1 Overview

1.1 Description

This operating instruction describes, using an example, how to configure Signaling System 7 defined by Intelligent Network Application Part (INAP) for the following standards:

- European Telecommunication Standard Institute (ETSI)

The procedure described in this example shows a complete configuration with usable values. For a specific customer configuration, other values may be relevant.

1.2 Prerequisites

1.2.1 Documents

For configuration parameter information, see "INAP ETSI Configuration File Description", Reference [3].

1.2.2 Tools

Signaling Manager is supposed to be used for module configuration. For more details, see Reference [1].

1.2.3 Conditions

Before starting this procedure, ensure that the following conditions are met:

- Configuration has been performed according to "Configuring SS7 TCAP", Reference [2].

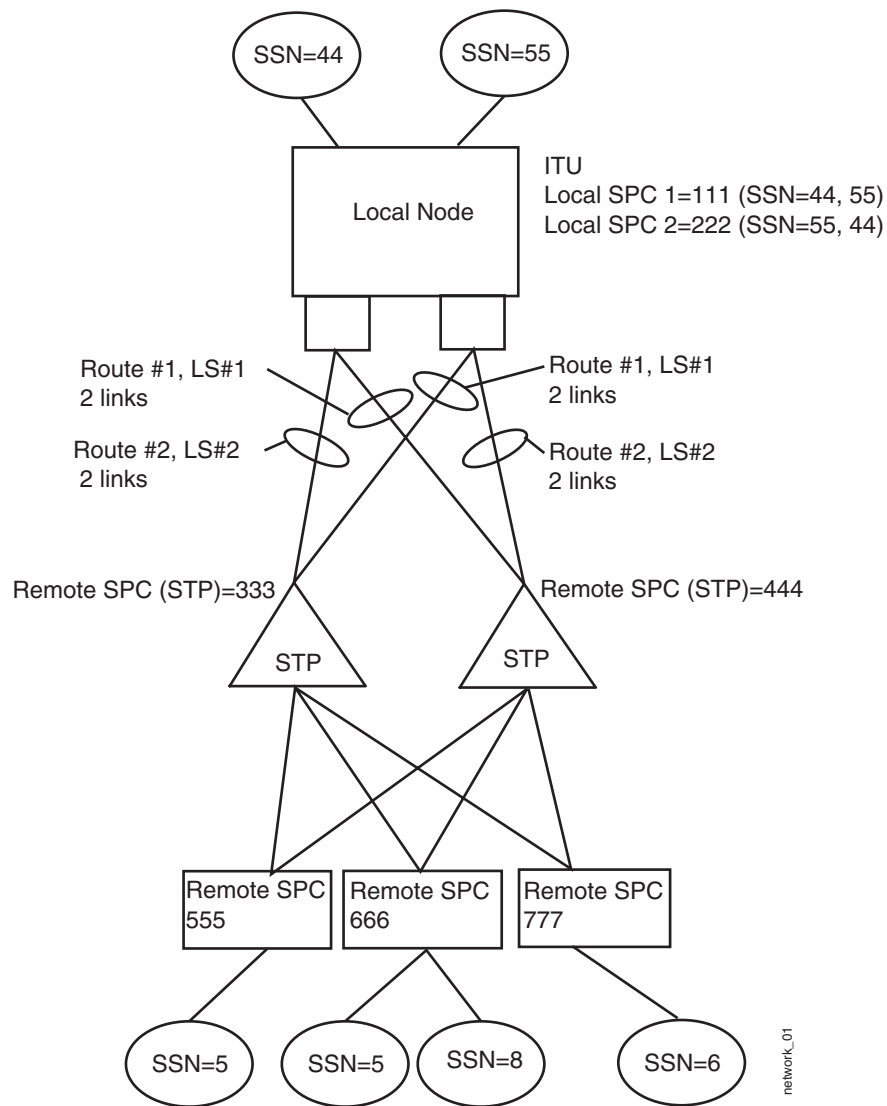

Figure 1 Example of a Network Configuration

2 Procedure

It is up to applications which values must be set in the configuration.

2.1 Configuring INAP

1. Add an element on **INAP**. An instance of an **INAP** is added.
2. Select the added **INAP** element to edit its properties.

Figure 2 Added INAP element in Signaling Manager Navigation Pane

Note: You do not need to define an **INAP Subsystem** if you are not going to use orders on INAP Subsystems.

2.2 Configuring INAP Subsystem

1. Add an element on **INAP Subsystems**. An instance of an INAP Subsystem called **INAP Subsystem:[undef]** is added.

Note: As it is seen in the name of the added **INAP Subsystem:[undef]**, the **Tcap Subsystem** reference is not set by default.

2. Select the added **INAP Subsystem:[undef]**, and assign the **Tcap Subsystem** reference.
