Computer Software Copyrights

The Motorola products described in this manual may include copyrighted Motorola computer programs stored in semiconductor memories or other media. Laws in the United States and other countries preserve for Motorola certain exclusive rights for copyrighted computer programs, including the exclusive right to copy or reproduce in any form, the copyrighted computer program. Accordingly, any copyrighted Motorola computer programs contained in the Motorola products described in this manual may not be copied or reproduced in any manner without the express written permission of Motorola. Furthermore, the purchase of Motorola products shall not be deemed to grant, either directly or by implication, estoppel or otherwise, any license under the copyrights, patents or patent applications of Motorola, except for the normal non-exclusive royalty-free license to use that arises by operation of law in the sale of a product.

Chapter 1

THEORY OF OPERATION

1.0 Keypad and Flexible Connectors

1.1 Keypad

The keypad block diagram is shown in Figure 1-1. The comparator compares the voltage when any one of the keypad row or keypad column keys is pressed. When a key is pressed, a message is sent to the microprocessor through the output (KEY_INT) telling it that a key has been pressed. The microprocessor then samples the analog to digital voltages at the keypad row and keypad column and map with a table so that the pressed key can be identified. Once the key has been identified, the message that corresponds to the key shows up at the display.

The LED_EN setting is set by the codeplug. When the value is set to high, the LED does not light up during power up and vice versa.

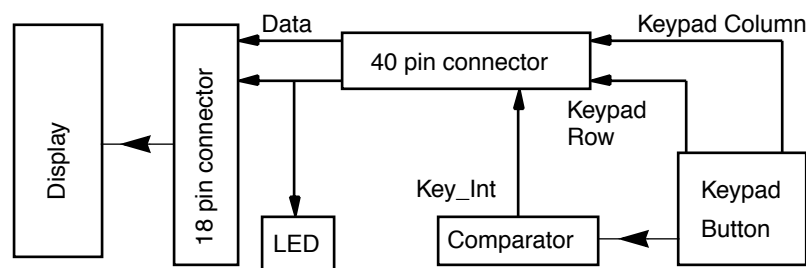

Figure 1-1 Keypad Block Diagram

1.2 Flexible Connectors

Flexible ribbon circuits (flexes) are used to connect the keypad and radio front panel components with the circuit boards. The flexes are locked into place in their connectors by latches which must be released before the flexes may be disconnected during maintenance disassembly.

Two types of flexible ribbon circuits are used in the radios:

- ☐ Keypad/Controller Interconnect flex - used for connecting the keypad with the main board circuits.
- ☐ Universal Flex connector - used to make connections to the Speaker, Microphone and accessory connector.
