

# Using Cloud WAF – Best Practices

[training@radware.com](mailto:training@radware.com)

Before changing **DNS server settings**, test service connectivity locally, using your local host static settings (hostfile) to point traffic through the Cloud WAF Service

During learning:

- Let the Application QA team run the main business flows through the system
- Cover special flows, such as end-of-quarter tasks, admin pages, and others

During ERT's review, review the events generated for the IP addresses used by your testing team.

After policy activation:

- Let your Application QA team run main business flows through the system
- If your system experiences false positives
  - refine Security Policies as soon as possible

To ensure smooth traffic flow from Radware Cloud to your servers, you need to whitelist Radware VIPs and monitoring services IPs.

# Thank You
