in progress

1. Perform a switch hook flash (the Called Party is held).
2. Hear the Special Dial Tone.
3. Dial the Access Code of DATA PRIVACY ON DEMAND [D-17] cancel.
4. Hear the Service Set Tone.
5. Press the switch hook button to reconnect the Held Party.
6. Tone Block is canceled.

Service Conditions

1. This service is available for the Analog Station or the Desktop terminal with analog adapter.
2. If the Station user stops to transfer a call in the middle of the operation, this service is not canceled.
3. This service is canceled when the Station, which has been set Tone Block, is released from the Connection.
4. Services to be restricted by setting Tone Block service are shown below.

ATTENDANT CAMP-ON WITH TONE INDICATION	[A-1]
BUSY VERIFICATION	[B-3]
EXECUTIVE RIGHT-OF- WAY	[E-1, 1D]
CALL WAITING TERMINATING	[C-12]
CALL WAITING - ORIGINATING	[C-31]

Interactions

1. When TONE BLOCK is set to the Desktop terminal which is assigned the DO NOT DISTURB (DND) Feature key, the lamp of the DND Feature key flashes. When the DND Feature key is pressed, the lamp goes off and the TONE BLOCK service is canceled.
2. A user can activate the current service for restricting a call (Data Privacy On Demand) as usual by:
   a.) dialing the Access Code for entry or cancel the service during communication, or
   b.) pressing the DND Feature key for entry or cancel the service.

Programming

STEP 1: **ANPD** - Reserve a Number Level for Feature Access and cancel. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan.

STEP 2: **ASPA** - Assign the Access Code for Tone Block as shown below:

CI = “H: Hooking”, SRV = "SSCA: Service Code Appendix", SIDA = 48 (Data Privacy on Demand; Entry)

CI = “H: Hooking”, SRV = "SSCA: Service Code Appendix", SIDA = 49 (Data Privacy on Demand; Cancel)

CI = “N: Normal”, SRV = "SSCA: Service Code Appendix", SIDA = 48 (Data Privacy on Demand; Entry)

STEP 3: **ASYD** - Assign the System Data.

System Data 1, Index322, Bit 6

0 = SPDT is sent after dialing the Access Code for this service.

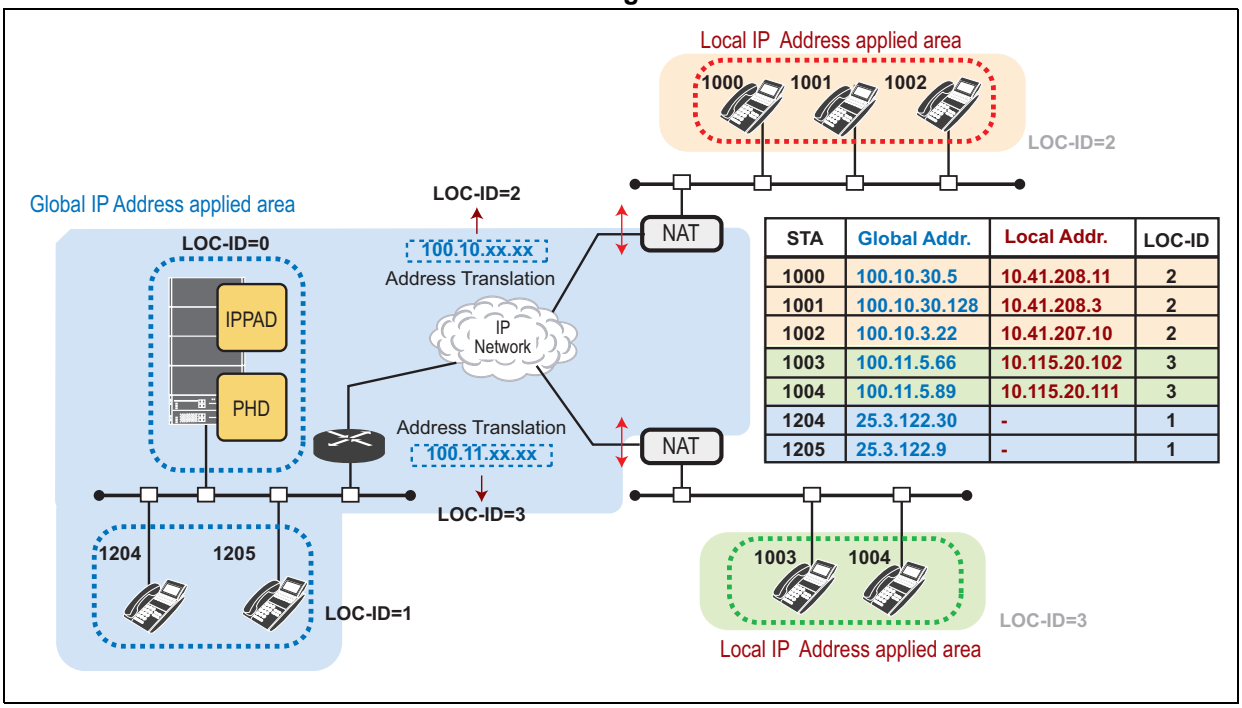
1 = DT is sent after dialing the Access Code for this service.

T-64 Terminal Login via NAT

General Description

This feature is to translate a local IP address used within one network to a global IP address known within global network.

Service Conditions



IP terminals can be connected over NAT when the network is under the following conditions:

- ASYDL, SYS 1, Index 824, Bit 6 = 1 is set.
- Global IP Address is assigned to MGC and the related devices such as PH, IPPAD circuit cards. (private IP Address can be assigned to IP terminals only.)
- As an address translation method, Basic NAT is used. (IP Masquerade is not supported.) Global IP address is assigned to an IP terminal placed in Local Network when NAT is performed. Only one single local IP address can be translated to one single global IP address.
- Global IP Address that is assigned to IP terminal does not change when the terminal has logged in.
- All IP terminals under a NAT device are assigned an identical LOC-ID. (Service features based on LOC-ID such as Bandwidth Control by Location ID cannot be used under the NAT.) LOC-ID is assigned to Global IP Address.

MGC can recognize if IP Address Translation was performed or not by comparing the Own IP Address of Initial Setup Request message with the source IP Address of the IP header. The terminal recognizes the global IP Address by Registered Address that was enclosed in the registration transaction.

The need of Address Translation is determined by comparing the two party's LOC-IDs. If the LOC-IDs are not the same, the Global IP Address is used. Otherwise, Local IP Address is used.

Terminal Login via NAT

STA	Global Addr.	Local Addr.	LOC-ID
1000	100.10.30.5	10.41.208.11	2
1001	100.10.30.128	10.41.208.3	2
1002	100.10.3.22	10.41.207.10	2
1003	100.11.5.66	10.115.20.102	3
1004	100.11.5.89	10.115.20.111	3
1204	25.3.122.30	-	1
1205	25.3.122.9	-	1

Programming

STEP 1: **ASYDL** - System Data 1, Index 824, Bit 6
1 = Peer-to-Peer Connection under NAT environment is in service **Note 1**, **Note 2**

When Peer-to-Peer connection within a private network is used, set b6 to 1.

Note 1: This bit allows Peer-to-Peer connection within the private network that is located under NAT environment, where MGC is located in global address side. Set this bit to 0 in the following cases:
- When unsupported network configuration such as Virtual Private Network (VPN) is used
- When NAT method other than Basic NAT (i.e. IP Masquerade) is used

Note 2: When Bit 6 is set to 0, global address is specified at the time of registration.

STEP 2: **ALOCL** - Assign LOC-IDs to Global IP Addresses. **Note 3**

Note 3: When NAT is used in the network, assign an identical LOC-ID to IP terminals under the NAT device.

T-65 Terminal Claim Handling

General Description

This feature allows users to send a claim notification (such as one against voice quality) by using the Desktop terminal. The user claim is output to SNMP manager and/or the EVLOG command to notify the maintenance personnel.

Operating Procedure

To operate Terminal Information/Terminal Claim Handling Feature

1. Push the Soft key or the Feature key assigned as a CLAIM or TERMINAL INFO Feature key to display a screen, which shows terminal's IP address (Terminal Info) or which requests user input for terminal information and Terminal Claim Handling information (Claim Menu).
2. If the Claim Menu is selected, enter "1" (Yes) or "0" (No) to select an item. To return to terminal mode, push the Soft key assigned as a CLAIM Feature key.

   Note: For Softphone, pressing "1" from keyboard does not send a trap. It works from the display keypad.

3. By pressing the Soft key or the Feature key assigned as a TERMINAL INFO key, the claim is sent to the SNMP manager as the TRAP packet and EVLOG command.

For more information about the way of outputting to SNMP manager, refer to SNMP [S-148] in this manual.

To display the terminal communicating status

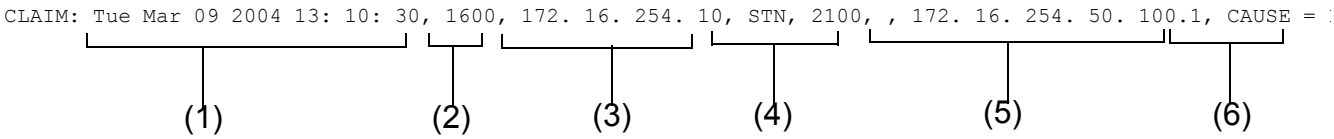
1. Dial a destination number.
2. When opposite party answers the call, press the CALL INFORMATION DISPLAY Feature key assigned as FKY or a Soft key. Otherwise, press the TERMINAL INFORMATION SELECTION Feature key, then press "1".

3. LCD display on DtermIP changes from the regular display to Call Information Display.
   - Displayed information is automatically updated every five seconds.
   - A displayed item can appear on the first line by pressing its corresponding Digit key.

Lost Packet (0-99999999)
: If the value is over eight digits, "99999999" is displayed.
Codec
: G711/G711a/G723/G729a

Note: During conversation, the current packet loss is displayed dynamically every 5 seconds. When on-hook and press the CALL INFORMATION DISPLAY Feature key, the total number of packets lost is displayed.

4. On the third line, Up/Down/Exit of a Soft key is displayed. If Down is pressed, the third item (Payload) as follows is displayed.



```
2. Codec        : G711
3. Payload      : XXXX
UP    DOWN        Exit
```

Payload Size (0-60ms)
: The range of the number is displayed in 10ms units.

5. Press the Exit key in the Soft key to change back to the Regular Display.

[Detailed information of SNMP Manager and EVLOG command]

The output format of claim information is in the following:

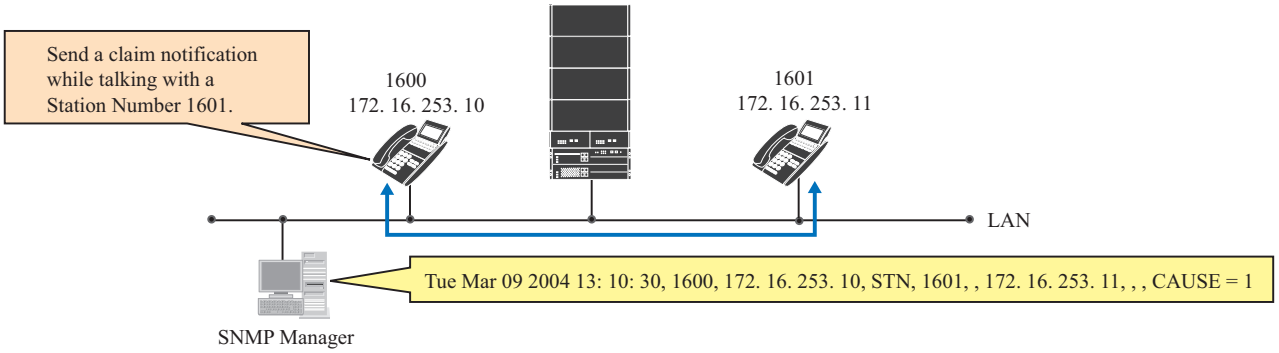
The claim message indicates that Station Number 1600 (IP address: 172.16.254.10) claimed "cut-off" while talking with another Station Number 2100 via IPPAD (C_RT=100, C_TK=1, IP Address: 172.16.254.50).

(1) Time when a claim notification has been received is indicated.

(2) Station Number that has sent a claim notification is indicated.

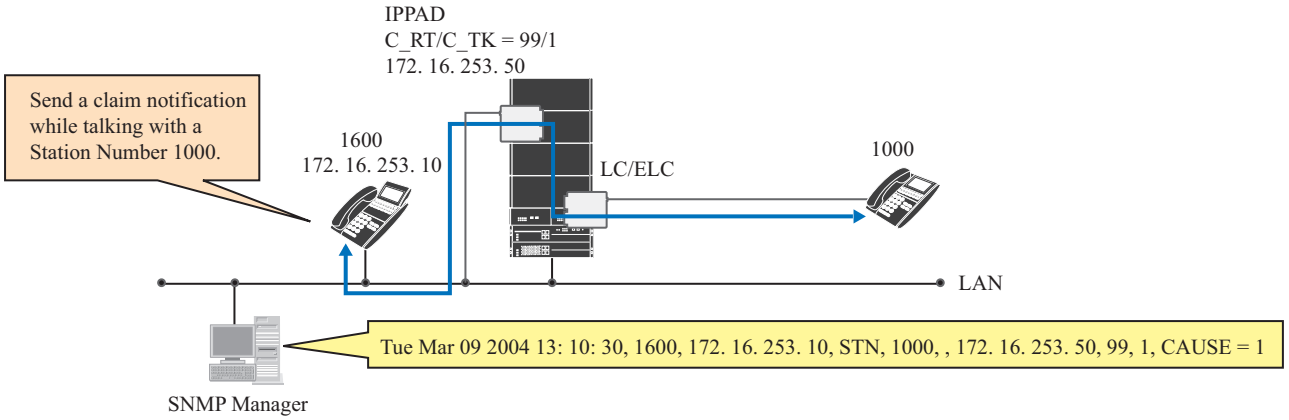
(3) IP Address of Station that has sent a claim notification is indicated.

(4) In the case of Extension-to-Extension connection, station number of opponent is indicated.
In the case of Trunk connection, route/trunk number is indicated.



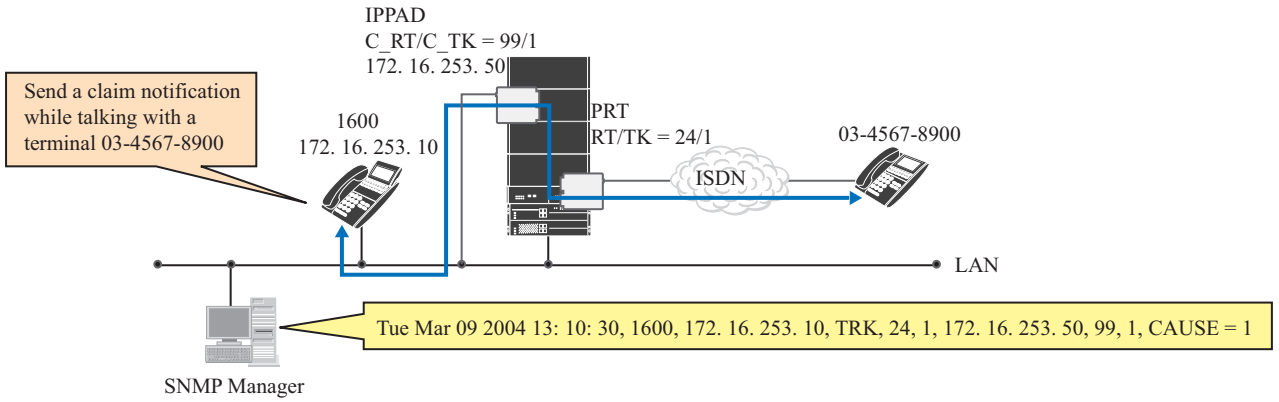
(5) IP Address of opposite system connected on the IP connection. In the case of speech via IPPAD, connection route and trunk number of the IPPAD are indicated.

(6) Contents of Claim are indicated. (Such as No Tone, Echo, Voice Cut, Delay, Noise, Low Volume, High Volume, One-way Speech, and Distortion)

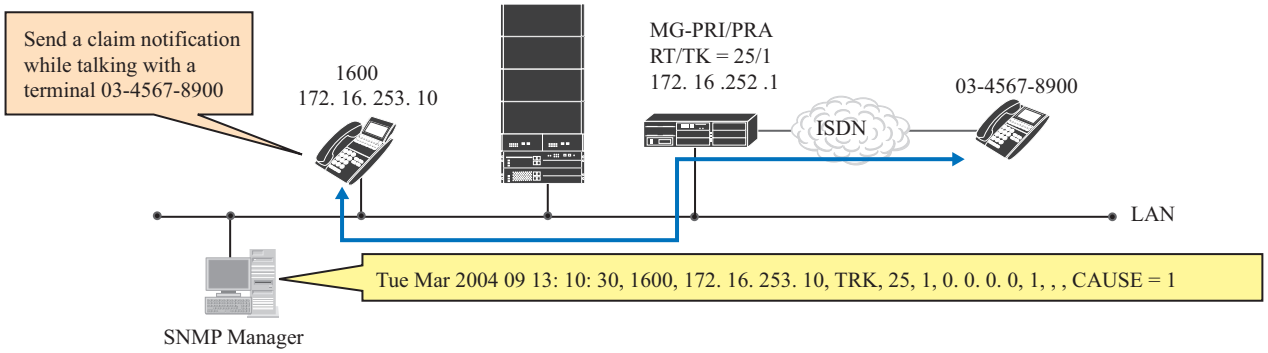


Available characters on SNMP Trap Display are up to 128 characters in ASCII format. Each parameter is separated by comma (,). Detailed information of EVLOG command are followed after “CLAIMS:”.

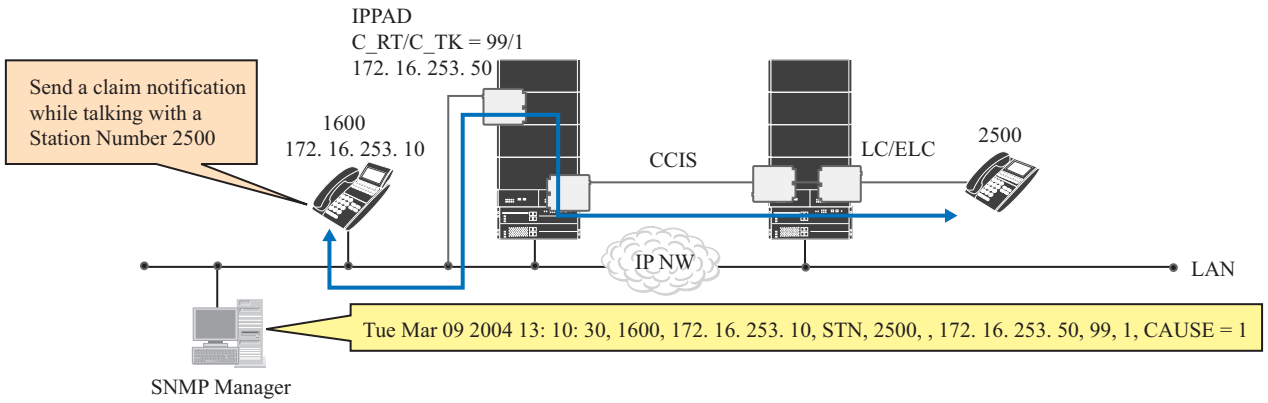
[OUTPUT IMAGE]



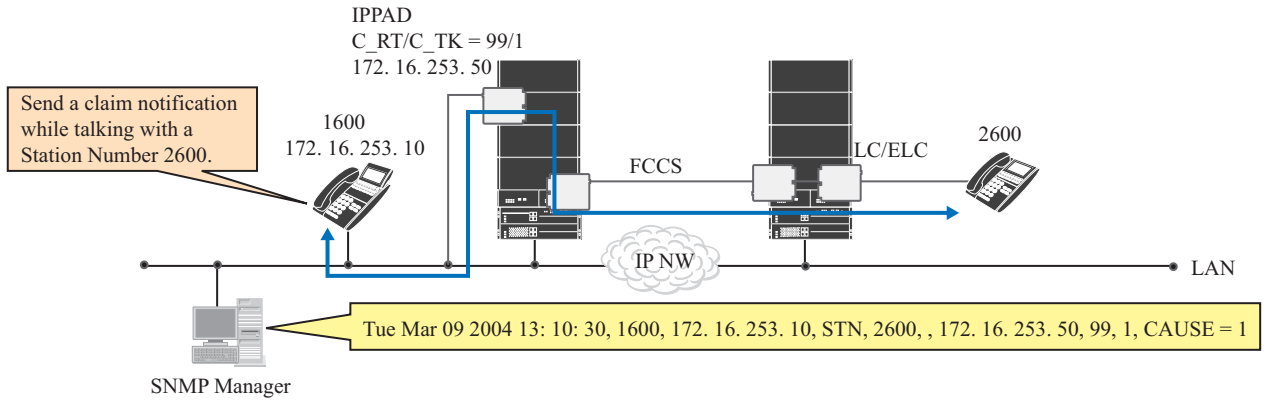
Example 1) When IP Station and IP Station are used



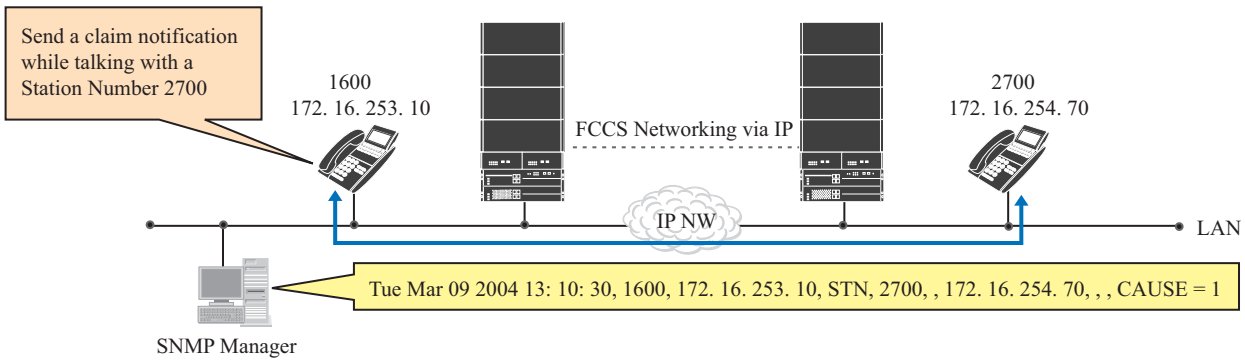
Example 2) When IP Station and Digital Terminal accommodated in a Node



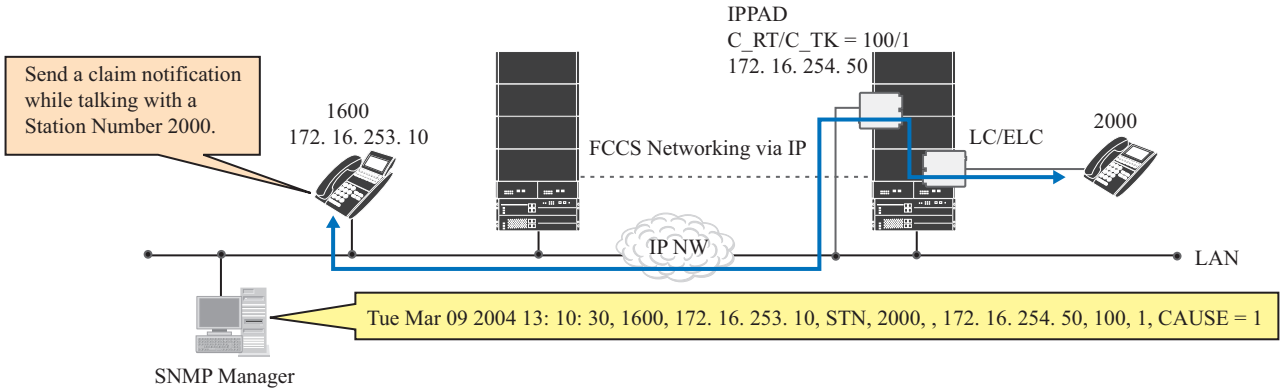
Example 3) When IP Station and Telephone connected to ISDN via Trunk



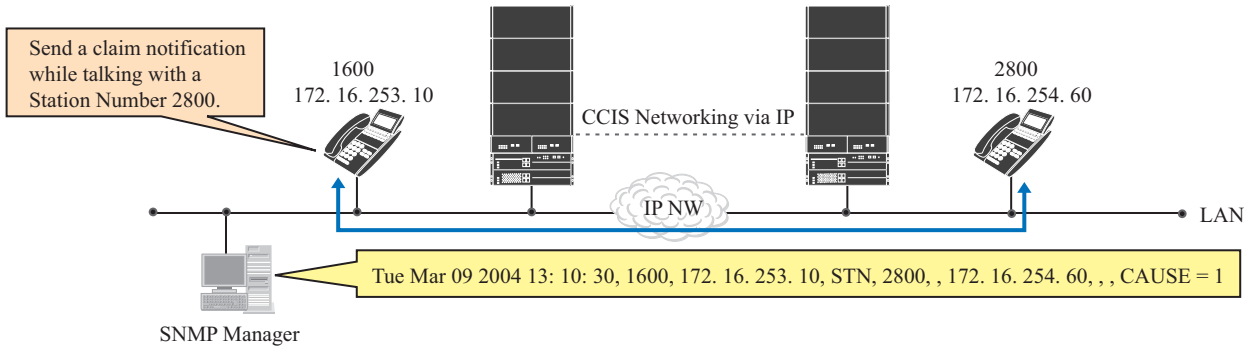
Example 4) When IP Station and Telephone connected to ISDN via MG-PRI



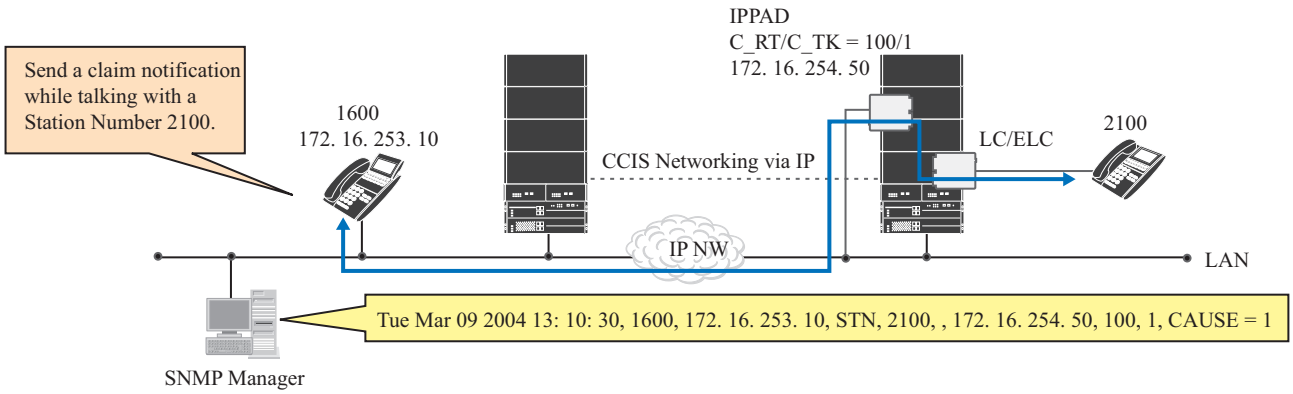
Example 5) When IP Station and Digital Terminal connected via CCIS



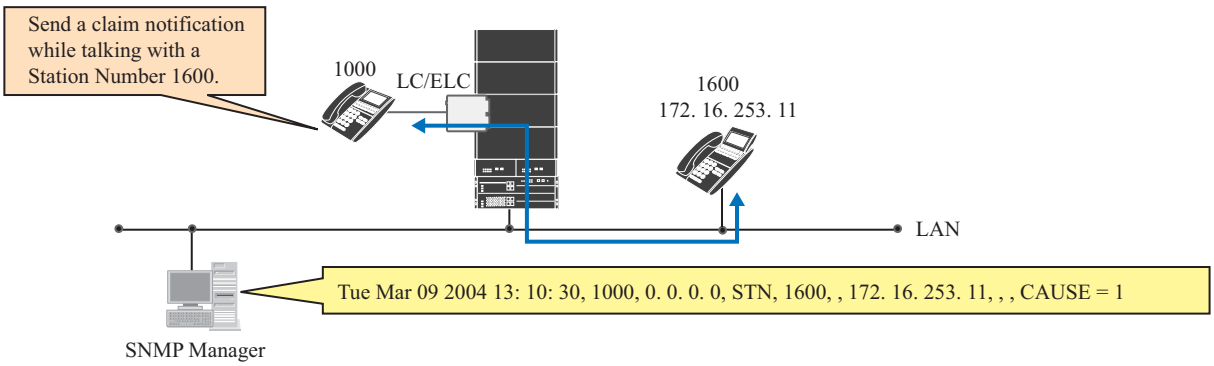
Example 6) When IP Station and Digital Terminal connected via FCCS



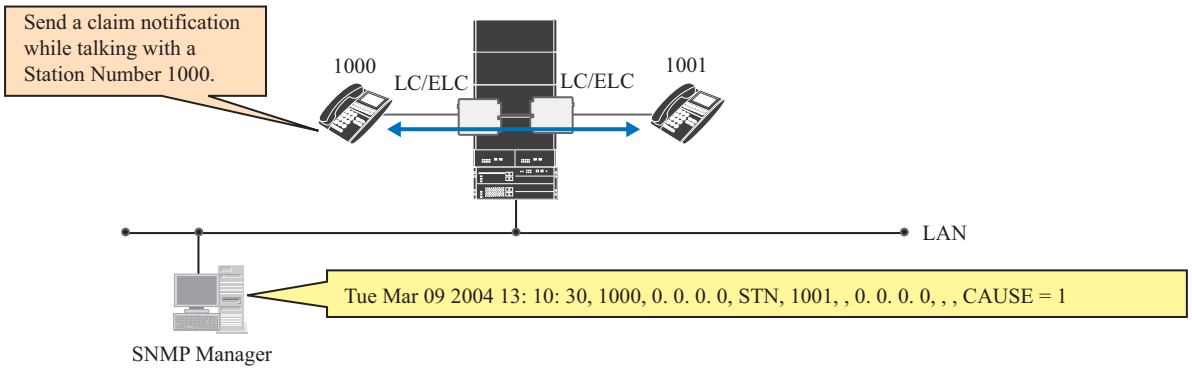
Example 7) When IP Station and IP Station are connected via FCCS Networking via IP



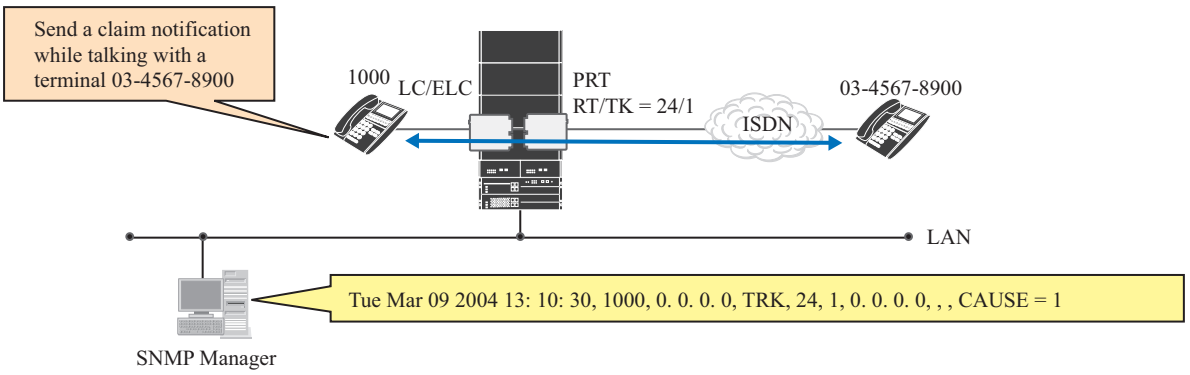
Example 8) When IP Station and Digital Terminal are connected via FCCS Networking via IP



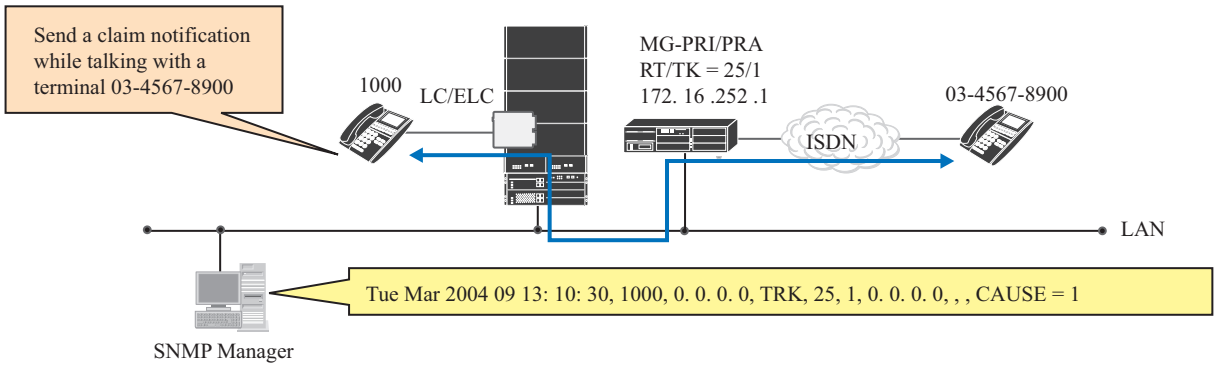
Example 9) When IP Station and IP Station are connected via CCIS Networking via IP



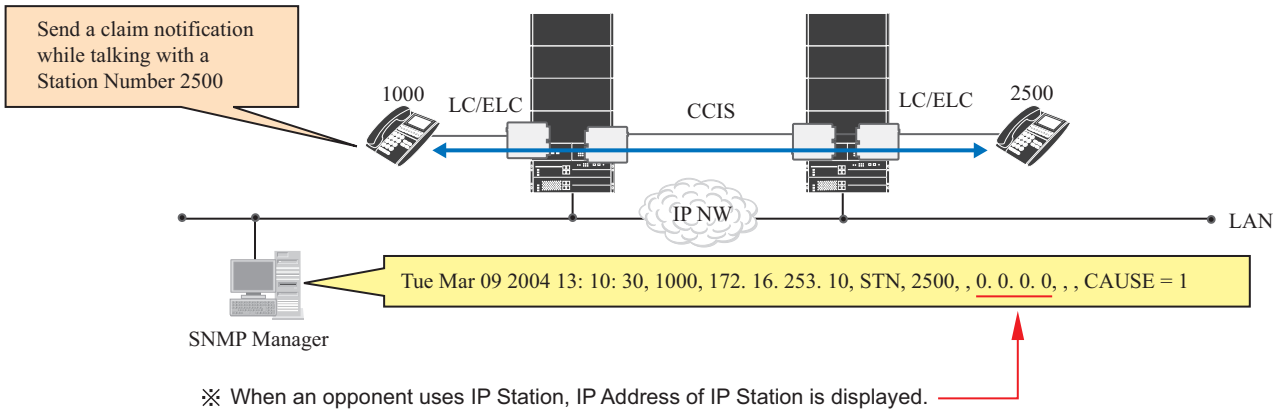
Example 10) When IP Station and Digital Terminal are connected via CCIS Networking via IP



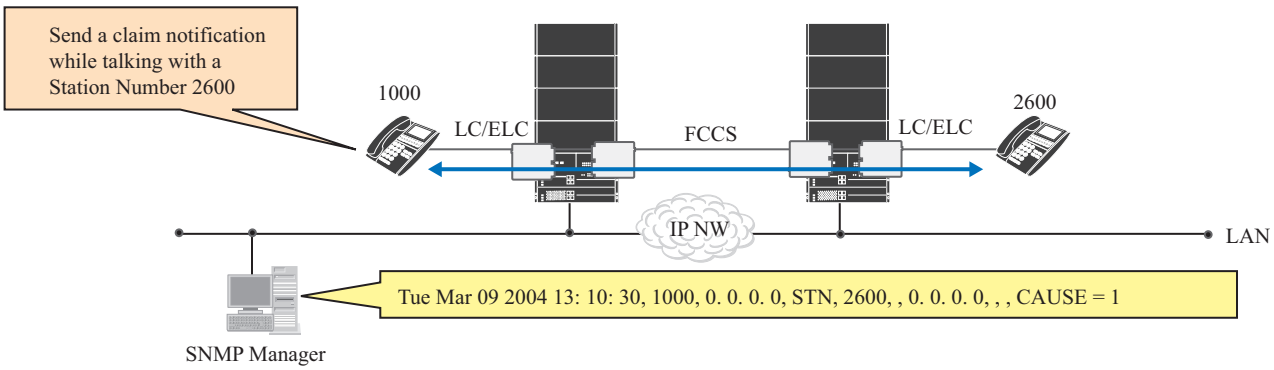
Example 11) When IP Station and Digital Terminal accommodated in a Node are connected



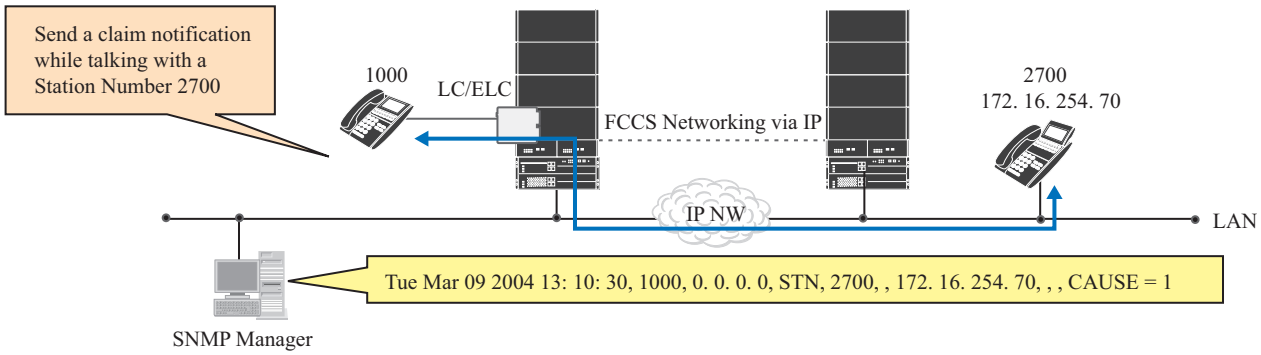
Example 12) When Digital Terminals accommodated in a Node are connected



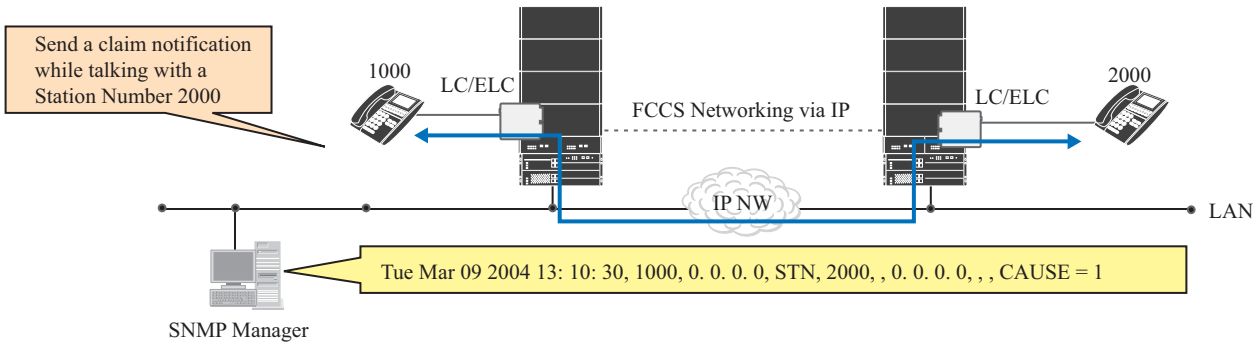
Example 13) When Digital Terminal and Telephone connected to ISDN via Trunk are connected



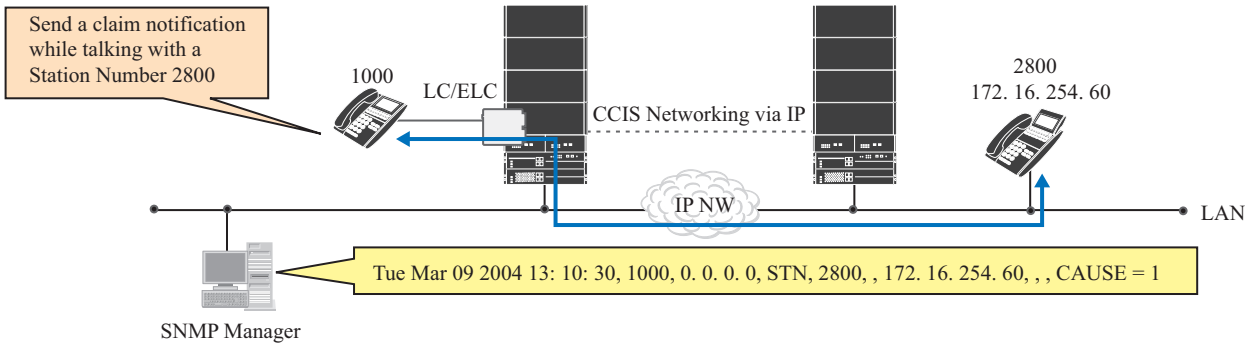
Example 14) When Digital Terminal and Telephone connected to ISDN via MG-PRI are connected



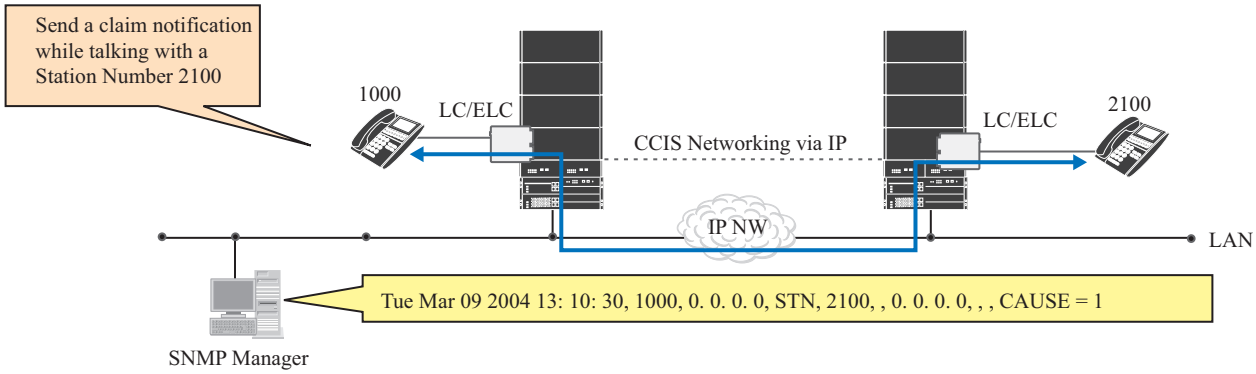
Example 15) When Digital Terminals via CCIS are connected



Example 16) When Digital Terminals via FCCS are connected



Example 17) When Digital Terminal and IP Station are connected via FCCS Networking via IP



Example 18) When Digital Terminals are connected via FCCS Networking via IP

Example 19) When Digital Terminal and IP Station are connected via CCIS Networking via IP

Example 20) When Digital Terminals are connected via CCIS Networking via IP

Service Conditions

1. Since this service utilizes OAI functionality, refer to Data Programming Manual - OAI.
2. The number of external OAI connections is normally up to 16. However, when one internal OAI connection is used, the number of external connections is limited to 15.
3. This feature is available on the Desktop terminal with LCDs.
4. After the system has been initialized, first-push of CLAIM Feature key or INFO Feature key is inactive due to OAI MSF specifications.
5. When the Digital Terminal sends a claim notification, IP address is not displayed.
6. In the case of ISDN Line with MG-PRI, IP address of MG-PRI is not displayed.
7. IP Station information call display cannot be performed during speech. However, the information from the system is stored in the terminal. Pushing the Soft key replaces it with the latest information.
8. If a Station in a standby status activates the IP Station information call display, the previous information is displayed. When Station activating the IP Station information call display starts to speech, the previous information is cleared, then the information on progress call starts to be collected.
9. When network congestion causes the communication trouble, Network Busy is displayed on the second line.
10. SP-PHD is required for using IP Station information call display.
11. When the system is switched to SR-MGC, this feature depends on the firmware version of the SR-MGC.
12. While IP Station information call display is displayed, if assigned IP address is expired or a file is being downloaded, call information display is active but the call information display is overwritten with "IP Address Expired" or "Downloading".
13. The number of packet loss will be counted at that time speech is started or finished, depending on network status.
14. While a terminal is displaying the terminal communicating status, terminal information, and terminal claim handling, because the terminal is switched to terminal-control status, other features such as Transfer on the terminal cannot be performed.
15. The only 10-key panel can be used in idle status in Softphone for the selection of the Claim Menu. The numeric keypad of the PC cannot be used.
16. Use the Online Monitoring Feature when using this feature for DtermIP (SIP) or DT800/DT700 Series.

Programming

STEP 1: **ASYD** - Assign data as shown below:
SYS1,
Index 31, Bit 0-3: Mounted Capacity of Common Memory
04H: For Telephony Server with OAI name display
05H: FLF FCCS service is used in OAI features
Index 79, Bit 6=0 (Enable OAI/ACD Service)
Index 207, Bit 0=1(ACDP/IP is mounted), Bit 1=fixed to 0

STEP 2: **ASYDL** - Assign data as shown below:
SYS1,
Index 513 (01H is fixed at Local Data Memory)
Index 864,
Bit 0=1 (Built-in IP or ACDP is used)
Bit 4=1 [Assign eight ports of Status Monitoring for terminal (SMFN)]
Bit 5=0 (Clear SMFN when the FCCS Link down)

Note: The following Index 965 must be assigned after the data described above has been assigned.

Index 965,
Bit 3=1 (Internal Claim Handling Server is enabled)

- When assigning a Feature key as a CLAIM Feature key

STEP 1: **AOKC** - Assign the OAI Key code as follows:
KEY-CODE: OAI Key Code
F-KIND=1 [Terminal Mode Set Facility (MSF)]
C-TONE=0/1 (Chime Control on Normal End of MSF, TMF, and OAI are controlled/not controlled)
OP-CODE: Operation Code (See the table below.)

STEP 2: **AKYD** - Assign the data when the Feature key is assigned as a CLAIM Feature key.

Table 0-1 AKYD and AOKC Compatible Sheet

AKYD	AOKC	
Function Key	**OAI Key Code (KEY-CODE)**	**Operation Code (OP-CODE)**
34	1	
35	2	
36	3	
37	4	
38	5	
39	6	
40	7	
41	8	
42	9	
43	10	
44	11	
45	12	
46	13	
47	14	

OP-CODE	OPERATION	DISPLAY
170	Top Menu	Push 1-9, #=Menu
171	Terminal Information	IP Address Display → Local Mode
172	Claim Menu	**Claim Menu**

To delete the attributes, take the opposite way described in the above.

- When assigning the Soft key as a CLAIM Feature key

STEP 1: **AOKC** - Assign the data as shown below:
KEY-CODE: OAI Key Code
F-KIND=1 [Terminal Mode Set Facility (MSF)]
C-TONE=0/1 (Chime Control on Normal End of MSF, TMF, and OAI are controlled/not controlled)
OP-CODE: Operation Code

STEP 2: **AFDD** - Assign the data as shown below:
FKY: Assign the Function Key Code specified by the AOKC command.
DSP: Display Message on LCD

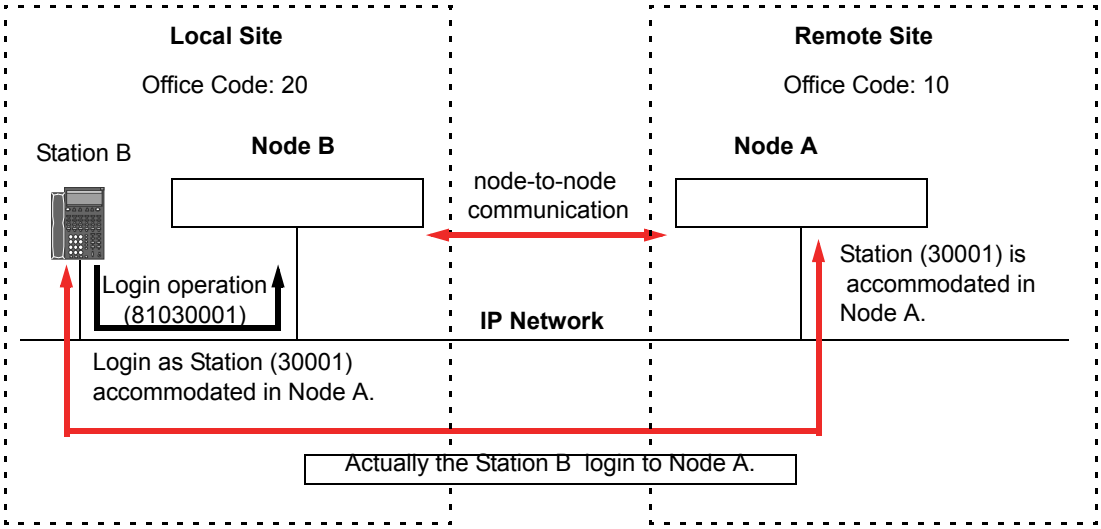
Operation Code (OP-CODE)	LCD Display (DIS)
170/173	INFO
171/174	STAT
172/175	CLM

Note: Up to six characters can be used per Soft key. However, if six characters are determined, it might be difficult to distinguish one from the next one.

STEP 3: **ADKS** - Assign the data as shown below:
The following are assigned if Soft Key Pattern other than default value (0) is used.
TN: Assign Tenant Number to be used for Terminal Claim Handling
STN: Assign Station Number to be used for Terminal Claim Handling
SKP: Assign Soft Key Pattern to be used for Terminal Claim Handling
LKP: Assign Line Key Pattern to be used for Terminal Claim Handling
PG: Enable/Disable LCD Page (PG) to be used for Terminal Claim Handling

STEP 4: **ADSL** - Assign the data as shown below:
SKP: Assign Soft Key Pattern specified by the ADKS command.
SN: Assign 0 (Empty) or 1 (Busy) in Status Number.
SKN: Assign Soft Key Number corresponding with OAI Key Code. The key number specified here should be the same key number assigned by the AOKC command.

T-66 Terminal Remote Login



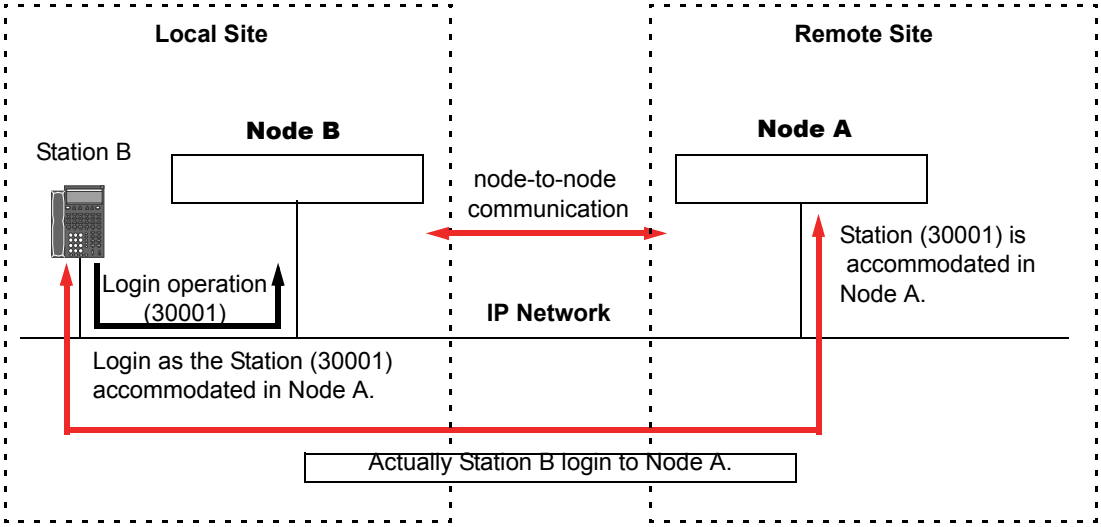
General Description

This feature allows a DtermIP to log in to the Remote Node without any change of the terminal settings.

Operating Procedure

There are two types of Login operations from DtermIP.

(a) CCIS over IP Network adopting the Open Numbering Plan
<Example>
- Access Code for outgoing: 8
- Station Number: 30001 (Accommodated in Node A)



Enter the Access Code + Office Code + Station Number at Login prompt. And enter the password that is for the Station "30001" of Node A. Example of display is shown below.

```
Login    :  81030001
Passwd   :       *****

Cancel  BK  Set  OK
```

(b) FCCS over IP Network adopting the Closed Numbering Plan
<Example>
- Station Number: 30001 (Accommodated in Node A)

Enter the Station Number at Login prompt. And enter the password that is for Station "30001" of Node A. Example of display is shown below.

```
Login   :    30001
Passwd  :    *****

Cancel  BK  Set  OK
```

Service Conditions

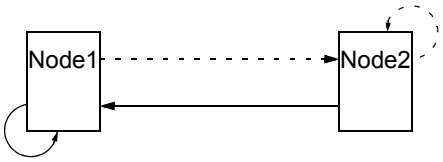
1. In the case of CCIS over IP network, assign the numbering (LCR) data (Maximum 16 digits) to access to Remote Site from Local site.
2. In the case of tandem connection, the number of hops is up to 16.
3. This feature is available when FCCS over IP network or CCIS over IP network is established between the Local site and the Remote site. If the maximum number of nodes is 64, CCIS - FCCS Co-existing Network is available.
4. If the number of offices installed is fewer than 64 nodes, networks with office numbers and networks without office number can coexists in the same network.
5. The following should be specified before this feature is performed.
   - Registration Ports of DtermIP must be available on two-way communication
   - All the Registration Ports of the Nodes performing this feature should be the same port number.

6. When CCIS over IP is used between nodes, LCR setting is required for login to the nodes.
7. The Local and Remote Node must be connected through the IP Network. Certain port numbers used by DtermIP must be open or free among sites. (Those ports should not be blocked by firewalls.)
8. This feature is not available via SV9300/SV8300/NEAX 2400 IPS.
9. When Q-sig is the first choice and CCIS over IP is the second choice, this feature does not work. To avoid this, program another CCIS over IP route as the first choice and make busy all trunks in the route.
10. If the terminal key data is changed after the login through this feature, the terminal is automatically reset (After the reset, Login prompt is displayed on the LCD of the terminal). To log in to the same Station after the reset, press the Yes key when "OVERRIDE?" is displayed on the LCD of the terminal.
11. For "Login", enter the number that can be used when originating a call to the login destination from the operating terminal.
12. When the user logs out with the LOGOUT Feature key during Remote Login operation, the first log-in operation for the same node will end in failure within three minutes of the log-out operation.
13. This feature is available for DtermIP(SIP) with firmware v.2.0.4.0 or later.
14. When SIP TERMINAL AUTHENTICATION [S-152] is used, this feature cannot be performed.
15. Login Code feature, which you can log in with an attribute number instead of Station Number, is available for an FCCS over IP network. For more details, refer to LOGIN CODE [L-56].
16. This feature does not work in case of CCIS over IP Network adopting the Closed Numbering Plan.

Programming

To call up the stations in the Self Node (where the particular station is accommodated) from any Local Nodes, LCR or FCCS over IP data setting is required. Before proceed the data programming for this feature, be sure the following setting has been completed:

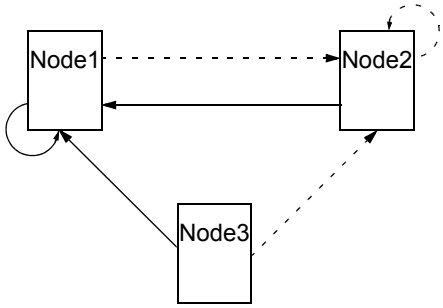
- LCR data setting (see the LCR/LCRS section in Chapter 2 of this manual)
- FCCS over IP data setting (see Data Programming Manual - FCCS)



STEP 1: **ADTM -** Activate Remote Login Handler
Options - Activation Setting of Internal Server
Check box for Remote Login

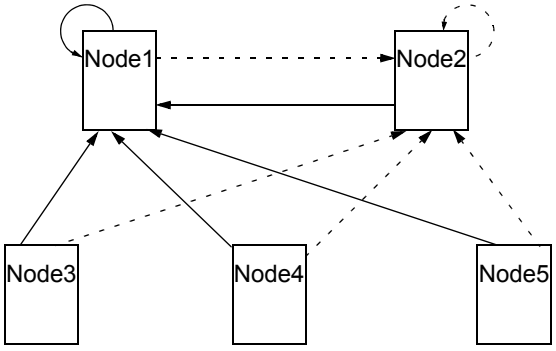
STEP 2: **ADTM** - Assign of Data for TCP/IP Module. **Note 3, Note 4**
Options - Registration Service
MGC Search Address 1: Enter the IP address 1 according to the examples mentioned below
MGC Search Address 2: Enter the IP address 2 according to the examples mentioned below
Consecutive Login Failure Threshold [0-15]
Password Encryption [MD5(Default)/Proprietary]

Note 3: Assign the same IP address (ACT) that has been assigned in the "REG" parameter of "Configure Application Port" under "Options" tab in the same node.



Note 4: Either the IP address of LAN1 (ACT) or LAN2 (ACT) can be chosen as the MGC Search Address. Note, however, that LAN2 is used when the existing IPX or SV7000 network is migrated to the SV9500 network. For more details about migration, refer to "Migration Guide". In the following examples, LAN1 is used.

- In case of two nodes in the network



Node	IP Address1	IP Address2
Node1	IP Address of Node1 (Self Node) (IP Address of LAN1 (ACT))	IP Address of Node2 (IP Address of LAN1 (ACT))
Node2	IP Address of Node1 (IP Address of LAN1 (ACT))	IP Address of Node2 (Self Node) (IP Address of LAN1 (ACT))

- In case of three nodes in the network

Node	IP Address1	IP Address2
Node1	Address of Node1 (Self Node) (IP Address of LAN1 (ACT))	Address of Node2 (IP Address of LAN1 (ACT))
Node2	Address of Node1 (IP Address of LAN1 (ACT))	Address of Node2 (Self Node) (IP Address of LAN1 (ACT))
Node3	Address of Node1 (IP Address of LAN1 (ACT))	Address of Node2 (IP Address of LAN1 (ACT))

- In case of more than four nodes in the network

Node	IP Address1	IP Address2
Node1	Address of Node1 (self node) (IP Address of LAN1 (ACT))	Address of Node2 (IP Address of LAN1 (ACT))
Node2	Address of Node1 (IP Address of LAN1 (ACT))	Address of Node2 (Self Node) (IP Address of LAN1 (ACT))
Node3	Address of Node1 (IP Address of LAN1 (ACT))	Address of Node2 (IP Address of LAN1 (ACT))
Node4	Address of Node1 (IP Address of LAN1 (ACT))	Address of Node2 (IP Address of LAN1 (ACT))
Node5	Address of Node1 (IP Address of LAN1 (ACT))	Address of Node2 (IP Address of LAN1 (ACT))

T-67 Timed Forced Disconnect Trunk

General Description

This feature will disconnect a trunk from a Station after a predetermined time elapses.

Note: This feature is available in North America and Asia.

Operating Procedure

No Station user operation is required for this feature to function.
When a Station is connected to a trunk for the predetermined (by ASYD timer) amount of time, the caller will be sent a warning tone (800hz for 500msec). After 30 seconds, the caller is then disconnected.

Service Conditions

1. SMDR must be in-service on the route for this service to function.
   a.) For incoming SMDR, set SMDR2 = 1 in ARTD.
   b.) For outgoing SMDR, set SMDR =1 in ARTD.
   c.) ASYD, System Data 2, Index 3 must also be set for SMDR in-service.
2. Emergency (911) routes should not have the service set.
   a.) ARTI data for FDISC should be set = 0.
3. The warning tone will be sent to the Station in any state of connection or tone.
   a.) This may interrupt some other service, such as Dial tone in a Consultation hold dialing state.
4. This feature timer is based on trunk connection so if the call is transferred or forwarded the timer starts from the first answer supervision for the trunk.
5. This feature is not available for PS or BRI Stations.
6. When the disconnection occurs the Stations state will respond like the trunk released.
7. The timer for this service will run every 30 seconds. Because of this the time before the warning tone is sent can very up to 30 seconds.
8. This feature is available for the following lines.

   - Analog COT via COT circuit card or MG-COT
   - MFC-R2
   - ISDN via PRT circuit card or MG (PRI)
   - CCIS over IP (Internal PHC)

Programming

STEP 1: **ARTD/ARTDN** - For routes using this service.
Assign SMDR = 1 for SMDR service.
Assign SMDR2 = 1 for incoming SMDR service.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or MG.

STEP 2: **ASYD** - System Data 1, Index 32, Bit 7 = 1 for SMDR in service.

STEP 3: **ARTI** - For each route using this service.

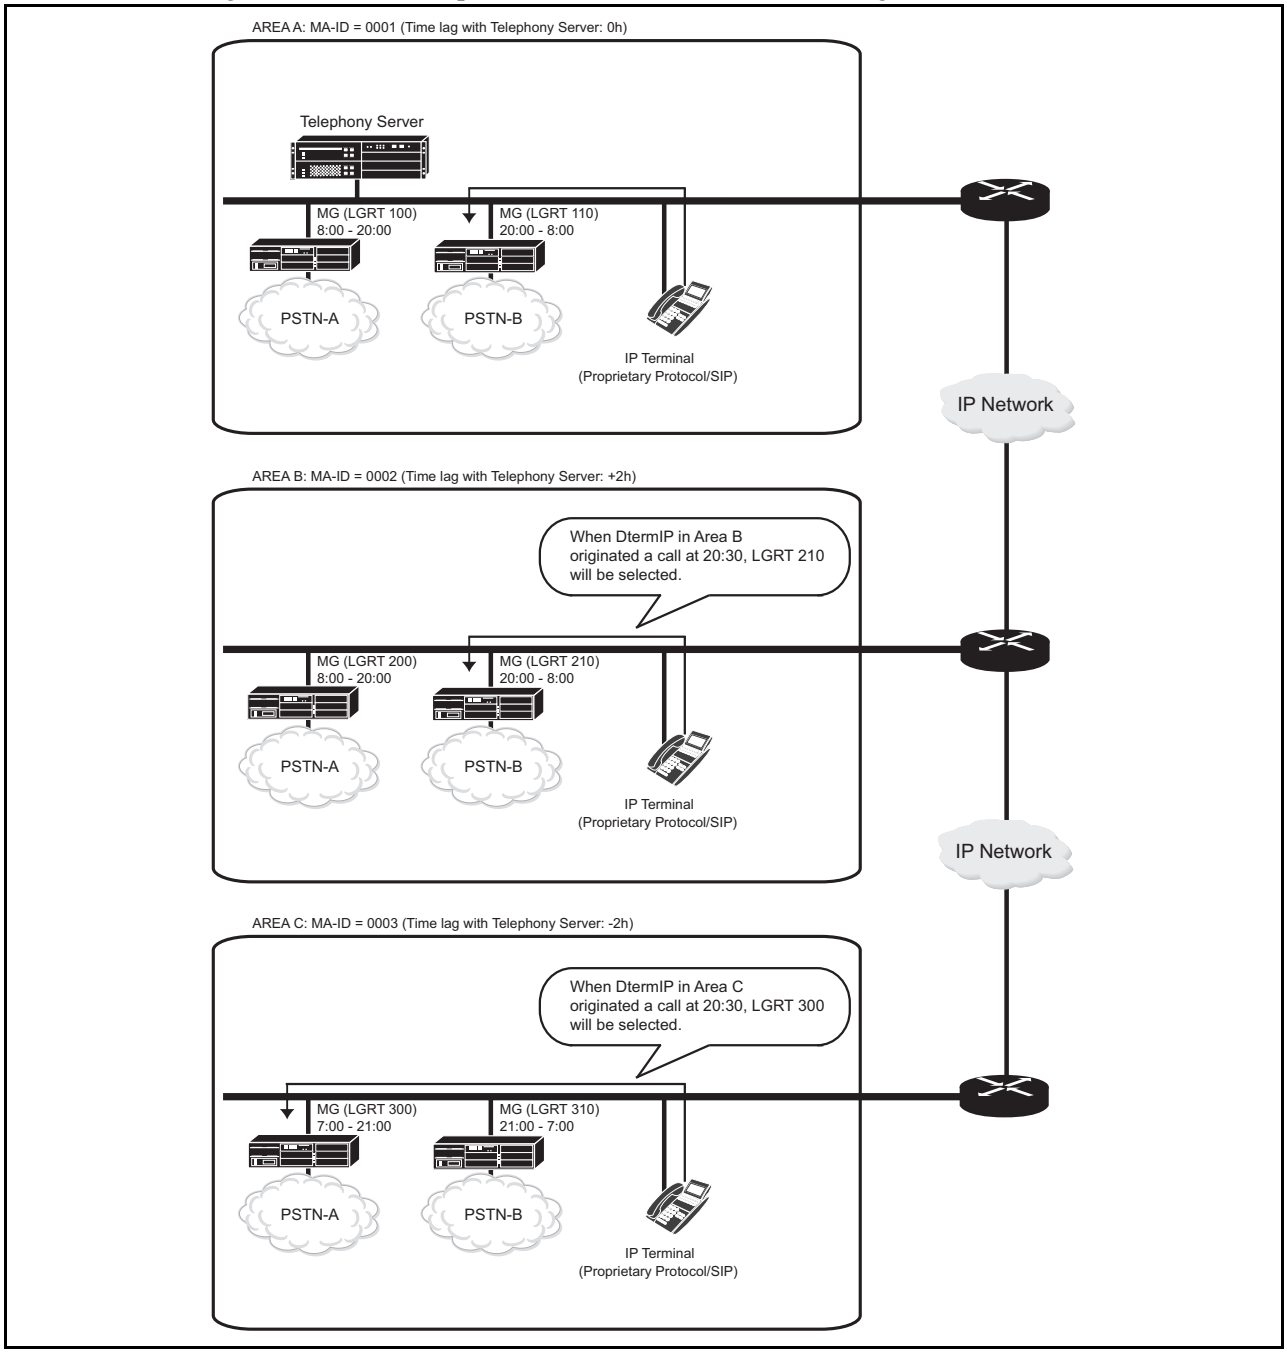
FDISC= 0 for no Forced Disconnect on this route.
1 for Forced Disconnect only on outgoing calls.
2 for Forced Disconnect only on incoming calls.
3 for Forced Disconnect on incoming and outgoing calls.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or MG.

STEP 4: **ASFC** - For Service Feature Restriction Classes using this service.

SFI 226 = 0 Forced Disconnect is out of service.
1 Forced Disconnect is in service.

STEP 5: **ASYDL** - System Data 1, Index 552, Bit 6: 0/1 = Forced Disconnect out of service/in service.
System Data 1, Index 552, Bit 7: 0/1 = Do not register 11-A alarm/Register 11-A for Forced Disconnect.
System Data 1, Index 662 Timer for Forced Disconnect. **Note 1**



Note 1: Index 662 is MTC of the timer. Timer = MTC * 30 sec.
Ex:01 = 30 seconds, 02 = 60 seconds.

T-68 Time-based Routing for Multiple Time Zones

General Description

This feature enables the system to select outgoing route for each time zone that originating party belongs to by assigning the time of day change pattern and route selecting pattern for MA-ID of each area and corresponding to Multiple Time Zone.

- The below figure shows an example the route is selected when making a call at 20:30 as a time of each area.

Operating Procedure

No operating procedure is required.

Service Conditions

1. To specify the time zone of each area, assign MA-ID to the network (the assigned MA-ID to network address must be used for time changing pattern). For more information about the assignment of MA-ID, refer to Multiple Time Zones [M-114].
2. This feature is available when the originating system is LCR or LCRS.
3. For using this feature, assign ATCPL/ATCPN command and specify MA-ID for the terminal that originates a call.
4. The time change pattern for each MA-ID can be specified at 30 minute intervals (ex. 8:30 / 9:00).
5. The time change pattern can be assigned up to eight patterns including default pattern.

   Note: Maximum of eight patterns can be separated by dividing 1 day (24 hours) into 16.
6. When ATCPL/ATCPN command is assigned, this feature will be given a priority over the following related features.

   - LCR-Time of Day Routing-PRI/PRA
   - LCR-Attendant Manual Override-PRI/PRA
   - LCR-Clocked Manual Override-PRI/PRA

   Note: These above features will be used when a call is originated from the terminal that MA-ID is not assigned.
7. This feature is available only for IP terminal. When originating calls from other than an IP terminal, a conventional Outgoing Route pattern (which does not use this feature) will be selected.

   Note: A terminal accommodated in Analog MC uses MA-ID of network address assigned to the Analog MC when changing the time change pattern.
8. This feature is not available for SR-MGC.
9. This feature is not supported for Hotel/OAI/ACD system.
10. If this feature is used at backup node by FCCS Cluster, LCR follows the setting at the backup node.

Interactions

1. For more information about multiple time zone, refer to Multiple Time Zones [M-114].
2. This feature can be used with Least Cost Routing for MG-PRI [L-54]. For more information about it, refer to Least Cost Routing for MG-PRI [L-54].
3. The following are the service conditions when Call Forwarding - All Calls - Outside [C-28] is assigned:

- When a terminal (Intermediate Party) assigned with Call Forwarding - All Calls, Call Forwarding - Don't Answer [C-74] or Call Forwarding - Busy Line - Outside [C-60] is in the same Node as the Calling Party, Outgoing Route pattern for the MA-ID assigned to the Intermediate Party will be used. If the Intermediate Party is in a different Node (including other node in FCCS Network), a conventional Outgoing Route pattern (which does not use this feature) will be selected.

  Note: If PS is the Intermediate Party, when using Call Forwarding - All Calls - Outside [C-28], Call Forwarding - Busy Line - Outside [C-60], a conventional Outgoing Route pattern (which does not use this feature) will be selected.

- Regardless of the Node in which the Intermediate Party is registered, conventional Outgoing Route pattern will be selected when Logged Out IP Station - Call Destination or Call Forwarding - PS Incoming Incomplete is assigned.

Programming

STEP 1: **AMAIL/AMAIN** - Specify MA-ID and the area information.
MA-ID: Message Area ID (4digits) within the range from 0000 to 9999.
AREA NAME: Enter an area name within 16 characters.

STEP 2: **AMAA** - Add MA-IDs to terminals and trunks.
In case of SIP station, select KIND=Network to assign MA-ID to corresponding network address.

STEP 3: **ATCPL/ATCPN** - Specify the Time-of-Day change pattern information for each MA-ID.
MA-ID: Enter the Message Area ID (4digits [0001-9999])
FROM: Enter the start time of TDPTN (00:00-23:30)
TO: Enter the end time of TDPTN (00:00-23:30)
TDPTN: Time of day change pattern (0-7)

STEP 4: **ANPDL/ANPDN** - Assign the first digit of an Access Code for LCR/LCRS and digit number of the Access Code.
TN: Tenant Number
1stDC: The first digit of service Access Code. (0-9, *, #)
CI: Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes.
NND: Number of Necessary Digits for service Access Code (max. 6-digit)
BLF: Busy Lamp Field Display Activated on ATT (0/1 = Out of Service/In Service)

STEP 5: **ASPAL/ASPAN** - Assign the Access Code for LCR/LCRS.
ACC: Access Code for LCR/LCRS (0-9, *, #)
CI: Connection Status Index (“N: Normal”/”H: Hooking”)
SRV: Kind of Service (“LCR: Least Cost Routing”/”LCRS: Register Sender LCR”)
LGRT: External Logical Route Number (Dummy Route Number)

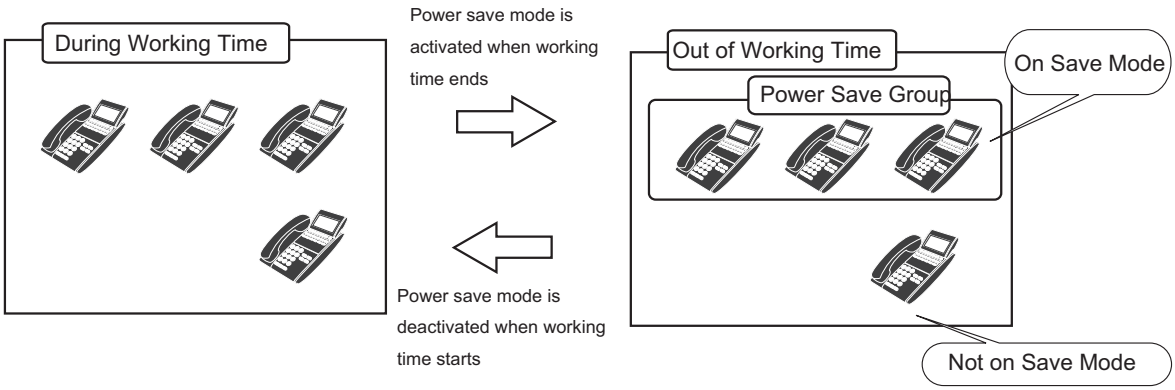
STEP 6: **AMNDL/AMNDN** - Specify a required maximum of the digits for MA-ID and DC.

Note: When the necessary data such as Destination Code and Maximum Necessary Digit Code has been already assigned, these data will be read out.

STEP 7: **ARNPL/ARNPN** - Specify the Reverse Numbering Plan Data for LDM/NDM.
LGRT: Logical Route Number (1-899)
ACC: Access Code (0-9, *, #)

STEP 8: **AFRSL/AFRSN** - Specify an Outgoing Route Selection Number (OPR). **Note 1**
TN: Tenant Number (1-899)
NPC: Number Pattern Code
MA-ID: Message Area ID (Max. 4digits [0-9999])
AREA NAME: Area Name
OPR: Outgoing Route Selection Number (0-4000)

Note 1: By changing the system data, you can reduce the amount of registered data for the AFRSN command, and the office data consumption. For details, refer to the Data Programming Manual - FCCS.



STEP 9: **AOPRL/AOPRN** - Specify routes and the condition for using the outgoing route selective pattern.
TDPTN: Time of Day Change Pattern Number (0-7)
OPR: Outgoing Route Selection Pattern Number (0-4000)
RA: Route Advancing Order (0-7)
E: Route Advancing End Indication (0/1 = Ended/-)
LGRT: Logical Route Number (1-899)
SKIP: Number of digits to be skipped (0-24)
PNL: Pattern Number Location (0-999)
OVFT: Overflow Tone (0/1 = -/Overflow Tone)
PRSC: Priority Restriction Class (0-15)

T-69 Terminal Power Save Mode

General Description

Electricity consumption can be reduced for a group of multiline telephones not in use by setting the terminals to a power save mode. The change to set power save mode and its cancellation are performed per each power save group as follows (all the methods can be used in combination):

- Automatic change based on a time schedule
- Change based on a terminal key operation
- Change with PCPro

Operating Procedure

1. In the case of an automatic change based on a time schedule, since the change to power save mode and its cancellation are performed based on the settings of such time schedule, it is not necessary to perform any operation on any of the terminals.
2. In the case of a change based on a terminal key operation, the procedure is as follows:

   (a) Power Save Mode Setting

   [1] Press the POWER SAVE Feature key.

   [2] A red light will flash on the POWER SAVE Feature key and a message indicating that the power save mode is off will be displayed on the LCD screen.

   [3] Press again the POWER SAVE Feature key.

   [4] A message indicating that the power save mode has been activated will be displayed on the LCD.

   [5] The stations of the power save group will change to power save mode.

Note: Read the point 4 of Important Notice on Service Conditions. In the power save group, a steady red light will light on the terminals that do not change to power save mode.

(b) Power Save Mode Cancellation

[1] Press the POWER SAVE Feature key.

[2] A red light will flash on the POWER SAVE Feature key and a message indicating that the power save mode is on will be displayed on the LCD screen.

[3] Press again the POWER SAVE Feature key.

[4] A message indicating that the power save mode has been disabled will be displayed on the LCD.

[5] The POWER SAVE Feature key that is lit on all the stations in the power save group will extinguish and the power save mode will be canceled for the group.

3. In the case of a change from PCPro, the procedure is as follows.

(a) Power Save Mode Setting

[1] Run the APSMCL command from PCPro.

[2] Choose [Immediate Switching] from the TYPE parameter and enter in the G-ID parameter the number of the power save group that you want to set to power save mode.

[3] Click the [GET] button.

[4] Current Status and the Switching Mode parameter will be displayed. Select [Power save].

[5] Click the [EXECUTE] button.

[6] The stations of the power save group will change to power save mode.

Note: In the power save group, a steady red light will light on the terminals that do not change to power save mode.

(b) Power Save Mode Cancellation

[1] Run the APSMCL command from PCPro.

[2] Choose [Immediate Switching] from the TYPE parameter and enter in the G-ID parameter the number of the power save group that you want to set to power save mode.

[3] Click the [GET] button.

[4] Current Status and the Switching Mode parameter will be displayed. Select [Power feed].

[5] Click the [EXECUTE] button.

[6] The POWER SAVE Feature key that is lit on all the stations in the power save group will extinguish and the power save mode will be canceled for the group.

Service Conditions

[Important Notice]

1. The terminals that can use this service are as follows.
    - Digital terminal **Note 1**
    - IP terminal (DT800/DT700 Series) **Note 2 Note 3**

    Note 1: Digital terminals accommodated in IPG and UG50 cannot use the service.

    Note 2: The valid versions of firmware for DT700 series are from version 5.0.4.0

    Note 3: DT830G/DT730G cannot use this service.

2. In case of using power save mode for Digital terminals, the following ELC card is required.
    - CH-16ELCA
3. Power save mode change is performed on a group basis. You can create a power save group by adding physical station numbers to it. The maximum number of groups available is 255. The only stations that can be registered in a group are terminals (TEC=12). The maximum number per group is the same as the maximum number of lines per system. Only stations that are in the same node can be registered in the same group.
4. When all the terminals in the group are digital, in the case of a change based on the terminal key operation, at least one of the group terminals that can perform changes must be left out of the power save mode. After the group is changed to power save mode, the terminal will remain in an active state.
   If you do not set a station that can perform changes to remain in normal state after the changeover (with the APSGL command settings), because all stations will get into a state of no power feeding, it will not be possible to cancel the power save mode with a terminal key operation.

    Note: Even if all terminals in a group are in a state of no power feeding, it is possible to cancel such state with PCPro or setting a time schedule.

5. To perform a change based on a terminal key operation, you can only use a terminal with Prime Line set to My Line.

[Interaction with other features]

1. In the case of SOFT PHONE WIRED PHONE HANDSET [S-147] changes can be done only with the wired telephone. Also, the soft phone and the wired telephone must have the same power save group number data (APSGL command G-ID parameter).

[Hardware/Software]

1. The POWER SAVE Feature key can be registered as a Soft key.
2. Regarding Digital terminals the following conditions apply.

    (a) During power save mode, since the power feeding of Digital terminals is stopped, no operation, including the reception and sending of calls, is possible. For this reason, it is recommended to let one terminal for emergency use out of the power save group or let it in an active state after the change (with the APSGL command settings).

(b) When being on power save mode, the outgoing/incoming call history is not saved. If you want to maintain the records use the following methods.

- Outgoing calls history: Last Number Called -D
- Incoming calls history: Call History

(c) If power supply is not available or any operation that requires ELC card initialization is performed (from PCPro with the AKYD, ADKS, MBST commands, etc), call control information (Call Indicator Display, call display, BLF function, etc) will be cleared.

(d) If a line stops being power fed, the BL lamp at the front of the ELC card will flash a green light.

(e) When power save mode is canceled, because of the power feeding control based on the ELC card mounting location information, the boot time can be different for each terminal (with no more than a 30-second duration).

(f) Digital terminals behave as terminals with a PFT adapter after changing to power save mode. After power save mode cancellation, the terminals behave again as Digital terminals.

3. In a power save mode, DT800/DT700 Series users have some limited functionality for the following features (note that other features are available in full functionality).

Power Save Function	Processing Content
Volume	Maximum volume restricted -20db
LED **Note 4**	Brightness restricted to half the usual
Hands-free function	Blocked
Backlight	Backlighting deactivated

Note 4: The LED of 8LK UNIT or DSS Console connected to DT800/DT700 series is not restricted by power save mode.

4. For DT800/DT700 Series, the volume level during power save mode will not be maintained after change the mode. If the power save mode is disabled, it will go back to the volume level before change to power save mode.

[Interaction with network services]

-

[Conditions of this service]

1. In the case of a change to save power mode based on a terminal key operation, there is no limitation on the type of terminal used for such operation. Also, DT800/DT700 Series and Digital terminals can be in the same group.
2. In the case of a call to a digital terminal on power save mode, if no transfer service is set, the caller will continually hear a ringing sound. If a transfer service is set, such service will be activated.

Note: Even on power save mode it is possible for DT800/DT700 series to perform incoming call and response operations.

3. The time needed to change to power save mode in all the terminals of the group will vary according to the number of terminals. For example, 100 terminals in 1 LP will need around 25 seconds and 200 terminals will require around 50 seconds.
4. On a terminal that is not in an idle state, changeover to power save mode is inhibited until the terminal becomes idle**.** The time needed for the turning into an idle state will be affected by the same rule stated on the point (3.). However, if during the waiting time one of the terminals enters into an active state, time count will be reset. **Note 5**, **Note 6**

   Note 5: A terminal that is not in an idle state means the following:
   - Being in the middle of a call.
   - Making an operation with the phone (putting on off-hook state, turning on the speaker, etc) or in the middle of an incoming call to My Line (however, in case of performing a local operation like using the operation menu, the power save mode change will be performed).
   - Other station is using as Sub Line the My Line of a terminal of the power save group (even if it is on hold).
   - There is a call held with CALL HOLD [C-6], EXCLUSIVE HOLD -D [E-4] or similar functions.
   - CALL BACK [C-1], CALL BACK - CCIS [C-44] or similar functions are set (if they are in the middle of being set the power save mode change will be performed).

   Note 6: In case of CALL PARK GROUP -D [C-176D] being set, the power save mode change will be performed.

5. If just after the system initialization of the Telephony Server, or during the reset of a terminal, one of the things mentioned below happens, all the terminals will boot in a non power save mode. The terminals will continue being in such non power save mode until a change is performed with one of the methods already explained.

   [Digital Terminal]

   - ELC card initialization

   [DT800/DT700 Series]

   - Terminal Log out/ Log in
   - Health Check error
   - A Power discontinuity of the terminal
6. If any data related to power save mode is changed while the terminals are in active state, the changes will be reflected the next time there is a change of the power save mode. However, if the power save group is erased the change will be reflected immediately and the concerned terminals will have their power save mode canceled **Note 7**.

   Note 7: Terminals on power save mode belonging to other groups will not be affected.

7. During power save mode, a red light will be lit steady on the POWER SAVE Feature key for terminals of the group that are not on such power save mode. The turn on/off of the light will happen at the same time that there is a change.

8. Regarding the automatic change based on a time schedule, the activation and cancellation of the mode can be registered to happen to each group on each day on intervals no lower than 15 minutes. It is also possible to only set its activation or cancellation.

   Examples of a setting

   (Example 1) From Monday to Friday change to power save mode from 19:00 to 8:00 and on weekend days stay all day on power save mode.

Day	Power save mode cancellation	Power save mode activation
Monday	8:00	19:00
Tuesday	8:00	19:00
Wednesday	8:00	19:00
Thursday	8:00	19:00
Friday	8:00	19:00
Saturday	-	-
Sunday	-	-

   (Example 2) Power save mode set to all day only on Wednesday, other days cancellation set with a time schedule to 8:30 and activation left to PCPro or performing a terminal keys operation.

Day	Power save mode cancellation	Power save mode activation
Monday	8:30	-
Tuesday	8:30	-
Wednesday	-	0:00
Thursday	8:30	-
Friday	8:30	-
Saturday	8:30	-
Sunday	8:30	-

9. The time scheduler is based on the clock of the Telephony Server. When the Daylight Saving Time option is enabled, the scheduler automatically accounts for one hour of Daylight Saving Time. This scheduler is not supported for multiple time zones.

   Note: If you have offices in multiple time zones, group them by time zone and create a separate schedule for each group, factoring in a time offset relative to the system clock.

10. If the time system of the Telephony Server is changed and exceeds the change time of the time schedule, the power save mode change will not be executed.
11. With the system data (ASYDL/N - SYS 1, Index 1262, Bit 5) it is possible to set a temporary deactivation of the time schedule function. For example you can keep the Desktop terminals in your office in power save mode on a holiday by deactivating the time schedule function a day before the holiday.

    Note: You can switch between power save and active modes with PCPro or a terminal key operation when time schedule function is not available.

12. A change performed with a terminal key operation will only affect the power save group to which the terminal belongs.
13. A POWER SAVE Feature key can be registered for more than one terminal of the power save group.
14. It is possible to perform a change based on a terminal key operation using a terminal that is in an idle state.
15. After pressing a POWER SAVE Feature key once, if one of the conditions listed below happens before pressing the key for the second time, the mode change does not take effect.
    - Operate with other key **Note 8**
    - An off-hook operation
    - 6 seconds pass after pressing the POWER SAVE Feature key for the first time (cancellation due to time-out)

    Note 8: The following buttons are excluded:
    - FEATURE key
    - Dial key, ANSWER key.
    - Cursor key (excluded the cursor on the left “redial”).

16. If more than one user presses the POWER SAVE Feature key simultaneously in an attempt to switch between power save and active modes:
    - If the timing of both the first and second key press is exactly the same across all those users, the change will happen as normal.
    - If the timing of the first key press is exactly the same across all those users, the change will happen at the timing when the next first POWER SAVE Feature key press is detected. A second POWER SAVE Feature key press by another user will be ignored. **Note 9**

    Note 9: If the second POWER SAVE Feature key press by another user is done more than 6 seconds after the first press, since the operation is canceled, this second press is detected as again a first press.

    - If another user presses the POWER SAVE Feature key for the first time after the power save mode activation, the key press is interpreted as the first key event for the power save mode cancellation. Thus, the second press of the POWER SAVE Feature key cancels the power save mode.
    - If another user presses the POWER SAVE Feature key for the first time after the power save mode deactivation, the key press is interpreted as the first key event for the power save mode activation. Thus, the second press of the POWER SAVE Feature key activates the power save mode.
17. The following conditions apply to a change done with PCPro.

    (a) If a mode checking is done with the APSMCL command, the actual mode at the time of performing a change and at the time the checking was done may be different.

    (b) The time required for the all terminals within the group to enter into the power save mode due to an immediate switchover is the same as with other change methods.

[Other]

-

Programming

1. APSGL (Assignment of Power Save Group ID for LDM)

   TN: Tenant Number
   STN: Station Number (Maximum 6 digits)
   G-ID: Power save group ID (1-255)
   No Power Saving:
   In case of setting group terminals that do not enter into power save mode, select the check box.

[Time Schedule Change]

1. ASYDL/ASYDN (System Data (LDM/NDM))

   SYS1 Index 1262

   Bit 5: Terminal power save mode change based on a time schedule.

   0/1: Enabled/Disabled

2. APSMCL (Assignment of Power Save Mode Change Data for LDM)

G-ID: Power save group ID (1-255)
TYPE: Time Schedule

Power Save Mode

From Sunday to Saturday set the following parameters.

Disable:

Select the check box of the days when power save mode is not used

Hour (0-23)

Minute (0/15/30/45)

Choose the time for power save cancellation

Enable:

Select the check box of the days when power save mode is used

Hour (0-23)

Minute (0/15/30/45)

Choose the starting time for power save mode

[Change based on a terminal key operation]

1. AKYD (Assignment of Key Data for Desktop Terminal)

   KYN: Key number
   KYI=1 (function key)
   FKY=184 (Power Saving)

   • In case of a Soft key

2. ADSL (Assignment of Desktop Terminal's Soft Key on LCD)

   SKP (0-15)
   SN=0 (idle)
   SKN (0-5)
   FKY=184 (Power Saving)

T-86 Timing Start

General Description

This feature enables the system to recognize the end of dialing by using not the digits of the dialed number but a specified timing. By pressing "#" or "*" key after dialing the station number, the station user will not have to wait for ring start.

Operating Procedure

1. Lift handset or press the SPEAKER key. Hear Dial Tone.
2. Dial the desired station.
3. Wait for inter-digit time-out or dial "#" or "*". Access to the desired service or station is completed.

Service Conditions

1. The Interdigit Timer (ASYD, SYS1, Index129, Bits 0 to 3) will be used for TIMING START if "#" or "*" is not assigned as a TIMING START character with the system data (ASYD, SYS1, Index161, Bit 6 or 7), or if the station users forgets to press the TIMING START character. In that case, ISDN Sub Address Dialing is not available.
2. This feature is available only when station numbers are dialed.
3. When "*" or "#" is used for TIMING START, it cannot be used as the second or third digit of any service feature access code or station number.
4. This feature is not available for Standard SIP telephone and Attendant Console.

Programming

STEP 1: **ASYD** - System Data 1, Index 129. Register Inter-digit Timer. Miscellaneous Timer Counter (MTC) is to be assigned a value from 0 Hex to F Hex (0-15). Timer Value Setting is MTC × 2 seconds.

Note: When this data is 00 Hexadecimal, the default data is automatically set to 6 seconds.

System Data 1, Index 161, Bit 6. Timing Start using "#" Code.
0/1 = Ineffective/Effective
System Data 1, Index 161, Bit 7. Timing Start using "*" Code.
0/1 = Ineffective/Effective
System Data 1, Index 170, Bit 4. Timing Start
0/1 = Not required/Required

U-1 Uniform Call Distribution (UCD)

General Description

This feature distributes Incoming Calls to a UCD Group of up to 100 Stations. Calls are distributed to Idle Stations in a circular pattern, in the order in which they arrive.

Operating Procedure

To transfer a call to a busy UCD Group

1. All the Stations in a UCD Group are busy.
2. A Station user not in the group answers an Incoming Call (Trunk or Station).
3. The Station user dial the UCD primary number after pressing the switch hook or the TRANSFER key:
   a.) The Station user hears Busy Tone.
   b.) The Calling Party is held.
4. The Station goes on-hook.
   a.) The Calling Party hears Ringback Tone (during queuing).
5. The UCD Group becomes idle:
   a.) The call terminates to an Idle Station in the UCD Group.
   b.) The Calling Party hears Ringback Tone. (during ringing)
6. The Idle Station answers the call:
   a.) The Calling Party is connected to the UCD Station.

To set Busy Out using Access Code from idle status

1. Lift the handset and Receive DT (Dial Tone).
2. Dial the Access Code for setting Busy Out.
3. Receive SST (Service Set Tone).
4. Replace the handset.

To cancel Busy Out using Access Code from idle status

1. Lift the handset and Receive DT (Dial Tone).
2. Dial the Access Code for canceling Busy Out.
3. Receive SST (Service Set Tone).
4. Replace the handset.

To set Busy Out using Access Code from busy status

1. Perform a switch hook flash and Receive SPDT (Special Dial Tone).
2. Dial the Access Code for setting Busy Out.
3. Receive SST (Service Set Tone). **Note 1**, **Note 2**
4. Perform a switch hook flash again to back to the conversation.

To cancel Busy Out using Access Code from busy status

1. Perform a switch hook flash and Receive SPDT (Special Dial Tone).
2. Dial the Access Code for canceling Busy Out.
3. Receive SST (Service Set Tone). **Note 1**, **Note 2**
4. Perform a switch hook flash again to back to the conversation.

Note 1: You would return to the conversation when 30 seconds has been elapsed after you have started to hear SST.

Note 2: You will be called back if you release the call while you hear SST.

To set Busy Out using Line/Feature key from idle status

1. Press the BUSY OUT Feature key.
2. The LED of the Feature key lights ("BYO SET" is displayed on LCD for 5 seconds).

To cancel Busy Out using Multi Line Feature key of Desktop terminal from idle status

1. Press the BUSY OUT Feature key.
2. The LED of the Feature key is extinguished ("BYO CNCL" is displayed on LCD for 5 seconds).

To set Busy Out using Multi Line Feature key of Desktop terminal from Busy Status

1. Press the BUSY OUT Feature key.
2. The LED of the Feature key lights ("BYO SET" is displayed on LCD for 5 seconds).
3. Back to the conversation. **Note 3**

To cancel Busy Out using Multi Line Feature key of Desktop terminal from Busy Status

1. Press the Busy Out Feature key.
2. The LED of the Feature key is extinguished ("BYO CNCL" is displayed on LCD for 5 seconds).
3. Back to the conversation. **Note 3**

Note 3: You can talk with the calling party even during a setting/canceling operation.

Service Conditions

1. A station belongs to a UCD Group and its station number is a UCD number is called "controlling station." If a caller dials the station number of the non-controlling station in UCD Group, the line is connected to the dialed station directly. When the dialed station is in busy state, the caller hears Busy Tone. (That is Uniform Call Distribution (UCD) [U-1] and UCD hunting are not performed.)
2. The maximum number of UCD Groups is 63.
3. A UCD Group may have 100 Stations.
4. The Route Restriction class (RSC) of Stations in an Uniform Call Distribution (UCD) Group must be identical.
5. UCD Groups are assigned through the PCPro.
6. Stations are configured in a circular-type Hunt Group. A call to the group starts at the first Idle Station, after the last Station that received a call.
7. If all of the group's Stations are busy, the call waits in a queue. The caller hears Ringback Tone. The first call in the queue will be answered.
8. If a Sub Line of a Station belongs to an UCD group where one or more incoming calls are waiting in the queue, the station is not called back immediately even though its My Line becomes available. The timing of the call back is; about 4 seconds if DELAY ANNOUNCEMENT - UCD [D-31] is not in service, and about 8 seconds if it is in service.
9. CALL WAITING LAMP-UCD [C-76] will light (if programmed) after calls are in queue and will flash when the threshold value for that UCD Group is reached.

10. A Station user can block UCD Calls by dialing a Busy Out (BYO) Code (one to three digits), or if it is a Dterm, by pressing the DND or BYO Feature key. The Station user can still originate calls from and receive calls to its own Telephone Number. The Station user can dial the BYO Code from a normal Dial Tone Connection or from a CONSULTATION HOLD-ALL CALLS [C-17] condition.
11. Each UCD Group is assigned a UCD Group Number, allowing DIRECT INWARD DIALING (DID) [D-8] Calls to be routed to selected groups.
12. If the Attendant or the Station user transfers a call to a busy UCD Group, the call will wait in queue until a Station in the group becomes idle.
13. Incoming Calls to individual Stations in the group are not distributed by UCD hunting. Only calls to the UCD Group Number follow the circular distribution.
14. Each UCD Group has a controlling Station. Only the controlling Station or the Attendant can activate or deactivate CALL FORWARDING-ALL CALLS [C-5] when the UCD Group Number is not a phantom number.
15. If CALL FORWARDING-ALL CALLS [C-5] is set on a controlling Station and the Destination Station is idle, a call to the UCD Group is transferred. If the designated Station is busy, the user will hear Busy Tone.
16. If CALL FORWARDING-ALL CALLS [C-5] is set on a non-controlling Station, that Station is skipped in any UCD hunt.
17. The Attendant can use BUSY VERIFICATION [B-3] to check the busy/idle condition of the UCD Stations. If the BYO Code or key has been used, the Attendant will receive a Reorder Tone.
18. CALL WAITING-ORIGINATING [C-31] can be activated by an individual UCD Station user towards another Station within the system. Also, another Station user can activate this feature towards an individual UCD Group Station. CALL WAITING-ORIGINATING [C-31] can be activated toward a UCD Group Number when all the Stations and the queue are busy. Waiting is set to the controlling Station.
19. CALL WAITING-TERMINATING [C-12], when assigned to an individual UCD Group Station, allows the Calling Station user to wait on the Called Station's line when it is busy. The Group Station user can be connected to the Waiting Call by hanging up. The Station rings and the call is connected when the caller goes off-hook. These calls have priority over UCD Calls in the queue.
20. CALL BACK [C-1] can be activated by an individual UCD Group Station user towards another Station. Also, another Station user can activate this feature towards an individual UCD Station. CALL BACK [C-1] can be activated toward a UCD Group Number when all the Stations and UCD queue are busy. CALL BACK [C-1] is set to the controlling Station.
21. A UCD Group Number can be used as the Destination Station of DIRECT-IN TERMINATION [D-7] or of NIGHT CONNECTION-FIXED/FLEXIBLE [N-1/N-2].
22. A UCD Group Number can be assigned as the Destination Station of OFF-HOOK ALARM [O-6], PRIORITY CALL [P-9], ATTENDANT NIGHT TRANSFER [A-19], and LDN NIGHT CONNECTION [L-28, 29].
23. If a Phantom Number is assigned to a controlling Station, UCD hunting may or may not occur (depending on the APHN command setting), when the Phantom Number is dialed.

24. Three types of traffic measurements can be provided for the UCD feature:
    a.) UCD route peg count:
    - Count of Incoming Calls from each route to each UCD Group
    - Count of calls answered by UCD
    - Count of other calls (abandoned, restricted, blocked)

    Example:

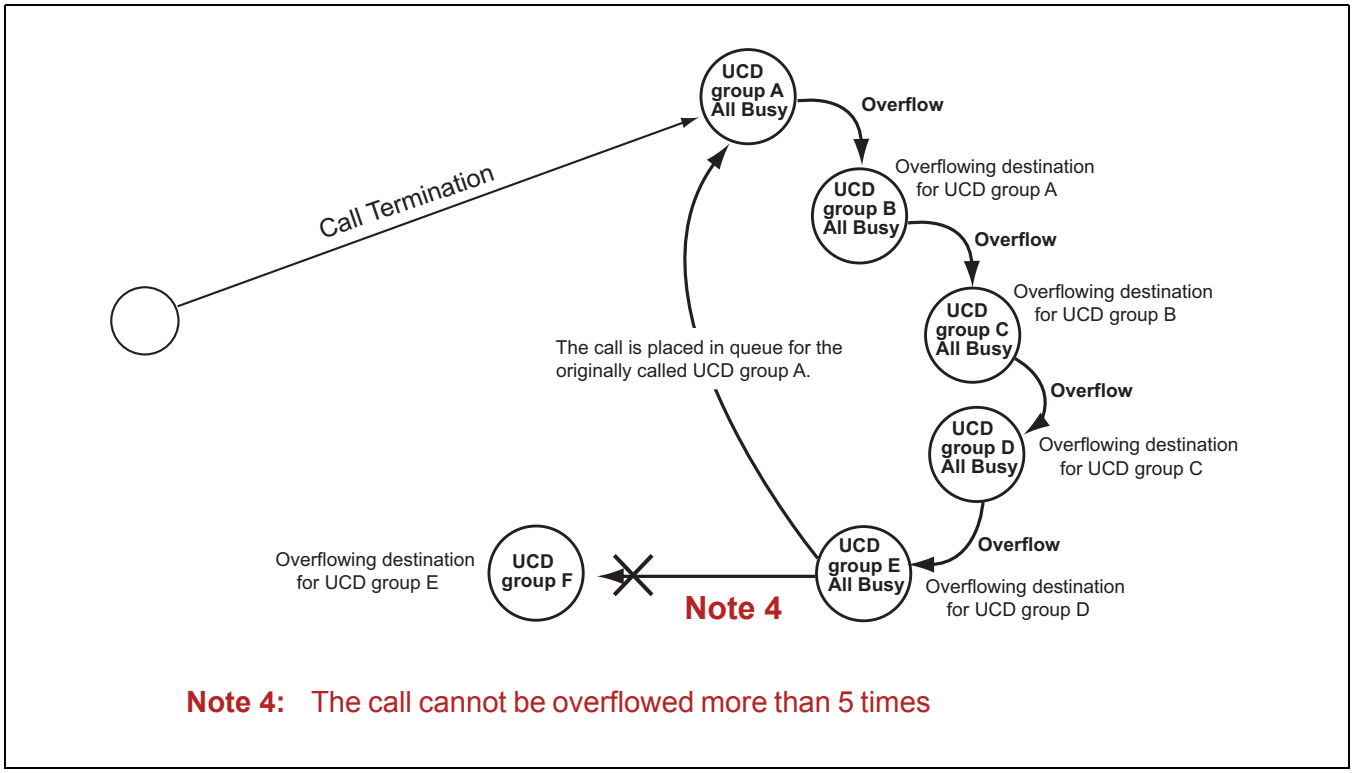
From 07/24 08:00 to 07/24 09:00				
Route	**UCD Group**	**Incoming**	**Answer**	**Abandon**
10	1	9	7	2
	2	15	15	0
Route Total	24	22	2	

    b.) UCD Group Peg Count:
    - Count of Incoming Calls to each UCD Group
    - Count of answered calls
    - Count of other calls (abandoned, restricted, blocked)

Example:

From 07/24 09:00 to 07/24 10:00			
UCD Group	**Incoming**	**Answer**	**Abandon**
1	12	6	6
2	11	8	3
Total	23	14	9

    c.) UCD Station peg count:
    - Count of Incoming Calls to each Station in each group
    - Count of answered calls
    - Count of other calls (abandoned, restricted, blocked)



Example:

From 07/24 9:00 to 07/24 10:00					
UCD Group	**TN**	**STN**	**Ringing**	**Answer**	**Abandon**
1	1	1000	4	4	0
		1001	3	2	1
Group Total			7	6	1

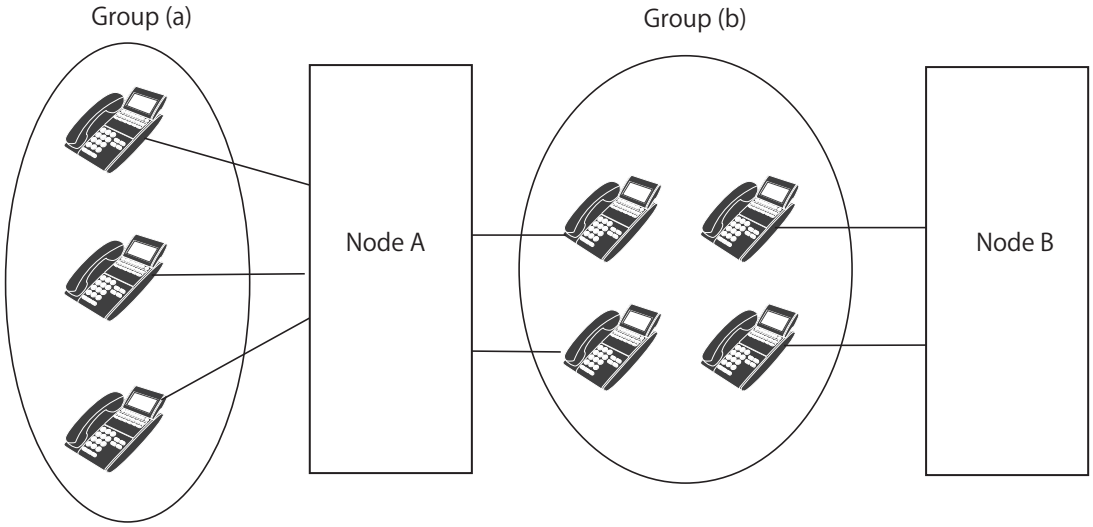
25. UCD Peg counts are available for calls transferred to the UCD Group by the Attendant and for calls transferred to the UCD Group from a Station.
26. The total numbers of Incoming Calls for which the UCD queueing feature is available, and other Incoming Calls such as Intra-office, TIE Line, etc., are 384 calls per System.

    Calls above this limit are terminated by a Busy Tone Connection.
27. During queueing block, the ATTENDANT CAMP-ON WITH TONE INDICATION [A-1] is valid. The Attendant hears Reorder Tone when the ATTENDANT CAMP-ON WITH TONE INDICATION [A-1] is restricted.
28. OVERFLOW-UCD [O-13] is available.

29. When a UCD controlling Station transfers the in-progress Station Call or Trunk Call to a Station which has been set CALL FORWARDING-ALL CALLS [C-5] or CALL FORWARDING-BUSY LINE [C-2] whose forwarding destination is the UCD controlling Station, these features are valid.
30. When UCD queueing is not available and the System Data ASYD System Data 1 Index 60 Bit 3 = 1 assigned, UCD peg count is not activated.
31. When using IPPAD, UCD queueing is not available (Assign ASYD System Data 1 Index 60 Bit 3 = 1.)
32. When using IPPAD (i.e. when calling from IP station), if link block occurs such as the IPPAD is all busy, the call is queued. Even if any IPPAD becomes available, the caller remains in queuing status. When any station of the UCD group releases the call, the station is connected to the caller. When Delay Announcement-UCD is set, it is performed on connecting to the announcement. When the service is not set, it takes less than 6 seconds to perform the action.
33. When the controlling Station transfers the Station/Trunk to another Station that has set CALL FORWARDING - ALL CALLS [C-5] or CALL FORWARDING - BUSY LINE [C-2] (to the same controlling Station), Call Forwarding is activated and the MCI message is sent out.
34. Whether UCD Incoming Call information is to be sent to a Message Center Interface (MCI) or not can be specified on a UCD Group basis using the AUCD command. This feature can be assigned to each UCD Group. In the case of UCD Incoming Calls overflowing to a UCD Group, the judgement whether the information is to be sent to MCI or not depends on the terminated UCD Group.
35. When OVERFLOW - UCD [O-13] is activated, the transferred destination's data decide whether UCD Incoming Call information is sent to MCI or not.
36. The UCD Group can be programmed to the Local Data Memory (LDM). The conditions are as shown below.
    a.) Only Telephone Number and PS Number can be used when programming UCD Group to LDM.
    b.) "UCD Group assigned by ASHU command", "UCD Group assigned by ASHUL command" and "UCD Group assigned by ASHUN command" cannot be used together in the system. If assigning different kind of UCD Groups in the system, the "UCD Group assigned by ASHUN command" has top priority, and the "UCD Group assigned by ASHUL command" takes precedence over "UCD Group assigned by ASHU command".
    c.) The maximum number of UCD Groups which can be programmed in LDM per Node are 63 groups.
    d.) A UCD Group, programmed in a LDM, can accommodate 100 Stations at the maximum.
    e.) The overflowing destination for UCD Group, programmed in LDM, is UCD Group, programmed in LDM only.
    f.) Only one overflowing destination can be assigned to an UCD Group.
    g.) A call can be overflowed 4 times at the maximum by using OVERFLOW-UCD [O-13]. If overflowing destinations are all busy, the call is queued into original group (depending on System Data). See the figure below.

h.) The user can set or cancel Busy Out using UCD Stations programmed in LDM.

37. This enhancement enables a Station within UCD Group to deny hunting function for an Incoming Call originated from Station (including ATT). The service conditions are as follows:
    a.) Incoming DDD (TCL = 1)/FX (TCL = 2)/WATS (TCL = 3) Line Call are not available.
    b.) When CALL FORWARDING-DON'T ANSWER or CALL FORWARDING-BUSY LINE is set to a Station within UCD Group, a call to the Station is forwarded according to their service condition.
    c.) To use this enhancement, allow SFI 181 of a Station which denies hunting function.
38. This feature is available via FCCS.
39. A UCD Group for FCCS Service is not available for the destination of the Dead Level or the dead number.
40. The following number is assignable to a Station of the UCD Group.
    a.) Physical Station Number [Physical Station Number, Monitored Number (Pilot Number), DTE Station]
    b.) Telephone Number
41. When activating this feature via the FCCS Network, only the Telephone Number is available for FCCS Service.
42. When activating this feature via the FCCS Network, the maximum number of the UCD Groups in a Node is 63.
43. When activating this feature via the FCCS Network, the Station assigned by using the Physical Station Number and the Station assigned by using the Telephone Number cannot be accommodated in the same group and the same Node.



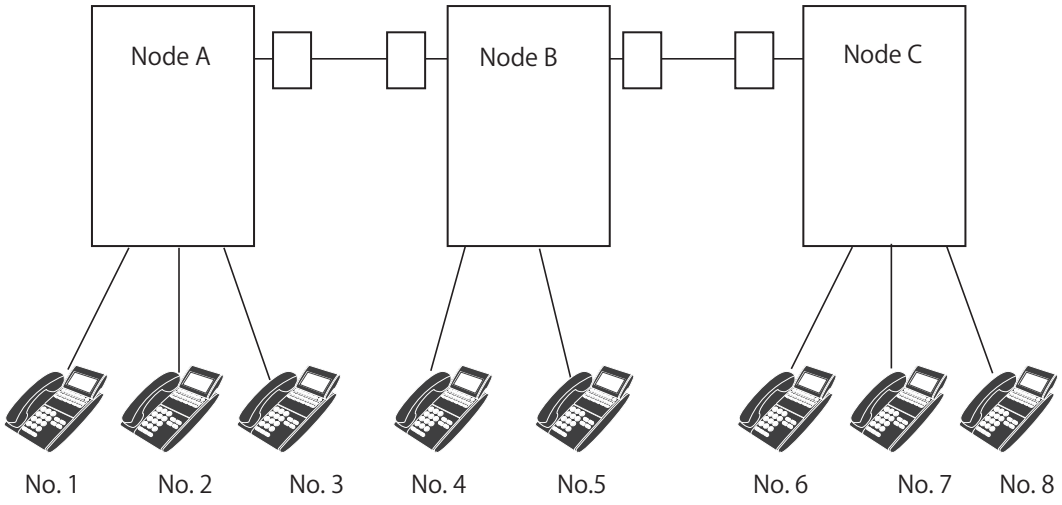
44. When activating this feature via the FCCS Network, the maximum number of Stations per group are as shown below:

    Physical Station Number: 100 Stations
    Telephone Number: 100 Stations

45. When activating this feature via the FCCS Network, two types of UCD Groups are available:

    Group (a): All the Stations belonging to one group are accommodated in the same Node.
    Group (b): Stations belonging to one group are accommodated in different Nodes.

    Group (a) and Group (b) can be used together within a FCCS Network.



46. When using the FCH card in conjunction with FCCS:
    a.) Stations in four different Nodes can be assigned in a UCD Group.
    b.) When Stations belonging to different Nodes are assigned to a UCD Group, the Station hunt is not activated in assigned order if the Stations are not assigned in continuous order within a Node. First, the call is shifted to the Stations within the Node of the UCD controlling Station, even though it is not in consecutive order (in the Node, Station hunt is activated in assigned order). After all the Stations in the Node are hunted, the Station hunt is shifted to the next assigned

Station and the Stations in the Node are hunted in assigned order. See the figure below.

Example:

Station No.1 is the UCD controlling Station. When the call encounters busy, the call in hunted in order of No. 3, No. 4 (hunted in the Node of the controlling Station) to No. 2, No. 6, No.8 (hunted in the Node C that accommodates the next Station in assigned order) to No. 5, No .7.

Note: No.1 to No.8 indicate the order being assigned.

47. Phantom Telephone Number (PH TELN) can also be assigned to each Telephone Number (a maximum of 16 PH TELNs per TELN, TELNs + PH TELNs in total = 60,000 or less). The assigned PH TELN may or may not be the UCD Group Number by the APHNN command setting (see Interactions).
48. When a call terminates to the UCD Station through FCCS, MCI data can be output. MCI text format is designated via the ASYDL command.
49. When activating this feature via the FCCS Network, when PEG COUNT [P-7] service is provided, UCD Route Peg Count/UCD Group Peg Count/UCD Station Peg Count is available.
50. When activating this feature via the FCCS Network, in regard to CALL WAITING LAMP - UCD [C-76] service, if a UCD Incoming Call is terminated when the queue slot is full, the lamps of the Stations in the same Node that accommodates the controlling Station, start to flash.
51. When activating this feature via the FCCS Network, a UCD Station assigned by the Telephone Number cannot be a Destination Station for DIRECT-IN TERMINATION (DIT) [D-7] or NIGHT CONNECTION FIXED/FLEXIBLE [N-1/2].
52. A UCD Group may accommodate members from four different Fusion Point Codes.
53. When all FCCS links are busy:
    a.) When the FCCS links between the UCD member Station Node and the Calling Station Node (or Trunk termination Node) are all busy, the UCD Stations are not hunted and they are treated as busy Stations.

b.) When the FCCS links between the Calling Station Node and the UCD controlling Station Node are all busy, UCD queuing function cannot be provided for the Calling Station and the Calling Station hears Busy Tone.
c.) When the CCIS line is used as the alternative routing, SERVICE DISPLAY is not activated and the hunting function is completed at the terminated Station.

54. When using a Phantom Telephone Number (PH TELN) for a UCD controlling Station via FCCS, consider the following:
    a.) Whether to use the PH TELN to start the UCD hunt or not can be selected by the command APHNN. When using the PH TELN, assign "1" in the "PH" parameter. If not, assign "0".
    b.) When "PH = 1": UCD hunt starts by dialing either the Telephone Number of the controlling Station or its Phantom Telephone Number. Both numbers can be the UCD Group Number.
    c.) When "PH = 0": UCD hunt starts by dialing the Telephone Number of the controlling Station only. The feature is not provided when the PH TELN is dialed.
55. When a WLAN Handset (MH Series)/SP Controlled SIP terminal or PS is assigned as a member of UCD group, UCD queueing is not available.
56. When using Location Diversity [L-55], the Telephone Number of User Profile Data must be assigned to the station except the controlling station by using ASHUN command.

Note: Controlling stations are not available in Location Diversity [L-55] (only non-controlling stations are available).

57. When registering UCD group by using ASHUEN command, be sure not to check the "Multi Boss Secretary Group" checkbox.
58. When using listup command, the following conditions are applied.

- When listing up by LSHUEN command, the all of UCD group and Boss-Secretary group are output, and ON (Boss-Secretary group)/OFF (UCD group) is displayed per groups.
- When listing up by LSHUN command, the all of UCD group and Boss-Secretary group are output. However, ON (Boss-Secretary group)/OFF I(UCD group) is not displayed per groups.

59. Busy Out is available under the following conditions.
    a.) A station which has set Busy Out can be temporarily removed from a UCD group. Thus, any incoming calls through UCD are not terminated to the station while Busy Out is being set (the station can receive/originate non-UCD calls as usual). After canceling Busy Out, UCD incoming calls are routed to the station again.
    b.) For Desktop terminals, setting/canceling of Busy Out is only possible from My Line.
    c.) Setting/canceling of Busy Out through use of Access Code is only possible while an operating station hears DT or is engaged in a two-party call.
    d.) System initialization cancels Busy Out in progress.
    e.) Busy Out cannot be set/canceled from other stations.
    f.) Attendant Console cannot set/cancel Busy Out to a station.
    g.) Only the UCD group member stations can set/cancel Busy Out.
    h.) Busy Out cannot be set/cancel from a Desktop terminal Sub Line.
    i.) When activating this feature via the FCCS Network, Busy Out is available for the Station assigned by the Telephone Number.
60. CALL FORWARDING - DON'T ANSWER [C-3] can be set up on every station in a UCD group. On a station where CALL FORWARDING - DON'T ANSWER is enabled, an incoming call, if unanswered, is forwarded to the designated destination accordingly.

61. When a UCD group is specified as the forwarding destination of CALL FORWARDING - DON'T ANSWER [C-3], unanswered calls are handled as follows:

    - When there is at least one idle station in the UCD group, unanswered calls are distributed to idle stations in the group evenly in a circular shape.
    - If all stations in the UCD group are busy and UCD Queuing is available (ASYD, System Data 1, Index 60, Bit 3 = 0),
        - a station call is not queued to the group, and it rings the original destination station.
        - a trunk call (including a call from a TIE line) is queued to the group.

<Conditions Specific to UMGi/RNIP System>

The total numbers of Incoming Calls for which the UCD queueing feature is available, and other Incoming Calls such as Intra-office, TIE Line, etc., are 640 calls per System.

Interactions

1. UCD PEG COUNT information is available using Traffic commands. Refer to PEG COUNT [P-7] for more information.
2. Do not set ASFC, SFI 252=1 (Multi-Boss/Multi-Secretary is in service) to stations belonging to UCD groups when using the following features.
    - CALL WAITING LAMP-UCD [C-76]
    - DELAY ANNOUNCEMENT-UCD [D-31]
    - OVERFLOW-UCD [O-13]
    - PEG COUNT [P-7] - UCD PEG COUNT
3. CALL FORWARDING-ALL CALLS [C-5]: Only the controlling Station or the Attendant Console can activate this feature. When activated, calls to the UCD Group will be diverted. If the Destination Station is busy, Busy Tone is returned to the Calling Party. If the UCD Group Number is a Phantom Number, CALL FORWARDING-ALL CALLS [C-5] cannot be activated.
4. CALL FORWARDING ALL CALLS/BUSY LINE [C-2, 5]: When a member Station in a UCD Group activates CALL FORWARDING-ALL CALLS [C-5] or CALL FORWARDING-BUSY LINE [C-2], only calls directed to that Station are forwarded. UCD Group Calls are not affected. UCD Calls will bypass the Call Forwarded Station.
5. CALL FORWARDING-DON'T ANSWER [C-3]: All calls terminating at a UCD Station will forward if the call is not answered before the Call Forwarding timer expires.
6. There is no peg count for calls directed to a UCD Group which terminate to a Station Outside the UCD Group due to CALL FORWARDING [C-2, 3, 5].
7. ATTENDANT CAMP-ON WITH TONE INDICATION [A-1]: UCD Calls extended by the Attendant to the controlling Station will not Camp-On unless all of the non-controlling Stations are either busy or in the Busy Out state, and the controlling Station is engaged in a two-way conversation. Then the call will Camp-On to the controlling Station and will terminate at the first available Station.
8. In the event of a non-UCD Call extended to a member Station of a UCD Group, ATTENDANT CAMP-ON WITH TONE INDICATION [A-1] will operate normally.

9. If the UCD controlling Station answers an ATTENDANT CAMP-ON WITH TONE INDICATION [A-1] Call using CONSULTATION HOLD-ALL CALLS [C-17], there is no peg count.
10. BUSY VERIFICATION [B-3]: This feature can be used by the Attendant to check the busy/idle condition of an individual Station assigned to a UCD Group. When this feature is used on an individual Station that is idle but has set Busy Out, the Attendant will receive Reorder Tone.
11. BUSY VERIFICATION [B-3] will activate the normal hunting sequence, and the next Station in the UCD Group scheduled to receive the call will be rung. BUSY VERIFICATION [B-3] will operate only when all the Stations in the group are busy, and only if the Station is engaged in an actual call.
12. A Dterm user can set or cancel Busy Out at any time and from any condition (Idle, Busy, Three-way Conference, PRIVACY RELEASE [P-18]), simply by pressing the BUSY OUT Feature key.
13. Single Line Station users can set Busy Out by going off-hook and dialing the BUSY OUT Access Code, or from the switch hook flash, by dialing the BUSY OUT Access Code when engaged in a normal two-way conversation.
14. The DND Feature key functions in the same manner as the BUSY OUT Feature key for UCD Calls. However, while the BUSY OUT Feature key allows non-controlling UCD Stations to receive calls dialed directly, use of the DND Feature key restricts all Incoming Calls.
15. If OVERFLOW-UCD [O-13] is in service, overflow will take place if all the Stations in the first group are busy or in the Busy Out state.
16. If the OVERFLOW-UCD [O-13] Group is also busy, queuing to the first group takes place.
17. Once BUSY OUT Cancel Code is activated, any UCD Call in queue will automatically be directed to and ring the cancelling UCD Station.
18. BUSY OUT set/cancel cannot be activated by a Dterm user from the idle (on-hook) condition if the My Line is in use by another Dterm user. The Dterm user must first go off-hook or press the SPEAKER key (even though no line will actually be seized), before pressing the BUSY OUT set/cancel key.
19. If the system is reset, traffic measurement requests are no longer in service.
20. When using a Phantom Number for a UCD controlling Station, consider the following:
    a.) Whether to use the Phantom Number to start the UCD hunt or not can be selected by the command APHN. When using the Phantom Number, assign "1" in the "PH" parameter. If not, assign "0".
    b.) When "PH = 1": UCD hunt starts by dialing either the Station Number of the controlling Station or its Phantom Number Both numbers can be the UCD Group Number.
    c.) When "PH = 0": UCD hunt starts by dialing the Station Number of the controlling Station only. The feature is not provided when the Phantom Number is dialed.

Programming

STEP 1: **ASYD** - System Data 1, Index 60, Bit 3. Selection of UCD Queuing:
0/1 = UCD Queuing is provided/Not provided
System Data 1, Index 70, Bit 6. Designation of Announcement Trunk used for Delay Announcement-UCD service: 0/1 = Common/Per UCD Group

STEP 2: **ASYDL** - System Data System Data 1, Index 804, Bit 0
0/1 = BT/RBT is sent to a caller when an Attendant Console transfers the call to UCD Group that is all busy.

STEP 3: **ASHU/ASHUL** - Assign the required data for the UCD Group:

TN/UGN:	Tenant Number/User Group Number
STN/TELN:	Station Number/Telephone Number

[Station List in Group]
STN/TELN: Station Number/Telephone Number
(The order in which Stations are programmed is the order in which they will be hunted.)

Note: Do not enter Phantom Number (PHSTN/PH TELN).

STEP 4: **ANPD** - Reserve a Number Level for Feature Access. Select Normal Service (N), Hooking Service (H) or Busy Service (B) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan.

STEP 5: **ASPA** - Assign an Access Code to UCD BUSY OUT. SRV = "SSCA: Service Code Appendix", SIDA = 50 BUSY OUT set, SRV = "SSCA: Service Code Appendix", SIDA = 51 BUSY OUT cancel. Connection Status Indexes CI = "N: Normal" and CI = "H: Hooking".

STEP 6: **AKYD** - Assign BUSY OUT set/cancel key (same key does both; toggles function on/off). Assign Type:Function:UCD BUSY OUT [19]. Assign UCD CALL WAITING INDICATION Feature key. Assign Type:Function:CALL WAITING LAMP [47].

STEP 7: **ADSL** - Assign UCDBO Feature key; Assign SN = 0 (Idle), 3 (Called Station Busy) and FKY = 19 (UCD Busy Out).
This command is used for assigning a function to each Soft key.

STEP 8: **ATRF** - Assign Traffic Measurement Order.
TYPE: Type of Traffic Measurement
8: UCD Route Peg Count
9: UCD Group Peg Count
10: UCD Station Peg Count
INTERVAL(min):
Output Interval must be assigned in units of ten minutes (range is from 30-120 minutes), or data "0" must be assigned, which is the instruction for assigning output time.
Start TIME, End TIME:
Assign the traffic measurement time period between Start TIME and End TIME longer than an hour. Also, if the measurement should be executed throughout a day, assign the same data in both Start TIME and End TIME parameters.
Start RT, End RT:
Start/End External Route Number (available when TYPE 8 is selected)
Output TIME: This data entry is valid only when INTERVAL(min)=0.

STEP 9: **DTFD** - Display of Traffic Data
UCD Route Peg Count: DTF301
UCD Group Peg Count: DTF302
UCD Station Peg Count: DTF303

STEP 10: **AUCD/AUCDL** - Assign the related data for the UCD Group, if necessary. Assign the Tenant Number/User Group Number and the Station Number/Telephone Number of the UCD controlling Station, QTH ACT, QTH for the UCD PEG COUNT, CWT for CALL WAITING LAMP UCD [C-76], and MCI for MESSAGE CENTER INTERFACE [M-26].

STEP 11: **APHN** - Assign Phantom Number to each UCD controlling Station (if necessary).
MODE: Read Mode
Choose the data retrieval mode between the following:
1: REAL STN (Real station number)

2: PH STN (Phantom station number)
TN: Tenant Number
REAL STN: Real Station Number of the controlling Station
PH STN: Phantom Station Number **Note 5**
[PH LIST]
PH: Kind of Phantom Station Number
0 = Individual Phantom Number
1 = Phantom Number in a Hunting Group (UCD hunting to be activated)
PH STN: Phantom Station Number

Note 5: This parameter is displayed when "2: PH STN" is specified for the parameter MODE.

By using the following command, a Station within a UCD Group can deny hunting function for Incoming Call from a Station.
ASFC - Allow the service feature restriction class (SFI 181) for UCD Group Station which denies hunting function for a Incoming Call from Station.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ASYD** - This data must be assigned to the NCN.
System Data 1, Index 60, Bit 3: 0/1 = UCD Queuing is used/not used
STEP 2: **ANPDN** - This data must be set to the NCN.
Reserve a Number Level for Feature Access.
STEP 3: **ASPAN** - This data must be set to the NCN.
Assign an Access Code of UCD BUSY OUT.
STEP 4: **ASHUN** - This data must be assigned to the NCN.
UGN: User Group Number
1st TELN: Telephone Number of UCD Controlling Station **Note 6**
TELN: Telephone Number of the UCD Station **Note 6**

Note 6: Do not enter Phantom Number (PHSTN/PH TELN).

STEP 5: **AUCDN** - This data must be assigned to the NCN, Assign the related data for UCD Group, if necessary.
UGN: User Group Number
TELN: Telephone Number of UCD Controlling Station
QTH ACT: UCD Queuing Peg Count is Invalid/Valid
QTH: UCD Queuing Peg Count Value
CWT: Threshold value of Call Waiting Lamp (1-255)

MCI: 0/1 = MCI data for the call terminated to the UCD Group can be output/cannot be output

STEP 6: **APHNN** - Assign Phantom Number to each UCD controlling Station (if necessary).

MODE: Read Mode
Choose the data retrieval mode between the following:
1: TELN (Telephone Number)
2: PH TELN (Phantom Telephone Number)

UGN: User Group Number

TELN: Telephone Number of the Circular Hunt Group

PH UGN: Phantom User Group Number **Note 7**

PH TELN: Phantom Telephone Number **Note 7**

[PH LIST]

PH: Kind of Phantom Telephone Number
0 = Individual Phantom Number
1 = Phantom Number in a Hunting Group (UCD hunting to be activated)

PH UGN: Phantom User Group Number

PH TELN: Phantom Telephone Number **Note 8**

Note 7: This parameter is displayed when "2: PH STN" is specified for the parameter MODE.

Note 8: Multiple PH TELNs (a maximum of 16) can be assigned per TELN. Select whether to use each PH TELN for UCD hunt or not by the "PH" parameter. When the BUSY OUT Feature key is assigned to the Feature key, assign the data to all the Nodes by the AKYD/ADSL command.

U-3 Universal Sender

General Description

This feature permits Dialed Numbers to be transmitted via a Sender, a device that will automatically add or delete the necessary number of digits or perform any necessary conversions.

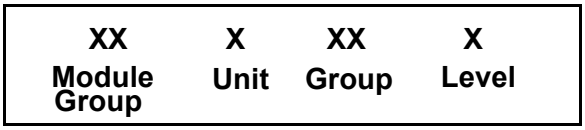
Operating Procedure

No manual operation is required.

Service Conditions

1. For Incoming Connections, digits may be deleted according to the route involved. A maximum of four digits may be added (including the Access Code).
2. For Outgoing Connections, digits may be added/deleted according to the route involved. A maximum of 24 digits may be deleted, and a maximum of 4 may be added (including the Access Code).
3. LEAST-COST ROUTING [L-5]: Digits may be added/deleted according to the route involved and the dialed digits. A maximum of 24 digits may be deleted, and a maximum of 24 may be added, consisting of either digits or about 3 second pauses.

Interactions



1. For features requiring digit translation, refer to the specific feature programming description.
2. The ASTP, AOSP, and AISP commands operate to translate Incoming TIE Line digits that are received by the Register and then sent to the opposite System via UNIVERSAL SENDER. The ANND command is used like the AMND command. It tells the system how many digits the Register is to expect for a specific route. The UNIVERSAL SENDER then sends the digits to the opposite System.

   Features requiring the UNIVERSAL SENDER are:

ATTENDANT CONSOLE	[A-3]
ATTENDANT KEY PAD	[A-4]
CALL FORWARDING-OUTSIDE	[C-28]
LEAST-COST ROUTING-3/6 DIGIT	[L-5]
OUTGOING TRUNK QUEUING	[O-2]
OFF-HOOK QUEUING	[O-7]
PUSHBUTTON CALLING	[P-4]
PUSHBUTTON-TO-ROTARY CONVERSION	[P-6]
SPEED CALLING	[S-3, 21, 23]
TOLL RESTRICTION-3/6-DIGIT	[T-7]

Programming

STEP 1: **ATRK** - Assign these LENS as Sender Route 905, Trunk. LENS consists of the following:

Level numbers for the Sender Trunks are 4-7.

STEP 2: **MBTK** - Assign the Make Idle status to the Sender Trunks.

V-1 Variable Timing Parameters

General Description

The Variable Timing Parameters feature gives the System the versatility to change timing parameters, using the PCPro. All timing parameters for a specific timing sequence are set initially within the generic program. These timing parameters can be changed to accommodate user requirements.

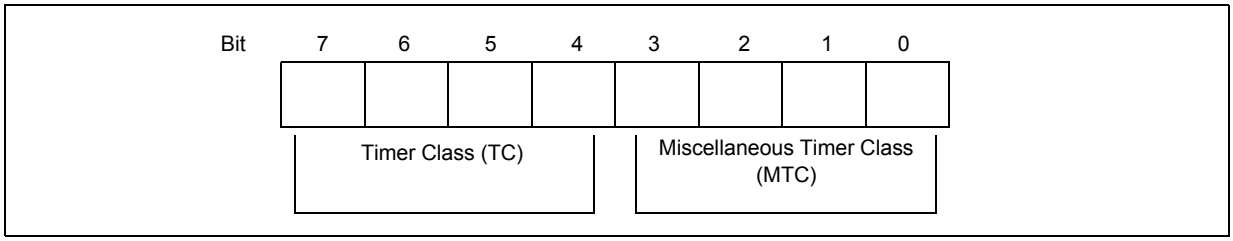
Operating Procedure

No manual operations required.

Service Conditions

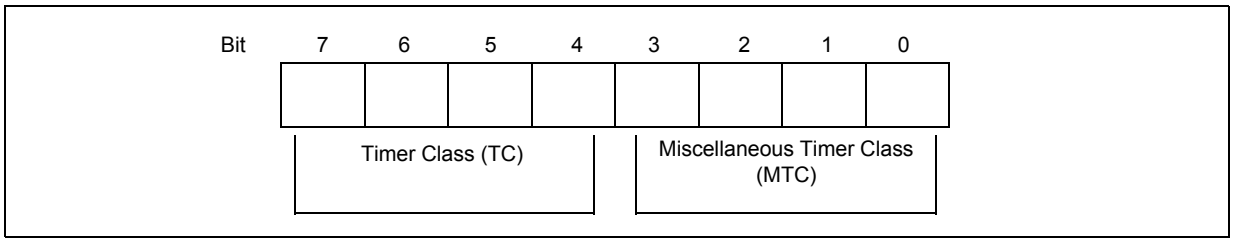
The following list describes the major VARIABLE TIMING PARAMETERS:

1. Automatic Recall Timer: AUTOMATIC RECALL [A-8]:
   a.) standard timing: 30 seconds
   b.) variable timing: 2-30 seconds (two-second increments)
2. No Answer Timer for Station Call: CALL FORWARDING-DON'T ANSWER [C-3]:
   a.) standard timing: 30 seconds
   b.) variable timing: 2-30 seconds (two-second increments)
3. No Answer Timer for Station Call via an Attendant Console: CALL FORWARDING-DON'T ANSWER [C-3]:
   a.) standard timing: 10 seconds
   b.) variable timing: 2-30 seconds (two-second increments)
4. No Answer Timer for Call Transfer: CALL TRANSFER-ALL CALLS [C-11]:
   a.) standard timing: 30 seconds
   b.) variable timing: 2-30 seconds (two-second increments)
5. Periodic Time Indication Tone Timer: PERIODIC TIME INDICATION TONE [P-11]:
   a.) standard timing: first period - 3 minutes; other periods - 3 minutes
   b.) variable timing: first period - 0.5 to 8 minutes (0.5-minute increments), other periods - 0.5 to 8 minutes (0.5-minute increments)
6. Recall Timer for unanswered paging: PAGING TRANSFER [P-10] and RADIO PAGING [R-16]:
   a.) standard timing: 30 seconds
   b.) variable timing: 30 to 480 seconds (30-second increments).



All other timers are variable (e.g., Register prepause timer, Sender prepause timer, and switch hook timer).

Note: If no data is entered, the system operates properly using Default data (RAM Data). ASYD Indexes are not usually reprogrammed, with the possible exception of System Data 1, Indexes 156 and 157. All the hexadecimal data mentioned is Default data.



Interactions

1. To calculate VARIABLE TIMING PARAMETERS, multiply the Timer Class by the Miscellaneous Timer Class, TC x MTC = VARIABLE TIMING PARAMETER. TC is a set value. MTC is any value from 1-15, assigned in hexadecimal. For the PERIODIC TIME INDICATION TONE Timer, a TC of 3 equaling two seconds is not available, but a TC of 4 equaling 30 seconds is available.

   Timer Index:

   TC values for Indexes 136, 147, 150, 155, 156, 157, 158
   TC 0 = -
   1 = -
   2 = -
   3 = two seconds.
   TC values for Indexes 134, 139, 140, 141, 152
   TC 0 = -
   1 = -
   2 = -
   3 = two seconds
   7 = eight seconds.
   TC values for Indexes 137, 146
   TC 0 = -
   1 = 64 milliseconds
   2 = -
   3 = two seconds
   4 = 30 seconds.
   TC values for Indexes 138
   TC 0 = -
   1 = 64 milliseconds
   2 = -
   3 = two seconds
   4 = 30 seconds
   5 = five minutes
   6 = one second.
   Timer Index:

TC values for Indexes 142, 143, 144
TC 0 = -
1 = -
2 = -
3 = two seconds
4 = 30 seconds
7 = eight seconds.
TC values for Indexes 135
TC 0 = -
1 = 64 msec.
TC values for Indexes 149
TC 0 = -
1 = -
2 = -
3 = two seconds
4 = 30 seconds.
TC values for Indexes 145
TC 0 = -
1 = two seconds.

Programming

ASYD - System Data 1. All VARIABLE TIMING PARAMETERS are located between Indexes 128 and 159, with the exception of Paging.

AUTOMATIC RECALL [A-8]

System Data 1, Index 145. Assign "9F" (in hex) for 30 seconds.

CALL FORWARDING-DON'T ANSWER [C-3]

System Data 1, Index 141. Assign 35H for 10 seconds. This timer works in conjunction with Index 139, which is assigned "3F" (in hex) for 30 seconds. After ringing for 10 seconds at the first Station and 30 seconds at the CALL FORWARDING Destination Station, the call returns to the Attendant Console. CALL TRANSFER-ALL CALLS [C-11].

System Data 1, Index 140. Assign 3FH for 30 seconds.

PERIODIC TIME INDICATION TONE [P-11]

System Data 1, Indexes 137 and 138. Timer Class of data "4" for 30 seconds is available for both timers. Index 137 sets when the first tone will be heard. Assign "46" (in hex) for 3 minutes. Index 138 sets the interval between the first tone and all subsequent tones. Assign "46" (in hex) for 3 minutes. This assignment works with ARTD, CDN 29:TELP.

PAGING TRANSFER [P-10]

System Data 1, Index 74, Bits 0-3. Set the Paging No-Answer timer for Recall on Transfer. Set to "00" (in hex) for 30 seconds. (0-F + 1) x 30 = Recall Value RADIO PAGING [R-16].

System Data 1, Index 73, Bit 4. Not used. System Data 1, Index 73, Bit 5. The Recall timer is doubled, as set in System Data 1, Index 74, Bits 4-7. After the first half of the timer, recall of the radio page occurs via the System. The system grabs a Register and the Radio Page Trunk and resends the two or three-digit Answer Code. Is this operation wanted? 0/1: Yes/No.

System Data 1, Index 74, Bits 4-7. Recall timer for radio page. (N + 1) x 30 = Time Out, where N = value set in hex in Bits 4-7. If the paged party doesn't respond, the page is canceled.

V-2 Voice Call

General Description

This feature enables a Single Line Telephone to make a VOICE CALL [V-2] when the Called Party is a Desktop terminal. This feature is also available for calls between two Desktop terminals. This path exists from the Calling Party to the Called Party's built-in speaker. If the Called Party's MIC is ON, the Called Party can converse hands-free. This feature is also available when the Called Station is in the headset mode.

Operating Procedure

From a Single Line Station to a Desktop terminal

1. Dial the Telephone Number of the desired Desktop terminal and receive Ringback Tone.
2. Perform a Switchhook flash.
3. Dial the VOICE CALL Access Code. A signal tone (Two-bursts) is transmitted over the Called Party's speaker.
4. Called Desktop terminal displays:

VOICE	**XXXX**
(Time Display)	

5. Announce the call over the built-in speaker.

From one Desktop terminal to another Desktop terminal

1. The originating Desktop terminal user dials the desired Telephone Number and receives a Ringback Tone.
2. The Calling Party presses the VOICE CALL Feature key. A signal tone (Two-bursts) is transmitted over the Called Party's speaker. The Calling Party's LCD displays:

Called Number

VOICE	**XXXX**
(Time Display)	

Service Conditions

1. This feature is available when the Called Station is a Desktop terminal.

   Note: Even if the Called Station is a Desktop terminal, Voice Calls can not be made to Sub Lines and Software Lines.

2. When the Called Station is not a Desktop terminal, Reorder Tone will be sent to the Calling Party for a pre-determined time, followed by Ringback Tone.
3. Once a VOICE CALL has been activated, the Called Station will appear busy on Multi Line sets displaying the Called Station.
4. VOICE CALL will follow CALL FORWARDING - ALL CALLS [C-5] and CALL FORWARDING - BUSY LINE/DON'T ANSWER [C-2, 3].

5. VOICE CALL will terminate at the Station whose My Line is the same as the extension called.
6. Only the Called Station can respond HANDS-FREE ANSWER BACK [H-4D].
7. STATION MESSAGE DETAIL RECORDING (SMDR) [S-10] is not available for this service.
8. If the Called Station is restricted from VOICE CALL SERVICE by Class of Service, status of the Calling/Called Party is as follows:
   a.) Calling Party
   Single Line: Receives Ringback Tone after hearing Reorder Tone for 30 seconds or by pressing the switch hook during Reorder Tone.
   Desktop Terminal: When using the VOICE key: Receives Ringback Tone, and LCD displays VOICE REST for five seconds.
   When using an Access Code: Receives Ringback Tone after hearing Reorder Tone for 30 seconds or by pressing the switch hook during Reorder Tone. During the Reorder Tone, LCD displays VOICE REST.
   b.) Called Party's Desktop terminal continues to ring. **Note 1**

   Note 1: To restrict Voice Call access to a called party, refer to "To restrict Voice Call access to a called party" in Programming.

9. This feature is also available when a called party is using a headset (in the headset mode). Consider the following:
   a.) To enable a VOICE CALL to a Desktop terminal in the headset mode, additional system data setting is required: ASYDL/ASYDN, SYS1, Index1144, Bit 5=1 (Voice Call to a Desktop terminal in the headset mode).
   b.) When a called party is in the headset mode, a VOICE CALL over CCIS is not available.
   c.) When you receive a VOICE CALL with a headset on (in the headset mode), note the following:
   - A special signal tone, one or two brief beeps different from the signal tone through the speaker, comes over the headset.
   - On the DT800/DT700 Series terminal, the VOICE CALL is heard over the headset. On other series of Desktop terminals, the Voice Call is heard from the speaker.
   - In the headset mode, pressing the HEADSET Feature key switches to the handset mode, in which the VOICE CALL is provided over the speaker with the indication "VCL" or "VOICE" on the called Desktop terminal (and calling one, if available).
   - To answer the VOICE CALL, press the SPEAKER key, instead of the ANSWER key.

Interactions

A Voice Call cannot be sent to a Single Line Station.

Programming

Operating with the Access Code:

STEP 1: **ASYD** - System Data 1, Index 17, Bit 0 = 0 no Voice Call from Analog Phone/Bit 0 = 1 Voice Call from Analog Phone. Hooking (H) service for single-line set. This is used for the MESSAGE REMINDER [M-19] and VOICE CALL features of a single-line set.

System Data 1, Index 321, Bit 7 = 0 Four beeps of Voice Call Chime (**Note 2**) /Bit 7 = 1 One beep of Voice Call Chime

Note 2: A Called Party in the headset mode will hear two beeps of Voice Call Chime.

STEP 2: **ASYDL/ASYDN** - System Data 1, Index 1144, Bit 5 = 0 no Voice Call to a Desktop terminal in the headset mode/Bit 5 = 1 Voice Call to a Desktop terminal in the headset mode.

STEP 3: **ANPD** - Reserve a Number Level for Feature Access. Select Normal Service (N), Hooking Service (H) or Busy Service (B) from the combo box for Connection Indexes (applicable to any feature assigned to this Level). Assign NND in accordance with a predetermined Numbering Plan.

STEP 4: **ASPA** - Assign an Access Code to VOICE CALL, SRV = "SSCA: Service Code Appendix", SIDA = 41.

Connection Status, CI = “H: Hooking”.

STEP 5: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 52 (Voice Call Using an Access Code) to Single Line Stations which will be allowed to initiate Voice Calls.

To refuse VOICE CALL:

Assign a Service Feature Restriction Class allowing SFI 93 (Voice Call Restrict) to Desktop terminals that do not allow access by VOICE CALL.

Operating with the Feature key:

STEP 1: **AKYD** - Assign the Station according to the following parameters:

TN: 1

STN: Station Number

TP: Type of Desktop Terminal (0-3)

RING:

0: No Ringing
1: Ringing All Lines
2: Ringing on Prime Line Only
3: Flexible Ring Assignment, enables RG parameter.

KYN: Key Number (1-40)

KYI: Service Index

0: Key Not Used
1: Feature Key
2: Multi Line Key

KD: Not assigned for Feature Key

FKY: Feature Key Number = 14, VOICE CALL

STEP 2: **ADSL** - Assign VOICE key; Assign SN = 2 (Originating; RBT Connection) and FKY = 14 (Voice Call).

This command is used for assigning a function to each Soft key.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ANPDL** - Reserve a Number Level for Feature Access. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes (applicable to any feature assigned to this Level). Assign NND in accordance with a predetermined Numbering Plan.

STEP 2: **ASPAL** - Assign an Access Code to VOICE CALL, SRV = “SSCA: Service Code Appendix”, SIDA = 41.
Connection Status, CI = “H: Hooking”.

V-3D Volume Control -D

General Description

This feature is used for controlling the volume of a Desktop terminal set's built-in speaker and receiver.

Operating Procedure

1. The Desktop terminal set is equipped with a sliding volume control knob located in the front, beneath the dial pad. Volume can be increased by moving the control to the right, and decreased by moving it to the left.
2. The ringing volume is controlled by a switch on the underside of the Desktop terminal. It is marked RING and located directly below the LCD Display Panel. The ringing volume is increased by moving the switch to the right and decreased by moving the switch to the left.
3. The ringing tone can be set to one of three distinct tones, using switch settings "1", "2", or "3", depending on user preference. Each switch setting produces a separate distinct ringing tone.

   Setting "1" produces the lowest.
   Setting "2" produces a medium.
   Setting "3" produces the highest.

   To control the ringing tone, there is a switch located underneath the Desktop terminal. It is opposite the TRANSFER key, and is labeled RINGING TONE. It has switch settings marked 1, 2 and 3.

For Desktop terminal

1. The Desktop terminal is equipped with two control buttons located on the top front of the phone. Volume can be increased by pushing the right control button while off-hook. Volume can be decreased by pushing the left control button while off-hook.
2. The ringing volume is also adjusted by the same two control buttons. Ringing volume by pushing the right control button while the Desktop terminal is ringing. Decrease the ringing volume by pushing the left control button while the Desktop terminal is ringing.
3. The ringing tone can be set to one of four distinct ringing tones by performing the following: Press the FEATURE key + 3. Each time this is performed, one of the four patterns is selected.

Service Conditions

Ringing, Recall Ringing, and Voice Call Signal Tone are not controlled by VOLUME CONTROL.

Programming

No programming is required.

V-19 Voice Mail Password Display Elimination

General Description

This feature eliminates Additional Digit Display on the Desktop terminal for security purposes.

Note: This feature is only available in North America.

Operating Procedure

1. Dial the station number; for example, 2000. The station number flashes.
2. When the called station answers, the station number (2000) becomes steady.
3. Dial additional digits. The display shows 2000XXXX; Xis the replacement for the authorization code.

Service Conditions

1. When the station-to-station call is established, all additional dial codes are replaced by X.
2. LAST NUMBER REDIAL and SAVE AND REPEAT features keep dialed information, but display X's when these Feature keys are pressed.
3. SPEED CALLING SYSTEM -D feature keeps dialed digits, and all digits are displayed at the same time when this Feature key is pressed.
4. This feature applies only to:
   - Station-to-Station calls (internal).
   - Station-to-Station calls over CCIS
5. This feature applies only to the Desktop terminal of the calling party. (The called party's Desktop terminal does not display X's.)
6. This function starts after the called party answers and ends by SHF (Transfer), Hang-up or Hold. If the calling party executes SHF, dialed digits are displayed (even if it comes back to the Station-to-Station call again).
7. This feature does not apply to Call Transfer or Consultation Hold to Station Call (Station/Trunk Hold) by station or Attendant, because these operations are for leaving messages. Example:
   - Station A talks to Station B.
   - Station A executes SHF and calls Station C, and is forwarded to Station D (Voice Mail).
   - Station A hangs up before or after Station D answers.
   - Station B leaves a message in Voice Mail.
8. This feature does not apply to a station call through a non-CCIS trunk.
9. This feature is allowed on a system-wide basis.

Programming

STEP 1: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 23 to the Stations for this feature.

V-26 VS32 Conference Server

General Description

The VS32 is a voice server with the Multiple-Party Conference, Three-Way Calling, Announcement, and Music On Hold features. These features can be performed over the networks in conjunction with the Telephony Server. Communication cost can be reduced drastically by using these features over the IP network. The VS32 Conference Server can perform these features without any circuit card the previous system has.

Note: Term “Conference leader” used here is the party who hosts the conference, and term “Conferee” used here is the party who attends the conference upon conference leader's request.

Note: “VS32” refers to the following devices.

DEVICE TYPE	FIRMWARE VERSION
VS-32(Dual) Box [MG-VS32VA]	SP-3891 CA-VS32 PROG-A Issue 3A or later
VS-32(Dual) Card [SCA-VS32VA-B/SCA-VS32VA] **Note 3**	SP-3891 CA-VS32 PROG-A Issue 2A or earlier
Software-based VS32 **Note 1 Note 2 Note 3**	SP-4094 VS32VM PROG-A

Note 1: Available from FP95-114 V4.

Note 2: Only provides Announcement service.

Note 3: It only operates in proprietary protocol mode.

Note: When VS32 having no Voice Compression feature is used, “G.711” needs to be assigned as payload type in the data programming.
For payload type of the VS32 having Voice Compression feature, refer to the System Description.

Operating Procedure

1. Announcement

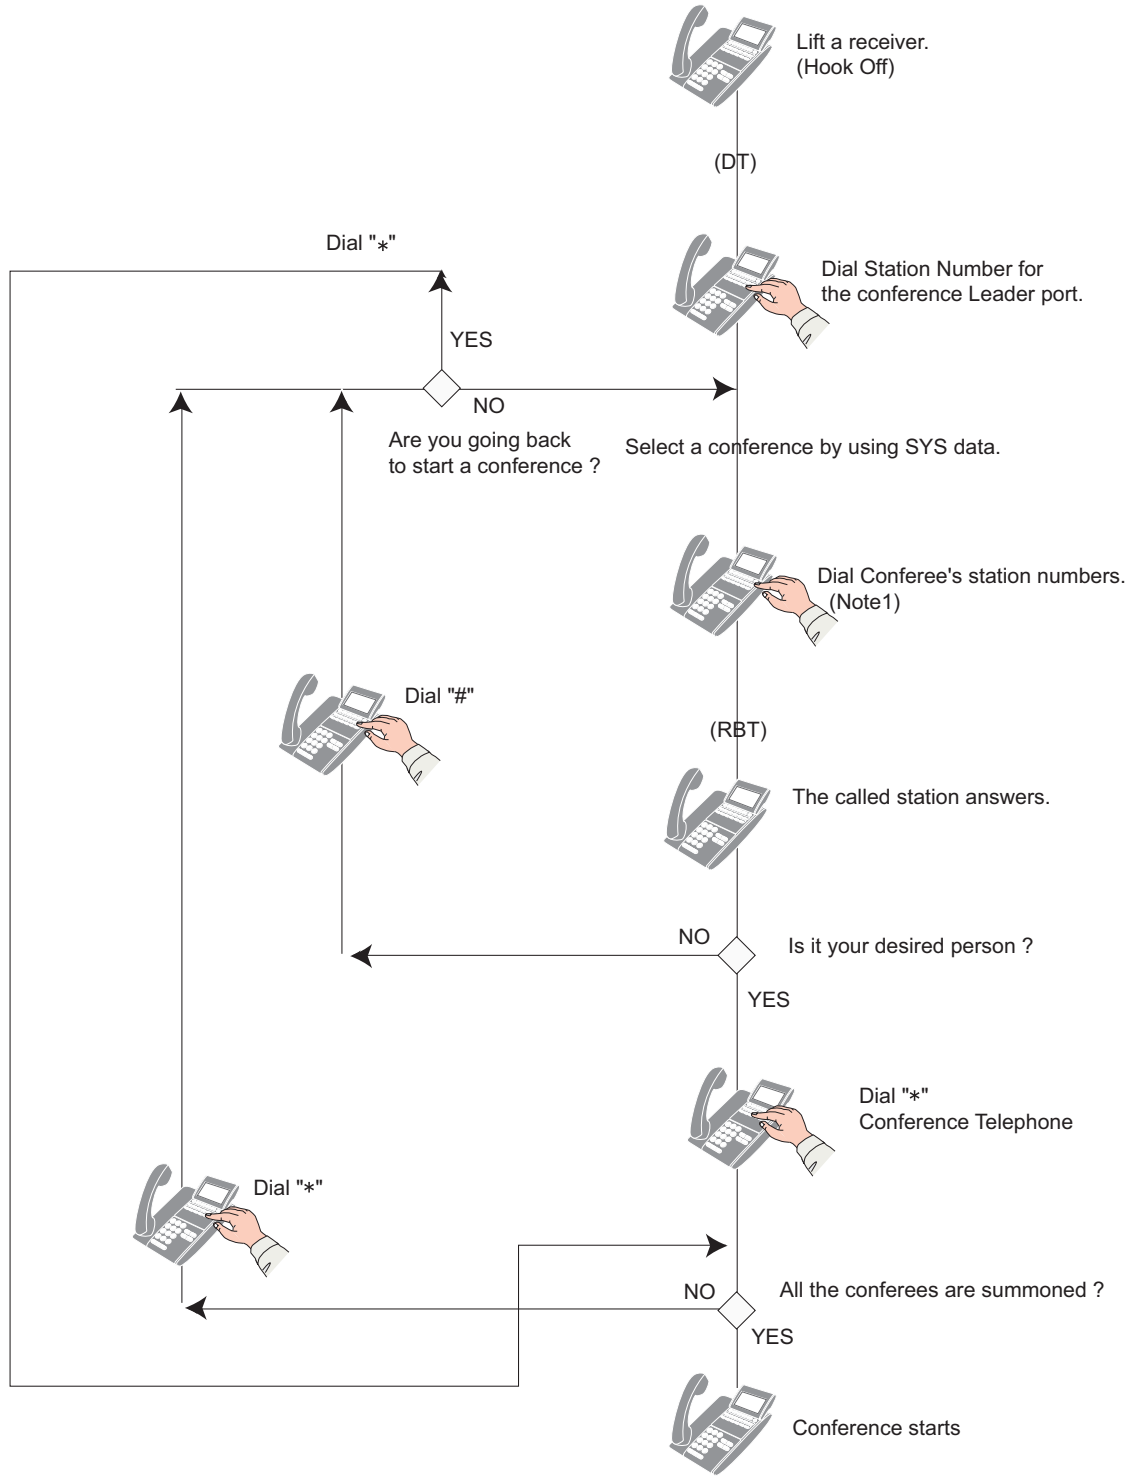
1. Lift the handset. Receive Dial Tone.
2. Dial the Announcement Service Access Code.
3. Listen to the message from the Announcement Machine.

2. IP External Music On Hold

None.

3. Music On Hold Per Line

None.



4. Multiple-Party Conference

4.1 PRESET

- Calling a conference
  1. Dial the Feature Access Code (One to Five digits) for PRESET CONFERENCE.
  2. Predesignated conferees (a maximum of 7 to 31, depending on the setup number of participant) will be called simultaneously and automatically. Receive Ringback Tone during that time.
  3. When the first conferee answers, Ringback Tone stops and the conference call mode is entered. Ringing will continue to the conferees who do not answer.
  4. The conferees who answer will enter the conference call one by one.
- Release of the conference call
  1. When one conferee who is in conference mode releases, the remaining conference leader will continue in the conference mode.
  2. When the conference leader releases from the conference mode, all the conferees will be released.

When all the conferees release, the conference leader will be released.

4.2 PROGRESSIVE

Note: Conferees is set in no-tone status and the person must wait with receiver hooked off.

4.3 MEET-ME

- Attendant-Controlled Conference
  1. Station (Conference Leader) calls Attendant to request Conference.
  2. Attendant dials the Station on Port #0 of the VS32, then presses RELEASE.
  3. Attendant sequentially calls all desired parties, presses START, dials the Station on Port #1 of the VS32, then presses RELEASE. Once all parties are connected, the Conference Leader with a Push button Telephone may dial "0" to block additional participants there by assuring privacy.
  4. If the Conference Leader dials "#", all Conferees will be disconnected. Otherwise, the conference is terminated only after all parties have hung up.
  5. To release from a Conference Circuit individually, a user must hang up. The remaining Conference may continue without interruption.
- Station-Controlled Conference
  - Procedure 1
    1. Station user wishing to establish the Conference (Conference Leader) calls each party desired and advises them of the Conference.
    2. All Stations then call the Conference Telephone Number, and the Conference Leader calls the special Conference number for the leader.
    3. Conference Connection is automatic.
    4. The Conference Leader may dial "0" to lock out additional parties.
    5. If the Conference Leader connected to the Conference Circuit dials digit "#", all Conferees will be disconnected. Otherwise, the Conference is terminated only after all parties have hung up.
    6. To release from a Conference Circuit individually, a Station user hangs up. The remaining Conferees may continue without interruption.
  - Procedure 2
    1. The Conference Leader dials the Telephone Number of conferee; receive Ringback Tone
    2. The Conferee answers.
    3. The Conference Leader makes a Switch Hook Flash (SHF).
    4. Conference Leader dials the Conference Telephone Number on the Conference port #1; Conference port automatically answers.
    5. The Conference Leader hangs up; the conferee is connected to the Conference port #1.
    6. The Conference Leader sequentially calls all desired parties (up to 7/15/31 parties) and connects them to the other Conference port (2 to 7/15/31).
    7. The Conference Leader dials the Conference Telephone Number on the Conference port #0.
    8. The Conference port automatically answers.
    9. The Conference Leader may dial "0" to lock out additional parties.
    10. If the Conference Leader connected to the Conference Circuit dials digit "#", all Conferees will be disconnected. Otherwise, the Conference is terminated only after all parties have hung up.
    11. To release from a Conference Circuit individually, a Station user hangs up. The remaining Conferees may continue without interruption.

4.4 Add-On

Refer to ADD-ON CONFERENCE - 8 PARTY [A-121].

5. Three-Way Calling

- Procedure 1
  1. Press switch hook. First party is placed on Consultation Hold. Receive Special Dial Tone.
  2. Dial the desired number. Receive answer.
  3. Announce the Conference and press switch hook again.
  4. The THREE-WAY CALLING is now established.
- Procedure 2
  1. While connected with the first party, press the hookswitch. Receive Special Dial Tone. The first party is placed on hold.
  2. Dial the Second Party (Desktop terminal). Receive Ringback Tone.
  3. The Second Party answers. The CONSULTATION HOLD - ALL CALLS state has been entered.
  4. The Second Party presses the HOLD key and the call in progress is held.
  5. Press the hookswitch and return to the Original Call.
  6. The Second Party or another Desktop terminal in the same Multi Line Group answers the Held Call.
  7. THREE-WAY CALLING is established.

Service Conditions

1. Service Conditions for VS32 (Common to Proprietary Protocol mode and SIP mode)

1. Accommodation Location Conditions and Hunt Selection Conditions are in the following:

<table>
<tr><th></th><th>ANNOUNCEMENT</th><th>IP EXTERNAL MUSIC ON HOLD</th><th>MULTIPLE-PARTY CONFERENCE</th><th>THREE-WAY CALLING</th></tr>
<tr><td rowspan="3">Accommodated Location Conditions
Note 1</td><td colspan="4">Accommodated in the same CPU</td></tr>
<tr><td colspan="2" rowspan="2">Accommodated in the same location with existing DAT Card</td><td>Accommodated in the same location with existing CFT Card</td><td>Free to assign the data except for Groups 24 to 31</td></tr>
<tr><td colspan="2">Register them in Consecutive Accommodated Locations</td></tr>
<tr><td>Payload</td><td colspan="4">For payload type/payload size available for VS32, refer to the System Description</td></tr>
</table>

Note 1: Accommodated Location can be assigned with Virtual PIR and Physical PIR.

2. Internal PHE is used in control of the same CPU with VS32 Conference Server.
3. Bandwidth Control is managed between IP terminals accommodated in MGC and VS32 Conference Server.
4. VS32 Conference Server can work with UMG type.
5. If VS32 having no VCT is in the network, because it supports only G.711, add G.711 as a CODEC used in Peer to Peer Bandwidth Control [P-75].
6. Individual trunk access with the Access Code and one assigned by PCPro are available.

7. Announcement Pattern (ANP) and Repeat Pattern (REP) positioned at Detailed Announcement Information of the AIVSL command are assigned per channel of VS32, which will determine the music source file on the channel.
8. The following Hotel features can be activated via VS32 Conference Server:

<Announcement feature>

a.) The following Hotel features can be activated via VS32 Conference Server:

- •Automatic Wake-Up [A-10/A-27]
- •Alert Service [A-57]
- •Announcement Service - Guest Station [A-141]
- •Do Not Disturb [D-11]/Do Not Disturb-D [D-11]
- •Emergency Call through PMS [E-31]
- •Group Service through PMS [G-4]
- •Group Restriction [G-21]
- •Maid Status [M-22]
- •Maid Status - Answerback [M-68]
- •Room Cutoff [R-9]

b.) Hotel Announcement features via VS32 Conference Server can be activated by single connection only. Hotel Announcement features provided by multiple connection are not available

c.) When same Announcement Equipment Number (EQP) can be set to both VS32 Conference Server (VS) and DAT card (DAT Announcement Machine) by AAEDL/AAEDN command. In this case, the destination equipment (VS32 Conference Server or DAT card) varies depending on the setting of LANG (Kind of Language) parameter.

(Example)
When checking into Guest Station with “English” from the host computer, the destination equipment is as follows:

Setting of LANG parameter (AAEDL/AAEDN)		**VS32 Conference Server**		
		Common	English	Other Language
DAT Card	Common	VS (DAT)	VS (VS)	DAT (DAT)
	English	DAT (DAT)	VS (DAT)	DAT (DAT)
	Other Language	VS (VS)	VS (VS)	-

VS: Connecting to VS32 Conference Server
DAT: Connecting to DAT card
-: None
( ): When destination is Legacy Equipment

<IP External Music On Hold feature>

a.) The following Hotel features can be activated via VS32 Conference Server:

•Automatic Wake-Up [A-10/A-27]

•Group Service through PMS [G-4]

•Maid Status [M-22]

<Three-Way Calling feature>

a.) The following Hotel feature can be activated via VS32 Conference Server:

•Overtime Call [O-9]

<Multiple-Party Conference>

a.) The following Hotel feature can be activated via VS32 Conference Server:

•Multiple-Party Conference (VS32) for Hotel [M-121]

2. Service Conditions for VS32 in Proprietary Protocol mode

1. VS32 Conference Server makes registration by concentrated PHE method. Therefore, if the PHE is not hunted due to a fault such as invalid internal PHE, VS32 Conference Server will not be able to work.
2. Internal PHE and VS32 Conference Server must be installed on the same CPU.
3. Health Check is performed between internal PHE and VS32 Conference Server. If Health Check NG occurs due to no response from VS32 Conference Server, the registration information will be deleted in MGC and VS32 Conference Server will restart.
4. Use the DISD command to confirm the status of VS32 Conference Server registration.

3. Service Conditions for VS32 in SIP mode

1. VS32 operating in SIP mode is available.
2. When the setting of ASYDL, SYS1, Index 880, Bit 1 (Internal PHI-PRI/BRI)/Bit 3 (Internal PHE) is modified, initialize the Internal PHI-BRI/Internal PHE module with the ADPM command.
3. VS32 requests registration to SP-PHI, not to Internal PHE. To accommodate VS32, activate SP-PHI referring to the data programming procedure.
4. VS32 makes registration by concentrated SP-PHI method. Therefore, when the SP-PHI is not hunted due to a fault such as invalid SP-PHI, VS32 will not be able to work.
5. Up to 4095 ports can be controlled by SP-PHI simultaneously (assigned by REGMAX to SP-PHI in ALIDL command).
6. Conditions on fault monitoring:

   - Health Check is performed between SP-PHI and VS32. If Health Check NG occurs due to no response from VS32, the registration information will be deleted in MGC and VS32 will restart.
   - SP-PHI and VS32 is connected via UDP/IP. So periodic diagnosis is activated in proprietary method. When any fault is detected in periodic diagnosis, System Message [33-S] IP PKG Warning: Health Check Error is output on the LENS of SP-PHI.

- When communication error is detected in sending control packets between Internal PHE and SP-PHI, System Message [33-R] IP PKG Warning: Sending Time-out is output on the LENS of Internal PHE. The System Message is output when control packet sending time-out occurs continuously 8 times or more.

7. Use the following maintenance command to display the operating state related to VS32:

- IPAN: to display the connection status between the Telephony Server and VS32.
  <IP terminal tab> Select "Voice Server (SIP)" under the category of SIP Multi-Function.
  <PH tab> Specify the LENS of SP-PHI. The number of registration/login on SP-PHI is displayed.

- DIPI: to display IP equipment information. Select "VS32 (SIP)" under the category of SIP Media Converter.

- DISD: to display the registration status of IP stations.
  <View Type: Station> SP-PHI's LENS is displayed on PH LENS, and PHI is displayed as PH TYPE.
  <View Type: PH Control> Specify the LENS of SP-PHI to display the registration status on SP-PHI.
  **Other type of IP equipment (MG) is not displayed.*
  <View Type: Voice Server> Specify the MAC address of VS32 to VS-ID.

- DPHL: to display the registration status on each PH, counted on the number of registration/login on SP-PHI.

4. Service Conditions for Announcement

Note: For additional conditions of the VS32 installed as a virtual machine in a server, see conditions section of Software-based VS32 in the Software Model Peripheral Equipment Description manual.

Service conditions of VS32 Conference Server Announcement Service Feature is same as those of Announcement Service. The following describes additional service conditions peculiar to VS32 Conference Server Announcement feature.

1. This feature is provided only in single connection.
2. When multiple VS32 Conference Servers are installed in a system, VS32 Conference Server sound file must be one source in the system.
3. Be sure to specify the music source. If any sound is not selected, 1kHz test tone will be set on the line.
4. Make sure that the routes of DAT circuit card and route of announcement machine have been divided.
5. Only Announcement Service defined by the AAED/AAEDL/AAEDN command is supported.
6. Multi-channel recording is not supported.

5. Service Conditions for IP External Music On Hold

1. This service is available when ASYD:SYS1 Index 64 Bit 7 = 1.
2. This feature is exclusively for IP stations.
3. The Music On Hold used in this service will be replayed from the beginning.
4. In the case of MC-MG, Hold Tone feature will be given higher priority than this service.
5. This feature is provided by single connection (a maximum of 255) only.
6. Make sure to specify the music source. If any sound is not selected, 1kHz test tone will be set on the line.

7. When using this service, if a resource for VS32 IP External Music On Hold cannot be used because VS32 Conference Server has not been registered, it cannot hunt a call, or other reason, the hold tone will depend on the ASYDL setting of SYS1 Index 810 Bit 2 = 0/1.

   - VS32 External Hold Tone cannot be used.

ASYDL		Alternative Music On Hold
SYS1, Index 810, Bit 2	SYS1, Index 818, Bit 2	
0	0	Terminal Internal Hold Tone
1	0	MGC External Hold Tone
0	1	Terminal Internal Hold Tone
1	1	MGC External Hold Tone

   - VS32 External Hold Tone can be used.

ASYDL		Alternative Music On Hold
SYS1, Index 810, Bit 2	SYS1, Index 818, Bit 2	
0	0	Terminal Internal Hold Tone
1	0	MGC External Hold Tone
0	1	VS32 IP External Music On Hold
1	1	VS32 IP External Music On Hold

8. For using this feature, it is required to register two or more channels for IP External Music On Hold.
9. For FCCS, this feature is available only in extensions belonging to the system; it is not available in extensions belonging to the other nodes.

6. Service Conditions for Music On Hold Per Line

1. This feature is available since FP95-114 V4.
2. This feature plays music when the user places a call on hold during conversation on a line (My Line or Sub Lines) configured for this feature with the ASADL or ASADN command.
3. This feature is able to send music on hold only to IP devices.
4. This feature is available on lines for Trunk Line Appearance [T-23] or Trunk Line Appearance -D [T-23D].
5. This feature is available during an outgoing call to a Phantom Number (**Note 1**) if a Telephone Number of the line being used is associated with this feature (through the ASADL or ASADN command).

   Note 1: Phantom Numbers cannot be assigned to the TELN parameter of the ASADL or ASADN command.

6. When activated, this feature always plays music on hold from the beginning.
7. This feature does not work with the following features:

   - Location Diversity [L-55]
   - Software Multiple My Line Appearance [S-143]

- Handover **Note 2**

Note 2: Handover during a PS call will switch the Music On Hold connection from a source for Music On Hold Per Line to the one for another Music On Hold feature for the system.

8. More than one channel (VS32 MOH: IP External Music On Hold) must be configured with the AIVSL command.
9. When configuring an ACD terminal for this feature, use the ASADL or ASADN command to specify sound sources to the ACD line (Virtual Line) number and the Non-ACD line (My Line) number, individually.
10. In case that this feature is not available for any reason (such as unavailability of the data for the ASADL or ASADN command), alternative Music On Hold features can be used by setting the following System Data:

ASYDL		Alternative Music On Hold
SYS1, Index 810, Bit 2	SYS1, Index 818, Bit 2	
0	0	Terminal Internal Hold Tone
1	0	MGC External Hold Tone
0	1	VS32 IP External Music On Hold
1	1	VS32 IP External Music On Hold

11. In configurations where this feature is used in conjunction with the IP External Music On Hold feature, these two features share the same resources of VS32.
12. The following settings override the Music On Hold Per Line settings:

(a) MG External Music-On-Hold [M-125] with the AMGIL command

For the MGs (Kind of MG Trunk) listed below, the setting of Music On Hold per MG (the Music On Hold Exists parameter in the AMGIL command) takes precedence over the setting of Music On Hold Per Line:

- ISDN Trunk (BRI)
- MC-MG (COT)
- ISDN Trunk (BRI) [SIP]
- MG (6COT)
- ISDN Trunk (PRI 1.5M) [SIP]
- ISDN Trunk (PRI 2M) [SIP]
- MG (6COT) [SIP]
- MG-T1 [SIP]

(b) Sound source and pattern of announcement for each channel using the AIVSL command

The setting of the ANP parameter in the AIVSL command takes precedence over the setting of the ANP parameters of the ASADL and ASADN commands.

(c) Suppression of music on hold during 8/16/32-Party Conference call with the ASFC or ASFCN command (SFI 221 = 1)

Setting the RES parameter of SFI 221 to 1 disables the Music On Hold Per Line feature during 8/16/32-Party Conference call.

13. Music On Hold Per Line uses the sound sources of VS32.
14. This feature supports the following hardware:

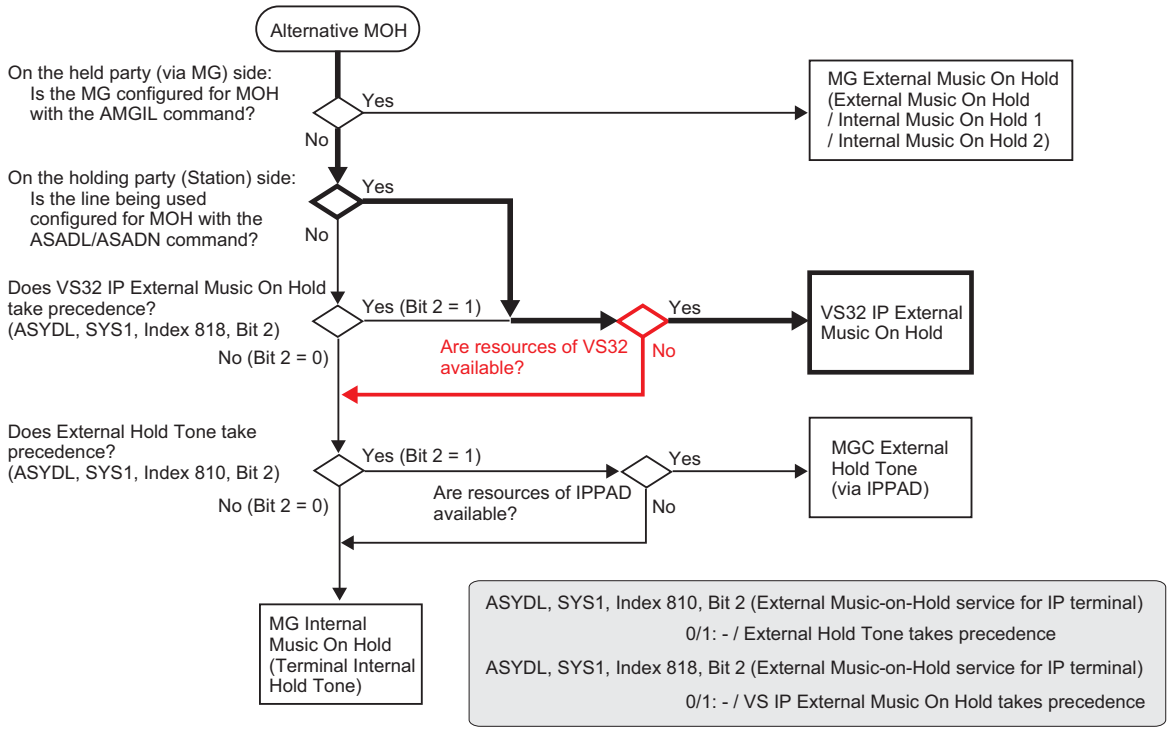
X: Supported, N: Not Supported, C: Conditionally Supported

Terminals/Devices	Holding Party	Held Party	Remarks
DT800 Series DT700 Series	X	X	
DT400 Series DT300 Series	X	N	Terminals directly connected to ELC
Soft Client SP350, DtermSP30	X	X	
UG50 (DLC), UG50-IPG (Digital), IPG Digital	X	X	
Analog MC, UG50-2MC, UG50-8LC	X	X	
Analog station	X	N	Terminals directly connected to LC
UG50 (LC), UG50-IPG (Analog), IPG Analog	X	X	
Standard SIP terminal (SP Controlled SIP terminal)	X	X	
Standard SIP terminal (SIP Handler Controlled SIP terminal)	X	X	
Attendant Console	N	N	
PS	N	N	
MC&MG-COT **Note 4**	N	X	
MG(BRI)	N	X	
MG(PRI) **Note 5**	N	X	
MG(SIP)	N	X	
MG-COT (6COT) **Note 6**	N	X	

Terminals/Devices	Holding Party	Held Party	Remarks
MG-T1	N	X	
COT, PRT, BRT	N	N	Trunks on cards mounted in PIR
VS32 (Multiple-Party Conference, Three-Way Calling)	N	C*	*No music on hold is played when Suppression of music on hold during 8/16/32-Party Conference call is enabled with the ASFC or ASFCN command (SFI 221 = 1).

Note 4: This includes UG50 (COT-TYPE1), UG50 (PGT-TYPE1), UG50-4LC2COTA (COT) and UG50-4LC2COTA (PGT).

Note 5: This includes UG50 (PRT), UG50-24PRIA and UG50-30PRIA.



Note 6: This includes UG50 (COT-TYPE2), UG50 (PGT-TYPE2) and UG50-6COT.

15. In an FCCS system, the VS32 in the node serving the held party provides music on hold through an external connection. This requires that each node of the system have its own VS32 and all the VS32 have the same WAVE files.
16. Music On Hold Per Line works in FCCS Networking via IP (Peer-to-Peer), but not in DTI-FCCS.
17. Music On Hold Per Line is not available for calls via CCIS over IP.
18. When using multiple VS32 as a sound source, assign the same WAVE files to each of them.
19. A maximum of 249 music source files (WAVE files 001 to 249) can be specified. Furthermore, you can play the audio material on an external sound source connected to the MUSIC Connector (auxiliary input interface) of VS32. For WAVE files, there is a limit to the capacity of VS32. See “VS-32(Dual) [SCA-VS32VA/MG-VS32VA/SCA-VS32VA-B]” in Peripheral Equipment Description (IP Devices) for details.

    Note: If no sound source is specified, a test tone of 1 kHz is generated.

20. If the resources of VS32 are not available (for example, because of non-registration of the VS32 or line all busy), an alternative Music On Hold feature is determined through the process shown in the following flow chart:

(a) Case where the held party is connected to an MG, such as MG(BRI), MG(PRI) and MC-MG (COT)

(b) Case where the held party is an IP station

7. Service Conditions for External Multiple Music-On-Hold Source

The following describes service conditions peculiar to External Multiple Music-On-Hold Source Feature.

1. This feature requires a port on IPPAD circuit card.
2. LENS (PIR) needs to be accommodated for SPM (Speech Path Memory). System capacity license software for more than three PIR is required.
3. Tone is not supported.
4. RSC of ARSC command cannot be used to restrict the connection to Announce equipment.
5. The following take approximately five minutes to establish connections between SPM and IPPAD, IPPAD and VS32. The External Multiple Music-On-Hold Source is unavailable until the connection has been re-established.

    - System initialization

      During this operation, the audible tone is retrieved from Tone ROM in TSW and the hold tone is retrieved from MUSIC ROM in EMA/PLO.

    - IPPAD Initialization

      Silent status during this operation.

    - Insert/remove connector into/from IPPAD

      Silent status during this operation.

    - VS32 re-registration

      Silent status during this operation.

    The connections between SPM and IPPAD, IPPAD and VS32 cannot be established under the following cases. During this operation, the audible tone is retrieved from Tone ROM in TSW and the hold tone is retrieved from MUSIC ROM in EMA/PLO.

    a.) VS32 cannot be used for some cases such as VS32 failed registration or MOH cannot be seized.
    b.) IPPAD cannot be used for some cases such as the system accommodates no IPPAD or the IPPAD is being used or busy.
6. Announcement head start is not supported.
7. In 160 and UMG types, non-IP terminals can take External Multiple Music-On-Hold Source only if they belong to the same LP with SPM
8. This feature is not supported in Multiple Music on Hold.
9. If IP External Music On Hold and this feature are assigned, IP terminal will use hold tone from IP External Music On Hold feature.
10. This feature is not available in ISDN trunks, ISDN terminals, and PSs.
11. This feature is not available in FCCS.

8. Service Conditions for Multiple-Party Conference

Service conditions of VS32 Conference Server Multiple-Party Conference Feature is same as those of Three-way Calling Feature. The following describes additional service conditions peculiar to VS32 Conference Server Multiple-Party Conference Feature.

8.1 PRESET

1. In the case of 8-party and 16-party features, CH15 and CH16 cannot be assigned as the same conference group by the AIVSL command.
2. The first port number in each group is used as Conference leader port.
3. When Extension is entered the HOLD key while participating in Multiple-Conference, the other party on the same conference can stop sounding the Hold Tone. When the Hold Tone is set to no sound (SFI 221 = 1 on the ASFC(N) command is set), the Hold Tone will not be heard. Except for extension pushed the HOLD key, the multiple-conference will be performed without any Hold Tone.
4. Cascade connection is not supported.
5. In billing information for the PRESET feature of VS32, all of the calling parties are included as Conference Leader extension by assigning SFI: 222 = 1 in the ASFC(N) command.
6. By assigning the Hotline to Extension Number of Conferee port used in Multiple-Party Conference, dial the Extension Number of Conference leader port when making a Multiple-Party Conference.
7. It is required for the Conferee to register the destination number by the AHLS command beforehand.

   Note: If the destination number is not registered, the call will be transferred to Attendant Console.

8. If Conference Leader port gets recovered (including a case that PS is out of range) in performing this feature, this feature will be terminated.
9. When Conferee is busy or out of range, the Conferee cannot be called. The Conferee will not be able to enter the conference afterward even though the conference has a vacant channel and/or the Conferee becomes available to connect to the network.
10. If the Conferee called is busy, out of range, or roaming, Conference Leader will hear ringback tone.
11. If a Conferee already participating in the conference releases the call while the other Conferees are not able to be caught for busy or out of range, the Conference Leader will be in a silent status.
12. If a Conferee on the conference releases the call before the other Conferees are called, the conference will not be made, and the Conference Leader will hear ROT.
13. Once any attended Conferee releases the conference call, Conference Leader cannot call the Conferee again to the ongoing conference call.
14. A calling cannot be made by Blind Transfer to Extension/Attendant and Call Transfer - All Calls.
15. Call-Back settings cannot be applied to Conferee port.
16. Each port on 8/16/32-party conference feature must be specified by using other Route Restriction Class and Service Feature Restriction Class than those used by General Extensions. In the case of outgoing routes, all routes should be restricted by using the ARSC command.
17. When any of Conferee answers the phone, RBT is stopped. Even though another Conferee is called, RBT will Not be heard again.
18. In the case of PS, the conference call might not work depending on channel status of CS.
19. Conference Call cannot be performed by outgoing trunk that failed to detect any answer signal.

20. It is not available to use any outgoing trunk that once had/has a fault and cannot be detected its release signal.
21. It is not available to call a conference via Central Office Line (including ISDN) or CCIS (including DP-CCIS) by using a Conferee port.
22. In FCCS, this feature is only available within Self Node. Extension Numbers belonging to other nodes and trunks cannot be used as Conferees.
23. This feature doesn't support specified two-party call with conferee.
24. This feature doesn't support forced release of conferee.
25. When VS32 is in non-registration status, if Conference Leader port is hunted, the ROT will be sent. Pilot Number such as that for Extension Hunting feature is assigned, slide action is activated.
26. Please restrict outgoing trunk whose fault cannot be recovered.
27. Calling to conferees cannot be made via external trunks such as CCIS, Q-SIG, Dp Channel Tie line, ISDN, and MG(SIP).

8.2 PROGRESSIVE

1. In the case of 8-party and 16-party features, CH15 and CH16 cannot be assigned as the same conference group by the AIVSL command.
2. The top number of ports assigned to each group is used as Conference leader port.
3. When the HOLD key is pressed on Extension during Multiple-Conference, the other participant on the same conference can stop sounding the Hold Tone. If no sound (SFI 221 = 1 in the ASFC(N) command) is specified for the Hold Tone, the Hold Tone will not be heard. Except for extension whose the HOLD key was pressed, the multiple-conference in progressive will be performed without any Hold Tone.
4. It might take four seconds at maximum to start sending a signal from Conferee Port. This action is to check ports that were once failed has been recovered and working normally.
5. In billing information for the PROGRESSIVE feature of VS32, all of the calling parties are included as Conference Leader extension by assigning SFI: 222 = 1 in the ASFC(N) command.
6. C.O. line cannot be used by Conference Leaders.
7. Conference Leader must call all of the Conferee by himself.
8. This feature is available by ISDN terminals, PSs, and ISDN trunk.
9. A group of Extension Hunting made across multiple conference trunks by Conference Leader depends on service conditions for Extension Hunting.
10. If the called party's number includes asterisk(*) or pound sign(#), the number cannot be called by another because these signs are used as the Extension numbers for inviting Conferees.
11. Any incoming call towards #1-#7 CHs, #15CH, and #31CH (Conferee Ports) is restricted.
12. Conference Leader's telephone must use PB. (DP type is not available.)
13. If called Conferee is absent at that time or the line is busy, disconnect the line by pushing a pound sign (#). In addition, if you intend to re-call Conferees because a wrong number or non-exist dialing number was called, clear already-entered numbers by pushing a pound sign (#).
    If you intend to stop calling a new Conferee and go back to the previous conference, push an asterisk (*).
    - Asterisk (*): Conference Speech
    - Pound sign (#): Calling Control
14. When Conference Leader is calling Conferees, if the Conference Leader does not make any operation, the status transition of the line takes place from Dial Tone to Busy Tone to no tone. At this time, the Conference Leader can push a pound sign (#) or asterisks (**) to go back to the previous conference speech or status for calling Conferees.

15. While Conference Leader is calling Conferees or two-party conference (a Conference Leader and a Conferee are in the conference is being made at an early stage before transition to a conference), if a call is released, the conference will end and the Conferee participating in the conference will hear Busy Tone.
16. Conference Leader pushes an asterisk (*) to cause no tone when no Conferee participated in. Pushing asterisk (*) again changes status to a mode for calling Conferees
17. While the Conference Leader is in the conference, if the call is released, the Conference Leader will not be able to enter the conference again.
18. If participants on a conference are less than three persons, the line will be disconnected forcefully to reserve conference port. As an exception here, if the Conference Leader connects CFT#0, the line will not be disconnected.
19. For connecting to trunks, any other connection cannot be made with Tie Line and C.O. line, which cannot detect any response and its recovery. (This is restricted by Office Data.)
20. When multiple VS32s exist in a place, make Extension Hunting Groups by Conference Ports.
21. The conditions for Extension Class (#0-#7CHs, #15CH, #31CH) are as follows:
    a.) Conference Leader Port (#0CH)
    ARSC Command:
    1. Assign connected restriction data for incoming calls from RSC of Conference Leader port to C.O. line.
    2. Assign connected restriction data for originating calls from C.O. line to RSC of Conference Leader port.

    b.) Conferee Port (#1-#7CHs, #15CH, #31CH)
    ARSC command
    1. Assign connected restriction data for originating calls from RSC of Conference Leader port to C.O. line.
    2. Assign connected restriction data for incoming calls from C.O. line to RSC of Conference Leader port.
22. If Conference Leader will use ISDN terminal, select a type of ISDN telephone that has PB signaling transmission feature on speech.
23. If the VS32 ports that have not made registration due to power-off is seized by call, the ROT will be sent. If a group of Station Huntings has been already assigned across VS32s, the call will be hunted by VS32 located in the group.
24. When a conferee exits the conference call, the other members may hear Reorder Tone (ROT) for a short time.
25. While a Desktop terminal is connected to one of conference ports in a conference trunk, if a DSS key where a station number for another conference port is assigned is pressed by mistake, the call is transferred to the conference port whose station number is assigned to the DSS Key. Even after the Desktop terminal is released, the connection between these conference ports is retained, and the conference trunk becomes unavailable.
    To prevent this, do not assign station numbers for conference ports on any DSS keys.

Note: When assigning station numbers for conference ports on DSS keys is required for any operational reasons, set different tenant numbers to a Desktop terminal and a conference trunk respectively, and restrict TRI=0 (station within OGTN calls to a station within TMTN) in the ATNR command for tenants where the conference ports belong.

8.3 MEET-ME

1. In the case of 8-party and 16-party features, CH15 and CH16 cannot be assigned as the same conference group by the AIVSL command.
2. The first port number in each group is used as Conference leader port.
3. When Extension is entered the HOLD key while participating in Multiple-Conference, the other party on the same conference can stop sounding the Hold Tone. If the Hold Tone is set to no sound (SFI 221 = 1 on the ASFC command is set), the Hold Tone will not be heard. Except for extension pushed the HOLD key, the multiple-conference will be performed without any Hold Tone.
4. Extension/Desktop terminal/Attendant Console/PS can be used as a Conference Leader.
5. Because Conference Leader Port (Port #0) and Conference Port (Port#1-7/#15/#31) are used as Line Circuit, Extension Number is required.
6. Connect Conference Leader to Conference Leader Port (Port #0), and Conference to Conference Port (Port#1-#7/#15/#31).
7. Conference Unit Extension Numbers should be placed in a STATION HUNTING [S-7,8,9] Group with only the pilot numbers.
8. When calling a conference, a Conference Leader transfers the Conferees to the conference port after confirming they answer a call.
9. It is available only for Conference Leader Port to perform forced release and Privacy Settings during the conference.
10. Push “#” for forced release. Push “0” for Privacy settings (all of the Conference port are made busy).
11. Privacy makes all the Conference ports busy.
12. When Conference Leader gets released after making Privacy in the conference time, the leader cannot be back to the Conference port but the Conference Leader port.
13. Privacy settings are canceled when the conference ends.
14. Only outgoing trunk that makes a response and detects release signaling can be used for the conference.
15. It is not available for Conference Leader to recover Conferees (port).
16. Even though Conference Leader is released in the conference time, or remaining participant are two or less, the conference trunk remains its connectivity.
17. Override services, such as BUSY VERIFICATION [B-3], ATTENDANT OVERRIDE [A-7], or EXECUTIVE RIGHT-OF-WAY [E-1] are denied on a Conference Call.
18. When VS32 is in non-registration status, if Conference Leader port is hunted, the ROT will be sent. If Pilot Number such as that for Station Hunting feature is assigned, slide action is activated.
19. You can disconnect the conference call by going on-hook.
20. When a conferee exits the conference call, the other members may hear Reorder Tone (ROT) for a short time.
21. While a Desktop terminal is connected to a conference trunk, if a DSS key where a station number for a conference port is assigned is pressed by mistake, the station is transferred to the conference trunk. If the Desktop terminal is released, the connection between the conference ports is retained, and the conference trunk becomes unavailable.
    To prevent this, do not assign station numbers for conference ports on any DSS keys.

Note: When assigning station numbers for conference ports on DSS keys is required for any operational reasons, set different tenant numbers to a Desktop terminal and a conference trunk, and restrict Station-to-Station Calling between tenants with the ATNR command.

8.4 Add-On

Refer to ADD-ON CONFERENCE - 8 PARTY [A-121].

9. Service Conditions for Three-Way Calling

Service conditions of Three-Way Calling Feature is same as those of the previous Three-Way Calling Feature. The following describes additional service conditions peculiar to Three-Way Conference Feature used by VS32.

1. When IP Extension assigned Three-Way Conference Feature and VS32 Conference Server assigned Three-Way Conference Feature have been registered in the same MG, VS32 Conference Server assigned feature (RT:909) will be taken: for example, conference leader has been assigned to MG7, the system searches the trunk of RT909 in the order of MG7→ MG0 → MG1 → MG2 → MG3 → MG4 → MG5 → MG6.
2. The first channels available for Three-Way Conference Feature are CH0, CH3, CH6, CH9, CH12, CH16, CH19, CH22, CH25, and CH28. Once these channels are registered, another two sequential channels from the first channel will be occupied: for example, when CH0 is occupied as the first channel of this feature, CH1 and CH2 are occupied as well.
3. Three-Way Calling feature supports 3-Party Conference (RT909) only. It does Not support 3-Party Conference Attendant (RT913).
4. Using Least Cost Routing feature, Three-Way Calling feature can be performed effectively. For more information, refer to Least Cost Routing for MG-PRI [L-54].
5. This feature can be activated via PHC (Internal PHC) under the following conditions:
   a.) Any operation other than Call Hold and Call Release cannot be performed during Three-Way Calling via PHC.
   b.) If there are not enough available ports on IPPAD when the CONFERENCE Feature key is pressed, a Three-Way Calling cannot be established. (For example, up to three ports are required when using a DtermIP.)
   c.) Additional party cannot perform switch hook flash during Three-Way Calling.
   d.) When Call Hold is released during Three-way Calling, Override tone is not provided.
6. By assigning system data (ASYDL, SYS 1, Index 830, Bit 5=1), Three-way Calling Tone (Add-On Ticker) can be sent when a Three-way Calling is established.

   Note: This system data (ASYDL, SYS 1, Index 830, Bit 5=0) works in a different way, depending on following countries:
   Austria
   : Three-Way Calling Tone (Add-On Ticker) is sent at a cycle of four seconds.
   EMEA except for Austria
   : Three-Way Calling Tone (Add-On Ticker) is sent at a cycle of 32 seconds.
   North America and Australia
   : Three-Way Calling Tone is not sent.

   The following are the service conditions of Three-way Calling Tone (Add-On Ticker).

   a.) Three-Way Calling Tone (Add-On Ticker) can be sent when a Three-Way Calling is established by the following operations.

   - Switching hook flash
   - Pressing the CONF key of Dterm/DtermIP/DT Series
   - Pressing the CONF key of Attendant Console

b.) Three-Way Calling Tone (Add-On Ticker) can be sent to all the parties of Three-Way Calling.
c.) This feature does not support the Three-way Calling created by OAI or Hotel feature.
d.) Three-Way Calling Tone (Add-On Ticker) supports the following MGs.

Product Name	F/W Product Name	Remarks
MG(BRI) [MG-2BRIA]	SP-3826 BRI MG SIP BSC PROG-A Issue 2 or later	-
MG(BRI) [SCA-2BRIA-B/ SCA-2BRIA]		
MG(PRI) (1.5M) [MG-24PRIA]	SP-3884 MG PRI PROG-A Issue 3 or later	SIP is supported for 5A or later.
MG(PRI) (1.5M) [SCA-24PRIA]		
MG(PRI) (2M) [MG-30PRIA]		
MG(PRI) (2M) [SCA-30PRIA]		
MCMG [MG-4LC2COTA]	SP-3778 MCMG PROG-A Issue 1 or later SP-3927 MCMG PROG-B Issue 1 or later **Note 1**	-
MCMG [SCA-4LC2COTA]		
MG-COT Card [SCA-6COTA]	SP-3875 6MGCOT PROG-A Issue 1 or later **Note 1**	North America is supported.
MG-COT Card [SCA-6COTB]	SP-3948 6MGCOT PROG-A Issue 1 or later	EMEA is supported.
MG-COT Card [SCA-6COTC]	SP-3948 6MGCOT PROG-A Issue 1 or later **Note 1**	North America is supported.
UG50 (PRT 1.5M)	Any version	-
UG50 (PRT 2M)		
UG50-24PRIA		
UG50-30PRIA		
UG50 (COT-TYPE1)		
UG50-4LC2COTA (COT)		
UG50 (COT-TYPE2)		
UG50-6COT		

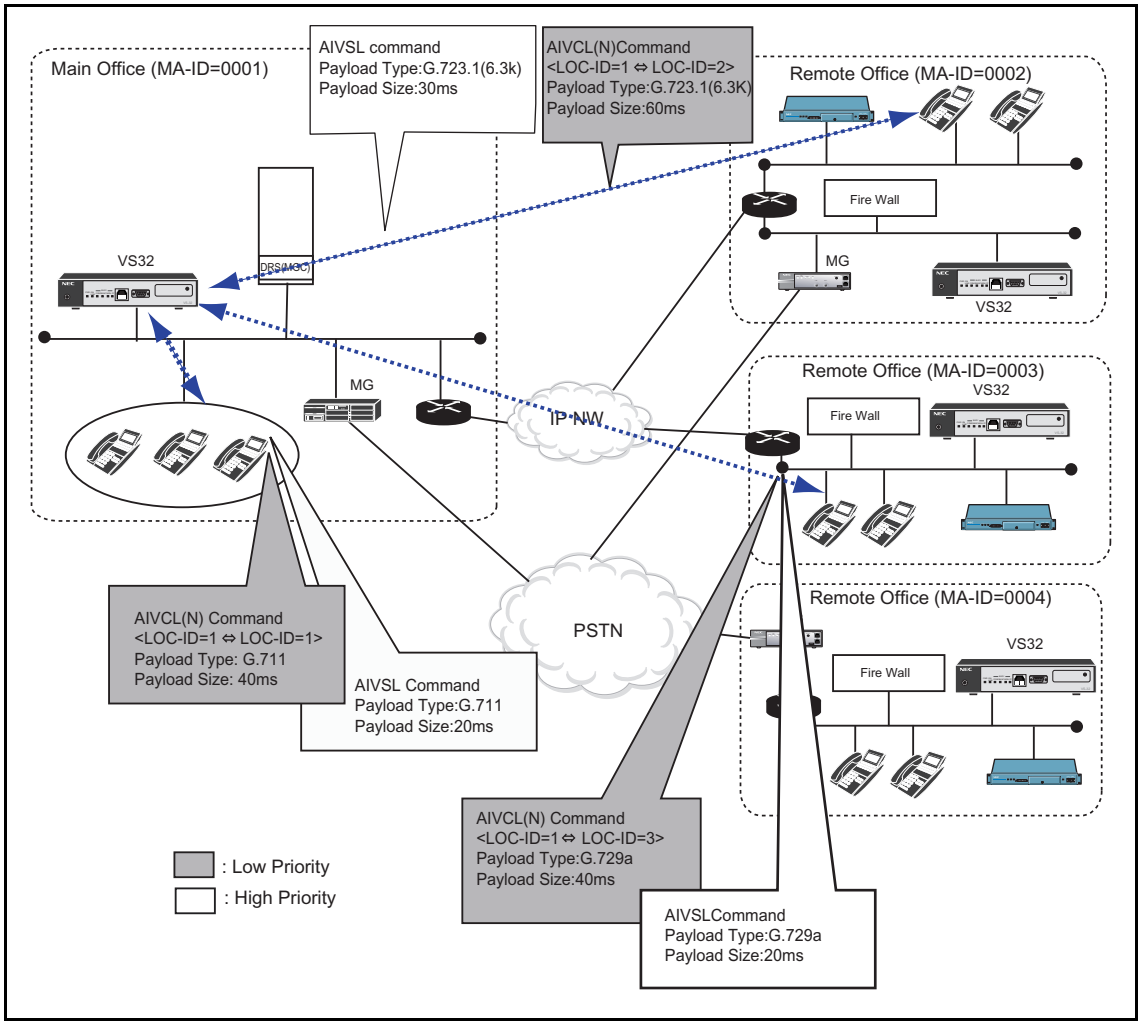
Note 1: EMEA is not supported.

e.) Three-Way Calling Tone (Add-On Ticker) is not transmitted to the operator and terminal connected via PHC.
f.) The following table shows the specifications of Three-Way Calling Tone (Add-On Ticker).

Country	Frequencies	Cadence	Time Slot
America	425 Hz -3 dBm	80ms-on/80ms-off/80ms-on/off	DTG TS = 3
Australia	425 Hz -3 dBm	80ms-on/80ms-off/80ms-on/off	DTG TS = 3
Netherlands	425 Hz -3 dBm	10 times 32ms-on/480ms-off - repeating every 32s	DTG TS = 3
Belgium	425 Hz -3 dBm	5 times 32ms-on/480ms-off - repeating every 32s	DTG TS = 3
Sweden	1400 Hz -27 dBm	352ms-on,off-repeating every 32s	DTG TS = 3
UK	425 Hz -3 dBm	2 times 32ms-on/352ms-off - repeating every 4s	DTG TS = 3
Germany	425 Hz -3 dBm	10 times 32ms-on/480ms-off - repeating every 32s	DTG TS = 3
Austria	425 Hz -3 dBm	4 times 32ms-on/960ms-off - repeating every 4s	DTG TS = 3
Denmark	425 Hz -3 dBm	2 times 32ms-on/480ms-off - repeating every 32s	DTG TS = 3
Swiss	425 Hz -23 dBm	448ms-on - repeating every 32s	DTG TS = 3
Spain	425 Hz -3 dBm	5 times 32ms-on/480ms-off - repeating every 32s	DTG TS = 3
Greece	950 Hz -13 dBm	480ms-on, off - repeating every 32s	DTG TS = 3
Italy	425 Hz -3dBm	10 times 32ms-on/480ms-off - repeating every 32s	DTG TS = 3

7. VS32 (SIP mode) does not support RFC2833 DTMF relay.

10. Service Conditions for Least Cost Routing Feature with VS32 Conference Server



1. MA-IDs must be added to trunks related to the VS32 (such as ANNC, MOH, and 3-CONF) and any equipment to use the VS32.
2. MA-ID is fixed from 0 to 9999. If MA-ID is added to VS32, the VS32 is activated with MA-ID = 0, which means any user can free to use.
3. CFTs in TSW-BOX/MUX circuit cards need to be enabled for any user; therefore, MA-ID of the CFT must be 0.
4. Connecting to specific trunk is not available with this feature.
5. Data assignment for outgoing trunk is not necessary.
6. This feature is available in CCIS over IP, Hotel, and OAI.
7. Backup command (MEM_HDD) and Telephony Server Maintenance Menu are used to back up MA-IDs and verify the backup data. If the backup data is verified after MA-IDs has been changed by the AMAA command, verification error will occur. Therefore, it is necessary to synchronize current data with backup data. For detailed information of Office Data Backup, refer to Operations and Maintenance Manual.
8. If the MA-ID is assigned to each terminal, it can be backed up by System Data. The result of the backup data will be notified in system messages.
9. If MA-ID backup data is stored in Flash Card when system is initialized, the backup data will be loaded onto the memory.
10. MA-ID loading by the backup command (MEM_HDD) and Telephony Server Maintenance Menu will be reflected to the running system in approximately 16 minutes.
11. When all of the related VS32s are busy or not installed, DAT circuit card is not able to select any trunk.
12. In FCCS, when Three-Way Calling is performed with this feature, even if two of them are in the same location, VS32 that the last extension making the Three-Way Calling belongs to will be selected.

11. Service Conditions for Payload Change Feature

The following describes service conditions peculiar to Payload Change Feature.

1. Each command has a priority, and the payload size is determined by system in the following condition:

High Priority				Low Priority
AMGVL/AMGVN	«	AIVSL	«	AIVCL/AIVCN

2. In the case of MG-relayed connection, the payload size can be applied by the AMGVL/AMGVN command only.
3. If payload size assigned by the AIVCL/AIVCN command is below the size assigned by the AIVSL command, the payload size in the AIVSL command will be applied to the system.
4. This feature is invalid for calls via IPPAD circuit card.
5. This feature will be applied to a default payload size even though the settings are not assigned by the AIVCL/AIVCN command and the AMGVL/AMGVN command.
6. The following are recommended payload sizes on the [Detail Setting] tab:

PAYLOAD TYPE	RECOMMENDED PAYLOAD SIZE	
	3-CONF, 8/16/32-CONF	ANNC, MOH
G.711	20ms	40ms
G.723.1 (5.3K → 6.3K)	30ms	60ms
G.723.1 (6.3K → 5.3K)	30ms	60ms
G.729a	20ms	40ms

Note: In the case of VS32 that has no Voice Compression (VC) feature, set 64kbps to G.711.

Note: For more information about the command, refer to the Command Manual.

<Conditions Specific to UMGi/RNIP System>

1. VS32 Conference Server (Common to Proprietary Protocol mode and SIP mode) can work with UMGi/RNIP system.
2. In UMGi system, all the channels of one VS32 Conference Server must be accommodated in the same node (CCN/RN).

Programming

1. VS32 Conference Server Basic Data (for VS32 operating in proprietary mode)

STEP 1: **ASYDL** - Assign System Data (LDM)
SYS1, Index 825, Bit 0 = 1 and Bit 1 = 0 (indicates PAD/EC Control for IP network)
SYS1, Index 880, Bit 3 = 1 (indicates Internal PHE effective)

STEP 2: **ALIDL** - Specify the LENS (five digits) of Internal PHE.
PH LENS: Specify an even-numbered Group No. other than those 24 through 31. The LENS of can be allocated on either a Virtual PIR or a Physical PIR.
[Another sequential group following the assigned group (treated as an smaller number group) are going to be used by the Internal PHE.]
PN TYPE = Internal PHE
REGMAX: Permitted capacity of registration (1-6144)

STEP 3: **AIVSL** - Assign the VS related data
To the MAC address of VS32, assign VS feature data for each channel. **Refer to each feature setting for the assignment on BASE DATA and DETAIL SETTING tabs.*

STEP 4: **ALOCL** - Assign the IP location ID data

STEP 5: **AIVCL** - Assign the voice control data of IP service

Note: For payload type/payload size available for VS32, refer to the System Description.

Note: Path error will occur on MG-V32A, SCA-VS32A and SCA-VS32A-B when any payload type other than G.711 is assigned.

STEP 6: After data registration has been completed, reset the VS32 Conference Server by using Power Switch (OFF→ON)

2. VS32 Conference Server Basic Data (for VS32 operating in SIP mode)

Note: When switching the Proprietary Protocol mode of VS32 to SIP mode registration, make sure to delete the existing VS32 data first, and then go on to the assignment of new SIP data.

2.1 Internal PHE Data Assignment

As SIP mode of VS32 is controlled by SP-PHI, the controlling signal between TP and SP-PHI transfers via Internal PHE. The following Internal PHE data is required.

STEP 1: **ASYDL** - Assign System Data (LDM)

SYS1, Index 880, Bit 3 = 1 (Internal PHE is valid)

STEP 2: **ALOCL** - Assign the IP location ID data

Assign Location ID data of Internal PHE.

TYPE: Select "Network Address".

IP ADDRESS: Enter 0.0.0.0 for the IP Address of Internal PHE.

MASK BIT: Mask bit 32 is automatically displayed for the Network Address 0.0.0.0.

LOC-ID: 0

STEP 3: **ADTM** - Assign the TCP/IP Module data

Assign the Port Number of Internal PHE.
(60130 is used for the communication port between TP and SP in default.)

Note: Internal PHE module needs to be initialized with the ADPM command after changing location ID and port number.

STEP 4: **ALIDL** - Specify the LENS (five digits) of Internal PHE.

PH LENS: Specify an even-numbered Group No. other than those 24 through 31. The LENS can be allocated on either a Virtual PIR or a Physical PIR.

PH TYPE: Select "Internal PHE" in the combo box.

REGMAX: Capacity of registration [1-6144] **Note 1**

Note 1: Up to 4608 ports can be assigned to Virtual PIR.

2.2 SP-PHI Data Assignment

As VS32 Card requests registration to SP-PHI, MPH and SP-PHI data assignment is required.

STEP 1: **ASYDL** - Assign System Data (LDM)

SYS1, Index 880, Bit 1 = 1 (Internal PHI-PRI/BRI is available)

SYS1, Index 885, Bit 7 = 1 (SP is valid)

STEP 2: **ALOCL** - Assign the IP location ID data

Assign Location ID data of SP.

TYPE: Select "Network Address".

IP ADDRESS: Enter the IP Address of SP. **Note 1**

MASK BIT: Enter the mask bit for the IP Address.

LOC-ID: Assign any identification number.

Setting Type of Signaling Packet Service: Place a checkmark to assign the ToS for signaling packet.

IP PRECEDENCE/DIFFSERV: **Note 2**, **Note 3**

<When IP PRECEDENCE is selected>

Priority (PRECEDENCE / DSCP): Specify the precedence in the range of 0-7 (low to high).

Low Delay: Place a checkmark to set Low Delay to ON.

Throughput: Place a checkmark to set High Throughput to ON.

Reliability: Place a checkmark to set High Reliability to ON.

MIN Cost: Place a checkmark to set Cost Precedence to ON.

<When DIFFSERV is selected>

Priority (PRECEDENCE / DSCP): Specify the DiffServ Code Point in the range of 0-63.

Note 1: Internal PHE module needs to be initialized with the ADPM command after changing location ID.

Note 2: Default settings (IP PRECEDENCE, Priority = 6, Low Delay = OFF, Throughput = OFF, Reliability = OFF, Min Cost = OFF) is applied when the check box is not clicked.

Note 3: Execute the following to make the changed data effective after assigning ToS data for signaling packet.
- Internal PHE module initialization with the ADPM command or system initialization
- IPPAD card initialization (MB key ON/OFF operation or make-busy cancel by MBPM command)
- Re-registration of IP terminals

STEP 3: **ALIDL** - Assign the LAN information data (accommodated location of MPH and SP-PHI)

<MPH registration>

PH LENS — Specify an even-numbered Group No. other than those 24 through 31 (five digits). The LENS can be allocated on either a Virtual PIR or a Physical PIR. **Note 4**

PH TYPE — Select "MPH" in the combo box.

MPH ID — Identification Number of MPH [1-4095]
- Single CPU: MPH ID = 1 (Fixed)
- Dual CPU: MPH ID = 1 and 2 (Fixed)

Note: Assign MPH ID = 1 for CPU #0 and MPH ID = 2 for CPU #1.

Note: For UMGi/RNIP System MPH-ID and IP-DTG data assignment see the Initial Data section in the System Startup chapter of UMGi Configuration and Maintenance Guide and Configuration and Maintenance Guide for Remote Node over IP manuals.

<SP-PHI registration>

PH TYPE: — Select "PHI" in the combo box.

PH LENS — Line Equipment Numbers of SP-PHI (five digits) **Note 4**

REGMAX: — Capacity of registration [1-4095]

MGC PORT: — Control port number between MPH and SP-PHI [1-65535] (default: 64105) **Note 4**

TERM PORT: — Control port number in SP-PHI [1-65535] (default: 64010) **Note 4**

Note 4:
- Do not assign the same LENS to MPH and SP-PHI.
- Do not assign the same port number to MGC PORT and TERM PORT.

2.3 VS32 Data Assignment

STEP 1: **ASYDL** - Assign System Data (LDM)

SYS1, Index 825, Bit 0 = 1 (PAD/EC control for IP network is valid)

STEP 2: **AIVSL** - Assign the VS related data

VS-ID: — MAC address of VS32

Use SIP Data: — Select ON for operating VS32 in SIP mode [ON/OFF]

**Refer to each feature setting for the assignment on BASE DATA and DETAIL SETTING tabs.*

STEP 3: **ALOCL** - Assign the IP location ID data

Assign Location ID data of VS32.

TYPE: — Select "Network Address".

IP ADDRESS: Enter the IP Address of VS32. **Note 1**
MASK BIT: Enter the mask bit for the IP Address.
LOC-ID: Assign any identification number.
Setting Type of Signaling Packet Service: Place a checkmark to assign the ToS for signaling packet.
IP PRECEDENCE/DIFFSERV: **Note 2**, **Note 3**
<When IP PRECEDENCE is selected>
Priority (PRECEDENCE / DSCP): Specify the precedence in the range of 0-7 (low-high).
Low Delay: Place a checkmark to set Low Delay to ON.
Throughput: Place a checkmark to set High Throughput to ON.
Reliability: Place a checkmark to set High Reliability to ON.
MIN Cost: Place a checkmark to set Cost Precedence to ON.
<When DIFFSERV is selected>
Priority (PRECEDENCE / DSCP): Specify the DiffServ Code Point in the range of 0-63.

Note 1: Internal PHE module needs to be initialized with the ADPM command after changing location ID.

Note 2: Default settings (IP PRECEDENCE, Priority = 6, Low Delay = OFF, Throughput = OFF, Reliability = OFF, Min Cost = OFF) is applied when the check box is not clicked.

Note 3: Execute the following to make the changed data effective after assigning ToS data for signaling packet.
- Internal PHE module initialization with the ADPM command or system initialization, and VS32 initialization
- IPPAD card initialization (MB key ON/OFF operation or make-busy cancel by MBPM command)
- Re-registration of IP terminals

STEP 4: **AIVCL** - Assign the voice control data of IP service
Assign voice control data on Location ID basis. Add the payload type G.711 on the priority list for all the IP terminals and MGs using VS32 feature.

Note: Path error will occur on MG-V32A, SCA-VS32A and SCA-VS32A-B when any payload type other than G.711 is assigned.

2.4 Authentication Data Assignment

STEP 1: **ASECL** - Assign the authentication data for security
ONE TIME PASSWORD:One Time Password (OTP) to be used for authentication procedure in VS32 registration [4-10 digits with numerics, - (hyphen), . (period)] **Note 1**
AVAILABLE PERIOD:Expiration date of One Time Password [No limit/1-7 days]

Note 1: Assign the same One Time Password to VS32 by configuration command setting.

3. Data Programming for Announcement

To perform Announcement Service Feature, set the following. Note that data settings are different from the settings for FCCS.

Note: This setting is for the physical voice server. Perform the settings for the Software-based VS32 as explained in the office data settings section of Software-based VS32 in the Software Model Peripheral Equipment Description manual.

STEP 1: **ASYDL** - Assign AAEDL/AAEDN command tenant data table development
Index 800, Bit 7=0/1: Separate/Common

STEP 2: **ASTD** - Assign State Translation Data
Allow tandem connection through the COT:
STM = 0, STS = 2, ST = 1

STEP 3: **ARTD** - Assign the route class data of Announcement Trunk (VS32)
OSGS (CDN: 1) = 2 (indicates second dial tone)
ONSG (CDN: 2) = 2 (indicates PB, 60-millisecond interval)
TF (CDN: 5) = 1 (indicates outgoing trunk)
TCL (CDN: 6) = 4 (indicates Tie Line 1)
L/T (CDN: 7) = 1 (indicates Line/Trunk Identification)
LSG (CDN: 15) = 4 (indicates Loop Dial Tone [TIE Line])

Note: Make sure to divide the routes of DAT circuit card and route of announcement machine.

Note: To change the data for existing route (RT), reboot the VS32.

STEP 4: **AIVSL** - Assign the announcement trunk (VS32) data
VS-ID: Assign the MAC Address of VS32.
[BASE DATA] tab
CH: Assign the channel number of the announcement trunk (VS32).
KIND = ANNC
RT: Assign Route number
TK: Assign Trunk number
LENS: Assign Line Equipment Numbers
TN: Assign Tenant number

Note: When this data is changed for VS32 that is in fixed connection, be sure to perform re-registration of the VS32 to reflect the data change.

[DETAIL SETTING] tab
Selecting Setting of External Input Interface, assign the necessary data if other equipment is used as external announcement source.
If the payload size needs to be changed, select DETAIL SETTING tab, select Setting of Payload size, and check the box of Adjust Payload size settings of ANNC and MOH. Then, assign appropriate values in the items.

Note: Data settings will be reflected in the different ways, depending on the system. If this data is modified here while VS32 is working, the data will be reflected immediately. If some of the ports are being used, the data will be reflected to the ports when the ports are set to be idle.

STEP 5: **AAEDL** - Assign the announcement data of VS32 Conference Server

KIND = VS

TN: Assign Tenant number.

EQP: Assign Announcement Equipment Number.

Duration of Connection:

- Disconnect in 30 seconds.
- The connection is held until the extension release.

Do not Send RBT

- Not checked = Send RBT
- Checked = Do not send RBT

Send Answer Signal

- Not checked = Do not Send Answer Signal.
- Checked = Send Answer Signal

LGRT: Assign logical route number to be connected to the VS32 Conference Server (1-899).

ANP: Assign the source of announcement to be played, using announcement pattern (0-255). ANP is associated with music source file number in VS32 Conference Server.

0 - 249: Music source file 000- 249
250: Minuet (built-in)
251 - 254: Reserved
255: External Input Interface

Note: If there is no music source file number associated with ANP in VS32 Conference Server, a test music source file (test.wav/1kHz Tone) will be executed for 10 seconds.

REP: Assign Repeat pattern of the announcement (0-3).

0:Play the music source file once
1:Repeat a music source file set on the ANP parameter.
2:Play four music source files set on the ANP parameter consecutively.
(Example: 00→01→02→03 → End)
3:Play four sounds to the last, and then repeat the third and the forth by rotations.
(Example 00-01-[02-03] Repeat)
4-255: Not used.

STEP 6: **MBTK** - Release the Make Busy of the announcement trunk (VS32)

STEP 7: **ARRC** - Cancel the restriction between COT/Tie line trunk and announcement trunk (VS32)

STEP 8: **ARSC** - Cancel the restriction between the extension, announcement trunk (VS32), and connected trunk

[FCCS Data Settings]

To perform Announcement Service Feature in FCCS, take the following steps. Note that FCCS data settings are different from the data settings.

STEP 1: **ASYDN** - Assign AAEDL/AAEDN command tenant data table development
Index 800, Bit 7=0/1: Separate/Common

STEP 2: **ARTDN** - Assign the route class data of trunk to be connected to VS32 Conference Server
OSGS (CDN: 1) = 2: Second dial tone
TF: (CDN: 5) = 1: Call originating trunk (OGT)
TCL: (CDN: 6) = 4: Tie line, announcement trunk
LSG: (CDN: 15) = 4: Loop Dial Tone (TIE Line)
L/T: (CDN: 7) = 1: Line/trunk kind (Fixed to "1")

Note: Make sure to divide the route with DAT circuit card and announcement trunk.

Note: To change the data for existing route (RT), reboot the VS32.

STEP 3: **ALRTN** - Assign the logical route toward the physical route assigned in ARTD command
LGRT: Assign Logical route
FPC: Assign Fusion Point Code (FPC) of the node with trunk connected to the VS32 Conference Server
RT: Assign Physical route

STEP 4: **AAEDL/AAEDN** - Assign the announcement equipment data
KIND = VS
TN: Assign Tenant number
EQP: Assign the announcement equipment number (0-127).
Duration of Connection: Assign Connection Time
0:Disconnect in 30 seconds
1:The connection is held until the extension release
Do Not Send RBT. Check the box to enable/disable.
Send Answer Signal. Check the box to enable/disable.
LGRT: Assign Logical route number of trunk to be connected to the VS32 Conference Server (1-899).
ANP: Assign the source of announcement to be played
0 - 249: Music source file 000- 249.
250: Minuet (built-in)
251 - 254: Reserved.
255: External Input Interface
REP: Assign Repeat pattern of the announcement (0-3).
0:Play the music source file once
1:Repeat a music source file set on the ANP parameter.
2:Play four music source files set on the ANP parameter consecutively.
(Example: 00→01→02→03 → End)
3:Play four sounds to the last, and then repeat the third and the forth by rotations.
(Example 00-01-[02-03] Repeat)
4-255: Not used.

The other parameters(0,2,3) will be ignored when EQP = 64.

STEP 5: **ARRCN** - Assign Alternative Route Restriction for NDM

This command cancels the restriction between COT/Tie line trunk and VS32 Conference Server (Logical route to Logical route via the FCCS Network).

STEP 6: **ARSCN** - Assign Route Restriction Class for NDM

Cancel the restriction between extension and VS32 Conference Server.

4. Data Programming for IP External Music On Hold

To perform IP External Music On Hold Feature, take the following steps.

STEP 1: **ASYD** - Assign System Data.

SYS1, Index 64, Bit 7 = 1 (Enable the send out of hold tone)

STEP 2: **ASYDL** - Assign System Data for NDM.

SYS1, Index 800 Bit 7 0/1: Separate/Common

SYS1, Index 810, Bit 2: Specify the Bit 0/1 (-/MGC External hold tone takes precedence)(*optional) **Note 1**

SYS1, Index 818, Bit 2: Specify the Bit 0/1 (-/VS External hold tone takes precedence)

- When MGC External Hold Tone has been registered:

SYS Index 810 Bit 2	0	1	0	1
SYS Index 818 Bit 2	0	0	1	1
Hold Tone	Terminal Internal Hold Tone	MGC External Hold Tone	Terminal Internal Hold Tone	MGC External Hold Tone

- When Both MGC and VS32 Conference Server External Hold Tones have been registered:

SYS Index 810 Bit 2	0	1	0	1
SYS Index 818 Bit 2	0	0	1	1
Hold Tone	Terminal Internal Hold Tone	MGC External Hold Tone	VS32 IP External Music On Hold	VS32 IP External Music On Hold

Note 1: Instead of ASYDL command, it is available to specify this data by using **AMGIL** command. (“Music on Hold” parameter)

STEP 3: **ARTD** - Assign the Route class data of Announcement Trunk (VS32).

OSGS (CDN: 1) = 2 [indicates Second dial tone]

ONSG (CDN: 2) = 2 (indicates PB, 60 milli-second interval)

TF (CDN: 5) = 1 (indicates Call originating trunk)

TCL (CDN: 6) = 4 (indicates Tie Line1)

L/T (CDN: 7) = 1 (indicates Trunk)

LSG (CDN: 15) = 5 (indicates E&M)

Note: Make sure to divide the route with DAT circuit card and announcement machine.

Note: To change the data for existing route (RT), reboot the VS32.

STEP 4: **ARTI** - Assign application data for Announcement Trunk.
CDN79: FTRKS (Least Cost Routing)
0: VS32 is selectable. **Note 2**
1: Voice quality is taken as top priority. **Note 3, Note 5**
2: An area to which an operator belongs is given top priority. **Note 4, Note 5, Note 6**
3: Not used (same as 0)

Note 2: VS32 (ANNC and MOH) will be selected by rotation.

Note 3: Transmission of voice packets towards network can be restricted to minimum.

Note 4: Restricting VS32 use from other MA-IDs, the use of VS32 can be limited per MA-ID.

Note 5: If there is no available trunk, select a VS32 whose MA-ID is set to 0. Other than appropriate MA-IDs and MA-ID = 0 cannot be connected, therefore, VS32 is not selected by rotation. Also, to perform this feature, MA-ID must be assigned in advance to all the terminals/trunks connected to the system.

Note 6: Only RT of IP External Music On Hold feature is available. Setting it to RT of Announcement trunk enables the system to operate the same as one when“1” is defined.

Note: To change the data for existing route (RT), reboot the VS32.

STEP 5: **AIVSL** - Assign the announcement trunk (VS32) data.
VS-ID: Assign the MAC Address of VS32.
[BASE DATA] tab
CH: Assign the channel number of the announcement trunk (VS32).
KIND = MOH
RT: Assign Route number.
TK: Assign Trunk number.
LENS: Assign Line Equipment Numbers.
TN: Assign Tenant number.
Detailed Settings for Announcement Data: If Music Source and the way of Playback need to be specified, assign the appropriate ones.
[DETAIL SETTING] tab
Selecting Setting of External Input Interface, assign the necessary data if BGM equipment is used as external music source.
If the payload size needs to be changed, select DETAIL SETTING tab, select Setting of Payload size, and check the box of Adjust Payload size settings of ANNC and MOH. Then, assign appropriate values in the items.

Note: Data settings will be reflected in the different ways, depending on the system. If this data is modified here while VS32 is working, the data will be reflected immediately. If some of the ports are being used, the data will be reflected to the ports when the ports are set to be idle.

STEP 6: **MBTK** - Release the Make Busy of the announcement trunk (VS32).

STEP 7: **AAEDL** - Assign the announcement data of VS32 Conference Server.

KIND = VS

TN: Assign Tenant number.

EQP = 64 (IP External Music On Hold)

LGRT: Logical route number of trunk to be connected to the VS32 Conference Server (1-899)

ANP: Assign an Announcement Pattern (sound source for announcement message). **Note 7**

0-249: Music source files 000-249

250: Minuet (built-in)

251-254: Reserved

255: External Input Interface

REP = 1(Repeats the audio material in the source specified by the ANP parameter.) **Note 8**

Note 7: ANP numbers are associated with music source file numbers stored in VS32. For more information, refer to Peripheral Equipment Description (IP Devices).

Note 8: The other parameters(0,2,3) will be ignored.

Note: In Detailed information for Announcement Data on AIVSL command, if ANP and REP are assigned per channel on VS32, even ANP and REP on AAEDL command have been specified, settings on AIVSL command is applied as higher priority.

5. Data Programming for Music On Hold Per Line

To perform the Music On Hold Per Line feature (**Note 1**), use the following steps.

Note 1: Available since FP95-114 V4.

STEP 1: **ASYD** - Assign System Data.

SYS1, Index 64, Bit 7 = 1 (Enables Music On Hold.)

STEP 2: **ASYDL** - Assign System Data for LDM.

SYS1, Index 800, Bit 7: Tenant data loading into Local Data Memory (LDM) for the AAEDL command

0/1: Separate per tenant / Common

SYS1, Index 810, Bit 2: External Music-on-Hold service for IP terminal **Note 2**

0/1: - / MGC External Hold Tone takes precedence (*optional)

SYS1, Index 818, Bit 2: External Music-on-Hold service for IP terminal **Note 3**

0/1: - / VS IP External Music On Hold takes precedence

Note 2: The System Data for the settings of "External Music-on-Hold service for IP terminal" (ASYDL, SYS1, Index 810, Bit 2; ASYDL, SYS1, Index 818, Bit 2) together determine an alternative Music On Hold feature in the event of unavailability of Music On Hold Per Line. The System Data (ASYDL, SYS1, Index 810) is also used to select an alternative Music On Hold feature when Music On Hold Per Line is technically available but does not actually work due to link block (resource capacity shortage) on VS32.

Note 3: The System Data for the settings of "External Music-on-Hold service for IP terminal" (ASYDL, SYS1, Index 810, Bit 2; ASYDL, SYS1, Index 818, Bit 2) together determine an alternative Music On Hold feature in the event of unavailability of Music On Hold Per Line.

STEP 3: **ARTD** - Assign the Route class data of Announcement Trunk (VS32).
OSGS (CDN: 1) = 2 (Second Dial Tone)
ONSG (CDN: 2) = 2 (PB, 60 millisecond interval or No.7 CCIS)
TF (CDN: 5) = 3 (Both Way Trunk (BWT))
TCL (CDN: 6) = 4 (Tie Line / Announcement Trunk)
L/T (CDN: 7) = 1 (Trunk)
LSG (CDN: 15) = 5 (E&M)
ANS (CDN: 28) = 1 (Answer signal is given.)

Note: Reboot the VS32 after making changes to the data for an existing route (RT).

STEP 4: **ARTI** - Assign application data for Announcement Trunk. **Note 4**
CDN79: FTRKS (Flexible Trunk select)
0: Arbitrary selection. VS32 is selectable. **Note 5**
1: Voice quality priority selection. Voice quality is taken as top priority. An area to which the held party belongs is preferentially selected. **Note 6, Note 8**
2: Operation person priority selection. An area to which the holding party belongs is given top priority. **Note 7, Note 8, Note 9**
3: Not used (same as 0).

Note 4: Reboot the VS32 after making changes to the data for an existing route (RT).

Note 5: VS32 (ANNC and MOH) will be selected by rotation.

Note 6: Transmission of voice packets towards network can be restricted to minimum.

Note 7: This option restricts access to VS32 from other areas to limit the usage of VS32 per MA-ID.

Note 8: If there is no available trunk, a VS32 with MA-ID = 0 is selected. In this option, either the VS32 with MA-ID = 0 or the one in the area where the held party is located is selectable; therefore, VS32 is not selected by rotation. This option requires MA-IDs to be assigned in advance to all the terminals/trunks connected to the system.

Note 9: Only RT for IP External Music On Hold feature is available. Setting it to RT of Announcement trunk enables the system to operate in the same way as when 1 is assigned.

STEP 5: **AIVSL** - Assign trunk (VS32) data for VS32 IP External Music On Hold.

Note: Changes to the settings for an online VS32 take effect immediately without the need for reregistration. In the case of a busy channel, changes take effect immediately after it becomes idle.

VS-ID: Assign the MAC Address of the VS32.

[BASE DATA] tab

CH: Assign the channel number of the VS32.

KIND = MOH

TN: Assign Tenant number.

LENS: Assign Line Equipment Numbers.

RT: Assign Route number

TK: Assign Trunk number

Setting of announcement detail data: **Note 10**

If you want to specify an announcement source and a playback pattern for each channel, click this button and enter the data.

Note 10: Do not configure this setting for a channel to play music on hold.

[DETAIL SETTING] tab

Setting of External Input Interface:

When you connect an external BGM source to the MUSIC Connector (external input interface), you can adjust the input level. To do this, click this button. In the Setting of External Input Interface dialog box, place a check mark in the "Adjust External Input Interface setting" check box, and then select a gain pad value from the list.

Setting of Payload size: **Note 11**

Specify a payload size for each payload type.

To do this, click this button. In the Setting of Payload size dialog box, place a check mark in the "Adjust Payload size setting of ANNC and MOH" check box, and then select a payload size from the list.

For details, see "11. Service Conditions for Payload Change Feature."

Note 11: Path error will occur on MG-V32A, SCA-VS32A and SCA-VS32A-B when any payload type other than G.711 is assigned.

STEP 6: **MBTK** - Release the Make Busy of the trunk for VS32 IP External Music On Hold.

STEP 7: **AAEDL** - Assign the data of VS32 IP External Music On Hold. **Note 12**

Equipment Kind = VS

TN: Assign Tenant number.

EQP = 64 (External Music on hold of IP)

Duration of Connection = "The connection is held until the station release."

Do not Send RBT: Select this check box.

Send Answer Signal: Select this check box.
LGRT: Logical route number of the trunk of VS32 for Music On Hold (1-899)
ANP: Assign an Announcement Pattern (sound source for announcement message). **Note 13**
0-249: WAVE files 000-249
250: Minuet (built-in)
251-254: (Reserved.)
255: External Input Interface
REP = 1(Repeats the audio material in the source specified by the ANP parameter.)

Note 12: Specify a sound source for music on hold for a tenant in the system.

Note 13: ANP numbers are associated with music source file numbers stored in VS32. For more information, refer to Peripheral Equipment Description (IP Devices).

STEP 8: **ASADL/ASADN** - Assign the data of Station's ANP Data for LDM/NDM.
Define music on hold for each station number (Telephone Number).
UGN: Assign User Group Number (1-255).
TELN: Assign Telephone Number (with a maximum of 16 digits).
ANP: Assign an Announcement Pattern (1-255).
Note 14, **Note 15**
1-249: WAVE files 001-249
250: Minuet (built-in)
251-254: (Reserved.)
255: External Input Interface

Note 14: Specify a sound source for Music On Hold Per Line.

Note 15: Do not set this parameter to zero.

6. Data Programming for External Music-On-Hold Source

To perform the External Multiple Music-On-Hold Source feature, use the following steps.

STEP 1: **ASYD** - Assign System Data.
SYS1, Index 60, Bit 4 = 1 (Enable Fixed Connection)
SYS1, Index 64, Bit 7 = 1 (Enable the send out of hold tone)

STEP 2: **ASYDL** - Assign System Data for NDM.
SYS1, Index 646, Bit 0
0/1 = MUSIC ROM/Speech Path Memory (External Music on Hold)

Note: The service is currently provided only for CH00.

STEP 3: **ARTD** - Assign the Route class data of Announcement Trunk (VS32).

Note: To change the data for existing route (RT), reboot the VS32.

The following is an example.

RT:1

1-OSGS	:2	2-ONSG	:0	3-ISGS	:0	4-INSG	:0	5-TF	:0
6-TCL	:4	7-L/T	:1	8-RLP	:0	9-TQ	:0	10-SMDR	:0
11-TD	:0	12-DR	:0	13-AC	:0	14-TNT	:0	15-LSG	:0
16-SMDR2	:0	17-H/M	:0	18-MC	:0	19-EANI	:0	20-D	:0
21-MSB	:0	22-MSW	:0	23-TR	:0	24-OC	:0	25-R/L	:0
26-RSVD	:0	27-TL	:0	28-ANS	:0	29-TELP	:0	30-PAD	:0
31-OGRL	:0	32-ICRL	:0	33-HD	:0	34-GUARD	:0	31-WINK	:0
36-VAD	:0	37-CLD	:0	38-FA	:0	39-BC	:0	40-TCM	:0
41-TDMQ	:0	42-TPQ	:0	43-BT	:0	44-PRV	:0	45-A/D	:0
46-CW	:0	47-TPQ	:0	48-BL	:0	49-TRKS	:0	50-DPLY	:0
51-ACD	:0	52-2W/4W	:0	53-FAAT	:0	54-GW	:0		

STEP 4: **AIVSL** - Assign the MOH trunk (VS32) data.
VS-ID: Assign the MAC Address of VS32.
[BASE DATA] tab
VS-ID: Assign the MAC Address of the MOH trunk (VS32).
CH: Assign the channel number of the MOH trunk (VS32).
KIND = MOH
RT: Assign Route number
TK: Assign Trunk number
LENS: Assign Line Equipment Numbers
TN: Assign Tenant number
[DETAIL SETTING] tab
Selecting Setting of External Input Interface, assign the necessary data if BGM equipment is used as external music source.
If the payload size needs to be changed, select DETAIL SETTING tab, select Setting of Payload size, and check the box of Adjust Payload size settings of ANNC and MOH. Then, assign appropriate values in the items.

Note: Data settings will be reflected in the different ways, depending on the system. If this data is modified here while VS32 is working, the data will be reflected immediately. If some of the ports are being used, the data will be reflected to the ports when the ports are set to be idle.

STEP 5: **MBTK** - Release the Make Busy of the announcement trunk (VS32).

STEP 6: **AFCD** - Assign data for fixed connection between VS32 MOH and SPM.
VS-32 MOH = LENS-A
SPM = LENS-B

7. Data Programming for Multiple-Party Conference

7.1 PRESET

The following are procedures for setting the PRESET feature. Note that the procedure from 6 is separated into two ways, depending on the Conferee Settings with Extension Number or Outgoing Trunk.

STEP 1: **ASYD** - Assign System Data, System Data 1, Index 20, Bit 6 = 0 (Line Circuit Reverse Relay Control when Reorder Tone is connected to a station.)

STEP 2: **ANPD** - Determine the Extension Number Digit.
Specify the digits for the Extension Number of Conference Port.

STEP 3: **ASPA** - Assign the Access Code.
Specify the Access Code for the Extension Number of Conference Port (SRV =”STN: Station Number”).

STEP 4: **AIVSL** - Assign VS32 Conference Server Related Data.
VS-ID: Assign the MAC Address of the VS32.

In the case of 8-party conference, assign the extension number to the VS32 Conference Server channel listed below:
CH#0 (Conference leader port) and CH#1 through #7 (Conferee port).
CH#8 (Conference leader port) and CH#9 through #15 (Conferee port).
CH#16 (Conference leader port) and CH#17 through #23 (Conferee port).
CH#24 (Conference leader port) and CH#25 through #31 (Conferee port).

In the case of 16-party conference, assign the extension number to the VS32 Conference Server channel listed below.
CH#0 (Conference leader port) and CH#1 through #15 (Conferee port).
CH#16 (Conference leader port) and CH#17 through #31 (Conferee port).

In the case of 32-party conference, assign the extension number to the VS32 Conference Server channel listed below:
CH#0 (Conference leader port) and CH#1 through #31 (Conferee port).

[BASE DATA] tab
CH: Assign the VS32 Conference Server channel number.
KIND: Choose 8-party conference, 16-party conference, or 32-party conference.
CONF KIND = PRESET
TN: Tenant number
STN: Extension number
LENS: Line equipment numbers
TEC: Assign “2 (indicates PB)” to the conference leader port, and assign “14 (indicates Hot Line)” to the conferee ports.
RSC: Assign Route Restriction Class other than ordinary extensions use.
SFC: Assign Service Feature Restriction Class other than ordinary extensions use.

[DETAIL SETTING] tab

These values has been specified as proper default values for the system. Note that the values should not be changed if the system works normally. If the system fails to work, click Setting of 8/16/32-CONF and change the data such as PAD value for 8/16/32-party conference settings.

To determine conference trunk operations, click Setting of Expansion Mode and assign the operation mode for the conference trunk.

To reflect these data on VS32 Conference Server running, re-registration must be performed in the system.

Note: Data settings will be reflected in the different ways, depending on the system. If this data is modified here while VS32 is working, the data will be reflected immediately. If some of the ports are being used, the data will be reflected to the ports when the ports are set to be idle.

For the configuration of the FCCS network, go to the [FCCS Data Settings] section; otherwise continue with the next step.

STEP 5: **ASFC** - Specify the information on Service Feature Restriction for stations.

Enter a Service Feature Index (SFI) and then specify Restriction Data (RES) for the Service Feature Restriction Class (SFC) of the stations.

SFI 32: RES = 1 (Line Circuit Reverse Relay Control is available.)

SFI 50: RES = 1 [Off-Premise Extension (Long Line Telephone - No Howler, No PAD Control)]

SFI 71: RES = 1 (Distinctive Dial Tone) **Note 1**

SFI 72: RES = 1 (Called Station Switch Hook Flash is not available.)

SFI 80: RES = 1 (8-Party Conference Terminal)

SFI 221: RES = 1 (Stop the hold music during 8/16/32-Party Conference call)

Note 1: This setting is required for the Conferee ports.

- Other Service (0/1 = None/Available)
  Specify RES for the following SFI if necessary. Assign 0 to RES for SFIs other than those mentioned below.

SFI 12: RES = 1 (Speed Calling System)

SFI 14: RES = 1 (System Message Detail Recording - Trunk Basis)

SFI 19: RES = 1 [Individual Speed Calling (Speed Calling - Station/Group)]

SFI 27: RES = 1 (Account Codes/Authorization Codes/Forced Account Codes)

SFI 58: RES = 1 (Station-to-Station Station Message Detail Recording (SMDR) Call)

- When an Extension Number is specified as the Conferee:

STEP 6: **ARSC** - Specify the information on route restriction for the Route Restriction Class (RSC) of the conference leader port and conferee ports.

Restrict the conference leader port and conferee port for COT and Tie line routes.

Note: Specify restriction data “0” for RRI-0 and RRI-1 of the target RSC to restrict the incoming connection.

STEP 7: **AHLS** - Assign Route Restriction Class.
Specify a destination number to the entry of the physical station data created with the AIVSL command.

HOT TN: Hotline Tenant Number

HOT STN: Hotline Station Number

TYPE = 1 (indicates Station Number)

CON TN: Destination Tenant Number

CON STN: Destination Station Number

- When an Outgoing Trunk is specified as the Conferee:

STEP 6: **ARSC** - Specify the information on route restriction for the Route Restriction Class (RSC) of the conference leader port and conferee ports.

Note: Specify restriction data "0" for RRI-0 and RRI-1 of the target RSC to restrict incoming connection. Also specify restriction data "1" for RRI-3 of the same RSC to allow direct outgoing connection through the C.O. line or Tie line.

STEP 7: **ASPD** - Assign Abbreviated Digit Code for called party.

STEP 8: **AHLS** - Assign Route Restriction Class.
Specify a destination number to the entry of the physical station data created with the AIVSL command.
HOT TN: Hotline Tenant Number
HOT STN: Hotline Station Number
TYPE = 2 (indicates Outside party (ADC))
CON ADC: Assign Speed Calling Code assigned by ASPD.

[FCCS Data Settings]

This subsection describes only the additional or replacement commands used to implement the Multiple-Party Conference (Preset) feature in an FCCS network. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the node.

STEP 1: **ALGSN** - Assign a Telephone Number to the entry of the physical station data created with the AIVSL command.

STEP 2: **ASFCN** - Specify the information on Service Feature Restriction for stations.
Enter a Service Feature Index (SFI) and then specify Restriction Data (RES) for the Service Feature Restriction Class (SFC) of the stations.
SFI 32: RES = 1 (Line Circuit Reverse Relay Control is available)
SFI 50: RES = 1 [Off-Premise Extension (Long Line Telephone - No Howler, No PAD Control)]
SFI 71: RES = 1 (Distinctive Dial Tone) **Note 1**
SFI 72: RES = 1 (Called Station Switch Hook Flash is not available.)
SFI 80: RES = 1 (8-Party Conference Terminal)

SFI 221: RES = 1 (Music On Hold feature is disabled during 8/16/32-Party Conference call.)

Note 1: This setting is required for the Conferee ports.

- Other Service (0/1 = None/Available)
  Specify RES for the following SFI if necessary. Assign 0 to RES for SFIs other than those mentioned below.

  SFI 12: RES = 1 (Speed Calling System)
  SFI 14: RES = 1 (System Message Detail Recording - Trunk Basis)
  SFI 19: RES = 1 [Individual Speed Calling (Speed Calling - Station/Group)]
  SFI 27: RES = 1 (Account Codes/Authorization Codes/Forced Account Codes)
  SFI 58: RES = 1 (Station-to-Station Station Message Detail Recording (SMDR) Call)

- When an Extension Number is specified as the Conferee:

STEP 3: **ARSCN** - Specify the information on route restriction for the Route Restriction Class (RSC) of the conference leader port and conferee ports.
Restrict the conference leader port and conferee port for COT and Tie line routes.

Note: Specify restriction data "0" for RRI-0 and RRI-1 of the target RSC to restrict the incoming connection.

STEP 4: **AHLSN** - Assign Route Restriction Class.
Specify a destination number to the entry of the physical station data created with the AIVSL command.

HOT UGN: Hotline User Group Number

HOT TELN: Hotline Telephone Number

TYPE = 1 (indicates Station Number)

CON UGN: Destination Station's User Group Number

CON TELN: Destination Telephone Number

- When an Outgoing Trunk is specified as the Conferee:

STEP 3: **ARSCN** - Specify the information on route restriction for the Route Restriction Class (RSC) of the conference leader port and conferee ports.

Note: Specify restriction data "0" for RRI-0 and RRI-1 of the target RSC to restrict incoming connection. Also specify restriction data "1" for RRI-3 of the same RSC to allow direct outgoing connection through the C.O. line or Tie line.

STEP 4: **ASPDN** - Assign the Abbreviated Digit Code for called party.
STEP 5: **AHLSN** - Assign Route Restriction Class.
Specify a destination number to the entry of the physical station data created with the AIVSL command.
HOT UGN: Hotline User Group Number

HOT TELN: Hotline Telephone Number
TYPE = 2 (indicates Outside party (ADC))
CON ADC: Assign Speed Calling Code assigned by ASPD.

7.2 PROGRESSIVE

To perform PROGRESSIVE Feature, take the following steps.

STEP 1: **ASYD** - Assign System Data.

SYS1
Index 27, Bit 0-3: Tone Kind

Note that these data are available when SFI 71 = 1 in the ASFC command.

DATA	TONE	DATA	TONE
0	Dial Tone (DT)	8	-
1	Special Dial Tone (SPDT)	9	Sender Transmitting Tone (SDTT)
2	Ringing Back Tone (RBT)	A	Call Waiting Ringing Back Tone (CWRBT)
3	Consecutive Ringing Back Tone (CRBT)	B	-
4	Busy Tone (BT)	C	-
5	Reorder Tone (ROT)	D	-
6	Service Set Tone (SST)	E	-
7	Second Dial Tone (SDT)	F	-

STEP 2: **AIVSL** - Assign VS32 Conference Server Related Data.

In the case of 8-party conference, assign the extension number to the VS32 Conference Server channel listed below:

CH#0 (Conference leader port) and CH#1 through #7 (Conferee port).

CH#8 (Conference leader port) and CH#9 through #15 (Conferee port).

CH#16 (Conference leader port) and CH#17 through #23 (Conferee port).

CH#24 (Conference leader port) and CH#25 through #31 (Conferee port).

In the case of 16-party conference, assign the extension number to the VS32 Conference Server channel listed below:

CH#0 (Conference leader port) and CH#1 through #15 (Conferee port).

CH#16 (Conference leader port) and CH#17 through #31 (Conferee port).

In the case of 32-party conference, assign the extension number to the VS32 Conference Server channel listed below:

CH#0 (Conference leader port) and CH#1 through #31 (Conferee port).

[BASE DATA] tab

VS-ID: Assign the MAC Address of VS32.

CH: Assign the VS32 Conference Server channel number.

KIND: Choose 8-party conference, 16-party conference, or 32-party conference.

CONF KIND = PROGRESSIVE

TN: Tenant number

STN: Extension number

LENS: Line equipment numbers

TEC = 2 (indicates PB)

RSC: Assign Route Restriction Class other than ordinary extensions use.

SFC: Assign Service Feature Restriction Class other than ordinary extensions use.

[DETAIL SETTING] tab

Click Setting of 8/16/32-CONF and assign the necessary data such as PAD value for 8/16/32-party conference settings.

Setting of Expansion Mode
If necessary, click this and assign the operation mode for the conference trunk.

Note: Data settings will be reflected in the different ways, depending on the system. If this data is modified here while VS32 is working, the data will be reflected immediately. If some of the ports are being used, the data will be reflected to the ports when the ports are set to be idle.

For the configuration of the FCCS network, go to the section; otherwise continue with the next step.

STEP 3: **ASFC** - Specify the information on Service Feature Restriction for stations.
Enter a Service Feature Index (SFI) and then specify Restriction Data (RES) for the Service Feature Restriction Class (SFC) of the stations.

SFI 32: RES = 1 [Line Circuit Reverse Relay Control (for 16LC) is available]

SFI 71: RES = 1 (Distinctive Dial tone)

RES: 0/1 (DT/Depends on SYS Data)

SFI 72: RES = 1 (Called Extension Switch Hook Flash is not available)

SFI 221: RES = 1 (Music On Hold feature is disabled during 8/16/32-Party Conference call.)

Note: If SFI 71 and SFI 72 are set to 1, a tone specified in SYS data (ASYD Index 27 Bit 0-3) will be heard when conference number is dialed.

STEP 4: **ARSC** - Specify the information on route restriction for the Route Restriction Class (RSC) of the conference leader port and conferee ports.
Restrict the RSC of the conference leader port and conferee ports for COT and Tie line routes.

STEP 5: If multiple conference trunks exist, set the type of Station Hunting for Conference Leader port by using either of the following commands:
ASHP - Set the type of Station Hunting to Pilot.
ASHC - Set the type of Station Hunting to Circular.

[FCCS Data Settings]

This subsection describes only the additional or replacement commands used to implement the Multiple-Party Conference (Preset) feature in an FCCS network. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the node.

STEP 1: **ALGSN** - Assign a Telephone Number to the entry of the physical station data created with the AIVSL command.

STEP 2: **ASFCN** - Specify the information on Service Feature Restriction for stations.
Enter a Service Feature Index (SFI) and then specify Restriction Data (RES) for the Service Feature Restriction Class (SFC) of the stations.

SFI 32: RES = 1 [Line Circuit Reverse Relay Control (for 16LC) is available]

SFI 71: RES = 1 (Distinctive Dial tone)

RES: 0/1 (DT/Depends on SYS Data)

SFI 72: RES = 1 (Called Extension Switch Hook Flash is not available)

SFI 221: RES = 1 (Music On Hold feature is disabled during 8/16/32-Party Conference call.)

Note: If SFI 71 and SFI 72 are set to 1, a tone specified in SYS data (ASYD, Index 27, Bit 0-3) will be heard when conference number is dialed.

STEP 3: **ARSCN** - Specify the information on route restriction for the Route Restriction Class (RSC) of the conference leader port and conferee ports.
Restrict the RSC of the conference leader port and conferee ports for COT and Tie line routes.

STEP 4: If multiple conference trunks exist, set the type of Station Hunting for Conference Leader port by using either of the following commands:

ASHPN - Set the type of Station Hunting to Pilot for NDM.
ASHCN - Set the type of Station Hunting to Circular for NDM.

7.3 MEET-ME

To perform MEET-ME Feature, take the following steps.

STEP 1: **ASYD** - Assign System Data.
SYS1
Index 20, Bit 6 = 0 (Line Circuit Reverse Relay Control when Reorder Tone is connected to an extension)
Index 64, Bit 0: Assign the compression method (0:μ-law/1:A-law)

STEP 2: **AIVSL** - Assign VS32 Conference Server Related Data.
VS-ID: Assign the MAC Address of the VS32.

In the case of 8-party conference, assign the extension number to the VS32 Conference Server channel listed below:
CH#0 (Conference leader port) and CH#1 through #7 (Conferee port).
CH#8 (Conference leader port) and CH#9 through #15 (Conferee port).
CH#16 (Conference leader port) and CH#17 through #23 (Conferee port).
CH#24 (Conference leader port) and CH#25 through #31 (Conferee port).

In the case of 16-party conference, assign the extension number to the VS32 Conference Server channel listed below:
CH#0 (Conference leader port) and CH#1 through #15 (Conferee port).
CH#16 (Conference leader port) and CH#17 through #31 (Conferee port).

In the case of 32-party conference, assign the extension number to the VS32 Conference Server channel listed below:
CH#0 (Conference leader port) and CH#1 through #31 (Conferee port).

[BASE DATA] tab
CH: Assign the VS32 Conference Server channel number.
KIND: Choose 8-party conference, 16-party conference, or 32-party conference.
CONF KIND = MEET-ME
TN: Tenant number
STN: Extension number
LENS: Line equipment numbers
TEC = 2 (indicates PB)
RSC: Assign Route Restriction Class other than ordinary extensions use.
SFC: Assign Service Feature Restriction Class other than ordinary extensions use.

Example: When accommodated in PIR1, Group 3.

VS Channel	LENS	Exten-sion Number	TEC	SFC	RSC	Reference
0	001030	3200	2	10	10	Conference leader port
1	001031	3201	2	10	10	
2	001032	3202	2	10	10	
3	001033	3203	2	10	10	
4	001034	3204	2	10	10	Conferee port
5	001035	3205	2	10	10	
6	001036	3206	2	10	10	
7	001037	3207	2	10	10	

[DETAIL SETTING] tab

Click Setting of 8/16/32-CONF and assign the necessary data such as PAD value for 8/16/32-party conference settings.

If necessary, click Setting of Expansion Mode and assign the operation mode for the conference trunk.

Note: Data settings will be reflected in the different ways, depending on the system. If this data is modified here while VS32 is working, the data will be reflected immediately. If some of the ports are being used, the data will be reflected to the ports when the ports are set to be idle.

Note: To assign data by Logical Extension Number, use the ALGSN command.

For the configuration of the FCCS network, go to the [FCCS Data Settings] section; otherwise continue with the next step.

STEP 3: **ASFC** - Specify the information on Service Feature Restriction for stations.

Enter a Service Feature Index (SFI) and then assign 1 to Restriction Data (RES) for the Service Feature Restriction Class (SFC) of the stations.

- SFC of the conference leader port extension
  SFI 32: RES = 0 [Line Circuit Reverse Relay Control (for 16LC) is not available.]
  SFI 72: RES = 1 (Called Station Switch Hook is not available.)

- SFC of the extension in conference trunk
  SFI 221: RES = 1 (Music On Hold feature is disabled.)

STEP 4: **ARSC** - Specify the information on route restriction for the Route Restriction Class (RSC) of the conference leader port and conferee ports.

Restrict the RSC of the conference leader port and conferee ports for COT and Tie line routes.

STEP 5: Set the type of Station Hunting by using any of the following commands. Ensure that all the conferee ports are configured to be in the same Hunting Group or that the Conference Leader port and conferee ports are in the same Hunting Group.

ASHP - Set the type of Station Hunting to Pilot.
ASHC - Set the type of Station Hunting to Circular.
ASHU - Set the type of Station Hunting to UCD.

[FCCS Data Settings]

This subsection describes only the additional or replacement commands used to implement the Multiple-Party Conference (Preset) feature in an FCCS network. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the node.

STEP 1: **ALGSN** - Assign a Telephone Number to the entry of the physical station data created with the AIVSL command.

STEP 2: **ASFCN** - Specify the information on Service Feature Restriction for stations.

Enter a Service Feature Index (SFI) and then specify Restriction Data (RES) for the Service Feature Restriction Class (SFC) of the stations.

- SFC of the conference leader port extension
  SFI 32: RES = 0 [Line Circuit Reverse Relay Control (for 16LC) is not available.]
  SFI 72: RES = 1 (Called Station Switch Hook is not available.)

- SFC of the extension in conference trunk
  SFI 221: RES = 1 (Music On Hold feature is disabled.)

STEP 3: **ARSCN** - Specify the information on route restriction for the Route Restriction Class (RSC) of the conference leader port and conferee ports.

Restrict the RSC of the conference leader port and conferee ports for COT and Tie line routes.

STEP 4: Set the type of Station Hunting by using any of the following commands. Ensure that all the conferee ports are configured to be in the same Hunting Group or that the Conference Leader port and conferee ports are in the same Hunting Group.

ASHPN - Set the type of Station Hunting to Pilot for NDM.
ASHCN - Set the type of Station Hunting to Circular for NDM.
ASHUN - Set the type of Station Hunting to UCD for NDM.

7.4 Add-On

Refer to ADD-ON CONFERENCE - 8 PARTY [A-121].

8. Data Programming for Three-Way Calling

To perform Three-Way Conference Feature, take the following steps.

STEP 1: **ASYD** - Assign System Data
SYS2, Index 1
Bit 0,1: Transfer Service
Bit 1 = 0, Bit 0 = 1 Transfer effective (available excluding tandem)
Bit 1 = 1, Bit 0 = 1 Transfer effective (available including tandem)
SYS3, Index 2: Recovery Timer

STEP 2: **ASYDL** - Assign System Data
SYS1, Index 830, Bit 5: This system data works in a different way, depending on following countries:
- When Bit 5=0
  Austria
  : Three-Way Calling Tone (Add-On Ticker) is sent at a cycle of four seconds.
  EMEA except for Austria
  : Three-Way Calling Tone (Add-On Ticker) is sent at a cycle of 32 seconds.
  North America and Australia
  : Three-Way Calling Tone is not sent.
- When Bit 5=1
  Three-Way Calling Tone (Add-On Ticker) is sent only once when Three-Way Calling is established.

SYS1, Index 811
Bits = 0-7: Specify the Country Code for IP terminal Tone. For more information about the country code, refer to Command Manual.

STEP 3: **ASTD** - Assign State Translation Data
The following need to be assigned when Three-Party conference with COT trunk is performed.
STM = 2
STS = 0 (indicates Tandem with COT)
ST = 1 (indicates Effective)

STEP 4: **AIVSL** - Assign the system data of Three-party conference trunk
VS-ID: Assign the MAC Address of the VS32.

[BASE DATA] tab
CH: Assign the following VS32 Conference Server channel number.
CH#0-2
CH#3-5
CH#6-8
CH#9-11
CH#12-14
CH#15 (This channel cannot be assigned)
CH#16-18
CH#19-21
CH#22-24

CH#25-27
CH#28-30
CH#31 (This channel cannot be assigned)

KIND = 3-CONF

RT: Route Number (909)

TK: Trunk Number

LENS: Line equipment numbers

[DETAIL SETTING] tab

Click Setting of 3-CONF and check the Adjust 3-CONF setting box if the following data should be modified:

- Threshold value to define extension/trunk

- PAD value for adjusting conference level

- PAD value for adjusting conference value when Three-Way conference trunk is connected to UMS recording

- PAD value of UMS conversion recording

Note: Data settings will be reflected in the different ways, depending on the system. If this data is modified here while VS32 is working, the data will be reflected immediately. If some of the ports are being used, the data will be reflected to the ports when the ports are set to be idle.

STEP 5: **MBTK** - Make Busy Trunk

Release the Make Busy of the trunk specified by AIVSL.

STEP 6: **ARRC** - Assign Alternative Route Restriction

Permit the tandem connection restriction for Three-Way conference with route outside the office.

ICRT: Incoming Route Number (1-255)

OGRT: Outgoing Route Number (1-255)

ARI A-RES: Restriction Data for Alternative Route INDEX-A (0/1)

RES = 1 (indicates No Restriction)

STEP 7: **ARSC** - Assign Route Restriction Data

Specify restriction data between the extension and outgoing trunks when using Three-Way conference via the outgoing trunk.

If you will use Least Cost Routing feature, refer to Least Cost Routing for MG-PRI [L-54].

9. Data Programming for Least Cost Routing with VS32 Conference Server

STEP 1: **AMAIL** - Assign MA-IDs
MA-ID: Message Area ID within the range from 0 to 9999.
AREA NAME: Enter an area name within 16 characters.

STEP 2: **AMAA** - Assign MA-ID allocation data
Assign MA-IDs to MOHs of VS32s. To confirm the MA-ID, enter the following parameters and click the Read button to display the MA-IDs.

- FUNCTION = Trunk (When a type of terminals is determined by trunk)

  TYPE: Select a type for specifying trunk (Individual or Collective).

  RT: Route Number, this can be specified when TYPE = Individual.

  RT START-END: The range of the Route Numbers, this can be specified when TYPE = Collective.

  MA-ID: Message Area ID within the range from 0 to 9999.

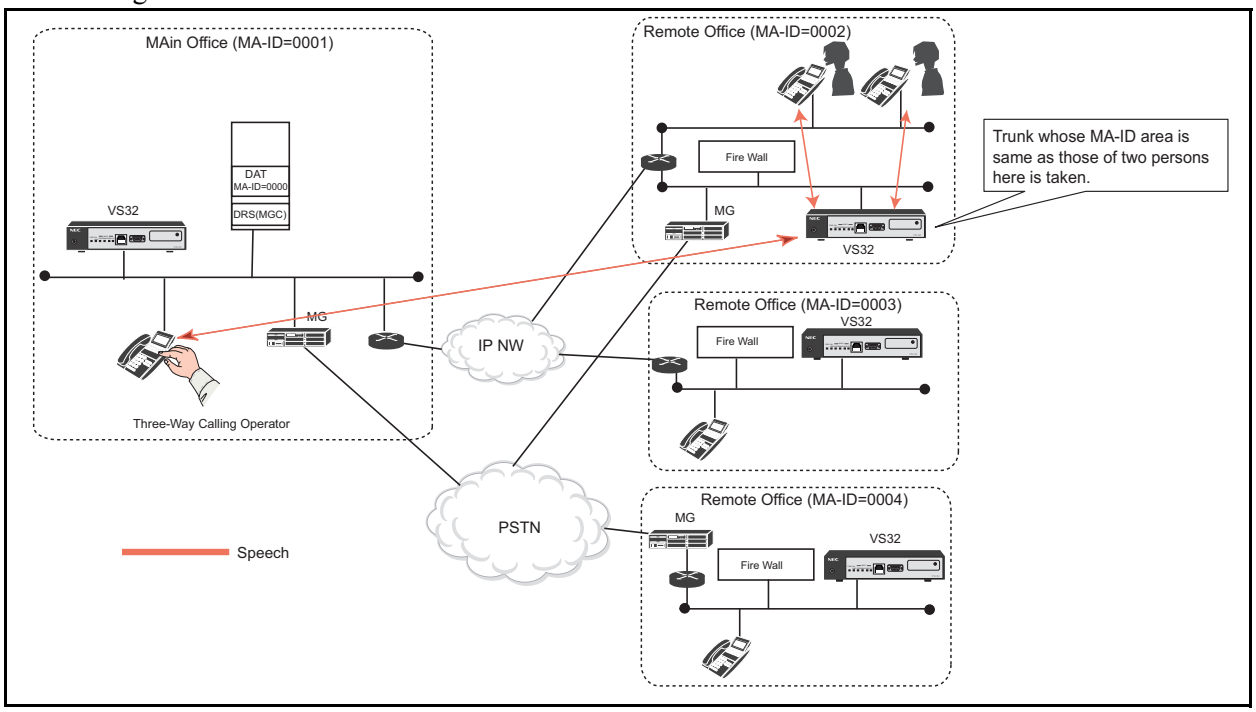
- FUNCTION = LENS (When a type of terminals is determined by Accommodation Location)

  TYPE: Select a type for specifying accommodation locations (Individual or Collective).

  LENS: Accommodation location, this can be specified when TYPE = Individual.

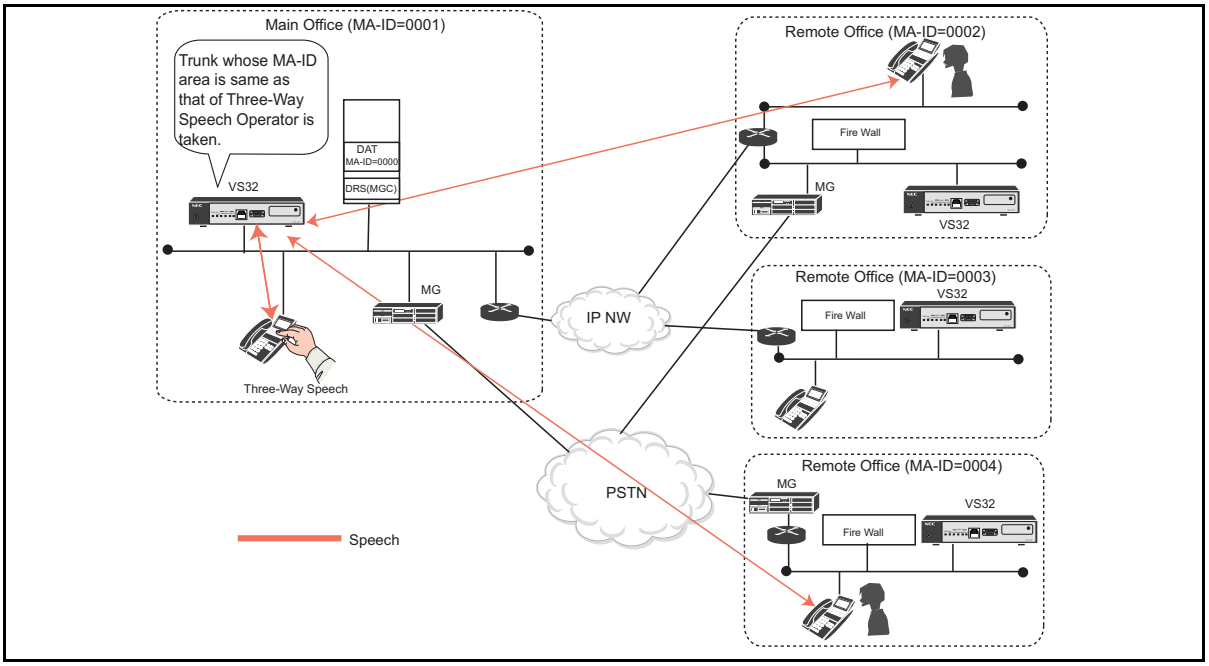
  LENS START-END: The range of the Route Numbers, this can be specified when TYPE = Collective.

  MA-ID: Message Area ID within the range from 0 to 9999.



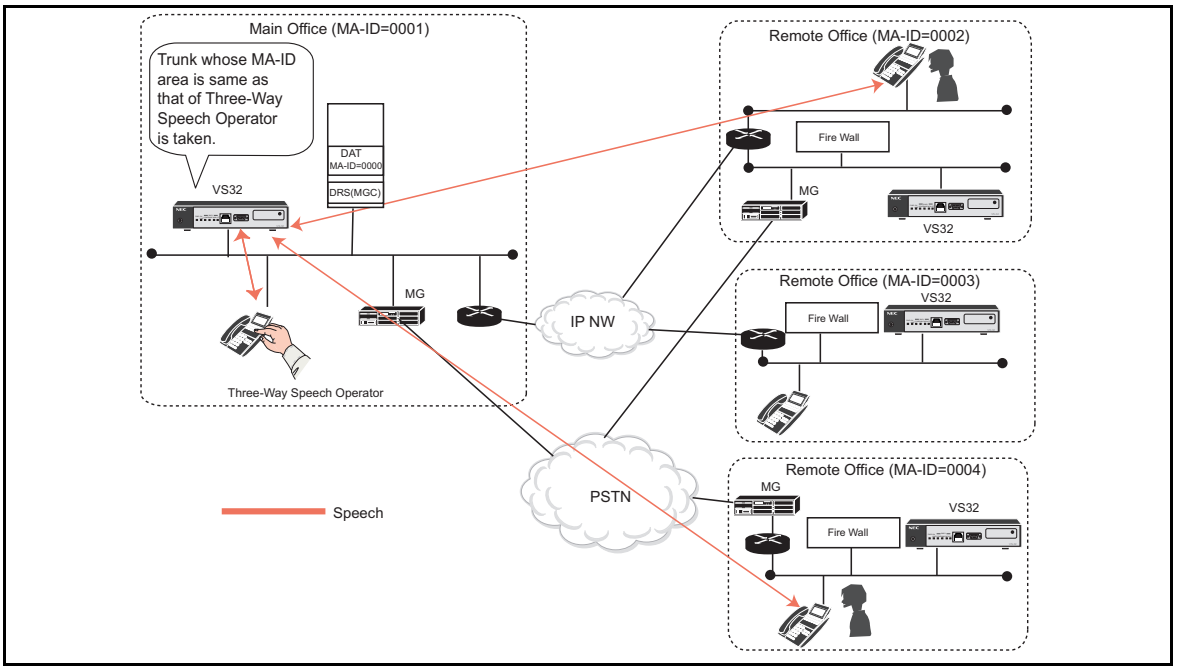
9.1 When Least Cost Routing is used with Three-Way Calling

Note: This feature is not available in FCCS.

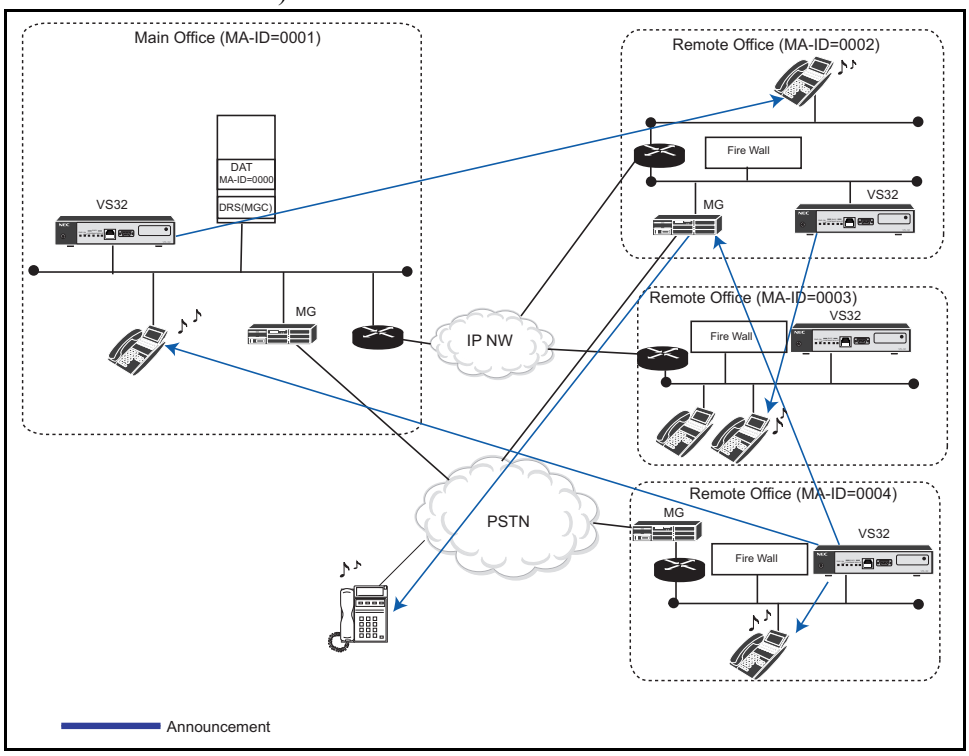


When Index 830 Bit 0 = 0 and Bit 1 = 0 on the ASYDL(N) command is assigned, an appropriate trunk (VS32 or TSW-BOX/MUX circuit card) is selected as follows:

When Index 830 Bit 0 = 1 and Bit 1 = 0 on the ASYDL(N) command (Voice quality is given top priority), if two of them are in the same location, a trunk belonging to the two people will be selected for Three-Way Calling.

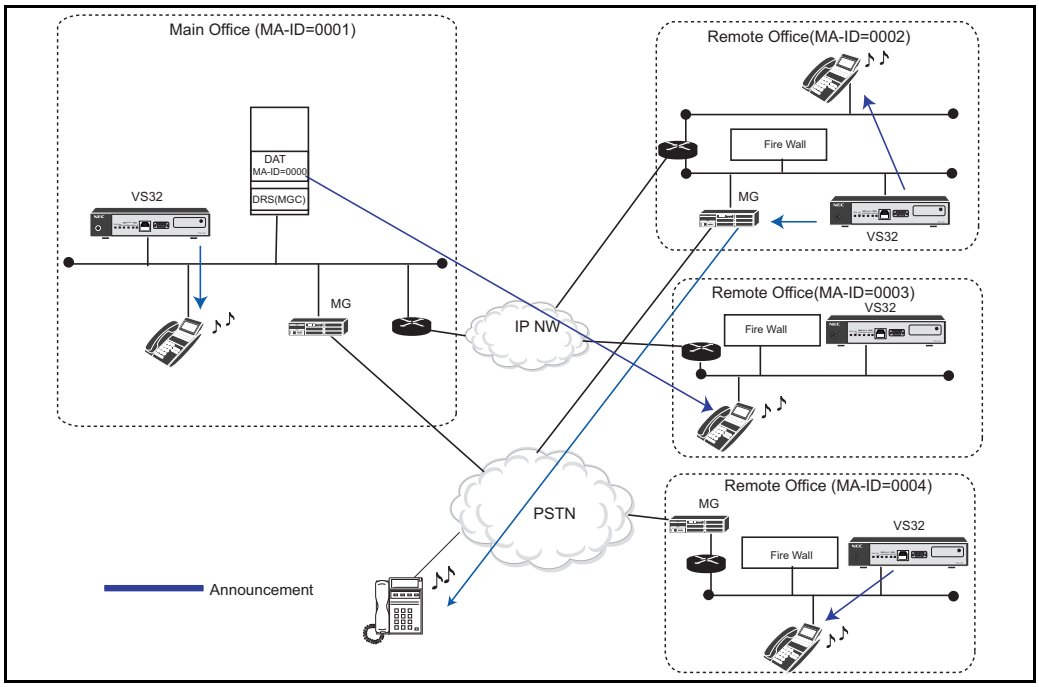


If all of three are located in different places, a trunk belonging to the Conference Leader will be selected for Three-Way Calling. Thereby, voice packets in the network can be kept to a minimum.
If the trunk cannot be used, one with MA-ID = 0 (VS32 or CFT in TSW-BOX/MUX circuit cards) will be selected.



When Index 830 Bit 0 = 0 and Bit 1 = 1, an appropriate trunk (VS32 or TSW-BOX/MUX circuit card) is selected:

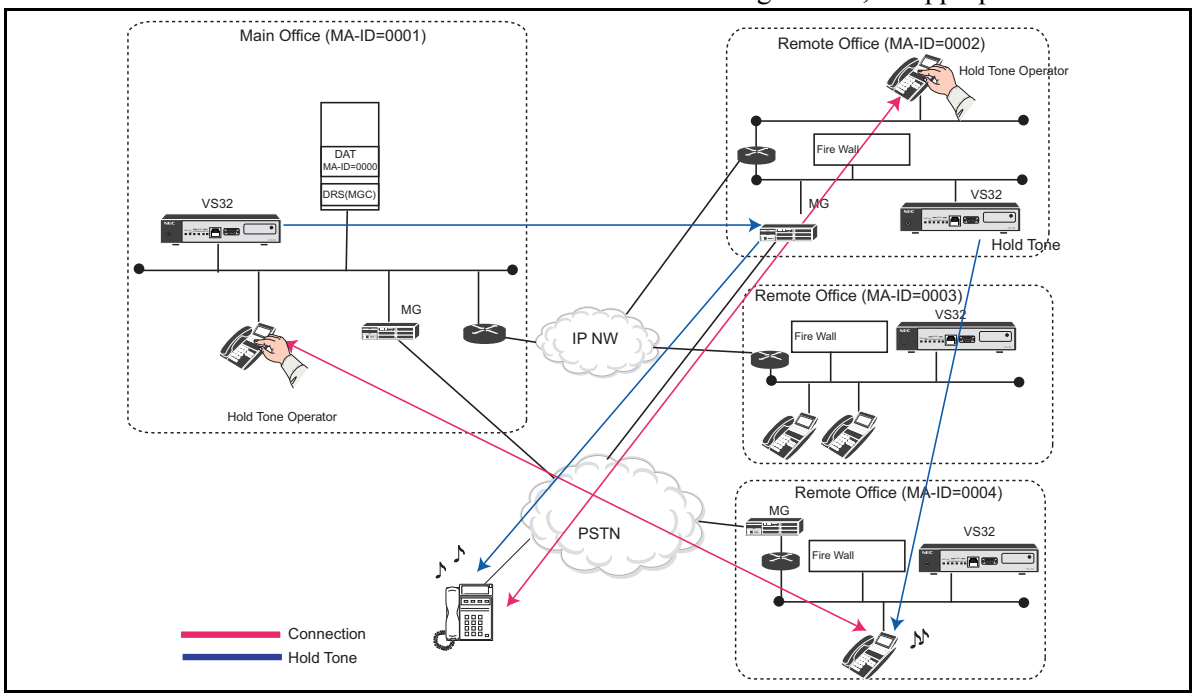
A trunk belonging to the Conference Leader is selected for Three-Way Calling. Thereby, terminals are limited to use trunks located in some locations.
If the trunk cannot be used, one with MA-ID = 0 (VS32 or CFT in TSW-BOX/MUX circuit cards) will be selected.



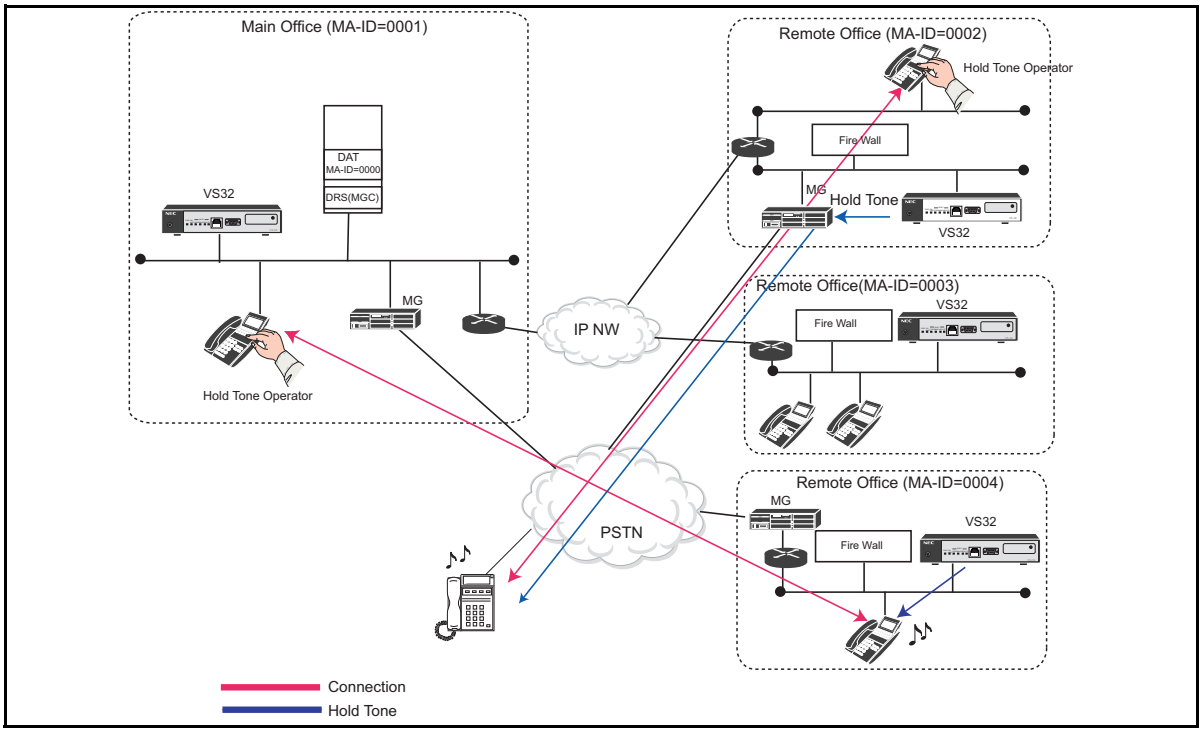
9.2 When Least Cost Routing is used with Announcement Service Feature

When CDN:79 FTRKS on the ARTI/ARTIN command is assigned “0”, an appropriate trunk (VS32 or TSW-BOX/MUX circuit cards) is selected:

When CDN:79 FTRKS on the ARTI/ARTIN command is assigned “1” (Voice quality is given top priority)

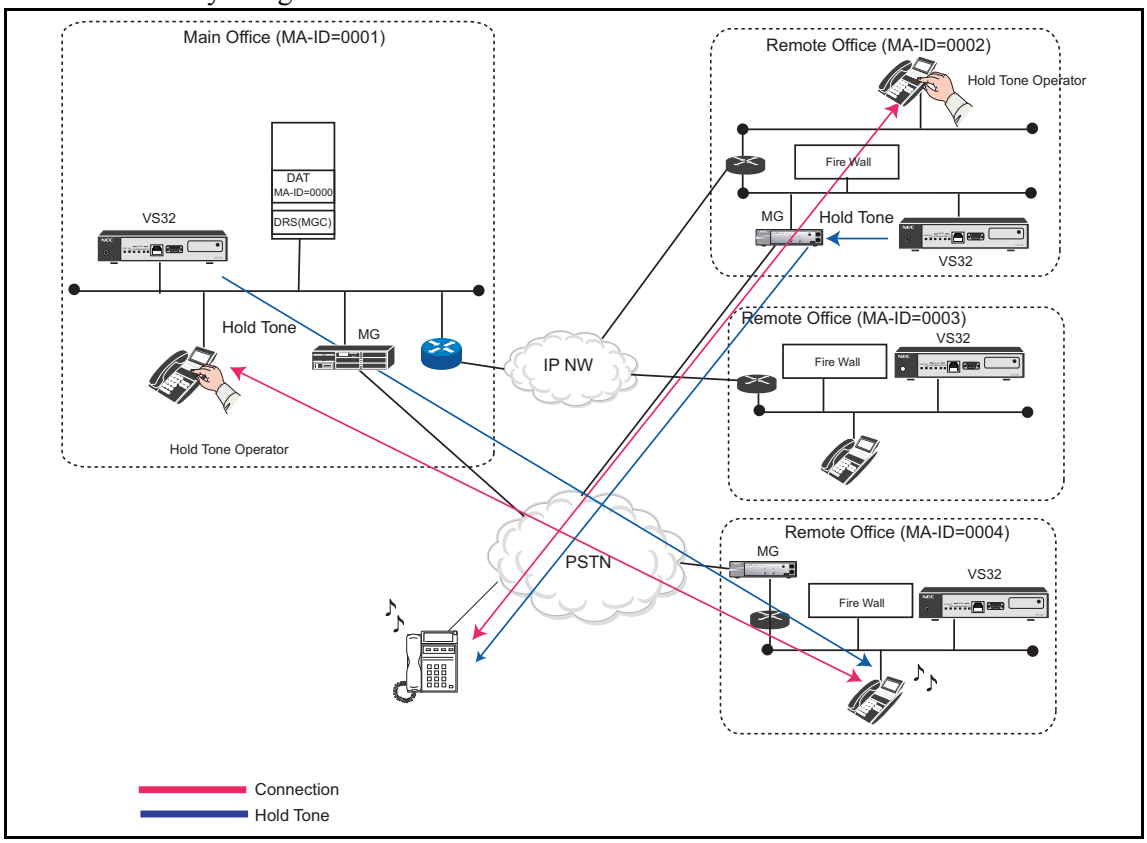


A trunk in the same location with announcement listener will be selected. If the trunk cannot be selected, a trunk with MA-ID = 0 will be selected.



9.3 When Least Cost Routing is used with IP External Music On Hold Feature

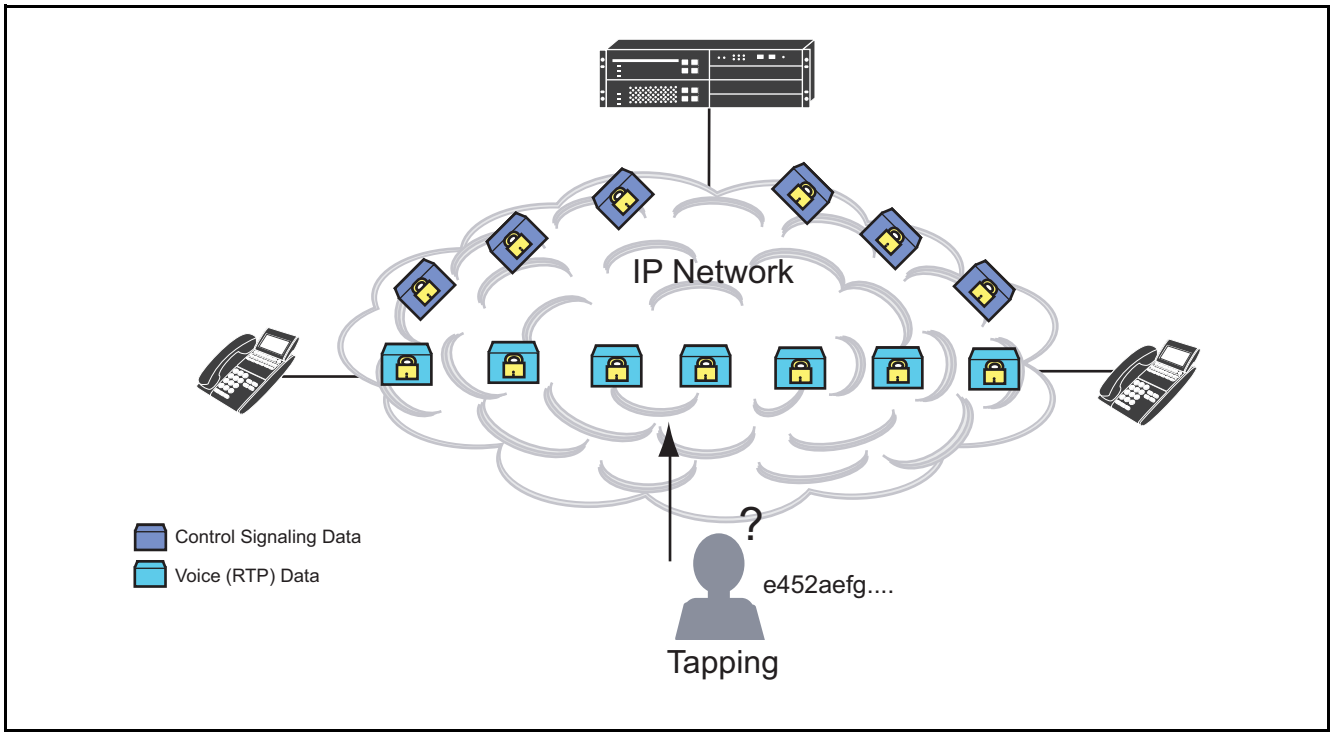
Note: This feature is not available in FCCS.



When CDN:79 FTRKS on the ARTI/ARTIN command is assigned "0", an appropriate trunk is selected:

When CDN:79 FTRKS on the ARTI/ARTIN command is assigned "1" (Voice quality is given top priority) A trunk in the same location with announcement listener will be selected. If the trunk cannot be selected, a trunk with MA-ID = 0 will be selected.

When CDN:79 FTRKS on the ARTI/ARTIN command is assigned “2” (Conference Leader is given top priority)
A trunk in the same location with Conference Leader will be selected. If the trunk cannot be selected, a trunk with MA-ID = 0 will be selected. At this time, External Hold Tone or Internal Hold Tone on terminals can be selected by using Index 810 Bit 2.



V-27 VoIP Encryption

General Description

This feature provides encrypted network system to strengthen security over IP network. This feature provides encryption feature for voice data [Real-Time Packets (RTP)] and signaling data (SIP Messages) that carries login numbers, passwords, and encryption keys. The encryption of voice data and signaling data both can be operated only in SIP-compatible equipment (hereinafter called “VoIP Encryption”). Non-SIP-compatible equipment can perform encryption only for voice data (hereinafter called “RTP Encryption”).
To use fully-featured encryption including signaling data, the verification using a one-time password (that is called “SIP Terminal Authentication [S-152]”) is required. The SIP Terminal Authentication is completed successfully, and then Encryptions for RTP data and signaling data are initiated with Advanced Encryption Standard (AES) modes (128-bit length). This secures a network by preventing third party from eavesdropping on its data.

Note: This feature is not available in China.

Operating Procedure

None.

Service Conditions

<Important Notices>

1. Using the encryption feature in the Telephony Server, accommodate PHDs/PHIs compatible with the feature (see the spread sheet for Signaling Data/Voice Data) into the system. Non-compatible PHDs/PHIs and compatible PHDs/PHIs cannot coexist in the same system.
2. Using the encryption feature for RTP in the Telephony Server, accommodate IPPAD compatible with its encryption feature into the system. Non-support IPPADs and support IPPADs cannot coexist in the same system.

<Interactions with Other Features>

1. When SIP TERMINAL AUTHENTICATION [S-152] is performed, encryption is automatically enabled for security. If the terminals/devices have not completed SIP TERMINAL AUTHENTICATION [S-152], the voice and signaling data are not encrypted. Also, although IP terminal is not supported by SIP TERMINAL AUTHENTICATION [S-152], voice data encryption is possible.
2. This feature is not available with OAI and ACD services.
3. When using VoIP Encryption on VS32(Dual)[SIP], do not mix other type of three-way conference trunks (TSW-BOX/MUX circuit card and proprietary mode of VS32(Dual)) in one system. Because only the SIP mode of VS32 supports encryption feature, encryption cannot work consistently in the system depending on the seized VS32 type. **Note 1**

Conference Trunk Type	Encryption
CFT with TSW-BOX/MUX circuit card	No Encryption
3-Way Conference with VS32(Dual) (proprietary mode)	No Encryption
3-Way Conference with VS32(Dual)(SIP mode)	Encryption

Note 1: Accommodating location (LENS) of the conference leader determines which conference trunk is to be seized in the system.

4. The devices/stations can continue to execute the encryption feature, even if they are rescued by SR-MGC.

<Hardware/Software>

1. The following are conditions for encryptions of voice data when terminals/devices are connected.

		Encrypted							Non-Encrypted
		IP terminal	SIP Multiple Line terminal Note 3	WLAN Handset (MH Series)	MG(PRI) Note 2 MG(BRI) 8LC MG-COT Note 2 MG-T1	IPPAD	VS32 Note 2	MG (SIP) Note 4	
Encrypted	IP terminal	X	X	-	X	X	X	X	-
	SIP Multiple Line terminal Note 3		X	-	X	X	X	X	-
	WLAN Handset (MH Series)			-	-	-	-	-	-
	MG(PRI) Note 2 MG(BRI) 8LC MG-COT Note 2 MG-T1				X	X	X	X	-
	IPPAD					X	X	X	-
	VS32 Note 2						X	X	-
	MG (SIP) Note 4							X	-
Non-Encrypted									

X: Available -: Not Available

Note 2: Only applies when used in SIP mode.

Note 3: The conditions of the SP350 are same as SIP Multiple Line terminal.

Note 4: Available since FP95-114 V4 Issue 2.0.

2. The following are the conditions when this feature is used with a Softphone.

   (a) When this feature is used with SP350, enables the encryption on SP350. See *UNIVERGE Soft Client SP350 Operations and Maintenance Manual* for more details.

   (b) This feature is not available for DtermSP30. Disable the encryption on DtermSP30.

   (c) SP350/DtermSP30 does not support SIP TERMINAL AUTHENTICATION [S-152].

3. If called and calling terminals/devices do not have the same encryption mode, or both/either of the terminals/devices cannot handle this feature, the voice packets will not be encrypted.
4. Using the encryption feature, use the terminal compatible with the feature.
   The following firmware is compatible with the encryptions

Note 5: Only for SIP mode.

Note 6: UG50 does not support this feature for Voice Data.

Note 7: Available since FP95-114 V4 Issue 2.0.

5. The following settings are necessary for the encryption of SIP Multiple Line terminal.

   (a) Enable SIP Terminal Authentication and VoIP Encryption on the terminal side. **Note 8**

(b) Assign one time password as explained in SIP TERMINAL AUTHENTICATION [S-152] in this manual.

Note 8: For DT830/DT820/DT700, see the respective <SIP Terminal Authentication and VoIP Encryption> in Security Mode/Settings section of Chapter 3 IP STATION of Peripheral Equipment Description (Multi-Line Telephone).
For DtermIP (SIP), see <Authentication Mode> and <One Time Password> in Encryption section of Chapter 3 IP STATION of Peripheral Equipment Description (Multi-Line Telephone).

6. In the following cases, the encryption of SIP Multiple Line terminal is not possible.
   - Log in without performing SIP TERMINAL AUTHENTICATION [S-152].
   - When SIP Terminal Authentication and VoIP Encryption are not enabled in the terminal.
7. If Telephony Server and Terminals communicate with each other over NAT, the encryption part of the signaling data needs to be “A part of the data is encrypted” in ASYDL SYS 1 Index 831 Bit 3=0. If the setting is changed, the key update needs to be performed using either Cipher Key Update in the ASECL command or have the operating terminals re-login to the system.
8. Refer to the Peripheral Equipment Description (UG50) for detailed conditions for UG50.

9. The number of channels that are processed depends on codec and payload cycle used by each IP component. Therefore, adjustments will be needed, such as placing unnecessary channels into the Make Busy status. The following table shows the number of available channels depending on the encryption status of each IP component.

Non-Encrypted						Encrypted

Note 10: MG(PRI) indicates MG(PRI) Card [SCA-24PRIA] / MG(PRI) Box [MG-24PRIA].

Note 11: UG50 (PRT 1.5M) [SIP] and UG50-24PRIA [SIP] are supported.

Note 12: MG(PRI) indicates MG(PRI) Card [SCA-30PRIA] / MG(PRI) Box [MG-30PRIA].

Note 13: UG50 (PRT 2M) [SIP] and UG50-30PRIA [SIP] are supported.

Note 14: 8LC indicates 8LC Card [SCA-8LCA/SCA-8LCA-EMEA/SCA-8LCC/SCA-8LCC-EMEA].

Note 15: UG50 (LC) [SIP] and UG50-8LC are supported.

Note 16: VS32(Dual) indicates VS-32(Dual) Card [SCA-VS32VA-B/SCA-VS32VA] / VS-32(Dual) Box [MG-VS32VA].

Note 17: 6COT indicates MG-COT [SCA-6COTB] / MG-COT [SCA-6COTC].

Note 18: UG50 (COT-TYPE2) [SIP], UG50 (PGT-TYPE2) and UG50-6COT [SIP] are supported.

Note 19: Available since FP95-114 V4 Issue 2.0.

<Interactions with Networks>

1. Encryption for RTP is applied to IP network only; it is not applied to PSTN.
2. RTP packets in CCIS over IP are not encrypted. Even though the speech via CCIS over IP is re-connected as CCIS Link Reconnection under the same node (without CCIS over IP), the RTP packets are not encrypted.

<Conditions Specific to This Feature>

1. An encryption key cannot be viewed by the maintenance personnel and the users.
2. An encryption method for RTP and signaling data is applied with AES mode using 128-bit encryption keys.
3. An encryption key for signaling data is automatically changed at 00:30 (fixed) every day. For manual operation, use the ASECL command to change the encryption key immediately.

Programming

<Data Assignment for VoIP Encryption (Encryption for Voice Data and Signaling Data)>

VoIP Encryption requires the settings for SIP Terminal Authentication [S-152]. For more information about it, refer to SIP Terminal Authentication [S-152].

STEP 1: **ASYDL** - SYS1, Index 831, bit 3: Assign the data to determine a range of encryption for signaling data. **Note 1**

Note 1: If "0" is selected in the above, a part of data is encrypted so that NAT is able to pass the data to next-hop equipment. If "1" is selected, all the data are encrypted, which NAT is not able to handle. Assign "0" when NAT is located between Telephony Server and the SIP Multiple Line terminals.

Note: If the period available for one-time password or the system is initialized, the password needs to be re-assigned when you want to use it.

Note: Assigning a one-time password with no-time-limit might risk your network security. It is recommended that a certain period should be assigned.

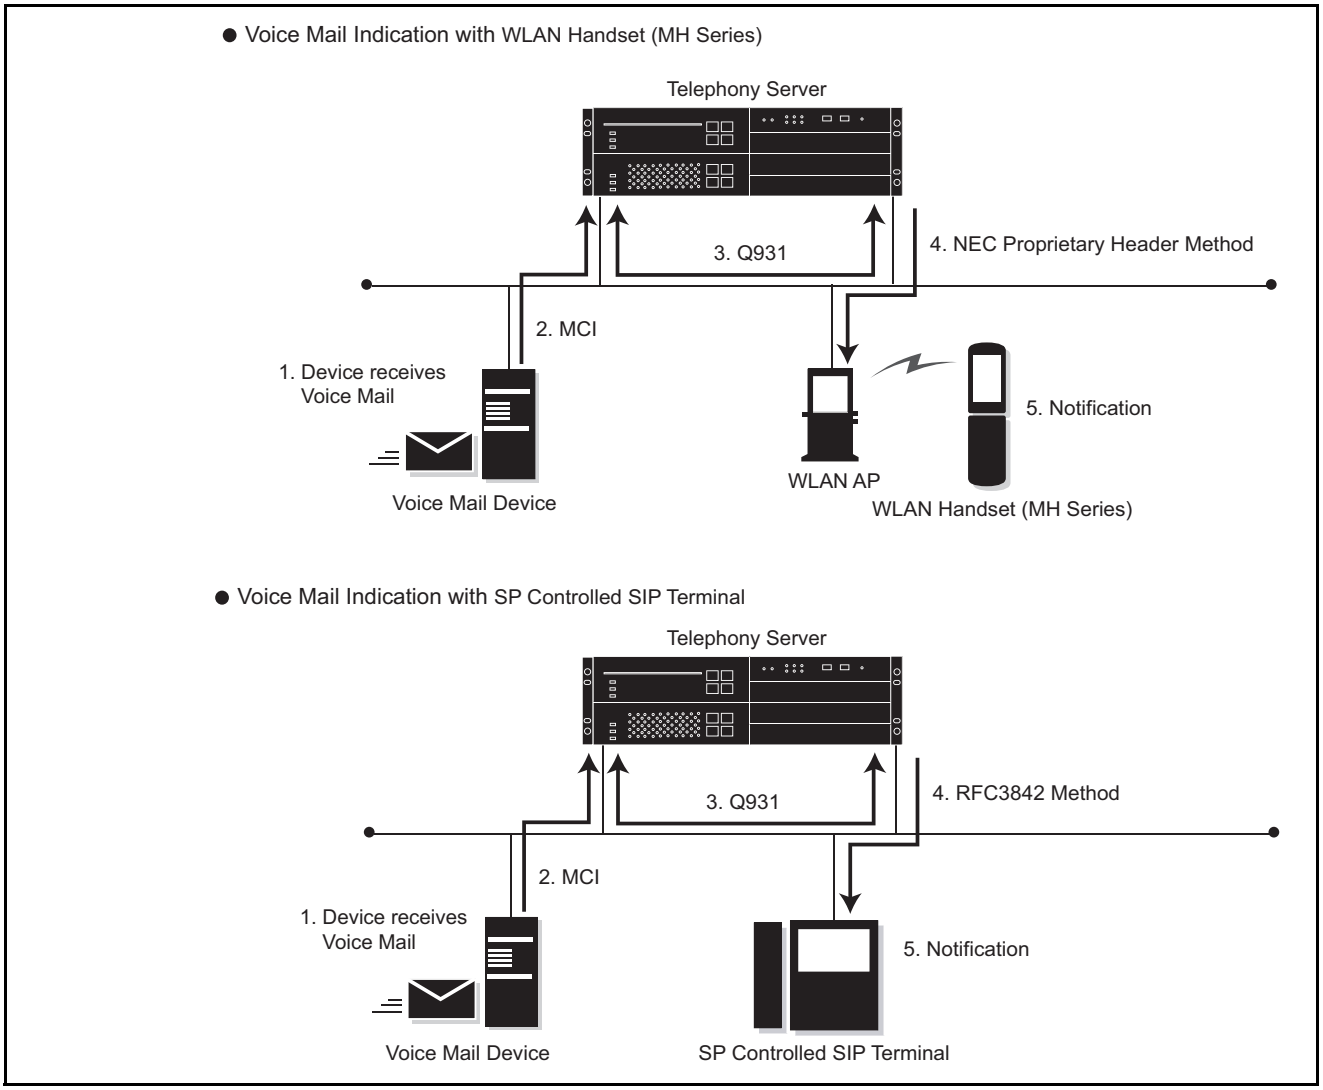
Note: Terminals that have completed the Terminal Authentication can be viewed by using the ASECL command.

<Data Assignment for RTP Encryption (Encryption for Voice Data only)>

None.

<Data Assignment for Updating Encryption Key >

To update the key, use the following procedure. This is necessary when the network setting is changed with NAT. For more information, refer to page 2657.



STEP 1: **ASECL** - Click the Maintenance Function tab. Select Cipher Key Update and click the Execute button.

V-29 Voice Mail Indication - SIP

General Description

This feature allows SP Controlled SIP terminals to receive notification of incoming voice mail from Message Center Interface (MCI).

Note: Voice Mail Indication-SIP with WLAN Handset (MH Series) is available.

Operating Procedure

For Voice Mail Indication-SIP with WLAN Handset (MH Series), refer to WLAN Handset (MH Series) User's Guide. For Voice Mail Indication-SIP with SP Controlled Standard SIP terminals, refer to the manual for SP Controlled Standard SIP terminals.

Service Conditions

Conditions for WLAN Handset (MH Series) and SP Controlled Standard SIP terminal

1. This feature is available for WLAN Handsets (MH Series) or SP Controlled Standard SIP terminals compliant with RFC3842, which support voice mail notification.
2. Terminals will be notified immediately after the voice mail device receives a message or all the messages not heard have been cleared.
3. Notification will not be sent to terminals without registration or terminals with expired registration time limits, when the voice mail device receives a message.
4. Notification of numbers of voice mail messages or mail types are not provided.
5. If the terminal fails to receive a MWI notification for any reason such as Out of Zone status, the notification can be provided again when the following events occur (If MWI notification request is within time limit):
   - When REGISTER process is completed
   - When MWI notification request is completed **Note 1**
   - When the terminal finishes a call
   - When the terminal abandons a call
   - When the calling party abandons a call after the call is terminated to the terminal

   Note 1: This event is applicable for Voice Mail Indication-SIP with SP Controlled Standard SIP terminals only.

Conditions for WLAN Handset (MH Series)

1. When WLAN Handset (MH Series) receives the notification of incoming voice mail, an icon appears on the terminal's LCD and LED Ring Indicator flashes green. **Note 2**

   Note 2: Ringing tone is not provided.

Conditions for SP Controlled Standard SIP terminal

1. Behaviors when the SP Controlled Standard SIP terminal receives a MWI notification such as lighting of the Message Waiting Lamp, Indicating the icon, and ringing of notification tone differ among specification of each terminal.
2. Notification will not be sent to terminals with failed MWI notification request or if a time limit of MWI notification request expires in spite of the fact that registration is within the time limit.
3. MWI notification request is canceled when registration is released or when registration time limit expires.
4. Digest Authentication for MWI notification request is not supported.
5. If the system uses SIP Wireless Terminal Backup [S-154] and SP changeover occurs, terminal will not be notified until SP that became Active finishes the MWI notification request.

   Note: "MWI notification request" stated here is the procedure that the SP Controlled Standard SIP terminal requests SP to notify the SP Controlled Standard SIP terminal about MWI information. "MWI notification request" is executed in SUBSCRIBE process.

Programming

The following shows only the data assignment pertaining to this feature. The data of this feature is usually assigned along with SIP Station data. For details on the data assignment of SIP Station, refer to SP CONTROLLED SIP TERMINAL [S-168].

STEP 1: **ASPTL/ASPTN** (SIP Terminal Data)

Note: Selectable parameters appear in DETAIL field when Type is selected.

To activate Voice Mail Indication-SIP with WLAN Handset

TERMINAL field	
TYPE:	Select “Type 3” for WLAN Handset (MH Series).
DETAIL filed	
NO DIGEST AUTHENTICATION:	Mark the checkbox if the terminal does not support.
WIRELESS:	Mark the checkbox when WLAN Handset (MH Series) is used.
SOFTPHONE:	Mark the checkbox when Soft Phone WLAN Handset [S-159] or Soft Phone Wired-Phone Handset [S-147] is activated.
VIDEO TERMINAL:	Mark the checkbox when Standard SIP Video terminal is used.
MWI (Extension header method):	Mark the checkbox to use this feature.

To activate Voice Mail Indication-SIP with SP Controlled Standard SIP Terminal

TERMINAL field	
TYPE:	Select “Type 1” for the SP Controlled Standard SIP terminal.
DETAIL filed	
NO DIGEST AUTHENTICATION:	Mark the checkbox if the terminal does not support.
WIRELESS:	Mark the checkbox when WLAN Handset (MH Series) is used.
SOFTPHONE:	Mark the checkbox when Soft Phone WLAN Handset [S-159] or Soft Phone Wired-Phone Handset [S-147] is activated.
VIDEO TERMINAL:	Mark the checkbox when Standard SIP Video terminal is used.
INVITE with SDP:	Mark the checkbox if the terminal does not support INVITE without SDP. (The terminal must support reINVITE without SDP.) When the checkbox is marked, a dummy SDP will be added to the initial INVITE from the Telephony Server. (This parameter is valid only when TYPE=1.)
When secondary call disconnected, held call remains on hold:	Mark the checkbox when using the following feature: when terminal A transfers a held call (terminal B) to terminal C, terminal B remains in hold state even when terminal A and terminal C are disconnected. (This parameter is valid only when TYPE=1.)
MWI (RFC3842):	Mark the checkbox to use this feature.
RTP Relay BOX:	Not used
Session Timer:	Not used.
Sendonly:	Select the checkbox when your SP Controlled Standard SIP terminal enables Call Hold features supporting RFC3264 a=sendonly method. When this parameter is not selected, the SP Controlled Standard SIP terminal performs Call Hold features supporting RFC2543 c=0 method.

V-30 Volume Set - Receiver

General Description

This feature allows Desktop terminal users to either retain or cancel the setting of handset/headset receiver volume changed during a telephone conversation. It should be noted that DT800 Series/DT700 Series retains the previous setting of receiver volume by default while the other terminals cancel the setting by default.

Operating Procedure

None.

Service Conditions

1. This feature is not available for DtermIP (SIP). DtermIP (SIP) always retains the changes of the receiver volume you have made during a telephone conversation.
2. When you change the setting of the system data (ASYD, SYS1, Index384, Bit 5/ASYDL, SYS1, Index678, Bit 0), you need to perform any of the following.
   - Initialization of ELC card
   - Initialization of the system
   - Initialization of DT800/DT700 Series telephone terminal
3. The setting of receiver volume is canceled when the telephone terminal is reset.
4. For DT800 Series/DT700 Series, this feature supports the control of the handset only.
5. Required system data and the default settings vary depending on telephone type.

Telephone Terminal	Data Setting	After the Changes
Dterm Series i DT400/DT300 Series DtermIP (Proprietary Protocol)	ASYD, SYS1, Index384, Bit 5 0: Previous setting is canceled 1: Previous setting is retained	For digital terminals: Initialization of ELC card For IP terminals: Initialization of the system
DtermIP (SIP)	Not available	-
DT800/DT700 Series	ASYDL, SYS1, Index678, Bit 0 0: Previous setting is retained 1: Previous setting is canceled	Initialization of telephone terminal

Programming

- For Dterm Series i, DT400 Series/DT300 Series and DtermIP (Proprietary Protocol)

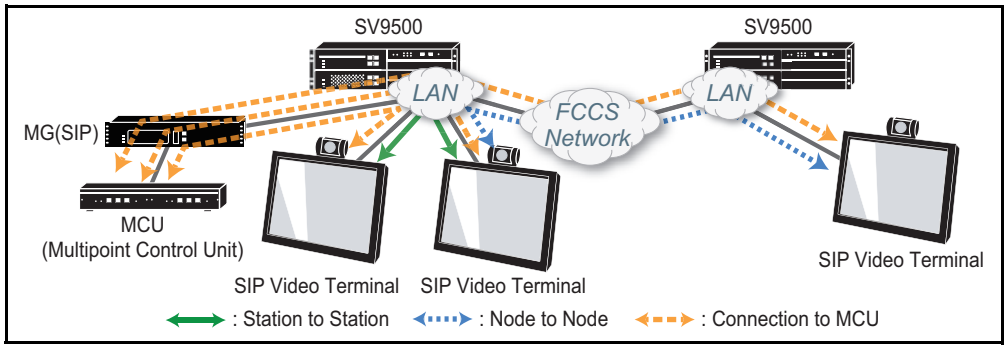
  ASYD- System Data 1, Index 384, Bit 5 Retaining the setting of handset/headset receiver volume changed during a call. (0/1 = Out of Service/In Service)

  Note: The setting of receiver volume is canceled when the telephone terminal is reset.

- For DT800 Series/DT700 Series

  ASYDL- System Data 1, Index 678, Bit 0 Retaining the setting of handset receiver volume changed during a call. (0/1 = In Service/Out of Service)

  Note: When a DT800/DT700 Series terminal is reset, whether or not to retain the setting of receiver volume depends on the reset condition. For more details, refer to the User Guide.



V-31 Video Call

General Description

This feature makes possible several video calls. Video calls can be transmitted using the following connections.

Note: Operations are not guaranteed for other features of SIP video terminal than video calls.

Note: The terminals used must have video transmission capabilities for a video call. A connection test performed by NEC is required before using a Standard SIP video terminal (3rd party product). Also, a test for the combination of the two specific terminals used must be performed.

Note: From FP95-114 V4 video call can be maintained by SIP Handler Controlled Standard SIP video terminals in different nodes (UMGi and FCCS).

Note: MCU (Multipoint Control Unit) allows the connection with several locations for video call.

X: Available, -: Not available

From \ To		SIP Handler Controlled Standard SIP video terminals Note 2				SP Controlled Standard SIP video terminals		MG(SIP) (MCU) Note 1	
		ASYDL SYS1 Index 1382 b2=0 Note 1		ASYDL SYS1 Index 1382 b2=1					
		Station to Station	Node to Node	Station to Station	Node to Node	Station to Station	Node to Node	Station to Station	Node to Node
SIP Handler Controlled Standard SIP video terminals Note 2	ASYDL SYS1 Index 1382 b2=0 Note 1	X	X	-	-	-	-	X	X
	ASYDL SYS1 Index 1382 b2=1	-	-	X	-	-	-	-	-
SP Controlled Standard SIP video terminals		-	-	-	-	X	X	-	-

Note 1: Available from FP95-114 V4.

Note 2: From FP95-114 V4 set ASYDL, SYS1, Index 1382, Bit 2=0.

Operating Procedure

None.

Service Conditions

<Important Notices>

1. VIDEO CALL [V-31] describes service conditions and programming for SIP Handler Controlled Standard SIP video terminals and MG(SIP) when ASYDL, SYS1, Index 1382, Bit 2= 0 (SIP Handler Controlled Standard SIP video terminal usage from SV9500 FP95-114 V4).
   See SIP HANDLER - SIP TERMINAL [S-167] for service conditions and programming for SIP Handler Controlled Standard SIP video terminals when ASYDL, SYS1, Index 1382, Bit 2= 1 (SIP Handler Controlled Standard SIP video terminal usage until SV9500 FP95-113 V3).
   See SP CONTROLLED SIP TERMINAL [S-168] for service conditions and programming for SP Controlled Standard SIP video terminals.
2. Telephony Server does not assign or control the codec for video call. Video call can be performed as long as both SIP Handler Controlled Standard SIP video terminals agree to use the same codec. SIP Handler Controlled Standard SIP video terminals operations when there is not a common codec are defined by each actual SIP Handler Controlled Standard SIP video terminal's model specifications.
3. SIP messages of video call are bigger than the messages of a voice call. If UDP is used for video call, packets may be fragmented and congestion control is not available. For this reason, if there is the risk of UDP packets fragmentation, TCP setting (**Note 3**) is recommended.

   Note 3: When using TCP, make sure that all the terminals employed for video call support TCP. Refer to the manual of each terminal for the TCP settings. See the <Interactions with Other Features> section of SIP HANDLER - SIP TERMINAL [S-167] for the conditions of TCP for Internal SIP Handler.

<Interactions with Other Features>

1. When using PEER TO PEER BANDWIDTH CONTROL [P-75], bandwidth of video call is not counted for the bandwidth calculation. Even if the video call is used as voice only and is using a codec supported by the Telephony Server, bandwidth will not be counted.
2. When MG-SIP SHARED ROUTE [M-123] is used, make sure that all the used MG(SIP) are usable for video call and have the same version. If different versions are used, even if the same access code is used, video call may become not possible depending of the seized trunk.

<Hardware/Software>

1. SIP Handler Controlled Standard SIP video terminals and devices used for video call must be compliant with the following RFCs:
   - RFC 2327
   - RFC 3261

- RFC 3262
- RFC 3264
- RFC 3311
- RFC 3323
- RFC 3515
- RFC 3550
- RFC 3891
- RFC 4028

2. MG(SIP) hardware/software conditions are as follows:
   a.) The following MG(SIP)s are supported:
      - MG-SIP128 [MG-128SIPMGL-A]
      - Software-based MG-SIP with firmware version SP-4085 Issue 1 or later
   b.) The call is connected by the first 128 channels. When all the first 128 channels are in use, a new video call will be converted to a voice call and only voice signals will be transmitted.
   c.) The maximum bandwidth for one channel is two megabytes. (beyond that bandwidth usage, video call service may deteriorate or not be possible).
   d.) When a terminal connected with MG(SIP) is put on hold, MG(SIP) does not send a hold notification to the IP network, but sends a hold tone.
   e.) When a call is sent from a terminal that supports G.711 and G.729a, MG(SIP) chooses first G.711.
   f.) When using MCU, the template pattern 8 setting is required by using "set config_template" command. For the configuration command, refer to the following manuals:
      - MG-SIP128 [MG-128SIPMGL-A]:
        CHAPTER 2 in Peripheral Equipment Description (IP Devices).
      - Software-based MG-SIP with SP-4085:
        Configuration Commands in Chapter 2 of Software Model Peripheral Equipment Description.
   g.) The following are supported on MCU connection:
      - Join a conference (Outgoing call to MCU)
      - Calling to a conference (Incoming call from MCU)
      - Video call during a conference

<Interactions with Networks>

1. In a FCCS system, video call can be used only with FCCS NETWORKING VIA IP [F-36].
2. CCIS NETWORKING VIA IP [C-163] of Data Programming Manual - CCIS cannot be used for a video call. Station-To-Station connection after the Link Reconnection of CCIS networking via IP is also not supported for the video call.
3. Connection between two SIP Handler Controlled Standard SIP video terminals or devices must be Peer-to-Peer.

<Conditions Specific to This Feature>

1. In case there is a failure in the session information inquiry, video call is possible based on the session information (proprietary protocol) (**Note 4**) exchanged during the establishing of the call. If such session information exchanged during the establishing of the call also fails, video call is not possible.

   Note 4: This session information exchange (proprietary protocol) is used for the media information (SDP information) interchange of the SIP Handler Controlled Standard SIP terminal (trough the Internal SIP Handler of the Telephony Server) and the MG(SIP). Session information inquiry is also included in the Session information exchange protocol.

2. The following are conditions for SIP Handler Controlled Standard SIP video terminal
   a.) SIP Handler Controlled Standard SIP video terminal in Multiline Mode does not perform session information inquiry for a video call received to a subline. However, video call is possible based on the session information exchanged during the establishing of the call.
   b.) Video call is not possible using the subline of a desktop terminal that has assigned the my line of a SIP Handler Controlled Standard SIP video terminal. In this case the desktop terminal can only maintain a voice communication.
   c.) According to the session information inquiry for a video call, the call sender notifies the receiver of the desired codecs for video call with an SDP included in the INVITE. However, in the following cases the INVITE message cannot include an SDP:
   - When receiving a blind transfer of REFER of a SIP Handler Controlled Standard SIP video terminal
   - In the recalling after CALL HOLD [C-6] for a long time
   - In the recalling of CALL BACK [C-1]
   - A call received to the subline when being in Multiline Mode

   Note: The reINVITE message send by the Telephony Server when switching the connection path may or may not include an SDP depending on the specific environment and other conditions.

   However, the video call is possible in the cases above with the response of the receiving side based on the session information exchanged during the establishing of the call.

   d.) The DTMF transparency conditions of a video call are the same as the conditions of a voice call. For voice call conditions see <Hardware/Software> section of SIP HANDLER - SIP TERMINAL [S-167].
   RFC2822, SIP-INFO and In-band Signaling can be used but the method is decided depending on the specifications of the actual SIP Handler Controlled Standard SIP video terminal.
   e.) In some cases, if a change in the media information using a reINVITE request is performed during a video call, the SIP Handler Controlled Standard SIP video terminal may reply with an error message regardless of the settings of CDN9 (Reject unacceptable reINVITE) in the AUACL/AUACN command.

   Note: A change in the media information means a change in the codec, etc without changing the call state.

f.) Set 2nd DT: 0 (Second DT is not sent) in the ASPA/ASPAL/ASPAN command for the connection of SIP Handler Controlled Standard SIP video terminals and MG(SIP) when using video call.

g.) When CDN20 (Multimedia Communication) of the AUACL/AUACN command is enabled, CDN3 (send INVITE with SDP) is disabled.

Programming

Note: Video call data assignment is done after finishing the basic programming for the used terminals and devices.
For SIP Handler Controlled SIP Video Terminal, see data programming in SIP HANDLER - SIP TERMINAL [S-167].
For MG(SIP), see data programming in MEDIA GATEWAY SIP [M-111].

<For SIP Handler Controlled SIP Video Terminal>

STEP 1: **ASYDL**- Assign the following.

Index 1394, Bit 0 and 1: Select transport protocol for session information exchange of SIP devices. **Note 5 Note 6**

Transport Protocol	Bit 0	Bit 1
AUTO **Note 7**	0	0
TCP **Note 8**	1	0
UDP	0	1

Note 5: If FCCS system is used, set these bits in the ASYDN to ensure that all nodes have the same settings.

Note 6: In the FCCS system and UMGi system, this setting is valid for session information exchanges of Internal SIP Handlers between nodes. In other combinations, UDP is used.

Note 7: With this setting the packets are sent using UDP, but if the size exceeds 1400 bytes TCP is automatically used.

Note 8: If there is the risk of packet fragmentation when using UDP, set to TCP.

Index 1408, Bit 0: Use TCP for SIP Messages.
0= Disabled
1= Enabled

Note: If this setting is changed, Internal SIP Handler needs to be initialized with the ADPM, ADTM or SINZ command.

Note: Since TCP for big messages is recommended, set this bit to Enabled is also recommended.

STEP 2: **AUACL/AUACN** - Assign the following.

CDN 20 (Multimedia Communication): 1 (Enable)

CDN 21 (Hold Detection at Multimedia): **Note 9**

0: Audio

1: Audio and Video

2: Non-detection

CDN 22 (Transport Layer) **Note 10**

0: AUTO

1: UDP

2: TCP

Note: Verify that ASYDL, SYS1, Index 1382, Bit 2=0.

Note: For video call until FP95-113 V3, see <Video Data Assignment> in the Programming section of SIP HANDLER - SIP TERMINAL [S-167].

Note 9: Please note the following points:

- This setting requires CDN 20 to be set to 1.
- For SIP Handler Controlled Standard SIP video terminals that notify media changes as the voice being muted while the video communication is kept, select pattern 1 or 2.
  For SIP Handler Controlled Standard SIP video terminals that do not notify media changes as the voice being muted, select pattern 0 (default).For a terminal without video capacity, even if 1 is set, operations will be the same as if 0 is set.
- A change in the parameter is applied when there is call sending/receiving.

Note 10: Please note the following points:

- This setting does not decide the transport layer for the terminals. What is set is the protocols used by the SIP Handler of the Telephony Server when assisting the communication between the terminals.
- This setting requires the TCP setting to be enabled. If TCP is not enabled (because system data settings or other reason), TCP for the sending and receiving of SIP messages is not possible.
- This setting is used only if the transport protocol is not set in the transport parameter of the Contact header in the REGISTER request. If the transport protocol is set in the REGISTER, that protocol is used regardless of the setting of CDN22.
- The default setting uses TCP for sending SIP messages of more than 1300 bytes or answering to TCP request messages (regardless of the size of the answering message).
- If UDP is selected, the SIP Handler sends the request messages using UDP (be aware that long messages may become fragmented). However, the SIP Handler is also able to process messages received with TCP and any message received with TCP is also answered with TCP regardless of this parameter setting.
- If TCP is selected, the SIP Handler uses TCP for sending messages but is able to process received messages with UDP.
- A change in the parameter is applied when there is call sending/receiving.

<For MG(SIP)>

STEP 1: **ARTI/ARTIN** - Assign the following.
CDN 110 (Multimedia Communication): 1 (In Service)

Note: Regarding the number plan (LCR/LCRS) of the MG(SIP) sending connection, set 2nd DT: 0 (Second DT is not sent) with the ASPA/ASPAL/ASPAN command.

W-1 WATS Access

General Description

This feature permits any Station user direct-dial access to outgoing Wide Area Telephone Service (WATS) lines.

Note: This feature is available in North America only.

Operating Procedure

To operate

1. Lift the handset. Receive Dial Tone.
2. Dial the WATS Access Code.
3. Receive Second Dial Tone.
4. Dial the desired number.

Service Conditions

Access to WATS lines may be denied to individual Stations via CLASS OF SERVICE-INDIVIDUAL [C-15].

Interactions

1. WATS ACCESS will operate in conjunction with the following features:

LEAST-COST ROUTING-3/6-DIGIT	[L-5]
MISCELLANEOUS Trunk Access	[M-1]
MISCELLANEOUS TRUNK RESTRICTION	[M-2]
INDIVIDUAL Trunk Access	[I-4]
OUTGOING TRUNK QUEUING	[O-2]
OFF-HOOK QUEUING	[O-7]
ROUTE ADVANCE	[R-6]
DIRECT-IN TERMINATION	[D-7]

2. A WATS Access Trunk can be used with any system feature that can be used with any other Trunk. There are no unique characteristics of a WATS Trunk of note in relation to the implementation of other features.

Programming

STEP 1: **ARTD** - Assign the WATS line routes as shown below:

INCOMING WATS LINES (GROUND START):

RT: 1

3-ISGS	:1	4-INSG	:3	5-TF	:2/3	6-TCL	:3	7-L/T	:1
8-RLP	:2	15-LSG	:1						

OUTGOING WATS LINES (GROUND START):

RT: 1

1-OSGS	:2	2-ONSG	:3	5-TF	:1/3	6-TCL	:3	7-L/T	:1
8-RLP	:2	15-LSG	:1						

STEP 2: **ATRK** - Assign the LENS, WATS Line Route Number, Trunk Number, and Tenant Number.

STEP 3: **MBTK** - Assign the Make Idle status to the WATS Line Trunks.

STEP 4: **ANPD** - Reserve a Number Level for Trunk Access. Select Normal Service (N), Hooking Service (H) or Busy Service (B) from the combo box for Connection Indexes. (applicable to any feature assigned to this Level). Number of Necessary Digits is usually one or two. Busy lamp Field is not activated.

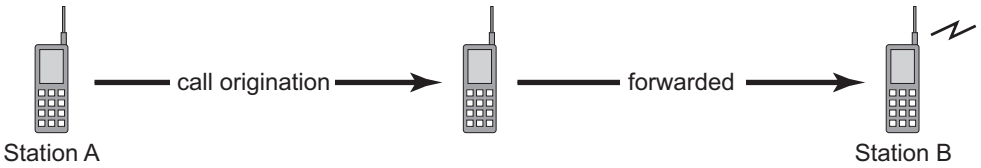
STEP 5: **ASPA** - Assign the Access Code as assigned in ANPD above. Type of Service, SRV = “OGC: Outgoing Call” for Outgoing Trunk. Assign the Route Number associated with this Access Code.

STEP 6: **ARSC** - The Route Restriction Class must be constructed to allow the Station access to the involved routes.

W-11 WLAN Handset Name Display

General Description

This feature offers the name display function to WLAN Handset (MH250) on station-to-station calls. Destination station's user name linked to its station number is displayed on the LCD of WLAN Handset.



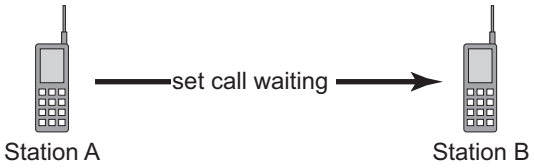
- On call origination:
  Called destination's user name is displayed on the calling WLAN Handset.
- On call termination:
  Caller station's user name is displayed on the called WLAN Handset.
- During talking:
  Connected station's user name is displayed on the WLAN Handset.
- On transferred/forwarded call:
  Transferred/Forwarded destination's user name is displayed on the calling WLAN Handset.

<CASE 1>
When Station A dials Station B's number:

	Station A	Station B
Assigned user name	N.TARO	N.HANAKO
State	Receiving RBT	Ringing
LCD display	N.HANAKO	N.TARO

<CASE 2>
When Station A's call is forwarded to Station B (by Call Forwarding-All Calls/Busy/Don't Answer/Incoming Incomplete):

	Station A	Station B
Assigned user name	N.TARO	N.HANAKO
State	Being forwarded	Ringing
LCD display	CF:N.HANAKO	CF:N.TARO



<CASE 3>
When Station A holds Station C and then transfers the call to Station B (Call Transfer/Blind Transfer):

	Station A	Station B	Station C
Assigned user name	N.TARO	N.HANAKO	F.ICHIRO
State	Receiving RBT	Ringing	Held
LCD display	N.HANAKO	N.TARO	N.TARO

	Station A	Station B	Station C
Assigned user name	N.TARO	N.HANAKO	F.ICHIRO
State	Released	Connected to Station C	Connected to Station B
LCD display	-	F.ICHIRO	N.HANAKO

<CASE 4>
When Station A sets Call Waiting to busy Station B, and then Station B answers the Call Waiting:

	Station A	Station B
Assigned user name	N.TARO	N.HANAKO
State	Receiving RBT	Answers the Call Waiting
LCD display	N.HANAKO	N.TARO

Operating Procedure

None.

Service Conditions

1. This feature is supported on MH250 stations only.

   Note: Except MH250, name display does not work on SIP terminals (Standard SIP Terminal, DtermIP (SIP)). However, these terminals can register user name, so their user name is displayed on the connected MH250 station's LCD.

2. Up to 16 digits of user name can be registered, excluding the “CF:” characters added for the forwarded calls by Call Forwarding - All Calls, Busy, Don’t Answer and Incoming Incomplete.
3. Alphanumeric characters and symbols are available to display.
4. When no user name is assigned to station number, existing Number Display features are applied.
5. This feature is not available for the calls via PHC.
6. If the last digit of user name assigned with the ANDD command is a blank space, MH250 station’s LCD will not display that blank space allocated as the last digit.

Interactions

1. This feature is supported on STATION-TO-STATION CALLS, CALL FORWARDING - ALL CALLS/ BUSY/DON’T ANSWER/INCOMING INCOMPLETE, CALL WAITING, BLIND TRANSFER, and CALL TRANSFER - ALL CALLS.
2. “CNF” is displayed on Three-Way Calling calls. When the Three-Way Calling call returns to station-to-station call, LCD displays the connected destination’s user name.
3. Name Display for OAI system takes precedence over this feature.

Programming

STEP 1: **ASYD** - System Data 1, Index 31 = 04 HEX (4 Mbyte of Common Memory (CM) mounting capacity)
System Data 1, Index 78, Bit 5 = 1 (Name display is in service)
System Data 1, Index 79, Bit 6 = 0 (OAI is in service)
System Data 1, Index 241, Bit 1. The number of characters for name display: 0/1 = 8 digits/16 digits

STEP 2: **ANDD** - Assign the name display data.
TN: Tenant Number
STN: Station Number
NAME: Name information

APPENDIX

APPENDIX A Tone Specifications for Each Country

This appendix shows the tone specifications for each country.

Note: This feature is used only for EMEA.

(1) Netherlands

Name	Signal Frequency (Hz)/ Sensitivity Level	Duration of Connection
Internal Ring Tone	425 Hz/-6 dBm	1s-on, 4s-off Repeating.
External Ring Tone	425 Hz/-6 dBm	1s-on, 4s-off Repeating.
Internal Dial Tone	425 Hz/-6 dBm	Continuous
Enquiry Dial Tone	425 Hz/-6 dBm	Continuous
First External Dial Tone	425 Hz/-6 dBm	Continuous
Busy Tone	425 Hz/-6 dBm	500ms-on, 500ms-off Repeating
Number Unobtainable Tone	425 Hz/ -6 dBm	50ms-on, 50ms-off Repeating
Congestion Tone	425 Hz/ -6 dBm	250ms-on, 250ms-off Repeating
Diversion Active Dial Tone	425 Hz/ -6 dBm	350ms-on, 25ms-off Repeating
Confirmation Tone	425 Hz/ -6 dBm	Continuous
Call Waiting Tone Burst	425 Hz/ -6 dBm	96ms-on, off
Camp-on Busy Tone to Caller	425 Hz/ -6 dBm	1s-on, 4s-off Repeating
Hold Tone	425 Hz/ -6 dBm	1s-on, 4s-off Repeating
Park Tone	425 Hz/ -6 dBm	50ms-on, 50ms-off Repeating
Routing Tone	425 Hz/ -6 dBm	5 times 75ms on/ 75ms off, followed by one time 75ms on, 425ms off - repeating
Break-in Ticker	425 Hz/ -3 dBm	10 times 32ms-on/480ms-off Repeating every 32ms **Note 1**
Add-on Ticker	425 Hz/ -3 dBm	10 times 32ms-on/480ms-off Repeating every 32ms **Note 1**
Howler Tone	2000 Hz/ +3 dBm	32ms-on, 32ms-off Repeating

Note 1: For repeating interval, time delay may occur. (maximum 4 seconds)

(2) Germany

Name	Signal Frequency (Hz)/ Sensitivity Level	Duration of Connection
Internal Ring Tone	425 Hz/-3 dBm	1s-on, 4s-off Repeating.
External Ring Tone	425 Hz/-3 dBm	1s-on, 4s-off Repeating.
Internal Dial Tone	425 Hz/-3 dBm	250ms-on, 250ms-off, 250ms-on, 250ms-off, 250ms-on, 1.25s-off Repeating.
Enquiry Dial Tone	425 Hz/-3 dBm	250ms-on, 250ms-off, 250ms-on, 250ms-off, 250ms-on, 1.25s-off Repeating.
First External Dial Tone	425 Hz/-9 dBm	Continuous
Busy Tone	425 Hz/-3 dBm	150ms-on, 475ms-off Repeating
Number Unobtainable Tone	425 Hz/-3 dBm	250ms-on, 250ms-off Repeating.
Congestion Tone	425 Hz/-3 dBm	250ms-on, 250ms-off Repeating.
Diversion Active Dial Tone	150 Hz + 450 Hz/-6 dBm + -15 dBm	250ms-on, 250ms-off, 250ms-on, 250ms-off, 250ms-on, 1.25s-off Repeating.
Confirmation Tone	425 Hz/-9 dBm	3488ms-on, off
Call Waiting Tone Burst	425 Hz/-9 dBm	992ms-on, off
Camp-on Busy Tone to Caller	425 Hz/-9 dBm	1s-on, 4s-off Repeating.
Hold Tone	425 Hz/-9 dBm	1s-on, 4s-off Repeating.
Park Tone	425 Hz/-3 dBm	250ms-on, 250ms-off Repeating.
Routing Tone	425 Hz/-6 dBm	7 times 75ms-on/75ms off, followed by one time 75ms on, 875ms - off Repeating
Break-in Ticker	425 Hz/-3 dBm	10 times 32ms-on/480ms-off-repeating every 32s **Note 2**
Add-on Ticker	425 Hz/-3 dBm	10 times 32ms-on/480ms-off-repeating every 32s **Note 2**
Howler Tone	2000 Hz/ +3 dBm	32ms-on, 32ms-off Repeating

Note 2: For repeating interval, time delay may occur. (maximum 4 seconds)

(3) Austria

Name	Signal Frequency (Hz)/ Sensitivity Level	Duration of Connection
Internal Ring Tone	425 Hz/-3 dBm	1s-on, 5s-off Repeating
External Ring Tone	425 Hz/-3 dBm	1s-on, 5s-off Repeating
Internal Dial Tone	425 Hz/-3 dBm	150ms-on, 150ms-off, 150ms-on, 150ms-off, 150ms-on, 750s-off, Repeating
Enquiry Dial Tone	425 Hz/-3 dBm	150ms-on, 150ms-off, 150ms-on, 150ms-off, 150ms-on, 750s-off, Repeating
First External Dial Tone	425 Hz/-3 dBm	Continuous
Busy Tone	425 Hz/-3 dBm	400ms-on, 400ms-off Repeating
Number Unobtainable Tone	425 Hz/-3 dBm	50ms-on, 50ms-off Repeating
Congestion Tone	425 Hz/-3 dBm	400ms-on, 400ms-off Repeating
Diversion Active Dial Tone	425 Hz/-3 dBm	375ms-on, 25ms-off Repeating
Confirmation Tone	425 Hz/-3 dBm	Continuous
Call Waiting Tone Burst	425 Hz/-3 dBm	192ms-on, 192ms-off, 192ms-on, off
Camp-on Busy Tone to Caller	150 Hz+450 Hz/-6 dBm + -15 dBm	1s-on, 5s-off Repeating.
Hold Tone	150 Hz+450 Hz/-6 dBm + -15 dBm	1s-on, 5s-off Repeating.
Park Tone	425 Hz/-3 dBm	50ms-on, 50ms-off Repeating.
Routing Tone	425 Hz/-6 dBm	7 times 75ms-on/75ms off, followed by one time 75ms on, 875ms - off Repeating
Break-in Ticker	425 Hz/-3 dBm	4 times 32ms-on/960ms-off - repeating every 4s **Note 3**
Add-on Ticker	425 Hz/-3 dBm	4 times 32ms-on/960ms-off - repeating every 4s **Note 3**
Howler Tone	2000 Hz/ +3 dBm	32ms-on, 32ms-off Repeating

Note 3: For repeating interval, time delay may occur. (maximum 4 seconds)

(4) Italy

Name	Signal Frequency (Hz)/ Sensitivity Level	Duration of Connection
Internal Ring Tone	425 Hz/-6 dBm	1s-on, 4s-off Repeating
External Ring Tone	425 Hz/-6 dBm	1s-on, 4s-off Repeating
Internal Dial Tone	350 Hz + 450 Hz/ -9 dBm + -9 dBm	Continuous
Enquiry Dial Tone	350 Hz + 450 Hz/ -9 dBm + -9 dBm	Continuous
First External Dial Tone	425 Hz/-6 dBm	600ms-on, 1.075s-off 200ms-on, 200ms-off, 600ms-on, 1.075s-off Repeating
Busy Tone	425 Hz/-6 dBm	500ms-on, 500ms-off Repeating
Number Unobtainable Tone	425 Hz/-6 dBm	100ms-on, 100ms-off Repeating
Congestion Tone	425 Hz/-6 dBm	500ms-on, 500ms-off Repeating
Diversion Active Dial Tone	350 Hz + 440 Hz/ -9 dBm + -9 dBm	350ms-on, 25ms-off Repeating
Confirmation Tone	425 Hz/-6 dBm	96ms-on, 96ms-off, 96ms-on, 96ms-off, 96ms-on, 1504 ms-off - Repeating 3 times, then silence
Call Waiting Tone Burst	425 Hz/-6 dBm	96ms-on, 4896ms-off Repeating **Note 4**
Camp-on Busy Tone to Caller	425 Hz/-6 dBm	200ms-on, 200ms-off, 200ms-on, 3.15s-off Repeating
Hold Tone	425 Hz/-6 dBm	200ms-on, 200ms-off, 200ms-on, 3.15s-off Repeating
Park Tone	425 Hz/-6 dBm	100ms-on, 100ms-off Repeating
Routing Tone	425 Hz/-6 dBm	250ms-on, 500ms-off, 250ms on, 4s-off Repeating
Break-in Ticker	425 Hz/-3 dBm	10 times 32ms-on/480ms-off - repeating every 32s **Note 4**
Add-on Ticker	425 Hz/-3 dBm	10 times 32ms-on/480ms-off - repeating every 32s **Note 4**
Howler Tone	2000 Hz/ +3 dBm	32ms-on, 32ms-off Repeating

Note 4: For repeating interval, time delay may occur. (maximum 4 seconds)

(5) Belgium

Name	Signal Frequency (Hz)/ Sensitivity Level	Duration of Connection
Internal Ring Tone	450 Hz/-4 dBm	1s-on, 3s-off Repeating
External Ring Tone	450 Hz/-4 dBm	1s-on, 3s-off Repeating
Internal Dial Tone	450 Hz/ -4 dBm	Continuous
Enquiry Dial Tone	450 Hz/ -4 dBm	Continuous
First External Dial Tone	450 Hz/-4 dBm	Continuous
Busy Tone	450 Hz/-4 dBm	500ms-on, 500ms-off Repeating
Number Unobtainable Tone	450 Hz/-4 dBm	200ms-on, 200ms-off Repeating
Congestion Tone	450 Hz/-4 dBm	200ms-on, 200ms-off Repeating
Diversion Active Dial Tone	450 Hz/ -4 dBm	1s-on, 250ms-off Repeating
Confirmation Tone	450 Hz/-4 dBm	480ms-on/480ms-off Repeating
Call Waiting Tone Burst	450 Hz/-4 dBm	256ms-on - repeating every 4s **Note 5**
Camp-on Busy Tone to Caller	450 Hz/-4 dBm	1s-on, 3s-off Repeating
Hold Tone	450 Hz/-4 dBm	1s-on, 3s-off Repeating
Park Tone	450 Hz/-4 dBm	200ms-on, 200ms-off Repeating
Routing Tone	450 Hz/-4 dBm	Continuous
Break-in Ticker	425 Hz/-3 dBm	5 times 32ms-on/480ms-off - repeating every 4s **Note 5**
Add-on Ticker	425 Hz/-3 dBm	5 times 32ms-on/480ms-off - repeating every 32s **Note 5**
Howler Tone	2000 Hz/ +3 dBm	32ms-on, 32ms-off Repeating

Note 5: For repeating interval, time delay may occur. (maximum 4 seconds)

(6) Denmark

Name	Signal Frequency (Hz)/ Sensitivity Level	Duration of Connection
Internal Ring Tone	425 Hz/-3 dBm	1s-on, 4s-off Repeating
External Ring Tone	425 Hz/-3 dBm	1s-on, 4s-off Repeating
Internal Dial Tone	400 Hz/-9 dBm	Continuous
Enquiry Dial Tone	400 Hz/-9 dBm	Continuous
First External Dial Tone	425 Hz/-3 dBm	Continuous
Busy Tone	425 Hz/-3 dBm	250ms-on, 250ms-off Repeating
Number Unobtainable Tone	425 Hz/-6 dBm	50ms-on, 50ms-off Repeating
Congestion Tone	425 Hz/-3 dBm	100ms-on, 100ms-off Repeating
Diversion Active Dial Tone	400 Hz/-9 dBm	350ms-on, 25ms-off Repeating
Confirmation Tone	425 Hz/-3 dBm	992ms-on/256ms-off Repeating
Call Waiting Tone Burst	425 Hz/-3 dBm	64ms-on, 96ms-off, 64ms-on, repeating every 4s **Note 6**
Camp-on Busy Tone to Caller	33.33 Hz x 400 Hz -17 dBm (suppressed carrier)	200ms-on, 200ms-off, 200ms-on, 200ms-off, 200ms-on, 9s-off Repeating
Hold Tone	33.33 Hz x 400 Hz -17 dBm (suppressed carrier)	200ms-on, 200ms-off, 200ms-on, 200ms-off, 200ms-on, 9s-off Repeating
Park Tone	425 Hz/-6 dBm	50ms-on, 50ms-off Repeating
Routing Tone	33.33 Hz x 400 Hz -17 dBm (suppressed carrier)	1s-on, 4s-off Repeating
Break-in Ticker	425 Hz/-3 dBm	5 times 32ms-on/480ms-off - repeating every 4s **Note 6**
Add-on Ticker	425 Hz/-3 dBm	2 times 32ms-on/480ms-off - repeating every 32s **Note 6**
Howler Tone	2000 Hz/ +3 dBm	32ms-on, 32ms-off Repeating

Note 6: For repeating interval, time delay may occur. (maximum 4 seconds)

(7) Sweden

Name	Signal Frequency (Hz)/ Sensitivity Level	Duration of Connection
Internal Ring Tone	425 Hz/-9 dBm	1s-on, 5s-off Repeating
External Ring Tone	425 Hz/-9 dBm	1s-on, 5s-off Repeating
Internal Dial Tone	425 Hz/-9 dBm	Continuous
Enquiry Dial Tone	425 Hz/-9 dBm	Continuous
First External Dial Tone	425 Hz/-9 dBm	Continuous
Busy Tone	425 Hz/-9 dBm	250ms-on, 250ms-off Repeating
Number Unobtainable Tone	425 Hz/-6 dBm	50ms-on, 50ms-off Repeating
Congestion Tone	425 Hz/-9 dBm	250ms-on, 750ms-off Repeating
Diversion Active Dial Tone	425 Hz/-9 dBm	350ms-on, 25ms-off Repeating
Confirmation Tone	425 Hz/-9 dBm	1504ms-on/512ms-off Repeating
Call Waiting Tone Burst	425 Hz/-9 dBm	192ms-on, 512ms-off, 192ms-on, off
Camp-on Busy Tone to Caller	425 Hz/-9 dBm	1s-on, 5s-off, Repeating
Hold Tone	425 Hz/-9 dBm	1s-on, 5s-off, Repeating
Park Tone	425 Hz/-6 dBm	50ms-on, 50ms-off Repeating
Routing Tone	425 Hz/-9 dBm	1s-on, 5s-off Repeating
Break-in Ticker	1400 Hz/-27 dBm	2 times 96ms-on/1504ms-off - repeating every 4s **Note 7**
Add-on Ticker	1400 Hz/-27 dBm	352ms-on, off - repeating every 32s **Note 7**
Howler Tone	2000 Hz/ +3 dBm	32ms-on, 32ms-off Repeating

Note 7: For repeating interval, time delay may occur. (maximum 4 seconds)

(8) Swiss

Name	Signal Frequency (Hz)/ Sensitivity Level	Duration of Connection
Internal Ring Tone	425 Hz/-9 dBm	1s-on, 4s-off Repeating
External Ring Tone	425 Hz/-9 dBm	1s-on, 4s-off Repeating
Internal Dial Tone	425 Hz/-9 dBm	Continuous
Enquiry Dial Tone	425 Hz/-9 dBm	Continuous
First External Dial Tone	425 Hz/-9 dBm	Continuous
Busy Tone	425 Hz/-9 dBm	500ms-on, 500ms-off Repeating
Number Unobtainable Tone	425 Hz/-9 dBm	200ms-on, 200ms-off Repeating
Congestion Tone	425 Hz/-9 dBm	200ms-on, 200ms-off Repeating
Diversion Active Dial Tone	425 Hz (-9 dBm) + 340 Hz (-14 dBm)	975ms-on, 25ms-off Repeating
Confirmation Tone	425 Hz/-19 dBm	800ms-on/992ms-off Repeating
Call Waiting Tone Burst	425 Hz/-19 dBm	192ms-on, 192ms-off, 192ms-on Repeating every 4s **Note 8**
Camp-on Busy Tone to Caller	425 Hz/-9 dBm	1s-on, 3.75s-off, 500ms-on, 500ms-off, 500ms-on, 3.75s-off Repeating
Hold Tone	425 Hz/-9 dBm	1s-on, 3.75s-off, 500ms-on, 500ms-off, 500ms-on, 3.75s-off Repeating
Park Tone	425 Hz/-9 dBm	200ms-on, 200ms-off Repeating
Routing Tone	425 Hz/-6 dBm	7 times 75ms on/off, followed by one time 75 ms on, 875ms off Repeating
Break-in Ticker	425 Hz/-23 dBm	2 times 192ms-on/1792ms-off - repeating every 4s **Note 8**
Add-on Ticker	425 Hz/-23 dBm	448ms-on - repeating every 32s **Note 8**
Howler Tone	2000 Hz/ +3 dBm	32ms-on, 32ms-off Repeating

Note 8: For repeating interval, time delay may occur. (maximum 4 seconds)

(9) UK

Name	Signal Frequency (Hz)/ Sensitivity Level	Duration of Connection
Internal Ring Tone	33.33 Hz x 400 Hz -17 dBm (suppressed carrier)	1s-on, 3s-off Repeating
External Ring Tone	33.33 Hz x 400 Hz -17 dBm (suppressed carrier)	1s-on, 3s-off Repeating
Internal Dial Tone	33.33 Hz x 400 Hz -17 dBm (suppressed carrier)	Continuous
Enquiry Dial Tone	33.33 Hz x 400 Hz -17 dBm (suppressed carrier)	Continuous
First External Dial Tone	33.33 Hz x 400 Hz -17 dBm (suppressed carrier)	Continuous
Busy Tone	400 Hz/-12 dBm	375ms-on, 375ms-off Repeating
Number Unobtainable Tone	400 Hz/-12 dBm	Continuous
Congestion Tone	400 Hz/-12 dBm	250ms-on, 250ms-off Repeating
Diversion Active Dial Tone	33.33 Hz x 400 Hz -17 dBm (suppressed carrier)	350ms-on, 25ms-off Repeating
Confirmation Tone	33.33 Hz x 400 Hz -17 dBm (suppressed carrier)	Continuous
Call Waiting Tone Burst	33.33 Hz x 400 Hz -17 dBm (suppressed carrier)	512ms-on, off
Camp-on Busy Tone to Caller	33.33 Hz x 400 Hz -17 dBm (suppressed carrier)	1s-on, 3s-off Repeating
Hold Tone	33.33 Hz x 400 Hz -17 dBm (suppressed carrier)	1s-on, 3s-off Repeating
Park Tone	400 Hz/-12 dBm	Continuous
Routing Tone	400 Hz/-12 dBm	250ms-on, 2.75ms-off Repeating
Break-in Ticker	425 Hz/-3 dBm	2 times 32ms-on/480ms-off - repeating every 4s **Note 9**
Add-on Ticker	425 Hz/-3 dBm	2 times 32ms-on/480ms-off - repeating every 4s **Note 9**
Howler Tone	2000 Hz/ +3 dBm	32ms-on, 32ms-off Repeating

Note 9: For repeating interval, time delay may occur. (maximum 4 seconds)

(10) Spain

Name	Signal Frequency (Hz)/ Sensitivity Level	Duration of Connection
Internal Ring Tone	425 Hz -12 dBm	300ms-on, 400ms-off, 300ms-on, 4s-off Repeating
External Ring Tone	425 Hz -12 dBm	300ms-on, 400ms-off, 300ms-on, 4s-off Repeating
Internal Dial Tone	425 Hz -9 dBm	Continuous
Enquiry Dial Tone	425 Hz -9 dBm	Continuous
First External Dial Tone	425 Hz x 25Hz -10 dBm (suppressed carrier)	Continuous
Busy Tone	425 Hz/-12 dBm	500ms-on, 500ms-off Repeating
Number Unobtainable Tone	425 Hz/-12 dBm	50ms-on, 50ms-off Repeating
Congestion Tone	425 Hz/-9 dBm	250ms-on, 250ms-off Repeating
Diversion Active Dial Tone	425 Hz/-9 dBm	350ms-on, 25ms-off Repeating
Confirmation Tone	425 Hz/-9 dBm	Continuous
Call Waiting Tone Burst	425 Hz/-9 dBm	2 times 256ms-on/256ms-off - repeating every 4s **Note 10**
Camp-on Busy Tone to Caller	425 Hz/-9 dBm	1s-on, 4s-off Repeating
Hold Tone	425 Hz/-9 dBm	1s-on, 4s-off Repeating
Park Tone	425 Hz/-12 dBm	50ms-on, 50ms-off Repeating
Routing Tone	425 Hz/-6 dBm	7 times 75ms on/off, followed by one time 75ms on, 875ms off - repeating
Break-in Ticker	425 Hz/-3 dBm	5 times 32ms-on/480ms-off - repeating every 4s **Note 10**
Add-on Ticker	425 Hz/-3 dBm	5 times 32ms-on/480ms-off - repeating every 32s **Note 10**
Howler Tone	2000 Hz/ +3 dBm	32ms-on, 32ms-off Repeating

Note 10: For repeating interval, time delay may occur. (maximum 4 seconds)

(11) Greece

Name	Signal Frequency (Hz)/ Sensitivity Level	Duration of Connection
Internal Ring Tone	425 Hz/-3 dBm	1s-on, 4s-off Repeating
External Ring Tone	425 Hz/-3 dBm	1s-on, 4s-off Repeating
Internal Dial Tone	425 Hz/-3 dBm	Continuous
Enquiry Dial Tone	425 Hz/-3 dBm	Continuous
First External Dial Tone	450 Hz/0 dBm	600ms-on, 1s-off 200ms-on, 200ms-off
Busy Tone	425 Hz/-3 dBm	500ms-on, 500ms-off Repeating
Number Unobtainable Tone	425 Hz/-3 dBm	200ms-on, 200ms-off Repeating
Congestion Tone	425 Hz/-3 dBm	200ms-on, 200ms-off Repeating
Diversion Active Dial Tone	25 Hz x 425 Hz/-10 dBm (suppressed carrier)	Continuous
Confirmation Tone	425 Hz/-3 dBm	3488ms-on, off
Call Waiting Tone Burst	425 Hz/-3 dBm	960ms-on, off
Camp-on Busy Tone to Caller	25 Hz x 425 Hz/-10 dBm (suppressed carrier)	200ms-on, 200ms-off 200ms-on, 1.9s-off Repeating
Hold Tone	25 Hz x 425 Hz/-10 dBm (suppressed carrier)	200ms-on, 200ms-off 200ms-on, 1.9s-off Repeating
Park Tone	425 Hz/-3 dBm	200ms-on, 200ms-off Repeating
Routing Tone	425 Hz/-6 dBm	7 times 75ms on/off, followed by one time 75ms on, 875ms off - Repeating
Break-in Ticker	950 Hz/-13 dBm	480ms-on, off - repeating every 4s **Note 11**
Add-on Ticker	950 Hz/-13 dBm	480ms-on, off - repeating every 32s **Note 11**
Howler Tone	2000 Hz/ +3 dBm	32ms-on, 32ms-off Repeating

Note 11: For repeating interval, time delay may occur. (maximum 4 seconds)

(12) South Africa

Name	Signal Frequency (Hz)/ Sensitivity Level	Duration of Connection
Internal Ring Tone	33.33 Hz x 400 Hz/ -3 dBm (suppressed carrier)	1s-on, 2s-off Repeating
External Ring Tone	33.33 Hz x 400 Hz/ -3 dBm (suppressed carrier)	1s-on, 2s-off Repeating
Internal Dial Tone	400 Hz/ -9dBm	Continuous
Enquiry Dial Tone	400 Hz/ -9dBm	Continuous
First External Dial Tone	33.33 Hz x 400 Hz	Continuous
Busy Tone	400 Hz/ -9 dBm	500ms-on, 500ms-off Repeating
Number Unobtainable Tone	400 Hz/ -9 dBm	2.5s-on, 500ms-off, Repeating
Congestion Tone	400 Hz/ -9 dBm	250ms-on, 250ms-off, Repeating
Diversion Active Dial Tone	33.33 Hz x 400 Hz/ -3 dBm (suppressed carrier)	1s-on, 200ms-off Repeating
Confirmation Tone	400 Hz/ -9dBm	608ms-on,192ms-off, Repeating
Call Waiting Tone Burst	400 Hz/ -9dBm	256ms-on, off repeating every 4s
Camp-on Busy Tone to Caller	33.33 Hz x 400 Hz/ -3 dBm (suppressed carrier)	400ms-on, 200ms-off Repeating
Hold Tone	33.33 Hz x 400 Hz/ -3 dBm (suppressed carrier)	400ms-on, 200ms-off Repeating
Park Tone	400 Hz/ -9 dBm	2.5s-on, 500ms-off, Repeating
Routing Tone	425 Hz/ -6dBm	7 times 75ms-on/75ms-off, followed by 1 time 75ms-on/875ms-off, Repeating
Break-in Ticker	425 Hz/ -3 dBm	5 times 32ms-on/480ms-off, repeating every 4s **Note 12**
Add-on Ticker	425 Hz/ -3 dBm	4 times 32ms-on/480ms-off **Note 12**
Howler Tone	<PCM Howler> 2000Hz/ +3 dBm <Power Howler> 800Hz±150Hz/ +23 dBm	<PCM Howler> 32ms-on,32ms-off Repeating <Power Howler> Continuous (Max.30s)

Note 12: For repeating interval, time delay may occur. (maximum 4 seconds)

APPENDIX B Tone Setting Differences between EMEA and Basic Tone Setting for EMEA

This appendix shows the differences of tone specification between EMEA and Basic Tone Setting for EMEA.

(a) Netherlands

Name	EMEA		Basic Tone Setting for EMEA	
	Signal Frequency (Hz)/Sensitivity Level (dBm)	Duration of Connection	Signal Frequency (Hz)/ Sensitivity Level (dBm)	Duration of Connection
Enquiry Dial Tone	425 Hz/-9 dBm	Continuous	425 Hz/- 6 dBm	Continuous
Number Unobtainable Tone	425 Hz/ -6 dBm	60ms-on, 60ms-off Repeating	425 Hz/ -6 dBm	50ms-on, 50ms-off Repeating
Diversion Active Dial Tone	425 Hz/ -6 dBm	320ms-on, 10ms-off Repeating	425 Hz/ -6 dBm	350ms-on, 25ms-off Repeating
Call Waiting Tone Burst	425 Hz/ -6 dBm	100ms-on, off	425 Hz/ -6 dBm	96ms-on, off
Routing Tone	425 Hz/ -6 dBm	5 times 80ms on/ 80ms off, followed by one time 80ms on, 500ms off - Repeating	425 Hz/ -6 dBm	5 times 75ms on/ 75ms off, followed by one time 75ms on, 425ms off - Repeating
Break-in Ticker	425 Hz/ -3 dBm	Continuous	425 Hz/ -3 dBm	10 times 32ms-on/ 480ms-off - Repeating every 32s
Add-on Ticker	425 Hz/ -3 dBm	4s-on, 30s-off Repeating	425 Hz/ -3 dBm	10 times 32ms-on/ 480ms-off Repeating every 32ms
Howler Tone	1800 Hz/ -13 dBm	250ms-on, 250ms-off Repeating	2000 Hz/ +3 dBm	32ms-on, 32ms-off Repeating

(b) Germany

Name	EMEA		Basic Tone Setting for EMEA (This feature)	
	Signal Frequency (Hz)/ Sensitivity Level (dBm)	Duration of Connection	Signal Frequency (Hz)/ Sensitivity Level (dBm)	Duration of Connection
Internal Dial Tone	425 Hz/-3 dBm	240ms-on, 240ms-off, 240ms-on, 240ms-off, 240ms-on, 1.4s-off Repeating	425 Hz/- 3 dBm	250ms-on, 250ms-off, 250ms-on, 250ms-off, 250ms-on, 1.25s-off Repeating
Enquiry Dial Tone	425 Hz/ -3 dBm	240ms-on, 240ms-off, 240ms-on, 240ms-off, 240ms-on, 1.4s-off Repeating	425 Hz/ -3 dBm	250ms-on, 250ms-off, 250ms-on, 250ms-off, 250ms-on, 1.25s-off Repeating
Busy Tone	425 Hz/ -3 dBm	160ms-on, 480ms-off Repeating	425 Hz/ -3 dBm	150ms-on, 475ms-off Repeating
Number Unobtainable Tone	425 Hz/ -3 dBm	240ms-on, 240ms-off Repeating	425 Hz/ -3 dBm	250ms-on, 250ms-off Repeating
Congestion Tone	425 Hz/ -3 dBm	240ms-on, 240ms-off Repeating	425 Hz/ -3 dBm	250ms-on, 250ms-off Repeating
Diversion Active Dial Tone	150 Hz+450 Hz -6 dBm + -15 dBm	240ms-on, 240ms-off, 240ms-on, 240ms-off, 240ms-on, 1.4s-off Repeating	150 Hz+450 Hz -6 dBm + -15 dBm	250ms-on, 250ms-off, 250ms-on, 250ms-off, 250ms-on, 1.25s-off Repeating
Confirmation Tone	425 Hz/ -3 dBm	3.5s-on, off	425 Hz/ -9 dBm	3488ms-on, off
Call Waiting Tone Burst	425 Hz/ -9 dBm	1s-on, off	425 Hz/ -9 dBm	992ms-on, off
Park Tone	425 Hz/ -3dBm	160ms-on, 480ms-off Repeating	425 Hz/ -3dBm	250ms-on, 250ms-off Repeating
Routing Tone	Not specified		425 Hz/ -6 dBm	7 times 75ms on/75ms off, followed by one time 75ms on, 875ms off - Repeating
Break-in Ticker	425 Hz/ -3dBm	Continuous	425 Hz/ -3dBm	10 times 32ms-on/ 480ms-off - repeating every 32s
Add-on Ticker	425 Hz/ -3dBm	4s-on, 30s-off Repeating	425 Hz/ -3dBm	10 times 32ms-on/ 480ms-off - repeating every 32s
Howler Tone	1800 Hz/ -13 dBm	250ms-on, 250ms-off Repeating	2000 Hz/ +3 dBm	32ms-on, 32ms-off Repeating

APPENDIX C Reference Information for Customizing/Editing Your Language Files through Optional Language Pack Loading

This appendix provides supplementary information about editing on-screen text through Optional Language Pack Loading [O-42].

The DT800/DT700/DT400/DT300 terminals have an LCD providing three lines of text information; The bottom line shows Soft keys, the middle line shows date and time, and the top line shows operation-related information. In the order of area from bottom to top of the screen, the following topics are explained:

- Soft Key Labels — Section 1
- Abbreviation of Name of Month and Day Name of the Week (Kind Number 44 and 45) — Section 2
- Non-Call Operations — Section 3
- Call Operations — Section 4
- Service-Specific Information Message — Section 5
- Help Messages — Section 6
- Trunk Class Numbers and Abbreviations — Section 7
- Annex — Section 8

The procedures explained in Sections 1 and 2 are relatively simple and straightforward because they are directly related to one name or one function key. However, procedures provided in Sections 3 and 4 are more complicated because text strings of information messages can be used in multiple features.

Note: Kind Number and Data Number referred to in this appendix are the “Kind” column and the “Data Number” column in the Excel sheet EXLANG_0001.xls, respectively.

1. Soft Key Labels

The Soft key labels classified as Kind Number 16 and 17 (see Tables 1 and 2) can be modified through both the maintenance command, AFDD, and Optional Language files. On the other hand, the Soft key labels classified as other Kind Numbers, shown in Table 3, can be modified only through Optional Language files.

The advantage of using Optional Language files instead of the AFDD command is that once you have completed modifying the language file, you can distribute copies of the file to other sites.

Kind Number = 16

2. Abbreviation of Name of Month and Day Name of the Week (Kind Number 44 and 45)

You can modify the abbreviation of the name of month and the day name of the week. The abbreviation cannot exceed three characters in length.

The text will appear in the middle line of the DT terminal LCD (e.g. “11:23 AM TUE 7 AUG 2012”).

Month and Day Name

Text Type	Meaning	Default	Deutsche	Kind No.	Data No.

	Saturday	SAT	SA	45	6

3. Non-Call Operations

Non-Call operations are categorized into two groups; First group is controlled by the Telephony Server and the second group is controlled by a DT terminal itself.

This section includes the following lists of information message text used in non-call operations:

- Non-Call Operations Controlled by the Telephony Server (Table 5 Kind Number 18)
- Cursor Up/Down Operation (Table 6 Kind Number 19)
- Non-Call Operations Controlled by Terminal (Table 7 Kind Number 26)
- Non-Call Operations Controlled by Terminal (Table 7 Kind Number 33-43)

Non-Call Operations Controlled by the Telephony Server

4. Call Operations

Some text strings of information messages are used in multiple features. For example, the text string “FORWARD” is used when call forwarding destination is set or canceled.

There are two groups for the call-operation-related text strings; One group is the ACTION group and the other group is the RESULT group.

(a) Where ACTION and RESULT information is displayed:

← 8-character length →	← 8-character length →	← 8-character length →	
ACTION	RESULT		
11:41 AM THU 9 AUG 2012			
Soft key 1	Soft key 2	Soft key 3	Soft key 4

As shown above, the text string for ACTION information is displayed at the left-top corner with a maximum length of eight characters. The text string for RESULT information is displayed at the middle position of the top line, following the ACTION information text string. With the combination of these two types of texts, most of procedures for regularly-used phone operations are guided.

When you make a simple phone call, these areas are left blank. Status information such as “CONNECTING” or “CALLING” will not be displayed. However, when another action is taken, these areas will be used.

(b) Holding a call / Being held

When you put someone on hold by pressing the Hold key, or you are on hold by someone else, the ACTION area displays the text HOLD, which is saved with Kind Number=13 and Data Number=04 in the Optional Language file.

	ACTION	RESULT
Default text message	HOLD	
Kind No., Data No.	13, 04	none

	ACTION	RESULT
Deutsche text	HALTEN	
Kind No., Data No.	13, 04	none

When you press the Hold key twice to put the call on “exclusive hold,” in which no one else can retrieve the call, the following text string is displayed on the LCD.

	ACTION	RESULT
Default text message	E-HOLD	
Kind No., Data No.	14, 00	none

	ACTION	RESULT
Deutsche text	EXKLHALT	
Kind No., Data No.	14, 00	none

(c) Transferring a call

When you press the Transfer key during a call, you will hear the second dial tone, and the ACTION display will show “TRANSFER” (13,06). At this moment, the other party will see “HOLD” (13,04) in his/her ACTION area.

	ACTION	RESULT
Default text message	TRANSFER	
Kind No., Data No.	13, 06	none

	ACTION	RESULT
Deutsche text	VERBINDE	
Kind No., Data No.	13, 06	none

When you have completed dialing the transfer destination number, you hear the Ring Back Tone. The ACTION display on the other party, who is being transferred, will change to “TRANSFER” (13,06). This “TRANSFER” (13,06) indication remains until you replace the handset to complete the transferring operation.

(d) Encountering busy

When your destination party is on another call and you are not automatically forwarded then you will see “BUSY” (13,05) in the ACTION area.

	ACTION	RESULT
Default text message	BUSY	
Kind No., Data No.	13, 05	none

	ACTION	RESULT
Deutsche text	BESETZT	
Kind No., Data No.	13, 05	none

(e) Dialing invalid number

In case of dialing an unregistered number or forbidden number, you will see "REST" (13,08) in the ACTION area.

Note: "REST" means restriction.

	ACTION	RESULT
Default text message	REST	
Kind No., Data No.	13, 08	none

	ACTION	RESULT
Deutsche text	ABGELEHN	
Kind No., Data No.	13, 08	none

A recommended text is "Invalid."

(f) Setting and canceling Call Forwarding and being forwarded

When you press a Call Forwarding key, you will see "FORWARD" (13,02) in the ACTION display area. This message prompts you to enter a forwarding destination number when you press a forwarding key and go off-hook, or when you press a forwarding key with the handset off hook and hear Dial Tone.

	ACTION	RESULT
Default text message	FORWARD	
Kind No., Data No.	13, 02	none

	ACTION	RESULT
Deutsche text	WEITERL	
Kind No., Data No.	13, 02	none

If you successfully enter the destination number to the “FORWARD” (13,02) prompt, you will see “SET” (04,01) message on the RESULT area, which is in the middle of the top line on the LCD.

	ACTION	RESULT
Default text message	FORWARD	SET
Kind No., Data No.	13, 02	(04, 01)

	ACTION	RESULT
Deutsche text	WEITERL	EIN
Kind No., Data No.	13, 02	(04, 01)

The text string “SET” (04,01) can be used in other operations, such as “Do Not Disturb.”

If you cancel the Call Forwarding feature by pressing the Call Forwarding key again while off-hook, you will see “CANCEL” (04,02) in the RESULT area.

	ACTION	RESULT
Default text message	FORWARD	CANCEL
Kind No., Data No.	13, 02	(04, 02)

	ACTION	RESULT
Deutsche text	WEITERL	ABBRUCH
Kind No., Data No.	13, 02	(04, 02)

When a call is forwarded, both the destination party and originating party will see the same ACTION information message. Three types of Call Forwarding messages are generated according to Call Forwarding events.

[Call Forward - All Calls]

	ACTION	RESULT
Default text message	CF ALL	
Kind No., Data No.	14, 01	none

	ACTION	RESULT
Deutsche text	RWALLE	ABBRUCH
Kind No., Data No.	14, 01	none

[Call Forward - Busy]

	ACTION	RESULT
Default text message	CF BUSY	
Kind No., Data No.	14, 02	none

	ACTION	RESULT
Deutsche text	RWBESETZT	ABBRUCH
Kind No., Data No.	14, 02	none

[Call Forward - No Answer]

	ACTION	RESULT
Default text message	CF NANS	
Kind No., Data No.	14, 03	none

	ACTION	RESULT
Deutsche text	RWKEINAW	ABBRUCH
Kind No., Data No.	14, 03	none

(g) Setting and canceling Do Not Disturb

As described in the Call Forwarding section, the text messages “SET” (04,01) and “CANCEL” (04,02) are also used to indicate Do Not Disturb status.

[Do Not Disturb Activated]

	ACTION	RESULT
Default text message	DND	SET
Kind No., Data No.	13, 24	04, 01

	ACTION	RESULT
Deutsche text	RUFABWEI	EIN
Kind No., Data No.	13, 24	04, 01

[Do Not Disturb Canceled]

	ACTION	RESULT
Default text message	DND	CANCEL
Kind No., Data No.	13, 24	04, 02

	ACTION	RESULT
Deutsche text	RUFABWEI	ABBRUCH
Kind No., Data No.	13, 24	04, 02

7. Trunk Class Numbers and Abbreviations

The trunk class indicates the type of trunk line for public or tie-lines. The trunk type is programmed as a numerical parameter called Trunk Class (TCL) in the "Route Class" data with the maintenance command ARTD. The following table indicates TCL number and the abbreviation of the trunk line.

Note that the abbreviation cannot exceed four characters in length.

Trunk Class Numbers and Abbreviations

Trunk Class	Meaning	Default	Deutsche	Kind No.	Data No.
1	Direct Distance Dialed (DDD) line	DDD	DDD	2	1
2	Foreign eXchange line	FX	FX	2	2
3	Wide Area Telephone Service line	WATS	WATS	2	3
4	Tie line	TIE	TIE	2	4
5	Common Channel Switching Arrangement	CCSA	CCSA	2	5
6	Toll terminal	TOLL	TOLL	2	6
7	Centralized Attendant Service (CAS) line	SATE	SATE	2	7
8	Paging	PG	PG	2	8
9	Code call trunk			2	9
10	Dictation trunk			2	10
11	General paging	PG	PG	2	11

8. Annex

a. List of Kind Number (Part 1)

Kind No.	Meaning	Note
1	Language information (number, name, version)	Only version number can be changed.
2	Trunk class numbers and abbreviations	Section 7.
3	On-call operation 4-character result information message (old)	Not used in Europe for Dterm series III or older
4	On-call operation 8-character result information message	Section 4. - (i)
5	12-character information message	OPR only
6	Service-specific 16-character information message - A	Section 5.
7	Service-specific 16-character information message - B	Section 5.
8	HELP messages for function keys - basic	Section 6.
9	HELP messages for function keys - extended	Section 6.
10	Service-specific 4-character information message - A (old)	Not used in Europe for Dterm series III or older
11	Service-specific 4-character information message - A (old)	Not used in Europe for Dterm series III or older
12	Service-specific 4-character information message - A (old)	Not used in Europe for Dterm series III or older
13	On-call (Call) operation 8-character information message - A	Section 4.
14	On-call (Call) operation 8-character information message - B	Section 4.
15	On-call (Call) operation 8-character information message - C	Section 4.
16	Soft key label for function keys - basic	Section 1.
17	Soft key label for function keys - extended	Section 1.
18	Off-call (Non-call) operation information message - server	Section 3.
19	Cursor operation - up/down	Section 3.
20	Service-specific 16-character information message - Message Area ID (old)	Not used in Europe for Dterm series III or older
21	Service-specific 24-character information message - Message Area ID	Section 5.
22	Service-specific information message - Phonebook	Section 5.
23	Service-specific Soft key label - Phonebook	Section 1.
24	Service-specific Soft key label - Call History, Prefix and Phonebook	Section 1.
25	Service-specific information message - Call History and Prefix	Section 5.
26	DT300 terminal menu text	Section 3.
27	DT300 short cut menu text	Section 3.

b. List of Kind Number (Part 2)

Kind No.	Meaning	Note
28	Service-specific information message - Preset Dial	Section 5.
29	Service-specific Soft key label - Preset Dial	Section 1.
30	Service-specific status indication	Section 5.
31	Service-specific information message - Language Select by Terminal	Section 5.
32	Service-specific Soft key label - Language Select by Terminal	Section 1.
33	SIP multi-line terminal login error - Override?	Section 3.
34	SIP multi-line terminal login error - Illegal LENS	Section 3.
35	SIP multi-line terminal login error - Not Acceptable Here	Section 3.
36	SIP multi-line terminal login error - Illegal Equipment Type	Section 3.
37	SIP multi-line terminal login error - PH Partially Available	Section 3.
38	SIP multi-line terminal login error - Exceeded Capability	Section 3.
39	SIP multi-line terminal login error - Resource Unavailable	Section 3.
40	SIP multi-line terminal login error - Parse Error	Section 3.
41	SIP multi-line terminal login error - Error Code	Section 3.
42	SIP multi-line terminal login error - Soft key	Section 3.
43	SIP multi-line terminal login error - Display	Section 3.
44	Month name	Section 2.
45	Day of week	Section 2.
46	Service-specific information message - Intercom	Section 5.
47	Service-specific Soft key label - SPD name character select	Section 1.
48	Service-specific information message - SPD name	Section 5.
49	Service-specific Soft key label - SPD name - input	Section 1.
50	Service-specific information message - Call History	Section 5.
51	Service-specific Soft key label - Call History (Default)	Section 1.
52	Service-specific information message - Call History - modified	Section 5.
53	Service-specific information message - Redial	Section 5.
54	Service-specific Soft key label - Redial	Section 1.
