1 Introduction

This document describes how to stop a threshold monitoring job. In maintenance situations, the user can suspend a threshold monitoring job to avoid forwarding threshold alarms to the management system when the Managed Element (ME) is unstable and already given specific attention. This is also a way to reduce the load on the ME.

1.1 Prerequisites

This section describes the prerequisites, which must be fulfilled before using the procedure.

1.1.1 Conditions

The following conditions must apply:

- The job name is known.

The job name is `POT_Thr_Job` in this document.

- An Ericsson Command-Line Interface (ECLI) session in Exec mode is in progress.

2 Procedure

To stop a threshold monitoring job:

1. Navigate to the *PmJob* managed object, for example:

```
>dn ManagedElement=NODE06ST, SystemFunctions=1, Pm=1, PmJob=POT_Thr_Job
```

2. Enter Config mode:

```
(PmJob=POT_Thr_Job) >configure
```

3. Set the *PmJob* state to STOPPED:

```
(config-PmJob=POT_Thr_Job) >requestedJobState=STOPPED
```

4. Commit the *PmJob* configuration:

```
(config-PmJob=POT_Thr_Job) >commit
```

5. Verify the result:

```
(PmJob=POT_Thr_Job) >show -v
```

The following is an example output:

```
PmJob=POT_Thr_Job
compressionType=[] <empty>
currentJobState=STOPPED <read-only>
granularityPeriod=FIFTEEN_MIN <default>
jobControl=FULL <default> <read-only>
jobGroup=[] <empty>
jobPriority=MEDIUM <default>
jobType=THRESHOLDJOB
pmJobId="POT_Thr_Job"
reportContentGeneration=CHANGED_ONLY <default>
reportingPeriod=FIFTEEN_MIN <default>
requestedJobState=STOPPED
MeasurementReader=POT_mr
```
