1. GENERAL

Note: The forms shown in this practice are intended to be used as illustrations and guides in making up local cross-connections forms.

1.01 This practice describes forms for recording cross-connection assignments and other data such as foreign area translator route description, centrex service options, etc., for No. 5 crossbar offices. Forms for information available from other sources (such as Traffic Department line assignment lists), and normally used directly as presented, are not included in this practice.

1.02 This practice is reissued to:

(1) Add a new form for recording the cross-connections of trunks to the Mini-ROTL (Remote Office Test Line) RTMB (Remote Test Make-Busy) jack.

(2) To incorporate forms listed in Addendum 218-013-301.

Revision arrows have been used to indicate significant changes.

1.03 Unless specified otherwise, all forms will be applicable to both wire-spring and nonwire-spring-relay type circuits.

1.04 Miscellaneous cross-connections not included in the detailed forms may be listed on the form provided in Part 12.

1.05 A general description of the forms is given in Parts 2 through 25. Each of these forms is illustrated in reduced size.

2. AUTOMATIC CONNECTION LINE CIRCUIT CROSS-CONNECTIONS (Fig. 1)

Preset Information

2.01 This form is used to list the preset called directory number, line link location of the originating line preset called number, privilege control digits, preset AMA information, and access code.

2.02 All cross-connections for one preset called directory number will be listed in the column under that number.

2.03 Cross-connections to punchings AG, BG, CG, DG, EG, FG, GG, HG, JG, KG, LG, CDG, CDPG, CUG, CTAG, HGG, FUG, VGG, and CRUG will be on a 2-out-of-5 or a 2-out-of-7 basis and from their associated punchings, FTG, on a 2-out-of-4 basis.

3. CAMA BILLING INDEXER CROSS-CONNECTIONS

A. Originating Code (Fig. 2)

3.01 This form is used to list the cross-connections for originating office code and coil groupings. Individual cross-connections may be indicated by a straight line drawn from the associated punching to the RSG1- column and the coils may be indicated by the check mark (✓).

3.02 The originating code assignments shall be entered in the space opposite the particular originating office.

Note: The following shall be cross-connected to the VOC punching:

(a) All unassigned OABL-, OABH-, and OC- punchings associated with an assigned CC- punching.

(b) All unassigned OAR- punchings associated with an assigned OAC- punching.

(c) All unassigned ORC- punchings associated with an assigned RCC- punching.

Headings

3.03 ***OAB-:*** The numerical equivalent of the originating office 'A' and 'B' digits shall be listed in this column. The 'C' digits 0 through 4 will be designated 'L' and 5 through 9 will be designated 'H.'

Example:

Midwest designated as L64

Midwest designated as H64

3.04 ***ORC-:*** The originating rate class shall be expressed as follows:

Example:

Originating rate class 1 punching 13 designated as 1-13. The RSG-1 designation will be the same as that listed for the ORC-.

Note: The VOCG cross-connection shall be cross-connected through the E4 coil to RSG1.

Terminating Code (Fig. 3)

3.05 This form is used to list the rate treatment cross-connections in terms of the coils to be assigned to derive the billing indices for the combination of 10 originating rate treatments (0 to 9) and 60 terminating rate treatments. The form may also be used for the combination of originating rate treatments 10 to 19, and the 60 terminating rate treatments by entering the tens digit (1) on the form. Connection is made from punchings TRTA0-59, TRTB0-59, TRTC0, and TRTD0-59 to the correspondingly numbered RSG3- punching. The letter A, B, C, or D should be entered after the TRT- and RSG3- as required.

3.06 The entry combination cross-connection shall be listed as 2L or 4L.

Note: The VTCG cross-connection shall be cross-connected through the E4 coil to RSG2.

B. Rate Treatment (Fig. 4)

3.07 This form is used to list the remaining rate treatment cross-connections. The A through F coils shall be listed on a 2-out-of-5 basis.

Note: Connect all unassigned TC punchings to VTC.

Headings

3.08 ***TC and RSG2:*** The numerical equivalent of the listed terminating office code shall be listed in these columns opposite the associated office.

4. CAMA TRANSVERTER CROSS-CONNECTIONS

A. Code Compression, Message Billing Index, and Recorder Group (Fig. 5)

4.01 This form is used to list the compressed code and recorder group cross-connections.

4.02 Cross-connections from TAC- to T4L, T5L, or G may be indicated by a check mark (✓). Cross-connections from FAC- to CC0-9 shall be indicated by the numeral of the associated CC- punching.

4.03 Cross-connections from CA0-9, CB0-9, and CD0-9 to T4LA, T4LB, T4LD, GA, GB, or GD shall be indicated by the letter associated with the T4L- or G- punching.

4.04 Cross-connections for the remaining forms may be expressed by a check mark (✓) or numeral as required.

5. CENTREX (MISCELLANEOUS CIRCUITS) CROSS-CONNECTIONS (Fig. 6)

5.01 This form is used to record the cross-connections for centrex circuits.

5.02 For the transfer line link and marker connectors, space is used to record the vertical file associated with each trunk link frame. All trunks that appear in the same vertical will have the same trunk link frame number.

5.03 For the transfer line identifier and connector, space is used to record the vertical group number for line sleeves associated with six or less vertical groups with dial transfer on line link frames when assigned on a pattern basis. Record the cross-connection for the vertical group on a pattern basis.

5.04 For the position link circuit, space is used to record the cross-connections for customers in a customer group per horizontal group basis.

5.05 For the traffic register translator circuit, space is used to record the customers on a customer group basis for traffic sampling to determine customer group usage.

6. FOUR-WIRE CONFERENCE CONTROLLER CIRCUIT CROSS-CONNECTIONS

A. Assignment to Conference Pattern and Line Unit (Fig. 7)

6.01 Space is used to record the cross-connections for each conferee address to a line unit for each pattern assignment.

B. Address Information to Marker (Fig. 8)

6.02 In Fig. 8 space is used for recording 20 called conferees (A) and their alternates (B) in one conference pattern. The A- through K-digits will be recorded in the column under the called conferee o called alternate conferee address on a 2-out-of-5 basis.

C. Line Link Location (Fig. 9)

6.03 Space is used for recording 17 conferees (A) and their alternates (B) in one conference pattern that may originate a conference call. The cross-connections for the line location of each conferee and their alternate will be shown in the column under the address on a 2-out-of-5 basis.

6.04 Space is used for recording the answer timing feature for each address.

D. Control Digit Information to Marker (Fig. 10)

6.05 Space is used for recording the procedure level assigned to each conferee line unit. CD-punchings are cross-connected to PS- punchings on a 2-out-of-7 basis.

E. Miscellaneous (Fig. 11)

6.06 In Fig. 11 space is used for recording class-of-service, procedure, 101 trunk assignments, line unit assignments to 101 trunks, controller recycle, conferee answer supervision, and miscellaneous cross-connections associated with one conference controller circuit and common to all conferees and line units.

7. FOREIGN AREA TRANSLATOR CROSS-CONNECTIONS

A. Code Point (Fig. 12)

7.01 This form is used to list the code point cross-connections associated with the direct route translation, switched route translation, and code screening for one translator group.

7.02 The number of the area route relay that is used in making translator cross-connection verification tests is also listed on this form.

7.03 Office or vacant codes in different areas in the same translator group with the same code point shall be entered on consecutive lines on this form. The assignment for the individual office or vacant code shall be entered on the line opposite the particular code and area.

Headings

7.04 ***Ref No.:*** A reference number corresponding to each line of each sheet is required to cross reference the information in this form with associated foreign area translator forms. The reference number should be a 4-digit number. The thousands and hundreds digits should be the same as the 2-digit number assigned to the sheet. The tens and units digits will be the particular line number on the sheet.

7.05 ***Code Point:*** The code points should be listed numerically in the C column.

7.06 ***Direct Route:*** The direct route cross-connection assignments shall be placed in the space opposite the particular code and area. The OR-, TAN-, TOL-, and OAT- punchings are associated with and numbered the same as the DIR punching. The DIR punching number opposite an entry in any space in OR-, TAN-, TOL-, and OAT- columns determines the number of the particular OR-, TAN-, TOL-, or OAT- punching.

> ***Note:*** Similar patterns of punching numbering associations are used on other forms throughout this practice.

7.07 ***Code Screening:*** The LC- and AC- punchings are associated with and numbered the same as the associated CS punching. (Refer to Note in paragraph 7.06)

7.08 ***Area Route Indications:*** The information on this portion of the form is used to make foreign area translator cross-connection verification tests. Information is entered as follows:

(a) When code screening is not required, enter the number of the area route in the space opposite the code and area under the proper A or L columns. The 7-digit local codes will have the area route entered in the L columns, and the 10-digit area codes will have the area route entered in the A columns.

(b) When code screening is required, indicate that the code key is required in the code key column. The area routes will be entered as covered in the previous paragraph.

B. Code Grouping Punchings (Fig. 13)

7.09 This form is used to list the code grouping cross-connections for one translator group.

7.10 The code grouping punchings consist of five individual punchings strapped together for connecting related cross-connections. When more than five punchings are used for this purpose, a suitable indication of this shall be made on the form.

7.11 All reference numbers for code point cross-connections associated with the code grouping punchings on Fig. 12 shall be entered in the related space on this form.

C. CAMA, Code Screening, and Direct Route Translator (Fig. 14)

7.12 This form is used to record the assignment of the code screening punchings and direct route translator punchings for one translator group.

7.13 All reference numbers for code point cross-connections associated with code screening punchings and direct route translator punchings on Fig. 12 shall be entered in the related space on this form.

D. Grouping Punchings (Fig. 15)

7.14 This form is used to list the grouping punching cross-connections for one translator group.

7.15 Grouping punchings consist of five individual punchings strapped together for connecting related cross-connections. When more than five punchings are used for this purpose, a suitable indication of this shall be made on the form.

7.16 All reference numbers for code point cross-connections associated with grouping punchings of Fig. 12 shall be entered in the related space on this form.

E. Ring Translator (Fig. 16)

7.17 Translator output cross-connections for switched routes are listed on this form. One form is required for each area.

7.18 All reference numbers for code point cross-connections associated with switched routes on Fig. 12 shall be entered in the related space on this form.

F. Route Description (Fig. 17)

7.19 This form is used to record the area route assignments and the associated information necessary for route assignments in the markers. Each sheet will accommodate 40 area route assignments.

Headings

7.20 ***AR:*** The area route numbers should be listed numerically in this column.

7.21 ***Reference Number:*** All reference numbers for code point cross-connections associated with area route relays on Fig. 12 shall be entered in this column.

G. Switched Route Grouping (Fig. 18)

7.22 This form is used for recording the assignment of all switched route grouping punchings for one translator group.

7.23 All reference numbers for code point cross-connections associated with switched route grouping punchings on Fig. 12 shall be entered in the related space on this form.

8. INCOMING REGISTER CROSS-CONNECTIONS (Fig. 19)

8.01 This form is used to list incoming register cross-connections, wire-spring and nonwire-spring-relay type. The left side of the form shall be used for the tandem and toll number group trunk number translation cross-connection information. The right side of the form is used for listing detailed terminal strip and punching information for the number group trunk number cross-connections and, if space permits, for other cross-connections necessary in the incoming register. If all the cross-connection information cannot be accommodated on this form, the miscellaneous cross-connections form, shown in Part 12, should be used as required.

Headings

8.02 ***Number Group Trunk Numbers:*** In the Cross-Connect Form columns, the HA-, HB-, TA-, TB-, EHA-, EHB-, ETA-, ETB-, ATA-, and ATB-punchings are associated with and numbered the same as the particular LT relay. (Refer to Note in paragraph 7.06.)

9. INCOMING REGISTER LINK CROSS-CONNECTIONS

A. Nonwire-Spring-Relay Type — Trunk Class and Frame (Fig. 20)

9.01 This form is used to list the cross-connections for the class of call and the trunk link frame units number of the incoming trunks assigned to one nonwire-spring-relay type incoming register link frame. Space is used to list trunk data opposite the associated TP relay.

B. Flexible Trunks (Fig. 21)

9.02 This form is used to list the distributing frame cross-connections between flexible incoming trunks and the incoming register link frame. One sheet will accommodate 120 trunk assignments. Space is used to list the trunk equipment relay rack and circuit and the cross-connection to the incoming register link frame switch and vertical (nonwire-spring-relay type) or horizontal group and vertical (wire-spring-relay type).

C. Wire-Spring-Relay Type — Trunk Link Frame and Trunk Class (Fig. 22)

9.03 This form is used to list cross-connections for either direct pulse- or bylink-type trunks. The TPU and TPC punchings are numbered the same as the associated TP relay. When the form is used only for a direct pulsing type of incoming register link, the trunk-type cross-connection is not necessary. When the form is used for a bylink-type of incoming register link, the trunk-type cross-connection will be necessary. On the latter type link, the TPU and TPC punchings 20 through 39 will be unused on the form, and the columns to the right of these punchings will not be required. Space is used for recording CLA-, CLB-, and CLC- cross-connections to the CL- punchings required to give class indication for incoming trunk, transfer, or attendant class, respectively, for phases I and II centrex.

10. LINE LINK CROSS-CONNECTIONS

A. Class-of-Service (Fig. 23)

10.01 This form is used for recording the class-of-service assigned to each vertical file on each line link frame. The association of a CS lead or punching with a particular type or class-of-service is also shown. One sheet will accommodate the assignment for 8 vertical groups and 40 line link frames. When this form is used in conjunction with wire-spring-relay type circuits that have been arranged for 60 classes-of-service, it will be necessary to enter in the Vertical Group column the class group (A or B) indication. The information in the Associated Class-of-Service column should also indicate the type or class-of-service associated with both class groups.

B. Class-of-Service and Rate Treatment (Fig. 24)

10.02 This form is used for recording the class-of-service and rate group assigned to each vertical file on each line link frame. One sheet will accommodate 2 vertical groups and 30 line link frames for offices equipped for 100 classes-of-service and 20 rate groups.

C. Class-of-Service and Rate Treatment on a Hold-Magnet Basis (Fig. 25)

10.03 This form is used for recording line link class-of-service and rate treatment cross-connections on a hold-magnet basis. One sheet will accommodate six vertical groups of a line link frame.

D. Line Sleeve (Fig. 26)

10.04 The line sleeve cross-connection (made at the distributing frame) to the number group or trunk circuit is shown on this form.

Headings

10.05 ***LS Punching:*** All information for each line link frame shall be grouped together and the line link frames entered numerically. The vertical files for each vertical group and the vertical groups shall be arranged numerically for each line link frame.

E. Line Load Control (Fig. 27)

10.06 This form is used to list the cross-connection required for line load control on one line link frame. When the line load control is on a line group basis, cross-connections for a class-of-service will be shown in the line group basis columns for adjacent horizontal groups in one vertical group. When the line load control is on a vertical group basis, cross-connections will be shown in the vertical group basis columns; only one cross-connection is required for each vertical group.

F. Wiring Options (Fig. 28)

10.07 This form is used to list the line equipment locations that require wiring options. One sheet will accommodate 90 line equipment assignments.

10.08 Typical of the information to be entered on this form are telephone numbers of lines or trunks that require terminating service only, line equipments that are to be bypassed by the line insulation test frame, or line equipment of coin lines where options are to be applied locally by the installation or maintenance force.

10.09 A list of tandem or toll trunks by telephone number will facilitate identifying individual trunks from the trouble recorder card information.

11. MARKER CROSS-CONNECTIONS

A. Route Relay Assignment (Fig. 29)

11.01 This form is used to record the route relay assignments for route relays.

Headings

11.02 ***Route Relay:*** The tens and units digits of the route relay number appear in this column. The hundreds digit of the route relay number shall be entered in this column as required.

B. Code Point and Route Assignment (Fig. 30)

11.03 This form is used to list the code point and associated route relay cross-connections. One sheet will accommodate 35 code point assignments. This form may also be used for showing route assignment for foreign area routes, route advance groups, and code groups. The foreign area routes would be designated FAR- and listed numerically in the Code Point column. The route advance group or code groups would be listed as such in the Assignment column. The blank columns shall be used for additional information as determined by local requirements.

Headings

11.04 ***Type of Trunk:*** The type of trunk as designated in AT&T Practice 819-600-150 may be listed in this column.

11.05 ***Cross-Connect from Route Relay Punchings:*** The RC-, R-, RA-, TB-, TG-, OS-, CL-, CP-, CR-, and DL- punchings are associated with and numbered the same as the particular route relay. (Refer to Note in paragraph 7.06.)

11.06 ***TB- to TBC-:*** The majority of TB- punchings will be cross-connected to a TBC- punching. When the TB- punching is cross-connected to other punchings, such as TBG0, the designation of that punching shall be placed in this column.

11.07 ***OS- to OSC-:*** The majority of the OS- punchings will cross-connect to the OSC- punching. When the OS- punching is cross-connected to other punchings, such as NS0, the designation of that punching shall be placed in this column.

C. Nonwire-Spring-Relay Type — Class-of-Service (Fig. 31)

11.08 This form is used to list the cross-connections associated with the service relays. One sheet will accommodate assignments for 36 service commons and 16 service relays.

D. Wire-Spring-Relay Type — Class-of-Service and Rate Treatment (Fig. 32)

11.09 This form is used to list the cross-connections associated with the marker class-of-service and rate treatment leads and to list the cross-connections associated with the service relays. Space is also used for recording the SC and USC multiple cross-connections. One sheet will accommodate assignments for 20 classes-of-service or rate treatments with 24 service commons per class-of-service or rate treatment.

E. Nonwire-Spring-Relay Type — Tandem Code Screening (Fig. 33)

11.10 This form is used for listing the originating, tandem, and toll cross-connections when two or more tandem classes are required.

Headings

11.11 ***Common Connection:*** This column is used for reference purposes. Space is used to list the punching that is cross-connected to the TSC punching. (Refer to Note in paragraph 7.06.)

11.12 ***TS Punchings:*** The individual TS punchings of the OR0- TOL0-, and TAN0- relays are associated with and numbered the same as the TSC punchings. (Refer to Note in paragraph 7.06.)

F. Code Conversion Preroute (Fig. 34)

11.13 The code conversion preroute cross-connections will be entered on this form. One sheet will accommodate the assignments for 80 CV relays.

Headings

11.14 ***Common Connection:*** The CV relays and punchings number 00 through 99. The units digit is in CV column. The tens digit shall be entered as required.

11.15 ***Cross-Connect from CV Relay Punchings:*** The CVB-, ARN-, BRN-, CRN-, CVR- punchings are associated with and numbered the same as the CV punching. (Refer to Note in paragraph 7.06.)

G. Nonwire-Spring-Relay Type — Class of Call and Presort Class (Fig. 35)

11.16 This form is used for listing the cross-connections for originating, tandem, toll, and CAMA class calls and presort class relays.

H. Grouping and Allotted Groups (Fig. 36)

11.17 This form is used for listing the cross-connections associated with route advance grouping, code grouping, service grouping, route convenience grouping or route grouping, code conversion route grouping, CAMA sender group convenience, and allotted groups.

Grouping

11.18 The units digit of the grouping number is listed in the route advance grouping, code grouping, service grouping, and route grouping or route convenience grouping columns. The tens digit shall be entered as required.

Headings

11.19 ***Cross-Connect from Punching:*** These punchings are associated with and numbered the same as the AL relay. (Refer to Note in paragraph 7.06.)

11.20 ***Remove Straps:*** This space is used to list the straps that have to be removed for allotted group operation.

I. Nonwire-Spring-Relay Type — Class-of-Service Leads, Class-of-Service Control, Intercepting, Route Transfer, Denied Route, and Coin Reroute (Fig. 37)

11.21 This form is used for listing the cross-connections for class-of-service leads and control, intercepting, route transfer, denied route, and coin reroute for nonwire-spring-relay type markers.

Headings

11.22 ***Denied Route:*** The NR punchings are numbered the same as the associated denied route relays.

11.23 ***Coin Reroute:*** The RR punchings are numbered the same as the associated coin reroute relays.

J. Wire-Spring-Relay Type — Intercepting (Fig. 38)

11.24 This form is used for listing the various cross-connections associated with various types of intercepting.

K. Wire-Spring-Relay Type — Route Transfer, Diverted Route, and Dial Tone Marker CS- and CST- Leads (Fig. 39)

11.25 This form is used for listing the cross-connections associated with route transfer (normal and transferred routes), diverted route, and dial tone marker CS- and CST- leads.

L. Dial Tone Marker Cross-Connections or Group Assignment, Class-of-Service, and Miscellaneous (Fig. 40)

11.26 This form is used for listing the cross-connections associated with 2-wire originating register group assignment, 4-wire originating group assignment, class-of-service, and miscellaneous features.

M. Control Digits and Class-of-Service Screening (Fig. 41)

11.27 This form is used for listing the assignment of control digits, the cross-connection of control digits for precedence and priority, and the cross-connections for class-of-service screening.

N. Treatment for Four-Wire Privilege Groups (Fig. 42)

11.28 This form is used for listing the cross-connections for 4-wire privilege groups.

O. Tens Block Screening (Fig. 43)

11.29 This form is used for listing the cross-connections for tens block screening.

P. Line Link Pulsing (Fig. 44)

11.30 This form is used for listing cross-connections for line link pulsing.

Headings

11.31 ***Cross-Connect from Line Route Relay Punching:*** The LRW-, LRU-, LRL-, LNST-, LNHB-, LNTB-, LCR-, LCL-, and LDL- punchings are associated with and numbered the same as the particular line route relay. (Refer to Note in paragraph 7.06.)

Q. Multiple Class-of-Service Match (Fig. 45)

11.32 This form is used for listing cross-connections for multiple class-of-service match for offices with centrex.

R. Four-Wire Routing Program (Fig. 46)

11.33 This form is used for listing the cross-connections for the 4-wire routing program.

Headings

11.34 ***Cross-connect from routing relay punchings:*** The RMW-, RMCL-, RMC1-, RMC2-, RMC3-, RMC4-, RMC5-, RMC6-, RMC7-, RMC8-, RMC9-, RMC10-, RMC11-, RMC12-, RM1- or MD-, RM2 or BA-, RM3- or SBA-, RM4- or GA-, RM5- or RS-, RM6- or CDM-, RM7- or CDB-, RM8- or CDS-, RM9- or SGA-, RM10- or FGA- punchings are associated with and numbered the same as the particular routing relay. (Refer to Note in paragraph 7.06.)

11.35 Punchings RM1 through RM10- are used in the ring routing program; 4-wire polygrid routing uses the alternate punchings in the same columns.

S. Four-Wire Privilege Group Screening (Fig. 47)

11.36 This form is used for listing the 4-wire class-of-service, 4-wire special request screening, control digit, and control digit grouping cross-connections for offices equipped for 4-wire switching.

T. Four-Wire Routing Program (Grade Screening) (Fig. 48)

11.37 This form is used for listing grade screening on a grade-relay basis. Cross-connections for two grade relays and associated punchings may be shown on one form.

U. Four-Wire Routing Program (Precedence Level) (Fig. 49)

11.38 This form is used for listing cross-connections associated with precedence level routing assignment. Route group separation, and special grade routing.

V. PBX Allotter (Fig. 50)

11.39 This form is used for listing the cross-connections associated with PBX allotting. The form on the right may be used to list any cross-connections that are not listed in the detailed portion of this form.

W. Special Features (Fig. 51)

11.40 This form is used for listing cross-connections associated with traffic sampling, wideband switching, and SSN (switched services network).

12. MISCELLANEOUS CROSS-CONNECTIONS (Fig. 52)

12.01 This form is used to list cross-connections not included on other forms. One sheet will accommodate 120 cross-connection assignments.

12.02 The name of the circuit(s) should be listed in the title of this form.

12.03 If this form is used to list cross-connections for more than one circuit, the circuit designation shall also be entered in the blank space above each group of cross-connections.

13. NUMBER GROUP CROSS-CONNECTIONS

A. Terminal Hunting (Fig. 53)

13.01 This form is used to list the number group cross-connections to TB- relays, A- relays, SC- relays, etc, associated with terminal hunting numbers.

13.02 When entering information on this form, the cross-connections shall be listed opposite the assigned hunt group. If additional space is required, the cross-connections may be continued on the following line.

13.03 The chart at the bottom of the form is for reference. The association of the A relay to the SC relays will be listed in this chart when the hunting group is extended over more than one tens block.

14. ORIGINATING REGISTER CROSS-CONNECTIONS (Fig. 54)

14.01 This form is used to list cross-connections associated with operation of the originating register circuit.

15. ORIGINATING REGISTER-CALLED ADDRESS TRANSLATED FROM LINE LINK LOCATION CROSS-CONNECTIONS

A. Preset Called Number (Fig. 55)

15.01 This form is used to list the originating line link location, the preset called directory number, the A- through K- digits of the called number on a 2-out-of-5 basis, control digits on a 2-out-of-7 basis, and the area code associated with the HL- relays in numerical sequence as required.

B. Address Relay Selection and Frame Unit Translation (Fig. 56)

15.02 This form is used to list the cross-connections required for selection of an H-address relay. Space is also used for listing cross-connection of frame units into low and high frames.

16. OUTGOING SENDER LINK CROSS-CONNECTIONS (Fig. 57)

16.01 This form is used to list the trunk cross-connections for one outgoing sender link frame.

Headings

16.02 ***TRK:*** The trunk number assigned to each trunk associated with the outgoing sender link shall be listed in this column.

17. PRETRANSLATOR CROSS-CONNECTIONS

A. Home Area Codes, Foreign Area Codes and Miscellaneous (Fig. 58 and 59)

17.01 These forms are used to list the cross-connections associated with the home and foreign area codes and also, the C digit zero codes and miscellaneous pretranslator cross-connections.

17.02 The home and foreign area codes are listed numerically. Space is used under each code to enter the number of digits to be dialed. This information will be used for assigning the R, S, or T punching to the proper P- punching.

17.03 The C digit zero codes are listed numerically. Space is used under each code to enter the number of digits to be dialed. This information will be used for assigning the particular code punching to the proper BS- or CM- punching.

18. ROUTE RELAY TB AND TG RECORD (Fig. 60)

18.01 This form is used to list the route relays associated with each TB- and TG- relay assignment. Each form will accommodate the assignments for one TB relay and TG relays 0 through 19. This information may be used for reference regarding XFT cross-connections.

18.02 If more space is required to list the various routes associated with a particular TB and TG relay, a list may be entered on the back of the form and designated by a letter which may be entered in the proper space.

19. SERVICE OPTIONS (Fig. 61)

19.01 This form is used to list trunk and miscellaneous circuits that have service options and to indicate what options are required for each circuit. One sheet will accommodate 120 circuits.

20. TRAFFIC REGISTER CROSS-CONNECTIONS (Fig. 62)

20.01 This form is used to list the traffic register cross-connections. One sheet will accommodate 80 traffic register assignments. The cross-connections that are made at the distributing frame should be grouped and it should be indicated that the connections will be made at the distributing frame. The cross-connections at the traffic register frame or

relay rack frame should be grouped, and it should be indicated that the connections are made at the particular frame.

Headings

20.02 ***From PCHG:*** The punching number will be the same at the pulse jack number and will be entered in this column.

21. TRANSVERTER CROSS-CONNECTIONS

A. Code Compression and Message Billing Index (Fig. 63)

21.01 This form is used to list the code compression and message billing index cross-connections in the pretranslator.

Code Compression

21.02 Two groups of cross-connections for code compression are listed. They are the X0X and X1X code cross-connections and the FAB relay cross-connections.

21.03 In the column associated with the individual FAB- relays, the assigned X0X and X1X codes will be entered.

22. TRUNK RECORD CARD (Fig. 64)

22.01 This form is used for recording all pertinent information for one trunk. Space is also used for maintaining a trouble record for the trunk. One card will accommodate one incoming or outgoing trunk.

23. TRUNK LINK CROSS-CONNECTIONS

A. Four-Wire (Fig. 65)

23.01 This form is used for recording the cross-connections associated with the individual trunks on one regular or one supplementary trunk link frame.

23.02 The last two digits of the F-, FT-, TKT-, or TRN- punchings are numbered the same as the particular SW and LEV.

B. Two-Wire — A and B Appearance (Fig. 66 and 67)

23.03 These forms are used for recording the cross-connections associated with the individual trunks.

23.04 These forms may be used for trunk frames equipped with or without small crossbar switches.

23.05 The FA-/FB-, FTA-/FTB-, BTA-/BTB-, RCA-/RCB-, RN-/KT-, TKT-, TSC-, and TRN- punchings are numbered the same as the particular SW and LEV.

C. Two-Wire — Miscellaneous (Fig. 68)

23.06 This form is used for recording ringing select switch directions and miscellaneous cross-connections.

24. TRUNK TEST AND MAKE-BUSY CROSS-CONNECTIONS (Fig. 69)

24.01 This form is used to list the test and make-busy jack cross-connections at the main distributing frame. One sheet will accommodate 80 jack assignments.

25. WIDEBAND CROSS-CONNECTIONS

A. Link Circuit (Fig. 70)

25.01 These forms are used for recording the cross-connections associated with line switch verticals 01 to 12.

B. Line Control Circuit (Fig. 71 and 72)

25.02 This form is used for recording the cross-connections associated with individual wideband lines. One sheet will accommodate one line control circuit.

C. Remote Switch and Remote Switch Signal Control Circuit (Fig. 73)

25.03 This form is used to list cross-connections for the remote switch and remote switch signal control circuit. One sheet will accommodate one remote switch and its associated remote switch signal control circuit.

D. Trunk Test Register Circuit (Fig. 74)

25.04 This form is used for recording the cross-connections associated with individual test trunks.

25.05 The last two digits of the FGA-, TFA-, TFB-, FTA-, FTB-, etc, punchings are the same as the test trunk number.

25.06 Cross-connections to punchings TF-, FU-, HG-, HT-, TT- will be on a 2-out-of-5 basis. Cross-connections to FT- punchings will be on a 2-out-of-4 basis. Cross-connections to VG- punchings will be on a 2-out-of-6 basis.

26. ▶TRUNK — MAKE-BUSY JACK — REMOTE TEST MAKE-BUSY CIRCUIT CROSS-CONNECTIONS (Fig. 75)

26.01 This form is used for listing the cross-connections from a trunk to the make-busy jack of that trunk and the cross-connection to the remote test make-busy circuit if equipped. The procedure(s) for entering information on this form is as follows:

(1) From office records, enter trunk information as follows:

(a) Trunk location

(b) MDF (main distributing frame) appearance of B1 & B2 leads

(2) Enter terminal strip, jack, and lead location of make-busy jack for each trunk.

(3) Enter the trunk identification — TB, TF, and TT (trunk block, trunk frame and trunk test), data onto form.

(4) At EOTT/RTMB keyboard, perform trunk group status dump of all make-busy circuits (X59 command).

(5) Enter the make-busy circuit number for each trunk as needed, as assigned by the RTMB unit.

(6) Using office trunk records enter the trunk bay location for where the make-busy circuit is connected to the MDF appearance B1 & B2 leads.◀
