COMPILING DATA FOR CONTROL TAPES FOR TRANSMISSION TESTING OF TRUNKS USING AUTOMATIC PROGRESSION TRUNK TEST FRAME AND AUTOMATIC TRANSMISSION MEASURING SYSTEM NO. 5 CROSSBAR OFFICES

CONTENTS PAGE

1. GENERAL

1.01 ▶This section describes the procedure for compiling data used in the preparation of control tapes for transmission testing of trunks using the Automatic Progression Trunk Test Frame (APTT) SD-25938-01, and the Automatic Transmission Measuring System (ATMS) SD-99746-01. These trunks may be outgoing from the office containing the APTT or outgoing from a remote office test line (ROTL). The control tapes provide instructions to the APTT, and when remote office testing is being performed, to the ROTL. These instructions include information to enable the APTT or ROTL to seize the trunks to be tested and to connect to the desired far-end test line. Transmission test control tapes also include the loss and noise requirements for each trunk to be tested.◀

1.02 This section is reissued for the following reasons:

(a) To add information in the TMT, TMU entries in Table A for tests of TSP(S), CCSA, and centrex trunks.

(b) To add information in the CLT, CLU entries in Table A for tests of CAMA, centrex and CCSA trunks.

(c) To include additional teletypewriter control characters in Table B for use when performing transmission tests of trunks using the Remote Office Test Line (ROTL).

(d) To revise Fig. 1, 2, 3, and 4 to show the current issue of the E-forms.

(e) To make minor changes as required.

This reissue does not affect Equipment Test Lists.

1.03 The Automatic Progression Trunk Test frame (APTT) and the Automatic Transmission Measuring System (ATMS) are arranged to perform transmission tests on the following types of trunks:

(a) Local interoffice trunks

(b) Intertoll trunks

(c) Toll connecting trunks, high-loss or others, including trunks to CAMA offices arranged for tone supervisory signaling

(d) Local tandem and tandem completing trunks

(e) Data trunks

(f) Intraoffice trunks

(g) Line link pulsing trunks

(h) Intermarker group trunks

(i) Automatic intercept trunks

(j) CCSA trunks

(k) TSP(S) trunks.

1.04 Automatic progression from one trunk to another is accomplished by information perforated on teletypewriter tape. Any 28-type teletypewriter may be used to produce a 5-level tape suitable for use with the APTT. However, it is recommended that a 28-type machine, equipped with a modified A-type keyboard and perforator wheel, be used to maintain consistency of the printed characters associated with each punched code. Use of a machine which produces chadless tape is also desirable. The method of preparing control tapes is described in Section 218-220-304.

1.05 In addition the marker and trunk priming information on the teletypewriter tapes, transmission data is also provided to prime the test circuit. The method of transmission testing is described in Section 218-262-502.

1.06 The APTT, Issue 36D and later is arranged to operate with remote office test line (ROTL) to test trunks outgoing from remote offices.

2. TEST AND PRIMING INFORMATION

2.01 The necessary information required for priming the APTT to perform a transmission test is given in Table A. This table is provided to aid in the preparation of Tape Preparation Worksheets. (See Fig. 1, 2, 3, and 4.) The worksheets when properly completed, provide the information required to prepare a control tape. Figure 1 illustrates a worksheet to record information for a preamble to be inserted at the beginning of a control tape. It should contain a brief description of the contents of the control tape and any other pertinent information desired. The preamble information is read by the transmitter-distributor and causes a printout to be made by the teletypewriter.

2.02 Information required for each item of priming information in Table A is covered in office records such as wiring lists, trunk cards, marker cross-connection tables, maintenance records, etc.

2.03 Caption information will be included on the worksheet. Recommended caption information is shown in Fig. 2. This information will appear on the perforated control tapes and page printout but serves no purpose in priming the APTT or ATMS. Caption information should ordinarily be limited to that information required for prompt identification of trunk group under test, transmission requirements, type of tests, originating and terminating offices, test lines, and similar type information.

2.04 Space is provided on the chart for recording information for office record purposes.

2.05 A second chart is provided as shown in Fig. 3, Supplementary Tape Preparation chart (All Trunks, Tape Simplification Provided—SD-25938-01, Issue 30 and Later). This chart contains blank spaces for trunk priming information and is used when the basic chart does not provide sufficient space to list all trunks in a group. A new chart (Fig. 2) should be started for each new trunk group.

2.06 The test circuit is arranged to lock in information common to all trunks of the group. Only that information which relates to the trunk location address and trunk number or the

digits to be outpulsed to a ROTL are required to be perforated for each trunk once the common priming has been perforated.

2.07 In addition to the priming entries, certain teletypewriter characters are required as machine instructions. These symbols and their usages are defined in Table B.

3. ARRANGEMENT OF DATA

3.01 ***General:*** The trunk data may be arranged for testing in various sequences depending on the purpose of the tests, as covered in Section 660-420-010. Usually, trunks will be arranged by transmission facility for transmission tests. If the results of the tests, as provided by the ATMS deviation registers, are to be used for computing the Trunk Transmission Maintenance Index, the trunks must be arranged so that results on 2-wire facilities can be separated from results on 4-wire facilities. This is necessary because different component index tables are used to compute the index. In addition, trunks tested at different intervals for index purposes cannot be mixed on the same tape.

3.02 The recommended transmission measurement intervals are monthly, semimonthly, weekly, and daily. The computer program for summarizing transmission results for index purposes will not accept any interval greater than monthly or any interval less than weekly. If some trunks are to be tested more frequently than weekly, these trunks should be on a tape separate from those trunks tested at other intervals. However, in the case of trunks tested more frequently than weekly, the deviation registers would be read only on one day per week.

3.03 There may be advantages in arranging the trunks for testing by trunk group (terminating office). Further information or factors relating to the sequencing of trunks for testing is covered in Section 660-420-100.

3.04 ***By Facility:*** In this arrangement, trunks routed over a common transmission facility are grouped together. A caption normally should be placed ahead of the data for the trunks or the particular facility in question. If any such group contains trunks to different terminating offices, the group is divided so that those in each subgroup have a common terminating office. Subcaptions to identify each subgroup and to provide other pertinent information applying to the subgroup, which is not included in the caption, would be placed ahead of the data for the trunks in each subgroup. Within each subgroup, the trunks would normally be arranged in order of the channel number of the facility which they occupy, if applicable. When compiling the data for testing by type of facility, a separate worksheet, or group of worksheets, should be prepared for each subgroup in the facility where different priming information is required. All of the worksheets applying to the facility should then be identified so that they will be grouped together in the proper order.

3.05 ***By Trunk Group:*** In this arrangement, trunks to a common terminating office are grouped together. If the trunks within the group require different transmission priming information, the group should be divided so that the trunks in each subgroup all require the same transmission priming information. Further subdivisions can be made if desired so that each resulting subgroup contains trunks leaving the office over a common transmission facility. Subcaptions would be used giving the identity of the corresponding subgroup and any pertinent information applying to it which is not included in the caption. Within each subgroup, the trunks would be arranged in order of the traffic assigned trunk number.

3.06 ***Compiling Data for Mechanized Tape Preparation:*** Control tapes are usually prepared at a centralized location using mechanized procedures. Normally, this requires that the data compiled on the sheets be entered on punched cards or other storage devices. In such cases, it is necessary to modify the attached forms to include entries for sort codes and other information. Also, the arrangement of the trunks must be in accordance with the particular mechanized procedure to be used. The exact methods employed vary between different centralized tape preparation locations and hence the modifications to the forms and the order in which the trunks are to be listed are to be specified locally.

4. PREPARING WORKSHEETS

4.01 Prepare worksheets to include all trunks of all trunk groups in the office on which transmission tests are to be made. Prepare each worksheet by trunk group and facilities within the trunk group. List on each worksheet only those

trunks that have common caption, marker priming, and transmission priming information (Fig. 2 and 3). Where the marker priming information for a trunk group is to be retained and the transmission priming information changed, prepare another worksheet containing new caption, transmission priming, and trunk priming information as indicated in Fig. 3.

4.02 Record proper entries in GROUPING METHOD (FACILITY OR TRUNK GROUP) and ACCESS boxes at the top of the chart. This information is for record purposes and does not appear on the control tape.

4.03 Using Table A and office records, record one digit in each space provided (Fig. 2) under the heading MARKER PRIMING. In some instances, the line designation may not be applicable. In these cases, Table A indicates the use of a filler digit or the omission of any digit. Refer to Table B for teletypewriter characters required as machine instructions.

4.04 Record one digit in each space provided (Fig. 2) for TRANSMISSION PRIMING. This information is included in Table A and referenced documents. Refer to Table B for teletypewriter characters required as machine instructions.

4.05 Under the heading TRUNK PRIMING (Fig. 2), list all trunks that have common marker and transmission priming information. ASN, ASH, IUT, and ITH will not be used for transmission testing as this information is used for making operational tests of CAMA trunk circuits. IHT and ITT are required only when making transmission tests of line link pulsing trunks. RDA, RDB, RDC, RDD, and RDE are required only when making ROTL tests. Refer to Table B for teletypewriter characters required as machine instructions.

4.06 Copies of these charts should be retained in the central office as part of the permanent office records.

¶¶¶ Information digits which are outpulsed to the ROTL, bypassed for non-ROTL tests (filler digit not required).

TABLE A (Cont)

	LINE DESIG	TRUNK SELECTING AND CONTROL INFORMATION				PRIMING DIGIT
TRUNK PRIMING	RDC ¶¶¶	When RDA Digit is: 6 or 7				
		Trunk Link Frame 20-29	Trunk Link Frame Tens	Trunk Tens — Within Block of 20 Trunks	Route Translation Tens	
		Trunk Group 00-19	2	0	0	0
			2	1	0	2
			2	0	1	4
			2	1	1	6
		Trunk Link Frame 20-29 Trunk Group 20-29	1	0	2	1
			1	1	2	3
			0	0	2	5
			0	1	2	7
			2	0	2	8
			2	1	2	9
	RDD ¶¶¶	Trunk Units — Within Block of 20 Trunks				0 Through 9
	RDE ¶¶¶	Route Translation Units				0 Through 9
		SXS ROTL				
	RDA ¶¶¶	Transmission Test (ATMS)				1
		Operational Test				2
	RDB ¶¶¶	Test Selector Number				0 Through 9
	RDC ¶¶¶	Test Selector Vertical Level				0 Through 9
	RDD ¶¶¶	Test Selector Horizontal Terminal				0 Through 9
	RDE ¶¶¶	Prepare to Outpulse				2

¶¶¶ Information digits which are outpulsed to the ROTL, bypassed for non-ROTL tests (filler digit not required).

TABLE B

TELETYPEWRITER CONTROL CHARACTER DEFINITIONS

< (Carriage return) ☰ (Line feed) ⋀ (Figures shift)	These are used wherever they are needed to control teletypewriter functions. (See dual usage of ⋀ , figures shift.)
— (Uppercase A)	ROTL responder trunk group signal. Precedes each responder trunk group having same transmission characteristics. Prepares the self-check signal to ATMS at beginning of each responder group.
? (Uppercase B)	ROTL responder trunk group signal. Clears previously stored marker and/or transmission priming, and prints and stores digits for new ROTL responder group.
# (Uppercase H)	Start copy signal. Permits preamble or caption information to be perforated and printed on tapes. This information will appear on page printout but will not prime the test circuit.
// (Uppercase Z)	Stop copy signal. Removes the teletypewriter from the copy mode. Information then perforated and printed on tapes will contain machine instructions, which will be absorbed by the APTT, and priming information for the test circuit.
▼ (Uppercase J)	Clears previously stored MARKER PRIMING information and prints and stores the following digits. (This is only a control character when the teletypewriter is ***not*** in the copy mode.)
⋀ (Figures shift)	When the teletypewriter is ***not*** in the copy mode, this character unlocks the steering chain. It must immediately precede the digits to be registered (MARKER PRIMING, TRANSMISSION PRIMING, TRUNK PRIMING). In addition, it causes a symbol or number to be printed. For example, upper case H = #.
<☰⋀	This combination will normally precede the digits of a new priming entry; it serves to columnize printout on copying and the character unlocks the chain.
((Uppercase K)	Clears previously stored TRANSMISSION PRIMING information and stores the following digits. (This is only a control character when the teletypewriter is ***not*** in the copy mode.)
• (Uppercase M)	Trunk Priming. Trunk Number, Issue 30D and later — Use in leading positions when traffic assigned trunk number is less than 4 digits, eg, ..45.

Summation:

Before preamble, caption, or subcaption: #<☰

At end of preamble, caption, or subcaption: //

Before MARKER PRIMING: ▼<☰⋀

Before TRANSMISSION PRIMING (following MARKER PRIMING): (⋀

Before each trunk entry: <

When changing TRANSMISSION PRIMING only, before new digits: (<☰⋀
