APPENDIX A Tone Specifications for Each Country APP-2

APPENDIX B Tone Setting Differences between EMEA and Basic Tone Setting for EMEA APP-14

APPENDIX C Reference Information for Customizing/Editing Your Language Files through Optional Language Pack Loading APP-26

CHAPTER 1
INTRODUCTION

1. General

This manual covers data assignment for UNIVERGE SV9500 system (in the remainder of this manual, denoted as "the system") under the following headings:

CHAPTER 1 INTRODUCTION
Explains the configuration of this manual.
CHAPTER 2 ASSIGNMENT OF BASIC OFFICE DATA
Explains basic data assignment (minimum requirements) for the system.
CHAPTER 3 BUSINESS FEATURES
Gives details on each Business Feature.

2. How to Use This Manual

This manual may be used when assigning each service data available for the system. First, assign the basic office data by referring to Chapter 2. Then assign each service feature data as shown in Chapter 3.

3. Abbreviations for System Types

In this manual, SV9500, SV8500, SV7000, NEAX IPX, NEAX IMX, SV9300, SV8300, NEAX IPS, NEAX IVS^2, or NEAX IVS are used as abbreviations for each System type instead of the actual product name according to market country. The correspondences between the abbreviation of each System type and actual product name are described in the table shown below.

SYSTEM TYPE		REMARKS
SV9500	UNIVERGE SV9500	
SV8500	UNIVERGE SV8500	
SV7000	UNIVERGE SV7000	
NEAX IPX	UNIVERGE NEAX2400 IPX/NEAX2400 IPX	
NEAX IMX	<North America> NEAX2400 IMX	
	<Australia> NEAX7400 IMX	
	<Asia, Latin America, Middle East, Russia> NEAX7400 ICS (IMX)	
SV9300	UNIVERGE SV9300	
SV8300	UNIVERGE SV8300	
NEAX IPS	UNIVERGE NEAX2000 IPS/NEAX2000 IPS	

SYSTEM TYPE		REMARKS
NEAX IVS^2	<North America & Australia> NEAX2000 IVS^2	
	<UK> NEAX2000 INTEGRATED VOICE SERVER	
	<Asia, Latin America, Middle East, Russia> NEAX7400 ICS M100MX	
NEAX IVS	<Australia> NEAX7400 ICS Model120 NEAX7400 ICS Model110	
	<Asia, Latin America, Middle East, Russia> NEAX7400 ICS Model100 NEAX7400 ICS Model80VS	

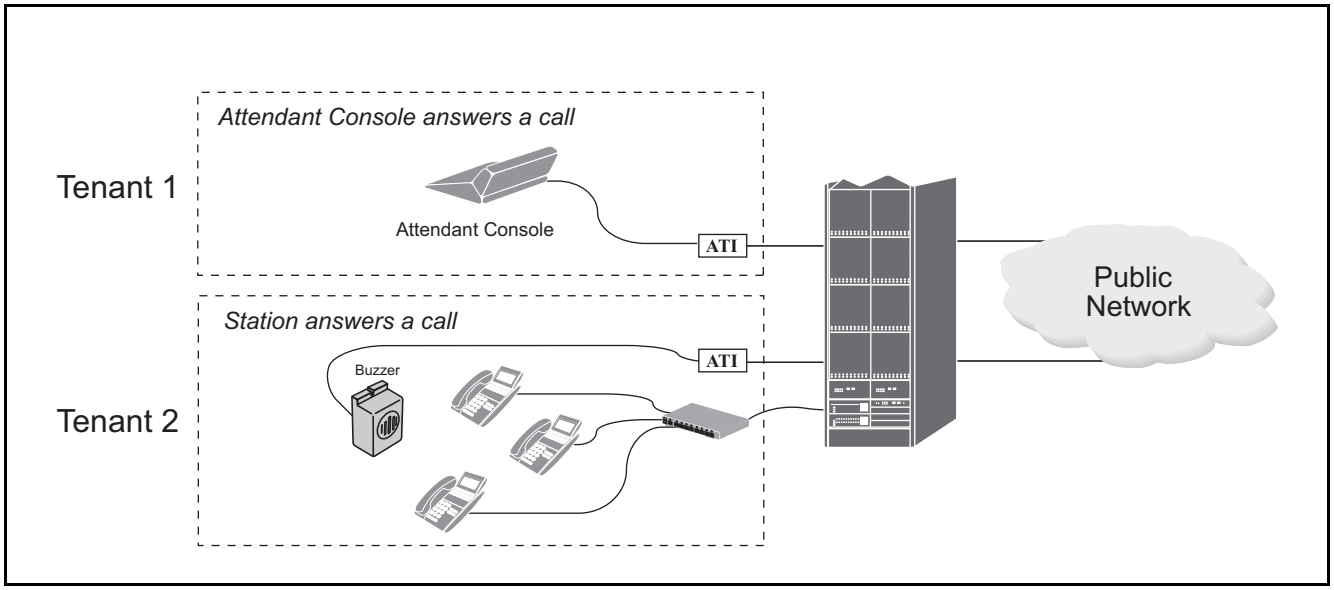
CHAPTER 2
ASSIGNMENT OF BASIC OFFICE DATA

This CHAPTER outlines the following basic Office Data assignment.

1. Tenant Data
2. Trunk Data
3. Attendant Console (ATTCON) Data
4. Station Data
5. Desktop Terminal Data
6. Telephone Number
7. OGC/OGCA
8. LCR/LCRS
9. Uniform Numbering
10. PH Data Setting
11. Tone Setting
12. Data Setting for Switch Redundancy Configuration
13. Day/Night Data Retention
14. IP Related Data Setting
15. UG50 Related Data Setting

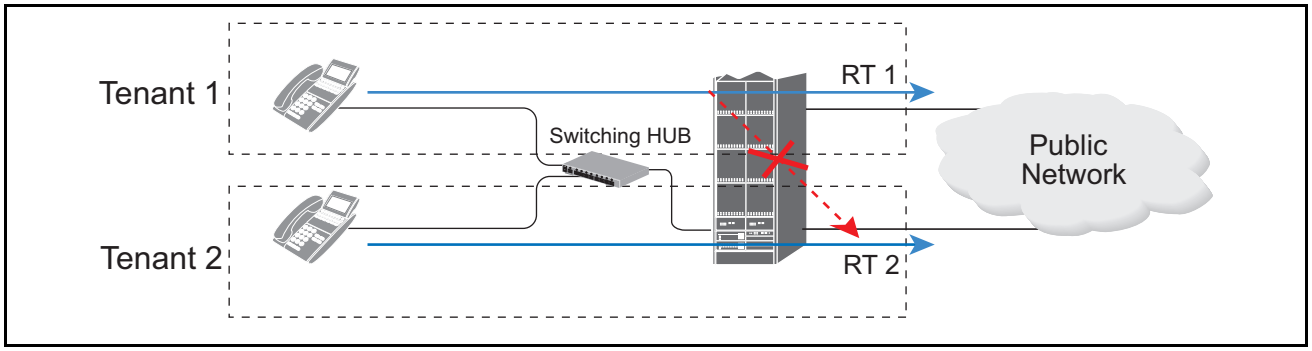
1. Tenant Data

1.1 Use of Tenant Service



A system can be used with multiple tenants (TN) such as companies, branches, or sections. The C.O. line, the TIE line, or an attendant console can be used for different purpose for each tenant, and also some of the Office Data (such as Numbering Plan, Call Connection Restriction, and External Trunk Routing) can be configured separately for each tenant. This section explains the basic concept of Tenant service by using examples.

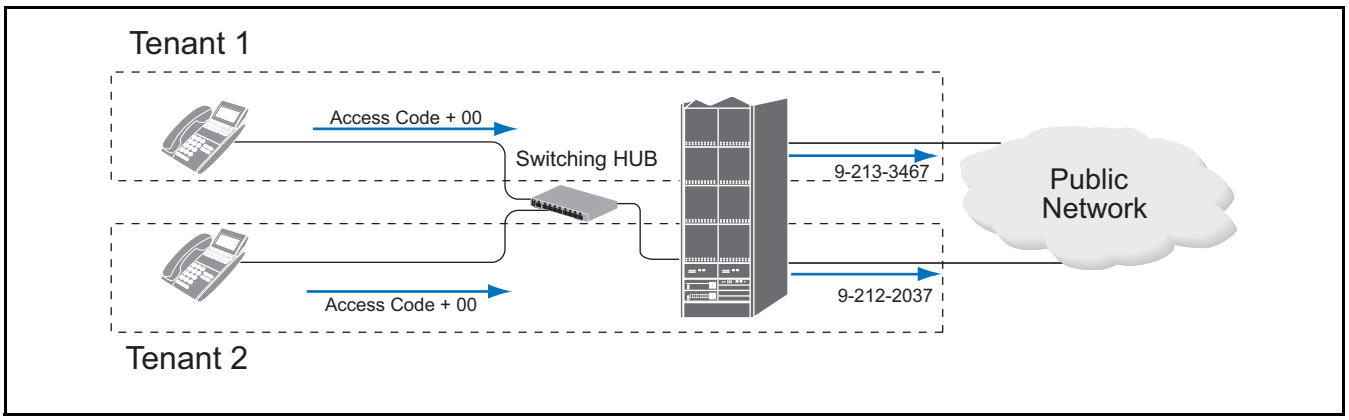
1.2 Example of Tenant Development



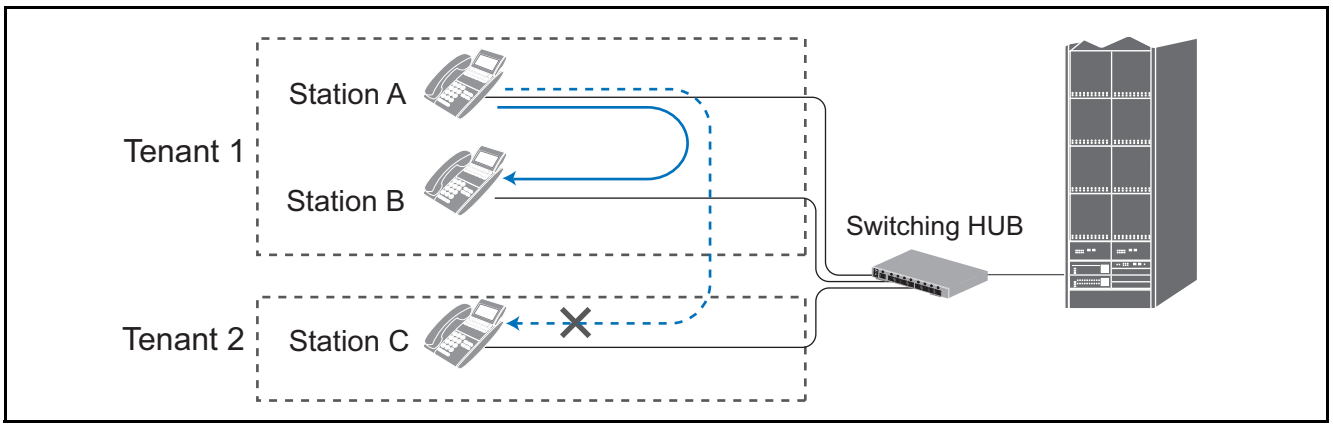
A System can have a maximum of 63 Tenants (TN 1 - 63), except Tenant 0 for ID code registration. The following are some examples of tenant development.

Note: System Initialization is required after changing the maximum number of Tenants.

Example 1: Tenant 1, answering Incoming Central Office Line Call via Attendant Console
Tenant 2, answering Incoming Central Office Line Call via Trunk Answer from Any Station (TAS) indicator



Example 2: Tenant 1, placing Central Office Outgoing Call via RT 1
Tenant 2, placing Central Office Outgoing Call via RT 2



Example 3: Tenant 1, "Speed Calling Access Code (ACC) + 00" → "9-213-3467"
Tenant 2, "Speed Calling Access Code (ACC) + 00" → "9-212-2037"

Note: Speed Calling data can be developed differently for each Tenant.

Example 4: Inter-Tenant Call (between Station A and Station C) is restricted.

1.3 Office Data related to Tenant Service

A list of Office Data, related to Tenant Service, is shown below.
Assign whether to separate Tenants for these commands by ASYD, SYS1, Index 92, Index 93, Index 94 and ASYDL/ASYDN, SYS1, Index 800, Index 801, Index 802.

When changing these Office Data from common to separate, and vice versa, first delete all the currently assigned data by using appropriate commands, change the system data, and then assign new data.

Note: The data assigned by ASPAL command can be deleted collectively by using CSPAL command. Use CSPAN command to delete the data assigned by ASPAN command collectively.

Command Name		Setting of ASYD/ ASYDL/ ASYDN	Description
ASYD, SYS2	Assignment of System Data-2	Index 92, Bit 0=0	ASYD, SYS2, can be developed independently for each Tenant (TN 1-63). SYS2 is associated with the following service: • Busy service • Attendant service • Call Forwarding Service • SMDR (Station Message Detail Recording) service etc.
		Index 92, Bit 0=1	ASYD, SYS2, is assigned for the common Tenant (TN 1).
ANPD/ ANPDL/ ANPDN	Assignment of Numbering Plan Data	Index 92, Bit 2=0	"1stDC (first digit of Access Code)" for each feature access and cancel can be developed independently for each Tenant (TN 1-63).
		Index 92, Bit 2=1	"1stDC" for each feature access and cancel is assigned for the common Tenant (TN 1).
ASPA/ ASPAL/ ASPAN	Assignment of Special Access Code	Index 92, Bit 1=0	"ACC (Access Code)" for each feature access and cancel can be developed independently for each Tenant (TN 1-63).
		Index 92, Bit 1=1	"ACC" for each feature access and cancel is assigned for the common Tenant (TN 1).
ATRK	Assignment of Trunk Data		While a RT (the same Route Number) can be shared by multiple Tenants, the respective Trunk Number of the RT cannot be duplicated for multiple Tenants.
ARSC	Assignment of Route Restriction Class	Index 92, Bit 4=0	RSC (Route Restriction Class) tables, determining Incoming/Outgoing Call restriction for Stations or Attendant Consoles, can be developed independently for each Tenant (TN 1-63).
		Index 92, Bit 4=1	RSC table is assigned for the common Tenant (TN 1).
ACFR/ ACFRN	Assignment of Call Forwarding Restriction	Index 92, Bit 5=0	Various kinds of Call Forwarding Restriction, such as DIT (Direct-In Termination), Night Attendant, Remote Access to System and Call Forwarding - All Calls/Busy Line/Don't Answer, etc., can be developed independently for each Tenant (TN 1-63).
		Index 92, Bit 5=1	Various kinds of Call Forwarding Restriction are assigned for the common Tenant (TN 1).
ASFC	Assignment of Service Feature Restriction Class	Index 93, Bit 0=0	SFC (Service Feature Restriction Class) table, determining permission/ restriction of each service feature on a Service Feature Restriction Class basis, can be developed independently for each Tenant (TN 1-63).
		Index 93, Bit 0=1	SFC table is assigned for the common Tenant (TN 1).

Command Name		Setting of ASYD/ ASYDL/ ASYDN	Description
ACFO	Assignment of Call Forwarding Data	Index 93, Bit 1=0	Various Call Forwarding Destination Table can be developed independently for each Tenant (TN 1-63).
		Index 93, Bit 1=1	Various Call Forwarding Destination Table is assigned for the common Tenant (TN 1).
ASPD/ ASPDN	Assignment of Speed Calling	Index 93, Bit 3=0	Abbreviated Digit Code data table (for Speed Calling-System feature) can be developed independently for each Tenant (TN 1-63).
		Index 93, Bit 3=1	Abbreviated Digit Code Data Table is assigned for the common Tenant (TN 1).
ASTP/ ASTPL/ ASTPN	Assignment of Signal Translation Pattern	Index 93, Bit 4=0	PNI/PNO tables, to be elaborated by AISP/AOSP command, can be developed independently for each Tenant (TN 1-63). PNI: Incoming Selection Translation Pattern Number PNO: Outgoing Selection Translation Pattern Number
		Index 93, Bit 4=1	PNI/PNO table is assigned for the common Tenant (TN 1).
AFRS/ AFRSL/ AFRSN	Assignment of Flexible Route Selection Data	Index 93, Bit 4=0	OPR (Outgoing Route Selection Pattern Number) tables, to be programmed by AOPR command, can be developed independently for each Tenant (TN 1-63).
		Index 93, Bit 4=1	OPR tables are specified for the common Tenant (TN 1).
AAED/ AAEDL/ AAEDN	Assignment of Announcement Equipment Data	Index 93, Bit 7=0	DAT (Digital Announcement Trunk) data table can be developed independently for each Tenant (TN 1-63).
		Index 93, Bit 7=1	DAT data table is assigned for the common Tenant (TN 1).
ATNR	Assignment of Tenant Restriction Class Data	Index 94, Bit 0=0	Allow/Deny table for Inter- and Intra-Tenant events, such as Station-to-Station Call between Tenants or service activation (Call Forwarding Service) across Tenants, can be developed independently for each Tenant (TN 1-63).
		Index 94, Bit 0=1	Allow/Deny table for Inter- and Intra-Tenant events is assigned for the common Tenant (TN 1).
AEFR/ AEFRN	Assignment of EPN Facility Restriction Data	Index 94, Bit 1=0	Allow/Deny tables for Call establishment between RSC1 (Calling Party's Restriction Class) and RSC2 (Called Party Restriction Class) can be developed independently for each Tenant (TN 1-63).
		Index 94, Bit 1=1	Allow/Deny tables for Call establishment between RSC1 and RSC2 are assigned for the common Tenant (TN 1).
APCR/ APCRN	Assignment of Primary Call Restriction Data	Index 94, Bit 2=0	Allow/Deny table for Call Origination to specific Area Code(s) can be developed independently for each Tenant (TN 1-63).
		Index 94, Bit 2=1	Allow/Deny table for Call Origination to specific Area Code(s) is assigned for the common Tenant (TN 1).
AMND/ AMNDL/ AMNDN	Assignment of Maximum Necessary Digits Data	Index 93, Bit 6=0	Tables of MND (maximum necessary digits) data, to be received by each Register (ORT/IRT) Circuit, can be developed independently for each Tenant (TN 1-63).
		Index 93, Bit 6=1	Tables of MND data are assigned for the common Tenant (TN 1).
AATC/ AATCN	Assignment of Authorization Code Data	Index 94, Bit 3=0	Authorization Code Table, to be used by Authorization Code, Forced Account Code, Pad Lock and Remote Access to System features, can be developed independently for each Tenant (TN 1-63).
		Index 94, Bit 3=1	Authorization Code Table is assigned for the common Tenant (TN 1).
APCNL/ APCNN	PHS community information (LDM)	Index 800, Bit 3=1	This command is used to assign PHS community number for each corresponding tenant.

Command Name		Setting of ASYD/ ASYDL/ ASYDN	Description
AUNE/ AUNEL/ AUNEN	Uniform Numbering (LDM)	Index 800, Bit 4=1	When a self office number is received in each tenant, this command is used for deleting its office number. It can also add number after deleting it.
AUGNN	UGN Information (NDM)	Index 801, Bit 2=1	This command is used to assign/delete UGN (User Group Number) for NPC (Number Pattern Code).
APBKN	System Phone Book (NDM)	Index 802, Bit 3=1	This command assign/modify/delete name and telephone number for the System Phone Book.
ATD-PEL/ ATDPEN	Extended Toll Code Restriction Data (LDM)	Index 802, Bit 1=1	This command restricts /allows toll call by developing Tenant Number (TN) and Destination Code (DC) for PSTN connection (including tandem connection via intermediate node).

The following data cannot be developed for multiple Tenants.

Command Name		Description
APSD	Assignment of PS Operation Data	A Station Number cannot be duplicated in a single system. (Tenants cannot be developed.)
ASDT	Assignment of Station Data	A Station Number cannot be duplicated in a single system. (Tenants cannot be developed.)
ASAT	Assignment of specific Attendant Number Data	The same Individual Attendant Number cannot be duplicated in a single system. (Tenants cannot be developed.)
ALDN	Assignment of Listed Directory Number	The same LDN Number cannot be duplicated in a single system. (Tenants cannot be developed.)

Note: When reassigning data from separate tenants to common tenants, or vice versa, preassigned data must be completely deleted first.

Note: When changing the maximum number of tenants, System Initialization is necessary.

1.4 Examples of Data Programming

The following are the data programming for Examples 1, 2, 4 of Section 2.2.

STEP 1: **ASYD** - SYS1, Index 8: Number of Tenants (01 - 3F hexadecimal)
Index 92, Bit 0: Tenant data table development for System Data 2 (SYS2)
(0/1: Multiple Tenants are used/Common Tenant (TN 1) is used.)
Index 92, Bit 1: Tenant data table development for Special Access Codes
(0/1: Multiple Tenants are used/Common Tenant (TN 1) is used.)
Index 92, Bit 2: Tenant data table development for Numbering Plan
(0/1: Multiple Tenants are used/Common Tenant (TN 1) is used.)
Index 92, Bit 4: Tenant data table development for Route Restriction Class (RSC)
(0/1: Multiple Tenants are used/Common Tenant (TN 1) is used.)
Index 94, Bit 0: Tenant data table development for Tenant Restriction Class
(0/1: Multiple Tenants are used/Common Tenant (TN 1) is used.)

<Necessary data for Example 1, ATT answer for Central Office Call>
SYS2, Index 0, 2, 4, 5, 6, 7, 8, 9, 10, 11, 14

STEP 2: **ANPD** - Assign 1st Digit Code (1stDC) and Number of Necessary Digits (NND) for Central Office Trunk Access. Then, also assign 1stDC and NND for ATT Answer (Operator Call)/TAS Answer.
When multiple Tenants are to be used (ASYD, SYS1, Index 92, Bit 2=0), develop respective "1stDC" and "NND" for each Tenant. If not (Index 92, Bit 2=1), develop only for Tenant 1.

STEP 3: **ASPA** -Assign Access Code (ACC) for Central Office Trunk Access, "ACC" for ATT Answer (Operator Call) and "ACC" for TAS Answer.
When multiple Tenants are to be used (ASYD, SYS1, Index 92, Bit 1=0), develop respective "1st DC" and "NND" for each Tenant. If not (Index 92, Bit 1=1), develop only for Tenant 1. In case of Operator Call, the ACC should be assigned only to the Tenant that was listed first in the Tenant data table of ATRK.

STEP 4: **ARSC** - Assign permission/restriction tables for Incoming/Outgoing Calls on a Route Restriction Class (RSC) basis.
When multiple Tenants are to be used (ASYD, SYS1, Index 92, Bit 4=0), develop respective tables for each Tenant. If not (Index 92, Bit 4=1), develop only for Tenant 1.

Note: RSC may be broken down into a maximum of 16 groups (RSC 0 for ATT, RSC1 - 15 for Stations), by using ASDT/ATRK command.

STEP 5: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 13, to the Stations used for "TAS Answer". Data must be "1".

STEP 6: **ATNR** - Assign connection restriction data between Originating Tenant (OGTN) and Terminating Tenant (TMTN).
TRI 0:Restriction/permission of Station-to-Station connection between Tenants.
TRI 4:Restriction/permission of the Individual Attendant Access/Inter-Position Transfer feature (Calling a specific ATT from Station/ATT in an different Tenant, by dialing individual ATT Number).
When multiple Tenants are to be used (ASYD, SYS1, Index 94, Bit 0=0), develop each data for each OGTN and TMTN. If not (Index 94, Bit 0=1), develop only for OGTN 1/TMTN 1.

STEP 7: **ASDT** - Assign Tenant Number and Route Restriction Class (RSC) Number to which each Station belong.
TN:Tenant Number (1-63)
RSC:Route Restriction Class (1-15)

STEP 8: **ARTD** - Assign Route Class Data to all the Route Numbers used for Central Office Call.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as circuit card, MG, or VS32.

STEP 9: **ATRK** - "RT (External or Internal Route Number)" and "TK (Number Trunk)" Number and its respective "TN (Tenant)" number, for all the Routes assigned by ARTD command. For each Trunk of ATT, specify TK, RSC (RSC 0) and all the TN that may use the ATT.

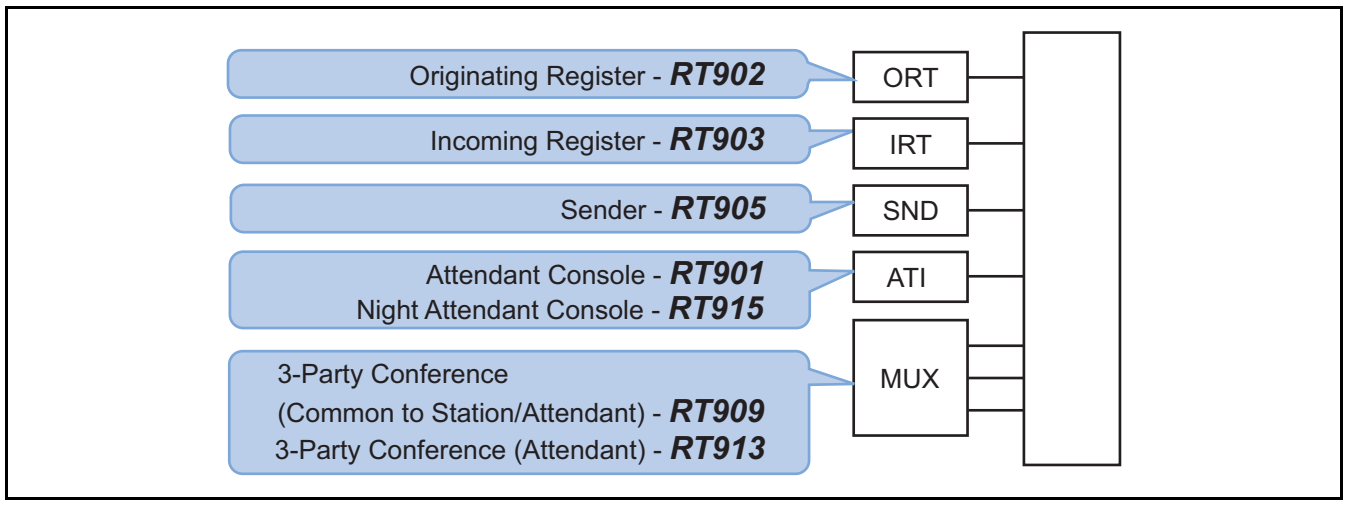
STEP 10: **MBTK** - Set each Trunk Port idle (serviceable) by using this command.

2. Trunk Data

2.1 Trunk

In addition to basic two-way connection between Stations, the System may handle various types of other connections, such as between a Station (Self Office) and a party in distant office (TIE Line/Public Network). When these connections are required, the system uses any of the following "Trunk" interfaces:

- External Trunk - A link channel between Self Office and other office (such as COT, ODT, DTI, CCT, PRT, etc.)
- Internal Trunk - Other function channel, such as Register (ORT, IRT), Sender (SND), Attendant Console Interface (ATI), Three-Party Conference Trunk (CFT), etc.



This section explains basic data assignment of these Trunks.

2.2 Internal Trunk

Each set of data for Internal Trunks is programmed by ATRK. Assign a Route Number (defined as "9xx" according to the Trunk Type), its Trunk Numbers and accommodated LENS (Line Equipment Numbers), following the command display.

Programming

STEP 1: **ATRK** - RT: Route Number (9xx)
Enter the defined Route Number, according to the Internal Trunk type. Refer to the following figure and table:

<Main Internal Trunk>

Definition of Route Number	Kind of Internal Trunk	Related Circuit Card (Symbol)	Maximum Capacity Note 1
901	ATT	ATI	60/System Note 2
902	ORT	RST	64/4 PIRs Note 3 Note 4
903	IRT	RST	64/4 PIRs Note 3 Note 4
905	SND	RST	64/4 PIRs Note 3 Note 5
906	PBR for Automated Attendant Service	RST	64/4 PIRs Note 3 Note 4
907	AMP	AMP	Limitless
909	DCFT	MUX TSW (PIR 0)	16/MG Note 6
913	DCFT for ATT	MUX TSW (PIR 0)	16/MG Note 6
915	Night ATT	ATI	60/System Note 2
933	CRT	RST	64/4 PIRs Note 3 Note 4
937	Caller ID Modem Sender Trunk Note 7	RST	64/4 PIRs Note 3 Note 5
940	Call Waiting Caller ID Register Trunk	RST	64/4 PIRs

Note: For other Internal Trunks, refer to the Command Manual.

Note 1: This field specifies the Physical Trunk capacity the system can register. No consideration is given to the circuit card mounting condition.

Note 2: Specifies total capacity of RT 901 and 915.

Note 3: For incoming/originating calls via ISDN lines, virtual registers/senders are used.

Note 4: The sum total of virtual registers and other registers (RT=902, RT=903, RT=906, and RT=933) per LP cannot exceed 64 channels. If all the channels are occupied by RT=902, RT=903, RT=906, and RT=933, there is no channel left for virtual registers to use. Be careful because this can cause incoming calls to ISDN lines unavailable.

Note 5: The sum total of virtual senders and other senders (T=905 and RT=937) per LP cannot exceed 64 channels. If all the channels are occupied by RT=905 and RT=937, there is no channel left for virtual senders to use. Be careful because this can cause originating calls from ISDN lines unavailable.

Note 6: Specifies total capacity of RT 909 and 913.

Note 7: This data is assignable only to Sender (SND) Trunk for Analog Caller ID-Station by Modem Sender.

TK: Trunk Number (1-255)
Enter the Trunk Number ranging from 1 to 255.
**When the "TK" is for Attendant Console (ATT), the number, assigned here, is used as the Attendant Number (ATN) for the AMAT/ASAT command.*

LENS: Line Equipment Numbers
Enter the LENS for each assigned Trunk. The LENS specifies accommodated location of the respective Trunk, by a six-digit (MG, U, G, Lv) number. For details, refer to the Operations and Maintenance Manual.

< For ATT or Night ATT Interface>
For ATT or Night ATT Interface, the following data must also be assigned:

CNT: Count (1-10)
Assign the total number of Tenants that may use the respective ATT. Note that allowed Tenants per ATT is a maximum of ten in total.

TN: Tenant Number
Assign all the Tenant Number, one by one, that may use the respective ATT.

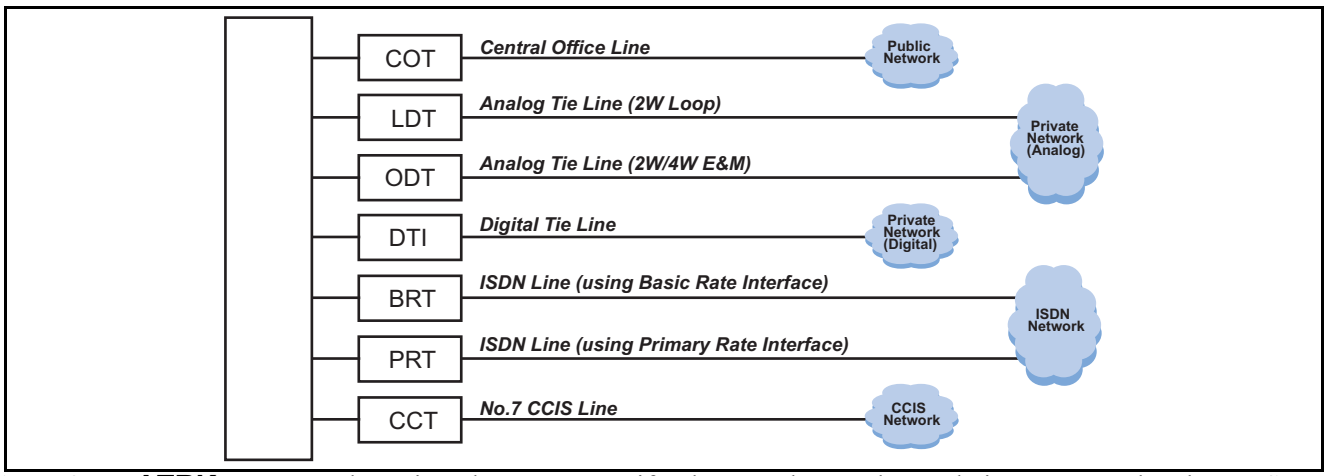
RSC: Route Restriction Class
Assign "0" for this parameter (RSC for ATT is 0 only)

SFC: Service Feature Restriction Class
Assign "0" for this parameter (SFC for ATT is 0 only)

STEP 2: **MBTK** - Set each assigned Trunk Port Idle (in service) by using this command.

Attention: *When deleting the once-assigned Trunk Data for an ATT, be sure to place the corresponding ATI Card into a make-busy state, then perform the command operation.*

2.3 External Trunk



Data assignment of External Trunk is performed by using ASYD, ARTD, and ATRK. The main flow of data setting is shown below.

Programming

STEP 1: **ASYD** - SYS1, Index 65.
Assign the maximum number of Routes (External Routes) that may be used in the system in hexadecimal (01-FF). This data is necessary for the system to determine the range of Traffic Measurement Target Routes.

STEP 2: **ARTD** - Assign Route Numbers and their respective attribute data, following the command display. Any Route, within the range specified by ASYD, SYS1, Index 65, can be entered uniquely. For detailed parameters and each input data definition, refer to the Command Manual.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as circuit card or MG.

STEP 3: **ATRK** - For each assigned Route, specify the Trunk Numbers, their accommodated LENS and belonging Tenant.
RT: Route Number
Enter the Route Numbers that were specified by ARTD. For each Route Number, detailed Trunks are to be assigned in the parameters, TK, LENS and TN below.
TK: Trunk Number (1-255)
For each Route assigned in the RT parameter, set the Trunk Numbers ranging from 1 to 255.
LENS: Line Equipment Numbers
Enter the LENS for each assigned Trunk. The LENS specifies accommodated location of the respective Trunk, by 6-digit (MG, U, G, Lv) number. For details, refer to the Operations and Maintenance Manual.
TN: Tenant Number (1-63)
For each Trunk, assign the Tenant Number to belong to. Note that, although a Route can be used for multiple Tenants, each Trunk of the Route cannot be duplicated at multiple Tenants.

Ex.)

RT	TK	TN	RT	TK	TN
10	1	1	10	31	2
	⋮			⋮	
10	30	1	10	120	2

STEP 4: **MBTK** - Set each assigned Trunk Port Idle (in service) by using this command.

3. Attendant Console (ATTCON) Data

3.1 Attendant Console

The Attendant Console (ATTCON) is used by the operator to answer an Incoming Call, then facilitate the connection by inward transfer, or place Outgoing (External Trunk) Calls, through each switched loop (generally, each ATTCON has six loops). This section explains basic data assignment of the ATTCON.

3.2 Assignment of ATTCON Data

Programming

STEP 1: **ASYD** - SYS1, Index 6, Bit 4 to Bit 6

Assign the Key Pattern for Attendant Console.

Bit 6	Bit 5	Bit 4
0	0	0=Pattern 1
0	0	1=Pattern 2
0	1	0=Pattern 3
1	0	0=Pattern 4

Note: For details on each pattern face layout, refer to the Command Manual.

SYS1, Index 9
Assign the number of Attendant Consoles to be used, including the Night ATT.

SYS1, Index 70, Bit 5
Assign priority to the call to be answered by ATTCON "ANSWER" Key.
0: Depends on type of call (Central Office Call has priority)
1: By call termination order

SYS1, Index 73, Bit 7
Assign whether the ATT uses the loop-to-loop connection function for the Meet-Me Paging - Attendant feature.
0: Loop-to-loop connection is not used.
1: Loop-to-loop connection is used.

* *Meet-Me Paging-Attendant is a feature that allows ATT to hold an Incoming Call, page the Called Party, and connect the two after the Called Party has answered the page. Of these operations, the last two-party connection is loop-to-loop connection.*

SYS1, Index 82
Bit 0 to Bit 3: Assign the Station Number Display Pattern on the ATTCON.
Bit 4 to Bit 7: Assign the Station Number Display Pattern for CCIS on the ATTCON.

Note: For details on each pattern, please refer to the Command Manual.

SYS1, Index 141
Assign the timer for recalling ATTCON, after the ATTCON activates Blind Transfer (ATT transfers a call, and then hangs up without response) to a Station that is setting Call Forwarding - Don't Answer.

* *The default value (00 hexadecimal) is ten seconds. Refer to the Command Manual.*

SYS1, Index 155
Assign the Sender prepause timer.
* *The default value (00 hexadecimal) is four seconds. Refer to the Command Manual.*

SYS1, Index 229, Bit 2
Specify the necessity for sending DTMF (PB) signal as a result of Key Pad Operation on the ATTCON, while speaking.
0: Not necessary
1: Necessary

SYS1, Index 246, Bit 0
Assign whether ATTCON can answer the next call, by placing the current call on hold by pressing either the ANSWER Key or Incoming Call Identification (ICI) Key, while in two-party connection with Station/Trunk.
0: Unable to answer
1: Able to answer

SYS1, Index 246, Bit 1
Assign whether ATTCON can answer the next call, by placing the current call on hold by pressing either ANSWER Key or Incoming Call Identification (ICI) Key, while in three-party connection with Station/Trunks.
0: Unable to answer
1: Able to answer

SYS1, Index 257, Bit 0
Assign the mounting condition of DLKC circuit card. Data must be “1 (fixed)”.

SYS2, Index 2, Bit 1
Specify the Sender signal (ATTCON) for DP/PB Route assigned by ONSG (CDN: 2) of ARTD.
0: DP
1: PB

SYS2, Index 2, Bit 2 to Bit 3
ATTCON Day/Night mode change is:

Bit 3	Bit 2
0	0=Not required (External Switch effective)
0	1=by Primary Attendant Console
1	0=by all Attendant Console
1	1=–

SYS2, Index 6, Bit 7
Specify either recalling ATTCON or activating Call Forwarding Don’t Answer, when a call is transferred (by ATT) to the Station provided with Call Forwarding Don’t Answer.
0: ATTCON is recalled
1: Call Forwarding Don’t Answer is activated

SYS2, Index 8 and Index 9

Assign detailed kinds of call to be counted as waiting calls on the display of the ATTCON. Refer to the Command Manual for details.

STEP 2: **ANPD** -Assign 1st Digit Code (1stDC) and Number of Necessary Digits (NND) for ATTCON access.
1stDC: 0
NND:1

STEP 3: **ASPA** -Elaborate full Access Code (ACC) for ATTCON access SRV (Kind of Service) = "SSC: Service Code", SID (Service Index) = 2 [Operator Call].
A sample data assignment for "ACC=0" is shown below:
TN = 1
ACC = 0
CI = N: Normal, H: Hooking
SRV = SSC: Service Code
SID = 2 (Operator Call)

Note: For Connection Index (CI), specify what state a Station may dial the designated Access Code (here, Operator Access Code "0"). When "N" is assigned, the Station can access ATTCON by dialing the Access Code in a normal state. When "H" is assigned, the Station can do so after making switch hook flash (SHF).

Attention: *The following shows a condition when using "#" as one of the dial numbers:*

- *After dialing ACC assigned by ASPA, the system recognizes "#" code as the identifier for Dialed Number completion. Therefore, for example, when "8# (ACC) + 2#2500 (Calling Number)" is dialed, only "2" before the "#" code is recognized as the Calling Number ("2500" after "#" code is not recognized by the system.).*

STEP 4: **ATRK** - Assign the Trunk (accommodated location) for each ATT
RT: Assign the defined Route Number out of the following:
RT = 901: ATT
RT = 915: Night ATT
RT = 913: Digital Conference Trunk (DCFT) for ATT
TK: Assign Trunk Numbers for designated "RT".
LENS:Assign the LENS (Line Equipment Numbers) for each "TK". The LENS specifies accommodated location of the respective Trunk, by 6-digit (MG, U, G, Lv) number. For details, refer to the Operation and Maintenance Manual.
CNT:Assign the total number of Tenants that may use the respective ATT.
Note that allowed Tenants per ATT is a maximum of 20.
TN:Assign all the Tenant Numbers, one by one, that may use the respective ATT.
RSC: Assign "0" for Route Restriction Class (RSC). (RSC for ATT is 0 only)
SFC:Assign "0" for Service Feature Restriction Class (SFC). (SFC for ATT is 0 only)

STEP 5: **MBTK** - Set each assigned Trunk Port Idle (in service) by using this command.

STEP 6: **AMAT** - When Day/Night mode of ATTCON is to be controlled by Primary Console (ASYD, SYS2, Index 2, Bit 2 and Bit 3), the Primary Console should be designated by this command.
MODE: Assign "1" for ATT (RT = 901), or "2" for Night ATT (RT = 915).
ATN:Assign Attendant No. of Master Console. (Assign the same number assigned in TK of ATRK.)

Attention: *When deleting already-assigned Trunk Data, be sure to place the corresponding ATI Card into make-busy state first, and then perform the command operation. When Attendant Number (ATN) is assigned on the ASAT command, be sure to delete this command data, too.*

4. Station Data

This section explains the basic data assignment of a station. For data assignment of a Desktop terminal station, refer to 5. Desktop Terminal Data in this chapter.

4.1 Assignment of Station Data

Main flow of data assignment for station is shown below:

Programming

<System Data>
Assign necessary System Data (ASYD Command), according to the pre-determined Station Numbering Plan. Refer to the following for the prerequisite minimum data:

STEP 1: **ASYD** - SYS1, Index 4, Bit 2 to Bit 3
Assign the Releasing Method for Station to Station Calling Service
00 = Calling Party Release
01 = Called Party Release
10 = First Party Release
11 = Both Party Release
10 = First Party Release" is usually assigned.

SYS1, Index 16
Assign the Number Level on Station Number composition
Bit 0:0/1 = one-digit Station Number is not used/used
Bit 1:0/1 = two-digit Station Number is not used/used
Bit 2:0/1 = three-digit Station Number is not used/used
Bit 3:0/1 = four-digit Station Number is not used/used
Bit 4:0/1 = five-digit Station Number is not used/used
Bit 5:0/1 = six-digit Station Number is not used/used (for Hotel system)

Note: A station number can be one to five digits. A six-digit number is only for the Hotel system.

SYS3, Index 0
Configure the Ring Cycle when a call from a Central Office Line terminates to a station. Normally, "21" should be assigned in hexadecimal (one-second ringing period, two-second silent period). Refer to Command Manual for details.

SYS3, Index 1
Configure the Ring Cycle when a station is called from another station/ATTCON (Ringer Pattern 1). Normally, "42" should be assigned in hexadecimal (two-second ringing period, four-second silent period). Refer to Command Manual for details.

SYS3, Index 2
Configure Station Release Timer (LT: Long Timer, ST: Short Timer). Normally, in North America, "91" should be assigned in hexadecimal (LT = 1,080 milliseconds, ST = 120 milliseconds). Refer to the Command Manual for details.

<Numbering Plan - Access Code Setting>

Program the Access Codes (ACC) for station access, by using the combination of ANPD and ASPA.
As described below, there are two patterns for these commands entry.
- Case 1: Assignment of 1stDC (1st digit code) for fixed-digit station numbers

When the number of total digits is assured for every station number that begins with the same 1stDC, the necessary data assignment is as follows:

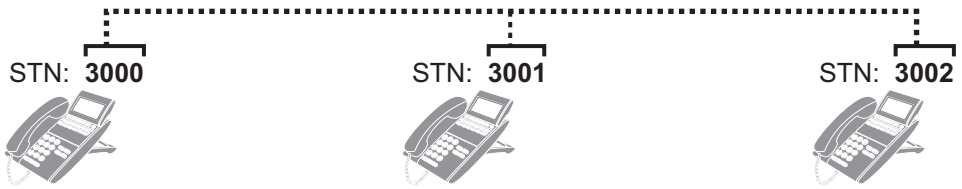
STEP 1: **ANPD** -1stDC: Assign the 1stDC of the Station Numbers
NND: Assign the total Station Number digits

STEP 2: **ASPA** -ACC: Assign the Access Code using the "1stDC" specified by ANPD.

**For Case 1 here, assignment of "NND" for ASPA command is not required.*

- Case 2:Assignment of 1stDC (1st digit code) for mixed-digit pattern Station Numbers

When the digit composition of Station Numbers having the same 1stDC is not stable (Station Numbers of different digit compositions are mixed), necessary data assignment is as follows:



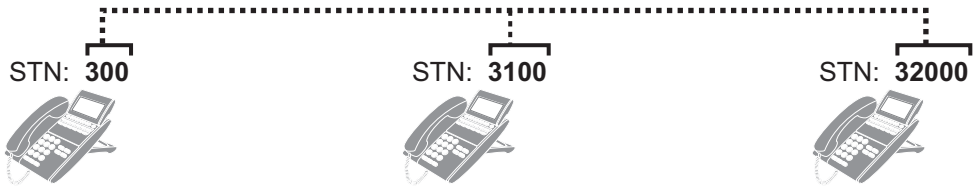
STEP 3: **ANPD** -1stDC: Assign the 1stDC of the Station Numbers
NND: Assign the total digit number of ACC to be specified by ASPA.

STEP 4: **ASPA** -ACC: Assign the Access Code using the 1stDC specified by ANPD. As the mixed-digit numbering for Case 2 uses several ACCs for a 1st C, assign one of the ACC and its corresponding NND (below) first, and then proceed with the next one repeating this command entry.
SRV: Assign "STN: Station Number" for Station Number Access
NND: Assign the total Station Number digits, associated with each ACC.

Note: For details, refer to the following figure.

Case 1: A fixed number of digits is used for every station number beginning with the same "1stDC"

A fixed number of digits (4 digits) is used for every station number beginning with "1stDC = 3"



< Data Assignment >

ANPD	**1stDC = 3**	**NND = 4**
ASPA	**ACC = 3**	**SRV = STN**

Case 2: Different digit numbers are mixed for station numbers beginning with the same "1stDC"

3-digit, 4-digit and 5-digit numbers are mixed for station numbers beginning with "1stDC = 3"

< Data Assignment >

ANPD	**1stDC = 3**	**NND = 2 (the number of digits of "ACC" for ASPA)**	
ASPA	**ACC = 30**	**SRV = STN**	**NND = 3**
	ACC = 31	**SRV = STN**	**NND = 4**
	ACC = 32	**SRV = STN**	**NND = 5**

STN: Station Number
1stDC: 1st Digit Code

< Station Accommodation Data >
According to the specified Numbering Plan (in the previous step), assign the Station Numbers, their accommodated location, telephone equipment class, and belonging Tenant, etc. For this data, ASDT is used.

Note: For Station Accommodation data programming of IP Stations (such as IP Enabled Dterm or analog/Fax Stations connected to Analog MC.) the AISTL (IP Station Data) command must be used instead of the ASDT (Station Data).
- For data assignment of IP Enabled Dterm, refer to IP ENABLED Dterm [I-43] of Chapter 3.
- For data assignment of the stations (such as Analog/Fax Stations) connected to Analog MC, refer to Peripheral Equipment Description (IP Devices).
- For data assignment of stations accommodated in UG50, refer to Peripheral Equipment Description (UG50).

ASDT - For each Station, assign the following data.
TN: Belonging Tenant Number
STN: Station Number
LENS: Line Equipment Numbers (accommodated location of the Station)
TEC: Telephone Equipment Class (DP or PB may be chosen. Refer to Command Manual for details)
RSC: Route Restriction Class, 1- 15 (class grouping on Outgoing/Incoming Call Restriction, specified by ARSC command)
SFC: Service Feature Restriction Class, 1 - 15 (class grouping on allowed/denied service features, specified by ASFC)

4.2 Assignment of Station-to-Station Connection Data

This section explains basic data assignment for Station-to-Station connection.

Programming

STEP 1: **ATNR** - Assign the connection restriction data between Originating Tenant (OGTN) and Terminating Tenant (TMTN). When ASYD, SYS1, Index 94, Bit 0=0 is assigned (i.e. multiple Tenant service is in service), assign the respective Tenant Number for OGTN and TMTN. If not (when the data is "1"), assign the fixed Tenant Number of "1" for both "OGTN" and "TMTN".
TRI: Assign "0" for Station-to-Station Calling.
OGTN: Assign the number of Originating Tenant.
TMTN: Assign the number of Terminating Tenant.
RES: Assign "0" for restriction, or "1" for permission.

STEP 2: **ATRK, MBTK**

- In addition to the above data, assignment of Originating Register Trunk (ORT) is also necessary. For details, refer to 2. Trunk Data.

Note: For the Station-to-Outgoing Trunk Connection, allow the Route restriction for each Trunk by the ARSC command.

Note: When using ISDN/CCIS service, the number of 8RST circuit cards that are accommodated in a LP must be seven or less (for the usual system condition, the maximum number of "8RST circuit cards" that can be accommodated per LP is eight) for the allocation of the ISDN/CCIS Register/Sender memory. When a maximum of eight 8RST circuit cards in an LP is assigned, the ISDN/CCIS call cannot be originated or terminated normally.

5. Desktop Terminal Data

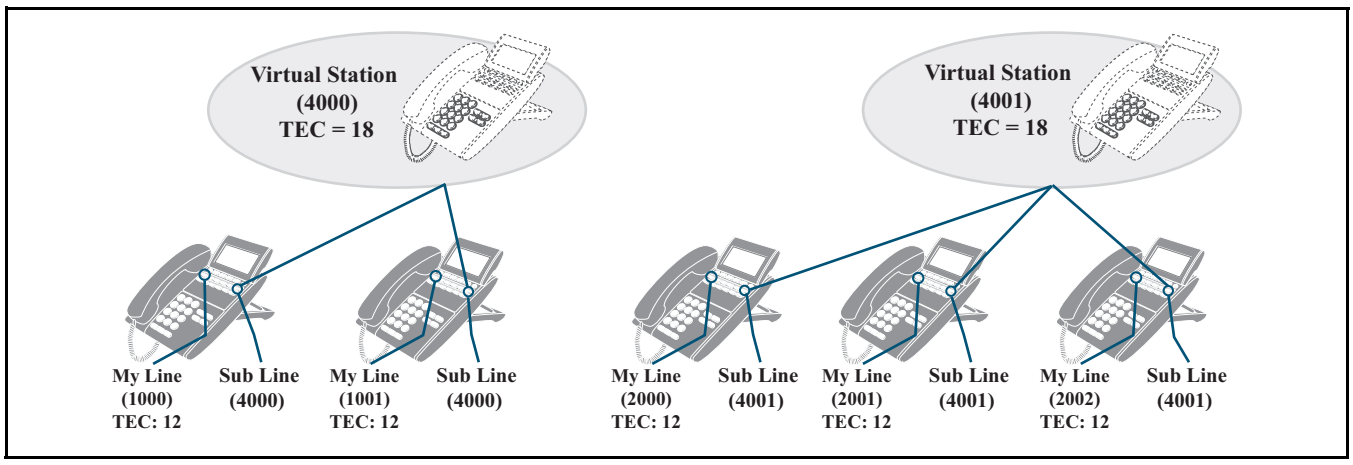
This section explains the following data related to the Desktop terminal stations:

- Multiple Lines
- Assignment of Desktop Terminal Station Data
- Display (LCD) Indications
- Line Pickup Preference
- Restriction of Call Termination on My Line
- Soft Key Assignment
- Expanded Ringer Pattern for Digital Terminal
- Headset Data
- Terminal Operations with Feature and Digit Keys for Digital Terminals
- Terminal Call History Data Clear

Note: For DT800/DT700 Series, only the call termination on My line enables illumination and displaying phonebook for incoming call. Information, such as number and internal/external call, is managed by each terminal according to notifications from the system.

5.1 Multiple Lines

A Desktop terminal is capable of registering two or more lines (My Line, Sub Lines) on the programmable Line/ Feature Keys. These lines (details are shown below) are generically called “Multiple Lines”.



a.) My Line
Refers to the actual line that is directly associated with the extension number of a specific Station (Desktop terminal). This line is connected to the Station’s physically accommodated port of ELC (at the system side), and the Station can make/answer a call only via this line, even though such events are available by using other Sub Lines.

b.) Prime Line
Refers to the line that is seized automatically only by lifting the handset or pressing the Speaker Key. Normally, the same number as My Line is assigned for Prime Line. (See Prime Line Pickup -D [P-13D] of Chapter 3 for more information.)

c.) Sub Line
Refers generically to the lines, other than My Line, that are accommodated on programmable Line/ Feature Keys.The “Sub Line” can consist of other Desktop terminal’s My Line, the Station Number of Single Line Telephone, and also Software (Virtual) Line that may be assigned on a physically non-existent port of Group No. 24 - 31. **Note 1**
Usually, every Sub Line uses Software Line, and the line can be assigned on a group of Desktop terminals as a common Sub Line, as shown in the following figure.

d.) Software Line
Refers to the line that is logically registered on the memory, by using the physically non-existent Group No.24 - 31. While the Group Numbers 00 - 23 are assigned physically to the universal Slots of a PIR, the Group Numbers 24 - 31 for the Software Line are programmed/managed on the memory. **Note 1**
Thus, the theoretically assigned number for a Software Line can be used as a virtual Station Number (having no actual telephone set to its end), and a call to that number can be answered by any Desktop terminal that is registering the line. For more information, refer to Software Line Appearance [S-33] of Chapter 3.

Note 1: Group Number is one of the elements specifying the accommodated location of a line -- generally referred to as Line Equipment Numbers (LENS). A LENS is configured by a six-digit number (two-digit Module Group Number, one-digit Unit number, two-digit Group Number and one-digit Level Number). For more information, refer to the Operations and Maintenance Manual.

5.2 Assignment of Desktop Terminal Station Data

To use the Desktop terminal stations, the following must be assigned, in addition to the data explained in 4. Station Data.

Programming

< Necessary (minimum) data for Desktop terminals, in addition to the basic station data (4. Station Data) >

STEP 1: **ASYD** -SYS1, Index 78
Assign the following data for LCD display.
Bit 0: Assign "1" (fixed)...Calling and Intermediate Station Numbers are indicated.
Bit 1: Assign "1" (fixed)...Kind of Service Class is indicated.

SYS1, Index 321
Assign the Multiple Line Operation data.
Bit 0: Assign "1" to enable the Inter-Module/Inter-IMG Multiple Line Operation

Note: For details on Multiple Line Operation, refer to the Multiple Line Operation-D [M-20D] and Expanded Multiple Line Operation-D [E-26] of CHAPTER 3.

SYS1, Index 390
Assign the following data for Caller ID display.
Bit 2: Assign "1" to enable the Caller ID display on the bottom line of Desktop terminal LCD

SYS2, Index 12
Assign Automatic Recall Ringer data for Non-Exclusive/Exclusive Hold
Bit 0: 0/1 = Automatic Recall Ringer is required/not required for Non-Exclusive Hold
(Non-Exclusive Hold: When a call is held, the held call can be retrieved by other Stations)
Bit 1: 0/1 = Automatic Recall Ringer is required/not required for Exclusive Hold
(Exclusive Hold: When a call is held, the held call cannot be retrieved by other Stations)

STEP 2: **ASYDL** - SYS1, Index 672, Bit 1
Flag this bit when using Desktop terminal. If not, assign "0".

STEP 3: **ASDT** - Assign Telephone Equipment Class (TEC) for Desktop terminal designation.
TEC: 12=Desktop terminal (voice)/13=Connection to Data Terminal via Desktop terminal (using adapter)
TEC: 18=Software (Virtual) Line (for configuring Multiple Lines)

STEP 4: **AKYD** - Assign My Line, other Multiple Line or desired function to each Line/Feature Key. When no modification is necessary in regard to the following default data, the related key assignment is not required.

Default Data for Line/Feature Keys

KEY NO.	DEFAULT DATA	KEY NO.	DEFAULT DATA
1	CALL PICKUP	9	PRIME LINE
2	CALL FORWARDING - BUSY LINE	10	SPEED CALLING ONE - TOUCH
3	CALL FORWARDING - ALL CALLS	11	SPEED CALLING ONE - TOUCH
4	EXECUTIVE RIGHT OF WAY	12	SPEED CALLING ONE - TOUCH
5	VOICE CALL	13	SPEED CALLING ONE - TOUCH
6	MESSAGE REMINDER	14	SPEED CALLING ONE - TOUCH

KEY NO.	DEFAULT DATA	KEY NO.	DEFAULT DATA
7	SAVE AND REPEAT	15	SPEED CALLING ONE - TOUCH
8	LAST NUMBER CALL	16	SPEED CALLING - SYSTEM

Note: KYN 13-16 do not exist for DT800 Series: DT830 (12-button type)/DT830G (12-button type (12DG/12CG)/DT700 Series: DT730 (12-button type)/DT730G (12-button type (12DG/12CG)/DT400 Series: DT430 (12-button type) and DT300 Series: DT330 (12-button type).

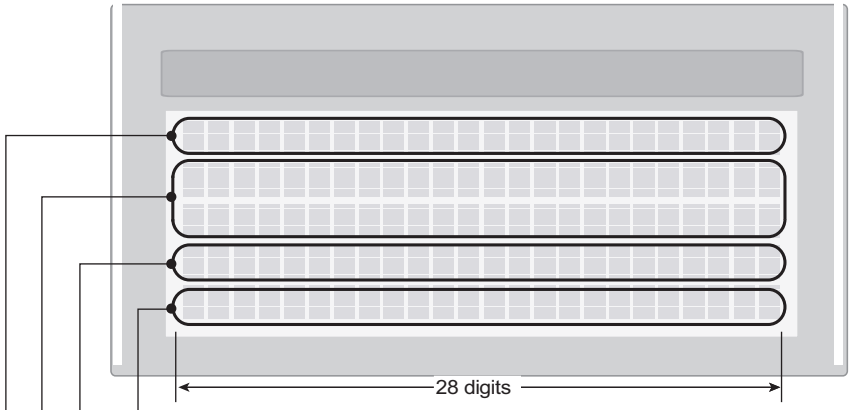
Note: Assignment of key data is required for Desktop terminal with 8 keys or less.

When the Desktop terminal is used for a Data Terminal, the following must be assigned.

- FKY = 29 (DATA)
- FKY = 30 (Manual/Auto changeover)
- FKY = 31 (Data transfer)

When using Speed Calling - One Touch with SPD setting key, the following data assignment is required.

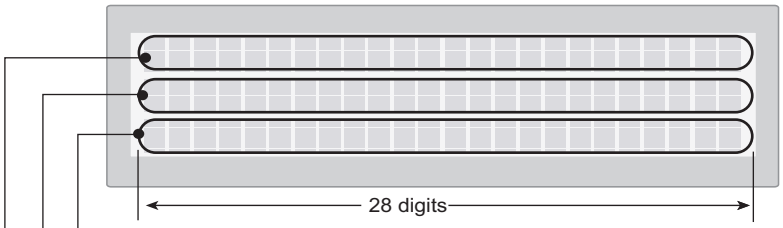
KYN: Key number
KYI = 1 (function key)
FKY = 199 (SPD setting)



STEP 5: **ADSL** - Assign the following data to a Soft Key when using a Soft Key as a Speed Calling - One Touch with SPD setting key.

SN = 0 (idle)
FKY = 199 (SPD setting)

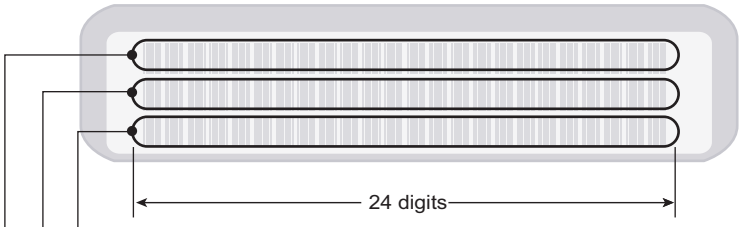
5.3 Display (LCD) Indications



The following shows the patterns of the Liquid Crystal Display (LCD) Indications on DT800 Series/DT700 Series/DT400 Series/DT300 Series, and DtermIP and Dterm Series *i*.

- DT830/DT730DT430/DT330

- Function name of Soft Key **Note 3**
- Time display
- Caller information
- Message Waiting data
  (Displayed, when "MWD = 1 (middle line)" is assigned by AKYD command) **Note 1, Note 4**
- Feature name
- Intermediate station information
- Station number of call originator
- Message Waiting data
  (Displayed, when "MWD = 0 (top line)" is assigned by AKYD command.) **Note 2, Note 4**
- Icon indication



- DT820/DT710/DT410/DT310

- Function name of Soft Key **Note 3**
- Time display
- Caller information
- Message Waiting data
  (Displayed, when "MWD = 1 (middle line)" is assigned by AKYD command) **Note 1, Note 4**
- Feature Name
- Intermediate station information
- Station number of call originator
- Message Waiting data
  (Displayed, when "MWD = 0 (top line)" is assigned by AKYD command.) **Note 2, Note 4**

Note: For DT800 Series/DT700 Series/DT400 Series/DT300 Series, time display pattern can be changed by system data assignment. For details, see "Time Display [T-18D]".

- **DtermIP/Dterm Series *i***

- Function name of Soft Key **Note 3**
- Time display
- Caller information
- Message Waiting data
  (Displayed, when "MWD = 1 (middle line)" is assigned by AKYD command) **Note 1, Note 4**
- Service Name
- Intermediate station information
- Station number of call originator
- Message Waiting data
  (Displayed, when "MWD = 0 (top line)" is assigned by AKYD command.) **Note 2, Note 4**

Note 1: When Message Waiting is OFF, date and time are displayed. When Message Waiting is ON, the related Message Waiting information is displayed. When OAI service is set, the OAI feature information is displayed in stead of Message Waiting information. (Message Waiting information and OAI information cannot be displayed at the same time.)

Note 2: When display of Message Waiting data and service name coincides, service name data is displayed. Then, after service data disappears, Message Waiting data is displayed.

Note 3: For details on programming of Software Key data, refer to 5.6 Soft Key Assignment.

Note 4: Whether to display the Message Waiting data on top line or bottom line can be specified by the "MWD" parameter of AKYD.

Programming

STEP 1: **AKYD** - Select the line to display MW data
MWD: Message Waiting Data Display Selection [0/1]
0 = MW data display on the top line
1 = MW data display on the bottom line

STEP 2: **ASYD** -When you assign the service function to Desktop terminal, the assigned function name of Soft Key is displayed at the beginning of Soft Key display area. If you do not want to display the function name, assign the following System Data.
SYS1, Index 390, Bit 3 to Bit 4
Assign the display of Soft Key when the station is in an Idle status or is in Dial Tone connection.

Bit 4	Bit 3	
0	0	: Blink
0	1	: Steady-lights
1	0	: Displays the assigned code on first column **Note 5**
1	1	: No indication

Note 5: Displays the code assigned by SYS1, Index 391.

5.4 Line Pickup Preference

Assign line pickup preference for the Speaker, Answer and Originate Keys, by using the AKYD command.

Programming

AKYD - For each Desktop terminal, specify the line pickup preference when the Speaker, Answer, or Originate Key is pressed:
LN PRE: 0 = The following standard values are used:

BUTTON	LINE PREFERENCE
SPEAKER Button	Prime Line Preference
ANSWER Button	Incoming Line Preference (Button Location Ascending Order)
ORIGINATING Button	Idle Line Preference (Button Location Ascending Order)

1 = Line pickup preference is to be customized. Proceed with the SPK, ANS and ORG parameters below.

Note: After changing data for LN PRE parameter, ELC card initialization is required.

SPK: Assign the line pickup preference when the Speaker Key is pressed. **Note 1**
0 = Prime Line preference
1 = Idle Line preference
2 = Incoming Line preference
3 = Ringing Line preference
ANS: Assign the line pickup preference when the Answer Key is pressed. **Note 1**
0 = Prime Line preference
1 = Incoming Line preference
2 = Ringing Line preference
ORG: Assign the line pickup preference when the Originate Key is pressed. **Note 1**
0 = Prime Line preference
1 = Idle Line preference
2 = Prime Line, Idle Line (ascending order)
FKY: 27 (Originate [ORG])
28 (Answer [ANS])
52 (Speaker [SPKR])

Note 1: These parameters appear when "LN PRE" is set as "1". Each preference stands for:

- Prime Line preference: Prime Line is picked up when the corresponding key is pressed.
- Idle Line preference: Idle line is picked up when the corresponding key is pressed.
- Incoming line preference: Regardless of the ringing sound, the currently Incoming Call is picked up, when the corresponding key is pressed.
- Ringing Line preference: The line with the ringing sound is picked up when the corresponding key is pressed.(The line with no ringing sound is not picked up.)

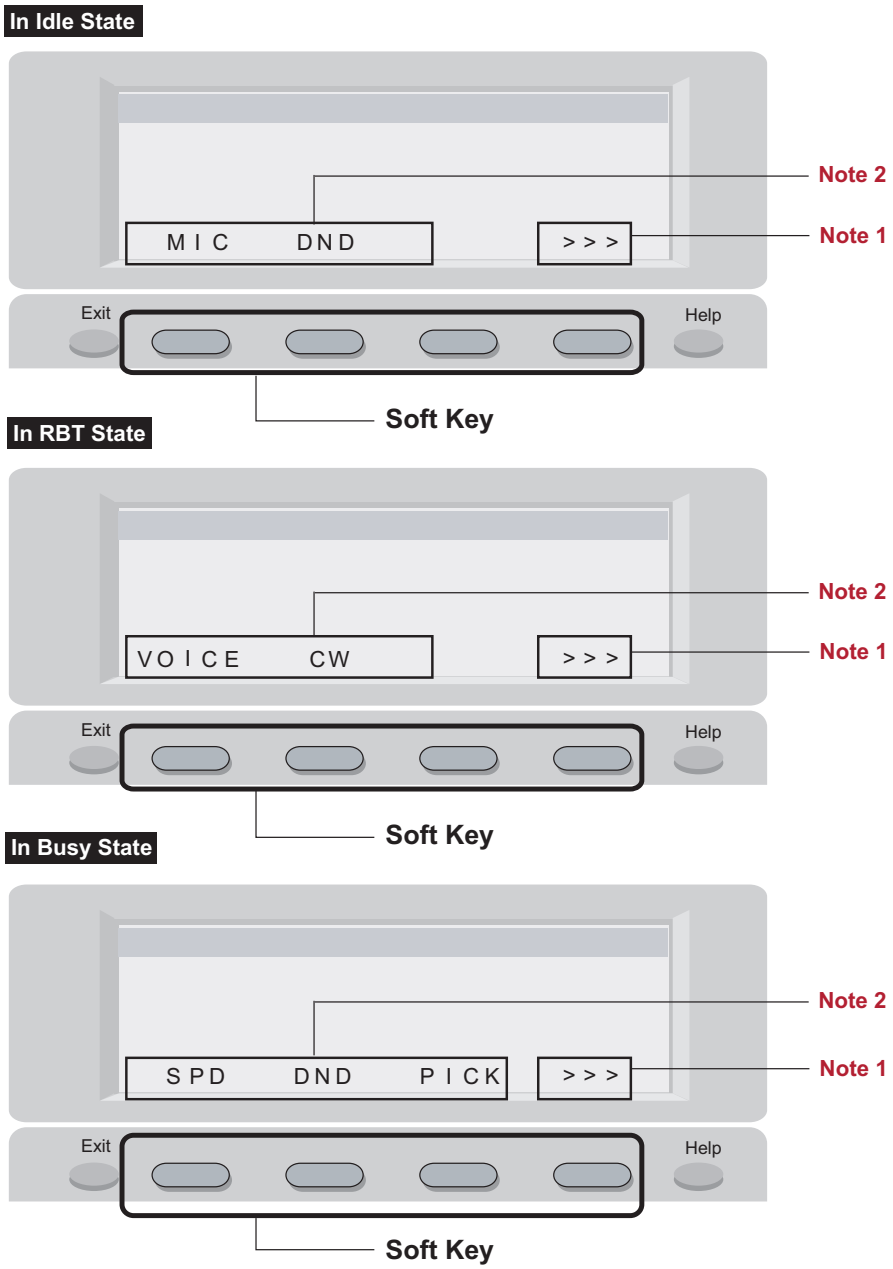
5.5 Restriction of Call Termination on My Line

A Desktop terminal can deny any Incoming Call to its My Line, when a call is made/received via one of its Sub Lines.

<Conditions>
1. Restricts a call to My Line only. (A call to Sub Line is not restricted.)
2. Available when the caller is a Station, TIE Line, Central Office Line or Attendant Console.
3. Available for a call as the destination of Call Forwarding - All Calls.
4. When the Original Call on the Sub Line is placed on hold:
   a.) If the terminal is off–hook after placing the call to Sub Line on hold, a call to My Line is restricted.
   b.) If the terminal goes on–hook while the call to Sub Line is still on hold, a call to My Line is not restricted.

Programming

ASYD - SYS1, Index 321, Bit 2=1: Termination on My Line is restricted.



5.6 Soft Key Assignment

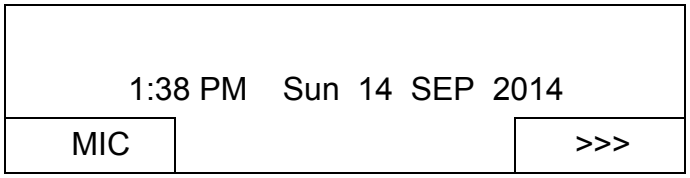
In addition to the programmable Line/Feature Key, DT800 Series, DT700 Series, DtermIP, DT400 Series, DT300 Series, Dterm Series *i* can use four Soft keys. Each key works variably according to the current state of station. For example, a Soft key provides a function of VOICE (Voice Call) when hearing Ringback Tone (after dialing the Called Station Number), etc.

Note: For adding a new node to the system in which the soft key data is already assigned by the AD-SLN command (*1), SKP (soft key pattern) and SN (status number) must be reassigned by the ADSLN command. (To reassign them, press [Get], [Del] and then [Set] buttons in that order.)

*(*1) It corresponds to the following situations:*
- *a new node is added to the existing standalone system and that system is upgraded to FCCS system.*
- *a new node is added to the existing FCCS system.*

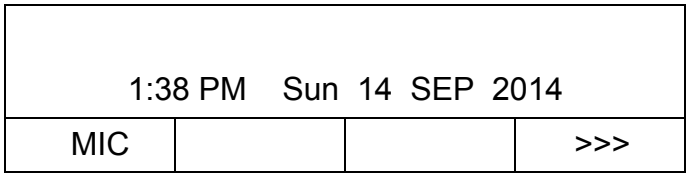
An example of using Soft keys is shown below:

Note 1: ">>>" key is used to go to the next page. (Soft key data can be programmed across four pages to be turned over manually).



Note 2: For DT830G/DT830, eight digits characters with a frame are displayed on LCD in default settings. When you assign the system data (ASYDL/ASYDN, SYS1, Index 1258, Bit 2=1), six digits characters without a frame will be displayed. For other terminals other than DT830G/DT830, the soft key indication characters are displayed as six digits without a frame. For details, see Command Manual.

Programming



The Soft key data can be assigned by taking the following procedure:

Note: The data assignment of ADSLN must be all deleted before assigning ADSL. If the data of ADSLN is assigned, an “Input error” might be caused.

STEP 1: **ASYDL** - Assign Telephone Number Display Pattern
SYS1, Index 513=01 (LDM)
SYS1, Index 672, Bit 0
0 = Telephone Number is displayed on the top line of LCD
1 = Telephone Number is displayed on the middle line of LCD
SYS1, Index 1248, Bit 5 (Setting of Soft key frame display on the LCD of DT830G/DT830) **Note 2**, **Note 3**
0 = Displays a soft key with a frame.

1 = Displays the soft key indication area with a frame.

Note 2: Available for FP95-112 V2 or later.

Note 3: The changes made to the system data above will take effect after about 30 seconds.

SYS1, Index 1258, Bit 2 (Display the Soft key on the LCD as eight characters with a frame)
Note 4, **Note 5**
0 = Enable
1 = Disable

Note 4: For DT830G/DT830 only. When the data is changed by AFDD command, LCD displays the Soft key as six characters without a frame.

Note 5: For the language settings except for Japanese, NEC English, or Extension Languages, LCD displays the Soft key as six characters without a frame.

STEP 2: **AFDD** - Assign the characters to be displayed on the LCD, corresponding to each Soft Key function. For each function, default data can be used for each display, therefore use this command only when customizing the display characters.
FKY: Specify the service function by using the corresponding Function Key Code (1 - 320). (For details on Function Key Code allocation, refer to the Command Manual)
DISP: Assign the desired characters (a maximum of six letters or numbers) for the service specified by FKY above.

STEP 3: **ADSL** - Assign the Soft Key Pattern tables that determine each case of indication on the LCD bottom line (dedicated Soft Key display area). The function of each Soft Key is variable, according to the state of the Desktop terminal (idle or originating, busy, in speech, etc.). Therefore, taking this into consideration, create the desired number of tables for Soft Key Pattern. **Note 6**

SKP: Assign the Soft Key Pattern number (a maximum of 16 patterns [0 - 15] are assignable).

Note that SKP 0 is reserved for the Key Pattern to be commonly used on a system basis. For details on SKP 0 allocation, refer to Command Manual.

SN: Assign each Status Number for "SKP".

0 = Idle
1 = Originating (Dial Tone Connection)
2 = Originating (Ringback Tone Connection)
3 = Called Station Busy (Busy Tone Connection)
4 = Communication in progress
5 = Consultation Hold
6 = Trunk Busy (Busy Tone Connection)
8 = Consultation Hold when Called Station is busy
9 = While in Three-party Conference
15 = Others

SKN: Enter Soft Key Number (0 - 15 **Note 7**)

FKY: Assign the service function for each SKN by using the Function Key Code. (For details on Function Key Code allocation, refer to the Command Manual)

Note 6: ADSL and ADSLN cannot be assigned at the same time. When both ADSL and ADSLN are assigned, a disagreement might be caused.

Note 7: A set of four Soft Keys can be developed over four pages. Soft Key Number 0/4/8/12 is for the first key, 1/5/9/13 for second key, 2/6/10/14 for third key, and 3/7/11/15 for fourth key.

DISP: Display Message on LCD

The soft key indication is displayed when DISP has been assigned by the AFDD command.

Note: The soft key indication characters are displayed as six digits when using AFDD command.

Note: When the soft key indication is assigned by AFDD command, the data assignment of AFDD command has priority.

STEP 4: **ADKS** - Register each SKP (Soft Key Pattern) data to the desired Desktop terminal(s).

TN: Assign the Tenant Number of the Desktop terminal

STN: Assign the Station Number of the Desktop terminal

SKP: Specify the desired Soft Key Pattern, referring to SKP of ADSL.

LKP: Assign the Key Pattern of the Desktop terminal.

1 = 16 Line/Feature Buttons + DSS Keys
2 = 24 Line/Feature Buttons + DSS Keys
3 = ALL Line/Feature Buttons

PG: Specify the page scroll key allocation

0 = Page change key appears on a software key (>>>)
1 = Page change key disappears on a software key

STEP 5: **AKYD** - Assign "Soft Key Assignment" Key to Line/Feature Key. **Note 8**
KYN: Key Number [1-40]
KYI: 1 = Function Key
FKY:122 = Soft Key Assignment

Note 8: This data assignment enables the Desktop terminal users to change the Soft Key data assignment.

5.7 Expanded Ringer Pattern for Digital Terminal

The variety of ringer pattern for Digital terminals has been expanded from four to ten. The ringer pattern changes and rotates by pressing the Feature + 3 key. The rotation pattern of the ringer pattern is as follows.

TONE NUMBER	TONE KIND	1st/2nd FREQUENCY
Tone 1	16 Hz Modulation	520/660 Hz
Tone 2	8 Hz Modulation	520/660 Hz
Tone 3	16 Hz Modulation	1100/1400 Hz
Tone 4	16 Hz Modulation	660/760 Hz
Tone 5	Musical scale ringing of door bell	here
Tone 6	Musical scale ringing 1	-
Tone 7	Musical scale ringing 2	-
Tone 8	Musical scale ringing 3	-
Tone 9	Musical scale ringing 4	-
Tone 10	Musical scale ringing 5	-

Note: Tones shown in this list can be specified by pressing the Feature + 3.

Note: This feature is available with DT400/DT300 Series.

5.7.1 To change the ringer pattern for SIP Multiple Line terminal

- To change the ringer pattern for DtermIP (SIP), refer to “Ring Settings” in Peripheral Equipment Description (Multi-Line Telephone).
- To change the ringer pattern for DT800/DT700 Series, refer to “Ring Tone” Peripheral Equipment Description (Multi-Line Telephone).

5.8 Headset Data

Headset can be used by pressing the Headset/Handset Key programmed to the Desktop terminal.
To set Headset/Handset Key to the Soft Key, all of the data for Status Number (SN=0-15) need to be assigned by ADSL command.

Programming

STEP 1: **AKYD** - Assign FKY=125 (Headset/Handset Key) to a Feature Key.
STEP 2: **ADSL** - To assign the Headset/Handset Key to a Soft Key, assign the following data.
SN = 0-15
FKY = 125 (Headset/Handset Key)

5.9 Terminal Operations with Feature and Digit Keys for Digital Terminals

Following shows the functions of digital terminals by the operation with Feature and Digit Keys. For the operations of SIP Multiple Line terminals, refer to "SIP Multiple Line Operation [S-160]" in Chapter 3. **Note 4**

Digit Key	Function
0	Sidetone ON ⇔ OFF
1	Microphone ON ⇔ OFF
2	Handset receiving volume setting
3	Ringing Tone setting
4	Sending/Receiving volume control
5	Hands-Free ON **Note 1**
6	Hands-Free OFF
7	Call Indicator Lamp ON ⇔ OFF
8	Dynamic Dial Pad/Preset Dial ON ⇔ OFF **Note 2**, **Note 3**

Note 1: To operate Hands-Free call, be sure to set the microphone as "ON" pressing Feature Key + Digit Key "1".

Note 2: Dynamic Dial Pad and Preset Dial ON cannot be activated simultaneously.

Note 3: For using this function, system data assignment is required. For the details, refer to "Selective Dialing [S-162]" in Chapter 3.

Note 4: From FP95-114 V4 Issue 2.0, these functions can be set with the ATIFD command instead of using the Feature key and the digit keys. For details, refer to PREFERENCE SETTING - MULTI-LINE TELEPHONE WITH PCPRO [P-90] in Chapter 3.

5.10 Terminal Call History Data Clear

For DT800/DT700 Series, the terminal call history (outgoing call history/incoming call history) data can be deleted with the following operations.

- Resetting the terminal with the DISD command
- Logging out of the terminal using the LOGOUT key

Note: Available for FP95-112 V2 or later.

Note: For DT400 Series/DT300 Series, this feature is not available. To delete the terminal call history data of DT400 Series/DT300 Series, insert and extract the Modular Cable, or clear the terminal call history data from the [History] menu.

1. When you delete the terminal call history data by resetting the terminal, the method of terminal reset depends on the PH Fixed Hunting method (ASYDL, SYS1, Index 824, Bit 0).

   - When PH Fixed Hunting method is invalid (ASYDL, SYS1, Index 824, Bit 0=0)

   Available: × Not available: N

	When Terminal Call History Data Clear is enabled (ASYDL/ASYDN, SYS1, Index 1248, Bit 6=1)		When Terminal Call History Data Clear is disabled (ASYDL/ASYDN, SYS1, Index 1248, Bit 6=0)
The method of terminal reset	**Terminal reset by DISD command/Terminal reset with LOGOUT key**	**Other methods of terminal reset**	**All methods of terminal reset**
Terminal Call History (outgoing call history/ incoming call history)	×	N **Note 1**	N **Note 1**
Call History	×	×	×
Last Number Called	×	×	×
Redial	×	×	×

- When PH Fixed Hunting method is valid (ASYDL, SYS1, Index 824, Bit 0=1)

Available: × Not available: N

	When Terminal Call History Data Clear is enabled (ASYDL/ASYDN, SYS1, Index 1248, Bit 6=1)			When Terminal Call History Data Clear is disabled (ASYDL/ASYDN, SYS1, Index 1248, Bit 6=0)	
The methods of terminal reset	**PH information clear and terminal reset by DISD command/ Terminal reset with LOGOUT key**	**Terminal reset by DISD command**	**Other methods of terminal reset**	**PH information clear and terminal reset by DISD command**	**Other methods of terminal reset**
Terminal Call History (outgoing call history/ incoming call history)	×	×	N **Note 1**	N	N **Note 1**
Call History	×	N	N	×	N
Last Number Called	×	N	N	×	N
Redial	×	N	N	×	N

Note 1: When you turn off the power of the terminal or make the configuration setting, the terminal call history data will be deleted.

2. The terminal call history data cannot be deleted by system initialization or terminal reset by AKYD command.
3. When this feature is available in the FCCS cluster network, the terminal call history data will be deleted when:
   - the terminal is reset with the CBKS command.
   - the terminal is brought back under the control of Primary node by means of the Visitor key.
4. When the terminal is reset, the ringing volume is not saved and returns to the default.

Programming

STEP 1: **ASYDL/ASYDN** - SYS1, Index 1248, Bit 6 (LDM/NDM)
0 = Do not delete the terminal call history data for DT800/DT700 Series
1 = Delete the terminal call history data for DT800/DT700 Series

Note: When the System Data is changed, restart the terminal.

STEP 2: **AKYD/AKYD_T** - Assign a LOGOUT key to the feature key of terminal
KYN: Key Number
KYI: 1 (Feature Key)
FKY: 142 (LOGOUT Key)

STEP 3: **ADSL/ADSLN** - Assign a LOGOUT key to the Soft key of terminal
SN: 0 (Line is idle)
FKY: 142 (LOGOUT Key)

6. Telephone Number

This section explains how to program Telephone Numbers. To program Telephone Numbers, use the ALGSL/ ALGSN command. The Telephone Number is assigned to a Station by using the LENS or by using the physical Station Number depending on programming. For more information about Telephone Numbers in the FCCS network, refer to Data Programming Manual - FCCS.

Note: Although the physical Station Number is assigned to a terminal with the ASDT command, it is also possible to assign at the same time the physical Station Number (ASDT command) and the Telephone Number (ALGSN command) with the ATSTN command.

Service Conditions

1. Each Telephone Number must be unique in the network.
2. If Telephone Numbers are used in the network, they are assigned in the Network Control Node (NCN).
3. Telephone Numbers assigned by the ALGSL command can only be used inside its own node.
4. Telephone Numbers assigned on ALGSN command can be shared in the network.
5. A maximum of 16 digits are used as a Telephone Number.

   Note: The maximum of digits may vary depending on features or systems. For details, refer to the related manuals.
6. Station Hunting Group or Call Pickup Group can be created with Telephone Numbers (LDM).
7. Telephone Number can be assigned to Phantom Number for a Station.
8. Attendant Console displays Telephone Numbers (two to five digits only) as Station Numbers.
9. Telephone Numbers used only inside its own node (assigned by the ALGSL command) and Telephone numbers used in the network (assigned by the ALGSN command) cannot coexist.

Programming

<Telephone Number for Self Node (Setting at Local Nodes)>

STEP 1: **ASYDL** (Assignment of System Data (LDM))
SYS1, Index 513: Assign 01 (hexadecimal) as the LDM's Memory Block Number.
SYS1, Index 514: Assign 01 (hexadecimal) as the NDM's Memory Block Number.
SYS1, Index 677, Bit 3=1 Display the Call Forwarding Information to a maximum of 16 digits on LCD **Note 1**
SYS1, Index 800.
Bit 1: ASPAL Tenant development is Separate / Common = 0/1
Bit 2: ANPDL Tenant development is Separate / Common = 0/1
SYS1, Index 1131, Bit 5=1 Non-Display of Telephone Number when the service is assigned by Feature Codes or Feature Keys. **Note 1**

Note 1: Assign this data for Telephone Numbers that have seven or more digits.

STEP 2: **ANPDL** (Assignment of Numbering Plan Data for Local Data Memory)
Assign numbering plan data for Telephone Number.

STEP 3: **ASPAL** (Assignment of Special Access Code for LDM)
CI (Connection Index) = N (Normal) or H (Hooking)
SRV (Kind of Service) = TELN (Telephone Number)

Note: When assigning the special access code data for telephone numbers using more than one tenant with the ASPAL/ASPAN command, the valid value for NND will be the one of the last assigned tenant.
Example:
1) TN: 1, ACC: 21, CI: N, SRV: TELN and NND: 5 are assigned with ASPAL/ASPAN command.
2) TELN: 21000 is assigned with ALGSL/ALGSN command.
3) TN: 2, ACC: 2, CI: N, SRV: TELN and NND: 4 are assigned with ASPAL/ASPAN command.
4) TELN: 2000 is assigned with ALGSL/ALGSN command.
5) Try to get the data for TELN: 21000 with ALGSL/ALGSN command.
Because the valid NND value is 4 (the last assigned) and the NND value for 21000 is 5, TELN: 21000 data cannot be obtained and an error message will be displayed.

STEP 4: **ALGSL** (Assignment of Telephone Station Data for LDM)
Assign telephone numbers to physical Station Number (Type 2) or to physical Line Equipment Numbers/Phantom Index (Type 1) by using the ALGSL command.

- When assigning TYPE=1 (Line Equipment Numbers/Phantom Index is used to specify the Telephone Number)

  TYPE = 1 (Line Equipment Numbers/Phantom Index is used to specify the Telephone Number)
  UGN: User Group Number
  TELN: Telephone Number (Up to 16 digits)
  LENS/PHIN: Line Equipment Numbers/Phantom Index of the physical Station

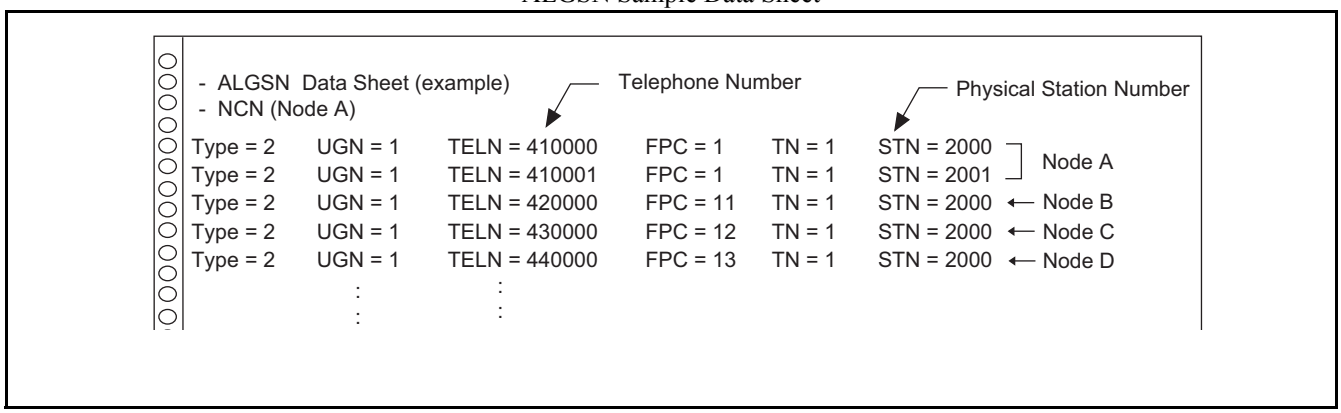
- When assigning TYPE=2 (Station Number is used to specify the Telephone Number)

  TYPE = 2 (Station Number is used to specify the Telephone Number)
  UGN: User Group Number
  TELN: Telephone Number (Up to 16 digits)
  TN: Tenant number of the physical Station
  STN: Station Number of the physical Station

<Telephone Number for Network (Setting at Network Control Nodes)>

STEP 1: **ASYDL** (Assignment of System Data (LDM))
SYS1, Index 513: Assign 01 (hexadecimal) as the LDM's Memory Block Number.
SYS1, Index 514: Assign 01 (hexadecimal) as the NDM's Memory Block Number.
SYS1, Index 677, Bit 3=1 Display the Call Forwarding Information to a maximum of 16 digits on LCD **Note 2**
SYS1, Index 1131, Bit 5=1 Non-Display of Telephone Number when the service is assigned by Feature Codes or Feature Keys) **Note 2**

Note 2: Assign this data for Telephone Numbers that have seven or more digits.



STEP 2: **ASYDN** (Assignment of System Data (NDM))
SYS1, Index 800.
Bit 1: ASPAN command tenant data table development is Separate / Common = 0/1
Bit 2: ANPDN command tenant data table development is Separate / Common = 0/1

STEP 3: **ANPDN** (Assignment of Numbering Plan Data for Network Data Memory)
Assign numbering plan data for Telephone Number.

STEP 4: **ASPAN** (Assignment of Special Access Code for NDM)
CI (Connection Index) = "N: Normal" or "H: Hooking"
SRV (Kind of Service) = "TELN: Telephone Number"

STEP 5: **ALGSN** (Assignment of Telephone Station Data for NDM)
Assign telephone numbers to physical Station Number (Type 2) or to physical Line Equipment Numbers/Phantom Index (Type 1) by using the ALGSN command. An example data sheet-Type 2 is shown as follows.

ALGSN Sample Data Sheet

- When assigning TYPE=1 (Line Equipment Numbers/Phantom Index is used to specify the Telephone Number)

  TYPE = 1 (Line Equipment Numbers/Phantom Index is used to specify the Telephone Number)
  UGN: User Group Number
  TELN: Telephone Number (Up to 16 digits)
  FPC: Fusion Point Code (FPC) of the designated LENS.
  LENS/PHIN: Line Equipment Numbers/Phantom Index of the physical Station

- When assigning TYPE=2 (Station Number is used to specify the Telephone Number)

  TYPE = 2 (Station Number is used to specify the Telephone Number)
  UGN: User Group Number
  TELN: Telephone Number (Up to 16 digits)
  TN: Tenant number of the physical Station.
  STN: Station Number of the physical Station.

7. OGC/OGCA

7.1 OGC

OGC Access Code is only used for seizing a Trunk. Therefore, after seizing, the Station Number or subscriber line number is sent (the Access Code is not sent). Basically, the originating method does not add or delete any number. However, when senderized line is used, a maximum of 24 digits can be deleted, and four digits can be added by using ASTP/AOSP command. When the Route is busy, the Calling Party hears Busy Tone, because the OGC method can seize only one Route. Details on the OGC are shown in the following figure.

Example of OGC: When dialing 810-3000, RT1 is seized by Access Code (810). After seizing, Station No. 3000 is sent.

Note: MC&MG-COT/MG-COT is not available for OGC/OGCA. For MC&MG-COT/MG-COT, use LCR Access Code.

Programming

The following describe the data assignment of the example in above figure.

<OGC Access Code Setting>

STEP 1: **ANPD** - Assign the first digit of Access Code for OGC and digit number of the Access Code.
1stDC (First Digit of Access Code) = 8
CI (Connection Index) = Select N (Normal Service) or H (Hooking Service) from the combo box.
NND (Number of Necessary Digits for Access Code) = 3

STEP 2: **ASPA** - Assign the Access Code for OGC
ACC (Access Code) = 810
CI (Connection Index) = "N: Normal" or "H: Hooking"
SRV (Kind of Service) = "OGC: Outgoing Call"
RT (External Route Number) = 1

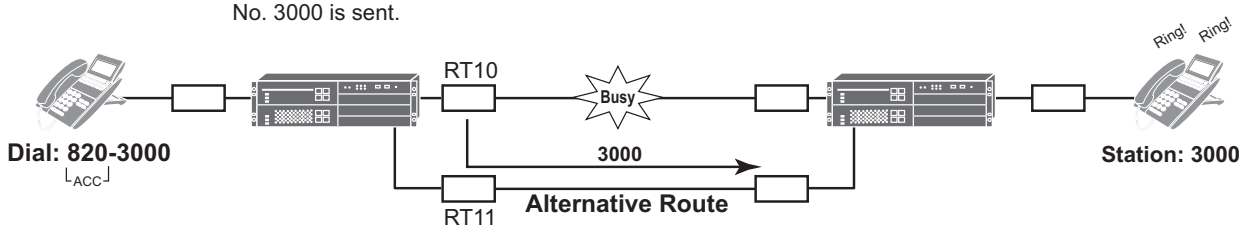
<Assignment of Necessary Digits to be received by Register>

- When acknowledgment signal interface is Second Dial Tone (ARTD command, OSGS = 2)
  AMND - Assign maximum necessary digits to be received by Register.
  DC (Destination Code) = 810
  MND (Maximum Necessary Digits) = 7

- When acknowledgment signal interface is Sender (ARTD command, OSGS =4/6/7)

  ANND - Assign the number of necessary digits to be received by Register.
  RT (Route Number) = 1
  IC/OG (Incoming/Outgoing Call) = O (Outgoing)
  NND (Number of Necessary Digits) = 7

  Note: When the digits, determined by the parameter, are dialed, Sender starts to transmit the number information to the Route.



<Assignment of Access Code for each Route>

ARNP - Assign Access Code for each Route access. In the example here, assign the OGC Access Code for RT 1.
RT (Route) = 1
ACC (Access Code) = 810

7.2 OGCA

Same as OGC, OGCA Access Code is only used for seizing a Trunk. Therefore, after seizing, the Station Number or Subscriber Line Number is actually sent (the Access Code is not sent). When the first Route is busy or restricted by Office Data, a call, originated by OGCA, can be routed to other Trunk Group which goes in the same direction. Thus, it is possible to select multiple routes by only one Access Code. The maximum number of route, seized by one Access Code, is 15. When these 15 routes are all busy, Busy Tone is sent to the Calling Party.

Example of OGCA: When dialing 820-3000, RT11(alternative route) is seized by Access Code (810). After seizing, Station No. 3000 is sent.

Programming

The following describe the data assignment of the example in figure above.

<OGCA Access Code Setting>

STEP 1: **ANPD** - Assign the first digit of Access Code for OGCA and digit number of the Access Code.
1stDC (First Digit of Access Code) = 8
CI (Connection Index) = Select N (Normal Service) or H (Hooking Service) from the combo box.
NND (Number of Necessary Digits for Access Code) = 3

STEP 2: **ASPA** - Assign the Access Code for OGCA
ACC (Access Code) = 820
CI (Connection Index) = “N: Normal” or “H: Hooking”
SRV (Kind of Service) = “OGCA: Outgoing Call with route advance”
1st RT (First External Route Number) = 10
2nd RT (Second External Route Number) = 11

<Assignment of Necessary Digits to be received by Register>

- When acknowledgment signal interface is Second Dial Tone (ARTD command, OSGS = 2)

  AMND - Assign maximum necessary digits to be received by Register.
  DC (Destination Code) = 820
  MND (Maximum Necessary Digits) = 7

- When acknowledgment signal interface is Sender (ARTD command, OSGS =4/6/7)

  ANND - Assign the number of necessary digits to be received by Register.

  For RT 10
  RT (Route Number) = 10
  IC/OG (Incoming/Outgoing Call) = O (Outgoing)
  NND (Number of Necessary Digits) = 7

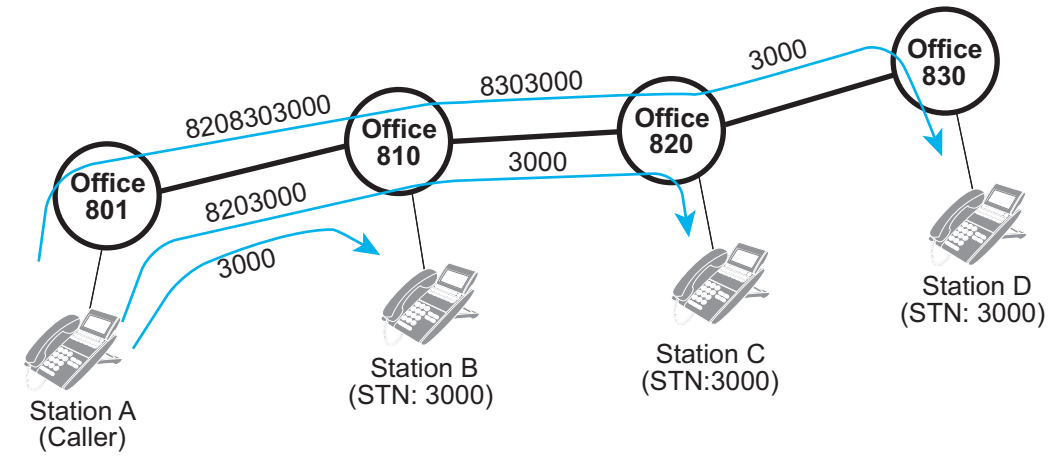
  For RT 11
  RT (Route Number) = 11
  IC/OG (Incoming/Outgoing Call) = O (Outgoing)
  NND (Number of Necessary Digits) = 7

  Note: When the digits, determined by the parameter, is dialed, Sender starts to transmit the number information to the route.

<Assignment of Access Code for each route>

ARNP - Assign Access Code for each route access. In the example here, assign the OGCA Access Code for RT 10 and 11.
RT (Route) = 10
ACC (Access Code) = 820
RT (Route) = 11
ACC (Access Code) = 820

7.3 Network by OGC



This section describes an example of a network using the OGC originating method.
If the user does not know the network configuration, the user may not be able to ring the Destination Station. Therefore, the OGC is most the suitable originating method for a small size network.

8. LCR/LCRS

8.1 LCR/LCRS

LCR/LCRS is the most suitable originating method for medium or large-sized network. It has many functions, for example, route selection and number transformation. If a call encounters busy, the system selects the next route according to the pre-programmed route selection table. Some number(s) may be added or deleted, depending on the selected route. The difference between OGC/OGCA and LCR/LCRS, that an Access Code for the latter is not necessarily to be deleted upon seizing a Trunk. Whether the system deletes/adds some numbers or not can be programmed by Office Data.

Example : To make a call, the caller should know the network configuration.

Number to be dialed
To Station B: 810-3000
To Station C: 810-820-3000
To Station D: 810-820-830-3000

8.2 Difference between LCR and LCRS

LCR: The system selects a Trunk after Register receives all dialed numbers. Therefore, the Trunk is not seized when dialing is not completed.
Use this method when:
- making a call to ISDN line or CCIS line.
- making a call with “Reduction of Data Consumption of the AFRSN command” feature. (**Note 1**)

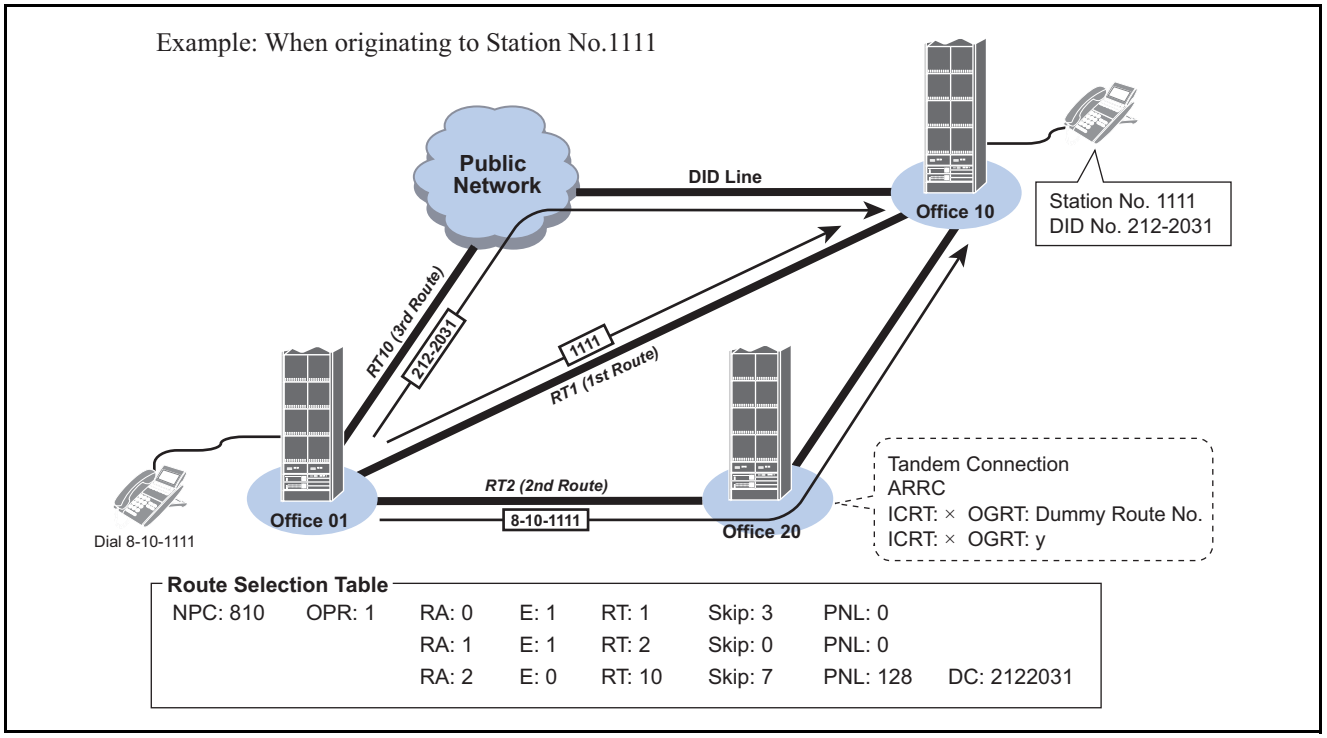
Note 1: For details, see 2.3 Reduction of Data Consumption of the AFRSN command, CHAPTER 5 DATA PROGRAMMING of Data Programming Manual - FCCS.

LCRS: The system selects a Trunk immediately after Register receives Number Pattern Code (NPC) assigned by AFRS. Therefore, the time for seizing the Trunk is faster than the LCR method. However, even if dialing is not completed (when NPC is dialed), the Trunk is seized until time-out. When the user dials numbers that refer to data, assigned by AADC/ATDP/APCR, the call is originated by the LCR method even though the LCRS method is set.

When the LCRS method is used, the system starts connecting and communication between the Calling Party and the Called Party without completing the maximum digits (MND) of Destination Number which is set by the AMND command from the Calling Party.

- Assign the parameter DCANS (CDN: 54) of ARTI command as "1" to the objected route.
- Assign the parameter OSGS (CDN: 1) of ARTD as "2" (Second Dial Tone) and LSG (CDN: 15) of ARTD as other than "12" (CCIS/ISDN) to the objected Route Class of Outgoing Trunk.
- In Tandem Connection, when LSG (CDN: 15) of ARTD command is set as "0" and ANS (CDN: 28) of ARTD command as "0" to terminating route of tandem office, the feature is not available.
- This feature is available when a call is directly originated from a Station via LCRS.
- This feature is available when a Station/Trunk Call, once placed on hold, is originated via LCRS.
- This feature is available when a Trunk Call is originated via LCRS (Tandem Connection).
- The enhancement is not available when a call is placed from an Attendant Console via LCRS or a call is made via LCRS by the Individual Trunk Access feature.

Note: The originating method for ISDN/CCIS/Dp Channel TIE Line is LCR only. The following tables shows conditions for Alternate Routing.



X: Available -: Not Available

	Alternate Routing						
	Analog Line ↓ ISDN Line	ISDN Line ↓ Analog Line	Analog TIE Line ↓ ISDN	CCIS Line ↓ ISDN Line	CCIS Line ↓ Analog Line	CCIS Line ↓ ACIS Line	ACIS Line ↓ CCIS Line
LCR	×	×	×	×	×	×	×
LCRS	× Note 2	–	–	–	–	–	× Note 2

Note 2: When alternating, the originating method is automatically changed to LCR.

Programming

The following describes an example of LCR/LCRS data assignment.

STEP 1: **ANPD** - Assign the first digit of an Access Code for LCR/LCRS and digit number of the Access Code.
1stDC (First Digit of Access Code for LCR/LCRS) = 8
CI (Connection Index) = Select N (Normal Service) or H (Hooking Service) from the combo box.
NND (Number of Necessary Digits for the Access Code) = 3

STEP 2: **ASPA** - Assign the Access Code for LCR/LCRS.
ACC (Access Code) = 810
CI (Connection Index) = "N: Normal" or "H: Hooking"
SRV (Kind of Service) = "LCR: Least Cost Routing" or "LCRS: Register Sender LCR"
RT (External Route Number) = Dummy Route Number (External Route Number that is not used in the system)

STEP 3: **ARTD** - Assign Route Class Data for dummy route.
RT (Route): Dummy Route Number
TCL = 4
L/T = 1
TQ = 1
AC = 1

STEP 4: **AFRS** - Assign Number Pattern Code (including Access Code) and route selection table used when dialing NPC (810).

RT (Route Number) = Dummy Route Number by ASPA.
NPC (Number Pattern Code) = 810
OPR (Outgoing Selection Pattern Number) = 1

STEP 5: **AOPR** - Develop the routing table associated with OPR of AFRS command.

TDPTN (Time-of-Day Change Pattern) = 0 (default) **Note 3**

Note 3: This parameter is used to select the Time-of-Day Change Pattern assigned by ATCP.
For details, refer to Command Manual.

OPR (Outgoing Route Selection Pattern) = 1 (the OPR table number assigned in OPR of AFRS)

1st Route Data
RA (Order of Route Advancing) = 0 (First Route)
E (Route Advancing End Indication) = 1
RT (Route Number) = 1
Skip (Number of Skipped Digits) = 3 (the number of digit to be deleted after RT 1 is selected)
PNL (Pattern Number Location) = 0
OVFT (Overflow Tone) = 0 (Overflow Tone is not required.)
PRSC (Priority Restriction Class) = 0 (Normally assign “0”)

2nd Route Data
RA (Order of Route Advancing) = 1 (Second Route)
E (Route Advancing End Indication) = 1
RT (Route Number) = 2
Skip (Number of Skipped Digits) = 0
PNL (Pattern Number Location) = 0
OVFT (Overflow Tone) = 0 (Overflow Tone is not required.)
PRSC (Priority Restriction Class) = 0 (Normally assign “0”)

3rd Route Data
RA (Order of Route Advancing) = 2 (3rd route)
E (Route Advancing End Indication) = 0 (Last route) **Note 4**
RT (Route Number) = 10
Skip (Number of Skipped Digits) = 7 (8101111 is deleted)
PNL (Pattern Number Location) = 128
OVFT (Overflow Tone) = 0 (Overflow Tone is not required.)
PRSC (Priority Restriction Class) = 0 (Normally assign “0”)

Note 4: Be sure to assign 0 at the last RA.

STEP 6: **AADC** - Assign an additional digit information to PNL (128) assigned by the AOPR command.

PNL (Pattern Number Location) = 128
DC (Additional Digit Information) = 2122031

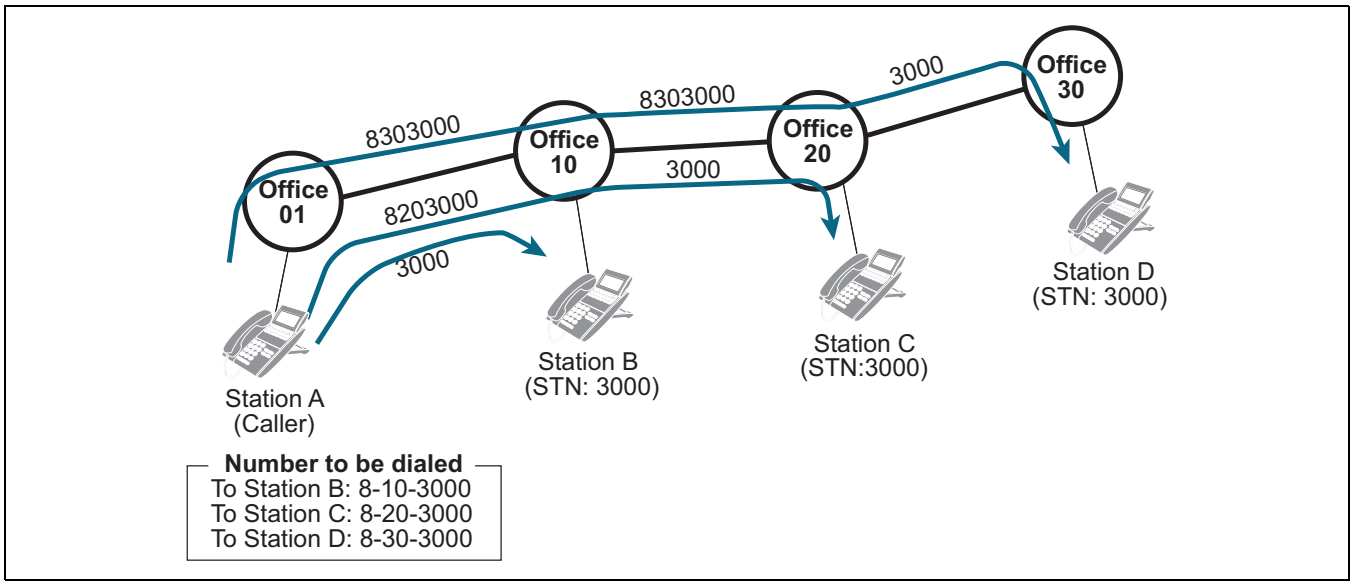
STEP 7: **AMND** - Assign number of necessary digits to be received by Register.
Do not assign this information to Additional Digits Information specified by the AADC command.

DC (Destination Code) = 810
MND (Maximum Necessary Digits) = 7

Note: In addition to the data above, Route Class Data (ARTD), Trunk Data (ATRK) and Route Restriction Class data [ARSC, (RRI = 3)] are also required. Also, at Office 20, Tandem Connection data (ARRC) is necessary.

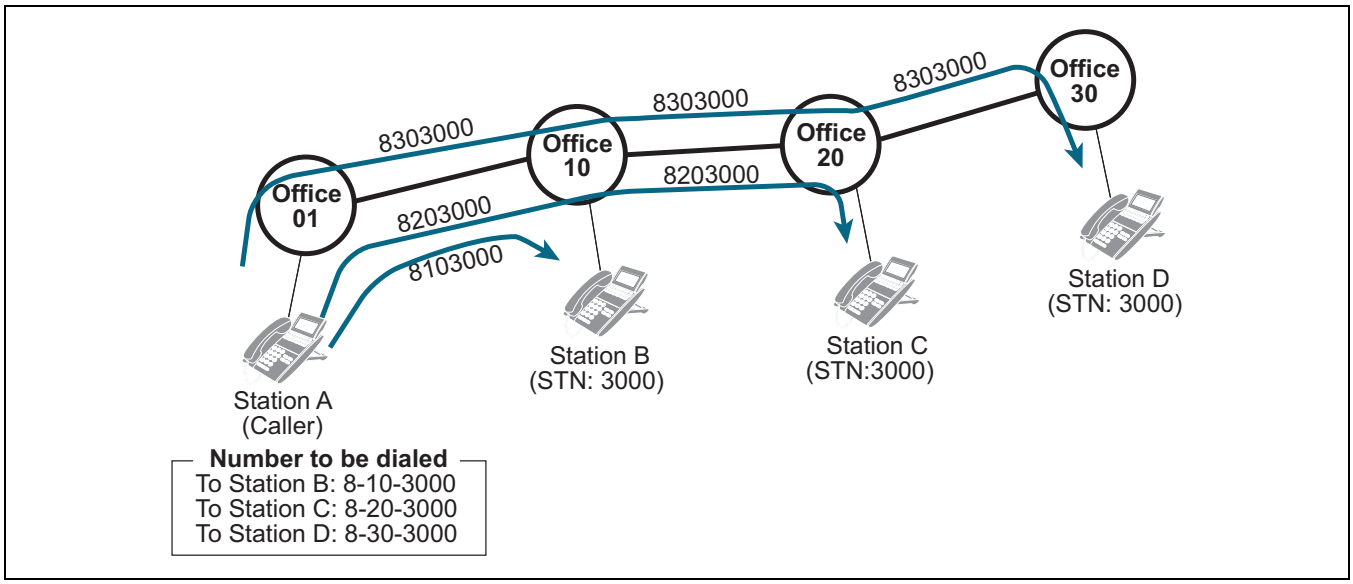
In the similar way, also perform the data programming for LCR access to Office 20 (ACC=820) and Public Network (ACC=9).

STEP 8: **ARNP** - Assign LCR Access Code for each Route, except Dummy Route.



In this example, the following data is required:
RT (Route) = 1
ACC (Access Code) = 810
RT (Route) = 2
ACC (Access Code) = 820 **Note 5**
RT (Route) = 10
ACC (Access Code) = 9 **Note 5**

Note 5: When LCR data for RT 2/RT 10 is not programmed, the respective ACC assignment is not required for this command.



8.3 Network by LCR/LCRS

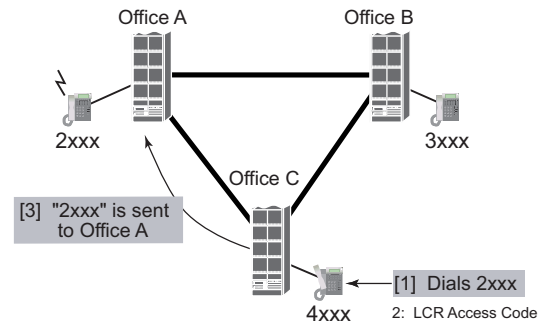
This section describes some examples of a network using LCR/LCRS originating method.

Example 1: When placing a call to a Station in the next office, only the Destination Station Number is sent. When originating to Station via tandem office, the Access Code, Office Code and Station Numbers are all sent. See the following figure.

Example 2: When placing a call to a Station in another office, Access Code, Office Code and Station Numbers are all sent at any time. In this case, data assignment by ASPA (SRV = "UNIF: Office Termination") or AUNE is necessary in each office. See the following figure.

Thus, on the network using LCR/LCRS, the user can easily place a call by dialing the "Access Code + Office Code + Station Number" (even if the user does not understand the network configuration). Addition or deletion of some number(s) is possible when the related Office Data has been assigned to do so.

9. Uniform Numbering



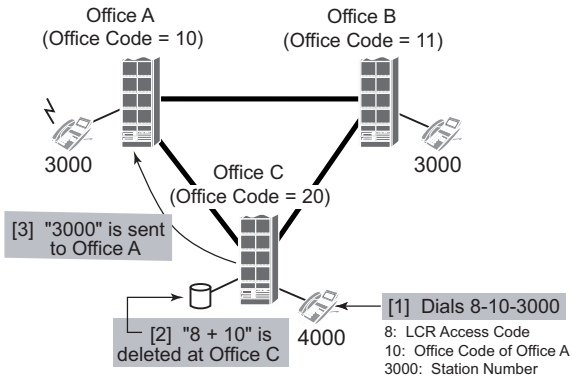
This section explains the data assignment procedure related to Uniform Numbering. The data is required when:

- Your system is one of the Nodes configuring an Open Numbering Network and,
- Inter Office Call via the network is set to be connected with the last destination Office deleting its Self Office Code.

If this is the case, perform the data setting as shown on the next pages. On some networks, the Office Code of the Call Destination Node is set to be deleted at the originating Node (by the data setting). However, if the network requests the Destination Office to delete the Code, this section data (Uniform Numbering) is necessary.

As shown in this figure, Uniform Numbering data is required when Systems achieve an Open Numbering Plan network, and the last destination office is set to receive its self-Office Code to allow inter-office calls bound for it.

< Closed Numbering >

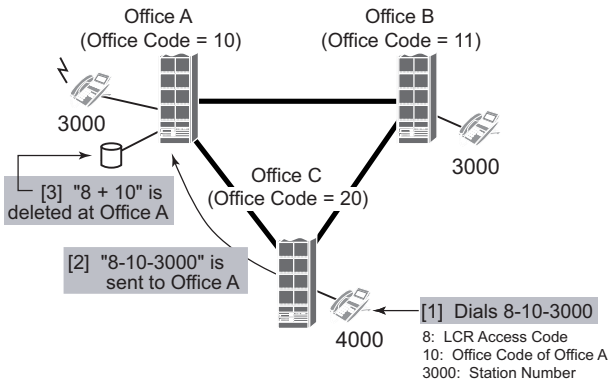


No station number is set to be duplicated on the network. An inter-office call can be made by dialing the intended station number only.
(i.e. there is no concept for "Office Code".)

Accordingly,

Uniform Numbering data ... NOT REQUIRED

< Open Numbering - Destination Office Code Is Deleted at Call Originating/Tandem Office >



Station numbers are assigned on a node basis, therefore there can be duplicated number(s) between the nodes. On this network, the caller dials the trunk access code (LCR access code, etc.) + destination Office Code + station number. This example shows "trunk access code + Office Code" is deleted at the call originating office.

If this is the case,

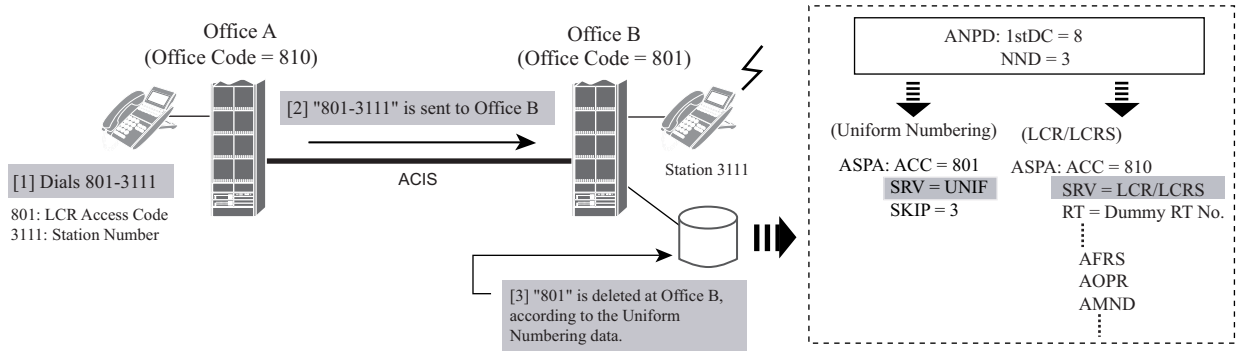
Uniform Numbering data ... NOT REQUIRED

< Open Numbering - Destination Office Code Is Deleted at Call Destination Office >

Station numbers are assigned on a node basis, therefore there can be duplicated number(s) between the nodes. On this network, the caller dials the trunk access code (LCR access code, etc.) + destination Office Code + station number. This example shows "trunk access code + Office Code" is deleted at the call destination office.

If this is the case,

Uniform Numbering data ... REQUIRED !



Programming

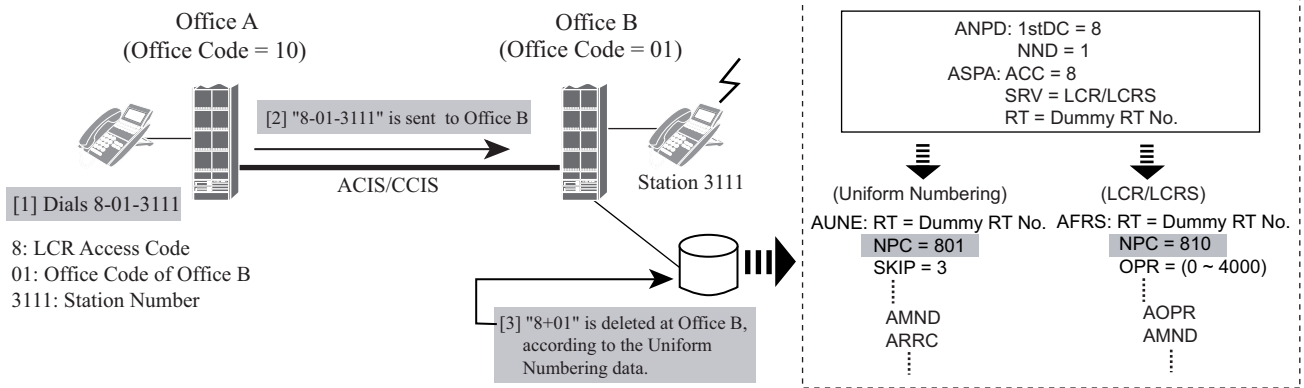
The following shows the Uniform Numbering data assignment procedure using examples for ACIS and CCIS network. By this data programming, you must allow your system to delete its Self Office Code when a call arrives with the number information inclusive of the Office Code. Note that you can use ASPA command or AUNE command, according to the Numbering Plan.

STEP 1: **ASPA** - Available when developing the Self Office Code itself directly as the Access Code for Uniform Numbering. You are to assign the same number as the Office Code in the ACC parameter, and to develop the Access Code (ACC) as SRV = "UNIF: Office Termination". In the SKIP parameter, specify the digit number for the Office Code. By this data, when your system receives a call with the number information of Self Office Code + Station Number, the call is connected after the Self Office Code is deleted. Note that ASPA cannot be used for Uniform Numbering in the case of a CCIS network.

[Example 1]

1. A station at Office A dials "801-3111".
2. The number information "801-3111" is sent to Office B.
3. "801" (self-Office Code) is deleted at Office B, and the call is connected to Station (3111).

The following is the data assignment (at Office B) of Example 1 in the preceding figure.



STEP 1: **ANPD** - Assign the first digit and digit number of Self Office Code.
1stDC (First Digit of Self Office Code) = 8
CI (Connection Index) = Select N (Normal Service) or H (Hooking Service) from the combo box.
NND (Number of Necessary Digits for Self Office Code) = 3

STEP 2: **ASPA** - Assign Self Office Code to be deleted.
ACC (Access Code) = 801 (Self Office Code)
CI (Connection Index) = "N: Normal"/"H: Hooking"
SRV = "UNIF: Office termination"
SKIP = 3 (Number of digits to be deleted)

STEP 3: **AUNE** - Available basically when first specifying the LCR/LCRS Access Code by the ANPD/ASPA, and then developing the Uniform Numbering data as its additional Number Pattern Code (NPC) table. When the NPC table is developed by the AFRS (and AOPR, AMND...) command, the table works for LCR/LCRS service. However, when the AUNE is used, the table works for Uniform Numbering. By this data, when a call arrives with the number information of LCR/LCRS Access Code + Self Office Code + Station Number, the system deletes the LCR/LCRS Access Code + Self Office Code to connect the call. Meanwhile, when the Node-to-Node Line is CCIS, you cannot use ASPA command. At this time, you must use AUNE for Uniform Numbering. When this command is used for a CCIS network, assign the LCR Access Code, assigned by ASPA, including the Self Office Code.

[Example 2]

1. A station at Office A dials "8-01-3111".
2. The number information "8-01-3111" is sent to Office B.
3. "8 + 01" (LCR Access Code + self-Office Code) is deleted at Office B, and the call is connected to Station (3111).

The following is the data assignment (at Office B) of Example 2 in the preceding figure.

STEP 1: **ANPD** - Assign the first digit and digit number of LCR/LCRS Access Code.
1stDC (First Digit of Access Code for LCR/LCRS) = 8
CI (Connection Index) = Select N (Normal Service) or H (Hooking Service) from the combo box.
NND (Number of Necessary Digits for the Access Code) = 1

STEP 2: **ASPA** - Assign the Access Code for LCR/LCRS.
ACC (Access Code) = 8 **Note 1**
CI (Connection Index) = "N: Normal"/"H: Hooking"
SRV = "LCR: Least Cost Routing"/"LCRS: Register Sender LCR"
RT (External Route Number) = Dummy Route Number

Note 1: When the network is CCIS, assign either "8" or "801".

STEP 3: **AUNE** - To delete Self Office Code, assign the Uniform Numbering data (including LCR/LCRS Access Code) for the dummy route assigned by the ASPA.
RT (External Route Number) = Dummy Route Number
NPC = 801 (LCR/LCRS Access Code + Self Office Code)
SKIP = 3 (The number of digits to be deleted)

STEP 4: **AMND** -Assign the MND (Maximum Necessary Digits) to be received.
DC = 801 (LCR/LCRS Access Code + Self Office Code)
MND = 7 (Maximum Necessary Digits)

STEP 5: **ARRC** -Allow the restriction between Incoming Route and Dummy Route.
ICRT = 1 (Incoming Route Number)
OGRT = Dummy Route Number
ARI-D_RES =1 (Tandem Connection without an operator/Station assistance is allowed)

10. PH Data Setting

This section gives the explanation of each PH and reference within each manual.
The DMOS command displays the status of the Telephony Server including TCP/IP Module, PH Module, SIP Server, and Standard SIP-GW.

10.1 MPH (Multi Protocol Handler)

MPH is an interface built-in the Telephony Server's SP which is used to connect TP and SP. MPH also has a function to control and monitor SP-PHD and SP-PHI.

<Reference>
Refer to the Appliance Model Installation Manual - Chapter 6 System Startup - 2. Additional information on System Startup - 2.1. Initial Data Assignment.

10.2 Internal PHE

Internal PHE is a type of PH embedded in the Telephony Server. Internal PHE enables the operation of SP Controlled SIP Terminals, MPH, MC functions, and VS-32 (Proprietary Protocol mode).

<Reference>

1. SP Controlled SIP Terminals

   a.) Basic Data Assignment

   Refer to the Appliance Model Installation Manual, Chapter 6 System Startup, 2. Additional information on System Startup, 2.1. Initial Data Assignment.

   b.) Assignment for Station Data

   Refer to the Data Programming Manual - Business, Chapter 3 Business Features, SP Controlled SIP Terminal [S-168].

2. MPH

   Refer to "10.1 MPH (Multi Protocol Handler)".

3. MC Functions

   a.) 2MC

   Refer to the Peripheral Equipment Description (IP Devices), Chapter 2 IP Devices, Analog 2MC (Analog Media Converter).

   For UG50-2MC, refer to the Peripheral Equipment Description (UG50).

   b.) UG50 (LC)/UG50-IPG (Analog)/UG50-4LC2COTA(COT)/UG50-4LC2COTA(PGT).

   Refer to the Peripheral Equipment Description (UG50).

c.) MC&MG-COT

Refer to the Peripheral Equipment Description (IP Devices), Chapter 2 IP Devices, MCMG [SCA-4LC2COTA/MG-4LC2COTA].

d.) IPG Analog

Refer to the Peripheral Equipment Description (IP Devices), Chapter 2 IP Devices, IP Gateway.

4. VS-32 (Proprietary Protocol mode)

Refer to the Data Programming Manual - Business, Chapter 3 Business Features, VS32 Conference Server [V-26].

10.3 SP-PHD

SP-PHD is a type of PHD accommodated in MPH. SP-PHD enables the operation of IP Multiple Line Terminal, SIP Multiple Line Terminal, Soft Phone, IPG Digital, UG50-IPG (Digital), and UG50 (DLC).

<Reference>

1. IP Multiple Line Terminal and Soft Phone

a.) Basic Data Assignment

Refer to the Appliance Model Installation Manual, Chapter 6 System Startup, 2. Additional information on System Startup, 2.1. Initial Data Assignment.

b.) SIP Multiple Line Terminal

Refer to the Data Programming Manual - Business, Chapter 3 Business Features, SIP Multiple Line Operation [S-160].

c.) IP Multiple Line Terminal

Refer to “14.1 IP Station Data” in this chapter.

d.) Soft Phone

Refer to “14.1 IP Station Data” in this chapter. and the Data Programming Manual - Business, Chapter 3 Business Features, Soft Phone [S-155].

2. SIP Multiple Line Terminals

a.) Basic Data Assignment

Refer to the Appliance Model Installation Manual, Chapter 6 System Startup, 2. Additional information on System Startup, 2.1. Initial Data Assignment.

b.) Station Data Assignment

Refer to the Data Programming Manual - Business, Chapter 3 Business Features, SIP Multiple Line Operation [S-160].

3. IPG Digital

   Refer to the Peripheral Equipment Description (IP Devices), Chapter 2 IP Devices, IP Gateway.

4. UG50-IPG (Digital)/UG50 (DLC)

   Refer to the Peripheral Equipment Description (UG50).

10.4 SP-PHI

SP-PHI is a type of PHI accommodated in MPH. SP-PHD enables the operation of MG(BRI), MG(PRI), MC&MG-COT, 8LC, UG50 (LC) [SIP] and VS-32 (SIP mode).

<Reference>

1. MG Data Assignment

   Refer to each section of Media Gateway in the Peripheral Equipment Description (IP Devices).

   For UG50 (PRT 1.5M) [SIP], UG50 (PRT 2M) [SIP], UG50-24PRIA [SIP], and UG50-30PRIA [SIP], refer to the Peripheral Equipment Description (UG50).

2. 8LC Data Assignment

   Refer to the Peripheral Equipment Description (IP Devices), Chapter 2 IP Devices, 8LC Card.

   For UG50-8LC, refer to the Peripheral Equipment Description (UG50).

3. UG50 (LC) [SIP], UG50 (COT-TYPE2) and UG50 (PGT-TYPE2) Data Assignment

   Refer to the Peripheral Equipment Description (UG50).

4. VS-32 (SIP mode) Data Assignment

   Refer to the Data Programming Manual - Business, Chapter 3 Business Features, VS32 Conference Server [V-26].

10.5 Internal PHI

Internal PHI is a type of PHI accommodated in the Telephony Server. There are two types of Internal PHI. Internal PHI (PRI) enables the operation of MG (PRI) (Proprietary Protocol mode) with TCP connection and Internal PHI (BRI) enables the operation of MG (BRI) (Proprietary Protocol mode), MC&MG-COT, and MG (SIP).

<Reference>

1. MG Data Assignment

   Refer to each section of Media Gateway in the Peripheral Equipment Description (IP Devices).

   For UG50 (COT-TYPE1), UG50 (COT-TYPE2), UG50-4LC2COTA (COT), UG50-6COT, UG50 (PGT-TYPE1), UG50 (PGT-TYPE2) and UG50-4LC2COTA (PGT) refer to the Peripheral Equipment Description (UG50).

10.6 Internal PHF

Internal PHF is an interface built-in the Telephony Server which is for transmitting the link information between nodes when the system is using FCCS networking. Only LAN1 can be used for transmitting the link information.

<Reference>
Refer to the Data Programming Manual - FCCS and the Data Programming Manual - Business, Chapter 3 Business Features, FCCS Networking via IP [F-36].

10.7 Internal PHC

Internal PHC is an interface built-in the Telephony Server which is for transmitting the link information between nodes when the system is using CCIS networking. LAN2 is used as a default setting for transmitting the link information, The LAN interface can be modified using the ADTM command.

<Reference>
Refer to the Data Programming Manual - CCIS and the Data Programming Manual - Business, Chapter 3 Business Features, CCIS Networking via IP [C-163].

10.8 Internal SIP Handler

Internal SIP Handler is an interface built-in the Telephony Server which is for controlling the Standard SIP Terminals without using SP. LAN1 (IP Address2 in ACT-side) is recommended for transmitting the signal packets.

<Reference>

a.) Basic Data Assignment

Refer to the Appliance Model Installation Manual, Chapter 6 System Startup, 2. Additional information on System Startup, 2.1. Initial Data Assignment.

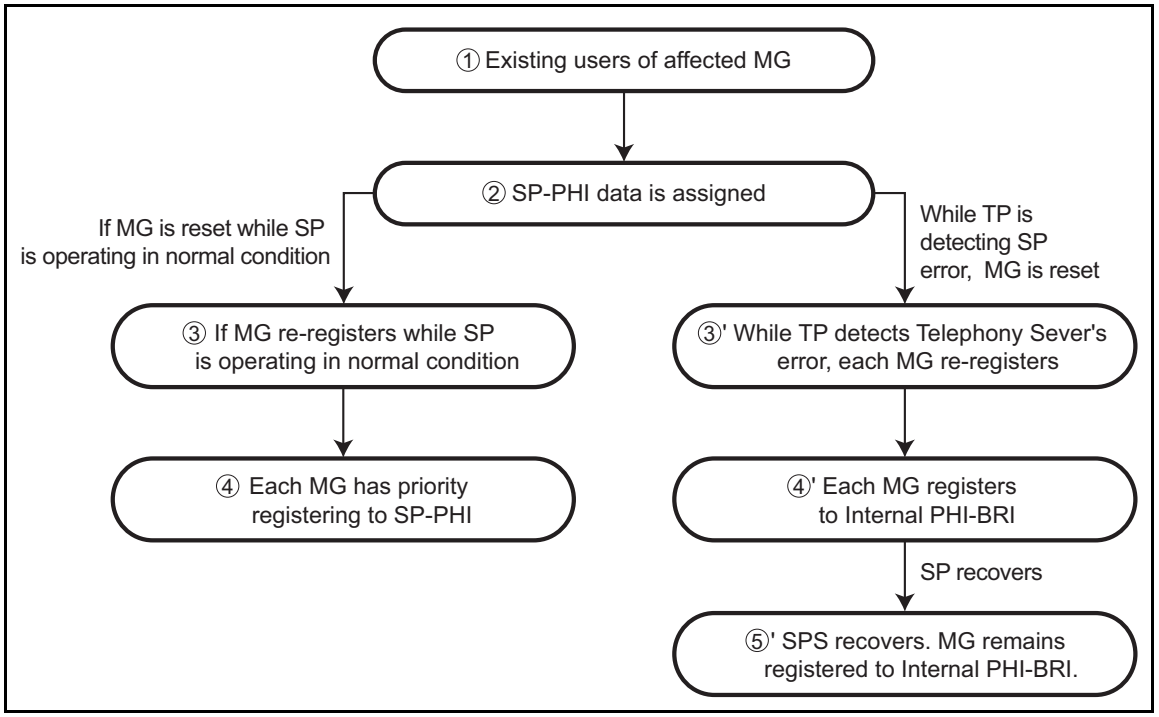
b.) Assignment for Station Data

Refer to the Data Programming Manual - Business, Chapter 3 Business Features, SIP Handler - SIP Terminal [S-167].

10.9 Consideration for SP-PHI Data Assignment

When SP-PHI data is assigned, if MG registered to Internal PHI-BRI of TP is reset, MG automatically registers to SP-PHI of SP. Because MG control packet is sent through TP and SP-PHI, failure in SP might affect communication for MG. This automatic registration is regulated through System Data (ASYDL, SYS1, Index 1017, Bit 0). Refer to the below information and configure as needed.

Affected MG

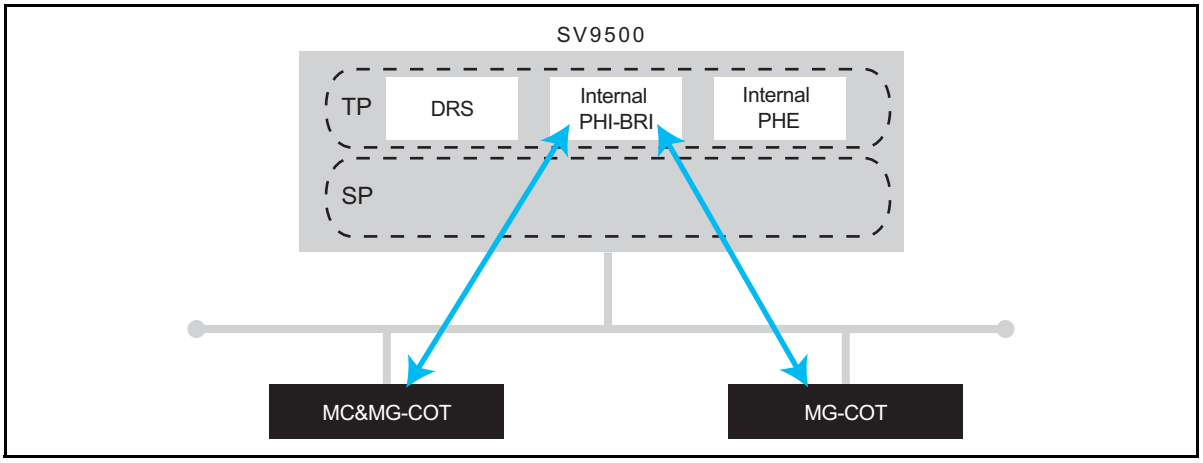


MG Types	Product Name
MC&MG-COT	MCMG [SCA-4LC2COTA/MG-4LC2COTA]
MG-COT (Proprietary Protocol)	MG-COT [SCA-6COTA]
	MG-COT [SCA-6COTB]
	MG-COT [SCA-6COTC]

The table below describes the registration destination for each MG. The shaded area indicates MG to be considered regarding the registration destination.

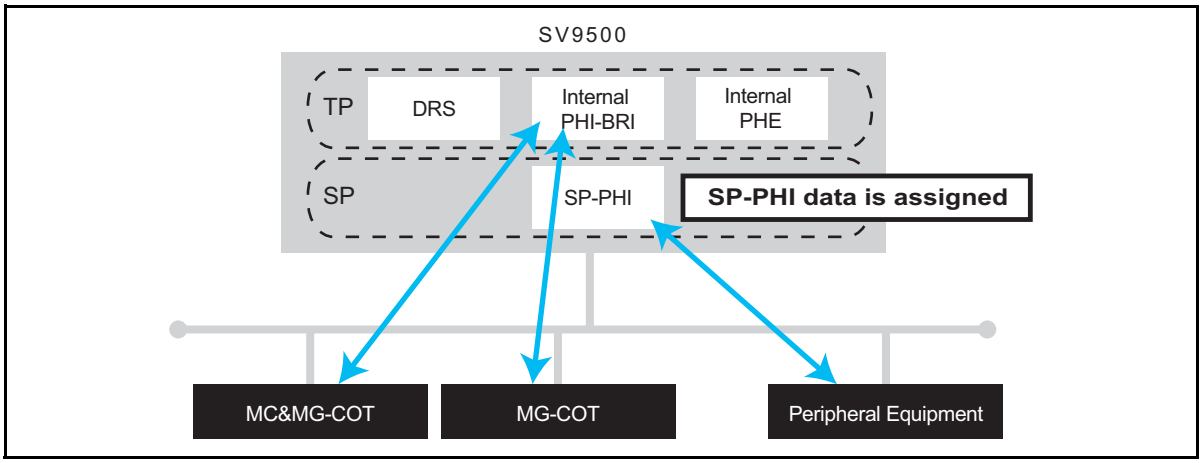
MG Types		Protocol	PH
IP equipment which registers only to TP	Analog MC	Proprietary Protocol	Internal PHE
	MG(PRI)		Internal PHI-PRI
	MG (SIP)		Internal PHI-BRI
	MC&MG-COT (MC Part)		Internal PHE
	VS32		Internal PHE
IP equipment which registers only to SP	Analog MC	SIP	SP-PHI
	MG(PRI)		
	MG(BRI)		
	VS32		
	MG-T1		
	MG-COT		
IP equipment which registers to TP or SP	MC&MG-COT (MG Part)	Proprietary Protocol	SP-PHI
	MG-COT		

Overview of Action



The following is the overview of action for MG when System Data (ASYDL, SYS1, Index, 1017, Bit 0=0) is in default.

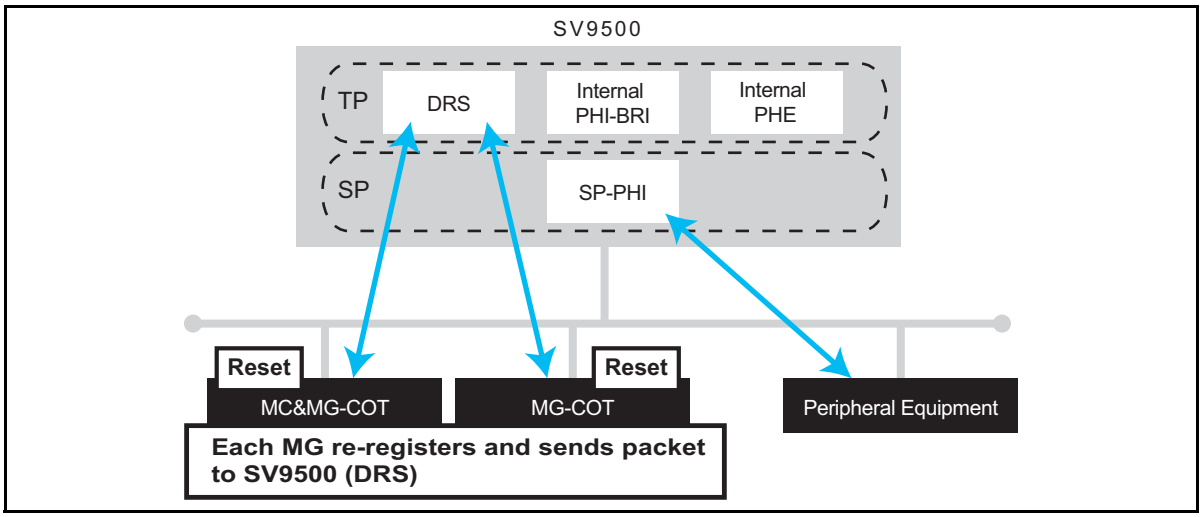
(1) Existing users of affected MG



(a) Each affected MG registers to Internal PHI-BRI (MC registers to Internal PHE).

(b) Control packet is sent directly between MG and TP (including DRS). Even if error occurs in SP, there is no direct influence, such as resetting, for the MG.

(2) SP-PHI data is assigned

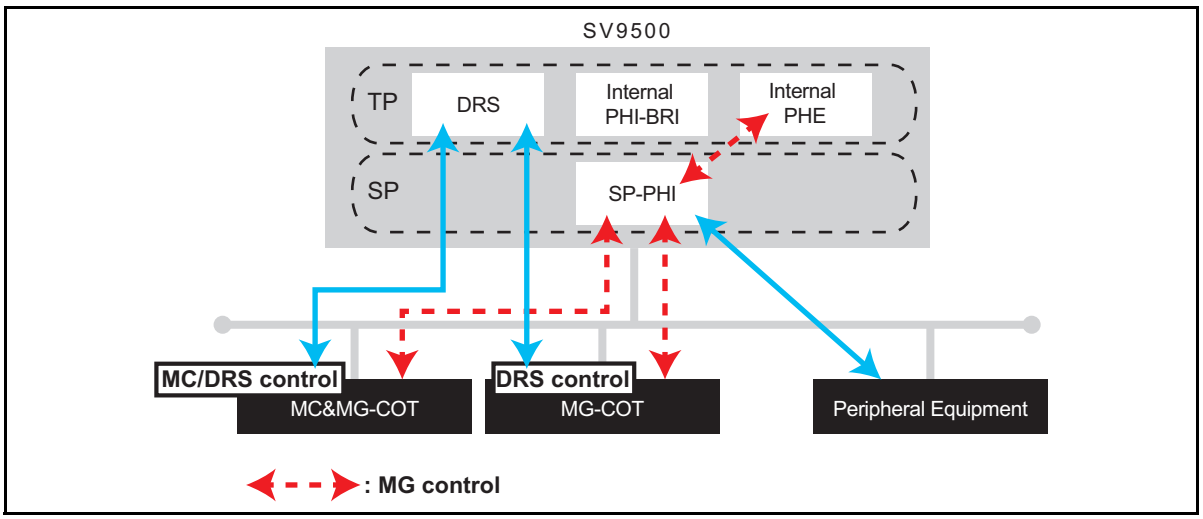


(a) MG remains registered to Internal PHI-BRI when SP-PHI data is assigned (MG has not yet been reset).

<If MG is reset while SP is operating in normal condition>

(3) If MG re-registers while SP is operating in normal condition

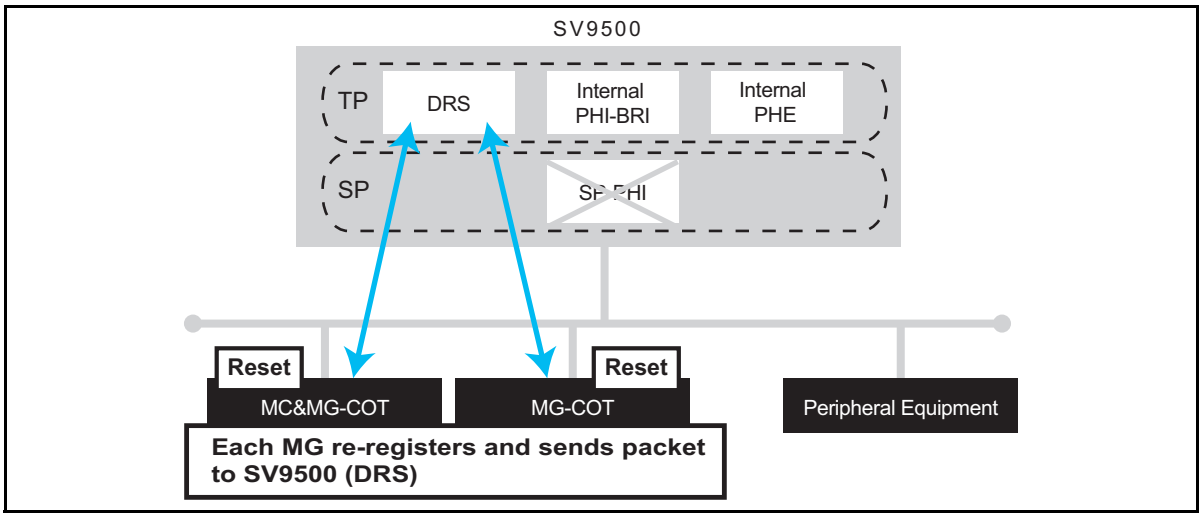
(a) When MG is reset, it sends packets to TP(DRS) to request registration.



(4) MG has priority registering to SP-PHI (current default action)

(a) MC&MG-COT(MG) has priority registering to SP-PHI (MC registers to Internal PHE).

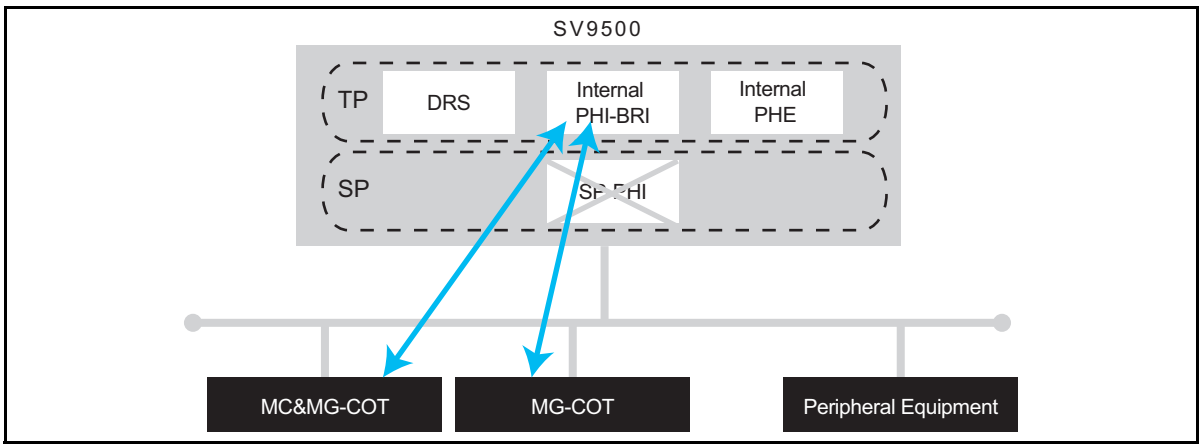
(b) MG control packet is sent through TP and SP-PHI. MC/DRS control packet is directly sent to TP (Internal PHE/DRS).



(c) Failure in SP might affect communication for MG and may cause it to reset. MG not affected by SP's error will be affected when SP-PHI data is assigned.

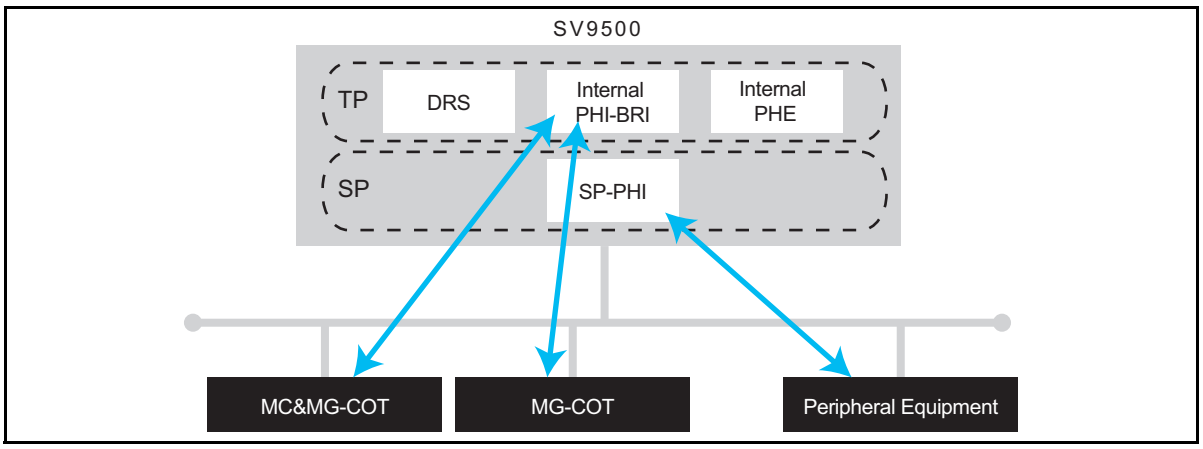
<While TP is detecting error in SP, affected MG is reset>

(3)' While TP is detecting error in SP, MG will re-register



(a) When MG is reset, it sends packets to TP(DRS) to demand registration.

(4)' Each MG registers to Internal PHI-BRI



(a) During registration, if TP detects SP error, MG registers to Internal PHI-BRI (MC registers to Internal PHE).

(b) Control packet is sent directly between MG and TP (including DRS). Even if error occurs in SP, there is no direct influence, such as resetting, for the MG. Assigning data for SP-PHI does not necessarily cause MG to be influenced by SP error.

(5)' SP recovers. Affected MG remains registered to Internal PHI-BRI.

(a) After the recovery of SP, MG will remain registered to Internal PHI-BRI if it is not reset.

Programming

ASYDL, SYS1, Index 1017, Bit 0

<When Bit 0=0 (default)>
If MG registers while SP-PHI is in operation, MG will have priority registering to SP-PHI. If SP-PHI is not operating during registration, MG will register to TP's Internal PHI-BRI.

Effect: If affected MG is registered to SP-PHI, it will be influenced by SP error. If MG is registered to PHI, it is not influenced by SP error.

<When Bit 0=1>
MG registers to Internal PHI-BRI.

Effect: Assigning SP-PHI data will not cause MG to register to SP-PHI. Furthermore, pre-existing MG actions will not change, nor will MG be influenced by SP error.

11. Tone Setting

Here describes how to set tones for each countries. There are two type of tones, Basic Tones and EMEA Tones.

Note: For setting the tones for each terminals, refer to Multiple Tone - D [M-119D].

Note: When using the EMEA tones, refer to “Appendix A” or “Appendix B” in this manual for Tone Specification.

[Conditions]

1. The Basic Tones and EMEA Tones require the following DTG.

Basic Tones	DTG	EMEA Tones	DTG
North America	SM-025 N24 DTG DATA	Germany	SM-613 DTG DE DATA-A
Australia	SM-243 N24 DTG DATA-AUS SM-027 N24 DTG DATA-AUS	Italy	SM-623 DTG IT DATA-A
Hong Kong	SP-593 SW05-B PROG-A	Netherlands	SM-610 DTG NL DATA-A
Malaysia	SP-591 SW05-B PROG-A	Denmark	SM-619 DTG DK DATA-A
Singapore	SP-594 SW05-B PROG-A	Sweden	SM-612 DTG SE DATA-A
England	SM-560 DTG UK DATA-A	Spain	SM-621 DTG ES DATA-A
Mexico	SP-599 SW05-B PROG-A	Austria	SM-618 DTG AT DATA-A
Taiwan	SP-590 SW05-B PROG-A SM-349 N24 DTG DATA-A	Belgium	SM-611 DTG BE DATA-A
New Zealand	SM-328 N74 DTG DATA	England	SM-603 DTG UK DATA-A
Korea	SM-309 N24 DTG DATA-A SP-588 SW05-B PROG-A	Greece	SM-622 DTG GR DATA-A
Brazil	SM-283 N74 DTG DATA	Switzerland	SM-620 DTG CH DATA-A
China	SM-303 N74 DTG DATA-B	South Africa	SM-649 DTG SA DATA-A
Thailand	SM-201 N24 DTG DATA SM-346 N24 DTG DATA-A		
Thailand (EGAT)	SP-592 SW05-B PROG-A		
Sri Lanka	SP-594 SW05-B PROG-A		

Note: Be sure to select the same countries on the system data [ASYDL, SYS1, Index 811].

2. Tone assigned by the system data [ASYDL, SYS1, Index 811] will be unavailable if other country has been selected by the ASLG command (Multiple Tone - D [M-119D]).
3. If tone assigned by the system data [ASYDL, SYS1, Index 811] is not supported on each terminal, the default tone will be applied.
4. MG(PRI), 8LC card, UG50, VS32, and IP Terminal are required to install the firmware that is compatible with this feature.

Note: The South Africa tone is supported by the following firmware for the each equipment.
- MG(PRI): SP-3884 MG PRI PROG-A Issue 16.0 or later
- 8LC card: SP-3893 8MC PROG-A Issue 7.0 or later/SP-3983 8MC PROG-B Issue 1.0 or later
- UG50: No firmware condition
- VS32: SP-3891 CA-VS32 PROG-A Issue 6.0 or later

5. The following shows a listing of EMEA tones that are not supported by this feature.
   - Second External Dial Tone
   - Delayed Hotline Dial Tone
   - Paging Absent Tone
   - Paging In-Progress Tone
   - Bypass Tone
   - Through Connect Ring Tone
   - ARB Destination Ring Back Tone
   - Password Tone
   - Call Waiting Ticker
   - Dial Up Automatic Break-In Ticker
6. The EMEA tones take precedence over the Australia tone.

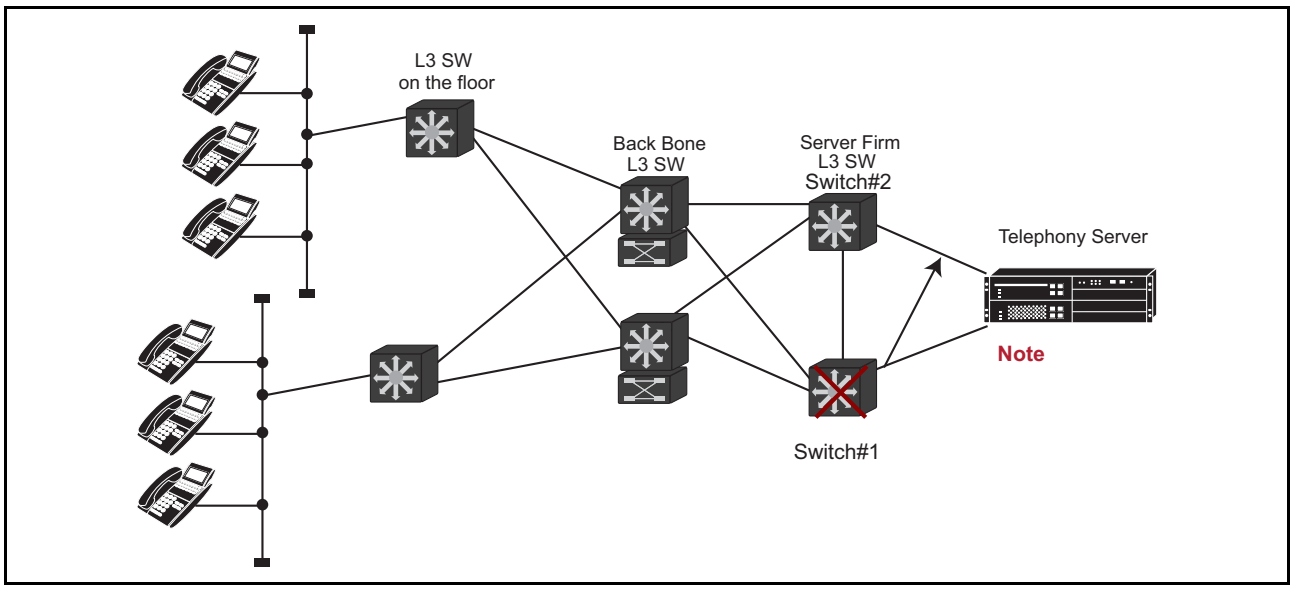
Programming

STEP 1: **ASYD** - SYS1, Index 59, Bit 6
Tone sending for Attendant and Override services (0/1 = Yes/No). When using EMEA tones, assign "1".

STEP 2: **ASYDL** - Assign the following system data.
SYS1
Index 811: Tone Code by Countries

ASYDL, SYS1, Index 811			
TONE CODE	**Basic Tones**	**TONE CODE**	**EMEA Tones**
00 H	Not used	C8 H	Germany
01 H	Japan	C9 H	Italy
02 H	North America	CA H	Netherlands
03 H	Australia	CC H	Denmark
04 H	Other countries	CD H	Sweden

ASYDL, SYS1, Index 811			
TONE CODE	**Basic Tones**	**TONE CODE**	**EMEA Tones**
05 H	Hong Kong	D3 H	Spain
06 H	Malaysia	D4 H	Austria
07 H	Singapore	D5 H	Belgium
08 H	England	D6 H	England [For EMEA]
09 H	Mexico	D7 H	Greece
0A H	Taiwan	D8 H	Switzerland
0B H	New Zealand	D9 H	South Africa
0C H	Korea	Other Values	Not used
0D H	Brazil		
0E H	China		
0F H	Thailand		
10 H	Thailand (EGAT)		
11 H	Sri Lanka		



Index 830, Bit 7=0/1: Hold Tone can be changed when one of the countries for EMEA has been set in ASYDL, SYS1, Index 811.

ASYDL, SYS1, Index 830	
Bit 7	**Hold Tone**
1	Music **Note 1**
0	Tone for EMEA

Note 1: When customer-provided Music is used, music source must be connected to TSW-BOX or PLO card. For more details, please refer to Appliance Model Installation Manual - CHAPTER 4 MODULES MOUNTING AND CONNECTION (7UPIR CONFIGURATION) - “Cable Connections” - “External Music-On-Hold Cable Connection”.

12. Data Setting for Switch Redundancy Configuration

This section explains the data settings required when placing the Telephony Server in the redundant network.
As shown in the figure below, if the Telephony Server is configured redundantly by using the network equipment such as Layer 2 Switch and Layer 3 Switch, the particular data settings are required.

As shown in the above figure, when Switch#1 goes down while CPU#0 operates in Active mode, CPU#1 starts operating in Active mode instead of CPU#0.
(Only when CPU#0 detects the Layer 1 link disconnection after the Switch#1 failure.*)*

Note: Required to assign the same network address to CPU#0 and TP#1.

Programming

Perform System Change over Test associated with detection of the Layer 1 Link disconnection after the following data programming. For System Change over Test, refer to Chapter 7 Installation Test of the Appliance Model Installation Manual.

• For LAN1

STEP 1: **ASYDL** - SYS1, Index 1344, Bit 0 to Bit 2: LAN Cable Layer 1 Fault Detection Monitor Timer of LAN1 connector.

Bit 3=1: System changeover is executed when detecting the Layer 1 link disconnection.

Bit 3	Bit 2	Bit 1	Bit 0	Changeover Operation Time
1	0	0	0	Starts immediately, and ends about 12 seconds later.
1	0	0	1	Starts after 6-8 seconds, and ends about 12 seconds later.
1	0	1	0	Starts after 10-12 seconds, and ends about 12 seconds later. (Standard setting)
1	0	1	1	Starts after 16-17 seconds, and ends about 12 seconds later.
1	1	0	0	Starts after 20-22 seconds, and ends about 12 seconds later.
1	1	0	1	Starts after 26-27 seconds, and ends about 12 seconds later.
1	1	1	0	Starts after 30-32 seconds, and ends about 12 seconds later.
1	1	1	1	Starts after 37-38 seconds, and ends about 12 seconds later.

STEP 2: **ADTM** - TCP/IP Module Data.
NIC
ARP Broadcasting Period
Choose “30 sec”, “60 sec”, or “120 sec”.

Note: For the dual system configuration, it is recommended to enable the periodic transmission of G-ARP on both LAN1 and LAN2 with the ADTM command. The parameter of ARP Broadcasting Period should be preferably selected as “60 sec”. As for the offices that frequently execute the CPU system changeover, select “30 sec” for the parameter of ARP Broadcasting Period.

• For LAN2

STEP 1: **ASYDL** - SYS1, Index 598, Bit 4 to Bit 6: LAN Cable Layer 1 Fault Detection Monitor Timer of LAN2 connector.

Bit 7=1: System changeover is executed when detecting the Layer 1 link disconnection.

Bit 7	Bit 6	Bit 5	Bit 4	Changeover Operation Time
1	0	0	0	Starts immediately, and ends about 12 seconds later.

Bit 7	Bit 6	Bit 5	Bit 4	Changeover Operation Time
1	0	0	1	Starts after 6-8 seconds, and ends about 12 seconds later.
1	0	1	0	Starts after 10-12 seconds, and ends about 12 seconds later. (Standard setting)
1	0	1	1	Starts after 16-17 seconds, and ends about 12 seconds later.
1	1	0	0	Starts after 20-22 seconds, and ends about 12 seconds later.
1	1	0	1	Starts after 26-27 seconds, and ends about 12 seconds later.
1	1	1	0	Starts after 30-32 seconds, and ends about 12 seconds later.
1	1	1	1	Starts after 37-38 seconds, and ends about 12 seconds later.

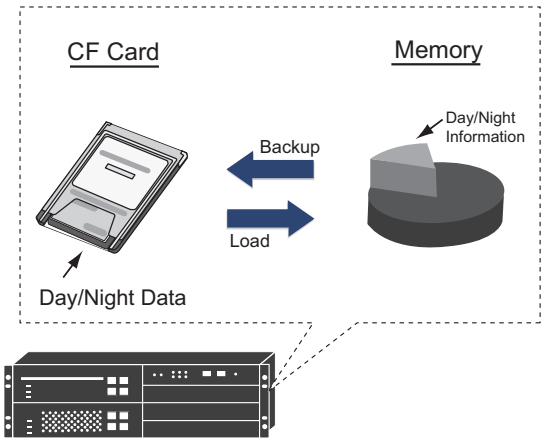
STEP 2: **ADTM** - TCP/IP Module Data.
NIC
ARP Broadcasting Period
Choose “30 sec”, “60 sec”, or “120 sec”.

Note: For the dual system configuration, it is recommended to enable the periodic transmission of G-ARP on both LAN1 and LAN2 with the ADTM command. The parameter of ARP Broadcasting Period should be preferably selected as "60 sec". As for the offices that frequently execute the CPU system changeover, select “30 sec” for the parameter of ARP Broadcasting Period.

• For LAN3/LAN4

ASYDL - SYS1, Index 927, Bit 0 to Bit 2: LAN Cable Layer 1 Fault Detection Monitor Timer of LAN3/LAN4 connector.

Bit 3=1: System changeover is executed when detecting the Layer 1 link disconnection at LAN3/LAN4 connector.



Bit 3	Bit 2	Bit 1	Bit 0	Changeover Operation Time
1	0	0	0	Starts immediately, and ends about 12 seconds later.
1	0	0	1	Starts after 6-8 seconds, and ends about 12 seconds later.
1	0	1	0	Starts after 10-12 seconds, and ends about 12 seconds later. (Standard setting)
1	0	1	1	Starts after 16-17 seconds, and ends about 12 seconds later.
1	1	0	0	Starts after 20-22 seconds, and ends about 12 seconds later.
1	1	0	1	Starts after 26-27 seconds, and ends about 12 seconds later.
1	1	1	0	Starts after 30-32 seconds, and ends about 12 seconds later.
1	1	1	1	Starts after 37-38 seconds, and ends about 12 seconds later.

13. Day/Night Data Retention

When system is initialized, this feature allows the system to be used in the day/night status before the system initialization by loading the backed up day/night data without setting the day/night mode again.

Service Conditions

1. For using this feature, the backup for day/night data is required. The backup method for day/night data, loading method for the backed up day/night data, and the day/night data verification is as follows.

a.) Automatic/manual backup for day/night data into CF card when changing the day/night mode.

- Manual Backup (by MEM_HDD/MEM_HDD_N command)

  From PCPro, execute **MEM_HDD/MEM_HDD_N command**, select [**Memory to Hard Disk**] → [**Day/Night data**], and press [**Start**]. For the detail, refer to Operations and Maintenance Manual - CHAPTER 2 Operations of Telephony Server - Office Data Maintenance - Office Data Backup. Use Telephony Server Maintenance Menu to back it up to PCPro.

- Automatic Backup (by assigning system data - ASYDL, SYS1, Index 1120, Bit 0 to Bit 5)

  Day/night data can automatically be backed up in a certain cycle. For enabling the Automatic Backup, the following data setting is needed. For the setting data of periodical backup activation time, refer to [Example for the setting of day/night data automatic backup cycle] in Programming. The automatic backup into CF card is not executed unless the Day/Night information is changed.

  [ASYDL, SYS1, Index 1120]

  Bit 0: Day/Night Data Automatic Backup, 0/1 = Out of service/In service
  Bit 1 to Bit 3: Backup Cycle,

Bit 3	Bit 2	Bit 1	Backup Cycle
0	0	0	every 2 hours (default)
0	0	1	every 1 hour

Bit 4: Standard Time for Starting Backup, 0/1 = 0/1 (hour)
Bit 5: Standard Time for Starting Backup, 0/1 = 0/30 (minutes)

[Conditions for Automatic Backup]

- If the time of day/night data automatic backup and routine diagnosis program start time (ASYD, SYS1, Index 87 and Index 88) are overlapped, the automatic backup will be executed while the routine diagnosis program is being executed. The time for starting automatic backup will be changed depending on routine diagnosis item (ASYD, SYS1, Index 89 and Index 90).
- If the time for starting automatic backup is within 5 minutes before the diagnosis program start time, the automatic backup will not be executed.
- The automatic backup will not be executed while the routine diagnosis program is being executed.
- The automatic backup will not be executed while office data is being copied to SR-MGC.
- If the Telephony Server (TP (CPU)) is configured redundant, the automatic backup will not be executed during the changeover of the CPU. Also, the changeover cannot be executed during the automatic backup.
- The automatic backup will not be executed while saving/loading/verifying office data by PCPro.

b.) Day/night data load after system initialization involving office data load (by Telephony Server Maintenance Menu)

Note: Use Telephony Server Maintenance Menu to load the backup data to PCPro. For detailed information, refer to Operations and Maintenance Manual.

Develop the backup data in Flash Card on system memory. For the detail, refer to Operations and Maintenance Manual - Chapter 7 Maintenance Commands.

1. In the case of system initial setting involving office data load:
The backup data is valid. **Note 1**

2.In the case of system initial setting not involving office data load:
The day/night data before the initialization is used.

3.In the case of system restart from while the power is off:
The backup data is used. **Note 1**

Note 1: Night mode 3 (N3) is used if the day/night data load failed when initialized.

c.) Day/night data verification (by Telephony Server Maintenance Menu and MEM_HDD/ MEM_HDD_N command) **Note 2**

Note 2: Use Telephony Server Maintenance Menu to verify the backup data in PCPro. For detailed information, refer to Operations and Maintenance Manual.

Verify the Day/Night data after the backup is finished. The verifiable data is as follows. For the details, refer to Operations and Maintenance Manual - Chapter 7 Maintenance Commands.

- Between HDD (CF card) and MEM (Memory on system)

d.) Display/deletion of the day/night backup data (by DHDF command)

From PCPro, execute **DHDF command**, select [**Day/Night data**], and press [**Get**] or [**Del**] button. For the datal, refer to Operations and Maintenance Manual - CHAPTER 2 Operations of Telephony Server - Office Data Maintenance - Office Data Backup.

2. Day/night data cannot be copied to SR-MGC. Therefore, the day/night data cannot be retained using this feature.
3. If using this feature in an environment where attendant console is accommodated, the day/night status after system initialization will be updated by the mode that is set at switch of ATI circuit cards (CH-CS00: SW12-8 (software switch), PA-CS33-C/PA-CS33: SW17-8). For the detail, refer to Circuit Card Description.
4. If using this feature in an environment where external key is accommodated, the day/night status after system initialization will be updated by the setting of external key.
5. If using this feature in FCCS network, the day/night status will be updated by the setting of NCN.

Programming

ASYDL - SYS1, Index 1120:
Bit 0: Day/Night Data Automatic Backup, 0/1 = Out of service/In service
Bit 1 to Bit 3: Backup Cycle

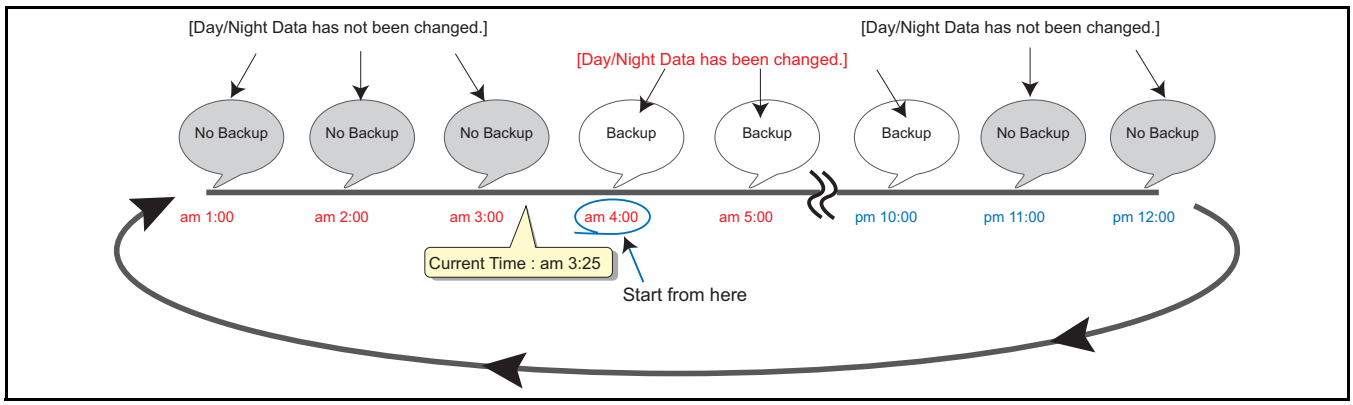
Bit 3	Bit 2	Bit 1	Backup Cycle
0	0	0	every 2 hours (default)
0	0	1	every 1 hour

Bit 4: Standard Time for Starting Backup, 0/1 = 0/1 (hour)
Bit 5: Standard Time for Starting Backup, 0/1 = 0/30 (minutes)

[Example for the setting of day/night data automatic backup cycle]

"AM 3:25" as current time:

if setting the standard time for starting backup as "AM 1:00" and backup cycle as "every 1 hour":



<Data Setting>

ASYDL, SYS1, Index 1120, Bit 4=0, Bit 5=1: Standard Time for Starting Backup is "AM 1:00"

ASYDL, SYS1, Index 1120, Bit 1=1: Day/night data is backed up every 1 hour from "AM 1:00" above.

<Backup Execution Time>

Because current time is "AM 3:25", the first backup will be executed at "AM 4:00". The backup will continues to be executed every 1 hour from now on. The automatic backup into CF card is not executed unless the Day/Night information is changed.

Ex: Automatic Backup Activation Time Table for Day/Night Data

Time	Standard Time for Starting Backup (ASYDL, SYS1, Index 1120)							
	Bit 5=0 (0 h) Bit 4=0 (0 min)		Bit 5=0 (0 h) Bit 4=1 (30 min)		Bit 5=1 (1 h) Bit 4=0 (0 min)		Bit 5=1 (1 h) Bit 4=1 (30 min)	
	0:00		0:30		1:00		1:30	
	Bit 1,2,3=0 (Every 2 hours)	Bit 1=1, Bit 2,3=0 (Every 1 hour)	Bit 1,2,3=0 (Every 2 hours)	Bit 1=1, Bit 2,3=0 (Every 1 hour)	Bit 1,2,3=0 (Every 2 hours)	Bit 1=1, Bit 2,3=0 (Every 1 hour)	Bit 1,2,3=0 (Every 2 hours)	Bit 1=1, Bit 2,3=0 (Every 1 hour)

14. IP Related Data Setting

14.1 IP Station Data

This section describes basic data assignment of IP station such as DT800/DT700 Series, DtermIP and Soft Phone.

Note: For the data assignment of SP Controlled SIP terminals, refer to SP CONTROLLED SIP TERMINAL [S-168] in Chapter 3.
For data assignment of stations accommodated in Analog MC, refer to the Peripheral Equipment Description (IP Devices).
For data assignment of stations accommodated in UG50, refer to the Peripheral Equipment Description (UG50).

Note: IP Terminal Automatic Assignment Function is not supported by SIP Multiple Line Terminal.

Note: In the UMGi system, all of Internal PHE, MPH, SP-PHD and IP stations must be accommodated in the same node (CCN/RN).

Programming

STEP 1: **ASYDL** - SYS1, Index 811, Bit 0 to Bit 7. Assign Tone Code by countries.
For the data assignment of Tone Code by countries, refer to page 124.

SYS1, Index 959, Bit 0 to Bit 7. Assign the cycle of periodic Health Check
00 = 60 seconds (Default)
01-FE = 1-254 seconds
FF = Health Check is not required.
* between PHD and IP stations: Values assigned by the above System Data.
between System and PHD: (Values assigned by the above System Data) x 1.5

Note: This data is required only when using SR-MGC.

SYS1, Index 880, Bit 3=1 (Internal PHE is valid)

SYS1, Index 885, Bit 7=1 [SP (Signaling Processor) implementation]

STEP 2: **ANPD** - Assign 1st Digit Code of Station Number and the total digit number of Station Number or "ACC" to be specified by ASPA. For details, see "4. Station Data" in this Chapter.

STEP 3: **ASPA** - Assign the Access Code of Station Number. For details, see "4. Station Data" in this Chapter.

STEP 4: **ALIDL** - Assign the Internal PHE and SP-PHD accommodated locations (LENS) data. Refer to "14.8 PAD/EC Control IP/PHC Support".

STEP 5: **AISTL** - Assign the IP Station data of each IP Station.

TN: Tenant Number [1-63]

IP STN: Station Number of each IP Station (a maximum of 5 digits)

KIND: Select either item in combo box, referring to the following table.

TERMINAL	ITEM
DT800 Series/DT700 Series, DtermIP (SIP)	SIP MultiLine TEL
DtermIP (Proprietary Protocol), IP Enabled Dterm	DtermIP
Soft Phone (SIP)	SIP SoftPhone
Soft Phone (Proprietary Protocol)	Soft Dterm
DtermIP INASET	INASET

TEC: "TEC (Telephone Equipment Class)" for IP Enabled Dterm designation.
TEC 12 = Dterm (voice)/13 Connection to data terminal via Dterm (using adapter)
TEC 16 = Data Terminal via Data Module

RSC: Route Restriction Class [0-15]

SFC: Service Feature Restriction Class [0-15]

LENS: IP Station Equipment Number. Allocate the IP Enabled Dterm to the LENS (Physical PIR or Virtual PIR **Note 1**) of vacant Slot on which the Station/Trunk is not mounted. (IP Stations cannot be assigned to the already registered Station in duplicate.)

Note 1: IP Stations can be allocated on a physically non-existent PIR (called Virtual PIR). When using Virtual PIR, the particular data assignment is required. For more details, refer to "14.8 PAD/EC Control IP/PHC Support" in this Chapter.

STEP 6: **ALOCL**- Assign the Location ID data. Each IP Station is given a "Location ID" that identifies it's location within the network, per a network address basis. By using this Location ID, IP Services such as PEER TO PEER BANDWIDTH CONTROL [P-75] and ToS Control can be provided for each IP Station.

TYPE: Select "Network Address".

IP ADDRESS: Assign the IP Address. For the System (IPPAD), assign "0.0.0.0."

MASK BIT: Assign the MASK BIT in the range 1-31 except when IP ADDRESS 0.0.0.0 is determined. When IP address = 0.0.0.0, MASK BIT = 32 is automatically assigned.

LOC-ID: Assign any number in the range 0-4095, associated with the IP address assigned in the IP ADDRESS parameter. When 0.0.0.0 is assigned in the IP ADDRESS parameter, LOC-ID is automatically set to "0" (the value cannot be changed).

Note: LOC-ID=0 is predetermined to the location ID of System (IPPAD).

- Check the Setting Type of Signaling Packet Service check box to assign the following ToS for Signaling Packet data.

Note: If the check box is not selected, the default settings (IP PRECEDENCE: Priority = 6, Low Delay = 0, Through put = 0, Reliability = 0, Min Cost = 0) will be provided.

Select either “IP PRECEDENCE” or “DIFFSERV”.
When IP PRECEDENCE is selected:
Priority (PRECEDENCE / DSCP): Specify the precedence in the range 0-7 (low-high).
Low Delay: Place a checkmark in the checkbox to set Low Delay to ON.
Through put: Place a checkmark in the checkbox to set High Throughput to ON.
Reliability: Place a checkmark in the checkbox to set High Reliability to ON.
Min Cost: Place a checkmark in the checkbox to set Cost Precedence to ON.
When DIFFSERV is selected:
Priority (PRECEDENCE / DSCP): Specify the DSCP in the range 0-63.

STEP 7: **AIVCL**- Assign the IP service Voice Control data.
A LOC-ID: Location ID of the self-location. (0-4095)
B LOC-ID: Location ID of the target location. (0-4095)

Note: LOC-ID=0 is used for the Location ID of System (IPPAD).

Note: Only the Location ID corresponding to the network address can be assigned on the AIVCL/AIVCN when assigning settings for locally programmed terminals. The Location IDs corresponding to FPC or STN cannot be assigned.

[Setting of Jitter Buffer]
Select the Setting of Jitter Buffer check box to assign the following Jitter Buffer data.

Note: If the check box is not selected, the default setting (JB MIN = 1 (10ms), JB MAX = 30 (300ms)) will be provided.

JB MIN: Jitter Buffer minimum value
JB MAX: Jitter Buffer maximum value

[Setting Type of Voice Packet Service]
Select the Setting Type of Voice Packet Service check box to assign the following ToS for Voice Packet data.

Note: If the check box is not selected, the default settings (IP PRECEDENCE, Priority (PRECEDENCE/DSCP) = 5, Low Delay = 0, Through Put = 0, Reliability = 0, Min Cost = 0) will be provided.

Choose either IP PRECEDENCE or DIFFSERV from the drop-down list box.
When IP PRECEDENCE is chosen:
Priority (PRECEDENCE / DSCP): Specify the precedence in the range 0-7 (low-high).
Low Delay: Place a checkmark in the checkbox to set Low Delay to ON.
Through Put: Place a checkmark in the checkbox to set High Throughput to ON.
Reliability: Place a checkmark in the checkbox to set High Reliability to ON.
Min Cost: Place a checkmark in the checkbox to set Cost Precedence to ON.
When DIFFSERV is chosen:
Priority (PRECEDENCE / DSCP): Specify the DSCP in the range 0-63.

[Setting of Payload]

Select the Setting of Payload check box to assign the following Payload data.

PRI1-PRI4: Select a payload type (TYPE) and payload size (SIZE) in order of precedence (PRI1(high) → PRI4 (low))

TYPE (Payload Type):

- •G.711
- •G.729a
- •G.723.1 (5.3K → 6.3K)
- •G.723.1 (6.3K → 5.3K)
- •G.722 **Note 1**, **Note 2**
- •AMR-NB **Note 1**
- •AMR-WB **Note 1**
- •G.711 μ law (FEC) **Note 1**, **Note 3**
- •G.711 A law (FEC) **Note 1**, **Note 3**
- •G.729a (FEC) **Note 1**, **Note 3**
- •G.722 (FEC) **Note 1**, **Note 3**
- •AMR-NB (FEC) **Note 1**, **Note 3**
- •AMR-WB (FEC) **Note 1**, **Note 3**

Note 1: These Payload Types is available for DtermSP30 Version 15. These data are effective only for the connection between DtermSP30s Version 15.

Note 2: Payload Type G.722 has been effective for the following connections in addition to the connection between DtermSP30s Version 15:

- The connection between DT800 Series (DT830/DT830G)
- The connection between DT700 Series (DT730/DT730G/DT750)
- The connection between DtermSP30 Version 15 and DT700 Series (DT730/DT730G/DT750)

Note 3: When Payload Type with “FEC” is selected, the data that is not transmitted correctly because of packet loss or bit error can be corrected according to the redundant data by the method of Forward Error Correction (FEC).

SIZE (Payload Size):

- •10ms
- •20ms
- •30ms
- •40ms
- •60ms

Note: For available payload type/payload size, refer to “Bandwidth Required for Voice Traffic” in CHAPTER 3 IP EQUIPMENT of System Description.”

Note: Soft Client SP350 in R3 or earlier cannot be used as ACD terminal.

Note: When no data related to Payload is set, default value (Type: G.711 (A/u), Size: 40 milliseconds) is used.

Note: If payload type G.711 is specified to more than two priorities in PRI 1 through PRI 4, assign different payload size to each priority.
- When payload types G.723.1 (5.3K → 6.3K) and G.723.1 (6.3K → 5.3K) are to be assigned on the same terminal, specify the same value to the payload size of both types.
- It is not necessary to assign the payload type/size to all priorities. Specifying the first priority only is allowed.

[Setting of PAD]

Select the "Setting of PAD" check box to assign the following PAD data.

KIND1: PAD value for the IP terminal (0-15)

INPUT DATA	0	1	2	3	4	5	6	7	8	9-15
dB	No PAD Control	2 dB	4 dB	6 dB	8 dB	10 dB	12 dB	14 dB	16 dB	PAD OFF (0 dB)

KIND2: PAD value for Analog/Digital MC (0-3) Refer to Peripheral Equipment Description.
KIND3: PAD value for IPPAD card (0-15)
For details on IPPAD PAD data assignment, refer to the Appliance Model Installation Manual.

[Setting of Echo Canceller]

Select the "Setting of Echo Canceller" check box to assign the following Echo Canceler data.

Select the Echo Canceler value by clicking one of the following radio buttons:
- A EC-ON/B EC-ON
- A EC-ON/B EC-OFF
- A EC-OFF/B EC-ON
- A EC-OFF/B EC-OFF

Note: When the same value is assigned to both the A LOC-ID and B LOC-ID parameters, select either A EC-ON/B EC-ON or A EC-OFF/B EC-OFF.

STEP 8: **AKYD** - Assign My Line, Multi Line or desired feature to each Line/Feature Key on IP station. **Note 4**, **Note 5**

Note 4: For Soft Phone, be sure to assign the following key data to a Programmable Feature key/Flex key of the Soft Phone.
- SPEAKER (When the Flex key data has been changed)
- LOGOUT
- CALL FORWARDING - BUSY LINE (When using the Call Forward Settings Panel of the Soft Phone)
- CALL FORWARDING - ALL CALLS (When using the Call Forward Settings Panel of the Soft Phone)
- CALL FORWARDING - DON'T ANSWER (When using the Call Forward Settings Panel of the Soft Phone)
- CALL FORWARDING - LOGOUT (When using the Call Forward Settings Panel of the Soft Phone)
- that you do.

Note 5: For DtermIP INASET, same number must be assigned to the parameters STN and PL STN.

STEP 9: **ADSL** - Assign desired feature to each Soft Key of IP station. For DtermIP INASET, assign the default URL (within 191 characters) to the "Default URL" parameter of ADTM as necessary.

STEP 10: **ADKS** - Assign the Soft key Pattern (which is assigned by the ADSL command) onto IP station. For Soft Phone, be sure to assign "3 (ALL Line/Feature buttons)" to the "LKP" parameter.

<IP Terminal Automatic Assignment Function>

IP station data (Station/Telephone Number, MAC address, LENS) of IP stations can be easily registered by key operation on each IP station, without PCPro commands AISTL, ALGSL, and AMAC manual assignment for every station by maintenance personnel.

By connecting IP station (whose station number and MAC address have not been assigned yet) to LAN, IP station data can be registered/deleted automatically using the specified password and Station/Telephone Number as login ID.

Operating Procedure

To register new IP station data

1. Connect a not-registered IP station to LAN. (Or on any registered IP station in logout state, turn the LCD to password entry indication of Login Mode).
2. Enter the following.
   Login ID: Station Number/Telephone Number to be allocated to the connected IP station (Use a Station/Telephone Number complying with the assigned numbering plan.)
   Password: Password for Registration (assigned by the AEAAL command)
3. The IP station turns login state, and the IP station data is automatically assigned. When MAC address automatic registration function is available, the MAC address is also automatically registered.

To delete the registered IP station data

1. On any IP station in logout state, turn the LCD to password entry indication of Login Mode.
2. Enter the following.
   Login ID: Station Number/Telephone Number to be deleted
   Password: Password for Deletion (assigned by the AEAAL command)
3. The IP station turns logout state, and the specified station data is automatically deleted. (MAC address must be manually deleted by the AMAC command.)

Service Conditions

1. Different number of digit cannot be assigned as Station Number/Telephone Number.
2. A maximum 16 digits of Telephone Number can be assigned in LDM data. NDM data is not available.
3. IP station data cannot be registered to the LENS whose mounting status has not been assigned by system data (ASYD, SYS1, Index 198 to Index 205).
4. MAC address automatic registration function is available when the check box "MAC address is registered" is checked on "Password for registration class instruction" tab of the AEAAL command, depending on the selected Template ID.

5. The result of IP station data registration can be output as history (system message), depending on the setting of the selected Template ID. System message is always output for the execution of IP station data deletion.
6. The password for registration/deletion must be assigned to fixed 10 digits (0-9, *, #).
7. Because DRS reads the password data periodically, there is a case to take a while to make the changed data effective.
8. IP station key data assignment is not covered by this function.
9. On "Station LENS range" tab of AEAAL command, vacant LENS can be searched up to 64 times.
10. On "Physical station number range" tab of AEAAL command, vacant Station Number can be searched up to 100 times per range.
11. MAC address cannot be deleted in the operation of IP station data deletion by this function. Delete the MAC address of deleted IP stations by the AMAC command.
12. When "Physical station number range" tab is used, login ID on IP station is considered as Telephone Number.
13. The IP station turns Login Mode operation after the IP station data is registered by this function.
14. The message "Station Deleted" is displayed on the LCD when succeeded in deleting the IP station data.
15. When multiple Station data sets (the MAC Address is registered checkbox on AEAAL is checked) are assigned from a terminal, only the first assigned station data set includes MAC address. The other station data sets will not have MAC address. (All data except MAC address is assigned, and "Normal" is displayed in the System Message.)
16. The MAC Address is registered checkbox on AEAAL is basically checked when Station data is assigned from each terminal.

Note: When the MAC Address is registered (checkbox on AEAAL is checked) and multiple Station data sets are assigned from a terminal, assign LOGOUT (FKY: 142) to a Soft Key on the IP station. (ADSL, except SKP=0)

Programming

STEP 1: **ANPD/ANPDL** - Assign 1st Digit Code and the total digit number (NND) of Station/Telephone Numbers.

STEP 2: **ASPA/ASPAL** - Assign the Access Code of Station/Telephone Number, using the 1st DC specified by ANPD.

STEP 3: **AEAAL** - Assign the IP Terminal Automatic Data.

<Password for registration class instruction tab>

ID: Template ID [1-30]
A maximum of 30 patterns of template can be registered. Click the Get button to read out the assigned data of entered Template ID.
Password: Password for Registration [10 digits fixed (0-9, *, #)]
TN: Tenant Number [1-63]
RSC: Route Restriction Class [0-15]
SFC: Service Feature Restriction Class [0-15]
MAC Address is registered: Click the check box ON when MAC address registration is required.
Log is displayed: Click the check box ON when system message output is required.

<Password for deletion tab>

Password: Password for Deletion [10 digits fixed (0-9, *, #)]

<Station LENS range tab>

Start/End LENS: Specify the range of LENS (virtual accommodate location of IP station).

<Physical station number range tab>

Start/End STN: Specify the range of Station Number to be allocated to the IP station.

Note: This tab is available only when Telephone Number is used as Login ID on IP station.

14.2 Consideration for Connecting an IP Station to a PSTN (Analog and ISDN)

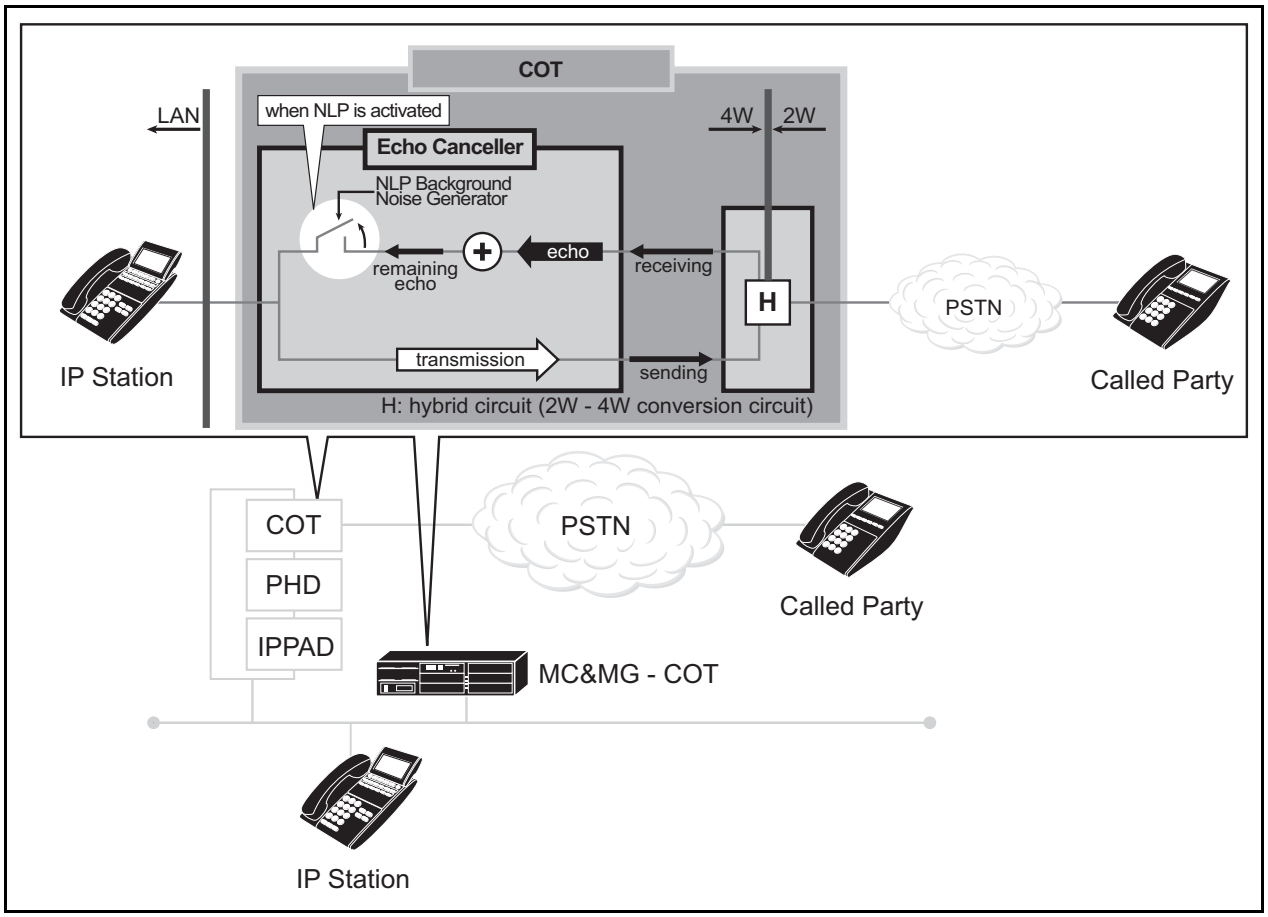
Voice quality for connecting an IP Station to a PSTN is explained below.
IP Station may be connected to a PSTN through the following methods:

- Connecting to an analog network (using MC&MG-COT / COT circuit card)
- Connecting to an ISDN network (using MG(PRI) / MG(BRI) / PRT circuit card)

When comparing voice quality between connections to an analog network and an ISDN network, the following voice quality deterioration may occur in an analog network:

(a) High possibility for echo to occur at beginning of speech (due to hybrid circuit wraparound)

(b) Audio breakup may occur during double talk (when both parties talk at once) since there is huge loss.



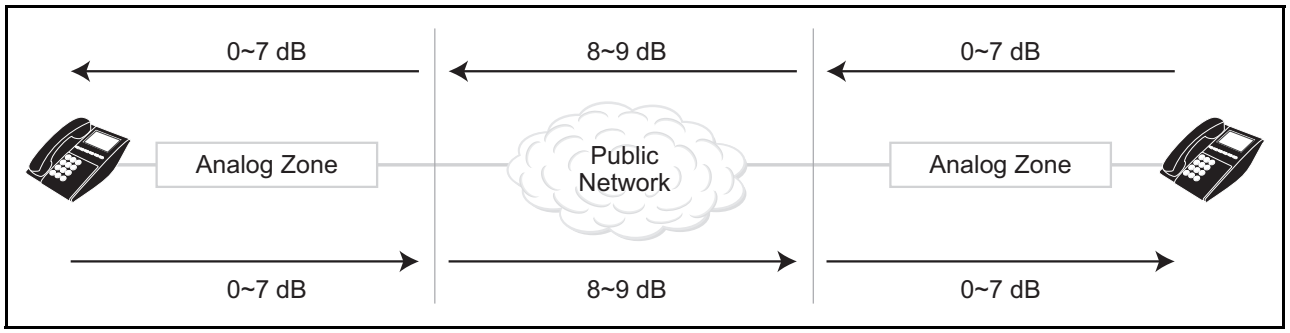
Hence, when voice quality equivalent to a legacy station is desired for an IP station connected to a PSTN, ISDN connection is recommended.

(1) Reasons for voice quality deterioration in an analog network (mechanisms for counter party's audio break-up)

When echo occurs during speech, echo is canceled by Echo Canceller. However, complete cancellation of echo is impossible since non-linear distortion cannot be completely avoided in the echo path.

Therefore to remove the echo that was not canceled by Echo Canceller, remaining echo is made inaudible by cutting the voice in Non Linear Processor (NLP) circuit. NLP operates, as a basic rule, while the caller from an IP station terminal is talking and the voice received from the other terminal is below a specific threshold.

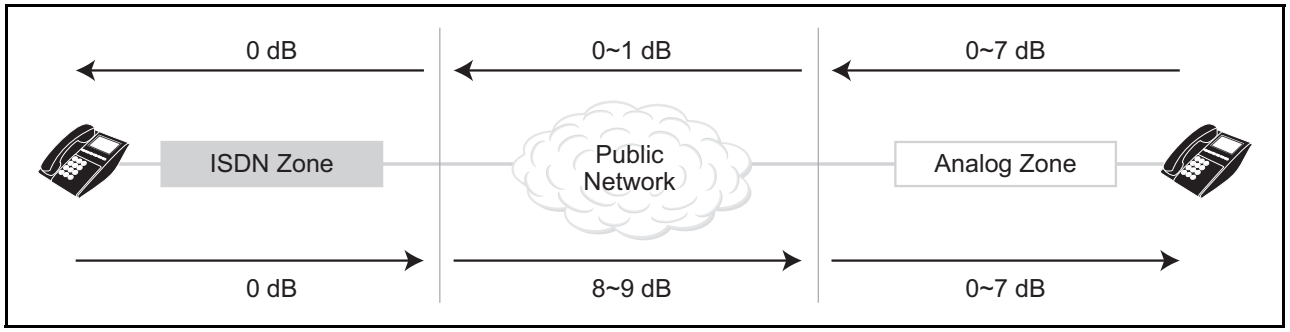
Audio breakup during connection to an analog circuit tends to have large remaining echo due to large wrap-around in the hybrid circuit. Audio breakup occurs when the counter party's voice from an analog circuit is below NLP's threshold, activating the NLP.



(2) Voice quality for analog network and ISDN network

Voice quality, when connected to a PSTN, is affected by the counter party's level of transmission. This value of loss greatly affects the activation of Echo Canceller NLP. The value of loss is as follows:

- Analog Network: approximately 23 dB (there are instances when it is above this level)
- ISDN Network: approximately 8 dB (there are instances when it is above this level)



Since ISDN network does not have much loss, rate of counter party's voice recognition is high and it smoothly detects double talk. Therefore far less audio breakup is caused by NLP.

- Analog network to analog network connection

In both directions, there is a maximum loss of 23 dB (in analog zone, loss may be over 7dB).

- ISDN network to analog network connection

In ISDN network to Analog network, there is a maximum loss of 16 dB (in analog zone, loss may be over 7dB). In Analog network to ISDN network, there is a maximum loss of 8dB (in analog zone, loss may be over 7dB).

Note: Loss from this direction greatly affects the activation of Echo Canceler's NLP.

(3) Considerations for data assignment

If the above audio deterioration occurs in an IP station, make the following adjustments.

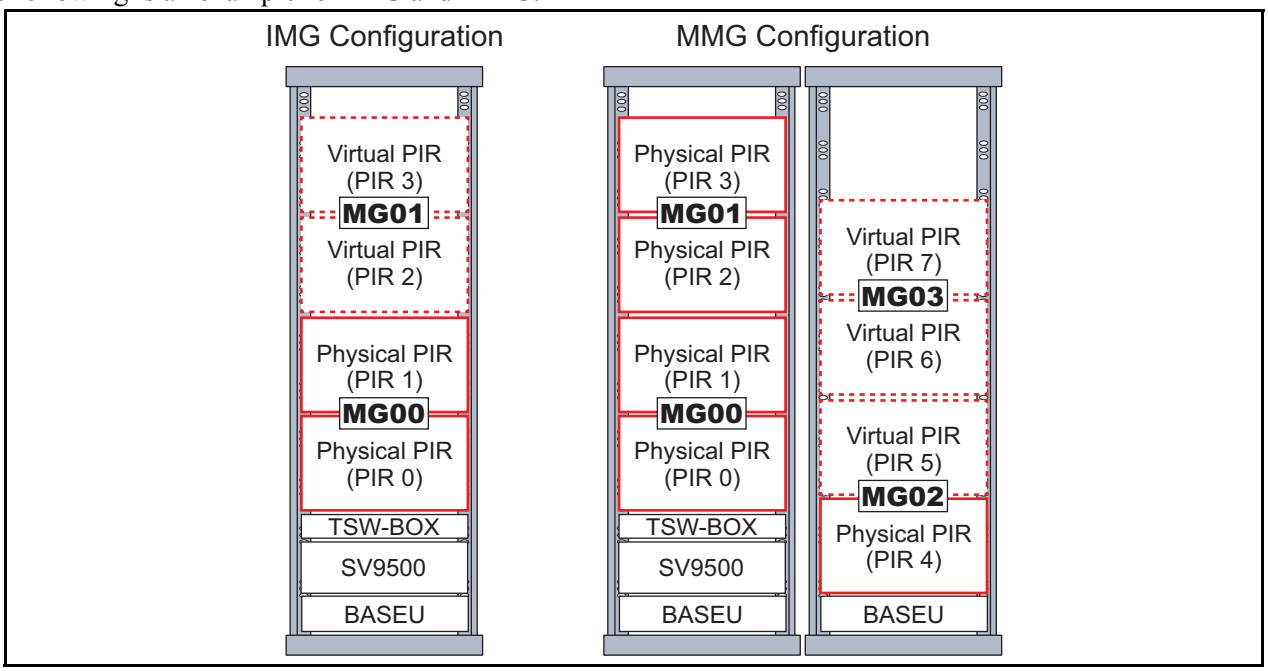
(a) Adjust the Balancing Network (BNW) of MC&MG-COT/UG50 (COT-TYPE1)/UG50-4LC2COTA (COT) COT circuit card.

How to adjust the Balancing Network (BNW)

For MC&MG-COT	See Peripheral Equipment Description (IP Devices): CODEC_COEF_MG of SET (MG side) command for each MC&MG-COT
For UG50 (COT-TYPE1)/UG50-4LC2COTA (COT)	See Peripheral Equipment Description (UG50): CODEC Filter Data Setup for each COT Card
For COT circuit card	See Circuit Card Description

(b) Use APDIL command to decrease the IP station's transmission (IP station: MC&MG-COT/COT circuit card) level to approximately 6-8 dB.

14.3 Virtual PIR Data



The following data can be assigned in a physically non-existent PIR (called Virtual PIR). When using Virtual PIR, the System can accommodate a maximum number of the lines with a minimum of hardware configuration.

- Virtual line (Desktop terminal Multiple Line)
- IP station data
- Internal PH
- Media Gateway (MG)
- PS station data

Note: System Initialization is required after deleted the Virtual PIR.

Note: For the IMG/MMG system: up to 4,000 lines (for IP stations) can be accommodated. For the UMGi system: up to 16,000 lines (for IP stations) can be accommodated.

The following is an example for IMG and MMG.

Service Conditions

1. The existing Virtual PIR data cannot be deleted while the System is in On-Line mode (The existing virtual PIR data must be deleted during the Off-Line mode). After deleting the Virtual PIR data, the System must be initialized.
2. IP Station data (by AISTL) cannot be assigned to the G24-G31 of Virtual PIR.
3. The Unit Data assignment (by AUNT) is required for the Virtual PIRs as well as the Physical PIRs. Also, system initialization is required if any change is made on the office data by the AUNT command.
4. When the Virtual PIR data is assigned to the physically non-existent LP via System data (ASYD, SYS1, Index 198 to Index 205), assign the Virtual PIR data in sequence (IMG 1 → IMG 15). **Note 1**
5. When the data programming procedure described in the Data Programming is not maintained, the System Message (4-D: TSW Ready Failure) may be output.

6. TSW data setting is not required for Virtual PIRs.

Note 1: ASYD, SYS1, Index 200 (IMG (LP) 4 and IMG (LP) 5) to Index 205 (IMG (LP) 14 and IMG (LP) 15) are only for UMGi system.

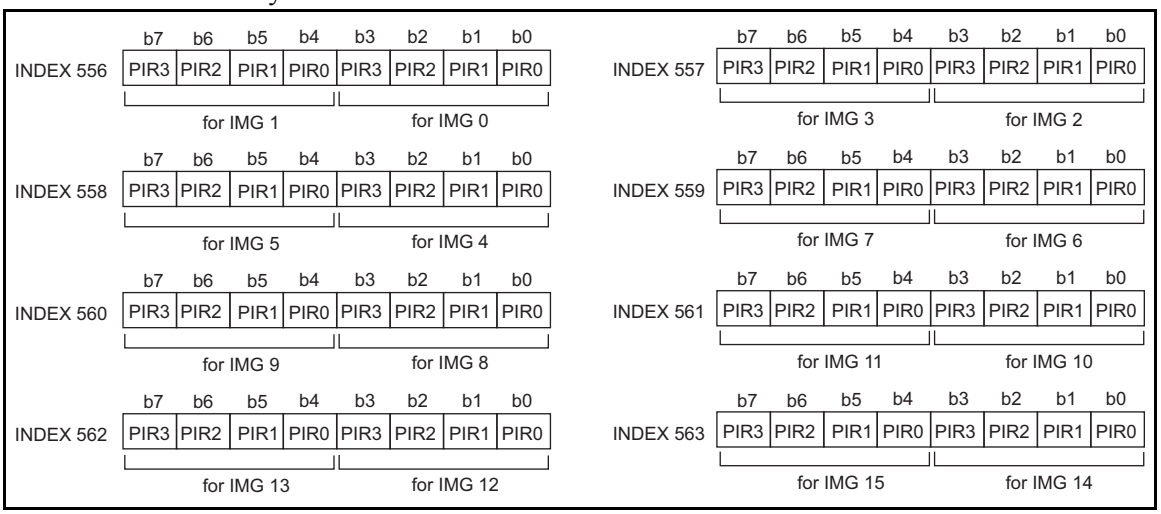
Programming

STEP 1: **ASYD** - Assign the number of Module Groups.

SYS1, Index 0 (01 HEX ~ 20 HEX (MG00 ~ 31)).

Note: Required to be set for both Physical PIR and Virtual PIR.

STEP 2: **ASYD** - Assign the Mounting Status for IMG (LP) 0 to IMG (LP) 15 (SYS1, Index 198 to Index 205).



SYS1, Index 198. Mounting Status for IMG (LP) 0 and IMG (LP) 1.
SYS1, Index 199. Mounting Status for IMG (LP) 2 and IMG (LP) 3.
SYS1, Index 200. Mounting Status for IMG (LP) 4 and IMG (LP) 5.
SYS1, Index 201. Mounting Status for IMG (LP) 6 and IMG (LP) 7.
SYS1, Index 202. Mounting Status for IMG (LP) 8 and IMG (LP) 9.
SYS1, Index 203. Mounting Status for IMG (LP) 10 and IMG (LP) 11.
SYS1, Index 204. Mounting Status for IMG (LP) 12 and IMG (LP) 13.
SYS1, Index 205. Mounting Status for IMG (LP) 14 and IMG (LP) 15.

Note: Required to be set for both Physical PIR and Virtual PIR.

Note: ASYD, SYS1, Index 200 to Index 205 are only for UMGi system.

STEP 3: **ASYDL** - Assign the Virtual PIR data (SYS1, Index 556 to Index 563).

Each Bit: 0/1 = Physical PIR/Virtual PIR

Note: Only in the case where a physical PIR is installed, the related bit in Index 556 to Index 563 must be 0. In all other cases, the bit must be 1. Be sure to match the setting of ASYDL, SYS1, Index 556 to Index 563 and the actual installed configuration.

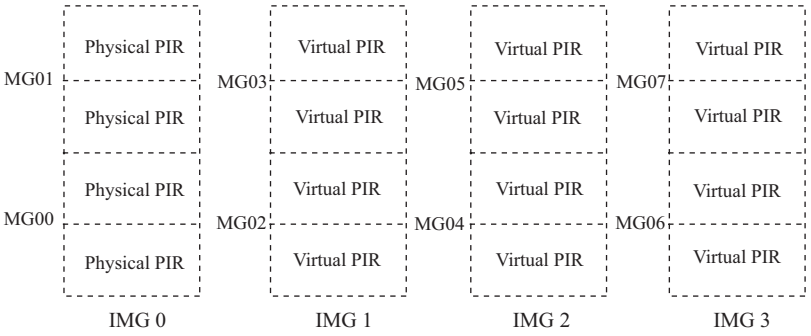
Note: ASYDL, SYS1, Index 558 to Index 563 are only for UMGi system.

STEP 4: **ASYDL** - Assign the UNIT data (SYS1, Index 1026 to Index 1033).

SYS1, Index 1026. UNIT use on MG00-MG03.
SYS1, Index 1027. UNIT use on MG04-MG07.
SYS1, Index 1028. UNIT use on MG08-MG11.
SYS1, Index 1029. UNIT use on MG12-MG15.
SYS1, Index 1030. UNIT use on MG16-MG19.
SYS1, Index 1031. UNIT use on MG20-MG23.
SYS1, Index 1032. UNIT use on MG24-MG27.
SYS1, Index 1033. UNIT use on MG28-MG31.

Note: Required to be set for both Physical PIR and Virtual PIR.

Note: ASYDL, SYS1, Index 1028 to Index 1033 are only for UMGi system.

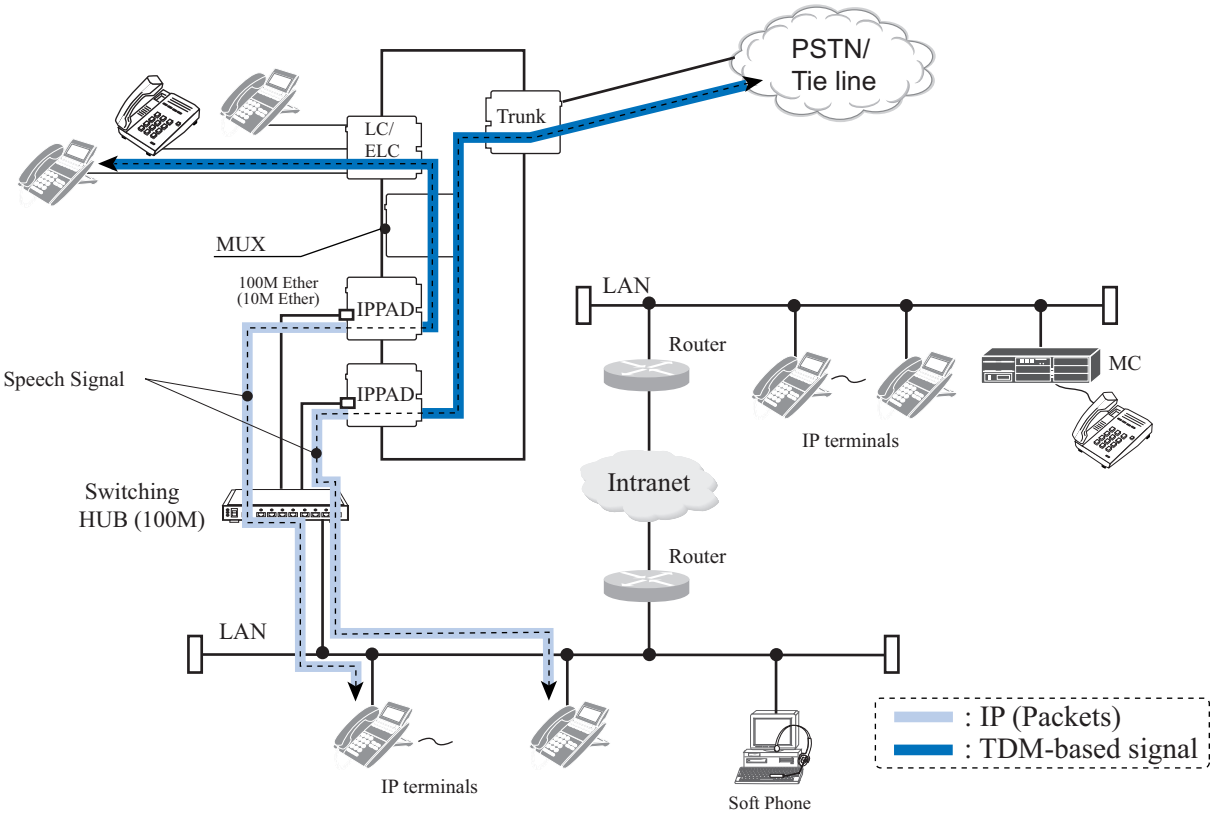


STEP 5: **AUNT** - Assign the Unit data.

MG = Module Group Number
TYPE: 1 (Select 1 for Unit data assignment)
UNIT0: 1 (Unit 0 is used)
UNIT1: 1 (Unit 1 is used)
UNIT2: 1 (Unit 2 is used)
UNIT3: 1 (Unit 3 is used)

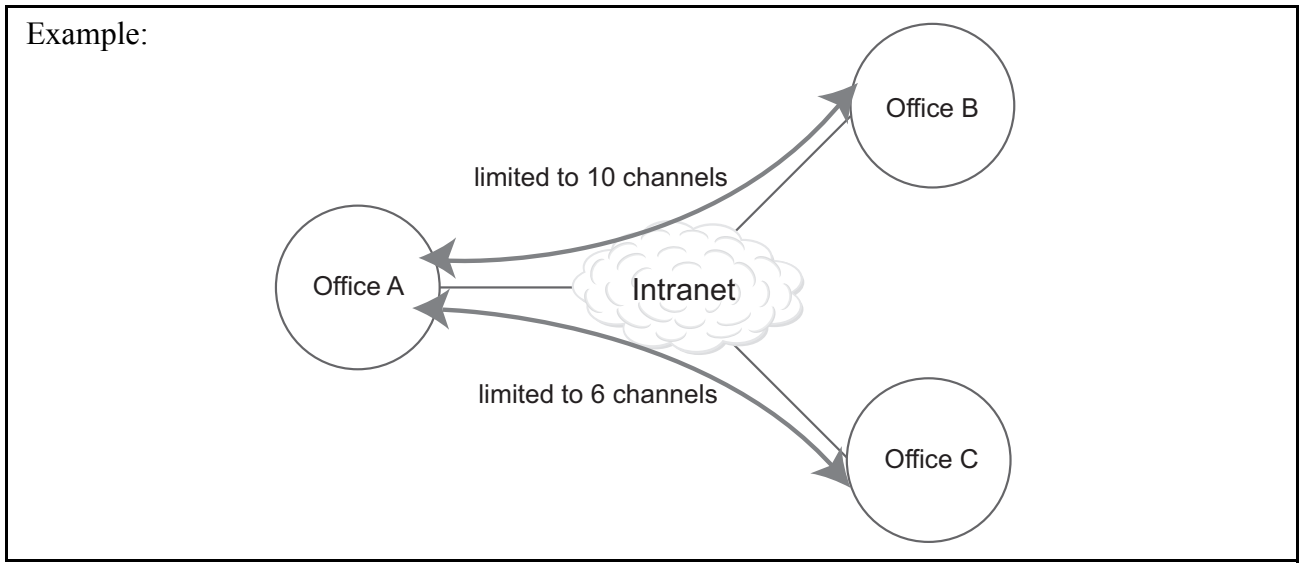
Note: Required to be set for both Physical PIR and Virtual PIR.

Note: System initialization is required for the change to take effect.



The following figure shows an example data assignment for the System including the Virtual PIR. At this time, the Unit data must be assigned for both the Physical PIR and the Virtual PIR.

1. ASYDL, System Data 1, INDEX 556 = F0 Hex
   INDEX 557 = FF Hex
   INDEX 1026 = FF Hex
   INDEX 1027 = FF Hex
2. ASYD, System Data 1, INDEX 0 = 08 Hex
   INDEX 198 = 11 Hex
   INDEX 199 = 11 Hex
3. AUNT
   MG = 00-07
   TYPE = 1 (Line/Trunk)
   UNIT 0 = 1 (UNIT 0 is used)
   UNIT 1 = 1 (UNIT 1 is used)
   UNIT 2 = 1 (UNIT 2 is used)
   UNIT 3 = 1 (UNIT 3 is used)



14.4 IPPAD Data

This section explains how to program the connection trunk data for IPPAD (IP Packet assembly/disassembly) circuit card. This circuit card is necessary when a call is to be established between the TDM-based Conventional Telephones/Network and IP terminals. At this time, IPPAD provides a gateway function: Voice Signal (IP Packets) sent from the LAN is disassembled as the TDM-based Signal, and the opposite directions assembled into the IP Packets. A maximum of 32 calls can be dealt with per IPPAD Card. A connection block diagram is shown below:

IPPAD: IP Packet Assembly/Disassembly (CH-IPDA for 7U-PIR, PA-32IPDA/PA-32IPDB for 8U-PIR)

It is available to limit the number of channels to be used for IPPAD per network.

The number of channels that are processed depends on codec and payload cycle used by this card. Therefore, adjustments will be needed, such as placing unnecessary channels into the Make Busy status.
See "VoIP Encryption [V-27]" for the number of available channels on the encryption status of this card.

Service Conditions

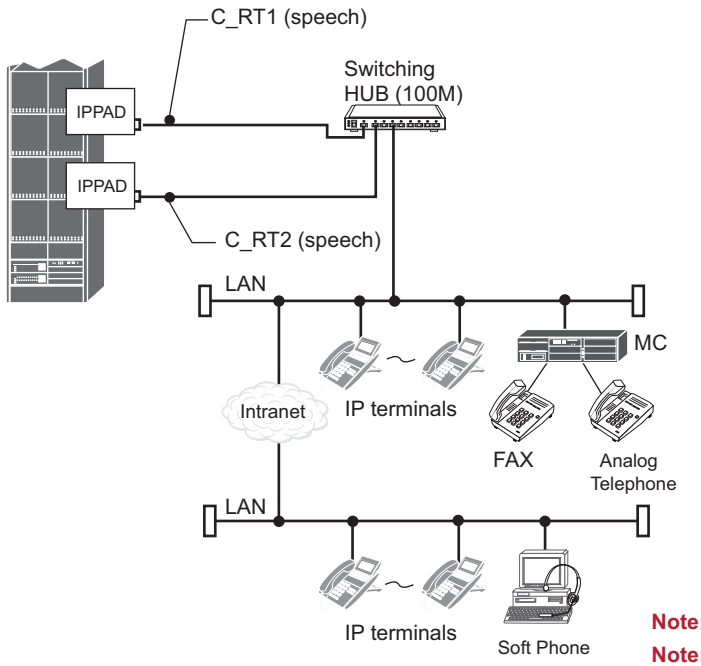
<Important Notices>

In case of performing voice signal compression, all the IPPAD circuit cards accommodated in the System should correspond to voice signal compression. In case of using voice signal compression with FCCS over IP or CCIS over IP, all the IPPAD circuit cards accommodated in the nodes inside the network should correspond to voice signal compression.

Programming

The following are the step-by-step procedures for IPPAD data programming. As shown, each port for an IPPAD Card is assigned as the Connection Trunk using the ACRD/ACTK commands.

STEP 1: **ASYDL** - SYS1, Index 810, Bit 4: Giving Priority of IPPAD in the Same Network feature **Note 1**, **Note 2**
0: Required (Default)
1: Not Required
When ASYDL, SYS1, Index 810, Bit 4=0 (Giving Priority of IPPAD in the Same Network feature is required):
- IPPAD in the same network has top priority.
- If IPPAD in the same network is all busy or cannot be used, IPPAD in another network is used.

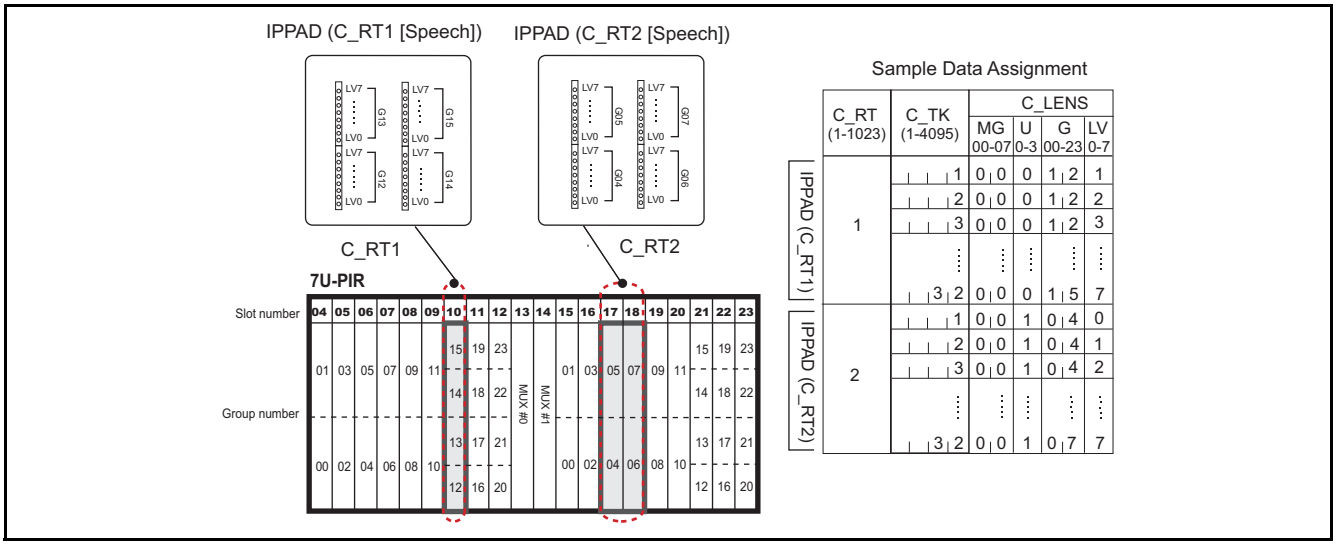


When ASYDL, SYS1, Index 810, Bit 4=1 (Giving Priority of IPPAD in the Same Network Feature is not required):
- According to the order of the assignment of Connection Route and Connection Trunk
- Using any one IPPAD in the Node, without the restriction between the networks

Note 1: This feature is also available for VLAN.

Note 2: This feature cannot be activated via the PHC.

STEP 2: **ACRD** -Assign Route Class data of Speech Routes. A sample data assignment is shown below.

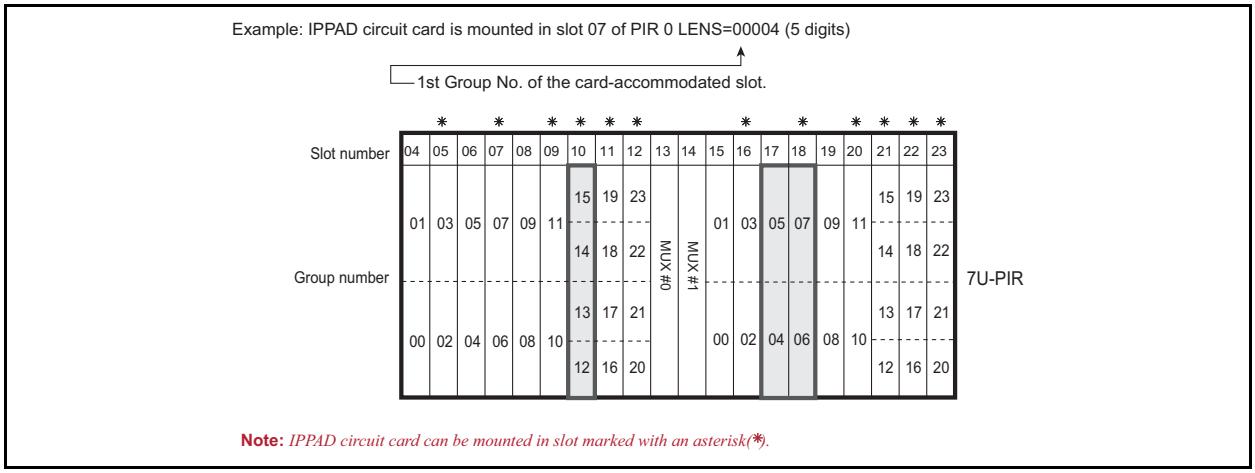


ACRD: Speech Route (LSG = 12, IPPAD = 1)

Type		Speech	Speech
CDN	C_RT	1	2
1	TF	3	3
2	TCL	4	4
3	RLP	2	2
4	SMDR	0	0
5	LSG	12	12
6	PAD		
7	TRKS	0(1)	0(1)
8	TC/EC		
9	FINT	0	0
10	FPEG	0	0
11	TC	0	0
12	MTC	0	0
13	STSEQ	0	0
14	FGH	0	0
15	MMN	0	0
16	LKIND	0	0
17	IPLYR	0	0
18	IPTRK	0	0
19	IPPAD	1	1
20	LMG	0	0

Note: This data setting is an example.
Note: "CDN20 LMG" is not used in the system.

STEP 3: **ACTK** -Assign Connection Trunk data (Connection Route, Connection Trunk and Line Equipment Numbers) of the IPPAD circuit card. A sample data assignment is shown below.



Sample Data Assignment

	C_RT (1-1023)	C_TK (1-4095)	C_LENS MG 00-07	U 0-3	G 00-23	LV 0-7
IPPAD (C_RT1)	1	1	0	0	1	2	1
		2	0	0	1	2	2
		3	0	0	1	2	3
		⋮	⋮	⋮	⋮	⋮
		32	0	0	1	5	7
IPPAD (C_RT2)	2	1	0	0	1	4	0
		2	0	0	1	4	1
		3	0	0	1	4	2
		⋮	⋮	⋮	⋮	⋮
		32	0	0	1	7	7

STEP 4: **AFPC** - For each IPPAD Connection Route assigned by the ACRD command, assign 0 (for IPPAD circuit card) to the FPC parameter.
FPC = 0 (for IPPAD circuit card)
C_RT: IPPAD Connection Route assigned by the ACRD.
FCCH: Assign "0".
P_ROUTE: Assign "0".
FCHN/FPCN: Assign "0".

STEP 5: **ALIDL** - Assign the detailed data of the IPPAD card such as Line Equipment Numbers, IP address, jitter butter, payload type/size.
LENS: Assign two-digit MG No. + one-digit Unit No. + 1st Group Number (two digits).

PH TYPE: Select IPPAD.
PH IP/IPPAD IP: Enter IP address of IPPAD card.

MASK BIT: Enter Mask Bit of IP address.
PORT: Enter the port number for control signal. (Recommendation: 61010)
REGMAX: Number of ports registered (Not used) **Note 3**
NTP_IP: IP Address of NTP Server (Not used) **Note 3**
FAX_DET: Fax Detection Timer
- •Conform to Switch Setting
- •Voice/Fax Automatic Detection
- •Fixed to Voice Mode
- •Fax Detectable Time 1 minute (Recommendation)
- •Fax Detectable Time 2 minute
- •Fax Detectable Time 3 minute
- •Fax Detectable Time 4 minute
- •Fax Detectable Time 5 minute

FAX_ECM: Specify the Fax ECM mode. (Not used) **Note 3**
FAX_TYP: Fax Mode Control Precedence (Not used) **Note 3**, **Note 4**
FAX_RATE: Fax Transmission Rate (bps)
- •14400 bps (Recommendation)
- •2400 bps
- •4800 bps
- •7200 bps
- •9600 bps
- •12000 bps

RTCP_PTN: RTCP (SR) Pattern (Not used) **Note 3**
RTCP_CYC: RTCP (SR) Cycle (fixed as 0) (5 seconds cycle)
DEF_GW IP: Enter the IP address of the default gateway. A maximum of eight IP addresses can be assigned. **Note 5**

Note 3: Since this parameter is not used, the currently displayed setting should not be changed.

Note 4: The data related to FAX should be assigned using the ARTI command with “FXPT” parameter.

Note 5: The maximum number of Default Gateway IP addresses varies depending on the firmware equipped on the IPPAD.

STEP 6: **MBCT** - Unbusy the Connection Trunk Data assigned in the previous step, by using this command.

To limit the number of channels to be used for IPPAD, use ALOCL command.

STEP 7: **ALOCL** - Assign Location ID to IP Address, PC or FPC, and then specify the connection route to be used for IPPAD.

Note: When not assigning connection route in ALOCL command, the connection routes assigned in AFPC command is used for IPPAD in the order of assignment.

- When Location ID is assigned to Network Address:

  IP ADDRESS: Enter the IP address.
  MASK BIT: Assign the mask bit in the range 1-31.
  LOC-ID: Assign Location ID to the IP address in the range of 1-4095.
  IPPAD CONNECTION ROUTE ASSIGNMENT: Place a checkmark in the checkbox.
  C_RT: Specify the connection route used for IPPAD.

- When Location ID is assigned to PC (Point Code):

Note: The IPPAD connection route assigned in the C_RT parameter is used for all CCIS over IP calls originated to the appropriate Point Code.

  PC: Enter the Point Code.
  LOC-ID: Assign Location ID to the Point Code in the range of 1-4095.
  IPPAD CONNECTION ROUTE ASSIGNMENT: Place a checkmark in the checkbox.
  C_RT: Specify the connection route used for IPPAD.

- When Location ID is assigned to FPC (Fusion Point Code):

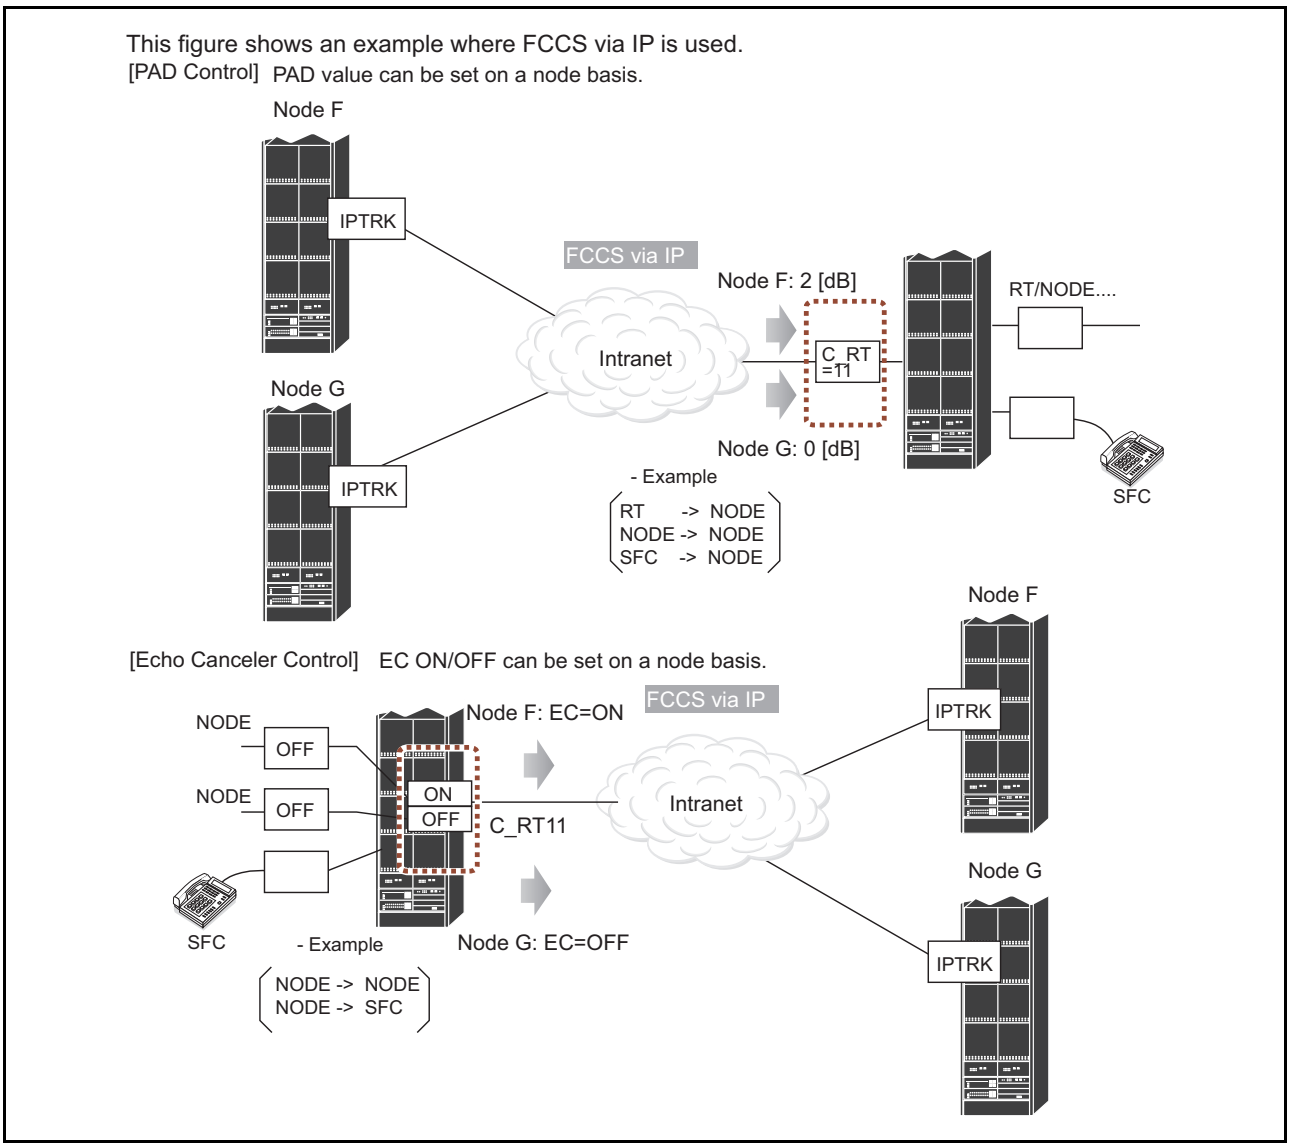
Note: The IPPAD connection route assigned in the C_RT parameter is used for all FCCS over IP calls originated to the appropriated Fusion Point Code.

  FPC: Enter the Fusion Point Code.
  LOC-ID: Assign Location ID to the Fusion Point Code in the range of 1-4095.
  IPPAD CONNECTION ROUTE ASSIGNMENT: Place a checkmark in the checkbox.
  C_RT: Specify the connection route used for IPPAD.

To delete IPPAD data

Be sure to place the MB switch to ON position (UP) on the corresponding IPPAD Card, then follow the programming steps above in reverse order.

14.5 IP Service PAD/Echo Canceler Data



This section explains how to set IP Service PAD/EC data. The data can be set on a Node basis (when using IPTRK: refer to 11.1 PAD/ EC Control on a Node basis) or a Location ID basis (when using PH-L/G, IPPAD: refer to 11.2 PAD/EC Control on a Location ID).

Note: The PAD/EC data can also be set on a route basis as usual.

14.5.1 PAD/EC Control on a Node Basis

< PAD Control and Echo Canceler Control>

PAD/EC Control on a Node Basis

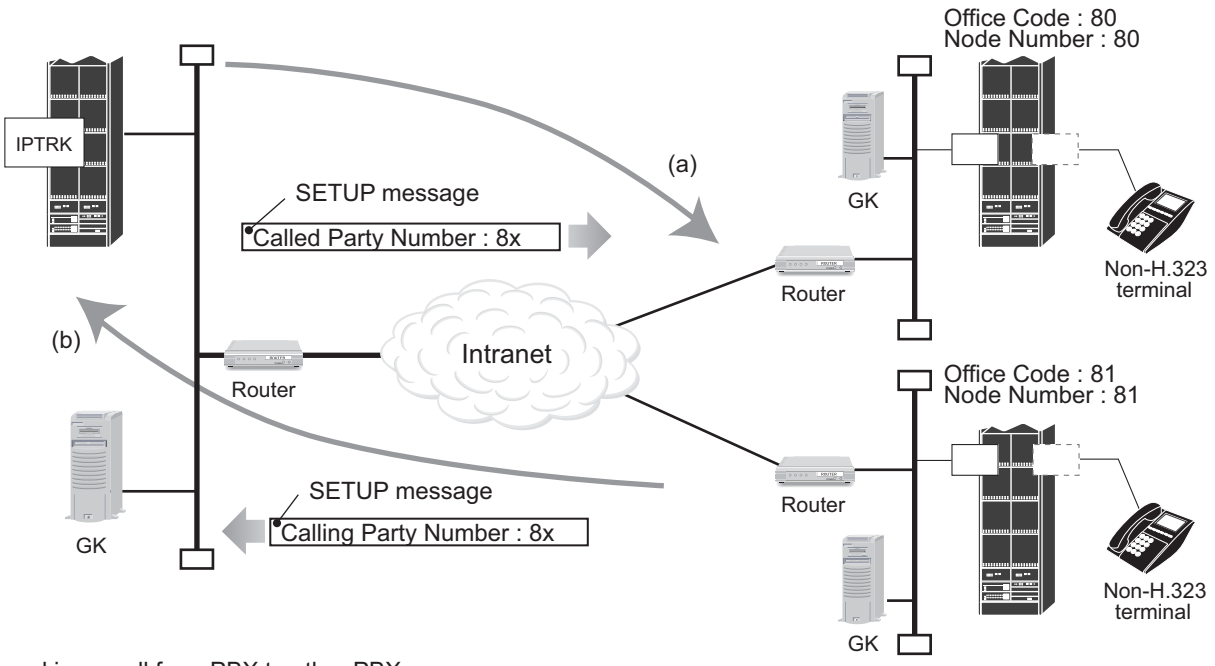
Note: FCCS Networking via IP (by IPTRK) is available only for a migrated system from the previous system.

The following is a list of the available PAD patterns:

IC Terminal Type	OG Terminal Type	IC PAD	OG PAD	DATA
RT (Trunk)	IPTRK	×	×	RT-NODE
SFC (Station/Dterm)		PAD OFF	×	NODE-SFC
ISDN Terminal		PAD OFF	×	NODE-SFC
C_RT (C_TK)		×	×	C_RT-NODE
IPTRK	IPTRK	×	×	NODE-NODE
	RT (Trunk)	×	×	NODE-RT
	SFC (Station/Dterm)	×	PAD OFF	NODE-SFC
	ISDN Terminal	×	PAD OFF	NODE-SFC
	C_RT (C_TK)	×	×	NODE-C_RT

Conditions

<PAD Control>



1. PAD data assigned by the AIPDL/AIPDN command is actually specified by the circuit card. Refer to the related explanation of the circuit card in this manual.
2. When the APADN data for FCCS Network has already been assigned, this feature is invalid.
3. When AFPD (used for "FCCS via IP") command data has already been assigned, this feature has precedence over the data assigned by the AFPD command.
4. This feature is available for External Trunk, C_TK, IPTRK only as APAD/APADN/AFPD command. (is not available for Stations.)
5. For this feature, use the Node Number which has been assigned in advance by using the ANTI.
6. When using an IPTRK, the PAD value can be set at the receive side. (Coding and decoding are performed after the PAD insertion. Therefore, the speech quality may not be guaranteed.)
7. When using the AIPDL/AIPDN by specifying SFC-NODE, use IC Terminal = NODE (IPTRK) and OG Terminal = SFC (Station). If IC Terminal = "SFC (Station)" and OG Terminal = "NODE (IPTRK)" are assigned, the data setting is invalid.
8. This feature is not available for a data call.

<Echo Canceler Control>

1. For this feature, use a Node Number that has been assigned in advance by using the ANTI.
2. When this data is not set, echo canceler data set by the ARTD/ACRD is used.
3. This feature is available for IPTRK-Station, or IPTRK-External Trunk. IPTRK-Internal Trunk such as ATI is not included. In this case, the echo canceler data of the Route Class data is used.
4. EC control is performed to an IPTRK or a Digital Trunk, it is not performed to an Analog Trunk even if any data has been set.

<When Connecting to the Telephony Server <Gateway>>

Considerations for Assigning Node Data (When Connecting to the Telephony Server <Gateway>)

(a) For making a call from PBX to other PBX:
Office code of the called party (8x) must be included to Called Party Number of the SETUP message.

(b) For making a call from other PBX terminal to PBX:
Office code of the calling party (8x) must be included to Calling Party Number of the SETUP message.

Note: FCCS Networking via IP (by IPTRK) is available only for a migrated system from the previous system.

Data Assignment in the Telephony Server:

- Assign the Access Code (8x) for other Telephony Server using the ASPAL/ASPAN and AFRSL/AFRSN.
- Do not delete the Access Code for Called Party Number using the AOPRL/AOPRN.
  (Or add the Office Code of the other Telephony Server using the AADC, after deleting the Access Code by the AOPRL/AOPRN.)

Data Assignment in "other" Telephony Server:

Perform one of the following for including the Self Office Code to the Calling Party Number:

- Assign the Self Office Code using the ARNP.

  or

- Assign Calling Number addition/deletion data using the ACNP and ACND.

By assigning the above data, PAD/EC Control data set by the ANTI becomes effective.

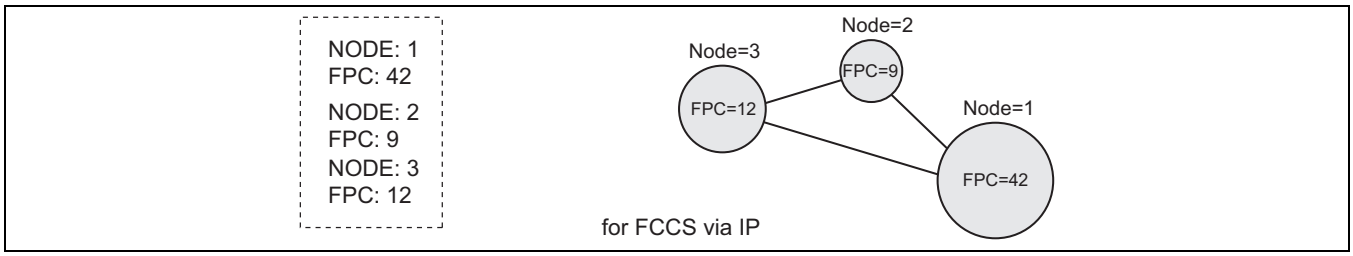
Programming

<Echo Canceler Control>

STEP 1: FCCS/CCIS via IPTRK Data Assignment

Assign Office Data for FCCS via IPTRK/CCIS via IPTRK. Refer to Programming of each service (FCCS NETWORKING VIA IP [F-36]/CCIS NETWORKING VIA IP [C-163]) in Chapter 3.

Note: FCCS Networking via IP (by IPTRK) is available only for a migrated system from the previous system.



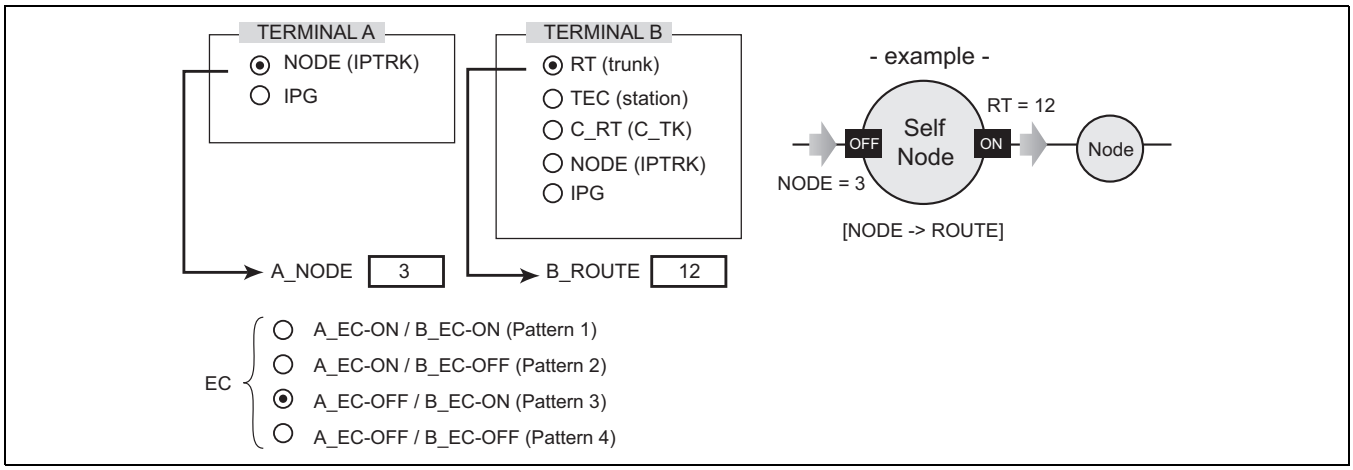
STEP 2: **ANTI** (Assignment of Node Number)

Assign a unique Node Number to each Node, using the following data depending on the system type.

FCCS over IP: FPC Number

CCIS over IP: PC

Assignment of Node Number (example - FCCS via IP)



STEP 3: **AIECL/AIECN** (Assignment of IP Service Echo Canceler Data for LDM/NDM)

[AIECL]

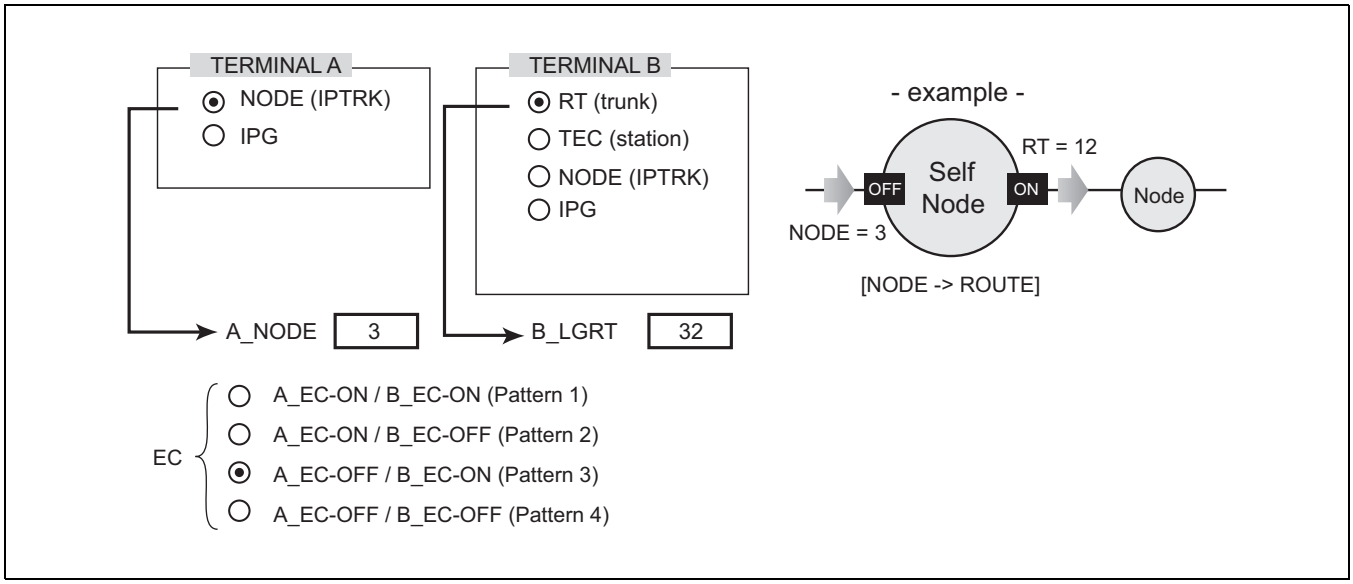
Assign EC value data on a specified value basis. The available combinations are shown below.

Assignment of EC value by AIECL (example)

Note 1: According to the combination of Terminal A and Terminal B, required parameters vary as shown below.

TERMINAL B \ TERMINAL A	NODE	IPG
RT	I	Not used
TEC	II	Not used
C_RT	III	Not used
NODE	III	Not used
IPG	Not used	Not used

I: In case of External Trunk the conditions are the same as III. For Internal Trunk, either Pattern 2 or 4 can be selected.



II: Pattern 2 or 4 can be selected for terminals.

III: Any pattern can be assigned.

[AIECN]

Assign EC value data on a specified value basis. The available combinations are shown below.

Assignment of EC value by AIECN (example)

Note 1: According to the combination of Terminal A and Terminal B, required parameters vary as shown below.

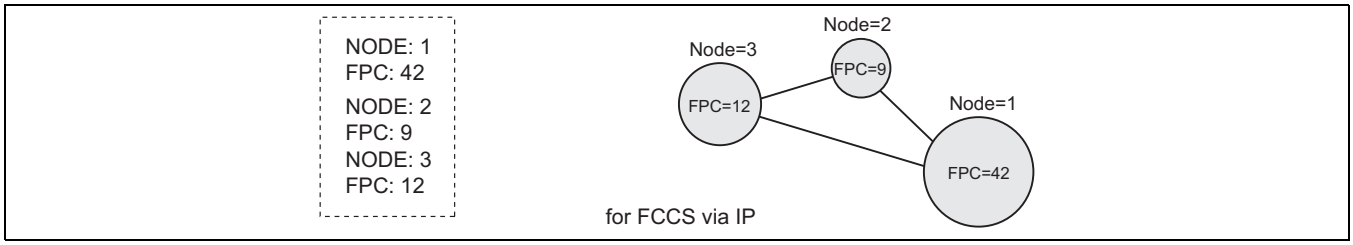
TERMINAL B \ TERMINAL A	NODE	IPG
LGRT	I	Not used
TEC	II	Not used
NODE	I	Not used
IPG	Not used	Not used

I: Any pattern can be selected.

II: Pattern 2 or 4 can be selected for terminals.

<PAD Control>

STEP 1: FCCS/CCIS via IPTRK Data Assignment



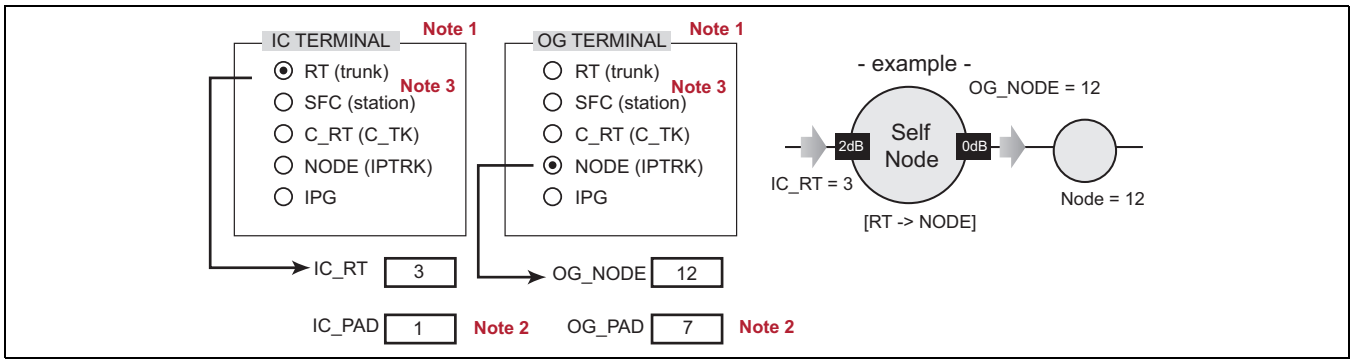
Assign Office Data for FCCS via IPTRK/CCIS via IPTRK. Refer to the Programming of each service (FCCS NETWORKING VIA IP [F-36]/CCIS NETWORKING VIA IP [C-163]) in Chapter 3.

Note: FCCS Networking via IP (by IPTRK) is available only for a migrated system from the previous system.

STEP 2: **ANTI** (Assignment of Node Number)

Assign a unique "Node Number" to each Node, using the following data depending on the system type.
FCCS over IP: FPC (Fusion Point Code) [1-253]
CCIS over IP: PC (Point Code) [1-16383)

Assignment of Node Number (example - FCCS via IP)



STEP 3: **AIPDL/AIPDN** (Assignment of IP Service PAD Data for LDM/NDM)

[AIPDL]

Assign PAD value data on a specified value basis. The available combinations are shown below.

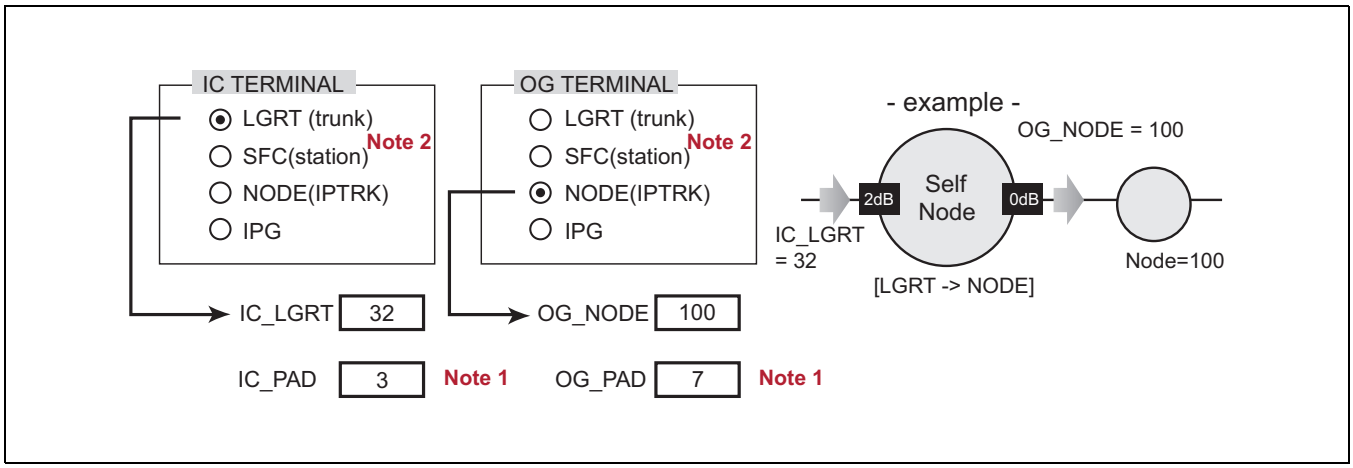
Assignment of PAD value by AIPDL (example)

Note 1: Available combinations are as follows.

		OG TERMINAL				
		RT	SFC	C_RT	NODE	IPG
IC TERMINAL	RT	-	-	-	×	Not used
	SFC	-	-	-	-	Not used
	C_RT	-	-	-	×	Not used
	NODE	×	×	×	×	Not used
	IPG	Not used	Not used	Not used	Not used	Not used

Note 2: Actual PAD value is determined by the combination of this PAD data and the circuit card switch setting.

Note 3: PAD value for SFC (Station), assign 1 (fixed).



[AIPDN]

Assign PAD value data on a specified value basis. The available combinations are shown below.

AIPDN

IC TERMINAL \ OG TERMINAL	LGRT	SFC	NODE	IPG
LGRT	-	-	×	Not used
SFC	-	-	-	Not used
NODE	×	×	×	Not used
IPG	Not used	Not used	Not used	Not used

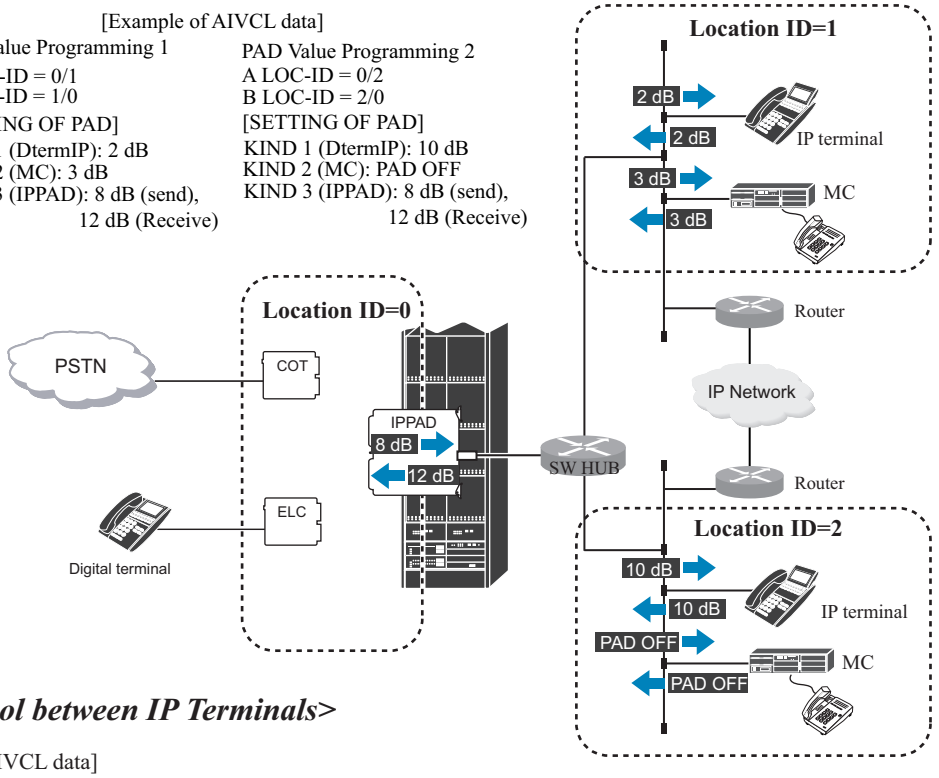
Assignment of PAD value by AIPDN (example)

Note 1: Actual PAD value is determined by the combination of this PAD data and the circuit card switch setting.

Note 2: PAD value for SFC (Station), assign 1 (fixed).

14.5.2 PAD/EC Control on a Location ID Basis

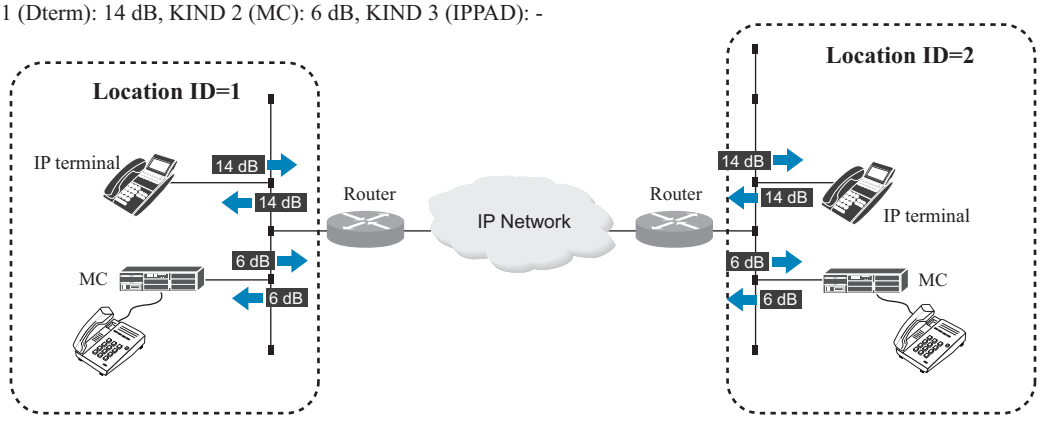
<PAD Control>



PAD Control on a Location ID Basis

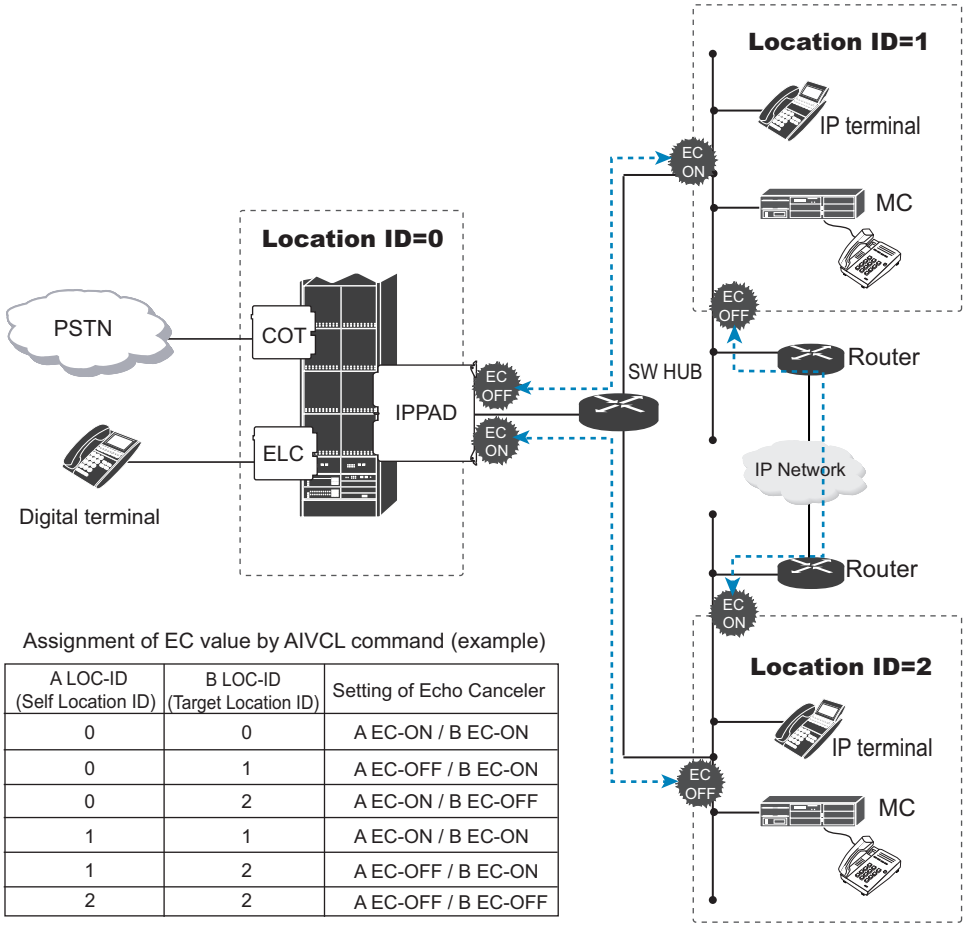
<PAD Control between IPPAD and IP Terminal>

[Example of AIVCL data]



PAD Value Programming 1
A LOC-ID = 0/1
B LOC-ID = 1/0
[SETTING OF PAD]
KIND 1 (DtermIP): 2 dB
KIND 2 (MC): 3 dB
KIND 3 (IPPAD): 8 dB (send), 12 dB (Receive)

PAD Value Programming 2
A LOC-ID = 0/2
B LOC-ID = 2/0
[SETTING OF PAD]
KIND 1 (DtermIP): 10 dB
KIND 2 (MC): PAD OFF
KIND 3 (IPPAD): 8 dB (send), 12 dB (Receive)



<PAD Control between IP Terminals>

[Example of AIVCL data]
PAD Value Setting 3:
A LOC-ID = 1/2, B LOC-ID = 2/1
SETTING OF PAD
KIND 1 (Dterm): 14 dB, KIND 2 (MC): 6 dB, KIND 3 (IPPAD): -

<Echo Canceler Control>

EC Control on a Location ID Basis

Assignment of EC value by AIVCL command (example)

A LOC-ID (Self Location ID)	B LOC-ID (Target Location ID)	Setting of Echo Canceler
0	0	A EC-ON / B EC-ON
0	1	A EC-OFF / B EC-ON
0	2	A EC-ON / B EC-OFF
1	1	A EC-ON / B EC-ON
1	2	A EC-OFF / B EC-ON
2	2	A EC-OFF / B EC-OFF

Programming

<PAD Control>

STEP 1: **ALOCL** - Assign the Location ID data.

TYPE:	Select “Network Address”.
IP ADDRESS:	Assign the IP Address. For the System (i.e. IPPAD), assign “0.0.0.0.”
MASK BIT:	Assign the Mask Bit in the range 1-31 except when IP address 0.0.0.0 is determined. When IP ADDRESS = 0.0.0.0, MASK BIT = 32 is automatically assigned.
LOC-ID:	Assign any number in the range 0-4095, associated with the network address assigned in the IP ADDRESS parameter. When 0.0.0.0 is assigned in the IP ADDRESS parameter, LOC-ID is automatically set to “0” (the value cannot be changed).

Note: LOC-ID=0 is determined by the Location ID of the System (IPPAD).

STEP 2: **AIVCL** - Assign the IP service voice control data.

A LOC-ID: Location ID of the Self Location. (0-4095)

B LOC-ID: Location ID of the Target Location. (0-4095)

Note: LOC-ID=0 is used for the Location ID of the System (IPPAD).

Note: Only the Location ID corresponding to the network address can be assigned on the AIVCL/AIVCN. The Location IDs corresponding to FPC or STN cannot be assigned.

[Setting of PAD]

Select the Setting of PAD check box to assign the following PAD data.

KIND 1: PAD value for the IP terminal (0-15)

0=PAD Control is not used. 5=10dB

1=2dB 6=12dB

2=4dB 7=14dB

3=6dB 8=16dB

4=8dB 9-15=PAD OFF (0dB)

KIND 2: PAD value for the Analog/Digital MC (0-3)

0=PAD Control is not used.

1=PAD OFF (0dB)

2=3dB

3=6dB

KIND3: PAD value for IPPAD card (0-15)

<Echo Canceler Control>

STEP 1: **ALOCL** - Assign the Location ID data.

TYPE:	Select “Network Address”.
IP ADDRESS:	Assign the IP Address. For the System (IPPAD), assign “0.0.0.0.”
MASK BIT:	Assign the MASK BIT in the range 1-31 except when IP ADDRESS 0.0.0.0 is determined. When IP ADDRESS = 0.0.0.0, MASK BIT = 32 is automatically assigned.
LOC-ID:	Assign any number in the range 0-4095, associated with the network address assigned in the IP ADDRESS parameter. When 0.0.0.0 is assigned in the IP ADDRESS parameter, LOC-ID is automatically set to “0” (the value cannot be changed).

Note: LOC-ID=0 is set to the location ID of the System (IPPAD).

STEP 2: **AIVCL** - Assign the IP service voice control data.

A LOC-ID: Location ID of the Self Location. (0-4095)

B LOC-ID: Location ID of the Target Location. (0-4095)

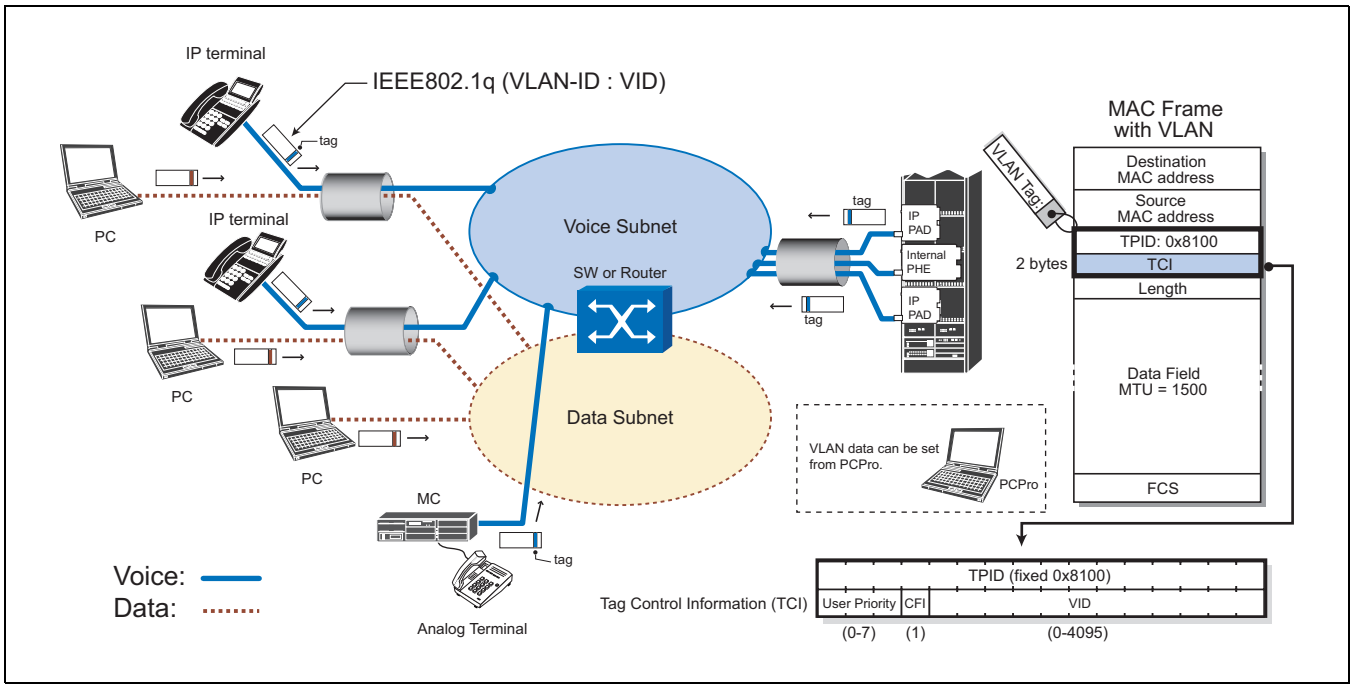
Note: LOC-ID=0 is used for the Location ID of the System (IPPAD).

Note: Only the Location ID corresponding to the network address can be assigned on the AIVCL/AIVCN. The Location IDs corresponding to FPC or STN cannot be assigned.

[Setting of Echo Canceller]

Select the “Setting of Echo Canceller” check box to assign the following Echo Canceler data.

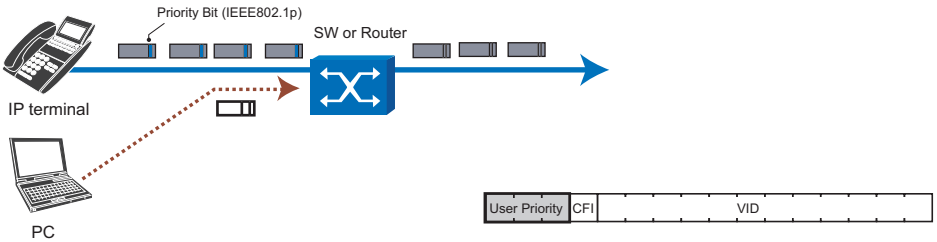
Select the Echo Canceler value by clicking each radio button. (**Note 1**)



- A EC-ON/B EC-ON
- A EC-ON/B EC-OFF
- A EC-OFF/B EC-ON
- A EC-OFF/B EC-OFF

Note 1: When the same value is assigned to both A LOC-ID and B LOC-ID parameters, select either A EC-ON/ B EC-ON or A EC-OFF/B EC-OFF.

14.6 Tag VLAN Data



The implementation of Virtual LANs (VLANs) divides voice and data network into different segments at Layer 2. The system uses Tag VLAN, which conforms to IEEE 802.1q. To identify VLAN frame, a unique ID (VLAN-ID) must be tagged for each packet sent from the IP terminals and the internal PH/IPPAD cards.
To tag a VID to packets sent from the internal PH/IPPAD cards, the ALIDL is used. Packets from the IP terminal can be tagged by key operations on the terminal. User priority can also be used, by which you can give higher priority to voice packets to provide high speech quality. User priority bits conform to IEEE 802.1p. The following figure shows a MAC frame tagged with a VLAN tag.

Tag VLAN

Layer 2 Packet Priority Control

By using "User Priority" bits, Layer 2 packets can be processed with priority at the switch device.

[Precautions]

1. The following data can be set from the PCPro (ALIDL command). One set of data can be set on a circuit card basis.

User Priority:	User Priority to voice packet [0-7] (low ← 1, 2, 0, 3, 4, 5, 6, 7 → high)
Virtual LAN Identifier:	Virtual LAN Identifier for each internal PH/IPPAD Card [2-4094]
VLAN IP Address:	IP Address of internal PH/IPPAD for Virtual LAN
VLAN Mask Bit:	Mask Bit of internal PH/IPPAD IP Address for Virtual LAN

2. One IP terminal/PH · IPPAD belongs to a single VLAN. (cannot belong to multiple VLANs) The value of the VLAN-ID should be determined by taking the network environment into account.
3. The number of VLANs connected to a LAN is proportional to the number of accommodated internal PH/IPPAD cards.
4. This feature provides IEEE802.1pq-compatible Tag VLAN only. Port-base VLAN can be set at the network side.
5. The priority bit is basically used for giving high priority to voice packets. The value should be determined by taking the network environment into account.
6. Be sure to initialize the internal PH/IPPAD card after setting/changing the data of the card.
7. Different Sub-network addresses must be allocated to VLAN IP address (assigned to VLAN IP parameter of the ALIDL) and PH/IPPAD IP address (assigned to "PH IP/IPPAD IP" parameter of the ALIDL).
8. Same Sub-network address must be allocated to Default Gateway IP address (assigned to "Def_GW IP" parameter of ALID) and PH/IPPAD address (assigned to the PH IP/IPPAD IP parameter of ALIDL).

Internal PH/IPPAD card can belong to a maximum of 32 VLANs at the same time. The following firmware is required on IPPAD card.

Circuit Card	Firmware
IPPAD	SP-3716 (Issue 1) or later

1. Assign at least one Default GW (network address same as the PH IP address).
2. One of the IP addresses of the Default GW must correspond to the network address of the PH.
3. IP address of the Default GW must correspond to the network address of PH or VLAN.
4. The same IP address cannot be assigned as the Default GW.
5. Delete the Default GW of the same network address when deleting VLAN data.
6. Individual network address must be assigned to the IP address of the VLAN.
7. VLAN ID can be assigned the range from 1 to 4094.

8. A unique VLAN ID must be assigned for internal PH.

9. When VLAN data is modified, registration of the terminal logging in the VLAN must be performed again.

Programming

ALIDL - Assign the following VLAN data.

Note: Be sure to initialize the internal PH/IPPAD Card after assigning the VLAN data by using the ALIDL command. When the SP-3716 (Issue 1) or later firmware is equipped on IPPAD, the Card initialization after the VLAN data setting is not required.

PH LENS: Assign two-digit Module Group Number + one-digit Unit Number + First Group Number (two digits) of PH/IPPAD-accommodated slot.

TYPE: Select the kind of internal PH/circuit card from the combo box.

<PH Basic Settings>

PH IP/IPPAD IP: Enter IP address of Internal PH/IPPAD card.

MASK BIT: Enter Mask Bit of IP address.

PORT: Enter the port number for controlling signal (the default value is 61010).

REGMAX: Number of ports registered by the internal PH. (This parameter is not required for IPPAD.)

<VLAN Settings>

PRIORITY: User priority to voice packet [0-7] (low ← 1, 2, 0, 3, 4, 5, 6, 7 → high)

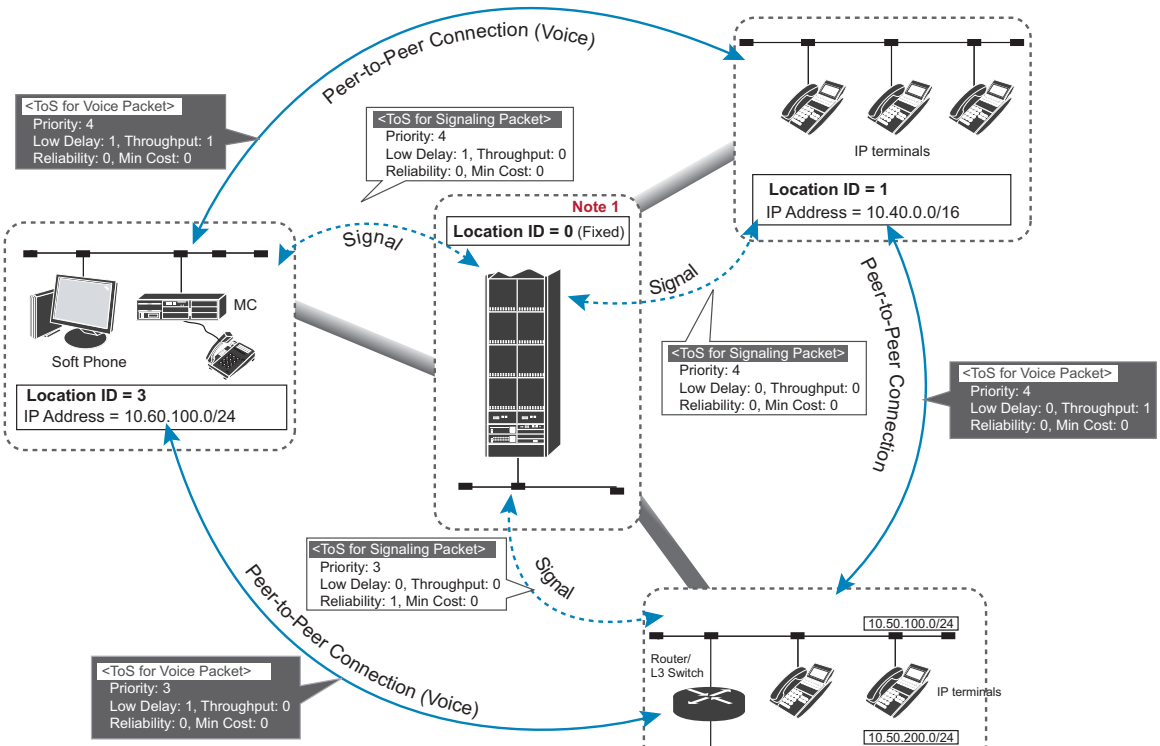
VLAN ID: Virtual LAN Identifier for each Internal PH/IPPAD card [1-4094]

VLAN IP: IP Address of PH/IPPAD for Virtual LAN. Be sure to assign IP address in different subnet to which PH IP belongs.

VLAN MASK BIT: Net Mask of PH/IPPAD IP address for Virtual LAN

<Def_GW Settings>

DEF_GW IP: Enter the IP address of the default gateway.



Note: When assigning two or more IP addresses, the IP addresses must be unique. Be sure to assign at least one IP address in the subnet to which PH IP belongs.

14.7 ToS Control Data

This section describes the data assignment to provide the Type of Service (ToS) control function between the IP terminals connected to the System. This function assigns priorities to the signaling packet and voice packet to ensure efficient, reliable communication within a network. Although the default ToS value is basically used, the ToS value can be changed on a Location ID basis, according to the network condition. The following figure shows an example of the network configuration using ToS Control.

Note: Each IP terminal is given a Location ID that identifies its location within the network, on a network address basis.

ToS Control

[Example]

・ Signaling Packet (Assigned by ALOCL command):

Location ID	Note 2 Priority	Low Delay	Throughput	Reliability	Min Cost
1	4	0	0	0	0
2	3	0	0	1	0
3	4	1	0	0	0

・ Voice Packet (Assigned by AIVCL command):

Location ID	The other Location ID	Note 3 Priority	Low Delay	Throughput	Reliability	Min Cost
1	1	5	0	0	0	0
1	2	4	0	1	0	0
1	3	4	1	1	0	0
2	2	5	0	0	0	0
2	3	3	1	0	0	0
3	3	5	0	0	0	0

Note 1: Location ID of the MGC location is fixed to "0".
Note 2: When no data is assigned, default value "6" is applied.
Note 3: When no data is assigned, default value "5" is applied.

Note: When ToS Control is applied for IPPAD, be sure to use all the IPPAD cards with voice compression function in the system.
- In FCCS via IP and CCIS via IP network, mount IPPAD cards corresponding to voice compression function in every node.

Note: When a SIP Handler Controlled SIP terminal is used, ToS control data can be assigned for SIP messages sent from the SIP Handler to the SIP terminal. In the Telephony Server side, ToS control data cannot be assigned for packets from the SIP terminal such as SIP messages and RTP packets (ToS control data is dependent on the SIP terminal specification).

Programming

STEP 1: **ALOCL** - Assign the Location ID data.

TYPE:	Select “Network Address”.
IP ADDRESS:	Assign the IP Address. For the System unit, assign 0.0.0.0.
MASK BIT:	Assign the Mask Bit in the range 1-31 except when IP ADDRESS 0.0.0.0 is determined. When IP ADDRESS = 0.0.0.0, MASK BIT = 32 is automatically assigned.
LOC-ID:	Assign any number in the range 0-4095, associated with the network address assigned in the IP ADDRESS parameter. When 0.0.0.0 is assigned in the IP ADDRESS parameter, LOC-ID is automatically set to “0” (the value cannot be changed).

Note: LOC-ID=0 is predetermined to the location ID of System unit/MGC (IPPAD).

- Check the Setting Type of Signaling Packet Service checkbox to assign the following ToS for Signaling Packet data.

Note: If the check box is not selected, the default settings (IP Precedence, Precedence = 6) will be provided.

Note: Initialization of IPPAD (by using MB Key or MBPM PCPro Command) and Re-registration of each IP Station are required for this data change to take effect.

Select either **IP PRECEDENCE** or **DIFFSERV**.
When IP PRECEDENCE is selected
Priority (PRECEDENCE / DSCP): Specify the precedence in the range 0-7 (low-high).
Low Delay: Place a checkmark in the checkbox to set Low Delay to ON.
Through Put: Place a checkmark in the checkbox to set High Throughput to ON.
Reliability: Place a checkmark in the checkbox to set High Reliability to ON.
Min Cost: Place a checkmark in the checkbox to set Cost Precedence to ON.
When DIFFSERV is selected
Priority (PRECEDENCE / DSCP): Specify the DSCP in the range 0-63.

STEP 2: **AIVCL** - Assign the IP service Voice Control data.
A LOC-ID: Location ID of the Self Location. (0-4095)
B LOC-ID: Location ID of the Target Location. (0-4095)

Note: LOC-ID=0 is used for the Location ID of System unit/MGC (IPPAD).

Note: Only the Location ID corresponding to the network address can be assigned on the AIVCL/AIVCN when assigning settings for locally programmed terminals. The Location IDs corresponding to FPC or STN cannot be assigned.

[Setting Type of Voice Packet Service]
Select the Setting Type of Voice Packet Service check box to assign the following ToS for Voice Packet data.

Note: If the check box is not selected, the default settings (IP PRECEDENCE, Priority (PRECEDENCE/DSCP) = 5) will be provided.

Choose either **IP PRECEDENCE** or **DIFFSERV**.
When IP PRECEDENCE is chosen
Priority (PRECEDENCE/DSCP): Specify the precedence in the range 0-7 (low-high).
Low Delay: Place a check mark in the check box to set Low Delay to ON.
Through Put: Place a check mark in the check box to set High Throughput to ON.
Reliability: Place a check mark in the check box to set High Reliability to ON.
Min Cost: Place a check mark in the check box to set Cost Precedence to ON.
When DIFFSERV is chosen
Priority (PRECEDENCE/DSCP): Specify the DSCP in the range 0-63.

14.8 PAD/EC Control IP/PHC Support

By assigning system data (ASYDL, SYS1, Index 825), default PAD/EC value that is appropriate to the network environment is automatically applied. If the value is not appropriate for a particular network or terminal, it can be adjusted to match the environment using the APDIL command in PCPro. PAD/EC value can be set on an IP device, IPPAD basis. Default PAD/value is provided on a country basis.

Note: This feature may not be available depending on the firmware version of the IP equipment. Refer to the following table.

List of Firmware Requirements for PAD/EC Control IP/PHC Support

NO.	IP TERMINAL/EQUIPMENT	FIRMWARE REQUIREMENT	REMARKS
1	IP Enabled Dterm (Dterm Series *i*)	Ver. 2.80 or higher	
2	DtermIP	Ver. 2.80 or higher	
3	DT700 Series	Available since first version	
4	DT830G/DT830	Ver. 3.00 or higher	
5	DT820 Series	Available since first version	
6	DtermIP INASET	Ver. 2.80 or higher	Not available when using ITR-LC-1 (BK)-(H).
7	DtermSP30	Ver. 4.0 or higher	
8	Soft Client SP350	Available from the first version.	
9	Analog MC	SP-3753 2AMC PROG-B Issue 10A or higher	
10	Software-based MG-SIP	Available from the first version.	
11	MG-SIP128 [MG-128SIPMGL-A]	Available from the first version.	**Note 1**
12	MG-SIP128 [MG-128SIPMGG-B/MG-128SIPMGG]	SP-4058 MGSIP PROG-J Issue 1 or higher SP-4051 MGSIP PROG-G Issue 2 or higher	**Note 1**

33	UG50	Available since the first version	

Note 1: PAD values can be changed from PCPro using the ASYD/ASYDL/ASYDN commands or from the Maintenance Console using configuration commands.

To set PAD/EC value, one of the following can be used.

14.8.1 Initial Value

Initial PAD/EC value is applied on a system basis by assigning ASYDL, SYS1, Index 825, Bit 0, Bit 1, Bit 4, and Bit 5. As to the initial value, click the Initial Value Display button.

14.8.2 Initial Value Modification

If the initial value is not adequate for a particular network, the PAD/EC value can be modified on a Connection Type (**Note 1**) basis. There are two ways to change the PAD/EC data.

(1) PAD/EC Initial Value Modification

After selecting an IP device from the list box, the default value can be modified on an IP device basis.

(2) Designated Connection Pattern

After selecting Connection Pattern (P2P Connection / Legacy Connection), PAD/EC value can be modified by using Service Feature Restriction Class (SFC) and/or Route Number (RT) in combination. This data assignment is useful when the default is not sufficient for a particular terminal such as an Off-Premise Station (OPS).

Note 1: The following Connection Type tabs in the APDIL command can be used:
- Station-to-Station tab
- Tandem tab
- OG/IC (Station) tab
- OG/IC (Trunk) tab
- Other tab160
- FCCS tab
- Advanced tab

14.8.3 Designated Station Assignment

Default PAD/EC value or PAD/EC value set by the above setting can be adjusted by applying additional value (±α) on a Station basis. To facilitate the data assignment of stations that have serial Station Numbers, 'en bloc data assignment' is also available. If a case arises where voice is too low to hear from a particular Station, the PAD value can be tuned by specifying the Station Number.

PAD Value Setting by Designated Station

	RECEIVE	SEND
DEFAULT	9 (dB)	0 (dB)
Additional Value for Designated Station	-3 (dB)	3 (dB)
APPLIED PAD VALUE	6 (dB)	3 (dB)

Note: Minus (-) indicates gain and Plus (+) indicates loss in electronics. The setting towards Minus increases volume and the setting towards Plus decreases the volume. Note that Plus symbol is not displayed in PCPro.

- Conditions

1. To use this PAD/EC control, the following data assignment is required.

   - ASYDL, SYS1, Index 825, Bit 0=1, Bit 1=0 (PAD Control IP support is in service)
   - ASYDL, SYS1, Index 825, Bit 4=1, Bit 5=0 (PAD Control PHC support is in service)
   - APDIL (PAD value assignment for IP devices, IPPAD circuit card) **Note 1**
   - APDCL (PAD value detailed assignment for IP devices, IPPAD circuit card via PHC) **Note 1**

   Note 1: When modifying the default value, this command is used.

2. This PAD/EC control has precedence over the following PAD related commands:

   - ASYDL, SYS1, Index 812, Bit 0 to Bit 4 (PAD value for IP terminal via PHC), Bit 7 (PAD control for PHC incoming/outgoing call) and Index 813, Bit 0 to Bit 3 (PAD value for Analog MC via PHC) **Note 2**
   - APAD/APADN
   - AIVCL
   - AFPD
   - ARTD/ARTDN
   - ACRD (PAD value assignment for IPPAD)
   - ASYD, SYS1, Index 4, Bit 5=0 (5 dB PAD for Station-to-Station is in service)

   Note 2: This is applied for a call originated from an IP terminal via PHC. PAD value is specified by the IP terminal kind of the calling party. The terminal kind of the called party is not considered. The following conditions exist: (1) This PAD is applied for IP terminals only. Not applied for Attendant Console. (2) This PAD control is activated when the terminal answers the call via PHC.

3. This PAD control is applied in the following precedence order:

   - When not using PHC

PRECEDENCE	DATA ASSIGNMENT
1	APDIL Command [Connection Pattern Designed]
2	APDIL Command [Initial Value Modification]
3	Initial Value

   - When using PHC

PRECEDENCE	DATA ASSIGNMENT
1	APDCN Command [Connection Pattern Designed]
2	APDCL Command [Connection Pattern Designed]
3	APDCN Command [Initial Value Modification]
4	APDCL Command [Initial Value Modification]

PRECEDENCE	DATA ASSIGNMENT
5	Initial Value

4. MG-SIP has two modes of PAD value setting: the auto mode and the local setting mode. The auto mode allows the user to set the system data from PCPro; the local setting mode allows the user to execute the configuration commands from the Maintenance Console. To use the auto mode, start the `set softdsp` command in the Maintenance Console and select “auto” for the PAD setting. For details on the `set softdsp` command, see the corresponding MG-SIP section in Peripheral Equipment Description (IP Devices).
5. When setting PAD values in the auto mode, consider the following:

   - For PAD setting on MG-SIP side, choose "BRI/PRI/T1" from the IP Devices list of the APDIL command.
   - For PAD setting of other devices connected to MG-SIP, choose "C.O.Line[D]" from the Connect to list of the APDIL command.

   In a configuration where MG-SIP / MG(BRI) / MG(PRI) are connected to the same Telephony Server, if "BRI/PRI/T1" is chosen for the IP Devices parameter, the PAD setting will be applied to all these gateways. To assign different PAD values for each gateway, use the configuration command in the Maintenance Console (local setting mode). In that case, select "local setting" for the PAD setting in the `set softdsp` command before setting PAD value (voice/FAX).
6. The following conditions must be considered in the setting of PAD values for MG-SIP:

   - When "local setting" is selected for the PAD setting in the `set softdsp` command, the PAD value specified in the configuration command takes precedence over the one specified in PCPro, even if the MG-SIP receives PAD value information from the PCPro.
   - G.711 μ-law/A-law is only available as a codec of PAD adjustment.
   - Echo Canceler Control function is not available for MG-SIP even when both EC and FAXEC parameters are set to ON with the APDIL command.
   - The Smooth PAD function is not available. Misadjustment of signal amplification caused by an unsuitable PAD value can produce clipping and unwanted noise.
7. When PAD adjustment is implemented during the activation of the multi-session function of MG-SIP, the PAD value that was set at the time of call setup is applied to RTP on the Telephony Server in the same way as a one-to-one connection between SIP network and Telephony Server.
8. PAD adjustment is available even when PCM data is processed through the μ-law/A-law conversion function of MG-SIP.
9. This PAD control cannot be applied to a legacy Station / Trunk. Note that it is applied to IPPAD circuit cards.
10. PAD value change may affect inband PB signal as well as speech level. Therefore, after the data change, make sure the change does not affect any service features that use inband PB signal.
11. When T.30 is assigned as the payload type of FAX, the PAD value for the FAX assigned by this feature becomes invalid. In this case, the PAD value for the FAX is set to 0dB (fixed).

Programming

<PAD Control>

STEP 1: **ASYDL** - Assign the following system data.
SYS1
Index 811: Tone Code by Countries

ASYDL, SYS1, Index 811			
TONE CODE	**Basic Tones**	**TONE CODE**	**EMEA Tones**
00 H	Not used	C8 H	Germany
01 H	Japan	C9 H	Italy
02 H	North America	CA H	Netherlands
03 H	Australia	CC H	Denmark
04 H	Other countries	CD H	Sweden
05 H	Hong Kong	D3 H	Spain
06 H	Malaysia	D4 H	Austria
07 H	Singapore	D5 H	Belgium
08 H	England	D6 H	England [For EMEA]
09 H	Mexico	D7 H	Greece
0A H	Taiwan	D8 H	Switzerland
0B H	New Zealand	D9 H	South Africa
0C H	Korea	Other Values	Not used
0D H	Brazil		
0E H	China		
0F H	Thailand		
10 H	Thailand (EGAT)		
11 H	Sri Lanka		

Index 825, Bit 0=1, Bit 1=0: PAD / EC IP support is in service

ASYDL, SYS1, Index 825		
Bit 1	**Bit 0**	**PAD/EC Control**
0	**0**	PAD/EC Control IP support is out of service
0	**1**	PAD/EC Control IP support is in service
1	**0**	-
1	**1**	-

When using PHC, assign also the following bits of ASYDL, SYS1, Index 825.

ASYDL, SYS1, Index 825		
Bit 5	**Bit 4**	**PAD/EC Control**
0	**0**	PAD/EC Control PHC support is out of service
0	**1**	PAD/EC Control PHC support
1	**0**	-
1	**1**	-

STEP 2: **APDIL** - Assign PAD/EC control data that supports IP. This PAD/EC control data is applied for calls not via PHC. If you want to assign PAD/EC data to PHC, go to page 130.
[Connection Type] Select an appropriate tab from the following.

Station-to-Station: Used when an IP device (Station) is connected to a Station.
Tandem: Used when an IP device (Trunk) is connected to C.O. line or TIE line.
OG/IC (Station): Used when an IP device (Station) is connected to C.O. line or TIE line.
OG/IC (Trunk): Used when an IP device (Trunk) is connected to a Station.
Other: Used when an IP device (Station/Trunk) is connected to other than above.
FCCS: Not used here.
Advanced: Used when assigning additional value to the initial value or modified value by "Initial Value Modification" or "Connection Pattern Designed" or used for IP device/IPPAD en bloc data assignment.

- **When selecting [Station-to-Station] tab**

<Initial value modification setting>

IP Devices: Select an IP device to set from the drop-down list box and then click the Setting button.

Note: Please assign the remainder of data following the parameters on the screen.

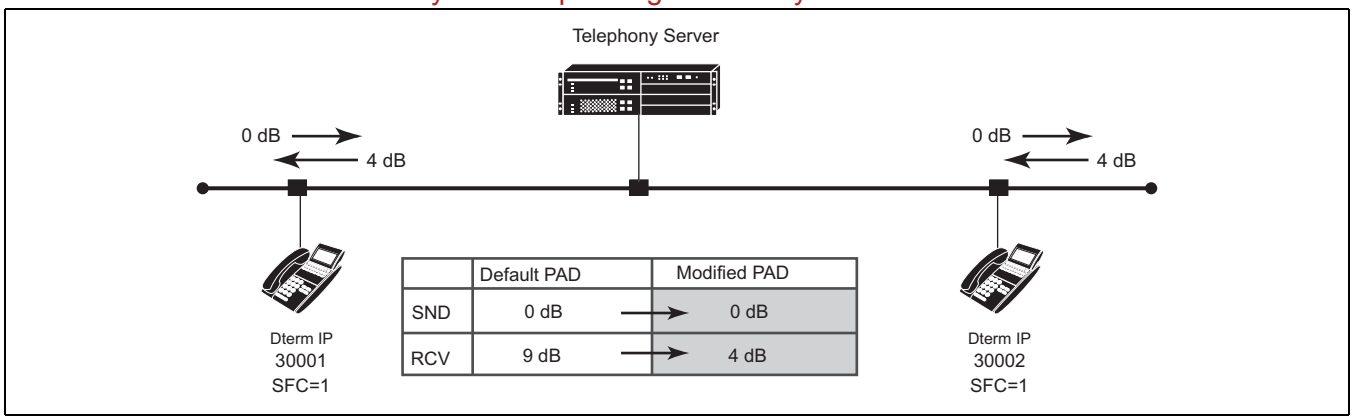
Sample Data Assignment 1



The following shows sample data for assigning PAD data. For more information about the settings of network configuration, refer to Sample Data Assignment 2.

[When not using PHC]

PAD Value Assignment for DtermIP-to-DtermIP call

The following example shows a case where default PAD value (**Note 1**) is changed for DtermIP-to-DtermIP call.

Note 1: Default PAD value may differ depending on country.

<Data Assignment>

- When using Initial Value Modification:

  APDIL: Station-to-Station tab → Initial Value Modification

  IP Devices: DtermIP
  Connection Destination: Station
  T_PAD: 0 dB
  R_PAD: 4 dB

- When using Designated Connection Pattern

  APDIL: Station-to-Station tab → Designated Connection Pattern

  Connection Pattern: P2P Connection
  IP Devices A:
  Kind: Station
  SFC: 1

  IP Devices B:
  Kind: Station
  SFC: 1

[ ] Select ALL: All items listed below are checked.
[×] Speech PAD adjustment
[×] EC is set
[ ] FAX PAD adjustment
[ ] FAX EC is set

T_PAD: 0 dB
R_PAD: 4 dB

- When using Designated Station Assignment

  APDIL: Station-to-Station tab → Designated Station Assignment

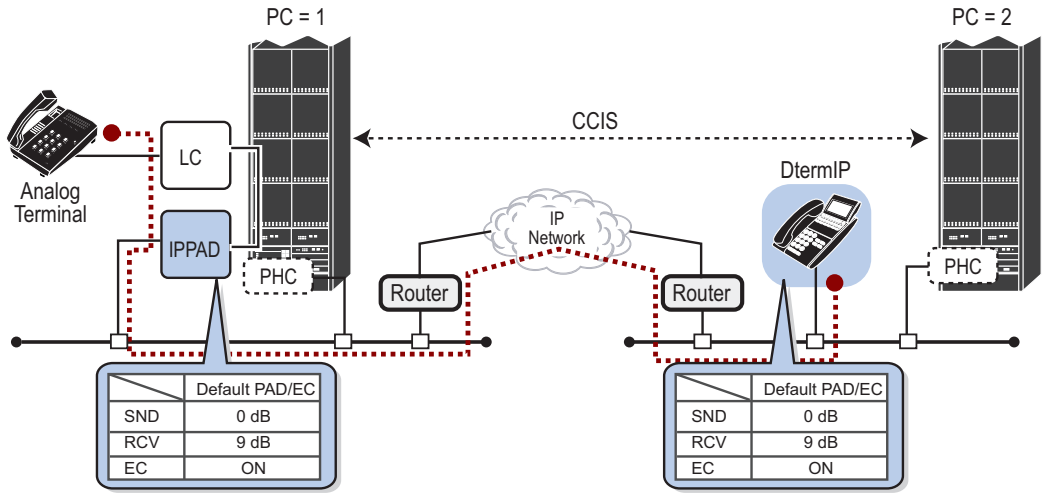
  Kind of Designation: Individual

  TN: 1
  STN: 30001 (30002)

  [ ] Select ALL: All items listed below are checked.
  [×] Speech PAD adjustment
  [×] EC is set
  [ ] FAX PAD adjustment
  [ ] FAX EC is set

  T_PAD: 0 dB
  R_PAD: 4 dB

[When using PHC]



The one of the following patters can be used:

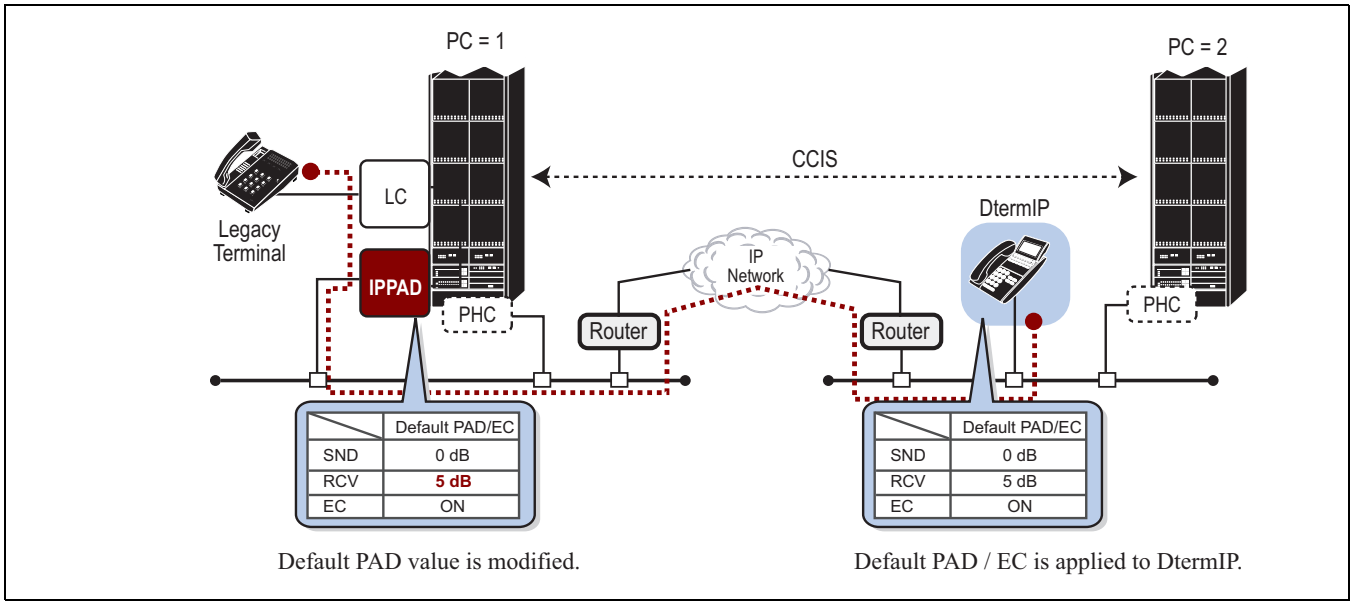
- Initial PAD/EC Value
- Initial PAD/EC Value Modification
- Designate Connection PAD/EC Assignment

Sample 1: When Initial PAD/EC Value is used.

The following example shows a case where default PAD/EC value (**Note 13**) is used for legacy terminal to DtermIP call. To apply the default value, use ASYDL, SYS1, Index 825 only is required.

Note 13: Default PAD value may differ depending on country.

Default PAD / EC is applied to IPPAD.

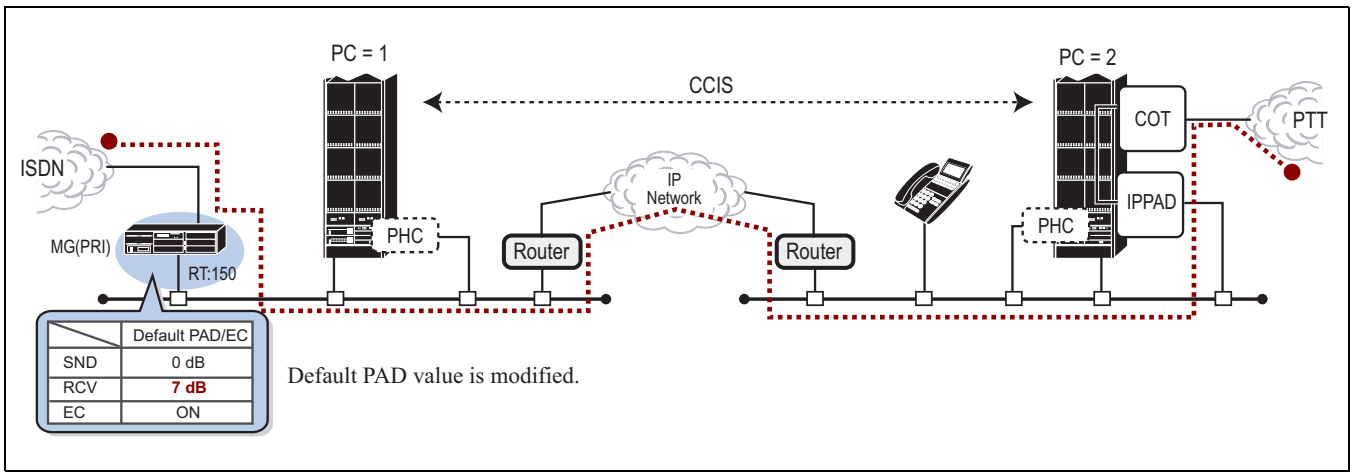


Default PAD / EC is applied to DtermIP.

Sample 2: When Initial PAD/EC Value Modification is used [1]

To change the default value, APDCL is required in addition to ASYDL, SYS1, Index 825. In this example, data assignment is required for Node (PC=1).

Select Initial Value Modification tab.
Self-node Connection Device: Legacy Terminal
Destination Point Code: 2
Connection Destination: Station
T_PAD: 0 dB
R_PAD: 5 dB
EC: ON

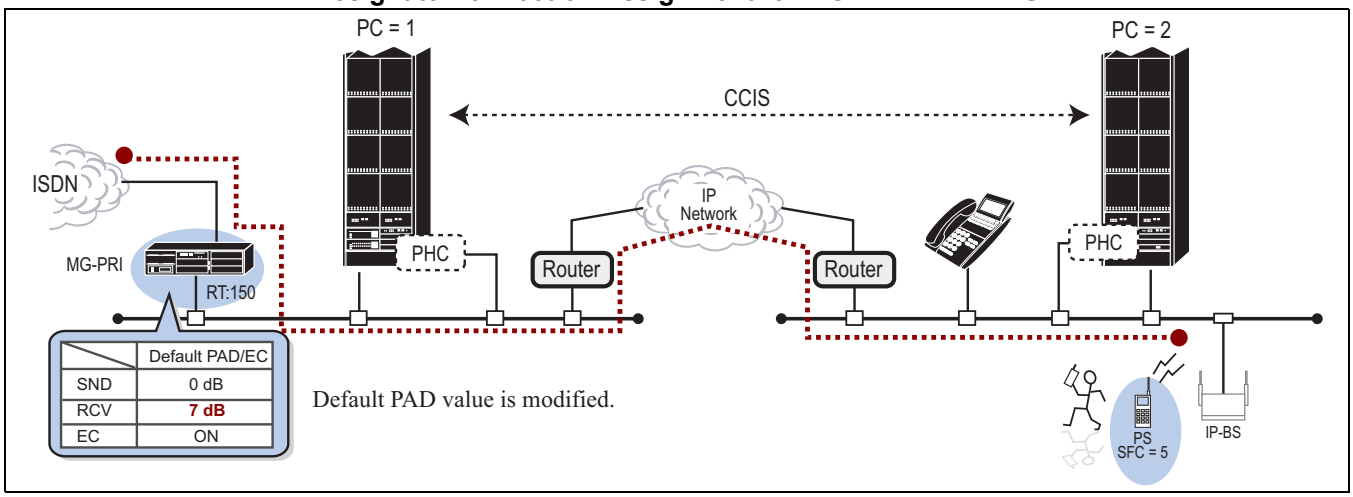


Initial PAD/EC Value Modification for MG-PRI - PHC - COT

Sample 3: When Initial PAD/EC Value Modification is used [2]

Select Initial Value Modification tab.
Self-node Connection Device: ISDN Trunk BRI/PRI or MG(BRI)/MG(PRI)
Destination Point Code: 2
Connection Destination: C.O. Line [D]
T_PAD: 0 dB
R_PAD: 7 dB
EC: ON

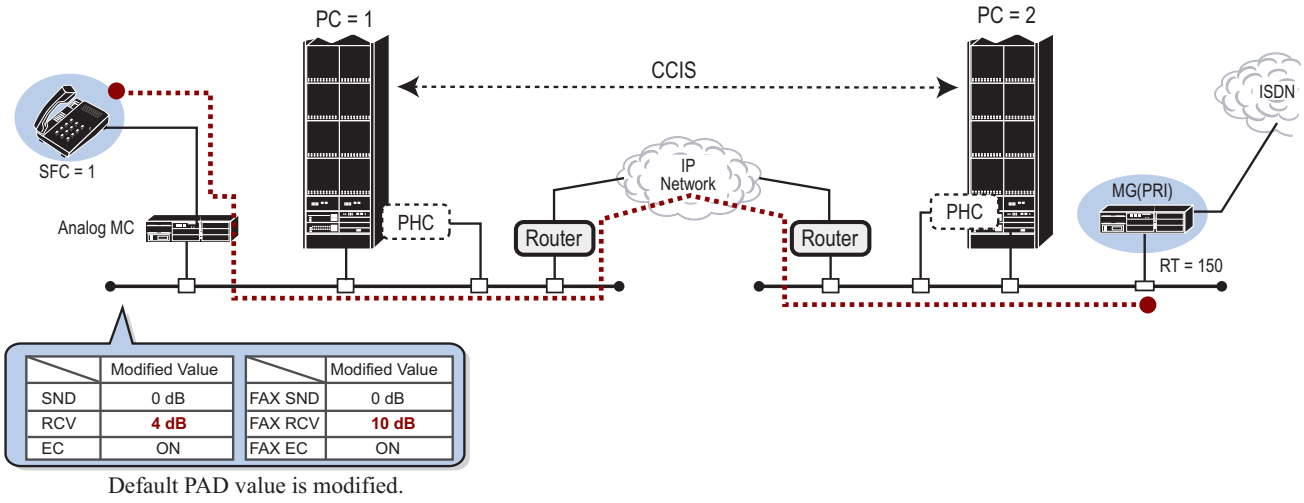
Initial PAD/EC Value Modification for MG-PRI - PHC - COT



Note: When a node (PC=2) as mentioned in the above makes a tandem connection through PHC and COT, PAD/EC values specified by ARTD/APAD command in the node (PC=2) is applied to COT. Therefore, the sum (PAD value set in IPPAD + PAD value specified by ARTD/APAD command) will be used. Also besides, when you assign data by APAD command, although it usually assigns data by combinations of RT numbers for Bch in PHC and RT numbers in COT, PAD/EC values assigned to RT of PHC become invalid while PAD/EC values assigned to RT of COT become valid.

Sample 4: When Designate Connection PAD/EC Assignment is used [1]

Select [Designate Connection Assignment] tab.
[Self Node Information]
Kind: Trunk
RT/LGRT: 150
[Destination Node Information]
Kind: Station
PC: 2
SFC: 5
T_PAD: 0 dB
R_PAD: 7 dB
EC: ON



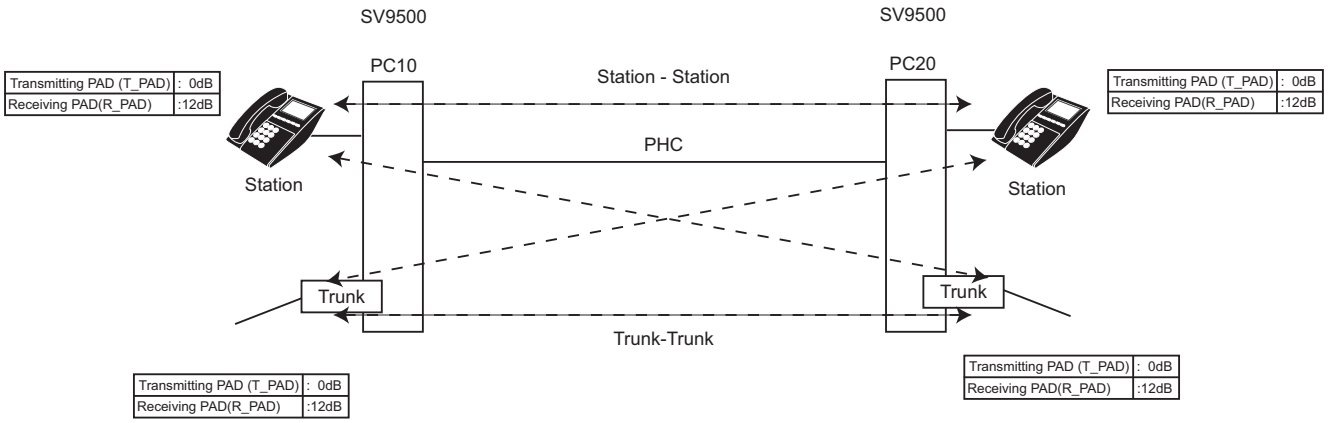
Designate Connection Assignment for MG-PRI - PHC - PS

Sample 5: When Designate Connection PAD/EC Assignment is used [2]

Select [Designate Connection Assignment] tab.
[Connection Patter]
Station-(PHC)-Trunk
[Self Node Information]
Kind: Station
SFC: 1
[Destination Node Information]
Kind: Trunk
PC: 2
RT: 150
T_PAD: 0 dB
T_FAXPAD: 0 dB
R_PAD: 4 dB
R_FAXPAD: 10 dB
EC: ON

Designate Connection Assignment for Legacy Station - PHC - MG(PRI)

	Modified Value		Modified Value
SND	0 dB	FAX SND	0 dB
RCV	**4 dB**	FAX RCV	**10 dB**
EC	ON	FAX EC	ON

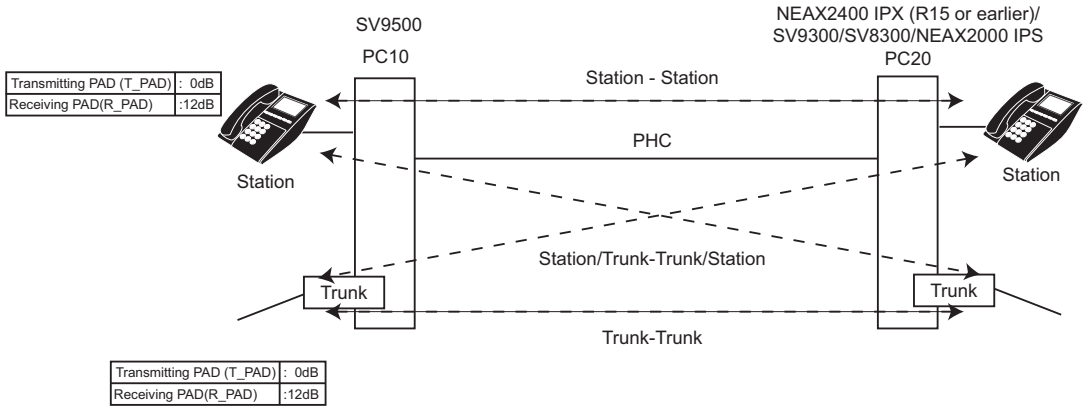


Default PAD value is modified.

Sample Data Assignment 2

This section describes the network settings for each network configuration as examples. The data settings in the following cases are described here.

- Standalone to Standalone
- Standalone to Standalone (NEAX2400 IPX (Feature Package 8800 (R15) or earlier)/SV9300/SV8300/NEAX2000 IPS)
- Standalone to FCCS
- Standalone to Peer-to-Peer FCCS
- FCCS to Standalone
- FCCS to Standalone (NEAX2400 IPX (Feature Package 8800 (R15) or earlier)/SV9300/SV8300/NEAX2000 IPS)
- FCCS to Peer-to-Peer FCCS
- Peer-to-Peer FCCS to Standalone
- Peer-to-Peer FCCS to Standalone (NEAX2400 IPX (Feature Package 8800 (R15) or earlier/SV9300/SV8300/NEAX2000 IPS)
- Peer-to-Peer FCCS to FCCS
- FCCS to FCCS
- Peer-to-Peer FCCS to Peer-to-Peer FCCS



- Standalone to Standalone

14.9 MG Based Call Retention

When the station is talking to the subscriber through SIP/analog/ISDN network via MG, if a restart message is generated by the Telephony Server or health check session has timed out, MG can retain the ongoing call without the Telephony Server. The ongoing call can be released by placing the handset on hook by the station or subscriber.

Service Conditions

1. Common conditions for each MG

a.) MG equipment and firmware version available for this feature is as follows.

IP Terminal/Equipment		Firmware Version
MC&MG-COT	MCMG Box [MG-4LC2COTA]	SP-3927 MCMG PROG-B Issue 1 or later
	MCMG Card [SCA-4LC2COTA]	
	UG50 (COT-TYPE1)	No conditions
	UG50-4LC2COTA (COT)	
	UG50 (PGT-TYPE1)	Software Version 2.00 or later

	MG-SIP128 [MG-128SIPMGG-B/MG-128SIPMGG]	SP-4051 MGSIP PROG-G Issue 1 or later SP-4058 MGSIP PROG-J Issue 1 or later
	MG-SIP128 [MG-128SIPMGJ-B/MG-128SIPMGJ]	SP-4032 MGSIP PROG-E Issue 1 or later SP-4060 MGSIP PROG-L Issue 1 or later
	Software-based MG-SIP	SP-4078 MGSIPVM PROG-B Issue 1 or later SP-4080 MGSIPVM PROG-D Issue 1 or later SP-4085 MGSIPVM PROG-E Issue 1 or later

b.) This feature will be used if communication failure to the SV9500 or SR-MGC occurs, and Soft Reset is received from the SV9500 or SR-MGC, both because of a network failure. If a reboot is required by a failure inside the MG, the system will reboot without executing this feature.
c.) A call cannot be retained while ringing or on hold. However, if this feature is activated while hold tone is being sent out, hold tone will continue to be sent out until network failure and call termination are detected.
d.) As soon as the Health Check Error of system message [33-S] (IP PKG Failure) against MG is detected on the SV9500 or SR-MGC because of a network failure, the billing for the call via MG will be stopped. Therefore, the call retained at MG by this feature is not subject to billing on the SV9500 or SR-MGC.
e.) If a failure occurs in the network between the connected party and MG, the call cannot be retained.
f.) The VS32 Conference Server is not supported for this feature.

2. Conditions for each MG

In the case of MC&MG-COT

Note: For UG50 (PGT-TYPE1) and UG50-4LC2COTA (PGT) only the RTP related contents of condition a.) applies.

a.) If any of the following conditions are applied during call retention after a time-out occurs in Health Check, the call will be determined to be released, and the MG will be rebooted.

- When RTP reception stopped while talking:

  The time by which RTP reception is determined stopped can be set by configuration command from 3 seconds (default) to 32 seconds.

- When release signal is detected from C.O.:

  - C.O. Outgoing Call: Polarity Reversal OFF
  - C.O. Incoming Call: Disconnect Signal (Loop Off)

b.) Other equipment such as GW or TA must not be connected between C.O. and MC&MG-COT because the signal from C.O. is monitored except in the case when other equipment have a function such as the disconnect signal transmission and polarity reversal.

c.) If even one channel is being used for a call, a new call origination / termination cannot be made to the rest of channel because MC&MG-COT will not be rebooted. However, PFT line can be used for an emergency telephone until changing to on-line status from [During Call Retention] → [Call Retention released] → [Re-registration after MG reboots].

d.) When this feature is used, Calling Party Release becomes invalid. **Note 1**

- MCMG Box/Card [MG/SCA-4LC2COTA] operates as when Configuration command: SET RELEASE_SIGNAL is set to “OFF”.
- UG50 (COT-TYPE1)/UG50-4LC2COTA (COT) operates as when Web Programing: 4-1-02: COT Basic Setup - RELEASE_SIGNAL is set to “Not checked (Invalid)”.

Note 1: When this release method is used for a C.O. outgoing call, the C.O. is kept in busy status until the station is released. The release signal (polarity reversal) sent from the network side when the opposite party is released will be ignored.

In the case of MG(PRI)/MG(BRI)

a.) If any of the following conditions are applied during call retention after a time-out occurs in Health Check, the call will be determined to be released, and the MG will be rebooted.

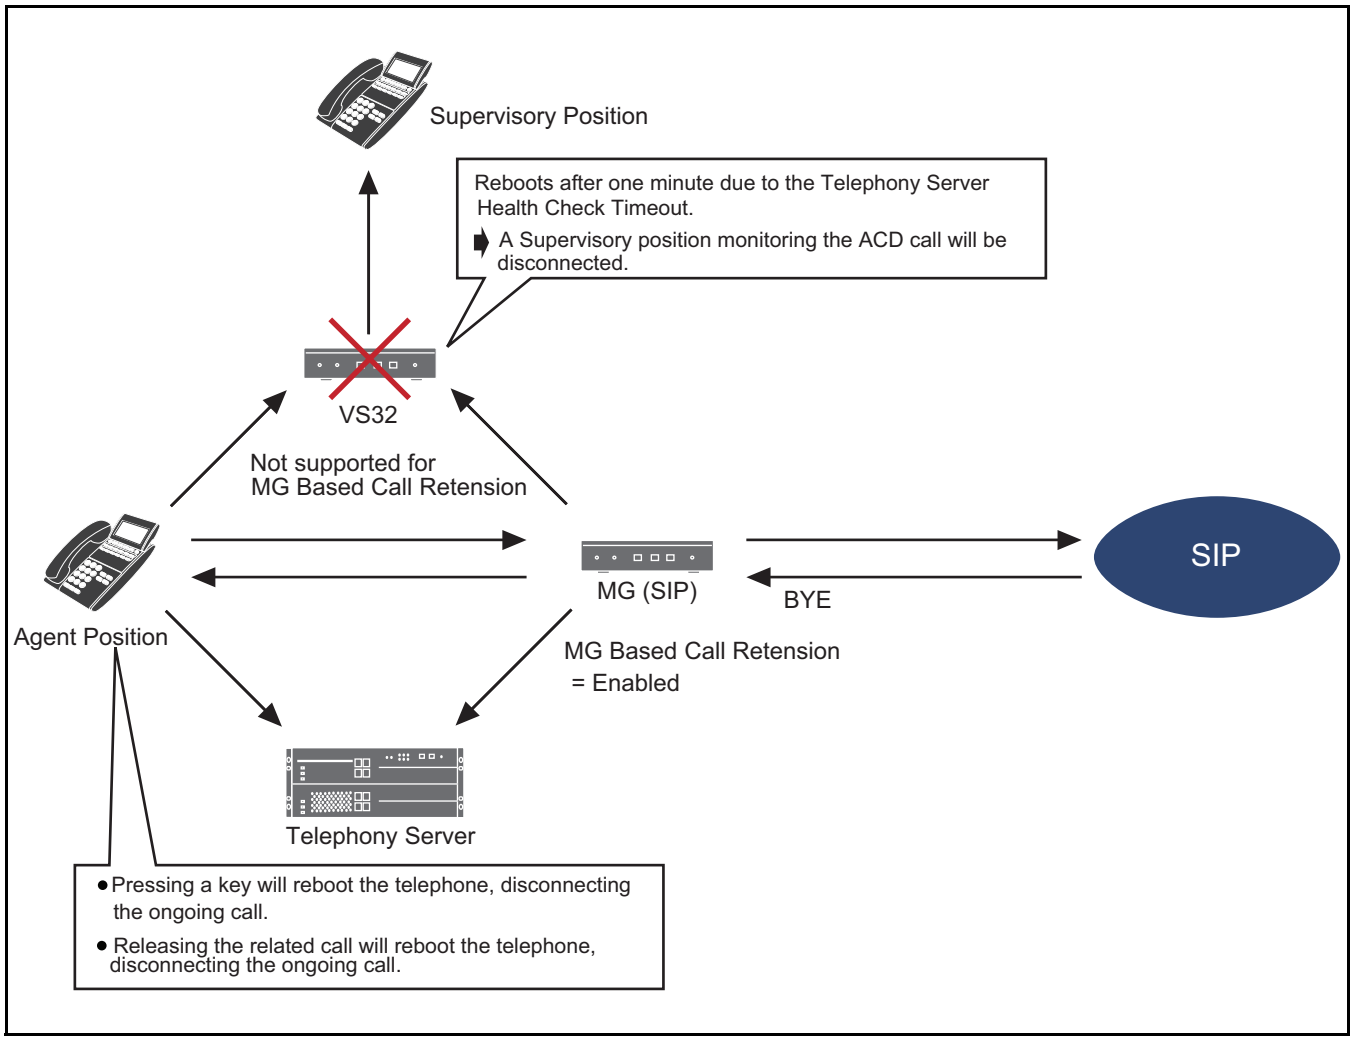
- When RTP reception stopped while talking.

  The time by which RTP reception is determined stopped can be set by configuration command of MG from 3 seconds (default) to 32 seconds.

- When DISCONNECT, RELEASE, or RELEASE COMPLETE message of layer 3 is received from opposite node or the SV9500. **Note 2**

  Note 2: The length of call reference value (in octets) for the layer 3 is fixed to 1 byte in the case of MG(BRI), and 2 bytes in the case of MG(PRI).

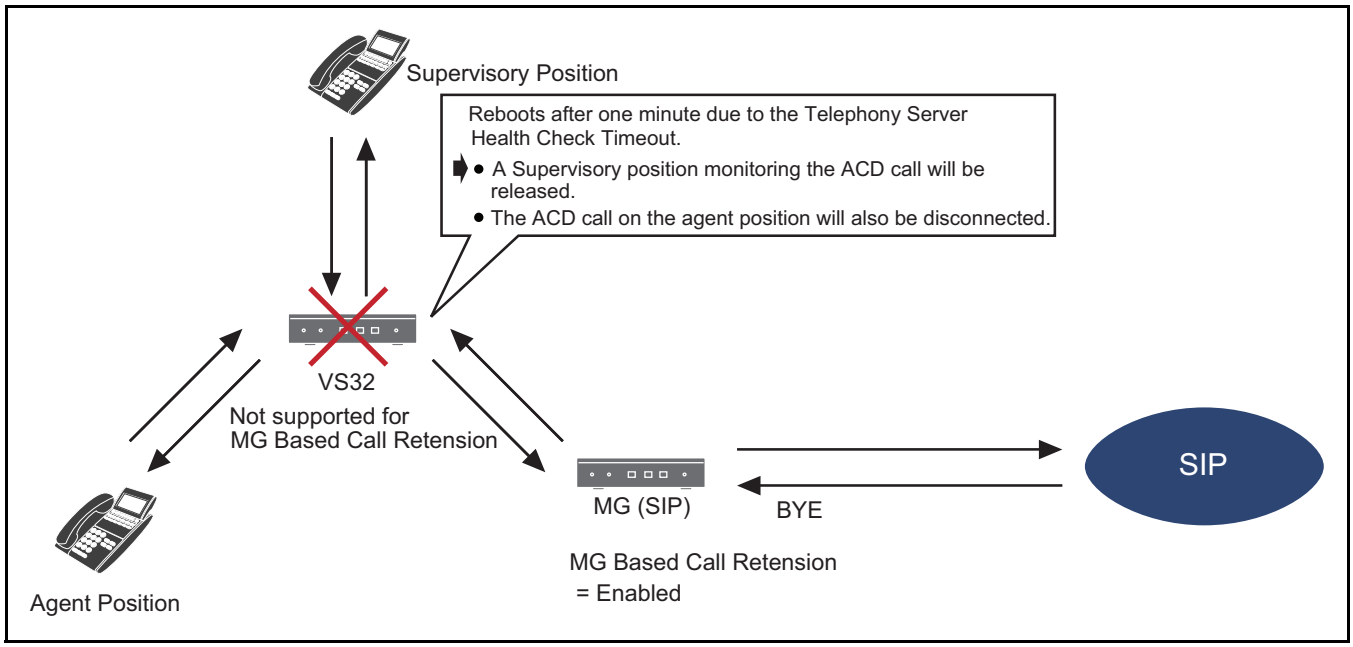
- When the link between Layer 2 and the opposite node is disconnected.



b.) If even one channel is being used for a call when a communication failure occurs between the SV9500 and MG, the MG will not be rebooted because the call will be retained until it is released. Therefore, the MG will not re-register to SR-MGC even if provided, and a new call origination / termination cannot be made to the rest of channels.
c.) In the case of MG(BRI), an emergency telephone cannot be used during call retention.
d.) If a call is assumed to be released during startup of the configuration command, it takes about five minutes to start rebooting MG(BRI)/MG(PRI) after you exit from the configuration command or enter the last command.
e.) When CALL PROTECTED RE-REGISTRATION [C-203] is enabled on MG(PRI) in Proprietary Protocol mode, it overrides this feature. See "Call Protected Re-Registration [C-203]" for further information.
f.) If STATUS ENQUIRY message of layer 3 is received from the opposite node, the call will be disconnected from the network because the status of the call cannot be recognized. For this reason, MG cannot retain the call in a network that uses STATUS ENQUIRY messages.

In the case of MG(SIP)

a.) When this feature is enabled, the warning tone generation on the MG(SIP) (audible alarm for Health Check Timeout configured with the "set hc_alarm") is automatically deactivated. In this case, the setting of the alarm generation feature is not changed.
b.) When a station call on the Telephony Server side is being put on hold or being transferred, the ongoing call is not retained by the activation of this feature.
c.) When RTP packets cannot be received from the Telephony Server while this feature is activated (e.g. When communication between telephones and the Telephony Server is not available, if call hold or call transfer is performed by a telephone user, the telephone detects a communication failure and reboots itself, stopping RTP packets.), the retained call is assumed to be ended.
d.) Billing information about calls retained by this feature will not be provided.



e.) When a call is being monitored by a supervisory position in an ACD system, if a restart message is generated by the Telephony Server or health check session has timed out:

- The ACD call on the agent position is retained by this feature. However, it will be disconnected by a key operation on the agent's telephone or the release of the related call.
- A call on a supervisory position is not retained since the VS32 is not supported for this feature.

f.) When a call is being barged by a supervisory position in an ACD system, if a restart message is generated by the Telephony Server or health check session has timed out;

- the ACD call on the agent position is not retained by this feature.
- a call on a supervisory position is not retained since the VS32 is not supported for this feature.

g.) In the Music On Hold [M-7] feature, the ongoing call is retained by this feature.

h.) When receiving Initial INVITE from the SIP network during call retention, the MG(SIP) returns an error response (default value: 488 Not Acceptable Here). The value of error response can be changed with the MG(SIP) configuration command “set call_hold”.

i.) When the call retention is activated during reception of a new call from a SIP network, the MG(SIP) returns an error response (default value: 488 Not Acceptable Here) to the incoming call, and at the same time, issues a disconnect order to the Telephony Server.The value of error response can be changed with the MG(SIP) configuration command “set call_hold”.

j.) This feature is activated when:

- The MG(SIP) receives Soft Reset from the Telephony Server.
- Health Check Timeout has occurred between the MG(SIP) and the Telephony Server.
- The Telephony Server performs system initialization.

k.) This feature is deactivated when:

- The reboot command is executed on the Configuration Command Setting screen.
- The “RESET” button is pressed on the MG(SIP) main unit.
- The power switch on the MG(SIP) main unit is turned off.

- The MG(SIP) is rebooted by using the MG option for the Reset Type parameter (**Note 3**) of the AMGIL command.

  Note 3: The Reset Type parameter is available since FP95-113 V3.

- The MG(SIP) is rebooted due to causes other than the above.

l.) The ongoing call retained by this feature will be disconnected when:

- The MG(SIP) does not receive RTP packets from the Telephony Server.
- The MG(SIP) has received a disconnect order from the Telephony Server.
- Ether link down is detected on the Telephony Server or in the SIP network. **Note 4**

  Note 4: A link down trap is generated after five consecutive failures of LAN cable connection for a period of one second.

- BYE request is received from the SIP network.
- Session timer is expired in the SIP network side.

m.) When all the retained calls are ended, the MG(SIP) reboots and performs reregistration.

Programming

This feature is invalid for default setting. Use the configuration command/Web Programming of MG/UG50 to make it valid. For the following data assignment, refer to the configuration command of each MG in Peripheral Equipment Description (IP Devices). For UG50, refer to Peripheral Equipment Description (UG50).

- Setting of Call Retention

  MC&MG-COT/MG(PRI) /MG(BRI)/MG(SIP) - [SET CALL_HOLD]

- Setting of the time-out value for RTP reception

  MC&MG-COT/MG(PRI)/MG(BRI) - [SET RTP_STOP_DETECT]

  MG(SIP) - [SET CALL_HOLD]

15. UG50 Related Data Setting

15.1 How to Use the ARAI Command to Assign or Delete Office Data for a UG50

General Description

The ARAI command collects and displays information on channels of the specified UG50, including Device Name, MAC address, slot number, etc. to facilitate office data input by using only PCPro and thus eliminating the need to look at the Web Programming screen of the UG50.

Service Conditions

<Important Notices>

1. The ARAI command is available from FP95-114 V4 Issue 2.0 and from UG50 software version 2.00.

<Interactions with Other Features>

1. If the FCCS CLUSTER feature of LOCATION DIVERSITY [L-55] is in use, the ARAI command cannot be used, use other commands as the AISTL command for displayed the needed data.

<Hardware/Software>

1. For supported UG50 cards, see "Registration Unit List" section in Startup chapter of Peripheral Equipment Description (UG50). For the settings of the cards, see "Office Data Settings on Telephony Server" section in the same chapter of Peripheral Equipment Description (UG50).

<Conditions Specific to This Feature>

1. If you modify the Device Name parameter in the UG50 that already has a channel registered with the Telephony Server, the old name prior to the modification may be displayed on the ARAI command screen. In this case, restart the UG50, and with the re-registration to the Telephony Server the new name will be displayed. However, even if you do not restart the UG50 and the old name is displayed, this does not affect the assignment of office data for the UG50
2. The following table shows the types of office data that can be entered on the ARAI command and provides a comparison with the AISTL command.

Office Data to Configure

R: Read Only, D: Data Entry, X: Available, N: Not Available

ARAI Command			AISTL Command Note 2
Parameter	Description	Read Only / Data Entry	
STS	Status of office data	R	N
SLOT	Slot Number	R	N
MAC ADDRESS	MAC address	R	X Note 3
CH	Channel Number	R	X Note 4
TN	Tenant Number	D	X
STN	Station Number	D	X Note 5
LENS	Line Equipment Number	D	X
TEC	Telephone Equipment Class	D	X
KIND	Type of IP device	R	X
RSC	Route Restriction Class	D	X
SFC	Service Feature Restriction Class	D	X
ADM/GST Note 1	Administration Station / Guest Station	D	X
ROOM CLASS Note 1	Room Class	D	X

ARAI Command			AISTL Command Note 2
Parameter	Description	Read Only / Data Entry	
ANNEX Note 1	Building in the complex (main building, Annex 1, Annex 2,...)	D	X
GROUND Note 1	Ground/Underground	D	X
FLOOR Note 1	Floor	D	X
RESULT	Result of the processing	R	N

Note 1: Displayed only when the Hotel feature is enabled (ASYD, SYS1, Index 160, Bit 0 = 1).

Note 2: This column indicates whether or not each parameter of the ARAI command is available in the AISTL command.

Note 3: The MAC ADDRESS parameter in the ARAI command corresponds to the MC-ID parameter in the AISTL command.

Note 4: The CH parameter in the ARAI command corresponds to the MC-CH parameter in the AISTL command.

Note 5: The STN parameter in the ARAI command corresponds to the IP STN parameter in the AISTL command.

Programming

15.1.1 Office Data Assignment

The following steps show how to assign the office data of each UG50 channel in the Telephony Server.

STEP 1: Start the ARAI command.

The initial screen is displayed.

If either of the following conditions is true, go to the next step. Otherwise, go to Step 3.

(a) [List of Remote Equipment Data] does not contain the IP address of the UG50 you want to update, and there are less than 256 UG50s shown.

(b) [List of Remote Equipment Data] contains the IP address of the UG50 you want to update, but the card information is empty.

STEP 2: Click the **Refresh** button.

The latest information (**Note 1**) about UG50s is loaded into the list.

Note: Information about UG50 is not displayed in [List of Remote Equipment Data] when the UG50 is:
- operating in IPG mode or Retrofit mode,
- unable to communicate with the Telephony Server, or
- running unsupported software.

Note 1: If you click the **Refresh** button when [List of Remote Equipment Data] is already filled with 256 IP addresses for the UG50s, only the slot information will be updated.

STEP 3: In [List of Remote Equipment Data], locate and select the IP address of a UG50 of your choice.

The selected item is highlighted.

Note: Consider the following:
- Up to 256 IP addresses for the UG50s are displayed in the list.
- Initializing the Telephony Server removes all records of the UG50s currently displayed in the list.
- UG50s and their associated information are listed from top to bottom in the order that they are detected.
- Slots with no information collected from the UG50 are left blank and cannot be used to assign or delete any data using the ARAI command. To refresh the screen with the latest UG50 information, click the **Refresh** button.

STEP 4: From the **Card** drop down list, select the slot containing the card with the office data that you want to assign in the Telephony Server.

If you select **"All <card type>"** (**Note 2**), you can enter office data for more than one of the same type of card at one time.

Note: The **Card** drop down list displays slots containing a card, regardless of whether or not the card is supported for the ARAI command. If a slot with an unsupported card is selected, the system disables the **GET** button, preventing access to the channel data of the card.

Note 2: The **All <card type>** option is displayed when multiple cards of the same type are present in the UG50.

STEP 5: Click the **GET** button. **Note 3**

[Autofill Specify] and [List of Remote Equipment Office Data] are displayed.

Note 3: Consider the following:
- When the **GET** button is clicked, the Telephony Server communicates with the UG50 to collect and display information about all the channels for the specified UG50 card.
- The collection process, however, can be stopped at any time by clicking the **ABORT** button. In that case, [List of Remote Equipment Office Data] only displays the office data collected before the interruption.
- If the ARAI command is collecting data and the **GET** button is pressed from another PCPro, this second PCPro is denied service and receive a pop-up error message.

If an error is detected in the information collection, an error message will appear in the **RESULT** field for the corresponding record.

STEP 6: In [List of Remote Equipment Office Data], select the check box next to each record with office data that you want to assign in the Telephony Server and then enter the office data values. To select all the records at one time, place a check mark in the **All Select** check box.

For details of office data parameters, see the table "Office Data to Configure" (**Note 4**).

Note: If you want to enter Telephone Numbers, use the ALGSL/ALGSN command in addition to the ARAI command.

Note: You can use autofill to enter office data. For details of autofill, see "[Autofill]."

Note 4: Items indicated with "R" in the "Read Only / Data Entry" column of Office Data to Configure are read only and automatically set by the command.

[Autofill]

The following autofill functions are available for each record selected:

Note: Autofill operates with two criteria:
- The lead value among the selected records.
- The value of already registered data among the selected records.

Value of already registered data criteria is the prevalent criteria. Even if autofill is operating with the lead value criteria, if there is already registered data, the value of already registered data criteria becomes prevalent and therefore autofill starts to use the data from the already registered value. If there are several already registered values, already registered data criteria is used each time.

(a) Identical

The "Identical" autofill copies the current value of the specified fields into the corresponding fields in subsequent selected records (applies to only records selected below the current record).

This function is available in the fields below:

- TN
- TEC
- RSC
- SFC
- ADM/GST **Note 5**
- ROOM CLASS **Note 5**
- ANNEX **Note 5**
- GROUND **Note 5**
- FLOOR **Note 5**

Note 5: Displayed only when the Hotel feature is enabled (ASYD, SYS1, Index 160, Bit 0 = 1).

(b) Count Up

The "Count Up" autofill populates the specified fields in the selected records with sequential numbers (with an increment of 1) starting from the number entered in the field in the top-most selected row. The sequential number generator counts all records from the top-most to the bottom-most selected rows, even including the records not selected in between.

This function is available in the fields below (**Note 6**):

- STN
- LENS

Note 6: The ARAI command does no validation. It is the users responsibility to verify the Station Number and LENS values are valid.

<Counting Station Numbers>

The "Count Up" autofill uses the following 12 symbols to count station numbers (**Note 7**):

0, 1, 2, 3, 4, 5, 6, 7, 8, 9, *, #

Asterisk (*) and a pound (#) symbol are used to count beyond 9. After "#" is reached, the digit goes to zero and "1" is added to the digit in the next place to the left.

Note 7: In this autofill function, "*" and "#" are not counted as the last digit in a station number string. These symbols, however, are counted as the digits other than the last digit.

<Counting LENS>

The "Count Up" autofill uses the following 10 symbols to count LENS:

0, 1, 2, 3, 4, 5, 6, 7, 8, 9

The range of values for each area is as follows:

MG: 0 to 31 (The maximum value depends on the System Data.)

UNIT: 0 to 3

GROUP: 0 to 31 **Note 8**

Note 8: LENS from Virtual Groups xxx240 to xxx317 cannot be used for assigning UG50 stations or trunks.

LEVEL: 0 to 7

[Autofill Data Entry]

[1] In [Identical] and/or [Count Up], select the check box for the field for which you want to use autofill.

[2] In [List of Remote Equipment Office Data], select the check box next to each record you want to enter office data for using the autofill option that you selected in [1].

Make sure that only the check box for the target records are selected.

[3] Click the **Apply** button.

STEP 7: In [List of Remote Equipment Office Data], select the check box next to each record containing office data that you want to assign in the Telephony Server, and then click the **SET** button.

Note: The writing process cannot be stopped until all the data of the selected records is written to the Telephony Server.

The result of the writing process is displayed in the **RESULT** field for each record. If an error is detected, corresponding error message will appear.

Now the data input is completed.

15.1.2 Office Data Deletion

If you want to remove unnecessary office data from [List of Remote Equipment Office Data], proceed as follows.

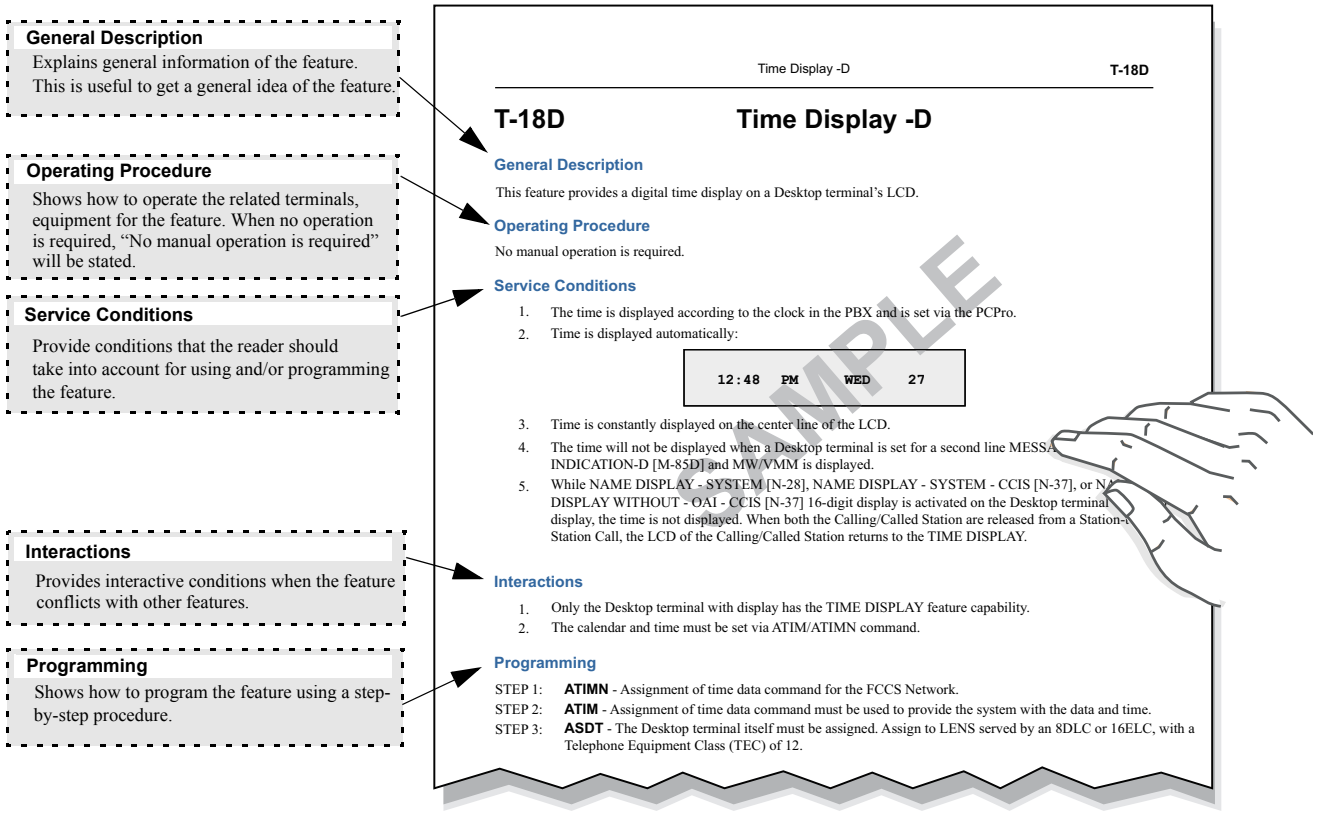
STEP 1: In [List of Remote Equipment Office Data], select the check box for a UG50 with office data that you want to delete, and then click the **DEL** button.

Note: The deleting process cannot be stopped until all the data of the selected records is deleted from the Telephony Server.

The result of the deleting process is displayed in the **RESULT** field for each record. If an error is detected, corresponding error message will appear.

Note: The **DEL** button deletes information that can be removed with the AISTL command.

CHAPTER 3
BUSINESS FEATURES



This chapter explains business features in an alphabetical order under the following headings:

- General Description
- Operating Procedure
- Service Conditions
- Interactions **Note 1**
- Programming
- FCCS Programming **Note 1**

Note 1: This item may not appear depending on service features.

The following shows an example of business features that is covered in this chapter.

Example of Business Feature Description

A-1 Attendant Camp-On with Tone Indication

General Description

This feature allows the Attendant to transfer an incoming trunk call to a busy station, placing the call in a special waiting mode (The call is "camped-on" to the busy station). The busy station receives a distinctive camp-on tone and when it becomes available, it is connected to the waiting call, either with or without the assistance of the Attendant as specified in the following options:

- Automatic Attendant Camp-On

  When the busy station becomes idle, it automatically rings and is connected to the waiting call upon answering.

- Semiautomatic Attendant Camp-On

  When the busy station becomes idle, the Attendant is informed of the availability, and then connects the waiting call to the station.

Operating Procedure

<Automatic Attendant Camp-On>

To activate from the ATTENDANT CONSOLE [A-3]

1. ATTENDANT CONSOLE [A-3] indicates an incoming call.
2. Press the ANSWER or INCOMING CALL IDENTIFICATION [I-2] key.
3. Dial the appropriate telephone number. Receive a busy tone.
4. Press the RELEASE key. The camp-on set tone is sent to the busy station and Camp-On is set.

To cancel from the ATTENDANT CONSOLE [A-3]

1. Press the LOOP key corresponding to the held call. The camp-on between the trunk call and the busy station is cancelled by this operation.
2. Press the DEST key. Hear a busy tone.
3. Press the CANCEL key, automatically returns to the trunk party.

<Semiautomatic Attendant Camp-On>

To activate from the ATTENDANT CONSOLE [A-3]

1. ATTENDANT CONSOLE [A-3] indicates an incoming call.
2. Press the ANSWER or INCOMING CALL IDENTIFICATION [I-2] key.
3. Dial the appropriate telephone number. Receive a busy tone.
4. Press the RELEASE key. The camp-on set tone is sent to the busy station and Camp-On is set.
5. Press the LOOP key to answer a recall when the station becomes idle.
6. Press the RELEASE key to connect the station and the waiting trunk party.

To cancel from the ATTENDANT CONSOLE [A-3]

1. Press the LOOP key corresponding to the held call. The camp-on between the trunk call and the busy station is cancelled by this operation.
2. Press the DEST key. Hear a busy tone.
3. Press the CANCEL key, automatically returns to the trunk party.

Service Conditions

<Common Conditions>

1. The Attendant Console must first be provided.
2. ATTENDANT CAMP-ON WITH TONE INDICATION (hereinafter also called as "Attendant Camp-On") can be used for incoming C.O. line or TIE line calls to a busy station. Attendant-assisted station-to-station calls cannot be camped-on.
3. Attendant Camp-On is controlled entirely from the ATTENDANT CONSOLE [A-3].
4. Only one incoming call may be camped-on to a particular station at any given time. Multiple Camp-On is not allowed.
5. When Attendant Camp-On is denied, the Attendant may place the Incoming Call into hold mode by pressing the HOLD key.
6. The maximum number of simultaneous Camp-Ons per ATTENDANT CONSOLE [A-3] is six. If ATTENDANT LOOP RELEASE [A-6] is enabled (ASYD, SYS2, Index 2, Bit 5=1), the maximum number is 12.
7. Attendant Camp-On may be denied if the busy station is:
   a.) dialing or in the LINE LOCKOUT [L-3] mode.
   b.) in the Make Busy state.
   c.) being rung.
   d.) already camped-on by a previous call.
   e.) protected from Camp-On by CLASS OF SERVICE - INDIVIDUAL [C-15].
   f.) protected with Data Line Privacy [ASFC SFI 11 = 0 (Data Line Privacy)].
   g.) being connected to an Attendant Loop.
   h.) activating any of the following conflicting features:

ATTENDANT OVERRIDE	[A-7]
ANNOUNCEMENT SERVICE	[A-15]
ANNOUNCEMENT SERVICE - ATTENDANT	[A-59]
BOSS - SECRETARY OVERRIDE -D	[B-5D]
BUSY VERIFICATION	[B-3]
CALL BACK	[C-1]
CALL HOLD	[C-6]
CALL TRANSFER	[C-10, C-11]
CALL WAITING - ORIGINATING	[C-31]
CALL WAITING - TERMINATING	[C-12]
CONSULTATION HOLD - ALL CALLS	[C-17]
DIAL ACCESS TO ATTENDANT	[D-2]
EXCLUSIVE HOLD -D	[E-4D]

EXECUTIVE RIGHT-OF-WAY	[E-1]
NON-EXCLUSIVE HOLD -D	[N-7D]
OFF-HOOK QUEUING	[O-7]
OUTGOING TRUNK QUEUING	[O-2]
PRIVACY -D	[P-14D]
PRIVACY RELEASE	[P-18]
THREE-WAY CALLING	[T-2]
VOICE CALL -D	[V-2]

Note: In each of the above instances, the Attendant will receive a reorder tone.

8. Attendant Camp-On may be denied on DICTATION ACCESS [D-3] and PAGING ACCESS [P-1] Connections by assigned Office Data.

9. Attendant Camp-On is available only when the busy station is in a one-on-one conversation with another extension or an outside party (through C.O. line or Tie line). There is no limit to the number of lines to which this feature can be assigned.

10. Any restriction that prevents a call from terminating directly at a station also prevents a call from waiting at that station.

11. CALL FORWARDING [C-2, 3, 5]: When call forwarding is in effect, the forwarding operation occurs before any Call Waiting is allowed. Once a call has been forwarded, the call may wait at the new station if Call Waiting is allowed.

12. HOT LINE [H-1]: Attendant Camp-On is allowed toward the Hot Line.

13. Route Restrictions not allowing a call to terminate at a station will also not allow Attendant Camp-On.

14. STATION HUNTING [S-7, 8, 9] and UNIFORM CALL DISTRIBUTION [U-1] take precedence over Attendant Camp-On. If all stations in the Station Hunting Group are busy, the call will wait at the called station.

15. TIE LINE ACCESS [T-3]: Attendant Camp-On is denied to a station over a TIE Line (distant end).

16. Attendant Camp-On and SERIAL CALL [S-15] are mutually exclusive.

17. Attendant Camp-On is usually denied to a station connected to Value-Added Modules (VAM).

18. The Automatic Attendant Camp-On and Semiautomatic Attendant Camp-On options cannot be used simultaneously. The Attendant Camp-On setting allows for either option.

19. Attendant Camp-On is not available for PSs, ISDN terminals and SP Controlled SIP terminals.

20. When a trunk call is camped on to a busy station, only the called party will hear a call waiting notification tone (camp-on set tone). In addition to the audible alert, if the called station is a Desktop terminal, the “CAMP” message appears on the LCD and the ANSWER key blinks.

21. By setting the System Data (ASYD, SYS1, Index 69, Bit 5), you can specify which station (originally called station or station forwarded to) an incoming trunk call is camped-on to when the call is forwarded with CALL FORWARDING- BUSY LINE [C-2] and encounters a busy condition.

    Note: This setting is also available when the call forwarding destination is a station in an FCCS network.

Note: When the call forwarding destination is outside of the self office, Attendant Camp-On is restricted and does not work.

22. Calls that remain camped-on for longer than the predetermined timing will initiate AUTOMATIC RECALL [A-8]. See VARIABLE TIMING PARAMETERS [V-1].

23. When an incoming trunk call is camped-on to a busy station with Attendant Camp-On, if the Attendant presses the LOOP key on the Attendant Console, the camp-on is canceled.

<Conditions Specific to Automatic Attendant Camp-On>

1. When receiving a camp-on set tone, a user of an Analog Station or Desktop terminal can place the current call on hold by pressing the switch hook and dialing a preprogrammed CALL HOLD Code (for details, see CALL HOLD [C-6]) to answer a camped-on call.

   Note: In addition, Desktop terminal users can also use the HOLD key* or ANSWER key to answer a camped-on call without releasing the original call.
   *: The HOLD key is a Line/Feature key to which the CALL HOLD [C-6] feature is assigned.

2. Automatic Attendant Camp-On may be denied if the Semiautomatic Attendant Camp-On is activated on the busy station.

<Conditions Specific to Semiautomatic Attendant Camp-On>

1. Unlike the Automatic Attendant Camp-On option, you cannot answer a camped-on call without disconnecting the first call. If you are a user of an IP/Digital terminal, the LCD screen displays “CAMP” and the ANSWER key blinks when a trunk call is camped on to your station. You cannot, however, answer the camped-on call by using the CALL HOLD Code, HOLD key or ANSWER key without releasing the original call.

2. Semiautomatic Attendant Camp-On may be denied if the Automatic Attendant Camp-On is activated on the busy station.

3. The Semiautomatic Attendant Camp-On option is also available for incoming calls on ISDN trunks.

4. When the semiautomatic camped-on station becomes idle, the Attendant Console receives a recall. If the station makes a call before the Attendant answers the recall, the system sends:

   - Ringback tone to the station when it is an analog telephone
   - No tone to the station when it is a Multiple Line terminal

Programming

STEP 1: **ASYD** - SYS1, Index 64, Bit 6. Type of Attendant Camp-On
0/1 = Automatic Attendant Camp-On/Semiautomatic Attendant Camp-On

SYS1, Index 145. This index provides timer for Camp-On call to recall to the Attendant Console. [RAM Data is 3F (hexadecimal) = 30 seconds.]

SYS2, Index 0, Bit 4 must be assigned as data "1," BUSY VERIFICATION.

SYS1, Index 69, Bit 5. Attendant Camp-On 0/1 = Set to Forwarded-from Station/Set to Forwarded-to Station

Note: All Timers settings (ASYD, SYS1, Index 128 to Index 159), operate normally on values set via the System RAM. Typically assign 00H. The RAM default values will be noted beside each System Timer.

STEP 2: **ASFC** - Assign to the telephone a Service Feature Restriction Class that allows SFI 11 (Attendant Camp-On). Data must be "1." Also allow SFI 10 (CALL HOLD [C-6]).

A-2 Attendant-Controlled Conference

General Description

This feature permits the Attendant to establish a Conference among 8-parties, 16-parties, or 32-parties. The Conferees may consist of any combination of stations and/or trunks, whether inside or outside parties. The number of conferee varies depending on the conference trunk (CFT) type as shown below:

CFT	NUMBER OF CONFEREES (including conference leader)
PA-CFTW	8-party × 2 groups
PA-CFTV	8-party × 4 groups
	16-party × 2 groups
	32-party × 1 group
CH-CFTA	8-party × 4 groups
	16-party × 2 groups
	32-party × 1 group

Operating Procedure

1. Station calls Attendant to request Conference.
2. Attendant dials the station on Circuit #0 of the CFT then presses RELEASE.
3. Attendant sequentially calls all desired parties, presses START, dials the station on Circuit #1 of the CFT, then presses RELEASE. Once all parties are connected, the Conference Leader with a Pushbutton Telephone may dial "0" to block additional participants, thereby assuring privacy.
4. If the Conference Leader dials "#", all Conferees will be disconnected. Otherwise, the Conference is terminated only after all parties have hung up.
5. To release from a Conference Circuit individually, a user must hang up. The remaining Conferees may continue without interruption.

Service Conditions

1. The Attendant Console must first be provided.
2. Conference Units are designed to provide adequate amplification, but the condition of the Central Office Connections will affect transmission.
3. Conference Extension Numbers should be placed in a STATION HUNTING - TERMINAL [S-9] Group with only the Pilot Number being published.
4. If the Conference Leader connected to the Conference Unit dials "#" during the course of the Conference, all Conferees will be disconnected.

- For privacy function
- When conference speech for less than defined members (8/16/32 parties) is made, the Conference Leader can keep another member from entering the conference by pushing "0".
- Conference Leader can set/cancel privacy by pushing "0."

- Privacy function makes available ports busy. (No calls cannot be arrived in.)
- It is unavailable to confirm whether or not Privacy function is set. The Conference Leader must be careful of using this function.
- When the Conference Leader sets privacy function and leaves the conference, the conference port is unavailable, however, the port for Conference Leader is available.
- Privacy function is canceled when all of the participants (Conference Leader and all the Conferees) have left the conference.

5. The Conference Leader with a Pushbutton Telephone must be connected to Level "0" of the Conference Circuit.
6. Override features such as BUSY VERIFICATION [B-3], ATTENDANT OVERRIDE [A-7] or EXECUTIVE RIGHT-OF-WAY [E-1] are denied on Conference Call.
7. This feature works with PA-CFTW, PA-CFTV or CH-CFTA. For setting the switches see the Circuit Card Description manual (CHAPTER 4 CARDS IN 8U-PIR for PA-CFTW and PA-CFTV and CHAPTER 3 CARDS IN 7U-PIR for CH-CFTA).
8. To disconnect a line from the conference, system data (ASYD, SYS1, Index 20, Bit 6=0) is required.
9. The Conference Leader cannot disconnect each Conferee (port) from the conference they are participated in.
10. If the Conference Leader is disconnected from the conference or the rest of members are only two parties or less, the conference trunk is still used.

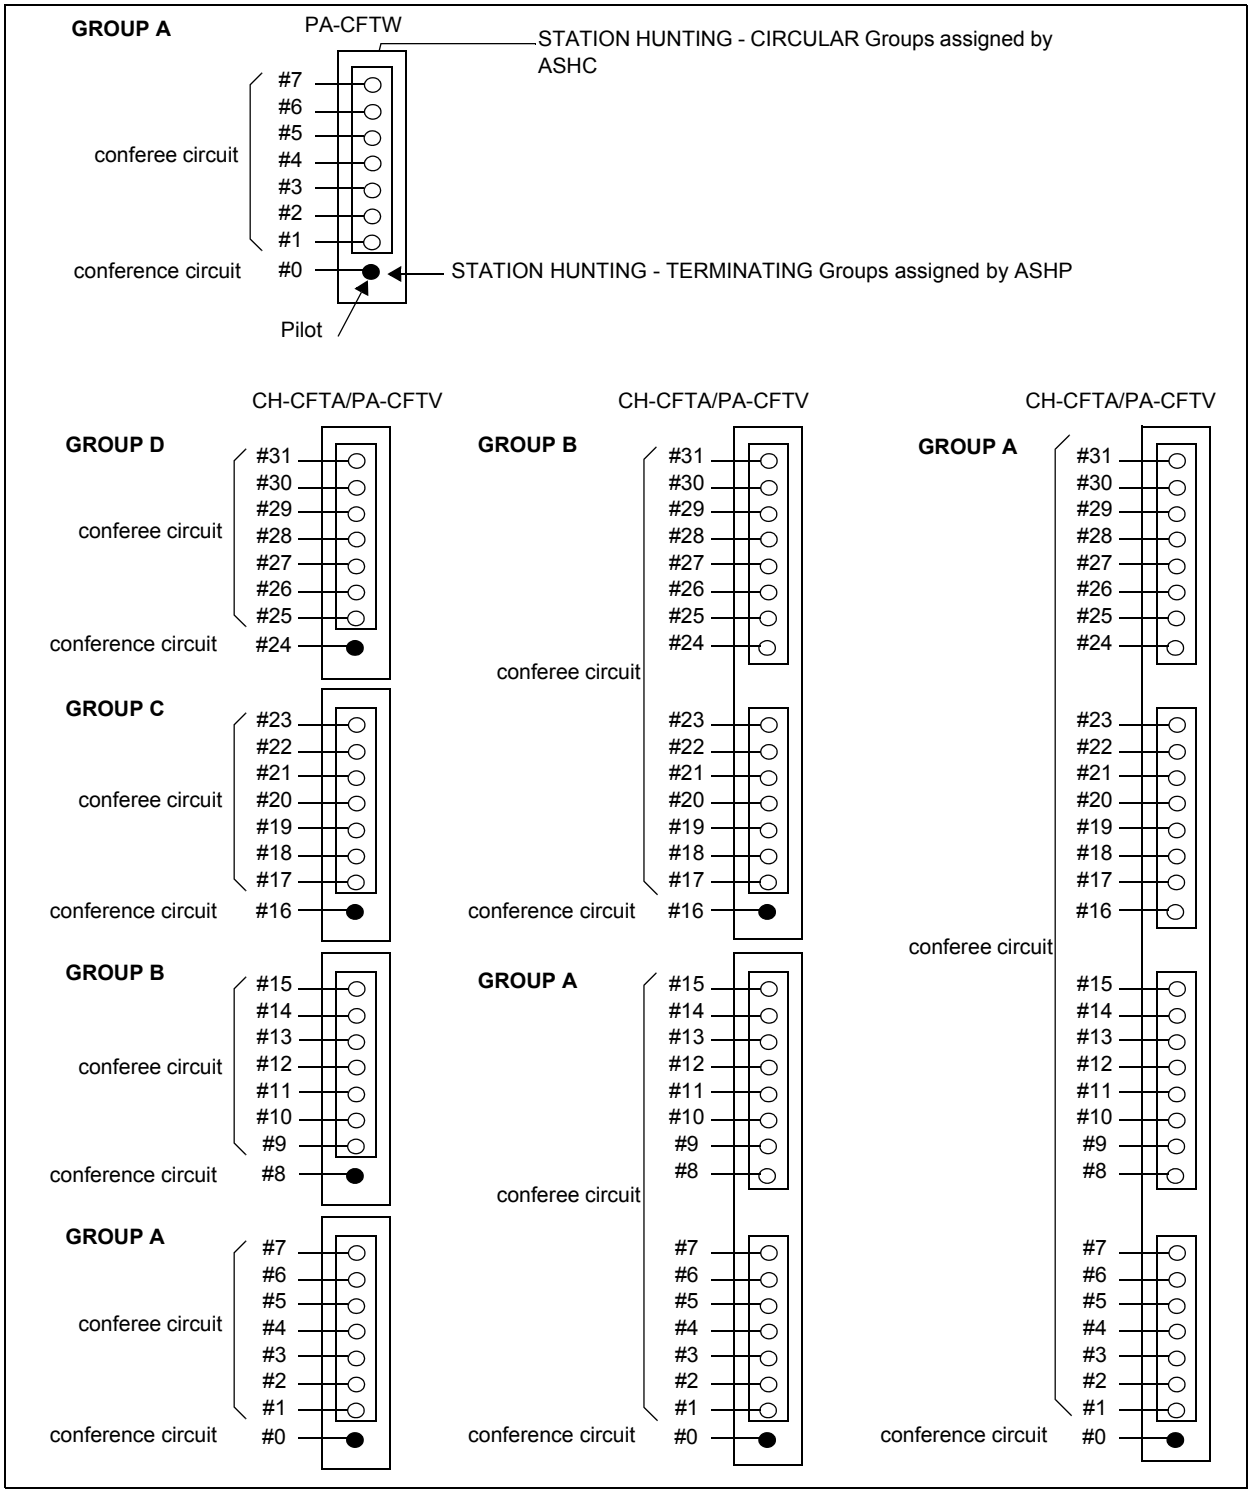
Programming

STEP 1: **ASYD** - Assign System Data, SYS1.
Index 20, Bit 6=0 (Line Circuit Reverse Relay Control when Reorder Tone is connected to a station/trunk.)
Index 64, Bit 0: Assign the compression method (0/1 = μ-law/A-law)

STEP 2: **ASDT** - Assign tenant number, station number, LENS, and the Telephone Equipment Class, (TEC), to the stations of the PA-CFTW/PA-CFTV/CH-CFTA. Also the Service Feature Restriction Class and Route Restriction Class (RSC) are assigned to the telephone. The RSC should allow connections to the Incoming and Outgoing Routes that will be connected to the Conference.

TN: Tenant Number
STN: Station Number
LENS: Line Equipment Numbers (six-digits)
TEC: Telephone Class (1-31)
1: DP (10 PPS)
2: PB
→ 3: DP/PB
12: Desktop Terminal
13: Data Terminal via Desktop Terminal
14: Hotline
15: CAS Line
16: Data Terminal via Data Module
18: Virtual Circuit

23: ISDN Terminal
26: VPS
27: Eight Conference Equipment



RSC: Route Restriction Class (0-15)

For assignment of RSC, ARSC.

SFC: Service Feature Restriction Class (0-15)

For assignment of SFC, use the ASFC command.

STEP 3: **ASHP** - Assign a Pilot Hunting Group using the conferees' circuits (other than conference circuit) of CFT card (PA-CFTW/PA-CFTV/CH-CFTA). Circuit #0/8/16/24 of all CFTs to be used for conference should be put into a Circular Hunt (ASHC).

STEP 4: **ASFC** - Assign 0 to Restriction Data (RES) for Service Feature Index (SFI) 11 (Data Line Privacy).

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, the AAED command is replaced by the AAEDN command). Note that the data setting for FCCS Service varies depending on the node.

STEP 1: **ASHPN** - Assign a Pilot Hunting Group using the conferees' circuits (other than conference circuit) of CFT card (CH-CFTA/PA-CFTW/PA-CFTV). Circuit #0/8/16/24 of all CFTs to be used for conference should be put into a Circular Hunt (ASHCN).

STEP 2: **ALGSN** - Assign a Telephone Number to the entry of the physical station data created with the ASDT command.

STEP 3: **ASFCN** - Assign 0 to RES for SFI 11 (Data Line Privacy).

A-3 Attendant Console

General Description

The ATTENDANT CONSOLE operates on a Switched Loop basis. Six Attendant Loops terminate at each Console via the associated position circuit. The Attendant can answer, originate, hold, extend and re-enter calls through each Loop. The number of calls may be effectively increased to 12 through use of the ATTENDANT LOOP RELEASE [A-6] feature.

Operating Procedure

Refer to the description of each feature related to Attendant Console.

Service Conditions

1. Each ATTENDANT CONSOLE is equipped with dual handset jacks, one on either side. For training purposes, both jacks may be used simultaneously. For normal operation, the Attendant may choose the most convenient side.

   Note: A drop in volume may be noticed while a second handset/headset is connected.

2. A Console Switched Loop may receive a second call immediately upon release of the first, regardless of whether or not the call has been answered by a Station when using the ATTENDANT LOOP RELEASE [A-6] feature.
3. A maximum of four Consoles per PIR can be provided.
4. The maximum number of Consoles allowed per system is:

   IMG System: 8
   MMG System: 32

   Note: When the system is the SV9500 migrated from IPX, the maximum number of Consoles allowed per system is:

   IMG System: 16
   MMG System: 60

5. The ATTENDANT CONSOLE is equipped with a digital time display.
6. The ATTENDANT CONSOLE is equipped with a numerical Call Waiting display.
7. When answering a CALL FORWARDING [C-2, 3, 5, 25] Call, the Attendant can identify the Called Telephone Number on display area instead of the Trunk Number by assigned System Data.
8. The Desk Console can display a maximum of 24-digit Calling/Called Station Number (Telephone Number) on the LCD. In addition, the Calling Number of Caller ID Service can be displayed.
9. The Desk Console can display 8-Bit ASCII characters.
10. Name Display is available when Name Display Service is available for the Desktop terminal. The contents of the Name Display is the same as that of the Desktop terminal.
11. The maximum number of digits for the Name Display are as shown below:
    - 16 for the Name assigned by PCPro
    - 15 for the Calling Name sent from the Central Office

12. When the Calling Number is not received, the Route/Trunk Number or the Central Office Code (COC) is displayed.
13. The Desk Console and the current Attendant Console can be used together in a system. However, the Attendant Console can display a maximum of 24-digit Telephone Numbers and Caller ID information is not displayed.
14. The data setting of the Station Number Display Pattern for the Attendant Console (SYS1, Index 82) is unavailable for the Desk Console.
15. An ATI circuit card is required. The switch setting for CH-CS00/PA-CS33-C/PA-CS33 (ATI) is shown below:

CH-CS00

Switch Name		Setting
SW 12	1	OFF (fixed)
	4	OFF (fixed)

PA-CS33-C/PA-CS33

Switch Name		Setting
SW 16	1	OFF (fixed)
	2	ON (fixed)

16. A Terminating Node (FPC) must be assigned in the FCCS Network.
17. Identical System Data related to Attendant Console should be programmed at all Nodes.
18. A different destination for Central Office Incoming Call (Ringdown) cannot be set at each Tenant Group.
19. TOLL DENIAL/TOLL DIVERSION [T-6] is not available for the Attendant Console.
20. Because the destination station is busy state, the Attendant Console presses the SRC key to go back to the two-way connection with the Calling Party. In this case, even if the destination station becomes the idle state and the Attendant Console presses the DEST key, Busy Tone is sent to the Attendant Console.
21. PAD Control (APAD) does not apply to Attendant Consoles. When the Attendant Console is connected to analog trunk, a receiver volume (PAD Control) can be changed by adjusting PAD value of ARTD somewhere between 6db and -5db and also by adjusting the volume setting of Attendant Console.

    Note: When the volume level of analog trunk is excessively low, the PAD value will not be in the range. A gap in receiver volume may be developed between calls with analog trunk and station.

22. When major alarms or minor alarms are generated in the system, alarm lamp on Attendant Console lights red. This lamp is enabled by setting the basic data for Attendant Console.

<Conditions Specific to UMGi/RNIP System>

23. The maximum number of Consoles allowed per system is:
    UMGi/RNIP System: 32

Note: In a RNIP/UMGi system is necessary to collectively set all the Attendant Consoles in one single node that can be the CCN or any of the RNs. Therefore, the maximum number of accommodated consoles can be different depending on the system configuration (IMG/MMG).

Interactions

There are no known interactions.

Programming

Called Numbers display when Call Forwarding to ATTCON.

STEP 1: **ASYD** - SYS1, Index 70, Bit 0 (0/1 = Out of Service/In Service)

Call Waiting Lamp Display.

SYS2, Index 8 and Index 9, Bit 0 to Bit 7.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ASYDL** - This data must be set to all the Nodes.

SYS1, Index 640: Assign the Fusion Point Code (FPC) of the Node providing the Attendant Console.

Note: Assign the Self FPC at the Terminating Node.

STEP 2: **ASPAL** - This data must be set to all the Nodes.

Assign SRV = “SSC: Service Code”, SID = 2 (Operator Call), FPC of the Node that Operator Calls are to be terminated to.

A-4 Attendant Keypad

General Description

This feature permits the Attendant to dial all calls from the ATTENDANT CONSOLE [A-3] via a Pushbutton PAD.

Operating Procedure

Refer to the description of each feature related to Attendant Console.

Service Conditions

1. Whether the System is equipped with DP or DTMF Trunk Lines, signals from the ATTENDANT KEYPAD will be converted.
2. Via the keypad, the Attendant may originate calls, process Incoming Calls, and activate various features. They are as follows:
   a.) PUSHBUTTON CALLING [P-4]
   b.) PUSHBUTTON CALLING - ATTENDANT ONLY [P-5]
   c.) ROTARY DIAL CALLING [R-5]
3. The ATTENDANT KEYPAD generates DC Signals, which in turn are converted to either DP or DTMF Signals by the Attendant Interface Circuit.
4. The keypad consists of 12 keys used to generate digits 0-9, * and #.

Programming

ASYD - SYS2, Index 2, Bit 1. This assignment will determine type of Sender used by the Attendant Console, either dial pulse or pushbutton, 0/1: DP/PB. The Attendant Console must first be provided.

SYS1, Index 134, RAM Data is 32H, four seconds. This is the Interdigit Timer for the Register/Sender Circuit on the ATI Card. For normal operation, no assignment is required via PCPro.

A-5 Attendant Lockout

General Description

This feature denies an Attendant the ability to re-enter an established Trunk/Station Connection without being recalled by the Station.

Operating Procedure

No manual operation is required once this feature has been programmed into System Data.

Service Conditions

1. This feature is mutually exclusive with:
   ATTENDANT OVERRIDE [A-7]
   BUSY VERIFICATION [B-3]
2. Lockout is inoperative on TRUNK-TO-TRUNK CONNECTION [T-10] when the Release Signal is not provided from the distant end.
3. Lockout is not used unless the feature is provided which gives Two-party Hold capability. Without this capability, the completed call is removed from the ATTENDANT CONSOLE [A-3] Loop, so the Attendant cannot reenter for assistance or any other purpose.

Interactions

1. ATTENDANT OVERRIDE [A-7]: In those cases where Answer Supervision is returned on TRUNK-TO-TRUNK CONNECTION [T-10], the Attendant can override the busy condition by using the ATTENDANT OVERRIDE [A-7] feature.
2. TRUNK-TO-TRUNK CONNECTION [T-10]: Privacy is automatically disabled for TRUNK-TO-TRUNK Calls, if the Release Signal is not provided from the distant end.
3. SPLITTING [S-4]: The Privacy feature works with the SPLITTING [S-4] feature causes automatic splitting.
4. Switched Loop Operation: Call processing is modified so that pressing a Loop key does not cause the Attendant to be bridged on an established call unless the Attendant is recalled. An exception is a TRUNK-TO-TRUNK CONNECTION [T-10] when the Release Signal is not provided from the distant end.
5. ATTENDANT-CONTROLLED CONFERENCE [A-2]: When the Attendant reenters a Conference connection to answer a recall, only the Attendant and the recalling Station are connected together.

Programming

Per-Route Basis:

ARTD - Assign CDN 44:PRV as a “1”, Line Privacy.

Per-Station Basis:

ASFC - Assign “0” to SFI 4 [Executive Right-of-Way (Called)] and SFI 11 (Data Line Privacy) to the SFC assigned to the Stations.

Per-Tenant Basis:

ASYD - SYS2, Index 0, Bit 3, Bit 4 and Bit 5. Assign data “0”.

A-6 Attendant Loop Release

General Description

This feature allows an ATTENDANT CONSOLE Loop to become available for a second call as soon as the Attendant has directed the first call to a Station, even if that Station does not answer.

Operating Procedure

1. ATTENDANT CONSOLE indicates an Incoming Call.
2. Press the ANSWER or INCOMING CALL INDICATION [I-2] key.
3. Dial the desired Telephone Number. Receive Ringback Tone.
4. Before the Station answers, press the RELEASE key.
5. The Loop is now available for another call.

Service Conditions

1. The Attendant Console must first be provided.
2. Unanswered calls will be routed to the Attendant within the predetermined time via AUTOMATIC RECALL [A-8]. See VARIABLE TIMING PARAMETERS [V-1].
3. If all Attendant Loop Circuits are busy when AUTOMATIC RECALL [A-8] is activated, the system will automatically scan for an Idle Loop every eight seconds.
4. A maximum of six calls (one per Loop) may be released simultaneously from any single ATTENDANT CONSOLE.
5. This feature provides the Attendant with the equivalent of 12 Switching Loops.
6. In a MULTIPLE CONSOLE OPERATION [M-4], the Attendant who initiated the Loop Release will be recalled.
7. ATTENDANT LOOP RELEASE is only applicable to Incoming Trunk Calls extended to an unanswered Station or busy Station (Camped-On).
8. Calls that are held by the Attendant, using the HOLD key, cannot be released from the ATTENDANT CONSOLE [A-3]. These calls remain on the Switched Loop until they are either extended by the Attendant or abandoned by the Calling Party.
9. After the ATTENDANT LOOP RELEASE is activated, the Attendant cannot interact with the call until altered by the AUTOMATIC RECALL [A-8] feature.
10. ATTENDANT CAMP-ON: This feature, when active, permits the Attendant to CAMP-ON [A-1] to a busy Called Station. Upon ATTENDANT CAMP-ON WITH TONE INDICATION [A-1], the Attendant may release the call from the ATTENDANT CONSOLE [A-3].

Interactions

1. ATTENDANT LOOP RELEASE and CALL FORWARDING - DON'T ANSWER [C-3] on calls extended to a Station via the Attendant Console (SYS2, Index 6, Bit 7) are mutually exclusive.
2. ATTENDANT LOOP RELEASE is only applicable to Incoming Station or Trunk Calls extended to an unanswered Station or busy Station. See ATTENDANT CAMP-ON WITH TONE INDICATION [A-1].
3. Calls placed on CALL HOLD [C-6] by the Attendant Console are not released from the Console. These calls remain on the Loop until they are either extended by the Attendant or abandoned by the Calling Party.
4. A maximum of six calls per Console can be released and stored in the System Memory. A seventh call extended (unanswered/camped-on) will remain in the Loop.
5. Calls processed via SERIAL CALL [S-15] are not released from the Attendant Console. These calls remain in the Loop until completion.

Programming

ASYD - SYS2, Index 2, Bit 5. Assign as data "1." Assign on a per Tenant basis.

A-7 Attendant Override

General Description

This feature permits an Attendant to enter a Busy Trunk Connection within the System, via the Attendant Console [A-3]. Upon activation, a Warning Tone will be heard by the connected parties, after which they will be connected with the Attendant in a three-way bridge.

Operating Procedure

1. Press the TKSL key.
2. Dial the desired Trunk Route (two or three digits) and the Identification Numbers (three digits).
3. Upon receiving Busy Tone, press the Busy Verification (BV) key.
4. A Two-burst Tone is sent to the connected parties.
5. The Attendant can now monitor or join the connection.
6. Press the RELEASE key to disengage.

Service Conditions

1. This feature may be used during Trunk-to-Trunk Calls (COT, FX, WATS, CCSA, TIE Lines).
2. This feature cannot be activated when the connected Station/Trunk is:
   a.) dialing.
   b.) connected to a Three-way Connection.
   c.) when a PRIVACY [P-14D, P-15D] feature is activated.
   d.) connected to a Route programmed for Line/Trunk, Privacy, CDN 44:PRV.
   e.) listening to a Tone (DT, ROT, SST, BT, RBT).

   Note: When assigning ARTD, CDN 28 (ANS) = 0 for the specified trunk, this feature is available while the connected Station/Trunk receives RBT.
   When assigning ARTD, CDN 28 (ANS) = 1 for the specified trunk, this feature is not available while the connected Station/Trunk receives RBT.

   f.) protected by DATA LINE SECURITY [D-12].
   g.) being connected to an Attendant Loop.
   h.) activating any conflicting feature, such as:

BUSY VERIFICATION	[B-3]
BOSS - SECRETARY OVERRIDE	[B-5]
CALL HOLD	[C-6]
CALL TRANSFER	[C-10, C-11]
CALL WAITING - TERMINATING	[C-12]
CONSULTATION HOLD - ALL CALLS	[C-17]
DATA LINE SECURITY	[D-12]
DATA PRIVACY ON DEMAND	[D-17]
DIAL ACCESS TO ATTENDANT	[D-2, D-71]
EXECUTIVE RIGHT-OF-WAY	[E-1]
EXCLUSIVE HOLD -D	[E-4D]
NON-EXCLUSIVE HOLD -D	[N-7D]
OFF-HOOK QUEUING	[O-7]

OUTGOING TRUNK QUEUING	[O-2]
PRIVACY -D	[P-14D]
PRIVACY RELEASE	[P-18]
THREE-WAY CALLING	[T-2]
VOICE CALL	[V-2]

In each of the above instances, the Attendant will receive Reorder Tone.

3. ATTENDANT OVERRIDE and ATTENDANT LOCKOUT [A-5] are mutually exclusive features.
4. Each Tone Burst is 0.08 seconds in duration and is used to alert both parties that the Attendant is overriding the conversation.
5. This feature can be denied on DICTATION [D-3] and PAGING [P-1] connections by assigned ARTD data.
6. It is possible, via System Data, to completely disable the sending of Warning Tone during an ATTENDANT OVERRIDE Connection. Normally the Two-burst Warning Tone is sent when the ATTENDANT OVERRIDE Connection is initiated and then is repeated approximately every 15 seconds. The initial Tone Burst is also disabled. If the Trunk is connected to a Desktop terminal, the display is as follows:

After five seconds, the display returns to the normal Conference display, CONF.

7. ATTENDANT OVERRIDE is temporarily denied and Reorder Tone is heard if any of the following features are active:
   a.) EXECUTIVE RIGHT-OF-WAY [E-1]: If the Called Trunk is connected to a line on which EXECUTIVE RIGHT-OF-WAY is being used.
   b.) Trunk Restriction: If the Called TIE Trunk was routed to Reorder Tone as a result of Trunk Restriction.
   c.) SPECIAL DIAL TONE [S-2]: If the Called Trunk is on hold.
   d.) ATTENDANT CAMP-ON WITH TONE INDICATION [A-1]: If the Called Trunk is camped-on to a busy Station.
   e.) SERIAL CALL [S-15]: ATTENDANT OVERRIDE is denied to the parties held on the Console.
   f.) ATTENDANT INTERACTION: During the normal operation of the SV9500 features, situations may arise whereby a Trunk may be connected to an ATTENDANT CONSOLE [A-3]. While the Trunk is connected to the ATTENDANT CONSOLE [A-3] or is in queue at an ATTENDANT CONSOLE [A-3], the Attendant at the Console or an Attendant at any other Console (when multiple Consoles are provided) is not allowed to bridge on the connection. The Trunk must be connected to a Station in a talking mode in order for the ATTENDANT OVERRIDE feature to function.
8. When this feature is used, the ATTENDANT CONSOLE cannot specify a Trunk accommodated in a different Node in the FCCS Network.

Interactions

1. With ATTENDANT OVERRIDE, the following Trunk types may be verified (busy or idle status):
   a.) One-way Incoming Trunks
   b.) One-way Outgoing Trunks
   c.) Bothway Trunk
2. Trunks in a Station-to-Trunk Connection or TRUNK-TO-TRUNK CONNECTION [T-10] can be verified when busy.

3. ATTENDANT LOCKOUT [A-5]: The Attendant is prevented from overriding a busy Trunk which is connected to a Loop held at the Attendant Console. Since the Lockout feature applies only to calls held on an Attendant Console Loop, ATTENDANT OVERRIDE of those Trunks will be denied and the Attendant will hear Reorder Tone.
4. CALL FORWARDING - ALL CALLS [C-5], BUSY [C-2] or DON'T ANSWER [C-3]: If an Attendant attempts to busy verify an idle or busy Station Line that has activated the Call Forwarding feature, busy verification of the Destination Station will occur. If an Attendant attempts to busy verify an idle or busy Station which is Call Forwarded to the Attendant Console, ATTENDANT OVERRIDE will not be allowed.
5. DICTATION ACCESS [D-3]: ATTENDANT OVERRIDE will be denied towards the Dictation Access Trunks.
6. PAGING ACCESS [P-1]: ATTENDANT OVERRIDE is denied to the Paging Access Trunks.
7. DATA PRIVACY - CCIS [D-67] [D-68]: To prevent interruption of Data Transmission, the Attendant cannot override a Trunk connected to a busy Station Line when the user activates this feature.

Programming

STEP 1: **ASYD** - SYS1, Index 78, Bit 0 and Bit 1.
SYS1, Index 60, Bit 5. Is the Two-burst Warning Tone to be disabled? No/Yes.
SYS1, Index 68, Bit 4. Trunk Select (TKSL) key must be enabled. Assign data "1."
SYS2, Index 0, Bit 3, assign as data "1".
SYS1, Index 158, timer between Tones.

STEP 2: **ATRK** - Assign the LENS as Route 909, Digital Conference Trunk. LENS # consists of the following:

XX	X	XX	X
Local Processor	Unit	Group	Level

Group and Level Numbers for the Digital Conference Trunk are 210, 213, 216, 221, 224, 227, 232 and 235.

STEP 3: **ASFC** - For Stations susceptible to ATTENDANT OVERRIDE, assign a Class of Service that allows SFI 4 [Executive Right of Way (Called)], and SFI 11 (Attendant Camp On).

STEP 4: **ARTD** - When a Station is connected to a Trunk, CDN 44:PRV of the route must be assigned as data "0" for ATTENDANT OVERRIDE to be allowed.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or MG.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

STEP 1: **ALRTN** - Assign this command to connect the Logical Route to the Physical Route.

STEP 2: **ARTDN** - When a Station is connected to a Trunk, CDN 44 PRV of the Route must be assigned as data "0" for ATTENDANT OVERRIDE to be allowed.

A-8 Automatic Recall

General Description

This feature works as a timed reminder. When an Incoming Central Office Call (including ISDN) handled by the Attendant remains on hold, camped-on, or ringing unanswered for a fixed interval, the Attendant is automatically alerted.

Operating Procedure

No manual operation is required.

Service Conditions

1. This feature is not available for calls originated from a station since the Attendant cannot blindly transfer them to another station.
2. AUTOMATIC RECALL [A-8] timing is preset in System Data at 30 seconds. See VARIABLE TIMING PARAMETERS [V-1] for other selectable timing choices.
3. If the Attendant reenters a held or Camped-On Trunk, timing is reset when the Trunk is returned to the previous condition.
4. The Attendant Console buzzer will sound to Signal Recall, provided no calls are being processed, in addition to the standard visual indication for Incoming Calls.
5. This feature is denied on INCOMING CENTRAL OFFICE CALL TO TIE LINE CONNECTION [I-3].
6. When an Attendant answers AUTOMATIC RECALL, either the Dialed Number or the Calling Telephone/Trunk Number can be displayed (on System Data basis).
7. The indication on the ATTENDANT CONSOLE [A-3] follows DIGITAL DISPLAY - STATION [D-5]. When the Dialed Number (destination) is displayed, the display is as follows:

Tenant Number:	Blank Space
Trunk Route Restriction Class:	Blank Space
Telephone Number:	Dialed Number (last digits)

8. When the Attendant responds to Automatic Recall, a Three-party conference will be established between the Attendant, the original party and the call forwarding destination if original party and the call forwarding destination are CCIS, ISDN or other trunks. In this case, the Attendant and the original party hear RBT until the call forwarding destination answers.
9. When the Attendant responds to Automatic Recall, the call will be reestablished between the Attendant and the original party. Afterwards, when the Attendant forwards a call and the call forwarding destination answers, the following will occur.

   a) If the call forwarding destination is a station, it will become on hold. The call between the Attendant and the original party remains in progress.

   b) If the call forwarding destination is a trunk, a Three-party conference will be established between the Attendant, the original party and the call forwarding destination.

10. This feature is available on calls extended to a branch System via a CENTRALIZED ATTENDANT SERVICE [C-20] (CAS) position.

11. SYS2, Index 6, Bit 7. On a per Tenant basis, allow this Bit for CALL FORWARD - DON'T ANSWER [C-2] via the Attendant Console. During this operation, the call will ring at the called station for the time interval set in SYS1, Index 141 (ASYD, Index 145, Bit 0 to Bit 3 must be longer than the Index 141). The call is then forwarded and rings at the forwarded station for the time interval set in Index 145. If the call is still not answered, it will be recalled to the Attendant Console via the AUTOMATIC RECALL feature.
12. SYS1, Index 70, Bit 0 (Called Number Display). This Bit does not affect the display on the Attendant Console for recalled calls. It is used for DIDs that have call forwarded to the Attendant or if the Attendant reenters the Loop on an extended call before AUTOMATIC RECALL has taken place.
13. When a Trunk Call recalls back to the Attendant Console, the Destination Telephone Number will display, and the SOURCE (SRC) LED will be lit. By pressing the SRC key, the display will change to the Originating Route and Trunk Number. By pressing the DEST key, the display will change to the destination station.
14. The station will continue to ring even as the call recalls to the Attendant Console. If the station should answer at the same time the Attendant answers the recalling call, a three-way conversation will take place (if Conferences is allowed and a Conference Card is programmed and installed). The Attendant can press the SRC, DEST, or TALK keys to achieve the desired conversation or press the RELEASE key to get out of the conversation.

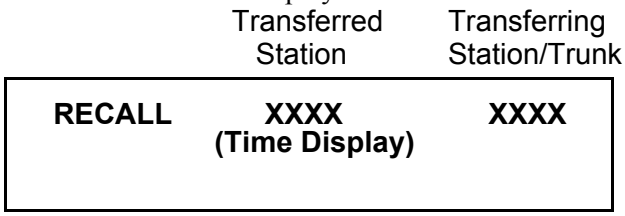
Programming

ASYD - SYS1, Index 145. Automatic Recall Timer.

Note: When "00 HEX" is assigned to this data, default data is automatically set to 32 seconds. For details, refer to Command Manual.

A-8D Automatic Recall -D

General Description



This feature works as a timed reminder. When a Desktop terminal handled call remains on hold (EXCLUSIVE HOLD [E-4D] or NON-EXCLUSIVE HOLD [N-7D]) or during an unattended transfer for a variable, programmable period of time, the Desktop terminal is automatically alerted.

Operating Procedure

No manual operation is required.

Service Conditions

1. AUTOMATIC RECALL -D timing is default in System Data at 30 seconds. See VARIABLE TIMING PARAMETERS [V-1] for other selectable timing choices.
2. If the Desktop terminal reenters a Held or Transferred Call, timing is reset when the call is returned to a RECALL position.
3. When a Held Call returns to the Desktop terminal, a continuous ring of 0.5 seconds ON, 0.5 seconds OFF, and an LED flashing at 240 IPM occurs until the call is retrieved. The upper LCD goes blank during recall. The signal occurs whether the Desktop terminal is on-hook or off-hook.
4. When an unattended transfer returns to the originator of the transfer, the Desktop terminal will ring normally for 30 seconds (VARIABLE TIMING PARAMETERS [V-1]), if the Release Signal is not provided from the distant end. The LCD displays:

Note: When the Telephone Number of the Transferred/Transferring Station exceeds eight digits, the last eight digits are displayed. However, a maximum of 16 digits Transferring Telephone Number can be displayed on the middle line of LCD depending on the System Data.

5. When a Desktop terminal holds a call by NON-EXCLUSIVE HOLD [N-7D] during a THREE-WAY CALL [T-2], the AUTOMATIC RECALL -D feature cannot be activated.

Programming

ASYD - SYS1, Index 144. Recall timing of calls placed on EXCLUSIVE HOLD [E-4D] and NON-EXCLUSIVE HOLD [N-7D]. For normal operation of 30 seconds, leave as data 00H. (RAM Data is 3FH)

SYS1, Index 140. Recall timing of Station transfers.

SYS2, Index 12, Bit 0 - Ringer for NON-EXCLUSIVE, Bit 1 - Ringer for EXCLUSIVE

0: Required

1: Not Required

A-15 Announcement Service

General Description

This feature allows a user to hear a prearranged announcement when the user dials a predetermined Access Code.

Operating Procedure

1. Lift the handset. Receive Dial Tone.
2. Dial the Announcement Trunk Access Code.
3. Listen to the message from the Announcement Machine.

Service Conditions

1. This feature requires one of the following hardware alternatives:
   a.) Central Office Trunk (COT) or 2W E&M Trunk (TLT) and an Announcement Machine.
   b.) Digital Announcement Trunk (DAT).
2. The following connections are available:
   a.) Multi Connection: many users or TIE line trunks can connect to one Announcement Trunk at the same time.
   b.) Single Connection: at any given time, only one Station/Trunk can connect to one Announcement Trunk.
3. This feature is also available for TIE line trunk access to Announcement Trunk.
4. This connection can be continuous until a user hangs up or it can be disconnected after 30 seconds. This function can be selected on a per Announcement Trunk basis.
5. Before connection to the Announcement Machine is made, the system can be programmed to send Ringback Tone.
6. When this feature is activated from a TIE line, an Answer Supervision Signal will be sent to the far end System.
7. ANNOUNCEMENT SERVICE can be provided for a maximum of 127 Trunks, which include the Announcement Trunks for CALL FORWARDING - INTERCEPT / ANNOUNCEMENT [C-25].
8. This feature is also available from the Attendant Console. The Attendant dials the Announcement Trunk Access Code and listens to a message from the Announcement Machine.
9. ANNOUNCEMENT SERVICE is provided to FCCS Nodes that have no Announcement Trunk in the Remote Node.
10. When a call is terminated from the ISDN Trunk or MG(SIP), RBT is sent to the caller if Announcement Trunk Answer Signal is not sent.
11. In AAEDN command, if the checkbox for “Do not send RBT” is OFF (sending RBT), when hearing the announcement from other Node’s VS32 via DTI-FCCS, the announcement starts to play as soon as RBT is sent. Therefore, the announcement heard after sending RBT will have its beginning cut off.
12. This feature is unavailable when a call is terminated via CCIS trunk.
13. If there is a possibility that an Announcement Trunk may be connected to another Announcement Trunk via C.O. line or TIE line, set the parameter C (Duration of connection) of the AAED command to Disconnect in 30 seconds.

Interactions

1. Each Route connected to an Announcement Machine is also an EQP. The same Route can be assigned as different EQPs. However, it is best to separate EQP functions by Route.
2. TLT, COT, or DAT cards may be used.

Programming

STEP 1: **ANPD** - Reserve a Number Level for Trunk Access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. Assign for NND values in accordance with a predetermined Numbering Plan.

STEP 2: **ASPA** - Assign an Access Code to the Announcement Trunk. Assign SRV = "ANNC: Announcement Service - Single Announcement". The EQP Number Assignment should be as assigned in AAED. TYPE = 0/1.

STEP 3: **ARTD** - Assign the Announcement Route as shown below.

RT: 1
1-OSGS :2 2-ONSG :3 5-TF :1 6-TCL :1 7-L/T :1
15-LSG :4

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or VS32.

STEP 4: **ARSC** - Assign a Route Restriction Class (RSC) to the Station that allows access to the Announcement Route. Assign RSC 0 to the Attendant, and allow that RSC Access to the Announcement Route.

STEP 5: **ATRK** - Assign the LENS, Announcement Trunk Route Number. Assign one or more Trunks to a specific Route used to connect to an Announcement Machine.

STEP 6: **MBTK** - Assign the Make Idle status to the Announcement Trunk.

STEP 7: **ARRC** - If TIE line, DID, or REMOTE ACCESS TO SYSTEM [R-2] Connection to the Announcement Service Trunk is required, allow Trunk-to-Trunk Connection using ARI-D-RES = 1 (Direct Connection is allowed.)

STEP 8: **AAED** - This command is used to assign Announcement Equipment.

TN: Tenant Number

EQP: Announcement Equipment Number

RT, TK:Route and Trunk Number of the Trunk connected to the Announcement Equipment.

C: Duration of connection, 0/1:Disconnect in 30 seconds/Connection is held until the Station releases. See the requirements of the application for the Announcement Equipment. For Dead Level applications, data 0 is assigned.

R: Sending RBT 0/1: sending RBT/not sending RBT.

A: Answer Signal Sending, 0/1: no answer from Incoming Trunk/answer from Incoming Trunk. Normally assign data "1".

M: Multiple Connection 0/1: Single Connection/Multiple Connection. Usually assign for Single Connection.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

STEP 1: **ALRTN** - Assign this command to connect the Logical Route to the Physical Route.

STEP 2: **ARRCN** - This data must be assigned to the NCN.

Release the restriction between the Terminating Trunk and the Announcement Trunk.

STEP 3: **ARTDN** - Assign the Announcement Route as shown below. Be sure to provide privacy by programming CDN 44:PRV as data "1".

LGRT: 1

1-OSGS	:2	2-ONSG	:3	5-TF	:1	6-TCL	:1	7-L/T	:1
8-RLP	:2	15-LSG	:4	44-PRV	:1				

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or VS32.

STEP 4: **AAEDN** - This data must be assigned to the NCN.

Assign the Announcement Equipment Data.

EQUIPMENT KIND:

- DAT/Announcement Machine
- VS32

TN: Enter Tenant Number

EQP: Announcement Equipment Number

0 = Dead Level

1 = Unused Number

2-15 = Announcement Service

Duration of Connection:

- Disconnect in 30 seconds
- Connection is held until the Station releases. See the requirements of the application for the Announcement Equipment. For Dead Level applications, data 0 is assigned.

Do Not Send RBT [On/Off]

Send Answer Signal [On/Off]

Multiple Connection: Select either Single or Multiple.

LGRT: Logical Route

TK: Trunk Number **Note 1**

STEP 5: **ARSCN** - This data must be assigned to the NCN.

Note 1: Not necessary for Multiple Connection = Single.

Note: The current command data shown is set to all Nodes using the service: ASTD, ARTD, ATRK, MBTK.

A-16 Alternate Routing

General Description

This feature automatically routes Outgoing On-net or Off-net Calls over alternate facilities when the first-choice Trunk Group is busy. The user selects the first-choice Route by dialing the corresponding Access Code, and the equipment then routes the call through Alternate Trunk Groups only if the first is busy. The System will also add or delete digits, when necessary, to complete the call to the desired Station.

Operating Procedure

No manual operation is required.

Service Conditions

1. No indication is provided to a user if the call is routed over first-choice or subsequent choice facilities.
2. STATION MESSAGE DETAIL RECORDING (SMDR) [S-10] may be used with this feature.
3. The same Route can be included in two or more Alternative Groups.
4. The total number of Routes that can be included in a single Route Advance Group is 15.
5. The total number of Routes that can be included in the system is 255.
6. The same Route can be included in two or more Alternative Groups.
7. The maximum number of Trunks to be included in a Route is 255.
8. ALTERNATE ROUTING [A-16] occurs only when the dialed Code accesses the first-choice Trunk Group in the ALTERNATE ROUTING List.
9. The Outgoing Call to the Trunk belonging to the different Node in the FCCS Network is available. For more detailed information, see the Data Programming Manual - FCCS.

Interactions

1. ALTERNATE ROUTING [A-16] may be affected by TOLL RESTRICTION -3/6 DIGIT [T-7]. For example, two Routes of WATS provide the same service but for two separate Route Restriction Classes (RSC). Stations of one RSC will be allowed to advance to the second WATS Route while the other RSC will not.
2. If LEAST COST ROUTING [L-5] is used, ALTERNATE ROUTING is not used. However, they may be made available in the same system.
3. ALTERNATE ROUTING provides for no digit translation, therefore, only Routes of the same type may be used. Keep this in mind when coordinating Route Advance Groups consisting of DDD and FX Routes.

Programming

STEP 1: **ANPD** - Reserve a Number Level for Trunk Access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. Assign NND values in accordance with a predetermined Numbering Plan.

STEP 2: **ASPA** - SRV = “OGCA: Outgoing Call with route advance”, assign Access Code, count number of Routes in a Route Advance Group, and the Route Numbers in the group.

STEP 3: **ARSC** - A Station must be assigned an RSC that will allow access to the Routes in the ALTERNATE ROUTING Route Advance Group.

STEP 4: **AMND** - must be assigned for the number of digits dialed.

FCCS Programming

Refer to the Data Programming Manual - FCCS.

A-17 Audible Indication Control

General Description

This feature allows the Attendant to adjust the audible indications provided to the ATTENDANT CONSOLE [A-3].

Operating Procedure

The Attendant Console is equipped with a Volume Control that can raise or lower the internal speaker level. The Volume Control is located on the left side of the Attendant Console. The audible indication may also be turned OFF when required.

Service Conditions

Each Attendant Console can adjust the audible indications to the ambient noise level, or completely disable audible indication where necessary.

Programming

No programming is required.

A-18 Account Code

General Description

This feature is adjunct to STATION MESSAGE DETAIL RECORDING (SMDR) [S-10], which provides a Station User with the capability to enter a Cost-accounting or Client-billing Code (up to ten digits) into the system before dialing a Long Distance Number.

Operating Procedure

To enter an ACCOUNT CODE:

1. Lift the handset. Receive Dial Tone.
2. Dial the Feature Access Code. Receive Service Set Tone.
3. Dial the ACCOUNT CODE (up to 10 digits).
4. Receive Dial Tone and dial the Called Number.

Note: Feature Access Code - Access Code for ACCOUNT CODE entry will be a maximum of three digits.

To enter an ACCOUNT CODE after an AUTHORIZATION CODE [A-20]:

1. Lift the handset. Receive Dial Tone.
2. Dial the Feature Access Code for AUTHORIZATION CODE and receive Service Set Tone.
3. Dial the AUTHORIZATION CODE (up to 10 digits) and receive Second Service Set Tone.
4. Dial the ACCOUNT CODE and receive Dial Tone.
5. Dial the Called Number.

Service Conditions

1. The maximum number of digits for an ACCOUNT CODE is 10. There is no limitation to the number of Account Codes used per system.

   Note: Service Set Tone after the Feature Access Code can be eliminated by System Data. System Data is common for ACCOUNT CODE, AUTHORIZATION CODE [A-20] and FORCED ACCOUNT CODE [F-7].

2. A Station User can enter an ACCOUNT CODE of fewer digits than the maximum length defined and indicate the end of the entry by pressing the “#” key.
3. The user may decide if ACCOUNT CODE follows the AUTHORIZATION CODE (on a per tenant basis).
4. ACCOUNT CODE dialing is also effective while in CONSULTATION HOLD [C-17]. A Special Dial Tone is received after entering the ACCOUNT CODE.
5. Stations are assigned this feature via Class of Service.
6. ACCOUNT CODEs can be output in the Station Message Detail Recording (SMDR) record for calls handled with OUTGOING TRUNK QUEUING [O-2] and OFF-HOOK QUEUING [O-7].
7. When the Called Number (including Trunk Access Code) is 23 digits or more, the 23rd and subsequent digits will be output to the Account Code Field of Station Message Detail Recording (SMDR).
8. If the Called Number (including Trunk Access Code) with 23 or more digits is dialed after the AUTHORIZATION CODE [A-20], the Calling Party hears Reorder Tone.

Interactions

1. If FORCED ACCOUNT CODEs [F-7] are used, ACCOUNT CODEs are not used.

2. ACCOUNT CODE is also effective while in CONSULTATION HOLD [C-17]. A Special Dial Tone is received after the ACCOUNT CODE.
3. When using this feature on a Single-line Telephone or Desktop terminal, the user can use the SPEED CALLING - SYSTEM, GROUP, INDIVIDUAL or SPEED CALLING - ONE TOUCH (Desktop terminal) to complete the call.
4. ACCOUNT CODES cannot be entered by a Station upon answering an Incoming Trunk Call. The ACCOUNT CODE can be entered by the Attendant Console before extending the call to a Station.
5. The Access Code for ACCOUNT CODEs is restricted to a maximum of three digits.
6. STATION MESSAGE DETAIL RECORDING (SMDR) [S-10] Split Billing (System Data Option): On Transferred Calls, or Incoming Calls via the Attendant Console, the ACCOUNT CODE will be recorded in all the call records.
7. When OUTGOING TRUNK QUEUING [O-2] is initiated, the ACCOUNT CODE will be recorded when the call is completed.
8. When a Desktop terminal user initiates the LAST NUMBER CALLED [L-6D] feature, the ACCOUNT CODE will be recorded, if previously dialed.
9. When a SIP Handler Controlled SIP terminal is used, dial Feature Access Code, Account Code and Called Number by preset dialing. To hear a Service Set Tone (SST) and a Dial Tone (DT), enable the IP-DTG Tone Send Control Bit through the AUACL/AUACN command.

Programming

STEP 1: **ASYD** - SYS1, Index 43, Bit 2. Is Service Set Tone sent after the ASPA Access Code for ACCOUNT CODE? 0/1: No/Yes. Assign data "1".

SYS2, Index 3, Bit 4. Is ACCOUNT CODE used with Authorization Code? 0/1: No/Yes.

SYS1, Index 93, Bit 6=0.

STEP 2: **ANPD** - Reserve a Number Level for Service Feature Access. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. (applicable to any feature assigned to this level). Assign NND in accordance with a predetermined Numbering Plan.

STEP 3: **ASPA** - For SRV = "SSC: Service Code", SID = 41, assign the Access Code. Assign the number of digits in the ASPA Service Feature Access Code plus the number of digits that will appear in the ACCOUNT CODE for the NND parameter. When ACCOUNT CODE operates with AUTHORIZATION CODE [A-20], the above assignment is omitted. In ASPA, assign for SRV = "SSC: Service Code", SID = 42. The NND value will include the number of digits in the ASPA Service Feature Access Code plus the number of digits that appear in the ACCOUNT CODE.

For example:

45 - 511234 - 617- 555 - 2323

2 + 6 = 8

ACC + ACCT.CODE = NND

For example:

44 - 623423 - 511234 - 617 - 555 - 2323

2 + 0 + 6 = 8

ACC + AUTH CODE + ACCT.CODE = NND

STEP 4: **ASFC** - For Stations to use ACCOUNT CODE, assign a Class of Service that allows SFI 27 (Acct. Codes/Auth. Codes/Forced Acct.Codes).

STEP 5: **AMND** - If Authorization Codes are used with ACCOUNT CODES, then for Tenant 0, assign the Destination Code (DC) as the first digit of all Authorization Codes and the Maximum Necessary Digits (MND) of the Authorization Codes. For the above example, a DC of six is assigned with an MND of six.

STEP 6: **AATC** - Assign when Authorization Code is used.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ANPDL** - Reserve a Number Level for Service Feature Access. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. (applicable to any feature assigned to this level). Assign NND in accordance with a predetermined Numbering Plan.

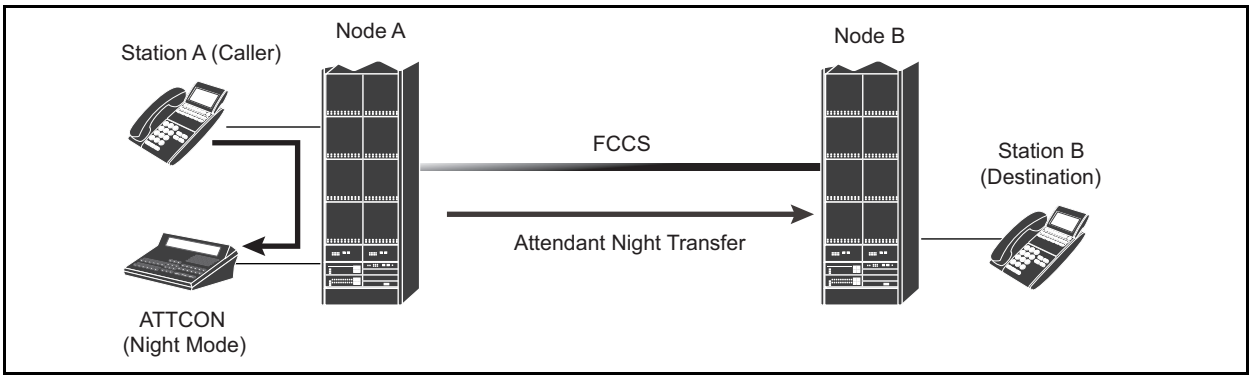
STEP 2: **ASPAL** - For SRV = "SSC: Service Code", SID = 41, assign the Access Code. Assign the number of digits in the ASPAL Service Feature Access Code plus the number of digits that will appear in the ACCOUNT CODE for the NND parameter. When ACCOUNT CODE operates with AUTHORIZATION CODE [A-20], the above assignment is omitted. In ASPAL, assign for SRV = "SSC: Service Code", SID = 42. The NND value will include the number of digits in the ASPAL Service Feature Access Code plus the number of digits that appear in the ACCOUNT CODE.

A-19 Attendant Night Transfer

General Description

When the ATTENDANT CONSOLE [A-3] is in Night Mode, any operator calls (dial 0 calls) are automatically routed to a predetermined Night Station.

Operating Procedure



To answer a Night Call

1. The station user dials the operator call code. Receives Ringback Tone.
2. An Operator Call is automatically transferred to the Night Answer Station.
3. The Calling Party hears Ringback Tone.
4. Ringing Signal is sent back to the Night Station.
5. The Night Station goes off-hook to answer the call. If necessary, this station can transfer the call to another station within the system or an outside party, using the CALL TRANSFER - ALL CALLS [C-11] feature, or transfer to an outside party, using TRUNK-TO-TRUNK CONNECTION [T-10] for Incoming Tie Trunk Calls to the operator.

Service Conditions

1. If the Night Station that an Operator Call has been directed to is busy, the Calling Party will receive a Ringback Tone until the Night Station becomes idle.
2. This feature may be provided with NIGHT CONNECTION - FLEXIBLE [N-2] or NIGHT CONNECTION - FIXED [N-1] to a Night Station. The Night Connection Station can also be assigned as a Night Station for ATTENDANT NIGHT TRANSFER.
3. The Night Station can be assigned as a station in a STATION HUNTING [S-7, 8, 9] Group.
4. One Night Station per tenant is available in multi-tenant arrangements.
5. The Night Station can set CALL FORWARDING - ALL CALLS [C-5], CALL FORWARDING - BUSY LINE [C-2], CALL FORWARDING - DON'T ANSWER [C-3] to another station. When the Night Station has set CALL FORWARDING - BUSY LINE [C-2] to the Attendant, the call is placed in a queue until the Night Station becomes idle. When the Night Station has set CALL FORWARDING - DON'T ANSWER [C-3] to the Attendant, the call is not forwarded. When the Night Station has set CALL FORWARDING - ALL CALLS [C-5] to the Attendant, Reorder Tone is sent.
6. PRIORITY CALL [P-9] and OFF-HOOK ALARM [O-6] are not routed by this function.
7. The Night Station can be assigned as a station in a Uniform Call Distribution (UCD) [U-1] Group.
8. If an Incoming Call terminates at the Night Station assigned by NIGHT CONNECTION - FIXED/ FLEXIBLE [N-1, N-2], and the station has set CALL FORWARDING - ALL CALLS [C-5] to the ATTENDANT CONSOLE [A-3], the Incoming Call will be forwarded to a Night Station assigned by ATTENDANT NIGHT TRANSFER [A-19].
9. This operation is not applicable to LDN Calls. Refer to LDN NIGHT CONNECTION [L-28] for more information.
10. Operator Calls from a Station or TIE Line Trunk in a Satellite System (Centralized Attendant Service (CAS) [C-20]) can be transferred to the Night Station.
11. Programmed Night Stations can use CALL HOLD [C-6], CALL TRANSFER [C-10, 11] and THREE-WAY CALLING [T-2], provided these features are programmed in CLASS OF SERVICE - INDIVIDUAL [C-15].

12. Operator calls after Consultation Hold is not transferred to the Night Station.
13. Individual Attendant Calls are not transferred to the Night Station assigned by ATTENDANT NIGHT TRANSFER.
14. The Night Station can set CALL FORWARDING - ALL CALLS - OUTSIDE [C-28], CALL FORWARDING - BUSY LINE - OUTSIDE [C-60], and CALL FORWARDING - DON'T ANSWER - OUTSIDE [C-74].
15. When a DIT call terminates to a Station that has set CALL FORWARDING - ALL CALLS [C-5] to Attendant, the call will be forwarded to a Night Station assigned by this service.
16. In case a Station places an Incoming Call on hold and calls an Attendant, this service is not activated and the Station receives Reorder Tone (including CALL FORWARDING - ALL CALLS [C-5] and CALL FORWARDING - BUSY LINE [C-2]).
17. An Incoming Call is transferred to a Station in the same Node that accommodates the Calling Station/ Trunk in the FCCS Network.
18. A Telephone Number cannot be used, the Physical Station Number must be used.
19. When the Operator Call from PS is not answered within a fixed period of time, some PSs release the call automatically.
20. When originating a call to the Attendant Console where the feature is set (from a Desktop terminal), NXF is displayed on the LCD.
21. For an ISDN Terminal, Phantom Number/Phantom Telephone Number are not available.
22. This feature is available via FCCS. A call to the ATTENDANT CONSOLE [A-3] in Night Mode can be routed to a predetermined Destination Station in the Remote Node.

23. When feature data is mixed on the DM, LDM, and NDM, data registered on the NDM has priority. Data registered on LDM takes precedence over data registered on DM (the priority is NDM⟶LDM⟶DM).

Interactions

1. There can be only one ATTENDANT NIGHT TRANSFER Station per tenant.
2. The ATTENDANT NIGHT TRANSFER Telephone Number must be programmed using the PCPro. This Telephone Number may be the same number as NIGHT CONNECTION - FIXED/FLEXIBLE [N-1, N-2], but each must be individually assigned. PRIORITY CALL [P-9] and OFF-HOOK ALARM [O-6] Calls cannot be answered by the ATTENDANT NIGHT TRANSFER Station.
3. Stations CALL FORWARDING [C-2, C-3, C-5] calls to the Operator (dial 0) will be directed to the ATTENDANT NIGHT TRANSFER Station.
4. CALL WAITING [C-12]: This feature cannot be activated at the ATTENDANT NIGHT TRANSFER Station for Operator Directed (dial 0) Calls.
5. STATION HUNTING [S-7,8,9]: If the ATTENDANT NIGHT TRANSFER Station is in a Station Hunting Group and all Stations in the group are busy, the call will wait in queue at the ATTENDANT NIGHT TRANSFER Station and will be answered by the first available Station in the Hunt Group.

Programming

ASID - Assign the Tenant, Group Number (GN) 1-7, and Function (F) = 3, ATTENDANT NIGHT TRANSFER. Assign the Point Of Destination as a Station. Assign the Station Number.

Note: ASGD assignment is not required. All Stations in the Tenant Group will be affected.

FCCS Programming

This feature is available via FCCS. Data assignment shown below is required.

When Data is registered to Local Data Memory (LDM)
ASIDL -Specify the Destination Telephone Number for Attendant Night Transfer.
TN: Tenant Number
F: Function = 3 (Attendant Night Transfer)
GN: Group Number = 1 (Fixed for the feature)
S/A: Assign “S (Telephone Number of the Station)”
STELN: Special Telephone Number (Destination Telephone Number) **Note 1**

Note 1: This parameter appears when “S” is assigned at S/A parameter.

When Data is registered to Network Data Memory (NDM)
ASIDN -Specify the Destination Telephone Number for Attendant Night Transfer.
TN: Tenant Number
F: Function = 3 (Attendant Night Transfer)
GN: Group Number = 1 (Fixed for the feature)
S/A: Assign “S (Telephone Number of the Station)”
STELN: Special Telephone Number (Destination Telephone Number) **Note 2**

Note 2: This parameter appears when “S” is assigned at S/A parameter.

A-20 Authorization Code

General Description

An AUTHORIZATION CODE is a numerical code dialed by users (up to 10 digits), which will override the Station CLASS OF SERVICE - INDIVIDUAL [C-15] for facility access restriction.

The AUTHORIZATION CODE can be masked on the Desktop terminal display if necessary using the AUTHORIZATION CODE DISPLAY ELIMINATION [A-99].

When a wrong code is received from a Station/Trunk, detailed information on the unauthorized user is output as System Message [26-M]. This message is Toll Fraud Report.

Operating Procedure

There are two procedures for entering an AUTHORIZATION CODE in the System Data base. One of the following choices will be employed:

Procedure 1

- Without an ACCOUNT CODE [A-18]:

1. Lift the handset and receive Dial Tone.
2. Enter the Feature Access Code and receive Service Set Tone.
3. Enter the AUTHORIZATION CODE (up to 10 digits).
4. Receive Dial Tone.
5. Enter the number to be called.

Note: The Feature Access Code for AUTHORIZATION CODE will be a maximum of three digits.

- With an ACCOUNT CODE [A-18]:

1. Lift the handset and receive Dial Tone.
2. Enter the Feature Access Code and receive Service Set Tone.
3. Enter the AUTHORIZATION CODE and receive second Service Set Tone.
4. Enter the ACCOUNT CODE [A-18] and receive Dial Tone.
5. Enter the number to be called.

Procedure 2 (only for LEAST COST ROUTING [L-5] calls)

- Without an ACCOUNT CODE [A-18]:

1. Lift the handset and receive Dial Tone.
2. Enter the number to be called.
3. If an AUTHORIZATION CODE is required, the caller will receive Special Dial Tone.
4. If Special Dial Tone is received, enter the AUTHORIZATION CODE (up to 10 digits) or the call is denied.

- With an ACCOUNT CODE [A-18]:

1. Lift the handset and receive Dial Tone.
2. Enter the Feature Access Code for the ACCOUNT CODE [A-18] and receive Service Set Tone.
3. Enter the ACCOUNT CODE [A-18] and receive Dial Tone.
4. Enter the number to be called.
5. If AUTHORIZATION CODE is required, the caller will receive Special Dial Tone.
6. If Special Dial Tone is received, enter AUTHORIZATION CODE (up to 10 digits) or the call is denied.

Note: The Feature Access Code for ACCOUNT CODE will be a maximum of three digits.

Service Conditions

1. A maximum of 10 digits for AUTHORIZATION CODE can be dialed, and 8 digits will be registered on STATION MESSAGE DETAIL RECORDING [S-10].
2. The maximum number of AUTHORIZATION CODEs is 4,000. This number is dependent upon system configuration.

   These specifications are based on the digits being assigned as follows:

1st digit:	A (when A equals a unique digit from 0 - 9)
2nd digit:	B - C (when b, c equal any two unique digits from 0 - 9)
3rd digit:	D-E (when d, e equal any two unique digits from 0 - 9)
4th digit:	F-G-H (when f, g, h equal any three unique digits from 0 - 9)
5th - 8th digits:	Any combination 0 - 9
9th and 10th digits:	Assigned using the checksum. These are for validation purposes only. See ETI: 091 for more details.

   Note: See ETI: 082 for details on AUTHORIZATION CODE/FORCED ACCOUNT CODE [F-7] assignment.

3. Service Set Tone is common to AUTHORIZATION CODE, ACCOUNT CODE [A-18] and FORCED ACCOUNT CODE [F-7], but can be eliminated by System Data as required.
4. AUTHORIZATION CODE and FORCED ACCOUNT CODE [F-7] cannot be provided simultaneously for the same Tenant Group. System Data determines, on a per Tenant basis, whether AUTHORIZATION CODE or FORCED ACCOUNT CODE [F-7] is used.
5. AUTHORIZATION CODE dialing (Procedure 1) is also effective with CONSULTATION HOLD [C-17]. Special Dial Tone is received instead of Dial Tone after AUTHORIZATION CODE.
6. Procedure 2 is effective only for LEAST-COST ROUTING - 3/6-DIGIT [L-5] calls.
7. Stations must be assigned for Procedure 1 and 2 via CLASS OF SERVICE - INDIVIDUAL [C-5] programming in System Data.
8. In Procedure 1, System Data can determine, on a per Tenant basis, whether or not an ACCOUNT CODE [A-18] follows the AUTHORIZATION CODE.
9. Assigned AUTHORIZATION CODEs can be used for the REMOTE ACCESS TO SYSTEM [R-2] function.
10. OG TRUNK QUEUING [O-2] and OFF-HOOK QUEUING [O-7] can be set according to the Service Feature Restriction Class of the user's AUTHORIZATION CODE.
11. AUTHORIZATION CODE can be recorded in the STATION MESSAGE DETAIL RECORDING [S-10] for Procedure 2.
12. The registered/non-registered condition of the AUTHORIZATION CODE is not included in the information block of Condition B on the SMDR output format.
13. Attendant cannot activate this feature by Procedure 1.
14. When the user goes on-hook or hooking, changed class goes back to normal class.
15. For service conditions for the AUTHORIZATION CODE DISPLAY ELIMINATION [A-99].
16. When originating a call using AUTHORIZATION CODE from a Station whose SFC is allowed to use PAD LOCK [P-57], the temporarily used RSC is retained even if the user goes on-hook.

Interactions

1. If FORCED ACCOUNT CODEs [F-7] are used, AUTHORIZATION CODEs are not used within the same tenant.
2. AUTHORIZATION CODEs may be used in conjunction with ACCOUNT CODEs [A-18].
3. When assigning an AUTHORIZATION CODE Restriction of 1 in AATC, the RSC must be constructed in ARSC.

4. AUTHORIZATION CODEs can be unrestricted or assigned one of 15 Route Restriction Classes (RSC) - 15.
5. There are no restrictions regarding the first digit of AUTHORIZATION CODEs, except what is programmed in AMND. Tenant 0 does not conflict with the System Numbering Plan. This is true when separate tenant tables are provided. If common tenant tables are used, a conflict between LCR(S) and OGC(A), used with SMDR, will occur.

   Note: The Access Code to the feature AUTHORIZATION CODE must be assigned within the System Numbering Plan.

6. If ASPA, SRV = "LCR: Least Cost Routing" / "LCRS: Register Sender LCR" AH parameter is assigned as data "1", the request for an AUTHORIZATION CODE is determined by the ARSC assignment of the Station in relationship to the chosen route.
7. When a Desktop terminal user initiates the LAST NUMBER DIALED [L-6D] feature, the AUTHORIZATION CODE will be recorded if previously dialed.
8. The AMND command determines the length of AUTHORIZATION CODEs, based on the first digit of the code.
9. AUTHORIZATION CODEs are recorded by STATION MESSAGE DETAIL RECORDING [S-10], Procedure 2.
10. AUTHORIZATION CODEs cannot be entered by the Attendant Console.
11. PEG COUNTS [P-7] of invalid AUTHORIZATION CODEs are not available.
12. AUTHORIZATION CODEs can be dialed by a user when establishing a CONSULTATION HOLD [C-17] connection.
13. For Procedure 2, LCR(S) must be provided.

Programming

Note: There are two methods of Authorization Code assignment: Full Implementation and the Checksum method. In the Full Implementation method, the entire AUTHORIZATION CODE is assigned in the AATC command and ASYD, SYS1. Index 12, Index 13, and Index 14 are assigned 00H. In the Checksum method, partial assignment for each AUTHORIZATION CODE is assigned in the AATC command. The last one or two digits (programmable option) are determined by the system according to the data assignments in ASYD, SYS1, Index 12, Index 13, and Index 14.

STEP 1: **ASYD** - SYS1, Index 4, Bit 4. Temporary Class Conversion. Assign as data "1". SYS1, Index 12. If Index 12=0, no Checksum method is used, and Index 13 and Index 14 are ignored, regardless of their assignments. Each Bit in Index 12 directly correlates to a digit in the AUTHORIZATION CODE assigned in AATC command, and will determine the first digit of the Checksum method. For this example, 26428 has been assigned as the AUTHORIZATION CODE in AATC. Arbitrarily pick any Bit 0 to Bit 4, and flag those Bits as data 1.

Note: Bit 0 to Bit 7 may be used when eight-digit AUTHORIZATION CODEs are assigned in the AATC command.

	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
AATC	8	2	4	6	2

	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
SYS1, Index 12	0	1	0	0	1
Designation	d4	d3	d2	d1	d0

SYS1, Index 13. Each Bit in Index 13 directly correlates to a digit in the AUTHORIZATION CODE assigned in AATC command, and will determine the second digit of the Checksum method. Pick any Bit 0 to Bit 4, but not the same combination of Bits as picked in Index 12.

	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
AATC	8	2	4	6	2
SYS1, Index 13	1	0	0	1	0
Designation	d4	d3	d2	d1	d0

SYS1, Index 14 determines the algorithm used to calculate the last two digits of every AUTHORIZATION CODE. (Only decimal numbers may be used in this index, therefore, hexadecimal values A to F may not be assigned). SYS1, Index 14 = X and Y, where X and Y represent any arbitrarily chosen decimal digit 1- 9, and where Y is used to determine the first digit and X is used to determine the second digit in the Checksum method. The following data, 37H, has been used for the example calculation:

	X				Y			
SYS1, Index 14	**Bit 7**	**6**	**5**	**4**	**3**	**2**	**1**	**0**
DATA	0	0	1	1	0	1	1	1

Note: If only one digit is to be added via the Checksum method, then Index 13 data will be 00h and Index 14, digit X (Bit 4 to Bit 7) = 0.

Example Calculation:

In AATC command, 26428 has been assigned. In SYS1, Index 12, Bit 0 and Bit 3 were chosen; 26428

2 + 2 = 4.

The decimal value of Bit 0 to Bit 3 of Index 14 = 7.

4 + N =7. N = 3.

7 is obtained as any whole number greater than 4 that ends with a 7, the decimal value as determined in SYS1, Index 14, Bit 0 to Bit 3. In AATC, 26428 has been assigned. In SYS1, Index 13, Bit 1 and Bit 4 were chosen; 26428.

8 + 6 = 14.

The decimal value of Index 14, Bit 4 to Bit 7 is 3.

14 + N = 23. N = 9.

23 is obtained as any whole number greater than 14 that ends with a 3, the decimal value determined in SYS1, Index 14, Bit 4 to Bit 7. The AUTHORIZATION CODE will be 26428-39.

Note: Digits 39 determined by the Checksum method will be unique to the AUTHORIZATION CODE 26428. 26428 will not be followed by any digits other than 39.

SYS1, Index 43, Bit 2, is Service Set Tone sent after AUTHORIZATION CODE. ASPA Access Code? 0/1: No/Yes. Assign data "1".

SYS1, Index 43, Bit 0, is AUTHORIZATION CODE required for DISA? 0/1: required/not required. Normally assign data "0."

SYS1, Index 93, Bit 6. Are the AMND tables Separate or Common for tenants in the system? 0/1: Separate/Common. Assign data "0" for separate tables.

SYS2, Index 3, Bit 4: Is Account Code used with AUTHORIZATION CODE? 0/1: No/Yes.

SYS2, Index 3, Bit 5: Type of code? 0/1: AUTHORIZATION CODE/ Forced Account Code; assign data "0".

STEP 2: **ANPD** - Reserve a Number Level for feature access. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. (if applicable to any feature in this level). Assign NND in accordance with a predetermined Numbering Plan.

STEP 3: **ASPA** - For SRV = "SSC: Service Code", SID = 42, assign the Access Code. For the NND parameter, no assignment is required when AUTHORIZATION CODE operates by itself. When Account Code operates with AUTHORIZATION CODE, assign for SRV = "SSC: Service Code", SID = 42. The NND value will include the number of digits in the AUTHORIZATION CODE Access Code, and Account Code. For example:

45	–	26428	–	623423	–	9-1-617-555-2323
(ACC)		(Auth Code)		(Account Code)		(Destination Code)
ASPA		ACC=45				NND=8 (ACC + Account Code)

For SRV = "LCR: Least Cost Routing" / "LCRS: Register Sender LCR", if operating Procedure 2 is to be used, (dialing the AUTHORIZATION CODE after the number dialed), then assign data "1" to the AH parameter when programming the LCR(S) Access Code. Therefore, operating Procedure 2 is only available with LEAST-COST ROUTING - 3/6 DIGIT [L-5].

STEP 4: **ASFC** - For Stations allowed AUTHORIZATION CODE, assign a Class of Service that allows SFI 27.

STEP 5: **AMND** - For Tenant 0, assign the Destination Code (DC) as the first digit of all AUTHORIZATION CODEs and the Maximum Necessary Digits (MND) of the AUTHORIZATION CODE. For the above example, a DC of 2 is assigned with an MND of 7. The MND value will include the digits added by the Checksum method.

STEP 6: **AATC** - Assign the TN, Digit Code (DC) (the actual code itself), the AUTHORIZATION CODE RESTRICTION (ACR) as data "1" and Service Feature Restriction Class (SFC) and Route Restriction Class (RSC). If ACR is assigned as data 2. Allowed: RSC and SFC parameters are not programmed. (SFC parameters are not operational.)

STEP 7: **LATC** - List up all the AUTHORIZATION CODEs. This is the simplest way to determine what digits have been added to the system with the Checksum method. This is not required if the Checksum method is not used.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ANPDL** - Reserve a Number Level for feature access. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. (if applicable to any feature in this level). Assign NND in accordance with a predetermined Numbering Plan.

STEP 2: **ASPAL** - For SRV = "SSC: Service Code", SID = 42, assign the Access Code. For the NND parameter, no assignment is required when AUTHORIZATION CODE operates by itself. When Account Code operates with AUTHORIZATION CODE, assign for SRV = "SSC: Service Code", SID = 42. The NND value will include the number of digits in the AUTHORIZATION CODE Access Code, and Account Code.

For SRV = "LCR: Least Cost Routing" / "LCRS: Register Sender LCR", if operating Procedure 2 is to be used, (dialing the AUTHORIZATION CODE after the number dialed), then assign data "1" to the AH parameter when programming the LCR(S) Access Code. Therefore, operating Procedure 2 is only available with LEAST-COST ROUTING - 3/6 DIGIT [L-5].

STEP 3: **LATCN** - List up all the AUTHORIZATION CODEs. This is the simplest way to determine what digits have been added to the system with the Checksum method. This is not required if the Checksum method is not used.

A-29 Authorization Code - Tie Line Incoming Routes

General Description

This feature offers an Outside Party the ability to enter an AUTHORIZATION CODE [A- 20] through an incoming TIE Line Trunk.

Note: This feature is available in North America only.

Operating Procedure

When the incoming route is restricted or when an AUTHORIZATION CODE [A-20] is always required:

1. The Called Number, office code, and terminal number are received by the TIE Line Trunk.
2. The outside Calling Party hears a Special Dial Tone.
3. Dial the AUTHORIZATION CODE [A-20].
   a.) The connection is established when the AUTHORIZATION CODE [A-20] is valid.
   b.) Busy Tone is sent to the Calling Party when the AUTHORIZATION CODE [A-20] is invalid.

Service Conditions

1. The outside Calling Party must be able to generate DTMF Signals to the System when entering AUTHORIZATION CODE [A-20].
2. An AUTHORIZATION CODE [A-20] can be used for Incoming Calls to a uniform Station or for LEAST-COST ROUTING [L-5] tandem connections.
3. CALL WAITING - TERMINATING [C-12] is available when the Called Station is busy, after the AUTHORIZATION CODE [A-20] is entered and validated.
4. INTER-OFFICE OFF-HOOK QUEUING [I-11] is available if the called route is busy, after the AUTHORIZATION CODE is entered and validated.
5. Through programming, the system defines the AUTHORIZATION CODE [A-20] to be required for all TIE Line Incoming Calls or when a restriction is encountered. This is assigned on a per Tenant basis.

Note: There are two methods of AUTHORIZATION CODE assignment - Full Implementation and the Checksum. In the Full Implementation method, the entire AUTHORIZATION CODE is assigned in the AATC command, and SYS1, Index 12, Index 13 and Index 14 are assigned 00H. In the Checksum method, partial assignment for each AUTHORIZATION CODE is assigned in the AATC command. The last one or two digits (programmable option) are determined by the system according to the data assignments in ASYD, SYS1, Index 12, Index 13 and Index 14.

Interactions

1. If FORCED ACCOUNT CODEs [F-7] are used, AUTHORIZATION CODEs-TIE LINE INCOMING ROUTES are not allowed within the same tenant.
2. AUTHORIZATION CODEs-TIE LINE INCOMING ROUTES may be used in conjunction with ACCOUNT CODEs [A-18].
3. When assigning an AUTHORIZATION CODE Restriction of 1 in AATC, the RSC must be constructed in ARSC.
4. AUTHORIZATION CODEs can be unrestricted or assigned one of 15 Route Restriction Classes (RSC 1 to 15).

5. There are no restrictions regarding the first digit of AUTHORIZATION CODEs, except what is programmed in AMND. Tenant 0 does not conflict with the System Numbering Plan.

   Note: The Access Code to the feature AUTHORIZATION CODE - TIE LINE INCOMING ROUTES must be assigned within the System Numbering Plan.

6. If ASPA, SRV = "LCR: Least Cost Routing" / "LCRS: Register Sender LCR" AH parameter is assigned as data "1", the request for an AUTHORIZATION CODE is determined by the ARSC assignment of the Station in relationship to the route chosen. For AUTHORIZATION CODE - TIE LINE INCOMING ROUTES, no RSC is assigned against the incoming TIE Line, therefore, AUTHORIZATION CODEs are always required. Trunk connection will be determined against the RSC of the dialed code.
7. When a Desktop terminal user initiates the LAST NUMBER CALLED -D [L-6D] feature, the AUTHORIZATION CODE will be recorded if previously dialed.
8. The AMND command determines the length of AUTHORIZATION CODEs based on the first digit of the code.
9. AUTHORIZATION CODEs are recorded by STATION MESSAGE DETAIL RECORDING [S-10].
10. AUTHORIZATION CODEs cannot be entered by the Attendant Console.
11. PEG COUNTS [P-7] of invalid AUTHORIZATION CODEs are not available.
12. AUTHORIZATION CODEs can be dialed by a user, when establishing a CONSULTATION HOLD [C-17] connection.
13. For Procedure 2, LCR(S) must be provided.
14. For senderized TIE Lines, see UNIVERSAL SENDER [U-3]. Also, the ANND command must be programmed for senderized TIE Lines. If other services, such as, STATION MESSAGE DETAIL RECORDING [S-10] and LEAST-COST ROUTING [L-5], the AMND command will be programmed. If digit translation is required, go to the ASTP and AOSP command.
15. For MISCELLANEOUS TRUNK RESTRICTION [M-3], restrictions to TIE trunks are determined by the Route Service Class (RSC) assigned to the AUTHORIZATION CODE.
16. When the incoming route passes through MG-SIPs, this feature cannot be used.

Programming

STEP 1: **ASYD** - SYS1, Index 4, Bit 4=1: Temporary Class Conversion is required.

SYS1, Index 12. If Index 12=0, no Checksum method is used, and Index 13 and Index 14 are ignored, regardless of their assignments. Each Bit in Index 12 directly correlates to a digit in the AUTHORIZATION CODE assigned in AATC, and will determine the first digit of the Checksum method. For this example, 26428 has been assigned as the AUTHORIZATION CODE in AATC. Pick any Bit 0 to Bit 4, and flag those Bits as data 1.

Note: Bit 0 to Bit 7 may be used when eight-digit AUTHORIZATION CODEs are assigned in the AATC command

	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
AATC	8	2	4	6	2
SYS1, Index 12	0	1	0	0	1
Designation	d4	d3	d2	d1	d0

SYS1, Index 13. Each Bit in Index 13 directly correlates to a digit in the AUTHORIZATION CODE

assigned in AATC command, and will determine the second digit of the Checksum method. Pick any Bit 0 to Bit 4, but not the same combination of Bits as picked in Index 12.

	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
AATC	8	2	4	6	2
SYS1, Index13	1	0	0	1	0
Designation	d4	d3	d2	d1	d0

SYS1, Index 14 determines the algorithm used to calculate the last two digits of every AUTHORIZATION CODE. (Only decimal numbers may be used in this index, therefore, hexadecimal values A to F may not be assigned).

SYS1, Index 14=X and Y, where X and Y represent any arbitrarily chosen decimal digit 1- 9, and where Y is used to determine the first digit, and X is used to determine the second digit in the Checksum method. The following data, 37H, has been used for the example calculation:

SYS1, Index 14	X				Y			
	Bit 7	6	5	4	3	2	1	0
DATA	0	0	1	1	0	1	1	1

Note: If only one digit is to be added via the Checksum method, then SYS1, Index 13 data will be 00h and Index 14, digit X (Bit 4 to Bit 7) = 0.

Example Calculation:

In AATC command, 26428 has been assigned. In SYS1, Index 12, Bit 0 and Bit 3 were chosen; 26428

2 + 2 = 4.

The decimal value of Bit 0 to Bit 3 of Index 14 = 7.

4 + N =7. N = 3.

7 is obtained as any whole number greater than 4 that ends with a 7, the decimal value as determined in SYS1, Index 14, Bit 0 to Bit 3. In AATC command, 26428 has been assigned. In SYS1, Index 13, Bit 1 and Bit 4 were chosen; 26428

8 + 6 = 14.

The decimal value of Index 14, Bit 4 to Bit 7, is 3.

14 + N = 23. N = 9.

23 is obtained as any whole number greater than 14 that ends with a 3, the decimal value determined in SYS1, Index 14, Bit 4 to Bit 7. The AUTHORIZATION CODE will be 26428-39.

Note: Digits 39, determined by the Checksum method, will be unique to the AUTHORIZATION CODE 26428. 26428 will not be followed by any digits other than 39.

SYS1, Index 43, Bit 2, is Service Set Tone sent after AUTHORIZATION CODE

ASPA Access Code? 0/1: No/Yes. Assign data “1”. SYS1, Index 93, Bit 6. Are the AMND tables Separate or Common for tenants in the system? 0/1: Separate/Common. Assign data “0” for separate tables.

SYS2, Index 3, Bit 4: Is Account Code used with AUTHORIZATION CODE? 0/1: No/Yes.

SYS2, Index 3, Bit 5: Type of code: 0/1 AUTHORIZATION CODE/ Forced Account Code; assign data “0”.

STEP 2: **ANPD** - Reserve a Number Level for feature access. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. (if applicable to any feature in this level). Assign NND in accordance with a predetermined Numbering Plan.

STEP 3: **ASPA** - For SRV = "SSC: Service Code" SID = 42, assign the Access Code. For the NND parameter, no assignment is required when AUTHORIZATION CODE [A-20] operates by itself. When Account Code [A-18] operates with AUTHORIZATION CODE - TIE LINE INCOMING ROUTES, assign for SRV = "SSC: Service Code", SID = 42. The NND value will include the number of digits in the AUTHORIZATION CODE Access Code, and Account Code.

Note: Procedure 1 is not available with AUTHORIZATION CODE - TIE LINE INCOMING ROUTES. For example:

45 -	*26428 -*	*623423 -*	*9-1-617-555-2323*
(ACC)	*(AUTH CODE)*	*(ACCOUNT CODE)*	*(DESTINATION CODE)*
ASPA	*ACC = 45*		*NND = 8 (ACC+ACCOUNT CODE)*

For SRV = "LCR: Least Cost Routing" / "LCRS: Register Sender LCR", if operating Procedure 2 is used, (dialing the AUTHORIZATION CODE after the number dialed), assign data "1" to the AH parameter when programming the LCR(S) Access Code. Therefore, operating Procedure 2 is only available with LEAST-COST ROUTING - 3/6 DIGIT [L-5].

STEP 4: **ASFC** - For Stations allowed AUTHORIZATION CODE - TIE LINE INCOMING ROUTES, assign a Class of Service that allows SFI 27.

STEP 5: **AMND** - For Tenant 0, assign the Destination Code (DC) as the first digit of all AUTHORIZATION CODEs and the Maximum Necessary Digits (MND) of the AUTHORIZATION CODE. For the above example, a DC of 2 is assigned with an MND of 7. The MND value will include the digits added by the Checksum method.

STEP 6: **AATC** - Assign the TN, Digit Code (DC) (the actual code itself), the AUTHORIZATION CODE Restriction (ACR) as data "1", and Service Feature Restriction Class (SFC) and Route Restriction Class (RSC). If ACR is assigned as data 2, Allowed: RSC and SFC parameters are not programmed. (SFC parameters are not operational.)

STEP 7: **LATC** - List all the AUTHORIZATION CODEs. This is the simplest way to determine what digits have been added to the system with the Checksum method. This is not required if the Checksum method is not used.

TIE Line Programming

STEP 8: **ARTD** - Assign the TIE Line routes as shown below:

RT:1

1-OSGS	:2	2-ONSG	:3	5-TF	:1	6-TCL	:1	7 L/T	:1
8-RLP	:2	15-LSG	:1						

Note: To change the data for existing route (RT), initialize the circuit card.

STEP 9: **ATRK** - Assign the LENS, TIE Line Route Number, Trunk Number, and Tenant Number.

STEP 10: **MBTK** - Assign the Make Idle status to the TIE Line Trunks.

STEP 11: **ANPD**- Assign a Number Level for Trunk Access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. Number of Necessary Digits is usually 1 or 2. Busy Lamp Field is not activated.

STEP 12: **ASPA** - Assign the Access Code as assigned in ANPD. Type of Service, SRV = "OGC: Outgoing Call" for Outgoing Trunk. Assign the Route Number associated with this Access Code.

STEP 13: **ARSC** - The Route Restriction Class (RSC) must be constructed to allow the Station access to the involved routes.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

STEP 1: **ANPDL** - Reserve a Number Level for feature access. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. (if applicable to any feature in this level). Assign NND in accordance with a predetermined Numbering Plan.

STEP 2: **ASPAL** - For SRV = "SSC: Service Code", SID = 42, assign the Access Code. For the NND parameter, no assignment is required when AUTHORIZATION CODE [A-20] operates by itself. When Account Code [A-18] operates with AUTHORIZATION CODE - TIE LINE INCOMING ROUTES, assign for SRV = "SSC: Service Code", SID = 42. The NND value will include the number of digits in the AUTHORIZATION CODE Access Code, and Account Code.

Note: Procedure 1 is not available with AUTHORIZATION CODE - TIE LINE INCOMING ROUTES.

For SRV = LCR (Least Cost Route Selection) / LCRS (Register Sender LCR), if operating Procedure 2 is used, (dialing the AUTHORIZATION CODE after the number dialed), assign data "1" to the AH parameter when programming the LCR(S) Access Code. Therefore, operating Procedure 2 is only available with LEAST-COST ROUTING - 3/6 DIGIT [L-5].

STEP 3: **LATCN** - List all the AUTHORIZATION CODEs. This is the simplest way to determine what digits have been added to the system with the Checksum method. This is not required if the Checksum method is not used.

TIE Line Programming

STEP 4: **ARTDN** - Assign the TIE Line routes as shown below:

RT:1

1-OSGS	:2	2-ONSG	:3	5-TF	:1	6-TCL	:1	7 L/T	:1
8-RLP	:2	15-LSG	:1						

Note: To change the data for existing route (RT), initialize the circuit card.

STEP 5: **ANPDL** - Assign a Number Level for Trunk Access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. Number of Necessary Digits is usually 1 or 2. Busy Lamp Field is not activated.

STEP 6: **ARSCN** - The Route Restriction Class (RSC) must be constructed to allow the Station access to the involved routes.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

A-30 Automatic/Manual Intercom

General Description

This feature permits multiple Desktop terminal users to simultaneously call all the Stations in a pre-assigned group, regardless of their idle/busy status. An INTERCOM member can optionally override another INTERCOM Station in a Two-party INTERCOM Connection. This service is referred to as INTERCOM BRIDGE. INTERCOM Service is separated into two types, AUTOMATIC INTERCOM (AICM) and MANUAL INTERCOM (MICM).

Automatic Intercom

All Stations in the INTERCOM Group are alerted simultaneously with a lamp indication. Ringing is directed to one predefined Station, as in a button and buzzer INTERCOM arrangement.

Manual Intercom

All Stations in the INTERCOM group are called simultaneously with a lamp indication. The Calling INTERCOM Station manually sends a one-second tone to the Called INTERCOM Signal Station, as in a button and buzzer INTERCOM arrangement.

Operating Procedure

- AUTOMATIC INTERCOM

To initiate an Automatic Intercom Call

1. The INTERCOM Station presses the AICM key and goes off-hook (within five to ten seconds). **Note 1**
2. The INTERCOM Station will hear Ringback Tone. A specified Station rings.
3. One of the Called INTERCOM Group Stations answers the call and is connected to the Calling Station.

To answer an Automatic Intercom Call

1. The AICM key will flash, indicating an Incoming INTERCOM Call. The Called Station will also ring according to the pre-assigned system parameters.
2. If the Called Station is already engaged in a conversation with a Non-Intercom Call, the Station may press the AICM key after pressing the HOLD key. Ringing will stop.

To bridge into an Automatic Intercom Call

1. When two Stations are engaged in an INTERCOM Call, a third Station in the same INTERCOM Group presses the AICM key and goes off-hook. **Note 1**
2. A Three-party Conference is established. The Called Stations may hear a Warning Tone when the Station bridges into the call. This Warning Tone is pre-assigned in System Data.

- MANUAL INTERCOM

To originate a Manual Intercom Call

1. A Station presses the MICM key and goes off-hook (within five seconds). **Note 1**
2. The Station will hear Ringback Tone.
3. The Calling Station sends a chime to the INTERCOM Station by pressing the SIG key.
4. When one of the Called INTERCOM Stations answers the call, the Calling Station will be connected. Also, all Stations in the group share the common talk path and can pick up an unanswered INTERCOM Call.

To answer a Manual Intercom Call

1. The MICM key will flash, indicating an Incoming INTERCOM Call. The Called Station may also hear

one second of ringing from the Calling INTERCOM Station.

2. If the Called Station in the INTERCOM Group is already engaged in a conversation with a Non-Intercom Call, the Station may press the MICM key after pressing the HOLD key.

To bridge into a Manual Intercom Call

1. When two Stations are engaged in an INTERCOM Call, a third Station, belonging to the same INTERCOM Group, will press the MICM key and go off-hook.**Note 1**
2. A Three-party Conference is established. The Called Stations may hear a Warning Tone when the Station bridges into the call. This Warning Tone is pre-assigned in System Data.

Note 1: When ASYD, SYS1, Index 384, Bit 0=0 is set, you can skip off-hook operation to initiate Automatic Intercom Call or originate Manual Intercom Call. However, off-hook operation cannot be skipped to bridge into an Automatic Intercom Call or a Manual Intercom Call regardless of the ASYD, SYS1, Index 384, Bit 0 data setting.

Use of the SIG key

1. The Manual INTERCOM Signal (SIG) key is operational at all times. An INTERCOM Call is not required. If the Signaled Station is ringing from another call, the Manual INTERCOM Signal will interrupt that ringing.

- PRIME-LINE PICK UP -D [P-13D]

  The Desktop terminal may be programmed to seize the Incoming Call on the AUTOMATIC, MANUAL, or DIAL INTERCOM [D-87] Lines before the Prime Line. If two Incoming Calls terminate simultaneously to the Prime Line and the MICM Line, when the user goes off-hook, PRIME LINE PICK UP -D [P-13D] will seize the MICM line before the Prime Line. If only the Prime Line is ringing when the user goes off-hook, PRIME LINE PICK UP -D [P-13D] will seize the Prime Line.

Service Conditions

1. Only Desktop terminals can be assigned as a member of an INTERCOM Group.
2. All members of the same INTERCOM Group must be assigned in the same Module Group (MG).
3. Up to 16 Stations may be assigned to one INTERCOM Group. Each Station in the INTERCOM Group can be assigned as both a Manual and Automatic INTERCOM member of two different groups.
4. No more than one connection can be established at the same time in one INTERCOM Group.
5. A Three-party Conference can be established in an INTERCOM Group if INTERCOM Bridge Service is available. If a fourth party tries to activate INTERCOM Bridge Service, the connection will be denied.
6. A maximum of 50 (per MG) Automatic or Manual INTERCOM Groups are allowed.
7. It is possible to assign one group of Stations as an AICM Group, Dial INTERCOM Group, and an MICM Group at the same time.
8. The DISTINCTIVE RINGING [D-10] sent from an Incoming AICM Station takes priority over the ringing of Multi Line Appearances.
9. Features normally available to Multi Line Appearances are not available for INTERCOM Lines.
10. INTERCOM Lines cannot be held with the activation of the HOLD key.
11. When MANUAL SIGNALING [M-47] is performed by a user, this ringing (one second) takes priority over any other Incoming Call indications from the Multi Line Appearance.
12. When a Station is moved from one INTERCOM Group to another INTERCOM Group, through system commands, the AICM or MICM key on the associated Desktop terminal must be canceled before the change is made.

13. Port traffic and Station PEG COUNT [P-7] reports will not record the use of the INTERCOM feature.
14. Flex keys on the Desktop terminal cannot be used while on an INTERCOM Call. Only the SPEAKER key can be used for hands-free operation.
15. FCCS is not available for this feature.
16. On SIP Multiple Line station, the pattern of Ringback Tone is the same as Ringing Tone.
17. The AICD command must be assigned before the AKYD command.
18. No programming is required to enable the SIG key to remain active at all times.

Interactions

1. The RECALL key will not operate on an INTERCOM Call.
2. THREE-WAY CALLING [T-6] must first be provided.
3. When assigning the PRI parameter in AKYD, the following data selections are available.

Priority PRI	1	2	3
0	Prime Line	-	-
1	Dial Intercom	Prime Line	-
3	Automatic Intercom	Prime Line	-
3	Manual Intercom	Prime Line	-
4	Automatic Intercom	Manual Intercom	Prime Line

4. The SIG key, when pressed by a Calling Station, will interrupt other Ringing Signals at the Called Station.
5. Hands-free operation is available with AUTOMATIC/MANUAL INTERCOM. When an Incoming Call terminates to a Station, by pressing the SPEAKER key, the line seized is based on the PRI assignment of AKYD.
6. MANUAL SIGNALING [M-47] will not operate if the DATA key has been pressed.

Programming

STEP 1: **ASYD** - SYS1, Index 59, Bit 7. Is AICM/MICM in service? 0/1: No/Yes.

SYS1, Index 69, Bit 6. Is a Warning Tone required when creating a three-way AICM/MICM Call? 0/1: No/Yes.

SYS3, Index 3. Assign the data 20H for Multiple Ringings per Ringing Period (for Automatic Intercom) if necessary.

SYS3, Index 7. Assign the Ringing Pattern (for Automatic Intercom) if necessary.

STEP 2: **AICD** - Assign the following data:

MG: Module Group

G-ID: Group ID Number per MG

A/M: Automatic/Manual Signal (0/1)

- A: Automatic
- M: Manual

BCR: Bridge Call Restriction (0/1)

- 0: Restricted
- 1: Allowed

For example, Station 1000 is to initiate AUTOMATIC/MANUAL INTERCOM to Station 1001. In AICD you must make two line entries:

ICM STN: 1000 SIG STN: 1001
ICM STN: 1001 SIG STN: 1000

TN: Tenant Number
ICM STN: Intercom Station Number
SIG STN: Signaling Station Number

STEP 3: **AKYD** - Assign a Station INTERCOM Line according to the following parameters:

TN: 1
STN: Station Number
TP: Type of Dterm (0-3)
PRI: Form of Line Preference (0-3)
KYN: Key Number (1-40)
KYI: Service Index
0: Key not used
1: Feature Key
2: Multi Line Key
KD: Kind of Line
0: Multi Line
1: INTERCOM Line
2: DSS Console Key
3: -
4: MultipleLine Appearance
ICM: Kind of INTERCOM
0: AUTOMATIC INTERCOM
1: MANUAL INTERCOM
2: DIAL INTERCOM

If Manual Signaling is used, assign a Line/Feature key as Type:Function: Manual Signaling key [60]

Note: AKYD A/M Data must be deleted before deleting AICD.

A-43 AC Clearing

General Description

This feature is provided to prevent the occurrence of double-line seizure by transmitting a Continuous Ringing Signal that supervises the balance condition of each Exchange Line while in an idle state.

Note: This feature is available only in Australia.

Operating Procedure

No manual operation is required.

Service Conditions

1. This feature is available in Australia only.
2. This feature is activated on Exchange Lines that are in the unbalanced idle condition.

Programming

STEP 1: **ARTD** - Assign the Route Class Data of the Trunk for AC CLEARING. Assign CDN: 39. BC (Central Office Line Balance Condition): 0/1 = Not balanced/Balanced, assign “0”.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or MG.

A-52 Account Code - Attendant

General Description

This feature provides the ATTENDANT CONSOLE [A-3] with the capability to enter an Account Code into the system after talking with a Central Office Outgoing/Incoming Call.

Operating Procedure

The Attendant talks with the Central Office Trunk Call.

1. Press the START key.
2. Dial the Account Code Feature Access Code. Service Set Tone is heard.
3. Dial the Account Code (up to ten digits).
4. Dial the desired Telephone Number.

Service Conditions

1. The Account Code may be a maximum of ten digits.
2. When the Account Code is entered again for the same call and Station, the last code entered will be recorded on STATION MESSAGE DETAIL RECORDING (SMDR) [S-10, 47].
3. Account Code dialing is available for an ATTENDANT CONSOLE [A-3] connected to a Trunk.
4. The Feature Access Code for Account Code will be a maximum of three digits.
5. An Attendant can enter an Account Code of fewer digits than the maximum length defined, indicating the end of entry by "#" key.

Programming

STEP 1: **ASYD** - SYS1, Index 43, Bit 2. Is Service Set Tone sent after the ASPA Access Code for ACCOUNT CODE? 0/1: No/Yes. Assign data "1".

SYS2, Index 3, Bit 4. Is ACCOUNT CODE used with Authorization Code? 0/1: No/Yes.

SYS1, Index 93, Bit 6=0.

STEP 2: **ANPD** - Reserve a Number Level for Service Feature Access. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. (applicable to any feature assigned to this level). Assign NND in accordance with a predetermined Numbering Plan.

STEP 3: **ASPA** - For SRV = "SSC: Service Code", SID = 41, assign the Access Code. Assign the number of digits in the ASPA Service Feature Access Code plus the number of digits that will appear in the ACCOUNT CODE for the NND parameter. When ACCOUNT CODE operates with AUTHORIZATION CODE [A-20], the above assignment is omitted. In ASPA, assign for SRV = "SSC: Service Code", SID = 42.

The NND value will include the number of digits in the ASPA Service Feature Access Code plus the number of digits that appear in the ACCOUNT CODE.

For example:

45 - 511234 - 617- 555 - 2323

2 + 6 = 8

ACC + ACCT.CODE = NND

For example:

44 - 623423 - 511234 - 617 - 555 - 2323

2 + 0 + 6 = 8

ACC + AUTH CODE + ACCT.CODE = NND

STEP 4: **ASFC** - For Stations to use ACCOUNT CODE, assign a Class of Service that allows SFI 27 (Acct. Codes/Auth. Codes/Forced Acct. Codes).

STEP 5: **AMND** - If Authorization Codes are used with ACCOUNT CODES, then for Tenant 0, assign the Destination Code (DC) as the first digit of all Authorization Codes and the Maximum Necessary Digits (MND) of the Authorization Codes. For the above example, a DC of six is assigned with an MND of six.

STEP 6: **AATC** - Assign when Authorization Code is used.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ANPDL** - Reserve a Number Level for Service Feature Access. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. (applicable to any feature assigned to this level). Assign NND in accordance with a predetermined Numbering Plan.

STEP 2: **ASPAL** - For SRV = "SSC: Service Code", SID = 41, assign the Access Code. Assign the number of digits in the ASPAL Service Feature Access Code plus the number of digits that will appear in the ACCOUNT CODE for the NND parameter. When ACCOUNT CODE operates with AUTHORIZATION CODE [A-20], the above assignment is omitted. In ASPAL, assign for SRV = "SSC: Service Code", SID = 42.

The NND value will include the number of digits in the ASPAL Service Feature Access Code plus the number of digits that appear in the ACCOUNT CODE.

A-53 All Zone Paging

General Description

This feature provides both the Attendant and a user with dial access to Multiple Zone Paging Equipment.

Operating Procedure

To operate from a Station

1. The Station goes off-hook. Receive Dial Tone.
2. The Station dials the ALL ZONE PAGING Access Code.
3. Connections to Multiple Paging Equipment are established.

Service Conditions

1. This feature allows only Paging Access. PAGING TRANSFER [P-10] and MEET-ME PAGING [M-11] are not provided.
2. A maximum of seven Paging Zones can be accessed simultaneously.
3. When a user or an ATTENDANT CONSOLE [A-3] has a held Station or Trunk, this feature is not activated.
4. If the Paging Trunk is busy, the Paging Connection is not established to the busy zone. PRIORITY PAGING [P-30] Access Code + ALL ZONE PAGING [A-53] Access Code dialing is possible. Even if this dialing operation is performed, the PRIORITY PAGING [P-30] function is not activated when the line is busy (it has the same result as ALL ZONE PAGING Access Code dialing).
5. One Trunk circuit is required for each PAGING ACCESS [P-1].
6. Amplifiers and speakers must be customer provided.
7. Where TENANT SERVICE [T-12] is provided, separate Access Codes and hardware should be provided for each Tenant.
8. The ALL ZONE PAGING Access Code is a maximum of three digits [Outgoing Call Alternative (OGCA)].
9. The following can be used as a paging trunk interface:

    - COT Circuit Cards
    - TLT Circuit Cards
    - MC&MG-COT (4LC2COT)
    - MG-COT (6COT)
    - UG50 (GCD-PGTA) **Note 1 Note 2**

    Note 1: UG50 (GCD-4COTA/B/C) cannot be used as a paging trunk interface.

    Note 2: Available from UG50 software version 2.00.

10. Loop Signaling is the recommended signaling type.
11. This feature can be activated via FCCS.

Interactions

1. MEET-ME PAGING [M-1, 11] and ALL ZONE PAGING [A-53] can be provided simultaneously in the same system.
2. To directly answer ALL ZONE PAGING by the Attendant Console, the Paged Party should use the INDIVIDUAL TRUNK ACCESS [I-4] feature.
3. Paging is limited to Stations or Attendant Consoles. Other parties (Central Office Trunk Calls) must have the Attendant Console or user perform the Paging operation.
4. BUSY VERIFICATION [B-3], EXECUTIVE RIGHT-OF-WAY [E-1]: These features will be denied if the Paging Route has been assigned for privacy. Verify the data in the assignment of Route Data command, ARTD, CDN 44:PRV. If TCL is assigned as "8", CDN 44:PRV is not required.
5. For simple ALL ZONE PAGING, assignments in ASFC are not required. Refer directly to the other Paging features, such as PAGING TRANSFER [P-10].
6. The Attendant Console can dial Priority Page Access Code and release a station.
7. When disconnecting from a Paging Trunk, the Trunk becomes idle immediately.
8. ALL ZONE PAGING is not possible from CONSULTATION HOLD [C-17].
9. CALL HOLD [C-6]: A Paging Trunk cannot be placed on Call Hold.
10. The Desktop terminal LCD indicates BUSY when the Paging Trunk is Busy. Reorder Tone is returned.
11. If Priority Page is to be used with ALL ZONE PAGING, ARTD, CDN 6:TCL must be assigned as "8", Page with Ringback Tone. SYS1, Index 73 affects the operation of Page Routes assigned Page with Ringback Tone. Therefore, if the Priority Page is used with ALL ZONE PAGING, then MEET-ME PAGING [M-1, 11] and PAGING TRANSFER [P-10] are not available to the system.
12. Priority Page access will not disconnect an Attendant Console engaged in a Paging Trunk Connection.

Programming

STEP 1: **ASYD** - SYS1, Index 73, Bit 0 and Bit 1. For the Page function only, assign Data 00.

STEP 2: **ARTD** - Assign the Paging Route as shown below:

RT:1

1-OSGS	:2	2-ONSG	:3	5-TF	:1	6-TCL	:8	7 L/T	:1
8-RLP	:2	15-LSG	:1						

Note: To change the data for existing route (RT), initialize the circuit card.

STEP 3: **ATRK** - Assign the LENS, Paging Trunk, Route Number, Trunk Number, and Tenant Number.

STEP 4: **MBTK** - Assign the Make Idle status to the Paging Trunks.

STEP 5: **ANPD** - Assign a level for Trunk Access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. Assign the Number of Necessary Digits, according to a predetermined Numbering Plan. Busy Lamp Field is not activated.

STEP 6: **ASPA** - Assign Paging Trunk Route Data for two or more Routes, with a maximum of seven. (CI = "N: Normal", SRV = "OGCA: Outgoing Call with route advance", COUNT = 2 - 7, RT = Paging Trunk Route).

STEP 7: **ARSC** - Assign to the Station, which is allowed access to Paging Trunks, a Route Restriction Class (RSC) that is allowed these Routes in Route Restriction Index (RRI) 2 and 3.

FCCS Programming

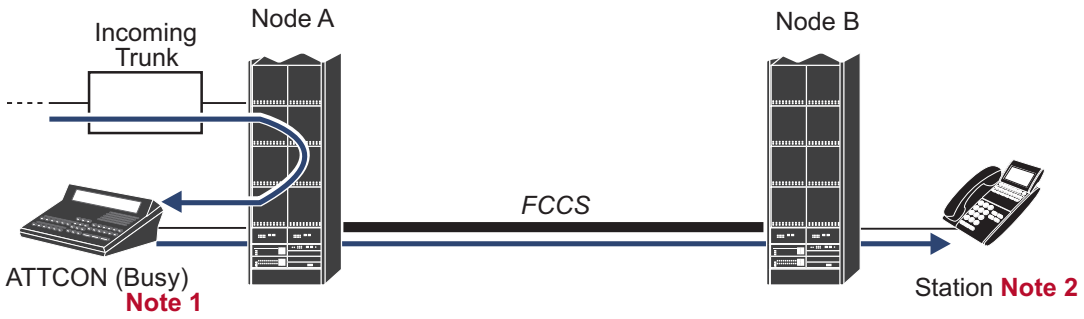
This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

STEP 1: **ALRTN** - Assign this command to connect the Logical Route to the Physical Route.

STEP 2: **ARTDN** - Assign this command in addition to assigning data for ARTD.

Note: To change the data for existing route (RT), initialize the circuit card.

STEP 3: **ANPDN** - Assign a level for Trunk Access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes.
Assign the Number of Necessary Digits, according to a predetermined Numbering Plan. Busy Lamp Field is not activated.



STEP 4: **ASPAN** - Assign Paging Trunk Route Data for two or more Routes, with a maximum of seven, (CI = N, SRV = "OGCA: Outgoing Call with route advance", COUNT = 2 - 7, RT = Paging Trunk Route).

STEP 5: **ARSCN** - Assign to the Station, which allowed access to Paging Trunks, a Route Restriction Class (RSC) that is allowed these Routes in Route Restriction Index (RRI) 2 and 3.

A-55 Automatic Change of Night Service

General Description

This feature allows calls directed to an Attendant from a Trunk Line to be transferred according to the Night Connection Service when the Attendant does not answer the call for a predetermined time.
The feature enables Incoming Trunk Calls, directed to the Attendant Console, to overflow to a predetermined Station on the FCCS Network via FCCS, also.

Note 1: When Attendant/Operator does not answer a call, the call overflows.
Note 2: This is the Station transfered by Night Connection Service.

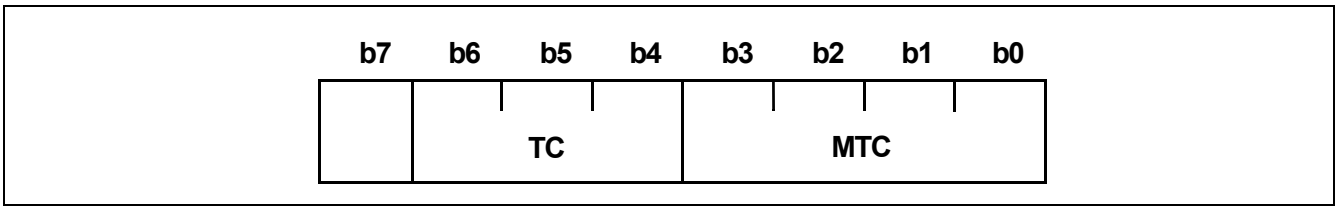
Note: This feature is not available in North America.

Operating Procedure

1. An Incoming Trunk Call arrives at the ATTENDANT CONSOLE [A-3].
2. The Attendant does not answer for a predetermined time.
3. Night Connection Service is activated for the Incoming Call.

Service Conditions

1. This feature is only available while the system is in Day Mode (not in Night Mode).
2. This feature is provided for Incoming Calls to the ATTENDANT CONSOLE [A-3] from a Central Office Trunk Line (TCL 1, 2, 3) or Ringdown Trunk Line.
3. This feature is not available for INDIVIDUAL ATTENDANT ACCESS [I-6], which allows a call to be directed to a particular ATTENDANT CONSOLE [A-3].
4. This feature is not available concurrently with ATTENDANT NIGHT TRANSFER [A-19].
5. The Overflowing Timer Value is determined by SYS1, Index 140 (the default is 40 seconds).
   When the destination does not answer the Overflowed Call, the time value is reset to 40 seconds.
6. This feature is not available for calls to be transferred outside by following the features:



CALL FORWARDING - ALL CALLS - OUTSIDE	[C-28]
CALL FORWARDING - BUSY LINE - OUTSIDE	[C-60]
CALL FORWARDING - DON'T ANSWER - OUTSIDE	[C-74]
LDN NIGHT CONNECTION	[L-28]
NIGHT CONNECTION OUTSIDE - SYSTEM	[N-17]

7. When a Station activated by this service has set CALL FORWARDING - DON'T ANSWER [C-3] to an Attendant (or outside), the station is connected to TRUNK ANSWER FROM ANY STATION (TAS) [T-8] by No Answer Time-out, but it will remain calling that station in the case of TAS Restriction.

8. In the case of DIRECT INWARD DIALING (DID) [D-8] Termination, this feature is available for an Operator Call, LDN, Intercept, and Forwarded Calls to an Attendant in CALL FORWARDING - ALL CALLS/BUSY LINE/DON'T ANSWER [C-5, 2, 3].
9. DID includes CCIS terminating call via MFC and Central Office Trunks.
10. In the case of DIRECT-IN TERMINATION (DIT) [D-7], this feature is available when a station has set CALL FORWARDING - ALL CALLS/BUSY LINE [C-5, 2] to the Attendant.
11. AUTOMATIC CHANGE OF NIGHT SERVICE and DELAY ANNOUNCEMENT - ATTENDANT [D-114] are mutually exclusive features. DELAY ANNOUNCEMENT ATTENDANT [D-114] takes priority over AUTOMATIC CHANGE OF NIGHT SERVICE.
12. A PS cannot be assigned as Overflowing Destination.
13. When Call Forwarding - All Calls [C-5] or Call Forwarding - Busy Line [C-2] is set to the Overflowing Station, an Overflowed Call to the station is transferred to the destination.
14. When Call Forwarding - All Calls [C-5] is set to the Overflowing Station in Hunting Group (Station Hunting - Circular [S-7]/Station Hunting - Terminal [S-9]/Uniform Call Distribution (UCD) [U-1]), an Overflowed Call to the station is transferred by Call Forwarding - All Calls. (Hunting function is not activated.)
15. When Call Forwarding - Busy Line [C-2] is set to the Overflowing Station in Hunting Group (Station Hunting - Circular [S-7]/Station Hunting - Terminal [S-9]/Uniform Call Distribution (UCD) [U-1]), an Overflowed Call to the station is hunted (only when all stations in the Hunting Group are busy, Call Forwarding - Busy Line is activated.)
16. When Call Forwarding - All Calls [C-5]/Call Forwarding - Busy Line [C-2] to outside is set to the Overflowing Station, the call is not overflowed (the Attendant Console is called).
17. Overflowing Destination/Timer is determined by the System Data of the node that accommodates the Trunk which a call terminates.
18. The Incoming Call continues to ring at the Attendant Console when designated FCCS trunks are all busy, or locked out, etc.
19. FPC of a node which transmits Day/Night changeover information is determined by SYS1, Index 640, and the information is transmitted to a node of FPC designated by SYS1, Index 704.

Programming

STEP 1: **ASYD** - SYS1, Index 140, Bit 0 to Bit 6: No Answer Timer for Automatic Change of Night Service.

MTC = 1 Hexadecimal to F Hexadecimal (1 -15)
TC = 3 Hexadecimal (two seconds) or 7 Hexadecimal (eight seconds)
(No Answer Timer) = (MTC) × (TC) (seconds)

Note: Default data is set to 40 seconds.

SYS2, Index 15, Bit 1 (Automatic Change of Night Service): 0/1 = Out/In Service, Assign "1".

STEP 2: **ACSI** - Assign the Connection Service Index (CSI) for AUTOMATIC CHANGE OF NIGHT SERVICE.

Assign CSI = 4 (Direct-In Termination (Night Mode))

STEP 3: **ACFR** - Assign the Call Forwarding Restriction Data.

TSFI = 2 [Direct in Termination (Night only)]

CCI: Assign the appropriate Call Category Index Number [1 = LDN (Central Office Line), 4 = TIE Line].

RES = 1 (Transfer Service is allowed)

FCCS Programming

The following command assignments are required when your system is configured as an FCCS Network.

STEP 1: **ASYDL** - SYS1, Index 640, Bit 0 to Bit 7. Assign FPC of the node which transfers the Day/Night changeover information. **Note 1**

SYS1, Index 704 to Index 735. Assign FPC of the node to which Attendant Console transfers the Day/Night changeover information.**Note 1**

STEP 2: **ASYD** - SYS1, Index 140. This determines the Timer Value at which the Incoming Call will overflow to the Destination Station. **Note 1**

SYS2, Index 15, Bit 1. Allowance of ATTENDANT OVERFLOW. Assign 0/1 = Out/In Service. **Note 1**

STEP 3: **ANPDL/ANPDN** - Reserve a number level for feature access. Assign following data in accordance with a predetermined plan.

TN: Tenant Number
1stDC: 1st digit Code (0-9,*,#)
CI: Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes.
NND: Number of Necessary Digits (1-6)

BLF: Busy Lamp Field Display Activated on ATT

STEP 4: **ASPAL/ASPAN** - Determine the kind of service and the Service Access Code to be executed.

TN: Tenant Number (1-255)
ACC: Access Code (maximum 6-digit)
CI: Connection Status Index (N: Normal, H: Hooking, B: Busy)
SRV: Kind of Service (TELN: Telephone Number)
NND: Necessary Digit of Telephone Number

STEP 5: **ASDT** - Assign the Station Data for Destination Overflow Station.

TN: Tenant Number (1-255)
STN: Station Number
LENS: Line Equipment Numbers
TEC: Telephone Class
SFC: Service Feature Restriction Class

STEP 6: **ALGSL/ALGSN** - Assign Telephone Number to the Destination Station Number programed by ASDT command above.

TYPE=1 (Line Equipment Numbers/Phantom Index is used to specify the Telephone Number)

UGN: User Group Number (1-255)
TELN: Telephone Number (maximum 16-digit)
FPC: Fusion Point Code (Only ALGSN)
LENS/PHIN:Line Equipment Numbers/Phantom Index of the destination Station Number

TYPE=2 (Station Number is used to specify the Telephone Number)

UGN: User Group Number (1-255)
TELN: Telephone Number (maximum 16-digit)
FPC: Fusion Point Code (Only ALGSN)
TN: Tenant Number
STN: Station Number of destination

STEP 7: **ACSIL** - Assign Overflowing Destination of Attendant Console. **Note 1**

RT/LGRT:External Route Number/Logical Route Number (1-899)
TK: Trunk Number (1-255)
CSI: Connection Service Index, assign 4 [Direct-In Termination (Night Mode)]
UGN: User Group Number (1-255) **Note 2**
TELN: Telephone Number (a maximum of 16 digits) **Note 2**

STEP 8: **ACFR** - Assign the Call Forwarding Restriction Data.

TSFI: Transfer Service Feature Index 2 = Direct Inward Dialing (DID)
CCI: Call Category Index [1 = LDN (Central Office Line), 4 = TIE Line)]
RES: Restriction Data (0 = Transfer service is not allowed, 1 = Transfer service is allowed)

Note 1: Assign the data to the node that a call terminates to.

Note 2: This parameter is displayed when CSI = 2, 3 or 4.

A-59 Announcement Service - Attendant

General Description

This feature allows the Attendant, via the ATTENDANT CONSOLE [A-3], to hear a prearranged announcement when the Attendant dials a predetermined Access Code.

Operating Procedure

1. Press an Idle Loop key.
2. Dial the Announcement Trunk Access Code.
3. Listen to the message from Announcement Machine.

Service Conditions

1. This feature requires one of the following hardware alternatives:
   a.) Central Office Trunk (COT) or 2W E&M Trunk and Announcement Machine.
   b.) Digital Announcement Trunk (DAT).
2. The following connections are available:
   a.) Multi Connection: several Attendants can connect to one Announcement Trunk at the same time.
   b.) Single Connection: one Attendant can connect to one Announcement Trunk at a time.
3. This connection can be continuous until the Attendant presses the CANCEL key or can be discontinued after 30 seconds. This function can be selected on a per Announcement Trunk, and per Tenant basis.
4. Before connection to the Announcement Machine is made, the system can be programmed to return Ringback Tone. This is selected on a per Tenant and per announcement basis.
5. This service can be provided for a maximum of 127 announcements per Tenant, which includes the Announcement Trunks for:

ANNOUNCEMENT SERVICE	[A-15]
CALL FORWARDING - ALL CALLS - ANNOUNCEMENT	[C-69]
CALL FORWARDING - INTERCEPT / ANNOUNCEMENT	[C-25]

6. ANNOUNCEMENT SERVICE is provided to FCCS Nodes that have no Announcement Trunk using the Trunk in the Remote Node.
7. When a call is terminated from the ISDN Trunk or MG(SIP), RBT is sent to the caller if the Announcement Trunk Answer Signal is not sent.

Programming

STEP 1: **ANPD** - Reserve a Number Level for Trunk Access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. Assign for NND values in accordance with a predetermined Numbering Plan.

STEP 2: **ASPA** - Assign an Access Code to the Announcement Trunk. Assign SRV = "ANNC: Announcement Service - Single Announcement". The EQP number assignment should be as assigned in AAED. TYPE = 0/1.

STEP 3: **ARTD** - Assign the Announcement Route as shown below. Be sure to provide privacy by programming CDN 44:PRV as data "1".

RT: 1

1-OSGS	:2	2-ONSG	:3	5-TF	:1	6-TCL	:1	7-L/T	:1		
8-RLP	:2	15-LSG	:4								

STEP 4: **ARSC** - Assign a Route Restriction Class (RSC) to the Station that allows access to the Announcement Route. Assign RSC 0 to the Attendant, and allow that RSC access to the Announcement Route.

STEP 5: **ATRK** - Assign the LENS, Announcement Trunk Route Number. Assign one or more Trunks to a specific Route used to connect to an Announcement Machine.

STEP 6: **MBTK** - Assign the Make Idle status to the Announcement Trunk.

STEP 7: **ARRC** - If TIE Line, DID, or REMOTE ACCESS TO System [R-2] Connection to the Announcement Service Trunk is required, allow Trunk-to-Trunk Connection using ARI-D-RES = 1 (Direct Connection is allowed.)

STEP 8: **AAED** - This command is used to assign Announcement Equipment.

Dead Level:

Assign:

TN: Tenant Number

EQP: (Announcement Equipment Number) = 0 (Dead Level). For example, Level 8 is not assigned. An announcement is returned rather than a Reorder Tone.

RT, TK:Route and Trunk Number of the Trunk connected to the Announcement Equipment.

Unused Number:

Assign:

TN: Tenant Number

EQP: 1 (Unused Number). For example: Extension 7836 is not in the system. An Announcement is returned rather than a Reorder Tone.

RT, TK:Route and Trunk Number of the Trunk connected to the Announcement Equipment.

Announcement Service:

Assign:

TN: Tenant Number

EQP: = 2 - 15

RT, TK:Route and Trunk Number of the Trunk connected to the Announcement Equipment.

C: Duration of connection, 0/1:Disconnect in 30 seconds/connection is held until the Station releases. See the requirements of the application for the Announcement Equipment. For Dead Level applications, data 0 is assigned.

R: Sending RBT 0/1: sending RBT/not sending RBT. **Note 1**

Note 1: Assign “1” (not sending Ringback Tone) when the “M” parameter = “0” (Single Connection).

A: Answer Signal Sending, 0/1: no answer from Incoming Trunk/answer from Incoming Trunk. Normally assign data “1”.

M: Multiple Connection 0/1: Single Connection/Multiple Connection. Assign usually for Single Connection.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

STEP 1: **ALRTN** - Assign this command to connect the Logical Route to the Physical Route.

STEP 2: **ARTDN** - Assign the Announcement Route as shown below. Be sure to provide privacy by programming CDN 44:PRV as data "1".

LGRT: 1

1-OSGS	:2	2-ONSG	:3	5-TF	:1	6-TCL	:1	7-L/T	:1
8-RLP	:2	15-LSG	:4	44-PRV	:1

STEP 3: **AAEDN** - This data must be assigned to the NCN.

Assign the Announcement Equipment Data.

EQUIPMENT KIND:

- DAT/Announcement Machine
- VS32

TN: Enter Tenant Number

UGN: Enter User Group Number

EQP: Announcement Equipment Number

0 = Dead Level

1 = Unused Number

2-15 = Announcement Service

Duration of Connection:

0 = Disconnect in 30 seconds

1 = Connection is held until the Station releases. See the requirements of the application for the Announcement Equipment. For Dead Level applications, data 0 is assigned.

Do Not Send RBT [On/Off]

Note: Assign "Do not Send RBT" when Multiple Connection = Single.

Send Answer Signal [On/Off]

Note: Normally assign "Send."

Multiple Connection:

0 = Single Connection

1 = Multiple Connection

LGRT: Logical Route

TK: Trunk Number **Note 2**

STEP 4: **ARRCN** - This data must be assigned to the NCN.
Release the restriction between the Terminating Trunk and the Announcement Trunk.

STEP 5: **ARSCN** - This data must be assigned to the NCN.
Release the restriction between the Announcement Trunk and the Station.

Note 2: Not necessary for Multiple Connection = Single.

Note: The current command data shown is set to all Nodes using the service: ASTD, ARTD, ATRK, MBTK

A-60 Attendant-to-Attendant Calling

General Description

This feature permits an Attendant, via an Attendant Console, to access a non-specific free Attendant by dialing the Operator Access Code, or to call a particular Attendant Console by dialing an Individual Attendant Identification Number.

Operating Procedure

1. Press an Idle Loop key.
2. Dial the Individual Attendant Identification Number or Operator Call Code.

Service Conditions

1. An Attendant Identification Number must be published for each Attendant.
2. ATTENDANT NIGHT TRANSFER [A-19] cannot be activated for calls via this feature.
3. The Operator Call Code should be a one-digit number. Normally, 0 is assigned as the Operator Call Code.
4. No Operation keys on the Called Attendant Console can be used while performing Attendant-to-Attendant Calling.
5. Only the CANCEL key on the Calling Attendant Console can be used to disconnect Attendant-to-Attendant Calling.
6. An Attendant can receive only one Attendant-to-Attendant Call at a time. An INCOMING CALL IDENTIFICATION (ICI) key can be designated for receipt of TF: INTER-POSITION TRANSFER CALLs and Attendant-to-Attendant Calls.
7. An Attendant cannot extend an Attendant-to-Attendant Call to any other destination.
8. With an Individual Attendant Identification Number, an Attendant Console/Desk Console within an FCCS Network can be specified.
9. The Operator Call Code is dialed. The call is routed to the predetermined Attendant Console by ASPAL.
10. When assigning Function Code to KYN 1 of an Attendant Console by AAKP, this feature cannot be used.

Programming

STEP 1: **ASYD** - SYS1, Index 9. Assign the number of Attendant Consoles/Desk Consoles.
STEP 2: **ASPA** - Assign SRV = “SSC: Service Code”, SID = 2 (Operator Call).
STEP 3: **ASAT** - Assign Identification Numbers to the specific Attendant Consoles.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ASYDN** - SYS1, Index 9. Assign the number of Attendant Consoles / Desk Consoles.

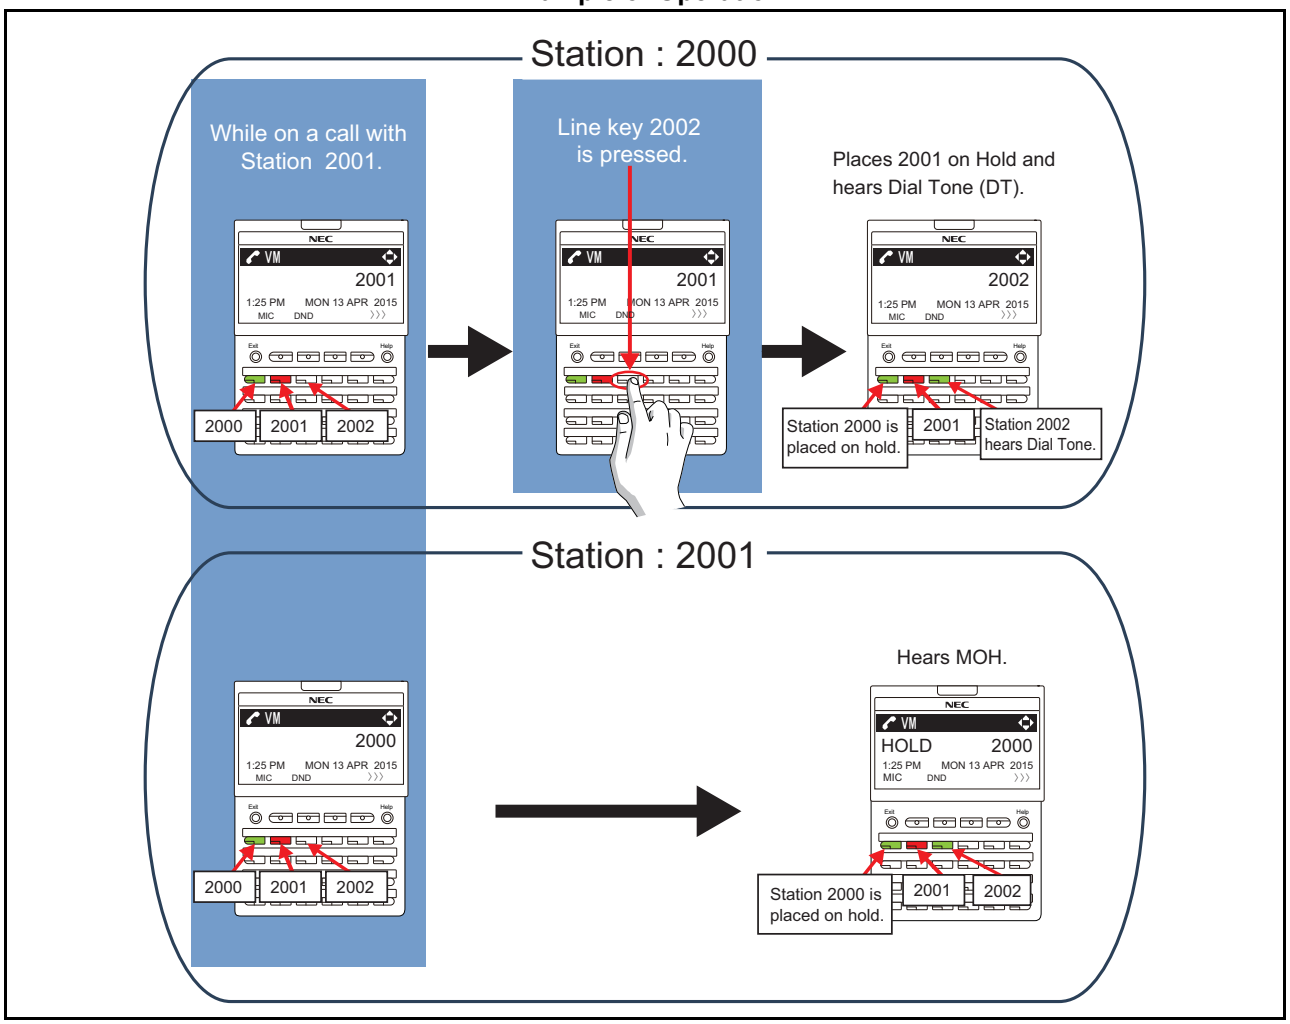
STEP 2: **ASPAL** - Set to all the Nodes (accommodates the Attendant Console). Assign SRV = "SSC: Service Code", SID = 2 (Operator Call), FPC of the Node that Operator Calls are to be terminated to.

STEP 3: **ALGNN** - Set to the NCN.

STEP 4: **ASATN** - Set to the NCN. Assign Identification Numbers to the specific Attendant Consoles.

A-68 Automatic Hold

General Description



This feature allows users to automatically place the first party on hold and answer the second party by just pressing the intended Line key. When this feature is used, an opposite party is placed on hold under the same conditions when HOLD key is pressed during a conversation. Hold status can be selected from the following by office data setting.

- Non-Exclusive Hold -D [N-7D]
- Hold Fixation Mode
- Call Park Group -D [C-176D]

Operating Procedure

Press a Line key while on a call with a station/trunk.

Example of Operation

Note: This feature is only available for Line keys (not currently being used) to which KD=0 (Multi-Line) or KD=4 (Same Number Sub Line) of AKYD command is assigned.

Service Conditions

<Important Notices>

1. The following system data setting is required to use this feature.

   ASYDL, SYS1, Index 1248, Bit 1=1

   Note: Initialize the terminal (for IP Multiple Line terminal/SIP Multiple Line terminal) or ELC card (for Digital Multiple Line terminal) for the change of this system data to take effect. For details, see Programming section.

2. This feature is only available for Line keys to which KD=0 (Multi-Line) or KD=4 (Same Number Sub Line) of AKYD command is assigned (when pressed during a call in progress).

   Note: This feature is not available during an Intercom call or a call with an Attendant Console.

3. While a line used currently (original line) is in other state than busy state such as in calling state and in held state, this feature does not function in the line. When you press another Line key, the existing line is released then the line you pressed will be connected.
4. When a Line key is pressed during a call in progress, status of each terminal is as follows:

Status of Each Party (Basic Pattern)

Case	Status of Line Key to be Pressed	Automatic Hold	Kind of Opposite Party	Status of Opposite Party	Status of Operating Party
1	Idle * Lamp goes off.	Disabled	Station/Trunk	Released	Seizing Second Party's line (hearing DT).
			ATT/Intercom		
		Enabled	Station/Trunk	Hearing MOH	
			ATT/Intercom	Released	
2	Receiving an incoming call or having a call held by another terminal * Lamp flashes red.	Disabled	Station/Trunk	Released	Answering the incoming call and starting the conversation.
			ATT/Intercom		
		Enabled	Station/Trunk	Hearing MOH	
			ATT/Intercom	Released	
3	Talking with/calling to another line * Lamp lights red.	Disabled	Station/Trunk	Status does not change (continues to talk).	
			ATT/Intercom		
		Enabled	Station/Trunk	Hearing MOH	Hold **Note 1**
			ATT/Intercom	Status does not change (continues to talk).	
4	Talking with the operating Party. * Lamp lights green.	Disabled	Station/Trunk		
			ATT/Intercom		
		Enabled	Station/Trunk		
			ATT/Intercom		

Note 1: After a line is held by Non-Exclusive Hold -D [N-7D], re-pressing the HOLD key changes its state to EXCLUSIVE HOLD -D [E-4D].

5. When Line keys not supporting this feature are pressed during a call in progress, status of each terminal is as follows:

Status of Each Party (When Line Keys Not Supporting This Feature are Pressed)

KD: Kind of Line (AKYD)	Status of Opposite Party	Status of Operating Party
KYI=2 (Multi-Line), KD=1 (Intercom)	Released	Intercom Calling
KYI=2 (Multi-Line), KD=2 (DSS key)	Hearing MOH	Forwarding to the appropriate Station

<Interactions with Other Features>

1. Interaction conditions between this feature and other Hold features are as follows:
   a.) Although you can use this feature even in Hold Fixation mode, you cannot seize an idle line or answer an incoming call.
   b.) After this feature is performed to place a call on hold, you cannot use the Hold button to perform Exclusive Hold -D [E-4D] against the held line. Exclusive Hold-D [E-4D] is able to function only when the line is held by the Hold button. [See **Note 1** in the Status of Each Party (Basic Pattern) list.]
   c.) Place an opposite party on hold once and then press the HOLD key to place the party on Exclusive Hold -D [E-4D].
   d.) When this feature is used while Call Park Group -D [C-176D] is enabled, a call is placed on hold under the conditions of Call Park Group -D [C-176D].
   e.) When this feature is used while Call Park Group -D [C-176D] is disabled, a call is placed on hold under the conditions of Non-Exclusive Hold -D [N-7D].
   f.) When this feature is used while Call Park Group -D [C-176D] with the CALL PARK GROUP -D HOLD key is enabled, a call is placed on hold under the conditions of Non-Exclusive Hold -D [N-7D].
2. After a Secretary answers a call terminated to Boss' line while this feature is enabled, the Secretary can transfer the call to the Boss by pressing the Boss's Line key.

Note: The status of Secretary when connecting to an Incoming call is the same as Case 4 of Status of Each Party (Basic Pattern). After the Boss' Line key is pressed, the existing feature (Boss - Secretary Transfer [B-11]) is activated.

3. When the BROKERAGE HOT LINE key is pressed while this feature is enabled, a call in progress is placed on hold and Hotline destination is called.
4. This feature cannot be activated from an Emergency Telephone and a station currently talking with an Emergency Telephone. When these station users press an idle Line key, the first call is released and the pressed Line key (second party) is seized. When these stations press a busy Line key, "RST" appears on the LCD and the conversation with the first party continues.
5. This feature is not available during an Intercom call. When an idle Line key is pressed during an Intercom call, the first call (Intercom call) is released and the pressed Line key (second party) is seized (for how each terminal operates, see Status of Each Party (Basic Pattern)). Also, when an Intercom Line key is

pressed during a call in progress, this feature cannot be activated (for how each terminal operates, see Status of Each Party (When Line Keys Not Supporting This Feature are Pressed)).

6. This feature is not available during a call with an Attendant Console. When an idle Line key is pressed during a call with an Attendant Console, the first call (call with the Attendant Console) is released and the pressed Line key (second party) is seized (for how each terminal operates, see Status of Each Party (Basic Pattern)).
7. This feature is not available during a conference call with Add-On Conference - 8 Party [A-121]. When an idle Line key is pressed during a conference call, the conference call is released and the pressed Line key (second party) is seized.

<Hardware/Software>

1. Requirement for circuit card to use this feature is shown in the table below.

Equipment	Firmware
CH-16ELCA	SP-4035 16ELCA PROG-A Issue 1 or later
PA-16ELCN-A **Note 2**	SP-4013 16ELCN PROG-A Issue 1 or later

Note 2: This feature only works when the Terminal Mode Setting of Switch 11 (SW11 5-6) on ELC circuit card is set to ON/ON (Standard Setting). For details on the switch settings of the circuit cards, see sections related to ELC cards in the Circuit Card Description.

2. When the held party is an IP terminal and the connection with the party is disconnected due to the accidents such as network failure or unplugging of cables, the lamp of the Line key on the Desktop terminal that held the call keeps flashing. If a user of this Desktop terminal tries to retrieve the call in this condition, dial tone is heard and the lamp of the Line key will stop flashing and turn on.

<Interactions with Networks>

None.

<Conditions Specific to This Feature>

None.

<Other Conditions>

None.

Programming

STEP 1: **ASYDL** - SYS1, Index 1248, Bit 1. Assign 1 to enable Automatic Hold [A-68].

Note: Initialize the terminal (for IP Multiple Line terminal/SIP Multiple Line terminal) or ELC card (for Digital Multiple Line terminal) for the change of this system data to take effect.

STEP 2: **AKYD** - Assign Multi-line data as follows:
KYI = 2 (Multi-line)
0/1 = OFF/ON
KD (Kind of Line): 0 (Multi-line) or 4 (Same Number Sub Line)

- When KD = 0 (Multi-line):

  Line TN: Enter the tenant number of Multi-line.
  STN: Enter the station number of Multi-line.
  RG: Assign Ring Information for each Multi-line (0-7).

- When KD = 4 (Same Number Sub Line):

  LENS: Enter the LENS of the Same Number Sub Line.

  Note: When KD = 4 (Same Number Sub Line), the following data setting is required.
  ASFC SFI 212 = 1 (Same Number Sub Line)

A-69 Automatic Idle Return

General Description

This feature enables a Desktop terminal to become idle automatically after a predetermined time when the line is released by the opposite Station. Therefore, manual operation for the line release (such as on-hook, speaker, monitoring, or call originating) is not required.

Operating Procedure

No manual operation is required.

Service Conditions

1. This feature is available for the following status:
   - While a conversation with hands-free operation is in progress
   - While a conversation using handset is in progress **Note 1**
   - While a conversation using headset is in progress **Note 1**

   Note 1: Available since FP95-114 V4 Issue 2.0.
2. This feature may be assigned based on AUTOMATIC IDLE RETURN (ASFC SFI 136=1) of each terminal.

   Note: The conditions of this feature for SIP Handler Controlled SIP terminal are as follows:
   - this feature does not based on Service Feature Class. For details, refer to SIP HANDLER - SIP TERMINAL [S-167].
   - when this feature is activated on off-hook state, Dial Tone (DT) connection may not be established. After the automatic line release, activation of the terminal depends on the type of terminal.

   Note: This feature is not available for SP Controlled SIP terminal, when this feature is activated, the terminal hears Reorder Tone only.

   Note: When using Sub Line, the setting depends on the SFC of My Line which accommodates the Sub Line. Not depended on the SFC of Sub Line.
3. This feature is not available when the Station has a call placed on hold.
4. This feature is activated when Reorder Tone (ROT) is sent to a Desktop terminal individually.
5. Release Timer for this feature can be set by the system data (ASYD, SYS1, Index 401, Bit 0-3).
6. When using this feature with handset/headset, assign the system data (ASYDL/ASYDN, SYS1, Index 686, Bit 4=1).

   Note: Available since FP95-114 V4 Issue 2.0.

7. The following conditions apply to use handset/headset on this feature. **Note 2**

   - After the line is released automatically, Dial Tone (DT) connection on the Prime Line will be established. However, when call restriction of Prime Line is set, the tone of line will be silence (being idle status). **Note 3**
   - Line Lockout [L-3] is not supported.

   Note 2: Available since FP95-114 V4 Issue 2.0.

   Note 3: When using Sub Line, this condition is also applicable.

Interactions

This feature is not available when the following features are enabled:

- ATT CAMP-ON WITH TONE INDICATION [A-1]
- AUTOMATIC/MANUAL INTERCOM [A-30]
- ATTENDANT CAMP-ON WITH TONE INDICATION - CCIS [A-45]
- CALL HOLD [C-6]
- CALL TRANSFER - ALL CALLS [C-11] **Note 4**
- DIAL INTERCOM [D-87]
- OFF-HOOK ALARM [O-6] **Note 5**
- TRUNK LINE APPEARANCE -D [T-23D]

Note 4: For Camp-On by Station only.

Note 5: When the Transferred Station assigned by OFF-HOOK ALARM is in the LINE LOCKOUT [L-3] status or make busy status, this feature is available.

Programming

STEP 1: **ASYD** - SYS1, Index 401, Bit 0 through Bit 3. Assign the timer value for AUTOMATIC IDLE RETURN.

Note: According to the timer value, the time to hear Reorder Tone (ROT) is determined. When the data is set to 0, the timer value will be 0-2. Then, no tone will be connected in nearly every case.

STEP 2: **ASYDL/ASYDN** - SYS1, Index 686, Bit 4: Availability of AUTOMATIC IDLE RETURN for handset and headset (off-hook). 0/1 = Available only when hands-free operation is activated (on-hook)/Available when activating hands-free operation (on-hook) and using handset or headset (off-hook).

Note: This system data is available since FP95-114 V4 Issue 2.0.

STEP 3: **ASFC** - For Stations allowed AUTOMATIC IDLE RETURN, assign a Class of Service that allows SFI 136 (Automatic Idle Return).

A-78 Automatic Number Identification (ANI)

General Description

This feature automatically sends the Calling Subscriber's Number to the Called Party after a response is received from the Distant Office. This feature is used for Outgoing Central Office Calls [Enhanced 911 (E911) Calls] or TIE Line Calls using MF Signaling.

Note: This feature is available only in North America.

Operating Procedure

No manual operation is required. Automatic Number Identification (ANI) Calls are placed using normal call origination procedures.

Service Conditions

1. The ANI feature for Enhanced 911 (E911) Outgoing Connections is available to the following connections:
   a.) Call from a Station by LCR, MF Signaling.
   b.) Call from an Attendant Console by LCR, MF Signaling.
2. ANI Sending Number by Enhanced 911 (E911) - ANI UNIFIED NUMBER OF DIGITS [E-18] is NXX-XXXX, where:
   NXX: Determined for each system
   XXXX: Telephone Number
3. Sending-digit patterns in Enhanced 911 (E911) - ANI UNIFIED NUMBER OF DIGITS [E-18]:
   a.) Outgoing Call from a Station:
   - If ANI Data is assigned:

   KP-0-NXX-XXXX-ST
   Telephone Number
   Information digit

   - If ANI Data is not assigned:

   KP-2-ST
   Information digit

   b.) Outgoing Call from ATTENDANT CONSOLE [A-3]:
   - Individual ATTENDANT CONSOLE [A-3] access available and ANI Data is assigned:

   KP-0-NXX-XXXX-ST
   Individual Attendant Console
   Information digit

   - Individual Attendant Console access not available and ANI Data is assigned:

   KP-0-NXX-XXXX-ST
   ANI sending number
   Information digit

   - ANND Data is not assigned or is invalid:

   KP-1-ST
   Information digit
4. An independent Route is required for an Enhanced 911 (E911) - ANI Interface.

5. It takes some time for a speech path to be established after a Calling Subscriber Number has been sent out to the Remote Office through the Enhanced 911 (E911) - ANI Interface.
6. A Direct Distance Dialed (DDD) Seizure Tone is not sent after the digits have been sent out.
7. Other interactions are the same as for MF Signal dialing.
8. FCCS is not available for this feature.

Programming

STEP 1: **ARTD** - Assign Route Class Data to the Route Number of the Outgoing Trunk.

RT:1
1-OSGS :7 2-ONSG :4 3-ISGS :7 4-INSG :4 15-LSG :5
19-EANI :1

Note: To change the data for existing route (RT), initialize the circuit card.

STEP 2: **AAND** - Assign ANI sending digit as per the Route Number and the number of digits of the Caller's Number.

When AT = 0:
RT: Route Number
AT: 0/1 = STA Outgoing / ATT Outgoing
CC 0
KT: Expansion of Station Number Length **Note 1**
0/1 = OFF/ON
STNL: Station Number Length (When KT = 1)
SKIP: Call Originator Digit to be Skipped
ADD: ANI Information Additional Number of Digits
DC: ANI Sending Number

Note 1: When 0 has been assigned to parameter KT and when the Station Numbers used consist of a different number of digits, Outgoing Routes must be divided on the basis of each number of digits.
When 1 has been assigned to parameter KT, Outgoing Routes need not be divided, even if the Station Numbers used consist of a different number of digits.

A-82 Automated Attendant

General Description

This feature allows a public or private network user to access the system without the Attendant or station user's assistance. After or during an announcement, the outside user may originate calls over any or all of the System facilities.

Operating Procedure

1. The Calling Party (Public or Private Network) lifts handset. Receive Dial Tone.
2. The Calling Party dials Automated Attendant Number. Receive Ringback Tone through either the Public/ Private Network. Announcement asking the caller to dial the desired Telephone Number is provided.
3. The Calling Party dials the desired Telephone Number. Receive Ringback Tone (if not busy or restricted).
4. The Called Party answers.

Service Conditions

1. The Incoming Routes from the Central Office Lines for Automated Attendant cannot be used for REMOTE ACCESS TO SYSTEM [R-2].
2. When a Ringdown Incoming Call encounters registers all busy status, call termination is retried approximately one second later. The call will wait until one of the receivers becomes available, but will not be placed in a queue.
3. System Data can select to provide or not provide the first announcement for an Incoming Call terminated to Automated Attendant. If first announcement sending is not provided, the Calling Party hears Ringback Tone from the System.
4. When a Ringdown Incoming Call encounters Announcement Trunk Busy/Blockout for the first announcement status, the Calling Party hears Ringback Tone from the Originating Office until the call is connected to the Announcement Trunk. When a TIE Line Incoming Call encounters Announcement Trunk Busy/Blockout for the first announcement status, the system returns Dial Tone.
5. Redial or Forced Release after the second announcement may be selected in System Data:
   a.) When the Calling Party has dialed a Dead Number. (When Dead Number Announcement is provided, it takes priority over the second announcement.)
   b.) When the Calling Party has abandoned dialing.
   c.) When the connection is restricted:
      - The Called Station is restricted from Incoming Trunk Connection.
      - The Calling Party has dialed an Access Code for Trunk Call Origination and encounters Digit Restriction. When a Trunk Call has encountered an Access Code Restriction, the second announcement is provided (digit reception ready), and the Calling Party can redial.
      - The Calling Party has dialed an Access Code for Trunk Call Origination and encounters an Inter-digit Pause Time-out Connection Restriction.
      - The Calling Party originates a Trunk Call and encounters Trunk Busy Status.
   d.) When the Called Station does not answer (the threshold value is 30 seconds), except when CALL FORWARDING - DON'T ANSWER [C-3] is set on the Called Station.
   e.) When the Called Station is busy, except when CALL FORWARDING - BUSY LINE [C-2] is set on the Called Station.

6. During the first or second announcement, the system can receive DTMF Signals. However, when a DTMF Signal is included in the Recorded Announcement, the announcement stops (first digit reception). Then, after providing the second announcement, either redial or forced release is selected (inter-digit time-out).
7. After the first or the second announcement, the system does not return any Tone until register time-out.
8. For the first or second Register time-out, either transfer to Attendant, or forced release can be selected by the System Data. However, forced release is executed, regardless of the above-mentioned system selection, for Central Office Lines for which release cannot be monitored. Call termination to the Night Transfer Station and TAS connection is not available.
9. To provide or not provide the second announcement can be selected in System Data. When second announcement sending is not designated, the system sends out Dial Tone. The call is single/multiple connected to the second Announcement Trunk, and Ringback Tone is not returned before sending the second announcement.
10. When a call encounters Announcement Trunk Busy/Blockout status in a Single Connection to the second announcement, the system returns a Dial Tone.
11. Tandem Switching as Automated Attendant is a service for Trunk-to-Station Connection, Tandem Connection is not available. When Tandem Connection or Authorization Code service is required, this service is activated by changing the Incoming Routes to that of REMOTE ACCESS TO SYSTEM [R-2].
12. If the Calling Party does not dial the desired Telephone Number after the first announcement, the call can be transferred to the Attendant after a predetermined period of time (prepause time-out), and the Calling Party receives Ringback Tone. However, if the Attendant is not available, Reorder Tone is returned.
13. When an Incoming Call has terminated to a Station, the following services are available:

CALL FORWARDING - ALL CALLS	[C-5]
CALL FORWARDING - BUSY LINE	[C-2]
CALL PICKUP	[C-7, C-30]
CALL WAITING - TERMINATING	[C-12]
STATION HUNTING	[S-7, S-8, S-9]

14. When an Incoming Call has terminated to a Station, CALL FORWARDING - DON'T ANSWER [C-3] is not available.
15. DAT card or VS32 is (**Note 1**) required for this service.

    Note 1: For details on the announcement feature of VS32, see description relating to announcement feature in VS32 Conference Server [V-26].

16. The length of the announcement depends on the key setting of the DAT circuit card. In case of Multiple Connection, it is fixed at 30 seconds. In case of Single Connection, it may be the length of the actual message (including pause) to a maximum of 64 seconds. When the message ends, the Announcement trunk is released.
17. The second announcement is not provided to the ISDN trunk.
18. Since the announcement is provided for a maximum of 30 seconds, the message recording should be completed within 30 seconds, unless a Single Connection is used.
19. This feature is available for Stations in the FCCS Network only.

Programming

STEP 1: **ASYD** - SYS1, Index 7, Bit 5:

Processing on unobtainable Number/Dead Level Dialed, dialing abandoned by Calling Station, Connection Restriction, and Called Station unanswered.

0/1: Redial is prompted by sending the second announcement/forcible disconnect

Bit 6: Processing on PB Receiver Time-out.

0/1: Forcible Disconnection/Transfer to ATT

Index 128: Assign the timer value of Register Prepause Time.

Index 139: Assign the value of No Answer Timer (Call Forwarding - All Calls, Call Back, etc.)

Index 246, Bit 4:

Process of Incoming Calls (Ringdown) after they encounter their first, second PB receiver time-out in a sequence of Automated Attendant.

0/1: Forced Release/Transfer to ATT

STEP 2: **ARTD** - Assign the Route Data of the Trunk for AUTOMATED ATTENDANT.

RT:1

1-OSGS :2 4-INSG :2 or 7 6-TCL :4

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or MG.

Assign the Route Data of the Digital Announcement Trunk.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or VS32.

STEP 3: **ATRK** - Assign the Trunk Data of both the Trunk for AUTOMATED ATTENDANT and the Digital Announcement Trunk. Also, assign the Trunk Data of PB Receiver (RT = 906).

STEP 4: **MBTK** - Cancel the make-busy of the Trunk assigned by ATRK.

STEP 5: **ACSI** - Assign CSI = 5 (Remote Access to Node) to the Route and Trunk Number of the Trunk for AUTOMATED ATTENDANT.

STEP 6: **ACFR** - Assign the Restriction Release of TSFI = 7 (Remote Access to System)

STEP 7: **AAED** - Assign the Announcement Equipment for AUTOMATED ATTENDANT.

Announcement Equipment for sending the first announcement.

(EQP = 34, C = 0, R = 1, A = 1, M = 0)

Announcement Equipment for sending the second announcement **Note 2**

(EQP = 35, C = 0, R = 1, A = 1, M = _) **Note 3**

Note 2: When ASYD, SYS1, Index 7, Bit 5=0, assign the Announcement Equipment to send the second announcement.

Note 3: When selecting M (0 = Single/1 = Multi) for the second announcement, take the following into account:
Do not assign the second announcement in the same Route as the first announcement when Multi (M = 1) is selected. In the case of Multi (M = 1), the DAT Trunk is forcibly released when 30 seconds have elapsed from the beginning of the second announcement. Note that the connection of the DAT Trunk still remains even if the playback reaches the end of the Recorded Announcement. In the case of Single (M = 0), the DAT Trunk is automatically released when the playback reaches the end of the Recorded Announcement.

STEP 8: **ASTD** - Assign the following State Translation Data:
STM = 0, STS = 2, ST = 1 (allows a Tandem Connection inclusive of COT)
STM = 4, STS = 0, ST = 1 (Remote Access to System in service)

STEP 9: **ARRC** - Cancel the restrictions on the Trunk Route for AUTOMATED ATTENDANT and the route for the Digital Announcement Trunk.
ICRT: (Trunk Route for AUTOMATED ATTENDANT)
OGRT: (Route for Digital Announcement Trunk)
ARI-D-RES

STEP 10: **ARAC** - Assign an Idle Station Number as the Remote Access Code.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node. **Note 4**

Note 4: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ALRTN** - Assign this command to connect the Logical Route to the Physical Route.

STEP 2: **ARTDN** - Assign the Route Data of the Trunk for AUTOMATED ATTENDANT.
LGRT:1
1-OSGS :2 4-INSG :2 or 7 6-TCL:4

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or MG.

Assign the Route Data of the Digital Announcement Trunk.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or VS32.

STEP 3: **AAEDN** - Assign the Announcement Equipment for AUTOMATED ATTENDANT.
Announcement Equipment for sending the first announcement.
EQP = 34, Duration of Connection: Disconnect in 30 seconds. Do not Send RBT. Send Answer Signal. Multiple Connection = Single.
Announcement Equipment for sending the second announcement
EQP = 35, Duration of Connection: Disconnect in 30 seconds. Do not Send RBT. Send Answer Signal. Multiple Connection = Single.

STEP 4: **ARRCN** - Cancel the restrictions on the Trunk Route for AUTOMATED ATTENDANT and the Route for the Digital Announcement Trunk.
IC LGRT:Trunk Route for AUTOMATED ATTENDANT
OG LGRT:Route for Digital Announcement Trunk
ARI-D-RES

A-98 Answer Hold - Attendant

General Description

This feature enables an Attendant to answer an Incoming Call by pressing the ANSWER key or flashing ICI key. If the Attendant is already engaged in a call, pressing one of these keys places the first call on hold and automatically connects the second one. Use of the ANSWER key or ICI key speeds call handling, while Answer Hold prevents accidental call dropping.

Operating Procedure

To answer a call while engaged in a Two-party Call

1. While the Attendant is engaged in a Station/Trunk Call, another call terminates at the Attendant Console.
2. The Attendant presses the ANSWER key or ICI key. The original call is placed on hold (MUSIC ON HOLD [M-7]). The LED of the ATND key goes out and that of the HOLD key lights.
3. The Attendant is connected to the second party. (ATND key LED lights.)

Note: When the ANSWER key is pressed, the calls connected to the Attendant will be placed on hold (if there is an Idle Loop).

To answer a call while engaged in a Three-way Call

1. While engaged in a Three-way Call, another call terminates at the Attendant Console.
2. The Attendant presses the ANSWER key or ICI key. Currently lit LEDs of the ATND key and the ANSWER key go out. The TALK key LED goes out and that of the SRC key lights. The parties formerly connected to the Attendant remain connected to each other.
3. The LEDs of ICI key and the ATND key light. The Attendant is connected to the Incoming Call.

Service Conditions

1. Activation of this service is determined in individual (Two-party Call or Three-way Call) System Data.
2. When the Attendant is engaged in a Two-party Call:
   a.) If there is no Idle Loop when the Attendant presses the ANSWER key or ICI Key, the party currently connected to the Attendant will be placed on hold (MUSIC ON HOLD [M-7]), but the Attendant cannot answer the second call.
   b.) When the number of available Attendants exceeds the number of Incoming Calls, the status of each Attendant Console will be one of the following:
      (1) The connected call will be placed on hold, and the Attendant will be connected to the second call.
      (2) The connected call will be placed on hold, and the Attendant Console will become idle.
      (3) No change.
   c.) ATTENDANT LOOP RELEASE [A-6] is not available when the call is placed on hold.
3. When the Attendant is engaged in a Three-way Call:
   a.) If there is no Idle Loop when the Attendant presses the ANSWER key or ICI key, one of the following occurs:
      (1) When both the Calling and the Called Parties are Trunk and when the Called Party has not answered yet, the call is held on the Loop and the Attendant cannot answer the next Incoming Call.
      (2) When Called Party has already answered the call, the Attendant can answer the next Incoming Call (the previous call is not held on the Loop).
   b.) ATTENDANT LOOP RELEASE [A-6] is available when the call is placed on hold.

c.) When the number of available Attendants exceeds the number of Incoming Calls, the status of Attendant Console will be one of the following:
(1) The Attendant will be released from the current call and will be connected to the next Incoming Call.
(2) The Attendant will be released from the current call and Attendant Consoles will be idle.
(3) No change.

4. AUTOMATIC RECALL [A-8] is available for a call held by the Attendant.

Programming

ASYD - SYS1, Index 246, Bit 0: Answer Hold - Attendant from a Two-party Connection. 0/1 = Out/In Service

SYS1, Index 246, Bit 1: Answer Hold - Attendant from a Three-way Connection. 0/1 = Out/In Service

Assign the data of the Attendant Console by referring to the Assignment Procedure of ATTENDANT CONSOLE [A-3].

A-99 Authorization Code Display Elimination

General Description

This feature eliminates AUTHORIZATION CODE [A-20] and FORCED ACCOUNT CODE [F-7] from being displayed on the Desktop terminal for security purposes.

Operating Procedure

- Procedure 1
  (Access Code for Authorization Code/Forced Account Code) + (SST) + (Authorization Code/Forced Account Code) + (DT) + (OG Access Code) + (OG Code)
  Dial: (DT) - 10 + (SST) - 1234 + (DT) - 9 - 753 - 7000
  Display on Desktop terminal is: 10XXXX97537000
  XXXX = Authorization Code/Forced Account Code
- Procedure 2
  (OG Access Code) + (OG Code) + (SPDT) + (Authorization Code/Forced Account Code)
  Dial: (DT) - 9 - 753 - 7000 + (SPDT) - 1234
  Display on Desktop terminal is: 97537000XXXX
  XXXX = Authorization Code/Forced Account Code

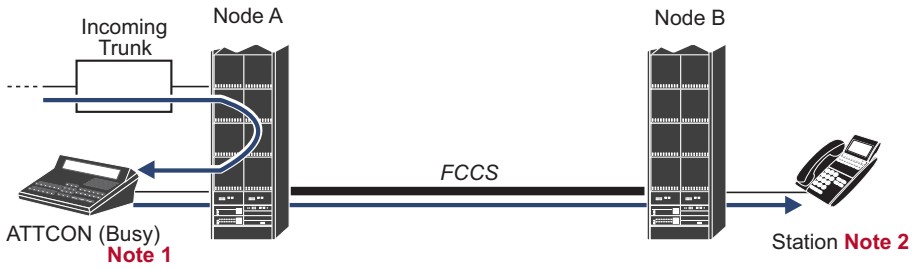
Service Conditions

1. When the Station dials the AUTHORIZATION CODE/FORCED ACCOUNT CODE, Xs appear on the display.
2. LAST NUMBER CALLED [L-6] and SAVE AND REPEAT -D [S-24D] features keep dialed information, but display Xs when these Feature keys are pressed.
3. SPEED CALLING STATION -D [S-2D] keeps dialed digits, and all digits are displayed at the same time when this Feature key is pressed.
4. ACCOUNT CODE [A-18] is displayed on Desktop terminal.
5. This feature is available only for the Calling Party's Desktop terminal.
6. This feature is available for the following dialing procedures:

Procedure	Before Dialing	After Dialing
OG Access without Held Party	Yes	Yes
OG Access with Held Party	Yes	Yes
Attendant	No	No

7. If the network is connected by a Trunk (including a CCIS Trunk), and AUTHORIZATION CODE/ FORCED ACCOUNT CODE is requested at the other Node, this function is not applied.
8. The Calling Party needs to confirm SPDT/SST if AUTHORIZATION CODE/FORCED ACCOUNT CODE is required. The first digit of AUTHORIZATION CODE/FORCED ACCOUNT CODE may or may not be recognized as AUTHORIZATION CODE/FORCED ACCOUNT CODE, if the inter-digit timing immediately before the AUTHORIZATION CODE/FORCED ACCOUNT CODE is too short.

Programming



STEP 1: **ASFC** - Assign SFI 137 (Authorization Code Display Elimination) = 1 to the Originating Terminal.
STEP 2: **ASYD** - SYS1, Index 63, Bit 1. This enables Authorization Code Display Elimination.

A-105 Attendant Overflow

General Description

This feature allows Incoming Trunk Calls directed to the ATTENDANT CONSOLE [A-3] to overflow to a predetermined Night Transfer Destination Station. The Trunk Call will ring the Attendant for a pre-programmed time period before overflowing to the Destination Station.
This feature enables the Incoming Trunk Calls, directed to the ATTENDANT CONSOLE, to overflow to a predetermined Station in the FCCS Network via FCCS, also.

Note: This feature is only available in North America.

Note 1: When Attendant/Operator does not answer a call, the call overflows.
Note 2: This is the Station transfered by Night Connection Service.

Operating Procedure

1. An Incoming Trunk Call arrives at the ATTENDANT CONSOLE [A-3].
2. The Attendant is busy or on another call for longer than the assigned timer (the Incoming Caller has waited for 30 seconds or longer).
3. The Incoming Call is directed to the Destination Overflow Station.

Service Conditions

1. This feature is provided for all Incoming Ringdown Trunk Calls, DIRECT INWARD DIALING (DID) [D-8] Trunk Calls and LISTED DIRECTORY NUMBER (LDN) [L-24] Trunk Calls directed to the ATTENDANT CONSOLE [A-3].
2. This feature is available only while the system is in Day mode (not available for Night mode).
3. For DIRECT-IN TERMINATION [D-7] (DIT) Calls, this feature is available when the receiving Station has set CALL FORWARDING - ALL CALLS/BUSY LINE [C-5, 2] to the Attendant.
4. For DID Call Termination, this feature is available for LDN, Intercept, and Forwarded Calls to the Attendant, using CALL FORWARDING - ALL CALLS/BUSY LINE/DON'T ANSWER [C-5, 2, 3].
5. This feature is available for DID Calls routed to the Attendant via CCIS.
6. This feature is also not available for INDIVIDUAL ATTENDANT ACCESS [I-6], which allows a call to be directed to a particular Attendant Console.
7. This feature is not available concurrently with ATTENDANT NIGHT TRANSFER [A-19].
8. Overflowing Timer Value is determined by SYS1, Index 140 (the default is 40 seconds). When the destination does not answer the overflowed call, the Timer Value is reset to 40 seconds.

9. When the designated Station used for ATTENDANT OVERFLOW has set CALL FORWARDING - DON'T ANSWER [C-3] to the Attendant or an Outside Number, the Incoming Caller will be directed to TRUNK ANSWER FROM ANY STATION [T-8] (TAS) after the timer expires. If the Incoming Trunk is restricted from connecting to the TAS Circuit, the caller will continue to ring at the designated Station.

   Note: This feature is not available for calls to be transferred by using the following features:

CALL FORWARDING - ALL CALLS - OUTSIDE	*[C-28]*
CALL FORWARDING - BUSY LINE - OUTSIDE	*[C-60]*
CALL FORWARDING - DON'T ANSWER - OUTSIDE	*[C-74]*
LDN NIGHT CONNECTION	*[L-28]*
NIGHT CONNECTION - OUTSIDE	*[N-17]*

10. A PS cannot be assigned as Overflowing Destination.
11. The Incoming Call continues to ring at the Destination Station when designated FCCS Trunks are all busy, or locked out, etc.
12. FPC of a Node which transmits Day/Night Changeover information is determined by SYS1, Index 640, and the information is transmitted to a Node of FPC designated by SYS1, Index 704.
13. The Overflow Station and the Attendant must be in the same node.

Interactions

1. All Routes and Trunk Numbers must be assigned for Ringdown Trunks that are to be terminated to the Attendant Console and that require overflow.
2. For DID Trunks, the LDN will be terminated to the Attendant Console with overflow capabilities when CSI = 4.
3. ATTENDANT OVERFLOW [A-105] and DELAY ANNOUNCEMENT ATTENDANT [D-114] are mutually exclusive features. DELAY ANNOUNCEMENT ATTENDANT [D-114] takes priority over ATTENDANT OVERFLOW [A-105].
4. When CALL FORWARDING - ALL CALLS [C-5] or CALL FORWARDING - BUSY LINE [C-2] is set to the Overflowing Station, an overflowed call to the Station is transferred to the destination.
5. When CALL FORWARDING - ALL CALLS [C-5] is set to the Overflowing Station in the Hunting Group (STATION HUNTING - CIRCULAR [S-7]/STATION HUNTING - TERMINAL [S-9]/UNIFORM CALL DISTRIBUTION (UCD) [U-1]), an overflowed call to the Station is transferred by CALL FORWARDING - ALL CALLS. (Hunting Function is not activated).
6. When CALL FORWARDING - BUSY LINE [C-2] is set to the Overflowing Station in Hunting Group (STATION HUNTING - CIRCULAR [S-7]/STATION HUNTING - TERMINAL [S-9]/UNIFORM CALL DISTRIBUTION (UCD) [U-1]), an overflowed call to the Station is hunted (only when all Stations in the Hunting Group are busy is CALL FORWARDING - BUSY LINE [C-2] activated.)
7. When CALL FORWARDING - ALL CALLS [C-5]/CALL FORWARDING - BUSY LINE [C-2] to outside is set to the Overflowing Station, the call is not overflowed (the Attendant Console is called).
8. Overflowing Destination/Timer is determined by System Data of the Node that accommodates the Trunk which a call terminates.

Programming

STEP 1: **ASYD** - SYS1, Index 140. This determines the timer value at which the Incoming Call will overflow to the Destination Station.

SYS2, Index 15, Bit 1. Set to data "1". This enables the feature to be assigned via each Tenant.

STEP 2: **ACSI** - Assign CSI = 4: Direct-In Termination (Night Mode). This enables the overflow station to be assigned.

Note: Make sure you assign all Routes that apply in ACSI. For example, ISDN is on Route 1, and DID is on Route 5. They must be assigned in ACSI in order for the Overflow Call to be routed to the predetermined station.

STEP 3: **ACFR** - Allow TSFI 2 to the CCI type [1=LDN (Central Office Line), 4 = TIE Line] of Trunks that will overflow.

FCCS Programming

The following command assignments are required when your system is configured as an FCCS Network.

STEP 1: **ASYDL** - SYS1, Index 640, Bit 0 to Bit 7. Assign FPC of the Node which transfers the Day/Night Changeover information. **Note 1**

SYS1, Index 704 to Index 735. Assign FPC of the Node to which Attendant Console transfers the Day/Night Changeover information. **Note 1**

STEP 2: **ASYD** - SYS1, Index 140. This determines the timer value at which the Incoming Call will overflow to the Destination Station. **Note 1**

SYS2, Index 15, Bit 1. Allowance of ATTENDANT OVERFLOW. Assign 0/1 = Out/In Service. **Note 1**

STEP 3: **ANPDL/ANPDN** - Reserve a Number Level for Feature Access. Assign following data in accordance with predetermined Plan.

TN: Tenant Number
1stDC: 1st digit Code (0-9,*,#)
CI: Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes.
NND: Number of Necessary Digits (1-6)
BLF: Busy Lamp Field Display Activated on ATT

STEP 4: **ASPAL/ASPAN** - Determine the kind of service and the service Access Code to be executed.

TN: Tenant Number (1-255)
ACC: Access Code (maximum of six digits)
CI: Connection Status Index (N: Normal, H: Hooking, B: Busy)
SRV: Kind of Service (TELN: Telephone Number)
NND: Necessary Digit of Telephone Number

STEP 5: **ASDT** - Assign the Station Data for Destination Overflow Station.

TN: Tenant Number (1-255)
STN: Station Number
LENS: Line Equipment Numbers
TEC: Telephone Class
SFC: Service Feature Restriction Class

STEP 6: **ALGSL/ALGSN** - Assign Telephone Number to the Destination Station Number programmed by ASDT above.

TYPE = 1 (Line Equipment Numbers/Phantom Index is used to specify the Telephone Number)
UGN: User Group Number (1-255)
TELN: Telephone Number (maximum of 16 digits)
FPC: Fusion Point Code (Only ALGSN)
LENS/PHIN:Line Equipment Numbers/Phantom Index of the Destination Station Number
TYPE=2 (Station Number is used to specify the Telephone Number)
UGN: User Group Number (1-255)
TELN: Telephone Number (maximum of 16 digits)
FPC: Fusion Point Code (Only ALGSN)
TN: Tenant Number
STN: Station Number of destination

STEP 7: **ACSIL** - Assign Overflowing Destination of Attendant Console. **Note 1**

RT/LGRT:External Route Number/Logical Route Number (1-899)
TK: Trunk Number (1-255)
CSI: Connection Service Index, assign 4 [Direct-In Termination (Night Mode)].
UGN: User Group Number (1-255) **Note 2**
TELN: Telephone Number (maximum of 16 digits) **Note 2**

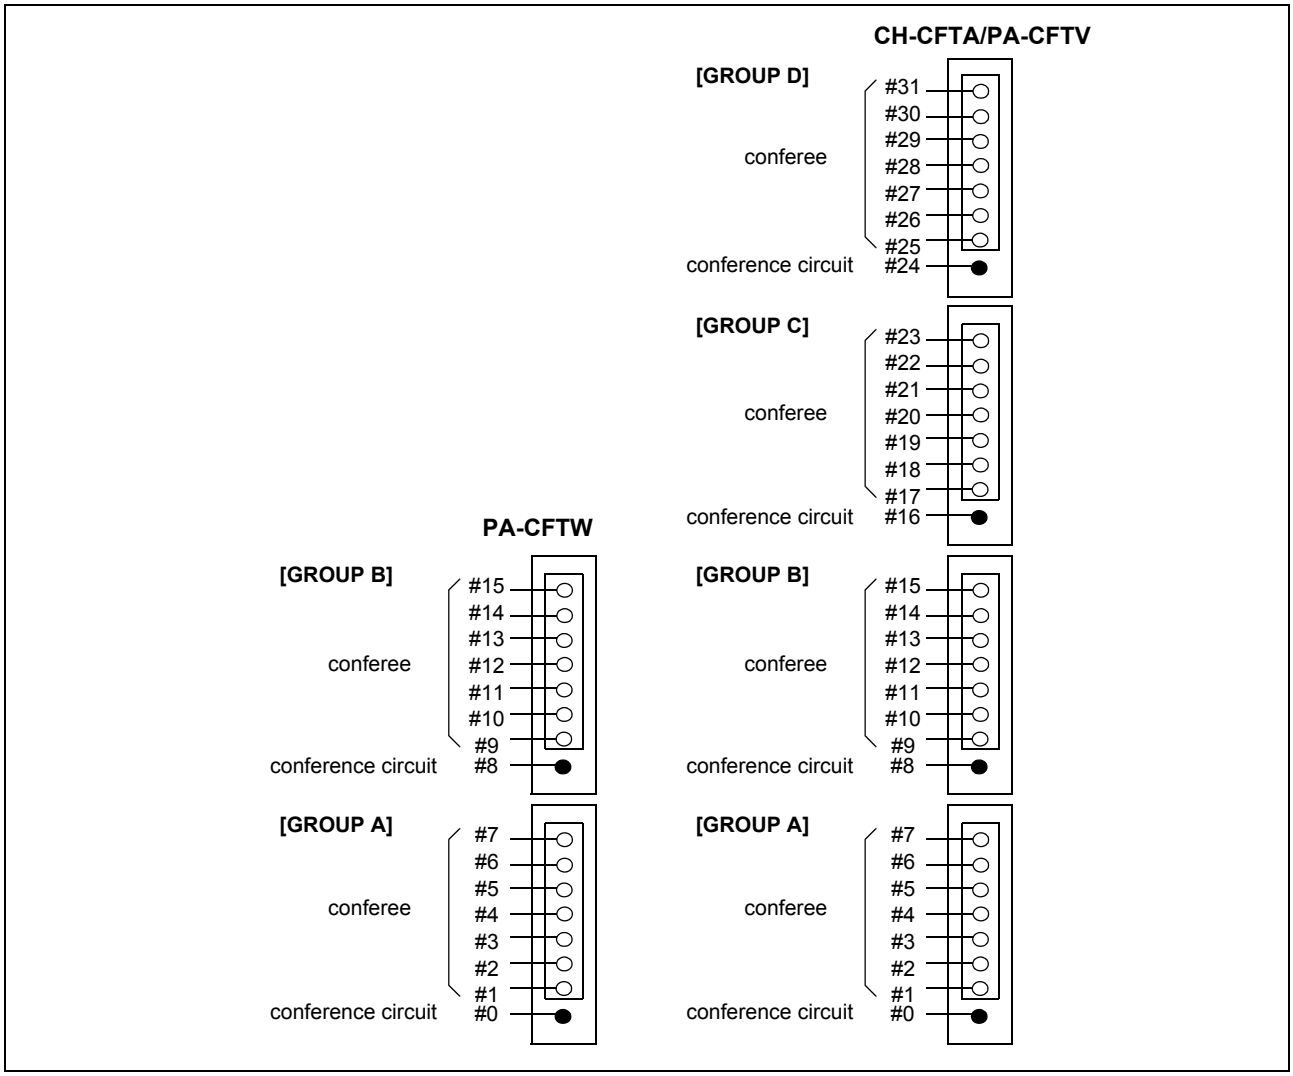
Note 1: Assign the data to the Node that a call terminates.

Note 2: This parameter is displayed when CSI = 2, 3 or 4.

STEP 8: **ACFR** - Assign the Call Forwarding Restriction data.

TSFI: Transfer Service Feature Index 2 = Direct Inward Dialing (DID)
CCI: Call Category Index [1 = LDN (Central Office Line), 4 = TIE Line]
RES: Restriction Data (0 = Transfer service is not allowed, 1 = Transfer service is allowed)

A-121 Add-On Conference - 8 Party



General Description

This service allows the Eight-Party Conference to be established any time by any Conferee by the use of the conference trunk.
The following words are defined in the description:

Item	Description
Conference member or Conferee	A member or station that is connecting to conference trunks or in a conference call.
Operating station	A station that calls a new conferee.
Called station	A station that is called by the operating station.
First station	The first station that is on a call with the operating station.

For using CFT cards:
The number of conferences per CFT varies depending on the CFT type as follows:

- PA-CFTW:8-party × 2 group
- PA-CFTV:8-party × 4 group
- CH-CFTA:8-party × 4 group

For using VS32:
A maximum of four conferences of Eight-Party Conference can be established by assigning and using the following combination of station numbers to the VS32 Conference Server channel.

CH#0 (Conference leader port) and CH#1 through #7 (Conferee port).

CH#8 (Conference leader port) and CH#9 through #15 (Conferee port).

CH#16 (Conference leader port) and CH#17 through #23 (Conferee port).

CH#24 (Conference leader port) and CH#25 through #31 (Conferee port).

ch	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
1																	Eight-Party								Eight-Party							
2	Eight-Party										Eight-Party						Eight-Party								Eight-Party							
3	Eight-Party										Eight-Party																					

Operating Procedure

There are the following operations:

- To establish an Eight-Party Conference (Basic operation):
- To operate establishing an Eight-Party Conference with a called station before the called station answers:

To establish an Eight-Party Conference (Basic operation):

1. Station A calls Station B. Station B answers.
2. Station A (or B) as an operating station performs switch hook flash (or presses the TRANSFER key) and dials Station C's number. Station C answers.
3. Station A (or B) (operating station) that had dialed Station C's number presses the CONF key. The Three-way Conference is established.

   Note: The conditions are as follows:
   - Pressing the CONF key to establish the conference is available for only Desktop terminals allowed Add-On Conference - 8 Party (ASFC/ASFCN SFI:131).
   - When the operating station is not allowed Add-On Conference - 8 Party (ASFC/ASFCN SFI:131) but Three-Party Conference trunk of RT909 is available, Three-Party Conference is established by pressing the CONF key and CONF is displayed on the LCD of Desktop terminals.

4. Operating Station A (B, or C) performs switch hook flash (or presses the TRANSFER key) and dials the number of Station D which is to be a called station. Station D answers.

5. Station A (B, or C) (operating station) that had dialed the number of Station D (called station) presses the CONF key. The Four-party Conference is established. In the same way, any user connected to the conference trunk can call other conference members asynchronously to establish the Eight-Party Conference by performing switch hook flash, dialing a station number to invite the conference and pressing the CONF key.

   - When an operating station is not allowed Add-On Conference - 8 Party (ASFC/ASFCN SFI:131), the station cannot be joined the conference and is restricted if the operating station user presses the CONF key.
   - If you try to invite the ninth conferee by performing switch hook flash and dialing the number of the ninth conferee, the operation is restricted when the CONF key is pressed.

6. When a conference member (station or trunk line) is released, a new conference member can be invited to the vacant conference port in the same way.

To operate establishing an Eight-Party Conference with a called station before the called station answers:

Note: SFI:131 (Add on Conference - 8 Party) and SFI:138 (Consultation Hold Enhancement) must be set to allowed by the ASFC/ASFCN command.

1. Station A calls Station B.
2. Station B answers. The two party calling is established.
3. Station A performs switch hook flash and dials Station C's number. The Station B user hears music on hold, and Station C is ringing.
4. < To make a conference from ringing state >
   When the CONF key of Station A is pressed before Station C answers, Station A is on a conference call with Station B using a conference trunk. Station C is called from the port of the conference trunk.

   Note: When CALL FORWARDING - DON'T ANSWER [C-3] is assigned to Station C, the call is transferred. However, if CALL FORWARDING - DON'T ANSWER - OUTSIDE [C-74] is assigned to Station C, the call is not transferred and Station C continues ringing.

5. In 4., when the Operating Station A user presses the Disconnect key assigned to Line/Feature keys or Soft keys, Station C can be disconnected. Station A and Station B are still on the conference call using the conference trunk.

   - The Disconnect key can be used by the operating station only. The target to be disconnected is the last station called by the operating station whose Disconnect key is pressed.
     When the operating station user presses the Disconnect key during the conference, the target to be disconnected is the opposite station on the call just before the conference call is established.
     The called stations that are invited by other conference members cannot be disconnected.
   - Pressing the Disconnect key by the conference member (Station B) who invites no stations to the conference is restricted.
   - When disconnecting the opposite party by using Disconnect key, RELEASE is displayed on the LCD of the terminal pressed the Disconnect key.

6. In 4., when Station C answers the call from the port of the conference trunk, the Three-Party Conference is established with Station A, B, and C.
7. For inviting Station D, any one of the conference members (Station A, B, or C) performs switch hook flash and dials Station D's number. Station D is ringing.
8. In 7., when the CONF key of the Station B is pressed before Station D answers, Station B is back to the conference call. Station D is called from the conference trunk.
9. < Transition to a conference from being in held state >
   In 7., when the Hold key of the Station D is pressed after Station D answers, Station B is placed on hold. When the CONF key of the Station B is pressed, Station B is back to the conference call. Station D will be in a state placing the conference trunk on hold.
   - Station B can invite other conference members while Station D places the conference trunk on hold.
10. When the Disconnect key assigned to Line/Feature keys or Soft keys of the Station B is pressed, held Station D is released. Station A, B and C are still on the conference call.
    - When disconnecting the opposite party by using the Disconnect key, RELEASE is displayed on the LCD of the terminal pressed the Disconnect key.
11. After canceling the hold state in 9. by Station D, the Four-party Conference is established with Station A, B, C and D by using the conference trunk.
12. In the same way, a maximum of eight parties conference can be established by operating switch hook flash, dialing station number of other conference members to invite to the conference asynchronously, and pressing the CONF key by any member connected the conference trunk.
13. When a conference member (station or trunk line) is released, a new conference member can be invited to the vacant conference port in the same way.

Service Conditions

<Important Notices>

1. To prevent a mistaken connection, the conference trunk is assigned in a different Tenant from the general Station/Trunk, and the connection between the conference trunk and the other Station/Trunk is set to be restricted (Inter-Tenant Restriction).

   (a) The conference trunk cannot be called from a Station, Outside Party, or the Attendant Console (Reorder Tone is sent out when attempted).

   (b) When a station (Station A) connected to the conference trunk transfers a call to another station (Station B) and Station A performs on-hook whether Station B answers or not, the conference trunk recalls to Station A but Station B will not be connected to the conference.
   However, if Station A performs on-hook while the call between Station A and Station B is being held, the conference trunk will not recall Station A and Station B will be connected to the conference.

   (c) The conference trunk cannot be assigned as the destination of CALL FORWARDING - ALL CALLS [C-5]/BUSY LINE [C-2]/DON'T ANSWER [C-3].

2. Assign System Data for Routine Diagnosis to check for Trunk Ineffective Hold Detect and Trunk Ineffective Hold Release for any conference trunks that may be held up.

<Interactions with Other Features>

1. This service can coexist in the same system with THREE-WAY CALLING [T-2] using the Three-way conference trunks in RT909 and RT913, and with the current Conference Service.
2. Status Number 9 of Soft Key Pattern (in ADSL) is supported during a Three-Party Conference. However, it is not supported during an Add-On Conference - 8 Party. If you customize Soft Key Pattern on an Add-On Conference - 8 Party, use Status Number 4 (converse) of Soft Key Pattern (in ADSL).
3. The following services are not available for the Stations/Trunks connecting to the Conference Trunk:

ATTENDANT CAMP-ON WITH TONE INDICATION	[A-1]
BUSY VERIFICATION	[B-3]
BROKERAGE - HOTLINE	[B-6] **Note 4**
BUSY VERIFICATION - CCIS	[B-9]
CALL TRANSFER - ALL CALLS	[C-11]
CALL WAITING - TERMINATING	[C-12]
CALL WAITING - ORIGINATING	[C-31]
EXECUTIVE RIGHT-OF-WAY	[E-1]
EXECUTIVE RIGHT-OF-WAY - CCIS	[E-8]
NAME DISPLAY	[N-28]
PRIVACY RELEASE	[P-18]

Note 4: When a conference member presses a Sub Line key assigned as a BROKERAGE - HOTLINE [B-6] during a conference, the conferee's station is released from the conference and originates a call to the BROKERAGE - HOTLINE [B-6] destination.

4. This feature does not support DIAL PLAN TO SUPPORT IP CENTREX FUNCTIONALITY [D-166].
5. Name data such as Name Display and System Phonebook should not be assigned for a conference trunk.
6. When you call a station set with CALL FORWARDING - DON'T ANSWER - OUTSIDE [C-74] while participating in a conference, the forwarding is invalid and the called station continues to ring. (This is a condition of CALL FORWARDING - DON'T ANSWER - OUTSIDE [C-74].) If the forwarding destination is a station, the forwarding is valid.
7. Traffic data of this feature is not reflected to PEG COUNT [P-7].
8. EXCLUSIVE HOLD -D [E-4D] is not supported for conferees.
9. A called station in a ringing state using VOICE CALL [V-2], INTERNAL ZONE PAGING [I-21] and VOICE CALL - CCIS [V-7] cannot participate in the conference by operating < To make a conference from ringing state >.
   However, the called station can participate in the conference by pressing the CONF key on the operating station after the called station answers the ringing call.
10. For FLEXIBLE NETWORK RE-ROUTING [F-41], if network failure occurs on a called station side when the station is called for a conference, automatic re-routing does not work.
11. Do not invite a terminal that is assigned as the Emergency Telephone on EMERGENCY CALL [E-11]. (Recall by performing switch hook flash or recall manually by pressing the TRANSFER key and automatically does not work.)

12. The conditions for the billing are as follows:

    (a) In case of Trunk Call Origination, the billing is performed on the Station which originated the Trunk Call until the Trunk is released. Therefore, there may be several billing messages sent for the same time for the same Station.

    (b) When a station joins a conference while the station is ringing or being held, station number of the conference port is recorded as “Calling Party” for the call between the station and the conference trunk in Station-to-Station Call Billing. (Setting SFI:222 = 1 (8-Party Conference Billing Enhancement) by the ASFC/ASFCN command, the conference member connecting with conference port 0 can be recorded as “Calling Party.”) On the other hand, when a station joins a conference while the station is engaged in a call or being held, the operating station is recorded as “Calling Party” in Station-to-Station Call Billing.
    When a trunk party joins a conference, the operating party is recorded as “Calling Party” in Trunk Call Billing, regardless of whether the party is ringing, engaged in a call or being held.

(c) The following table shows the billing information for Station-to-Station Call Billing by using a combination of SFI: 222 (8-Party Conference Billing Enhancement) and by system data (ASYDL, SYS1, Index 589, Bit 3=1) (Billing after transfer over different MA-IDs).

Preconditions / State		Billing after transfer over different MA-IDs: Out of Service (ASYDL, SYS1, Index 589, Bit 3=0)				Billing after transfer over different MA-IDs: In Service (ASYDL, SYS1, Index 589, Bit 3=1)			
		SFI: 222 = 0		SFI: 222 = 1		SFI: 222 = 0		SFI: 222 = 1	
		Calling Party	Called Party	Calling Party	Called Party	Calling Party	Called Party	Calling Party	Called Party
Ringing	Conference Transition (Two-way to Three-way) **Note 4**	Station number of conference port	The number of called station	The number of operating station	The number of called station	The number of conferees connected with conference port 0	The number of called station	The number of conferees connected with conference port 0	The number of called station
	A New Member Invitation after Conference Transition			The number of conferees connected with conference port 0					
Calling	Conference Transition (Two-way to Three-way) **Note 4**	No output billing information	The number of called station	No output billing information	The number of called station	The number of operating station	The number of called station	The number of operating station	The number of called station
	A New Member Invitation after Conference Transition								
Holding	Conference Transition (Two-way to Three-way) **Note 4**	Station number of conference port	The number of called station	The number of conferees connected with conference port 0	The number of called station	The number of operating station	The number of called station	The number of operating station	The number of called station
	A New Member Invitation after Conference Transition								

Note 4: In addition to the table information above, the information in Station-to-Station Call Billing for the call between the first station and the operating station is also output.

<Hardware/Software>

1. The following firmwares are required for the conference trunks:

Hardware	Conditions
CH-CFTA **PA-CFTW** **PA-CFTV**	No conditions.
VS32 **Note 5**	The firmware version SP-3891 CA-VS32 PROG-A Issue 10 or later.

Note 5: Available since FP95-115 V5.

2. The following devices cannot be a conference member:

   - Attendant Consoles
   - SP controlled SIP Terminals **Note 6**
   - SIP Handler controlled SIP Terminals **Note 7**
   - ISDN terminals **Note 6**
   - PS **Note 6**, **Note 8**
   - WLAN Handset (MG Series) **Note 8**
   - Softphone **Note 8**

   Note 6: When THREE-WAY CALLING [T-2] for Three-Party Conference trunks in RT909 is available for the terminals, the call is transferred to the current Conference Service by pressing the CONF key regardless of the setting for SFI:131.
   To be called from any conference member whose CONF key is pressed is restricted.

   Note 7: Assignment of RES=0 (Restricted) to SFI:131 (Add-On Conference - 8 Party) in Service Restriction Class for SIP Handler controlled SIP Terminals is required because this feature is not supported.
   The terminals can be a conference member as Called station or First station.

   Note 8: The device cannot be a conference member when using SOFT PHONE WIRELESS HANDSET [S-145] or SOFT PHONE WLAN HANDSET [S-159].

3. This feature cannot be activated by a Single Line Telephone.
4. On the LCD of the Desktop terminals, the number of the Stations and Trunks attending the Conference is shown as STA:3, TRK:2 in the upper line (displays the number of conference members). Name Display Service is not available.
5. During the Conference, the CONF lamp remains lit.
6. When using CFT cards with tone indication enabled, no tone is provided when a conference leader port (Port 0) leaves the conference.
7. In the same system, a conference trunk using CFT cards and a conference trunk using VS32 can coexist.

<Interactions with Networks>

1. In a FCCS network, a Conference Trunk is required in the node to which the first station to perform a conference operation belongs. For that reason, accommodate Add-On 8-Party Conference trunks to each node in the FCCS network, and configure Station Hunting - Terminal on each node. Assignment of pilot station number of Station Hunting - Terminal on the self node to the pilot station number on system data (ASYD, SYS1, Index 432 to 434) is also required.
2. For using VS32, only FCCS over IP (Peer-to-Peer) is supported in a FCCS network.

<Conditions Specific to This Feature>

1. The Conference Trunk will be treated as a Station (TEC=27).
2. Any one of the following lines can be a conference member:
   a.) Station
   b.) C.O. (COT and ISDN)
   c.) TIE **Note 9**
   d.) CCIS
   e.) SIP Network (Network Carrier and TIE)

   Note 9: When the called station is External Trunk of ACIS line, a conference cannot be established using < To make a conference from ringing state >. However, if the called station in ACIS answers the call from the operating station and the CONF key on the operating station is pressed, the conference is established.

3. In the following cases, this feature by pressing the CONF key is not available:
   a.) When service is not set in System Data (ASYD, SYS1, Index 432 to 434)
   b.) When service is restricted (SFI:131 Add-On Conference - 8 Party by the ASFC/ASFCN command) **Note 10**
   c.) When the Conference Trunk is not assigned, not accommodated, or busy.

   Note 10: Pressing the CONF key to establish the conference is available for only Desktop terminals allowed Add-On Conference - 8 Party (ASFC/ASFCN SFI: 131)

   In the cases above, if THREE-WAY CALLING [T-2] using Three-Party Conference trunks in RT909 is available for the terminals, a Three-Party Conference by pressing the CONF key is established and CONF is displayed on the terminal LCD.
4. The Stations connected to the Conference trunks can call the Conferees separately at any time.
5. When all of the ports of the Conference trunks are used by Conferees, no other Conferee can be added to the Conference. Pressing the CONF key, RST is displayed on the terminal LCD.
6. The Station/Trunk which is connected to the Conference trunks can be released and exit from the Conference at any time.

   Note: When the conferee exits the conference call, the other members may hear Reorder Tone (ROT) for a short time.

7. An Incoming Call from a Ringdown Trunk (Route Class Data: LSG=0 or LSG=3, except MC-MG(COT) **Note 11**), where a release cannot be detected, cannot be connected to the Conference trunks.

Note 11: The following equipment are included:

- MG (6COT)
- UG50 (COT-TYPE1)
- UG50-MC-MG (COT)
- UG50 (6COT)
- UG50 (COT-TYPE2)

8. When all the Trunks and Stations connected to the Conference trunks are released, the Conference Trunk becomes free. Until then, the same Trunk cannot be used by another group for a Conference.
9. When the Conferee presses the RETAIN CONF key, the LCD shows the follows for five seconds, depending on the connection:
   a.) One Station and multiple Outside Parties RETAIN CONF
   b.) One Station and one Outside Party REST
   c.) Multiple Stations REST

   Note: Only in case "a" above will the Conference status be retained.

10. When a Desktop terminal user who has Retain Conference presses the RETAIN CONF key a second time, Retain Conference is canceled. At that time, the LCD of the Desktop terminal indicates DISCONNECT CONF and the Conference Trunk is released after the Stations perform an on-hook.
11. When only two parties (Station/Station, Station/Outside Party, Outside Party/Outside Party) are connected to the Conference trunks, if either one of the parties is released, the Conference Trunk is released.
12. The Station setting Retain Conference can only cancel Retain Conference or perform on-hook (no other operation is available). When the Station performs on-hook, the RETAIN CONF lamp turns OFF.
13. When one Desktop terminal (station) and multiple outside parties (trunks) are connected to the conference trunk, the conference by the outside parties can continue by pressing the RETAIN CONF key and performing on-hook after setting retain conference from the Desktop terminal. The Desktop terminal that assigned the settings of the retain conference becomes idle and cannot return to the retained conference.

    - When one Desktop terminal and multiple outside parties are connected to the conference trunk, the conference trunk is released forcibly when the Desktop terminal goes on-hook without pressing the RETAIN CONF key.

    - In other cases, when a station that is not a Desktop terminal is connected with one outside party (not multiple parties), the conference trunk is forcibly released when the station goes on-hook.

    Note: Pressing the CONF key on the operating station before the called station answers or while it is ringing or placed on hold, the conference call can be established. (For details, see To operate establishing an Eight-Party Conference with a called station before the called station answers:.)
    For this operation, SFI:131 (Add on Conference - 8 Party) and SFI:138 (Consultation Hold Enhancement) is required for the operating station.

14. The operating station user can press the CONF key to connect to the conference before the called station answers or while the operating station is being held by the called station under the following conditions.
    a.) For using this feature, assign the System Data (ASYDL/ASYDN, SYS1, Index 678, Bit 3=1).
    b.) This feature is available only for Desktop terminals where SFI:131 (Add-On Conference - 8 Party) and SFI:138 (Consultation Hold Enhancement) are enabled by the ASFC/ASFCN command.

c.) Even if one conferee is left in the conference while a called station is ringing or being held, the conference call remains without release. The remaining station user hears no tone until the called station that is ringing or being held joins the conference or the remaining station invites a new conference member to the conference.

d.) When all conferees release the conference call while one or more called stations are ringing or being held, the called stations are automatically released and the conference trunk is also released.

e.) If the called station connects to the conference while hearing ringback tone or music on hold sent from the counter office, the ringback tone or the music is sent to all the other conferees. In this case, the operating station can release the called station by pressing the Disconnect key.

f.) If any of the items listed below exists, when an operating station user presses the CONF key when calling a transfer destination through CONSULTATION HOLD [C-17], then RST/REST will be displayed on the LCD of operating station. Likewise, when an operating station user presses the CONF key while being held by the transfer destination, the operating station will connect to the conference using Three-Party Conference trunk (Consultation Hold Enhancement).

- No trunk data for Eight-Party Conference is assigned
- No Eight-Party Conference trunk is accommodated in the system
- Eight-Party Conference trunks are all busy
- Eight-Party Conference trunks are in link block status

g.) If the operating station user presses the CONF key and connects to the conference while calling a target party via P2P-CCIS, the information (Station Number) about the connected Eight-Party Conference trunk appears on the LCD of the called station.

h.) Assign FKY=13 (Three-Way Calling) to Status Number: 15 (Others) for soft key pattern data using the ADSL/ADSLN command in order to operate a conference using soft keys.

15. The key of the Eight-Party Conference trunk must be set to not detect PB signals. For details on the switch settings, refer to Circuit Card Description.

16. When a conferee places a conference trunk on hold, the other conferees need to be set to not to hear the music on hold.

< For CH-CFTA/PA-CFTW/PA-CFTV >

For details on the switch settings, refer to Circuit Card Description.

< For VS32 >

Even if a conferee places a conference trunk on hold, the other conferees do not hear the music on hold.

< For all>

The other conferees hear music on hold in the followings:

- The Conference member is a trunk and hears the music on hold from the counter office.

17. For Eight-Party Conference trunk, the pilot number for station hunting set in system data (ASYD, SYS1, Index 432 to 434) can be assigned up to six digits. The telephone number of station number assigned to the Eight-Party Conference trunks can also be up to six digits.

18. A station number assigned to Level-0 of an Eight-Party Add-On Conference, will be the pilot number for the conference. Pilot numbers for all Eight-Party Add-On Conferences can be assigned in the ASHP/ ASHPN command. When dialed, this allows the system to hunt for a conference that is not in use.

19. When an operating station user dials any vacant number or vacant level during a conference call, the operating station does not connect to the announcement service but hears Reorder Tone (ROT). When the operating station is restricted from outgoing calls on a C.O. line or TIE line and originates a call with trunks or a TIE line as a Conferee, the operating station does not connect to the outgoing restriction announcement service but hears Reorder Tone (ROT).

20. The conditions of displaying the number of conference members on the LCD of Desktop terminals are as follows:
    a.) In the following cases, the number of Conferees are not displayed but the station number of conference trunk is displayed.
    - A call is transferred to other Desktop terminal by performing Call Forwarding - All Calls while participating in a conference.
    - A held call is returned to the holding party by pressing the ANSWER key while talking with another call after the call is held using CALL HOLD.

    b.) In the following cases, the number of Conferees are not displayed but a service corresponding to the various features (SERVICE DISPLAY -D [S-25D]) is displayed.
    - When a called station belonging to a Call Pickup Group is in a ringing state from a conference port < To make a conference from ringing state > or To operate establishing an Eight-Party Conference with a called station before the called station answers:, the called station is picked up by another member of the Call Pickup Group.
      (The service of CALL PICKUP - GROUP is displayed.)

    In addition, when establishing an Add-On conference by combining other features, the number of Conferees is not displayed but station number of the conference port may be displayed or SERVICE DISPLAY -D [S-25D] may be displayed depending on the combined services.
21. Terminals operate per the table below when a terminal failure or a communication failure (such as power-off of IP equipment, network failure or by a disconnected LAN cable) during an Eight-Party Conference.

Note: The failure includes the following:
- If a patrol function is activated by using RLST command while talking.
- If disconnected by the trunk ineffective hold detect during routine diagnosis.
- Re-registration of the terminals for conference members.
- Re-registration of the VS32.

Location of Failures	Terminal Behavior
The conference leader port 0	The calls connected with Eight-Party Conference are all released.
Conference member connected with the conference leader port 0	The calls connected with Eight-Party Conference are all released. **Note 12**
Any of the conference port 1 to 7	System releases only the conferees that are connected with the conference port occurred the failures. **Note 13**
Any of the conference member connected with the conference port 1 to 7	System releases only the conferees occurred the failures. **Note 13**

Note 12: When a modular cable is pulled out from Digital terminal accommodated in ELC card, all the calls connected with Eight-Party Conference are not released but only the conferee using the Digital terminals whose cables are disconnected is released.

Note 13: In this case of failure, the number of released stations or trunks is deducted from the number of Conferees displayed on the terminal LCD of other Conferees.

Programming

- < Basic system data settings >
- < Conference Transition Settings before Called Station Answers >

< Basic system data settings >

Note: When using a VS32, the system data of Internal PHE and SP-PHI are required to be assigned beforehand. For details, refer to the PH Data Setting in CHAPTER 2.

STEP 1: **ASYD** - SYS1, Index 8, Bit 0 to Bit 7. Assign the number of Tenants.
SYS1, Index 20, Bit 6=0 (Line Circuit Reverse Relay Control when Reorder Tone is connected to a station/trunk.)
SYS1, Index 92, Bit 4=0/1. This enables Tenant-to-Tenant Route Restriction Service.
SYS1, Index 94, Bit 0=0/1. This enables Tenant-to-Tenant Restriction Service.
SYS1, Index 432, Bit 0 to Bit 3. Assign the first digit of the Pilot Number used for this service. **Note 14**
SYS1, Index 432, Bit 4 to Bit 7. Assign the second digit of the Pilot Number. **Note 14**
SYS1, Index 433, Bit 0 to Bit 3. Assign the third digit of the Pilot Number. **Note 14**
SYS1, Index 433, Bit 4 to Bit 7. Assign the fourth digit of the Pilot Number. **Note 14**
SYS1, Index 434, Bit 0 to Bit 3. Assign the fifth digit of the Pilot Number. **Note 14**
SYS1, Index 434, Bit 4 to Bit 7. Assign the sixth digit of the Pilot Number. **Note 14**

Note 14: The conditions for setting ASYD, SYS1, Index 432 to 434 are as follows:
- One to six digits may be used.
- For the digit "0" use the HEX value format - "A."
- For the digit "*" use the HEX value format - "B."
- For the digit "#" use the HEX value format - "C."
- Assign the bits accordingly. If a digit is not used, assign those bits as "0". If a bit is used for 0, see the following example for Station 7001:
  SYS1, Index 432 is A7,
  SYS1, Index 433 is 1A,
  SYS1, Index 434 is 00.

STEP 2: **ASYDL** - This data must be assigned to all the nodes that have Add-On Conference - 8 Party implemented across FCCS.

Note: This step is required when using CFT cards or performing Add-On Conference - 8 Party on DTI-FCCS.

SYS1, Index 527, Bit 4=1 (Dial Pulse (DP) Relay Broadcasting to FCCS Link: Valid)

STEP 3: **ASDT** - Assign a station number to a conference trunk.

Note: This step is required when using CFT cards.

TN: Tenant Number **Note 15**
STN: Station Number **Note 16**, **Note 17**
LENS: Line Equipment Numbers
TEC: 27 (8 Conference Equipment) **Note 18**
RSC: Route Restriction Class **Note 18**
SFC: Service Feature Restriction Class **Note 18**

Note 15: To prevent dialing the station number of the conference trunk directly, assign the station number to a tenant that is different from general stations or trunks, and then restrict the connection with the general stations or trunks (Tenant Restriction).

Note 16: To prevent dialing the station number of the conference trunk directly, assign the conference station numbers to include a "#" or "*."

Note 17: When using only one 8-Party Add-On Conference trunk, the station number assigned to Level 0 of the conference trunk must be the same as the station number assigned in system data (ASYD, SYS1, Index 432 to 434).

Note 18: Assign a class that is different from general stations for the RSC and SFC.

Note: When using Telephone Numbers, the following setting is required. Also, assignment of the NDM commands (ASFCN, ASHCN, ASHPN, ARSCN) is also required after this step.
- ALGSN (Assignment of Telephone Station Data for NDM)
  Assign the Telephone Number for the station number assigned in the ASDT command.

STEP 4: **AIVSL** - Assign a station number to the following channels of VS32.

Note: This step is required when using VS32.

- CH#0 (Conference leader port) and CH#1 through #7 (Conferee port)
- CH#8 (Conference leader port) and CH#9 through #15 (Conferee port)
- CH#16 (Conference leader port) and CH#17 through #23 (Conferee port)
- CH#24 (Conference leader port) and CH#25 through #31 (Conferee port)

VS-ID: Assign the MAC Address of the VS32.

[BASE DATA] tab
CH: Assign the channel number of the VS32.
KIND: 8-CONF
CONF KIND: ADD-ON
TN: Tenant number **Note 19**

STN: Station number **Note 20**, **Note 21**
LENS: Line Equipment Numbers
TEC: 27 (8 Conference Equipment) (Display only) **Note 22**
RSC: Route Restriction Class **Note 23**
SFC: Service Feature Restriction Class **Note 23**

Note 19: To prevent dialing the station number of the conference trunk directly, assign the station number to a tenant that is different from general stations or trunks, and then restrict the connection with the general stations or trunks (Tenant Restriction).

Note 20: To prevent dialing the station number of the conference trunks directly, assign the conference station numbers to include a "#" or "*."

Note 21: When using only one 8-Party Add-on Conference trunk, the station number assigned to Level 0 of the conference trunk must be the same as the station number assigned in system data (ASYD, SYS1, Index 432 to 434).

Note 22: Selecting ADD-ON in CONF KIND, TEC=27 is selected automatically.

Note 23: Assign a class that is different from general stations for the RSC and SFC.

Note: When using Telephone Numbers, the following is required. Also, assignment of the NDM commands (ASFCN, ASHCN, ASHPN, ARSCN) is also required after this step.
- ALGSN (Assignment of Telephone Station Data for NDM)
  Assign the Telephone Number for the station number set by ASDT command.

STEP 5: **ASFC/ASFCN** - Specify the information related to Service Feature Restriction for the stations.

Enter a Service Feature Index (SFI) and then specify Restriction Data (RES) for the Service Feature Restriction Class (SFC) of the stations.

- For stations connected to the CFT cards
  SFI 32: RES = 1 (Line Circuit Reverse Relay Control (for 16LC) is available.)
- For stations to use this feature
  SFI 131: RES = 1 (Add on Conference - 8 Party is available.)

Assign the following data for the SFC of the conference trunks.

- For stations to allow Conference trunk.
  SFI 221: RES = 1 (Conference trunk is allowed.)

STEP 6: **ASHC/ASHCN** - Assign a STATION HUNTING - CIRCULAR Group for Stations programmed to LENS Levels 1 through Level 7 of the CFT cards.

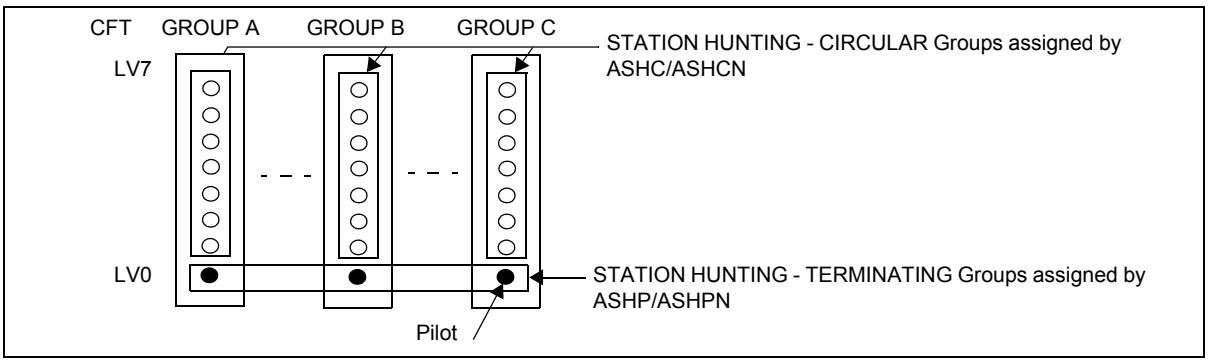
STN: Station number of the first member station in the Hunt Group (Station number on port 1 of the conference trunks).

[Station List in Group]

STN: Station number of the member station in the Hunt Group (Station numbers on port 2 to 7 of the conference trunks).

<< When using ASHCN command >>

UGN: User group number



TELN: Telephone Number of the first member station in the Hunt Group (Station number on port 1 of the conference trunks).

[Station List in Group]

TELN: Telephone Number of the member stations in the Hunt Group (Station number on port 2 to 7 on the conference trunks).

FPC: Fusion Point Code (Display only)

STEP 7: **ASHP/ASHPN** - When the system accommodates multiple CFT cards, assign STATION HUNTING - TERMINATING Group for the Stations programmed to the LENS on Level 0 of each CFT card. See the figure below:

STN: Station number of the Pilot Station in the Hunt Group (Station number on port 0 of the GROUP A conference trunk). **Note 24**

[Station List in Group]

STN: Station number of the Pilot Station in the Hunt Group (Station number on port 0 of the conference trunks of GROUP B conference trunk. Continue to add the Pilot Station numbers for any other Eight-Party Add-On Conference Groups).

<< When using ASHPN command >>

UGN: User group number

TELN: Telephone Number of the Pilot Station in the Hunt Group (Station number on port 0 of the GROUP A conference trunk). **Note 24**

[Station List in Group]

TELN: Telephone Number of the Pilot Station in the Hunt Group (Station number on port 0 for the GROUP B conference trunk. Continue to add the Pilot Station numbers for any other Eight-Party Add-On Conference Groups).

FPC: Fusion Point Code (Display only)

Note 24: The station number of the Pilot Station in the Hunt Group must be the same as the station number assigned in system data (ASYD, SYS1, Index 432 to 434).

STEP 8: **AKYD/AKYD_T** - Assign the Line/Feature key Retain Conference [83] to any Desktop terminals that require the use of the Retain Conference feature.

Note: This step is required when assigning the Retain Conference feature to a Line/Feature key.

KYN: Key number
KYI: 1 (Function Key)
FKY: 83 (Retain Conference)

STEP 9: **ADSL/ADSLN** - Assign the features Three-Way Calling [13] and Retain Conference [83] to any Desktop terminal which require the use of RETAIN CONFERENCE.

Note: This step is required when assigning the Retain Conference feature to a Soft key.

SKP: Soft key pattern
SN: 15 (Others)
SKN: Soft key number
FKY: 13 (Three-Way Calling)
FKY: 83 (Retain Conference)

STEP 10: **ARSC/ARSCN** - Assign Restriction Data between Routes and the RSC.
STEP 11: **ATNR** - Assign Restriction Data between Tenants.

Note: Assign RES=0 (Restricted) to all the TRIs of the Tenants where the conference trunk is registered.

< Conference Transition Settings before Called Station Answers >

Note: Assign system data for CONSULTATION HOLD RELEASE [C-169] and < Basic system data settings > beforehand. For CONSULTATION HOLD RELEASE, refer to CONSULTATION HOLD RELEASE [C-169] in this manual.

STEP 1: **ASYDL** - Enable the operating station to connect to the conference before the called station answers or while the operating station is placed on hold by the called station.
SYS1, Index 678, Bit 3=1 (In service)

STEP 2: **ASFC/ASFCN** - Specify the information related to Service Feature Restriction for the stations.
Enter a Service Feature Index (SFI) and then specify Restriction Data (RES) for the Service Feature Restriction Class (SFC) of the stations.
- For stations to use Consultation Hold Enhancement
  SFI 138: RES = 1 (Consultation Hold Enhancement is available.)
- For stations to use Send Warning Tone to interrupted parties when Three-Way-Calling is established using Consultation Hold Enhancement
  SFI 140: RES = 1 (Send Warning Tone to interrupted parties when Three-Way-Calling is established using Consultation Hold Enhancement is available.)

When the conference members connecting with the conference port 0 will be recorded as “Calling Party” in Station-to-Station Call Billing to the conference call while ringing or placing on hold, assign the following to the SFC of the conference trunk.
- For stations to use 8-Party Conference Billing Enhancement
  SFI 222: RES = 1 (8-Party Conference Billing Enhancement is available.)

A-125 Analog Caller ID (Class SM)

General Description

This feature allows the Desktop terminal to display Calling Party's Number and/or Name on the LCD when a call from an analog Central Office Line is terminated. In addition, the Calling Number can be output as a part of SMDR information. Caller ID information can be displayed on an Analog Telephone with a display device or the display of a Desktop terminal.

Operating Procedure

No manual operation is required.

Service Conditions

1. This service is available when an Incoming Call from Central Office Line is terminated directly to a Station.
2. First ringing pattern for this service is two-seconds ON and four-seconds OFF. After that, ringing pattern assigned by System Data is applied.
3. The Calling Numbers received by using this feature or current MF/ISDN feature may be output to the SMDR expanded area.
4. A Calling Number cannot be received during conversation.
5. The Calling Numbers which may be added to SMDR output are the dial code only. The Calling Name is not added.
6. This service is not provided for the Attendant Console.
7. This service is not applied to SAVE AND REPEAT [S-24D] Service. The Calling Number received may not be saved.
8. A maximum of 256 calls per LP are available at the same time.
9. When an Incoming Call is sent as a test, the LCD does not display both the Number and the Name.
10. Display conditions are shown below. Also, the ID display of ISDN Service has the same conditions.
    a.) It is assigned by System Data in which display of the Calling Number or Name has priority on termination. When the Calling Name has priority, the LCD displays:

Calling Number XXXXXXXX **(Time Display)** **Calling Name**	* 1 * 2

When the Calling Number has priority, the LCD displays:

Calling Name XXXXXXXX **(Time Display)** **Calling Number**	* 1 * 2

*** 1** - In ISDN Service, the sub-address is displayed. When the Dterm does not receive the data pertaining to the sub-address, nothing is displayed.
*** 2** - If the prior display is not assigned by System Data, the other is displayed.

b.) The Calling Number and Name may be exchanged by pressing the Line/Feature key, according to the following conditions:
- When My Line is Prime Line, displays may be exchanged during termination or conversation.

- When My Line is not the Prime Line, displays may be exchanged only during conversation.

c.) When the Received Numbers of a Calling Number and Calling Name exceed the Display Field, the decision to put the digits to the right or left may be chosen in System Data. An "*" is indicated on the exceeded digit position.

d.) The display is flashing during termination. It is lit during conversation.

e.) The following are examples of displays when the received digits of a Calling Number and Name exceed the Display Field:

1234567*	Calling Number
(Time Display)	
ABCDEFGHIJKLMNOPQRSTUVW*	Calling Name

OR

***4567890**	Calling Number
(Time Display)	
***DEFGHIJKLMNOPQRSTUVWXYZ**	Calling Name

OR

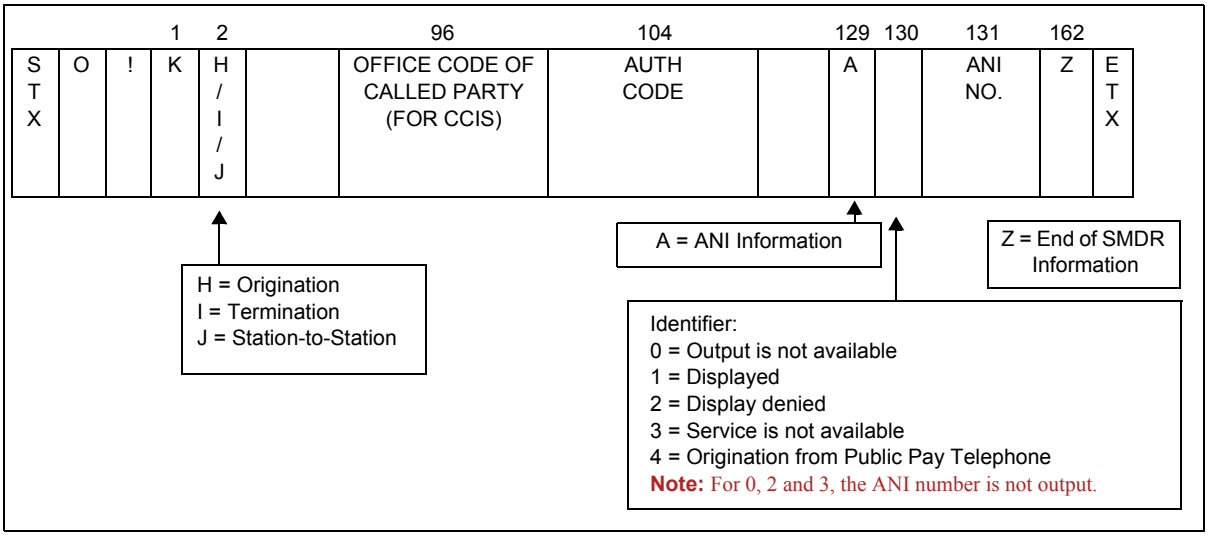
ABCDEFG*	Calling Name
(Time Display)	
1234567890123456789012345*	Calling Number

OR

***TUVWXYZ**	Calling Name
(Time Display)	
8901234567890123456789012345	Calling Number

11. This feature is not supported via Analog MC.

Programming



See TRUNK LINE APPEARANCE [T-23] for information on how to accommodate Central Office Line on a Desktop terminal Line/Feature key.

STEP 1: **ASYD** - SYS1, Index 241, Bit 6. 0/1 = When the length of Caller ID exceeds the limit, only the former/latter part of data appears on the LCD.

SYS1, Index 390, Bit 0. Caller ID display pattern on the LCD. 0/1 = Calling Number/Calling Name has priority.

SYS1, Index 390, Bit 2. When using Dterm two-line LCD, the lower LCD can be used for displaying Caller ID. 0/1 = Out/In Service.

When Calling Number is output to SMDR, the following expanded format is used:

SYS1, Index 288, Bit 5. Expanded SMDR Output for SMDR A Apparatus. 0/1 = Out/In Service.
SYS1, Index 290, Bit 5. Expanded SMDR Output for SMDR B Apparatus. 0/1 = Out/In Service.
SYS1, Index 292, Bit 5. Expanded SMDR Output for SMDR C Apparatus. 0/1 = Out/In Service.
SYS1, Index 294, Bit 5. Expanded SMDR Output for SMDR D Apparatus. 0/1 = Out/In Service.
SYS1, Index 296, Bit 0. Output of Calling Number (ANI information). 0/1 = Out/In Service. Assign data "1".
SYS1, Index 300, Bit 0. 0/1 = -/Billing information is sent to the Main Node in Expanded SMDR format in the case of CENTRALIZED BILLING - CCIS [C-55].

STEP 2: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 14 (Station Message Detail Recording - Trunk Basis) to Stations allowed STATION MESSAGE DETAIL RECORDING (SMDR) [S-10].
Assign a Service Feature Restriction Class that allows SFI 146 (Analog Caller ID - Station) to Analog Stations allowed this service.

STEP 3: **ARTD** - Assign Route Class Data for the Central Office Trunk.
15-LSG :3 50-DPLY :1 **Note 1**
When Calling Number is output to SMDR:
10-SMDR :1

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or MG.

Note 1: Up to 16 digits of a Caller ID can be shown on the display.

STEP 4: **ATRK** - Assign Trunk Data for the Central Office Trunk.

STEP 5: **MBTK** - Cancel the make busy of the Central Office Trunk.

STEP 6: **AKYD** - Assign Feature key Call ID Change Display [113].

STEP 7: **ADSL** - Assign ID CHG key, SN = 4 (Communication in Progress), Feature key Call ID Change Display [113].
This command is used for assigning a function to each Soft key on the Desktop terminal.

<When MG-COT is used for C.O. trunk>

STEP 1: **ASYD** - SYS1, Index 390, Bit 0: Caller ID display pattern on the LCD
0/1 = Calling Name/Calling Number has priority.

STEP 2: **ASYDL** - SYS1, Index 672, Bit 6=1: MG-COT Caller ID is in service

STEP 3: **ARTD** - Assign Route Class Data for the Central Office Trunk.

15-LSG : 3 (Caller ID [Loop])
-or-
15-LSG : 14 (Caller ID [Ground])
-and-
50-DPLY : 1 (Caller ID display is enabled) **Note 2**
114-DCH : 1 (Channel Integration is ON)
125-MG COT : 1 (Available)

Note: To change the data for existing route (RT), initialize the circuit card.

Note 2: Up to 16 digits of a Caller ID can be shown on the display.

STEP 4: **ARTI** - Assign Trunk Application Data.

68-VIR : 2 (MG Connection)

STEP 5: **AMGIL** - Assignment of Media Gateway Information.
Refer to the Peripheral Equipment Description for details.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node. **(Note 3)**

STEP 1: **ALRTN** - Assign this command to connect the Logical Route to the Physical Route.

STEP 2: **ARTDN** - Assign Route Class Data for the Central Office Trunk.

15-LSG :3 50-DPLY :1 **Note 4**
When Calling Number is output to SMDR:
10-SMDR :1

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or MG.

Note 3: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

Note 4: Up to 16 digits of a Caller ID can be shown on the display.

A-127 Analog Caller ID - Station

General Description

This feature allows a Called Station to receive caller ID information (time, Calling Number and Name) from Central Office when a call terminates via the analog COT. The Calling Number received from the ISDN network, MF-ANI information received from Central Office with the MF feature or the calling Telephone Number within the System can change into caller ID information and be sent to the Called Station.
This feature is also provided for the Analog Station equipped with the function of receiving the Calling Number. This function is called Analog Caller ID - Station by Modem Sender.

Operating Procedure

No manual operation is required.

Service Conditions

<Caller ID with CH-12COTB/PA-8COTBJ>

1. This service is provided for Analog Stations.
2. This feature adheres to the following specifications and recommendation:
   Bellcore Caller ID (for North America) --- Bellcore (Telcordia) GR-30-CORE
3. Message types of caller ID information sent to Called Station are as follows:
   04H: Calling Number Delivery Information (for Calling Number)
   80H: Call Setup (for Calling Number and Name, or reason not to inform.)
4. When a call is answered by one party (intermediate station) then transferred to another (target station), the caller ID displayed on the target station is the intermediate station's number and not the original caller's number. The caller ID is not updated even when the intermediate party drops out of the call.
5. If a Calling Number exceeds ten digits, the first or last exceeded digits will not be displayed according to System Data.
6. This service is not provided if a call does not terminate directly on a line: in the case of termination using such services as Call Pickup, Executive Right of Way.
7. This service is not available when a Calling Party is the Attendant Console.
8. This service is not available for the 1A2 key telephone.
9. This service is not available in Boss - Secretary service.
10. The first ringing upon termination is two-second ring and four-second silence. A ringer pattern is provided from the second ringing.
11. The following firmware is required to be equipped on COT card:

CIRCUIT CARD	FIRMWARE
PA-8COTBJ	SW-317 8COTBJ PROG-A
CH-12COTB	SP-4065 12COTB PROG-A

<Analog Caller ID - Station by Modem Sender compatible with Bellcore Caller ID>

1. This service is also provided for Analog Stations equipped with the function of receiving the Calling Number.

2. This feature adheres to the following specifications and recommendation:
   Bellcore Caller ID (for North America) --- Bellcore (Telcordia) GR-30-CORE
3. Message types of caller ID information sent to a called Analog Station are as follows:
   - Message type - 04H: Calling Number Delivery Information (for Calling Number)
   - Message type - 80H: Call Setup (for Calling Number, Name, or reason not to inform)
   - Parameter - 02H: Calling line DN parameter
     - 04H: Reason for absence of calling DN Parameter
     - 07H: Name
     - 08H: Reason for absence of name
4. When the reason not to inform the caller ID is received through Central Office Line, the reason is notified.
5. The function equipped with the Station for restricting the caller ID notification can not be used.
6. The caller ID notification can be restricted only when originating the Trunk Call.
   When restricting the caller ID notification on each conversation, dial the number following the Numbering Plan preassigned at the self-Office.
7. Station allowed Analog Caller ID - Station by Modem Sender (ASFC, SFI 168) can receive a maximum of 10 digits per Calling Number.
   Station allowed Expanded Analog Caller ID - Station by Modem Sender (ASFC, SFI 194) can receive a maximum of 20 digits per Calling Number. If a Calling Number exceeds 10 or 20 digits, the first or last exceeded digits are not displayed according to the System Data (ASYD, SYS1, Index 241, Bit 1).
8. This feature is available for Station allowed Analog Caller ID - Station by Modem Sender (ASFC, SFI 168) or Expanded Analog Caller ID - Station by Modem Sender (ASFC, SFI 194). When a Station is allowed both SFI 168 and SFI 194, SFI 194 has higher priority than SFI 168.
9. When a call is answered by one party (intermediate station) then transferred to another (target station), the caller ID displayed on the target station is the intermediate station's number and not the original caller's number. The caller ID is not updated even when the intermediate party drops out of the call.
10. The caller ID notification is not provided for the following services because the call is not terminated to line using the services.
    CALL PICKUP - GROUP [C-7]
    CALL WAITING-TERMINATING [C-12]
    CALL WAITING-ORIGINATING [C-31]
    EXECUTIVE RIGHT-OF-WAY [E-1]
    Also, the caller ID notification is not provided to the Boss Station for Boss - Secretary service.
11. The system starts to count for No Answer timer when the caller ID notification process is complete.
12. The Incoming Call using this service is also counted as the maximum number of calls terminated at the same time in a system.
13. Since some telephones can not display the Telephone Number using "*" or "#" (other than the numerical digits), Telephone Number of numerical digits is recommended to use.
14. The maximum number of Register/Sender Trunk in an LP is 64. And, when the maximum number of Register/Sender Trunks is assigned (64 × LP no.), the ISDN/CCIS call can not be originated or terminated (the same as the usual system condition).
15. The following messages are notified when the reason for restricting caller ID notification is received: P (Privacy Security) and O (Outside Area where Service is not provided
16. Calling Number conversion (add or delete preassigned numbers) is not available when the caller ID information is received via Analog Caller ID Trunk.
17. When the Calling Party or the intermediate party is Attendant Console, or the Calling Party number is not received when the call is terminated via Central Office Line or TIE Line, the Calling Number can not be notified.

18. When the Name Display data is assigned to the Calling Party in Station-to-Station Calling, the Calling Party's name is also sent to the Called Party. Note that only 1 byte character data can be effective in this case. Since the name data is sent without confirming whether the proper character is used or not, characters that are not proper may cause abnormal status to the system.
19. When all the Sender Trunks are busy, the Calling Number cannot be notified.
20. To activate Analog Caller ID - Station by Modem Sender service in the FCCS Network, the Sender Trunk for sending Modem signal (RT=937, ATRK) should be accommodated in the all Nodes where Stations providing the service is installed.
21. Assigning SFI=168 and SFI=194 in ASFC/ASFCN command for non-Analog Caller ID station will cause a failure of displaying caller ID afterward. Therefore, be sure to assign SFI=168 and SFI=194 in ASFC/ASFCN command toward Analog Caller ID station.
22. The following circuit cards require the firmware condition as follows:

CIRCUIT CARD	FIRMWARE
PA-8RSTAE	SP-3899 8RSTAD PROG-B
PA-16LCBY	SP-3396 16LCBX PROG-A
PA-16LCCD	SP-3876 16LCCD PROG-A

Note: PA-16LCBY/PA-16LCCD and PA-8RSTAE must be used together for caller ID.

<Analog Caller ID - Station by Modem Sender compatible with ETSI Caller ID>

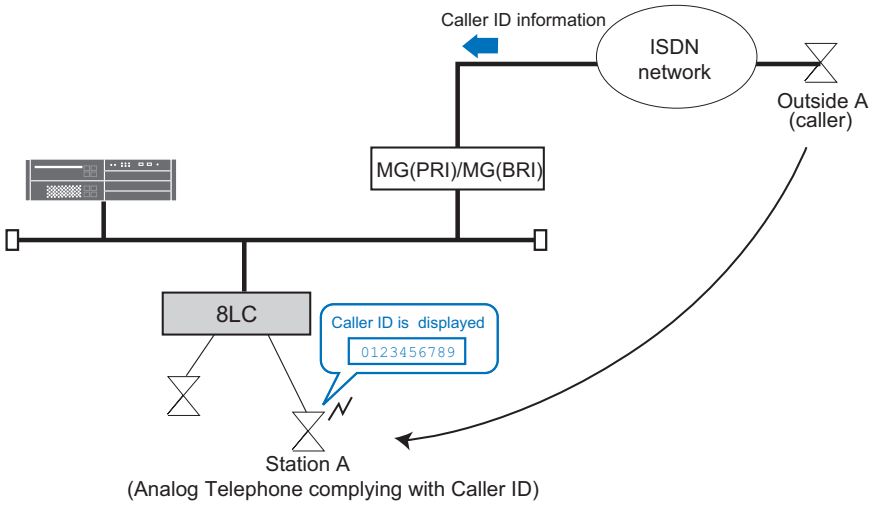
1. This feature adheres to the following specification and recommendation:
   ETSI Caller ID (for EMEA) --- ETSI EN 300-659-3 V1.3.1
2. Analog Stations compatible with ETSI Caller ID are available in this feature. (Be sure to execute performance test for each terminal before using this feature.)
3. When a call is answered by one party (intermediate station) then transferred to another (target station), the caller ID displayed on the target station is the intermediate station's number and not the original caller's number. The caller ID is not updated even when the intermediate party drops out of the call.
4. When the number of digits exceeds the limit to display, the caller ID is displayed on the called station deleting the last or first digits depending on the system data setting (ASYD, SYS1, Index 241, Bit 6).
   Up to 20 digits can be displayed on the called station.
5. The caller ID notification is not provided for the following services because the call is not terminated to line using the services.
   CALL PICKUP - GROUP [C-7]
   CALL WAITING-TERMINATING [C-12]
   CALL WAITING-ORIGINATING [C-31]
   EXECUTIVE RIGHT-OF-WAY [E-1]
   Also, the caller ID notification is not provided to the Boss Station for Boss - Secretary service.
6. One second ON - four seconds OFF for the first ringing is used for the incoming call termination. Then specified ringer pattern is applied from the second ringing.
7. If the Calling Party or the intermediate party is Attendant Console, or the Calling Party number is not received when the call is terminated via Central Office Line or TIE Line, “the cause of No ID” will be notified.
8. For the destination station of BLIND TRANSFER TO STATION [B-18], caller ID of original Calling Party is notified when the intermediate station disconnects the line before Register/Sender Trunk receives the information. Caller ID of the intermediate station is notified when the intermediate station disconnects the line after or during Register/Sender Trunk receives the information.
9. When a Sender cannot be seized, or information sending error occurs, caller ID is not notified. The called party receives the call without caller ID.
10. Caller ID is informed in Call Set-up message (CODE 80 Hex) from ISDN line. The following parameters are used in Call Set-up message for each specification.

PARAMETER TYPE	CODE (Hex)	ETSI CALLER ID SPECIFICATION
Date and Time	01	-
Calling Line Identity or Reason for absence of Calling Line Identity	02 04	X X
Calling Party Name or Reason for absence of Calling Party Name	07 08	- -
Visual Indicator	0B	-
Message Identification	0D	-
Last Message CLI	0E	-
Complementary Date and Time	0F	-
Complementary Calling Line Identity	10	-

PARAMETER TYPE	CODE (Hex)	ETSI CALLER ID SPECIFICATION
Number of Message	13	-
Type of Calling User	16	-
Network Provider Identity	30	-
Selection of Terminal Function	40	-
Display Information	50	-
Extension for network operator use	E0	-
Network operator parameter	E1 to FF	-

X: Available -: Not available

Note: Assign “0” to the related SFIs other than SFI 239 ETSI Caller ID (that is, SFIs 146, 153, 168 and 194).



11. To activate Analog Caller ID - Station by Modem Sender service in the FCCS Network, the Sender Trunk for sending Modem signal (RT=937, ATRK) should be accommodated in the all Nodes where Stations providing the service is installed.
12. This feature is not supported via Analog MC.
13. The following circuit cards are required for this service:

CIRCUIT CARD	FIRMWARE
PA-8RSTAE	SP-3899 8RSTAD PROG-B Issue 5 or later version
PA-16LCCD	SP-3876 16LCCD PROG-A Issue 2 or later version

Note: PA-16LCCD and PA-8RSTAE must be used together for caller ID.

<Service Conditions for Analog Caller ID with 8LC (8LC card/UG50 (LC) [SIP]/UG50-8LC)>

Caller ID information (caller's number) can be displayed on called Analog Telephone stations connected to 8LC when incoming calls terminate from station, CCIS network, DP line, and ISDN line with caller ID. Caller ID for ETSI (EMEA) and Bellcore (North America) are supported depending on the Analog Telephone terminal types and line specification.

1. This feature adheres to the following specifications and recommendation:
   - ETSI Caller ID (for EMEA) --- ETSI EN 300-659-3 V1.3.1
   - Bellcore Caller ID (for North America) --- Bellcore (Telcordia) GR-30-CORE

   Analog TEL terminals compatible with ETSI/Bellcore Caller ID are available in this feature. (Be sure to execute performance test for each terminal before using this feature.)
2. The following firmware is required to be equipped on 8LC card.
   - For SCA-8LCA/SCA-8LCA-EMEA: SP-3893 8MC PROG-A Issue 4.0.0.0 or later version
   - For SCA-8LCC/SCA-8LCC-EMEA: SP-3983 8MC PROG-B Issue 1.0.0.0 or later version

   8LC not complying with caller ID cannot be used.
3. To activate this feature, assign the Service Feature Restriction Class (SFC) data depending on each specification.
   a.) For ETSI Caller ID
   SFI 239=1 (ETSI Caller ID is allowed) and SFI 146=0 (Analog Caller ID-Station is restricted)
   b.) For Bellcore Caller ID
   SFI 239=0 (ETSI Caller ID is restricted) and SFI 146=1 (Analog Caller ID-Station is allowed)
   c.) For Bellcore Caller ID complying with Single Message
   SFI 239=0 (ETSI Caller ID is restricted), SFI 146=1 (Analog Caller ID-Station is allowed), and SFI 153=1 (Analog Caller ID-Station (Single Mode) is allowed)

Note: When both SFIs 146 and 239 are assigned to be allowed, Bellcore Caller ID (SFI 146) takes precedence over ETSI Caller ID (SFI 239).

Note: When ETSI Caller ID is in service (SFI 239=1), Analog Caller ID-Station by Modem Sender feature is not activated.

4. When a call is answered by one party (intermediate station) then transferred to another (target station), the caller ID displayed on the target station is the intermediate station's number and not the original caller's number. The caller ID is not updated even when the intermediate party drops out of the call.
5. When the number of digits exceeds the limit to display, the caller ID is displayed on the called station deleting the last or first digits depending on the system data setting (ASYD, SYS1, Index 241, Bit 6). The maximum number of digits to be displayed on the called station is:
    - ETSI Caller ID --- 20 digits
    - Bellcore Caller ID --- 10 digits/20 digits
6. Caller ID information is not sent out for the features without line termination (e.g. Call Pickup, Executive Right of Way).
7. Caller ID information is not sent out when the call originator is an Attendant Console.
8. Caller ID information is not sent out for Secretary Call features.
9. The following ringing is used for the incoming call termination:
    - ETSI Caller ID --- 1 second ON - 4 seconds OFF for the first ringing
    - Bellcore Caller ID --- 2 seconds ON - 4 seconds OFF for the first ringing

    Specified ringer pattern is applied from the second ringing.
10. Branch station does not send out caller ID information.
11. Caller ID is informed in Call Set-up message (CODE 80 Hex) from ISDN line. The following parameters are used in Call Set-up message for each specification.

PARAMETER TYPE	CODE (Hex)	CALLER ID SPECIFICATION	
		ETSI	Bellcore
Date and Time	01	-	X
Calling Line Identity or Reason for absence of Calling Line Identity	02 04	X X	X X
Calling Party Name or Reason for absence of Calling Party Name	07 08	- -	X X
Visual Indicator	0B	-	-
Message Identification	0D	-	-
Last Message CLI	0E	-	-
Complementary Date and Time	0F	-	-
Complementary Calling Line Identity	10	-	-
Number of Message	13	-	-
Type of Calling User	16	-	-
Network Provider Identity	30	-	-
Selection of Terminal Function	40	-	-
Display Information	50	-	-
Extension for network operator use	E0	-	-
Network operator parameter	E1 to FF	-	-

X: Available -: Not available

12. Assigning SFI=146 and SFI=153 in ASFC/ASFCN command for non-Analog Caller ID station will cause a failure of displaying caller ID afterward. Therefore, be sure to assign SFI=146 and SFI=153 in ASFC/ASFCN command toward Analog Caller ID station.

13. To activate Analog Caller ID - Station by Modem Sender service in the FCCS Network, the Sender Trunk for sending Modem signal (RT=937, ATRK) should be accommodated in the all Nodes where Stations providing the service is installed.

Interactions

1. Only one Route Number can be assigned for each Sender and Register in a PA-8RSTAE circuit card.
2. In Hotel system, this service is provided only for administration stations.
3. This service is not provided for the call using OAI system.

Programming

<**Analog Caller ID - Station by Modem Sender feature for Bellcore Caller ID**>

STEP 1: **ASFC** - Assign the Service Feature Restriction Class to each Analog Station.

DAY/NIGHT: Day/Night Mode
TN: Tenant Number
SFI: 168=1 (Analog Caller ID Station by Modem Sender) **Note 1**

or

SFI: 194=1 (Expanded Analog Caller ID Station) **Note 1**
SFI: 239=0 (ETSI Caller ID is out of service) **Note 2**
When Calling Number Delivery (Message Type - 04H) is notified
SFI: 153=1 **Note 1**

Note 1: Assigning SFI=153, SFI=168 and SFI=194 in ASFC/ASFCN command for non-Analog Caller ID station will cause a failure of displaying caller ID afterward. Therefore, be sure to assign SFI=153, SFI=168 and SFI=194 in ASFC/ASFCN command toward Analog Caller ID station.

Note 2: Setting SFI 239=0 is required to activate “Analog Caller ID Station by Modem Sender” or “Expanded Caller ID Station by Modem Sender” for Bellcore Caller ID.

STEP 2: **ATRK** - Assign the Sender Trunk data.

RT: 937

Note: RT 937 must be programmed in level 4, 5, 6, or 7 for FSK Sender.
Level 0, 1, 2, or 3 may be used for RT 902 or PB/MF Sender.

Note: Optional ASYD, SYS1, Index 241, Bit 6. When a Calling Number exceeds ten digits:
0/1= The last/first exceeded digits are deleted.

<Analog Caller ID - Station by Modem Sender feature for ETSI Caller ID>

STEP 1: **ATRK** - Assign the Sender Trunk data.
RT: 937

Note: RT 937 must be programmed in level 4, 5, 6, or 7 for FSK Sender. Level 0, 1, 2, or 3 may be used for RT 902 or PB/MF Sender.

STEP 2: **MBTK** - Cancel the make-busy of Sender Trunk.

STEP 3: **ASFC/ASFCN** - Assign a Service Feature Restriction Class
D/N: Day/Night Mode
TN: Tenant Number
SFI: 168=0 (Analog Caller ID Station by Modem Sender is out of service)
SFI: 194=0 (Expanded Analog Caller ID Station is out of service)
SFI: 239=1 (ETSI Caller ID)
SFC: Service Feature Restriction Class
RES: 1 (Allowed)

STEP 4: **ASYD** - SYS1, Index 241, Bit 6: 0/1=Display the first/last 20 digits of Caller ID

Note: Assign ACNP and ACND commands for adding the access code of incoming route.

STEP 5: **ACNP** - Assign Calling Number Pattern.
IC/OG: IC: Incoming Call (Calling Party Recognition)
RT: External Route Number of incoming trunk.
CNP: Calling Number Pattern [1-255]

STEP 6: **ACND** - Assign Calling Number Data.
CNP: Calling Number Pattern assigned in ACNP command [1-255]
SKIP: Number of Skip Digits
ADD: Number of Digits of the Additional Number [0-24]
DC: Additional Digit Information [Maximum 24 digits]

<When MG-COT is used for C.O. trunk>

Note: Firmware SP3875 6MGCOT PROG-A Issue 4.0.0.0 or later version is required when using SCA-6COTB.

STEP 1: **ASYD** - SYS1, Index 390, Bit 0: Caller ID display pattern on the LCD
0/1 = Calling Name/Calling Number has priority.
STEP 2: **ASYDL** - SYS1, Index 672, Bit 6=1: MG-COT Caller ID is in service
STEP 3: **ARTD** - Assign Route Class Data for the Central Office Trunk.
15-LSG : 3 (Caller ID [Loop])
-or-

15-LSG : 14 (Caller ID [Ground])
-and-
50-DPLY : 1 (Caller ID display is enabled **Note 3**)
114-DCH : 1 (Channel Integration is ON)
125-MG COT : 1 (Available)

Note: To change the data for existing route (RT), initialize the circuit card.

Note 3: Up to 16 digits of a Caller ID can be shown on the display.

STEP 4: **ARTI** - Assign Trunk Application Data.
68-VIR : 2 (MG Connection)

Note: To change the data for existing route (RT), reboot the MG.

STEP 5: **AMGIL** - Assignment of Media Gateway Information.
Refer to the Peripheral Equipment Description for details.

<When 8LC Card>
STEP 1: **ASFC/ASFCN** - Assign a Service Feature Restriction Class
SFI: 146=0 (To restrict Analog Caller ID-Station for North America specification) **Note 4**
239=1 (To allow ETSI Caller ID)
STEP 2: **ASYD** - SYS1, Index 241, Bit 6: 0/1=Display the first/last 20 digits of caller ID
*Assign ACNP and ACND commands for adding the access code of incoming route.
STEP 3: **ACNP** - Assign Calling Number Pattern.
IC/OG: IC: Incoming Call (Calling Party Recognition)
RT: External Route Number of incoming trunk.
CNP: Calling Number Pattern [1-255]
STEP 4: **ACND** - Assign Calling Number Data.
CNP: Calling Number Pattern assigned in ACNP command [1-255]
SKIP: Number of Skip Digits
ADD: Number of Digits of the Additional Number [0-24]
DC: Additional Digit Information [Maximum 24 digits]

<When 8LC card/UG50 (LC) [SIP]/UG50-8LC>

STEP 1: **ASFC/ASFCN** - Assign a Service Feature Restriction Class

SFI: 146=1 (To allow Analog Caller ID-Station for North America specification) **Note 4**
153: 0/1=To restrict/To allow Caller ID-Station (Single Mode) **Note 4**, **Note 5**
239=0 (To restrict ETSI Caller ID)
194=1 (Expanded Analog Caller ID Station)

Note 4: Assigning SFI=146 and SFI=153 in ASFC/ASFCN command for non-Analog Caller ID station will cause a failure of displaying caller ID afterward. Therefore, be sure to assign SFI=146 and SFI=153 in ASFC/ASFCN command toward Analog Caller ID station.

Note 5: Assign SFI 153=0 when informing date/time, calling party name, and the reason of caller ID blocking. Assign SFI 153=1 when informing the caller number only.

STEP 2: **ASYD** - SYS1, Index 241, Bit 6: 0/1=Display the first/last 10 digits of caller ID

Note: Assign ACNP and ACND commands for adding the access code of incoming route.

STEP 3: **ACNP** - Assign Calling Number Pattern.

IC/OG: IC: Incoming Call (Calling Party Recognition)
RT: External Route Number of incoming trunk.
CNP: Calling Number Pattern [1-255]

STEP 4: **ACND** - Assign Calling Number Data.

CNP: Calling Number Pattern assigned in ACNP command [1-255]
SKIP: Number of Skip Digits
ADD: Number of Digits of the Additional Number [0-24]
DC: Additional Digit Information [Maximum 24 digits]

A-139 Account Code Override

General Description

This feature allows an Account Code to be entered during a conversation, overriding the original Account Code entered for that conversation.

Note: This feature is available in North America only.

Operating Procedure

1. While in conversation with an Incoming or Outgoing Call, the Station user presses the Flash or the TRANSFER key, enters the Account Code Override Access Code followed by the desired Account Code.
2. The Station user will hear a short tone and be returned to the original conversation, when the user hangs up, the last entered Account Code will be output to SMDR.

Service Conditions

1. This feature is not available for Station-to-Station Calls.
2. Desktop terminal users may store, on a Station Speed Dial Button, the TRANSFER key Code and the Special Access Code for Account Code Override.
3. An Account Code with fewer digits than the maximum length defined may be used by pressing # after the Account Code is entered, to identify the end of the code.
4. All Interactions and Limitations of Account Code [A-18] apply to this feature.
5. Desktop terminal users may store, on a Station Speed Dial Button, the TRANSFER key Code and the Special Access Code for Account Code Override.

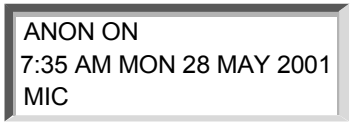
Programming

ASPA - For SRV = “SSCA: Service Code Appendix”, SIDA = 107, assign the Access Code. Assign the number of digits in the ASPA Service Feature Access Code plus the number of digits that will appear in the Account Code for the NND Parameter.

A-142 Anonymous Call Block

(Series 8800 software feature)

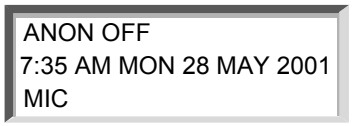
General Description



This feature allows a Station User to block calls that do not present a Calling Party Number. Anonymous Call Block also allows a Trunk Caller to be routed to a common announcement instead of receiving a Busy Tone.

Note: This feature is only available in North America.

Operating Procedure



To turn on Anonymous Call Block

1. Lift the handset and dial the Anonymous Call Block ON Access Code (SSCA SIDA 131).
2. Wait for Service Set Tone.
3. Replace the handset.
4. The Desktop terminal LCD displays:

To turn off Anonymous Call Block

1. Lift the handset and dial the Anonymous Call Block OFF Access Code (SSCA SIDA 132).
2. Wait for Service Set Tone.
3. Replace handset.
4. The Desktop terminal LCD displays:

Service Conditions

1. Anonymous Call Block is normally off. To activate, use the Anonymous Call Block activation code.
2. When Anonymous Call Block is activated, any incoming trunk call that originally has Caller ID (Calling Party Number/ANI) but does not present a valid Calling Party Number or ANI will be restricted. (Example, a COT trunk that never had Caller ID would not present a valid Calling Party Number but would not be restricted.)
3. Call Forward-All [C-5] and Call Forward-Busy [C-2] take precedence over Anonymous Call Block.
4. To use this feature on a Desktop terminal Sub Line, Anonymous Call Block must also be set from each Sub Line.
5. For MF DID to receive reorder tone, when announcements are not used, set ASYD, SYS1, Index 59, Bit 2=1.
6. DIT Trunks will receive ring-no-answer if blocked using Anonymous Call Block.
7. Incoming call to stations that are Forward-All or Forward-Busy to restricted stations, will hear busy on Anonymous Call Block.
8. Restricted incoming calls will follow Call Forward Busy.

Programming

STEP 1: **ANPD/ANPDL/ANPDN** - Assign a number level for Anonymous Call Block.

STEP 2: **ASPA/ASPAL/ASPAN** - Assign the following access codes for CI (N: Normal):

Anonymous Call Block - ON: SRV = "SSCA:Service Code Appendix", SIDA = 131

Anonymous Call Block - OFF:SRV = "SSCA:Service Code Appendix", SIDA = 132

STEP 3: **DICBD** - Command shows if Anonymous Call Block is inactive/active.

AN BLK ACT = 0: Inactive

AN BLK ACT = 1: Active

STEP 4: **ASFC** - Assign SFI 189 RES = 1

Note: If Anonymous Call Block has been set, prior to SFI-189 being changed from a '1' to a '0', Anonymous Call Block will remain. Likewise the user will be restricted from turning it off.

STEP 5: **AAED/N** - Assign Announcement Equipment Number 63 to route Call Block calls to an announcement.

"R" must be set to "0" to send ring back. If "R" is set to "1", ISDN will not operate with the announcement. When using a DAT card for the announcement equipment, set the card to Multiple Playback.

STEP 6: **ARRC/N** - Allow Incoming Routes to Announcement Routes.

To delete

The deletion procedure is the reverse order of assigning the feature.

A-143 Assisted Conference 8 Party

General Description

This feature will allow a station user to move an existing 2 party call to the Add-On Conference - 8 Party [A-121] bridges without interrupting the current call.
It will also allow a station user to join an already in process Add-On Conference - 8 Party [A-121], call with out action by a current attendee.

This is accomplished by dialing the Assisted Conference Access code and then My-line of the terminal to conference with. The system will determine if the terminal is on a sub-line and use the sub-line automatically if needed. The calling party does not need to know the line number the called party is using.feature allows a Station User to block calls that do not present a Calling Party Number. Anonymous Call Block also allows a Trunk Caller to be routed to a common announcement instead of receiving a Busy Tone.

Note: This feature is only available in North America.

Operating Procedure

Example Environment

Station 1000 is an executive.
Station 2000 is 1000's assistant.
Station 2000 has a line appearance of 1000 appear in its key data along with a virtual line 2200.
*1 is assigned as the Assisted Conference Access Code. (ASPA)

Example Operation

1. Station 1000 (Executive) is on a call to an outside party.
2. Station 2000 goes off hook and dials the Assisted Conference Access code and the my line number of the Executive 1000 (*1-1000).
    a.) If Executive 1000 is using a sub-line the system will determine which sub-line is in use on 1000 and set the barge to that sub line.
3. All three parties are moved on to the conference bridge in a normal Add-on Conference 8 party [A-121] conference state.
4. Station 2000 (or 1000) can then use Add-on Conference 8 party [A-121] or Call Hold Conference [C-146] to add other parties.

(The same operation can be preformed if the original call is already an Add-on conference 8 party [A-121] call)

Example Operation Consult call with voice announce

1. Station 1000 (Executive) is on a call to another party on RT 1 TRK 1.
2. Station 2000 calls makes outgoing call or receives an incoming call on RT 2 TRK 1.
3. Station 2000 press transfer and dials Assisted Conference Access code and the my line number of the Executive 1000 (*1-1000).
    a.) RT 2 TRK 1 is placed on consultation hold.
    b.) If Executive 1000 is using a sub-line the system will determine which sub-line is in use on 1000 and set the barge to that sub line.
4. 1000, 2000 and RT 1 TRK 1 are moved on to the conference bridge in a normal 8 party add-on conference state. RT 2 TRK 1 remains on consultation hold.

5. Station 2000 can then press CONF to add RT 2 TRK 1 to the conference.
6. This becomes a normal Add-On Conference 8 party [A-121] state.

(The same operation can be preformed if the original call is already an 8 party add-on conference call)

Service Conditions

1. All the other A-121 service conditions apply.
2. Firmware must be SP-3654 (04.00 or above) for PA-CFTV and PA-CFTW.
3. The assistant must go off hook on an idle line to dial the Assisted Conference access code.
   a.) Or press transfer and get dial tone.
4. There must be an 8 party Add-on Conference port available for this feature.
5. OAI is not supported for 8 party Assisted Conference.
6. Wireless terminals are not supported for 8 party Assisted Conference.
   a.) If an 8 party Conference bridge is not available the assistant is given ROT.
7. Desktop terminal, Virtual, Outside Trunks, and Single line stations can be moved to the conference bridge using this feature.
8. Outside trunks must have answer and disconnect supervision to be used with this feature.
9. This feature is allowed on an SFC basis.
10. Emergency call [E-11] and 8 Party Assisted Conference are mutually exclusive features.
11. This feature will hunt for the line in use on the dialed executive station. (My line).
    a.) If the executive is on a sub-line and the My-line of the executive station is dialed, the system will automatically conference in the sub-line being used.
    b.) If the executive set does not have an active 2 party call, or 8 party conference and the executives My-line is idle, the system will return ROT.
    c.) If the Executive does not have an active line, but the My-line of the executive is in use by another station as a sub-line the conference will be established to the station using the executive's My-line.
    d.) The target station will not hunt to the add-on module of the dialed number.

        (a) All lines that need to be hunted must be on the physical Desktop terminal.

    e.) The system will only hunt the first 32 lines of the Executive station.
12. Once a party is in an 8 party conference state the assisted conference feature may not be used.
    a.) Only parties outside of the conference can use the assisted conference feature.
13. Each IP station or IP Trunk in the conference will use a separate IPPAD channel.
14. If the Executive or the party the executive is talking to is an IP station or Trunk they may here the cut through of voice because of IP packet delay between the terminal and the IPPAD.
15. See all other interactions for Add-On Conference - 8 Party [A-121].
16. For a quick connection PA-CFTV must set SW14-6 = On, SW14-7 = On and CH-CFTA SW13-5 = Off, SW13-6 = Off.
    This will allow immediate cut through of the voice path. If this is not done the Executive will hear momentarily a silence when the feature is used.

Programming

All normal Programming for A-121 apply plus the below steps.

STEP 1: **ASYD** SYS1, Index 17, Bit 3= 0/1 No Tone/Tone on barge in

STEP 2: **ASYDL** SYS1, Index 803, Bit 1=1 for the DISCONNECT Feature key adds.
SYS1, Index 803, Bit 2=1 for 8 party DISCONNECT key.

STEP 3: **ASPA/ASPAL/ASPAN**

TN: X
CI: N: Normal
H: Hooking, SRV = "SSCA: Service Code Appendix", SIDA = 163
Assign for the Assisted Conference access code.
CI is for N: Normal and H: Hooking.

STEP 4: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 250, to perform Assisted Conference.

Assign a Service Feature Restriction Class that allows SFI 251.
0 = allow assist conference without station line appearance.
1 = Allow assisted conference only with station line appearance.

B-2 Busy Lamp Field - Flexible

General Description

This feature provides the Attendant with visual indications of line status - busy, idle, or LINE LOCKOUT [L-3] for a particular group of Stations via a designated lamp in the dial pad on the Desk Console.

Operating Procedure

1. Press an Idle Loop key.
2. Key in first digit for three-digit station numbers or first two digits for four-digit station numbers. For example:
   a.) To monitor Stations 200 to 209, dial "20".
   b.) To monitor Stations 2220 to 2229, dial "222".
3. A BLF lamp indicates the status of the station line, such as busy (steady on), idle (off), or Line LOCKOUT [L-3] (flashing).
   a.) ANPD - 1stDC = 3, NND = 3
   b.) ASPA - ACC = 300, SRV = "STN: Station Number"
   To monitor STN 3000 to STN 3009, key in 3000.

Note: For the Desk Console, dial all digits except the last digit of the desired number. The Desk Console indicates only ten Stations' status at once with the last digit.

Service Conditions

<Important Notices>

This feature does not work for a station number containing an asterisk (*) or number (#) sign.

<Interactions with Other Features>

1. For three-digit Telephone Numbers, the digital display will show the first two digits of the group being monitored (110s, 120s, etc.). Lamps 0-9 will provide visual indication of the status of each Station in the selected group.
2. For four-digit Telephone Numbers, the digital display will show the first three digits of the group being monitored (1110s, 1120s, etc.). Lamps 0-9 will provide visual indication of the status of each Station in the selected group.
3. For a Desk Console, the BLF display is available for three through five-digit Station Numbering Plans.

   Note: Not available for Station Numbering Plans with two digits or less.

4. The BLF display is enabled/disabled through the configuration setting of Desk Console.
5. The BLF display feature overrides the CALL WAITING LAMP [C-13] feature.
6. The lamp indication for LINE LOCKOUT [L-3] is an LED flashing at 60 pulses per minute.
7. LINE LOCKOUT [L-3] lamp indication can be provided by System Data programming.
8. The BLF does not indicate busy/idle status for Stations located in CCIS Satellite Offices.
9. For the FCCS Network, when assigning a Telephone Number to a Station, the Telephone Number is displayed for the Station.

10. For the FCCS Network, the BLF display is available for three-digit to five-digit physical station numbers/ Telephone Numbers.

    Note: For a Desk Console, BLF display is applicable for 3 through five-digit Station Numbering Plans.

11. For FCCS Network, when using BLF display among multiple nodes, all Attendant Consoles must be accommodated in one node.
12. To use this feature, the user must initialize the system after SYS1, Index 257, Bit 0=1 is assigned.

<Conditions Specific to MMG/UMGi/RNIP System>

For FCCS Network, set all the Attendant Consoles in one node. It is advisable to set Attendant Consoles in a node that is not part of a UMGi/RNIP system and has a MMG system.

Interactions

1. CENTRALIZED ATTENDANT SERVICE (CAS) [C-20]: At the CAS Main Location, when the ATTENDANT CONSOLE [A-3] is handling a call from a CAS branch over a Release Line Trunk (RLT), the BLF will give no indication of busy or idle status of Branch Location Stations.
2. The BLF indicates the station status after the hundreds digit is keyed in by the Attendant.
3. A two-digit Digital Display Indicator is used to display the thousands and hundreds digit of the displayed stations.
4. The BLF display is also available for Hotel system.
5. The BLF display is available for all stations including ISDN terminals, PS, and SIP terminals.
6. LINE LOCKOUT [L-3] of PS cannot be identified by the BLF lamp.
7. This feature is available even after a PS performed handover.
8. This feature is not available for a PS roaming to a visitor node.

Programming

STEP 1: **ASYD** - SYS1, Index 16, Bit 0 to Bit 5. Place one to six-digit station numbers in service. Assign 1FH, Busy Lamp Field - Flexible (BLF display) is available for three and four-digit Station Numbering Plans only.
SYS1, Index 70, Bit 1. Assign as data “0”. For Stations in Line Lockout, flash on BLF display.
SYS2, Index 7, Bit 0. Assign as data “1”. Enables BLF display on a tenant basis.

STEP 2: **ANPD** - For the levels reserved for station numbering, assign BLF display in service. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. NND value is assigned in accordance with the Numbering Plan.

Note: Consideration should be given when the system has stations of mixed-digit numbering (two- digit STN, three-digit STN, etc.) with the same first digit. In this case, the BLF display on Desk Consoles can only show the status of stations where the same value is provided for the Number of Necessary Digits (NND) parameter of both the ASPA and ANPD commands.

FCCS Programming

STEP 1: **ASYD** - SYS1, Index 16, Bit 0 to Bit 5. Place one to six-digit station numbers in service. Assign 1FH, Busy Lamp Field - Flexible (BLF display) is available for three and four-digit Station Numbering Plans only.
SYS1, Index 70, Bit 1. Assign "0". For Stations in Line Lockout, the lamp on BLF display.
SYS2, Index 7, Bit 0. Assign "1". Enables BLF display on a tenant basis.

STEP 2: **ANPDL** - For the levels reserved for station numbering, assign BLF display in service. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. NND value is assigned in accordance with the Numbering Plan.

STEP 3: **ASYDL** - SYS1, Index 640. Assign FPC (Fusion Point Code) of the Node installed Desk Console to all the Nodes in the FCCS network. For the Node installed Desk Console, assign the Self Node FPC.
SYS1, Index 650, Bit 6. Assign as data: 0/1 = When BLF information clear has started, the system message is sent/not sent.
SYS1, Index 650, Bit 7. Assign as data: 0/1 = BLF information is cleared/not cleared.

STEP 4: **ASFC -** Permits this feature with the Service Feature Restriction Class for each stations.
SFI 218 = 1 (Send BLF information over FCCS)

Note: Consideration should be given when the system has stations of mixed-digit numbering (two- digit TELN, three-digit TELN, etc.) with the same first digit. In this case, the BLF display on Desk Consoles can only show the status of stations where the same value is provided for the Number of Necessary Digits (NND) parameter of both the ASPAL and ANPDL commands.

B-3 Busy Verification

General Description

When an Attendant places a call to a busy Station, this feature allows the Attendant to break into the connection. When this feature is initiated from the Console, the system sends a Warning Tone to the Stations before establishing a Three-party Conference. Additionally, the Attendant Monitor Function can be activated depending on System Data.

Operating Procedure

To activate

1. Press an Idle Loop key and dial the desired Telephone Number. Receive the Busy Tone.
2. Press the BV key. Two-burst Tones are sent to the connected parties. Attendant may now monitor or join the connection.
3. Press the RELEASE key to disengage.

To monitor the call in progress before entering the Busy Connection from a Station

1. Press an Idle Loop key and dial the desired Telephone Number. Receive the Busy Tone.
2. Press the BV key. The Attendant can monitor the connection. (BV Lamp lights.)
3. Press the TALK key. A Warning Tone is sent, and a Three-way Call is established (TALK Lamp lights).

   Note: If the Called Station is a Desktop terminal, the LCD displays OPE BV for five seconds, then CNF/CONF.
   If Counter Party of the Called Station is a Desktop terminal, the LCD displays OPE BV for five seconds, then CNF/CONF.

4. Press the CANCEL key to disengage. Attendant returns to the Incoming Call. The originally connected parties remain connected.

Service Conditions

1. This feature may be used during Station-to-Station and Station-to-Trunk Calls (COT, FX, WATS, CCSA, or TIE Lines).
2. BUSY VERIFICATION cannot be established to a Station when the Station is:
   a.) Dialing
   b.) Listening to a Tone
   c.) Being rung
   d.) Being connected to an Attendant Loop
   e.) Activating a conflicting feature such as:

ATTENDANT CAMP-ON WITH TONE INDICATION	[A-1][A-45]
ATTENDANT OVERRIDE	[A-7]
BOSS - SECRETARY OVERRIDE -D	[B-5D]
CALL HOLD	[C-6]
CALL TRANSFER	[C-10] [C-11] [C-50] [C-54]
CALL WAITING - ORIGINATING	[C-31]
CALL WAITING - TERMINATING	[C-12]
CONSULTATION HOLD - ALL CALLS	[C-17, -17D] [C-58]
DATA LINE SECURITY	[D-12] [D-66]

DATA PRIVACY ON DEMAND	[D-17] [D-68]
DIAL ACCESS TO ATTENDANT	[D-2] [D-71]
EXCLUSIVE HOLD -D	[E-4D]
EXECUTIVE RIGHT-OF-WAY	[E-1]
NON-EXCLUSIVE HOLD -D	[N-7D]
PRIVACY -D	[P-14D]
PRIVACY RELEASE	[P-18]
THREE-WAY CALLING	[T-2]
VOICE CALL	[V-2]

f.) Modem Pooling Connection
g.) Data Call through Data Adapter
h.) Data Call through Data Module
i.) The Calling Station is connected to an Attendant Loop

Note: In each of the above instances, the Attendant will receive Reorder Tone.

3. Before the Attendant is added to an existing connection, a Two-burst Tone is applied to alert the parties of the Attendant's presence. Sending this Tone Burst can be suppressed by System Data.
4. BUSY VERIFICATION and ATTENDANT LOCKOUT [A-5] are mutually exclusive features.
5. This feature can be denied on DICTATION ACCESS [D-3] and PAGING ACCESS [P-1] Connections by assigned System Data assignment.
6. PAGING ACCESS [P-1]: BUSY VERIFICATION will be denied on a Station Line that is connected to Paging Equipment. If the initiating Paging Station goes on-hook and is waiting for a Call Back Call from the Paged Party, BUSY VERIFICATION will be allowed on that Station line.
7. DICTATION ACCESS [D-3]: BUSY VERIFICATION will be denied on a Station that is connected to a Dictation Trunk. Attempts to busy-verify a Station on this connection will result in a Reorder Tone being sent to the Attendant.
8. STATION HUNTING (CIRCULAR [S-7], SECRETARIAL [S-8], or TERMINAL [S-9]): If an Attendant attempts to busy-verify a busy Station Line in a Hunt Group, the call will hunt. That is, STATION HUNTING will take precedence over BUSY VERIFICATION. If all Stations in a Hunt Group are busy, BUSY VERIFICATION takes place on the dialed Station.
9. The BUSY VERIFICATION feature is assigned to Attendant Consoles only.
10. ATTENDANT LOCKOUT [A-5]: The Attendant is prevented from busy-verifying a Station Line that is connected to a Loop held on the ATTENDANT CONSOLE [A-3]. Because the LOCKOUT feature applies only to calls held on the Attendant Console Loop, BUSY VERIFICATION of those Station Lines will be denied, and the Attendant will hear the Reorder Tone.
11. CALL BACK [C-1]: When Station A is busy and Station B has activated this feature toward Station A, and then goes on-hook to wait for Station A to become idle, both Stations can be busy-verified. When Station A goes on-hook and the CALL BACK [C-1] process has begun, neither Station can be busy-verified until the Talking Connection between Stations A and B has been established. The Attendant will hear the Reorder Tone when BUSY VERIFICATION attempts are made during the denied period.
12. CALL FORWARDING (ALL CALLS [C-5], BUSY LINE [C-2]): If an Attendant attempts to busy-verify a (busy or idle) Station Line that has the CALL FORWARDING (ALL CALLS [C-5], BUSY LINE [C-2]) feature activated to another Station Line, the call will be forwarded to the other line, and BUSY VERIFICATION will proceed as if the Attendant had attempted to busy-verify the other line. If an

Attendant attempts to busy-verify a (busy or idle) Station Line that has the CALL FORWARDING (ALL CALLS [C-5], BUSY LINE [C-2]) feature activated to the Attendant, BUSY VERIFICATION will be denied.

13. CALL HOLD [C-6]: When two Stations have established a Talking Connection, and one of the Stations has a third party on hold, the two talking parties can be verified, but the party on hold cannot be busy-verified.
14. CALL WAITING [C-12, 31]: If an Attendant attempts to busy-verify a Station Line that already has a Waiting Call, BUSY VERIFICATION will be denied. Also, if the Attendant attempts to busy-verify a Station Line that is waiting for another line, the BUSY VERIFICATION attempt will be temporarily denied, because such Waiting Calls always involve either a connection to the Attendant position or the Calling Party is listening to the Ringback Tone.
15. UNIFORM CALL DISTRIBUTION (UCD) [U-1]: The Attendant can busy-verify a Station Line that is part of a UCD Group. That is, the BUSY VERIFICATION Call will not hunt. If BUSY VERIFICATION is attempted on the Group Number, UCD Hunting will take precedence over BUSY VERIFICATION.
16. It is determined in System Data to allow monitoring of the Busy Connection before establishing a Three-way Call.
17. The Attendant cannot monitor the call when activating the INDIVIDUAL TRUNK ACCESS [I-4].
18. When the Attendant presses the TALK key and enters a Three-party Call, the Attendant cannot return to the monitor mode.
19. While monitoring, only the operations via the TALK key or CANCEL key are valid.
20. If one of the originally connected parties disconnects while the Attendant is monitoring the call, the Reorder Tone is sent to the Attendant and the other party. The third party will remain on hold.
21. While being monitored with this feature, you cannot control the call in progress (for example, perform switch hook flash, place it on hold, or transfer it). Depending on Hooking Timer specification or data assignment of analog terminal, the ongoing station call may be disconnected by pressing Recall/Transfer key.
22. The billing during the monitor mode is continued from the status before monitoring.
23. The Node accommodating the Attendant Console requires CFT function for FCCS Service.
24. When Called Station activates CALL FORWARDING- BUSY LINE [C-2], and the call forwarding destination is busy:

    - When call forwarding destination is a station (including stations in FCCS network), ASYD, SYS1, Index 69, Bit 5 determines whether to break into the Forwarded-from Station, or into the Forwarded-to Station.

    - When the call forwarding destination is in outside of the self office, BUSY VERIFICATION is restricted and does not work.

Interactions

1. This feature is allowed whenever the Destination Telephone Set is engaged in any state other than:
   a.) a Three-way Connection,
   b.) a PRIVACY [P-14D, 15D] feature is activated,
   c.) connected to a Route programmed to have Line/Trunk, Privacy, CDN 44:PRV,
   d.) listening to a Tone (Dial Tone, Reorder Tone, Service Set Tone, Busy Tone, Ringback Tone).
2. With the ATTENDANT OVERRIDE [A-7] feature, the following Trunk types may be verified busy or idle status:
   a.) One-way Incoming Trunks,

b.) One-way Outgoing Trunks,
c.) Bothway Trunk.

3. Trunks in a Station-Trunk Connection, TRUNK-TO-TRUNK CONNECTION [T-10], and ATTENDANT CONTROLLED CONFERENCE [A-2] can be verified when busy.
4. ATTENDANT LOCKOUT [A-5]: The Attendant is prevented from verifying a busy Station Line which is connected to a Loop held at the Attendant Console. Since the LOCKOUT feature applies only to calls held on an Attendant Console Loop, BUSY VERIFICATION of those Station Lines will be denied and the Attendant will hear the Reorder Tone.
5. CALL FORWARDING - ALL CALLS [C-5], BUSY [C-2]: If an Attendant attempts to busy-verify a (busy or idle) Station Line that has the CALL FORWARDING (ALL CALLS [C-5], BUSY [C-2]) feature activated to another Station Line, the call will be forwarded to the other line, and BUSY VERIFICATION will proceed as if the Attendant had attempted to busy-verify the other line. If an Attendant attempts to busy-verify a (busy or idle) Station Line that has the CALL FORWARDING (ALL CALLS [C-5], BUSY [C-2]) feature activated to the Attendant, BUSY VERIFICATION will not be denied.
6. CALL HOLD [C-6]: When two Stations have established a connection and one of the Stations has a third party on hold, the two talking parties can be busy verified, but the party on hold cannot be busy verified.
7. DATA LINE SECURITY [D-12]: An Attendant cannot busy-verify a busy Station Line that has a DATA LINE SECURITY [D-12] Class of Service. If BUSY VERIFICATION is attempted, the Attendant will hear the Reorder Tone.
8. CALL WAITING [C-12, 31]: If an Attendant attempts to busy-verify a Station Line that already has a Waiting Call, BUSY VERIFICATION will be denied. Also, if the Attendant attempts to busy-verify a Station Line that is waiting for another line, the BUSY VERIFICATION attempt will be temporarily denied because such Waiting Calls always involve either a connection to the Attendant position or the Calling Party is listening to a Ringback Tone.
9. UNIFORM CALL DISTRIBUTING (UCD) [U-1]: The Attendant can busy-verify a Station Line that is part of a UCD Group. That is, the BUSY VERIFICATION Call will not hunt. If BUSY VERIFICATION is attempted on the Group Number, UCD Hunting will take precedence over BUSY VERIFICATION.
10. DATA PRIVACY - CCIS [D-67, 68]: To prevent interruption of Data Transmission, the Attendant cannot busy-verify a Station Line when this feature is used.
11. DICTATION ACCESS [D-3]: Dictation Access Trunks cannot be busy-verified by the Attendant. The Attendant will hear the Reorder Tone.
12. PAGING ACCESS [P-1]: Paging Access Trunks cannot be busy-verified by the Attendant.

Programming

STEP 1: **ASYD** - SYS1, Index 60, Bit 5. Is the Two-burst Warning Tone to be disabled? 0/1: No/Yes.
SYS1, Index 68, Bit 4. Trunk Select (TKSL) key must be enabled. Assign data “1”.
SYS1, Index 158. Timer between Tones.
SYS1, Index 179, Bit 4. Is ATT Monitor Service - in service? 0/1: No/Yes.
SYS2, Index 0, Bit 3. Attendant Override Service. Assign as data “1”.
SYS2, Index 0, Bit 4. Attendant Busy Verification Service. Assign as data “1”.
SYS1, Index 69, Bit 5. Busy Verification. 0/1 = Break into Forwarded-from Station/Break into Forwarded-to Station

STEP 2: **ATRK** - Assign these LENS as Route 909, Digital Conference Trunk. LENS consists of:
Group and Level Numbers for the Digital Conference Trunk are 210, 213, 216, 221, 224, 227, 232, and 235.

STEP 3: **ASFC** - for Stations subject to ATTENDANT OVERRIDE [A-7], assign a Class of Service that

allows SFI 4, [Executive Right-of-Way (Called)], and SFI 11 (Attendant Camp-On).

STEP 4: **ARTD** - When a Station is connected to a Trunk, CDN 44:PRV of the Route must be assigned as data "0" for ATTENDANT OVERRIDE [A-7] to be allowed.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or MG.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

STEP 1: **ALRTN** - Assign this command to connect the Logical Route to the Physical Route.

STEP 2: **ARTDN** - When a Station is connected to a Trunk, CDN 44:PRV of the Route must be assigned as data "0" for ATTENDANT OVERRIDE [A-7] to be allowed.

B-5D Boss - Secretary Override -D

General Description

This feature enables a Secretary to Voice Announce a call to a Boss when he is currently on his My Line.

Operating Procedure

- Station 200 - Boss
- Station 201 - Secretary

Boss is currently connected to Trunk A. Call at Trunk B, intended for 200, reroutes to Station 201 by way of Call Forwarding - Busy Line.

1. Secretary answers Station 201.
2. Secretary asks the caller to hold and presses the CALL HOLD [C-6] Feature key or TRANSFER key and CALL HOLD Code (CALL WAITING - ORIGINATING [C-31] key), Secretary hears Dial Tone.
3. Secretary presses the SPEED CALLING - ONE TOUCH [S-26D] key on which the BOSS - SECRETARY OVERRIDE Tone Code pause (RECALL key) and the Boss' Telephone Number (200) has been programmed.
4. Secretary hears Ringback Tone. Boss receives three bursts of Camp-On Tone (to distinguish it from the single burst for an Attendant Camp-On).

Boss' Response Options

Case 1:

1. Boss presses the ANSWER key and talks with Secretary (Trunk A is placed on hold).
2. Secretary hangs up, Boss speaks with Trunk B.

Case 2:

1. Boss presses the ANSWER key and talks with Secretary (Trunk A is placed on hold).
2. Boss presses 201 key and talks with Trunk B. Secretary hears Reorder Tone.
3. Boss presses ANSWER to reconnect with Trunk A. Trunk B is placed on hold.

Case 3:

1. If Boss does not respond to three bursts of waiting Tone, Secretary presses the RECALL key to resume talking to Trunk B.

Case 4:

1. Boss presses the ANSWER key and talks with Secretary (Trunk A is placed on hold). Boss denies the call.
2. Boss presses TRANSFER to return to Trunk A. Secretary can also press the TRANSFER key, so that both Boss and Secretary return to original callers.
3. Secretary is returned to Trunk B.

Service Conditions

1. The Secretary must have a Dterm for this operation. The Boss may have a Single Line telephone, but since no Line key or the CALL HOLD Feature key is available, the Boss's switch hook flashes to alternate between Trunk A and Trunk B. To disconnect from one Trunk, the Boss hangs up. The remaining Trunk recalls to the Single Line Set. The Held Party hears Ringback Tone.
2. If Boss and Secretary have Multi Line operations, they must have each other's My Line appearing on their Dterm.
3. This feature is available only when the Boss and the Secretary are on their own My Lines.

4. This feature must be allowed in CLASS OF SERVICE - INDIVIDUAL [C-15] via System Data programming.
5. BOSS - SECRETARY OVERRIDE is denied if the Boss is connected to the ATTENDANT CONSOLE.
6. If provided in the system, the Held Caller will hear MUSIC ON HOLD [M-7].
7. The call is recorded in SMDR for the Secretary's Station (201).
8. This feature is denied to a UCD [U-1] Group.
9. BOSS - SECRETARY OVERRIDE [B-5] overrides DO NOT DISTURB -D [D-11D] if set for the Boss.
10. BOSS - SECRETARY OVERRIDE [B-5] is denied under the following conditions:

ATTENDANT CAMP-ON WITH TONE INDICATION	[A-1]
ATTENDANT OVERRIDE	[A-7]
BUSY VERIFICATION	[B-3]
CALL BACK	[C-1]
CALL HOLD	[C-6]
CALL TRANSFER	[C-10] [C-11] [C-50] [C-54]
CALL WAITING - ORIGINATING	[C-31]
CALL WAITING - TERMINATING	[C-12]
CONSULTATION HOLD - ALL CALLS	[C-17] [C-58]
DATA LINE SECURITY	[D-12] [D-66]
DATA PRIVACY ON DEMAND	[D-17] [D-68]
DIAL ACCESS TO ATTENDANT	[D-2] [D-71]
EXCLUSIVE HOLD -D	[E-4D]
EXECUTIVE RIGHT-OF-WAY	[E-1]
NON-EXCLUSIVE HOLD -D	[N-7D]
OFF-HOOK QUEUING	[O-7]
OUTGOING TRUNK QUEUING	[O-2]
PRIVACY -D	[P-14D]
PRIVACY RELEASE	[P-18]
THREE-WAY CALLING	[T-2]
VOICE CALL	[V-2]

11. FCCS is not available for this feature.

Programming

STEP 1: **ASYD** - SYS2, Index 1, Bit 0 and Bit 1. Consultation Hold allowed or denied. 00: Denied; 01: Originating and Terminating Calls Allowed, Tandem Call Denied; 11: All Calls Allowed.

SYS2, Index 10. Assign data 10H to enable CALL WAITING ORIGINATING [C-31] Service.

STEP 2: **ANPD** - Reserve a Number Level for Service Feature Access. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan.

STEP 3: **ASPA** - Assign an Access Code to CALL HOLD set, SID = 1 for Connection Status Index (CI) of "H: Hooking". Assign an Access Code to CALL WAITING - ORIGINATING [C-31] service. SRV = "SSC: Service Code", SID = 5. Assign for a Connection Index of "N: Normal" and "B: Busy".

Assign an Access Code to BOSS - SECRETARY OVERRIDE Tone, SRV = "SSCA: Service Code Appendix", SIDA = 53. Assign for Connection Status Index of "N: Normal" and "H: Hooking".

STEP 4: **ASFC** - Assign Station to receive BOSS - SECRETARY OVERRIDE [B-5] a Feature Class that allows the following SFIs: 5 [Call Waiting -Originating (Calling)], 6 [Call Waiting - Originating (Called)], 10 (Call Hold), 11 (Attendant Camp On), and 51 (Boss - Secretary Features). Assign these SFIs as data "1".

STEP 5: **AKYD** - Optional. Assign Feature key CALL HOLD [10]. (The operation of TRANSFER key and Access Code is also available.) Optional. Assign to a Line/Feature key a CALL WAITING - ORIGINATING [C-31] key. Assign Feature key Call Waiting [4]. (The operation of the TRANSFER key and Access Code is also available).

STEP 6: **ADSL** - Assign SN = 5 (Consultation Hold) and Feature key Call Hold [10] and Feature key Call Waiting [4].

This command is required only for assigning the function to each Soft key.

B-6 Brokerage - Hotline

General Description

This feature provides a HOTLINE [H-1] function for Desktop terminal.

Operating Procedure

To access from Dterm

1. Lift handset or press the SPEAKER key.
2. Press a Sub Line key associated with the predetermined desired Station. The Destination Station is automatically dialed. Ringback Tone is heard, the Destination Station answers.
3. After completion of conversation, hang up or press the SPEAKER key.

   Note: To make another HOTLINE [H-1] Call instantaneously, press another Sub Line key without going on-hook and off-hook.

4. If the desired Station is busy - While hearing Busy Tone, press the EXECUTIVE RIGHT-OF-WAY (OVER) key. Receive Warning Tone. The caller can override the call in progress.

Service Conditions

1. One of the Line/Feature keys must be assigned as a My Line.
2. A Station to be set Hotline (Calling Party) cannot belong to Hunt [S-7, 8, 9] or UCD [U-1] Group.
3. Single Line Station or Virtual Lines (SOFTWARE LINE APPEARANCE [S-33]) can be assigned as a BROKERAGE - HOTLINE Destination. (ISDN Terminal cannot be assigned as the destination.)
4. When a Hotline Call is made from a Dterm, the Dterm's display shows the Destination Station Number but doesn't show the SERVICE DISPLAY [S-25] of Hotline.
5. This Hotline feature is applicable for Intra-Office Connection within the system.
6. My Line of a Dterm cannot be assigned as the HOTLINE Feature key.
7. Destinations must be Stations or an ATTENDANT CONSOLE [A-3] of the system.
8. When a destination is an ATTENDANT CONSOLE [A-3], the Hotline Call terminates as an ATND Call.
9. ATTENDANT CAMP-ON [A-1], EXECUTIVE RIGHT-OF-WAY [E-1], CALL WAITING [C-31] and CALL BACK [C-1] can be prohibited to the Hotline Connection through CLASS OF SERVICE - INDIVIDUAL [C-15].
10. When a Destination Station is busy, STEP CALL [S-13], CALL BACK [C-1], CALL WAITING [C-31], or MESSAGE REMINDER [M-19] cannot be activated.
11. Station Hunting works if the Destination Station is in a Hunt Group.
12. UCD function works if the Destination Station is a UCD Station, but Busy Tone is given if all the UCD Stations within the group are busy (no UCD queuing).
13. Calling party hears Reorder Tone (ROT) in the following cases.
    a.) When the Called Station has set CALL FORWARDING - ALL CALLS - OUTSIDE [C-28]
    b.) When the Called Station has set CALL FORWARDING - BUSY LINE - OUTSIDE [C-60] and line is busy
    c.) When the Called Station has set LOGGED OUT IP STATION-CALL DESTINATION [L-53] (for Trunk) and in logout status
14. Overriding is available only via the OVER key on Desktop terminal. If switch hook flash is attempted, the caller receives Reorder Tone.

15. In the following cases, overriding by the OVER key is not available, and the caller receives Reorder Tone.
    a.) the Conference-function Trunks are all busy.
    b.) the Destination Station is not engaged in a Two-party Call, as when
        - Call is terminating to the Destination Station.
        - The Destination Station has a call on hold.
        - The Destination Station is off-hook.
        - The Destination Station is already engaged in a Three-party Call.
    c.) the destination is the Attendant or is connected to an Outside Party.
16. When EXECUTIVE RIGHT-OF-WAY [E-1] is used with this feature, it is not activated under any of the following conditions:
    - when utilizing EXECUTIVE RIGHT-OF-WAY [E-1] using switch hook flash and Access Code.
    - when all Three-party Conference Trunks are busy.
    - when the destination is not in the Two-party Connection (an Incoming Call is in the middle of terminating to the destination or the destination places a call on hold or the destination is in off-hook status or the Three-party Connection including the destination has already been established).
    - when the destination is connected with the Attendant Console.
17. This feature can be activated via FCCS.
18. Only the Station assigned a Telephone Number is available for the Station assignment when activating this feature via FCCS.
19. The Station, the Attendant Console/Desk Console (Operator Call), and the Trunk can be a destination for Hotline.
20. When Call Forwarding - All Calls/Busy Line/Don't Answer Service has been set to the Called Station, these features are available for the call to the Station.
21. When a Calling Party encounters a busy Station, the call may bridge into the connection, depending on the data assigned by ASYD.

Programming

STEP 1: **ASYD** - SYS2, Index 0, Bit 1. Is Executive Right-of-Way in service? 0/1:No/Yes. **Note 1**

STEP 2: **ASDT** - Assign to a PA-16LC Circuit the following data:

TN: Tenant Number

STN: Station Number

LENS: Line Equipment Numbers (six digits) - Actual LENS for TEC 14, Virtual LENS for TEC 18

TEC: Telephone Class (1-31)

1: DP (10 PPS)
2: PB
3: DP/PB
12: Dterm
13: Data Terminal via Dterm
→ 14: HOTLINE
15: CAS Line
→ 18: Virtual Circuit

RSC: Route Restriction Class (0-15)

SFC: Service Feature Restriction Class (0-15)

STEP 3: **AHLS** - Assign the Station Numbers programmed above for the following parameters:
HOT TN:Hotline Tenant Number
HOT STN:Hotline Station Number
TYPE: 1 = Station
CON TN: Destination Tenant Number
CON STN: Destination Station Number

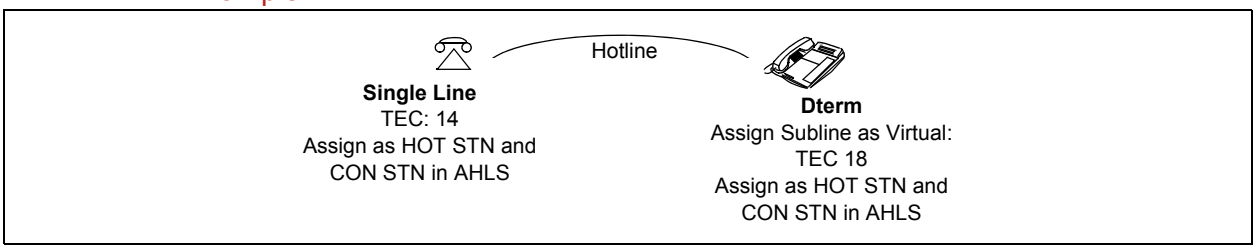
STEP 4: **ASFC** - When the station that Hotline is performed is Telephone Number(TEC=18), assign SFC of Telephone number as follows.
SFC: Service Feature Restriction Class[0-15]
SFI 36=1(Brokerage-Hotline)

STEP 5: **AKYD** - Assign to a Dterm a Line Appearance of the Hotline Station Number.
TN: 1
STN: Station Number
TP: Type of Dterm (0-3)
KYN: Key Number (1-40)
KYI: Service Index
0: Key not used
1: Feature Key
→ 2: Multi Line Key
KD: 0
TN, STN:Tenant Number and Station Number of Multi Line (Virtual)
RG: Ringing assignment per Multi Line Appearance
0: No ringing
1: Ringing in Day mode only
2: Ringing in Night mode only
3: Not Used
4: Ringing in Day and Night Mode - 30 second delay.
5: Ringing in Day and Night Mode - 20 second delay.
6: Ringing in Day and Night Mode - 10 second delay.
7: Ringing in Day and Night Mode.

STEP 6: **AKYD** - When Executive Right-of Way is enabled using ASYD, assign Executive Right-of-Way to a Line/Feature key. **Note 2**
KYN: Key Number(1-40)
KYI=1(Feature Key)
FKY=3(Executive Right-of-Way)

STEP 7: **ASFC** - When Executive Right-of Way is enabled using ASYD, lift restriction on Executive Right-of-Way. **Note 1**
SFI 3=1(Executive Right-of-Way)
SFI 4=1(Tone Block)
SFI 11=1(Data Line Security)

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for



example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

AHLSN - This data must be assigned to the NCN.

HOT UGN: Hotline User Group Number
HOT TELN: Hotline Telephone Number of the Calling Party
TYPE: 1 (the Called Party is a Station)
CON UGN: User Group Number of the Called Party
CON TELN: Telephone Number of the Called Party

Note 1: Set STEP 1,6,7 when Executive Right-of-Way is assigned.

Note 2: The following data should also be set in addition to the commands above.
The commands to be set to the Node accommodating the Calling Party: ASDT/AKYD
The following ASFC command data must be assigned at all Nodes to be set BROKERAGE - HOTLINE Service. SFI 36 (Brokerage - Hotline), RES 1 (allowed)
Example:

B-8 Boss - Secretary - Message Waiting Lamp Control

General Description

This feature allows a Secretary, via the Station, to control the Call Indicator Lamp or Message Waiting (MW) display on the Boss' Station.

Note: The Call Indicator Lamp is used as the Message Waiting Lamp.

Operating Procedure

1. CALL FORWARDING [C-3, 5] is not set on Boss' Station.
2. An Incoming Call for Boss' Station is answered on Secretary's Desktop terminal.
3. Secretary sets the Call Indicator Lamp or Message Waiting display on Boss' Station. See Procedure 1 below.
4. Boss's Station Call Indicator Lamp or the Message Waiting display is ON.
5. Secretary cancels the Call Indicator Lamp or Message Waiting display on Boss' Station.

To set Message Waiting at a Boss' Station

Procedure 1 (Secretary's Station requires a Desktop terminal with a LED)

1. While remaining connected to the Calling Party, press the MESSAGE WAITING Set key.
2. The LCD will indicate Message Waiting Set (for five seconds, in place of time display).
3. Message Waiting is set on Boss' Station. Call Indicator Lamp or the Message Waiting display is ON.
4. Secretary will not hear Service Set Tone.

Procedure 2

1. Secretary releases the call after taking the message and presses the RECALL key. Dial Tone is heard.
2. Secretary presses the MESSAGE WAITING Set key. LCD will indicate Message Waiting Set.
3. Special Dial Tone (SPDT) is heard and Secretary's LCD will display Message Waiting.
4. Secretary dials Boss' station number.
5. Secretary will hear Service Set Tone. Message Waiting is set to Boss' Station. Call Indicator Lamp or the Message Waiting display is ON.

To cancel Message Waiting indication

Procedure 1

1. While remaining connected, Secretary presses the MESSAGE WAITING Cancel key.
2. The LCD will indicate Message Waiting Cancel (for five seconds, in place of time display).
3. Boss' Message Waiting indication is then canceled. Call Indicator Lamp or the Message Waiting display is OFF.

Procedure 2

1. Secretary presses Boss' Line Appearance. Dial Tone is heard.
2. Press the MESSAGE WAITING Cancel key. Special Dial Tone (SPDT) is heard and Secretary's LCD will display Message Waiting.
3. Secretary dials Boss' station number.
4. Service Set Tone is heard. Secretary's LCD will display Message Waiting Cancel.
5. Boss' Message Waiting indication is canceled.

Service Conditions

1. Any number of Desktop terminal stations within the system can be assigned to activate this feature.
2. Secretary must have a Desktop terminal.
3. Any attempt to set BOSS - SECRETARY MESSAGE WAITING LAMP CONTROL to a Station that already has an Message Waiting indication will receive Message Waiting Busy following Procedure 1 or a Busy Tone following Procedure 2.
4. Any Station provided with the Sub Line can set or cancel BOSS - SECRETARY MESSAGE WAITING LAMP CONTROL indication on that Sub Line.
5. This feature is not restricted by CLASS OF SERVICE - INDIVIDUAL [C-15] on either the Boss or Secretary Stations.
6. BOSS - SECRETARY MESSAGE WAITING LAMP CONTROL indication is cleared by System Initialization or a Local Processor Initialization.
7. Message Waiting control is provided to Stations using the Desktop terminal Sub Line when:
   a.) one Station is talking with another Station.
   b.) a Special Purpose Button is pushed after a call is established.
   c.) the Station is calling another Station in the Network.
   d.) CALL WAITING [C-12, 13] is being set up.
   e.) the Station is using VOICE CALL [V-2].
   f.) the ATTENDANT CONSOLE [A-3] indication shows an Incoming Call.
8. Message Waiting for one Station of the network can be Controlled from the ATTENDANT CONSOLE [A-3] and any other Station at the same time. The controlled Station cannot identify the Controlling Party.
9. The Message Waiting indication on the Boss' Station appears as follows:

Type of Station Set	Message Waiting Indication
Desktop terminal	**MW** **(Time Display)**

10. The LCD on the Secretary's Station displays the following messages:

Status of Boss' Station		LCD Desktop Terminal	Type of Tone
MESSAGE WAITING (already set)	SETTING	**MW BUSY** **(Time Display)**	
	CANCELLING	**MW CANCEL** **(Time Display)**	
MESSAGE WAITING (not set)	SETTING	**MW SET** **(Time Display)**	Call Indicator is ON

11. Message Waiting cannot be activated on a Virtual Line. The LCD displays Message Waiting Rest, and Reorder Tone is heard when activation from a Virtual Line is attempted.

    Note: Reorder Tone is not heard while talking to the Calling Party.

12. This feature can control the Call Indicator Lamp or Message Waiting display from the Sub Line during:
    a.) conversation with the Calling Party.
    b.) special code dialing after replacing the handset or pressing the SPEAKER key.
    c.) Ringback Tone for Station Calling.
    d.) MUSIC ON HOLD [M-7] when the other party has pressed the HOLD key.
    e.) dialing of Telephone Number.
    f.) Trunk Origination or Called Number dialing.
    g.) calls to or talking to Attendant.
    h.) THREE-WAY CALLING [T-2].
    i.) CONSULTATION HOLD - ALL CALLS [C-17].
    j.) calls by VOICE CALL [V-2].
    k.) Call Waiting Ringback Tone with Call Waiting set.
    l.) Secretary calls to Boss by BOSS - SECRETARY TRANSFER [B-11].
13. Message Waiting can be canceled for a Station in the same Module Group using the My Line during:
    a.) conversation with the Calling Party.
    b.) Ringback Tone for Station Calling.
    c.) MUSIC ON HOLD [M-7] when the other party has pressed the HOLD key.
    d.) THREE-WAY CALLING [T-2].
    e.) CONSULTATION HOLD - ALL CALLS [C-17].
    f.) calls by VOICE CALL [V-2].
    g.) Call Waiting Ringback Tone with Call Waiting set.
14. CALL WAITING [C-12, 13] set from any other Station causes the Message Waiting Indication for the party setting the Call Waiting to go OFF.
15. THREE-WAY CALLING [T-2] established by EXECUTIVE RIGHT-OF-WAY [E-1] causes the Message Waiting Indication connected to the Interrupted Party to go OFF when the interrupting party presses the MESSAGE WAITING Cancel key. When using a Soft key, press the Message Waiting OFF to cancel.
16. FCCS is not available for this feature.
17. If Boss' telephone to which the secretary transfers a call is busy, the Call Indicator Lamp flashes without giving any ringing tone.

    Note: Ringing tone will be provided if the Boss' terminal is idle or is in off-hook status including pressing the SPEAKER key.

Interactions

1. Use of the following features has no effect on this feature. BOSS - SECRETARY MESSAGE WAITING LAMP CONTROL can be set/canceled to a Station that has previously activated any of the following features:
   a.) DO NOT DISTURB -D [D-21D]
   b.) CALL BACK [C-1] set to Boss' Station
   c.) CALL BACK [C-1] set from Boss' Station
   d.) CALL FORWARDING - ALL CALLS [C-5] will not follow Forwarding data
   e.) CALL FORWARDING - DON'T ANSWER [C-3] will not follow Forwarding data
   f.) CALL FORWARDING - BUSY [C-2] will not follow Forwarding data.
2. When the Boss' Line is answered by the Secretary, the following services may be activated either by the Secretary or by another Station towards the Secretary. These services will not interfere with the Secretary's ability to set/cancel Message Waiting:
   a.) PRIVACY -D [P-14D]
   b.) CONSULTATION HOLD - ALL CALLS [C-17]
   c.) CALL WAITING - ORIGINATING [C-31] set to Boss' Station
   d.) CALL WAITING - ORIGINATING [C-31] set from Boss' Station
   e.) ATTENDANT CAMP ON WITH TONE INDICATION [A-1] set to Boss' Station
   f.) THREE-WAY CALLING [T-2]
   g.) NON-EXCLUSIVE HOLD -D [N-7D], EXCLUSIVE HOLD -D [E-4D] or DUAL HOLD [D-32]

Programming

STEP 1: **ASYDL** - SYS1, Index 1088, Bit 2=1 (is Ringing tone provided if Boss' telephone is in busy status when secretary transfers a call?): 0/1 = Provided/Not provided

STEP 2: **AKYD** - Assign to a Line/Feature key a MESSAGE WAITING LAMP Set key. Feature key BOSS-SECRETARY MSG WAIT Set [9] and a MESSAGE WAITING LAMP Cancel key. Feature key BOSS-SECRETARY MSG WAIT- Cancel [11].

STEP 3: **ADSL** - Assign SN = 4 (Communication in Progress) when operating Procedure 1, SN = 2 (Originating) when operating Procedure 2. Assign Feature key BOSS-SECRETARY MSG WAIT - Set [9] and Feature key BOSS-SECRETARY MSG WAIT - Cancel [11].
This command is required only for assigning the function to each Soft key.

STEP 4: **ASFC** - Assign the Stations a Feature Class that allows SFI 74 [Msg Waiting Lamp from the ATT or Station (Called)] and SFI 82 [Msg Waiting Lamp from the Station (Calling)].

B-11 Boss - Secretary Transfer

General Description

This feature allows a Secretary to Voice Announce a call to a Boss when the Secretary answers a call to the Boss' Line.

Operating Procedure

To transfer from Dterm to Dterm

1. Call terminates to Boss' Line.
2. Secretary answers the call on the Sub Line of Secretary's Dterm.
3. Secretary presses the Line key of Answered Call. Boss and Secretary talk by Voice Call. The LCD displays:

Boss/Secretary

ICM	**XXXX**
(Time Display)	

4. Boss answers the call. The LCD displays:

Secretary

TRANSFER	**XXXX**
(Time Display)	

5. Secretary hangs up. Calling Party talks to Boss. The LCD displays:

Calling Party

	XXXX
(Time Display)	

To transfer from Dterm to a Single Line Telephone

1. Call terminates to Boss' Line.
2. Secretary answers the call on the Sub Line of Secretary's Desktop terminal.
3. Secretary presses the Line key of the Answered Call. Boss' Station rings. The LCD displays (Secretary):

TRANSFER	**XXXX**
(Time Display)	

4. Boss answers the call.
5. Secretary hangs up. Calling Party talks to Boss.

To cancel

1. Secretary presses the Line key.
2. Secretary talks to the Calling Party.

Service Conditions

1. Secretary must have Boss' My Line appearing on the Desktop terminal in a Multi Line operation.
2. Secretary must have a Desktop terminal for this operation. Boss may have a Single Line Telephone.
3. This feature is only available when the Secretary is talking on the Boss' My Line.
4. This feature must be allowed in CLASS OF SERVICE - INDIVIDUAL [C-15] via System Data.
5. BOSS - SECRETARY TRANSFER [B-11] is denied if the Secretary is connected to the ATTENDANT CONSOLE [A-3].
6. If provided in the system, the Held Caller will hear MUSIC ON HOLD [M-7].
7. The call is recorded in STATION MESSAGE DETAIL RECORDING (SMDR) [S-10] for the Boss' Station.
8. This feature will override CALL FORWARDING - BUSY LINE [C-2] set for the Boss, unless the Boss' Line is forwarded to the Secretary.
9. THREE-WAY CALLING [T-2] (Boss, Secretary and Calling Party) is not available.
10. A BOSS - SECRETARY TRANSFER Call cannot be picked up by CALL PICKUP [C-7, 30].
11. Name Display Service is not available when the Secretary is calling the Boss or when the Secretary is talking to the Boss.
12. When the Boss is using a Desktop terminal, the Boss must always press the Line key in order to answer the call transferred from the Secretary.
13. FCCS is not available for this feature.
14. Assigning ASYDL, SYS1, Index 1088, Bit 2=1 stops Boss's telephone from providing ringing tone during busy state of Boss's telephone: Call indicator lamp (Line key) on the Boss's telephone flashes with no ringing tone.
    This setting is valid only when the Secretary answers a call to the Boss' Line and transfers it to the Boss's telephone. However, this setting becomes invalid in some cases. In the following conditions, Boss's telephone is ringed even though the person is in busy state.
    - Line is idle.
    - The Speaker button is pressed.
    - Off the hook

Programming

STEP 1: **ASYDL** - Optional. SYS1, Index 1088, Bit 2
Assign "1" to this bit when disabling ringing tone on the Boss's telephone during its busy status. If not, assign "0".

STEP 2: **ANPD** - Reserve a Number Level for Feature Access. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan.

STEP 3: **ASFC** - Assign Station to receive Boss - Secretary Override a Feature Class that allows the following SFIs 5 [Call Waiting - Originating (Calling)], 6 [Call Waiting - Originating (Called)], 10 (Call Hold), 11 (Attendant Camp-On) and 51 (Boss - Secretary Features). Assign these SFIs as "1".

STEP 4: **AKYD** - Boss' My Line must be assigned as a Sub Line on the Secretary's telephone.

B-12 Brokerage Hotline - Outside

General Description

This feature provides a HOTLINE - OUTSIDE [H-9] function for a Desktop terminal.

Operating Procedure

To access a BROKERAGE HOTLINE - OUTSIDE from a Desktop terminal

1. Lift the handset or press the SPEAKER key.
2. Press a Sub Line key associated with a predetermined desired Outside Party. The Destination Station is automatically dialed; Ringback Tone is heard. The Destination Station answers.
3. After completion of the conversation, hang up or press the SPEAKER key.

To immediately make another BROKERAGE HOTLINE - OUTSIDE Call

1. Press another Sub Line Button associated with another Station without going on/off-hook. The RELEASE key on the Add-On Module can be used as the RELEASE key.
2. A maximum of 39 BROKERAGE HOTLINEs - OUTSIDE can be used to access distant destinations.

Service Conditions

1. One of the Line keys of the Desktop terminal must be assigned as the My Line.
2. When a BROKERAGE HOTLINE - OUTSIDE Call is made, the Desktop terminal display shows the connected Trunk Number but does not show a SERVICE DISPLAY [S-25] for the BROKERAGE - HOTLINE.
3. The My Line of a Desktop terminal cannot be assigned as a BROKERAGE HOTLINE - OUTSIDE.
4. The Virtual Line of a Single Line Station can be assigned as the Hotline Station.
5. BROKERAGE HOTLINE - OUTSIDE uses SPEED CALLING - SYSTEM [S-3] memory. The total number of BROKERAGE HOTLINE - OUTSIDE Destinations is limited by the capacity of the SPEED CALLING - SYSTEM [S-3].
6. ATTENDANT CAMP-ON [A-1], CALL BACK [C-1], CALL WAITING [C-31], and EXECUTIVE RIGHT-OF-WAY [E-1] can be prohibited to the BROKERAGE HOTLINE - OUTSIDE Connection through CLASS OF SERVICE - INDIVIDUAL [C-15].
7. A Hotline Station user confronted with all Trunks busy or all Senders busy at the time of calling hears the Reorder Tone. No indication is shown on the user's Desktop terminal LCD.
8. Outside Connection when a user calls in BROKERAGE HOTLINE - OUTSIDE Service is used when Trunk Classification (DDD, TIE, CCSA) and the Trunk Number is indicated on the LCD indication.
9. Outside Connection when a user answers in BROKERAGE HOTLINE - OUTSIDE Service is used when Time Duration, Trunk Classification (DDD, TIE, CCSA) and the Trunk Number is indicated on the LCD indication.
10. Station Message Detail Recording (SMDR) is available for Outgoing Calls in BROKERAGE HOTLINE - OUTSIDE Service.
11. A Desktop terminal with an Add-On Module attached is used for applications requiring at least 15, but fewer than 39 destinations. In this case, one of the Line keys of the Desktop terminal must be assigned as the My Line.
12. An AC Adapter is required for the Add-On Module for the Desktop terminal phones.
13. This feature can be activated via FCCS.

14. Only the Station assigned a Telephone Number is available for the Station assignment when activating this feature via FCCS.
15. The Station, the Attendant Console / Desk Console (Operator Call), and the Trunk can be a destination for Hotline.
16. When Call Forwarding - All Calls/Busy Line/Don't Answer Service has been set to the Called Station, these features are available for the call to the Station.
17. When a Calling Party encounters a busy Station, the call may bridge into the connection, depending on the data assigned by ASYD.
18. When Telephone Number to be set by ASPD command is 8 digits or more, Desktop terminal LCD can display only 8 digits from the top digit.
19. A SIP Handler Controlled SIP terminal cannot be used as a Hotline Station but it can be used as a destination of a Hotline Station.
20. This feature is not supported for MC&MG-COT or MG-COT (including UG50).

Programming

STEP 1: **ASDT** - Assign to a 16LC Circuit the following data:

TN: Tenant Number
STN: Station Number
LENS: Line Equipment Numbers (six digits)
TEC: Telephone Class (1 - 31)
1: DP (10 PPS)
2: PB
3: DP/PB
12: Dterm
13: Data Terminal via Dterm
→ 14: Hotline
15: CAS Line
18: Virtual Circuit
RSC: Route Restriction Class (0 - 15)
SFC: Service Feature Restriction Class (0 - 15)

STEP 2: **ASPD** - Assign ADC, maximum of three digits. Assign CD = Called Number, maximum 24 -digits, corresponding to the ADC.

STEP 3: **AHLS** - Assign the Station Number programmed above for the following parameters:

HOT TN: Hotline Tenant Number
HOT STN: Hotline Station Number
TYPE: 2=Calling Party is an Outside Party using Abbreviated Digit Code (ADC)
3=Called Party is a Trunk
CON ADC: Speed Calling Code of the Destination Station
CON TN: Destination Tenant Number
CON STN: Destination Station Number
CON RT: Destination Route Number
CON TK: Destination Trunk Number

STEP 4: **AKYD** - Assign to a Dterm a Line Appearance of the Hotline Station Number.

TN: Tenant Number

STN: Station Number
TP: Type of Dterm (0-3)
KYN: Key Number (1 - 40)
KYI: Service Index
0: Key not used
1: Feature Key
→ 2: Multi Line Key
KD: 0
RG: Ringing Assignment per Multi Line Appearance
0: No ringing
1: Ringing in Day mode only
2: Ringing in Night mode only
3: Not Used
4: Ringing in Day and Night Mode - 30 second delay.
5: Ringing in Day and Night Mode - 20 second delay.
6: Ringing in Day and Night Mode - 10 second delay.
7: Ringing in Day and Night Mode.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

STEP 1: **AHLSN** - This data must be assigned to the NCN. Assign the Station Number programmed above for the following parameters:

HOT UGN: Hotline User Group Number of the Calling Party
HOT TELN: Hotline Telephone Number of the Calling Party
TYPE: 2 (Calling Party is an Outside Party using Abbreviated Digit Code (ADC))
3 (Called Party is a Trunk)
CON UGN: User Group Number of the Called Party (for TYPE = 2)
CON ADC: Speed Calling Code assigned by the ASPD command (for TYPE = 2)
CON LRN: Logical Route Number of the Called Party (for TYPE = 3)
CON TK: Trunk Number of the Called Party (for TYPE = 3)

Note: The following data should also be set in addition to the commands above.
The commands to be set to the Node accommodating the Calling Party: ASDT/AKYD/ASPD
If Hotline TEC 14, the ASFC command data must be assigned at all the Nodes to be set Brokerage - Hotline Service: SFI 36 (Brokerage - Hotline), RES 1 (allowed).
When assigning Virtual Hotline, set the ASFC command data to TEC 18.
If Hotline is Virtual TEC 18, assign SFI 36 (Brokerage - Hotline). If Hotline is a TEC 14, do not assign SFI 36 (Brokerage - Hotline).

B-13 Blocking of Trunk Usage

General Description

This feature is activated to set make busy status on a Bothway Trunk, so that the Trunk cannot be used for either Incoming or Outgoing Calls.

Note: This feature is only available in Australia.

Operating Procedure

Bothway Trunk Make Busy is both set and canceled by MBTK.

Service Conditions

1. At office which sets Bothway Trunk Make Busy
   a.) The system does not detect any Incoming Calls received at the Bothway Trunk placed in the Make Busy state by this service.
   b.) As soon as Bothway Trunk Make Busy is set, the BL lamp (red) starts to flash at 120 IPM and the SUP lamp (yellow) lights up on the corresponding Trunk Card.
   c.) The Trunk is completely released from the Make Busy state only after an Outgoing Call is placed to it, following Make Busy release by the appropriate command.
   d.) As soon as the Make Busy state is completely released, both the BL and SUP lamps on the Trunk Card go off.
   e.) This service can be used to set Make Busy on Bothway Trunk only.
   f.) It is not possible to set Make-Busy on a line currently engaged in a call.
   g.) Make Busy state is not released by system, LP or circuit card initialization.
2. At office at which Bothway Trunk Make Busy is assigned
   a.) When the distant office sets up Incoming and Outgoing Make Busy, the corresponding Trunks are placed to Make Busy state and both the BL and SUP lamps on the Card start to flash at 120 IPM.
   b.) Make Busy is released following the receipt of an Incoming Call from the distant office to the Trunk which has been in the Make Busy state.
   c.) Outgoing Trunk Make Busy established by the Trunk Make Busy setting at the distant office may be released by LP initialization, though not by circuit card initialization.
   d.) Both the BL and SUP lamps go off as soon as the Outgoing Trunk Make Busy status is released.

Programming

STEP 1: **ASYD** - SYS1, Index 7, Bit 2 (Trunk Blocking-Wink Signal Tie Lines): 0/1 = Out/In Service.
Assign "1".

STEP 2: **ARTD** - Assign the Route Class Data for the Trunk Route.
< CDN: 48 >
BL (Detection of Blocking Signal): 0/1 = No detection/Detection.
Assign "1".

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or MG.

STEP 3: **MBTK4** - Assign make busy data for the Trunk.
MB = 2 (Make Busy (Bothway)).

B-17 Blind Transfer To Attendant

General Description

This feature allows a Station to transfer a Held Call (Station or Trunk) to the Attendant Console and hang up without having to wait for the Attendant to answer.

Operating Procedure

<For terminals other than Standard SIP Terminal>

1. While connected to another party (Station or Trunk), the user presses switch hook or the TRANSFER key. Receives Special Dial Tone.
2. User dials the Access Code for operator. Receives Ringback Tone while the call terminates to the Attendant at the RECALL key. The Transferred Party hears MUSIC ON HOLD [M-7].
3. User can either:
   a.) Hang up before the Attendant answers, and call will be connected to the Attendant when the Attendant answers.

   Note: The call will terminate at the Attendant's INCOMING CALL IDENTIFICATION (ICI) key depending on the Call Class (LDN, FX, WATS, CCSA, TIE, ATND) of the party being transferred. Peg count will be incremented by one, according to the Call Class. The Transferred Party hears Ringback Tone.

   b.) Wait for the Attendant to answer and then hang up after announcing that a call is being transferred.

   Note: When this method is used, the call is identified at the Attendant's INCOMING CALL IDENTIFICATION (ICI) key as the RECALL key. Peg count for RECALL will be incremented by one.

<For Standard SIP Terminals>

Refer to the manual of each Standard SIP Terminal for operating procedures.

Note: This feature is available for Standard SIP Terminal.

Service Conditions

1. Reorder Tone will be sent to the Station if an attempt is made to transfer to an Attendant in Night mode.
2. This feature is not available on a Tenant basis.
3. If the Attendant does not answer the Transferred Call within the predetermined time set for Transfer Call Recall, the Transferring Station will not be recalled.
4. This feature is allowed only when a Station is engaged in a Two-party Connection (Station or Trunk).
5. Reorder Tone will be sent to the transfer Originating Station if that Station is restricted from accessing the Attendant.
6. Attendant peg count is incremented by one for the following:
   a.) RECALL when the Attendant answers before the Transferring Station releases.

b.) LDN, FX, WATS, CCSA, TIE, or ATND when the Attendant answers after the Transferring Station releases.

7. The System will not set a Priority Queue for the call being transferred when the Station originating the transfer hangs up before the Attendant answers.
8. CALL TRANSFER - ATTENDANT [C-10] is restricted when this feature is activated.
9. If a call is blind transferred to a Station that has set CALL FORWARDING - DON'T ANSWER [C-3] to the Attendant, the following conditions will occur:
   a.) if No Recall on Call Transfer is in service, the call will forward in a Don't Answer scenario. BLIND TRANSFER TO STATION [B-18] must be in service.
   b.) if Recall on Call Transfer is in service, the Transferred Call will recall to the Transferring Party.
10. This feature is available for Stations in the FCCS Network only.

<Conditions particular to Standard SIP Terminals>

SP Controlled SIP terminal:

1. This feature is available for SP Controlled SIP terminals which are confirmed by the connection test of NEC as well as in compliance with IETF RFC3261 and the Internet-Drafts listed below.
   - "draft-ietf-sipping-service-examples-12 (2.4. Transfer - Unattended)"
   - "draft-ietf-sipping-cc-transfer-07"
2. This feature is not available when the control of the terminal is changed over to SR-MGC.
3. SP Controlled SIP terminals are essentially disconnected right after the Blind Transfer is performed.
4. Step Call cannot be activated for SP Controlled SIP terminals when the transferred destination is busy.
5. A SP Controlled SIP terminal which operated Blind Transfer is called back by the Telephony Server when a transferring ends in a failure caused by cases such as when the transferred destination is busy or when misdialed.

SIP Handler Controlled SIP terminal:

1. When a SIP Handler Controlled SIP terminal is in Multi Line Mode, only BLIND TRANSFER through the REFER method is available. BLIND TRANSFER through the secondary session is unavailable.

Programming

STEP 1: **ASYD** - SYS1, Index 17, Bit 4=1, Blind Transfer to Attendant In Service.
SYS2, Index 1, Bit 0 and Bit 1=1.

STEP 2: **ASFC** - Cancel the restriction of Blind Transfer to Attendant from SFC of the Station.
SFI 103 (Assignment of No Answer Timer), RES = 1.

STEP 3: **ANPD** - 0 = Hooking Service (H) NND = 1.

STEP 4: **ASPA** - CI = "H: Hooking" SRV = "SSC: Service Code", SID = 2.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node. **Note 1**

STEP 1: **ANPDL** - 0 = Hooking Service (H), NND = 1.

STEP 2: **ASPAL** - CI = “H: Hooking” SRV = “SSC: Service Code”, SID = 2, FPC = “x”.

Note 1: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

B-18 Blind Transfer To Station

General Description

This feature allows two Service Feature Restriction Classes to be assigned to Stations, enabling services such as Voice Mail, Announcement Machine, etc. depending on the Service Feature Restriction Class.

1. A Service Feature Restriction Class which allows No Answer Timer to be extended when the Blind Transferred-to Station does not answer within the predetermined period of time interval.
2. A Service Feature Restriction Class which activates CALL FORWARDING - DON'T ANSWER [C-3] set to the Blind Transferred-to Station when CALL FORWARDING - DON'T ANSWER [C-3] is available.

Operating Procedure

<For terminals other than Standard SIP Terminal>

To transfer a call in progress

1. While connected to another party (Station or Trunk), the user presses switch hook or the TRANSFER key on Dterm. Receive Special Dial Tone.
2. User dials the third Station. Receive Ringback Tone. If the user remains on the line, the Transferred Party hears MUSIC ON HOLD [M-7].
3. At this point, the user can hang up before the third Station answers. The Transferred Party hears Ringback Tone.

<For Standard SIP Terminals>

Refer to the manual of each Standard SIP Terminal for operating procedures.

Service Conditions

1. This feature is allowed only when a Station is engaged in a Two-party Connection (Station or Trunk).
2. Samples of Connection Patterns available under BLIND TRANSFER Service are as follows:
   a.) Station A blind-transfers Incoming Trunk/Station to Station B (if Index 69=0).
   b.) Station A blind-transfers Incoming Trunk/Station Call to the Attendant (if Index 69=1).
   c.) Station A blind-transfers Incoming Trunk/Station Call to Station B, which has set CALL FORWARDING - DON'T ANSWER to Station C [the call is forwarded to Station C (if Index 69=1)].
   d.) Station A blind-transfers Incoming Trunk/Station Call to Station B, which has set CALL FORWARDING - DON'T ANSWER Trunk (the call is forwarded to outside Station).
3. The Service Feature Restriction Class that extends No Answer Timer must be the same as the one used for BLIND TRANSFER TO ATTENDANT [B-17]. This Service Feature Restriction Class is assigned to the Transferring Station.
4. Depending on System Data assignment, the following conditions occur when CALL FORWARDING - DON'T ANSWER feature is set on the Blind Transferred-to Station:
   a.) the Transferring Station is recalled.
   b.) the Transferred-to Station rings continuously.
   c.) the call is forwarded when the CALL FORWARDING - DON'T ANSWER Timer expires.
5. If the Destination Station for Blind Transfer has set CALL FORWARDING - DON'T ANSWER [C-3] to a Station/Trunk, Call Forwarding is activated when a predetermined No Answer Timer expires.

6. If you use this feature in the FCCS network, the feature is not available for stations outside the FCCS network.
7. When PS becomes Out of Zone while holding a call (switch hook flash), it will be recalled.
   However, if it remains in Out of Zone state, the following will operate.
   If CALL FORWARDING - PS INCOMING INCOMPLETE [C-155] is set, the aborted call will be transferred to the preprogrammed destination. If AUTOMATIC ANNOUNCEMENT - CALLED PS OUT OF ZONE [A-129] is set, the system automatically provides an announcement.
8. When you blind transfer a call to a PS station in the Local Node, and if the PS station goes out of zone before answering the call, you will be recalled.
9. When ASYD - SYS1, Index 69, Bit 2=1 (Call Forward Recall Tone. A burst of Ringback Tone to alert the person receiving a recall when a BLIND TRANSFER - TO STATION is not answered) is assigned: when a SIP station/PHS receives a recall when a BLIND TRANSFER - TO STATION call is not answered, there will be no burst of Ringback Tone.

<Conditions particular to Standard SIP Terminals>

SP Controlled SIP Terminal:

1. This feature is available for SP Controlled SIP terminals which are confirmed by the connection test of NEC as well as in compliance with IETF RFC3261 and the Internet-Drafts listed below.
   - “draft-ietf-sipping-service-examples-12 (2.4. Transfer - Unattended)”
   - “draft-ietf-sipping-cc-transfer-07”
2. This feature is not available when the control of the terminal is changed over to SR-MGC.
3. SP Controlled SIP terminals are essentially disconnected right after the Blind Transfer is performed.
4. Step Call cannot be activated for SP Controlled SIP terminals when the transferred destination is busy.
5. A SP Controlled SIP terminal which operated Blind Transfer is called back by the Telephony Server when a transferring ends in a failure caused by cases such as when the transferred destination is busy or when misdialed.

SIP Handler Controlled SIP terminal:

1. When a SIP Handler Controlled SIP terminal is in Multi Line Mode, only BLIND TRANSFER through the REFER method is available. BLIND TRANSFER through the secondary session is unavailable.

Programming

STEP 1: **ASYD** - SYS1, Index 69, Bit 0:

Processing for a case where the Transfer Destination Station does not answer the call within a predetermined period of time. 0/1 = the Transferring Station is recalled/the Transfer Destination Station is continuously rung, or if the Call Forwarding - Don't Answer is set at the Destination Station, Call Forwarding - Don't Answer is executed.

SYS1, Index 247: Assign the timer value of No Answer Timer for Blind Transfer to Station.

SYS1, Index 448, Bit 2: When Blind Transfer is activated via CCIS:

0 = If Incoming Call is terminated to the Trunk that cannot detect the release signal, the call is forcedly released when the destination party does not answer within a period of time (60 seconds).

1 = Incoming Call is forcedly released when the destination party does not answer within the predetermined timer assigned by ASYD, SYS1, Index 448, Bit 4 to Bit 7.

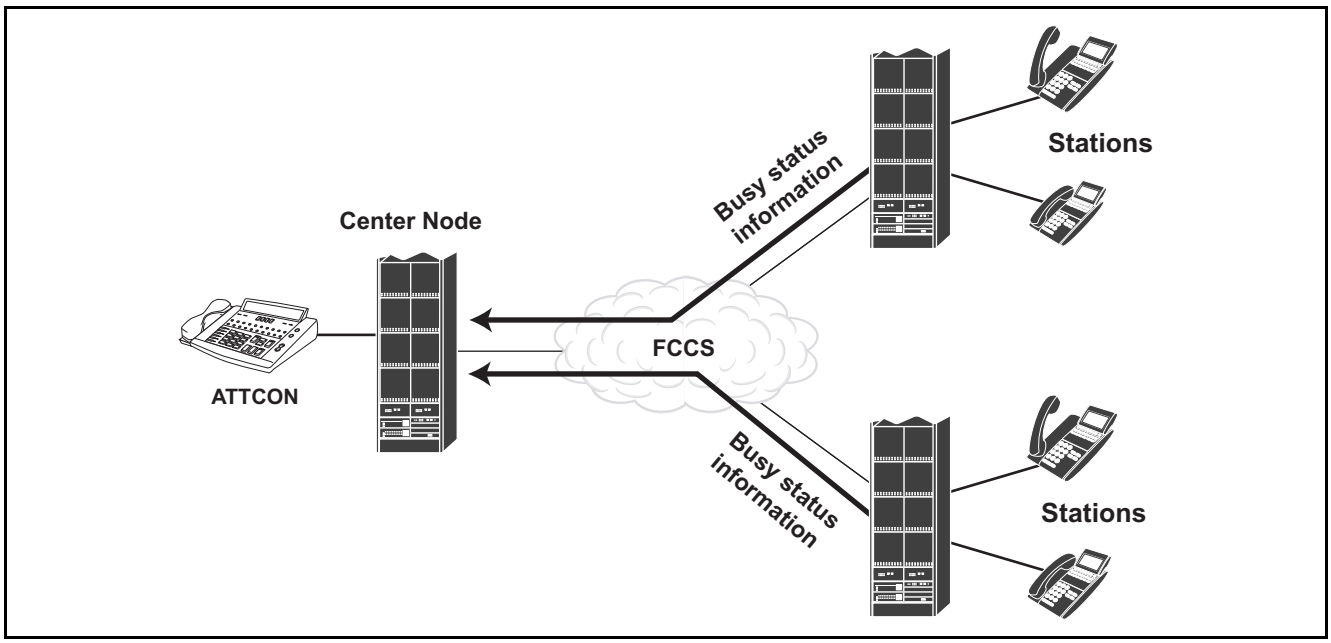
SYS1, Index 448, Bit 4 to Bit 7: Assign the forced release timer value when ASYD, SYS1, Index 448, Bit 2=1. (Default value is 64 seconds.)

STEP 2: **ASFC** - Assign the following data to the SFC of the Station:

SFI 103: Assign the timer value of No Answer Timer for BLIND TRANSFER TO STATION.

RES: 0/1 = Index 140/Timer value assigned by ASYD, SYS1, Index 247
0 = Index 140
1 = Index 247

Also, when ASYD, SYS1, Index 69, Bit 0=1 has been assigned, assign the following data to the SFC of the Station:



SFI 104: Processing in a case when the Transfer Destination Station does not answer within a predetermined period of time.

RES: 0/1 The Transfer Destination Station is continuously rung/Call Forwarding - Don't Answer is executed if it is set at the Transfer Destination Station.

B-29 BLF over FCCS

General Description

The system can exchange Busy Lamp Field (BLF) data. As shown below, the busy status information of the other nodes within FCCS network can be displayed on the ATTCON of the Center Node designated by the System data.

Operating Procedure

Refer to the Data Programming Manual - FCCS.

Service Conditions

Refer to the Data Programming Manual - FCCS.

Programming

Refer to the Data Programming Manual - FCCS.

B-30 Blind Transfer with Recall

General Description

This feature combines the BLIND TRANSFER TO STATION [B-18] with AUTOMATIC RECALL -D [A-8D] to allow blind transfer with recall capability. If the target of a blind transfer has CFD set, the call will follow the forward. If CFD is not set, the call will recall back to the transferring Station.

Note: This feature is only available in North America.

Operating Procedure

No Station user operation is required for Blind Transfer and Recall work from same Station.

Service Conditions

1. All of the service conditions for BLIND TRANSFER TO STATION [B-18] and AUTOMATIC RECALL -D [A-8D] apply.

Interactions

1. BLIND TRANSFER TO STATION [B-18] and AUTOMATIC RECALL -D [A-8D] must be provided.

Programming

See the programming sections of BLIND TRANSFER TO STATION [B-18] and AUTOMATIC RECALL -D [A-8D]. Then perform the following.

STEP 1: **ASYDL** - SYS1, Index 805, Bit 6=0/1 B-30 out of service / B-30 in service

C-1 Call Back

General Description

This feature provides the ability for a Calling Station that has dialed a busy Station to dial a CALL BACK code. This feature also provides the ability for a Desktop terminal, which has dialed a busy Station, to press the CALL BACK key. When this has been done, the Calling Station will be rung as soon as the busy Station becomes available, provided the Calling Station is also idle.

Operating Procedure

To set using Call Back Code

1. Dial the desired Telephone Number. Receive Busy Tone.
2. Press switch hook for Special Dial Tone.

   Note: The availability of special dial tone is changed depending on the combination of the Step Call - CCIS Restriction (ASYD, SYS2, Index 6, Bit 2) and SHF method (ASYD, SYS1, Index 68, Bit 0). Refer to Step Call - CCIS [S-59] in Data Programming Manual - CCIS for the detail.

3. Dial CALL BACK Code. Receive Service Set Tone.
4. Hang up.
5. When the Station becomes idle, Calling Station will ring. Upon answering, the Called Station will be rung.

To cancel using Call Back Code

1. Lift the handset. Receive Dial Tone.
2. Dial CALL BACK Cancel Code. Receive Service Set Tone.

<The following procedures are applied for Desktop terminals only.>

To set using the CALL BACK key

1. Dial desired Telephone Number. Receive Busy Tone.
2. Press the CALL BACK key. Receive Service Set Tone. The LCD displays:

Called Station

CB SET	**XXXX**
(Time Display)	

3. Hang up.
4. When the desired Station becomes idle, the Calling Station will ring. The LCD displays:

Called Station (Flashing)

CB	**XXXX**
(Time Display)	

5. Upon answering, the Called Station will be rung.

6. Called Desktop terminal's LCD displays:

Calling Station

CB	XXXX
(Time Display)	

To cancel using the CALL BACK key

1. Lift the handset or press the SPEAKER Key. Receive Dial Tone.
2. Press the CALL BACK Key. Receive Service Set Tone. CALL BACK is canceled.
3. The LCD displays:

CB CANCEL
(Time Display)

Service Conditions

1. If CALL BACK is not answered within 30 seconds, ringing will stop and CALL BACK will be automatically canceled.

   Note: No Answer Time is variable (ASYD, SYS1, Index 139).

2. As with certain other CLASS OF SERVICE - INDIVIDUAL [C-15] features, CALL BACK may be assigned via Feature Class.
3. CALL BACK to a busy Station cannot be established if that Station is in the LINE LOCKOUT [L-3] mode.
4. There is no time limit for CALL BACK. Once activated, it will remain in status memory until completed or manually canceled.
5. A Station cannot activate CALL BACK to more than one Station at a time.
6. CALL BACK cannot be set by more than one Station at a time (Called Party).
7. A Station cannot use CALL BACK and OUTGOING TRUNK QUEUING [O-2] at the same time.
8. When the Calling Station is called back, STATION HUNTING [S-7, 8, 9] and CALL PICKUP [C-7] programming will be ignored.
9. There is no limit to the number of Stations that may access this feature simultaneously.
10. A Delay Timer can be set in system programming, on a system-wide basis. This allows a Station, to which CALL BACK has been set, to initiate another call within a predetermined time period after becoming idle, before the CALL BACK feature is activated. The Delay Timer can be set in multiples of two seconds for up to a maximum of 14 seconds. (Delay Timer is unavailable for PHS/PCS/WLAN Handset.)
11. CALL BACK Service cannot be set when FCCS Links are all busy.
12. CALL BACK Service that has already been set is automatically canceled when all FCCS Links are busy at the moment the Target Station becomes idle.
13. When Called Station activates CALL FORWARDING- BUSY LINE [C-2], and the call forwarding destination is busy:

- When call forwarding destination is a station (including stations in FCCS network), ASYD, SYS1, Index 69, Bit 5 determines whether to set CALL BACK to the Forwarded-from Station, or to the Forwarded-to Station.
- When the call forwarding destination is in outside of the self office, CALL BACK is restricted and does not work.

<The following conditions are applied for Desktop terminals only.>

1. CALL BACK may be assigned via CLASS OF SERVICE - INDIVIDUAL [C-15].
2. CALL BACK can only be activated from My Line of a Desktop terminal.
3. CALL BACK cannot be established to a busy Station when the Station is engaged in any of the following:

ATTENDANT CAMP-ON WITH TONE INDICATION	[A-1]
CALL HOLD	[C-6]
OFF-HOOK QUEUING	[O-7]
OUTGOING TRUNK QUEUING	[O-2]

Interactions

1. OUTGOING TRUNK QUEUING [O-2] and CALL BACK cannot be accessed simultaneously.
2. ASYD, SYS1, Index 139, No Answer Timer is also used for Station-to-Station Call, DID, or TIE Line Call for CALL FORWARDING - DON'T ANSWER [C-3], and CALL HOLD [C-6].
3. CALL WAITING - ORIGINATE [C-31] automatic setting and CALL BACK are mutually exclusive.
4. CALL BACK cannot be activated toward the Attendant Console.
5. CALL HOLD [C-6]: Activation of CALL BACK is not allowed if the Calling or Called Station has a party on Call Hold. CALL BACK can be activated on a Desktop terminal that is holding a call or is being held by EXCLUSIVE HOLD [E-4D] or NON-EXCLUSIVE HOLD [N-7D].
6. When CALL FORWARDING - ALL CALLS [C-5] has been set from Station A to Station B, and Station B is busy, the CALL BACK feature will be set to Station A.
7. CALL BACK cannot be activated when using CONSULTATION HOLD [C-17].
8. CALL BACK cannot be set when all FCCS Links are busy.
9. When the FCCS Links are all busy at the moment the Target Station becomes idle, CALL BACK that has already been set is automatically cancelled.
10. To operate this feature from SIP Handler Controlled SIP terminal, perform the one digit dial hooking operation while hearing Busy Tone (BT) and dial the access code for this feature. To hear Busy Tone (BT), enable IP-DTG with the AUACL/AUACN command.

Programming

STEP 1: **ASYD** - SYS1, Index 68, Bit 0. 0/1: SHF and Access Code/last digit of Telephone Number + Access Code.
Index 71, Bit 0 through Bit 3. Call Back Automatic Cancel Timer (TC=2-F)
3.5 × (TC-1) < value < 3.5 × TC (minutes)
Index 71, Bit 7. Enable Call Back Automatic Cancel Timer 0/1: No/Yes
Index 139. No Answer Timer for CALL BACK. Assign 00H. (RAM Data is 3FH = 30 seconds.)
SYS2, Index 0, Bit 0. Is CALL BACK enabled on a per Tenant basis? 0/1: No/Yes.

SYS2, Index 4, Bit 0. CALL BACK and OUTGOING TRUNK QUEUING [O-2] Access Codes are same or separate? 0/1: Separate/Same.

SYS3, Index 3, Bit 5. Enable Ringer Pattern 5 for CALL BACK. See DISTINCTIVE RINGING [D-10]. (Unavailable for PS/WLAN Handset.)

SYS3, Index 7. Assign data 24H for four seconds ON, two seconds OFF.

SYS1, Index 5, Bit 7. CALL BACK - Delay Timer: 0/1 = Out/In Service. (Unavailable for PHS/PCS/WLAN Handset.)

SYS1, Index 5, Bit 4 through Bit 6. Delay Timer. Value equals two seconds x the Data set. (Unavailable for PHS/PCS/WLAN Handset.)

SYS1, Index 69, Bit 5. CALL BACK: 0/1 = Set to Forwarded-from Station/Set to Forwarded-to Station

STEP 2: **ANPD** - Reserve a Number Level for Service Feature Access and Cancel. Select Normal Service (N) or Busy Service (B) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan.

STEP 3: **ASPA** - Assign an Access Code to CALL BACK - Entry, SRV = "SSC: Service Code", SID = 3 and a Connection Status Index (CI) for "B: Busy" service. For CALL BACK - Cancel, SRV = "SSC: Service Code", SID = 6. Assign a Connection Status Index (CI) for "N: Normal" service.

STEP 4: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 2 (CALL BACK) to Stations to be allowed CALL BACK.

STEP 5: **AKYD** - For Desktop terminals, CALL BACK may be assigned to a Line/Feature key. Assign Feature key CALL BACK [5].

STEP 6: **ATNR** - Allow Tenant Restriction Index TRI 0, Station-to-Station Calling for Inter and Intra-Tenant Connections.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ANPDL** - Reserve a Number Level for Service Feature Access and Cancel. Select Normal Service (N) or Busy Service (B) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan.

STEP 2: **ASPAL** - Assign an Access Code to CALL BACK - Entry, SRV = "SSC: Service Code", SID = 3 and a Connection Status Index (CI) for "B: Busy" service. For CALL BACK - Cancel, SRV = "SSC: Service Code", SID = 6. Assign a Connection Status Index (CI) for "N: Normal" service.

Note: System Timers may be set on a network basis in ASYDN.

C-2 Call Forwarding - Busy Line

General Description

This feature permits a call to a busy Station to be immediately forwarded to a predesignated Station or to the ATTENDANT CONSOLE [A-3].

If a Called Station is in a STATION HUNTING [S-7, 8, 9] Group and forwards calls to another Hunt Group, it can be determined through System Data that the Calling Party has been directed either to the Called Parties Hunt Group or to the Terminating Parties Hunt Group when all of the Forwarded Stations are busy.

For Desktop terminals:
CALL FORWARDING - BUSY LINE may be set or canceled by the user for all Multi Line Appearances on the Desktop terminals. Additionally, a Single Line user may set CALL FORWARDING - BUSY LINE for all Sub Lines on the Desktop terminals.

Operating Procedure

To set from an Individual Station using Access Code

1. Lift the handset. Receive Dial Tone.
2. Dial the specific CALL FORWARDING - BUSY LINE Access Code. Receive Special Dial Tone.
3. Dial the desired target Telephone Number. Receive Service Set Tone.

Note: A tone will not be provided when an access code is used to set this feature on SP Controlled Standard SIP terminal.

To cancel from an Individual Station using Cancel Code

1. Lift the handset. Receive Dial Tone.
2. Dial the specific CALL FORWARDING - BUSY LINE Cancel Code. Receive Service Set Tone.

To set from the ATTENDANT CONSOLE [A-3]

1. Press an Idle Loop key.
2. Dial the specific CALL FORWARDING - BUSY LINE Access Code. Receive Special Dial Tone.
3. Dial the TENANT SERVICE [T-12] Number (two or three digits).
4. Dial the Originating Telephone Number.
5. Dial the desired Target Telephone Number. Receive Service Set Tone.

To cancel from the ATTENDANT CONSOLE [A-3]

1. Press an Idle Loop key.
2. Dial the specific CALL FORWARDING - BUSY LINE Cancel Code.
3. Dial the TENANT SERVICE [T-12] Number (two or three digits).
4. Dial the Originating Telephone Number. Receive Service Set Tone.

<The following procedures are applied for Desktop terminals only.>

To set from an Individual Station using a Line/Feature key

1. Lift the handset or press the SPEAKER key. Receive Dial Tone.
2. Press the CALL FORWARDING - BUSY LINE FORWARD - BY key. Receive Special Dial Tone.
3. Dial the desired Target Telephone Number. Receive Service Set Tone. The LED of the associated Feature key lights and the LCD displays:

Target Station

FORWARD SET XXXX (Time Display)

4. Replace the handset or press the SPEAKER key.
5. If the Target Station is the Attendant Console, the LCD displays:

FWD SET (Time Display)

To monitor

1. Press the CALL FORWARDING - BUSY LINE FORWARD - BY Feature key. The LCD displays:

Target Station

FORWARD XXXX (Time Display)

2. If the Target Station is the Attendant Console:

FWD SET (Time Display)

To cancel

1. Lift the handset or press the SPEAKER key. Receive Dial Tone.
2. Press the FORWARD-BY key. Receive Service Set Tone. The LCD displays:

FORWARD CANCEL (Time Display)

3. The associated LED goes out.
4. Replace the handset or press the SPEAKER key.

To set CALL FORWARDING - BUSY LINE to a Desktop terminal Multi Line:

1. Press the Multi Line key for which CALL FORWARDING - BUSY LINE feature is to be set.
2. Lift the handset or press the SPEAKER key. Receive Special Dial Tone.
3. Press the CALL FORWARDING - BUSY LINE "FORWARD-BY" Feature key. Receive Special Dial Tone.
4. Dial the desired Target Telephone Number. Receive Service Set Tone. The LCD displays:

Target Station

FORWARD SET XXXX (Time Display)

5. The LED of the associated Feature key lights on the Desktop terminal for which this Multi Line is a My Line.

6. If the Target Station is the Attendant, the LCD displays:

FWD SET OPR (Time Display)

7. Replace the handset or press the SPEAKER key.

To monitor CALL FORWARDING - BUSY LINE to a Desktop terminal Multi Line

1. Press the Multi Line key for which CALL FORWARDING - BUSY LINE is to be monitored.
2. Press the FORWARD - BY key. The LCD displays:

Target Station

FORWARD XXXX (Time Display)

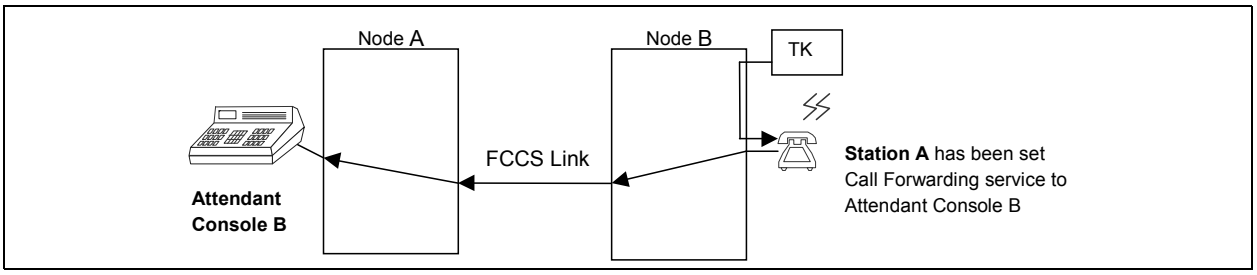
If the Target Station is the Attendant Console:

FWD SET OPR (Time Display)

To cancel CALL FORWARDING - BUSY LINE to a Desktop terminal Multi Line

1. Press the Multi Line key for which CALL FORWARDING - BUSY LINE feature is to be canceled.
2. Lift the handset or press the SPEAKER key. Receive Dial Tone.
3. Press the FORWARD - BY key. Receive Service Set Tone. The LED of the associated Feature key will go out on the Desktop terminal for which this Multi Line is a My Line. The LCD displays:

FORWARD CANCEL (Time Display)



4. Replace the handset or press the SPEAKER key.

Service Conditions

1. This feature may be set and canceled by either the Station or the Attendant.
2. CALL FORWARDING - BUSY LINE Data remains in the Data Memory, even if the system is re-initialized or in the event of a power failure, but it must be saved to HD.
3. This feature is assigned to Stations through CLASS OF SERVICE [C-15] programming in System Data.
4. Registration memories for CALL FORWARDING - BUSY LINE and CALL FORWARDING - DON'T ANSWER [C-3] are common. Changing System Data will enable separation of the two, permitting separate Access Codes to be assigned.
5. CALL FORWARDING - BUSY LINE can be provided on a Tenant and/or an individual Station basis.
6. Call Forwarding on a Tenant basis allows any Incoming Calls, which encounter a busy condition, to be forwarded to a predetermined Station or the ATTENDANT CONSOLE [A-3].
7. Individual CALL FORWARDING - BUSY LINE supersedes system basis Call Forwarding.
8. If all the Stations in the Terminating Hunt Group are busy, the Calling Party will hear Busy Tone and will not return to the Called Party's Hunt Group.

9. When MULTIPLE CALL FORWARDING - BUSY LINE [M-24] is activated, hunting will be performed at the last destination of the forwarded call, even though the multiple jumped stations are in a Hunt Group.
10. When the Pilot Station of a STATION HUNTING [S-7, 8, 9] Group activates CALL FORWARDING - BUSY LINE to a station (not a member of a Hunt Group) and system parameters specify that call hunting will be activated at the forwarded station, the system will send Busy Tone if the forwarded station is busy. If the system parameters specify hunting at the forwarding station, and the forwarded station is busy, the call will hunt in the forwarding stations Hunt Group.
11. When a station sets CALL FORWARDING - ALL CALLS [C-5] to a pilot in a STATION HUNTING [S-7, 8, 9] Group and the pilot activates CALL FORWARDING - BUSY LINE to another station, if system parameters define the call to hunt to the forwarded Hunt Group and all stations are busy, the Calling Party will hunt at the called stations Hunt Group. If system parameters define the call to hunt to the forwarding Hunt Group and all stations are busy, the Calling Party will then hunt to the forwarding stations Hunt Group.
12. If the Called Station is the pilot of a Uniform Call Distribution (UCD) [U-1] Group and activates CALL FORWARDING - BUSY LINE, the Calling Station will queue to the Uniform Call Distribution (UCD) [U-1] Group and will not call forward.
13. If a Calling Station, ATTENDANT CONSOLE [A-3], or Trunk receives a Busy Tone after CALL FORWARDING - BUSY LINE is set, and then activates EXECUTIVE RIGHT - OF - WAY [E-1], CALL WAITING - ORIGINATING [C-31], CALL WAITING - TERMINATING [C-12] or BUSY VERIFICATION [B-3], these services will be activated to the Calling Station.
14. There is no limit to the number of stations that can set CALL FORWARDING - BUSY LINE simultaneously.
15. The operator answering a call forwarded call can identify the Called Telephone Number on the ATTENDANT CONSOLE [A-3] display.
16. When a Station User places a call to a Busy Station which has been set CALL FORWARDING - BUSY LINE [C-2], the Calling Party can override the Call Forwarding feature, activating features associated with busy status such as CALL BACK [C-1], EXECUTIVE RIGHT-OF-WAY [E-1], STEP CALL [S-13], provided that the Service Feature Restriction Class (SFC) of the Calling Party permits this feature. Otherwise, the call is forwarded to a predetermined destination as usual. See the following command assignment to program this feature:
    ASFC - DAY / NIGHT
    TN: Tenant Number
    SFI: Service Feature Index 128 (Call Forwarding - Busy Line Override)
    SFC: Service Feature Restriction Class
    RES: Allowed
17. The OAI Monitor Number and the ACD Pilot Number cannot be assigned as the Call Forwarding Target Telephone Number except when called from a Station or a TIE Line Trunk.
18. When a call terminates to a Busy Station setting CALL FORWARDING - BUSY LINE, depending on the Calling Station Service Feature Restriction Class, it can be selected to make the station busy (not to activate CALL FORWARDING - BUSY LINE) and to activate such services as ATTENDANT CAMP-ON [A-1], BUSY VERIFICATION [B-3], CALL WAITING - TERMINATING [C-12], STEP CALL [S-13], etc.
19. This service is not available when the Called Party is the Attendant Console or Monitoring Station. However, the service is available when these Stations are designated as the Transfer Destination of CALL FORWARDING - BUSY LINE.
20. This service is available only when the Called Party is busy and has set CALL FORWARDING - BUSY LINE. In case CALL FORWARDING - BUSY LINE is set as the second hop and after in the Multiple Call Forwarding Link, this service is not available.

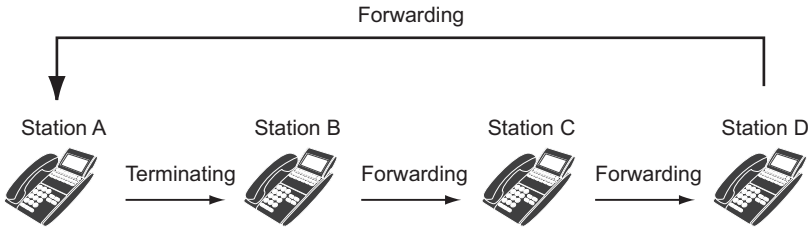
21. This service is available in the following occasions:
    a.) the destination of the CALL FORWARDING - BUSY LINE is the Calling Station.
    b.) the Calling Party is the Attendant Console or the Night Station, and the destination of the CALL FORWARDING - BUSY LINE is also the Attendant Console or the Night Station.
22. SPLIT CALL FORWARDING [S-99] is available only when the Calling Party is the Station or the CCIS Line.
23. A Digital Announcement Trunk cannot be set as the Forwarding Destination.
24. When using FCCS, a Telephone Number must be set to the Call Forwarding Destination.
25. A call can be forwarded to an Attendant Console in the Remote Node via FCCS.

26. When a call is forwarded through FCCS, the Numbering Plan of the originally Called Station must be identical with that of the forwarded Attendant Console.
27. The forwarding destination for this feature can be assigned with the ACFO/ACFOL/ACFON command on a tenant basis. At this time, the following conditions must be considered:
    a.) To forward an incoming trunk call to a station via FCCS, specify the destination station with TELN through the ACFOL/ACFON command.
    b.) Setting call forwarding destination from an individual station or Attendant Console overrides the setting specified with the ACFO/ACFOL/ACFON command.
    c.) The feature data via DM, LDM and NDM can coexist in a system. However, data registered on NDM has top priority. Data registered on LDM has precedence over data registered on DM. The priority is NDM → LDM → DM.
28. The forwarding destination for this feature can be assigned with ACFO/ACFOL/ACFON command on a route basis. For details, see CALL FORWARDING DESTINATION PER TRUNK ROUTE - INCOMING CALL [C-209].

    Note: Data assignment on a route basis is available since FP95-114 V4 Issue 2.0 (earlier than FP95-114 V4 Issue 2.0, the destination can be assigned with the ACFO/ACFOL/ACFON command on a tenant basis only).

29. If a Called Station is in a UNIFORM CALL DISTRIBUTION (UCD) Group or a Station Hunting Group, UNIFORM CALL DISTRIBUTION [U-11] and STATION HUNTING [S-7, 8, 9] are activated first rather than Call Forwarding - Busy Line (CF-1).
30. Specific Attendant Number cannot be set as Forwarding Destination Number.
31. Assign the System Data (ASYDL, SYS1, Index 677, Bit 3=1), and press the CALL FORWARDING - BUSY LINE FORWARD - BY key, a maximum of 16 digits Call Forwarding Information can be displayed.

    Note: This feature is available only for the terminal that can display 24 digits on LCD.



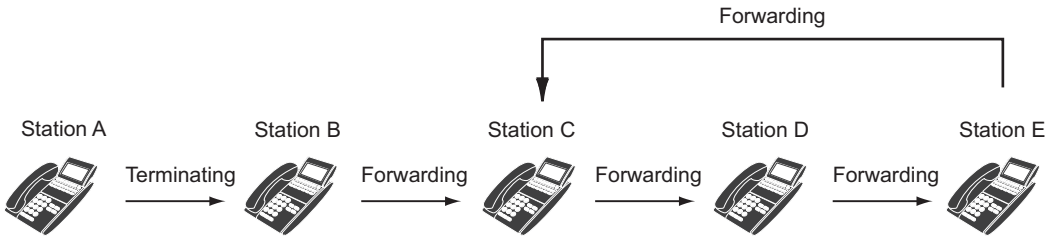
32. When SYS1, Index 69, Bit 1 [(Bit 2 - Call Forward Recall Tone). A burst of Ringback Tone to alert the person receiving a call that this is a CALL FORWARDING - ALL CALLS Call. In service? 0/1:No/Yes. Normally assigned as data "0".] is assigned, there will be no burst of Ringback Tone if the call is received by a SIP station.
33. Multiple Call Forwarding - Busy Line/All Calls/Logout (Logged Out IP Station - Call Destination [L-53]) can be selected to use or not by ASYD command [SYS1, Index 69, Bit 7 (0/1 = Out of service/In service)].

- When using Multiple Call Forwarding - Busy Line/All Calls/Logout.

  A maximum number of Multiple Call Forwarding - All Calls/Busy Line/Logout occurrences can be selected by ASYD command [SYS1, Index 5, Bit 1 to Bit 3].

  The following shows the call forwarding operation that is looped within the assigned number of Multiple Call Forwarding - Busy Line/All Calls/Logout occurrences.

< If target station is Station A. >



The call of Station A calls Station D. If Station D is busy, Station A hears a busy tone.

< If call forwarding is looped among Station B-D >

The call of Station A calls Station C. If Station C is busy, Station A hears a busy tone.

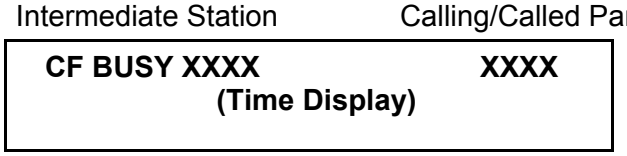
< If call forwarding is looped among Station C-E >

The call of Station A calls Station C. If Station C is busy, Station A hears a busy tone.

- When not using Multiple Call Forwarding - Busy Line/All Calls/Logout.

Depending on the call forwarding setting for destination terminal, the operation will change as follows.

Example: Call Forwarding Operation among Station A-D When Station A calls Station B



Station B sets	Station C sets	Operation
"Call Forwarding - All Calls [C-2]/Logged Out IP Station - Call Destination [L-53]" for Station C	"Call Forwarding - Busy Line [C-2]" for Station D	Station C is called.
"Call Forwarding - All Calls [C-2]/Logged Out IP Station - Call Destination [L-53]" for Station C	"Call Forwarding - All Calls [C-2]/Logged Out IP Station - Call Destination [L-53]" for Station D	Station D is called.
"Call Forwarding - Busy Line [C-2]" for Station C	"Call Forwarding - All Calls [C-2]/Logged Out IP Station - Call Destination [L-53]" for Station C	Station C is called.
"Call Forwarding - Busy Line [C-2]" for Station C	"Call Forwarding - Busy Line [C-2]" for Station D	Station A hears a busy tone.

<The following conditions are applied for Desktop terminals only.>

1. CALL FORWARDING - BUSY LINE may also be accessed via the dial pad or SPEED CALLING - ONE TOUCH [S-22].

   Note: If this feature is accessed via the dial pad, it must be canceled via the dial pad.

2. If separate Access Codes are programmed into System Data for CALL FORWARDING - DON'T ANSWER [C-3] and CALL FORWARDING - BUSY LINE [C-2], separate Feature keys must be programmed on each Desktop terminal to equip it with both features.
3. Individual CALL FORWARDING - BUSY LINE supersedes Tenant basis CALL FORWARDING.
4. The display of an Intermediate Station on a Desktop terminal's LCD may be allowed or denied according to System Data. This assignment is done on a system basis. The LCD displays:

Note: When the Telephone Number of the Intermediate or Calling/Called Station exceeds eight digits, the last eight digits are displayed. However, a maximum of 16 digits Calling/Called Telephone Number can be displayed on the middle line of LCD depending on the System Data.

5. CALL FORWARDING - BUSY LINE supersedes STATION HUNTING [S-7, 8, 9].
6. This feature can be restricted according to the Service Feature Restriction Class of the Desktop terminal My Line. Even after the CALL FORWARDING - BUSY LINE [C-2] has been set to a Desktop terminal Multi Line, incoming calls to the Multi Line cannot be transferred if the Service Feature Restriction Class of the My Line restricts this feature.
7. A user may set CALL FORWARDING - BUSY LINE for a Multi Line Appearance based on the CLASS OF SERVICE - INDIVIDUAL [C-15], as assigned to the Station setting the service. The figure below is a simplified Key Sheet Assignment for Stations 200 and 201. The CLASS OF SERVICE - INDIVIDUAL [C-15] for Station 200 is allowed CALL FORWARDING - BUSY LINE, but the CLASS OF SERVICE - INDIVIDUAL [C-15] for Station 201 is not. Station 200 is able to set CALL FORWARDING - BUSY LINE for Station 201. The associated Feature key LED on Station 201 will illuminate.
   Even when a Sub Line of Desktop terminal is assigned as the Destination Station, the call is not forwarded if the My Line of that Desktop terminal is not allowed CALL FORWARDING - DON'T ANSWER.

Note: The FORWARD - BY key is same as the CALL FORWARDING - BUSY LINE Feature key.

8. This feature is applicable to CALL FORWARDING - OUTSIDE [C-28] and CALL FORWARDING/ MULTIPLE CALL FORWARDING - BUSY LINE - CCIS [C-46] [M-41].

Interactions

1. If Access Codes for CALL FORWARDING - BUSY LINE and CALL FORWARDING - DON'T ANSWER [C-3] are the same, only one key needs to be assigned in AKYD.
2. An ATTENDANT CAMP-ON [A-1] Call is terminated at Station A, and Station A has CALL FORWARDING - BUSY LINE set to Station B. If Station B is busy and part of a STATION HUNTING [S-7, 8, 9] Group, the call will Camp-On at Station A and will not hunt. Set via ASYD, SYS1, Index 69, Bit 5=0.
3. When CALL WAITING [C-12, 31], ATTENDANT CAMP-ON [A-1], and CALL BACK [C-1] is directed toward Station A, which has Call Forwarding set to Station B, and Station B is busy, Station A will receive Call Waiting Tone. Set via ASYD, SYS1, Index 69, Bit 5=0.
4. A non-controlling UNIFORM CALL DISTRIBUTION (UCD) Station is allowed to activate CALL FORWARDING - BUSY LINE [C-2]. When this station sets CALL FORWARDING - BUSY LINE, only calls directly dialed to this station are call forwarded.

5. The Attendant attempts BUSY VERIFICATION [B-3] to Station A. Station A has CALL FORWARDING - BUSY LINE set to Station B. Station B is busy. BUSY VERIFICATION is allowed at Station A. If Station A has set CALL FORWARDING - BUSY LINE to the Attendant Console, BUSY VERIFICATION [B-3] is allowed at Station A.
6. When CALL FORWARDING - BUSY LINE is in effect, the Activating Station may be used to originate calls.
7. When a call is set to call forward, the Destination Station is recorded for STATION MESSAGE DETAIL RECORDING (SMDR) [S-10].
8. STATION-TO-STATION CALLING [S-11] must be provided.
9. A Calling Station, Attendant Console, or Trunk can successfully activate EXECUTIVE RIGHT-OF-WAY [E-1], CALL WAITING - ORIGINATING [C-31], CALL WAITING - TERMINATING [C-12], or BUSY VERIFICATION [B-3] after having been call forwarded and having received Busy Tone. A trunk cannot activate EXECUTIVE RIGHT-OF-WAY [E-1] or BUSY VERIFICATION [B-3]. Set via ASYD, SYS1, Index 69, Bit 5=1.
10. A tone will not be provided when an access code is used to set this feature on SP Controlled Standard SIP terminal.
11. When SIP Handler Controlled SIP terminal is in Multi Line Mode, the Call Forwarding setting applies to the seized line while setting. In normal case, where My Line is not used by another station, the Call Forwarding setting applies to My Line. To set the Call Forwarding applying to Sub Line, use the ACFS/ ACFS_T commands.

Programming

<Call Forwarding - Busy Line with Access Code>

STEP 1: **ASYD** - SYS1, Index 5, Bit 0. Are Access Codes for CALL FORWARDING - BUSY LINE and CALL FORWARDING - DON'T ANSWER the same or separate? 0/1: Same/Separate.
SYS1, Index 5, Bit 1 to Bit 3. Maximum number of Multiple Call Forwarding - Busy Line/All Calls/ Logout (Logged Out IP Station - Call Destination [L-53]). **Note 1**

Note 1: This data is valid only when SYS1, Index 69, Bit 7 is assigned as"1".

STEP 2: **ASYDL** - SYS1, Index 677, Bit 3.
Display a maximum of 16 digits Call Forwarding Information on LCD? 0/1 = No (default)/Yes.

STEP 3: **ANPD** - Reserve a number level for Feature Access and Cancel.
Select Normal Service (N) from the combo box for Connection Indexes (applicable to any feature assigned to this level).
For Desktop terminal, select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes.
Assign NND in accordance with a predetermined Numbering Plan.

STEP 4: **ASPA** - Assign an Access Code to CALL FORWARDING - BUSY LINE Entry, SID = 10 and to CALL FORWARDING - BUSY LINE Cancel, SID = 11. Assign Connection Status Index (CI) for "N: Normal" service.

STEP 5: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 9 (Call Forwarding - Busy Line) to the Stations that receive CALL FORWARDING - BUSY LINE.

STEP 6: **AKYD** - For Desktop terminal sets, CALL FORWARDING - BUSY LINE may be assigned to a Line/ Feature key. Assign Feature key Call Forwarding - Busy Line [1].

STEP 7: **ADSL** - Assign SN = 3 (Called Station is Busy) and Feature key Call Forwarding - Busy Line [1]
This command is required only for assigning the function to each Soft key.

STEP 8: **ATNR** - Allow Tenant-to-Tenant Connection for Inter and Intra-tenant Connections. Assign Tenant Restriction Index (TRI) = 1. For this feature to be set, assign Inter and Intra-Tenant Connection TRI = 3 from the Attendant Console. This allows a Station in one Tenant to be call forwarded to a Station in the same or different Tenant. Also assign TRI = 0, Station-to-Station Calling.

<Call Forwarding - Busy Line with PCPro command (per Station)>

STEP 1: **ASYD** - SYS1, Index 79, Bit 2=1. Split Call Forwarding Service: 0/1 = Out/In service.

Note: This data is required only when Split Call Forwarding service is used.

STEP 2: **ACFS** - Specify a forwarding destination per station.
* When you set the data with Telephone Number, use ACFS_T command.
TN: Tenant Number
STN: Station Number
TYPE: Call Forwarding Type
1: Call Forwarding
2: Split Call Forwarding
SRV: Call Forwarding Kind
B: Busy Line
RCV: Kind of Received Call
This parameter (RCV) is available when "TYPE = Split Call Forwarding" is chosen.
T: Trunk
S: Station
CFD: Call Forwarding Destination Number (Maximum 24 digits)

<Call Forwarding - Busy Line with PCPro command (per Tenant)>

- Setting with Physical Station Number

ACFO - Specify a forwarding destination with Physical Station Number.
TN: Tenant Number
CF = 1: Call Forwarding - Busy Line
CFI = STN
STN: Physical Station Number of forwarding destination

Note: When you specify an Attendant Console as a forwarding destination, choose CFI = Attendant Console (ATT).

- Setting with Telephone Number

ACFOL/ACFON - Specify a forwarding destination with Telephone Number.
TN: Tenant Number
CF = 1: Call Forwarding - Busy Line
CFI = TELN
UGN: User Group Number of call forwarding destination
TELN: Telephone Number of forwarding destination (Maximum 16 digits)

Note: When you specify an Attendant Console as a forwarding destination, choose CFI = Attendant Console (ATT).

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

ASYDL - This Data must be assigned to all the nodes setting Call Forwarding service.
SYS1, Index 640: Assign the Fusion Point Code (FPC) of the node providing the Attendant Console.

Note: The data of ASFC is assigned to the node setting Call Forwarding service.

C-3 Call Forwarding - Don’t Answer

General Description

This feature permits a call to an unanswered Station to be forwarded to a predesignated Station, or to the Attendant, when the Called Station doesn’t answer after a predetermined time interval. If the individual Call Forwarding - Don’t Answer Timer is not assigned, the Default Timer assigned by System Data programming is used.
For Desktop terminals, CALL FORWARDING - DON’T ANSWER may be set or canceled by the user for all Multi Line Appearances on the Desktop terminal. Additionally, a single Station user may set CALL FORWARDING - DON’T ANSWER to all Sub Lines on the Desktop terminal.

Operating Procedure

To set from an individual Station using Access Code

1. Lift the handset. Receive Dial Tone.
2. Dial the specific CALL FORWARDING - DON’T ANSWER Access Code. Receive Special Dial Tone.
3. Dial the desired Target Telephone Number. Receive Service Set Tone.

Note: A tone will not be provided when an access code is used to set this feature on SP Controlled Standard SIP terminal.

To cancel from an individual Station using Cancel Code

1. Lift the handset. Receive Dial Tone.
2. Dial the specific CALL FORWARDING - DON’T ANSWER Cancel Code. Receive Service Set Tone.

To set from the ATTENDANT CONSOLE [A-3]

1. Press an Idle Loop key.
2. Dial the specific CALL FORWARDING - DON’T ANSWER Access Code. Receive Special Dial Tone.
3. Dial the TENANT SERVICE [T-12] Number (two or three digits).
4. Dial the Originating Telephone Number.
5. Dial the desired Target Telephone Number. Receive Service Set Tone.

To cancel from the ATTENDANT CONSOLE [A-3]

1. Press an Idle Loop key.
2. Dial the specific CALL FORWARDING - DON’T ANSWER Cancel Code. Receive Special Dial Tone.
3. Dial the TENANT SERVICE [T-12] Number (two or three digits).
4. Dial the Originating Telephone Number. Receive Service Set Tone.

To assign individual Call Forwarding - Don’t Answer Timer to each Station

1. Use the ADAI command.
   a.) Parameter NAT 139 overrides ASYD, SYS1, Index 139
   b.) Parameter NAT 140 overrides ASYD, SYS1, Index 140
   c.) Parameter NAT 141 overrides ASYD, SYS1, Index 141
   d.) Parameter NAT 247 overrides ASYD, SYS1, Index 247
2. Timer assigned to Called Party is valid.

Note: ADAI command is available only for Australia and North America.

<The following procedures are applied for Desktop terminals only.>

To set from My Line on an individual Station using a Line/Feature key

1. Lift the handset or press the SPEAKER key. Receive Dial Tone.
2. Press the CALL FORWARDING - DON'T ANSWER FORWARD - NA key. Receive Special Dial Tone.
3. Dial the desired Target Telephone Number. Receive Service Set Tone. The LCD displays:

Target Station

FORWARD SET	**XXXX**
(Time Display)	

To monitor from a Desktop terminals from My Line

1. Press the CALL FORWARDING - DON'T ANSWER FORWARD - NA key. The LCD displays:

FORWARD	**XXXX**
(Time Display)	

OR

FWD SET
(Time Display)

To set for a Multi Line Appearance other than the My Line

1. Lift the handset or press the SPEAKER key.
2. Press the Multi Line Appearance. Receive Dial Tone. Press the CALL FORWARDING - DON'T ANSWER FORWARD - NA key. Receive Special Dial Tone.
3. Dial the desired Target Telephone Number. Receive Service Set Tone. The LED of the associated Feature key does not light at the Station setting the service. If the Multi Line Appearance is another Desktop terminal's My Line, that Station's Feature key LED will light. The setting Station's LCD displays:

Target Station:

FORWARD SET	**XXXX**
(Time Display)	

4. Replace the handset or press the SPEAKER key.
5. If the Target Station is the Attendant, the LCD displays:

FWD SET OPR
(Time Display)

To monitor for a Multi Line Appearance other than the My Line

1. Press the CALL FORWARDING - DON'T ANSWER FORWARD - NA key. The LCD displays:

Target Station

FORWARD	**XXXX**
(Time Display)	

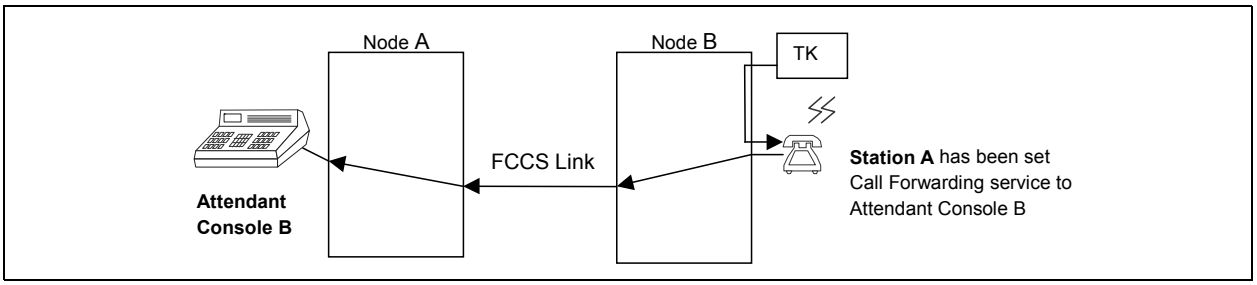
To cancel from My Line on an individual Station using a Line/Feature key

1. Lift the handset or press the SPEAKER key. Receive Dial Tone.
2. Press the CALL FORWARDING - DON'T ANSWER FORWARD - NA key. The associated LED goes out. Receive Service Set Tone. The LCD displays:

FORWARD CANCEL **(Time Display)**

To cancel for a Multi Line Appearance other than the My Line

1. Lift the handset or press the SPEAKER key.
2. Press the Multi Line Appearance. Receive Dial Tone. Press the CALL FORWARDING - DON'T ANSWER FORWARD - NA key. Receive Service Set Tone. The LCD displays:



FORWARD CANCEL **(Time Display)**

   The associated LED that is lit at another Station goes out.
3. Replace the handset or press the SPEAKER key.

Service Conditions

1. This feature may be set and canceled by either the user or the Attendant.
2. When the Attendant extends a call to a Station that has set CALL FORWARDING - DON'T ANSWER, the Called Station will ring for ten seconds. If the call is not answered, AUTOMATIC RECALL [A-8] is activated. This timing can be changed through the VARIABLE TIMING PARAMETERS [V-1] feature.
3. This feature is assigned by CLASS OF SERVICE - INDIVIDUAL [C-15] programming in System Data.
4. A Station programmed for access to CALL FORWARDING - DON'T ANSWER is automatically allowed CALL FORWARDING - BUSY LINE [C-2].
5. There is no limitation to the number of Stations that can set the CALL FORWARDING - DON'T ANSWER simultaneously.
6. CALL FORWARDING - DON'T ANSWER can be provided on either a Tenant or an individual basis.
7. Individual CALL FORWARDING - DON'T ANSWER takes precedence over Tenant basis Call Forwarding.
8. Call Forwarding on a Tenant basis allows direct Incoming Trunk Calls that encounter a Don't Answer condition to be forwarded to a predetermined Station or the ATTENDANT CONSOLE [A-3].
9. The operator answering a Call Forwarding Call can identify the Called Telephone Number on the ATTENDANT CONSOLE [A-3] display.
10. CALL FORWARDING - DON'T ANSWER from the Attendant is only activated after pressing the RELEASE key.
11. If the Station's own Telephone Number is set for CALL FORWARDING - DON'T ANSWER, then this feature is changed to CALLING PARTY RECOGNITION SERVICE (CALL FORWARDING - DON'T ANSWER [C-103]).

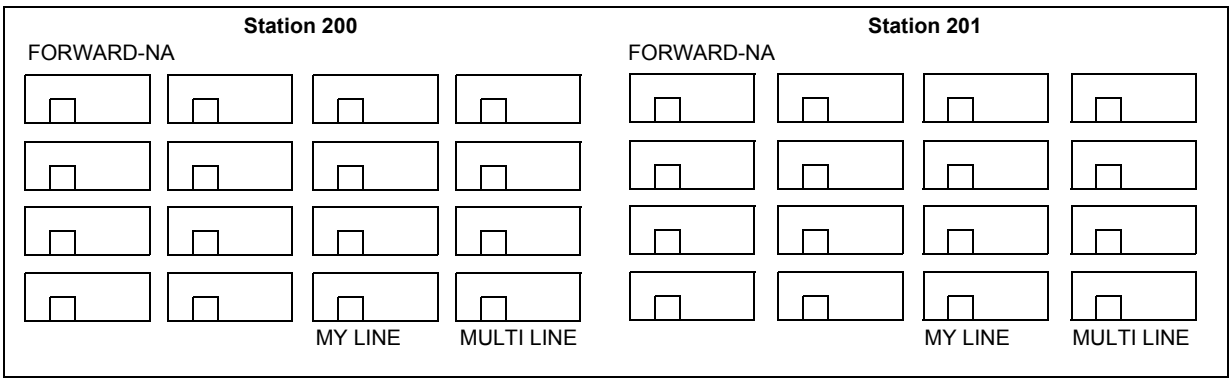
12. When the Called Station does not answer for a predetermined time interval, Stations are assigned this feature according to the TENANT SERVICE [T-12] Class of the Calling and Destination Stations. In the following cases, when the Calling Station and Destination Station are restricted by TENANT SERVICE [T-12] Class, this feature is not activated, and the Called Station continues to ring:
    a.) when the Station Called is setting CALL FORWARDING - DON'T ANSWER,
    b.) when a Station holding an original call (Station or Trunk) on CONSULTATION HOLD [C-17] places a call to a Station setting CALL FORWARDING - DON'T ANSWER.
13. Call Transfer - Attendant (Trunk): Trunk Calls transferred by the Attendant are assigned this feature when the Called Station does not answer for a predetermined time interval according to Route Restriction Class of the Trunk and the Destination Stations. When restricted by Route Restriction Class, this feature is not activated, and the Called Station continues to ring.
14. Call Transfer - Attendant (Station): Station Calls transferred by the Attendant are assigned this feature when the Called Station does not answer for a predetermined time interval according to TENANT SERVICE [T-12] Class of the Originating and Destination Stations. When restricted by Tenant Service Class, this feature is not activated, and the Called Station continues to ring.
15. Speed Calling List Numbers may be programmed as the Destination Telephone Number. This permits the sent digits to exceed the 12-digit maximum.
16. CALL FORWARDING - DON'T ANSWER Data remains in the Data Memory, even if the system or LP is re-initialized.
17. SPLIT CALL FORWARDING [S-99]: When a call is forwarded to the parties predesignated by SPLIT CALL FORWARDING [S-99], Service Conditions are the same as described in Items 12, 13, and 14.
18. When a call is transferred from the Attendant to a Station that has set CALL FORWARDING - DON'T ANSWER, this feature may be restricted or activated according to SYS2, Index 6, Bit 7.
19. Digital Announcement Trunk cannot be set as Forwarding Destination.
20. If individual Call Forwarding - Don't Answer Timer is not given, the Default Timer is used by ASYD.
21. A call can be forwarded to an Attendant Console in the Remote Node via FCCS.

22. When a call is forwarded through FCCS, the Numbering Plan of the originally Called Station must be identical with the one of the Forwarded Attendant Console.
23. The forwarding destination for this feature can be assigned with the ACFO/ACFOL/ACFON command on a tenant basis. At this time, the following conditions must be considered:
    a.) To forward an incoming trunk call to a station via FCCS, specify the destination station with TELN through the ACFOL/ACFON command.
    b.) Setting call forwarding destination from an individual station or Attendant Console overrides the setting specified with the ACFO/ACFOL/ACFON command.

c.) The feature data via DM, LDM and NDM can coexist in a system. However, data registered on NDM has top priority. Data registered on LDM has precedence over data registered on DM. The priority is NDM → LDM → DM.

24. The forwarding destination for this feature can be assigned with ACFO/ACFOL/ACFON command on a route basis. For details, see CALL FORWARDING DESTINATION PER TRUNK ROUTE - INCOMING CALL [C-209].

Note: Data assignment on a route basis is available since FP95-114 V4 Issue 2.0 (earlier than FP95-114 V4 Issue 2.0, the destination can be assigned with the ACFO/ACFOL/ACFON command on a tenant basis only).

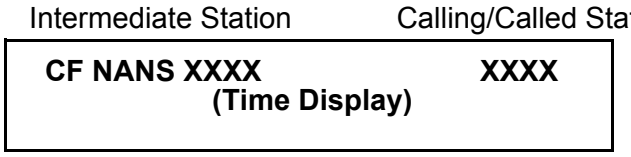


25. Specific Attendant Number cannot be set as Forwarding Destination Number.
26. Assign the System Data (ASYDL, SYS1, Index 677, Bit 3=1), and press the CALL FORWARDING - DON'T ANSWER FORWARD - NA key, a maximum of 16 digits Call Forwarding Information can be displayed.

Note: This feature is available only for the terminal that can display 24 digits on LCD.

27. A station number including self office code cannot be assigned as the destination number of PS. (It can be assigned but not be transferred)

The following conditions are applied for Desktop terminals only.



1. If separate Access Codes are programmed into System Data for CALL FORWARDING - DON'T ANSWER and CALL FORWARDING - BUSY LINE [C-2], each feature must be programmed on a separate Feature key at the Desktop terminal.
2. CALL FORWARDING - DON'T ANSWER may also be accessed via the dial pad or SPEED CALLING - ONE TOUCH -D [S-26D]. If this feature is accessed via the dial pad, it must be canceled via the dial pad.
3. CALL FORWARDING - DON'T ANSWER is not applicable to CONSULTATION HOLD - ALL CALLS [C-17], and CALL TRANSFER - ALL CALLS [C-11].
4. A user may set CALL FORWARDING - DON'T ANSWER for a Multi Line Appearance based on the CLASS OF SERVICE - INDIVIDUAL [C-15] as assigned to the Station (My Line) setting the service. The figure below is a simplified Key Sheet Assignment for Stations 200 and 201. The CLASS OF SERVICE - INDIVIDUAL [C-15] for Station 200 is allowed CALL FORWARDING - DON'T ANSWER, but the CLASS OF SERVICE - INDIVIDUAL [C-15] for Station 201 is not. Station 200 is able to set CALL FORWARDING - DON'T ANSWER for Station 201. The associated Feature key LED on Station 201 will illuminate.

Note: The FORWARD - NA key is same as the CALL FORWARDING - DON'T ANSWER Feature key.

Even when a Sub Line of Desktop terminal is assigned as the Destination Station, the call is not forwarded if the My Line of that Desktop terminal is not allowed CALL FORWARDING - DON'T ANSWER.

5. This feature is applicable to CALL FORWARDING - ALL CALLS - OUTSIDE [C-28], CALL FORWARDING - DON'T ANSWER - CCIS [C-47], and MULTIPLE CALL FORWARDING -DON'T ANSWER - CCIS [M-42].
6. The display of an Intermediate Station on a Desktop terminal's LCD may be allowed or denied according to System Data. This arrangement is done on a system basis. The LCD displays:

Note: When the Telephone Number of the Intermediate or Calling/Called Station exceeds eight digits, the last eight digits are displayed. However, a maximum of 16 digits Calling/Called Telephone Number can be displayed on the middle line of LCD depending on the System Data.

Interactions

1. If Access Codes for CALL FORWARDING - BUSY LINE and CALL FORWARDING - DON'T ANSWER are the same, only one key needs to be assigned in AKYD.
2. ACFO is applicable to DID, DIT, and TIE Line Calls only.
3. A Non-Controlling UCD Station is allowed to activate CALL FORWARDING - DON'T ANSWER. When this Station sets Call Forwarding, calls directed to this Station will be Call Forwarded. The member Station is not removed from the UCD Group under the conditions of the Call Forwarding feature used. When it is the Station's turn to ring, that call is affected by CALL FORWARDING - DON'T ANSWER.
4. CALL FORWARDING - DON'T ANSWER to an Attendant Console will not operate when the system is in Night mode. If ATTENDANT NIGHT TRANSFER [A-19] is provided, the call is forwarded to the ATTENDANT NIGHT TRANSFER [A-19] Station.
5. If the CALL FORWARDING-DON'T ANSWER Target Station is a Desktop terminal that has activated DO NOT DISTURB [D-21D], Call Forwarding is not activated. The Station will ring, and the timer setting in SYS1, Index 145 is ignored.
6. The CALL FORWARDING - DON'T ANSWER feature is set from Station A to Station B if Station A is idle and Station B is busy. The timer setting in SYS1, Index 145 is ignored.
7. When a call is Call Forwarded, the Destination Station is recorded for STATION MESSAGE DETAIL RECORDING (SMDR) [S-10].
8. STATION-TO-STATION CALLING [S-11] must first be provided.
9. A tone will not be provided when an access code is used to set this feature on SP Controlled Standard SIP terminal.
10. When SIP Handler Controlled SIP terminal is in Multi Line Mode, the Call Forwarding setting applies to the seized line while setting. In normal case, where My Line is not used by another station, the Call Forwarding setting applies to My Line. To set the Call Forwarding applying to Sub Line, use the ACFS/ ACFS_T commands.

Programming

<Call Forwarding - Don't Answer with Access Code>

STEP 1: **ASYD** - SYS1, Index 5, Bit 0. Are the Access Codes for CALL FORWARDING - BUSY LINE [C-2] and CALL FORWARDING - DON'T ANSWER the same or separate? 0/1: Same/Separate.

SYS1, Index 69, Bit 1 and Bit 2 is a Short Tone to alert person receiving the call that this is a CALL FORWARDING - DON'T ANSWER Call? 0/1: No/Yes.

Note: There will be no Short Tone if the call is received by a SIP station.

SYS1, Index 139. Assign the No Answer Timer for Station-to-Station, DID and TIE Line Calls. For 30 seconds, assign 00H. (RAM Data is 3FH.)

Note: By using ADAI, No Answer Timer can be assigned on a Terminal basis. ADAI command is available only for Australia and North America.

SYS1, Index 141. Assign the No Answer Timer for Incoming Calls via the Attendant Console. It will then be forwarded to the next Station according to SYS1, Index 145 timer. For ten seconds, assign 00H. (RAM Data is 35H.)

SYS1, Index 145. Assign the time an Incoming Call via the Attendant Console will ring at the CALL FORWARDING - DON'T ANSWER Station before recalling to the Attendant Console. For 30 seconds, assign 00H. [RAM Data is 9FH.]

SYS2, Index 6, Bit 7. Enable CALL FORWARDING - DON'T ANSWER via the Attendant Console.

STEP 2: **ASYDL** - SYS1, Index 677, Bit 3.
Display a maximum of 16 digits Call Forwarding Information on LCD? 0/1 = No (default)/Yes.

STEP 3: **ANPD** - Reserve a Number Level for Feature Access and Cancel. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. (in order to be applicable to any feature assigned to this level). Assign NND in accordance with a predetermined Numbering Plan.

STEP 4: **ASPA** - Assign an Access Code to CALL FORWARDING - DON'T ANSWER entry, SID = 12, and to CALL FORWARDING-DON'T ANSWER cancel, SID = 13. Assign CI for "N: Normal" service.

STEP 5: **ASFC** - Assign the Stations to receive CALL FORWARDING - DON'T ANSWER a Service Feature Restriction Class that allows SFI 8 (Call Forwarding - Don't Answer).

STEP 6: **ADSL** - Assign SN=1 (Originating; DT Connection) and Feature key Call Forwarding Don't Answer; FDN [22]. This command is used for assigning the function to each Soft key.

STEP 7: **AKYD** - For Dterm sets, CALL FORWARDING - DON'T ANSWER may be assigned to a Line/ Feature key. Assign Feature key Call Forward - Don't Answer [22].

STEP 8: **ATNR** - Allow Tenant-to-Tenant Connection for Inter and Intra-Tenant Connections. Assign Tenant Restriction Index (TRI) = 1. For this feature to be set by the Attendant Console, assign Inter and Intra-Tenant Connection via the Attendant Console, TRI = 3. Also assign TRI = 0, Station-to-Station Calling.

CFI of either the Attendant Console or a Station.

STEP 9: **ADAI** - Assign NAT139, NAT140, NAT141 and NAT247 for Individual Call Forwarding - Don't Answer Timer.

Note: ADAI command is available only for Australia and North America.

<Call Forwarding - Don't Answer with PCPro command (per Station)>

STEP 1: **ASYD** - SYS1, Index 79, Bit 2=1. Split Call Forwarding Service: 0/1 = Out/In service.

Note: This data is required only when Split Call Forwarding service is used.

STEP 2: **ACFS** - Specify a forwarding destination per station.
* When you set the data with Telephone Number, use ACFS_T command.
TN: Tenant Number
STN: Station Number
TYPE: Call Forwarding Type
1: Call Forwarding
2: Split Call Forwarding
SRV: Call Forwarding Kind
D: Don't Answer
RCV: Kind of Received Call
This parameter (RCV) is available when "TYPE = Split Call Forwarding" is chosen.
T: Trunk
S: Station
CFD: Call Forwarding Destination Number (Maximum 24 digits)

<Call Forwarding - Don't Answer with PCPro command (per Tenant)>

- Setting with Physical Station Number

ACFO - Specify a forwarding destination with Physical Station Number.
TN: Tenant Number
CF = 2: Call Forwarding - Don't Answer
CFI = STN **Note 1**
STN: Physical Station Number of forwarding destination

- Setting with Telephone Number

ACFOL/ACFON - Specify a forwarding destination with Telephone Number.
TN: Tenant Number
CF = 2: Call Forwarding - Don't Answer
CFI = TELN **Note 2**
UGN: User Group Number of call forwarding destination
TELN: Telephone Number of forwarding destination (Maximum 16 digits)

Note 1: When you specify an Attendant Console as a forwarding destination, choose CFI = Attendant Console (ATT).

Note 2: When you specify an Attendant Console as a forwarding destination, choose CFI = Attendant Console (ATT).

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

ASYDL - This data must be assigned to the Node setting Call Forwarding Service.
SYS1, Index 640: Assign the FPC of the Node providing the Attendant Console.

Note: The data of ASFC is assigned to the Node setting Call Forwarding Service.

C-5 Call Forwarding - All Calls

General Description

This feature permits all calls destined for a particular Station to be routed to another Station, or to the Attendant, regardless of the busy or idle status of the Called Station. Activation and cancellation may be accomplished by the user or the Attendant. This feature may be set or canceled by the user for all Multi Line Appearances on the Dterm. Additionally, a single user may set this feature to all Sub Lines on the Dterm.

Operating Procedure

To set and cancel from an individual Station using the same Access Code Note 1 Note 2

- For setting:

1. Lift the handset. Receive Dial Tone.
2. Dial the CALL FORWARDING - ALL CALLS entry Access Code. Receive Special Dial Tone.
3. Dial the desired Forwarding Destination Number. Receive Service Set Tone.

- For cancellation:

1. Lift the handset. Receive Dial Tone.
2. Dial the CALL FORWARDING - ALL CALLS entry Access Code. Receive Special Dial Tone.

Note 1: Available from FP95-114 V4 Issue 2.0 with system data ASYDL, SYS1, Index 686, Bit 0= 1.

To set and cancel from an individual Station using different Access Codes Note 2

- For setting:

1. Lift the handset. Receive Dial Tone.
2. Dial the CALL FORWARDING - ALL CALLS entry Access Code. Receive Special Dial Tone.
3. Dial the desired Forwarding Destination Number. Receive Service Set Tone.

- For canceling:

1. Lift the handset. Receive Dial Tone.
2. Dial the CALL FORWARDING - ALL CALLS cancel Access Code. Receive Service Set Tone.

To set from the ATTENDANT CONSOLE [A-3]

1. Press an Idle Loop key.
2. Dial the CALL FORWARDING - ALL CALLS entry Access Code. Receive Special Dial Tone.
3. Dial the TENANT SERVICE [T-12] Number (two digits).
4. Dial the Originating Telephone Number.
5. Dial the desired Forwarding Destination Number. Receive Service Set Tone.

To cancel from the ATTENDANT CONSOLE [A-3]

1. Press an Idle Loop key.
2. Dial the specific CALL FORWARDING - ALL CALLS cancel Access Code. Receive Special Dial Tone.
3. Dial the TENANT SERVICE[T-12] Number (two digits).
4. Dial the Originating Telephone Number. Receive Service Set Tone.

Note 2: A tone will not be provided when an access code is used to set this feature on SP Controlled Standard SIP terminal.

<The following procedures are applied for Desktop terminal only.>

To set from My Line using a Line/Feature key

1. Lift the handset or press the SPEAKER key. Receive Dial Tone.
2. Press the CALL FORWARDING - ALL CALLS Feature key. Receive Special Dial Tone.
3. Dial the desired Forwarding Destination Number. Receive Service Set Tone. The LED will light. The LCD displays:

Target Station

FORWARD SET XXXX **(Time Display)**

4. Replace the handset or press the SPEAKER key.

To monitor from My Line

1. Press the CALL FORWARDING - ALL CALLS Feature key. The LCD displays:

Target Station

FORWARD XXXX **(Time Display)**

OR

Operator

FWD SET **(Time Display)**

To cancel from My Line using a Line/Feature key

1. Lift the handset or press the SPEAKER key. Receive Dial Tone.
2. Press the CALL FORWARDING - ALL CALLS Feature key. Receive Service Set Tone. The LED of the associated Feature key will go out. The LCD displays:

FORWARD CANCEL **(Time Display)**

3. Replace the handset or press the SPEAKER key.

To set for a Multi Line Appearance other than the My Line

1. Lift the handset or press the SPEAKER key.
2. Press the Multi Line Appearance. Receive Dial Tone. Then press the CALL FORWARDING - ALL CALLS Feature key. Receive Special Dial Tone.
3. Dial the desired Forwarding Destination Number. Receive Service Set Tone. The LED of the associated Feature key does not light at the Station setting the service. If the Multi Line Appearance is another Dterm's My Line, that Station's Feature key LED will light. The setting Station's LCD displays:

Target Station

FORWARD SET XXXX (Time Display)

4. Replace the handset or press the SPEAKER key.
5. If the Target Station is the operator, the LCD displays:

FWD SET OPR (Time Display)

To monitor for a Multi Line Appearance other than the My Line

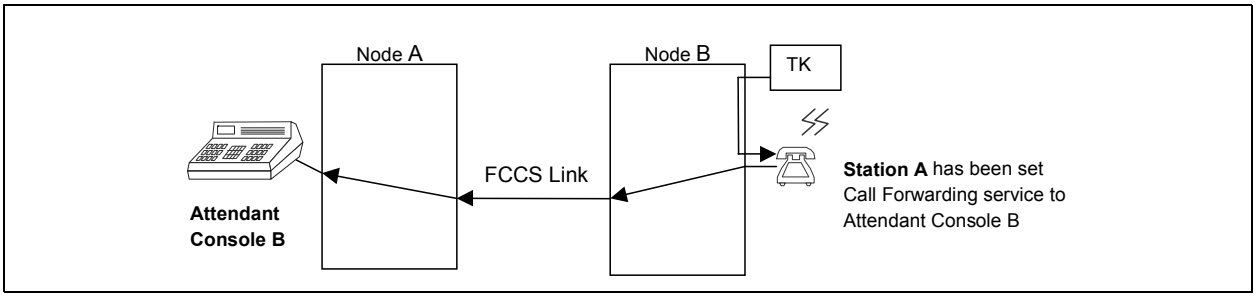
1. Press the Multi Line Appearance. Then press the CALL FORWARDING - ALL CALLS Feature key. The LCD displays:

Target Station

FORWARD XXXX (Time Display)

To cancel for a Multi Line Appearance other than the My Line

1. Lift the handset or press the SPEAKER key. Receive Dial Tone.
2. Press the Multi Line Appearance. Receive Dial Tone. Press the CALL FORWARDING - ALL CALLS Feature key. Receive Service Set Tone. The LCD displays:



FORWARD CANCEL (Time Display)

   The associated LED that is lit at another Station goes out.
3. Replace the handset or press the SPEAKER key.

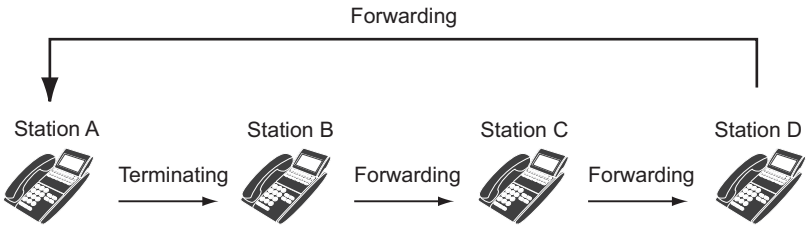
Service Conditions

1. Stations with this feature set may originate any calls and access the CALL FORWARDING - ALL CALLS cancellation Code.
2. There is no limitation to the number of Stations that can set CALL FORWARDING - ALL CALLS simultaneously.
3. Stations may be assigned this feature via CLASS OF SERVICE - INDIVIDUAL [C-15] programming in System Data.
4. When a call is forwarded to another Station, one burst of Ringing Signal will be sent to the Station to indicate that it is Call Forwarded.
5. Stations activating CALL FORWARDING - ALL CALLS may be restricted from placing any calls, except to the Attendant. (This is an optionally programmable feature).
6. When the Operator answers a Forwarded Call, System Data programming can provide a Called Telephone Number display on the ATTENDANT CONSOLE [A-3].
7. CALL FORWARDING - ALL CALLS Data remains in the Data Memory, even if the system is re-initialized or in the event of a power failure.

8. If the Station's own Telephone Number is set for CALL FORWARDING - ALL CALLS, this feature is changed to CALLING PARTY RECOGNITION SERVICE (CALL FORWARDING - ALL CALLS) [C-103].
9. When the Station user setting CALL FORWARDING - ALL CALLS goes off-hook, Special Dial Tone can be provided instead of Dial Tone (activation of this service is determined by System Data).
10. The OAI Monitor Number and the ACD Pilot Number cannot be assigned as the Call Forwarding Target Telephone Number except when called from a Station or TIE Line Trunk.
11. When a destination of CALL FORWARDING - ALL CALLS has already been assigned, even if the feature is restricted by the new Office Data or changing of Day/Night mode, the assigned data can still be used or canceled.
12. A Digital Announcement Trunk can be set as Forwarding Destination.
13. A Telephone Number must be set to the call Forwarding Destination.
14. A call can be forwarded to an Attendant Console in the Remote Node via FCCS.

15. When a call is forwarded through FCCS, the Numbering Plans of the originally Called Station and the Forwarded Attendant Console must be the same.
16. Specific Attendant Number cannot be set as Forwarding Destination Number.
17. Assign the System Data (ASYDL, SYS1, Index 677, Bit 3=1), and press the CALL FORWARDING - ALL CALLS Feature key, a maximum of 16 digits Call Forwarding Information can be displayed.

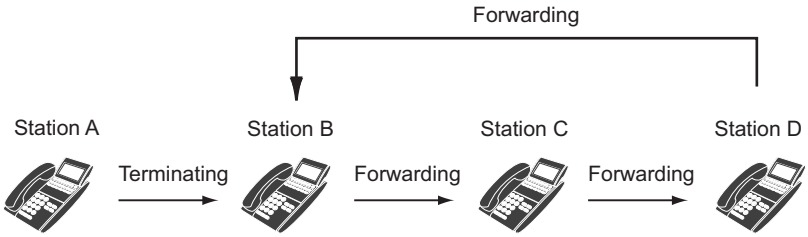
    Note: This feature is available only for the terminal that can display 24 digits on LCD.



18. Multiple Call Forwarding - Busy Line/All Calls/Logout (Logged Out IP Station - Call Destination [L-53]) can be selected to use or not by ASYD command [SYS1, Index 69, Bit 7 (0/1 = Out of service/In service)].

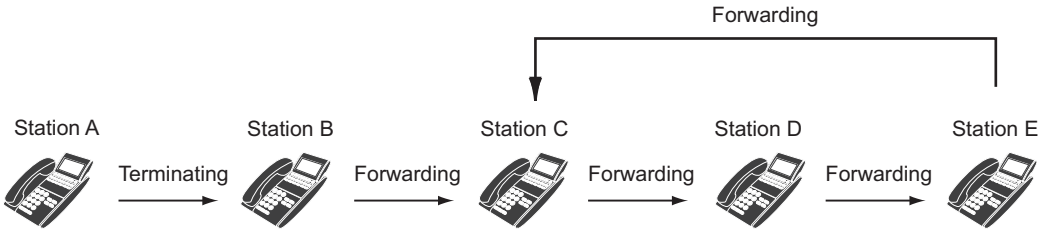
    - When using Multiple Call Forwarding - Busy Line/All Calls/Logout.

      A maximum number of Multiple Call Forwarding - All Calls/Busy Line/Logout occurrences can be selected by ASYD command [SYS1, Index 5, Bit 1 to Bit 3].



The following shows the call forwarding operation that is looped within the assigned number of Multiple Call Forwarding - Busy Line/All Calls/Logout occurrences.

< If target station is Station A. >



The call of Station A calls Station D. If Station D is busy, Station A hears a busy tone.

< If call forwarding is looped among Station B-D >

The call of Station A calls Station C. If Station C is busy, Station A hears a busy tone.

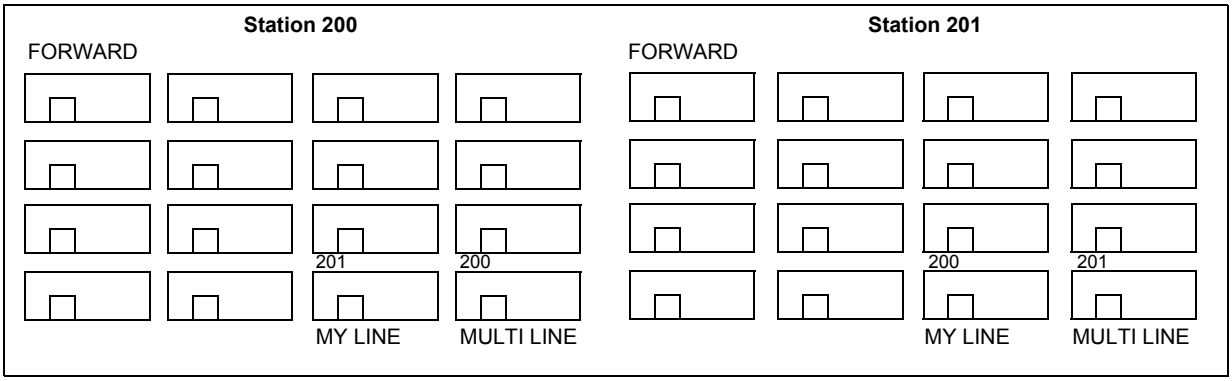
< If call forwarding is looped among Station C-E >

The call of Station A calls Station C. If Station C is busy, Station A hears a busy tone.

- When not using Multiple Call Forwarding - Busy Line/All Calls/Logout.

Depending on the call forwarding setting for destination terminal, the operation will change as follows.

Example: Call Forwarding Operation among Station A-D When Station A calls Station B



Station B sets	Station C sets	Operation
"Call Forwarding - All Calls [C-2]/Logged Out IP Station - Call Destination [L-53]" for Station C	"Call Forwarding - Busy Line [C-2]" for Station D	Station C is called.
"Call Forwarding - All Calls [C-2]/Logged Out IP Station - Call Destination [L-53]" for Station C	"Call Forwarding - All Calls [C-2]/Logged Out IP Station - Call Destination [L-53]" for Station D	Station D is called.
"Call Forwarding - Busy Line [C-2]" for Station C	"Call Forwarding - All Calls [C-2]/Logged Out IP Station - Call Destination [L-53]" for Station C	Station C is called.
"Call Forwarding - Busy Line [C-2]" for Station C	"Call Forwarding - Busy Line [C-2]" for Station D	Station A hears a busy tone.

19. By registering the Call Forwarding - All Calls Access Code + the desired Forwarding Destination Number to the CF Setting button of a Line/Feature key on a Desktop terminal, it is possible to enable and disable CALL FORWARDING - ALL CALLS [C-5] just by pressing the CF Setting button. For a detailed explanation, see CALL FORWARDING (CF) BUTTON - ONE TOUCH [C-208].

Note: CALL FORWARDING (CF) BUTTON - ONE TOUCH [C-208] is available from FP95-114 V4 Issue 2.0.

<The following conditions are applied for Desktop terminal only.>

1. CALL FORWARDING - ALL CALLS can only be set from the My Line or Sub Line.
2. CALL FORWARDING - ALL CALLS may also be accessed via the dial pad or SPEED CALLING - ONE TOUCH [S-26D]. If this feature is accessed via the dial pad, it must also be canceled via the dial pad.
3. A Station user may set CALL FORWARDING - ALL CALLS for a Multi Line Appearance based on the CLASS OF SERVICE - INDIVIDUAL [C-15] assigned to the Station setting the service. The figure below is a simplified Key Sheet Assignment for Stations 200 and 201. The CLASS OF SERVICE - INDIVIDUAL [C-15] for Station 200 is allowed CALL FORWARDING - ALL CALLS, but the CLASS OF SERVICE - INDIVIDUAL [C-15] for Station 201 is not. Station 200 is able to set CALL FORWARDING - ALL CALLS for Station 201. The associated Feature key LED on Station 201 will illuminate.

Note: The FORWARD key is same as the CALL FORWARDING - ALL CALLS Feature key.

4. This feature is applicable to CALL FORWARDING - ALL CALLS - OUTSIDE [C-28] and CALL FORWARDING and MULTIPLE CALL FORWARDING - ALL CALLS - CCIS [C-45] [M-40].
5. The display of an Intermediate Station on a Dterm's LCD may be allowed or denied according to System Data. This assignment is done on a system basis. The LCD displays:

Intermediate Station Calling/Called Party

CF ALL XXXX	**XXXX**
(Time Display)	

Note: When the Telephone Number of the Intermediate or Calling/Called Station exceeds eight digits, the last eight digits are displayed. However, a maximum of 16 digits Calling/Called Telephone Number can be displayed on the middle line of LCD, depending on the System Data.

Interactions

1. Users are unaccustomed to hearing Ringback Tone when responding to their own Station's ring. Inform users when providing Ringback Tone with CALL FORWARDING - ALL CALLS in SYS1, Index 69, Bit 1.
2. Call Forwarding can only be activated from an idle Station.
3. When CALL WAITING [C-12, 31], ATTENDANT CAMP-ON [A-1], and CALL BACK [C-1] are directed toward Station A, with CALL FORWARDING set to Station B, Station B will receive Call Waiting Tone.
4. When a Station in a STATION HUNTING [S-7, 8, 9] Group initiates CALL FORWARDING - ALL CALLS, calls normally destined for this Station will not be received. The Hunt Group operates as if the Station were busy.
5. A Non-Controlling UCD Station is allowed to activate CALL FORWARDING [C-5]. With this Station Call Forwarded, only calls that are directly dialed to this Station are Call Forwarded. The member Station is removed from the UCD Group under the conditions of this Call Forwarding feature.
6. If an Attendant attempts BUSY VERIFICATION [B-3] to Station A, which has CALL FORWARDING - ALL CALLS set to Station B, BUSY VERIFICATION [B-3] proceeds as if the Attendant had attempted to Verify Station B. If Station A has set CALL FORWARDING - ALL CALLS to the Attendant Console, BUSY VERIFICATION [B-3] is allowed at Station A if Station A is busy.
7. When CALL FORWARDING - ALL CALLS is in effect, the Call Forwarded Station may be used to originate calls. See SYS2, Index 6, Bit 4.
8. When a Station is Call Forwarded, the Destination Station is recorded for STATION MESSAGE DETAIL RECORDING (SMDR) [S-10].
9. CALL FORWARDING - ALL CALLS can be overridden, allowing Station B to Initiate or Transfer Calls back to Station A.
10. STATION-TO-STATION CALLING [S-11] must first be provided.
11. A tone will not be provided when an access code is used to set this feature on SP Controlled Standard SIP terminal.
12. When SIP Handler Controlled SIP terminal is in Multi Line Mode, the Call Forwarding setting applies to the seized line while setting. In normal case, where My Line is not used by another station, the Call Forwarding setting applies to My Line. To set the Call Forwarding applying to Sub Line, use the ACFS/ ACFS_T commands.

Programming

STEP 1: **ASYD** - SYS1, Index 4, Bit 6. One burst of ringing at the Forwarding Station when Call Forwarding - All Calls is in service? 01: No/Yes.
SYS1, Index 5, Bit 1 to Bit 3. Maximum number of Multiple Call Forwarding - Busy Line/All Calls/ Logout (Logged Out IP Station - Call Destination [L-53]). **Note 3**
SYS1, Index 69, Bit 1 (Bit 2 - Burst of Tone for Recall). A burst of Ringback Tone to alert the person receiving a Call Forwarding - All Calls Call. In service? 0/1: No/Yes. Normally assigned as data "0". **Note 4**
SYS1, Index 248, Bit 7. Dial Tone to be sent out when a Station on which CALL FORWARDING - ALL CALLS is set, goes off-hook to place an Outgoing Call 0/1: Dial Tone/Special Dial Tone.
SYS 2, Index 6, Bit 4. Enables Station set for Call Forwarding - All Calls to be allowed to use phones normally. If data "0" is assigned, the Station will only be able to call the Attendant Console. Assign on a per Tenant basis.

STEP 2: **ASYDL** - SYS1, Index 677, Bit 3.
Display a maximum of 16 digits Call Forwarding Information on LCD? 0/1 = No (default)/Yes.
SYS1, Index 686, Bit 0=1. **Note 5**
Disabling Call Forwarding - All Calls with entry Access Code is in service.

STEP 3: **ASYDN** - SYS1, Index 686, Bit 0=1. **Note 5**
Disabling Call Forwarding - All Calls with entry Access Code is in service.

STEP 4: **ANPD** - Reserve a Number Level for Feature Access and Cancel (**Note 6**). Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan.

STEP 5: **ASPA** - Assign an Access Code to Call Forwarding - All Calls entry SID = 8, and to Call Forwarding - All Calls cancel SID = 9 (**Note 6**). Assign Connection Status Index (CI) for "N: Normal" service.

STEP 6: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 7 (Call Forwarding - All Calls) to Stations that will activate Call Forwarding - All Calls.

STEP 7: **AKYD** - For Dterm sets, Call Forwarding - All Calls may be assigned to a Line/Feature key. Assign Feature key Call Forwarding - All Calls [2].

STEP 8: **ADSL** - Assign SN = 1 (Originating) and Feature key Call Forwarding - A - All Calls [2].
This command is required only for assigning the function to each Soft key.

STEP 9: **ATNR** - Allow Tenant-to-Tenant Connection for Inter and Intra-Tenant Connections. Assign Tenant Restriction Index (TRI) = 1. For this feature to be set by the Attendant Console, assign Inter and Intra-Tenant Connection TRI = 3, via the Attendant Console. Also allow TRI = 0, Station-to-Station Calling.

Note 3: This data is valid only when SYS1, Index 69, Bit 7 is assigned as"1".

Note 4: There will be no burst of Ringback Tone if the call is received by a SIP station.

Note 5: Available from FP95-114 V4 Issue 2.0.

Note 6: When SYS1, Index 686, Bit 0=1 (Disabling Call Forwarding - All Calls with entry Access Code is in service), Call Forwarding - All calls cancel is not required because the cancellation can be performed with the entry Access Code.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

ASYDL - This data must be assigned to the Node setting Call Forwarding Service.
SYS1, Index 640: Assign the Fusion Point Code (FPC) of the Node providing the Attendant Console.

Note: The data of ASFC is assigned to the Node setting Call Forwarding Service.

C-6 Call Hold

General Description

This feature permits any user to hold a call in progress by performing a switch hook flash and dialing a pre-programmed CALL HOLD Code or pressing the HOLD Feature key, thus allowing that Line to be used for originating another call or returning to a previously Held Call.

Operating Procedure

To hold a call in progress using Access Code

1. Press the switch hook. Receive Special Dial Tone.
2. Dial CALL HOLD Code. Receive normal Dial Tone.
3. The call in progress is held. The user may initiate a new call.

To release a new call and return to the held call

1. Go on-hook, releasing the new call.
2. The original call rings back to Station.
3. Go off-hook and continue with the original call.

To hold a new call and return to original call

1. Press the switch hook. Receive Special Dial Tone.
2. Dial the CALL HOLD Code. The new call is now held.
3. The original call is automatically returned.

Note: By repeating the above steps, users can talk alternately with two parties.

<The following procedures are applied for Desktop terminal only.>

To hold a call in progress without the HOLD Feature key

1. Press the TRANSFER key. Receive Special Dial Tone. The LCD displays:

TRANSFER **(Time Display)**

2. Dial the CALL HOLD [C-6] Code. Receive normal Dial Tone.
3. The user may initiate a new call.

To release a new call and return to the original call

1. Go on-hook, releasing the new call, or press the RECALL key.
2. The original call will ringback to the Dterm.

To hold a new call and return to the original call

1. Press the TRANSFER key. Receive Special Dial Tone.
2. Dial CALL HOLD [C-6] Code. The new call in progress is held, the original call is automatically returned.

Note: By repeating the above steps, user can talk alternately with two parties.

To hold a call in progress with the HOLD key programmed to a Line/Feature key

1. While a call is in progress, press the HOLD key.
2. The call is placed on HOLD, Dial Tone is restored.
3. A new call may be dialed.

To release a new call and return to the original call

1. Go on-hook, releasing the new call, or press the RECALL key.

To hold a new call and return to the original call

1. Press the HOLD key. The new call in progress is held, the original call is automatically returned.

Note: By repeating the above steps, user can talk alternately with two parties.

On a Dterm, a SPEED CALLING - ONE TOUCH [S-26] may be used to place a call on HOLD

1. Press FEATURE key, plus a SPEED CALLING - ONE TOUCH [S-26] key. The LCD will display any previously stored data.
2. Press the RECALL key. The LCD displays:

   This acts as a switch hook flash. See FLASH ENTRY -D [F-4D].
3. Dial CALL HOLD [C-6] Access Code.
4. Press the SPEED CALLING - ONE TOUCH [S-26] key. The LCD displays:

5. This key may now be used to access the CALL HOLD feature.
6. When engaged in a conversation, press the SPEED CALLING - ONE TOUCH [S-26] key with the stored CALL HOLD Access Code.
7. Dial Tone is restored to the telephone, and user is free to make another call.

To operate a Dterm via the FLASH BUTTON [F-3D]

1. When engaged in a conversation, press the programmable Feature/Line key programmed as a FLASH BUTTON [F-3D]. The LCD will display:

2. Dial the CALL HOLD [C-6] Access Code. The LCD goes blank and Dial Tone is restored to the user.

Service Conditions

1. Lines freed through use of this feature may also be used for answering Incoming Calls via the CALL PICKUP - GROUP [C-7] or TRUNK ANSWER FROM ANY STATION [T-8] features.
2. If the Controlling user does not dial any further digits after the CALL HOLD Code, removal of Dial Tone will occur after 12 seconds; Reorder Tone is then applied for 30 seconds followed by muting of the Station set.
3. Calls will remain on hold until the Controlling user either replaces the handset, causing the Held Call to ringback, or will press the TRANSFER key or Flash Button and redial the Hold Code to return to the original call.
4. Only one call at a time may be held per Station Line, and the Held Call cannot be added to another call as in THREE-WAY CALLING [T-2].
5. Stations may be assigned this feature via CLASS OF SERVICE - INDIVIDUAL [C-15] programming in System Data.
6. There is no limitation to the number of Stations that may simultaneously access this feature.
7. CALL WAITING [C-12, 31] cannot be activated if the Target Station has a call on HOLD.
8. CALL BACK [C-1]:
   a.) A user cannot activate CALL HOLD when CALL BACK [C-1] has already been activated.
   b.) A user cannot use the CALL HOLD feature while CALL BACK [C-1] is in effect toward it.
   c.) A user with a call on HOLD cannot activate the CALL BACK [C-1] feature.
9. CALL PICKUP [C-7, 30]: A user is denied use of the CALL PICKUP [C-7, 30] feature when holding one call and in a talking state with another call.
10. THREE-WAY CALLING [T-2]: This feature used in conjunction with the CALL HOLD feature, allows the Calling Station user to transfer a second call while holding the first call. After transferring the second call, the Calling Station user is recalled by the party on hold.
11. EXECUTIVE RIGHT-OF-WAY [E-1]: Executive Override of a Station that has a call on HOLD and is connected to another call is allowed. However, Executive Override of a Station on HOLD is denied (Reorder Tone is heard).
12. CALL FORWARDING [C-2, 3, 5]: This feature interacts with CALL HOLD as follows: CALL HOLD ringbacks are not forwarded. Instead, the Calling Station is recalled with the Held Call after going on-hook.
13. BUSY VERIFICATION [B-2]: Busy Verification of a Station on HOLD is denied. Busy Verification of a Station that has a call on HOLD is allowed if the Station is in a talking state with another party.
14. OUTGOING TRUNK QUEUING [O-2, 2D]: A Station user cannot be placed in a Ringback Queue while holding another call in hold.
15. Attendant Calls cannot be held.
16. ATTENDANT CAMP-ON [A-1]: Call hold cannot be activated when ATTENDANT CAMP-ON has already been set.
17. This feature is not available for ISDN trunk, ISDN terminal, and PS.
18. This feature cannot be used when the party on the other end is PS.

19. The Operating Station is recalled by the party on CALL HOLD after going on-hook in the following situations:
    - operational error (dialing a wrong number or an incomplete number, etc.)
    - the second station is busy
    - the second station is ringing
    - when engaged in a two-party connection with the second station
    - etc.
20. During a new call after activating the CALL HOLD feature on the Desktop terminal, press the ANSWER key to return to the original call. This operation is same as dialing CALL HOLD [C-6] Code after pressing the TRANSFER key, or pressing the HOLD key.
21. A SIP Multiple Line terminal, a Soft Phone (SIP) and an MG with a setting that hold tone is sent out from the terminal itself plays the hold tone back from the beginning when the counter station dials a Call Hold access code.
22. If External IP Music-on-Hold of VS32 CONFERENCE SERVER [V-26] is used, the hold tone after dialing the Call Hold access code is replayed from the beginning.

Interactions

1. CONSULTATION HOLD [C-17] must be allowed for all features that will operate by using the switch hook to make a connection. This includes CALL TRANSFER [C-11], CALL PICKUP [C-7], THREE-WAY CALLING [T-2], etc.
2. A Station can CALL HOLD only one call at a time.
3. CALL WAITING [C-12, 31]: When a Station has a call on CALL HOLD, CALL WAITING [C-12, 31] features are denied to both the holding and the held Station.
4. CALL BACK [C-1]:
    a.) A user cannot activate CALL HOLD when CALL BACK [C-1] has already been activated.
    b.) A user cannot use the CALL HOLD feature while CALL BACK [C-1] is in effect toward it.
    c.) A user with a call on HOLD cannot activate the CALL BACK [C-1] feature.
5. NON-EXCLUSIVE and EXCLUSIVE HOLD [N-7D, E-4D] are not affected by CALL BACK [C-1].
6. CALL PICKUP [C-7, 30]: A Station user is allowed use of the CALL PICKUP [C-7, 30] feature when holding Station B to pickup Station C.
7. EXECUTIVE RIGHT-OF-WAY [E-1]: Executive Override of a Station that has a call on HOLD and is connected to another call is allowed. However, Executive Override of a Station on HOLD is denied (Reorder Tone is heard).
8. AUTOMATIC RECALL [A-8] of a Held Call will not be affected by CALL FORWARDING [C-2, 3, 5].
9. BUSY VERIFICATION [B-2]: Busy Verification of a Station on HOLD is denied. Busy Verification of a Station that has a call on HOLD is allowed if the Station is in a talking state with another party

10. OUTGOING TRUNK QUEUING [O-2]: A Station user cannot queue a Trunk while using CALL HOLD.
11. Calls that include the Attendant Console cannot have access to CALL HOLD.
12. ATTENDANT CAMP-ON WITH TONE INDICATION [A-1]: This feature is denied if a Station has a call on CALL HOLD.
13. CALL HOLD cannot be activated if a call has been previously camped-on. A switch hook flash will seize the Camped-On Call.
14. Calls remain on CALL HOLD until the Controlling Station replaces the handset, causing the Held Call to ringback. If the Controlling Station does not answer the recall within the preset time-out interval (SYS1, Index 139), the connection is released.
15. This feature cannot be used with SP Controlled/SIP Handler Controlled Standard SIP terminals.

Programming

STEP 1: **ASYD** - SYS1, Index 139. No Answer Timer for CALL HOLD. (When Station A places Station B on HOLD, and hangs up, Station A will ring after a preset period of time has elapsed. If Station A does not answer, then Station B goes from Ringback Tone to Reorder Tone.)

SYS2, Index 1, Bit 0 and Bit 1. CONSULTATION HOLD [C-17] allowed or denied. 00: denied; Originating and Terminating Calls allowed, Tandem Calls denied; 11: All calls allowed.

STEP 2: **ANPD** - Reserve a Number Level for Feature Access and Cancel. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan.

STEP 3: **ASPA** - Assign an Access Code for CALL HOLD, SID = 1 for Connection Status Index (CI) of "H: Hooking".

STEP 4: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 10 (Call Hold) to Stations that are allowed CALL HOLD.

STEP 5: **AKYD** - Optional. Assign CALL HOLD to a Line/Feature key. Assign Feature key Call Hold [10]. (The operation of TRANSFER key and Access Code is also available). Assign Feature key Flash Button [21].

STEP 6: **ADSL** - Assign SN = 5 (Consultation Hold) and Feature key Call Hold [10].

This command is required only for assigning the function to each Soft key.

To operate a Dterm via the FLASH BUTTON [F-3D], assign SN = 4 (Communication is in Progress) and Feature key Flash Button [21].

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ANPDL** - Reserve a Number Level for Feature Access and Cancel. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan.

STEP 2: **ASPAL** - Assign an Access Code for CALL HOLD, SID = 1 for Connection Status Index (CI) of "H: Hooking".

Note: System Timers may be set on a network basis in ASYDN.

C-7 Call Pickup - Group

General Description

This feature permits a user to answer any calls directed to other Lines in the user's preset CALL PICKUP - GROUP by using a Line/Feature key or dialing a Pickup Code.

This feature may be used by seizing Dial Tone from any Multi Line Appearance on the Desktop terminal.
A user can be assigned to an additional CALL PICKUP - GROUP, referred to as EXPANDED CALL PICKUP - GROUP.

Operating Procedure

To pick up an Incoming Call using Access Code

1. A Station within the CALL PICKUP - GROUP rings.
2. Lift the handset. Receive Dial Tone.
3. Dial the CALL PICKUP Code. The call is connected to the Station.

To pick up an Incoming Call (CALL HOLD [C-6]) using Access Code

1. A Station within the CALL PICKUP - GROUP rings.
2. The Station flashes the switch hook. Receives Special Dial Tone.
3. Dial the CALL PICKUP Code. The call is connected to the Station.
4. The first party is put on CALL HOLD [C-6] status.

To pick up an Incoming Call within the EXPANDED CALL PICKUP - GROUP using Access Code

1. A Station within the EXPANDED CALL PICKUP - GROUP rings.
2. Lift the handset. Receive Dial Tone.
3. Dial the Access Code for EXPANDED CALL PICKUP. The call is connected to the Station.

<The following procedures are applied for Desktop terminal only.>

To pick up an Incoming Call using a Line/Feature key

1. A Station within the CALL PICKUP - GROUP rings.
2. Lift the handset. Receive Dial Tone.
3. Press the CALL PICKUP - GROUP Feature key. The call is connected to the Station. The LCD displays:

Called Station	Calling Station Trunk
PICKUP XXXX	**XXXX**
(Time Display)	

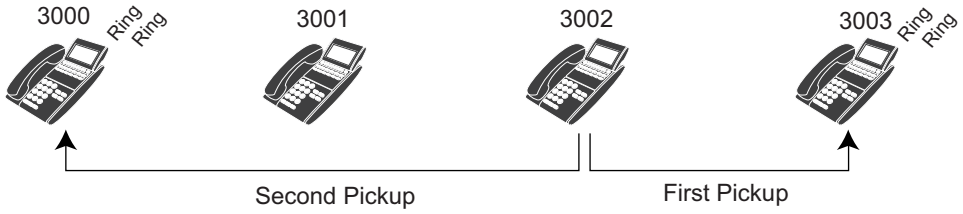
Note: When the Telephone Number of the Called/Calling Station exceeds eight digits, the last eight digits are displayed. However, a maximum of 16-digit Calling Telephone Number can be displayed on the middle line of the LCD, depending on the System Data.

To pick up an Incoming Call CALL HOLD [C-6] using a Line/Feature key

1. A Station within the CALL PICKUP - GROUP rings.
2. Press the TRANSFER/HOLD Feature key. Receive Special Dial Tone.
3. Press the CALL PICKUP - GROUP Feature key. The call is connected to the Station.

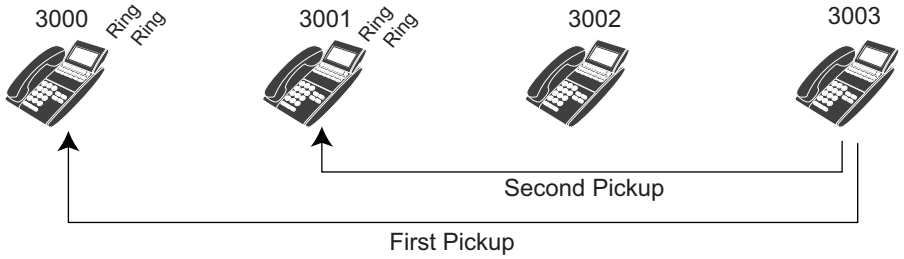
4. The first party is put on CALL HOLD [C-6] status.

To pick up an Incoming Call within the EXPANDED CALL PICKUP - GROUP using a Line/Feature key



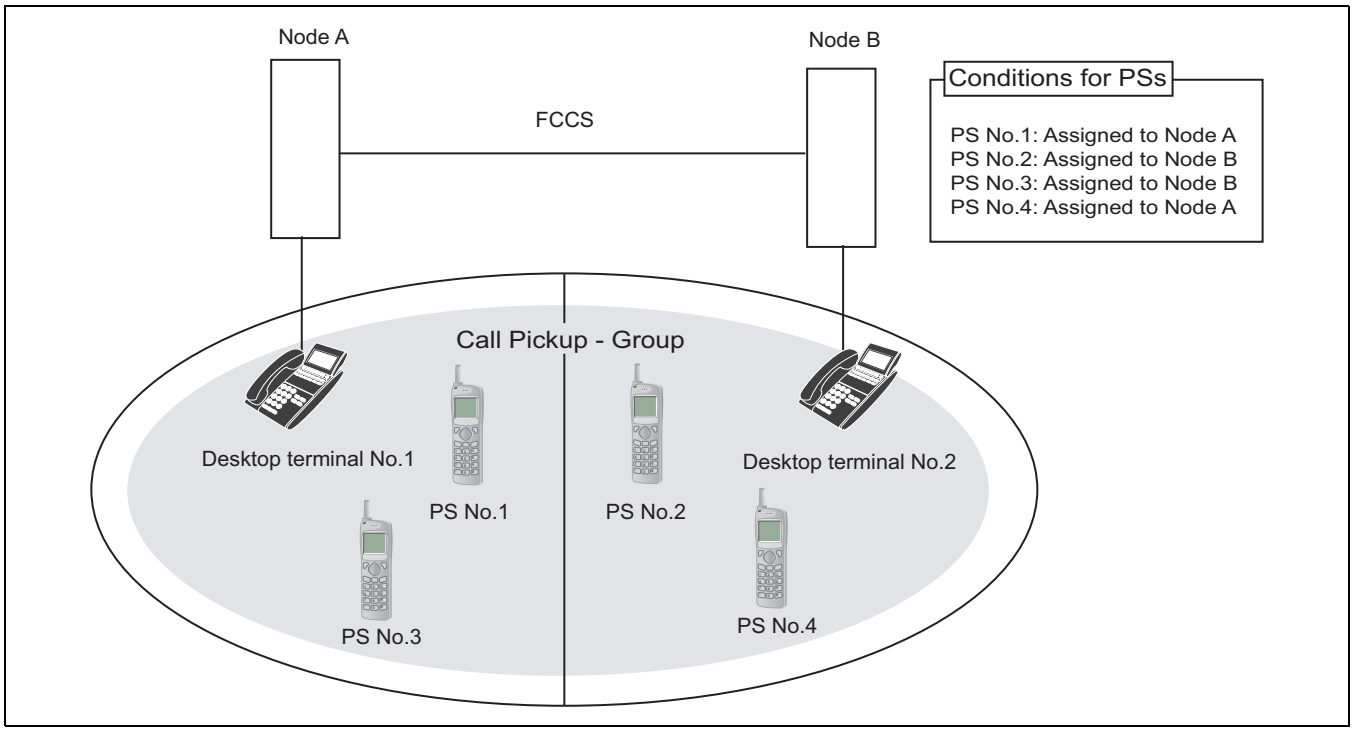
1. A Station within the EXPANDED CALL PICKUP - GROUP rings.
2. Lift the handset. Receive Dial Tone.
3. Press the Feature key for EXPANDED CALL PICKUP. The call is connected to the Station.

Service Conditions



1. This feature may be provided on a per line basis via System Data.
2. Any Station assigned a fully restricted CLASS OF SERVICE - INDIVIDUAL [C-15] will be unable to answer Incoming Central Office Calls using this feature.
3. A CALL PICKUP - GROUP is defined as those Stations having the ability to pick up each other's calls using the CALL PICKUP feature.
4. A maximum of 100 Stations can be assigned to each group. There is no limit to the number of groups per system.
5. PS can pick up a call except for the time for roaming from self office to another office. Multi Line of Desktop terminal which accommodates PS, or L2 line of PS Dual Line capable can pick up the call during the PS roaming.
6. If the CALL PICKUP - GROUP Code is dialed while two or more Stations within the group are ringing, the Switching System will connect the calls in the order of priority assigned to the Call Pickup Chain. This feature allows the user to pickup from the next Station in assigned order. See the following figure:

Assume that a total of 4 stations (3000, 3001, 3002 and 3003) are configured as a Call Pickup Group.
These Stations are assigned as members of a Call Pickup Group in the following order :
3000 to 3001 to 3002 to 3003



[Example 1] When Stations 3000 and 3003 are ringing:
If the user answers via Station 3002, the user will pick up a call terminated to Station 3003 first.
The user will pick up Station 3000, if Station 3000 is still ringing.

[Example 2] When Stations 3000 and 3001 are ringing:
If the user answers via Station 3003, the user will pick up a call terminated to Station 3000 first.
The user will pick up Station 3001, if Station 3001 is still ringing.

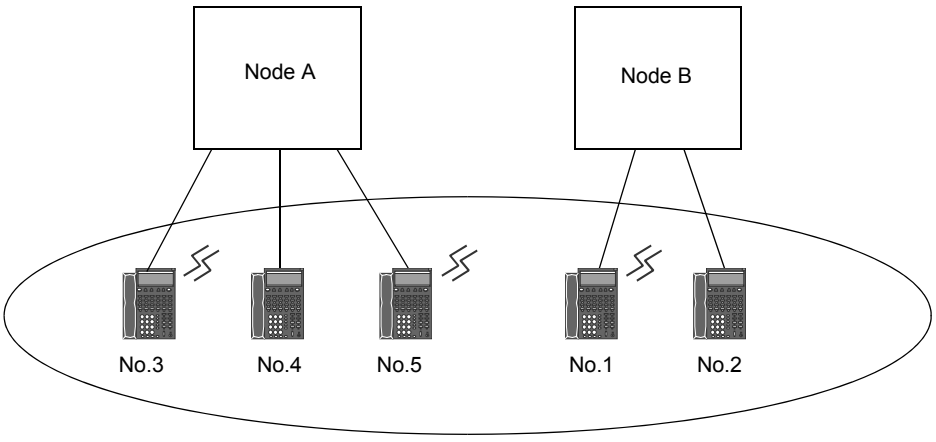
7. The conditions for Call Pickup-Group including PSs are as follows:

Call Pickup Decision Table (X: Available/N: Not Available)

Ringing Terminals	Terminal picking up a call					
	Desktop terminal No.1	Desktop terminal No.2	PS No.1	PS No.2	PS No.3	PS No.4
Desktop terminal No.1	-	-	-	-	-	-
Desktop terminal No.2	-	-	-	-	-	-
PS No.1	-	-	-	-	-	-
PS No.2	-	-	-	-	-	-
PS No.3	N Note 1	N Note 1	N Note 1	N Note 1	-	N Note 1
PS No.4	N Note 1	N Note 1	N Note 1	N Note 1	N Note 1	-

Note 1: If L2 (SubLine) feature is used in the ringing terminal, Call Pickup is available.

8. To register a group including PS, use the ACPGN command. If the ACPG command is used in this case, Picking up any incoming call to PS will not be available.
9. A CALL PICKUP - GROUP cannot be used to answer OUTGOING TRUNK QUEUING [O-2] or CALL BACK [C-1] from another Station.



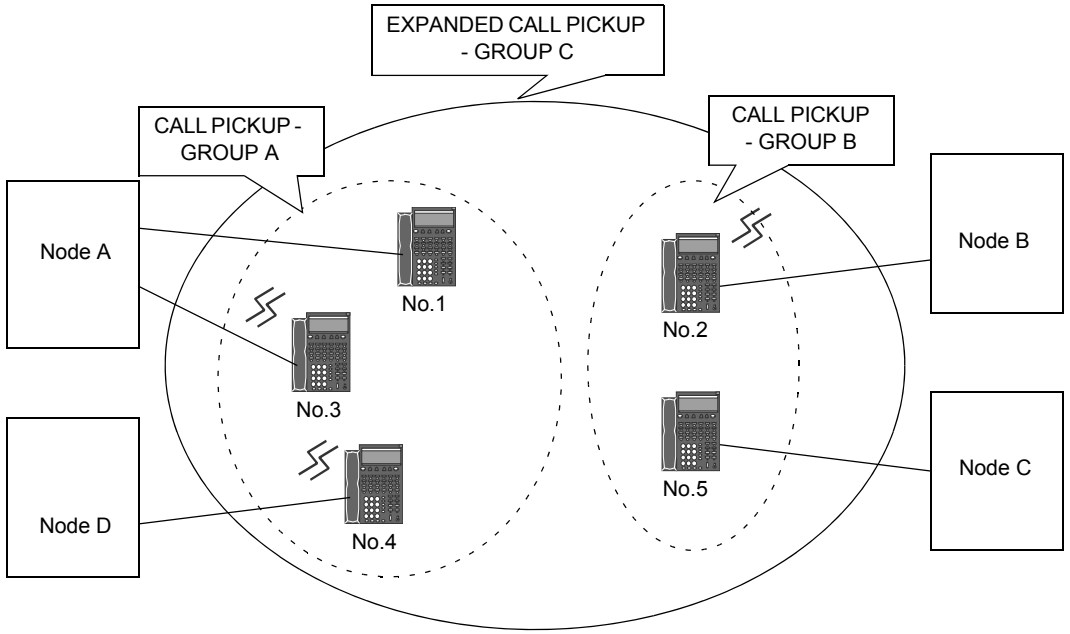
10. A busy Station can accomplish Call Pickup by flashing the switch hook and then dialing the CALL PICKUP - GROUP Code. The call in progress will automatically be placed on hold.
11. The CALL PICKUP - GROUP feature cannot be used to answer the following types of calls:
    - Automatic callback from the station number requested through CALL BACK [C-1]
    - Automatic callback from the outgoing trunk queue requested through OUTGOING TRUNK QUEUING [O-2]
    - Recall indicating unsuccessful connection to another party in CALL HOLD [C-6]
    - Call from the paged individual through Paging Answer Access Code in the Delay System of PAGING TRANSFER [P-10]
12. A maximum of 100 Stations can be assigned to each EXPANDED CALL PICKUP - GROUP. There is no limit to the number of groups per system.
13. A user cannot pickup a call in the EXPANDED CALL PICKUP - GROUP when engaged in another call.
14. This feature is available via FCCS.
15. The allowable Station Number type for a member of CALL PICKUP - GROUP or CALL PICKUP EXPAND - GROUP is the Telephone Number only.
16. When using the FCH Card with:
    a.) Stations in up to a maximum of four different Nodes can be assigned to a CALL PICKUP - GROUP or an EXPANDED CALL PICKUP - GROUP.
    b.) When a CALL PICKUP - GROUP/EXPANDED CALL PICKUP - GROUP has Stations that belong to different Nodes, and the Multiple Call Pickup/Call Pickup Expand Stations are ringing simultaneously, if ringing Stations belong to the same Node, the user will pick up the call in assigned order. However, if ringing Stations belong to different Nodes, the user cannot pick up the call in assigned order or terminated order. The user will first pick up the call terminated to the Station belonging to the same Node of the user's Station. See the figures below.

CALL PICKUP - GROUP

The number below the Station is the assigned order.

Example: All the Stations No.1 through No. 5 belong to the same CALL PICKUP - GROUP. When Stations No. 1, No. 3 and No. 5 are ringing:

- If the user answers via Station No.4, the user will pick up a call terminated to Station No.5 first (this feature allows the user to pickup from the next Station in assigned order). The user will then pick up Station No. 3, if Station No. 3 is still ringing.
- If the user answers via Station No. 2, the user will pick up a call terminated to Station No. 1 first.



EXPANDED CALL PICKUP - GROUP

The number below the Station is the assigned order.

Example: All the Stations No.1 through No.5 belong to the same EXPANDED CALL PICKUP - GROUP C.
When Stations No.2 through No.4 are ringing simultaneously:

- If the user answers via Station No. 1, the user will pick up a call terminated to Station No. 3 first.
- If the user answers via Station No. 5, the user will pick up a call terminated to Station No. 2 first.

c.) The number of CALL PICKUP - GROUPs or EXPANDED CALL PICKUP - GROUPs is not limited.

17. A Station user cannot answer an Incoming Call to the Station in another CALL PICKUP - GROUP or EXPANDED CALL PICKUP - GROUP.
18. Even if a Station has been assigned to the existing CALL PICKUP - GROUP or EXPANDED CALL PICKUP - GROUP by Physical Station Number, the Station can also be assigned to the same CALL PICKUP - GROUP or an EXPANDED CALL PICKUP - GROUP via FCCS Service.
19. When the Station holds a call (switch hook flash or Call Hold) which terminated through FCCS, the Station cannot pick up a call via CALL PICKUP/CALL PICKUP EXPAND.
20. When both Stations, a Calling Station and a Station that will picks up a call, place another call on hold, this service is activated on the condition that all the Stations (the Calling Station, the Station that picks up the call, the ringing Station, and the held Stations) belong to the same Node. If any of the Stations belong to a different Node, this service is not activated.
21. The CALL PICKUP - GROUP/EXPANDED CALL PICKUP - GROUP can be set on a Node basis, even in the use of Telephone Numbers. In other words, the features are available via the data written on the Local Data Memory (LDM), not only on the Data Memory (DM) or the Network Data Memory (NDM). The following are conditions in this case:
    a.) The features are to be programmed by using the Telephone Number (TELN) of each Station.
    b.) A maximum of 100 Stations can be assigned per CALL PICKUP - GROUP.
    c.) A maximum of 100 Stations can be assigned per EXPANDED CALL PICKUP - GROUP.
    d.) A Station can belong to one CALL PICKUP - GROUP only.

e.) A Station can belong to one EXPANDED CALL PICKUP - GROUP only.
f.) No limitation is attached to the number of CALL PICKUP - GROUPs/EXPANDED CALL PICKUP - GROUPs per Node.
g.) When multiple Stations are ringing in a CALL PICKUP - GROUP/EXPANDED CALL PICKUP - GROUP, the calls won't be picked up in the terminating order or in the assigned order of Stations.
h .) A Station cannot pick up a call to a member of other CALL PICKUP - GROUPs/EXPANDED CALL PICKUP - GROUPs.
i .) A call to be picked up can be that from a Station, a Trunk or an Attendant Console.
j.) When there is a restriction on the connection between an Incoming Call and the Answering Station, the restriction is applied. As a result of this, the Station cannot pick up the call.
k.) The features, though using the Telephone Numbers, cannot be used together with the same features via FCCS.
l.) Stations denied access to a Route via Route Restriction Class may not be able to pick up an Incoming Trunk Call.
m.) A specific Attendant Number cannot be assigned for these features.
n.) CALL PICKUP - GROUPs via DM and groups via LDM can coexist in a system.

22. When using the FCCS Network, the specific Attendant Number cannot be assigned to a CALL PICKUP - GROUP or an EXPANDED CALL PICKUP - GROUP, which is activated with NDM Data.
23. When programmed on LDM, a call by Automatic Wake-up [A-27] or Timed Reminder [T-62] cannot be picked up.
24. Assign CALL PICKUP - GROUP data using NDM commands in FCCS network to register the member stations in a group across multiple nodes.
25. Stations that are not belonging to any CALL PICKUP - GROUP can be a member of an EXPANDED CALL PICKUP - GROUP. These Stations can pick up a call directed to an appropriate group.
26. You can answer a call ringing on a virtual line of another station. Also, you can answer a call by picking it up from a virtual line.
27. Virtual lines can be assigned to a Call Pickup Group.

Interactions

1. CALL HOLD [C-6]: To pick up a call while engaged in a Two-party Connection, the Station can switch hook flash to place the other party on CALL HOLD [C-6] and dial the Call Pickup Code. The first party is put on CALL HOLD [C-6].
2. CALL BACK [C-1]: The Call Back Station Originator being called back cannot be picked up by a Station with the CALL PICKUP - GROUP feature. If the call back is directed to the Terminating Station, then Call Pickup may be used to answer the call. Any other Station attempting to pick up the call will result in the Station user receiving Reorder Tone.
3. OUTGOING TRUNK QUEUING [O-2]: The OUTGOING TRUNK QUEUING Station being recalled cannot be picked up by a Station with the CALL PICKUP - GROUP feature. An attempt to pick up the call will result in the Station receiving Reorder Tone.
4. CALL PICKUP - ONE TOUCH KEY [C-207] is available in combination with this feature.
5. RESTRICTION: A Station assigned as fully restricted or with Inward Restrictions cannot use the CALL PICKUP feature if assigned to a CALL PICKUP - GROUP.
6. THREE-WAY CALLING [T-2]: CALL PICKUP can be used only after a THREE-WAY CONFERENCE has been reduced to a Two-party Connection or the Station has returned to an idle state.

7. STATION MESSAGE DETAIL RECORDING (SMDR) [S-10]: If a billing after transfer over different MA-IDs is out of service (ASYDL, SYS1, Index 589, Bit 3=0), when a call is answered using the CALL PICKUP - GROUP feature, the SMDR record is not created.
   If a billing after transfer over different MA-IDs is in service (ASYDL, SYS1, Index 589, Bit 3=1), the SMDR record is created. The number of a station using this feature is output to the SMDR record as a called party number.
8. CONSULTATION HOLD - ALL CALLS [C-17] must be provided.
9. Station A will not be able to pick up Station B, if Station A is engaged in any state other than idle or a simple Two-party Connection.
10. Stations denied access to a Route via Route Restriction Class may not use CALL PICKUP - GROUP to answer restricted Incoming Trunk Calls.
11. CALL PICKUP - GROUP is not available for AUTOMATIC/MANUAL INTERCOM [A-30] or DIAL INTERCOM [D-87] Calls.
12. If more than one Station Line in a CALL PICKUP - GROUP is ringing, the individual call answered is selected by the system. The system priority is based on a circular chain arrangement with first priority given to the Station following the Station dialing the pick up Code.
13. A call ring in a recall state cannot be picked up with this feature.

Programming

STEP 1: **ANPD** - Reserve a Number Level for Feature Access and Cancel. Select Normal Service (N) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan.

STEP 2: **ASPA** - Assign an Access Code for the CALL PICKUP - GROUP, SID = 7 and the CALL PICKUP EXPAND, SIDA = 63 (if necessary) for Connection Status Index (CI) of "N: Normal" and "H: Hooking".

STEP 3: **ACPG** - Assign members of CALL PICKUP - GROUP. If two Stations are ringing simultaneously, the Station that was programmed first will be picked up first.

STEP 4: **ACPE** - Assign the EXPANDED CALL PICKUP - GROUP (if necessary).

STEP 5: **AKYD** - Optional. For Desktop terminal, assign a Line/Feature key as the CALL PICKUP Feature key. Assign Feature key Call Pickup - Group [12]. If necessary, assign Feature key Expanded Call Pickup - Group [115].

STEP 6: **ADSL** - Assign SN = 1 (Originating) and Feature key Call Pickup Group [12]. When answering an Incoming Call while the user is on the line, assign SN = 4 (Communication is in Progress) and Feature key Call Pickup Group [12]. This command is required for assigning the function of each Soft key.

Note: When using a Soft key on a Desktop terminal, use ADSL and ADKS for the necessary data assignments. The Status Number (SN) of the ADSL command may be "1 DT" or "4 Communication in Progress".

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

STEP 1: **ANPDN** - This command must be assigned to the NCN.

Reserve a Number Level for Feature Access and Cancel. Select Normal Service (N) from the combo box for Connection Indexes.

Assign NND in accordance with a predetermined Plan.

STEP 2: **ASPAN** - This command must be assigned to the NCN. Assign Access Code for CALL PICKUP, CI = N, SRV = "SSC: Service Code", SID = 7 (CALL PICKUP - GROUP). If necessary, assign SRV = "SSCA: Service Code Appendix", SIDA = 63 (EXPANDED CALL PICKUP - GROUP).

CI = "N: Normal"

SRV = "SSC: Service Code"

SID = 7 (CALL PICKUP - GROUP)

STEP 3: **ACPGN** - This command must be assigned to the NCN.

Assign members of CALL PICKUP - GROUP.

UGN: User Group Number

TELN: Telephone Number in CALL PICKUP - GROUP

STEP 4: **ACPEN** - This command must be assigned to the NCN.

Assign the EXPANDED CALL PICKUP - GROUP (if necessary).

UGN: User Group Number

TELN: Telephone Number in EXPANDED CALL PICKUP - GROUP

When entering data via LDM

STEP 1: **ANPDL** - Assign 1st Digit Code (1stDC) and Number of Necessary Digits (NND) for Feature Access and Cancel. Select Normal Service (N) from the combo box for Connection Indexes.

STEP 2: **ASPAL** - Assign Access Code for CALL PICKUP, CI = "N: Normal", SRV = "SSC: Service Code", SID = 7 (CALL PICKUP - GROUP). If necessary, assign SRV = "SSCA: Service Code Appendix", SIDA = 63 (EXPANDED CALL PICKUP - GROUP).

STEP 3: **ACPGL** - Assign members of CALL PICKUP - GROUP.

UGN: User Group Number

TELN: Telephone Number of member Stations

STEP 4: **ACPEL** - Assign members of EXPANDED CALL PICKUP - GROUP (if necessary).

UGN: User Group Number

TELN: Telephone Number of member Stations

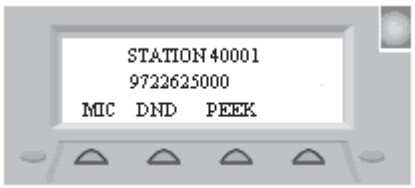
STEP 5: **AKYD** - Optional. Assign a Line/Feature key as the CALL PICKUP Feature key. KYI = 1 (Feature key), Feature key Call Pickup Group [12]. If necessary, assign Feature key Expanded Call Pickup - Group [115].

Note: When using a Soft key on a Desktop terminal, use ADSL and ADKS for necessary data assignment. At this time, Status Number (SN) of ADSL may be 1 DT or 4 Communication in Progress.

For Call Pickup - Group enhancement, see **Call Pickup Preview** (next page).

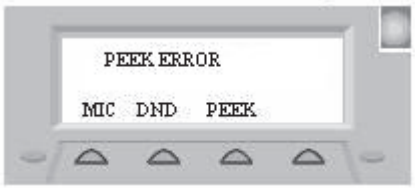
Call Pickup Preview

General Description



This is an enhancement to [C-7] Call Pickup - Group for Desktop terminals. This enhancement will allow calling party number/ANI or station number, up to a maximum of 15 digits, to be previewed on a Desktop terminal LCD display before answering. If name display is in service, a maximum of 16 ASCII characters can be displayed. Note that this feature is only for North America.

Operating Procedure



To Preview an Incoming Call

1. A Station within the CALL PICKUP - GROUP rings.
2. Press the CALL PICK UP PREVIEW Feature key.
3. LCD displays the following based on the incoming call type:
   a.) NAME
   b.) Station number/CPN/ANI

Note: A maximum of 15 digits are displayed.

Display of invalid CPN/ANI

Service Conditions

1. Call Pickup Preview is only available for Desktop terminal stations assigned in the same call pickup group. Consult the SV9500 feature and programming manual for complete details on feature [C-7] Call Pick Up Group.
2. If Call Pickup Preview is activated while two or more stations within the group are ringing, the system will view the call in the order of priority assigned to the Call Pickup Group Chain. See [C-7] Call Pickup for more detail.
3. Call Pickup Preview for Expanded call pickup - group is not available.
4. Call Pickup Preview will override the top and middle line display for approximately 5 seconds. After the 5 seconds the previous display will return. If no name is received the top display will remain as is.
5. If no stations are ringing within the Peek station call pick up group, “Peek Error” is displayed.
6. Call Pick Preview is not available for ISDN when ASFC SFI 94 is valid on the ringing station.
7. Route name assigned in ADTRL (Assignment of Dterm Display Route Data) will not be displayed in place of name.
8. On an internal station to station call, if the calling station is the same as the “Peek” station, “Peek Error” is displayed.
9. Call Pickup Preview name is not available for Guest Name Display Through PMS [G-5].
10. Call Pickup Preview is not available for PHS.
11. Call Pickup Preview will not show service type displays such as transfer, conference etc.
12. Call Pickup Preview will not display station numbers beginning with “# or *”, the display will be “PEEK ERROR”.

Interactions

1. Consult [C-7] Call Pickup -D for a complete list of interactions.
2. Call Pick Up Preview can used in an idle or consultation hold condition.

Programming

STEP 1: **ACPG** - Assign members of CALL PICKUP - GROUP. (See note)

STEP 2: **AKYD** - Assign a Line/Feature key as the CALL PICKUP Preview Feature key. KYI = 1 (Feature Key), Feature key Call Pickup Preview [166].

STEP 3: **ADSL** - Assign SKP - Soft key pattern to set, SN-status, SKN - Soft key number, FKY = 166

FCCS Programming

Additional FCCS Programming

This data setting describes only the additional commands used to activate FCCS Services. Note that the data setting for FCCS Service varies depending on the Node.

ACPGN - This command must be assigned to the NCN. Assign members of CALL PICKUP - GROUP.

UGN: User Group Number

TELN: Telephone Number in CALL PICKUP - GROUP

Note: ACPG setting is performed regardless of the LDM/NDM programming.

Take reverse procedures of above if you want to delete the settings.

C-8 Call Processing Indication

General Description

This feature provides visual indications at the ATTENDANT CONSOLE [A-3] of all calls being handled by the Attendant.

Operating Procedure

None.

Service Conditions

Each ATTENDANT CONSOLE [A-3] is provided with six dedicated Switched Loop keys. Each Loop key is associated with five lamp indicators (BUSY, RING, ATND, ANSWER, or HOLD) to display the status of the call on that Loop. The indicators may be on, OFF or flashing (400 milliseconds on and 400 milliseconds OFF).

Interactions

1. When the ATTENDANT LOOP RELEASE [A-6] feature is activated, the status of the call is removed from the ATTENDANT CONSOLE [A-3] until alerted by the AUTOMATIC RECALL [A-8] feature.
2. See DIGITAL DISPLAY - STATION [D-5], DIGITAL DISPLAY - TRUNK [D-6], and ATTENDANT LOOP RELEASE [A-6].

Programming

No programming is required.

Note: These indications are generic to the system and are enabled when the Attendant Console is programmed.

C-9 Call Queueing

General Description

This feature enables an Attendant to handle a series of Exchange Network Calls in the order of their arrival, eliminating unnecessary delays.

Operating Procedure

Press ATTENDANT CONSOLE [A-3] ANSWER key to receive calls in order of queue.

Service Conditions

1. Incoming calls arriving at the Attendant Console will light the CALL WAITING LAMP [C-13].
2. When an Incoming Call lights an INCOMING CALL IDENTIFICATION [I-2] (LDN, RECALL, etc.) Lamp, the Attendant may answer it out of the queueing sequence by pressing the indicated key.
3. Automatic Call Distribution is not used in Multi-Console operation. All Incoming Call Indications appear at each Attendant Console, so that the call can be answered by any Console. See MULTIPLE CONSOLE OPERATION [M-4] and INCOMING CALL IDENTIFICATION [I-2].
4. If an Incoming Call has been answered simultaneously by multiple Attendants, only the Attendant that operated the ANSWER key first will be connected to the call. The other Attendant's ANSWER key is non-effective when pressed.

Interactions

1. ASYD - SYS1, Index 64, Bit 1 and Bit 2. Display of Call Waiting Indication; 00 - PA Lamp is on 10 - Always.
   SYS2, Index 8 and Index 9. What kinds of calls are counted as Calls Waiting?
   SYS2, Index 14, Bit 0 to Bit 3. When CALL WAITING value exceeds a threshold value, the Call Waiting Lamp will flash.
   SYS2, Index 14, Bit 4. Will CALL WAITING - INDICATION flash for all Calls? 0/1: All Calls/Pegged Calls.
2. NIGHT CONNECTION FIXED/FLEXIBLE [N-1, 2], TRUNK ANSWER ANY STATION [T-8]: If the system is changed from Day to Night mode, calls waiting in queue will be removed and disconnected.
3. Incoming Call Indications are common to all the Attendant Consoles.
4. If the NIGHT CONNECTION - FIXED [N-1] Station is a Pilot Number in a STATION HUNTING - TERMINAL [S-9] Hunt Group, Incoming Calls will hunt to an Idle Station in the group. If all Stations in the group are busy, the call queues on the Pilot Number of the Hunt Group. When any Station becomes idle, the call is removed from queue and completed.
5. If the system is changed from Night to Day mode, Incoming Calls will be routed to the Attendant Console. A call physically ringing at the Night Station is not re-routed and is handled by the NIGHT CONNECTION - FIXED [N-1] Station.
6. If a power failure occurs, only the calls in queue that have POWER FAILURE TRANSFER [P-3] associated with their Trunk will be connected to Power Failure Stations.

Programming

No programming is required. This is generic to the system after programming the Attendant Console.

C-10 Call Transfer - Attendant

General Description

This feature permits a user, while connected to an Exchange Network Call, to signal the Attendant and have the Attendant transfer the call to another Station within the system.

Operating Procedure

Calling the Attendant

1. While engaged in a Central Office Trunk Call, press the switch hook. Receive Special Dial Tone.
2. Dial the operator Access Code.
   a.) ATTENDANT CONSOLE [A-3] RECALL Lamp flashes and buzzer sounds.
   b.) The Station receives Ringback Tone.

Answering by the Attendant

1. Refer to the Command Manual

If the Station wishes to return to the Central Office Trunk Call while the Attendant is being called

1. Press the switch hook. The RECALL lamp goes out; the buzzer stops.
2. Ringback Tone ceases. The Station returns to Central Office Trunk Call.

Note: For all Desktop terminals, use the TRANSFER key instead of the switch hook.

Service Conditions

1. This feature is available for Incoming and Outgoing Central Office Trunk Calls and Station-to-Station Calls.
2. When the ATTENDANT CONSOLE [A-3] is in the NIGHT CONNECTION [N-1, 2] mode, the Transferring Station will receive Reorder Tone if ATTENDANT NIGHT TRANSFER [A-19] is not provided.
3. The CALL TRANSFER - ATTENDANT feature allows a user, while participating in a Two-party Connection (a Two-party Connection can be comprised of two Stations or a Station and a Trunk), to call the Attendant so that the Attendant may transfer the call or provide other assistance as required.
4. If all Registers are busy and the user switch hook flashes, the flash is ignored by the system and the parties remain connected.

Interactions

1. When the HOTLINE [H-1] set is equipped with a dial, the user switch hook flashes to get Special Dial Tone and dials “0”. Ringback Tone is provided and the Attendant is notified of the call.
2. CALL TRANSFER - ATTENDANT: This feature can be used by a fully restricted Station. The Attendant can transfer a fully restricted Station to another Station only.
3. This feature is not operable when NIGHT CONNECTION - FIXED [N-1] or FLEXIBLE [N-2] is activated. To process a transfer, use CALL TRANSFER - ALL CALLS [C-11] feature. Reorder Tone is returned when CALL TRANSFER - ATTENDANT is attempted.
4. If the SPLITTING [S-4] and ATTENDANT LOCKOUT [A-5] features are activated, this feature can be activated.
5. Refer to BLIND TRANSFER TO ATTENDANT [B-17] for blind transfer from Station to Attendant Console.

6. A HOTLINE [H-1] Station may transfer a call to the Attendant Console.
7. A CALL TRANSFER to a Station with CALL FORWARDING [C-2, 3, 5] set will forward according to the conditions of the feature set, unless the Station is set to CALL FORWARD - ALL CALLS [C-5] to the Attendant Console. CALL FORWARDING - OVERRIDE [C-26] supersedes CALL FORWARDING - ALL CALLS [C-5].
8. A CALL TRANSFER to a Station in a STATION HUNTING [S-7, 8, 9] Group will hunt according to the conditions of the STATION HUNTING [S-7, 8, 9] Group.
9. A CALL TRANSFER to a Dterm that has DO NOT DISTURB [D-21D] set will receive Reorder Tone.

Programming

STEP 1: **ASYD** - SYS2, Index 1, Bit 0 and Bit 1. Assign data "11" to allow CONSULTATION HOLD - ALL CALLS [C-17] for all types of connections.

STEP 2: **ATNR** - Allow Tenant-to-Tenant Connection for Inter and Intra-Tenant Connections. Assign Tenant Restriction Index (TRI) 0 and 4 on an Inter and Intra-Tenant basis.

C-11 Call Transfer - All Calls

General Description

This feature permits a user to transfer Incoming or Outgoing Central Office and Intra-office Calls to another Station within the system without Attendant assistance.

The user can set Camp-On function to the busy destination while transferring an Incoming Call (Camp-On by Station). With this feature, the Trunk Party is called back directly, as the destination becomes idle.

Operating Procedure

To transfer a call in progress using switch hook flash

1. While connected with the first party, press the switch hook. Receive Special Dial Tone.
2. Dial the third party. Receive Ringback Tone.
3. At this point, the user can either:
   a.) Hang up before the third party answers. The first and third parties will be connected when third party answers.
   b.) Wait for third party to answer and announce the transfer while keeping the first party in CONSULTATION HOLD - ALL CALLS [C-17] condition. When the user hangs up, the first and third parties will be automatically connected.

To set the Camp-On by Station function to the Busy Station

- Manual Operation

1. While connected with the first party, press the switch hook. Receive Special Dial Tone. At this time, the Calling Trunk Party hears music on hold.
2. Dial the third party, and the third party is busy. Receive Busy Tone.
3. Press the switch hook. Receive Special Dial Tone, and then dial the Access Code of CALL BACK. Receive Service Set Tone.
4. Replace the handset. The Station to be set Camp-On by Station (destination) hears Warning Tone. At this time, the Calling Trunk Party hears Ringback Tone.
5. The Target Station starts to ring when the target Station lifts the handset.
6. The Target Station (Called Party) can call back to the Trunk Party directly by answering.

- Automatic Operation

1. While connected with the first party, press the switch hook. Receive Special Dial Tone. At this time, the Calling Trunk Party hears music on hold.
2. Dial the third party, and the third party is busy. Receive Busy Tone.
3. Replace the handset. The Station to be set Camp-On by Station hears Warning Tone. At this time, the Trunk Party hears Ringback Tone.
4. When the Target Station becomes available, the Target Station starts to ring.
5. The Target Station can call back to the Trunk Party directly as the Station answers.

To answer the Camp-On by Station Call from the Busy Station

1. After receiving Warning Tone, the third party in the condition that the communication is in progress can answer the call by pressing the ANSWER key. At this moment, the call connected by the third Station is placed on hold.

<The following procedures are applied for Desktop terminal only.>

To transfer a call in progress using the TRANSFER key

1. While connected with the first party, press the TRANSFER key. Receive Special Dial Tone.
2. Dial the third party. Receive Ringback Tone.
3. At this point, the user can either wait and announce the call or hang up before the transfer is completed. The LCD display for an announced transfer will be:

Transferred Party

The LCD for an unannounced transfer will be:

Transferring Party Transferred Party

Note: When the Telephone Number of the Transferring/Transferred Station exceeds eight digits, the last eight digits are displayed. However, a maximum of 16 digit Transferred Telephone Numbers can be displayed on the middle line of the LCD, depending on System Data.

To set the Camp-On by Station function to the Busy Station

- Manual Operation

1. While connected with the first party, press the TRANSFER key. Receive Special Dial Tone. The Calling Trunk Party hears music on hold. The Desktop terminal LCD of the Mediate Party (Operating Station) displays:

2. Dial the third party, and the third party is busy. Receive Busy Tone. The LCD of the Operating Station displays:

The Extension Number of the third party

3. Method of operation:
   a.) When the Access Code is used, press the FLASH key. Receive Special Dial Tone and no indication on the LCD, then dial the Access Code of CALL BACK. Receive Service Set Tone.

   b.) When the Feature key/Soft key is used, press the CALL BACK key. Receive Service Set Tone. The LCD of the operating Station displays as mentioned above in the way of using the Access Code.
4. Replace the handset. The Station to be set Camp-On by Station (destination) hears Warning Tone. The LCD of the operating Station displays:

The Calling Trunk Party hears Ringback Tone. The LCD of the target party displays:

(TRK): Trunk kind or the Calling Number

5. The Target Station starts to ring when the Target Station lifts the handset. The LCD of the Target Party displays:

(TRK): Trunk kind or the Calling Number

6. The Target Station (Called Party) can call back to the Trunk Party directly by answering the ringing. The LCD of the Target Party displays:

ELAPSED TIME for the communication

(TRK): Trunk kind or the Calling Number

- Automatic Operation

1. While connected with the first party, press the switch hook. Receive Special Dial Tone. The Calling Trunk Party hears music on hold. The LCD of the operating Station displays:

2. Dial the third party, and the third party is busy. Receive Busy Tone. The LCD of the Operating Station displays:

The Extension Number of the third party

3. Replace the handset. The Station to be set Camp-On by Station hears Warning Tone. The LCD of the Operating Party displays:

The LCD Display is changed after the Trunk receives Ringback Tone:

The LCD Display of the Target Party:

(TRK): Trunk kind or the Calling Number

The Trunk Party hears Ringback Tone.

4. When the Target Station becomes available, the Target Station starts to ring. The LCD of the Target Party displays:

(TRK): Trunk kind or the Calling Number

5. The Target Station can call back to the Trunk Party directly as the Station answers the ringing. The LCD of the Target Party displays:

ELAPSED TIME for the communication

(TRK): Trunk kind or the Calling Number

To answer the Camp-On by Station Call from the Busy Station

1. After receiving Warning Tone, the third party can answer the call by pressing the ANSWER key. The original call connected by the third Station is placed on hold.

Service Conditions

1. The Station performing the CALL TRANSFER - ALL CALLS can drop off the connection before the Called Party answers. If the Called Station does not answer within the predetermined time, Ringing Signal is returned to the Transferring Station. See VARIABLE TIMING PARAMETERS [V-1] for other selectable timing choices.
2. In the case of Outgoing Calls (No Answer Supervision), this feature may be activated only after 18 seconds have elapsed since the last digit dialed.
3. Outgoing Calls with Answer Supervision may be transferred immediately after call is answered (no time delay).
4. If all Registers are busy and the user switch hook flashes, the flash is ignored by the system, and the parties remain connected.
5. When TRUNK-TO-TRUNK CONNECTION [T-10] is provided with the system, an Incoming or Outgoing Network or TIE Line Call may be transferred to an Outgoing Network Trunk, if Release Signal is provided from distant end. The user who transfers the call gives line control to the two remaining parties upon hanging up. If the Release Signal is not provided, Call Transfer from Trunk-to-Trunk will not function.
6. The THREE-WAY CALLING [T-2] feature can comprise not more than three parties on one connection. The three parties connected can be as follows:
   a.) three Stations
   b.) two Stations and one Trunk
   c.) one Station and two Trunks.
7. The maximum number of simultaneous THREE-WAY CALLING [T-2] Connections per system is dependent on the quantity of CFT-function Circuits equipped (traffic engineered).
8. Reorder Tone is returned to the user when the following actions occur:
   a.) The user's line is restricted by Outward or Miscellaneous Trunk Restrictions by the Class of Service,
   b.) The user dials the number of an unequipped line or termination is restricted (Route Restrictions),
   c.) The user dials an invalid first digit.
9. Transferring a call in progress by switch hook flash, if you hang up the call while receiving Special Dial Tone within four minutes, Busy Tone will be given to the call being held. And no call is transferred to any Station.
10. The Camp-On by Station cannot be set to the Station via CCIS.
11. The Camp-On by Station cannot be set in the following cases:
    a.) When the Calling Station:
        sets or is set CALL BACK [C-1].
        holds a call.
        Service Feature Restriction Class is not allowed.
        uses Sub Line.
    b.) When the Target Station:
        is in LINE LOCKOUT [L-3] state.
        is in male-busy state.
        sets or is set CALL BACK [C-1].
        holds a call.
        has already been set another Camp-On.
        answers another Camp-On with the ANSWER key.

is in Consultation Hold.
is in Exclusive Hold.
is set Fixed Connection - Nailed Down Connection.
sets Do Not Disturb -D [D-11D]
Incoming Route Restriction Class is not allowed.

12. The Camp-On by Station can be set to one Station only once.
13. The Camp-On by Station is restricted when the Target Station is in the Three-party Connection.
14. The Camp-On by Station is not available for the Target Station in LINE LOCKOUT [L-3] condition.
15. The Camp-On by Station is not available in the following cases:
    a.) When the Transferred Station is dialing the number.
    b.) When a call is terminating to the Transferred Station (the Station is ringing).
    c.) When the Transferred Station hears Busy Tone or Reorder Tone.
    d.) When the Transferred Station hears Special Dial Tone.
16. The Station allowed to set the Camp-On by Station (operating Station) is only the Dterm and the Analog Station.
17. When using Camp-On by Station, 1 Dial Hooking cannot be used.
18. The Station to set the Camp-On by Station (Transferred Station) is the Analog Station, the Desktop terminal and the ISDN terminal.
19. When the Camp-On by Station is set to the Desktop terminal:
    a.) The ANSWER key of the Desktop terminal lights when Warning Tone is received.
    b.) At the Station to be set the Camp-On by Station, the LCD displays the Service Set indication (CAMP) and the Trunk Kind or the Calling Number if the Caller ID notification is received.
20. The following conditions should be considered when this service is set by manual operation (see Operating Procedure) because the service becomes effective when the operating Station is released from the connection:
    a.) When the operating Station is not released within the predetermined time period after receiving Service Set Tone, the service which has been set will be ineffective. And the operating user hears Busy Tone.
    b.) When the Transferred Destination Station becomes available before the Transferring Station is released from the connection after the service was set (after the operating user hears Service Set Tone), the Trunk Incoming Call is connected with the Destination Station after the operating Station (Mediate Party) replaces the handset.
    c.) When the Transferred Destination Station becomes LINE LOCKOUT condition or the destination becomes make busy before the Transferring Station is released from the connection after the service was set (after the operating user hears Service Set Tone), the Called Station (Mediate Party) is recalled even though the Station is disconnected.
21. The following are the conditions when the Destination Station does not answer within the time period of the No Answer Timer:
    a.) When the timer time-out occurs due to that the Destination Station not being answered within the predetermined time period after the operating Station is disconnected, the operating Station is called back.
    b.) When the No Answer Timer expires and the Destination Station has not answered within the predetermined time period, the call management is decided by the System Data (recall to the operating Station or CALL FORWARDING - DON'T ANSWER activation).
22. The Service Conditions for Warning Tone are as follows:
    a.) The Destination Station receives Call Waiting Tone when Camp-On by Station has been set.

b.) The amount of time between tones is decided on a system basis.

23. A call can be transferred to a Station in the Remote Node via FCCS link.
24. Camp-On by Station can be set to the Station in the Self Office or the Self Node in the FCCS Network.
25. When PS becomes Out of Zone while holding a call (switch hook flash), it will be recalled. However, if it remains in Out of Zone state, the following will operate.
    If CALL FORWARDING - PS INCOMING INCOMPLETE [C-155] is set, the aborted call will be transferred to the pre programmed destination.
    If AUTOMATIC ANNOUNCEMENT - CALLED PS OUT OF ZONE [A-129] is set, the system automatically provides an announcement.
26. Camp-On by Station is unavailable for PS.
27. When a Control Station (second party) transfers a Station or Trunk call to another Station (third party) and the Control Station goes on-hook during ringing, if the third party's line is busy, the Control Station will be recalled right away. If the third party does not answer the call in time (30 seconds), the Control Station will be recalled after the time expires.

    Note: When the Control Station does not answer the call recalled, operations are different depending on the third party's state.
    If the third party's line is busy and the Control Station is recalled, but it does not answer:
    - Ringing the Control Station is stopped, and then the line held by the Control Station is disconnected regardless of whether the held line is Trunk or Station line. If the Control Station is a PS Station, the PS Station is kept ringing.

    If the third party does not answer the call and the Control Station is recalled but it does not answer:
    - The Control Station is kept ringing regardless of whether the held line is Trunk or Station line.

28. When an attendant console places a station or a trunk call on hold and transfers it to another station then the transferring destination releases the connection after answering the transferred call, the attendant console hears a silence.
    When an attendant console places a station or a trunk call on hold and transfers it to C.O. line party then the transferring destination releases the connection after answering the transferred call, the attendant console hears a Reorder Tone (ROT).
29. When a SIP Handler Controlled SIP terminal is talking with the transferring destination and the transferring destination is released, the SIP Handler Controlled SIP terminal returns to the state putting the previous call on Call Hold (the Call Hold state is not canceled automatically). An operation to cancel the Call Hold state is needed to talk with the previous call.

Interactions

1. This feature is denied whenever the Transferring Station is engaged in any state other than a simple Two-party Connection.
2. See TRUNK-TO-TRUNK CONNECTION [T-10] for additional programming if the call is to be transferred off-network.
3. If a Station is in an established THREE-WAY CALLING [T-2] Connection, that Station cannot activate any features. If a Station switch hook flashes to activate a feature, the flash is ignored and the Three-way Connection remains established.
4. Features that cannot be activated if a party is involved in a CONSULTATION HOLD [C-17] or in an established THREE-WAY CONFERENCE [T-2] Connection are:

ATTENDANT CAMP-ON WITH TONE INDICATION	[A-1]
ATTENDANT OVERRIDE	[A-7]
BOSS - SECRETARY OVERRIDE -D	[B-5D]
BUSY VERIFICATION	[B-3]
CALL BACK	[C-1]
CALL FORWARDING (Activate or Cancel)	[C-2, 3, 5]
CALL PICKUP - DIRECT	[C-30]
CALL WAITING - TERMINATING	[C-12]
EXECUTIVE RIGHT-OF-WAY	[E-1]
MESSAGE REMINDER	[M-19]
OUTGOING TRUNK QUEUING Cancel	[O-2]
SPEED CALLING - STATION Entry	[S-21]
TRUNK ANSWER FROM ANY STATION (TAS)	[T-8]

5. Upon establishing a CONSULTATION HOLD [C-17] Connection and dialing a third party, if the Station user receives busy or Reorder Tone instead of Ringback Tone, the Station user flashes once to disconnect the Tone and reconnect the second party.
6. Upon establishing a CONSULTATION HOLD [C-17] Connection and dialing a MISCELLANEOUS TRUNK ACCESS [M-2] Code, if no Dial Tone is heard (after the Trunk is seized), if a mistake is made in dialing, or if an Intercept Announcement or a Permanent Tone is heard, the Station user must go on-hook and wait for Ringback Tone.
7. The Station user, who establishes CONSULTATION HOLD [C-17], will be reconnected to the party in soft hold when the third party disconnects.
8. A Call Transfer to a Station with CALL FORWARDING [C-2, 3, 5] set will forward according to the conditions of the feature set.
9. A Call Transfer to a Station in a STATION HUNTING [S-7, 8, 9] Group will hunt according to the conditions of the STATION HUNTING [S-7, 8, 9] Group.
10. A Call Transfer to a Desktop terminal that has DO NOT DISTURB [D-21D] set will receive Reorder Tone.
11. A Call Transfer Call may be answered by CALL PICKUP - GROUP/DIRECT [C-7, 30].
12. The Camp-On by Station is not available when DO NOT DISTURB -D [D-11D] has been set to the Target Station. **Note 1**
13. The Camp-On by Station is not available when the Target Station uses PRIVACY RELEASE [P-18]. **Note 1**
14. When the Camp-On by Station is set by automatic operation and the Destination Station is the UCD Group member, the Camp-On by Station feature takes priority over BLIND TRANSFER TO BUSY UCD if it is available.

15. The TRANSFER key on the Desktop terminal is used in place of the switch hook.

Note 1: The operating Station hears Busy Tone when the destination is in the above condition.

Programming

STEP 1: **ASYD** - SYS1, Index 69, Bit 0. Return Transferred Call to origin of Call Transfer after the Recall Timer elapses (only applicable to Blind Transfers). SYS1, Index 69, Bit 2. Short Tone on recall of CALL TRANSFER - ALL CALLS. Ringback Tone is briefly heard by the person answering the recall (only applicable to Blind Transfers).

SYS1, Index 140 if ASFC SFI 103 = 0. Index 247 if ASFC SFI 103 = 1. Assign the Recall Timer for a Station-to-Station CALL TRANSFER - ALL CALLS. For 30 seconds, assign data 00H. (TC 3 = 2 seconds, TC 7 = 8 seconds). RAM Data 3FH for 30 seconds.

SYS2, Index 1, Bit 0 and Bit 1. Assign data "11" to allow CONSULTATION HOLD.

SYS1, Index 156 and Index 157. How long before SHF is possible.

SYS2, Index 0, Bit 0=1 (Allow the restriction for Call Back Service)

SYS2, Index 5, Bit 2. Camp-On by Station is set automatically after the operating Station is released from the connection after encountering the busy Target Station.

0: No (Recall to the mediate Station)

1: Yes (Camp-On Service is set)

SYS2, Index 10, Bit 7. Number of times that the Warning Tone (Call Waiting Tone) is sent to the Target Station.

0/1:Once/At Intervals

Note: When "1" is assigned, the interval of this Tone is assigned in SYS1, Index 152.

SYS1, Index 248, Bit 6. When the Destination Station has been set Call Forwarding - Don't Answer.

0/1: Recall to the Station/Call Forwarding - Don't Answer is activated

STEP 2: **ASTD** - Assignment of State Translation Data

STM: 2
STS: 2 (Outgoing call to a C.O. Line or a Tie Line after holding the COT)
ST: 0/1 (Restricted/Allowed)

STM: 2
STS: 3 (Outgoing call to a C.O. Line after holding a station or a Tie Line)
ST: 0/1 (Restricted/Allowed)

STEP 3: **ANPD** - Assign the first Number Level for the Feature Access Code.

STEP 4: **ASPA** - Assign the Feature Access Code.

TN: Tenant Number
ACC: Access Code for CALL BACK
CI: "H: Hooking" (Switch hook Flash)
SRV: "SSC: Service Code"
SID: 3 (Call Back; Entry)

STEP 5: **AKYD** - Assign CALL BACK Feature key.

KYI: 1 (Feature Key)
FKY: 5 (Call Back)

ADSL - Assign CALL BACK Soft Key.

FKY: 5 (Call Back)
SN: 8 (Encounters the busy Station while holding an original call)

STEP 6: **ASFC** - Assign the Service Feature Restriction Class on Camp-On by Station.
SFI 174 (Camp-On by Station) RES 1 (Allowed)

STEP 7: **ATNR** - Allow Tenant-to-Tenant Connection for Inter and Intra-tenant Connections. Assign Tenant Restriction Index (TRI) 0 and 4 on an Inter and Intra-tenant basis.

STEP 8: **ARSC** - The station receiving the call must be assigned a Route Restriction Class (RSC) that will allow the station to be connected to the trunk, if a trunk is involved.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ALRTN** - Assign this command to connect the Logical Route to the Physical Route.

STEP 2: **ARSCN** - The Station receiving the call must be assigned a Route Restriction Class (RSC) that will allow the Station to be connected to the Trunk, if a Trunk is involved.

C-12 Call Waiting - Terminating

General Description

This feature enables a busy Station to receive a second Incoming Call. A Camp-On Indication Tone is sent to the busy Station, the user can use a switch hook flash to answer the second call. A switch hook flash may be used to alternate between the two calls.

Operating Procedure

To activate from a Station

1. Dial the desired Telephone Number.
2. If the Called Station is busy, CALL WAITING - TERMINATING is automatically set. The Calling Station receives Call Waiting Ringback Tone. Call Waiting Tone (one beep) is sent to the busy Station.

To activate on a Direct-In Trunk Call

1. The System receives the Called Telephone Number.
2. If the Called Station is busy, CALL WAITING - TERMINATING is automatically set. The Calling Party receives Call Waiting Ringback Tone. Call Waiting Tone (two beeps) is sent to the busy Station.

To answer

1. Call Waiting Tone is heard during the call in progress.
2. A switch hook flash or pressing the ANSWER key on the Desktop terminal will hold the existing call.
3. CALL WAITING - TERMINATING Call is automatically connected.
4. Another switch hook flash or pressing the ANSWER key on the Desktop terminal will return to the original call and hold the second call.

OR

1. Call Waiting Tone is heard during the call in progress.
2. The Called Station hangs up. Priority ringing is sent.
   Priority ringing = 0.4 seconds ON 0.2 seconds OFF0.8 seconds ON
   0.2 seconds OFF0.4 seconds ON0.4 seconds OFF
   Lift the handset to answer.

Service Conditions

1. Call Waiting Tone is one beep for a Station Call and two beeps for a Trunk Call. A beep is 200 milliseconds ON/OFF.
2. Periodic Call Waiting Tone can be eliminated by System Data programming on a per Tenant basis.
3. CALL WAITING - TERMINATING must be allowed in the call originator's CLASS OF SERVICE - INDIVIDUAL [C-15] programming to be activated.
4. There is no limit to the number of Stations that can receive this feature simultaneously.
5. CALL WAITING - TERMINATING is denied when the Called Station is connected to the ATTENDANT CONSOLE [A-3].
6. CALL WAITING - TERMINATING can be set only when the Called Station is busy on a Two-party Call with another Station or Trunk.
7. Call Waiting Ringback Tone changes to normal Ringback Tone for the Calling Party when the Called Station goes on-hook.
8. CALL WAITING - TERMINATING cannot be activated while in CONSULTATION HOLD [C-17] mode.

9. CALL WAITING - TERMINATING cannot be used in conjunction with DIAL ACCESS TO ATTENDANT [D-2].
10. CALL WAITING - TERMINATING cannot be activated if the Target Station has accessed, entered, or is engaged in any of the following features or modes:

ATTENDANT CAMP-ON WITH TONE INDICATION	[A-1]
ATTENDANT OVERRIDE	[A-7]
BOSS - SECRETARY OVERRIDE -D	[B-5D]
BUSY VERIFICATION	[B-3]
CALL BACK	[C-1]
CALL HOLD	[C-6]
CALL TRANSFER	[C-10, C-11]
CALL WAITING - ORIGINATING	[C-31]
CONSULTATION HOLD - ALL CALLS	[C-17]
DATA LINE SECURITY	[D-12]
DATA PRIVACY ON DEMAND	[D-17]
DIAL ACCESS TO ATTENDANT	[D-2]
EXCLUSIVE HOLD -D	[E-4D]
EXECUTIVE RIGHT-OF-WAY	[E-1]
LINE LOCKOUT	[L-3]
NON-EXCLUSIVE HOLD -D	[N-7D]
OUTGOING TRUNK QUEUING	[O-2]
PRIVACY -D	[P-14D]
PRIVACY RELEASE	[P-18]
THREE-WAY CALLING	[T-2]
VOICE CALL	[V-2]

11. The following features take precedence over CALL WAITING - TERMINATING:

CALL FORWARDING - ALL CALLS	[C-5]
CALL FORWARDING - BUSY LINE	[C-3]
STATION HUNTING - CIRCULAR	[S-7]
STATION HUNTING - SECRETARIAL	[S-8]
STATION HUNTING - TERMINAL	[S-9]

12. When Called Station activates CALL FORWARDING- BUSY LINE [C-2], and the call forwarding destination is busy:

- When call forwarding destination is a station (including stations in FCCS network), ASYD, SYS1, Index 69, Bit 5 determines whether to set CALL WAITING - TERMINATING to the Forwarded-from Station, or to the Forwarded-to Station.
- When the call forwarding destination is in outside of the self office, CALL WAITING - TERMINATING is restricted and does not work.

Interactions

1. This feature is allowed whenever the Destination Telephone Set is in any state other than:
   a.) Engaged in Three-way Connection,
   b.) A PRIVACY feature is activated,
   c.) Connected to a Route programmed to have Line/Trunk, Privacy, CDN 44:PRV,
   d.) Listening to a Tone (Dial Tone, Reorder Tone, Service Set Tone, Busy Tone, Ringback Tone).
   e.) Connected to the Attendant Console.

2. To answer a CALL WAITING - TERMINATING call, SYS2, Index 0, Bit 0 and Bit 1, CONSULTATION HOLD [C-17]. Assign data "11" to allow CONSULTATION HOLD.
3. To answer a CALL WAITING - TERMINATING Call from a Dterm, press the ANSWER key. The Answering Party can alternate between the calls by pressing the ANSWER key.
4. Enabling ATTENDANT LOOP RELEASE [A-6] (SYS2, Index 6, Bit 7), a call Camped-On to a Station via the Attendant Console will wait at that Station for the time set in Index 145. When the preset time has elapsed, the call will return to the Attendant Console.
5. If ATTENDANT LOOP RELEASE [A-6] is not provided and CALL FORWARDING - DON'T ANSWER [C-3] via the Attendant Console is provided, a call extended to a Station via the Attendant Console will wait at the Station for the time set in Index 141 and will then be forwarded to the Destination Station for the time set in Index 145. Index 145 is the total time before recall. When that time expires, the call will return to the Attendant Console.
6. When CALL FORWARDING [C-2, 3, 5] is in effect, the forwarding operation occurs before CALL WAITING - TERMINATING is allowed, unless the CALL FORWARDING - OVERRIDE [C-26] feature is applicable. If CALL FORWARDING - OVERRIDE [C-26] is used, the call will wait. After a call has been forwarded, the call may wait at the new Station if CALL WAITING - TERMINATING is allowed.
7. BUSY VERIFICATION [B-3]: This feature is denied to a Station that is in a CALL WAITING - TERMINATING state.
8. EXECUTIVE RIGHT-OF-WAY [E-1]: This feature is denied to a Two-party Connection that is in a CALL WAITING-TERMINATING state.
9. STATION HUNTING [S-7, 8, 9]: This feature takes precedence over CALL WAITING - TERMINATING.
10. LINE LOCKOUT [L-3]: CALL WAITING - TERMINATING is not allowed to a Station in LINE LOCKOUT [L-3]
11. OUTGOING TRUNK QUEUING [O-2]: CALL WAITING - TERMINATING is not allowed on any Station involved in THREE-WAY CALLING [T-2].
12. When using this feature against a Station that is engaged in Tandem connection other than CCIS-CCIS, SFI 4 and SFI 11 require to be set to 1 for SFC 0 by using ASFC/ASFCN.
13. This feature cannot be set from SIP Handler Controlled SIP terminals. Also this feature cannot be set from different terminals to SIP Handler Controlled SIP terminals.

Programming

STEP 1: **ASYD** - SYS1, Index 64, Bit 6. Leave as data "0".

SYS1, Index 145. Assign the Recall Timer for a call extended by the Attendant Console that is not answered. Normally assign data 00H for 30 seconds. (RAM Data 9F for 30 seconds).

SYS2, Index 10, Bit 6. Assign 1H for automatic. Bit 7 is used for CALL WAITING TONE INDICATION. 0/1: Once/Repeat-per setting of SYS1, Index 152.

SYS1, Index 69, Bit 5. CALL WAITING - TERMINATING 0/1 = Set to Forwarded-from Station/Set to Forwarded-to Station

STEP 2: **ASFC** - Assign a Service Feature Index (SFI) of 11 (Data Line Privacy = 0/Attendant Camp-On = 1) to the Station. SFI 5 [Call Waiting - Originating (Calling)] and 6 [Call Waiting - Originating (Called)], RES = 1.

STEP 3: **ARTD** - For CALL WAITING - TERMINATING to operate automatically for TIE Lines and DID Routes, assign CDN 46:CW, Call Waiting, as data "1".

Note: To change the data for existing route (RT), initialize the circuit card.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

STEP 1: **ALRTN** - Assign this command to connect the Logical Route to the Physical Route.

STEP 2: **ARTDN** - For CALL WAITING - TERMINATING to operate automatically for TIE Lines and DID Routes, assign CDN 46:CW, Call Waiting, as data "1".

Note: To change the data for existing route (RT), initialize the circuit card.

C-13 Call Waiting Lamp

General Description

This feature provides a visual indication to the Attendant when one or more calls are waiting to be answered.

Operating Procedure

Refer to the Command Manual.

Service Conditions

1. All Incoming Calls to the ATTENDANT CONSOLE [A-3] that have to be answered will signal the Attendant via the CALL WAITING LAMP.
2. The CALL WAITING LAMP can be set to flash at 60 IPM only after "x" number of calls are waiting. "x" can be anywhere from 1 to 15 calls waiting per TENANT SERVICE [T-12].
3. In the case of MULTIPLE CONSOLE OPERATION [M-4], the CALL WAITING LAMP will light on all Consoles until one of the positions has processed the calls.
4. Where TENANT SERVICE [T-12] is provided, the CALL WAITING LAMP will light only on the Consoles of the Called Tenant.
5. In addition to the CALL WAITING LAMP indication, each Console is provided with a two-digit display that shows the number of calls waiting.

Interactions

1. The CALL WAITING LAMP lights if any of the following Incoming Calls are waiting to be answered at the ATTENDANT CONSOLE [A-3]:

LDN	Listed Directory Number
ATND	Attendant Dial "0" Calls, CALL FORWARDING - ALL CALLS [C-5]
RECALL	Attendant Recall Calls
FX	Foreign Exchange
WATS	Wide Area Telephone Service
TIE	TIE Line Calls
BUSY	Call Forwarding - Busy Line to Attendant
NANS	Call Forwarding - Don't Answer to Attendant
TF	Inter-Position Transfer
ICPT	Call Forwarding - Intercept
CCSA	Common Channel Switching Arrangement

2. In addition to the CALL WAITING LAMP, an audible buzzer is sounded whenever a call is waiting and the Attendant is available to answer calls. The buzzer volume can be adjusted and silenced by operation of a Volume Control key. If the Attendant is on a Loop, a buzzer can be activated.
3. An indication of the type of calls waiting is given by the INCOMING CALL IDENTIFICATION [I-2] feature.
4. When TENANT SERVICE [T-12] is used, the CALL WAITING LAMP will flash only on the Consoles assigned to the Called Tenant. The Tenant Console is assigned in ATRK. The Route of the Tenants of the individual Trunks are assigned in ATRK as well.

Programming

STEP 1: **ASYD** - SYS1, Index 64, Bit 1 and Bit 2. When will the number of calls waiting appear on the Attendant Console? 00: When Position Available Lamp is ON (Attendant Console is not actively processing a call); 01: When Busy Lamp Field is OFF; 10: Continuously.

SYS2, Index 8 and Index 9. These bits flag types of Incoming Calls to the Attendant Console to be counted as calls waiting. This is assigned on a per Tenant basis.

Index 8:

Bit 0 - Is an LDN Call counted as a Call Waiting? 0/1: No/Yes.

Bit 1 - Is an Incoming Station Call counted as a Call Waiting? 0/1: No/Yes.

Bit 2 - Is an Attendant Console Recall counted as a Call Waiting? 0/1: No/Yes.

Bit 3 - Is an FX Call counted as a Call Waiting? 0/1: No/Yes.

Bit 4 - Is a WATS Call counted as a Call Waiting? 0/1: No/Yes.

Bit 5 - Is a CCSA (DID) Call counted as a Call Waiting? 0/1: No/Yes.

Bit 6 - Is a TIE Line Call counted as a Call Waiting? 0/1: No/Yes.

Bit 7 - Is a CALL FORWARDING - BUSY LINE [C-2] Call counted as a Call Waiting? 0/1: No/Yes.

Index 9:

Bit 0 - Is a CALL FORWARDING - DON'T ANSWER [C-3] Call counted as a Call Waiting? 0/1: No/Yes.

Bit 1 - Is a CALL FORWARDING - INTERCEPT [C-25, 25D] Call counted as a Call Waiting? 0/1: No/Yes.

Bit 2 - Will this key (type of call is assigned in AAKP) be counted as a Call Waiting? 0/1: No/Yes.

Bit 3 - Is an INTERPOSITION TRANSFER [I-5] Call counted as a Call Waiting? 0/1: No/Yes.

Note: The types of calls listed above are the default types of Incoming Calls. SYS2, Index 8, Bit 6 to Bit 7, and Index 9, Bit 0 to Bit 3 only turn ON or OFF the ability to count an Incoming Call to a specific key as a Call Waiting. A different type of Incoming Call may be assigned via AAKP.

SYS2, Index 14, Bit 0 to Bit 3. When CALL WAITING value exceeds a threshold value, the Call Waiting Lamp will flash.

SYS2, Index 14, Bit 4. Will CALL WAITING - INDICATION flash for All Calls? 0/1: All Calls/ Pegged Calls.

Note: This data is required only when assigning "x" number of calls waiting.

STEP 2: **ARTD** - Flag the type of Route in CDN 6:TCL, Trunk Class.

Note: To change the data for existing route (RT), initialize the circuit card.

STEP 3: **AAKP** - This command may be used to change the meaning of the top six Call Identification keys of the Attendant Console. (See SYS2, Index 8 and Index 9). The following functions may be assigned to L1 - L6:

Function:

(1) CAS
(2) Off-Hook Alarm
(3) Priority Call 1
(4) Priority Call 2
(5) Priority Call 3

C-14 CCSA Access

General Description

This feature enables connection to a Common Channel Switching Arrangement (CCSA) Network. CCSA Networks provide customers with the use of a completely private inter-facility dial system. They use individual facilities for dedicated Access Lines and Trunks that terminate in Common Control Switching Equipment and in various types of Telephone Equipment at Customer Locations. **Note 1**

Note 1: This feature is available in North America only.

Operating Procedure

To place an Outgoing CCSA Call

1. Lift the handset. Receive Dial Tone.
2. Dial the CCSA ACCESS Code. Receive Second Dial Tone.
3. Dial the desired number.
4. Wait for the call to be processed.

To answer an Incoming CCSA Call

1. The Attendant presses either the CCSA or ANSWER key.
2. The call is extended to the desired Station in normal fashion.

Service Conditions

1. CCSA Trunks are physically the same as those used for TIE Trunks. The CCSA Trunks may be pushbutton or rotary in either direction.
2. Careful consideration should be given to System Numbering Plans before assigning CCSA ACCESS Codes to avoid numbering conflicts.
3. CCSA ACCESS Codes can be either one or two digits.
4. Pad Control can be used on a CCSA Call. Refer to TIE LINE CONNECTION WITH PAD CONTROL [T-5].
5. LEAST COST ROUTING - 3/6-DIGIT [L-5] may access a CCSA Trunk Group for Off-net Calling only.
6. Tandemming through on a CCSA Network requires an Attendant and TRUNK-TO-TRUNK CONNECTION [T-10].

Programming

ARTD - For CCSA TIE Line Routes, assign CDN 6:TCL, TRUNK CLASS as a CCSA Route:

RT:1

1-OSGS	:2/7	2-ONSG	:3	3-ISGS	:2/7	4-INSG	:3	5-TF	:3
6-TCL	:5	7-L/T	:1	8-RLP	:2	15-LSG	:5/8 **Note 2**		

Note 2: Assign “5” for TIE Lines and “8” for DID Trunks. For all other programming, see TIE LINE ACCESS [T-3].

Note: To change the data for existing route (RT), initialize the circuit card.

C-15 Class of Service - Individual

General Description

This feature permits all Stations to be assigned a Class of Service in accordance with the degree of system use desired. Each Station is assigned one Class from each of three groups.

Operating Procedure

CLASS OF SERVICE - INDIVIDUAL is assigned via System Data entry. Thereafter, each Station is automatically provided with the desired degree of service.

Service Conditions

1. The CLASS OF SERVICE - INDIVIDUAL feature in the System contains three categories: Telephone Equipment Class (TEC), Service Feature Restriction Class (SFC), and Route Service Class (RSC).
2. TEC determines the type of Terminal and the Signalling Arrangement necessary.
3. Trunk Route Restriction Class provides 15 Groups. Separate Restriction Patterns for each group are programmed in System Data. Group RSC0 is reserved for ATTENDANT CONSOLE use only.
4. Fifteen types of Service Feature Restriction Classes are available for access to the following special features. These classes are assigned to each Station in order to determine which features a particular Station will be permitted to use.

ATTENDANT CAMP-ON WITH TONE INDICATION	[A-1]
CALL BACK	[C-1]
CALL FORWARDING	[C-2, C-3, C-5]
CALL HOLD	[C-6]
DATA LINE SECURITY	[D-12]
EXECUTIVE RIGHT-OF-WAY	[E-1]
OUTGOING TRUNK QUEUING	[O-2]
STATION MESSAGED DETAIL RECORDING (SMDR)	[S-10]
SPEED CALLING - SYSTEM	[S-3]
TRUNK ANSWER FROM ANY STATION (TAS)	[T-8]

   For details, refer to the Command Manual.
5. Stations may be programmed to change SFC and RSC when the Attendant has set NIGHT CONNECTION [N-1, 2]. This is accomplished via System Data entry. For further information, refer to DAY/NIGHT CLASS OF SERVICE [D-15].
6. TEC, RSC, and SFC are independent, with no interaction between them.
7. RSC and SFC can be assigned independently on a TENANT SERVICE [T-12] basis.
8. The system software is capable of eliminating 5db loss on Station-to-Station Calls on a per Station basis.
9. The system software is capable of eliminating DISTINCTIVE RINGING [D-10] on a per Station basis (for OPX Stations).
10. RSC can be overridden by a new RSC, using the AUTHORIZATION CODE [A-20] feature.

Interactions

The following features interact with the fully restricted Station

1. CALL TRANSFER - ALL CALLS [C-11]: A fully restricted Station can be transferred to a Station or the Attendant by another party using CALL TRANSFER - ALL CALLS [C-11]. The fully restricted Station

may transfer a Station-to-Station Call to a Station or the Attendant.

2. CALL FORWARDING [C-2, 3, 5]: Station-to-Station Calls can be forwarded to a fully restricted Station. An attempt to forward an Incoming Trunk Call to a fully restricted Station will result in Reorder Tone.
3. STATION HUNTING [S-7, 8, 9]: Any call directed to a busy, fully restricted Station will hunt to an alternate Station. Careful consideration is required when assigning a fully restricted Station to a Hunt Group, since Incoming Trunk Calls directed to a fully restricted Station will result in Reorder Tone.
4. TRUNK ANSWER FROM ANY STATION (TAS) [T-8]: An attempt by a fully restricted Station to answer a call via the TAS feature will result in Reorder Tone.

The following features interact with Inward Route Restricted Stations

1. THREE-WAY CALLING [T-2]: When a user is restricted from receiving Direct Calls from a Trunk Group, the user cannot be added to an established connection that includes the restricted Trunk Group.
2. CALL FORWARDING [C-2, 3, 5]: Incoming Trunk Calls cannot be forwarded to an Inward Route Restricted Station.
3. CALL PICKUP [C-7, 30]: Incoming Trunk Calls cannot be answered by an Inward Route Restricted Station.
4. ATTENDANT CAMP-ON [A-1]: This feature is denied on calls extended to an Inward Route Restricted Station. Attempts will be routed to Reorder Tone.
5. STATION HUNTING [S-7, 8, 9]: Hunting of an Incoming Trunk Call to an Inward Route Restricted Station is not allowed.
6. TRUNK ANSWER FROM ANY STATION [T-8]: A user restricted from receiving direct Incoming Calls via a given Trunk Group cannot use the TAS feature to answer calls received via that Trunk Group.
7. NIGHT SERVICE [N-1, 2]: Restrictions can be changed for a given Station when the system is switched to the night mode of operation. Therefore, the assignment of an Inward Route Restricted Station as a Night Station can be allowed (see DAY/NIGHT CLASS OF SERVICE [D-15].)
8. CODE CALLING ACCESS [C-21]/MEET ME PAGING [M-1]: Connection of an Inward Route Restricted Line to an answer-back channel is not denied when the call is an Incoming Exchange Call.

Programming

Day/Night Class

STEP 1: **ASYD** - SYS1, Index 75. Should the following commands be developed for Day/Night. 0/1: No/Yes

Note: DAY/NIGHT CLASS OF SERVICE [D-15] - If Day/Night operation is to remain the same, the following Bits should be assigned as data “0”. Only those restrictions that will change between Day and Night should be assigned as data “1”. Further assignments MUST be made in the corresponding command.

Bit 0 - Develop ARSC for Day/Night?
Bit 1 - Develop ASFC for Day/Night?
Bit 2 - Develop ATNR for Day/Night?
Bit 3 - Develop ATDP for Day/Night?

Telephone Class

STEP 1: **ASDT** - Assign Tenant Number, Station Number, LENS, and the TEC to the Station. This is used in regular Business Systems. Assign the SFC and RSC.

TN: Tenant Number
STN: Station Number
LENS: Line Equipment Numbers (six digits)
TEC: Telephone Class (1-31)
1: DP (10 PPS)
2: PB
3: DP/PB
12: Dterm
13: Data Terminal via Dterm
14: Hotline
15: CAS Line
16: Data Terminal via Data Module
18: Virtual Circuit
23: ISDN Terminal
26: Voice Mail (Digital Voice Mail Ports)
27: Eight Conference Equipment
RSC: Route Restriction Class (0-15). For assignment of RSC, ARSC.
SFC: Service Feature Restriction Class (0-15). For assignment of SFC, ASFC.

STEP 2: **ASCL** - This command may be used to change the CLASS OF SERVICE - INDIVIDUAL for existing Stations. The RSC, SFC, and TEC may all be changed.

Service Feature Restriction Class

STEP 1: **ASFC** - A possible 16 (0-15) different SFCs may be constructed allowing or denying access to the various features.

Route Restriction Class

STEP 1: **ASYD** - SYS2, Index 1, Bit 4 and Bit 5. Should a restricted Station be routed to the Attendant Console or receive Reorder Tone? Reorder Tone: Bit 4=0, Bit 5=0. ATTENDANT CONSOLE: Bit 4=1, Bit 5=0.

STEP 2: **ARSC** - A possible 16 (0 - 15) different Route Restriction Classes may be constructed, either allowing a call or subjecting the call to TOLL DENIAL/DIVERSION [T-7] or TOLL RESTRICTION - 3/6-DIGIT [T-7].

Note: RSC 0 is reserved for Attendant Console use only.

STEP 3: **ATDP** - Assignment of Toll Distinctive Pattern command is assigned when Toll Restriction is required. When Toll Restriction changes from Day to Night, then ATDP must be assigned for both Day mode and Night mode.

Note: If a restricted Station is routed to the ATT, all RRI 3 must be RES = 2.

C-17 Consultation Hold - All Calls

General Description

This feature permits a user to hold any Incoming or Outgoing Public Network or TIE Line Call, or any Intra-Office Call, while originating a call to another Station within the system.

Operating Procedure

To hold the original call and place the second call using switch hook flash

1. Press the switch hook. Receive Special Dial Tone.
2. The original call is held.
3. Dial the second Telephone Number. Receive Ringback Tone.
4. The second Station answers. The CONSULTATION HOLD state has been entered.

To return to the original call using switch hook flash

1. In any of the following cases, the Calling Station can return to the original call by pressing the switch hook:
   a.) The second Station called for CONSULTATION HOLD is busy.
   b.) The Calling Station cannot gain access to second Station because of restriction or some other reason.
   c.) The second Station does not answer.
2. If the second Station hangs up, the Calling Station will be returned to the original call.
3. If the Originating Station flashes the switch hook, a THREE-WAY CALL [T-2] will be initiated.

<The following procedures are applied for Desktop terminal only.>

To hold the original call and place the second call using the TRANSFER key

1. Press the TRANSFER key. Receive Special Dial Tone.
2. The original call is held.
3. Dial the second Telephone Number. Receive Ringback Tone.
4. The second Station answers. The CONSULTATION HOLD state has been entered.

To return to the original call using the TRANSFER key

1. In any of the following cases, the Calling Station can return to the original call by pressing the TRANSFER key:
   a.) Second Station Called for consultation is busy.
   b.) Calling Station cannot gain access to the second Station because of a restriction or some other reason.
2. If the second Station hangs up, the Calling Station will be returned to the original call.
3. If the second Station stays on, pressing the TRANSFER key returns the original call to the Dterm while the second call is being held.

By pressing the CONF key, a THREE-WAY CALL [T-2] will be initiated.

Note: After pressing the CONF key, you cannot reestablish a call with the 2nd party while having the 3rd party on hold state.

Service Conditions

1. When TRUNK-TO-TRUNK CONNECTION [T-10] is provided with the system, an Outgoing Public Network or TIE Line Call can be made by the user.
2. For Outgoing Calls, this feature may be activated only after 18 seconds have elapsed since the last digit dialed.
3. CALL PICKUP - GROUP [C-7] is available on CONSULTATION HOLD.
4. A call can be forwarded to a Station in the Remote Node via FCCS.

Interactions

1. This feature is denied whenever the Destination Telephone Set is engaged in any state other than a simple Two-party Connection.
2. CONSULTATION HOLD - ALL CALLS must always be made available when features require switch hook flashing.
3. Index 156 and Index 157 also are used for SMDR, establishing an Arbitrary Connection Timing.
4. If a party is involved in a CONSULTATION HOLD - ALL CALLS state or in an established THREE-WAY CALLING [T-2] Connection, attempts to override the connection are denied. These features are:

EXECUTIVE RIGHT-OF-WAY	[E-1]
CALL WAITING - TERMINATING	[C-12]
BUSY VERIFICATION	[B-3]
ATTENDANT CAMP-ON WITH TONE INDICATION	[A-1]
ATTENDANT OVERRIDE	[A-7]

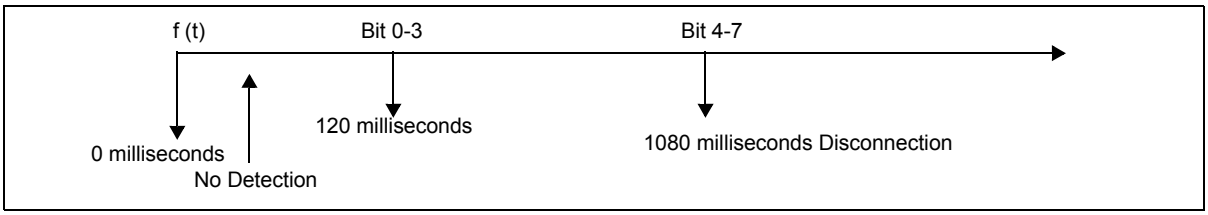
5. Features that cannot be activated while a user has a party in CONSULTATION HOLD - ALL CALLS are:

EXECUTIVE RIGHT-OF-WAY	[E-1]
TRUNK ANSWER FROM ANY STATION	[T-8]
CALL BACK, Activate or Cancel	[C-1]
CALL PICKUP - DIRECT	[C-30]
CALL FORWARDING, Activate or Cancel	[C-2, 3, 5]
OUTGOING TRUNK QUEUING, Cancel	[O-2]
SPEED CALLING - INDIVIDUAL, Entry	[S-21]
MESSAGE REMINDER	[M-19]

6. All other features may be activated as long as the user's line CLASS OF SERVICE - INDIVIDUAL [C-15] allows that feature.
7. Upon establishing a CONSULTATION HOLD - ALL CALLS Connection and dialing a third party, if the user receives Busy or Reorder Tone instead of Ringback Tone, the user flashes once to disconnect the Tone and reconnect the second party.
8. Upon establishing a CONSULTATION HOLD - ALL CALLS Connection and dialing a MISCELLANEOUS TRUNK ACCESS [M-2] Code, if no Dial Tone is given (after the Trunk is seized), or if a mistake is made in dialing, or if Intercept Announcement or a Permanent Tone is given, the user must go on-hook and wait for Ringback Tone.
9. A user, who established CONSULTATION HOLD - ALL CALLS, is reconnected to the party in soft hold when the third party is disconnected.
10. When using CALL TRANSFER - ALL CALLS [C-11] from a Station (second party) to another Station or Trunk (third party), the Control Station can transfer the call during ringing (blind transfer). When the Control Station goes on-hook, the Station in soft hold is connected to the Third Party's Connection and hears Ringback Tone. A 30-second timer is set when the Controlling Station goes on-hook. If the timer times out before the third party answers, the Control Station will receive Ringback Tone.

11. Reorder Tone is returned to the Station using CONSULTATION HOLD - ALL CALLS when the following actions occur:
    - The user attempts to place an Off-net Call using MISCELLANEOUS TRUNK ACCESS [M-2] on a Restricted Route.
    - The user dials the number of an unassigned Station or Station residing in an inaccessible Tenant via Tenant Service.
    - The user dials vacant or invalid first digit (no assignment in ANPD either for Level or Connection Status).
    - The TRANSFER key or FLASH-BUTTON -D [F-3D] is used instead of momentarily pressing the switch hook. A FLASH BUTTON -D[F-3D] is required for a Connection Index of B, Busy.
12. When a SIP Handler Controlled SIP terminal is talking with the transferring destination and the transferring destination is released, the SIP Handler Controlled SIP terminal returns to the held call but the call hold state is not canceled automatically. An operation to cancel the call hold state is needed.

Programming



ASYD - SYS1, Index 156. Trunk Soft Hold Timer A, used with Second Dial Tone Trunks. Assign data 00H for 30 seconds. (Data 31H may be used for a value of two seconds if CALL TRANSFER - ALL CALLS [C-11] is to be used immediately after connecting to the Trunk.) This is the time between Trunk Connection and when switch hook flash is allowed on a Non-senderized Trunk Connection.

SYS1, Index 157. Trunk Soft Hold Timer A, used with Senderized Trunks. Assign data 00H for a value of 18 seconds. (Data 31H may be used for a value of two seconds, if CALL TRANSFER - ALL CALLS [C-11] is to be used immediately after connecting to the Trunk.). This is the time between Trunk Connection and when switch hook flash is allowed on a Senderized Trunk Connection. It is also used to determine when SMDR billing will begin.

SYS2, Index 1, Bit 0 and Bit 1. CONSULTATION HOLD allowed or denied? 00: denied; 01: Originating and Terminating Calls allowed, Tandem Call denied; 11: All calls allowed. Normally assign data “11”.

SYS3, Index 2, Bit 0 to Bit 3. Switch hook flash starts timer. To calculate this value: (1 ~ FH) × 120 milliseconds = timer.

SYS3, Index 2, Bit 4 to Bit 7. Switchhook flash ends timer. To calculate this value: (1 ~ FH) × 120 milliseconds = timer. For both beginning and ending timers, assign 91H for 120 - 1080 milliseconds.

C-20 Centralized Attendant Service (CAS)

General Description

For applications requiring multiple sites, but having common interests or operation, the System can operate in a Main (attended) or Satellite (unattended) configuration. Typically, Incoming Calls to the Satellite are routed to the Main Location for processing by the Central Attendants within the CAS Network. This feature can be used to improve overall communication efficiency.

Operating Procedure

Listed Directory Number (LDN) Call

1. Upon arrival of an LDN Call at a Satellite System, the LDN Call is automatically directed to the Main System via a Release Link Trunk.
2. Upon receiving the Incoming CAS Call, the ATTENDANT CONSOLEs [A-3] will display the Incoming CAS Call by flashing the CAS Lamp.
3. The Attendant answers the Incoming CAS Call by pressing the CAS or ANSWER key. Hear the Incoming Call Tone (480 Hz - 440 Hz - 480 Hz) for 300 milliseconds.
4. The Attendant presses SHF, causing a switch hook flash. Hear Special Dial Tone from the Satellite System.
5. The Attendant dials the required Telephone Number in the Satellite System.
6. Upon hearing Ringback Tone, the Attendant presses the RELEASE key to make the Release Link Trunk available to serve another call.

Recall on Don't Answer Call

1. A Satellite System is configured to re-establish a connection from a Calling Party via a Release Link Trunk to an Attendant in the Main System, if the Called Station does not answer within a prefixed time.
2. Upon receiving the recall on a No Answer Call, the ATTENDANT CONSOLE [A-3] will display the Incoming CAS Call by flashing the CAS Lamp.
3. The Attendant answers the Incoming CAS Call by pressing the CAS or ANSWER key. Hear continuous Ringback Tone (440 Hz - 480 Hz) for 300 milliseconds.
4. After hearing the burst of continuous Ringback Tone, the Attendant and the Calling Party talk over Ringback Tone because of ringing the Called Station continuously during Recall Connection.
5. If the Calling Party desires to hold the connection, the Attendant presses the RELEASE key to make the Release Link Trunk available to serve another call.

Camp-On

1. If the Attendant directs the Satellite System to connect a call to a Busy Station, the Satellite System transmits a Camp-On Confirmation Tone (100 millisecond burst of 440 Hz) to the Attendant, also a camp-on indication Tone (200 millisecond burst of 480 Hz) to the Called Station, and reconnects the Calling Party to the Attendant.
2. If the Calling Party desires to wait, the Attendant presses the RELEASE key to make the Release Link Trunk available to serve another call.
3. If the Camped-On Station remains busy for longer than the prefixed time, the Satellite System reconnects the Calling Party via a Release Link Trunk.
4. Upon receiving the recall on a Camped-On Call, the ATTENDANT CONSOLE [A-3] will display the Incoming CAS Call by flashing the CAS Lamp.

5. The Attendant answers the Incoming CAS Call by pressing the CAS or ANSWER key. Hear the Camp-On Identification Tone (100 millisecond burst of 440 Hz).
6. When the Camped-On Station becomes idle, the Satellite System rings the camped-on Station.

Remote Hold

1. The Attendant talks with a Central Office party.
2. The Attendant presses the SHF key. Hear Special Dial Tone.
3. The Attendant dials the Remote Hold Access Code (one or two digits). The Central Office party is placed in the hold state at the Satellite System, and the Attendant hears the Hold Confirmation Tone (five, 50 millisecond bursts of 440 Hz).
4. The Attendant presses the RELEASE key to make the Release Link Trunk available to serve another call.
5. If the Central Office party remains in the hold state for longer than the prefixed time, the Satellite System reconnects the Central Office party via the Release Link Trunk.
6. Upon receiving the recall on the Hold Call, the ATTENDANT CONSOLE [A-3] will display the Incoming CAS Call by flashing the CAS Lamp.
7. The Attendant answers the Incoming CAS Call by pressing the CAS or ANSWER key. Hears the Hold Recall Identification Tone (five, bursts of 440 Hz).
8. The Attendant is now able to complete the call.

Operator Call

1. When an Operator Call Code (one or two digits) is received from a Station or TIE Line Trunk in the Satellite System, an Operator Call is directed to the Main System via Release Link Trunks.
2. Upon receiving the Incoming CAS Call, the ATTENDANT CONSOLE [A-3] will display the Incoming CAS Call by flashing the CAS Lamp.
3. The Attendant answers the Incoming CAS Call by pressing the CAS or ANSWER key. Hear the Operator Call Identification Tone (two, 100 millisecond bursts of 440 Hz).
4. At the expiration of this Tone, the Attendant talks with the Calling Party.
5. The Attendant's procedure for serving this call is similar to that for an LDN Call.

Call Transfer - Attendant

1. After any call is completed to a Satellite Station, the Called Party Station can call the Attendant in the Main System to transfer the Calling Party to another Station in the Satellite System. The operation of this feature is similar to that of an Operator Call.
2. The Attendant answers the Incoming CAS Call by pressing the CAS or ANSWER key. Hear the Operator Call Identification Tone (two, 100 millisecond bursts of 440 Hz).
3. After answering the call, the Attendant presses the SHF key, causing the Satellite System to disconnect the Station that dialed the Operator Call Code and connects to the Calling Party.

Night Service for the Incoming CAS Call in the Main System

1. In Night mode, the Incoming CAS Call is directed to a Night Station to be answered.
2. When the Night Station answers that call, the Night Station hears the Identification Tone depending on the call.
3. The Night Station momentarily switch hook flashes. Hear the Special Dial Tone from the Main System.
4. Dials the Flash Signal Sending Access Code (one or two digits). Hear Special Dial Tone.
5. After this, the operation of the Night Station is similar to that of the Attendant.
6. The Night Station must be provided with DTMF Signaling.

Service Conditions

The following applies to a System used at the Main CAS Location (Attendant Location)

1. The number of Release Link Trunks is determined by overall Satellite to Main Location traffic requirements.
2. RLTs can be seized in one direction only, from the Satellite System to the Main System.
3. The Attendant cannot originate or INTER-POSITION TRANSFER [I-5] a call on an RLT.
4. The Attendant cannot extend an Incoming CAS Call to a Station, Trunk, or another Attendant in the Main System.
5. CALL PROCESSING INDICATION [C-8] is not provided to the Attendant serving the Incoming CAS Call.
6. The Attendant at the Main System cannot connect RLT Calls to Main System users.
7. The Main System Attendant cannot busy verify a Station in the Satellite System.

The following applies to a System used as a Satellite Location

1. The number of Station ports used will equal the number of RLTs required.
2. A call extended by an Attendant in the Main System can be recorded on STATION MESSAGE DETAIL RECORDING (SMDR) [S-10].
3. An optional ATTENDANT CONSOLE [A-3] may be provided at a Satellite System to allow a local Attendant to control access to WATS or FX Trunks.
4. CAMP-ON [A-1] and Remote Hold are not provided for an Operator Call.
5. The NIGHT CONNECTION - FIXED [N-1]/FLEXIBLE [N-2] and TAS feature can be provided at the Branch Location.
6. A System can be equipped with 100 RLTs per Hunt Group.
7. FCCS is not available for this service.

Interactions

1. Release Link Trunks are not used for Voice Calls between Systems. Release Link Trunks cannot be transferred to a Station in the Main System. TIE Lines must be installed for regular Voice Connection between systems.
2. CAS Systems have no effect on Tandem Connection, LCR (6)/LCRS (7), or any other Trunking application.
3. The following applies to a system used at the Main CAS Location (Attendant Location): The Attendant Console cannot originate or INTERPOSITION TRANSFER [I-5] a call on an RLT. The Attendant Console at the Main System cannot connect RLT Calls to Main System Station users.
4. A System can be equipped with 100 RLTs per STATION HUNTING [S-7, 8, 9] Group. This is a constraint of STATION HUNTING [S-7, 8, 9] and UNIFORM CALL DISTRIBUTION [U-1], not CAS.
5. Listed Directory Numbers (LDN) may be provided for the various Satellite Systems. Because these LDNs will ring in only at the CAS key of the Attendant Console, indications to distinguish among the multiple LDNs are not specifically available. However, the Route Number is displayed and can be used to distinguish Satellite Systems.
6. During the Day mode of operation, if all RLTs are busy, Incoming COT Calls will wait and Ringback Tone is sent to the Calling Party.
7. If the Attendant Console at the Main System should switch hook flash to get Dial Tone from the Satellite and all ports are busy, Reorder Tone is sent to the Attendant Console. The Attendant can switch hook flash COT Party.

8. The CAS feature allows Attendant Console to be located at both the Main and Satellite Locations. When the Satellite Location goes to the Night mode, translations are available to connect Incoming Central Office Calls to the RLT Circuits. This is accomplished by ACSI and the NIGHT CONNECTION FIXED/ FLEXIBLE [N-1, 2] feature.
9. When the Night Stations are located at the Satellite System and no Attendant Console is provided, a Night key must be installed at the Satellite Location to activate Night Service. When the key is operated, the CAS operations are suspended, and Incoming Calls are terminated at the NIGHT CONNECTION FIXED/ FLEXIBLE Stations [F-1, 2] or via TRUNK ANSWER FROM ANY STATION [T-8]. When answered, the Night Station can transfer the call to the Main Location via the TIE Trunks but not the RLT Circuits. A PA-D07 (Attendant Console) circuit card must be supplied to the Satellite System.
10. PAGING ACCESS [P-1]: This feature allows the CAS Attendant to access Paging Equipment located at the Branch Location upon answering an RLT Call. See PAGING ACCESS [P-1] and MEET-ME PAGING [M-1].
11. CODE CALLING ACCESS [C-21]: This feature allows the CAS Attendant Console to access CODE CALLING Equipment located at the Satellite Location upon answering an RLT Call.
12. STATION MESSAGE DETAIL RECORDING (SMDR) [S-10]: SMDR is provided for calls extended by a CAS Attendant Console.

Programming

Main System

STEP 1: **ASYD** - SYS1, Index 150. Assign data 00H. This is the Guard Timer between the Attendant Console switch hook flash and the dialing of digits.

SYS1, Index 151. Assign data 00H. This allows a 480 milliseconds SHF. Timer Class is given as 32 milliseconds. For variable Hooking values, adjust the Miscellaneous Timer Class in Bit 0 to Bit 3.

SYS2, Index 13, Bit 1. Assign a data "0" for a Main System. This Bit applies to the PFT circuit card. This application is not common.

STEP 2: **ARTD** - Assign the CAS Routes (Release Link Trunks, RLT) in ARTD as follows. Be sure to assign CDN 6:TCL as data "7", CA Line.

RT:1

1-OSGS	:2	2-ONSG	:3	5-TF	:3	6-TCL	:7*	7-L/T	:1

Note: 15-LSG:5**

Note: *This Bit will provide a Dterm Trunk display when used as a Night Station.

Note: **This Bit is used when the TLT Card is used at the Main System Location for the Release Link Trunks. At the Satellite Location, a TLT Card is used for Release Link Trunk (RLT). If a COT Card is used as the RLT at the Main Location, assign LSG as data 0 Loop.

Note: To change the data for existing route (RT), initialize the circuit card.

STEP 3: **ATRK** - Program the LENS of the RLT Trunks. These Trunks must be COT circuit cards.

STEP 4: **MBTK** - Make idle the Release Link Trunk.

STEP 5: **AAKP** - To provide the Attendant Console with a FLASH key, the assignment of Attendant Console key Pattern (AAKP) must be programmed. Assign the ATN: Attendant Number (TRK Number for RT 901); KYN 5; and FUNC 1, CAS Line. (If this data is not assigned, CAS Trunks will not ring into the

Attendant Console.)

STEP 6: **ANND** - For the Outgoing Connection Parameter, OG; assign Route Number and the Number of Necessary Digits. The NND is the number of digits in the Satellite Switches' Station Numbering Plan.

Night Station - CAS

STEP 1: **ANPD** - Reserve a Number Level for Feature Access.

STEP 2: **ASPA** - Assign an Access Code to the Hooking, SRV = "SSC: Service Code"; SID = 43. Assign for a Connection Status Index (CI) of "H: Hooking".

STEP 3: **ACFR** - Assignment of Call Forwarding Restriction. Allow Call Class Index (CCI) 14, CAS Trunk Main, a Transfer Service Feature Index (TSFI) of 5, TAS.

STEP 4: **ACSI** - Assign the Incoming CAS Route and Trunk to the Night Station and Tenant Number. Assign the CSI = 4 for Night Connection.

TAS

STEP 1: **ANPD** - Reserve a Number Level for Feature Access.

STEP 2: **ASPA** - Assign an Access Code to TRUNK ANSWER ANY STATION, SRV = "SSC: Service Code"; SID = 16. Assign for a Connection Status Index (CI) of "N: Normal".

STEP 3: **ACFR** - Assignment of Call Forwarding Restriction. Allow Call Class Index (CCI) 14, CAS Trunk Main, a Transfer Service Feature Index (TSFI) of 5, TAS.

STEP 4: **ATAS** - Assign the TAS Circuit to the system. Refer to TRUNK ANSWER FROM ANY STATION [T-8] for details.

Note: A second call will go to TRUNK ANSWER FROM ANY STATION if the first call is being answered by the Night Station.

Satellite System

STEP 1: **ASYD** - SYS1, Index 149. Assign 00H for Recall Timer to Attendant Console at the Main System Location. This value is 30 seconds.

SYS2, Index 11, Bit 7. Will DIT Park in a Busy Station queue? 0/1: Yes/No, it will be re-routed to the Attendant Console. Assign data "0" for Queuing.

SYS2, Index 13, Bit 1. Assign data "1" for Satellite System.

STEP 2: **ANPD** - Reserve a Number Level for Feature Access. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan. Reserve a Number Level for Station Numbers. If the Satellite System does not have an Attendant Console, 0 can be used as a Station Number. If not, consider a Numbering Plan for the Release Link Trunks that will be assigned to the Stations assigned a TEC = 15.

STEP 3: **ARSC** - Construct a Route Restriction Class that allows a Direct Connection to all Incoming Trunks that will be served by the Attendant Console at the Main System Location. Assign via Route Restriction Index, RRI 1, Direct Connection on Incoming Trunks.

STEP 4: **ASFC** - Construct a Service Feature Restriction Class that allows Station Message Detail Service SFI 14. Do not provide CALL FORWARDING [C-2, 3, 5].

STEP 5: **ASDT** - Assign ports of the 16LC that receive the Release Link Trunks as TEC 15. The RSC assignment should allow a Direct Connection with all required Incoming Trunks. Allow these Trunks via Route Restriction Index (RRI) = 0 and 1. The SFC assigned is separately constructed and can include SFI 14 [Station Message Detail Recording (SMDR) - Trunk Basis]. See STATION MESSAGE DETAIL RECORDING (SMDR) [S-10]. When assigning Station Numbers, keep in mind that one of these Stations will be the lead Station in a UCD Group and that Station Number will be used by the Satellite Stations to access the Attendant Console at the Main System Location. To keep the user from becoming confused when a different number appears on the LCD, other than the one

dialed, make the Station Numbers appear as sequential Circuit Numbers such as 100, 101, 102, etc.

Note: If a COT Card is used at the Main Location for the RLTs, 16LC Cards are used at the Satellite Location.

STEP 6: **ASHU** - Assign the Release Link Trunk Stations to a UCD Group. See UNIFORM CALL DISTRIBUTION [U-1]. One Station Number will be designated as the lead Station. This number will simulate Dial Access to Attendant. Also, Incoming Trunk Calls will be distributed among the available Release Link Trunks evenly. ASHC may also be used, STATION HUNTING - CIRCULAR [S-7].

STEP 7: **ACSI** - Assign the Incoming Satellite Trunks to be answered at the Main System CSI = 3, Direct In Termination, Day and Night Mode. Then assign the Stations programmed above. This ties Incoming Trunks to the TLTs.

STEP 8: **ACFR** - Assignment of Call Forwarding Restriction. Upon determining which types of Call Class Indexes (CCI) will be answered at the Main System, such as LDN (DDD), WATS, FX. Allow those CCI a Transfer Service Feature Index of 15, CAS Line.

STEP 9: **ACSA** - (Optional) Use this command rather than ACSI if CAS operation is desired in Day mode, and if Incoming Trunks are to stay at the Satellite and be answered by TAS or a NIGHT CONNECTION - FIXED/FLEXIBLE [F-1/2] Station in Night mode.

C-21D Code Calling Access -D

General Description

This feature provides the ATTENDANT CONSOLE [A-3] and users dial access to Code Calling Equipment.

Note: This feature is only available in North America.

Operating Procedure

1. Go off hook. Receive Dial Tone.
2. Dial the CODE CALLING ACCESS Code.
3. Dial the Code Number for the unit desired.

Service Conditions

1. Amplifiers, speakers, and Code Calling Units must be provided by the customer.
2. Loop Start Central Office Trunks are used for interfacing Code Calling Equipment. One Central Office Trunk circuit is required per Paging Port and per Answer Back Port.
3. FULLY RESTRICTED STATIONS: A fully restricted Station may make only dial “0” and Station-to-Station Calls. Therefore, the CODE CALL ACCESS is denied.
4. HOTLINE [H-1]: A Hotline Station user can be programmed to connect to a Code Call Unit when the Station goes off-hook.
5. ROUTE RESTRICTION: A Station that is Code Calling Route Restricted is denied dial access to the Code Call Unit. Restricted Calls are routed to Reorder Tone. If allowed by the user’s Class of Service, Attendant assistance can be used to complete a Code Call for a Route-Restricted Station.
6. Attendants, users and TIE Trunk users can dial an Access Code and a two or three-digit Called Party Code to activate a Coded Signal.
7. The Desktop terminal display will indicate the Elapsed Call Time and Trunk Number.

Interactions

PAGING TRANSFER [P-10] may be used along with CODE CALLING ACCESS. Refer to PAGING TRANSFER [P-10] for additional programming.

Programming

STEP 1: **ANPD** - Reserve a Number Level for Miscellaneous Trunk Access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan.

STEP 2: **ASPA** - Assign the Access Code in the level as assigned in ANPD above. Type of Service, SRV = "OGC: Outgoing Call" for Outgoing Trunk. Assign the Route Number associated with this Access Code.

STEP 3: **ARTD** - Assign the CODE CALLING ACCESS Route in ARTD as follows:

RT:1
1-OSGS :2 2-ONSG :3 5-TF :1 6-TCL :9 7-L/T :1
8-RLP :2

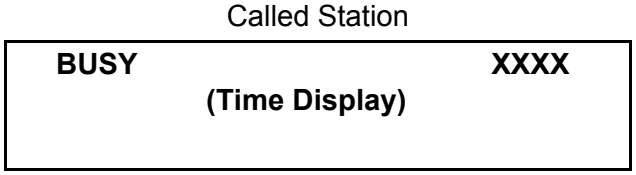
Note: To change the data for existing route (RT), initialize the circuit card.

STEP 4: **ATRK** - Program the LENS of the Paging Trunks. These Trunks must be COT or 8TLT Cards.

STEP 5: **MBTK** - Make idle the Paging Trunk.

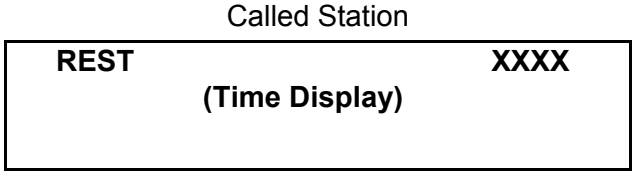
C-22D Called Station Status Display -D

General Description



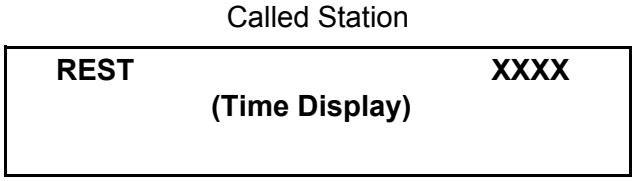
This feature provides for the status of a Called Station to appear on the LCD of a Calling Desktop terminal.

Operating Procedure



Lift handset or press the SPEAKER key. Dial desired Station. The LCD display indicates the status of the Called Station.

Service Conditions

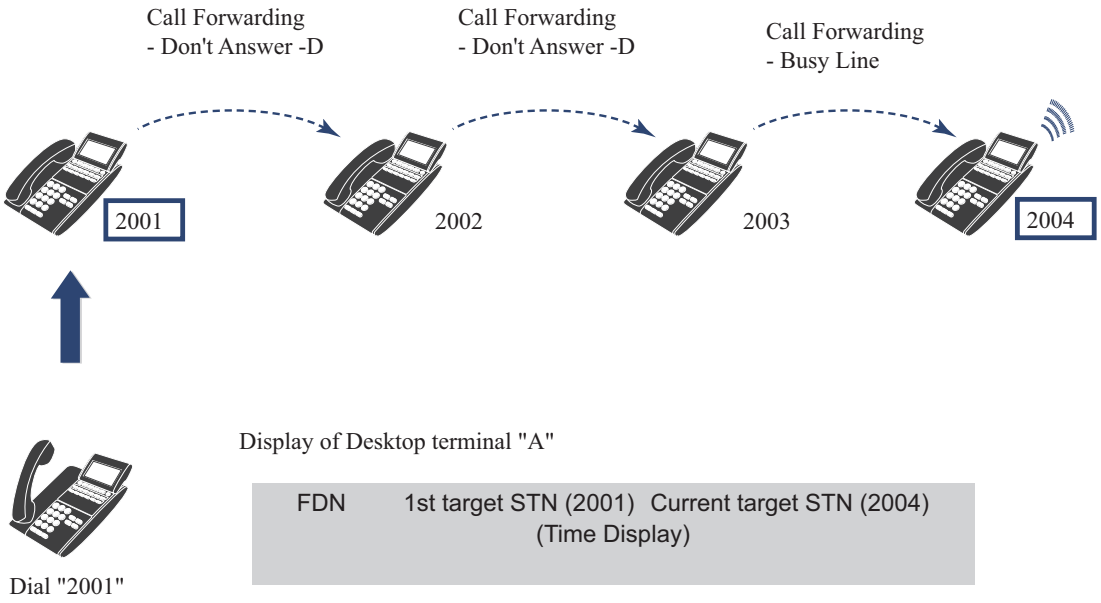


1. If the Called Station is idle, the display flashes its number until the call is answered. If the Called Station is busy, the LCD displays:

2. If the Called Station is in DO NOT DISTURB -D [D-11D], the LCD displays:

3. If the Calling Station encounters a restricted Station, the LCD displays:

4. CALLED STATION STATUS DISPLAY -D can be restricted on a system basis. The LCD displays:



5. If calling a target station by Call Forwarding - All Calls, Call Forwarding - Busy Line, Call Forwarding - Don't Answer -D, Logged Out IP Station - Call Destination, or Call Forwarding PS Incoming Call Incomplete, the LCD of calling party's Desktop terminal displays as follows.

FWD 1st target STN Current target STN (Time Display)

Note: If Call Forwarding - All Calls, Call Forwarding - Busy Line, Call Forwarding - Don't Answer -D, Logged Out IP Station - Call Destination, or Call Forwarding PS Incoming Call Incomplete are mixed on Multi-hops forwarding, the kind of forwarding and the first station number that are displayed on the LCD of calling party's Desktop terminal and called party's Desktop terminal is the kind of forwarding and the station number of station that is forwarded first.

Note: If Call Forwarding - All Calls, Call Forwarding - Busy Line, Call Forwarding - Don't Answer -D, Logged Out IP Station - Call Destination, or Call Forwarding PS Incoming Call Incomplete are mixed on Multi-hops forwarding, the current target station number to be displayed on the LCD of calling party's Desktop terminal is the station number that is currently called.

Programming

ASYD - SYS1, Index 78, Bit 1. Is the Service Feature Display in service? 0/1: No/Yes.

C-24D Calling Number Display -D

General Description

This feature provides for the Station and Trunk Number of an Incoming Call to appear on the Desktop terminal's LCD. This display will flash while the call is ringing, then appear steady when the call is answered.

Operating Procedure

No manual operation is required.

Service Conditions

1. When a call terminates on a line other than the PRIME-LINE [P-13D], the LCD displays the Incoming Station determined by LINE PRE-SELECTION -D [L-9D].
2. LINE PRE-SELECTION -D [L-9D] is governed by a timer.

Programming

No programming is required.

C-25 Call Forwarding - Intercept / Announcement

General Description

This feature provides for interception of STATION-TO-STATION [S-11], DIRECT INWARD DIALING [D-8], Attendant-to-Station and CCSA ACCESS [C-14] Calls that cannot be completed (unassigned Station, Level, etc.). These calls are automatically routed to a Recorded Announcement informing the caller that an Inoperative Number was reached and giving the Listed Directory Number for information.

This feature permits a Station-originated Call, upon encountering a restricted Outgoing Number, to automatically be routed to a Recorded Announcement informing the caller that the Dialed Number is restricted for this Station.

This feature permits a Station-originated Call, upon encountering a Trunk Busy Condition, to automatically be routed to a Recorded Announcement informing the Main System caller that all the Outgoing Trunks are busy.

Operating Procedure

No manual operation is required, once this feature has been programmed in System Data.

Service Conditions

1. CALL FORWARDING - INTERCEPT / ANNOUNCEMENT requires one of the following hardware alternatives:
   a.) Central Office Trunk (COT) or 2W E&M Trunk and an Announcement Machine, or
   b.) Digital Announcement Trunk (DAT).
2. If the Outside Party or Attendant forgets to hang up, the system will automatically disconnect in 30 seconds (provided this is programmed in System Data). If no disconnect timing is programmed, the Outside Party will control disconnect.
3. The forwarding destination for this feature can be set on a tenant basis or on a route basis.

   Note: The following conditions apply:

   - Data assignment on a route basis is available since FP95-114 V4 Issue 2.0 (earlier than FP95-114 V4 Issue 2.0, it can be set on a tenant basis only).
   - To set the forwarding destination on a route basis, see CALL FORWARDING DESTINATION PER TRUNK ROUTE - INCOMING CALL [C-209].

4. The following call conditions, which cannot be completed, can be routed to intercept:
   a.) vacant level
   b.) unassigned Telephone Number
   When Attendant is assigned as the forwarded destination by Call Forwarding-Intercept, the LCD on the caller's station shows the same display as Call Forwarding-Don't Answer.
5. Only one common message can be provided for the different intercept conditions.
6. There is no method by which to exempt individual DID, CCSA, and TIE Trunks from intercept.
7. A Station dials the LEAST COST ROUTING [L-5] Access Code and then an Outside Number. If that Outside Number is not listed in LEAST COST ROUTING [L-5] Tables (Outgoing Routing Patterns, OPR), the call will be routed to an Intercept Announcement.
8. If a different message is required for each of the three intercept conditions, three Trunks or three Announcement Machines must be provided.

9. When a call is terminated from the ISDN Trunk or MG(SIP), RBT is sent to the caller if Announcement Trunk Answer Signal is not sent.
10. When a call with Consultation Hold is terminated from a counter office, if the Announcement Trunk Answer Signal exists, announcement trunk will operate. To return to the call, press the DISC key. For more information about it, refer to Consultation Hold Release [C-169].
    Note that pressing the hooking key disables the announcement trunk to operate although it returns to a call.

When encountering a Restricted Route

11. This feature is valid when Station to Outgoing Trunk Connection is restricted.
12. This feature is applied equally to all Trunk Routes in the system. It cannot be denied to some Routes and available to other Routes.
13. This service is valid when a call is redirected to an OG Trunk via CALL FORWARDING - OUTSIDE [C-28]. The Announcement will be heard when the Calling Station is also a restricted Station.
14. This service is not valid for TRUNK-TO-TRUNK CONNECTION [T-10] when the Called Station has set CALL FORWARDING - OUTSIDE [C-28] via DID or TIE Trunk.
15. This service is not valid for Outgoing Calls that do not go out when all Trunks or Senders are busy.

When encountering All Trunks Busy

11. This feature is valid for Outgoing Station-to-Trunk or Tandem Trunk-to-Trunk Connections.
12. Automatic OUTGOING TRUNK QUEUING [O-2], OFF-HOOK QUEUING [O-7] and ROUTE ADVANCE [R-6] are mutually exclusive with this feature. These features take priority over OUTGOING TRUNK BUSY - ANNOUNCEMENT [O-21].
13. ANNOUNCEMENT SERVICE is provided to FCCS Nodes that have no Announcement Trunk using the Trunk in the Remote Node.
14. When CALL FORWARDING - INTERCEPT / ANNOUNCEMENT [C-25] or CALL FORWARDING - INTERCEPT / ANNOUNCEMENT - ATTENDANT [C-75] is used in an FCCS Network, the additional data shown below is required.
    a.) The Logical Route Number should be applied to the Physical Route that is provided the service.
    b.) The restriction of Route-to-Route Connection between FCCS Nodes should be released.
15. When using the FCCS Network, CALL FORWARDING - INTERCEPT / ANNOUNCEMENT [C-25] or CALL FORWARDING - INTERCEPT / ANNOUNCEMENT - ATTENDANT [C-75] is not provided for an Incoming Call using AUTOMATED ATTENDANT [A-82], DIRECT-IN TERMINATION [D-7], or REMOTE ACCESS TO SYSTEM [R-2].
16. When using the FCCS Network, the Call Forwarding for an Incoming Call routed to a Dead Level or an Unused Number has priority over the Announcement Service for the Incoming Call.
17. This feature allows the Incoming Trunk Call that cannot be completed [including a CCIS Terminating Call that is abandoned by a Route Restriction Class (RSC) of the Calling Party] to be forwarded to a designated Station in the Remote Node via FCCS. The Call Forwarding Destination Number must be programmed by using the Telephone Number (TELN) of the Station.
18. To forward an Incoming Trunk Call to a predetermined Station in the Remote Node via FCCS, the data assignment of ACFOL/ACFON is required. When Call Forwarding is activated by using ACFOL/ ACFON, only one Station can be registered as the Call Forwarding Destination in a system.
19. The Call Forwarding Destination that is registered by ACFOL/ACFON is available only when an Incoming Call is forwarded to a Station.
20. The feature data via DM, LDM and NDM can coexist in a system. However, data registered on NDM has priority. Data registered on LDM has precedence over data registered on DM (the priority is NDM $\rightarrow$ LDM $\rightarrow$ DM).

Interactions

1. Each Route connected to an Announcement Machine is also an EQP. The same Route can be assigned as different EQPs. However, it is best to separate EQP functions by Route.
2. TLT, COT, or DAT Card may be used.

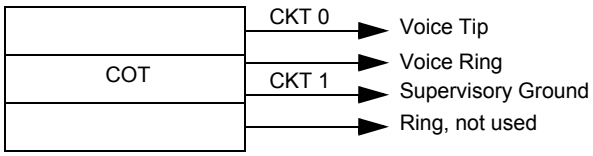
Programming

STEP 1: **ACFO** - Enable this feature by allowing CF = 3: Call Forwarding - Intercept. The CFI parameter will come up for assignment. An Attendant Console may be programmed so that Intercepted Calls will terminate at the Call Forwarding Intercept key. If no assignment is made, the System program goes to AAED for Announcement Trunk information because the destination of the transfer is a Trunk and not a Station or Attendant Console.

STEP 2: **ARTD** - Assign the Announcement Route as shown below:

RT:1

1-OSGS	:2	2-ONSG	:3	5-TF	:1	6-TCL	:1	7-L/T	:1
8-RLP	:2	15-LSG	:0*						



Note: *If a TLT circuit card is used, assign five, E&M.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or VS32.

STEP 3: **ATRK** - Assign the LENS, Announcement Trunk Route Number, Trunk Number, and Tenant Number.

STEP 4: **MBTK** - Assign the Make Idle status to the Announcement Trunk.

Note: If supervision is required, use the first two circuits of the COT circuit card. Move the switch on the COT to PGT.

STEP 5: **ARRC** - If TIE Line or REMOTE ACCESS TO SYSTEM [R-2] Connection to the ANNOUNCEMENT SERVICE Trunk is required, allow Trunk-to-Trunk Connection using ARI-D-RES, Direct Connection.

STEP 6: **AAED** - Used to assign Announcement Equipment. Assign:

TN: Tenant Number

EQP: Announcement Equipment Number

- 0: Dead Level
- 1: Unused Number (LCR OPR not programmed)
- 2: Available
- 3: Available
- 4: Outgoing Trunk Group Busy Announcement
- 5: Available

6: Available
7: Outgoing Route Restriction Announcement
8-15: Available for ANNOUNCEMENT SERVICE [A-15] applications.

RT, TK: Route and Trunk Number of the Trunk connected to the Announcement Equipment.

C: Duration of connection, 0/1: Disconnect in 30 seconds/the connection is held until the Station releases. See the requirements of the Announcement Equipment.

R: Sending RBT, 0/1: Sending/Not sending. Normally assign data "0".

Note: Assign "1" (not sending Ringback Tone) when the "M" parameter = 0 (Single Connection).

A: Answer Signal Sending, 0/1: No answer from Incoming Trunk/answer from Incoming Trunk. Normally assign data "0". No Answer Signal is sent to the Central Office, therefore the Calling Party will not be billed for the call.

M: Multiple Connection, 0/1: Single Connection/Multiple Connection. See the requirements of the Announcement Equipment.

STEP 7: **ACFR** - Assignment of Call Forwarding Restriction. Upon determining which types of Call Class Indexes (CCI) will be answered via CALL FORWARDING - INTERCEPT, for example, CCSA and DID Calls: allow those CCIs a Transfer Service Feature Index of 1, for CALL FORWARDING - ALL CALLS, NO ANSWER, BUSY.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

STEP 1: **ALRTN** - This data must be assigned to the NCN. Assign the Logical Route Number to the physical route.

STEP 2: **AAEDN** - This data must be assigned to the NCN. Assign the Announcement Equipment Data.

EQUIPMENT KIND:
- DAT/Announcement Machine
- VS32

TN: Enter Tenant Number

EQP: Announcement Equipment Number
0 = Dead Level
1 = Unused Number
2-15 = Announcement Service

Duration of Connection:
- Disconnection occurs in 30 seconds
- Connection is held until the Station releases. See the requirements of the application for the Announcement Equipment. For Dead Level applications, data 0 is assigned.

Do Not Send RBT [On/Off]

Note: Assign Do not Send RBT when Multiple Connection = Single.

Send Answer Signal [On/Off]
Multiple Connection: Select either Single or Multiple.
LGRT: Logical Route
TK: Trunk Number **Note 1**
ANP: Announcement Pattern (0 - 255)
REP: Repeat Pattern (0 - 255)

STEP 3: **ARRCN** - This data must be assigned to the NCN.
Release the restriction between the Terminating Trunk and the Announcement Trunk.

STEP 4: **ARSCN** - This data must be assigned to the NCN.
Release the restriction between the Announcement Trunk and the Station.

Note 1: Not necessary for Multiple Connection = Single.

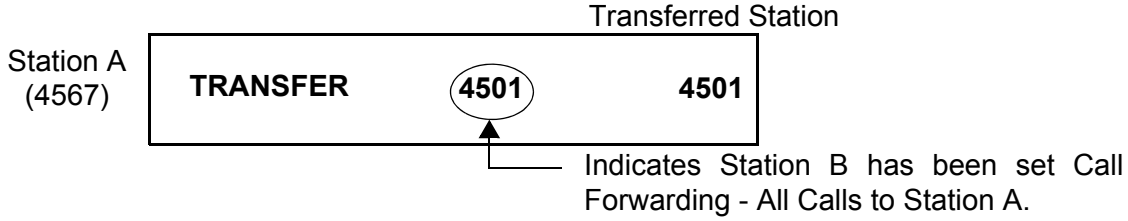
Note: The current command data shown is set to all Nodes using the service: ASTD, ARTD, ATRK, MBTK

To forward the Incoming Trunk Call that cannot be completed to the predetermined Station in the Remote Node via FCCS, the following data assignment is required.

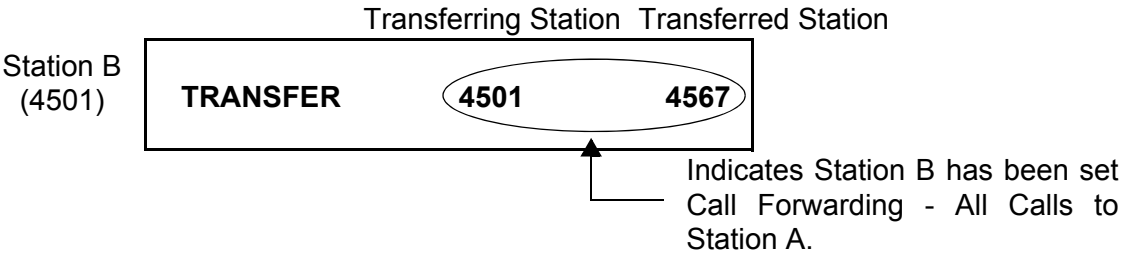
ACFOL/ACFON - TN = Tenant Number, Call Forwarding Service, CF = 3: Call Forwarding - Intercept, Forwarding Destination, CFI = TELN (Forwarded to Station). When TELN is assigned to the CFI Parameter, assign the Telephone Number (a maximum of 16 digits) of the Forwarding Destination Station to the TELN Parameter.

C-26 Call Forwarding - Override

General Description



This feature allows a Target user (Station A) to call the Station (Station B) which has set CALL FORWARDING - ALL CALLS [C-5] to it. If the Called Station (Station B) has set the CALL FORWARDING - BUSY LINE [C-2] to the Calling Station (Station A), the Calling Station (Station A) hears Busy Tone and can activate CALL BACK [C-1], EXECUTIVE RIGHT-OF-WAY [E-1], or CALL WAITING - ORIGINATING [C-31].



Operating Procedure

Station A presses EXECUTIVE RIGHT-OF-WAY [E-1] or CALL WAITING [C-31] after hearing Busy Tone.

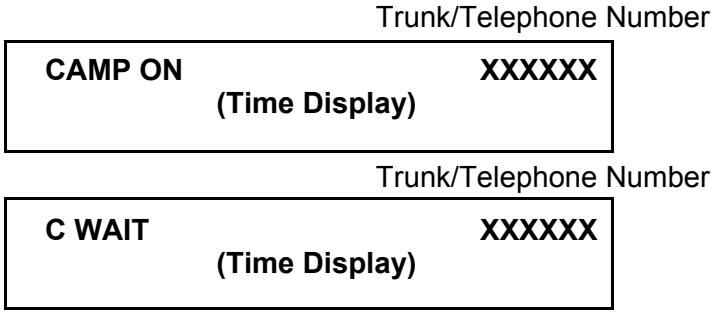
Service Conditions

1. This feature is allowed to all Stations in the System, except the ATTENDANT CONSOLE [A-3].
2. Any Station that has set CALL FORWARDING - ALL CALLS [C-5] can activate any feature, if the Station is allowed the feature via CLASS OF SERVICE [C-15].
3. When Station A (Desktop terminal) calls Station B (Desktop terminal), or if Station A places an Incoming Call into hold condition and calls Station B, each Dterm LCD displays as shown below:

Programming

ASFC - Assign Service Feature Restriction Class that allows SFI 156 (Call Forwarding - Override Indication) to the Dterm Stations allowed LCD indication of this service.

C-27D Call Waiting - Answer -D



General Description

This feature allows a Desktop terminal user to answer a CAMPED-ON [A-1] or CALL WAITING [C-12, 31] Call while putting an existing call on HOLD [C-6], by pressing the ANSWER key.

Operating Procedure

CAMP-ON [A-1] or CALL WAITING [C-12, 31] to a busy Desktop terminal is activated:

1. The user hears camp-on indication Tone or Call Waiting Tone during a call in progress. The LCD of the Desktop terminal displays:

2. The user presses the ANSWER key and is connected to the Waiting Call.
3. To return to the original call, the Desktop terminal user re-presses the ANSWER key.

Service Conditions

1. Service conditions are essentially the same as those of CALL WAITING - TERMINATING [C-12] for ordinary Telephone Sets.
2. Pressing RECALL will disconnect the party presently engaged in conversation.

Interactions

1. This feature is allowed whenever the Destination Telephone is engaged in any state other than:
   a.) engaged in a Three-way Connection,
   b.) a Privacy feature is activated,
   c.) connected to a Route programmed to have Line/Trunk, Privacy, CDN 44:PRV,
   d.) listening to a Tone (Dial Tone, Reorder Tone, Service Set Tone, Busy Tone, Ringback Tone).
2. CALL WAITING - ANSWER -D is operated by pressing the ANSWER key located on the Desktop terminal instrument. This feature is used for ATTENDANT CAMP-ON [A-1] and CALL WAITING - ORIGINATING [C-31].
3. Periodic Call Waiting Tones will not operate for ATTENDANT CAMP-ON WITH TONE INDICATION [A-1].
4. This feature cannot be set from SIP Handler Controlled SIP terminals. Also this feature cannot be set from different terminals to SIP Handler Controlled SIP terminals.

Programming

STEP 1: **ASYD** - SYS1, Index 152. Timer Class 3 = Two seconds. MTC×TC = Interval for CALL WAITING.

MTC assigned in hexadecimal to Bit 0 to Bit 3 of this index. Default value is ten seconds.

SYS2, Index 10, Bit 6. Should CALL WAITING - ORIGINATING [C-31] operation be automatic upon encountering a busy Station? 0/1: No/Yes. Assign on a per Tenant basis.

SYS2, Index 10, Bit 7. Should the Warning Tone set in SYS1, Index 152 be periodically sent? 0/1: No/Yes. Assign on a per Tenant basis.

STEP 2: **ASFC** - Assign a Service Feature Restriction Class that allows SFIs 5 [Call Waiting - Originating (Calling)], 6 [Call Waiting - Originating (Called)], and 11 [Data Line Privacy = 0/Attendant Camp-On = 1). This allows the ability to originate a CALL WAITING - ORIGINATE (SFI 5), to terminate a CALL WAITING - ORIGINATING [C-31] (SFI 6), and to receive Camp-On Tone (SFI 11).

Commands related to CALL WAITING - ORIGINATING [C-31]

STEP 3: **ANPD** - Reserve a Number Level for Feature Access. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan.

STEP 4: **ASPA** - Assign an Access Code to CALL WAITING - ORIGINATING [C-31], SRV = "SSC: Service Code", SID = 5 for Connection Status Index (CI) of "B: Busy". Assign the NND value as equal to the digits in the Feature Access Code.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ANPDL** - Reserve a Number Level for Feature Access. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan.

STEP 2: **ASPAL** - Assign an Access Code to CALL WAITING - ORIGINATING [C-31], SRV = "SSC: Service Code", SID = 5 for Connection Status Index (CI) of "B: Busy". Assign the NND value as equal to the digits in the Feature Access Code.

Note: System Timers may be set on a network basis in ASYDN.

C-28 Call Forwarding - All Calls - Outside

General Description

This feature allows a call, which originates from a Station or Trunk and is destined for a Station, to be routed to another Station outside the System via the appropriate Trunk Line. This feature can also be activated from a Desktop terminal Multi Line.

Operating Procedure

To set and cancel from an individual Station using the same Access Code Note 1

- For setting:

1. Lift the handset. Receive Dial Tone.
2. Dial the CALL FORWARDING - ALL CALLS - OUTSIDE entry Access Code (same as CALL FORWARDING - ALL CALLS [C-5]) (**Note 2**). Receive Special Dial Tone.
3. Dial the desired Forwarding Destination Number. Receive Service Set Tone.

- For cancellation:

1. Lift the handset. Receive Dial Tone.
2. Dial the CALL FORWARDING - ALL CALLS - OUTSIDE entry Access Code (same as CALL FORWARDING - ALL CALLS [C-5]). Receive Special Dial Tone.

Note 1: Available from FP95-114 V4 Issue 2.0 with system data ASYDL, SYS1, Index 686, Bit 0= 1.

Note 2: A tone will not be provided when an access code is used to set this feature on SP Controlled Standard SIP terminal.

To set and cancel from an individual Station with different Access Codes

- For setting (**Note 3**):

1. Lift the handset. Receive Dial Tone.
2. Dial the Call Forwarding - All Calls - Outside entry Access Code (same as CALL FORWARDING - ALL CALLS [C-5]). Receive Special Dial Tone.
3. Dial the desired Forwarding Destination Number (or Speed Calling Access Code and Abbreviated Code). If the ATTENDANT CONSOLE [A-3] is setting this feature, dial the entry Access Code, Tenant Number, Originating Telephone Number, and then the desired Outside Number. Receive Service Set Tone.

Note 3: A tone will not be provided when an access code is used to set this feature on SP Controlled Standard SIP terminal.

- For canceling:

1. Lift the handset. Receive Dial Tone.
2. Dial the Call Forwarding - All Calls - Outside cancel Access Code, (same as CALL FORWARDING - ALL CALLS [C-5] Cancel Code). Receive Service Set Tone.

To set from a Multi Line

1. Press a Line/Feature key to be used for Call Forwarding - All Calls - Outside.
2. Lift the handset or press the SPEAKER key. Receive Dial Tone.
3. Press the CALL FORWARDING -ALL CALLS - OUTSIDE Feature key. Receive Special Dial Tone.
4. Dial the desired Forwarding Destination Number (or Speed Calling Access Code and Abbreviated Code). Receive Service Set Tone. The Call Forwarding - All Calls FKY LED will light on the phone of the station that this feature has been set. No lamp indication will be given on the multi-line of the setting phone once this feature is set. The LCD displays:

FORWARD SET **(Time Display)**

5. Replace the handset or press the SPEAKER key.

To monitor from a Multi Line

1. Press the Multi Line Appearance, then press the CALL FOWARDING -ALL CALLS Feature key. The LCD displays:

Outside Number*

FORWARD	**XXXXXXXX**
(Time Display)	

Note: *A dialed Abbreviated Number is transferred into the Forwarding Number, and the first 16 digits are displayed on LCD, even if a maximum of 24 digits can be stored.

To cancel from a Multi Line

1. Lift the handset or press the SPEAKER key. Receive Dial Tone. Press the CALL FOWARDING -ALL CALLS Feature key. Receive Service Set Tone. The LED of the associated Feature key will go out. The LCD displays:

FORWARD CANCEL **(Time Display)**

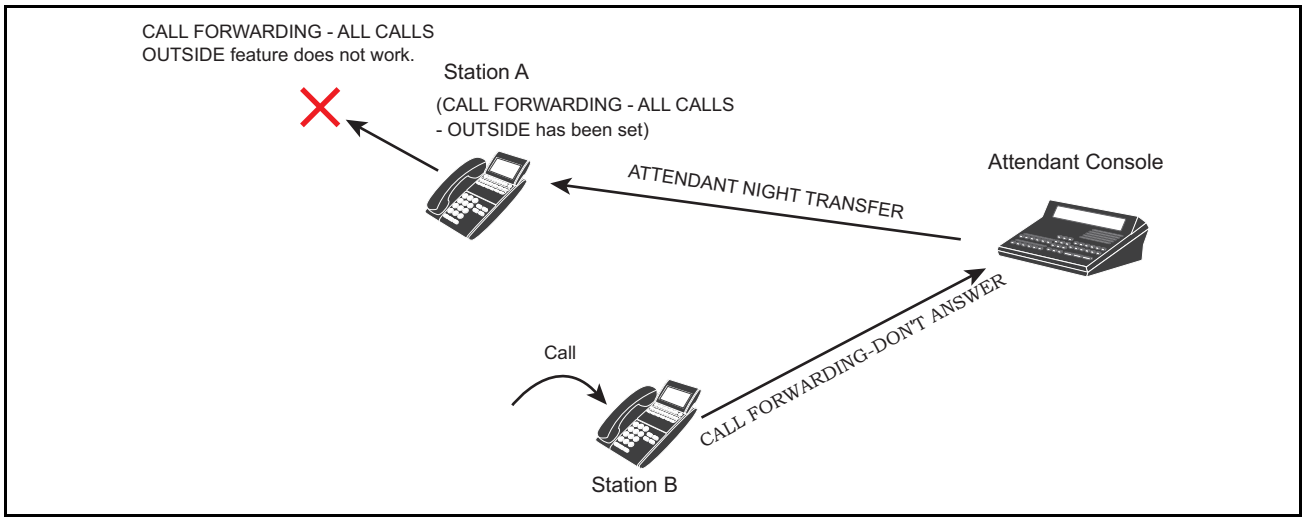
2. Replace the handset or press the SPEAKER key.

Service Conditions

1. Call Forwarding - All Calls - Outside may be set or cancelled by either a user or the Attendant.
2. Stations may be assigned this feature via CLASS OF SERVICE - INDIVIDUAL [C-15] programming in System Data.
3. For Call Forwarding - All Calls - Outside, Speed Call List Numbers may be programmed as the Destination Telephone Number. This permits the sent digits to exceed the 12-digit maximum.
4. When using this feature, either the Calling Station or the Forwarding Station is recorded by STATION MESSAGE DETAIL RECORDING (SMDR) [S-10] as the Originating Station of calls forwarded. The selection between the above Stations is decided by System Data.
5. The Calling Desktop terminal display for Call Forwarding and Busy Line - Outside appear as regular Outgoing Central Office Calls. The Calling Desktop terminal display for Call Forwarding Don't Answer - Outside appears as a STATION-TO-STATION CALLING - CCIS [S-57] Call.

6. Call Forwarding - All Calls - Outside can be restricted by the Trunk Route Restriction Class (RSC) of the Originating Station.
7. There is no limit to the number of Stations that may activate this feature simultaneously.
8. Restrictions for Outgoing Connection by Call Forwarding - All Calls - Outside are as follows:
   a.) When originating a call from a Station: RSC is verified when this service is in effect.
   b.) When originating a call from a Trunk: Restriction for Tandem Connections between the incoming trunk and the outgoing trunk is selected for the call where Call Forwarding - All Calls service occurs.
9. When a caller places a call via OGCA and when the first Outgoing Route and the Calling Party are restricted, this service cannot be set. In this case, the service can be set via the following procedure:
   a.) assign a Dummy Route,
   b.) clear the restriction between the Dummy Route and all the Stations,
   c.) assign the Dummy Route as the first Route of OGCA.
10. When a destination of Call Forwarding - All Calls - Outside has already been assigned, even if the feature is restricted by the new Office Data or changing of Day/Night mode, the assigned data can still be used or canceled.
11. A maximum of 24 digits, including Trunk Access Code, can be stored.
12. This feature allows a call to terminate to a Trunk outside of the FCCS Network. Accordingly, the Access Code + Office Code or the Access Code including Office Code is required before dialing the Telephone Number to recognize the Terminating Node.
13. When the Incoming Call is forwarding to the Public Network, be sure to add the Outgoing Access Code + Destination Area Code or the Outgoing Access Code including Destination Area Code Number before dialing Subscriber Number.
14. A call can be forwarded to a Trunk in the Remote Node via FCCS.
15. Assign the System Data (ASYDL, SYS1, Index 677, Bit 3=1), and press the Call Forwarding - All Calls - Outside Feature key, a maximum of 16 digits Call Forwarding Information can be displayed.

    Note: This feature is available only for the terminal that can display 24 digits on LCD.



16. By registering the Call Forwarding - All Calls Access Code - Outside + the desired Forwarding Destination Number to the CF Setting button of a Line/Feature key on a Desktop terminal, it is possible to enable and disable CALL FORWARDING - ALL CALLS - OUTSIDE [C-28] just by pressing the CF Setting button. For a detailed explanation, see CALL FORWARDING (CF) BUTTON - ONE TOUCH [C-208].

    Note: CALL FORWARDING (CF) BUTTON - ONE TOUCH [C-208] is available from FP95-114 V4 Issue 2.0.

Interactions

1. A 24-digit limitation exists in memory for Call Forwarding - Outside.
2. Call Forwarding - Outside is an enhancement of the Call Forwarding - All Calls feature.
3. This feature may be set from the Attendant Console.
4. A call may be Call Forwarded - Outside to a SPEED CALLING - SYSTEM [S-3] or SPEED CALLING - STATION/GROUP [S-21, 23] Number. This will allow a Long-distance Number that exceeds 12 digits.
5. A user can verify that Call Forwarding - Outside has been correctly activated and can inform the designated Outside Party of the activation by dialing the Forwarded Station from any Station in the system.

6. If a Station is restricted from outside calling, Call Forwarding - Outside will be denied. TOLL RESTRICTION - 3/6 DIGIT [T-7] will be applied to Call Forwarding - Outside via SPEED CALLING - SYSTEM, STATION, GROUP [S-3, 21, 23], if Tenant Data assigned in System Data 2 applies Toll Restriction to Speed Calling.
7. Upon activation of this feature, STATION MESSAGE DETAIL RECORDING (SMDR) [S-10] will record the Outside Exchange Number whenever a call is forwarded.
8. A Station can use the OUTGOING TRUNK QUEUING [O-2] feature to queue an outgoing trunk and a call that is being forwarded via the Call Forwarding - Outside feature. The call will be outpulsed when a Trunk becomes available.
9. A Station assigned to a STATION HUNTING [S-7, 8, 9] Group will be temporarily removed from the Hunt Group if it initiates Call Forwarding - Outside.
10. If a call using the CALL BACK [C-1] feature is placed from a Station that has activated Call Forwarding - Outside, the Call Back will ring at the Forwarding Station, not the outside Station.
11. When OUTGOING TRUNK QUEUING [O-2] (on-hook) is initiated by the Forwarding Station, the ring back will be to the Forwarding Station and not to the outside Station.
12. A DIRECT-IN TERMINATION [D-7] call may be sent through Call Forwarding - Outside.
13. The number of digits (maximum 12) that will be accepted before forwarding is set is determined by AMND.
14. This feature allows a call to terminate to a Trunk outside of the FCCS Network. Accordingly, “the Access Code + Office Code” or “the Access Code including Office Code” is required before dialing a Telephone Number to recognize the Terminating Node.
15. When forwarding the Incoming Call to the Public Network, be sure to add the Outgoing Access Code + Destination Area Code or the Outgoing Access Code including Destination Area Code Number before dialing a Subscriber Number.
16. When CALL FORWARDING - ALL CALLS - OUTSIDE [C-28] is set to Station A (Destination Station for ATTENDANT NIGHT TRANSFER [A-19]), the following call routing is not available.
    a.) Station B has set CALL FORWARDING - DON’T ANSWER [C-3] to the Attendant Console.
    b.) A call terminates to Station B when the system is in Night mode.
    c.) Station B does not answer the call. It is transferred to the Attendant Console after a predetermined period of time.
    d.) The Attendant Console transfers the call to Station A (Destination Station for ATTENDANT NIGHT TRANSFER [A-19]).
    e.) Although Station A has set CALL FORWARDING - ALL CALLS - OUTSIDE [C-28], the call cannot be transferred to the outside party.

17. A tone will not be provided when an access code is used to set this feature on SP Controlled Standard SIP terminal.
18. When a SIP Handler Controlled SIP terminal is in Multi Line Mode, the Call Forwarding setting applies to the seized line while setting. In normal case, where My Line is not used by another station, the Call Forwarding setting applies to My Line. To set the Call Forwarding applying to Sub Line, use the ACFS/ ACFS_T commands.

Programming

STEP 1: **ASYD** - SYS1, Index 4, Bit 6. One burst of ringing all CALL FORWARDING - ALL CALLS [C-5] in service = 0/1: No/Yes. SYS1, Index 20, Bit 7. Calling or Forwarded Party shows on SMDR = 0/1: Calling/Forwarded.

SYS2, Index 6, Bit 4. Call-forwarded Station restricted from making calls = 0/1: Yes/No.

STEP 2: **ASYDL** - SYS1, Index 677, Bit 3.
Display a maximum of 16 digits Call Forwarding Information on LCD? 0/1 = No (default)/Yes.
SYS1, Index 686, Bit 0=1. **Note 4**
Disabling Call Forwarding - All Calls with entry Access Code is in service.

STEP 3: **ASYDN** - SYS1, Index 686, Bit 0=1. **Note 4**
Disabling Call Forwarding - All Calls with entry Access Code is in service.

STEP 4: **ANPD** - Reserve a Number Level for Feature Access and Cancel (**Note 5**). Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan.

STEP 5: **ASPA** - Assign an Access Code to CALL FORWARDING -ALL CALLS [C-5] set SID = 8, and to CALL FORWARDING -ALL CALLS [C-5] cancel SID = 9 (**Note 5**). Assign Connection Status Index (CI) for "N: Normal" service.

Note 4: Available from FP95-114 V4 Issue 2.0.

Note 5: When SYS1, Index 686, Bit 0=1 (Disabling Call Forwarding - All Calls with entry Access Code is in service), Call Forwarding - All calls cancel is not required because the cancellation can be performed with the entry Access Code.

STEP 6: **ASFC** - Assign the Station a Service Feature Restriction Class that allows SFI 7 (Call Forwarding - All Calls). And also assign either SFI 25 (Call Forward Outside - Local) or SFI 26 (Call Forward Outside - Long Distance). Assign SFI 151 (Call Forwarding - Outside) when Call Forwarding - Outside is performed, RSC of the Forwarding Station is used.

Note: SFI 25 checks AMND for 11 digits or less (Local Service). SFI 26 checks AMND for 12 digits or more (Long Distance Service).

Note: SFI 151 (Call Forwarding - Outside) is not available when the System Data (ASYDL/ASYDN, SYS1, Index 1393, Bit 5) is set to 1.

STEP 7: **ARRC** - Allow trunk-to-trunk connection between an incoming route and an outgoing route that may be used for this feature. The incoming trunk includes calls extended by the Attendant Console and DID Calls. The outgoing trunk would be DDD or Trunks seized when using SPEED CALLING - GROUP [S-23] or SPEED CALLING - SYSTEM [S-3]. If LCR is used, allow trunk-to-trunk connection to the Outgoing LCR Flag Route, usually Route 31.

To forward tie line calls, you need to allow trunk-to-trunk connection between tie lines by setting the following properties:

IC RT: External route number of a tie line for incoming calls

OG RT: External route number of a tie line for outgoing calls

ARI A-RES = 1: Alternate routing is Allowed

ARI D-RES = 1: Alternate routing is Allowed

STEP 8: **AKYD** - For Dterm sets, Call Forwarding - Outside may be assigned to a Line/Feature key. Assign Feature key Call Forwarding - All Calls [2].

STEP 9: **ADSL** - Assign SN = 1 (Originating; DT Connection) and Feature key Call Forwarding - All Calls [2].

STEP 10: **ATNR** - Allow Tenant-to-Tenant Connection for Inter and Intra-Tenant Connections. TRI = 1. For this feature to be set by the Attendant Console, assign Inter and Intra-Tenant Connection via the Attendant Console, TRI = 3.

STEP 11: **AMND** - Local Outgoing Destination Codes (DC) must be programmed to allow Local Outgoing Calls such as 92, 93, 94, etc.

STEP 12: **ACFS** - Call Forwarding can also be assigned, displayed, or deleted by this command.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ANPDL** - Reserve a Number Level for Feature Access and Cancel. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan.

STEP 2: **ASPAL** - Assign an Access Code to CALL FORWARDING -ALL CALLS [C-5] set SID = 8, and to CALL FORWARDING -ALL CALLS [C-5] cancel SID = 9. Assign Connection Status Index (CI) for "N: Normal" service.

STEP 3: **ARRCN** - Allow trunk-to-trunk connection between an incoming trunk and an outgoing trunk that will be involved with this application. The incoming trunk includes calls extended by the Attendant Console and DID Calls. The outgoing trunk would be DDD or Trunks seized when using SPEED CALLING - GROUP [S-23] or SPEED CALLING - SYSTEM [S-3]. If LCR is used, allow trunk-to-trunk connection to the Outgoing LCR Flag Route, usually Route 31.

Note: System Timers may be set on a network basis in ASYDN.

C-29 Call Park

General Description

This feature enables the Attendants or Station Users to "Park" calls against their own Extension Numbers. Calls can easily be retrieved from any Station within the system.

Operating Procedure

To Park a call from the ATTENDANT CONSOLE [A-3]

1. The Attendant presses the CALL PARK Feature key. The CALL PARK Number (Individual Attendant Number) is automatically selected and displayed at the ATTENDANT CONSOLE [A-3].
2. The Attendant receives Service Set Tone.
3. The Attendant presses either the RELEASE or CANCEL key.

To retrieve a Parked Call from any Station within the system

1. Dial the CALL PARK Remote Retrieval Code and the Individual Attendant Number that has Parked a call. The Parked Call is reconnected.

Note: An attendant cannot retrieve a Parked Call.

To Park a call from a Station

1. Momentarily press the switch hook. Receive Special Dial Tone.
2. Dial the CALL PARK Access Code. Receive Service Set Tone.
3. Replace the handset.

To retrieve a Parked Call from the Originating Station

Dial the CALL PARK Local Retrieval Code. The Parked Call is reconnected.

To retrieve a Parked Call from a Different Station

Dial the CALL PARK Remote Retrieval Code and the number of the Station that Parked the call. The Parked Call is reconnected.

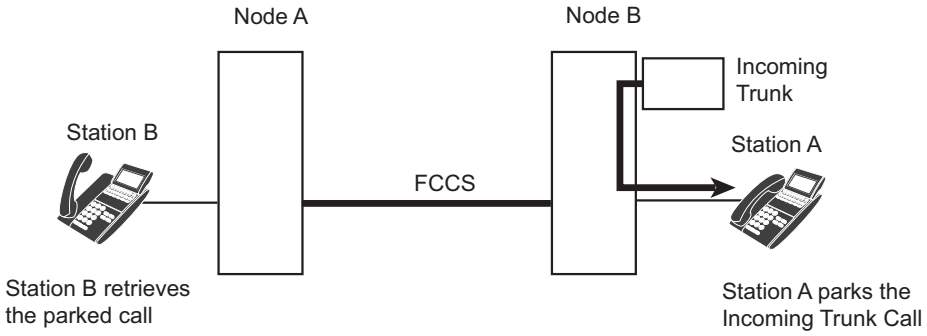
Service Conditions

1. Calls Parked by a Station are automatically Parked on that Station's Extension Number. The My Line Number is used for a Dterm.
2. CALL PARK may be activated only during calls involving two parties.
3. The system provides one Attendant CALL PARK Number for each Attendant. The Individual Attendant Number is the CALL PARK Number. See INDIVIDUAL ATTENDANT ACCESS [I-6].
4. A Station or Attendant can only Park one call at a time. If a Station or Attendant attempts to Park a second call, Reorder Tone will be heard.
5. This feature may be assigned to Stations via CLASS OF SERVICE - INDIVIDUAL [C-15] programming in System Data.
6. The dedicated key (for Parking calls) on the Attendant Console is located between the HOLD and Busy Verification (BV) keys. An Attendant cannot use a CALL PARK Access Code.
7. A user can Park a call only by dialing a CALL PARK Access Code.
8. Stations can Originate and Receive Calls while having a call Parked.

9. The following features cannot be activated to a Station that has set CALL PARK:

ATTENDANT CAMP-ON WITH TONE INDICATION	[A-1]
ATTENDANT OVERRIDE	[A-7]
BUSY VERIFICATION	[B-3]
CALL WAITING - ORIGINATING	[C-31]
CALL WAITING - TERMINATING	[C-12]
EXECUTIVE RIGHT-OF-WAY	[E-1]

10. A Station in an ATTENDANT-CONTROLLED CONFERENCE [A-2] cannot be Parked.
11. There is no limit to the number of calls that can be Parked simultaneously within a system.
12. A Parked Call will recall to the Station that has set the CALL PARK. The Recall Timer is preprogrammed into System Data. A call Parked by the Attendant will not recall.
13. CALL PARK is denied for the following Station status:



ATTENDANT OVERRIDE	[A-7]
BOSS - SECRETARY OVERRIDE -D	[B-5D]
BUSY VERIFICATION	[B-3, B-9]
CALL TRANSFER	[C-10, C-11]
CALL WAITING - ORIGINATING	[C-31]
CALL WAITING - TERMINATING	[C-12]
CONSULTATION HOLD - ALL CALLS	[C-17, C-58]
DATA LINE SECURITY	[D-12, D-66]
DIAL ACCESS TO ATTENDANT	[D-2, D-71]
EXCLUSIVE HOLD -D	[E-4D]
EXECUTIVE RIGHT-OF-WAY	[E-1, E-8]
NON-EXCLUSIVE HOLD -D	[N-7D]
PRIVACY RELEASE	[P-18]
THREE-WAY CALLING	[T-2]
VOICE CALL	[V-2, V-7]

14. CALL PARK is denied for the following Attendant Console status:

ATTENDANT OVERRIDE	[A-7]
BUSY VERIFICATION	[B-3]
CALL TRANSFER - ATTENDANT	[C-10]
Call on Hold	
THREE-WAY CALLING	[T-2]

15. An Attendant Console cannot be Parked.
16. A CALL PARK Connection remains Parked until retrieved or until the party disconnects.
17. A Parked Call can only be retrieved from an Idle Station.
18. An ISDN Terminal User cannot use this feature.
19. An Incoming Call from the ISDN Trunk can be Parked from a Station/Attendant.
20. A Parked Call by an Attendant can be retrieved from a Station by dialing the CALL PARK Retrieval Code and the Individual Attendant Number. Attendant can Park a call only when the call is on SRC side.
21. This feature is available via FCCS Network.

For example, an Incoming Trunk Call is parked from Station A, the call parked by Station A is retrieved from Station B via FCCS.

22. A Parked Call cannot be retrieved from a Station in the Remote Node when all FCCS Links are busy.
23. Feature data may be programmed on either the Local Data Memory (LDM) or the Network Data Memory (NDM).
24. The Night Attendant Console cannot Park a call.
25. A Parked Call will recall to the Station that has set the CALL PARK after a predetermined period of time assigned by the system data (ASYD, SYS1, Index 142) has elapsed (the default value is 500 seconds). If the recalling parked call is from an analog C.O line (except MC&MG-COT/MG-COT), it will be released after a predetermined period of time assigned by the system data (ASYD, SYS1, Index 139) has elapsed (the default value is 30 seconds). As for other than the analog C.O line (except MC&MG-COT/MG-COT), the recalling will be continued.
26. A Parked Call by the Desktop terminal is always retrieved by using the My Line of the Desktop terminal. Even if a Desktop terminal Parks a call by using the Sub Line, the Parked Call is retrieved by using My Line of the Desktop terminal.

Interactions

Only calls directly terminated to the Attendant Console can be Parked. This includes calls transferred to the Attendant from another Station or Attendant Console.

Programming

STEP 1: **ASYD** - SYS1, Index 139, Bit 0 to Bit 3 (MTC), Bit 4-6 (TC). Assign No Answer Timer for CALL PARK recall ringing. If a Parked Call from an analog C.O line (except MC&MG-COT/MG-COT) recalls and the set timer value (default is 30 seconds) elapses, the call will be released. SYS1, Index 142. For CALL PARK Recall, the Miscellaneous Timer Counter is assigned in Bit 0 to Bit 3. The Timer Class is assigned in Bit 4 to Bit 6.

YS2, Index 1, Bit 0 and Bit 1. CONSULTATION HOLD - ALL CALLS [C-17] allowed or denied. 00: denied; 01: Originating and Terminating Calls allowed, Tandem Call denied; 11: All calls allowed.

STEP 2: **ANPD** - Reserve a Number Level for Feature Access and Retrieval. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan.

STEP 3: **ASPA** - Assign an Access Code to:

CALL PARK Access Code, SRV = "SSC: Service Code", SID = 61, Connection Index of Hooking, CI = "H: Hooking".

CALL PARK Local Retrieval Code, SRV = "SSC: Service Code", SID = 62, Connection Index of "N: Normal".

CALL PARK Remote Retrieval Code, SRV = "SSC: Service Code", SID = 63, NND = number of digits in the Access Code, and assign a Connection Index of "N: Normal".

STEP 4: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 67 (Call Park - Access and Answer) to the applicable Stations. This allows the Station to Park a call and to retrieve a Parked Call. Assign Stations a Service Feature Restriction Class that allows SFI 68 (Call Park Called). This allows a Station to be Parked by another Station or Attendant Console.

STEP 5: **ASAT** - This command must be assigned to designate a specific Station Number to the Attendant Console. This number is used to identify the Attendant Console when Parking a call.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ANPDL** - Reserve a Number Level for Feature Access and Retrieval. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan.

STEP 2: **ASPAL** - Assign an Access Code to:

CALL PARK Access Code, SRV = "SSC: Service Code", SID = 61, FPC = "x", Connection Index of Hooking, CI = "H: Hooking".

CALL PARK Local Retrieval Code, SRV = "SSC: Service Code", SID = 62, FPC = "x", Connection Index of "N: Normal".

CALL PARK Remote Retrieval Code, SRV = "SSC: Service Code", SID = 63, FPC = "x", NND = number of digits in the Access Code, and assign a Connection Index of "N: Normal".

STEP 3: **ASATN** - This command must be assigned to designate a specific Station Number to the Attendant Console. This number is used to identify the Attendant Console when Parking a call.

Note: System timers may be set on a network basis in ASYDN.

The following command assignments are required when the Parked Call is retrieved from a Station in the Remote Node via FCCS.

STEP 1: **ASYD** - SYS1, Index 139, Bit 0 to Bit 3 (MTC), Bit 4 to Bit 6 (TC). Assign No Answer Timer for CALL PARK recall ringing. If a Parked Call from an analog C.O line (except MC&MG-COT/MG-COT) recalls and the set timer value (default is 30 seconds) elapses, the call will be released. SYS1, Index 142, Bit 0 to Bit 3. Assign the Miscellaneous Timer Counter for CALL PARK recall.

If the set Timer Value elapses, a Parked Call will recall to the Station that has set the CALL PARK.

The Timer Class is assigned in Bit 4 to Bit 6. SYS1, Index 6, Bit 4 to Bit 6. This data assignment is required to Park a call from the Attendant.

Bit 4 to Bit 6 (ATTCON Key Arrangement Pattern): Bit 4=0, Bit 5=0, Bit 6=0

STEP 2: **ANPDL/ANPDN** - Reserve a Number Level for feature access. Assign the following data in accordance with the predetermined Numbering Plan.

TN: Tenant Number
1stDC: 1st Digit Code (0-9,*,#)
CI: Connection Status Index (N = Normal, H = Hooking)
NND: Number of Necessary Digits (1-6)
BLF: Busy Lamp Field Display Activated On ATT (Fixed to "0")

STEP 3: **ASPAL/ASPAN** - Assign an Access Code:

CALL PARK Access Code, SRV = "SSC: Service Code", SID = 61, Connection Index of Hooking, CI = "H: Hooking"

CALL PARK Local Retrieval Code, SRV = "SSC: Service Code", SID = 62, Connection Index of "N: Normal.

CALL PARK Remote Retrieval Code, SRV = "SSC: Service Code", SID = 63, NND = Number of Digits in the Access Code, and assign a Connection Index of "N: Normal".

STEP 4: **ALGSL/ALGSN** - Assign Telephone Number to the Station Number programmed by ASDT.

TYPE = 1 (Line Equipment Numbers/Phantom Index is used to specify the Telephone Number)
UGN: User Group Number (1-255)
TELN: Telephone Number (maximum of 16 digits)
FPC: Fusion Point Code (only ALGSN)
LENS/PHIN: Line Equipment Numbers/Phantom Index of the Station Number
TYPE = 2 (Station Number is used to specify the Telephone Number)
UGN: User Group Number (1-255)
TELN: Telephone Number (maximum of 16 digits)
FPC: Fusion Point Code (only ALGSN)
TN: Tenant Number
STN: Station Number of destination

STEP 5: **ASFC** - The same data must be assigned to all the nodes.

Assign a Service Feature Restriction Class that allows SFI 67 (Call Park - Access and Answer) to the applicable Stations. This allows the Station to Park a call and to retrieve a Parked Call. Assign a Service Feature Restriction Class that allows SFI 68 (Call Park - Called) to the applicable Stations. This allows a Station to be Parked by another Station or Attendant Console.

C-30 Call Pickup - Direct

General Description

This feature allows a user to pick up a call to any other Station in the system by dialing a specific CALL PICKUP - DIRECT code.

Operating Procedure

1. Lift the handset. Receive Dial Tone.
2. Dial the CALL PICKUP - DIRECT Code. Receive Dial Tone.
3. Dial the specific Telephone Number to be picked up. Incoming Call is connected to user Station.

Service Conditions

1. This feature is provided on a per line basis, based on the Station CLASS OF SERVICE - INDIVIDUAL [C-15].
2. A Station in a fully restricted class cannot answer a Central Office Incoming Call using CALL PICKUP - DIRECT.
3. If the ringing Call is a result of CALL BACK [C-1], CALL HOLD [C-6] Recall, or OUTGOING TRUNK QUEUING [O-2] Recall, it cannot be picked up by any Station.
4. This feature cannot be accessed from the ATTENDANT CONSOLE [A-3].
5. The Stations in this procedure can belong to the different TENANT SERVICE [T-12] Groups. A TN 2 can pick up a TN 1 call.
6. A busy Station can accomplish CALL PICKUP - DIRECT by placing an existing call on CALL HOLD [C-6].
7. CALL PICKUP - DIRECT cannot be accessed while in the CONSULTATION HOLD - ALL CALLS [C-17] mode.
8. CALL PICKUP - ONE TOUCH KEY [C-207] is available in combination with this feature.
9. When a Station holds a call (CALL HOLD) terminated through FCCS, the Station cannot pick up a call.
10. When both the Calling Station and the Station that will pick up a Call Hold the call, if one of the Held Calls is terminated through FCCS, the Station cannot pick up the call.
11. The call terminated through FCCS cannot be picked up from the other Station in the system by dialing the Physical Station Number.
12. PS can pick up a call arrived in a specific Station.
13. A call which has terminated to a PS/ISDN terminal cannot be answered using this feature (the caller hears busy tone). However, if PS line is assigned as a Multi Line of Desktop terminal (APLAML/APLAMN), calls terminating to the corresponding PS can be answered using this feature.
14. You can answer a call ringing on a virtual line of another station. Also, you can answer a call by picking it up from a virtual line.

Interactions

1. After answering via CALL PICKUP - DIRECT, the CALL TRANSFER - ALL CALLS [C-11] feature can be used.

2. A STATION MESSAGE DETAIL RECORDING (SMDR) [S-10]: If a billing after transfer over different MA-IDs is out of service (ASYDL, SYS1, Index 589, Bit 3=0), when a call is answered using the CALL PICKUP - DIRECT feature, the SMDR record is not created.
   If a billing after transfer over different MA-IDs is in service (ASYDL, SYS1, Index 589, Bit 3=1), the SMDR record is created. The number of a station using this feature is output to the SMDR record as a called party number.
3. The CALL PICKUP - DIRECT feature cannot be used to answer a call from the paged individual through Paging Answer Access Code in the Delay System of PAGING TRANSFER [P-10].
4. You can pick up an incoming call which arrives to Call Pickup Group of CALL PICKUP - ONE TOUCH KEY [C-207].

Note: Available since FP95-115 V5.

Programming

STEP 1: **ASYD** - SYS2, Index 1, Bit 0 and Bit 1. CONSULTATION HOLD - ALL CALLS [C-17] allowed or denied. 00: denied; 01: Originating and Terminating Calls allowed, Tandem Call denied; 11: All calls allowed.

STEP 2: **ASYDL/ASYDN** - SYS1, Index 685, Bit 5=0/1 (Picking up an incoming call which arrives to Call Pickup Group of Call Pickup - Direct [C-30] = Disabled/Enabled)

Note: Available since FP95-115 V5.

STEP 3: **ANPD** - Reserve a Number Level for Feature Access. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes.

STEP 4: **ASPA** - Assign an Access Code to CALL PICKUP - DIRECT, SRV = “SSC: Service Code”, SID = 35 for Connection Status Index (CI) of “N: Normal”.

STEP 5: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 29 (Direct Call Pickup) to the Stations.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ANPDL** - Reserve a Number Level for Feature Access. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes.

STEP 2: **ASPAL** - Assign an Access Code to CALL PICKUP - DIRECT, SRV = “SSC: Service Code”, SID = 35 for Connection Status Index (CI) of “N: Normal”.

C-31 Call Waiting - Originating

General Description

This feature provides selected Stations with Camp-On capability to a busy Internal Station.

Operating Procedure

To activate

1. Dial the desired Telephone Number. Receive Busy Tone.
2. Switch hook flash. Receive Special Dial Tone, dial the CALL WAITING - ORIGINATING code, or press the CW key on the Desktop terminal.
3. Receive Call Waiting Ringback Tone. Call Waiting Tone (three beeps) is sent to the busy Station.

OR

1. Dial the CALL WAITING - ORIGINATING Access Code. Receive Dial Tone.
2. Dial the desired Telephone Number.
3. If the Called Station is busy, CALL WAITING - ORIGINATING is automatically set. Receive Call Waiting Ringback Tone. Call Waiting Tone (three beeps) will be sent to the busy Station.

Note: Soft key can be used for the Desktop terminal.

To answer

1. Call Waiting Tone is heard during a call in progress.
2. Switch hook flash, or press the ANSWER key on the Desktop terminal to hold the existing call.
3. The CALL WAITING - ORIGINATING Call is automatically connected.
4. Another switch hook flash or pressing the ANSWER key can be used to return to the original call, and the second call will be held.

OR

1. Call Waiting Tone is heard during the call in progress.
2. The Called Station hangs up. Priority ringing is sent.
3. Lift the handset to answer.

Service Conditions

1. Once CALL WAITING - ORIGINATING is activated to a given Station, other Stations attempting CALL WAITING - ORIGINATING to this Station will receive Reorder Tone.
2. Call Waiting Tone is three bursts, 200 milliseconds ON and 200 milliseconds OFF. The repetition rate can be programmed in System Data.
3. Periodic Call Waiting Tone can be eliminated by System Data programming on a per Tenant basis.
4. The ability to activate this feature must be assigned in the call originators CLASS OF SERVICE - INDIVIDUAL [C-15] programming.
5. CLASS OF SERVICE - INDIVIDUAL [C-15] for the Called Station must be programmed for CALL WAITING - TERMINATING [C-12].
6. There is no limit to the number of Stations that may access this feature simultaneously.
7. CALL WAITING - ORIGINATING is denied when the Called Station is connected to the ATTENDANT CONSOLE [A-3].

8. CALL WAITING - ORIGINATING can be set only if the Called Station is busy on a Two-party Call with another Station or Trunk.
9. When the Called Station goes on-hook, the Call Waiting Ringback Tone changes to Normal Ringback Tone to the Calling Station.
10. CALL WAITING - ORIGINATING cannot be activated while in CONSULTATION HOLD [C-17].
11. CALL WAITING - ORIGINATING cannot be used in conjunction with DIAL ACCESS TO ATTENDANT [D-2].
12. CALL BACK [C-1] activation is denied if a call is waiting at the Calling or Called Station Line.
13. If a Station has set CALL FORWARDING [C-2, 3, 5], a call will wait at the Target Station if CALL WAITING - TERMINATING is provided via CLASS OF SERVICE [C-15].
14. CALL WAITING - TERMINATING [C-12] at the Called Station can be restricted by CLASS OF SERVICE [C-15]. In this case, the Calling Station receives Busy Tone and can set CALL BACK [C-1].
15. ATTENDANT CAMP-ON [A-1] Tone is One-burst Tone and Call Waiting Tone from the Incoming Trunk Call is Two-burst Tones to the busy Station.
16. EXECUTIVE RIGHT-OF-WAY [E-1] is denied a Two-party Connection that has a Call Waiting.
17. STATION HUNTING [S-7, 8, 9] takes precedence over Call Waiting.
18. Priority ringing is:

0.4 seconds ON	0.2 seconds OFF	0.8 seconds ON
0.2 seconds OF	0.4 seconds ON	0.4 seconds OFF

19. These features are denied if a call is waiting at the Calling or Called Station:

ATTENDANT CAMP-ON WITH TONE INDICATION	[A-1]
ATTENDANT OVERRIDE	[A-7]
BOSS - SECRETARY OVERRIDE -D	[B-5D]
BUSY VERIFICATION	[B-3]
CALL BACK	[C-1]
CALL TRANSFER	[C-10, C-11]
CALL WAITING - TERMINATING	[C-12]
DIAL ACCESS TO ATTENDANT	[D-2]
EXCLUSIVE HOLD -D	[E-4D]
EXECUTIVE RIGHT-OF-WAY	[E-1, E-8]
NON-EXCLUSIVE HOLD -D	[N-7D]
PRIVACY RELEASE	[P-18]
THREE-WAY CALLING	[T-2]

20. CALL WAITING - ORIGINATING cannot be activated if the Target Station has accessed, entered, or is engaged in any of the following features or modes:

ATTENDANT CAMP-ON WITH TONE INDICATION	[A-1]
ATTENDANT OVERRIDE	[A-7]
BOSS - SECRETARY OVERRIDE -D	[B-5D]
BUSY VERIFICATION	[B-3, B-9]
CALL BACK	[C-1]
CALL HOLD	[C-6]
CALL TRANSFER	[C-10, C-11]
CALL WAITING - TERMINATING	[C-12]
CONSULTATION HOLD - ALL CALLS	[C-17]
DATA LINE SECURITY	[D-12]
DATA PRIVACY ON DEMAND	[D-17]
DIAL ACCESS TO ATTENDANT	[D-2, D-71]

DICTATION ACCESS	[D-3]
EXCLUSIVE HOLD -D	[E-4D]
EXECUTIVE RIGHT-OF-WAY	[E-1, E-8]
NON-EXCLUSIVE HOLD -D	[N-7D]
OFF-HOOK QUEUING	[O-7]
OUTGOING TRUNK QUEUING	[O-2]
PRIVACY -D	[P-14D]
PRIVACY RELEASE	[P-18]
THREE-WAY CALLING	[T-2]
VOICE CALL	[V-2]

21. The following features take precedence over CALL WAITING - ORIGINATING:

CALL FORWARDING - ALL CALLS	[C-5]
CALL FORWARDING - BUSY LINE	[C-3]
STATION HUNTING - CIRCULAR	[S-7]
STATION HUNTING - SECRETARIAL	[S-8]
STATION HUNTING - TERMINAL	[S-9]

22. This feature is denied while the Called Station is hearing an announcement.
23. CALL WAITING - ORIGINATING is denied if the called party connected via PHC trunk is hearing hold tone. CALL WAITING - ORIGINATING is available, however, if the called party is in tandem connection via non-PHC trunk beyond the connection via PHC trunk.
24. When Called Station activates CALL FORWARDING- BUSY LINE [C-2], and the call forwarding destination is busy:

    - When call forwarding destination is a station (including stations in FCCS network), ASYD, SYS1, Index 69, Bit 5 determines whether to set CALL WAITING - ORIGINATING to the Forwarded-from Station, or to the Forwarded-to Station.

    - When the call forwarding destination is in outside of the self office, CALL WAITING - ORIGINATING is restricted and does not work.

Interactions

1. When Station A directs the second CALL WAITING - ORIGINATING to a given Station, Station A will receive Reorder Tone.
2. A CALL WAITING - ORIGINATING Call is answered by flashing the switch hook of a Single Line Set or pressing the ANSWER or TRANSFER keys of a Desktop terminal. CALL TRANSFER - ALL CALLS [C-11] is not allowed. If the TRANSFER key on a Desktop terminal or the switch hook is flashed on a Single Line Set, the SPLITTING -D [S-4D] feature is being used.
3. CALL WAITING - ORIGINATING is denied toward a TIE Line.
4. When using this feature against a Station that is engaged in Tandem connection other than CCIS-CCIS, SFI 4 and SFI 11 require to be set to 1 for SFC 0 by using ASFC/ASFCN.
5. This feature cannot be set from SIP Handler Controlled SIP terminals. Also this feature cannot be set from different terminals to SIP Handler Controlled SIP terminals.

Programming

STEP 1: **ASYD** - SYS1, Index 69, Bit 5. CALL WAITING - ORIGINATING 0/1 = Set to Forwarded-from Station/Set to Forwarded-to Station
SYS1, Index 152. Interval for CALL WAITING - ORIGINATING. Indication Tone to be sent to the

Destination Telephone. Timer Class 3 = Two seconds. MTC × TC = Interval for CALL WAITING - ORIGINATING. MTC assigned in hexadecimal to Bit 0 to Bit 3 of this Index. Default value is ten seconds.

Example: Data 36H is assigned.

2 × 6 = 12 second intervals (TC × MTC = Timer)

SYS2, Index 10, Bit 4. Is CALL WAITING - ORIGINATING Access Code to be dialed before the Station Number? This will activate the feature automatically upon encountering a busy Station. 0/1: No/Yes.

SYS2, Index 10, Bit 6. Should CALL WAITING - ORIGINATING operation be automatic upon encountering a busy Station? If yes, no Access Code is required for operating the feature. 0/1: No/Yes. Assign on a per Tenant basis.

Note: Index 10, Bit 4 and Bit 6 are mutually exclusive. Once Bit 6 is assigned data "1", Bit 4 is not needed.

SYS2, Index 10, Bit 7. Should the Warning Tone set in SYS1, Index 152 be periodically sent? 0/1: No/Yes.

SYS3, Index 3, Bit 5. Enable Ringer Pattern 5.

SYS3, Index 7. Default data provides for four seconds ON, two seconds OFF for DISTINCTIVE RINGING [D-10].

STEP 2: **ANPD** - Reserve a Number Level for Feature Access. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan.

STEP 3: **ASPA** - Assign an Access Code to CALL WAITING - ORIGINATING, SRV = "SSC: Service Code", SID = 5 for Connection Status Index (CI) of "B: Busy" and "N: Normal".

STEP 4: **ASFC** - Assign to the Stations a Service Feature Restriction Class that allows SFIs 5 [Call Waiting - Originating (Calling)], 6 [Call Waiting - Originating (Called)], and 11 (Data Line Privacy = 0/ Attendant Camp-On =1). This allows the ability to originate a Call Waiting - Originating (SFI 5), to terminate a Call Waiting - Originating (SFI 6), and to receive Camp-On Tone (SFI 11).

STEP 5: **AKYD** - Optional. Assign CALL WAITING - ORIGINATING to a Line/Feature key. Assign Feature Key Call Waiting [4].

STEP 6: **ADSL** - SN = 5 (Consultation Hold) and Feature key Call Waiting [4].

This command is used for assigning the function of each Soft key.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node. **Note 1**

STEP 1: **ANPDL** - Reserve a Number Level for Feature Access. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan.

STEP 2: **ASPAL** - Assign an Access Code to CALL WAITING - ORIGINATING, SRV = "SSC: Service Code", SID = 5 for Connection Status Index (CI) of "B: Busy" and "N: Normal".

Note 1: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

C-33 Consecutive Dialing - Attendant

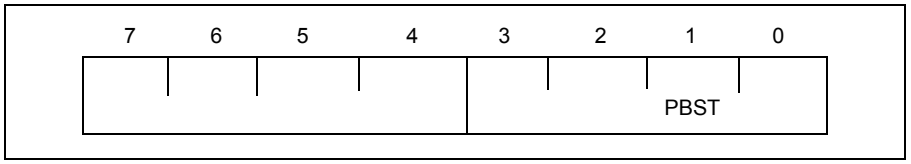
General Description

This feature gives the Attendant Console the ability to generate DTMF Signals while engaged in a Station/Trunk Connection. These DTMF Signals are generated via the dial keypad of the Attendant Console.

Operating Procedure

When doing a transfer from the Attendant, the Attendant presses the Start key then dials the desired number.

Service Conditions



1. The ATTENDANT CONSOLE [A-3] can transmit DTMF Signals under the following conditions:
   a.) When the Attendant Console originates a Trunk Call while an Internal Station is holding, DTMF Signals can be transmitted to the Trunk or Station but not to both in a Three-way Connection.
   b.) When the Attendant Console originates a Trunk Call while another Trunk Call is on hold, DTMF Signals can be transmitted to either Trunk but not to both in a Three-way Connection.
   c.) When the Attendant Console originates an internal Station Call while holding a Station or Trunk, DTMF Signals can be transmitted to either Station or Trunk but not to both in a Three-way Connection.
   d.) When the Attendant Console originates/answers an Internal Station or Trunk Call and remains engaged in the connection. If the Start key is pressed, DTMF Signals cannot be transmitted from the Attendant Console (even when DTMF Signal sending is selected in the System Data).
2. All digits (DTMF Signals) generated by the Attendant Console will not appear on the display.
3. Additional digits can be dialed after the Trunk Soft-hold Timer has timed out or after the Trunk Answer Signal has been received.
4. If the Attendant Console overrides a connection between a Station/Trunk and a Station/Trunk, the Attendant Console may generate DTMF Signals.
5. After answering any of the following calls: the Attendant can send DTMF Signal to the Calling Party by pressing keypad while connected with the call, or the Attendant can hold the answered call and transfer it to a specific destination. Either function can be selected through the System Data.

Ring-down	Operator Call
Individual Attendant Call	Listed Directory Number
Recall	CALL FORWARDING [C-2, 3, 5] to Attendant
OFF-HOOK ALARM [O-6]	CALL FORWARDING - INTERCEPT [C-25] to Attendant
PRIORITY CALL [P-9]	CCIS Incoming Call
HOUSE PHONE [H-2] (Hotline)	

6. If the Attendant answers an Incoming Call transferred from one Attendant Console to another, by INTER-POSITION TRANSFER [I-5], DTMF Signals cannot be generated from the Attendant Console on which the Transferred Call has been answered.

Programming

ASYD - SYS1, Index 229, Bit 2. DTMF Signal sending with the keypad pressed after the Attendant has answered an Incoming Call 0/1: Out/In Service. SYS3, Index 11. Assign a Miscellaneous Timer counter for the duration of the DTMF Sender Tone. 128 milliseconds × (PBST + 1) = Duration of Sender Tone. Maximum value is 2.048 seconds.

C-43 Call Metering

General Description

This feature enables the Metering Pulses received from an Exchange Line involved in an established connection to be detected, counted, and stored as billing information. This information is output to Station Message Detail Recording (SMDR), following the release of the line.

Note: This feature is not available in North America.

Operating Procedure

No manual operation is required.

Service Conditions

1. This facility counts the Metering Pulses, received between the time speech is established and the release of the Station at the Called Office.
2. In the event that the AUTHORIZATION CODE [A-20] is activated on a route provided with the CALL METERING, the records of the Authorization Code will also be included.
3. When the Pulse Count Value exceeds 9999, all Pulse Count Records output to Station Message Detail Recording (SMDR) will indicate 9999.

Programming

STEP 1: **ARTD** - Assign the Route Class Data for the Trunk Route.

Assign CDN: 16:

SMDR2 (Detail Billing information) = 4

- Detail billing is not required for Incoming Calls.
- Detail billing is required for toll and local Outgoing Calls.
- Metering pulses are used.

Assign CDN: 39:

BC (Central Office Line Balance Condition): 0/1 = Not balanced/Balanced. (This is available in Australia only.)

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or MG.

STEP 2: **ARTI**

Assign CDN: 40:

SPMET (Account Pulse Watch Control)

0 = -

1 = Low to High Transition

2 = High to Low Transition

3 = Low to High and High to Low Transition

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or MG.

C-59 Called Number Display - Attendant

General Description

If a call is transferred to the ATTENDANT CONSOLE [A-3] as a result of:

DO NOT DISTURB	[D-11]
CALL FORWARDING - ALL CALLS	[C-5]
CALL FORWARDING - BUSY LINE	[C-2]
CALL FORWARDING - DON'T ANSWER	[C-3]
CALL FORWARDING - INTERCEPT / ANNOUNCEMENT	[C-25]

Information pertaining to the Called Station is displayed on the Attendant Console.

Operating Procedure

1. The Attendant answers an Incoming Call.
   a.) The DEST Lamp lights.
   b.) The Called Telephone Number is displayed.
2. The Attendant presses the SRC key.
   a.) The DEST Lamp goes OFF, and the SRC Lamp lights.
   b.) Either the Calling Party's Tenant Number is displayed, or RSC Number and Telephone Number are displayed.

Service Conditions

1. This service is effective when a Station-to-Station Call or a DID Call has been routed to an Attendant Console as a result of:

DO NOT DISTURB	[D-11]
CALL FORWARDING - ALL CALLS	[C-5]
CALL FORWARDING - BUSY LINE	[C-2]
CALL FORWARDING - DON'T ANSWER	[C-3]
CALL FORWARDING - INTERCEPT / ANNOUNCEMENT	[C-25] and is answered by the Attendant.

2. If the Attendant presses the SRC key while the Called Telephone Number is displayed, the display changes to the number of the Calling Party. The Called Telephone Number cannot be displayed again.
3. While the Called Telephone Number is displayed, the Attendant can transfer the call to a desired Station by keying the Destination Number on the keypad. In this case, the Called Telephone Number of that call cannot be displayed again.
4. While the Called Telephone Number is displayed, the Attendant can place the call on hold by pressing the HOLD key. The Called Telephone Number is displayed again when the Attendant picks up the call again.
5. While the Called Telephone Number is displayed, the Attendant can set CALL PARK [C-29] Service. The Called Telephone Number cannot be displayed again.

Programming

ASYD - SYS, Index 70, Bit 0. Called Number Display when Call Forwarding to ATTCON 0/1: Out/In Service.

C-60 Call Forwarding - Busy Line - Outside

General Description

This feature allows a call that originates from a Station or Trunk, and is destined for a Station to be routed to another Station outside the System via the appropriate Trunk Line. This feature can also be activated from a Desktop terminal Multi Line.

Operating Procedure

To set

1. Lift the handset. Receive Dial Tone.
2. Dial the CALL FORWARDING - BUSY LINE - OUTSIDE Access Code (same as CALL FORWARDING - BUSY LINE [C-2]). Receive Special Dial Tone.
3. Dial the desired Target Telephone Number (or Speed Calling Access Code and Abbreviated Code). If the ATTENDANT CONSOLE [A-3] is setting this feature, dial the Access Code, Tenant Number, Originating Telephone Number, and then the desired Outside Number. Receive Service Set Tone.

Note: A tone will not be provided when an access code is used to set this feature on SP Controlled Standard SIP terminal.

To cancel

1. Lift the handset. Receive Dial Tone.
2. Dial the CALL FORWARDING - BUSY LINE - OUTSIDE Cancel Code, (same as CALL FORWARDING - BUSY LINE [C-2] Cancel Code). Receive Service Set Tone.

To set from a Multi Line

1. Press the Multi Line key to be used for CALL FORWARDING - BUSY LINE - OUTSIDE.
2. Lift the handset or press the SPEAKER key. Receive Dial Tone.
3. Press CALL FORWARDING - BUSY LINE - OUTSIDE Feature Key. Receive Special Dial Tone.
4. Dial the desired Target Number (or Speed Calling Access Code and Abbreviated Code). Receive Service Set Tone. The LED will light. The LCD displays:

FORWARD SET **(Time Display)**

5. Replace the handset or press the SPEAKER key.
6. The LED of the associated Feature key lights on the Dterm for which this Multi Line is the My Line.

To monitor from a Multi Line

1. Press the Multi Line key of the Station CALL FORWARDING - BUSY LINE - OUTSIDE is to monitor.
2. Press CALL FORWARDING - BUSY LINE - OUTSIDE Feature key.
3. The LCD displays:

Target Number **Note 1**

FORWARD XXXXXXXX **(Time Display)**

Note 1: An entered Abbreviated Number is translated into the Forwarding Number and the first 16 digits are displayed on LCD even if a maximum of 24 digits can be stored.

To cancel from a Multi Line

1. Press the Multi Line key of the Station to which CALL FORWARDING - BUSY LINE - OUTSIDE is to be canceled.
2. Lift the handset or press the SPEAKER key. Receive Dial Tone.
3. Press the CALL FORWARDING - BUSY LINE - OUTSIDE Feature key. Receive Service Set Tone. The LED of the associated Feature key will go out. The LCD displays:

FORWARD CANCEL **(Time Display)**

4. Replace the handset or press the SPEAKER key.

Service Conditions

1. CALL FORWARDING - BUSY LINE - OUTSIDE may be set or canceled by either a user or the ATTENDANT CONSOLE [A-3].
2. Stations may be assigned this feature via CLASS OF SERVICE - INDIVIDUAL [C-15] programming in System Data.
3. CALL FORWARDING - BUSY LINE - OUTSIDE Data remains in the Data Memory, even if the system is re-initialized or in the event of a power failure.
4. A maximum of 24 digits, including Trunk Access Code, can be stored.
5. For CALL FORWARDING - BUSY LINE - OUTSIDE, Speed Call List Numbers may be programmed as the Destination Telephone Number. This permits the sent digits to exceed the 24-digit maximum.
6. When using this feature, either the Calling Station or the Forwarding Station is recorded by STATION MESSAGE DETAIL RECORDING (SMDR) [S-10] as the Originating Station of calls forwarded. The selection between the above Stations is determined through System Data.
7. CALL FORWARDING - BUSY LINE - OUTSIDE can be restricted by the RSC of the Originating Station.
8. ROUTE PEG COUNT [P-7] is used for CALL FORWARDING - BUSY LINE - OUTSIDE.
9. This feature can be restricted according to the Dterm My Line Service Feature Restriction Class. Incoming CALL FORWARDING - BUSY LINE - OUTSIDE Calls to the Dterm Multi Line cannot be transferred if the Service Feature Restriction Class of the Dterm My Line restricts this feature.

My Line Service Feature Restriction Class	Multi Line Service Feature Restriction Class	Activation from Dterm Multi Line	Remarks
Non-Restricted	Non-Restricted	Possible	
Restricted	Restricted	Not Possible	
	Non-Restricted		
	Restricted		

10. There is no limit to the number of Stations which may activate this feature simultaneously.

11. Restriction for Outgoing Connection by CALL FORWARDING - BUSY LINE - OUTSIDE are as follows:
    a.) When originating a call from a Station, Route Restriction Data Assignment is verified when this service is in effect.
    b.) When originating a call from a Trunk Restriction for Tandem Connections between the Incoming Trunk and the Outgoing Trunk selected for the call where CALL FORWARDING - BUSY LINE Service occurs.
12. When a caller places a call via OGCA and when the first Outgoing Route and the Calling Party are restricted, this service cannot be set. In this case, the service can be set via the following procedure:
    a.) Assign a Dummy Route.
    b.) Clear the restriction between the Dummy Route and all the Stations.
    c.) Assign the Dummy Route as the first Route of OGCA.
13. When a destination of Call Forwarding - All Calls - Outside has already been assigned, even if the feature is restricted by the new Office Data or changing of Day/Night mode, the assigned data can still be used or canceled.
14. This feature allows a call to terminate to a Trunk outside of the FCCS Network. Accordingly, the Access Code + Office Code or the Access Code including Office Code is required before dialing the Telephone Number to recognize the Terminating Node.
15. When the Incoming Call is forwarding to the Public Network, be sure to add the Outgoing Access Code + Destination Area Code or the Outgoing Access Code including Destination Area Code Number before dialing Subscriber Number.
16. A call can be forwarded to a Trunk in the Remote Node via FCCS.
17. Assign the System Data (ASYDL, SYS1, Index 677, Bit 3 = 1), and press the CALL FORWARDING - BUSY LINE - OUTSIDE Feature key, a maximum of 16 digits Call Forwarding Information can be displayed.

    Note: This feature is available only for the terminal that can display 24 digits on LCD.

18. A tone will not be provided when an access code is used to set this feature on SP Controlled Standard SIP terminal.
19. When a SIP Handler Controlled SIP terminal is in Multi Line Mode, the Call Forwarding setting applies to the seized line while setting. In normal case, where My Line is not used by another station, the Call Forwarding setting applies to My Line. To set the Call Forwarding applying to Sub Line, use the ACFS/ ACFS_T commands.
20. The forwarding destination for this feature can be assigned with the ACFO/ACFOL/ACFON command on a route basis. For details, see CALL FORWARDING DESTINATION PER ROUTE - TRUNK INCOMING CALL [C-209].

    Note: Data assignment on a route basis is available since FP95-114 V4 Issue 2.0 (earlier than FP95-114 V4 Issue 2.0, the destination can be assigned with the ACFO/ACFOL/ ACFON command on a tenant basis only).

Programming

STEP 1: **ASYD** - SYS1, Index 5, Bit 0. Are Access Codes for CALL FORWARDING - BUSY LINE and CALL FORWARDING - DON'T ANSWER the same or separate? 0/1: Same/Separate.
SYS1, Index 69, Bit 7, and SYS1, Index 5, Bit 1 to Bit 3 for MULTIPLE CALL FORWARDING.

STEP 2: **ASYDL** - SYS1, Index 677, Bit 3.

Display a maximum of 16 digits Call Forwarding Information on LCD? 0/1 = No (default)/Yes.

STEP 3: **ANPD** - Reserve a Number Level for Feature Access and Cancel. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. (applicable to any feature assigned to this level). Assign NND in accordance with a predetermined Numbering Plan.

STEP 4: **ASPA** - Assign an Access Code to CALL FORWARDING - BUSY LINE Entry, SID = 10 and to CALL FORWARDING - BUSY LINE Cancel, SID = 11. Assign Connection Status Index (CI) for "N: Normal" service.

STEP 5: **ASFC** - Assign the Stations to receive CALL FORWARDING - BUSY LINE a Service Feature Restriction Class that allows SFI 9 (Call Forwarding - Busy Line).

Assign either SFI 25 (Call Forward Outside - Local) or SFI 26 (Call Forward - Long Distance). And assign SFI 151 (Call Forwarding - Outside) when CALL FORWARDING - OUTSIDE is performed, RSC of the Forwarding Station is used.

Note: SFI 25 checks AMND for 11 digits or less (Local Service). SFI 26 checks AMND for 12 digits or more (Long Distance Service).

Note: SFI 151 (Call Forwarding - Outside) is not available when the System Data (ASYDL/ ASYDN, SYS1, Index 1393, Bit 5) is set to 1.

STEP 6: **ARRC** - Allow trunk-to-trunk connection between an incoming route and an outgoing route that may be used for this feature.

IC RT: External route number of a tie line for incoming calls

OG RT: External route number of a tie line for outgoing calls

ARI A-RES = 1: Alternate routing is Allowed

ARI D-RES = 1: Alternate routing is Allowed

STEP 7: **AKYD** - For Dterm sets, CALL FORWARDING - BUSY LINE may be assigned to a programmable Line/Feature key. Assign Feature key Call Forwarding - Busy Line [1].

STEP 8: **ATNR** - Allow Tenant-to-Tenant Connection for Inter and Intra-Tenant Connections. Assign Tenant Restriction Index (TRI) = 1. For this feature to be set by the Attendant Console assignment, assign TRI = 3 for Inter and Intra-Tenant Connection via the Attendant Console. This allows a Station in one Tenant to be Call Forwarded to a Station in the same or different Tenant. Also assign TRI = 0, Station-to-Station Calling.

STEP 9: **ACFO** - For Tenant-wide CALL FORWARDING - BUSY LINE of an Incoming DID and DIT Calls, assign CF = 1: Call Forwarding - Busy Line for a destination (CFI) of either the Attendant Console or Station.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ANPDL** - Reserve a Number Level for Feature Access and Cancel. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. (applicable to any feature assigned to this level). Assign NND in accordance with a predetermined Numbering Plan.

STEP 2: **ASPAL** - Assign an Access Code to CALL FORWARDING - BUSY LINE Entry, SID = 10 and to CALL FORWARDING - BUSY LINE Cancel, SID = 11. Assign Connection Status Index (CI) for "N: Normal" service.

Note: System Timers may be set on a network basis in ASYDN.

C-62 Consecutive Speed Calling - System

General Description

This feature allows a user to call frequently dialed DID Numbers using fewer digits (Abbreviated Call Codes) than would normally be required. The stored digits would include Route Access Code, Area Code and Office Code. The caller would then manually enter the Called Telephone Number.

Operating Procedure

1. Dial the Speed Calling Access Code (one to three digits).
2. Dial the Abbreviated Call Code (maximum of four digits).
3. Dial the four-digit Telephone Number. The call is completed.

Service Conditions

1. SPEED CALLING Codes programmed in System Data are accessible to all Stations with a CLASS OF SERVICE - INDIVIDUAL [C-15] that allows CONSECUTIVE SPEED CALLING - SYSTEM.
2. Each Abbreviated Call Code can consist of a maximum of 24 digits, including Access Codes.
3. The maximum number of CONSECUTIVE SPEED CALLING - SYSTEM Codes that can be stored in the system is 10,000.

   Note: The capacity depends on the system configuration due to memory requirements.

4. Speed Calling Numbers are programmed via System Data entry on the PCPro.
5. Stations may be denied access to Speed Calling via CLASS OF SERVICE - INDIVIDUAL assignment in System Data. Speed Calling may also be allowed or denied on a System or Tenant basis.
6. TOLL DENIAL/TOLL DIVERSION [T-6] and TOLL RESTRICTION - 3/6-DIGIT [T-7] may be applied to Speed Calling, if desired.
7. LEAST COST ROUTING - 3/6-DIGIT [L-5] may be provided for Speed Calling access.
8. This feature cannot be used for an Outgoing Call that uses OUTGOING TRUNK QUEUING [O-2].
9. CONSECUTIVE SPEED CALLING - SYSTEM may not be accessed via CONSULTATION HOLD.
10. Digits dialed after the abbreviated call codes are not recorded on SMDR.

Programming

STEP 1: **ASYD** - SYS1, Index 93, Bit 3. Tenant Data 0/1: Separate/Common

SYS2, Index 1, Bit 4 and Bit 5 Toll Restriction

Bit 5	Bit 4	
0	0:	Toll Denial (ROT Connection)
0	1:	Toll Diversion (Terminated to Attendant Console)
1	0:	-
1	1:	-

STEP 2: **ANPD** - Reserve a Number Level for Feature Access. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan.

STEP 3: **ASPA** - Assign an Access Code to SPEED CALLING - SYSTEM, assign SRV = "SSC: Service Code", SID = 15. Program for "N: Normal. NND = Access Code plus Abbreviated Digit Code (ADC). See ASPD. For example:

6 + 010

1 digit + 3 digits = NND = 4

STEP 4: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 12 (Speed Calling - System) to Stations that will have SPEED CALLING - SYSTEM.

STEP 5: **ASPD** - Enter Tenant Number (TN), Abbreviated Digit Code (ADC), and Called Number (CD). For details, see the Command Manual.

Note: Enter the necessary numbers of letter Ms instead of the digits for the Station Number.

Example: If the Destination Numbers are: 9 3300 1111 ~ 9 3300 9999

4 digits 4 digits

The required number and letter Ms to be assigned in the CD is: 9 3300 MMMM

4 digits (4 Ms)

C-63 Camp-On Busy

General Description

This feature provides a lamp and tone indication on the ATTENDANT CONSOLE [A-3] as to whether the status of the desired Station Line allows the Attendant to set CAMP-ON service.

Note: This feature is available in Australia only.

Operating Procedure

No manual operation is required.

Service Conditions

1. This feature is available in Australia only.
2. If the status of the desired Station Line allows the Attendant to set CAMP-ON service, a Busy Tone Connection is made and the Busy lamp on the Console lights up.
   Note, however, that the initial lamp and tone indications will not change if the Station Line later enters a status that does not allow CAMP-ON.
3. When the status of the desired Station Line does not allow the Attendant to set CAMP-ON, a Reorder Tone (NUT) Connection is established, and the Busy Lamp on the Attendant Console starts to flash at 60 IPM. The initial lamp and tone indications will not change if the Station Line later enters a status that allows ATTENDANT CAMP-ON WITH TONE INDICATION [A-l].
4. Refer to the specification ATTENDANT CAMP-ON WITH TONE INDICATION [A-1] for the conditions in which the Attendant is not allowed to set CAMP-ON.
5. This feature cannot be activated when CALL BACK - CCIS [C-44] has already been set.
6. This feature cannot be activated when ATTENDANT CAMP-ON WITH TONE INDICATION - CCIS [C-45] has already been set.

Programming

STEP 1: **ASYD** - SYS1, Index 7, Bit 4 (Attendant Camp-On Lamp Display): 0/1 = Busy Lamp Steady/Busy Lamp Flashing (60 IPM). Assign “1”.

C-69 Call Forwarding - All Calls - Announcement

General Description

This feature permits all calls destined for a particular Station to be routed to a Recorded Announcement. Activation and cancellation may be accomplished by either the individual user or the ATTENDANT CONSOLE [A-3].

Operating Procedure

To set and cancel from an individual Station using the same Access Code Note 1

- For setting:

1. Lift the handset. Receive Dial Tone.
2. Dial the CALL FORWARDING - ALL CALLS - ANNOUNCEMENT entry Access Code (same as CALL FORWARDING - ALL CALLS [C-5]) (**Note 2**). Receive Special Dial Tone.
3. Dial the desired Announcement Trunk Access Code (same as ANNOUNCEMENT SERVICE [A-15]). Receive Service Set Tone.

- For cancellation:

1. Lift the handset. Receive Dial Tone.
2. Dial the CALL FORWARDING - ALL CALLS - ANNOUNCEMENT entry Access Code (same as CALL FORWARDING - ALL CALLS [C-5]) (**Note 2**). Receive Special Dial Tone.

Note 1: Available from FP95-114 V4 Issue 2.0 with system data ASYDL, SYS1, Index 686, Bit 0= 1.

To set and cancel from an individual Station using different Access Codes

- For setting:

1. Lift the handset. Receive Dial Tone.
2. Dial the CALL FORWARDING - ALL CALLS - ANNOUNCEMENT entry Access Code (same as CALL FORWARDING - ALL CALLS [C-5]) (**Note 2**). Receive Special Dial Tone.

Note 2: For a Desktop terminal, press the Line/Feature key or Soft Key programmed for CALL FORWARDING - ALL CALLS [C-5].

3. Dial the desired Announcement Trunk Access Code (same as ANNOUNCEMENT SERVICE [A-15]). Receive Service Set Tone.

- For cancellation:

1. Lift the handset. Receive Dial Tone.
2. Dial the CALL FORWARDING - ALL CALLS - ANNOUNCEMENT cancel Access Code (same as CALL FORWARDING - ALL CALLS [C-5]) (**Note 3**). Receive Service Set Tone.

Note 3: For a Desktop terminal, press the Line/Feature key or Soft Key programmed for CALL FORWARDING - ALL CALLS [C-5].

Service Conditions

1. This feature requires one of the following hardware alternatives:
   a.) Central Office Trunk (COT) or TIE Line Trunk (TLT) and an Announcement Machine.
   b.) Digital Announcement Trunk (DAT).
2. Stations with this feature set may originate calls and access the CALL FORWARDING - ALL CALLS - ANNOUNCEMENT Cancellation Code.
3. Stations activating CALL FORWARDING - ALL CALLS - ANNOUNCEMENT [C-69] can be restricted from placing any calls, except to the Attendant, depending upon System Data.
4. There is no limitation to the number of Stations which can simultaneously set CALL FORWARDING - ALL CALLS - ANNOUNCEMENT [C-69].
5. Stations may be assigned this feature via CLASS OF SERVICE - INDIVIDUAL [C-15] programming in System Data.
6. By assigning the Announcement Trunk Access Code to the Announcement Trunk, you can set an announcement device as a destination of CALL FORWARDING - ALL CALLS - ANNOUNCEMENT [C-69].

   Note: An attempt to connect a call on consultation hold to a recorded announcement will fail:
   - If you press the switch hook or the TRANSFER key and dial the Announcement Trunk Access Code while placing the current call on hold.
   - If you, while placing the current call on hold, make a second call to a station where CALL FORWARDING - ALL CALLS - ANNOUNCEMENT [C-69] is enabled.
7. When a call is directed to a Forwarded Station, one burst of Ringing Signal will be sent to the Station to indicate that it is Call Forwarded.
8. Call Forwarding Data remains programmed, even if the system is re-initialized or a power failure occurs.
9. CALL FORWARDING - ALL CALLS - ANNOUNCEMENT can be provided for a maximum of 127 Trunks, which include the Announcement Trunks for:

ANNOUNCEMENT SERVICE	[A-15]
ANNOUNCEMENT SERVICE - ATTENDANT	[A-59]
CALL FORWARDING - INTERCEPT / ANNOUNCEMENT	[C-25]

10. This feature is available with the following connections:

DIRECT INWARD DIALING (DID)	[D-8]
DIRECT-IN TERMINATION (DIT)	[D-7]
STATION-TO-STATION CALLING	[S-11]
Station Calls from a TIE Line Trunk	

11. When a designation of CALL FORWARDING - ALL CALLS - ANNOUNCEMENT has already been assigned, even if the feature is restricted by the new Office Data or changing of Day/Night mode, the assigned data can still be used or canceled.
12. When SIP Handler Controlled SIP terminals are in Multiple Mode, the Call Forwarding setting applies to the seized line while setting. In normal case, where My Line is not used by another station, the Call Forwarding setting applies to My Line. To set the Call Forwarding applying to Sub Line, use the ACFS/ ACFS_T commands.

13. If the called station (Station A) is set to forward all unanswered calls to another station (Station B), on which CALL FORWARDING - ALL CALLS - ANNOUNCEMENT [C-69] is enabled, CALL FORWARDING - DON'T ANSWER [C-3] does not work. Station A will continue ringing and sending Ringback Tone (RBT) to the caller until the call is answered.
14. By registering the Call Forwarding - All Calls Access Code + the desired Announcement Trunk Access Code to the CF Setting button of a Line/Feature key on a Desktop terminal, it is possible to enable and disable CALL FORWARDING - ALL CALLS - ANNOUNCEMENT [C-69] just by pressing the CF Setting button. For a detailed explanation, see CALL FORWARDING (CF) BUTTON - ONE TOUCH [C-208].

Note: CALL FORWARDING (CF) BUTTON - ONE TOUCH [C-208] is available from FP95-114 V4 Issue 2.0.

Programming

Call Forwarding-All Calls

STEP 1: **ASYD** - SYS1, Index 4, Bit 6. One burst of ringing at Forwarding Station when CALL FORWARDING - ALL CALLS [C-5] is in service? 0/1: No/Yes. (For a Single Line Station only).

SYS1, Index 69, Bit 1. A burst of Ringback Tone to alert the person receiving a call that this is a CALL FORWARDING - ALL CALLS [C-5] Call. In service? 0/1: No/Yes. Normally assigned as data "0".

SYS2, Index 6, Bit 4. Enable Station set for CALL FORWARDING - ALL CALLS [C-5] be allowed to use their phones normally. If data "0" is assigned, the Station will only be able to call the Attendant Console. Assign on a per Tenant basis.

STEP 2: **ASYDL/N** - SYS1, Index 686, Bit 0=1.
Disabling Call Forwarding - All Calls with entry Access Code is in service.

Note: Available from FP95-114 V4 Issue 2.0.

STEP 3: **ANPD** - Reserve a Number Level for Service Feature Access and Cancel (**Note 4**). Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan.

STEP 4: **ASPA** - Assign an Access Code to CALL FORWARDING - ALL CALLS [C-5] entry SID = 8, and to CALL FORWARDING - ALL CALLS [C-5] cancel SID = 9 (**Note 4**). Assign Connection Status Index (CI) for "N: Normal" service.

Note 4: When SYS1, Index 686, Bit 0=1 (Disabling Call Forwarding - All Calls with Access Code is in service), Call Forwarding - All calls cancel is not required because the cancellation can be performed with the entry Access Code.

STEP 5: **ASFC** - Assign the Stations to activate CALL FORWARDING - ALL CALLS [C-5] a Service Feature Restriction Class that allows SFI = 7 (Call Forwarding - All Calls).

STEP 6: **AKYD** - For Desktop terminal, CALL FORWARDING - ALL CALLS [C-5] may be assigned to a Line/Feature key. Assign Feature key Call Forwarding - All Calls [2].

STEP 7: **ADSL** - Assign SN = 1 (Originating; DT Connection) and Feature key Call Forwarding - All Calls [2].
This command is used for assigning the function for each Soft key.

STEP 8: **ATNR** - Allow Tenant-to-Tenant Connection for Inter and Intra-Tenant Connections. Assign Tenant Restriction Index (TRI) = 1. For this feature to be set by the Attendant Console, assign Inter and Intra-Tenant connection via the Attendant Console TRI = 3. Also allow TRI = 0, Station-to-Station Calling.

Announcement Service

STEP 1: **ANPD** - Reserve a Number Level for Trunk Access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. Assign NND values in accordance with a predetermined Numbering Plan.

STEP 2: **ASPA** - Assign an Access Code to the Announcement Trunk. Assign SRV = "ANNC: Announcement Service - Single Announcement" and the EQP Number Assignment should be as assigned with AAED.

STEP 3: **ARTD** - Assign the Announcement Route as shown below.

RT:1

1-OSGS	:2	2-ONSG	:3	5-TF	:1	6-TCL	:1	7-L/T	:1
15-LSG	:4								

Note: To change the data for existing route (RT), initialize the circuit card.

STEP 4: **ATRK** - Assign the LENS. Announcement Trunk Route Number, Trunk Number, and Tenant Number. Assign one or more Trunks to a specific Route used to connect to an Announcement Machine.

STEP 5: **MBTK** - Assign the Make Idle status to the Announcement Trunk.

STEP 6: **ADSL** - Assign SN = 1 (Originating; DT Connection) and Feature key Call Forwarding - All Calls [2]. This command is used for assigning the function for each Soft key.

STEP 7: **ARRC** - If a TIE Line, DID or REMOTE ACCESS TO SYSTEM [R-2] Connection to the Announcement Service Trunk is required, allow Trunk-to-Trunk Connection using ARI-D-RES, Direct Connection.

STEP 8: **AAED** - Used to assign Announcement Equipment.

Assign:

TN:	Tenant Number
EQP:	Announcement Equipment Number
RT, TK:	Route and Trunk Number of the Trunk connected to the Announcement Equipment
C:	Duration of connection, 0/1: Disconnect in 30 seconds/the connection is held until the Station releases. See the requirements of the Announcement Equipment.
R:	Sending RBT, 0/1: Sending RBT/Not Sending RBT. Normally assign data "0".
A:	Answer Signal Sending, 0/1: No answer from Incoming Trunk/answer from Incoming Trunk. Normally assign data "0". No Answer Signal is sent to the Central Office, therefore, Calling Party will not be billed for the call.
M:	Multiple Connection 0/1: Single Connection/Multiple Connection. See the requirements of the Announcement Equipment.

C-73 Call Back - Delayed

General Description

This feature allows a Station to which CALL BACK [C-1] has been set to initiate another call, within a predetermined time period after becoming idle and before the CALL BACK [C-1] feature is activated.

Operating Procedure

No manual operation is required.

Service Conditions

1. This feature is assigned in system programming, on a system-wide basis.
2. The CALL BACK - DELAYED Timer can be set in multiples of two seconds, to a maximum of 14 seconds. (Delay Timer is unavailable for PHS/PCS/VoWLAN.)

Programming

ASYD - SYS1, Index 5, Bit 4 to Bit 6 = Timer; Bit 7 = Out of Service/In Service (No/Yes).

Timer as default is set at 00 = two seconds. Maximum delay is 14 seconds.

SYS1, Index 139. No Answer Timer for CALL BACK. Assign 00H. (RAM Data is 3FH = 30 seconds.)

SYS2, Index 0, Bit 0. Is CALL BACK enabled on a per Tenant basis? 0/1: No/Yes.

SYS2, Index 4, Bit 0. CALL BACK and TRUNK QUEUING Access Code are same or separate? 0/1: Separate/Same.

SYS3, Index 3, Bit 5. Enable Ringer Pattern 5 for CALL BACK. See DISTINCTIVE RINGING [D-10]. (Delay Timer is unavailable for PHS/PCS/VoWLAN.)

SYS3, Index 7. Assign data 42H for four seconds ON, two seconds OFF.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

ASYDN - These data must be assigned to the NCN.

SYS1, Index 5, Bit 4 to Bit 6: Call Back Delayed Timer.

SYS1, Index 5, Bit 7=0/1: Call Back Delayed Timer is Out of Service/In Service.

C-74 Call Forwarding - Don't Answer - Outside

General Description

This feature allows a call which originates from a Station or Trunk, and is destined for a Station, to be routed to another Station outside the System via the appropriate Trunk Line. This feature can also be activated from a Desktop terminal Multi Line.

Operating Procedure

To set

1. Lift the handset. Receive Dial Tone.
2. Dial the CALL FORWARDING - DON'T ANSWER - OUTSIDE Access Code (same as CALL FORWARDING - DON'T ANSWER [C-3] Access Code). Receive Special Dial Tone.
3. Dial the desired Target Telephone Number (or Speed Calling Access Code and Abbreviated Code). If the ATTENDANT CONSOLE [A-3] is setting this feature, dial the Access Code, Tenant Number, Originating Telephone Number, and then the desired Outside Number. Receive Service Set Tone.

FORWARD SET **(Time Display)**

Note: A tone will not be provided when an access code is used to set this feature on SP Controlled Standard SIP terminal.

To cancel

1. Lift the handset. Receive Dial Tone.
2. Dial the CALL FORWARDING - DON'T ANSWER - OUTSIDE Cancel Code, (same as CALL FORWARDING - DON'T ANSWER [C-3] Cancel Code). Receive Service Set Tone.

To set from a Multi Line

1. Press the Multi Line key to be used for CALL FORWARDING - DON'T ANSWER - OUTSIDE.
2. Lift the handset or press the SPEAKER key. Receive Dial Tone.
3. Press CALL FORWARDING - DON'T ANSWER - OUTSIDE Feature key. Receive Special Dial Tone.
4. Dial the desired Target Number (or Speed Calling Access Code and Abbreviated Code). Receive Service Set Tone. The LED will light. The LCD displays:

FORWARD SET **(Time Display)**

5. Replace the handset or press the SPEAKER key.
6. The LED of the associated key lights on the Desktop terminal to which the call is forwarded.

To monitor from a Multi Line

1. Press the Multi Line key for the Station CALL FORWARDING - DON'T ANSWER - OUTSIDE is to monitor.

   Press CALL FORWARDING - DON'T ANSWER - OUTSIDE Feature key. The LCD displays:

   Target Number **Note 1**

FORWARD XXXXXXXX
(Time Display)

Note 1: A dialed Abbreviated Number is translated into the Forwarding Number and the first 16 digits are displayed on LCD even if 24 digits can be stored.

To cancel from a Multi Line

1. Press the Multi Line key for the Station CALL FORWARDING - DON'T ANSWER - OUTSIDE is to be canceled.
2. Lift the handset or press the SPEAKER key. Receive Dial Tone.
3. Press the CALL FORWARDING - DON'T ANSWER - OUTSIDE Feature key. Receive Service Set Tone. The LED of the associated Feature key will go out. The LCD displays:

FORWARD CANCEL
(Time Display)

4. Replace the handset or press the SPEAKER key.

Service Conditions

1. This feature may be set or canceled by either a Station User or the Attendant.
2. For countries except North America, when an original call is placed from a station, this feature is available only if the call is routed to the called station (station to which this feature is set) directly.
3. Stations may be assigned this feature via CLASS OF SERVICE - INDIVIDUAL [C-15] programming in System Data.
4. CALL FORWARDING - DON'T ANSWER - OUTSIDE Data remains in the Data Memory even if the system or LP is re-initialized or in the event of a power failure.
5. For this feature, Speed Call List Numbers may be programmed as the Destination Telephone Number. This permits the sent digits to exceed the 24-digit maximum.
6. When using this feature, the Forwarding Station is recorded by STATION MESSAGE DETAIL RECORDING (SMDR) [S-10] as the Originating Station of calls forwarded. (See ASYD, SYS1, Index 20, Bit 7).
7. This feature can be restricted by the RSC of the Originating Station.
8. Route PEG COUNT [P-7] is used for CALL FORWARDING - DON'T ANSWER - OUTSIDE. Every time CALL FORWARDING - DON'T ANSWER is set or canceled, it is counted in the Service PEG COUNT.

9. This feature can be restricted according to the Dterm My Line Service Feature Restriction Class. Incoming CALL FORWARDING - DON'T ANSWER - OUTSIDE Calls to the Dterm Multi Line cannot be transferred if the Service Feature Restriction Class of the Dterm My Line restricts this feature.

Dterm MY LINE Service Feature Restriction Class	Dterm MULTI LINE Service Feature Restriction Class	ACTIVATION FROM Dterm MULTI LINE	REMARKS
Non-Restricted	Non-Restricted	Possible	
	Restricted		
Restricted	Non-Restricted	Not Possible	
	Restricted		

10. Restriction for Outgoing Connection by CALL FORWARDING - DON'T ANSWER - OUTSIDE are as follows:
    a.) When originating a call from a Station: Route Restriction Data assignment is verified when this feature is in effect.
    b.) When originating a call from a Trunk: Restriction for Tandem Connections between the Incoming Trunk and the Outgoing Trunk selected for the call where this feature occurs.
11. There is no limit to the number of Stations that may activate this feature simultaneously.
12. When the Called Station does not answer for a predetermined time interval, this feature is applied according to the Route Restriction Class of the Originating Station and the Trunk used in Call Forwarding. When restricted by Route Restriction Class, CALL FORWARDING - DON'T ANSWER - OUTSIDE is not activated, and the Called Station continues to ring.
13. Call Transfer - Attendant: When the Called Station does not answer for a predetermined time interval, calls which have been transferred by the Attendant are assigned to this feature according to their Route Restriction Class. When calls are restricted by Route Restriction Class, this feature is not activated, and the Called Station continues to ring.
14. When Attendant transfers a call to a Station that has set CALL FORWARDING - DON'T ANSWER - OUTSIDE, TOLL DENIAL/TOLL DIVERSION [T-6] is not activated.
15. When a caller places a call via OGCA and when the first Outgoing Route and the Calling Party are restricted, this service cannot be set. In this case, the service can be set via the following procedure:
    a.) Assign a Dummy Route.
    b.) Clear the restriction between the Dummy Route and all the Stations,
    c.) Assign the Dummy Route as the first Route of OGCA.
16. This feature is not available for the Trunk Calls by the MF signals. In this case, the call is not forwarded to the designated Station.
17. This feature is not available for the Trunk Calls by MF signals. In this case, the call is not forwarded to the designated Station.
18. A call can be forwarded to a Trunk in the Remote Node via FCCS.
19. A maximum of 24 digits, including Trunk Access Code, can be stored.
20. Assign the System Data (ASYDL, SYS1, Index 677, Bit 3 = 1), and press the CALL FORWARDING - DON'T ANSWER - OUTSIDE Feature key, a maximum of 16 digits Call Forwarding Information can be displayed.

Note: This feature is available only for the terminal that can display 24 digits on LCD.

21. If you set Self Office Code (using ASPA SRV = "UNIF: Office Termination" or AUNE) in front of Outgoing Access Code + Station Number as a forwarding destination, this feature does not work. However, Uniform Numbering through setting Office Code of other node is available.
22. A tone will not be provided when an access code is used to set this feature on SP Controlled Standard SIP terminal.
23. When a SIP Handler Controlled SIP terminal is in Multi Line Mode, the Call Forwarding setting applies to the seized line while setting. In normal case, where My Line is not used by another station, the Call Forwarding setting applies to My Line. To set the Call Forwarding applying to Sub Line, use the ACFS/ ACFS_T commands.

Programming

STEP 1: **ASYD** - SYS1, Index 20, Bit 7. Charging to a call transferred by Call Forwarding - Outside Service 0/ 1: Charging is made to the caller of the Transferred Call/Charging is made to the Station that has set Call Forwarding - Outside Service.

STEP 2: **ASYDL** - SYS1, Index 677, Bit 3.
Display a maximum of 16 digits Call Forwarding Information on LCD? 0/1 = No (default)/Yes.

STEP 3: **ASFC** - Assign SFI 25 (Call Forward Outside - Local) or SFI 26 (Call Forward Outside - Long Distance). Also assign SFI 151 (Call Forwarding - Outside) when CALL FORWARDING - OUTSIDE is performed, RSC of the Forwarding Station is used.
See CALL FORWARDING - DON'T ANSWER [C-3].

Note: SFI 25 checks AMND for 11 digits or less (Local Service). SFI 26 checks AMND for 12 digits or more (Long Distance Service).

Note: SFI 151 (Call Forwarding - Outside) is not available when the System Data (ASYDL/ ASYDN, SYS1, Index 1393, Bit 5) is set to 1.

STEP 4: **ARRC** - Allow trunk-to-trunk connection between an incoming route and an outgoing route that may be used for this feature.
IC RT: External route number of a tie line for incoming calls
OG RT: External route number of a tie line for outgoing calls
ARI A-RES = 1: Alternate routing is Allowed
ARI D-RES = 1: Alternate routing is Allowed

C-75 Call Forwarding - Intercept / Announcement - Attendant

General Description

This feature provides for interception of Attendant-originated Calls that cannot be completed (unassigned Station, Level, etc.). These calls are automatically routed to a Recorded Announcement informing the caller that an Inoperative Number was reached.

Operating Procedure

No manual operation is required once this feature has been programmed in System Data.

Service Conditions

1. This feature requires one of the following hardware alternatives:
   a.) Central Office Trunk (COT) or 2W E&M Trunk and an Announcement Machine.
   b.) Digital Announcement Trunk (DAT).
2. The following connections are available:
   a.) Multi Connection: several Attendants can be connected to the Announcement Trunk at the same time.
   b.) Single Connection: at any given time, only one Attendant can be connected to the Announcement Trunk.
3. If the attendant forgets to cancel a call, the announcement will automatically disconnect in 30 seconds [provided this is programmed in System Data]. AAED must not have the duration of connection set to disconnect in 30 seconds. If the Duration of Connection is set to disconnect in 30 seconds, the Attendant will control disconnection of the announcement.
4. This feature is provided on a per Tenant basis.
5. This feature is only available on Attendant-originated Calls.
6. Only one message can be provided for different intercept conditions.
7. Before connection to the Announcement Machine is made, the system can be programmed to return Ringback Tone.
8. ANNOUNCEMENT SERVICE is provided to FCCS Nodes that have no Announcement Trunk in the Remote Node.
9. When CALL FORWARDING - INTERCEPT/ANNOUNCEMENT [C-25] or CALL FORWARDING - INTERCEPT/ANNOUNCEMENT - ATTENDANT [C-75] is used in an FCCS Network, the additional data shown below is required:
   a.) The Logical Route Number should be applied to the Physical Route that is provided the service.
   b.) The restriction of Route-to-Route Connection between FCCS Nodes should be released.
10. CALL FORWARDING - INTERCEPT / ANNOUNCEMENT [C-25] or CALL FORWARDING - INTERCEPT / ANNOUNCEMENT - ATTENDANT [C-75] is not provided for an Incoming Call using AUTOMATED ATTENDANT [A-82], DIRECT-IN TERMINATION [D-7], or REMOTE ACCESS TO SYSTEM [R-2].
11. Call Forwarding for an Incoming Call routed to a Dead Level or an Unused Number has priority over the ANNOUNCEMENT Service for Incoming Calls. When Attendant is assigned as the forwarded destination, the LCD on the caller's station shows the same display as Call Forwarding-Don't Answer.

12. When a call is terminated from the ISDN Trunk or MG(SIP), RBT is sent to the caller if Announcement Trunk Answer Signal is not sent.
13. When a call with Consultation Hold is terminated from a counter office, if the Announcement Trunk Answer Signal exists, announcement trunk will operate. To return to the call, press the DISC Key. For more information about it, refer to Consultation Hold Release [C-169].
    Note that pressing the hooking key disables the announcement trunk to operate although it returns to a call.

Programming

Programming of hardware into System Data is required. Refer to CALL FORWARDING-INTERCEPT / ANNOUNCEMENT [C-25]. Timers are also programmed into System Data (see VARIABLE TIMING PARAMETER [V-1]).

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

STEP 1: **ALRTN** - This data must be assigned to the NCN.
Assign the Logical Route Number to the Physical Route.

STEP 2: **AAEDN** - This data must be assigned to the NCN.
EQUIPMENT KIND:
- DAT/Announcement Machine
- VS32

TN: Enter Tenant Number
EQP: Announcement Equipment Number
0 = Dead Level
1 = Unused Number
2-15 = Announcement Service

Duration of Connection:
- Disconnect in 30 seconds
- Connection is held until the Station releases. See the requirements of the application for the Announcement Equipment. For Dead Level applications, data 0 is assigned.

Do Not Send RBT [On/Off]

Note: Assign Do not Send RBT when Multiple Connection = Single.

Send Answer Signal [On/Off]
Multiple Connection: Select either Single or Multiple.
LGRT: Logical Route
TK: Trunk Number **Note 1**

Note 1: Not necessary for Multiple Connection = Single.

STEP 3: **ARRCN** - This data must be assigned to the NCN.
Release the restriction between the Terminating Trunk and the Announcement Trunk.

STEP 4: **ARSCN** - This data must be assigned to the NCN.
Release the restriction between the Announcement Trunk and the Station.

Note: The current command data shown is set to all Nodes using the service: ASTD, ARTD, ATRK, MBTK.

C-76 Call Waiting Lamp - UCD

General Description

This feature uses an LED indication, which is one of the programmable keys on the Desktop terminal, to indicate when a call is waiting to be answered in the UCD Queue.

Operating Procedure

No manual operation is required.

Service Conditions

1. The UCD Call Waiting Lamp displays the status of the UCD Group as follows:
   Lamp ON: One or more calls waiting in the UCD Queue.
   Lamp FLASHING: More than the pre-assigned number of calls are waiting in the UCD Queue.
   Lamp OFF: No calls are waiting in the UCD Queue.
2. The number of calls waiting in the UCD Queue that causes the UCD Call Waiting Lamp to light or flash can be assigned on a per UCD Group basis through the Maintenance Administration Terminal (PCPro).
3. The UCD Call Waiting Lamp indicates the status of the UCD Group that the Desktop terminal is assigned to, not the status of other UCD Groups.
4. The UCD Call Waiting Lamp indication lasts as long as calls are in a queue.
5. The lamp must be assigned to a Desktop terminal Line/Feature key LED through PCPro. A call cannot be answered by this key. Only the UCD Line Number key (Prime, Sub, etc.) can be used to connect a call.
6. The number of UCD Groups per system is 63.
7. When an additional Desktop terminal is allowed this service, or when a Desktop terminal Data using this service is deleted, the circuit card that accommodates the port of the Desktop terminal must be initialized.
8. This feature can be programmed in Local Data Memory (LDM).
9. When using the FCCS Network, this feature is available for UCD Stations belonging to the Node that accommodates the UCD Controlling Station.
10. When using the FCCS Network, if the number of UCD Calls in the queue is over the threshold value, the lamps of Stations in the same Node that the UCD Controlling Station belongs to, start to flash.

Interactions

1. The lamp will toggle between solid and flashing as the number of calls in the queue increases and decreases, crossing the threshold value set in AUCD.
2. If the Pilot Telephone Number of a UCD Group is set to CALL FORWARDING - ALL CALLS [C-5] to another UCD Group, UCD Hunting takes place in the second group. If all Stations in the second group are busy, queuing takes place in the second group and its Call Waiting Lamp will light.
3. ATTENDANT CAMP-ON [A-1] Call directed to the UCD Pilot Station will activate the UCD Call Waiting Lamp if all Stations in the group are busy.
4. CALL WAITING LAMP - UCD is not affected by CALL WAITING - TERMINATING [C-12].
5. CALL WAITING LAMP - UCD is only effective for the My Line Station of a Desktop terminal. Even if another UCD Group appears as Sub Lines on that Dterm, CALL WAITING LAMP - UCD will only function for the UCD Group of the My Line Telephone Number.

6. If OVERFLOW-UCD [O-13] is programmed, overflow to the second group will take place if all Stations in the first group are either busy or in the busy-out state. There will be no CALL WAITING LAMP - UCD indication to the first group.
7. If the Overflow Group is all busy, queuing takes place to the first group and the CALL WAITING LAMP - UCD will light to indicate a queuing condition at the first group.
8. When a UCD Station is assigned as the Destination Station of LDN Night Connection, this service cannot be activated.
9. For the FCCS Network, this feature is available only for UCD Stations in the same Node as the UCD Controlling Station. For more information, see UNIFORM CALL DISTRIBUTION [U-1].
10. This feature does not support LOCATION DIVERSITY [L-55].
11. Do not set ASFC, SFI 252=1 (Multi-Boss/Multi-Secretary is in service) to stations belonging to UCD groups.

Programming

STEP 1: **ASYD** - SYS1, Index 61, Bit 5. Is UCD Call Waiting Lamp - In Service? 0/1: No/Yes.

STEP 2: **ASHU/ASHUL** - Assign Stations to UCD Group.

STEP 3: **AUCD/AUCDL** - UCD Call Waiting Lamp threshold value. This command assigns the number of calls in UCD Queue before the UCD Call Waiting Lamp flashes.

TN/UGN: Tenant Number/User Group Number

STN/TELN: Assign Station Number/Telephone Number in the UCD Group. After one Station is assigned in the group, all Stations in the group will automatically have the same threshold value.

QTH ACT: UCD Queueing Peg Count Value Valid/Invalid (1/0).

QTH: UCD Queueing Peg Count Value (0-255).

MCI: Message Center Interface Data Transfer Valid/Invalid (1/0).

CWT: Call Waiting Threshold Value (1-255).

1-255: Quantity of calls in UCD Queue before the UCD Call Waiting Lamp will begin to flash.

Note: When programming the data, initialize the ELC Card which accommodates the UCD Group Station.

STEP 4: **AKYD** - The Call Waiting Lamp must be assigned to a programmable Line/Feature key to a Desktop terminal. Assign Feature key Call Waiting Lamp [47].

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ASYDN** - This data must be assigned to the NCN.

SYS1, Index 60, Bit 3: 0/1= UCD Queuing is used/not used.

STEP 2: **AUCDN** - This data must be assigned to the NCN.

UCD Call Waiting Lamp threshold value. This command assigns the number of calls in UCD Queue before the UCD Call Waiting Lamp flashes.

UGN: User Group Number

TELN: UCD Telephone Number

QTH ACT: 0/1 = UCD Queuing Peg Count Value Invalid/Valid

QTH: UCD Queuing Peg Count Value (0-255).

CWT: Call Waiting Threshold Value (1-255).

MCI: 0/1 = Message Center Interface Data Transfer is Valid/Invalid.

Note: When programming the data, initialize the ELC Card which accommodates the UCD Group Station.

C-81 Call Forwarding - I'm Here

General Description

This feature permits the CALL FORWARDING - ALL CALLS feature to be set/canceled from the Target Station.

This feature allows the user (Target Station) to overwrite the existing destination number with new number (Reconfiguration). There is no need to cancel this feature before setting new destination number. Also, Station ID Code for Privacy protection (User Authentication) can be set from Call Forwarding Station (Called Station).

Note: PS and SP Controlled SIP terminal are not supported.

Operating Procedure

To set Station ID Code from Call Forwarding Station (Called Station)

1. Lift the handset. Receive Dial Tone (DT).
2. Dial Access Code for Station ID Code Entry. Receive Special Dial Tone (SPDT).
3. Dial Station ID Code. Receive Service Set Tone (SST). **Note 1**, **Note 2**
4. Replace the handset.

Note 1: Dial a desired Station ID Code (in the range of 1-10 digits). If the number of digits for Station ID Code is less than 10, dial "#" or "*" after the Station ID Code. Dialing "#" or "*" implies the completion of Station ID Code.

Note 2: When Inter-digit timer expires, the dialed number becomes invalid (the user hears ROT).

To cancel Station ID Code from Call Forwarding Station (Called Station)

1. Lift the handset. Receive Dial Tone (DT).
2. Dial Access Code for Station ID Code Entry. Receive Special Dial Tone (SPDT).
3. Dial "#" or "*". Receive Service Set Tone (SST). **Note 3**
4. Replace the handset.

Note 3: The system data (ASYDL/ASYDN, SYS1, Index 895, Bit 4) determines whether to use "#" or "*" as a character which indicates the completion of Station ID Codes.

To set CALL FORWARDING - I'M HERE from Target Station

- When User Authentication is disabled:

1. Lift the handset. Receive Dial Tone (DT).
2. Dial CALL FORWARDING - I'M HERE Entry Access Code (from Target Station). Receive Special Dial Tone (SPDT).
3. Dial Called Station (Call Forwarding Station) Number. Receive Service Set Tone (SST).
4. Replace the handset.

- When User Authentication is enabled:

1. Lift the handset. Receive Dial Tone (DT).

2. Dial CALL FORWARDING - I'M HERE Entry Access Code (from Target Station). Receive Special Dial Tone (SPDT).
3. Dial Called Station (Call Forwarding Station) Number. Receive Special Dial Tone (SPDT).
4. Dial Station ID Code. Receive Service Set Tone (SST). **Note 4**
5. Replace the handset.

Note 4: If the number of digits for Station ID Code is less than 10, dial "#" or "*" after the Station ID Code.

To cancel CALL FORWARDING - I'M HERE from Target Station

- When User Authentication is disabled:

1. Lift the handset. Receive Dial Tone (DT).
2. Dial CALL FORWARDING - I'M HERE Cancel Code (from Target Station), receive Special Dial Tone (SPDT).
3. Dial Called Station (Call Forwarding Station) Number. Receive Service Set Tone (SST).
4. Replace the handset.

Note: Target Station and any Stations other than Forwarding Station can cancel CALL FORWARDING-ALL CALLS [C-5] set at the Forwarding Station by this operation.

- When User Authentication is enabled:

1. Lift the handset. Receive Dial Tone (DT).
2. Dial CALL FORWARDING - I'M HERE Cancel Code (from the Target Station), receive Special Dial Tone (SPDT).
3. Dial Called Station (Call Forwarding Station) Number. Receive Special Dial Tone (SPDT).
4. Dial Station ID Code. Receive Service Set Tone (SST). **Note 5**
5. Replace the handset.

To overwrite CALL FORWARDING - I'M HERE from new Target Station Note 5

- When User Authentication is disabled:

1. Lift the handset. Receive Dial Tone (DT).
2. Dial CALL FORWARDING - I'M HERE Entry Access Code (from new Target Station). Receive Special Dial Tone (SPDT).
3. Dial Called Station (Call Forwarding Station) Number. Receive Service Set Tone (SST).
4. Replace the handset.

- When User Authentication is enabled:

1. Lift the handset. Receive Dial Tone (DT).
2. Dial CALL FORWARDING - I'M HERE Entry Access Code (from new Target Station). Receive Special Dial Tone (SPDT).
3. Dial Called Station (Call Forwarding Station) Number. Receive Special Dial Tone (SPDT).
4. Dial Station ID Code. Receive Service Set Tone (SST). **Note 5**
5. Replace the handset.

Note 5: If the number of digits for Station ID Code is less than 10, dial "#" or "*" after the Station ID Code.

Note: Available when ASYDL/ASYDN, SYS1, Index 895, Bit 3=1.

To cancel CALL FORWARDING - I'M HERE from Called Station (Call Forwarding Station)

1. Lift the handset. Receive Dial Tone (DT).
2. Dial CALL FORWARDING - ALL CALLS Cancel Code (from the Called Station), receive Special Dial Tone (SPDT).
3. Replace the handset.

Service Conditions

1. The following Stations cannot set CALL FORWARDING - I'M HERE:
   The following Station can set Call FORWARDING - I'M HERE when ASYDL, SYS1, Index 895, Bit 3=1.
   a.) a Station where CALL FORWARDING - I'M HERE is being set,
   b.) a Station setting CALL FORWARDING - ALL CALLS [C-5].
2. CALL FORWARDING - I'M HERE can be set to the following Stations:
   a.) a Station setting CALL FORWARDING - I'M HERE,
   b.) a Station where CALL FORWARDING - ALL CALLS [C-5] is being set.
3. A call can be forwarded multiple times following CALL FORWARDING - I'M HERE setting, if assigned in System Data.
4. CALL FORWARDING - I'M HERE can be set or canceled from a Sub Line of a Desktop terminal. However, the Transferred Call terminates to the My Line of the Desktop terminal that has set the service.
5. CALL FORWARDING - I'M HERE can be set or canceled when the Target Station is idle.
6. CALL FORWARDING - I'M HERE can be canceled from the Forwarding Station, following the CALL FORWARDING - ALL CALLS [C-5] cancellation procedure.
7. If Call Back is set to/by the Station setting CALL FORWARDING - I'M HERE, Call Back takes precedence.
8. Other Service Conditions are the same as for CALL FORWARDING - ALL CALLS [C-5].
9. The Target Station in the Remote Node can set CALL FORWARDING - I'M HERE through FCCS.
10. CALL FORWARDING - I'M HERE does not support ISDN terminals and Attendant Consoles.
11. Terminals in logout status can also set/cancel CALL FORWARDING - I'M HERE. When both CALL FORWARDING - I'M HERE and LOGGED OUT IP STATION - CALL DESTINATION [L-53] are set at a terminal, the priority order of these two features can be determined according to Service Feature Restriction Class of the Station (ASFC/ASFCN SFI 209).
12. When setting CALL FORWARDING - I'M HERE across Tenants, use Telephone Numbers (TELN). When setting CALL FORWARDING - I'M HERE within a node, Station Number can also be used.
13. When using DIAL PLAN TO SUPPORT IP CENTREX FUNCTIONALITY [D-166], dial Station Numbers for calls within a node and Telephone Numbers (TELN) for calls between nodes.
14. When using LOCATION DIVERSITY [L-55], this feature data must be assigned with Telephone Number (TELN).
15. Terminals accommodated in Virtual LENS (PHS, SP Controlled SIP terminal) cannot be used as a transferring terminal, since User Authentication or overwriting the existing destination number are restricted on those terminals. Assign RES=0 (restricted) to SFI 143 and SFI 243 (ASFC/ASFCN).

16. When using the FCCS Network, there is no limit to the number of Stations that may access this feature simultaneously.
17. When using the FCCS Network, a Service Feature Restriction Class (SFC) is necessary for the Forwarded Destination and the Forwarding Party.
18. When using the FCCS Network, if the destination (Target Station) is a Desktop terminal, CALL FORWARDING - I'M HERE can be set or canceled from a Sub Line of a Desktop terminal. At that time, the Transferred Call terminates to the My Line of the Desktop terminal that sets the service.
19. When using the FCCS Network, the service can be set or canceled when the Forwarding Station is idle.
20. When using the FCCS Network, the Service Conditions are the same between CALL FORWARDING - DON'T ANSWER Services to be set from the Forwarding Station and the Target Station (CALL FORWARDING - I'M HERE).
21. When using the FCCS Network, CALL FORWARDING - I'M HERE cannot be set from the ISDN Terminal (ISDN Terminal cannot be the destination).
22. When using the FCCS Network, CALL FORWARDING - I'M HERE can be set from the Target Station (not ISDN Terminal) toward the ISDN Terminal (ISDN Terminal can be a Forwarding Station).
23. When using the FCCS Network, CALL FORWARDING - I'M HERE cannot be a set to the Station that has already set CALL FORWARDING - ALL CALLS (Forwarding Station). However, setting this service to the Station that operates CALL FORWARDING - ALL CALLS (destination) is available.
24. When using the FCCS Network, this service cannot be used with SPLIT CALL FORWARDING [S-99].
25. When using the FCCS Network, CALL BACK [C-1, 1D] that is set to or from the Forwarding Station has priority over CALL FORWARDING - I'M HERE (Recall or Answer Call for CALL BACK is not the object of CALL FORWARDING - I'M HERE).
26. When using the FCCS Network, if this feature is set from the Target Station in the Remote Node within an FCCS Network, dial the Telephone Number for the Forwarding Station Number.
27. When using the FCCS Network, the Telephone Number must be assigned to the Destination Station also.
28. When using the FCCS Network, the Service Restriction is decided by the ASFC Data programmed to the Station that sets the service (Destination Station).
29. The following shows service conditions concerning Station ID Code.
    a.) Up to 10 digits (0-9) can be dialed as a Station ID Code.
    b.) If the number of digits for Station ID Code is less than 10, dial "#" or "*" after the Station ID Code. Dialing "#" or "*" implies the completion of Station ID Code. If Inter digit timer expires before dialing "#" or "*", this feature is restricted.
    c.) Station ID Codes cannot be displayed or listed by PCPro. Therefore, user needs to manage their Station ID Codes by themselves.
    d.) Authorization Code Display Elimination

    - By setting SFI 137 = 1 (ASFC/ASFCN), Authorization Code Display Elimination will be allowed. The Station ID Code being dialed will be displayed as "XXXXX."

    - While dialing, character code (* or #) for end of reception will be displayed as "X," although they will not be recognized as Station ID Code. For example, if "12345" is the Station ID Code and "#" is the character code for end of reception:

      example 1: 123*45# (7 digit display: XXXXXXX)
      example 2: *12345# (7 digit display: XXXXXXX)
      example 3: 12345**# (8 digit display: XXXXXXXX)

      Station ID Code will be recognized as 12345 in all of the above.

Note: If Authorization Code Display Elimination is restricted, the dial number for the above examples 1-3 will be displayed. Furthermore, "*" and "#" will not be recognized as Station ID Code regardless of whether Authorization Code Display Elimination is allowed or restricted.

e.) Station ID Codes are shared between this feature and REMOTE CALL FORWARDING CONTROL [R-54]

f.) Even if User Authentication is enabled (ASFC/ASFCN SFI 243=1), this feature can be set without dialing Station ID Code if no Station ID Code is set in advance.

g.) If Station ID Codes already exist in the system, be sure to delete and set them again ("*" may be included in the existing Station ID Codes).

30. When SYS1, Index 69, Bit 1 [(Bit 2 - Call Forward Recall Tone). A burst of Ringback Tone to alert the person receiving a call that this is a CALL FORWARDING - ALL CALLS Call. In service? 0/1:No/Yes. Normally assigned as data "0".] is assigned, there will be no burst of Ringback Tone if the call is received by a SIP station.

31. Regarding Forwarding Party:

a.) It is possible to set Forwarding Party number by SPEED CALLING - SYSTEM [S-3].

b.) It is not possible to set Forwarding Party number by SPEED CALLING - STATION/GROUP [S-21/23].

Programming

STEP 1: Assign the CALL FORWARDING - ALL CALLS Data. (See CALL FORWARDING - ALL CALLS [C-5].)

STEP 2: **ASYD** - SYS1, Index 79, Bit 2. Assign as data "0". Disable Split Call Forwarding Service.

SYS1, Index 90, Bit 1. Backup Call Forwarding and Individual Speed Data to HDD. 0/1: No/Yes

Note: When using Routine Backup, be sure to assign as data "1".

SYS1, Index 304, Bit 0. Individual Speed Calling Data Save. 0/1 = Out of service/In service
Bit 1. Call Forwarding Data Save. 0/1 = Out of service/In service
Bit 2. PS Data Save. 0/1 = Out of service/In service

SYS1, Index 305, Bit 1. CFL (Call Forwarding-Logout) Data Save. 0/1 = Out of service/In service

STEP 3: **ASYDL** - SYS1, Index 895, Bit 3. Allows the user to overwrite the existing forwarding destination number with new one when setting CALL FORWARDING - I'M HERE. 0/1 = Out of service/In service

SYS1, Index 895, Bit 4. Determines whether to use "#" or "*" as a character which indicates the completion of Station ID Codes. 0/1 = "#" is used as a character which indicates the completion of Station ID Codes/"*" is used as a character which indicates the completion of Station ID Codes

STEP 4: **ANPD** - Reserve a Number Level for Feature Access and Cancel.

STEP 5: **ASPA** - Assign an Access Code to CALL FORWARDING - I'M HERE Entry; SID = 28 and to CALL FORWARDING - I'M HERE Cancel SID = 29. Assign a Connection Status Index (CI) for "N: Normal" service.

Assign an Access Code for Station ID Code. Set SRV = "SSCA: Service Code Appendix"; SIDA = 100.

Note: When setting with Telephone Numbers (TELN), use ASPAL/ASPAN command.

STEP 6: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 99 [Call Forward I'm Here (Destination)] to the Target Stations, and SFI 100 [Call Forward I'm Here (Origination)] to the Station to be set.

Assign a Service Feature Restriction Class that allows SFI 137 [Authorization Code Display Elimination] to the Target Stations.

Assign a Service Feature Restriction Class that allows SFI 143 [Station ID Code Entry] to the Target Stations.

Assign a Service Feature Restriction Class that allows SFI 243 [User Authentication for Call Forwarding - I'm Here] to the Called Stations.

STEP 7: **MEM_HDD** - Back up the Call Forwarding data to the hard disk.

Direction Select: Memory to Hard Disk

Data Type Select: Wireless Call Forwarding, Call Forwarding, Call Forwarding-Logout and SIP Terminal Call Transfer

LP Select: Specify the LP Number.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

STEP 1: **ASYD** - SYS1, Index 4, Bit 6. One Burst of ringing on Call Forwarding telephone when Call Forwarding - All Calls Service has been assigned (Analog Telephones only).

0/1 = Not Required/Required

SYS1, Index 5, Bit 1 to Bit 3. Maximum number of Multiple Call Forwarding - All Calls/Busy Line occurrences:

Note: This data is valid when SYS1, Index 69, Bit 7 is assigned as "1".

SYS1, Index 69, Bit 1. Send Short Tone when a Call Forwarded via Call Forwarding - All Calls Service is answered.

0/1 = Not Required/Required

SYS1, Index 69, Bit 7. Multiple Call Forwarding - Busy Line/All Calls

0/1 = Out/In Service

SYS1, Index 79, Bit 2. Assign as data "0". Disable Split Call Forwarding Service.

SYS1, Index 90, Bit 1. Backup Call Forwarding and Individual Speed Data to HDD. 0/1: No/Yes

Note: When using Routine Backup, be sure to assign as data "1".

SYS1, Index 248, Bit 7. Tone to be sent out when the handset is off-hook at the Station on which Call Forwarding - All Calls Service is set.

0/1 = Dial Tone/Special Dial Tone

SYS1, Index 304, Bit 0. Individual Speed Calling Data Save. 0/1 = Out of service/In service
Bit 1. Call Forwarding Data Save. 0/1 = Out of service/In service
Bit 2. PS Data Save. 0/1 = Out of service/In service

SYS1, Index 305, Bit 1. CFL (Call Forwarding-Logout) Data Save. 0/1 = Out of service/In service

SYS2, Index 6, Bit 4. Call Origination Restriction of Station upon setting Call Forwarding - All Calls
0/1 = Required/Not Required

STEP 2: **ASYDN** - SYS1, Index 895, Bit 3. Allows the user to overwrite the existing forwarding destination number with new one when setting CALL FORWARDING - I'M HERE. 0/1 = Out of service/In service

SYS1, Index 895, Bit 4. Determines whether to use "#" or "*" as a character which indicates the completion of Station ID Codes. 0/1 = "#" is used as a character which indicates the completion of Station ID Codes/"*" is used as a character which indicates the completion of Station ID Codes

STEP 3: **ANPDN** - Assign the first number of the numbering level for Feature Set and Cancel Access Code.

STEP 4: **ASPAN** - Assign the Feature Access Code.

CI = N, SRV = "SSC: Service Code" and SID 28 (Call Forwarding - I'm Here; set)

CI = N, SRV = "SSC: Service Code" and SID 29 (Call Forwarding - I'm Here; cancel)

Assign an Access Code for Station ID Code. Set SRV = "SSCA: Service Code Appendix"; SIDA = 100.

STEP 5: **ASFCN** - Assign the Service Restriction Data.

Assign RES = 1 (allowed) to SFI 99 [Call Forwarding - I'm Here (Destination)]
and SFI 100 [Call Forwarding - I'm Here (Origination)]

Note: SFI 100 should be allowed at the Node that the Destination Station belongs to.

Assign a Service Feature Restriction Class that allows SFI 137 [Authorization Code Display Elimination] to the Target Stations.

Assign a Service Feature Restriction Class that allows SFI 143 [Station ID Code Entry] to the Target Stations.

Assign a Service Feature Restriction Class that allows SFI 243 [User Authentication for Call Forwarding - I'm Here] to the Called Stations.

STEP 6: **MEM_HDD_N** - Back up the Call Forwarding data to the hard disk.

Direction Select: Memory to Hard Disk
Data Type Select: Wireless Call Forwarding, Call Forwarding, Call Forwarding-Logout and SIP Terminal Call Transfer
LP Select: Specify the LP Number.

C-109 Centrex Compatibility

General Description

This feature allows a DTMF Type Telephone user engaged in a Trunk Call to send a Hooking Signal to the Called Office, enabling the call to be transferred to another Station in that Office.

Operating Procedure

Single Line Phone
Station A is connected to Station B, accommodated in another Office

1. Station A presses switch hook. Receives Special Dial Tone from System. Dial the switch hook outside Access Code. Station B is placed on hold.
2. Station A dials the desired Telephone Number. When Station A releases from the call, Station B will be connected to the dialed Station.

OR

1. Station A dials the Attendant Access Code. When Station A releases from the call, Station B will be connected to the Attendant.

Dterm
Station A is connected to Station B, accommodated in another Office

1. Station A presses the TRANSFER key. Receives Special Dial Tone of the System. Dial the switch hook Outside Access Code, or press the CAS Switch Hook Feature key. Station B is placed on hold and Station A will receive Central Office Dial Tone.
2. Station A dials the desired Telephone Number. If Station A releases from the call, Station B will be connected to the dialed Station. If Station A presses the CAS Switch Hook Feature key there will be Three-Way Conference.

OR

1. Station A dials the Attendant Access Code. When Station A releases from the call, Station B will be connected to the Attendant.

Service Conditions

1. This feature is available for DTMF Telephones TEC = 2/12 only.
2. The Trunk that passes the Hooking Signal is determined by Route Class Data.
3. A COT is required for this application.
4. A Desktop terminal instrument may have a CAS Switch Hook Feature key assigned as one of its Feature/ Line Appearance Buttons, or it can use an Access Code.
5. A Dterm may use its dedicated TRANSFER key to transfer calls internally.
6. CALL TRANSFER - ALL CALLS [C-11] to an Inter-Office Station is not available when this feature is activated.

Programming

STEP 1: **ARTD** - Assign CDN 67:HKS, Central Office Line hooking, as “1” for Central Route.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as circuit card or MG.

STEP 2: **AKYD** - Feature key CAS SHF [17] is assigned for Dterms to switch hook flash the Centrex Route.

STEP 3: **ADSL** - Assign SN = 6 (Trunk Busy) and Feature key CAS SHF [17]. This command is used for assigning the function to each Soft key.

STEP 4: **ASPA -** SRV = “SSC: Service Code”, SID = 43 Condition (CI) = “H: Hooking” for CAS switch hook outside.

C-131 Call Forwarding - Toll Restriction

General Description

This feature allows the system to be programmed to restrict Call Forwarding Destinations by determining the maximum number of digits (8-12) that can be assigned as a Destination Station Number.

Note: This feature is only available in Australia.

Operating Procedure

No manual operation is required.

Service Conditions

1. This feature is available in Australia only.
2. This service is applicable to the following Call Forwarding services.

CALL FORWARDING - ALL CALLS	[C-5]
CALL FORWARDING - ALL CALLS - CCIS	[C-45]
CALL FORWARDING - ALL CALLS - OUTSIDE	[C-28]
CALL FORWARDING - BUSY LINE	[C-2]
CALL FORWARDING - BUSY LINE - CCIS	[C-46]
CALL FORWARDING - BUSY LINE - OUTSIDE	[C-60]
CALL FORWARDING - DON'T ANSWER	[C-3]
CALL FORWARDING - DON'T ANSWER - CCIS	[C-47]
CALL FORWARDING - DON'T ANSWER - OUTSIDE	[C-74]
CALL FORWARDING - ASSIGNMENT - ATTENDANT	[C-94]

3. Whether to activate this service or not is determined by the Service Feature Restriction Class of each Station.
4. The maximum number of digits (8-12) of a Destination Station Number is determined on a system basis. When a station user tries to assign a Destination Station Number longer than the maximum the user receives a Reorder Tone.
5. When this service is not activated, the maximum number of digits of a Destination Station Number is 12.

Programming

STEP 1: **ASFC** - Assign Service Feature Restriction Class of the Station.
SFI = 111 (Call Forwarding - Toll Restriction). RES: 0/1 = Restricted/Allowed. Assign "1".

STEP 2: **ASYD** - Assign the maximum number of digits. SYS1, Index 248, Bit 0 to Bit 3 (Maximum Number of Digits for Call Forwarding - Toll Restriction)

INPUT DATA	MAXIMUM NUMBER OF DIGITS	REMARKS
0	12	
1~8	8	
9	9	
A	10	
B	11	
C~F	12	

C-133 Call Forwarding - Don't Answer To UCD Queue

General Description

This feature allows calls to a Station that has set CALL FORWARDING - DON'T ANSWER to a UNIFORM CALL DISTRIBUTION Group to be added to a UCD Queue if all Stations in the UCD Group are busy. (Originally, calls forwarded to a UCD Group would receive Reorder Tone if all Stations in the group were busy.)

Note: This feature is only available in North America.

Operating Procedure

The operating procedure is the same as for normal CALL FORWARDING - DON'T ANSWER [C-3] operation.

Service Conditions

1. This feature is available in the USA and Canada and only works in the following cases:
   a.) Station Call to a Station that has set CALL FORWARDING - DON'T ANSWER to a UCD Group.
   b.) Trunk Call to a Station that has set CALL FORWARDING - DON'T ANSWER to a UCD Group.
   c.) Attendant transfers a Station or Trunk Call to a Station that has set CALL FORWARDING - DON'T ANSWER to a UCD Group.
2. This feature is not applicable with calls on CONSULTATION HOLD [C-17] or CALL TRANSFER [C-10, C-11].
3. This feature is only available for FCCS link with CCIS.

Programming

No additional programming is required once UCD parameters are assigned.

C-146 Call Hold - Conference

General Description

This feature allows a user to establish a Conference Connection by adding a third party who is held on a Multi Line of a Desktop terminal to the existing Two-party Connection. The Held Call which is to be added may be a Station or Trunk Call.

Operating Procedure

To operate from a Desktop terminal via Access Code

1. Make a Trunk/Station Call using Line A on the Desktop terminal.
2. Place the in-progress call on hold.
3. Place or answer a call using line B on the Desktop terminal.
4. Press the TRANSFER key.
5. Enter an Access Code for Call Hold - Conference and Line Number of line A.
6. Three-party Conference is established.

To operate from a Desktop terminal via Feature key

1. Make a Trunk/Station Call using Line A on the Desktop terminal.
2. Place the in-progress call on hold.
3. Place or answer a call using Line B on the Desktop terminal.
4. Press the Call Hold Conference Feature key.
5. Press the held Line key, or dial the Line Number of Line A.
6. Three-party Conference is established.

To operate from an Analog Station

1. Make a Trunk/Station Call using line A on the Desktop terminal.
2. Place the in-progress call on hold.
3. Place or answer a call using an Analog Station that is appearing on the Desktop terminal.
4. From the Analog Station, momentarily press the SHF key of the Analog Station.
5. Enter an Access Code for Call Hold - Conference and Line Number of Line A.
6. Three-party Conference is established.

Service Conditions

1. This service is available for the general user and the Desktop terminal user (not available for the ATT and ISDN Terminal user).
2. This service is available when the call is held by the Desktop terminal HOLD key.
3. When the originally connected Party B is placed on Exclusive Hold, this service is available only when the Dterm user A engages in the call with the third Party C.
4. When the Desktop terminal user A places the Station or Trunk B on hold, including Exclusive Hold, DUAL HOLD [D-32D] cannot be activated.
5. This service is not available when Line A or B is an intercom line, Hotline or CAS line. In these cases, the service is restricted.
6. This service is available when the Parties A, C, the Lines A and B are the following:

a.) Interoffice Trunk (including ISDN Line)
b.) Central Office Line/TIE Line
c.) Station, including Virtual Stations.
In case the ISDN Terminal, Intercom Line, Hotline, or CAS Line is used, the service is restricted.

7. Data communications are not considered in this service.
8. A Desktop terminal user dials the CALL HOLD CONFERENCE Code and then dials the Telephone Number. After the CALL HOLD CONFERENCE Code is dialed, no tone is returned and the LCD shows Transferring.
9. When the Three-way Call cannot be established due to all Conference Trunks Busy, Service Restriction, etc., Reorder Tone is returned.
10. When the Held Party is the Trunk, billing is performed according to the System Data (SYS1, Index 33, Bit 6, Bit 5, Bit 4 and Bit 3). In case the Held Party is the Station, the billing stops at the time the Station is placed on hold.
11. This feature and Add-On Conference - 8 Party [A-121] are mutually exclusive.

Programming

STEP 1: **ASFC** - SFI 75 (Call Hold - Conference) must be allowed for appropriate Service Feature Restriction Classes.

STEP 2: **ANPD** - Reserve a Number Level for Feature Access.

STEP 3: **ASPA** - Assign an Access Code for Call Hold - Conference.
CI = "H: Hooking", SRV = "SSCA: Service Code Appendix", SIDA = 97, NND = Number of Digits in Access Code.

STEP 4: **ATRK** - Assign LENS in Route 909 (Digital Conference Trunk).

XX	X	XX	X
Module	Unit	Group	Level

Note that Group Number and Level Number must be one of the following: 210, 213, 216, 221, 224, 227, 232, or 235.

STEP 5: **MBTK** - Make idle the assigned Digital Conference Trunks.

STEP 6: **ARSC**: - Allow Route Restriction Data for appropriate RSCs.

STEP 7: **ARRC** - Allow Trunk-to-Trunk Connections between Routes if necessary.

STEP 8: **ASTD** - Assign the following data when a Central Office Line is involved in a Conference: STM = 0, STS = 2, and ST = 1.

STEP 9: **AKYD** - Assign FKY 116 to a key (Call Hold Conference).

C-149 CS Report

General Description

This feature provides interface between the Telephony Server and the host computer, allowing the system to output the following traffic related data. The output data is sent to the host computer connected to the system enabling the user to calculate adequate system specification. LAN interface as well as RS-232C interface is available to be output.

- Outgoing Trunk Call - Complete (Charged)
- Outgoing Trunk Call - Complete (Not Charged)
- Outgoing Trunk Call - Complete (Not Charged)
- Outgoing Trunk Call - Incomplete (Called Party No Answer)
- Outgoing Trunk All Busy - Incomplete
- Incoming Trunk Call - Complete
- Incoming Trunk Call - Incomplete (Called Station Busy, All IRTs Busy)
- Incoming Trunk Call - Incomplete (Abandoned Call)

Note: This feature is only available in Australia.

Operating Procedure

No manual operation is required.

Service Conditions

1. The maximum number of CS Report information is 47000 calls (IMG/MMG/UMGi/RNIP).

   Note: Memory area for CS Report information is shared with SMDR information.
   Buffer memory usage rate of CS Report information is determined by SYS1, Index 307 (Default value is 50%). When changing this System Data, note the following points:
   - System Initialization is not required after changing this data.
   - When the memory area for CS Report is decreased, existing CS Report information in the decreased area is deleted.
   - When the memory area for CS Report is increased, existing SMDR information in the increased area is not deleted. Consequently, new CS Report information cannot be stored until existing SMDR information is output and the memory area becomes free.
   - When the memory area for CS Report reaches full, new CS Report information cannot be stored until existing CS Report information is output and the memory area becomes free.
   - SMDR buffer overflow alarm is applicable only to the memory area for SMDR.

2. CS Report information is automatically erased when the timer assigned by ASYD, SYS1, Index 95 expires.
3. Output can be selected between RS-232C and LAN interface (ASYDL, SYS1, Index 587, Bit 0). Output to LAN and RS-232C port all together is not available.
   a.) When outputting to LAN port
   - Output port can be allocated by ASYDL (SYS1, Index 587, Bit 6 to Bit 7).
   - Maximum port number is two.

   b.) When outputting to RS-232C port

- Output port can be allocated by ASYD (SYS1, Index 308, Bit 0 to Bit 7)

- Maximum port number is two.
- If allocated port number is the same as that of MCI (ASYD, SYS1, Index 29) or SMDR (ASYD, SYS1, Index 288), CS report cannot be output (MCI or SMDR information is printed).

Programming

Basic Programming Procedure (When output to RS-232C port)

STEP 1: **ASYD** - SYS1,

Index 18, Bit 4=1 (SMDR Incomplete Message Output In Service)

Index 32, Bit 1=1 (Record Tenant Data for SMDR/CS Report), Bit 2=1 (Record Selected Trunk type for SMDR/CS Report). Bit 7=1 (SMDR/CS Report In Service)

Index 33, Bit 3 to Bit 4 (Telephone Subject to Total Billing), Bit 5=1 (Billing for transferred Incoming Call is Split), Bit 6=1 (Billing for Transferred Outgoing Call is Split)

Index 34, Bit 0=1 (SMDR RS-232C output is in service) When LAN is used, Bit 0=0

Index 58, Bit 7=1 (Specific Attendant Number is output to SMDR is Valid)

Index 67, Bit 7=0 (fixed, SMDR Spending Designation)

Index 95, Bit 0 to Bit 3: When billing data output failure has occurred to SMDR (RS-232C), the unit digit of the time in which the billing data can be saved; 0-9 (10 minutes basis) Bit 4 to Bit 7: When billing data output failure has occurred to SMDR (RS-232C), the unit digit of the time in which the billing data can be saved; 0-9 (100 minutes basis).

Note: When LAN is used, Index 95, Bit 0 to Bit 3 are not used.

SYS1, Index 296, Bit 0=1 (Output of Calling Number (ANI information) is In Service)

SYS1, Index 300, Bit 7; Output information of Calling Party intended the billing for when the received number exceeds 6 digits in CCIS/ISDN tandem connection. Bit 7=1; Route Number + Trunk Number is output.

SYS1, Index 307, Bit 0 to Bit 3: Assign Buffer memory usage rate of CS Report information.

SYS2, Index 3, Bit 0=1: SMDR is In Service

STEP 2: **AIOC** - Assign the function and attribute data of IOC port.

Note: This assignment is not needed in the case of using LAN interface.

IOC:	IOC PORT NUMBER (Assigned by ASYD, SYS1, Index 308)
TERMINAL:	SMDR
SPEED:	1200/2400/4800/9600 bps
PARITY BIT:	Non Parity
STOP BIT:	2 Bits
CHARACTER BIT:	8 Bits

STEP 3: **ASFC** - Assign 1 to SFI 14 for allowing SMDR service.

STEP 4: **ARTD** - Assign 1 to CDN 10 (SMDR). Assign appropriate data for CDN 16 (SMDR2)

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or MG.

STEP 5: **ARTI** - CDN: 70 - Collected Information of CS Report and SMDR billing.

Note: If this data is not assigned, all the information of CS Report and SMDR billing is to be output.

0: CS Report and SMDR billing for Outgoing/Incoming Trunk Call is to be collected
1: SMDR billing for Outgoing Trunk Call is to be collected
2: SMDR billing for Incoming Trunk Call is to be collected
3: SMDR billing for Outgoing/Incoming Trunk Call is to be collected
4: CS Report for Outgoing Trunk Call is to be collected
5: CS Report and SMDR billing for Outgoing Call is to be collected
6: CS Report for Outgoing Call and SMDR billing for Incoming Call is to be collected
7: CS Report for Outgoing Call and SMDR billing for Outgoing/Incoming Call is to be collected
8: CS Report for Incoming Call is to be collected
9: CS Report for Incoming Call and SMDR billing for Outgoing Call is to be collected
10: CS Report and SMDR billing for Incoming Call is to be collected
11: CS Report for Incoming Call and SMDR billing for Outgoing/Incoming Call is to be collected
12: CS Report for Outgoing/Incoming Call is to be collected
13: CS Report for Outgoing/Incoming Call and SMDR billing for Outgoing Call is to be collected
14: CS Report for Outgoing/Incoming Call and SMDR billing for Incoming Call is to be collected
15: CS Report and SMDR billing for Outgoing/Incoming Call is to be collected

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as s circuit card or MG.

STEP 6: **ASAT** - Assign the data when Attendant Console is connected.
TN: Tenant Number (1-63)
ACC: Access Code
ATNATTENDANT NUMBER (1-63, Assign the number that is assigned in ATRK - TK)
ASYDL - SYS1,
Index 584, Bit 0 to Bit 4 Assign Polling Cycle within the Self Node. [For UMGi/RNIP system]

Call/day	System Data	Call/day	System Data
~5,400,000	01	~600,000	09
~2,700,000	02	~540,000	0A
~1,800,000	03	~490,000	0B
~1,350,000	04	~450,000	0C
~1,080,000	05	~400,000	0D
~900,000	06	~385,000	0E
~770,000	07	~360,000	0F
~675,000	08	~337,000	10

Index 586, Bit 0 to Bit 7 Assign Upper limit of polling buffer rate. [For UMGi/RNIP system] **Note 1**
Index 587, Bit 0=0 (Interface type for CS Report Output is RS-232C)

Index 641, Bit 0: Designation of output numbers for SMDR ICS format. (0/1 = Physical (Station) Number/Telephone Number) **Note 2** Bit 3: Designation of Output Routes for SMDR ICS format. (0/1 = Physical Route/Logical Route)

Note 1: When the value is 00H (default), the upper limit is 50%.

Note 2: When Bit 0=1 and Telephone Number is within 6 digits, Telephone Number is to be output.

STEP 7: **ASYD** - SYS1, Index 308, Bit 0 to Bit 7. CS Report Output Port Designation. Assign 1 to the Bit corresponding to the Port Number of the IOC circuit card. **Note 3**

Note 3: This assignment should be done lastly. This assignment is not needed in the case of using LAN interface

Note: Up to 2 ports can be assigned. If more than 2 ports are assigned, CS Report data is output from the smaller numbered 2 ports.

Note: If allocated port number is the same as that of MCI (ASYD, SYS1, Index 29) or SMDR (ASYD, SYS1, Index 288), CS report cannot be output (MCI or SMDR information is output).

When output to LAN port

LAN interface as well as RS-232C interface is available to output. At first, do the Basic Programming Procedure (**1. Basic Programming Procedure**). And then go on to STEP 9.

STEP 1: **ASYDL** - SYS1,

Index 529, Bit 0 to Bit 1. Assign Parity Check Method for SMDR/MCI/CS Report with LAN Interface.
Index 584, Bit 0 to Bit 4. Assign polling cycle within the Self Node. [For UMGi/RNIP System]

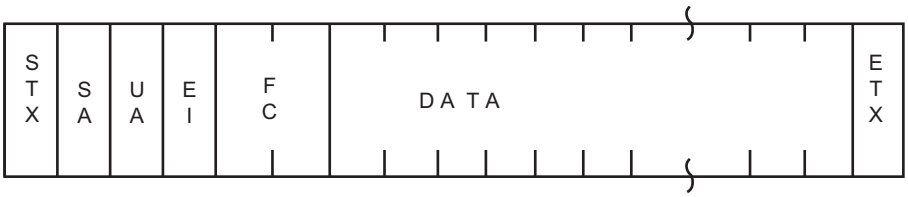
Index 586, Bit 0 to Bit 7. Modify the upper limit of polling buffer usage rate (01% - 99%) if required. [For UMGi/RNIP system]
The default value is 50%. If the usage rate exceeds this limit, the Centralized Billing Office will not receive any billing information sent from local offices.

b7	b6	b5	b4	b3	b2	b1	b0
Tens				Unit			

Note: This setting applies to “Centralized Billing -CCIS [C-55]”, “Centralized Billing -FCCS (Polling Method)”, and “CS Report [For UMGi/RNIP system] [C-149]”.

SYS1, Index 587, Bit 0=1: Interface type for CS Report Output is LAN interface.
Bit 1: System Message Output for CS Report with LAN interface related to connection failure in system changeover. 0/1 = Out/In Service
Bit 6: Output equipment A for CS Report with LAN interface. 0/1=Out/In Service
Bit 7: Output equipment B for CS Report with LAN interface. 0/1=Out/In Service

SYS1, Index 641. Output Number and Route Number designation that is applied for SMDR - ICS format only.
Bit 0=0/1 (Station Number/Telephone Number) **Note 4**
Bit 4=0/1 (Physical Route Number/Logical Route Number)

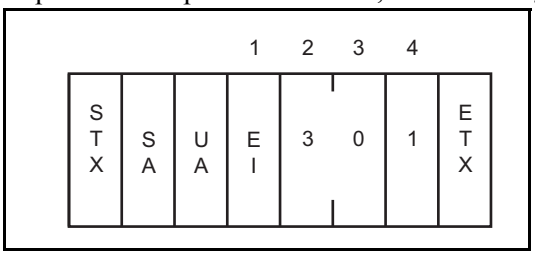


Note 4: If the number of digits of Telephone Number is within 6 digits, the Telephone Number will be output when Bit 0=1.

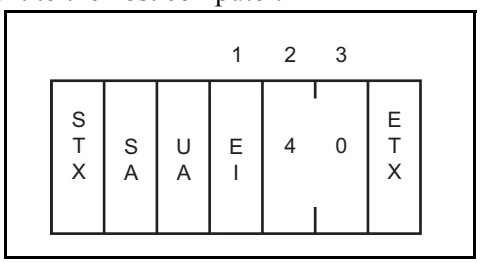
SYS1, Index 916/917. CS Report LAN Interface port number. When data is 00H, 60080 is used.

Message Format

1. RS-232C Interface



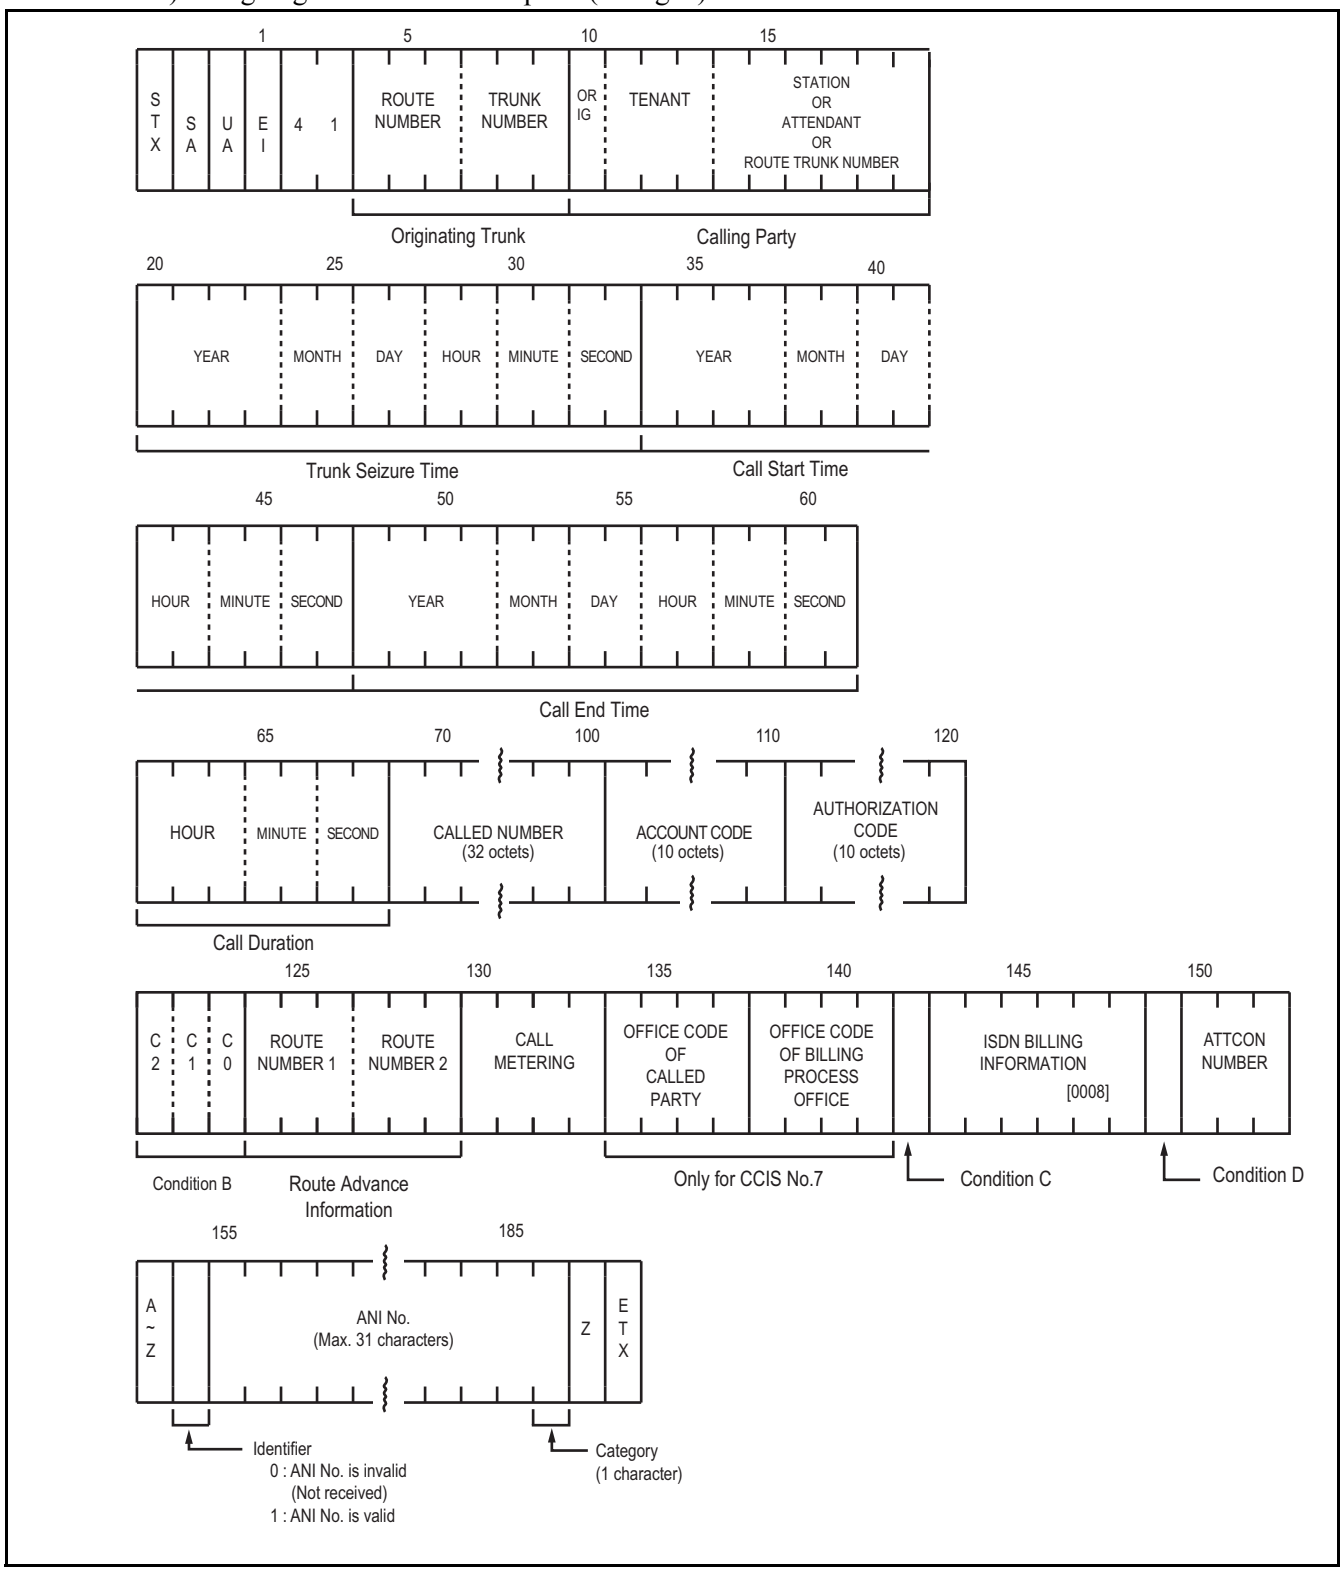
Message format via RS-232C is shown below:



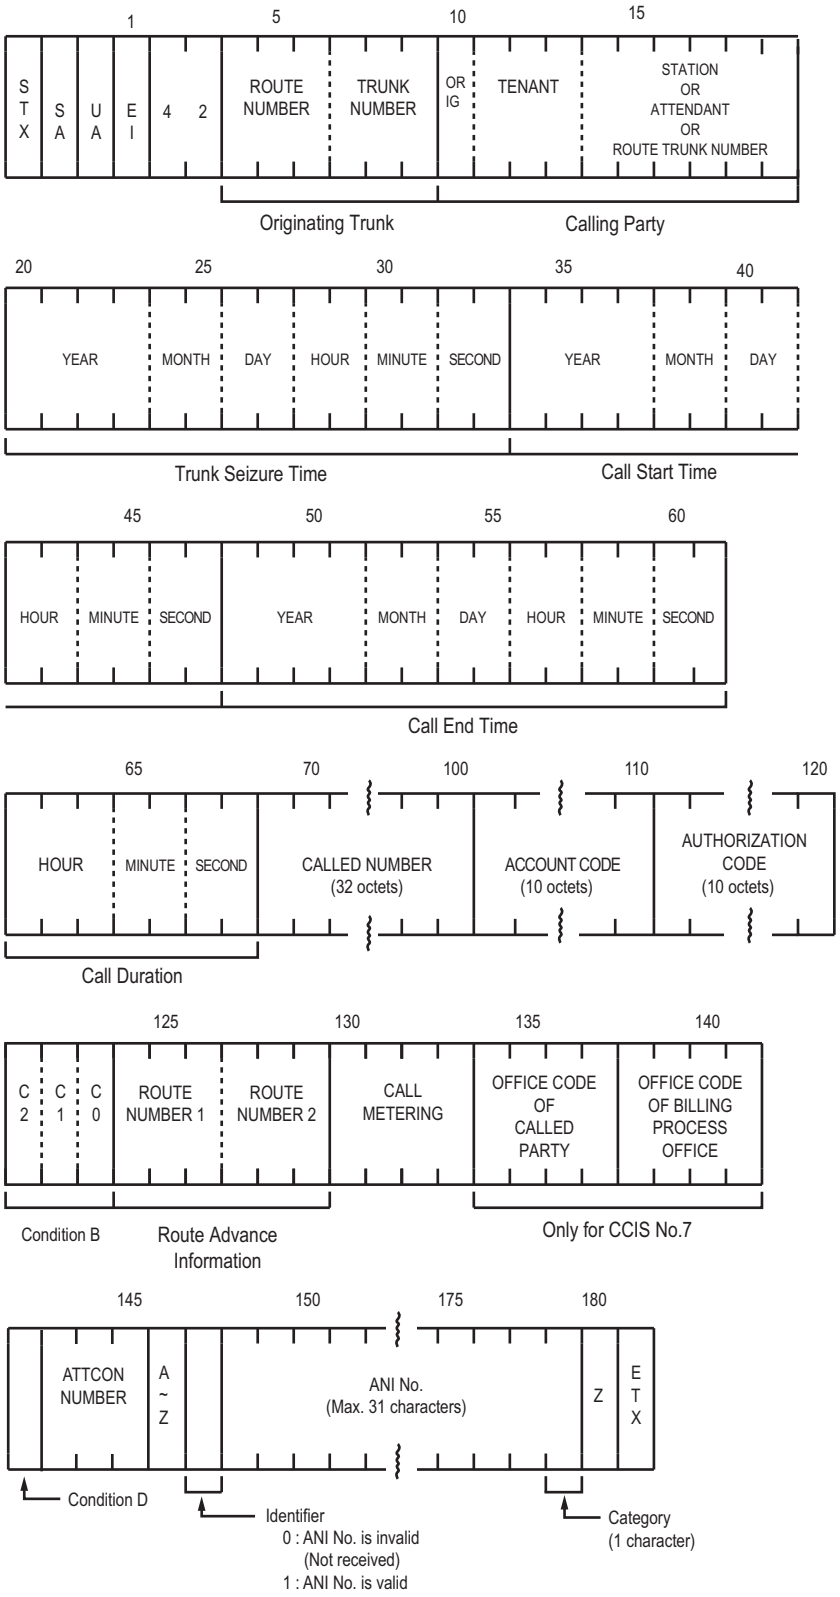
STX: Start of Text
EXT: End of Text
SA: System Address
UA: Unit Address
EI: Entry Index (P: CS Report message)
FC: Function Code **Note 5**

Note 5: The Meaning of Function Code is as follows:
30: Request for sending traffic data
40: No data
41: Outgoing Trunk Call - Complete (Charged)
42: Outgoing Trunk Call - Complete (Not charged)
43: Outgoing Trunk Call - Incomplete (Called Party No Answer)
44: Outgoing Trunk Call - Incomplete
45: Incoming Trunk Call - Complete
46: Incoming Trunk Call - Incomplete (Called Station busy, All IRTs Busy)
47: Incoming Trunk Call - Incomplete (Abandoned Call)

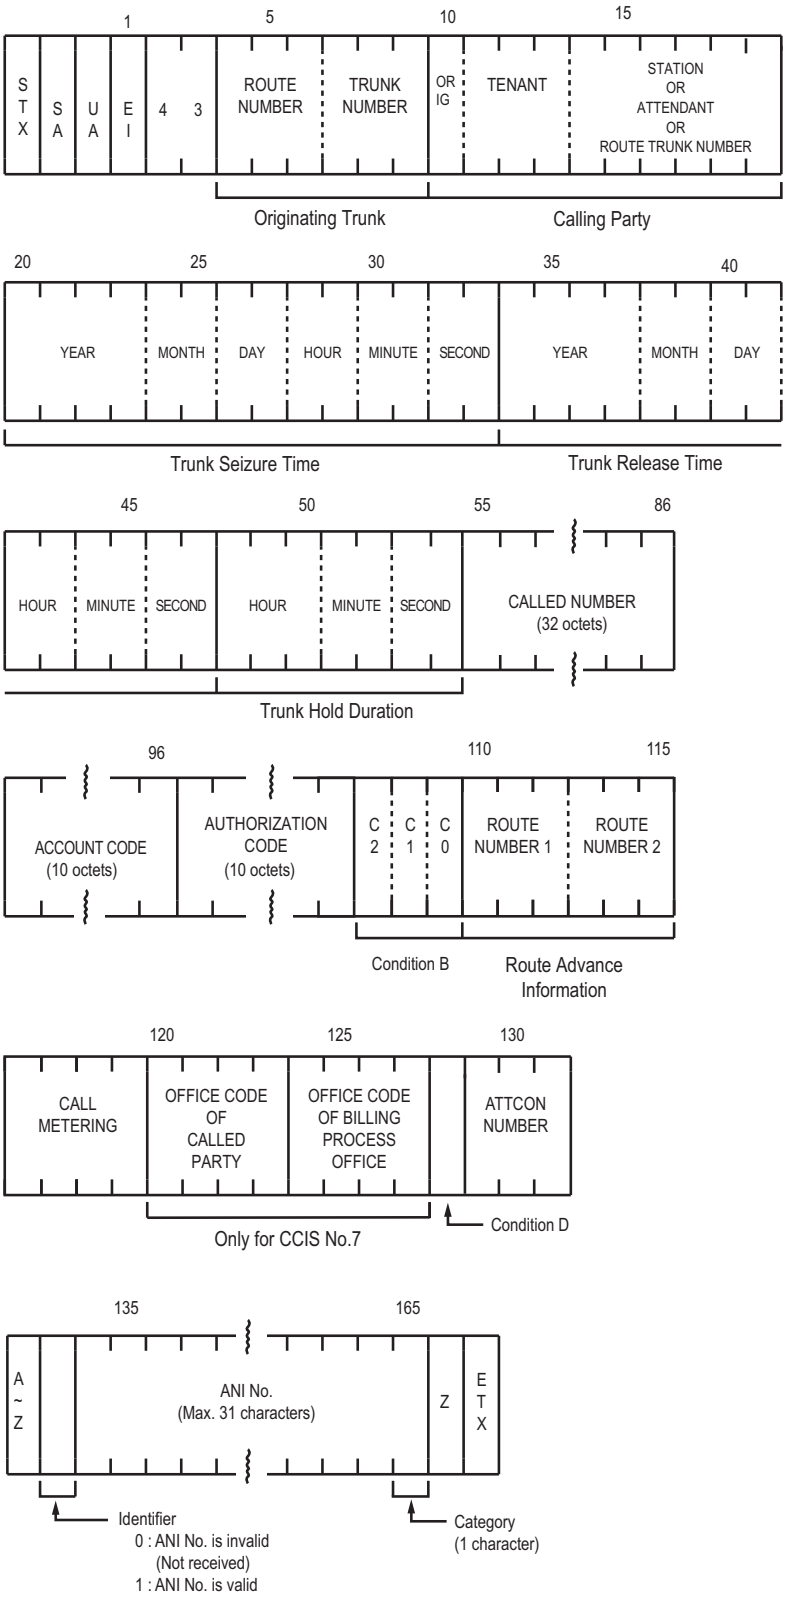
2. When the host computer requests CS Report information, the following message is sent to the PBX.



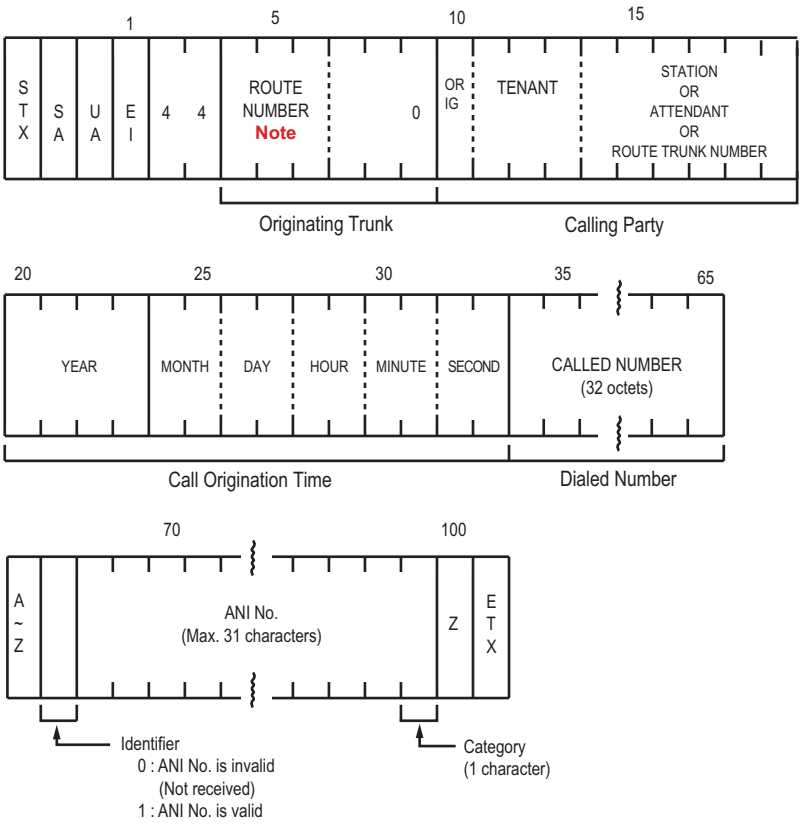
3. When the system is requested to send CS Report information, if no CS Report information is stored, the following message is sent to the host computer.



4. CS Report information sent from the PBX to the host computer is shown below:

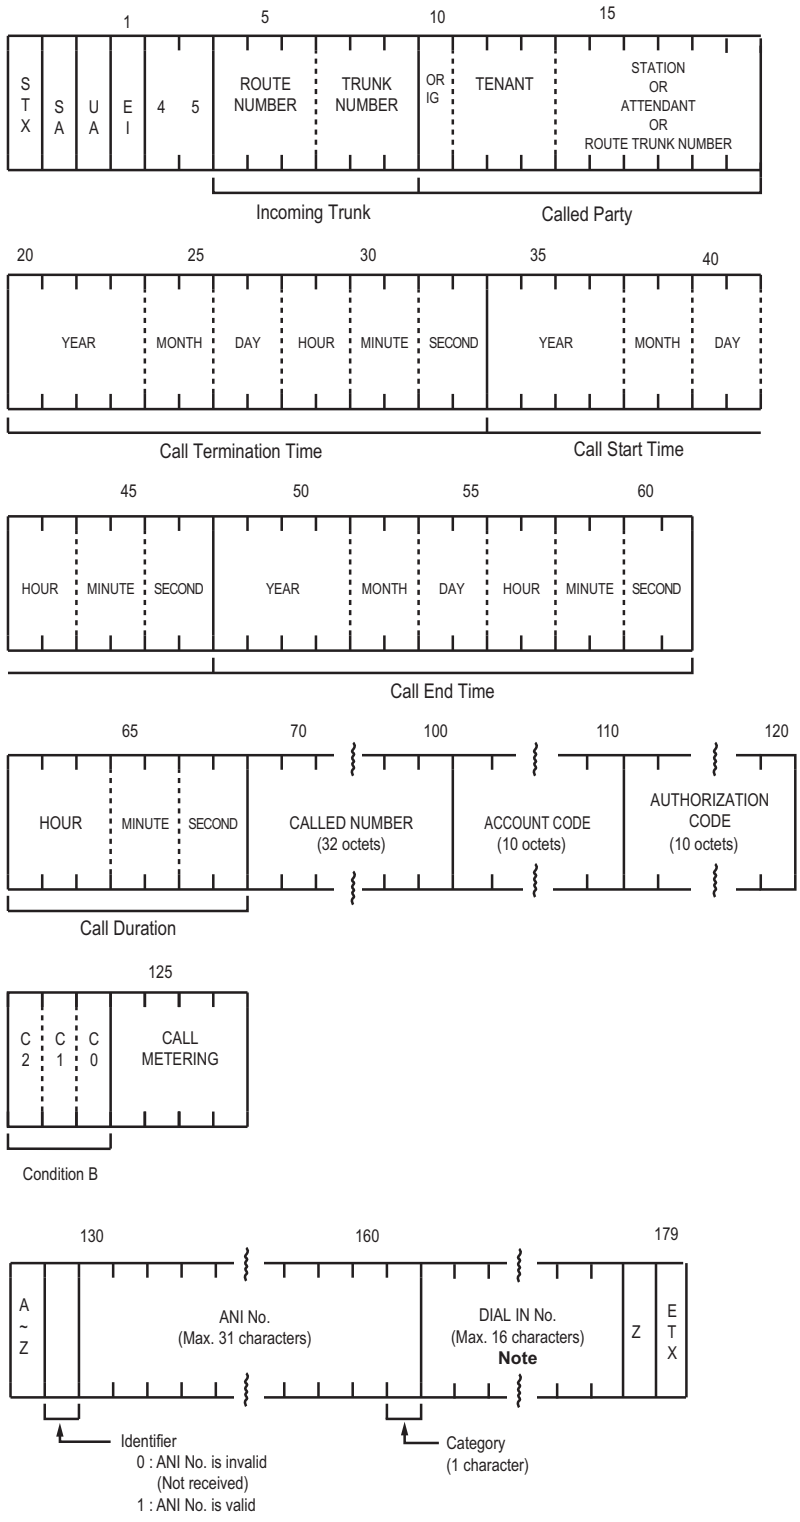


a.) Outgoing Trunk Call - Complete (Charged)

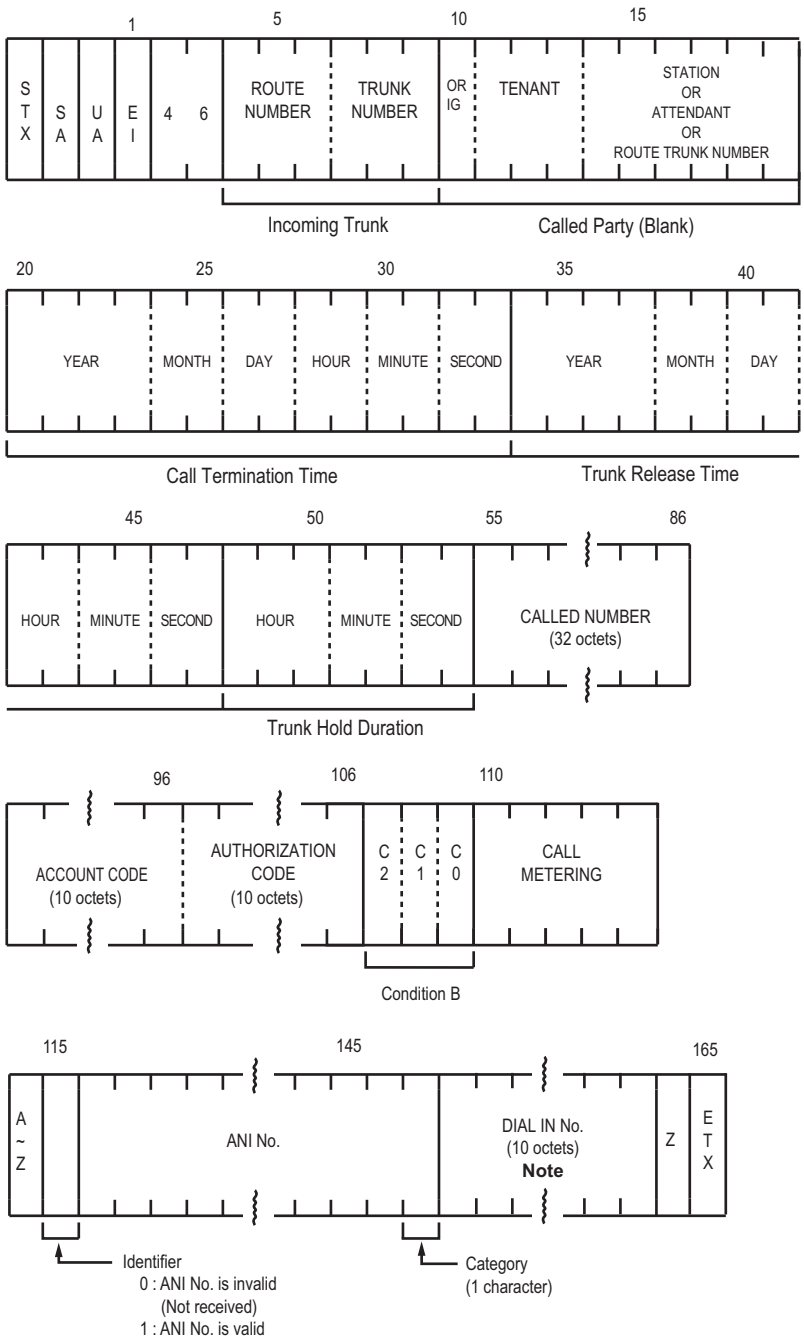


b.) Outgoing Trunk Call - Complete (Not Charged)

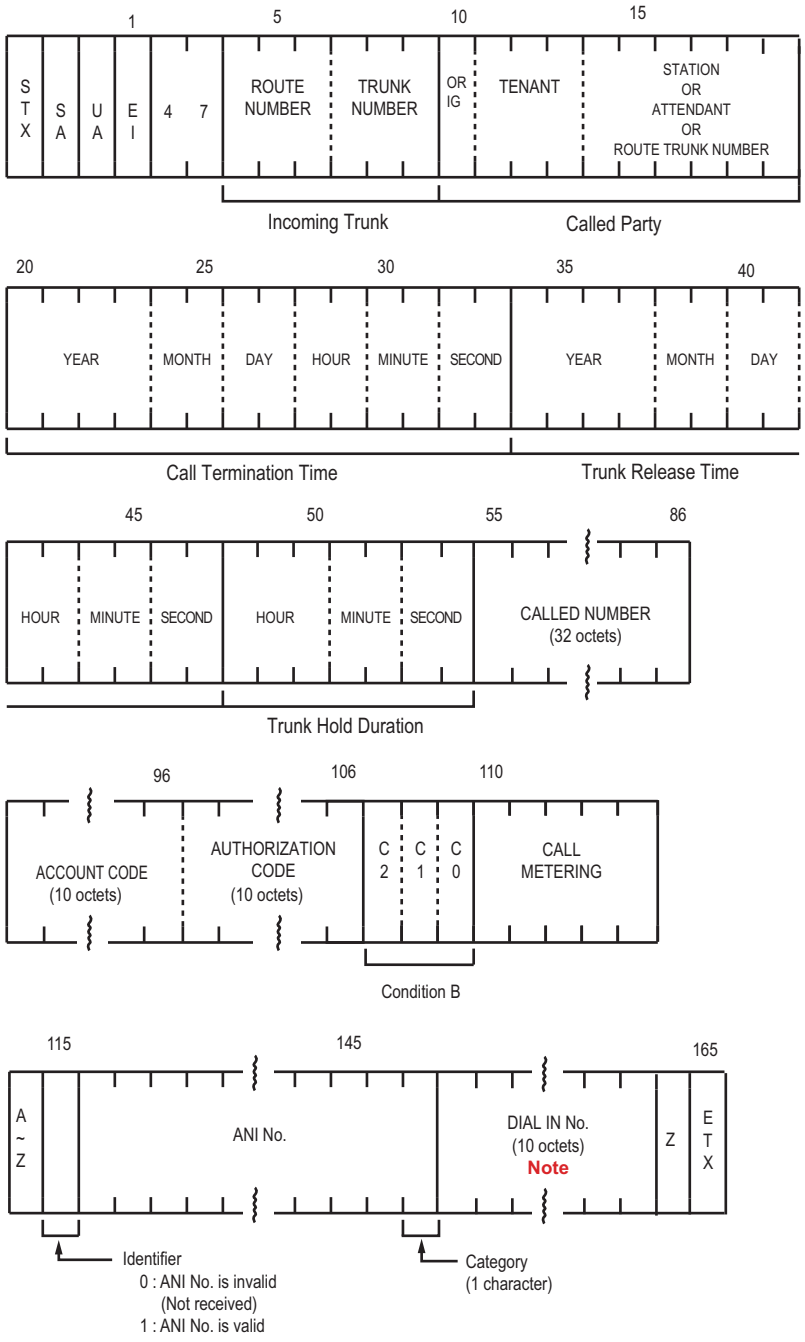
c.) Outgoing Trunk Call - Incomplete (Called Party No Answer)



d.) Outgoing Trunk All Busy - Incomplete



Note: In LCR/LCRS service, first selected route number is output.



e.) Incoming Trunk Call - Complete

f.) Incoming Trunk Call - Incomplete (Called Station Busy, All IRTs Busy)

g.) Incoming Trunk Call - Incomplete (Abandoned Call)

ORIG (Originating Source Identification):

0 = Calling/Called Party is a Station
1 = Calling/Called Party is Attendant
2 = Calling/Called Party is an Outside Party

Condition B:

C0 =

0: Regular Call (Direct Dialing from a Station)
1: Regular Call (Call is made through an ATTCON)
2: Call through route advance (Direct Dialing from a Station)
3: Call through route advance (Call is made through an ATTCON)
4: Call through Least Cost Routing (Direct Dialing from a Station)
5: Call through Least Cost Routing (Call is made through an ATTCON)
6: The first 6 digits of the converted number are output to Called Number (Direct Dialing from a Station)
7: The first 6 digits of the converted number are output to Called Number (Call is made through an ATTCON)

C1 =

0: Normal Call
1: Call originated by OG Trunk Queuing
2: Call originated by dialing with Account Code
3: Call originated by OG Trunk Queuing and dialing with Account Code
4: Call originated by Call Forwarding - Outside

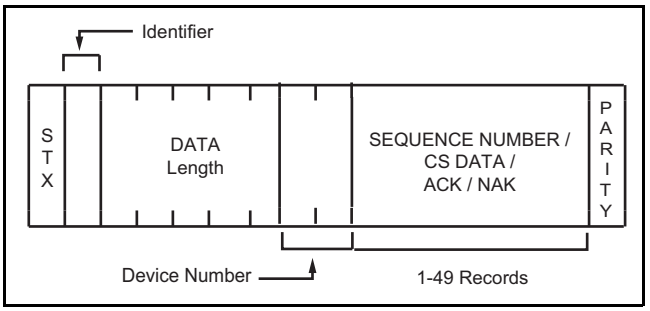
C2 =

0: Call is not transferred
1: Call is transferred
4: The last Station to which the call is transferred

Condition C:

0: ISDN Charge Notification Not Available
1: Charge Notification Available (Unit: 0.1 cent)
2: Charge Notification Available (Unit: 1 cent)
3: Charge Notification Available (Unit: 10 cents)
4: Charge Notification Available (Unit: 1 dollar)
?: Charge Information Error (when exceeding the maximum value)

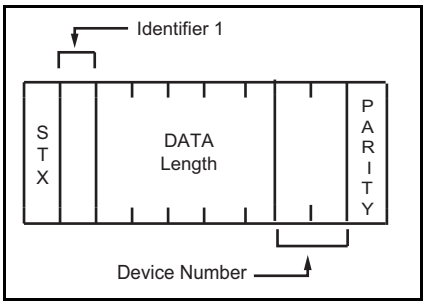
Condition D:



Blank: ATT Charge Notification Not Available
0: ATT Charge Notification Not Applicable
1: ATT Charge Notification Available

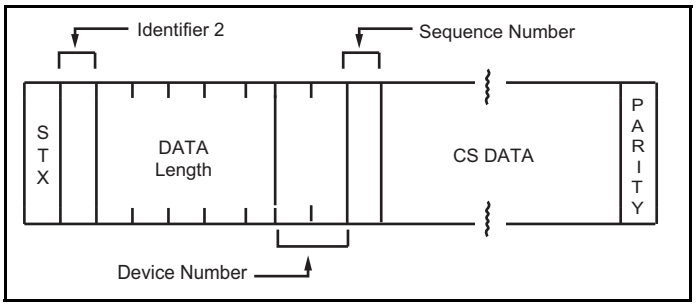
(2) LAN Interface

1. Interface between the Telephony Server and host computer is described below;

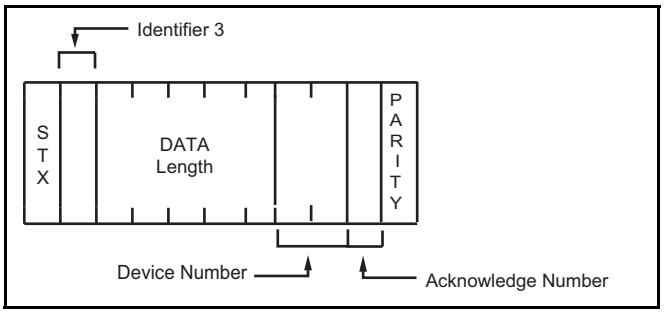


PROTOCOL	TCP/IP
INTERFACE	Ethernet
Telephony Server	SOCKET Interface
EXTERNAL DEVICE	Use the library of WinSock or Unix socket.
PORT NUMBER	60080
TRANSMISSION CODE	ASCII
CONTROL CODE	SYN: 16H Synchronous Idle STX: 02H Start of Text ETX: 03H End of Text ACK: 06H Acknowledgements NAK: 15H Negative Acknowledgements

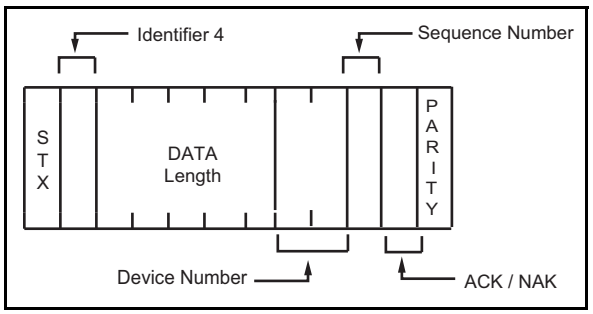
2. Basic text format is shown below:



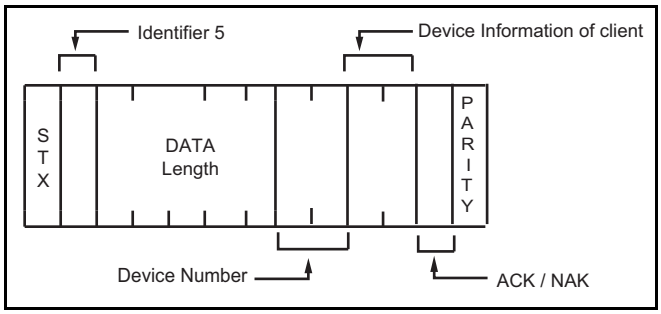
Note: The information of one record is described in (1) RS-232C.



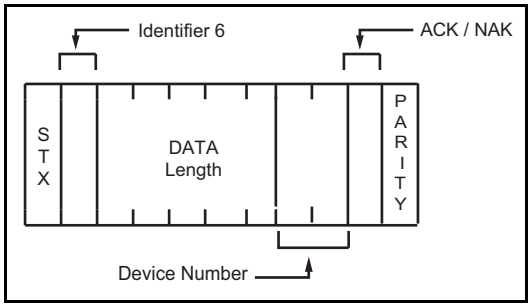
3. CS Report information is shown below.
   a.) Data Request Text: The client requests the data of server.



b.) Send CS Data Text: The CS data is sent to client.



c.) Response Text: When the server has no data to send, this text is sent to client. This text is also sent to client as a response to 'Status Monitor Text'.



d.) Response Text: This text is sent to server as a response to 'Send CS Data Text'.

e.) Status Monitor Text: This text is the report of the status of server monitored from client side or sever side. At the same time, the condition of client is also reported. This text is sent to server. The server sends 'Response Text' as a response to this text.

f.) Request Disconnection Text: The client sends this text to disconnect from client to server. The disconnection is performed after receiving this text.

SYN: Synchronous Idle
Identifier: Identifies whether the data is sent or received
DATA Length: Size of Data
Device Number: Client sends the device number to server, and server sends client's device number to which the text is sent.
00-Client A
01-Client B
Sequence Number: Serial Number of data (Number is cyclic).
Acknowledge Number: The information of server.

0: Not used
1: Send no data as a response to Request Data from client
2: Acknowledgement Text as a response to Status Monitor Text
3: Parity Error with the received text
4: Device Number Duplication
5: Error with received text (receive invalid text)
6: The state which can not be Sent and Received
7-9: Not used

ACK/NAK:

ACK:Parity Check Result is OK
NAK:Parity Check Result is NG

Device Information of Client:

DEVICE INFORMATION OF CLIENT	ALARM	INFORMATION
00	-	Normal (Text is printed when initializing)
01	SUP	Action is stopped
02	SUP	Error when initializing
03	SUP	Error with Database when receiving data
04	SUP	Error with Database when saving data

DEVICE INFORMA-TION OF CLIENT	ALARM	INFORMATION
05	SUP	Error with Database when making report
06	SUP	Alarm to capacity over with database (more than 1.6GB)
07	SUP	Alarm to insufficient memory with Hard disk (less than 100MB)
08-50	-	Not used
51	-	Start of action
52	-	Release from error when initializing
53-99	-	Not used

C-150 Call Block

General Description

This feature is a part of Caller ID Service. This feature restricts termination of Incoming Calls from the preassigned Calling Numbers. This feature is available by designating the Calling Number by PCPro.

Call Block is used to restrict an Incoming Call that has a Restriction Number (Physical Station Number, Telephone Number or the Caller ID Number, which are preset by each station). The Restriction Number can be set or canceled at each station by using the Access Code or the Feature key. The Called station can send Busy Tone to the caller. For the Station to Station Calls, Incoming Call can be restricted by using the Access Code or the Feature key (Not by ACID command).

Note: This feature is not available in Australia.

Operating Procedure

When using Access Code

To assign the Restriction Number (the newest Incoming Call is to be registered as the Restriction Number):

1. Lift the handset.
2. Dial the Access Code (ACC for registration of Restriction Number by the last Incoming Call).
3. Receive Service Set Tone. **Note 1**
4. The newest Incoming Call Number is registered as the Restriction Number.

When using Feature key

To set the Restriction Number (the newest Calling Number is to be registered as the Restriction Number):

1. Press the CALL BLOCK Feature key when the station is idle, a call is terminating to the station, or when the station is in a two-party connection.
2. The newest Calling Number is displayed for five seconds on the LCD.
3. Press the CALL BLOCK Set key (* or # key, depending on System Data) while the number is displayed.
4. The Call Block LED lights red.
5. The newest Incoming Calling Number (the Physical Station Number or the received Calling Number) is registered as the Restriction Number.

To assign the Restriction Number by dialing an Optional Number

1. Lift the handset.
2. Dial the Access Code (ACC for registration of Restriction Number by dialing an Optional Number).
3. Receive Special Dial Tone.
4. Dial the number to be restricted.
5. Receive Service Set Tone after the preassigned Inter-digit Timer (default is six seconds). **Note 1**
6. The Dialed Number is registered as the Restriction Number.

To cancel the Registered Restriction Number

1. Lift the handset.
2. Dial the Access Code (ACC for canceling the Restriction Number).
3. Receive Service Set Tone.

To set the Restriction Number by dialing an Optional Number

1. Lift the handset.
2. Press the CALL BLOCK Feature key.
3. Receive Special Dial Tone.
4. Dial number to be restricted.
5. Receive Service Set Tone after the preassigned Inter-digit Timer (default is six seconds). **Note 1**
6. The CALL BLOCK Feature key lights red.
7. The Dialed Number is registered as the Restriction Number.

When using the PCPro command to confirm the Registered Restriction Number

1. Start the DCBD command.
2. Enter the Telephone Number or LENS.
3. Select to display the Registered Restriction Number.
4. The Restriction Number, which is registered to the line corresponding to the specified Telephone Number or LENS, is displayed.

To confirm the Registered Restriction Number

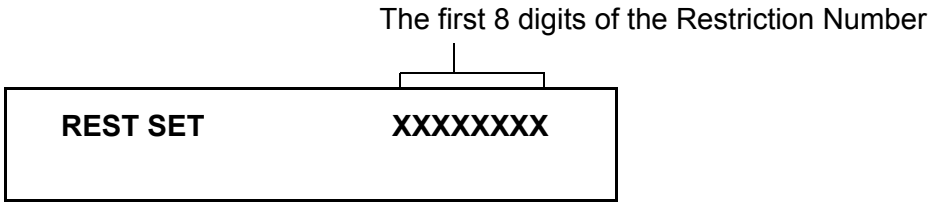
1. Press the CALL BLOCK Feature key when the station is idle (when the newest received Calling Number has been registered, the number is displayed on the LCD).
2. Continue pressing the CALL BLOCK Feature key in the same manner to confirm the other Restriction Numbers. The other Restriction Numbers are displayed in consecutive order.
3. The Registered Restriction Number is displayed for five seconds.

To cancel the registered Restriction Number

1. Confirm that the Restriction Number to be canceled is displayed on the LCD.
2. Press the * or # key for the Restriction Number to be cleared (depends on the System Data), while the corresponding number is displayed.
3. When all the Restriction Numbers are deleted, the LED of CALL BLOCK Feature key (or Soft key) goes OFF.

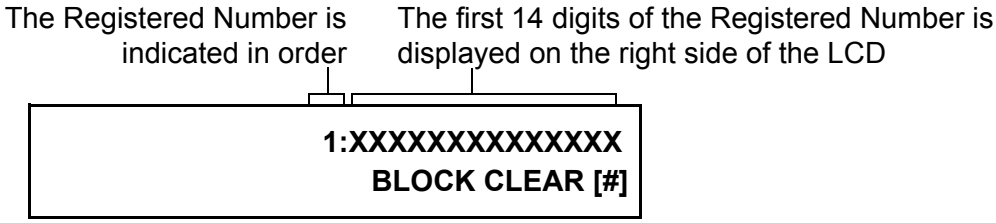
   Note: When a Desktop terminal is used as the station, the LCD displays are as shown on the next page.

4. LCD displays for Service Set, Confirmation, and Cancel are shown on the following page. Set/cancel can be selected as the "*" or "#" key, depending on System Data. Assignment of one of these keys as Cancel key, will assign the other as the Set key.



Note 1: When the Restriction Number has already registered up to the maximum number of five, Re-order Tone is heard. First cancel the former Registered Restriction Number, then set the new Restriction Number again from the beginning.

24 digit display of Desktop terminal

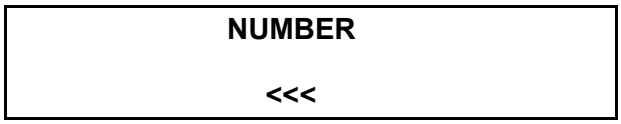


- When the last Incoming Call is displayed:

- When the Restriction Number is set:

- When confirming the Restriction Number:

- When the Restriction Number is canceled



- When HELP key for CALL BLOCK of Soft key is pressed:

Page 1

Page 2

Service Conditions

When the Restriction Number is registered by PCPro

1. When the Calling Number is not received, this service is not activated.
2. The Calling Number for this service is assigned to the parameter CID of ACID. When only the first part of the Calling Number is assigned to the CID, this service is applied to any Calling Number that begins with the Assigned Number. For example, when "0471" is assigned to the CID, this service is applied to any Calling Number that begins with "0471" such as 0471-12-3456 and 0471-234-5678.
3. The following numbers cannot be assigned to the parameter CID of ACID:
   a.) The first part of the already Assigned Number
   b.) The number whose first part is the same as the already Assigned Number. For example, when "123" is already assigned to the CID, such numbers as "1", "12", "1234" cannot be assigned.
4. When the Calling Number is received via CCIS Line, this feature is available for the first 16 digits (provided that "1" is assigned to CDN:98 (CI) of ARTD).
5. This service is available only for stations (Single Line Telephone and Desktop terminal).
6. This service is available for the following cases:
   a.) When an Incoming Call is directly terminated to a station
   b.) When an Incoming Call is transferred to a station using Call Forwarding - All Calls/Busy Line/ Don't Answer
7. Call Forwarding - All Calls and Call Forwarding - Busy take precedence over this feature.
8. A maximum of 12 Calling Numbers can be assigned for a single station.
9. A CH-12COTB or PA-8COTBJ circuit card is required for Analog Caller ID:
10. This service is available only for the Stations Service Restrictions are released [SFI 165 (Call Block) = 1].
11. This service is not available for PS terminal or ISDN terminal.
12. Only one Restriction Number (a maximum of 32 digits) can be registered per station. A maximum of a 32 digit Restriction Number can be assigned up to five numbers per Desktop terminal and one number per Analog station. A maximum of 511 stations can be registered per System/IMG.
13. The Restriction Number cannot be confirmed from Single Line Telephones after registration.
14. To assign the Restriction Number, it is available to register the newest Incoming Call Number if the call is received in the Station-to-Station Calling, or a call is terminated via the Trunk which received the Calling Number. For example, if the station cannot receive the number of the last Incoming Call, the newest call that meets the conditions above is registered as the Restriction Number. Thus, it cannot be available to assign the newest Calling Number as the Restriction Number immediately after System Initialization.
15. When assigning the newest Incoming Call as the Restriction Number using Feature key from an idle station or a ringing station, the newest Calling Number to the My Line is registered as the Restriction Number (then the Feature key on the Controlling Terminal lights red). Thus, on a Desktop terminal whose Prime Line is not My Line, the Displayed Number is not registered when a call is terminated at Prime Line. The newest Calling Number terminating at My Line is registered in place of the Displayed Number.
16. When a call is transferred, the Telephone Number of the Intermediate Station is to be registered as the newest Incoming Call Number even if that station releases the connection. Only the first Terminating Number is to be the Restriction Number.
17. This service is activated corresponding to each line. In case a Desktop terminal containing some Lines, the Restriction Number is effective only for the line to be registered the Number.
18. When confirming the Registered Restriction Number, the number registered on My Line is displayed for five seconds on the LCD.

19. This service is available only when the predetermined Restriction Number and the receiving Physical Station Number/Telephone Number or the Calling Number are exactly the same.
20. In this service, a Telephone Number is used to recognize the Station Incoming Call, however, a Physical Station Number is used for the station which is not assigned the Telephone Number.
21. When an Incoming Call via CCIS is terminated, a maximum 16-digit Calling Number (Route Data CI = 1) can be received. If the Telephone Number is more than 17 digits, the Incoming Call is not restricted.
22. There is no need to register ACC for a Central Office Trunk Call (ex. "9") when assigning Restriction Number by dialing operation.
23. In case Restriction Numbers are registered up to the maximum number, a previous Restriction Number must be canceled before setting the new Restriction Number on a station. (It is impossible to overwrite the Restriction Number.)
24. Sending Tone, which is used when originating a call from a station on which Call Block is set, can be selected on the system basis (ASYD, SYS1, Index 322, Bit 5).
25. When initialization of the circuit card is activated, the Restriction Number already registered is not cleared.
26. When System Initialization is activated, the Restriction Number already registered is not cleared. However, when initialization of System Data loading is activated, the Loaded Number (former Restriction Number), not the newest Restriction Number, is to be registered as new Restriction Number.
27. Restriction Numbers, which users set from the terminals, can be checked by the DCBD command.
28. This service is activated to each line. When a Desktop terminal is used, Restriction Numbers can be registered at Multiple Lines. However, to clear the Restriction Number using the * or # key is effective for only the number registered to My Line.
29. When confirming the Registered Restriction Number, the oldest number registered on My Line is displayed for five seconds on the LCD. When the Multiple Restriction Number is assigned, press CALL BLOCK Feature key to change the display to the later Registered Number, the Displayed Number is changed in order as the key is pressed.
30. When deleting the Restriction Number with the Access Code from a Desktop terminal, the oldest Restriction Number is deleted.
31. When five Restriction Numbers are registered at a line, the assignment of the already Registered Number is available.
32. System Data decides the * key or the # key as the Restriction Number Delete key. When the Delete key is decided, the other one is used as Set key.

    Note: The Set/Delete key is available for only five seconds (while the number is displayed).

33. When the correct ELC card is not used, the indication for the operation is not displayed at the middle line of the LCD. In this case, Restriction Number is set or deleted by Set/Delete key (* or #).
34. When all Calling Numbers are deleted, the CALL BLOCK Feature key goes OFF.
35. ACID applies only to inbound Trunk Calls with ANI.
36. ACID will not light a Feature key if the Telephone is equipped with one.
37. ACID will operate via the FCCS Network for Tandem Trunk Calls.
38. Feature keys and SIDAs will operate for Physical and Logical Stations, as well as Inbound Trunk Calls with ANI. It will also light the Feature keys for both.
39. When an Incoming Call via MFC trunk is terminated, this service is not available.

40. The COT Card for receiving the Caller ID information is shown below:

CIRCUIT CARD NAME	PROGRAM	ISSUE
CH-12COTB	SP-4065 12COTB PROG-A	
PA-8COTBJ	SW-317 8COTBJ PROG-A	

41. The LC Card for notifying the Caller ID information is shown below.

CIRCUIT CARD NAME	PROGRAM	ISSUE
PA-16LCBY	SP-3396 16-LCBX PROG-A	

Interactions

1. Call Forwarding - All Calls [C-5] takes precedence over this feature.
2. If this service is set at both the station and PCPro, the station has priority.
3. When the data on a station is changed by FOLLOW PHONE [F-31] Service, the Registered Restriction Number on the station is carried over to the next user.
4. When a station is deleted, the Registered Restriction Number on the station is also deleted.
5. When activating with DUAL STATION CALL [D-156], CALL BLOCK is available only for the Main station.

Programming

When the Restriction Number is registered by PCPro

ACID - Assign the Calling Number for this service.

TYPE 1

TN: Tenant Number

STN: Station Number

CID: Calling Number (a maximum of 28 digits)

SRV: 5 (Call Block)

Note: The Restriction Numbers assigned by this command cannot be checked by DCBD.

STEP 1: **ASYD** - SYS1, Index 322, Bit 5. Assign the sending Tone when Call Block is set.

0/1: DT/SPDT

SYS1, Index 80, Bit 1. Decide the Cancel key for the Registered Restriction Number.

0/1: # key, * key

STEP 2: **ASPA** - Assign the Access Code for Call Block, SRV = "SSCA: Service Code Appendix", SIDA = 111 (ACC for the latest Incoming Call is to be the Restriction Number), SIDA = 112 (ACC for assigning the Restriction Number by dialing an Optional Number), SIDA = 113 (ACC for canceling the Restriction Number)

STEP 3: **ASFC** - Assign a Service Feature Restriction Class to allow CALL BLOCK [C-150] for the Stations. SFI 165 (Call Block), RES = 1 (to release the restriction)

STEP 4: **AKYD** - Assign the key data for CALL BLOCK on the Feature key of Desktop terminal. FKI = 1 (Feature Key) and CALL BLOCK Feature key [128]

STEP 5: **ADSL** - Assign the Soft key data of Call Block for Desktop terminal according to the following

parameter:

SKP: 0-15 (Soft Key Pattern)

SN: 0, 1, 4 (Call Situation Number)

SKN: 1-16 (Soft Key Number)

FKY: 128 (Call Block Key)

STEP 6: **ADKS** - Assign the Soft key data of Call Block for Desktop terminal according to the following parameter:

TN: Tenant Number

STN: Station Number

SKP: 1-15 (Soft Key Pattern of Call Block assigned in ADSL)

LKP: 1-2 (Location of Key Pattern)

PG: 0/1 (Soft Key/Feature Key is allocated for Page Change Key)

STEP 7: **ASYD** - Assign the routine diagnosis program start time SYS1, Index 87: Hour, Index 88: Minutes

SYS1, Index 90, Bit 1=1: Routine Backup is to be executed

SYS1, Index 304, Bit 6=1: Data Backup of Call Block

C-151 Call Return

General Description

This feature allows a Desktop terminal or an analog station to save the received Calling Number of an incoming trunk call and the received Station Number of an incoming station call. The following two types of saving features are available:

- Automatic Saving: The received Calling Number/Station Number is automatically saved when the Station rings. The Stored Number can be dialed by pressing the Feature key or dialing the Access Code.
- Manual Saving: The received Calling Number is manually saved by the Desktop terminal user while in conversation. The Stored Number can be dialed by pressing the Feature key.

Note: Call Return to Station Number of an incoming station call is not available in Hotel System.

Operating Procedure

Automatic Saving

1. Saving Calling Number:
   a.) A call is terminated to an Analog Station or My Line of the Desktop terminal.
   b.) The received Calling Number is automatically saved. When the Station is the Desktop terminal with the CALL RETURN Feature key, the received Calling Number is displayed on the LCD and the CALL RETURN Feature key lights red.

   Note: A maximum of three Calling Numbers are stored for the Desktop terminal/A maximum of one Calling Number is stored for an Analog Station.

2. Displaying Stored Calling Number (for the Desktop terminal with the CALL RETURN Feature key):
   a.) While in idle state, press the CALL RETURN Feature key.
   b.) The saved Calling Number is displayed for five seconds. When multiple numbers are stored, the display changes each time the CALL RETURN Feature key is pressed. The number is displayed from the newest to the oldest. When the indication reaches the Oldest Number, the newest number appears again by pressing the CALL RETURN Feature key.
3. Call Origination:
   - When using the CALL RETURN Feature key on the Desktop terminal
     a.) Display the desired number by pressing the CALL RETURN Feature key. (Refer to #2.)
     b.) Lift the handset and receive Dial Tone.
     c.) Press the CALL RETURN Feature key. The Displayed Number is dialed.

     Note: The Dialed Number is automatically deleted. When all the Stored Numbers are deleted, the CALL RETURN Feature key goes OFF.

   - When using Access Code
     a.) Lift the handset and receive Dial Tone.
     b.) Dial the Access Code for Call Return. The last number saved is dialed.

     Note: The Dialed Number is not deleted.

4. Deleting Stored Number (for the Desktop terminal with the CALL RETURN Feature key)
   a.) Display the desired number by pressing the CALL RETURN Feature key. (Refer to #2.)
   b.) Press the * or # key (according to System Data assignment). The Displayed Number is deleted and CANCEL is displayed on the Desktop terminal LCD.

Note: When all the Stored Numbers are deleted, the CALL RETURN Feature key goes OFF.

Note: The Set/Delete key (* or #) is available for only five seconds (while the Calling Number is displayed).

- **Manual Saving (equal to SAVE AND REPEAT -D [S-24D]**

1. Saving Calling Number:
   a.) Press the S&R Feature key while in conversation using My Line or Sub Line.
   b.) The received Calling Number is saved and the S&R Feature key lights red.

Note: One Calling Number can be saved. When a Calling Number has already saved using SAVE AND REPEAT -D, the saved Calling Number is overwritten.

2. Displaying Stored Calling Number (for the Desktop terminal with the S&R Feature key):
   a.) While in idle status, press the S&R Feature key.
   b.) The saved Calling Number is displayed for five seconds.
3. Call Origination:
   a.) Lift the handset and receive Dial Tone.
   b.) Press the S&R Feature key. The Stored Number is dialed.

Note: The Dialed Number is automatically deleted and the S&R Feature key goes OFF.

Service Conditions

1. Service Conditions for Automatic/Manual Saving:
   a.) A CH-12COTB or PA-8COTBJ circuit card is required for Analog Caller ID.
   b.) Automatic/Manual Saving is available for the Desktop terminals.
   c.) This service is not available when the Calling Number is not received.
   d.) A maximum of 32 digits can be saved. However, when the Calling Number is received via CCIS Line, this feature is available for the first 16 digits (provided that "1" is assigned to 98: CI of ARTD).
   e.) When a Trunk Access Code (ex. "9") is required for Call Origination to the Saved Number, the Access Code must be added on a Route basis by ACNP and ACND. Note - for Analog Caller ID trunks only. The added Access Code is not displayed on the Desktop terminal LCD. However, the added Code is saved.

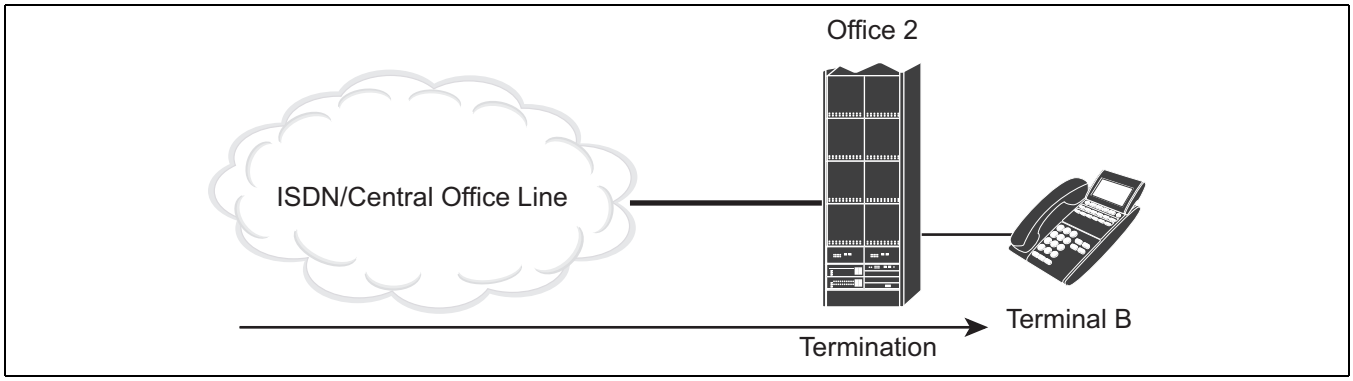
Note: For Analog Caller ID trunks the added Access Code is not displayed on the Desktop terminal LCD. However, the added Access Code is saved even if it is not displayed. For ISDN trunks, the Access Code will be displayed on the Desktop terminal LCD.

   f.) When the Area Code is not to be sent to within the same area, the Area Code must be deleted by

AFRS, AOPR and AADC.

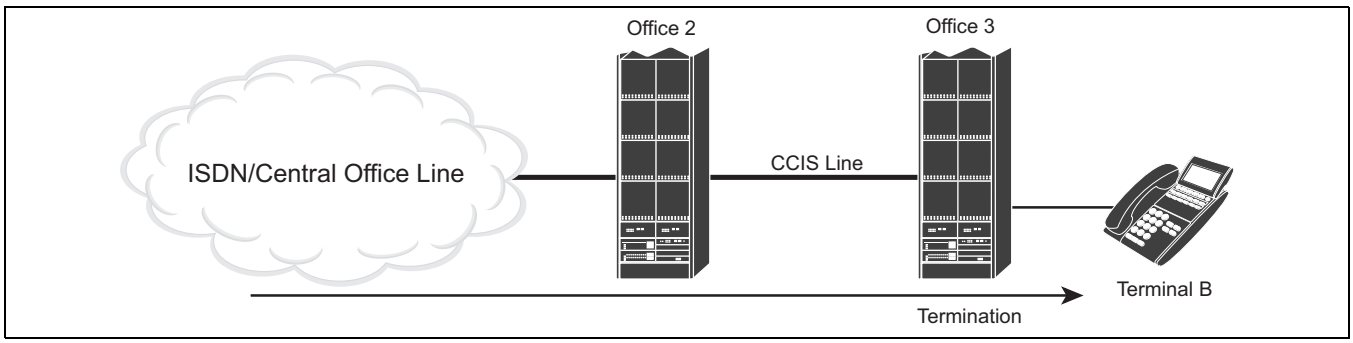
g.) When Station Data is changed by Follow Phone etc., Stored Number Data is not exchanged.

h.) When the system is initialized, Stored Number Data is deleted.



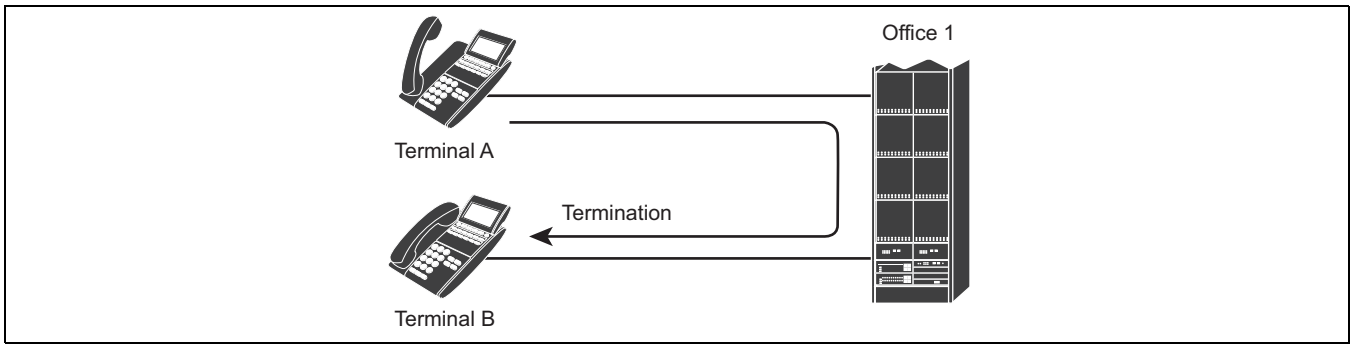
i.) When this service is used in an FCCS Network, the System Data should be set to all Nodes. However, when the Calling Number received from the Remote FCCS Node is not assigned a Telephone Number, the number of the Calling Station is not saved.

2. Service Conditions for Automatic Saving with the Feature key/Access Code:

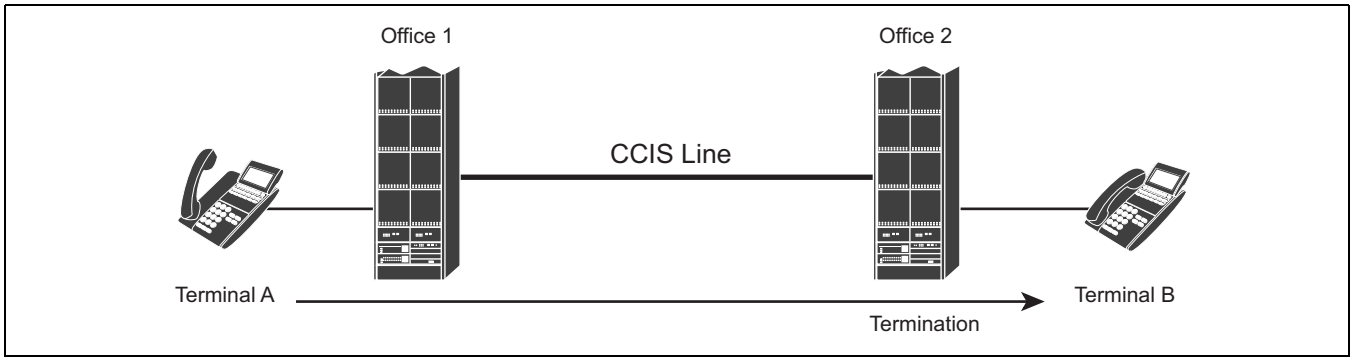


a.) Automatic Saving is available for Analog Stations allowed this service [ASFC, SFI 155 (Call Return) = 1] and the Desktop terminal with CALL RETURN Feature key.

b.) This feature is available for following calls.



- ISDN/Central Office Call:



- CCIS Call via ISDN/Central Office Line:

- Station-to-Station Call:

- CCIS Call

c.) When the Station answers a call held on Multi Line, the Calling Number/Calling Station Number cannot be saved (Held Line is not My Line). When the call is terminated at the Trunk, the Calling Number is saved in the ELC Card only.

3. Sub-Service Conditions:
   a.) The newest Calling Number is saved in the Data Memory even when Call Return is not available, according to ASFC SFI 155 (Call Return) = 0. Accordingly, the office data is changed later, call origination using the number saved when the service is restricted is available.
4. The Calling Station Number is not saved in the following cases:
   a.) When answering the Station-to-Station Call is held by CALL PARK and CALL PICKUP Service.
   b.) When answering the Station-to-Station Call using CALL PICKUP Service.
5. Calling Number can be saved for Station-to-Station Call via the System Data Assignment (see Programming).

Note: When the Incoming Call is terminated via CCIS Line, the System Data assignment described above is required.

6. Service Conditions for Automatic Saving with the Feature key:
   a.) The CALL RETURN Feature key must not be assigned to the Desktop terminal which has no LCD, because Stored Number Data cannot be checked.
   b.) A maximum of three received Calling Numbers are saved with the ELC Card. If the received Calling Number is the same number as the last call, the Calling Number is not saved.
   c.) When the ELC circuit card is initialized, Stored Number Data is deleted.
   d.) The Calling Number is displayed on the Desktop terminal LCD when a call is terminated to Prime Line. Accordingly, when My Line of the Desktop terminal is not Prime Line, the displayed Calling Number is not saved.
   e.) When a call is terminated to My Line, even if the Desktop terminal user is in conversation using Sub Line, the Calling Number is saved.
   f.) When the Stored Number is displayed, the Calling Number is displayed on the upper LCD. The maximum number of digits that indicates the Calling Number is different, depending on the Desktop terminal type. When using a Desktop terminal with a 16-digit LCD, the first 16 digits are displayed. When using a Desktop terminal with a 24 digit display, the first 24 digits are displayed.
   g.) When a call is terminated while one of the Stored Numbers is displayed, the lower line of the LCD indicates the Calling Number and the upper LCD displays the Stored Number for five seconds.
   h.) When three Calling Numbers are already stored, if a call is terminated while the oldest number is displayed, the oldest number is deleted and the Received Number is saved. Consequently, call

origination cannot be made to the Displayed Number.

i.) Call origination can be made to the Stored Number while Dial Tone is heard. After seizing a Trunk, this feature is not available.

j.) When originating a call using this service, the last 24 digits are displayed on the Desktop terminal LCD.

7. Service Conditions for Automatic Saving with the Access Code:

a.) This service is available for the telephone corresponding with Caller ID Service. The Access Code equips Caller ID function or the telephone using Caller ID adapter.

b.) This service is not available when a call is terminated to an ISDN Terminal or a PS Terminal.

c.) The last Calling Number is stored in the Data Memory.

d.) Even when the Office Data makes Analog Caller ID Station effective by ASFC, SFI 146 = 1, Received Numbers are saved (Calling Number is saved for the Trunk receiving the Number and Calling Station Number is saved for the Station Call).

e.) The Operating Procedure with the Access Code is effective for call origination to the Stored Number's Party.

f.) When originating a call via the Access Code from the Desktop terminal, the LCD displays the Dialed Number and does not display Stored Number.

g.) Even if the LC Card is initialized, saved Calling Number is not deleted.

h.) The newest Calling Number is saved in the Data Memory even when CALL RETURN is not available according to the ASFC SFI 155 (Call Return) = 0. Accordingly, the Office Data is changed later, call origination using the number saved when the service is restricted is available.

8. Service Conditions for Manual Saving:

a.) Manual Saving is available for the Desktop terminal with the S&R Feature key.

b.) This service is available when a Desktop terminal is in communication with the Terminating Trunk.

c.) When the Calling Number is saved, S&R and the first 12 digits are displayed on the Dterm LCD.

d.) When the circuit card listed in item 1-b is not used, the first six digits of the Received Number are saved.

e.) Call origination can be made to the Stored Number while Dial Tone is heard. After seizing a Trunk, this feature is not available.

f.) For more information, refer to SAVE AND REPEAT -D [S-24D].

g.) When pressing the call origination key (such as Flex keys) on the station originates a call out of the office, 16 digits including an access code is stored in memory.

Programming

STEP 1: **ASYD** - SYS1, Index 80, Bit 1. 0/1 = #/* key is used to delete the stored Calling Number.
SYS1, Index 322, Bit 7. 0 = Call Return is not available for Station-to-Station Calling.
1 = Call Return is available for Station-to-Station Calling.

Note: For an Incoming Call from a CCIS line, this data is required.

STEP 2: **ASPA/ASPAL/ASPAN** - When originating a call to the Saved Number using the Access Code, assign the Access Code for this service.
SRV: "SSCA: Service Code Appendix"
SIDA: 106 (Call Return)

STEP 3: **ASFC** - When using the Access Code for this service, assign Service Feature Restriction Class that allows SFI 155 (Call Return) to the Stations activating this service.

STEP 4: **AKYD** - Assign CALL RETURN Feature key when using Automatic Saving function.
KYI: 1
FKY: 118 (Call Return)
Assign S&R Feature key when using Manual Saving function.
KYI: 1
FKY: 7 (Save and Repeat)

C-154 Call Hold Pick Up

General Description

This feature allows a user to pick up a Trunk or Station Call that is put on hold by a second user. The user can accomplish this by dialing an Access Code followed by the Telephone Number that is holding the call.

Note: This feature is only available in North America.

Operating Procedure

1. Make a Trunk or Station Call to Station A.
2. Station A places the call in progress on hold.
3. From Station B, dial the Access Code and the Station A Telephone Number.
4. Station B is connected to the Station or Trunk Call that is on hold at Station A.

Service Conditions

1. Only Stations in the same Tenant can use this feature.
2. This feature remains in effect even after hold time-out and the Station is in the re-ring state.
3. This feature also overrides the Exclusive Hold feature (a call that is put in Exclusive Hold can be picked up by using this feature).

Programming

STEP 1: **ASPA** - Assign the Access Code for this service. SRV = “SSCA: Service Code Appendix”, SIDA = 103.

STEP 2: **ASFC** - Assign Service Feature Restriction Class that allows SFI 150.

C-157 Calling Party Number - Name Assignment and Display

General Description

This feature allows a user to assign the desired name for the Calling Number, which is provided by Central Office, CCIS or ISDN feature, using PCPro command. The assigned name is displayed on the LCD of the Desktop terminal, the Desk Console and the SIP Handler Controlled SIP terminal.

Operating Procedure

No manual operation is required.

Service Conditions

1. When the Calling Number is not received, the assigned name cannot be displayed.
2. The Calling Number for this feature is assigned to the parameter CID of ACID. When only the first part of the Calling Number is assigned to the CID, the corresponding name is applied to any Calling Number that begins with the Assigned Number. For example, when "1471" is assigned to the CID, the Calling Name assigned for the number is applied to any Calling Number that begins with 1471, such as 1471-12-3456 or 1-471-234-5678.
3. The following numbers cannot be assigned to the parameter CID of ACID:
   a.) The first part of an already Assigned Number.
   b.) The number whose first part is the same as the already Assigned Number. For example, when "123" is already assigned to the CID, numbers such as "1", "12", and "1234" cannot be assigned.
4. When a Calling Number is sent via CCIS Line, this feature is available for the first 16 digits only.
5. The Name Display is available only when a call directly terminates to a Desktop terminal from the Trunk received the Calling Number. For example, the assigned name is not displayed for the Transferred Call. However, in this case, the assigned name appears after the Transferring Party (an Attendant Console or a Station) is disconnected.
6. If forwarding a call via CALL FORWARDING - BUSY LINE [C-2]/DON'T ANSWER [C-3]/ALL CALLS [C-5], the assigned name can be displayed only when the Destination Station is a Desktop terminal.
7. The assigned name cannot be displayed on the Attendant Console. Displaying the assigned name on Desk Console is available.
8. The assigned name cannot be output to the SMDR expanded area.
9. A maximum of 10,000 names for the Calling Numbers can be assigned in a system. However, this amount varies depending on the Data Capacity of CALL BLOCK [C-150] or the Data Memory Capacity of the system.
10. This feature has priority over the basic Caller ID Service.
11. The display for OAI Service has priority over the display for this service.

12. The Display Patterns are shown below:

Note: These examples below are only for Desktop Terminals and DESKCON.

Display Pattern 1 (SYS1, Index 390, Bit 0=0, Bit 1=0)

	8-digit Calling Number
24-character Assigned name	

Display Pattern 2 (SYS1, Index 390, Bit 0=0, Bit 1=1)

	Type of Call, Sub-address
24-character Assigned name	

Display Pattern 3 (SYS1, Index 390, Bit 0=1, Bit 1=0)

	8-digit Assigned Name
24-digit Calling Number	

Display Pattern 4 (SYS1, Index 390, Bit 0=1, Bit 1=1)

	Type of Call, Sub-address
24-digit Calling Number	

13. Characters of 8-bit ASCII can be displayed for this feature.
14. When the CALL ID CHANGE DISPLAY [FKY=113] Feature key is pressed, the display pattern on the LCD (assigned by ASYD) changes according to the following conditions:
    - When My Line is Prime Line, the Call ID Change Display Feature Key is effective while terminating or in conversation.
    - When My Line is not Prime Line, Call ID Change Display Feature Key is effective while in conversation.

    However, display pattern returns to the original setting when answering, holding, or transferring the call.
15. When the Received Numbers of a Calling Number and characters of the assigned name exceed the Display Field, whether to put them close to the right or left may be chosen by System Data. At this time an asterisk (*) is indicated on the exceeded digit position.
16. The Displayed Number and Characters flash when a call terminates and lights steadily during conversation.
17. The Trunk Card CH-12COTB and PA-8COTBJ are available for Analog COT.
18. When this feature is activated via FCCS, the same data should be set to all Nodes.

19. The following shows conditions when SIP Handler Controlled SIP terminals are used.

    - When a call arrives at a SIP Handler Controlled SIP terminal which supports RFC3325 and RFC5876, Calling Name can be displayed on the SIP Handler Controlled SIP terminal (in the INVITE request message, Name Display information is given in the display-name field of the From header). However, when the connected party is changed by the transferring operation or shifting from a three-way call into a two-way call due to the disconnect of one of the three parties, the display of the connected party information depends on the standard SIP terminal. For the conditions of the display, refer to SIP HANDLER - SIP TERMINAL [S-167] of Data Programming Manual - Business.

    - Name information assigned by the NAME parameter of the ACID command can be notified. Only Name Display information containing symbols and alphanumeric characters can be notified.

Programming

STEP 1: **ASYD** - SYS1, Index 241, Bit 6: Assign the data when the length of Caller ID exceeds the limit:
0/1=Only the former/latter part of data appears on the LCD.
Index 390,
Bit 0: Assign the prior data to display
0/1: Assigned Name/Calling Number
Bit 1: Assign the information displayed on the top line of the LCD
0/1: 0: Caller ID Data
1: Call Type, Sub-address
Bit 2: Enable to display Caller ID information on the Dterm to which the called line is assigned as a Sub Line.
0/1: Out/In Service

STEP 2: **ACID** - Assign the desired name to the Calling Number.
TYPE 3: Calling Party Number - Name Assignment and Display
CID: Caller ID Number
SRV3: 1: Calling Party Number - Name Assignment and Display
NAME: 24 digits maximum

STEP 3: **AKYD** - Assign the Call ID Display Change to a Line/Feature Key. (FKY=113).

STEP 4: **ADSL** - Assign the Call ID Display Change to a Soft Key.
SN: 0, 3
FKY: 113 (Call ID Change Display)

C-160 Call Trace

General Description

This feature enables the output of System Message [26-R] **Note 1**, that gives information on a Malicious Call (kind of call, number of Calling Terminal, etc.) originated from a Station/Trunk. The feature is made available when an Access Code is dialed or the CALL TRACE Feature key is pressed by the called user.

Note: This feature is not available in Australia.

Note 1: For details on the System Message [26-R], see the Operations and Maintenance Manual.

Operating Procedure

Dialing Access Code

- To output the System Message for an Abandoned Call:

1. After call termination, the Calling Party abandons the call.
2. The Called Party lifts the handset.
3. The Called Party dials the Access Code.
4. Information on the Abandoned Call is output as System Message [26-R].

- To output the System Message after the release of a call:

1. After call termination, the Called Party answers the call.
2. After speaking, the Called Party releases the call.
3. The Called Party lifts the handset.
4. The Called Party dials the Access Code.
5. Information on the Malicious Call is output as System Message [26-R].

Using Soft key or Line/Feature key

- To output the System Message for an Abandoned Call:

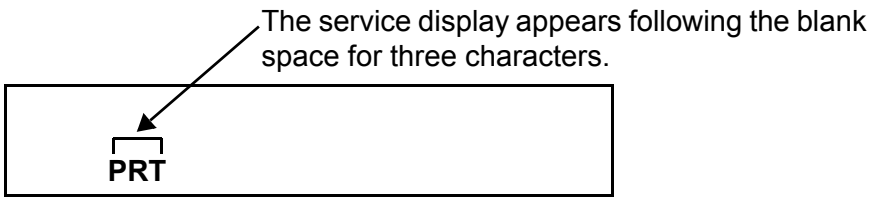
1. After call termination, the Calling Party abandons the call.
2. The Called Party lifts the handset.
3. The Called Party presses the CALL TRACE Feature key.
4. Information on the Abandoned Call is output as System Message [26-R].

- To output the System Message after the release of a call:

1. After call termination, the Called Party answers the call.
2. After speaking, the Called Party releases the call.
3. The Called Party lifts the handset.
4. The Called Party presses the CALL TRACE Feature key.
5. Information on the Malicious Call is output as System Message [26-R].

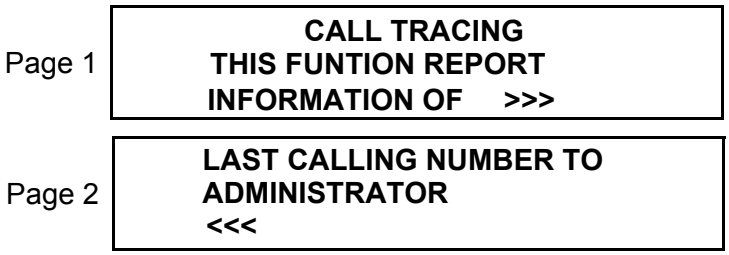
- To output the System Message while in speech:

1. After call termination, the Called Party answers the call.
2. While in speech, the Called Party presses the CALL TRACE Feature key.
3. Information on the Malicious Call is output as System Message [26-R].



Note: Details on the LCD display (Desktop terminal only) are as follows:

24 digits display of a Desktop terminal



- When the CALL TRACE is set:

- When the CALL TRACE is assigned to the Soft key:

- When the HELP key (Soft key) is pressed:

Service Conditions

1. This feature is made available via the Stations, to which the following data is assigned via ASFC [SFI 170 (Call Trace), RES = 1 (Service: Allowed)].
2. This feature can be activated by Analog or Desktop terminal stations. Other Terminals such as Wireless Stations (PS), ISDN Terminals, and Attendant/Desk Consoles cannot provide this feature.
3. This feature is designed to get information on a Terminated Call (the last call terminated to a Station Line). CALL TRACE is not available for Originating Calls.
4. Because a Desktop terminal can contain Multiple Lines, the message output is executed on a line basis. Therefore, when activating this feature via an Access Code, use the line that actually handled the Target Call.
5. When a call is terminated via a transfer (the call is transferred from other Station), the System Message [26-R] shows the information only related to the immediate Station (the party who transferred the call). Information about the first originated call cannot be obtained.
6. The following are the conditions for System Message [26-R].
   a.) Each data is output in hexadecimal, giving details from the first digit.
   b.) When the Message Data contains “A”, “B”, “C” or “0”, the actual meaning is as follows:
   A: 0
   B: *
   C: #
   0: blank
   c.) Date/Time Data is based on the actual date and time when the Access Code is dialed.

d.) The maximum digits for each data are as follows:

Data	Maximum Digits
FPC	3
Tenant Number	3
Station Number	6
UGN	3
Telephone Number	16
Trunk Call Number	32

e.) When the Called Station does not have the Telephone Number, the FPC/Telephone Number/UGN Data is output as "0".

f.) When the Calling Party is the Station which does not have the Telephone Number, the Tenant Number/FPC/Telephone Number/UGN Data is output as "0". The kind of call is output as "10".

g.) If the number of the Trunk Call (Caller ID) cannot be identified, the Trunk Call Number Data is output as "0". The kind of call is displayed as "20".

7. When the call is terminated via the CCIS, the obtainable Calling Party Numbers are:
   - Maximum eight digits [when CI (Route Data) = 0]
   - Maximum 16 digits [when CI (Route Data) = 1]

   System Message is output at the Node that the Called Station (informer) belongs to.
8. Unless the message output is set on a network basis, System Message [26-R] is created at the Node which contains the Called Station (informer).
9. The default message output grade is shown below:

	MJ	MN	SUP	GR
26-R	—	—	—	2

10. To obtain the Caller ID via an Analog Trunk, use CH-12COTB or PA-8COTBJ card. Other Analog Trunk Cards cannot provide this feature.
11. This service is available with the Analog Caller ID Service.

Interactions

1. When DUAL STATION CALL [D-156] is used, a call can be terminated to a main station and a sub-station simultaneously. At this time, the Calling Party information can be obtained only by the key operation from the main station side. Information to be obtained from the sub-station is about the last call directly terminated to the sub-station.

Programming

STEP 1: **ANPD/ANPDL/ANPDN** - Assign 1st digit code (1stDC) and Number of Necessary Digits (NND) for Feature Access and Cancel. Select Normal Service (N) from the combo box for Connection Indexes.

STEP 2: **ASPA/ASPAL/ASPAN** - Assign the Access Code for CALL TRACE, CI = "N: Normal", SRV = "SSCA: Service Code Appendix", SIDA = 116 (Output of System Message [26-R]).

STEP 3: **ASFC** - Assign a Service Feature Restriction Class to allow CALL TRACE for the Stations, SFI 170, RES = 1 (Restriction: lifted).

STEP 4: **AKYD** - Optional. Assign the CALL TRACE to a Line/Feature key on the Desktop terminal, FKI = 1 (Feature Key), Feature key Call Trace [129].

STEP 5: **ADSL** - Optional. Assign the following to use a Soft key on the Desktop terminal for CALL TRACE:

SKP: 0 - 15 (Soft Key Pattern)
SN: 1 (DT), 4 (Communication in Progress) (Status Number)
SKN: 1 - 16 (Soft Key Number)
FKY: 129 (Call Trace)

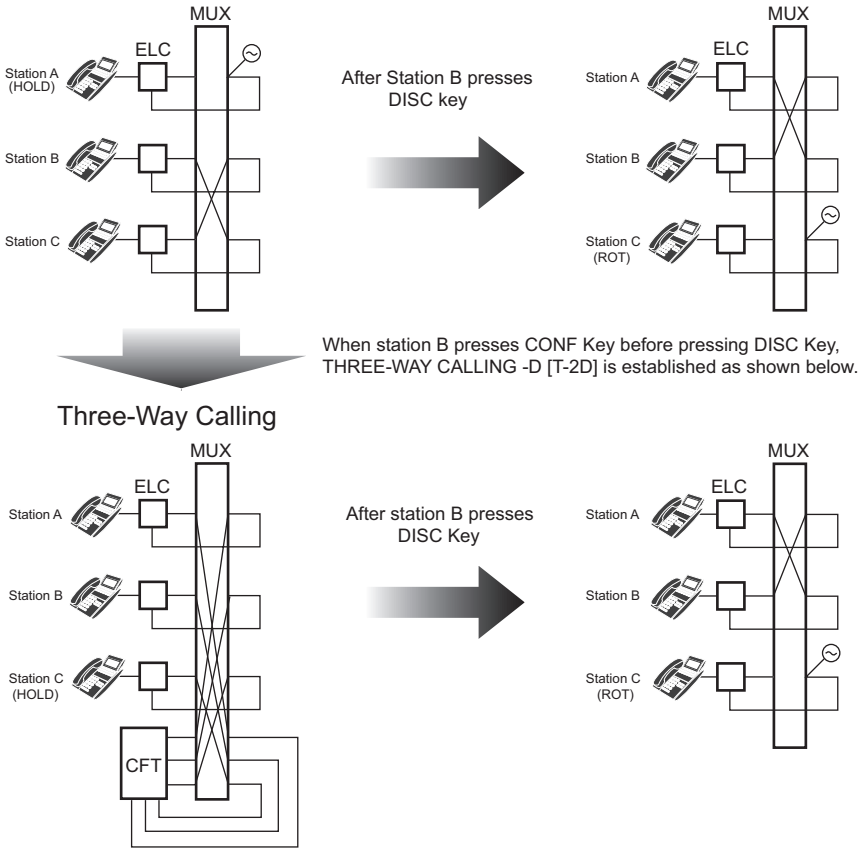
STEP 6: **ADKS** - Assign the following to use a Soft key on the Desktop terminal for CALL TRACE:

TN: Tenant Number
STN: Station Number
SKP: 0 - 15 (Soft Key Pattern assigned in STEP 5)
LKP: 1 - 3 (Location of Key Pattern)
PG: 0/1 (LCD Page Change: Soft Key/Line Key)

C-169 Consultation Hold Release

General Description

This feature enables a Station, connecting to a second call while the Station has been holding (Consultation Hold) an original call (including ADD-ON CONFERENCE - 8 PARTY [A-121] member), to disconnect the second call forcibly by pressing the DISC key once for Desktop terminal, or switch hook flashing for Analog Stations/PSs/WLAN Handsets twice. After that, the second call is released, and the original call is retrieved from hold.

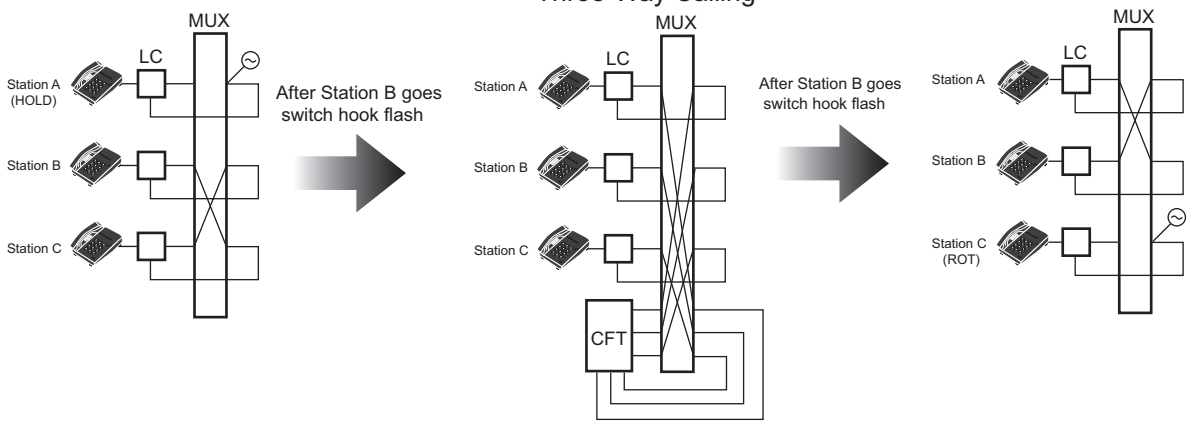


Operating Procedure

<When the operating Station for this feature is other than SP Controlled Standard SIP Terminal>

Situation 1: When Station B is talking with C while holding (Consultation Hold) an original call (Station A).

- Station A: Original Call
- Station B: Operating Station for this feature (Desktop terminal/Analog Station/PS/WLAN Handset/SIP Handler Controlled SIP terminal)
- Station C: Second call called by Station B (It can be disconnected by this feature.)

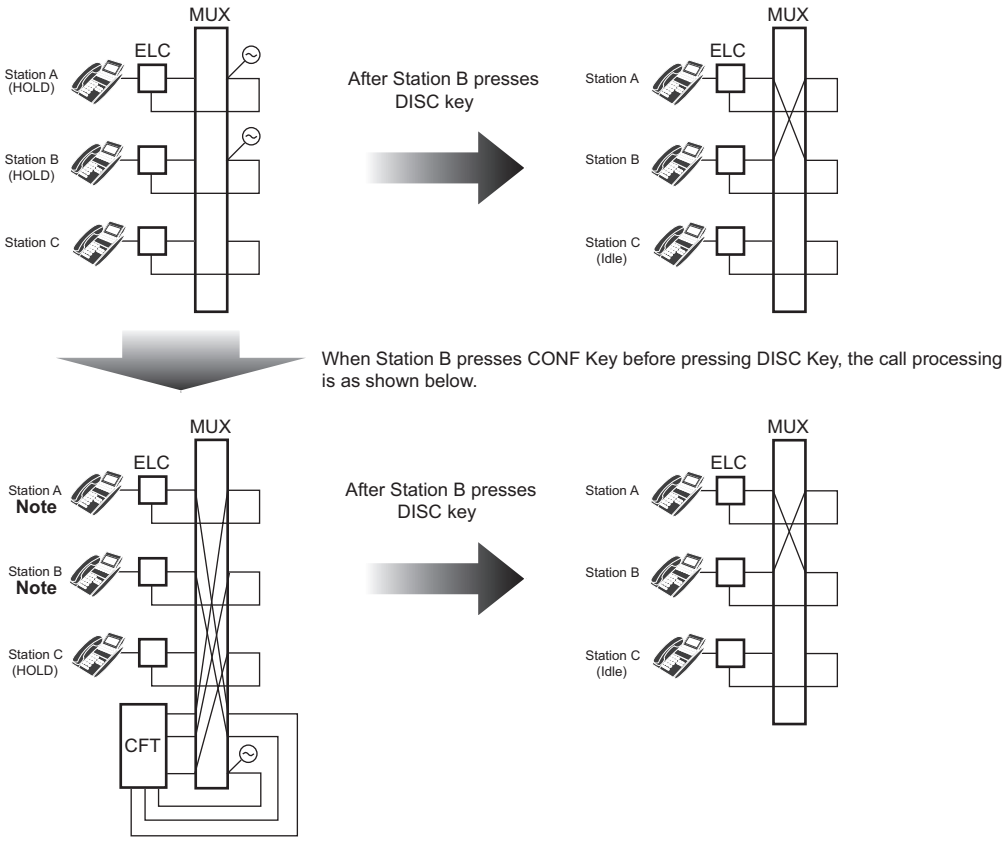


Procedure for Desktop Terminal

Note: If a Trunk for Three-Way Calling within a MUX Card is busy, this feature is not available.

Procedure for Analog Station/PS/WLAN Handset

Three-Way Calling

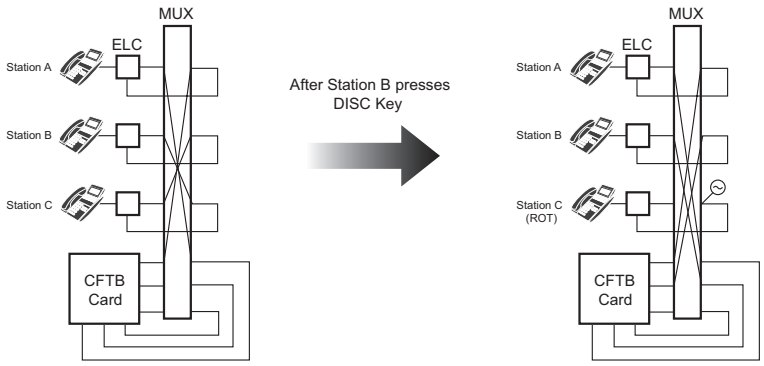


Note: If a Trunk for Three-Way Calling within a MUX Card is busy, this feature is not available.

Situation 2: When Station B is held by Station C during Situation 1 (In this case, only Desktop terminal is available.)

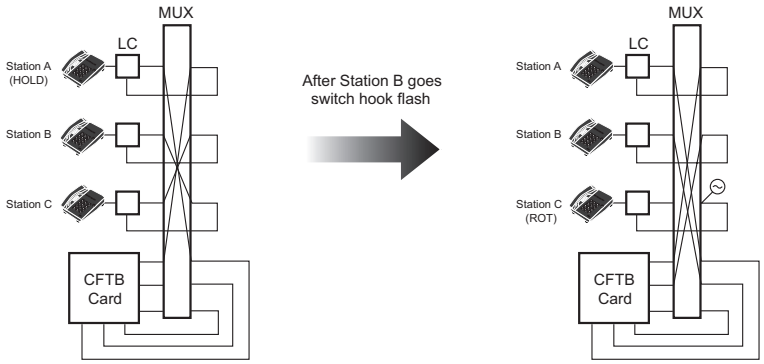
- Station A: Original call
- Station B: Operating Station for this feature (Desktop terminal)
- Station C: Second call called by Station B (It can be disconnected by this feature.)

Procedure for Desktop Terminal



Note: Hold Tone cannot be heard.

Situation 3: When Station B is talking with Station C after Station B holds (Consultation Hold - All Calls -D [C-17D]) Station A while Station A and B in a Conference (Add - On Conference - 8 Party [A-121]). (PS/ISDN Terminal Equipment/WLAN Handset/SIP Handler Controlled SIP terminal cannot be applied to the feature.)



- Station A: Original call (Conference member)
- Station B: Operating Station for this feature (Conference member)
- Station C: Second call, which is not Conference member, called by Station B (it can be disconnected by this feature)

Procedure for Desktop Terminal

Note : This feature is not available when operation Station (Station B) is in Add-On Conference-8 PARTY [A-121] while holding Station C (Station/Trunk) using TRANSFER Key.

Procedure for Analog Station

Note : Only when SYS1, Index 803, Bit 2=1 is assigned, Station C can be disconnected.

Note : When ASFC, SFI 131 (Add-On Conference 8 - party) = 1 is assigned to Station B, Station C is called into Add-On Conference 8 - Party [A-121].

<When the operating Station for this feature is Standard SIP Terminal>

Refer to the manual of each Standard SIP Terminal for operating procedures.

Note: This feature is available for Standard SIP Terminal.

Service Conditions

1. This feature is available when SYS1, Index 803, Bit 1=1 is assigned.
2. When there is a call terminated at Chinese specification MFC Trunk in calls related to this feature, this feature is not available.
3. ISDN Terminal Equipment cannot be applied to Operating Station of this feature.
4. A Station assigned Emergency Call (SFI 24) cannot be applied to Operating Station of this feature.
5. The DISC key used for this feature can be assigned through the AKYD command (FKY=131).
6. When an Analog Station uses this feature while in ADD-ON CONFERENCE - 8 PARTY [A-121], assign SYS1, Index 803, Bit 2=1 also. However, the Analog Station assigned SFI 131 = 1 (Permission of calling an Add-On Conference - 8 Party) cannot be applied to Operating Station for this feature.
7. When SYS1, Index 244, Bit 6=1 is assigned, switch hook flash cannot be used while in THREE-WAY CALLING [T-2].
8. A Desktop terminal can execute this feature using the FLASH BUTTON (FKY=21) key as a substitute for the DISC key. In this case, comply with Operating Procedure for Analog Station/PS/WLAN Handset.
9. A second party (second call) is the last Terminal connected with Operation Station. Therefore, when the user changes a party using the TRANSFER key, the original party and second party are also changed.
10. When there is a call originated from Attendant Console in the calls related to this feature, this feature is not available.
11. When assigning the DISC key to a Soft key, DISC is displayed on the LCD of Desktop terminal. HELP for the DISC key is as follows:

DISC KEY PRESS THIS KEY TO RELEASE THE LAST >>>	CALLED PARTY AND RECONNECT TO THE <<< HELD PARTY

12. When a consultation call to the destination party is made via a trunk line, Consultation Hold Release is available, regardless of System Data setting (ASYDL/ASYDN, SYS1, Index 803, Bit 1).
13. Service Conditions when the operating Station for this feature is an SP Controlled SIP terminal are as follows:
    a.) This feature is available for SP Controlled Standard SIP terminals with Consultation Hold Release function. SP Controlled Standard SIP terminals must be confirmed by the connection test of NEC as well as in compliance with IETF RFC3261 and Internet-Drafts.
    b.) Holding a call must be canceled by an SP Controlled Standard SIP terminal (the intermediate party) to reconnect the original call with the first party.
    c.) If this feature becomes invalid for reasons such as when a call is transferred to an Attendant, Call Forwarding - All Calls [C-5] is executed.
14. Service Conditions when the operating Station for this feature is a SIP Handler Controlled SIP terminal are as follows. When the following conditions apply, Consultation Hold Release works with operations for putting/canceling the call on hold, but the SIP Handler Controlled SIP terminal cannot talk with the held station until the SIP Handler Controlled SIP terminal answers the held call.
    If the following conditions are not met, the SIP Handler Controlled SIP terminal is released with operations for putting/canceling the call on hold, and then the call shifts to a Two-way call between the held station and the forwarding destination.
    a.) Setting AKYD, FKY=131 (DISCONNECT key) is required.
    b.) Setting ASYDL/ASYDN, SYS1, Index 803, Bit 1=1 (Consultation Hold) is required. This setting is also required when the destination is a trunk.

15. When using this feature in the ACD/OAI system, the following system data setting is required:
ASYDL/ASYDN, SYS1, Index 1240, Bit 1=1 (Consultation Hold Release - ACD is enabled)
For more information, refer to the Data Programming Manual - ACD, "C-205A CONSULTATION HOLD RELEASE - ACD."

<For terminals other than SP Controlled Standard SIP Terminal>

Note: Refer to this section for the programming steps for SIP Handler Controlled SIP terminals. These instructions assume that the data for SIP Handler Controlled SIP terminals is already assigned.

STEP 1: **ASYDL/ASYDN** - Allow this feature. SYS1, Index 803, Bit 1: 0/1 = this feature is not allowed/allowed.

SYS1, Index 803, Bit 2: 0/1 = Analog Station cannot/can use this feature during ADD-ON CONFERENCE - 8 PARTY [A-121].

STEP 2: **ADSL/AKYD** - Assign the DISCONNECTION (DISC) key used for this feature to Soft key or Line/Feature key.

ADSL - When assigning the DISC key to a Soft key:

SKP (Soft Key Pattern):	0-15
SN (Status Number):	5 (Consultation Hold)/9 (Three-Way Calling)
SKN (Soft Key Number):	1-16
FKY (Function Key Data):	131

AKYD - When assigning the DISC key to a Line/Feature key:

KYN:	Key Number
KYI (Service Condition):	1 (Feature Key)
FKY (Feature Key Code for Flex Key):	131

<For SP Controlled Standard SIP Terminal>

The programming after the SP Controlled Standard SIP Terminal Data is assigned is as follows:

STEP 1: **ASPTL/ASPTN** - Assign SIP Terminal Data.
TERMINAL field
DETAIL field
When secondary call is disconnected, held call remains on hold:
Select the check box if this feature is used with Standard SIP Terminal.

Note: This feature has been available for Standard SIP Terminal.

Note: If the data on the TERMINAL tab is changed, the System receives a notification about the data change. If the System cannot receive the notification for some reasons such as when SP is down or when a network failure occurs, the disparity between the actual Office data and information on the System is created. At this time, the SIP Terminal is required to re-register. When SP cannot receive the notification, "There is no response from SP" message will be displayed in PCPro.

C-172 Call Forward by Service Feature Class

General Description

This feature will implement all types of Station Based Call Forwarding (Call Forwarding - Busy Line, Call Forwarding - Don't Answer, Call Forwarding - All Calls) to a predetermined number, based on the Service Feature Restriction Class (SFC) of the Called Station. This feature may be set using Common or Split Forwarding, depending on system programming.

Note: This feature is available in North America only.

Operating Procedure

No special Operating Procedures are required by the Station user to activate this feature.

Service Conditions

1. This service will have all the current limitations of the each Call Forwarding feature.
2. This feature works based on the ACFCL Data of the Service Feature Restriction Class of the Terminating Party.
3. In an FCCS Network, this feature works off the ACFCL Data that is assigned in the System of the Calling Party, for the SFC of the Called Station. Because of this, it is strongly recommended that ACFCL be assigned the same throughout the FCCS Network.
   a.) Station 1000 is in Telephony Server A SFC 1.
   b.) Station 2000 is in Telephony Server B SFC 1.
   c.) In Telephony Server A SFC 1 has Forward All to 5000 set by ACFCL.
   d.) In Telephony Server B SFC 1 has Forward All to 6000 set by ACFCL.
   - When Station 2000 calls Station 1000, the call will forward to Station 6000 in the FCCS Network. This feature reads the LDM ACFCL Data in the Calling Party's office for the Called SFC.

   e.) This feature will have the same limitation of up to five Call Forwarding - All Calls or Call Forwarding - Busy Line forwards in a row.
   f.) If ACFCL is set for SFC 1 to Call Forwarding - All Calls to 4140 and 4140 is in SFC 1 when a call is made to 4140, it will ring. If the call is placed to another Station in SFC 1, the call will forward to 4140.
   g.) Examples of Call Forwarding scenarios using ACFCL:
   SFC 1 Call Forwarding - All Calls to 4140 (4140 is programmed in SFC 2)
   SFC 2 Call Forwarding - All Calls to 4141 (4141 is programmed in SFC 3)
   SFC 3 Call Forwarding - All Calls to 4142 (4142 is programmed in SFC 4)
   SFC 4 Call Forwarding - All Calls to 4143 (4143 is programmed in SFC 5)
   SFC 5 Call Forwarding - All Calls to 4144 (4144 is programmed in SFC 6)
   SFC 6 Call Forwarding - All Calls to 4145 (4145 is programmed in SFC 7)
   SFC 7 Call Forwarding - All Calls to 4146 (4146 is programmed in SFC 8)
   SFC 8 No Data assigned
   SFC 15 No Data assigned
   - Using the assignments above, if a call is made to a Station in SFC 1, the call forwards to 4140. The call will then follow the forwarding set for each SFC. The call will forward up to five times (based on ASYD, SYS1, Index 5, Bit 1 to Bit 3) and will ring 4144.

- Using the assignments above, if 4141 sets individual Call Forwarding - All Calls to Station 5000 (SFC 15) and a call is made to 4140 the call will forward from 4140 to 4141 and then to 5000.
- Using the assignments above, if 4141 sets individual Call Forwarding - All Calls to Station 4145 (4145 has ACFCL set to 4146), a call made to 4140 will forward to 4141 (because of ACFCL), then forward to 4145 (because of individual Call Forwarding - All Calls), then forward to 4146 (because of ACFCL), it would then ring there (because no Forwarding Data is set in ACFCL for SFC 8 and no individual Call Forwarding is set).

h.) The following table illustrates the hierarchy for Call Forwarding:

PRIORITY	CALL FORWARDING TYPE	COMMAND USED
1	Call Forwarding - All Calls Individual	ACFS or as set by the individual Station
2	Call Forwarding - All Calls by SFC	ACFCL
3	Call Forwarding - Busy Line Individual	ACFS or as set by the individual Station
4	Call Forwarding - Busy Line by SFC	ACFCL
5	Call Forwarding - Busy Line by Tenant	ACFO
6	Call Forwarding - No Answer Individual	ACFS or as set by the individual Station
7	Call Forwarding - No Answer by SFC	ACFCL
8	Call Forwarding - No Answer by TN	ACFO

i.) Separate Destinations will be allowed, based on current Call Forwarding types.

- Based on ASYD, SYS1, Index 5, Bit 0=0/1
  Call Forwarding - Busy Line and No Answer Destination is separate/common.
- Based on ASYD, SYS1, Index 79, Bit 2=0/1
  Calling Party Trunk/Station Call Forward Destination is common/separate.

Note: If either of the bits above are changed while ACFCL is open, the command must be restarted. If data is already assigned in ACFCL and either of these bits is to be changed, all data should be deleted from ACFCL first.

j.) When using ACFCL Call Forwarding - Don't Answer after Blind Transfer, Service Feature Index 103 (Assignment of No Answer Timer) and Service Feature Index 104 (Blind Transfer) must be set correctly and will operate just like individual Call Forwarding - Don't Answer.

- ASFC Service Feature Index 8 (Call Forwarding - Don't Answer) should be assigned to allow Call Forwarding - Don't Answer to occur in the SFCs that use ACFCL for Call Forwarding - Don't Answer.

k.) If ACFCL for Call Forwarding - All Calls is assigned to an SFC that contains UCD members, those members are skipped in the UCD Group. This is the same as if the Call Forwarding - All Calls Individual feature is used.

- If the UCD Pilot is in an SFC that is set Call Forwarding - All Calls by ACFCL, all calls to that Pilot will forward to the Destination Station. This is the same as if the Call Forwarding - All Calls Individual feature is used.

Programming

This service can be split by Tenant Service.
This is controlled by ASYD, SYS1, Index 93, Bit 0.
If ASYD, SYS1, Index 93, Bit 0=0, this service is assigned separately on a per TN basis.
If ASYD, SYS1, Index 93, Bit 0=1, this service is common across all TNs using the data from TN 1.
This service can be split to forward, based on Day or Night mode of the System.
This is controlled by ASYD, SYS1, Index 75, Bit 1.
If ASYD, SYS1, Index 75, Bit 1=0, both D/N is common.
If ASYD, SYS1, Index 75, Bit 1=1, D/N will develop separate tables.
ACFCL - Set the following data:

D/N:	Day/Night Mode (radio button)
TN:	Tenant
SFI:	Service Feature Index

When ASYD, SYS1, Index 5, Bit 0=0 and ASYD, SYS1, Index 79, Bit 2=0
Call Forwarding - All Calls Destination
Call Forwarding - Busy Line/Call Forwarding - Don’t Answer Destination

When ASYD, SYS1, Index 5, Bit 0=1 and ASYD, SYS1, Index 79, Bit 2=0
Call Forwarding - All Calls Destination
Call Forwarding - Busy Line Destination
Call Forwarding - Don’t Answer Destination

When ASYD, SYS1, Index 5, Bit 0=0 and ASYD, SYS1, Index 79, Bit 2=1
Call Forwarding - All Calls Destination for Stations
Call Forwarding - Busy Line/Call Forwarding - Don’t Answer Destination for Stations
Call Forwarding - All Calls Destination for Trunks
Call Forwarding - Busy Line/Call Forwarding - Don’t Answer Destination for Trunks

When ASYD, SYS1, Index 5, Bit 0=1 and ASYD, SYS1, Index 79, Bit 2=1
Call Forwarding - All Calls Destination for Stations
Call Forwarding - Busy Line Destination for Stations
Call Forwarding - Don’t Answer Destination for Stations
Call Forwarding - All Calls Destination for Trunks
Call Forwarding - Busy Line Destination for Trunks
Call Forwarding - Don’t Answer Destination for Trunks

C-173 Call Redirect

General Description

This feature allows a Desktop terminal user to view on the Desktop terminal display the Station Number or Caller ID of an Incoming Call and immediately redirect the call by pressing a Feature key. The destination of the Call Redirect will be the Call Forwarding - Don't Answer Destination or the Recall Destination (if the call is transferred and no Call Forwarding - Don't Answer Destination is set).

Operating Procedure

In the case of My Line

1. Station 1001 is a Desktop terminal My Line.
2. Station 1001 sets Call Forwarding - Don't Answer via PCPro or feature to Station 4140 (VMM).
3. Station 1000 dials Station 1001.
4. Station 1001 rings and displays 1000 on its LCD.
5. Station 1001 presses the CALL REFIRECT Feature key.
6. REDIRECTING is displayed on the LCD, and the call immediately forwards to 4140.
7. In the case of Sub Line:
   a.) Station 1001 is a Desktop terminal and Station 1002 is a Sub Line appearing on 1001.
   b.) Station 1002 sets CFDNA to by PCPro or feature to Station 4140 (VMM).
   c.) Station 1000 dials Station 1002.
   d.) Station 1002 rings.
   e.) User of Station 1001 presses the line appearance of Station 1002 and then immediately presses the CALL REFIRECT Feature key.
   f.) REDIRECTING is displayed on Station 1001 and the call immediately forwards to Station 4140.
8. In the case of Call Forwarding - Don't Answer while Call Waiting - Terminating:
   a.) Station 1001 is a Desktop terminal My Line and has Call Forwarding - Don't Answer Call Waiting applied.
   b.) Station 1001 sets Call Forwarding - Don't Answer via PCPro or feature to Station 4140 (VMM).
   c.) Incoming Trunk in a Route which has Call Waiting set in Route Data calls Station 1001
   d.) Station 1001 hears Call Waiting Tone and the ANSWER key flashes.
   e.) User at 1001 presses the CALL REFIRECT key.
   f.) Trunk immediately forwards to Station 4140. In this case, if the line used is not the My Line (Station 1001), the Line key must be pressed before the Call Redirect key.
9. In the case of Automatic Recall (ASYD, SYS1, Index 69, Bit 0=0):
   a.) Station 1001 is the My Line of Desktop terminal Station 1001.
   b.) Station 1000 dials Station 1002.
   c.) Station 1002 answers the call and transfers to Station 1001 and releases the call.
   d.) Station 1001 rings.
   e.) User at Station 1001 presses the CALL REFIRECT key.
   f.) REDIRECTING is displayed on Station 1001 and the call immediately recalls to Station 1002.

Service Conditions

1. All the current limitations of normal Call Forwarding - Don't Answer also apply to this feature.
2. If the destination of a Call Redirect is in a Hunt Group, the call will follow the hunting as normal Call Forwarding - Don't Answer would. This is the same as current Call Forwarding - Don't Answer [C-3].
3. If the destination of the Call Redirect is Busy or in a state that will not accept the call, the call will continue to ring on the Station trying to invoke the Redirect feature and will display REDIRECTING. Because of this limitation, whenever possible, the destination of Call Redirect should be a UCD (VMM) Group or should have Call Forwarding - Busy Line set to a UCD. This way Call Redirect will always queue to the UCD Group if all Stations are Busy.
4. If the destination of a Call Redirect is call forwarded, the Call Redirect will follow the Route same as a normal Call Forwarding - Don't Answer [C-3] would.
5. This service is only available for Desktop terminal Stations.
6. Wireless - PHS Terminals cannot use this feature.
7. A Feature key (or Soft key) must be provided for this service.
8. This feature will operate with Call Forwarding - Don't Answer while Call Waiting - Terminate is in effect.
9. Call Redirect during Call Waiting - Terminate has all of the current Call Waiting - Terminate limitations.
10. This includes only Incoming Trunk Calls that will be redirected in a Call Waiting - Terminate state.
11. Call Redirect will not function with Call Forwarding - Don't Answer with Attendant Camp-On.
12. If the CALL REFIRECT key is pressed in a state that will not allow a Call Redirect, "REDIRECT NA" will be displayed.
13. This feature will only function on the My Line of a Dterm when ASYD, SYS1, Index 384, Bit 0=1.
14. If Call Redirect is used with Automatic Recall, the call will be redirected to the Transferring Station (this is when ASYD, SYS1, Index 69, Bit 0=0).
15. If the Prime Line and My Line of the Dterm is split, pressing the CALL REFIRECT key will redirect the My Line by default. To redirect the Prime Line or other lines, in this case the Line key must be pressed before the CALL REFIRECT Feature key.
16. For Call Redirect to be used for Call Forwarding - Don't Answer while Call Waiting - Terminate, ASYD, SYS2, Index 10, Bit 7 must be set to 1. This bit is used to send periodic Call Waiting Tone, but is also the Call Forwarding - Don't Answer Call Waiting Timer.
17. This feature will not function during Camp-On by Station feature.

Programming

Normal Call Forwarding - Don't Answer [C-3] programming applies. For Call Redirect to function during Call Forwarding - Don't Answer, Call Waiting Timer normal Call Forwarding - Don't Answer, Call Waiting Timer programming applies as described in this manual.

When used as a Feature key/Soft key, assign the following:

STEP 1: **AKYD** - FKY 132 (CALL REFIRECT Feature key)

When used as a Soft key, assign the following:

STEP 1: **ADSL** - State 0 (ringing state)

FKY 132 (CALL REFIRECT Soft key)

State 15 (Miscellaneous state)

The Soft key display will show "REDIR" on the Desktop terminal.

When programmed to State 15, this key may appear on a Soft key in a state it cannot be used. If it is pressed in that state, "REDIRECT NA" will be displayed.

If ASYD, SYS1, Index 384, Bit 0=1, Call Redirect can only be used on the My Line of a Dterm, because pressing the Line key of a Ringing Line will answer the call.

C-174 Calling Station Number Display Elimination

General Description

This feature allows calling and called station numbers to be hidden on each Desktop terminal for privacy or security purposes during a station-to-station call. Station numbers are masked with "********."

No special operating procedures are required by the station user to activate this feature.

Service Conditions

<Important Notices>

1. As for Terminal Call History, station numbers are displayed without the information masking in the outgoing call history.
2. A station number is masked with an 8-digit code "********" on each Desktop terminal by data assignment of two SFIs (SFI 179 and SFI 180) which enable the station number display elimination on calling and called stations.

   Note: This manual explains service conditions based on a case where both calling and called stations enable this feature (both SFI 179=1 and SFI 180=1 are assigned in each station).

3. Temporary cancellation and setting of this feature by terminal key operations are not available.

<Interactions with Other Features>

1. A called station number is hidden on a calling station which sets a message of Message Reminder [M-19]. When a called station user presses the MESSAGE REMINDER Feature key, a station number of the calling station which has set the message is displayed (the calling station number is not hidden). The called station user can return the call by pressing the MESSAGE REMINDER Feature key in off-hook state.
2. When Call Back [C-1] is in service, station numbers are hidden and Call Back [C-1] works normally.
3. When Save And Repeat -D [S-24D] is in service, a dialed station number is stored without the information masking, and Save And Repeat -D [S-24D] works properly.
4. When Call Return [C-151] Automatic Saving/Manual Saving is in service, "********" is stored as the station number information, and then the station attempts to call "********" during the call origination operation by the station user.
5. When a station user uses Last Number Called -D [L-6D], station numbers are displayed without the information masking, allowing the user to redial the last number called.
6. When a station user uses Call History, station numbers are hidden by this feature. The station fails to call using the Call History because it attempts to call to "********."
7. When Dial Plan to support IP Centrex Functionality [D-166] is in service, a Private Number is hidden as well as a station number.
8. When Name Display - System [N-28]/PHS Name Display [P-79] is in service, only a station number is hidden although a station name is displayed.

9. Station number of an Intermediate Station is displayed without the information masking.

   Example:

   - Station number of an Intermediate Station for Blind Transfer To Station [B-18], Call Forwarding - All Calls [C-5], Call Forwarding - Busy Line [C-2], Call Forwarding - Don't Answer [C-3], Logged Out IP Station - Call Destination [L-53]
   - Pilot Station number of Station Hunting features when an incoming call is hunted
   - Station number of a party to which an incoming call arrives before the other party picks it up by Call Pickup features
   - Station number of the party already connected when the third party tries to make a connection by Executive Right-of-Way [E-1]

10. Do not set Telephone Number to be displayed on the middle line of the LCD (ASYDL, SYS1, Index 672, Bit 0=1). Telephone Number will be displayed on the top line of the LCD regardless of the setting.
11. When a party makes a call to a busy station, the busy station's number is hidden on the calling party's LCD in six seconds. However, after six seconds eventually pass, the busy station's number is displayed without the information masking.
12. As for Terminal Call History, when an incoming call is answered or missed, station number of a calling party is not saved in the incoming call history.
    If the called party answers an incoming call arriving at a Sub Line when the called party accommodates a PS/SP Controlled SIP terminal station line as the Sub Line, a calling party number is hidden on the LCD but the number is saved without the information masking in the incoming call history.
13. To make a call to two stations simultaneously by Dual Station Call [D-156], the main station and sub-station need to be included in the same Service Feature Restriction Class (SFC).

<Hardware/Software>

1. This feature is supported by Desktop terminals such as Digital terminals, IP terminals, Soft Phones and SIP Multiple Line terminals.
2. During a connection between a PS and a Desktop terminal, the Desktop terminal station number is displayed on the PS. The PS station number can be hidden on the Desktop terminal depending on the setting of the SFIs.
3. When a Desktop terminal originates a call to an Analog Caller ID station, the Desktop terminal station number is hidden on the Analog Caller ID station. The actual display pattern depends on the type of Analog Caller ID station and the information masking may be different from "********."
4. When an Analog Caller ID station originates a call to a Desktop terminal, the Desktop terminal station number is displayed without the information masking on the Analog Caller ID station.
5. During a connection between an attendant console and a Desktop terminal, the Desktop terminal station number is displayed without the information masking on the attendant console. The attendant console's number is masked with "********" on the Desktop terminal.
6. When a Desktop terminal originates a call to an attendant console, an indication "OPR" appears on the Desktop terminal until the attendant console answers. The indication changes to "********" after the call is answered.

<Interactions with Networks>

1. This feature only works when the Desktop terminal is directly connecting to the station on which a counter station number is hidden. This feature does not work when stations are connecting through a CCIS or ISDN Trunk.
2. When this feature is used over FCCS, using ASFCN command is recommended for the data assignment. If ASFC command is used, assign SFI 179=1 (Self station number display elimination on the counter station) and SFI 180=1 (Counter station number display elimination on the self station) to the same Service Feature Restriction Class in all FCCS nodes.

<Conditions Specific to This Feature>

1. This feature functions according to the SFI data settings of the actual line, not the Prime Line for Multiple Line Operation -D [M-20D].

<Other Conditions>

None

Programming

ASYDL/ASYDN - Assign Telephone Number Display Pattern.
SYS1, Index 672, Bit 0=0 (Telephone Number is displayed on the top line of LCD)

ASFC/ASFCN - Assign the following data to the Service Feature Restriction Class (SFC) for each station.
SFI: 179 (Self station number display elimination on the counter station) **Note 1**
SFI: 180 (Counter station number display elimination on the self station) **Note 2**
RES: 0/1 (Restricted/Allowed)

Note 1: This data is valid when SFI 180=1 is set to the counter station.

Note 2: This data is valid when SFI 179=1 is set to the self station.

[Example]

The following figure shows examples of data assignment when SFC=1 is set for a calling station 4000 and SFC=2 is set for a called station 4001.

Service Feature Class (SFC): 1	Service Feature Class (SFC): 2
Calling Station: 4000	Called Station: 4001

• To hide Station Numbers on the Calling and Called Stations

LCD: ＊＊＊＊＊＊＊＊

Originates

LCD: ＊＊＊＊＊＊＊＊

SFC = 1
SFI 179 = 1 (Allow the self station number display elimination on the counter station)

C-176D Call Park Group -D

General Description

This feature enables the Desktop terminal (including Soft Phone) users to make a connected call on Call Park Hold state by pressing the HOLD key, or CALL PARK GROUP -D HOLD Feature key, on the Desktop terminal. The held call can be retrieved from any member Stations of the Group with the CALL PARK GROUP -D Feature key. This feature allows the Desktop terminal users to place a call on hold without occupying a line (My Line/Sub Line) of the telephone system. Thus, Station can originate/receive another call by using a Line key while holding the call. Three options are available for retrieving a call in Call Park Group -D hold: 1) from the same line occupied by the call immediately before being held; 2) from the Prime Line; 3) from the My Line. (refer to Operating Procedure) This setting can be configured with System Data.

Note: The following keys are typically used for this feature:

HOLD key:
A Flex key. It puts a call in Call Park Group -D hold state or places a call on hold.

CALL PARK GROUP -D HOLD Feature key:
A user-defined Line/Feature key to place a call in Call Park Group -D hold state.

CALL PARK GROUP -D Feature key:
A user-defined Line/Feature key to retrieve a call which has been placed in Call Park Group -D hold state.

Operating Procedure

To hold a Central Office/TIE Line or Station Call with the CALL PARK GROUP -D HOLD Feature key

1. Press the CALL PARK GROUP -D HOLD Feature key on the Desktop terminal.
2. A call in progress is placed on hold. The lamp of the CALL PARK GROUP -D Feature key flashes (flashes green for the Operating Desktop terminal, flashes red for the other members).
3. The Operating Desktop terminal hears SERVICE SET TONE (SST).
4. Replace the handset.

Note: When you press the HOLD key (FLEX key) on the Desktop terminal, a call is placed on hold as usual (this feature is not activated).

To hold a Central Office/TIE Line or Station Call with the HOLD Feature key

1. Press the HOLD Feature key on the Desktop terminal.
2. The call in progress is placed on hold. The lamp of the CALL PARK GROUP -D Feature key flashes (flashes green for the Operating Desktop terminal, flashes red for the other members).
3. The Operating Desktop terminal hears SERVICE SET TONE (SST).
4. Replace the handset.

To retrieve a Held Call

1. Lift the handset. **Note 1, Note 2**
2. Press a the CALL PARK GROUP -D Feature key. **Note 1, Note 2**

3. The call between the operating Desktop terminal and the held call is reestablished. The lamps of the CALL PARK GROUP -D Feature keys on all members are extinguished.

Note 1: These steps can be performed in reverse order except for using Soft Phone with a USB handset. When the CALL PARK GROUP -D Feature key is pressed first, the held call is not reconnected to the Station until the handset is lifted.

Note 2: In the case of Soft Phone with a USB handset, these steps cannot be performed in reverse order. Be sure to lift the handset before pressing a CALL PARK GROUP -D Feature key; otherwise, the Held Call cannot be retrieved.

To retrieve a Held Call after Operating Desktop terminal is recalled by Party on Hold

1. When Call Back Timer for Call Park Group -D expires, the operating Desktop terminal is recalled by the party on hold.
2. Lift the handset. **Note 3, Note 4**
3. Press the CALL PARK GROUP -D Feature key. **Note 3, Note 4**
4. The call between the operating Desktop terminal and the held call is reestablished.

Note 3: These steps can be performed in reverse order except for using Soft Phone with a USB handset. When the CALL PARK GROUP -D Feature key is pressed first, the held call is not reconnected to the Station until the handset is lifted.

Note 4: In the case of Soft Phone with a USB handset, these steps cannot be performed in reverse order. Be sure to lift the handset before pressing the CALL PARK GROUP -D Feature key; otherwise, the Held Call cannot be retrieved.

Service Conditions

1. This feature is available to Desktop terminal.
2. A Station cannot belong to more than one Group.
3. The CALL PARK GROUP-D Feature key can be assigned only to keys numbered lower than 25 with the AKYD command.
4. The CALL PARK GROUP-D Feature key cannot be assigned on a DSS console in DSS mode.
5. You cannot retrieve a held call when activating Intercom, waiting for Bridge Call P-RLS key, reading NSG, using Boss-Secretary Service, making a Voice Call, and registering the SPEED CALLING-ONE TOUCH Feature key.
6. There is a difference between this feature and CALL PARK [C-29]. Thus, a call which has been placed on hold through this feature cannot be retrieved by using CALL PARK Retrieval Code.
7. When ASYDL/ASYDN, SYS1, Index 679, Bit 4 is assigned as "0", each group must consist of stations belonging to the same Module Group (MG).
8. A maximum number of Groups that can be used by this feature depends on the System Data setting (ASYDL/ASYDN, SYS1, Index 679, Bit 4):

   a.) ASYDL/ASYDN, SYS1, Index 679, Bit 4=0
   (Call Park Group across MGs/IMGs is unavailable.)
   IMG/MMG/UMGi/RNIP System: 255 Groups per Local Partition (LP) (i.e., 2 MGs (Module Groups)) **Note 1**

   Note 1: Do not assign the same Group Number to more than one Module Group (MG) in the same LP.

   b.) ASYDL/ASYDN, SYS1, Index 679, Bit 4=1
   (Call Park Group across MGs/IMGs is available.)
   IMG/MMG System: 255 Groups per System
   UMGi/RNIP System: 255 Groups per node **Note 2**

   Note 2: For UMGi/RNIP System, the stations accommodated in different nodes cannot belong to the same group.

   When enabling/disabling ASYDL/ASYDN, SYS1, Index 679, Bit 4 data setting, delete all data assigned through the APGS, APGN and ADGN commands in advance.
9. When ASYDL/ASYDN, SYS1, Index 679, Bit 4 is set to "0", all Multi Lines registered on a Desktop terminal must be accommodated in the same Module Group (MG).
10. A maximum number of member stations in a single group is 768.
11. A maximum number of the CALL PARK GROUP -D Feature keys that can be assigned to a Desktop terminal is eight.
12. The number of calls which can be placed on hold at the same time depends on the number of the CALL PARK GROUP -D Feature keys assigned to a Desktop terminal.

13. Only station numbers of My Lines can be assigned as a member of the group.

14. This feature is not available for TRUNK LINE APPEARANCE -D [T-23D]. The HOLD key is not operational during an INTERCOM Call.

15. This feature is available only when an operating station is engaged in a two-party call with another station or a trunk. This feature is not available when the operating station hears RBT, is engaged in a three-party call, or is engaged in a call with an Attendant Console.

16. A party which has been placed on hold through this feature can only release the call. Any other operations such as hooking cannot be performed.

17. When using this feature with the HOLD key, EXCLUSIVE HOLD -D [E-4D] via the HOLD key cannot be performed. EXCLUSIVE HOLD -D [E-4D] needs to be performed by dialing designated Access Code. When operating this feature with the CALL PARK GROUP -D HOLD Feature key, both EXCLUSIVE HOLD -D [E-4D] via the HOLD key and NON-EXCLUSIVE HOLD -D [N-7D] are available.

18. When Call Back Timer for Call Park Group -D specified by ASYDL, SYS1, Index 661 expires, the operating station will be recalled. At this time, the lamp of the CALL PARK GROUP -D Feature key flashes (120 millisecond interval). The setting of ASYD, SYS2, Index 12, Bit 0 determines whether Automatic Recall Ringer is required or not required.

19. When you retrieves a call on hold through this feature, the elapsed time on your LCD is reset to one second.

20. When you press the CALL PARK GROUP -D Feature key without lifting the handset, the LCD displays the information on the held party, but you cannot retrieve the call. When you press the ANSWER/SPEAKER key or go off-hook within ten seconds after pressing the CALL PARK GROUP -D Feature key, you can retrieve the call on hold (after a lapse of ten seconds, a call is made to the party on hold).

21. When all of Multi Lines on your Desktop terminal are busy, you cannot retrieve a call on hold. You can avoid this problem by assigning more than one line (other than Multi Lines in Station Hunting group) exclusively for making a call (station number which is hidden from public view).

22. The lamp of the Feature key corresponding to the line on which you hold a call in progress blinks in green until someone retrieves the call on hold. (The lamp state is not affected if another call is held with this feature on a different Desktop terminal.)

23. Pressing the CALL PARK GROUP -D Feature key during a call connects you to a held call. In this case, when Automatic Hold [A-68] is enabled, the previously active call is automatically placed on hold. If Automatic Hold is disabled, the previously active call is disconnected.

24. You cannot place an ISDN terminal on hold through this feature. An ISDN terminal placed on hold with the line in use, as usual.

25. When you press a CALL PARK GROUP -D Feature key and another Desktop terminal uses the line where you set Call PARK GROUP - D to make/receive a call, the indication on your LCD disappears.

26. The CALL PARK GROUP -D Feature key cannot be assigned to a Desktop terminal Soft key.

27. An operation key placing a call on hold can be selected either HOLD key, which is a Flex key, or CALL PARK GROUP -D HOLD Feature key which is Feature key by system data assignment (ASYDL, SYS1, Index 678, Bit 2).

(a) HOLD key (ASYDL, SYS1, Index 678, Bit 2=0) is selected;

- Pressing the HOLD key is recognized as an operation placing a call on hold for CALL PARK GROUP - D [C-176D]. The call cannot be placed on hold regularly on the operating terminal by itself.
- When a call is placed on hold by the HOLD key on the Desktop terminal without registration in a group by ADGN command, it is recognized as an operation placing a call on hold regularly on the operating terminal by itself.

(b) The CALL PARK GROUP -D HOLD Feature key (ASYDL, SYS1, Index 678, Bit 2=1) is selected;

- The CALL PARK GROUP -D HOLD Feature key (AKYD, FKY=183) needs to be assigned to a Feature Key.
- Pressing the CALL PARK GROUP -D HOLD Feature key is recognized as an operation placing a call on hold for Call Park Group - D [C-176D].
  Pressing the HOLD key is recognized as an operation placing a call on hold regularly on the operating terminal by itself.
- When a call is placed on hold by the HOLD key on the Desktop terminal without registration in a group by the ADGN command, it is recognized as an operation placing a call on hold regularly on the operating terminal by itself.
  Also, when a call is placed on hold with the CALL PARK GROUP -D HOLD Feature key, an indication meaning “Restricted” (**Note 3**) appears on the LCD and the call is maintained.
- On the Soft Phone using Soft Phone-PS [S-158] or Soft Phone WLAN Handset [S-159], CALL PARK GROUP-D [C-176D] is available only when operating with the HOLD key.
  EXCLUSIVE HOLD -D [E-4D] via the HOLD key, NON-EXCLUSIVE HOLD -D [N-7D], and CALL PARK GROUP -D [C-176D] via the CALL PARK GROUP -D HOLD Feature key are not available.

Note 3: An actual indication on the LCD is different depending on the language used on the LCD and the LCD type of Desktop terminal. As an English indication on a 24-digit LCD Desktop terminal for example, “REST” appears on the LCD.

28. In the case of Soft Phone with a USB handset, be sure to lift the handset before pressing the CALL PARK GROUP -D Feature key; otherwise, the held call cannot be retrieved.
29. 139MTC/139TC on the ADAI command (No Answer Timer determined by ASYD, SYS1, Index 139) does not take effect in this feature.
30. When the held party is an IP terminal and the connection with the party is disconnected due to the accidents such as network failure or unplugging of cables, the lamp of the CALL PARK GROUP -D Feature key on the Desktop terminal that held the call keeps flashing. If a user of this Desktop terminal tries to retrieve the call in this condition, dial tone is heard and flashing of the lamp of the CALL PARK GROUP -D Feature key will stop.

Programming

STEP 1: **ASYD** - SYS1, Index 42, Bit 7. Service Set Tone, Special Dial Tone. 0/1: Continuous/Burst.
SYS1, Index 79, Bit 0=1 (Line Preference Service via AKYD is used.)
SYS1, Index 139. No Answer Timer (Default = 30 seconds) **Note 1**

Note 1: When ASYDL, SYS1, Index 661, Bit 4 to Bit 6=03 HEX or 04 HEX, this data becomes invalid.

SYS1, Index 388, Bit 2=1 (Desktop terminal Call Hold service is used.)
SYS1, Index 388, Bit 3. Tone setting when Call Hold is completed. 0/1: Dial Tone (DT)/Service Set Tone (SST).
SYS2, Index 12, Bit 0. 0/1: Automatic Recall Ringer is required/not required for Non-Exclusive Hold.

STEP 2: **ASYDL** - SYS1, Index 661, Bit 0 to Bit 3. Call Back Timer for Call Park Group -D and Call Park Group (PS). MTC = 1 - 15 (1 HEX to F HEX) seconds. Timer value = MTC × TC.
SYS1, Index 661, Bit 4 to Bit 6. Timer Class (TC) for Call Park Group -D and Call Park Group (PS). TC3 (03 HEX) = 2 seconds, TC4 (04 HEX) = 30 seconds. **Note 2**
SYS1, Index 678, Bit 2, operation key to hold a call on a terminal in Call Park Group -D state. 0/1: HOLD key/CALL PARK GROUP -D HOLD Feature key **Note 3**

Note 2: When this data is 03 HEX or 04 HEX, ASYD, SYS1, Index 139 data becomes invalid.

Note 3: Assign this data when selecting an operation key to hold a call on a terminal in Call Park Group -D state.

STEP 3: **ASYDL/ASYDN** - SYS1, Index 1262, Bit 3=1 (Retrieving a Call in Call Park Group -D Hold from a Fixed Line is enabled.) **Note 4**
SYS1, Index 1262, Bit 4. Fixed Line Used for Retrieving a Call in Call Park Group -D Hold.
0/1: Prime Line/My Line **Note 4**, **Note 5**

Note 4: This step is required to specify a line to be used for retrieving a call placed in Call Park Group -D hold state.

Note 5: When setting this parameter, you must enable “Retrieving a Call in Call Park Group -D Hold from a Fixed Line” (ASYDL/ASYDN, SYS1, Index 1262, Bit 3=1). This setting is not required if My Line is assigned as Prime Line.

The following data setting is required when assigning the stations belonging to different MGs and LPs to the same group:
SYS1, Index 679, Bit 4=1 (Enable Call Park Group across MGs/IMGs) **Note 6**

Note 6: Delete all existing data assigned through the APGS, APGN and ADGN commands in advance.

STEP 4: **ASDT** - Assign Station Data of the Desktop terminal using this service.

STEP 5: **AKYD** - Assign the CALL PARK GROUP -D Feature key. Assign FKY 75-82 to the Desktop terminal key. **Note 7**

Assign the CALL PARK GROUP -D HOLD Feature key. Assign FKY 183 to the Desktop terminal key **Note 8**

Note 7: When only one CALL PARK GROUP -D Feature key is assigned, assign FKY 75 to the Desktop terminal key. When more than one CALL PARK GROUP -D Feature key is assigned, FKY 75 must be assigned first, and then FKY 76, FKY 77, and continuing through the remaining FKY 78 - FKY 82.

Note 8: Assign this data when using the CALL PARK GROUP -D HOLD Feature key.

STEP 6: **ASFC** - Assign Service Feature Restriction Class of the Station.

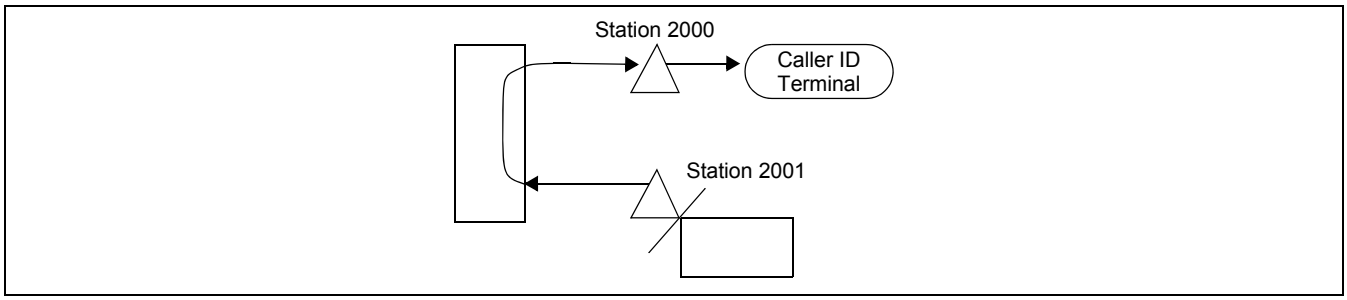
SFI = 67 (Call Park - Access and Answer)
SFI = 68 (Call Park - Called)
RES = 1 (Allowed)

STEP 7: **ADGN** - Assign the Group Number to each Station.

TN:	Tenant Number
STN:	Station Number
GROUP NO:	Group Number (1 - 255)
RINGER:	Ringer Information Not used. This parameter should be fixed to 0.

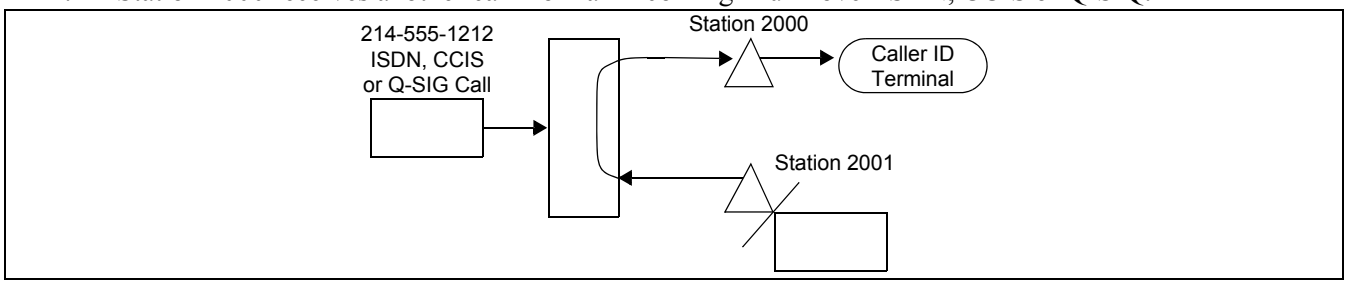
C-177 Caller ID on Call Waiting

(Series 8400 software feature)



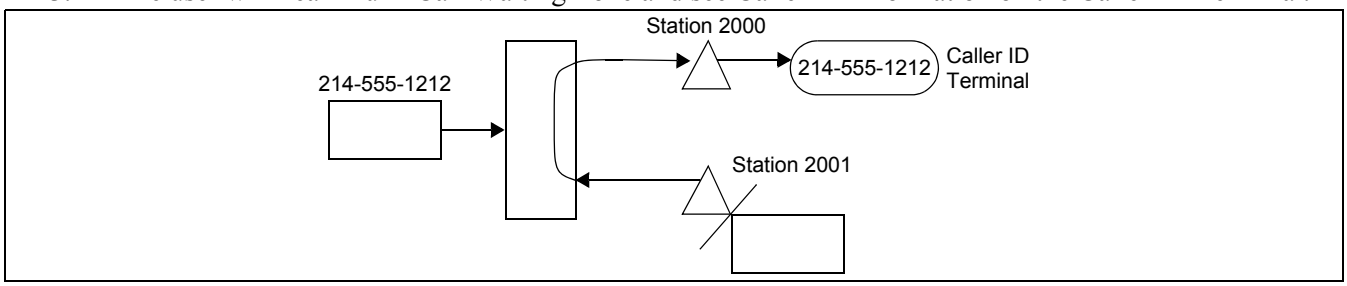
General Description

This feature allows Incoming Trunk Calls with Caller ID information to be displayed on a Caller ID device while the user is on another Station or Trunk Call. A standard Trunk Call Waiting Indication Tone is sent to the Busy Station. Caller ID information for the Calling Party that is in a Call Waiting Mode is sent to the Caller ID device. This allows the user to see the Caller ID information on the new caller and decide if they wish to use a switch hook flash to answer the second call. The user may also alternate between the two calls by switch hook flash.



Note: This feature is only available in North America.

Operating Procedure



1. Station 2000 is on a call with a Station or Trunk 2001.

2. Station 2000 receives another call from an Incoming Trunk over ISDN, CCIS or Q-SIQ.

3. The user will hear Trunk Call Waiting Tone and see Caller ID information on the Caller ID Terminal.

4. No manual operation is required to activate or cancel Caller ID on Call Waiting.

Service Conditions

1. Service Conditions are the same as those of CALL WAITING - TERMINATING [C-12] for ordinary telephone sets.
2. This feature requires a telephone that is capable of Caller ID, or a Caller ID adaptor that must conform to Bellcore SR-TSV-002476.
3. This feature supports only Multiple Data Message Format (MDMF) for all data in the off-hook data format as per GR-575-CORE R3-14.
4. For Name Display from ISDN, the ISDN Interface must be an NI-2 Interface type.
5. Only TEC 3 and TEC 7 are supported for the call waiting to be answered.
6. This feature cannot be activated for an Analog Caller ID Trunk.
7. This feature requires the SPA-8RSTY-A Register Card and assigning Sender Trunk 937 to this card to send out SAS and CAS Signal to the terminal. It also requires assigning new Register Trunk 940 specified for Caller ID on Call Waiting.
8. Calling Party Caller ID data must be provided by the Central Office.
9. This feature will only provide a single Call Waiting Tone.
10. The Caller ID information is transmitted only once to the Caller ID Terminal, no attempt to re-send will be made if an error is detected (in this case, normal Call Waiting is provided).
11. As per Bellcore's GR575 Specs R3-14: During off-hook data transmission, the SPCS will send the Caller ID Call Waiting data in the Multiple Data Message Format for all Caller ID features enabled on the line.
12. System Message 36-D (Caller Waiting Caller ID Error) will be generated when an error occurs with the Call Waiting Caller ID process. This message will contain the Called Party LENS, Calling Party LENS, Sender (937) LENS, and Register (940) LENS (if available). It will also contain information designating if the error was a CAS ACK time-out, Sender time-out, or an equipment not available error.

Programming

STEP 1: **ASYD** - SYS1, Index 145, Bit 6: Leave as data "0". SYS1, Index 145. Assign the Recall Timer for a call extended by the Attendant Console that is not answered. Normally assign data 00H for 30 seconds (RAM Data 9F for 30 seconds).

STEP 2: **ASYDL** - Assign new SYS1, Index 803, Bit 6 for Call Waiting Caller ID PRINT ERR MSG flag. Bit 6=0/1 (No/Yes).

Assign new SYS1, Index 667, Bit 0 to Bit 3 for CASWT Timer. MTC * 16 milliseconds.

Assign new SYS1, Index 667, Bit 4 to Bit 7 for CASST Timer. MTC * 16 milliseconds.**Note 1**

Assign new SYS1, Index 668, Bit 0 to Bit 7 for FSWT Timer. MTC * 16 milliseconds.

SYS1, Index 669 for SAS Wait Timer. MTC * 16 milliseconds.

SYS1, Index 670 for OSI Interval. MTC * 16 milliseconds.

SYS1, Index 806 for CPE ACK Time-out.

SYS1, Index 807 for Complete Time-out Timer

SYS1, Index 808 for ACKWT Timer. MTC * 16 milliseconds.

STEP 3: **ASFC** - Set Service Feature Index 188 for Analog Phone to "1".

STEP 4: **ATRK** - Assign 937 Sender Trunk to Senders of PA-8RSTY-A Register Card. Assign 940 Register Trunk to Registers of PA-8RSTY-A Register Card.

STEP 5: **MBTK** - Assign "0" to busy bit of all 937 Sender Trunks - Top of Register Card. Assign "0" to busy bit of all 940 Register Trunks - Bottom of Sender Card.

STEP 6: **ARTD** - For CALL WAITING - TERMINATING to operate automatically for the TIE Lines and DID Routes, assign CDN 46:CW as data "1".

Note 1: Assign data 50 Hex for ASYDL, SYS1, Index 667, Bit 4 to Bit 7 when the PA-8RSTAE card is used for this feature.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or MG.

C-192 Called Station Name Display on CF

(Series 8700 software feature)

General Description

This feature allows the name data of a Call Forwarded Station to be displayed on the Desktop terminal target of the forward.

Note: This feature is only available in North America.

For example:
1. Station 1000 with name JOHN DOE sets Call Forwarding-All Calls to Station 1001.
2. Route 1 TRK 1 calls station 1000.
3. 1001 rings showing the name display of Station 1000.

Operating Procedure

No manual operation is required.

Service Conditions

1. The target Station must be a Desktop terminal.
2. This feature is valid for Call Forward-All Calls only.
3. The Call Forwarded Station must have Name Display Service assigned.
4. If the trunk is forwarded all multiple times, the displayed name is the first called forwarded Station.
5. This feature only functions for incoming trunk calls.
   a.) Supported Trunk types are DID, ISDN and TIE LINE.
   b.) The incoming route cannot have IND set in Route data for this feature to function.
6. The forwarded party must be a TEC 12 or TEC 18.
7. Digital Voice Mail integration will integrate with calling and called number the same when forwarded from a Station with Name Follow on CF service.

Interactions

1. This feature will override the normal display of the Route on the incoming call.
   Example: CCSA, DID

Programming

STEP 1: **ASFC** - Assign Service Feature Restriction Class of the Station.
SFI = 202 (Name Display Follow on CF)
RES = 1 (Allowed)

C-193 Call Forwarding - Don’t Answer while Call Waiting - Termination

General Description

This feature enhancement is to make Station and Trunk calls behave the same when Call Forwarding Don’t Answer with Call Waiting is used.

Note: This feature is only available in North America.

Operating Procedure

When Call Waiting - Terminating [C-12] is in service:

(A) When STN-A’s CFDNA is idle.

1. STN-A sets CFDA to STN-E.
2. STN-A talks with TRK-A (or STN-C).
3. Incoming call from STN-D to STN-A.
4. STN-A call waits.
5. CW timer (ASYD, SYS1, Index 152) expires.
6. STN-D forwards to STN-E.

(B) When STN-A is already CW, CONF, etc. And ASFC SFI 129 = 1(Refer to service condition of C-12).

1. STN-A sets CFDNA to STN-E.
2. STN-A talks with TRK-A (or STN-C).
3. STN-D calls STN-A.
4. STN-D forwards to STN-E.

(C) When STN-E(CFDNA Destination) is busy and not in a UCD group and ASFC SFI 129 =1

1. STN-A sets CFDA to STN-E.
2. STN-A talks with TRK-A (or STN-C).
3. STN-D calls STN-A
4. STN-D call waits to STN-A
5. CW timer (ASYD, SYS1, Index 152) expires.
6. Since STN-E is busy STN-D will continue to Call wait at STN-A.
7. CW timer is reset to ASYD, SYS1, Index 152.
8. When CW timer expires again the idle busy state of STN-E is checked and the call will forward if possible or the CW timer will be reset.

(D) When STN-A is already CW, CONF, etc. (Refer to service condition of C-12) and STN-E is in a busy state and not in a UCD group.

1. STN-A sets CFDA to STN-E.
2. STN-A talks with TRK-A (or STN-C).
3. STN-D calls to STN-A.

4. STN-D does not forward, STN-D shows “BUSY” and receives busy tone.

(E) When STN-E is busy and STN-E is in a UCD group.

1. STN-A set CFDA to STN-E.
2. STN-A talks with TRK-A (or STN-C).
3. STN-D calls to STN-A.
4. STN-D call waits to STN-A.
5. CW timer (ASYD, SYS1, Index 152) expires.
6. STN-D forwards to the UCD group of STN-E.

When Call Waiting - Originating [C-31] is in service:

The same operating Call Waiting - Originating procedure is required and the call will complete as above.

Service Conditions

This service requires ASYD, SYS2, Index 10, Bit 7=1 (Call Waiting Tone at intervals).

Programming

All programming for the following features must be completed for the enhancement to function. (Please see the Data Programming Manual - Business)

- Call Waiting - Terminating [C-12]
- Call Waiting - Originating [C-31]
- Call forwarding - Don’t Answer [C-3]

STEP 1: **ASYD** - SYS1, Index 152 - Interval for Call Waiting Indication Tone to Busy Station.
Default is approximately 10 seconds.
SYS1, Index 10, Bit 7=1 Call Waiting Tone at intervals.

STEP 2: **ASFC**
SFI:129=1 (CFDA while CW)
SFI:130=0/1 (ATT Transfer while CW in case CFDA busy)

FCCS Programming

All programming must be assigned in each FCCS node.

C-194 Call Park Group

General Description

This feature enables the Station Users to "Park" calls against their own Extension Numbers. Maximum of five calls can easily be parked and retrieved from any Station within the Call Park Deluxe Group by just pressing the access code or the pre-assigned Line/Feature key of a Desktop terminal (including Soft key). When retrieving a parked call from the station out of the Call Park Deluxe group, station must dial the access code of CALL PARK [C-29] (or press the Feature key of CALL PARK [C-29]) + station number of the station actually parked the call.

Operating Procedure

To set this feature from a station using the access code

1. While connected to the COT, TIE line, Station or a PS
2. Momentarily press the switch hook. Receive Special Dial Tone.
3. Dial the Call Park Deluxe Access Code. Receive Service Set Tone.
4. Replace the handset.

To set this feature from a Desktop terminal station using the Line/Feature key

1. While connected to the COT, TIE line, Station or a PS
2. Press the Line/Feature key of which Call Park Deluxe is assigned.
3. Receive Service Set Tone.
4. Call Park Deluxe has been set.

To retrieve a parked call from the originating station

1. Dial the Call Park Deluxe Retrieval Code. The Parked Call is reconnected.

To retrieve a parked call from a different station within the same Call Park Deluxe Group using the access code.

1. Dial the Call Park Deluxe Retrieval Code. The Parked Call is reconnected.

To retrieve a parked call from a different station within the same Call Park Deluxe Group using the Line/ Feature key of a Desktop terminal.

1. Press the Line/Feature key of which Call Park Deluxe Retrieval Code is assigned. The Parked Call is reconnected.

Service Conditions

1. Calls parked by a station are automatically parked on that station's extension number. The My-Line number is used for a Desktop terminal.
2. CALL PARK may be activated only during calls involving two parties.
3. A station can only park one call at a time. If a station attempts to park a second call, Reorder Tone will be heard.
4. This feature may be assigned to stations via CLASS OF SERVICE - INDIVIDUAL [C-15] programming in System Data.
5. A user can set this feature by dialing a Call Park Deluxe access code or by pressing the Line/Feature key on a Desktop terminal (Including the Soft key).
6. Stations can originate and receive calls while having a call parked.

7. The following features cannot be activated to a station that has set Call Park Deluxe:
   BUSY VERIFICATION[B-3]
   CALL WAITING - ORIGINATING[C-31]
   CALL WAITING - TERMINATING[C-12]
   EXECUTIVE RIGHT-OF-WAY[E-1]
8. A station in an ATTENDANT-CONTROLLED CONFERENCE [A-2] cannot be parked.
9. Station cannot be assigned in multiple Call Park Deluxe group (Retrieving Group).
10. A parked call will Re-call to the station that has set the Call Park Deluxe. The Re-call Timer is pre-programmed by the System Data.
11. Call Park Deluxe is denied in the following station status:
    BOSS - SECRETARY OVERRIDE -D [B-5D]
    BUSY VERIFICATION [B-3, B-9]
    CALL TRANSFER[C-10, C-11]
    CALL WAITING - ORIGINATING[C-31]
    CALL WAITING - TERMINATING[C-12]
    CONSULTATION HOLD - ALL CALLS [C-17, C-58]
    DATA LINE SECURITY [D-12, D-66]
    EXCLUSIVE HOLD -D[E-4D]
    EXECUTIVE RIGHT-OF-WAY [E-1, E-8]
    NON-EXCLUSIVE HOLD -D[N-7D]
    PRIVACY RELEASE[P-18]
    THREE-WAY CALLING [T-2]
    VOICE CALL [V-2, V-7]
12. An Attendant Console cannot be parked.
13. A Call Park Deluxe connection remains parked until retrieved or until the party disconnects.
14. A Parked Call can only be retrieved from an Idle Station.
15. An ISDN terminal user cannot use this feature.
16. An Incoming Call from the ISDN Trunk can be Parked from a Station/Attendant.
17. A station can park only one station/trunk using Call Park Deluxe feature simultaneously.
18. Call Park Deluxe is not available via FCCS network.
19. The Night Attendant Console cannot park a call.
20. A Parked Call will recall to the Station that has set the CALL PARK after a predetermined period of time assigned by the system data (ASYD, SYS1, Index 142) has elapsed (the default value is 500 seconds). If the recalling parked call is from an analog C.O line (except MC&MG-COT/MG-COT), it will be released after a predetermined period of time assigned by the system data (ASYD, SYS1, Index 139) has elapsed (the default value is 30 seconds). As for other than the analog C.O line (except MC&MG-COT/MG-COT), the recalling will be continued.
21. A parked call by the Desktop terminal is always retrieved by using the My-Line of the Desktop terminal. Even if a Desktop terminal parks a call by using the Sub Line, the parked call is retrieved by using My-Line of the Desktop terminal.

Interactions

1. A call parked using Call Park Deluxe feature is automatically parked by the CALL PARK [C-29] feature at the same time. Therefore, call also can be retrieved by the call retrieving procedure of CALL PARK [C-29] feature.

2. When a SIP Handler Controlled SIP terminal is in Multi Line Mode, the SIP terminal cannot Park the ongoing call but the SIP terminal can retrieve a call Parked from a different terminal.

Programming

STEP 1: **ASYD** - SYS1, Index 139, Bit 0 to Bit 3 (MTC), Bit 4-6 (TC). Assign No Answer Timer for Call Park Deluxe recall ringing. If a Parked Call from an analog C.O line (except MC&MG-COT/MG-COT) recalls and the set timer value (default is 30 seconds) elapses, the call will be released. SYS1, Index 142. For Call Park Deluxe Recall, the Call Park Set Timer Counter is assigned in Bit 0 to Bit 3. The Timer Class is assigned in Bit 4 to Bit 6.

SYS2, Index 1, Bit 0 and Bit 1. CONSULTATION HOLD - ALL CALLS [C-17] allowed or denied. 00: denied; 01: Originating and Terminating Calls allowed, Tandem Call denied; 11: All calls allowed.

STEP 2: **ANPD/ANPDL** - Reserve a Number Level for Feature Access and Retrieval. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan.

STEP 3: **ASPA/ASPAL** - Assign an Access Code to:

Assign an access code to set the Call Park Deluxe Feature:

CI="H: Hooking"

SRV="SSCA: Service Code Appendix"

a) Call Park Deluxe access code, SIDA=146 (Call Park Deluxe Hold: Hold-1)
b) Call Park Deluxe access code, SIDA=147 (Call Park Deluxe Hold: Hold-2)
c) Call Park Deluxe access code, SIDA=148 (Call Park Deluxe Hold: Hold-3)
d) Call Park Deluxe access code, SIDA=149 (Call Park Deluxe Hold: Hold-4)
e) Call Park Deluxe access code, SIDA=150 (Call Park Deluxe Hold: Hold-5)

Assign an access code to retrieve from the Call Park Deluxe Feature:

CI="N: Normal"

SRV="SSCA: Service Code Appendix"

a) Call Park Deluxe access code, SIDA=146 (Call Park Deluxe Hold: Retrieval-1)
b) Call Park Deluxe access code, SIDA=147 (Call Park Deluxe Hold: Retrieval-2)
c) Call Park Deluxe access code, SIDA=148 (Call Park Deluxe Hold: Retrieval-3)
d) Call Park Deluxe access code, SIDA=149 (Call Park Deluxe Hold: Retrieval-4)
e) Call Park Deluxe access code, SIDA=150 (Call Park Deluxe Hold: Retrieval-5)

Note: Same access code can be used for Parking and Retrieving a call by assigning the same number but making the CI to "N: Normal" for Retrieving and "H: Hooking" for Parking.

STEP 4: **AKYD** - For Desktop terminal, Call Park Deluxe may be assigned to a Line/Feature key. Assign the following parameters.

KYN: Key Number (1-40)

KYI=1 (Function Key)

a.) FKY=158 (Call Park Deluxe Hold/Retrieve-1)
b.) FKY=159 (Call Park Deluxe Hold/Retrieve-2)

c.) FKY=160 (Call Park Deluxe Hold/Retrieve-3)
d.) FKY=161 (Call Park Deluxe Hold/Retrieve-4)
e.) FKY=162 (Call Park Deluxe Hold/Retrieve-5)

STEP 5: **ADSL** - For Desktop terminal, Call Park Deluxe may be assigned to a Soft key. Assign the following parameters. This command is required only for assigning the function to each Soft key.

SN = 1 (Originating - DT connection)

a.) FKY=158 (Call Park Deluxe Hold/Retrieve-1)
b.) FKY=159 (Call Park Deluxe Hold/Retrieve-2)
c.) FKY=160 (Call Park Deluxe Hold/Retrieve-3)
d.) FKY=161 (Call Park Deluxe Hold/Retrieve-4)
e.) FKY=162 (Call Park Deluxe Hold/Retrieve-5)

SN = 4 (Communication in progress - Converse)

a.) FKY=158 (Call Park Deluxe Hold/Retrieve-1)
b.) FKY=159 (Call Park Deluxe Hold/Retrieve-2)
c.) FKY=160 (Call Park Deluxe Hold/Retrieve-3)
d.) FKY=161 (Call Park Deluxe Hold/Retrieve-4)
e.) FKY=162 (Call Park Deluxe Hold/Retrieve-5)

STEP 6: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 220 (Call Park Deluxe Entry/Retrieve) to the applicable stations. This allows the station to park a call and to retrieve a parked call using Call Park Deluxe feature. Assign stations a Service Feature Restriction Class that allows SFI 68 (Call Park - Called). This allows a station to be parked by another station.

STEP 7: **ASCS** (Assignment of Call Park Group/DM)

Assign the Call Park Deluxe Group Number.

TN: Tenant Number (1-63)

STN: Station Number

GPN: Call Park Group Number (1-4095)

Note: When the station has the TELN (LDM), skip (7) and assign (8).

STEP 8: **ACPSL** (Assignment of Call Park Group Service Data/LDM)

Assign the Call Park Deluxe Group Number.

UGN: User Group Number (1-255)

TELN: Telephone Number (maximum 16 digits)

GPN: Call Park Group Number (1-4095)

C-195 Call History

General Description

This feature enables call history to be stored and displayed on the LCD. As for the system side Call History (hereinafter System Call History), key lamp or display is used to notify users of unanswered calls. Also, Call History inside of this feature is divided in system side and terminal side as explained below.

- **System Call History**

  It is the feature that can be used by enabling the ASFC/ASFCN command SFI 238 in the terminal and maintains in the system side a record of incoming calls. Outgoing call history and Incoming call history operations are explained in the following table. For a detailed explanation of this feature operation procedure and behavior, see Operating Procedure and the User's Guide of each terminal.

	Outgoing call history	Incoming call history
Terminal operation	Cursor key (Left side) **Note 1**	Feature key/Soft key

Note 1: If System Call History is used, Outgoing call history of Terminal Call History cannot be used. For that reason, use REDIAL [R-60].

- **Terminal Call History**

  It is the feature that can be used by enabling the ASFC/ASFCN command SFI 248 in the terminal and maintains in the terminal side an internal record of incoming/outgoing calls. Outgoing call history and Incoming call history operations are explained in the following table. For a detailed explanation of this feature operation procedure, see the User's Guide of each terminal.

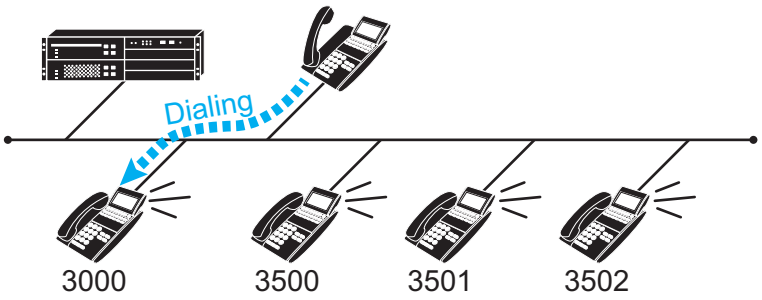
	Outgoing call history	Incoming call history
Terminal operation	[Menu screen] - Select [History] - Select [History] - Select [Outgoing]	[Menu screen] - Select [History] - Select [Missed]/[Incoming]

Also, the pattern for Call History using My Line and Sub Line is as follows:

X: Available, N: Not available

	My Line		Sub Line Note 7		
	Answered	Unanswered	Answered		Unanswered
			My station	Other station	
System Call History					
Outgoing call history	N	N	N	N	N
Incoming call history	X	X	X Note 2	X Note 2 Note 3 Note 4 Note 5	X Note 2 Note 3 Note 4 Note 6
Terminal Call History					
Outgoing call history	X	X	N	N	N
Incoming call history	X	X	N	N	N

Note 2: Available if ASYDL, SYS1, Index 678, Bit 7=1.

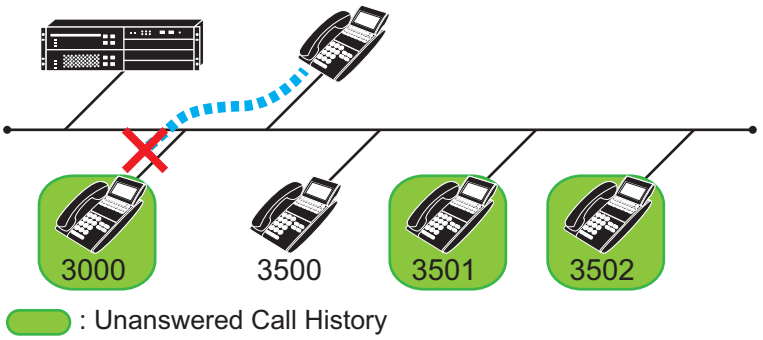


Note 3: Available from FP95-104 V4 Issue 4.0.

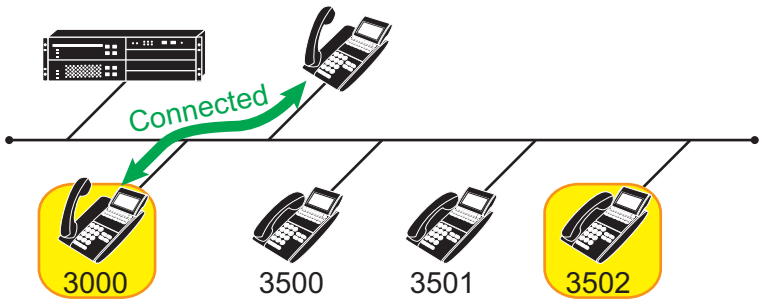
Note 4: Available if ASYDL, SYS1, Index 686, Bit 5=1.

Note 5: In the ASFC/ASFCN command, SFI 266 and SFI 267 need to be enabled for the target terminal.

Note 6: In the ASFC/ASFCN command, SFI 266 needs to be enabled for the target terminal.



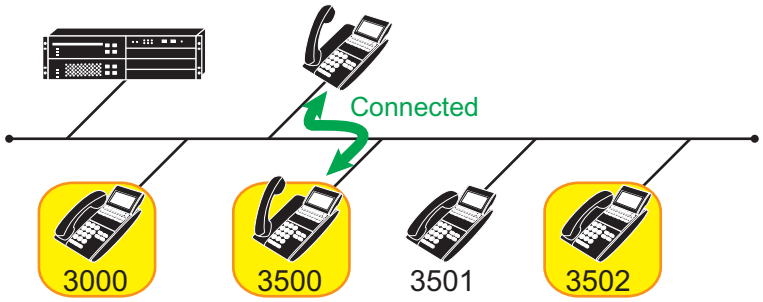
Note 7: The following are examples of how Call History is displayed when there is an incoming call to Station 3000 and the call is answered or unanswered by the My Line or the Sub Line on the terminals with different SFI settings.



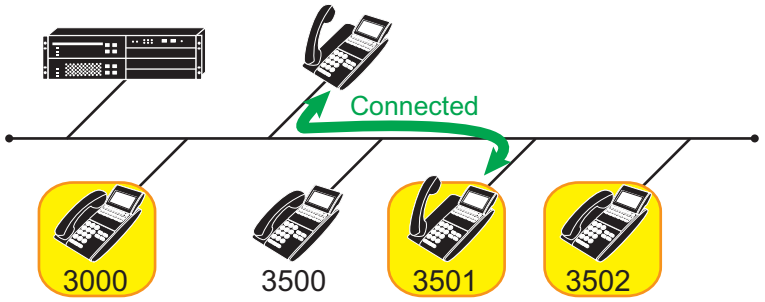
Station Number		ASFC/ASFCN	
My Line	Sub Line	SFI 266	SFI 267
3000	-	Enabled (1) or Disabled (0) *1	Enabled (1) or Disabled (0) *1
3500	3000	Disabled (0)	Enabled (1) or Disabled (0) *2
3501	3000	Enabled (1)	Disabled (0)
3502	3000	Enabled (1)	Enabled (1)

*1: The settings of SFI 266 and SFI 267 have no relation with the operations of My Line.
*2: Because SFI 266 is set to disabled, the settings of SFI 267 become irrelevant.

- Station 3000 does not answer the call:

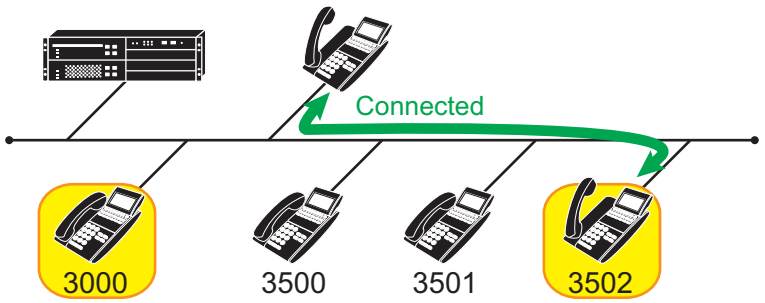


- Station 3000 answers the call:



: Answered Call History

- Station 3500 answers the call with Sub Line:



: Answered Call History

- Station 3501 answers the call with Sub Line:

: Answered Call History

- Station 3502 answers the call with Sub Line:

: Answered Call History

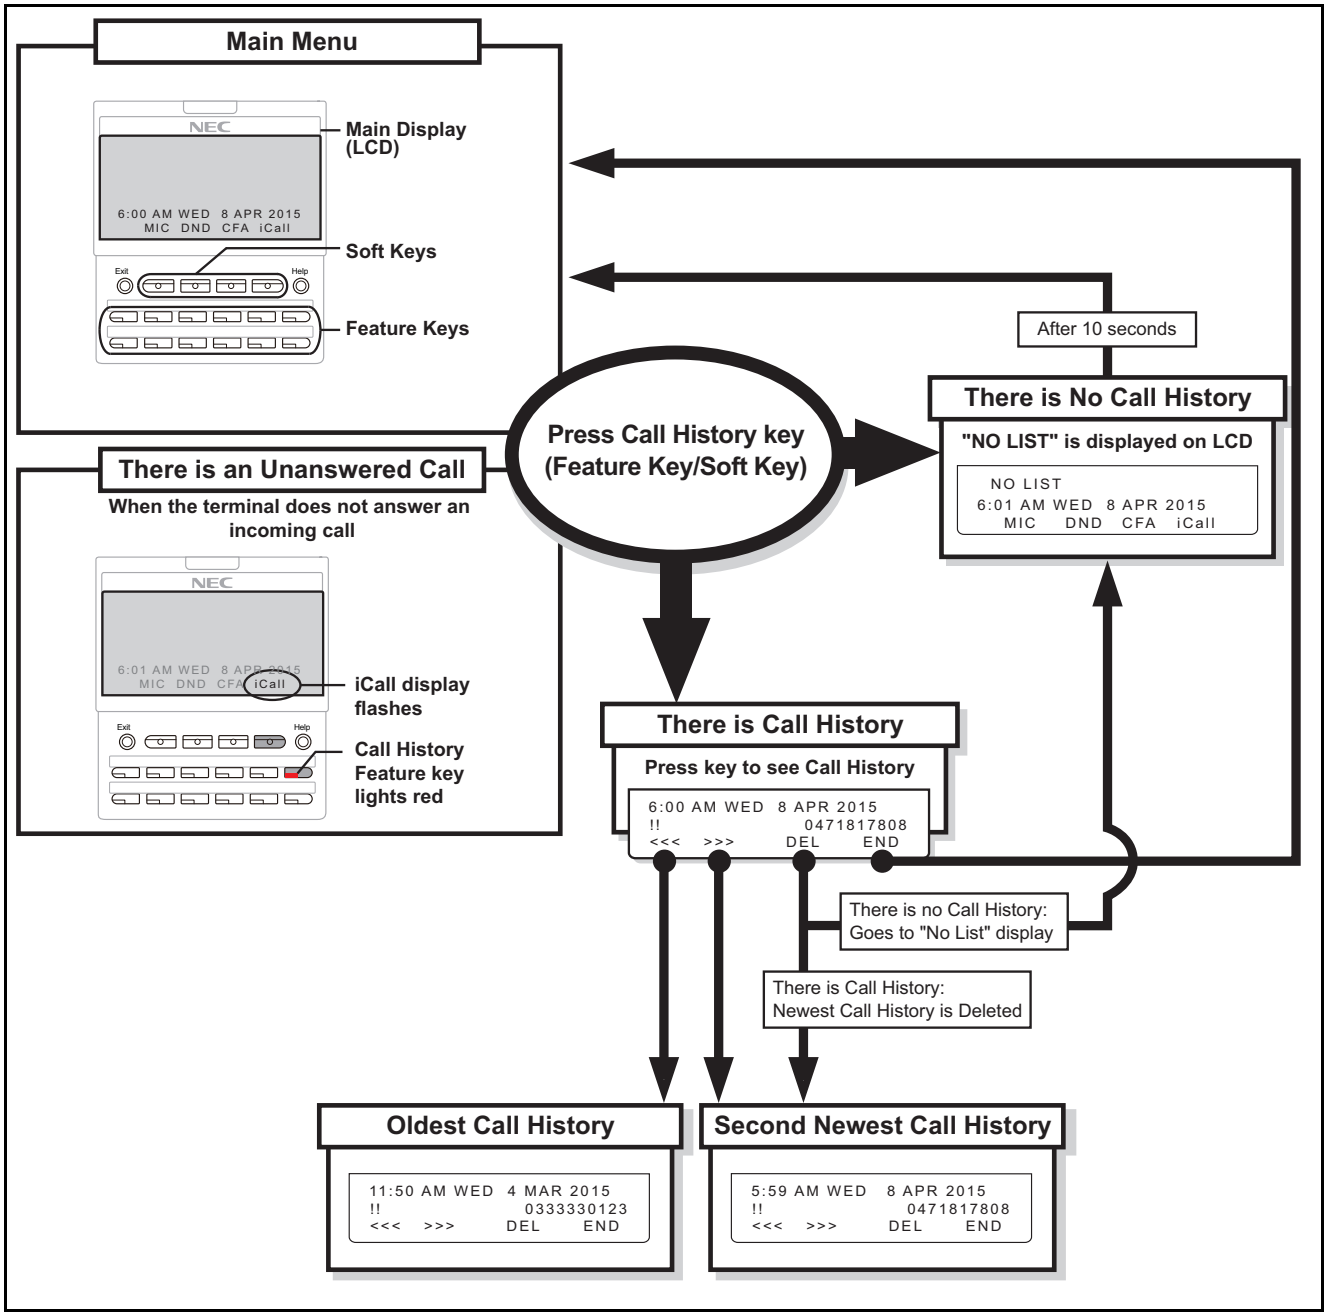
Besides that, System Call History can be displayed in case it is used in combination with other features. The features

in which System Call History can be displayed are as follows.

X: Available, -: Not applicable

Feature	System Call History	
	Answered	Unanswered
CALL PICKUP - GROUP [C-7] **Note 8**	X	-
CALL PICKUP - DIRECT [C-30] **Note 8**	X	-
CALL WAITING - TERMINATING [C-12] **Note 9**, **Note 10**	X	X
CALL WAITING - ORIGINATING [C-31] **Note 9**, **Note 10**	X	X
CALL WAITING-TERMINATING-PRI/PRA [C-114/116] **Note 9**, **Note 10**	X	X
EXECUTIVE RIGHT-OF-WAY [E-1] **Note 9**, **Note 10**	X **Note 11**	-
EXECUTIVE RIGHT-OF-WAY - CCIS [E-8] **Note 9**, **Note 10**	X **Note 11**	-

Note 8: The setting ASYDL/ASYDN, SYS1, Index 678 Bit 7=1 is required.



Note 9: Available from FP95-104 V4 Issue 4.0.

Note 10: The setting ASYDL/ASYDN, SYS1, Index 686 Bit 6=1 is required.

Note 11: Call History is only displayed for the overridden station.

Operating Procedure

The following diagram shows the operating procedure for using System Call History. For the operating procedure of Terminal Call History, refer to the User's Guides of DT800/DT700/DT400/DT300 Series.

Service Conditions

<Conditions for System Call History (ASFC SFI 238=1)>

1. Terminal Call History can be used in combination with System Call History through the entire system; however, Terminal Call History cannot be used in combination with System Call History in one terminal. When SFI 248=1 (Terminal Call History is allowed) and SFI 238=1 (Call History is allowed) are assigned, SFI 248=1 takes priority and Terminal Call History is effective.
2. When ASFC/ASFCN SFI 238=1 (Call History is in service) is assigned, outgoing Call History by ASFC/ASFCN SFI 248=1 (Terminal Call History is in service) is not effective. For that reason, use REDIAL [R-60].
3. This feature is available for the following terminals.

   - IP terminal **Note 12**
   - SIP Multiple Line terminal
   - Digital terminal **Note 13**, **Note 14**

   Note 12: This feature is not available on Soft Phone (Soft Client SP350/DtermSP30), since it does not have Soft keys.

   Note 13: Only available for DT400/DT300 series.

   Note 14: The ELC card (CH-16ELCA) is required.

   Note: This feature is not available with the Attendant Console.

4. The setting and terminal conditions for a terminal that uses this feature are as follows:
   a.) To use this feature, assign CALL HISTORY to a Line/Feature key or Soft key.

   Note: On DT830G/DT830/DT820/DT750/DT730G/DT730, incoming call history by this feature can be displayed by selecting [User Menu] - “1. History”. However, parameters under “1. History” menu is not available. (In the case of DT820, this condition is from firmware version 3.0.0.0.)

   b.) Do not assign CALL HISTORY Feature key if SFI = 238 is not acceptable on the terminal. If Call History is assigned to such terminal, Feature key Lamp and Soft key will be controlled but Call History will not be displayed. Key control will be cleared by pressing the CALL HISTORY Feature key.
   c.) Do not assign CALL HISTORY to a Flex key.
   d.) This feature is available only on terminals where the LCD is capable of displaying 24 digits.
   e.) For the terminals except DT Series, if the terminal has Terminal Call History capability for incoming calls, this feature cannot be used.
   f.) Depending on the type of terminal, the Soft key display can be different.

5. This terminal incoming Call History record will be cleared in the following cases.
   a.) When deleting terminal data through PCPro command, all Call History data will be deleted.
   b.) When performing System Initialization or SP Initialization, all Call History data will be deleted.

c.) When the terminal is re-registered or logged out, all Call History data will be deleted. To maintain the Call History list, activate Fixed PH Hunting by assigning System Data (ASYDL, SYS1, Index 824, Bit 0=1).

6. If there is a call to the My Line or Sub Line of a terminal that is displaying the incoming Call History record, the display will be finished and go back to the main menu.
7. Call History will store a maximum of 20 calls.
8. When Call History data exceeds 20 calls, data will be deleted, starting from the oldest data.
9. The following shows the status of Line/Feature key and Soft key display when the CALL HISTORY Feature key is assigned.

Status	Feature Key	Soft Key
Terminal has not answered an incoming call	Lights in red	Flash Display **Note 15**
After Call History is displayed	OFF	Normal Display

Note 15: When an incoming call is unanswered, Soft key maintains the Call History flashing display.

10. When receiving a second call from a number already in Call History, assign System Data to select whether to save data or overwrite the list (SYS1, Index 677, Bit 4).
11. The history of an answered call without Caller ID information is displayed as "-----" at the center of the 3-line LCD, or at the name display area of the 4-line LCD.
12. A Station can display Call History for a line which is being used by another Station.
13. Two options are available for the display format of Call History; three-line format and four-line format. You can specify the format by setting System Data (ASYDL, SYS1, Index 681, Bit 0).

Note: These options are only available for DT830/DT700/DT400/DT300 Series terminals with a 4-line LCD (4 lines for display + 1 line for icon).

14. When receiving a second call from a number already in Call History, assign System Data to select whether to save data or overwrite the list (SYS1, Index 677, Bit 4).
15. DT800/DT700/DT400/DT300 Series can originate a call using the incoming Call History with prefix added. For the operation procedure, refer to the related manuals of DT800/DT700/DT400/DT300 Series.

Note: On Desktop terminals used earlier than DT800/DT700/DT400/DT300 Series, as Call History is not compatible with prefix function, office data programming is required to add access code of incoming route.

a.) Up to 10 digits of number can be added for prefix.
b.) When prefix is added, a maximum of 32 digits of numbers can be sent out and displayed. If the number exceeds 32 digits, the overflowing last digits are deleted.
c.) In the case of incoming call termination after moving to prefix screen, process of prefix is continued during ringing. When the call is answered, process of prefix is canceled and the speech is established. The display moves to the idle state after releasing the call.
d.) The LCD cannot go back to Call History screen after moving to prefix screen.

16. The conditions for an incoming Call History to Sub Line are as follows.
    a.) When ASYDL, SYS1, Index 678, Bit 7=1 is assigned, the record of a call answered on the Sub Line of a station is kept on both stations which the call is placed to and which the call is answered on. For example, when My Line of Station B is accommodated on a Sub Line of Station A, if Station A answers a call placed to Station B by pressing the corresponding Sub Line key, the call record is stored on both Station A and Station B.

        Note: When ASYDL, SYS1, Index 678, Bit 7=0 is assigned, a call record is stored only when a call arrives on My Line. For example, in the above case, the call record is stored on Station B as an unanswered incoming call.

    b.) DSS Console Line Keys (AKYD command (KD=2)) do not support Call History to Sub Line.
    c.) Digital terminal accommodated in ELC card is not supported for unanswered Call History to Sub Line and Call History to Sub Line answered in a different terminal.
    d.) Call History is administrated per terminal. For that reason, when several terminals have registered the same Sub Line, if an unanswered call is checked in a terminal, the call remains unchecked in other terminals.
    e.) In the case of Call History to Sub Line, light and signals to inform of an unanswered call may need up to one minute to be displayed.

17. When this feature is used in combination with other features, the following conditions apply.
    a.) When ASYDL, SYS1, Index 678, Bit 7=1 is assigned, the record of a call answered through Call Pickup is kept on both stations which the call is originally placed to and which the call is answered on. When ASYDL, SYS1, Index 678, Bit 7=0 is assigned, a call answered through Call Pickup is recorded as an unanswered incoming call and kept on the station to which the call is originally placed.
    b.) If there is an incoming call to either Prime Line or My Line engaged in Call Redirect [C-173] operation while displaying Call History, the display will return to the main menu of IP terminal (except for Soft Phone) and SIP Multiple Line terminal.
    c.) When Optional Language Pack Loading [O-42] is used, Call History information for an answered/unanswered incoming call can be arbitrarily defined. A maximum of eight single-byte characters can be set. When this setting is not configured, "!!" is displayed for an unanswered call.
    d.) When Name Display - System [N-28] is in service, you can specify a preference for the type of caller information to be displayed in the Call History.
    When you assign ASYDL, SYS1, Index 678, Bit 6=1, Calling Number is preferentially displayed regardless of the setting of ASYD, SYS1, Index 390, Bit 0 (Caller ID display pattern on the LCD (Top line)). If you assign ASYDL, SYS1, Index 678, Bit 6=0, the priority is determined by the value set for ASYD, SYS1, Index 390, Bit 0.
    If the priority is set to Calling Name and a matching name is not found in the Call History file, the caller's number is displayed instead.
    e.) In the Call History screen, a Caller ID exceeding the number of digits the display can handle is truncated to the length supported by the terminal. You can specify whether to display the first or the last digits of the ID by setting System Data (ASYD, SYS1, Index 241, Bit 6).
    4-line LCD can display maximum 24 digits for Caller ID information type specified by the System Data (ASYDL, SYS1, Index 678, Bit 6 or ASYD, SYS1, Index 390, Bit 0), and 16 digits for otherwise. On the other hand, 3-line LCD supports maximum 16 digits as in previous versions.

f.) When receiving a call through CALL TRANSFER - ALL CALLS [C-11]/CONSULTATION HOLD - ALL CALLS [C-17], the number of the intermediate party (the first terminal to receive the call) will be saved in Call History.
g.) When the terminal is placed under the control of SR-MGC, Call History data will not be carried over.
h.) When the terminal is placed under the control of the Backup Node, Call History data will not be carried over. (In cases such as when using LOCATION DIVERSITY [L-55], SR-MGC, etc.)
i.) When Software Multiple My Line Appearance [S-143] is in service, records of calls to the Same Number Sub Line (a Sub Line assigned to the same My Line number) are kept as long as they are answered. (Unanswered calls are not recorded.) If a call arriving on the Same Number Sub Line is answered through Call Pickup, the record is kept only on the answering station and not on the station to which the call is originally placed.
j.) The call history data of this feature (both System side and Terminal side) are not cleared by Guest Station Call Record Automatic Clear [G-27]. However, when you use DT700 Series with firmware versions earlier than 2.2.0.0, only Terminal Call History data (terminal side) can be cleared (Terminal Call History data cannot be cleared when you use DT700 Series (except DT730G) with firmware 2.1.0.0 or later versions).

<Conditions for Terminal Call History (ASFC SFI 248=1)>

Terminal Call History allows the dialed number to be stored to the terminal as outgoing Call History; the received number to be stored to the terminal as incoming Call History. The conditions for Terminal Call History are as follows.

1. This feature can be used only by the following DT Series terminals.

- DT830G/DT830
- DT430 **Note 16**
- DT750/DT730G/DT730
- DT330 **Note 16**

Note: When SFI 248 (Terminal Call History) setting is changed;
- DT830/DT700 Series requires to request re-registration. (Make-busy and make-busy cancel operation by MBST command is also available.)
- DT400/DT300 Series requires ELC circuit card to perform initialization. (Make-busy and make-busy cancel operation by MBPM/MBST command is also available.)
- ASYDL, SYS1, Index 673, Bit 4=0/1 (inform only Calling Number to call history/inform Calling Number and Calling Name to call history) needs to be assigned.
  Data change does not turn effective without re-registration and circuit card initialization.

Note 16: The PA-16ELCN (SP-3956 16ELCN PROG-A or later) is required.

Outgoing Call History:

1. Regardless of using line, the outgoing Call History is stored to operating terminal.
2. When outgoing Call History data exceeds the following number of calls, data will be deleted, starting from the oldest data.

   DT830/DT700 Series: 50
   DT400/DT300 Series (DT430/DT330): 10

3. Data stored as outgoing Call History are;

   - DT830/DT700 Series:

     The dialed number and the dialed number that completely matches the registered name in the Terminal Phone book database are stored as outgoing Call History. Calling Name notified from the system is not stored.

   - DT400/DT300 Series (DT430/DT330):

     The dialed number is stored as outgoing Call History. Calling Name notified from the system is not stored.

4. Conditions for dialed number stored as outgoing Call History to the terminal are;

   - The number dialed until the call is released from the call origination:

     Such as the dialed number during an ongoing call or the dialed number for the Call Forwarding operation. However, the dialed number after holding a line is not stored.

   - The number dialed until the call is released after an incoming call is answered:

     Such as the dialed number during an ongoing call or the dialed number during the Call Forwarding operation. However, the dialed number after holding a line is not stored.

   Note: Up to 24 digits dialed number is stored. When the number exceeds 24 digits, the first 24 digits are stored.

   Note: The dialed number mentioned above does not include the Secret Code (the default is "*" or "#") displayed when Dialed Number Privacy Mode [D-165] is activated.

5. The outgoing Call History is cleared in the following conditions.

   - "Delete All" function of the terminal is executed by the user.
   - The terminal is turned off caused by a condition such as removed user cable (modular, LAN, etc).
   - The terminal is released from the status terminal is turned off because of a failure.
   - The terminal is turned off temporarily by the HUB reset when the power is supplied by the HUB. [For DT800/DT700 Series]
   - The station data is changed or deleted. [For DT800/DT700 Series] **Note 17**

- The terminal is in logout status. [For DT800/DT700 Series] **Note 17**

Note 17: Call history is cleared for DT730 Series with firmware version prior to 2.2.0.0.

6. Outgoing Call history shows incorrect outgoing time for up to one minute (the cycle of sending the time information) immediately after the initialization of the system or the card ("0/0 00:00" is displayed).

Incoming Call History:

1. Two types of incoming Call History such as answered incoming Call History and unanswered incoming Call History are stored.
2. When incoming Call History data exceeds the following number of calls, data will be deleted, starting from the oldest data.

   DT830/DT700 Series: 50
   DT400/DT300 Series (DT430/DT330): 10

3. Whether only Calling Number or Calling Number and Calling Name can be selected per system as the incoming call history information sent from the system to the terminal.
4. Conditions of Calling Number sent from the system are:

   - The station number is sent from the system when the Calling Party is a station. On the other hand, the Calling Number is sent from the system when the Calling Party is a trunk.
   - Up to 24 digits Calling Number is sent. When the number exceeds 24 digits, the exceeded digits will be deleted by system data setting (ASYD, SYS1, Index 241, Bit 6). In this case, "*" mark which indicates the deleted number is not displayed.
   - When the Calling Number is not existed, "Withhold", "Public Telephone", or "No Notification" (**Note 18**) is stored in Terminal Phone book on DT800/DT700 Series as a reason Calling Number is not existed.
     For DT400/DT300 Series (DT430/DT330), "Withhold" is displayed as incoming call history.

Note 18: "No Notification" means beyond the limits to display.

5. When the destination is a station, or Name Display - CCIS [N-37] applies to a station, registered name assigned by Name Display feature (ANDD) is stored. When the destination is a trunk, registered name assigned by Caller ID feature (ACID) is stored.
6. The calling name of the number completely matches the registered name in the Phone book is stored as the incoming call history.
7. When an incoming call is answered by "Terminal B" in which My Line of "Terminal A" is accommodated, incoming call history is stored into both "Terminal A" and "Terminal B".
8. When a call is answered by CALL PICKUP - GROUP [C-7] or CALL PICKUP - DIRECT [C-30], incoming call history is stored into the terminal which is accommodated the call terminating My Line. Also the incoming call history is also stored into the answered terminal.
9. When a call is answered by Direct Inward Dialing (DID) [D-8], incoming call history will not be stored.
10. When a forwarded call is terminated, Calling Number stored as incoming Call History is as follows.

    - Call Transfer - All Calls [C-11]:
      The number of Intermediate station (the first terminal to receive the call)

- Blind Transfer To Attendant [B-17]/Blind Transfer To Station [B-18]:
  The number of originally calling station

11. The incoming Call History is cleared in the following conditions.
    - "Delete All" function of the terminal is executed by the user.
    - The terminal is turned off caused by a condition such as removed modular cable.
    - The terminal is released from the status terminal is turned off because of a failure.
    - The terminal is turned off temporarily by the HUB reset when the power is supplied by the HUB. [For DT830/DT700 Series]
    - The station data is changed or deleted. [For DT830/DT700 Series] **Note 19**
    - The terminal is in logout status. [For DT830/DT700 Series] **Note 19**

    Note 19: Call history is cleared for DT730 Series with firmware version prior to 2.2.0.0.

12. Because the missed call notification icon of the Bluetooth Handset of Cordless Terminal (DT430/DT330 (12BT)) is synchronized with the call history of the Bluetooth Cradle, browse the incoming call history on Bluetooth Cradle to turn off the icon.
13. While the Bluetooth Cradle of the Cordless Terminal (DT430/DT330 (12BT)) displays Incoming/ Outgoing call history, Dynamic Dial Pad cannot be executed from the Bluetooth Handset.
14. Bluetooth Cradle of the Cordless Terminal (DT430/DT330 (12BT)) can display only in English and Japanese.

For DT800/DT700 Series only:

1. In the case of a call origination using Phone book, display of Phone book data is exited when dialing the number is finished. Then the LCD changes over to the display informed from the system automatically. During a call termination or answering a call, the LCD keeps displaying Phone book data.
2. When the Calling Station performs operations such as pressing the SPEAKER key or Headset key, or going off-hook while displaying Phone book data, the call is originated toward the Phone book data on display. If a call terminates Prime Line of the station, operations such as pressing the SPEAKER key or Headset key, or going off-hook are processed as answering call operation. Call origination toward the Phone book data on display is not available.
3. For the prefix function, refer to the related manuals of DT800/DT700 Series.
4. On the terminal's configuration menu, the parameters under [History] menu is not available when this [C-195] Call History (ASFC SFI: 238) is in service.
5. Even though Terminal Call History is set as out of service (ASFC SFI: 248=0), the parameters under [History] menu will be displayed on the terminal's configuration menu regardless of SFI: 248 data setting.
6. DT830/DT700 Series user has an option between Call History and Terminal Call History according to the setting of the ASFC/ASFCN command (SFI 238=1: Call History, SFI 248=1: Terminal Call History).
7. Phonebook information can be displayed in 4-line with a DT800/DT700 series terminal that has 4-line (except the line for icon display) LCD. By displaying Phonebook information in 4-line, you can see the name and the number in the search result display or the deletion confirmation display, whereas in 3-line, you can only see the name.

If you wish to display Phonebook in 3-line as before, assign the system data (ASYDL, SYS1, Index 681, Bit 1=1).

Note: The search result with 4-line display is only available for Local Phonebook and System Phonebook. Deletion confirmation with 4-line display is only available for Local Phonebook.

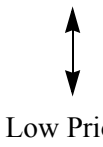
<Conditions Specific to combination of Call History and Phonebook>

The following shows the conditions when DT800/DT700/DT400/DT300 Series are used.

X: Available, C: Conditionally available, N: Not available

Kind of Call History	DT800/DT700 Series					DT400/DT300 Series	
	DT830G/ DT830	DT820	DT750	DT730G/ DT730	DT710	DT430/ DT330	DT410/ DT310
CALL HISTORY [C-195]							
System Call History	X	C Note 21	X	X	C Note 20	X	C Note 20
Terminal Call History Note 22	X	N	X	X	N	X	N
PHONEBOOK [P-83]							
Local Phonebook	X	X	X	X	C Note 20	X	C Note 20
System Phonebook	X	X	X	X	C Note 20	X	C Note 20
Terminal Phonebook	X	N	X	X	N	N	N
Corporate Phonebook	X	N	X	X	N	N	N

Note 20: Only 6-button type terminal is supported.



Note 21: From firmware version 3.0.0.0, incoming call history by this feature can be displayed by selecting [User Menu] - “1. History”. However, parameters under “1. History” menu are not available.

Note 22: Terminal Call History is targeted for DT Series only. When DT Series operate in Dterm Series *i* mode, SFI 248 (Terminal Call History) settings take no effect.

1. For DT800/DT700 Series, you can add a prefix before the displayed number when originating a call by Terminal Call History. For DT400/DT300 Series, prefix function is not supported.

   Note: For using prefix function, register the prefix with user setting on the terminal beforehand. For details, refer to the related manuals of DT800/DT700 Series.

2. The priority order to display the name on incoming call termination and call history is as follows.

- Registered name on the selected phone book (Local Phone book/ Terminal Phone book)
- Registered name on System Phone book
- Registered name assigned by Name Display feature (ANDD) and Caller ID feature (ACID)

Note: In the following cases, contact names are not displayed in the above priority order.
- The combination of Terminal Phone book and Call History is used:
- Contact name of priority order I is not displayed. Contact name of priority order II or priority order III is displayed.
- The combination of Local Phone book and Terminal Call History when ASYDL, SYS1, Index 673, Bit 4=0 is assigned (inform only Calling Number to call history):
- Contact name is not displayed as the call history.
- The combination of Terminal Phone book and Terminal Call History when ASYDL, SYS1, Index 673, Bit 4=0 is assigned (inform only Calling Number to call history):
- Contact name of the priority order II and III are not displayed as the call history.

3. Phone book information can be registered from call history generated by Call History [C-195] to Local Phone book on DT830/DT700 Series. For more information, refer to Phonebook [P-83]. Also Phone book information can be registered from call history generated by Terminal Call History to Terminal Phone book on DT830/DT700 Series. For more information, refer to the related manuals of call DT830/DT700 Series.
4. When either Call History or Terminal Call History is selected by **Call History** → **Incoming** menu displayed by pressing Menu button, the selected call history can be displayed.
5. When you disable Terminal Call History, the missed call icon must be cleared before changing the office data.

Programming

Note: When you want to change the display information on an answered/unanswered incoming call, the data setting for Optional Language Pack Loading [O-42] is required before setting the following data. For details, see Optional Language Pack Loading [O-42].

< System Call History >

STEP 1: **ASYD** - System Data
SYS1, Index 241, Bit 6
When Caller ID digits exceed the number of digits able to be displayed by terminal.
0: Display from Caller ID's first digit to display limit
1: Display from Caller ID's last digit to display limit

SYS1, Index 390, Bit 0
Specify which Caller ID data is given priority for display
0/1: Name Display is given priority/Number Display is given priority

STEP 2: **ASYDL** - System Data for LDM
SYS1, Index 824
Assign Fixed PH Hunting method
Bit 0 = 0/1: No/Yes

STEP 3: **ASYDL/ASYDN** - System Data for LDM/NDM
SYS1, Index 677, Bit 4
When receiving an incoming call from a station whose Call History data is already on the list.
0/1 = Save the Call History data on the list/Overwrite the call history data on the list

SYS1, Index 678, Bit 6 **Note 23**
Preference for the type of caller information to be displayed in the Call History.
0/1 = Follows the setting of ASYD, System Data 1, Index 390, Bit 0/Displays Calling Number

SYS1, Index 678, Bit 7 **Note 24**, **Note 25**
Sub Line Call History (answered calls) and Call History used in combination with Call Pickup features.
0/1 =Kept only on the original destination station (My Line)/Kept on both original destination station (My Line) and answering station

SYS1, Index 681, Bit 0
Number of lines displayed for Call History.
0/1 = 4 lines/3 lines

SYS1, Index 686, Bit 5 **Note 26**
Sub Line Call History (unanswered calls and calls answered in other station).
0/1 = Out of service/In service

SYS1, Index 686, Bit 6 **Note 26**
Call History used in combination with Call Waiting features and Executive Right-of-Way features.
0/1 = Out of service/In service

Note 23: If you assign ASYDL, SYS1, Index 678, Bit 6=1, Calling Number of call history is preferentially displayed regardless of the setting of ASYD, SYS1, Index 390, Bit 0 (Caller ID display pattern on the LCD (Top line)). Otherwise, the display follows the setting of ASYD, SYS1, Index 390, Bit 0.

Note 24: When ASYDL, SYS1, Index 678, Bit 7=1 is assigned, the records of the following calls are kept on both stations which the call is originally placed to and which the call is answered on:

- Calls answered through Call Pickup feature
- Calls answered on the Sub Line of a station (where My Line of the original destination station is accommodated on a Sub Line

Note 25: If Sub Line Call History (unanswered calls and calls answered in other station) is used, this Bit needs to be set to 1.

Note 26: Available from FP95-114 V4 Issue 4.0.

STEP 4: **ASFC** - Assign a Service Feature Restriction Class that allows the following

SFI 238 (RES=1) to the station using Call History

SFI 266 (RES=1) to the station using Call History for unanswered Sub Line calls **Note 27**, **Note 28**

SFI 267 (RES=1) to the station using Call History for Sub Line calls answered in another station **Note 27**, **Note 28**

Note: When SFI 238=1 (Call History is in service) is assigned, assign also SFI 248=0 (Terminal Call History is out of service).

Note: When SFI 248=0 (Terminal Call History is out of service) is assigned, outgoing call history on Terminal side will be also out of service.
On DT400/DT300 Series (DT430/DT330), **[Menu]** → **Call History** and **[Shortcut Menu]** → **1 Missed Calls** will not be operated.

Note: IP terminal/SIP Multiple Line terminal requires to request re-registration (Make-busy and make-busy cancel operation by MBST command is also available).
Digital terminal requires ELC circuit card to perform initialization (Make-busy and make-busy cancel operation by MBPM/MBST command is also available).

Note 27: Available from FP95-114 V4 Issue 4.0.

Note 28: The relation between SFI 266 and SFI 267 is as follows:

Operation	SFI 266= Disabled	SFI 266= Enabled	
		SFI 267= Disabled	SFI 267= Enabled
Call History for unanswered Sub Line calls	Call History is not kept	Call History is kept	Call History is kept
Call History for Sub Line calls answered in another station	Call History is not kept	Call History is not kept	Call History is kept

STEP 5: **ADSL/ADSLN**- Assign a programmable Soft key as Call History to the following parameter:
SKP: 0-15 (Soft Key Pattern)
SN: 0 = idle
FKY: 178 = Call History

STEP 6: **ADKS** - Assign each Soft Key Pattern data to the desired IP terminals (except for Soft Phone) and SIP Multiple Line terminals.
TN: Tenant Number
STN: Station Number
SKP: 1-15 (Soft Key Pattern assigned by ADSL)
LKP: Assign the Key Pattern of the IP terminal (except for Soft Phone) and SIP Multiple Line terminal.
1 = 16 Line/Feature Buttons + DSS keys
2 = 24 Line/Feature Buttons + DSS keys
3 = All Line/Feature Buttons
PG: Specify the Page Scroll key allocation
0 = Page change key appears on a software key (>>>)
1 = Page change key disappears on a software key

STEP 7: **AKYD** - Assign FKY=178 to a Feature key.

STEP 8: **ACNP -** Assign a Calling Number Pattern.
In Call History, when saving a number with an access code attached, assign the caller's Calling Number Pattern.
IC/OG: Incoming/Outgoing Call
IC: Incoming Call
OG: Outgoing Call
RT: External Route Number [1-255]
CNP: Calling Number Pattern [1-255]

STEP 9: **ACND** - Assign a Calling Number Data.
In Call History, when saving a number with an access code attached, assign the caller's Calling Number Data (Access Code).
CNP: Calling Number Pattern [1-255]
SKIP: Number of Skip Digits [0-24]
ADD: Number of Digits of the Additional Number [0-24]
DC: Additional Digit Information [Maximum 24 digits]

< Terminal Call History >

STEP 1: **ASYD**
SYS1, Index 241, Bit 6
When Caller ID digits exceed the number of digits able to be displayed by terminal.
0: Display from Caller ID's first digit to display limit
1: Display from Caller ID's last digit to display limit

STEP 2: **ASYDL**
SYS1, Index 673, Bit 4
Incoming calling history display pattern on the LCD.
0/1 = Calling Name only/Calling Name and Calling Number

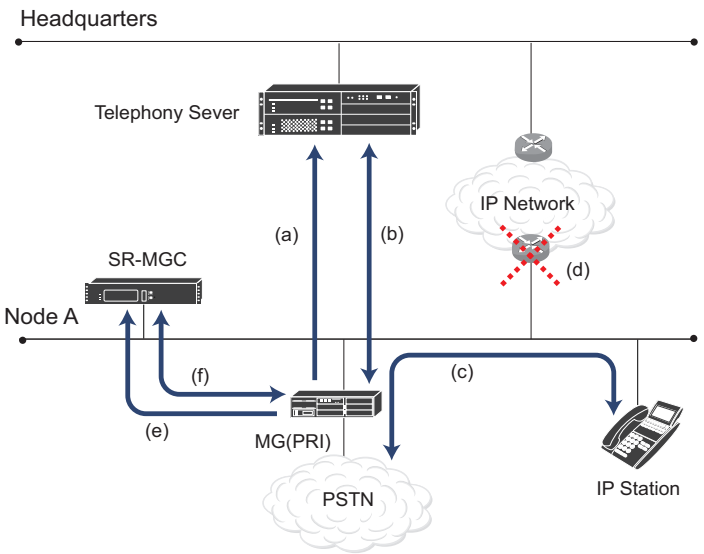
STEP 3: **ASFC** - Assign a Service Feature Restriction Class that allows the following:
SFI 248 (RES=1) to the station using Terminal Call History

Note: To activate Terminal Call History on Digital terminal, assign also SFI 247=0 (Terminal Phone book is out of service).
If SFI 247=1 (Terminal Phone book is in service) is assigned, System Phone book, which is controlled by the system, will be activated when **[Menu]** → **2 Directory** is selected or Right-Cursor key is pressed on the DT400/DT300 Series (DT430/DT330) in idle state.

Note: Re-registration of terminal or circuit card initialization are required after changing data assignment.

STEP 4: **ACNP -** Assign a Calling Number Pattern.
In Call History, when saving a number with an access code attached, assign the caller's Calling Number Pattern.
IC/OG: Incoming/Outgoing Call
IC: Incoming Call
OG: Outgoing Call
RT: External Route Number [1-255]
CNP: Calling Number Pattern [1-255]

STEP 5: **ACND** - Assign a Calling Number Data.
In Call History, when saving a number with an access code attached, assign the caller's Calling Number Data (Access Code).
CNP: Calling Number Pattern [1-255]
SKIP: Number of Skip Digits [0-24]
ADD: Number of Digits of the Additional Number [0-24]
DC: Additional Digit Information [Maximum 24 digits]



C-203 Call Protected Re-Registration

General Description

By this feature, while talking via the MG(PRI), if an ongoing call is disconnected by a network failure between the MG(PRI) and the Telephony Server, the MG(PRI) with the retained ongoing call can be re-registered to the SR-MGC. Therefore, all the channels of the MG(PRI) except the channel retaining the ongoing call can be used under the SR-MGC.

If a network failure occurs, the MG(PRI) with the retained ongoing call re-registers to the SR-MGC as follows.

Note: This feature is different from the MG Based Call Retention feature, details of which are found in "14.9 MG Based Call Retention" in Chapter 2.

(a) When the MG(PRI) is activated, it registers to the Telephony Server.

(b) Health Check between the Telephony Server and MG(PRI) starts right after the registration.

(c) A call is originated from the IP station via the MG(PRI) and the call is answered. (Example: channel 0 is used and becomes busy state.)

(d) A network failure occurred between the Telephony Server and MG(PRI) and a Health Check time-out is detected.

(e) The MG(PRI) re-registers to the SR-MGC. In this case, channel 0 in busy state is not reset and the ongoing call can be retained. Also, all the channels except channel 0 are available for a call origination/termination after the re-registration.

(f) SR-MGC periodically checks the status of channel 0 retaining the ongoing call. When the ongoing call is disconnected, the SR-MGC resets channel 0. Channel 0 becomes available for a call origination/termination again.

Operating Procedure

No operation is required.

Service Conditions

1. This feature supports the following MGs.
   - MG(PRI) (1.5M) [SCA-24PRIA/MG-24PRIA] (SP-3884 MG PRI PROG-A Issue 10 or later)
   - MG(PRI) (2M) [SCA-30PRIA/MG-30PRIA] (SP-3884 MG PRI PROG-A Issue 10 or later)
   - UG50 (PRT 1.5M) [Proprietary Protocol]
   - UG50 (PRT 2M) [Proprietary Protocol]
   - UG50-24PRIA [Proprietary Protocol]
   - UG50-30PRIA [Proprietary Protocol]

   Note: This feature supports proprietary protocol only. SIP is not supported.
2. This feature is available for SR-MGC.
3. This feature is available for FCCS Cluster. The ongoing call can be retained when moving to backup node as well.
4. The software version of the Telephony Server and office data assigned by AMGIL command must be common for all devices (all nodes). If there is a device for which this feature is not valid, the MG(PRI) will not register to the device when a network failure occurred.
5. Use RLMG command to disconnect forcefully the channel retaining the ongoing call only. For other channel, use RLST command.
6. Use AMGIL command to reset the MG(PRI) supporting this feature. When resetting, all the ongoing call will be disconnected even if this feature is valid.
7. There is no limitation of time to retain the ongoing call. The ongoing call is disconnected in the following cases.
   - When RTP packet stopped in such the case that the equipment of connected party is rebooted.
   - When the opposite party released the call.
   - When RLMG command is executed from PCPro.
   - When a reset is executed by the AMGIL command.

   Note: For the detail of call retention function that each terminals have individually, refer to System Description - CHAPTER 3 IP Equipment - Operation of Each IP Equipment/ Terminal When a Fault Occurs During a Conversation.

   Note: The time-out value to determine that the ongoing call is disconnected is assigned by the Configuration Command (RTP_STOP_DETECT).

8. When the network failure between the Telephony Server and MG(PRI) is recovered, the control of MG(PRI) changes over to the Telephony Server from SR-MGC. In this case, the MG(PRI) with the retained ongoing call will re-register to the Telephony Server.
9. For the changeover from SR-MGC, assign Automatic Changeover (Forceful Switchover is not used). Otherwise, the ongoing call cannot be retained.
10. The retained ongoing call can be retained until it is released, regardless of the number of changeovers to SR-MGC/Telephony Server.
11. Use RLMG command on the registering device to check which channel is retaining the ongoing call.
12. When using SPTS command on the registering device to check the channel retaining the ongoing call, the channel state is make-busy.
13. When the channel retaining the ongoing call remains seized although the terminal using the channel is released, the channel can be released forcefully by RLMG command.
14. There is no limitation for the number of channels that can retain an ongoing call. An ongoing call can be retained although all the channels are busy. However in this case, call origination/termination from the telephony server/SR-MGC of registration destination is not available until any channel is released.
15. Billing information will be output from the device to which the MG(PRI) had registered just before a network failure occurred. At this time, the billing information is output at the instant of the network failure detection, assuming the ongoing call is released. Therefore, the time length of talk will be different from the actual time length.
16. If ARTD command is used for the PAD control of MG(PRI) while operating, the MG(PRI) needs to be turned off and on or needs to be reset by using AMGIL command to apply the changed PAD value.
17. There is no limitation for the number of MG(PRI)s that can use this feature at the same time.
18. This feature will be available even if MG(PRI) uses a DHCP server.
19. A call origination may fail if the call reference value used by the channel retaining the ongoing call and the call reference value used when making a new call are different.

    Note: In this case, make a new call again. When making a new call again, a new call reference value is used.

20. This feature cannot retain the ongoing call if the status of the call is changed.
21. A call cannot be retained when ringing or held.
22. A call cannot be retained when rebooting from the local console of MG(PRI).
23. A call cannot be retained in the following cases.

    - If a patrol function is inactivated by using RLST command while talking.
    - If disconnected by the trunk ineffective hold detect of routine diagnosis.

Programming

1. To use Call Protected Re-Registration
   Assign the office data for the MG(PRI). The procedure here describes just the data setting to use this feature. Refer to Peripheral Equipment Description (IP Devices) for the configuration of MG(PRI) or Peripheral Equipment Description (UG50) for the following UG50 PRT cards:

   - UG50 (PRT 1.5M) [Proprietary Protocol]
   - UG50 (PRT 2M) [Proprietary Protocol]

- UG50-24PRIA [Proprietary Protocol]
- UG50-30PRIA [Proprietary Protocol]

AMGIL - Select the checkbox of "CALL HOLD (MG-PRI Call Hold Service)" to enable CALL PROTECTED RE-REGISTRATION [C-203].

Note: When this feature is used on the already registered MG(PRI) or deleted, the MG(PRI) will be reset and the ongoing call will be disconnected.

Note: When this feature is enabled, it overrides MG Based Call Retention configured with the maintenance command of MG(PRI).

[Call Control Takeover by SR-MGC]

ASYDL - SYS1
Index 847, Bit 0 to Bit 3 (Timer Counter for forceful switchover) = F (Forceful switchover is not executed while the active calls remain.)
Index 852, Bit 5 (IP terminal registration changeover from SR-MGC to MGC) = 1 (Automatic Changeover)

2. To reset MG(PRI).

AMGIL - Enter the MG-ID of the corresponding MG(PRI) to reset.

MG-ID: ID of MG [00-FF (Hex)]
Assign the MAC Address of MG (Media Gateway).

FUNCTION
Reset: To reset the MG-PRI

Note: When resetting, the ongoing call cannot be retained.

3. When resetting the channel retaining an ongoing call.

RLMG - Resets the channel retaining an ongoing call.

LENS: Line Equipment Numbers of MG(PRI) [six digits]
Allocate the head channel of HW (Highway Block) to which Virtual Speech/Signal Channel is assigned.

Channel Number to reset: Forceful Switchover Channel Number (0-31)
Assign the channel number to switch over forcefully.

Note: Channel 0 indicates the LENS to which the corresponding MG(PRI) is registered by AMGIL command.

For example, in the case of MG(PRI) assigned to "LENS: 022120" by AMGIL command.

The relation of the channel number and LENS is as follows.

CH0: 022120
CH1: 022121
:
CH7: 022127
CH8: 022130
:
:
CH31: 022157

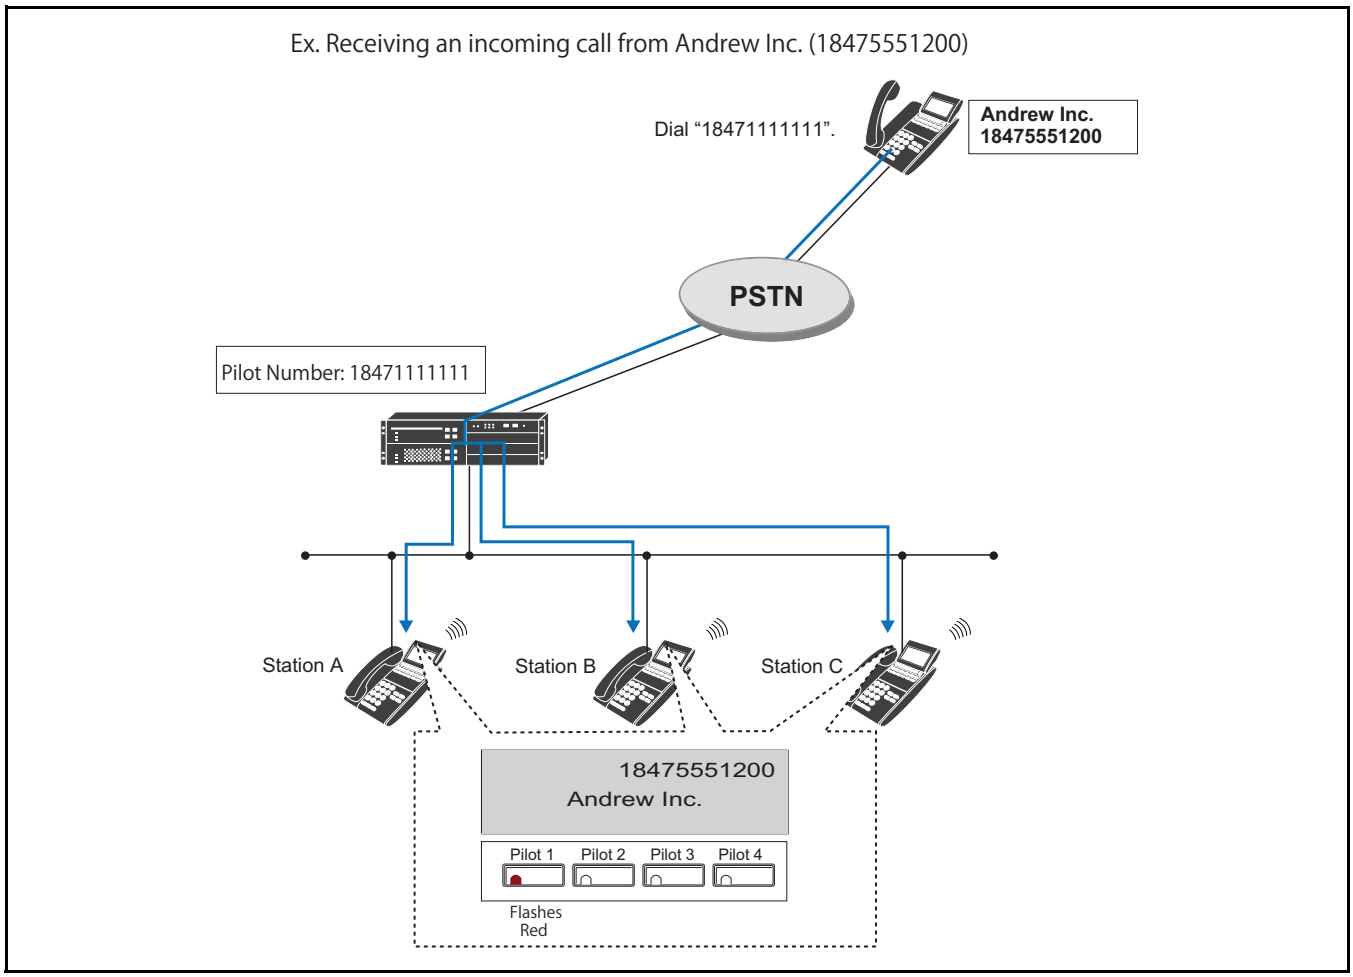
4. For displaying the information of the Media Gateway.

DIMG - Display Information of Media Gateway

Input Data
ISDN Trunk (PRI) Information: Information of MG(PRI) belonging to the Telephony Server.

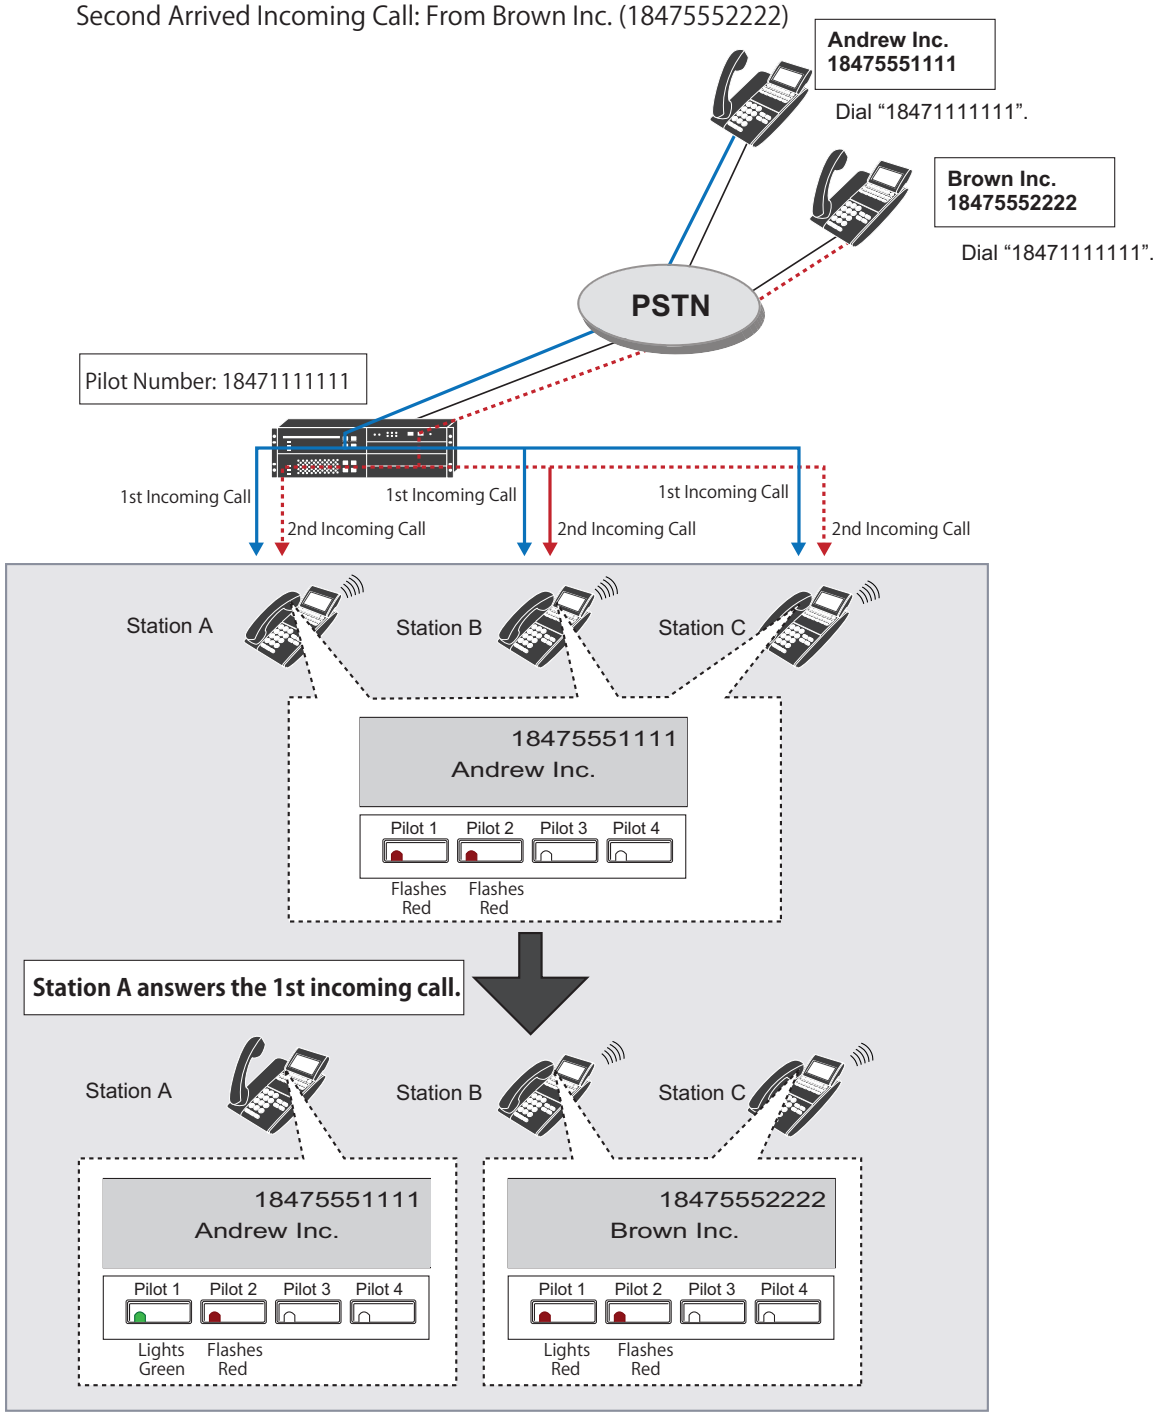
Note: The route information here is the information of virtual signaling channel (Dch) assigned by AMGIL command.

C-204 Caller ID Display - Sub Line



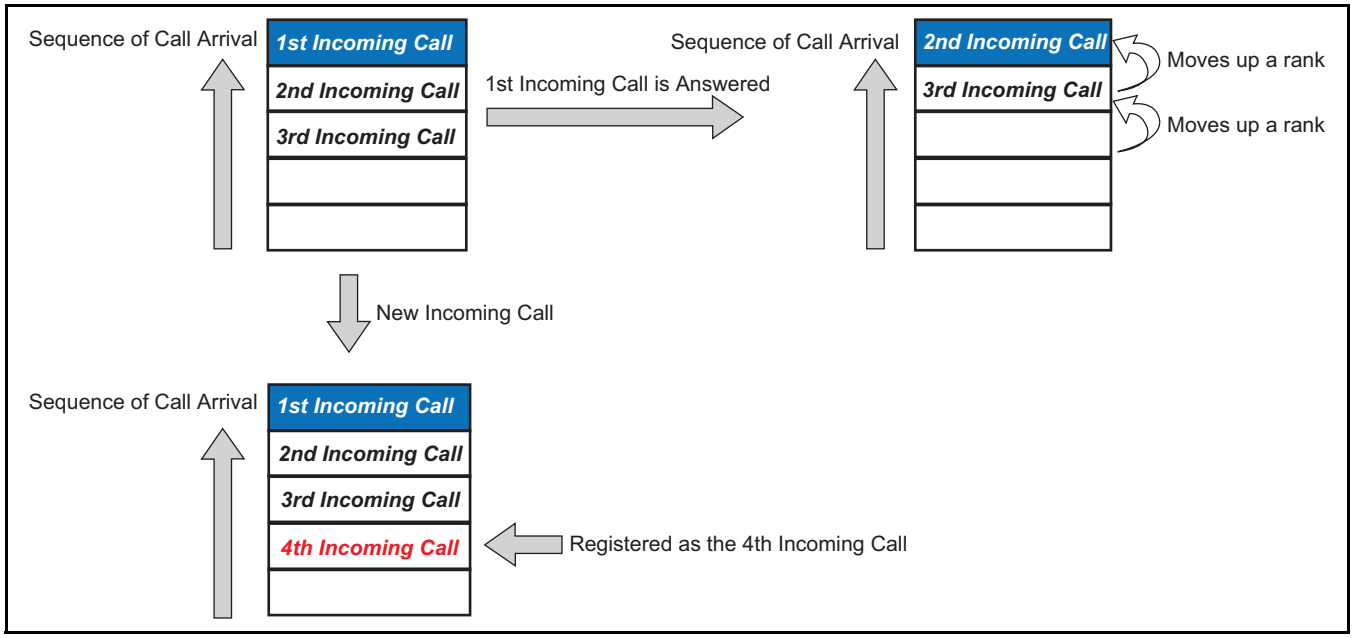
General Description

This feature displays Caller ID (calling party number and the registered name) on the LCD of the Desktop terminal when Sub Line receives an incoming call. A user can answer the incoming call which is currently displayed on the LCD.



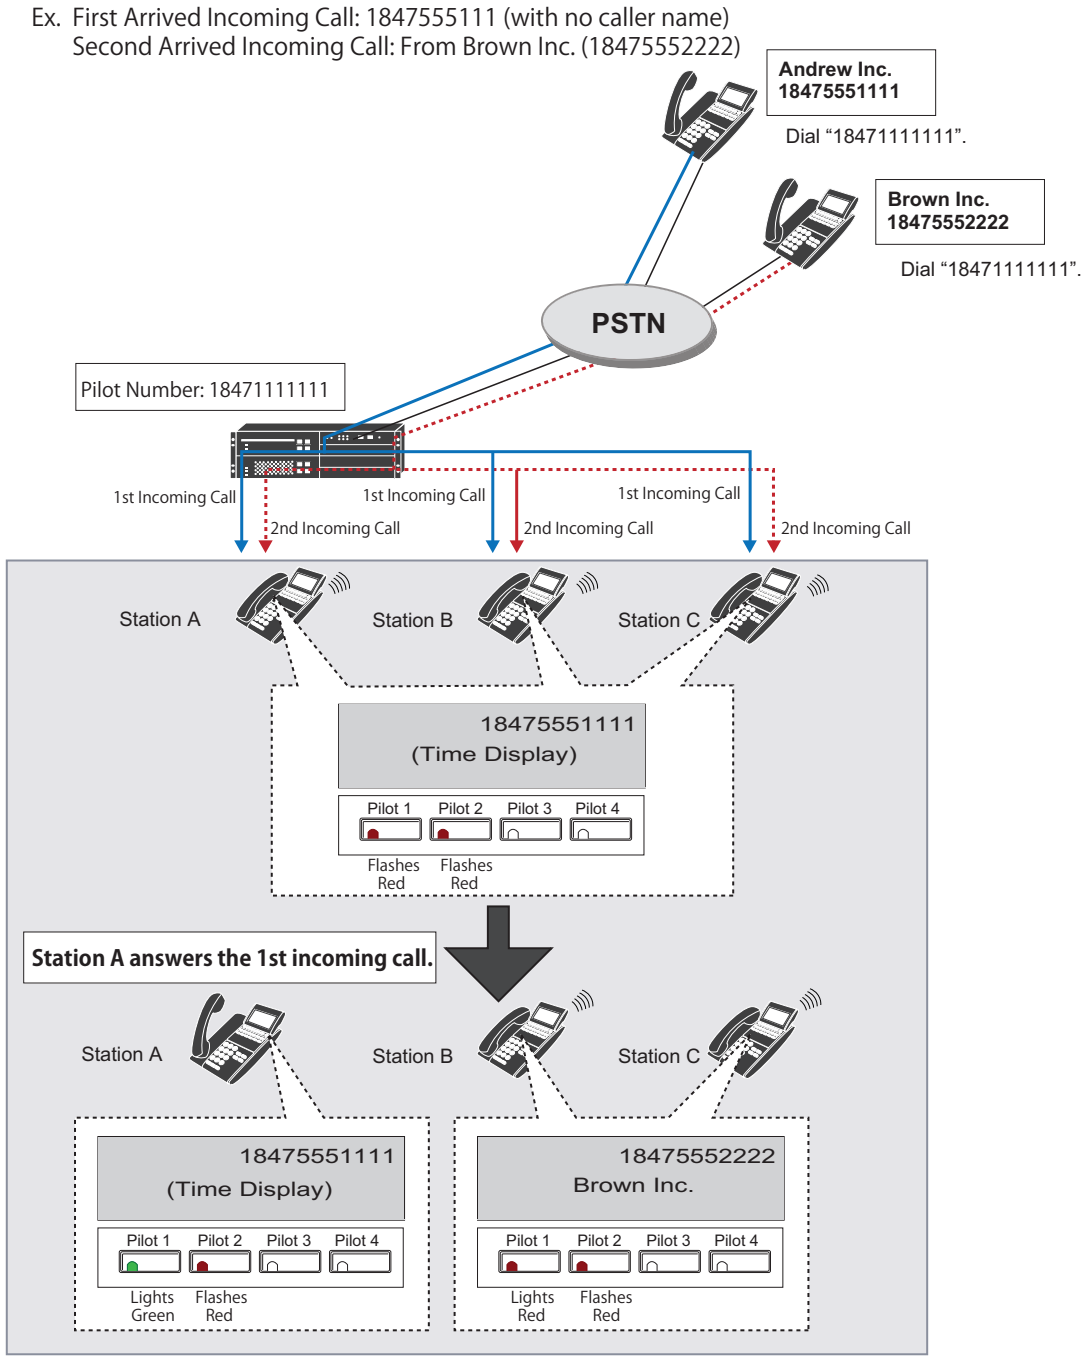
Note: After the data of Caller ID Display - Sub Line (ASYDL/ASYDN, SYS1, Index 1248, Bit 0) and Mixed Display of Caller ID Display-Subline (ASYDL/ASYDN, SYS1, Index 1248, Bit 4) are changed, a system needs to be initialized. For terminals connected to an ELC card, the card needs to be initialized.

Note: After changing data for the LN PRE parameter of AKYD command, initialize the ELC card.



Note: In this feature description, it is assumed that Prime Line and My Line are set as the same number, and both are referred to as Prime Line. For more information about multiple lines, refer to 5.1 Multiple Lines of CHAPTER 2.

Ex. First Arrived Incoming Call: From Andrew Inc. (18475551111)
Second Arrived Incoming Call: From Brown Inc. (18475552222)



Note: When multiple Sub Lines receive incoming calls respectively, Caller ID of the first arrived call is displayed. When the first arrived call is answered, Caller ID of the second arrived call is displayed on the other stations' LCDs.

When multiple lines receive calls, an LCD shows the information of the Caller ID and the caller name that are corresponding to each other.

When the first incoming call does not have the caller name but the second incoming call has the caller name, Station A displays only the Caller ID of the first incoming call that is being answered.

Operating Procedure

None.

Service Conditions

<Important Notices>

1. The information to be displayed for incoming calls on Sub Line is the same as for calls on Prime Line.

   Note: When the terminal type or setting of the language of Prime Line and Sub Line differs, the information which is applied in each terminal condition is displayed.

2. When name is not registered, current time is displayed.

   Top line : Calling Party Number

   Middle Line : Calling Party Name

   Bottom line : Not used in this feature

3. A maximum of 40 Caller IDs can be accumulated per telephone (Prime Line is included, therefore, 39 lines are available as Sub Line). LCD displays Caller IDs for the lines which are registered to KYNs 1-40 of AKYD command.
4. When Station A accommodates Prime Line of Station B using Phonebook [P-83] - Local Phonebook as its Sub Line, and Prime Line of Station B receives an incoming call, Local Phonebook data of Station B is displayed on the LCD of Station A. In such a case, do not use Phonebook [P-83] - Local Phonebook at Station B.

<Interactions with Other Features>

1. When this feature is used in conjunction with Multiple Line Operation, a station number can be shared among up to 20 SIP Multiple Line telephones (set as their Sub Lines). If an incoming call is terminated to a station whose number is shared among more than 20 SIP Multiple Line telephones, the traffic of IP packets sent from SIP server to the SIP telephone is momentarily increased. This restriction does not apply to Legacy terminals such as DT300 Series.
2. When you use Call History [C-195], Call History data for Prime Line is stored regardless of whether or not the call has been answered; however, the data for Sub Line cannot be stored (displayed on the LCD but not stored).
3. This feature is not available for Line keys on the DSS console (ADM mode). Even when the Line key on the console receives an incoming call, LCD does not display the Caller ID.
4. When you use Phonebook [P-83], LCD displays name registered to Phonebook. Also, the LCD displays numbers notified from the system.
5. Intermediate Station Number Display - D [I-10D] is still available when you use this feature.
6. For an incoming call from a station with Telephone Number set, LCD on the called station displays the Telephone Number as Caller ID.
7. Enable 24-digit format by assigning ASYDL, SYS1, Index 672, Bit 1=1.
8. LCD does not display Caller ID when CLI Suppression–CCIS is allowed (ASFC, SFI 242 = 1).
9. This feature is not available in OAI/ACD system.
10. This feature is available for the Hotel system.
11. When your system enables Line Pre-selection-D [L-9D], this feature executes as follows:
    - LCD displays Caller ID with higher priority when multiple Sub Lines receive incoming calls through this feature.
    - LCD displays Caller ID for a certain period of time by pressing a Line key when multiple Sub Lines receive incoming calls. You can answer the displayed call.

12. When the conversation of the first call ends, in case a station receives the second call during the Elapsed Time Display for the first call, Calling Party Number (for the second call) will be displayed after the Elapsed Time Display ends.

<Hardware/Software>

1. One of the ELC cards listed below is required for this feature.

ELC Card	Firmware Requirements
CH-16ELCA	SP-4035 16ELCA PROG-A Version 1 or later.
PA-16ELCN **Note 1**	SP-3981 16ELCN PROG-C Version 1 or later.
PA-16ELCN-A **Note 1**	SP-4013 16ELCN-A PROG-A Version 1 or later.

Note: Use SP-4034 16ELCN-A PROG-B Issue 1A or later to stop showing information of the call that is terminated to another line while you are talking on or placing a call.

Note 1: This feature does not work except when the ELC card switch setting (SW11-5, 6) is set to standard (both SW11-5, 6 are turned on). For more details about the ELC card switch setting, refer to each ELC card description in CHAPTER 4 Cards in 8U-PIR of Circuit Card Description.

2. DtermIP INASET do not support this feature.

Note: SIP/IP terminal starts to accumulate Caller IDs for incoming calls after the telephone boots up. Once you reboot the telephone, the accumulated Caller IDs are cleared. However, when PH Fixed Hunting is enabled, the accumulated Caller ID information is retained even if you reboot the telephone.

Note: The following system data determines PH Fixed Hunting: ASYDL, SYS1, Index 824, Bit 0.

Note: When the following command data is assigned or changed, Caller ID information is cleared by a restart of the telephone even if PH Fixed Hunting is used in the system.

- ADKS
- AKYD
- AKYD_T
- ASCL
- ASCL_T
- ASTN
- MBLE
- MBST
- MBST_T

3. (Conditions for PA-16ELCJ-B/PA-16ELCN/PA-16ELCN-A) This feature only works when the Terminal Mode Setting of Switch 11 (SW11 5-6) on ELC circuit card is set to ON/ON (Standard Setting). For details on the switch settings of the circuit cards, see sections related to ELC cards in the Circuit Card Description.

4. When calls concurrently arrive at both of My Line and Sub Line of a SIP Handler Controlled SIP terminal in Multi Line Mode, the SIP Handler Controlled SIP terminal receives the calling station information such as name and number from both calling stations. The calling station information to be displayed depends on the specification of the SIP Handler Controlled SIP terminal.

<Interactions with Networks>

None.

<Conditions Specific to This Feature>

1. When a station receives multiple incoming calls, and the first arrived call is answered by another station or abandoned, the displayed Caller ID changes to that of the second incoming call.
2. When a station receives multiple incoming calls, LCD displays Caller IDs as follows:
   - When Prime Line receives an incoming call, LCD displays Caller ID for Prime Line.
   - When Prime Line does not receive an incoming call, LCD displays Caller IDs in order of arrival.
3. When a station becomes idle (from busy status) while receiving multiple incoming calls, LCD displays Caller ID of the next priority call.
4. When you answer an incoming call, LCD displays Caller ID of the answered call. Even though Prime Line receives another call, the LCD displays Caller ID of the answered call.
5. When multiple Sub Lines receive incoming calls, you can answer the displayed call by pressing the ANSWER key. An incoming call received on Prime Line has higher priority than other calls.
6. When multiple stations answer incoming calls at the same time, there may be differences between the displayed Caller ID and that of the actually answered call. In that case, check the Caller ID displayed after answering the call.
7. When multiple Sub Lines receive incoming calls, you cannot identify which call (call terminated to Sub Line) is currently displayed on the LCD.
8. When you use Terminal Call History (terminal side call history), only the history data of answered call will be saved. (history data of unanswered call is not saved even if the Caller ID is displayed).

Note: History data for Prime Line can be saved regardless of whether the call is answered or not answered; however, when using Soft Phone, history data is not saved in the following situation.
- A call is not answered.
- A call via Soft Phone WLAN Handset or SOFT PHONE - PS is answered.
- A call via Desktop terminal with call history feature is answered.

9. This feature has the following limitations on the Line Pickup Preference function controlled by the LN PRE parameter of the AKYD command:

   - When LN PRE is set to 0 (Standard)

     Incoming Line Preference (Button Location Ascending Order) does not work when the ANSWER button is pressed.

   - When LN PRE is set to 1 (Customize; Line Preference data is set by ANSWER button and ORIGINATING button.)

     The ANS parameter (Line Preference For Answer Button or Handset/Headset) cannot be set to 2 (Ringing Line Preference (CO Incoming Call takes precedence)). Since this option gives preference to CO incoming calls over other incoming calls, the CALLER ID DISPLAY - SUB LINE [C-204] feature does not operate properly.

10. If a call is terminated to any line while you are talking on or placing a call, LCD does not display the information of the incoming call until you finish talking or placing the call.

Note: If you need to see incoming call information while you are talking or placing a call, assign ASYDL/ASYDN, SYS1, Index 1248, Bit 4=1 (Mixed Display of Caller ID Display-Subline is enabled).

Displayed Information For Each Status (Basic Pattern)

Note: The above flowchart shows an example of displayed information.

11. The following conditions are applied when you use Terminal Phonebook.
    a.) LCD displays as follows:

When a Sub Line is being called	Telephone number of a called party is only displayed
When a call terminated on a Sub Line is being answered	Information registered on Terminal Phonebook is displayed

    b.) When you also use a name display service by system settings such as Name Display data corresponding to each station number (assigned by the ANDD/ANDD_T command), Caller ID data (assigned by the ACID command) or System Phonebook data (assigned by the APBKN command), LCD displays as follows:

When a Sub Line is being called	Caller name by system settings such as the ANDD/ANDD_T, ACID or APBKN command data is displayed
When a call terminated on a sub line is being answered	Information registered on Terminal Phonebook is displayed

Note: For the other conditions concerning Terminal Phonebook, see Phonebook [P-83].

<Other Conditions>

None.

Programming

STEP 1: **ASYD** - System Data
SYS1, Index 390, Bit 2=1 (Caller ID is displayed on the bottom line of the LCD)

STEP 2: **ASYDL** - System Data for LDM
SYS1, Index 672, Bit 1=1 (24-digit format is enabled)

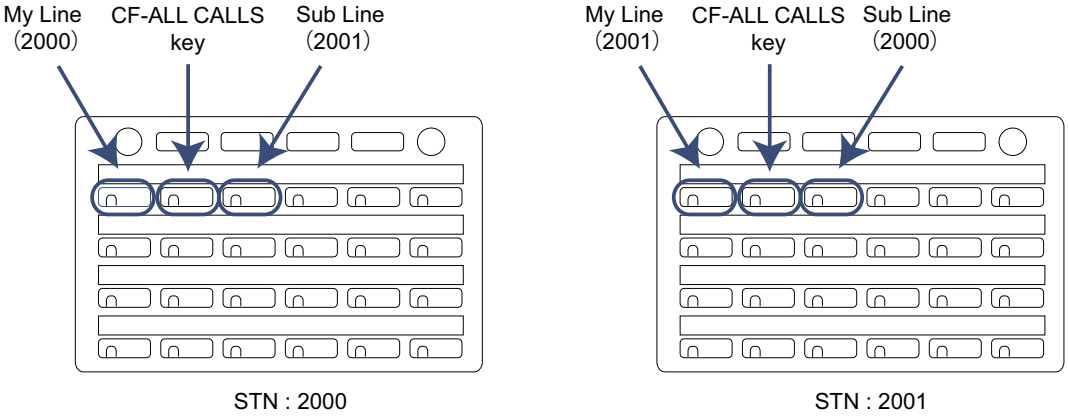
STEP 3: **ASYDL/ASYDN** - System Data (LDM/NDM)
SYS1, Index 1248, Bit 0=1 (Caller ID Display - Sub Line is enabled)
SYS1, Index 1248, Bit 4=0 (Mixed Display of Caller ID Display-Subline is disabled)

Note: Initialize the terminal (for IP Multiple Line terminal/SIP Multiple Line terminal) or ELC card (for Digital Multiple Line terminal) for the change of this system data to take effect.

STEP 4: **AKYD** - Key Data for Desktop Terminal
TN: Tenant Number
STN: Station Number (Assign Station Number of My Line)
PRI: Form of Line Preference
PL TN: Prime Line Tenant
PL STN: Prime Line Station Number
MWD: Message Waiting Data Display Selection
0: MW data display on the top line
1: MW data display on the bottom line
LN PRE: Line Preference **Note 2**, **Note 3**
0: Standard
1: Customize (Line Preference data is set by ANSWER button and ORIGINATING button)

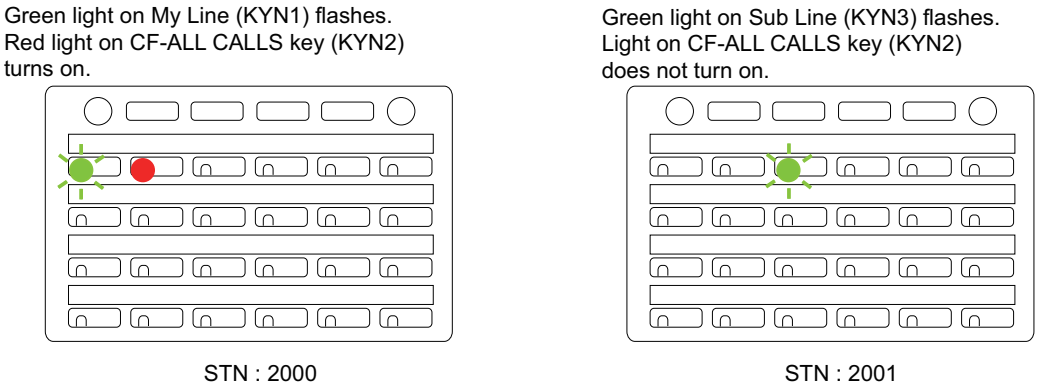
Note 2: For details about Line Pickup Preference setting, see “5.4 Line Pickup Preference” in CHAPTER 2.

Note 3: When LN PRE is set to 1, do not assign 2 (Ringing Line Preference (CO Incoming Call takes precedence)) to the ANS parameter of this command.



C-206 Call Forward Line Lamp Indication

General Description



A Line key lamp turns on or flashes (hereinafter both status are described as “flash”) by enabling this feature when Call Forwarding-All Calls features are set to My Line as well as Sub Lines. You can set the indication pattern of the Line key lamp by assigning system data.

The following shows the behavior of Line key lamps when this service is used with the settings outlined below.

Key Number	Settings	
	STN : 2000	STN : 2001
1	My Line (2000)	My Line (2001)
2	Call Forwarding - All Calls	Call Forwarding - All Calls
3	Sub Line (2001)	Sub Line (2000)

<Call Forwarding - All Calls is set to STN: 2000>

Operating Procedure

None.

Service Conditions

<Important Notices>

1. After changing the system data, perform one of the following operations for each system data to reflect the setting.

   [Index 679, Bit 3 and Index 681, Bit 3]

   - Setting and canceling Make-Busy for a station by the MBST command

   [Index 1257, Bit 3, Bit 4 to Bit 6 and Bit 7]

   - System Initialization

<Interactions with Other Features>

1. If the Prime Line key is flashing due to this feature, Dynamic Dial Pad located in SELECTIVE DIALING [S-162] cannot be used.
2. If Call Forwarding-All Calls features are set for My Line on the terminal where Software Multiple My Line Appearance [S-143] is set, the Line key lamp of the Same Number Sub Line does not flash.
3. When using this feature and Message Lamp Control with Message Center Interface [M-26] and Message Waiting Lamp Setting - Station [M-30] at the same time, the priority of these features needs to be set by the system data, Line Lamp Priority for Call Forward Line Lamp Indication (ASYDL, SYS1, Index 681, Bit 3).
4. This feature cannot be used on Line keys that are accommodated by PS Line Appearance On Dterm [P-71].
5. This feature is not available for OAI systems.

<Hardware/Software>

1. For DT800 Series/DT700 Series, when the Prime Line key is flashing due to this feature, a call cannot be originated from the Terminal Phonebook.

   Note: A small LCD type of DT700 Series does not have Terminal Phonebook.

2. For DESI-less terminal, an icon is displayed in accordance with the indication pattern while the Line key lamp is flashing. The Exclusive Hold icon is displayed with the default setting of the system data (ASYDL, SYS1, Index 1257, Bit 4 to Bit 6).

   Note: When Call Forward Line Lamp Indication Pattern (ASYDL, SYS1, Index 1257, Bit 4 to Bit 6) is set to 1 or 7, an icon turns on. Other than this setting, an icon flashes (the flashing patterns cannot be set).

3. For DT700 Series (a large LCD type), an icon can be displayed instead of the Line key lamp indication. When using this function, set the system data (ASYDL, SYS1, Index 1257, Bit 7=1).

   Note: When Call Forward Line Lamp Indication Pattern (ASYDL, SYS1, Index 1257, Bit 4 to Bit 6) is set to 1 or 7, an icon turns on. Other than this setting, an icon flashes (the flashing patterns cannot be set).

4. When using this feature on Softphone, you need to assign Call Forward Line Lamp Indication for Softphone (ASYDL, SYS1, Index 1257, Bit 3=1). In this case, the Softphone display shows an icon on the action screen in accordance with the indication pattern (the default is the "HOLD" icon). When Call Forward Line Lamp Indication Pattern (ASYDL, SYS1, Index 1257, Bit 4 to Bit 6) is set to 1 (Red light turns on) or 7 (Green light turns on) and Call Forwarding-All Calls is set, once you lift the handset you will hear no tone and you will not be able to cancel Call Forwarding-All Calls, therefore, avoid to set to "Red light turns on" or "Green light turns on" patterns.

5. When using this feature on Softphone, if you want to cancel Call Forwarding-All Calls, lift the handset and press the Feature Key for Call Forwarding-All Calls. Using the forwarding set screen of Softphone you can set Call Forwarding-All Calls but you cannot cancel it.

6. This feature is not available for the following terminals.
   - DtermSP30 (Proprietary Protocol/SIP)

7. When you use DSS Console, the following restrictions are applied at the time of terminal re-registration.

   - ADM mode

     This feature can be set for the top 24 Line keys on a DSS console.

   - DSS mode

     This feature cannot be set for the DSS keys on a DSS console.

8. This feature is not available for a terminal that does not have lamps on Line keys.

9. This feature is not available for a PA-16ELCJ-B card.

<Conditions Specific to This Feature>

1. Do not load the Call Forwarding data to a memory during system operation. If you do so, the Desktop terminal LCD may not indicate the correct Call Forwarding status.
   To correct this, you can do either of the following:

   - Setup or cancellation of the Call Forwarding feature

   - System Initialization

2. When Call Forward Line Lamp Indication Pattern (ASYDL/ASYDN, SYS1, Index 1257, Bit 4 to Bit 6) is set to 1 (Red light turns on) or 7 (Green light turns on) and Call Forwarding-All Calls is set, you can originate a call by lifting the handset or pressing the Speaker key after pressing the lighting Line key.

<Other Conditions>

None.

Programming

ASYDL/ASYDN - System Data (LDM/NDM)

System Data 1

Index 679
Bit 3=1: Call Forward Line Lamp Indication is enabled **Note 1**

Index 681
Bit 3: Line Lamp Priority for Call Forward Line Lamp Indication **Note 1**

0 = Message Waiting Lamp Setting - Station [M-30] has priority over Call Forward Line Lamp Indication [C-206]

1 = Call Forward Line Lamp Indication [C-206] has priority over Message Waiting Lamp Setting - Station [M-30]

Index 1257
Bit 3: Call Forward Line Lamp Indication for Soft Phone

0 = Call Forward Line Lamp Indication is not enabled on Soft Phone

1 = Call Forward Line Lamp Indication is enabled on Soft Phone

Bit 4-6: Call Forward Line Lamp Indication Pattern

: Green light is on : Red light is on : Light is off
The number (ms) displays how long the lights turn on/off.

Setting	Status	Pattern
0	Green light flashes	640ms, 128ms, 128ms, 128ms
1	Red light turns on	
2	Red light flashes	128ms, 128ms, 128ms, 128ms, 128ms, 128ms, 128ms, 128ms
3	Red light flashes	512ms, 512ms
4	Green light flashes	128ms, 128ms, 128ms, 128ms, 128ms, 128ms, 128ms, 128ms
5	Green light flashes	512ms, 512ms
6	Green light flashes	640ms, 128ms, 128ms, 128ms
7	Green light turns on	

Note: When using this feature on Softphone (SYS1, Index 1257, Bit 3=1), set the Bit 4 to Bit 6 to 0 or 2~6.

Bit 7: Call Forward Line Lamp Indication for DT700 Series (Large LCD Type)

0 = Call Forward Line Lamp Indication is not enabled on DT700 Series (Large LCD Type)

1 = Call Forward Line Lamp Indication is enabled on DT700 Series (Large LCD Type)

Note 1: To apply the change, setting and canceling Make-Busy for a station by the MBST command are required.

C-207 Call Pickup - One Touch Key

General Description

This feature allows an incoming call directed to a Call Pickup Group to be answered using a Line/Feature key assigned to a Desktop terminal. Desktop terminal users can pick up the call by pressing the Feature key corresponding to the Call Pickup Group.
If multiple Call Pickup Groups are assigned to Feature keys, the lamp for the corresponding Call Pickup Group key flashes when an incoming call arrives to a station.

Operating Procedure

To pick up an incoming call

1. A station belonging to Call Pickup Group A receives an incoming call.
2. The Lamp for the Feature key that is assigned to Call Pickup Group A flashes red.
3. Lift the handset or press the SPEAKER key.
4. Press the Feature key corresponding to the Call Pickup Group. You can now start talking with the calling party.

Service Conditions

<Important Notices>

None

<Interactions with Other Features>

1. A Call Pickup Group for this feature is not the same as a Call Pickup Group assigned for CALL PICKUP - GROUP [C-7] feature.
2. This feature is available in combination with the following features:
   CALL PICKUP - GROUP [C-7]
   Expanded Call Pickup - Group
   CALL PICKUP - DIRECT [C-30]
3. This feature is counted as CALL PICKUP - GROUP [C-7] in the SERVICE FEATURE PEG COUNT [S-27]. This feature is not counted individually.
4. Location Diversity feature is not available with this feature.
5. As for DIAL PLAN TO SUPPORT IP CENTREX FUNCTIONALITY [D-166], note the following restrictions:
   - Assignment of the data by the ACPKN command is available for the same site in the same node.
   - Assignment of the data by the ACPDN command is available not only for the same site but also for the different site in the same node.
6. The CALL PICKUP - ONE TOUCH Feature key cannot be used to answer a call from the paged individual through Paging Answer Access Code in the Delay System of PAGING TRANSFER [P-10].

<Hardware/Software>

1. When an incoming call arrives to a Call Pickup Group, the lamp for the Feature key assigned to the Call Pickup Group flashes red.
2. When multiple incoming calls arrive to a Call Pickup Group, the Feature key continues to flash until all the calls are picked up. When a single incoming call arrives to a Call Pickup Group, the Feature key stops flashing after the call is picked up.
3. Once Ringer Tone is enabled for a Call Pickup Group, the ringing can be enabled/disabled per terminal by assigning the RG parameter in AKYD/AKYD_T command.

Note: For FP95-114 V4 or earlier, when an incoming call arrives to a Call Pickup Group, the lamp for the Line/Feature key flashes but there is no Ringing Tone.

a.) You can set whether to enable/disable the Ringing Tone per Call Pickup Group.
b.) The ringer pattern of an incoming call can be assigned by ASYDL/ASYDN, SYS1, Index 685, Bit 0-2. Also, when multiple incoming calls arrive to the Call Pickup Group, the priority of the ringer pattern for terminals other than those belonging to the group, will be as follows:

INDEX 685 bit 0-2	Ringer Pattern Name	Ringer Pattern Setting (default)	Ringing Tone	Priority of when multiple incoming calls arrive
0	No tone	-	No tone	7 (Low)
1	Ringer Pattern 1	ASYD, SYS3, Index1 (0x21)	1 second ON/2 seconds OFF (When Index3, bit 1=1, the tone is 0.4 seconds ON/0.2 seconds OFF/0.4 seconds ON/2 seconds OFF)	6
2	Ringer Pattern 0	ASYD, SYS3, Index0 (0x21)	1 second ON/2 seconds OFF (When Index3, bit 0=1, the tone is 0.4 seconds ON/0.2 seconds OFF/0.4 seconds ON/2 seconds OFF)	5
3	-	-	0.5 seconds ON/0.5 seconds OFF	4
4	Not used (This setting is restricted)			
5	Ringer Pattern 5	ASYD, SYS3, Index7 (0x42)	2 seconds ON/4 seconds OFF (When Index3, bit 5=1, the tone is 0.4 seconds ON/0.2 seconds OFF/0.8 seconds ON/0.2 seconds OFF/0.4 seconds ON/4 seconds OFF)	3
6	Ringer Pattern 6	ASYD, SYS3, Index8 (0x00)	1 second ON/2 seconds OFF	2
7	Ringer Pattern 7	ASYD, SYS3, Index9 (0x11)	1 second ON/1 second OFF	1 (High)

For example:
If an incoming call arrives to the Call Pickup Group that is assigned Ringer Pattern 0, and the My Line is assigned Ringer Pattern 1, the ringing tone changes to Ringer Pattern 0.

c.) Depending on the settings of the RG parameter in the AKYD command and system data (ASYDL/ASYDN, SYS1, Index 685, bit 0-2), the terminal operation when an incoming call arrives to a Call Pickup Group is as follows:

RG Parameter of AKYD Command	SYS1 INDEX 685 Bit 0-2	Call Indicator Lamp	Ringing Tone
0-6	0	No lamp indication	No tone
	0-7	No lamp indication	No tone
7	0	No lamp indication	No tone
	1/2/3/4/5/6/7	Flashes red	Ringer pattern is 1/2/3/4/5/6/7

Note: The flashing pattern of the call indicator lamp cannot be changed.

d.) For the terminals accommodated in a UG50, the ringer patterns for incoming calls are different from those of the terminals accommodated in the Telephony Server. For details, see 7.5 Limitations on Voice and Tone in the CHAPTER 1 BEFORE INSTALLATION on Peripheral Equipment Description (UG50).

e.) When RG=7 is assigned to the group pickup key on AKYD/AKYD_T command, if an incoming call arrives at a busy state terminal that is in Call Pickup Group, the ringing tone volume will be smaller than one used in on-hook status (approximately 20dB smaller than the setting).

f.) When using a headset, ringing tone volume will be lower for the incoming call except during a conversation. The volume for the ringing tone can be set not to change by assigning SFI: 263=1 in ASFC/ASFCN command. For details, see RING VOLUME IN HEADSET MODE [R-62].

4. As for Soft Phones, flashing of a Line/Feature key Lamp can be shown by displaying Line Lamp Indication.
5. A Call Pickup Group can be assigned to Line/Feature keys of Desktop terminals but it cannot be assigned to Soft keys.
6. The following terminals can belong to a Call Pickup Group, but cannot pick up calls arriving to the Call Pickup Group.

- Analog station
- SIP Handler Controlled SIP terminal

<Interactions with Networks>

1. For the system using FCCS network, the stations assigned to the same Call Pickup Group must be accommodated in the same Node.

<Conditions Specific to This Feature>

1. When using CALL PICKUP - DIRECT [C-30], you can answer a specific incoming call for the Call Pickup Group using the access code assigned for Call Pickup - Direct + the station number that is receiving the incoming call you want to answer.

   Note: Available since FP95-115 V5. For FP95-114 V4 or earlier, call pickup with access code is not available.

2. When an incoming call to a station that is a member of Group A is picked up and another new incoming call arrives for a different station that is also a member of Group A, the latter call can also be picked up by pressing the Feature key of Group A assigned to the other Desktop terminals.
3. Telephone Numbers assigned in the ALGSN command are used as the station numbers for the Call Pickup Group members.
4. This feature is available only to the member stations accommodated in the same Node. An incoming call to the group that is accommodated in another Node cannot be picked up.
5. A maximum number of 1000 Call Pickup Groups can be assigned per System.
6. A maximum number of 50 stations can be assigned per Call Pickup Group.
7. A maximum number of five Call Pickup Groups can be assigned per Desktop terminal.
8. The same Call Pickup Group can be assigned to up to 100 Desktop terminals.
9. A station cannot be assigned to two or more different Call Pickup Groups.
10. The same Call Pickup Group cannot be assigned to a Desktop terminal more than once.
11. The conditions for accommodating member stations of Call Pickup Group and Desktop terminals are as follows.

System Configuration	Conditions for Accommodation
IMG/MMG System	within IMG0 - IMG3 (including virtual lines)
UMGi/RNIP System	Not supported

12. If multiple incoming calls arrive to stations assigned to the same Call Pickup Group, the order for answering the incoming calls depends on system data. The following two patterns will determine the order that is used to answer the incoming calls.

    Pattern 1:
    The calls are picked up in the order they are assigned to the group in the ACPKN command (ASYDL/ASYDN, SYS1, Index 685, bit 7=0).

    Pattern 2:
    The incoming calls are picked up in the order of their arrival (ASYDL/ASYDN, SYS1, Index 685, bit 7=1).

    Note: For FP95-114 V4 or before, only Pattern 1 is supported.

13. For Pattern 2 above, the conditions are as follows:
    a.) When an incoming call arrives to a Call Pickup Group, if the incoming call is forwarded to a station within the same group or to a different group via Call Forwarding - All Calls/Busy Line/ Logout, the order of the incoming call will be last in the forwarding destination group. After that, calls to the forwarding destination group, are answered in the order of the incoming calls to the forwarding destination group including the forwarded call.
    b.) When an incoming call arrives to a Call Pickup Group, if the incoming call is forwarded to a station within the same group or to a different group via Call Forwarding - Don't Answer, the order of the incoming call will be last in the forwarding destination group (the order of the incoming call before being forwarded will not be maintained). After that, calls to the forwarding destination group, are answered in the order of the incoming calls to the forwarding destination group including the forwarded call.

Note:

- If a call to a Call Pickup Group of the forwarding destination is picked up before the call is forwarded via Call Forwarding - Don't Answer, the call is answered in the order of the forwarding destination group if there are other incoming calls to the forwarding destination group. If there are no incoming calls to the forwarding destination group, the pickup will be restricted.
- After a call has been forwarded via Call Forwarding - Don't Answer, when you pick up a call to the Call Pickup Group that the call has been forwarded to, if there are other incoming calls on the forwarded destination group, the call is answered in order of the forwarded destination group except the forwarded call. If there are no incoming calls to the forwarding destination group, the pickup will be restricted.

    c.) When an incoming call arrives to a Call Pickup Group, if the incoming call is transferred to a station within the same group or to a different group by Call Transfer - All Calls, the order of the incoming call will be last in the transferring destination group. After that, calls to the transferring destination group, are answered in order of the incoming calls to the transferring destination group including the transferred call (The call has already been answered. Therefore, the order of the incoming call before being transfered will not be maintained. The call will be regarded as the new incoming call to the transferring destination group without relating the order after the call transferred.)
    d.) When the setting for answering calls in order of arrival for Call Pickup - One Touch Key (ASYDL/ASYDN, SYS1, Index 685, Bit 7) is changed from disable to enable, calls can be picked up in the order of arrival only if the incoming calls arrived to the pickup group while the system data is being set to enabled. Calls arriving to the pickup group when the system data is still set to disabled will be last.
    e.) When the setting for answering calls in order of arrival for Call Pickup - One Touch Key (ASYDL/ASYDN, SYS1, Index 685, Bit 7) is changed from enable to disable, calls can be picked up in the order they are assigned to the Call Pickup Group in the ACPKN command.
    f.) Change the data of ACPKN command only when all lines for the terminals are in an idle state and when there are no incoming calls in the pickup group.
14. When incoming calls to a Call Pickup Group are answered, the pickup information can be not displayed on the LCD by ASYDL/ASYDN, SYS1, Index 685, Bit 4.

15. When an incoming call is arriving at a Call Pickup Group, when the assignment is changed for the CALL PICKUP - ONE TOUCH Line/Feature keys on each terminal in the ACPDN command, the following are conditions for the lamp indication for the Line/Feature keys.

    Note: For FP95-114 V4 or before, be sure to change the setting in the ACPDN command only when all lines of the terminals are in an idle state and when there are no incoming calls to the pickup group. If you change the group number when an incoming call is arriving to the Pickup Group, the lamp for the feature key for the Call Pickup Group might not flash or turn off.

    a.) When you are changed from a group that is receiving a call to a group that is not receiving a call or if deleted from a group that is receiving a call, the lamp is turned off immediately.
    b.) When you are changed from a group that is not receiving a call to a group that is receiving a call or if creating a new group, the lamp for the new incoming calls arriving to the changed group, the lamp will flash red. Also, you can answer the incoming call when the lamp is turned off.
    c.) When you are changed from a group that is receiving a call to a group that is receiving a call, the lamp is turned off immediately. If a new incoming call arrives to the changed group, the lamp flashes red. Also, you can answer the incoming call for the changed group when the lamp is turned off.
    d.) When the assignment of a Line/Feature key is changed from one group, that is receiving an incoming call, to another groups that is also receiving an incoming call, the lamp will be turned off immediately. If a new incoming call arrives to the group, the lamp for the changed Line/Feature key will flash red.
    You can answer the incoming call by pressing the Line/Feature key for the changed group, but you cannot answer the incoming call by pressing the Line/Feature key before it is changed; the lamp status will not be changed.
    e.) When a new group is being assigned via the ACPDN command while an incoming call is arriving to the Call Pickup Group, the lamp for the Line/Feature key will be off. When a new incoming call arrives after the group is added, the lamp will flash red. Also, you can answer the incoming call even if the lamp is turned off.

<Other Conditions>

None

Programming

STEP 1: **ASYDL/ASYDN** (Assignment of System Data (LDM/NDM))

SYS1
Index 679
Bit 5=1 (Call Pickup - One Touch Key = Enabled)

Index 685 **Note 1**
Bit 0-2=1-7 (Ringing Tone for Call Pickup - One Touch Key (1-7))
Bit 3=1 (Call Pickup - One Touch Key Enhancement = Enable)
Bit 4=0/1 (Call Pickup information display on LCD = 0 (Enable)/1 (Disable))
Bit 7=0/1 (Answering a call in order of incoming calls for Call Pickup - One Touch Key = 0 (Disable)/1 (Enable))

Note 1: Note the following conditions:

- Available since FP95-115 V5.
- For the Bit 3, assign **Enable** to use the following commands:
  - ASYDL/ASYDN, SYS1, Index 685, Bit 0-2
  - ASYDL/ASYDN, SYS1, Index 685, Bit 4=1
  - RG=7 setting for AKYD/AKYD_T command

STEP 2: **ACPKN** (Assignment of Call Pickup Key Group for NDM)
Assign Telephone Numbers (up to 50 station numbers) to the corresponding Call Pickup Group.

TYPE: Select either of the radio buttons.
Telephone Number
Call Pickup Group Number

When Telephone Number is selected:
BASE UGN: User Group Number (1 - 255)
BASE TELN: Telephone Number (up to 16 digits)
BASE CPG: Call Pickup Group Number (1 - 1000)
TELN: Telephone Number (up to 16 digits)

When Call Pickup Group Number is selected:
BASE CPG: Call Pickup Group Number (1 - 1000)
UGN: User Group Number (1 - 255)
TELN: Telephone Number (up to 16 digits)

STEP 3: **AKYD/AKYD_T** (Assignment of Desktop Terminal Data/ Assignment of Desktop Terminal Data (Telephone Number))
Assign up to five Line/Feature keys for Call Pickup - One Touch keys to a Desktop terminal.
FKY=185 - Call Pickup Key Group-1
FKY=186 - Call Pickup Key Group-2
FKY=187 - Call Pickup Key Group-3
FKY=188 - Call Pickup Key Group-4
FKY=189 - Call Pickup Key Group-5

To provide a ringing tone when an incoming call arrives to the Call Pickup Group, assign RG (Ringing information for each multi-line (0-7)) = 7 to the target group pickup key. **Note 2**

Note 2: The conditions are as follows.
- Available since FP95-115 V5.
- When you assign 1-6 to RG, the terminal works the same as the parameter 0 (No tone).
- RG cannot be specified to fix key. Be sure not to assign FKY=185-189 to fix key.
- For AUPDN command and AKDTN command, RG cannot be specified on FKY=185-189.
- For ADM mode of DSS console, be sure not to assign FKY=185-189 to the key data of DSS console by AKYD/AKYD_T command.

STEP 4: **ACPDN** (Assignment of Call Pickup Key Group Dterm for NDM)

Assign Call Pickup Group Numbers to Call Pickup - One Touch keys.
UGN: User Group Number (1 - 255)
TELN: Telephone Number (up to 16 digits)
CPG: Call Pickup Group Number (1 - 1000)

Note: To delete/change the data, perform the above procedure in reverse order.
Deletion/change of the data through the ACPDN command should be performed when no incoming call arrives to a Call Pickup Group.
If the data is deleted/changed while an incoming call arrives to a Call Pickup Group, there is a possibility that Feature key lamps might not flash/turn off.

C-208 Call Forwarding (CF) Button - One Touch

General Description

By registering the Call Forwarding - All Calls (**Note 1**) Access Code + a desired Forwarding Destination Number to a CF Setting button that is assigned to one of the Line/Feature keys on a Desktop terminal, this feature allows the setting and canceling of the Call Forwarding - All Calls feature just by pressing a CF Setting button.

Note: This feature is available from FP95-114 V4 Issue 2.0.

Note 1: Regarding this feature, Call Forwarding - All Calls is used to refer to the following features:

- CALL FORWARDING - ALL CALLS [C-5]
- CALL FORWARDING - ALL CALLS - ANNOUNCEMENT [C-69]
- CALL FORWARDING - ALL CALLS - OUTSIDE [C-28]
- MULTIPLE CALL FORWARDING - ALL CALLS [M-44]
- SPLIT CALL FORWARDING [S-99] (only the Call Forwarding - All Calls related content)
- CALL FORWARDING - ALL CALLS - CCIS [C-45]
- MULTIPLE CALL FORWARDING - ALL CALLS - CCIS [M-40]
- CALL FORWARDING-ALL CALLS- PRI/PRA [C-95/111]
- CALL FORWARDING-ALL CALLS- ANNOUNCEMENT - PRI/PRA [C-123/124]
- CALL FORWARDING-ALL CALLS - OUTSIDE - PRA [C-139]
- MULTIPLE CALL FORWARDING - ALL CALLS - PRI/PRA [M-75/83]

To register the desired Forwarding Destination Number

(A) Registration with Feature key

1. Press the Feature key located among the Flex keys.
2. Press a CF Setting button to register.
3. Dial the Call Forwarding - All Calls entry Access Code + the desired Forwarding Destination Number.
4. Press the Feature key.

(B) Registration with SPD setting key **Note 2**

1. Press the SPD setting key registered to one of Line/Feature keys or Soft keys.
2. Press the CF Setting button to register.
3. Dial the Call Forwarding - All Calls Access Code + the desired Forwarding Destination Number.

Note 2: For details on the SPD setting key, see SPEED CALLING - ONE TOUCH [S-26D] feature in this manual.

To set the Call Forwarding - All Calls feature

1. Press the CF Setting button to which the desired Forwarding Destination Number is registered.

To cancel the Call Forwarding - All Calls feature

1. Press any CF Setting button where Call Forwarding - All Calls feature is assigned.

Service Conditions

<Important Notices>

1. The CF Setting button can be used also as the button for Speed Calling - One Touch. However, in that case, the lamp control is only for Call Forwarding - All Calls.
2. If there is a Line/Feature key set with Call Forwarding - All Calls using the AKYD command, the lamp of such key also turns on and off. The lamp patterns for turning on and off of the CF Setting button (AKYD command FKY= 201 to 204) and the Call Forwarding - All Calls Line/Feature key (AKYD command FKY= 2) are as follows:

When Call Forwarding Feature is Set

Operation	Line/Feature key Lamp	
	CF Setting button	Call Forwarding - All Calls button
CF Setting button registered with Access Code (Call Forwarding - All Calls) + desired Forwarding Destination Number is pressed	Light	Light
Key registered with Speed Calling - One Touch and Access Code (Call Forwarding - All Calls) + desired Forwarding Destination Number is pressed	Not Light	Light
Access Code (Call Forwarding - All Calls) + desired Forwarding Destination Number are dialed	Not Light	Light
Call Forwarding - All Calls Line/Feature key is pressed + desired Forwarding Destination Number is dialed	Not Light	Light
Call Forwarding - All Calls data is set with the ACFS command	Not Light	Light
Call Forwarding - All Calls feature is set in the OAI service	Not Light	Light
CALL FORWARDING - I'M HERE [C-81] is set	Not Light	Light
REMOTE CALL FORWARDING CONTROL [R-54] is set	Not Light	Light

When Call Forwarding Feature is Canceled

Operation	Line/Feature key Lamp	
	CF Setting button	Call Forwarding - All Calls button
CF Setting button registered with Access Code (Call Forwarding - All Calls) + desired Forwarding Destination Number is pressed	Not Light	Not Light
Key registered with Speed Calling - One Touch and Access Code (Call Forwarding - All Calls) + desired Forwarding Destination Number is pressed	Not Light	Not Light
Access Code (Call Forwarding - All Calls) is dialed	Not Light	Not Light
Cancel Code (Call Forwarding - All Calls) is dialed	Not Light	Not Light
Call Forwarding - All Calls Line/Feature key is pressed	Not Light	Not Light
Call Forwarding - All Calls data is deleted with the ACFS command	Not Light	Not Light
Call Forwarding - All Calls feature is canceled in the OAI service	Not Light	Not Light
CALL FORWARDING - I'M HERE [C-81] is canceled	Not Light	Not Light
REMOTE CALL FORWARDING CONTOL [R-54] is canceled	Not Light	Not Light
Call Forwarding All Clear is set	Not Light	Not Light

3. For Digital terminals, register the CF Setting button with the AKYD command in the range of KYN= 1 to 32. In the range of KYN= 33 to 40, the CF Setting button cannot be used.
   SIP Multiple Line terminals can use the range KYN= 1 to 40 if 16LK Unit is used. Also, if ADM mode is used, the valid range is KYN= 1 to 16.
4. Several CF Setting buttons can be set with different desired Forwarding Destination Numbers. However, more than one CF Setting button cannot be set at a time.
5. If the operations described below are performed when a CF Setting button is set, the lamp of the CF Setting button turns OFF. Therefore, before performing such operations, cancel the CF Setting button and verify that the lamp turns OFF.

   - Changing/deleting a phone number that is assigned to the CF Setting button with the Feature key or the SPD Setting key.
   - Writing One-Touch Speed Calling data from HD to the memory with the BOSD command.
   - Replacing an ELC card.

6. Backup of the CF Setting button lamp state can be performed with the MEM_HDD command by selecting "One Touch Speed Calling for DtermIP". This way, when performing an Office Data Load & System Initialize, the state that is backup with the MEM_HDD command for CF Setting button lamp, One-Touch Speed Call Data (**Note 3**) and Call Forwarding data is used.

Note 3: In the case of Digital terminals, Speed Calling - One Touch Data is saved in ELC card and backup is not possible with the MEM_HDD command. For that reason, perform the backup and writing for this data with the BOSD command.

7. If station data is deleted, the data set for the CF Setting button is also deleted. When necessary, perform a backup with the MEM_HDD command or the BOSD command.
8. CF Setting button is available for DT800/DT700 Series and DT400/DT300 Series.
9. If the CF Setting button is used with a Digital terminal, an ELC card with the following firmware is required:

    - SP-4035 16ELCA PROG-A Issue 4 or later.

<Interactions with Other Features>

1. The following applies when using SPLIT CALL FORWARDING [S-99]:
    a.) A different CF Setting button can be set for an internal Station incoming call access code and an Outside Party (Central Office TIE, DID, etc.) incoming call access code. Therefore, setting and canceling operations can be performed also individually for each CF Setting button.
    b.) The CF Setting button lamp control can be different for the internal Station incoming call and the Outside Party incoming call.
2. If SOFTWARE MULTIPLE MY LINE APPEARANCE [S-143] is used, the desired Forwarding Destination Number can be set only for My Line.
3. CF Setting button cannot use Speed Calling - One Touch key with Page Changeover. Even if a page is designated when a desired Forwarding Destination Number is assigned, the same number is used to both pages.
4. For CALLING PARTY RECOGNITION SERVICE (CALL FORWARDING-All Calls/Busy Line/Don't Answer) [C-103] it is not possible to cancel the Call Forwarding - All Calls feature with the CF Setting button or by dialing the CALL FORWARDING - ALL CALLS entry ACCESS CODE (**Note 4**). Do not set the CF Setting button with this feature.

    Note 4: Call Forwarding - All Calls can be canceled with the entry Access Code with system data ASYDL/N, SYS1, Index 686, Bit 0= 1).

5. CF Setting button cannot be used if the features below are in use. Do not set the CF Setting button.

    - LOCATION DIVERSITY [L-55].
    - SPEED CALLING - STATION [S-21]
    - SPEED CALLING - GROUP [S-23]
    - SPEED CALLING - STATION-PRI/PRA [S-84/102]
    - SPEED CALLING - GROUP-PRI/PRA [S-85/103]

<Interactions with Networks>

None.

<Hardware/Software>

1. Display (LCD) Indications on DESI-Less terminals show the same data as Speed Calling - One Touch. You can register data to be displayed on LCD Indications for CF Setting buttons as well. For details, see Speed Calling - One Touch - D on DESI-Less Phone of Interactions section in DESI-LESS TERMINAL [D-169]. Note that there is the following condition on LCD Indications for Speed Calling - One Touch.

    - When CF Setting button is in service (ASYDL, SYS1, Index 1249, Bit 4=1), registering information to be displayed on LCD Indications to the 13th to 16th SPEED CALLING - ONE TOUCH buttons (**Note 5**) on the page 1 is not available.

    Note 5: This does not apply to Line/Feature keys where Speed Calling - One Touch (FKY= 49 in the AKYD command) is assigned.

    - When DESI-Less icon display is in service (ASYDL/ASYDN, SYS1, Index 684, Bit 1=0), DESI-Less icon is displayed in synchronization with lamp status.

2. CF Setting button cannot be assigned to Line/Feature keys on the DSS console.
3. For the Cordless Terminal used in DT400/DT300 Series, if the CF Setting button is used in the Bluetooth Handset, assign KYN= 1-8 with the AKYD command.

<Conditions Specific to This Feature>

1. If a telephone using this feature is re-registered with the same station number, regardless of the settings of PH Fixed Hunting method, the CF Setting button set/cancel state and lamp state do not change.
2. Pressing any of the CF Setting buttons cancels the Call Forwarding - All Calls feature that is set on any of the CF Setting buttons.
3. The lamp control of the CF Setting button when setting/canceling the Call Forwarding - All Calls feature is only for My Line. If My Line is not the Primary Line, it is necessary to preset My Line as Primary Line before using the CF Setting button. If CF Setting button is used with a Sub Line, the setting/canceling of the Call Forwarding - All Calls feature is performed for such Sub Line and the CF Setting button lamp control does not happen.
4. If a CF Setting button is pressed, and then another CF Setting button is pressed while the setting or canceling of a function that is set to the first CF Setting button is still being processed, the operation of the second CF Setting button will not be processed.

<Others>

None.

Programming

Note: It is assumed that access code for Call Forwarding - All Calls has been assigned.

STEP 1: **ASYDL/ASYDN** - Assign the following System Data
SYS1, Index 686, Bit 0=1 (Disabling Call Forwarding - All Calls with entry Access Code) **Note 6**
SYS1, Index 1249, Bit 4=1 (CF Setting button is in service) **Note 6**

STEP 2: **AKYD** - Assign CF Setting button for Line/Feature key of the Desktop terminal. **Note 8**
KYN: Key number
KYI= 1
FKY= 201 to 204 (CF Setting buttons 1 to 4) **Note 6**, **Note 7**

Note 6: Available from FP95-114 V4 Issue 2.0.

Note 7: Assign four CF Setting buttons with four FKY (201-204) one by one.

Note 8: For Registration with SPD setting key, assign the following as well:
KYN: Key number
KYI= 1 (Function Key)
FKY= 199 (SPD setting)

C-209 Call Forwarding Destination Per Trunk Route - Incoming Call

General Description

This feature allows an incoming trunk call to be forwarded to a destination on an incoming route basis by specifying a destination with the ACFO/ACFOL/ACFON command.

Note: Please note the following conditions:

- Earlier than FP95-114 V4 Issue 2, only a Call Forwarding destination on a tenant basis could be assigned with the ACFO/ACFOL/ACFON command.
- This feature is available since FP95-114 V4 Issue 2.0.

Operating Procedure

None.

Service Conditions

<Important Notices>

1. This feature requires a vacant tenant (the maximum number of tenants set with ASYD, SYS1, Index 8 must be two or more).
2. To enable this feature, for the Call Forwarding data set with the ACFO command, Tenant Data table development must be separated by the system data (ASYD, Index 93, Bit 1). For the Call Forwarding data set with the ACFOL/ACFON command, Tenant Data table development is separated without condition. When the ACFO command is used, set the following to separate Tenant Data table development:

   ASYD, SYS1, Index 93, Bit 1=0
   (Separate Tenant Data table development for the Call Forwarding data (ACFO command))

3. When the Trunk Application data (ARTI/ARTIN command) via DM and NDM coexist in a system, the data registered on NDM (ARTIN command) takes priority over the data registered on DM (ARTI command).
4. When the Call Forwarding data (ACFO/ACFOL/ACFON command) via DM and LDM/NDM coexist in a system, the priority is:

   NDM (ACFON command) → LDM (ACFOL command) → DM (ACFO command)

5. When Tenant Data table development for the Station Data (ASDT, AAST, AGST, ALDN, ASAT commands) is separated (ASYD, SYS1, Index 92, Bit 3=0), a forwarding destination station cannot be set with the ACFO command. In this case, the forwarding destination station (Telephone Number) needs to be set with the ACFOL/ACFON command.

   Note: This feature uses vacant tenants. No station data such as station numbers are not assigned to the vacant tenants.

<Interactions with Other Features>

1. This feature does not support Trunk Answer from Any Station (TAS).
2. Setting a Call Forwarding destination from an individual station or attendant console, UCD and busy station services overrides the setting with the ACFO/ACFOL/ACFON command.
3. If Call Forwarding - Busy Line (CF=1) is set together with Call Forwarding - Don't Answer (CF=2), when a call arrives at the destination station of Call Forwarding - Don't Answer and the timeout of its timer occurs, the destination station is regarded as in busy state. Then the call is forwarded to another destination station of Call Forwarding - Busy Line (CF=1).
4. The table below shows relationship between incoming trunk calls and Call Forwarding features.

Supported: X, Not Supported: -, Supported with Conditions: C

Incoming Trunk Call		Call Forwarding Feature									
		CALL FORWARDING - BUSY [C-2] Note 1		CALL FORWARDING - DON'T ANSWER [C-3] Note 2		CALL FORWARDING - INTERCEPT/ ANNOUNCEMENT [C-25] Note 3		CALL FORWARDING - PS INCOMING INCOMPLETE [C-155]		LOGGED OUT IP STATION - CALL DESTINATION [L-53]	
		ATT	STN/ TELN	ATT	STN/ TELN	ATT	STN/ TELN	ATT	TELN	ATT	STN/ TELN

	CALL FORWARDING - BUSY [C-2] Note 1	X	X	-	-	-	-	-	-	-	-
	CALL FORWARDING - DON'T ANSWER [C-3] Note 2	-	-	X	X	-	-	-	-	-	-
	CALL FORWARDING - INTERCEPT/ANNOUNCEMENT [C-25] Note 3	-	-	-	-	X	X	-	-	-	-
	CALL FORWARDING - PS INCOMING INCOMPLETE [C-155]	-	-	-	-	-	-	X	X	-	-
	LOGGED OUT IP STATION - CALL DESTINATION [L-53]	-	-	-	-	-	-	-	-	X	X
	STATION HUNTING [S-7/S-8/S-9] (When all stations are busy)	C Note 4	C Note 6	-	-	-	-	-	-	-	-
	UNIFORM CALL DISTRIBUTION (UCD) [U-1] (When all stations in the UCD group are busy)	- Note 4	C Note 7	-	-	-	-	-	-	-	-

Note 1: Same conditions apply to the following features:
- CALL FORWARDING - BUSY LINE - CCIS [C-46]
- CALL FORWARDING - BUSY LINE - OUTSIDE [C-60]
- CALL FORWARDING - BUSY LINE - PRI/PRA [C-96/113]
- CALL FORWARDING - BUSY LINE - D - PRA [C-113D]

Note 2: Same conditions apply to the following features:
- CALL FORWARDING - DON'T ANSWER - CCIS [C-47]
- CALL FORWARDING - DON'T ANSWER - PRI/PRA [C-129/130]

Note 3: Same conditions apply to CALL FORWARDING - INTERCEPT/ANNOUNCEMENT - PRI/PRA [C-101/115].

Note 4: When a call arrives at a tenant where the attendant console/the night attendant console belongs by using DIRECT-IN TERMINATION (DIT) [D-7], the call needs to be received by the attendant console/the night attendant console according to the system data setting (ASYD, SYS2, Index 11 Bit 7). Thus this system data setting takes priority over the data assigned with the ACFO/ACFOL/ACFON command.

Note 5: When a call is received via ISDN by using DIRECT INWARD DIALING (DID) [D-8], the call cannot be transferred by using BLIND TRANSFER TO STATION [B-18].

Note 6: When a call is received by using DIRECT-IN TERMINATION (DIT) [D-7], the Call Forwarding feature is not available for the call.

Note 7: The Call Forwarding feature is available only for the incoming call from the analog trunk. It is not available for the incoming call using CCIS NETWORKING VIA IP (Peer-to-Peer connection) [C-163] and incoming call from the ISDN trunk.

<Hardware/Software>

None.

<Interactions with Networks>

None.

<Conditions Specific to This Feature>

1. Supporting patterns are as follows:

Supported: X, Not Supported: -

Call Forwarding Features (CF parameter set with ACFO/ACFOL/ACFON command)	Call Forwarding Destination	Support Status
1: Call Forwarding - Busy Line	Attendant Console (ATT) STN/TELN	X
2: Call Forwarding - Don't Answer	Attendant Console (ATT) STN/TELN	X
3: Call Forwarding - Intercept	Attendant Console (ATT) STN/TELN	X
4: Night Connection Outside	Abbreviated Digit Code (ADC)	-
5: Call Forwarding - Logout	Attendant Console (ATT) STN/TELN	X
6: Call Forwarding - Incomplete Number **Note 8**	Attendant Console (ATT) TELN Monitor	-
7: Call Forwarding - Not Reach **Note 9**	Attendant Console (ATT) TELN	X

Note 8: **6: Call Forwarding - Incomplete Number** is only displayed in the ACFOL/ACFON command.

Note 9: **7: Call Forwarding - Not Reach** is only displayed in the ACFON command.

<Other Conditions>

None.

Programming

This feature supports features mentioned below.

For the programming procedure, see explanations of each related feature in this manual.

- AUTOMATED ATTENDANT [A-82]
- BLIND TRANSFER TO STATION [B-18]
- CALL FORWARDING - BUSY [C-2]
- CALL FORWARDING - DON'T ANSWER [C-3]
- CALL FORWARDING - INTERCEPT/ANNOUNCEMENT [C-25]
- CALL FORWARDING - BUSY LINE - OUTSIDE [C-60]
- DIRECT-IN TERMINATION (DIT) [D-7]
- DIRECT INWARD DIALING (DID) [D-8]
- LOGGED OUT IP STATION - CALL DESTINATION [L-53]
- STATION HUNTING - CIRCULAR [S-7]
- UNIFORM CALL DISTRIBUTION (UCD) [U-1] **Note 10**

Note 10: Call Forwarding is available when the following condition applies:
When a call is received by using [D-7] DIRECT-IN TERMINATION (DIT) or an analog line call is received by using [D-8] DIRECT INWARD DIALING (DID) and the call overflows because all stations in the UCD group are busy. Also the following system data are assigned:

- ASYD, SYS1, Index 60, Bit 3=1 (UCD Queuing is not required (BT))
- ASYD, SYS2, Index 11, Bit 6=0 (Trunk Answer from Any Station (TAS) is out of service)

For the programming procedure, see explanations of each related feature in Data Programming Manual-CCIS.

- CALL FORWARDING - BUSY LINE - CCIS [C-46]
- CALL FORWARDING - DON'T ANSWER - CCIS [C-47]

For the programming procedure, see explanations of each related feature in Data Programming Manual-ISDN.

- CALL FORWARDING - BUSY LINE - PRI/PRA [C-96/113]
- CALL FORWARDING-BUSY LINE-D-PRA [C-113D]
- CALL FORWARDING - INTERCEPT/ANNOUNCEMENT - PRI/PRA [C-101/115]
- CALL FORWARDING - DON'T ANSWER - PRI/PRA [C-129/130]
- OVERSEAS COLLECT CALL ISDN DIVERSION [O-40]

For the programming procedure, see explanations in Data Programming Manual-PCS/PHS.

- CALL FORWARDING - PS INCOMING INCOMPLETE [C-155]

To set this feature, creating vacant tenants is required. The following explains the procedure how to change the maximum number of tenants coexisting in the system, create vacant tenants, and set this feature to the vacant tenants.

Note: For details of Tenant Development, see Tenant Data section in CHAPTER 2 ASSIGNMENT OF BASIC OFFICE DATA.

[When ASYD, SYS1, Index 93, Bit 1=0 (Separate Tenant Data Table Development for Call Forwarding Data (ACFO command))]

STEP 1: **ASYD** - System Data
SYS1
Assign the maximum number of tenants coexisting in the system.
Index 8 (Number of Tenants: 2-63 (02-3F (HEX))

Note: When the existing data is **01**, set a value equal to the number of Call Forwarding destinations to separate (**02** or more).

Separate Tenant Data Table Development for Call Forwarding Data (ACFO command).
Index 93, Bit 1=0 (Separate)

STEP 2: **MEM_HDD/MEM_HDD_N** - Data Control Between Memory and HDD
Back up the Call Forwarding data in the memory to the hard disk.

STEP 3: **SINZ/SINZN** - System Initialize
Execute one of these operations:

- System Initialize
- Office Data Load & System Initialize
- Restart

Note: It is possible to use Telephony Server Maintenance Menu in this step. In the Telephony Server Maintenance Menu, select **Reboot** in the SYSTEM CONTROL field (for a dual CPU system, perform the same operation on both systems).

STEP 4: Go to [Setting A Call Forwarding Destination on A Route Basis].

[When ASYD, SYS1, Index 93, Bit 1=1 (Common Tenant Data Table Development for Call Forwarding Data (ACFO command))]

Note: When ASYD, SYS1, Index 93, Bit1=1 (common Tenant Data table development for the Call Forwarding data (ACFO command)) is active on the system with the Call Forwarding feature data assignments, delete the existing Call Forwarding data assigned with the ACFO command at first. Add more vacant tenants, and then assign the Call Forwarding data again with the ACFO command.

STEP 1: **LCFO** - Listup of Call Forwarding Data
As a preparation to re-registration of ACFO command, list up all the current data assigned with the ACFO command.

STEP 2: **ACFO/ACFOL/ACFON** - Assignment of Call Forwarding Data
Delete the current ACFO/ACFOL/ACFON command data.

STEP 3: **ASYD** - System Data
SYS1, Index 8 (Number of Tenants: 2-63 (02-3F (HEX))

Note: When the existing data is **01**, set a value equal to the number of Call Forwarding destinations to separate (**02** or more).

Separate Tenant Data Table Development for Call Forwarding Data (ACFO command).
Index 93, Bit 1=0 (Separate)

STEP 4: **MEM_HDD/MEM_HDD_N** - Data Control Between Memory and HDD
Back up the Call Forwarding data in the memory to the hard disk.

STEP 5: **SINZ/SINZN** - System Initialize
Execute one of these operations:

- System Initialize
- Office Data Load & System Initialize
- Restart

Note: It is possible to use Telephony Server Maintenance Menu in this step. In the Telephony Server Maintenance Menu, select **Reboot** in the SYSTEM CONTROL field (for a dual CPU system, perform the same operation on both systems).

STEP 6: **ACFO/ACFOL/ACFON** - Assignment of Call Forwarding Data
Re-register Call Forwarding data which was saved in STEP 1 to all the operating tenants.

STEP 7: Go to [Setting A Call Forwarding Destination on A Route Basis].

[Setting A Call Forwarding Destination on A Route Basis]

STEP 1: **ARTI/ARTIN** - Assignment of Trunk Application Data
Specify a vacant tenant number to set the data with the ACFO command.
CDN: 112 (ACFO_TN): 1-63

Note: The following are conditions for this step:

- If ACFO_TN is not programmed, the ACFO/ACFOL/ACFON uses the tenant number which the existing call forward destination station belongs to.
- The tenant number to be specified here should be a new tenant number. If a number being used is specified, the existing Call Forwarding feature which is on a tenant basis will be valid (calls will be forwarded to the tenant which the existing call forwarding destination station belongs to).

STEP 2: **ACFO/ACFOL/ACFON** - Assignment of Call Forwarding Data
Assign the Call Forwarding features to the tenant number specified with the ARTI/ARTIN command.
TN: 1-63
CF: Call forwarding service (1-7) **Note 11**

1: Call Forwarding - Busy Line
2: Call Forwarding - Don't Answer
3: Call Forwarding - Intercept
5: Call Forwarding - Logout
7: Call Forwarding - Not Reach **Note 12**

CFI: Call forwarding destination

Attendant Console (ATT)
STN (Station)
TELN **Note 13**

STN: Station number

When CFI=STN (Station) is set with the ACFO command, assign a Station Number of a forwarding destination.

UGN: User Group Number

When CFI=TELN is set with the ACFOL/ACFON command, assign a User Group Number of a forwarding destination.

TELN: Telephone Number

When CFI=TELN is set with the ACFOL/ACFON command, assign a Telephone Number of a forwarding destination.

Note 11: This feature does not support **4: Night Connection Outside** and **6: Call Forwarding - Incomplete Number**.

Note 12: 7: Call Forwarding - Not Reach is only displayed in the ACFON command.

Note 13: TELN is only displayed in the ACFOL/ACFON command.

[Example Data Assignment]

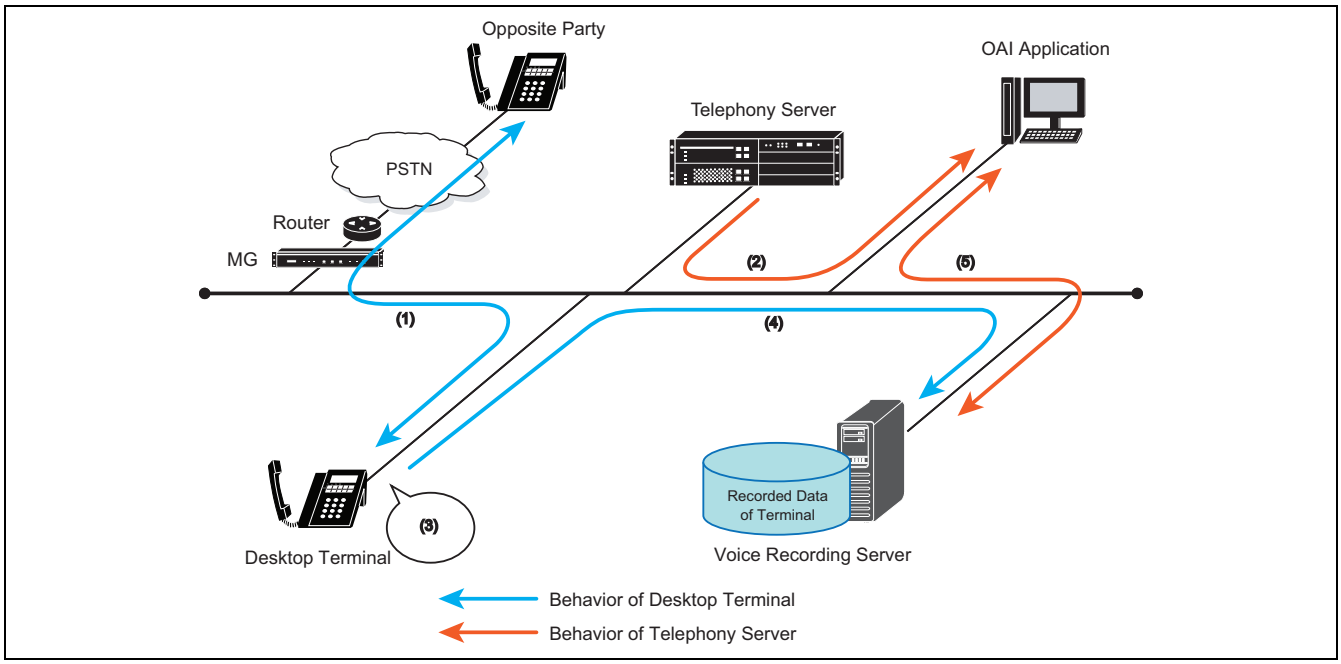
To forward an incoming trunk call to a destination on a route basis, assign the data as shown in the table below. The table shows example data assignments and destinations of incoming trunk calls forwarded by a busy station (Station A) when it receives trunk calls.

Example Data Assignments and Destinations for Call Forwarding-Busy Line

Route	Called Party	ARTI Data ACFO_TN (CDN: 112)	ACFO Data	Call Forwarding Destination
C.O. Line RT=3	TN: 1 (Station A in busy state receives a call)	ACFO_TN=0 (No data)	TN=1 CF=1: Call Forwarding - Busy Line CFI=STN (Station) STN=Station Number of Station B	Station B
Tie Line RT=5	TN: 1 (Station A in busy state receives a call)	ACFO_TN=2	TN=1 CF=1: Call Forwarding - Busy Line CFI=STN (Station) STN=Station Number of Station C	Station C
Tie Line RT=7	TN: 1 (Station A in busy state receives a call)	ACFO_TN=4	TN=4 (No data for Call forwarding destination)	Calls are not forwarded. **Note 14**

Note 14: In the system with the data assignments of the Call Forwarding on a tenant basis (assigned with the ACFO/ACFOL/ACFON command), to disable the data assignments of the Call Forwarding to a specific route, set a vacant tenant number to CDN=112 (ACFO_TN) with the ARTI/ARTIN command. If no Call Forwarding data is set to the vacant tenant with the ACFO/ACFOL/ACFON command, calls are not forwarded.

C-210 Call Recording



General Description

Note: Available since FP95-115 V5.

You can record the voice call data to a voice recording server (hereafter recording server).
The voice call data is divided into transmitted and received data and sent separately from the terminal to the recording server.
The recording server obtains the call information (such as call start/end time, recording start/end time and call partner information) from the notified RTCP data by the terminal and the recorded sent/received RTP data, and the recorded data can be managed in conjunction with an OAI application.
The methods for starting the call recording that can be chosen on the terminal configuration are as follows:

- Automatic start recording
  A call recording is started automatically when the call is started.
- Manual start recording (**Note 1**)
  A call recording is started when pressing the Call Recording key.

Note 1: For manual start recording, assigning FKY=194 (Call Recording) to Line/Feature keys by the AKYD or AKYD_T command is required.
For automatic start recording, the record key can be used for pausing/resuming the recording if assigned. Depending on the recording server, the recording data during pausing time may be no voice.

(1) A call is started.
(2) Telephony Server sends call information of the terminal to an OAI application by using SMFN.
(3) A recording is started on the terminal.
(4) The terminal sends voice recorded data and the call information to the recording server.

(5) The recorded data is managed with the OAI application.

Operating Procedure

There are two operations as follows:

<Automatic start recording>

<Manual start recording>

<Automatic start recording>

A call recording is started automatically when the call is started. The other use is as follows:

Example 1: Skipping a call recording for a call and then using call recording for the next call.

STEP 1: Press the Call Recording key before a call.
The LED of the Call Recording key lights in green (the recording standby state) is turned off (the recording stop state).
STEP 2: Make a call (or answer an incoming call).
The LED of the Call Recording key is still off.
STEP 3: End the call.
Green LED light is turned on (the recording standby state).
STEP 4: Make a call (or answer an incoming call).
Red LED light is turned on (the recording start state). The call recording is started.
STEP 5: End the call.
Green LED light is turned on (the recording pause state). The call recording stops.

Example 2: Pausing and resuming operation during recording.

STEP 1: Press the Call Recording key during the call.
Green LED light is turned on (the recording pause state). The call recording is paused.

Note: When the Call Recording key is assigned, the recording is paused/resumed by pressing the Call Recording key even if the automatic start recording is selected.

STEP 2: Press the Call Recording key.
Red LED light is turned on (the recording resuming state). The call recording is resumed.

<Manual start recording>

A call recording is started when pressing the Call Recording key.

STEP 1: Press the Call Recording key during a call.
Red LED light is turned on (the recording start state). The call recording is started.
STEP 2: Press the Call Recording key.

Green LED light is turned on (the recording pause state). The call recording is paused.
STEP 3: Press the Call Recording key again.
Red LED light is turned on (the recording resuming state). The call recording is resumed.
STEP 4: End the call.
The LED is off (the recording stop state). The call recording stops.

Note: The call recording stops regardless of the Call Recording key being assigned or not.

Example: When handling the call recording from the beginning of the call (similar behavior to automatic start recording).

STEP 1: Press the Call Recording key before a call.
Green LED light is turned on (the recording standby state).
STEP 2: Make a call (or answering an incoming call).
Red LED light is turned on (the recording start state). The call recording is started.
STEP 3: Press the Call Recording key during the call recording.
Green LED light is turned on (the recording pause state). The call recording is paused.
STEP 4: Press the Call Recording key.
Red LED light is turned on (the recording resuming state). The call recording is resumed.
STEP 5: End the call.
The LED is off (the recording stop state). The call recording stops.

Service Conditions

<Important Notices>

1. The following firmware version is required on each terminal for this feature.

DT830G/DT830	:	FW 5.2.0.0 or later
DT820	:	FW 3.2.0.0 or later

2. Assigning the Telephone Number to stations that use this feature is required.
3. When the call recording failed with any errors between terminals and the recording server, Telephony Server will not recognize or acknowledge the failure.
4. A number of call recording licenses that is greater than a number of stations allowed a call recording is required for releasing the restriction of this feature by the ATSRL/ATSRN commands.
   When a number of call recording licenses is less than a number of stations, the restriction of this feature cannot be released.
   Restarting the terminal is required in the following cases:
   - After the restriction of this feature is released by the ATSRL/ATSRN commands.
   - When changing the restriction data by the ATSRL/ATSRN commands during the terminal in operation.
5. The call information (such as call start/end time, recording start/end time and call partner information) is notified from Telephony Server by using SMFN of OAI. The conditions of SMFN notification for each service follows the conditions of OAI.

6. Handling of SMFN of OAI and the information of recorded data on the terminal depends on the specification of a recording server.

<Interactions with Other Features>

1. This feature cannot be used with USB Call Recording.
2. The conditions for PEER TO PEER BANDWIDTH CONTROL [P-75] are as follows:

   (a) A speech signal between a terminal and a recording server is not included in the calculation of used bandwidth. Also a bandwidth restriction between a terminal and a recording server cannot be controlled.

   (b) The payload type configured by system data is applied to the call only. The payload type between a terminal and a recording server uses one of the following payload types configured by the terminal side.

   LinearPCM (8kHz, 16bit), LinearPCM (16kHz, 16bit) (**Note 3**), G.711μ, G.711A

   Note 3: LinearPCM (16kHz, 16bit) is invalid for DT820.

3. The conditions for VoIP ENCRYPTION [V-27] are as follows:

   (a) Using this feature, a control signal between a call recording activated terminal and Telephony Server is encrypted.

   (b) Using this feature when an RTP packet encryption is activated, the RTP packet between the call recording activated terminal and an opposite party is encrypted, but the RTP packet between the terminal and a recording server cannot be encrypted.

4. For RTP INFORMATION OUTPUT [R-58], the information between a terminal and a recording server is not included in the output call log information. The information only between the terminal and an opposite party is included in it.

5. The conditions for MONITORING - ACD SUPERVISOR - ACD [M-28A] are as follows:

   (a) When a call recording activated terminal is an agent's terminal:
   When Silent Monitor (Multi-path Monitor) is enabled, the call only between the agent terminal and an opposite party is recorded. The voice path of monitoring for a supervisor is not recorded.

   (b) When a call recording activated terminal is a supervisor's terminal:
   When Silent Monitor (Multi-path Monitor) is enabled, the monitoring received call between the agent terminal and an opposite party is recorded.

6. For PAD/EC Control IP/PHC Support, a voice that has applied PAD/EC control settings is recorded.
7. The conditions for ToS Control are as follows:

   (a) A ToS value that is used in SIP, RTP and RTCP packets sent from a terminal to recording equipment such as a recording server can be set in the terminal configuration. The value cannot be set on the Telephony Server side.

   (b) The ToS value in the packets sent from the recording equipment depends on the specification of the recording equipment.

8. The conditions for SURVIVABLE REMOTE MGC [S-141] are as follows:

   (a) This feature is available when a terminal is registered to SR-MGC. Communicating between the terminal and a recording server is required in this case.

   (b) Assigning the call recording licenses to the Telephony Server side beforehand and releasing the restriction by the ATSRL/ATSRN commands are required. The call recording license is not required on the SR-MGC side.

   (c) To change the data by the ATSRL/ATSRN commands is not available for SR-MGC. For this reason, the restriction of this feature cannot be enabled/disabled while the terminal is registered to SR-MGC.

   (d) OAI-SMFN notification during operating SR-MGC depends on the operation on the OAI application side. (Monitor request in the SR-MGC is required.)
   Other conditions of OAI follow the conditions on “SR-MGC for OAI” in Data Programming Manual - OAI.

9. The conditions for Geographic Redundancy are as follows:

   (a) This feature is available when a terminal is registered to GR-Node or SR-Node. Communicating between the terminal and a recording server is required in this case.

   (b) For Primary Node, a number of call recording licenses that is greater than a number of stations using call recording is required.

   (c) OAI-SMFN notification on GR-Node or SR-Node depends on the operation on the OAI application side. (Monitor request in the backup side is required.)
   Other conditions of OAI follow “Interactions to Other Features” on “Geographic Redundancy in Stand Alone OAI System” or “Geographic Redundancy in OAI System with FCCS Networking via IP” in Data Programming Manual - OAI

<Hardware/Software>

1. A Call Recording key cannot be assigned to DSS Console or 8LK Unit.
2. The conditions for a recording server are as follows:

   (a) A redundant recording server is available.

   (b) As the following ports are consumed on a terminal in the communication with the recording server, the Firewall settings must be configured carefully.

Recording Session	:	One port (Default: 5080) The port number follows the terminal settings.
Recorded Media Stream	:	96 ports (Default: 21050~21146) The port number follows the terminal settings.

(c) When a destination port number of recorded Tx data and recorded Rx data from the terminal to the recording server is the same, treat both data separately on the recording server side.

Note: Distinguishing both data is performed as follows:
- When the sender IP address and the IP address set as CNAME in RTCP are the same address
  = Recorded Tx data
- When the sender IP address and the IP address set as CNAME in RTCP are the different address
  = Recorded Rx data

(d) Call information that a recording server accepted is as follows:

- Call start time
- Call end time
- Recording start time
- Recording stop time
- Recorded TX data
- Recorded RX data
- Call partner number information **Note 5**
- Call partner name information **Note 5**
- Phonetic transcription in kana with a call partner name **Note 5**
- Company name information **Note 5**
- Department information **Note 5**

Note 5: The recording server may not be notified of this information depending on the system or the terminal operation.

3. The conditions for a terminal are as follows:

(a) A recording target is from the start to the end of the call session including held.

(b) BGM is not recorded even if "All" is selected at "Reg Segments" in a terminal configuration.

(c) For a terminal with Bluetooth Connection Adapter (BCA-Z UNIT), the call on the mobile phone side is not recorded when using a mobile phone provided with Bluetooth functions.

(d) When upgrading the terminal firmware version from 5.0.0.0 or earlier to 5.1.0.0 or later for DT830 or the terminal firmware version from 3.0.0.0 or earlier to 3.1.0.0 for DT820, the Rec Tone value in the terminal configuration is back to the default setting and the behavior of the Rec Icon displaying may be irregular.

(e) When using this feature, the call information sent from a terminal to a recording server is not encrypted. To prevent an information leak to a third person, install and operate the terminal and the recording server in secured guaranteed network. If not, it is not supported.

(f) The recording works even if RTP in a call session on Dynamic Mode (SIP control) is already encrypted. However, the data sent to a recording server is not encrypted.

(g) When a terminal cannot receive an RTP data from an opposite party because of network failure and so on, the terminal sends the received RTP data (Rx) with no voice to a recording server. The transferred RTP data (Tx) is sent to the recording server even if network failure occurs.

(h) When a terminal cannot receive an RTCP Reception Report (**Note 9**), displaying of online monitoring is still default value ("---"). The follows are likely to be factors.
- RTCP packets sent from a recording server cannot reach to the terminal.
- No packets of RTP or RTCP sent from the terminal reach to the recording server.

Note 9: An RTCP Reception Report is one of RTCP packets.

(j) It takes several seconds to be recording ready of this feature after a terminal starts up.

(k) When an event notified from Telephony Server is the same with the event information stored in a recording server, the recording may not work.

(l) For Dynamic mode (with SIP control), it may take several times to complete sending a recording data after operation of recording stop on a terminal because of recording session control with a recording server. When the duration from recording stop to recording start is shorter, the recording may not work.

(m) A volume control change operation on the terminal is not reflected to the recorded contents.

(n) When using recording servers in redundant configuration, a terminal sends the recorded data to both recording servers.

(o) Playing recorded data on a recording server is not supported. For playing the recorded data, refer to a recording server manual.

(p) For DT820, assign a Call Recording key to Line/Feature keys by the AKYD or AKYD_T command because displaying Rec Icon to LCD is not supported.

<Interactions with Networks>

1. The conditions for FCCS are as follows:

(a) For NCN, a number of call recording licenses that is greater than a number of stations using a call recording is required.

(b) For LN, the call recording license is not required.

2. LOCATION DIVERSITY [L-55] is not supported.

<Conditions Specific to This Feature>

1. The conditions in UMGi system are as follows:

(a) This feature is available for CCN or RN in Survival Mode that is controlling a terminal (because of a network failure, etc). Communicating between the terminals and a recording server is required in this case.

(b) For CCN, a number of call recording licenses that is greater than a number of stations using a call recording in the all RN is required.

(c) For RN, the call recording license is not required. It follows a number of call recording licenses in CCN.

(d) OAI-SMFN notification does not work in survival mode (based on the OAI conditions).

2. The following tones heard on a terminal side are recorded:
   - PBX tone (such as DT, RBT, BT and Internal Music-on-hold)
   - RTP warning tone **Note 5**
   - Short tone when each service is used
   - PB tone when a terminal receives DTMF **Note 6**

   It is possible that the tones above are not recorded by using "Rec Segments" in the terminal configuration. However, the tones heard during a call (RTP warning tone, short tone and PB tone when a terminal receives DTMF) are recorded even if the "Talk Segments" in "Rec Segments" is selected in the terminal configuration.
   Also, a part of the PBX tone may be included in recorded data depending on a timing of switching a call.

   Note 5: Available when RTP warning tone is enabled.

   Note 6: Available when DTMF playback is enabled.

3. For conferences (**Note 7**), the conference data is recorded to each call recording that terminal joined the conference.

   Note 7: The following conferences are indicated:
   - Conference - 3 party with conference trunk (CFT, VS32)
   - Conference - over 4 party with CFT circuit card and VS32

Programming

For the settings on a terminal side, see “Call Recording” on Chapter 3 in Peripheral Equipment Description (Multi-Line Telephone).

Note: Assign the station data and Telephone Number to the terminal allowing Call Recording before the following settings.

STEP 1: **ATSRL/ATSRN** - Release the restriction of Call Recording for Telephone Number. The assigned data is deleted automatically when the Telephone Number is deleted by the ALGSL/ALGSN, AUPDN and ASPTL/ASPTN commands.
UGN=User Group Number
TELN=Telephone Number (Up to 16 digits)
SVN=1 (Call Recording)
STATUS=1: Used

Note: When a number of call recording licenses is less than a number of stations, the restriction of this feature cannot be released.

When using the recording start manually, the following step is also required. For using the recording start automatically, the Call Recording key can be used for pausing/resuming the recording if assigned by the following step.

STEP 2: **AKYD/AKYD_T** - Assign a Call Recording key to the Line/Feature keys of a terminal.
KYN=Key Number (1 to 24)
KYI=1 (Function Key)
FKY=194 (Call Recording)

Note: Be sure to assign this key data to Line/Feature keys within KYN=1 to 24. For DSS keys, assign this key data within KYN=1 to 16. However, this key data cannot be assigned to the optional line key units (such as 8LK Unit or DSS console).

D-2 Dial Access To Attendant

General Description

This feature allows users to access the ATTENDANT CONSOLE [A-3] by dialing the Operator Call Code.

Operating Procedure

To access the Attendant:

1. The user dials the Operator Call Code. Receives Ringback Tone.
2. The ATND Lamp for the INCOMING CALL IDENTIFICATION [I-2] flashes. Attendant answers the call.

Service Conditions

1. The Operator Call Code will be maximum six digits. Normally "0" should be assigned as the Operator Call Code.
2. All Stations, including fully restricted Stations, can originate a call to the Attendant.
3. If TENANT SERVICE [T-12] is provided, each Tenant Group may access their own ATTENDANT CONSOLE [A-3] via the same code.
4. This feature allows any user or dial repeating TIE Line Trunk to reach the ATTENDANT CONSOLE [A-3] by dialing an Operator Call Code, usually but not necessarily a "0". The ATTENDANT CONSOLE [A-3] may complete these calls to Trunk facilities if allowed by the Station's CLASS OF SERVICE [C-15]. There is no restriction on the Attendant Console [A-3] extending a Station Call to another Station.
5. The Fusion Point Code (FPC) of the Node which accommodates the Called Attendant Console must be assigned after System Data assignment.

Interactions

1. Stations will terminate to the Attendant Console located in the same Tenant when the Station dials "0".
2. Stations in Tenant A will terminate to the Attendant Console of Tenant B if Tenant A is not equipped with an Attendant Console. Tenant B's Attendant Console must be programmed to accept calls from Tenant A.
3. Stations may dial the ASAT Number to terminate at a specific Attendant Console. See INDIVIDUAL ATTENDANT ACCESS [I-6].
4. When the system is in the Night mode, a Station dialing "0" can be answered by the assigned ATTENDANT NIGHT TRANSFER [A-19] Station, if provided. However, when the ASAT Number is dialed in the Night mode, Reorder Tone is returned. No connection to the ATTENDANT NIGHT TRANSFER [A-19] is allowed.

Programming

STEP 1: **ANPD** - Reserve a Number Level for Feature Access and Cancel. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. Assign the NND in accordance with a predetermined numbering scheme. Usually Level 0 is assigned for the Attendant Console.

STEP 2: **ASPA** - For Access Code "0", assign SRV = "SSC: Service Code" SID = 2 for Operator Call. Assign for a Connection Index (CI) of "N: Normal" and "H: Hooking".

STEP 3: **ATNR** - Allow Tenant-to-Tenant Connection for Inter and Intra-Tenant Connections. TRI = 0 and TRI = 4.

STEP 4: **ASAT** - If required, assign a specific number to the Attendant Console. This number must be equivalent to a Station Number.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

STEP 1: **ASPAL** - This data must be assigned to the Node calling the Attendant.

SRV: "SSC: Service Code"

SID: 2 = Operator Call

FPC: FPC of the Node that accommodates the Called Attendant Console

D-3 Dictation Access

General Description

This feature permits users to access customer provided Dictation Equipment, and in some instances allows them to maintain telephone dial control of normal dictation System features.

Operating Procedure

1. Dial the DICTATION ACCESS Code.
2. Proceed according to the dictation instructions provided by your organization.

Service Conditions

1. One Trunk Circuit is required for each DICTATION ACCESS.
2. Dictation Equipment must be equipped to receive DTMF Tone Signals if dial control is desired.
3. Dictation Equipment must be customer provided.
4. Dictation Trunks can be used with Rotary Dial Signals.
5. The dictation Trunk can be accessed from a Station, Attendant, TIE Line, or REMOTE ACCESS [R-2] Trunk.
6. OUTGOING TRUNK QUEUING [O-2]: If OUTGOING TRUNK QUEUING is provided and the user dials a busy dictation Trunk Group, the Station is placed in queue and is called back when the group becomes available.
7. THREE-WAY CALLING [T-2]: An attempt to access the DICTATION ACCESS Trunk from a Two-party Connection is allowed.
8. FULLY RESTRICTED STATION: With this feature assigned, only Station-to-Station and ATTENDANT CONSOLE [A-3] dial “0” calls are permitted. Any attempt to access the DICTATION ACCESS Trunk is routed to Reorder Tone.
9. MISCELLANEOUS TRUNK RESTRICTIONS [M-3]: This feature prevents certain Stations from using Miscellaneous Service Trunks. Any attempt to access the DICTATION ACCESS Trunk from a Station with this feature assigned is routed to Reorder Tone.

Interactions

1. OUTGOING TRUNK QUEUING [O-2]: If OUTGOING TRUNK QUEUING [O-2] is provided and the user dials a busy Trunk Route, the Station is placed in queue and is called back when a Trunk in the Route becomes available. If the Trunk Route is part of a ROUTE ADVANCE [R-6] Group, all Trunks in the ROUTE ADVANCE [R-6] Group must be busy before queuing takes place. OUTGOING TRUNK QUEUING [O-2] is available on DICTATION ACCESS.
2. THREE-WAY CALLING [T-2]: An attempt to Conference the DICTATION ACCESS Trunk from a Two-party Connection may be allowed. This depends on assignments in ARSC.
3. MISCELLANEOUS TRUNK RESTRICTION [M-3]: This feature prevents certain Stations via Route CLASS OF SERVICE - INDIVIDUAL [C-15] from using various Routes in the system. If a Station is restricted, any attempt by a Station to access the DICTATION ACCESS results in Reorder Tone.

Note: This feature may be installed on the Station side of the switch. In that case, the PA-16LC may be used. However, when installed on the Station side, Route Restrictions are not available to the system programmer. All Stations within the system (Tenant Restrictions excluded), as well as Stations in other Telephony Servers connected via a TIE Line, will have access to the Dictation Equipment.

4. If the Station side is used to connect DICTATION ACCESS, STATION HUNTING [S-7, 8, 9] will provide capabilities to connect multiple Dictation Machines to the system.

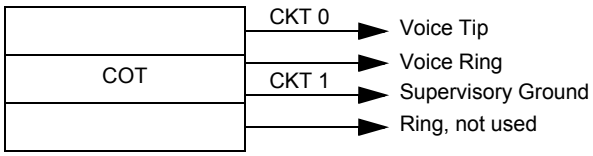
Programming

STEP 1: **ANPD** - Reserve a Number Level for Station Access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan.

STEP 2: **ASPA** - Assign an Access Code to the DICTATION ACCESS Trunk, SRV = "OGC: Outgoing Call". Correlate Access Code to Route. One Trunk per Announcement Route. Assign CI: of "N: Normal" and "H: Hooking".

STEP 3: **ARTD** - Assign the DICTATION ACCESS Route as follows:

RT:1



1-OSGS	:2	2-0NSG	:3	5-TF	:1	6-TCL	:10	7-L/T	:1
8-RLP	:2	44-PRV	:1						

Note: To change the data for existing route (RT), initialize the circuit card.

STEP 4: **ATRK** - Assign the LENS, DICTATION ACCESS Trunk Route Number, Trunk Number, and Tenant Number.

STEP 5: **MBTK** - Assign the Make Idle status to the DICTATION ACCESS Trunk.

Note: If supervision is required, use the first two circuits of the COT circuit card. Move the switch on COT to PGT.

STEP 6: **ARRC** - If TIE Line or Remote Access Connection to DICTATION ACCESS Trunk is required, allow Trunk-to-Trunk Connection using ARI-D-RES, Direct Connection.

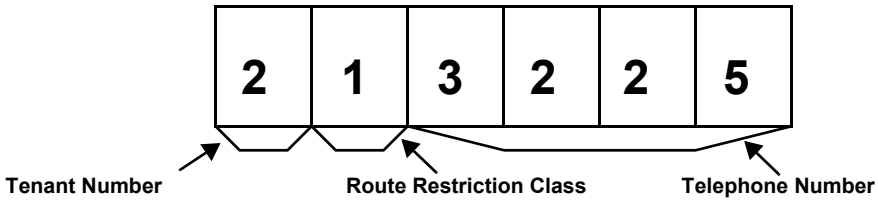
Note: The DICTATION ACCESS Equipment may be installed on the Line Side of the System. The connection would then be considered STATION-TO-STATION CALLING [S-11].

STEP 7: **ARSC** - Allow RRI 3 to the RSCs allowed access to Dictation.

D-5 Digital Display - Station

General Description

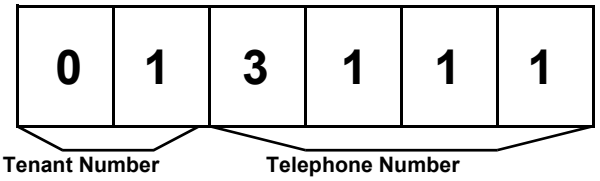
This feature provides the Attendant with a visual display (via the ATTENDANT CONSOLE [A-3]) of the Telephone Number, its Trunk Route Restriction, CLASS OF SERVICE - INDIVIDUAL [C-15] and TENANT SERVICE [T-12] Number during Attendant-to-Station Connection.



Operating Procedure

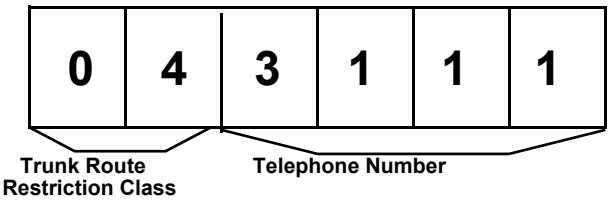
The DIGITAL DISPLAY STATION is automatically activated whenever the Attendant answers an Incoming Call from a Station, or originates a call to a Station.

Service Conditions

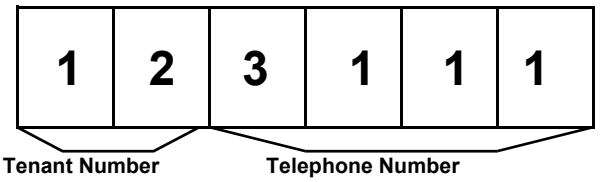


1. The Telephone Number is displayed on the left side of the ATTENDANT CONSOLE [A-3] digital display. Trunk Route Restriction CLASS OF SERVICE - INDIVIDUAL [C-15] and TENANT SERVICE [T-12] number are simultaneously displayed on the left. See Example 1 below.

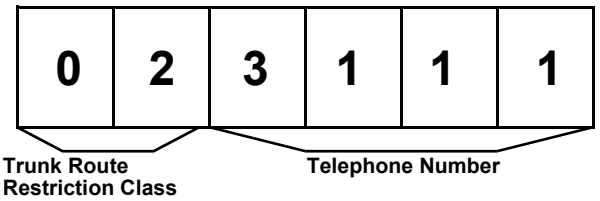
   Example 1: Single-digit Trunk Route Restriction CLASS OF SERVICE - INDIVIDUAL [C-15] and TENANT SERVICE [T-12] Number (four-digit Telephone Number).



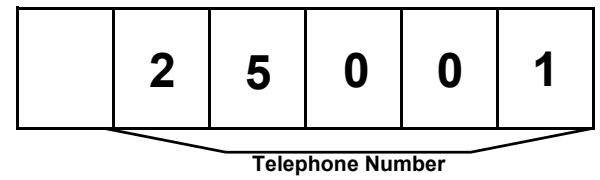
2. If the Trunk Route Restriction Class and/or TENANT SERVICE [T-12] Number are two digits, only the Telephone Number may be displayed. Refer to Example 2.
3. If a Station dialed by the Attendant is busy or in the LINE LOCKOUT [L-3] mode, only the Telephone Number will be displayed.
4. The ATTENDANT CONSOLE [A-3] digital display is limited to a six-digit numeric display. Since the Class of Service and Trunk routing display is in numeric form, a list must be provided to the Attendant explaining the restrictions of each Class of Service Number and Trunk Identification Number.
5. CALL FORWARDING [C-2, 3, 5]: When this feature is activated by (or for) the Called Station, the Terminating Telephone Number is indicated on the digital display rather than the Called Telephone Number when the Attendant extends a call.
6. STATION HUNTING [S-7, 8, 9]: When this feature is applied because of the Called Station being busy and the Station belonging to a Hunt Group, the Terminating Telephone Number is indicated on the digital display rather than the Called Telephone Number when the Attendant extends a call.
7. In the case of a three or four-digit Station-to-Station Numbering Plan:
   a.) One digit is used to identify the Tenant (in the case where two digits are required for Class of Service, the Tenant Number is not identified).
   b.) One or two digits are used to identify the Station Class of Service.
   c.) Four digits are used to display the Telephone Number.
8. The DIGITAL DISPLAY - STATION feature will occur whenever the Attendant:
   a.) Extends an Incoming Call to a user.
   b.) Originates a call to a user.



c.) Answers a Recall or Call Forwarded Call.
Example 2: Two-digit TENANT SERVICE [T-12] Number, four-digit Telephone Number.



Example 3: Two-digit Trunk Route Restriction Class, four-digit Telephone Number.



Example 4: Single digit TENANT SERVICE [T-12] number, five-digit Telephone Number.

Example 5: Single digit Trunk Route Restriction Class, five-digit Telephone Number.

Example 6: When five-digit Station Numbering is used, only the Telephone Number is displayed.

9. For the FCCS Network, when a Telephone Number has been assigned for a Station, it is displayed on the Attendant Console. However, if a Telephone Number is seven digits or more, the Physical Station Number is displayed.

Programming

ASYD - SYS1, Index 82, Bit 0 to Bit 3. Assign a hexadecimal value according to the choice.
HEXADECIMAL - Station information

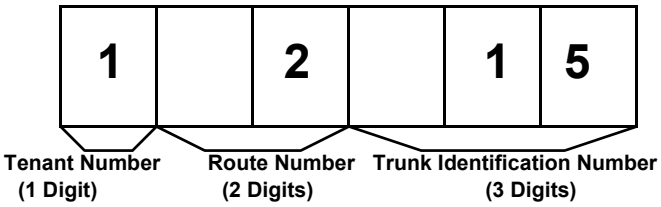
0: TN + CLS + Four-digit Station Number
1: TN + Four-digit Station Number
2: RSC + Four-digit Station Number
3: TN + Five-digit Station Number
4: RSC + Five-digit Station Number
5: Station Number

Note: This above only works on the PA-CS33 circuit card if SW 16 Element 2 is OFF (Desk Console Expanded LCD is not available).
Element 2 is ON (Desk console Expanded LCD is available) displays as follows:
TN OO CLS OO
NO: OOOO
Element 2 is Off, ASYD 82 takes effect.

D-6 Digital Display - Trunk

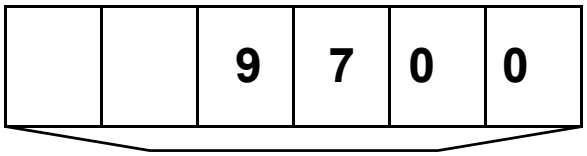
General Description

This feature provides the Attendant with a visual indication of Incoming and Outgoing Trunk Calls on the ATTENDANT CONSOLE [A-3]. Trunk Identification Number, Trunk Route Number, and TENANT SERVICE[T-12] Number, or Central Office Trunk Code, are displayed in a numerical readout.



Operating Procedure

The DIGITAL DISPLAY TRUNK is automatically activated whenever the Attendant answers an Incoming Trunk Call or originates a Trunk Call.



Service Conditions

1. By pressing the Loop key of a call that is in the ATTENDANT CAMP-ON [A-1] mode and using the DEST key, the Attendant can determine both Trunk and Telephone Number onto which the call is camped (Telephone Number and Trunk Number cannot be displayed simultaneously).
2. The Trunk Identification Number is displayed on the right side of the ATTENDANT CONSOLE [A-3] display while TENANT SERVICE [T-12] and Trunk Route Numbers are simultaneously displayed on the left.

   Example 1:

   Example 2:

   Example 3:

3. If the Trunk Route Number is three digits, the Trunk Identification Number and Trunk Route Number are displayed.
4. The ATTENDANT CONSOLE [A-3] digital display is limited to a six-digit numeric display. Since the Class of Service and Trunk routing display is in numeric form, a list must be provided to the Attendant explaining the restrictions of each Class of Service Number and Trunk Identification Number.

5. The DIGITAL DISPLAY - TRUNK feature displays Trunk Routing information or a four-digit Central Office Line Number. The method used can be optionally selected on a per Trunk Group basis.
6. The DIGITAL DISPLAY - TRUNK feature will occur whenever the Attendant answers/originates:
   a.) An Incoming Central Office (DID, Bothway, Oneway, FX, WATS) type call.
   b.) An Incoming TIE Line Call.
   c.) An Intercept Call.
   d.) An Outgoing Central Office (DOD, WATS, FX) Type Call.
   e.) An Outgoing TIE Line Call or re-enters a Held Trunk Call.
7. An Attendant Console also indicates the Central Office Code assigned by System Data at each Node in the FCCS Network.
8. Regardless of the value of the data assignment DPLY (CND:50) for the ARTD command, a received Telephone Number will be displayed.
9. Trunk Number cannot be displayed during an incoming call.

Programming

STEP 1: **ASYD** - SYS1, Index 68, Bit 1. Type of INDIVIDUAL TRUNK ACCESS, 0/1: Route and Trunk Number/Central Office Code.

Note: If SYS1, Index 68, Bit 1 is assigned for the Individual Trunk Access to be the ACOC Code, then all of the Trunks in all of the Routes in the system must have the ACOC Code assigned.

STEP 2: **ARTD** - In CND 25:R/L, if data "0" is assigned, then Tenant, Route Number, and Trunk Number are displayed. If data "1" is assigned, then Central Office Code is displayed. ACOC must be assigned.

Note: For display purposes only, Route and Trunk Numbers and Central Office Codes may be used simultaneously in the same system and are applied on a per Route basis, CDN 25:R/L.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or MG.

Route and Trunk Number

STEP 3: **ATRK** - The route and Trunk Number assigned here provides the system with specific information on types of Routes and their associated Trunks, LENS, number of Tenants, and any CLASS OF SERVICE - INDIVIDUAL [C-15] Route Restriction information.

Central Office Code

STEP 4: **ACOC** - Each Trunk must be assigned a Central Office Code.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node. **Note 1**

STEP 1: **ARTDN** - In CND 25:R/L, if data "0" is assigned, then Tenant, Route Number, and Trunk Number are displayed. If data "1" is assigned, then Central Office Code is displayed. ACOC must be assigned.

STEP 2: **ACOCN** - Each Trunk must be assigned a Central Office Code.

Note 1: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

D-7 Direct-In Termination (DIT)

General Description

This feature automatically routes Incoming Public Network Calls directly to a Pre-selected Station without Attendant assistance. The call can then be processed by the Called Party. THREE-WAY CALLING [T-2], CALL TRANSFER [C-10], etc., are handled in the same manner as any Normal Trunk Call.

Operating Procedure

The Calling Party, outside the system, dials the desired number as usual. However, the call is answered directly at a predetermined Station, bypassing the ATTENDANT CONSOLE [A-3].

Service Conditions

1. Any groups of Trunks can be used, up to the maximum capacity of the System.
2. Bothway Trunks can be used for DIRECT-IN TERMINATION, but incoming-only Trunks are recommended.
3. It is not necessary to have special DID Trunk Connections to the Public Network as is required with DIRECT INWARD DIALING [D-8]. However, care should be exercised in the application of Central Office Trunk Hunting.
4. If the DIT Station is busy, the Incoming Call is kept ringing until the DIT Station becomes idle, or forwarded to the ATTENDANT CONSOLE [A-3].
5. If there is no answer at a Station, the Calling Party will continuously receive Ringback Tone. There is no AUTOMATIC RECALL [A-8] to the Attendant in this case.
6. If the Station is assigned to a STATION HUNTING [S-7, 8, 9] Group, the Incoming Call will follow the Hunt Group Station assignment. If the Station is in a CALL FORWARDING [C-2, 3, 5] mode, the Incoming Call is connected to the CALL FORWARD Target Station.
7. This feature is normally used where Direct-in Service is required on a limited basis. The number of Stations serviced is effectively limited to the number of Trunks available for DIRECT-IN TERMINATION.
8. DIRECT-IN TERMINATION is mutually exclusive with NIGHT CONNECTION - FIXED [N-1].
9. DIT Trunks can be programmed to terminate elsewhere in the Night mode.
10. When the system is in the Night mode of operation and the DIRECT-IN TERMINATION (DIT) Station is busy, the call will divert to TAS if provided, otherwise, the call will wait on the busy Station until it becomes idle.
11. More than one Trunk can be programmed for DIRECT-IN TERMINATION to a particular Station Line.
12. The DIT Call can terminate to a DO NOT DISTURB -D [D-11D] Station.
13. When a DIT Call terminates to a restricted Station or a Station setting CALL FORWARDING - ALL CALLS [C-5]/BUSY LINE [C-2], or MULTIPLE CALL FORWARDING - ALL CALLS [M-44]/BUSY LINE [M-24] to a restricted Station, the call is routed to the Attendant and terminates at the ICPT key on the ATTENDANT CONSOLE [A-3].

    Note: This service can be activated in System Data.

14. After a call is answered, it can be processed by the Called Station like any normal Trunk Call.

15. Only the Telephone Number is available for the Destination Station assignment when activating this feature via FCCS.
16. When activating this feature via the FCCS Network, this feature is activated by data in the LDM of the Node accommodating the Terminated COT.
17. When activating this feature via the FCCS Network, when the Telephone Number of the Destination Station is deleted:
    a.) When the Attendant Console is used, the DIT Call terminates to the Attendant Console.
    b.) When the Attendant Console is not used, or if the Attendant Console is in Night mode, the caller hears Ringback Tone.
18. When activating this feature via the FCCS Network, a DIT Call cannot be queued while all the FCCS Links are busy. Calling Party receives Ringback Tone at that time and after the FCCS Link is restored to idle.
19. When activating this feature via the FCCS Network, the different destination for Central Office Incoming Call (Ringdown) cannot be set at each Tenant Group.

Interactions

1. Night DIT Service is NIGHT CONNECTION - FIXED [N-1]. The NIGHT CONNECTION - FIXED/FLEXIBLE [N-1, 2] feature can be used to simulate a DIT application.
2. When using NIGHT CONNECTION - FIXED/FLEXIBLE [N-1, 2], if the Station is busy, the call will divert to TRUNK ANSWER ANY STATION [T-8], if provided. If not provided, the call will queue at the busy Station until it becomes idle.
3. The DIRECT-IN TERMINATION Trunk is limited to DDD, FX, WATS, and CCSA.
4. All CALL FORWARDING [C-2, 3, 5] features may be used in conjunction with DIRECT-IN TERMINATION. In the case of CALL FORWARDING - DON'T ANSWER [C-3], the call must physically be ringing the DIT Station. Call Forwarding is only available from a ground start DIT Trunk.
5. STATION HUNTING [S-7, 8, 9] and UNIFORM CALL DISTRIBUTION (UCD) [U-1] may be used with DIRECT-IN TERMINATION.

Programming

STEP 1: **ASYD** - SYS2, Index 11, Bit 7. Will the DIT Call to a busy Station be routed to the Attendant Console, or will it queue to the busy Station? 0/1: Attendant Console/Queue. Assign on a per Tenant basis. If the call goes to the Attendant Console, it will ring in on the BUSY or ICPT key.

SYS1, Index 147. DIT Supervisory Timer for a Busy Station. How often will the CPU look at the Idle/Busy status of the Station for rerouting the DIT Call to the destination? This index works when SYS2, Index 11, Bit 7 is 1.

STEP 2: **ARTD** - Assign the DIRECT-IN TERMINATION Route as shown below:

GROUND START:

RT: 1

1-OSGS	:2	2-ONSG	:3	3-ISGS	:1	4-INSG	:3	5-TF	:2
6-TCL	:1	7-L/T	:1	8-RLP	:2	15-LSG	:1		

LOOP START:

RT:1

1-OSGS	:2	2-ONSG	:3	3-ISGS	:1	4-INSG	:3	5-TF	:2
6-TCL	:1	7-L/T	:1	8-RLP	:2				

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or MG.

STEP 3: **ATRK** - Assign the LENS, DIT Trunk Route Number, Trunk Number, and Tenant Number.

STEP 4: **MBTK** - Assign the Make Idle status to the DIT Trunk.

STEP 5: **ARSC** - The DIT Target Station receiving the call must be assigned a Route Restriction Class (RSC), allowing the Station to be connected to the Trunk. The DIT Route must be allowed via Route Restriction Indexes (RRI) 0 and 1.

STEP 6: **ACFR** - Designate the type of Incoming Call Class Indexes (CCI) that require a Transfer Service Feature Index (TSFI) = 3, DIRECT-IN TERMINATION. The type of CCI must match CDN 6 of the DIT Route. For Night DIT (NIGHT CONNECTION - FIXED [N-1]), allow the CCI a TSFI = 2, NIGHT CONNECTION - FIXED [N-1].

For Day and Night DIT Service - Same Station

ACSI - Assign the External Route Number, Trunk Number, and Connection Service Index = 3 for DIT. Then assign the Tenant Number and Station Number to serve as the DIT Station.

For Day DIT Service

ACSA - Assign the External Route Number, Trunk Number, Connection Service Index A = 2 for DIT. Then assign the Tenant Number and Station Number to serve as the DIT Station.

For Day and Night DIT Service - Different Stations

ACSI - Assign the External Route Number, Trunk Number, Connection Service Index = 4 for NIGHT CONNECTION - FIXED (DIT) [N-1]. Then assign the Tenant Number and Station Number to serve as the DIT Station.

Night DIT Only

ACSI - Assign the External Route Number, Trunk Number, Connection Service Index = 4 for NIGHT CONNECTION - FIXED (DIT) [N-1]. Then assign the Tenant Number and Station Number to serve as the DIT Station.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ACSIL** - This command must be assigned to the Node accommodating the COT. Assign External Route Number/Logical Route Number (RT/LGRT), Trunk Number (TK), and Connection Service Index (CSI) = 3 for DIT activated in Day and Night mode or 4 for DIT activated in Night mode. Then assign the User Group Number (UGN) and Telephone Number (TELN) to serve as the DIT Station.

STEP 2: **ACSAL** - This command must be assigned to the Node accommodating the COT, when setting the DIT Service in Day only or different DIT Station is used in Day and Night. Assign External Route Number/Logical Route Number (RT/LGRT), Trunk Number (TK), and Connection Service Index A (CSIA) = 2 for DIT activated in Day mode. Then assign the User Group Number (UGN) and Telephone Number (TELN) to serve as the DIT Station.

Note: The following data should also be set in addition to the above-mentioned commands: The commands to be set to the Node accommodating the COT: ASYD/ARTD/ATRK/MBTK/ARSC/ACFR.

D-8 Direct Inward Dialing (DID)

General Description

This feature provides for all Incoming Calls from the Public Network (except FX or WATS) to reach any System Station without Attendant assistance.

Operating Procedure

The Calling Party, outside the system, dials the Telephone Number as usual. However, the call is answered directly at a predetermined Station, bypassing the Attendant.

Service Conditions

1. This feature requires that special DID Trunks and Telephone Number be obtained through the local Telephone Company.

   Note: Not all Telephone Company Central Offices are capable of providing this service.

2. If the Central Office Numbering Plan differs from the user's Station Numbering Plan, addition or deletion of digits can be implemented to coincide with the existing Numbering Plan.
3. This feature is normally used when DIRECT-IN Service is desired on an extensive or system basis.
4. DID is also frequently referred to as CENTREX Service.
5. If the Called Station is non-existent, the DID Call is automatically routed to the Attendant or another predesignated Station. Calls to invalid numbers can be routed to an Attendant or to a Recorded Announcement. See CALL FORWARDING - INTERCEPT/ANNOUNCEMENT [C-25].
6. Wink Start or Delay Start Signaling is recommended for use in conjunction with this feature.
7. The DID Trunk contains a switchable 2db transmission pad that is switched in or out via software control.
8. If DID Trunk is immediate start, dial pulse is required.
9. Incoming Calls have priority over Outgoing Calls. When a Register is assigned as an Outgoing Register Trunk (ORT), it will also act as an Incoming Register Trunk (IRT) if no IRTs are available. Therefore, ORTs can act as IRTs, but if IRTs are programmed, they will not act as ORTs.
10. If immediate Start DID Trunks are required, Incoming Register Trunks must be programmed in the same local processor as the DID Trunks.

Interactions

1. CALL FORWARDING [C-2, 3, 5]: When a Station has activated CALL FORWARDING - ALL CALLS [C-5], CALL FORWARDING - BUSY LINE [C-2], or CALL FORWARDING - DON'T ANSWER [C-3], the DID Call is forwarded to a designated Station rather than to the Specific Station dialed.
2. STATION HUNTING [S-7, 8, 9]: If the Called Station is programmed for this feature and is busy, the call follows any prescribed Hunting Pattern.
3. CALL WAITING - TERMINATING [C-12]: If the Called Station has the Call Waiting - Terminating feature, Call Waiting Ringback Tone to the Calling Party is provided when the Called Station is busy. The Called Station hears a Two-burst Call Waiting Tone. Call Waiting is allowed in CDN 46:CW, of ARTD.
4. On an Incoming Call to a busy Station, the Call Forwarding feature takes precedence over the Station Hunting feature, and the Station Hunting feature takes precedence over the Call Waiting feature.
5. The PA-8TLT circuit card provides interface capabilities for eight DID Circuits.

Programming

STEP 1: **ASYD** - SYS, Index 16, Bit 3. Enable the four-digit Station Number. It is normal to enable all options regarding length of Station Numbering. Assign data 1FH.

SYS1, Index 65. Assign the number of Routes in the system.

SYS1, Index 70, Bit 0. Is Calling Number for a DID Incoming to the Attendant in service? 0/1: No/Yes.

STEP 2: **ARTD** - Assign the DIRECT INWARD DIALING Route as shown below:

RT:1

3-ISGS	:7	4-INSG	:3	5-TF	:2	6-TCL	:5*	7-L/T	:1
8-RLP	:2	15-LSG	:8	28-ANS	:1	46-CW	:1		

Note: *This can be assigned as data 1, DDD.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as circuit card or MG.

STEP 3: **ATRK** - Assign the LENS, DID Trunk Route Number, Trunk Number, and Tenant Number.

Assign the LENS and Incoming Register Trunk Route Number (903). The LENS must be for Levels 0-3 for any 8RST circuit card (see Interactions).

STEP 4: **MBTK** - Assign the make idle status to the DID and Incoming Register Trunks.

STEP 5: **ANPD** - Reserve a Number Level for Station Access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. Number of Necessary Digits (NND) is usually four, and the Busy Lamp Field is activated.

STEP 6: **ASPA** - Assign the Access Code as assigned in ANPD above. Type of Service, SRV = “STN: Station Number”. The number of digits usually required is four.

STEP 7: **ARSC** - The DID Station receiving the call must be assigned a Route Restriction Class (RSC) that will allow the Station to be connected to the Incoming DID Route. The DID Route must be allowed via Route Restriction Indexes (RRI) 0 and 1.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as circuit card or MG.

STEP 1: **ARTDN** - Assign the DIRECT INWARD DIALING Route as shown below:

RT:1

3-ISGS	:7	4-INSG	:3	5-TF	:2	6-TCL	:5	7-L/T	:1
8-RLP	:2	15-LSG	:8	28-ANS	:1	46-CW	:1		

STEP 2: **ANPDN** - Reserve a Number Level for Station Access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. Number of Necessary Digits (NND) is usually four, and the Busy Lamp Field is activated.

STEP 3: **ASPAN** - Assign the Access Code as assigned in ANPD above. Type of Service, SRV = "TELN: Telephone Number". The number of digits usually required is four.

STEP 4: **ARSCN** - The DID Station receiving the call must be assigned a Route Restriction Class (RSC) that will allow the Station to be connected to the Incoming DID Route. The DID Route must be allowed via Route Restriction Indexes (RRI) 0 and 1.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

D-9 Direct Outward Dialing (DOD)

General Description

This feature permits any user to gain access to the Public Network without the assistance of the Attendant, by dialing an Access Code and receiving a Second Dial Tone. The user may then proceed to dial the desired Public Network Number.

Operating Procedure

To place an Outside Call:

1. Go off-hook. Receive Dial Tone,
2. Dial the Trunk Access Code (usually “9”).
3. Receive Second Dial Tone from Central Office.
4. Dial the desired Telephone Number.
5. If the call is denied for any reason, Reorder Tone is heard.

Service Conditions

1. Outgoing Connection Restriction can be assigned on an individual Station basis. Refer to CLASS OF SERVICE - INDIVIDUAL [C-15].
2. Various types of Trunks (FX, WATS, TIE, Central Office, etc.) can be directly accessed using this feature.
3. The Trunk Group Access Code is limited to a maximum of three digits (only when the SPEED CALLING [S-3, 3D, 21, 23] Service is required).
4. Use of the DOD feature can be denied on a Trunk Group basis when the following restrictions are active on the Originating Station Line.
    - FULLY RESTRICTED STATIONS: Direct Outward Dialing attempts are routed to Reorder Tone when the Station is Fully Restricted.
    - RESTRICTION FROM OUTGOING CALLS: A Station assigned this feature is denied the ability to dial-access preselected Trunk Groups.
    - HOTLINE [H-1]: Exchange Network Call Completion using this feature is not permitted. The Originating Station can only be routed to the ATTENDANT CONSOLE [A-3] or another Station when going off-hook.
    - MISCELLANEOUS TRUNK RESTRICTION [M-3]: Preselected Station Lines are denied access to preselected miscellaneous Trunk Groups, the Station is routed to Reorder Tone when the Station attempts to originate a call on the Trunk Group.
    - TOLL RESTRICTION: Level of this feature Restricts unauthorized Station Lines’ ability to complete Outgoing Central Office or Foreign Exchange Calls to specified areas or Office Codes within an area.
    - TOLL DENIAL: A Station with Toll Denial is routed to Reorder Tone when a 0 or 1 is dialed as the first digit after the Trunk Access Code has been dialed.
5. The Outgoing Call using a Trunk in the Remote Node via FCCS link is available. For more detailed information, see the Data Programming Manual - FCCS.

Interactions

1. The COT circuit card is used for all Ringdown Trunks. This circuit card is equipped to interface with Central Office circuits and may be used for either Loop Start or Ground Start Trunks.
2. TOLL RESTRICTION - 3/6-DIGIT [T-7] may be applied to DIRECT OUTWARD DIALING.

Programming

STEP 1: **ASYD** - SYS1, Index 65. Assign the number of Routes in the system.

STEP 2: **ANPD** - Reserve a Number Level for Outgoing Trunk Access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined numbering scheme.

STEP 3: **ASPA** - Assign the Access Code as assigned in ANPD above. Type of Service, SRV = "OGC: Outgoing Call" for Outgoing Trunk. Assign the Route Number associated with the Access Code.

STEP 4: **ARTD** - Assign the DOD Route as shown below:

GROUND START:

RT: 1

1-OSGS	:2	2-ONSG	:3	5-TF	:1	6-TCL	:1	7-L/T	:1
8-RLP	:2	15-LSG	:1						

LOOP START:

RT:1

1-OSGS	:2	2-ONSG	:3	5-TF	:1	6-TCL	:1	7-L/T	:1
8-RLP	:2								

Note: To change the data for existing route (RT), initialize the circuit card.

STEP 5: **ATRK** - Assign the LENS, DOD Trunk Route Number), Trunk Number, and Tenant Number.

STEP 6: **MBTK** - Assign the Make Idle status to the DOD Trunks.

STEP 7: **ARSC** - The Route Restriction Class must be constructed via RRI: 3, direct access, to allow the Station access to the involved Routes.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: To change the data for existing route (RT), initialize the circuit card.

STEP 1: **ANPDL** - Reserve a Number Level for Outgoing Trunk Access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined numbering scheme.

STEP 2: **ASPAL** - Assign the Access Code as assigned in ANPD above. Type of Service, SRV = "OGC: Outgoing Call" for Outgoing Trunk. Assign the Logical Route Number associated with the Access Code.

STEP 3: **ARTDN** - Assign the DOD Route as shown below:

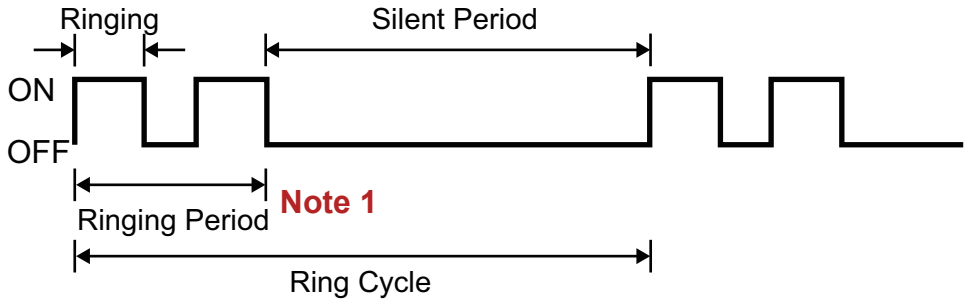
GROUND START:

RT: 1

1-OSGS	:2	2-ONSG	:3	5-TF	:1	6-TCL	:1	7-L/T	:1
8-RLP	:2	15-LSG	:1						

LOOP START:
RT:1
1-OSGS :2 2-ONSG :3 5-TF :1 6-TCL :1 7-L/T :1
8-RLP :2

STEP 4: **ARSCN** - The Route Restriction Class must be constructed via RRI: 3, direct access, to allow the Station access to the involved Routes.



Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

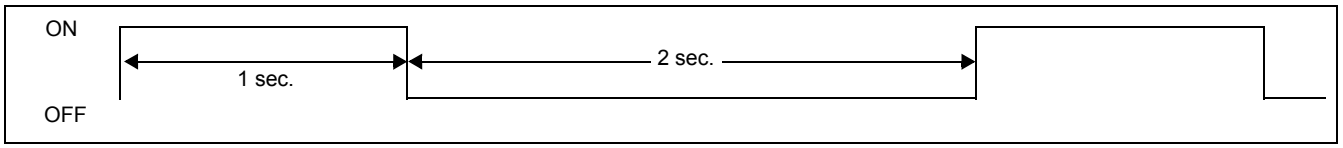
D-10 Distinctive Ringing

General Description

This feature provides distinctive station ringer patterns so that the user can distinguish between internal and External Incoming Calls.
Ringer patterns are as follows:

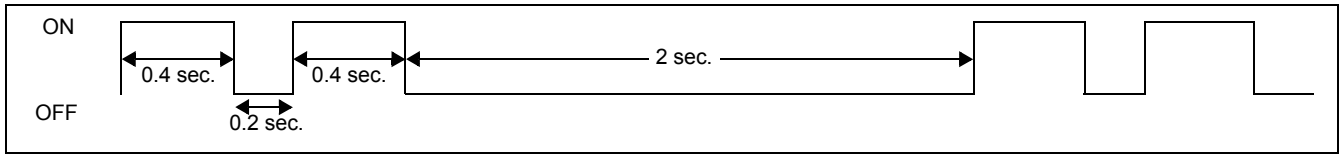
[Definition of Terms]

Note 1: Ringing Period consists of a single ringing or group of ringings.



[Ringer Patterns]

(1) Ringer Pattern 0: Used for an incoming call from a central office line.

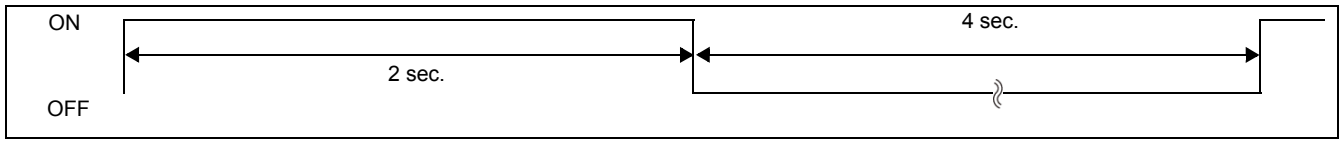


Recommended Setting of Ringer Pattern 0

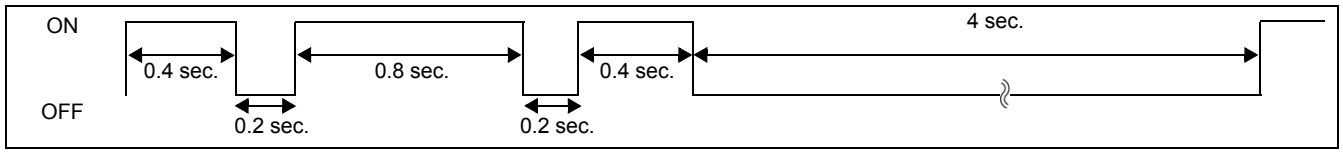
System Data	Description	Recommended Value
ASYD, SYS3, Index 0	Duration of the Ring Cycle (timer value for ringer used for incoming trunk calls)	21 (Hex)
ASYD, SYS3, Index 3, Bit 0	Multiple Ringings per Ringing Period for Ringer Pattern 0	Bit 0=0 (Disabled)

<Recommended Ring Cycle>

<Ring Cycle When Multiple Ringings per Ringing Period is Enabled
(ASYD, SYS3, Index 3, Bit 0=1)>



(2) Ringer Pattern 1: Used for an incoming call from a station or TIE line trunk.

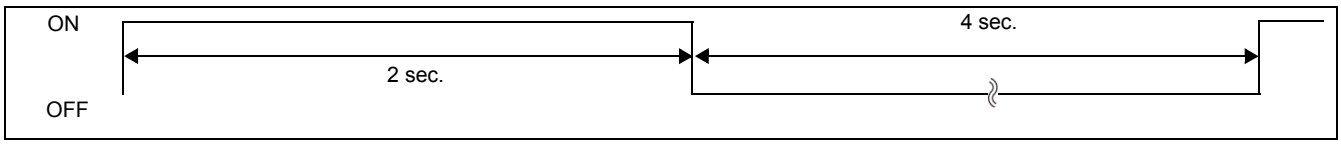


Recommended Setting of Ringer Pattern 1

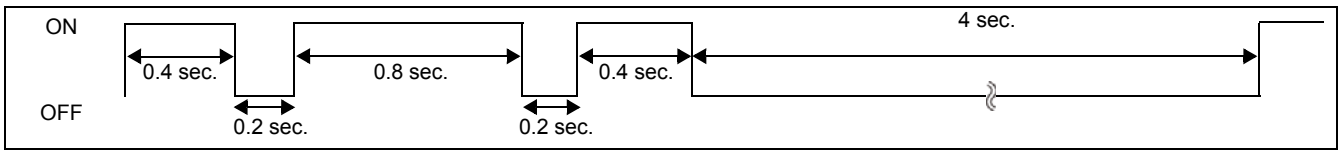
System Data	Description	Recommended Value
ASYD, SYS3, Index 1	Duration of the Ring Cycle (timer value for ringer used for station calls)	42 (Hex)
ASYD, SYS3, Index 3, Bit 1	Multiple Ringings per Ringing Period for Ringer Pattern 1	Bit 1=0 (Disabled)

<Recommended Ring Cycle>

<Ring Cycle When Multiple Ringings per Ringing Period is Enabled
(ASYD, SYS3, Index 3, Bit 1=1)>



(3) Ringer Pattern 5: Used for an incoming call from a station or TIE line trunk to the Personal Number, CALL BACK [C-1], OUTGOING TRUNK QUEUING [O-2], Priority Ringing in CALL WAITING [C-12], AUTOMATIC/MANUAL INTERCOM [A-30], and DIAL INTERCOM [D-87].



Recommended Setting of Ringer Pattern 5

System Data	Description	Recommended Value
ASYD, SYS3, Index 7	Duration of the Ring Cycle (timer value for ringer for Call Back, OG Trunk Queuing, Priority Ringing in Call Waiting, Auto/Manual Intercom, and Dial Intercom)	42 (Hex)
ASYD, SYS3, Index 3, Bit 5	Multiple Ringings per Ringing Period for Ringer Pattern 5	Bit 5=0 (Disabled)

<Recommended Ring Cycle>

<Ring Cycle When Multiple Ringings per Ringing Period is Enabled
(ASYD, SYS3, Index 3, Bit 5=1)>

Operating Procedure

No manual operation is required.

Service Conditions

1. The following Ringer Patterns are recommended. For the ringer patterns for the Personal Number, refer to PERSONAL RINGER [P-59].

Note: Personal Number means the Telephone Number allowed Personal Ringer function.

Note: Only Desktop terminals can use Personal Ringer function. (This function is not available for analog telephones and Software Line).

- Ringing for Incoming Internal Call:

a.) When a Service Feature Restriction Class that allows Personal Ringer (ASFC, SFI 148) is assigned to a station:
Ringer Pattern 1 - Ringing for Incoming Internal Call to Pilot Number:
A two-second ringing followed by a four-second silence.
Ringer Pattern 5 - Ringing for Incoming Internal Call to Personal Number (ex. My Line):
A two-second ringing followed by a four-second silence

b.) When a Service Feature Restriction Class that restricts Personal Ringer (ASFC, SFI 148) is assigned to a station:
Ringer Pattern 1 - A two-second ringing followed by a four-second silence.

- Ringing for Incoming External Call:

a.) Ringer Pattern 0 - A one-second ringing followed by a two-second silence.

- Recall Ringing for CALL BACK [C-1], CALL WAITING - ORIGINATING [C-31], or OUTGOING TRUNK QUEUING [O-2]:

a.) Ringer Pattern 1 - A two-second ringing followed by a four-second silence
Or
Ringer Pattern 5 - A two-second ringing followed by a four-second silence

Note: These timing parameters can be changed via the end users requirements (1-15 seconds).

Availability of Customization for Ringer Patterns 0 to 7

X: Available N: Not Available –: Not applicable

Ringer Pattern	Customization of Ringer Pattern	Customization of Ring Cycle (Note 2) Duration through System Data		Recommended Ring Cycle Duration (Ringing/Silent) (sec.)	Used for
		ELC	LC	ELC	
Ringer Pattern 0	X	X	X	1/2	Incoming Trunk Calls
Ringer Pattern 1	X	X	X	2/4	Station Calls
Ringer Pattern 2	N	N	N	-	Fax
Ringer Pattern 3	N	N	N	-	Wake Up Calls
Ringer Pattern 4	N	N	N	-	Not used.

Availability of Customization for Ringer Patterns 0 to 7

X: Available N: Not Available –: Not applicable

Ringer Pattern	Customization of Ringer Pattern	Customization of Ring Cycle (Note 2) Duration through System Data		Recommended Ring Cycle Duration (Ringing/Silent) (sec.)	Used for
		ELC	LC	ELC	
Ringer Pattern 5	X	X	X	2/4	Call Back, Outgoing Trunk Queuing, Call Waiting, Auto/Manual Intercom, and Dial Intercom
Ringer Pattern 6	X	X	N	1/2	-
Ringer Pattern 7	X	X	N	1/1	-

Note 2: The Ring Cycle consists of a ringing period and a silent period.

2. This feature may be assigned per Trunk Route via System Data programming.
3. If an Off-Premises Station (OPX) or denied station is assigned to a station line, an option is available for that Class of Service to eliminate burst Ringing Signals.
4. The DISTINCTIVE RINGING interruption rates can be optionally selected on a per system basis. In this case, System Initialization may be required.
5. An option is available on a per Trunk Group basis to provide one-burst ringing on Terminating Calls.
6. When calling a third station (THREE-WAY CALLING [T-2], CONSULTATION HOLD [C-17], etc.), the Ringing Signal to the called station depends on the type of facility (station or trunk) on hold.

Interactions

1. CALL HOLD [C-6]: Recall ringing for CALL HOLD [C-6] can be distinguished between a held station call (two-burst ringing) from a held trunk call (one-burst ringing).
2. CONSULTATION HOLD [C-17]: Station A places Party B on CONSULTATION HOLD [C-17] and calls Station C. If Party B is a Trunk, Station C hears DISTINCTIVE RINGING for a Trunk Call. If Party B is a station, Station C hears Distinctive Ringing for a station call.
3. When Personal Ringer function is set to a station, if an Incoming Internal Call is terminated to the Personal Number and the call is transferred by CALL FORWARDING - DON'T ANSWER [C-3], the Ringer Pattern of the transferred station is Ringer Pattern 3 for an analog telephone, and Ringer Pattern 5 for a Dterm.

Type Of Transferred Station	Ringer Pattern
Analog Telephone	1
Dterm	5

4. The ringer pattern options provided by this feature are not available on telephones connected to UG50, where those patterns are translated into corresponding ringer patterns. For details, see Peripheral Equipment Description (UG50), Chapter 1, "Limitations on Voice and Tone."

Programming

STEP 1: **ASYD** - SYS1, Index 72, Bit 6. Is DISTINCTIVE RINGING applied to calls handled via the *Intermediate Party (Station or Attendant Console)*? 0/1: No/Yes. Otherwise, these calls will ring as Station-to-Station Calls.

Note: This system data is also available in the following case.
- Trunk line → CCIS → Intermediate Party (Station or Attendant Console) → Station

Ringer Pattern 0 - Normally used for central office calls.

SYS3, Index 0. Duration of the Ring Cycle (Timer Value) for Ringer Pattern 0. Normally, data 21 hexadecimal (one second-ON, two seconds-OFF) should be assigned to this Index.

SYS3, Index 3, Bit 0. Two Ringings (0.4 seconds.ON, 0.2 seconds.OFF, 0.4 seconds.ON) per Ringing Period for Ringer Pattern 0. 0/1: Disabled/Enabled.

Ringer Pattern 1 - Used for Station Calls.

SYS3, Index 1. Duration of the Ring Cycle (Timer Value) for Ringer Pattern 1. Normally, data 42 hexadecimal (two seconds-ON, four seconds-OFF) should be assigned to this Index.

SYS3, Index 3, Bit 1. Three ringings (0.4 seconds-ON, 0.2 seconds-OFF, 0.8 seconds-ON, 0.2 seconds-OFF, 0.4 seconds-ON) per Ringing Period for Ringer Pattern 1. 0/1: Disabled/Enabled.

Ringer Pattern 5 - Used for Call Back, OG Trunk Queuing, Call Waiting, and Auto/Dial Intercom.

SYS3, Index 7. Duration of the Ring Cycle (Timer Value) for Ringer Pattern 5.

SYS3, Index 3, Bit 5. Three ringings (0.4 seconds-ON, 0.2 seconds-OFF, 0.8 seconds-ON, 0.2 seconds-OFF, 0.4 seconds-ON) per Ringing Period for Ringer Pattern 5. 0/1: Disabled/Enabled.

Note: For information on how to customize the Ringer Pattern, refer to Command Manual.

Note: When the System Data is changed, circuit card (ELC) initialization is required.

SYS1, Index 417, Bit 0. Recall Ringer Pattern for CALL BACK [C-1], CALL WAITING - ORIGINATING [C-31], and OUTGOING TRUNK QUEUING [O-2].

0/1: Ringer Pattern 5/Ringer Pattern 1.

STEP 2: **ARTD** - To provide a distinctive ring to specific Routes, assign data "1" to CDN 12: DR (follows the ringer pattern assigned by ASYD, SYS3, Index 0, Bit 0 and ASYD, SYS3, Index 3, Bit 0).

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as circuit card or MG.

STEP 3: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 48 (Burst Ringing), to PA-16LC Port Station that will not operate using DISTINCTIVE RINGING. With this feature, the system does not look at ASYD, SYS3, Index 3, Bit 0 and Bit 1 to determine how this telephone will ring. Telex, Fax Machines, and OPX Stations may require a longer Ringing Signal. Digital terminals will not respond to this feature.

Assign a Service Feature Restriction Class that allows SFI 148 (Personal Ringer) to the stations that activates Personal Ringer function. Personal Ringer function changes ringer pattern for Incoming Internal Call according to the Called Number as shown below:

Incoming Internal Call terminated to Pilot Number: Ringer Pattern 1

Incoming Internal Call terminated to Personal Number (ex. My Line): Ringer Pattern 5

D-11D Do Not Disturb -D

General Description

This feature allows a user to establish DO NOT DISTURB status. Incoming Calls will be denied access to My Line, while DO NOT DISTURB status is in effect.

Operating Procedure

To set

1. Press the DO NOT DISTURB (DND) Feature key. The associated LED will light. The LCD displays:

DND SET
(Time Display)

To cancel

2. Press the DO NOT DISTURB (DND) Feature key. The LED will go out. The LCD displays:

DND CANCEL
(Time Display)

Service Conditions

1. This service can only be set or canceled while the Dterm is idle.
2. Lines programmed to ring will not do so while this service is set.
3. While DO NOT DISTURB is set, Outgoing Calls may be made. The user may answer other Lines, excluding My Line.
4. DND is not displayed on the Calling Station's Dterm when the Called Station is in the DO NOT DISTURB condition. Restriction (REST) appears on the display in place of DND. Reorder Tone is heard, and no indication will appear in the DO NOT DISTURB condition when the Calling Station is a HOTLINE [H-1].

REST	**XXXXX**
(Time Display)	

5. A DND Station in a HUNT GROUP [D-7, 8, 9] is skipped.
6. CALL FORWARDING - BUSY LINE [C-2] can be activated for an idle Station that has set DND.
7. The following features are denied to the DND Station:

ATTENDANT CAMP-ON WITH TONE INDICATION	[A-1]
ATTENDANT OVERRIDE	[A-7]
BOSS - SECRETARY OVERRIDE -D	[B-5D]
BUSY VERIFICATION	[B-3]
EXECUTIVE RIGHT-OF-WAY	[E-1]
VOICE CALL	[V-2]

8. When the user sets DO NOT DISTURB while engaged in a call, privacy is set. In this case, the following services will be restricted:

CALL WAITING - TERMINATING	[C-12]
EXECUTIVE RIGHT-OF-WAY	[E-1]

9. When the terminal performs re-registration while DO NOT DISTURB is set, the associated LED of the DND Feature key will light and the Soft key will flash. However, this is only available for IP terminals and SIP Multiple Line terminals and will not be available for Digital terminals.

Interactions

1. DO NOT DISTURB may be listed in some literature as available by a Line/Feature key. A Desktop terminal ACD Station is not equipped with the DND Feature key. If DO NOT DISTURB is to be made available to this Station, it must be programmed to a Line/Feature key.
2. DATA INTERFACE - AUTOMATIC ANSWER may be activated if the Dterm Station is in the DO NOT DISTURB mode.

Programming

STEP 1: **AKYD** - Assign the following Key Data for the Desktop terminal:

TN: 1
STN: Station Number
TP: Type of Dterm (0-3)
KYN: Key Number (1-40)
KYI: Service Index
0: Key not used
→ 1: Feature Key
2: Multi Line Key
KD: Not assigned for Feature key
FKY: Feature Key Number
FKY: 50 (Do Not Disturb)

STEP 2: **ADSL** - Assign SN = 0 (Idle) and Feature key Do Not Disturb [50].
This command is used for assigning the function to each Soft key.

STEP 3: **ASFC** - Select an indication type (REST/DND) on the display of a Dterm when it terminates to a Station that has been set DO NOT DISTURB.

SFI: 114, [Calling Party DND Indication (Dterm)]
0/1: REST/DND.

D-13D Dial Monitor -D

General Description

This feature provides for dialed digits to appear on the Desktop terminal LCD.

Operating Procedure

1. Lift the handset or press the SPEAKER key. Receive Dial Tone.
2. Dial the desired number. The digits will appear in sequence on the LCD.

Service Conditions

1. Digits appear from the right and move to the left as additional digits are dialed. A maximum of 16 digits can be displayed. If more than 16 digits are dialed, the first dialed digits will be dropped and the last dialed digit appears. This process continues until all digits have been dialed.
2. Digits also appear on the display when implementing SPEED CALLING - ONE TOUCH -D [S-26D], LAST NUMBER CALLED -D [L-6D] and SAVE AND REPEAT -D [S-24D].

Programming

No programming is required.

D-15 Day/Night Class of Service

General Description

This feature permits any Station to be assigned one CLASS OF SERVICE - INDIVIDUAL [C-15], for Day and another for Night. System Data can be programmed so that once the ATTENDANT CONSOLE [A-3] has entered the NIGHT CONNECTION [N-1, 2] mode, a Station's CLASS OF SERVICE - INDIVIDUAL [C-15] will be automatically changed when required. Class may be upgraded or downgraded, and Trunk Groups normally controlled by the Attendant in the Daytime may be opened to Station control in the Night mode.

Operating Procedure

This feature is controlled entirely via the ATTENDANT CONSOLE [A-3]. Pressing the Night key or removing the handset changes the Service Class. Releasing the Night key or replacing the handset restores normal CLASS OF SERVICE - INDIVIDUAL [C-15].

Service Conditions

1. DAY/NIGHT CLASS OF SERVICE may be assigned on a per Tenant and per Station basis.
2. DAY/NIGHT CLASS OF SERVICE may be assigned to different Trunk Restriction and Service Feature Restriction Classes.
3. Refer to CLASS OF SERVICE - INDIVIDUAL [C-15] for further details.
4. Night mode Restriction Classes can be set at any time by entering the related command on the PCPro.
5. When TENANT SERVICE [T-12] is provided with MULTIPLE CONSOLE OPERATION [M-4], the system can be programmed for either all ATTENDANT CONSOLEs [A-3] or primary ATTENDANT CONSOLE [A-3] to control activation of DAY/NIGHT CLASS OF SERVICE.
6. When DAY/NIGHT mode Changeover occurs, Tenant Number, Day/Night mode of the Tenant, status of the External Switch, and cause of changeover are printed out on the Alarm Printer and PCPro Printer. This service is determined by System Data.
7. Day/Night information of the unused Tenant is not printed out.
8. A maximum of 14 Tenants' information can be printed per message.
9. This feature will output a 17-H informational System Message as per System Data programming (see System Message 17-H below for details).
10. When the Attendant's Night key or External Switch is turned ON and OFF repeatedly, the messages printed out and the operation may not coincide, but the System Message will represent the final Day/Night mode.
11. In the following cases, Day/Night mode is not changed when the External Switch is turned ON, and only the System Message is printed out:
    a.) When neither the ATTENDANT NIGHT TRANSFER [A-19] or TAS [T-8] is available, SYS2, Index 13, Bit 1=1 (no check by Attendant at the time of Day/Night mode Changeover), and the Night key of Attendant indicates Day.
    b.) When neither ATTENDANT NIGHT TRANSFER [A-19] or TAS [T-8] is available, SYS2, Index 13, Bit 1=0 (check by Attendant at the time of Day/Night mode Changeover), and the Night key of Attendant indicates Night.
12. In the same Tenant, it is not available to use both the Attendant's Night key and the External Switch for Day/Night mode Changeover. Select either the Night key or External Switch per Tenant.

13. When Day/Night mode Changeover is activated by jack at the time System Data is SYS1, Index 77, Bit 0=1 (Day/Night mode Changeover by jack available), the cause of changeover is indicated as the Night key (= 1).
14. This feature is to be controlled by the Attendant Console accommodated in the Terminating Node for the FCCS Network.
15. Day/Night mode is changed by the Destination Node of the Operator Call assigned System Data for the FCCS Network.

    Note: The following Attendant Console Day/Night mode Change methods are determined by System Data: By the Primary Attendant Console/By all Attendant Consoles.

16. The Node which does not accommodate the Attendant Console controls DAY/NIGHT mode of the Self Node using the External key for the FCCS Network.
17. The user can assign only one Destination Node from a Node, even when the system is organized by more than one Tenant.
18. When activating this feature by using the External key, only the Self Node which accommodates the External key can be controlled.

Interactions

1. When assigning Station data, assign the Restriction Classes desired to cause the Station to upgrade, downgrade, or remain unchanged status of Restriction Class when going from Day to Night. If DAY/NIGHT CLASS OF SERVICE is not required, assign the commands normally.
2. The DAY/NIGHT CLASS OF SERVICE arrangements are based on the Day/Night Operating Status of the Tenant.
3. DAY/NIGHT CLASS OF SERVICE affects the following restrictions:
   a.) Route Restriction Class (ARSC/ARSCN)
   b.) Service Feature Restriction Class (ASFC/ASFCN)
   c.) Toll Restrictions (ATDP/ATDPL/ATDPN)
   d.) Tenant Restrictions (ATNR)
4. When TRUNK ANSWER FROM ANY STATION (TAS) [T-8] is changed with set or applied, a Station's Night RSC must allow access to the IC Trunks. Also, the Night SFC must allow TAS, SFI 13.

Programming

STEP 1: **ASYD** - SYS1, Index 75, Bit 0. Are Route Restriction Class Pattern (ARSC/ARSCN) Tables to be developed for both Day and Night? 0/1: No/Yes.

SYS1, Index 75, Bit 1. Are the Service Feature Restriction Class Pattern (ASFC/ASFCN) Tables to be developed for both Day and Night? 0/1: No/Yes.

SYS1, Index 75, Bit 2. Are the Tenant Restriction Data Pattern (ATNR) Tables to be developed for both Day and Night? 0/1: No/Yes.

SYS1, Index 75, Bit 3. Are the Toll Restriction Data (ATDP/ATDPL/ATDPN) Tables to be developed for both Day and Night? 0/1: No/Yes.

SYS1, Index 77, Bit 0. Is Day/Night mode change accomplished by removing the handset from the ATTCON? 0/1: No/Yes.

SYS1, Index 229, Bit 3. System Message printout on changeover of the Day/Night mode? 0/1: Out/In Service.

SYS2, Index 2, Bit 2 to Bit 3. ATTCON Day/Night mode change is:

Bit 3	Bit 2	
0	0	= Not required (External Switch effective)
0	1	= by Primary Attendant Console
1	0	= by all Attendant Consoles

STEP 2: **ASFC/ASFCN** - Assign this command for both the Day and Night Tables.

STEP 3: **ARSC/ARSCN** - Assign this command for both the Day and Night Tables.

STEP 4: **ATNR** - Assign this command for both the Day and Night Tables.

STEP 5: **ATDP/ATDPL/ATDPN** - Assign this command for both the Day and Night Tables.

STEP 6: **ASID** - If ATTENDANT NIGHT TRANSFER [A-19] is needed, assign this command.

FCCS Programming

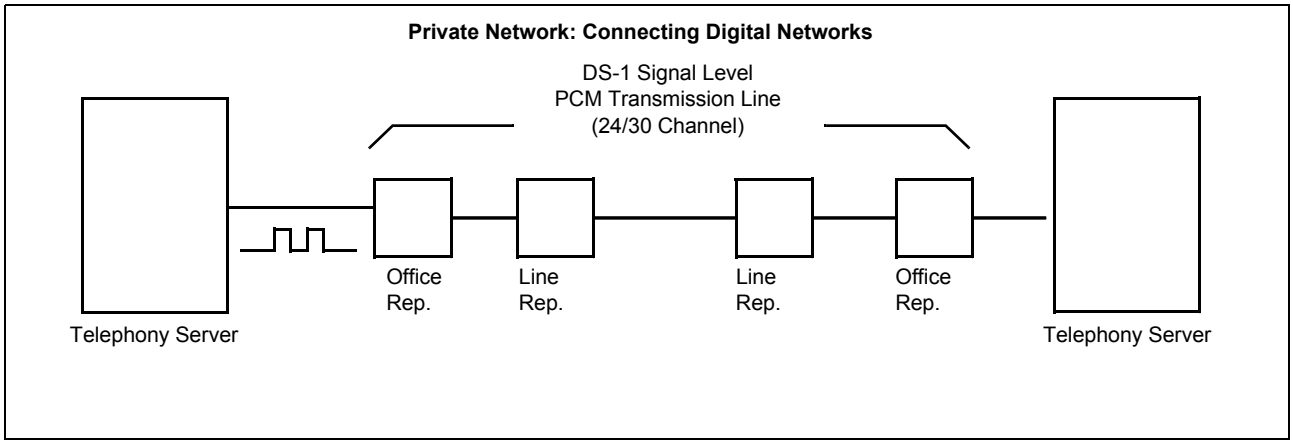
This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ASYDL** - This data must be set to all the Nodes. SYS1, Index 640. Assign the Node of Attendant Console.

STEP 2: **ASPAL** - These data must be set to the Node that calls the Attendant.

SRV: "SSC: Service Code"



SID: 2 = Operator Call

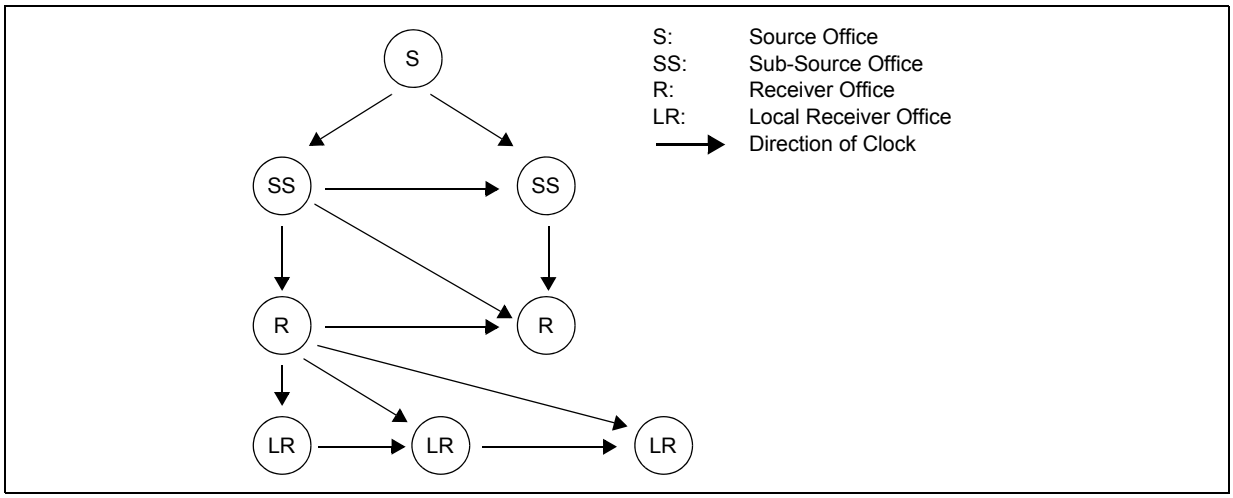
FPC: FPC of the Node accommodates the Attendant Console

D-16 Direct Digital Interface

General Description

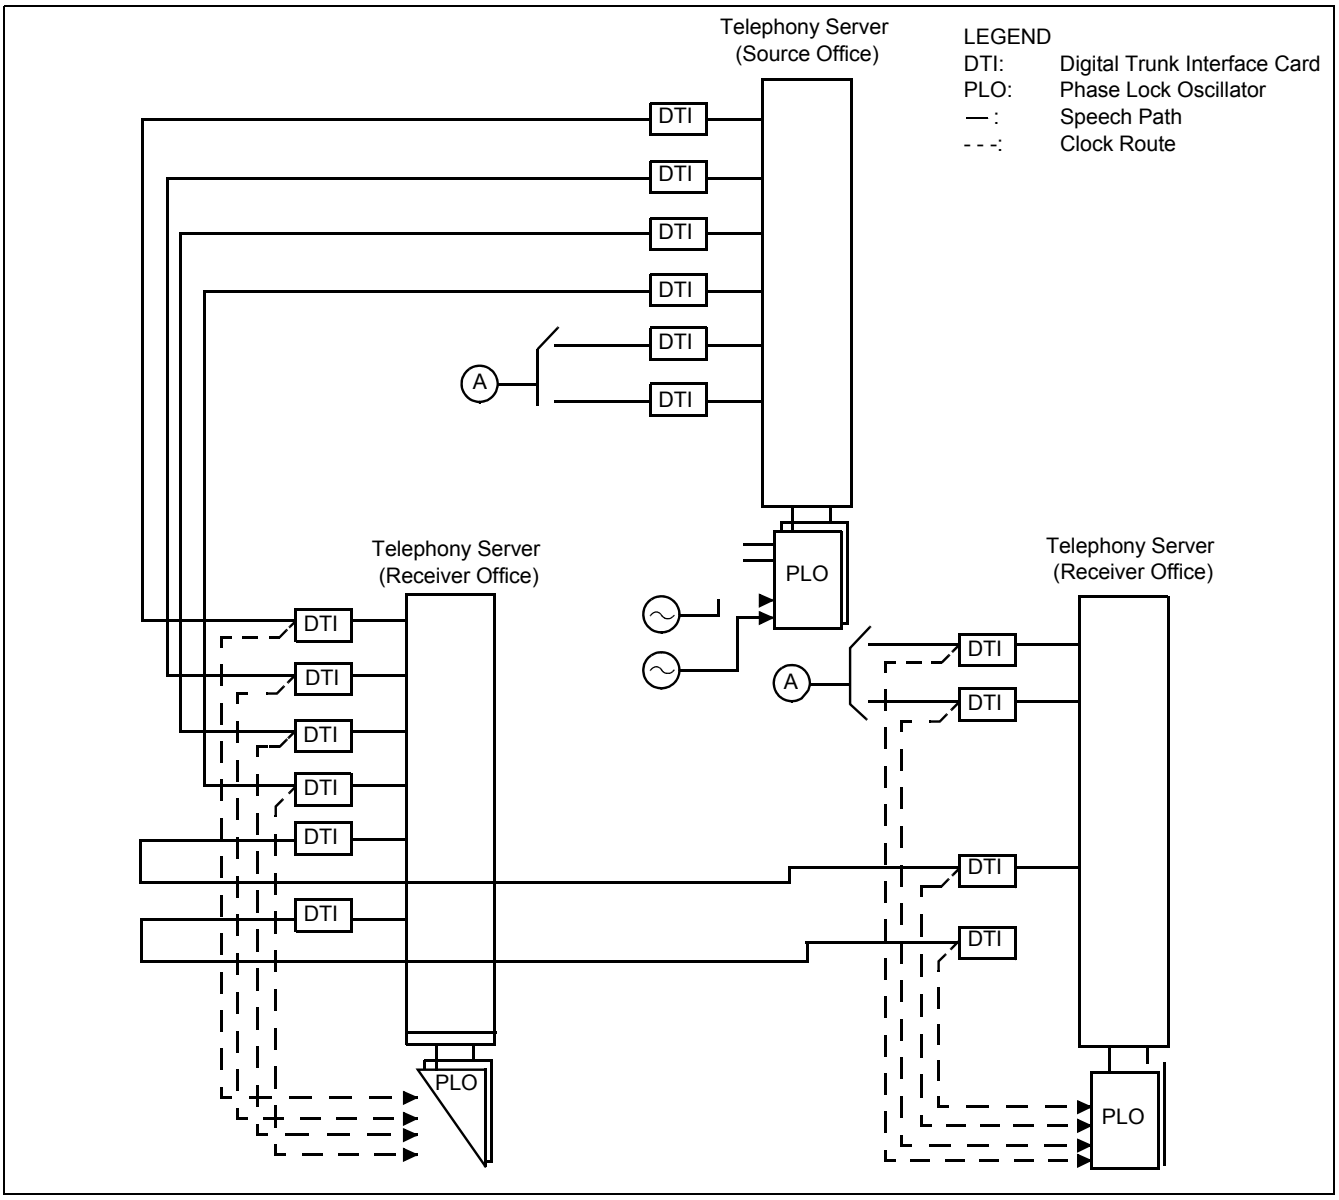
This feature provides the capability to connect Trunks from the Telephony Server directly to T1/E1 Carrier Links via either Private or Public Network.

Operating Procedure



No manual operation is required.

Service Conditions



1. The DTI provides Signalling Interface, Bipolar/Unipolar Conversion, Frame Synchronization, Insertion/ Extraction and Alarm Detection.
2. The Digital Interface Module can be provided with circuit cards to interface with T1/E1 Carrier and/or CCITT Standard Networks.
3. The Digital Interface Module (DTI) is mounted in a Port Interface Rack (PIR).
4. Source-Receiver System (Source) or Source-Receiver System (Receiver) may be used for network synchronization:
5. Each Office hierarchy is defined as follows:
   a.) Source Office: One center will operate as the Source Office. This location has two highly stabilized Source Oscillators, and distributes the Source Clock to all the systems through the Digital Interface Lines.
   b.) Sub-Source Office: This Office operates using a Phase Lock Oscillator (PLO) to synchronize with the clock at the Source Office. If the Source Clock has some failure, the Office can operate using its own backup oscillator.
   c.) Receiver Office: This Office is programmed so it will have at least two Clock Routes, one for Receiver and the other for Standby. Synchronization Clock is derived from Incoming PCM Bit Stream from higher hierarchy Offices.
   d.) Local Receiver Office: This is the End Office in a Digital Network arrangement. This Office will not be provided with a backup Route for the PLO, because this Office is the only one influenced in an event of trouble occurrence.

6. Each Telephony Server can be equipped with a duplicate Phase Lock Oscillator used for network synchronization. Each PLO has four inputs that clocks from the Source Oscillator or Digital Interface Module connect to.

Network Clocking Hierarchy

Network Clock Synchronization

Programming

STEP 1: **ASYD** - SYS1, Index 91, Bit 4 to Bit 7. If one Phase Lock Oscillator (PLO) is mounted, assign data "1" to Bit 4 and Bit 6. If two PLO's are mounted, assign all four Bits as data "1".

STEP 2: **ARTD** - Assign the DIRECT DIGITAL INTERFACE Route as follows. This is for Second Dial Tone TIE Lines.

RT: 1

1-OSGS	:2	2-ONSG	:3	3-ISGS	:2	4-INSG	:3	5-TF	:3
6-TCL	:4	7-L/T	:1	8-RLP	:2	13-AC	:1	15-LSG	:5
30-PAD	:7								

LCR FLAG ROUTE:

RT: 31

5-TF	:3	6-TCL	:1	7-L/T	:1	8-RLP	:2	9-TQ	:1
13-AC	:1								

Note: To change the data for existing route (RT), initialize the circuit card.

STEP 3: **ATRK** - Assign the LENS, DIRECT DIGITAL INTERFACE Trunk Route Number, Trunk Number, and Tenant Number.

STEP 4: **MBTK** - Assign the make idle status to the DIRECT DIGITAL INTERFACE Trunks.

STEP 5: **ANPD** - Reserve a Number Level for Register Sender Least Cost Routing. This level should correspond to the Station Numbering Plan of the Opposite Office. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. Number of Necessary Digits will be the length of the digits in the Opposite Office's Station Numbering Plan.

STEP 6: **ASPA** - Assign the Access Code of the LCR Flag Route. Type of Service, SRV = "LCR: Least Cost Routing", LEAST COST ROUTING - 3/6 DIGIT [L-5]. Assign Connection Index, CI = "N: Normal", "H: Hooking". Assign the LCR Flag Route Number associated with this Access Code.

STEP 7: **ARNP** - Assign the Physical Route Numbers as assigned in ARTD, and relate these Routes to the LCR Access Code as assigned in ASPA for SRV = "LCR: Least Cost Routing". The LCR Access Code is the first digit of the Opposite Offices' Station Numbers.

Note: These same Routes may also be listed in ASPA for SRV = "OGC: Outgoing Call". In that case, these Routes may also be available via direct dial Access Codes, but are not assigned for LCR in ARNP.

STEP 8: **AMND** - Assign the Maximum Necessary Digits the system must translate for correct Route selection. In this case, assign the first digit of the other system's Station Numbering and the number of digits in the Station Numbering Plan.

STEP 9: **AFRS** - List the dialing patterns in groups that are served by a specific sequence of Routes. Use only the DTI Routes and the first digit of the Station Numbering. Assign this dialing sequence to an OPR.

STEP 10: **AOPR** - AFRS designates the dialing sequence and the OPR to be selected. The AOPR defines the Routes and in what order these Routes will be selected. In this case, only the DTI Routes will be assigned. Assign the following parameters:

TDC Number (TDPTN) - Time-of-Day Pattern Change. Usually, this parameter does not apply, and data "0" must be entered. For an AFRS assignment, however, if different OPRs will be required as a function of time, designate which Time-of-Day Pattern Change Number (TDPTN) OPR is assigned (0 -7).

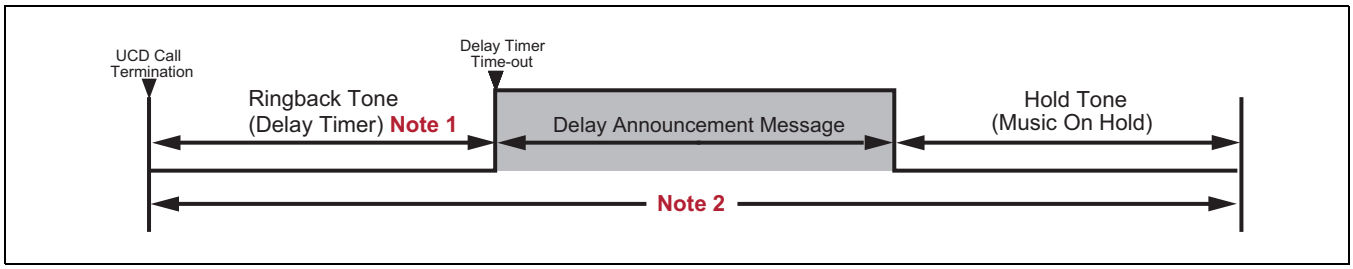
OPR Number (OPR) - Outgoing Pattern Route, the number referenced in AFRS consisting of a series of routes to be chosen based on the Dialed Number.

Route Advance Number (RA) - The order in which a Route will be selected (0-7). Usually only one or two Routes are involved with DTI TIE Lines.

Route Advance End Display (E) - The last Route in the Route Advance Group. Indicate with data "0". All other Routes are indicated by data "1".

Route Number (RT) - The Physical Route Number to be selected, as programmed in ARTD.

Skip Digits (SKIP) - Do not skip any digits. Usually the LCR Access Code is the opposite system's Station Level. This digit must be sent to the Opposite System.



Pattern Number Location (PNL) - If digits are to be added after translating the dialed digits in AFRS, use AADC. This is usually not applicable.

Overflow Tone (OVFT) - Assign if a Tone is wanted for the Last Choice Route. If so, assign data "1" for DDD. Usually not applicable.

D-31 Delay Announcement - UCD

General Description

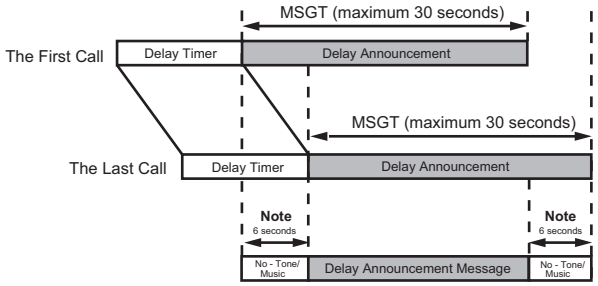
This feature provides recorded Announcement Service for an Incoming Call directed to a busy UNIFORM CALL DISTRIBUTION (UCD) [U-1] Group and placed in a Waiting Queue. The Recorded Announcement occurs after Ringback Tone is sent for a predetermined time. Refer to the figure below.

Note 1: Delay Time depends on DLYT parameter of AUAD.

Note 2: When a UCD group Station becomes idle, a Queued Call is connected to the UCD Group Station.

This feature can provide Announcement Service by using VS32 Conference.

Operating Procedure



No manual operation is required.

Service Conditions

1. UNIFORM CALL DISTRIBUTION [U-3] must first be provided.
2. Up to eight Announcement Machines can be assigned per UCD [U-1] Group.
3. After the announcement is played, MUSIC ON HOLD [M-7] is activated.
4. Ringback Tone is sent to the Queued UCD [U-1] Call before the first Delay Announcement begins.
5. If programmed, the DELAY ANNOUNCEMENT can be repeated while the Incoming Call is waiting in the queue. Between each announcement, MUSIC ON HOLD [M-7] will be heard.
6. When a UCD [U-1] Station becomes idle, the Incoming Call is connected immediately to the idle Station, even if the Incoming Call is connected to the DELAY ANNOUNCEMENT - UCD.
7. If the Incoming Call comes from a Central Office/ISDN Trunk, billing begins with the start of the Delayed Announcement.
8. If an Incoming Call encounters all Stations busy in a UCD [U-1] Group and overflows to another UCD [U-1] Group, and if all Stations are busy in the OVERFLOW - UCD [O-13] Group, the Calling Party will be placed in the queue for the originally Called UCD [U-1] Group, and DELAY ANNOUNCEMENT - UCD will be invoked, if programmed.
9. The following figure shows Delayed Announcement.

Time Chart for Delay Announcement

The first duration of six seconds after Delay Announcement plays, calls can be connected to the Announcement Trunk (Multiple Connection is available). Calls which are not connected to the Trunk are connected to another Announcement Trunk or received RBT until the Trunk or UCD Group Station becomes idle.

Note: When sending the announcement to all connected calls from the outset, record the no-Tone or music before and after the Delay Announcement Message.

10. This feature can be programmed in Local Data Memory (LDM).
11. When a UCD Station is assigned as the destination of LDN Night Connection this service cannot be activated.
12. Delay Announcement Trunk (DAT) in the Node accommodating the UCD Controlling Station must be used for this feature in the FCCS Network.
13. When all the IPPADs are placed into busy state during the Announcement, Ringback Tone is sent instead of Hold Tone (Music On Hold) after the Announcement.
14. When this feature is activated for CCIS incoming call, the call duration count is renewed every time the line is connected to the announcement trunk.
15. Do not set ASFC, SFI 252=1 (Multi-Boss/Multi-Secretary is in service) to stations belonging to UCD groups.

When using VS32 Conference Server:

1. Announcement patterns can be specified per trunk.
2. Announcement message is sent from the VS32 Conference Server in the System having the UCD group data.
3. This feature is available for an incoming call via PHC.
4. When using this feature via FCCS network, announcement message is sent from the VS32 Conference Server in the System having the UCD Control Station.
5. Multi-connection is not supported.
6. A maximum number of channels that can be used as Announcement Trunk of VS32 at a time is as follows:
   - When Payload Type = 10 msec: 16 channels
   - When Payload Type = 20/30/40 msec: 32 channels

Interactions

1. When a UCD Station is assigned as the destination of LDN Night Connection, this service cannot be activated.
2. This feature does not support LOCATION DIVERSITY [L-55].

Programming

STEP 1: **ASYD** - SYS1, Index 70, Bit 6. Are DELAY ANNOUNCEMENT - UCD common or separate for all UCD Groups assigned by ASHU? 0/1: Common/Separate.
ASYDL - SYS1, Index 804, Bit 4. Are DELAY ANNOUNCEMENT - UCD common or separate for all UCD Groups assigned by ASHUL? 0/1: Separate/Common

STEP 2: **ARTD** - Assign the Announcement Route as follows:

1-OSGS	:2	2-ONSG	:3	3-ISGS	:2	4-INSG	:3	5-TF	:3
6-TCL	:4	7-L/T	:1	8-RLP	:2	15-LSG	:5	28-ANS	:0/1

Note: To change the data for existing route (RT), initialize the circuit card.

STEP 3: **ATRK** - Assign the LENS, Announcement Route Number, Trunk Number, and Tenant Number.

STEP 4: **MBTK** - Assign the Make Idle status to the Announcement Trunks.

STEP 5: **AUAD/AUADL** - This command is used to assign the DELAY ANNOUNCEMENT - UCD.

Assign the following information:

TN/UGN: Tenant Number/User Group Number of UCD Control Station

STN/TELN: Station Number/Telephone Number of UCD Control Station

Equipment Kind: Select “DAT/Announcement Machine”. (only for AUADL)

DLYT: Delay Timer (0 - 30 seconds in 2 second even numbered intervals. 32 - 120 seconds in 8 second even numbered intervals).

MSGT: Message Timer (0 - 30 seconds in 2 second even numbered intervals).

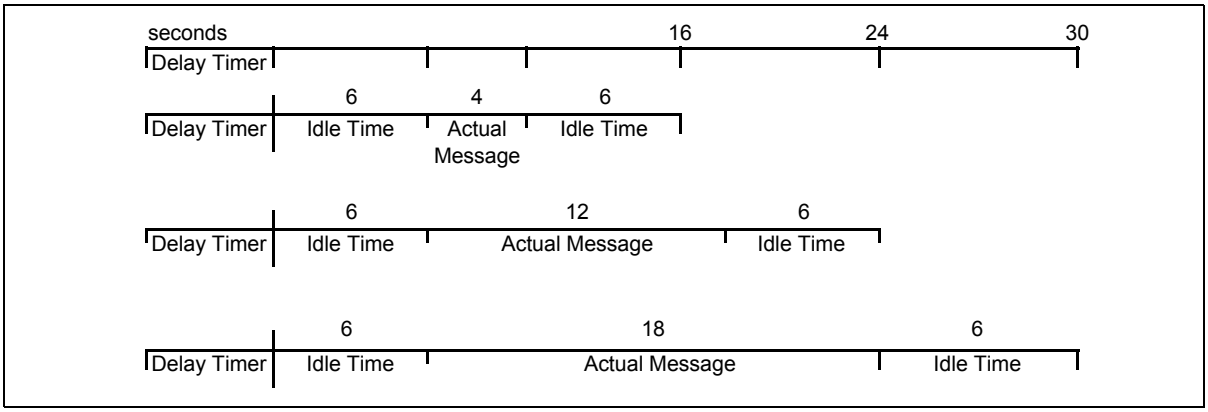
RP: Announcement Output Reply

0: Only once

1: Replay

INT: Replay Interval (0 - 30 seconds in 2 second even numbered intervals. 32 - 120 seconds in 8 second even numbered intervals).

When RP = 0 is assigned, INT (Replay Interval) value is “0”.



CNT: Number of Announcement Trunks (0-30 seconds; two seconds, even number increments)

RT: Route Number

TK: Trunk Number

The Delay Timer, DLYT, is the time that the Delay Announcement Trunk will ring and collect other Incoming Calls that will listen to the DELAY ANNOUNCEMENT - UCD.

The Message Timer, MSGT, should include both the DELAY ANNOUNCEMENT - UCD time plus idle time before and after the announcement. The following patterns are available (example).

When using VS32 Conference Server:

STEP 1: **ASYD** - SYS1, Index 60, Bit 3=0. UCD Queuing is used.

STEP 2: **ASYDL** - SYS1, Index 804, Bit 4 (UCD Announcement Information): 0/1 = Individual setting for each UCD group/Common in all the UCD groups. This data is set for UCD group created by the Telephone Numbers (ASHUL/ASHUN).

STEP 3: **ARTD/ARTDN** - Assign the route class data of the Announcement trunk.
CDN28 (ANS): Fixed to 0 (No answer signal is given.from the destination office).

Note: To change the data for existing route (RT), reboot the VS32.

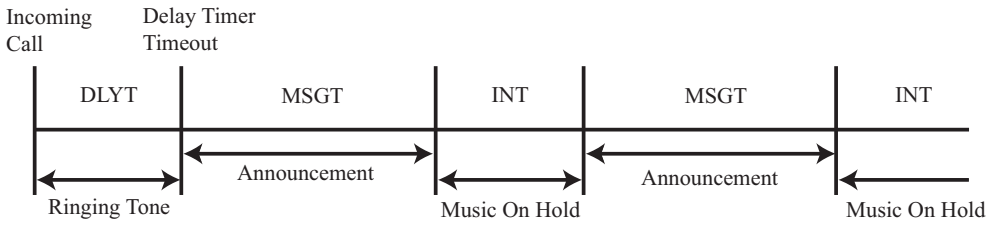
Note: When using logical route number, assign the following data. At this time, the remainder of the data must be set by using the NDM commands (ASHUN, AUADN, ARRCN, ARSCN).

STEP 4: **ALRTN** - Assign the logical route number to the route number set by ARTD.

STEP 5: **AIVSL** - Assign the announcement trunk data.

- Basic Data

CH: Enter Channel Number of VS32.
KIND: Select “ANNC”.
RT: Route Number
TK: Trunk Number
LENS: Line Equipment Numbers
TN: Tenant Number



STEP 6: **ASHUL/ASHUN** - Assign the UCD Group data.
UGN: User Group Number
TELN: Telephone Number of UCD Control Station
[Station List in Group]
TELN: Telephone Number of UCD Member Station

STEP 7: **AUADL/AUADN** - Assign the Delayed Announcement data.
UGN: User Group Number
TELN: Telephone Number of UCD Control Station

Equipment Kind: Select “VS”.
DLYT: Delay Timer Value (0 - 30 seconds in 2 second even numbered intervals. 32 - 120 seconds in 8 second even numbered intervals).
MSGT: Message Timer Value (0 - 30 seconds in 2 second even numbered intervals).
RP: Only Once/Replay
INT: Repetition Period (0 - 30 seconds in 2 second even numbered intervals. 32 - 120 seconds in 8 second even numbered intervals).
CNT: Number of Announcement Trunks (1-8)
RT/LGRT: Route/Logical Route Number of Announcement Trunk
TK: Announcement Trunk Number
ANP: Assign the source of announcement to be played.
0-254: Wave file 0 to 254
255: External Input Interface
REP: Assign repeat pattern of the announcement (0-3).
0: Play it once only
1: Play the wave file specified by the ANP parameter.
2: Play four wave files specified by the ANP parameter.
(Example: 00(wave file specified by ANP)–01–02–03–End)
3: Play four wave files to the last, and then repeat the third and the forth by rotations.
(Example: 00–01–[02–03] Repeat)
4-255: Not used

Note: The INT parameter appears when RP = 1.

Note: The ANP and REP parameters appear when Equipment Kind = VS.

Note: Repeat Pattern in the MSGT is assigned by the REP.

STEP 8: **MBTK** - Release the make-busy of Announcement Trunk.
RT: Route Number of Announcement Trunk
TK: Announcement Trunk Number
MB: Assign “0” (Make Idle).

STEP 9: **ARRC/ARRCN** - Allows the tandem connection restriction between Office Line/TIE Line Trunk and Announcement Trunk.

ICRT: Route Number of Office Line/TIE Line Trunk
OGRT: Route Number of Announcement Trunk
ARI A-RES: Assign "1" (Not restrict).
ARI D-RES: Assign "1" (Not restrict).

STEP 10: **ARSC/ARSCN** - Release the restriction between trunks to be used for the connection between Station and Announcement Trunk.

D/N: Day/Night
TN: Tenant Number
RT: Route Number of Announcement Trunk
PRI: Route Restriction Index (0-3)
RSC: Route Restriction Class
RES: Assign "1" (Not restrict).

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program on an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ASYDL** - SYS1, Index 804, Bit 4.
Are DELAY ANNOUNCEMENT-UCD common or separate for all UCD groups assigned by ASHUL command? 0/1 = Separate/Common.

STEP 2: **AUADN** - The following data must be assigned to the NCN.

UGN: User Group Number

TELN: Telephone Number

Equipment Kind: Select “DAT/Announcement Machine”.

DLYT: Delay Timer (0 - 30 seconds in 2 second even numbered intervals. 32 - 120 seconds in 8 second even numbered intervals).

MSGT: Message Timer Value (0 - 30 seconds in 2 second even numbered intervals).

RP: Announcement Replay
0/1=Only one/Replay

INT: Replay Interval (0 - 30 seconds in 2 second even numbered intervals. 32 - 120 seconds in 8 second even numbered intervals).

Note: When RP=0 is assigned, INT (Replay Interval) value is “0.”

CNT: Number of Announcement Trunks

LGRT: Logical Route Number

TK: Trunk Number

Note: The following data should also be set in addition to the above-mentioned commands. The commands to be set to the Node that accommodates the UCD Controlling Station only: ATRK, MBTK

D-32D Dual Hold -D

General Description

This feature allows two Desktop terminals to simultaneously be placed on hold. This allows the Held Parties to answer or originate a call from a Sub Line Appearance or the idle Prime Line.

Operating Procedure

To place a call in a DUAL HOLD -D condition

1. When two Desktop terminals are connected, either Desktop terminal user can press the pre-assigned HOLD key and place the other Desktop terminal on hold.
2. If the held Desktop terminal user wishes to originate or answer another call from a Sub Line Appearance, the held Desktop terminal user presses the pre-assigned HOLD key and places the connection in a DUAL HOLD -D condition.

To place back to the original connection

1. The Desktop terminal user goes off-hook and presses the Held Line.
2. The held Desktop terminal hears MUSIC ON HOLD [M-7] if the originally connected Desktop terminal is still holding the call.
3. The held Desktop terminal comes back to the original call if the originally connected Desktop terminal has already returned to the original call.

Service Conditions

1. The DUAL HOLD -D feature can be activated by pressing the HOLD key during a call between any two Desktop terminals.
2. While a call is being held, Automatic Recall is initiated after a preprogrammed time on the Desktop terminal that placed the call on Hold.
3. For STATION MESSAGE DETAIL RECORDING (SMDR) [S-10] information between extensions, a call is regarded as completed when the HOLD key is pressed to hold the call. When both Stations answer the Held Call, it is processed as a new call.
4. Even in the case of a call between two Desktop terminals, DUAL HOLD -D cannot be initiated between Boss and Secretary after the Boss - Secretary Service, or between Overriding and Overridden Parties after the PRIVACY RELEASE [P-18] Service.
5. This feature is not restricted by the Class of Service for the Stations in the network.
6. The following services are available to either the holding line or the line placed on hold when a call is held by pressing the HOLD key in a DUAL HOLD -D situation:

CALL BACK	[C-1]
MESSAGE REMINDER	[M-19]

7. The following services are not available to either the holding line or the held line in a DUAL HOLD -D situation:

ATTENDANT CAMP-ON WITH TONE INDICATION	[A-1]
BUSY VERIFICATION	[B-3]
CALL WAITING - ORIGINATING	[C-31]
CALL WAITING - TERMINATING	[C-12]
EXECUTIVE RIGHT-OF-WAY	[E-1]
PRIVACY RELEASE	[P-18]

8. DUAL HOLD -D cannot be activated for calls established by:

BOSS - SECRETARY Service	[B-5D, 8, 11]
PRIVACY RELEASE	[P-18]
BUSY VERIFICATION	[B-3]
ATTENDANT CAMP-ON	[A-1]
EXECUTIVE RIGHT-OF-WAY	[E-1]
CALL WAITING - ORIGINATING	[C-31]
CALL WAITING - TERMINATING	[C-12]

9. In FCCS network, this feature is available within the self node only.

Programming

ASYD - SYS1, Index 144. Recall Timer for EXCLUSIVE, NON-EXCLUSIVE HOLD. Assign data 00H for 30 seconds. (RAM default data is 3FH.)

SYS2, Index 12, Bit 0. Is Automatic Recall Ringing provided on a per Tenant basis? 0/1: Yes/No

D-63 Day/Night Change - Outside Key Operation

General Description

This service allows users to switch the DAY/NIGHT mode by operation of an External key connected to the system.

Note: This feature is not available in North America and Australia.

Operating Procedure

To switch the DAY/NIGHT mode:

1. Switch the mode by External key connected to the system.

Service Conditions

1. An NCU is required to connect the External key.
2. The same package for this feature is also used for POWER FAILURE TRANSFER [P-3] (a maximum of 12 circuits per package).
3. Single tenant or multi tenant control by one point of contact can be selected by the system data.
4. Even when the system switches to night mode by use of an External key, all ordinary night time services such as Day/Night Class of Service will operate.
5. External Key Box must be provided by the customer.

Interactions

1. When this feature is enabled, the Day/Night switching feature of DAY-NIGHT MODE STATUS -D - II [D-164D - II] is not available.
   On the other hand, the Day/Night mode status display feature of DAY-NIGHT MODE STATUS -D - II [D-164D - II] is available.
2. This feature is not available when DAY-NIGHT MODE STATUS -D - II [D-164D - II] is enabled.

Programming

No programming is required.

D-80 Denied Tone Classification

General Description

This feature provides the Caller (Station, Attendant Console or Exchange Line), who is not connected with the Called Party, with an appropriate Distinctive Tone Connection, identifying the status (Busy, Restricted, Blocked) in which the Called Party is denying the Calling Party.

Note: This feature is only available in Australia.

Operating Procedure

No manual operation is required.

Service Conditions

1. This feature is available in Australia only.
2. Tone are classified as follows:
   a.) Number Unobtainable Tone (NUT): Dead Level, Dead Number, Restriction.
   b.) Congestion Tone (CGT): Trunk Block (not sent to the Distant Office).

      Note: CGT is also sent out where the OUTGOING TRUNK QUEUING [O-2] service is available. However, if OGTQ is automatically set, Service Set Tone is sent out instead.

   c.) Busy Tone (BT): Sent out in cases other than l and 2 above.

Interactions

There are no known Interactions.

Programming

ASYD - SYS1, Index 6, Bit 3 (Tone for Outgoing Connection): 0/1=NEC Standard/Australian (Second Dial Tone on LCR). Assign “1”.

D-81 Double Seizure Protection

General Description

This feature is provided to prevent the occurrence of double-line seizure, or the collision of Outgoing and Incoming Calls on the same TIE Lines.

Note: This feature is available in Australia only.

Operating Procedure

No manual operation is required.

Service Conditions

1. This feature is available in Australia only.
2. Double Seizure is identified if an Incoming Call is detected within 120 milliseconds after the TIE Trunk Seizure by an Outgoing Call.
3. If Double Seizure is detected, Busy Tone is sent to the Calling Station and the line is monitored for release. When the Calling Station is a Dterm, the LCD shows “BUSY”, together with the dialed number flashing at 60 IPM.
4. This feature does not operate with an Outgoing Connection from a Data Terminal.

Programming

ASYD - SYS1, Index 7, Bit 3 (Double Seizure Protection): 0/1=Out/In Service. Assign “1”.

D-87 Dial Intercom

General Description

This feature gives multiple Desktop terminal users the ability to simultaneously call any other member of the Intercom Group, regardless of their idle or busy status. An Intercom Group member can override another Intercom Station in a Two-party Intercom Connection. This service is referred to as an Intercom Bridge.

Operating Procedure

To originate

1. The Intercom Station presses the DICM key and goes off-hook within five seconds.
2. Dial the desired INTERCOM Telephone Number. Receive Ringback Tone. The Calling Desktop terminal displays:

Dialed Intercom Number

ICM	XX
(Time Display)	

3. The desired INTERCOM Station answers the call and is connected to the Calling Station.

To answer

1. The DICM key will flash, indicating an Incoming DIAL INTERCOM Call. The Called Station may also hear distinctive three-burst ringing. The Called Desktop terminal displays:

Calling Intercom Number

ICM	XX
(Time Display)	

2. If the Called Station is already engaged in a conversation with a Non-Intercom Call, the Station may press the HOLD key and answer the DIAL INTERCOM Call by pressing the DICM key. Ringing will stop.

To bridge

1. When two Stations are engaged in a DIAL INTERCOM Call, a third Station, belonging to the same DIAL INTERCOM Group, presses the DICM key and goes off-hook (**Note 1**). The Called and Calling Desktop terminals display:

Intercom Number

OVERRIDE	XX
(Time Display)	

Note 1: When ASYD, SYS1, Index 384, Bit 0=0 is set, you can skip off-hook operation to initiate Automatic Intercom Call or originate Manual Intercom Call. However, off-hook operation cannot be skipped to bridge into an Automatic Intercom Call or a Manual Intercom Call regardless of the ASYD, SYS1, Index 384, Bit 0 data setting.

2. A Three-party Conference is established. The Called Stations may hear a Warning Tone. The option for hearing the Tone is preassigned in System Data. The Called and Calling Desktop terminals display:

3. If Intercom Bridge Service is denied, the Desktop terminal displays:

Prime Line Pickup -D [P-13D]

The Desktop terminal may be programmed to seize the Incoming Call on the AUTOMATIC, MANUAL, or DIAL INTERCOM Lines before the Prime Line. If two Incoming Calls terminate simultaneously to both the Prime Line and the DIAL INTERCOM Line, when the user goes off-hook, PRIME-LINE-PICKUP -D [P-13D] will seize the DIAL INTERCOM Line before the Prime Line. If only the Prime Line is ringing when the user goes off-hook, then PRIME-LINE-PICKUP -D [P-13D] will seize the Prime Line. The programmable options and ringing priority are illustrated in the following table:

Ringing Priority	Programmable Options				
	PRI 0	PRI 1	PRI 2	PRI 3	PRI 4
1	Prime Line	Dial Intercom	Automatic Intercom	Manual Intercom	Automatic Intercom
2	--	Prime Line	Prime Line	Prime Line	Manual Intercom
3	--	--	--	--	Prime Line

Service Conditions

1. Only Desktop terminals can be assigned as a member of a DIAL INTERCOM Group.
2. All members of the same DIAL INTERCOM Group must be assigned in the same Module Group.
3. Up to 64 Stations may be assigned to one Dial Intercom group when two digits (00-63) Dial Intercom Station is selected via PCPro. Each Station in the DIAL INTERCOM Group can be assigned as an Automatic, Manual and a DIAL INTERCOM member of three different groups.
4. No more than one connection can be established at the same time in one DIAL INTERCOM Group.
5. A Three-party Conference can be established in a DIAL INTERCOM Group if Intercom Bridge Service is available. If a fourth party tries to activate Intercom Bridge Service, the connection is denied.
6. The maximum number of DIAL INTERCOM Groups in the System is 50 per Module Group.
7. It is possible to simultaneously assign one group of Stations as an Automatic/Manual Intercom Group, as well as a DIAL INTERCOM Group.
8. The Distinctive Ringing (three-burst ringing) sent from an Incoming DIAL INTERCOM Station takes priority over the ringing of Multi Line Appearances.
9. Features normally available to Multi Line Appearances are not available to DIAL INTERCOM Lines.
10. DIAL INTERCOM Lines cannot be held by pressing the HOLD key.

11. When a Station is moved from one DIAL INTERCOM Group to another via system commands, the DICM key on the associated Desktop terminal must be deleted before the change is made.
12. Port traffic and Station PEG COUNTS [P-7] reports will record the use of the DIAL INTERCOM feature under "other".
13. Dedicated Desktop terminal Feature keys cannot be used during a DIAL INTERCOM Call. Only the SPEAKER key for hands-free operation can be used.
14. If there are simultaneous Incoming Calls to the Prime Line, Automatic Intercom Line, the Manual Intercom Line, and/or the DIAL INTERCOM Line, the Prime Line will normally be selected when the Station goes off-hook. The selection order can be changed for each Desktop terminal via Office Data assignment.
15. DIAL INTERCOM Group Numbers are either one or two digits and can be set for each DIAL INTERCOM Group:

    One digit: 0-9
    Two digits: 00-63
16. The display on the Desktop terminal is as follows:

    a.) Calling

    Dial Intercom Number of the Calling Station
    (appears for ten seconds when the DICM Line is preselected)

    Called Station | **ICM** **XX** / **(Time Display)** | 60 IPM flashing

    Dial Intercom Number of the Calling Station

    Calling Station | **ICM** **XX** / **(Time Display)**

    b.) Called Station Answers

    Dial Intercom Number of the Calling Station

    Called Station | **ICM** **XX** / **(Time Display)**

    Dial Intercom Number of the Answering Station

    Calling Station | **ICM** **XX** / **(Time Display)**

c.) Intercom Bridge

* CONF lamp goes on

d.) Intercom Bridge Restriction

* When the DICM key is pressed for the bridge, after originating a call, the above is shown for five seconds.

17. To answer a call terminated to the INTERCOM Line while the Prime Line is busy, press an INTERCOM Line key.
18. The DIAL INTERCOM ringing by an Incoming Call is interrupted while the MANUAL SIGNALING [M-47] Signal is being sent out.
19. While a call is in progress on a Multi Line, the AUTOMATIC INTERCOM Line, or MANUAL INTERCOM Line, pressing the DICM key can disconnect the call to allow a DIAL INTERCOM Call origination or answer.
20. This feature does not work in FCCS network.

Programming

STEP 1: **ASYD** - SYS1, Index 59, Bit 7. Is AUTOMATIC/MANUAL and DIAL INTERCOM in service? 0/1: No/Yes.

SYS1, Index 69, Bit 6. Is a Warning Tone required when creating a three-way AUTOMATIC/MANUAL INTERCOM Call? 0/1: No/Yes.

SYS1, Index 78, Bit 0 and Bit 1. Assign both Bits as data "1" to enable full Desktop terminal display operation.

SYS3, Index 3. Assign data 20H for Multiple Ringings per Ringing Period, if necessary.

SYS3, Index 7. Assign the Ringing Pattern if necessary.

STEP 2: **ADIM** - Assign the following data:

MG: Module Group

G-ID: Group ID Number per MG

N: Number of Digits of Dial Intercom Group (0/1)
- 0: One digit
- 1: Two digits

BCR: Bridge Call Restriction (0/1)
- 0: Restricted
- 1: Allowed

TN: Tenant Number

ICMCT Number of Intercom Stations (2-64) (actual number to dial)

ICM STN: Intercom Station Number

STEP 3: **AKYD** - Assign an Intercom Line to the Station according to the following parameters:

TN: 1

STN: Station Number

TP: Type of Desktop terminal (0-3)

PRI: Form of Line Preference (0-3)

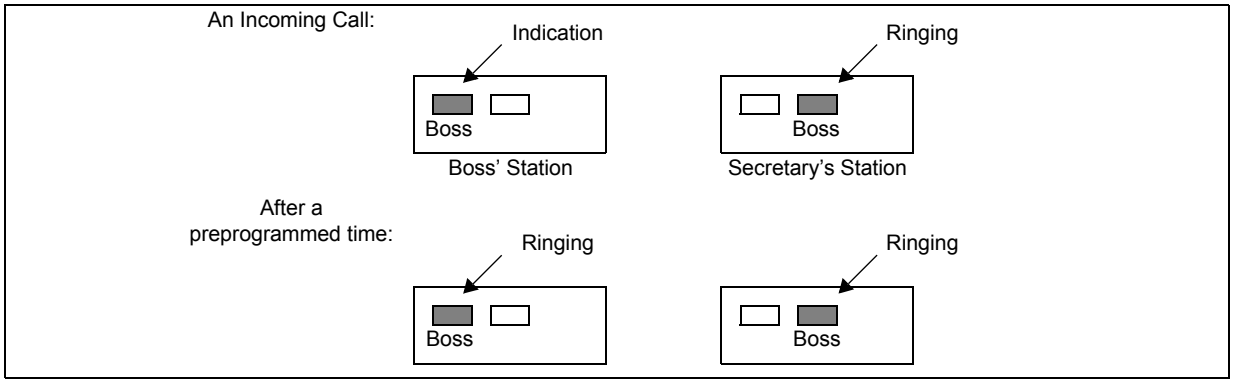
KYN: Key Number (1-40)

KYI: Service Index
- 0: Key Not Used
- 1: Feature Key
- → 2: Multi Line Key

KD: Kind of Line
- 0: Multi Line
- → 1: Intercom Line
- 2: DSS Console Key
- 3: -
- 4: Multiple Line Appearance

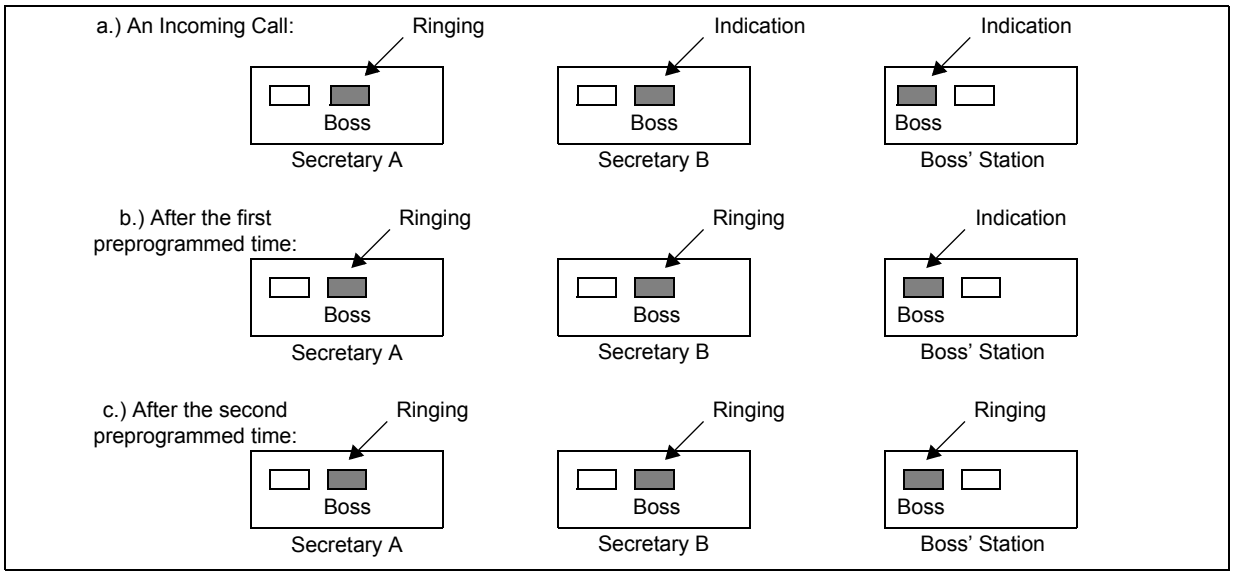
ICM: Kind of Intercom
- 0: Automatic Intercom
- 1: Manual Intercom
- → 2: Dial Intercom.

G-ID: Group ID Number



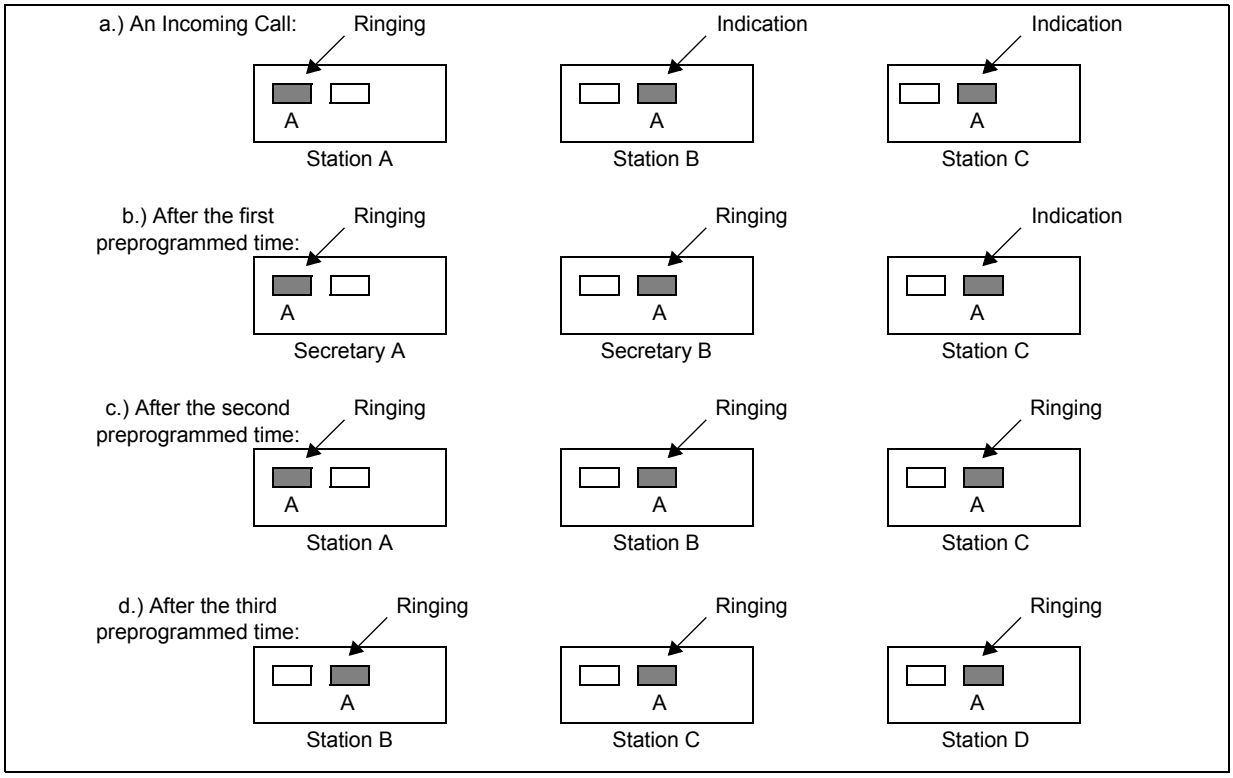
As programmed in ADIM

D-90D Delayed Ringing -D

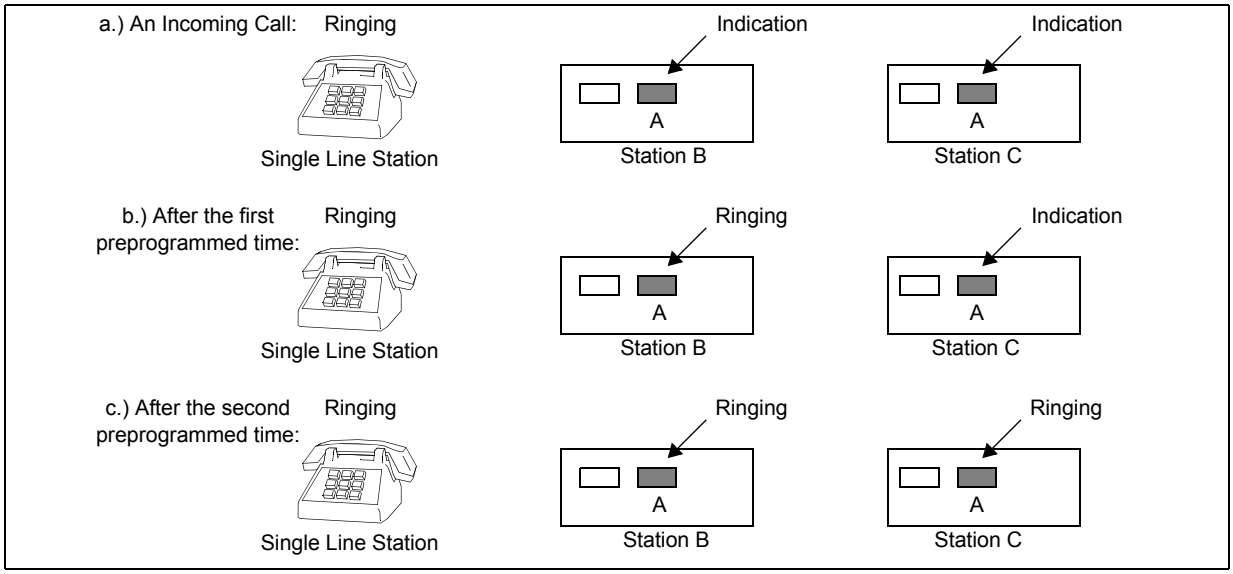


General Description

This feature allows a Desktop terminal to receive an Incoming Ringing Signal after a predetermined time.



1. In Boss - Secretary Service, a call terminating on the Boss' Line first rings at the Secretary's Station. If the Secretary does not answer within a preprogrammed time, the Boss' Station will also ring. This service is convenient when many Lines terminate on a Secretary's telephone, and the Secretary is engaged in a call, or is temporarily away from the telephone, and cannot answer the call terminated to the Boss' Station.



2. Calls terminated to the Boss' Station may be routed to multiple secretaries by assigning timing delays for ringing to each Secretary's Station.

3. When a call to the Boss' Station is received, it rings on Secretary A's Station. If it is not answered in a preprogrammed time, it will also ring on Secretary B's Station. If Secretary B does not answer within the second preprogrammed time, the call will also ring on Boss' Station.
4. This feature may also be used in a similar way to CALL FORWARDING - DON'T ANSWER [C-3] or STATION HUNTING [S-7, 8, 9].

5. A call rings on Station A. If Station A does not answer within a preprogrammed time, the call also rings on Station B. If the call is not answered within the second preprogrammed time, the call also rings on Station C. If the call is not answered within the third preprogrammed time, the call also rings on Station D.
6. DELAYED RINGING may also be used for calls terminated to Single-Line Appearances on a Desktop terminal. Calls to Single Line Appearances that are not answered within a preprogrammed time will ring on the next Station in sequence.

7. A call rings on Single Line Station A. If Station A does not answer within a preprogrammed time, the call also rings on Desktop terminal Station B. If the call is not answered within the second preprogrammed time, the call also rings on Desktop terminal Station C.

Operating Procedure

No manual operation of the feature is required after it has been programmed in System Data.

Service Conditions

1. This feature is available for Multi Lines on Desktop terminals.
2. Delay timing for each line on the Desktop terminal may be programmed through PCPro.
3. Delay timing may be 10, 20, or 30 seconds.

Interactions

1. Off-hook ringing on a Desktop terminal will follow the assigned DELAYED RINGING -D [D-90D] Timer the same as on-hook ringing.
2. Stations that have Multi Line Appearances with DELAYED RINGING -D assigned must be aware of the interaction with CALL FORWARDING - DON'T ANSWER [C-2]. For example, Station A appears on Desktop terminal B with a delayed ringing of 30 seconds (RG = 4); and also on Desktop terminal C with a delayed ringing time of 20 seconds (RG = 5). If Station A sets CALL FORWARDING - DON'T ANSWER [C-2] and the CALL FORWARDING - DON'T ANSWER [C-2] Timer is set at 24 seconds, when an Incoming Call comes into Station A, it will begin to ring. At 20 seconds Desktop terminal C will begin to ring also. At 24 seconds the call will forward to Station A's Target Destination and Station A and Desktop terminal C will stop ringing. Desktop terminal B never rings.
3. After a call has been answered by a Secretary, the activation of the Boss - Secretary feature by the Secretary to a Single Line Boss Station will not reactivate the DELAYED RINGING -D cycle.

Programming

AKYD - Assign the following parameters to Stations that will have delayed ringing:

TN: Tenant Number
STN: Station Number
TP: Type of Dterm (0-3)
PL TN STN: Prime Line Tenant and Station Number
KYN: Key Number (1-40)
KYI: Service Index
0: Key Not Used
1: Feature Key
→ 2: Multi Line Key
KD: Kind of Line
→ 0: Multi Line
1: Intercom Line
2: DSS Console Key
3: -
4: Multiple Line Appearance
TN STN: Tenant Number and Station Number of Multi Line Appearance
RG: Ringing Assignment of Multi Line Appearance
0: No Ringing
1: Ringing Day Only
2: Ringing Night Only
3: Not Used
4: 30-second delay time before ringing
5: 20-second delay time before ringing
6: 10-second delay time before ringing
7: Ringing Day and Night (immediate)

D-114 Delay Announcement - Attendant

General Description

This feature provides a Recorded Announcement to the Incoming Trunk Caller waiting to be answered by the Attendant. This feature is divided into the following two types, depending on the time when the call is connected with the Announcement Trunk.

1. The call is connected to Announcement Trunk immediately after terminating to the Attendant Console. The announcement continues until the Attendant answers, or the Trunk side abandons the call.
2. The call is connected to the Announcement Trunk after the Ringback Tone Connection.

Operating Procedure

When the Announcement Service is provided immediately after the call terminates

1. When an Incoming Call terminates to an Attendant Console, which is handling calls, the Calling Party receives an announcement from the Digital Announcement Trunk (DAT).
2. When the Attendant completes call handling, ringing starts at the Attendant Console.
3. The Attendant presses the ANSWER key. The Calling Party and the Attendant talk with each other.

When the Announcement Service is provided after a fixed time

1. When an Incoming Call terminates to an Attendant Console, the LDN key lamp starts to flash and ringing starts at the Attendant Console, and the Calling Party receives the Ringback Tone.
2. When the Attendant has not answered in the designated time (SYS1, Index 242), the call is connected to the Announcement Trunk automatically (the lamp keeps flashing and the ringing continues at the Attendant Console).
3. If the Attendant does not answer the call when the first announcement completes, the Trunk Call disconnects from the announcement automatically and the caller hears the music on hold.
4. The Attendant presses the ANSWER or LDN key. The Calling Party and the Attendant talk with each other.

Service Conditions

When the Delay Announcement Service is provided immediately after the call terminates

1. This service requires a DAT card or VS32.
2. This feature is available for the following Incoming Trunk types:
   a.) Ringdown
   b.) LDN (DID, TIE, ISDN)
   c.) Call Forwarding - All Calls/Busy Line/Don't Answer (DID, TIE, ISDN)
   d.) Call Forwarding - Intercept - Attendant (DID, TIE, ISDN)
   e.) Central Office Line, TIE Line Incoming Call via CCIS network.

   Note: This feature is not available for the following Incoming Trunk types transferred to the Attendant Console by Call Forwarding-All Calls/Busy Line:
   - Direct Inward Dialing (DID)
   - Direct-In Termination (DIT)

3. If IPPAD is all busy while the system sends announcement, the attendant can answer when IPPAD becomes available.

4. This feature is not available for TAS Incoming Calls.
5. When the system is in NIGHT mode, this service is not available.
6. At the time of DAY/NIGHT mode Changeover, the call connected to the announcement will be released, and the Calling Party receives Reorder Tone. A call will be released as follows, according to the Incoming Trunk type:
   a.) When a call terminates from a Trunk where Trunk release cannot be supervised, the Trunk will be released forcefully (Night Transfer Station cannot be assigned).
   b.) When a call terminates from a Trunk where Trunk release can be supervised, the Trunk will not be released forcefully, but will be released on its own accord (Night Transfer Station can be assigned).
7. This service is not available for Incoming Calls to an Individual Attendant.
8. When a Central Office Line Incoming Call terminates to a Trunk where Call Clear cannot be confirmed after the call has been answered, the Incoming Trunk and Announcement Trunk remain connected until Attendant answers and releases the Trunk.
9. When a call terminates to an Incoming Trunk, for which this service is not required, the Connection Route between the Incoming Trunk and the Announcement Trunk is restricted.
10. The Announcement Trunk remains connected until the Incoming Trunk is released (Timer Control Release is not used).
11. In case of Multiple Connection:
    a.) Caller is not connected at the beginning of the announcement.
    b.) The Announcement Trunk is not released by Attendant upon answering or releasing the Incoming Trunk.
12. For Single Connections, this service is not available when the Announcement Trunks all are busy.
13. When an External Announcement Machine is used, the announcement starts from the time the System acknowledges the Announcement Trunk answer, and ends at the time of the Announcement Trunk release.
14. Whether to use an Announcement Trunk for Single or Multiple Connection is determined by the System Data on a Tenant basis.

When the Announcement is provided after the Ringback Tone has been heard

1. This service requires a DAT card. VS32 is not supported for this feature.
2. When the caller is hearing the message or music, the call is still indicated on the ICI key on the Attendant Console. Therefore, the Attendant can answer the call anytime by pressing the ANSWER key or the corresponding ICI key.
3. The message is sent in the following sequence. Whether to send the second message and after can be determined in the System Data. When the other messages are not sent after the first announcement, MUSIC ON HOLD [M-7] continues.

Note: Separate timers are used for No Answer Timer and Music On Hold.

4. Each channel of the DAT can record a single message. Recording time for a single message is 16 or 32 seconds.
5. When Multiple Playback is selected, additional DAT Channel is required for the second announcement, even if the second announcement has the same contents as the first one.
6. A maximum of ten Incoming Trunk Calls can be connected to a single DAT Trunk at one time for sending a prerecorded message from the beginning to the Called Parties.
7. The maximum programmable Channels of DAT for this feature are five Channels for the first announcement, and five Channels for the second announcement.
8. When a call encounters Announcement Trunks all busy, the call waits in a queue until a Trunk becomes available. The latter Trunk Call hears Ringback Tone until the announcement to the former terminated call completes.
9. When providing the first message, the Answer Signal is sent to the Opposite End (the billing starts here). In the case of Central Office Trunks, where Trunk Release cannot be detected after the call has been answered, the display on the Attendant Console continues even after the Calling Party has gone on-hook (the Trunk does not release). Therefore, the Incoming Call should always be answered by the Attendant.
10. In the case of billing for the Incoming Call, billing starts when the caller is answered by the Attendant, not when connected to a message.
11. When the call terminates to the Attendant Console at the time of DAY/NIGHT mode Changeover, this service is activated as follows:

DAY/NIGHT Mode Change	Call Processing
Attendant Console in Day mode to Night Attendant Console	The Announcement Service is provided after the call is transferred to the Night Attendant Console and the Night Attendant Console answers the call.
Attendant Console in Day mode to Attendant Console of Night Connection - Fixed [N-1]/Flexible [N-2]	The call stays at the Attendant Console in Day mode and the Announcement Service is provided. The Attendant Console answers the call.
Night Attendant Console to Attendant Console of Night Connection - Fixed [N-1]/ Flexible [N-2]	The call stays at the Night Attendant Console and the Announcement Service is provided. The Night Attendant Console answers the call.

12. This feature is not available for the following calls:
    a.) AUTOMATIC RECALL [A-8] Calls.
    b.) calls from an Attendant (ATTENDANT-TO-ATTENDANT CALLING [A-60]/INTER-POSITION TRANSFER [I-5]).
    c.) calls from a Station (DIAL ACCESS TO ATTENDANT [D-2]/OFF-HOOK ALARM [O-6]/ PRIORITY CALL [P-9]).
    d.) Calls transferred to the Attendant due to unused number dialing.
    e.) Calls transferred to the Night Station via ATTENDANT NIGHT TRANSFER [A-19].
    f.) Calls via CALL FORWARDING - ALL CALLS [C-5]/BUSY LINE [C-2]/DON'T ANSWER [C-3]
    g.) Incoming calls via CCIS/TIE Line.
    h.) TAS Incoming Calls.
    i.) DIRECT INWARD DIALING (DID) [D-8] Calls.
    j.) DID ADDRESSING [D-123] Calls.
13. This service is not available for Incoming Calls to an Individual Attendant.

14. This service is not activated for the Attendant of NIGHT CONNECTION - FIXED [N-1] or NIGHT CONNECTION - FLEXIBLE [N-2].
15. The message is sent only once. If the Attendant does not answer by the end of the message, the caller will be disconnected from the Announcement Trunk automatically and will hear MUSIC ON HOLD [M-7].
16. CALL QUEUING [C-9] and CALL WAITING LAMP [C-13] Services are available when this service is activated.
17. The Calling Party cannot receive the message if the restriction between the Incoming Trunk and the Announcement Trunk is not cleared.
18. When this service is allowed in System Data, the ATTENDANT OVERFLOW [A-105] feature cannot be activated.
19. When the External Announcement Machine is used, the announcement starts from the time when the System acknowledges the Announcement Trunk answer, and ends at the time of the Announcement Trunk release.
20. When activating this feature in an FCCS Network, the announcement device and the Called Attendant Console must be accommodated in the same Node.

Programming

When the Delay Announcement Service is provided immediately after the call is terminated

STEP 1: **ASYD** - SYS1, Index 244, Bit 5=0 (announcement is provided immediately after the Trunk Call is terminated to the Attendant Console)

STEP 2: **ARTD** - Assign the Route Data of the Announcement Trunk

1-OSGS	:2	2-ONSG	:3	5-TF	:1	6-TCL	:5	7-L/T	:1
8-RLP	:2	15-LSG	:5	28-ANS	:0 **Note 1**	44-PRV	:1		

Note 1: When the External Announcement Equipment is used, assign “1” in ANS parameter.

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as circuit card or VS32.

STEP 3: **ATRK** - Assign the Trunk Data of the Announcement Trunk.

STEP 4: **MBTK** - Cancel the make-busy of the Trunk assigned by ATRK.

STEP 5: **AAED** - Assign the data to the Announcement Unit Number and the Route Data, etc. assigned by ATRK.

EQP: 32
C: 1
R: 1
A: 0
M: 0
SS: 0
RT: Route Number

STEP 6: **ASTD** - Allow Tandem Connection between COT and the Announcement Trunk. STM = 0, STS = 2, ST = 1

STEP 7: **ARRC** - Cancel the restrictions on the Trunk Route for Incoming Trunk and the Route for the Announcement Trunk.

ICRT: Route Number for Incoming Trunk

OGRT: Route Number for Announcement Trunk
ARI-D-RES: 1

STEP 8: **ALDN** - Assign the Listed Directory Number [L-24] of the Console if using DID, TIE, or ISDN.

When the Delay Announcement Service is provided after the Ringback Tone:

STEP 1: **ASYD** - SYS1, Index 242. Timer for Delay Announcement - Attendant (Duration of RBT)
Timer for duration of RBT = TC × MTC. TC = 3.2 seconds. MTC = 1-15
SYS1, Index 244. Bit 5=1 (announcement is provided immediately after the Ringback Tone)
SYS1, Index 245. Timer for Delay Announcement - Attendant (Duration of Music on Hold)
Timer for duration of RBT = TC × MTC. TC=3.2 seconds. MTC = 1-15
SYS1, Index 246. Bit 2 (Attendant Delay Announcement): 0/1= Multiple Playback/Single Playback

STEP 2: **ARTD** - Assign the Route Data of the Announcement Trunk

1-OSGS	:2	2-ONSG	:3	5-TF	:1	6-TCL	:5	7-L/T	:1
8-RLP	:2	15-LSG	:5	28-ANS	:0 **Note 2**			44-PRV	:1

Note 2: When External Announcement Equipment is used or Multiple Playback is selected by key setting on the DAT Card, set 1 to CDN 28 (ANS).

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as circuit card or VS32.

Note: For the Incoming Route, CND 6-TCL must be assigned “1”.

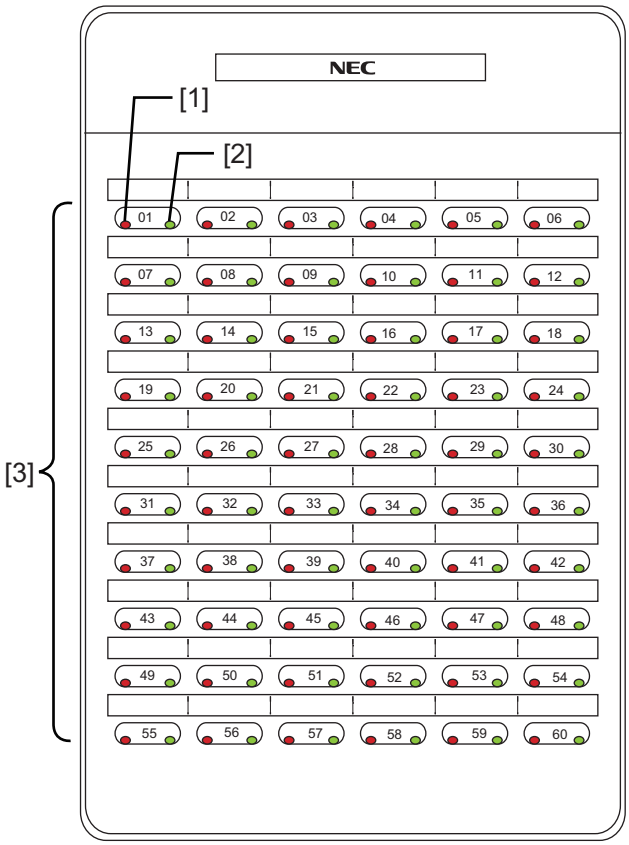
STEP 3: **ATRK** - Assign the Trunk data of the Announcement Trunk.

STEP 4: **MBTK** - Cancel the make-busy of the Trunk assigned by ATRK.

STEP 5: **AAED** - Assign the data to the Announcement Unit Number and the Route Data, etc. assigned by ATRK.
EQP = 49, 50, 51, 52, 53 (for the first announcement)
= 54, 55, 56, 57, 58 (for the second announcement)
RT: Route Number
TK: Trunk Number
C: 1
R: 1
A: 1
M: 1 (Multiple Connection)

STEP 6: **ASTD** - Allow Tandem Connection between COT and the Announcement Trunk. STM - 0, STS = 2, ST = 1

STEP 7: **ARRC** - Cancel the restrictions on the Trunk Route for Incoming Trunk and the Route for the Announcement Trunk.
ICRT: Route Number for Incoming Trunk
OGRT: Route Number for Announcement Trunk
ARI-D-RES: 1



STEP 8: **ALDN** - Assign the Listed Directory Number [L-24] of the Console if using DID, TIE, or ISDN.

D-149 Direct Station Selection (DSS) Console

General Description

Direct Station Selection (DSS) Console has 60 keys, each of which has two lamps. DSS Console can be used in combination with a digital terminal or a SIP multiple line terminal.

Keys, Lamps and Functions of Direct Station Selection (DSS) Console

[1] Red Lamp (Total 60 Lamps)

- When Multiple Lines are set:
  OFF (Idle) **Note 1** / ON (The other station is talking) / Flash (On hold)
- When the Feature keys are set:
  OFF (The feature set to the key is invalid.) / ON (The feature set to the key is valid. / Flash (The feature set to the key is valid.)

[2] Green Lamp (Total 60 Lamps)

- When Multiple Lines are set:
  OFF (Idle) **Note 1** / ON (Talking) / Flash (On hold)
- When Feature keys are set:
  OFF (The feature set to the key is invalid.) / ON (The feature set to the key is valid. / Flash (The feature set to the key is valid.)

[3] 01 - 60 keys

(key numbers are not actually imprinted.)

- Used as:
  The programmable Line keys
  The programmable Feature keys
- The programmable Line keys for internal calls and external calls, and the Feature keys can coexist in one DSS Console.

Note 1: The key is in idle state only when both red and green lamps are OFF.

DSS Console has following two operating modes:

- Direct Station Selection (DSS) / Busy Lamp Field (BLF) Mode

  Connecting DSS Console to a Desktop terminal adds more Line keys to the terminal. A Desktop terminal that is attached to DSS Console can transfer a call by pressing a key on the console that is assigned to a desired station number. This is called Direct Station Selection (DSS) mode.
  Each key on DSS Console has a pair of LED lamps to indicate whether the station that is assigned to that key is BUSY or IDLE. This is called Busy Lamp Field (BLF) Mode.

  Note: For a SIP multiple line terminal, DSS/BLF mode is not supported for FP95-114 V4 or earlier. DSS/BLF mode is supported since FP95-114 V4 Issue 2.0.

- Add-On Module (ADM) Mode

  Connecting DSS Console to a Desktop terminal can practically add up to 60 Line/Feature Access keys to the terminal. Available lines keys include Multi-Line keys and Feature keys.

Either mode is assigned to each console depending on connected LENS for DSS Console and the Office Data.

For other information such as operation procedures or service conditions of terminals, refer to the following headings:

Direct Station Selection (DSS) Console for SIP Multiple Line terminal

Direct Station Selection (DSS) Console for Digital Terminal

Direct Station Selection (DSS) Console for SIP Multiple Line terminal

This section explains service conditions and programming procedure for Direct Station Selection (DSS) Console used in combination with a DT800/DT700 Series.

Operating Procedure

To originate a call using SPEED CALLING - ONE TOUCH:

1. User A lifts the handset or presses the SPEAKER key on a terminal.
   User A hears the dial tone.
2. User A presses a key on DSS Console where a station number of User B to whom User A wants to call is assigned.
   User A hears the ringback tone from the terminal. A terminal of User B starts ringing.
3. User B answers the call.
   They can start a conversation.

To transfer the call to the Station assigned on the DSS key:

1. While User A and User B are engaged in a call, User A goes on-hook. **Note 2**
2. User A presses a key on DSS Console where a station number of User C to whom User A wants to transfer the call is assigned.
   User A hears a ringback tone from the terminal. User B is placed on hold. A terminal of User C starts ringing.
3. User C answers the call.
   User B and User C can start a conversation.

Note 2: Going on-hook is not a required operation. You can still transfer a call by pressing a key on DSS Console without going on-hook first.

Service Conditions

<Important Notices>

1. DSS/BLF mode is available since FP95-114 V4 Issue 2.0. For FP95-114 V4 or earlier, ADM mode only is available.
2. Make sure that a DT800/DT700 Series and DSS Console are turned off when connecting them to each other. After the connection process is completed, connect the AC adapter to DSS Console, and then perform the registration of the DT800/DT700 Series on the Telephony Server. To connect DSS Console to a DT800/DT700 Series, refer to Peripheral Equipment Description (Multi-Line Telephone).
3. Power must be provided to DSS Console as well as a DT800/DT700 Series (Power supply by AC adapter).
4. To use 60 keys as DSS Console, two lines of key data needs to be assigned by the AKYD command. Refer to STEP 3: for DSS/BLF mode and STEP 2: for ADM mode of the AKYD command.
5. When DSS Console calls a station on which Call Forwarding is set, if the forwarding destination is a PS that is roaming at that moment, the incoming call will not arrive at the PS. Instead of it, out-of-zone features such as Automatic Announcement - Called PS Out of Zone [A-129] will be performed.
6. For ADM mode, up to 16 Line/Feature keys can be used on the DT800/DT700 Series side. This setting is assigned by the ADKS command. Refer to STEP 3: the ADKS command.

7. In DSS/BLF mode, Call Forwarding via trunks is available on DSS Console by pressing a key where a station whose forwarding destination for Call Forwarding - All Calls - Outside, Call Forwarding - Busy Line - Outside, and Logged Out IP Station - Call Destination is an outside number.

   Call Forwarding conditions are as follows:

   - The system data (ASYDL/ASYDN, SYS1, Index 686, Bit 2=1) is required.
   - When a forwarding destination of the station is an attendant console, Call Forwarding is restricted.
   - When a forwarding destination number is Uniform Numbering, Call Forwarding is restricted.
   - LCR, LCRS, OGC, and OGCA are supported for the originating methods.
   - When a forwarding destination is a station, Call Forwarding - All Calls, Call Forwarding - Busy Line, and Call Forwarding - Don't Answer are supported. However, it is not supported when the forwarding destination is an attendant console.
     When a forwarding destination is a trunk line, calls for Call Forwarding - All Calls - Outside, Call Forwarding - Busy Line - Outside, and Logged Out IP Station - Call Destination can be forwarded when:

     - a transferor is hearing a dial tone

     - a transferor is on a call

     - a transferor goes on-hook while on a call

   - As Split Call Forwarding is not available, the call is transferred to the forwarding destination of Call Forwarding for trunk calls.

Note: Call Forwarding via trunks in DSS/BLF mode is available since FP95-114 V4 Issue 2.0.

<Interactions with Other Features>

1. For ADM mode, do not assign the following parameters to Function Key Number (FKY) when the Line/Feature keys are assigned on DSS Console by the AKYD command.
   - FKY = 6 (Message Reminder)
   - FKY = 49 (Speed Calling - One Touch)
   - FKY = 75 to 82 (Call Park Group-D key)
   - FKY = 118 (Call Return)
   - FKY = 163 (Privacy key)
2. When LOCATION DIVERSITY [L-55] is in active, DSS Console can be used in a Primary Node.
   If the terminal performs re-registration to a Backup Node, DSS Console which is used in combination with a DT800/DT700 Series is not included in service.
3. When the user of the station with DSS Console calls the station assigned on the DSS key by SPEED CALLING - ONE TOUCH, or transfers the call to the station assigned on the DSS key, and the station assigned on the DSS key is the member of the UCD [U-1] or Station Hunting Group, the call follows the UCD or the Hunting Operation. (If the MCI is valid, the message is sent out.)
4. When the station assigned on the DSS key that becomes the call destination or the forwarding destination is not in an idle state but in a call-block state, a lockout state or a make-busy state, BUSY is displayed on the originating terminal.
5. For DSS/BLF mode, the following features do not work after a call is originated by using DSS keys.
   - CALL BACK [C-1]
   - CALL WAITING - TERMINATING [C-12]
   - CALL WAITING - ORIGINATING [C-31]
   - EXECUTIVE RIGHT-OF-WAY [E-1]
   - MESSAGE REMINDER [M-19]

- STEP CALL [S-13]
- VOICE CALL [V-2]

<Hardware/Software>

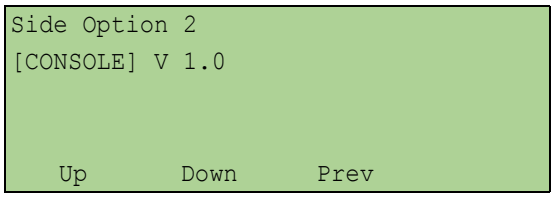
1. Multiple DT800/DT700 Series cannot share one DSS Console.
2. DSS Console can be used in combination with the following DT800/DT700 Series.

Terminals		Firmware	Connection Condition
DT710	2-button/6-button Type	-	Not supported
	8-button Type (DESI-LESS)		Not supported
DT730 **Note 3**	12-button Type	FW4.0.0.0 or later	Supported
	24-button Type **Note 4**		Supported
	8-button Type (DESI-LESS)		Supported
DT730G	12-button Type (12DG/12CG)	No conditions	Supported
	24-button Type (24DG/24CG) **Note 4**		Supported
DT750 **Note 3**		FW4.0.0.0 or later	Supported
DT770G		-	Not supported
DT820	6-button Type	-	Not supported
	8-button Type (DESI-LESS)		Not supported
DT830 **Note 3**	12-button Type	For DSS/BLF mode: FW4.0.0.0 or later For ADM mode: FW3.0.0.0 or later	Supported
	24-button Type **Note 4**		Supported
	8-button Type (DESI-LESS)		Supported
DT830G	12-button Type (12DG/12CG)		Supported
	24-button Type (24DG/24CG) **Note 4**		Supported

Note 3: You cannot use DSS Console in combination with the following terminals.
- The terminal with ACD button unit attached
- The terminal with Hotel button unit attached

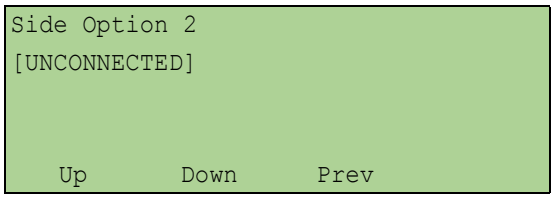
Note 4: 8LK Unit is also available.

<Interactions with Networks>



None

<Conditions Specific to This Feature>



1. The IPAN command (Display of IP Machine Status Display Function) does not show registration information and version on DSS Console side.

2. To view the version of DSS Console on the DT800/DT700 Series LCD screen, access the Terminal Information Menu, following the steps presented below:
   [1] Hold down the HELP key on the DT800/DT700 Series. The Online Monitoring Menu will open.
   [2] Press the digit key "2" to go to the System Information Menu.
   [3] Press the digit key "5" to display the Terminal Information Menu.
   [4] Use Soft keys for "Up" or "Down" to move the page up or down, and check the version of DSS Console on "Side Options 2".

   Example 1: Case where DSS Console is attached to the [SIDE2] connector on the back of DT800/DT700 Series

   Example 2: Case where no device is attached to the [SIDE2] connector

Note: The following terminal information is available:

Menu	Item	Description
Terminal Information Menu	Hardware Version	Hardware version of the DT800/DT700 Series
	MAC Address	MAC address of the DT800/DT700 Series
	Firmware Version	Firmware version of the DT800/DT700 Series
	Bottom option	ADA Unit version connected to the DT800/DT700 Series
	Side Option 1	Version of the optional device connected to the Option 1 connector on the back of the DT800/DT700 Series *e.g. 8LK Unit
	Side Option 2	Version of the optional device connected to the Option 2 connector on the back of the DT800/DT700 Series *e.g. DSS Console

3. When you originate a call to DSS Console station number, you will hear Reorder Tone (ROT). If a Call Forwarding feature is set to DSS Console station number, Telephony Server operates in the following way regardless of DSS Console state.

Call Forwarding	Operation
CALL FORWARDING - ALL CALLS [C-5]	Forwarded

Call Forwarding	Operation
CALL FORWARDING - DON'T ANSWER [C-3]	Not Forwarded **Note 5**
CALL FORWARDING - BUSY LINE [C-2]	Forwarded
LOGGED OUT IP STATION - CALL DESTINATION [L-53]	Forwarded

Note 5: Calling Party's display shows a busy connection state.

4. When a user of a DT800/DT700 Series paired with DSS Console is already logged in to the system, another IP/SIP Multiple Line terminal user who is attempting to log in by using the station number of DSS Console will fail and return to the login screen. (Login inhibited.)
   If MAC authentication is implemented, the IP/SIP Multiple Line terminal will repeat registrations.
5. When an IP/SIP Multiple Line terminal user is already logged in to the system by using the station number of DSS Console, if another user of a DT800/DT700 Series paired with DSS Console logs in, the console cannot be used.
6. When a user of a DT800/DT700 Series paired with DSS Console is already logged in to the system, another user who needs to use the station number currently used by the mentioned terminal must perform either of the following steps before connection:
   a.) Log out the current user of the station number by using the LOGOUT key.
   b.) Disconnect the LAN cable from the IP/SIP Multiple Line terminal and turn the power off. This causes the system to detect Health Check NG. (System message 33-S will be output.)
   c.) Set the terminal to the Configuration mode.
7. If a currently logged-in user of a DT800/DT700 Series paired with DSS Console makes a change with the AKYD command, the DT800/DT700 Series performs re-registration, and **Line Busy** is displayed.
   This re-registration also occurs when a change is made with the ASLG command in such a situation. However, **Line Busy** is not displayed.
8. To remove DSS Console, use the AISTL command to delete data from both the terminal that is attached to the console and console itself. The order of deletion is irrelevant. If you wish to keep the data on the terminal, delete the data on DSS Console, and register the terminal again.
9. To connect DSS Console to a terminal while the terminal is operating, add the data of DSS Console to Telephony Server, and register the terminal again.
10. A SIP multiple line terminal with DSS Console in any mode spends one client license.
11. For ADM mode, My Line/Prime Line must be assigned within 16 Line/Feature keys. (However, when the 12-button type terminal is used, My Line/Prime Line must be assigned within 12 Line/Feature keys.)

<Other Conditions>

None

Programming

<For DSS/BLF mode>

<For ADM mode>

<For DSS/BLF mode>

This section describes how to assign DSS/BLF mode to DSS Console and DT800/DT700 Series that is attached to the console. The data programming is explained using the example below:

Note: Note the following conditions:
- Available since FP95-114 V4 Issue 2.0.
- Set the level of LENS for DT800/DT700 Series between level 0 and level 5, and then accommodate the two LENS for DSS Console from there.

Example of Data Programming

TERMINAL	LINE EQUIPMENT NUMBERS (LENS)	STATION NUMBER (STN)
DSS Console-2	060102	3099
DSS Console-1	060101	3098
DT800/DT700 Series	060100	3000

Perform the following procedure. Note that X indicates a value that should be tailored to the existing system.

STEP 1: **ASYDL/ASYDN** - SYS1, Index 686
Bit 1=1: DSS/BLF mode for DT800/DT700 Series is available.
Bit 2=1: Call Forwarding - Outside of a station assigned to the DSS key is available.

Note: Available since FP95-114 V4 Issue 2.0.

STEP 2: **AISTL** - Assign a station number of DT800/DT700 Series and DSS Console.

[Assignment of the station number of DT800/DT700 Series (3000)]
TN: X
IP STN: 3000 ← Station Number of DT800/DT700 Series
TEC: 12 ← Fixed
KIND: SIP MultiLine TEL
RSC: X
SFC: X
LENS: 060100 **Note 6**

[Assignment of the station number of DSS Console-1 (3098)]
TN: X
IP STN: 3098 ← Station Number of DSS Console-1

TEC: 12 ← Fixed
KIND: SIP MultiLine TEL
RSC: X
SFC: X
LENS: 060101 **Note 7**

[Assignment of the station number of DSS Console-2 (3099)]
TN: X
IP STN: 3099 ← Station Number of DSS Console-2
TEC: 12 ← Fixed
KIND: SIP MultiLine TEL
RSC: X
SFC: X
LENS: 060102 **Note 8**

Note 6: Set the level of LENS for DT800/DT700 Series between level 0 and level 5.

Note 7: Set the LENS next to DT800/DT700 Series.

Note 8: Set the LENS next to DSS Console-1.

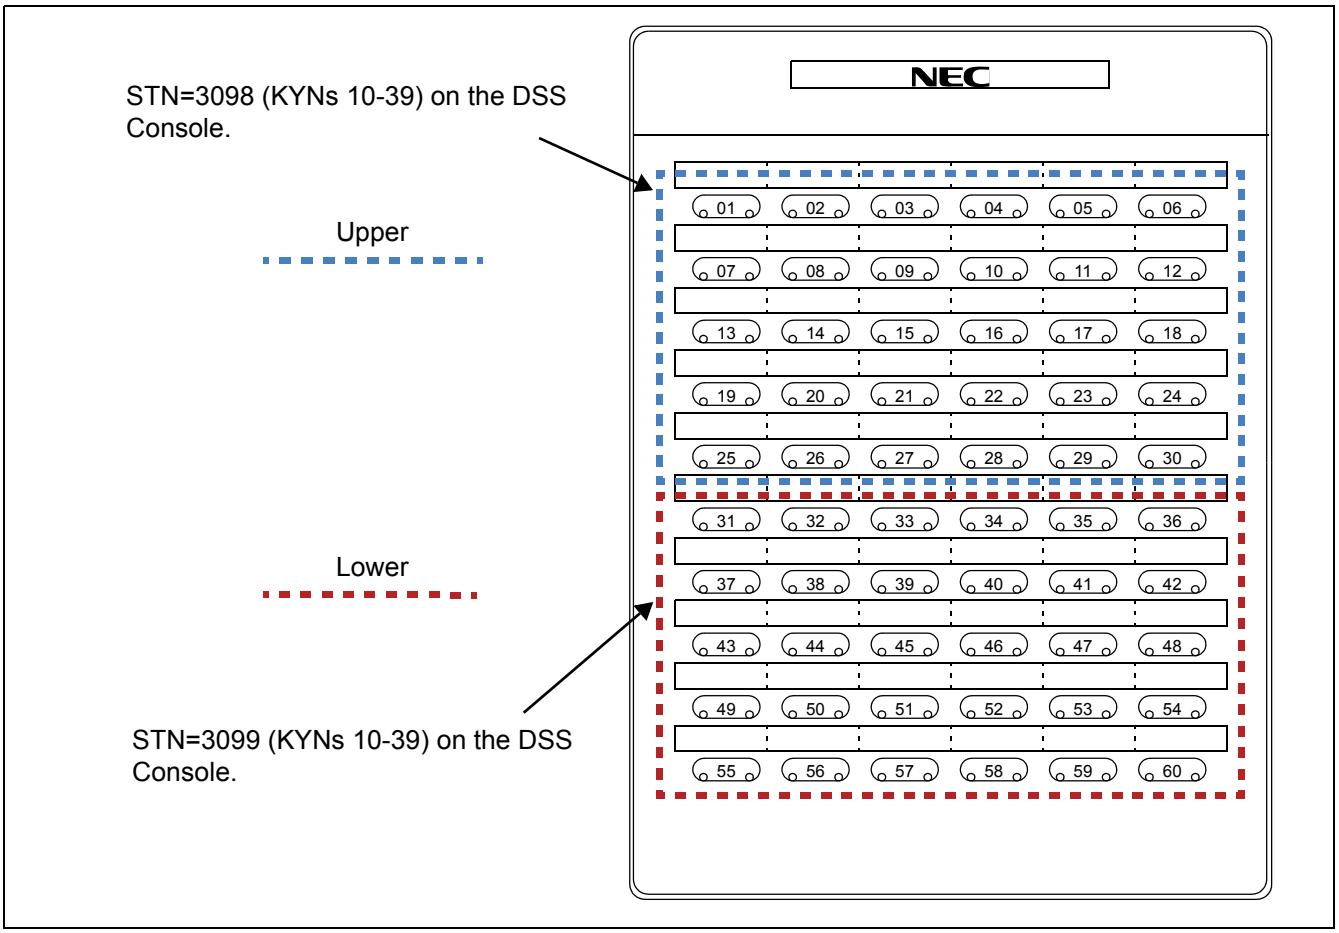
STEP 3: **AKYD** - Assign the station numbers to the Line/Feature Access keys for DT800/DT700 Series (STN=3000), DSS Console-1 (STN=3098) and DSS Console-2 (STN=3099) which are assigned by AISTL command.

Note: **Line Busy** is displayed when the data assignment, but the data is assigned correctly.

a.) Data Assignment of the DT800/DT700 Series for DSS Console

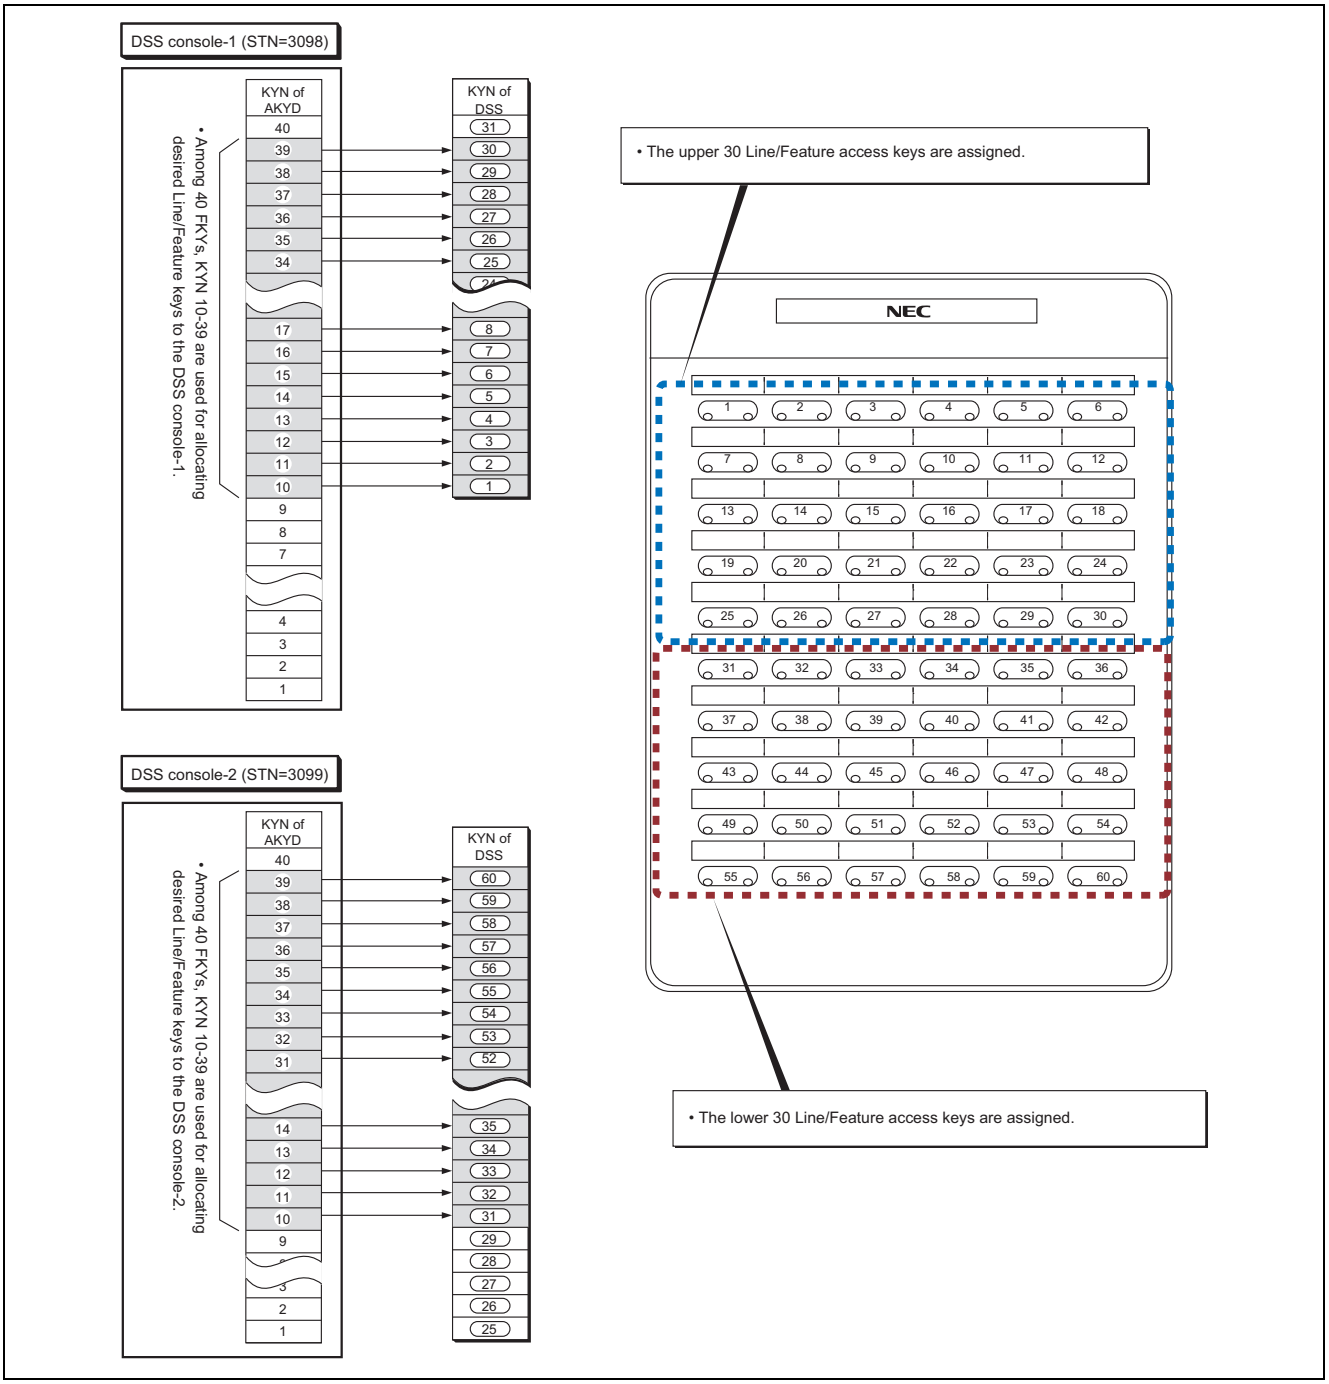
To assign information of these keys, use the port of the DT800/DT700 Series that is paired with DSS Console.
TN: X
STN: 3098/3099 ← Station Number of DSS Console
PRI: 0
PL TN: X
PL STN: 3000
S: 0 (Off-hook Suppression is OFF)
MWD: X (Message Waiting Data Display Selection)
LN PRE: 0 (Prime Line Pickup)
TP: 1

[Data Assignment for KYN=1]
KYN: 1 (Assign DT800/DT700 Series Prime Line.)
KYI: 2 (Multi-line)
KD: 0 (LINE)



ML TN: Multi-line Tenant Number
ML STN: 3098/3099 (Station Number of DSS Console)
RG: 0-7 (Ring Information for Each Line)

[Data Assignment for KYN=2]
KYN: 2 (Assign DSS Console station number.)
KYI: 2 (Multi-line)
KD: 0 (LINE)
ML TN: Multi-line Tenant Number
ML STN: 3000 (DT800/DT700 Series station number paired with DSS Console)
RG: 0-7 (Ring Information for Each Line)



[Data Assignment for KYN=10 to 39]
KYN: 10-39 (Assign KYNs 10-39 keys on DSS Console.)
KYI: 2 (Multi-line)
KD: 2 (DSS Console Key)
ML TN: Multi-line Tenant Number
ML STN: Station number for use
RG: 0-7 (Ring Information for Each Line)

Note: Execute the AKYD command to both station numbers 3098 and 3099 of DSS Console that was assigned with the AISTL command.

DSS Key Assignment

Assignment for all of 60 keys on DSS Console are not required. The setting image of the AKYD command is shown in the figure below.

b.) Data Assignment of the DT800/DT700 Series for the SIP Multiple Line Terminal

TN: X
STN: 3000
PRI: 0
PL TN: X
PL STN: 3000
S: 0 (Off-hook Suppression is OFF)
MWD: X (Message Waiting Data Display Selection)
LN PRE: 0 (Prime Line Pickup)
TP: X (Type of SIP Multiple Line Terminal)

Example List of Data Programming

The following table provides all of steps for Data Programming.

ASYDL/ASYDN

	INDEX	BIT		REMARKS
SYS1	686	Bit 1	1	DSS/BLF mode is available.
		Bit 2	1	Call Forwarding via trunks is enabled when a station assigned to a key on DSS Console is assigned Call Forwarding via trunks.

AISTL

Note: *Buttons 1-40 (1-32 buttons for DT800) are assignable / **Assignment of Line Appearance Data for DSS Console 3098 or 3099 / ***Assignment of Line/Feature Access keys (KYNs 25-60) on DSS Console 3098 or 3099

<For ADM mode>

This section describes how to assign ADM mode to DSS Console and DT800/DT700 Series that is attached to the console. For ease in understanding, the data programming is explained using the example below:

Example of Data Programming

TERMINAL	LINE EQUIPMENT NUMBERS (LENS)	STATION NUMBER (STN)
DSS Console	000101	201 **Note 9**
DT800/DT700 Series	000100	200

Note 9: Station Number "201" is used only for assigning Line/Feature Access keys to the DSS Console. The number is not used in actual operations.

Perform the following procedure. Note that X indicates a value that should be tailored to the existing system.

STEP 1: **AISTL** - Assign a DT800/DT700 Series to an even-numbered LENS level. (In this example, "LV 0" is used.) Assign DSS Console (ADM) to the subsequent odd-numbered LENS level. (In this example "LV 1" is used.)

[An even-numbered level of LENS for DT800/DT700 Series paired with DSS Console]

TN: X
IP STN: 200 ← Station Number of DT800/DT700 Series
TEC: 12 ← Fixed
KIND: SIP MultiLine TEL
RSC: X

SFC: X
LENS: 000100 ◄—— Even-numbered LENS level

[An odd-numbered level of LENS for DSS Console]
TN: X
IP STN: 201 ◄—— Station Number of DSS Console
TEC: 12 ◄—— Fixed
KIND: SIP MultiLine TEL
RSC: X
SFC: X
LENS: 000101 ◄—— Odd-numbered LENS level

STEP 2: **AKYD** - Assign the station numbers to the Line/Feature Access keys for DT800/DT700 Series (STN=200) and DSS Console (STN=201) which are assigned by AISTL command.
To STN=200, assign 16 keys on the DT800/DT700 Series and the upper 24 (KYNs 1-24) Line/Feature Access keys on DSS Console that belong to the paired DT800/DT700 Series.
To STN=201, assign the remaining lower 36 (KYNs 25-60) Line/Feature Access keys belong to DSS Console. Also assign DT800/DT700 Series Prime Line to KYN=1 of DSS Console (STN=201), and assign the station number of DSS Console itself (STN=201) to KYN=2.

[Data Assignment of the DT800/DT700 Series and Upper 24 Keys on DSS Console]
To assign information of these keys, use the port of the DT800/DT700 Series that is paired with DSS Console.
TN: X
STN: 200 ◄—— Station Number of DT800/DT700 Series
PRI: 0

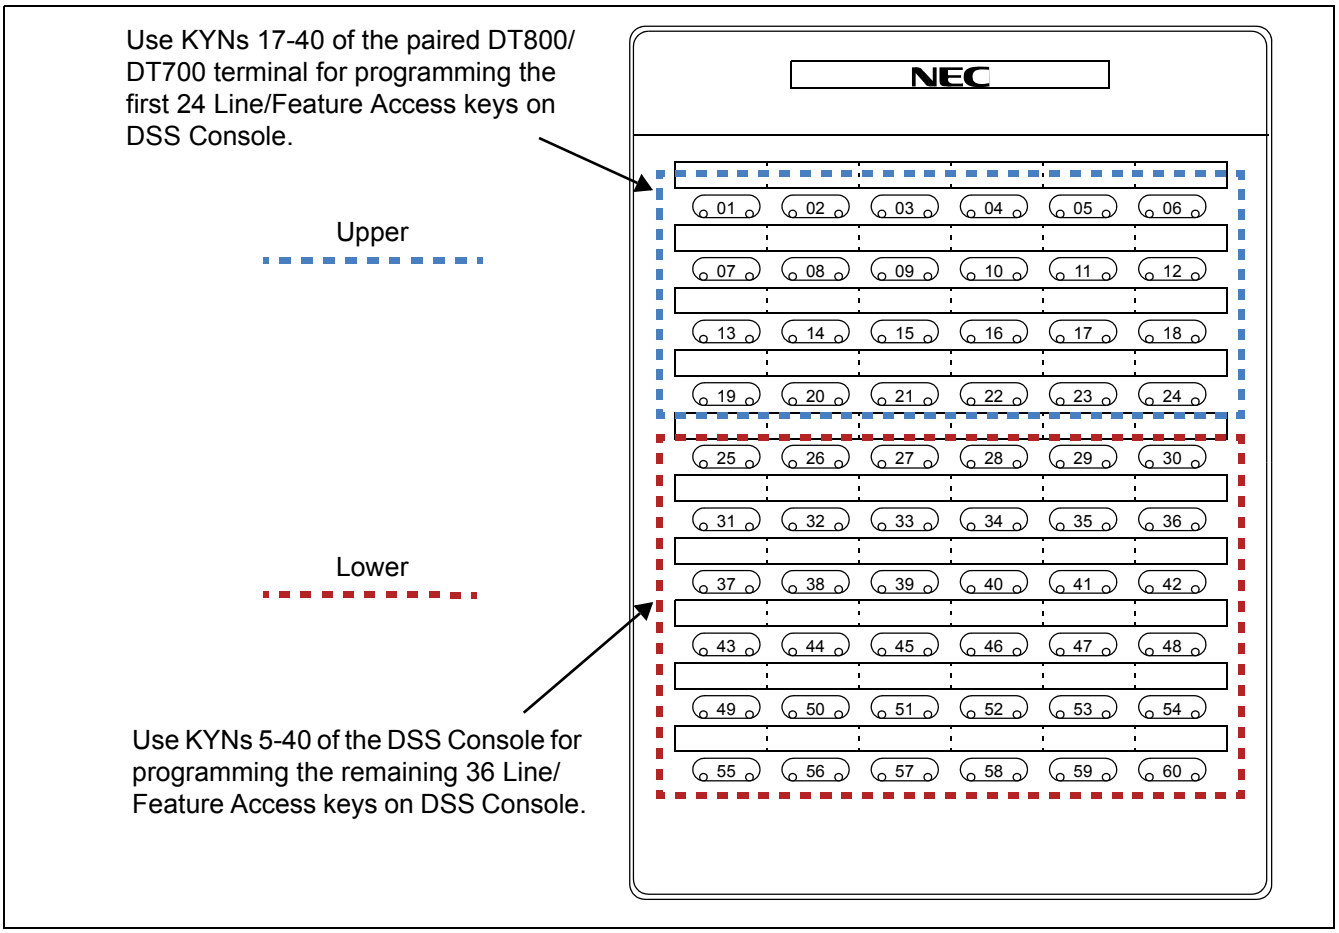
STN: Multi-line Station Number
RG: 0-7 (Ring Information for Each Line)
ICM: 0-2 (Kind of Intercom)
G-ID: 1-50 (Group ID Number)

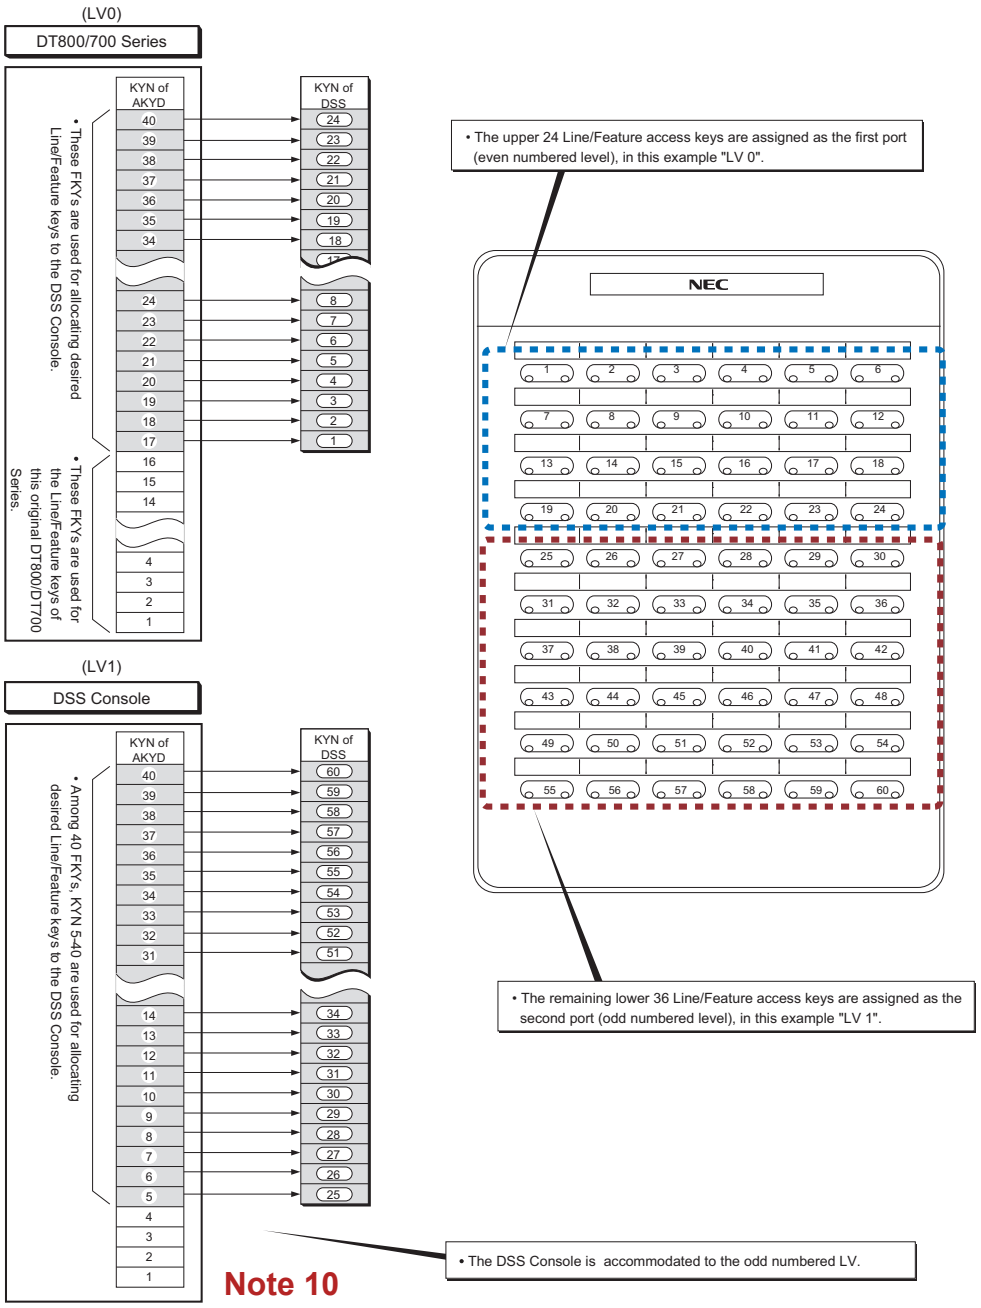
[Data Assignment of the Lower 36 Keys on DSS Console]

To assign information of these keys, use the port of DSS Console (ADM).



TN: X
STN: 201 ← Station Number of DSS Console
PRI: 0
PL TN: X (Prime Line Tenant Number)
PL STN: 200 ← Enter the paired DT800/DT700 Series Prime Line as a PL STN
S: 0 (Off-hook Suppression is OFF)
MWD: X (Message Waiting Data Display Selection)
LN PRE: 0 (Prime Line Pickup)
TP: 1

KYN=1: Assign DT800/DT700 Series Prime Line.
KYN=2: Assign DSS Console station number.
KYI: 2 (Multi-line)
KD: 0 (Line)
Line TN: Multi-line Tenant Number
STN: 200/201



KYN	KYI	KD	LINE TN	STN	Remarks
1	2	0	1	200	DT800/DT700 Series Prime Line
2	2	0	1	201	DSS Console station number

KYN=5-40: Assign KYNs 25-60 keys on DSS Console.
KYI: X (Service Index)
0: Key is not used
1: Function Key
2: Multi-line
FKY: 1-320 (Function Key Number)
KD: 0-2 (Kind of Line)
TN: X
STN: XXX
RG: 0-7 (Ring Information for Each Line)
ICM: 0-2 (Kind of Intercom)
G-ID: 1-50 (Group ID Number)

DSS Key Assignment

To designate the meaning of the upper 24 keys on DSS Console, FKYs 17-40 of a DT800/DT700 Series that works in combination with DSS Console are used. The remaining 36 keys on DSS Console are assigned using FKYs 5-40 of the original port of DSS Console. The relationship between KYN, that appears in the AKYD command, and 60 keys on DSS Console are shown in the figure below. This figure also shows DSS Console connected to LV 1.

Note 10: Note the following conditions:

- To KYN=1, assign the Prime Line of DT800/DT700 Series paired with the DSS Console.
  In the case of Data Programming Procedure in this manual: AKYD, KYI=2, KD=0, STN=200.
- To KYN=2, assign the DSS Console station number which is accommodated in the second port (odd numbered level).
  In the case of Data Programming Procedure in this manual: AKYD, KYI=2, KD=0, STN=201.
  On the 8-button Digital terminal, KYN=9-16 cannot be used.

STEP 3: **ADKS** - Assign Digital terminal Key Status Data to the station number for DT800/DT700 Series (STN=200) which is assigned by AISTL command.

TN: X
STN: 200 ← Station Number of DT800/DT700 Series
SKP: 0-15 (Soft Key Pattern data)
LKP: 1 (16 Line/Feature buttons + DSS keys)
PG: 0/1 (Soft key/Feature key is allocated for the PAGE CHANGE key)

Example of Data Programming

The following table provides all of steps for Data Programming.

AISTL

TENANT NUMBER (TN) 1-63	STATION NUMBER (IP STN) MAXIMUM SIX DIGITS	KIND OF IP STATION (KIND)	LINE EQUIPMENT NUMBERS (LENS)				TELE. EQUIP. CLASS (TEC) 1-31	ROUTE REST. CLASS (RSC) 0-15	Service Feature Restriction Class (SFC) 0-15	REMARKS

Direct Station Selection (DSS) Console for Digital Terminal

This section explains service conditions and programming procedure for Direct Station Selection (DSS) Console used in combination with a Digital terminal.

Operating Procedure

The following shows examples of the operating procedure when the 60 keys are used as the Line keys, allowing the user to activate SPEED CALLING - ONE TOUCH and Call Transfer.

To originate a call using SPEED CALLING - ONE TOUCH:

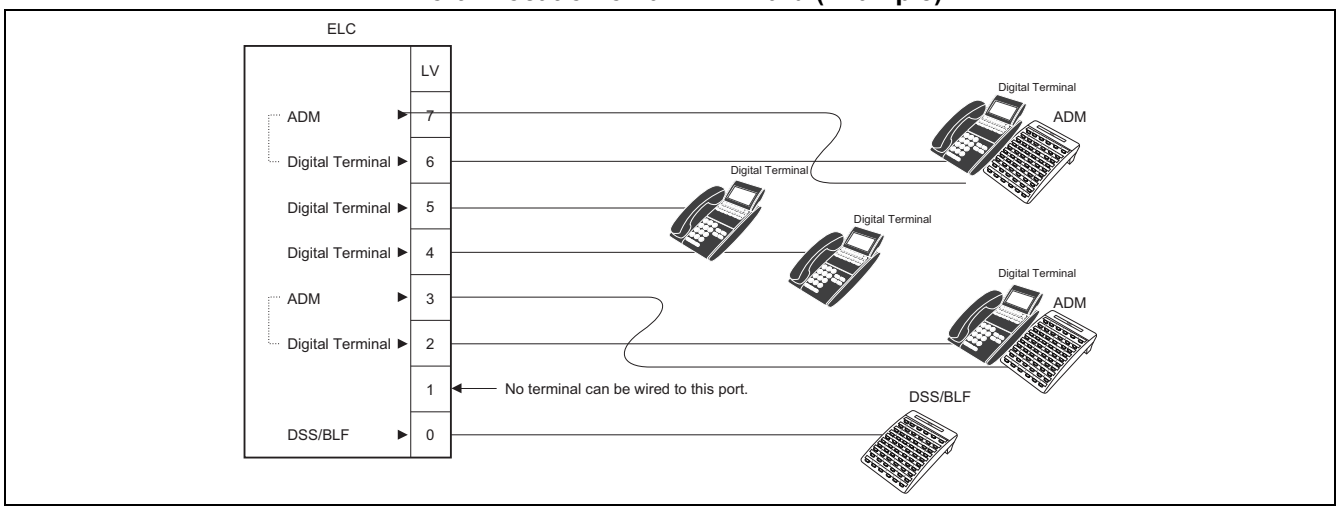
1. User A lifts the handset or presses the SPEAKER key on a Digital terminal.
   User A hears the dial tone.
2. User A presses a key on DSS Console where a station number of User B to whom User A wants to call is assigned.
   User A hears the ringback tone from the terminal. A terminal of User B starts ringing.
3. User B answers the call.
   They can start a conversation.

To transfer the call to the Station assigned on the DSS key:

1. While User A and User B are engaged in a call.
2. User A presses a key on DSS Console where a station number of User C to whom User A wants to transfer the call is assigned.
   User A hears a ringback tone from the terminal. User B is placed on hold. A terminal of User C starts ringing.
3. User C answers the call.
   User B and User C can start a conversation.

Note: When the a Digital terminal user switch hook flashes during a ringback tone, the user returns to the Held Party, and the third party (the station assigned on the DSS key) stops ringing.

Note: If the Digital terminal user replaces the handset before the third party answers, Blind Transfer is activated. In this case, if the third party does not answer for approximately 30 seconds, the user is recalled and upon answering, will be connected to the Held Party.



For more information, refer to the User Guide.

Service Conditions

Common Condition

1. DSS Console (DSS/BLF) and DSS Console (ADM) can co-exist on one circuit card. The figure below shows an example of a port allocation on an ELC circuit card.

Port Allocation on an ELC Card (Example)

2. When the station assigned on the DSS key that becomes the call destination or the forwarding destination is not in an idle state but in a call-block state, a lockout state or a make-busy state, BUSY is displayed on the originating terminal.

For DSS Console (DSS/BLF)

<Important Notices>

1. One DSS Console (DSS/BLF) requires two consecutive ports on an ELC card.
2. To use 60 keys on DSS Console (DSS/BLF), key data for two consecutive ports need to be assigned by the AKYD command. Refer to STEP 3: AKYD command.
3. Since FP95-114 V4 Issue 2.0, Call Forwarding via trunks is available on DSS Console by pressing a key where a station whose forwarding destination for Call Forwarding - All Calls - Outside, Call Forwarding - Busy Line - Outside, and Logged Out IP Station - Call Destination is an outside number is assigned.
   Call Forwarding conditions are as follows:
   - The system data (ASYDL/ASYDN, SYS1, Index 686, Bit 2=1) is required.
   - When a forwarding destination of the station is an attendant console, Call Forwarding is restricted.
   - When a forwarding destination number is Uniform Numbering, Call Forwarding is restricted.
   - LCR, LCRS, OGC, and OGCA are supported for the originating methods.
   - When a forwarding destination is a station, Call Forwarding - All Calls, Call Forwarding - Busy Line, and Call Forwarding - Don't Answer are supported. However, it is not supported when the forwarding destination is an attendant console.
     When a forwarding destination is a trunk line, calls for Call Forwarding - All Calls - Outside, Call Forwarding - Busy Line - Outside, and Logged Out IP Station - Call Destination can be forwarded when:

     - a transferor is hearing a dial tone

     - a transferor is on a call

     - a transferor goes on-hook while on a call

- As Split Call Forwarding is not available, the call is transferred to the forwarding destination of Call Forwarding for trunk calls.

For FP95-114 V4 or earlier, a station cannot make/transfer a call by using a DSS key when the target station of the DSS key sets following forwarding features.

- CALL FORWARDING to Attendant Console (including ALL CALLS, BUSY LINE, DON'T ANSWER)
- CALL FORWARDING - OUTSIDE (including ALL CALLS, BUSY LINE, DON'T ANSWER)
- MULTIPLE CALL FORWARDING (including ALL CALLS, BUSY LINE, DON'T ANSWER)
- SPLIT CALL FORWARDING

<Interactions with Other Features>

1. When the Station user calls the station assigned on the DSS key by SPEED CALLING - ONE TOUCH, or transfers the call to the station assigned on the DSS key, and the station assigned on the DSS key is the member of the UCD [U-1] or Station Hunting Group, the call follows the UCD or the Hunting Operation. (If the MCI is valid, the message is sent out.)
2. When the user calls the station assigned on the DSS key by SPEED CALLING - ONE TOUCH, or transfers the call to the station assigned on the DSS key, following features set by the station assigned on the DSS key are not available:
   - BUSY VERIFICATION [B-3]
   - CALL BACK [C-1]
   - CALL WAITING [C-12, C-31]
   - EXECUTIVE RIGHT-OF-WAY [E-1]
   - MESSAGE REMINDER [M-19]
   - STEP CALL [S-13]
3. The following features are not used when DSS Console (DSS/BLF) encounters a busy station.
   - CALL BACK
   - CALL WAITING
   - EXECUTIVE RIGHT-OF-WAY
   - STEP CALL
4. The following features do not work after a call is originated by using DSS keys.
   - CALL BACK [C-1]
   - CALL WAITING - TERMINATING [C-12]
   - CALL WAITING - ORIGINATING [C-31]
   - EXECUTIVE RIGHT-OF-WAY [E-1]
   - MESSAGE REMINDER [M-19]
   - STEP CALL [S-13]
   - VOICE CALL [V-2]

<Hardware/Software>

1. One Digital terminal can use multiple DSS Console.
2. Multiple Digital terminals cannot share one DSS Console.
3. DSS Console can accommodate IP Stations (IP terminals/SIP Multiple Line terminals) as Multiple Lines, but cannot be paired with IP Stations expect for DT800/DT700 Series. For more information, refer to Direct Station Selection (DSS) Console for SIP Multiple Line terminal.
4. ACD Agent/Supervisor terminals do not support this feature.

<Interactions with Networks>

None

<Conditions Specific to This Feature>

1. When DSS Console is used as DSS Console (DSS/BLF), assign and wire DSS Console (DSS/BLF) to a specific LENS whose level (LV) is an even number (LV = 0, 2, 4, 6). Since DSS Console (DSS/BLF) requires two consecutive ports for programming the DSS keys, the subsequent port of the designated port, to which DSS Console (DSS/BLF) is wired, must be reserved.
2. A Digital terminal, attached DSS Console, and stations that are assigned to the DSS keys must belong to the same Module Group.
3. DSS Console and the attached Digital terminal can be accommodated in the different circuit cards, but should belong to the same Module Group. Also, the stations assigned on the DSS keys should belong to the same LP with DSS Console.
4. When the user calls the station assigned on the DSS key using SPEED CALLING - ONE TOUCH and the station assigned on the DSS key is either busy, not available, or restricted, the user receives a Reorder Tone.
5. When the user transfers the call to the station assigned on the DSS key which is either busy, not available, or restricted, the user receives a Reorder Tone. The user returns to the original call by switch hook flash.
6. The user can recognize the idle/busy status of the accommodated Stations by the lamps.
   The left lamp (red) lights when busy and goes out when the accommodated Stations are in idle status. Also the lamp shows status such as having an incoming call, or a call on hold. The right lamp (green) shows status such as I-Used, I-Hold.

<Other Conditions>

None

For DSS Console (ADM)

<Important Notices>

1. One DSS Console (ADM) occupies one port on an ELC card.
2. To use 60 keys on DSS Console (ADM), key data for two consecutive ports need to be assigned by the AKYD command. Refer to STEP 2: AKYD command.
3. Up to 16 Line/Feature keys on Digital Multiline terminal can be used in ADM mode. This setting is assigned by the ADKS command. Refer to STEP 3: ADKS command.

<Interactions with Other Features>

1. Do not assign the following parameters to Function Key Number (FKY) when the Line/Feature keys are assigned on the DSS Console (ADM) by the AKYD command.
   - FKY = 6 (Message Reminder)
   - FKY = 49 (Speed Calling - One Touch)
   - FKY = 75 to 82 (Call Park Group-D key)
   - FKY = 118 (Call Return)
   - FKY = 163 (Privacy key)
2. When the Station user calls the station assigned on the DSS key by SPEED CALLING - ONE TOUCH, or transfers the call to the station assigned on the DSS key, and the station assigned on the DSS key is the member of the UCD [U-1] or Station Hunting Group, the call follows the UCD or the Hunting Operation. (If the MCI is valid, the message is sent out.)

<Hardware/Software>

1. Multiple Digital terminals cannot share one DSS Console.
2. Either of the following circuit card is required.
   - PA-16ELCJ-B
   - PA-16ELCN

<Interactions with Networks>

None

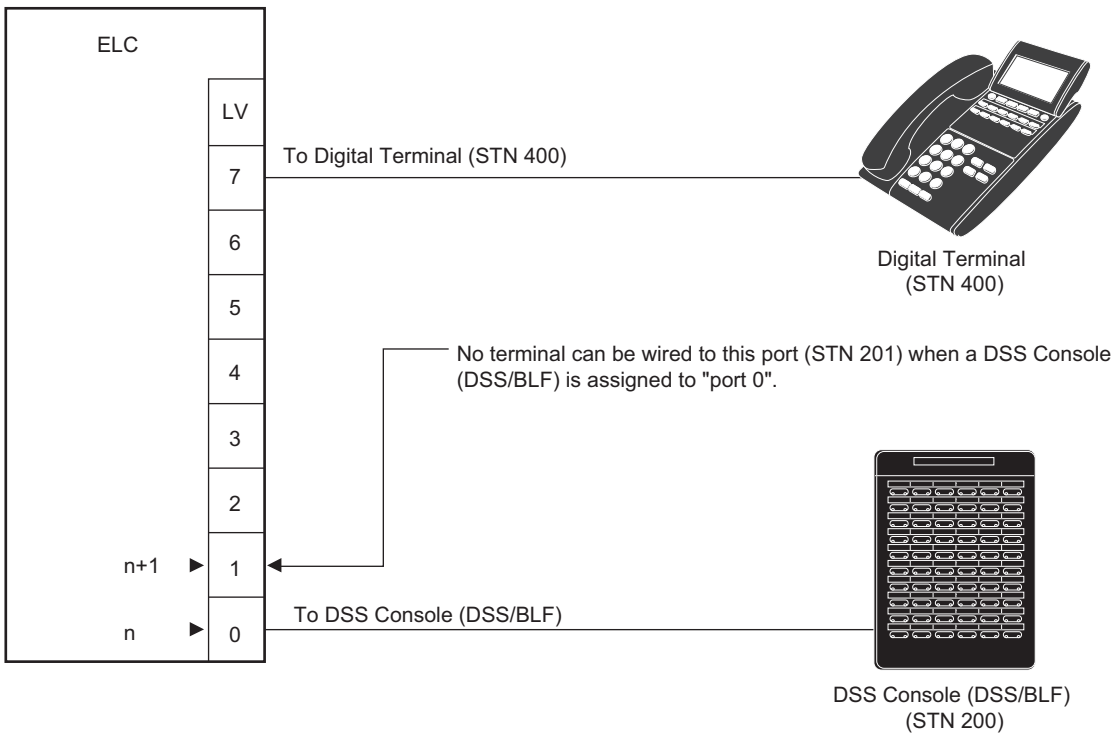
<Conditions Specific to This Feature>

1. For DSS Console (ADM), assign DSS Console to a specific LENS whose Level (LV) is an odd number (LV = 1, 3, 5, 7). The Digital terminal that is used in combination with DSS Console (ADM) must be assigned to the preceding even numbered LENS level (LV = 0, 2, 4, 6).
2. A Digital terminal, attached DSS Console (ADM), and stations that are assigned to the DSS keys must belong to the same Module Group.
3. The Digital terminal to be attached to DSS Console should be accommodated in the same circuit card as DSS Consoles on the even-numbered port, using a number smaller than the one where DSS Console is accommodated.
4. On the 25th key and following keys, My Line/Prime Line for Digital terminal cannot be assigned.
5. A maximum of 48 line appearances and 12 Feature keys can be programmed for DSS Console (ADM).
6. The 48th key and following keys can be used only as the Feature keys, not as the Line keys. These keys do not have the green lamps, therefore, I-Used or I-Hold cannot be indicated.

<Other Conditions>

None

Programming



This section describes how to program Office Data to pair Digital terminal with DSS Console (DSS/BLF).

DSS Console (DSS/BLF)

This section describes how to assign DSS Console (DSS/BLF). The data programming is explained using the example below:

Example of Data Programming for DSS Console (DSS/BLF)

TERMINAL	LINE EQUIPMENT NUMBERS (LENS)	STATION NUMBER (STN)
DSS Console (DSS/BLF) **Note 11**	000100	200
	000101	201
Digital terminal	000107	400

Note 11: Two Station Numbers are required only for programming DSS keys. Accordingly, these numbers are not used in actual operations of the DSS Console (DSS/BLF).

When assigning DSS Console (DSS/BLF) Data, perform the following procedure. Note that X indicates a value that should be tailored to the existing system.

STEP 1: **ASYDL/ASYDN** - SYS1, Index 686
Bit 2=1: Call Forwarding - Outside of a station assigned to the DSS key is available.

Note: Available since FP95-114 V4 Issue 2.0.

STEP 2: **ASDT** - Assign DSS Console (DSS/BLF) to an even numbered LENS level. (In this example **LV 0** is used.)

TN: X
STN: 200 ← Station Number of Digital terminal
LENS: 000100 ← Even-numbered LENS level
TEC: 12 ← Fixed
RSC: X
SFC: X

Assign a Station which is used for programming DSS keys (KYNs 31-60) to the subsequent LENS (In this example **LV 1** is used.)

TN: X
STN: 201
LENS: 000101 ← To the subsequent LENS
TEC: 12 ← Fixed
RSC: X
SFC: X

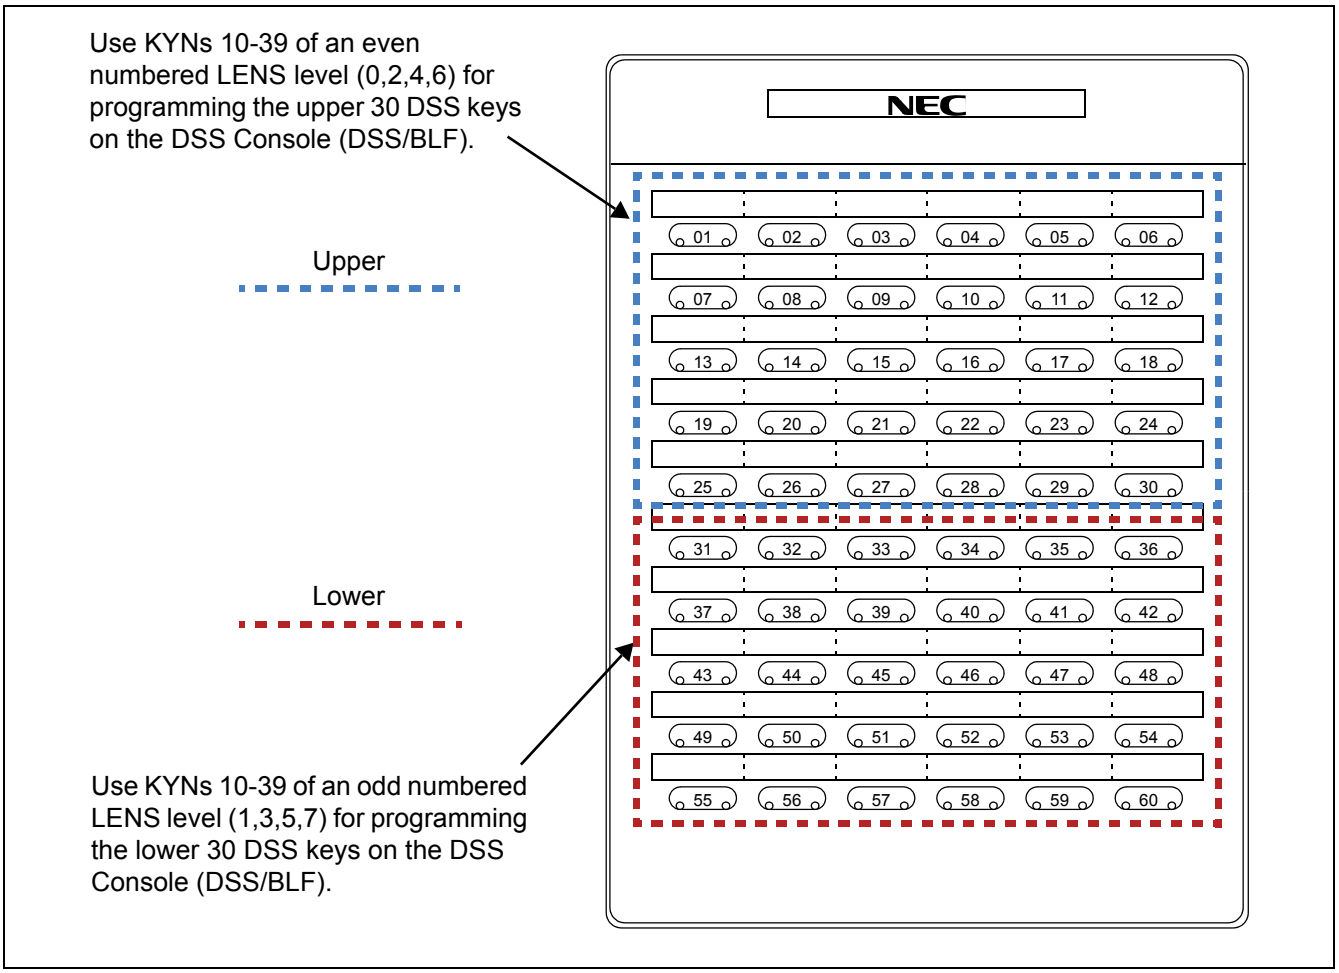
STEP 3: **AKYD** - Assign key data for 60 DSS keys. The upper 30 DSS keys (KYNs 1-30) are assigned using the first port (**LV 0** in this example) and the remaining lower 30 DSS keys (KYNs 31-60) are assigned using the second port (**LV 1** in this example). Be sure to assign the paired Digital terminal Station Number as the Station Number of Prime Line.

TN: X
STN: 200/201
TP: 1 or 3 ← Buttons 1-40 assignable
RING: X
PRI: 0
PL TN: X
STN: 400 ← Enter the paired Digital terminal as a PL STN
S: 0 (Off-hook Suppression is OFF)
LN PRE: 0 (Prime Line Pickup)
MWD: X

KYN 1 must be programmed as DSS Console station which has been assigned in ASDT.

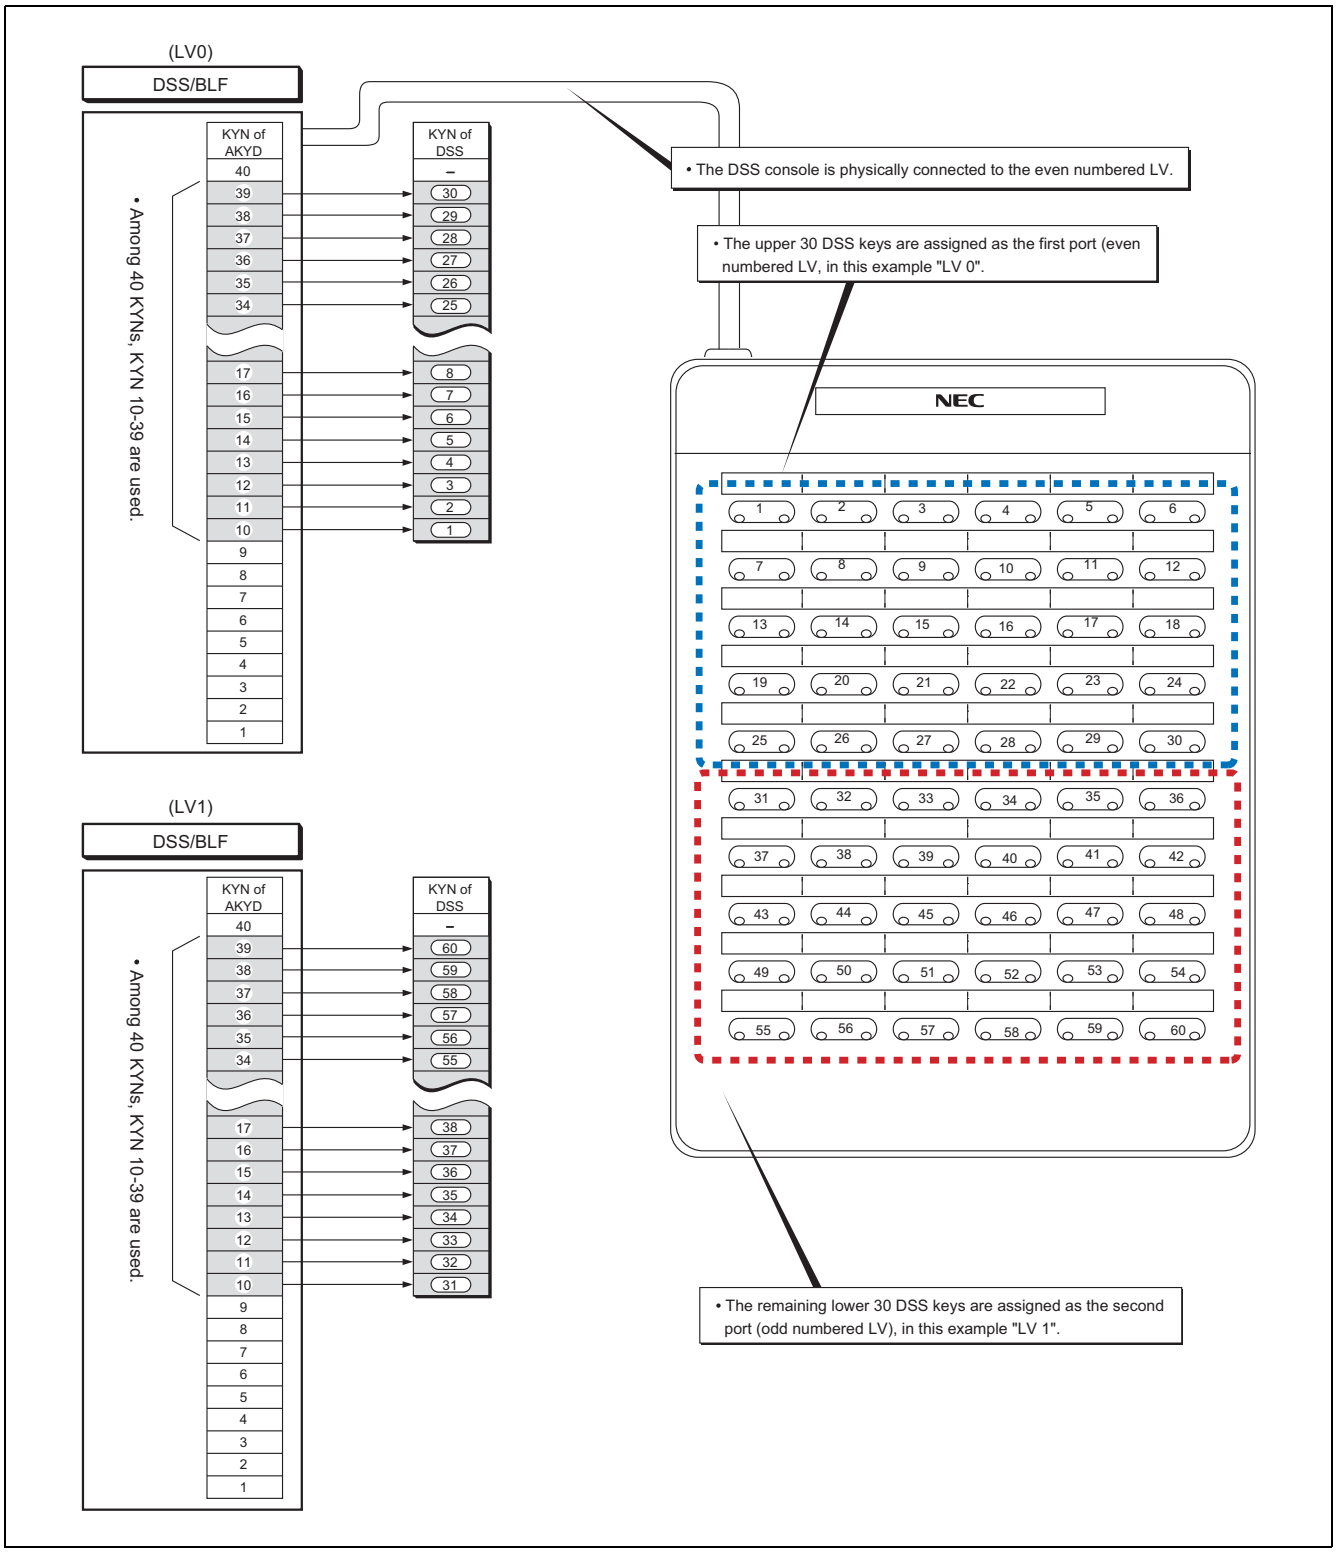
KYN: 1
KYI: 2 (Multi Line)
KD: 0 (Line)
TN: X
STN: 200/201 ← Station Number of DSS Console

KYN 2 must be programmed as the paired Digital terminal station.



KYN: 2
KYI: 2 (Multi Line)
KD: 0 (Line)
TN: X
STN: 400 ← The paired Digital terminal

Assign desired Station Numbers to the corresponding DSS keys on the Console. In this instance, KYNs 10-39 are used. The upper and lower 30 keys are paired with even-numbered port and odd-numbered port respectively as shown in the following figure.



KYN: 10-39
KYI: 2 (Multi Line)
KD: 2 (For DSS Console key)
TN: X
STN: XXXXX ← Desired Station Number (maximum five digits)

Note: Assign AKYD command data for both STN 200 and STN 201 registered by the ASDT command.

DSS Key Assignment for DSS Console (DSS/BLF)

Key Numbers (KYN: 1-40) that appear in the AKYD command, correspond to 60 DSS keys. This figure also shows an example of DSS key allocation on DSS Console (DSS/BLF) when it is connected to LV 0.

Example of Data Programming for DSS Console (DSS/BLF)

The following table provides all of steps for Data Programming.

ASYDL/ASYDN

	INDEX	BIT		REMARKS
SYS1	686	Bit 2	1	Call Forwarding via trunks is enabled when a station assigned to a key on DSS Console is assigned Call Forwarding via trunks.

ASDT

DSS Console (ADM)

This section describes how to assign DSS Console (ADM) and the paired digital terminal. For ease in understanding, the data programming is explained using the example below:

Example of Data Programming for DSS Console (ADM)

TERMINAL	LINE EQUIPMENT NUMBERS (LENS)	STATION NUMBER (STN)
DSS Console (ADM)	000101	201 **Note 12**
Digital terminal	000100	200

Note 12: Station Number 201 is used only for assigning Line/Feature Access keys to the DSS Console (ADM). The number is not used in actual operations of the DSS Console (ADM).

When assigning DSS Console (ADM) data, perform the following procedure. Note that X indicates a value that should be tailored to the existing system.

STEP 1: **ASDT** - Assign a Digital terminal to an even-numbered LENS level. (In this example, **LV 0** is used.) Assign DSS Console (ADM) to the subsequent odd-numbered LENS level. (In this example **LV 1** is used.)

[An even-numbered LENS level of LENS for Digital terminal paired with DSS Console]
TN: X
STN: 200

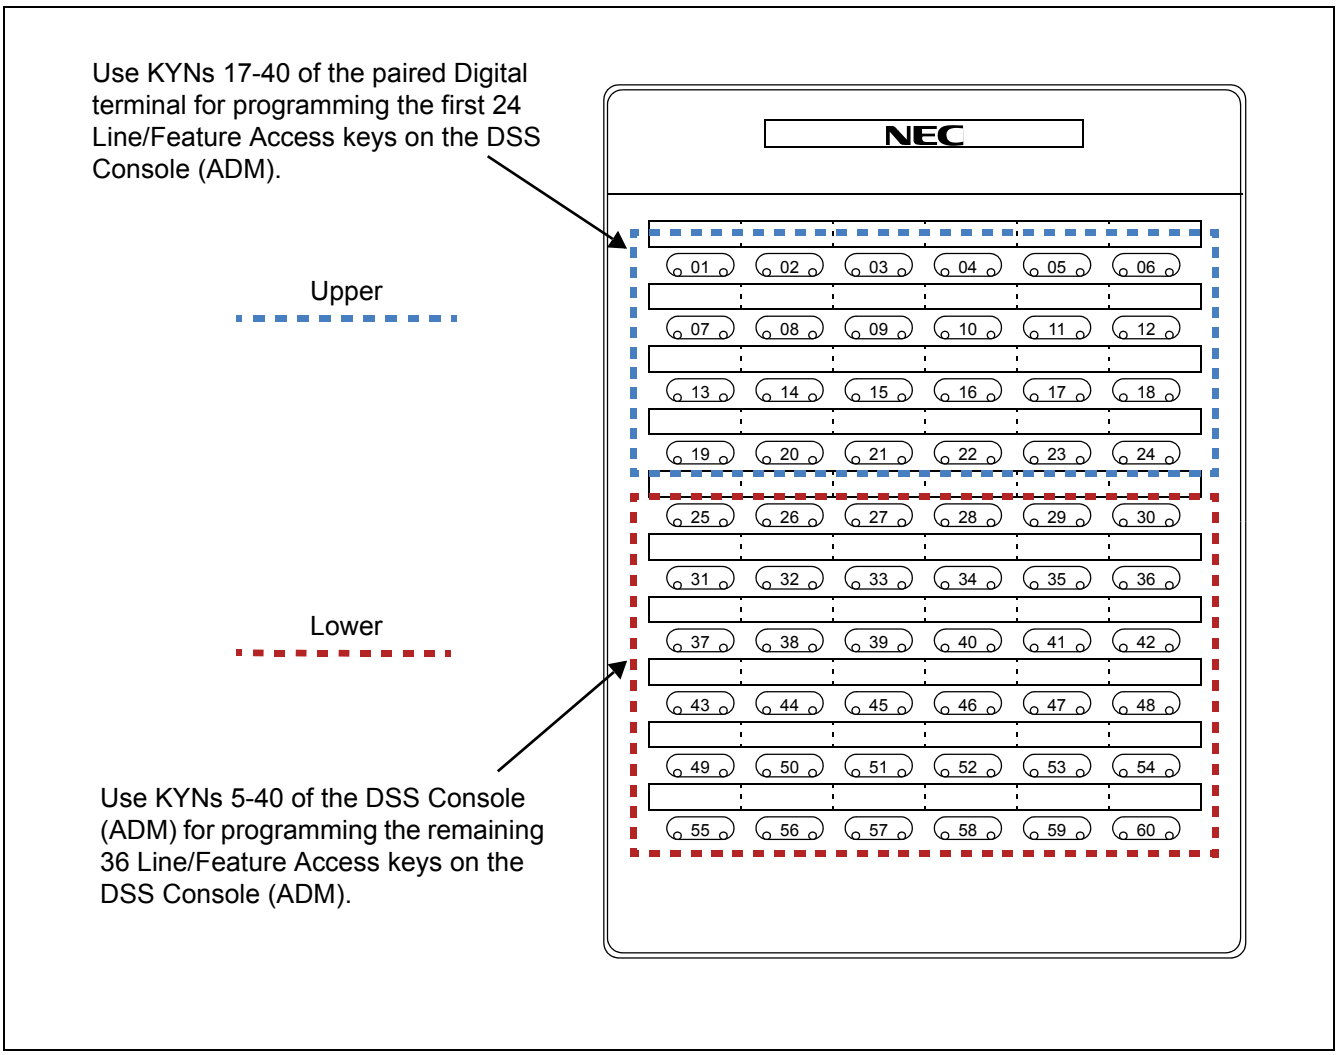
LENS: 000100 ← Even-numbered LENS level
TEC: 12 ← Fixed
RSC: X
SFC: X

[An odd-numbered LENS level of LENS for DSS Console]
TN: X
STN: 201
LENS: 000101 ← Odd-numbered LENS level
TEC: 12 ← Fixed
RSC: X
SFC: X

STEP 2: **AKYD** -Assign the station numbers to the Line/Feature Access keys for Digital terminal (STN=200) and DSS Console (STN=201) which are assigned by ASDT command.
To STN=200, assign 16 keys on the Digital terminal and the upper 24 (KYNs 1-24) Line/Feature Access keys on DSS Console that belong to the paired digital terminal.
To STN=201, assign the remaining lower 36 (KYNs 25-60) Line/Feature Access keys belong to DSS Console.
Also assign Digital terminal Prime Line to KYN=1 of DSS Console (STN=201), and assign the station number of DSS Console itself (STN=201) to KYN=2.

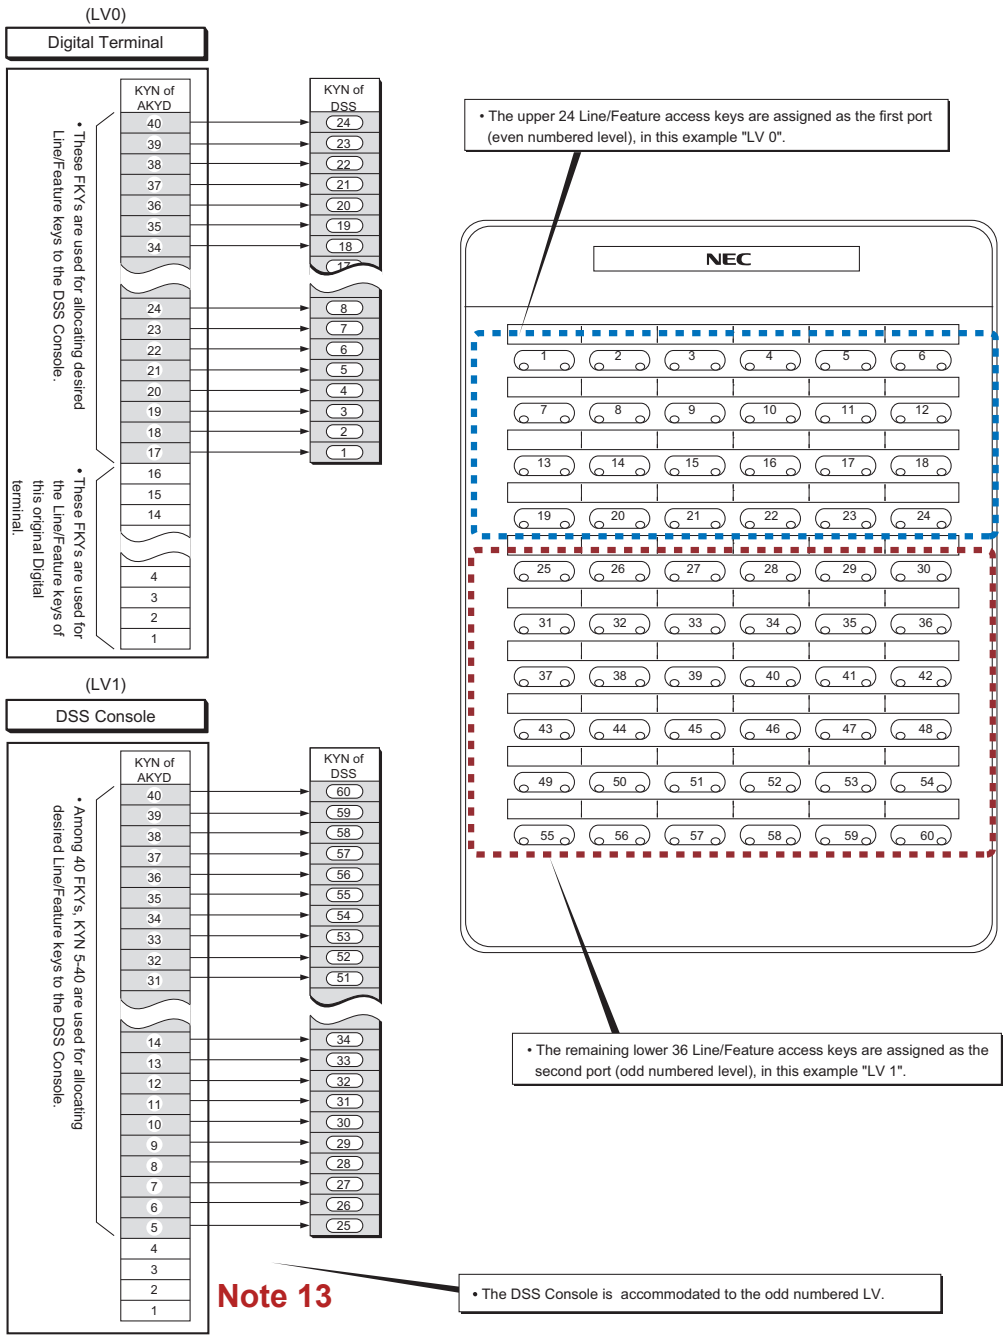
[Data Assignment of the Digital terminal and the upper 24 keys on DSS Console (ADM)]
To assign information of these keys, use the port of the Digital terminal that is paired with DSS Console.
TN: X
STN: 200 ← Station Number of Digital terminal
RING: X
PRI: 0
PL TN: X
PL STN: 200
S: 0 (Off-hook Suppression is OFF)
MWD: X (Message Waiting Data Display Selection)
LN PRE: 0 (Prime Line Pickup)
TP: 1 or 3 ← Buttons 1-40 assignable
KYI: X (Service Index)
0: Key is not used
1: Function Key
2: Multi-line
KYN: 1-16 (for Digital terminal)
17-40 (Correspond to KYNs 1-24 on DSS Console (ADM))
KD: 0-2 (Kind of Line)
Line TN: Multi-line Tenant Number
STN: Multi-line Station Number

RG: 0-7 (Ring Information for Each Line)
ICM: 0-2 (Kind of Intercom)
G-ID: 1-50 (Group ID Number)



[Data Assignment of the lower 36 keys on DSS Console (ADM)]
To assign information of these keys, use the port of DSS Console (ADM).
TN: X
STN: 201 ← Station Number of DSS Console (ADM)
PRI: 0
PL TN: X (Prime Line Tenant Number)
PL STN: 200 ← Enter the paired Digital terminal Prime Line as a PL STN
S: 0 (Off-hook Suppression is OFF)
MWD: X (Message Waiting Data Display Selection)
LN PRE: 0 (Prime Line Pickup)
TP: 1 ← Buttons 1-40 assignable

KYN=1: Assign Digital terminal Prime Line.
KYN=2: Assign DSS Console station (ADM) number.
KYI: 2 (Multi-line)
KD: 0 (Line)
TN: X
STN: 200/201



KYN	KYI	KD	LINE TN	STN	Remarks
1	2	0	1	200	Digital terminal Prime Line
2	2	0	1	201	DSS Console station number

KYN=5-40: Assign KYNs 25-60 keys on DSS Console (ADM).
KYI: X (Service Index)
0: Key is not used
1: Function Key
2: Multi-line
FKY: 1-320 (Function Key Number)
KD: 0-2 (Kind of Line)
TN: X
STN: XXX
RG: 0-7 (Ring Information for Each Line)
ICM: 0-2 (Kind of Intercom)
G-ID: 1-50 (Group ID Number)

DSS Key Assignment for DSS Console (ADM)

To designate the meaning of the upper 24 keys on DSS Console (ADM), FKYs 17-40 of a Digital terminal that works in combination with DSS Console are used. The remaining 36 keys on DSS Console (ADM) are assigned using FKYs 5-40 of the original port of DSS Console (ADM). The relationship between KYN, that appears in the AKYD command, and 60 keys on DSS Console (ADM) are shown in the figure below. This figure also shows an example of DSS key allocation on DSS Console (ADM) when it is connected to LV 1.

Note 13: Note the following conditions:

- To KYN=1, assign the Prime Line of Digital terminal paired with the DSS Console.
  In the case of Data Programming Procedure in this manual: AKYD, KYI=2, KD=0, STN=200
- To KYN=2, assign the DSS Console station number which is accommodated in the second port (odd numbered level).
  In the case of Data Programming Procedure in this manual: AKYD, KYI=2, KD=0, STN=201

STEP 3: **ADKS** - Assign Digital terminal Key Status Data to the station number for Digital terminal (STN=200) which is assigned by ASDT command.

TN: X
STN: 200 ← Digital station number
SKP: 0-15 (Soft Key Pattern Data)
LKP: 1 (16 Line/Feature buttons + DSS keys)
PG: 0/1 (Soft key/Feature key is allocated for the PAGE CHANGE key)

Example of Data Programming for DSS Console (ADM)

The following table provides all of steps for Data Programming.

ASDT

TENANT NUMBER (TN) 1-63	STATION NUMBER (STN) MAXIMUM SIX DIGITS	LINE EQUIPMENT NUMBERS (LENS)				TELE. EQUIP. CLASS (TEC) 1-31	ROUTE REST. CLASS (RSC) 0-15	Service Feature Restriction Class (SFC) 0-15	REMARKS

D-153 Distinctive Ringing - Caller ID

General Description

This feature is a part of CALLER ID Service. This feature provides a Distinctive Ringer Pattern (0, 1, 5, 6 or 7) according to the received Calling Number.

Note: This feature is available in North America only.

Note: For the definition of terms related to ringer patterns, see DISTINCTIVE RINGING [D-10].

Operating Procedure

No manual operation is required.

Service Conditions

1. ON-OFF timing of Ringer Patterns 0, 1, 5, 6 and 7 can be changed using ASYD. System Data assigned for Ringer Patterns 6 and 7 cannot be applied to analog telephones.
2. Ringer Patterns 6 and 7 can be used for ELC cards and the LC card. With regard to other LC cards, Ringer Patterns 0, 1, 5 are available for this feature.
3. When the Calling Number is not received, this service is not available (the Ringer Pattern is determined according to the parameter 12:DR of ARTD).
4. The Calling Number for this service is assigned to the parameter CID of ACID. When only the first part of the Calling Number is assigned to the CID, this feature is applied to any Calling Number that begins with the Assigned Number. For example, when 1471 is assigned to the CID, this feature is applied to any Calling Number that begins with 1471 such as 1471-12-3456 and 1-471-234-5678.
5. The following numbers cannot be assigned to the parameter CID of ACID:
   - The first part of the already Assigned Number
   - The number whose first part is the same as the already Assigned Number

   For example, when “123” is already assigned to the CID, such numbers as “1”, “12” or “1234” cannot be assigned.
6. When the Calling Number is received via CCIS Line, this feature is available for the first 16 digits (provided that “1” is assigned to 98: CI of ARTD).
7. This service is available only for stations (Single Line telephones and Desktop terminals).
8. This service is available when an Incoming Call is directly terminated to a station and/or an Incoming Call is transferred to a station using Call Forwarding - All Calls/Busy Line/Don’t Answer.
9. This service is not available when a call is terminated to an ISDN terminal.
10. Fax Ringer overrides this feature.
11. This feature takes precedence over the Personal Ringer function.
12. A maximum of 12 Calling Numbers can be assigned for a single station.
13. Ringer Patterns 2, 3 or 4 cannot be assigned for this feature. When one of those Ringer Patterns is assigned from PCPro, recommended value Ringer Pattern 6 is automatically set.
14. When SYS3 is changed, circuit card (LC, ELC) initialization is required.
15. A CH-12COTB or PA-8COTBJ circuit card is required for Analog Caller ID.

16. When multiple incoming calls are simultaneously terminated to the Multi Line on the Desktop terminal, the priority of Ringer Pattern is as follows:

Priority	1st	2nd	3rd	4th	5th
Ringer Pattern	RG 7	RG 6	RG 5	RG 0	RG 1

17. When no value is specified for either Ringer Pattern 6 or 7 (ASYD, SYS3, Index 8/Index 9=0), default (Recommended) values of Ringer Patterns 0 to 7 are as follows:

Ringer Patterns 0 to 7

X: Available N: Not Available –: Not applicable

Ringer Pattern	Customization of Ringer Pattern	Customization of Ring Cycle (Note 1) Duration through System Data		Recommended Ring Cycle Duration (Ringing/Silent) (sec.)	Used for
		ELC	LC	ELC	
Ringer Pattern 0	X	X	X	1/2	Incoming Trunk Calls
Ringer Pattern 1	X	X	X	2/4	Station Calls
Ringer Pattern 2	N	N	N	-	Fax
Ringer Pattern 3	N	N	N	-	Wake Up Calls
Ringer Pattern 4	N	N	N	-	Not used.
Ringer Pattern 5	X	X	X	2/4	Call Back, Outgoing Trunk Queuing, Call Waiting, Auto/Manual Intercom, and Dial Intercom
Ringer Pattern 6	X	X	N	1/2	-
Ringer Pattern 7	X	X	N	1/1	-

Note 1: The Ring Cycle consists of a ringing period and a silent period.

Programming

STEP 1: **ASYD** - SYS1, Index 417, Bit 0. Recall Ringer Pattern for CALL BACK [C-1], CALL WAITING - ORIGINATING [C-31], and OUTGOING TRUNK QUEUING [O-2].

0/1 = Ringer Pattern 5/Ringer Pattern 1.

SYS3, Index 0: Duration of the Ring Cycle (Timer Value) for Ringer Pattern 0.

SYS3, Index 1: Duration of the Ring Cycle (Timer Value) for Ringer Pattern 1.

SYS3, Index 3, Bit 0: Two Ringings (0.4 seconds.ON, 0.2 seconds.OFF, 0.4 seconds.ON) per Ringing Period for Ringer Pattern 0.

0/1 = Disabled/Enabled.

SYS3, Index 3, Bit 1: Three ringings (0.4 seconds-ON, 0.2 seconds-OFF, 0.8 seconds-ON, 0.2 seconds-OFF, 0.4 seconds-ON) per Ringing Period for Ringer Pattern 1.

0/1 = Disabled/Enabled.

SYS3, Index 3, Bit 5: Three ringings (0.4 seconds-ON, 0.2 seconds-OFF, 0.8 seconds-ON, 0.2 seconds-OFF, 0.4 seconds-ON) per Ringing Period for Ringer Pattern 5.

0/1 = Disabled/Enabled.

SYS3, Index 7: Duration of the Ring Cycle (Timer Value) for Ringer Pattern 5.

SYS3, Index 8: Duration of the Ring Cycle (Timer Value) for Ringer Pattern 6.

SYS3, Index 9: Duration of the Ring Cycle (Timer Value) for Ringer Pattern 7.

STEP 2: **ACID** - Assign the Calling Number for this service.

TYPE: 1

TN: Tenant Number

STN: Station Number

CID: Calling Number (maximum 28 digits)

SRV: 6 (Distinctive Ringing - Caller ID)

RGP: Ringer Pattern (0, 1, 5 - 7)

D-156 Dual Station Call

General Description

This feature allows a user to simultaneously call two Stations (referred to as a main station and sub-station), which are accommodated in two different Nodes within an FCCS Network, by dialing one Telephone Number of the main station. At that time, the call can be answered from either the Main or the sub-station. Additionally, when this service is used with BOSS - SECRETARY Service, the main station can forward a call automatically from a Secretary Station.

This service requires the data setting of FCCS. For more information on FCCS Data, see the Data Programming Manual - FCCS.

Operating Procedure

To activate this service

When DUAL STATION CALL is activated without BOSS - SECRETARY Service

1. To call two Desktop terminals from the Station:
   a.) Lift the handset.
   b.) Receive Dial Tone.
   c.) Dial the Telephone Number of a main station.
   d.) Main station and sub-station ring.
2. To pick up a call:
   a.) A Station answers the call.
   b.) The caller is connected with the Station which picked up the call (the other Station stops ringing).

Note: If the call is abandoned, both Desktop terminals stop ringing.

When DUAL STATION CALL is activated with BOSS - SECRETARY Service (B-MOVE Feature key is not set)

Station A ⟶ Main station (Boss Station)
Station B ⟶ Sub-station
Station C ⟶ Secretary Station which accommodates Sub Line to be assigned the main station's Number

1. To call two Desktop terminals from a Station:
   a.) Lift the handset.
   b.) Receive Dial Tone.
   c.) Dial Station A's Telephone Number.
   d.) Station A, Station B and Station C ring.
2. To pick up a call via Station C:
   a.) Station C answers the call.
   b.) The caller is connected with Station C.
   c.) Station A and Station B stop ringing.
   d.) Station C presses Station A's Line.
   e.) The caller hears MSC.
   f.) Station C calls Station A.

When DUAL STATION CALL is activated with the BOSS - SECRETARY Service (B-MOVE Feature key is set)

Station A ⟶ Main station (Boss Station)
Station B ⟶ Sub-station (the destination for the B-MV Feature key)
Station C ⟶ Secretary Station which accommodates Sub Line to be assigned the main station's Number

1. To call two Desktop terminals from a Station:
   a.) Lift the handset.
   b.) Receive Dial Tone.
   c.) Dial Station A's Telephone Number.
   d.) Station A, Station B and Station C ring.
2. To answer a call via Station C:
   a.) Station C answers.
   b.) The caller is connected with Station C.
   c.) Station A and Station B stop ringing.
   d.) Station C presses Station A's Line.
   e.) The caller hears MSC and Station C's user hears Ringback Tone.
   f.) Station C calls Station B as assigned Station A's destination for the B-MV Feature key. Station B rings.

Note: When Station B is busy, Station C hears Busy Tone. Station C can perform a switch hook flash to connect with the Calling Party again. This operation is the same as CONSULTATION HOLD - ALL CALLS [C-17].

Note: When a sub-station is programmed as BOSS Station, the current BOSS - SECRETARY Service is activated.

Note: When the destination for NUMBER SHARING is set by pressing the PS key, the Secretary Station cannot transfer a call to the sub-station.

To set/cancel the B-MV Feature key

1. To set the B-MV Feature key:
   a.) When a Desktop terminal is idle, press the B-MV Feature key.
   b.) Lamps of the B-MV Feature key accommodated in the main station and sub-station light. (When the PS key is assigned to the Desktop terminal, PS key lights also.) The LCD displays as shown below:

FORWARD SET

2. To cancel the B-MV Feature key:
   a.) Press the B-MV Feature key while the Desktop terminal is idle.
   b.) Lamps of the B-MV Feature key accommodated in the main station and sub-station go OFF. (When the PS key is assigned to the Desktop terminal, PS key also goes OFF.) The LCD displays as shown below:

FORWARD CANCEL

Service Conditions

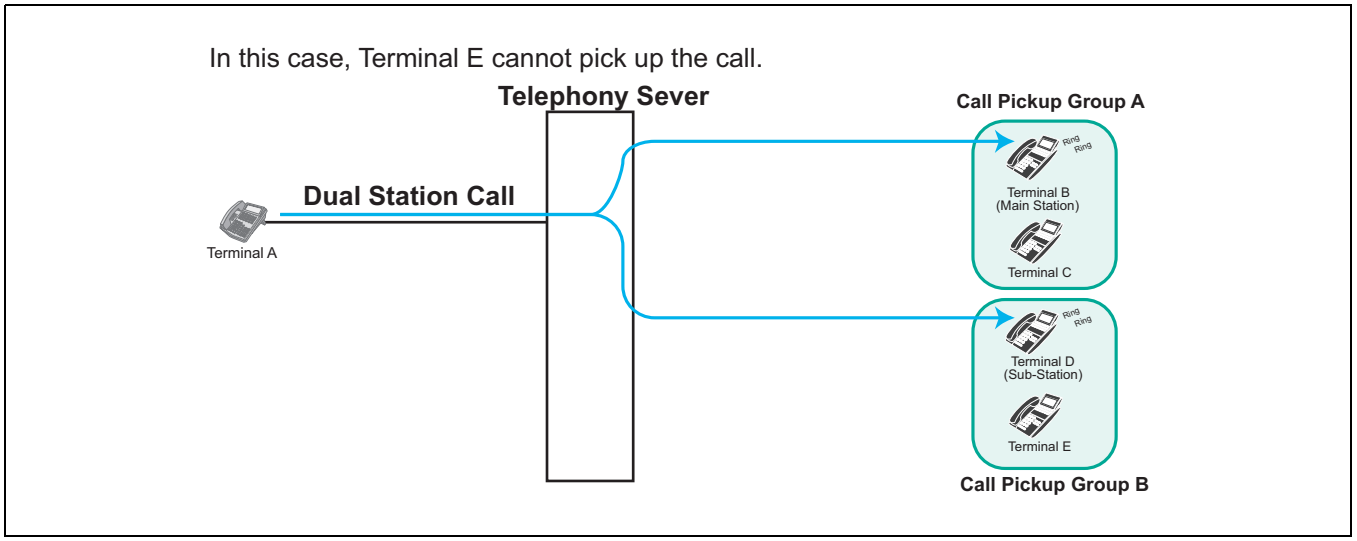
1. A Telephone Number must be assigned to main station and sub-station.
2. Only the Desktop terminal can be programmed as main station and sub-station.
3. When using ANSDN command, only stations within the FCCS Network can be assigned as main station and sub-station.
4. Main station or sub-station assignment cannot be duplicated for another pair.
5. Only one Telephone Number as sub-station can be assigned to a main station.
6. B-MV Feature key can only be set when the Station is idle.
7. The Calling Party's LCD will display the Telephone Number of a main station no matter which Station picks up the call. Also, when sub-station picks up a call from CCIS Line, the Telephone Number of the main station is sent to the Calling Party.
8. MESSAGE REMINDER [M-19] is available for the Terminating Station Service (all Stations).
9. MESSAGE WAITING Service set by the CMWL is available for the preassigned Station.
10. CALL BACK [C-1] is available for only the Station to be set CALL BACK.
11. This service is activated in a Hotel/Motel System, but not activated with Hotel/Motel Application Service.
12. When a sub-station is in communication, the Telephone Number of the sub-station is sent to OAI or MFC as Calling Number Notification.
13. When a sub-station is busy, a call terminates to the main station only. However, when a main station is busy, a call is not terminated to an idle sub-station.
14. When the Telephone Number of a sub-station is dialed, a call is terminated to the sub-station only.
15. When this Service is activated with BOSS - SECRETARY Service and a sub-station is assigned as a BOSS Station, the BOSS - SECRETARY service is activated as usual by pressing Boss's Line accommodated in Secretary Station's Sub Line.
16. When a sub-station is called through FCCS:
    - FLEXIBLE ROUTING - FCCS [F-35] is not available, even though all FCCS are busy.
    - If all Connection Trunks are busy when the sub-station tries to answer the call, the call cannot be established and Busy Tone is sent.

Interactions

1. When any of these services is set to a main station, the service has priority over DUAL STATION CALL:

CALL FORWARDING - BUSY LINE	[C-2]
CALL FORWARDING - ALL CALLS	[C-5]
DO NOT DISTURB	[D-11]

2. When CALL FORWARDING - DON'T ANSWER is set to a main station, it is activated depending on the time-out data programmed in the main station.
3. When CALL BLOCK is set to a main station, which is in the middle of being called for DUAL STATION CALL, CALL BLOCK has priority over this feature. (CALL BLOCK cannot be set to a sub-station while DUAL STATION CALL is activated.)
4. The LCD for My Line displays each Station's Telephone Number.



5. When a main station is assigned as a member of a UCD Group or a STATION HUNTING Group, the priority order of these services is shown in the table below:

Main Station		Controlling/Pilot Station		The Other Member Station	
B-MV Key		None	Set	None	Set
Group	Station Hunting-Pilot	1	1	1	2
	Station Hunting-Circular	1	1	1	2
	UCD	1	2	1	2

Legend:

1 = Both main station and sub-station are called (DUAL STATION CALL is activated).
2 = UCD/STATION HUNTING is activated.

6. When CALL FORWARDING-ALL CALLS/-BUSY LINE/-DON'T ANSWER is set to a sub-station:
   a.) DUAL STATION CALL is activated by dialing the main station's Telephone Number.
   b.) The services shown above are activated by dialing the sub-station's Telephone Number.
7. A Station cannot be used simultaneously for DUAL STATION CALL and NUMBER SHARING because the data of these services are used in common. For more detailed information on NUMBER SHARING, refer to the PCS Features and Specifications.
8. When a Calling Party sets VOICE CALL [V-2] or performs switch hook flash while calling a main station and sub-station, the sub-station stops ringing.
9. This service is not activated when a call is terminated via INTERCOM CALLING [I-9], AUTOMATIC/ MANUAL INTERCOM [A-30], DIAL INTERCOM [D-87] or MANUAL SIGNALING [M-47] (only the main station rings).
10. This service is not activated while CALL BACK [C-1], CALL BACK DELAYED [C-73], CALL BACK - CCIS [C-44], ATTENDANT CAMP-ON WITH TONE INDICATION [A-1] or ATTENDANT CAMP-ON WITH TONE INDICATION - CCIS [A-45] is activated.
11. When a Main or sub-station accommodates PS key and B-MV Feature key, both keys light by pressing any of these keys.
12. When DO NOT DISTURB [D-11] is set to a sub-station, the Incoming Call routed to a main station is terminated to the main station only.
13. When a sub-station is set CALL BLOCK [C-150], the Incoming Call routed to a main station terminates to both the main station and sub-station.
14. When DO NOT DISTURB [D-11] or CALL BLOCK [C-150] is set to a sub-station, the Incoming Call routed to the sub-station is restricted.
15. When a main station and sub-station belong to different Call Pickup - Groups, a Dual Station Call cannot be picked up from Terminal in Pickup Group that the sub-station belongs to. For details, refer to the following figure.

16. When a sub-station is called through FCCS, FLEXIBLE ROUTING - FCCS [F-35] is not available.
17. When a main station does not pick up a CALL FORWARDING - DON'T ANSWER Call within the pre-assigned time via System Data, the sub-station stops ringing.
18. The B-MV Feature key does not work on the SIP Handler Controlled SIP terminal.

Programming

STEP 1: **ASYDL** - SYS1, Index 513: Assign 01 (hexadecimal) as the LDM's Memory Block Number
SYS1, Index 514: Assign 01 (hexadecimal) as the NDM's Memory Block Number

STEP 2: **ANSDL/ANSDN** - Assign the related data of Dual Station Call.
MAIN UGN, MAIN TELN:
SUB UGN, SUB TELN:
OD: 0 = Only Main Telephone Number is used for SMDR and MCI Mailbox Number
1 = Both Main Telephone Number and Sub Telephone Number are used for SMDR and MCI Mailbox Number

Note: When OD = 0, the mailbox for the sub-station must be deleted.

MW (This data is available when OD = 0)
0 = Message Waiting Control for Main and Sub Telephone Numbers
1 = Message Waiting Control for Main Telephone Number only

Note: When the data value for MW changes from 0 to 1, make sure there are no messages left (MWL is OFF). If MWL is ON at that time, the old lamp indication stays after the data is changed.

LM: 0 = Number Sharing
1 = Dual Station Call

STEP 3: **AKYD** - Assign Sub Line Appearance on Secretary Telephone of main station and sub-station. Assign KYI 1 (Feature Key) and Feature key B-MV [127].

STEP 4: **ADSL** - Assign the Soft Key Pattern Data.
SN: 0
FKY: 127 (B-MV key)

STEP 5: **ADKS** - Assign the B-MV key to the Soft key of each Station. **Note 1**
TN (Tenant Number), STN (Station Number)
SKP (Soft Key Pattern):1~15
LKP (Key Pattern Data):
1 = 16 Line/Feature buttons + DSS keys
2 = 24 Line/Feature buttons + DSS keys
3 = ALL Line/Feature buttons
PG: 0 = Page change key appears on a software key(>>>)
1 = Page change key disappears on a software key

Note 1: When the Soft key data is used on a system basis (SKP = 0 is assigned by ADSL), this data is not necessary.

FCCS Programming

Refer to the Data Programming Manual - FCCS.

D-157 Dialed Number Primary Restriction

(Series 8400 software feature)

General Description

This feature provides the ability to block Dialed Numbers up to 24 digits long. This function is very similar to Primary Code Restriction via APCR. The main difference is that the number of restrictions has been expanded.

Operating Procedure

1. No special operating procedures are required by the Station user to activate this feature.
2. The user dials an Outside Number and is restricted or allowed based on the number dialed. The following are examples using this feature with the North American Numbering Plan:
   The number 1-800-444-2222 is a Toll Free Number that is answered and then transferred to a per minute charged number. The cost of this call can be from $1.00 to $25.00 per minute after the transfer is made. By use of this feature, the Telephony Server administrator could assign 918004442222 in ADNPRL to stop users from dialing the original Number.
   An Outgoing Call Center makes calls to numbers to solicit products and services to the public. If a person at 972-555-1234 requests not to be called by the Call Center any more, by law, they cannot call this number again for one year. If they do call the number again with in a one year time period, the Call Center may have a fine imposed upon them by the Federal Communications Commission.
   By using this feature, the Telephony Server administrator can assign 919725551234 in ADNPRL and stop calls from being made to the number.

Service Conditions

1. This service is based on the number dialed, not the number sent on the Trunk.
2. The Access Code is included in the number to be restricted.
3. This service is limited to a maximum of 24 digits.
4. ADNPRL cannot be used as an Allow Table to override any other restriction. It can only be used to restrict.
5. This feature only functions on Outgoing Calls to External Trunk Routes from Stations.
6. Station Numbers cannot be restricted using this service.
7. Tandem Calls cannot be restricted by this service, except RSC mate-check with CCIS.
8. This service can be used while a Station has a call on Consultation Hold, the RSC of the Transferring Party will be used in this case.

9. The following shows the Restriction Order of Tables checked:
   a.) The quantity of numbers that may be entered by this service is limited to the amount of available Local Data Memory. Currently there is 6 Mb of LDM available for use by all LDM features, DDMO may be used to calculate the amount of free LDM.
   b.) The Attendant Console is not affected by this service.
   c.) This service supports the use of Authorization Codes with the following limitations:
      - For this service to work with Authorization Codes, the code must be assigned as a Restriction Type 1 with a specific RSC and SFC assigned, the RSC value must be assigned a value between 1 and 15.
      - If Restriction Type 2 is used, calls using that Authorization Code will be restricted, based on any information assigned in ADNPRL, regardless of which RSC it is assigned to.
      - When restriction via OAI is required when using SCF 1, 3, 4, and 7, the Notify Field in the SCF message must be set to three or four, depending on the application. Please see the restriction for Class Error Service Feature Specification for more information on this service.
      - If the number 9972 is entered in to ADNPRL to be restricted for all SFCs, and 99725185555 is dialed, the call will be restricted (all calls beginning with 9972 will be restricted).
      - This feature is only supported when LCR routing is used. LCRS, OGC, OGCA, or other types of call routing are not supported with this feature.

Programming

STEP 1: **ADNPRL** - Assignment of Dialed Number Primary Restriction LDM. This command is used to assign and delete numbers to be restricted.

TN: Tenant

PDC: The number to be restricted

RSC: Route Restriction Class (0 - 15)

Because the ADNPRL Table is a Restrict Table, allowing all RSCs (RSC 0 ~ 15 = 1) tells the system to remove that entry from the table.

D-158 Digital Announcement Trunk Recording via Remote Access

(Series 8400 software feature)

General Description

This feature allows a user to record/playback an announcement on DAT via remote access to the System using an external Central Office Trunk. This is required by any user who needs to re-record or to replay (playback) DAT Announcements because of severe weather closure of Office/Call Center. This feature provides the following four functions:

- Recording/Playback by designating Route and Trunk
- Recording/Playback by designating Route
- Recording/Playback of an announcement for a UCD Group
- Recording/Playback of an announcement for ACD

Note: This feature is only available in North America.

1. Recording DAT via remote access:
   a.) The outside user dials the Remote Access Number to connect to the System. Receive Ringback Tone through Public Network.
   b.) If there is an Announcement Service, it will be heard. Receive Service Set Tone.
   c.) Dial the Authorization Code. Receive the Dial Tone.
   d.) Dial the DAT Recording Access Code. Receive Special Dial Tone.
   e.) For recording via Route and Trunk Number:
   Enter Route Number and Trunk Number. The Special Dial Tone stops.
   Or
   For recording via Route Number (all Trunks in Route are recorded):
   Enter Route Number and enter #. The Special Dial Tone stops.
   Or
   For recording via UCD Group:
   Enter * and enter the UCD Controlling Station Number. The Special Dial Tone stops.
   Or
   For recording via ACD Message Number:
   Enter # and enter the Message Number that has been assigned to ACD. The Special Dial Tone stops.
   f.) Receive Service Set Tone after completion of entry of the Route and Trunk Number, Route Number, UCD Group Number or ACD Message Number.

   Note: The Service Set Tone continues for three seconds.

   g.) Start your recording when the Service Set Tone stops.
   h.) The outside user releases the call to finish recording.
2. Playback DAT via remote access:
   a.) The outside user dials the Remote Access Number to connect to the System. Receive Ringback Tone through Public Network.
   b.) If there is an Announcement Service, it will be heard. Receive Service Set Tone.
   c.) Dial the Authorization Code. Receive the Dial Tone.

d.) Dial the DAT Playback Access Code. Receive Special Dial Tone.
e.) For playback by Route and Trunk Number
Enter Route Number and Trunk Number. The Special Dial Tone stops.
Or
For playback by Route Number:
Enter Route Number and enter #. The Special Dial Tone stops.
Or
For playback by UCD Group:
Enter * and enter the UCD Controlling Station Number. The Special Dial Tone stops.
Or
For playback by ACD Message Number:
Enter # and enter the Message Number that has been assigned to ACD. The Special Dial Tone stops.
f.) Enter Route Number and Trunk Number. The Special Dial Tone stops.
g.) A recorded message of the designated Trunk is automatically played back.
h.) The outside user releases the call to finish playback of the recorded message.

Service Conditions

1. The maximum values for RT, TK, and Message Number for ACD are:
   RT: 001 - 899
   TK: 001 - 255
   Message Number: 01 - 58
2. The maximum recording length is 60 seconds (30 seconds in the case of UCD).
3. This feature is not effective for Trunks currently being dubbed or that are placed in busy status.
4. When a RT, TK, UCD Controlling Station, or Message Number that has not been assigned is dialed, the caller will be connected to Reorder Tone.
5. When all DAT Trunks are busy, the outside user (via Incoming Trunk) will hear a Busy Tone after dialing RT/TK/UCD Controlling Station Number/ACD Message Number.
6. An outside user cannot record a message to an Announcement Trunk in which a recording/dubbing is being made.
7. When the system encounters a Busy Trunk in an attempt to make a dubbing of the message to the remaining Trunks, the Trunk is retried after a 16 second interval. Each Trunk is attempted a maximum of 16 times. If the final attempt is rejected because of busy, the system does not make a dubbing to the Trunk.
8. After completion of dialing RT/TK/UCD Controlling Station Number/ACD Message Number, the outside user hears Service Set Tone. In this instance, if the designated Trunk is making a dubbing or being dubbed, the dubbing is stopped. When the outside user goes on-hook during the Service Set Tone, the dubbing is also stopped.
9. A maximum of four TRKs can be simultaneously dubbed when recording is initiated by dialing RT Number or UCD Control Station Number or ACD Message Number.
10. When in Dubbing mode, the current message will override the previous message.
11. All TRKs in same RT will be dubbed by dialing RT Number without TRK Number.
12. All TRKs (assigned by AUAD) will be dubbed by dialing UCD Control Station Number.
13. All TRKs (assigned by AADT) will be dubbed by dialing ACD Message Number.
14. In the dubbing message processing, if the TRK being dubbed is not a DAT, it will try to dub the next assigned TRK after two seconds.
15. The TRK being used as the primary for dubbing is not available while recording to the other TRKs.

16. A message is recorded in the following sequence. As illustrated in the following figure, 1.5 seconds after the Service Set Tone and one second before releasing, messages are not recorded. This is to insure that no Service Set Tone or Reorder Tones are recorded.

17. Refer to the following table to obtain the approximate time for dubbing.

DUBBING TIME	NUMBER OF TRUNK					
	1	**10**	**15**	**20**	**63**	**1**
6 SECONDS	8	80	120	160	504	8n
16 SECONDS	18	180	270	360	1134	18 × 1
30 SECONDS	32	320	480	640	2016	32 × 1
46 SECONDS	48	480	720	960	3024	48 × 1
60 SECONDS	62	620	930	1240	3906	62 × 1

Note: The dubbing time is calculated by the following equation:
(Dubbing Time) = (Recording Time + 2 seconds) × (Number of Trunks)

18. When accessing the Remote Access DAT Recording feature, a 36-B System Message will output by way of the PCPro/system printer. The 36-B message is generated to the PCPro/system printer upon successful validation of an Authorization/Forced Account Code and a RT/TK, RT, ACD or UCD Access Code. The purpose of this System Message is to inform the technician/System Administrator that an External Trunk attempted to record or playback a message to or from a Digital Announcement Trunk. The 36-B System Message does not guarantee that the operation was successful, only that an access attempt was made. The message is an informational message only and will not generate a Top Unit Alarm.
19. The Remote Access DAT Recording feature will not generate or output an SMDR record.

Interactions

This section describes the interaction between this feature and MULTI CHANNEL RECORDING - DAT [M-48]. The functionality of this feature is exactly the same as that of the MULTI CHANNEL RECORDING - DAT [M-48]. The only difference between these two features is that the feature's originator is different. The originator of this feature is an Incoming Trunk (ICT), while the originator of MULTI CHANNEL RECORDING - DAT [M-48] is a Station.
In function, they will override each other. In short, the current message will override the previous message. For example, one DAT's Trunk was accessed and recorded with Message "A" by a Station using MULTI CHANNEL RECORDING - DAT [M-48]. After that, the same DAT's Trunk is accessed and recorded with Message "B" by an Incoming Trunk using Remote Access DAT Recording [D-158]. The result will be that the Message "B" will override Message "A". Message "B" is recorded on this DAT's Trunk. Basically whichever method is used to record the message last will be the message recorded.

System Message

Upon accessing Remote Access DAT Recording, a 36-B System Message will output by way of the PCPro/system printer. The message is an informational message only, and will not generate a Top Unit Alarm.

The following information is in the System Message

Route - Maximum of three digits (001 - 899)

Trunk - Maximum of three digits (001- 255)

ACD (AADT) Announcement Number - Maximum of three digits (000 - 058)

UCD Controlling Station Number (AUAD) - Maximum of five digits

Automatic Number Identification (ANI)/Calling Party Number (CPN) - Maximum 16 digits (Trunk must provide ANI/CPN)

Authorization Code/Forced Account Code - Maximum of ten digits

System Message details

1: Route + Trunk Number
2: Route Number only
3: ACD (AADT) Announcement Number
4: UCD Controlling Station Number (digit code entered in AUAD)
5: Authorization/Forced Account Code (digit code entered in AATC)
6: ANI/CPN Number [provided by the Incoming Trunk (ISDN, Caller ID, etc.)].

Programming

The following commands are used to set this feature in service. For this feature, the programming procedures are same as MULTI CHANNEL RECORDING - DAT [M-48]. Also, the Service Code Appendix (SSCA) and the Service Feature Restriction Class (SFC) are identical to that of MULTI CHANNEL RECORDING - DAT [M-48]. To use this feature, REMOTE ACCESS TO SYSTEM [R-2] and AUTHORIZATION CODE [A-20] both must be assigned.

Programming for MULTI CHANNEL RECORDING - DAT [M-48]

STEP 1: **ANPD** - Assign Number of Necessary Digits (NND) for the first digit of the Access Code of the DAT RECORDING/PLAYBACK.

STEP 2: **ASPA** - Assign Access Codes for the following Service Code Appendix (SSCA).
SRV "SSCA: Service Code Appendix"

SIDA 66 (Multi Channel Recording <REC>)
68 (Multi Channel Recording <RPY>)

STEP 3: **ASFC** - For this feature, Service Feature Restriction Data must be entered on a Service Feature Restriction Class (SFC) basis.
SFI 87 (Multi Channel Recording <REC>) and SFI 90 (Multi Channel Recording <REPLAY>)

STEP 4: **ARTD** - Assign Route Class Data for an Announcement Trunk.

Note: To change the data for existing route (RT), initialize the circuit card.

STEP 5: **ATRK** - Assign the Announcement Trunk Data.

STEP 6: **MBTK** - Assign the Make Idle Status to the Announcement Trunk.

STEP 7: **ASYD** - SYS1, Index 390, Bit 0=1 for Caller ID CPN to appear in System Message 36-C.

STEP 8: **MBTK** - Assign the Make Idle Status to the Announcement Trunk.

STEP 9: **ASYD** - SYS1, Index 390, Bit 0=1 for Caller ID CPN to appear in System Message 36-C.

To delete this feature, the steps are shown as follows

STEP 1: **ATRK** - Delete the Announcement Trunk Data.

STEP 2: **ARTD** - Delete Route Class Data for an Announcement Trunk.

STEP 3: **ASFC** - Delete Service Feature Restriction Class (SFC). For this feature, Service Feature Restriction Data must be entered on a SFC basis.
SFI 87 (Multi Channel Recording <REC>) and SFI 90 (Multi Channel Recording <REPLAY>)

STEP 4: **ASPA** - Delete Access Code for the following Service Code Appendix (SSCA).
SRV "SSCA: Service Code Appendix"
SIDA 66 (Multi Channel Recording <REC>)
68 (Multi Channel Recording <RPY>)

STEP 5: **ANPD** - Delete Number of Necessary Digits (NND) for the first digit of the Access Code of the DAT RECORDING/PLAYBACK.

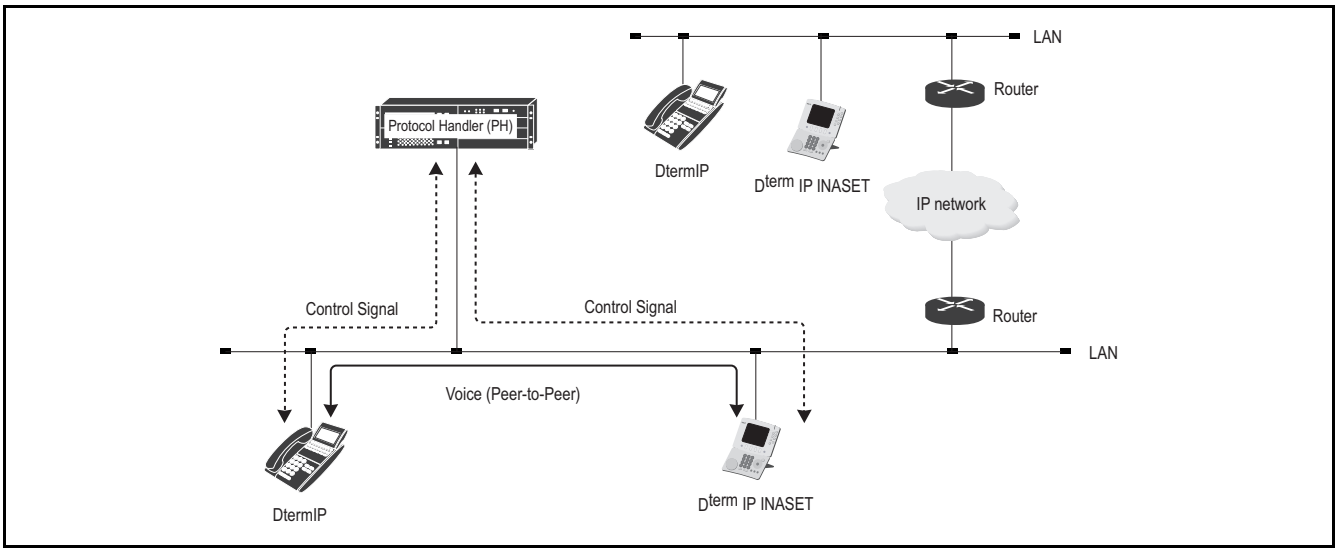
Programming for Remote Access to System [R-2]

This feature allows a user outside of the System to access the system via an Exchange Network Connection without Attendant or Station assistance. The outside user may originate calls over any or all System facilities.

Programming Conditions

Authorization [A-20] or Forced Account Code [F-7] must be used when Remote Access to System is used in conjunction with Remote Access DAT Recording. For additional Service Conditions see Programming for Remote Access to System [R-2].

STEP 1: **ASYD** - SYS1, Index 43, Bit 0 must =0 - Authorization or Forced Account Code required.



STEP 2: **AATC** - Assign Tenant Number (TN) and Digit Code (DC).
Authorization Code Restriction (ACR) must be 1.
The RSC entered must be allowed to the DAT Announcement Routes.
The SFC entered must be allowed SFI 87 (DAT Record) and/or SFI 90 (DAT Playback).
Only Service Feature Restriction Classes 1 - 15 are valid. SFC "0" is not valid.
For additional Programming Conditions see Programming for Remote Access to System [R-2].

D-159 DtermIP

General Description

This feature allows the system to use the Voice Over IP-capable telephone as a Station.
DtermIP and DtermIP INASET terminals have two LAN connectors (on the back panel) and the internal switching HUB. One of the LAN connectors may be used for the LAN and the other can be used for PC.

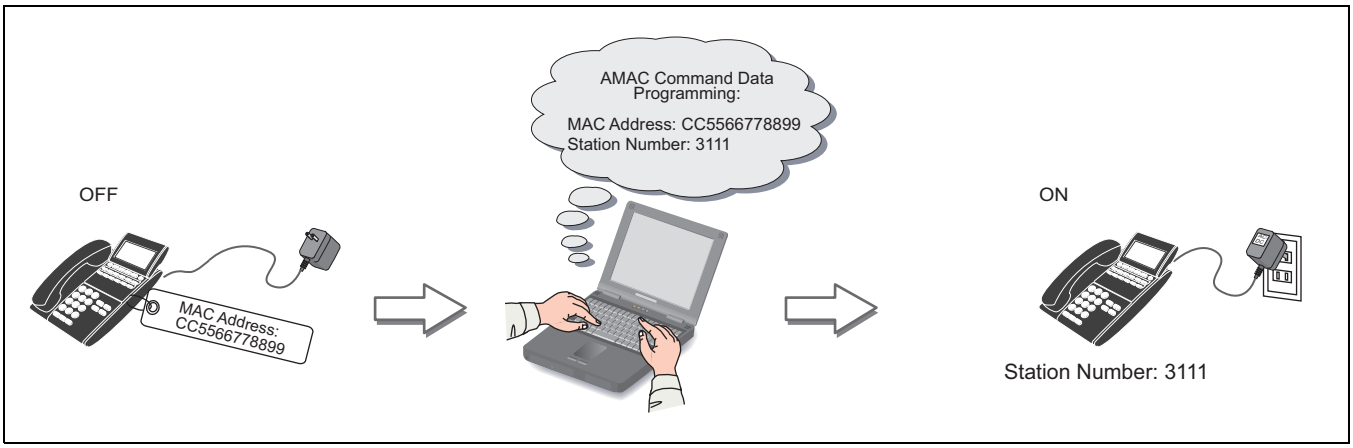
SP-PHD controls the registration of all the IP terminals and SIP Multiple Line terminals. For details on SIP Multiple Line terminal, see SIP MULTIPLE LINE OPERATION [S-160].

[DtermIP]

In addition to the existing Digital terminal features, web-based management can be performed on DtermIP, DtermIP INASET, IP Enabled Dterm, and Soft Phone (hereinafter called DtermIP in this feature).

DtermIP Operation Mode

DtermIP operates in one of the following two modes:



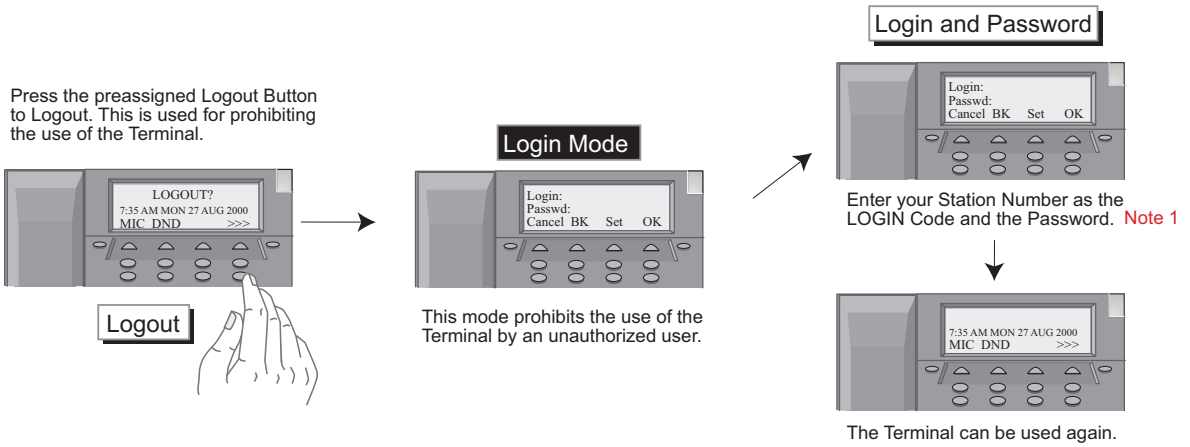
- MAC Authentication Mode
- Login Mode

MAC Authentication Mode

This mode enables each DtermIP to start up automatically, upon being connected to the LAN (with its power ON). Once this mode is set, the terminal does not require the “Login” operation by the terminal user. “Login” operation is necessary only when pressing the LOGOUT Feature key, in a temporary attempt to use the terminal as the one with a different Station Number. For example, assume that the user of IP Station 2000 is now in a distant location and tries to make a call from IP Station 2021. At this time, the user can use IP Station 2021 temporarily as Station 2000 by pressing the LOGOUT Feature key. When this key is pressed, a Login prompt appears on the LCD and the user can log in to the Terminal using the Station Number (2000).

Note: This mode is available as a result of “MAC Address Authentication” by the System. For this reason, be sure to assign the MAC Address Data of the DtermIP as well as its Station Number, SFC/RSC and others. For details on MAC Address Authentication, refer to “MAC Authentication” in this section.

MAC Authentication Mode

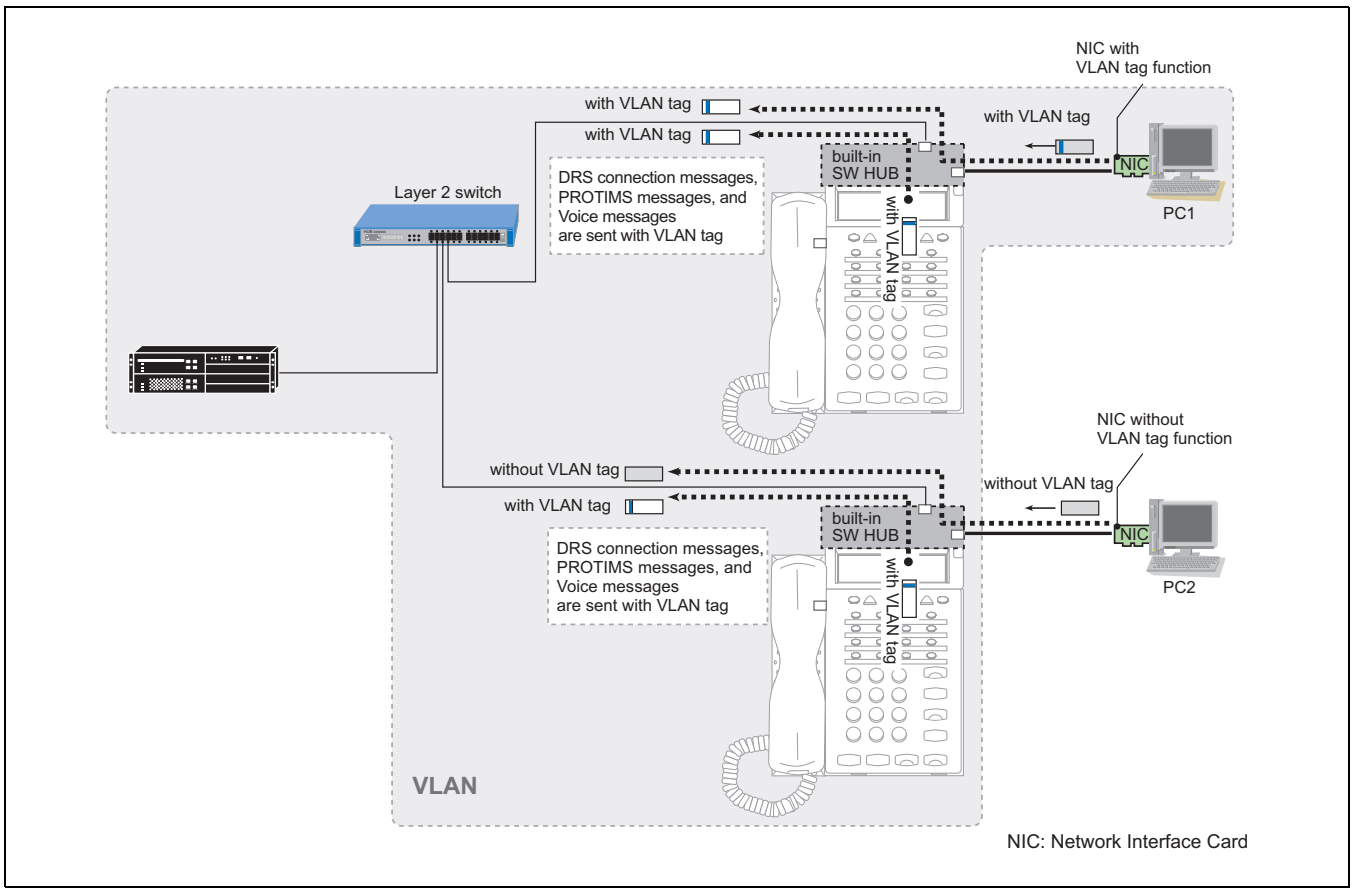


Note: Assignment of MAC address can also be registered from DtermIP. In this case, you don't need to assign the MAC address from PCPro in advance.

Login Mode

In this mode, DtermIP requests the user to enter “Login Code” and “Password” whenever the Terminal power is turned on. When the user enters the Login Code and the Password, the Terminal becomes operational as a Station with the number specified by Login Code. This mode is useful for the user to prohibit the use of the Terminal by unauthorized user while he or she is absent. When the user returns to the desk, the Terminal can be used again by entering the Login Code and Password.

Login Mode



Note 1: If an arbitrary number is assigned as Login Code by ALGCL/ALGCN command, enter the Login Code instead of the Station Number.

Tag VLAN for DtermIP

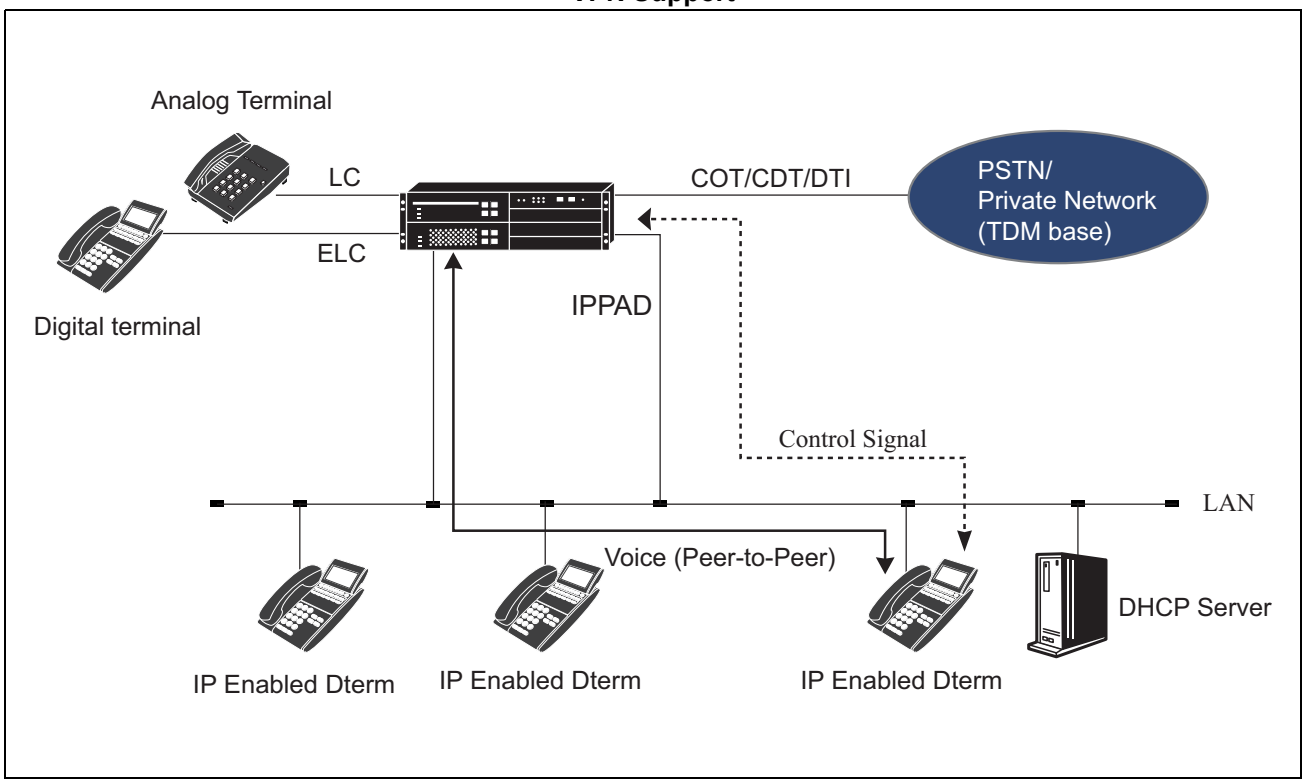
In the following example, DtermIPs and the System belong to the same VLAN. Each DtermIP embeds the VLAN tag in the frame with MAC Address, PROTIMS messages (PRW), Voice messages (RTP). A PC can be connected to an DtermIP using the PC port. To set VLAN tag to the MAC frames of the PC, a NIC Card having VLAN function is required on the PC. In this example, PC2, not having VLAN tag function, cannot set the VLAN tag.

VLAN for DtermIP

Built-In SW-HUB

The following shows a listing of function of Built-in SW HUB.

Function of Built-in SW HUB



Function		Remarks
Auto Negotiation	x	
10/100 BASE support	x	
Spanning Tree	-	
Remote Maintenance	-	
Port VLAN	-	
Tag VLAN	*	SW HUB passes through the MAC frames.
MAC VLAN	-	
GARP	-	
GMRP	-	
GVRP	-	

x: available
-: not available
*: available with condition

Virtual Private Network (VPN) Support

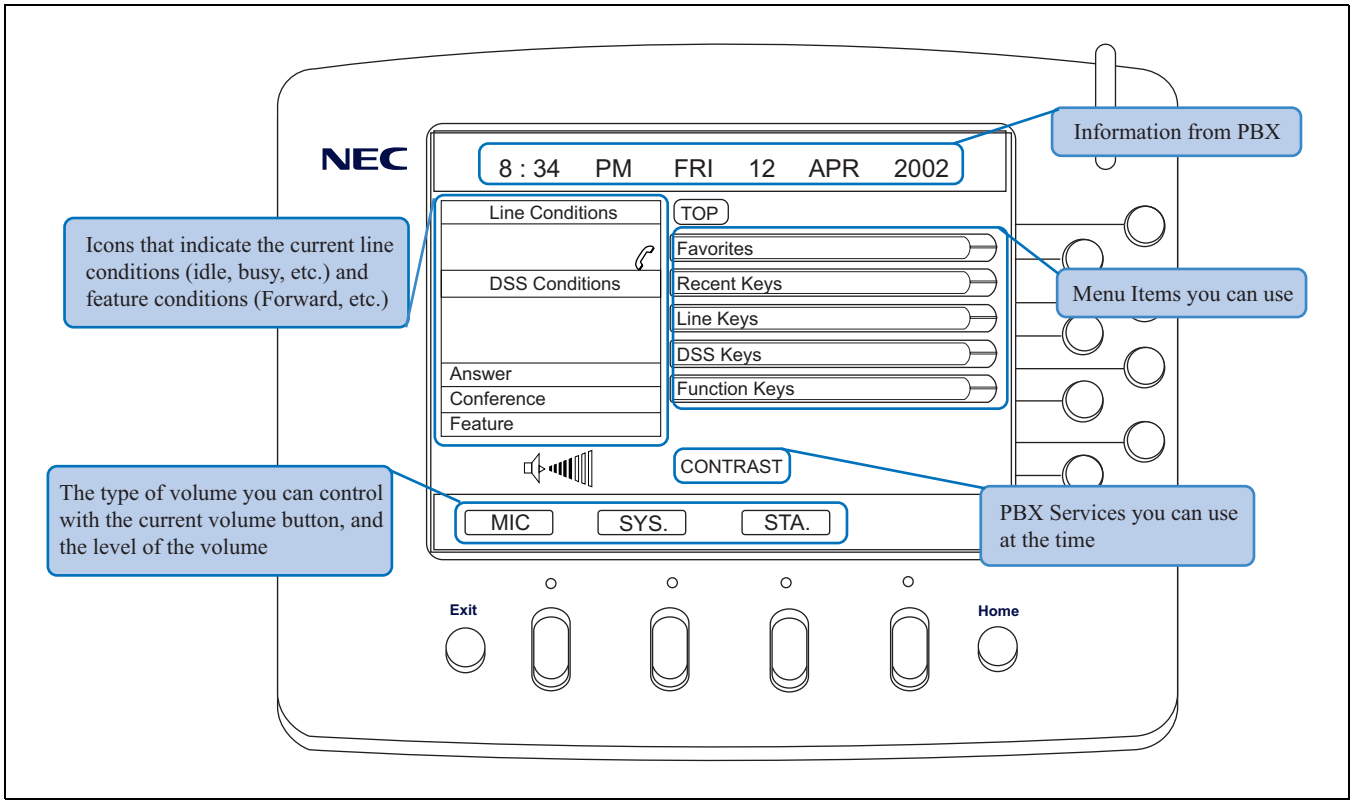
This feature allows the Telephony Server to notify private IP Address that is assigned by VPN server to the VPN client. Thus, the IP Telephone application can communicate with Station/Trunk accommodated in the Telephony Server. In the following example, a home PC uses the global IP Address that is temporarily given by ISP. When the PC user attempts to communicate with terminals accommodated in the Telephony Server, IP packets are sent and received through VPN tunnel. However, the IP Telephone Application cannot know the private IP Address assigned to the VPN tunnel by the VPN Server. By using this feature, the Telephony Server can notify the private IP address to the IP Telephone Application, accomplishing communications between IP telephone application and terminals accommodated in the Telephony Server.

VPN Support

Note: No Data Programming is required for this feature.

[DtermIP INASET]

DtermIP INASET enables you to perform the following three application features in addition to the DtermIP features.

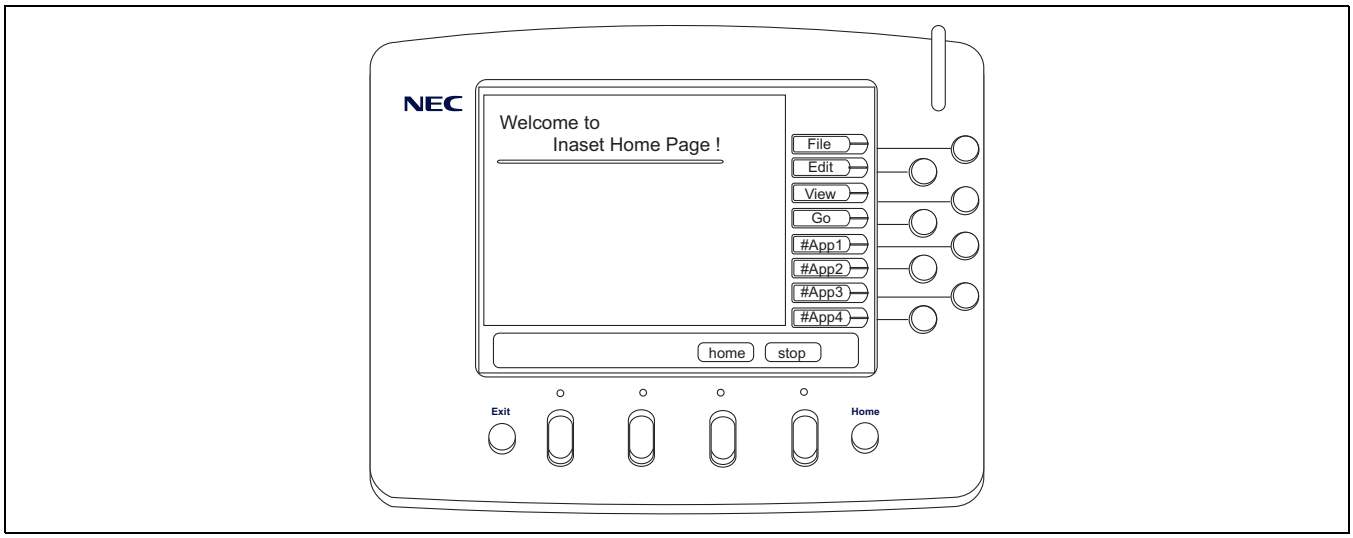


- Home Application
- Browser Application
- Directory Application

Home Application

The Home Application enables a user to perform operations of telephones, such as placing or receiving calls by much the same way as the conventional Dterm.

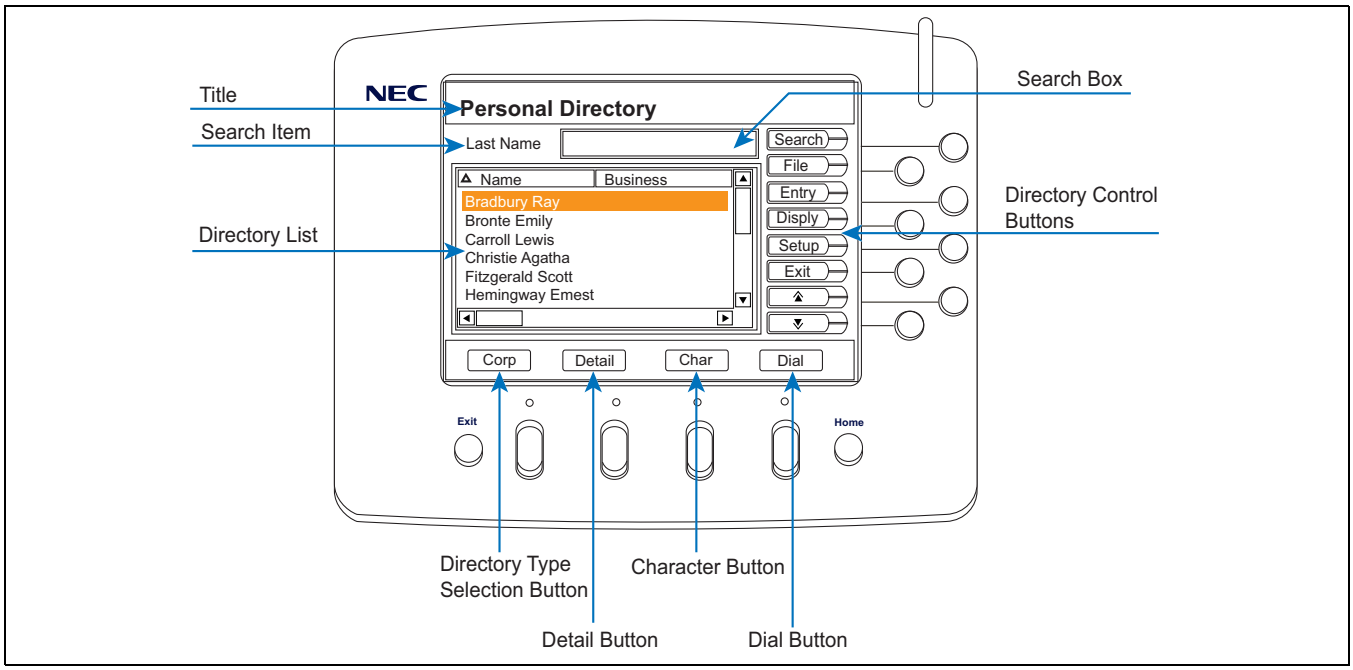
To give most of the same LCD displays as the conventional Dterm, the Home Application allows you to use the many functions supported by the conventional Dterm.



Home Application Window

Browser Application

The Browser Application enables a user to view the DtermIP INASET web page provided on the Internet. You can get various services by accessing the web page where you can find DtermIP INASET applets registered.

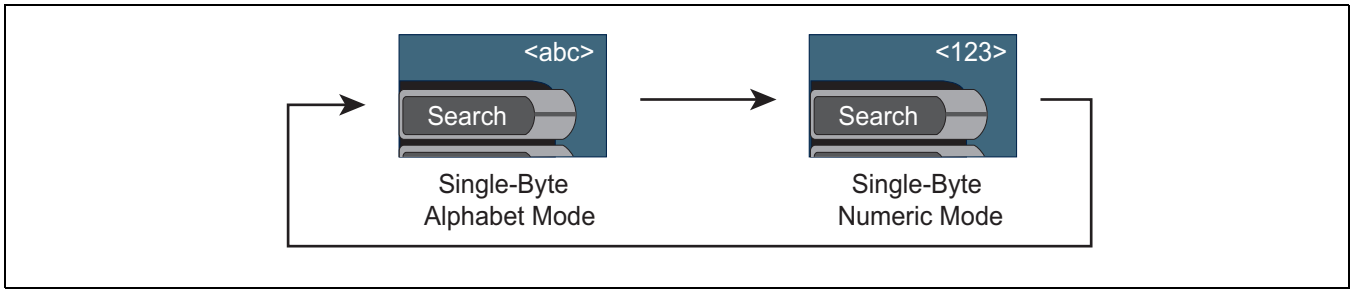


Browser Application Window

Directory Application

The Directory Application can search the registered directory data and originate a call based on the data. In addition, when a call is terminated, the Caller Name can be displayed on the screen (the Caller's Telephone Number and Name must be registered in advance).

Directory Application Window



Title
The title shows a directory type. Three directory types are available: Personal, Corporate and Group.

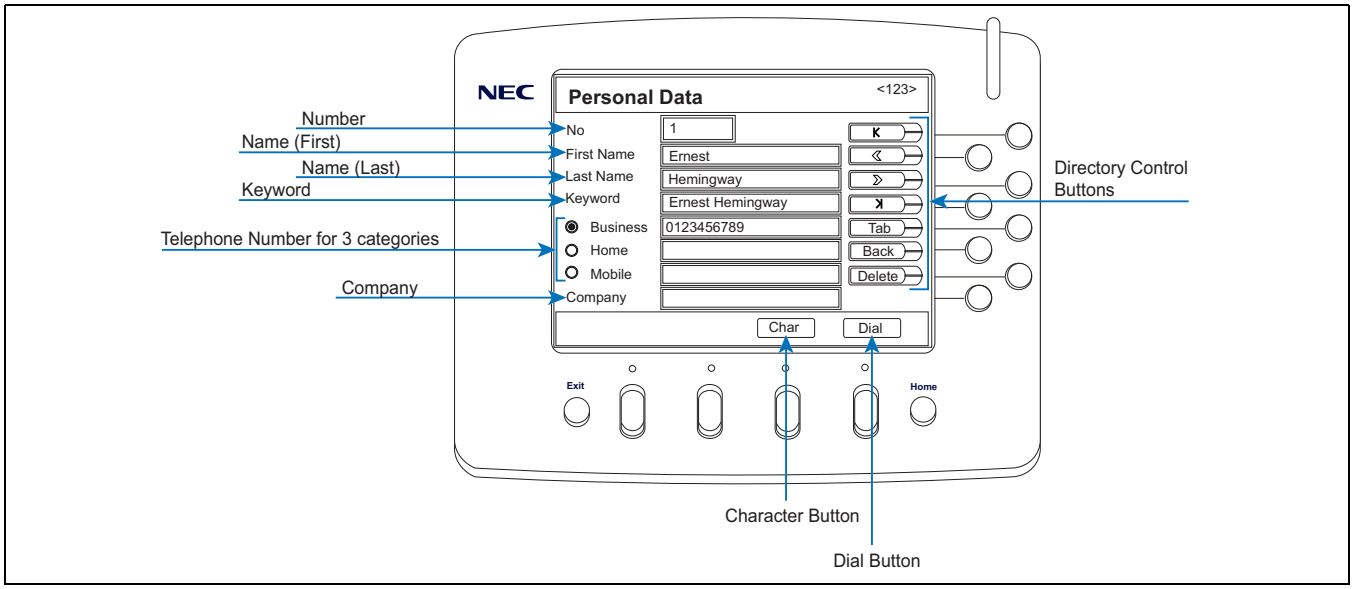
Search Item
When you search by entering a character in a search box, you can select the search condition. The three types of search conditions are keyword, Last Name and company.

Search Box
Enter characters here. The searching Target Data predetermined by the Search Item will be searched for in the Directory List, and the cursor will move to the piece of data where a forward match occurs.

Directory List
The Directory List is a quick reference list of the registered data. Each of the three types of directory lists allow registration of up to 200 items.

Character Entry Mode
The Character Entry Mode shows the type of characters that can now be entered in the directory data search mode. The type of characters that can be used in the search mode can be selected by the Character button. The character <123> indicates single-byte numeric characters, and <abc> indicates single-byte alphabet.
Each time you press the Character Button, the character types will change in the following sequence.

Directory Control Buttons
The Directory Control Buttons are used to perform eight different types of directory control procedures.



Directory Type Selector Button
Use the button to select a directory type. Each time you click the button, the directory types will change to Corporate to Group to Personal (when you start the procedure with the Personal Data List on the screen).

Detail Button
The Detail window of selected Directory Data will open. When you have selected two or more pieces of data, the details of the first piece of data will be displayed.

Character Button
The focus will move onto the Search Box, and control will enter the Directory Data Search mode. Each time you click the button, the Character Entry Mode will change to Single-Byte Numeric to Single-Byte Alphabet.

Dial Button
Click the button to place a call to the first selected piece of data on the Directory List without specifying a Line Number. When selecting a piece of Directory Data on the initial window shown above and clicking the Detail Button, the following Detail window will open.

Directory Application - Detail Window

No.
Shows a Directory Data Number. You can choose any number from 1 through 200.

Name (First)
Shows the first name of a person.

Name (Last)
Shows the last name of a person.

Keyword
Shows the keyword to use for data search.

Business, Home, Mobile
Shows registered directory numbers. You can register three directory numbers per person. You can place a call by selecting any of the radio buttons Business, Home, Mobile and then clicking the Dial button. You can change the item names Business, Home, Mobile to different names.

Company
Shows the name of the company to which a person belongs.

Directory Control Button
The Directory Control Buttons are used to perform seven different types of Directory Control Procedures for a detail window.

Add Button
Use the button to add the entered data to the Directory List. Use the button when registering a new piece of data.

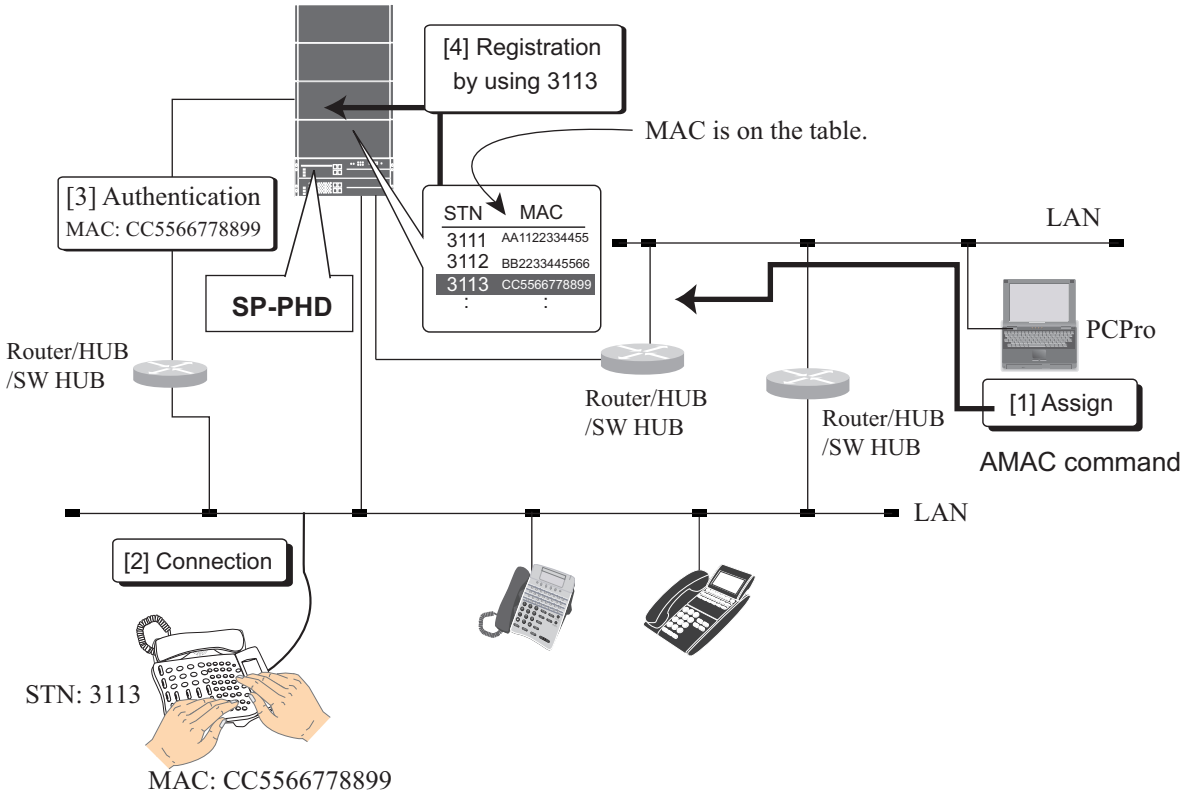
OK Button
Use the button to validate the entered data. Use the button when modifying data.

Character Button
Each time you click the button the Character Entry Mode will change. As in the Directory List Window, you can choose any of the two types of characters: Single-Byte Numeric, Single-Byte Alphabet.

Dial Button
Use the button to place a call to the selected Directory Number.

[Improved UMG System Durability]

For UMG system, IP terminals can be controlled even if the System Processor (SP) is down. This is accomplished by storing registry information in both SP and CMP.

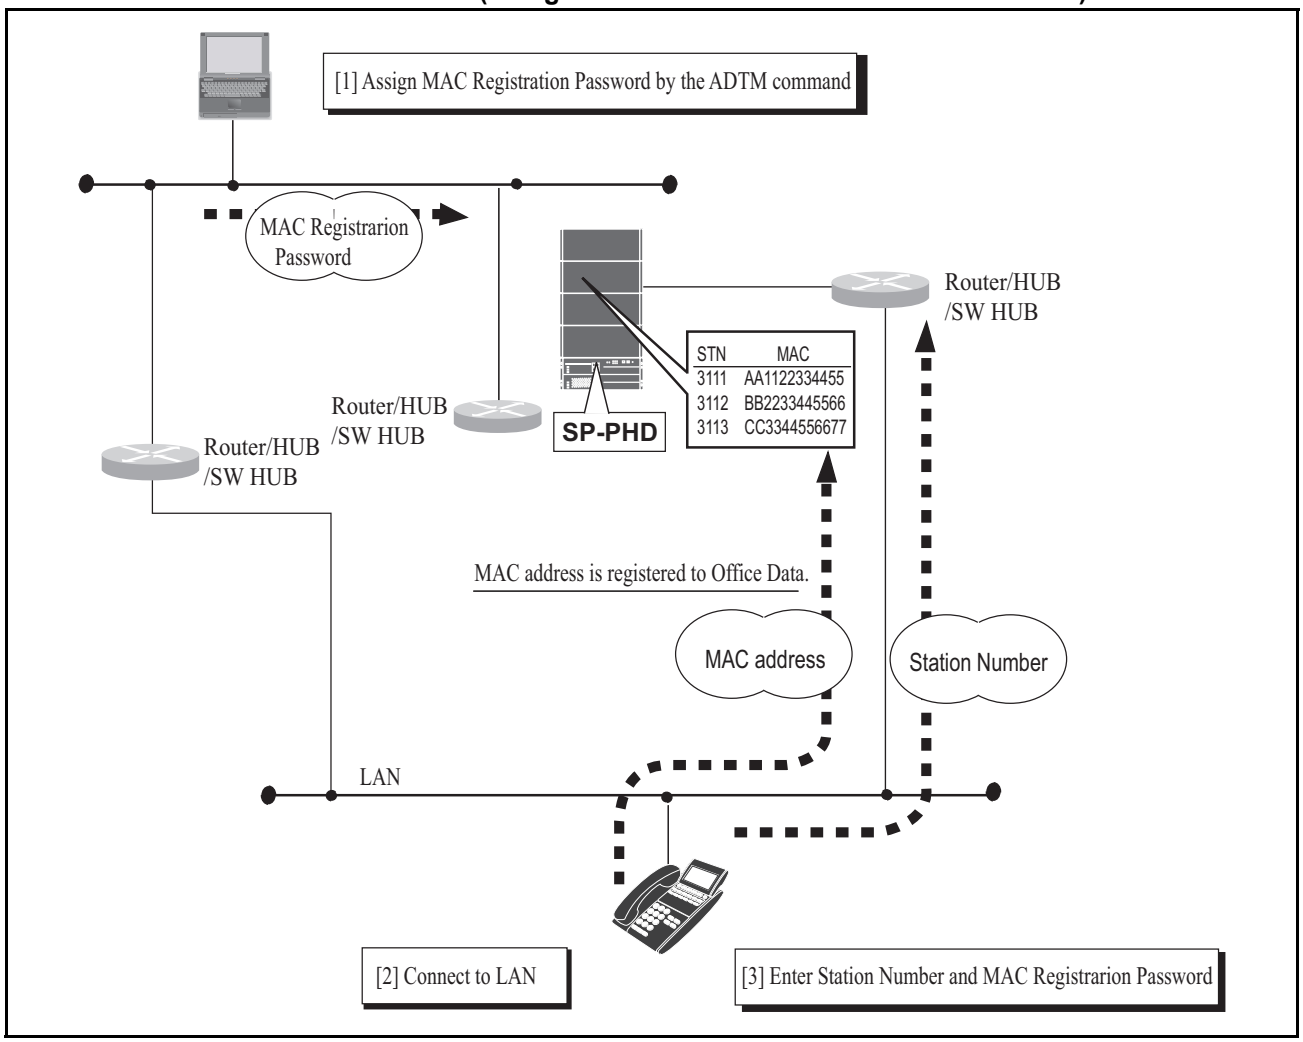


Operating Procedure

Note: Refer to the related User's Guide for the operation on each terminal.

<MAC Authentication>

This feature allows the system to perform authentication of DtermIP users by checking the MAC address of the terminal. Registration is accepted when the MAC address of the terminal has been assigned on the System. For this feature, Station Number and MAC address must be assigned in advance by using the PCPro command. By connecting the terminal to the LAN, the authorized user can log in to the system by the preassigned Station Number.



MAC Authentication (Assignment of MAC Address from PCPro)

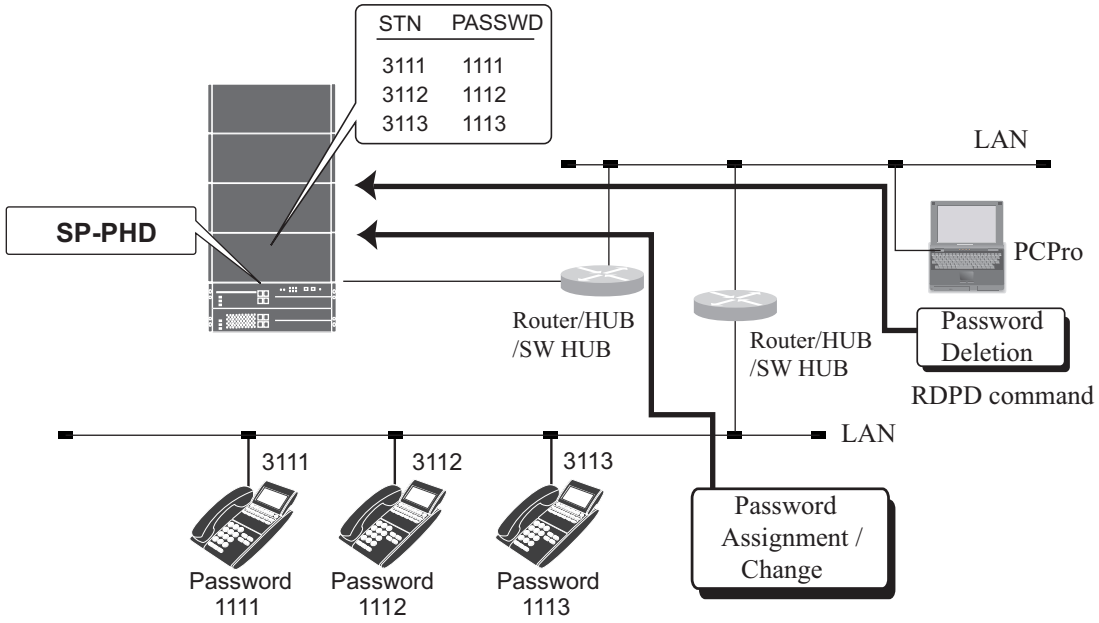
1. Assign the MAC address of the DtermIP and the Station Number by using AMAC command.
2. Connect the DtermIP to the LAN.
3. MAC authentication is automatically performed.
4. The DtermIP is registered by the assigned Station Number.

The MAC address can also be assigned from DtermIP when initially connecting the terminal to the LAN. By entering MAC Registration Password (pre-assigned by the ADTM command) from the terminal, the MAC address is automatically registered to the MGC Office Data. In this case, you need not assign MAC address from the PCPro (AMAC command) in advance. For information on how to register MAC address onto the Telephony Server data from the terminal, refer to the Peripheral Equipment Description (Multi-Line Telephone).

MAC Authentication (Assignment of the MAC Address from DtermIP)

Note: When you register MAC address from your DtermIP, MAC Registration Password must be assigned by ADTM command in advance. Once this assignment is performed, after that you don't need to assign any more.

1 Connect the DtermIP to the LAN: The packet (including MAC address) is sent to the System.
2 Enter Station Number and MAC Registration Password (pre-assigned by the ADTM command) from DtermIP.
3 MAC address and Station Number is registered to the Office Data: IP terminal becomes available status automatically with pre-assigned Station Number.



<Login>

This feature allows a user to log in to the system by using password stored in the Telephony Server memory. The password is assigned or changed from DtermIPs. To delete password PCPro is used.

Note: The password used by this feature is not for the line to be used, but for the terminal itself.

DtermIP Login Mode

Passwords set from DtermIPs are stored in the Telephony Server memory.

Service Conditions

1. SP-PHD can handle a maximum of 4000 DtermIPs.
2. Station Number can be composed of a maximum of 16-digit numerics including "*", "#".
3. DtermIP cannot be accommodated in Group 24 or larger Group.
4. DtermIP controlled by SP-PHD can be used on any point of LAN (Intranet). However, restrictions related to LENS is also applied to DtermIP as Dterm. (i.e. Multi Line)
5. Be sure to initialize the SP-PHD after assigning the IP data by using the ALIDL command
6. DtermIP can be allocated to the LENS (physical LENS) of vacant slot on which the Station/Trunk is not mounted. (IP Station cannot be assigned to the already registered Station in duplicate.) IP Stations can also be allocated to the virtual-LENS in addition to the physical LENS.

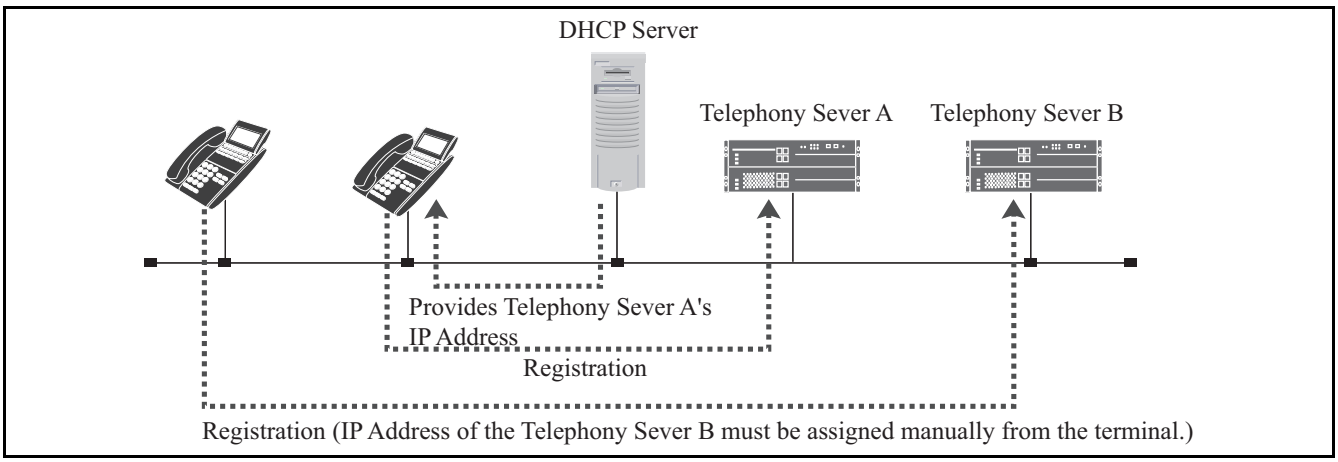
7. DtermIPs with duplicate Station Number cannot operate in a system. When attempting "Registration" (**Note 1**) using the Station Number that is already used, "Override?" indication appears on the overriding DtermIP LCD, and then the user can determine whether to override the existing Station or not (use the different Station Number). The overridden DtermIP becomes inoperative.
"Override" function can be performed under the following conditions.

   - This function is available between IP terminals.
   - DtermIP cannot use the Station Number that is already used by other IP Stations connected to the Analog MC.
   - Stations connected to the Analog MC cannot use this function.

   Note 1: "Registration" is the function that supports the establishment of control signal (IP Packet) path between DtermIP and the System, the information such as IP address of each device must be notified each other.

8. The default number of UDP port used for Registration by MGC is "3456." When changing this port number by the ADTM command, the existing data settings of DtermIP must be modified.

9. By installing a Registration Proxy server on the network having multiple System(s), the Registration Proxy server can handle the Registration Requests from DtermIPs on the network, as a substitute for the System(s).



10. When SP-PHD is reset while in operation, MGC sends Software Reset Packet to IP terminals connected to the SP-PHD. At this time, the terminals that are reset can re-perform Registration to the MGC which would hunt the other SP-PHD available for the terminals.

11. When the System is initialized, all the IP terminals must re-perform Registration.

12. When communication between IP terminals and PH (Protocol Handler) is released while in operation, communication failure notification is provided under the following conditions.

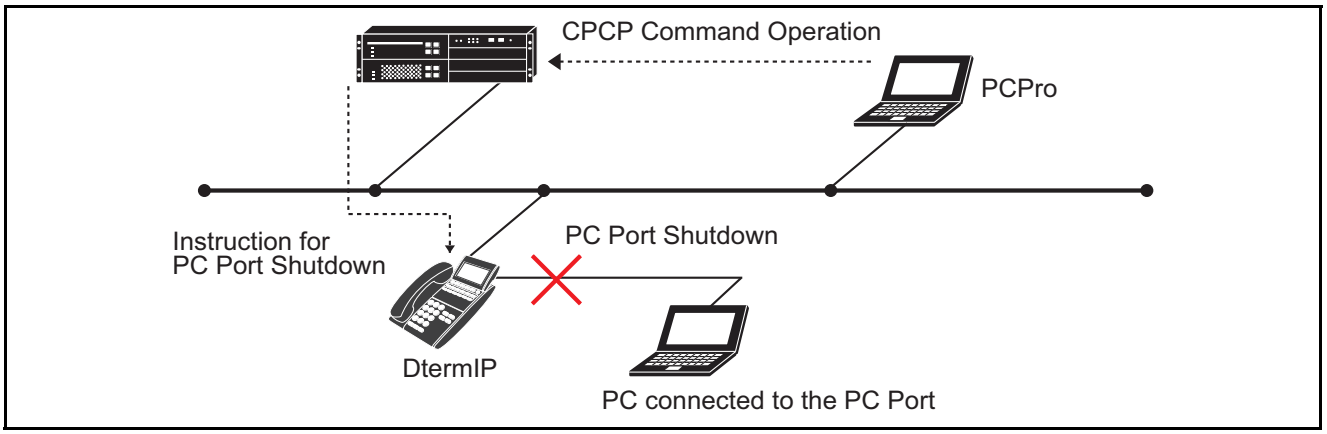
    - When the communication failure is detected by PH side, the System stores the fault information received from PH for a certain period of time, and then notifies the fault information to PCPro if required.
    - When the communication failure is detected by IP terminals, the fault notification packet is sent to the Telephony Server from IP terminals, and then the Telephony Server stores the information received from IP terminals for a certain period of time and notifies the fault information to PCPro if required.

13. When multiple Telephony Server(s) exist on the same LAN, the DtermIP can select a target Telephony Server of the registration per a terminal basis, by setting the each IP address of the target System.
For System having DHCP server: For IP addresses of the target Telephony Server(s) not to be assigned at the DHCP Server, they must be assigned manually from each DtermIP.

14. IP Stations can also be allocated to the virtual-LENS in addition to the physical LENS. The virtual-LENS requires no Physical PIM (Port Interface Module). Consequently, the system can accommodate a maximum number of the IP Stations (*For 1-IMG/4-IMG system: Max. 4,000 IP Stations. For UMGi system: Max. 16,000 IP Stations.*) with a minimum of hardware configuration. For more details, refer to the Virtual PIR Data section in Chapter 2 of this manual.

15. The Health Check function can be provided for the IP terminals (such as DtermIP, DtermIP INASET, Soft Phone, etc.) controlled by the SP-PHD. By providing the Health Check, the system can monitor the state of the IP terminals in real-time and figure out the cause of failure immediately. The cycle of periodic Health Check can be determined by the System Data, ASYDL, SYS1, Index 959 (see the Programming section).

16. If the data of your IP terminal is changed by AKYD command while your line is busy, the new data is passed to your terminal when your line is released.



17. If you change the data of AKYD/ADKS command, re-login operation (Login and Password) is not necessary.

18. First, Registration Request is sent to the same network. If the available internal PH/SP-PH are not found (or can not be connected), it will be transferred to another network. In the case of Analog MC, it will be registered to internal PHE.

19. The maintenance personnel can disconnect/connect the PC port of DtermIP from/to the network by using the CPCP command. For example, this feature allows the maintenance personnel to quickly disconnect the PC (that is connected the PC port of DtermIP) from the network when virus is detected on the network. For details, see "IP Device PC Port Remote Control" in Operations and Maintenance Guide.

Note: Available firmware version is as follows:
Dterm Series i: Ver. 3.06 or later
DtermIP (Proprietary Protocol): Ver. 3.08 or later

Note: Condition only for DtermIP (Proprietary Protocol):
PC Port setting of this feature is canceled when DtermIPs (Proprietary Protocol) perform Registration. Therefore, DtermIPs (Proprietary Protocol) needs to be placed in "PC Port shutdown" status (by the CPCP command) after each Registration process.

20. When an IP terminal is in a make busy state with the MBST command, if there is a network failure between the Telephony Server and the IP terminal, even if you try to put the IP terminal in a make idle state with the MBST command after the network is restored, the IP terminal continues being in a make busy state. To disable the make busy state, restart the IP terminal by turning manually OFF then ON again.

<Conditions for MAC Authentication mode>

1. You can use Mac Authentication mode with a DtermIP that has a MAC address.

2. MAC address data is assigned per DtermIP by the AMAC command. MAC address data can also be assigned from each DtermIP.

3. A single Station Number can be shared among multiple MAC addresses. However, the DtermIP that came on-line last, is the terminal that will be operative. Multiple DtermIP Stations assigned to the same Station Number cannot be simultaneously used.

4. When DtermIPs to which no AMAC command data is assigned are connected to the LAN, the DtermIPs start up in Login Mode.

5. The following conditions must be considered when MAC address data is assigned from DtermIP.
   a.) MAC Registration Password is pre-assigned by the ADTM command.
   b.) When you assign MAC address from DtermIP, you can use Physical Station Number (STN) only. Telephone Number (TELN) cannot be used as your Station Number. When you want to allocate a Telephone Number with your MAC address, use the AMAC command. You can use either Physical Station Number (STN) or Telephone Number (TELN) when assigning Station Number through this feature. In a FCCS network, you cannot use Telephone Numbers allocated to Stations of the nodes other than the node to which your DtermIP registers.
   c.) If you would delete a MAC address that has already assigned, use the AMAC command. Enter the MAC Address and then press the DELETE key.
   d.) By pressing the LOGOUT Feature key, DtermIP operating in MAC Authentication mode can be forcibly changed to “Login Mode” and requests the user to enter “Login Code” and “Password.” At this time, when the user does not enter the Login code (Station Number) and password within 10 minutes, the DtermIP is automatically returned to the MAC Authentication mode.
   e.) Confirmation of Station Number, MAC address and date and hour that is registered could be performed by ADTM command (Option - Retrieve Information - Log Information). To save Log Information on PCPro, you should select “Save to disc"”.
   f.) A single Station Number can be shared among multiple MAC addresses, but only one IP terminal

is available at the same time. If terminal (A) connects to the LAN when terminal (B) is already connected to the LAN with the same Station Number as terminal (A), terminal (A) would be displayed “Override?” If user of terminal (A) presses the “Yes” key, terminal (A) becomes available status, and terminal (B) becomes not available status. Terminal (B) would display the message “Override” in 90 seconds.

g.) If the DtermIP MAC Address Registration Password (assigned in the ADTM command), is the same as the Password used by a terminal for Login Mode, the Login Mode will take precedence and the station cannot use this feature.

h.) If you attempt to register an incorrect Station Number, you couldn't register MAC address to the Office Data. Your DtermIP would display the message “Unauthorized”.

i.) When the number of digits for the Station Number is greater than the number of digits for the password, MAC address needs to be assigned by the AMAC command.

6. If you change the following data settings, delete the AMAC command data for the corresponding Station Numbers.

   - IP station data (AISTL data) for stations whose Physical Station Number is associated with AMAC is deleted by AISTL command.
   - Telephone Number data (ALGSL/ALGSN data) for stations whose Telephone Number is associated with AMAC is deleted.
   - Physical Station Numbers or Telephone Numbers associated with AMAC are reassigned to stations other than DtermIPs.
   - Telephone Numbers associated with AMAC are reassigned to stations of the nodes other than the node having the AMAC data.

   Note: You need to delete the MAC address data assigned from DtermIP as in the case of AMAC command data.

7. When Physical Station Number Calling Restriction [P-87] is activated by the system data (ASYDL/ASYDN, SYS1, Index 1144, Bit 0=1), only login with a Telephone Number is available.

8. Do not use Mac Authentication mode with a Soft Phone.

<Conditions for Login mode>

1. Login can be restricted per a Service Feature Restriction Class (SFC) basis by assigning "1" to SFI186 (IP Enabled Dterm Login).
2. This feature is available for DtermIPs.
3. If terminals other than DtermIP attempt this feature (dials "DtermIP Password Entry" Access Code):
   Analog Telephone: Receive ROT
   Dterm: Receive ROT with "RST" indication on the LCD
4. When attempting Login for the first time, use the Station Number as the password. Then the password can be newly assigned/modified by dialing "Password Entry" Access Code (refer to "New Password Assignment" in Peripheral Equipment Description (Multi-Line Telephone)).

   Note: If an arbitrary number is assigned as Login Code by the ALGCL/ALGCN command, enter registered Login Code instead of Station Number for a password.

5. The number of digits that can be used as a password is 4 through 10. The maximum number of digits is determined by the AMND command.
6. Password can be deleted from the Telephony Server memory only by using the RDPD command.
7. Password is not displayed or listed up on the PCPro display.
8. Backup copies of assigned password is created on the hard disk by using the MEM_HDD command Data Type: Call Forwarding from PCPro or by routine diagnosis.
9. While setting or changing password "6-sec timer" is automatically set for the 1st digit. If the timer expires, the password setting becomes NG with "ERROR" indication on the LCD with BT.
10. While setting or changing password, if the inter-digit timer expires, the password setting becomes NG with "ERROR" indication on the LCD with BT.
11. Available digits for password are: 0 - 9, # and *.
12. Password set from the DtermIP is not displayed on the LCD. (The LCD indicates the input password as "*****".)
13. When the system is initialized without loading the Office Data, the passwords before the System Initialization are effective.
14. When the system is initialized with loading the Office Data, the passwords stored on the hard disk become effective. If passwords are changed in between "Office Data Backup Completion" and "System Initialization with loading the Office Data," the previous passwords become effective.
15. In order to keep the password (the password entered by the DtermIP) secret, the encrypted password will be sent to the System from the DtermIP (operating in Login mode). The password to be sent to the System is encrypted with MD5 algorithm as default. The algorithm can be changed to Proprietary Protocol by assigning the System Data (ASYDL, SYS1, Index 848, Bit 7).
16. When Physical Station Number Calling Restriction [P-87] is activated by the system data (ASYDL/ASYDN, SYS1, Index 1144, Bit 0=1), only login with a Telephone Number is available.

<Conditions for DtermIP INASET>

1. This feature provides Peer-to-Peer Connection.
2. A Tag VLAN-capable Two-port Switching HUB is embedded in the DtermIP INASET.
3. Available Voice Compression Types for DtermIP INASET are G.711, G.729a and G.723.1.
4. DtermIP INASET can be powered through the AC Adapter, Local Power Supply and the Power Feeding Patch Panel (SN1604PWEMS), or Center Power Supply.
5. Each of three types of directory lists (Personal, Corporate and Group), allows registration of up to 200 Telephone Numbers. The Directory Lists can be created in Comma Separated Value (CSV) format on the FTP Server. This CSV file can be shared between more than one DtermIP INASET Operator by downloading the file from each Terminal.
6. All Digital terminal features except [I-21] INTERNAL ZONE PAGING are available for DtermIP INASET.
7. Using DtermIP INASET in MAC Authentication Mode is recommended.

<Conditions for Improved UMGi/RNIP System Durability>

1. While the CCN is down, the system does not accept any registration. When an IP terminal logs out, it cannot log in again while the CCN is down.
2. IP terminals that have been registered before the CCN failure can continue to be serviceable.
3. If any SPEED CALLING - ONE TOUCH -D [S-26D] data is set after a RN changes to survival mode, the data will be used. However, when the RN reverts normal mode, also the data will revert to its original settings in normal mode.

Note: For the conditions other than above, refer to UMGi Configuration and Maintenance Guide.

<Conditions for Improved UMG System Durability>

1. While SP is down, the system does not accept any registration. When an IP terminal logs out, it cannot log in again while the SP is down.
2. IP terminals that have been registered before SP failure can continue to be serviceable.
3. If any SPEED CALLING - ONE TOUCH data has been set during SP failure, the data can be used temporarily. When the terminal performs registration again, however, the data will return to the original data.
4. When the failed SP recovers, it does not accept any registration until it completes loading registry information from the CMP. The loading takes a few seconds. On completion of the loading, registration will be resumed.

Interactions

The passwords used for this feature are shared with [P-57] PAD LOCK. The following shows conditions related to PAD LOCK.

1. When PAD Lock ID Code has been assigned before performing password entry for this feature, use the already assigned password for this feature.
2. After performing PAD Lock ID Code assignment, if the password is changed by this feature, the changed password takes effective.
3. After performing password entry by this feature, if PAD Lock ID code is set, the assigned password becomes effective.

4. After canceling PAD Lock ID Code, the PAD Lock becomes ineffective. However, the password is valid.
5. The following shows the relationship between memory status and the commands.

command / memory status	DtermIP Login Function			PAD LOCK		
	Assign/ Change	Delete		Assign/ Change	Delete	
		DtermIP	PCPro		DtermIP	PCPro
Not Assigned	PASSWD only assigned	-	NG	PASSWD + RSC + SFC	receives BT	NG
PASSWD	PASSWD changed	-	all deleted	PASSWD + RSC + SFC	receives BT	all deleted
PASSWD + RSC + SFC	PASSWD only changed	-	all deleted	PASSWD + RSC + SFC	RSC + SFC only deleted	all deleted

Programming

This section describes the necessary data assignments for MAC Authentication mode and Login/Logout mode. The following must be assigned in addition to the basic Station data, the basic Desktop terminal data, and the basic IP Station data. For the assignment of Station Accommodation Data for the DtermIP, AISTL command (for IP Station) must be used instead of ASDT command (for the conventional Station) command.

- For the basic Station data, see the Assignment of Station Data section in Chapter 2.
- For the basic Desktop terminal data, see the Assignment of Desktop Terminal Station Data section in Chapter 2.
- For the basic IP Station data, see the IP Station Data section in Chapter 2.

Note: For the assignment of the Configuration data, refer to Peripheral Equipment Description (IP Devices).

<Data Assignment - MAC Authentication>

STEP 1: **ASYDL** - SYS1, Index 811: Tone Code by countries. For more details, see Command Manual.

STEP 2: **AMAC** - Assign MAC address associated with each Station Number assigned in AISTL command.

MAC ADDRESS:Enter the fixed MAC Address of each DtermIP terminal in Hexadecimal notation.
TYPE: Select either “STN” or “TELN”.
When TYPE=STN is selected:
TN: Tenant Number
STN: Enter Station Number associated with MAC address assigned in the MAC ADDRESS parameter.
When TYPE=TLEN is selected:
UGN: User Group Number
TELN: Enter Telephone Number associated with MAC address assigned in the MAC ADDRESS parameter.

Note: If this data is assigned, the DtermIP operates in MAC Authentication mode. If not, it operates in Login mode. This data is not required when MAC address is assigned from each terminal.

STEP 3: **ADTM** - Assign MAC Registration Password when you assign MAC address from DtermIP.

Option -DtermIP MAC Address Registration Password
Password: Enter the Password to assign MAC Registration Password.
Confirmation input: Enter the Password again.

<Data Assignment - Login/Logout>

STEP 1: **ASYD** - SYS1, Index 93, Bit 6. Are the AMND tables Separate or Common for tenant in the system. Assign data "0" (= Separate).

STEP 2: **ASYDL** - SYS1, Index 848, Bit 0 to Bit 3 Output the system message (36-E) when the password entered from the DtermIP is invalid. **Note 1**

0: System message is not output.
1-15: The System will generate a system message if login failed consecutively and the number of failure read has to this.

Note 1: For SIP Multiple Line terminal, the system message (36-E) is not output even though a wrong password is entered in the terminal.

STEP 3: Assign the following data related to the Registration Password Encryption function, by using either ASYDL or ADTM command.

(In the case of ASYDL command)
SYS1, Index 848, Bit 7=0 (Registration Password Encryption Function (0 = MD5))

(In the case of ADTM command)
Password Encryption: Select either of the algorithms for Password Encryption

- MD5 (default)
- Proprietary (NEC Standard Procedure)

STEP 4: **ANPD** - Reserve a Number Level for DtermIP Password Entry.

TN: Tenant Number
1stDC: 1st Digit Code
CI: Select Normal Service from the combo box for Connection Indexes.
NND: Number of Necessary Digits
BLF: 0 (Out of Service)

STEP 5: **ASPA** - Assign the Access Code for DtermIP password entry.

TN: Tenant Number
ACC: Access Code
CI: "N: Normal"
SRV: "SSCA: Service Code Appendix", SIDA = 123 (DtermIP Password Entry)

STEP 6: **ASFC** - Restrict DtermIP LOGIN.

SFC: Service Feature Restriction Class
SFI: 186 (DtermIP LOGIN)
RES: 0 (Allowed)/1 (Restricted)

STEP 7: **AMND** - Assign the MND data for the passwords.

TN: 0
DC: Destination Code (Assign the 1st digit of all passwords.)
MND: Maximum Necessary Digits (Assign the MND of passwords.)

STEP 8: **AKYD** - Assign the key data of DtermIP.

FKY 142 = LOGOUT (for DtermIP)

STEP 9: **ADSL/ADKS** - Assign the Software key data of DtermIP.

FKY 142 = LOGOUT (for DtermIP)

D-162 Distinctive Ringing List

(Series 8800 software feature)

General Description

This feature allows a Station the ability to set 16 individual CPNs in bins, up to 16 digits each. These numbers will then ring the station with a Distinctive Ringing Pattern.

Note: This feature is available in North America only.

Operating Procedure

To set a Distinctive Ringing List entry by Bin Number

1. Lift the handset and dial the Distinctive Ringing List (DRL) Feature Set Access Code.
2. Receive Stutter Dial Tone.
3. Dial the individual Bin Number 00-15.
4. Dial the exact digits to distinctively ring (a maximum of 16 digits).
5. Wait for Service Set Tone.
6. Replace the handset.

To remove a Distinctive Ringing List entry by Bin Number

1. Lift the handset and dial the Distinctive Ringing List (DRL) SET Code.
2. Dial the individual Bin Number 00-15.
3. Wait for Service Set Tone.
4. Replace the handset.

Service Conditions

1. This feature can only be set/canceled by an individual station using the appropriate Access Code.
2. The PCPro command DDRL will only display the list, it cannot modify it.
3. Individual Call Block can only be used if the incoming Station/Trunk supplies a Calling Party Identification Number.
4. When the System is initialized with data memory load, the Distinctive Ringing List (DRL) feature will be in the last state saved to the System hard drive.
5. This feature is only available for stations with Service Feature Restrictions Released (SFI 191 = 1).
6. This feature is not available for BRI or Wireless Terminals even if Individual Call Block Service Feature Restriction Class SFI 165 is allowed.
7. This feature can be used with any trunk or station supplying a valid Calling Party Number Identification to the System (Caller ID/ISDN or MF).
8. This feature is not supported in a Hotel/Motel system.
9. ASYD, SYS1, Index 160, Bit 0 and Bit 1 must=0.

Programming

STEP 1: **ASFC** - Assign a Service Feature Restriction Class to allow DR LIST for stations. SFI 191 RES = 1 to release restriction.

STEP 2: **ANPD/ANPDL/ANPDN** - Assign a number level for Individual Call Block.

STEP 3: **ASPA/ASPAL/ASPAN** - Assign the following Access Codes for CI = “N: Normal”
Distinctive Ringing List - Set/Cancel - SRV = “SSCA: Service Code Appendix”, SIDA = 133.

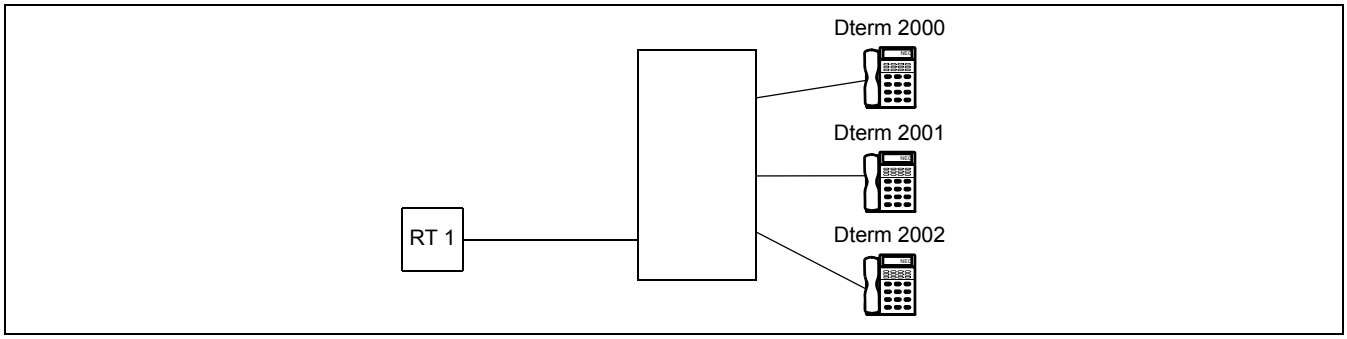
To delete

The deletion procedure is the reverse order of assigning the feature.

D-163 Distinctive Ringing for Toll Calls

(Series 8500 software feature)

General Description



This feature allows Incoming Calls from outside of a defined Local Area to ring with Ringer Pattern 5, while Incoming Calls from the defined Local Area will ring with Ringer Pattern 1.

Note: This feature is only available in North America.

Operating Procedure

There will be no change in the Operating Procedure for the user.
Example of operation:

1. The ALCAL command has the area codes 972 and 214 defined as local.
2. Station 2000 is assigned to SFC 1 and SFC 1 has new SFI = 1.
3. RT 1 is a PRI with CPN data.
4. ASYD, SYS3, Index 1 is set to 42 (4 on/2 off) (Ringer Pattern 1).
5. ASYD, SYS3, Index 7 is set to 73 (7 on/3 off) (Ringer Pattern 5).

6. Station 2000 receives a call from CPN 972-555-1234, the call rings with Ringer Pattern 1.
7. Station 2000 receives a call from CPN 316-555-5678, the call rings with Ringer Pattern 5.

Service Conditions

1. This service is only active for Incoming Calls on PRI, Feature Group DMF, and Analog Caller ID, and Trunks when at least ten digits of CPN are provided.
2. If no CPN is provided, or not enough digits are provided, the call will ring as it normally would have.
3. This feature is mutually exclusive with Personal Ringer Service (SFI 148). If both features are on, Personal Ringer Service will have priority.
4. This feature cannot be used with Distinctive Ring on Phantom Extensions.
5. Call Back, Recall and other features may also use Ringer Pattern 5.
6. After the Ringer Timers are changed in system data 3, the line package must be reset before the new Ringer Timers will go in to effect.
7. A maximum of 16 Area Codes per TN can be assigned as Local in ALCAL.

8. This service is available on Incoming Calls that are Tandem from CCIS, as long as the requirements in #3 are met. CI in ARTD of the CCIS Route must be set to receive more than eight digits on CCIS Tandem Calls.
9. To split this command data by TN, use ASYD, SYS1, Index 93, Bit 0.
10. To split this command data by Day/Night, use ASYD, SYS1, Index 75, Bit 1.
11. This feature is not supported in a Hotel/Motel system.
12. ASYD, SYS1, Index 160, Bit 0 and Bit 1 must=0 for this feature to operate.

Programming

To assign

STEP 1: **ASYD** - Assignment of System Data. SYS3, Index 1 must be set for Ringer Pattern 1. SYS3, Index 7 must be set for Ringer Pattern 5.

STEP 2: **ASFC** - Assignment of Service Feature Restriction Class.

TN: X
SFC: X
SFI: SFI 190 (Distinctive Ringing for Toll Calls) must be set to "1" for this service to be in effect.

STEP 3: **ALCAL** - Assignment of Local Calling Area for LDM.

DN: Day/Night
TN: Tenant
Local Area Codes: 0-15
Assign Local Codes up to 16 entries.

To delete

STEP 1: **ALCAL** - Assignment of Local Calling Area for LDM.

DN: Day/Night
TN: Tenant
Local Area Codes: 0-15
Delete this data.

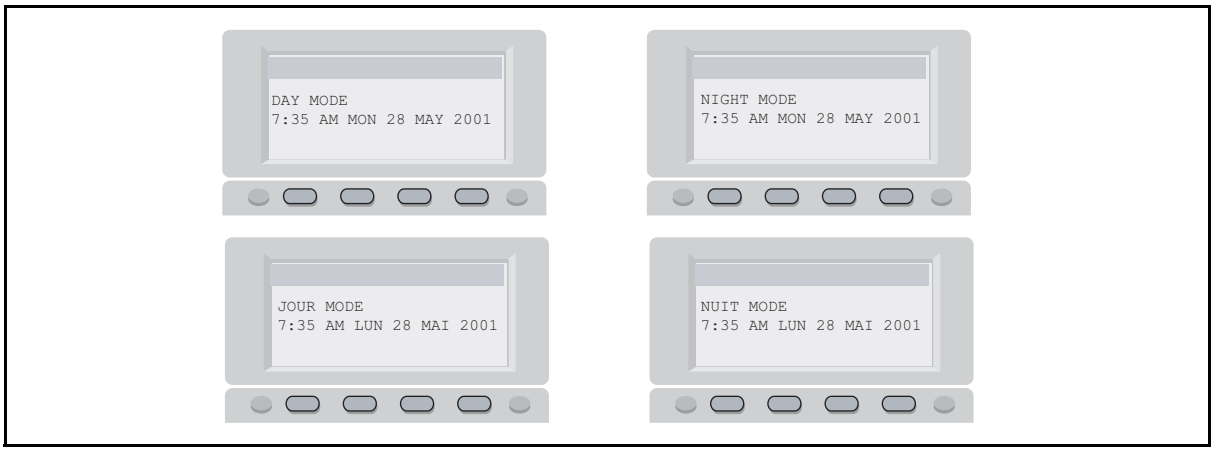
STEP 2: **ASFC** - Assignment of Service Feature Restriction Class.

TN: X
SFC: X
SFI: SFI 190 (Distinctive Ringing for Toll Calls) must be set to "0" for this service to be removed.

STEP 3: **ASYD** - Assignment of System Data. SYS3, Index 1 must be set for Ringer Pattern 1. SYS3, Index 7 must be set for Ringer Pattern 5. Set to Normal data.

D-164D Day-Night Mode Status -D

General Description



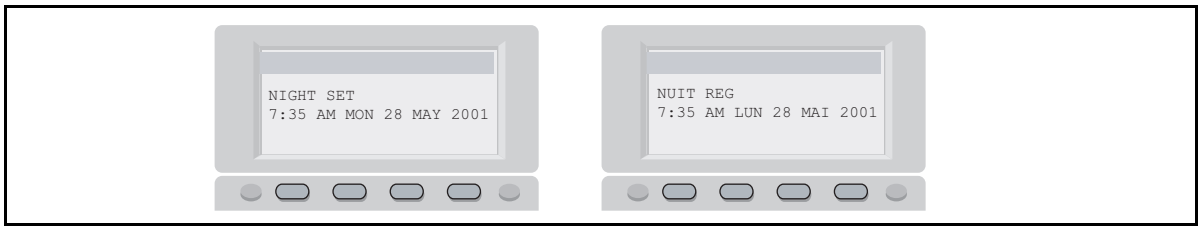
This feature allows a Desktop terminal the ability to display the current System status and change the System into Day or Night using either the "*" or "#" key.

Note: This feature is available only in North America.

Operating Procedure

Day/Night Mode Status Display on LCD of Desktop Terminal
(Not effected by ASFC)

1. Lift the handset or press the SPEAKER key. Receive Dial Tone.
2. Press the DAY/NIGHT MODE Feature key. Receive the Service Set Tone.
3. Display the current Day/Night status of the System.
4. Place handset in cradle or press the SPEAKER key.



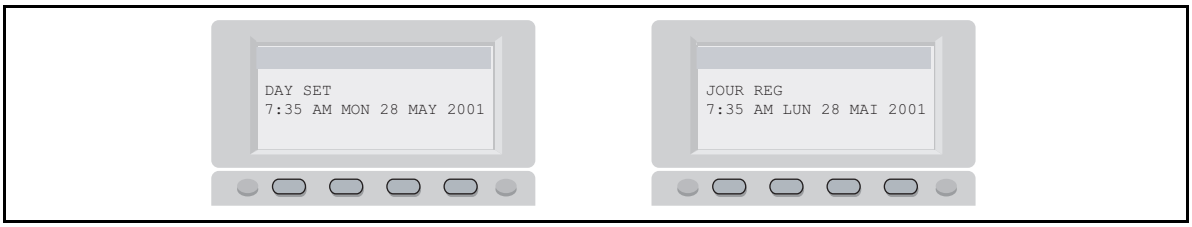
Day/Night Mode Status Display on LED of DAY/NIGHT MODE Feature key
(Not effected by ASFC/ASFCN)

The LED lamp status of DAY/NIGHT MODE Feature key on Desktop terminal indicates the day/night mode status as follows.

LED Status	Day/Night Mode Status
Turned OFF	Day Mode
Lights red	Night Mode

Change from Day mode to Night mode from Desktop terminal
(Effected by ASFC)

1. Lift the handset or press the SPEAKER key. Receive Dial Tone.
2. Press the DAY/NIGHT MODE Feature key. Receive burst Special Dial Tone.
3. Display the current Day/Night status of the System.
4. Dial "#" to set Night mode. Receive the Service Set Tone.
5. Place handset in cradle or press the SPEAKER key.



Change from Night mode to Day mode from Desktop terminal
(Effected by ASFC)

1. Lift the handset or press the SPEAKER key. Receive Dial Tone.
2. Press the DAY/NIGHT MODE Feature key. Receive burst Special Dial Tone.
3. Display the current Day/Night status of the System.
4. Dial "*" to set Day mode. Receive the Service Set Tone.
5. Place handset in cradle or press the SPEAKER key.

This feature is restricted or not available

1. Lift the handset or press the SPEAKER key. Receive Dial Tone.
2. Press the DAY/NIGHT MODE Feature key. Receive the Reorder Tone.

Service Conditions

1. This feature is available for the following Desktop terminals.
   - Digital terminal
   - IP terminal (Proprietary Protocol/SIP)
   - Soft Phone (Proprietary Protocol/SIP)
2. This feature is controlled by Service Feature Restriction Class and available by assigning the DAY/NIGHT MODE Feature key (FKY = 153) and Service Feature Index 214 unrestricted (SFI 214 = 1).

   Note: The day/night mode status display on the LCD of Desktop terminal is available when "0" is assigned to SFI 214 as well.

3. Any Desktop terminal Line appearance may be used to perform the day/night status change. However, only the Tenant of the Desktop terminals My Line will be effected. (For example, a Tenant 3 Line appearance on a Tenant 1 Desktop terminal can not change day/night mode of Tenant 3, only Tenant 1).
4. The DAY/NIGHT MODE Feature key LED will never light during display, setting or completion of this feature, therefore the Desktop terminal key LED does not indicate the DAY or NIGHT mode status.
5. This feature will not update the Night Status Lamp on the ATTCON/DESKCON.
6. ATTCON/DESKCON PCB is provided:
   a.) TAS service is available as per system programming.
   b.) If the DESKCON circuit card is reset, the day/night mode will be determined by switch settings on the PCB (For details, refer to the Circuit Card Description).
   c.) In case of a System system reset, the day/night mode will be determined by the switch settings on the DESKCON PCB (For details, refer to the Circuit Card Description).
   d.) When a ATTCON terminal is provided and the ATTCON circuit card is reset the day/night condition of the System will be determined by the position of the ATTCON terminal Night Key.
7. DESKCON(s) or ATTCON(s) terminal provided:
   a.) In the case of a night to day status change via this feature, the Deskcon(s) will not have incoming call indication when the night LED is illuminated on the terminal(s).
8. ATTCON or DESKCON PCB is not provided:
   a.) TAS service is not available.
   b.) In the event of system initialization the Telephony Server will be in Night mode.
9. For changing of DAY-NIGHT MODE STATUS -D Special Dial Tone is fixed to burst tone.
10. This feature can control the day/night mode of the same tenant in remote nodes as specified in programming for a FCCS network.
11. This feature can control the day/night mode of remote nodes as specified in programming for a CCIS network.
12. This feature setting is not available in consultation hold condition.
13. In the case of DAY-NIGHT MODE STATUS -D [D-164D] in a non-controlling node of a FCCS network, the local System can change day/night status. However if the network is controlled by a master day/night node the local System will change day/night status as per FCCS programming.
14. For CCIS network DAY-NIGHT MODE STATUS -D [D-164D] can be assigned however, if the network is controlled by a master day/night node the local System will change day/night status as per [C-56] Centralized Day/Night Mode Change - CCIS.

15. Night Attendant Console [(NATT) ATRK = 915] can not be used in conjunction with DAY-NIGHT MODE STATUS -D [D-164D]. These features are mutually exclusive.
16. DAY-NIGHT MODE STATUS -D [D-164D] can not be used with an External key Unit (NCU). These features are mutually exclusive.
17. DAY-NIGHT MODE STATUS -D [D-164D] will output a 17-H informational System Message as per System Data programming. (see System Message 17-H below for details).
18. The DAY/NIGHT MODE Feature key cannot be assigned as a Soft key.

Interactions

1. Refer to the Service Conditions and Programming pertaining to the following features:
    - ATTENDANT NIGHT TRANSFER [A-19]
    - CENTRALIZED DAY/NIGHT MODE CHANGE - CCIS [C-56]
    - DAY NIGHT CLASS OF SERVICE [D-15]
    - LDN NIGHT CONNECTION [L-28]
    - LDN NIGHT CONNECTION - CCIS [L-29]
    - LDN NIGHT CONNECTION OUTSIDE [L-30]
    - NIGHT CONNECTION - FIXED [N-1]
    - NIGHT CONNECTION - FLEXIBLE [N-2]
    - NIGHT CONNECTION - FIXED - CCIS [N-15]
    - NIGHT CONNECTION - FLEXIBLE - CCIS [N-16]
    - NIGHT CONNECTION OUTSIDE - SYSTEM [N-17]

Programming

STEP 1: **ASFC** - Assign to the Dterm telephone a Service Feature Restriction Class that allows SFI 214. Data must be "1".

Note: The day/night mode status display on the LCD of Desktop terminal is available when "0" is assigned to SFI 214 as well.

STEP 2: **AKYD** - Assign DAY-NIGHT Mode STATUS -D to a Line/Feature key. Assign KYI =1, FKY = 153.

STEP 3: **ASYD** - SYS1, Index 229, Bit 3. 17-H System Message output of Day/Night Change: 0/1= Out of service/In service

STEP 4: **ASYDL** - SYS1, Index 1131, Bit 0=1. The current day/night mode LED status of day/night mode: 0/1=Out of service/In service

(FCCS Programming)

STEP 1: **ASYDL** - SYS1, Index 640. Assign Fusion Point Code of Day/Night Controlling Node (1-255).

SYS1, Index 704 to Index 735. Assign Fusion Point Code of the nodes (1-255) to be controlled by the Day/Night Controlling Node (assigned by the ASYDL, SYS1, Index 640).

(CCIS Programming)

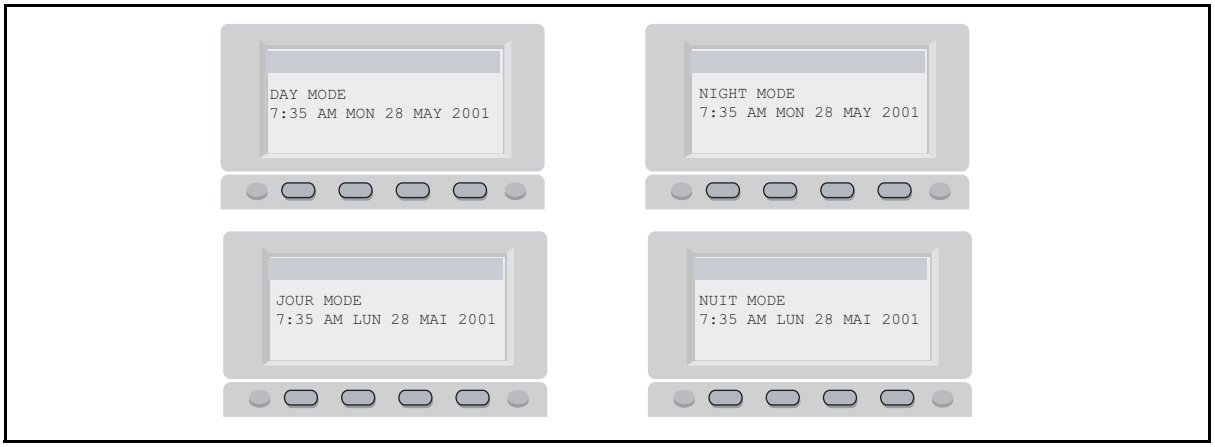
STEP 1: **ASYD** - SYS1, Index 18, Bit 6=1. Assign for satellite Office to follow Day/Night Mode at Main Controlling Node (1-15).

SYS1, Index 19, Bit 0 to Bit 3. Assign Tenant (TN = 1 - 15) of the Main Office where the Satellite Office belongs.

D-164D - II Day-Night Mode Status -D - II

General Description

This feature allows a Desktop terminal to display the current day/night mode status and change the System into Day or Night mode using either the "*" or "#" key.



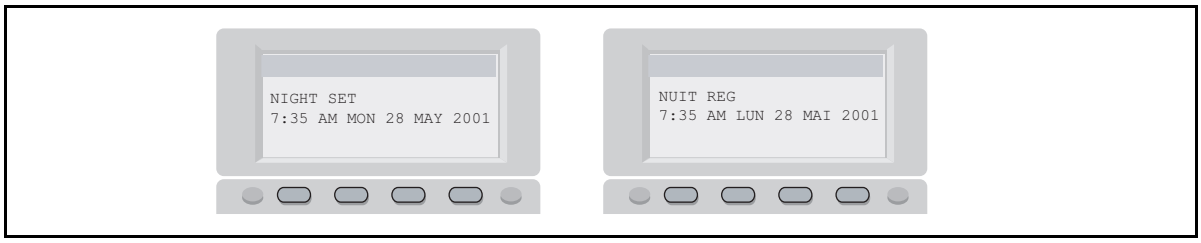
Note: If this feature is used in an environment where an attendant console is accommodated, day/night mode cannot be changed from Desktop terminal.

Note: This feature is not available in North America.

Operating Procedure

Day/Night Mode Status Display on LCD of Desktop terminal
(Not effected by ASFC/ASFCN)

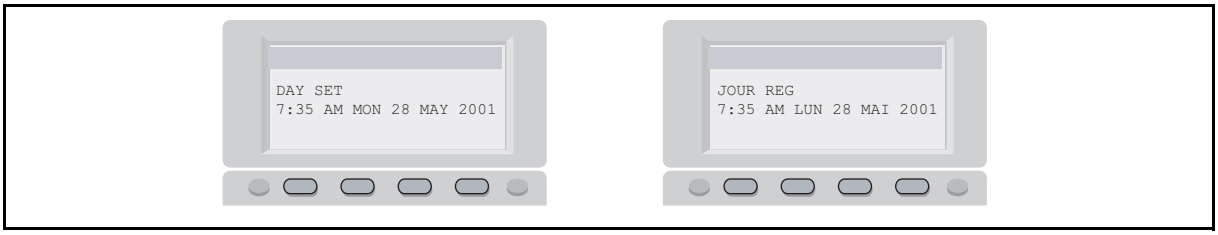
1. Lift the handset or press the SPEAKER key. Receive Dial Tone.
2. Press the DAY/NIGHT MODE Feature key. Receive the Service Set Tone.
3. The current day/night status of the System is displayed.
4. Place handset in cradle or press the SPEAKER key.



Day/Night Mode Status Display on LED of DAY/NIGHT MODE Feature key
(Not effected by ASFC/ASFCN)

The LED lamp status of DAY/NIGHT MODE Feature key on Desktop terminal indicates the day/night mode status as follows.

LED Status	Day/Night Mode Status
Turned OFF	Day Mode
Lights red	Night Mode



Change from Day mode to Night mode from Desktop terminal
(Effected by ASFC/ASFCN)

1. Lift the handset or press the SPEAKER key. Receive Dial Tone.
2. Press the DAY/NIGHT MODE Feature key. Receive burst Special Dial Tone.
3. The current day/night status of the System is displayed.
4. Dial "#" to set Night mode. Receive the Service Set Tone.
5. Place handset in cradle or press the SPEAKER key.

Change from Night mode to Day mode from Desktop terminal
(Effected by ASFC/ASFCN)

1. Lift the handset or press the SPEAKER key. Receive Dial Tone.
2. Press the DAY/NIGHT MODE Feature key. Receive burst Special Dial Tone.
3. The current day/night status of the System is displayed.
4. Dial "*" to set Day mode. Receive the Service Set Tone.
5. Place handset in cradle or press the SPEAKER key.

Change the language for display

1. To change the language for display, the data assignment is required. For the detail, refer to Programming in [M-117] Multilingual Display.

Service Conditions

1. This feature is available for the following Desktop terminals.
   - Digital terminal
   - IP terminal (Proprietary Protocol/SIP)
   - Soft Phone (Proprietary Protocol/SIP)
2. The current day/night mode status can be checked by the LCD of Desktop terminal, or the LED status of DAY/NIGHT MODE Feature key by assigning the system data (ASYDL, SYS1, Index 1131, Bit 0=1).
3. It may take a maximum of two minutes to change the LED status of DAY/NIGHT MODE Feature keys on all the corresponding Desktop terminals. Also, when activating the system by night mode, it may take a maximum of two minutes after the system activation to light red the LED of DAY/NIGHT MODE Feature keys on all the corresponding Desktop terminals.
4. This feature is controlled by Service Feature Restriction Class and available by assigning the DAY/NIGHT MODE Feature key (FKY = 153) and Service Feature Index 214 for MGC (SFI 214 for MGC = 1) or Service Feature Index 244 for SR-MGC (SFI 244 for SR-MGC = 1).

   Note: The day/night mode status display on the LCD of Desktop terminal and the LED of DAY/NIGHT MODE Feature key are available when "0" is assigned to SFI 214 for MGC or SFI 244 for SR-MGC as well.

5. ASYD - SYS1, Index 9 (Number of Attendant Consoles) must be "00" hex for this feature. Otherwise, this feature except "Day/Night Mode Status Display on LCD of Desktop terminal" and "Day/Night Mode Status Display on LED of DAY/NIGHT MODE Feature key" is not available.
6. Any Desktop terminal Line appearance may be used to perform the day/night status change, however only the Tenant of the Desktop terminals My Line will be effected. (For example, a Tenant 3 Line appearance on a Tenant 1 Desktop terminal can not change day/night mode of Tenant 3, only Tenant 1).
7. When the day/night mode change is executed from multiple terminals, the mode is changed by each terminal.
8. The day/night mode change by this feature indicates the mode change from Day mode to Night mode 3 or from Night mode 3 to Day mode.
9. For changing day/night mode, Special Dial Tone is fixed to burst tone.

   Note: When using Softphone, the burst Special Dial Tone will not be provided for changing day/night mode after DAY/NIGHT MODE Feature key is pressed. In this case, Dial Tone will be provided, and the Day-Night mode can be changed from this state.

10. The day/night mode in day/night non-controlling nodes can be changed from the day/night controlling node of the same tenant only as specified in programming for a FCCS network. The day/night data is transferred to the day/night non-controlling nodes from the day/night controlling node in 30 seconds cycle, regardless of the day/night mode change execution.
11. When this feature is used in a FCCS network, "Day/Night Mode Status Display on LED of Desktop terminal" is available for the day/night controlling node only.
12. This feature must not be assigned to a Line/Feature key of terminals under the day/night non-controlling nodes.
13. This feature setting is not available in consultation hold condition.

14. This feature can not be used with External Key Unit (NCU). These features are mutually exclusive.
15. This feature will output a 17-H informational System Message as per System Data programming. (see System Message [17-H] in Operations and Maintenance Manual for details).
16. This feature cannot be assigned to a Soft key.
17. The day/night mode cannot be changed by an access code.
18. At the time of changeover from MGC to SR-MGC, the day/night mode (fixed to Night Mode 3 at this time) can be changed from station that is assigned the SFC that has the following system data.

    - ASFC/ASFCN command: SFI 244 for SR-MGC = 1 (Day/night mode change (only for SR-MGC) is allowed.)

    Note: SFI = 244 is valid only when registered in SR-MGC. (SFI = 214 is valid only when registered in MGC)

    At the time of changeover from MGC to SR-MGC, the day/night mode can be changed from SR-MGC as well, by dividing the SFC for the terminal under MGC (hereinafter called headquarters office in the following example) and terminal under SR-MGC (hereinafter called branch office in the following example).

[Example]

The day/night mode can be changed from the terminal on headquarters side only when being registered in MGC (At the time of changeover from MGC to SR-MGC, the day/night mode cannot be changed), and from the terminal on branch office side at the time of changeover from MGC to SR-MGC only (it cannot be changed unless the changeover is executed).

Terminal's belonging	Tenant	SFC	Mode Change on MGC side	Mode Change on SR-MGC side
Headquarters Office	TN = 1	SFC = 1	Available (SFI 214 for MGC = 1)	Not available (SFI 244 for SR-MGC = 0)
Branch Office	TN = 1	SFC = 2	Not available (SFI 214 for MGC = 0)	Available (SFI 244 for SR-MGC = 1)

19. TAS service is not available.
20. Current day/night mode can be retained after the system initialization by assigning System data - ASYDL, SYS1, Index1120, Bit 0 to Bit 5 for Day/Night Data Automatic Backup. For the detail, refer to the Day/Night Data Retention section in Chapter 2 of this manual.
21. Assign a destination number for a COT incoming call. If not assigned, the system cannot answer COT incoming calls. For more information, refer to [D-7] Direct-In Termination (DIT) or [D-8] Direct Inward Dialing.

Interactions

1. Refer to the Service Conditions and Programming pertaining to the following features:
    - Day/Night Data Retention
    - DAY-NIGHT MODE STATUS -D [D-164D]
    - MULTILINGUAL DISPLAY [M-117]
2. When DAY-NIGHT MODE STATUS -D - II [D-164D - II] is enabled, neither NIGHT CONNECTION - FIXED [N-1] nor NIGHT CONNECTION - FLEXIBLE [N-2] is available.
3. The Day/Night switching feature of DAY-NIGHT MODE STATUS -D - II [D-164D - II] is not available when one of the following services is enabled:
    - NIGHT CONNECTION - FIXED [N-1]
    - NIGHT CONNECTION - FLEXIBLE [N-2]
    - DAY/NIGHT CHANGE - OUTSIDE KEY OPERATION [D-63]

On the other hand, the Day/Night mode status display feature of DAY-NIGHT MODE STATUS -D - II [D-164D - II] can be used in conjunction with the above services.

Programming

STEP 1: **ASFC** - Assign to the Dterm under MGC a Service Feature Restriction Class that allows SFI 214 for MGC and, assign to the Dterm in remote nodes an other Service Feature Restriction Class that allows SFI 244 for SR-MGC. By assigning "1" to the each SFI, day/night mode can be changed from Dterm at both MGC and SR-MGC if a changeover is executed. **Note 1**

Note 1: The day/night mode status display on the LCD of Desktop terminal and the LED of DAY/NIGHT MODE Feature key are available when "0" is assigned to SFI 214 for MGC or SFI 244 for SR-MGC as well.

STEP 2: **AKYD** - Assign DAY/NIGHT MODE to a Line/Feature key. Assign KYN (1-40), KYI =1, FKY = 153.

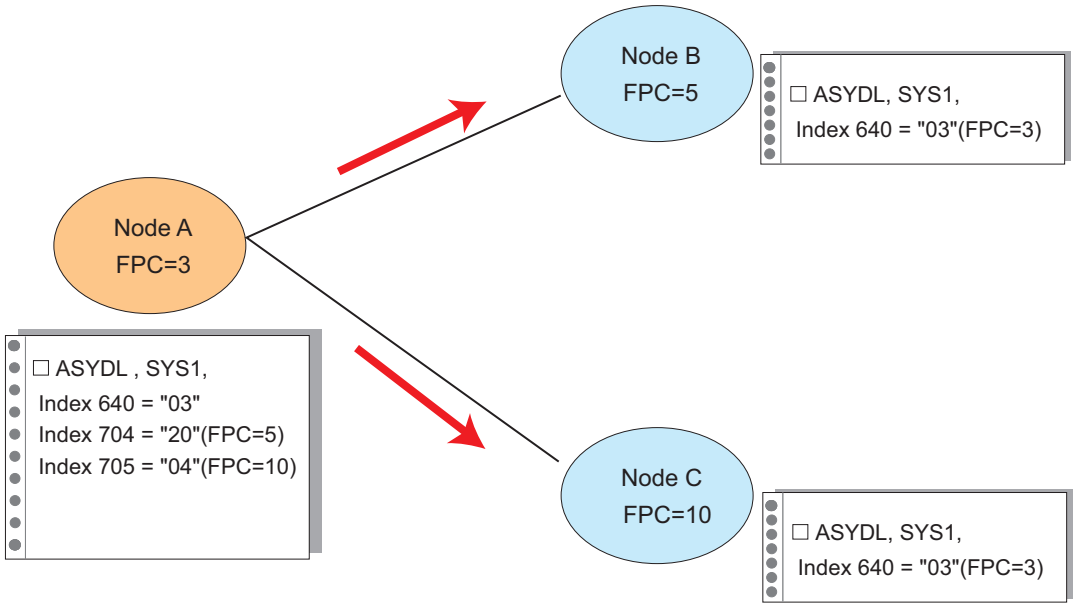
STEP 3: **ASYD** - SYS1, Index 9=00. Number of Attendant Consoles **Note 2**
SYS1, Index 229, Bit 3. 17-H System Message output of Day/Night Change: 0/1= Out of service/In service
SYS2, Index 11, Bit 6=0. Trunk Answer from Any Station (TAS) **Note 3**

Note 2: This data must be "00" hex for this feature. Otherwise, this feature except "Day/Night Mode Status Display on LCD of Desktop terminal" and "Day/Night Mode Status Display on LED of DAY/NIGHT MODE Feature key" is not available.

Note 3: For the tenant where this feature is used, this data must be “0”. If this data is changed from “1” to “0”, the following procedure will be required.
- Backup office data (select all Data Type) by using MEM_HDD command.
- Delete “GPCM04.DAT (Day/Night Data)” by using DHDF command if it exists.
- Execute “Office Data Load & System Initialize” by using SINZ command.

STEP 4: **ASYDL** - SYS1, Index 1131, Bit 0. Day/Night Mode Status Display on LED of DAY/NIGHT MODE Feature key: 0/1 = Out of service/In service.

(FCCS Programming)
STEP 1: **ASYDL**



[For all nodes]

SYS1, Index 640. Assign Fusion Point Code of Day/Night Controlling Node (1-255).

[For Day/Night Controlling Node]

SYS1, Index 704 to Index 735. Assign Fusion Point Code of the Day/Night Non-Controlling Nodes (1-255) to be controlled by the Day/Night Controlling Node (assigned by the ASYDL, SYS1, Index 640).

[Example: Day/night data is transferred from Node A to Node B/Node C]

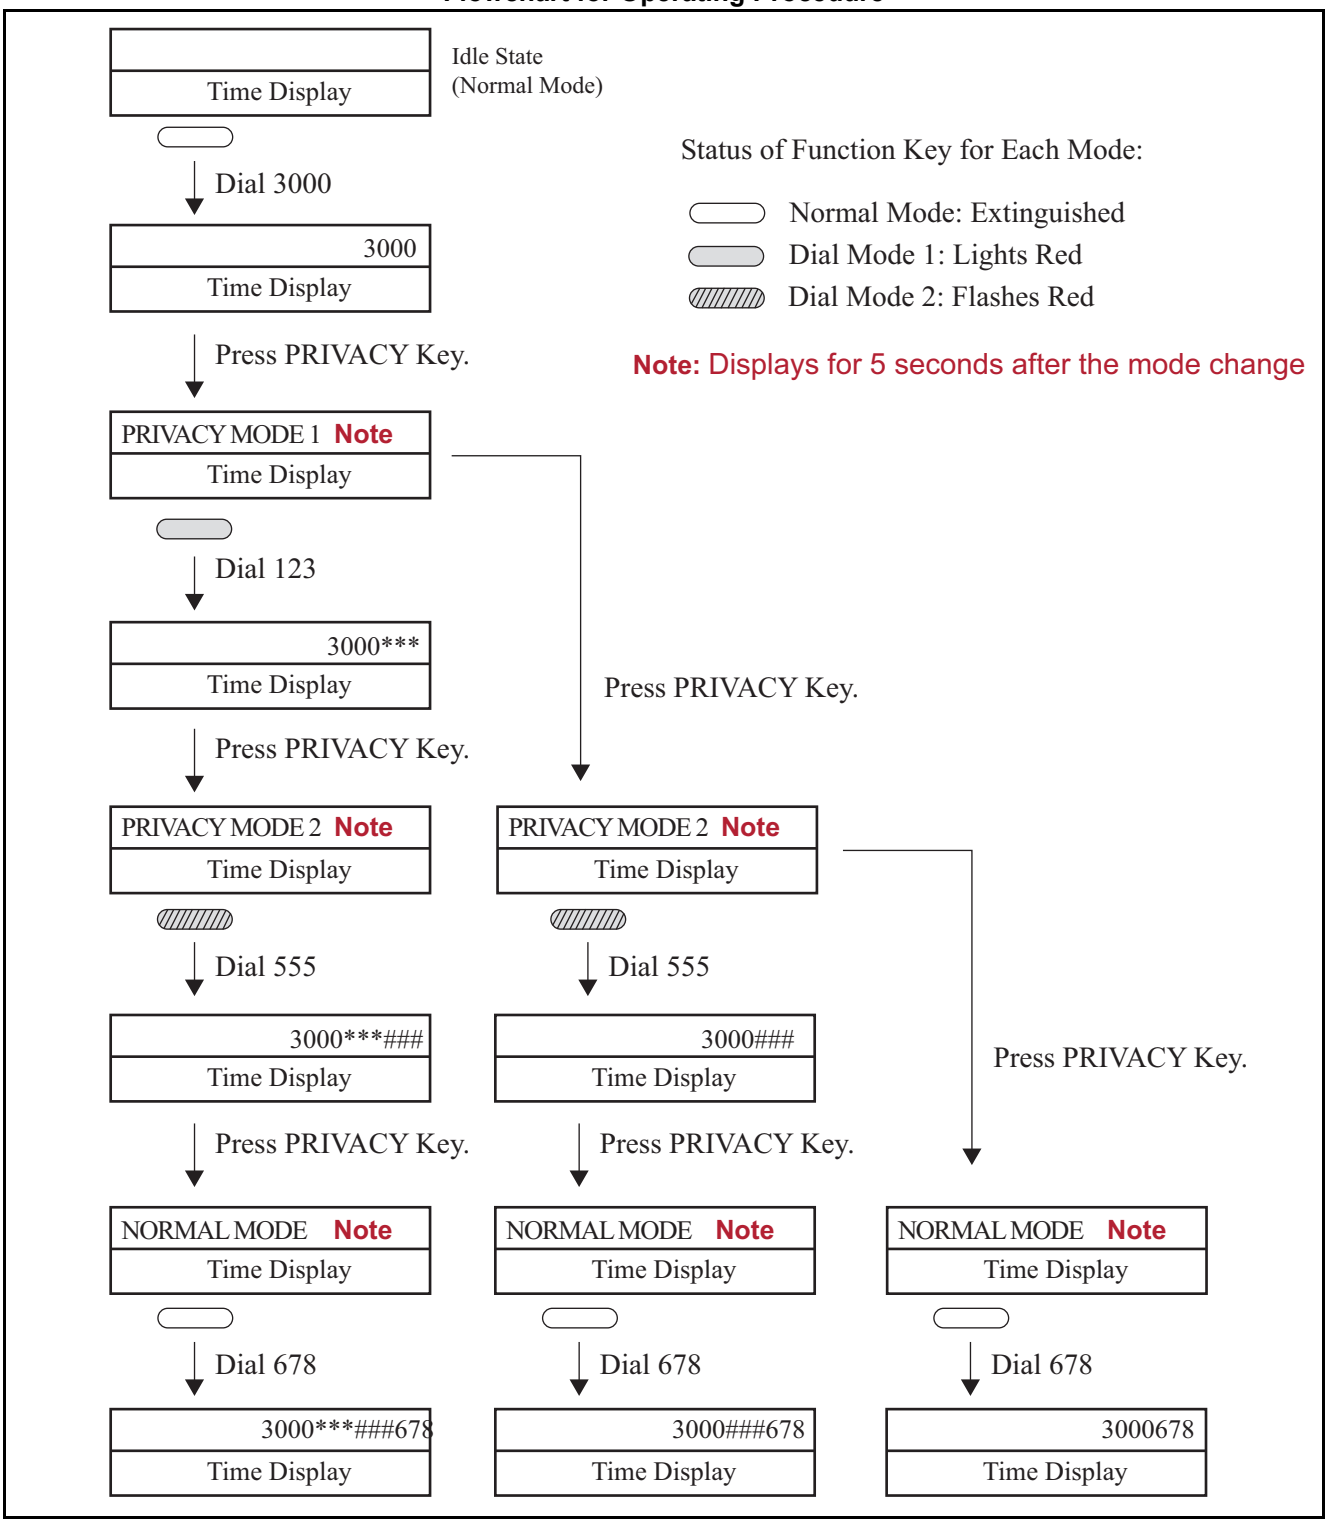
STEP 2: **ASFCN** - Assign to the Desktop terminal under MGC a Service Feature Restriction Class that allows SFI 214 for MGC and, assign to the Desktop terminal in remote nodes an other Service Feature Restriction Class that allows SFI 244 for SR-MGC. By assigning "1" to the each SFI, day/night mode can be changed from Desktop terminal at both MGC and SR-MGC if a changeover is executed.

Note: The day/night mode status display on the LCD of Desktop terminal and the LED of DAY/NIGHT MODE Feature key are available when "0" is assigned to SFI 214 for MGC or SFI 244 for SR-MGC as well.

D-165 Dialed Number Privacy Mode

General Description

This feature allows the Desktop terminal user to change the Dialed Number Privacy mode at any time. The following three modes are available:



Normal Mode:
Dialed Number is displayed on the LCD of Desktop terminal as usual.
In this mode, Last Number Called -D [L-6D] is available.

Privacy Mode 1:
The Secret Code (the default is "*") is displayed on the LCD of Desktop terminal instead of the dialed number.
In this mode, Last Number Called -D [L-6D] is not available.

Privacy Mode 2:
The Secret Code (the default is "#") is displayed on the LCD of Desktop terminal instead of the dialed number.
In this mode, Last Number Called -D [L-6D] is available.

Operating Procedure

Flowchart for Operating Procedure

Service Conditions

1. This feature is available for the following terminals:
   Dterm Series *i*
   Softphone
   DtermIP INASET
   DtermIP
   DT800 Series/DT700 Series/DT400 Series/DT300 Series
2. This feature doesn't conceal the Calling Party Number and Name during the conversation, ringing and call termination.
3. All the dialed numbers, including Service Access Codes, can be concealed by this feature.
4. System Initialization and the ASDT data modification/deletion place the Stations in the Normal mode.
5. Except in case of the above (4), the existing mode is maintained until it is changed manually, regardless of the status of the terminal.
6. When the terminal is reset (AKYD, ASCL, ASTN, ADKS, MBST, MBLE or DtermIP Registration):
   If the PRIVACY Feature key (FKY: 163) is programmed to the terminal, the existing mode is preserved even after the terminal reset.
7. The Secret Code to be used for this feature can be changed by the System Data (ASYDL, SYS1, Index 675 and Index 676). If an invalid code is set by the System Data, the default code (Privacy Mode 1: "*", Privacy Mode 2: "#") will be used.
8. When the Secret Code is changed by the System Data, new Secret Code is valid after the next mode change.
9. By assigning ASYDL, SYS1, Index 674, Bit 7=1, this feature can be activated with DESI-Less Phone under the following conditions.
   a.) The icon on DESI-Less Phone indicates each dial mode as follows:
   - Normal Mode: No information
   - Privacy Mode 1: ■ (steady)
   - Privacy Mode 2: ■ (flashing)

   b.) When ASYDL, SYS1, Index 674, Bit 6=1 (Speed Calling number is displayed on the LCD of SPD key), Speed Calling number display can act together with this feature depending on the system data setting (**Note 1**).
   <Example>
   When "12345" is registered to SPD key and ASYDL, SYS1, Index 674, Bit 7=1 (Dial mode works on Speed Calling number display):
   - Normal Mode: "12345" is displayed.
   - Privacy Mode 1, 2: "SPD" is displayed.

Note 1: Regardless of the ASYDL, SYS1, Index 674, Bit 7 setting, the feature name "SPD" is displayed when ASYDL, SYS1, Index 674, Bit 6=0.

Interactions

1. When using this feature, Last Number Called -D [L-6D] is activated under the following conditions:

   Note: "***" indicates the dialed numbers while the terminal is in Privacy Mode 1.
   "###" indicates the dialed numbers while the terminal is in Privacy Mode 2.

   a.) When verifying the stored number in the memory, the number indication is dependent on the mode at the time it was dialed.
   Example: "123###" was dialed:
   When verifying the above stored number, "123###" is displayed, regardless of the present mode.
   b.) Dialed Number while the terminal is in Privacy Mode 1 cannot be stored in the memory.
   c.) When the user originates a call by Last Number Called -D [L-6D], the Digit Codes are sent under the following conditions:
   Example: The following tables shows the display indication when "123456789" is redialed in each mode.
   "***" indicates the Digit Codes sent when the user redials in Privacy Mode 1.
   "###" indicates the Digit Codes sent when the user redials in Privacy Mode 2.

Dialed Number	Mode when the user redials			Remarks
	Normal Mode	Privacy Mode 1	Privacy Mode 2	
123###***	123###	******	######	"123456" is sent as Digit Codes.
123***###	123	***	###	"123" is sent as Digit Codes.
###456***	###456	******	######	"123456" is sent as Digit Codes.
###***789	###	***	###	"123" is sent as Digit Codes.
***456###	-	-	-	Redial is not available.
***###789	-	-	-	Redial is not available.

   d.) If the user redials while the terminal is in Mode 1 or 2, the numbers are stored in the memory under the following conditions:
   Example: Redial the stocked number "123###":
   (In the case of Privacy Mode 1)
   The redialed number "******" is not stored in the memory, and "123###" remains in the memory.
   (In the case if Privacy Mode 2)
   The redialed number "######" is stored in the memory, instead of the stored number "123###."
   e.) When verifying the stored number in the memory after the Secret Code is changed by the System Data, the stored numbers are indicated with the new Secret Code.
2. This feature (Privacy Mode 1 or 2) has precedence over the other concealment function such as Authorization Code Display Elimination and DtermIP Password Encryption. When using Normal mode, the other concealment function works as usual ("X" will be displayed).
3. This feature (Privacy Mode 1 or 2) is also available for the call origination by using Speed Calling - One Touch -D [S-26], Call Return [C-151], and Message Reminder [M-19].
4. When a call is originated by Speed Calling - Station [S-21], Speed Calling - Group [S-23], or Speed Calling - System [S-3], only the Abbreviated Call Code is concealed. The destination number cannot be concealed.

5. When using this feature, Speed Calling - One Touch -D [S-26] is activated under the following conditions:
   - If the destination number is programmed to the SPEED CALLING-ONE TOUCH key while in the terminal is in Privacy Mode 1 or 2, "*" or "#" is displayed on the LCD of Desktop terminal.
   - If the PRIVACY Feature key is pressed to change the Privacy Mode during the SPEED CALLING-ONE TOUCH key programming, the programming is canceled.
   - When verifying the destination number programmed to the SPEED CALLING-ONE TOUCH key, the LCD display is dependent on the present mode.
   - This feature can conceal the number only.
6. When using this feature, Save And Repeat -D [S-24D] is activated under the following conditions:
   - The number dialed in Normal Mode or Privacy Mode 2 can be saved. The number dialed in Privacy Mode 1 cannot be saved. At this time, the call origination is restricted.
   - The Calling Party Number can be saved regardless of the Mode.
   - When the saved number is re dialed, the LCD display is dependent on the present mode.
7. When this feature is activated with PA-16ELCJ-B, the following firmware is required: SP-3797 PROG-H or later
   This feature is not available for the speech log panel (by pressing call logs button) of Soft Phone.

Programming

STEP 1: **ASYDL/ASYDN** -

SYS1, Index 675: Assign Secret Code for Privacy Mode 1. [The default (00 hexadecimal) is "*."]
SYS1, Index 676: Assign Secret Code for Privacy Mode 2. [The default (00 hexadecimal) is "#."]

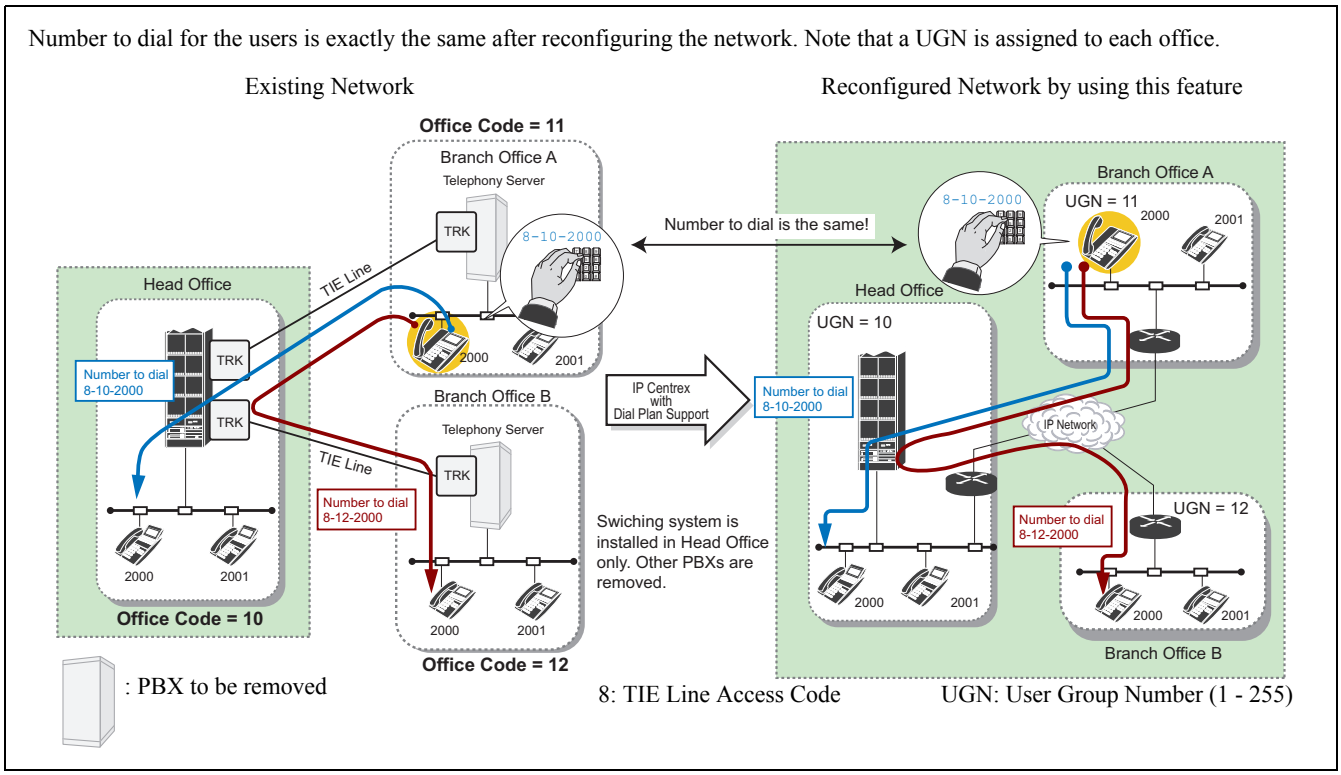
Programmable Secret Codes

		Higher order 4 bits (hex.)															
		0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
Lower order 4 bits (hex.)	0				0	@	P	`	p								
	1			!	1	A	Q	a	q								
	2			"	2	B	R	b	r								
	3			#	3	C	S	c	s								
	4			$	4	D	T	d	t								
	5			%	5	E	U	e	u								
	6			&	6	F	V	f	v								
	7			'	7	G	W	g	w								
	8			(	8	H	X	h	x								
	9			)	9	I	Y	i	y								
	A			*	:	J	Z	j	z								
	B			+	;	K	[	k	{								
	C			,	<	L	¥	l	|							
	D			-	=	M	]	m	}								
	E			.	>	N	^	n									
	F			/	?	O	_	o									

STEP 2: **AKYD** - Assign the PRIVACY Feature key data to a programmable Line/Feature key on the desired Dterm. (This command data is necessary when using a Line/Feature key as the PRIVACY key.)
FKI: 1 (Function Key)
FKY: 163 (PRIVACY Key)

STEP 3: **ADSL** - Assign the PRIVACY key data to a Soft key on the desired Dterm. (This command data is necessary when using a Soft key as the PRIVACY key.)
SKP: 0-15 (Soft Key Pattern)
SN: Assign each Status Number for "SKP." (0-15)
SKN: 1-16 (Soft Key Number)
FKY: 163 (PRIVACY key)

STEP 4: **ADKS** - Register each Soft Key Pattern data to the desired Dterm(s). (This command data is necessary when using a Soft key as the PRIVACY key.)
TN: Tenant Number
STN: Station Number
SKP: 1-15 (Soft Key Pattern assigned by ADSL)
LKP: Assign the Key Pattern of the Dterm.
1 = 16 Line/Feature keys + DSS keys
2 = 24 Line/Feature keys + DSS keys
3 = ALL Line/Feature keys
PG: Specify the page scroll key allocation
0 = Page change key appears on a software key (>>>)
1 = Page change key disappears on a software key



<Data Programming for Speed Calling on DESI-Less Phone>

STEP 1: **ASYDL** - SYS1, Index 674, Bit 7=1: Dialed Number Privacy Mode works with Speed Calling number display.

D-166 Dial Plan to support IP Centrex Functionality

General Description

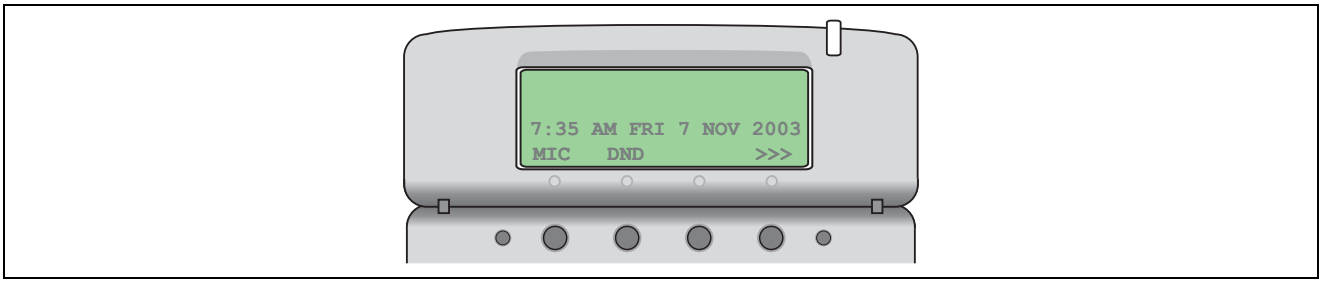
This feature is useful when changing an existing network to IP-based network. In the following example, two switching systems installed in branch offices are removed. Telephones in the branch office are accommodated in the Head Office. And then the users can use the existing telephone services without their own switching system (Centrex Functionality). Thus this feature can bring about the cost reduction of telecommunications. In addition, the telephone users can use the previous numbering plan to which they have been accustomed - Dial Plan is supported.

Operating Procedure

Number Definition

The following number is used for this feature.

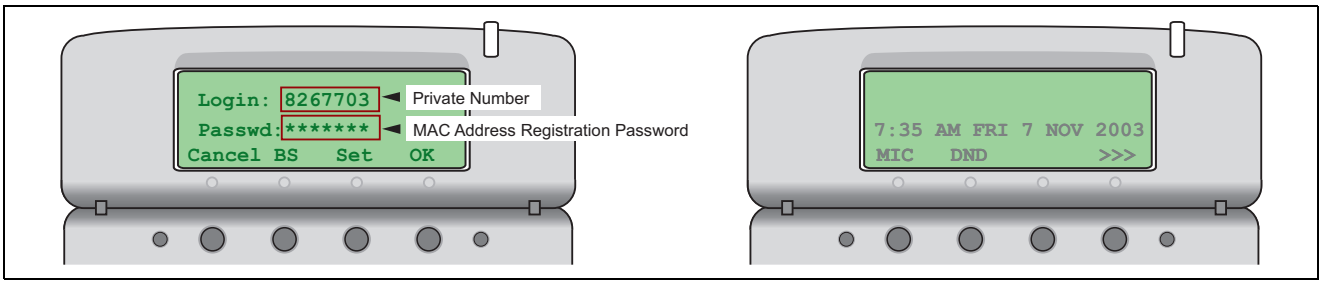
Extension Number: Used for a Station-to-Station call within a node.
example: `77033` (Telephone Number)



Private Number: Used for a call over nodes. This number includes the access code.
example: `8 + 26 + 77033` (Access Code + Office Code + Extension Number)

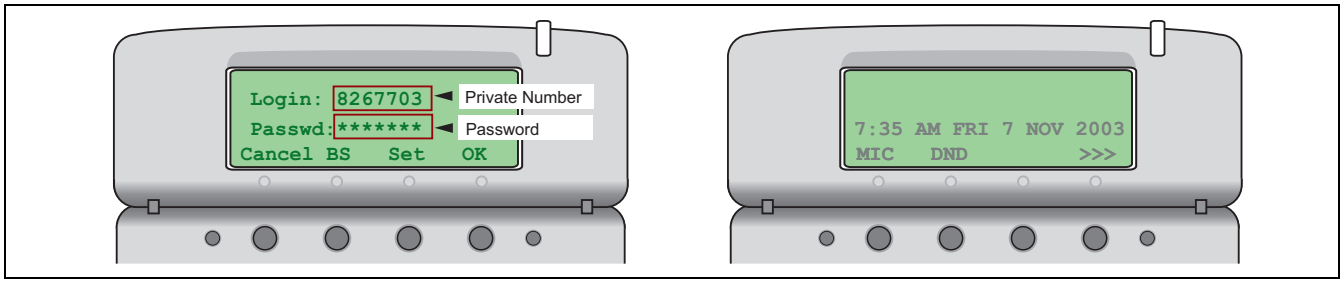
Public Number: Used for an outgoing call to PSTN.
example: `9 + 04 + 71420230` (Access Code + Toll Code + Local Number)

Login Operation from a DtermIP



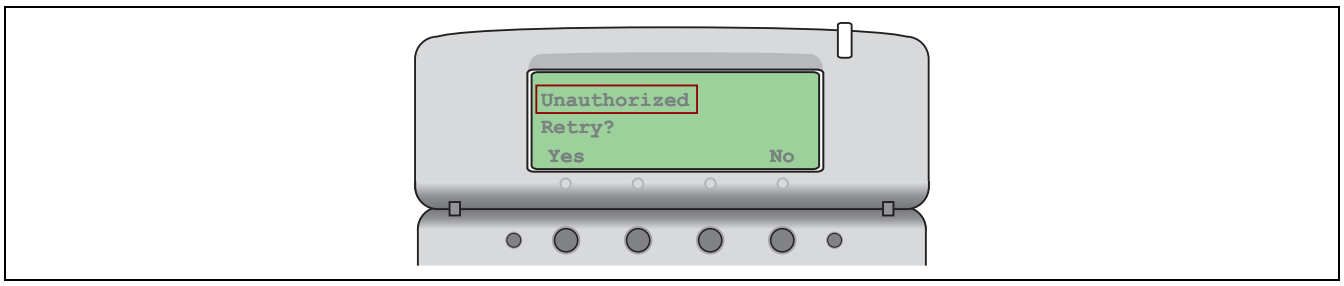
[MAC Authentication Mode by AMAC]

1. Assign the MAC address of DtermIP you want to use together with the Extension Number by AMAC.
2. Turn on the DtermIP.
3. After a while, the current time is appeared on the LCD, indicating that the DtermIP is in service.



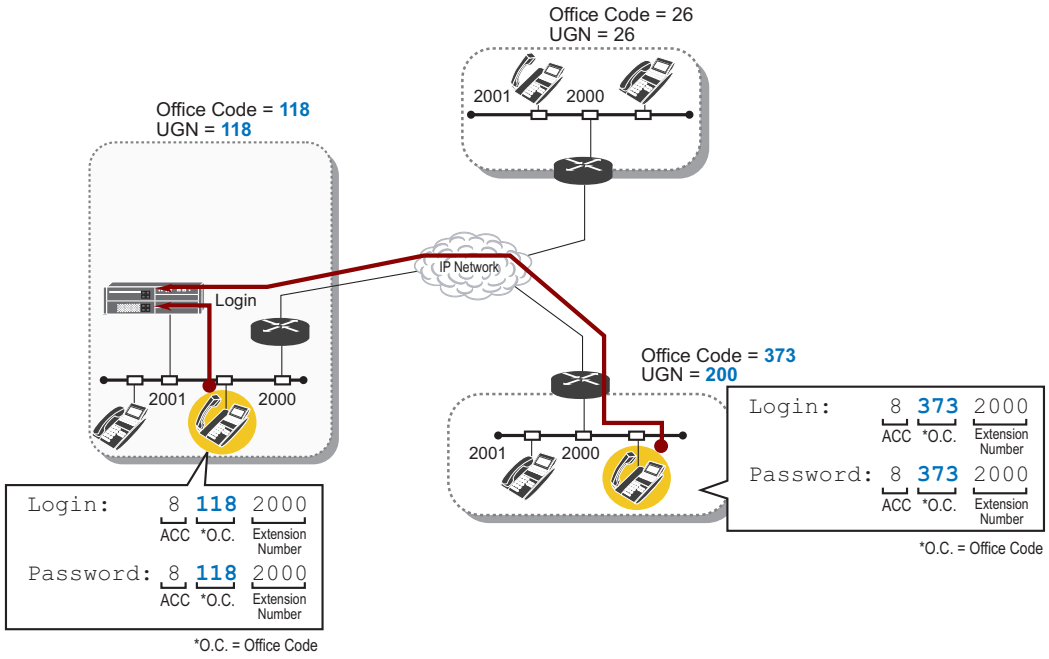
[MAC Authentication Mode by MAC Address Registration Password]

1. Assign the MAC Address Registration Password by ADTM.
2. Turn on the DtermIP.
3. To log in, enter the Private Number as Login Code at Login prompt. And enter the MAC Address Registration Password that has been assigned by ADTM at Password prompt.
4. After a while, the current time is displayed on the LCD, indicating the DtermIP is in service. (When reconnecting the DtermIP to the LAN, the terminal is in service without entering the Login Code and Password.)



[Login Mode]

1. Turn on the DtermIP.
2. To log in, enter the Private Number as Login Code at the login prompt. And then enter the password at the Passed prompt. If the password has not been assigned, enter the Private Number as the password.
3. After a while, the DtermIP can be used. (When the user logs off or reconnects the DtermIP to the LAN, the terminal can be operational after entering the Login Code and Password.)



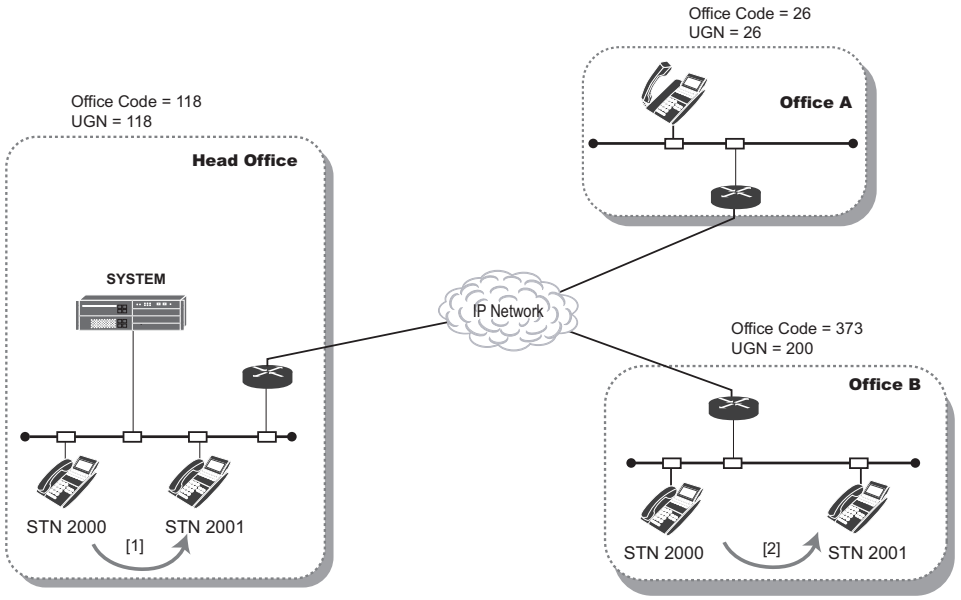
Note: In login mode, the LCD displays “Unauthorized” if Private Number is not entered at Login prompt or a wrong Password is entered.

Login Code / Password entry Example

The following shows an example of Login Code/Password entry from the DtermIP at each office. Note that Private Number is used to log into the system. When the Password has not been assigned, enter the Private Number as the Password.

UGN: User Group Number ACC: Access Code

[Password Change]



1. Lift the handset and dial “IP Enabled Dterm/DtermIP Password Entry” access code; receive SPDT. The LCD indicates “OLD PASSWORD” prompt.
2. Enter the current password; receive SPDT.
3. Enter the new password at “NEW PASSWORD” prompt; receive DT.
4. “REPEAT” prompt appears. Enter the new password again to confirm your entry; receive SST.
5. Replace the handset.

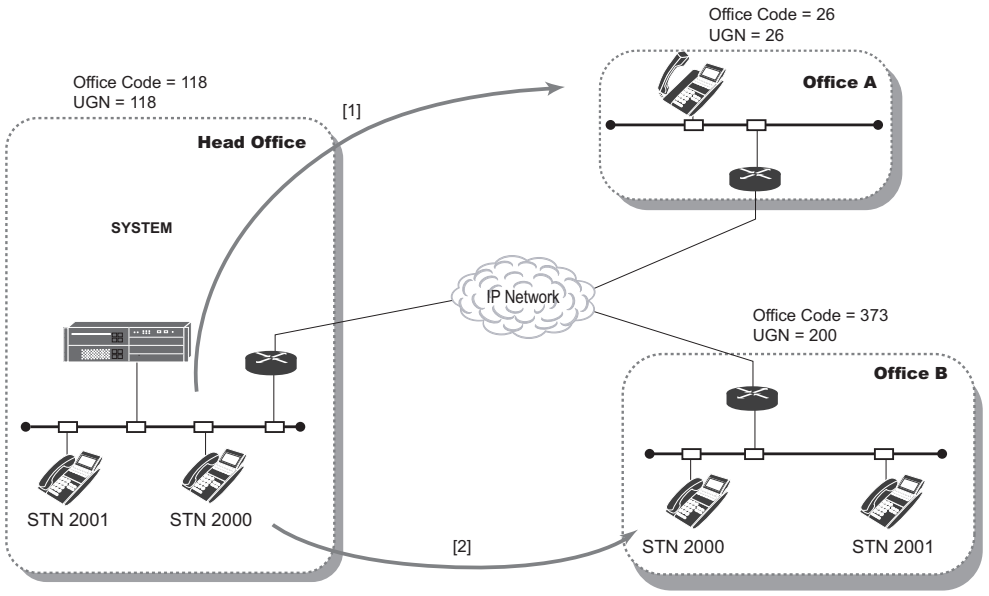
Service Conditions

1. Basic connection conditions are as follows.

[Internal Node Connections]

- Number is managed by Telephone Number assigned on a UGN basis.
- Dialed number is logically developed by using the UGN of the calling party.

[1] When STN 2000 of Head Office dials 2001, the number is logically developed using UGN = 118, Telephone Number = 2001. Then the call terminates to STN 2001 of Head Office.



[2] When STN 2000 of Office B dials 2001, the number is logically developed using UGN = 373, Telephone Number = 2001. Then the call terminates to STN 2001 of Office B.

- Calling Party Information

Station-to-Station Call	Number to dial	Calling Party Information to be displayed
STN 2000 (UGN:118) => STN 2001 (UGN:118)	2001	2000
	8–118–2001	2000

[Inter-UGN Call]

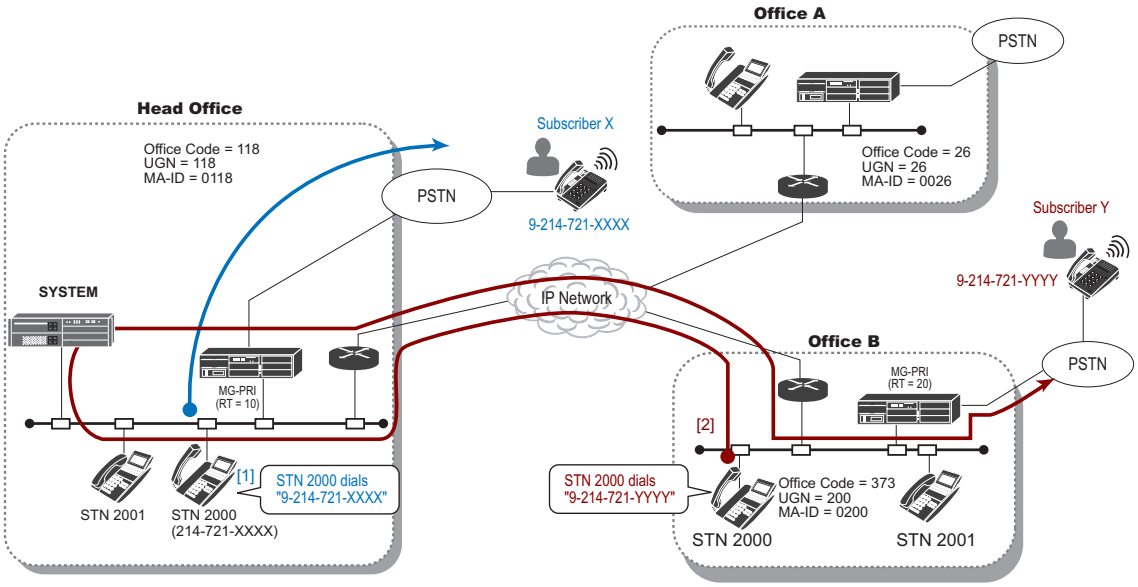
- The relationship between UGN and Private Number is managed by AUGNN and AUPVN commands.
- UGN and Telephone number are decided by dialed number. And it is logically developed.
  (example) Dialed number: Access Code (8) + Office Code (26)* + Telephone Number (77033)
  * The underlined part corresponds to AUGNN command.

[1] When STN 2000 of Head Office dials 8-26-2000, the number is logically developed using UGN = 26, Telephone Number = 2000. Then the call terminates to STN 2000 of Office A. By using the LENS of the calling party, the UGN and Telephone Number of the calling party can be decided. Then the Private Number (81182000) can be obtained that is indicated on the LCD of the called party by using the UGN (118) and Telephone Number (2000).

[2] When STN 2000 of Head Office dials 8-373-200, the number is logically developed using UGN = 200, Telephone Number = 2000. Then the call terminates to STN 2000 of Office B. By using the LENS of the calling party, the UGN and Telephone Number of the calling party can be decided. Then the Private Number (81182000) can be obtained that is indicated on the LCD of the called party by using the UGN (118) and Telephone Number (2000).

- Calling Party Information is obtained by the following procedure.

  - UGN, Telephone Number are decided by using the LENS of the calling party.
  - Access Code, Office Code are determined by the UGN and Telephone Number.
  - The Access Code and Office Code are added to the Telephone Number.
  - The obtained Number is displayed on the LCD of the called party.



- Calling Party Information

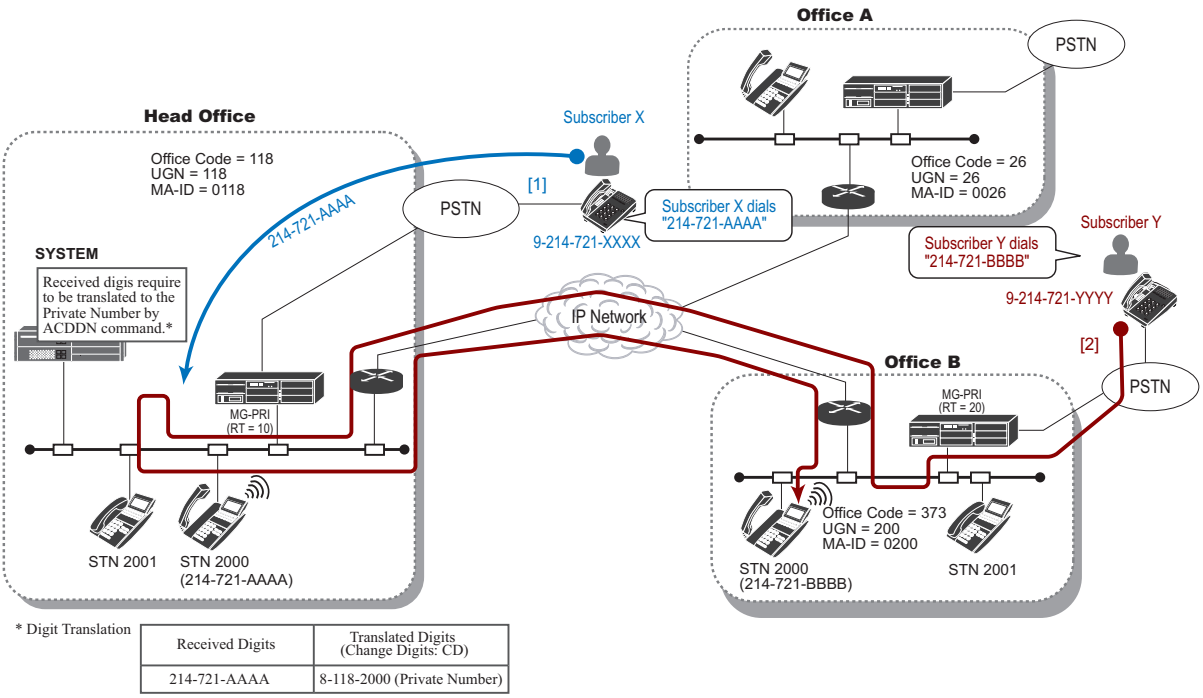
  Before using this feature, this call was treated as a trunk call. Therefore, the trunk type and elapsed time indication were displayed. After using this feature, the information is not displayed. Only the following information is displayed.

Inter-UGN Call	Number to dial	Calling Party Information to be displayed
STN 2000 (UGN:118) => STN 2001(UGN:26)	8-26-2000	8-118-2000

[Central Office Outgoing Call]

- Routing by using MG in each node is performed by LEAST COST ROUTING FOR MG-PRI [L-54].

[1] When STN 2000 of Head Office dials 9-214-721-XXXX, MG-PRI (RT 10) is selected by LEAST COST ROUTING FOR MG-PRI for placing the call to PSTN.



[2] When STN 2000 of Office B dials 9-214-721-YYYY, MG-PRI (RT 20) is selected by LEAST COST ROUTING FOR MG-PRI for placing the call to PSTN.

- Calling Party Information

Central Office Outgoing Call	Number to dial	Calling Party Information to be displayed
STN 2000 (UGN:118) => STN 2001 (UGN:26)	8-26-2000	8-118-2000

[Central Office Incoming Call]

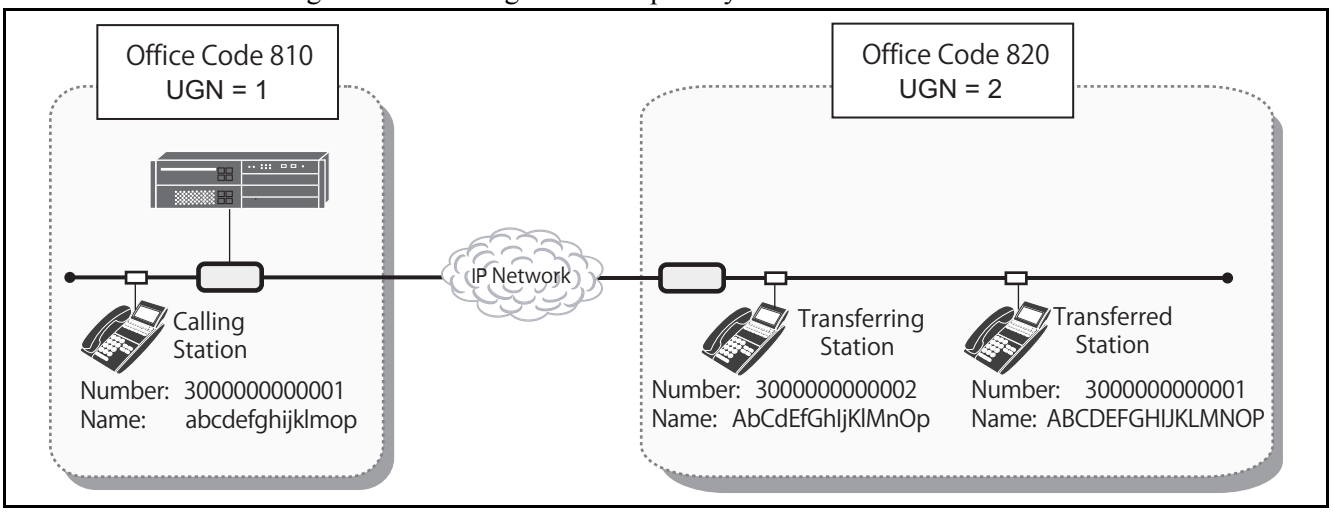
- Received number is translated to the corresponding Private Number by ACDDN command.
- Be sure to assign Private Number to the Change Digit Code (CDC) of ACDDN command. If not, the call cannot terminate to the destination.

* Digit Translation

Received Digits	Translated Digits (Change Digits: CD)
214-721-AAAA	8-118-2000 (Private Number)

[1] When Subscriber X dials 214-721-AAAA, the received digits are translated to 81182000 by ACDDN data, terminating to MG-PRI of Head Office. The call is logically developed by Private Number 81182000.

[2] When Subscriber Y dials 214-721-BBBB, the received digits are translated to 83732000 by ACDDN data, terminating to MG-PRI of Office B. The call is logically developed by Private Number 83732000.

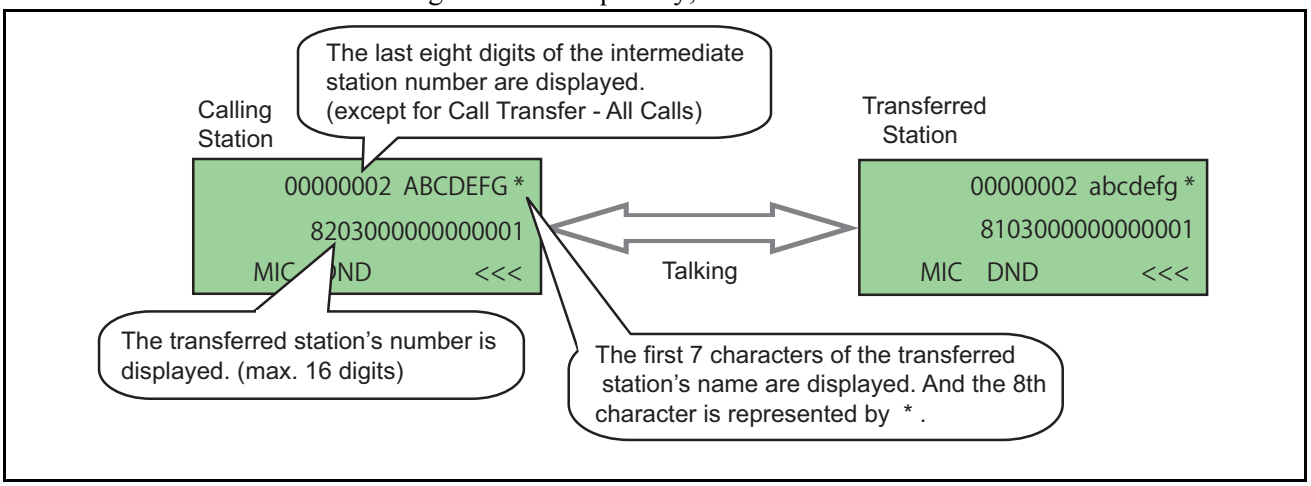


2. User Group Number (UGN) is used to realize Identical Number Processing.
3. Extension Number (Telephone Number), Private Number, and Public Number can be used by telephone users. The maximum digits for each number is as follows:

   - Extension Number (Telephone Number) : 14 digits **Note 1**
   - Private Number : 16 digits (inclusive of Access Code and Office Code) **Note 1**
   - Public Number : 16 digits

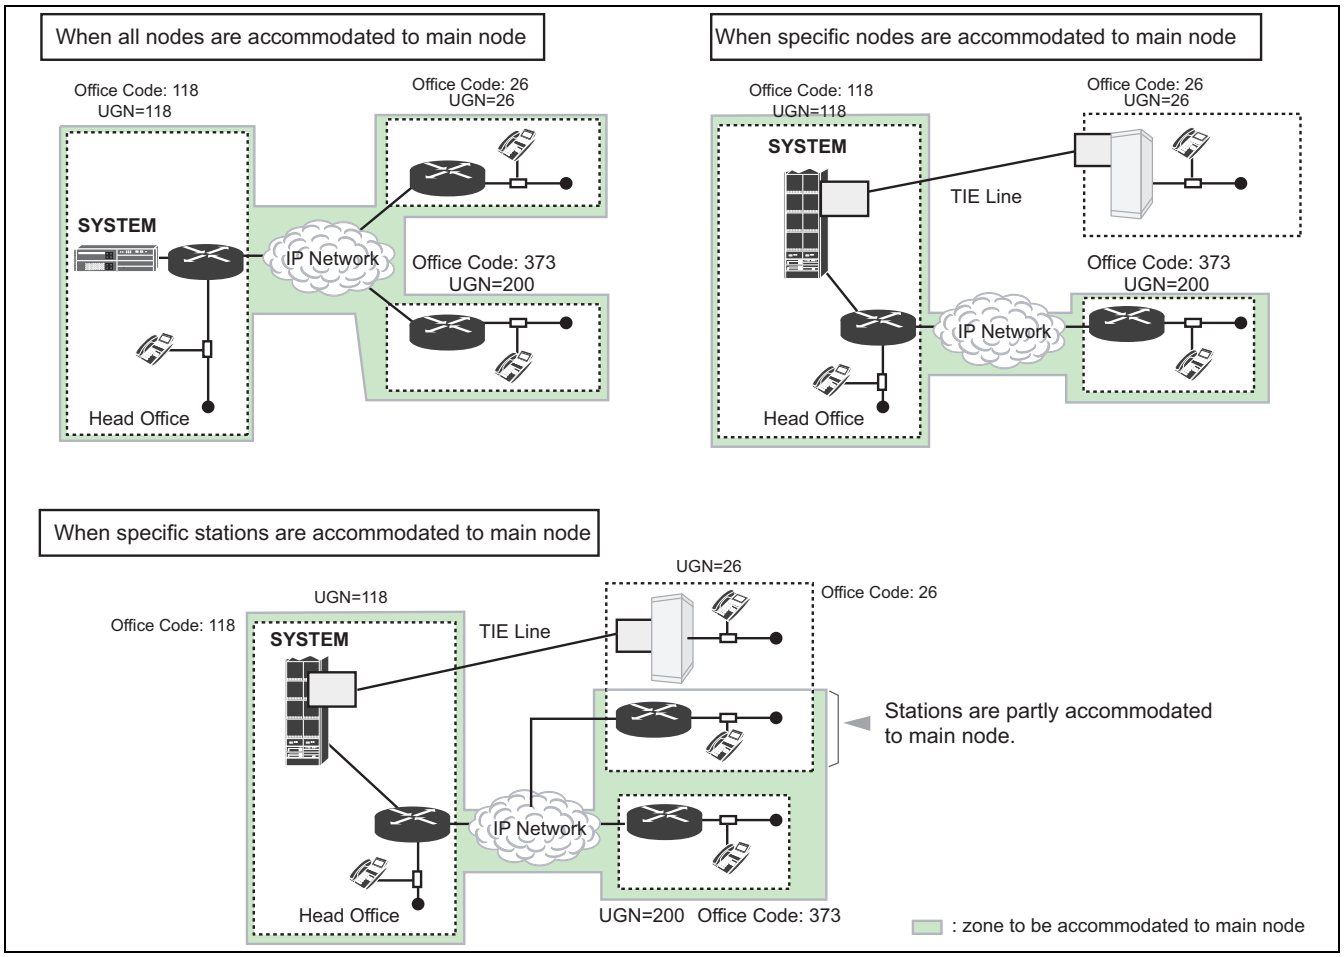
   Note 1: Only when the following system data is enabled: ASYDN, SYS1, Index 818, Bit 3; if not, up to five digits for an Extension Number and up to eight digits for a Private Number.
4. The following are the service conditions when more than 9-digit Private Number is used in Inter-UGN calls.

- If a call is transferred (except when a call is transferred by Call Transfer - All Calls), the last eight digits of the intermediate station number are displayed.
- When using Name Display - System [N-28], the LCD display varies depending on the following system data setting. The following shows an example.



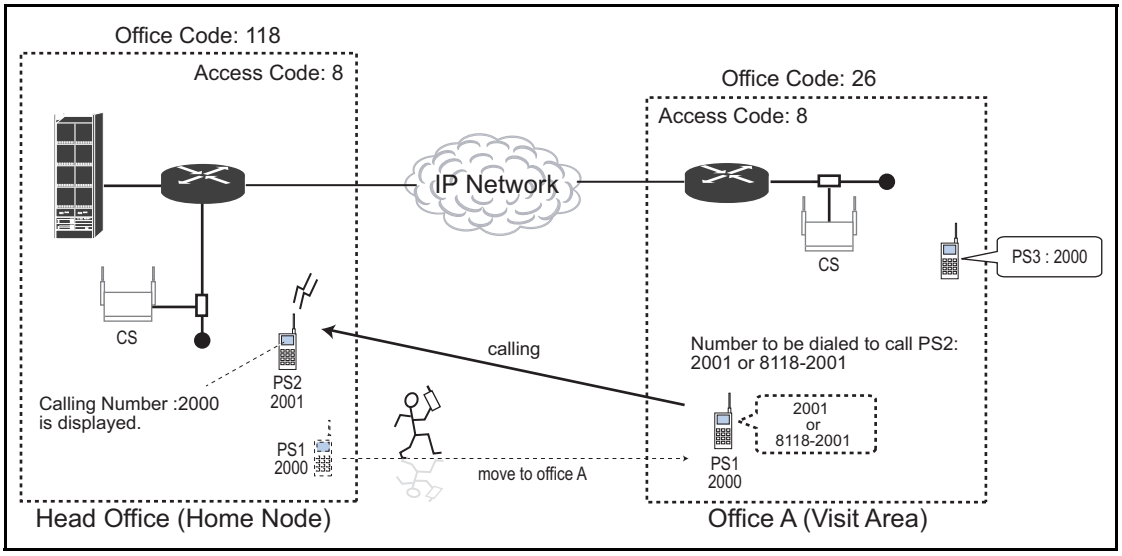
ASYDN, SYS1, Index 390, Bit 0 Caller ID display pattern on the LCD
0/1 = Calling Number/Calling Name has priority.

- Bit 0=0: When Calling Name has priority;



- Bit 0=1: When Calling Number has priority;

- If the numbers have more than 16 digits, only the first 16 digits are displayed.
- As for DT800/DT700 Series, refer to Name Display - System [N-28].

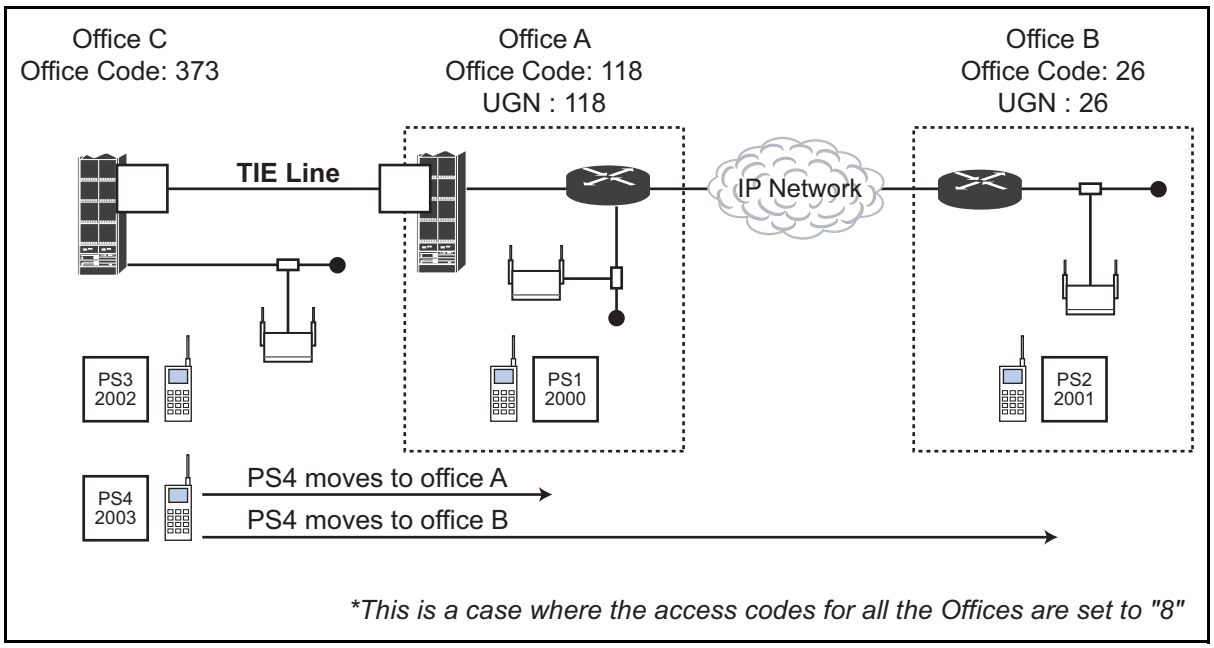


5. The following three types of system configuration are available.

6. An arbitrary number between 1 and 255 can be used as a UGN. Note that limitations may be imposed by the number of offices to be used after re-configuration and internal resources.
7. Tenant, Service Feature Restriction Class (SFC), and Route Restriction Class (RSC) can be used as usual. Separate/Common Tenant Data table is also available. Outgoing Call restriction, Incoming Call restriction, Service Feature restriction can be set on a tenant basis. These restrictions are applied on a node basis. Therefore, the Tenant Number must be separated on a node basis. Accordingly, a maximum of 62 nodes can be accommodated to the main node since the maximum tenant number is 63. (One tenant number is used at the main node. The remaining nodes are 62 nodes.)
8. Route Number ranges from 1 to 899.
9. In a configuration where TIE line(s) is remained after stations are partially accommodated to the main node, all digits (of Private Number) must be sent out from the call originating node. If the node sends out the Extension Number only, the call can not reach the destination. When all digits (of Private Number) cannot be sent out depending on the numbering plan, assign the Additional Digits by AISPN/AOSPN command for the terminating node to receive all digits (of Private Number).
10. Service Access Codes used for the previous node are not inherited to the newly configured network.
11. In login mode, the LCD displays “Unauthorized” if Extension Number only is entered at Login prompt.

12. This feature is not available for Hotel systems.
13. This feature is not available for ACD systems.
14. This feature is available for OAI systems. For details, refer to Data Programming Manual - OAI.
15. Conditions for PS movement are as follows:
    a.) When moving to a different User Group Number (UGN).

    - Even if a PS moves out the PHS/PCS home node, it follows the numbering plan of the home node.
    - For Nodes with Dial Plan to support IP Centrex Functionality, assign the same settings for CS System ID (SYS-ID).



When PS1, which has CS of Head Office as its Home Node, moves to Office A:

Originating a call from PS1 to PS2	Dial Number	2001 or 81182001
	Calling number displayed on PS2	2000
Originating a call from PS1 to PS3	Dial Number	8262000
	Calling number displayed on PS3	81182000
Originating a call from PS2 to PS1	Dial Number	2000 or 81182000
	Calling number displayed on PS1	2001
Originating a call from PS3 to PS1	Dial Number	81182000
	Calling number displayed on PS1	8262000

b.) When a PS moves in a configuration where a TIE line is included.

When roaming across a TIE line, Roaming is only possible to only one User Group Number (UGN):

While it is possible to Roam to Office A, if PS4, which has Office C's CS as its Home Node, moves to Office A or Office B:

Originating a call from PS4 to PS1	Dial Number	2000 or 81182000
	Calling number displayed on PS1	83732003
Originating a call from PS4 to PS2	Dial Number	8262001
	Calling number displayed on PS2	83732003
Originating a call from PS4 to PS3	Dial Number	83732002
	Calling number displayed on PS3	83732003
Originating a call from PS1 to PS4	Dial Number	83732003
	Calling number displayed on PS4	81182000
Originating a call from PS2 to PS4	Dial Number	83732003
	Calling number displayed on PS4	8262001
Originating a call from PS3 to PS4	Dial Number	2003
	Calling number displayed on PS4	83732002

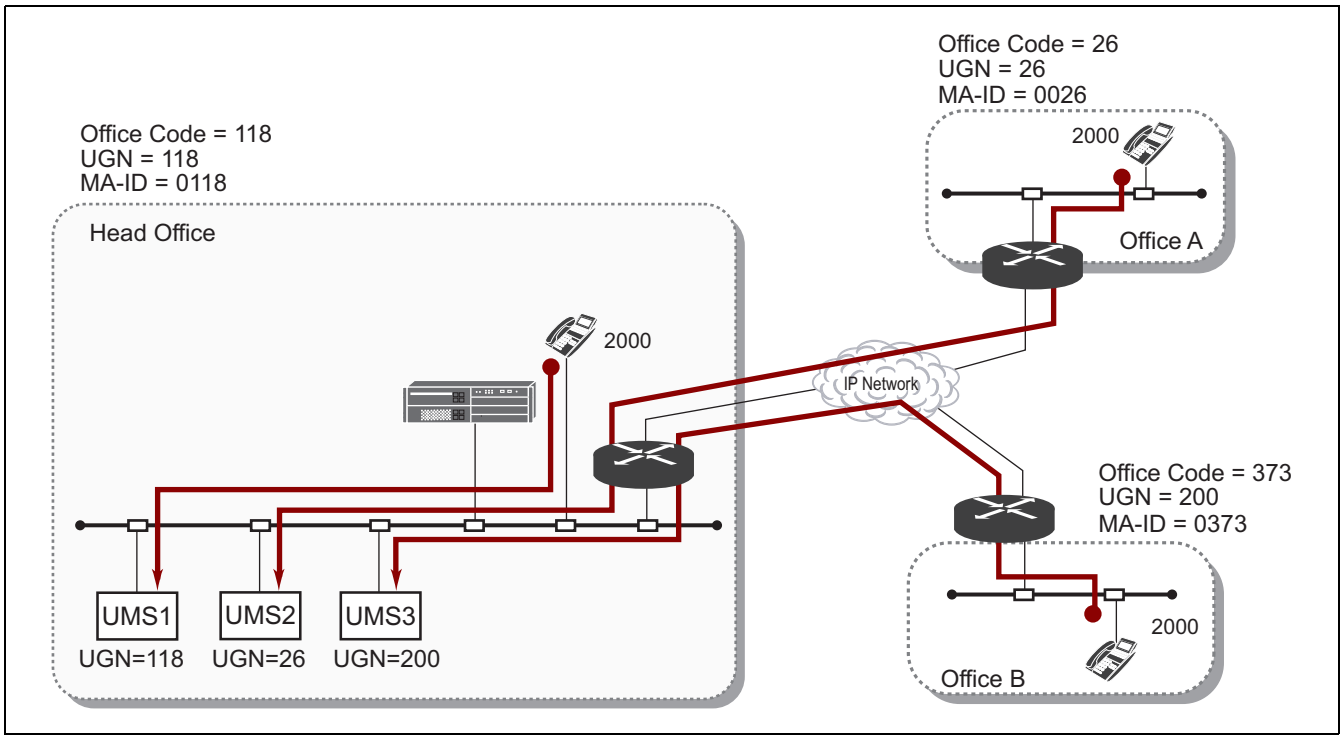
Note: Even when moving to Office B, it will be the same status as moving to Office A.

c.) For Nodes with Dial Plan to support IP Centrex Functionality, register the private number code of the Roaming destination Node (UGN) to the Roaming Self Node number. Roaming Self Node number is one setting per PHS community number (PCN). Since PCN is one setting per PBX, settings may not be made per Node (UGN).

d.) For Nodes with Dial Plan to support IP Centrex Functionality, set the Node for private number code (UGN) as the virtual station registered for Roaming PS (Visiting Area PS).

e.) For Nodes with Dial Plan to support IP Centrex Functionality, assign the same settings for CS System ID (SYS-ID). Also, SYS-ID must be different from the Node across a TIE line.

16. SMDR - When a node is accommodated into the main node, calls that were output as Outgoing/Incoming Calls in the previous configuration are output as Station-to-Station Calls.
17. MCI - UGN data is output in the UGN field of the extended format. Therefore, the external terminal requires to support the extended format.
18. SIP terminals (WLAN Handset (MH Series) and Standard SIP Terminal) that are accommodated in the System can use this feature under the following conditions.

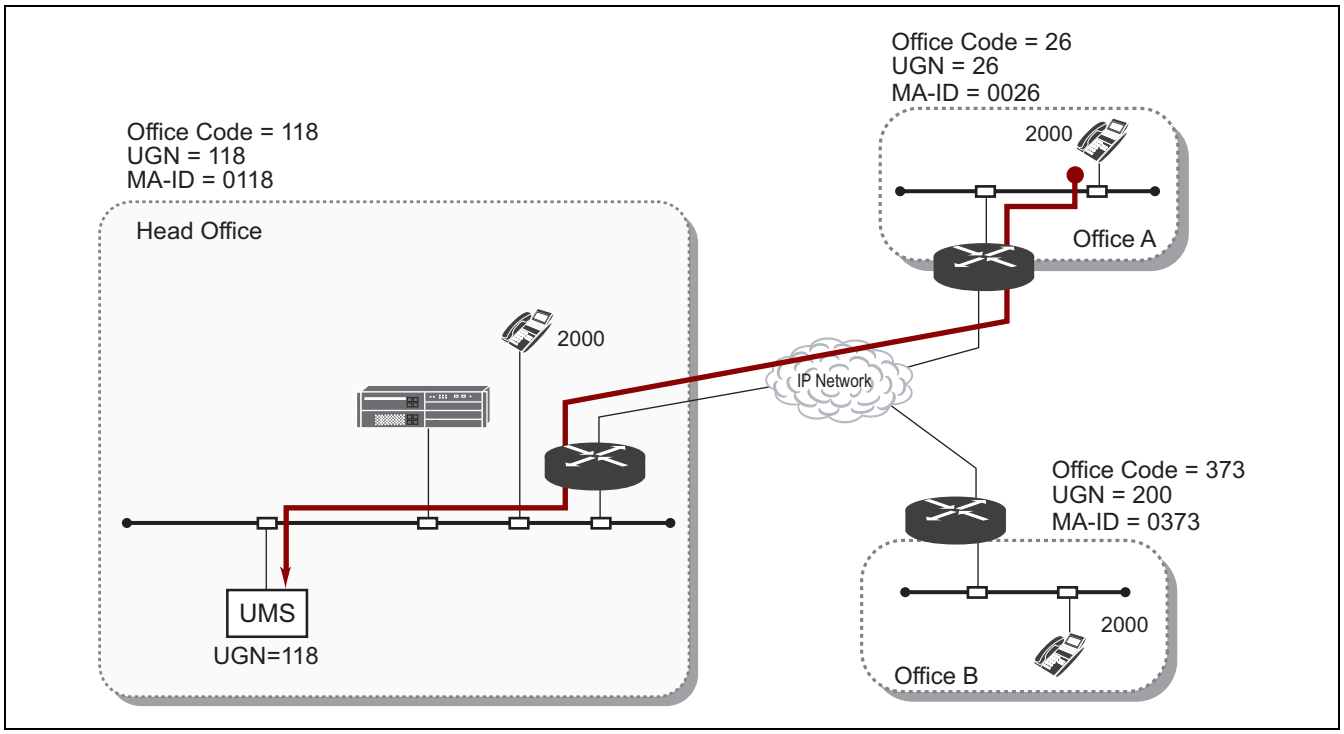


a.) The same Station number can be assigned to multiple SIP terminals accommodated in different nodes (User Group Numbers). For example, both SIP terminal A in Node B and SIP terminal C in Node D can use “2000” as their Station numbers.

b.) Dial Plan to support IP Centrex Functionality feature must be enabled.

c.) Each SIP terminal must be given a unique number as Private Number.

19. See the examples below when Unified Messaging System (UMS) is configured.



[When UMS is accommodated on each node]

- Extension Number is informed to each UMS from each office.
- Assign Extension Numbers when registering user IDs to UMS.

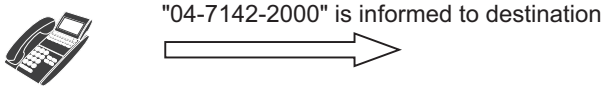
  <UMS user ID registration example>
  UMS1 (UGN=118) User ID: 2000 (UGN=118)
  UMS2 (UGN=26) User ID: 2000 (UGN=26)
  UMS3 (UGN=200) User ID: 2000 (UGN=200)

[When UMS is accommodated on Head Office]

- Private Number is informed from Office A/B to UMS, and Extension Number is informed in Head Office.
- Assign Extension Numbers when registering user IDs to UMS in Head Office (in the same UGN). Assign Private Numbers to the user IDs for Office A/B (in other UGN).

  <UMS user ID registration example>
  UMS1 (UGN=118)
  User ID: 2000 (UGN=118)
  User ID: 8262000 (UGN=26)
  User ID: 83732000 (UGN=200)

20. Conditions on caller identification number:



ARTDN		ARTIN	ACDDN (Note 2)	ACNDN	INDICATION
(INT)	(NET)	(INTD)			
4	1	–		×	ACNDN + Private Number Note 2
				–	Private Number
4 10	0 –	– 2	×	×	ACNDN + ACDDN

×: Required to assign

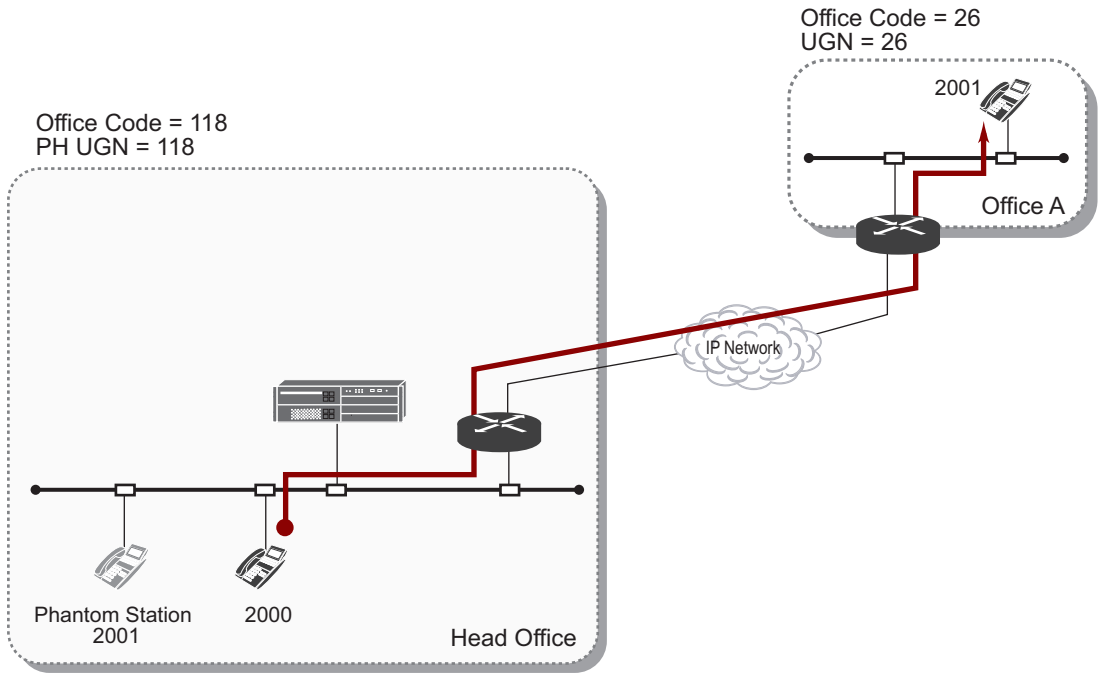
Note: Assign Private Number to “CDC (Change Digit Code)” parameter of ACDDN command.

Note 2: Private Number is displayed as caller number identification when INT=3 and NET=1 is assigned to the route class data of ISDN route.

<Example setting>
To inform “04-7142-2000” as the caller number for the route class of INT=3 and NET=1:

Extension Number: 2000
Private Number: 8118200

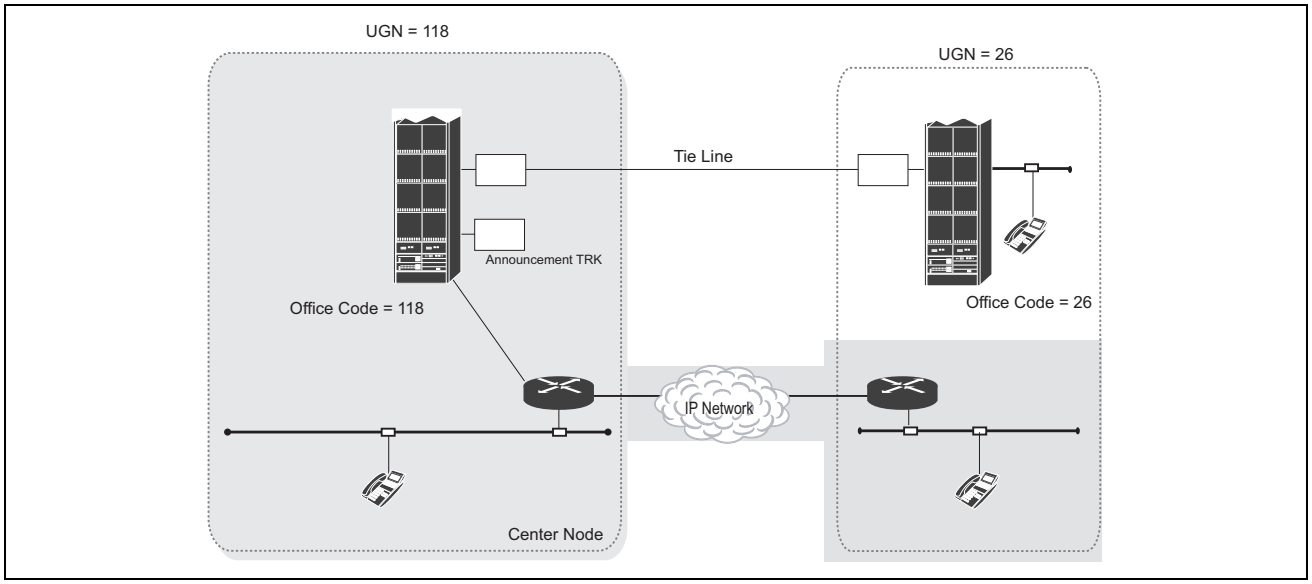
ACNPN: IC/OG = OG: Outgoing Call
LGRT = ISDN route
CNP = 1



ACNDN: CNP =1
SKIP = 4
ADD = 6
DC = 047142

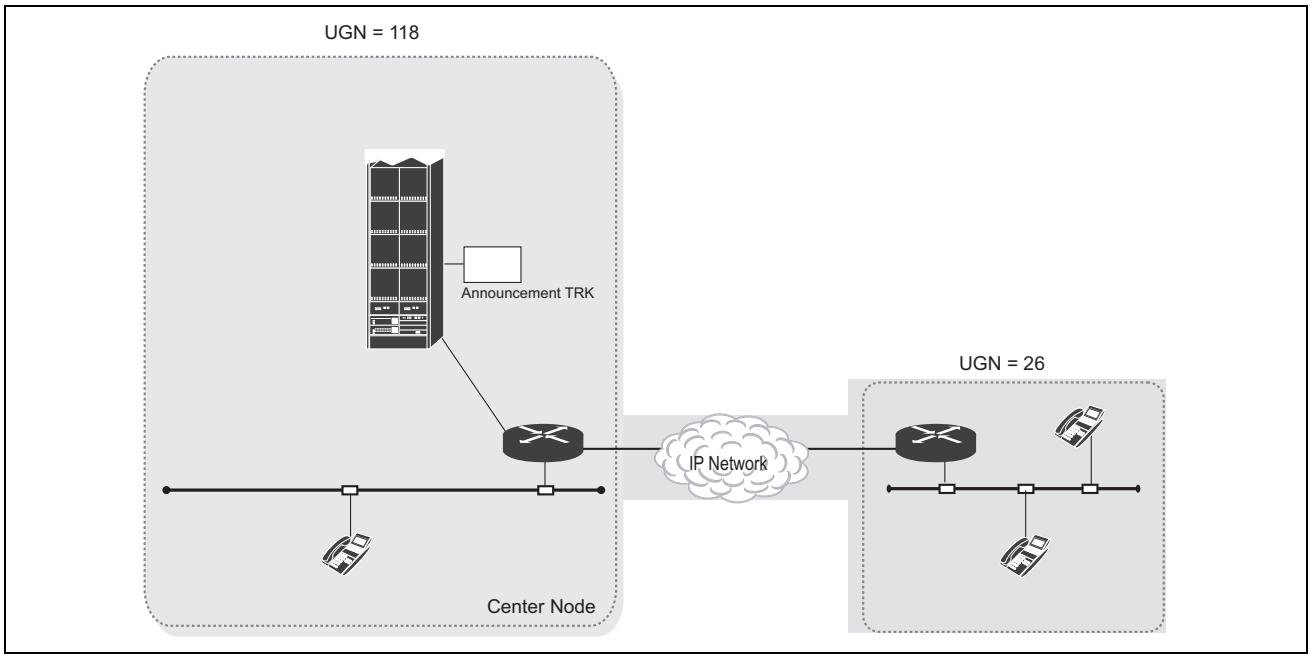
21. Phantom Number can be assigned across different UGNs. In the numbering development below, calls terminate to extensions in other UGN by dialing Extension Number only.

<Example setting>



APHNN: UGN = 26
TELN = 2001
PH = 0
PH UGN = 118
PH TELN = 2001

When Extension 2000 dials "2001" in Head Office (PH UGN=118), the call terminates to Extension 2001 in Office A (UGN=26).



22. When using Unused Number/Dead Level Number-Announcement

When some station numbers are accommodated in a center node, Unused Number/Dead Level Number-Announcement feature the center node provides is not available.

When all the station numbers are accommodated in a center node, if all the data assigned on AFRS(L/N), AOPR(L/N), AUNE(L) are deleted, Unused Number/Dead Level Number-Announcement feature the center node provides will be available.

23. When you use PSs as stations, assign the PS data under the following.
    a.) When you assign Individual PS Numbers (IND-PS) and PS Station Numbers (PS NO) by the APSD command, use Private Numbers (Access Code + Office Code + Station Number) rather than Telephone Numbers because they must be unique in a system (among all nodes in a FCCS network).
    To use Individual PS Numbers with less than 5 digits, Individual PS Numbers must be mutually unique in a system. In that case, when you attempt to display your own telephone number on PS, some types of PSs may display the corresponding Individual PS Numbers instead of the Station Numbers.
    b.) If PHS Inter-Node Roaming is used, PS Station Numbers must be numbers which can receive a call from a station in Visitor Node when the PSs are in Home Node. If the PS moves to another node across a Tie Line, assign PS Station Numbers (PS NO) as Private Numbers (Self Node office code=Access Code + Office Code).

    Note: When you change Individual PS Numbers (IND-PS) and PS Station Numbers (PS NO) by the APSD command, you need to download the new data to PS again.

24. By changing the system data, you can reduce the amount of registered data for the AFRSN command, and the office data consumption. For details, see 2.3 Reduction of Data Consumption of the AFRSN command, CHAPTER 5 DATA PROGRAMMING of Data Programming Manual - FCCS.

25. The following tables show service feature availability and conditions for this feature.

Note: When using Dial Plan to support IP Centrex Functionality [D-166], User Group Number (UGN) can be assigned in the range of 1 to 255.

OG Call Features Availability

SERVICE FEATURE NAME	Provided	MAXIMUM	REMARKS
Direct Outward dialing	×		
Restriction from Outgoing Calls	×		
Toll Denial/Toll Diversion	×		
Toll Restriction - 3/6-Digit	×		
Speed Calling - Station	×	A maximum of 1400 blocks can be stored per system. (One block can be used for 10 numbers.)	AEIA command is assigned by station number.
Speed Calling - System	×	A maximum of 10000 codes can be stored per system.	
Outgoing Trunk Queuing	×		
Off-Hook Queuing	×		
Alternate Routing	×		
Pushbutton-To-Rotary Conversion	×		

×: Available N: Not Available -: Not Applicable C: Conditionally Available

IC Call Features Availability

SERVICE FEATURE NAME	Provided	MAXIMUM	REMARKS
Attendant Console	–		
Direct-In Termination (DIT)	×		
Direct Inward Dialing	×		
Remote Access to System	×		Additional Number is dialed by Private Number.
Night Connection - Fixed	–		
Music-On-Hold	×		
Multiple Music-On-Hold	×	A maximum of 16 music sources can be assigned.	
Distinctive Ringing	×		
Tenant Service	×	A maximum of 63 tenants can be used per system.	
Slumber Time - Do Not Disturb	×		

×: Available N: Not Available -: Not Applicable C: Conditionally Available

Station Service Features Availability

SERVICE FEATURE NAME	Provided	MAXIMUM	REMARKS
Station Hunting	×	Station Number: 100 Stations/Group Telephone Number: 100 Stations/ Group There is no limitation for the number of Groups. Number of Secretaries Terminal: 255 Circular: 255 Priority: 4096 Priority with Switchback: 4096	Cannot be set over UGNs.
Call Pickup	×	Station Number: 100 Stations/Group Telephone Number: 100 Stations/ Group There is no limitation for the number of Groups.	Cannot be set over UGNs.
Selectable Station Call Pickup	×		Cannot be set over UGNs.
Call Pickup - Direct	×		Cannot be set over UGNs.
Step Call	×		
Call Back	×		
Automatic Call Back Cancel	×		
Call Waiting - Terminating / Originating	×		
Executive Right of Way	×		
Privacy	×		
Call Forwarding - All Calls	×		Can be set over UGNs.
Call Forwarding - Busy Line	×		Can be set over UGNs.
Call Forwarding - Don’t Answer	×		Can be set over UGNs.
Call Forwarding - All Calls - Outside	×		Can be set over UGNs.
Call Forwarding - Busy Line - Outside	×		Can be set over UGNs.
Call Forwarding - Don’t Answer - Outside	×		Can be set over UGNs.
Split Call Forwarding	×		The incoming call is transferred to the target station for station calling when this feature has been set over UGNs.
Call Forwarding All Call - Cancel by Routine Diagnosis	×		
SPDT is sent out when lifting the handset of terminal on which C.F. - All Call has been set.	×		
Call Forwarding - Busy Line - Override	×		

Call Forwarding - I'm Here	×		Cannot be set over UGNs.
Remote Call Forwarding Control	N		
Call Transfer - All Calls	×		
Camp On by Station	×		Can be set over UGNs.
Boss - Secretary	×		
Three - Way Calling	×		
Station - Controlled Conference / Preset Conference	×		
Call Hold	×		
Recall	×		
Exclusive Hold	×		
Hot Line	×

Programming

[Data for Main Node]

STEP 1: **ASYDN** - Assign SYS1, Index 801.
Index 801
Bit 2: AUGNN tenant data table development is Separate / Common = 0/1

STEP 2: **ASYDL/ASYDN** - Assign System Data 1.
Index 514/Index 957
Bit 0 to Bit 7: Network Data Memory (NDM) usage
Index 672 **Note 3**
Bit 0: Location of Telephone Number displayed on Desktop terminal
0/1 = 8-digit Extension Number Display on the first line of Desktop terminal/16-digit Extension Number Display on the second line of Desktop terminal
Index 800
Bit 0=0: ALGNL/ALGNN, ALGSL/ALGSN commands tenant UGN table development is Separate.
Bit 1: ASPAL/ASPAN command tenant data table development is Separate / Common = 0/1
Bit 2: ANPDL/ANPDN command tenant data table development is Separate / Common = 0/1
Index 801
Bit 1: AMNDL/AMNDN command tenant data table development is Separate / Common = 0/1
Index 818
Bit 5=1: Dial Plan to support IP Centrex Functionality is in service.
Bit 3: 16-digit Dial Plan Support for IP Centrex Functionality **Note 3**
0/1 = In Service/Out of Service

STEP 3: **ANPDN** - Reserve a Number Level for Private Number.

STEP 4: **ASPAN** - Assign an Access Code to the Private Number. SRV = "LCR: Least Cost Routing", LGRT = dummy route.

STEP 5: **AUGNN** - Assign a UGN to NPC.

TN: Tenant Number
LGRT: Logical Route Number (1-899) (Assign the dummy route specified in STEP 3.)
NPC: Number Pattern Code (Maximum 16 digits)
UGN: User Group Number (1-255)
PVNND: Private Number Necessary Digits (2-8) **Note 4**, **Note 5**

STEP 6: **AUPVN** - Assign Private Number to the assigned UGN.

UGN: User Group Number
PRVDC: Private Digit Code (Maximum 8 digits) For example, 8 + 95, Private Digit Code is 895. **Note 7**

STEP 7: **ARTDN** - Assign the number of digits for using as an Extension Number for the ISDN Bch route by using CDN 66. The number of digits is counted from the last digit of the received digits. This DC value corresponds to the DC parameter of ACDDN command in the next step.

CDN 66: Dialed Number Confirmation

STEP 8: **ACDDN** - Assign Change Digit Code to change the received digits to adequate number that conforms to the numbering plan of the main node.

D/N:	Day/Night
LGRT:	Logical Route Number (1-899)
FPC:	Fusion Point Code
RT:	Route Number
DC:	Digit Code (Maximum 8 digits)
CDC:	Change Digit Code (Maximum 16 digits) **Note 3**
AD:	Additional Dialing
XFR:	Transfer Service

STEP 9: **AMNDN** - Assign the maximum necessary digits for Private Number.

TN:	Tenant Number
DC:	Destination Code. Enter Access Code + Office Code. (Maximum 10 digits)
MA-ID:	Message Area ID. AMNDL only. (0-9999)
AREA NAME:	Area Name (Maximum 16 digits)
MND:	Maximum Necessary Digit (1-32)
TOLL:	Toll Code Identification (Local Code/Toll Code)
AN:	Optional Service Restriction Data (Out of service/Account code)
RATE:	Optional Service Data. Fixed to 0.
A/D:	Analog/Digital

Note 3: Set these data to either enable or disable the use and display of 9-16 digits for Private Number.

Note 4: Assign the number of digits for Access Code + Office Code.) For example, 8 + 95 = 3 digits, assign 3.

Note 5: The maximum eight digits can be assigned for PVNND and PRVDC. In the following cases, the maximum six digits can be assigned for PVNND and PRVDC.

- ASYDN, SYS1, Index 818, Bit 3=1 (16-digit Dial Plan Support for IP Centrex Functionality is out of service.)

[Data for Node to be accommodated to Main Node]

STEP 1: **ANPDN** - Reserve a Number Level for Private Number.

STEP 2: **ASPAN** - Assign an Access Code to the Private Number. SRV = "LCR: Least Cost Routing", LGRT = dummy route.

STEP 3: **AUGNN** - Assign a UGN to NPC.

TN:Tenant Number
LGRT:Logical Router (1-899) (Assign the dummy route specified in STEP 2.)
NPC:Number Pattern Code (Maximum 16 digits)
UGN:User Group Number (1-255)
PVNND:Private Number Necessary Digits (2-8) **Note 6**, **Note 7**

[Reference]
When Access Code = 8, Office Code = 95, Extension Number = 2×××
NPC = 8952, UGN = 20, PVNND = 3

STEP 4: **AUPVN** - Assign Private Number to the assigned UGN.

UGN: User Group Number (1-255)
PRVDC: Private Digit Code (Maximum 8 digits) **Note 7**

[Reference]
When Access Code = 8, Office Code = 95, Extension Number = 2×××
UGN = 20, PRVDC = 895

STEP 5: **AISTL** - Assign IP Station data.

TN: Tenant Number (1-63)
IP STN: IP Station Number (Maximum 5 digits)
KIND: Kine of IP Station
TEC: Telephone Class (0-31)
RSC: Route Restriction Class (0-15)
SFC: Service Feature Restriction Class (0-15)
LENS: Line Equipment Numbers

STEP 6: **ALGSN** - Assign Telephone Station data to LENS/PHIN or Station Number.

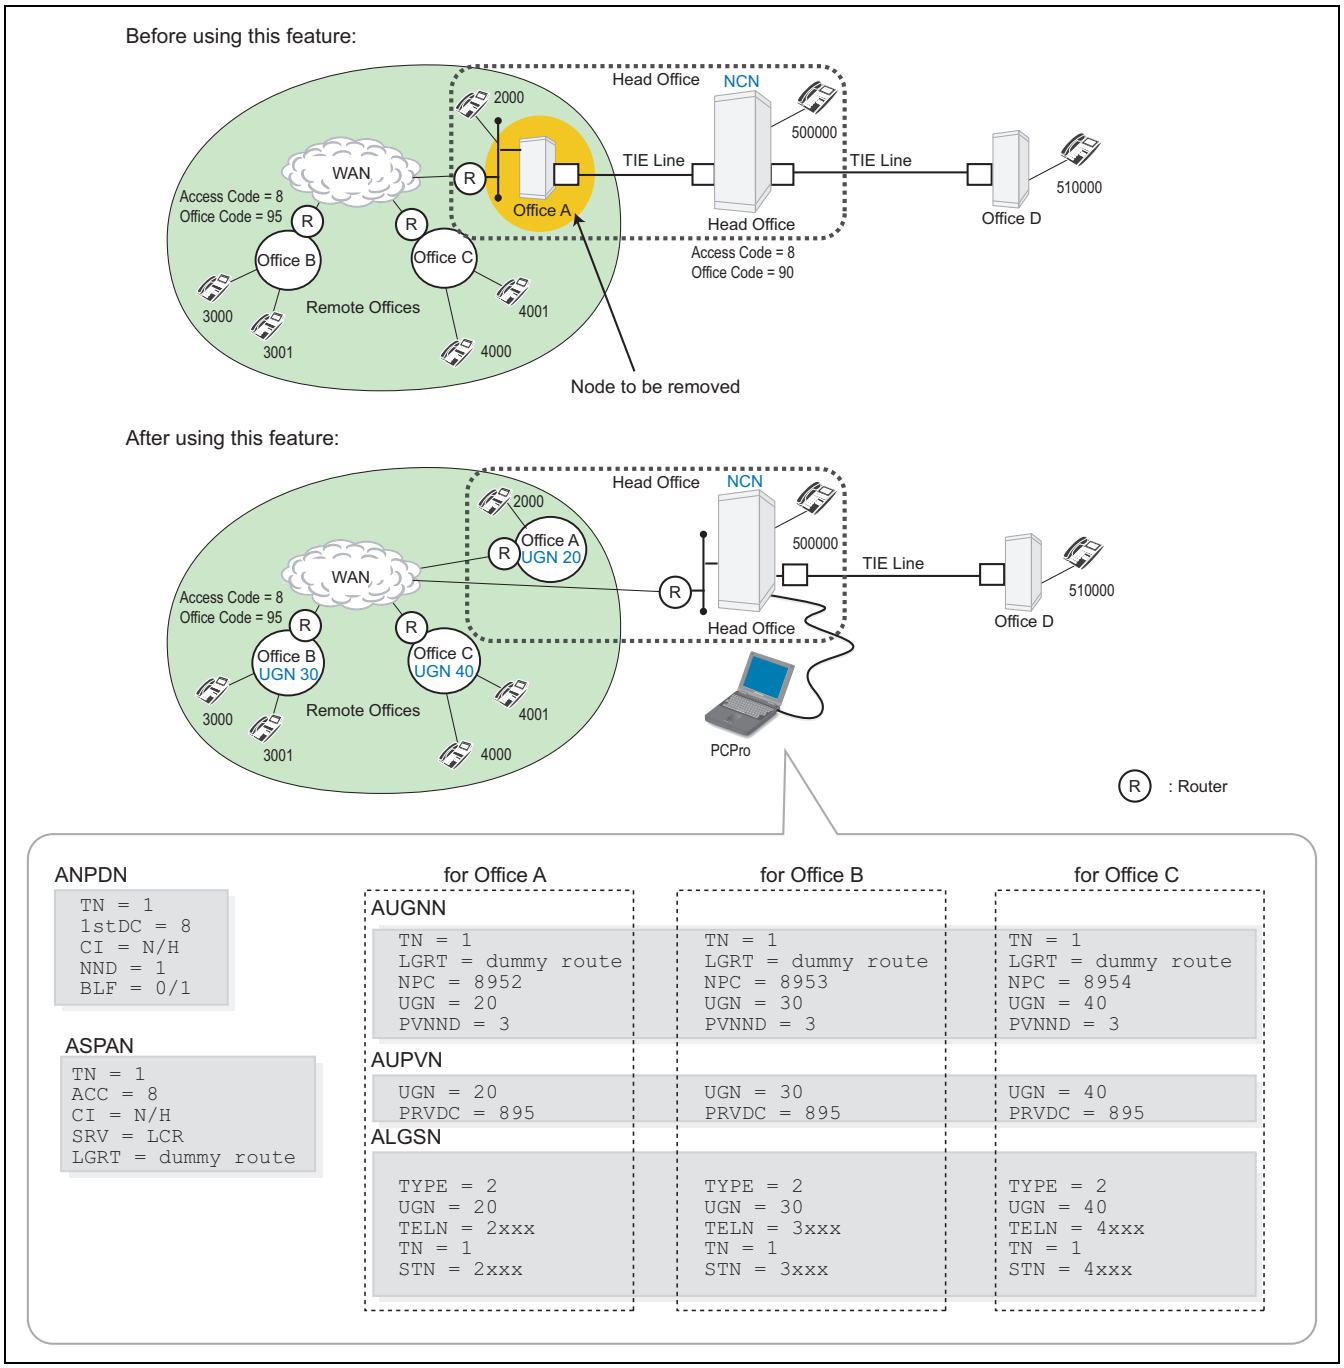
TYPE = 1 (Line Equipment Numbers/Phantom Index is used for specifying Telephone Number)
UGN: User Group Number (1-255)
TELN: Telephone Number (Maximum 16 digits)
FPC: Fusion Point Code (1-253)
LENS/PHIN: Line Equipment Numbers/Phantom Index

TYPE = 2 (Station Number is used for specifying Telephone Number)
UGN: User Group Number (1-255)
TELN: Telephone Number (Maximum 16 digits)
TN: Tenant Number (1-255)
STN: Station Number

STEP 7: **ARTDN** - Assign the number of digits that is used as an Extension Number for the ISDN Bch route by using CDN 66. The number of digits is counted from the last digit of the received digits. This DC value corresponds to the DC parameter of ACDDN command in the next step.

CDN 66: Dialed Number Confirmation

STEP 8: **ACDDN** - Assign Change Digit Code to change the received digits to adequate number that conforms to the numbering plan of the main node.



D/N: Day/Night
LGRT: Logical Route Number (1-899)
FPC: Fusion Point Code
RT: Route Number
DC: Digit Code (Maximum 8 digits)
CDC: Change Digit Code (Maximum 16 digits) **Note 6**
AD: Additional Dialing
XFR: Transfer Service

Note 6: Assign the number of digits for Access Code + Office Code.

Note 7: The maximum eight digits can be assigned for PVNND and PRVDC. In the following cases, the maximum six digits can be assigned for PVNND and PRVDC.
- ASYDN, SYS1, Index 818, Bit 3=1 (16-digit Dial Plan Support for IP Centrex Functionality is out of service.)

[Sample Office Data Assignment]

The following shows a sample data sheet for this particular network.

D-168 Distinctive Ringing - PBC

General Description

This feature allows the system to provide distinctive ringing patterns for EMEA Type system so that EMEA Type system users can distinguish between incoming trunk calls and station calls.

Note: This feature is only available for EMEA Type system.

Operating Procedure

No manual operation is required.

Service Conditions

1. The following Ringer Patterns are applied by ASYD, SYS1, Index 385, Bit 6 data setting.
   a.) Ringer Pattern 0 - Ringing for incoming trunk calls:
   0.25 seconds-ON, 0.25 seconds-OFF, 0.25 seconds-ON, 4.25 seconds-OFF
   b.) Ringer Pattern 1 - Ringing for station calls:
   1 second-ON, 4 seconds-OFF
   c.) Ringer Pattern 2 - Ringing for No Answer Timer for Call Hold:
   0.25 seconds-ON, 0.125 seconds-OFF, 0.25 seconds-ON, 0.125 seconds-OFF, 0.25 seconds-ON, 2 seconds-OFF
   d.) Ringer Pattern 3, 4 - Not used for EMEA Type system
   e.) Ringer Pattern 5 - Ringing for Call Back, Outgoing Trunk Queuing, Call Waiting, and Automatic/Dial Intercom:
   0.25 seconds-ON, 0.125 seconds-OFF, 0.25 seconds-ON, 0.125 seconds-OFF, 0.25 seconds-ON, 2 seconds-OFF
   f.) Ringer Pattern 6, 7 - Distinctive Ringing for Caller ID:
   1 second-ON, 2 seconds-OFF
2. ON/OFF timing of each Ringer Pattern is fixed (ON/OFF timing cannot be changed by ASYD, SYS3, Index 0, Index 1, Index 3, Index 7, Index 8 and Index 9 data setting).
3. To activate the system data (ASYD, SYS1, Index 385, Bit 6), initialize the corresponding ELC card and re-register the terminal accommodated on SP-PHD.
4. When multiple incoming calls are simultaneously terminated to the Multi Line on the Desktop terminal, the priority of Ringer Pattern is as follows:

Priority	1st	2nd	3rd	4th	5th	6th
Ringer Pattern	RG 7	RG 6	RG 5	RG 2	RG 0	RG 1

5. To activate this feature with PA-16ELCJ-B, the following firmware is required.

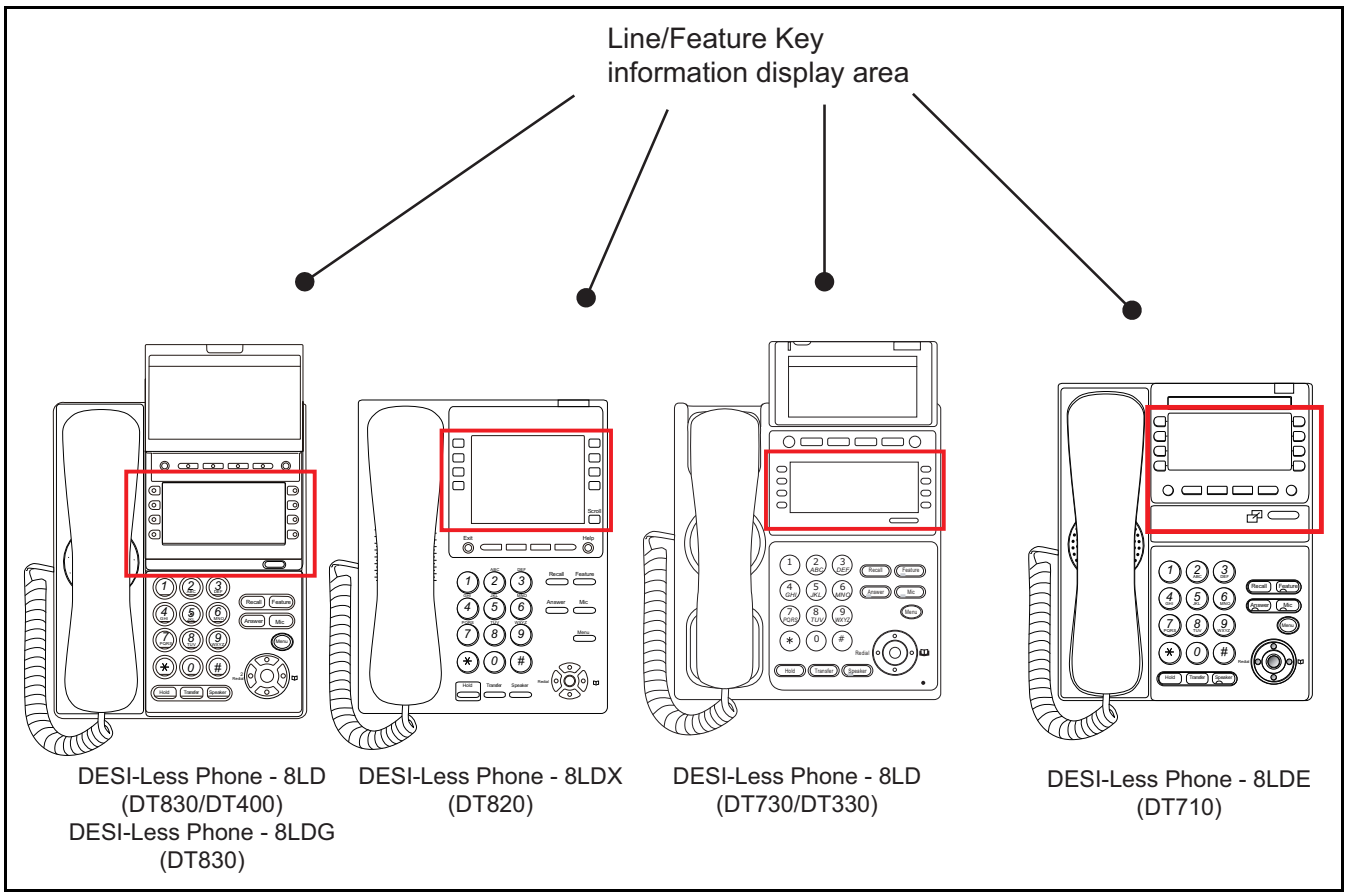
Equipment	Firmware
PA-16ELCJ-B	SP-3873 16ELCJB PROG-J Issue 1 or later

6. When Tone five, six, eight, nine or ten is specified on the Desktop terminal, Ringer Patterns provided by this feature become invalid. The tone can be changed by pressing the Feature + 3.

7. Only the following IP terminals are available for this feature.

   - DtermIP (Dterm Series *i*)
   - DtermIP INASET

   Note: Tones five to ten are only available with Dterm Series i. There will be only four tones for previous Dterm series and IP Enabled Dterms.



Programming

ASYD - SYS1, Index 385, Bit 6. Ringer Pattern for EMEA Type system. 0/1: Out of service/In service.

D-169 DESI-Less Terminal

General Description

DESI-Less Phone refers to Desktop terminals with Line/Feature key information display area. The information assigned on each Line/Feature key is displayed on the corresponding LCD.

Operating Procedure

Refer to the User's Guide or Operation Manual of each terminal.

Service Conditions

1. When Line/Feature key data is changed by PCPro, periodic refresh for Line/Feature key information display area is required. By assigning ASYDL, SYS1, Index 674, Bit 5=0, periodic refresh is executed every 90 seconds.

   Note: When periodic refresh is out of service (ASYDL, SYS1, Index 674, Bit 5=1), even when the display information is changed by ANDD or ALGSL/ALGSN commands, the displayed information on the LCD is not refreshed automatically. Execute one of the following to update the display:
   - Pull out and push in the modular/LAN cable of the terminal

- Re-login
- Initialize the ELC card on which the terminal is accommodated
- Initialize the system

2. System data (ASYD, SYS1, Index 78, Bit 4 and Index 389, Bit 0 to Bit 4) and ASLG command setting can change the language to be displayed on the LCD.

Note: Refer to [M-117] Multilingual Display for the data assignment of ASLG command.

3. The table below shows the number of characters to be displayed on the LCD of each key:

Line/Feature key information	Maximum number of characters to be displayed **Note 1**
Line key (Information about name and number)	8 characters
SPD key (Information about name and number)	8 characters
Feature key (Feature name of software key)	11 characters

Note 1: For the terminals other than DT800/DT700/DT400/DT300 Series, the maximum number of characters will be 6. Also, when the feature name is changed by Line key, SPD key, or AFDD command, the maximum number of characters will be 6.

4. When the number of characters exceeds the limit, system data (ASYD, SYS1, Index 241, Bit 6) can change the display option. **Note 2**
5. When a line is assigned on any Line/Feature key, the displayed information on Line/Feature key information display area can be chosen by the system data (ASYDL, SYS1, Index 673, Bit 5) to show name or number. However, when name information is not assigned, Telephone Number (if registered) or Station Number is displayed.
6. When a feature is assigned on any Line/Feature key, the same feature name with software key is displayed. When no feature is assigned, the FKY code is displayed. In both cases, you can modify the feature name by AFDD/AFDDN command. **Note 2**

Note 2: When periodic refresh is in service (ASYDL, SYS1, Index 674, Bit 5=0), the display is updated in about a minute after changing the office data.

7. Icons are displayed on the LCD corresponding to each Line/Feature key. They work according to the LED control of Line/Feature key.
8. Only for DESI-Less terminals in DT830/DT730/DT430/DT330, an icon for page scrolling is provided. Page icon moves you forward through pages to cover total 32 features/lines corresponding to 8LD/8LDE/8LDG per page.
9. Using ASFC/ASFCN command (SFI=264), Line/Feature key information display area can be fixed to a single page with scrolling disabled.

Note: Available since FP95-115 V5.

Interactions

Speed Calling - One Touch -D on DESI-Less Phone

The following are the conditions for the Name Display function of [S-26D] Speed Calling - One Touch -D on DESI-Less Phone.

1. When SPD key is assigned on any Line/Feature key, Line/Feature key information display area shows the name information of Speed Calling. When name information is not assigned for Speed Calling, the LCD displays the Speed Calling number or the feature name on a system base (ASYDL, SYS1, Index 674, Bit 6).
   However, when [D-165] Dialed Number Privacy Mode is in-service (ASYDL, SYS1, Index 674, Bit 7=1), "*" is displayed instead of Speed Calling number.
2. Name Display for Speed Calling is only available on DESI-Less Phone.
3. Name information can only be assigned, modified, or deleted on the stations using DESI-Less Phone (**Note 3**). Assignment from PCPro is not supported.

   Note 3: Refer to the User's Guide or Operation Manual of the terminal for the assignment procedure.

4. Alphanumeric characters and special characters are available to use for name information entry. Euro characters (uppercase, lowercase) are supported on DT800/DT700/DT400/DT300 Series.
5. Up to 4096 stations can assign the name information of Speed Calling per system.
6. Assigned name information can be saved by the maintenance command MEM_HDD. For Digital terminals accommodated on ELC card, use BOSD command to backup Speed Calling number and use MEM_HDD command to backup Speed Calling name information. See the table below.

Terminal Type	Speed Calling number	Speed Calling name information
IP station	MEM_HDD	MEM_HDD
Digital terminal	BOSD	MEM_HDD

7. When station data is deleted, name information of related station is also deleted.
8. Because Speed Calling name information is assigned toward a key, the name data is not cleared/changed by changing the assigned number.
9. Assigned name information is only used for the display on Line/Feature key information display area. The display when the terminal is dialing, hearing RBT, or being connected corresponds to the assigned number.
10. Name information entry is available only when the station is idle or ringing. Even when My Line is not used, name information entry does not work during other key operation.
11. Station user can continue assignment operation when a call terminates during name information entry. However, when digit code or any keys irrelevant to name information entry is pressed, the terminal exits the assignment and then acts as operated.
12. When 30 seconds of no key operation is detected, the station goes back to idle state discarding the name information entry.
13. SPD key data can be changed as many times as desired by pressing the SPD key again, unless any digit code or software key is pressed.
14. A blank space can be entered by pressing INS key or "→" key.
15. Name information will be deleted when SET key is pressed without entering any data.

Dialed Number Privacy Mode

By assigning ASYDL, SYS1, Index 674, Bit 7=1, [D-165] Dialed Number Privacy Mode can be activated with DESI-Less Phone under the following conditions.

1. The icon on DESI-Less Phone indicates as follows in each dial mode:
   - Normal Mode: No information
   - Privacy Mode 1: ■ (steady)
   - Privacy Mode 2: ■ (flashing)
2. When ASYDL, SYS1, Index 674, Bit 6=1 (Speed Calling number is displayed on the LCD of SPD key), Speed Calling number display can act together with the Dialed Number Privacy Mode depending on the system data setting (**Note 4**):

   <Example>
   When "12345" is registered to SPD key and ASYDL, SYS1, Index 674, Bit 7=1 (Dial mode works on Speed Calling number display):
   - Normal Mode: "12345" is displayed.
   - Privacy Mode 1, 2: "SPD" is displayed. **Note 5**

Note 4: Regardless of the ASYDL, SYS1, Index 674, Bit 7 setting, the feature name "SPD" is displayed when ASYDL, SYS1, Index 674, Bit 6=0.

Note 5: "Speed Call" is displayed when 11 characters is enabled (ASYDL, SYS1, Index 684, Bit 0 = 0).

Programming

STEP 1: **ASYD** - SYS1, Index 241, Bit 6: How to handle the characters/numbers when the number of digits exceeds the limit (8 digits) to display on the LCD of Line/Feature key information display area.

0 = The first 7 digits + an asterisk (*) are displayed (i.e. CALL-FO*)

1 = An asterisk (*) + the last 7 digits are displayed (i.e. *LLCALLS)

SYS1, Index 78, Bit 4 and Index 389 Bit 0 to Bit 4: Language displayed on the LCD

	Index 78	Index 389				
	Bit 4	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
English	0	0	0	0	0	0
Portuguese	0	0	0	0	0	1
Spanish	0	0	0	0	1	0
French	0	0	0	0	1	1

Note: Refer to [M-117] Multilingual Display for the data assignment of ASLG command.

STEP 2: **ASYDL** -
SYS1, Index 673, Bit 5: Choose the information to be displayed on DESI-Less Phone.
0/1 = Name/Number
SYS1, Index 674, Bit 5: Periodic refresh for display information on DESI-Less Phone.
0/1 = ON/OFF

STEP 3: **ASYDL/ASYDN** -
SYS1, Index 684, Bit 0: 11 characters indication for Feature key information
0/1 = ON/OFF

Note: Available for DT800/DT700/DT400/DT300 Series.

SYS1, Index 684, Bit 1: DESI-Less icon display
0/1 = ON/OFF

STEP 4: **ASFC/ASFCN** - Assign a Service Feature Restriction Class that allows SFI 259 to the station (DT710 DESI-Less)
DAY/NIGHT: Day/Night Mode
TN: Tenant Number
SFI: 259 (DT710 DESI-Less (The terminal display is switched to Home display by pressing Feature key)) **Note 6**, **Note 7**
SFI: 264 (DESI-Less Display - One Page Mode) **Note 7**, **Note 8**, **Note 9**
SFC: Service Feature Restriction Class
RES: 0/1 (Restricted/Allowed)

Note 6: Assign this data when using DT710 DESI-Less.

Note 7: Reboot the terminal after assigning this data.

Note 8: Assign this data when Line/Feature key information display area (DESI-Less Display) is fixed to a one page display.

Note 9: Available since FP95-115 V5.

<Data Programming for Line key information (My Line, Sub Line, Virtual Line)>

For the data programming of name information, refer to [N-28] Name Display - System.

<Data Programming for Feature key information>

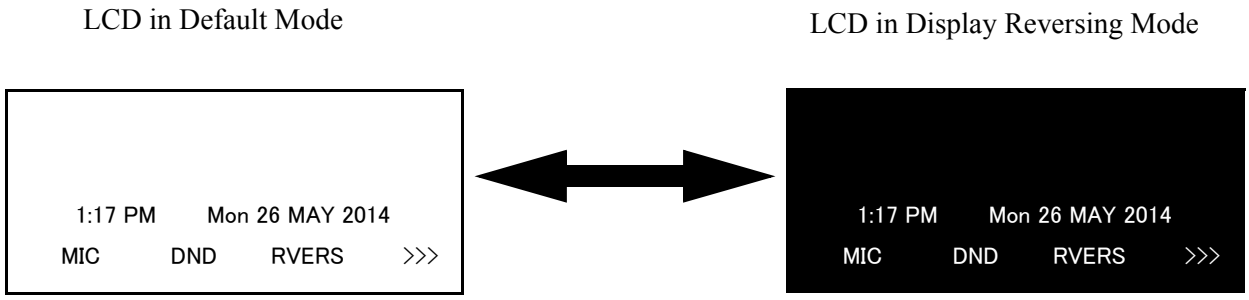
Refer to AFDD/AFDDN command in Command Manual.

<Data Programming for SPD key information>

STEP 1: **ASYDL** - SYS1, Index 674
Bit 6: Display for SPD key on DESI-Less Phone. 0/1 = Feature name/Speed Calling number
Bit 7: Dialed Number Privacy Mode works with Speed Calling number display. 0/1 = OFF/ON

STEP 2: **AKYD** - Assign the Feature key data of Desktop terminal.
KYN: Key number
FKI: 1 (Function key)
FKY: 165 (SPD Name Assign)

STEP 3: **ADSL** - Assign the Software key data of Desktop terminal.
SN: 0 (Idle)
SKN: Software key number
FKY: 165 (SPD Name Assign)



Note: Assign the name information of Speed Calling by pressing the SPD Name Assign key on DESI-Less terminal's Line/Feature key. For the assignment procedure, refer to User's Guide or Operation Guide of each terminal.

D-170 Display Reversing

General Description

This feature enables DT800/DT700 and DT400/DT300 Series terminal to reverse the black and white in its display: background, characters and icons. Perform one of the following to reverse the black and white in the display;

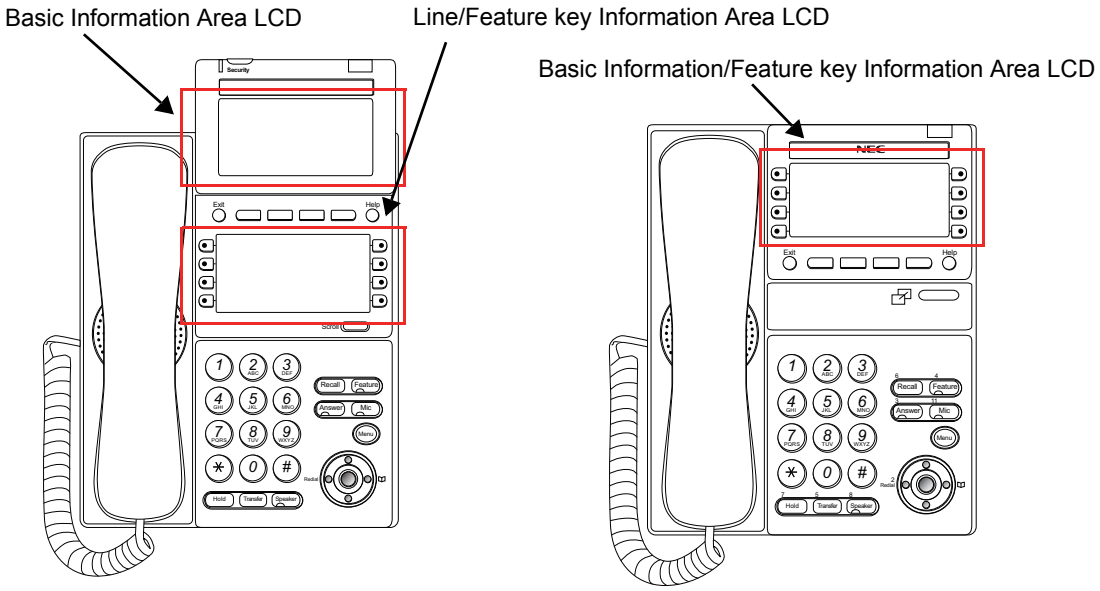
- Assign the feature to a Line/Feature key.
- Assign the feature to a Soft key.

Operating Procedure

Press Line/Feature key or Soft key assigned for Display Reversing. LCD will toggle between Display Reversing Mode and Default Mode each time the key is pressed.

Service Conditions

1. To maintain “Display Reversing” state,
   - When the terminal is initialized, the terminal maintains the state prior to initialization.
   - Following actions of terminals will erase data;
     a.) DT800 Series/DT700 Series: Turning the Telephony Server's power OFF-ON. **Note 1**
     b.) DT400 Series/DT300 Series: Mounting the ELC circuit card in a different mounting slot.
   - Saved data for “Display Reversing” returns to default when switching to SR-MGC, or when switching to Backup Node by Location Diversity [L-55].



Note 1: To maintain data, save “One Touch Speed Calling for DtermIP” using the MEM_HDD command.

2. This feature is available for the following terminals;

   - DT800 Series/DT700 Series: DT830/DT730, DT830G/DT730G (12DG/24DG), DT710 **Note 2**
   - DT400 Series/DT300 Series: DT430/DT330

   Note 2: This feature is not available for the following DT800 Series/DT700 Series;
   - DT710 2-button/12-button type without LCD
   - DT830G/DT730G (12CG/24CG)
   - DT750

3. For DT830/DT730/DT710 (DESI-LESS)/DT430/DT330 (DESI-LESS) terminal: "Display Reversing" occurs in both Basic Information Area LCD and Line/Feature key information area LCD.

DT830/DT730/DT430/DT330 (DESI-LESS)

DT710 (DESI-LESS)

4. One of the ELC cards listed below is required for this feature.

ELC Card	Firmware Requirements
CH-16ELCA	SP-4035 16ELCA PROG-A Version 1 or later.
PA-16ELCN	SP-3977 16ELCN PROG-B Version 1 or later.
PA-16ELCN-A	SP-4013 16ELCN-A PROG-A Version 1 or later.

<Conditions Specific to This Feature>

1. This feature is not available in the terminal's Configuration menu.
2. Controlling the Line/Feature key lamp and Soft key display by configuring ASYDL, SYS1, Index 1256, Bit 2: **Note 3**

SYS1, Index 1256, Bit 2=	Mode	Line/Feature Key Lamp	Soft Key
0	Default	OFF	Remains the same.
	Display Reversing	OFF	Remains the same.
1	Default	OFF	Remains the same.
	Display Reversing	ON	RVERS

Note 3: When changing data for ASYDL, SYS1, Index 1256, Bit 2, user must execute the following:
- DT800 Series/DT700 Series: Initialize the Telephony Server
- DT400 Series/DT300 Series: Initialize the circuit card

Programming

<Assigning Display Reversing Feature to a Line/Feature key>

AKYD - Assign the following key data for DT Series terminals.
TN (Tenant Number): 1-63
UGN (User Group Number): 1-255
STN (Station Number): Maximum 5 digits for Business Services, 6 digits for Hotel services.
TEL (Telephone Number): Maximum 16 digits.
KYI (Service Index): 1 (Line/Feature Key)
FKY (Function Key Number): 190 (Display Reversing)

<Assigning Display Reversing Feature to a Soft key>

STEP 1: **ADSL** - Assign the Soft key pattern data.
SKP (Soft Key Pattern Data): 0-15
SN (Status Number): 0-15
SKN (Soft Key Number): 0-15
FKY (Function Key Number): 190 (Display Reversing)

STEP 2: **ADKS** - Assign the Soft key pattern data to DT Series terminals.
TN (Tenant Number): 1-63
STN (Station Number): Maximum 5 digits for Business Services, 6 digits for Hotel services.
SKP (Soft Key Pattern): SKP assigned by the ADSL command.

<Controlling the Line/Feature key lamp and Soft key Display>

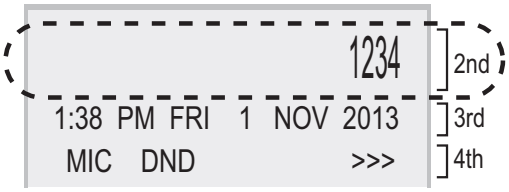
ASYDL - Assignment of System Data for LDM.
SYS1
Index 1256
Bit 2=1
Behaviors of Line/Feature key lamp and Soft key display are;

- Line/Feature key: Lamp turns on.
- Soft Key: RVERS

Note: When changing data for ASYDL, SYS1, Index 1256, Bit 2, user must execute the following:

- DT800 Series/DT700 Series: Initialize the Telephony Server
- DT400 Series/DT300 Series: Initialize the circuit card

D-172 Display Enlarged Characters



General Description

This feature enables a DT800 Series/DT700 Series terminal to switch the size of characters displayed in the 2nd line and the 3rd line on the LCD to a double height size. The following shows an example when using this feature:

1. No enlarge characters

2. Display enlarged characters (2nd line)

3. Display enlarged characters (3rd line)

Operating Procedure

To switch the characters displayed to double height size, press the Soft Key or the Line/Feature Key. By pressing the Soft Key or the Line/Feature Key, you can switch the characters displayed to double height size in the order of "Display enlarged characters (2nd line)"→"Display enlarged characters (3rd line)"→"No enlarge characters".

Service Conditions

1. The enlarged characters display will be cleared by turning off/on the power of the Telephony Server.

   Note: To maintain data, save “One Touch Speed Calling for DtermIP” using the MEM_HDD command.

2. When the terminal initialization is executed, the previous status of the terminal initialization will be maintained.

3. For using this feature, use the terminal with the following firmware versions.

Terminals	Firmware Version
DT830G Series	Version 3.0.0.0 or later
DT830 Series	Version 3.0.0.0 or later
DT730G Series	Version 1.0.3.0 or later
DT730 Series	Version 5.0.5.0 or later
DT750	Version 5.0.5.0 or later

Note: This feature is only available for the terminals with a 4-line LCD. For other terminals, this feature is not available.

4. If you delete the station data while enlarged characters are displayed, and assign another station number to the same location, the deleted information of enlarged characters is taken over.
5. The line displayed in enlarged characters can be specified per terminal.

Interactions

1. This feature and Name Display Service cannot be activated simultaneously. For using this feature enabling Name Display Service, assign System Data (ASYDL, SYS1, Index 673, Bit 0=1 and Bit 1=1), and disable the indication of Name Display information registered on Terminal Phonebook.
2. Even if call status or display contents are changed, the indication of enlarged characters in the line is maintained. However, while the terminal displays the screen for each of the following conditions, the indication of enlarged characters will be canceled. If you switch the line of enlarged characters while displaying the screen for each of the following features, the indication of enlarged characters will be enabled after the screen closed.

   - When Call History is displayed.
   - When Phonebook is displayed.
   - When help screen displayed pressing Soft Key.
   - When menu screen is displayed.

Programming

<Assigning Display Reversing Feature to a Line/Feature Key>

STEP 1: **AKYD/AKYD_T** - Assign the following key data for DT Series terminals.
TN (Tenant Number): 1-63
UGN (User Group Number): 1-255
STN (Station Number): Maximum 5 digits for Business Services, 6 digits for Hotel services.
TEL (Telephone Number): Maximum 16 digits.
KYI (Service Index): 1 (Line/Feature Key)
FKY (Function Key Number): 198 (Large Font)

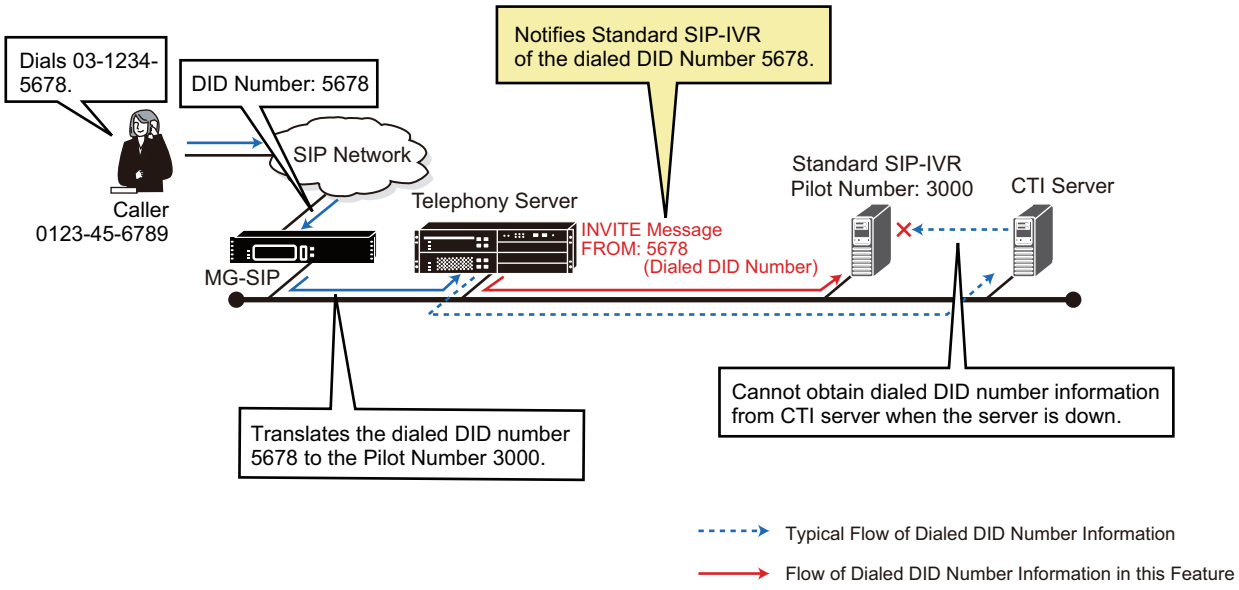
<Assigning Display Reversing Feature to a Soft Key>

STEP 1: **ADSL** - Assign the soft key pattern data.
SKP (Soft Key Pattern Data): 0-15
SN (Status Number): 0-15
SKN (Soft Key Number): 0-15
FKY (Function Key Number): 198 (Large Font)

STEP 2: **ADKS** - Assign the soft key pattern data to DT Series terminals.
TN (Tenant Number): 1-63
STN (Station Number): Maximum 5 digits for Business Services, 6 digits for Hotel services.
SKP (Soft Key Pattern): SKP assigned by the ADSL command.

D-173 DNIS without CTI Server

General Description



This feature provides reliable Dialed Number Identification Service (DNIS) that requires no CTI server. It allows the Telephony Server to directly notify Standard SIP-IVR server (**Note 1**) of Direct Inward Dialing (DID) number information received from public ISDN or SIP network.

A typical IVR system obtains dialed DID number information via a CTI server, which means it cannot access the information if the CTI server is down. With this feature, the Telephony Server sends dialed DID number information directly to your Standard SIP-IVR server using the FROM field of INVITE message to establish the connection to the IVR. This way your Standard SIP-IVR server can offer DNIS regardless of the state of the CTI server.

Note 1: The term “Standard SIP-IVR server” means an Interactive Voice Response (IVR) system that satisfies the service conditions specified in SIP HANDLER - SIP TERMINAL [S-167].

Note: This feature is available since FP95-112 V2.

Example: DID Call Received from SIP Network

Operating Procedure

None.

Service Conditions

<Important Notices>

This feature is only available for incoming calls from ISDN or SIP network; otherwise it does not work.

<Interactions with Other Features>

None.

<Hardware/Software>

None.

<Interactions with Networks>

This feature can be used in conjunction with the Peer-to-Peer FCCS routing. However, it does not support the DTI-FCCS routing.

<Conditions Specific to This Feature>

With the User Agent Class Data setting of the AUACL/AUACN command, you can specify whether to notify Standard SIP-IVR server of both caller's number (ANI) and dialed number (DNIS) or dialed number only.

<Other Conditions>

None.

Programming

The procedure differs, depending on whether the same User Agent information is applied to all Standard SIP-IVR servers in the system when this feature is activated.

- Using the Same User Agent Information on All Standard SIP-IVR Servers

  User Agent Class is identified by User Agent information commonly used among all Standard SIP-IVR servers in the system. For details, see <Using the Same User Agent Information on All Standard SIP-IVR Servers>.

- Using Fixed User Agent Class Specified on a Telephone Number Basis

  User Agent Class is identified by a login Telephone Number, regardless of the User Agent Information shared among IVR servers in the system. Using this procedure, you can configure User Agent Class on a Telephone Number basis for multiple Standard SIP-IVR servers. For details, see <Using Fixed User Agent Class Specified on a Telephone Number Basis>.

<Using the Same User Agent Information on All Standard SIP-IVR Servers>

STEP 1: **AUACL/AUACN** - Assignment of the User Agent Class Data for LDM/NDM

Configure User Agent Classes in accordance with the User Agent information available on the Standard SIP-IVR servers.

FUNC=User Agent Class Setting

TYPE=User Agent Class

UAN: User Agent Class Number (1-63)

UA: User Agent (Maximum 32 Characters)

Enter User Agent information used on the Standard SIP-IVR server.

INFORMATION: Information of SIP Phone (Maximum 32 Characters)

Enter additional information or comments on the User Agent Class, if necessary.

User Agent Class Data

DNIS Notification of INVITE: **Note 2**

Only dialed number information is provided in the FROM field of INVITE message for an incoming call.

0/1=Disabled/Enabled

DNIS and ANI Notification of INVITE: **Note 2**

Both dialed number and caller's number information is provided in the FROM field of INVITE message for an incoming call.

0/1=Disabled/Enabled

Note 2: Please note the following points:

- Parameters of **User Agent Class Data**, other than **DNIS Notification of INVITE** and **DNIS and ANI Notification of INVITE**, must be specified to suit the operating environment of the Standard SIP-IVR server. For further information, see the AUACL/AUACN section of Command Manual.
- Parameters **DNIS Notification of INVITE** and **DNIS and ANI Notification of INVITE** are mutually exclusive and cannot be enabled simultaneously.

<Using Fixed User Agent Class Specified on a Telephone Number Basis>

STEP 1: **AUACL/AUACN** - Assignment of the User Agent Class Data for LDM/NDM

Create particular User Agent Classes to be used on a Standard SIP-IVR server for this feature.

FUNC=User Agent Class Setting

TYPE=User Agent Class

UAN: User Agent Class Number (1-63)

UA: User Agent (Maximum 32 Characters) **Note 3**

Enter User Agent information used on the Standard SIP-IVR server.

Note 3: This parameter can be left blank, in which case User Agent data cannot be included in the list of User Agent Search Sequence.

INFORMATION: Information of SIP Phone (Maximum 32 Characters)

Enter additional information or comments on the User Agent Class, if necessary.

User Agent Class Data

DNIS Notification of INVITE: **Note 4**

Only dialed number information is provided in the FROM field of INVITE message for an incoming call.

0/1=Disabled/Enabled

DNIS and ANI Notification of INVITE: **Note 4**

Both dialed number and caller's number information is provided in the FROM field of INVITE message for an incoming call.

0/1=Disabled/Enabled

Note 4: Please note the following points:

- Parameters of **User Agent Class Data**, other than **DNIS Notification of INVITE** and **DNIS and ANI Notification of INVITE**, must be specified to suit the operating environment of the Standard SIP-IVR server. For further information, see the AUACL/AUACN section of Command Manual.
- Parameters **DNIS Notification of INVITE** and **DNIS and ANI Notification of INVITE** are mutually exclusive and cannot be enabled simultaneously.

STEP 2: **ADSDL/ADSDN** - Assignment of Detail SIP phone Data for LDM/NDM

Assign the User Agent Classes specified with the AUACL/AUACN command to Telephone Numbers available on the Standard SIP-IVR server.

UGN: User Group Number (1-255)

TELN: Telephone Number (Maximum 16 Digits (0-9, *, #))

Enter a Telephone Number available on the Standard SIP-IVR server.

KIND=User Agent of System

TYPE=User Agent Class

UAN: User Agent Class Number (1-63)

Enter an User Agent Class Number specified with the AUACL/AUACN command.

E-1 Executive Right-of-Way

General Description

This feature enables selected station users, upon encountering a busy condition at an Internal Station, to barge into the Busy Connection after transmitting a Warning Tone.

Operating Procedure

To enter a Busy Connection using Access Code

1. Dial the busy Station. Receive Busy Tone.
2. Switch hook flash. Receive Special Dial Tone.

   Note: The availability of special dial tone is changed depending on the combination of the Step Call - CCIS Restriction (ASYD, SYS2, Index 6, Bit 2) and SHF method (ASYD, SYS1, Index 68, Bit 0). Refer to Step Call - CCIS [S-59] in Data Programming Manual - CCIS for the detail.

3. Dial the EXECUTIVE RIGHT-OF-WAY Access Code. Warning Tone is sent.
4. The Calling Station has barged into a Three-way Call.

<The following procedures are applied for Desktop terminal only.>

To enter a Busy Connection using Line/Feature key

1. Dial the busy Station. Receive Busy Tone.
2. Press the EXECUTIVE RIGHT-OF-WAY OVER Feature key. The associated LED lights and Warning Tone is sent.
3. The Calling Station has barged into a THREE-WAY CALLING [T-2]. The LCD displays:

Interrupted Party Called Party

OVERRIDE	**XXXX**	**XXXX**
	(Time Display)	

The LCD then displays:

CONF
(Time Display)

Service Conditions

1. Two Burst Tones (.08 second) are transmitted upon activation of this feature to alert the connected parties that an EXECUTIVE RIGHT-OF-WAY Call has been barged into the connection.

   Note: This warning tone is not available for MG(BRI)-SIP.

2. The LCD on the interrupted party's Desktop terminal will give an indication only if INTERMEDIATE STATION NUMBER DISPLAY -D [I-10D] has been programmed in System Data.
3. EXECUTIVE RIGHT-OF-WAY is denied if the busy Station is:
   a.) dialing or in a LINE LOCKOUT [L-3] state
   b.) listening to a Tone
   c.) being rung
   d.) protected from override via CLASS OF SERVICE - INDIVIDUAL [C-15]
   e.) being connected to an ATTENDANT CONSOLE [A-3] Loop
   f.) activating a conflicting feature, such as:

ATTENDANT CAMP-ON WITH TONE INDICATION	[A-1] (Desktop terminal only)
ATTENDANT OVERRIDE	[A-7]
BOSS - SECRETARY OVERRIDE -D	[B-5D]
BUSY VERIFICATION	[B-3, B-9]
CALL HOLD	[C-6]
CALL TRANSFER	[C-10, C-11, C-50, C-54]
CALL WAITING - ORIGINATING	[C-31]
CALL WAITING - TERMINATING	[C-12]
CONSULTATION HOLD - ALL CALLS	[C-17, C-58]
DATA LINE SECURITY	[D-12, D-66]
DATA PRIVACY ON DEMAND	[D-17, D-68]
DIAL ACCESS TO ATTENDANT	[D-2, D-71]
EXCLUSIVE HOLD -D	[E-4D]
NON-EXCLUSIVE HOLD -D	[N-7D]
OFF-HOOK QUEUING	[O-7, O-11]
OUTGOING TRUNK QUEUING	[O-2]
PRIVACY -D	[P-14D]
PRIVACY RELEASE	[P-18]
THREE-WAY CALLING	[T-2]
VOICE CALL	[V-2, V-7]
Data Call through Data Adapter/Data Call through Data Module	(Desktop terminal only)

   Note: In any of the above instances, the Calling Station will receive Reorder Tone.

4. If one party disconnects after the Three-way Conference Barge is established, the remaining two parties will still be connected.
5. The EXECUTIVE RIGHT-OF-WAY Access Code may be assigned according to customer preference.
6. The maximum number of simultaneous EXECUTIVE RIGHT-OF-WAYs allowable is dependent on the number of Conference Function Trunks in the system. (Conference function is included in TSW and MUX circuit cards.)
7. This feature can be denied on DICTATION ACCESS [D-3] and PAGING ACCESS [P-1, 28] Connections through programming in System Data.

8. When Called Station activates CALL FORWARDING- BUSY LINE [C-2], and the call forwarding destination is busy:

   - When call forwarding destination is a station (including stations in FCCS network), ASYD, SYS1, Index 69, Bit 5 determines whether to set EXECUTIVE RIGHT-OF-WAY to the Forwarded-from Station, or to the Forwarded-to Station.

   - When the call forwarding destination is in outside of the self office, EXECUTIVE RIGHT-OF-WAY is restricted and does not work.

9. If the Called Station Line has a party on CALL HOLD [C-6], override is not allowed to the Called Station Line. Also override to a Station Line in CALL HOLD [C-6] is denied and Reorder Tone is provided. Terminating Override Calls are denied when the Called Party has another party in a CONSULTATION HOLD [C-17] condition.
10. If the Called Station is maintenance busy and EXECUTIVE RIGHT-OF-WAY is invoked, override is denied and Reorder Tone is returned to the Calling Station.
11. It is possible, via System Data, to disable the sending of a Warning Tone during an EXECUTIVE RIGHT-OF-WAY Connection. Normally the Two-burst Warning Tone is sent when the connection is initiated.
12. The Node accommodating the Called Station requires Conference Trunk (CFT) function in the FCCS Network.
13. When an EXECUTIVE RIGHT-OF-WAY Connection is established, all the parties (Calling Party, Called Party and Interrupted Party) hear Warning Tone for a certain time.

    Note: Interrupting calls in progress via PHC does not provide Warning Tone to the party connected with Called Party.

    Note: Interrupting calls in progress via CCIS network does not provide the lamp indication of CONF key on the party connected with Called Party.

14. When using this feature against a Station that is engaged in Tandem connection other than CCIS-CCIS, SFI 4 and SFI 11 require to be set to 1 for SFC 0 by using ASFC/ASFCN.
15. This feature can not be used when the Called Party is connected with the Attendant Console.
16. EXECUTIVE RIGHT-OF-WAY is denied if the called party connected via PHC trunk is hearing hold tone. EXECUTIVE RIGHT-OF-WAY is available, however, if the called party is in tandem connection via non-PHC trunk beyond the connection via PHC trunk.
17. To operate this feature from a SIP Handler Controlled SIP terminal, perform the one digit dial hooking operation while hearing Busy Tone (BT) and dial the access code for this feature. To hear Busy Tone (BT), enable IP-DTG with the AUACL/AUACN command.
18. This feature cannot be used when a SIP Handler Controlled SIP terminal is in Multi Line Mode, the SIP Handler Controlled SIP terminal cannot hear a Warning Tone whether it barges into or another station barges into the connection with it.

<The following conditions are applied for Desktop terminals only.>

1. EXECUTIVE RIGHT-OF-WAY can also be accessed via the dial pad (Access Code) or SPEED CALLING - ONE TOUCH -D [S-26D].

Programming

STEP 1: **ASYD** - SYS1, Index 70, Bit 7. Send Warning Tone to interrupted parties when Executive Right-of-Way is in operation 0/1: Required/Not Required.

SYS2, Index 0, Bit 1. Busy Station Service. Assign data "1".

SYS1, Index 69, Bit 5. EXCECUTIVE RIGHT-OF-WAY 0/1 = Set to Forwarded-from Station/Set to Forwarded-to Station

STEP 2: **ANPD** - Assign first digit of Access Code for EXECUTIVE RIGHT-OF-WAY.

STEP 3: **ASPA** - Assign an Access Code for EXECUTIVE RIGHT-OF-WAY, SID 4 for Connection Status Index (CI) of "B: Busy".

STEP 4: **ASFC** - Assign SFI 3 [EXECUTIVE RIGHT-OF-WAY (Calling Side)], SFI 4 [EXECUTIVE RIGHT-OF-WAY (Called Side)], and SFI 11 (Data Line Security).
When using this feature against a Station that is engaged in Tandem connection other than CCIS-CCIS, assign SFI 4 and SFI 11 to 1 for SFC 0.

STEP 5: **AKYD** - Assign EXECUTIVE RIGHT-OF-WAY to a Line/Feature key. Assign Feature key Executive Right-of-Way [3].

STEP 6: **ADSL** - Assign SN = 3 (Called Station is Busy) and Soft key Executive Right-of-Way [3].

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ANPDL** - Assign first digit of Access Code for EXECUTIVE RIGHT-OF-WAY.

STEP 2: **ASPAL** - Assign an Access Code for EXECUTIVE RIGHT-OF-WAY, SID 4 for Connection Status Index (CI) of "B: Busy".

E-3D Elapsed Time Display -D

General Description

This feature provides an LCD display of the time elapsed while a Desktop terminal is connected to any trunk.

Operating Procedure

No manual operation is required.

Service Conditions

1. The ELAPSED TIME is displayed as follows. (H: hour, M: minute, S: second)
   - For a legacy terminal
     M:SS ---> MM:SS ---> H:MM:SS
   - For an IP terminal
     H:MM:SS
2. The ELAPSED TIME is displayed in the eight left-side positions of the LCD.
3. The ELAPSED TIME can reach a maximum of 9 hours, 59 minutes and 59 seconds. After that time, the clock returns to zero.
4. After a conversation ends, the ELAPSED TIME is being displayed for approximately 5 seconds.
5. A continuous time display will occur during CONSULTATION HOLD - ALL CALLS [C-17] and THREE-WAY CALLING [T-2].
6. When a call is transferred, the time display of the party receiving the transfer begins from zero.
7. The ELAPSED TIME is not displayed when the Station is in a specific condition such as:
   a.) THREE-WAY CALLING [T-2]
   b.) connected to a Trunk with held Trunk, as in the case of CONSULTATION HOLD [C-17].
8. In DtermIP, when hooking-off status on the phone is kept after the speech has been finished, LCD displays Hang Up message. Then, if the phone is put in on-hook status, LCD displays “0:00:00”.

Programming

No programming is required.

E-4D Exclusive Hold -D

General Description

This feature allows a user to place a call on hold and to exclude all other users from retrieving the Held Call.

Operating Procedure

While a call is in progress

1. Press the HOLD key twice. The LCD displays:

Held Station or Trunk

2. To return to the Held Call, press the Held Line key. The conversation is re-established.

Service Conditions

1. EXCLUSIVE HOLD -D may be activated from any line appearing on a Desktop terminal.
2. After EXCLUSIVE HOLD has been set, the user can make or answer calls from any other line appearing on the Dterm.
3. Only the Dterm that sets EXCLUSIVE HOLD may retrieve the Held Call.
4. After a variable programmable period of time, the Held Call will enter AUTOMATIC RECALL [A-8] regardless of the status of the Dterm. Ringing, however, is disabled while DO NOT DISTURB -D [D-11D] is activated.
5. The LCD of other Dterm Stations on which the Held Line appears will be lit steadily.
6. Two-party Hold is not available when a Dterm is engaged in a Three-party Conference with a Station and/or Trunk.
7. The held Station is denied the following services:

ATTENDANT CAMP-ON WITH TONE INDICATION	[A-1]
ATTENDANT OVERRIDE	[A-7]
BOSS - SECRETARY OVERRIDE -D	[B-5D]
BUSY VERIFICATION	[B-3, B-9]
CALL WAITING - ORIGINATING	[C-31]
CALL WAITING - TERMINATING	[C-12]
EXECUTIVE RIGHT-OF-WAY	[E-1]

8. In the case of SIP Handler Controlled SIP terminals, use the IP-DTG tone assigned with the AUACL/AUACN command (SST is recommended to use) instead of tones assigned by ASYD, SYS1, Index 72, Bit 2 (Tone pattern to be sent out to stations on Exclusive Hold/Non-Exclusive Hold).
9. This feature cannot be used when a SIP Handler Controlled SIP terminal is in Multi Line Mode.
10. When the held party is an IP terminal and the connection with the party is disconnected due to the accidents such as network failure or unplugging of cables, the lamp of the Line key on the Desktop terminal that held the call keeps flashing. If a user of this Desktop terminal tries to retrieve the call in this condition, dial tone is heard and the lamp of the Line key will stop flashing and turn on.

Programming

STEP 1: **ASYD** - SYS1, Index 144. Automatic Recall Timer for Dterm hold. Assign as data 00H for default value of 30 seconds.

SYS2, Index 12, Bit 1: Automatic Recall Ringer for Exclusive Hold.

0/1 = Recall/No Recall

STEP 2: **ANPD** - Reserve a Number Level for Feature Access. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan.

STEP 3: **ASPA** - Assign an Access Code to Exclusive Hold -D, SRV = "SSCA: Service Code Appendix", SIDA = 32, 35, and assign Connection Status Index (CI) of "H: Hooking" and "N: Normal".

STEP 4: **ASFC** - Permit Exclusive Hold -D for each Service Feature Restriction Class.

SFC: Service Feature Restriction Class [0-15]

SFI: SFI 35=1 (Exclusive Hold -D, Non-Exclusive Hold -D)

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ANPDL** - Reserve a Number Level for Feature Access. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan.

STEP 2: **ASPAL** - Assign an Access Code to Exclusive Hold -D, SRV = "SSC: Service Code", SID = 5 for Connection Status Index (CI) of "B: Busy" and "N: Normal".

E-11 Emergency Call

General Description

This feature allows a user to make an EMERGENCY CALL by dialing a Special Telephone Number (Emergency Telephone Number). Even if the Calling Station goes on-hook, the Calling Station is recalled by either of the following methods and the speech path is maintained until the Emergency Telephone goes on-hook.

- Recall the Calling Station by pressing the switch hook or the TRANSFER key
- Recall the Calling Station automatically

When a Station dials the Emergency Telephone Number, a System Message is printed out to report the EMERGENCY CALL.

Operating Procedure

Recall the calling station by pressing the switch hook or the TRANSFER key

- Recalling the calling station by pressing the switch hook

1. Calling Station puts the handset down.
2. Emergency Telephone goes on-hook.
3. Calling Station is recalled.

- Recalling the calling station by pressing the TRANSFER key

Note: If the terminal is equipped with the TRANSFER key, operation by pressing the TRANSFER key is required. Operation by pressing the switch hook is not effective for the terminal equipped with the TRANSFER key.

1. Calling Station puts the handset down.
2. Emergency Telephone presses the TRANSFER key.
3. Calling Station is recalled.

Recall the calling station automatically

1. Single Line Telephone and Digital terminal can be used as the Emergency Telephone. IP terminal, SIP Multiple Line Terminal, and Soft Phone cannot be used as the Emergency Telephone.
2. This feature is available when an Emergency Telephone Number is dialed via STATION-TO-STATION CALLING [S-11].
3. This feature is also available when an Emergency Call is made via CALL FORWARDING - ALL CALLS [C-5] or CALL FORWARDING - BUSY LINE [C-2].
4. Switch hook flash services, such as CONSULTATION HOLD - ALL CALLS [C-17], may be restricted.
5. Only the Emergency Telephone is allowed to disconnect from an Emergency Call. Upon disconnection, the Calling Station will hear Reorder Tone.
6. This feature is not available between Emergency Stations. When either of the Emergency Stations goes on-hook, the other Emergency Station receives Reorder Tone, and CALL BACK [C-1] is not performed.

7. When a Station makes an EMERGENCY CALL by any method, other than STATION-TO-STATION CALLING [S-11] (STATION-TO-STATION CALLING - OPERATOR ASSISTANCE [S-12], OFF-HOOK ALARM [O-6], etc.), there is no System Message printout, but CALL BACK [C-1] to the Calling Station is performed.
8. When a Digital Terminal is used for an EMERGENCY CALL, VOICE CALL [V-2] can be used.
9. An Emergency Telephone can assign CALL FORWARDING - BUSY LINE [C-2] or CALL FORWARDING - ALL CALLS [C-5], but when transfer is made to other than an Emergency Station, this feature is not available.
10. An Emergency Station can assign CALL FORWARDING - DON'T ANSWER [C-3]. In this case, when a call terminates to the Emergency Station, a System Message printout is performed. When a call is transferred by CALL FORWARDING - DON'T ANSWER [C-3], the situation regarding when the Station goes on-hook is as follows:
    a.) If neither the Calling Station nor the Transfer Destination Station is an Emergency Station, there is no CALL BACK [C-1].
    b.) If either the Calling Station or the Transfer Destination is an Emergency Station, CALL BACK [C-1] is operative. (No printout is performed).
    c.) If both the Calling and Destination Stations are Emergency Stations, there is no CALL BACK [C-1]. (No printout is performed).
11. When the Emergency Station is busy, the caller receives Busy Tone, and this feature is not available.
12. The Emergency Station can be a member of a Hunting Group. If hunting results in transfer to a Station other than an Emergency Station, this service is not available.
13. The Emergency Station can be a member of a UCD [U-1] group. If a call is distributed to the Emergency Station after queuing, System Message printout is not performed.
14. When the Emergency Station is busy, CALL BACK [C-1] to the Emergency Station is effective (no printout is performed).
15. When the Emergency Station is busy, CALL WAITING - ORIGINATING [C-31] and CALL WAITING - TERMINATING [C-12] are effective, but this feature is not available. However, when a Two-way Call is made between an Emergency Station and another Station, CALL BACK [C-1] is performed when the Station releases.
16. When an Emergency Station is busy, ATTENDANT CAMP-ON WITH TONE INDICATION [A-1] to the Emergency Station is effective, but the feature is not available to the CAMP-ON Call.
17. When a Digital Terminal is used as an Emergency Station, VOICE CALL [V-2] to the Emergency Station is possible. If the Calling Station goes on-hook before the Emergency Station answers by pressing the SPEAKER key or going off-hook, CALL BACK [C-1] is not possible.
18. When Camp-On or Privacy is set to a Station, the Station cannot be recalled from the Emergency Station. Therefore, data security [SFI 11 = 0 (Data Line Privacy)] must be assigned to the Emergency Stations, so that Camp-On and Privacy cannot be set.

Interactions

1. STATION-TO-STATION CALLING [S-11] must first be provided.
2. SINGLE-DIGIT STATION CALLING [S-1] may be used with this feature.

Programming

STEP 1: **ASYD** - SYS1, Index 4, Bit 1. Recalling method of EMERGENCY CALL. 0/1: SHF or Pressing the TRANSFER key/Recalled Automatically. This allows for Called Party Release only on an Emergency Call. If the Calling Party releases, the Calling Party is rung by the Emergency Telephone.

SYS1, Index 4, Bit 7: Printout of Emergency Call System Messages.

0/1 = No printout/printout

STEP 2: **ASFC** - Assign to the Emergency Call Telephone a Service Feature Restriction Class that allows SFI 24 (Emergency Call). Stations that may call the Emergency Call Telephone are not allowed SFI 24.

Note: The SFC must be allowed for My Line of the telephone, even if the Sub Line is assigned as Emergency Call Telephone.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

STEP 1: **ANPDN** - Assign first digit of FCCS Numbering Plan.

STEP 2: **ASPAN** - Assign Numbering Plan Data for FCCS.

STEP 3: **ALGSN** - Assign FCCS Logical numbers to Stations used in the FCCS network.

E-18 E911-ANI Unified Number of Digits

General Description

This service unifies the number of ANI information digits sent out by E911-ANI Service.

Note: This feature is available in North America only.

Operating Procedure

The Operating Procedure is the same as for a normal Outgoing Connection.

Service Conditions

1. The ANI function for E911 Outgoing Connections is the same as in previous E911-ANI Service and is applicable to the following connections:
   a.) LCR Call from a Station by MF Signaling
   b.) LCR Call from an Attendant Console by MF Signaling.
2. ANI Sending Number by this Enhanced Service is NXX-XXXX.
3. The method of obtaining the ANI Sending Number is shown below:

   Caller's Telephone Number: 12345 (Closed Numbering)
   Outgoing Route Number (RT): **
   Station Outgoing: AT = 0
   Number of digits of Caller's Telephone Number: 16
   ANI Assigned Data (from the above data):
   Skip: 2 (Number of digits to be skipped from the top of the Telephone Number)
   Add: 4 (Number of digits to be added to ANI information)
   ANI information: 7890

   a.) The specified number of Skip digits is deleted from the Telephone Number: 12345
   b.) The ANI Sending Number is created by combining these digits with the ANI information: 7890345
   c.) Sending ANI information: KP-0-789-0345-ST
4. Sending digit patterns in E911-ANI:
   a.) Outgoing Call from Station.
   • If ANI Data is assigned:

   KP-0-NXX-XXXX-ST
   - NXX-XXXX: ANI sending number
   - 0: Information digit

   • If ANI Data is not assigned:

   KP-2-ST
   - 2: Information digit

b.) Outgoing Call from Attendant:

- If Individual Attendant Access Code is assigned, and also ANI Data is assigned:

KP-0-NXX-XXXX-ST
- ANI sending number
- Information digit

- If Individual Attendant Access Code is not assigned, and ANI Data is assigned:

KP-0-NXX-XXXX-ST
- ANI sending number
- Information digit

- If ANI Data is unassigned:

KP-1-ST
- Information digit

5. An independent route is required for E911 Interface.
6. After the Caller's Number is sent out to the Distant Office by E911-ANI, it takes some time until a speech path is established.
7. Sending Data is considered to be not assigned if:
   a.) Service version data specifies that Unified Number of Digits is provided.
   b.) No data is assigned for Unified Number of Digits Service.
   c.) Data for previous E911-ANI Service is assigned.
8. After digits have been sent out, DDD Seizure Tone is not sent.
9. Other interactions are the same as those of Outgoing Calls by MF Signaling.
10. An 8RST-K circuit card is used.

Programming

STEP 1: **ARTD** - Assign the Route Data as shown below.

RT: 4

1-OSGS	:7	2-ONSG	:4	3-ISGS	:7	4-INSG	:4	5-TF	:3
6-TCL	:5	7-L/T	:1	8-RLP	:2	10-SMDS	:1	13-AC	:1
15-LSG	:5	19-ANI	:1	30-PAD	:4	43-BT	:1	73-KPST	:7
74-KPPT	:13	75-STC	:15	77-MT	:1				

Note: To change the data for existing route (RT), initialize the circuit card.

STEP 2: **ATRK** - Assign RT 905 to LENS for TK 1, TK 2 (depending on Register Location). Assign RT 904 to LENS for TK 1, TK 2 (depending on Register Location).

STEP 3: **AAND** - Assign the following parameters:

RT: 0 (Outgoing RT Number)

AT: 0 (0/1: Station/Individual Attendant)

CC: 0 (0/1: Main Central/Satellite Central) Programming is only necessary at the Main Node.

COC: (Central Office Code, CCIS Office Code, or first digit of CCIS Remote Station Number). Use CCIS Office Code.

STNL: (Number of Digits in Caller's Number)

SKIP: (Number of Digits to be skipped from Caller's Number) This strips the Office Code from being sent out in front of the Calling Station Number.

ADD: 3 (Number of Digits to be added to the ANI information).

DC: 753 (ANI Sending Number)

Note: Using this programming, if the call was originated at Remote Node Station Number 2000, the number being sent to the E911 Central Office would be "753-2000"

STEP 4: **AANDE** - Assign the following parameters

TN: (1-255)

Skip: Call Originator digit

ADD: Office Code to be added (1-10)

DC: Office Code (1-10)

E-22 Emergency System Control

General Description

This feature provides the emergency terminating method to Attendant Console and the originating call restriction.
Operator calls which are originated from Local Nodes belonging to a Hub node during an emergency mode terminate to VMS, IVR or the specific ATTCON in the Main node, and the operator there will answer and operate.
All outgoing C.O. calls originated during an emergency mode are restricted from Local Nodes belonging to a Hub node.

Note: This feature is only available in Australia.

Operating Procedure

No manual operation is required.

Service Conditions

1. Assignment of the emergency mode
   a.) Designation of mode switching and the terminated Attendant Console may be made to the relevant Hub node from NMS/CMAT remotely.
   b.) Assignment of the emergency mode may be changed by the Attendant operator in the Main node or a maintenance administration staff.
   c.) When a Main node is set in the emergency mode, only the Main node is treated as the emergency mode.
   d.) When a Hub node is set in the emergency mode, not only the Hub node but also its Local Nodes are treated as the emergency mode.
   e.) Set/cancellation will be informed by the system message and MN lamp on the TOPU.
2. The terminating method to the Attendant Console during an emergency mode.
   a.) When the Main node is changed into the emergency mode during the Day mode:
      - all incoming C.O. calls (LDN) are not transferred to Another main node but terminate to VMS(UCD), IVR (monitor number) or the specific Attendant Console in the Main node.
      - ATND calls or transferred calls are indicated their termination on the specific ATTCON in the Main node.

   b.) When the Main node is changed into the emergency mode during the Night mode:
      - all incoming C.O. calls (LDN) terminate to VMS (UCD), IVR (monitor number) or the specific Attendant Console in Another main node.
      - ATND calls or transferred calls terminate to the specific ATTCON in Another main node.

   c.) When the Hub node is changed into the emergency mode during the Night mode:
      - incoming C.O. calls to the Hub or Local Nodes are not transferred to the Main node but terminate to VMS (UCD), IVR (monitor number) or the specific Attendant Console in the Hub node.
      - ATND calls or transferred calls terminate to the specific ATTCON in the Main node.

   d.) When the Hub node is changed into the emergency mode during the Day mode:
      - incoming C.O. calls to the Hub or Local Nodes are not transferred to the Main node but terminate to VMS (UCD), IVR (monitor number) or the specific Attendant Console in the Hub node.
      - ATND calls or transferred calls are indicated their termination on the specific ATTCON in the Hub node.

e.) If the specific Attendant Console is set as emergency termination, another ANSWER key may be selected instead of that for LDN, ATND calls or transferred calls on an office date basis.

3. Connection restrictions during the emergency mode.
   a.) When a Hub node is set in the emergency mode, the offices in the Hub node is forced to be changed into the "Priority Class of Service" mode. If the offices have already been in the "Priority Class of Service" mode, they will be in the same as the Night mode.
   b.) In the above case, originating calls from a station in the Hub or Local Node to the Central Office or CCIS are restricted.
   c.) In the above status, it is permitted to originate a call by dialing the AUTHORIZAION CODE or from the station in the special class.
4. The following table is showing service conditions 2,3.

Assigning node / Call	Main node		Hub node			Main node	Hub node	Local Node
	Day mode	Night mode	Day mode	Night mode	Station	Permitted	Permitted	Permitted
ATND	Main specific ATT	Another main specific ATT	Hub specific ATT	Main specific ATT	**OG(C.O.)**	Permitted	Restricted	Restricted
LDN	Main VMM	Another main VMM	Hub VMM	Hub VMM	**OG(Tie)**	Permitted	Restricted	Restricted
CF-ATT	Main specific ATT	Another main specific ATT	Hub specific ATT	Main specific ATT	**IC**	Permitted	Permitted	Permitted

5. If trouble is caused on the CCIS, the ISDN Central Office line is used as the alternate route.
6. An incoming C.O. call (LDN) through the MFC trunk can not be transferred in an emergency mode.
7. All calls originated to the specific Attendant Console are treated as the incoming calls in an emergency mode. (Incoming calls originated by dialing the specific Attendant Console number can not be differentiated from incoming calls in an emergency mode.)
8. If the Attendant Console in the Main (or Hub) node transfers the call, which was originated from a station in Another node (e.g. Local Node) during an emergency mode, to Another main node via CCIS, the transferring Attendant Console will be recalled when the transferred call is not answered. If the transferred call is which originated from a station within the office (Main or Hub node), even though it is not answered, recall to the transferring Attendant Console will not be made.

E-26D Expanded Multiple Line Operation -D

General Description

This feature allows operation of whichever lines from ELC Cards in the same IMG or in different IMGs in the same Node/CCN/RN, as the Dterm's programmable Multiple Lines (My Line + Prime Line/Sub Lines). While Multiple Line Operation -D [M-20] only allows such programming within the reach of ELC Cards in the same IMG, this feature enables Multiple Line Operation beyond the reach of a single IMG (though the ELCs must be in one Node/CCN/RN).

Operating Procedure

No manual operation is required.

Service Conditions

1. To use this feature (operation of Multiple Lines beyond different IMGs), a PA-16ELCJ-B/PA-16ELCN/PA-16ELCN-A/CH-16ELCA card is required.
2. (Conditions for PA-16ELCJ-B/PA-16ELCN/PA-16ELCN-A) Depending on the switch setting on the card, assignable Multiple Lines vary.
   a.) SW 10, Element 1 = ON:
   Dterm's My Line and the other Lines (other Analog Telephones/Dterm) accommodated on this card must be in the same IMG.

   Note: Even if Element 1 of SW10/11 is ON, data programming for this feature (Multiple Lines beyond different IMGs) is possible. However, the data does not become effective until the switch is manually switched to OFF.

   b.) SW 10, Element 1 = OFF:
   Dterm and other Lines (other Analog Telephones/Dterm) accommodated on this card can be in different IMGs, yet in the same Node/CCN/RN. For more details on PA-16ELCJ-B/PA-16ELCN/PA-16ELCN-A card, refer to the Circuit Card Description.
3. Three kinds of lines can appear on Line/Feature key of the Desktop terminal:
   - My Line (ML): This Line is associated with the Extension Number assigned to the port on the Interface Circuit.
   - Prime Line (PL): This Line is given priority for Outgoing and Incoming Calls. Prime Line is automatically seized when going off-hook.
   - Sub Line (SL): This Line designates any other Line appearing on a Dterm. My Line will serve as a Prime Line, unless differentiated in system data programming.
4. A maximum of 32 ELC cards (a total of 512 Ports) can be used for this feature (Multiple Lines beyond different IMGs), per Node/CCN/RN.

   Note: This is not the case if the Multiple Lines are programmed in a single IMG.

5. If the system is a 1-IMG, this feature is not available.
6. A Virtual Line (Software Line Appearance [S-33]), Single Line Telephone or Dterm can be assigned as a Sub Line.

7. To use this feature, flag "1" to ASYD, SYS1, Index 321, Bit 0.
8. When KD = 1 (Intercom) or KD = 2 (DSS key) is assigned on AKYD, this service is not available. Be sure to assign KD = 0 (Line).
9. When the Caller Number is displayed on the bottom line of the LCD, ASYD, SYS1, Index 390, Bit 2 must be "1."
10. Restriction of Call Termination on My Line:
    A Desktop terminal can deny any Incoming Call to its My Line, when a call is made/received via one of its Sub Lines.

    Conditions:

    a.) Restricts a call to My Line only. (A call to Sub Line is not restricted.)
    b.) Available when the caller is a Station, TIE Line, Central Office Line or Attendant Console.
    c.) Available for a call as the destination of Call Forwarding - All Calls.
    d.) When the Original Call on the Sub Line is placed on hold:
    • If the terminal is off–hook after placing the call to Sub Line on hold, a call to My Line is restricted.
    • If the terminal goes on–hook while the call to Sub Line is still on hold, a call to My Line is not restricted.

Interactions

1. This feature is available with the following services:

CALL HOLD	[C-6, 6D]
CALL FORWARDING - BUSY LINE	[C-2, 2D]
CALL FORWARDING - DON'T ANSWER	[C-3, 3D]
CALL FORWARDING - ALL CALL	[C-5, 5D]
VOICE CALL	[V-2]
CALL PICK UP - GROUP	[C-7, 7D]
BOSS - SECRETARY OVERRIDE -D	[B-5D]
BOSS - SECRETARY - MESSAGE LAMP CONTROL	[B-8]
BOSS - SECRETARY TRANSFER	[B-11]
STATION HUNTING - CIRCULAR	[S-7]
STATION HUNTING - SECRETARIAL	[S-8]
STATION HUNTING - TERMINAL	[S-9]
THREE WAY CALLING	[T-2, 2D]
CALL TRANSFER	[C-11]
CONSULTATION HOLD - ALL CALLS	[C-17]
BLIND TRANSFER TO ATTENDANT	[B-17]
BLIND TRANSFER TO STATION	[B-18]
SERIAL CALL	[S-15]
SERIAL CALL - LOOP RELEASE	[S-64]
SERIAL CALL - CCIS	[S-52]
SERIAL CALL -D	[S-127]
EXECUTIVE RIGHT-OF-WAY	[E-1]
CALL BACK	[C-1]
MESSAGE REMINDER	[M-19]
BROKERAGE - HOTLINE	[B-6]
SPLIT CALL FORWARDING	[S-99]
CALL WAITING - TERMINATING	[C-12]

CALL WAITING - ANSWER -D	[C-27D]
CALL WAITING - ORIGINATING	[C-31]
GUEST NAME DISPLAY -D	[G-6D]

2. This feature does not support OAI/ACD related services.
3. This feature is supported by Hotel related services.
4. If Multiple Lines are programmed beyond different IMGs, this feature does not provide PRIVACY RELEASE [P-18].
5. FOLLOW PHONE [F-31] is not available for this feature.
6. When Multiple Lines are programmed on a Dterm using SID TO TERMINATING USER - DISPLAY [S-93], CALLING PARTY NUMBER - NAME ASSIGNMENT AND DISPLAY [C-157] or NAME DISPLAY - SYSTEM [N-28], ASYD, SYS1, Index 390, Bit 2 must be "1".

Programming

STEP 1: **ASYD** - Flag "1" to SYS1, Index 321, Bit 0 (Extended Multiple Line Operation is allowed).
SYS1, Index 390, Bit 2 (Show bottom line of LCD used for caller number).

STEP 2: **ASDT** - LENS equipped with a Dterm Circuit Board must be assigned a Station Number and a Telephone Equipment Class (TEC) of 12.

STEP 3: **AKYD** - Assign a My Line, a Prime Line, and various Sub Lines to the Dterms.

→TN: 1
→STN: Station Number
TP: Type of Dterm (0-3)
PL TN STN: Prime Line Tenant and Station Number
KYN: Key Number (1-40)
KYI: Service Index
0: Key Not Used
1: Feature Key
2: Multi Line Key
KD: Not assigned for Feature Key
TN STN: Tenant Number and Station Number of Multi Line
RG: Ringing Assignment per Multi Line Appearance
0: No Ringing
1: Ringing in Day Mode only
2: Ringing in Night Mode only
3: Not Used
4: Ringing in Day and Night Mode - 30 second delay.
5: Ringing in Day and Night Mode - 20 second delay.
6: Ringing in Day and Night Mode - 10 second delay.
7: Ringing in Day and Night Mode.

E-27 Expanded Individual Speed Dial

(Series 8600 software feature)

General Description

This feature allows a user to dial certain frequently called exchange network numbers using fewer digits (abbreviated call codes) than normally required. Using this feature, a user can establish his own abbreviated codes.

Note: This feature is available in North America only.

Operating Procedure

1. Lift handset or press the SPEAKER key. Receive Dial Tone.
2. Dial Expanded Individual Speed Dial access code (one to three digits).
3. Dial the abbreviated call code (one to three digits). Call is completed.

To use via Feature key

1. Lift handset or press the SPEAKER key. Receive Dial Tone.
2. Press the EXPANDED INDIVIDUAL SPEED DIAL Feature key (FKY=146).
3. Dial the abbreviated call code (one to three digits). Call is completed.
4. Lift handset or press the SPEAKER key. Receive Dial Tone.

To set using the primary station only

1. Lift handset. Receive Dial Tone.
2. Dial Expanded Individual Speed Dial. Enter feature access code (one or two digits).
3. Dial the abbreviated call code (one to three digits). At this point no tone is returned.
4. Dial the outgoing number, including the route access code. A brief pause will occur before receiving Service Set Tone.

Service Conditions

1. Expanded Individual Speed Dial codes are programmed into RAM memory per local processor.
2. Each abbreviated call code can store a maximum of 24 digits, including access codes and pauses.
3. A maximum of 1400 stations per IMG can be equipped with Expanded Individual Speed Dial and Expanded Individual Speed Dial - Group.
4. 1400 memory blocks per IMG are assigned for Expanded Individual Speed Dial. A maximum of 10 numbers can be stored in each memory block. This allows for a total of 14,000 numbers per IMG. 14,000 includes Expanded Individual Speed Dial and Expanded Individual Speed Dial - Group.
5. Each station can be assigned ten Memory Blocks for Speed Calling. Therefore, it can be programmed for 100 numbers maximum.
6. Toll Denial/Toll Diversion [T-6] and Toll Restriction - 3/6-Digit [T-7] may or may not be applied to Expanded Individual Speed Dial, as desired.
7. Least Cost Routing - 3/6-Digit [L-5] may be provided via Expanded Individual Speed Dial access.
8. Expanded Individual Speed Dial data will be retained in memory (even if the system is initialized or in the event of a power failure) by means of a hard disk for a system.
9. A pause may be programmed, using the "*" key of a PB pad. This will take one of the 24 digits available. Rotary type phones cannot store a pause. A pause lasts about 3 seconds.

10. It is not necessary to erase a stored number in order to store another number. The second number replaces the first.
11. When a caller places a call via OGCA, and when the first outgoing route and the station setting Expanded Individual Speed Dial are restricted, this service cannot be set. In this case, the service can be set via the following procedure:
    a.) Assign a dummy route.
    b.) Clear the restriction between the dummy route and all the stations.
    c.) Assign the dummy route as the first route of OGCA.
12. This feature cannot be the target of a Call Forwarding Assignment - Attendant call.
13. When the attendant console transfers a call outside via Expanded Individual Speed Dial and the held party is a Dterm, the holding party will display Expanded Individual Speed Dial access code, plus the bin number when the call is released from the attendant console. The called number will not display.
14. The maximum number of digits that can be entered in Expanded Individual Speed Dial is 24. If the maximum length is exceeded, Reorder Tone will be returned.

Interactions

1. Blocks are not assigned sequentially (1-1400), but are assigned as a quantity of blocks in AIEA. These quantities will never exceed the value of 10.
2. If one block is assigned, the abbreviated call code will be digits 0-9. If two blocks are assigned, the abbreviated call code will be digits 00 - 19. If three blocks are assigned, the abbreviated call code will be digits 00 - 29, to a maximum of 10 blocks with Abbreviated Call Codes 00 - 99.
3. Only the primary station will be allowed to use the Expanded Individual Speed Dial access code. When assigning the abbreviated Expanded Individual Speed Dial access code and number, a delay of six to eight seconds will occur until Service Set Tone is returned.
4. Only those stations assigned as secondary stations are considered to be members of the Expanded Individual Speed Dial - Group.
5. Stations of an Expanded Individual Speed Dial must be in the same IMG (LP). Error 0x256, “IMG Number of My Line/Primary Station Mismatch” is displayed.
6. Expanded Individual Speed Dial requires the assignment of senders, Route 905. See Universal Sender [U-3] to use outgoing routes.
7. Outgoing Trunk Queuing [O-2] - This feature may be used with Expanded Individual Speed Dial - Group if all trunks are busy.
8. Route Advance [R-6] and Least Cost Routing - 3/6-Digit [L-5] may be used with this feature. The ASPA access code to either Route Advance [R-6] or Least Cost Routing - 3/6-Digit [L-5] will be stored in the memory of the Expanded Individual Speed Dial number.
9. If Expanded Individual Speed Dial is used with OAI make call facility, only LCR, LCR(S), or stations are supported destinations.

Programming

STEP 1: **ASYD** - SYS2, Index 1, Bit 3. Does Toll Restriction apply to Expanded Individual Speed Dial? 0/1: Yes/No. (If yes, refer to Toll Restriction - 3/6-Digit [T-10]).

STEP 2: **ANPD** - Reserve a number level for feature access. Select Normal Service (N), Hooking Service (H) or Busy Service (B) from the combo box for Connection Indexes. (applicable to any feature assigned to this level). Assign NND in accordance with the numbering plan.

STEP 3: **ASPA** - Two access codes must be assigned for this feature.

For the Expanded Individual Speed Dial number assignment, assign the tenant and Access Code (ACC). Assign for a Connection Index of Normal (N). For SRV = "SSC: Service Code Appendix", assign SID 134.

For individual station speed calling access, assign the tenant and Access Code (ACC). Assign for a Connection Index of "N: Normal". For SRV = "SSCA: Service Code Appendix", assign SID 135.

STEP 4: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 197 to the stations to receive Expanded Individual Speed Dial.

STEP 5: **AIEA** - Program the tenant, station, type of station, and the number of Expanded Individual Speed Dial blocks to be assigned to the primary station.

TN:	Tenant Number
STN:	Station Number
STATION TYPE:	Primary/Secondary
	1: MST (Master Station)
	2: SLV (Slave Station)
BLOCK:	Number of Blocks
MST STN:	When assigning secondary station, assign the primary station number.

STEP 6: **AKYD** - Assign the EXPANDED INDIVIDUAL SPEED DIAL Feature key (FKY=146)

STEP 7: **ADSL** - Assign G_SPD key. Assign SN = 1 (Originating; DT Connection) and EXPANDED INDIVIDUAL SPEED DIAL Feature key (FKY=146).

This command is used for assigning a function to each Soft key.

STEP 8: **AIED** - This command is used to assign, delete, and display the destination number of Expanded Individual Speed Dial.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS service varies depending on the node.

STEP 1: **ANPDL** - Reserve a number level for feature access. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. (applicable to any feature assigned to this level). Assign NND in accordance with the numbering plan.

STEP 2: **ASPAL** - Two access codes must be assigned for this feature.

For the individual station speed calling number assignment, assign the tenant and Access Code (ACC). Assign for a Connection Index of "N: Normal". For SRV = "SSC: Service Code", assign SID 14.

For individual station speed calling access, assign the tenant and Access Code (ACC). Assign for a Connection Index of "N: Normal". For SRV = "SSC: Service Code", assign SID 21.

When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

E-28 Expanded Individual Speed Dial - Group

(Series 8600 software feature)

General Description

This feature allows a user to share a set of common Speed Dial numbers with other users in the group.

Note: This feature is only available in North America.

Operating Procedure

1. Lift handset or press the SPEAKER key. Receive Dial Tone.
2. Dial Expanded Individual Speed Dial access code (one to three digits).
3. Dial the abbreviated call code (one to three digits). Call is completed.

To use via Feature key

1. Lift handset or press the SPEAKER key. Receive Dial Tone.
2. Press Feature key Expanded Individual Speed Dial [146].
3. Dial the abbreviated call code (one to three digits). Call is completed.
4. Lift handset or press the SPEAKER key. Receive Dial Tone.

To set using the primary station only

1. Lift handset. Receive Dial Tone.
2. Dial Expanded Individual Speed Dial. Enter feature access code (one or two digits).
3. Dial the abbreviated call code (one to three digits). At this point no tone is returned.
4. Dial the outgoing number, including the route access code. A brief pause will occur before receiving Service Set Tone.

Service Conditions

1. Expanded Individual Speed Dial - Group codes are programmed into RAM memory per local processor.
2. Each abbreviated call code can store a maximum of 24 digits, including access codes and pauses.
3. A maximum of 1400 stations per IMG can be equipped with Expanded Individual Speed Dial and Expanded Individual Speed Dial - Group.
4. 1400 memory blocks per IMG are assigned for Expanded Individual Speed Dial. A maximum of 10 numbers can be stored in each memory block. This allows for a total of 14,000 numbers per IMG. 14,000 includes Expanded Individual Speed Dial and Expanded Individual Speed Dial - Group.
5. Expanded Individual Speed Dial - Group primary station will be assigned memory blocks, and associate stations in that group are assigned as secondary stations. The primary station has the capability to program ten memory blocks that are commonly used as Speed Dial numbers for that group. A group can consist of a maximum of 100 Speed Dial numbers.
6. Toll Denial/Toll Diversion [T-6] and Toll Restriction - 3/6-Digit [T-7] may or may not be applied to Expanded Individual Speed Dial, as desired.
7. Least Cost Routing - 3/6-Digit [L-5] may be provided via Expanded Individual Speed Dial access.
8. Expanded Individual Speed Dial - Group data will be retained in memory (even if the system is initialized or in the event of a power failure) by means of a hard disk for a system.
9. It is not necessary to erase a stored number in order to store another number. The second number replaces the first. If using the AIED command, the number must first be deleted.

10. When a caller places a call via OGCA, and when the first outgoing route and the station setting Expanded Individual Speed Dial are restricted, this service cannot be set. In this case, the service can be set via the following procedure:
    a.) Assign a dummy route.
    b.) Clear the restriction between the dummy route and all the stations.
    c.) Assign the dummy route as the first route of OGCA.
11. When the attendant console transfers a call outside via Expanded Individual Speed Dial and the held party is a Dterm, the holding party will display Expanded Individual Speed Dial access code, plus the bin number when the call is released from the attendant console. The called number will not display.
12. The maximum number of digits that can be entered in Expanded Individual Speed Dial is 24. If the maximum length is exceeded, Reorder Tone will be returned.

Interactions

1. Blocks are not assigned sequentially (1-1400), but are assigned as a quantity of blocks in AIEA. These quantities will never exceed the value of 10.
2. If one block is assigned, the abbreviated call code will be digits 0-9. If two blocks are assigned, the abbreviated call code will be digits 00 - 19. If three blocks are assigned, the abbreviated call code will be digits 00 - 29, to a maximum of 10 blocks with Abbreviated Call Codes 00 - 99.
3. Only the primary station will be allowed to use the Expanded Individual Speed Dial access code. When assigning the abbreviated Expanded Individual Speed Dial access code and number, a delay of six to eight seconds will occur until Service Set Tone is returned.
4. Only those stations assigned as secondary stations are considered to be members of the Expanded Individual Speed Dial - Group.
5. Stations of an Expanded Individual Speed Dial must be in the same IMG (LP). Error 0x256, “IMG Number of My Line/Primary Station Mismatch” is displayed.
6. Expanded Individual Speed Dial requires the assignment of senders, Route 905. See Universal Sender [U-3] to use outgoing routes.
7. Outgoing Trunk Queuing [O-2] - This feature may be used with Expanded Individual Speed Dial - Group if all trunks are busy.
8. Route Advance [R-6] and Least Cost Routing - 3/6-Digit [L-5] may be used with this feature. The ASPA access code to either Route Advance [R-6] or Least Cost Routing - 3/6-Digit [L-5] will be stored in the memory of the Expanded Individual Speed Dial number.
9. If Expanded Individual Speed Dial is used with OAI make call facility, only LCR, LCR(S), or stations are supported destinations.

Programming

STEP 1: **ASYD** - SYS2, Index 1, Bit 3. Does Toll Restriction apply to Expanded Individual Speed Dial? 0/1: Yes/No. (If yes, refer to Toll Restriction - 3/6-Digit [T-10]).

STEP 2: **ANPD** - Reserve a number level for feature access. Select Normal Service (N), Hooking Service (H) or Busy Service (B) from the combo box for Connection Indexes. (applicable to any feature assigned to this level). Assign NND in accordance with the numbering plan.

STEP 3: **ASPA** - Two access codes must be assigned for this feature.

For the Expanded Individual Speed Dial number assignment, assign the tenant and Access Code (ACC). Assign for a Connection Index of “N: Normal”. For SRV = “SSCA: Service Code Appendix”, assign SID 134. For individual station speed calling access, assign the tenant and Access Code (ACC). Assign for a Connection Index of “N: Normal”. For SRV = “SSCA: Service Code Appendix”, assign

SID 135.

STEP 4: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 197 to the stations to receive Expanded Individual Speed Dial.

STEP 5: **AIEA** - Program the tenant, station, type of station, and the number of Expanded Individual Speed Dial blocks to be assigned to the primary station.

TN:	Tenant Number
STN:	Station Number
STATION TYPE:	Primary/Secondary
	1: MST (Master Station)
	2: SLV (Slave Station)
BLOCK:	Number of Blocks
MST STN:	When assigning secondary station, assign the primary station number.

STEP 6: **AKYD** - Assign EXPANDED INDIVIDUAL SPEED DIAL Feature key (FKY=146)

STEP 7: **ADSL** - Assign G_SPD key. Assign SN = 1 (Originating; DT Connection) and EXPANDED INDIVIDUAL SPEED DIAL Feature key (FKY=146).

This command is used for assigning a function to each Soft key.

STEP 8: **AIED** - This command is used to assign, delete, and display the destination number of Expanded Individual Speed Dial.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS service varies depending on the node.

STEP 1: **ANPDL** - Reserve a number level for feature access. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. (applicable to any feature assigned to this level). Assign NND in accordance with the numbering plan.

STEP 2: **ASPAL** - Two access codes must be assigned for this feature.

For the individual station speed calling number assignment, assign the tenant and Access Code (ACC). Assign for a Connection Index of “N: Normal”. For SRV = “SSC: Service Code”, assign SID 14.

For individual station speed calling access, assign the tenant and Access Code (ACC). Assign for a Connection Index of “N: Normal”. For SRV = “SSC: Service Code”, assign SID 21.

When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

E-29 Expanded Account Code

(Series 8700 software feature)

General Description

This feature is an adjunct to STATION MESSAGE DETAIL RECORDING [S-10], which provides a station user with the capability to enter a cost-accounting or client-billing code (up to 24 digits) into the system before dialing a long distance number.

Note: This feature is only available for North America.

Operating Procedure

To enter an Account Code:

1. Lift the handset. Receive Dial Tone.
2. Dial the Feature Access Code. Receive Service Set Tone.
3. Dial the ACCOUNT CODE (when the account code is less than 24 digits, a "#" must be dialed).
4. Receive dial tone and dial the called number.

Note: Feature Access Code - Access Code for ACCOUNT CODE entry will be a maximum of three digits.

To enter an ACCOUNT CODE after an AUTHORIZATION CODE [A-20]:

1. Lift the handset. Receive Dial Tone.
2. Dial the Feature Access Code for AUTHORIZATION CODE. Receive Service Set Tone.
3. Dial the AUTHORIZATION CODE (up to 10 digits). Receive second Service Set Tone.
4. Dial the ACCOUNT CODE (up to 24 digits). Receive Dial Tone.
5. Dial the number desired.

Service Conditions

1. The expansion of Account Code length is on a per system basis, controlled by ASYDL as 10 or 24 maximum digits in Account Code.
2. The Attendant Console, before extending a trunk to a station, can enter an account code up to 24 digits, but only 10 digits will record for SMDR service.
3. FCCS Networks must have the same Account Code length for nodes. See Programming.
4. The maximum number of digits for an ACCOUNT CODE is 24 digits. There is no limitation to the number of account codes used per system. There is no change in the maximum amount of digits in Forced Account or Authorization codes.

   Note: Service Set Tone after the Feature Access Code can be eliminated by System Data. System Data is common for ACCOUNT CODE, AUTHORIZATION CODE [A-20] and FORCED ACCOUNT CODE [F-7].

5. A station user can enter an ACCOUNT CODE of fewer digits than the maximum length defined and indicate the end of entry by pressing the # key.
6. The Expand Account Code feature is not compatible with Hotel systems (ASYD, SYS1, Index 160, Bit 0=1).

7. This feature is not available for station to station SMDR and account code.
8. Only IMX type SMDR format (ASYDL, SYS1, Index 578, Index 579, Index 580 and Index 581, Bit 0=1) can be used to record expanded account code to SMDR. All other formats record only the first 10 digits.
9. The user may decide if ACCOUNT CODE follows the AUTHORIZATION CODE (per tenant basis) however the ACCOUNT CODE maximum length is 24 per system.
10. ACCOUNT CODE dialing is also effective while in CONSULTATION HOLD [C-17]. Special dial tone is received after entering the ACCOUNT CODE.
11. Stations are assigned this the Account Code feature via Class of Service, account code length is assigned on a system wide basis.
12. ACCOUNT CODES can be output in the SMDR record for calls handled with OUTGOING TRUNK QUEUING [O-2] and OFF-HOOK QUEUING [O-7].
13. When the expanded account feature is selected, by system data, the maximum amount of digits is expanded to 24, if the amount of dialed digits exceed 24 reorder tone is returned.
14. When this feature is used in conjunction with STATION MESSAGE DETAIL RECORDING [S-10] the digit field for account code will expand from a maximum of 16 to a maximum of 24 digits.
    a.) Change in the IMX SMDR TEXT FORMAT on KIND-OF-CALL BASIS as outlined in the NEC SYSTEM MESSAGE DETAILED RECORD Interface Specification. **Note 1**
    b.) The expanded Account Code feature is System Data (ASYDL, SYS1, Index 805, Bit 5) controlled.

Note 1: Change in IMX SMDR format for data kind 07 (Account Code)

Current Method:
Data Length = 01 - 16
Account Code Data = 01 - 16
New Method:
Data Length = 01 - 24
Account Code Data = 01 - 24

Interactions

1. If FORCED ACCOUNT CODES [F-7] are used, ACCOUNT CODES can not be used.
2. ACCOUNT CODE is also effective while in CONSULTATION HOLD [C-17]. A special dial tone is received after the ACCOUNT CODE.
3. When using this feature on a single-line telephone or Dterm, the user can use the SPEED CALLING SYSTEM,GROUP, INDIVIDUAL or SPEED CALLING-ONE TOUCH (Dterm) to complete the call.
4. ACCOUNT CODES cannot be entered by a station upon answering an incoming trunk call.
5. The access code for ACCOUNT CODES is restricted to a maximum of three digits.

6. STATION MESSAGE DETAIL RECORDING [S-10] Split Billing (System Data Option): On transferred calls, or incoming calls via the Attendant Console, the ACCOUNT CODE will be recorded in all the call records.
7. This feature is not compatible with Centralized Billing - CCIS [C-55]. The maximum ACCOUNT CODE length for SMDR Centralized Billing - CCIS [C-55] is 10 digits.
8. When OUTGOING TRUNK QUEUING [O-2] is initiated, the ACCOUNT CODE will be recorded when the call is completed.
9. When a Dterm user initiates the LAST NUMBER DIALED [L-6D] feature, the ACCOUNT CODE will be recorded, if previously dialed.
10. Change in IMX SMDR format for data kind 07 (Account Code).
    Current 07 data is 01 - 16 account code length - account code data maximum of 16 digits.
    New 07 data is 01 - 24 account code length - account code data maximum of 24 digits. THERE IS NO CHANGE FOR ICS standard or expanded SMDR FORMAT.

Programming

STEP 1: **ASYD** - SYS1, Index 43, Bit 2. Is service set tone sent after the ASPA access code for ACCOUNT CODE? 0/1 = No/Yes. Assign data "1".

SYS 2, Index 3, Bit 4. Is ACCOUNT CODE used with Authorization Code? 0/1 = No/Yes.

STEP 2: **ASYDL** - SYS1, Index 805, Bit 5. Use 10 or 24 digits Account Code. 0/1 = 10 digits/24 digits.

SYS1, Index 578, Index 579, Index 580 and Index 581, Bit 0=1 for IMX type SMDR output.

STEP 3: **ANPD** - Reserve a number level for service feature access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes.(applicable to any service feature assigned to this level).

Assign NND in accordance with a predetermined numbering plan.

STEP 4: **ASPA** - For SRV = "SSC: Service Code", SID = 41, assign the access code (maximum of three digits). Assign the number of digits in the ASPA service feature access code plus the number of digits that in the ACCOUNT CODE for the NND parameter.

When ACCOUNT CODE operates with AUTHORIZATION CODE [A-20], the above assignment is omitted. In ASPA, assign for SRV = "SSC: Service Code", SID = 42.

The NND value will include the number of digits in the ASPA service feature access code plus the number of digits in the ACCOUNT CODE.

For example:

45 - 511234

2 + 6 = 8

ACC + ACCT CODE = NND

STEP 5: **ASFC** - For Stations to use ACCOUNT CODE, assign a Class of Service that allows SFI 27.

STEP 6: **AMND** - If Authorization Codes are used with ACCOUNT CODES, then for Tenant 0, assign the Destination Code (DC) as the first digit of all Authorization Codes and the Maximum Necessary Digits (MND) of the Authorization Codes. For the above example, a DC of six is assigned with an MND of six. For standard ACCOUNT CODE there is no entry required.

STEP 7: **AATC** - Assign when Authorization Code is used.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

STEP 1: **ASYDN** - SYS1, Index 805, Bit 5. Use 10 or 24 digits Account Code. 0/1 = 10 digits/24 digits.

STEP 2: **ANPDL** - Reserve a Number Level for Service Feature Access. Select Normal Service (N), Hooking Service (H), or Busy Service (B) from the combo box for Connection Indexes. (applicable to any feature assigned to this level). Assign NND in accordance with a predetermined Numbering Plan.

STEP 3: **ASPAL** - For SRV = "SSC: Service Code" SID = 41, assign the Access Code. Assign the number of digits in the ASPAL Service Feature Access Code plus the number of digits that will appear in the ACCOUNT CODE for the NND parameter. When ACCOUNT CODE operates with AUTHORIZATION CODE [A-20], the above assignment is omitted. In ASPAL, assign for SRV = "SSC: Service Code", SID = 42. The NND value will include the number of digits in the ASPAL service feature access code plus the number of digits that appear in the ACCOUNT CODE.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

F-1 Flexible Numbering of Stations

General Description

This feature provides the ability to assign Telephone Number of the Voice Station and Data Station to any corresponding instrument location, depending solely upon Numbering Plan limitations.

Operating Procedure

Refer to the Command Manual.

Service Conditions

1. Careful consideration should be given to any numbering assignment, especially in larger systems, to avoid the unnecessary loss of Access Codes or duplication of Telephone Numbers. There is no limit to the number of groups that can be assigned per system.
2. Where TENANT SERVICE [T-12] is provided, Telephone Numbers may not be duplicated between Tenants. A combination of one, two, three, four and five-digit numbering may be used.

   Example: a. 3 1
   b. 3 2 1
   c. 3 2 2 1

   Example a., b., c., can be assigned as three different Stations.
3. BUSY LAMP FIELD - FLEXIBLE [B-2] Service can be provided only when the defining Telephone Number digits exceed two.
4. The FCCS Network allows the user to use a Telephone Number in addition to the existing Station Numbers. FCCS features are activated when a Telephone Number is dialed. A Telephone Number, which can be assigned on a Station basis, is a Unique Number on the FCCS Network.

Note: A maximum of 16 digits can be used as a Telephone Number. However, the maximum of digits may vary depending on features or systems. For details, refer to the related manuals.

Interactions

Caution should be exercised when programming this feature. Large quantities of potential Telephone Number are consumed. As programmed below, the system will be equipped with just one two-digit Station and one three-digit Station.

Programming

STEP 1: **ASYD** - SYS1, Index 16. Enable one to five digits Station Numbering for the system. Assign 3FH. SYS1, Index 92, Bit 3. Must be assigned as data "1".

STEP 2: **ANPD** - Reserve an Access Code for Station Numbering. For the NND parameter, assign the NND equal to the smallest quantity of digits planned for Station Numbering that will use the Busy Lamp Field. Only the Stations with the NND assigned here will appear on the BLF.

STEP 3: **ASPA** - Assign the Station Numbering in such a way that the system will differentiate the Station Numbering via the Access Codes programmed here. The following data is programmed:

For STATION 31	For STATION 321	For STATION 3221
TN: 1	TN: 1	TN: 1
ACC: 31	ACC: 321	ACC: 322
CI = "N: Normal, "H: Hooking"	CI = "N: Normal, "H: Hooking"	CI = "N: Normal, "H: Hooking"
SRV = "STN: Station Number"	SRV = "STN: Station Number"	SRV = "STN: Station Number"
NND: 2	NND: 3	NND: 4

The following Access Codes should also be assigned: 323, 324, 325, 326, 327, 328, 329, 320. CI: "N: Normal", "H: Hooking"; SRV = "STN: Station Number"; and NND: 4 will be assigned with each of the above.

F-2 FX Access

General Description

This feature provides dial access to distant Central Offices using Foreign Exchange (FX) Trunks. All Incoming Calls to the System from the FX Central Office area are placed to the listed Foreign Exchange Directory Number and are answered by the Attendant in a manner similar to LDN Service. Outgoing Calls can be made on an Attendant-handled basis using direct or dial access and/or on a direct basis by Station.

Note: This feature is only available in North America.

Operating Procedure

To place an Outgoing FX Call from a Station

1. Lift the handset and receive Dial Tone.
2. Dial the FX Trunk Access Code and receive Second Dial Tone.
3. Dial the desired Telephone Number.

To answer an Incoming FX Call at the ATTENDANT CONSOLE [A-3]

1. The FX Lamp flashes.
2. An Audible Signal is received.
3. Press the FX or ANSWER key to answer.
4. Process the call as usual.

Service Conditions

1. One INCOMING CALL IDENTIFICATION [I-2] key may be used for all FX Groups.
2. Access to various types of Trunks may be denied to certain Stations according to CLASS OF SERVICE - INDIVIDUAL [C-15] programming.
3. TOLL DENIAL/TOLL DIVERSION [T-6] may be provided for FX ACCESS [F-2].
4. TOLL RESTRICTION - 3/6-DIGIT [T-7] may be provided for FX Trunks on a per Route basis.
5. Care should be exercised in System Data assignment when utilizing this feature in conjunction with LEAST COST ROUTING - 3/6-DIGIT [L-5], since Foreign Exchange Trunks may require that “1” be dialed as a prefix to the desired number.

Interactions

1. LEAST COST ROUTING - 3/6-DIGIT [L-5]: FX Trunk Groups may be assigned to a Least Cost Routing list.
2. ROUTE ADVANCE [R-6]: This feature routes Outgoing FX Calls over alternate facilities when the first-choice Trunk Group is busy.
3. UNIFORM CALL DISTRIBUTION [U-1]: This feature permits Incoming Calls, including FX Calls, to be terminated directly from the Central Office to the next Idle Station in a prearranged group of Stations without Attendant assistance.
4. DIRECT-IN TERMINATION [D-7]: This feature allows one FX Trunk to terminate directly to a designated Station. Incoming FX Calls to this Station are queued if the Station is busy.

5. OUTGOING TRUNK QUEUING [O-2]: This feature provides a means for users to dial a busy FX Trunk Group to be automatically placed in a queue, and to be called back when a Trunk in the Trunk Group becomes available.
6. When the system is in the Night mode of operation, Incoming FX Calls can be answered using NIGHT CONNECTION - FIXED [N-1], FLEXIBLE [N-2] or TRUNK ANSWER FROM ANY STATION [T-8].
7. DIRECT INWARD DIALING [D-8] is not provided for FX Trunks. All calls are normally routed to the Attendant, UCD Group, or a CAS Attendant.
8. Outgoing FX Trunk Calls can be restricted from preselected Stations by the assignment of one or more of the following restrictions:
   a.) Restriction from Outgoing Calls
   b.) Miscellaneous Trunk Restrictions
   c.) Toll Restriction
9. FX Central Office Access: This service provides access to a distant Central Office via FX Trunks. All Incoming Calls to the system (from the FX, Central Office Area) are placed to the listed FX Directory Number and are answered by the Attendant in a similar way to Listed Directory Number (LDN) Service. Outgoing Calls are made on an Attendant-handled basis or on a dial access basis by Stations.
10. A unique Attendant Console INCOMING CALL IDENTIFICATION (ICI) [I-2] may be displayed for each Local and FX LDN.
11. A unique Attendant Console Trunk Group Busy Lamp may be assigned to indicate the busy/idle status for an FX Trunk Group.
12. The COT Circuit Packages are used to provide the Trunk Interface Circuit.
13. An FX Route may be used with any other feature available to any other Route, including the following:

DIRECT OUTWARD DIALING	[D-9]
REMOTE ACCESS TO SYSTEM	[R-2]
TRUNK-TO-TRUNK CONNECTION	[T-10]
TRUNK ANSWER FROM ANY STATION (TAS)	[T-8]
TOLL RESTRICTION - 3/6 DIGIT	[T-7]

Programming

STEP 1: **ARTD** - Assign the FX ACCESS Route as shown below:

GROUND START:

RT: 1

1-OSGS	:2	2-ONSG	:3	3-ISGS	:1	4-INSG	:3	5-TF	:3
6-TCL	:2	7-L/T	:1	8-RLP	:2	15-LSG	:1		

LOOP START:

RT: 31

1-OSGS	:2	2-ONSG	:3	3-ISGS	:1	4-INSG	:3	5-TF	:3
6-TCL	:2	7-L/T	:1	8-RLP	:2				

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or MG.

STEP 2: **ATRK** - Assign the LENS, FX ACCESS Trunk Route Number, Trunk Number, and Tenant Number.

STEP 3: **MBTK** - Assign the Make Idle Status to the FX Access Trunks.

STEP 4: **ANPD** - Reserve a Number Level for Trunk Access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. Number of Necessary Digits (NND) is usually one or two. Busy Lamp Field is not activated.

STEP 5: **ASPA** - Assign the Access Code to the FX Route. The type of service is SRV = "OGC: Outgoing Call" for Outgoing Trunk. Assign the Route Number associated with this Access Code.

STEP 6: **ARSC** - The Route Restriction Class must be constructed in a manner to allow the Station access to the involved Routes.

F-3D Flash Button -D

General Description

This feature provides for a Dterm set to program one of Line/Feature keys to function as a FLASH BUTTON. The FLASH BUTTON will function in the manner a switch hook flash does for a Single Line Set.

Operating Procedure

When activating features common to both Dterm and Single Line sets

1. Press the FLASH BUTTON to receive Special Dial Tone.
2. Dial the Access Code of the desired feature.

Service Conditions

1. When using the FLASH BUTTON, the feature will not be activated again until digits are dialed. The FLASH BUTTON may function during a Two-way Connection.

   Note: If a transfer is attempted via the FLASH BUTTON, Three-way Conference will be established by pressing the FLASH BUTTON again. To retrieve the original connection after the connection with the Transferred Station, the TRANSFER key should be pressed.

2. The FLASH BUTTON is optional. Its use in various features will be explained throughout this document.

Interactions

1. This feature provides switch hook flash capabilities to a Dterm with a Connection Index (CI) of "B: Busy". See ASPA. The features in which a FLASH key are used include CALL BACK [C-1] and OUTGOING TRUNK QUEUING [O-2]. The FLASH BUTTON is usually required with the four-key Desktop terminal.
2. See ASYD, SYS3, Index 2 for programming the characteristics of a switch hook flash (Hooking).

Programming

STEP 1: **AKYD** - When assigning key data for the Desktop terminal, assign the following.

- TN: 1
- STN: Station Number
- TP: Type of Dterm (0-3)
- KYN: Key Number (1-40)
- KYI: Service Index
  - 0: Key Not Used
  - 1: Feature Key
  - 2: Multi Line Key
- KD: Not assigned for Feature key
- KYN: Feature Key Number
- FKY: 21 (Flash Button)

STEP 2: **ADSL** - SN = 5 (Consultation Hold) and Feature Key Flash Button [21].
This command is used for assigning the function to each Soft key.

F-4D Flash Entry -D

General Description

This feature allows a Desktop terminal user to insert a switch hook flash as the first digit in a stored SPEED CALLING - ONE TOUCH -D [S-26D] Number.

Operating Procedure

To add a flash to a stored SPEED CALLING - ONE TOUCH -D [S-26D] Number to a Desktop terminal

1. Stay on-hook.
2. Press the FEATURE key and SPEED CALLING - ONE TOUCH -D Feature key. The LCD display will either be blank, or display previously stored digits.
3. Press the RECALL key as the first digit. A switch hook flash is entered into the memory and the LCD displays:

4. If a Feature Access Code is to follow the Flash Entry, dial the desired digits.
5. Press the FEATURE key. The LCD displays:

To add a flash to a stored SPEED CALLING - ONE TOUCH [S-26D] Number to a Desktop terminal

1. Stay on-hook.
2. Press the FEATURE key and SPEED CALLING - ONE TOUCH Feature key. LCD will either be blank or display previously stored digits.
3. Press the RECALL key as the first digit. A switch hook flash is entered into the memory and the LCD displays:

4. If a Feature Access Code is to follow the FLASH ENTRY, dial the desired digits.
5. Press the FEATURE key. The LCD displays:

Service Conditions

1. A FLASH ENTRY may be entered only as a first digit. For example:
   a.) Call Transfer - ! + Telephone Number
   b.) Busy Service - + Calling Waiting - Originating Access Code, ! + Executive Right-of-Way Access Code
   c.) Call Hold - ! + Call Hold Access Code
2. A FLASH ENTRY, stored as a flash, may be used only once, unless digits are dialed between use.

Interactions

Refer to the Command Manual, ASYD, SYS3, Index 2 for programming the characteristics of a switch hook.

Programming

This is a Desktop terminal feature. It is inherent to the instrument and requires no programming via the PCPro.

F-5D Flexible Ringing Assignment -D

General Description

This feature enables Dterm Line Appearances to be individually programmed for ringing, not ringing, ringing (Day only), or ringing (Night only).

Operating Procedure

No manual operation is required once FLEXIBLE RINGING ASSIGNMENT has been programmed in System Data.

Service Conditions

1. Recall ringing supersedes all ringing possibilities and will ring regardless of other programming.
2. Incoming Central Office ringing supersedes Internal Calls and will interrupt Internal Call Ringing while it is in progress.
3. Recall Ringing, Central Office Ringing, and Internal Call Ringing all vary. Refer to DISTINCTIVE RINGING [D-10].

Interactions

The following ASYD assignments are for normal ringer patterns. For more information, refer to DISTINCTIVE RINGING [D-10].

Programming

STEP 1: **ASYD** - SYS3, Index 0 and Index 1. Assign Index 0 as 21 for one second ON, two seconds OFF (Trunk Calls). Assign Index 1 as 42 for two seconds ON, four seconds OFF (Station Calls).

STEP 2: **AKYD** - Assign the Station according to the following parameters:

TN: 1

STN: Station Number

TP: Type of Dterm (0-3)

KYN: Key Number (1-40)

KYI: Service Index

- 0: Key Not Used
- 1: Feature Key
- 2: Multi Line Key

KD: Not assigned for Feature Key

TN: Tenant Number

STN: Station Number

RG: Ringing Assignment per Multi Line Appearance

- 0: No Ringing
- 1: Ringing in Day mode only
- 2: Ringing in Night mode only
- 3: Not Used
- 4: Ringing in Day and Night Mode - 30 second delay.
- 5: Ringing in Day and Night Mode - 20 second delay.
- 6: Ringing in Day and Night Mode - 10 second delay.
- 7: Ringing in Day and Night Mode.

F-6 Faulty Trunk Report

General Description

This feature allows a Station to report a noisy or faulty Trunk Number by dialing a Special Access Code before hanging up. The FAULTY TRUNK REPORT consists of a Trunk Number, Telephone Number, Associated Time Division Switch and Reported Time. This information is displayed at the maintenance console (PCPro) and/or system printer.

Operating Procedure

To enter

1. Switch hook flash before disconnecting. Receive Special Dial Tone.
2. Dial the FAULTY TRUNK REPORT Access Code. Receive Service Set Tone.
3. The PCPro records the FAULTY TRUNK REPORT and returns the line to the original connection.

Service Conditions

1. This feature may be accessed during any Station-to-Station or Station-to-Trunk Connection.
2. The following information will appear on a Station-to-Station FAULTY TRUNK REPORT:
   a.) Station at which the operation was performed
   b.) Called Telephone Number
   c.) Time division switch
   d.) Time and date.
3. The following information will appear on a Station-to-Trunk FAULTY TRUNK REPORT:
   a.) Station at which the operation was performed
   b.) Route Number and Trunk Number
   c.) Time division switch
   d.) Time and date.
4. Stations are assigned this feature according to CLASS OF SERVICE - INDIVIDUAL [C-15] programming in System Data.
5. When this feature is activated, a Supervisory Alarm (SUP) will appear on the system.

Interactions

1. When this feature is activated, System Message [6-H] Faulty Trunk is generated. This message is sent to the PCPro or Fault Printer.
2. FAULTY TRUNK REPORT Data is displayed/printed in the Hexadecimal Numbering System.
3. The FAULTY TRUNK REPORT is displayed/printed periodically or can be obtained directly with the DFTD, Display of System Message command.

Programming

STEP 1: **ANPD** - Reserve a Number Level for Feature Access. Select Normal Service (N), Hooking Service (H) or Busy Service (B) from the combo box for Connection Indexes. Assign NND in accordance with a predetermined Numbering Plan.

STEP 2: **ASPA** - Assign an Access Code to FAULTY TRUNK REPORT, SRV = “SSC: Service Code”, SID = 46 and a Connection Status of hooking, CI = “H: Hooking”.

STEP 3: **ASFC** - Assign to the Stations allowed FAULTY TRUNK REPORT a Service Feature Restriction Class that allows SFI 46 (Bad Call Notify - Faulty Trunk Report).

F-7 Forced Account Code

General Description

This feature is a variation of the AUTHORIZATION CODE [A-20] feature, which makes it mandatory to enter an ACCOUNT CODE (up to ten digits) for all Outgoing Calls. The Account Code must be dialed before dialing the Outgoing Number. Calls are processed only when the dialed Account Code is valid.

The FORCED ACCOUNT CODE can be masked on the Desktop terminal display if necessary using the AUTHORIZATION CODE DISPLAY ELIMINATION [A-99].

Operating Procedure

When dialing an Outgoing Call

1. Lift the handset. Receive Dial Tone.
2. Enter the Access Code. Receive Service Set Tone.
3. Enter the FORCED ACCOUNT CODE (up to ten digits). Receive Dial Tone.
4. Dial the desired number.

Note: The Access Code for FORCED ACCOUNT CODE will be a maximum of three digits.

Service Conditions

1. The maximum number of digits per Forced Account Code is ten.
2. If both FORCED ACCOUNT CODE and AUTHORIZATION CODE [A-20] are provided in the system, the maximum number of codes are 20,000. **Note 1**

   Note 1: Capacity depends on system configuration.

   These specifications are based on the digits being assigned as follows:

1st digit:	A (when A equals a unique digit from 0 - 9)
2nd digit:	B - C (when b, c equal any two unique digits from 0 - 9)
3rd digit:	D-E (when d, e equal any two unique digits from 0 - 9)
4th digit:	F-G-H (when f, g, h equal any three unique digits from 0 - 9)
5th - 8th digits:	Any combination 0 - 9
9th and 10th digits:	Assigned using the checksum. These are for validation purposes only.

   Note: See ETI: 082 for details on AUTHORIZATION CODE/FORCED ACCOUNT CODE [F-7] assignment.

3. AUTHORIZATION CODE [A-20] and FORCED ACCOUNT CODE cannot be provided simultaneously for the same TENANT SERVICE [T-12] Group. System Data Programming determines whether AUTHORIZATION CODE [A-20] or FORCED ACCOUNT CODE is provided for each Tenant.
4. Stations are assigned this feature according to CLASS OF SERVICE - INDIVIDUAL [C-15] programming in System Data.
5. An assigned FORCED ACCOUNT CODE can be used for REMOTE ACCESS TO SYSTEM [R-2].

6. FORCED ACCOUNT CODE can be recorded on STATION MESSAGE DETAIL RECORDING (SMDR) [S-10] for INWATS and Central Office Incoming Calls, when used in conjunction with REMOTE ACCESS TO SYSTEM [R-2]. A maximum of ten digits can be registered as an account code for SMDR purposes.
7. When used in conjunction with REMOTE ACCESS TO SYSTEM [R-2], FORCED ACCOUNT CODE cannot be registered on SMDR if the Incoming Calls are terminated to Stations via Night Service or DID [D-8].
8. FORCED ACCOUNT CODE can be output in the STATION MESSAGE DETAIL RECORDING (SMDR) [S-10] record for Outgoing Calls from a Station handled with OUTGOING TRUNK QUEUING [O-2].

Note: There are two methods of FORCED ACCOUNT CODE assignment. These methods are Full Implementation and the Check Sum method. In the Full Implementation method, the entire FORCED ACCOUNT CODE is assigned in AATC and SYS1, Index 12, Index 13 and Index 14 are assigned 00H. In the Check Sum method, partial assignment for each FORCED ACCOUNT CODE is assigned in AATC. The last one or two digits (programmable option) are determined according to the data assignments in ASYD, SYS1, Index 12, Index 13 and Index 14.

Interactions

1. If FORCED ACCOUNT CODES are used on a per Tenant basis, AUTHORIZATION CODES [A-20] and ACCOUNT CODES [A-18] are not.
2. Station and Remote Access users share the same FORCED ACCOUNT CODES, assigned in AATC.
3. There are no restrictions regarding the first digit of FORCED ACCOUNT CODES except what is programmed in AMND. Tenant 0 does not conflict with the System Numbering Plan when separate Tenant Tables are provided. If Common Tenant Tables are used, a conflict between LCRS and OGC(A) used with SMDR will occur.

Note: The Access Code to the FORCED ACCOUNT CODES feature must be assigned within the System Numbering Plan.

4. When a Desktop terminal user initiates the LAST NUMBER CALL -D [L-6D] feature, the FORCED ACCOUNT CODE will be recorded if previously dialed.
5. AMND determines the length of FORCED ACCOUNT CODES based on the first digit of the code. For example, FORCED ACCOUNT CODES beginning with the digit “4” can be assigned as six digits long, and codes beginning with “5” can be assigned as three-digits long.
6. PEG COUNTS [P-7] of invalid FORCED ACCOUNT CODES are not available.
7. FORCED ACCOUNT CODES can be dialed by a user when establishing a CONSULTATION HOLD [C-17] Connection.
8. Access to the FORCED ACCOUNT CODE feature is determined by the Station’s CLASS OF SERVICE - INDIVIDUAL [C-15].
9. FORCED ACCOUNT CODES cannot be programmed for use via SPEED CALLING - SYSTEM/GROUP/INDIVIDUAL [S-7, 8, 9] features. As a feature to make Outgoing Calls, SPEED CALLING [S-7, 8, 9] does not first provide translation for feature access. However, FORCED ACCOUNT CODES can be programmed as part of the Desktop terminal SPEED CALLING - ONE TOUCH [S-26D] feature.

10. SIP Handler Controlled SIP terminals can place a call with preset dialing of Access Code, Forced Account Code and destination station number. To allow SIP Handler Controlled SIP terminals to receive a Service Set Tone (SST) or a Dial Tone (DT), enable the IP-DTG Tone Send Control Bit through the AUACL/ AUACN command.

Programming

STEP 1: **ASYD** - SYS1, Index 12. If Index 12=0, no Check Sum method is used and Index 13 and Index 14 are ignored regardless of their assignments.

Each Bit in Index 12 directly correlates to a digit in the FORCED ACCOUNT CODE assigned in AATC, and will determine the first digit of the Check Sum method. For this example, 26428 has been assigned as the FORCED ACCOUNT CODE in AATC. Arbitrarily pick any Bits, Bit 0 to Bit 4, and flag those Bits as data 1.

Note: Bit 0 through Bit 7 may be used when eight-digit FORCED ACCOUNT CODEs are assigned in the AATC command.

	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Remarks
AATC	8	2	4	6	2	
SYS1, Index 12	0	1	0	0	1	
Designation	d4	d3	d2	d1	d0	

SYS1, Index 13. Each Bit in Index 13 directly correlates to a digit in the FORCED ACCOUNT CODE assigned in AATC, and will determine the second digit of the Check Sum method. Again pick any Bits, Bit 0 to Bit 4, but not the same combination of Bits as picked in Index 12.

	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Remarks
AATC	8	2	4	6	2	
SYS1, Index 13	1	0	0	1	0	
Designation	d4	d3	d2	d1	d0	

SYS1, Index 14. Determines the algorithm used to calculate the last two digits of every FORCED ACCOUNT CODE. Only decimal numbers may be used in this index; hexadecimal values A to F may not be assigned.

SYS1, Index 14=XY. X and Y represent any arbitrarily chosen decimal digit 1-9; Y is used determine the first digit in the Check Sum method and X is used to determine the second digit in the Check Sum method. The following data, 37H; has been used for the example calculation:

	X				Y				
SYS1, Index 14	**Bit 7**	**6**	**5**	**4**	**3**	**2**	**1**	**0**	**Remarks**
DATA	0	0	1	1	0	1	1	1	

Note: If only one digit is to be added via the Check Sum method, Index 13 data will be 00H and Index 14, digit X (Bit 4 to Bit 7) = 0.

EXAMPLE CALCULATION

In AATC, 26428 has been assigned.

In SYS1, Index 12, Bit 0 and Bit 3 were chosen; 26428

2 + 2 = 4.

The decimal value of Bit 0 to Bit 3 of Index 14=7.

4 + N = 7. N = 3.

7 is obtained as any whole number greater than 4 that ends with a 7, the decimal value as determined in Index 14, Bit 0 to Bit 3.

In AATC, 26428 has been assigned.

In Index 13, Bit 4 and Bit 1 were chosen; 26428

8 + 6 = 14.

The decimal value of Bit 4 to Bit 7 of Index 14 is 3.

14 + N = 23. N = 9.

23 is obtained as any whole number greater than 14 that ends with a 3, the decimal value determined in Index 14, Bit 4 to Bit 7.

The FORCED ACCOUNT CODE will be 26428-39.

Note: Digits 39 determined by the Check Sum method will be unique to the FORCED ACCOUNT CODE 26428. In other words, 26428 will not be followed by any digits other than 39.

SYS1, Index 43, Bit 2. Is Service Set Tone sent after FORCED ACCOUNT CODE, ASPA Feature Access Code? 0/1: No/Yes.

SYS1, Index 93, Bit 6. Are the AMND Tables Separate or common for Tenants in the System? 0/1: Separate/Common. Assign data "0" for separate Tables.

SYS2, Index 3, Bit 5. Type of Code: 0/1 AUTHORIZATION CODE/FORCED ACCOUNT CODE. Assign data "1".

STEP 2: **ANPD** - Reserve a Number Level for Feature Access. Select Normal Service (N), Hooking Service (H) or Busy Service (B) from the combo box for Connection Indexes. (applicable to any feature assigned to this level). Assign NND in accordance with a predetermined Numbering Plan.

STEP 3: **ASPA** - For SRV = "SSC: Service Code" SID = 42, assign the Access Code. Assign for Connection Indexes of "N: Normal" and "H: Hooking".

STEP 4: **ASFC** - For Stations operating via FORCED ACCOUNT CODES, assign these Stations a Service Feature Restriction Class (SFC) that allows SFI 27 (Acct. Codes/Auth. Codes/Forced Acct. Codes). This SFC will be assigned to the Station in ASDT. Presently, the SFC parameter in AATC is inoperative.

NND = Access Code + Forced Account Code. For example, Access Code = 88 (two digits), Forced Account Code = 12345678 (eight digits). The NND is the sum of digits of the Access Code plus the Forced Account Code, therefore in this example the NND would be ten.

STEP 5: **ARSC** - For this feature to operate correctly, assign a Route Restriction Class (RSC) that Toll Restricts (see TOLL RESTRICTION - 3/6 DIGIT [T-10]) or denies access to Routes on a Direct Dial Access, RRI 3. This restricted RSC should then be assigned to the stations that use FORCED ACCOUNT CODE in ASDT. Additionally, construct an RSC that will be appropriate for the desired operation of the Station after the user has dialed the FORCED ACCOUNT CODE. This RSC can then be used when assigning an ACR of "1" AATC.

STEP 6: **AMND** - For Tenant 0, assign the first digit of all FORCED ACCOUNT CODES as the Destination Code (DC) and the Maximum Necessary Digits (MND) of the FORCED ACCOUNT CODE.

STEP 7: **AATC** - Assign the TN, Digit Code (DC) (the actual Forced Account Code itself), the FORCED ACCOUNT CODE Restriction (ACR) as data "1". Then assign the Route Restriction Class (RSC) that is allowing the outgoing call. ACR = 2, does not require RSC restriction.

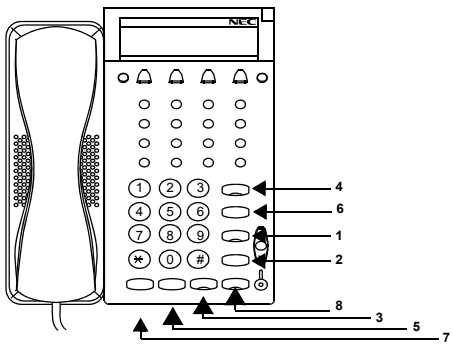
STEP 8: **LATC** - Listing of all the FORCED ACCOUNT CODEs. This is the simplest way to determine what digits have been added to the system with the Check Sum method. This is not required if the Check Sum method is not used.

F-17 Flexible Assignment of Function Buttons

General Description

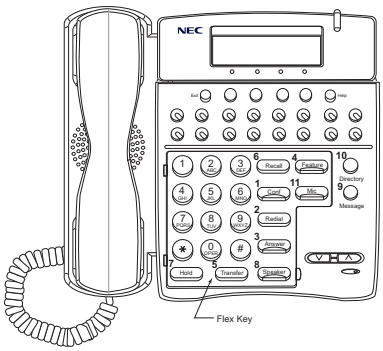
This feature allows Flex keys (REDIAL, FEATURE, SPEAKER, CONF, ANSWER, RECALL, HOLD, and TRANSFER) to be freely assigned on each individual Dterm. Flex keys are programmed through the maintenance console (PCPro) and are part of System Data.

Service Conditions



1. A Flex key cannot be used as a Line key.
2. SPEAKER, ANSWER, FEATURE, CONF, and REDIAL should be assigned to Flex keys that have lamps.
3. SPEAKER must always be assigned.
4. RECALL and TRANSFER must be assigned because they are used to indicate a Pause (-), Hooking (H) (!), and Voice Call (V) when programming a SPEED CALLING - ONE TOUCH -D [S-26D] Destination Number.

Programming



Flex key Assignment Example

AKYD -

TP:	2 or 3	KYN:	1~ 8	KYI2:	0 or 1		
CONF:	KYN 1	REDIAL:	KYN 2	ANS:	KYN 3	FEATURE:	KYN 4
TRANSFER:	KYN 5	RECALL:	KYN 6	HOLD:	KYN 7	SPEAKER:	KYN 8
Message:	KYN 9	Directory:	KYN 10				

KYN	FKY	STANDARD
3	28	Answer
2	8	Redial
1	13	Conference
4	16	Feature
5	18	Transfer
7	20	Hold
8	52	Speaker
6	57	Recall

KYN	FKY	STANDARD
3	28	Answer
2	8	Redial
1	13	Conference
4	16	Feature
5	18	Transfer
7	20	Hold
8	52	Speaker
6	57	Recall
9	147	Message
10	15	Directory

Note: For the examples of other terminals, refer to AKYD command in Command Manual.

F-24 Forced Release - Attendant

General Description

This service feature provides an attendant with the capability to override and release a busy trunk connection within the Telephony Server, via ATTENDANT CONSOLE [A-3]. Upon activation, a Warning Tone will be heard by the connected parties, after which they will be connected with the Attendant in a three-way bridge.

Note: This feature is not available in North America and Australia.

Operating Procedure

To activate FORCED RELEASE - ATTENDANT:

1. Depress TKSL key.
2. Dial the desired trunk route (2 or 3 digits) and identification number (3 digits).
3. Upon receiving Busy Tone, depress BV key.
4. A two-burst tone is sent to the connected parties.
5. The Attendant can now monitor or join the connection (ATTENDANT OVERRIDE [A-7]).
6. Depress CANCEL key to release the connection; the connected parties hear Reorder Tone and the Attendant becomes idle.

Service Conditions

1. Availability of this service feature is assigned by the system data.
2. ATTENDANT OVERRIDE [A-7] feature is a prerequisite for this service feature.
3. This service feature is effective when an Attendant enters a busy connection using ATTENDANT OVERRIDE [A-7].
4. For detailed service conditions, refer to ATTENDANT OVERRIDE [A-7].

F-31 Follow Phone

General Description

This feature allows individual station data of a terminal to be exchanged with another, without the assistance of the PCPro. The result of the exchange is printed out in the system message. The exchange of terminal data by this service is called SWAP service. The following information is included in the system message:

a.) Successful activation: Station data change notice.
b.) Unsuccessful activation: Station data change notice and error code to indicate the restricted condition.

Operating Procedure

To swap the station data of Station A (202) for Station B (209), operating from Station A

1. Go off-hook. Receive Dial Tone.
2. Dial the Swap service Access Code. Receive Special Dial Tone. The LCD displays.

SWAP **(Time Display)**

3. Dial the Station B number (209). Receive Service Set Tone. The LCD displays:

SWAP OK **209** **(Time Display)**

4. Replace the handset; the service will be activated.When the service is restricted, the user hears Reorder Tone after dialing the Target Telephone Number. The LCD displays:

Flashing

REST **209** **(Time Display)**

To confirm

5. Dial 202 from Station A; Station B rings, and Station A receives Ringback Tone, or vice versa.

Service Conditions

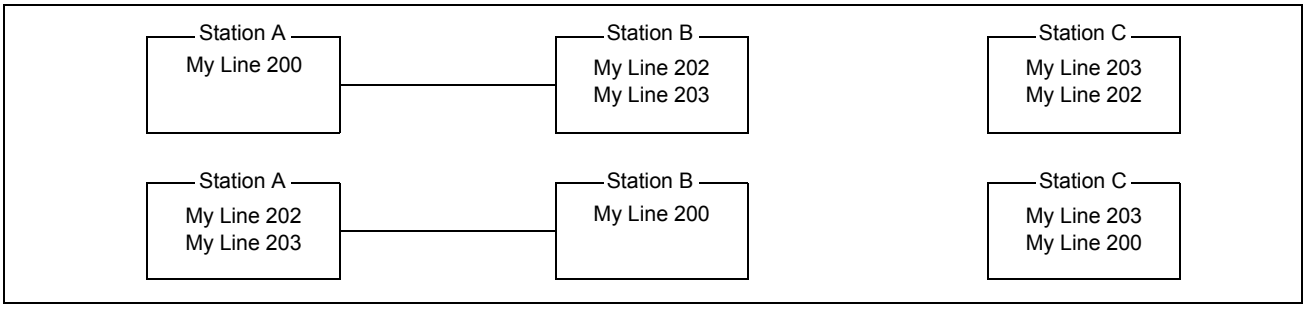
1. This service is available for the following Telephone Class:
   TEC= 1: Analog Telephone - DP (10 P)
   2: Analog Telephone - PB
   3: Analog Telephone - DP/PB
   4: Analog Telephone - DP (20 P)
   12: Digital Terminal (Dterm)
2. This service is available between the same types of Terminals. This service is not available for Dterm IP Telephones and Single Line Telephones connected to the MC.
3. The Target Station has to be idle in order to activate this service. In case the Station is busy or lock-out is set, the service will be restricted.
4. This service is available for the Terminals that belong to the same Tenant or Module Group.

5. This service is not available for the following Stations:
   a.) Night Station (ACSI)
   b.) HOTLINE [H-1] Station
   c.) HOUSE PHONE [H-2]
   d.) Data Line, or Dterm that has a Data Line assigned
   e.) Station setting/being set CALL BACK [C-1] or OUTGOING TRUNK QUEUING [O-2]
   f.) Stations where following services are set:

CALL FORWARDING - ALL CALLS	[C-5]
CALL FORWARDING - BUSY LINE	[C-2]
CALL FORWARDING - DON'T ANSWER	[C-3]
MESSAGE WAITING INDICATION -D	[M-85D]

   g.) DIT [D-7]
   h.) Dterm calling from a Sub Line
   i.) Station which has set or has been set for Busy Service.

   Note: The service is available after the message is canceled.



6. The following information is swapped when this service is activated:

ITEM	DATA SWAPPED IN FOLLOW PHONE SERVICE	STATION TYPE	
		SINGLE LINE	Dterm
1.	Feature Key information	Not Available	Available
2.	Add-On Module Key information **Note 1**	Not Available	Available
3.	Flexible Line/Feature Key information	Not Available	Available
4.	Speed Calling - One Touch Data **Note 2**	Not Available	Available
5.	Intercom information (Automatic, Manual, Dial)	Not Available	Available
6.	Telephone Number	Available	Available
7.	Route Restriction Class	Available	Available
8.	Service Class	Available	Available
9.	Speed Calling - Group/Station Data	Available	Available
10.	Phantom Number	Available	Available
11.	Name Display information	Available	Available

Note 1: The Add-On Module key information of Dterm does not swap.

Note 2: There are some hardware/firmware limitations in order to swap all the SPEED CALLING key information. SPEED CALLING key assigned on the Feature keys does not swap.

7. When this service is activated, the key information of Desktop terminal, which has the target station as a Multi Line will be changed automatically. For example:

8. If the Multi Line LED of Dterm is lit (busy) when the Station swaps, the line LED key may not light immediately after the service is activated. The LED lights normally after the user goes on-hook.
9. For the Stations that belong to the following Service Groups, this service is available only for those Stations belonging to the same group.

CALL PICKUP	[C-7, 30]
CALL PARK	[C-29]
STATION HUNTING - CIRCULAR	[S-7]
STATION HUNTING - TERMINAL	[S-9]
UCD	[U-1]

Note: In case of STATION HUNTING - SECRETARIAL [S-8], the function as the Secretarial Station does not swap even when the Station swaps. The Secretary Station is not considered as a member of the Hunt Group.

10. When the Following Station activates this service, its Destination Station is not swapped.
    a.) Stations where following services are set:
    - CALL FORWARDING - BUSY LINE set by the system
    - CALL FORWARDING - DON'T ANSWER set by the system
    - CALL FORWARDING - INTERCEPT / ANNOUNCEMENT [C-25]

    b.) Predetermined Station for HOTLINE [H-1]
    c.) Predetermined Station for OFF-HOOK ALARM [O-6]
    d.) DIRECT-IN TERMINATION (DIT) [D-7] Station
11. If Dterm has individual Terminal Data assigned, this service is available for Dterms with identical Terminal Data.
12. This service is not available for:
    a.) Desktop terminal with OAI service key
    b.) ACD Agent Console and Supervisory Console
    c.) Desktop terminal with CALL WAITING LAMP - UCD [C-76]
13. This feature cannot be activated between Dterms of different types. When different Dterms are used, there may be cases where the Incoming Call cannot be answered or some services cannot be activated, due to lack of Line/Feature keys. In this case, the data can be restored by activating the service again or by exchanging the Terminal sets.
14. When activating this service, the Terminals cannot be exchanged. (There may be some inconvenience if the number of SPEED CALLING keys, etc. differ between the Terminals.)

15. When activating this service, swap of the SPEED CALLING - ONE TOUCH -D key data start upon replacement of the handset. It takes approximately 42 seconds for the SPEED CALLING key data to swap, and during this time, FOLLOW PHONE Service and SPEED CALLING - ONE TOUCH operations are restricted.
16. After this service is activated, and if DM Load Reset is activated before the data is backed-up to the hard disk, the Stations return to the previous status. However, this is not the case with the SPEED CALLING - ONE TOUCH -D Feature keys.
17. The DSS Console data does not swap. The My Line of the connected Dterm may swap, but in this case, reassignment of DSS data and cabling will be necessary. The above is the same when using the DSS as an Add-On Module.
18. This feature is restricted at the office using Telephone Number.
19. When a Swap Restriction occurs, “System Message 16-X” will be generated.

Interactions

This service is restricted for a Dterm using Expanded Multiple Line Operation -D [E-26].

Programming

STEP 1: **ANPD** - Assign the minimum necessary number of digits for the first number of the SWAP Access Code.

STEP 2: **ASPA** - Assign the Access Code for SWAP. CI = “N: Normal”, SRV = “SSCA: Service Code Appendix”, SIDA = 96, SWAP.

F-35 Flexible Routing - FCCS

General Description

With this feature, an FCCS Trunk Call can automatically be routed via a Non-FCCS Trunk (Central Office or TIE Line), if all the FCCS Trunks are busy or a Data Link Failure occurs at the FCH Card.

Operating Procedure

No manual operation is required.

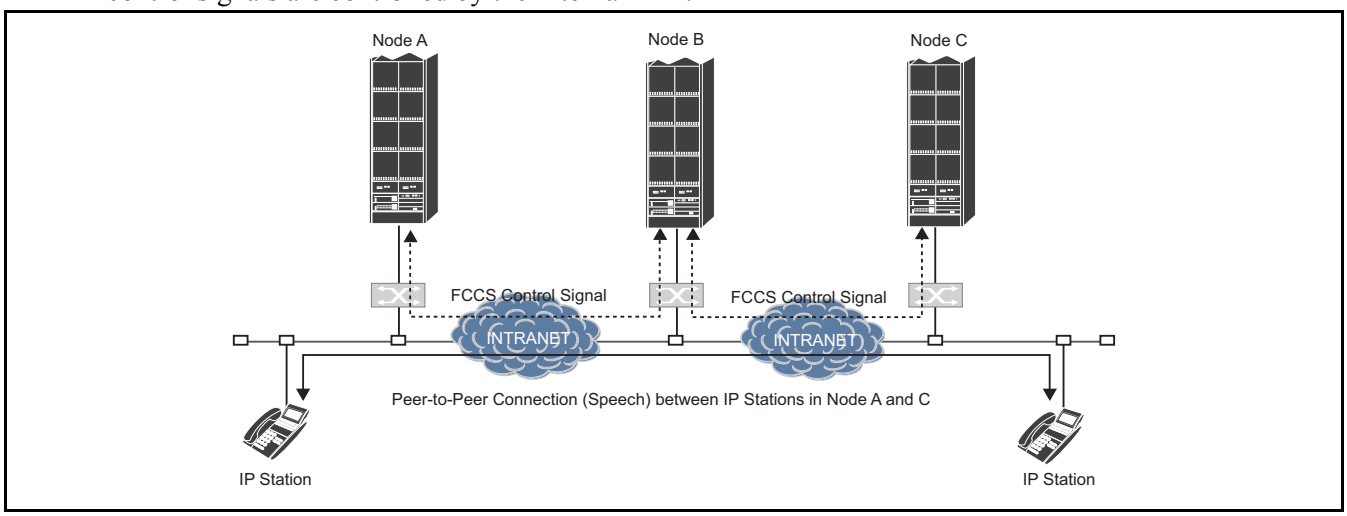
Service Conditions

Refer to the Data Programming Manual - FCCS.

Programming

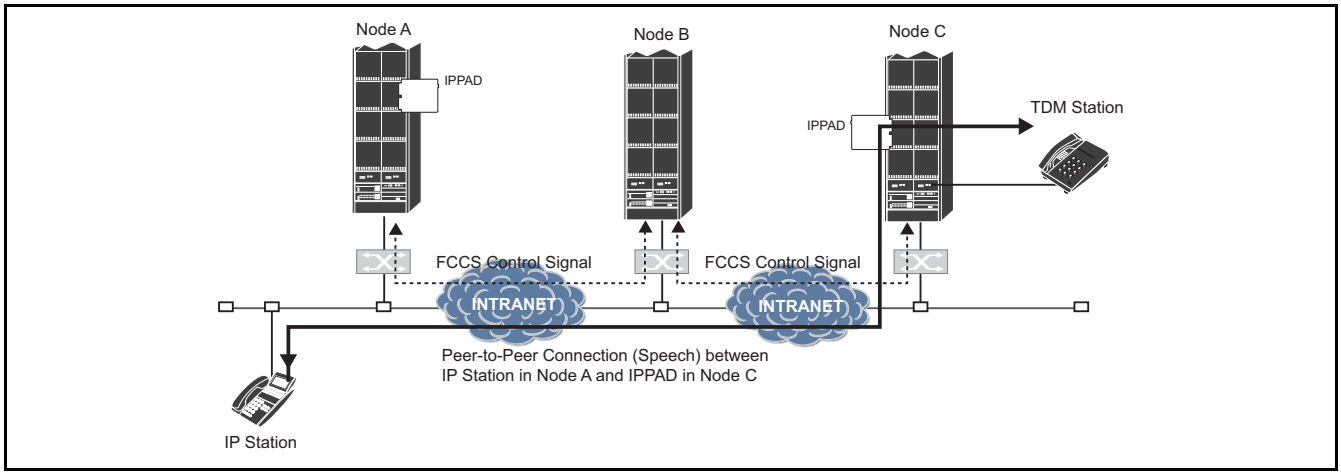
Refer to the Data Programming Manual - FCCS.

F-36 FCCS Networking via IP



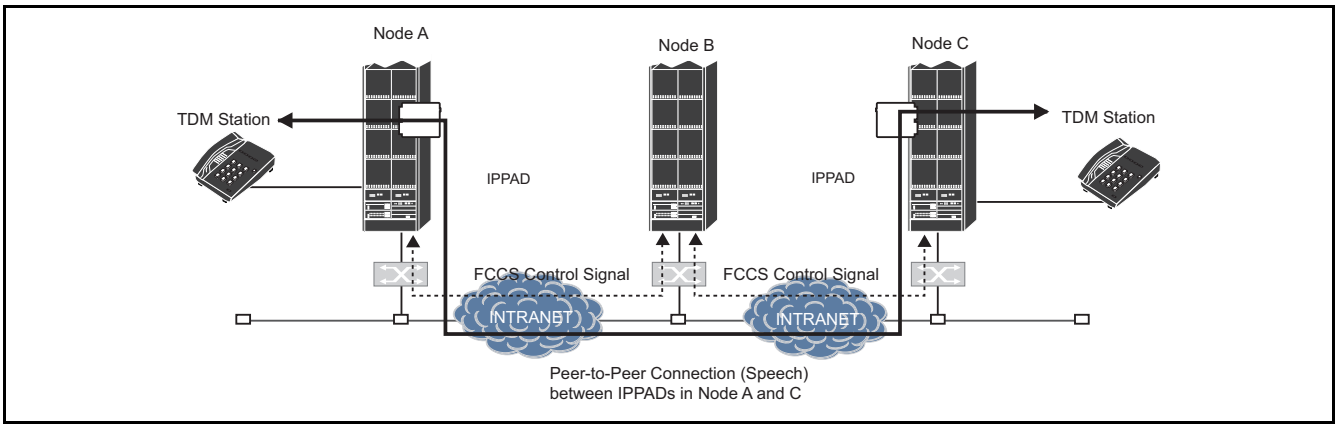
1. FCCS Networking via IP (Peer-to-Peer)

General Description



This feature allows the system to exchange both Speech and FCCS Signals over an Intranet. This feature can be activated by using Internal PHF. The Speech data between the IP Stations can be sent/received in a Peer-to-Peer connection, while the control signals are handled by the System. The following are typical connection patterns for this feature.

Note: The System has an interface function to send/receive the FCCS signals to/from the IP network. This interface function is called Internal PHF. Internal PHF converts the FCCS signals into the IP packets and vice versa.



- Connection between the IP Stations: The Speech data is sent/received in a Peer-to-Peer connection. The control signals are controlled by the Internal PHF.

- Connection between the IP Station and Legacy Station: The Speech data is sent/received via IPPAD circuit card accommodated in the Legacy Station Node. At this time, Peer-to- Peer connection is established between the IPPAD and the other Node IP Station.

- Connection between the Legacy Stations: Each IP Station seizes the Self Node IPPAD, and Peer-to-Peer connection is established between the IPPADs.

Operating Procedure

No manual operation is required.

Service Conditions

1. This feature realizes the existing FCCS (hereafter called DTI-FCCS) services in a Peer-to-Peer network.
2. If the routing data for both Peer-to-Peer FCCS and DTI-FCCS is programmed for a single FPC, the Peer-to-Peer FCCS routing takes precedence. At this time, the DTI-FCCS routing is used as the backup, or used as an alternative if a link disconnection occurred in the Peer-to-Peer FCCS.
3. Tandem Path Through Control to Peer-to-Peer FCCS network is not available.
4. DP signal cannot be relayed via Peer-to-Peer FCCS. However, PB signals can be relayed on Peer-to-Peer FCCS when IPPAD with Sub Board is used.
5. A maximum of 63 nodes can be connected in a network.
6. The IP address of a destination Node is assigned by AFIPN. The port number of a destination Node (default is 60180) is assigned by ADTM. When the port number is changed by ADTM, Internal PHF must be initialized by either of the following methods.

PCPro	Command Menu	Descriptions
ADTM	Restart	All the IP-related port, including the Internal PHF communication port, are disconnected and then generated again. The destination Node information and Send Control information controlled by Internal PHF is cleared.
ADPM	Module Initialize	Internal PHF communication port is disconnected and then generated again. The destination Node information and Send Control information controlled by Internal PHF is cleared.
	Module Reset	All the IP-related port, including the Internal PHF communication port, are disconnected and then generated again. The destination Node information and Send Control information controlled by Internal PHF is maintained.

7. A maximum of four Nodes (three links) can be connected as tandem nodes.
8. This feature does not support Wide-Band services H0, H1 of ISDN/CCIS Line.

9. When using this feature, the tone such as RBT or Music is sent under the following conditions:

Tones	DTI-FCCS	Peer-to-Peer FCCS
Dial Tone (DT)	Self Node Tone	Self node
Special Dial Tone (SPDT)	Self Node Tone	Self node
Ringback Tone (RBT)	Connected Node Tone	IP terminal
Call Waiting Tone (CWT)	Self Node Tone	Self node
Busy Tone (BT)	Self Node Tone	Self node
Reorder Tone (ROT)	Self Node Tone	Self node
Service Set Tone (SST)	Self Node Tone	Self node
Second Dial Tone (SDT)	Connected Node Tone	IP terminal
Tone Ringer (TRG)	Self Node Tone	Self node
Sender Transmitting Tone (SDTT)	Connected Node Tone	IP terminal
Call Waiting RBT (CWRBT)	Connected Node Tone	IP terminal
Music on Hold (MUSIC)	Connected Node Tone	IP terminal
No Tone	Self Node Tone	Self node

Note: If a DTI-FCCS Node exists between the holding party and held party, the tone is sent from the DTI-FCCS Node. If no DTI-FCCS Node exists between the holding party and held party, the held IP terminal provides the tone itself.

10. If the Peer-to-Peer FCCS link is down due to the LAN failure, etc., the alternate routing to another outgoing trunk is available.
11. The restrictions for connection containing Peer-to-Peer FCCS and DTI-FCCS are as follows:
- SIP terminals are unavailable to use.
12. If Peer-to-Peer FCCS, DTI-FCCS and Peer-to-Peer CCIS coexist in the same network and each node is connected in tandem, the following must be considered:

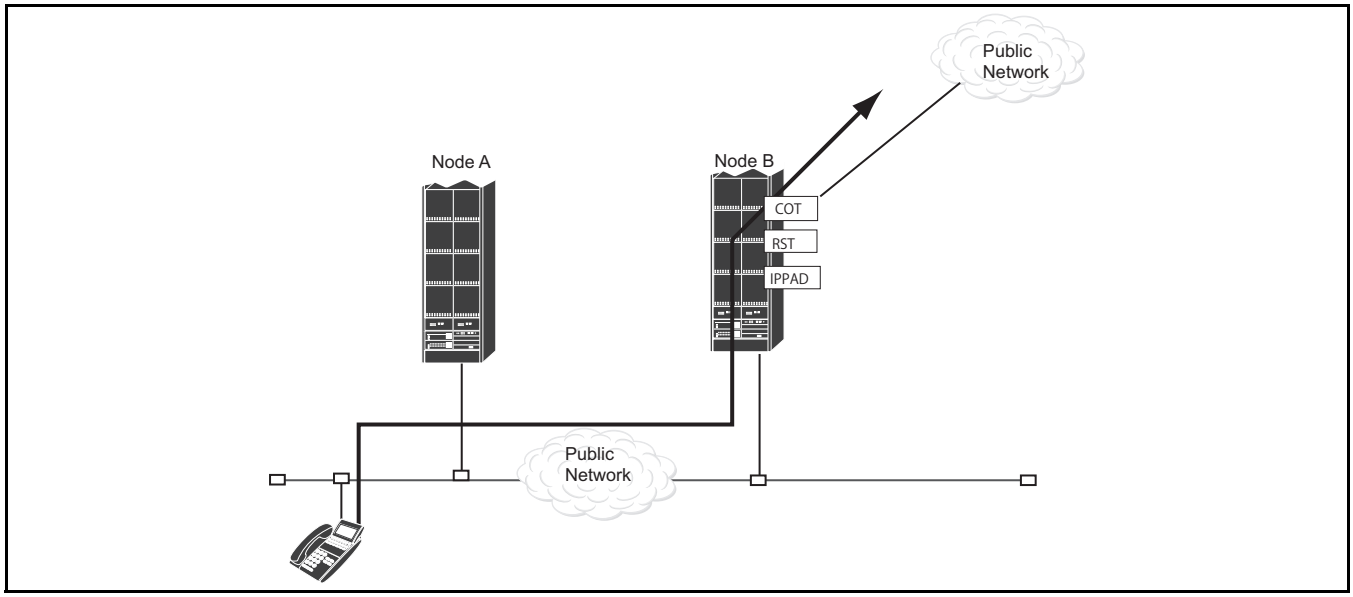
Connection Patterns	Availability of Connection
Peer-to-Peer FCCS – Peer-to-Peer FCCS – Peer-to-Peer CCIS	Available
Peer-to-Peer FCCS – DTI-FCCS – Peer-to-Peer CCIS	Available
DTI-FCCS – Peer-to-Peer FCCS – Peer-to-Peer CCIS	Available **Note 1**
DTI-FCCS – DTI-FCCS – Peer-to-Peer CCIS	Available

Note 1: Peer-to-Peer CCIS ↔ Peer-to-Peer FCCS ↔ DTI-FCCS tandem connection is available. The restrictions for this connection are as follows:
- SP Controlled SIP terminals are unavailable to use.

13. The Number of PHF Packet Retransmissions appropriate for the network status can be selected from 1-5 (maximum) by assigning System Data [ASYDL, SYS1, Index 1078, Bit 0 to Bit 3 (Number of PHF Packet Retransmissions)]. **Note 2**, **Note 3**, **Note 4**

Note 2: Assign “1” for the number of PHF packet retransmissions. Increase the number only if a packet loss has occurred frequently because of the network.

Note 3: When the number of PHF packet retransmissions is increased, the entire system performance may go down depending on the network status.



Note 4: When the number of PHF packet retransmissions is changed, Internal PHF Module Reset is required by using ADPM command.

14. When a PHF communication failure such as consecutive PHF packet retransmissions or packet loss occurred, the system message (IP PKG Warning [33-R]/IP PKG Failure [33-S]/IP PKG Restore [33-T]) can notify the maintenance personnel.

Note: PHF module must be restarted when the number of PHF packet retransmissions and PHF packet retransmission timer is changed by system data.

Note: When enabling the internal PHF packet retransmission control function, enable the internal PHF packet retransmission control function for all the nodes in the network and use the common value for the number of PHF packet retransmissions and PHF packet retransmission timer. However, in the case of [P2P-FCH-P2P] configuration, one of the Peer-to-Peer FCCS network only will be available for this function.

15. When originating a trunk call via Peer-to-Peer FCCS, if the same sender as that of the originating terminal in the node is not available, the same sender as that of the outgoing trunk in the node is selected.

a.) To use this function, accommodate an RST circuit card in the same node as the outgoing trunk.
b.) The relationship between the system data and the sender to select is as follows.

- In the case of the system data [ASYDN, SYS1, Index 641, Bit 6=0]

  The same sender as that of the originating terminal in the node is selected. If it cannot be selected, the same sender as that of the outgoing trunk is selected. If the both of them cannot be selected, outgoing call is restricted.

- In the case of the system data [ASYDN, SYS1, Index 641, Bit 6=1]

The same sender as that of the outgoing trunk in the node is selected. If it cannot be selected, the same sender as that of the originating terminal is selected. If the both of them cannot be selected, outgoing call is restricted.

c.) If the sender cannot be selected, “Busy” will be displayed on the LCD of Digital Terminal.
d.) The sender “RT905 (Sender Trunk)” is used in this function.
e.) The peg count for sender trunk seizure is processed in the node where the sender trunk is seized.
f.) When using the following features, this function is disabled.

- Individual Trunk Access - CCIS (MAT)
- Trunk Call Origination from Attendant Console (LCRS)
- Trunk Call Origination from ISDN Terminal
- OGC/OGCA Call Origination to ACSI line through Second Dial Tone.
- Hot Line Station through Trunk Line method (AHLS/AHLSN TYPE=3)
- Trunk Line Appearance

g.) This function is not available for Hotel system and OAI/ACD system.

16. To use this feature, the Speech Link Reconnection via FCCS Networking via IP function must be enabled [ASYDL, SYS1, Index 527, Bit 5=0].

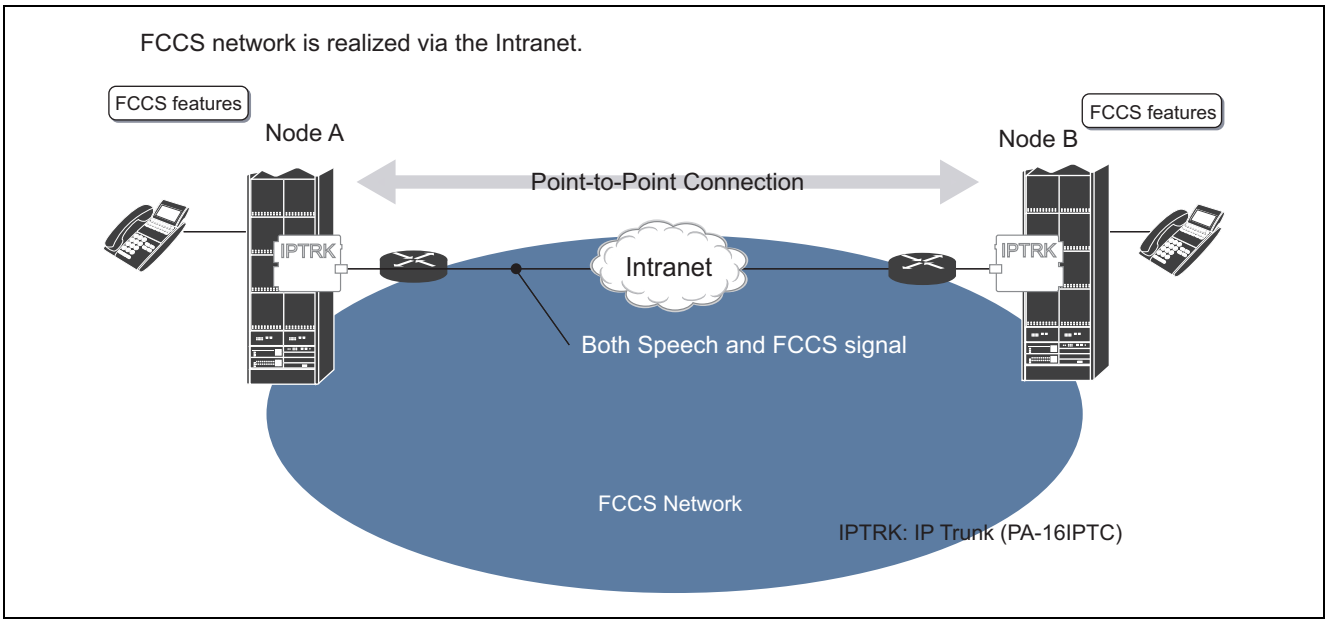
Programming

For information about data programming for FCCS Networking via IP, refer to FCCS Networking via IP in Chapter 5 of Data Programming Manual - FCCS.

2. FCCS Networking via IP (by IPTRK)

Note: Initialize the appropriate IPTRK(s) after the office data assignment.

Note: FCCS Networking via IP (by IPTRK) is available only for a migrated system from IPX/SV7000/SV8500. For a newly installed the SV9500 system, use FCCS Networking via IP (Peer-to-Peer).

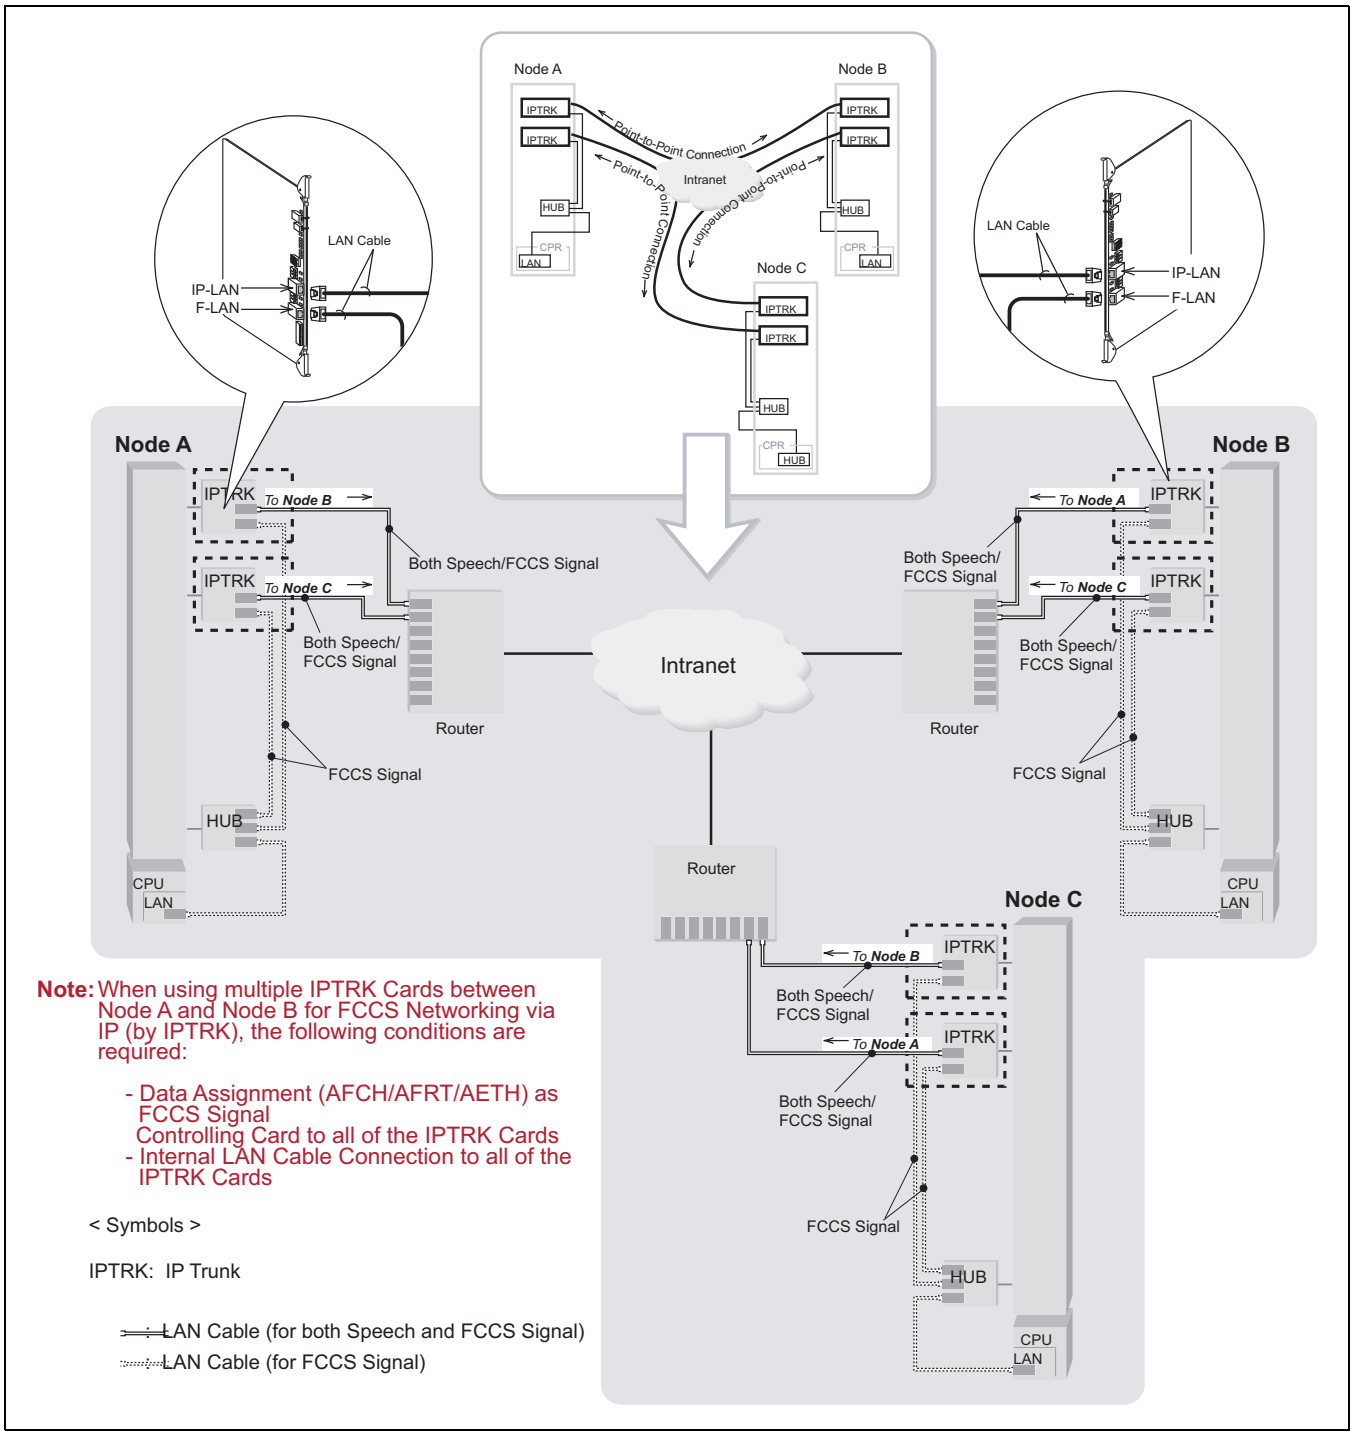


General Description

This feature allows the system to exchange both Speech and FCCS Signals over an Intranet. It is not necessary to use an FCH circuit card. To establish or release a call, the following Connection Pattern can be selected:

- Point-to-Point Connection: For both Speech and FCCS Signal Channels, an IPTRK circuit card is used. At this time, the IPTRK Cards in the Self Node and each of its connected node(s) must be in one-to-one ratio.
- Point-to-Multipoint Connection: For both Speech and FCCS Signal Channels, an IPTRK circuit card is used. At this time, the IPTRK Card, accommodated in the Self Node, can be connected to multiple destination (IPTRK Cards of multiple nodes).

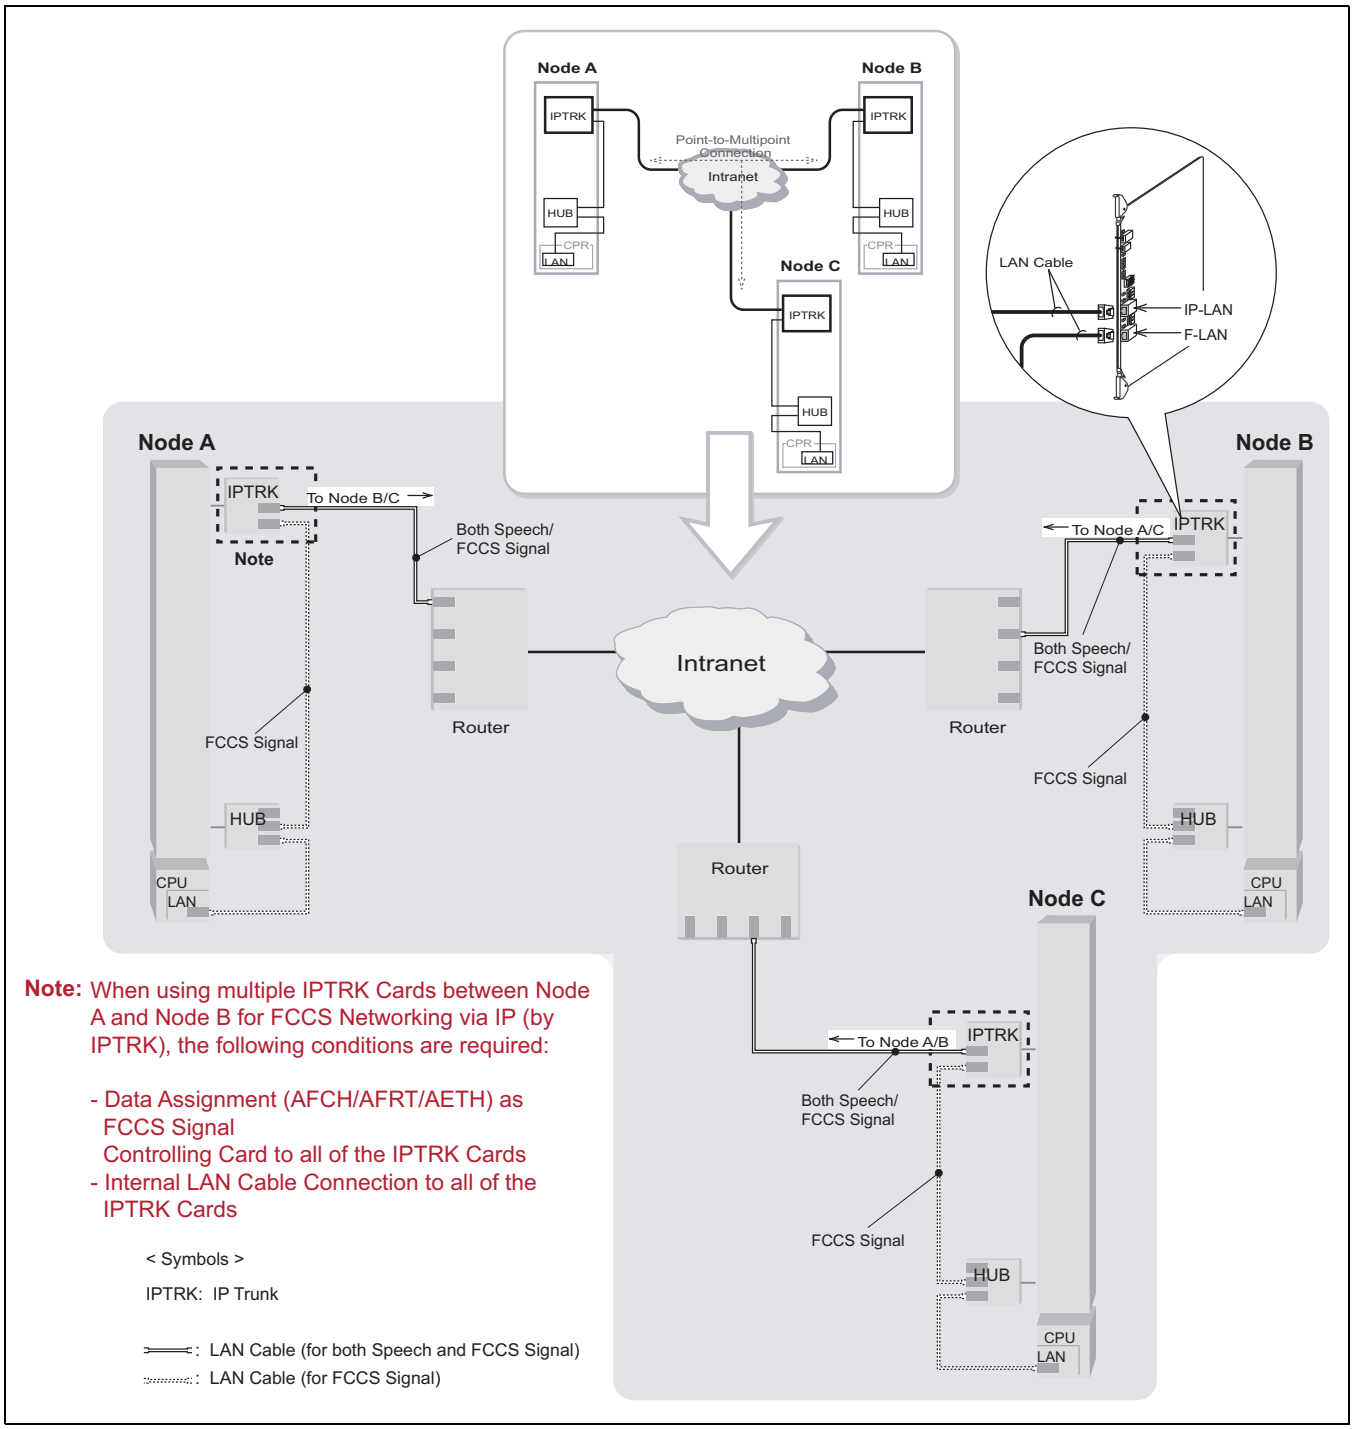
Point-to-Point Connection is functionally a kind of form within Point-to-Multipoint Connection.



FCCS Networking via IP - Overview

- **Required Hardware (Point-to-Point Connection)**

  This feature is made available by using the following hardware equipment. As shown, both Speech and FCCS Signal Channels between the Nodes must be provided by Point-to-Point Connection of IPTRK Cards with LAN cables.

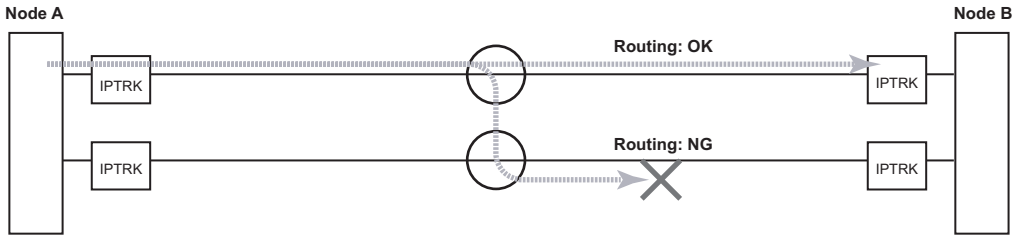


Required Hardware (Example) for FCCS Networking via IP [IPTRK: Point-to-Point]

- **Required Hardware (Point-to-Multipoint Connection)**

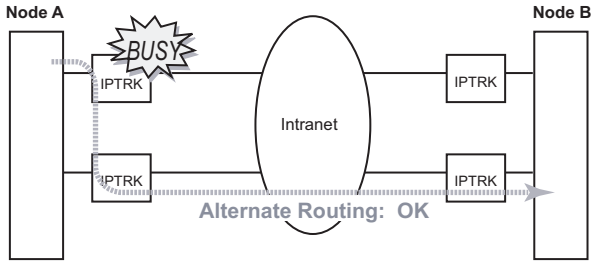
  This feature (allowing IPTRK Card for both Speech and FCCS Signal Channels) is made available by using the following hardware equipment. Once this feature is set, each IPTRK Card can make a Point-to-Multipoint Connection with IPTRKs of multiple nodes.

Required Hardware (Example) for FCCS Networking via IP [IPTRK: Point-to-Multipoint]



Operating Procedure

No manual operation is required.

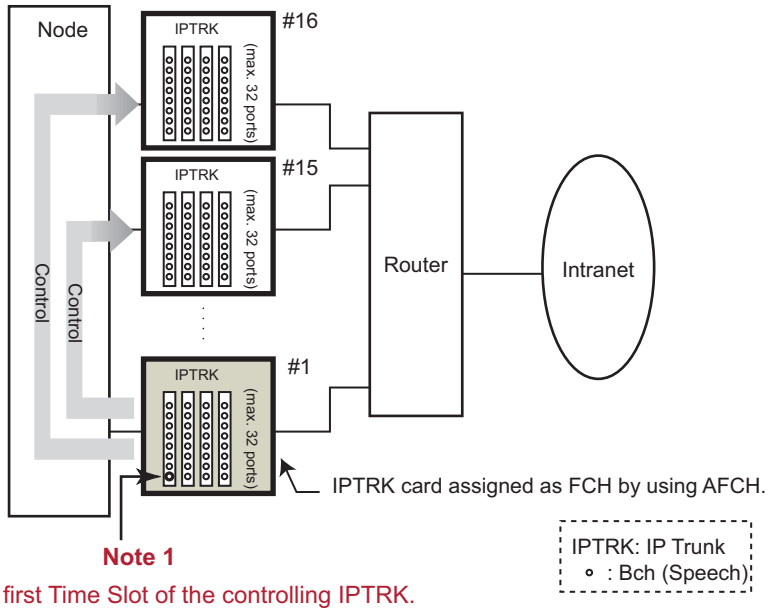


Service Conditions

1. FCCS Networking via IP (by IPTRK) is available only for a migrated system from IPX/SV7000/SV8500. For a newly installed the SV9500 system, use FCCS Networking via IP (Peer-to-Peer).
2. To send or receive voice information, each node will use IPTRK circuit cards. At this time, the IPTRK Cards in the Self Node and its connected nodes can be either in a one-to-one ratio (referred to as Point-to-Point Connection) or in a one-to-n ratio [(n=2 or more), referred to as Point-to-Multipoint Connection].
3. Use a Router for connections between the IP Network and an IPTRK Card.
4. The maximum number of IPTRK Cards allowed is two per UNIT. Accordingly, a total of 16 IPTRK Cards can be accommodated per IMG.
5. Only Voice and FAX (G3) information can be sent or received via an IPTRK Card.
6. A call cannot be established or routed across multiple IP Networks. Refer to the following figure:

7. When multiple IPTRK Cards are used for Node-to-Node Connections and all of the lines on the IPTRK are busy, Alternate Routing is available. However, if a Router is not used for some reason, the related IPTRK Routes are not available. Refer to the following figure.

As shown, when multiple IPTRKs exist, Alternate Routing is available:



IPTRK: IP Trunk

8. When using multiple IPTRK Cards between Node A and Node B for FCCS Networking via IP (by IPTRK), the following conditions are required:

   - Data Assignment (AFCH/AFRT/AETH) as FCCS Signal Controlling Card to all of the IPTRK Cards
   - Internal LAN Cable Connection to all of the IPTRK Cards

   Refer to the following figure:

An IPTRK Card, assigned as an FCCS Signal Controlling Card by AFCH, can control the B-Channels of the card and a maximum of 15 other cards.

Note 1: Assign a B-Channel in the first Time Slot of the controlling IPTRK.

9. During an IPTRK-related Tandem Connection, speech quality can be diminished, or a dual connection failure may occur. DTMF and FAX Relay cannot be used.
10. This feature supports Quality of Service (QoS) function.
11. Tandem Path through function is not released.
12. A feature must be available for the FCCS Network to be available for this feature.
13. When a system message indicates “TCP Link Failure” due to data congestion on the Router or IP Network, a call cannot be made via an IPTRK circuit card. When a call is attempted despite this, the caller hears Busy Tone.
14. When a system message, related to “TCP Link Failure”, is created during Call Origination or Speech, that call’s Speech Channel is automatically released via Patrol Function.
15. When all lines of an IPTRK Card are busy, Alternate Routing to the Central Office Line or TIE Line is available. For more detailed information, refer to the table below.

Alternate Routing To Be Provided/Not Provided (FCCS Networking via IP)

×: Available NA: Not Available

	FROM FCCS Networking via IP ***(Point-to-Point/Point-to-Multipoint)***	**TO FCCS Networking via IP** ***(Point-to-Point/Point-to-Multipoint)***
Analog Central Office Line	NA	NA
Analog Tie Line	×	NA
CCIS	×	NA
ISDN	× (via Sub Address-Addressing only)	NA
Dp Channel	×	NA
FCCS Network over Intranet (via DTI)	×	×
FCCS Networking via IP (Point-to-Point/Point-to-Multipoint)	×	×
CCIS Networking via IP (Point-to-Point/Point-to-Multipoint)	×	NA

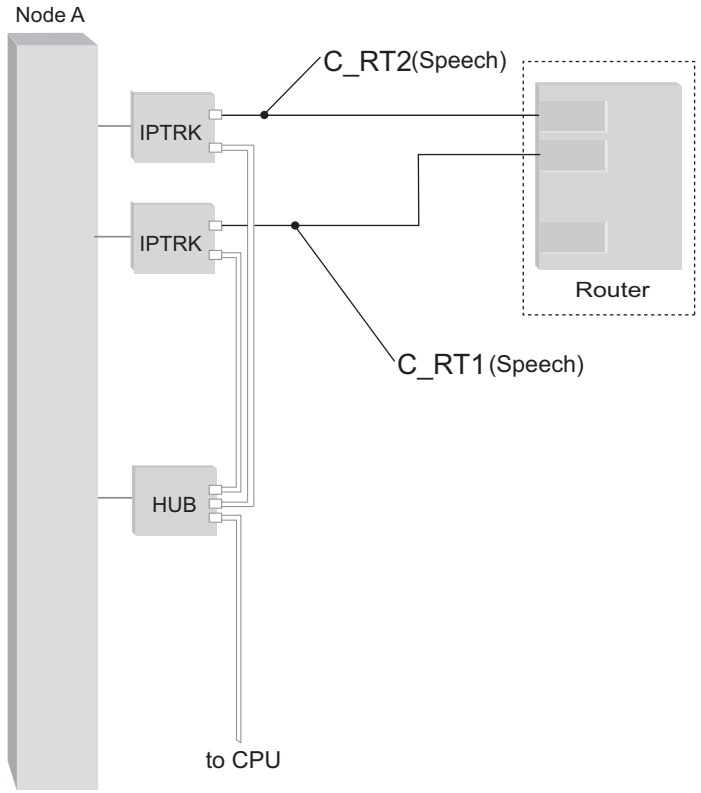
16. This feature does not support Broad Band Services H0, H1 of ISDN/CCIS Line. Supports 1B only.
17. Link Reconnection is available.
18. This feature does not support Hotel/Motel services.
19. When using IPTRK card, Dial Pulse (DP) relay broadcasting to FCCS Link (ASYDL, SYS1, Index 527, Bit 4=1) is not available.

Programming

Note: The data programming for both Point-to-Point Connection and Point-to-Multipoint Connection is identical.

Attention: *When any Office Data is assigned or modified, be sure to reset the IPTRK circuit card (by flipping the MB key OFF → ON → OFF).*

STEP 1: **ASYDL** - SYS1, Index 534, Bit 7=1 (NDM Data individual broadcasting from NCN to each LN)



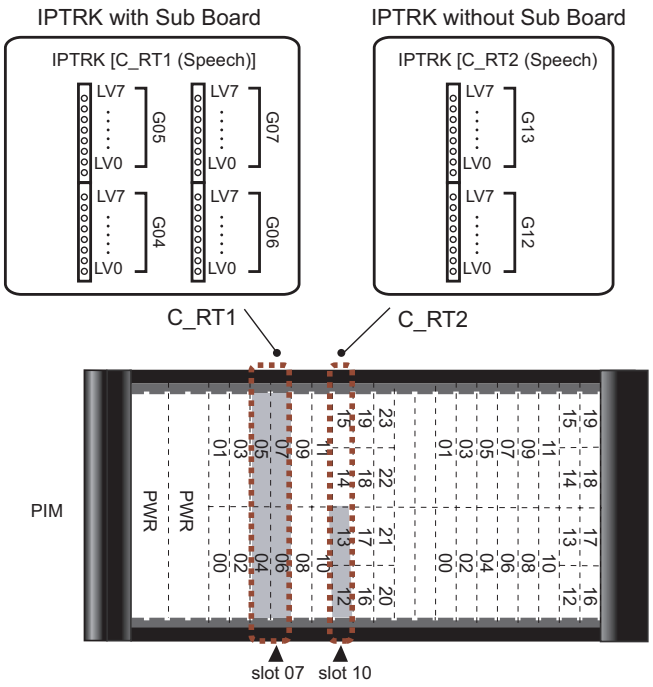
Note: Provided that IPTRK circuit card is equipped in the Node within FCCS Network, NDM data broadcasting is not to be executed. Therefore, when IPTRK Card is used in the FCCS Network, perform this data assignment at the Network Control Node (NCN).

SYS1, Index 527, Bit 5=0 (Speech Link Reconnection in FCCS via IP network is valid)

STEP 2: **ACRD** - Assign Route Class Data of Speech Routes. The IPTRK Card assigned with the AFCH command is to be used as the FCCS Signal Channel Controlling Card. It is not required to assign the Signal Route Data with the ACRD command. See the following sample data assignment.

Sample Data Assignment (ACRD)

ACRD: Speech Route (LSG=12, FGH=0, LKIND=3, IPTRK=1)



Type		Speech	Speech
CDN	C_RT	*1*	*2*
1	TF	3	3
2	TCL	4	4
3	RLP	2	2
4	SMDR	0	0
5	LSG	12	12
6	PAD		
7	TRKS	0	0
8	TC/EC		
9	FINT	0	0
10	FPEG	0	0
11	TC	0	0
12	MTC	0	0
13	STSEQ	0	0
14	FGH	0	0
15	MMN		
16	LKIND	3	3
17	IPLYR	0	0
18	IPTRK	1	1
19	IPPAD	0	0

Note: This data setting is an example.

STEP 3: **ACTK** - Assign the Connection Trunk Data of the IPTRK circuit card. It is not required to assign the Trunk Data for D-Channel. See the following sample data assignment.

Sample Data Assignment (ACTK)

Sample Data Assignment

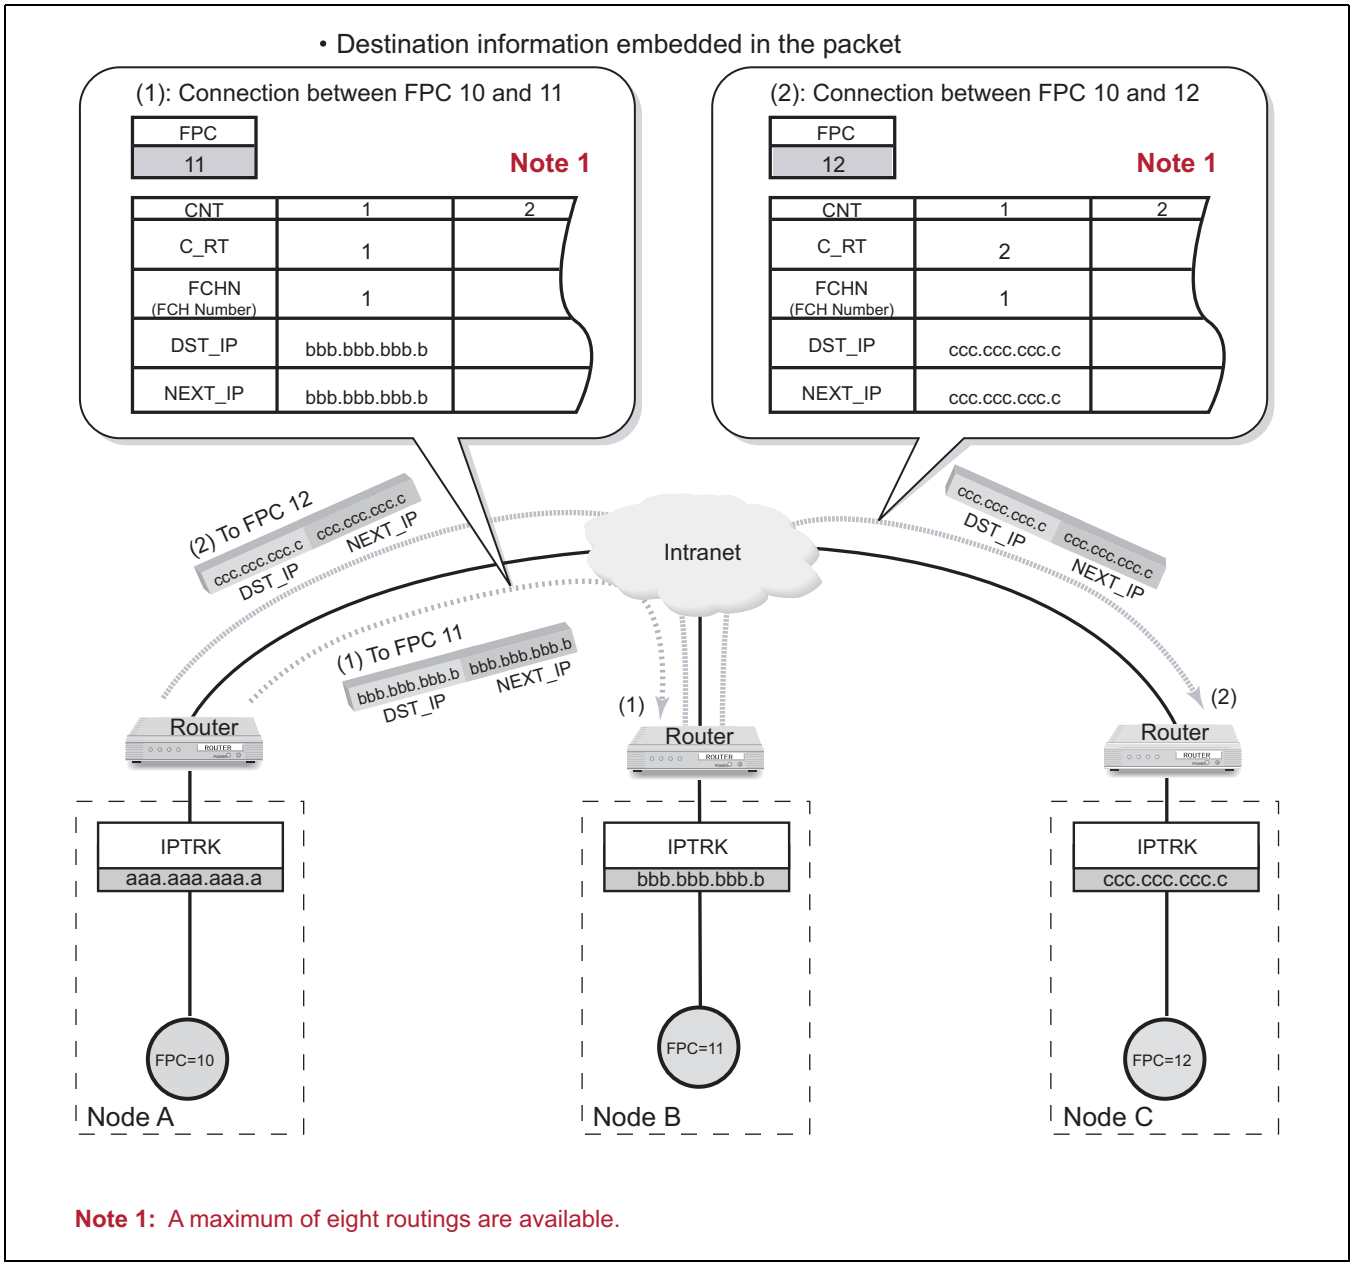
	C_RT (1-1023)	C_TK (1-4095)	C_LENS MG 00-07	U 0-3	G 00-23	LV 0-7
IPTRK(C_RT1)	1	1	0 0	0	0 4	0
		2	0 0	0	0 4	1
		3	0 0	0	0 4	2
		⋮ 32	⋮ 0 0	⋮ 0	⋮ 0 7	⋮ 7
IPTRK(C_RT2)	2	1	0 0	0	1 2	0
		2	0 0	0	1 2	1
		3	0 0	0	1 2	2
		⋮ 16	⋮ 0 0	⋮ 0	⋮ 1 3	⋮ 7

STEP 4: **MBCT** - Unbusy the Connection Trunk Data assigned in the previous step by using MBCT.

STEP 5: **AFCH** - Assign FCH Number (FCHN) to each IPTRK Card that is used as the FCCS Signal Controlling Card.

Assignment of FCHN (Example)

In this example, the FCHN = 1 is assigned to the IPTRK Card controlling the FCCS Signal.



Note 1: This data setting is an example.

STEP 6: **AETH** - Assign the FCCS Routing Data as follows:

FPC (Fusion Point Code):	Assign FPC number (1 - 253) of the Destination Node.
FCHN (FCH Number):	Assign the FCH Number, specified in STEP 5.
C_RT (Connection Route):	Connection Route Number of Speech Channel (1-1023).
DST_IP (Destination IP Address):	Assign IPTRK IP address of the Destination Node.
NEXT_IP (Next IP Address):	Assign IPTRK IP address of the Destination Node.

A data assignment example is shown in the following figure. For additional information, refer to the FCCS Routing Sample Data Sheets at the end of this feature.

Sample Assignment of Destination IP and Next IP (AETH)

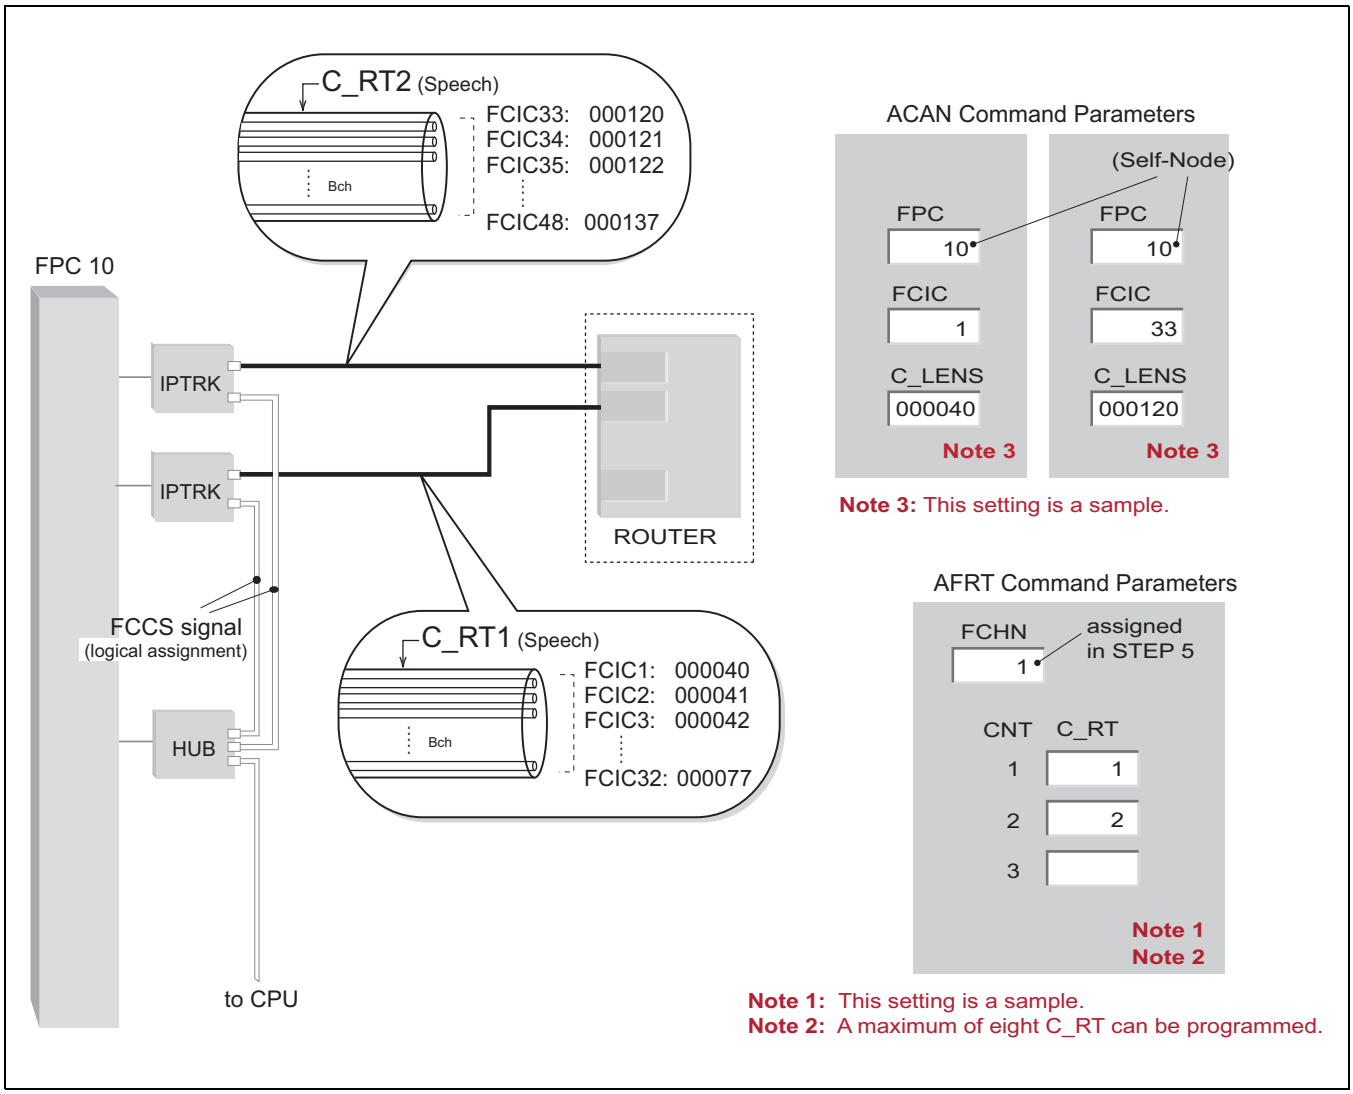
Note 1: A maximum of eight routings are available.

STEP 7: **ACAN** - Assign the Fusion Connection Index Code (FCIC) to the Self Node FPC:

FPC (Fusion Point Code): Assign FPC Number (1 - 253) of the Self Node.

FCIC (Fusion Connection Index Code): Assign unique Fusion CICs in the Self Node.

C_LENS (Connection_LENS): Assign IPTRK LENS Data (Speech Channel Data) specified in STEP 3.



See the example data assignment shown in the figure following AFRT.

STEP 8: **AFRT** - Set Connection Route Numbers of the Speech Channels for the FCHN which was assigned in STEP 5.

FCHN (FCH Number): Assign FCHN, specified in STEP 5.

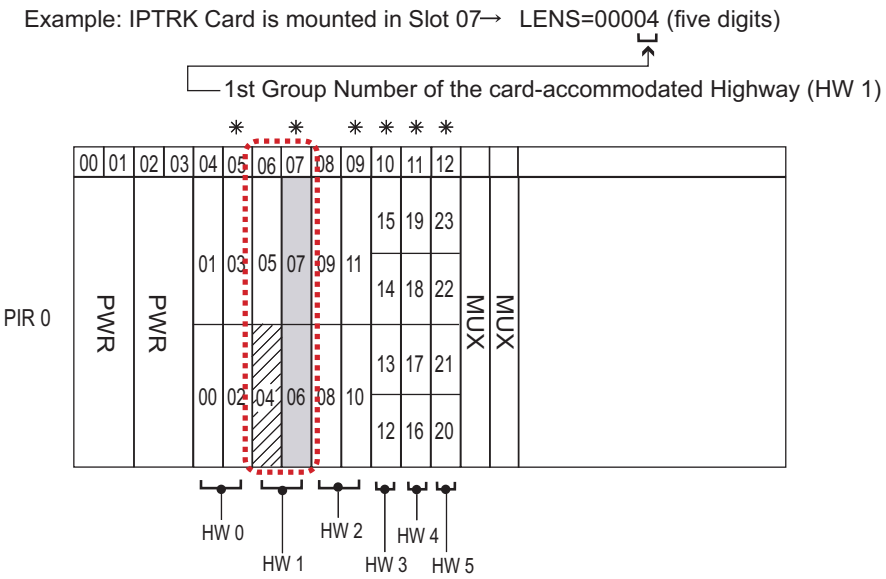
C_RT (Connection Route): Assign Connection Route of the Speech Channels, specified in STEP 2. See the following figure of example data assignment.

Sample Data Assignment (ACAN/AFRT)

STEP 9: **AGIP** - Assign the IP Addresses of IPTRK Card and its connected Router.

LENS (Line Equipment Numbers):	Assign the 1st LENS (MG + U + G: five digits) of IPTRK-accommodated HW block.
KIND (Kind of Selection):	Select “IPTRK (FCCS)”
IPTK_IP (IP Address of IPTRK):	Assign IP address of the IPTRK card. **Note 1**
DG_IP (IP Address of Default Gateway):	Assign IP address of the router.
NETMSK (Net Mask of IP Address):	Assign the Net Mask of IP address
ToS CONTROL:	Select the either, IP Precedence or DiffServ
QoS 1 (QoS Data for Signal Route):	When IP Precedence is selected, 0-7 When DiffServ is selected, 0x00-0x3F
QoS 2 (QoS Data for Speech Path):	When IP Precedence is selected, 0-7 When DiffServ is selected, 0x00-0x3F

NETID (Network ID):	Fixed to "0."
CSLINK_NUM (Maximum number of client/server connection):	Select the nearest number to the number of counter IPTRKs.
ARP (Frame Type of ARP):	Select "DIX" when the "Detail" box is checked.
RTP:	"RTP" checkbox is provided for detail assignment of the following parameters, if required. (Usually default data "0" is set for all the parameters.)
PKTLOSS:	Amount of Packet Loss [0%-100% (default is 0=8%)]
JIT_MAX:	Maximum Jitter Buffer [0-60 × 10 milliseconds (default is 0=120 milliseconds)]
JIT_MIN:	Minimum Jitter Buffer [0-60 × 10 milliseconds (default is 0= 40 milliseconds)]
MNGS:	Interval of Jitter Adjustment [0-255 times (default is 0=5 times)]
JIT_COUNT:	Interval of Jitter statistics [0-255 seconds (default is 0=1 seconds)]
BASE_ COUNT:	Interval of Time-base Correction [0-255 seconds (default is 0=10 seconds)]
JIT_FAST:	Judging rate of Fast Arrived Packet [0-100% (default is 0=100%)]
TIME_FAST:	Time-base Correction Judgment [0-100% (default is 0=80%)]



Note 1: Do not assign an IP address used in the internal LAN (172.16.254.xx/24).

STEP 10: **AVIPS** - Assign the detailed data of the IPTRK Card, such as Jitter Buffer, Payload Type/Size. When the data is not assigned, the default data is used.

Note: This command and AGIP cannot be activated simultaneously.

Note: IPTRK-related data specified by the LENS must be assigned by the AGIP command in advance.

LENS: Assign two-digit MG Number + one-digit Unit Number + 1st Group Number (two digits) of IPTRK-accommodated Highway.

Note: IPTRK circuit card can be mounted in slot marked with an asterisk (*).

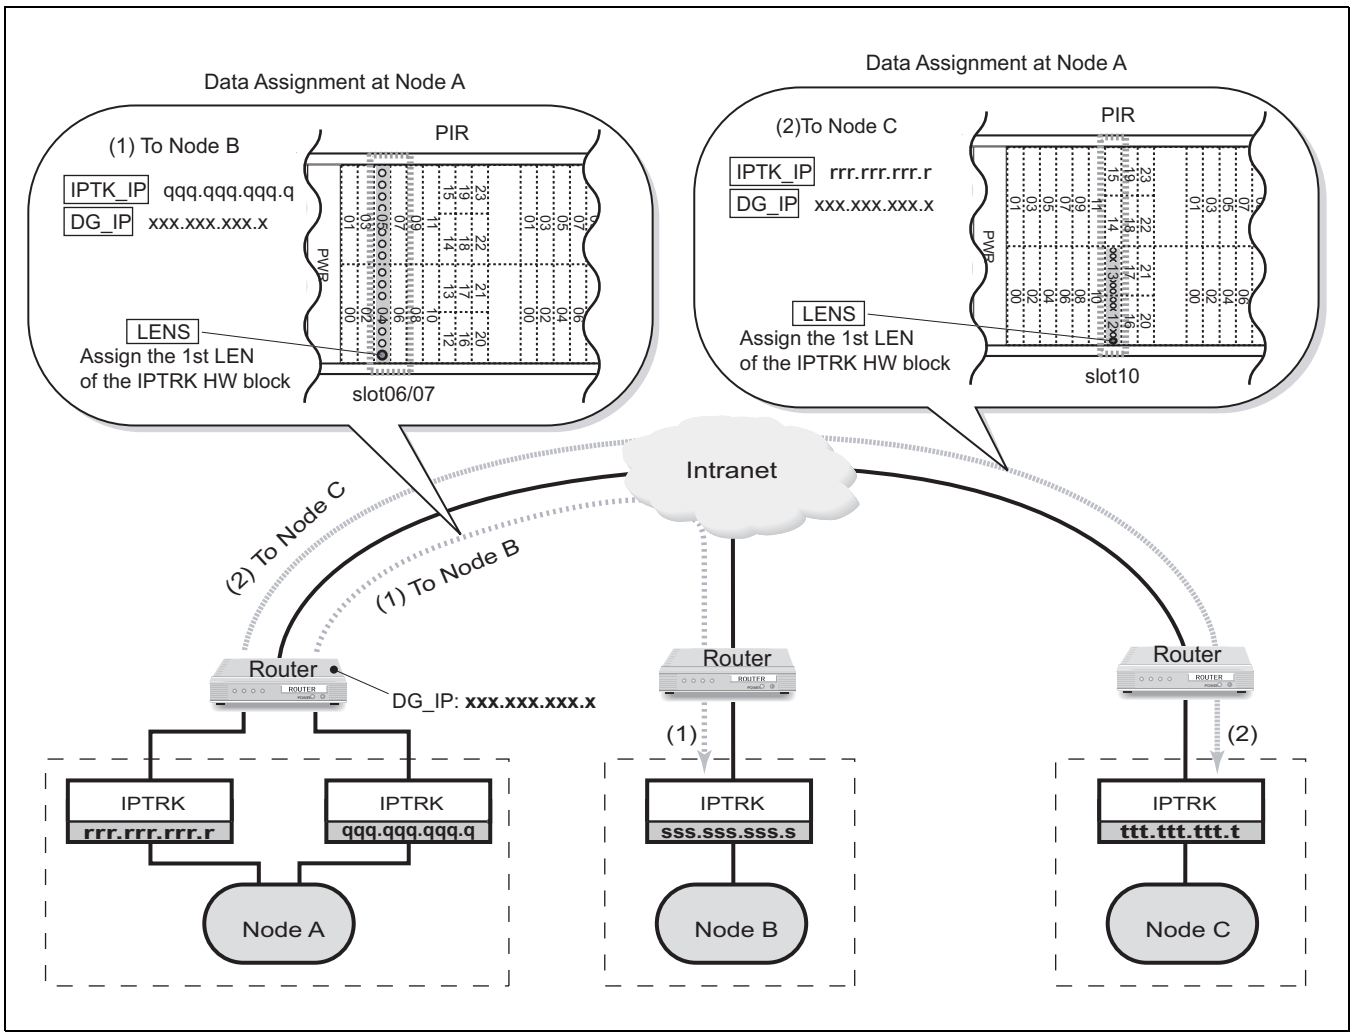
KIND: Kind of Selection [IPTRK (FCCS)/IPTRK (CCIS)] **Note 2**

Note 2: The kind assigned by the AGIP command is displayed.

<Voice> [For KIND=IPTRK (FCCS)/IPTRK (CCIS)]

JIT_ACT: Select Jitter Buffer Mode
- 0: Operates according to the Switch Setting on the IPTRK Card
- 1: Static Jitter Buffer
- 2: Dynamic Jitter Buffer

PAY_TYP: Payload Type Selection Pattern
- 0: Follows to Switch Setting on the IPTRK
- 1: Standard Setting [G.729a -> G.723.1 (6.3 k) -> G.723.1 (5.3 k) -> G.711]
- 2: Voice Quality Precedence Mode [G.711 -> G.729a -> G.723.1 (6.3 k) -> G.723.1 (5.3 k)]
- 3: Band Precedence Mode 1 [G.723.1 (5.3 k) -> G.723.1 (6.3 k) -> G.729a -> G.711]
- 4: Band Precedence Mode 2 [G.723.1 (6.3 k) -> G.723.1 (5.3 k) -> G.729a -> G.711]



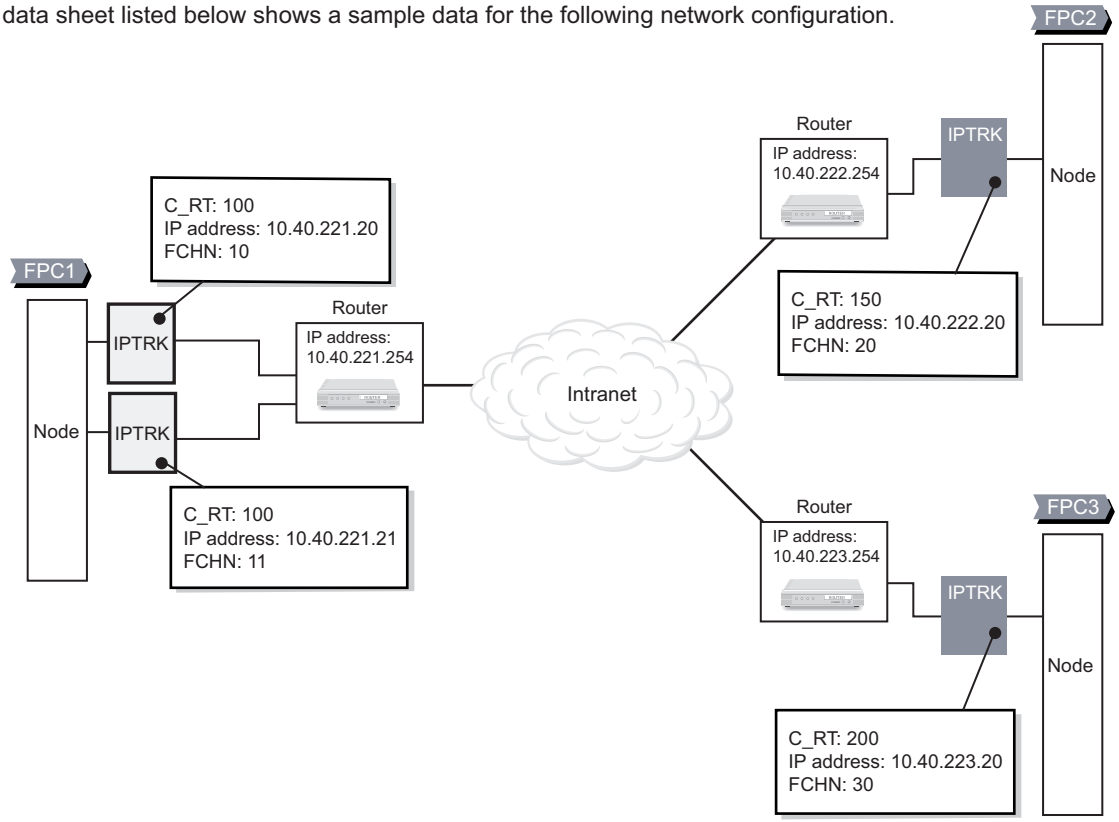
PAY_SIZ1: Specify the Payload Size 1 (G.711) data
- 0: Follows Switch Setting on the IPPAD Card
- 1: 10 (milliseconds)
- 2: 20 (milliseconds)
- 3: 30 (milliseconds)
- 4: 40 (milliseconds)

5-14: Not Used
- 15: G.711 is not used.

PAY_SIZ2:	Specify the Payload Size 2 (G.729a) data
0:	Follows Switch Setting on the IPPAD Card
1:	10 (milliseconds)
2:	20 (milliseconds)
3:	30 (milliseconds)
4:	40 (milliseconds)
	5-14: Not Used
15:	G.729a is not used
PAY_SIZ3:	Specify the Payload Size 3 (G.723.1) data
0:	Follows Switch Setting on the IPPAD Card
1:	10 (milliseconds)
2:	20 (milliseconds)
3:	30 (milliseconds)
4:	40 (milliseconds)
5-14:	Not Used
15:	G.723.1 is not used
FAX_DET:	Fax Error Detection Timer
0:	Follows to Switch Setting on the IPTRK
1:	Voice/FAX Automatic Distinction
2:	Fixed to Voice Mode
3:	FAX Detection Available Timer After Starting Speech => 1 minute
4:	FAX Detection Available Timer After Starting Speech => 2 minutes
5:	FAX Detection Available Timer After Starting Speech => 3 minutes
6:	FAX Detection Available Timer After Starting Speech => 4 minutes
7:	FAX Detection Available Timer After Starting Speech => 5 minutes
FAX_ECM:	Specify the FAX ECM Mode
0:	Follows to Switch Setting on the IPTRK
1:	ECM ON (Not Used)
2:	ECM OFF
FAX_TYP:	FAX Mode Control Precedence
0:	T.30 (Original Procedure) Not Used
1:	T.38 (UDP)
2:	T.38 (TCP) Not Used
FAX_RATE:	FAX Transmission Rate [bps]
0:	14400 bps
1:	2400 bps
2:	4800 bps
3:	7200 bps
4:	9600 bps
5:	12000 bps
RTCP_PTN:	RTCP Pattern
0:	Fixed Rate
1:	Random (Not Used)

RTCP_CYC:	RTCP Cycle
0:	5 seconds
1-5:	Not Used
6-120:	6-120 seconds

Assignment of IP Addresses of IPTRK Card, Its Connected Router (Example)



FCCS Routing Sample Data Sheets

1. FCCS Networking via IP (Point-to-Multipoint)

Sample Data Sheet (Example 1)

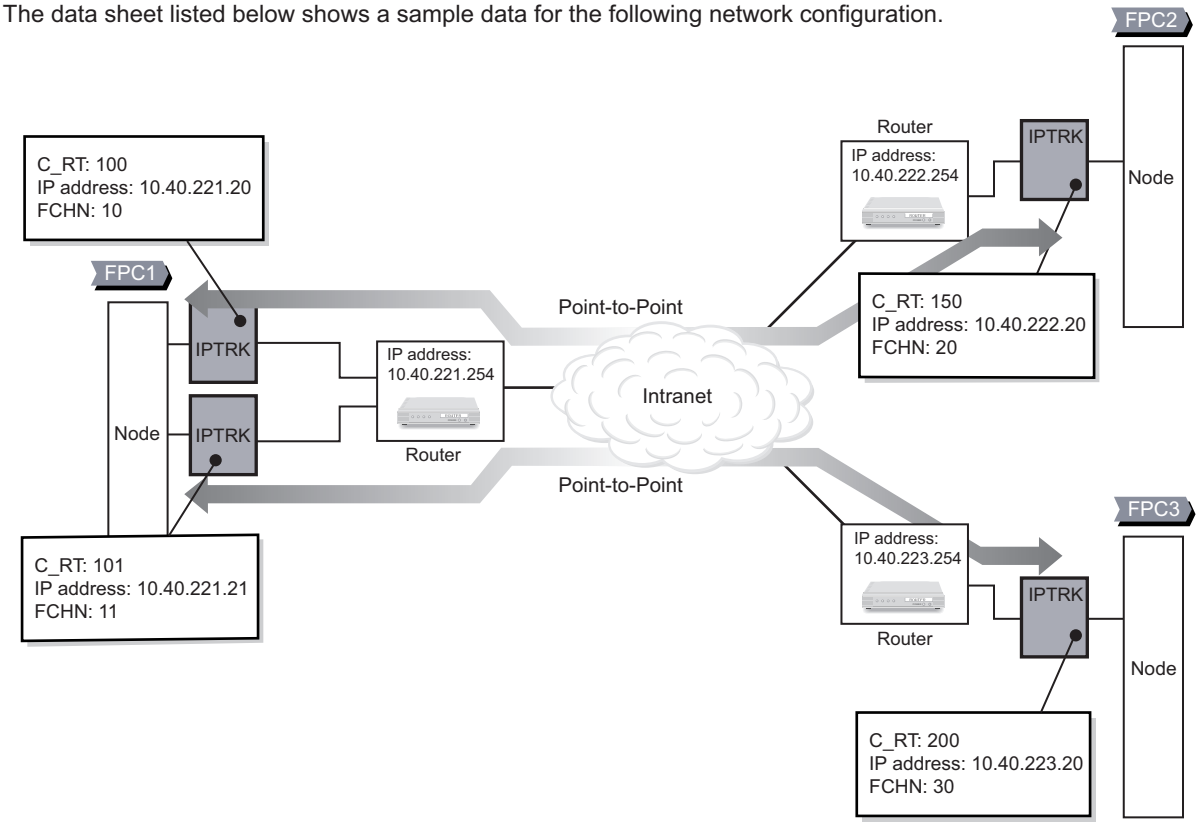
The data sheet listed below shows a sample data for the following network configuration.

Routing Information Assignment (by AETH) Example

FPC1
FPC=2, FCHN = 10, C_RT=100, DST_IP/NEXT_IP = 10.40.222.20
FPC=2, FCHN = 11, C_RT=100, DST_IP/NEXT_IP = 10.40.222.20
FPC=3, FCHN = 10, C_RT=100, DST_IP/NEXT_IP = 10.40.223.20
FPC=3, FCHN = 11, C_RT=100, DST_IP/NEXT_IP = 10.40.223.20

FPC2
FPC=1, FCHN = 20, C_RT=150, DST_IP/NEXT_IP = 10.40.221.20
FPC=3, FCHN = 20, C_RT=150, DST_IP/NEXT_IP = 10.40.223.20

FPC3
FPC=1, FCHN = 30, C_RT=200, DST_IP/NEXT_IP = 10.40.221.20
FPC=2, FCHN = 30, C_RT=200, DST_IP/NEXT_IP = 10.40.222.20



: IP trunk accommodating Speech and Control Channels.

: IP trunk accommodating Speech and Control Channels.
Speech Channels are shared between FCHN = 10 and FCHN = 11.

2. FCCS Networking via IP (Point-to-Point)

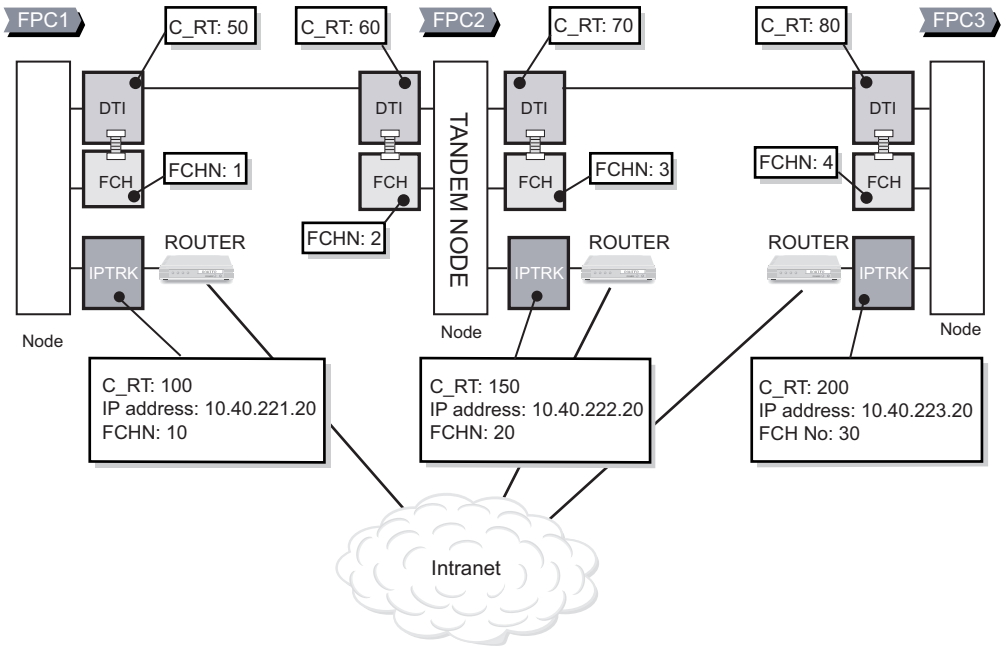
Sample Data Sheet (Example 2)

The data sheet listed below shows a sample data for the following network configuration.

Routing Information Assignment (by AETH) Example

FPC1 FPC=2, FCHN = 10, C_RT=100, DST_IP=10.40.222.20, NEXT_IP = 10.40.222.20
FPC=3, FCHN = 11, C_RT=101, DST_IP=10.40.223.20, NEXT_IP = 10.40.223.20

FPC2 FPC=1, FCHN = 20, C_RT=150, DST_IP=10.40.221.20, NEXT_IP = 10.40.221.20



FPC3 FPC=1, FCHN = 30, C_RT=200, DST_IP=10.40.221.21, NEXT_IP = 10.40.221.21

: IP trunk accommodating Speech and Control Channels.

3. FCCS Networking via IP and FCH FCCS Networking (when assigning both AFPC and AETH)

Sample Data Sheet (Example 3)

The data sheet listed below shows a sample data for the following network configuration, where AFPC and AETH commands are required for an identical FPC at the tandem node.

Routing Information Assignment (by AFPC and AETH) Example

AFPC

FPC1

FPC=2, FCCH = 1, P_ROUTE=0/1, C_RT=50, FCHN=1
FPC=3, FCCH = 1, P_ROUTE=0/1, C_RT=50, FCHN=1

FPC2

FPC=1, FCCH = 1, P_ROUTE=0/1, C_RT=60, FCHN=2
FPC=3, FCCH = 1, P_ROUTE=0/1, C_RT=70, FCHN=3

FPC3

FPC=1, FCCH = 1, P_ROUTE=0/1, C_RT=80, FCHN=4
FPC=2, FCCH = 1, P_ROUTE=0/1, C_RT=80, FCHN=4

AETH

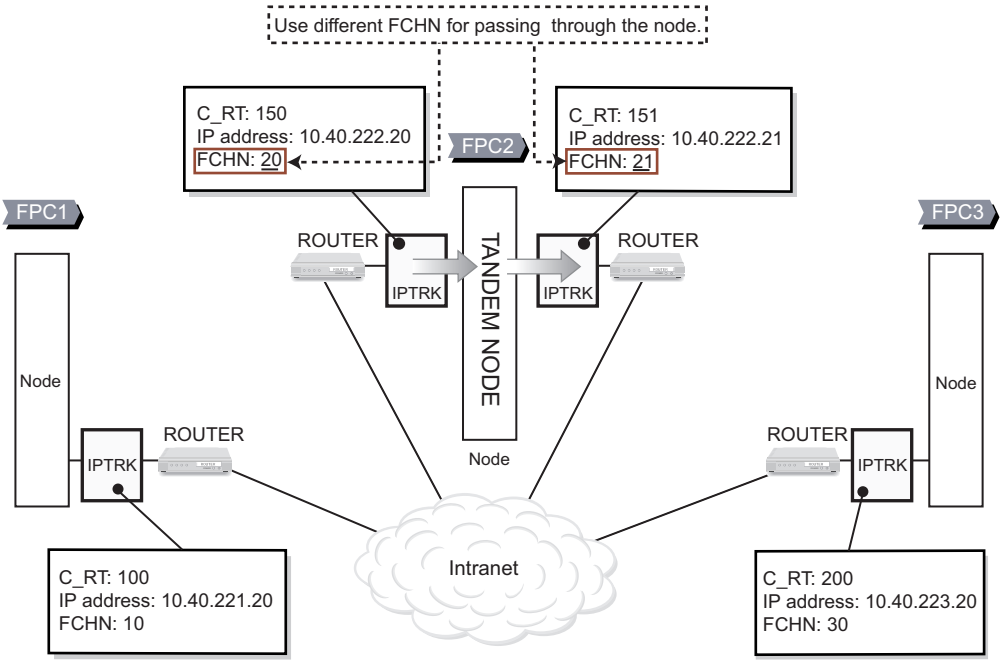
FPC1

FPC=2, FCHN = 10, C_RT=100, DST_IP=10.40.222.20, NEXT_IP = 10.40.222.20
FPC=3, FCHN = 10, C_RT=100, DST_IP=10.40.223.20, NEXT_IP = 10.40.223.20

FPC2

FPC=1, FCHN = 20, C_RT=150, DST_IP=10.40.221.20, NEXT_IP = 10.40.221.20
FPC=3, FCHN = 20, C_RT=150, DST_IP=10.40.223.20, NEXT_IP = 10.40.223.20

FPC3



FPC=1, FCHN = 30, C_RT=200, DST_IP=10.40.221.20, NEXT_IP = 10.40.221.20
FPC=2, FCHN = 30, C_RT=200, DST_IP=10.40.222.20, NEXT_IP = 10.40.222.20

Note: Provided that both FCCS Networking via IP and FCH FCCS Networking are configured, it depends on the setting on “P_ROUTE” parameter whether the either routing take precedence. To take the priority for FCCS Networking via IP routing, assign data “1” to P_ROUTE parameter.

4. FCCS Networking via IP - FCCS Networking via IP Tandem Connection (when assigning AFPC dummy data)

Sample Data Sheet (Example 4)

The data sheet listed below shows a sample data for the following network configuration, where FCCS Routing Data is not assigned by using AFPC. In this case, be sure to assign the following Dummy Data.

Routing Information Assignment (by AFPC and AETH) Example

AFPC

FPC1

None

FPC2

FPC=1, FCCH = 1, P_ROUTE=1, C_RT=150, FCHN=20
FPC=3, FCCH = 1, P_ROUTE=1, C_RT=151, FCHN=21

FPC3

Be sure to assign this dummy data.

None

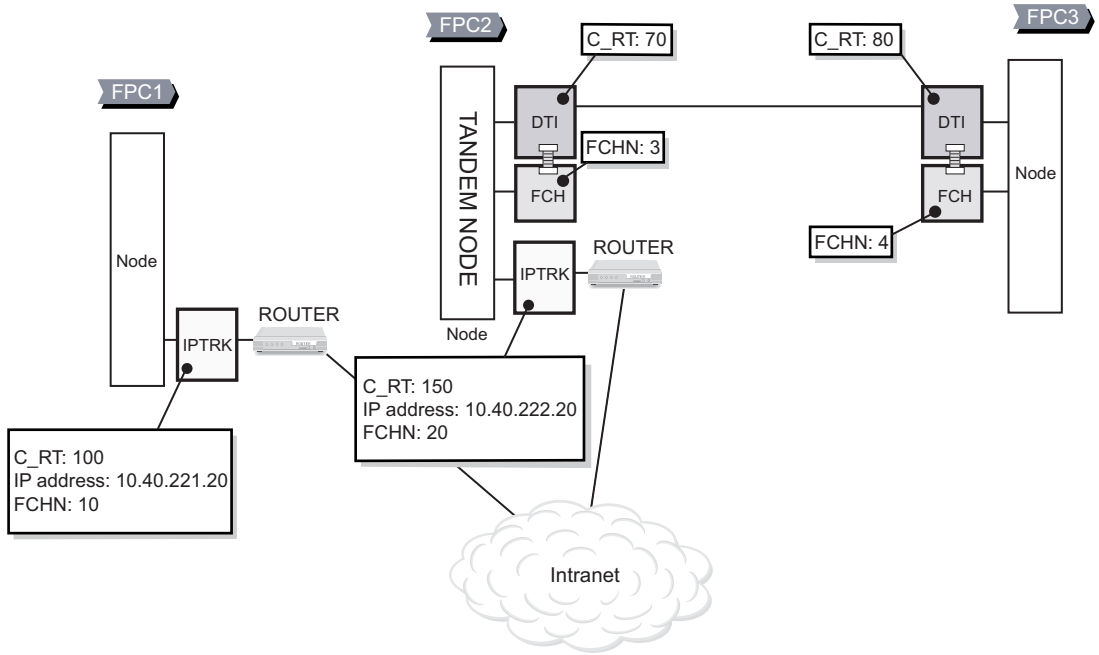
AETH

FPC1

FPC=2, FCHN = 10, C_RT=100, DST_IP=10.40.222.20, NEXT_IP = 10.40.222.20
FPC=3, FCHN = 10, C_RT=100, DST_IP=10.40.222.20, NEXT_IP = 10.40.222.20

FPC2

FPC=1, FCHN = 20, C_RT=150, DST_IP=10.40.221.20, NEXT_IP = 10.40.221.20
FPC=3, FCHN = 21, C_RT=151, DST_IP=10.40.223.20, NEXT_IP = 10.40.223.20



FPC3

FPC=1, FCHN = 30, C_RT=200, DST_IP=10.40.222.21, NEXT_IP = 10.40.222.21
FPC=2, FCHN = 30, C_RT=200, DST_IP=10.40.222.21, NEXT_IP = 10.40.222.21

5. FCCS Networking via IP and FCH FCCS Networking (when assigning AFPC or AETH)

Sample Data Sheet (Example 5)

The sheet listed below shows a sample data for the following network configuration, where AFPC or AETH command is required for an identical FPC at the tandem node.

Routing Information Assignment (by AFPC and AETH) Example

AFPC

FPC1

None

FPC2

Be sure to assign this dummy data.

FPC=1, FCCH = 1, P_ROUTE=1, C_RT=150, FCHN=20
FPC=3, FCCH = 1, P_ROUTE=0, C_RT=70, FCHN=3

FPC3

FPC=1, FCCH = 1, P_ROUTE=0, C_RT=80, FCHN=4
FPC=2, FCCH = 1, P_ROUTE=0, C_RT=80, FCHN=4

AETH

FPC1

FPC=2, FCHN = 10, C_RT=100, DST_IP=10.40.222.20, NEXT_IP = 10.40.222.20
FPC=3, FCHN = 10, C_RT=100, DST_IP=10.40.222.20, NEXT_IP = 10.40.222.20

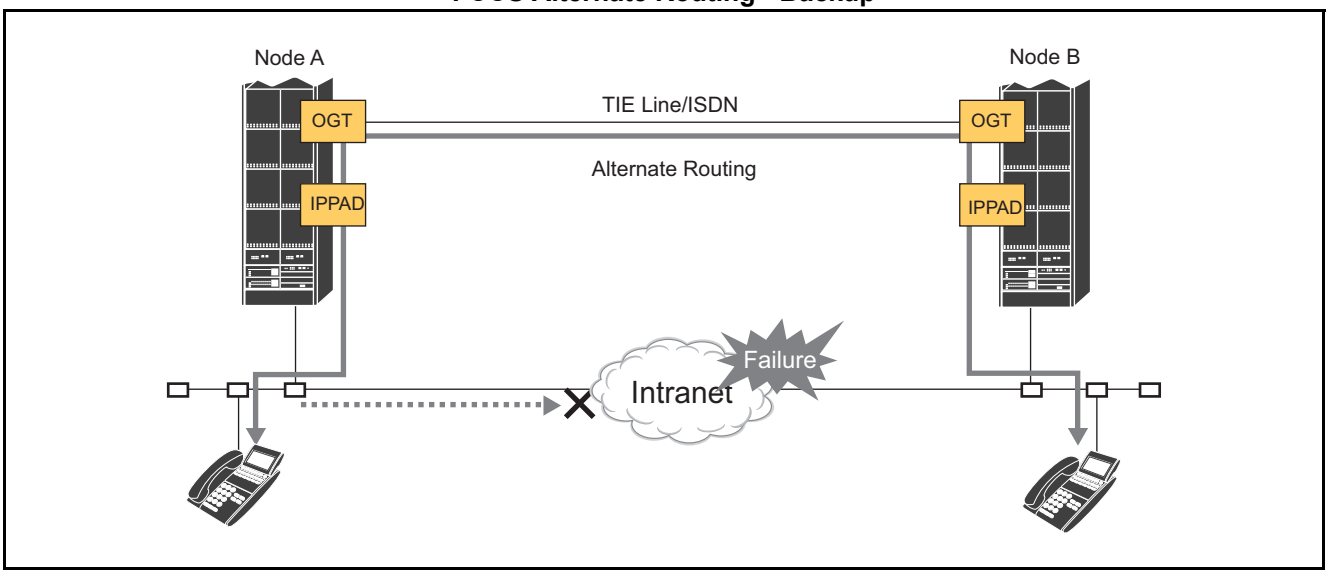
FPC2

FPC=1, FCHN = 20, C_RT=150, DST_IP=10.40.221.20, NEXT_IP = 10.40.221.20
FPC=3, FCHN = 3, C_RT=70, DST_IP=0.0.0.0, NEXT_IP = 0.0.0.0

FPC3

Be sure to assign this dummy data.

None



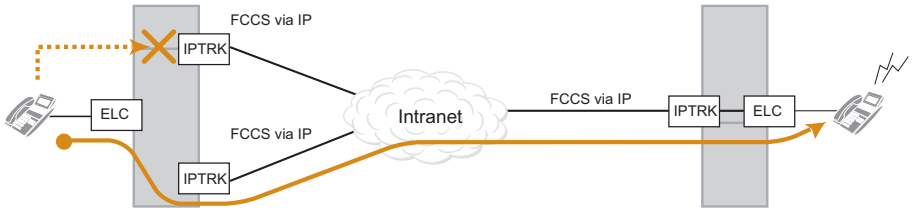
F-37 FCCS Alternate Routing - Backup

General Description

This feature automatically routes a FCCS over IP call over Alternate Routes when the first-choice Trunk Group is all busy or not available (such as the LAN cable is disconnected or LAN failure is occurred).

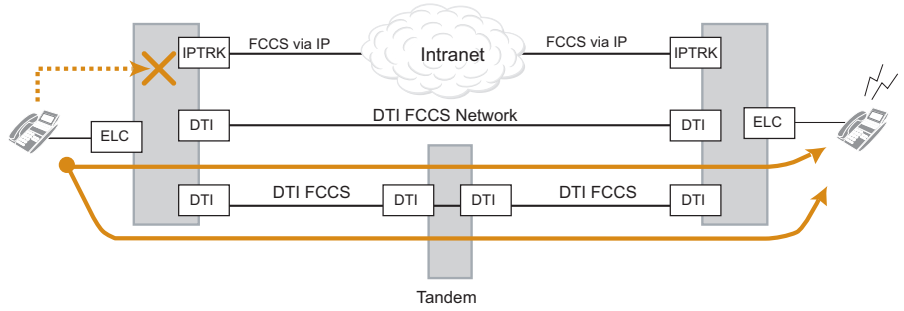
Note: This feature is available only for a migrated system from IPX and SV7000.

FCCS Alternate Routing - Backup



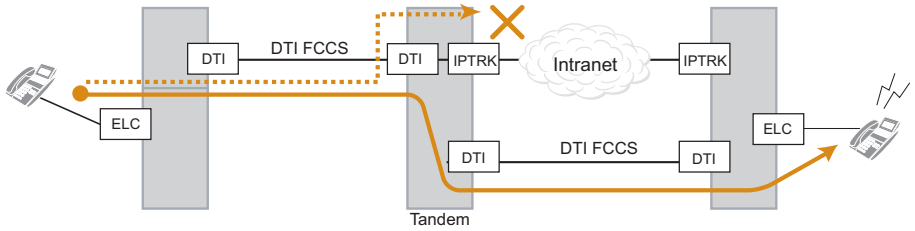
Service Conditions

Routing Patterns

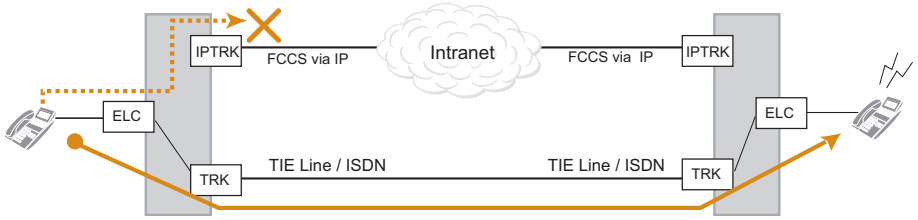


- Alternate Routing from IPTRK

Available Alternate Routing Patterns (1/2)



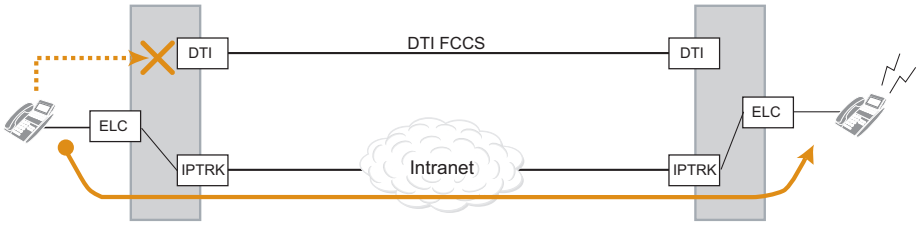
1. Routing to IPTRK (FCCS via IP)

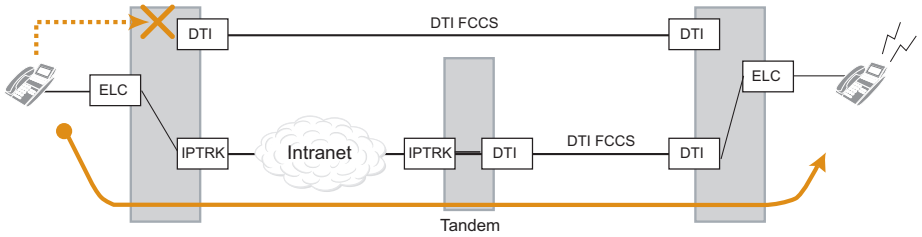


2. Routing to DTI (FCCS) at Self Node

3. Routing to DTI (FCCS) at Tandem Node

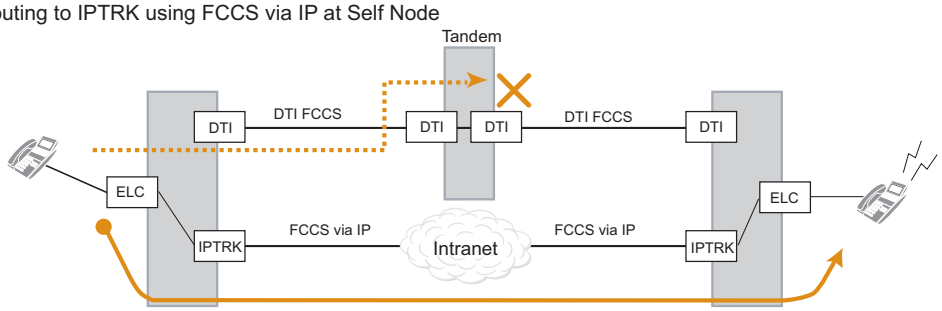
4. Routing to Trunk other than above (DTI, CCT, PRT etc.)



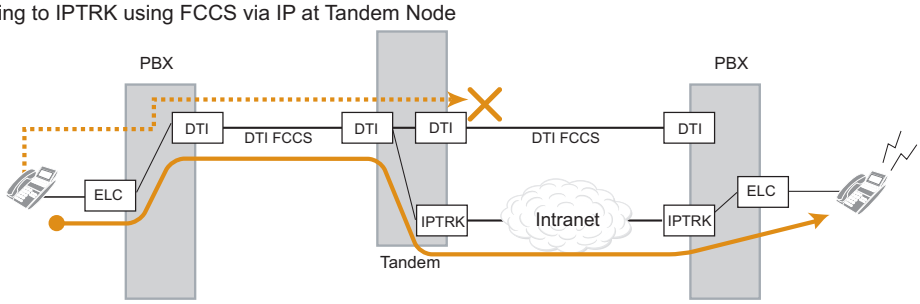


- Alternate Routing from DTI FCCS Trunk

Available Alternate Routing Patterns (2/2)



1. Routing to IPTRK



2. Routing to IPTRK via Tandem Node

3. Routing to IPTRK using FCCS via IP at Self Node

4. Routing to IPTRK using FCCS via IP at Tandem Node

: First Choice
: Alternate Routing

Alternate Routing IPTRK to TIE Line/ISDN

1. As a condition for this feature, Outgoing Calls via Alternate Routes (TIE Line/ISDN) must be made as usual.
2. The following Terminals listed in the figure below are available for this feature.
   - Calling Party: DtermIP, Dterm, Analog Terminal, ISDN Terminal, PS, COT, TIE Line, ATTOCON, DESKCON
   - Called Party: DtermIP, Dterm, Analog Terminal, ISDN Terminal
3. LCR or LCRS is required for this feature.
4. An Access Code for Alternate Routing is a maximum of 24 digits.
5. Alternate Routing to a Public Network is available for ISDN Lines only.
6. Use the Sub-address for Alternate Routes to a Public Network.
7. When Alternate Routing is performed, the DtermIP LCD shows an Outgoing/Incoming Trunk Call indication.
8. If all alternate routes assigned by AFRFL are busy, the system selects another route assigned by AOPR.

9. The following table shows available/unavailable features when performing FCCS Alternate Routing to TIE Line/ISDN.

FEATURE	PROVIDED/NOT PROVIDED
Station Hunting	Provided
Call Pickup	Not provided
Call Pickup - One Touch Key	Not provided
Direct Call Pickup	Not provided
Step Call	Provided
Call Back	Not provided
Call Waiting	Not provided
Executive Right-Of-Way	Not provided
Call Forwarding - Busy Line	Provided
Call Forwarding - Don't Answer	Provided
Split Call Forwarding	Provided
Call Transfer - All Calls	Provided
Blind Transfer to Station	Provided
Three-Way Calling	Not provided
8-Party Conference	Not provided
Hotline	Not provided
Priority Call	Provided when the destination is a Station
Station-to-Station Call	Provided
Emergency Call	Not provided
Uniform Call Distribution (UCD)	Provided
Virtual Line	Provided

Alternate Routing IPTRK to IPTRK, IPTRK to DTI FCCS, DTI FCCS to IPTRK

1. As a condition for this feature, Outgoing Calls via Alternate Routes (FCCS Routes) must be made as usual.

2. The following Terminals listed in the figure below are available for this feature.
   - Calling Party/Called Party:
     DtermIP, Dterm, Analog Terminal, ISDN Terminal, PS, COT, TIE Line, ATTOCON, DESK-CON

3. When an FCCS Trunk is all busy in the Alternating Route, the call can be advanced to another Route if any Flexible Route Data has been assigned by the AFRFL command.

Programming

When routing to Tie Line/ISDN Line Trunk

AFRFL -Assignment of Flexible Route Data for FCCS for LDM
Assign Access Code for the Alternative Route.

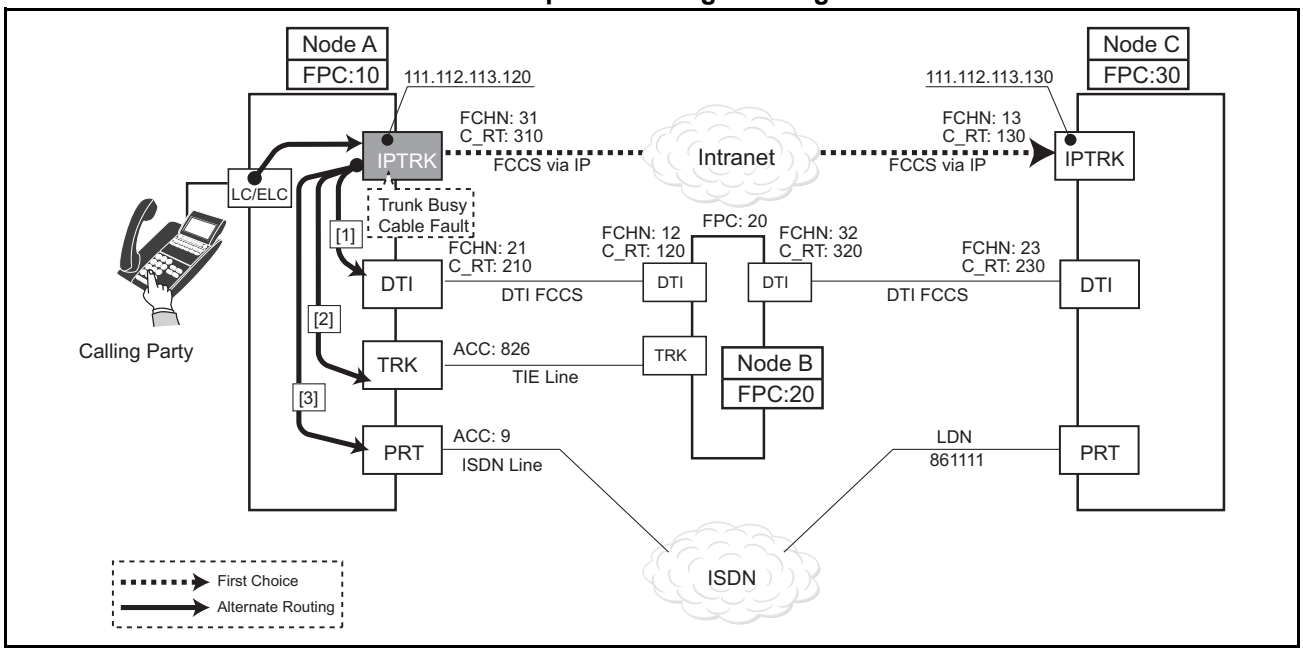
TN: Tenant Number (1-255)
FPC: Fusion Point Code of the Terminating Node (1-253)
ACC: Access Code for the Alternative Route

When routing to DTI FCCS

AFPC - Assignment of FCCH Routing Data for LDM

FPC: Fusion Point Code (1-253)
FCCH: 0/1= FCCH Not Use/FCCH Use
P_ROUTE: Priority Route (0/1= FCCH/FGH)
C_RT: Connection Route (1-1023)
FCHN/FPCN: 1-253

When routing to FCCS via IP from DTI FCCS



AETH - Assignment of External Router Connection Routing Data for LDM

FPC: Fusion Point Code (1-253)
FCHN: FCH Number (1-255)
C_RT: Connection Route (1-1023)
DST_IP: Destination IP Address
NEXT_IP: Next IP Address

Reference

This reference shows two examples of data programming for this feature

Example Data Programming

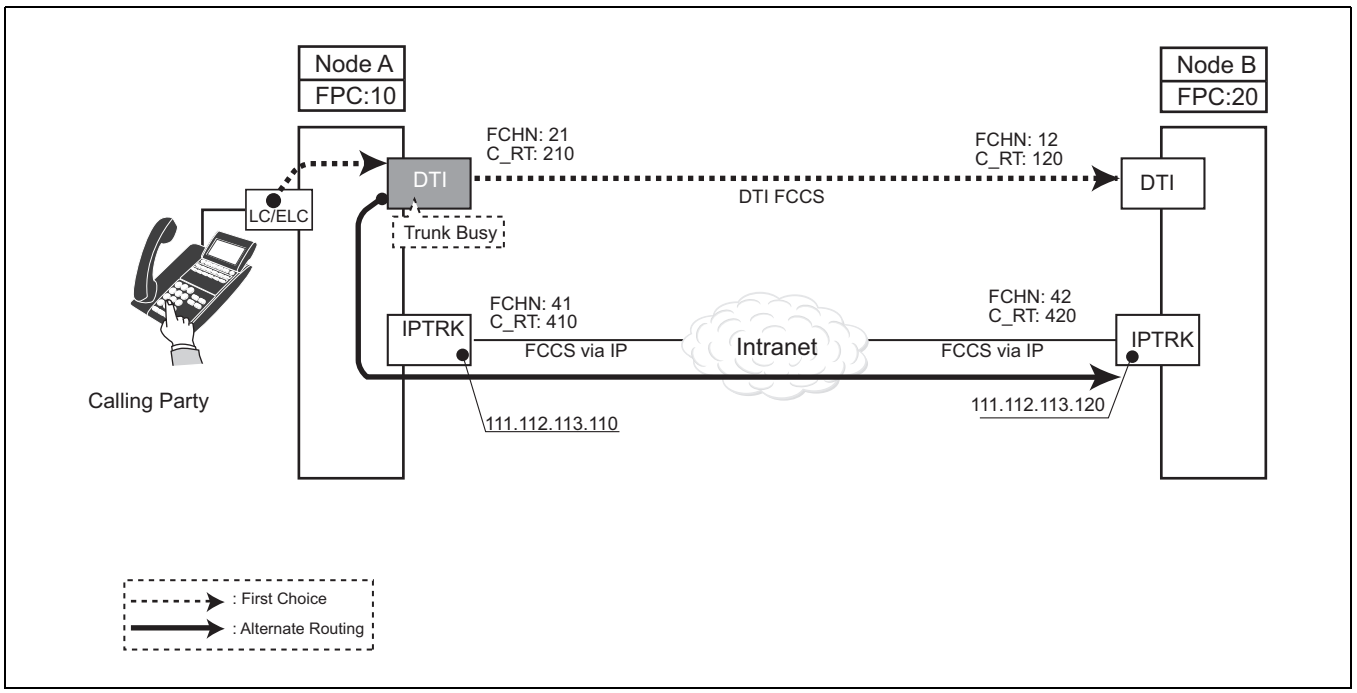
Data Programming at Node A

Routing to DTI FCCS

AFPC - Assignment of FCCH Routing Data for LDM
FPC=30 ⇐ Assign the FPC of the Destination Node
FCCH=1
P_ROUTE=1
C_RT=210
FCHN/FPCN=21
AETH - Assignment of External Router Connection Routing Data for LDM
FPC=30
FCHN=31
C_RT=310
DST_IP=111.112.113.130
NEXT_IP=111.112.113.130

Note: When both AFPC and AETH are assigned with P_ROUTE=1, FCCS via IPTRK assigned by AETH has priority. When all trunks are busy, the call routes to DTI FCCS.

Routing to Tie Line



AFRFL - Assignment of Flexible Route Data for FCCS for LDM
TN=1
FPC=20 ⇐ Assign the FPC of the Destination Node
ACC=826 ⇐ Assign the Trunk Access Code for the Tie Line

Routing to ISDN Line

AFRFL - Assignment of Flexible Route Data for FCCS for LDM
TN=1
FPC=30 ⇐ Assign the FPC of the Destination Node.
ACC=9861111 * **Note 1**

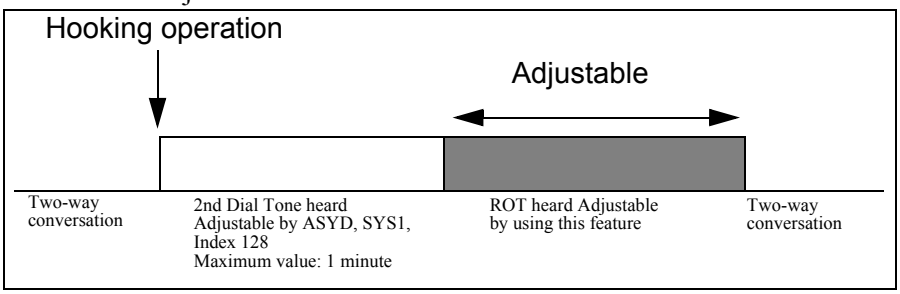
Note 1: Be sure to add "*" at the end of the digits (sub-addressing).

Alternate Routing from DTI FCCS

Data Programming at Node A

AFPC - Assignment of FCCH Routing Data for LDM
FPC=20 ⇐ Assign the FPC of the Destination Node
FCCH=1
P_ROUTE=0
C_RT=210
FCHN/FPCN=21
AETH - Assignment of External Router Connection Routing Data for LDM
FPC=20
FCHN=41
C_RT=410
DST_IP=111.112.113.120
NEXT_IP=111.112.113.120

Note: When both AFPC and AETH are assigned with P_ROUTE =0, DTI FCCS assigned by AFPC has priority. When all trunks are busy, the call routes to FCCS via IPTRK.



F-38 Flexible ROT Time

General Description

This feature enables the user to flexibly change the length of Reorder Tone (ROT) hearing time. At the recent system, hearing time of ROT is fixed to 30 seconds. Second dial tone is adjustable though the maximum time is only 1 minute and may be a cause of register block when system traffic is high because register is seized all time while second dial tone is being heard. Therefore, new timer is added to make ROT hearing time flexible.

Service Conditions

1. This feature is effective in all case which station hears the reorder tone.
   a.) Reorder tone when off-hook alarm.
   b.) Reorder tone when service feature restriction or route restriction.
   c.) Reorder tone when Dead level or unused number was dialed.
2. This feature is effective with the Non-IP terminal and IP terminal.
3. System data (ASYDL, SYS1, Index 663) need to be unified in all nodes when this feature is to be used in FCCS network environment.
4. The situation when Reorder tone has been adjusted is explained in the figure below.
5. When Reorder tone is adjusted.

6. This feature is not available with the PHS/PCS/VoWLAN system.

Interactions

Refer to the table below for further details on relation of this feature and Automatic Idle Return [A-69].

[F-38] Flexible ROT Time	[A-69] Automatic Idle Return	When Off-hook	When On-hook
Effective	Effective	Flexible ROT feature **Note 1**	Automatic Idle Return
Effective	Not effective	Flexible ROT feature	Flexible ROT feature
Not effective	Effective	30 seconds (default) **Note 1**	Automatic Idle Return
Not effective	Not effective	30 seconds (default)	30 seconds (default)

Note 1: Automatic Idle Return will be enabled by the System Data (ASYDL/ASYDN, SYS1, Index 686, Bit4=1) and the following conditions:
- Activating hands-free operation (on-hook)
- Using handset/headset (off-hook)

Programming

1. **Data assignment need be done in the procedure listed below.**

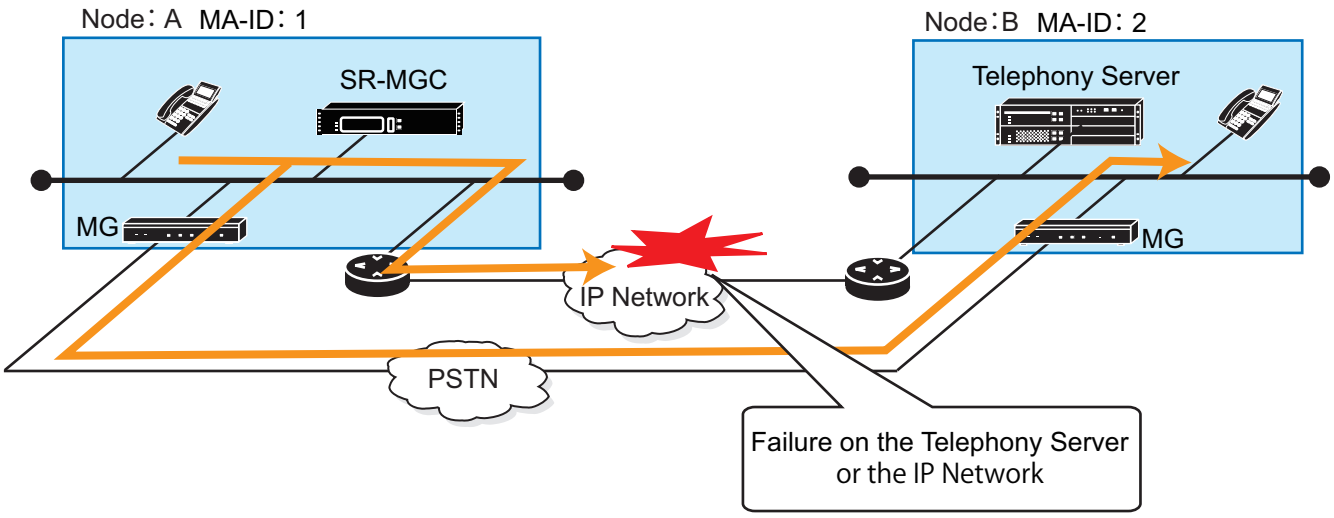
   ASYDL -Assignment of System Data for LDM
   SYS1, Index 663
   bit 0 - 3: 1 - =MTC
   bit 4 - 6: 0 - 7=TC
   bit 7: Not used

   TC: Timer Class, MTC: Miscellaneous Timer Counter
   TC = 0: -
   1: -
   2: -
   3: 2 seconds
   4: 30 seconds
   5: 5 minutes
   6: -
   7: -
   The value of TC x MTC will be the hearing time of Reorder tone.
   (Maximum: 5 minutes x 15 = 75 minutes)

   Note: Do not assign “0” for MTC value when TC = 3, 4 or 5.

   Note: There may be a gap between the assigned length of time and actual hearing time, the maximum range of gap will be same one assigned on “Interval range assigned for TC.”

   Note: Assign “00” for ASYDL, SYS1, Index 663 to disable this feature.



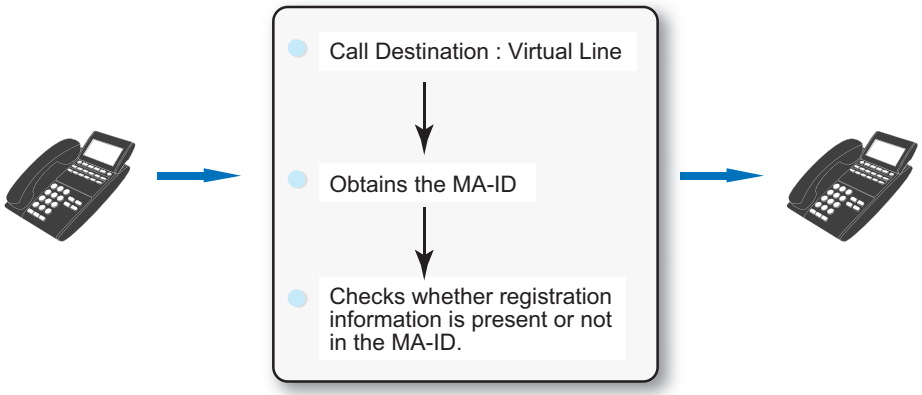
F-41 Flexible Network Re-routing

General Description

In the following cases, re-routing is available.

1. Automatic Re-routing when SR-MGC is in Operating Mode

This feature is useful when the Telephony Server or network failure occurs, and one of the nodes in a network is switched over to operation by SR-MGC, unable to connect to the opposite node via IP network. By assigning forwarding data to a trunk line in advance between the nodes, re-routing is automatically activated via a public network. Thus, this feature provides a connectivity equal to what could be attained by the Telephony Server via SR-MGC installed at each node.



<Example>
In the above example, a network failure occurs at Node A. Therefore, Node A is operating by SR-MGC, Node B is operating by the Telephony Server.

- Call from Node A to Node B:
  The call is forwarded by forwarding control of Node A to PSTN, terminates to Node B via PSTN.
- Call from Node B to Node A:
  The call is forwarded by forwarding control of Node B to PSTN, terminates to Node A via PSTN.

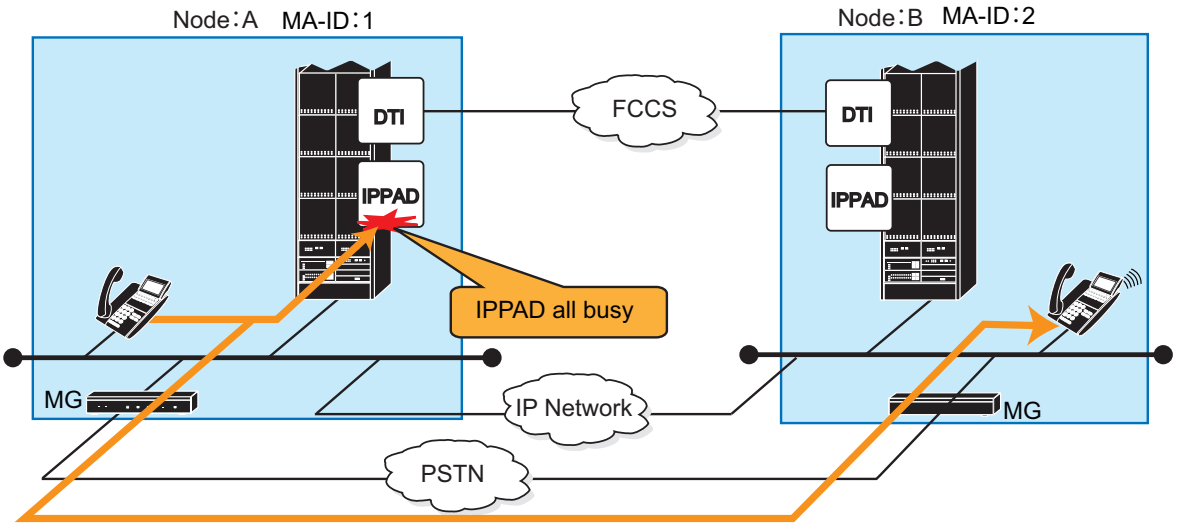
2. Network Check Before Placing Call to Virtual Line

When placing a call to a virtual line between nodes, network check is performed at the Telephony Server side. At this time, if any network failure is detected, the call can be forwarded to a predetermined trunk line.

Note:

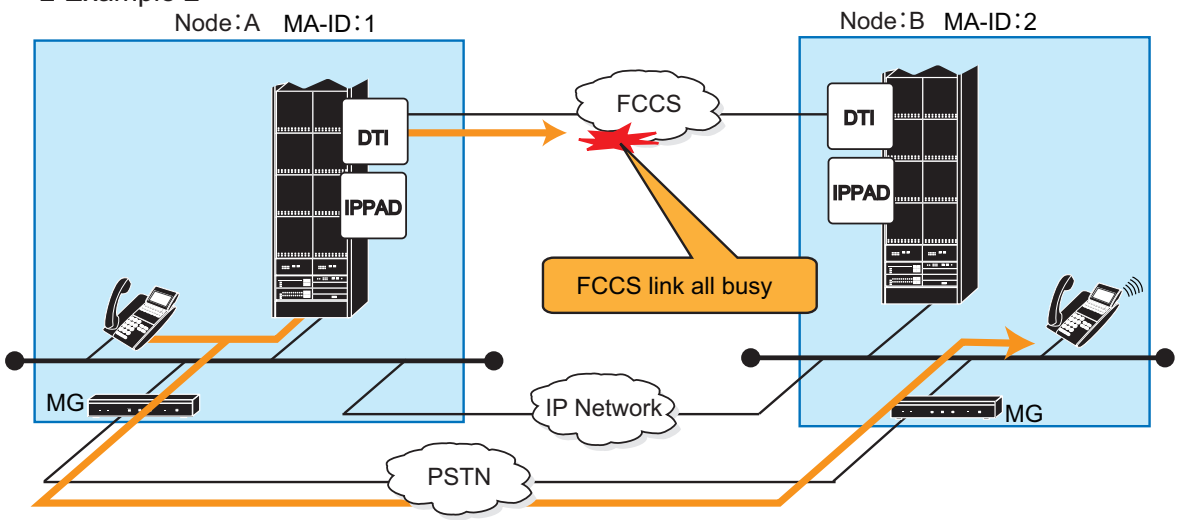
- The system specifies MA-ID assigned with the AMAA command for the virtual line. If the number of IP terminals/SIP Multiple Line terminals/SIP Handler Controlled SIP terminals* that are registered to the MA-ID becomes 0, network failure is detected.
- The terminal kinds that are checked for registration are IP terminals/SIP Multiple Line terminals/SIP Handler Controlled SIP terminals only. Other IP devices such as Analog MC, VS32, Media Gateway (MG) are not counted even if they are registered within the same MA-ID as the virtual line.
- IP terminals/SIP Multiple Line terminals whose configuration has been set as “Remote” are not counted even if they have been registered.
- Considerations should be taken for the following when attempting to load the MA-ID data with backup commands such as MEM_HDD and MEM_HDD_N while the system is in operation.

  If any difference is found between the MA-ID data on the MEM and that of CF card to which you are about to load the MA-ID data, discrepancy may be caused to the number of registration that is managed by a MA-ID basis when MA-ID data load is attempted. For this reason, network failure detection feature will not be able to work normally when calling a virtual line. In this case, after loading the MA-ID data, perform re-registration of all IP terminals/SIP Multiple Line terminals/SIP Handler Controlled SIP terminals in which MA-ID discrepancy is found.



3. Re-routing between nodes in FCCS

In an FCCS system, if FCCS-link- all-busy or network failure is detected when a call is placed to another node, the call is forwarded to ISDN network specified in advance.



Note: FCCS link all busy means the following cases:

- IPPAD cards used for speech are all busy. (Only for IPPAD cards which are located in a call-originating node)
- Connection Trunks are all busy at the time of FCCS-DTI tandem connection.
- Bandwidth used for speech exceeds the limit which is configured with Peer to Peer Bandwidth Control [P-75].

■ Example 1

■ Example 2

Operating Procedure

Connection is automatically requested as follows depending on each terminal kind:

<Non-IP Terminal>

- Connection is requested by an IP device that is controlled by SR-MGC to a non-IP terminal that is controlled by the Telephony Server.

<IP Terminal/SIP Multiple Line terminals>

- Connection is requested to a logged-out Station (for which Logged Out IP Station - Call Destination has not been set).

<PS>

- Connection is requested to a PS that is out of range (for which Call Forwarding - PS Incoming Incomplete has not been set).

<SIP Handler Controlled SIP Terminal/SP Controlled SIP Terminal>

- Connection is requested to a SIP Handler Controlled SIP terminal/SP Controlled SIP terminal) which has no REGISTER information.

<Virtual Line>

- Connection is requested to a Virtual Line (no terminal registered to the same MA-ID **Note 1**).

<Attendant Console>

- Connection is requested by an IP device that is controlled by SR-MGC to an Attendant Console that is controlled by the Telephony Server.

Note 1: As to registration, care should be taken for the following:

- The terminal kinds that are checked for registration are IP terminals/SIP Multiple Line terminals/SIP Handler Controlled SIP terminals only. Other IP devices such as Analog MC, VS32, Media Gateway (MG) are not counted even if they are registered within the same MA-ID as the virtual line.
- IP terminals/SIP Multiple Line terminals whose configuration has been set as “Remote” are not counted even if they have been registered.
- Considerations should be taken for the following when attempting to load the MA-ID data with backup commands such as MEM_HDD and MEM_HDD_N while the system is in operation.
- If any difference is found between the MA-ID data on the MEM and that of CF card to which you are about to load the MA-ID data, discrepancy may be caused to the number of registration that is managed by a MA-ID basis when MA-ID data load is attempted. For this reason, network failure detection feature will not be able to work normally when calling a virtual line. In this case, after loading the MA-ID data, perform re-registration of all IP terminals/SIP Multiple Line terminals/SIP Handler Controlled SIP terminals in which MA-ID discrepancy is found.

Service Conditions

<Important Notices>

1. An ISDN line must be accommodated in node where this feature is used. Only an ISDN line can be specified as the destination trunk for re-routing. Assign the data so as to include ISDN route only in Route Selection Pattern for the re-routing. Available routing methods are LCR or LCRS. Note that when ISDN line is used for re-routing, the call is established by LCR, where the digits are sent to the network side after receiving all digits.
2. Unique Message Area ID (MA-ID) needs to be assigned to each node. MGs, IP Stations and SR-MGC in the same node must share the same MA-ID.
3. For re-routing, you have to assign the call forwarding destination number with the AFRRL/AFRRN command in advance. When assigning the data, set proper data in terms of numbering and restriction class so as not to forbid the call originator to reach the destination.
4. You can use Telephone Number only for the call forwarding destination (CFD) with AFRRL/AFRRN command. Station Number cannot be used.
5. Should this feature fail to re-route a call to the 1st RT due to all the ISDN trunks being busy or ISDN network going down, the existing re-routing feature will be activated according to the data setting of AOPR/AOPRL/AOPRN).
6. If N-ISDN2 is used for alternate re-routing, set CDN64 (NET) to 0 (user side, fix) in the ARTD/ARTDN command.

   Note: If CDN64 (NET) is set to 1 (network side), it will cause a ringback tone (RBT) or tone generated during re-routing to be unheard.

7. The following table shows the availability of re-routing to ISDN in the event of a network failure on the basis of the combination of communication lines and devices on the call source and destination.

X: Available P/A: Partially available N/A: Not available -: Not applicable

Call Source \ Call Destination		Registered to MGC			Registered to SR-MGC	
		• Digital Terminal • Analog Telephone • Virtual Line (Sub Line) • ISDN Terminal • CS/PS	• IP Terminal • SIP Multiple Line Terminal • Analog MC • Soft Phone • SP Controlled SIP Terminal/ SIP Handler Controlled SIP Terminal	• Attendant Console	• Sub Line (Virtual Line)	• IP Terminal • SIP Multiple Line Terminal • Analog MC • Soft Phone • SP Controlled SIP Terminal/ SIP Handler Controlled SIP Terminal
Registered to MGC	• Digital Terminal • Analog Telephone • Virtual Line (Sub Line) • ISDN Terminal • CS/PS	X	X	P/A	X	X
	• IP Terminal • SIP Multiple Line Terminal • Analog MC • Soft Phone • SP Controlled SIP Terminal/SIP Handler Controlled SIP Terminal	X	X	P/A	X	X
	• Attendant Console	N/A	N/A	N/A	N/A	N/A
Registered to SR-MGC	• Virtual Line (Sub Line)	X	X	P/A	X	X
	• IP Terminal • SIP Multiple Line Terminal • Analog MC • Soft Phone • SP Controlled SIP Terminal	X	X	P/A	X	X

Note: For the terminal types that can be accommodated in the SR-MGC, refer to the manual of SR-MGC.

8. The following are specific conditions for re-routing feature while SR-MGC is in Operating Mode.
   a.) ASYDL, SYS1, Index 1133, Bit 0 (Flexible Network Re-routing) must be enabled (Bit 0=1).
   b.) Re-routing can take place when SR-MGC which is in the same MA-ID group as the called trunk/station operates and the status of the called terminal is detected as a network failure (logged-out for IP Station, out-of-zone for PS). Note that this does not mean other terminals at the same node also fall into the network failure.
   c.) Re-routing is not available when the MA-ID of the called terminal is the same as that of the calling party.
   d.) MA-ID can be allocated for calling and called terminals (Station Number/Telephone Number (TELN)/Trunk/Logical Route Number (LGRT)/Line Equipment Numbers (LENS)/CS/Network) with the AMAA command.
   e.) When enabling this feature on Multiple Lines (Sub Lines), assign Multiple Lines to IP terminals in the same node.

      Note: If a Sub Line is assigned to IP terminals in a different node, network failure check will not work on the line.

   f.) When a call is placed to a destination in a different node via a Sub Line, the originator's MY Line is used for network failure check (of MA-ID).
   g.) To use this feature in FCCS connection, the following points must be considered:

   - When calls can be made between the nodes due to an FCCS link transmission line failure, MA-ID of the destination terminal cannot be read. In this case, automatic re-routing is available only when re-routing data are assigned to each TYPE=Telephone Number with the AFRRN command. (This feature is not activated with the rerouting data of TYPE=MA-ID.)

   - When a call is made from a Station operating under SR-MGC to a Station of another FPC node in the FCCS network, MA-ID of the destination terminal cannot be read. In this case, re-routing is available only when re-routing data are assigned to each TYPE=Telephone Number with the AFRRN command. (This feature is not activated with the rerouting data of TYPE=MA-ID.)

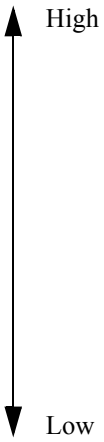
   h.) In the following cases, SR-MGC is placed in Operating Mode.

   - When SR-MGC starts operation because of a network failure or the Telephony Server failure

   - When "To Operating mode" is executed for Condition on Change Operating tab with the CMNT command.

      Note:

      - Even if SR-MGC has been assigned with the CMNT command, if the SR-MGC is not connected to network or no communications (Health Check) are made between MGC and the SR-MGC, when "To Operating mode" is performed for "Condition" on "Change Operating" tab, re-routing is activated.
      - Re-routing is not activated when the Telephony Server is initialized while the SR-MGC is in Operating Mode. This is because discrepancy is made between the two systems. To activate re-routing, you have to match the state of the two systems with the CMNT command (on Change Operating tab, Condition, To Operating mode).



i.) Re-routing is also available when SR-MGC, which is in Operating Mode, requests connection to other devices (such as upstream Telephony Server or other FPC node in FCCS).
j.) When PIR becomes unavailable on the ground that the operation switched over to SR-MGC, a call request to a terminal accommodated in the PIR can also activate this feature.
k.) This feature is not available for calls originated over a trunk. When an outgoing trunk in a node outside of the source node cannot be seized because of a network failure, re-routing is not activated.

<Interactions with Other Features>

1. When multiple call forwarding features have been set, the priority order of them is shown below

Note: You can change the priority order with the following commands:
- ASYDL, SYS1, Index 1144, Bit 2=1: (2) Mobility Access < (4) Call Forwarding - All Calls
- ASFC/ASFCN SFI=209 RES=1: (3) Logged Out IP Station - Call Destination < (4) Call Forwarding - All Calls

Priority Order of Call Forwarding Features (Default)

Call Forwarding Features	Priority
(1) Number Sharing (Sub-station is set as Call Forwarding destination)	
(2) Mobility Access (MA) (EMEA Only)	
(3) Logged Out IP Station - Call Destination	
(4) Call Forwarding - All Calls	
(5) Flexible Network Re-routing (SR-MGC)	
(6) Multi-Boss/Multi-Secretary (EMEA Only)	
(7) Uniform Call Distribution (UCD)	
(8) Station Hunting - Terminal	
(9) Do Not Disturb	
(10) Call Forwarding - Don't Answer	

Changing the Priority Order of Call Forwarding Features

ASYDL, SYS1, Index 1144, Bit 2	ASFC/ASFCN SFI 209	Priority Order High <--> Low
0	0	(1) **(2) (3) (4)** (5) (6) (7) (8) (9) (10)
	1	(1) **(2) (4) (3)** (5) (6) (7) (8) (9) (10)
1	0	(1) **(3) (4) (2)** (5) (6) (7) (8) (9) (10)
	1	(1) **(4) (3) (2)** (5) (6) (7) (8) (9) (10)

2. Re-routing by this feature is counted as the number of Multiple Call Forwarding - All Calls/Busy Line. For the number of times of Multiple Call Forwarding, see “Programming on page 981”.
3. When using this feature, Billing Party is always the call originator regardless of the data setting of ASYD, SYS1, Index 20, Bit 7 (Billing Party for a call transferred by Call Forwarding - Outside Service).
4. Calls re-routed by this feature are counted as normal Route Peg Count.
5. Caller ID notification in this feature is as follows:

   - Station-to-Station calls: the Caller ID of the calling party is notified.
   - Trunk-to-Station calls: the Caller ID of the party who made the trunk call is notified.

6. Outgoing calls placed by using the following features can be re-routed by this feature:
   - Last Number Called - Single Line Station
   - Last Number Called - D
   - One touch Button
   - Speed Calling - System **Note 2**
   - Speed Calling - Station
   - Phone Book (Local Phone Book **Note 3**/System Phone Book), Terminal Phone Book
   - Message Reminder **Note 4**

   Note 2: Available only when the CD that is entered with the ASPD command is a Private Number in Dial Plan to Support IP Centrex Functionality.

   Note 3: Local Phone Book data is not copied from the Telephony Server to SR-MGC. For this reason, a station that is controlled by SR-MGC cannot make a phone call by using the Local Phone Book data.

   Note 4: A station that is controlled by SR-MGC cannot make a call to a station that is controlled by the Telephony Server by using Message Reminder.

7. This feature is not available for an outgoing call using Brokerage Hot Line.
8. This feature is not available for Preset Conference, where the conference leader dials the station number of conference leader port.
9. This feature is not available if a network failure occurs at a station that is specified as the following call forwarding destination.
   - Call Forwarding - All Calls - CCIS
   - Call Forwarding - Busy Line - CCIS
   - Call Forwarding - Don’t Answer - CCIS
10. If SR-MGC detects a network failure on a station that is specified as Call Forwarding - Don’t Answer destination when the forwarding is activated by Blind Transfer while Station/Trunk is on hold, this feature works as follows:

    - In case that Call Forwarding - Don’t Answer destination is PS/SP Controlled SIP terminal, this feature is available. However, if a network failure occurs on FCCS Network, this feature is not available (Call Forwarding - Don’t Answer also does not work).

    - In case that Call Forwarding - Don’t Answer destination is not PS/SP Controlled SIP terminal, this feature is not available (Call Forwarding - Don’t Answer also does not work).

11. When a call terminates on a station where a network failure is detected and the station detects a network failure, hunting does not take place for calls placed to the Hunting Group. In this case, the calls are forwarded according to the following forwarding information.

<Hunting Type>		<Re-routing Forwarding Information>
Pilot	=	to Pilot Station
Circular	=	to first called Station
Priority with Switchback	=	to first called Station
Priority	=	to first called Station

When Pilot Station (first called Station) is busy, and one of members other than the Pilot Station (first called Station) detects a network failure, hunting will take place. If there is no available Station in the group, the call is not forwarded and the caller receives BT.

Note: For inter node calls in FCCS system, considerations should be taken for the following. When a calling party dials the number of a Pilot Station (first called Station) and Bandwidth used for speech exceeds the limit which is configured with Peer to Peer Bandwidth Control [P-75] on the FCCS Link, hunting will take place (the call is not forwarded).

12. When the Pilot Station/first called Station of Hunting Group is a PS/SP Controlled SIP terminal, the following occurs when the PS/SP Controlled SIP terminal is called depending on the system data (ASYDL, SYS1, Index 688, Bit 0 (0/1=Hunting/PS Out of Zone Processing).
    a.) When “Hunting” is selected (Bit 0=0):

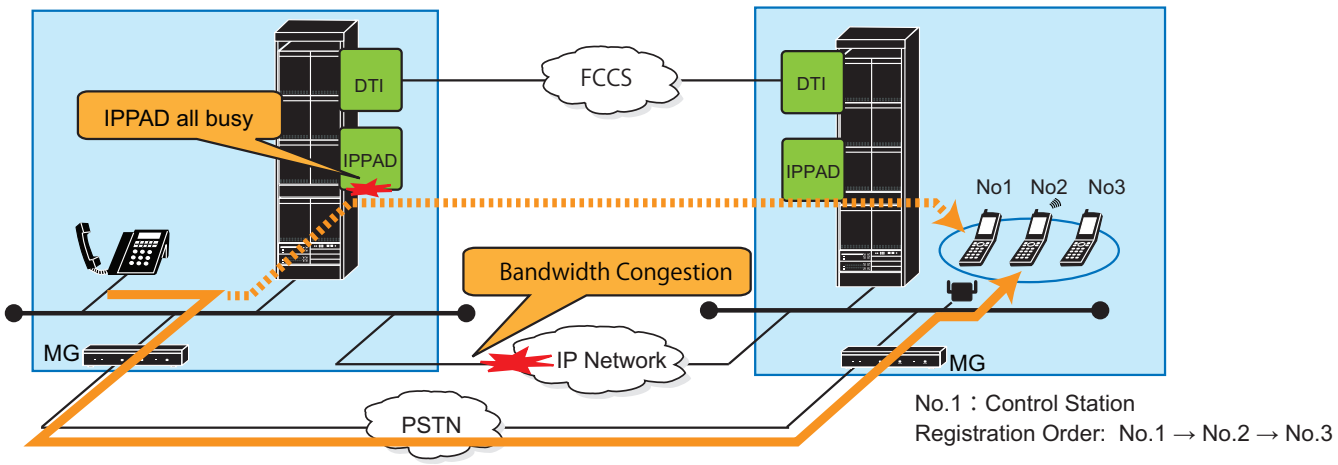
    When a network failure is found at the PS/SP Controlled SIP terminal which is working as a Pilot Station/first called Station of Hunting Group, hunting takes place to the next candidate Station in the same Hunting Group if available, and if not, it is not forwarded any more.

    b.) When “PS Out of Zone Processing” is selected (Bit 0=1):

    When a network failure is found at the PS/SP Controlled SIP terminal which is working as a Pilot Station/first called Station of Hunting Group, the call is forwarded according to the forwarding information specified for the Pilot Station/first called Station.

    Note: For inter node calls in FCCS system, considerations should be taken for the following.
    When a calling party dials the number of a pilot station/first called Station (PS/SP Controlled SIP terminal) and network failure is detected, the call is forwarded according to the call forwarding information set on the Pilot Station/first called Station regardless of the system data (ASYDL, SYS1, Index 688, Bit 0 (0/1=Hunting/PS Out of Zone Processing)).

13. When a call terminates on a station (UCD controlling station) where a network failure is detected, the call is forwarded according to the forwarding information of the controlling station.
    a.) When the controlling station is busy, and a member station detects a network failure, re-routing is not activated even if call forwarding information has been set for the member station. The incoming call terminates to available station in the UCD group.



b.) If there is no available station in the UCD group since all stations are busy, the following occurs:

- When "UCD Queuing is Required (RBT)" with ASYD, SYS1, Index 60, Bit 3=0, re-routing is not activated. Places the call in queue and connects the call to a station if available.
- When "UCD Queuing is Not Required (BT)" with ASYD, SYS1, Index 60, Bit 3=1, the calling party receives BT.

Note: For inter node calls in FCCS system, considerations should be taken for the following:

- When a calling party dials a UCD number and IPPAD All busy is detected on Calling Node, the call is forwarded according to the forwarding information set on the controlling station.
- When a calling party dials a UCD number and Bandwidth used for speech exceeds the limit which is configured with Peer to Peer Bandwidth Control [P-75], re-routing is not activated and the incoming call terminates to available station in the UCD group.
- If IPPAD All busy is detected on Calling Node or Bandwidth used for speech exceeds the limit which is configured with Peer to Peer Bandwidth Control [P-75] when a calling party dials UCD number (PS/SP Controlled SIP terminal), the call is forwarded according to the forwarding information of the Controlling station. In this case, the forwarded call terminates not to UCD Control station but to available station in the UCD group.

[Example]
When a calling party dials a Control Station number (No.1), station hunting normally takes place according the registration order of terminals (No.1 - No.2 - No.3). However, when IPPAD All busy is detected on calling node or Bandwidth used for speech exceeds the limit, the call terminates not to No.1 station but to No.2 station.

Note: If BOSS ABSENT is set at BOSS' station, and CALL FORWARDING - ALL CALLS is set at secretary's station in "MULTI-BOSS/MULTI-SECRETARY Overriding from a Stand-In Secretary" feature, the call which terminates on BOSS' station number via FCCS link will be forwarded to the forwarding destination specified by the secretary. However, if FCCS-link-all-busy is detected at the forwarding destination, the call will be forwarded according to the forwarding information of the forwarding destination station.

14. When Least Cost Routing for MG-PRI is used, routing is determined by the MA-ID of the calling party at the time of re-routing.
15. When Location Diversity is in use, this feature is not supported.
16. ACD is not supported.

<Hardware/Software>

1. As to incoming calls to the following terminal/line, this feature can be disabled by system data. See "Programming " for more details.
   - IP terminal/SIP Handler Controlled SIP terminal
   - PS
   - SP Controlled SIP terminal
   - Virtual Line

   Note: If an FCCS link failure is detected when a call is placed to a PS/SP Controlled SIP terminal via FCCS network, terminal type cannot be read out. In this case, if ASYDL/ASYDN, SYS1, Index 1125, Bit 1 (Re-routing for legacy terminal/IP Station in the event of a network failure) is set to 1 (In service), re-routing will be activated regardless of ASYDL/ASYDN, SYS1, Index 1125, Bit 2 (Re-routing for PS/SP Controlled SIP terminal in the event of a network failure).

   Note: If an call is placed from a station which operates under SR-MGC (operating mode) to PS/SP Controlled SIP terminal in another FPC node via FCCS link, terminal type cannot be read out. In this case, if ASYDL/ASYDN, SYS1, Index 1125, Bit 1 (Re-routing for legacy terminal/IP Station in the event of a network failure) is set to 1 (In service), re-routing will be available regardless of ASYDL/ASYDN, SYS1, Index 1125, Bit 2 (Re-routing for PS/SP Controlled SIP terminal in the event of a network failure).

2. When a call is placed from a PS, the location is checked by using the MA-ID of CS that is used by the PS at the time of call origination. When PS is out of Zone or Power OFF, as MA-ID for PS, the MA-ID of CS that is used by the PS at the time of call origination/location registration/handover is applied (There is no need to assign MA-ID to PS using the AMAA command). If MA-ID has not been set for the CS, MA-ID=0000 is applied.
3. When a call is received by a PS while it is out of zone, the location check is made by MA-ID that has been allocated for the PS. When an IP terminal that is controlled by SR-MGC places a call to a PS that is controlled by other device in FCCS system, location check is not made for MA-ID, activating re-routing. When a central office incoming call is received by a PS which is in out of zone state, re-routing is not activated.

4. As to PS/SP Controlled SIP terminal, incoming incomplete timer value is fixed (about 8 seconds). The value is used for the system to recognize an out-of-zone terminal when a call is attempted to a PS/SP Controlled SIP terminal. For this reason, when CS/SP Controlled SIP terminal performs re-registration to the SR-MGC because of network failure, it will take about 8 seconds until the Telephony Server detects Health Check NG of the CS/SP Controlled SIP terminal, and the registration information held by the Telephony Server is deleted, and then re-routing is activated.
5. This feature can be enabled or disabled for the following calls by setting the system data ASYDL/ASYDN, SYS1, Index 1133, Bit 1 (Re-routing calls placed to an Attendant Console in the event of a network failure 0=Disabled/1=Enabled). The table below shows availability and conditions of re-routing when a call terminates to an attendant console for each type of attendant calling.

    - Call from IP equipment that is controlled by SR-MGC to an Attendant under the Telephony Server
    - Attendant call between nodes at the time of FCCS link transmission line failure in the FCCS system

X: Available P/A: Partially available N/A: Not available -: Not applicable

Features	Availability	Conditions
Operator Call	P/A	• Re-routing Call Forwarding information will be forwarded according to forwarding information against MA-ID that is set in ASYDL/ ASYDN, SYS1, Index 1134, Index 1135 (MA-ID of ATT). **Note:** MA-ID that is set for RT901(ATT) or RT915(Night ATT) with the AMAA command is not used. • In an FCCS System, when FCCS links to the Node which handles Ring Down (IC) Calls (ASYDL, SYS1, Index 640) are all busy, this feature is not available. • In an FCCS system, if FCCS links all busy is detected at a node accommodating an Attendant Console which is set as Call Forwarding - All Calls/Call Forwarding - Don't Answer destination by an Direct-In Termination destination, this feature is not available.
Individual Attendant Access	P/A	• Re-routing is available only for Individual Attendant Identification Number that is set with the ASATN command. Not available for Individual Attendant Identification Number that is set with the ASAT command. • Re-routing Call Forwarding information will be forwarded according to the Telephone Number of Individual Attendant Identification Number that is set with ASATN command, or forwarded according to the MA-ID that has been set for RT901 (ATT) or RT915 (Night ATT) with the AMAA command. • Although Individual Attendant Identification Number is set as forwarding destination for Call Forwarding-All Calls, Call Forwarding-Don't Answer, and Call Forwarding-Busy Line, the call forwardings are not activated.

Features	Availability	Conditions
LDN Call	P/A	• Re-routing is available only for LDN that is set with the ALDNN command. Not available for LDN Number that is set with the ALDN command. • Re-routing Call Forwarding information will be forwarded by the Telephone Number of LDN or MA-ID that is set with ASYDL/ ASYDN SYS1 Index 1134, 1135 (MA-ID of Attendant Console). **Note:** MA-ID that is set for RT901(ATT) or RT915(Night ATT) with the AMAA command is not used. • Availability of this feature is limited according to "TYPE: Night Transfer Type [0-3]" in the ALDNN command and day/night mode of node where an LDN call terminates. **Note:** The table below shows conditions for re-routing activation according to "TYPE: Night Transfer Type [0-3]" in the ALDNN command.

Note: Care should be taken for the following:
- Re-routing is not available for Attendant calls within the Telephony Server.
- This feature is not intended for an outgoing call from Attendant Console.

Note: When Flexible Network Re-routing - FCCS link all busy is enabled (ASYDL/ASYDN, SYS1, Index 1133, Bit 2=1), re-routing is available in the following cases.
- FCCS links are all busy.
- IPPAD cards used for speech are all busy. (Only for IPPAD cards which are located in a call originating node)
- Connection Trunks are all busy at the time of FCCS-DTI tandem connection.
- Bandwidth used for speech exceeds the limit which is configured with Peer to Peer Bandwidth Control [P-75].

X: Available N/A: Not available

Type (Night Transfer Type)	System	D/N mode	Re-routing	Conditions
0: No Night Transfer	SV9500	D	X	Re-routing is activated according to LDN number (pilot station number in an Attendant) that is set with the ALDNN command, or call forwarding information that is set for MA-ID in ASYDL/ ASYDN, SYS1, Index 1134, Index 1135 (MA-ID of Attendant).
		N3	X	Re-routing is activated according to LDN number (pilot station number in an Attendant) that is set with the ALDNN command, or call forwarding information that is set for MA-ID in ASYDL/ ASYDN, SYS1, Index 1134, Index 1135 (MA-ID of Attendant). **Note:** Although re-routing is activated, call is not terminated on an Attendant console and a calling party continues to hear a Ringback Tone (RBT).
	SR-MGC	D N3	X	Re-routing is activated according to LDN number (pilot station number in an Attendant) that is set with the ALDNN command, or call forwarding information that is set for MA-ID in ASYDL/ ASYDN, SYS1, Index 1134, Index 1135 (MA-ID of Attendant) regardless of D/N mode.
1: Telephone Number	SV9500	D	X	Re-routing is activated according to LDN number (pilot station number in an Attendant) that is set with the ALDNN command, or call forwarding information that is set for MA-ID in ASYDL/ ASYDN, SYS1, Index 1134, Index 1135 (MA-ID of Attendant).
		N3	X	When a network failure is detected at the telephone number of station in Night Connection destination, re-routing is activated according to call forwarding information that is set in LDN Night Connection destination.
	SR-MGC	D N3	X	Re-routing is activated according to LDN number (pilot station number in an Attendant) that is set with the ALDNN command, or call forwarding information that is set for MA-ID in ASYDL/ ASYDN, SYS1, Index 1134, Index 1135 (MA-ID of Attendant) regardless of D/N mode.

Type (Night Transfer Type)	System	D/N mode	Re-routing	Conditions
2: Trunk Line	SV9500	D	X	Re-routing is activated according to LDN number (pilot station number in an Attendant) that is set with the ALDNN command, or call forwarding information that is set for MA-ID in ASYDL/ ASYDN, SYS1, Index 1134, Index 1135 (MA-ID of Attendant).
		N3	N/A	Re-routing is not activated, and a call is forwarded to trunk-in number by Night Connection.
	SR-MGC	D	X	Re-routing is activated according to LDN number (pilot station number in an Attendant) that is set with the ALDNN command, or call forwarding information that is set for MA-ID in ASYDL/ ASYDN, SYS1, Index 1134, Index 1135 (MA-ID of Attendant) regardless of D/N mode.
		N3		
3: Abbreviated Digit Code	SV9500	D	X	Re-routing is activated according to LDN number (pilot station number in an Attendant) that is set with the ALDNN command, or call forwarding information that is set for MA-ID in ASYDL/ ASYDN, SYS1, Index 1134, Index 1135 (MA-ID of Attendant).
		N3	N/A	Re-routing is not activated, and a call is forwarded to Abbreviated Digit Code (ADC) that is set with the ASPDL/ ASPDN) command by Night Connection.
	SR-MGC	D	X	Re-routing is activated according to LDN number (pilot station number in an Attendant) that is set with the ALDNN command, or call forwarding information that is set for MA-ID in ASYDL/ ASYDN, SYS1, Index 1134, Index 1135 (MA-ID of Attendant) regardless of D/N mode.
		N3		

6. By setting system data, you can configure terminals to generate a beep when a station (including PS) activates this feature. See “Programming “for more details.

Note: Considerations should be taken for the following as to beep.

- The beep is the same as Overflow Tone that is provided for LCR/LCRS outgoing calls when route advance takes place. This tone is also the same as Service Set Tone (SST).
- No beep is provided for SP Controlled SIP terminals and SIP Handler Controlled SIP terminals.
- No beep is provided for VS32 conference, if re-routing is activated by network failure that is detected at conferee port and/or conference leader port.
- If ISDN trunks that are used for alternate routing are all busy, no beep will be provided when an idle trunk is seized as a result of Outgoing Trunk Queuing.
- If ISDN trunks that are used for alternate routing are MG(BRI) in Proprietary Protocol Mode, no beep will be provided.

7. The call cannot terminate to the PS/SP Controlled SIP terminal/SIP Handler Controlled SIP terminal while the terminal is moving to other node.

8. For a call originated from the SP Controlled SIP terminal, the location is checked by using MA-ID that has been set with AMAA command (KIND=Network) at the time of SP Controlled SIP terminal REGISTER. At the time of SP Controlled SIP terminal UN-REGISTER, the MA-ID that was applied at the time of REGISTER will be retained. If MA-ID of Kind=Network has not been assigned, MA-ID=0000 will be applied.
9. For a call originated from the SIP Handler Controlled SIP terminal, the location is checked by using MA-ID that has been set with AMAA command (KIND=LENS). At the time of SIP Handler Controlled SIP terminal UN-REGISTER, the MA-ID that was applied at the time of REGISTER will be retained. If MA-ID of Kind=LENS has not been assigned, MA-ID=0000 will be applied.
10. If a call is originated to an UN-REGISTER-state Standard SIP terminal which has not performed REGISTER after the system startup, MA-ID=0000 will be applied.
11. As for a call to the SIP Handler Controlled SIP terminal under the Telephony Server, when SR-MGC, which belongs to the same MA-ID group as the SIP Handler Controlled SIP terminal, goes into the operation mode and the status of the SIP Handler Controlled SIP terminal is detected as a network failure, the call does not arrive at the terminal although re-routing is activated.

<Interactions with Networks>

1. If connection between Telephony Servers is not available because of FCCS link transmission line failure, the priority order of call forwarding features is as follows when forwarding data has been assigned with the AFRFL command.

Call Forwarding Features	Priority
(1) Re-routing in case all the connection trunks are busy/FCCS link failure (AFRFL command)	High ↑
(2) Automatic Re-routing when SR-MGC is in Operating Mode **Note 5**	↓ Low

Note: When using “Automatic Re-routing when SR-MGC is in Operating Mode”, delete the forwarding data of the AFRFL command.

Note 5: In case that Flexible Network Re-routing - FCCS link all busy is enabled (ASYDL/ASYDN, SYS1, Index 1133, Bit 2=1), re-routing when FCCS links are all busy is available. FCCS link all busy means following status.

- IPPAD cards used for speech are all busy. (Only for IPPAD cards which are located in a call originating node)
- Connection Trunk is all busy at the time of FCCS-DTI tandem connection.
- Bandwidth used for speech exceeds the limit which is configured with Peer to Peer Bandwidth Control [P-75].

2. As to Tie Line/C.O. Line incoming calls, this feature can be disabled by system data. See “Programming ” for more details.

<Conditions Specific to This Feature>

1. You can assign the call forwarding destination number for each Telephone Number or MA-ID, where data for Telephone Number are preferentially read over data for MA-ID.
2. When a call is forwarded outside the network by this feature, the LCD of the originator’s Desktop terminal displays the current call status as “TRANSFER” without showing the intermediate station.

Note: You can specify whether to display call status on the LCD with the system data (ASYD, SYS1, Index 78, Bit 1), but information on the intermediate station is not provided regardless of the setting of the system data.

Note: In case that 1st route cannot be selected due to all the ISDN trunks being busy or ISDN network going down, and then 2nd route selected by the existing re-routing feature is activated according to the data setting of AOPR/AOPRL/AOPRN, “TRANSFER” is not displayed.

3. When a call is forwarded to public network by this feature, the LCD of the originator’s Desktop terminal displays the 8 digits of the Call Forwarding Information regardless of the setting of the system data (ASYDL, SYS1, Index 677, Bit 3), as follow:

T	R	A	N	S	F	E	R								1	2	3	4	5	6	7	8
1	0	:	1	4		A	M		M	O	N		1	4		N	O	V		2	0	1	1
	M	I	C																>	>	>	

4. Re-routing is also possible when making a call from a terminal that is registered in SR-MGC to a virtual line that is accommodated in other device’s Telephony Server regardless of the setting of ASYDL/ ASYDN, SYS1, Index 1125, Bit 4.

Note: If an FCCS link failure is detected when a call is originated to a virtual line between nodes, terminal type cannot be read out. In this case, if ASYDL/ASYDN, SYS1, Index 1125, Bit 1(Re-routing for legacy terminal/IP Station in the event of a network failure) is set to 1 (In service), re-routing will be available regardless of system data setting (ASYDL/ASYDN, SYS1, Index 1125, Bit 4).

<Other Conditions>

None

Programming

STEP 1: Assign the following system data as required with the ASYD/ASYDL/ASYDN command.

- ASYD, SYS1, Index 5:
  - Bit 1 to Bit 3: Maximum number of Multiple Call Forwarding-All Calls/Busy Line/Logout occurrence
    (1-5 times)

Bit 3	Bit 2	Bit 1	Number of Times	Bit 3	Bit 2	Bit 1	Number of Times
0	0	0	once	1	0	0	four times
0	0	1		1	0	1	five times
0	1	0	twice	1	1	0	
0	1	1	three times	1	1	1	

Note: Set twice or more for this feature.

- ASYD, SYS1, Index 69
  - Bit 7: Multiple Call Forwarding - Busy Line/All Calls/Logout
    0/1: Out of service/In service

Note: Set this bit only when you want to change the number of times for Multiple Call Forwarding.

- ASYDL, SYS1, Index 640
  - Bit 0 to Bit 7: Fusion Point Code (FPC) of the node providing Attendant Console. **Note 13**
- ASYDL, SYS1, Index 688:
  - Bit 0: Hunting/PS Out of Zone Processing when called PS is Out of Zone
    0/1: Hunting/PS Out of Zone Processing.

Note: Processing when a network failure is found at PS which has Station Hunting. If a network failure is found at a PS when selecting “PS Out of Zone Processing” the call is forwarded according to bandwidth congestion forwarding data that has been set to the PS. Note that this system data is shared with behavior pattern of general PS Out of Zone Processing.

- ASYDL/ASYDN, SYS1, Index 1125:
  - Bit 1: Re-routing calls placed to a legacy terminal/IP Station in the event of a network failure. **Note 6**, **Note 7**
    0/1 : Disabled/Enabled
  - Bit 2: Re-routing calls placed to a PS/SP Controlled SIP terminal in the event of a network failure. **Note 8**, **Note 9**
    0/1 : Disabled/Enabled

- Bit 3: Generate a beep when a legacy terminal/IP terminal call or PS call is automatically rerouted in the event of a network failure. **Note 6**, **Note 8**, **Note 10**
  0/1 : Disabled/Enabled
- Bit 4: Re-routing calls placed on a Virtual Line in the event of a network failure. **Note 7**
  0/1 : Disabled/Enabled
- Bit 6: Re-routing incoming TIE Line calls in the event of a network failure. **Note 11**
  0/1 : Disabled/Enabled
- Bit 7: Re-routing incoming C.O. Line calls in the event of a network failure. **Note 12**
  0/1 : Disabled/Enabled

Note 6: Set this bit to enable this feature for legacy/IP terminals/SIP Handler Controlled SIP terminal.

Note 7: Set this bit to enable this feature for virtual lines.

Note 8: Set this bit to enable this feature for PS.

Note 9: Set this bit to enable this feature for SP Controlled SIP terminal.

Note 10: Not available for SP Controlled SIP terminal/SIP Handler Controlled SIP terminal and VS32.

Note 11: Set this bit to enable this feature for TIE Line (CDN:6 (TCL) of ARTD/ARTDN is 4 - 31).

Note 12: Set this bit to enable this feature for CO Line (CDN:6 (TCL) of ARTD/ARTDN is 1 - 3).

- ASYDL/ASYDN, SYS1, Index 1133:
  - Bit 0: Flexible Network Re-routing
    0/1 : Disabled/Enabled
  - Bit 1: Flexible Network Re-routing - Attendant
    0/1 : Disabled/Enabled **Note 13**
  - Bit 2: Flexible Network Re-routing - FCCS link all busy
    0/1 : Disabled/Enabled

Note 13: Set this data to enable this feature for calls terminating to an attendant.

- ASYDL/ASYDN, SYS1, Index 1134, Index 1135:
  - MA-ID of the attendant
    [example: MA-ID = 16]
    Index 1134 = 10 (Hex)
    Index 1135 = 00 (Hex)

STEP 2: Assign the flexible rerouting data with the AFRRL/AFRRN command.

- When TYPE=TELN (Telephone Number)
  - **UGN**: User Group Number
  - **TELN**: Assign the Transfer Source Telephone Number (maximum 16 digits) for call forwarding source.

- **CFD (Call Forwarding Destination Number)**: Assign the call forwarding destination number (0-9, *, maximum 24 digits).**Note 18**, **Note 19**
  Enter a Public Network number (all digits) including the Trunk Access Code and Area Code.
- **Called Party Subaddress**: **Note 14**, **Note 15**
  Check the checkbox when adding the called party Subaddress, and then select either Automatic Addition Digit Code or Manual Input Digit Code.
- **Address Specification Method**:

  Automatic Addition Digit Code **Note 16**: Telephone Number/Private Number Code of the call forwarding destination is automatically added as the called party Subaddress.

  Manual Input Digit Code: Uses the data entered in IDC as the called party Subaddress.
- **IDC (Input Digit Code)**: Called Party Subaddress [0-9, *, maximum 24 digits ("#" is not used)]

- When TYPE=MA-ID
  - **MA-ID**: Charged Area ID (0-9999)
  - **CFD (Call Forwarding Destination Number)**: Assign the call forwarding destination number (0-9, *, maximum 24 digits). **Note 18**, **Note 19**
    Enter a Public Network number (all digits) including the Trunk Access Code and Area Code.
  - **Called Party Subaddress**: **Note 14**, **Note 15**
    Check the checkbox when adding the called party Subaddress, and then select either Automatic Addition Digit Code or Manual Input Digit Code.
  - **Address Specification Method**:
    Automatic Addition Digit Code **Note 16**: Telephone Number/Private Number Code of the forwarding destination is automatically added as the called party Subaddress.
    Manual Input Digit Code: Uses the data entered in IDC as the called party Subaddress.
  - **IDC (Input Digit Code)**: Called Party Subaddress [0-9, *, maximum 24 digits ("#" is not used)]

Note 14: Do not add the called party Subaddress when "#" is included in the Telephone Number/Private Number Code of the call forwarding destination.

Note 15: When you add the called party Subaddress, the number of digits for CFD assigned by AFRRL/AFRRN must be the same as MND assigned by AMND/AMNDL/AMNDN.
Set "Out of Service" for SUB (Sub Address Dialing) of ASPA/ASPAL/ASPN used for the trunk access code included in CFD assigned by AFRRL/AFRRN.
When the setting of the Subaddress is required for a normal call origination to an outside line, the trunk access code used for the normal call origination must be different from the one used for re-routing.

Note 16: Automatic Addition Digit Code
- When the AFRRL command is used, the Telephone Number (LDM) is added.
- When the AFRRN command is used and Dial Plan to support IP Centrex Functionality is disabled (ASYDN, SYS1, Index 818, Bit 5=0), the Telephone Number (NDM) is added.
- When the AFRRN command is used and Dial Plan to support IP Centrex Functionality is enabled (ASYDN, SYS1, Index 818, Bit 5=1), Private Number Code (**Note 17**) + Telephone Number (NDM) are added.

Note 17: ”Private Number Code” means a private number code which is assigned to UGN with the AUPVN command.

Note 18: You can assign the called number (remote access number) and called party subaddress (ID code plus called party number) which are used in “Automated Attendant [A-82]”/“Remote Access to System [R-2]” as a destination number.

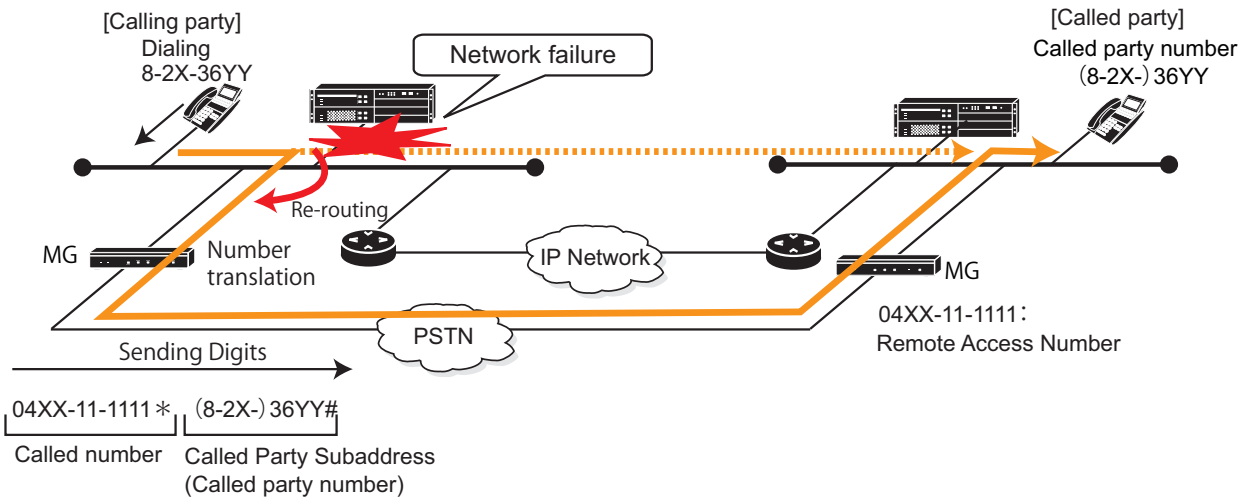
Note 19: If Called Party Subaddress (ID code) is assigned as a destination number, note the following.

- Assign outside line access codes used in re-routing for destination number with and without ID code respectively.
- Assign the total digits of ID code and called subaddress according to the maximum digits indicated in “Maximum Digits for Called Party Subaddress Information” table.

[Example]

CFD: Call Forwarding Destination Number				Called Party Subaddress	
0	04XX-11-1111	*	3333	*	12345678901234
Access Code	Called Number 1111: Remote access code		ID code	(Automatic addition)	Called Party Subaddress

Maximum digits for called party subaddress

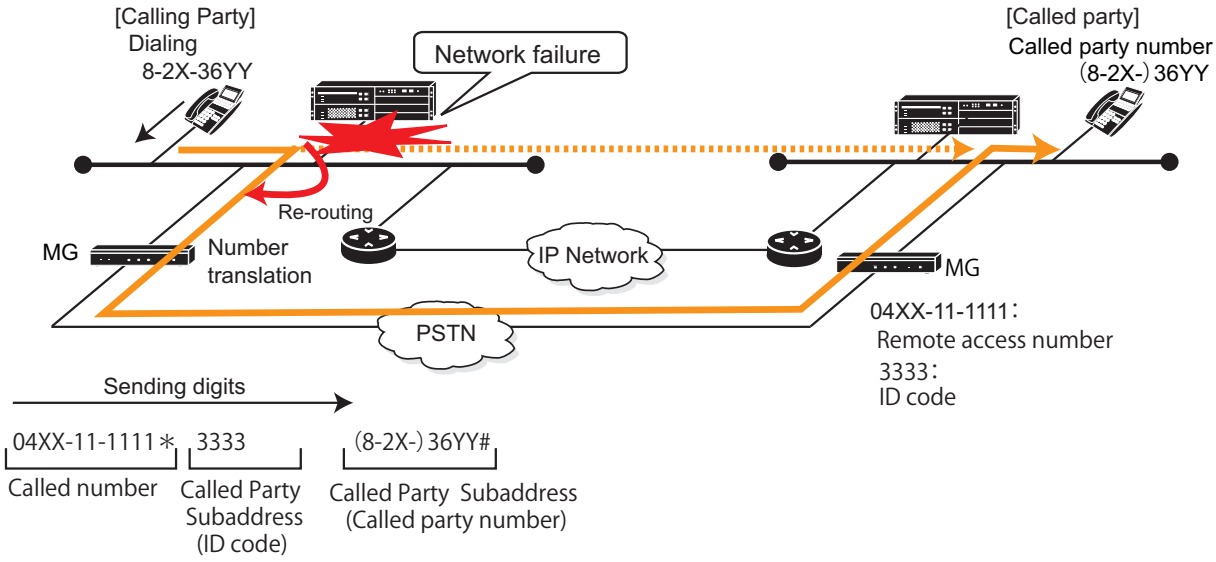


Maximum Digits for Called Party Subaddress Information

ARTD/ ARTDN CDN65 (INT)	Interface Specification for ISDN (0-15)	Maximum Digits
1	N-ISDN2	20
2	Australia	20
3	INS 1500(NTT)	19
4	ITU(CCITT), ETSI(PRI)	20
5	AT&T(#4/#5 ESS)	20
6	INS 64(NTT), ETSI(BRI)	19
7	NTT DMS100/DMS250	Not available
9	TTC Q931 a protocol Tie Line (JAPAN)	19
10	QSIG(ETS 300 172)/IS-11572	19

<Without ID code>
Called number (Remote access number) plus called subaddress (Called party number).

(Example)



- **UGN**: 1
- **TELN**: 3683
- **CFD**: 0 (Access code) 04XX 11 1111 (Called number (1111=Remote access code))
- **Called Party Subaddress**: Address Specification Method = Automatic Addition Digit Code

<With ID code>
Called number (Remote access number) plus called subaddress (ID code plus called party number).

(Example)

- **UGN**: 1
- **TELN**: 3683
- **CFD**: 0 (Access code) 04XX 11 1111 (Called number (1111=Remote access code))
  *3333 (ID code)
- **Called Party Subaddress**: Address Specification Method = Automatic Addition Digit Code

STEP 3: Assign the MA-ID number for SR-MGC number with the CMNT command.

<Setting Tab>

MGC No.: Assign a number for the SR-MGC. (0-255)
Office Name: Set the office name for the SR-MGC. (Maximum 20 characters)
IP Address: Enter the IP address of the SR-MGC.

Note: Assign the actual IP address, not the default one.

Mode: Assign the type of changeover and recovery.

1 = Automatically switched to SR-MGC operation when communication failure has been detected between MGC and SR-MGC.

Automatically switched back to MGC operation when communication recovery has been detected between MGC and SR-MGC.

2 = Automatically switched to SR-MGC operation when communication failure has been detected between MGC and SR-MGC.

Automatically switched back to MGC operation when communication recovery between MGC and SR-MGC, and normality of communication between MGC and a selected terminal have been detected.

C_MGC: Assign the operating mode for SR-MGC.**Note 20**

0: Normal Operation (used to set the SR-MGC at the Self Node)

1: Backup node (used to set the SR-MGC at the backup node)

Note 20: This is required when using FCCS Cluster. For node where this data = 1, office data copy and initialization from the Telephony Server are not available.

Assigning MA-ID: Check this box to assign MA-ID for the SR-MGC.

MA-ID: Message Area ID (0 - 9999)

Note: Only one SR-MGC No. can be assigned for one MA-ID. Attempting to assign an already allocated MA-ID will result in error message.

STEP 4: Assign MA-ID and the Area Name with the AMAIL/AMAIN command.

MA-ID: Message Area ID (0-9999) Max. 4digits (fixed)

AREA NAME: Area Name (8-digit indication, 16-digit indication)

Note: For SP Controlled SIP terminal, set Message Area also for MA-ID.

STEP 5: Assign MA-ID allocation data for each terminal and trunk with the AMAA command.

KIND: Select a kind.

LENS: Assigned to the originating.

Network: Assigned to a network.

Note: Considerations should be taken for the following when setting this parameter.

[For SP Controlled SIP terminals]
- Be sure to select KIND = Network and assign MA-ID.
- MA-ID cannot be assigned to each SP Controlled SIP terminal.
- The MA-ID of KIND=Network is applied when the SP Controlled SIP terminal registers to the Telephony Server. If MA-ID is not assigned, MA-ID=0 is applied.
- The MA-ID registered at the time of REGISTER will be retained when the terminal performs UNREGISTER.
- If a call terminates on UN-REGISTER-state SP Controlled SIP terminal, which has not performed REGISTER after the system startup, MA-ID=0 will be applied.
- This feature cannot be used if KIND = Network has been set for equipment other than SP Controlled SIP terminal.
- If MA-ID is assigned to the station number of SP Controlled SIP terminal, the registration result will not be displayed in the setting data of the AMAA command.

[For SIP Handler Controlled SIP terminals]
- Be sure to select KIND = LENS and assign MA-ID.

[For PS]
- Assign MA-ID to CS-IP.
- Be sure to select KIND = LENS and FUNCTION = CS when assigning MA-ID.
- PS acquire MA-ID of CS at the time of location registration and the MA-ID is automatically applied to PS (There is no need to assign MA-ID to PS using the AMAA command). When a call is placed from PS or handed over to another base station, PS acquire MA-ID for CS newly, and the MA-ID is applied to PS. if MA-ID is not assigned to CS, MA-ID=0 will be applied to PS.

- When PS is in out of zone, the MA-ID applied to PS is retained.
- If a call is placed to out-of-zone-state PS, which has not performed REGISTER after the system startup, MA-ID=0 will be applied.
- If MA-ID is registered to station number of PS, the registration result is not displayed in the setting data of the AMAA command.

Note: Only one SR-MGC No. can be assigned for one MA-ID. Attempting to assign an already allocated MA-ID will result in error message.

- KIND=LENS, FUNCTION=Station: Used when specifying terminal type of terminal you want to set data by Station.

  DETAIL: Select a type where MA-ID is to be set (STN/TELN (NDM)/TELN (LDM))

  TYPE: Select whether STN is set individually or collectively (Individual/Collective)

  FPC: Fusion Point Code (when DETAIL=STN or DETAIL=TELN(LDM))

  TN: Tenant Number (when DETAIL=STN)

  UGNN/L: User Group Number (when DETAIL=TELN (NDM)/TELN (LDM))

  STN: Station Number (when DETAIL=STN, TYPE=Individual)

  TELNN/L: Telephone Number (when DETAI=TELN (NDM) or TELN (LDM) and TYPE=Individual)

  STN START-END: Specify the range of Station Number (when DETAIL=STN, TYPE=Collective)

  TELN START-END: Specify the range of TELN (when DETAIL=TELN (NDM) or TELN (LDM) and TYPE=Collective)

  MA-ID: Message Area ID (0 - 9999)

- KIND=LENS, FUNCTION=Trunk: Used when specifying terminal type of terminal you want to set data by Trunk.

  DETAIL: Select a type where MA-ID is to be set (RT/LGRT)

  TYPE: Select whether RT/LGRT is set individually or collectively (Individual/Collective)

  FPC: Fusion Point Code (when DETAIL=RT)

  RT: Route Number (when DETAIL=RT, TYPE=Individual)

  LGRT: Logical Route Number (when DETAIL=LGRT, TYPE=Individual)

  RT START-END: Specify the range of Route Number (when DETAIL=STN, TYPE=Collective)

  LGRT START-END: Specify the range of Logical Route Number (when DETAIL=LGRT and TYPE=Collective)

  MA-ID: Message Area ID (0 - 9999)

- KIND=LENS, FUNCTION=CS: Used when specifying terminal type of terminal you want to set data by CS.

  When selecting TYPE=Individual

  PCN: PHS Community Number

ERN: Calling Area Number

GRN: Group Number

CSN/ZTN: CS/ZT Number

MA-ID: Message Area ID (0 - 9999)

When selecting TYPE=Collective

PCN: PHS Community Number

ERN START-END: Specify the range of Calling Area Number

GRN START-END: Specify the range of Group Number

CSN/ZTN START-END: Specify the range of CS Number

MA-ID: Message Area ID (0 - 9999)

- KIND=LENS, FUNCTION=LENS: Used when specifying terminal type of terminal you want to set data by LENS.

  TYPE: Select whether LENS is set individually or collectively (Individual/Collective)

  FPC: Fusion Point Code

  LENS: Line Equipment Numbers (when TYPE=Individual)

  LENS START-END: Specify the range of LENS (when TYPE=Collective)

  MA-ID: Message Area ID (0 - 9999)

- KIND=Network: Used when allocating MA-ID to SP Controlled SIP terminal.

  FPC: Fusion Point Code

  IP Address: IP address of the node

  SubNet Mask: Subnet mask of the node

  MA-ID: Message Area ID (1 - 9999) **Note 21**

  Note 21: Assign the Message Area ID within the range from 1 to 9999. When 0 is assigned, the MA-ID is cleared.

G-2 Group Calling

General Description

This feature allows a user to dial certain frequently Called Stations within a System Group using an easily remembered number. The same number can be assigned to different user groups. The Group Call can initiate CALL WAITING - ORIGINATING [C-31] to a busy Station.

Operating Procedure

To initiate a Group Call

1. Lift the handset. Receive Dial Tone.
2. Dial the GROUP CALLING Access Code (maximum of three digits) plus the GROUP CALLING Station Code (one or two digits).
3. The call is completed.

To initiate a Group Call from a Dterm

1. Press the REDIAL key, plus GROUP CALLING Station Code (one or two digits).
2. Call is completed.

Service Conditions

1. Each Primary Station equipped in a Calling Group will program the GROUP CALLING Numbers through their telephone.
2. GROUP CALLING Data is retained in memory, even in the event of power failure, by means of Flash Card Backup via MEM_HDD.
3. The memory for GROUP CALLING is shared with SPEED CALLING - STATION or GROUP [S-21, 23].
4. A group for GROUP CALLING is identical to that of a SPEED CALLING - GROUP [S-23].
5. The number of groups per Module Group for GROUP CALLING and SPEED CALLING - STATION/ GROUP [S-21, 23] is limited to the following:

   GROUP CALLING Station Code: One digit (X) Maximum 100 Groups
   Two digits (XX)Maximum 10 Groups
6. The number of Stations that can be called per group can be set within the following limit:
   a.) Number of Groups × Number of Station Codes = Less than 1,000.
   b.) The number of Stations per group is assigned in multiples of 10.
7. For more information, refer to SPEED - CALLING GROUP [S-23].
8. A Station using GROUP CALLING must be allowed individual SPEED CALLING - STATION [S-21] and CALL WAITING - ORIGINATING [C-31] Service.
9. CALL WAITING - ORIGINATING [C-31] Service can be set when the Called Station is busy. CALL WAITING - ORIGINATING [C-31] will not be activated under the following conditions:
   a.) DO NOT DISTURB (DND) is set to the Called Station.
   b.) DATA LINE PRIVACY is set to the Called Station.
   c.) The Called Station is connected to the Attendant Console.
   d.) The Called Station is in a THREE-WAY CALLING [T-2] condition.
   e.) CALL BACK, CAMP-ON or CALL WAITING - ORIGINATING Service is set to the Called Station.

10. To initiate CALL WAITING - ORIGINATING with GROUP CALLING, a Dterm must:
    a.) Dial the CALL WAITING - ORIGINATING Access Code.
    b.) Dial the GROUP CALLING Access Code (maximum of three digits).
    c.) Dial the GROUP CALLING Station Code (one or two digits).
    d.) CALL WAITING - ORIGINATING Access Code is not needed if automatic is set.
11. This feature can be activated via FCCS.

Interactions

1. As an example of a GROUP CALLING application, the following conditions exist:
   System Station Numbering: 5XXXX and 6XXX
   Speed Calling Access: 3 (Assigned in ASPA)
   100 Groups of ten Stations
   GROUP CALLING Station Numbering consists of the following: 30-39
2. A Station in GROUP CALLING dials only two digits to reach other members of the group.
3. All normal STATION-TO-STATION CALLING [S-11] capabilities and restrictions apply, such as VOICE CALL [V-2], MESSAGE REMINDER [M-19], CALL BACK [C-1], etc.
4. GROUP CALLING applies to the My Line of the Dterm.

Programming

STEP 1: **ANPD** - Reserve a Number Level for Feature Access. Select Normal Service (N), Hooking Service (H) or Busy Service (B) from the combo box for Connection Indexes. (applicable to any feature assigned to this level). Assign NND in accordance with a predetermined Numbering Plan.

STEP 2: **ASPA** - Two Access Codes must be assigned for this feature. Assign a Tenant and an Access Code (ACC) for assigning Individual Speed Calling. For INDIVIDUAL SPEED CALLING - ENTRY, assign a Connection Index of "N: Normal". For SRV = "SSC: Service Code", assign SID 14. For INDIVIDUAL SPEED CALLING - ACCESS, assign a Tenant and an Access Code (ACC). Assign Connection Index of "N: Normal". For SRV = "SSC: Service Code", assign SID 21.

STEP 3: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 19 to the Stations allowed SPEED CALLING - STATION [S-21].

STEP 4: **AISA** - Program the Tenant, Station, type of Station, and the number of SPEED CALLING blocks to be assigned to the Source Station. One Station of each GROUP CALLING Group is assigned as the Source. The Source then assigns all the Stations and Virtual Numbers as Abbreviated Codes.

TN: Tenant Number
STN: Station Number
MST/SLV: Primary/Secondary
1: MST (Master Station)
2: SLV (Slave Station)
BLOCK: Number of Blocks
MST STN: When assigning the secondary Station, assign the Primary Station Number.

STEP 5: **AKYD** - Assign the virtual circuit to a Desktop terminal key. Assign KYI = 2, Multi Line key, and assign the Station Number of the virtual circuit. This key will be the GROUP CALLING key.

STEP 6: **AISD -** can also be used to assign INDIVIDUAL SPEED CALLING Data.

G-3 Ground Button Access

General Description

This feature designates the GROUND BUTTON provided on a Station Telephone as either the only means or an optional means of performing any available Hooking Services.

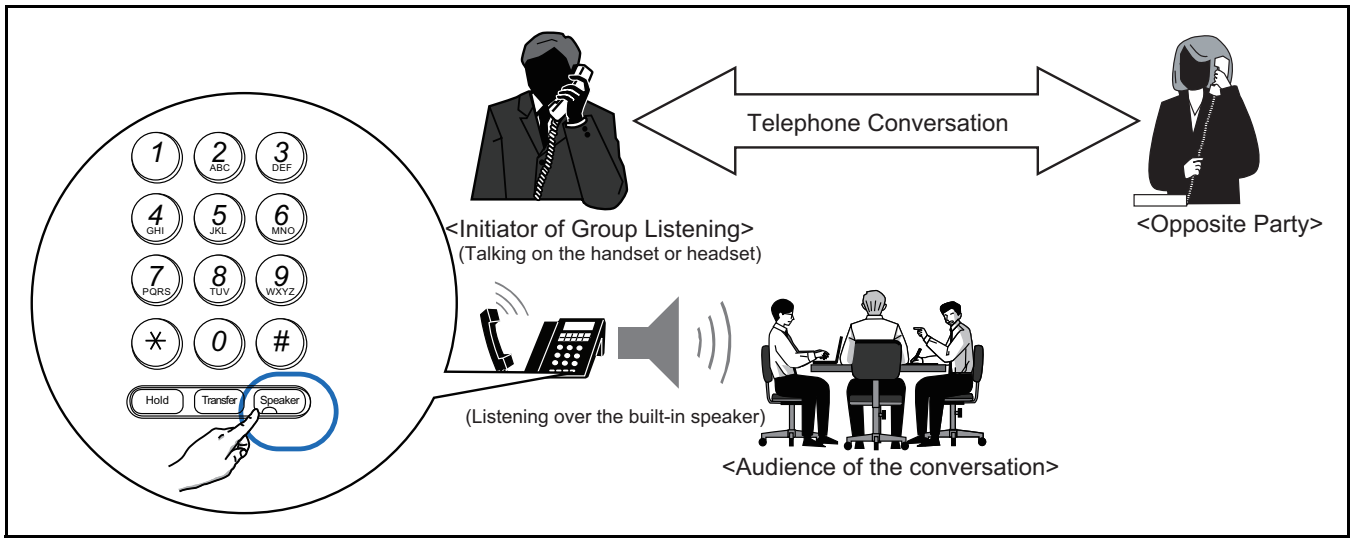
Note: This feature is only available in Australia.

Operating Procedure

No manual operation is required.

Service Conditions

1. Hooking can be performed by pressing the GROUND BUTTON when the status of the Station permits the Hooking Service.
2. System Data can be set to designate only the GROUND BUTTON or both the GROUND BUTTON and switch hook as effective means for performing hooking operations.
3. If only the GROUND BUTTON is designated as effective by System Data, any Hooking Service attempt by means of a switch hook flash will result in the release of the existing connection.
4. In the case of CAS Satellite Offices, both the GROUND BUTTON and SHF must be designated as effective for hooking operations.



Programming

ASYD - SYS1, Index 6, Bit 3 (Tone for O/G Connection): 0/1=NEC Standard/Australian (Second Dial Tone on LCR). Assign "1".
SYS1, Index 68, Bit 6 (Switch Hook Flash): 0/1= Available/Not Available. Assign "1" when the GROUND BUTTON is used for hooking operations. Assign "0" when the GROUND BUTTON and SHF are used.

G-29 Group Listening

General Description

Group Listening enables you to hear the opposite party through the built-in speaker on the Desktop terminal by pressing the SPEAKER key while you are talking on the handset or headset.
To activate the built-in speaker during a call, you can simply press the SPEAKER key without replacing the handset (on-hook), thus allowing the opposite party's voice to come from both the handset or headset and the built-in speaker simultaneously.
This feature is useful when you need to share a telephone conversation with others nearby without them being overheard by the opposite party.

The following Desktop terminals are supported for this feature:

- Digital terminals: Dterm Series *i* and DT400 Series/DT300 Series **Note 1**
- SIP Multiple Line terminals: DT800 Series/DT700 Series

In this section, descriptions and specifications apply to both Digital and SIP Multiple Line terminals unless otherwise noted.

Note 1: Cordless terminal (DT430/DT330 (12BT)) and the terminal where a Bluetooth adapter (BHA-LD UNIT) is installed are not supported for this feature.

Operating Procedure

To activate Group Listening

1. Press the SPEAKER key on the Desktop terminal while talking on the handset or headset.
2. The Group Listening mode is activated and the LED on the SPEAKER key is turned on. (You can hear the opposite party through both the handset/headset and the built-in speaker.)

To deactivate Group Listening by using SPEAKER key

1. Press the SPEAKER key on the Desktop terminal in the Group Listening mode (then, the LED on the SPEAKER key is on).
2. The Group Listening mode is deactivated and the LED on the SPEAKER key is turned off. (You can hear the opposite party only through the handset or headset.)

To deactivate Group Listening by replacing the handset (on-hook)

1. Replace the handset (on-hook) in the Group Listening mode (then, the LED on the SPEAKER key is on).
2. The Group Listening mode is deactivated (then, the LED on the SPEAKER key remains on).

Service Conditions

<Important Notices>

1. This feature only operates on a Station where a Service Feature Restriction Class allowing SFI=258 is assigned with the ASFC/ASFCN command.
2. If any change is made in the above data (SFI=258) while the system is in operation, perform one of the following:

   [For Digital terminals]

   - Desktop terminal initialization by the MBST command
   - ELC card initialization

   Note: Changes in the data setting of this feature will not be made effective by inserting and removing the cable.

   [For SIP Multiple Line terminals]

   - System initialization or SP-PHD initialization **Note 2**
   - Terminal re-registration

   Note 2: To initialize SP-PHD, do one of the following:
   - System initialization
   - Internal PHE module initialization with the ADPM command

<Interactions with Other Features>

1. Group Listening is deactivated by:

   (a) switching lines with Line/Feature key or ORG key

   (b) reconnecting to the same line with RECALL key, or

   (c) activating the following features related to Call Hold:

- Non-Exclusive Hold -D [N-7D]
- Exclusive Hold -D [E-4D]
- Call Park Group -D [C-176D]
- Automatic Hold [A-68]

2. In the Group Listening mode, turning on the microphone (MIC) of the Desktop terminal does not enable the Hands-free features. To initiate hands-free conversation in this mode, turn on the microphone (MIC), and replace the handset (on-hook.)
3. While Group Listening is active, receiver volume control is available on the built-in speaker but not on the handset. This may need prior volume tune up of the handset or temporary deactivation of Group Listening to make adjustment.
4. If the function key data (the AKYD command, FKY=52) is assigned to a Line/Feature key to act like the SPEAKER key, Group Listening can also be activated by the key.
5. While Group Listening is active, Call Waiting Tone or Override Tone can be heard from both the handset or headset and the built-in speaker of the Desktop terminal.
6. Group Listening is available while using the consultation hold or 3-way conference. The Group Listening mode is maintained after the call is switched back to the basic two-way connection from the consultation hold/3-way conference.
7. **[For Digital terminals]**
   The following is the availability of Group Listening when a Desktop terminal is connected to an analog telephone using the Analog Port Adaptor (APR):

   (a) B1-Channel mode

   - Group Listening is not activated by pressing the SPEAKER key during a telephone conversation with the handset of the analog telephone.
   - Group Listening is activated by pressing the SPEAKER key during a telephone conversation with the handset of the Desktop terminal.

   (b) B2-Channel mode

   - Group Listening cannot be used on the analog telephone.
   - Group Listening can be used on the Desktop terminal even when a conversation is in progress on the analog telephone.]

8. This feature is not available for Hotel System.
9. This feature is not available for ACD/OAI system.

<Hardware/Software>

1. This feature is available for the following terminals:

   - Dterm Series *i*
   - DT400 Series/DT300 Series
   - DT800 Series/DT700 Series

Note: Cordless terminal (DT430/DT330 (12BT)) and the terminal where a Bluetooth adapter (BHA-LD UNIT) is installed are not supported for this feature.

2. Headsets can also be used.
3. **[For Digital terminals]**
   Requirement for circuit card to use this feature is shown in the table below:

Devices	Firmware
CH-16ELCA	SP-4035 16ELCA PROG-A Issue 1 or later
PA-16ELCN-A **Note 3**	SP-4013 16ELCN PROG-A Issue 1 or later

Note 3: This feature only works when the Terminal Mode Setting of Switch 11 (SW11-5/6) on ELC circuit card is set to ON/ON (Standard Setting). For details on the switch settings of the circuit cards, see sections related to ELC cards in Chapter 3 of the Circuit Card Description.

<Interactions with Networks>

None

<Conditions Specific to This Feature>

1. Acoustically degraded conditions such as background noise and residual echo can adversely affect communication with Group Listening.
2. In the Group Listening mode, clarity of the voice through the built-in speaker can be reduced.

<Other Conditions>

None

Programming

STEP 1: **ASYDL** - Assign "1" (the memory block is used) to the corresponding bit.
SYS1, Index 513 (Local Data Memory (LDM) usage)
SYS1, Index 514 (Network Data Memory (NDM) usage)

STEP 2: **ASFC/ASFCN** - Assign the following data to the Service Feature Restriction Class (SFC) for each station.
D/N: D/N (Day/Night Mode)
TN: 1 - 63 (Tenant Number)
SFC: 0 - 15 (Service Feature Restriction Class)
SFI: 258 (Group Listening) **Note 4**
RES: 1 (Allowed)

Note 4: Assign the same settings to both Day and Night modes if ASYD, SYS1, Index 75, Bit 1=1.

H-1 Hotline

General Description

This feature permits a pair of Station sets to be associated with one another on an automatic ringdown basis.

Operating Procedure

a.) Station A lifts the handset.
b.) Station B is rung.
c.) Station B lifts the handset. The conversation proceeds.

Service Conditions

1. If both phones in a Hotline Pair are equipped with dials, either one may transfer a Hotline Call to another Station.
2. Only one call destination is available per Hotline station.
3. There is no limit to the number of Hotline Stations.
4. Hotline assignments are programmed into System Data via the PCPro.
5. The Hotline Station will hear Reorder Tone when the Called Station is in busy, lockout or make busy condition.
6. When the Station called from the Hotline has activated CALL FORWARDING - BUSY LINE [C-2], the call will be forwarded when the Called Station is busy.
7. When the Station called from the Hotline has activated CALL FORWARDING - ALL CALLS [C-5], the call will be forwarded.
8. When the Station called from the Hotline has activated CALL FORWARDING - DON'T ANSWER [C-3], the call will be forwarded when the Called Station doesn't answer after a predetermined time interval.
9. STATION HUNTING [S -7, 8, 9] and UCD [U-1] will be activated for a call from the Hotline, but the Incoming Hotline Call cannot be placed in the UCD [U-1] Queue.
10. Calling party hears Reorder Tone (ROT) in the following cases.
    a.) When the Called Station has set CALL FORWARDING - ALL CALLS - OUTSIDE [C-28]
    b.) When the Called Station has set CALL FORWARDING - BUSY LINE - OUTSIDE [C-60] and line is busy
    c.) When the Called Station has set LOGGED OUT IP STATION-CALL DESTINATION [L-53] (for Trunk) and in logout status
11. An ISDN Terminal cannot be assigned as a destination.
12. Only the Station assigned Telephone Number is available for activating this feature via FCCS.
13. The Station, the Attendant Console/Desk Console (Operator Call), and the Trunk can be a destination for Hotline.
14. When Call Forwarding - All Calls/Busy Line/Don't Answer Service has been set to the Called Station, these features are available for the call to the Station.
15. When a Calling Party encounters a Busy Station, the call may bridge into the connection depending on the data assigned by ASYD.

Interactions

1. The connecting Station does not have to be a HOTLINE Station. If the connecting Station is busy, the HOTLINE Station will hear Reorder Tone.
2. CONSULTATION HOLD [C-17]: The HOTLINE Station may put the Destination Station on CONSULTATION HOLD [C-17]. In this state, the HOTLINE Station may make an Outgoing Call, and is therefore affected by CLASS OF SERVICE - INDIVIDUAL [C-15].
3. CALL WAITING - ORIGINATING [C-31]: A HOTLINE will not be allowed to camp-on to a busy Destination Station.
4. If the connecting Station is also a HOTLINE Station, then the reverse connection must also be programmed.

Programming

STEP 1: **ASDT** - Assign the Station as a TEC = 14 for HOTLINE.

STEP 2: **AHLS** - Assign the Station Number programmed above for the following parameters:

HOT TN: HOTLINE Tenant Number
HOT STN: HOTLINE Station Number
CON TN: Destination Tenant Number
CON STN: Destination Station Number

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

AHLSN - This data must be assigned to the NCN.

HOT UGN: HOTLINE User Group Number
HOT TELN: HOTLINE Telephone Number of the Calling Party
TYPE: 1 (The Called Party is a Station)
CON UGN: User Group Number of the Called Party
CON TELN: Telephone Number of the Called Party

Note: The following data should also be set in addition to the above-mentioned commands. ASDT must be set to the Node accommodating the Calling Party.

H-2 House Phone

General Description

This feature allows selected Stations to reach the Attendant Console by going off-hook.

Operating Procedure

To reach the Attendant Console

1. The HOUSE PHONE user lifts the handset. The Attendant is called automatically.
2. The Attendant answers.
3. The Attendant connects the user to the desired Station or Trunk.

Service Conditions

1. Attendant Console indications will appear as follows:
   a.) ATND Lamps flash.
   b.) Console buzzer sounds.
2. HOUSE PHONES may be equipped with or without dials.
3. HOUSE PHONE assignments are programmed into System Data via the PCPro.
4. There is no limit to the number of HOUSE PHONES permitted in the system.

Interactions

1. AHLS is not needed. When a Station is programmed as TEC: 14, HOTLINE, it will automatically be connected to the Attendant Console.
2. If the HOUSE PHONE is to be used for Outgoing Calls via the Attendant Console (ARSC command RRI 2), assign a Route Restriction Class that will allow these connections. The same consideration should be made for Incoming Calls via the Attendant Console (RRI 0).

Programming

ASDT - Assign the Station as a TEC = 14 for HOTLINE.

H-4D Hands-free Answer Back -D

General Description

This feature allows the user to respond to a VOICE CALL [V-2] without lifting the handset.

Operating Procedure

To answer an Incoming Call

1. Lift the handset and press a Line key to answer the call.
2. Press the FEATURE key and “1”. The MIC LED lights.
3. Press the FEATURE key and “5” to select HANDS-FREE operation.

   Note: This step is not necessary for SIP Multiple Line terminals.

4. Press the SPEAKER key and replace the handset. Respond to the call HANDS-FREE.

To answer a VOICE CALL

1. Press the FEATURE key and “1”. The MIC LED lights.
2. Press the FEATURE key and “5” to select HANDS-FREE operation.
3. Respond to the call HANDS-FREE.

Service Conditions

1. The MIC may be left ON at all times.
2. HANDS-FREE operation may be selected at all times.
3. HANDS-FREE ANSWER BACK may be used when responding to a VOICE CALL [V-2] on My Line.

Programming

No programming is required. See VOICE CALL [V-2].

H-5D Hands-free Dialing/Monitoring -D

General Description

This feature allows the Dterm user to dial or monitor and call without lifting the handset.

Operating Procedure

To dial a call HANDS-FREE

1. Press the SPEAKER key. Receive Dial Tone.
   a.) Dial the desired number.
   b.) When the Called Party answers, lift the handset.

To monitor a call HANDS-FREE

1. When placed on hold, press the SPEAKER key.
2. Replace the handset. When the call resumes, pick up the handset.

Service Conditions

None.

Programming

No programming is required.

H-9 Hotline - Outside

General Description

This feature allows a user to access an outside destination by going off-hook or selecting the HOTLINE - OUTSIDE [H-1] Feature key and automatically dialing a SPEED CALLING - SYSTEM [S-3] Number.

Operating Procedure

To place a HOTLINE - OUTSIDE Call using a Single Line Telephone

1. User lifts the handset.
2. The System automatically selects a Trunk and dials the Outside Number.
3. The Called Number is answered and conversation proceeds.

To place a HOTLINE - OUTSIDE Call from a Dterm

1. The Dterm user presses the HOTLINE - OUTSIDE Feature key and lifts handset or presses the SPEAKER key.
2. The System automatically selects a Trunk and dials the Outside Number.
3. The Called Number is answered and the conversation proceeds.

Service Conditions

1. There is no limit to the number of HOTLINE Stations.
2. The Destination Parties for this service use Abbreviated Call Codes prepared in SPEED CALLING - SYSTEM [S-3]. Therefore, the number of Destination Stations is limited by the capacity of SPEED CALLING - SYSTEM [S-3].
3. When a user is confronted with a situation whereby all Trunks are busy, or all Senders are busy at the same time calling in this service, Reorder Tone is heard at the HOTLINE Stations.
4. Outside connection in BROKERAGE HOTLINE - OUTSIDE [B-12] Service can be used when the LCD indicates:
   a.) Trunk Classification such as DDD, TIE, and CCSA and Trunk Number for an Outgoing Call.
   b.) Time duration, Trunk Classification, and Trunk Number for an Incoming Call.
5. When a user of BROKERAGE - HOTLINE - OUTSIDE [B-12] is confronted with a situation in which all Trunks are busy or all Senders are busy, the user hears Reorder Tone. No indication is shown on the LCD of the user's Dterm.
6. STATION MESSAGE DETAIL RECORDING (SMDR) [S-10] is available for Outgoing Calls with the HOTLINE - OUTSIDE Service.
7. OUTGOING TRUNK QUEUING [O-2] is not provided for a HOTLINE - OUTSIDE Call.
8. The Prime Line of a Dterm cannot be assigned as a HOTLINE - OUTSIDE.
9. When a Dterm activates HOTLINE - OUTSIDE, the display will be for an Outgoing Trunk Connection.
10. This feature can be activated via FCCS.
11. Only the Station assigned Telephone Number is available for the Station assignment when activating this feature via FCCS.
12. The Station, the Attendant Console/Desk Console (Operator Call), and the Trunk can be a destination for Hotline.

Interactions

SPEED CALLING - SYSTEM [S-3] must first be provided.

Programming

STEP 1: **ASYD** - SYS2, Index 1, Bit 7. Does TOLL RESTRICTION apply to SPEED CALLING - SYSTEM [S-3]? 0/1: Yes/No. If TOLL RESTRICTION applies, construct an RSC that will allow the Station access to the Outgoing Number.

STEP 2: **ASFC** - Construct a Service Feature Restriction Class that allows SFI 12 (Speed Calling - System). Assign this SFC to the Hotline Station.

If using a Virtual Circuit (TEC = 18) for the Hotline, SFI 36 (Special Common Battery/Hotline) must be set to "1" for the Virtual Circuit's SFC.

STEP 3: **ASDT** - Assign the HOTLINE - OUTSIDE Station as a TEC = 18, Virtual Circuit or TEC = 14, Hotline.

TN: Tenant Number
STN: Station Number
LENS: Line Equipment Numbers (six digits)
TEC: Telephone Class (1-31)

- 1: DP (10 PPS)
- 2: PB
- 3: DP/PB
- 12: Dterm
- 13: Data Terminal via Dterm
- → 14: HOTLINE
- 15: CAS Line
- 18: Virtual Circuit
- 23: ISDN Terminal
- 27: Eight Conference Equipment

RSC: Route Restriction Class (0-15)

For assignment of RSC, ARSC.

SFC: Service Feature Restriction Class (0-15)

For assignment of SFC, ASFC.

STEP 4: **ASPD** - Enter Tenant Number (TN), Abbreviated Digit Code (ADC), and the Called Number (CD) to be sent. Include in the CD the Access Code of the Route.

STEP 5: **AHLS** - Assign the HOTLINE - OUTSIDE Station with the following parameters:

HOT TN: HOTLINE - OUTSIDE Tenant Number
HOT STN: HOTLINE - OUTSIDE Station Number
TYPE: 2 (Calling Party is an Outside Party using Abbreviated Digit Code (ADC))
CON TN: Connecting Stations Tenant. Assign same TN Number as in HOT TN:
CON ADC: Speed Calling Code of corresponding Outside Number.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

STEP 1: **AHLSN** - This data must be assigned to the NCN. Assign the HOTLINE - OUTSIDE Station with the following parameters:

HOT UGN: HOTLINE User Group Number of the Calling Party
HOT TELN: HOTLINE Telephone Number of the Calling Party
TYPE: 2 (Calling Party is an Outside Party using Abbreviated Digit Code (ADC))
3 (Called Party is a Trunk)
CON UGN: User Group Number of the Called Party (for TYPE = 2)
CON ADC: The Dialed Number for the Called Party (for TYPE = 2)
CON LRN: Logical Route Number of the Called Party (for TYPE = 3)
CON TK: Trunk Number of the Called Party (for TYPE = 3)

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

Note: The following data should also be set in addition to the above-mentioned commands. The commands to be set to the Node accommodating the Calling Party: ASYD/ ASFC/ASDT/ASPD

I-1 Immediate Ringing

General Description

This feature causes Called Stations to ring immediately upon establishment of connections.

Operating Procedure

No manual operation is required.

Service Conditions

1. Ringing is applied to a Called Station as soon as the switch has determined that the Station is idle. There is no delay caused by waiting for a ring cycle.
2. This feature applies to STATION-TO-STATION [S-11], Attendant (originated or completed), Direct Inward Dialing (DID), and TIE Line Calls.
3. An idle Station rings immediately after the last digit of the Called Station is dialed.

Programming

ASYD - SYS1, Index 27, Bit 7. Assign data “1”.

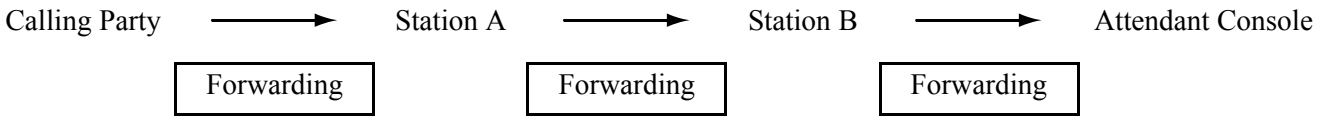
I-2 Incoming Call Identification

General Description

This feature allows an ATTENDANT CONSOLE [A-3] to visually identify the type of service and/or Trunk Group that is arriving or waiting to be answered.

Operating Procedure

No manual operation is required.



Service Conditions

1. A flashing lamp indicates a Call Waiting to be answered.
2. A steady lamp indicates an answered call.
3. A limit of 12 lamp and key groups can be associated with INCOMING CALL IDENTIFICATION.
4. Lamps and keys may be assigned as follows:

LDN:	Listed Directory Number (Central Office)
WATS:	Wide Area Telephone Service
FX:	Foreign Exchange
ATND:	Attendant Call
RECALL:	Attendant Recall Calls
ICPT:	Call Forwarding - Intercept
NANS:	Call Forwarding - Don’t Answer
BUSY:	Call Forwarding - Busy Line
TIE:	TIE Line
TF:	Inter-Position Transfer
CAS:	Centralized Attendant Access
PR1:	Priority Call 1
PR2:	Priority Call 2
PR3:	Priority Call 3
SC/RC:	Serial Call Recall key
EMG:	Off-Hook Alarm

5. More than one INCOMING CALL IDENTIFICATION Lamp can be duplicated at the ATTENDANT CONSOLE [A-3]. The Attendant can select any Incoming Call by pressing the associated key.
6. Calls can be answered via the ANSWER key for first-in, first-out priority. (CALL QUEUING [C-9]).
7. ATTENDANT CONSOLEs [A-3] are limited to 12 unique INCOMING CALL IDENTIFICATION indications. However, more than one Incoming Trunk Group can be programmed for the same INCOMING CALL IDENTIFICATION.

8. When a call is terminated to the Attendant Console in consequence of Multi-hops for Call Forwarding - All Calls/Busy Line/Don't Answer, the lamp indication on the Attendant Console will be as follows:

		STATION A		
		CALL FORWARDING - ALL CALLS	CALL FORWARDING - BUSY LINE	CALL FORWARDING - DON'T ANSWER
STATION B	Call Forwarding - All Calls	Note 1	Note 1	NANS
	Call Forwarding - Busy Line	BUSY	BUSY	NANS
	Call Forwarding - Don't Answer	Note 1	BUSY	NANS

Note 1: The lamp indication varies depending on the Calling Party.

Interactions

1. Step 1 is not required to fulfill the requirements of the feature description. However, the CALL WAITING LAMP [C-13] should be programmed in relationship to the INCOMING CALL IDENTIFICATION.
2. SYS2, Index 8, Bit 6 and Bit 7, and Index 9, Bit 0 to Bit 3 can be flagged to represent an Incoming Call, but the meaning of the Incoming Call can be reassigned via AAKP.
3. The first six keys (LDN to CCSA) are fixed and cannot be changed. AAKP is used to program the remaining six optional keys.

Programming

STEP 1: **ASYD** - SYS2, Index 8 and Index 9, flag the type of Incoming Calls the Attendant Console should expect. **Note 2**

Index 8
Bit 0: Listed Directory Number
Bit 1: Incoming Station Call
Bit 2: Attendant Recall
Bit 3: FX
Bit 4: WATS
Bit 5: CCSA (DID)
Bit 6: TIE Line
Bit 7: Call Forwarding - Busy Line

Index 9
Bit 0: Call Forwarding - Don't Answer
Bit 1: Call Forwarding - Intercept

Bit 2: Special Common Battery Station
Bit 3: Interposition Transfer

Note 2: SYS2, Index 8, Bit 6 and Bit 7, and SYS2, Index 9, Bit 0 to Bit 3 can be assigned different meanings via AAKP.

STEP 2: **ARTD** - Flag the type of Route in CDN 6:TCL, Trunk Class.

0: Not used
1: DDD Line (LDN)
2: FX Line (FX)
3: WATS Line (WATS)
4: TIE Line (TIE)
5: CCSA Line (CCSA)
6: Toll Line
7: CAS Line
8: Paging
9: Not used
10: Not used
11: General Page
12: Radio Page

Note: To change the data for existing route (RT), initialize the circuit card.

STEP 3: **AAKP** - This command may be used to change the meaning of the top six keys of the Call Identification keys of the Attendant Console. (See SYS2, Index 8 and Index 9.)

The following functions may be assigned to Key Numbers (KYN) 1-6.

Function:

a: CAS
b: Off-Hook Alarm
c: Priority Call 1
d: Priority Call 2
e: Priority Call 3

I-3 Incoming Central Office Call to TIE-Line Connection

General Description

This feature permits an Attendant to connect an Incoming Public Network Exchange Call, via a TIE Line, to a Station at a distant office.

Operating Procedure

To connect an Incoming Call

1. The Attendant presses the LDN key and answers the Incoming Trunk Call.
2. Dial the TIE Line Access Code. Receive Dial Tone from distant office.
3. Dial the distant office Station Number.
4. Press the RELEASE key.
5. The TIE Line and Central Office Call are connected.

Service Conditions

1. The Attendant can connect a Trunk and TIE Line Call either before or after the distant Station answers.
2. There is no limitation on the number of Incoming Trunks that may be connected to TIE Lines using this feature.
3. TRUNK-TO-TRUNK CONNECTION [T-10] may significantly degrade transmission quality.
4. TRUNK-TO-TRUNK CONNECTION [T-10] can be restricted through alternative Route Restriction Assignments.
5. AUTOMATIC RECALL [A-8] is denied on Incoming Central Office Call to TIE Line Connection.
6. Since AUTOMATIC RECALL [A-8] cannot be initiated by a Trunk, the ATTENDANT LOCKOUT [A-5] feature is automatically disabled in order to allow the Attendant to reenter TRUNK-TO-TRUNK CONNECTION [T-10] Calls held on the ATTENDANT CONSOLE [A-3].
7. This feature is applicable to the following types of Incoming Central Office Calls:
    - FX
    - WATS
    - CCSA
    - DID (Direct Inward Dialing)
    - COT (Ringdown/Loop Start)
8. Loop Start Central Office Trunks can be connected to TIE Trunks since Release Supervision is provided by the TIE Trunks.
9. When Release Signal is not provided by TIE Line Trunk, the Attendant must monitor the connection and manually disconnect after use.

Interactions

1. The Attendant Console must first be programmed.
2. For TIE Line Route to Central Office Route Connection, the reverse must be programmed. However, program for ARI-D-RES:, Direct Connection. This connection may also be Toll Restricted by using ATDP.

3. A Station can transfer a call to a Station or to the Attendant Console at a distant office via a TIE Line Connection. This Station must be assigned a correct Class of service.
4. Stations must be allowed access to the Routes they will need via the appropriate Connection Status, either via the Attendant Console (RRI 2) or Direct Connection (RRI 3).
5. Various combinations of TRUNK-TO-TRUNK [T-10] Connections can be restricted by Alternate Route Restriction (ARRC).

Programming

STEP 1: **ARTD** - Assign the Central Office Route as shown below:

GROUND START:

RT: 1

1-OSGS	:2	2-ONSG	:3	3-ISGS	:1	4-INSG	:3	5-TF	:3
6-TCL	:1	7-L/T	:1	8-RLP	:2	15-LSG	:1		

LOOP START:

RT: 1

1-OSGS	:2	2-ONSG	:3	3-ISGS	:1	4-INSG	:3	5-TF	:3
6-TCL	:1	7-L/T	:1	8-RLP	:2				

Assign the TIE Line Route as shown below:

2 OR 4 WIRE E & M:

RT: 1

1-OSGS	:2	2-ONSG	:3	3-ISGS	:2	4-INSG	:3	5-TF	:3
6-TCL	:4	7-L/T	:1	8-RLP	:2	15-LSG	:5		

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or MG.

STEP 2: **ATRK** - Assign the LENS, Central Office Route Number, Trunk Number, and Tenant Number.

Assign the LENS, TIE Line Route Number, Trunk Number, and Tenant Number.

STEP 3: **MBTK** - Assign the Make Idle status to the Trunks.

For TIE Line:

STEP 4: **ANPD** - Reserve a Number Level for Trunk Access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. Number of Necessary Digits is usually one or two. Busy Lamp Field is not activated.

STEP 5: **ASPA** - Assign the Access Code as assigned in ANPD above. Type of Service, SRV = "OGC: Outgoing Call" for Outgoing Trunk. Assign the Route Number associated with this Access Code.

STEP 6: **ARSC** - For the Incoming Central Office Route, allow for RRI: 0, Incoming Call via the Attendant Console (with Call Transfer). This Route Restriction Class (RSC) is to be assigned for the Attendant Console in ATRK. (RSC 0).

For Outgoing TIE Line Route and for RSC 0, allow for RRI: 2 Outgoing Call via the ATTCON (with Call Transfer). RSC 0 is to be assigned to the ATTCON in ATRK.

STEP 7: **ARRC** - Assign 1 to the parameter ARI-D-RES for allowing Tandem Connection with an Operator assistance. Allow the Incoming Route Number (ICRT) of the Incoming Central Office Route to be connected to the Outgoing Route Number (OGRT) of the Outgoing TIE Line Route.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

STEP 1: **ALRTN** - Assign this command to connect the Logical Route to the Physical Route.

STEP 2: **ARTDN** - Assign the Central Office Route as shown below:

GROUND START:

LGRT: 1

1-OSGS	:2	2-ONSG	:3	3-ISGS	:1	4-INSG	:3	5-TF	:3
6-TCL	:1	7-L/T	:1	8-RLP	:2	15-LSG	:1		

LOOP START:

LGRT: 1

1-OSGS	:2	2-ONSG	:3	3-ISGS	:1	4-INSG	:3	5-TF	:3
6-TCL	:1	7-L/T	:1	8-RLP	:2				

Assign the TIE Line Route as shown below:

2 OR 4 WIRE E & M:

LGRT: 1

1-OSGS	:2	2-ONSG	:3	3-ISGS	:2	4-INSG	:3	5-TF	:3
6-TCL	:4	7-L/T	:1	8-RLP	:2	15-LSG	:5		

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as a circuit card or MG.

STEP 3: **ANPDL** - Reserve a Number Level for Trunk Access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. Number of Necessary Digits is usually one or two. Busy Lamp Field is not activated.

STEP 4: **ASPAL** - Assign the Access Code as assigned in ANPD above. Type of Service, SRV = "OGC: Outgoing Call" for Outgoing Trunk. Assign the Logical Route Number associated with this Access Code.

STEP 5: **ARSCN** - For the Incoming Central Office Route, allow for RRI: 0, Incoming Call via the Attendant Console (with Call Transfer). This Route Restriction Class (RSC) is to be assigned for the Attendant Console in ATRK. (RSC 0).

For Outgoing TIE Line route and for RSC 0, allow for RRI: 2 Outgoing Call via the ATTCON (with Call Transfer). RSC 0 is to be assigned to the ATTCON in ATRK.

STEP 6: **ARRCN** - Assign 1 to the parameter ARI-D-RES for allowing Tandem Connection with an Operator assistance. Allow the Incoming Route Number (ICRT) of the Incoming Central Office Route to be connected to the Outgoing Route Number (OGRT) of the Outgoing TIE Line Route.

I-4 Individual Trunk Access

General Description

Individual Trunk Access allows Station/Attendant Console users to seize specific Trunk by dialing. By using the feature, the user can perform the Connection Tests. For details, refer to table below:

KIND OF TEST	ORIGINATING TERMINAL (Allowed: × Not allowed: —)			
	STATION	PS TERMINAL	ATT CON	ISDN TERMINAL
Resister Test	Allowed	Not Allowed	Not Allowed	Not Allowed
Sender Test	Allowed	Not Allowed	Not Allowed	Not Allowed
Three-party Conference Trunk Test	Allowed	Not Allowed	Not Allowed	Not Allowed
Tone Test	Allowed	Not Allowed	Not Allowed	Not Allowed
Interrupted Ringing (IR) Test	Allowed	Not Allowed	Not Allowed	Not Allowed
External Trunk (Central Office/TIE/MFC/ CCIS) Test	Allowed **Note 1**	Not Allowed	Allowed **Note 1**	Not Allowed

Note 1: A Specific ISDN Trunk can be seized from the Station and Attendant Console.

Individual Trunk Access (PCPro)

By using TOGC, the user can perform the tests even involving the Tandem Connection. For more details refer to the Operations and Maintenance Manual.

Operating Procedure

Operating Procedure for Individual Access from Attendant Console

By using a feature key (TKSL)

1. Press the TKSL key.
2. Dial the route number + trunk number (for example, 002+005), or dial the C.O line number (for example, 3001).
3. Dial the called party number and receive Ring Back Tone (RBT).
4. Press the CANCEL key after the call is finished.

By using the access code

1. Press a Loop key.
2. Dial the access code.
3. Dial the route number + trunk number (for example, 002+005), or dial the C.O line number (for example, 3001).
4. Dial the called party number and receive Ring Back Tone (RBT).
5. Press CANCEL key after the call is finished.

Operating Procedure for Individual Access from Station

By using the access code

1. Pick up the handset (or perform an equivalent operation for the specific type of station you are using such as pressing the Speaker button, etc.)
2. Dial the access code.
3. Dial the route number + trunk number (for example, 002+005), or dial the C.O line number (for example, 3001).
4. Dial the called party number and receive Ring Back Tone (RBT).
5. Press CANCEL key after the call is finished.

Service Conditions

1. A designated connection to a Trunk is limited to CCIS, TIE, Central Office, MFC and ISDN Line of either second DT System or Sender System. Connection Tests are not available for a Q-SIG Line.
2. This feature is provided when combination of Telephone Equipment Class (TEC) for Outgoing Terminal and ONSG (assigned by ARTD) for Outgoing Trunk is suitable. Details on the combinations are as follows:

OUTGOING TRUNK SIDE / OUTGOING TERMINAL SIDE	CENTRAL OFFICE/TIE			MFC	CCIS/ISDN
	PB (ONSG = 2, 8)	DP (ONSG = 1, 5, 7, 9)	DP/PB (ONSG = 3)	MFC (ONSG = 10)	PB (ONSG = 2)
PB (TEC = 2, 12)	Provided	Not Provided	Provided	Provided	Provided
DP (TEC = 1, 4)	Not Provided	Provided	Provided	Provided	Provided
DP/PB (TEC = 3)	Not Provided	Not Provided	Provided	Provided	Provided

3. In this feature, confirmation of an Answer Back Signal from other Office is not performed.
4. A digital display will appear on the ATTENDANT CONSOLE [A-3], which will consist of either:
   a.) TENANT SERVICE [T-12] Number, Route Number, and Trunk Number.
   b.) Central Office Code Number. This data is programmed on a per Route basis.
5. If the Trunk is busy, the Attendant will receive a Busy Tone.
6. The Attendant can use ATTENDANT OVERRIDE [A-7], if it is included in System Programming, to gain entry into a particular Trunk when it is in use.
7. If the Trunk is made busy, either by hardware or software control, the Attendant can still access that Trunk.
8. Central Office Code (COC) is not available to access an individual Trunk through FCCS.
9. This feature is not available for the following connections:
   - CCIS over IP (Point-to-Multipoint) connections by IPTRK card
   - CCIS over IP connections by PHC
10. This feature is not applicable to the billing.

11. Trunk Access to IPPAD is available. The conditions are below:
    - Both of Single Line Telephone/Digital terminals, and IP Station can access to Station/Trunk.
    - Access to IPPAD is available in released and soft make-busy status.
    - For IPPAD channel assigned while executing TOGC command, MB should not be canceled by MBCT command.
    - The combination with other Trunk Access features (CCIS, TIE, Central Office, MFC and ISDN Line) are not available.
    - Echo Canceler training is also valid toward IPPAD which is executed Trunk Access.
    - Trunk Access to IPPAD has priority over the function for IP terminals to seize the IPPAD within the same network preferentially (ASYDL, SYS1, Index 810, Bit 4).

Interactions

If the Trunk is busy, ATTENDANT OVERRIDE [A-7] may be used. THREE-WAY CALLING [T-2] is established following a Warning Tone. If the Station should disconnect, the Attendant Console can either disconnect or extend the Trunk to another Station via the keypad by pressing the START key and entering the desired Telephone Number.

Programming

Data assignment for individual access from Station

STEP 1: **ANPD** -Assign first digit of an Access Code for Individual Trunk Access and Number of Digit Number of the Access Code.

TN:	Tenant Number
1stDC:	1st Digit Code (0-9,*, #)
CI:	Select Normal Service (N) from the combo box for Connection Indexes.
NND:	Number of Necessary Digits

STEP 2: **ASPA** -Assign the Access Code for Individual Trunk Access

ACC:	Access Code
CI:	Connection Status Index = “N: Normal”
SRV:	Kind of Service = “SSC: Service Code”
SID:	Service Index = 17 (Individual Trunk Access)

STEP 3: **ARNP** -Assign the reverse number to the Route when Answer Back Signal method is Second Dial Tone (mark-out).

RT:	Route Number
ACC:	Access Code

STEP 4: **ASFC** -Allow the Service Feature Restriction Class for Individual Trunk Access.

SFC:	Service Feature Restriction Class (1-15)
SFI:	39 (Individual Trunk Access) = 1 (Allowed)

Data assignment for individual access from Attendant Console

STEP 1: **ASYD** -SYS1, Index 68

Index 68, Bit 1=Designate the method that the Attendant Console must use to operate Individual Trunk Access.
0/1 = External Route and Trunk Number/Central Office Code (assigned by ACOC)

Index 68, Bit 4=Is Trunk Select key in service? 0/1 = No/Yes Assign "1".

STEP 2: **ANPD** -Assign first digit of an Access Code for Individual Trunk Access and Number of Digit Number of the Access Code.

TN:	Tenant Number
1stDC:	1st Digit Code (0-9,*, #)
CI:	Select Normal Service (N) from the combo box for Connection Indexes.
NND:	Number of Necessary Digits

STEP 3: **ASPA** -Assign the Access Code for Individual Trunk Access

ACC:	Access Code
CI:	Connection Status Index = "N: Normal"
SRV:	Kind of Service = "SSC: Service Code"
SID:	Service Index = 17 (Individual Trunk Access)

STEP 4: **ARTD** -When the Central Office Code is used, assign CDN 25 = 1.

Note: To change the data for existing route (RT), initialize the circuit card.

STEP 5: **ACOC** -When the Central Office Code is used, Trunks in the system must be programmed to have an associated Central Office Code. This code is dialed after pressing the Attendant Console's Trunk Select key.

Note: Central Office Code does not apply to Stations. Stations permitted this feature must dial an Access Code, the Trunk Route Number and the Trunk Number.

I-5 Inter Position Transfer

General Description

This feature allows Attendants to transfer calls at their ATTENDANT CONSOLE [A-3] to another Attendant's Console in systems where MULTIPLE CONSOLE OPERATION [M-4] has been provided.

Operating Procedure

To transfer a call from Attendant Console A to Attendant Console B

1. Press the START key.
2. Attendant A dials Attendant Console B Identification Number, or "0" for all Attendants.
3. The call is indicated at Attendant Console B or all Attendant Consoles.
4. Attendant B presses the ANSWER key or TF ICI key.
5. Attendant A presses the RELEASE key to transfer, or may consult first, then release.

Service Conditions

1. A designated Identification Number is assigned to each ATTENDANT CONSOLE [A-3] for the purpose of INDIVIDUAL ATTENDANT ACCESS [I-6].
2. This feature can be provided on a TENANT SERVICE [T-12] basis.
3. An Attendant can receive one INTER-POSITION TRANSFER Call at a time. An INCOMING CALL IDENTIFICATION (TF ICI) [I-2] key can be designated for receipt of these calls.
4. An Attendant cannot transfer a Conference Connection to another Attendant.
5. An Attendant can extend an Inter Position Transferred Call to any other destination.
6. NIGHT CONNECTION - FIXED/FLEXIBLE [N-1, 2]: When Night Service is active, an Attendant Position Call to another Attendant cannot be answered by the Night Service arrangements. The Calling Attendant hears Reorder Tone.
7. When the Operator Call Code is dialed, the call is routed to the predetermined Attendant Console designated in System Data for the FCCS Network.
8. When assigning Function Code (FUNC) to KYN 1 of an Attendant Console by AAKP, this feature cannot be used.

Interactions

The ASAT Number may not be programmed in place of a Telephone Number in ASID and ASGD. See OFF-HOOK ALARM [O-6], ATTENDANT NIGHT TRANSFER [A-19], and PRIORITY CALL [P-9].

Programming

STEP 1: **ASYD** - SYS2, Index 6, Bit 5. Enable INTER-POSITION TRANSFER? 0/1: No/Yes. Assign data 1. Assigned on a per Tenant basis.

SYS2, Index 9, Bit 3. Is INTERPOSITION TRANSFER considered an Incoming Call to the Attendant Console and to be counted as a Call Waiting? 0/1: No/Yes. See CALL WAITING LAMP [C-13]. Assigned on a per Tenant basis.

STEP 2: **ASAT** - Assign a specific Attendant Number to each Attendant Console.

STEP 3: **ATNR** - Allow Station-to-Station Connection on an Intra and Inter-Tenant basis.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

Note: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

ASPAL - This data must be set to the Node calling Attendant, Assign SRV = “SSC: Service Code”, SID = 2 (Operator Call), and FPC of the Node that Operator Calls are to be terminated to.

I-6 Individual Attendant Access

General Description

This feature permits a user to call a particular ATTENDANT CONSOLE [A-3] via an Individual Attendant Identification Number.

Operating Procedure

1. The user dials the Individual Attendant Identification Number.
2. The directed Attendant gets INCOMING CALL IDENTIFICATION (ICI) [I-2] indication ("ATND") and can answer using the normal operating procedure.

Service Conditions

1. Attendant Identification Numbers (maximum of five digits) must be programmed and published for each Attendant Console.
2. The ASAT Number should be the same number of digits as any other Station Number. ASAT assigns a Station Number to each Attendant Console.
3. ATTENDANT NIGHT TRANSFER [A-19] feature cannot be activated for calls in this feature.
4. The Individual Attendant Identification Number cannot be used to assign the destination of Call Forwarding Service.
5. Only a Telephone Number can be assigned as the Individual Attendant Identification Number when this feature is activated via FCCS.

Programming

STEP 1: **ASAT** - Assign a Station Number to each Attendant Console. The Attendant Console Number is the Trunk Number assigned in ATRK, Route 901.

STEP 2: **ATNR** - Allow Tenant Stations either access or denial to the Tenant in which the Attendant Console is located.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

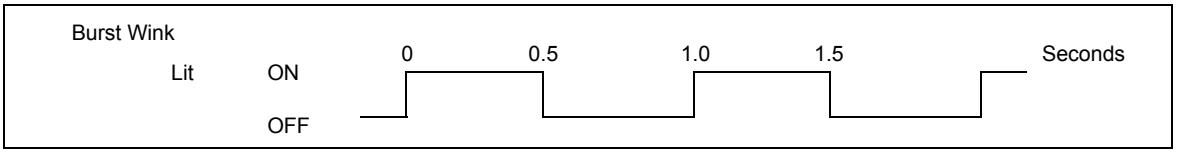
STEP 1: **ALGNN** - This command must be assigned to the NCN. Assign the User Group Number and Telephone Number for the Individual Attendant Identification Number.

STEP 2: **ASATN** - This command must be assigned to the NCN. Assign User Group Number (UGN), Telephone Number assigned by ALGNN for specifying the Attendant Console (ACC), Fusion Point Code accommodating the designated Attendant Console, Tenant Number to which the Attendant Console belongs (TN), and the Trunk Number assigned by ATRK for the Attendant Console (ATN).

Note: Assign the ATNR command data to both the Nodes accommodating the Station and the Attendant Console.

I-7D I-Hold Indication -D

General Description



This feature provides the Desktop terminal with a distinctive flash to differentiate between a call the user placed on hold from other calls.

Operating Procedure

No manual operation is required.

Service Conditions

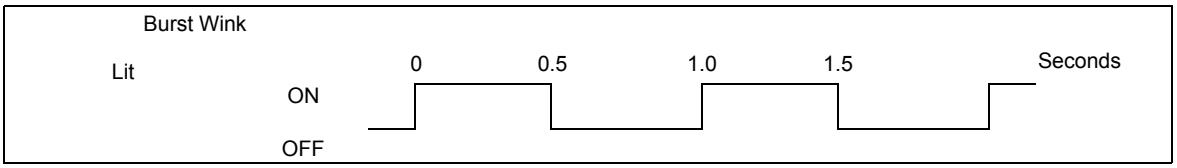
Condition of the LED is as follows:

Programming

No programming is required.

I-8D I-Use Indication -D

General Description



This feature provides the Desktop terminal with a unique LED indication to display the particular line the user is on.

Operating Procedure

Manual operation is not required.

Service Conditions

Condition of the LED is as follows:

Programming

No programming is required.

I-9 Intercom Calling

General Description

This feature allows a Sub Line Appearance, assigned to a Desktop terminal, to be used for INTERCOM CALLING.

Note: This feature is only available in North America.

Operating Procedure

To originate

1. Press the Intercom Sub Line Appearance.
2. Lift the handset or press the SPEAKER key. Dial Tone is heard.
3. Dial an Intercom Station, receive Ringback Tone. The display will show:

ICM	XXXX
(Time Display)	

4. The Called Party answers and the conversation begins.

To answer

1. Ringing is heard from the Intercom Sub Line.
2. Press the Intercom Sub Line Appearance. The display will show:

ICM	XXXX
(Time Display)	

3. Lift the handset or press the SPEAKER key.
4. The conversation can then begin.

Service Conditions

1. An Intercom Sub Line Appearance cannot be the Prime Line of a Desktop terminal.
2. An Intercom Sub Line Appearance cannot call any Station or Trunk in a system other than another Intercom Sub Line Appearance.
3. An Intercom Sub Line Appearance cannot activate any features.
4. An Intercom Sub Line Appearance must be assigned as a Software Line Appearance.
5. This feature is only available for Desktop terminals.
6. Intercom Sub Lines must be allowed Service Feature Restriction of SFI 70 (Intercom Group).
7. FCCS is not available for this feature.

Interactions

1. As an example for Group Calling application, the following conditions exist:
   System Station Numbering
   5XXXX and 6XXX
   Speed Calling Access:
   3 (Assigned in ASPA)
   100 Groups of Ten Stations

Group Calling Station
Numbering Consists of the following:
30-39
Stations in Group Calling would dial only two digits to reach other members of the group.

2. All My Line STATION-TO-STATION CALLING [S-11] capabilities such as VOICE CALL [V-2], MESSAGE REMINDER [M-19], CALL BACK [C-1], etc. are denied because INTERCOM CALLING uses a Virtual Circuit Sub Line Appearance.
3. An Incoming Intercom Call will be provided with distinctive three-burst ringing.
4. An Intercom Station is only allowed to call other Intercom Stations. If a Non-Intercom Station attempts a call, Reorder Tone is heard, and the LCD displays:

REST **(Time Display)**

5. An Intercom Station cannot call the Attendant Console.

Programming

STEP 1: **ASFC** - Construct a Service Feature Restriction Class that allows SFI 19 [Individual Speed Calling (Station/Group)] and SFI 70 (Intercom Group). Assign this SFC to the Stations that act as INTERCOM CALLING Extension Numbers. SFI 70 (Intercom Group) is only used on Virtual Lines in their own SFC.

STEP 2: **ASDT** - Program the Stations within a group as a virtual line (TEC = 18). Determine LENS from available time slots in the system.

TN: Tenant Number
STN: Station Number
LENS: Line Equipment Numbers (six digits)
TEC: Telephone Class (1-31)
- 1: DP (10 PPS)
- 2: PB
- 3: DP/PB
- 12: Desktop terminal
- 13: Data Terminal Via Desktop terminal
- 14: Hotline
- 15: CAS Line
- 16: Data Terminal via Data Module
- → 18: Virtual Circuit
- 23: ISDN Terminal
- 27: Eight Conference Equipment

RSC: Route Restriction Class (0-15)
For assignment of RSC, ARSC.
SFC: Service Feature Restriction Class (0-15)
For assignment of SFC, ASFC.

STEP 3: **AKYD** - Assign the Virtual Circuit to Desktop terminal key. Assign FYI = 2, Multi Line key, and assign the Station Number of the Virtual Circuit. This key will be the GROUP CALLING key.

I-10D Intermediate Station Number Display -D

General Description

This feature displays on the LCD screens of calling and called parties the number of an Intermediate station, if any.

Note: "Intermediate station" mentioned here refers to a station through which a call is routed.

Operating Procedure

No manual operation is required.

Service Conditions

1. For a Transferred Call, the LCD displays:

Call Status (**Note 1**)	Intermediate Station	Calling/Called Station
TRANSFER	**XXXX (Time Display)**	**XXXX**

Note: When the Telephone Number of the Intermediate or Calling/Called Station exceeds eight digits, last eight digits are displayed. However, a maximum of 16-digit Calling/Called Telephone Numbers can be displayed on the middle line of the LCD depending on the System Data.

Note 1: Call status indication is provided by SERVICE DISPLAY -D [S-25D].

2. The LCD displays one of the following features being used:

Call Status	Feature
TRANSFER	Blind Transfer To Attendant [B-17]
TRANSFER	Blind Transfer To Station [B-18]
TRANSFER	Call Transfer - All Calls [C-11]
PICKUP	Call Pickup - Group [C-7]
CF ALL	Call Forwarding - All Calls [C-5]
CF BUSY	Call Forwarding - Busy Line [C-2]
CF NANS	Call Forwarding - Don't Answer [C-3]
CF-OUT	Call Forwarding - PS Incoming Incomplete [C-155]
CF LOUT	Call Forwarding - Logout
HUNTING	Station Hunting - Circular [S-7]

Call Status	Feature
HUNTING	Station Hunting - Secretarial [S-8]
HUNTING	Station Hunting - Terminal [S-9]

3. The INTERMEDIATE STATION NUMBER DISPLAY will not be displayed if a call is announced in CALL TRANSFER - ALL CALLS [C-11].
4. For the FCCS Network, when a Telephone Number has been assigned for a Station, it is displayed on the Dterm LCD. However, if a Telephone Number is seven digits or more, the Physical Station Number is displayed.

Programming

ASYD - SYS1, Index 78, Bit 0 and Bit 1. Assign both as data “1” to enable all displays on the 16-button Dterm instrument.

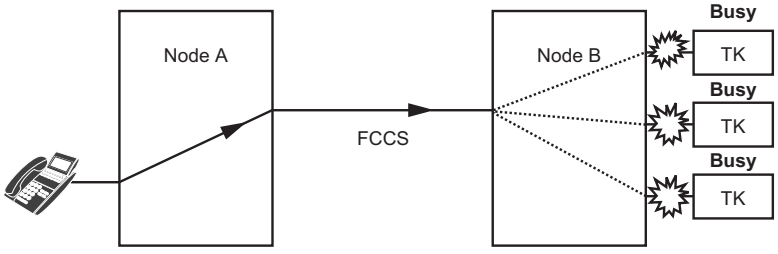
I-11 Inter-Office Off-Hook Queuing

General Description

This feature can be employed in a Main-Satellite configuration to allow a Satellite user to queue for LEAST COST ROUTING - 3/6-DIGIT [L-5] at the Main Location. This feature can also be used when all Outgoing Facilities are concentrated at the Main Location.

Operating Procedure

Operation at the Main Location



1. The Main Location receives dialed digits from the Satellite Location via a TANDEM TIE TRUNK [T-1].
2. The Main Location determines that no Trunks are available and places the call in an available hold on queue slot.
3. The Main Location returns Service Set Tone to the Satellite Caller.
4. The Satellite Caller remains off-hook, and waits for the call to be completed.
5. If there are no hold on queue slots available, the Main Location will return Reorder Tone to the Satellite Caller.
6. If the Satellite Caller goes on-hook (TANDEM TIE TRUNK [T-1] releases) while in queue, the assigned hold on queue slot is cleared.

Service Conditions

1. This feature is usually used in conjunction with LEAST COST ROUTING - 3/6-DIGIT [L-5].
2. The maximum queuing slots per system are: 64 calls for 1-IMG system
   256 calls for 4-IMG system
   The queue slots are commonly used by OFF-HOOK QUEUING [O-7], INTER-OFFICE OFF-HOOK QUEUING [I-11], and OUTGOING TRUNK QUEUING [O-2, 2D, 16].
3. If the Incoming TIE Trunk is a Second Dial Tone Signal Trunk, the caller will hear Service Set Tone while waiting in queue for a maximum of three minutes. After this period, the Trunk will automatically be released.
4. When a Trunk becomes available, the Dialed Number is automatically sent to the connecting Central Office.
5. If all OFF-HOOK QUEUING [O-7] slots are in use, Reorder Tone (fast Busy Tone) will be sent to the Satellite Office.
6. This feature can also be activated when using a Trunk in the Remote Node via FCCS.

Example: Node A and Node B are in an FCCS Network.

- Although a Station belonging to Node A tried to call outside using a Trunk belonging to Node B, all the Trunks are busy. The call can be in the queue using this feature.

7. OGQ Data is transmitted to and stored in the Network Control Node (NCN). Therefore, all the OGQ Data will be cleared by the System Initialization of the NCN.
8. When the access to the NCN is impossible (system down, cable disconnection or trouble has occurred), the user cannot set or cancel OGQ Data. After dialing the Access Code or pressing the Feature keys for Set/Cancel OGQ, the user hears the Reorder Tone.
9. When the Trunk becomes idle status after the NCN is recovered, and the call in the queue will be called back, if data has not been cleared. If data has been cleared, the call is canceled automatically.
10. A maximum of 1024 Stations per system may use OFF-HOOK QUEUING [O-7] and OUTGOING TRUNK QUEUING [O-2] simultaneously in an FCCS Network.
11. The Class Of Service for OFF-HOOK QUEUING [O-7] is different from the Class Of Service for OUTGOING TRUNK QUEUING [O-2]. Both services are mutually exclusive.
12. This feature does not work for the tandem connection when the incoming call terminates by DIRECT-IN TERMINATION (DIT) [D-7].

Interactions

1. This feature is a combination of other features. See TRUNK-TO-TRUNK CONNECTION [T-10], TANDEM SWITCHING OF TIE TRUNKS-2/4 WIRE [T-1], OFF-HOOK QUEUING [O-7], OUTGOING TRUNK QUEUING [O-2] and LEAST - COST ROUTING - 3/6 - DIGIT [L-5].
2. Calls in queue are served on a first in/first out basis. All Routes share a common queue.
3. This feature is used with LEAST COST ROUTING - 3/6 - DIGIT [L-5]. It is not used with ALTERNATE ROUTING [A-16], or MISCELLANEOUS TRUNK ACCESS [M-2].
4. Do not disable continuous Service Set Tone by changing SYS1, Index 42, Bit 7 to data “1”. This changes “continuous” Service Set Tone to “burst” Special Dial Tone, and Special Dial Tone to Burst Special Dial Tone followed by continuous Dial Tone. This will also disable TANDEM OFF-HOOK QUEUING.
5. When testing OGQ, at least one Trunk, of the Trunk Group being tested, must be engaged in a Station-to-Trunk or Trunk-to-Trunk Connection. Use of the MB key on the Trunk circuit card will not allow OGQ to test and operate properly.

Programming

STEP 1: **ASYD** - SYS1, Index 42, Bit 7. This Bit must be assigned as data "0", continuous Service Set Tone.

STEP 2: **ARTD** - Assign the Incoming TIE Line Route as follows:

2 and 4 WIRE E & M:

RT: 2

1-OSGS	:2	2-ONSG	:3	3-ISGS	:2	4-INSG	:3	5-TF	:3
6-TCL	:4	7-L/T	:1	8-RLP	:2	15-LSG	:5	41-TDMQ	:1

LCR(S) FLAG ROUTE:

RT: 31

6-TCL	:1	7-L/T	:1	8-RLP	:2	10-SMDR	:1	13-AC	:1
41-TDMQ	:1								

Note: To change the data for existing route (RT), initialize the circuit card.

STEP 3: **ARRC** - Allow Trunk-to-Trunk Connection between the Incoming TIE Route and the Outgoing Route in which INTER-OFFICE OFF-HOOK QUEUING will apply. Also allow Trunk-to-Trunk Connection between the Incoming TIE Route and the LCR (S) Flag Route. Assign both of these for ARI-D-RES. The Outgoing Route and the LCR(S) Flag Route must be programmed to allow OUTGOING TRUNK QUEUING [O-2].

**When incoming trunk is CCIS, assign the following data.*

STEP 4: **ASFC** - Assign SFI21=1 (Off-Hook OG Queuing is to be allowed) for the Service Feature Restriction Class of stations.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node. **Note 1**

Note 1: When using ASYDL or ASYDN to program an FCCS feature, the basic programming of ASYD is required in addition to ASYDL or ASYDN.

STEP 1: **ALRTN** - Assign this command to connect the Logical Route to the Physical Route.

STEP 2: **ASYDN** - This data must be assigned to the NCN.

SYS1, Index 41: Designate the Trunk Queuing Override Timer

Index 68, Bit 3: Enables automatic Cancel Timer

0/1 = -/Automatic Cancel Timer is available

Index 159: Designate Automatic Cancel Timer

STEP 3: **ARTDN** - Assign the Incoming TIE Line Route as follows:

2 and 4 WIRE E & M:

LGRT: 2

1-OSGS	:2	2-ONSG	:3	3-ISGS	:2	4-INSG	:3	5-TF	:3
6-TCL	:4	7-L/T	:1	8-RLP	:2	15-LSG	:5	41-TDMQ	:1

LCR(S) FLAG ROUTE:

LGRT: 31

6-TCL	:1	7-L/T	:1	8-RLP	:2	10-SMDR	:1	13-AC	:1
41-TDMQ	:1								

STEP 4: **ARRCN** - Allow Trunk-to-Trunk Connection between the Incoming TIE Route and the Outgoing Route in which INTER-OFFICE OFF-HOOK QUEUING will apply. Also allow Trunk-to-Trunk Connection between the Incoming TIE Route and the LCRS Flag Route. Assign both of these for ARI-D-RES. The Outgoing Route and the LCR(S) Flag Route must be programmed to allow OUTGOING TRUNK QUEUING [O-2].

STEP 5: **ASPAN** - These data must be assigned to the NCN.

TN: Tenant Number
ACC: Access Number
CI: "B: Busy" (for Entry), "N: Normal" (for Cancel)
SRV: "SSC: Service Code"
SID: 19 = OG Queuing-Entry
CI: "N: Normal"
SID: 20 = OG Queuing-Cancel

**When incoming trunk is CCIS, assign the following data.*

STEP 6: **ASFCN** - Assign SFI21=1 (Off-Hook OG Queuing is to be allowed) for the Service Feature Restriction Class of stations.

Note: The following data should also be set in addition to the above-mentioned commands:
The command to be set to the Node that accommodates the Trunk: ARTD
The commands to be set to all the Nodes: ASFC, AKYD

I-20 Immediate Ringback Tone

General Description

IMMEDIATE RINGBACK TONE will be heard by the caller immediately upon determination by the system that the Called Station is idle. IMMEDIATE RINGBACK TONE is connected, even if the call occurs during the OFF portion of the ringing cycle.

Operating Procedure

When a Station calls another Station or Attendant

1. The Station goes off-hook, hears Dial Tone, and dials the desired Station or Attendant.
2. IMMEDIATE RINGBACK TONE is returned.

When an Attendant calls another Station or Attendant

1. The Attendant presses an Idle Loop key and dials the desired Station or Attendant.
2. IMMEDIATE RINGBACK TONE is returned.

When a Trunk is connected to a Station or Attendant

1. The Calling Party will hear IMMEDIATE RINGBACK TONE when the source of the Ringback Tone is the Telephony Server, as is the case on DID and TIE Line Calls.

Service Conditions

The initial Ringback Tone is a brief burst, after which the system re-synchronizes the Ringback Tone with the ringing cycle.

Programming

ASYD - SYS1, Index 27, Bit 7. Assign data “1”.

I-21 Internal Zone Paging

General Description

This feature allows an individual to make a voice call through the Desktop terminal speakers of a designated group by dialing the INTERNAL ZONE PAGING Access Code or pressing the INTERNAL ZONE PAGING key on the Desktop terminal.
When an IP station is the calling party, INTERNAL ZONE PAGING can be used with several extra restrictions (for a detailed explanation, see [Service Conditions Specific to IP Station Calling Party]).

Operating Procedure

To originate

1. Lift the handset. Receive Dial Tone.
2. Dial the Access Code or press the Feature key for INTERNAL ZONE PAGING. Receive Second Dial Tone.
3. Dial the 2 or 3 digit Group Number of INTERNAL ZONE PAGING.
4. Announce the call over the built-in speakers on the Desktop terminals in the INTERNAL ZONE PAGING Group.

To answer

1. Voice Call by Internal Zone Paging [I-21] (Single)

IZP: Internal Zone Paging

a.) To answer by using Prime Line: **Note 1**

OPERATION		TONE CONTROL		DESKTOP TERMINAL DISPLAY	
CALLING PARTY	CALLED PARTY	CALLING PARTY	CALLED PARTY	CALLING PARTY	CALLED PARTY
(1) Lift the Handset (Speaker key)		(1) Dial Tone can be heard			
(2) Dial the Access Code for IZP [I-21] (IZP key)		(2) Second Dial Tone can be heard		PG	
(3) Dial the IZP Group Number **Note 3**			(1) Chimes can be heard **Note 2**	PG GPNO	PG XXXXX P: flash *P = Prime Line
Voice Call is made from Desktop terminal speakers in the IZP Group.					
	• Lift the Handset (after/before) • Press Prime Line key for the IZP Call			XXXXX	XXXXX P: light
Two-way conversation is made.					

Note 1: Using Prime Line or Off-Hook to answer is selected by ASYD, SYS1, Index 388, Bit 4=0/1: Press Prime Line key after Off-Hook/Press Off-Hook.

Note 2: The number of chimes can be set by ASYD, SYS1, Index 321, Bit 7=0/1: 4/1 times.

Note 3: The number of digits of NIZPG Number is determined by ASYDL/ASYDN, SYS1, Index 804, Bit 3.
Bit 0=0:Two-digit (Group 01~99) Ex. When NIZPG = 1, dial 01.
Bit 0=1:Three-digit (Group 001~255) Ex. When NIZPG = 1, dial 001.

b.) To Answer by using Off-Hook: **Note 4**

OPERATION		TONE CONTROL		DESKTOP TERMINAL DISPLAY	
CALLING PARTY	CALLED PARTY	CALLING PARTY	CALLED PARTY	CALLING PARTY	CALLED PARTY
(1) Lift the Handset (Speaker key)		(1) Dial Tone can be heard			
(2) Dial the Access Code for IZP [I-21] (IZP key)		(2) Second Dial Tone can be heard		PG	
(3) Dial the IZP Group Number **Note 6**			(1) Chimes can be heard **Note 5**	PG GPNO	PG XXXXX P: flash *P = Prime Line
Voice Call is made from Desktop terminal speakers in the IZP Group.					
	(1) Lift the Handset			XXXXX	XXXXX P: light
Two-way conversation is made.					

Note 4: Using Prime Line or Off-Hook to answer is selected by the ASYD, SYS1, Index 388, Bit 4=0/1: Press Prime Line key after Off-Hook/Press Off-Hook.

Note 5: The number of chimes can be set by ASYD, SYS1, Index 321, Bit 7=0/1: 4/1 times.

Note 6: The number of digits of NIZPG Number is determined by ASYDL/ASYDN, SYS1, Index 804, Bit 3.
Bit 0=0:Two-digit (Group 01~99) Ex. When NIZPG = 1, dial 01.
Bit 0=1:Three-digit (Group 001~255) Ex. When NIZPG = 1, dial 001.

c.) To answer by using CALL PICKUP - DIRECT [C-30]:

OPERATION		TONE CONTROL		DESKTOP TERMINAL DISPLAY	
CALLING PARTY	CALLED PARTY	CALLING PARTY	CALLED PARTY	CALLING PARTY	CALLED PARTY
(1) Lift the Handset (Speaker key)		(1) Dial Tone can be heard			
(2) Dial the Access Code for IZP [I-21] (IZP key)		(2) Second Dial Tone can be heard		PG	
(3) Dial the IZP Group Number **Note 8**			(1) Chimes can be heard **Note 7**	PG GPNO	PG XXXXX P: flash *P = Prime Line
Voice Call is made from Desktop terminal speakers in the IZP Group.					
	(1) Lift the Handset		(2) Dial Tone can be heard		
	(2) Dial the Access Code for Call Pickup - Direct [C-30]		(3) Second Dial Tone can be heard		
	(3) Dial the desired Station Number in the IZP [I-21] Group			XXXX	XXXXX P: light
Two-way conversation is made.					

Note 7: The number of chimes can be set by ASYD, SYS1, Index 321, Bit 7=0/1: 4/1 times.

Note 8: The number of digits of NIZPG Number is determined by ASYDL/ASYDN, SYS1, Index 804, Bit 3.
Bit 0=0:Two-digit (Group 01~99) Ex. When NIZPG = 1, dial 01.
Bit 0=1:Three-digit (Group 001~255) Ex. When NIZPG = 1, dial 001.

d.) To answer by using CALL PICKUP - GROUP [C-7]:

OPERATION		TONE CONTROL		DESKTOP TERMINAL DISPLAY	
CALLING PARTY	CALLED PARTY	CALLING PARTY	CALLED PARTY	CALLING PARTY	CALLED PARTY
(1) Lift the Handset (Speaker key)		(1) Dial Tone can be heard			
(2) Dial the Access Code for IZP [I-21] (IZP key)		(2) Second Dial Tone can be heard		PG	
(3) Dial the IZP Group Number **Note 10**			(1) Chimes can be heard **Note 9**	PG GPNO	PG XXXXX P: flash *P = Prime Line
Voice Call is made from Desktop terminal speakers in the IZP Group.					
	(1) Lift the Handset		(2) Dial Tone can be heard		P: light
	(2) Dial the Access Code for Call Pickup - Group [C-7] (Call Pickup key)			XXXXX	XXXXX
Two-way conversation is made.					

Note 9: The number of chimes can be set by ASYD, SYS1, Index 321, Bit 7=0/1: 4/1 times.

Note 10: The number of digits of NIZPG Number is determined by ASYDL/ASYDN, SYS1, Index 804, Bit 3.
Bit 0=0:Two-digit (Group 01~99) Ex. When NIZPG = 1, dial 01.
Bit 0=1:Three-digit (Group 001~255) Ex. When NIZPG = 1, dial 001.

2. Voice Call by Internal Zone Paging [I-21] (Station Hold)

IZP: Internal Zone Paging

a.) To answer using Prime Line: **Note 11**

OPERATION		TONE CONTROL			DESKTOP TERMINAL DISPLAY		
OPERATING PARTY	CALLED PARTY	OPERATING PARTY	CALLED PARTY	CALLING PARTY	OPERATING PARTY	CALLED PARTY	CALLING PARTY
(1) Receive a call					XXXXX		XXXXX
(2) Perform the SHF		(1) Special Dial Tone can be heard		(1) MSC can be heard	XFR		HOLD
(3) Dial the Access Code for IZP [I-21] (IZP key)		(2) Second Dial Tone can be heard			PG		HOLD
(4) Dial the IZP Group Number **Note 13**			(1) Chimes can be heard **Note 12**		PG GPNO	PG XXXXX P: flash	HOLD
Voice Call is made from Desktop terminal speakers in the IZP Group							
	• Lift the Handset (after/ before) • Press Prime Line key for the IZP Call				XXXXX	XXXXX P: light	HOLD
Two-way conversation is made.							
(5) Replace the handset				(2) MSC is stopped	(time)	XXXXX	XXXXX
	Two-way conversation between the Calling and Called Party is made.						

Note 11: Using Prime Line or Off-Hook to answer is selected by the ASYD, SYS1, Index 388, Bit 4=0/1: Press Prime Line key after Off-Hook/Press Off-Hook.

Note 12: The number of chimes can be set by ASYD, SYS1, Index 321, Bit 7=0/1: 4/1 times.

Note 13: The number of digits of NIZPG Number is determined by ASYDL/ASYDN, SYS1, Index 804, Bit 3.
Bit 0=0:Two-digit (Group 01~99) Ex. When NIZPG = 1, dial 01.
Bit 0=1:Three-digit (Group 001~255) Ex. When NIZPG = 1, dial 001.

b.) To answer by using Off-Hook: **Note 14**

OPERATION		TONE CONTROL			DESKTOP TERMINAL DISPLAY		
OPERATING PARTY	CALLED PARTY	OPERATING PARTY	CALLED PARTY	CALLING PARTY	OPERATING PARTY	CALLED PARTY	CALLING PARTY
(1) Receive a call					XXXXX		XXXXX
(2) Perform the SHF		(1) Special Dial Tone can be heard		(1) MSC can be heard	XFR		HOLD
(3) Dial the Access Code for IZP [I-21] (IZP key)		(2) Second Dial Tone can be heard			PG		HOLD
(4) Dial the IZP Group Number **Note 16**			(1) Chimes can be heard **Note 15**		PG GPNO	PG XXXXX P: flash *P = Prime Line	HOLD
Voice Call is made from Desktop terminal speakers in the IZP Group							
	(1) Lift the Handset				XXXXX	XXXXX P: light	HOLD
Two-way conversation is made.							
(5) Replace the handset				(2) MSC is stopped	(time)	XXXXX	XXXXX
	Two-way conversation between the Calling and Called Party is made.						

Note 14: Using Prime Line or Off-Hook to answer is selected by the ASYD, SYS1, Index 388, Bit 4=0/1: Press Prime Line key after Off-Hook/Press Off-Hook.

Note 15: The number of chimes can be set by ASYD, SYS1, Index 321, Bit 7=0/1: 4/1 times.

Note 16: The number of digits of NIZPG Number is determined by ASYDL/ASYDN, SYS1, Index 804, Bit 3.
Bit 0=0:Two-digit (Group 01~99) Ex. When NIZPG = 1, dial 01.
Bit 0=1:Three-digit (Group 001~255) Ex. When NIZPG = 1, dial 001.

c.) To answer by using Call Pickup - Direct [C-30]:

OPERATION		TONE CONTROL			DESKTOP TERMINAL DISPLAY		
OPERATING PARTY	CALLED PARTY	OPERATING PARTY	CALLED PARTY	CALLING PARTY	OPERATING PARTY	CALLED PARTY	CALLING PARTY
(1) Receive a call					XXXXX		XXXXX
(2) Perform the SHF		(1) Special Dial Tone can be heard		(1) MSC can be heard	XFR		HOLD
(3) Dial the Access Code for IZP Number [I-21] (IZP key)		(2) Second Dial Tone can be heard			PG		HOLD
(4) Dial the IZP Group Number **Note 18**			(1) Chimes can be heard **Note 17**		PG GPNO	PG XXXXX P: flash *P = Prime Line	HOLD
Voice Call is made from Desktop terminal speakers in the IZP Group							
	(1) Lift the Handset (Speaker key)		(2) Dial Tone can be heard				
	(2) Dial the Access Code for Call Pickup - Direct [C-30]		(3) Second Dial Tone can be heard				
	(3) Dial the desired Station Number in the IZP [I-21] Group				XXXXX	XXXXX P: light	HOLD
Two-way conversation is made.							
(5) Replace the handset				(2) MSC is stopped	(time)	XXXXX	XXXXX
	Two-way conversation between the Calling and Called Party is made.						

Note 17: The number of chimes can be set by ASYD, SYS1, Index 321, Bit 7=0/1: 4/1 times.

Note 18: The number of digits of NIZPG Number is determined by ASYDL/ASYDN, SYS1, Index 804, Bit 3.
Bit 0=0:Two-digit (Group 01~99) Ex. When NIZPG = 1, dial 01.
Bit 0=1:Three-digit (Group 001~255) Ex. When NIZPG = 1, dial 001.

d.) To answer by using Call Pickup - Group [C-7]:

OPERATION		TONE CONTROL			DESKTOP TERMINAL DISPLAY		
OPERATING PARTY	CALLED PARTY	OPERATING PARTY	CALLED PARTY	CALLING PARTY	OPERATING PARTY	CALLED PARTY	CALLING PARTY
(1) Receive a call					XXXXX		XXXXX
(2) Perform the SHF		(1) Special Dial Tone can be heard		(1) MSC can be heard	XFR		HOLD
(3) Dial the Access Code for IZP Number [I-21] (IZP key)		(2) Second Dial Tone can be heard			PG		HOLD
(4) Dial the IZP Group Number **Note 20**			(1) Chimes can be heard **Note 19**		PG GPNO	PG XXXXX P: flash *P = Prime Line	HOLD
Voice Call is made from Desktop terminal speakers in the IZP Group							
	(1) Lift the Handset		(2) Dial Tone can be heard				
	(2) Dial the Access Code for Call Pickup - Group [C-7] (Call Pickup - Group key)				XXXXX	XXXXX P: light	HOLD
Two-way conversation is made.							
(5) Replace the handset				(2) MSC is stopped	(time)	XXXXX	XXXXX
	Two-way conversation between the Calling and Called Party is made.						

Note 19: The number of chimes can be set by ASYD, SYS1, Index 321, Bit 7=0/1: 4/1 times.

Note 20: The number of digits of NIZPG Number is determined by ASYDL/ASYDN, SYS1, Index 804, Bit 3.
Bit 0=0:Two-digit (Group 01~99) Ex. When NIZPG = 1, dial 01.
Bit 0=1:Three-digit (Group 001~255) Ex. When NIZPG = 1, dial 001.

3. Voice Call by Internal Zone Paging (Trunk Hold)

a.) To answer by using Prime Line: **Note 21**

OPERATION		TONE CONTROL			DESKTOP TERMINAL DISPLAY		
OPERATING PARTY	CALLED PARTY	OPERATING PARTY	CALLED PARTY	CALLING PARTY	OPERATING PARTY	CALLED PARTY	CALLING PARTY
(1) Receive a call					XX:XX DDD2		
(2) Perform the SHF		(1) Special Dial Tone can be heard		(1) MSC can be heard	XFR		
(3) Dial the Access Code for IZP [I-21] (IZP key)		(2) Second Dial Tone can be heard			PG		
(4) Dial the IZP Group Number **Note 23**			(1) Chimes can be heard **Note 22**		PG GPNO	PG XXXXX P: flash *P = Prime Line	
Voice Call is made from Desktop terminal speakers in the IZP Group							
	• Lift the Handset (after/ before) • Press Prime Line key for the IZP Call				XXXXX	XXXXX P: light	
Two-way conversation is made.							
(5) Replace the handset				(2) MSC is stopped	(time)	XX:XX DDD2	
	Two-way conversation between the Calling and Called Party is made.						

Note 21: Using Prime Line or Off-Hook to answer is selected by the ASYD, SYS1, Index 388, Bit 4=0/1: Press Prime Line key after Off-Hook/Press Off-Hook.

Note 22: The number of chimes can be set by ASYD, SYS1, Index 321, Bit 7=0/1: 4/1 times.

Note 23: The number of digits of NIZPG Number is determined by ASYDL/ASYDN, SYS1, Index 804, Bit 3.
Bit 0=0:Two-digit (Group 01~99) Ex. When NIZPG = 1, dial 01.
Bit 0=1:Three-digit (Group 001~255) Ex. When NIZPG = 1, dial 001.

b.) To answer by using Off-Hook: **Note 24**

OPERATION		TONE CONTROL			DTERM DISPLAY		
OPERATING PARTY	CALLED PARTY	OPERATING PARTY	CALLED PARTY	CALLING PARTY	OPERATING PARTY	CALLED PARTY	CALLING PARTY
(1) Receive a call					XX:XX DDD2		
(2) Perform the SHF		(1) Special Dial Tone can be heard		(1) MSC can be heard	XFR		
(3) Dial the Access Code for IZP [I-21] (IZP key)		(2) Second Dial Tone can be heard			PG		
(4) Dial the IZP Group Number **Note 26**			(1) Chimes can be heard **Note 25**		PG GPNO	PG XXXXX P: flash *P = Prime Line	
Voice Call is made from Desktop terminal speakers in the IZP Group.							
	(1) Lift the Handset				XXXXX	XXXXX P: light	
Two-way conversation is made.							
(5) Replace the handset				(2) MSC is stopped	(time)	XX:XX DDD2	
	Two-way conversation between the Calling and Called Party is made.						

Note 24: Using Prime Line or Off-Hook to answer is selected by the ASYD, SYS1, Index 388, Bit 4=0/1: Press Prime Line key after Off-Hook/Press Off-Hook.

Note 25: The number of chimes can be set by ASYD, SYS1, Index 321, Bit 7=0/1: 4/1 times.

Note 26: The number of digits of NIZPG Number is determined by ASYDL/ASYDN, SYS1, Index 804, Bit 3.
Bit 0=0:Two-digit (Group 01~99) Ex. When NIZPG = 1, dial 01.
Bit 0=1:Three-digit (Group 001~255) Ex. When NIZPG = 1, dial 001.

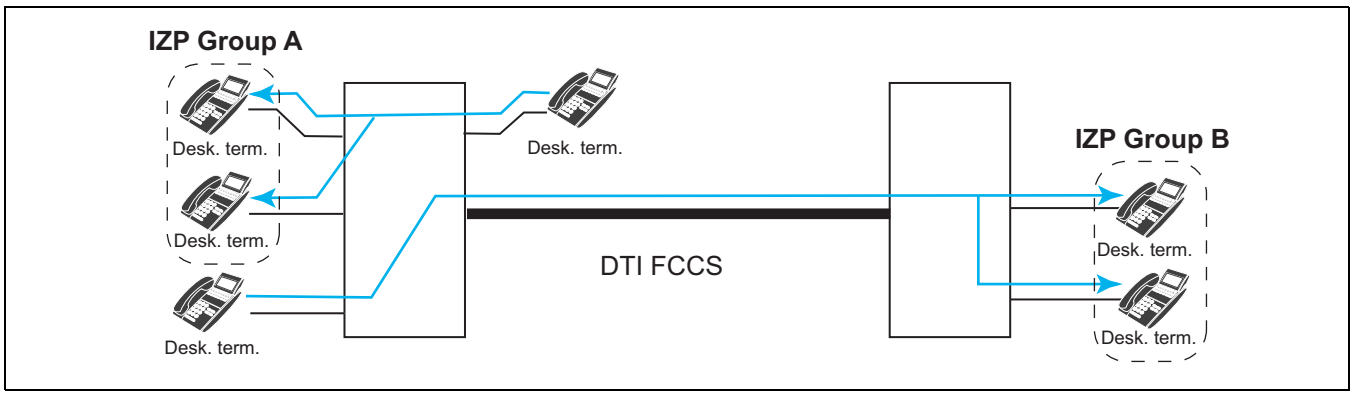
c.) To answer by using Call Pickup - Direct [C-30]:

OPERATION		TONE CONTROL			DESKTOP TERMINAL DISPLAY		
OPERATING PARTY	CALLED PARTY	OPERATING PARTY	CALLED PARTY	CALLING PARTY	OPERATING PARTY	CALLED PARTY	CALLING PARTY
(1) Receive a call					XX:XX DDD2		
(2) Perform the SHF		(1) Special Dial Tone can be heard		(1) MSC can be heard	XFR		
(3) Dial the Access Code for IZP [I-21] (IZP key)		(2) Second Dial Tone can be heard			PG		
(4) Dial the IZP Group Number **Note 28**			(1) Chimes can be heard **Note 27**		PG GPNO	PG XXXXX P: flash *P = Prime Line	
Voice Call is made from Desktop terminal speakers in the IZP Group.							
	(1) Lift the Handset (Speaker key)		(2) Dial Tone can be heard				
	(2) Dial the Access Code for Call Pickup - Direct [C-30]		(3) Second Dial Tone can be heard				
	(3) Dial the desired Station Number in the IZP [I-21] Group				XXXXX	XXXXX P: light	
Two-way conversation is made.							
(5) Replace the handset				(2) MSC is stopped	(time)	XX:XX DDD2	
	Two-way conversation between the Calling and Called Party is made.						

Note 27: The number of chimes can be set by ASYD, SYS1, Index 321, Bit 7=0/1: 4/1 times.

Note 28: The number of digits of NIZPG Number is determined by ASYDL/ASYDN, SYS1, Index 804, Bit 3.
Bit 0=0:Two-digit (Group 01~99) Ex. When NIZPG = 1, dial 01.
Bit 0=1:Three-digit (Group 001~255) Ex. When NIZPG = 1, dial 001.

d.) To answer by using Call Pickup - Group [C-7]



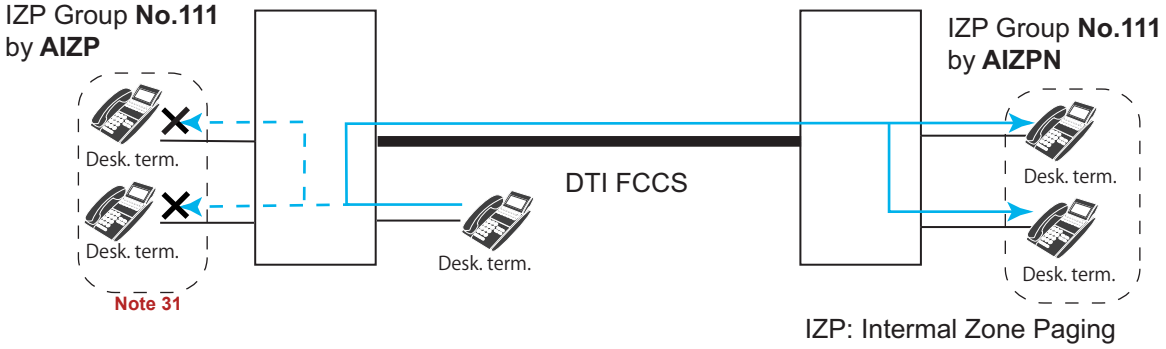
OPERATION		TONE CONTROL			DESKTOP TERMINAL DISPLAY		
OPERATING PARTY	CALLED PARTY	OPERATING PARTY	CALLED PARTY	CALLING PARTY	OPERATING PARTY	CALLED PARTY	CALLING PARTY
(1) Receive a call					XX:XX DDD2		
(2) Perform the SHF		(1) Special Dial Tone can be heard		(1) MSC can be heard	XFR		
(3) Dial the Access Code for IZP [I-21] (IZP key)		(2) Second Dial Tone can be heard			PG		
(4) Dial the IZP Group Number **Note 30**			(1) Chimes can be heard **Note 29**		PG GPNO	PG XXXXX P: flash *P = Prime Line	
Voice Call is made from Desktop terminal speakers in the IZP Group							
	(1) Lift the Handset (2) Dial the Access Code for Call Pickup - Group [C-7] (Call Pickup - Group key)		(2) Dial Tone can be heard		XXXXX	XXXXX P: light	
Two-way conversation is made.							
(5) Replace the handset				(2) MSC is stopped	(time)	XX:XX DDD2	
	Two-way conversation between the Calling and Called Party is made.						

Note 29: The number of chimes can be set by ASYD, SYS1, Index 321, Bit 7=0/1: 4/1 times.

Note 30: The number of digits of NIZPG Number is determined by ASYDL/ASYDN, SYS1, Index 804, Bit 3.
Bit 0=0:Two-digit (Group 01~99) Ex. When NIZPG = 1, dial 01.
Bit 0=1:Three-digit (Group 001~255) Ex. When NIZPG = 1, dial 001.

Service Conditions

1. The number of Internal Zone Paging Groups is a maximum of 99 Groups for each Tenant.
2. Each Desktop terminal can be a member of Multiple Internal Zone Paging Groups.
3. A maximum of 255 Groups per system can be simultaneously Paged using this feature.
4. This feature is activated to idle Desktop terminals in an Internal Zone Paging Group.
5. When all INTERNAL ZONE PAGING Groups are busy, Busy Tone is sent.
6. This service is not available from the Attendant Console, Central Office and TIE Line.
7. If all Desktop terminals in the designated group are unavailable, a Busy Tone will be sent.
8. When originating a call (or answering an Incoming Call) from a Multi (Sub) Line on the Desktop terminal called by INTERNAL ZONE PAGING, the Voice Call to the Prime Line stops and becomes idle, and the path on the Multi Line is established. Even if the call is completed, the Voice Call is not established again.
9. When a user cancels this feature with a Held Call, the user is recalled.
10. If a Desktop terminal in the Paged Group is busy when the INTERNAL ZONE PAGING Call is originated, the terminal is not called/recalled even if it becomes idle later.
11. After a Desktop terminal in the Paged Group answers the INTERNAL ZONE PAGING Call, ringing at the other member Desktop terminals stop and two-way conversation starts.
12. While member Desktop terminals are Paged by INTERNAL ZONE PAGING Call, the Prime Lines of Desktop terminals in the group are in busy status. Thus, the Desktop terminals cannot receive another call from Desktop terminal, TIE Line, Central Office Line or Attendant Consoles during Paging.
13. When a Prime Line of a Desktop terminal in the Paged Group is a Sub Line of another Desktop terminal, the Sub Line assigned to another Desktop terminal cannot be affected by the INTERNAL ZONE PAGING Call (the Sub Line key does not flash or light).
14. The user can Page any INTERNAL ZONE PAGING Groups in the DTI FCCS using this feature.

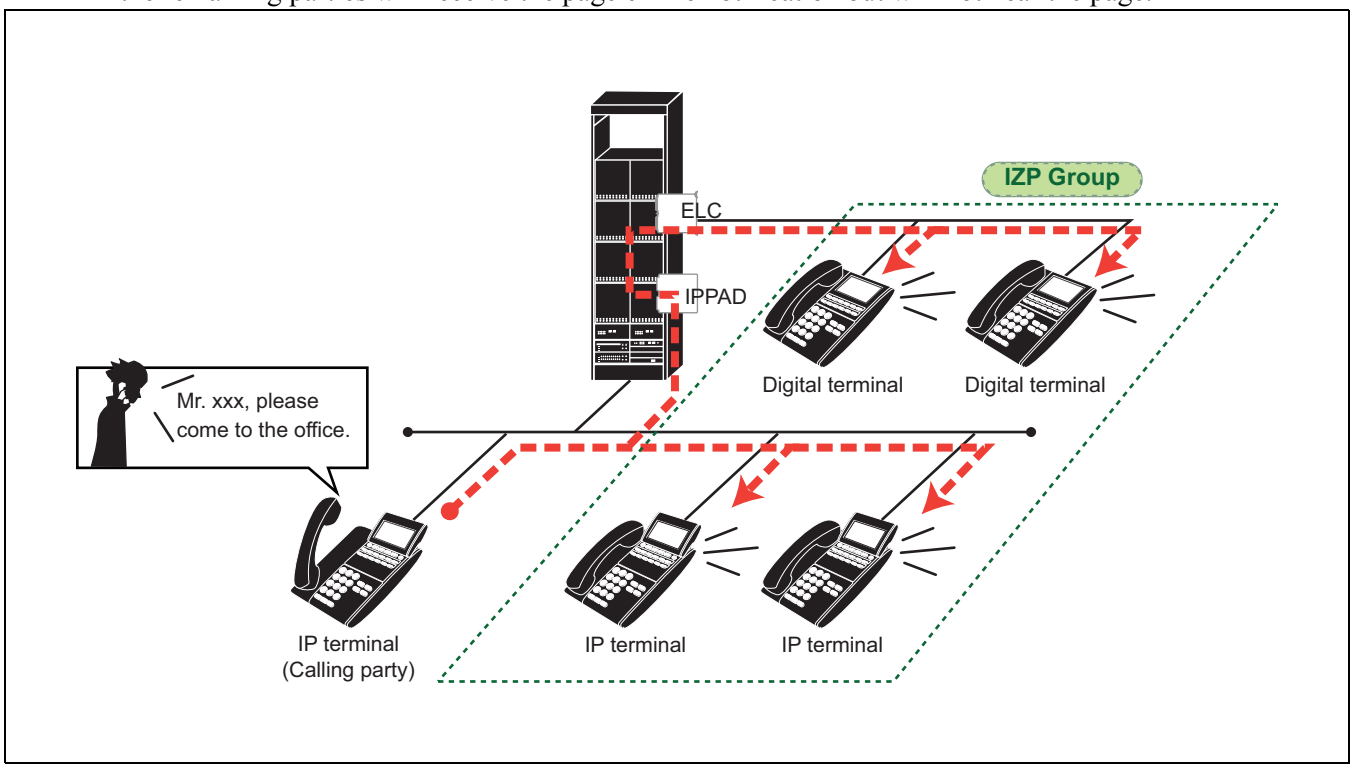


15. When activating this feature via the FCCS Network, an Internal Zone Paging Group can consist of the Desktop terminals accommodated in the same Node. (The group cannot be comprised of the Desktop terminals in different Nodes.)
16. The maximum number of INTERNAL ZONE PAGING Group per FCCS Network is 255 Groups.
17. Using Prime Line or Off-Hook to answer can be selected. If this selection is not unified between each Node within the FCCS Network, execute the method of answering assigned to each Node when answering a telephone.
18. When the Connection Trunk for the Node that accommodates the designated group is in one of the following status, Busy Tone is sent or “Busy” is displayed on the LCD.

- the designated Connection Trunk is busy
- FCCS link failure (Layer 2 down) occurs at the Connection Trunk
- the Connection Trunks in an idle state are fewer than the Idle Stations in the designated group

19. A Desktop terminal that has a call on Hold cannot answer the voice call via FCCS using CALL PICKUP-DIRECT [C-30] and CALL PICKUP-GROUP [C-7].
20. When the IZP Group Number assigned by AIZP and IZP Group Number assigned by AIZPN are mixed in the FCCS Network, the IZP Group Number assigned by AIZPN takes priority. Refer to the following figure.

- When identical IZP Group Numbers assigned by AIZP and AIZPN are used in the FCCS network.



Note 31: In this case, this IZP Group cannot be paged.

21. Multiple voice calls cannot be made at a time.
22. This service is not available for FCCS over IP Network.
23. A maximum of four Desktop terminals for INTERNAL ZONE PAGING can be assigned to a Group (Level 0 - Level 7) for physical ports connected to the system.
24. A maximum number of 24 Desktop terminals can be set in a group with this feature

[Service Conditions Specific to IP Station Calling Party]

1. When the calling party is DT830G/DT730G, the IZP group cannot be bigger than four members. If more than four stations are programmed in the same group, only four stations in the group will hear the page; the remaining parties will receive the page chime notification but will not hear the page.

2. IP stations cannot be the calling party except for DT830G/DT730G.

   Note: If the calling party is DT730G, it must be 1.0.3.0 release or higher.

3. The PCPro AIZP command will not show an alert if more than four stations are programmed.

Interactions

When a Station answers a Voice Call using this feature, the call becomes Station-to-Station Connection Status. Accordingly, various hooking services are available.

Programming

Refer to CALL PICKUP - DIRECT [C-30] and CALL PICKUP - GROUP [C-7] when using those features with INTERNAL ZONE PAGING.

STEP 1: **ASYD** - SYS1, Index 31 (Mounting capacity of Common Memory) must be assigned as data "04". This data is required when using the Virtual PIR.
SYS1, Index 321, Bit 7:0/1 = Voice Call Chime 4 chime/1 chime
SYS1, Index 388, Bit 4:0/1 = Answer the INTERNAL ZONE PAGING call by Prime Line key after off-hook/by going off hook.

STEP 2: **ASYDL** - SYS1, Index 679, Bit 1: 1 (Multiple Session for SIP Multiple Line Terminals: In Service). **Note 32**
SYS1, Index 804, Bit 3 (Designation of the maximum digit number of INTERNAL ZONE PAGING Group Number) 0/1 = two/three digits. **Note 33**

STEP 3: **ANPD** - Reserve a Number Level for Feature Access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. Assign NND according to the predetermined Numbering Plan.

STEP 4: **ASPA** - Assign the Access Code for INTERNAL ZONE PAGING, SRV = "SSCA: Service Code Appendix", SIDA = 98. Connection Status Indexes for "N: Normal" and "H: Hooking" services.

STEP 5: **AIZP** - Assign INTERNAL ZONE PAGING Group Data.

TN: Tenant Number of Calling Party
IZPG: INTERNAL ZONE PAGING Group Number (1~99)
IZPTN: Tenant Number of IZPSTN
IZPSTN: Station Number assigned to the INTERNAL ZONE PAGING Group

STEP 6: **AKYD** - For Desktop terminal sets, INTERNAL ZONE PAGING can be activated using a programmable Line/Feature key. Assign KYI = 1, Feature key Answer [28] for answering INTERNAL ZONE PAGING and KYI = 1, Feature key Internal Zone Paging [85] for calling INTERNAL ZONE PAGING Group.

STEP 7: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 134 (Internal Zone Page Calling) to the Stations that originate INTERNAL ZONE PAGING.

Assign a Service Feature Restriction Class that allows SFI 145 (Internal Zone Paging Answer) to the Stations that answer to INTERNAL ZONE PAGING.

Note 32: Only when IP stations are used. After the setting, a re-registration must be performed.

Note 33: When selecting 3 digits, ASYDL setting is performed regardless of the LDM programming.

FCCS Programming

The following command assignments are required when your system is configured as an FCCS Network.

STEP 1: **ASYD** - SYS1, Index 31 (Mounting capacity of Common Memory) must be assigned as data "04".
SYS1, Index 321, Bit 7:0/1 = Voice Call Chime 4 chime/1 chime
SYS1, Index 388, Bit 4 0/1= Answer the INTERNAL ZONE PAGING call by Prime Line key after off-hook/by going off-hook.

STEP 2: **ASYDL/ASYDN** - SYS1, Index 679, Bit 1: 1 (Multiple Session for SIP Multiple Line Terminals: In Service). **Note 34**
SYS1, Index 804, Bit 3 (Designation of the maximum digit number of INTERNAL ZONE PAGING Group Number) 0/1 = two or three digits.

STEP 3: **ANPD/ANPDL/ANPDN** - Reserve a Number Level for Feature Access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. Assign NND according to the predetermined Numbering Plan.

STEP 4: **ASPA/ASPAL/ASPAN** - Assign the Access Code for INTERNAL ZONE PAGING, SRV = "SSCA: Service Code Appendix", SIDA = 98. Connection Status Indexes for "N: Normal", and "H: Hooking" services.

STEP 5: **AIZPN** - Assign INTERNAL ZONE PAGING Group Data.

NIZPG: Network Internal Zone Paging Group Number (1~255) **Note 35**
UGN: User Group Number
TELN: Telephone Number
CNT: Number of Telephone Number

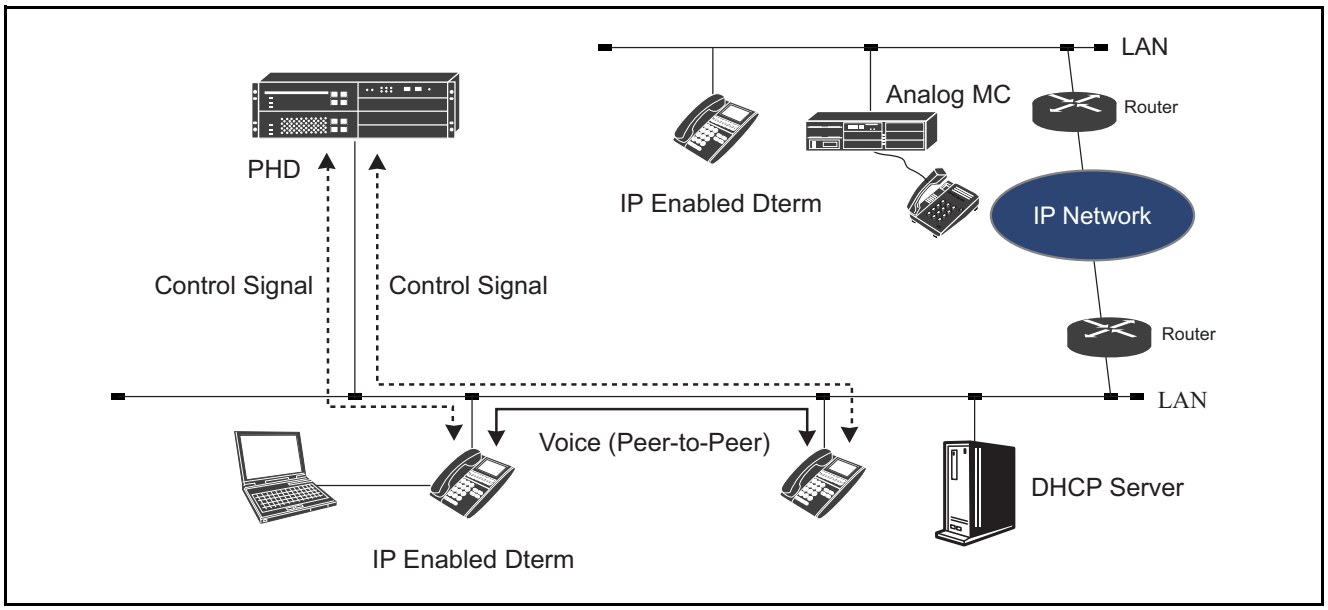
STEP 6: **AKYD** - For Dterm sets, INTERNAL ZONE PAGING can be activated using a programmable Line/Feature key. Assign KYI (Service Condition) = 1 (Feature Key) and Feature key Internal Zone Paging [85]. Assign KYI (Service Condition) = 1 (Feature Key) and Feature key Answer [28] for answering INTERNAL ZONE PAGING.

STEP 7: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 145 (Internal Zone Paging Answer) to the Stations that answer to INTERNAL ZONE PAGING. Assign a Service Feature Restriction Class that allows SFI 134 (Internal Zone Page Calling) to the Stations that originate INTERNAL ZONE PAGING.

Note 34: Only when IP stations are used. After the setting, a re-registration must be performed.

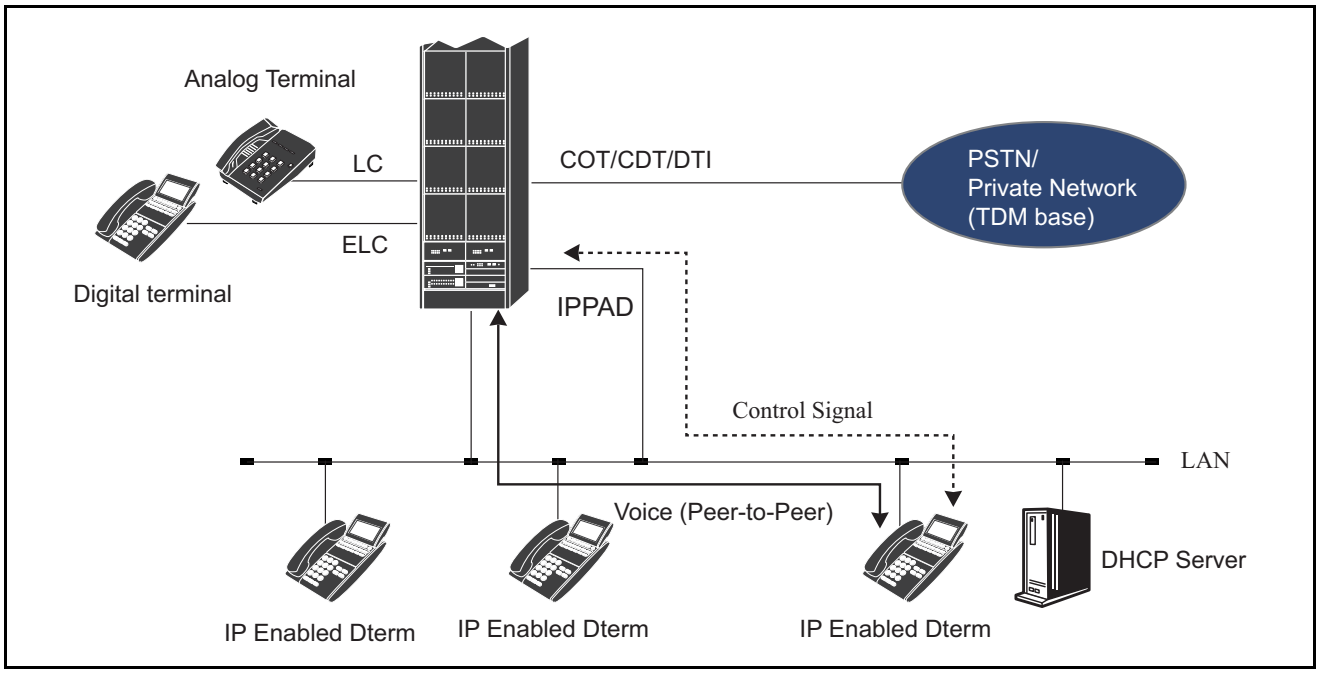
Note 35: The number of digits of Internal Zone Paging Group Number is determined by SYS1, Index 804, Bit 3.

I-43 IP Enabled Dterm



General Description

This feature allows the system to use the Dterm Series *i* telephone sets on the LAN. A Dterm Series *i* telephone set that is equipped with an adapter (hereafter referred to as IP Enabled Dterm) can send or receive Voice Signals to or from other IP terminals (such as an Analog MC, other IP Enabled Dterm, or IPPAD circuit card). An IP Enabled Dterm can be relocated by simple plug-in operation, without changing the office data.
At this time, the control signals are processed by the System, while the speech path is established directly between the IP terminals (voice data are sent/received in a Peer-to-Peer connection).



Note: An IPPAD circuit card is used to help establish a call between IP Enabled Dterm (IP Station) and another TDM-based Conventional Telephone/Network (such as Analog Telephone, Dterm Series i without an adapter, Public Network, TIE Line.) IPPAD provides a gateway function between IP (Internet Protocol on the LAN side) and TDM (Time Division Multiplexer). For more details, refer to the **IPPAD Data** section in Chapter 2 of this manual.

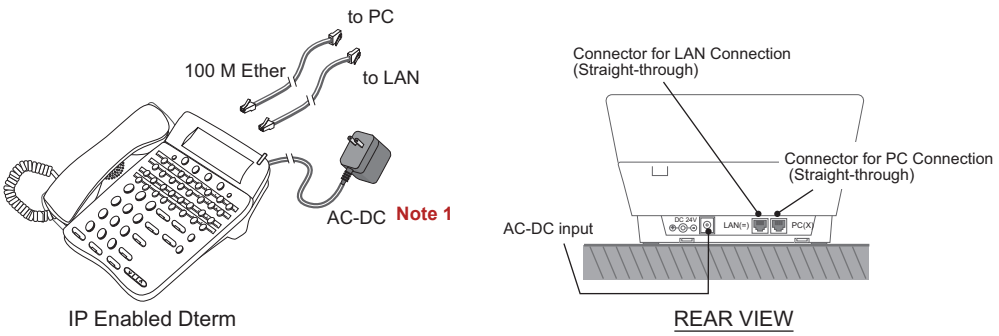
Note: IP Enabled Dterm does not support Follow Phone [F-31].

IP Enabled Dterm

IP Enabled Dterm with IPPAD

Hardware Requirements

The following hardware is required for this feature:



- ☐ IP Enabled Dterm

  Consists of the following:

  - Dterm Series *i*
  - IP Interface Adapter
  - AC Power Adapter

Note: An IP Enabled Dterm is composed of a Desktop terminal and an IP Interface Adapter.

- ☐ Switching HUB (10/100M)

Note 1: Center power feeding by using a Power Patch Panel is also available.

- DHCP Server - Option
- FTP (TFTP) Server - Option
- IPPAD - Option

  This circuit card is necessary when a call is to be established between the TDM-based Conventional Telephones/ Network and IP Enabled Dterms. At this time, IPPAD provides a gateway function: Voice Signal (IP Packets) sent from the LAN is disassembled as the TDM-based Signal, and the opposite directions assembled into the IP Packets. Thus, a maximum of 32 calls can be dealt with per IPPAD Card. For more detailed information, refer to Section 10 of CHAPTER 2 or the Circuit Card Description.

Operating Procedure

See [D-159] for the operating procedure in MAC Authentication mode and Login mode.

Service Conditions

1. SP-PHD is required for this feature.

   Note: SP-PHD handles the Control Signals sent to and from IP Enabled Dterm. SP-PHD can handle a maximum of 4000 IP Enabled Dterms. For more detailed information on PH, refer to the Protocol Handler Reference Note.

2. IP Enabled Dterm operates for Dterm Series *i* only.
3. Desktop terminal without IP Interface Adapter cannot be used.
4. IP Enabled Dterm cannot use features supported by other adapters like Analog Port adapter, Ancillary Device adapter, and so on.
5. A DSS console can accommodate IP Enabled Dterms as Multiple Lines, but cannot be connected to them.

Programming

See [D-159] DtermIP for the data programming.

I-44 IP Control-FAX

General Description

This feature allows the user to specify jitter-buffer size, payload type (G.711, G.726, T.30, and T.38) and payload size of RTP packet from the PCPro for the Peer to Peer FAX connection.

Operating Procedure

None

Service Conditions

1. When no FAX data is assigned, or connecting to IPPAD without VCT, data transmission as voice data (jitter-buffer size=150ms, payload type=G.711, payload size=40ms) is used.
2. Available FAX communication methods are T.30, T.38 and data transmission as voice data (G3 FAX (V.17, V.21, V.29, V.27ter, V33)).

   Note: Payload Type T.38 is available from FP95-114 V4. It is only available as explained in the connection pattern (f) of the service condition number 4.

3. For FAX communication between Legacy Stations/External Trunks accommodated in different nodes in FCCS over IP network, communication is established between IPPADs in those nodes. FAX control data can be changed by ASYDL/ASYDN, Index 652 to Index 654.
4. The following table shows the FAX connection patterns. Priority of FAX data to be used is different in each Connection Pattern.

   Note: Data settings and priorities for connection patterns (a) to (d) are the same even if the connections are established in FCCS over IP network.

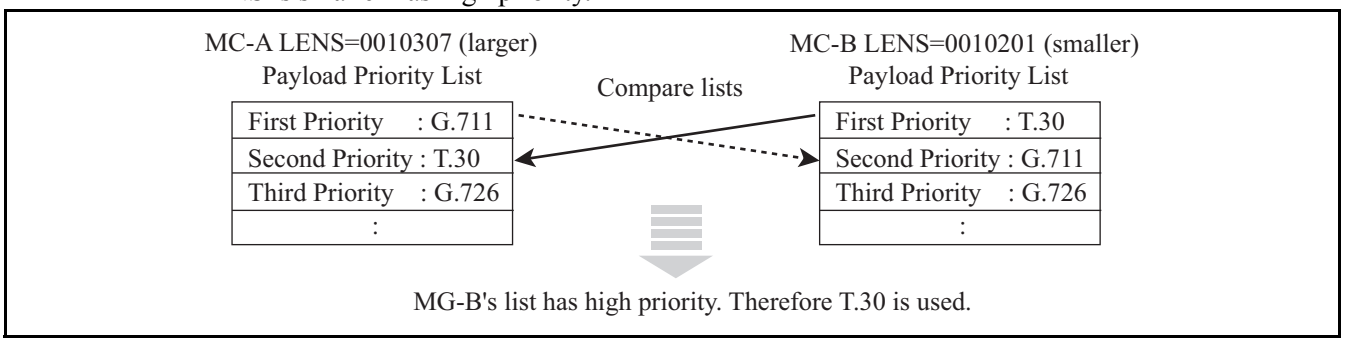
   Note: “MC” mentioned here is MC side equipped with Analog MC and MC&MG-COT (hereafter MC).

Connection Pattern	Data Setting	PCPro Command	Priority
(a) IP Station (MC) ⇔ IP Station (MC)	Set the data per MC port	AISTL	-
(b) IP Station (MC) ⇔ IPPAD (IP Station [MC] ⇔ Legacy Station/External Trunk)	When MC is to be connected to the external trunk, the FAX data for each route is used.	ARTI/ARTIN	High ↕ Low
	When MC is to be connected to the external trunk, and no FAX data is set to the external trunk, the data set to the MC is used.	AISTL	
	When MC is to be connected to Station, the data set to the MC is used.	AISTL	
	When no FAX data is set, the data transmission as voice data (payload type=G.711, payload size=40ms, jitter-buffer size=150ms) is used.	-	

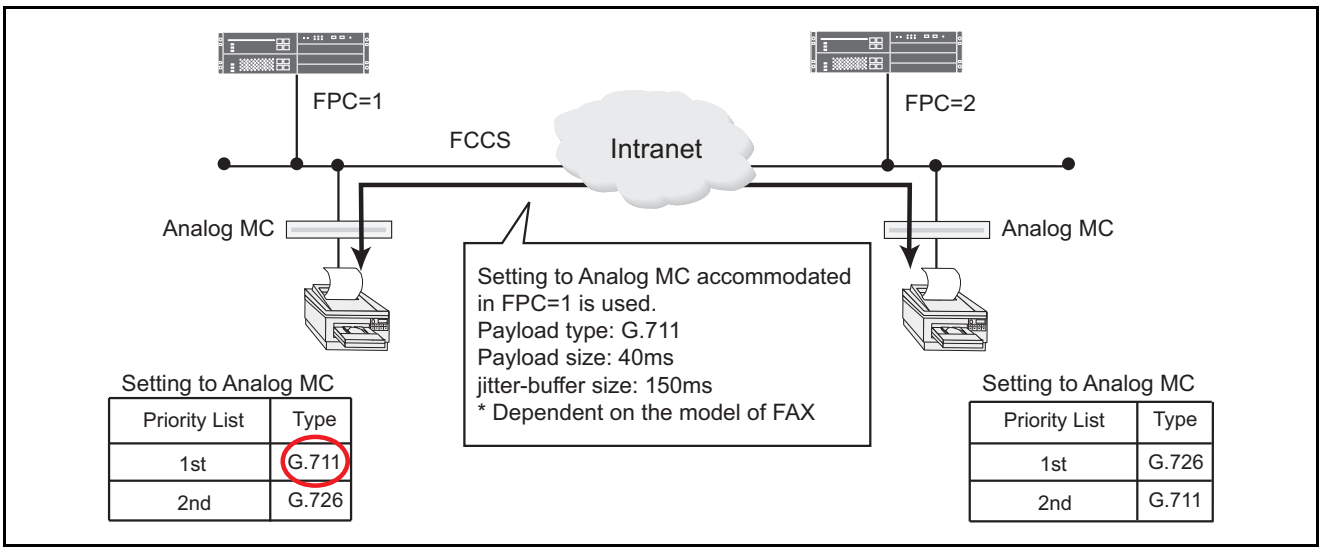
Connection Pattern		Data Setting	PCPro Command	Priority
(c) IP Station (MC) ⇔ MG		When MC is to be connected to the MG, FAX data for each external trunk route set to the MG is used.	ARTI/ARTIN	High ↕ Low
		When no FAX data (data set by ARTI/ARTIN command) is set to the external trunk route on MG, the data transmission as voice data (payload type=G.711, payload size=40ms, jitter-buffer size=150ms) is used.	-	
(d) CCIS over IP by PHC		FAX data set to the virtual speech route for CCIS over IP by PHC is used.	ARTI/ARTIN	-
		When no FAX data is set, the data transmission as voice data (payload type=G.711, payload size=40ms, jitter-buffer size=150ms) is used. **Note:** FAX data set to the destination through CCIS over IP by PHC is not valid.	-	
(e) Legacy Station/External Trunk ⇔ Legacy Station/External Trunk via FCCS over IP network	Legacy Station ⇔ Legacy Station	System data set to each node is used.	ASYDL/ ASYDN	-
	Legacy Station ⇔ Legacy External Trunk	FAX data set to each external route is used.	ARTI/ARTIN	
		When no FAX data is set, the data transmission as voice data (payload type=G.711, payload size=40ms, jitter-buffer size=150ms) is used.	-	
(f) SIP Handler Controlled Standard SIP Terminal ⇔ SIP Handler Controlled Standard SIP Terminal/ MG(SIP)	SIP Handler Controlled Standard SIP Terminal ⇔ SIP Handler Controlled Standard SIP Terminal	FAX data is set by enabling multimedia communication. **Note:** T.38 is the only possible payload type. **Note:** SIP Handler Controlled Standard SIP Terminals must have software installed for T.38 FAX use.	AUACL/ AUACN	-
	SIP Handler Controlled Standard SIP Terminal ⇔ MG(SIP)		ARTI/ARTIN AUACL/ AUACN	

(a) IP Station (MC) ⇔ IP Station (MC)

Note: The figures in (a) to (c) show the connections in case of via Analog MC.



Command: AISTL

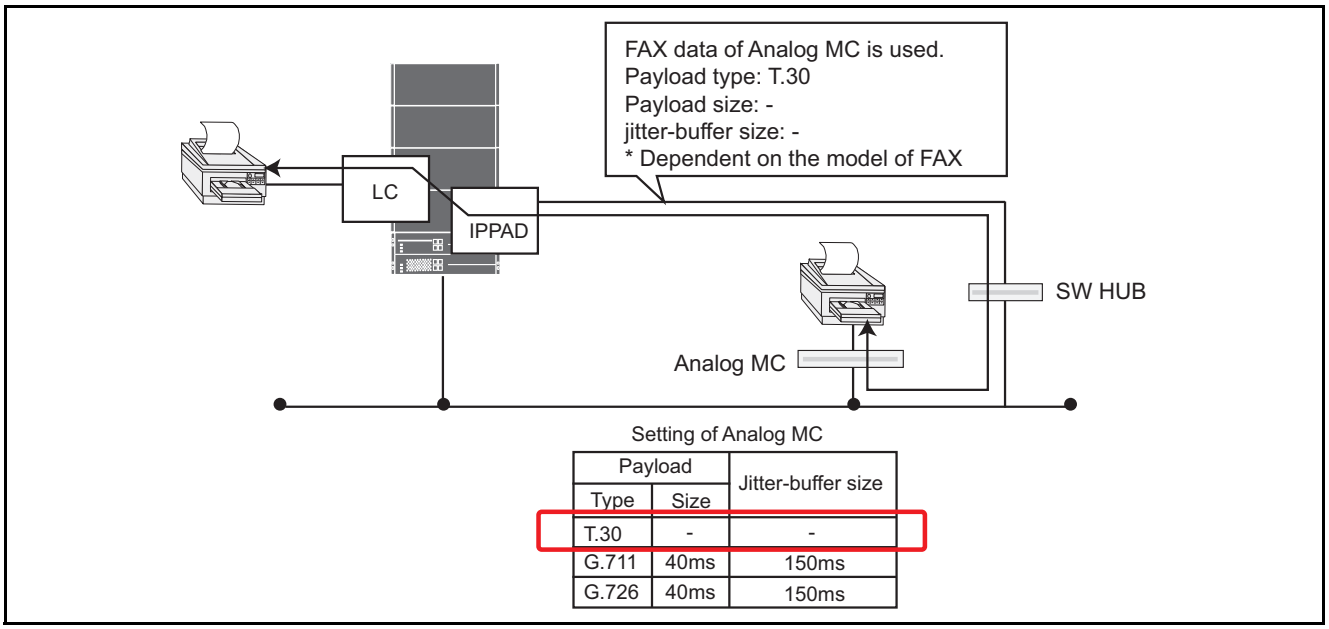


Setting Pattern	Setting Intent	Payload Type	Payload Size	Jitter-Buffer Size	Remarks
Recommended	Speed, Bandwidth Priority	T.30	-	-	Dependent on the model of FAX
Available	Connection Priority	G.711	40ms	150ms	-
Available	Bandwidth Priority	G.726	40ms	150ms	-

- Up to four priorities can be set by combining payload types and payload sizes (AISTL).
- When establishing FAX connection between MCs, specify the payload priority list and jitter-buffer size per MC port by AISTL.
- The payload type and payload size set in the both MCs' priority lists are used for the FAX connection between MCs.
- When the payload type and payload size set in the both terminals' priority lists are not found, G.711 is automatically selected and the data transmission as voice data (payload size=40ms, jitter-buffer size=150ms) is used.

- When there are differences in both terminals' payload priority list as shown below, MC whose LENS is smaller has high priority.

Example: FAX connection between IP Stations via FCCS over IP network



Command: AISTL

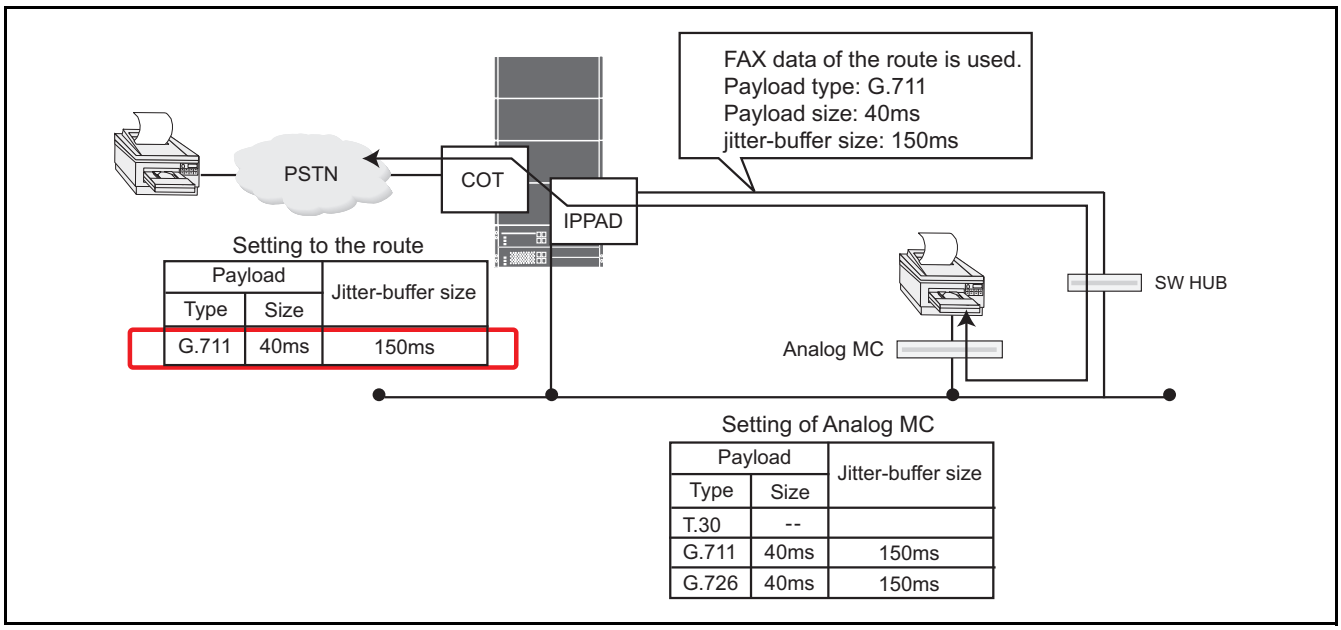
Setting Pattern	Setting Intent	Payload Type	Payload Size	Jitter-Buffer Size	Remarks
Recommended	Connection Priority	G.711	40ms	150ms	-
Available	Bandwidth Priority	G.726	40ms	150ms	-
Not available	Speed, Bandwidth Priority	T.30	-	-	-

Note: AISTL data set to MC accommodated in the node whose FPC is smaller has high priority.

(b) IP Station (MC) ⇔ IPPAD

[MC - IPPAD - TSW - LC (Legacy Station)]

Setting of Analog MC



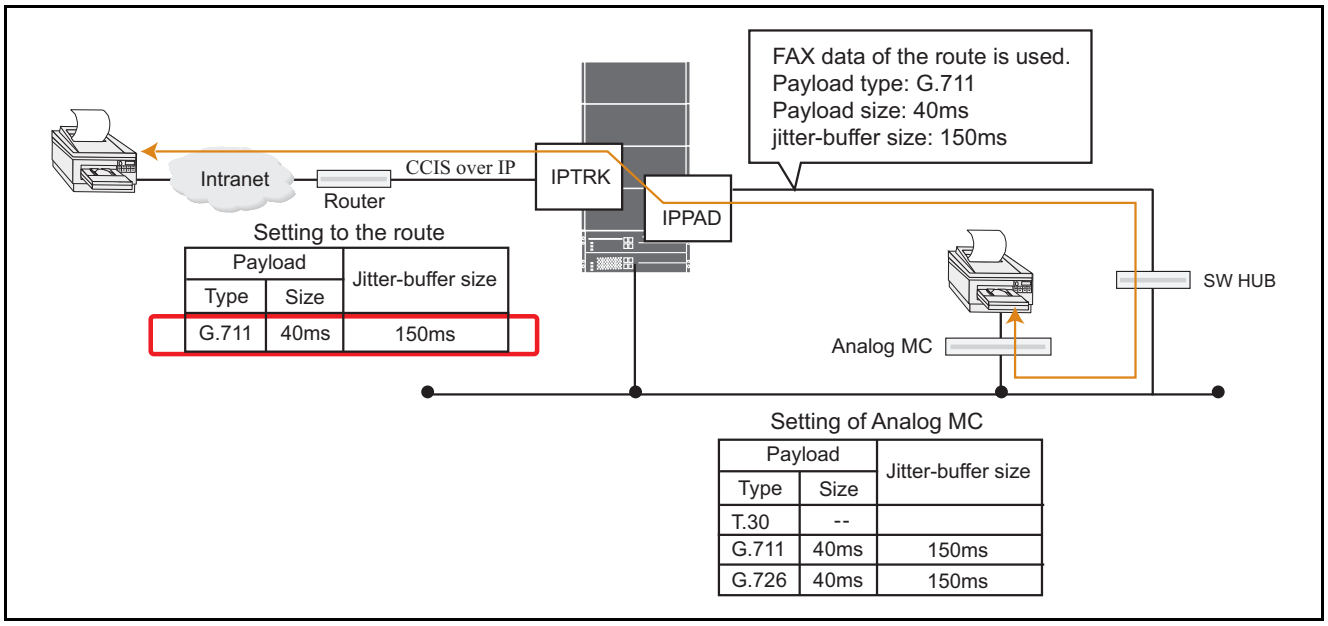
Payload		Jitter-buffer size
Type	Size	
T.30	-	-
G.711	40ms	150ms
G.726	40ms	150ms

Command: AISTL

Setting Pattern	Setting Intent	Payload Type	Payload Size	Jitter-Buffer Size	Remarks
Recommended	Speed, Bandwidth Priority	T.30	-	-	Dependent on the model of FAX
Available	Connection Priority	G.711	40ms	150ms	-
Available	Bandwidth Priority	G.726	40ms	150ms	-

[MC - IPPAD - TSW - External Trunk (Legacy Trunk)]

Example: FAX connection when COT circuit card is used as the External Trunk

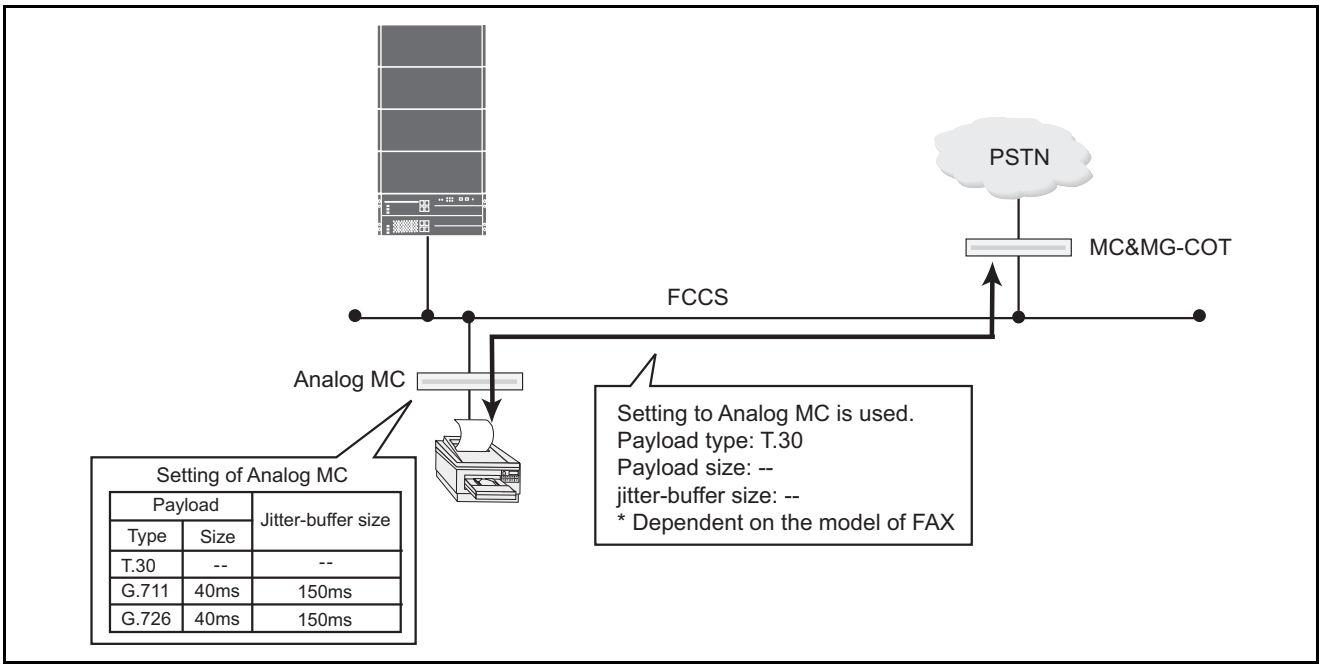


Command: ARTI/ARTIN, AISTL

Setting Pattern	Setting Intent	Payload Type	Payload Size	Jitter-Buffer Size	Remarks
Recommended	Connection Priority	G.711	40ms	150ms	-
Available	Bandwidth Priority	G.726	40ms	150ms	-
Available with restrictions	Speed, Bandwidth Priority	T.30	-	-	Dependent on the model of FAX (Available only when there is no FAX Relay on the external route.)

- The FAX data set to the external trunk route is used for the connection between MC and IPPAD.
- Even if the FAX data is set to the MCs, the FAX data set to the external trunk route is used.
- When no FAX data is set to the external trunk route, the FAX data set to the MC is used.
- Legacy external trunks are all the external trunks whose circuit cards are accommodated in PIR. IP-TRK (CCIS over IP) is also included.

Example: FAX connection when IPTRK (CCIS over IP) is used as External Trunk.



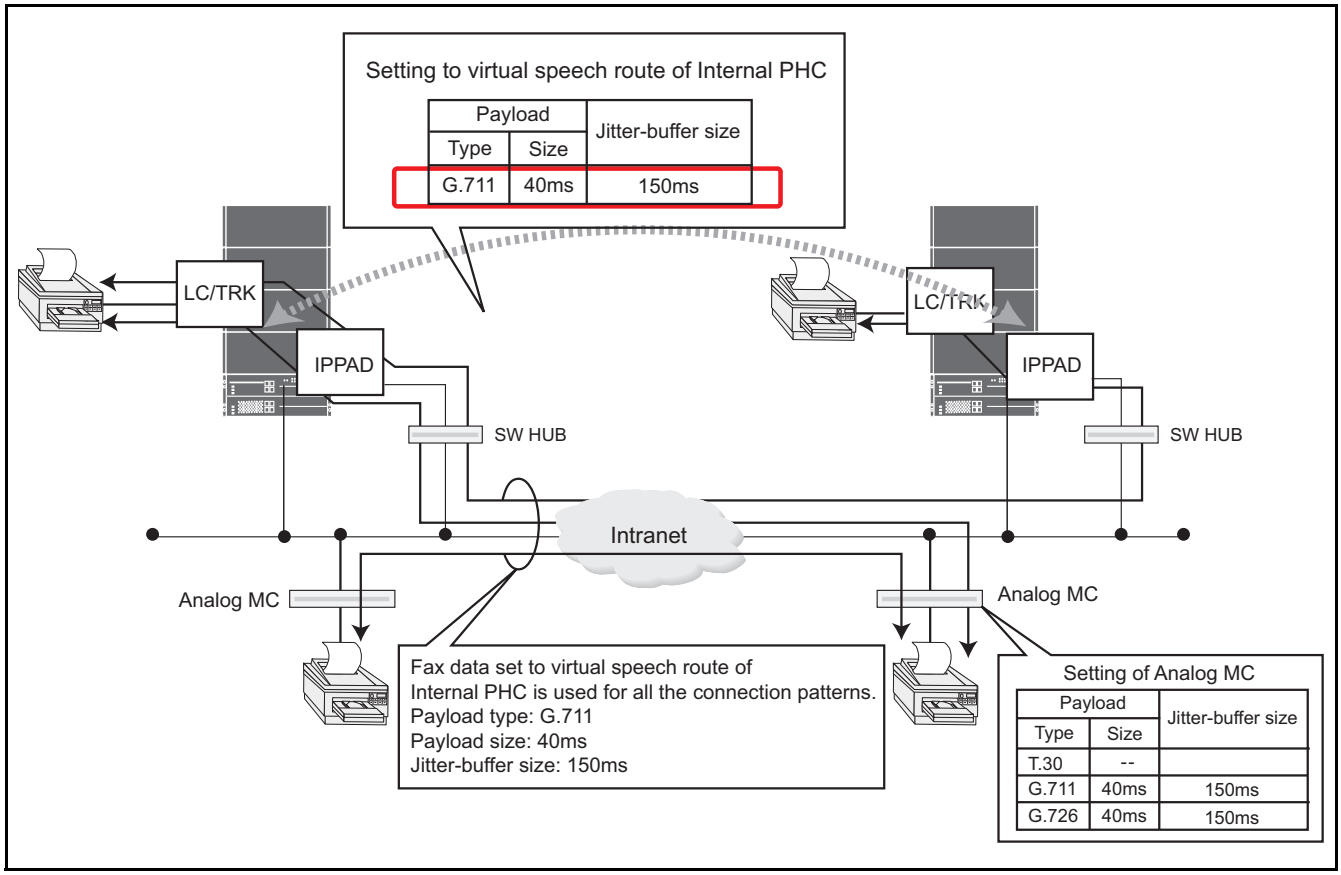
Command: ARTI/ARTIN

Setting Pattern	Setting Intent	Payload Type	Payload Size	Jitter-Buffer Size	Remarks
Recommended	Connection Priority	G.711	40ms	150ms	-
Available	Bandwidth Priority	G.726	40ms	150ms	-
Available with restrictions	Speed, Bandwidth Priority	T.30	-	-	Dependent on the model of FAX (Not available when there is FAX Relay on the IPTRK route.)

- The FAX data set per IPTRK route is used for the connection between MC and IPPAD.
- Even if the FAX data is set to MCs, the FAX data set to the IPTRK route is used.
- When IPPAD is connected to the external trunk having route number, the FAX data set per the route (by ARTI/ARTIN) is used.
- When IPPAD is connected to the Station, the FAX data set per MC is used.
- When there is no VCT on the IPPAD, or no FAX data is set to the IPTRK route, the data transmission as voice data (payload type = G.711, payload size=40ms, jitter-buffer size=150ms) is used.

(c) IP Station (MC) ⇔ MG

Command: ARTI/ARTIN, AISTL



Setting Pattern	Setting Intent	Payload Type	Payload Size	Jitter-Buffer Size	Remarks
Recommended	Connection Priority	G.711	40ms	150ms	-
Available	Bandwidth Priority	G.726	40ms	150ms	-
Available with restrictions	Speed, Bandwidth Priority	T.30	-	-	Dependent on the model of FAX (Available only when there is no FAX Relay on the external route.)

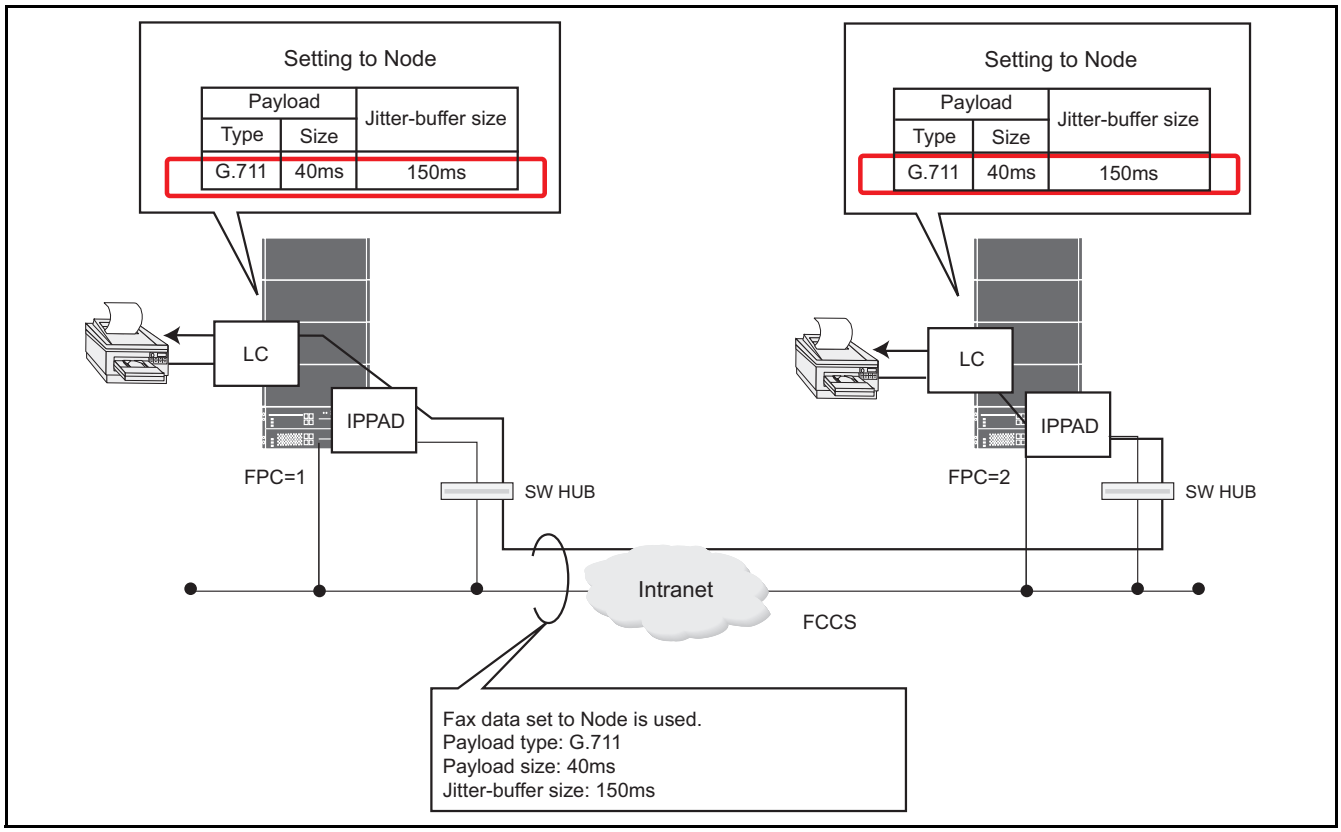
- The above FAX data set to the external trunk route is used for the connection between MC and MG.
- Even if the FAX data is set to the MC side, the FAX data set to the external trunk route is used.
- When no FAX data (data set by ARTI/ARTIN command) is set to the external trunk route, the data transmission as voice data (payload type=G.711, payload size=40ms, jitter-buffer size=150ms) is used.
- Legacy external trunks are all the external trunks whose circuit cards are accommodated in PIR. IP-TRK (CCIS over IP) is also included.

(d) CCIS over IP by PHC

Example: FAX connection to Internal PHC in Counter-office

FAX data set to virtual speech route is used as payload type, payload size, and jitter-buffer size in CCIS over IP by PHC connection. When no data is set to the virtual speech route, the FAX data set to MC that communicates with the destination via CCIS over IP by PHC is not used. Instead of that, the data transmission as voice data is used.

Command: ARTI/ARTIN



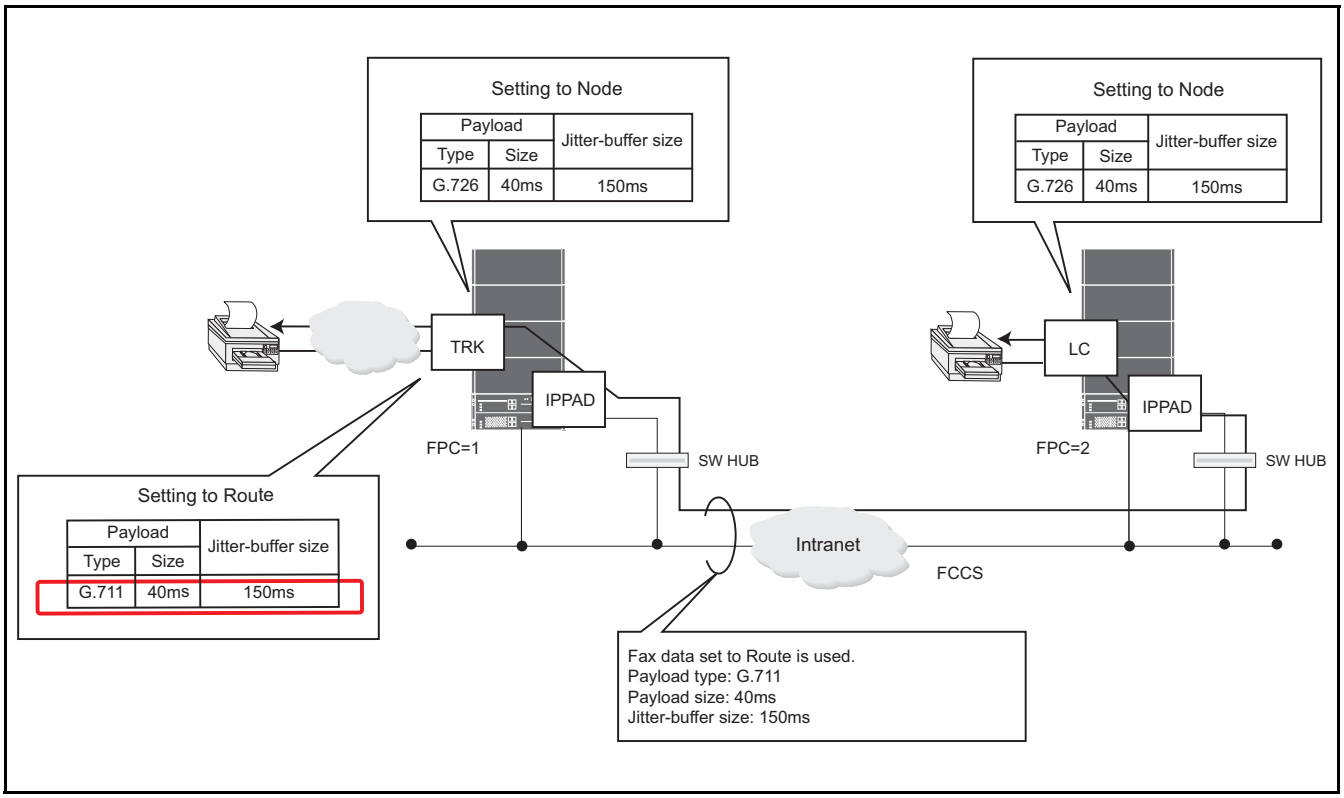
Setting Pattern	Setting Intent	Payload Type	Payload Size	Jitter-Buffer Size	Remarks
Recommended	Connection Priority	G.711	40ms	150ms	-
Available	Bandwidth Priority	G.726	40ms	150ms	-
Available with restrictions	Speed, Bandwidth Priority	T.30	-	-	Available only when there is no FAX Relay except PHC on the route for the FAX connection.

- The above FAX data set to each CCIS over IP by PHC virtual speech route is used for the FAX connection via CCIS over IP by PHC.

- Even if the FAX data is set to the sending and receiving MCs, the FAX data set to CCIS over IP by PHC route is used.
- When no FAX data is set to the CCIS over IP by PHC virtual speech route, the data transmission as voice data (payload type = G.711, payload size=40ms, jitter-buffer size=150ms) is used even if the FAX data is set to the sending and receiving MCs.

(e) Legacy Station/External Trunk ⇔ Legacy Station/External Trunk via FCCS over IP network

Example: FAX connection between Legacy Stations



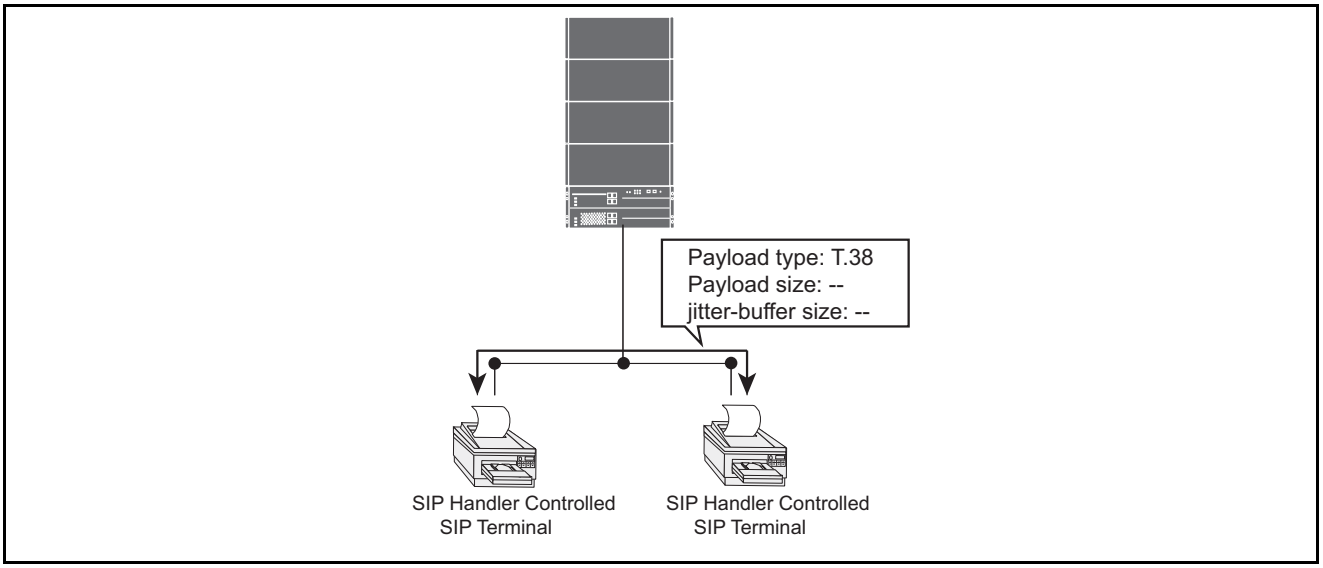
Command: ASYDL/ASYDN

Setting Pattern	Setting Intent	Payload Type	Payload Size	Jitter-Buffer Size	Remarks
Recommended	Connection Priority	G.711	40ms	150ms	-
Available	Bandwidth Priority	G.726	40ms	150ms	-
Available with restrictions	Speed, Bandwidth Priority	T.30	-	-	Dependent on the model of FAX (Available only when there is no FAX Relay on the external route.)

- When the FAX connection is established between Legacy Stations, system data set to each node is used. Set the same payload type, payload size and jitter-buffer size to the all nodes by ASYDL command.
- When no system data is set, the data transmission as voice data (payload type = G.711, payload size=40ms, jitter-buffer size=150ms) is used.

Example: FAX connection between Legacy Station and External Legacy Trunk

Command: ARTI/ARTIN

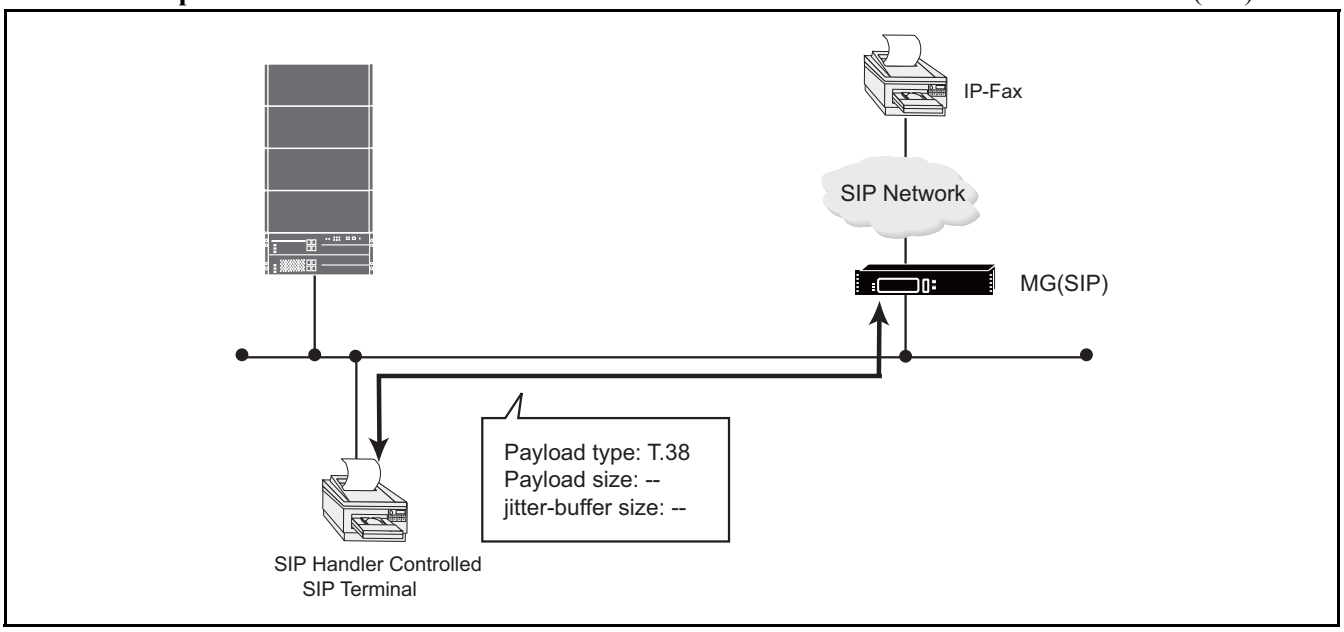


Setting Pattern	Setting Intent	Payload Type	Payload Size	Jitter-Buffer Size	Remarks
Recommended	Connection Priority	G.711	40ms	150ms	-
Available	Bandwidth Priority	G.726	40ms	150ms	-
Available with restrictions	Speed, Bandwidth Priority	T.30	-	-	Dependent on the model of FAX (Available only when there is no FAX Relay on the external route.)

- When no system data is set, the data transmission as voice data (payload type = G.711, payload size=40ms, jitter-buffer size=150ms) is used.
- When IPPAD without VCT is used, data transmission as voice data (jitter-buffer size=150ms, payload type=G.711, payload size=40ms) is used.

(f) SIP Handler Controlled Standard SIP Terminal ⇔ SIP Handler Controlled Standard SIP Terminal/ MG(SIP)

Note: Operations are not guaranteed for other features of SIP Handler Controlled SIP terminal than T.38 FAX data.



Example: FAX connection between SIP Handler Controlled Standard SIP Terminals

Command: AUACL/AUACN

- FAX data is set by enabling multimedia communication for SIP Handler Controlled Standard SIP Terminals.
- T.38 is the only possible payload type.
- SIP Handler Controlled Standard SIP Terminals must have software installed for T.38 FAX use.

Example: FAX connection between SIP Handler Controlled Standard SIP Terminal and MG(SIP)

Command: ARTI/ARTIN and AUACL/AUACN

- FAX data is set by enabling multimedia communication for SIP Handler Controlled Standard SIP Terminals and MG(SIP).
- T.38 is the only possible payload type.
- SIP Handler Controlled Standard SIP Terminals must have software installed for T.38 FAX use.

5. Conditions for FAX using T.38 payload type are as follows:
   a.) FAX data can be transmitted using only the following connection patterns:
      - SIP Handler Controlled SIP terminal and SIP Handler Controlled SIP terminal
      - SIP Handler Controlled SIP terminals and MG(SIP)

   b.) Telephony Server does not assign or control the payload type for FAX data. FAX data can be sent as long as both SIP Handler Controlled Standard SIP terminals use T.38 payload type. Terminals operations when the SIP Handler Controlled Standard SIP terminal does not have T.38 payload type are defined by each actual SIP Handler Controlled Standard SIP terminal's model specifications.

   c.) If UDP is used for FAX data, packets may be fragmented and congestion control is not available. For this reason, if there is the risk of UDP packets fragmentation, TCP setting (**Note 7**) is recommended.

   Note 7: When using TCP, make sure that all the terminals employed support TCP. Refer to the manual of each terminal for the TCP settings. See the <Interactions with Other Features> section of SIP HANDLER - SIP TERMINAL [S-167] for the conditions of TCP for Internal SIP Handler.

   d.) When using PEER TO PEER BANDWIDTH CONTROL [P-75], bandwidth of FAX data is not counted for the bandwidth calculation. Even if the FAX data is used as voice only and is using a codec supported by the Telephony Server, bandwidth will not be counted.

e.) SIP Handler Controlled Standard SIP terminals and devices used for FAX data must be compliant with the following RFCs:
- RFC 2327
- RFC 3261
- RFC 3262
- RFC 3264
- RFC 3311
- RFC 3323
- RFC 3515
- RFC 3550
- RFC 3891
- RFC 4028

f.) The SIP Handler Controlled Standard SIP terminal must have transmission capabilities for FAX data. A connection test performed by NEC is required before using a Standard SIP terminal (3rd party product).

g.) In a FCCS system FAX data can be sent only with FCCS NETWORKING VIA IP [F-36].

h.) CCIS NETWORKING VIA IP [C-163] of Data Programming Manual - CCIS cannot be used for FAX data. Station-To-Station connection after the Link Reconnection of CCIS networking via IP is also not supported for FAX data.

i.) Connection between two SIP Handler Controlled Standard SIP terminals or devices must be Peer-to-Peer.

j.) In case there is a failure in the session information inquiry, FAX data is possible based on the session information (**Note 8**) exchanged during the establishing of the call. If such session information exchanged during the establishing of the call also fails, FAX transmission is not possible.

Note 8: This session information exchange (proprietary protocol) is used for the media information (SDP information) exchange of the SIP Handler Controlled Standard SIP terminal (trough the Internal SIP Handler of the Telephony Server) and the MG(SIP). Session information inquiry is also included in the Session information exchange protocol.

k.) SIP Handler Controlled SIP terminal in Multiline Mode does not perform session information inquiry for a call received to a subline. However, FAX data is possible based on the session information exchanged during the establishing of the call.

l.) FAX data sending is not possible using the subline of a desktop terminal that has assigned the my line of a SIP Handler Controlled SIP terminal. In this case the desktop terminal can only maintain a voice communication.

m.) According to the session information inquiry for FAX data, the call sender notifies the receiver of the desired codec for FAX data with an SDP included in the INVITE. However, in the following cases the INVITE message cannot include an SDP:
- When receiving a blind transfer of REFER of a SIP Handler Controlled SIP terminal
- In the recalling after CALL HOLD [C-6] for a long time
- In the recalling of CALL BACK [C-1]
- A call received to the subline when being in Multiline Mode

Note: The reINVITE message send by the Telephony Server when switching the connection path may or may not include an SDP depending on the specific environment and other conditions.

However, the FAX data is possible in the cases above with the response of the receiving side based on the session information exchanged during the establishing of the call.

n.) The DTMF transparency conditions of FAX data sending are the same as the conditions of a voice call. For voice call conditions see <Hardware/Software> section of SIP HANDLER - SIP TERMINAL [S-167].
RFC2833, SIP-INFO and In-band Signaling can be used but the method is decided depending on the specifications of the actual SIP Handler Controlled Standard SIP terminal.

o.) In some cases, if a change in the media information using a reINVITE request is performed during FAX data sending, the SIP Handler Controlled Standard SIP terminal may reply with an error message regardless of the settings of CDN9 (Reject unacceptable reINVITE) in the AUACL/AUACN command.

Note: A change in the media information means a change in the codec, etc without changing the call state.

p.) Set 2nd DT: 0 (Second DT is not sent) in the ASPA/ASPAL/ASPAN command for the connection of SIP Handler Controlled Standard SIP terminals and MG(SIP) when using FAX data.

q.) MG(SIP) conditions are as follows:

- The following MG(SIP)s are supported:
  - MG-SIP128 [MG-SIP128 [MG-128SIPMGL-A]
  - Software-based MG-SIP with firmware version SP-4085 MGSIPVM PROG-E Issue 1 or later
- When MG-SIP SHARED ROUTE [M-123] is used, make sure that all the used MG(SIP) are usable for FAX data and have the same version. If different versions are used, even if the same access code is used, FAX data may become not possible depending on the seized trunk.
- When a SIP Handler Controlled Standard SIP terminal connected with MG(SIP) is put on hold, MG(SIP) does not send a hold notification to the IP network, but sends a hold tone.
- T.38 payload type only supports UDPTL protocol for packets sending.
- If the MG(SIP) does not have the suitable codec when receiving the reINVITE/UPDATE request from SIP network side, Error response assigned by the configuration command “set no_media_code” (**Note 9**) is sent back to the SIP network side.
- If the MG(SIP) does not have the suitable codec when receiving the reINVITE/UPDATE request from Telephony Server network side, 488 (Reject) response is sent back to the Telephony Server side.

  Note: The “set no_media_code” command is not used in the Telephony Server network side because the command is used to answer a request from the SIP network side.
- FAX data sending is available only when “enable” is assigned by the configuration command “set sip_tel_service”. (**Note 9**)

Note 9: For details of configuration commands, see the MG-SIP128 [MG-128SIP-MGG-B/MG-128SIPMGG] section of CHAPTER 2 in Peripheral Equipment Description (IP Devices).

6. Conditions of MG(SIP) usage for FAX communication, except in case of using T.38, are as follows:

a.) FAX communication can be established with G.711 assigned to payload for Voice and FAX.

However, regarding G.711, when the codec change feature and G.711 FAX Renegotiation feature are enabled, FAX communication can be established while a call is in progress with G.729a. For more details, refer to the command section (set codec_change) of each MG(SIP) in Peripheral Equipment Description (IP Devices). **Note 10**

b.) FAX communication can be established only when Payload Sizes for Voice and FAX are the same.

c.) To establish FAX communication with SIP network via MG-SIP, be sure to assign G.711 as Payload Type for all the FAX accommodated in the system.

Note 10: When using G.711, the following firmware is required for MG(SIP):

- MG-SIP16 [SCA-16SIPMG (US)] with SP-3988 MGSIP (16) PROG-G Issue 3 or later
- MG-SIP96 with SP-3987 MGSIP PROG-B Issue 3 or later
- MG-SIP128 [MG-128SIPMGG]/[MG-128SIPMGG-B]/ MG-SIP128 [MG-128SIPMGL-A]: any version
- Software-based MG-SIP: SP-4085 MGSIPVM PROG-E

Programming

- For MC Port

STEP 1: **ASYD** - SYS1, Index 64, Bit 0. G.711 Voice Compression CODEC Conversion μ–Law/A-Law Selection = 0/1

STEP 2: **AISTL** (Assignment of IP Station Data)

TN: Tenant Number [1-63]

KIND: Select Analog MC/MC-MG (COT)/8MC-SIP from the combo box.

UG50 Multi-slot mode: Check the checkbox to register UG50 in Multi-slot mode.

Check the FAX Setting Data box to assign the following FAX control data. If the check box is not checked, the default values will be applied.

JITSIZ: Specify Jitter Buffer size for FAX control [1-60] (The values from 1 to 60 indicate that 10 milliseconds to 600 milliseconds.)

PAYTYP1-4: Specify Payload Type for FAX control [G711, G726, or T30]

PAYSIZ1-4: Specify Payload Size for FAX control [10-40 milliseconds] (This data is required only when G.711 or G.726 is specified in the FXPT parameter)

Note: When deleting FAX IP data, follow the procedure below.
AISTL (Assignment of IP Station Data)
KIND: Select Analog MC from the combo box.
Uncheck the FAX Setting Data box to delete the existing FAX IP data. (FAX connection is established with the default values.)

To Delete: FAX data is deleted by unchecking the check box of “FAX setting data”. After the data is deleted, default FAX data is applied.

- For External Trunk (Legacy Trunk, MG, CCIS over IP by PHC virtual speech channel) Route

STEP 1: **ASYD** - SYS1, Index 64, Bit 0. G.711 Voice Compression CODEC Conversion μ–Law/A-Law Selection = 0/1

STEP 2: **ARTI/ARTIN** (Assignment of Trunk Application Data)

RT: Assign Route Number used for FAX connection [1-255]

CDN71: FXD: Enable/Disable IP FAX Data (FXJS, FXPT, FXPS) =0/1

CDN72: FXJS: Specify Jitter Buffer size for FAX control [1-60] (The values from 1 to 60 indicate that 10 milliseconds to 600 milliseconds.)

CDN73: FXPT: Specify Payload Type for FAX control [G.711, G.726, or T.30]

CDN74: FXPS: Specify Payload Size for FAX control [10-40 milliseconds] (This data is required only when G.711 or G.726 is specified in the FXPT parameter)

Note: To change the data for existing route (RT), initialize or reboot the trunk device such as circuit card or MG.

To Delete: FAX data is deleted by specifying "0" for the following data. After the data is deleted, default FAX data is applied.

ARTI/ARTIN command:
CDN71: FXD
CDN72: FXJS
CDN73: FXPT
CDN74: FXPS

- For connection between Legacy Stations/External Trunks via FCCS over IP network

STEP 1: **ASYD** - SYS1, Index 64, Bit 0. G.711 Voice Compression CODEC Conversion μ–Law/A-Law Selection = 0/1

STEP 2: **ASYDL/ASYDN** - SYS1, Index 652, Bit 0 to Bit 3. Payload Type for FAX control (0: -, 1: G.711, 2: G.726, 3: T.30, 4-15: Not used). *Assign Payload Type for FAX in hexadecimal format. (Ex: G.726.1 → 02 [hex]) **Note 11**

SYS1, Index 653, Bit 0 to Bit 4. Payload Size for FAX control (0: -, 1: 10ms, 2: 20ms, 3: 30ms, 4: 40ms, 5-31: Not used) *Assign Payload Type for FAX in hexadecimal format. (Ex: 30ms → 03 [hex]) **Note 12**

SYS1, Index 654, Bit 0 to Bit 7. Jitter Buffer size for FAX control (1-30 **Note 13, Note 14**) *Assign the Jitter Buffer size in hexadecimal format. (Ex: 10ms → 01, 100ms → 0A, 200ms → 14, 300ms → 1E)

Note 11: When ASYDL/ASYDN, SYS1, Index 652=0 is set, "payload type: G.711" and "payload size: 40ms" are applied as default data. (Even if payload size is set by Index 653, payload size is fixed to 40ms.)

Note 12: Assign this data when ASYDL/ASYDN, SYS1, Index 652=1 (G.711) or 2 (G.726) is set.
When Index 652=0 is set, default data "payload size: 40ms" is applied even if payload size is set by this parameter.
When Index 652=1 (G.711) or 2 (G.726) is set and Index 653=0 is set, default data "payload size: 40ms" is applied.

Note 13: The values from 1 to 30 indicate that 10 milliseconds to 300 milliseconds.

Note 14: When the value 0 is set,"150 milliseconds" is set as default data.

To Delete: FAX data is deleted by specifying "0" for the following data. After the data is deleted, default FAX data is applied.

ASYDL/ASYDN command:
Index 652, Bit 0 to Bit 7=0
Index 653, Bit 0 to Bit 7=0
Index 654, Bit 0 to Bit 7=0

- For connection between SIP Handler Controlled Standard SIP Terminals or with MG(SIP)

Note: FAX data assignment is done after finishing the basic programming for the used terminals and devices.
For SIP Handler Controlled SIP Terminal, see data programming in SIP HANDLER - SIP TERMINAL [S-167].
For MG(SIP), see data programming in MEDIA GATEWAY SIP [M-111].

<For SIP Handler Controlled SIP Terminal>

STEP 1: **ASYDL**- Assign the following.
Index 1394, Bit 0 and 1: Select transport protocol for session information exchange of SIP devices.**Note 15 Note 16**

Transport Protocol	Bit 0	Bit 1
AUTO **Note 17**	0	0
TCP **Note 18**	1	0
UDP	0	1

Note 15: If FCCS system is used, set these bits in the ASYDN to ensure that all nodes have the same settings.

Note 16: in the FCCS system and UMGi system, this setting is valid for session information exchanges of Internal SIP Handlers between nodes. In other combinations, UDP is used.

Note 17: With this setting the packets are sent using UDP, but if the size exceeds 1400 bytes TCP is automatically used.

Note 18: If there is the risk of packet fragmentation when using UDP, set to TCP.

Index 1408, Bit 0: Use TCP for SIP Messages.
0= Disabled
1= Enabled

Note: If this setting is changed, Internal SIP Handler needs to be initialized with the ADPM, ADTM or SINZ command.

Note: Since TCP for big messages is recommended, set this bit to Enabled is also recommended.

STEP 2: **AUACL/AUACN** - Assign the following.
CDN 20 (Multimedia Communication): 1 (Enable)
CDN 21 (Hold Detection at Multimedia): **Note 19**
0: Audio
1: Audio and Video

2: Non-detection
CDN 22 (Transport Layer) **Note 20**

0: AUTO
1: UDP
2: TCP

Note: Verify that ASYDL, SYS1, Index 1382, Bit 2 =0.

Note 19: Please note the following points:

- This setting requires CDN 20 to be set to 1.
- For SIP Handler Controlled Standard SIP video terminals that notify media changes as the voice being muted while the video communication is kept, select pattern 1 or 2.
  For SIP Handler Controlled Standard SIP video terminals that do not notify media changes as the voice being muted, select pattern 0 (default).For a terminal without video capacity, even if 1 is set, operations will be the same as if 0 is set.
- A change in the parameter is applied when there is call sending/receiving.

Note 20: Please note the following points:

- This setting does not decide the transport layer for the terminals. What is set is the protocols used by the SIP Handler of the Telephony Server when assisting the communication between the terminals.
- This setting requires the TCP setting to be enabled. If TCP is not enabled (because system data settings or other reason), TCP for the sending and receiving of SIP messages is not possible.
- This setting is used only if the transport protocol is not set in the transport parameter of the Contact header in the REGISTER request. If the transport protocol is set in the REGISTER, that protocol is used regardless of the setting of CDN22.
- The default setting uses TCP for sending SIP messages of more than 1300 bytes or answering to TCP request messages (regardless of the size of the answering message).
- If UDP is selected, the SIP Handler sends the request messages using UDP (be aware that long messages may become fragmented). However, the SIP Handler is also able to process messages received with TCP and any message received with TCP is also answered with TCP regardless of this parameter setting.
- If TCP is selected, the SIP Handler uses TCP for sending messages but is able to process received messages with UDP.
- A change in the parameter is applied when there is call sending/receiving.

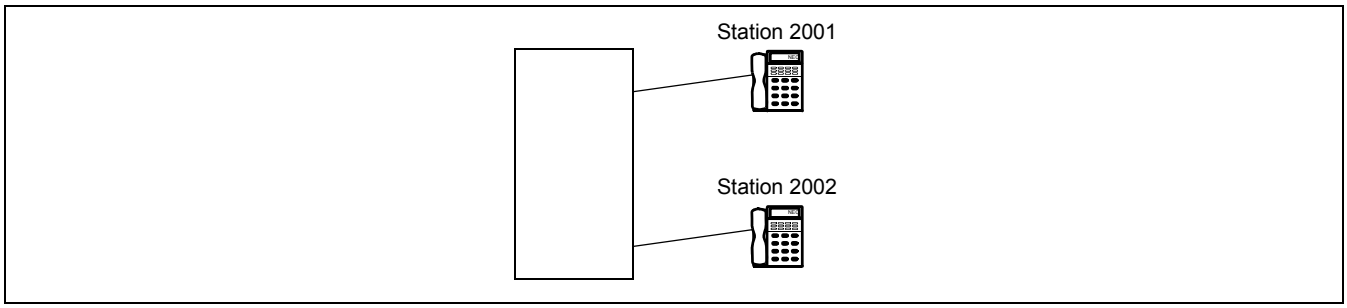
<For MG(SIP)>

STEP 1: **ARTI/ARTIN** - Assign the following.
CDN 110 (Multimedia Communication): 1 (In Service)

Note: Regarding the number plan (LCR/LCRS) of the MG(SIP) sending connection, set 2nd DT: 0 (Second DT is not sent) with the ASPA/ASPAL/ASPAN command.

I-45 Individual Call Hold Recall Timer

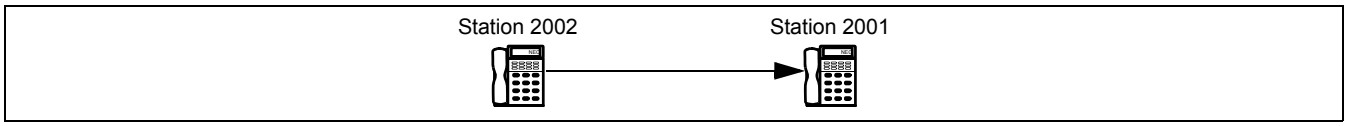
(Series 8400 software feature)



General Description

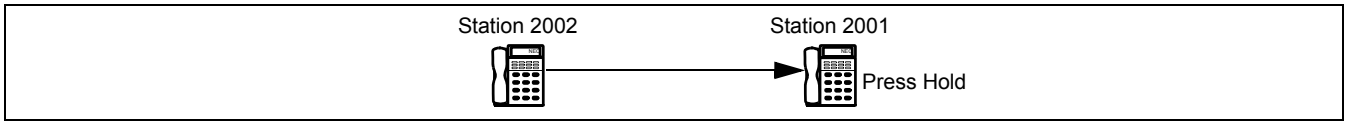
This feature provides the Desktop terminal with the ability to individually set the options for the Call Hold Recall Timer setting.

Note: This feature is only available in North America.

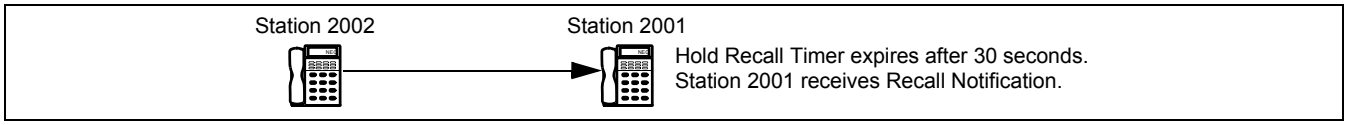


Operating Procedure

1. Station 2001 places or receives a call and presses the HOLD key. After Call Hold Recall Timer Individual expires, Station 2001 is recalled.

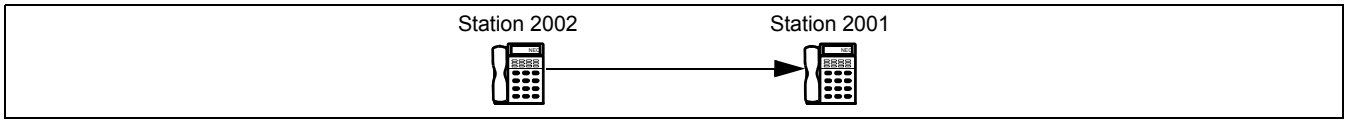


Desktop terminal Procedure for 30-second Timer

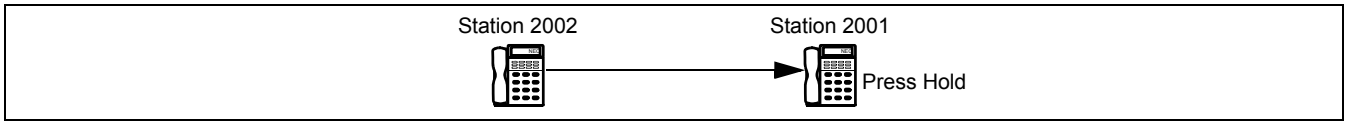


1. The ASYD, SYS1, Index 144 is set to 10 seconds.
2. The ADAI command has 144 MTC set to "F", 144 TC set to "3" (30 seconds), and 144 RA set to "0".
3. Station 2001 receives and answers a call from Station 2002.

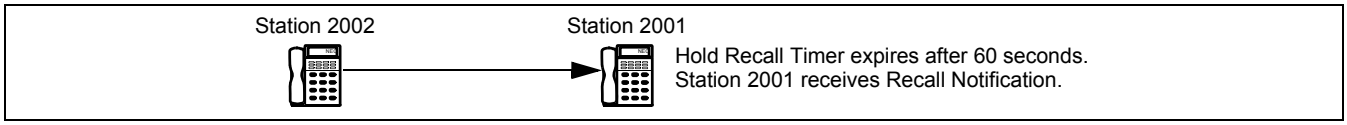
4. The User at Station 2001 presses the HOLD key and places the call on Hold.



5. The ADAI setting of 30 seconds takes priority over System Data (ASYD, SYS1, Index 144) setting of ten seconds. Station 2001 receives Recall Notification in 30 seconds.

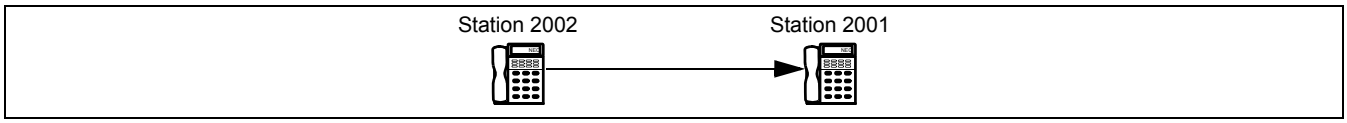


Desktop terminal Procedure for 60-second Timer

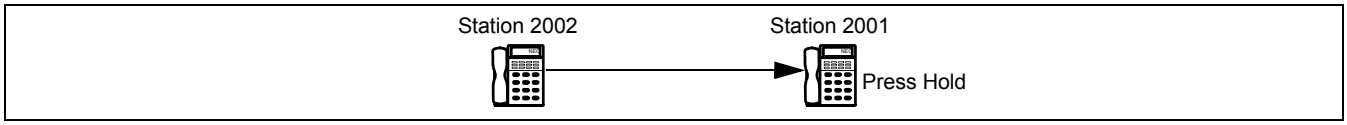


1. The ASYD, SYS1, Index 144 is set to 10 seconds.
2. The ADAI command has 144 MTC set to "8", 144 TC set to "7" (60 seconds), and 144 RA set to "0".
3. Station 2001 receives and answers a call from Station 2002.

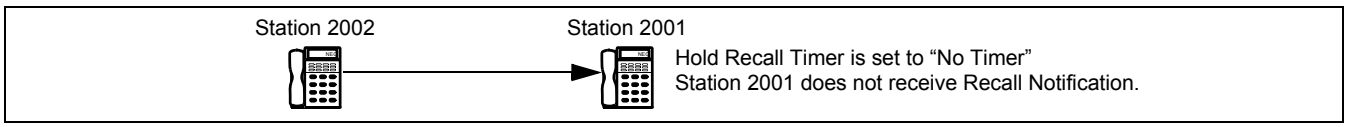
4. User at Station 2001 presses the HOLD key and places call on Hold.



5. The ADAI setting of 60 seconds takes priority over System Data (ASYD, SYS1, Index 144) of ten seconds. Station 2001 receives Recall Notification in 60 seconds.



Desktop terminal Procedure for no Timer



1. The ASYD, SYS1, Index 144 is set to 10 seconds.
2. The ADAI command has 144 MTC set to "0", 144 TC set to "0", and 144 RA set to "1" (no Timer).
3. Station 2001 receives and answers a call from Station 2002.

4. The User at Station 2001 presses the HOLD key and places the call on Hold.

5. The ADAI setting of no Timer takes priority over System Data (ASYD, SYS1, Index 144) of ten seconds. Station 2001 does not receive Recall Notification.

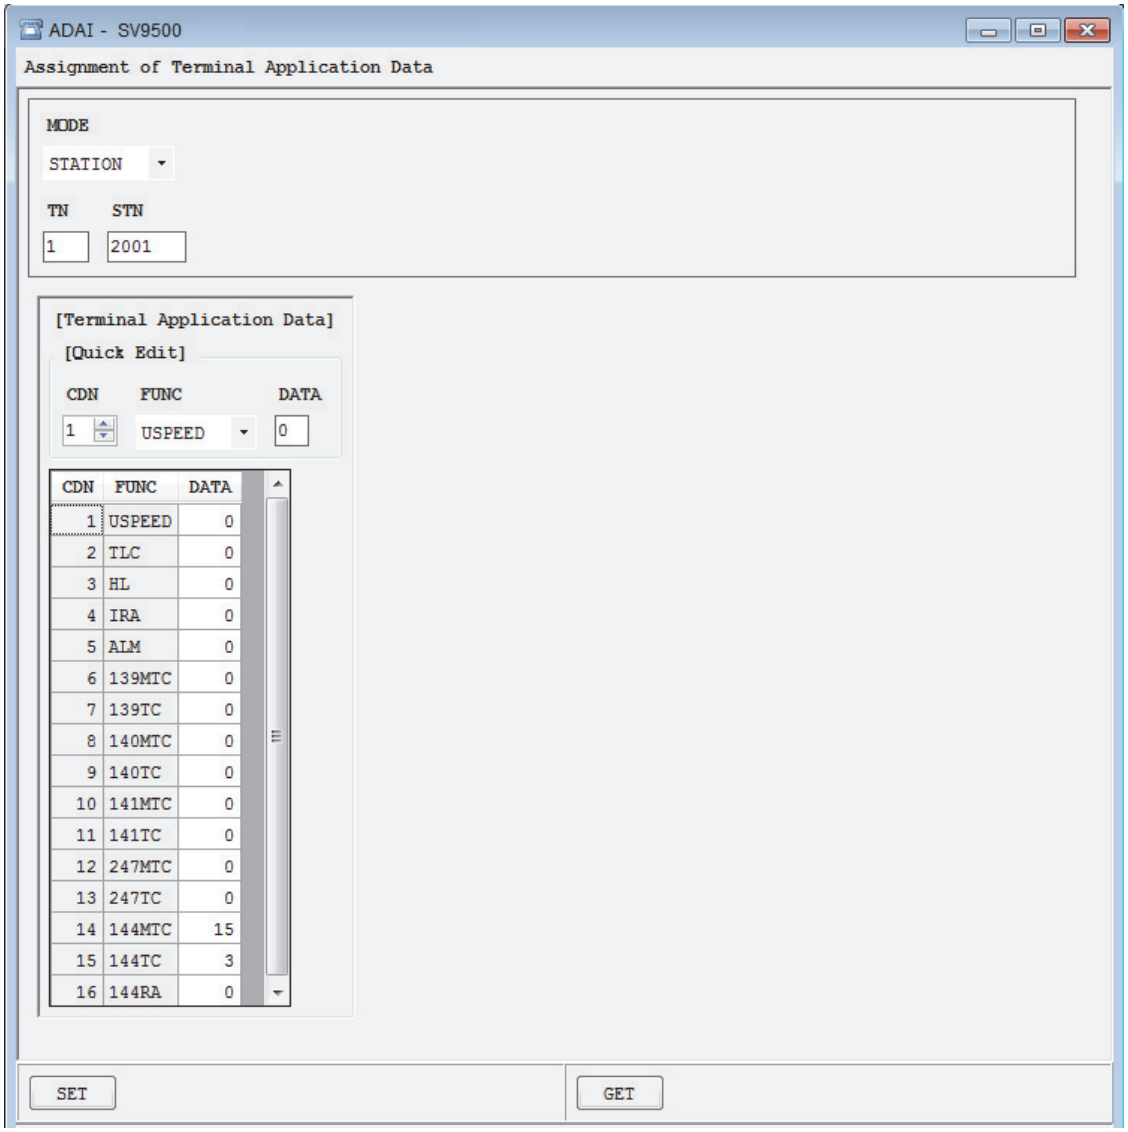
Service Conditions

1. This feature is only be available for a Desktop terminal.
2. Pressing the HOLD key on the Desktop terminal accesses the feature.
3. Without the ADAI command, the feature uses the System Data (ASYD, SYS1, Index 144).
4. This feature is not available for an Analog Station.
5. The use of an Access Code is available on both an Analog Station and a Desktop terminal.
6. When using an Access Code, both an Analog Station and a Desktop terminal use System Data Index 139.
7. When ADAI Recall Timer is set, it takes priority of the setting in ASYD.
8. The 144 RA parameter in the ADAI command is for a “No Recall” option.
9. The 144 RA parameter in ADAI will only override the System Data (ASYD, SYS1, Index 144).

Programming

To assign

Station 2000 calls Station 2001. Hold Recall Timer is set to 3F, which overrides System Data (ASYD, SYS1, Index 144).



ADAI - Assign the following data.

Mode: Station

TN: 1

STN: 2001

See the following example:

To delete

ADAI - Assign the following data.

Delete:
Mode: Station
TN: 1
STN: 2000
DEL?: Y

I-46 Individual Call Block

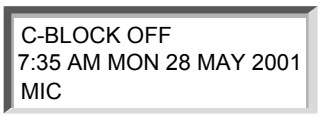
(Series 8800 software feature)

General Description

This feature allows up to 1023 LENS per IMG the ability to set 16 individual Call Block bins (up to 16 digits each). Individual Call Block can be turned off or on for all Call Block Numbers by means of an Access Code, without the need to delete the Call Block bins.
Individual Call Block allows a Trunk Caller to be routed to a common announcement instead of a Busy Tone.
In addition, the last number received feature allows the last calling number received to be saved without dialing the Block Number or Individual Calling Number (only one number can be saved in this manner).

Note: This feature is only available in North America.

Operating Procedure



To turn on Individual Call Block

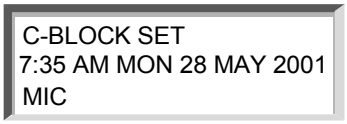
1. Lift the handset and dial the Call Block Active On Access Code "SSCA SIDA 126).
2. Wait for the Service Set Tone.
3. Replace the handset.
4. The Desktop terminal LCD displays:

To turn off Individual Call Block

1. Lift the handset and dial the Call Block Active Off Code Access Code (SSCA SIDA 127).
2. Wait for Service Set Tone.
3. Replace the handset.
4. The Desktop terminal LCD displays:

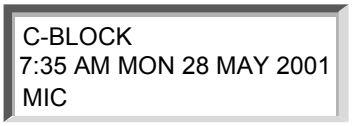
To set Call Block Restriction DC to a bin

1. Lift the handset and dial the Call Block Set Access Code (SSCA SIDA 129).
2. Receive Stutter Dial Tone.
3. The Desktop terminal displays:



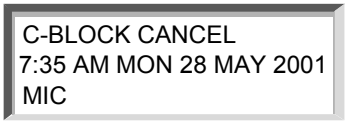
4. Dial the individual Bin Number 00-15, receive Special Dial Tone.

   Note: Call Block last number received is automatically saved to Block Bin 00.



5. Dial the exact digits to be blocked (a maximum of 16 digits).

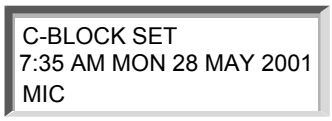
6. Wait for Service Set Tone.
7. Replace the handset.
8. The Desktop terminal LCD displays:



To delete Call Block Restriction DC from a bin

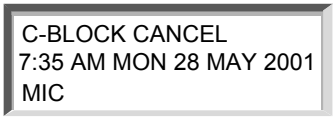
1. Lift the handset and dial the Call Block Set Access Code (SSCA SIDA 129).
2. Receive Special Dial Tone.
3. The Desktop terminal LCD displays:

4. Dial the individual Bin Number 00-15, receive Dial Tone.
5. Wait for Service Set Tone.
6. Replace the handset.
7. The Desktop terminal LCD displays:



To set Call Block DC for last number received

1. Lift the handset and dial the Call Block Last Number Set Access Code (SSCA SIDA 128).
2. Receive Service Set Tone.
3. Replace the handset.

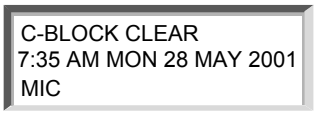


Note: Block Bin 00 is used for setting the last number block received feature. Block Bin 00 will be overwritten each time the set Call Block DC for last number received is dialed.

4. The Desktop terminal LCD displays:

TO remove Call Block DC for last number received

1. Lift the handset and dial the Call Block DEL Access Code plus “00” (SSCA SIDA 129).
2. Wait for Service Set Tone.
3. Replace the handset.
4. The Desktop terminal LCD displays:



To delete all Call Block Numbers

1. Lift the handset and dial the Call Block Delete All Access Code (SSCA SIDA 130).
2. Wait for Service Set Tone
3. Replace the handset.

Note: This procedure deletes all Block Bins 00-15.

4. The Desktop terminal LCD displays:

Service Conditions

1. Individual Call Block is mutually exclusive to Call Block [C-150] by Service Feature Restriction Class. Service Feature Restriction Class 165 must be restricted (SFI 165 = 0) in order to use the Individual Call Block feature. Stations using the Individual Call Block enhancements must delete all Call Block [C-150] entries. If the blocked numbers entered by Call Block [C-150] are not deleted, unexpected results will occur. See feature Call Block [C-150] for complete deletion instructions.
2. Individual Call Block is programmable to be automatically active or inactive by means of ASYDL (See the Programming section).
3. Individual Call Block can only be set/canceled/activated/de-activated by an individual station using the appropriate Access Code. A PCPro command is not available for the entry or deletion of Block Numbers for Individual Call Block.
4. Individual Call Block bin contents can be displayed by the PCPro using the DICBD command.
5. This feature is only available for stations with Service Feature Restriction Released (SFI 165 = 1).
6. The Station User is allowed to overwrite any Individual Call Block List Number.
7. Individual Call Block can support up to 1023 Individual Call Block Lists per IMG.
8. Only one Individual Call Block List is allowed per LENS with a maximum of 1023 lists/LENS per LP.
9. Individual Call Block enhancements can be used with any trunk supplying a valid Calling Party Number Identification or ANI to the System (Caller ID/ISDN or MF).
10. Individual Call Block will only be effective when the Incoming Trunk supplies a Calling Party Identification Number. If a Calling Party Number is not received, the Anonymous Call Block feature must be used to block the Incoming Call.
11. When the System is initialized with data memory load, the Call Block feature will be in the last state saved to the System hard drive.
12. Call Forwarding - All Calls [C-5] and Call Forwarding - Busy Line [C-2] take precedence over this feature.

13. If Call Forwarding - Busy Line is set and the Incoming Calling Number is restricted by Individual Call Block, the Incoming Call will follow Call Forwarding - Busy Line regardless of the station being idle or busy.
14. Dterm Stations with addition Line Appearances must program each Line Appearance with the number to be blocked (for example, Dterm Station 1000 has Line Appearances of 1001 and 1002 appearing on its phone. To restrict a specific Calling Party Number the Station User 1000 must program Lines 1000, 1001 and 1002 with the number to be restricted).
15. Station-to-Station Calls in the same Local Node or in the same FCCS Network as the Blocking Station can be restricted using Individual Call Block. However, any override feature (such as (but not limited to) Executive Right-of-Way [E-1], Privacy Release [P-18] and Call Waiting - Terminating [C-12]) will take precedence over this restriction.
16. Dterm Stations blocked via Individual Call Block will receive Reorder Tone and display either DND or RST depending on Service Feature Restriction Class programming.
17. Single-line Stations restricted by Individual Call Block will receive Reorder Tone.
18. When no announcement is provided: ASYD, SYS1, Index 59, Bit 2=1 must be set for a MF DID to receive Reorder Tone. If this bit is not set, no indication is sent to the trunk that the call has been blocked.
19. Dterms with addition Line Appearances must program each Line Appearance on its set to be restricted. However, the Call Block Number entered will apply for all Line Appearances of that number.
20. A Virtual Station Appearance can have Individual Call Block set. However, the Call Block Number entered will apply for all LINE APPEARANCEs of that Virtual Station.
21. When a Station or Virtual Line is deleted, the Call Block List will be automatically removed.
22. Individual Call Block Announcement Service is not available for Station-to-Station Blocked Calls.
23. Individual Call Block restrictions are not available for calls transferred by the Attendant Console or a station.
24. Individual Call Block enhancements are not available for the Attendant Console (RT 901), Night Attendant (RT 915), BRI or Wireless Terminals, even if Individual Call Block Service Feature Restriction Class 165 is allowed.
25. Internal Telephony Server Stations using Individual Call Block cannot restrict Incoming Calls from the System Operator (RT 901 or 915).
26. Direct Incoming Trunks (DID, ISDN, DIT) that are set for Call Forwarding - All Calls or Call Forwarding - Busy Line to a station that has restricted the Calling Party Number will receive Busy Tone (or if available, the Individual Call Block Enhancement Announcement).
27. The Call Block last number received function will always enter in to Bin 00 the last valid Calling Party Number received. In the case of Call Waiting - Terminating [C-12], the Call Waiting Call must be answered and have a valid Calling Party Number in order to be restricted using the Call Block last number received function.
28. Individual Call Block last number received function is not available for Attendant Camp-on With Tone Indication [A-1] or Attendant/Station Transferred Calls, regardless of a valid Calling Party Number.
29. After a System initialization (with or without data memory load) the Call Block last number received feature cannot be used by a station, until an Incoming Call with a valid Calling Party Number is received.
30. Individual Call Block Bin Numbers are from 00 to 15. If an invalid Block Number is entered, Reorder Tone is returned.
31. Call Pickup - Group [C-7], Call Pickup - Direct [C-30], Call Hold Pickup [C-154] and Call Pickup - One Touch key [C-207] take precedence over this feature.

32. Individual Call Block will not function if all stations programmed in a UCD Group have blocked the Incoming Calling Party Number. The call will remain in the UCD queue. Busy Tone or Call Block announcement is not available. UCD Overflow is available providing the Overflow Stations have not set individual Call Block to the Calling Party Number.
33. Pilot and Circular Hunt take precedence over this feature. If all members of the Hunt Group have restricted the Calling Party Number, Busy Tone or individual Call Block Enhancement Announcement is returned.
34. A DIT Trunk that has been restricted from Incoming Calls by means of Individual Call Block can reroute to the Attendant Console by system programming.
35. A DIT Trunk Call that is blocked and is not otherwise rerouted will continue to receive Ringback Tone unless an announcement (AAED/N Equipment Number 63) is available. Tandem Trunk Connection must be allowed between the DIT Trunk Route and the Announcement Trunk Route.

    Note: ASYD, SYS2, Index 11, Bit 7 setting to the Attendant Console will take precedence over the announcement.

36. Individual Call Block takes precedence over Slumber Time - Do Not Disturb [S-106].
37. Individual Call Block enhancements cannot be set in a Consultation Hold condition.
38. Call Block announcement must be set for Multiple Connection to announcement by means of switch setting options on the DAT card. Callers cannot be guaranteed to start from the beginning of the message.
39. A Dterm cannot display a Call Block Bin List.
40. When a SIP Handler Controlled SIP terminal is in Multi Line Mode, Individual Call Block is set to the seized line. Normally, Individual Call Block is set to My Line if it is not used by another station.

Programming

To assign Individual Call Block

STEP 1: **ANPD/ANPDL/ANPDN** - Assign a number level for Individual Call Block.

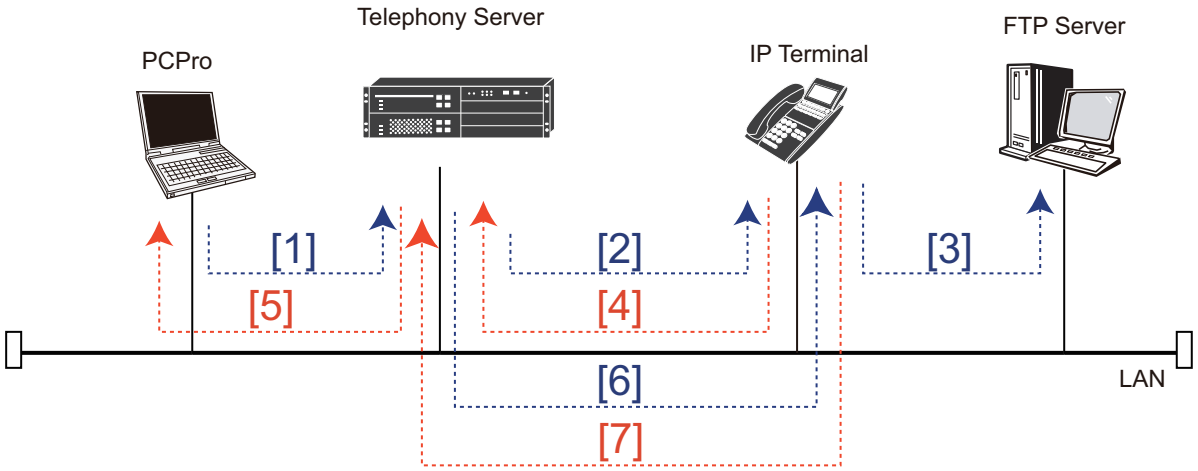
STEP 2: **ASPA/ASPAL/ASPAN** - Assign the following Access Codes for CI = "N: Normal"
Call Block List On:SRV = "SSCA: Service Code Appendix", SIDA = 126
Call Block List Off:SRV = "SSCA: Service Code Appendix", SIDA = 127
Call Block Set: SRV = "SSCA: Service Code Appendix", SIDA = 129
Call Block Last Number Set:SRV = "SSCA: Service Code Appendix", SIDA = 128
Call Block - Delete All:SRV = "SSCA: Service Code Appendix", SIDA = 130

STEP 3: **ASYDL** - Index 804, Bit 5 - Individual Call Block automatic active 0/1 = On/Off.

STEP 4: **ASFC** - Assign a Service Feature Restriction Class to allow Call Block [C-150] for stations (SFI 192, RES = 1 to release restriction).

STEP 5: **AAED/N** - Assign Announcement Equipment Number 63 to route Call Block Calls to an announcement.
"R" must be set to "0" to send ring back. If "R" is set to "1", ISDN will not operate with the announcement.

STEP 6: **ARRC/N** - Allow Incoming Routes to Announcement Routes.

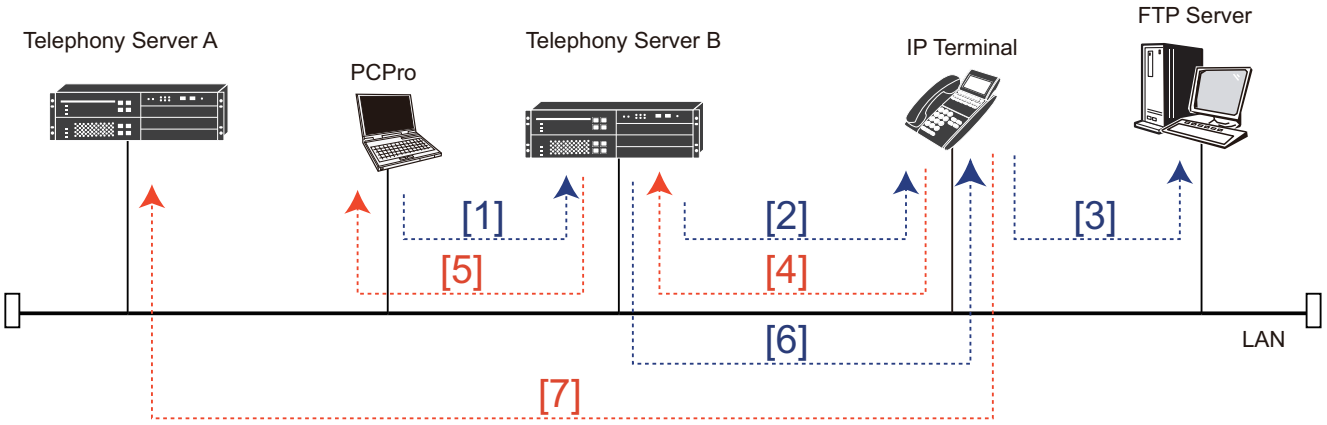


To delete Individual Call Block

The deletion procedure is the reverse order of assigning the feature.

I-47 IP Device Firmware Remote Download

General Description



This feature allows IP terminals to update their firmware by downloading new firmware file. At this time, the downloading can be performed manually at any time or automatically at a predetermined time.
After downloading a new firmware file, IP terminals will perform reregistration to the Telephony Server with the new firmware.

This feature is activated through the following steps.

1. The PCPro specifies the terminal and sends the downloading order to the Telephony Server.
2. The Telephony Server orders the terminal to download a new firmware file.
3. The new firmware file on the FTP server (**Note 1**) is downloaded to the assigned terminal dependent on the parameters defined via the PCPro.
4. The terminal informs the Telephony Server of the download state.
5. The Telephony Server informs the PCPro of the download state and the PCPro displays it.
6. The Telephony Server requires the terminal to restart.
7. The terminal is reset and registered to Telephony Server with its new firmware.

It is also possible to download a config file (DRS setup file). After downloading the file, the IP terminal that has been set with the new config file is registered to the Telephony Server.

1. The PCPro specifies the terminal and sends the downloading order to the Telephony Server.
2. The Telephony Server orders the terminal to download a new config file.
3. The new config file on the FTP server (**Note 1**) is downloaded to the assigned terminal dependent on the parameters defined via the PCPro.
4. The terminal informs the Telephony Server of the download state.
5. The Telephony Server informs the PCPro of the download state and the PCPro displays it.
6. The Telephony Server requires the terminal to restart.
7. The terminal is reset and registered to the Telephony Server with its new config file.

For convenience, firmware and config files for IP terminals are hereinafter called “download files”.

Note 1: In case of using an external PC as the FTP server, set the proper file permissions.

Operating Procedure

Be sure to register the following two settings for the FTP server:

1. Store the download file of the IP terminal on the FTP server.

   Store the download file on the FTP server. NEC recommends using the default directory that the users have access to when they are logged in to the FTP server. When using the Telephony Server as the FTP server, log in from a terminal on which FTP client software is installed and upload the download files with the “put” command.

2. Register the FTP user account of the IP terminal to the FTP server.

   Register the FTP user account of the IP terminal to the FTP server.
   a.) When using the Telephony Server as the FTP server, register the FTP user account on “Maintenance User Account Settings” of the ADTM command.
   b.) When using External FTP server, register the FTP user account on the external server.

   (Example: For Microsoft® Windows® XP/Vista)

1. Select “Start” - “Control Panel” - “Administrative Tools” - “Computer Management.”
2. Right-click on the “Users” under the “Local Users and Groups”.
3. Select “New User...” on the menu to display the “New User” screen.
4. Assign the necessary data for the FTP User Account.

Note: For other External FTP Server programs, refer to the documentation for that software when setting up the Login Account.

Service Conditions

1. The following are necessary in FTP server:
   - Downloading via TFTP is not supported.
   - Download file must be put in an appropriate location.
   - The FTP user account for IP terminals must be registered.

2. When using Automatic Download by specifying a predefined time.
   - The terminal must be Peer-to-Peer type. (Dterm with IP adapter for IPELC are not supported.)
   - The terminal has been registered in the System in advance.
   - Firmware update information is specified correctly in ATDL command.
   - The terminal coincides with the terminal information list in the ATDL command.
   - Download time is set in ATDL command.
   - The terminal is connected via LAN from the download start time until it has completed. During this time, the LAN connection and the power to the terminal cannot be interrupted.

3. When using Manual Download by individual setting
   - The terminal must be Peer-to-Peer type. (Dterm with IP adapter for IPELC are not supported.)
   - The terminal has been registered in System in advance.
   - Firmware update information is specified correctly in ATDL command.
   - The terminal coincides with the terminal information list in the ATDL command.

4. When downloading different types of files, create a separate directory for each download file that is placed on the Internal FTP Server. The name of the file, that is placed on the Internal FTP server, must match exactly the “File Name” field on the “Registered File Name List” in the ATDL command. If the name of the file does not appear in the list, an entry can be created.

5. The number of IP terminals that can download the download file simultaneously varies between External and Internal FTP Server (embedded in the Telephony Server).
   (The Internal FTP server uses the CPU in the System. When using the internal server, log in to the System from a PC with FTP. As default, the data type for Internal FTP is binary. Therefore, use the FTP “bin” command, prior to the FTP “put” command, when transferring files to the Internal FTP Server.)
   a.) When using Internal FTP Server, the file cannot be downloaded to more than one terminal at the same time. Download method is automatically set to “Sequential.”
   b.) When using External FTP Server, the Download Method can be assigned as “parallel.” At this time, a maximum of 8 terminals can download the new firmware simultaneously.

6. When the file downloading ends in failure, the terminal starts up with the previous version. The cause of fault is described below:

a.) Assigned FTP server is out of service.
b.) The network from the terminal to the FTP server doesn't work properly.
c.) Login account for FTP server is not registered correctly.
d.) Download file is not located in an appropriate directory or does not exist in the designated FTP server.
e.) The maximum number of concurrent connections to FTP server is exceeded.

7. When using Internal FTP Server:
   a.) Be sure to place the download files in the default FTP directory (home directory), which is created with the ADTM command so that logged in users can access it.
   b.) After downloading is completed, the unnecessary downloaded file must be deleted from the directory.

8. While IP terminal has an ongoing call or is originating a call, the file cannot be downloaded.

9. If a file is downloaded while IP terminal is receiving a call, the file will be downloaded as the terminal rings. The ringing will stop when the download is complete.

10. With IP terminals, do not disconnect a power cord that is plugged into them until a clock screen appears.

11. DT800 Series/DT700 Series cannot use this service during its registration to SR-MGC.

12. File access for an IP terminal is restricted when the FTP commands (such as "*put*" and "*get*") are being used by users other than the FTP user account for IP terminals to access a download file on the Internal FTP server (Telephony Server), and vice versa.

13. Stop Routine Diagnosis while downloading.

14. The information on terminals that execute downloading can be added to the [Terminal List] by either of the following manner.
   a.) Adding from Office Data to [Terminal List]
   The information on each IP terminal, such as a station number, LENS and Terminal Type is read out and is added to the [Terminal List].
   b.) Adding from File to [Terminal List]. **Note 2**
   The information on terminals is added to the [Terminal List] by importing the file that is created beforehand to specify terminals that execute downloading.
   There are two ways to output the file to specify terminals to execute downloading.
   • Exporting
   • Outputting a template firm for specifying terminals

Note 2: When adding the information by using a file, note the following:
- Only one file can be imported to [Terminal List]. If the information on multiple terminals are to be input, all information must be listed in one file.
- The exported file (*.text) can be edited directly with a text editor or Excel. When editing with Excel, see the section of <Editing the Data File with Excel>.

Programming

STEP 1: **ADTM (Assignment of Data for TCP/IP Module)**

Register the FTP user account of IP terminals with the ADTM command when using the Telephony Server as the FTP server.

[Select LAN Interface]
Select LAN1

[Options Tab]

(1) Select [Maintenance User Account Setting] under [LAN1] from [A list of Functions], and click the EXECUTE button.

(2) Click the ADD button on the [Maintenance Account Setting] screen.

(3) Configure the following settings on the [Maintenance Account Setting] sub screen, then click OK.

- Login Name: 4~12 characters
- Password: 4~12 characters
- Check [FTP]

Note: For details on the availability of characters used for Login Name and Password, see [ADTM: Assignment of Data for TCP/IP Module] in the Command manual.

Note: The level is fixed to low.

(4) Click the write button on the [Maintenance Account Setting] screen.

STEP 2: **ADTL (Assignment of Terminal for Download)**

Follow the below procedure to configure settings for IP terminals that execute downloading.

(1) Setting the download file name

(2) Adding information of the terminals that execute downloading

(3) Selecting the terminals and executing downloading

1. Setting the download file name

☐ Display the List of Download File Name:
Click this checkbox when displaying [List of Download File Name].

Terminal Type: Type of IP terminal (maximum of 64 characters)
The types of IP terminals corresponding to each download file are displayed.

HWTP: Hardware Type(00~FF)
The hardware types corresponding to each type of IP terminals are displayed.

HWVER: Hardware Version (00~FF)
The versions of hardware corresponding to each type of IP terminals are displayed.

File Name: File Name (maximum of 16 characters)
The names of files to be downloaded for each terminal are displayed.

Note: The file of List of Download File Name can be imported by pressing the Import button, and it can be output to a desired folder by pressing the Export button. When pressing the Reset to the Default Setting button after importing the file, the information listed in the [List of Download File Name] returns to the default values. Also, the imported information returns to the default values if the command processing is aborted. If you wish to change the default values, import the file at the time of the desired command booted.

2. Adding information of the terminals that execute downloading

Up to 4000 items of download file information can be registered by either of the following manner.

(a) [Adding from Office Data to [Terminal List]]

(b) [Adding from File to [Terminal List]]

[Adding from Office Data to [Terminal List]]

Process Type:

- Execute downloading
  Specify a terminal and execute downloading.

Terminal Specifying Method:

- Office Data
  Information of the downloading terminal is read out from Office Data.

Terminal Specifying Type:

- Station Number
  Select this when specifying a station number of the IP terminal.

  TN: Tenant Number
  STN: Station Number

- Line Equipment Numbers
  Select this when specifying Line Equipment Numbers of the IP terminal.

  LENS: Line Equipment Numbers (six digits)

- Terminal Type
  Select this when specifying a type of the IP terminal.

  Terminal Type:
  Select a type of the IP terminal.

  HWTP-HWVER: Hardware Type-Hardware Version
  Select the hardware type and the hardware version corresponding to the selected 'Terminal Type'.

Specify Conditions for Filtering:

- All

- Station Number

  Select this from the drop-down list box to search for terminals by specific Tenant Number (TN) and Station Number (STN) range.

  Firmware Version:
  The selected Terminal Type can be narrowed down by choosing Firmware Version.

  Version:
  Enter the Firmware Version(00.00-99.99)
  Conditions:
  Select the conditions for filtering (!=, <, <=, ==, >=, >).

  TN: Tenant Number

  Start: First Tenant Number to start searching.
  End: Last Tenant Number to stop searching.

  STN: Station Number

  Start: First Station Number to start searching.
  End: last Station Number to stop searching.

- Line Equipment Numbers

  Select this from the drop-down list box to search for terminals by specific Line Equipment Numbers (LENS) range.

  Firmware Version:
  The selected Terminal Type can be narrowed down by choosing Firmware Version.

  Version:
  Enter the Firmware Version(00.00-99.99
  Conditions:
  Select the conditions for filtering (!=, <, <=, ==, >=, >).

  LENS: Line Equipment Numbers

Start: First LENS to start searching (six digits).
End: Last LENS to stop searching (six digits).

- IP Address
  Select this from the drop-down list box to search for terminals by specific IP address range.

  Firmware Version:
  The selected Terminal Type can be narrowed down by choosing Firmware Version.

  Version:
  Enter the Firmware Version(00.00-99.99)
  Conditions:
  Select the conditions for filtering (!=, <, <=, ==, >=, >).

  IP Address:

  Start: (0.0.0.1 - 255.255.255.254)
  End: (0.0.0.1 - 255.255.255.254)

[Adding from File to [Terminal List]]

Process Type:

- Execute downloading
  Specify a terminal and execute downloading.

Terminal Specifying Method:

- File
  Import the file that is created beforehand for specifying terminals.

File Path: (Display only)
File path for the file for specifying terminals will display.

Note: LENS has first priority to be used when both LENS and TN/STN are included in the specified file. For information on creating a file, refer to 'How to create a file for specifying terminals'.

3. Selecting the terminals and executing downloading

Terminal List:
Downloading is executed for the checked items of information. The file for specifying terminals can be output to any folder by clicking the Export button.

Note: When information is added to [Terminal List] by selecting 'Execute downloading' for Process Type, the terminals which cannot execute downloading will appear in gray in [Terminal List]. The checkbox displayed on the head of the rows cannot be checked in this case.

Terminal Type
HWTP: Hardware Type
HWVER: Hardware Version
Version
LENS: Line Equipment Numbers
SW/SP: SW/SP Number
TN: Tenant Number
STN: Station Number
RT: Route Number
TK: Trunk Number
PCN: PHS Community Number
ERN: Calling Area Number
GRN: Group Number
CSN/ZTN: CS/ZTN Number
IP Address
File Name
Status/Result
Error Detail

Settings for Downloading:

FTP Server Type:
Select one of the following to specify the FTP server for storing download files.

- ACT CPU (to specify the ACT side of the Telephony Server as FTP server)
- STBY CPU (to specify the STBY side of the Telephony Server as FTP server, or in dual configuration)
- External Server (to specify the FTP server connected to LAN)

IP Address:
This parameter is displayed only when “External Server” is selected for **FTP Server Type**. Assign the IP Address of FTP server connected to LAN (0.0.0.1 - 255.255.255.254).

Login Name/Password [Maximum 15 digits]:
Enter the Login Name and Password required to log in to the FTP server.

☐ Specify File Storage Directory:
Click this check box to specify the directory where the download files are stored. When no directory is specified, the home directory (default directory) that the users are allowed to access after logging in to the FTP server is automatically used.

Directory Name:
Enter a directory name within 63 characters. NEC recommends using the default directory that the users have access to when they are logged in to the FTP server.

Download Method:
Select either of the following to specify the download method. Automatically set to Sequential when "ACT CPU" or "STBY CPU" is selected in **FTP Server Type**.

- Sequential
  After downloading to one terminal has been completed, download to the next sequentially numbered terminal starts immediately.
- Parallel
  Used when "External Server" is selected in **FTP Server Type**. The maximum number of terminals to which download is concurrently executed depends on the number singed to **Concurrent Number**.

  Concurrent Number (2-8)

☐ Specify the download start time.

Click the checkbox of 'Specify the download start time' to enter the desired date and time.

Start Date (YY/MM/DD)

Start Time (HH/MM/SS)

How to create a file for specifying terminals

Follow the procedure below to create a file for specifying terminals.

(1) Output the file for specifying terminals.

(2) Edit the output file for specifying terminals.

1. Output the file for specifying terminals.

   The file for specifying terminals is output by either of the following manner.

   (a) [Exporting]

   (b) [Outputting a template firm for specifying terminals]

[Exporting]
Terminal information, retrieved from Office Data, is exported.

Process Type:

- Creating a file for specifying terminals.

Terminal Specifying Method:

- Office Data
  Information of the downloading terminal is read out from Office Data.

Terminal Specifying Type:
Add terminal information referring to ‘Adding from Office Data to [Terminal List]’ of ‘4. Adding information of the terminals that execute downloading.’
Save the file for specifying terminals in any folder by clicking the Export button.

[Outputting a template firm for specifying terminals]

Output the template firm for specifying terminals.

Process Type:

- Creating a file for specifying terminals.

Terminal Specifying Method:

- Edit directly.
  A template file for specifying terminals is output.

2. Editing the output file for specifying terminals.

   The exported file can be edited directly with a text editor or Excel. When editing with Excel, see the section of <Editing the Data File with Excel>.

I-48 IP Terminal Failover - Alternate System

General Description

In CCIS over IP/CCIS (Legacy)/FCCS over IP/FCCS (Legacy) network, if a failure occurs in the Primary Telephony Server, DtermIPs can automatically reregister to a predetermined Backup Telephony Server. While the DtermIPs are placed under the control of Backup Node (Telephony Server), they can operate as they ware in Primary Node (Telephony Server).

Outline of IP Terminal Failover - Alternate System

This feature is comprised of the following four processes:

- Polling and Creating of Visitor Station User Profile Database
- Creating of Physical Station Pool (by ABKS)
- Providing Physical Station Resource for Visitor Station
- Updating Process of Free Location Table

- **Polling and Creating of Visitor Station User Profile Database**

  This process determines which the Telephony Server is used as Secondary Telephony Server for each Station. Also, Station Numbers used for Second-registration are registered on Secondary Telephony Server by this process. Secondary Telephony Server reads the Station Profile information (key data, Speed Calling data, etc.) from the Primary Telephony Server accommodating the appropriate Stations, at the specified time.

- **Creating of Physical Station Pool (assigned by ABKS)**

  For Visitor Stations, it is necessary to assign Physical Station Numbers on the Secondary Telephony Server in advance. Resources of the pre-assigned Station Numbers are provided for Registration process of Visitor Stations as necessary.

- **Providing Physical Station Resource for Visitor Station**

  If the MAC address of the Visitor Station is not registered on the Secondary Telephony Server, the Secondary Telephony Server queries MAC address data table in the User Profile database read from Primary Telephony Server. At this time, when the Secondary Telephony Server can find the appropriate MAC address in the User Profile database, the Secondary Telephony Server will use one of the pre-assigned Physical Station Numbers in Physical Station Pool for Registration of the Visitor Station. When the Secondary Telephony Server cannot find the appropriate MAC address, the Secondary Telephony Server displays login prompt on the LCD of the Visitor Station. Then, if the Secondary Telephony Server can find the Station Number and the password entered by Visitor Stations in the User Profile database, the Secondary Telephony Server will accept the Registration request from the Visitor Station.

- **Updating Process of Free Location Table (Station Number Conversation Table)**

  To permit the call termination to the Visitor Station that has completed Second Registration process, it is necessary to update all the Free Location Tables in the network. The Secondary Telephony Server sends FLF Update request packets to Master Telephony Server after the Second Registration Process of the Visitor Station. Then, to share the Physical Station Number allocated to the Visitor Station among the network, the Master Telephony Server sends the updated FLF information to all the Telephony Server in the network. When this updating has completed, the VISITOR key on the Visitor Station flashes green to inform the user that it operates in Visitor mode. At this time, when this key is assigned to a Soft key, "VISIT" on the LCD will flash.

- **Master/Sub-Master Telephony Server**

  It is necessary to place the Telephony Server that controls the Free Location tables created by each Telephony Server in the network (including a maximum of 64 Telephony Servers). This Telephony Server is called "Master Telephony Server." Master Telephony Server receives the update information of the Free Location tables from each Telephony Server in the network. For this reason, TCP links must be established between Master Telephony Server and all the other Telephony Servers, at all times.

  A maximum of two Master Telephony Servers can be placed in a network (at this time, another one is called "Sub-Master Telephony Server). By placing two Master Telephony Servers (Master Telephony Server and Sub-Master Telephony Server), redundancy for this Free Location table update mechanism can be accomplished.

Operating Procedure

- **Registration to Secondary Telephony Server from IP Station in MAC Authentication mode**

  It is necessary to assign the IP address of Secondary Telephony Server at each IP terminal in advance. When using DHCP Server, assign IP addresses of both Primary Telephony Server and Secondary Telephony Server on the DHCP Server (Index 161). By assigning MAC addresses of IP terminals on Primary Telephony

Server in advance, the IP terminals can be automatically backed up by Secondary Telephony Server when Primary Telephony Server breaks down. At this time, the VISITOR key on the Visitor Station flashes green to inform the user that it operates in Visitor mode.

- **Registration to Secondary Telephony Server from IP Station in Login mode**

  When MAC address of Visitor Station is not assigned on Primary Telephony Server, the Visitor Station must perform Login operation for the Registration to Secondary Telephony Server. At this time, the VISITOR key on the Visitor Station flashes green to inform the user that it operates in Visitor mode.

  Note: When Visitor Stations perform Registration to Secondary Telephony Server, they cannot use their Station Numbers as the default password (for the security reason).

- **Recovery from Visitor Mode**

  Visitor Station operated under the control of Secondary Telephony Server monitors Primary Telephony Server periodically. When the Primary Telephony Server recovers from a network fault, the VISITOR key on the Visitor Station lights green. At this time, if MAC address of Visitor Station has been assigned on Primary Telephony Server, it performs Registration to the Primary Telephony Server automatically when it become idle. Conversely, if MAC address of Visitor Station has not been assigned on Primary Telephony Server, the user must perform Login operation again for the Registration to Primary Telephony Server. After the Registration to Primary Telephony Server has completed successfully, the VISITOR key will be extinguished.

- **Example Application for Login Operation from Visitor Station**

  Even if Primary Telephony Server operates normally, a Visitor Station whose Station Number is assigned on Secondary Telephony Server can log into the Secondary Telephony Server by using its Station Number. For example, when a branch officer uses an IP terminal accommodated in the main office Telephony Server, the officer can log into the main office Telephony Server by using one's Station Number. At this time, the officer logs into the main office Telephony Server as a Visitor Station. While the Station Number is used in Visitor mode, VISITOR key on the terminal at the branch office flashes red.

Service Conditions

1. This feature is available only for the network with Closed Numbering.
2. This feature is available for IP Enabled Dterm and DtermIP (NEC Proprietary) such as ITR series but is not available for DtermIP (SIP) such as ITN series and DT800 series/DT700 series.
3. A Secondary Telephony Server can accept Registration requests from a maximum of 1000 Visitor Stations.
4. Secondary Telephony Server can accept Registration requests from Visitor Stations without consuming its licenses.
5. Secondary Telephony Server provides the following data to Visitor Stations.
   - Station Forwarding data (Call Forwarding-All Calls/Busy/Don't Answer)
   - Speed Calling - One Touch data
   - Function key data (except the data related to Multi Line and Intercom)
   - Login Password data
   - Name Display data
6. The following data assigned on a System-wide basis can be backed up by Secondary Telephony Server.
   - MAC Address and IP terminal Mapping Information

7. When Secondary Telephony Server backs up the Stations accommodated in Primary Telephony Server, Secondary Telephony Server does not inherit their SFC/RSC data from Primary Telephony Server. They are operated with the SFC/RSC determined on Secondary Telephony Server. For this reason, there may be cases where the some features which are allowed at Primary Telephony Server are restricted in Secondary Telephony Server and vice versa.
8. Station Number of a Visitor Station (not Physical Station Number) can be output to SMDR as a Calling Telephone Number.
9. Station Number of Visitor Station (not Physical Station Number) can be output to MCI as Calling/ Transferring Telephone Number.
10. Station Number of Visitor Station (not Physical Station Number) can be displayed on the Dterm's LCD via Off-Hook Line Number Display -D [O-37D].
11. It is necessary to place a Master Telephony Server that controls the Free Location tables created by each Telephony Server in the network. A maximum of two Master Telephony Servers can be placed in a network If there are only two Telephony Servers (Primary Telephony Server and Secondary Telephony Server) in the network, the Secondary Telephony Server can work as Master Telephony Server.

    Note: When this feature is activated in the FCCS Network, Master Telephony Server must be placed in VNDM Center Node. At this time, only one Master Telephony Server can be placed in a network.

12. When Stations recover from Visitor mode, Primary Telephony Server does not inherit their setting data (forwarding data, etc.) from Secondary Telephony Server.
13. The Physical Station Numbers on Secondary Telephony Server are automatically allocated to Visitor Stations for each Registration to Secondary Telephony Server. Therefore, the Visitor Stations cannot use the previous setting data.
14. The Physical Station Numbers on Secondary Telephony Server are automatically allocated to Visitor Stations on a per Tenant Number basis. If a Visitor Station cannot detect the Physical Station Number belonging to the same Tenant Number as assigned on Primary Telephony Server, the default Physical Station Number Pool (Pool Number = 0) is allocated to the Visitor Station.
15. For Visitor Station, the number as My Line must be assigned for Prime Line because Secondary Telephony Server inherits only the My Line data from Primary Telephony Server. If the Station whose Primary Line is assigned as Sub Line is backed up by Secondary Telephony Server, My Line Number is automatically assigned for Prime Line.
16. When some features (such as Camp-On and Call Forwarding - Don't Answer features) are activated between a Visitor Station and the other Station via CCIS, Physical Station Number automatically allocated to Visitor Station is displayed on the LCD of the called party.
17. To activate this feature, the firmware version 02.00 or later must be equipped on the Dterm.
18. The physically non-existent ports of Group No. 24 - 31 cannot use as Physical Station Number Pool.
19. The necessary number of Physical Station Number Pools for Visitor Stations must be assigned on Secondary Telephony Server in advance.
20. Physical Station Number Pools can be assigned on the Virtual PIR.
21. Do not assign the duplicate number for Physical Station Number, Visitor Station Number/Telephone Number and Feature Access Code within the same network.
22. A maximum of 96 Physical Station Numbers can be assigned per Pool.

Interactions

1. Visitor Stations under the control of Secondary Telephony Server cannot use ACD feature provided by ACDP built in Primary Telephony Server. To solve this problem, manipulate Agent Positions accommodated in Primary Telephony Server via ACDP built in Secondary Telephony Server by using AGENT ANYWHERE - ACD [A-133A].
2. Visitor Stations under the control of Secondary Telephony Server cannot use OAI feature provided by UAP connected with Primary Telephony Server. To solve this problem, manipulate OAI Terminals accommodated in Primary Telephony Server via UAP connected with Secondary Telephony Server.
3. The CCIS Cluster port assignment, which is set via ADTM command ("Configure Application Port" window on option tab), has to be the same side with the registration port setting, which is shown as "REG" in the window. The recommended side is LAN1 (Default).
4. The following tables show the availability of each Telephony Server feature.

List of OG Call Features for IP Terminal Failover - Alternate System

x: Available N: Not Available C: Conditionally available –: Not Applicable

SERVICE FEATURES	AVAIL-ABILITY	CARRY OVER	REMARKS
Direct Outward Dialing (DOD)	x	N	
Miscellaneous Trunk Restriction	x	N	
Toll Denial/Toll Diversion	x	N	
Toll Restriction - 3/6-Digit	x	N	
Speed Calling-Station	N	N	
Speed Calling-System	N	N	
Outgoing Trunk Queuing	x	N	
Off-Hook Queuing	x	N	
Alternate Routing	x	N	
Pushbutton-To-Rotary Conversion	–	–	

Note: The above Outgoing Call features can be provided by using Outgoing Trunks, Outgoing Restriction Tables, Outgoing Access Codes Authorization Codes assigned on Secondary Telephony Server.

List of IC Call Features for IP Terminal Failover - Alternate System

x: Available N: Not Available C: Conditionally available –: Not Applicable

SERVICE FEATURES	AVAIL-ABILITY	CARRY OVER	REMARKS
Attendant Console	x	N	
Direct-In Termination (DIT)	N	N	
Direct Inward Dialing (DID)	x	N	
Automated Attendant	–	N	
Remote Access To System	N	N	
Master Console	x	N	
Power Failure Transfer	–	–	
Internal Music On Hold	x	N	
External Music On Hold	x	N	
Distinctive Ringing	x	N	
Tenant Service	x	N	
Slumber Time-Do Not Disturb	N	N	
Multiple Music On Hold	x	N	

Note: The above Incoming Call features can be provided by using Incoming Trunks assigned on Secondary Telephony Server.

List of Station Features for IP Terminal Failover - Alternate System (1/2)

x: Available N: Not Available C: Conditionally available –: Not Applicable

SERVICE FEATURES	AVAIL-ABILITY	CARRY OVER	REMARKS
Station Hunting	N	N	
Call Pickup	N	N	
Call Pickup-Direct	N	N	
Step Call	C	N	Available except when Visitor Station is the destination of STEP CALL.
Call Back	x	N	
Automatic Call Back Cancel	x	N	
Call Waiting	x	N	
Executive Right-of Way	x	N	
Privacy-D	x	N	
Call Forwarding-Busy Line	C	x	Available except when Visitor Station is assigned as the forwarding party of the other Station.
Call Forwarding-Busy Line-Outside	C	x	Available except when Visitor Station is assigned as the forwarding party of the other Station.
Call Forwarding-Don't Answer	C	x	Available except when Visitor Station is assigned as the forwarding party of the other Station.
Call Forwarding-Don't Answer-Outside	C	x	Available except when Visitor Station is assigned as the forwarding party of the other Station.
Call Forwarding-All Calls	C	x	Available except when Visitor Station is assigned as the forwarding party of the other Station.
Call Forward All/Busy/No Answer Clear	x	N	
Call Forwarding-All Calls-Outside	C	x	Available except when Visitor Station is assigned as the forwarding party of the other Station.
Split Call Forwarding	x	x	
Tone to be sent out when the handset is off-hook at the station on which C.F. - All Calls service is set.	x	N	
Call Transfer-All Calls	x	N	
Blind Transfer	x	N	
Boss Secretary	N	N	
Three-Way Calling	x	N	
Station-Controlled Conference	x	N	
Call Hold	x	N

Prime Line Pickup-D	N	N	

List of Dterm Features for IP Terminal Failover - Alternate System (2/2)

x: Available N: Not Available C: Conditionally available –: Not Applicable

SERVICE FEATURES	AVAIL-ABILITY	CARRY OVER	REMARKS
Splitting-D	x	N	
Pause Entry	x	x	
Non-Exclusive Hold-D	x	N	
Multiple Line Operation-D	N	N	Available only for My Line.
Message Remainder-D	x	N	
Call Forwarding-Busy Line-D	C	x	Available except when Visitor Station is assigned as the forwarding party of the other Station.
Call Forwarding-Don't Answer-D	C	x	Available except when Visitor Station is assigned as the forwarding party of the other Station.
Privacy-D	x	x	
Speed Calling-One Touch-D	x	x	
Page Changeover	x	x	
Manual Signaling	N	N	
Automatic/Manual Intercom	N	N	
Brokerage Hot Line	N	N	
Last Number Called-D	x	N	
Call Park Group-D	N	N	
Internal Zone Paging	N	N	Due to the specifications of IP terminal.
Serial call-D	x	N	
Off-Hook Line number Display-D	x	N	
Ringer Mute	x	N	
Soft Key	x	N	

Programming

STEP 1: **ASYD** - SYS1, Index 31 (Mounting capacity of Common Memory) must be assigned as data "06." SYS1, Index 79, Bit 6=0 (OAI service is available).

STEP 2: **ADTM** - Assign the IP address of Master Telephony Server (and Sub-Master Telephony Server) to all Telephony Servers in the network. The identical data must be assigned to all Telephony Servers in the network.

Options - Registration Service

Telephony Server Search Address 1: Enter the IP address of Master Telephony Server

Telephony Server Search Address 2: Enter the IP address of Sub-Master Telephony Server if necessary.

STEP 3: **ASYDL** - SYS1, Index 848, Bit 6=1 (Internal FLF Server / Client is available).

STEP 4: **ASFC** - SFI 205 must be assigned as 1 to the stations used as Physical Station Pool in the Backup Telephony Server.

STEP 5: **ARTD** - Assign the following Route Class Data for CCIS Trunk Route.

IND (CDN: 112) Inter-office Name Display: 1 (In service)

Note: To change the data for existing route (RT), initialize the circuit card.

STEP 6: **ABKS** - Assign the following data on each tab.

Pool Station tab - Assign the following Physical Station Number Pool data on Secondary Telephony Server.

POOL NUMBER:	Specify the Pool Number (0-63)
PHONE TYPE:	Select "Digital" from the combo box.
TN:	Tenant Number
RSC:	Route Restriction Class (0-15)
SFC:	Service Feature Restriction Class (0-15)
START STN:	First Station Number (a maximum of six digits)
START LENS:	First Line Equipment Numbers (five digits)
NUMBER OF REGISTRATION:	Assign the number of Stations belonging to the Pool assigned in POOL NUMBER parameter. (the number from 8 to 96, in multiples of 8)

Note: "*" and "#" shall not be included in the last two digits of Station Number.

Note: The following explains the relationship among "STN START", "LENS START" and "NUMBER OF REGISTRATION" parameters.
[Example of Data Assignment]
START STN = 3000
START LENS = 00006
NUMBER OF REGISTRATION = 8

Station Number	*LENS*
3000	**00006**0
3001	000061
3002	000062
3003	000063
3004	000064

Station Number	*LENS*
3005	000065
3006	000066
3007	000067

Backup Station tab - Assign Station Number or Telephone (Logical) Number of Visitor Station on Secondary Telephony Server.

STN: Assign Station Number (a maximum of six digits) or Telephone Number (a maximum of 12 digits) of Visitor Station

STN/TELN: Select either STN or TELN.

PC: Assign Point Code of Primary Telephony Server. (1-4095) This parameter is assigned only when

STN/TELN = STN is selected.

Specify the Polling time on Secondary Telephony Server.

Option tab

TYPE: Select "Polling" by clicking the appropriate radio button.

FUNCTION:

Manual Start: Polling process is executed immediately.

Auto Start: Polling process is executed at the specified time.

Polling start time: Specify the Polling time in hours and minutes. (00:00-23:59) This parameter appears only when FUNCTION = Auto Start is selected.

Note: When FUNCTION = Manual Start is selected, click "Start" button to start Polling of User Profile Database.

STEP 7: **AKYD** - Assign a programmable Line/Feature key as a Visitor key. KYI = 1 (Feature key). FKY = 156 (Visitor key).

Note: A Soft key can also be used as Visitor key. At this time, "VISIT" is displayed on the Dterm's LCD.

I-49 Internal Zone Paging - Multi-Zone

General Description

This feature allows an individual to make a Voice Call through the Dterm speakers of the first 4 (1-4) designated IZP groups by dialing the MULTI INTERNAL ZONE PAGING Access Code or pressing the MULTI INTERNAL ZONE PAGING key on the Desktop terminal. Refer to the Internal Zone Paging [I-21].

Note: This feature is only available in North America.

Operating Procedure

To originate

1. Lift the handset. Receive Dial Tone.
2. Dial the Access Code or press the Feature key for MULTI INTERNAL ZONE PAGING.
3. Announce the call over the built-in speakers on the Dterms in the INTERNAL ZONE PAGING [I-21] Groups 1-4.

To originate with Station or Trunk Hold

1. Receive a call or make a call to a Station or Trunk.
2. Perform a Switch hook flash.
3. Dial the Access Code or press the Feature key for MULTI INTERNAL ZONE PAGING.
4. Announce the call over the built-in speakers on the Dterms in the INTERNAL ZONE PAGING [I-21] Groups 1-4.

To answer

Same as INTERNAL ZONE PAGING [I-21]. Refer to the INTERNAL ZONE PAGING [I-21].

Service Conditions

1. See Service Conditions of INTERNAL ZONE PAGING [I-21].
2. This feature is only supported on the CPRRI-A (600mhz) and newer processors.
   a.) This feature uses a large amount of processing. If the System is already under a load of greater than 50%, expect short delays of service when MIZP is used.
   b.) This would be the same condition as if 4 24 member IZP groups were paged at the same time.
3. For MIZP the IZP groups 1-4 must be in the same node (FPC) of the FCCS network.
   a.) If any of groups 1-4 are in different FPC's the caller will receive RST and be sent Reorder tone.
   b.) This does not prevent the Calling party from being in a different FPC than IZP groups 1-4.
4. If all the Stations in all 4 groups are busy or in a state that will not accept the IZP the user is returned Busy Tone.
5. A maximum of 96 Stations can be paged using MIZP.
6. A maximum of 255 IZP Groups per system can be simultaneously Paged using MIZP and IZP together.
   a.) For all systems with MIZP the maximum number of IZP groups that can be simultaneously paged is 252.
   b.) Memory blocks 252-255 can be used for MIZP only.
7. A maximum of 1 MIZP can be made simultaneously.
8. First party release must be set by SYS1, Index 4, Bit 3=1 and SYS1, Index 4, Bit 2=0.
   a.) Improper operation will result if this is not set.

9. Directed Call Pick-Up may be used to answer a MIZP only if the destination of the MIZP is in the same FPC as the Station Picking-Up station.
10. To be used in an FCCS network the Access code for MIZP must be programmed in ASPAN or common numbering for this access code must be used in the network.
11. When using from IP Stations the connections are limited by the number of IPPAD trunks in the switch. You must have 1 trunk per paged Station.

Programming

See Programming for INTERNAL ZONE PAGING [I-21].
Extra Programming for MIZP follows:

STEP 1: **ANPD** - Reserve a Number Level for Feature Access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. Assign NND according to the predetermined Numbering Plan.

STEP 2: **ASPA** - Assign the Access Code for MULTI INTERNAL ZONE PAGING, SRV = "SSCA: Service Code Appendix", SIDA = 143. Connection Status Indexes for "N: Normal and "H: Hooking" services.

STEP 3: **AIZP** - Assign INTERNAL ZONE PAGING Group Data.

TN: Tenant Number of Calling Party

IZPG: INTERNAL ZONE PAGING Group Numbers 1-4 are used by MIZP

IZPTN: Tenant Number of IZPSTN

IZPSTN: Station Number assigned to the INTERNAL ZONE PAGING Group.

STEP 4: **AKYD** - For Dterm sets, MULTI-INTERNAL ZONE PAGING can be activated using a programmable Line/Feature key. Assign KYI = 1, Feature key Answer [28] for answering MULTI-INTERNAL ZONE PAGING and KYI = 1, Feature key Internal Zone Paging [154] for calling MULTI-INTERNAL ZONE PAGING.

STEP 5: **ASFC** - Assign a Service Feature Restriction Class that allows SFI 215 (Internal Zone Page Calling) to the Stations that originate MULTI-INTERNAL ZONE PAGING.

Assign a Service Feature Restriction Class that allows SFI 145 (Internal Zone Paging Answer) to the Stations that answer to MULTI-INTERNAL ZONE PAGING.

STEP 6: **ASYD** - Assign SYS1, Index 4, Bit 3=1 and SYS1, Index 4, Bit 2=0 This is first party release and must be set for this feature to operate correctly.

FCCS Programming

This data setting describes only the additional or replacement commands used to activate FCCS Services. When used as an FCCS feature, these commands replace the non-network commands (for example, AAED is replaced by AAEDN). Note that the data setting for FCCS Service varies depending on the Node.

STEP 1: **ANPD/ANPDL/ANPDN** - Reserve a Number Level for Feature Access. Select Normal Service (N) or Hooking Service (H) from the combo box for Connection Indexes. Assign NND according to the predetermined Numbering Plan.

STEP 2: **ASPA/ASPAL/ASPAN** - Assign the Access Code for INTERNAL ZONE PAGING, SRV = "SSCA: Service Code Appendix", SIDA = 143. Connection Status Indexes for "N: Normal", and "H: Hooking" services.

STEP 3: **AIZPN** - Assign INTERNAL ZONE PAGING Group Data.
