Ordering Information

General

This Translation Guide has been established for the purpose of furnishing the latest information for the construction and maintenance of the 4ESS™-2000 Switch trunking and routing database. This information is implemented into the database via specific input forms described herein and used by Engineering, Operations, and Administration personnel.

This document is entitled TG-4 for ordering purposes and is available through standard Lucent Technologies Standing Order Procedures.

The TG-4 document number 234-010-100 is ordered on a standing order basis. Every set of volumes ordered will receive periodic updates as translation data changes until the recipient cancels the standing order.

Ordering Procedure

Distribution of this document will be made on an individual or bulk basis from a standing order list. Additions or deletions to the existing standing order lists, changes of names or addresses and requests for individual pages should be forwarded to:

Lucent Technologies
Customer Information Center
2855 N. Franklin Road
P.O. Box 19901
Indianapolis, IN 46219-1385

Orders must include the telephone company area and accounting codes for billing purposes plus the complete information within the appropriate categories.

Continued on next page

ORDERING INFORMATION

Ordering Information, Continued

Ordering Procedure (cont'd.)

Standing Order

Addition to Standing Order:

(Quantity) Document TG-4, 4ESS™-2000 Switch Translation Guide, 234-010-100, complete (include binders and complete set of tabs for each document specified in quantity above) and all subsequent items.

Change of Names or Addresses on Existing Standing Order:

Document TG-4, 4ESS™-2000-Switch Translation Guide, 234-010-100

Change:

OLD - LOC ID (from address label) Name, Address, City, State, and ZIP Code.

NEW - Name, Address, City, State and ZIP Code.

Deletion of Addressee from Standing Order:

Document TG-4, 4ESS™-2000 Switch Translation Guide, 234-010-100.

Delete:

LOC ID (from address label) Name, Address, City, State and ZIP Code

Non-Recurring

Individual Items to Standing Order:

Document TG-4, 4ESS™-2000 Switch Translation Guide, 234-010-100

1. Pages: (quantity) Page Number, Section, Division
2. Binder (empty): (quantity) Volume Number
3. Index Tabs: (quantity) Tab number/s
4. Quantity: (for total amount of volume sets)
5. Include Name, Address, City, State, and ZIP Code on all orders.

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instruction

Translation Inquiry

General

A means of communication feedback has been established for the 4ESS™-2000 Switch TG-4 Translation Guide. The translation inquiry form (ESS400A) is the vehicle to be used for feedback relating to the Translation Guide. This inquiry may deal with problems in using translation forms, difficulties in interpreting written translation information, or any other problem involving translations.

The translation inquiry may also be used for suggestions and proposals relating to Translation Guide contents or arrangement. The objective is to provide a quick and efficient means for providing detailed translation feedback to the user of the Translation Guide.

Requests for feature development should not be submitted as a translation inquiry. This type of correspondence should be directed to the Lucent Technologies Engineering Department through normal channels.

Translation Inquiry Routine

A reproducible copy of the translation inquiry form (ESS400A) is located in Division 10 of this Translation Guide. This master should be reproduced locally to provide a standard format for submitting Translation Guide questions, corrections, or proposals.

Forward the completed ESS400A to Lucent Technologies. An inquiry number is assigned when the ESS400A is received. The inquiry will be reviewed by the TG-4 Coordinator to determine where it should be forwarded for appropriate consideration. The completed form, including details of the disposition, will be returned to the originator. A copy of the translation inquiry will be filed for possible future reference.

Continued on next page

Translation Inquiry, Continued

Form Preparation

The form is divided into three sections. Section A is for reference information, Section B is for the problem description or comment, and Section C is for Lucent Technologies administration.

Section A:

Reference Information - If the information included under Section B description or comment relates to a specific 4ESS™-2000 Switch, complete all of the blanks for office reference.

Section B:

Problem or proposal description -Include enough detail to fully describe the problem or proposal and make reference to division, section and paragraph or figure of the TG-4 document relating to the inquiry.

The inquiry should be dated and signed by a supervisor or manager of the person submitting the request. Include title and complete address. This address will be used for the acknowledged inquiry return.

Forward completed form to:

Sandra Amey - JFA2A7120
LUCENT TECHNOLOGIES
2000 Naperville Road
P.O. Box 3033
Naperville IL 60566-7033
630-979-5475
630-224-6118 Fax

Section C:

Administration - For Lucent Technologies use only to process the Translation Inquiry.

Introduction to the TG-4 Translation Guide

General

The Translation Guide is the means for providing documentation relative to translations and office administration for the switch owner personnel.

The TG-4 for the 4ESS™-2000 Switch is available to all owners of the switch. See Division 2, Section 1 of this series for ordering information.

The TG-4 is updated on a monthly basis. It is being proposed that the updates in the future coincide with the quarterly generic releases.

Organization

The 4ESS™-2000 Switch Translation Guide documents information and instructions for creating, retrieving and modifying data in the switch database.

In each periodic update, the changes to text are noted by shaded background. The shading will be removed from the text in the subsequent update. The new text for that issue will be shaded. This shading will replace the current process for DIFF marking the updated text.

All three media used in the 4ESS™-2000 Switch translations (Office Data Assembler [ODA] input, Recent Change, and Verify System displays) use the same format. Common language keyword combinations are used to designate fields and entries in the fields. By designing the ODA input, Recent Change and Verify System display to use the same format and keywords, the amount of time required for familiarization and training is minimized.

As an introduction to the TG-4, the following paragraphs give a brief description of the function and intent of each division.

Continued on next page

Introduction to the TG-4 Translation Guide, Continued

Description

DIV 0: TG-4 Title Sheet

Section 0 - Table of Contents

Lists the topics covered within the entire TG-4 series specifically by Division and Section number.

DIV 1: Subject Index

Section 1 - Subject Index

Lists the keyword by subject and their associated reference sections.

DIV 2: General

Section 0 - Table of Contents

Section 1 - Ordering Information

Describes how to order the TG-4 on a Standing and Non-recurring order basis.

Section 2 - Translation Inquiry

Gives instruction on how to implement the communication from the customer to Lucent Technologies for comments, proposals or questions.

Section 3 - Introduction to the TG-4 Translation Guide

Lists the function, purpose, and arrangement of the TG-4 Translation Guide.

Section 4 - Introduction to the 4ESS™-2000 Switch Translations

Describes briefly and identifies the layout of the software translators.

Section 5 - Office Data Assembler

Reviews the ODA process of the 4ESS™-2000 Switch.

Continued on next page

Introduction to the TG-4 Translation Guide, Continued

Description (cont'd.)

Section 6 - Universal Terminating Test Lines

Describes the operation of the standard terminating test lines and the codes associated with each test line required.

Section 7 - Routing Philosophy

Gives a general overview of routing telephone traffic within the network.

Section 8 - Recent Change Administration

Introduces the on-line system used to modify the translations in a 4ESS™-2000 Switch office. All available Recent Changes are listed, as well as their locations, in this Translation Guide. The Administration of the Recent Change Activity is also explained.

Section 9 - Verify System

Outlines the translation verification procedures and specifies the input and output messages and their correlation to the ODA input forms and Recent Change Messages.

Section 10 - CCIS INWATS Routing

Describes routing, numbering, and screening for Common Channel Interoffice Signaling (CCIS) Inward Wide Area Telephone Service.

Section 11 - Trunk Order Codes

Describes the TOCs and the manner used in the Next Generation - Trunk Assignment Generation System (NXTGEN-TAGS) and Circuit Assignment Record Transfer System (CARTS) for ODA.

Section 12 - Line Busy Verification

Gives an overview of the feature permitting an operator to access a dedicated network for the purpose of verifying whether a called customer line is actually busy as opposed to out of order.

Continued on next page

Introduction to the TG-4 Translation Guide, Continued

Description (cont'd.)

Section 13 - MASS Announcement Service

Describes the various Public Announcement Services available for local, regional or national call-in promotions.

Section 14 - Translation Growth / Retrofit Administration

Identifies the activities associated with modifying the office database.

DIV 3: Recent Change And Verify

Explains the Recent Change and Verify Message fields and formats. Individual sections cover Recent Change (RC) functions for Trunking, Routing, and Miscellaneous controls. Also, specific verification formats are specified for each RC application.

DIV 4: Feature Descriptions

Presents the major features for the 4ESS™-2000 Switch in a structured format. The newer feature documents will initially be added to the TG-4 with a standardized structure, i.e., Description, Provisioning, Availability, & Environment. Each of these structure categories will also be divided to sub categories, i.e., Dependencies, Interaction, Software Resource, Assignment Rules, Recent Change, etc. Older feature documents will eventually be converted to this structure and updated to the TG-4. This Division is planned to serve as an ongoing resource for feature information to be periodically updated as required.

DIV 5: Translation Implementation Guidelines

Feature topics such as Numbering Plan Area (NPA) Splits, Multiple Treatment Screening, etc. The topics will be presented as considerations for engineering and translation administration planning.

Continued on next page

Introduction to the TG-4 Translation Guide, Continued

Description (cont'd.)

DIV 6: Office Data Assembler Form Preparation

Section 0 - Table of Contents

Section 1 - 406 Series / Miscellaneous

Identifies office parameter requirements for each ODA Form.

DIV 7: Recent Change

Explains the RC Message fields and formats. Individual sections cover RC functions for Trunking, Routing, and Miscellaneous controls

DIV 8: Verification

Lists all of the input and output messages.

DIV 9: Miscellaneous

Section 0 - Table of Contents

Section 1 - Keyword Glossary

Contains the alpha-numerical listing of all the keywords used in translations of the 4ESS™-2000 Switch system. Each keyword is defined by its application/s and associated with the valid entries related to each. This Glossary also will be periodically updated as newer keywords are available for future translation administration.

Section 2 - Keyword Cross-Reference

Lists the alphanumeric listing of all the keywords used in the 4ESS™2000-Switch translations. This listing associates all of the various translation forms having an input for each individual keyword. A viable asset to be used for implementing new translations or troubleshooting problems.

Continued on next page

Introduction to the TG-4 Translation Guide, Continued

Description (cont'd.)

Section 3 - TG-4 Page Inventory

Lists each page in the TG-4 guide by division, section and issue date. The quantity of pages is shown for each section. There are two issued date columns. The left column reflects the issue date that should presently be found in the TG-4. The right column shows the issue date of the section that is being provided in the periodical update package.

DIV 10: Traffic/Plant Measurement System

Presents the methods used to set and change schedules and databases relating to traffic measurements. Included are detailed message formats and instructions for Traffic Measurements Input and Output messages.

DIV 11: Data Management Systems

Covers the Common Network Interface (CNI) Recent Changes using the CNI Database Management System (DMS).

DIV 12: Reproducible Forms

Provides all 4ESS forms relating to translation administration. These are card stock masters intended for ongoing reproduction for onsite personnel use. All forms are provided even if the same form has totally different formats due to Generic use. All forms will reflect a generic/release issue number for control.

Introduction to the 4ESS™-2000 Switch Translations

4ESS™-2000 Switch Translations

Description

Translations is the name for the on-line, real time information storage and retrieval system used for call processing in the 4ESS Switch. This system provides an interface between the generic program and the physical equipment.

More specifically, translations is the means for storage and retrieving office and trunk information. Translations provides the center of knowledge for programs and retrieves the knowledge upon request. Descriptions for thousands of trunks and routing possibilities are available for quick retrieval.

Translations differ from most storage retrieval systems in that information can be uniquely categorized prior to actual storage. Each piece of data has a predefined structural location where it is always found and stored. If new requirements dictate a new category, then the system must be augmented with a new category.

File Structure

Information about trunks, routing and the 4ESS Switch is systematically organized into translators dependent upon the relationship of the data elements. A translator is a unit of memory 1,024 words long.

Call Store Sizing

Translators reside within the simplex call store unit of the 1B processor. The number of translators required is dependent on the quantity of trunks in service and the quantity of special features provided. Special features such as Service Switching Point (SSP) and special screening functions all contribute to the need for additional call store space.

Translation Types

Translations can be built in the 4ESS Switch on an Office Data Assembler (ODA) basis or on a Recent Change (RC) basis. There are, however, translation changes that can only be done on an ODA basis.

4ESS™-2000 Switch Translations (cont'd.)

Office Data Assembler (ODA) Translations

Each 4ESS Switch contains a unique database consisting of equipment assignments and the generic parameters. This data base is referred to as the Office Dependent Data (ODD). Translations can be updated by accessing the ODD via the ODA system. Annually, the database will be updated when retrofitting to the next generic. At this time, specific ODA forms can be processed to change data in the ODD.

Recent Change (RC) Translations

The Recent Change (RC) system is part of the generic program. The RC system is designed to allow translation data to be modified on a real-time basis. Specific RC forms are used for changing trunking, routing and some equipment parameters.

Trunk Identifiers

Description

The various ways of identifying trunks in the 4ESS Switch have been influenced strongly by hardware and software. These identifiers are used in call processing. If translation data fails the recent change edit, these identifiers are used to highlight the rejected data.

Trunk Scanner Numbers (TSN)

The TSN identifies the actual physical appearance of a trunk on the Digital Interface Frame (DIF) or Expanded Time Slot Interchange (XTSI) Frame. This is the main identifier used in the 1B Processor for call processing.

Trunk Identifiers
(cont'd.)

Trunk Appearance Number (TAN)

The TAN identifies a trunk appearance on the Time Slot Interchange (TSI) or Expanded Time Slot Interchange (XTSI) frame. This is the most common identifier used in human interface to the 1B Processor.

Trunk Number (TN)

The TN identifies a trunk appearance on the Time Division Network (TDN) after decorrelation to the Buffer B location on the TSI.

Trunk Block and Member Number (TBMN)

The TBMN is the internal software identifier for a trunk block and member number within a trunk block.

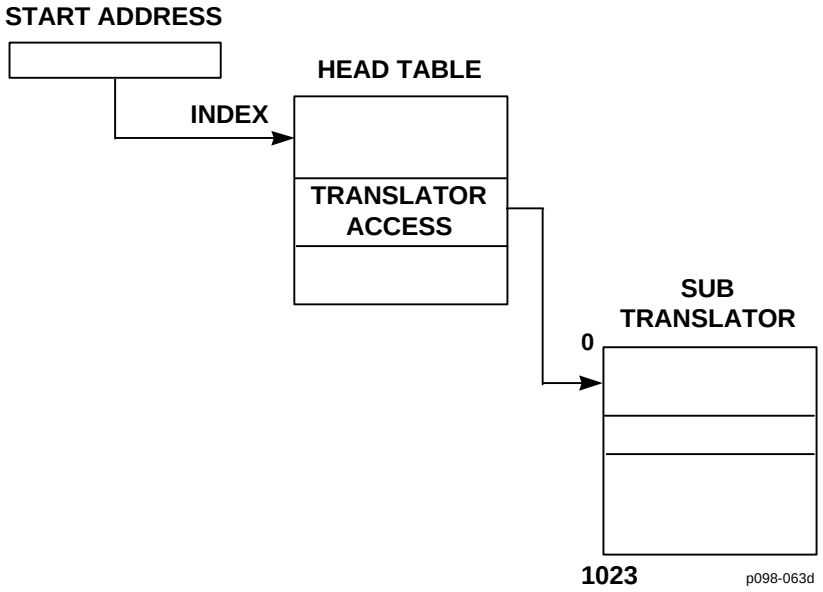
Translator Access

TRANSLATOR ACCESS



Continued on next page

Introduction to the 4ESS™-2000 Switch Translations,
Continued

Translator Access (cont'd.)

Translator access begins with a starting address, which exists in the generic program for each unique translation structure. The starting address defines the location of a unique head table in simplex call store.

The head table contains an address directory of all translators for a particular application, e.g., trunk block. The address within the head table points you to a subtranslator. The subtranslator either provides the data you need or another subtranslator address.

Call Setup

The four basic steps performed in the translation process for the setup of a call are as follows:

1. Incoming Call Translations
2. Digit Translations
3. Trunk Hunt
4. Outgoing Trunk Translations

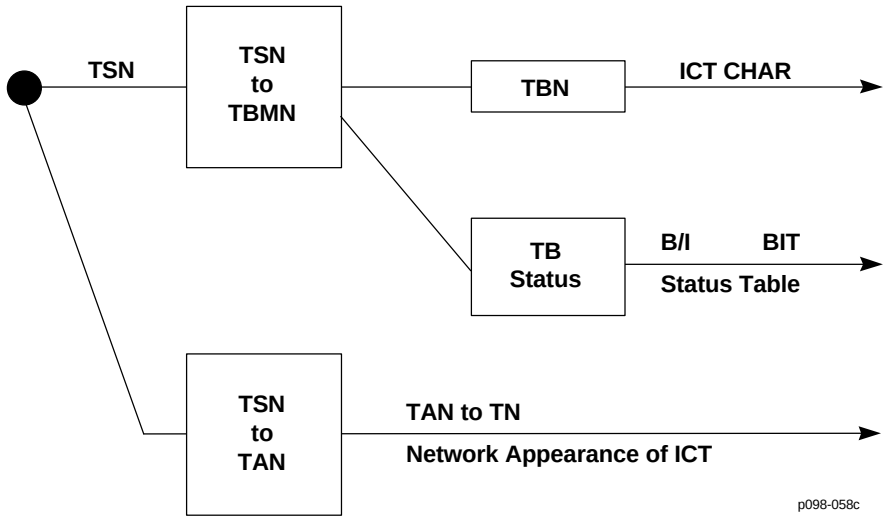
Translator Access
(cont'd.)

INCOMING CALL TRANSLATIONS



Continued on next page

Introduction to the 4ESS™-2000 Switch Translations,
Continued

Translator Access
(cont'd.)

Incoming Call Translations

Incoming Call Translations consist of the data derived from the trunk block. A trunk block contains certain information for up to 24 trunks. Additional trunks blocks are required when there are more than 24 trunks.

Trunk Block Translator Layout

WORDS 0 - 7

These words contain data required in the proper processing of a call This includes data such as type of trunks and the signaling type.

WORDS 8 - 31

Each word contains a Trunk Scanner Number (TSN) for one trunk. This TSN is used by the 1B Processor to identify the specific appearance of each trunk on the DIF or XTSI.

Note: Words 8 - 31 in the trunk block are only used on outgoing call setup. On an incoming call, the TSN is received from the DIF or XTSI.

Translator Access
(cont'd.)

Digit Translations

After the incoming call translations have been retrieved, preparations are made to receive the incoming digits. The sequence of events is as follows:

1. Domain Selection - Initially it is based on the Domain (DOM) field on the incoming trunk Trunk Block (TB).

2. Address Digits - Digits received from the customer

3. Routing Translations - List of one or more Trunk Subgroups (TSGs) to be used based on the address digits.

Domain Selection

The 4ESS Switch has various domains available for assignments of traffic. A domain is defined as a category used to identify a specific type of traffic. The type of traffic to be carried on the incoming TSG determines the appropriate domain.

Address Digits

The 4ESS Switch is designed to always look at the first 3 digits received. The digits received and the incoming trunk subgroup characteristics start the call processing within the 3-digit head table subtranslator.

Each active domain in the head table points to a unique block of 1024 words which contains all routing treatments to apply to the first 3 digits in the range of 000-999.

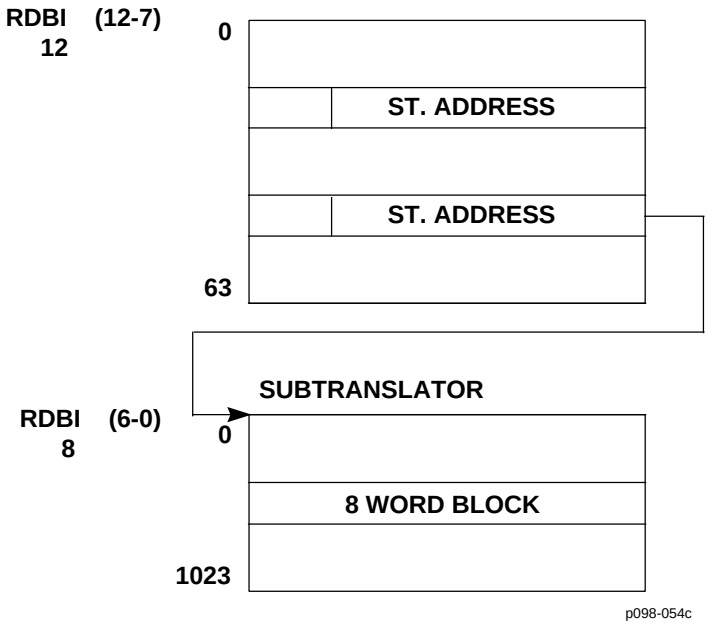
Translator Access
(cont'd.)

ROUTING DATA BLOCK (RDB) TRANSLATOR



Continued on next page

Introduction to the 4ESS™-2000 Switch Translations,
Continued

Translator Access
(cont'd.)

Routing Translations

Routing data is constructed using the code group tables. These tables define the number of digits to receive, the number of digits to use in translations, Call Type (CT) words, and how to handle the call.

If a valid routing data block index is found during digit translations, the next step is to access that Routing Data Block (RDB) to retrieve the list of TSGs. As with digit translations, the head table for the RDBs is entered to identify the location of the 1024 word translator containing the 8-word RDB subtranslator.

Trunk Hunt

After an outgoing trunk subgroup has been selected, the associated Trunk Subgroup Head Cell (TSGHC) is entered in the 1B software. The TSGHC identifies the location of the first Trunk Block Status (TBS) table. This table is used to identify an idle trunk.

Trunk Block Status Sub Translator Layout:

BIBW - Busy/Idle Bit Word

This field represents the busy idle status for a corresponding trunk in the trunk block.

Last - Last Used Member Number

The trunk hunt with memory capability. This is the member number of the last trunk that was hunted.

LC - Link

This field identifies the next choice TB. If a trunk hunt does not find an idle trunk in a TB, then it uses the next link to find the next TB that should be searched for an idle trunk. If link = 0, this indicates the end of the idle TB list.

Continued on next page

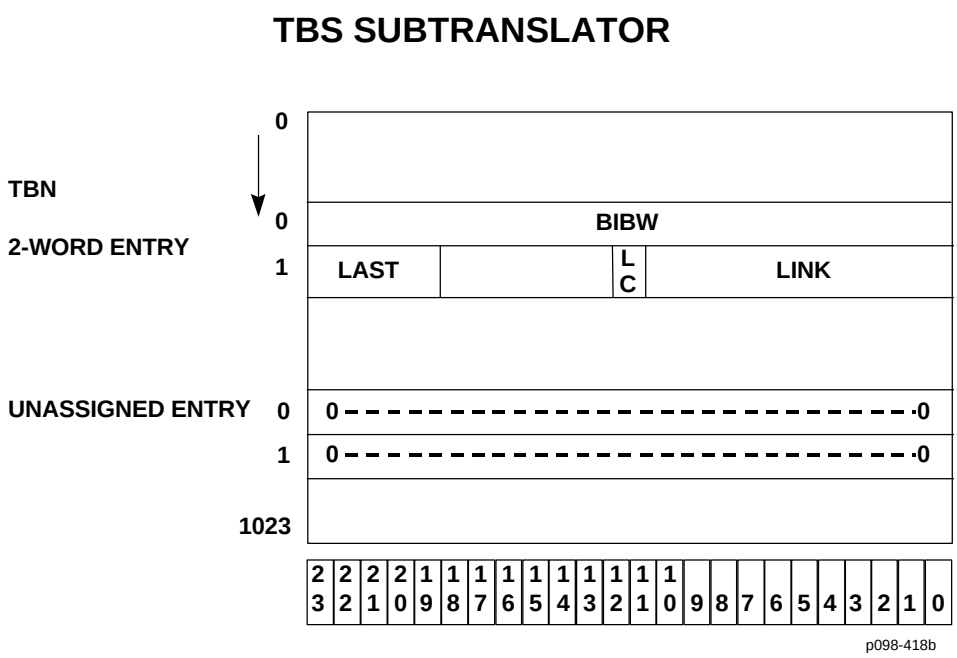
Continued

Translator Access
(cont'd.)



Continued on next page

Introduction to the 4ESS™-2000 Switch Translations,
Continued

Translator Access
(cont'd.)

The 4ESS Switch trunk hunt is unique. Individual trunks are engineered by traffic numbers. The trunk hunt process searches for idle member numbers. Up to 24 sequential traffic numbers are assigned to a member number within the TB. The members are always numbered 0 - 23. When an idle member is selected, it is without regard to the traffic number.

Note: The far end switching system may dictate how trunk hunt is performed. Therefore, it is imperative to identify the equipment at the far end. Trunk hunt only applies to 1-way outgoing and 2-way TSGs.

Three RC fields are used to determine how hunting of trunks are performed on a 2-way TSG. These fields must be properly set at both ends of a 2-way TSG in order to first limit glare where both ends seize the same trunk at the same instant in time, and if glares occur, determine which office retains control while the other office does a retrial.

The three RC fields are:

Reverse

Glare

Trunk Hunt with Memory (MEM)

There is only one RC field (MEM) that determines trunk selection on a 1-way outgoing TSG.

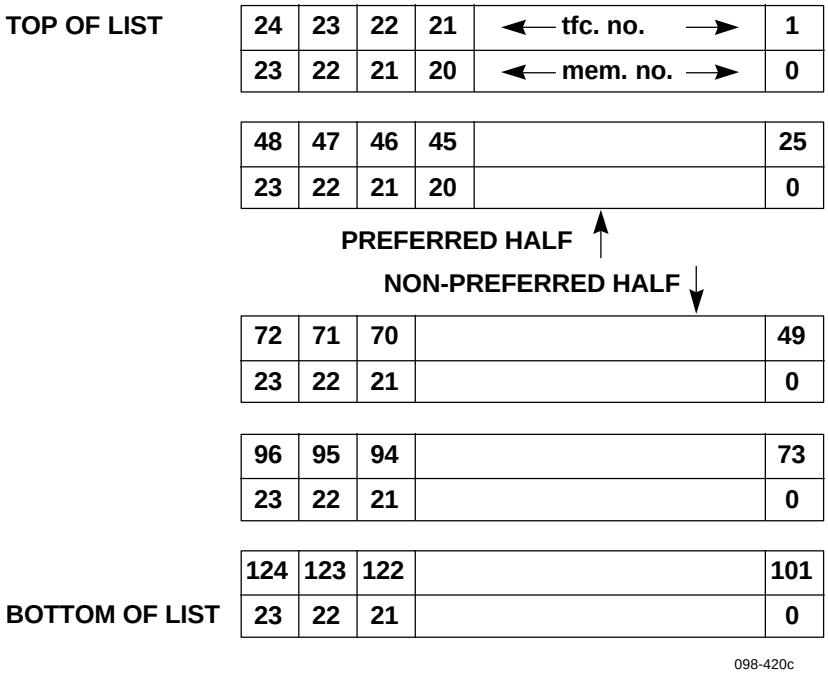
2-WAY MULTIPLE TRUNK BLOCK REV = N



Continued on next page

Introduction to the 4ESS™-2000 Switch Translations,
Continued

Translator Access
(cont'd.)

Multiple Trunk Blocks

Reverse=N (2-way Trunk Subgroup)

The population of the reverse field determines the preferred and the nonpreferred trunks. If a trunk hunt does not find an idle trunk in a TB, then it uses the next link to find the next TB that should be searched for an idle trunk. The TB is put back on the top of the list when a preferred trunk is idle. Blocks, in the nonpreferred half when returned to the idle list, are placed at the bottom of the list in that half. The search is confined to the preferred half only accessing the nonpreferred as necessary.

Translator Access
(cont'd.)

Outgoing Trunk Translations

The sequence is as follows:

1. After the outgoing trunk is selected in the Trunk Block Status table, the bit is changed from a “1” to a “0” to mark the trunk busy.

2. Based on the bit made busy, the TB then is entered to retrieve the Outgoing Trunk (OGT) characteristics and the TSN.

3. The TSN then is used to access the TSN to TAN translator to retrieve the TDN appearance of the OGT.

4. The TAN is converted into the TN in order to be used in path hunt in the TDN.

Office Data Assembler

Purpose

Database

The Office Data Assembler (ODA) is an off-line large scale data processing system which is used to generate office dependent translation and parameter data for 4ESS™-2000 Switch offices. The 4ESS™-2000 Switch ODA system requires all of the data for translations and parameters as input, utilizing the ODA and Recent Change (RC) forms in the TG-4 Translation Guide.

The ODA is an actual tape or electronic file of a database that is unique to each individual 4ESS™-2000 Switch. The file contains a profile of every type and quantity of equipment that is to be included in the office and consists of equipment planned for working and future use within the engineering period. The ODA also contains the office dependent parameters and all of the required translations for call processing. These translations relate to both trunking and routing.

The first manually prepared ODA is required for the 4ESS™-2000 Switch initialization. Initialization is the initial cutover process of the new switch system. This manual ODA input process is the only way to have all of the required information input to the file. Once the initial ODA is loaded, the 4ESS™-2000 Switch is ready to interface with its specific and unique application to the local or toll network.

Generic Retrofit

Subsequent to the initial cutover, a new ODA is required whenever an update is requested for the next generic. This is referred to as a generic retrofit. The plan is to include both new equipment requirements for service provisioning and office profile changes required for the next generic. This ODA is prepared using the existing 4ESS™-2000 Switch ODA as a foundation on which to grow. For the Local Exchange Carrier (LEC) switches, this "snap-shot" of time is taken 2 to 3 weeks prior to the actual ODA load via a tape from the 4ESS™-2000 Switch office. The snap-shot in time begins the start of the "Quiet Period." Any RC updates performed during the quiet period must be added back into the ODA. In addition, sometimes this data must be restructured for compatibility to the new generic being loaded. Therefore, it is important to limit the input activity during the quiet period.

Continued on next page

Office Data Assembler, Continued

TAGS or NXTGEN-TAGS

Next Generation Trunk Assignment Generation System (NXT GEN-TAGS)

When an ODA is required for a new office or a retrofit of an existing 4ESS™-2000 Switch, the process must begin at the basic foundation. This foundation is called Next Generation Trunk Assignment Generation System (NXT GEN-TAGS). This is administrated by the Lucent Technologies Next Generation ODA (NG-ODA) organization located at Indian Hill in Naperville, Illinois. This organization is responsible for a very large scale off-line data processing system that is used to generate office dependent translations and parameter data for the 4ESS™-2000 Switch offices. They are responsible for every new office cutover and subsequent generic retrofit. Each office has been assigned a date for the generic and ODA load. If one office fails to meet committed dates for inputs, that office cutover/retrofit may be jeopardized, as well as, other offices' schedules may be affected later.

The NXT GEN-TAGS is a program that creates the drawings for the office and sizes all of the required cabling for the 4ESS™-2000 Switch equipment. The cabling is down to actual circuit level within the confines of the switch. Every scan and distribute point is assigned to its appropriate equipment type and location. The Lucent Technologies Line Engineer uses the customer Telephone Equipment Order (TEO) to prepare the required forms for input to the NXT GEN-TAGS program. The fixed floor plan of the 4ESS™-2000 Switch location is input for critical data to size the lengths of required cabling. If any input errors occur, or if the customer desires to change an item on the Telephone Equipment Order (TEO), the NXT GEN-TAGS program has to be rerun. This can be costly and very penalizing for rigid time constraints

Continued on next page

Office Data Assembler, Continued

Office Drawings

The NXT GEN-TAGS provides drawings to the office, identifying every individual time slot. The only drawings that "must" be retained are those identifying the assignments for service circuits. These include:

464 Office Drawing

Remote Measurement System (RMS-D2) Assignments - Another use of the 464 drawings is to identify the Trunk Appearance Number (TAN) for the RMS-D2 system. The RMS-D2 system is a trunk testing system. It utilizes 24 consecutive TANs of each digroup.

464 Office Drawing

MF-DIU Assignments - The growth of Multifrequency-Digital Interface Unit (MF-DIU) through the RC process requires the TANs from this drawing.

465 Office Drawing

Multifrequency Signaling (MFS) frames. These frames contain a series of terminal strips for accumulating all of the miscellaneous services. Newer offices contain a pseudo MFS frame with only the terminal strips. These drawings should be retained to identify the terminal strip assignments.

CARTS
(cont'd.)

Circuit Assignment Record Transfer System (CARTS)

The final NXT GEN-TAGS cable assignment data is input to a subsequent output function called Circuit Assignment Record Transfer System (CARTS). The distributing frame assignments for the 4ESS™-2000 Switch are inputs to NXT GEN-TAGS. These assignments are approximately 99 percent Digital Service Cross Connect (DSX) frame, panel and punching assignments for a 4ESS™-2000 Switch. The outputs generated from CARTS are the "Trunk Assignment Worksheets" or "CARTS Worksheets." These worksheets are a complete breakdown to the actual circuit level of all message type paths through the 4ESS™-2000 Switch. They list every TAN provided and each related Digital Interface Frame (DIF), DIU, circuit number, and appropriate DSX frame, panel, and punching.

The CARTS Summary Report shown on the opposite page reflects the following:

Terminating equipment type (usually a DIF)

Terminating equipment location

Trunk Order Code (TOC - usually 0405 for SM1B or 1200 for SM9)

DIF member number

DIU number

Base TAN

DSX frame location, panel, side, and jack number of its hard-cabled appearance (for each DIU/digroup terminating on the 4ESS™-2000 Switch).

Office Data Assembler, Continued

Equipment Data Load

Connect VU

Equipment Data Load is performed via a Connect VU.G2 file. This is used to populate the Connect VU system with the added 4ESS™-2000 Switch equipment. This is the only means of inputting the assignable TAN information into the system. Circuit order activity of assigning trunks to TANs cannot transpire until this file is loaded into the Connect VU system. The Connect VU.G2 files are put on a tape and sent to the Connect VU site where it is loaded.

The CARTS Summary Report reflects all TAN digroups available for "message" type trunk assignments. Note: The TANs that have been listed on the 464 and 465 drawings for "miscellaneous and service circuits" are not shown on this drawing.

With CARTS, a complete new issue of the CARTS Summary Report and the related Connect VU file are sent to the Connect VU site prior to the office cutover or generic retrofit. The engineer at the Connect VU site should coordinate with the Telco Engineer so that a request is made in the Telco Equipment Order (TEO) for the provision of a separate issue of the changed CARTS Summary Report or new CARTS Summary Reports in addition to the complete issue.

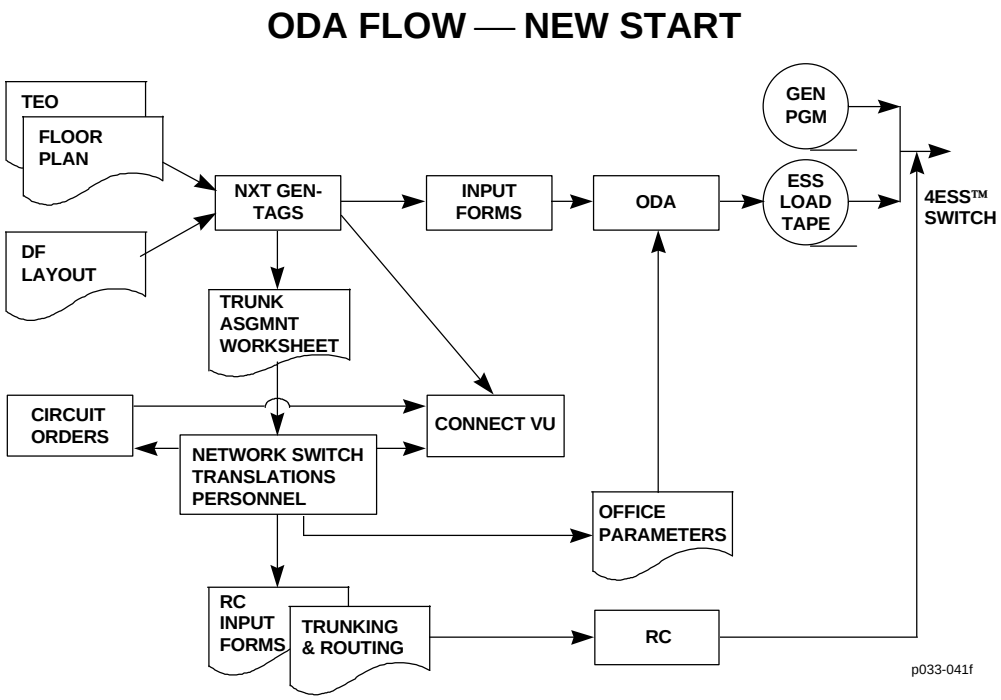
Office Data Assembler, Continued

ODA Flow ––New Start



Continued on next page

Office Data Assembler, Continued

ODA Flow ––New Start (cont'd.)

The ODA process for each Initial 4ESS™-2000 Switch is a very regimented structure. The flow is outlined as follows:

The Telco Engineer submits the Telephone Equipment Order (TEO), the proposed equipment floor plan, and the Distributing Frame (DF) assignments to the Lucent Technologies Line Engineer.

The Lucent Technologies Line Engineer enters the Telco data into the NXT GEN-TAGS system. Any conflicting data at this point is referred back to the Telco Engineer for resolution.

The first output from TAGS is used to populate the input forms for CARTS which creates an equipment load tape of the hardware assignments to be used for trunk assignments and miscellaneous service circuits.

The second output is input into Connect VU for the Telco translations use in the mechanized system.

The Network Switch Translations Personnel complete the "406C & 406Z" forms (office parameters) and forward to the Lucent Technologies line engineer for required memory sizing and input to the ODA tape.

The Network Switch Translations Personnel also prepare all of the required Recent Change Input forms for trunking and routing. These recent changes are manually entered to the switch subsequent to the Generic & ODA tape load.

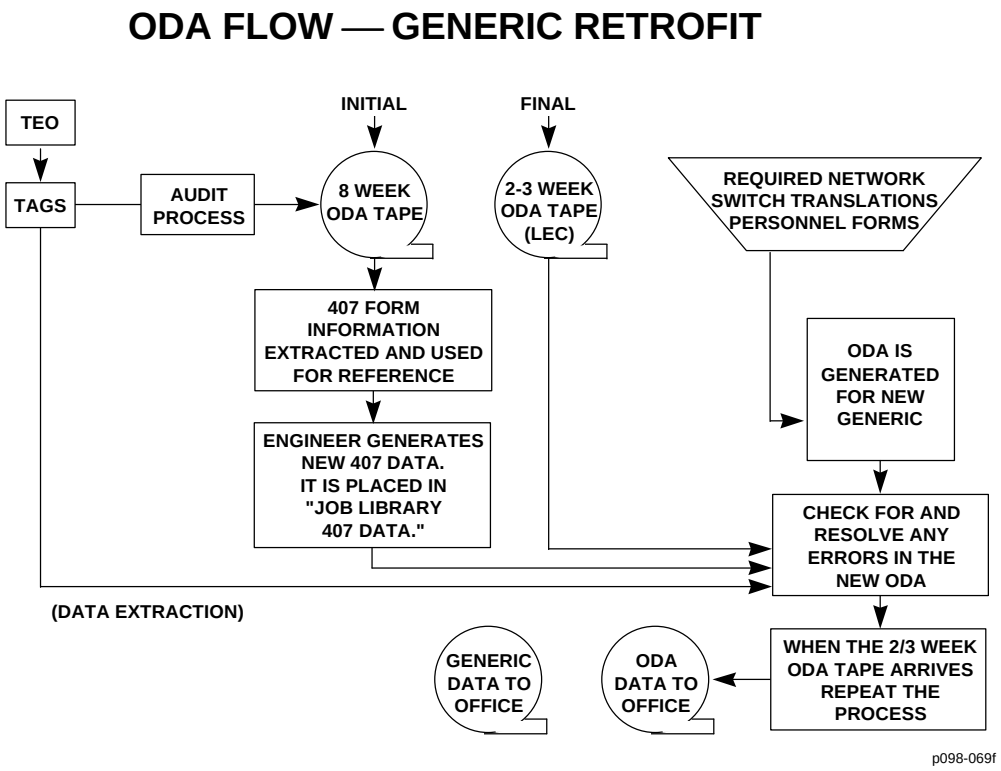
Office Data Assembler, Continued

ODA Flow ––Generic Retrofit



Continued on next page

Office Data Assembler, Continued

ODA Flow ––Generic Retrofit (cont'd.)

The ODA process for a Generic Retrofit is similar to the Initial but also must coordinate the newer equipment parameters with the existing 4ESS™-2000 Switch system. The Generic Retrofit may or may not be coincidental with any equipment additions. The following process outlined will assume that new equipment is being added for terminal assignments:

The Telco Engineer submits the TEO, the proposed growth area floor plan, and the growth DF assignments to the Lucent Technologies Line Engineer.

The Lucent Technologies Line Engineer enters the Telco data into the NXT GEN-TAGS system.

One output of the NXT GEN-TAGS system is part of the new equipment structure update to the new ODA load tape.

At the time frame of -8 weeks prior to Generic Load, the Telco must perform a Tape Write-Read Program (TWRP) tape from the 4ESS™-2000 Switch and forward it to Lucent Technologies for use as the first modification procedure of the new ODA load tape. This is merged with the Audit Process output from the NXT GEN-TAGS system and used to create the new 407 Type ODA forms for the new equipment. This tape is also used to perform any translations reformatting that may be required for the newer Generic to be loaded.

At the time frame of -2/3 weeks prior to Generic Load, a second TWRP ODA tape must be forward by Telco to Lucent Technologies. At the completion of this tape on site, the recent change "Quiet Period" begins. Any RCs made during this period must be reentered in the new format to the 4ESS™-2000 Switch.

The -2/3 tape is merged with data from the Job Library 407 Data from the -8 week tape, the NXT GEN-TAGS output, and any forms required from Telco to create the new ODA load tape for the new Generic.

Lucent Technologies checks the new ODA tape for any errors and resolves any if required.

The new ODA tape and Generic tape are forwarded to the Telco 4ESS™-2000 Switch site and loaded as required.

Telco reloads any RC translations that were performed previously during the "Quiet Period."

Universal Terminating Test Lines and Codes

General

This section will explain the operation of the standard terminating test lines and the codes associated with each test line.

For new start offices, all of the basic test call types 100, 101, 102, 103, 104, 105, 108, 109 and SYN (Synchronous) are automatically programmed in Office Data Assembler (ODA). In addition to the basic codes, a group of 6- or 7-digit numbers have been preassigned and automatically programmed in ODA for new start offices (see Table 55). These additional codes provide greater flexibility and consistency with other switching systems where different numbers are necessary for various reasons.

For offices undergoing a retrofit or growth, only those test codes which already existed in the office will be reinstated by the ODA process after the retrofit or growth. No new test codes will be automatically assigned. Additional test codes may be assigned using the RC 300 series of forms (see Division 3, Section 3, Code Grouping Forms).

The 109 Test Line is provided using the Digital Trunk Test Unit (DTTU). The 109 Call Type is automatically programmed by ODA for new start offices.

An office which is switching data over a dedicated network of digital trunks, is provided with a Data Test Line. ODA will automatically program the code 959-606d for the Data Test Line in a new start Data Office.

Universal Terminating Test Lines and Codes, Continued

Description The following are Terminating Test Line descriptions:

- **Code 100** - Termination Test Line. This test line will provide a 5.5 second 1000 Hz milliwatt tone thru the switching network. The network connection is then taken down. After the network is taken down, a 600 ohm quiet termination is provided until the originating end goes idle. This circuit is used for noise and balance testing. If the number of 100 type test calls reaches the maximum number set in the generic program and another 100 type test call is attempted, that attempt will receive a busy tone (60 Interrupts Per Minute [I.P.M.]).

- **Code 101** - Communications Trunk. The 101 test line provides a communications circuit to a testboard position. It is used to contact a technician and to make transmission and supervisory tests in both directions. A call arriving at the 4ESS Switch as digits 101, 959-101, 959-151 or 959-970 will be directed to the particular testboard position that was designated for the two way or one way incoming Trunk Subgroup (TSG) by the entries in the CAREA and CPOS fields on the RC Form 100 Series. If a position other than that designated on the RC Form 100 Series is desired, or if testing is required on a one way outgoing trunk from the 4ESS Switch, the number received would be 101XXY or 9595XXY. The XX designates the particular testboard position to which the call will be routed. If when a call is directed to a particular 51A position either by the information on the RC Form 100 Series or by the digits received and that position is busy, the call will be terminated in a designated alternate position. If the alternate position is busy the call will be connected to busy tone (60 I.P.M.). If the call is directed to a particular Digital Trunk Test Unit (DTTU) test position by translations and the RC Form 100 Series, and the test position is busy, it will hunt for any acceptable DTTU test position in the office that may be available to receive the call. If the call is directed to a particular DTTU test position by digits XX, and both Test Access Trunks (TATs) are busy, a busy tone will be returned. If the call is directed to a particular TAT by digits XXY, and that particular individual trunk is busy, no hunt will be performed, and a busy tone will be returned. (The Y digit is an optional 0 or 1, which indicates Test Access Trunk 0 or 1.)

Universal Terminating Test Lines and Codes, Continued

Description (cont'd)

- **Code 102** - 1000 Hz Milliwatt Tone. This test line provides 1000 Hz milliwatt tone for a repeating sequence of 9 seconds of tone and 1 second of quiet termination until the incoming trunk abandons the call. It is used for one way manual transmission tests. When the number of 102 type test calls reaches the maximum number of terminations set in the Generic Programs and another 102 type call is attempted, that attempt will receive busy tone (60 I.P.M.).

- **Code 103** - Signaling Test Line. This test consists of a series of off hook to on hook transitions after two ring forward signals have been received on the incoming trunk. The flashing continues until the incoming trunk disconnects (goes on hook) or until the upper limit of transitions or flashes has been reached. There is no network connection but when the number of 103 type test calls reaches the maximum number of terminations set in the generic program and another 103 type call is attempted, that attempt will receive busy tone (60 I.P.M.). If a Common Channel Signaling 7 (CCS7) type of trunk requests a 103 type test line, a "call failure" signal will be returned to the originating office over the CCS7 signaling link.

- **Code 104** - Transmission Test Line. The 104 test line provides a connection to transmission measuring equipment which can be controlled by a person at a far end test position to perform 2 way loss and noise measurements. When an incoming trunk requests connection to a 104 test line, a test progress tone is returned to the originating end for at least 1 second and continues until a connection to a 104 test line can be made. Once the 104 test line is attached, the originator may send signals to perform loss or noise measurements. Upon completion of the tests, the incoming trunk disconnects and the 104 test line returns to the idle condition. (The 104 Test Line has been unused for numerous generics. In 4E21 and later, the two TSGs may have no circuits assigned. The DTTU Time Slot for the 104D has been re-assigned as an additional 109 Test Line.)

Continued on next page

Universal Terminating Test Lines and Codes, Continued

Description (cont'd)

- **SYN** - Synchronous Test Line. This test line consists of a series of off hook to on hook transitions or flashes of varying duration with no network connection. The start of the transitions is automatic, no ring forward is required. After the required flashes or supervisory transitions has been transmitted to the trunk, it is left in a quiet termination mode until the originator disconnects. When the total of SYN type test terminations reaches the maximum number set in the Generic Program and another SYN type test call is attempted that attempt will receive busy tone (60 I.P.M.). If a CCS7 type of trunk requests a SYN type test line a "call failure" signal will be returned to the originating office over the CCS7 signaling link.

- **Code 105** - Transmission Test Line - The 105 test line provides a connection to an Automatic Transmission Measuring System responder. When the TSG Sub Category is 105D, the responder is located in a DTTU (FMS-D2). When an incoming trunk attaches to the 105 test line a test progress tone is returned to the originating end for at least 900 MS and continues until the 105 test line connects to an idle responder. When the responder is attached, the originating director may send signals to the responder to make transmission or noise tests. Each Canceler test may also be performed. Upon completion of the tests in both directions the originating director sends a signal to the responder. The incoming trunk and the 105 test line are then restored to an idle condition.

- **Code 108** - Noninverting Digital Loopback Test Line. This test line is used for testing digital data without the assistance of a technician at the other end. Unlike the 959-606 (DATA) Loopback/Complement Test Line, which inverts the digital bit stream, the 108 test line provides a noninverting loopback of the digital bit stream. The digital loopback is provided by the time division network. The 4ESS Switch can provide a maximum of 32 simultaneous 108 test line terminations. If a 108 attempt is made and there are already 32 loopbacks active, a 60 I.P.M. busy tone will be returned.

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Universal Terminating Test Lines and Codes, Continued

Description (cont'd)

- **Code 109** - The 109 Test Line provides the terminations required to a DTTU responder. Prior to 4E21 this responder provided the capability to test Echo Suppressors/Cancelers as directed by the originating end of the trunk. Starting in 4E21 these DTTU responders are being downloaded with the capability to perform all of the same measurements as the 105 test line. The access and disconnect logic for this responder remains as previously defined for the 109 test line.

- **Code 110** - Termination Test Line. This test line will provide a 5.5 second 1004Hz tone at -10 dbm and is accessible to all types of trunks. This test line operates in the same manner as the 100 test line. The digits used to access the 110 test line are 959110X and are provided automatically by ODA for new start offices. Local assignments of other numbers are allowed.

- **DATA** - Loopback/Complement Test Line. The Data Test Line provides a connection to a channel unit plug-in in a D4 bank which performs a loopback/complement function. This test line is used for testing digital trunks that are dedicated for switching data calls. This testline connects the receive path to the transmit path after modifying the received bit stream in a predefined manner. The Data Test Line is used in combination with a test circuit at the far end office which transmits and receives data patterns and determines the bit or byte error rate of the trunk under test. If the far end office is a 4ESS Switch, the test circuit is in the Digital Trunk Test Unit (DTTU), Remote Measurement System (RMS).

Universal Terminating Test Lines and Codes, Continued

Assignment Procedures for Test Lines

Since the synchronous and the 103 test lines are strictly software programs in the 4ESS Switch and do not use network connections, it is not necessary to make any assignments for these basic test lines in the ODA assignments.

The 100 and 102 test lines require a one milliwatt 1000 Hz tone supply. The milliwatt supply must be assigned in ODA. The milliwatt tone is supplied on a multipled TSI connection for all 100 and 102 test type calls.

The 104, 105, 109 and Data test lines require hardware in addition to the software programs. The test calls require machine assignments in ODA.

The 4ESS Switch provides for directed access to a particular test position. The 101 test line uses a test access trunk which then controls the further processing of the call and directs it to a particular position. The Test Access Trunk (TAT) must be assigned in ODA.

Universal Terminating Test Lines and Codes, Continued

Test Line Code Assignment

In general, since the codes for the various test lines (100, 101, 102, 103, 104, 105, 108, 109, SYN, 959110X are universal for all 4 ESS new start toll switches. The ODA system will program these codes in every new start office which does not have these codes assigned to other call types. For a retrofit, only the call types already populated in the office will be rebuilt; no new test codes will be built automatically. If additional 3 or 6 digit codes are required, ODA must use TST in the CALLTYP field and the particular test line number in the CALLDATA field and list the additional codes in the ABC field.

In addition, the ODA program will allow 4, 5, 6, or 7 digits to be dialed, to access all of the test lines. The 4ESS Switch will ignore all digits after the test line number except on a 5 digit call of 101XX. The XX after the 101 will be used by the Generic Program to terminate the call to the test position identified by the two digits. Regardless of the number of digits received, only the first 3 digits are translated.

In addition to the standard test numbers ODA will generate additional test codes for new start offices using 959 as a prefix with 10Xd for test lines where X would indicate the specific test line and d could be any number or blank. The 4ESS Switch will accept either 6 or 7 digits using the 959-10Xd combination and will always translate six digits. This combination could be used by those offices that need to outpulse 6 or 7 digits, and want to test an intertoll trunk. See Table 55 for a complete listing of these codes.

Additional 6 or 7 digit codes have also been preprogrammed into new start offices for use by those offices that wish to test Toll Connecting trunks. These codes use 959 for the prefix also, but, instead of 10X for the test line code, 15Xd is used. The X will still get the specific test line as the 10X series, except, if X is a 3 it will access the synchronous test line instead of the 103 test line. The machine translates six digits for these codes.

These codes are programmed in the new start offices to allow offices that would be testing toll completing type trunks and need to outpulse 6 or 7 digits to use these codes. Refer to Table T4TGP-TAA for a complete listing of these codes.

Continued on next page

Universal Terminating Test Lines and Codes, Continued

Test Line Code Assignment (cont'd)

To permit even greater flexibility in test numbers to access the test positions, two additional 6 or 7 digit numbers have been assigned for new starts. These codes are 959-5XXd and 959-970d. The 959-5XXd will allow a particular test position to be accessed. The XX in the number directs the call to a specific testboard position (See notes in Table 55). The 959-970d number will access the 101 type test line and terminate to the test position indicated for the two way or one way incoming trunk indicated by CAREA and CPOS fields. Six or seven digits are acceptable for both of these codes and the digits received will be translated. If the receiving test position is on a DTTU, the d digit may be used to indicate a particular Test Access Trunk (TAT), 0 or 1.

If there is a need for additional 3, 4, 5, 6, or 7 digit codes to be routed to any of the 7 terminating test lines, they may be locally assigned using RC Form 300 Series, depending on the number of digits to be translated. Instructions for filling out these forms may be found in Division 3, Section 3 for Code Grouping.

Some switching offices have a 958 test line that terminates in the maintenance operating center, to a regular telephone. The 4ESS Switch does not have this type of test line. Therefore, if the 958 code is used, routing based on the "958" should cause the call to be sent to a local office. Using the 4ESS Switch ability to delete and prefix digits, the proper digits should be outpulsed to cause the local office to terminate the call on a telephone in the maintenance operating center. If fewer than 7 digits are required to terminate the call, then 3 digits will be deleted and the proper number of digits to complete the call will be prefixed and outpulsed. If 7 digits are required, then the 7th digit must always be an 8. Two digits are then deleted and the first six digits to be outpulsed will be prefixed. The 958 code would be listed in ODA and the routing would be done using an inchain Routing Data Block.

Table 55 (cont'd)

Notes for Table 55

1. All digit formats will be accepted on all 2-way and 1-way incoming trunks.

2. The apparent redundancy in number assignments is to provide consistency with other switching systems where the different numbers are necessary for various transmission level plans and physical reasons.

3. A "101" call of five or six digits will be directed by the test line to the test position identified by the d and e digits (10-99), and by the f digit 0 or 1 to Test Access Trunk (TAT) 0 or 1.

4. The test line will direct the call to the test position identified by the e and f digits (10-99), and by the g digit 0 or 1 to TAT 0 or 1.

5. The local assignment of any non-preassigned 3, 4, 5, 6, or 7 digit number to a terminating test line is permitted within the restrictions of the DDD numbering plan. The acceptable digit count will include all values from the number of digits translated through seven. Of course any restrictions in capability that exists in the generic program for routing translations for non-test-line routing also apply here.

6. The "110" test line is similar to the code "100" test line except the 1004Hz tone is returned at -10DBM. Local assignment of other than the ODA built 959110X is not permitted.

7. 101 Calls - all digits deleted, incoming call defaults to CAREA and CPOS assigned to the incoming trunk.

8. The Data Test Line is used for testing digital data trunks. Local assignment of other than the ODA built 959-606d is not permitted.

9. This Test Line is preassigned by the ODA for the DEV, DED, DEVP (<4E15), DEDP (<4E15) and SDNA domains in addition to the POTS domain.

Routing Philosophy

General

Routing in the telephone network is the process of directing a call dialed by a telephone customer to its ultimate destination. The manner of which the call reaches the destination may vary based on different factors established to complete or not complete the call depending on the service.

Basic Routing Plans

A basic routing plan describes the routing strategy that is used to complete a call through the network. There are many components that are factored into the composition of the routing plan:

Translation Parameters consisting of:

Geographic Area

- In order to perform proper digit translation, it is necessary to know the Point of Presence (POP) and the Local Access Transport Area (LATA) of the specific TSG.

Routing Pattern

- The routing pattern identifies how the TSG has been engineered. This determines if the TSG is to be direct routed only or if an alternate route has been engineered.

Type of Traffic

- The specific TSG has been engineered to carry a certain type and volume of traffic. Proper classification ensures that accurate screening is assigned to the TSG.

Domain

- Routing translations are categorized by the type of traffic to be carried on the TSG. These categories are classified as domains. Domain assignments are input on both the trunking and the routing translations.

Special Handling

- Routing translation allows for special handling on a TSG basis. Special handling includes the type of screening as well as the Call Handling Instructions (CHI) for Final Handling Treatment (FHT).

Continued on next page

Routing Philosophy, Continued

Basic Routing Plans (cont'd.)

Trunk Subgroup (TSG)

The 4ESS™-2000 Switch routes on a TSG basis instead of on a trunk basis. The TSG is another structure prepared in translations containing all of the specific and unique characteristics of each specific TSG. The TSG consists of trunks assigned to each TSG to carry the message service. The digits of a dialed call are received at the 4ESS™-2000 Switch on trunks of an incoming TSG. Of all the various translation items specified on the incoming TSG characteristics there are critical fields containing data that determines restrictions of how a call received will be handled or routed. Some of these fields are Domain (DOM), GoNoGo Screening (GNS), Multiple Treatment Screening Class (MTSC), Satellite (SAT), etc. If entries in these fields do not match the parameters on the Code Group "opened" for the incoming digits, or the "routed to" TSG characteristics, the call is final handled.

Code Group

The Code Group is a translation structure pre-built in ODA at initialization of the 4ESS™-2000 Switch. All possible digit codes are initially set to Call Type (CALLTYP) Final Handling Treatment (FHT) and Call Data (CALLDATA) to Vacant Code Announcement (VCA). When digits are received that match the three digits of a Code Group, it is at this point the customer is given the VCA final handling (" . . . this number is not in service . . ."). When it is determined this digit code group is to be "opened up," the 4ESS™-2000 Network Switch Translations personnel will prepare a code group form to change the FHT-VCA , i.e., CALLTYP-RDB and CALLDATA-104. This would change the treatment of these received digits to "point" to RDBI#104 and route to the TSG/s listed on the RDB. That is if the code group also met the parameters specified for Acceptable Digit Count (ADC) specified, the appropriate Domain (DOM), Area Code (AC) or not, various screening parameters, etc. If the incoming digits to the TSG do not meet all of the translations detailed, the call will be final handled.

Continued on next page

Routing Philosophy, Continued

Basic Routing Plans (cont'd.)

Routing Data Blocks (RDB)

The Routing Data Block is a software translations structure prepared to route a specifically translated call (per the incoming digits [code]) for completion out of the office to one or more specific Trunk Subgroups (TSGs). Each RDB will automatically be assigned its own unique index number (RDBI) for administration. If more than one TSG is specified, the first in order will be the one selected for routing the call. If none of the trunks in the first TSG are available (i.e. busy, maintenance, etc.), the routing selection will overflow to the next TSG in order on the list, etc., until there are no more TSGs on the list with trunks available. At that time, the call will be directed to the Final Handling Treatment (FHT) specified in the RDB structure, i.e., No Circuits Available (NCA), etc. At the point of routing the call from the specific RDB, the structure can also delete up to 15 digits and/or prefix digits up to 6 digits as specified for each TSG on the selection list. More than 1 RDB can point to a specific TSG, i.e., a TSG selection could be first and only on one RDB, and third of six on another.

Routing Philosophy, Continued

Domains

As previously discussed, all TSGs and Code Groupings are assigned to a specific domain. Domains are categorized as follows:

POTS (Plain Old Telephone Service)

Home NPA (HNPA) (POTS sub-domain)

Served NPA (SNPA) (POTS sub-domain)

Intertoll (IT) (POTS sub-domain)

Area Code (AC) (POTS sub-domain)

Non-Area Code (NAC) (POTS sub-domain)

Non-POTS

User Defined

Generically Defined Domains

The preceding diagram shows the POTS Domains as assigned to the 3-Digit Head Table and the relationship to the 3-Digit Code Translators. The numbers by the Domains are the index values of each on the Head Table.

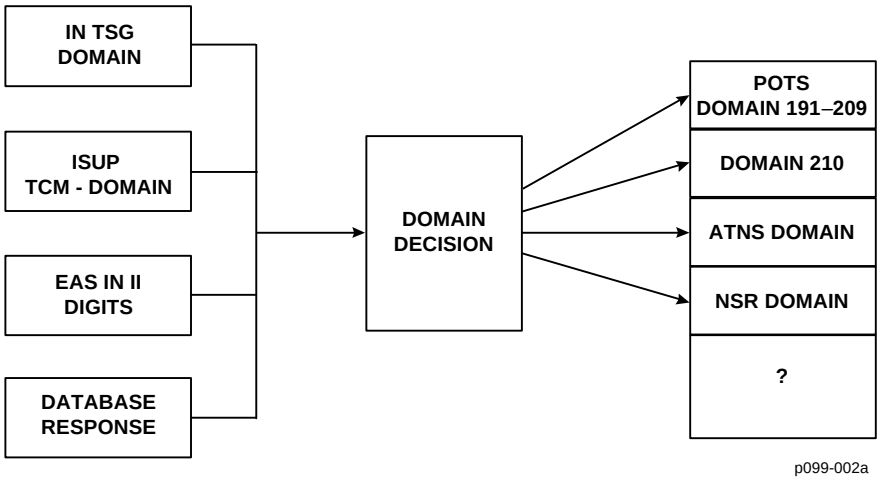
Routing Philosophy, Continued

Domains
(cont'd.)

LEC DOMAIN SELECTION
INCOMING CALL



The above diagram depicts the domain selection process. The incoming trunk domain class, either by TSG characteristics, TCM, Database dip, or II digits can determine the completion handling of a call.

Continued on next page

Routing Philosophy, Continued

Domains (cont'd.)

Domain Selection for an incoming call is based on the following parameters:

Incoming Trunk Subgroup Domain: The initial domain used for digit translation is contained in the DOM field of the TSG characteristics. For most TSGs, the entry is POTS. In addition, special use domains are available for data and verify.

Traveling Class Mark (TCM) Domain: The out-of-band signaling system Integrated Services Digital Network (ISDN) User Part (ISUP) signaling provide for the change in DOM through the use of a TCM embedded in the message, i.e., ISUP TCMs are used on POTS domain TSGs to alter the routing domain.

II/OLI Digits: The Information Digits (II)/Originating Line Information in the Automatic Number Identification (ANI) stream also may be used to change the routing domain. A current list of II/OLI digits is show on the following page. For example, if the first 2 digits are 61 or 63, the call processing is changed from a POTS call to a cellular mobile type call.

Database Response: Information for calls requiring a database dip (for example, 800 service) may result in a change of the domain.

Continued on next page

Routing Philosophy, Continued

Domain
(cont'd.)

II/OLI DIGIT ASSIGNMENTS

2-Digit Code	Meaning
00	Identified Line - No Special Treatment
01	Operator Number Identification (Multiparty)
02	ANI Failure
06	Hotel Without Room Identification
07	Coinless, Hospital, Inmate, etc.
08	Inter-LATA Restricted
10	Test Call
12-19	Not Assignable
20	Automatic Identified Outward Dialing (AIOD) - Listed Directory Number Sent
23	No Coin/Noncoin Distinction
24	Translated 800 Number Local Exchange Carrier (LEC) Service Switching Point (SSP)
27	Coin Call
30	Blank Number Intercept
31	Trouble Intercept
32	Regular Intercept
34	Operator Handled
52	OUTWATS
66 & 67	Telecommunications Relay Service
61	Cellular Mobile Carrier (CMC) - Type 1
62	Cellular Mobile Carrier (CMC) - Type 2
63	Cellular Mobile Carrier (CMC) - Roaming
64	Advanced Intelligent Network
68	Inter-LATA Restricted - Hotel Line
78	Inter-LATA Restricted - Coinless Line, Etc.
93	Virtual Private Network
95	Test Call

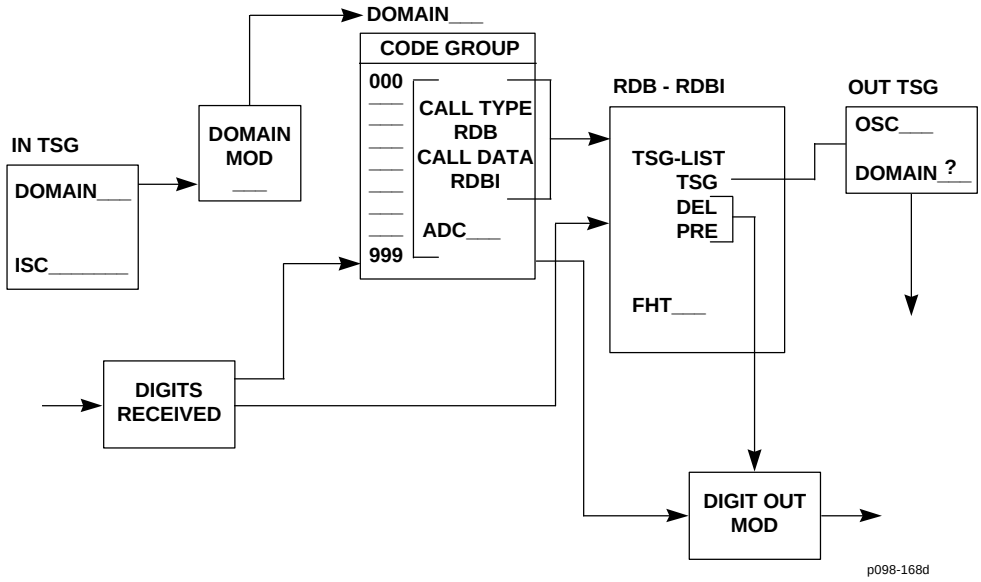
BASIC CALL



Continued on next page

Routing Philosophy, Continued

Domain (cont'd.)

The BASIC CALL sequence of events is as follows:

The domain from the incoming TSG characteristics is identified.

The domain may be modified based on one of the previously described means.

The code group table for the appropriate domain is entered with the first 3 digits.

Eventually an RDB is identified.

The RDB, in turn, lists one or more TSGs that can be used to route the call, plus any digit modification that must be accomplished relative to digit prefixing or deleting.

Complete the path between the incoming trunk to the outgoing trunk.

The information for the administration of the Code Group and Routing Data Block is shown in the Recent Change division of this TG-4 Translation Guide Series.

Routing Philosophy, Continued

Recent Change Administration

General

This section is intended to provided the 4ESS™-2000 Switch Network Translations Personnel with a general understanding of the Recent Change (RC) system and the internal RC support feature. Guidance is also provided for establishing the external procedures and controls necessary for maintaining up-to-date status of RC activity.

RC activity involves the many day-to-day changes made to the office translations database using the 4ESS™-2000 Switch RC system.

Continued on next page

Recent Change Administration, Continued

Recent Change System - Overview

The Recent Change system is divided into the following three programs:

The Recent Change Message Assembly (RCMA) program performs RC message input processing.

The Recent Change Message Processing (RCMP) program performs internal data change checking and computation.

The Recent Change Message Update (RCMU) program performs the actual update.

The RCMA program accepts all input to the RC system, performs various input message format and integrity checks, and returns an acceptance or rejection message to the input terminal.

The RCMP program performs various translator internal data change checks such as determining that the data to be changed actually exists. RCMP converts the input message language to the necessary internal data language required by the RCMU program to actually write the new data into translators.

The primary function of the RCMU program is to perform the translator data changes requested. The RCMU program replaces the existing data with the new data. The secondary function of RCMU is to perform rapid removal (Rollback) of RCs when necessary.

Recent Change System - Overview (cont'd.)

The three classes of input messages used with the RC system are listed below. The complete complement of RC messages are listed at the end of this section. All of the actual RC forms are covered in Division 3 of this TG-4 Translation Guide.

Recent Change Data Messages (RCDMs) messages are the input medium for data change requests. RCDM messages employ a fixed format form to specify the translator data changes desired. The RCDM itself changes no translation data. Once a RCDM is accepted by the RC system, the message is stored in a data buffer area to await further action by the RC system.

Recent Change Action Messages (RCAMs) are used to change the status of an RC message. As such, they initiate the testing and activation of a "Buffered" RC. They also cancel an individual Buffered RC message or cancel all Buffered messages.

Recent Change Administrative Messages (RCADs) are used to request administrative feedback such as: list of RC messages in the Buffer, print a Buffered message, print an RCDM form to be filled out, and print the amount of buffer area space remaining for use.

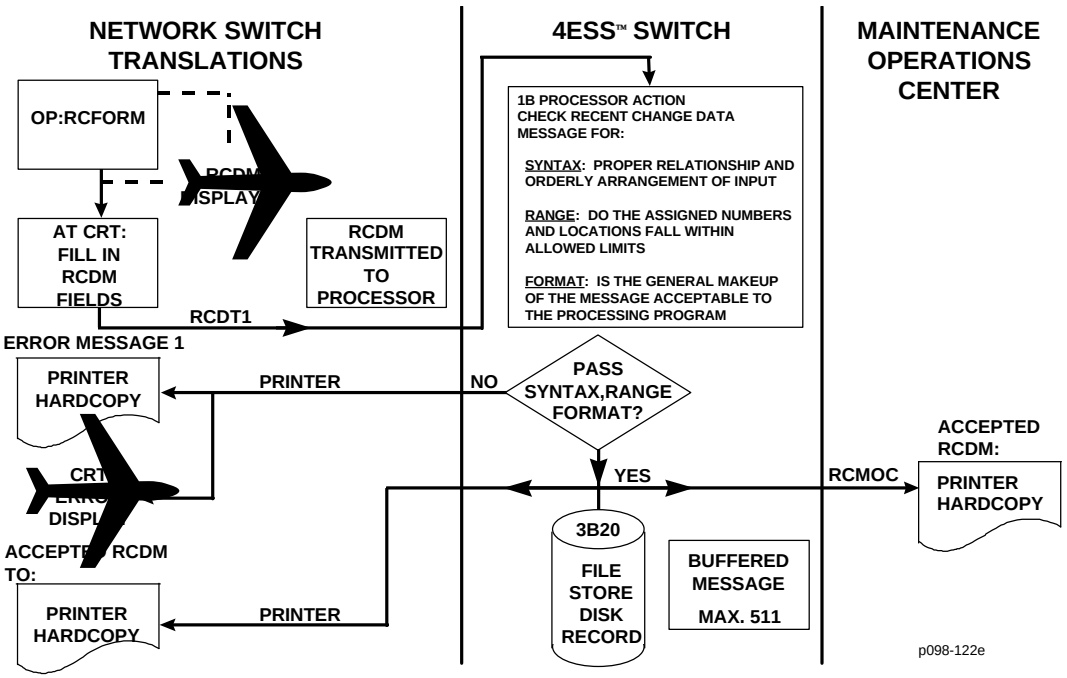
INITIATING RCDMS TO THE BUFFER STATE



Continued on next page

Recent Change Administration, Continued

Recent Change System - Overview (cont'd.)

The preceding graphic depicts the message flow, the 4ESS™-2000 Switch areas affected, and a brief description of actions taken. RCDMs generally progress through the following three stages during the RC process:

BUFFER STATE

To enter an RCDM into the Buffer, 4ESS™-2000 Switch personnel will use an RCAD message to call up the desired RC form display on a video monitor. (Example OP:RCFORM 101!) After entering data to all of the required form fields, the entire form (message) is transmitted to the RC process via keyboard command (BUF). This process checks the submitted RC form for syntax, range, and format errors. If any of the checks fail, the RC form is rejected and the process must start again. If the process is accepted, the RCDM resides in the RC Disk Buffer Storage Area until it is activated or canceled. The Buffer file has a maximum capacity of 511 messages. The Buffered RCDM is also recorded on a floppy disk unit. This serves as a permanent record of the RC activity. It could be used to restore the Buffered messages if the Buffer Disk Storage Area should be mutilated or lost.

Recent Change System - Overview (cont'd.)

TESTING

A buffered RCDM is sent through the Test Process (TST) by using an RCAM message. (Example: RCTST:ORNU 203!) At this stage, the RCDM is sent to the 1B Processor for defensive checks to assure the related translations are in the proper state for the new RC data to successfully complete. The failure or acceptance message of the test state process is then printed on the Recent Change and the Maintenance printers. This is the final state for Trunk Subgroup and Trunking RCs. All other types will be placed back into the buffer awaiting activation.

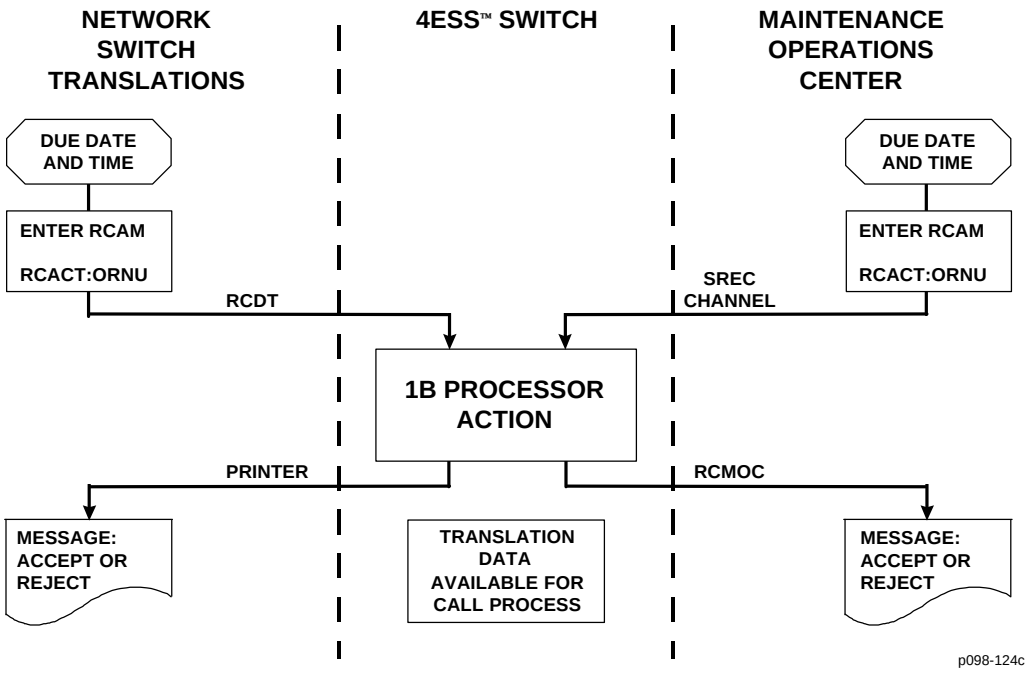
ADVANCE BUFFER MESSAGE TO THE ACTIVE STATE



Continued on next page

Recent Change Administration, Continued

Recent Change System - Overview (cont'd.)

ACTIVATION

An RCAM message is utilized to. activate an RCDM. (Example: RCACT:ORNU 102!) When the RCDM is activated, the new data is entered into the translators and is made available to call processing. The old translation data is entered into the RC Disk Rollback Area. The buffer entry is erased. An acceptance message is printed as well as a copy of the RCDM. Finally a copy of the RCDM is sent to the "Roll-Forward" floppy disk unit. The roll-forward floppy disk is used to recover from a rollback action described in a later section. Immediate activation can be requested by placing ACT in the action field on the form. In this mode, the testing and activation of the change is performed without buffering the message.

Fast RCAM

RCDMs can also be buffered, tested, and/or activated by using FTB (fast BUF), FTT (fast TST), and FTA (fast ACT). These fast RCAMs limit the output text to a success or failure message and the RCDMs will not be recorded on a floppy disk.

Recent Change Data Message Numbering

A very significant piece of information used in RC administration is the RC message number (ORNU field). A unique six digit number is to be assigned to each RCDM to assist administration of RC messages as they progress through the RC system. A typical numbering system used has the first three digits of the message number equal to the Julian Calendar day number, i.e., Feb 2 = 033. Also, typically, the fourth, fifth, & sixth digits are the RC number.

Rollback Feature

The RC system contains a feature known as "Rollback." The Rollback feature provides the capability for the RC system to Rollback (return) the translation data base to a pre-existing condition by removing activated RCs on a last in/first out basis. As each RC is rolled back, the affected translators are returned to the previous condition, prior to initial activation of the RCs being rolled back, using the old translation data stored in the Disk Rollback Area. The following describes the three types of Rollback.

TYPE I ROLLBACK is applicable only to a RCDM that is actively being processed. It can occur automatically and provides for automatically rolling back the translation data to its previous state when an interrupt is triggered while an RC is being processed. This is necessary to prevent the incomplete (partial) update of an RC. When a Type I Rollback occurs, a message will be received on the printer indicating that the RC activity was not accepted. This requires the affected RC be corrected and resubmitted.

Continued on next page

Recent Change Administration, Continued

Rollback Feature (cont'd.)

TYPE II ROLLBACK is applicable for rolling back RC messages previously processed by the system and active in the 4ESS™-2000 Switch. A Type II Rollback is manually requested usually in an attempt to return the switching system to a stable condition. Also, a phase 3 or 4 must be directed to accompany the Type II Rollback. This means impaired service for a given time. Normally, the decision to initiate a Type II Rollback is made by mutual agreement with the assistance of the Technical Support Organization. The rolling back of critical RCs will, in most cases, result in wrong routing and/or trunking configurations. The effect of traffic handling must be considered in the decision-making process. Several options are available using a Type II Rollback. The following output messages are used to list all the RCs affected by each Rollback option:

Rollback a particular recent change or certain quantity. **OP:RCRORNU, LAST __!**

Rollback all the RCDMs activated since the last ODA tape. **OP:RCRORNU, LAST TAPE __!**

Rollback all RCDMs in the entire rollback area. **OP:RCRORNU, ALL!**

Some quick but analytical troubleshooting must take precedence using output reports and RC logic to see how far back the rollback should go. Use of the last two options or rollback messages should be cautiously considered to assure the total impact of the result. But, more importantly, consider one of the last two before the decision to reinitialize with the last Tape Write-Read Program (TWRP) (ODA) tape.

Continued on next page

Recent Change Administration, Continued

Rollback Feature (cont'd.)

The TTY ROLLBACK is the most user friendly solution if the sanity of the 4ESS™-2000 Switch allows for its use. It is manually activated via an Input/Output (I/O) terminal message with "NO PHASE" initiation involved. Each message activation rolls back the last RC activated. Multiple Rollbacks are accomplished with a message for each RC in reverse order of activation. This is usually the most logical fix to a problem to a 4ESS™-2000 Switch that has its sanity. The input message is **RCCNL:ROLLBACK [;UCL]!** Trunking RCs may need the UCL (Unconditional) suffix since the trunks may not be in the correct state to honor RC. Routing RCs will not need the UCL. As stated for the previous Rollback types, careful interaction should transpire before any decision is made to initiate.

RECENT CHANGE ACTION - After the various Rollback options have been reviewed, it is still most prudent to fix any translation problems via the RC process. This will maintain the cleanest TWRP ODA tape at the next interval. If the RCs required to correct a service problem are trunking related and no trunk maintenance personnel are available to work the no-service states, the Machine Operations personnel can save the day. The Machine Operations personnel can enter the RCs required from the MTC I/O channel using the [;UCL]! (unconditional) suffix. **Phases and/or rolling back unnecessary RCs should be avoided whenever possible.**

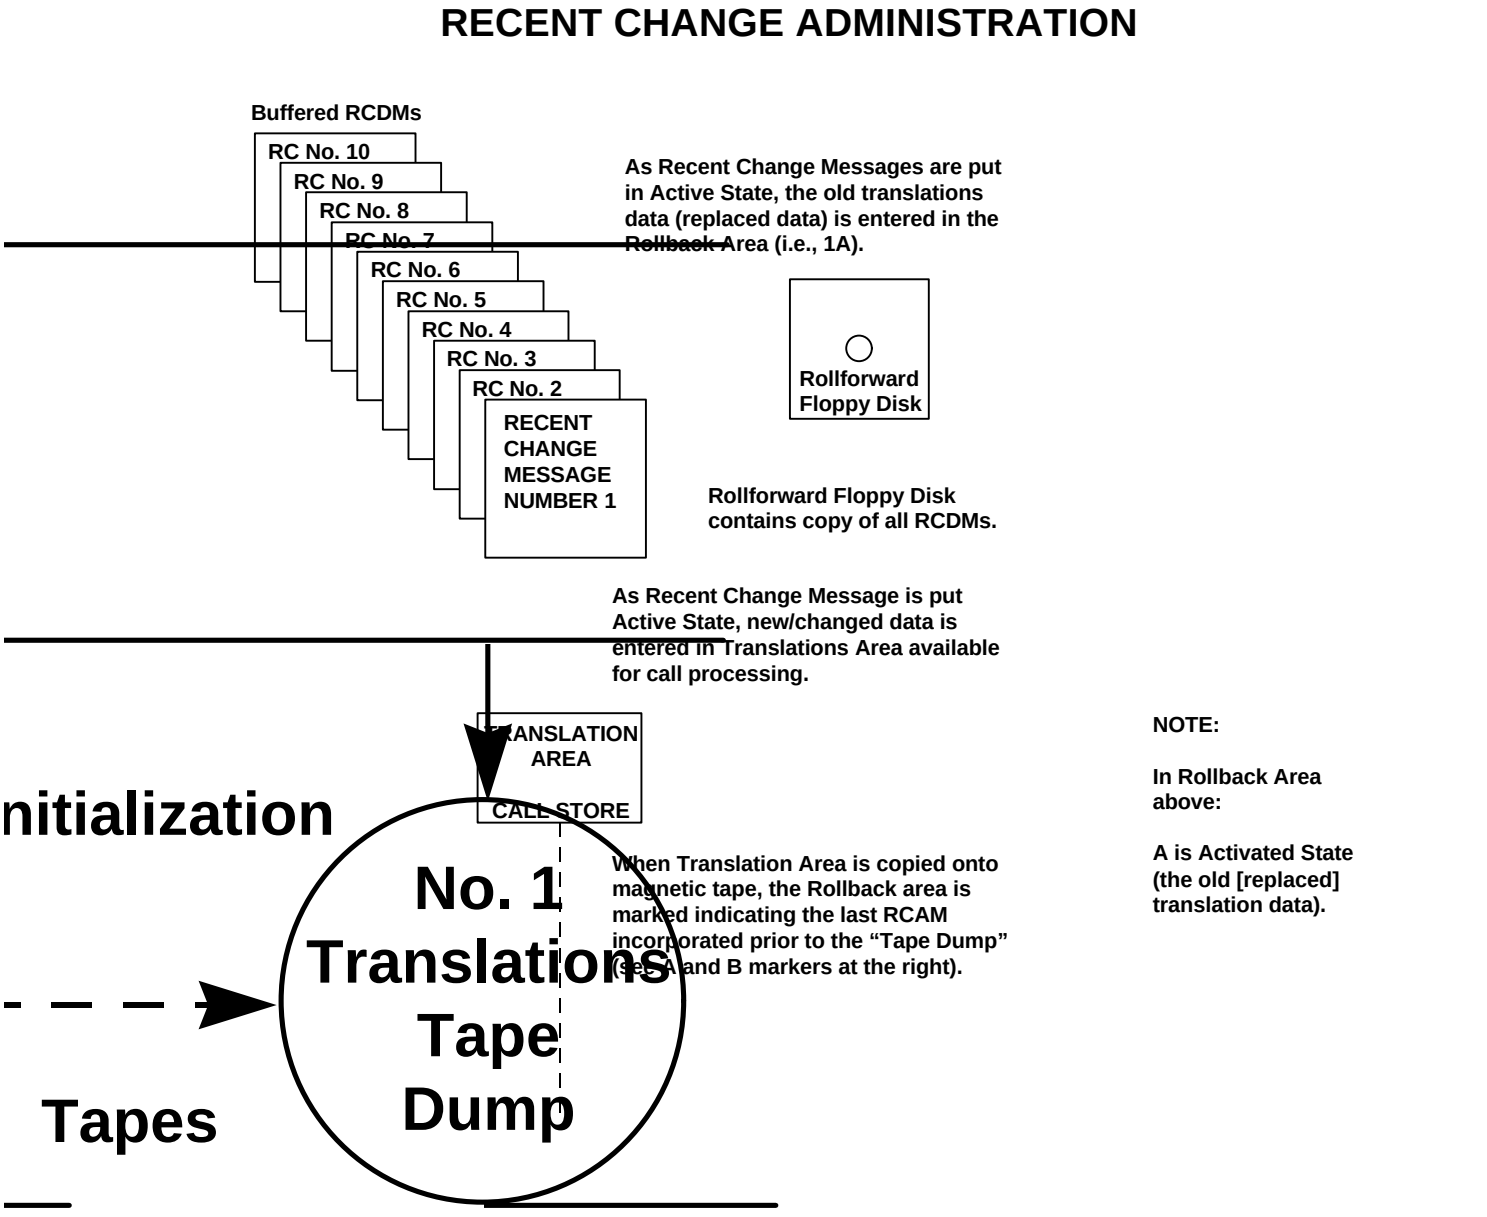
Rollback Area - Overview (cont'd.)



Continued on next page

Recent Change Administration, Continued

Rollback Area - Overview

The rollback Area is a 16,000 word section of disk memory. This area is used to store Rollback information for RCDMs that have been activated. Since it is possible for RC activity to overflow the memory space available, a warning message is printed when memory is at 40, 60, 80, & 90 percent of capacity. If overflow is permitted to occur, new RC entries will wrap-around (over-write) previous entries, which will be lost.

The Rollback feature example on the preceding page depicts the various RC events and the resulting records produced. The example displays the sequence of events described as follows:

1. The development of the RC Rollback area begins at point "A." This will be Tape #1 (TWRP) Index placed in the Rollback area to indicate the last RC message entry prior to the ODA tape. This tape is a termed several names being a, Tape-Write-Read-Program (TWRP Tape), an) Office Data Assembler copy (ODA tape, a Re-initialization tape (if used to re-initialize the 4ESS™-2000 Switch to this point in time again), or a Back-up tape. It is a magnetic tape record of the translations based in the Call Stores at that point in time. This becomes the "Tape #1 Index" for now. Reference this at point "A."
2. If RCDM Number 2 is activated first, the actual data change will be made in the translation area of the Call Stores, making the new data available for call processing. The old translation data will be entered in the Rollback Area as entry 2A. A copy of the RCDM new data will be recorded on the "Rollforward Floppy Disk." An RC comment message will be recorded on the Rollforward floppy disk indicating RC message Number 2 has been activated.
3. If processing of RCDMs continues for RC message Numbers 1A, 6A, 4A, and 3A the same transactions as paragraph "B" take place. At this point, an ODA tape (TWRP) #2 is made. This will become "Tape #2 Index." Reference this point "B."

Continued on next page

Recent Change Administration, Continued

Rollback Area - Overview (cont'd.)

4. Processing of RC message Numbers 7A and 5A will result in actions and records also similar to previous paragraph "B."
5. At this point, an ODA tape (TWRP) #3 is made. Reference this point "C." The "Tape #2 Index" now moves to this point of the Rollback Area. And, also at this time, the "Tape #1 Index" moves from Reference point "A" to Reference point "B." As RC activity continues, the Tape #1 and #2 Indexes keep moving forward.
6. The "Tape #1 Index" is always referred to as the "NEXT TO THE LAST TAPE" and the "Tape #2 Index is the "LAST TAPE." When the Tape #3 was made in previous step "5," RCs are now made from Reference point "C" and forward. Access can only be made back to "THE LAST TAPE" (Tape #2 Index) or back to "NEXT TO THE LAST TAPE" (Tape #1 Index).
7. There is no common size for each type of RC form. Some require more words of space than others. As RCs now continue and if a new ODA tape (TWRP) is not made judicially, the area between point "B" to the last RC will exceed the maximum 16,000 word section of memory. This starts overwriting the memory that was forward of point.
8. Recent Change terminal, "ACCESS TO THE NEXT TO LAST TAPE IS NO LONGER AVAILABLE." This means a Rollback can only be performed back to Tape #2 Index (Reference point "C") or referred to as "THE LAST TAPE."
9. If additional RCs still continued from paragraph "7," and an ODA tape (TWRP) still is not performed, the memory area between the Tape #2 Index (Reference point "C") and the last RC made will eventually exceed 16,000 words. At this time, the message "ACCESS TO THE LAST TAPE IS NO LONGER AVAILABLE." From this point, NO Rollback activity can be performed. If reinitialization is required use the last TWRP tape or the one prior to that. Now the Translation Personnel will have to manually determine which RCs were made back to the point in time of the TWRP tape used for the Re-initialization. History must be recreated in translations.

Continued on next page

Recent Change Administration, Continued

Rollback Options

Manually initiated Type II Rollback provides four options for rolling back RCs on a last-in/first-out basis:

1. A request can be made that a specific number "X" of activated RCDMs be rolled back, not to exceed the number entered since the last ODA tape was made.

2. A request can be made to roll back all replaced translations data associated with RCDMs through a specific RC order number. This option will not roll back beyond the last ODA tape.

3. A request can be made to roll back all replaced translation data associated only with RCDMs which were activated since the last ODA tape.

4. A request can be made to roll back all replaced translation data associated with all activated RCDMs in the Rollback area, including those that were entered in the Rollback area prior to the last ODA tape, up the next to last ODA tape.

NOTE: These four options are only possible for the RCDMs that still exist in the Rollback area. If TWRP tapes were not performed correctly, some or all of the RCDMs could be overwritten and no longer available for Rollback.

Continued on next page

Recent Change Administration, Continued

Rollback Options (cont'd.)

The initiation of any of the four Type II Rollback options can seriously affect call processing and must be carefully considered before any Rollback action is taken. Traffic handling can be affected as follows:

1. When an activated RCDM adding trunks to a Trunk Subgroup (TSG) is rolled back, any calls on the added trunks during Rollback will be interrupted. The Rollback program itself may not interfere with established calls, but the audit program will remove connections since the added trunks no longer exist.

2. When an activated RCDM deleting trunks from a Trunk Sub-group is rolled back, the deleted trunks are not placed in an operational status following Rollback. To minimize routing problems, the restored trunks are placed in a special Rollback status associated with Trunks Out of Service List.

3. A very severe call processing problem can occur when an activated RCDM affecting "Unit Type" equipment changes is rolled back. For example, if an activated RCDM adding a new Time-Slot Interchange (TSI) is rolled back, all calls on the new TSI could be disconnected.

4. When an activated RCDM which established a new Routing Data Block is rolled back, a severe service interruption could result.

Administrative Guidelines for Recent Change Activity

The Network Translations Switch Personnel are responsible for managing the RC system in determining Rollback, Rollforward, and/or Reinitialization strategies. They should establish certain RC and Reinitialization records to assist in being fully aware of the status of activities that affect the machine translations database.

High-Volume Recent Change Activity - Given all of the full awareness rules just presented for RC activity with respect to preserving service at all costs, there is a time when to flex the procedure. There are times when a major RC activity project prevails, i.e., office re-home, fold in another switch to the 4ESS™-2000 Switch, etc. Under these conditions, if the MOC were to perform an ODA tape every time the rollback area reached 60% full, the project would never have a timely completion. Most often these projects are initiated on evenings and/or nights and must be completed by morning business. A management decision can be considered to just do an ODA tape function at the beginning of the project when hundreds of RCs will be activated. After the project is completed the final ODA tapes can then be made. The result is available re-initialization tapes for pre-project and post-project. The possibility of utilizing roll-back during the project is unlikely.

However, if the project size is small enough, another consideration would allow RC activity until the 90% Rollback area utilization is reached. Then, perform only one ODA tape (instead of the usual three) at each interval during the project to at least have Rollback possibility to the last tape, but preserve some productive time for RC activity. At the completion of the project, the final set of ODA tapes would be made.

Recent Change Administrative Messages

RCADs are used to request administrative feedback such as: list of Recent Changes messages in the buffer, print a buffered message, print an RCDM form to be filled out, and print the amount of buffer area space remaining for use. These messages are described in detail in DIV. 3-Sec 9 of the TG-4. The following is a list of RC Administrative Messages:

```
OP:RCFORM___!
OP:RCBMSG,ORNU___!
OP:RCBORNU!
OP:RCBSPACE!
OP:RCRORNU,_____!
OP:RCTORNU!
```

Recent Change Action Messages

RCAMs are used to change the status of a Recent Change message. As such, they initiate the testing and activation of a "Buffered" Recent Change. They also cancel an individual Buffered RC message or cancel all Buffered messages. These messages are described in detail in DIV. 3-Sec 9 of the TG-4. Following is a list of RC Action Messages:

```
RCCNL:RCBORNU____!
RCTST:ORNU_____!
RCACT:ORNU_____!
RCCNL:RCTORNU!
RCCNL:ROLLBACK!
CLR:CHAN!
CLR:RCB!
```

Translation Growth/Retrofit Administration

General

This section is intended to provide 4ESS Switch office personnel with information concerning general procedures and guidelines for the successful management of the translations data during office transition period. Additional information can be found in Lucent Technologies Practices 234-185-XXX, where XXX depends on the issue of the Generic Program.

An office transition period is the extended interval encompassing major equipment additions and/or translations data base modifications beyond the scope of the existing Office Data Assembly (ODA) base and normal Recent Change (RC) procedures. Two types of transition periods are called GROWTH and RETROFIT:

1. GROWTH is defined as the introduction of a new Office Data Assembler (ODA) which expands the 4ESS Switch capacity to accommodate hardware additions compatible with the resident Generic Program.

2. RETROFIT is defined as the introduction of a new issue Generic Program which requires coincidental data base and/or hardware changes.

A GROWTH/RETROFIT period will be twelve (12) weeks. The overall transition period is broken into three consecutive steps; Planning and Preliminary Preparation, Initial ODA development, and Final ODA development and 4ESS Switch load/retrofit.

Support Organization - A support group will be providing assistance prior to and during retrofit, or an ODA growth. It may be one or more of the following:

1. National Electronic Systems Assistance Center (NESAC)

2. Lucent Technologies Network Software Center (NSC)

3. Switching Management Control Center (SMCC) (LEC)

4. Lucent Technologies Product Engineering Control Center (PECC) Diagnostic Center (PDC)

5. Lucent Technologies Technical Control Center (TCC).

Translation Growth/Retrofit Administration, Continued

Planning And Preliminary Preparation

The Planning and Preliminary Preparation period is the time between the start of the project and twelve (12) weeks prior to the scheduled office retrofit date. The following paragraphs outline the 4ESS Switch personnel involvement.

The 4ESS Switch personnel should carefully review the complete project to identify exactly how the office is affected. In In cooperation with Lucent Technologies installation people, ensure that a comprehensive Method Of Procedure (MOP) is prepared covering all facets of the project. Every effort should be made to minimize interference with call processing. The Machine Administrator will approve the MOP before allowing any physical work to begin.

The Machine Administrator will be responsible for the generation of the initial office Tape, Write, Read Process (TWRP) dump to be used as input to the Lucent Technologies initial Office Data Assembly (ODA) decompile process. The initial tape dump (TWRP) is to be supplied to the Lucent Technologies ODA Software Database Management group at least twelve (12) weeks in advance of the scheduled office retrofit date.

The Machine Administrator and TELCO Engineer will need to schedule preparation of the necessary TG-4, Division 6, ODA input forms covering the new or revised translations data. The completed ODA input forms should be forwarded to Lucent Technologies coincident with the initial tape dump discussed above.

Initial ODA Development

The initial ODA development period is normally the eight week interval starting twelve (12) weeks prior to, and ending four weeks prior to the scheduled office retrofit date.

During the ODA development interval, the Machine Administrator and Routing Supervisor groups will be working with the Lucent Technologies ODA Software Database Management group to resolve any questions or discrepancies in the ODA translations.

The Machine Administrator will be responsible for the generation of a final office tape dump (TWRP) at the end of this interval. This input tape for the final ODA run is to be supplied to the ODA Software Database Management group four weeks in advance of the scheduled office retrofit date.

Final ODA Development - Office Load/Retrofit

The most critical period of any growth/retrofit project is the four-week period prior to the scheduled office retrofit date. The following paragraphs provide standard guidelines for 4ESS Switch retrofits to assure successful implementation and to minimize service risks.

A 4ESS Switch machine that is scheduled to undergo retrofit must meet system performance criteria as outlined in Lucent Technologies Practice 234-185-XXX (where XXX is the Generic Program number).

Special Recent Change procedures are to be initiated for this final four-week period:

1. Only very critical Recent Changes should be allowed during the four weeks following the Recent Change cut-off date. This procedure will minimize the volume of Recent Changes that need to be re-entered into the system after retrofit.

2. No absolute Recent Changes will be allowed during the entire four-week interval prior to the retrofit. Absolute Recent Changes cannot be applied to the new ODA using the RC Update process.

The retrofit occurs early on a Saturday morning. Generally, retrofits are not scheduled for a holiday weekend, due to the increased telephone usage on those weekends.

After the retrofit, Recent Change activity from the four-week quiet period must be applied to 4ESS Switch translations. This procedure is described in Division 2, Section 5, of the TG-4.

General

This information applies to all sections within this division:

1. The characters > and < are used to indicate which Generic Programs will apply.

   Examples:

   - 4E22> indicates 4E22 and later Generic Programs.
   - <4E22 indicate 4E22 and earlier Generic Programs.
   - 4E22 indicates the 4E22 Generic Program only.
   - >4E22 indicates all Generic Programs up to, but not including, 4E22.

2. Following the general section is a copy of the applicable Recent Change (RC) Form/s. Where there is more than one Generic published, the forms will be filed in ascending order by Generic.

3. The Keyword field names of the form entries in each section are listed in order of appearance on the latest Generic Recent Change Form. (Keywords deleted from the latest form issue will still remain in the form order of the last RC Form that it appeared until finally deleted).

4. The alphabetical "Keyword Index" of the field names is located at the end of each Recent Change Section, following the text, and any tables and/or graphics that may apply.

5. Each Keyword definition will only list the valid entries for the RC Form covered in each applicable section. Some Keywords may have additional valid entries related overall and may be found in the alphabetical Keyword Glossary (Div. 9, Sec. 1).

RC Form 100

General

Recent Change (RC) Form 100 establishes the translations for a new two-way Trunk Subgroup. This message is classed as a Recent Change Data Message (RCDM).

An alphabetical keyword list is included in this section, starting on page 62.

Form Entries

RC:TSG;NEW;OPT(TWOWAY),___:

Recent Change action field – Entries appended to the message header indicate the action to be taken by the Recent Change (RC) system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at a time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks, and also, the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast Activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast Test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

ORNU

Order Number – The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

Form Entries, Continued

TSG

Trunk Subgroup - This series of codes identifies a Trunk Subgroup. The TSG is a set of trunks within a Trunk Group having certain identical characteristics. A Trunk Group must have a common destination. In addition to group characteristics, a TSG also has common signaling characteristics, transmission delay, originating Numbering Plan Area (NPA), domain, traffic separation index and screening classes. The Trunk Group and TSG are identified by a series of codes that specify the near and far ends of the trunk. In most cases, the full near end definition is not required because it will always be the same. The Trunk Group designation is comprised of the town, state, building and building subdivision for the far end plus the near end building subdivision. A TSG is uniquely identified by adding a Base Traffic Number reference. Trunk Group and TSG definitions are available in the
4ESS Switch as abbreviated Circuit Identification Names (CINs). Common Language Location Identification (CLLI) codes must be entered in the fields that make up the Trunk Group definition. Rules for establishing these codes are covered in Lucent Technologies Practices 795-100-100. The code for any established office may be found by referring to the location code index in that same Lucent Technologies Practices. For non-message TSGs, the format does not include mnemonics for identifying the far end of the trunk. The TSG will mnemonically identify the type of trunk category by function. Asterisks are used in columns where no information is necessary. The following paragraphs describe the individual fields within a TSG definition.

Continued on next page

Form Entries, Continued

TSG (cont'd)

- **BTFN** - Base Traffic Number - The BTFN is a number in the range of **"0-9976"** that is part of the TSGs designation (which consists of the BTFN, TOWN, ST, BL, FBS, and NBS). The BTFN is the first traffic number in the first block of traffic numbers that is assigned to a TSG. Additional traffic numbers, which are assigned in blocks of 24, either higher or lower in numerical value than the BTFN can be assigned to the TSG, but the BTFN remains as defined above. All non-message trunks have a BTFN of **"0000"**. For RC 104, the BTFN is stored as the starting point for a block of traffic numbers that range up to the limit originally defined on RC Forms 100, 101 and 102 when the TSG was first built. Other blocks of traffic numbers, either higher or lower in numerical value, may be assigned to this TSG, via Recent Change (RC) procedures. In this case the original BTFN would still apply, but the QTFN field would contain the number of new traffic numbers to be assigned following the First Traffic Number (FTFN) specified.

- **TOWN** - Town is a 4-character alphabetic field - The code must represent the bona fide town, city or location per Lucent Technologies Practices 795-100-100 for the far end of the TSG.

- **ST** - State - This field represents the state, province or foreign country in which the far end office is located. The code in ST must be a standard 2-character alphabetic combination. Valid standard abbreviations for states, Canadian provinces and foreign countries may be found in Lucent Technologies Practices 795-100-100.

- **BL** - Building - The BL field contains the office identity for the far end of a TSG. This code consists of either two alphabetic characters or two numeric characters. Independent Telephone Company locations are always designated by an **"X"** plus some alpha character in this field. If the TSG terminates in a customer's building and it is not necessary to identify that particular building, this code may be arbitrary.

TSG
(cont'd)

- **FBS** - Far Building Subdivision - This field contains a code that identifies the internal building subdivision for the far end of a TSG. The code is a traffic, plant, or administrative assignment. It must be a 3-character alphanumeric combination. For non-message TSGs, this field is not required. Three asterisks are pre-printed on the form to provide an entry for this field.

- **NBS** - Near Building Subdivision - The NBS designation is the internal building identity for the near end termination of a TSG. It is always a 3-character alphanumeric code. This field should be left **"Blank"** if the NBS for this TSG is the same as the NBS assigned in the near office Circuit Identification Number (CIN) for the 4ESS Switch. The Office Data Assembler (ODA) system will add the NBS on a default basis.

Form Entries, Continued

PCF

Point Code Format - This field is used to specify the format of the point code that is being entered in the point code field. If no entry is being made in the Destination Point Code (DPC) (Originating Point Code [OPC]) field, then this field must be left **"Blank"**. Three different formats are available for input: **ATT, ANSI,** or **ISPC**.

ATT is used for AT&T standard input/output which consists of a three digit network indicator, a two digit cluster region, a one digit cluster type, and a three digit cluster member.

1. **NET**: Network Indicator - This value specifies which signaling network will be used for transport. Valid entries are **"000-255"**.

2. **CR**: Cluster Region - This value specifies the region of the signaling network where the office is located. Valid entries are **"00-31"**.

3. **CT**: Cluster Type - Valid entries are **"0-7"**.

4. **MEM**: - Cluster Member - This value specifies the office member number within the cluster. Valid entries are **"000-255"**.

ANSI is used to indicate that the input/output is in the American National Standards Institute format which consists of a three digit network indicator, a three digit cluster, and a three digit member number.

1. **NET**: Network Indicator - This value specifies which signaling network will be used for transport. Valid entries are **"000-255"**.

2. **CLU**: Cluster - This value specifies the cluster of the signaling network where the office is located. Valid entries are **"000-255"**.

3. **MEM**: Member Number - This value specifies the office member number within the cluster. Valid entries are **"000-255"**.

Continued on next page

Form Entries, Continued

PCF
(cont'd)

ISPC is used for international signaling point code input/output which consists of a one digit world geographical zone, a three digit area/network identifier, and a one digit signaling point identifier. Reference: International Consultative Committee for International Telephone & Telegraph Signaling System (CCITT) Recommendation "Numbering of International Signaling Point Codes", Vol. VI, Rec. Q.708.

1. **WGZ**: World Geographical Zone - This value specifies the world geographical zone of the office. Valid entries are "**1-7"**.

2. **ANI**: Area/Network Identification - This value specifies a geographical area or network in a specific zone. Valid entries are **"000-255"**.

3. **SPID**: Signaling Point Identification - This value specifies a signaling point in a specific geographical area or network. Valid entries are **"0-7"**.

Continued on next page

Form Entries, Continued

AOPC

Alias Origination Point Code - This field will provide a unique combination of a Local Exchange Carrier (LEC) Signal Transfer Point (STP) Point Code (PC) and an AT&T STP PC for each Local Access Transport Area (LATA) dedicated D-link set via a logical point code. AOPC, if entered, must be entered in the ATT format. See the Point Code Format (PCF) field for the format description. AOPC may only be entered when the PCF field is not **"Blank"**.

DPC

Destination Point Code - This field is used to specify the Destination Point Code of the far-end switch.

This field entry is divided into three subfield entries:

1. NET - Network Indicator - This value specifies which signaling network will be used for transport. Valid entries are **"Blank"**, **"000-255"**.

2. CLU - Cluster - This value specifies the cluster of the signaling network where the office is located. Valid entries are **"Blank"**, **"000-255"**.

3. MEM - Cluster Member - This value specifies the office member number within the cluster. Valid entries are **"Blank"**, **"000-255"**.

For the Trunk Subgroup (TSG) forms, nine digits must be entered, depending on the format specified in the Point Code Format (PCF) field. Nine digits must be entered if PCF is American National Standards Institute (ANSI) format. An entry must be made in this field if either the Incoming Signaling Characteristics (ISC) or Outgoing Signaling Characteristics (OSC) field value is **"ISUP"**, **"INUP"**, or **"TUP"**; otherwise this field must be **"Blank"**.

Continued on next page

Form Entries, Continued

FENCLASS This field specifies the classification of the Far End Network (FEN). If the Trunk Subgroup (TSG) is not associated with any FEN, this field is left **"Blank"**. The FEN with which the TSG is to be associated must be described via 4ESS Switch RC 617.

For RC 524, this field identifies the class for accumulating counts.

The following classifications are available:

- **ACCESA** - This identifier specifies that the TSG is a link to an Inter-exchange Carrier (IC) or International Carrier (INC), and the 4ESS Switch is being used by a Local Exchange Carrier (LEC) as an Access Tandem (AT) and/or Service Switching Point (SSP) to switch calls from this TSG.

- **CMC** - Cellular Mobile Carrier - This identifier specifies that the FEN is a CMC. The TSG connects an Access Tandem (AT) and a CMC.

- **OWATS** - This identifier specifies that the TSG is a link to a Private Branch Exchange (PBX) over which only Outward Wide Band Area Telephone Service (WATS) calls are allowed.

- **OEO** - Other End Office connecting, meaning an Equal Access End Office (EAEO) owned by a different company. This identifier specifies that the FEN is an OEO. The TSG connects an Access Tandem (AT) and an OEO.

- **PBX** - This identifier specifies that the TSG is a link to a PBX.

- **POTS** - This identifier specifies that the TSG is a link to a switching machine serving either a Local Access Transport Area (LATA) of the Local Exchange Carrier (LEC) owning/sharing the 4ESS Switch, the Continental United States/Plain Old Telephone Service (POTS) (CUSP) network of the IEC owning/sharing the 4ESS Switch, or some other FEN to be treated similarly.

Continued on next page

Form Entries, Continued

FENID

Far End Network (FEN) Identification - This field distinguishes the specific FEN with which this Trunk Subgroup (TSG) is associated. One to six alphanumeric characters may be entered to distinguish among several FENs with the same classification, or the field may be left **"Blank"**. If FENCLASS is **"Blank"**, FENID must also be **"Blank"**.

When the FENCLASS is ACCESA or ACCESI, FENID should consist of type of feature group access and the 4 numeric digits of the Carrier Identification Code (CIC).

The type of feature group definitions are:

- **G** - All access types (B, C, & D).
- **B** - Feature Group B Access.
- **C** - Feature Group C Access.
- **D** - Feature Group D Access.

Examples include:

- **G0288** - Carrier ID 288 has Feature Group B, C, & D access.
- **BC0288** - Carrier ID 288 has Feature Group B & C access.
- **BD0288** - Carrier ID 288 has Feature Group B & D access.
- **B2882** - Carrier ID 2882 has Feature Group B access only.
- **D2882** - Carrier ID 2882 has Feature Group D access only.

For an access type, both B2882 and D2882 can exist but be for different carriers.

Continued on next page

Form Entries, Continued

TFG

Type of Feature Group - This field is used to specify whether the Type of Access for this Trunk Subgroup (TSG) is tariffed under Feature Group B, Feature Group C, or Feature Group D. An entry can only be made if the FENCLASS is ACCESA. If FENCLASS is ACCESA, a **"B"**, **"C"**, or **"D"** must be entered, corresponding to Feature Groups B, C, or D, respectively. FENCLASS is not ACCESA, this field must be left **"Blank"**.

TSGBBC

Trunk Subgroup (TSG) Broadband Capability - Integrated Services Digital Network User Part (ISUP), International ISUP (INUP), and Q.931 signaling systems allow for broadband switching. This entry specifies what type of circuits may be populated in this TSG. Valid entries are:

- **Blank** - 1 trunk circuit
- **0** - 1 trunk circuit
- **1** - 6 trunk circuits
- **2** - 24 trunk circuits
- **3** - Combined usage 1 and 6 trunk circuits
- **4** - Combined usage 1 and 24 trunk circuits
- **5** - Combined usage 6 and 24 trunk circuits
- **6** - Combined usage 1, 6, and 24 trunk circuits.

VDCAP

Not Applicable – Entries: **"Blank"**

DATAF

Not Applicable – Entries: **"Blank"**

FEAREA

Not Applicable – Entries: **"Blank"**

FESWID

Not Applicable – Entries: **"Blank"**

Continued on next page

Form Entries, Continued

EXSEQ Not Applicable – Entries: **"Blank"**

FEPTY Not Applicable – Entries: **"Blank"**

QTFN Quantity of Traffic Numbers - This field specifies the size of the block of traffic numbers to be reserved with this input form beginning with the Base Traffic Number (BTFN) for this Trunk Subgroup (TSG). Traffic numbers must be allocated in groups of 24. Enter a multiple of 24 in the range of **"24 -504"**. If more than 504 traffic numbers are required for a given TSG, additional blocks of 24 may be added using RC Form 104. The total quantity of reserved traffic numbers should be equal to or greater than (to the nearest 24) the maximum size projected for this TSG during the engineering interval. This total should not include other blocks of traffic numbers that may be assigned separately with RC Form 104.

The maximum number of trunks that can be assigned to one TSG is 1023. If a TSG requires more than 1023 trunks and consequently more than 1023 traffic numbers, it must be split into two TSGs. The breakpoint must be a multiple of 24 and less than 1023 which makes 1008 trunks the logical maximum for one TSG. If for example, 1300 trunks were required between point A and point B, two TSGs should be built. The first TSG would contain 1008 trunks, and the second TSG would contain 292 trunks. The two TSGs would be linked in the Routing Data Block (RDB).

The 4ESS Switch feature, Inward Wide Band Area Telephone Service (INWATS) terminating directly to a customer's Automatic Call Distributor, has a limitation of 1023 TSGs totaling 24552 trunks (1023 trunk blocks of 24 registers).

For Voice Frequency Link (VFL) TSGs, if the traffic numbers for the VFLs are separated by 100, e.g., 801 IPLS IN 01 MSP and 901 IPLS IN 01 MSP, the QTFN must be 24 for building new TSGs. Then build the second set of 24 traffic numbers using RC Form 104.

Use pursuant to Company Instructions

Form Entries, Continued

TOT

Type of Trunk - This field specifies the trunk type for this Trunk Subgroup (TSG). TOT entries of **"ETC"** for End Office or Tandem Connecting, **"LCC"** for Local Exchange Carrier Connecting, and **"OCC"** for Other Carrier Connecting are used for network interconnect. When these TOT values are used on Integrated Services Digital Network User Part (ISUP)
trunks, the Local Exchange Carrier (LEC) (Bellcore TR-317) and/or network interconnect version (TR-394) of the ISUP protocol is used. For all other allowed TOT values, the AT&T version of the ISUP protocol is used. The codes that may be entered are as follows:

- **ETC** - End Office or Tandem Office Connecting - This Type of Trunk (TOT) is used to identify Equal Access (EA) or Intra Local Access Transport Area (IntraLATA) trunks at a switch serving as an Access Tandem (AT) or Service Switching Point (SSP) where the other end connects to an End Office. This TOT is also used to identify EA trunks between ATs or between an AT and a switch serving as an SSP. When the type of trunk is ETC, the signaling characteristic of the Trunk Subgroup (TSG) must be either Multifrequency Wink (MFWINK) or ISUP.

- **INTL** - International - International circuit with the far end outside of World Zone 1, and having signaling characteristics of International Consultative Committee for International Telephone & Telegraph Signaling System 5 (CCITT5), CCITT6, International ISUP (INUP), and CCITT7 Telephone User Part (TUP).

- **INTLO** - International Overflow - International Overflow circuit (for overflow transit traffic) with the far end inside World Zone 1 in another International Switching Center (either the U.S. or foreign).

- **ITAND** - Inter Tandem - This TOT can be used to handle traffic between two tandem switchers in the same local calling area.

Continued on next page

Form Entries, Continued

TOT (cont'd)

- **ITOLL** - Intertoll - Intertoll trunks will carry toll traffic between class 4 or higher offices, or trunks dedicated to Inter-International Switching Center (inter-ISC) international overflow traffic. This includes final, full and high usage TSGs.

- **ITOPA** - International Operator Trunk A – International Operator Center 3C/3CL switchboards associated with Operator Bridged Access Trunks (OBAT). Each OBAT has two appearances on the A trunk and B trunk.

- **ITOPB** - International Operator OBAT B Trunk - Operator bridged access Trunk B from 3C/3CL switchboard.

- **LCC** - Local exchange Carrier Connecting - This TOT is used to identify EA trunks at an AT&T switch This identifier is also used for outgoing ISUP trunks from the Interexchange Carrier/International Exchange Carrier (IC/INC) to an SSP office. When the type of trunk is LCC, the signaling characteristic of the TSG must be either MFWINK or ISUP and the Equal Access Signaling (EAS) field must be marked as either **"E"**, **"A"**, **"D"** or **"R"**.

- **NSDSD** - Network Services Frame Direct Services Dialing Capability - This identifier indicates trunks in this TSG are used to interface the Network Services Frame (NSF) for Direct Services Dialing Capability (DSDC) features. This TSG may only have two way Common Channel Interoffice Signaling (CCIS) characteristics. This TSG is not hunted via normal routing mechanisms, so there can be only one TSG bearing this TOT designation (all trunks connecting a 4ESS Switch to its DSDC equipped NSF must be in the same TSG).

Continued on next page

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

TOT (cont'd)

- **OCC** - Other Carrier Connecting - This TOT is used to identify EA trunks at a switch serving as an AT or SSP where the other end connects to an IC or INC switch. This type of trunk should be used when the signaling on the TSG is MFWINK or ISUP.

- **PBX** - Private Branch Exchange - This identifier indicates that the trunks in this TSG terminate on a PBX unit. If the PBX interface is via a 2-wire PBX Channel Unit (J98726ST), then the Incoming Signaling Characteristics (ISC) should be Dial Pulse Immediate (DPIMMED) and the Outgoing Signaling Characteristics (OSC) should be Dial Pulse Wink (DPWINK).

- **SECIT** - Secondary Intertoll - These trunks interconnect toll switching machines and manually operated toll or assistance switchboards for routing of operator completed traffic.

- **STC** - Single Trunk Customer - This TOT is used to designate a TSG for single trunk terminations not supported by a PBX. When TOT is STC, the following TSG fields must be **"Blank"** or **"N"** as allowed: ANISID, APS, BRL, CCIS2WRE, DNHR, DPC, EAS, FAR4E, PBXAW, PBXESGD, REV, RFA, RFMP, SAT, SINDEX, TFG, TSGBBC, WANISID, XCPA.

- **TAND** - Tandem - This code is used for 2-way tandem, tandem completing and tandem connecting TSGs.

Continued on next page

Form Entries, Continued

SAT

Satellite – Enter a **"Y"** for Yes or **"N"** for No to indicate whether or not this Trunk Subgroup (TSG) is associated with satellite facilities. This entry performs a screening function to avoid two satellite TSGs from being connected together to complete a call. If the incoming TSG has SAT = "Y", then call processing will insist the outgoing TSG must have SAT = "N". This can also be used for local screening functions even though the TSG is not via a satellite.

For Voice Frequency Link (VFL) TSGs, satellite facilities cannot be used for a domestic Common Channel Interoffice Signaling (CCIS) system, i.e. if DOM is Plain Old Telephone Service (POTS), then SAT must be **"N"**.

Continued on next page

Form Entries, Continued

DOM

DOMAIN - This field designates a community of interest that requires separate routing. The types of Domain are "Direct Distance Dialing (DDD), International Direct Distance Dialing (IDDD), Verify (VRFY)" and a number ranging from **"20-83"** denoting a NON-Plain Old Telephone Service (POTS) domain. DDD is indicated by an entry of **"POTS"** in the DOM field. The Office Data Assembler (ODA) system will automatically build the DDD Domains (0 through 19). The **"VRFY"** Domain enables the Line-Busy Verification feature by operators over a dedicated network. When DOM equals VRFY, then Type of Trunk (TOT) must be ITOLL, MISC, or TSPS or CALLTYP must equal FHT, GNS, or TST. The NON-POTS Domains may be a Common Control Switching Arrangement (CCSA) Network, such as Federal Telecommunications System (FTS). These domains are entered as a number from **"20-69"**.

- The **NON-POTS domain of 78** is used to skip Network Management code controls for quality assurance testing, i.e. CASPER.
- The **NON-POTS domains 79 and 80** are reserved for specific International Switching Center (ISC) use.
- The **NON-POTS domain of 81**, also denoted by **"IVT"** for International Voice Transport, is reserved for call processing to transport international voice calls through the network to an ISC.
- The **NON-POTS domain of 82** is used as the translation domain for Data calls. The Data feature provides the capability for full rate data transmission via the 4ESS Switch over a dedicated network of digital trunks. These digital trunks terminate exclusively on Digital Interface Frames (DIF) at 4ESS Switch locations.
- **N64C** -This domain is used to route 64 kbps clear data calls using the 10-digit North American Numbering Plan (NANP).
- **N64R** -This domain is used to route 64 kbps restricted data calls using the 10-digit North American Numbering Plan.
- **I64C** -This transport domain is used to route 64 kbps clear international data calls up to an ISC.
- **I56D** -This transport domain is used to route 56 kbps international data calls up to an ISC.

Continued on next page

Form Entries, Continued

DOM (cont'd)

- **APN** - Action Point Numbering Plan - This domain is used as an access domain for originating Direct Connect voice or data calls. The calls arrive at the 4ESS Switch as 10-digit calls. When DOM equals APN, then TOT must be PBX or STC for TSG forms.

NOTE: For Voice Frequency Link (VFL) TSGs, this field identifies the domain in which this TSG operates. Valid inputs are "POTS" (if VFL is associated with a domestic Common Channel Interoffice Signaling [CCIS] system).

ACD

Automatic Call Distributor – This field is used to indicate whether or not this Trunk Subgroup (TSG) is used to terminate Inward Wide Band Area Telephone Service (INWATS) traffic. Enter **"Y"** if this TSG will terminate INWATS traffic. Enter **"T"** if INWATS Time Of Day (TOD) billing is required. Enter **"N"** or leave **"Blank"** if this TSG will not terminate INWATS traffic.

IT

Intertoll Treatment – This field is used when the domain of the Trunk Subgroup (TSG) is Plain Old Telephone Service (POTS) and the type of trunk is either End Office or Tandem Connecting (ETC) or Other Carrier Connecting (OCC) to specify whether the TSG should receive intertoll treatment (IT="**Y**") or toll connect treatment (IT=**"N"**) or **"Blank"**. Intertoll treatment means that the call is routed in the POTS intertoll domain, that is, a normal 7-digit call will be terminated in the home Numbering Plan Area (NPA).

(4E22>) - **Offices using Traditional routing only**. Toll connect treatment means the call is terminated in the NPA specified by the Far End Numbering Plan Area (FENPA) field. This field should be set to **"Y"** in any FENPA that is not the Home NPA.

(4E22>) - **Offices using Traditional routing only** or a served NPA.
This field can also be set to **"Y"** in the Home NPAs.

(4E22>) - **Offices using Traditional routing only** or Served NPAs to force the POTS-IT domain.

Continued on next page

Form Entries, Continued

FAI Not Applicable – Entries: **"Blank"**

FENPA Far End Numbering Plan Area/Trunk Subgroup (TSG) - Enter a 3-digit Numbering Plan Area (NPA) code to identify the far end of the subgroup. Valid entries range from **"200-999"**. With an International Trunk Subgroup, if the far end of the Trunk Subgroup is outside World Zone 1, enter the 1-, 2-, or 3-digit country code. Valid ranges of Country Code entries are **"2-9"**, **"20-99"**, and **"200-999"**.

This field is the NPA of the Far-End Office. If this office is not in the Home or Served area, then the Domain will be Plain Old Telephone Service-Intertoll/Intertandem (POTS-IT) and the IT field will be forced to **"Y"** in a Local Exchange Carrier (LEC) switch.

FEOFC Far End Office – This field is used to identify the office code of the far-end switch. Typically this value will range from **"200** to **999"**. Valid entries are: **"Blank"**, or **"000 - 999"**.

FELATA Far End Local Access Transport Area – This field is used to identify the Local Access Transport Area (LATA) of the far-end switch. Valid entries: **"Blank"** or **"000 - 999"**.

FESC6 Far End 6-Digit Screening – A **"Y"** for Yes or **"N"** for No indicates whether or not the far-end office which outpulsed the incoming digits is doing 6-digit screening. An **"N"** should be entered in this field if it cannot be determined if the far-end is doing 6-digit screening. If this field is equal to yes, then vacant code analysis assumes the far-end office will never outpulse a vacant central office code (NXX), vacant Numbering Plan Area (NPA) code, an originating Inward Wide Band Area Telephone Service (INWATS) call which has been denied originating capabilities, or an incorrect number of digits on this Trunk Subgroup (TSG).

Continued on next page

Form Entries, Continued

IWZ1 International World Zone 1 - Enter **"Y"** if this Trunk Subgroup (TSG) will carry international traffic within World Zone 1. Enter **"N"** or leave **"Blank"** if this TSG will not carry international traffic within World one 1. Valid entries are **"Blank"**, **"N"**, or "**Y**".

MEM Memory - This field is used to indicate if trunk hunt with memory is to be performed on this Trunk Subgroup (TSG) when searching for an idle trunk. Trunk hunt with memory is not performed on a TSG if the TSGBBC field is greater than zero (the MEM field should be set to **"N"** in this case). Enter **"N"** if trunk hunt with memory is not to be done. Enter **"Y"** or leave **"Blank"** if trunk hunt with memory is to be done.

PSES Prohibit Service Evaluation - An entry of **"N"** for No specifies that this Trunk Subgroup (TSG) is eligible for service evaluation by the No. 2 Service Evaluation System. An entry of **"Y"** for Yes specifies that the TSG is not eligible for service evaluation. Valid entries are **"Blank"**, **"Y"**, or **"N"**. Blank defaults to "**N**".

INSEP Incoming Traffic Separation Class – Enter a number in the range of **"0-255"** to indicate a traffic class for measurement purposes. This code will be used with the outgoing destination (Destination Separation [DESEP] on code group forms) to determine the peg and usage counts for traffic flow identification. Test position and test call Trunk Subgroups (TSGs) are generically assigned to Incoming Separation Class (INSEP) 31. This should be considered before assigning any other TSG to INSEP 31. Also, since service circuits, other non-message circuits, and 1-way outgoing TSGs have a generically assigned INSEP of zero, they will appear as part of TSG listings for INSEP zero. This fact should be considered before assigning any other Trunk Subgroup to INSEP zero.

Continued on next page

Form Entries, Continued

MTSC Multiple Treatment Screening Class - This field is used to assign an MTSC to this Trunk Subgroup (TSG). Multiple treatment screening may be used to separate routing treatments for TSGs in the same domain. An example is giving independent company trunks a different routing even though the received digits and domain are the same as some other TSG. All TSGs must have an MTSC in the range of **"0-63"**.

GNSC Go/No Go Screening Class - Go/No Go Screening may be used to block traffic dialing specific digits over a Trunk Subgroup (TSG). All incoming and two-way message TSGs are given a Go/No Go class in the range of **"0**-**3**". When this type of screening is required for a group of codes, those codes are correlated with a specific class and a "Go" or "No Go" condition (RC Forms 300-304). If a group of codes specify "Go" on a given class, those codes will be blocked on TSGs having a class other than the specified class. For a "No Go" correlation, a set of codes will not be blocked except on TSGs having the specified class. All blocked traffic is given the vacant code Final Handling Treatment (FHT).

GEOSEP Geographical Traffic Separation Class – Valid entries for this field are one or two digits in the range of **"0** to **31"** to indicate a traffic class for measurement purposes. This code is used with the Announcement Separation Class to score geographical survey counts in Mass Announcement System (MAS) offices.

Form Entries, Continued

ISC

Incoming Signaling Characteristics - Enter one of the following codes to specify the incoming signaling characteristics required for this Trunk Subgroup (TSG).

- **DPDDSD** - Dial Pulse with Delay Dial/Start Dial.
- **DPIMADG** - Dial Pulse with Immediate start and "A" Digit reconstruction.
- **DPIMMED** - Dial Pulse with Immediate start (no delay).
- **DTMFWK** - Dual-Tone Multifrequency (DTMF) with Wink Start.
- **DTS** - Dial-Tone Start.
- **ISUP** - CCITT7 Integrated Services Digital Network (ISDN) User Part.
- **MFDDSD** - MF with Delay Dial/Start Dial.
- **MFOPWK** - MF Operator trunk with Wink start - International operator trunks.
- **MFWINK** - MF with Wink start.

RFA

Ring Forward Allowed – Enter a **"Y"** for Yes or **"N"** for No to indicate if ring forward is allowed. All intertoll (ITOLL) trunks (Type of Trunk [TOT] field is equal to ITOLL) will require the RFA feature. All trunks that have the possibility of receiving operator calls from lower class offices will also require this feature. Each 4ESS Switch office must determine which Trunk Subgroups (TSGs) may receive operator type calls. These TSGs must have the RFA feature assigned.

ADIG

"A" Digit - Reconstruction will be necessary when receiving digits from a machine that absorbs the first digit of a dialed address. Valid entries are **"0"** or **"2-9"** if International Switching Center (ISC) equals DPIMADG. This field is **"Blank"** for all other cases.

Use pursuant to Company Instructions

Form Entries, Continued

CCIS2WRE Common Channel Interoffice Signaling (CCIS) 2Wire – This field should be **"Blank"** for a non-Common Channel Signaling (CCS) Trunk Subgroup (TSG). If this is a CCIS or Integrated Services Digital Network User Part (ISUP) TSG, then it must be determined whether the far end office will terminate the trunks in this TSG on a 2-wire or 4-wire switching network in order to perform the continuity check test on CCIS or ISUP trunks. The CCS continuity check tests will be performed by using the transceiver in either a transceive mode for 4-wire CCS trunks or in a transpond mode for 2-wire CCS trunks. Enter a **"Y"** for Yes if the far end office has a 2-wire network, e.g., 1 ESS/1A ESS 2-wire. Enter an **"N"** for No if the far end office has a 4-wire network, e.g., 1 ESS/1A ESS HILO, 4ESS, 5ESS®, etc.

CBNPR Calling Party Number/Billing Number (CPN/BN) Default Presentation Restriction Indicator – This field indicates whether the received CPN/BN can be passed from the network at the egress point or not. Enter **"Y"** if the default condition for the presentation of CPN/BN should be to restrict it. Enter **"N"** or leave **"Blank"** if the default condition for the presentation of CPN/BN should be unrestricted. This field applies to incoming trunks for which CPN/BN is pre-stored or on which CPN/BN can be received. For Integrated Services Digital Network User Part (ISUP) Trunk Subgroups (TSGs) with Type of Trunk (TOT) or Local Exchange Carrier Connecting (LCC), this field should be populated with a **"Y"**.

For 4E17 and later generics: Enter **"PA"** or **"Blank"** if the default condition for the presentation of CPN/BN should be unrestricted. Enter **"PR"** if the default condition for the presentation of CPN/BN should be to restrict it.

Continued on next page

Form Entries, Continued

OSC

Outgoing Signaling Characteristics - Enter one of the following codes to specify the outgoing signaling characteristics required for this Trunk Subgroup (TSG):

- **DPDDSD** - Dial Pulse with Delay Dial/Start Dial.
- **DPIMMED** - Dial Pulse with Immediate pulsing (no delay).
- **DPWINK** - Dial Pulse with Wink start.
- **DTMFWK** - DTMF with Wink Start.
- **ICOPNOP** - Integrity Check Operator trunk with No Outpulsing. Use this characteristic on trunk subgroups which return a wink signal.
- **ISUP** - CCITT7 ISDN User Part.
- **MFDDSD** - MF with Delay Dial/Start Dial.
- **MFWINK** - MF with WINK start.
- **MIOPNOP** - Miscellaneous Operator with No Outpulsing. This OSC. is used for information and other operator calls. This OSC may be used for Direct Connect calls on 1-way outgoing and 2-way TSGs when Type of Trunk (TOT) is Private Branch Exchange (PBX) or Single Trunk Customer (STC). Use this characteristic only on TSGs which do not return a wink signal.

RFMP

Ring Forward Miscellaneous Distributor Point - Leave **"Blank"** or enter **"N"** for No to indicate that a miscellaneous distributor point is not associated with the outgoing portion of the Trunk Subgroup (TSG). This feature is only required for outgoing trunks requiring 130V ring forward battery. This feature is presently not available on the outgoing portion of 2-way trunk circuits.

Use pursuant to Company Instructions

Form Entries, Continued

DPSTOP	Dial Pulse Stop – Enter a **"Y"** for Yes if this Trunk Subgroup (TSG) terminates in a panel, step-by-step or other office that might not be able to receive a complete train of dial pulse digits without a pause between digits (Outgoing Signaling Characteristic [OSC] equal to DPWINK, DPDDSD, or DPIMMED). This feature will tell the program to look for a DPSTOP signal from the far-end office after any one of the first three digits is outpulsed. Enter an **"N"** for No if this feature is not required for DP outpulsing. For other types of outpulsing, leave this field **"Blank"**.
DELAY	Delay Interval – An entry must be made if the OSC is DTMFWK, MFWINK, or MFDDSD. Leave this field **"Blank"** if another OSC is specified. If OSC is MFWINK, MFDDSD, SIOPMFW, enter **20**, **80**, or **220** to indicate the delay in milliseconds before outpulsing is started. This delay interval starts when the wink or start dial signal from the other office is recognized. Twenty milliseconds is basic for most offices. A delay of 20 may be associated with 7 or 10 multifrequency digits per second. When the OSC is DTMFWK, enter **70**, **140**, **210**, or **280** to indicate the delay in milliseconds before outpulsing. This delay interval starts when the wink from the Private Branch Exchange (PBX) is received. 70 milliseconds is the minimum required for PBXs.
MFSPEED	Multifrequency Speed – If Outgoing Signaling Characteristic (OSC) is specified as MFWINK, MFDDSD, SIOPMFW, or TWOPMFW enter **"7"** or **"10"** to indicate the number of outpulsed Multifrequency (MF) digits per second. Enter **"10"** for Lucent Technologies ESS machines. Seven digits per second is used for all electromechanical machines. If OSC is equal to International Consultative Committee for International Telephone & Telegraph Signaling System 5 (CCITT5), this field should indicate an MF speed of 10. Leave this field **"Blank"** for any other value of OSC.
DNHR	Not Applicable - Entries: **"N"**

Continued on next page

Form Entries, Continued

XCPA

Transceiver (XC) Pad Adjustment – This item will be left **"Blank"** for non-Common Channel Interoffice Signaling (CCIS) trunks. If the Outgoing Signaling Characteristic (OSC) is equal to International Consultative Committee for International Telephone & Telegraph Signaling System 6 (CCITT6), Domestic CCIS (DOMCCIS), Integrated Services Digital Network User Part (ISUP), International ISUP (INUP), or CCITT7 Telephone User Part (TUP) enter a digit from **"0"** to **"3"** to indicate the pad setting for the CCIS transceiver. The correct entry can be determined by comparing the highest Inserted Connection Loss (ICL) value assigned to a trunk in this Trunk Subgroup (TSG) to the following table. The ICL can be obtained from the Circuit Order Layout Record (COLR) card.

DIGIT	ICL APPLICATION	PAD
• **0**	0 loss trunk	5 DB
• **1**	.1 to .8 loss	3.5 DB
• **2**	.9 to 1.7 loss	1.8 DB
• **3**	1.8 to 4.1 loss	0 DB

Continued on next page

Form Entries, Continued

DNP

Dialed Number Preferred – This field indicates whether the called user prefers to receive the original dialed number, if available, as delivered to the network rather than the routing number. Enter **"Y"** if the called user prefers receiving the original dialed number, otherwise, enter **"N"** or leave **"Blank"**. This field applies to outgoing Q.931 trunks only.

REV

Reverse Traffic Numbers - Enter a **"Y"** for Yes or **"N"** for No to indicate whether or not the hunt sequence for this Trunk Subgroup (TSG) is to be reversed. This is determined by comparing the name of the far-end office to the local office using the Common Language Location Identification (CLLI) code for each office. The last office alphabetically should be set to hunt in a reverse sequence. This determination is required only on 2-way TSGs in order to reduce the possibility of both offices seizing a trunk at the same time (a GLARE condition).

Internally, the trunks are stored in ascending traffic number order in the trunk block when REV is set to **"N"**. For non-broadband TSGs, the trunks are stored in descending traffic number order in the trunk block when REV is set to **"Y"**. Trunk hunt always starts searching from the beginning of the trunk block. For broadband TSGs, the trunks are always stored in ascending traffic number order in the trunk block regardless of whether REV is set to **"Y"** or **"N"**, however, when REV is **"Y"**, the busy-idle-bits are searched in a reverse order.

Continued on next page

Form Entries, Continued

GLARE

Glare Control – For domestic E&M trunks, enter an **"A"** for all if this office remains in control when a 2-way trunk is seized by both offices. The other office should be arranged to relinquish control. If the other office (far end) has control, enter an **"N"** for None.

For Integrated Services Digital Network User Part (ISUP) trunks, an "**O**" indicates that this office will control the odd labels. An "**E**" indicates that this office will control the even labels. The switch with the lower point code should be assigned to maintain control of the odd numbered Circuit Identification Codes (CICs). The switch with the higher point code should be assigned to maintain control of the even numbered CICs. The point codes to be compared are the Origination Point Code (OPC) and the Destination Point Code (DPC). Alternatively, for ISUP trunks, an **"A"** can be entered to indicate that the switch will control all CICs or an **"N"** can be entered to indicate that the switch will control no CICs.

The Machine Administrator should furnish this Trunk Subgroup (TSG) information.

PSOLI

Prohibit Sending Originating Line Identity - This field indicates whether OLI can be passed to a connecting network. Legal values are **"Blank"**, **"Y"** or **"N"**. **"Y"** specifies that OLI should not be sent. **"N"** specifies that OLI should be sent.

BN

Billing Number/Trunk Subgroup- This field is used to specify a BN associated with the TSG. It may be left **"Blank"**, or a **"3-"**, **"4-"**, or **"10-digit"** number may be entered. If FENCLASS is ACCESA or ACCESI, BN must be a 4-digit number (4-digit number if Type of Feature Group [TFG] is "B") equal to the (X)XXX corresponding to the inter-Local Area Transport Access (LATA) or International Carrier at the far end of the TSG. If FENCLASS is CMC, OWATS, or PBX, BN must be a 10-digit number. If the Automatic Call Distributor (ACD) field is **"Y"**, then BN must be a 10-digit number specifying the billing number of the INWATS ACD customer. If the ACD field is **"T"**, then BN must be **"199"**.

Continued on next page

Form Entries, Continued

BRL	Billing Record Length – This field is used to specify whether long or short Automatic Message Accounting (AMA) records should be created for calls on this Trunk Subgroup (TSG). An "**S**" should be entered if Short AMA records are required or an "**L**" should be entered if Long AMA records are required. If "**L**" is entered, both answered and unanswered calls are recorded. If "**S**" is entered, only answered calls are recorded. If this field is left "**Blank**", short AMA records will be made (if necessary). **NOTE: There is only one record length for Private Branch Exchange (PBX) calls, so this field should be used to indicate whether both answered and unanswered.**
ITC	Incoming Trunk Subgroup Class – This value identifies the incoming trunk as belonging to one of four incoming classes. The ITC is used in conjunction with Local Exchange Carrier (LEC) Service Switching Point (SSP) call routing instructions to identify which Number Services Data Block (NDB) will be selected for picking a trunk to an Interexchange Carrier/International Carrier (IC/INC). The use of this field is similar to that of Multiple Treatment Screening (MTS) but is associated with the BOC SSP feature. Legal entries are "**Blank**" or "**0**-**3**".
GSDN.tsg	Not Applicable - Entries: "**Blank**"
GSDNPHSE	Not Applicable - Entries: "**Blank**"

Continued on next page

Form Entries, Continued

EAS

Equal Access Signaling – This field is used to specify if Equal Access Signaling (EAS) will be received on this Trunk Subgroup (TSG), and if so, whether Automatic Number Identification (ANI) is expected for the EAS calls. Note that this field only applies to an Inter-Local Access Transport Area (LATA) Carrier switch receiving EAS or an office with the Service Switching Point (SSP) feature receiving EAS. This field must be set to **"N"** for None if EAS is not received on the TSG. If EAS can be received on the TSG, but ANI is not expected for the EAS calls, then an **"E"** must be entered. If EAS can be received on the TSG, and ANI is expected on the EAS calls, then an **"A"** must be entered.

Entries of **"D"** and **"R"** in the EAS field are used to designate Feature Group D (FGD) only. If only FGD is received on the TSG, but ANI is not expected, then a **"D"** must be entered. If only FGD is received on the TSG, and ANI is expected, then a **"R"** must be entered.

This field only applies to an Inter-LATA Carrier switch receiving Equal Access Signaling (EAS), i.e., the Type of Trunk (TOT) value is Local Exchange Carrier Connecting (LCC).

NPARINH

Inhibit Numbering Plan Area (NPA) Reconstruction – This field is used to specify whether NPA reconstruction for equal access calls or SDN should be inhibited on this TSG or not. ANI is taken to be NPA if only seven digits are received. If NPA reconstruction should be inhibited, enter **"Y"**, otherwise enter **"N"** or leave **"Blank"**. This field only applies to Local Exchange Carrier Connecting (LCC) Type of Trunks (TOTs). Valid entries are **"Blank"**, **"Y"**, or **"N"** .

WATSBN

General Wide Area Telephone Service (WATS) Billing Number - Enter a 10-digit billing number for each Trunk Subgroup (TSG) which will be used to carry WATS type traffic. If an entry is not required, then the field must be "**Blank**" . Valid entries are **"0000000000-999999999"** and **"Blank"** .

Continued on next page

Form Entries, Continued

PSBN

Prohibit Sending Billing Number – This field is used to indicate that the caller's billing number should not be sent in the outgoing signaling messages.

For 4E17 and earlier generic programs, enter **"Y"** if the billing number should not be forwarded. This value should only be used on Trunk Subgroups (TSGs) connecting to another network. Enter **"N"** or leave **"Blank"** if the billing number can be sent. This field applies to outgoing Integrated Services Digital Network User Part (ISUP) trunks only.

For 4E18 and later generic programs, this value should only be used on TSGs connecting to another network. Enter:

- **Blank** or **PNNA** - prohibit sending a billing number with a numbering plan type other than North American Numbering Plan (NANP).
- **SALL -** if the billing number can be sent, regardless of the numbering plan type.
- **PALL -** if all billing numbers are to be prohibited from being sent, regardless of the numbering plan type. This field only applies to outgoing ISUP and Q.931 trunks. The PALL value applies only to ISUP trunks.

PSCPN

Prohibit Sending Calling Party Number – This field is used to indicate that the caller's calling party number should not be sent in the outgoing signaling messages. Enter **"Y"** if the calling party number should not be forwarded. This value should only be used on Trunk Subgroups (TSGs) connecting to another network. Enter **"N"** or leave **"Blank"** if the calling party number can be sent. This field applies to outgoing Integrated Services Digital Network User Part (ISUP) and International ISUP (INUP) trunks only.

Form Entries, Continued

ANISID ANI/SID requester value – This field specifies the type of calling party information which should be transmitted to the customer. Valid entries are:

Blank	- No information
NONE	- No information
ANI	- Automatic Number Identification (AIN) only
SID	- Service Identity (SID) only
PANI	- ANI or SID (prefer ANI)
PSID	- ANI or SID (prefer SID)
REQ	- Customer will use signaling to specify

WANISID Wide Area Telephone Service (WATS) Automatic Number Identification (ANI)/Service Identity (SID) requester value - This field specifies the type of calling party information which should be transmitted to the customer when Megacom* 800 type of traffic is delivered to the customer. Valid entries are:

Blank	- No information
NONE	- No information
ANI	- ANI only
SID	- SID only
PANI	- ANI or SID (prefer ANI)
PSID	- ANI or SID (prefer SID)
REQ	- Customer will use signaling to specify

*Megacom is a registered trademark of AT&T.

Form Entries, Continued

PSUUI	Prohibit Sending User-to-User Information – This field indicates whether to accept/send Message Associated (MA) UUI on this Trunk Subgroup (TSG). Legal values are **"Blank"**, **"Y"**, or **"N"**. Enter **"Y"** if MA-UUI should not be sent. This value should be used on access TSGs to prohibit the receipt of MA-UUI, and it should be used on egress TSGs to prohibit the sending of MA-UUI. The default condition is **"N"**. This field applies to Integrated Services Digital Network User Part (ISUP), International ISUP (INUP), and Q931 trunks only.
BNPT	Not Applicable – Entries: **"Blank"**
WBNPT	Not Applicable – Entries: **"Blank"**
CMERGE	Not Applicable – Entries: **"Blank"**
SCFN	Send Confusion Message – This field indicates if received Confusion messages are counted and if Confusion messages are to be sent when an unimplemented message is received. Valid entries are **"Blank"**, **"Y"**, or **"N"**.
OVLP	Overlap Signaling – This field indicates if Consultative Committee for International Telephone & Telegraph Signaling System 7 (CCITT7) Overlap Signaling is allowed when processing an International Integrated Services Digital network User Part (INUP) or CCITT7 Telephone User Part (TUP) call. If OVLP is set to **"Y"**, then Overlap Signaling will be allowed on transit non-operator, non-test calls. The default value for this field is: **"Blank"** (Overlap Signaling not allowed).
PRIT	Not Applicable – Entries: **"Blank"**

APS

Accunet® Packet Service - This field is used to indicate if Accunet packet service can be performed on this Trunk Subgroup (TSG). Enter **"Y"** if Accunet packet service is allowed. Enter **"N"** or leave **"Blank"** if Accunet packet service is not allowed.

CHNEG

Channel Negotiation – This field is used to indicate whether channel negotiation can be performed on this Trunk Subgroup (TSG) or not. Enter **"Y"** if channel negotiation is allowed. Enter **"N"** or leave **Blank** if channel negotiation is not allowed.

PSATP

Prohibit Sending Access Transport Parameters – This field indicates whether Access Transport Parameters (ATP) can be passed to or from a connecting network. Legal values are **"Blank"**, **"Y"** or **"N"**. Enter **"Y"** if ATP should not be sent. This value should be used on access Trunk Subgroups (TSGs) to prohibit the receipt of ATP; it should be used on egress TSGs to prohibit the sending of ATP. The default condition is **"N"**. This field applies to Integrated Services Digital Network User Part (ISUP), International ISUP (INUP), and Q931 trunks only. This new field will not affect the sending of ATP at an Access Tandem (AT) switch.

PBXESGD

Private Branch Exchange (PBX) Expect Station Group Designation – This field is used for the Software Defined Network (SDN) feature and is set equal to **"Y"** if the SDN customer has a direct connect PBX that will append an extra digit to the dialed number to indicate authorization of calling station. A **"Y"** or **"N"** must be entered in this field if Type Of Trunk (TOT) is PBX and Domain (DOM) is Software Defined Network Access (SDNA), otherwise it must be set to **"N"** or left **"Blank"**.

PBXAW

PBX Answer Withheld – This field is used to specify whether Answer Supervision can or cannot be sent to the PBX. An entry can only be made if TOT is PBX. A **"Y"** is entered if Answer Supervision is to be withheld. An **"N"** is entered if Answer Supervision should not be withheld (i.e., Answer Supervision is returned). If this field is left **"Blank"**, Answer Supervision is returned (not withheld).

FAR4E	The FAR4E field is set to **"Y"** for Yes whenever the far end of the trunks in this Trunk Subgroup (TSG) is terminated on a 4ESS Switch with the international announcements. This is used in common channel signaling (Incoming Signaling Characteristics [ISC] is Domestic Common Channel Interoffice Signaling [DOMCCIS] or Integrated Services Digital Network User Part [ISUP]) to control sending backward failure messages on failed international calls. These switches are equipped with the international announcements. The FAR4E field also controls common channel signaling sending network management call preference data in a forward direction (OSC is DOMCCIS or ISUP). Such data must not be sent forward to switches not equipped to handle it. Enter **"N"** if the far end is not a 4ESS Switch or the 4ESS Switch does not have the international announcements. This field should be left **"Blank"** for International Consultative Committee for International Telephone & Telegraph Signaling System 7 [CCITT7] ISUP (INUP) trunks.
DOFP	Disable Outgoing Fraud Prevention – A **"Y"** indicates that Black Box and Blue Box fraud prevention controls are disabled on this Trunk Subgroup (TSG). An entry of **"N"** indicates that fraud prevention controls are enabled on this TSG.
SBRIV	Not Applicable – Entries: **"Blank"**

SDNPLAN	Not Applicable – Entries: **"Blank"**
BFTIS	Backward Failure Treatment Integrated Services Digital Network User Part (ISUP) all the way. This field is used to specify whether an Announcement (ANN) should be played or a Release (REL) message should be sent when a call has gone ISUP all the way. On the Trunk Subgroup (TSG) Forms, this field is only used when signaling is ISUP and the type of trunk is OCC. Valid entries are **"Blank"**, **"ANN"**, or **"REL"**. If left **"Blank"**, this field will default to **"REL"** when it applies. For Office Data Assembler (ODA) Form 406Z, this field is used for designating the action for intra-Local Access Transport Area (LATA) ISUP call failures occurring at the switch. Valid entries are **"Blank"**, **"ANN"**, or **"REL"**. If left **"Blank"**, this field will default to **"REL"**.

BFTNI

Backward Failure Treatment not Integrated Services Digital Network User Part (ISUP) all the way. This field is used to specify whether an Announcement (ANN) should be played or a Release (REL) message should be sent when a call has not gone ISUP all the way.

On the Trunk Subgroup (TSG) Forms, this field is only used when signaling is ISUP and the type of trunk is OCC. Valid entries are **"Blank"**, **"ANN"**, or **"REL"**. If left **"Blank"**, this field will default to **"ANN"** when it applies.

For Office Data Assembler (ODA) Form 406Z, this field is used for designating the action for intra- Local Access Transport Area (LATA) ISUP call failures occurring at the switch when a call has not gone ISUP all the way. Valid entries are **"Blank"**, **"ANN"**, or **"REL"**. If left **"Blank"**, this field will default to **"ANN"**.

SKSP

Not Applicable – Entries: **"Blank"**

PBXNWW

Private Branch Exchange (PBX) No Wait for Wink – An entry of **"Y"** in this field is used to specify that the Trunk Subgroup (TSG) has a PBX which does not wait for a wink from the 4ESS Switch before outpulsing digits. This field is used only for TSGs with a Type of Trunk (TOT) value of PBX and signaling of Dual Tone Multifrequency WINK (DTMFWK). Enter **"Y"** if the PBX does not wait for a wink from the 4ESS Switch. Otherwise, enter **"N"** or leave **"Blank"**.

HYBRD

Not Applicable – Entries: **"Blank"**

CCTT

Not Applicable – Entries: **"Blank"**

INCID

Number of Carrier ID digits to be received – An entry of **"3"** specifies that the Trunk Subgroup (TSG) should expect to receive a 3-digit CID. An entry of **"4"** specifies that the TSG should expect to receive a 4-digit CID. An entry of **"B"** specifies that the TSG should expect to receive a 3- or 4-digit CID.

Form Entries, Continued

CBN	Incoming Trunk Connecting Access Billing Number Option. (4E22R2>) –Valid entries are **"Blank"** – No special Automatic Message Accounting (AMA) recording options (default), **"N"** – Non-Feature Group-D signaled calls, or **"L"** – Local Number Portability (LNP) Non-Feature Group-D signaled calls.
ONCID	Number of Carrier ID digits to send – An entry of **"3"** specifies that the Trunk Subgroup (TSG) send a 3-digit CID. An entry of **"4"** specifies that the TSG send a 4-digit CID. If the TSG is not going to send a CID, leave **"Blank".**
D3DBN	Not Applicable – Entries: **"Blank"**
MULAW	This field is used to identify the type of encoding (A-law/Mu-law) used in the user information layer 1 protocol ID field of the User Service Information (USI) parameter. An entry of **"Y"** in this field along with an outgoing signaling characteristic of International Consultative Committee for International Telephone & Telegraph Signaling System 7 (CCITT7) Integrated Services Digital Network User Part (INUP) will indicate that Mu-law encoding is being used. A entry of **"N"** or leaving the field **"Blank"** will indicate that A-law encoding is being used.
CSCSET	Not Applicable – Entries: **"Blank"**
CID	Carrier ID. This field is populated with the pre-subscription carrier selected by the customer to handle inter-Local Access Transport Area (LATA) calls; and intra-LATA calls when intra-LATA competition is allowed. It is a 4-digit number with a range of **"0000-9999"**, indicating the XXXX digits of the desired carrier. This field is only populated for ISC/OSC=Q.931.

ITCENC

Information Transfer Capability Encoding - (4E21>) – This Trunk Subgroup (TSG) parameter indicates the allowed Information Transfer Capability (ITC) coding in the outgoing Initial Address Message (IAM). The parameter can have values shown below:

- **"Blank"**, **"N"** (use office): encode the outgoing IAM, User Service Information (USI) parameter ITC field, the same as used in the office indicator
- **"Y"** (use opposite of office): encode the outgoing IAM, USI parameter ITC field, with the opposite of what is used in the office indicator

The default is **"use office"**.

OFITR

Not Applicable – Entries: **"Blank"**

SPN

Signal Ported Number: (4E22R2>) – This Trunk Subgroup (TSG) indicator indicates if the destination switch is capable of supporting the Local Number Portability (LNP). If **"Blank"** or **"N"** (the default), the destination switch is considered LNP capable and the Local Routing Number (LRN) will be signaled. If **"Y"**, the destination switch is NOT considered LNP capable and only the Ported Number will be signaled and not the LRN.

CAREA

Control Area - Valid input for this field is a single digit in the range of **"0-9"**. This number identifies the Control Area that is to be associated with this Trunk Subgroup (TSG) for trouble reporting. The number assignable in a given office is limited, however, to the highest control area assigned at Office Data Assembler (ODA) time as defined by the highest Member Number for a test position. This is because of engineered memory allocated for plant measurement purposes. Each Control Area can have a maximum of 10 (0-9) associated Control Positions (CPOS). The Control Area number and the CPOS number combined make up the testboard position number. For example CAREA-2 and CPOS-5 would be testboard position 25. A maximum of 100 (0-99) testboard positions may be installed for a 4ESS Switch location.

Any test position can access every trunk assigned to the 4ESS Switch with the exception of international trunks. International trunks having Incoming Signaling Characteristic (ISC) or Outgoing Signaling Characteristic (OSC) equal to Consultative Committee for International Telephone & Telegraph 5 (CCITT5) must be assigned to a CAREA that is equipped with 51AL6 test positions. The 51AL6 test position can access any trunk assigned to the 4ESS Switch. However, the alarms, Teletype (TTY) printouts, and 101 calls associated with a particular TSG will only be transmitted to the CAREA and CPOS that is specified on the input form for a TSG. A single trouble receiving location could be specified for all TSGs in the office. Trouble tickets might be originated here and distributed to occupied test positions as necessary. Some other typical applications could be to assign the TSGs to testboard positions alphabetically, by direction, by ownership, or by Type of Trunk (TOT).

The only other restraint on assigning a TSG to a particular CAREA and CPOS is that all positions might not have the optional equipment required to satisfactorily test some Trunk Subgroups. The arrangement in a given office depends on the administrative decisions made for that office.

Continued on next page

Form Entries, Continued

CAREA
(cont'd.)

Position 00 (CAREA 0, CPOS 0) has been assigned to the Master Test and Control Channel (MTC) teletype in the Maintenance Operating Center (MOC). This position was established to receive trouble reports for certain non-message type TSGs. Lucent Technologies recommend that positions
01-09 not be assigned in an office at this time. The circuits that should be assigned to test position 00 are:

- ACI*DCHN - D-Channel circuits to the Common Network Interface (CNI) Ring
- CLN*DLPC - Loopback/complement Data Test
- MAS*BIPB - Mass Announcement System (MAS) Barge-in Playback Trunk
- MIS*AART - Auxiliary Audible Ring Trunk
- MIS*TERM - Common Channel Interoffice Signaling (CCIS) Terminals
- SVC*AIN* - Advanced Intelligent Network (AIN)
- SVC*DMRV - Dual-Tone Multifrequency (MF) Receivers (DTMFR)
- VC*DMXM - Dual-Tone Multifrequency Transmitters (DTMFT)
- SVC*MFR* - Multifrequency Receivers
- SVC*MFX* - Multifrequency Transmitters
- SVC*XCVR - CCIS Continuity Check Transceivers
- SVC*XCVT - CCIS Continuity Check Transceiver Test Circuit
- SVC*MFRT - Multifrequency Receiver Test Circuits
- SVC*MFXT - Multifrequency Transmitter Test Circuits
- SVC*SCAN - Service Circuit System Expanded Announcements
- SVC*SCBN - Service Circuit System Expanded Announcements
- SVC*SCNS - Network Services Complex Set S
- TAS*ANN* - Recorded announcements
- TAS*TONE - Tone Circuits
- TAS*MWAT - 1004 hz at 0 dBm
- TAS*MW10 - 1004 hz at 10 dBm

CAREA (cont'd.)

The balance of the non-message type TSG may be assigned to working testboard positions.

For RC Forms 604 and 605, this number identifies the Control Area that is to be associated with this announcement trouble report. The number assignable in a given office is limited, however, to the highest control area assigned at ODA time as defined by the highest Member Number for a test position. This is because of engineered memory allocated for plant measurement purposes. Each Control Area can have a maximum of 10 (0-9) associated Control Positions (CPOS). The Control Area number and the CPOS number combined make up the testboard position number. For example CAREA-2 and CPOS-5 would be testboard position 25. A maximum of 100 (0-99) testboard positions may be installed for a 4ESS Switch location. If
CAREA 0, CPOS 0 is specified, all MAS messages will be sent to the MTC channel in the MOC.

CPOS

Control Position – Enter a number from **"0-9"** to specify the testboard position that is to be associated with the Trunk Subgroup (TSGs) and Control Area (CAREA) for test reporting purposes. This assignment together with the CAREA designation can be used to distribute the maintenance responsibility for Trunk Subgroups. This assignment does not prevent any test position from accessing a particular group of trunks. It is only for reporting purposes.

For RC Forms 604 and 605, enter a number from **"0-9"** to specify the testboard position that is to receive the announcement trouble reports. If CAREA is 0, only CPOS 0 is allowed. When the Message Announcement System (MAS) is administered by the Operations National Administration Center (ONAC), assign the CPOS that has been dedicated for its use.

SINDEX

Access Change Verification Sampling Rate Index value - This field specifies the rate at which calls will be sampled for access charge verification. Legal values are **"Blank"**, **"0"**, **"1"**, **"2"**, **"4"**, **"8"**, **"16"**, **"32"**, **"64". "Blank"** and **"0"** imply no verification recording. Otherwise, one call out of the number entered will be recorded.

Continued on next page

Form Entries, Continued

CODSC

Customer Premise Equipment (CPE) Outgoing Disconnect. An entry of **"Y"** in this field is used to specify (from the 4ESS Switch perspective) that a disconnect will be effected faster than normal when the called customer goes on-hook. This field is used only for TSGs with a type-of-trunk value of Private Branch Exchange (PBX) or Single Trunk Customer (STC) and with signaling other than Q.931. Valid entries are **"Blank"**, **"Y"**, or **"N"**.

(4E21>) - CPE Outgoing Disconnect or Signaling System 7 (SS7) Trunk Subgroup (TSG) Control of Per Channel Inhibit Signaling (PCIS) Bits. An entry of **"Y"** specifies that:

1. From the 4ESS Switch perspective, a disconnect will be effected faster than normal when the called customer goes on-hook. This application of CODSC is only for TSGs with a type-of-trunk value of PBX or STC and with signaling other than Q.931.

   or

2. The TSG is to have its PCIS bits reset to force a steady state AB bit indication. This application of CODSC is for non-AT&T offices where the TSG has type-of-trunk of Other Common Carrier (OCC) and outgoing signaling of Integrated Services Digital Network User Part (ISUP).

Valid entries are **"Blank"**, **"Y"**, or **"N"**.

NEOTR

Enter a **"Y"** for Yes or **"N"** for No to indicate whether or not this office is responsible for the operational (signaling) test on outgoing trunks in this Trunk Subgroup (TSG). If a **"Y"** is entered in this field, then the OTSTT and/or OTMTT field(s) must have an entry other than **"N"**. If an **"N"** is entered in this field, then all test types are optional.

If OTSTT and OTMTT fields are **"N"**, then NEOTR must be **"N"**.

If an office has Near End Operational Test Responsibility but the far end office does not have a test number, an **"N"** should be entered in this field.

If Outgoing Signaling Characteristic (OSC) is equal to Domain Class (DOMCCIS) or Integrated Services Digital Network User Part (ISUP), then NEOTR should be **"N"** since operational tests cannot be made on Domestic Common Channel Signaling (CCS) trunks.

Form Entries, Continued

TRIDX Not Applicable – Entries: **"Blank"**

OTSTT Operational Thru Switch Test Type - Certain offices (No. 5 Crossbar and 1ESS) can function both as a local and a tandem or as a local and toll office. These offices have trunks that can function in both a through switch mode and a terminating mode. As a result, more than one test is required to test both modes of operation. The OTSTT is used to specify an operational (signaling) test for a trunk in the tandem (thru switch) mode. OTSTT is also used to specify the ATME B test for Consultative Committee for International Telephone and Telegraph Signaling System Number 5 (CCITT5) and Consultative Committee for International Telephone and Telegraph Signaling System Number 6 (CCITT6) trunks which have a far end test line capable of running this test. The following codes may be entered in the OTSTT field.

- **ATMB** - Siemens' ATME B test line - This is a signaling test which applies to CCITT5 and CCITT6 trunks only. The test consists of the far end test line returning a clear back/reanswer in response to a forward transfer.
- **CTX2** - Centrex II test - This test is made toward a No. 5 Crossbar office having Phase II Centrex features. CTX2 is similar to the SYNC test.
- **CTX3** - Centrex III - This test is made to a No. 5 Crossbar office having Phase III Centrex features. CTX3 is similar to the SYNC test.
- **SXS** - Step-by-Step - If the far end of this Trunk Subgroup (TSG) is working in to a Step-by-Step office, this test may be specified.
- **SYNC** - Synchronous test - This test is an automatic series of off hook/on hook transitions (flashes) on the M lead. In the 4ESS Switch, the SYNC test is software controlled and no external hardware is needed. A data table is used to specify the pulsing rate for each series of flashes. The test automatically advances from one pulsing rate to another via a timing procedure. In any system, after all of the flashes are complete, the trunk will be left in the quiet termination state.

Continued on next page

Form Entries, Continued

OTSTT (cont'd)

- **T103 -** 103 Test - The 103 Test is similar to the synchronous test in that a series of flashes are sent on the M lead. However, the sequence of pulses is controlled by the ring forward signal, rather than a timed automatic progression. Flashing of a given rate will continue until a ring forward signal is received, or, in 4ESS Switch, until an upper limit of flashes has been sent. At this point, the trunk will be put into the quiet termination state until disconnect.

- **"N" -** Enter **"N"** if no thru switch operational test is to be made on this TSG.

OTSTN

Operational Thru Switch Test Number – If Operational Thru Switch Test Type (OTSTT) is **"N"** for None, leave this item **"Blank"**. If a thru switch test of some type is specified, then a corresponding test number in the range of **"000-9999999"** must also be specified. This number will normally be a 3- or 7-digit test number associated with the test specified in the OTSTT field. Test numbers are derived locally and they may differ for each 4ESS Switch location. If OTSTT is Siemens' ATME B test line **(**ATMB), then OTSTN should specify a 062 for Consultative Committee for International Telephone and Telegraph Signaling System Number 5 (CCITT5) trunks or a 2 for Consultative Committee for International Telephone and Telegraph Signaling System Number 6 (CCITT6) trunks when the far end has an ATME B test line. If the far end has an Siemens' ATME A test line (ATME A), OTSTT equals ATMB and OTSTN should specify 061 for CCITT5 or 1 for CCITT6 trunks.

Continued on next page

Form Entries, Continued

OTMTT Operational Terminating Test Type - If an operational (signaling) test is to be made directly to the far end of this Trunk Subgroup (TSG) terminating mode, enter a code to identify the test.

- **ATMC** - Siemens' ATME C test line - This is a signaling test used with Consultative Committee for International Telephone and Telegraph Signaling System Number 5 (CCITT5) trunks only. The far end returns a busy flash from the test line.
- **CTX2** - Centrex II test - This test is made toward a No. 5 Crossbar office having Phase II Centrex features. This test is similar to the SYNC test.
- C**TX3** - Centrex III - This test is made towards a No. 5 Crossbar office having Phase III Centrex features. This test is similar to the SYNC test.
- **SXS** - Step-by-Step - If the far end of this TSG is working into a Step-by-Step office, this test may be specified.
- **SYNC** - Synchronous test - This test is an automatic series of on hook/off hook transitions (flashes) on the M lead. In the 4ESS Switch, the SYNC test is software controlled and no external hardware is needed. A data table is used to specify the pulsing rate for each series of flashes. The test automatically advances from one pulsing rate to another via a timing procedure. In any system, after all of the series of flashes are complete, the trunk will be left in the quiet termination state.

Continued on next page

Form Entries, Continued

OTMTT (cont'd)

- **T103** - 103 test - The 103 test is similar to the synchronous test in that a series of flashes are sent on the M lead. However, the sequence of pulses is controlled by the ring forward signal, rather than a timed automatic sequence. Flashing of a given rate will continue until a ring forward signal is received, or, in 4ESS Switch, until an upper limit of flashes has been sent. At this point, the trunk will be put into the quiet termination state until the originator disconnects.

- **"N"** - None - Enter an **"N"** if no test is to be made on this TSG.

OTMTN

Operational Terminating Test Number – If OTMTT is **"N"** for None, leave this field **"Blank"**. If a test is specified, then a corresponding test number in the range of "**000-9999999"** must also be specified. This number will normally be a 3- or 7-digit test number associated with the test specified in the OTMTT field. Test numbers are derived locally and they may differ for each 4ESS Switch location. If OTMTT equals Siemens' ATME C test line (ATMC), then OTMTN must specify **"063"**.

Continued on next page

Form Entries, Continued

XTSTT Transmission Thru Switch Test Type – If a transmission test is to be made in the thru switch (tandem) mode for this Trunk Subgroup (TSG), enter a code to identify the type of test.

- **ATMA** - Siemens' ATME A transmission test line - This entry provides access to an ATME A responder. The ATME A test permits automatic transmission loss and noise measurements in both directions for International Consultative Committee for International Telephone & Telegraph Signaling System 5 (CCITT5),CCITT6, International Integrated Services Digital Network User Part (INUP), or CCITT7 Telephone User Part (TUP) trunks.

- **T100** - 100 code test - This test provides a quiet termination (600 ohms). In a 4ESS Switch, the 100 test provides a sequence of 1000 hz, milliwatt tone for 5.5 seconds followed by the quiet termination until disconnect.

- **T102** - 102 code test - The 102 test provides 1000 hz. milliwatt tone. The 4ESS Switch provides cycles of 9-second tone and 1-second quiet termination until disconnect.

- **T105** - 105 code test - This code provides access to an Automatic Trunk Measuring System (ATMS) responder. The 105 test permits automatic transmission loss and noise measurements in both directions.

- **N** - Enter **"N"** if no test is to be made OR if the presubscription carrier is to be populated.

Continued on next page

Form Entries, Continued

XTSTN

Transmission Thru Switch Test Number – Add Presubscription Carrier. If Transmission Thru Switch Test Type (XTSTT)=N and this field is non-**"Blank"**, then the field is populated with the presubscription carrier selected by the customer to handle inter Local Access Transport Area (interLATA) calls; and intraLATA calls when intraLATA competition is allowed. It is a 4-digit number with a range of **"0000-9999"**, indicating the XXXX digits of the desired carrier. The presubscription carrier can only be populated for Incoming/Outgoing Signaling Characteristics (ISC/OSC) of Q931.

If XTSTT does not equal to N, and this field is non-**"Blank"** , then the field is populated with the transmission thru switch test number. If a test is specified, then a corresponding test number in the range of **"000-9999999"** must also be specified. This number will normally be a 3- or 7-digit test number associated with the test specified in the XTSTT field. Test numbers are derived locally and they may differ for each 4ESS Switch location. If XTSTT is Siemens' ATME A transmission test line (ATMA), the XTSTN should be specified as **"061"** for International Consultative Committee for International Telephone & Telegraph Signaling System 5 (CCITT5) trunks or **"1"** for CCITT6, International Integrated Services Digital Network User Part (INUP), or CCITT7 Telephone User Part (TUP) trunks.

Continued on next page

Form Entries, Continued

XTMTT Transmission Terminating Test Type – If a transmission test is to be made directly to the far end of this Trunk Subgroup (TSG) in a terminating mode, enter a code to identify the type of test.

- **T100** - 100 code test - This test provides a quiet termination (600 ohms). In the 4ESS Switch, the 100 code test provides a sequence of 1000 hz. milliwatt tone for 5.5 seconds, followed by quiet termination until disconnect.
- **T102** - 102 code test - The 102 test provides 1000 hz. milliwatt tone. The 4ESS Switch provides cycles of 9-second tone and 1-second quiet termination until disconnect.
- **T105** - 105 code test - This code provides access to a Automatic Trunk Measuring System (ATMS) responder. The 105 test permits automatic transmission loss and noise measurements in both directions.
- If no test is to be made, enter **"N"** for None.

XTMTN Transmission Terminating Test Number – If Transmission Terminating Test Type (XTMTT) is **"N"** for None, leave this field **"Blank"** . If a test is specified, then a corresponding test number in the range of **"000-9999999"** must also be specified. This number will normally be a 3- or 7-digit test number associated with the test specified in the XTMTT field. Test numbers are derived locally and they may differ for each 4ESS Switch location.

Form Entries, Continued

S1-10

These fields are reserved for future use in order to be able to implement new capabilities in a more timely fashion. When a new capability is requested for Generic Programs currently deployed in the field, one of these spare fields will be designated for use in implementing that capability.

S1 - Valid entries are **"Blank"**, or **"0-7"**.
S2-10 - Valid entries are **"Blank"**, **"Y"**, or **"N"**.

- S2 - (4E18/4E19/4E20) - An entry of **"Y"** in this field identifies Signaling System 7 (SS7) trunks which have their Per Channel Inhibit Signaling (PCIS) bits reset to force a steady state AB bit indication. Otherwise, enter **"N"** or leave **"Blank"**. In 4E21, the CODSC field will replace the use of S2 for this purpose.

- S2 - (4E21R4) This Trunk Subgroup (TSG) parameter allows TSG circuits to trigger the Advanced Intelligent Network (AIN) processing. The parameter can have the following values: **"Blank"**, **"N"** for no access allowed, and **"Y"** for access allowed. The default is **"N"**.

- S5 - Unassigned - Reserved for future use.

- S6 (4E18/19/20) - this Trunk Subgroup (TSG) parameter indicates the allowed Information Transfer Capability (ITC) coding in the outgoing Initial Address Message (IAM). The parameter can have the following values: **"Blank"**, **"N"** (use office) to encode the outgoing IAM, User Service Information (USI) parameter ITC field, the same as used in the office indicator, and **"Y"** (use opposite of office) to encode the outgoing IAM, USI parameter ITC field, with the opposite of what is used in the office indicator. The default is "use office".

NOTE: An entry of "0-7" in the S1 field or a "Y" in any of the fields S2 thru S10 without knowledge of the capability to which the field has been assigned may result in undesirable switch behavior.

RC Form 101

General

Recent Change (RC) Form 101 establishes the translations for a new one-way incoming Trunk Subgroup (TSG). This message is classed as a Recent Change Data Message (RCDM).

An alphabetical keyword list is included in this section, starting on page 44.

Form Entries

RC:TSG;NEW;OPT(IN1WAY),---:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

ORNU Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

Form Entries, Continued

TSG

Trunk Subgroup - This series of codes identifies a Trunk Subgroup. The TSG is a set of trunks within a Trunk Group having certain identical characteristics. A Trunk Group must have a common destination. In addition to group characteristics, a TSG also has common signaling characteristics, transmission delay, originating Numbering Plan Area (NPA), domain, traffic separation index and screening classes. The Trunk Group and TSG are identified by a series of codes that specify the near and far ends of the trunk. In most cases, the full near end definition is not required because it will always be the same. The Trunk Group designation is comprised of the town, state, building and building subdivision for the far end plus the near end building subdivision. A TSG is uniquely identified by adding a Base Traffic Number reference. Trunk Group and TSG definitions are available in the 4ESS Switch as abbreviated Circuit Identification Names (CINs). Common Language Location Identification (CLLI) codes must be entered in the fields that make up the Trunk Group definition. Rules for establishing these codes are covered in Lucent Technologies Practices 795-100-100. The code for any established office may be found by referring to the location code index in that same Lucent Technologies Practices. For non-message TSGs, the format does not include mnemonics for identifying the far end of the trunk. The TSG will mnemonically identify the type of trunk category by function. Asterisks are used in columns where no information is necessary. The following paragraphs describe the individual fields within a TSG definition.

Continued on next page

Form Entries, Continued

TSG (cont'd)

- **BTFN** - Base Traffic Number - The BTFN is a number in the range of **"0-9976"** that is part of the TSGs designation (which consists of the BTFN, TOWN, ST, BL, FBS, and NBS). The BTFN is the first traffic number in the first block of traffic numbers that is assigned to a TSG. Additional traffic numbers, which are assigned in blocks of 24, either higher or lower in numerical value than the BTFN can be assigned to the TSG, but the BTFN remains as defined above. All non-message trunks have a BTFN of **"0000"**. For RC 104, the BTFN is stored as the starting point for a block of traffic numbers that range up to the limit originally defined on RC Forms 100, 101 and 102 when the TSG was first built. Other blocks of traffic numbers, either higher or lower in numerical value, may be assigned to this TSG, via Recent Change (RC) procedures. In this case the original BTFN would still apply, but the QTFN field would contain the number of new traffic numbers to be assigned following the First Traffic Number (FTFN) specified.

- **TOWN** - Town is a 4-character alphabetic field - The code must represent the bona fide town, city or location per Lucent Technologies Practices 795-100-100 for the far end of the TSG.

- **ST** - State - This field represents the state, province or foreign country in which the far end office is located. The code in ST must be a standard 2-character alphabetic combination. Valid standard abbreviations for states, Canadian provinces and foreign countries may be found in Lucent Technologies Practices 795-100-100.

- **BL** - Building - The BL field contains the office identity for the far end of a TSG. This code consists of either two alphabetic characters or two numeric characters. Independent Telephone Company locations are always designated by an **"X"** plus some alpha character in this field. If the TSG terminates in a customer's building and it is not necessary to identify that particular building, this code may be arbitrary.

Continued on next page

Form Entries, Continued

TSG (cont'd)

- **FBS** - Far Building Subdivision - This field contains a code that identifies the internal building subdivision for the far end of a TSG. The code is a traffic, plant, or administrative assignment. It must be a 3-character alphanumeric combination. For non-message TSGs, this field is not required. Three asterisks are pre-printed on the form to provide an entry for this field.

- **NBS** - Near Building Subdivision - The NBS designation is the internal building identity for the near end termination of a TSG. It is always a 3-character alphanumeric code. This field should be left **"Blank"** if the NBS for this TSG is the same as the NBS assigned in the near office Circuit Identification Number (CIN) for the 4ESS Switch. The Office Data Assembler (ODA) system will add the NBS on a default basis.

Form Entries, Continued

PCF

Point Code Format - This field is used to specify the format of the point code that is being entered in the point code field. If no entry is being made in the Destination Point Code (DPC) (Originating Point Code [OPC]) field, then this field must be left **"Blank"**. Three different formats are available for input: **ATT, ANSI,** or **ISPC**.

ATT is used for AT&T standard input/output which consists of a three digit network indicator, a two digit cluster region, a one digit cluster type, and a three digit cluster member.

1. **NET**: Network Indicator - This value specifies which signaling network will be used for transport. Valid entries are **"000-255"**.

2. **CR**: Cluster Region - This value specifies the region of the signaling network where the office is located. Valid entries are **"00-31"**.

3. **CT**: Cluster Type - Valid entries are **"0-7"**.

4. **MEM**: - Cluster Member - This value specifies the office member number within the cluster. Valid entries are **"000-255"**.

ANSI is used to indicate that the input/output is in the American National Standards Institute format which consists of a three digit network indicator, a three digit cluster, and a three digit member number.

1. **NET**: Network Indicator - This value specifies which signaling network will be used for transport. Valid entries are **"000-255"**.

2. **CLU**: Cluster - This value specifies the cluster of the signaling network where the office is located. Valid entries are **"000-255"**.

3. **MEM**: Member Number - This value specifies the office member number within the cluster. Valid entries are **"000-255"**.

Continued on next page

Form Entries, Continued

PCF (cont'd)

ISPC is used for international signaling point code input/output which consists of a one digit world geographical zone, a three digit area/network identifier, and a one digit signaling point identifier. Reference: International Consultative Committee for International Telephone & Telegraph Signaling System (CCITT) Recommendation "Numbering of International Signaling Point Codes", Vol. VI, Rec. Q.708.

1. **WGZ**: World Geographical Zone - This value specifies the world geographical zone of the office. Valid entries are "**1-7**".

2. **ANI**: Area/Network Identification - This value specifies a geographical area or network in a specific zone. Valid entries are **"000-255"**.

3. **SPID**: Signaling Point Identification - This value specifies a signaling point in a specific geographical area or network. Valid entries are **"0-7"**.

AOPC

Alias Origination Point Code - This field will provide a unique combination of a Local Exchange Carrier (LEC) Signal Transfer Point (STP) Point Code (PC) and an AT&T STP PC for each Local Access Transport Area (LATA) dedicated D-link set via a logical point code. AOPC, if entered, must be entered in the ATT format. See the Point Code Format (PCF) field for the format description. AOPC may only be entered when the PCF field is not **"Blank"**.

Continued on next page

Form Entries, Continued

DPC

Destination Point Code - This field is used to specify the Destination Point Code of the far-end switch.

This field entry is divided into three subfield entries:

1. NET - Network Indicator - This value specifies which signaling network will be used for transport. Valid entries are **"Blank"**, **"000-255"**.

2. CLU - Cluster - This value specifies the cluster of the signaling network where the office is located. Valid entries are **"Blank"**, **"000-255"**.

3. MEM - Cluster Member - This value specifies the office member number within the cluster. Valid entries are **"Blank"**, **"000-255"**.

For the Trunk Subgroup (TSG) forms, nine digits must be entered, depending on the format specified in the Point Code Format (PCF) field. Nine digits must be entered if PCF is American National Standards Institute (ANSI) format. An entry must be made in this field if either the Incoming Signaling Characteristics (ISC) or Outgoing Signaling Characteristics (OSC) field value is **"ISUP"**, **"INUP"**, or **"TUP"**; otherwise this field must be **"Blank"**.

Continued on next page

Form Entries, Continued

FENCLASS This field specifies the classification of the Far End Network (FEN). If the Trunk Subgroup (TSG) is not associated with any FEN, this field is left **"Blank"**. The FEN with which the TSG is to be associated must be described via 4ESS Switch RC 617.

For RC 524, this field identifies the class for accumulating counts.

The following classifications are available:

- **ACCESA** - This identifier specifies that the TSG is a link to an Inter-exchange Carrier (IC) or International Carrier (INC), and the 4ESS Switch is being used by a Local Exchange Carrier (LEC) as an Access Tandem (AT) and/or Service Switching Point (SSP) to switch calls from this TSG.

- **CAMA** - This identifier specifies that the TSG is terminated on an office which delivers traffic on Centralized Automatic Message Accounting (CAMA) trunks.

- **CMC** - Cellular Mobile Carrier - This identifier specifies that the FEN is a CMC. The TSG connects an Access Tandem (AT) and a CMC.

- **OWATS** - This identifier specifies that the TSG is a link to a Private Branch Exchange (PBX) over which only Outward Wide Band Area Telephone Service (WATS) calls are allowed.

- **OEO** - Other End Office connecting, meaning an Equal Access End Office (EAEO) owned by a different company. This identifier specifies that the FEN is an OEO. The TSG connects an Access Tandem (AT) and an OEO.

- **PBX** - This identifier specifies that the TSG is a link to a PBX.

- **POTS** - This identifier specifies that the TSG is a link to a switching machine serving either a Local Access Transport Area (LATA) of the Local Exchange Carrier (LEC) owning/sharing the 4ESS Switch, the Continental United States/Plain Old Telephone Service (POTS) (CUSP) network of the IEC owning/sharing the 4ESS Switch, or some other FEN to be treated similarly.

Continued on next page

Form Entries, Continued

FENID

Far End Network (FEN) Identification - This field distinguishes the specific FEN with which this Trunk Subgroup (TSG) is associated. One to six alphanumeric characters may be entered to distinguish among several FENs with the same classification, or the field may be left **"Blank"**. If FENCLASS is **"Blank"**, FENID must also be **"Blank"**.

When the FENCLASS is ACCESA or ACCESI, FENID should consist of type of feature group access and the 4 numeric digits of the Carrier Identification Code (CIC).

The type of feature group definitions are:

- **G** - All access types (B, C, & D).
- **B** - Feature Group B Access.
- **C** - Feature Group C Access.
- **D** - Feature Group D Access.

Examples include:

- **G0288** - Carrier ID 288 has Feature Group B, C, & D access.
- **BC0288** - Carrier ID 288 has Feature Group B & C access.
- **BD0288** - Carrier ID 288 has Feature Group B & D access.
- **B2882** - Carrier ID 2882 has Feature Group B access only.
- **D2882** - Carrier ID 2882 has Feature Group D access only.

For an access type, both B2882 and D2882 can exist but be for different carriers.

Continued on next page

Form Entries, Continued

TFG

Type of Feature Group - This field is used to specify whether the Type of Access for this Trunk Subgroup (TSG) is tariffed under Feature Group B, Feature Group C, or Feature Group D. An entry can only be made if the FENCLASS is ACCESA. If FENCLASS is ACCESA, a **"B"**, **"C"**, or **"D"** must be entered, corresponding to Feature Groups B, C, or D, respectively. FENCLASS is not ACCESA, this field must be left **"Blank"**.

TSGBBC

Trunk Subgroup (TSG) Broadband Capability - Integrated Services Digital Network User Part (ISUP), International ISUP (INUP), and Q.931 signaling systems allow for broadband switching. This entry specifies what type of circuits may be populated in this TSG. Valid entries are:

- **Blank** - 1 trunk circuit
- **0** - 1 trunk circuit
- **1** - 6 trunk circuits
- **2** - 24 trunk circuits
- **3** - Combined usage 1 and 6 trunk circuits
- **4** - Combined usage 1 and 24 trunk circuits
- **5** - Combined usage 6 and 24 trunk circuits
- **6** - Combined usage 1, 6, and 24 trunk circuits.

Continued on next page

Form Entries, Continued

QTFN

Quantity of Traffic Numbers - This field specifies the size of the block of traffic numbers to be reserved with this input form beginning with the Base Traffic Number (BTFN) for this Trunk Subgroup (TSG). Traffic numbers must be allocated in groups of 24. Enter a multiple of 24 in the range of **"24 -504"**. If more than 504 traffic numbers are required for a given TSG, additional blocks of 24 may be added using RC Form 104. The total quantity of reserved traffic numbers should be equal to or greater than (to the nearest 24) the maximum size projected for this TSG during the engineering interval. This total should not include other blocks of traffic numbers that may be assigned separately with RC Form 104.

The maximum number of trunks that can be assigned to one TSG is 1023. If a TSG requires more than 1023 trunks and consequently more than 1023 traffic numbers, it must be split into two TSGs. The breakpoint must be a multiple of 24 and less than 1023 which makes 1008 trunks the logical maximum for one TSG. If for example, 1300 trunks were required between point A and point B, two TSGs should be built. The first TSG would contain 1008 trunks, and the second TSG would contain 292 trunks. The two TSGs would be linked in the Routing Data Block (RDB).

The 4ESS Switch feature, Inward Wide Band Area Telephone Service (INWATS) terminating directly to a customer's Automatic Call Distributor, has a limitation of 1023 TSGs totaling 24552 trunks (1023 trunk blocks of 24 registers).

For Voice Frequency Link (VFL) TSGs, if the traffic numbers for the VFLs are separated by 100, e.g., 801 IPLS IN 01 MSP and 901 IPLS IN 01 MSP, the QTFN must be 24 for building new TSGs. Then build the second set of 24 traffic numbers using RC Form 104.

Continued on next page

Form Entries, Continued

TOT

Type of Trunk - This field specifies the trunk type for this Trunk Subgroup (TSG). TOT entries of **"ETC"** for End Office or Tandem Connecting, **"LCC"** for Local Exchange Carrier Connecting, and **"OCC"** for Other Carrier Connecting are used for network interconnect. When these TOT values are used on Integrated Services Digital Network User Part (ISUP)
trunks, the Local Exchange Carrier (LEC) (Bellcore TR-317) and/or network interconnect version (TR-394) of the ISUP protocol is used. For all other allowed TOT values, the AT&T version of the ISUP protocol is used. The codes that may be entered are as follows:

- **CAMAA** – Centralized Automatic Message Accounting with Automatic Number Identification (ANI).
- **CAMAO** – Centralized Automatic Message Accounting with Operator Number Identification (ONI).
- **ETC** - End Office or Tandem Office Connecting - This Type of Trunk (TOT) is used to identify Equal Access (EA) or Intra Local Access Transport Area (IntraLATA) trunks at a switch serving as an Access Tandem (AT) or Service Switching Point (SSP) where the other end connects to an End Office. This TOT is also used to identify EA trunks between ATs or between an AT and a switch serving as an SSP. When the type of trunk is ETC, the signaling characteristic of the Trunk Subgroup (TSG) must be either Multifrequency Wink (MFWINK) or ISUP.
- **INTL** - International - International circuit with the far end outside of World Zone 1, and having signaling characteristics of International Consultative Committee for International Telephone & Telegraph Signaling System 5 (CCITT5), CCITT6, International ISUP (INUP), and CCITT7 Telephone User Part (TUP).
- **INTLO** - International Overflow - International Overflow circuit (for overflow transit traffic) with the far end inside World Zone 1 in another International Switching Center (either the U.S. or foreign).
- **ITAND** - Inter Tandem - This TOT can be used to handle traffic between two tandem switchers in the same local calling area.

Continued on next page

Form Entries, Continued

TOT (cont'd)

- **ITOLL** - Intertoll - Intertoll trunks will carry toll traffic between class 4 or higher offices, or trunks dedicated to Inter-International Switching Center (inter-ISC) international overflow traffic. This includes final, full and high usage TSGs.
- **ITOP** - International Operator - International Operator tandem trunk from a No. 5 switchboard.
- **ITOPA** - International Operator Trunk A – International Operator Center 3C/3CL switchboards associated with Operator Bridged Access Trunks (OBAT). Each OBAT has two appearances on the A trunk and B trunk.
- **ITOPB** - International Operator OBAT B Trunk - Operator bridged access Trunk B from 3C/3CL switchboard.
- **LCC** - Local exchange Carrier Connecting - This TOT is used to identify EA trunks at an AT&T switch This identifier is also used for outgoing ISUP trunks from the Interexchange Carrier/International Exchange Carrier (IC/INC) to an SSP office. When the type of trunk is LCC, the signaling characteristic of the TSG must be either MFWINK or ISUP and the Equal Access Signaling (EAS) field must be marked as either "**E**", "**A**", "**D**" or "**R**".
- **MISC** - Miscellaneous - This designation is used for operator (except for inward, leave word or 2-way operator trunks), service circuit, and other miscellaneous TSGs.
- **NSDSD** - Network Services Frame Direct Services Dialing Capability - This identifier indicates trunks in this TSG are used to interface the Network Services Frame (NSF) for Direct Services Dialing Capability (DSDC) features. This TSG may only have two way Common Channel Interoffice Signaling (CCIS) characteristics. This TSG is not hunted via normal routing mechanisms, so there can be only one TSG bearing this TOT designation (all trunks connecting a 4ESS Switch to its DSDC equipped NSF must be in the same TSG).

Continued on next page

Form Entries, Continued

TOT (cont'd)

- **OCC** - Other Carrier Connecting - This TOT is used to identify EA trunks at a switch serving as an AT or SSP where the other end connects to an IC or INC switch. This type of trunk should be used when the signaling on the TSG is MFWINK or ISUP.

- **PBX** - Private Branch Exchange - This identifier indicates that the trunks in this TSG terminate on a PBX unit. If the PBX interface is via a 2-wire PBX Channel Unit (J98726ST), then the Incoming Signaling Characteristics (ISC) should be Dial Pulse Immediate (DPIMMED) and the Outgoing Signaling Characteristics (OSC) should be Dial Pulse Wink (DPWINK).

- **SECIT** - Secondary Intertoll - These trunks interconnect toll switching machines and manually operated toll or assistance switchboards for routing of operator completed traffic.

- **STC** - Single Trunk Customer - This TOT is used to designate a TSG for single trunk terminations not supported by a PBX. When TOT is STC, the following TSG fields must be **"Blank"** or **"N"** as allowed: ANISID, APS, BRL, CCIS2WRE, DNHR, DPC, EAS, FAR4E, PBXAW, PBXESGD, REV, RFA, RFMP, SAT, SINDEX, TFG, TSGBBC, WANISID, XCPA.

- **TAND** - Tandem - This code is used for 2-way tandem, tandem completing and tandem connecting TSGs.

- **TOLLC** - Toll Connecting or Completing - This code is used for Direct Distance Dialing (DDD) access, toll connecting or toll completing TSGs.

- **TSPS** - Traffic Service Position System - Enter this designation for TSGs associated with TSPS.

Continued on next page

Form Entries, Continued

SAT

Satellite - Enter a **"Y"** for Yes or **"N"** for No to indicate whether or not this Trunk Subgroup (TSG) is associated with satellite facilities. This entry performs a screening function to avoid two satellite TSGs from being connected together to complete a call. If the incoming TSG has SAT = "Y", then call processing will insist the outgoing TSG must have SAT = "N". This can also be used for local screening functions even though the TSG is not via a satellite.

For Voice Frequency Link (VFL) TSGs, satellite facilities cannot be used for a domestic Common Channel Interoffice Signaling (CCIS) system, i.e. if DOM is Plain Old Telephone Service (POTS), then SAT must be **"N"**.

Continued on next page

Form Entries, Continued

DOM

DOMAIN - This field designates a community of interest that requires separate routing. The types of Domain are "Direct Distance Dialing (DDD), International Direct Distance Dialing (IDDD), Verify (VRFY)" and a number ranging from **"20-83"** denoting a NON-Plain Old Telephone Service (POTS) domain. DDD is indicated by an entry of **"POTS"** in the DOM field. The Office Data Assembler (ODA) system will automatically build the DDD Domains (0 through 19). The **"VRFY"** Domain enables the Line-Busy Verification feature by operators over a dedicated network. When DOM equals VRFY, then Type of Trunk (TOT) must be ITOLL, MISC, or TSPS or CALLTYP must equal FHT, GNS, or TST. The NON-POTS Domains may be a Common Control Switching Arrangement (CCSA) Network, such as Federal Telecommunications System (FTS). These domains are entered as a number from **"20-69"**.

- The **NON-POTS domain of 78** is used to skip Network Management code controls for quality assurance testing, i.e. CASPER.
- The **NON-POTS domains 79 and 80** are reserved for specific International Switching Center (ISC) use.
- The **NON-POTS domain of 81**, also denoted by **"IVT"** for International Voice Transport, is reserved for call processing to transport international voice calls through the network to an ISC.
- The **NON-POTS domain of 82** is used as the translation domain for Data calls. The Data feature provides the capability for full rate data transmission via the 4ESS Switch over a dedicated network of digital trunks. These digital trunks terminate exclusively on Digital Interface Frames (DIF) at 4ESS Switch locations.
- **N64C** -This domain is used to route 64 kbps clear data calls using the 10-digit North American Numbering Plan (NANP).
- **N64R** -This domain is used to route 64 kbps restricted data calls using the 10-digit North American Numbering Plan.
- **I64C** -This transport domain is used to route 64 kbps clear international data calls up to an ISC.
- **I56D** -This transport domain is used to route 56 kbps international data calls up to an ISC.

Continued on next page

Form Entries, Continued

DOM (cont'd)

- **APN** - Action Point Numbering Plan - This domain is used as an access domain for originating Direct Connect voice or data calls. The calls arrive at the 4ESS Switch as 10-digit calls. When DOM equals APN, then TOT must be PBX or STC for TSG forms.

NOTE: For Voice Frequency Link (VFL) TSGs, this field identifies the domain in which this TSG operates. Valid inputs are "POTS" (if VFL is associated with a domestic Common Channel Interoffice Signaling [CCIS] system).

IT

Intertoll Treatment - This field is used when the domain of the Trunk Subgroup (TSG) is Plain Old Telephone Service (POTS) and the type of trunk is either End Office or Tandem Connecting (ETC) or Other Carrier Connecting (OCC) to specify whether the TSG should receive intertoll treatment (IT="**Y**") or toll connect treatment (IT=**"N"**) or **"Blank"**. Intertoll treatment means that the call is routed in the POTS intertoll domain, that is, a normal 7-digit call will be terminated in the home Numbering Plan Area (NPA).

((4E22>) - Offices using Traditional routing only). Toll connect treatment means that the call is terminated in the NPA specified by the Far End Numbering Plan Area (FENPA) field.

This field should be set to "**Y**" in any FENPA that is not the Home NPA

((4E22>) - Offices using Traditional routing only) or a Served NPA. This field can also be set to "**Y**" in the Home NPAs

((4E22>) - Offices using Traditional routing only) or Served NPAs to force the POTS-IT domain.

FAI

Not Applicable - Entries: **"Blank"**

Continued on next page

Form Entries, Continued

FENPA

Far End Numbering Plan Area/Trunk Subgroup (TSG) - Enter a 3-digit Numbering Plan Area (NPA) code to identify the far end of the subgroup. Valid entries range from **"200-999"**. With an International Trunk Subgroup, if the far end of the Trunk Subgroup is outside World Zone 1, enter the 1-, 2-, or 3-digit country code. Valid ranges of Country Code entries are **"2-9"**, **"20-99"**, and **"200-999"**.

This field is the NPA of the Far-End Office. If this office is not in the Home or Served area, then the Domain will be Plain Old Telephone Service-Intertoll/Intertandem (POTS-IT) and the IT field will be forced to **"Y"** in a Local Exchange Carrier (LEC) switch.

FEOFC

Far-End Office Code - This field is used to identify the office code of the far end switch. Typically this value will range from 200-999. Legal entries are: **"Blank"**, **000-999**.

FELATA

Far End Local Access Transport Area/Trunk Subgroup - This field is used to identify the Local Access Transport Area (LATA) of the far end switch. Legal entries are: **"Blank"**," **000-999"**.

FESC6

Far-End 6-Digit Screening - A **"Y"** for Yes or **"N"** for No indicates whether or not the far-end office which outpulsed the incoming digits is doing 6-digit screening. An **"N"** should be entered in this field if it cannot be determined whether or not the far-end is doing 6-digit screening.

If this field is equal to yes, then vacant code analysis assumes the far-end office will never outpulse a vacant central office code (NXX), vacant Numbering Plan Area (NPA) code, an originating Inward Wide Band Area Telephone Service (INWATS) call which has been denied originating capabilities, or an incorrect number of digits on this Trunk Subgroup (TSG).

Continued on next page

Form Entries, Continued

IWZ1 International World Zone 1 - Enter **"Y"** if this Trunk Subgroup (TSG) will carry international traffic within World Zone 1. Enter **"N"** or leave **"Blank"** if this TSG will not carry international traffic within World one 1. Valid entries are **"Blank"**, **"N"**, or "**Y**".

MEM Memory - This field is used to indicate if trunk hunt with memory is to be performed on this Trunk Subgroup (TSG) when searching for an idle trunk. Trunk hunt with memory is not performed on a TSG if the TSGBBC field is greater than zero (the MEM field should be set to **"N"** in this case). Enter **"N"** if trunk hunt with memory is not to be done. Enter **"Y"** or leave **"Blank"** if trunk hunt with memory is to be done.

PSES Prohibit Service Evaluation - An entry of **"N"** for No specifies that this Trunk Subgroup (TSG) is eligible for service evaluation by the No. 2 Service Evaluation System. An entry of **"Y"** for Yes specifies that the TSG is not eligible for service evaluation. Valid entries are **"Blank"**, **"Y"**, or **"N"**. Blank defaults to "**N**".

INSEP Incoming Traffic Separation Class - Enter a number in the range of **"0-255"** to indicate a traffic class for measurement purposes. This code will be used with the outgoing destination (Destination Separation [DESEP] on code group forms) to determine the peg and usage counts for traffic flow identification. Test position and test call Trunk Subgroups (TSGs) are generically assigned to Incoming Separation Class (INSEP) 31. This should be considered before assigning any other TSG to INSEP 31. Also, since service circuits, other non-message circuits, and 1-way outgoing TSGs have a generically assigned INSEP of zero, they will appear as part of TSG listings for INSEP zero. This fact should be considered before assigning any other Trunk Subgroup to INSEP zero.

Continued on next page

Form Entries, Continued

MTSC Multiple Treatment Screening Class - This field is used to assign an MTSC to this Trunk Subgroup (TSG). Multiple treatment screening may be used to separate routing treatments for TSGs in the same domain. An example is giving independent company trunks a different routing even though the received digits and domain are the same as some other TSG. All TSGs must have an MTSC in the range of **"0-63"**.

GNSC Go/No Go Screening Class - Go/No Go Screening may be used to block traffic dialing specific digits over a Trunk Subgroup (TSG). All incoming and two-way message TSGs are given a Go/No Go class in the range of **"0-3**". When this type of screening is required for a group of codes, those codes are correlated with a specific class and a "Go" or "No Go" condition (RC Forms 300-304). If a group of codes specify "Go" on a given class, those codes will be blocked on TSGs having a class other than the specified class. For a "No Go" correlation, a set of codes will not be blocked except on TSGs having the specified class. All blocked traffic is given the vacant code Final Handling Treatment (FHT).

GEOSEP Geographical Traffic Separation Class - Valid entries for this field are one or two digits in the range of "**0-31**" to indicate a traffic class for measurement purposes. This code is used with the Announcement Separation Class to score geographical survey counts in Mass Announcement System (MAS) offices.

Continued on next page

Form Entries, Continued

ISC

Incoming Signaling Characteristics - Enter one of the following codes to specify the incoming signaling characteristics required for this Trunk Subgroup (TSG).

- **DPDDSD** - Dial Pulse with Delay Dial/Start Dial.
- **DPIMADG** - Dial Pulse with Immediate start and "A" Digit reconstruction.
- **DPIMMED** - Dial Pulse with Immediate start (no delay).
- **DPIMPSW** - Dial Pulse Immediate Start Permanent Signal Wink Off.
- **DTMFWK** - Dual-Tone Multifrequency (DTMF) with Wink Start.
- **DTS** - Dial-Tone Start.
- **ISUP** - CCITT7 Integrated Services Digital Network (ISDN) User Part.
- **MFDDSD** - MF with Delay Dial/Start Dial.
- **MFOPWK** - MF Operator trunk with Wink start - International operator trunks.
- **MFWINK** - MF with Wink start.
- **TOLLMFD** - Toll operator MF Delay dial.
- **TSPSMFD** - Traffic Service Position System with MF Delay dial.
- **TSPSMFW** - Traffic Service Position System with MF Wink start.

Continued on next page

Form Entries, Continued

RFA

Ring Forward Allowed - Enter a **"Y"** for Yes or **"N"** for No to indicate if ring forward is allowed. All intertoll (ITOLL) trunks (Type of Trunk [TOT] field is equal to ITOLL) will require the RFA feature. All trunks that have the possibility of receiving operator calls from lower class offices will also require this feature. Each 4ESS Switch office must determine which Trunk Subgroups (TSGs) may receive operator type calls. These TSGs must have the RFA feature assigned.

ADIG

"A" Digit - Reconstruction will be necessary when receiving digits from a machine that absorbs the first digit of a dialed address. Valid entries are **"0"** or **"2-9"** if International Switching Center (ISC) equals DPIMADG. This field is **"Blank"** for all other cases.

CCIS2WRE

Common Channel Interoffice Signaling (CCIS) 2-Wire - This field should be **"Blank"** for a non-Common Channel Signaling (CCS) Trunk Subgroup (TSG). If this is a CCIS or Integrated Services Digital Network User Part (ISUP) TSG, then it must be determined whether the far end office will terminate the trunks in this TSG on a 2-wire or 4-wire switching network in order to perform the continuity check test on CCIS or ISUP trunks. The CCS continuity check tests will be performed by using the transceiver in either a transceive mode for 4-wire CCS trunks or in a transpond mode for 2-wire CCS trunks. Enter a **"Y"** for Yes if the far end office has a 2-wire network, e.g., 1 ESS/1A ESS 2-wire. Enter an **"N"** for No if the far end office has a 4-wire network, e.g., 1 ESS/1A ESS HILO, 4ESS, 5ESS®, etc.

Continued on next page

Form Entries, Continued

CBNPR

Calling Party Number/Billing Number Default Presentation Restriction Indicator - This field indicates whether the received CPN/BN can be passed from the network at the egress point or not. Enter **"Y"** if the default condition for the presentation of CPN/BN should be to restrict it. Enter **"N"** or leave **"Blank"** if the default condition for the presentation of CPN/BN should be unrestricted. This field applies to incoming trunks for which CPN/BN is pre-stored or on which CPN/BN can be received. For Integrated Services Digital Network User Part (ISUP) Trunk Subgroups (TSGs) with Type of Trunk (TOT) or Local Exchange Carrier Connecting (LCC), this field should be populated with a **"Y"**.

For 4E17 and later generics: Enter **"PA"** or **"Blank"** if the default condition for the presentation of CPN/BN should be unrestricted. Enter **"PR"** if the default condition for the presentation of CPN/BN should be to restrict it.

BN

Billing Number/Trunk Subgroup- This field is used to specify a BN associated with the TSG. It may be left **"Blank"**, or a **"3-"**, **"4-"**, or **"10-digit"** number may be entered. If FENCLASS is ACCESA or ACCESI, BN must be a 4-digit number (4-digit number if Type of Feature Group [TFG] is "B") equal to the (X)XXX corresponding to the inter-Local Area Transport Access (LATA) or International Carrier at the far end of the TSG. If FENCLASS is CMC, OWATS, or PBX, BN must be a 10-digit number. If the Automatic Call Distributor (ACD) field is **"Y"**, then BN must be a 10-digit number specifying the billing number of the INWATS ACD customer. If the ACD field is **"T"**, then BN must be **"199"**.

Continued on next page

Form Entries, Continued

BRL	Billing Record Length - This field is used to specify whether long or short Automatic Message Accounting (AMA) records should be created for calls on this Trunk Subgroup (TSG). An "**S**" should be entered if Short AMA records are required or an "**L**" should be entered if Long AMA records are required. If "**L**" is entered, both answered and unanswered calls are recorded. If "**S**" is entered, only answered calls are recorded. If this field is left "**Blank**", short AMA records will be made (if necessary). **NOTE: There is only one record length for Private Branch Exchange (PBX) calls, so this field should be used to indicate whether both answered and unanswered.**
ITC	Incoming Trunk Class - This value identifies the incoming trunk as belonging to one of four incoming classes. The ITC is used in conjunction with Local Exchange Carrier (LEC) Service Switching Point (SSP) call routing instructions to identify which Number Services Data Block (NDB) will be selected for picking a trunk to an Interexchange Carrier/International Carrier (IC/INC). The use of this field is similar to that of Multiple Treatment Screening (MTS) but is associated with the BOC SSP feature. Legal entries are "**Blank**" or "**0**-**3**".
GSDN.tsg	Not Applicable - Entries: "**Blank**"
GSDNPHSE	Not Applicable - Entries: "**Blank**"

Continued on next page

Form Entries, Continued

EAS

Equal Access Signaling - This field is used to specify if Equal Access Signaling (EAS) will be received on this Trunk Subgroup (TSG), and if so, whether Automatic Number Identification (ANI) is expected for the EAS calls. Note that this field only applies to an Inter-Local Access Transport Area (LATA) Carrier switch receiving EAS or an office with the Service Switching Point (SSP) feature receiving EAS. This field must be set to **"N"** for None if EAS is not received on the TSG. If EAS can be received on the TSG, but ANI is not expected for the EAS calls, then an **"E"** must be entered. If EAS can be received on the TSG, and ANI is expected on the EAS calls, then an **"A"** must be entered.

Entries of **"D"** and **"R"** in the EAS field are used to designate Feature Group D (FGD) only. If only FGD is received on the TSG, but ANI is not expected, then a **"D"** must be entered. If only FGD is received on the TSG, and ANI is expected, then a **"R"** must be entered.

This field only applies to an Inter-LATA Carrier switch receiving Equal Access Signaling (EAS), i.e., the Type of Trunk (TOT) value is Local Exchange Carrier Connecting (LCC).

CMTYP

Centralized Automatic Message Accounting (CAMA) Type - This field is used to specify the type of CAMA record made on this Trunk Subgroup (TSG). Enter **"1"** if the standard Operating Company CAMA record must be made on this TSG. Enter **"2"** if an Inter-Local Area Transport Access (LATA) Carrier CAMA record and an Operating Company access record must be made on this TSG. If TOT is not CAMAA or CAMAO, this field must be **"Blank"**.

NOTE: The entries correspond to the number of records which will be made.

Form Entries, Continued

NPARINH	Inhibit Numbering Plan Area (NPA) Reconstruction - This field is used to specify whether NPA reconstruction for equal access calls or SDN should be inhibited on this TSG or not. ANI is taken to be NPA if only seven digits are received. If NPA reconstruction should be inhibited, enter **"Y"**, otherwise enter **"N"** or leave **"Blank"**. This field only applies to Local Exchange Carrier Connecting (LCC) Type of Trunks (TOTs). Valid entries are **"Blank"**, "**Y"**, or **"N"**.
WATSBN	General Wide Area Telephone Service (WATS) Billing Number - Enter a 10-digit billing number for each Trunk Subgroup (TSG) which will be used to carry WATS type traffic. If an entry is not required, then the field must be "**Blank**" . Valid entries are **"0000000000-999999999"** and **"Blank"** .
PSUUI	Prohibit Sending User-to-User Information - This field indicates whether to accept/send Message Associated (MA) UUI on this Trunk Subgroup (TSG). Legal values are **"Blank"**, **"Y"**, or **"N"**. Enter **"Y"** if MA-UUI should not be sent. This value should be used on access TSGs to prohibit the receipt of MA-UUI, and it should be used on egress TSGs to prohibit the sending of MA-UUI. The default condition is **"N"**. This field applies to Integrated Services Digital Network User Part (ISUP), International ISUP (INUP), and Q931 trunks only.
BNPT	Not Applicable - Entries: **"Blank"**
WBNPT	Not Applicable - Entries: **"Blank"**
CMERGE	Not Applicable – Entries: **"Blank"**
SCFN	Send Confusion Messages - This field indicates if received Confusion messages are counted and if Confusion messages are to be sent when an unimplemented message is received. Valid entries are **"Blank"**, **"Y"**, or **"N"**.

Continued on next page

Form Entries, Continued

OVLP

Overlap Signaling- This field indicates if Consultative Committee for International Telephone & Telegraph Signaling System 7 (CCITT7) Overlap Signaling is allowed when processing an International Integrated Services Digital network User Part (INUP) or CCITT7 Telephone User Part (TUP) call. If OVLP is set to **"Y"**, then Overlap Signaling will be allowed on transit non-operator, non-test calls. The default value for this field is: **"Blank"** (Overlap Signaling not allowed).

PRIT

Not Applicable - Entries: **"Blank"**

APS

Accunet® Packet Service - This field is used to indicate if Accunet packet service can be performed on this Trunk Subgroup (TSG). Enter **"Y"** if Accunet packet service is allowed. Enter **"N"** or leave **"Blank"** if Accunet packet service is not allowed.

PSATP

Prohibit Sending Access Transport Parameters - This field indicates whether Access Transport Parameters (ATP) can be passed to or from a connecting network. Legal values are **"Blank"**, **"Y"** or **"N"**. Enter **"Y"** if ATP should not be sent. This value should be used on access Trunk Subgroups (TSGs) to prohibit the receipt of ATP; it should be used on egress TSGs to prohibit the sending of ATP. The default condition is **"N"**. This field applies to Integrated Services Digital Network User Part (ISUP), International ISUP (INUP), and Q931 trunks only. This new field will not affect the sending of ATP at an Access Tandem (AT) switch.

PBXESGD

Private Branch Exchange (PBX) Expect Station Group Designation - This field is used for the Software Defined Network (SDN) feature and is set equal to **"Y"** if the SDN customer has a direct connect PBX that will append an extra digit to the dialed number to indicate authorization of calling station. A **"Y"** or **"N"** must be entered in this field if Type Of Trunk (TOT) is PBX and Domain (DOM) is Software Defined Network Access (SDNA), otherwise it must be set to **"N"** or left **"Blank"**.

Continued on next page

Form Entries, Continued

PBXAW	Private Branch Exchange Answer Withheld - This field is used to specify whether Answer Supervision can or cannot be sent to the PBX. An entry can only be made if Type Of Trunk (TOT) is PBX. A **"Y"** is entered if Answer Supervision is to be withheld. An **"N"** is entered if Answer Supervision should not be withheld (i.e., Answer Supervision is returned). If this field is left **"Blank"** Answer Supervision is returned (not withheld).
FAR4E	The FAR4E field is set to **"Y"** for Yes whenever the far end of the trunks in this Trunk Subgroup (TSG) is terminated on a 4ESS Switch with the international announcements. This is used in common channel signaling (Incoming Signaling Characteristics [ISC] is Domestic Common Channel Interoffice Signaling [DOMCCIS] or Integrated Services Digital Network User Part [ISUP]) to control sending backward failure messages on failed international calls. These switches are equipped with the international announcements. The FAR4E field also controls common channel signaling sending network management call preference data in a forward direction (OSC is DOMCCIS or ISUP). Such data must not be sent forward to switches not equipped to handle it. Enter **"N"** if the far end is not a 4ESS Switch or the 4ESS Switch does not have the international announcements. This field should be left **"Blank"** for International Consultative Committee for International Telephone & Telegraph Signaling System 7 [CCITT7] ISUP (INUP) trunks.
MEGC	Not Applicable – Entries: **"Blank"**
SDNA	Not Applicable - Entries: **"Blank"**

BFTIS	Backward Failure Treatment Integrated Services Digital Network User Part (ISUP) all the way. This field is used to specify whether an Announcement (ANN) should be played or a Release (REL) message should be sent when a call has gone ISUP all the way. On the Trunk Subgroup (TSG) Forms, this field is only used when signaling is ISUP and the type of trunk is OCC. Valid entries are **"Blank"**, **"ANN"**, or **"REL"**. If left **"Blank"**, this field will default to **"REL"** when it applies. For Office Data Assembler (ODA) Form 406Z, this field is used for designating the action for intra-Local Access Transport Area (LATA) ISUP call failures occurring at the switch. Valid entries are **"Blank"**, **"ANN"**, or **"REL"**. If left **"Blank"**, this field will default to **"REL"**.

BFTNI

Backward Failure Treatment not Integrated Services Digital Network User Part (ISUP) all the way. This field is used to specify whether an Announcement (ANN) should be played or a Release (REL) message should be sent when a call has not gone ISUP all the way.

On the Trunk Subgroup (TSG) Forms, this field is only used when signaling is ISUP and the type of trunk is OCC. Valid entries are **"Blank"**, **"ANN"**, or **"REL"**. If left **"Blank"**, this field will default to **"ANN"** when it applies.

For Office Data Assembler (ODA) Form 406Z, this field is used for designating the action for intra- Local Access Transport Area (LATA) ISUP call failures occurring at the switch when a call has not gone ISUP all the way. Valid entries are **"Blank"**, **"ANN"**, or **"REL"**. If left **"Blank"**, this field will default to **"ANN"**.

SKSP

Not Applicable - Entries: **"Blank"**

PBXNWW

Private Branch Exchange (PBX) No Wait for Wink - An entry of **"Y"** in this field is used to specify that the Trunk Subgroup (TSG) has a PBX which does not wait for a wink from the 4ESS Switch before outpulsing digits. This field is used only for TSGs with a type-of-trunk value of PBX and signaling of Dual Tone Multifrequency Wink (DTMFWK). Enter **"Y"** if the PBX does not wait for a wink from the 4ESS Switch. Otherwise, enter **"N"** or leave **"Blank"**.

HYBRD

Not Applicable - Entries: **"Blank"**

CCTT

Not Applicable - Entries: **"Blank"**

INCID

Number of Carrier ID digits to be received - An entry of **"3"** specifies that the Trunk Subgroup (TSG) should expect to receive a 3-digit CID. An entry of **"4"** specifies that the TSG should expect to receive a 4-digit CID. An entry of **"B"** specifies that the TSG should expect to receive a 3- or 4-digit CID.

CAREA Control Area - Valid input for this field is a single digit in the range of **"0-9"**. This number identifies the Control Area that is to be associated with this Trunk Subgroup (TSG) for trouble reporting. The number assignable in a given office is limited, however, to the highest control area assigned at Office Data Assembler (ODA) time as defined by the highest Member Number for a test position. This is because of engineered memory allocated for plant measurement purposes. Each Control Area can have a maximum of 10 (0-9) associated Control Positions (CPOS). The Control Area number and the CPOS number combined make up the testboard position number. For example CAREA-2 and CPOS-5 would be testboard position 25. A maximum of 100 (0-99) testboard positions may be installed for a 4ESS Switch location.

Any test position can access every trunk assigned to the 4ESS Switch with the exception of international trunks. International trunks having Incoming Signaling Characteristic (ISC) or Outgoing Signaling Characteristic (OSC) equal to Consultative Committee for International Telephone & Telegraph 5 (CCITT5) must be assigned to a CAREA that is equipped with 51AL6 test positions. The 51AL6 test position can access any trunk assigned to the 4ESS Switch. However, the alarms, Teletype (TTY) printouts, and 101 calls associated with a particular TSG will only be transmitted to the CAREA and CPOS that is specified on the input form for a TSG. A single trouble receiving location could be specified for all TSGs in the office. Trouble tickets might be originated here and distributed to occupied test positions as necessary. Some other typical applications could be to assign the TSGs to testboard positions alphabetically, by direction, by ownership, or by Type of Trunk (TOT).

The only other restraint on assigning a TSG to a particular CAREA and CPOS is that all positions might not have the optional equipment required to satisfactorily test some Trunk Subgroups. The arrangement in a given office depends on the administrative decisions made for that office.

CAREA
(cont'd.)

Position 00 (CAREA 0, CPOS 0) has been assigned to the Master Test and Control Channel (MTC) teletype in the Maintenance Operating Center (MOC). This position was established to receive trouble reports for certain non-message type TSGs. Lucent Technologies recommend that positions
01-09 not be assigned in an office at this time. The circuits that should be assigned to test position 00 are:

- ACI*DCHN - D-Channel circuits to the Common Network Interface (CNI) Ring
- CLN*DLPC - Loopback/complement Data Test
- MAS*BIPB - Mass Announcement System (MAS) Barge-in Playback Trunk
- MIS*AART - Auxiliary Audible Ring Trunk
- MIS*TERM - Common Channel Interoffice Signaling (CCIS) Terminals
- SVC*AIN* - Advanced Intelligent Network (AIN)
- SVC*DMRV - Dual-Tone Multifrequency (MF) Receivers (DTMFR)
- VC*DMXM - Dual-Tone Multifrequency Transmitters (DTMFT)
- SVC*MFR* - Multifrequency Receivers
- SVC*MFX* - Multifrequency Transmitters
- SVC*XCVR - CCIS Continuity Check Transceivers
- SVC*XCVT - CCIS Continuity Check Transceiver Test Circuit
- SVC*MFRT - Multifrequency Receiver Test Circuits
- SVC*MFXT - Multifrequency Transmitter Test Circuits
- SVC*SCAN - Service Circuit System Expanded Announcements
- SVC*SCBN - Service Circuit System Expanded Announcements
- SVC*SCNS - Network Services Complex Set S
- TAS*ANN* - Recorded announcements
- TAS*TONE - Tone Circuits
- TAS*MWAT - 1004 hz at 0 dBm
- TAS*MW10 - 1004 hz at 10 dBm

CAREA (cont'd.)

The balance of the non-message type TSG may be assigned to working testboard positions.

For RC Forms 604 and 605, this number identifies the Control Area that is to be associated with this announcement trouble report. The number assignable in a given office is limited, however, to the highest control area assigned at ODA time as defined by the highest Member Number for a test position. This is because of engineered memory allocated for plant measurement purposes. Each Control Area can have a maximum of 10 (0-9) associated Control Positions (CPOS). The Control Area number and the CPOS number combined make up the testboard position number. For example CAREA-2 and CPOS-5 would be testboard position 25. A maximum of 100 (0-99) testboard positions may be installed for a 4ESS Switch location. If CAREA 0,
CPOS 0 is specified, all MAS messages will be sent to the MTC channel in the MOC.

CPOS

Control Position - Enter a number from **"0-9"** to specify the testboard position that is to be associated with the Trunk Subgroup (TSGs) and Control Area (CAREA) for test reporting purposes. This assignment together with the CAREA designation can be used to distribute the maintenance responsibility for Trunk Subgroups. This assignment does not prevent any test position from accessing a particular group of trunks. It is only for reporting purposes.

For RC Forms 604 and 605, enter a number from **"0-9"** to specify the testboard position that is to receive the announcement trouble reports. If CAREA is 0, only CPOS 0 is allowed. When the Message Announcement System (MAS) is administered by the Operations National Administration Center (ONAC), assign the CPOS that has been dedicated for its use.

SINDEX

Access Change Verification Sampling Rate Index value - This field specifies the rate at which calls will be sampled for access charge verification. Legal values are **"Blank"**, **"0"**, **"1"**, **"2"**, **"4"**, **"8"**, **"16"**, **"32"**, **"64". "Blank"** and **"0"** imply no verification recording. Otherwise, one call out of the number entered will be recorded.

Form Entries, Continued

S1-10

These fields are reserved for future use in order to be able to implement new capabilities in a more timely fashion. When a new capability is requested for Generic Programs currently deployed in the field, one of these spare fields will be designated for use in implementing that capability.

S1 - Valid entries are **"Blank"**, or **"0-7"**.
S2-10 - Valid entries are **"Blank"**, **"Y"**, or **"N"**.

- S2 - (4E18/4E19/4E20) - An entry of **"Y"** in this field identifies Signaling System 7 (SS7) trunks which have their Per Channel Inhibit Signaling (PCIS) bits reset to force a steady state AB bit indication. Otherwise, enter **"N"** or leave **"Blank"**. In 4E21, the CODSC field will replace the use of S2 for this purpose.

- S2 - (4E21R4) This Trunk Subgroup (TSG) parameter allows TSG circuits to trigger the Advanced Intelligent Network (AIN) processing. The parameter can have the following values: **"Blank"**, **"N"** for no access allowed, and **"Y"** for access allowed. The default is **"N"**.

- S5 - Unassigned - Reserved for future use.

- S6 (4E18/19/20) - this Trunk Subgroup (TSG) parameter indicates the allowed Information Transfer Capability (ITC) coding in the outgoing Initial Address Message (IAM). The parameter can have the following values: **"Blank"**, **"N"** (use office) to encode the outgoing IAM, User Service Information (USI) parameter ITC field, the same as used in the office indicator, and **"Y"** (use opposite of office) to encode the outgoing IAM, USI parameter ITC field, with the opposite of what is used in the office indicator. The default is "use office".

NOTE: An entry of "0-7" in the S1 field or a "Y" in any of the fields S2 thru S10 without knowledge of the capability to which the field has been assigned may result in undesirable switch behavior.

REMARKS ____________________________________________________!

                EQUIVALENT ODA INPUT FORM - ESS 401C

                     ASSOCIATED VERIFY MESSAGES

                     INPUT-11a-VER:TSG:CIN....
                     INPUT-11c-VER:TSG:TSGN....

            OUTPUT(CHARACTERISTICS)-1c-VER:TSG,OPT(OUT1WAY):

             OUTPUT(LIST OF TRUNKS)-1d-VER:TSG,OPT(TRUNKS):
```

Form Entries

RC:TSG;NEW;OPT(OUT1WAY),---:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

ORNU Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

Form Entries, Continued

TSG

Trunk Subgroup - This series of codes identifies a Trunk Subgroup. The TSG is a set of trunks within a Trunk Group having certain identical characteristics. A Trunk Group must have a common destination. In addition to group characteristics, a TSG also has common signaling characteristics, transmission delay, originating Numbering Plan Area (NPA), domain, traffic separation index and screening classes. The Trunk Group and TSG are identified by a series of codes that specify the near and far ends of the trunk. In most cases, the full near end definition is not required because it will always be the same. The Trunk Group designation is comprised of the town, state, building and building subdivision for the far end plus the near end building subdivision. A TSG is uniquely identified by adding a Base Traffic Number reference. Trunk Group and TSG definitions are available in the 4ESS Switch as abbreviated Circuit Identification Names (CINs). Common Language Location Identification (CLLI) codes must be entered in the fields that make up the Trunk Group definition. Rules for establishing these codes are covered in Lucent Technologies Practices 795-100-100. The code for any established office may be found by referring to the location code index in that same Lucent Technologies Practices. For non-message TSGs, the format does not include mnemonics for identifying the far end of the trunk. The TSG will mnemonically identify the type of trunk category by function. Asterisks are used in columns where no information is necessary. The following paragraphs describe the individual fields within a TSG definition.

Continued on next page

Form Entries, Continued

TSG (cont'd)

- **BTFN** - Base Traffic Number - The BTFN is a number in the range of **"0-9976"** that is part of the TSGs designation (which consists of the BTFN, TOWN, ST, BL, FBS, and NBS). The BTFN is the first traffic number in the first block of traffic numbers that is assigned to a TSG. Additional traffic numbers, which are assigned in blocks of 24, either higher or lower in numerical value than the BTFN can be assigned to the TSG, but the BTFN remains as defined above. All non-message trunks have a BTFN of **"0000"**. For RC 104, the BTFN is stored as the starting point for a block of traffic numbers that range up to the limit originally defined on RC Forms 100, 101 and 102 when the TSG was first built. Other blocks of traffic numbers, either higher or lower in numerical value, may be assigned to this TSG, via Recent Change (RC) procedures. In this case the original BTFN would still apply, but the QTFN field would contain the number of new traffic numbers to be assigned following the First Traffic Number (FTFN) specified.

- **TOWN** - Town is a 4-character alphabetic field - The code must represent the bona fide town, city or location per Lucent Technologies Practices 795-100-100 for the far end of the TSG.

- **ST** - State - This field represents the state, province or foreign country in which the far end office is located. The code in ST must be a standard 2-character alphabetic combination. Valid standard abbreviations for states, Canadian provinces and foreign countries may be found in Lucent Technologies Practices 795-100-100.

- **BL** - Building - The BL field contains the office identity for the far end of a TSG. This code consists of either two alphabetic characters or two numeric characters. Independent Telephone Company locations are always designated by an **"X"** plus some alpha character in this field. If the TSG terminates in a customer's building and it is not necessary to identify that particular building, this code may be arbitrary.

Continued on next page

Form Entries, Continued

TSG (cont'd)

- **FBS** - Far Building Subdivision - This field contains a code that identifies the internal building subdivision for the far end of a TSG. The code is a traffic, plant, or administrative assignment. It must be a 3-character alphanumeric combination. For non-message TSGs, this field is not required. Three asterisks are pre-printed on the form to provide an entry for this field.

- **NBS** - Near Building Subdivision - The NBS designation is the internal building identity for the near end termination of a TSG. It is always a 3-character alphanumeric code. This field should be left **"Blank"** if the NBS for this TSG is the same as the NBS assigned in the near office Circuit Identification Number (CIN) for the 4ESS Switch. The Office Data Assembler (ODA) system will add the NBS on a default basis.

Form Entries, Continued

PCF

Point Code Format - This field is used to specify the format of the point code that is being entered in the point code field. If no entry is being made in the Destination Point Code (DPC) (Originating Point Code [OPC]) field, then this field must be left **"Blank"**. Three different formats are available for input: **ATT, ANSI,** or **ISPC**.

ATT is used for AT&T standard input/output which consists of a three digit network indicator, a two digit cluster region, a one digit cluster type, and a three digit cluster member.

1. **NET**: Network Indicator - This value specifies which signaling network will be used for transport. Valid entries are **"000-255"**.

2. **CR**: Cluster Region - This value specifies the region of the signaling network where the office is located. Valid entries are **"00-31"**.

3. **CT**: Cluster Type - Valid entries are **"0-7"**.

4. **MEM**: - Cluster Member - This value specifies the office member number within the cluster. Valid entries are **"000-255"**.

ANSI is used to indicate that the input/output is in the American National Standards Institute format which consists of a three digit network indicator, a three digit cluster, and a three digit member number.

1. **NET**: Network Indicator - This value specifies which signaling network will be used for transport. Valid entries are **"000-255"**.

2. **CLU**: Cluster - This value specifies the cluster of the signaling network where the office is located. Valid entries are **"000-255"**.

3. **MEM**: Member Number - This value specifies the office member number within the cluster. Valid entries are **"000-255"**.

Continued on next page

Form Entries, Continued

PCF (cont'd)

ISPC is used for international signaling point code input/output which consists of a one digit world geographical zone, a three digit area/network identifier, and a one digit signaling point identifier. Reference: International Consultative Committee for International Telephone & Telegraph Signaling System (CCITT) Recommendation "Numbering of International Signaling Point Codes", Vol. VI, Rec. Q.708.

1. **WGZ**: World Geographical Zone - This value specifies the world geographical zone of the office. Valid entries are "**1-7**".

2. **ANI**: Area/Network Identification - This value specifies a geographical area or network in a specific zone. Valid entries are **"000-255"**.

3. **SPID**: Signaling Point Identification - This value specifies a signaling point in a specific geographical area or network. Valid entries are **"0-7"**.

AOPC

Alias Origination Point Code - This field will provide a unique combination of a Local Exchange Carrier (LEC) Signal Transfer Point (STP) Point Code (PC) and an AT&T STP PC for each Local Access Transport Area (LATA) dedicated D-link set via a logical point code. AOPC, if entered, must be entered in the ATT format. See the Point Code Format (PCF) field for the format description. AOPC may only be entered when the PCF field is not **"Blank"**.

Continued on next page

Form Entries, Continued

DPC

Destination Point Code - This field is used to specify the Destination Point Code of the far-end switch.

This field entry is divided into three subfield entries:

1. NET - Network Indicator - This value specifies which signaling network will be used for transport. Valid entries are **"Blank"**, **"000-255"**.

2. CLU - Cluster - This value specifies the cluster of the signaling network where the office is located. Valid entries are **"Blank"**, **"000-255"**.

3. MEM - Cluster Member - This value specifies the office member number within the cluster. Valid entries are **"Blank"**, **"000-255"**.

For the Trunk Subgroup (TSG) forms, nine digits must be entered, depending on the format specified in the Point Code Format (PCF) field. Nine digits must be entered if PCF is American National Standards Institute (ANSI) format. An entry must be made in this field if either the Incoming Signaling Characteristics (ISC) or Outgoing Signaling Characteristics (OSC) field value is **"ISUP"**, **"INUP"**, or **"TUP"**; otherwise this field must be **"Blank"**.

Continued on next page

Form Entries, Continued

FENCLASS This field specifies the classification of the Far End Network (FEN). If the Trunk Subgroup (TSG) is not associated with any FEN, this field is left **"Blank"**. The FEN with which the TSG is to be associated must be described via 4ESS Switch RC 617.

For RC 524, this field identifies the class for accumulating counts.

The following classifications are available:

- **ACCESA** - This identifier specifies that the TSG is a link to an Inter-exchange Carrier (IC) or International Carrier (INC), and the 4ESS Switch is being used by a Local Exchange Carrier (LEC) as an Access Tandem (AT) and/or Service Switching Point (SSP) to switch calls from this TSG.

- **CMC** - Cellular Mobile Carrier - This identifier specifies that the FEN is a CMC. The TSG connects an Access Tandem (AT) and a CMC.

- **OWATS** - This identifier specifies that the TSG is a link to a Private Branch Exchange (PBX) over which only Outward Wide Band Area Telephone Service (WATS) calls are allowed.

- **OEO** - Other End Office connecting, meaning an Equal Access End Office (EAEO) owned by a different company. This identifier specifies that the FEN is an OEO. The TSG connects an Access Tandem (AT) and an OEO.

- **PBX** - This identifier specifies that the TSG is a link to a PBX.

- **POTS** - This identifier specifies that the TSG is a link to a switching machine serving either a Local Access Transport Area (LATA) of the Local Exchange Carrier (LEC) owning/sharing the 4ESS Switch, the Continental United States/Plain Old Telephone Service (POTS) (CUSP) network of the IEC owning/sharing the 4ESS Switch, or some other FEN to be treated similarly.

Continued on next page

Form Entries, Continued

FENID

Far End Network (FEN) Identification - This field distinguishes the specific FEN with which this Trunk Subgroup (TSG) is associated. One to six alphanumeric characters may be entered to distinguish among several FENs with the same classification, or the field may be left **"Blank"**. If FENCLASS is **"Blank"**, FENID must also be **"Blank"**.

When the FENCLASS is ACCESA or ACCESI, FENID should consist of type of feature group access and the 4 numeric digits of the Carrier Identification Code (CIC).

The type of feature group definitions are:

- **G** - All access types (B, C, & D).
- **B** - Feature Group B Access.
- **C** - Feature Group C Access.
- **D** - Feature Group D Access.

Examples include:

- **G0288** - Carrier ID 288 has Feature Group B, C, & D access.
- **BC0288** - Carrier ID 288 has Feature Group B & C access.
- **BD0288** - Carrier ID 288 has Feature Group B & D access.
- **B2882** - Carrier ID 2882 has Feature Group B access only.
- **D2882** - Carrier ID 2882 has Feature Group D access only.

For an access type, both B2882 and D2882 can exist but be for different carriers.

Continued on next page

Form Entries, Continued

TFG

Type of Feature Group - This field is used to specify whether the Type of Access for this Trunk Subgroup (TSG) is tariffed under Feature Group B, Feature Group C, or Feature Group D. An entry can only be made if the FENCLASS is ACCESA. If FENCLASS is ACCESA, a **"B"**, **"C"**, or **"D"** must be entered, corresponding to Feature Groups B, C, or D, respectively. FENCLASS is not ACCESA, this field must be left **"Blank"**.

TSGBBC

Trunk Subgroup (TSG) Broadband Capability - Integrated Services Digital Network User Part (ISUP), International ISUP (INUP), and Q.931 signaling systems allow for broadband switching. This entry specifies what type of circuits may be populated in this TSG. Valid entries are:

- **Blank** - 1 trunk circuit
- **0** - 1 trunk circuit
- **1** - 6 trunk circuits
- **2** - 24 trunk circuits
- **3** - Combined usage 1 and 6 trunk circuits
- **4** - Combined usage 1 and 24 trunk circuits
- **5** - Combined usage 6 and 24 trunk circuits
- **6** - Combined usage 1, 6, and 24 trunk circuits.

Form Entries, Continued

QTFN

Quantity of Traffic Numbers - This field specifies the size of the block of traffic numbers to be reserved with this input form beginning with the Base Traffic Number (BTFN) for this Trunk Subgroup (TSG). Traffic numbers must be allocated in groups of 24. Enter a multiple of 24 in the range of **"24 -504"**. If more than 504 traffic numbers are required for a given TSG, additional blocks of 24 may be added using RC Form 104. The total quantity of reserved traffic numbers should be equal to or greater than (to the nearest 24) the maximum size projected for this TSG during the engineering interval. This total should not include other blocks of traffic numbers that may be assigned separately with RC Form 104.

The maximum number of trunks that can be assigned to one TSG is 1023. If a TSG requires more than 1023 trunks and consequently more than 1023 traffic numbers, it must be split into two TSGs. The breakpoint must be a multiple of 24 and less than 1023 which makes 1008 trunks the logical maximum for one TSG. If for example, 1300 trunks were required between point A and point B, two TSGs should be built. The first TSG would contain 1008 trunks, and the second TSG would contain 292 trunks. The two TSGs would be linked in the Routing Data Block (RDB).

The 4ESS Switch feature, Inward Wide Band Area Telephone Service (INWATS) terminating directly to a customer's Automatic Call Distributor, has a limitation of 1023 TSGs totaling 24552 trunks (1023 trunk blocks of 24 registers).

For Voice Frequency Link (VFL) TSGs, if the traffic numbers for the VFLs are separated by 100, e.g., 801 IPLS IN 01 MSP and 901 IPLS IN 01 MSP, the QTFN must be 24 for building new TSGs. Then build the second set of 24 traffic numbers using RC Form 104.

Continued on next page

Form Entries, Continued

TOT

Type of Trunk - This field specifies the trunk type for this Trunk Subgroup (TSG). TOT entries of **"ETC"** for End Office or Tandem Connecting, **"LCC"** for Local Exchange Carrier Connecting, and **"OCC"** for Other Carrier Connecting are used for network interconnect. When these TOT values are used on Integrated Services Digital Network User Part (ISUP)
trunks, the Local Exchange Carrier (LEC) (Bellcore TR-317) and/or network interconnect version (TR-394) of the ISUP protocol is used. For all other allowed TOT values, the AT&T version of the ISUP protocol is used. The codes that may be entered are as follows:

- **ETC** - End Office or Tandem Office Connecting - This Type of Trunk (TOT) is used to identify Equal Access (EA) or Intra Local Access Transport Area (IntraLATA) trunks at a switch serving as an Access Tandem (AT) or Service Switching Point (SSP) where the other end connects to an End Office. This TOT is also used to identify EA trunks between ATs or between an AT and a switch serving as an SSP. When the type of trunk is ETC, the signaling characteristic of the Trunk Subgroup (TSG) must be either Multifrequency Wink (MFWINK) or ISUP.

- **INTL** - International - International circuit with the far end outside of World Zone 1, and having signaling characteristics of International Consultative Committee for International Telephone & Telegraph Signaling System 5 (CCITT5), CCITT6, International ISUP (INUP), and CCITT7 Telephone User Part (TUP).

- **INTLO** - International Overflow - International Overflow circuit (for overflow transit traffic) with the far end inside World Zone 1 in another International Switching Center (either the U.S. or foreign).

- **ITAND** - Inter Tandem - This TOT can be used to handle traffic between two tandem switchers in the same local calling area.

- **ITOLL** - Intertoll - Intertoll trunks will carry toll traffic between class 4 or higher offices, or trunks dedicated to Inter-International Switching Center (inter-ISC) international overflow traffic. This includes final, full and high usage TSGs.

Continued on next page

Form Entries, Continued

TOT (cont'd)

- **ITOP** - International Operator - International Operator tandem trunk from a No. 5 switchboard.
- **LCC** - Local exchange Carrier Connecting - This TOT is used to identify EA trunks at an AT&T switch This identifier is also used for outgoing ISUP trunks from the Interexchange Carrier/International Exchange Carrier (IC/INC) to an SSP office. When the type of trunk is LCC, the signaling characteristic of the TSG must be either MFWINK or ISUP and the Equal Access Signaling (EAS) field must be marked as either **"E"**, **"A"**, **"D"** or **"R"**.
- **MISC** - Miscellaneous - This designation is used for operator (except for inward, leave word or 2-way operator trunks), service circuit, and other miscellaneous TSGs.
- **OCC** - Other Carrier Connecting - This TOT is used to identify EA trunks at a switch serving as an AT or SSP where the other end connects to an IC or INC switch. This type of trunk should be used when the signaling on the TSG is MFWINK or ISUP.
- **PBX** - Private Branch Exchange - This identifier indicates that the trunks in this TSG terminate on a PBX unit. If the PBX interface is via a 2-wire PBX Channel Unit (J98726ST), then the Incoming Signaling Characteristics (ISC) should be Dial Pulse Immediate (DPIMMED) and the Outgoing Signaling Characteristics (OSC) should be Dial Pulse Wink (DPWINK).
- **SECIT** - Secondary Intertoll - These trunks interconnect toll switching machines and manually operated toll or assistance switchboards for routing of operator completed traffic.
- **STC** - Single Trunk Customer - This TOT is used to designate a TSG for single trunk terminations not supported by a PBX. When TOT is STC, the following TSG fields must be **"Blank"** or **"N"** as allowed: ANISID, APS, BRL, CCIS2WRE, DNHR, DPC, EAS, FAR4E, PBXAW, PBXESGD, REV, RFA, RFMP, SAT, SINDEX, TFG, TSGBBC, WANISID, XCPA.

Continued on next page

Form Entries, Continued

TOT (cont'd)

- **TAND** - Tandem - This code is used for 2-way tandem, tandem completing and tandem connecting TSGs.
- **TOLLC** - Toll Connecting or Completing - This code is used for Direct Distance Dialing (DDD) access, toll connecting or toll completing TSGs.

SAT

Satellite - Enter a **"Y"** for Yes or **"N"** for No to indicate whether or not this Trunk Subgroup (TSG) is associated with satellite facilities. This entry performs a screening function to avoid two satellite TSGs from being connected together to complete a call. If the incoming TSG has SAT = "Y", then call processing will insist the outgoing TSG must have SAT = "N". This can also be used for local screening functions even though the TSG is not via a satellite.

For Voice Frequency Link (VFL) TSGs, satellite facilities cannot be used for a domestic Common Channel Interoffice Signaling (CCIS) system, i.e. if DOM is Plain Old Telephone Service (POTS), then SAT must be **"N"**.

Continued on next page

Form Entries, Continued

DOM

DOMAIN - This field designates a community of interest that requires separate routing. The types of Domain are "Direct Distance Dialing (DDD), International Direct Distance Dialing (IDDD), Verify (VRFY)" and a number ranging from **"20-83"** denoting a NON-Plain Old Telephone Service (POTS) domain. DDD is indicated by an entry of **"POTS"** in the DOM field. The Office Data Assembler (ODA) system will automatically build the DDD Domains (0 through 19). The **"VRFY"** Domain enables the Line-Busy Verification feature by operators over a dedicated network. When DOM equals VRFY, then Type of Trunk (TOT) must be ITOLL, MISC, or TSPS or CALLTYP must equal FHT, GNS, or TST. The NON-POTS Domains may be a Common Control Switching Arrangement (CCSA) Network, such as Federal Telecommunications System (FTS). These domains are entered as a number from **"20-69"**.

- The **NON-POTS domain of 78** is used to skip Network Management code controls for quality assurance testing, i.e. CASPER.
- The **NON-POTS domains 79 and 80** are reserved for specific International Switching Center (ISC) use.
- The **NON-POTS domain of 81**, also denoted by **"IVT"** for International Voice Transport, is reserved for call processing to transport international voice calls through the network to an ISC.
- The **NON-POTS domain of 82** is used as the translation domain for Data calls. The Data feature provides the capability for full rate data transmission via the 4ESS Switch over a dedicated network of digital trunks. These digital trunks terminate exclusively on Digital Interface Frames (DIF) at 4ESS Switch locations.
- **N64C** -This domain is used to route 64 kbps clear data calls using the 10-digit North American Numbering Plan (NANP).
- **N64R** -This domain is used to route 64 kbps restricted data calls using the 10-digit North American Numbering Plan.
- **I64C** -This transport domain is used to route 64 kbps clear international data calls up to an ISC.
- **I56D** -This transport domain is used to route 56 kbps international data calls up to an ISC.

Continued on next page

Form Entries, Continued

DOM (cont'd)

The following translations domains are used for the Software Defined Network (SDN) and Private Branch Exchange (PBX) Interface features:

- **SDNA** - Software Defined Network (SDN) Access - This domain is used to translate the digits of an originating SDN (voice or data) call and determine if the call is a 7-digit or 10-digit call. Trunks in the SDNA domain are dedicated to SDN calls. When DOM equals SDNA, then TOT must be CAMAA, CAMAO, ETC, LCC, PBX, STC, TAND, or TOLLC for Trunk Subgroup (TSG) forms or CALLTYP must be CRB, DSD, DSN, EAR, FHT, GNS, INW, IRA, MCT, MMT, MRT, PAS, PRT, RDB, RNR, SDX, SSP, TEL, TST, or TTS for code group forms.

- **DEV** - Dedicated Egress Voice - This domain is available at the terminating 4ESS Switch to translate SDN and Direct Connect voice calls and route them to a directly connected PBX, via direct egress, or to a local office, via switched egress.

  This domain is also used as an access domain for originating Direct Connect voice calls. The calls arrive at the 4ESS Switch as 10-digit calls. When DOM equals DEV, then TOT must be PBX or Single Trunk Customer (STC) for TSG forms or CALLTYP must be CRB, DSD, DSN, EAR, FHT, GNS, INW, IRA, MCT, MMT, MRT, PAS, PRT, RDB, RNR, SDX, SSP, TEL, TST, or TTS for code group forms.

- **DED** -Dedicated Egress Data - This domain is available at the terminating 4ESS Switch to translate the SDN data call and route it to a directly connected PBX, via direct egress, or to a local office, via switched egress.

  This domain is also used as an access domain for originating Direct Connect data calls. The calls arrive at the 4ESS Switch as 10-digit calls and are routed through the network (translations and facilities) via the data domain. When DOM equals DED, then TOT must be PBX or STC for TSG forms or CALLTYP must be CRB, DSD, DSN, EAR, FHT, GNS, INW, IRA, MCT, MMT, MRT, PAS, PRT, RDB, RNR, SDX, SSP, TEL, TST, or TTS for code group forms.

Continued on next page

Form Entries, Continued

DOM (cont'd)

The following translations domains are used for wideband transmission:

- **NH0C** -This domain is used to route 384 kbps clear data calls using the 10-digit North American Numbering Plan (NANP).
- **NH1C** - This domain is used to route 1536 kbps clear data calls using the 10-digit NANP.
- **APN** - Action Point Numbering Plan - This domain is used as an access domain for originating Direct Connect voice or data calls. The calls arrive at the 4ESS Switch as 10-digit calls. When DOM equals APN, then TOT must be PBX or STC for TSG forms.

NOTE: For Voice Frequency Link (VFL) TSGs, this field identifies the domain in which this TSG operates. Valid inputs are "POTS" (if VFL is associated with a domestic Common Channel Interoffice Signaling [CCIS] system).

ACD

Automatic Call Distributor - This field is used to indicate if this Trunk Subgroup (TSG) is used to terminate Inward Wide Band Area Telephone Service (INWATS) traffic. Enter **"Y"** if this TSG will terminate INWATS traffic. Enter **"T"** if INWATS Time of Day (TOD) billing is required. Enter **"N"** or leave **"Blank"** if this TSG will not terminate INWATS traffic.

FAI

Not Applicable - Entries: **"Blank"**

Continued on next page

Form Entries, Continued

FENPA

Far End Numbering Plan Area/Trunk Subgroup (TSG) - Enter a 3-digit Numbering Plan Area (NPA) code to identify the far end of the subgroup. Valid entries range from **"200-999"**. With an International Trunk Subgroup, if the far end of the Trunk Subgroup is outside World Zone 1, enter the 1-, 2-, or 3-digit country code. Valid ranges of Country Code entries are **"2-9"**, **"20-99"**, and **"200-999"**.

This field is the NPA of the Far-End Office. If this office is not in the Home or Served area, then the Domain will be Plain Old Telephone Service-Intertoll/Intertandem (POTS-IT) and the IT field will be forced to **"Y"** in a Local Exchange Carrier (LEC) switch.

FEOFC

Far-End Office Code - This field is used to identify the office code of the far end switch. Typically this value will range from 200-999. Legal entries are: **"Blank"**, **000-999**.

FELATA

Far End Local Access Transport Area/Trunk Subgroup - This field is used to identify the Local Access Transport Area (LATA) of the far end switch. Legal entries are: **"Blank"**," **000-999"**.

IWZ1

International World Zone 1 - Enter **"Y"** if this Trunk Subgroup (TSG) will carry international traffic within World Zone 1. Enter **"N"** or leave **"Blank"** if this TSG will not carry international traffic within World one 1. Valid entries are **"Blank"**, **"N"**, or "**Y**".

MEM

Memory - This field is used to indicate if trunk hunt with memory is to be performed on this Trunk Subgroup (TSG) when searching for an idle trunk. Trunk hunt with memory is not performed on a TSG if the TSGBBC field is greater than zero (the MEM field should be set to **"N"** in this case). Enter **"N"** if trunk hunt with memory is not to be done. Enter **"Y"** or leave **"Blank"** if trunk hunt with memory is to be done.

Continued on next page

Form Entries, Continued

PSES	Prohibit Service Evaluation - An entry of **"N"** for No specifies that this Trunk Subgroup (TSG) is eligible for service evaluation by the No. 2 Service Evaluation System. An entry of **"Y"** for Yes specifies that the TSG is not eligible for service evaluation. Valid entries are **"Blank"**, **"Y"**, or **"N"**. Blank defaults to **"N"**.
CCIS2WRE	Common Channel Interoffice Signaling (CCIS) 2-Wire - This field should be **"Blank"** for a non-Common Channel Signaling (CCS) Trunk Subgroup (TSG). If this is a CCIS or Integrated Services Digital Network User Part (ISUP) TSG, then it must be determined whether the far end office will terminate the trunks in this TSG on a 2-wire or 4-wire switching network in order to perform the continuity check test on CCIS or ISUP trunks. The CCS continuity check tests will be performed by using the transceiver in either a transceive mode for 4-wire CCS trunks or in a transpond mode for 2-wire CCS trunks. Enter a **"Y"** for Yes if the far end office has a 2-wire network, e.g., 1 ESS/1A ESS 2-wire. Enter an **"N"** for No if the far end office has a 4-wire network, e.g., 1 ESS/1A ESS HILO, 4ESS, 5ESS®, etc.

Form Entries, Continued

OSC

Outgoing Signaling Characteristics - Enter one of the following codes to specify the outgoing signaling characteristics required for this Trunk Subgroup (TSG):

- **DPDDSD** - Dial Pulse with Delay Dial/Start Dial.
- **DPIMMED** - Dial Pulse with Immediate pulsing (no delay).
- **DPWINK** - Dial Pulse with Wink start.
- **DTMFWK** - DTMF with Wink Start.
- **ICOPNOP** - Integrity Check Operator trunk with No Outpulsing. Use this characteristic on trunk subgroups which return a wink signal.
- **ISUP** - CCITT7 ISDN User Part.
- **MFDDSD** - MF with Delay Dial/Start Dial.
- **MFWINK** - MF with WINK start.
- **MIOPNOP** - Miscellaneous Operator with No Outpulsing. This OSC. is used for information and other operator calls. This OSC may be used for Direct Connect calls on 1-way outgoing and 2-way TSGs when Type of Trunk (TOT) is Private Branch Exchange (PBX) or Single Trunk Customer (STC). Use this characteristic only on TSGs which do not return a wink signal.
- **SIOPMFW** - Secondary Intertoll Operator with MF and Wink start. This is used to route inward and leave word operator traffic to a Traffic Service Position System (TSPS) operator.
- **SIOPNOP** - Secondary Intertoll Operator with No Out Pulsing. This type of trunk is used only for the secondary intertoll operator treatment.
- **TWOPDPD** - 2-Way Operator Dial Pulse Delay.
- **TWOPDPI** - 2-Way Operator Dial Pulse Immediate.

Continued on next page

Form Entries, Continued

OSC (cont'd)

- **TWOPDPW** - 2-Way Operator Dial Pulse Wink.
- **TWOPMFW** - 2-Way Operator MF Wink.

RFMP

Ring Forward Miscellaneous Distributor Point - Leave **"Blank"** or enter **"N"** for No to indicate that a miscellaneous distributor point is not associated with the outgoing portion of the Trunk Subgroup (TSG). This feature is only required for outgoing trunks requiring 130V ring forward battery. This feature is presently not available on the outgoing portion of 2-way trunk circuits.

DPSTOP

Dial Pulse Stop - Enter a **"Y"** for Yes if this Trunk Subgroup (TSG) terminates in a panel, Step-by-Step or other office that might not be able to receive a complete train of dial pulse digits without a pause between digits (Outgoing Signaling Characteristic [OSC] equal to DPWINK, DPDDSD, DPIMMED, TWOPDPD, TWOPDPI, or TWOPDPW). This feature will tell the program to look for a DPSTOP signal from the far-end office after any one of the first three digits is outpulsed. Enter an **"N"** for No if this feature is not required for DP outpulsing. For other types of outpulsing, leave this field **"Blank"**.

DELAY

Delay Interval - An entry must be made if the Outgoing Signaling Characteristic (OSC) is CCITT5, DTMFWK, MFWINK, MFDDSD, SIOPMFW, or TWOPMFW. Leave this field **"Blank"**, if any other OSC is specified. If OSC is MFWINK, MFDDSD, SIOPMFW, or TWOPMFW, enter **"20"**, **"80"**, or **"220"** to indicate the delay in milliseconds before outpulsing is started. This delay interval starts when the wink or start dial signal from the other office is recognized. Twenty milliseconds is basic for most offices. A delay of 20 may be associated with 7 or 10 multifrequency digits per second. When the OSC is Dual Tone Multifrequency Wink (DTMFWK), enter **"70"**, **"140"**, **"210"**, or **"280"** to indicate the delay in milliseconds before outpulsing. This delay interval starts when the wink from the Private Branch Exchange (PBX) is received. **"70"** milliseconds is the minimum required for PBXs.

Continued on next page

Form Entries, Continued

MFSPEED Multifrequency Speed - If Outgoing Signaling Characteristic (OSC) is specified as MFWINK, MFDDSD, SIOPMFW, or TWOPMFW enter **"7"** or **"10"** to indicate the number of outpulsed Multifrequency (MF) digits per second. Enter **"10"** for Lucent Technologies ESS machines. Seven digits per second is used for all electromechanical machines. If OSC is equal to International Consultative Committee for International Telephone & Telegraph Signaling System 5 (CCITT5), this field should indicate an MF speed of 10. Leave this field **"Blank"** for any other value of OSC.

XCPA Transceiver (XC) Pad Adjustment - This item will be left **"Blank"** for non-Common Channel Interoffice Signaling (CCIS) trunks. If the Outgoing Signaling Characteristic (OSC) is equal to International Consultative Committee for International Telephone & Telegraph Signaling System 6 (CCITT6), Domestic CCIS (DOMCCIS), Integrated Services Digital Network User Part (ISUP), International ISUP (INUP), or CCITT7 Telephone User Part (TUP) enter a digit from **"0"** to **"3"** to indicate the pad setting for the CCIS transceiver. The correct entry can be determined by comparing the highest Inserted Connection Loss (ICL) value assigned to a trunk in this Trunk Subgroup (TSG) to the following table. The ICL can be obtained from the Circuit Order Layout Record (COLR) card.

DIGIT	ICL APPLICATION	PAD
• **0**	0 loss trunk	5 DB
• **1**	.1 to .8 loss	3.5 DB
• **2**	.9 to 1.7 loss	1.8 DB
• **3**	1.8 to 4.1 loss	0 DB

DNP Dialed Number Preferred - This field indicates whether the called user prefers to receive the original dialed number, if available, as delivered to the network rather than the routing number. Enter **"Y"** if the called user prefers receiving the original dialed number, otherwise, enter **"N"** or leave **"Blank"**. This field applies to outgoing Q.931 trunks only.

Form Entries, Continued

PSOLI

Prohibit Sending Originating Line Identity - This field indicates whether OLI can be passed to a connecting network. Legal values are **"Blank"**, **"Y"** or **"N"**. **"Y"** specifies that OLI should not be sent. **"N"** specifies that OLI should be sent.

BN

Billing Number/Trunk Subgroup- This field is used to specify a BN associated with the TSG. It may be left **"Blank"**, or a **"3-"**, **"4-"**, or **"10-digit"** number may be entered. If FENCLASS is ACCESA or ACCESI, BN must be a 4-digit number (4-digit number if Type of Feature Group [TFG] is "B") equal to the (X)XXX corresponding to the inter-Local Area Transport Access (LATA) or International Carrier at the far end of the TSG. If FENCLASS is CMC, OWATS, or PBX, BN must be a 10-digit number. If the Automatic Call Distributor (ACD) field is **"Y"**, then BN must be a 10-digit number specifying the billing number of the INWATS ACD customer. If the ACD field is **"T"**, then BN must be **"199"**.

BRL

Billing Record Length - This field is used to specify whether long or short Automatic Message Accounting (AMA) records should be created for calls on this Trunk Subgroup (TSG). An "**S**" should be entered if Short AMA records are required or an **"L"** should be entered if Long AMA records are required. If **"L"** is entered, both answered and unanswered calls are recorded. If **"S"** is entered, only answered calls are recorded. If this field is left **"Blank"**, short AMA records will be made (if necessary).

NOTE: There is only one record length for Private Branch Exchange (PBX) calls, so this field should be used to indicate whether both answered and unanswered.

GSDN.tsg

Not Applicable - Entries: **"Blank"**

Form Entries, Continued

PSBN

Prohibit Sending Billing Number - This field is used to indicate that the caller's billing number should not be sent in the outgoing signaling messages.

For 4E17 and earlier generic programs, enter **"Y"** if the billing number should not be forwarded. This value should only be used on Trunk Subgroups (TSGs) connecting to another network. Enter **"N"** or leave **"Blank"** if the billing number can be sent. This field applies to outgoing Integrated Services Digital Network User Part (ISUP) trunks only.

For 4E18 and later generic programs, this value should only be used on TSGs connecting to another network. Enter:

- **Blank** or **PNNA** - prohibit sending a billing number with a numbering plan type other than North American Numbering Plan (NANP).
- **SALL -** if the billing number can be sent, regardless of the numbering plan type.
- **PALL -** if all billing numbers are to be prohibited from being sent, regardless of the numbering plan type. This field only applies to outgoing ISUP and Q.931 trunks. The PALL value applies only to ISUP trunks.

PSCPN

Prohibit Sending Calling Party Number - This field is used to indicate that the caller's calling party number should not be sent in the outgoing signaling messages. Enter **"Y"** if the calling party number should not be forwarded. This value should only be used on Trunk Subgroups (TSGs) connecting to another network. Enter **"N"** or leave **"Blank"** if the calling party number can be sent. This field applies to outgoing Integrated Services Digital Network User Part (ISUP) and International ISUP (INUP) trunks only.

ANISID

ANI/SID requester value: This field specifies the type of calling party information which should be transmitted to the customer. Valid entries are:

- **Blank** No information
- **NONE** No information
- **ANI** Automatic Number Identification (ANI) only
- **SID** Service Identity (SID) only
- **PANI** ANI or SID (prefer ANI)
- **PSID** ANI or SID (prefer SID)
- **REQ** Customer will use signaling to specify.

WANISID

Wide Area Telephone Service (WATS) Automatic Number Identification (ANI)/Service Identity (SID) requester value - This field specifies the type of calling party information which should be transmitted to the customer when Megacom* 800 type of traffic is delivered to the customer. Valid entries are:

- **Blank** - No information
- **NONE** - No information
- **ANI** - ANI only
- **SID** - SID only
- **PANI** - ANI or SID (prefer ANI)
- **PSID** - ANI or SID (prefer SID)
- **REQ** - Customer will use signaling to specify.

*Megacom is a registered trademark of AT&T.

PSUUI	Prohibit Sending User-to-User Information - This field indicates whether to accept/send Message Associated (MA) UUI on this Trunk Subgroup (TSG). Legal values are **"Blank"**, **"Y"**, or **"N"**. Enter **"Y"** if MA-UUI should not be sent. This value should be used on access TSGs to prohibit the receipt of MA-UUI, and it should be used on egress TSGs to prohibit the sending of MA-UUI. The default condition is **"N"**. This field applies to Integrated Services Digital Network User Part (ISUP), International ISUP (INUP), and Q931 trunks only.
BNPT	Not Applicable - Entries: **"Blank"**
CMERGE	Not Applicable – Entries: **"Blank"**
SCFN	Send Confusion Messages - This field indicates if received Confusion messages are counted and if Confusion messages are to be sent when an unimplemented message is received. Valid entries are **"Blank"**, **"Y"**, or **"N"**.
PRIT	Not Applicable - Entries: **"Blank"**
APS	Accunet® Packet Service - This field is used to indicate if Accunet packet service can be performed on this Trunk Subgroup (TSG). Enter **"Y"** if Accunet packet service is allowed. Enter **"N"** or leave **"Blank"** if Accunet packet service is not allowed.
CHNEG	Channel Negotiation - This field is used to indicate whether channel negotiation can be performed on this Trunk Subgroup (TSG) or not. Enter **"Y"** if channel negotiation is allowed. Enter **"N"** or leave **"Blank"** if channel negotiation is not allowed.

Form Entries, Continued

PSATP	Prohibit Sending Access Transport Parameters - This field indicates whether Access Transport Parameters (ATP) can be passed to or from a connecting network. Legal values are **"Blank"**, **"Y"** or **"N"**. Enter **"Y"** if ATP should not be sent. This value should be used on access Trunk Subgroups (TSGs) to prohibit the receipt of ATP; it should be used on egress TSGs to prohibit the sending of ATP. The default condition is **"N"**. This field applies to Integrated Services Digital Network User Part (ISUP), International ISUP (INUP), and Q931 trunks only. This new field will not affect the sending of ATP at an Access Tandem (AT) switch.
DOFP	Disable Outgoing Fraud Prevention - **"Y"** indicates that Black Box and Blue Box fraud prevention controls are disabled on this Trunk Subgroup (TSG). **"N"** indicates that fraud prevention controls are enabled on this TSG.
SBRIV	Not Applicable - Entries: **"Blank"**
FOSPS	Not Applicable - Entries: **"Blank"**
CCIF	Not Applicable - Entries: **"Blank"**
ONCID	Number of Carrier ID digits to send - An entry of **"3"** specifies that the Trunk Subgroup (TSG) send a 3-digit CID. An entry of **"4"** specifies that the TSG send a 4-digit CID. If the TSG is not going to send a CID leave **"Blank"**.
D3DBN	Not Applicable - Entries: **"Blank"**

MULAW This field is used to identify the type of encoding (A-law/Mu-law) used in the user information layer 1 protocol ID field of the User Service Information (USI) parameter. An entry of **"Y"** in this field along with an outgoing signaling characteristic of International Consultative Committee for International Telephone & Telegraph Signaling System 7 (CCITT7) Integrated Services Digital Network User Part (INUP) will indicate that Mu-law encoding is being used. A entry of **"N"** or leaving the field **"Blank"** will indicate that A-law encoding is being used.

CSCSET Not Applicable - Entries: **"Blank"**

CID Carrier ID. This field is populated with the pre-subscription carrier selected by the customer to handle inter-Local Access Transport Area (LATA) calls; and intra-LATA calls when intra-LATA competition is allowed. It is a 4-digit number with a range of **"0000-9999"**, indicating the XXXX digits of the desired carrier. This field is only populated for ISC/OSC=Q.931.

ITCENC Information Transfer Capability Encoding - (4E21>) - This Trunk Subgroup (TSG) parameter indicates the allowed Information Transfer Capability (ITC) coding in the outgoing Initial Address Message (IAM). The parameter can have values shown below:

- **"Blank"**, **"N"** (use office): encode the outgoing IAM, User Service Information (USI) parameter ITC field, the same as used in the office indicator
- **"Y"** (use opposite of office): encode the outgoing IAM, USI parameter ITC field, with the opposite of what is used in the office indicator

The default is **"use office"**.

OFITR Not Applicable – Entries: **"Blank"**

CAREA

Control Area - Valid input for this field is a single digit in the range of **"0-9"**. This number identifies the Control Area that is to be associated with this Trunk Subgroup (TSG) for trouble reporting. The number assignable in a given office is limited, however, to the highest control area assigned at Office Data Assembler (ODA) time as defined by the highest Member Number for a test position. This is because of engineered memory allocated for plant measurement purposes. Each Control Area can have a maximum of 10 (0-9) associated Control Positions (CPOS). The Control Area number and the CPOS number combined make up the testboard position number. For example CAREA-2 and CPOS-5 would be testboard position 25. A maximum of 100 (0-99) testboard positions may be installed for a 4ESS Switch location.

Any test position can access every trunk assigned to the 4ESS Switch with the exception of international trunks. International trunks having Incoming Signaling Characteristic (ISC) or Outgoing Signaling Characteristic (OSC) equal to Consultative Committee for International Telephone & Telegraph 5 (CCITT5) must be assigned to a CAREA that is equipped with 51AL6 test positions. The 51AL6 test position can access any trunk assigned to the 4ESS Switch. However, the alarms, Teletype (TTY) printouts, and 101 calls associated with a particular TSG will only be transmitted to the CAREA and CPOS that is specified on the input form for a TSG. A single trouble receiving location could be specified for all TSGs in the office. Trouble tickets might be originated here and distributed to occupied test positions as necessary. Some other typical applications could be to assign the TSGs to testboard positions alphabetically, by direction, by ownership, or by Type of Trunk (TOT).

The only other restraint on assigning a TSG to a particular CAREA and CPOS is that all positions might not have the optional equipment required to satisfactorily test some Trunk Subgroups. The arrangement in a given office depends on the administrative decisions made for that office.

Continued on next page

Form Entries, Continued

CAREA
(cont'd.)

Position 00 (CAREA 0, CPOS 0) has been assigned to the Master Test and Control Channel (MTC) teletype in the Maintenance Operating Center (MOC). This position was established to receive trouble reports for certain non-message type TSGs. Lucent Technologies recommend that positions
01-09 not be assigned in an office at this time. The circuits that should be assigned to test position 00 are:

- ACI*DCHN - D-Channel circuits to the Common Network Interface (CNI) Ring
- CLN*DLPC - Loopback/complement Data Test
- MAS*BIPB - Mass Announcement System (MAS) Barge-in Playback Trunk
- MIS*AART - Auxiliary Audible Ring Trunk
- MIS*TERM - Common Channel Interoffice Signaling (CCIS) Terminals
- SVC*AIN* - Advanced Intelligent Network (AIN)
- SVC*DMRV - Dual-Tone Multifrequency (MF) Receivers (DTMFR)
- VC*DMXM - Dual-Tone Multifrequency Transmitters (DTMFT)
- SVC*MFR* - Multifrequency Receivers
- SVC*MFX* - Multifrequency Transmitters
- SVC*XCVR - CCIS Continuity Check Transceivers
- SVC*XCVT - CCIS Continuity Check Transceiver Test Circuit
- SVC*MFRT - Multifrequency Receiver Test Circuits
- SVC*MFXT - Multifrequency Transmitter Test Circuits
- SVC*SCAN - Service Circuit System Expanded Announcements
- SVC*SCBN - Service Circuit System Expanded Announcements
- SVC*SCNS - Network Services Complex Set S
- TAS*ANN* - Recorded announcements
- TAS*TONE - Tone Circuits
- TAS*MWAT - 1004 hz at 0 dBm
- TAS*MW10 - 1004 hz at 10 dBm

Continued on next page

Form Entries, Continued

CAREA (cont'd.)

The balance of the non-message type TSG may be assigned to working testboard positions.

For RC Forms 604 and 605, this number identifies the Control Area that is to be associated with this announcement trouble report. The number assignable in a given office is limited, however, to the highest control area assigned at ODA time as defined by the highest Member Number for a test position. This is because of engineered memory allocated for plant measurement purposes. Each Control Area can have a maximum of 10 (0-9) associated Control Positions (CPOS). The Control Area number and the CPOS number combined make up the testboard position number. For example CAREA-2 and CPOS-5 would be testboard position 25. A maximum of 100 (0-99) testboard positions may be installed for a 4ESS Switch location. If CAREA 0,
CPOS 0 is specified, all MAS messages will be sent to the MTC channel in the MOC.

CPOS

Control Position - Enter a number from **"0-9"** to specify the testboard position that is to be associated with the Trunk Subgroup (TSGs) and Control Area (CAREA) for test reporting purposes. This assignment together with the CAREA designation can be used to distribute the maintenance responsibility for Trunk Subgroups. This assignment does not prevent any test position from accessing a particular group of trunks. It is only for reporting purposes.

For RC Forms 604 and 605, enter a number from **"0-9"** to specify the testboard position that is to receive the announcement trouble reports. If CAREA is 0, only CPOS 0 is allowed. When the Message Announcement System (MAS) is administered by the Operations National Administration Center (ONAC), assign the CPOS that has been dedicated for its use.

SINDEX

Access Change Verification Sampling Rate Index value - This field specifies the rate at which calls will be sampled for access charge verification. Legal values are **"Blank"**, **"0"**, **"1"**, **"2"**, **"4"**, **"8"**, **"16"**, **"32"**, **"64". "Blank"** and **"0"** imply no verification recording. Otherwise, one call out of the number entered will be recorded.

Form Entries, Continued

CODSC

Customer Premise Equipment (CPE) Outgoing Disconnect. An entry of **"Y"** in this field is used to specify (from the 4ESS Switch perspective) that a disconnect will be effected faster than normal when the called customer goes on-hook. This field is used only for TSGs with a type-of-trunk value of Private Branch Exchange (PBX) or Single Trunk Customer (STC) and with signaling other than Q.931. Valid entries are **"Blank"**, **"Y"**, or **"N"**.

(4E21>) - CPE Outgoing Disconnect or Signaling System 7 (SS7) Trunk Subgroup (TSG) Control of Per Channel Inhibit Signaling (PCIS) Bits. An entry of **"Y"** specifies that:

1. From the 4ESS Switch perspective, a disconnect will be effected faster than normal when the called customer goes on-hook. This application of CODSC is only for TSGs with a type-of-trunk value of PBX or STC and with signaling other than Q.931.

   or

2. The TSG is to have its PCIS bits reset to force a steady state AB bit indication. This application of CODSC is for non-AT&T offices where the TSG has type-of-trunk of Other Common Carrier (OCC) and outgoing signaling of Integrated Services Digital Network User Part (ISUP).

Valid entries are **"Blank"**, **"Y"**, or **"N"**.

Continued on next page

Form Entries, Continued

NEOTR	Near Operational Test Responsibility - Enter a **"Y"** for Yes or **"N"** for No to indicate whether or not this office is responsible for the operational (signaling) test on outgoing trunks in this Trunk Subgroup (TSG). If a **"Y"** is entered in this field, then the OTSTT and/or OTMTT field(s) must have an entry other than **"N"**. If an **"N"** is entered in this field, then all test types are optional. If OTSTT and OTMTT fields are **"N"**, then NEOTR must be **"N"**. If an office has Near End Operational Test Responsibility but the far end office does not have a test number, an **"N"** should be entered in this field. If Outgoing Signaling Characteristic (OSC) is equal to Domain Class (DOMCCIS) or Integrated Services Digital Network User Part (ISUP), then NEOTR should be **"N"** since operational tests cannot be made on Domestic Common Channel Signaling (CCS) trunks.
TRIDX	Not Applicable - Entries: **"Blank"**

Continued on next page

Form Entries, Continued

OTSTT

Operational Thru Switch Test Type - Certain offices (No. 5 Crossbar and 1ESS) can function both as a local and a tandem or as a local and toll office. These offices have trunks that can function in both a through switch mode and a terminating mode. As a result, more than one test is required to test both modes of operation. The OTSTT is used to specify an operational (signaling) test for a trunk in the tandem (thru switch) mode. OTSTT is also used to specify the ATME B test for Consultative Committee for International Telephone and Telegraph Signaling System Number 5 (CCITT5) and Consultative Committee for International Telephone and Telegraph Signaling System Number 6 (CCITT6) trunks which have a far end test line capable of running this test. The following codes may be entered in the OTSTT field.

- **ATMB** - Siemens' ATME B test line - This is a signaling test which applies to CCITT5 and CCITT6 trunks only. The test consists of the far end test line returning a clear back/reanswer in response to a forward transfer.

- **CTX2** - Centrex II test - This test is made toward a No. 5 Crossbar office having Phase II Centrex features. CTX2 is similar to the SYNC test.

- **CTX3** - Centrex III - This test is made to a No. 5 Crossbar office having Phase III Centrex features. CTX3 is similar to the SYNC test.

- **SXS** - Step-by-Step - If the far end of this Trunk Subgroup (TSG) is working in to a Step-by-Step office, this test may be specified.

- **SYNC** - Synchronous test - This test is an automatic series of off hook/on hook transitions (flashes) on the M lead. In the 4ESS Switch, the SYNC test is software controlled and no external hardware is needed. A data table is used to specify the pulsing rate for each series of flashes. The test automatically advances from one pulsing rate to another via a timing procedure. In any system, after all of the flashes are complete, the trunk will be left in the quiet termination state.

Continued on next page

Form Entries, Continued

OTSTT (cont'd)

- **T103 -** 103 Test - The 103 Test is similar to the synchronous test in that a series of flashes are sent on the M lead. However, the sequence of pulses is controlled by the ring forward signal, rather than a timed automatic progression. Flashing of a given rate will continue until a ring forward signal is received, or, in 4ESS Switch, until an upper limit of flashes has been sent. At this point, the trunk will be put into the quiet termination state until disconnect.

- **"N" -** Enter **"N"** if no thru switch operational test is to be made on this TSG.

OTSTN

Operational Thru Switch Test Number - If Operational Thru Switch Test Type (OTSTT) is **"N"** for None, leave this item **"Blank"**. If a thru switch test of some type is specified, then a corresponding test number in the range of **"000-9999999"** must also be specified. This number will normally be a 3- or 7-digit test number associated with the test specified in the OTSTT field. Test numbers are derived locally and they may differ for each 4ESS Switch location. If OTSTT is Siemens' ATME B test line **(**ATMB), then OTSTN should specify a 062 for Consultative Committee for International Telephone and Telegraph Signaling System Number 5 (CCITT5) trunks or a 2 for Consultative Committee for International Telephone and Telegraph Signaling System Number 6 (CCITT6) trunks when the far end has an ATME B test line. If the far end has an Siemens' ATME A test line **(**ATME A), OTSTT equals ATMB and OTSTN should specify 061 for CCITT5 or 1 for CCITT6 trunks.

Continued on next page

Form Entries, Continued

OTMTT Operational Terminating Test Type - If an operational (signaling) test is to be made directly to the far end of this Trunk Subgroup (TSG) terminating mode, enter a code to identify the test.

- **ATMC** - Siemens' ATME C test line - This is a signaling test used with Consultative Committee for International Telephone and Telegraph Signaling System Number 5 (CCITT5) trunks only. The far end returns a busy flash from the test line.
- **CTX2** - Centrex II test - This test is made toward a No. 5 Crossbar office having Phase II Centrex features. This test is similar to the SYNC test.
- C**TX3** - Centrex III - This test is made towards a No. 5 Crossbar office having Phase III Centrex features. This test is similar to the SYNC test.
- **SXS** - Step-by-Step - If the far end of this TSG is working into a Step-by-Step office, this test may be specified.
- **SYNC** - Synchronous test - This test is an automatic series of on hook/off hook transitions (flashes) on the M lead. In the 4ESS Switch, the SYNC test is software controlled and no external hardware is needed. A data table is used to specify the pulsing rate for each series of flashes. The test automatically advances from one pulsing rate to another via a timing procedure. In any system, after all of the series of flashes are complete, the trunk will be left in the quiet termination state.
- **T103** - 103 test - The 103 test is similar to the synchronous test in that a series of flashes are sent on the M lead. However, the sequence of pulses is controlled by the ring forward signal, rather than a timed automatic sequence. Flashing of a given rate will continue until a ring forward signal is received, or, in 4ESS Switch, until an upper limit of flashes has been sent. At this point, the trunk will be put into the quiet termination state until the originator disconnects.
- **"N"** - None - Enter an **"N"** if no test is to be made on this TSG.

Continued on next page

Form Entries, Continued

OTMTN

Operational Terminating Test Number - If OTMTT is **"N"** for None, leave this field **"Blank"**. If a test is specified, then a corresponding test number in the range of "**000-9999999"** must also be specified. This number will normally be a 3- or 7-digit test number associated with the test specified in the OTMTT field. Test numbers are derived locally and they may differ for each 4ESS Switch location. If OTMTT equals Siemens' ATME C test line **(**ATMC), then OTMTN must specify **"063"**.

XTSTT

Transmission Thru Switch Test Type - If a transmission test is to be made in the thru switch (tandem) mode for this Trunk Subgroup (TSG), enter a code to identify the type of test.

- **ATMA** - Siemens' ATME A transmission test line - This entry provides access to an ATME A responder. The ATME A test permits automatic transmission loss and noise measurements in both directions for International Consultative Committee for International Telephone & Telegraph Signaling System 5 (CCITT5),CCITT6, International Integrated Services Digital Network User Part (INUP), or CCITT7 Telephone User Part (TUP) trunks.

- **T100** - 100 code test - This test provides a quiet termination (600 ohms). In the 4ESS Switch, the 100 test provides a sequence of 1000 hz, milliwatt tone for 5.5 seconds followed by the quiet termination until disconnect.

- **T102** - 102 code test - The 102 test provides 1000 hz. milliwatt tone. The 4ESS Switch provides cycles of 9-second tone and 1-second quiet termination until disconnect.

- **T105** - 105 code test - This code provides access to an Automatic Trunk Measuring System (ATMS) responder. The 105 test permits automatic transmission loss and noise measurements in both directions.

- **N** - Enter **"N"** if no test is to be made OR if the presubscription carrier is to be populated.

Continued on next page

Form Entries, Continued

XTSTN

Transmission Thru Switch Test Number - Add Presubscription Carrier. If Transmission Thru Switch Test Type (XTSTT)=N and this field is non-**"Blank"**, then the field is populated with the presubscription carrier selected by the customer to handle inter Local Access Transport Area (interLATA) calls; and intraLATA calls when intraLATA competition is allowed. It is a 4-digit number with a range of **"0000-9999"**, indicating the XXXX digits of the desired carrier. The presubscription carrier can only be populated for Incoming/Outgoing Signaling Characteristics (ISC/OSC) of Q931.

If XTSTT does not equal to N, and this field is non-**"Blank"** , then the field is populated with the transmission thru switch test number. If a test is specified, then a corresponding test number in the range of **"000-9999999"** must also be specified. This number will normally be a 3- or 7-digit test number associated with the test specified in the XTSTT field. Test numbers are derived locally and they may differ for each 4ESS Switch location. If XTSTT is Siemens' ATME A transmission test line (ATMA), the XTSTN should be specified as **"061"** for International Consultative Committee for International Telephone & Telegraph Signaling System 5 (CCITT5) trunks or **"1"** for CCITT6, International Integrated Services Digital Network User Part (INUP), or CCITT7 Telephone User Part (TUP) trunks.

XTMTT

Transmission Terminating Test Type - If a transmission test is to be made directly to the far end of this Trunk Subgroup (TSG) in a terminating mode, enter a code to identify the type of test.

- **T100** - 100 code test - This test provides a quiet termination (600 ohms). In the 4ESS Switch, the 100 code test provides a sequence of 1000 hz. milliwatt tone for 5.5 seconds, followed by quiet termination until disconnect.
- **T102** - 102 code test - The 102 test provides 1000 hz. milliwatt tone. The 4ESS Switch provides cycles of 9-second tone and 1-second quiet termination until disconnect.
- **T105** - 105 code test - This code provides access to a Automatic Trunk Measuring System (ATMS) responder. The 105 test permits automatic transmission loss and noise measurements in both directions.
- If no test is to be made, enter **"N"** for None.

Continued on next page

Form Entries, Continued

XTMTN	Transmission Terminating Test Number - If Transmission Terminating Test Type (XTMTT) is **"N"** for None, leave this field **"Blank"**. If a test is specified, then a corresponding test number in the range of **"000-9999999"** must also be specified. This number will normally be a 3- or 7-digit test number associated with the test specified in the XTMTT field. Test numbers are derived locally and they may differ for each 4ESS Switch location.

Form Entries, Continued

S1-10

These fields are reserved for future use in order to be able to implement new capabilities in a more timely fashion. When a new capability is requested for Generic Programs currently deployed in the field, one of these spare fields will be designated for use in implementing that capability.

S1 - Valid entries are **"Blank"**, or **"0-7"**.
S2-10 - Valid entries are **"Blank"**, **"Y"**, or **"N"**.

- S2 - (4E18/4E19/4E20) - An entry of **"Y"** in this field identifies Signaling System 7 (SS7) trunks which have their Per Channel Inhibit Signaling (PCIS) bits reset to force a steady state AB bit indication. Otherwise, enter **"N"** or leave **"Blank"**. In 4E21, the CODSC field will replace the use of S2 for this purpose.

- S2 - (4E21R4) This Trunk Subgroup (TSG) parameter allows TSG circuits to trigger the Advanced Intelligent Network (AIN) processing. The parameter can have the following values: **"Blank"**, **"N"** for no access allowed, and **"Y"** for access allowed. The default is **"N"**.

- S5 - Unassigned - Reserved for future use.

- S6 (4E18/19/20) - this Trunk Subgroup (TSG) parameter indicates the allowed Information Transfer Capability (ITC) coding in the outgoing Initial Address Message (IAM). The parameter can have the following values: **"Blank"**, **"N"** (use office) to encode the outgoing IAM, User Service Information (USI) parameter ITC field, the same as used in the office indicator, and **"Y"** (use opposite of office) to encode the outgoing IAM, USI parameter ITC field, with the opposite of what is used in the office indicator. The default is "use office".

NOTE: An entry of "0-7" in the S1 field or a "Y" in any of the fields S2 thru S10 without knowledge of the capability to which the field has been assigned may result in undesirable switch behavior.

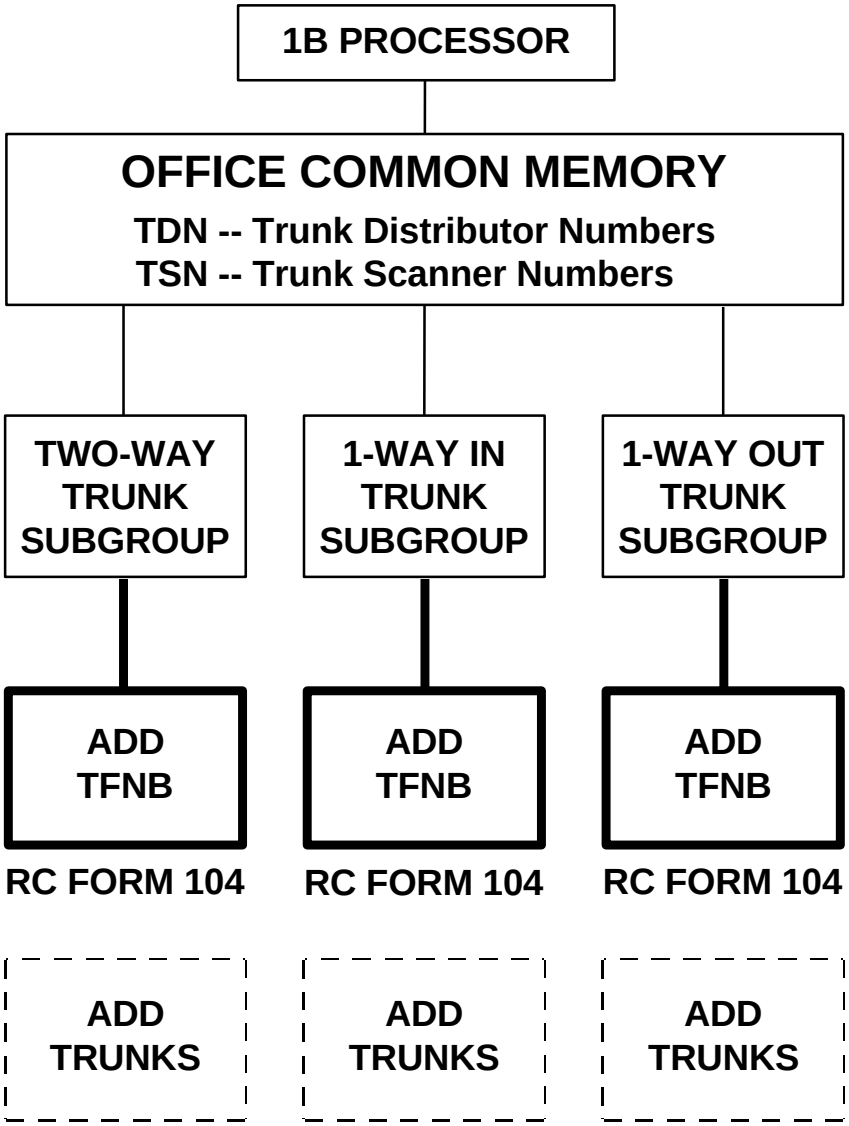
RC Form 104

General

Recent Change (RC) Form 104 adds a Traffic Number Block(s) (TFNB) to an existing Trunk Subgroup (TSG). This message is classed as a Recent Change Data Message (RCDM).

An alphabetical keyword list is included in this section on page 10.



Continued on next page

RC Form 104, Continued

General (cont'd.)

The traffic number block (TFNB) is explained previously under "QTFN" in the RC 100 Section. It must be structured in multiples of 24 traffic numbers each. The original TSG will have the original TFNB(s) created by the entry in QTFN on the appropriate TSG RC FORM. If the original TSG required adding more the 504 trunks, then the administrator would be required to use this RC FORM to build additional traffic numbers from 24 to 504. However, if the traffic numbering is "modular", i.e., no traffic numbers 0, 97, 98, & 99, not more than 96 could be entered in QTFN. An additional RC 104 would have to be entered for each additional 96 traffic numbers. If trunks were to be augmented to the specific TSG at a later date and more traffic numbers were required, this RC FORM would again be used following the same guidelines.

Attention should be given to the planning of the TFNB arrangement while building the original TSG. This attention should not only be the specific quantity of the traffic numbers required but also the Reverse (REV) entry. As explained in the RC 100 Section, the REV determines the traffic numbering of each block to be in either forward or reverse order from top to bottom. If the initial REV decision is found to be in error and creates a “Glare” condition, the REV entry must be changed. Before the REV entry can be changed, all of the assigned trunks must be placed in CADOOS state and removed from the TSG. The RC 105 would be used to remove all of the assigned TFNB(s), and the REV entry can be changed to the alternative selection. At that time, this RC 104 would be used to rebuild all of the required TFNB(s) before reassigning all of the trunks to the TSG. As this operation could have a definite service impact, the work usually would have to be performed out of normal business hours unless an adequate traffic reroute could be implemented for the duration.

Form Entries

RC:TSG;NEW;OPT(ADDTFNB),---:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

ORNU Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

Form Entries, Continued

TSG

Trunk Subgroup - This series of codes identifies a Trunk Subgroup. The TSG is a set of trunks within a Trunk Group having certain identical characteristics. A Trunk Group must have a common destination. In addition to group characteristics, a TSG also has common signaling characteristics, transmission delay, originating Numbering Plan Area (NPA), domain, traffic separation index and screening classes. The Trunk Group and TSG are identified by a series of codes that specify the near and far ends of the trunk. In most cases, the full near end definition is not required because it will always be the same. The Trunk Group designation is comprised of the town, state, building and building subdivision for the far end plus the near end building subdivision. A TSG is uniquely identified by adding a Base Traffic Number reference. Trunk Group and TSG definitions are available in the 4ESS Switch as abbreviated Circuit Identification Names (CINs). Common Language Location Identification (CLLI) codes must be entered in the fields that make up the Trunk Group definition. Rules for establishing these codes are covered in Lucent Technologies Practices 795-100-100. The code for any established office may be found by referring to the location code index in that same Lucent Technologies Practices. For non-message TSGs, the format does not include mnemonics for identifying the far end of the trunk. The TSG will mnemonically identify the type of trunk category by function. Asterisks are used in columns where no information is necessary. The following paragraphs describe the individual fields within a TSG definition.

Continued on next page

Form Entries, Continued

TSG
(cont'd)

- **BTFN** - Base Traffic Number - The BTFN is a number in the range of **"0-9976"** that is part of the TSGs designation (which consists of the BTFN, TOWN, ST, BL, FBS, and NBS). The BTFN is the first traffic number in the first block of traffic numbers that is assigned to a TSG. Additional traffic numbers, which are assigned in blocks of 24, either higher or lower in numerical value than the BTFN can be assigned to the TSG, but the BTFN remains as defined above. All non-message trunks have a BTFN of **"0000"**. For RC 104, the BTFN is stored as the starting point for a block of traffic numbers that range up to the limit originally defined on RC Forms 100, 101 and 102 when the TSG was first built. Other blocks of traffic numbers, either higher or lower in numerical value, may be assigned to this TSG, via Recent Change (RC) procedures. In this case the original BTFN would still apply, but the QTFN field would contain the number of new traffic numbers to be assigned following the First Traffic Number (FTFN) specified.

- **TOWN** - Town is a 4-character alphabetic field - The code must represent the bona fide town, city or location per Lucent Technologies Practices 795-100-100 for the far end of the TSG.

- **ST** - State - This field represents the state, province or foreign country in which the far end office is located. The code in ST must be a standard 2-character alphabetic combination. Valid standard abbreviations for states, Canadian provinces and foreign countries may be found in Lucent Technologies Practices 795-100-100.

- **BL** - Building - The BL field contains the office identity for the far end of a TSG. This code consists of either two alphabetic characters or two numeric characters. Independent Telephone Company locations are always designated by an **"X"** plus some alpha character in this field. If the TSG terminates in a customer's building and it is not necessary to identify that particular building, this code may be arbitrary.

Continued on next page

Form Entries, Continued

TSG (cont'd)

- **FBS** - Far Building Subdivision - This field contains a code that identifies the internal building subdivision for the far end of a TSG. The code is a traffic, plant, or administrative assignment. It must be a 3-character alphanumeric combination. For non-message TSGs, this field is not required. Three asterisks are pre-printed on the form to provide an entry for this field.

- **NBS** - Near Building Subdivision - The NBS designation is the internal building identity for the near end termination of a TSG. It is always a 3-character alphanumeric code. This field should be left **"Blank"** if the NBS for this TSG is the same as the NBS assigned in the near office Circuit Identification Number (CIN) for the 4ESS Switch. The Office Data Assembler (ODA) system will add the NBS on a default basis.

Continued on next page

Form Entries, Continued

QTFN

Quantity of Traffic Numbers - This field specifies the size of the block of traffic numbers to be reserved with this input form beginning with the Base Traffic Number (BTFN) for this Trunk Subgroup (TSG). Traffic numbers must be allocated in groups of 24. Enter a multiple of 24 in the range of **"24 -504"**. If more than 504 traffic numbers are required for a given TSG, additional blocks of 24 may be added using RC Form 104. The total quantity of reserved traffic numbers should be equal to or greater than (to the nearest 24) the maximum size projected for this TSG during the engineering interval. This total should not include other blocks of traffic numbers that may be assigned separately with RC Form 104.

The maximum number of trunks that can be assigned to one TSG is 1023. If a TSG requires more than 1023 trunks and consequently more than 1023 traffic numbers, it must be split into two TSGs. The breakpoint must be a multiple of 24 and less than 1023 which makes 1008 trunks the logical maximum for one TSG. If for example, 1300 trunks were required between point A and point B, two TSGs should be built. The first TSG would contain 1008 trunks, and the second TSG would contain 292 trunks. The two TSGs would be linked in the Routing Data Block (RDB).

The 4ESS Switch feature, Inward Wide Band Area Telephone Service (INWATS) terminating directly to a customer's Automatic Call Distributor, has a limitation of 1023 TSGs totaling 24552 trunks (1023 trunk blocks of 24 registers).

For Voice Frequency Link (VFL) TSGs, if the traffic numbers for the VFLs are separated by 100, e.g., 801 IPLS IN 01 MSP and 901 IPLS IN 01 MSP, the QTFN must be 24 for building new TSGs. Then build the second set of 24 traffic numbers using RC Form 104.

Continued on next page

Form Entries, Continued

FTFN

First Traffic Number - For each line under FTFN, enter the FTN of the block of traffic numbers being assigned on that line. The quantity of trunks assigned on each line will be numbered sequentially by an internal program manipulation beginning with the FTFN specified. Valid inputs are **"0-9999**". Quantity of Trunks (QTRK) plus FTFN must be less than 10001.

For RC 104, this field should specify the first traffic number of the new block of traffic numbers that is being added to the Trunk Subgroup. Valid inputs are **"0-9976"**.

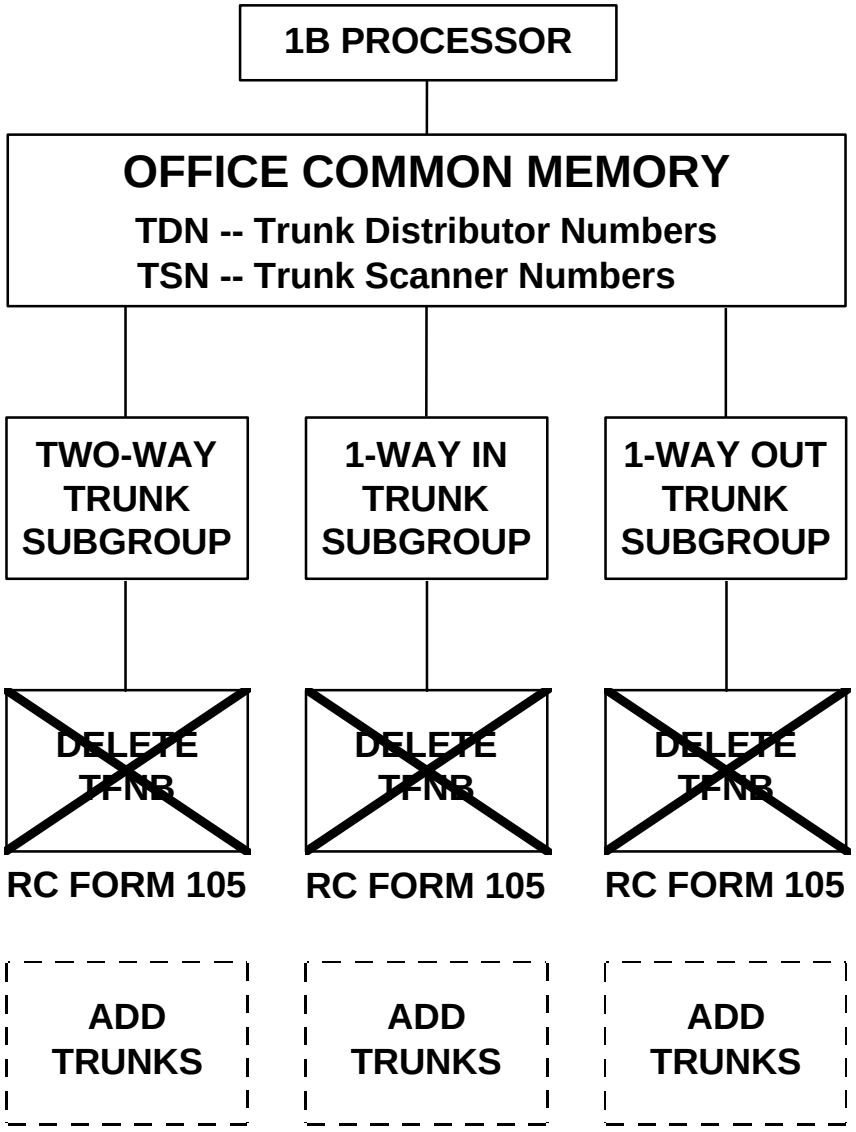
RC Form 105

General

Recent Change (RC) Form 105 removes a Traffic Number Block(s) (TFNB) from an existing Trunk Subgroup (TSG). This message is classed as a Recent Change Data Message (RCDM).

An alphabetical keyword list is included in this section on page 10.



Continued on next page

RC Form 105, Continued

General (cont'd.)

The Traffic Number Block (TFNB) is explained previously under "QTFN" in the RC Form 100 Section. It must be structured in multiples of 24 traffic numbers each. This RCDM allows the removal of each assigned TFNB one at a time per activation. Therefore, the QTFN for this RCDM is preprinted as **"24"** on the blank form. Prior to activation, the associated trunks must be put to the CADOOS state and removed from translations. At this time, the TFNB can be removed in the reverse order in which it was initially installed. Subsequent RC Form 105s can remove TFNBs one at a time. Typically, this RCDM will be used for one of three reasons.

1. To remove a TSG entirely. All trunks and TFNBs must be removed prior to removing the TSG structure.

2. To change the trunk numbering scheme. This RCDM would be required to remove the TFNBs for the trunks related to the number assignment change or possibly all of them if the Base Traffic Number (BTFN) of the TSG also had to be changed.

3. To change the Reverse (REV) entry on the TSG form due to a Glare trunk problem. This also requires all trunks to CADOSS and the removal of all trunks and TFNBs prior to changing the REV value on the RC Form 100. After the REV entry change, the RC Form 104 would be used to rebuild all of the required TFNB(s) before reassigning all of the trunks to the TSG.

The TFNB removal operation could have a definite service impact; therefore, the work usually would have to be performed out of normal business hours unless an adequate traffic reroute could be implemented for the duration.

TSG

Trunk Subgroup - This series of codes identifies a Trunk Subgroup. The TSG is a set of trunks within a Trunk Group having certain identical characteristics. A Trunk Group must have a common destination. In addition to group characteristics, a TSG also has common signaling characteristics, transmission delay, originating Numbering Plan Area (NPA), domain, traffic separation index and screening classes. The Trunk Group and TSG are identified by a series of codes that specify the near and far ends of the trunk. In most cases, the full near end definition is not required because it will always be the same. The Trunk Group designation is comprised of the town, state, building and building subdivision for the far end plus the near end building subdivision. A TSG is uniquely identified by adding a Base Traffic Number reference. Trunk Group and TSG definitions are available in the 4ESS Switch as abbreviated Circuit Identification Names (CINs). Common Language Location Identification (CLLI) codes must be entered in the fields that make up the Trunk Group definition. Rules for establishing these codes are covered in Lucent Technologies Practices 795-100-100. The code for any established office may be found by referring to the location code index in that same Lucent Technologies Practices. For non-message TSGs, the format does not include mnemonics for identifying the far end of the trunk. The TSG will mnemonically identify the type of trunk category by function. Asterisks are used in columns where no information is necessary. The following paragraphs describe the individual fields within a TSG definition.

Form Entries, Continued

TSG
(cont'd)

- **BTFN** - Base Traffic Number - The BTFN is a number in the range of **"0-9976"** that is part of the TSGs designation (which consists of the BTFN, TOWN, ST, BL, FBS, and NBS). The BTFN is the first traffic number in the first block of traffic numbers that is assigned to a TSG. Additional traffic numbers, which are assigned in blocks of 24, either higher or lower in numerical value than the BTFN can be assigned to the TSG, but the BTFN remains as defined above. All non-message trunks have a BTFN of **"0000"**. For RC 104, the BTFN is stored as the starting point for a block of traffic numbers that range up to the limit originally defined on RC Forms 100, 101 and 102 when the TSG was first built. Other blocks of traffic numbers, either higher or lower in numerical value, may be assigned to this TSG, via Recent Change (RC) procedures. In this case the original BTFN would still apply, but the QTFN field would contain the number of new traffic numbers to be assigned following the First Traffic Number (FTFN) specified.

- **TOWN** - Town is a 4-character alphabetic field - The code must represent the bona fide town, city or location per Lucent Technologies Practices 795-100-100 for the far end of the TSG.

- **ST** - State - This field represents the state, province or foreign country in which the far end office is located. The code in ST must be a standard 2-character alphabetic combination. Valid standard abbreviations for states, Canadian provinces and foreign countries may be found in Lucent Technologies Practices 795-100-100.

- **BL** - Building - The BL field contains the office identity for the far end of a TSG. This code consists of either two alphabetic characters or two numeric characters. Independent Telephone Company locations are always designated by an **"X"** plus some alpha character in this field. If the TSG terminates in a customer's building and it is not necessary to identify that particular building, this code may be arbitrary.

TSG (cont'd)

- **FBS** - Far Building Subdivision - This field contains a code that identifies the internal building subdivision for the far end of a TSG. The code is a traffic, plant, or administrative assignment. It must be a 3-character alphanumeric combination. For non-message TSGs, this field is not required. Three asterisks are pre-printed on the form to provide an entry for this field.

- **NBS** - Near Building Subdivision - The NBS designation is the internal building identity for the near end termination of a TSG. It is always a 3-character alphanumeric code. This field should be left **"Blank"** if the NBS for this TSG is the same as the NBS assigned in the near office Circuit Identification Number (CIN) for the 4ESS Switch. The Office Data Assembler (ODA) system will add the NBS on a default basis.

Continued on next page

Form Entries, Continued

QTFN

Quantity of Traffic Numbers - This field specifies the size of the block of traffic numbers to be reserved with this input form beginning with the Base Traffic Number (BTFN) for this Trunk Subgroup (TSG). Traffic numbers must be allocated in groups of 24. Enter a multiple of 24 in the range of **"24 -504"**. If more than 504 traffic numbers are required for a given TSG, additional blocks of 24 may be added using RC Form 104. The total quantity of reserved traffic numbers should be equal to or greater than (to the nearest 24) the maximum size projected for this TSG during the engineering interval. This total should not include other blocks of traffic numbers that may be assigned separately with RC Form 104.

The maximum number of trunks that can be assigned to one TSG is 1023. If a TSG requires more than 1023 trunks and consequently more than 1023 traffic numbers, it must be split into two TSGs. The breakpoint must be a multiple of 24 and less than 1023 which makes 1008 trunks the logical maximum for one TSG. If for example, 1300 trunks were required between point A and point B, two TSGs should be built. The first TSG would contain 1008 trunks, and the second TSG would contain 292 trunks. The two TSGs would be linked in the Routing Data Block (RDB).

The 4ESS Switch feature, Inward Wide Band Area Telephone Service (INWATS) terminating directly to a customer's Automatic Call Distributor, has a limitation of 1023 TSGs totaling 24552 trunks (1023 trunk blocks of 24 registers).

For Voice Frequency Link (VFL) TSGs, if the traffic numbers for the VFLs are separated by 100, e.g., 801 IPLS IN 01 MSP and 901 IPLS IN 01 MSP, the QTFN must be 24 for building new TSGs. Then build the second set of 24 traffic numbers using RC Form 104.

Form Entries, Continued

FTFN

First Traffic Number - For each line under FTFN, enter the FTN of the block of traffic numbers being assigned on that line. The quantity of trunks assigned on each line will be numbered sequentially by an internal program manipulation beginning with the FTFN specified. Valid inputs are **"0-9999**". Quantity of Trunks (QTRK) plus FTFN must be less than 10001.

For RC 104, this field should specify the first traffic number of the new block of traffic numbers that is being added to the Trunk Subgroup. Valid inputs are **"0-9976"**.

RC Form 106

General

Recent Change (RC) Form 106 is used to delete an entire Trunk Subgroup (TSG) from translations of the 4ESS-2000 Switch. This message is classed as a Recent Change Data Message (RCDM).

Prior to activating this RC, all trunks and Traffic Number Blocks (TFNBs) must be removed. Also, the TSG to be removed cannot appear on any routing translators, network management controls, network management studies, or measurement reports.

An alphabetical keyword list is included in this section on page 9.

Form Entries

RC:TSG;OUT:---:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message. FTT – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

TSG

Trunk Subgroup - This series of codes identifies a Trunk Subgroup. The TSG is a set of trunks within a Trunk Group having certain identical characteristics. A Trunk Group must have a common destination. In addition to group characteristics, a TSG also has common signaling characteristics, transmission delay, originating Numbering Plan Area (NPA), domain, traffic separation index and screening classes. The Trunk Group and TSG are identified by a series of codes that specify the near and far ends of the trunk. In most cases, the full near end definition is not required because it will always be the same. The Trunk Group designation is comprised of the town, state, building and building subdivision for the far end plus the near end building subdivision. A TSG is uniquely identified by adding a Base Traffic Number reference. Trunk Group and TSG definitions are available in the 4ESS Switch as abbreviated Circuit Identification Names (CINs). Common Language Location Identification (CLLI) codes must be entered in the fields that make up the Trunk Group definition. Rules for establishing these codes are covered in Lucent Technologies Practices 795-100-100. The code for any established office may be found by referring to the location code index in that same Lucent Technologies Practices. For non-message TSGs, the format does not include mnemonics for identifying the far end of the trunk. The TSG will mnemonically identify the type of trunk category by function. Asterisks are used in columns where no information is necessary. The following paragraphs describe the individual fields within a TSG definition.

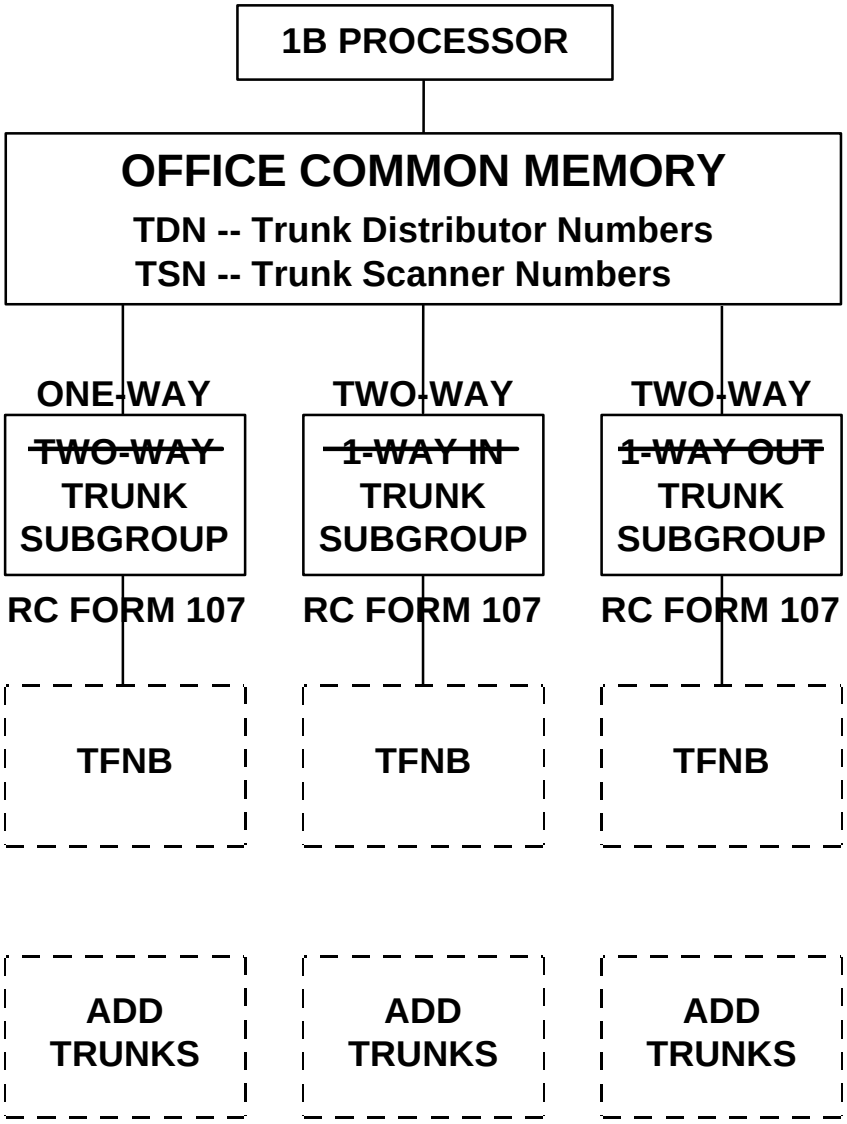
RC Form 107

General

Recent Change (RC) Form 107 changes the translations for an existing two-way Trunk Subgroup (TSG). This form can also be used to convert a one-way TSG to a two-way TSG. This message is classed as a Recent Change Data Message (RCDM).

An alphabetical keyword list is included in this section, starting on page 66.



Continued on next page

RC Form 107, Continued

General (cont'd.)

RC FORM 107 changes the translations for an existing two-way Trunk Subgroup (TSG). This form can also be used to convert a one-way TSG to a two-way TSG. This message is classed as a Recent Change Data Message (RCDM).

There are two characteristics that are not changeable with this form: the Circuit Identification Name (CIN) (use form 802) and the Quantity of Traffic Numbers (QTFN) (use forms 104 or 105).

The restrictions imposed for changing the Domain (DOM) are:

- The existing domain has to be in the range of 20 through 69.
- The new domain has to be in the range of 20 through 69.

All other changes to the Domain are prohibited.

Certain characteristics cannot be changed unless all trunks in the TSG are in a particular state. For more information, Refer to Table 3 – Relationship Between Characteristics and State of Trunks in Trunk Subgroup. This table confirms that almost all of the popular characteristics related to a TSG change require the trunks to be either put in the CADOOS state or removed. Therefore, it should be noted that it may be much easier and more efficient (maintaining service) to build the new TSG. Then, as the trunks from the old TSG are put to the CADOOS state, they can be removed from the old TSG and reassigned to the new TSG. This is a prudent choice as service could be working on both TSGs as some of the trunks are being turned down and reassigned to the new TSG. Also, the new two-way TSG is more apt to have the more accurate Traffic Numbering Block (TFNB) scheme as a result of the Reverse (REV) considerations while building the new TSG. After all of the trunks are removed from the old TSG (this transition could be over a number of days if desired), it can be entirely removed.

Form Entries

RC:TSG;CHG;OPT(TWOWAY),---:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

ORNU Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

Form Entries, Continued

TSG

Trunk Subgroup - This series of codes identifies a Trunk Subgroup. The TSG is a set of trunks within a Trunk Group having certain identical characteristics. A Trunk Group must have a common destination. In addition to group characteristics, a TSG also has common signaling characteristics, transmission delay, originating Numbering Plan Area (NPA), domain, traffic separation index and screening classes. The Trunk Group and TSG are identified by a series of codes that specify the near and far ends of the trunk. In most cases, the full near end definition is not required because it will always be the same. The Trunk Group designation is comprised of the town, state, building and building subdivision for the far end plus the near end building subdivision. A TSG is uniquely identified by adding a Base Traffic Number reference. Trunk Group and TSG definitions are available in the 4ESS Switch as abbreviated Circuit Identification Names (CINs). Common Language Location Identification (CLLI) codes must be entered in the fields that make up the Trunk Group definition. Rules for establishing these codes are covered in Lucent Technologies Practices 795-100-100. The code for any established office may be found by referring to the location code index in that same Lucent Technologies Practices. For non-message TSGs, the format does not include mnemonics for identifying the far end of the trunk. The TSG will mnemonically identify the type of trunk category by function. Asterisks are used in columns where no information is necessary. The following paragraphs describe the individual fields within a TSG definition.

Continued on next page

Form Entries, Continued

TSG (cont'd)

- **BTFN** - Base Traffic Number - The BTFN is a number in the range of **"0-9976"** that is part of the TSGs designation (which consists of the BTFN, TOWN, ST, BL, FBS, and NBS). The BTFN is the first traffic number in the first block of traffic numbers that is assigned to a TSG. Additional traffic numbers, which are assigned in blocks of 24, either higher or lower in numerical value than the BTFN can be assigned to the TSG, but the BTFN remains as defined above. All non-message trunks have a BTFN of **"0000"**. For RC 104, the BTFN is stored as the starting point for a block of traffic numbers that range up to the limit originally defined on RC Forms 100, 101 and 102 when the TSG was first built. Other blocks of traffic numbers, either higher or lower in numerical value, may be assigned to this TSG, via Recent Change (RC) procedures. In this case the original BTFN would still apply, but the QTFN field would contain the number of new traffic numbers to be assigned following the First Traffic Number (FTFN) specified.

- **TOWN** - Town is a 4-character alphabetic field - The code must represent the bona fide town, city or location per Lucent Technologies Practices 795-100-100 for the far end of the TSG.

- **ST** - State - This field represents the state, province or foreign country in which the far end office is located. The code in ST must be a standard 2-character alphabetic combination. Valid standard abbreviations for states, Canadian provinces and foreign countries may be found in Lucent Technologies Practices 795-100-100.

- **BL** - Building - The BL field contains the office identity for the far end of a TSG. This code consists of either two alphabetic characters or two numeric characters. Independent Telephone Company locations are always designated by an **"X"** plus some alpha character in this field. If the TSG terminates in a customer's building and it is not necessary to identify that particular building, this code may be arbitrary.

Continued on next page

Form Entries, Continued

TSG
(cont'd)

- **FBS** - Far Building Subdivision - This field contains a code that identifies the internal building subdivision for the far end of a TSG. The code is a traffic, plant, or administrative assignment. It must be a 3-character alphanumeric combination. For non-message TSGs, this field is not required. Three asterisks are pre-printed on the form to provide an entry for this field.

- **NBS** - Near Building Subdivision - The NBS designation is the internal building identity for the near end termination of a TSG. It is always a 3-character alphanumeric code. This field should be left **"Blank"** if the NBS for this TSG is the same as the NBS assigned in the near office Circuit Identification Number (CIN) for the 4ESS Switch. The Office Data Assembler (ODA) system will add the NBS on a default basis.

Continued on next page

Form Entries, Continued

PCF

Point Code Format - This field is used to specify the format of the point code that is being entered in the point code field. If no entry is being made in the Destination Point Code (DPC) (Originating Point Code [OPC]) field, then this field must be left **"Blank"**. Three different formats are available for input: **ATT, ANSI,** or **ISPC**.

ATT is used for AT&T standard input/output which consists of a three digit network indicator, a two digit cluster region, a one digit cluster type, and a three digit cluster member.

1. **NET**: Network Indicator - This value specifies which signaling network will be used for transport. Valid entries are **"000-255"**.

2. **CR**: Cluster Region - This value specifies the region of the signaling network where the office is located. Valid entries are **"00-31"**.

3. **CT**: Cluster Type - Valid entries are **"0-7"**.

4. **MEM**: - Cluster Member - This value specifies the office member number within the cluster. Valid entries are **"000-255"**.

ANSI is used to indicate that the input/output is in the American National Standards Institute format which consists of a three digit network indicator, a three digit cluster, and a three digit member number.

1. **NET**: Network Indicator - This value specifies which signaling network will be used for transport. Valid entries are **"000-255"**.

2. **CLU**: Cluster - This value specifies the cluster of the signaling network where the office is located. Valid entries are **"000-255"**.

3. **MEM**: Member Number - This value specifies the office member number within the cluster. Valid entries are **"000-255"**.

Continued on next page

Form Entries, Continued

PCF (cont'd)

ISPC is used for international signaling point code input/output which consists of a one digit world geographical zone, a three digit area/network identifier, and a one digit signaling point identifier. Reference: International Consultative Committee for International Telephone & Telegraph Signaling System (CCITT) Recommendation "Numbering of International Signaling Point Codes", Vol. VI, Rec. Q.708.

1. **WGZ**: World Geographical Zone - This value specifies the world geographical zone of the office. Valid entries are "**1-7"**.

2. **ANI**: Area/Network Identification - This value specifies a geographical area or network in a specific zone. Valid entries are **"000-255"**.

3. **SPID**: Signaling Point Identification - This value specifies a signaling point in a specific geographical area or network. Valid entries are **"0-7"**.

AOPC

Alias Origination Point Code - This field will provide a unique combination of a Local Exchange Carrier (LEC) Signal Transfer Point (STP) Point Code (PC) and an AT&T STP PC for each Local Access Transport Area (LATA) dedicated D-link set via a logical point code. AOPC, if entered, must be entered in the ATT format. See the Point Code Format (PCF) field for the format description. AOPC may only be entered when the PCF field is not **"Blank"**.

Continued on next page

Form Entries, Continued

DPC

Destination Point Code - This field is used to specify the Destination Point Code of the far-end switch.

This field entry is divided into three subfield entries:

1. NET - Network Indicator - This value specifies which signaling network will be used for transport. Valid entries are **"Blank"**, **"000-255"**.

2. CLU - Cluster - This value specifies the cluster of the signaling network where the office is located. Valid entries are **"Blank"**, **"000-255"**.

3. MEM - Cluster Member - This value specifies the office member number within the cluster. Valid entries are **"Blank"**, **"000-255"**.

For the Trunk Subgroup (TSG) forms, nine digits must be entered, depending on the format specified in the Point Code Format (PCF) field. Nine digits must be entered if PCF is American National Standards Institute (ANSI) format. An entry must be made in this field if either the Incoming Signaling Characteristics (ISC) or Outgoing Signaling Characteristics (OSC) field value is **"ISUP"**, **"INUP"**, or **"TUP"**; otherwise this field must be **"Blank"**.

Continued on next page

Form Entries, Continued

FENCLASS This field specifies the classification of the Far End Network (FEN). If the Trunk Subgroup (TSG) is not associated with any FEN, this field is left **"Blank"**. The FEN with which the TSG is to be associated must be described via 4ESS Switch RC 617.

For RC 524, this field identifies the class for accumulating counts.

The following classifications are available:

- **ACCESA** - This identifier specifies that the TSG is a link to an Inter-exchange Carrier (IC) or International Carrier (INC), and the 4ESS Switch is being used by a Local Exchange Carrier (LEC) as an Access Tandem (AT) and/or Service Switching Point (SSP) to switch calls from this TSG.

- **ACCESI** -This identifier specifies that the TSG is a link to an International Carrier (INC), and the 4ESS Switch is being used by an Interexchange Carrier (IC) (e.g., AT&T-C) to switch calls from this TSG.

- **ACCESO** - This identifier specifies that the TSG is a link to an Operating Company and the 4ESS Switch is used as an IC.

- **CAMA** - This identifier specifies that the TSG is terminated on an office which delivers traffic on Centralized Automatic Message Accounting (CAMA) trunks.

- **CMC** - Cellular Mobile Carrier - This identifier specifies that the FEN is a CMC. The TSG connects an Access Tandem (AT) and a CMC.

- **INTL** - This identifier specifies that the TSG is an international link with the far end outside World Zone 1 and that the 4ESS Switch is being used as an International Switching Center (ISC)

- **OWATS** - This identifier specifies that the TSG is a link to a Private Branch Exchange (PBX) over which only Outward Wide Band Area Telephone Service (WATS) calls are allowed.

Continued on next page

Form Entries, Continued

FENCLASS (cont'd)

- **OEO** - Other End Office connecting, meaning an Equal Access End Office (EAEO) owned by a different company. This identifier specifies that the FEN is an OEO. The TSG connects an Access Tandem (AT) and an OEO.
- **PBX** - This identifier specifies that the TSG is a link to a PBX.
- **POTS** - This identifier specifies that the TSG is a link to a switching machine serving either a Local Access Transport Area (LATA) of the Local Exchange Carrier (LEC) owning/sharing the 4ESS Switch, the Continental United States/Plain Old Telephone Service (POTS) (CUSP) network of the IEC owning/sharing the 4ESS Switch, or some other FEN to be treated similarly.

Continued on next page

Form Entries, Continued

FENID

Far End Network (FEN) Identification - This field distinguishes the specific FEN with which this Trunk Subgroup (TSG) is associated. One to six alphanumeric characters may be entered to distinguish among several FENs with the same classification, or the field may be left **"Blank"**. If FENCLASS is **"Blank"**, FENID must also be **"Blank"**.

When the FENCLASS is ACCESA or ACCESI, FENID should consist of type of feature group access and the 4 numeric digits of the Carrier Identification Code (CIC).

The type of feature group definitions are:

- **G** - All access types (B, C, & D).
- **B** - Feature Group B Access.
- **C** - Feature Group C Access.
- **D** - Feature Group D Access.

Examples include:

- **G0288** - Carrier ID 288 has Feature Group B, C, & D access.
- **BC0288** - Carrier ID 288 has Feature Group B & C access.
- **BD0288** - Carrier ID 288 has Feature Group B & D access.
- **B2882** - Carrier ID 2882 has Feature Group B access only.
- **D2882** - Carrier ID 2882 has Feature Group D access only.

For an access type, both B2882 and D2882 can exist but be for different carriers.

Continued on next page

Form Entries, Continued

TFG

Type of Feature Group - This field is used to specify whether the Type of Access for this Trunk Subgroup (TSG) is tariffed under Feature Group B, Feature Group C, or Feature Group D. An entry can only be made if the FENCLASS is ACCESA. If FENCLASS is ACCESA, a **"B"**, **"C"**, or **"D"** must be entered, corresponding to Feature Groups B, C, or D, respectively. FENCLASS is not ACCESA, this field must be left **"Blank"**.

TSGBBC

Trunk Subgroup (TSG) Broadband Capability - Integrated Services Digital Network User Part (ISUP), International ISUP (INUP), and Q.931 signaling systems allow for broadband switching. This entry specifies what type of circuits may be populated in this TSG. Valid entries are:

- **Blank** - 1 trunk circuit
- **0** - 1 trunk circuit
- **1** - 6 trunk circuits
- **2** - 24 trunk circuits
- **3** - Combined usage 1 and 6 trunk circuits
- **4** - Combined usage 1 and 24 trunk circuits
- **5** - Combined usage 6 and 24 trunk circuits
- **6** - Combined usage 1, 6, and 24 trunk circuits.

VDCAP

EXSEQ	Not Applicable - Entries: **"Blank"**
FEPTY	Not Applicable - Entries: **"Blank"**
C1WTO2W	Convert a One-way Trunk Subgroup(TSG) to a Two-way Trunk Subgroup -This specifies a one-way TSG (incoming or outgoing) is to be converted to a two-way TSG. Valid entries are **"Blank"**, **"Y"**, or **"N"**.

Continued on next page

Form Entries, Continued

TOT

Type of Trunk - This field specifies the trunk type for this Trunk Subgroup (TSG). TOT entries of **"ETC"** for End Office or Tandem Connecting, **"LCC"** for Local Exchange Carrier Connecting, and **"OCC"** for Other Carrier Connecting are used for network interconnect. When these TOT values are used on Integrated Services Digital Network User Part (ISUP)
trunks, the Local Exchange Carrier (LEC) (Bellcore TR-317) and/or network interconnect version (TR-394) of the ISUP protocol is used. For all other allowed TOT values, the AT&T version of the ISUP protocol is used. The codes that may be entered are as follows:

- **ETC** - End Office or Tandem Office Connecting - This Type of Trunk (TOT) is used to identify Equal Access (EA) or Intra Local Access Transport Area (IntraLATA) trunks at a switch serving as an Access Tandem (AT) or Service Switching Point (SSP) where the other end connects to an End Office. This TOT is also used to identify EA trunks between ATs or between an AT and a switch serving as an SSP. When the type of trunk is ETC, the signaling characteristic of the Trunk Subgroup (TSG) must be either Multifrequency Wink (MFWINK) or ISUP.

- **INTL** - International - International circuit with the far end outside of World Zone 1, and having signaling characteristics of International Consultative Committee for International Telephone & Telegraph Signaling System 5 (CCITT5), CCITT6, International ISUP (INUP), and CCITT7 Telephone User Part (TUP).

- **INTLO** - International Overflow - International Overflow circuit (for overflow transit traffic) with the far end inside World Zone 1 in another International Switching Center (either the U.S. or foreign).

- **ITAND** - Inter Tandem - This TOT can be used to handle traffic between two tandem switchers in the same local calling area.

- **ITOLL** - Intertoll - Intertoll trunks will carry toll traffic between class 4 or higher offices, or trunks dedicated to Inter-International Switching Center (inter-ISC) international overflow traffic. This includes final, full and high usage TSGs.

Continued on next page

Form Entries, Continued

TOT (cont'd)

- **ITOPA** - International Operator Trunk A – International Operator Center 3C/3CL switchboards associated with Operator Bridged Access Trunks (OBAT). Each OBAT has two appearances on the A trunk and B trunk.

- **LCC** - Local exchange Carrier Connecting - This TOT is used to identify EA trunks at an AT&T switch This identifier is also used for outgoing ISUP trunks from the Interexchange Carrier/International Exchange Carrier (IC/INC) to an SSP office. When the type of trunk is LCC, the signaling characteristic of the TSG must be either MFWINK or ISUP and the Equal Access Signaling (EAS) field must be marked as either **"E"**, **"A"**, **"D"** or **"R"**.

- **NSDSD** - Network Services Frame Direct Services Dialing Capability - This identifier indicates trunks in this TSG are used to interface the Network Services Frame (NSF) for Direct Services Dialing Capability (DSDC) features. This TSG may only have two way Common Channel Interoffice Signaling (CCIS) characteristics. This TSG is not hunted via normal routing mechanisms, so there can be only one TSG bearing this TOT designation (all trunks connecting a 4ESS Switch to its DSDC equipped NSF must be in the same TSG).

- **OCC** - Other Carrier Connecting - This TOT is used to identify EA trunks at a switch serving as an AT or SSP where the other end connects to an IC or INC switch. This type of trunk should be used when the signaling on the TSG is MFWINK or ISUP.

- **PBX** - Private Branch Exchange - This identifier indicates that the trunks in this TSG terminate on a PBX unit. If the PBX interface is via a 2-wire PBX Channel Unit (J98726ST), then the Incoming Signaling Characteristics (ISC) should be Dial Pulse Immediate (DPIMMED) and the Outgoing Signaling Characteristics (OSC) should be Dial Pulse Wink (DPWINK).

- **SECIT** - Secondary Intertoll - These trunks interconnect toll switching machines and manually operated toll or assistance switchboards for routing of operator completed traffic.

Continued on next page

Form Entries, Continued

TOT (cont'd)

- **STC** - Single Trunk Customer - This TOT is used to designate a TSG for single trunk terminations not supported by a PBX. When TOT is STC, the following TSG fields must be **"Blank"** or **"N"** as allowed: ANISID, APS, BRL, CCIS2WRE, DNHR, DPC, EAS, FAR4E, PBXAW, PBXESGD, REV, RFA, RFMP, SAT, SINDEX, TFG, TSGBBC, WANISID, XCPA.

- **TAND** - Tandem - This code is used for 2-way tandem, tandem completing and tandem connecting TSGs.

- **TOLLC** - Toll Connecting or Completing - This code is used for Direct Distance Dialing (DDD) access, toll connecting or toll completing TSGs.

SAT

Satellite - Enter a **"Y"** for Yes or **"N"** for No to indicate whether or not this Trunk Subgroup (TSG) is associated with satellite facilities. This entry performs a screening function to avoid two satellite TSGs from being connected together to complete a call. If the incoming TSG has SAT = "Y", then call processing will insist the outgoing TSG must have SAT = "N". This can also be used for local screening functions even though the TSG is not via a satellite.

For Voice Frequency Link (VFL) TSGs, satellite facilities cannot be used for a domestic Common Channel Interoffice Signaling (CCIS) system, i.e. if DOM is Plain Old Telephone Service (POTS), then SAT must be **"N"**.

Continued on next page

Form Entries, Continued

DOM

DOMAIN - This field designates a community of interest that requires separate routing. The types of Domain are "Direct Distance Dialing (DDD), International Direct Distance Dialing (IDDD), Verify (VRFY)" and a number ranging from **"20-83"** denoting a NON-Plain Old Telephone Service (POTS) domain. DDD is indicated by an entry of **"POTS"** in the DOM field. The Office Data Assembler (ODA) system will automatically build the DDD Domains (0 through 19). The **"VRFY"** Domain enables the Line-Busy Verification feature by operators over a dedicated network. When DOM equals VRFY, then Type of Trunk (TOT) must be ITOLL, MISC, or TSPS or CALLTYP must equal FHT, GNS, or TST. The NON-POTS Domains may be a Common Control Switching Arrangement (CCSA) Network, such as Federal Telecommunications System (FTS). These domains are entered as a number from **"20-69"**.

- The **NON-POTS domain of 78** is used to skip Network Management code controls for quality assurance testing, i.e. CASPER.
- The **NON-POTS domains 79 and 80** are reserved for specific International Switching Center (ISC) use.
- The **NON-POTS domain of 81**, also denoted by **"IVT"** for International Voice Transport, is reserved for call processing to transport international voice calls through the network to an ISC.
- The **NON-POTS domain of 82** is used as the translation domain for Data calls. The Data feature provides the capability for full rate data transmission via the 4ESS Switch over a dedicated network of digital trunks. These digital trunks terminate exclusively on Digital Interface Frames (DIF) at 4ESS Switch locations.
- **N64C** -This domain is used to route 64 kbps clear data calls using the 10-digit North American Numbering Plan (NANP).
- **N64R** -This domain is used to route 64 kbps restricted data calls using the 10-digit North American Numbering Plan.
- **I64C** -This transport domain is used to route 64 kbps clear international data calls up to an ISC.
- **I56D** -This transport domain is used to route 56 kbps international data calls up to an ISC.

Continued on next page

Form Entries, Continued

DOM (cont'd)

The following translations domains are used for the Software Defined Network (SDN) and Private Branch Exchange (PBX) Interface features:

- **SDNA** - Software Defined Network (SDN) Access - This domain is used to translate the digits of an originating SDN (voice or data) call and determine if the call is a 7-digit or 10-digit call. Trunks in the SDNA domain are dedicated to SDN calls. When DOM equals SDNA, then TOT must be CAMAA, CAMAO, ETC, LCC, PBX, STC, TAND, or TOLLC for Trunk Subgroup (TSG) forms or CALLTYP must be CRB, DSD, DSN, EAR, FHT, GNS, INW, IRA, MCT, MMT, MRT, PAS, PRT, RDB, RNR, SDX, SSP, TEL, TST, or TTS for code group forms.

- **DEV** - Dedicated Egress Voice - This domain is available at the terminating 4ESS Switch to translate SDN and Direct Connect voice calls and route them to a directly connected PBX, via direct egress, or to a local office, via switched egress.

  This domain is also used as an access domain for originating Direct Connect voice calls. The calls arrive at the 4ESS Switch as 10-digit calls. When DOM equals DEV, then TOT must be PBX or Single Trunk Customer (STC) for TSG forms or CALLTYP must be CRB, DSD, DSN, EAR, FHT, GNS, INW, IRA, MCT, MMT, MRT, PAS, PRT, RDB, RNR, SDX, SSP, TEL, TST, or TTS for code group forms.

- **DED** -Dedicated Egress Data - This domain is available at the terminating 4ESS Switch to translate the SDN data call and route it to a directly connected PBX, via direct egress, or to a local office, via switched egress.

  This domain is also used as an access domain for originating Direct Connect data calls. The calls arrive at the 4ESS Switch as 10-digit calls and are routed through the network (translations and facilities) via the data domain. When DOM equals DED, then TOT must be PBX or STC for TSG forms or CALLTYP must be CRB, DSD, DSN, EAR, FHT, GNS, INW, IRA, MCT, MMT, MRT, PAS, PRT, RDB, RNR, SDX, SSP, TEL, TST, or TTS for code group forms.

Continued on next page

Form Entries, Continued

DOM (cont'd)

The following translations domains are used for wideband transmission:

- **NH0C** -This domain is used to route 384 kbps clear data calls using the 10-digit North American Numbering Plan (NANP).
- **NH1C** - This domain is used to route 1536 kbps clear data calls using the 10-digit NANP.
- **APN** - Action Point Numbering Plan - This domain is used as an access domain for originating Direct Connect voice or data calls. The calls arrive at the 4ESS Switch as 10-digit calls. When DOM equals APN, then TOT must be PBX or STC for TSG forms.

NOTE: For Voice Frequency Link (VFL) TSGs, this field identifies the domain in which this TSG operates. Valid inputs are "POTS" (if VFL is associated with a domestic Common Channel Interoffice Signaling [CCIS] system).

ACD

Automatic Call Distributor - This field is used to indicate if this Trunk Subgroup (TSG) is used to terminate Inward Wide Band Area Telephone Service (INWATS) traffic. Enter **"Y"** if this TSG will terminate INWATS traffic. Enter **"T"** if INWATS Time of Day (TOD) billing is required. Enter **"N"** or leave **"Blank"** if this TSG will not terminate INWATS traffic.

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

IT

Intertoll Treatment - This field is used when the domain of the Trunk Subgroup (TSG) is Plain Old Telephone Service (POTS) and the type of trunk is either End Office or Tandem Connecting (ETC) or Other Carrier Connecting (OCC) to specify whether the TSG should receive intertoll treatment (IT="**Y**") or toll connect treatment (IT=**"N"**) or **"Blank"**. Intertoll treatment means that the call is routed in the POTS intertoll domain, that is, a normal 7-digit call will be terminated in the home Numbering Plan Area (NPA).

((4E22>) - Offices using Traditional routing only). Toll connect treatment means that the call is terminated in the NPA specified by the Far End Numbering Plan Area (FENPA) field.

This field should be set to "**Y**" in any FENPA that is not the Home NPA

((4E22>) - Offices using Traditional routing only) or a Served NPA. This field can also be set to "**Y**" in the Home NPAs

((4E22>) - Offices using Traditional routing only) or Served NPAs to force the POTS-IT domain.

FAI

Not Applicable - Entries: **"Blank"**

FENPA

Far End Numbering Plan Area/Trunk Subgroup (TSG) - Enter a 3-digit Numbering Plan Area (NPA) code to identify the far end of the subgroup. Valid entries range from **"200-999"**. With an International Trunk Subgroup, if the far end of the Trunk Subgroup is outside World Zone 1, enter the 1-, 2-, or 3-digit country code. Valid ranges of Country Code entries are **"2-9"**, **"20-99"**, and **"200-999"**.

This field is the NPA of the Far-End Office. If this office is not in the Home or Served area, then the Domain will be Plain Old Telephone Service-Intertoll/Intertandem (POTS-IT) and the IT field will be forced to **"Y"** in a Local Exchange Carrier (LEC) switch.

Continued on next page

Form Entries, Continued

FEOFC Far-End Office Code - This field is used to identify the office code of the far end switch. Typically this value will range from 200-999. Legal entries are: **"Blank"**, **000-999**.

FELATA Far End Local Access Transport Area/Trunk Subgroup - This field is used to identify the Local Access Transport Area (LATA) of the far end switch. Legal entries are: **"Blank"**," **000-999"**.

FESC6 Far-End 6-Digit Screening - A **"Y"** for Yes or **"N"** for No indicates whether or not the far-end office which outpulsed the incoming digits is doing 6-digit screening. An **"N"** should be entered in this field if it cannot be determined whether or not the far-end is doing 6-digit screening.

If this field is equal to yes, then vacant code analysis assumes the far-end office will never outpulse a vacant central office code (NXX), vacant Numbering Plan Area (NPA) code, an originating Inward Wide Band Area Telephone Service (INWATS) call which has been denied originating capabilities, or an incorrect number of digits on this Trunk Subgroup (TSG).

IWZ1 International World Zone 1 - Enter **"Y"** if this Trunk Subgroup (TSG) will carry international traffic within World Zone 1. Enter **"N"** or leave **"Blank"** if this TSG will not carry international traffic within World one 1. Valid entries are **"Blank"**, **"N"**, or "**Y**".

MEM Memory - This field is used to indicate if trunk hunt with memory is to be performed on this Trunk Subgroup (TSG) when searching for an idle trunk. Trunk hunt with memory is not performed on a TSG if the TSGBBC field is greater than zero (the MEM field should be set to **"N"** in this case). Enter **"N"** if trunk hunt with memory is not to be done. Enter **"Y"** or leave **"Blank"** if trunk hunt with memory is to be done.

Continued on next page

Form Entries, Continued

PSES Prohibit Service Evaluation - An entry of **"N"** for No specifies that this Trunk Subgroup (TSG) is eligible for service evaluation by the No. 2 Service Evaluation System. An entry of **"Y"** for Yes specifies that the TSG is not eligible for service evaluation. Valid entries are **"Blank"**, **"Y"**, or **"N"**. Blank defaults to "**N**".

INSEP Incoming Traffic Separation Class - Enter a number in the range of **"0-255"** to indicate a traffic class for measurement purposes. This code will be used with the outgoing destination (Destination Separation [DESEP] on code group forms) to determine the peg and usage counts for traffic flow identification. Test position and test call Trunk Subgroups (TSGs) are generically assigned to Incoming Separation Class (INSEP) 31. This should be considered before assigning any other TSG to INSEP 31. Also, since service circuits, other non-message circuits, and 1-way outgoing TSGs have a generically assigned INSEP of zero, they will appear as part of TSG listings for INSEP zero. This fact should be considered before assigning any other Trunk Subgroup to INSEP zero.

MTSC Multiple Treatment Screening Class - This field is used to assign an MTSC to this Trunk Subgroup (TSG). Multiple treatment screening may be used to separate routing treatments for TSGs in the same domain. An example is giving independent company trunks a different routing even though the received digits and domain are the same as some other TSG. All TSGs must have an MTSC in the range of **"0-63"**.

GNSC Go/No Go Screening Class - Go/No Go Screening may be used to block traffic dialing specific digits over a Trunk Subgroup (TSG). All incoming and two-way message TSGs are given a Go/No Go class in the range of **"0-3**". When this type of screening is required for a group of codes, those codes are correlated with a specific class and a "Go" or "No Go" condition (RC Forms 300-304). If a group of codes specify "Go" on a given class, those codes will be blocked on TSGs having a class other than the specified class. For a "No Go" correlation, a set of codes will not be blocked except on TSGs having the specified class. All blocked traffic is given the vacant code Final Handling Treatment (FHT).

Continued on next page

Form Entries, Continued

GEOSEP

Geographical Traffic Separation Class - Valid entries for this field are one or two digits in the range of "**0**-**31**" to indicate a traffic class for measurement purposes. This code is used with the Announcement Separation Class to score geographical survey counts in Mass Announcement System (MAS) offices.

ISC

Incoming Signaling Characteristics - Enter one of the following codes to specify the incoming signaling characteristics required for this Trunk Subgroup (TSG).

- **DPDDSD** - Dial Pulse with Delay Dial/Start Dial.
- **DPIMADG** - Dial Pulse with Immediate start and "A" Digit reconstruction.
- **DPIMMED** - Dial Pulse with Immediate start (no delay).
- **DTMFWK** - Dual-Tone Multifrequency (DTMF) with Wink Start.
- **DTS** - Dial-Tone Start.
- **ISUP** - CCITT7 Integrated Services Digital Network (ISDN) User Part.
- **MFDDSD** - MF with Delay Dial/Start Dial.
- **MFOPWK** - MF Operator trunk with Wink start - International operator trunks.
- **MFWINK** - MF with Wink start.

Continued on next page

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

RFA	Ring Forward Allowed - Enter a **"Y"** for Yes or **"N"** for No to indicate if ring forward is allowed. All intertoll (ITOLL) trunks (Type of Trunk [TOT] field is equal to ITOLL) will require the RFA feature. All trunks that have the possibility of receiving operator calls from lower class offices will also require this feature. Each 4ESS Switch office must determine which Trunk Subgroups (TSGs) may receive operator type calls. These TSGs must have the RFA feature assigned.
ADIG	"A" Digit - Reconstruction will be necessary when receiving digits from a machine that absorbs the first digit of a dialed address. Valid entries are **"0"** or **"2-9"** if International Switching Center (ISC) equals DPIMADG. This field is **"Blank"** for all other cases.
CCIS2WRE	Common Channel Interoffice Signaling (CCIS) 2-Wire - This field should be **"Blank"** for a non-Common Channel Signaling (CCS) Trunk Subgroup (TSG). If this is a CCIS or Integrated Services Digital Network User Part (ISUP) TSG, then it must be determined whether the far end office will terminate the trunks in this TSG on a 2-wire or 4-wire switching network in order to perform the continuity check test on CCIS or ISUP trunks. The CCS continuity check tests will be performed by using the transceiver in either a transceive mode for 4-wire CCS trunks or in a transpond mode for 2-wire CCS trunks. Enter a **"Y"** for Yes if the far end office has a 2-wire network, e.g., 1 ESS/1A ESS 2-wire. Enter an **"N"** for No if the far end office has a 4-wire network, e.g., 1 ESS/1A ESS HILO, 4ESS, 5ESS®, etc.

Continued on next page

Form Entries, Continued

CBNPR

Calling Party Number/Billing Number Default Presentation Restriction Indicator - This field indicates whether the received CPN/BN can be passed from the network at the egress point or not. Enter **"Y"** if the default condition for the presentation of CPN/BN should be to restrict it. Enter **"N"** or leave **"Blank"** if the default condition for the presentation of CPN/BN should be unrestricted. This field applies to incoming trunks for which CPN/BN is pre-stored or on which CPN/BN can be received. For Integrated Services Digital Network User Part (ISUP) Trunk Subgroups (TSGs) with Type of Trunk (TOT) or Local Exchange Carrier Connecting (LCC), this field should be populated with a **"Y"**.

For 4E17 and later generics: Enter **"PA"** or **"Blank"** if the default condition for the presentation of CPN/BN should be unrestricted. Enter **"PR"** if the default condition for the presentation of CPN/BN should be to restrict it.

Continued on next page

Form Entries, Continued

OSC

Outgoing Signaling Characteristics - Enter one of the following codes to specify the outgoing signaling characteristics required for this Trunk Subgroup (TSG):

- **DPDDSD** - Dial Pulse with Delay Dial/Start Dial.
- **DPIMMED** - Dial Pulse with Immediate pulsing (no delay).
- **DPWINK** - Dial Pulse with Wink start.
- **DTMFWK** - DTMF with Wink Start.
- **ICOPNOP** - Integrity Check Operator trunk with No Outpulsing. Use this characteristic on trunk subgroups which return a wink signal.
- **ISUP** - CCITT7 ISDN User Part.
- **MFDDSD** - MF with Delay Dial/Start Dial.
- **MFWINK** - MF with WINK start.
- **MIOPNOP** - Miscellaneous Operator with No Outpulsing. This OSC. is used for information and other operator calls. This OSC may be used for Direct Connect calls on 1-way outgoing and 2-way TSGs when Type of Trunk (TOT) is Private Branch Exchange (PBX) or Single Trunk Customer (STC). Use this characteristic only on TSGs which do not return a wink signal.

Continued on next page

Form Entries, Continued

RFMP

Ring Forward Miscellaneous Distributor Point - Leave **"Blank"** or enter **"N"** for No to indicate that a miscellaneous distributor point is not associated with the outgoing portion of the Trunk Subgroup (TSG). This feature is only required for outgoing trunks requiring 130V ring forward battery. This feature is presently not available on the outgoing portion of 2-way trunk circuits.

DPSTOP

Dial Pulse Stop - Enter a **"Y"** for Yes if this Trunk Subgroup (TSG) terminates in a panel, Step-by-Step or other office that might not be able to receive a complete train of dial pulse digits without a pause between digits (Outgoing Signaling Characteristic [OSC] equal to DPWINK, DPDDSD, or DPIMMED). This feature will tell the program to look for a DPSTOP signal from the far-end office after any one of the first three digits is outpulsed. Enter an **"N"** for No if this feature is not required for DP outpulsing. For other types of outpulsing, leave this field **"Blank"**.

DELAY

Delay Interval - An entry must be made if the Outgoing Signaling Characteristic (OSC) is CCITT5, DTMFWK, MFWINK, or MFDDSD. Leave this field **"Blank"**, if any other OSC is specified. If OSC is MFWINK, MFDDSD, SIOPMFW, or TWOPMFW, enter **"20"**, **"80"**, or **"220"** to indicate the delay in milliseconds before outpulsing is started. This delay interval starts when the wink or start dial signal from the other office is recognized. Twenty milliseconds is basic for most offices. A delay of 20 may be associated with 7 or 10 multifrequency digits per second. When the OSC is Dual Tone Multifrequency Wink (DTMFWK), enter **"70"**, **"140"**, **"210"**, or **"280"** to indicate the delay in milliseconds before outpulsing. This delay interval starts when the wink from the Private Branch Exchange (PBX) is received. **"70"** milliseconds is the minimum required for PBXs.

Continued on next page

Form Entries, Continued

MFSPEED Multifrequency Speed - If Outgoing Signaling Characteristic (OSC) is specified as MFWINK, MFDDSD, SIOPMFW, or TWOPMFW enter **"7"** or **"10"** to indicate the number of outpulsed Multifrequency (MF) digits per second. Enter **"10"** for Lucent Technologies ESS machines. Seven digits per second is used for all electromechanical machines. If OSC is equal to International Consultative Committee for International Telephone & Telegraph Signaling System 5 (CCITT5), this field should indicate an MF speed of 10. Leave this field **"Blank"** for any other value of OSC.

DNHR Not Applicable - Entries: **"N"**

XCPA Transceiver (XC) Pad Adjustment - This item will be left **"Blank"** for non-Common Channel Interoffice Signaling (CCIS) trunks. If the Outgoing Signaling Characteristic (OSC) is equal to International Consultative Committee for International Telephone & Telegraph Signaling System 6 (CCITT6), Domestic CCIS (DOMCCIS), Integrated Services Digital Network User Part (ISUP), International ISUP (INUP), or CCITT7 Telephone User Part (TUP) enter a digit from **"0"** to **"3"** to indicate the pad setting for the CCIS transceiver. The correct entry can be determined by comparing the highest Inserted Connection Loss (ICL) value assigned to a trunk in this Trunk Subgroup (TSG) to the following table. The ICL can be obtained from the Circuit Order Layout Record (COLR) card.

DIGIT	ICL APPLICATION	PAD
• **0**	0 loss trunk	5 DB
• **1**	.1 to .8 loss	3.5 DB
• **2**	.9 to 1.7 loss	1.8 DB
• **3**	1.8 to 4.1 loss	0 DB

Continued on next page

Form Entries, Continued

DNP

Dialed Number Preferred - This field indicates whether the called user prefers to receive the original dialed number, if available, as delivered to the network rather than the routing number. Enter **"Y"** if the called user prefers receiving the original dialed number, otherwise, enter **"N"** or leave **"Blank"**. This field applies to outgoing Q.931 trunks only.

REV

Reverse Traffic Numbers - Enter a **"Y"** for Yes or **"N"** for No to indicate whether or not the hunt sequence for this Trunk Subgroup (TSG) is to be reversed. This is determined by comparing the name of the far-end office to the local office using the Common Language Location Identification (CLLI) code for each office. The last office alphabetically should be set to hunt in a reverse sequence. This determination is required only on 2-way TSGs in order to reduce the possibility of both offices seizing a trunk at the same time (a GLARE condition).

Internally, the trunks are stored in ascending traffic number order in the trunk block when REV is set to **"N"**. For non-broadband TSGs, the trunks are stored in descending traffic number order in the trunk block when REV is set to **"Y"**. Trunk hunt always starts searching from the beginning of the trunk block. For broadband TSGs, the trunks are always stored in ascending traffic number order in the trunk block regardless of whether REV is set to **"Y"** or **"N"**, however, when REV is **"Y"**, the busy-idle-bits are searched in a reverse order.

Continued on next page

Form Entries, Continued

GLARE

Glare Control - For domestic E&M trunks, enter an **"A"** for all if this office remains in control when a 2-way trunk is seized by both offices. The other office should be arranged to relinquish control. If the other office (far end) has control, enter an **"N"** for None.

For Integrated Services Digital Network User Part (ISUP) trunks, an "**O**" indicates that this office will control the odd labels. An "**E**" indicates that this office will control the even labels. The switch with the lower point code should be assigned to maintain control of the odd numbered Circuit Identification Codes (CICs). The switch with the higher point code should be assigned to maintain control of the even numbered CICs. The point codes to be compared are the Origination Point Code (OPC) and the Destination Point Code (DPC). Alternatively, for ISUP trunks, an **"A"** can be entered to indicate that the switch will control all CICs or an **"N"** can be entered to indicate that the switch will control no CICs.

The Machine Administrator should furnish this Trunk Subgroup (TSG) information.

Form Entries, Continued

PSOLI	Prohibit Sending Originating Line Identity - This field indicates whether OLI can be passed to a connecting network. Legal values are **"Blank"**, **"Y"** or **"N"**. **"Y"** specifies that OLI should not be sent. **"N"** specifies that OLI should be sent.
BN	Billing Number/Trunk Subgroup- This field is used to specify a BN associated with the TSG. It may be left **"Blank"**, or a **"3-"**, **"4-"**, or **"10-digit"** number may be entered. If FENCLASS is ACCESA or ACCESI, BN must be a 4-digit number (4-digit number if Type of Feature Group [TFG] is "B") equal to the (X)XXX corresponding to the inter-Local Area Transport Access (LATA) or International Carrier at the far end of the TSG. If FENCLASS is CMC, OWATS, or PBX, BN must be a 10-digit number. If the Automatic Call Distributor (ACD) field is **"Y"**, then BN must be a 10-digit number specifying the billing number of the INWATS ACD customer. If the ACD field is **"T"**, then BN must be **"199"**.
BRL	Billing Record Length - This field is used to specify whether long or short Automatic Message Accounting (AMA) records should be created for calls on this Trunk Subgroup (TSG). An "**S**" should be entered if Short AMA records are required or an **"L"** should be entered if Long AMA records are required. If **"L"** is entered, both answered and unanswered calls are recorded. If **"S"** is entered, only answered calls are recorded. If this field is left **"Blank"**, short AMA records will be made (if necessary). **NOTE: There is only one record length for Private Branch Exchange (PBX) calls, so this field should be used to indicate whether both answered and unanswered.**

Continued on next page

Form Entries, Continued

ITC	Incoming Trunk Class - This value identifies the incoming trunk as belonging to one of four incoming classes. The ITC is used in conjunction with Local Exchange Carrier (LEC) Service Switching Point (SSP) call routing instructions to identify which Number Services Data Block (NDB) will be selected for picking a trunk to an Interexchange Carrier/International Carrier (IC/INC). The use of this field is similar to that of Multiple Treatment Screening (MTS) but is associated with the BOC SSP feature. Legal entries are "**Blank**" or "**0**-**3**".
GSDN.tsg	Not Applicable - Entries: **"Blank"**
GSDNPHSE	Not Applicable - Entries: **"Blank"**
EAS	Equal Access Signaling - This field is used to specify if Equal Access Signaling (EAS) will be received on this Trunk Subgroup (TSG), and if so, whether Automatic Number Identification (ANI) is expected for the EAS calls. Note that this field only applies to an Inter-Local Access Transport Area (LATA) Carrier switch receiving EAS or an office with the Service Switching Point (SSP) feature receiving EAS. This field must be set to **"N"** for None if EAS is not received on the TSG. If EAS can be received on the TSG, but ANI is not expected for the EAS calls, then an **"E"** must be entered. If EAS can be received on the TSG, and ANI is expected on the EAS calls, then an **"A"** must be entered. Entries of **"D"** and **"R"** in the EAS field are used to designate Feature Group D (FGD) only. If only FGD is received on the TSG, but ANI is not expected, then a **"D"** must be entered. If only FGD is received on the TSG, and ANI is expected, then a **"R"** must be entered. This field only applies to an Inter-LATA Carrier switch receiving Equal Access Signaling (EAS), i.e., the Type of Trunk (TOT) value is Local Exchange Carrier Connecting (LCC).

Continued on next page

Form Entries, Continued

NPARINH Inhibit Numbering Plan Area (NPA) Reconstruction - This field is used to specify whether NPA reconstruction for equal access calls or SDN should be inhibited on this TSG or not. ANI is taken to be NPA if only seven digits are received. If NPA reconstruction should be inhibited, enter **"Y"**, otherwise enter **"N"** or leave **"Blank"**. This field only applies to Local Exchange Carrier Connecting (LCC) Type of Trunks (TOTs). Valid entries are **"Blank"**, "**Y"**, or **"N"**.

WATSBN General Wide Area Telephone Service (WATS) Billing Number - Enter a 10-digit billing number for each Trunk Subgroup (TSG) which will be used to carry WATS type traffic. If an entry is not required, then the field must be "**Blank**" . Valid entries are **"0000000000-999999999"** and **"Blank"**.

PSBN Prohibit Sending Billing Number - This field is used to indicate that the caller's billing number should not be sent in the outgoing signaling messages.

For 4E17 and earlier generic programs, enter **"Y"** if the billing number should not be forwarded. This value should only be used on Trunk Subgroups (TSGs) connecting to another network. Enter **"N"** or leave **"Blank"** if the billing number can be sent. This field applies to outgoing Integrated Services Digital Network User Part (ISUP) trunks only.

For 4E18 and later generic programs, this value should only be used on TSGs connecting to another network. Enter:

- **Blank** or **PNNA** - prohibit sending a billing number with a numbering plan type other than North American Numbering Plan (NANP).
- **SALL** - if the billing number can be sent, regardless of the numbering plan type.
- **PALL** - if all billing numbers are to be prohibited from being sent, regardless of the numbering plan type. This field only applies to outgoing ISUP and Q.931 trunks. The PALL value applies only to ISUP trunks.

Continued on next page

Form Entries, Continued

PSCPN

Prohibit Sending Calling Party Number - This field is used to indicate that the caller's calling party number should not be sent in the outgoing signaling messages. Enter **"Y"** if the calling party number should not be forwarded. This value should only be used on Trunk Subgroups (TSGs) connecting to another network. Enter **"N"** or leave **"Blank"** if the calling party number can be sent. This field applies to outgoing Integrated Services Digital Network User Part (ISUP) and International ISUP (INUP) trunks only.

ANISID

ANI/SID requester value: This field specifies the type of calling party information which should be transmitted to the customer. Valid entries are:

- **Blank** No information
- **NONE** No information
- **ANI** Automatic Number Identification (ANI) only
- **SID** Service Identity (SID) only
- **PANI** ANI or SID (prefer ANI)
- **PSID** ANI or SID (prefer SID)
- **REQ** Customer will use signaling to specify.

Continued on next page

Form Entries, Continued

WANISID Wide Area Telephone Service (WATS) Automatic Number Identification (ANI)/Service Identity (SID) requester value - This field specifies the type of calling party information which should be transmitted to the customer when Megacom* 800 type of traffic is delivered to the customer. Valid entries are:

- **Blank** - No information
- **NONE** - No information
- **ANI** - ANI only
- **SID** - SID only
- **PANI** - ANI or SID (prefer ANI)
- **PSID** - ANI or SID (prefer SID)
- **REQ** - Customer will use signaling to specify.

*Megacom is a registered trademark of AT&T.

PSUUI Prohibit Sending User-to-User Information - This field indicates whether to accept/send Message Associated (MA) UUI on this Trunk Subgroup (TSG). Legal values are **"Blank"**, **"Y"**, or **"N"**. Enter **"Y"** if MA-UUI should not be sent. This value should be used on access TSGs to prohibit the receipt of MA-UUI, and it should be used on egress TSGs to prohibit the sending of MA-UUI. The default condition is **"N"**. This field applies to Integrated Services Digital Network User Part (ISUP), International ISUP (INUP), and Q931 trunks only.

BNPT Not Applicable - Entries: **"Blank"**

WBNPT Not Applicable - Entries: **"Blank"**

Continued on next page

Form Entries, Continued

CMERGE	Not Applicable – Entries: **"Blank"**
SCFN	Send Confusion Messages - This field indicates if received Confusion messages are counted and if Confusion messages are to be sent when an unimplemented message is received. Valid entries are **"Blank"**, **"Y"**, or **"N"**.
OVLP	Overlap Signaling- This field indicates if Consultative Committee for International Telephone & Telegraph Signaling System 7 (CCITT7) Overlap Signaling is allowed when processing an International Integrated Services Digital network User Part (INUP) or CCITT7 Telephone User Part (TUP) call. If OVLP is set to **"Y"**, then Overlap Signaling will be allowed on transit non-operator, non-test calls. The default value for this field is: **"Blank"** (Overlap Signaling not allowed).
PRIT	Not Applicable - Entries: **"Blank"**
APS	Accunet® Packet Service - This field is used to indicate if Accunet packet service can be performed on this Trunk Subgroup (TSG). Enter **"Y"** if Accunet packet service is allowed. Enter **"N"** or leave **"Blank"** if Accunet packet service is not allowed.
CHNEG	Channel Negotiation - This field is used to indicate whether channel negotiation can be performed on this Trunk Subgroup (TSG) or not. Enter **"Y"** if channel negotiation is allowed. Enter **"N"** or leave **"Blank"** if channel negotiation is not allowed.

Continued on next page

Form Entries, Continued

PSATP

Prohibit Sending Access Transport Parameters - This field indicates whether Access Transport Parameters (ATP) can be passed to or from a connecting network. Legal values are **"Blank"**, **"Y"** or **"N"**. Enter **"Y"** if ATP should not be sent. This value should be used on access Trunk Subgroups (TSGs) to prohibit the receipt of ATP; it should be used on egress TSGs to prohibit the sending of ATP. The default condition is **"N"**. This field applies to Integrated Services Digital Network User Part (ISUP), International ISUP (INUP), and Q931 trunks only. This new field will not affect the sending of ATP at an Access Tandem (AT) switch.

PBXESGD

Private Branch Exchange (PBX) Expect Station Group Designation - This field is used for the Software Defined Network (SDN) feature and is set equal to **"Y"** if the SDN customer has a direct connect PBX that will append an extra digit to the dialed number to indicate authorization of calling station. A **"Y"** or **"N"** must be entered in this field if Type Of Trunk (TOT) is PBX and Domain (DOM) is Software Defined Network Access (SDNA), otherwise it must be set to **"N"** or left **"Blank"**.

PBXAW

Private Branch Exchange Answer Withheld - This field is used to specify whether Answer Supervision can or cannot be sent to the PBX. An entry can only be made if Type Of Trunk (TOT) is PBX. A **"Y"** is entered if Answer Supervision is to be withheld. An **"N"** is entered if Answer Supervision should not be withheld (i.e., Answer Supervision is returned). If this field is left **"Blank"** Answer Supervision is returned (not withheld).

Form Entries, Continued

FAR4E	The FAR4E field is set to **"Y"** for Yes whenever the far end of the trunks in this Trunk Subgroup (TSG) is terminated on a 4ESS Switch with the international announcements. This is used in common channel signaling (Incoming Signaling Characteristics [ISC] is Domestic Common Channel Interoffice Signaling [DOMCCIS] or Integrated Services Digital Network User Part [ISUP]) to control sending backward failure messages on failed international calls. These switches are equipped with the international announcements. The FAR4E field also controls common channel signaling sending network management call preference data in a forward direction (OSC is DOMCCIS or ISUP). Such data must not be sent forward to switches not equipped to handle it. Enter **"N"** if the far end is not a 4ESS Switch or the 4ESS Switch does not have the international announcements. This field should be left **"Blank"** for International Consultative Committee for International Telephone & Telegraph Signaling System 7 [CCITT7] ISUP (INUP) trunks.
DOFP	Disable Outgoing Fraud Prevention - **"Y"** indicates that Black Box and Blue Box fraud prevention controls are disabled on this Trunk Subgroup (TSG). **"N"** indicates that fraud prevention controls are enabled on this TSG.
SBRIV	Not Applicable - Entries: **"Blank"**
MEGC	Not Applicable – Entries: **"Blank"**
SDNA	Not Applicable - Entries: **"Blank"**
OWAT	Not Applicable – Entries: **"Blank"**
DATA	Not Applicable - Entries: **"Blank"**
CBC	Not Applicable - Entries: **"Blank"**

DDD	Not Applicable - Entries: **"Blank"**
IDDD	Not Applicable - Entries: **"Blank"**
FOSPS	Not Applicable - Entries: **"Blank"**
CCIF	Not Applicable - Entries: **"Blank"**
SDNPLAN	Not Applicable - Entries: **"Blank"**
BFTIS	Backward Failure Treatment Integrated Services Digital Network User Part (ISUP) all the way. This field is used to specify whether an Announcement (ANN) should be played or a Release (REL) message should be sent when a call has gone ISUP all the way. On the Trunk Subgroup (TSG) Forms, this field is only used when signaling is ISUP and the type of trunk is OCC. Valid entries are **"Blank"**, **"ANN"**, or **"REL"**. If left **"Blank"**, this field will default to **"REL"** when it applies. For Office Data Assembler (ODA) Form 406Z, this field is used for designating the action for intra-Local Access Transport Area (LATA) ISUP call failures occurring at the switch. Valid entries are **"Blank"**, **"ANN"**, or **"REL"**. If left **"Blank"**, this field will default to **"REL"**.

BFTNI

Backward Failure Treatment not Integrated Services Digital Network User Part (ISUP) all the way. This field is used to specify whether an Announcement (ANN) should be played or a Release (REL) message should be sent when a call has not gone ISUP all the way.

On the Trunk Subgroup (TSG) Forms, this field is only used when signaling is ISUP and the type of trunk is OCC. Valid entries are **"Blank"**, **"ANN"**, or **"REL"**. If left **"Blank"**, this field will default to **"ANN"** when it applies.

For Office Data Assembler (ODA) Form 406Z, this field is used for designating the action for intra- Local Access Transport Area (LATA) ISUP call failures occurring at the switch when a call has not gone ISUP all the way. Valid entries are **"Blank"**, **"ANN"**, or **"REL"**. If left **"Blank"**, this field will default to **"ANN"**.

SKSP

Not Applicable - Entries: **"Blank"**

PBXNWW

Private Branch Exchange (PBX) No Wait for Wink - An entry of **"Y"** in this field is used to specify that the Trunk Subgroup (TSG) has a PBX which does not wait for a wink from the 4ESS Switch before outpulsing digits. This field is used only for TSGs with a type-of-trunk value of PBX and signaling of Dual Tone Multifrequency Wink (DTMFWK). Enter **"Y"** if the PBX does not wait for a wink from the 4ESS Switch. Otherwise, enter **"N"** or leave **"Blank"**.

HYBRD

Not Applicable – Entries: **"Blank"**

CCTT

Not Applicable - Entries: **"Blank"**

INCID

Number of Carrier ID digits to be received - An entry of **"3"** specifies that the Trunk Subgroup (TSG) should expect to receive a 3-digit CID. An entry of **"4"** specifies that the TSG should expect to receive a 4-digit CID. An entry of **"B"** specifies that the TSG should expect to receive a 3- or 4-digit CID.

PCPEACEL	Not Applicable – Entries: **"Blank"**
UT15DA	Not Applicable - Entries: **"Blank"**
LRN	Location Routing Number: (4E22R2>) - To support Local Number Portability (LNP), a location Routing Number (LRN) has been defined to identify a Local Service Provider (LSP) End Office. LRN is used to provide Jurisdiction Information Parameter (JIP) if not present in an initial Integrated Services Digital Network User Part (ISUP) Initial Address Message (IAM) or if Incoming Trunk (ICT) is Multifrequency (MF) type signaling. Valid entries: **"Blank"** or a **"10-digit number"**.
CBN DIGS.tsg	(4E22R2>) Incoming Trunk TSG Connecting network access Billing Number Digits - a 10 digit TSG parameter. This field can only be populated if the CBN field is **"N"** - Non-Feature group-D signaled calls, or **"L"** - Local Number Portability (LNP) Non-Feature Group-D signaled calls. Entries: **"Blank"** or a **"10-Digit Number"**.

Continued on next page

Form Entries, Continued

CBN	Call Back Number - CBN is a seven or 10 digit telephone number associated with the Centralized Automatic Reporting On Trunks (CAROT) control location. It is used by the 4ESS Switch as part of the CAROT/ROTL interface.
ONCID	Number of Carrier ID digits to send - An entry of **"3"** specifies that the Trunk Subgroup (TSG) send a 3-digit CID. An entry of **"4"** specifies that the TSG send a 4-digit CID. If the TSG is not going to send a CID leave **"Blank"**.
D3DBN	Not Applicable - Entries: **"Blank"**
MULAW	This field is used to identify the type of encoding (A-law/Mu-law) used in the user information layer 1 protocol ID field of the User Service Information (USI) parameter. An entry of **"Y"** in this field along with an outgoing signaling characteristic of International Consultative Committee for International Telephone & Telegraph Signaling System 7 (CCITT7) Integrated Services Digital Network User Part (INUP) will indicate that Mu-law encoding is being used. A entry of **"N"** or leaving the field **"Blank"** will indicate that A-law encoding is being used.
CSCSET	Not Applicable - Entries: **"Blank"**
CID	Carrier ID. This field is populated with the pre-subscription carrier selected by the customer to handle inter-Local Access Transport Area (LATA) calls; and intra-LATA calls when intra-LATA competition is allowed. It is a 4-digit number with a range of **"0000-9999"**, indicating the XXXX digits of the desired carrier. This field is only populated for ISC/OSC=Q.931.

Form Entries, Continued

ITCENC

Information Transfer Capability Encoding - (4E21>) - This Trunk Subgroup (TSG) parameter indicates the allowed Information Transfer Capability (ITC) coding in the outgoing Initial Address Message (IAM). The parameter can have values shown below:

- **"Blank"**, **"N"** (use office): encode the outgoing IAM, User Service Information (USI) parameter ITC field, the same as used in the office indicator
- **"Y"** (use opposite of office): encode the outgoing IAM, USI parameter ITC field, with the opposite of what is used in the office indicator

The default is **"use office"**.

OFITR

Not Applicable – Entries: **"Blank"**

SPN

Signal Ported Number (SPN) outgoing Trunk Subgroup (TSG) indicator - This TSG indicator indicates if the destination switch is capable of supporting the Local Number Portability (LNP). If ""**Blank**"" or **"N"** (the default), the destination switch is considered LNP capable and the Local Routing Number (LRN) will be signaled. If **"Y"**, the destination switch is NOT considered LNP capable and only the Ported Number will be signaled not the LRN.

LNPIC

A Trunk Subgroup (TSG) field not used - valid entries are: **"Blank"**.

NCAR

Form Entries, Continued

CAREA

Control Area - Valid input for this field is a single digit in the range of **"0-9"**. This number identifies the Control Area that is to be associated with this Trunk Subgroup (TSG) for trouble reporting. The number assignable in a given office is limited, however, to the highest control area assigned at Office Data Assembler (ODA) time as defined by the highest Member Number for a test position. This is because of engineered memory allocated for plant measurement purposes. Each Control Area can have a maximum of 10 (0-9) associated Control Positions (CPOS). The Control Area number and the CPOS number combined make up the testboard position number. For example CAREA-2 and CPOS-5 would be testboard position 25. A maximum of 100 (0-99) testboard positions may be installed for a 4ESS Switch location.

Any test position can access every trunk assigned to the 4ESS Switch with the exception of international trunks. International trunks having Incoming Signaling Characteristic (ISC) or Outgoing Signaling Characteristic (OSC) equal to Consultative Committee for International Telephone & Telegraph 5 (CCITT5) must be assigned to a CAREA that is equipped with 51AL6 test positions. The 51AL6 test position can access any trunk assigned to the 4ESS Switch. However, the alarms, Teletype (TTY) printouts, and 101 calls associated with a particular TSG will only be transmitted to the CAREA and CPOS that is specified on the input form for a TSG. A single trouble receiving location could be specified for all TSGs in the office. Trouble tickets might be originated here and distributed to occupied test positions as necessary. Some other typical applications could be to assign the TSGs to testboard positions alphabetically, by direction, by ownership, or by Type of Trunk (TOT).

The only other restraint on assigning a TSG to a particular CAREA and CPOS is that all positions might not have the optional equipment required to satisfactorily test some Trunk Subgroups. The arrangement in a given office depends on the administrative decisions made for that office.

Continued on next page

Form Entries, Continued

CAREA
(cont'd.)

Position 00 (CAREA 0, CPOS 0) has been assigned to the Master Test and Control Channel (MTC) teletype in the Maintenance Operating Center (MOC). This position was established to receive trouble reports for certain non-message type TSGs. Lucent Technologies recommend that positions
01-09 not be assigned in an office at this time. The circuits that should be assigned to test position 00 are:

- ACI*DCHN - D-Channel circuits to the Common Network Interface (CNI) Ring
- CLN*DLPC - Loopback/complement Data Test
- MAS*BIPB - Mass Announcement System (MAS) Barge-in Playback Trunk
- MIS*AART - Auxiliary Audible Ring Trunk
- MIS*TERM - Common Channel Interoffice Signaling (CCIS) Terminals
- SVC*AIN* - Advanced Intelligent Network (AIN)
- SVC*DMRV - Dual-Tone Multifrequency (MF) Receivers (DTMFR)
- VC*DMXM - Dual-Tone Multifrequency Transmitters (DTMFT)
- SVC*MFR* - Multifrequency Receivers
- SVC*MFX* - Multifrequency Transmitters
- SVC*XCVR - CCIS Continuity Check Transceivers
- SVC*XCVT - CCIS Continuity Check Transceiver Test Circuit
- SVC*MFRT - Multifrequency Receiver Test Circuits
- SVC*MFXT - Multifrequency Transmitter Test Circuits
- SVC*SCAN - Service Circuit System Expanded Announcements
- SVC*SCBN - Service Circuit System Expanded Announcements
- SVC*SCNS - Network Services Complex Set S
- TAS*ANN* - Recorded announcements
- TAS*TONE - Tone Circuits
- TAS*MWAT - 1004 hz at 0 dBm
- TAS*MW10 - 1004 hz at 10 dBm

Continued on next page

Form Entries, Continued

CAREA (cont'd.)

The balance of the non-message type TSG may be assigned to working testboard positions.

For RC Forms 604 and 605, this number identifies the Control Area that is to be associated with this announcement trouble report. The number assignable in a given office is limited, however, to the highest control area assigned at ODA time as defined by the highest Member Number for a test position. This is because of engineered memory allocated for plant measurement purposes. Each Control Area can have a maximum of 10 (0-9) associated Control Positions (CPOS). The Control Area number and the CPOS number combined make up the testboard position number. For example CAREA-2 and CPOS-5 would be testboard position 25. A maximum of 100 (0-99) testboard positions may be installed for a 4ESS Switch location. If CAREA 0,
CPOS 0 is specified, all MAS messages will be sent to the MTC channel in the MOC.

CPOS

Control Position - Enter a number from **"0-9"** to specify the testboard position that is to be associated with the Trunk Subgroup (TSGs) and Control Area (CAREA) for test reporting purposes. This assignment together with the CAREA designation can be used to distribute the maintenance responsibility for Trunk Subgroups. This assignment does not prevent any test position from accessing a particular group of trunks. It is only for reporting purposes.

For RC Forms 604 and 605, enter a number from **"0-9"** to specify the testboard position that is to receive the announcement trouble reports. If CAREA is 0, only CPOS 0 is allowed. When the Message Announcement System (MAS) is administered by the Operations National Administration Center (ONAC), assign the CPOS that has been dedicated for its use.

SINDEX

Access Change Verification Sampling Rate Index value - This field specifies the rate at which calls will be sampled for access charge verification. Legal values are **"Blank"**, **"0"**, **"1"**, **"2"**, **"4"**, **"8"**, **"16"**, **"32"**, **"64". "Blank"** and **"0"** imply no verification recording. Otherwise, one call out of the number entered will be recorded.

Continued on next page

Form Entries, Continued

CODSC

Customer Premise Equipment (CPE) Outgoing Disconnect. An entry of **"Y"** in this field is used to specify (from the 4ESS Switch perspective) that a disconnect will be effected faster than normal when the called customer goes on-hook. This field is used only for TSGs with a type-of-trunk value of Private Branch Exchange (PBX) or Single Trunk Customer (STC) and with signaling other than Q.931. Valid entries are **"Blank"**, **"Y"**, or **"N"**.

(4E21>) - CPE Outgoing Disconnect or Signaling System 7 (SS7) Trunk Subgroup (TSG) Control of Per Channel Inhibit Signaling (PCIS) Bits. An entry of **"Y"** specifies that:

1. From the 4ESS Switch perspective, a disconnect will be effected faster than normal when the called customer goes on-hook. This application of CODSC is only for TSGs with a type-of-trunk value of PBX or STC and with signaling other than Q.931.

   or

2. The TSG is to have its PCIS bits reset to force a steady state AB bit indication. This application of CODSC is for non-AT&T offices where the TSG has type-of-trunk of Other Common Carrier (OCC) and outgoing signaling of Integrated Services Digital Network User Part (ISUP).

Valid entries are **"Blank"**, **"Y"**, or **"N"**.

Continued on next page

Form Entries, Continued

NEOTR	Near Operational Test Responsibility - Enter a **"Y"** for Yes or **"N"** for No to indicate whether or not this office is responsible for the operational (signaling) test on outgoing trunks in this Trunk Subgroup (TSG). If a **"Y"** is entered in this field, then the OTSTT and/or OTMTT field(s) must have an entry other than **"N"**. If an **"N"** is entered in this field, then all test types are optional. If OTSTT and OTMTT fields are **"N"**, then NEOTR must be **"N"**. If an office has Near End Operational Test Responsibility but the far end office does not have a test number, an **"N"** should be entered in this field. If Outgoing Signaling Characteristic (OSC) is equal to Domain Class (DOMCCIS) or Integrated Services Digital Network User Part (ISUP), then NEOTR should be **"N"** since operational tests cannot be made on Domestic Common Channel Signaling (CCS) trunks.
TRIDX	Not Applicable - Entries: **"Blank"**

Continued on next page

Form Entries, Continued

OTSTT Operational Thru Switch Test Type - Certain offices (No. 5 Crossbar and 1ESS) can function both as a local and a tandem or as a local and toll office. These offices have trunks that can function in both a through switch mode and a terminating mode. As a result, more than one test is required to test both modes of operation. The OTSTT is used to specify an operational (signaling) test for a trunk in the tandem (thru switch) mode. OTSTT is also used to specify the ATME B test for Consultative Committee for International Telephone and Telegraph Signaling System Number 5 (CCITT5) and Consultative Committee for International Telephone and Telegraph Signaling System Number 6 (CCITT6) trunks which have a far end test line capable of running this test. The following codes may be entered in the OTSTT field.

- **ATMB** - Siemens' ATME B test line - This is a signaling test which applies to CCITT5 and CCITT6 trunks only. The test consists of the far end test line returning a clear back/reanswer in response to a forward transfer.
- **CTX2** - Centrex II test - This test is made toward a No. 5 Crossbar office having Phase II Centrex features. CTX2 is similar to the SYNC test.
- **CTX3** - Centrex III - This test is made to a No. 5 Crossbar office having Phase III Centrex features. CTX3 is similar to the SYNC test.
- **SXS** - Step-by-Step - If the far end of this Trunk Subgroup (TSG) is working in to a Step-by-Step office, this test may be specified.
- **SYNC** - Synchronous test - This test is an automatic series of off hook/on hook transitions (flashes) on the M lead. In the 4ESS Switch, the SYNC test is software controlled and no external hardware is needed. A data table is used to specify the pulsing rate for each series of flashes. The test automatically advances from one pulsing rate to another via a timing procedure. In any system, after all of the flashes are complete, the trunk will be left in the quiet termination state.

Continued on next page

Form Entries, Continued

OTSTT (cont'd)

- **T103 -** 103 Test - The 103 Test is similar to the synchronous test in that a series of flashes are sent on the M lead. However, the sequence of pulses is controlled by the ring forward signal, rather than a timed automatic progression. Flashing of a given rate will continue until a ring forward signal is received, or, in 4ESS Switch, until an upper limit of flashes has been sent. At this point, the trunk will be put into the quiet termination state until disconnect.

- **"N"** - Enter **"N"** if no thru switch operational test is to be made on this TSG.

OTSTN

Operational Thru Switch Test Number - If Operational Thru Switch Test Type (OTSTT) is **"N"** for None, leave this item **"Blank"**. If a thru switch test of some type is specified, then a corresponding test number in the range of **"000-9999999"** must also be specified. This number will normally be a 3- or 7-digit test number associated with the test specified in the OTSTT field. Test numbers are derived locally and they may differ for each 4ESS Switch location. If OTSTT is Siemens' ATME B test line (ATMB), then OTSTN should specify a 062 for Consultative Committee for International Telephone and Telegraph Signaling System Number 5 (CCITT5) trunks or a 2 for Consultative Committee for International Telephone and Telegraph Signaling System Number 6 (CCITT6) trunks when the far end has an ATME B test line. If the far end has an Siemens' ATME A test line (ATME A), OTSTT equals ATMB and OTSTN should specify 061 for CCITT5 or 1 for CCITT6 trunks.

Continued on next page

Form Entries, Continued

OTMTT Operational Terminating Test Type - If an operational (signaling) test is to be made directly to the far end of this Trunk Subgroup (TSG) terminating mode, enter a code to identify the test.

- **ATMC** - Siemens' ATME C test line - This is a signaling test used with Consultative Committee for International Telephone and Telegraph Signaling System Number 5 (CCITT5) trunks only. The far end returns a busy flash from the test line.
- **CTX2** - Centrex II test - This test is made toward a No. 5 Crossbar office having Phase II Centrex features. This test is similar to the SYNC test.
- C**TX3** - Centrex III - This test is made towards a No. 5 Crossbar office having Phase III Centrex features. This test is similar to the SYNC test.
- **SXS** - Step-by-Step - If the far end of this TSG is working into a Step-by-Step office, this test may be specified.
- **SYNC** - Synchronous test - This test is an automatic series of on hook/off hook transitions (flashes) on the M lead. In the 4ESS Switch, the SYNC test is software controlled and no external hardware is needed. A data table is used to specify the pulsing rate for each series of flashes. The test automatically advances from one pulsing rate to another via a timing procedure. In any system, after all of the series of flashes are complete, the trunk will be left in the quiet termination state.
- **T103** - 103 test - The 103 test is similar to the synchronous test in that a series of flashes are sent on the M lead. However, the sequence of pulses is controlled by the ring forward signal, rather than a timed automatic sequence. Flashing of a given rate will continue until a ring forward signal is received, or, in 4ESS Switch, until an upper limit of flashes has been sent. At this point, the trunk will be put into the quiet termination state until the originator disconnects.
- "**N**" - None - Enter an "**N**" if no test is to be made on this TSG.

Continued on next page

Form Entries, Continued

OTMTN

Operational Terminating Test Number - If OTMTT is **"N"** for None, leave this field **"Blank"**. If a test is specified, then a corresponding test number in the range of "**000-9999999"** must also be specified. This number will normally be a 3- or 7-digit test number associated with the test specified in the OTMTT field. Test numbers are derived locally and they may differ for each 4ESS Switch location. If OTMTT equals Siemens' ATME C test line (ATMC), then OTMTN must specify **"063"**.

XTSTT

Transmission Thru Switch Test Type - If a transmission test is to be made in the thru switch (tandem) mode for this Trunk Subgroup (TSG), enter a code to identify the type of test.

- **ATMA** - Siemens' ATME A transmission test line - This entry provides access to an ATME A responder. The ATME A test permits automatic transmission loss and noise measurements in both directions for International Consultative Committee for International Telephone & Telegraph Signaling System 5 (CCITT5),CCITT6, International Integrated Services Digital Network User Part (INUP), or CCITT7 Telephone User Part (TUP) trunks.

- **T100** - 100 code test - This test provides a quiet termination (600 ohms). In the 4ESS Switch, the 100 test provides a sequence of 1000 hz, milliwatt tone for 5.5 seconds followed by the quiet termination until disconnect.

- **T102** - 102 code test - The 102 test provides 1000 hz. milliwatt tone. The 4ESS Switch provides cycles of 9-second tone and 1-second quiet termination until disconnect.

- **T105** - 105 code test - This code provides access to an Automatic Trunk Measuring System (ATMS) responder. The 105 test permits automatic transmission loss and noise measurements in both directions.

- **N** - Enter **"N"** if no test is to be made OR if the presubscription carrier is to be populated.

Continued on next page

Form Entries, Continued

XTSTN

Transmission Thru Switch Test Number - Add Presubscription Carrier. If Transmission Thru Switch Test Type (XTSTT)=N and this field is non-**"Blank"**, then the field is populated with the presubscription carrier selected by the customer to handle inter Local Access Transport Area (interLATA) calls; and intraLATA calls when intraLATA competition is allowed. It is a 4-digit number with a range of **"0000-9999"**, indicating the XXXX digits of the desired carrier. The presubscription carrier can only be populated for Incoming/Outgoing Signaling Characteristics (ISC/OSC) of Q931.

If XTSTT does not equal to N, and this field is non-**"Blank"**, then the field is populated with the transmission thru switch test number. If a test is specified, then a corresponding test number in the range of **"000-9999999"** must also be specified. This number will normally be a 3- or 7-digit test number associated with the test specified in the XTSTT field. Test numbers are derived locally and they may differ for each 4ESS Switch location. If XTSTT is Siemens' ATME A transmission test line (ATMA), the XTSTN should be specified as **"061"** for International Consultative Committee for International Telephone & Telegraph Signaling System 5 (CCITT5) trunks or **"1"** for CCITT6, International Integrated Services Digital Network User Part (INUP), or CCITT7 Telephone User Part (TUP) trunks.

XTMTT

Transmission Terminating Test Type - If a transmission test is to be made directly to the far end of this Trunk Subgroup (TSG) in a terminating mode, enter a code to identify the type of test.

- **T100** - 100 code test - This test provides a quiet termination (600 ohms). In the 4ESS Switch, the 100 code test provides a sequence of 1000 hz. milliwatt tone for 5.5 seconds, followed by quiet termination until disconnect.
- **T102** - 102 code test - The 102 test provides 1000 hz. milliwatt tone. The 4ESS Switch provides cycles of 9-second tone and 1-second quiet termination until disconnect.
- **T105** - 105 code test - This code provides access to a Automatic Trunk Measuring System (ATMS) responder. The 105 test permits automatic transmission loss and noise measurements in both directions.
- If no test is to be made, enter **"N"** for None.

Continued on next page

Form Entries, Continued

XTMTN	Transmission Terminating Test Number - If Transmission Terminating Test Type (XTMTT) is **"N"** for None, leave this field **"Blank"**. If a test is specified, then a corresponding test number in the range of **"000-9999999"** must also be specified. This number will normally be a 3- or 7-digit test number associated with the test specified in the XTMTT field. Test numbers are derived locally and they may differ for each 4ESS Switch location.

S1-10

These fields are reserved for future use in order to be able to implement new capabilities in a more timely fashion. When a new capability is requested for Generic Programs currently deployed in the field, one of these spare fields will be designated for use in implementing that capability.

S1 - Valid entries are **"Blank"**, or **"0-7"**.
S2-10 - Valid entries are **"Blank"**, **"Y"**, or **"N"**.

- S2 - (4E18/4E19/4E20) - An entry of **"Y"** in this field identifies Signaling System 7 (SS7) trunks which have their Per Channel Inhibit Signaling (PCIS) bits reset to force a steady state AB bit indication. Otherwise, enter **"N"** or leave **"Blank"**. In 4E21, the CODSC field will replace the use of S2 for this purpose.

- S2 - (4E21R4) This Trunk Subgroup (TSG) parameter allows TSG circuits to trigger the Advanced Intelligent Network (AIN) processing. The parameter can have the following values: **"Blank"**, **"N"** for no access allowed, and **"Y"** for access allowed. The default is **"N"**.

- S5 - Unassigned - Reserved for future use.

- S6 (4E18/19/20) - this Trunk Subgroup (TSG) parameter indicates the allowed Information Transfer Capability (ITC) coding in the outgoing Initial Address Message (IAM). The parameter can have the following values: **"Blank"**, **"N"** (use office) to encode the outgoing IAM, User Service Information (USI) parameter ITC field, the same as used in the office indicator, and **"Y"** (use opposite of office) to encode the outgoing IAM, USI parameter ITC field, with the opposite of what is used in the office indicator. The default is "use office".

NOTE: An entry of "0-7" in the S1 field or a "Y" in any of the fields S2 thru S10 without knowledge of the capability to which the field has been assigned may result in undesirable switch behavior.

RC Form 108

General

Recent Change (RC) Form 108 changes the translations for a one-way incoming Trunk Subgroup (TSG). This message is classed as a Recent Change Data Message (RCDM). There are two characteristics that are not changeable with this form: The Circuit Identification Name (CIN) (use RC Form 802) and the Quantity of Traffic Numbers (QTFN) (use RC Forms 104 or 105).

The restrictions imposed for changing the Domain (DOM) are:

- The existing domain has to be in the range of 20 through 69.
- The new domain has to be in the range of 20 through 69.

All other changes to the Domain are prohibited.

Certain characteristics cannot be changed unless all trunks in the TSG are in a particular state. For more information, Refer to Table 3 – Relationship Between Characteristics and State of Trunks in Trunk Subgroup. This table confirms that almost all of the popular characteristics related to a TSG change require the trunks to be either put in the CADOOS state or removed. Therefore, it should be noted that it may be much easier and more efficient (maintaining service) to build the new TSG. Then, as the trunks from the old TSG are put to the CADOOS state, they can be removed from the old TSG and reassigned to the new TSG. This is a prudent choice as service could be working on both TSGs as some of the trunks are being turned down and reassigned to the new TSG. Also, the new two-way TSG is more apt to have the more accurate TFNB numbering scheme as a result of the Reverse (REV) considerations while building the new TSG. After all of the trunks are removed from the old TSG (this transition could be over a number of days if desired), it can be entirely removed.

If input to the FEAREA and/or IWZ1 field are modified, the RC Form must update Routing Data Block (RDB) Alternate Route Lists. If the Roll back Area becomes full from these updates, the Form will print a warning message that not all of the RDB Route Lists have been updated and that the TSG form must be reentered. The user must reenter the form to complete building the RDB Route Lists.

An alphabetical keyword list is included in this section, starting on page 45.

Form Entries

RC:TSG;CHG;OPT(IN1WAY),---:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

ORNU Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

Form Entries, Continued

TSG

Trunk Subgroup - This series of codes identifies a Trunk Subgroup. The TSG is a set of trunks within a Trunk Group having certain identical characteristics. A Trunk Group must have a common destination. In addition to group characteristics, a TSG also has common signaling characteristics, transmission delay, originating Numbering Plan Area (NPA), domain, traffic separation index and screening classes. The Trunk Group and TSG are identified by a series of codes that specify the near and far ends of the trunk. In most cases, the full near end definition is not required because it will always be the same. The Trunk Group designation is comprised of the town, state, building and building subdivision for the far end plus the near end building subdivision. A TSG is uniquely identified by adding a Base Traffic Number reference. Trunk Group and TSG definitions are available in the 4ESS Switch as abbreviated Circuit Identification Names (CINs). Common Language Location Identification (CLLI) codes must be entered in the fields that make up the Trunk Group definition. Rules for establishing these codes are covered in Lucent Technologies Practices 795-100-100. The code for any established office may be found by referring to the location code index in that same Lucent Technologies Practices. For non-message TSGs, the format does not include mnemonics for identifying the far end of the trunk. The TSG will mnemonically identify the type of trunk category by function. Asterisks are used in columns where no information is necessary. The following paragraphs describe the individual fields within a TSG definition.

Continued on next page

Form Entries, Continued

TSG (cont'd)

- **BTFN** - Base Traffic Number - The BTFN is a number in the range of **"0-9976"** that is part of the TSGs designation (which consists of the BTFN, TOWN, ST, BL, FBS, and NBS). The BTFN is the first traffic number in the first block of traffic numbers that is assigned to a TSG. Additional traffic numbers, which are assigned in blocks of 24, either higher or lower in numerical value than the BTFN can be assigned to the TSG, but the BTFN remains as defined above. All non-message trunks have a BTFN of **"0000"**. For RC 104, the BTFN is stored as the starting point for a block of traffic numbers that range up to the limit originally defined on RC Forms 100, 101 and 102 when the TSG was first built. Other blocks of traffic numbers, either higher or lower in numerical value, may be assigned to this TSG, via Recent Change (RC) procedures. In this case the original BTFN would still apply, but the QTFN field would contain the number of new traffic numbers to be assigned following the First Traffic Number (FTFN) specified.

- **TOWN** - Town is a 4-character alphabetic field - The code must represent the bona fide town, city or location per Lucent Technologies Practices 795-100-100 for the far end of the TSG.

- **ST** - State - This field represents the state, province or foreign country in which the far end office is located. The code in ST must be a standard 2-character alphabetic combination. Valid standard abbreviations for states, Canadian provinces and foreign countries may be found in Lucent Technologies Practices 795-100-100.

- **BL** - Building - The BL field contains the office identity for the far end of a TSG. This code consists of either two alphabetic characters or two numeric characters. Independent Telephone Company locations are always designated by an **"X"** plus some alpha character in this field. If the TSG terminates in a customer's building and it is not necessary to identify that particular building, this code may be arbitrary.

Continued on next page

Form Entries, Continued

TSG (cont'd)

- **FBS** - Far Building Subdivision - This field contains a code that identifies the internal building subdivision for the far end of a TSG. The code is a traffic, plant, or administrative assignment. It must be a 3-character alphanumeric combination. For non-message TSGs, this field is not required. Three asterisks are pre-printed on the form to provide an entry for this field.

- **NBS** - Near Building Subdivision - The NBS designation is the internal building identity for the near end termination of a TSG. It is always a 3-character alphanumeric code. This field should be left **"Blank"** if the NBS for this TSG is the same as the NBS assigned in the near office Circuit Identification Number (CIN) for the 4ESS Switch. The Office Data Assembler (ODA) system will add the NBS on a default basis.

Continued on next page

Form Entries, Continued

PCF

Point Code Format - This field is used to specify the format of the point code that is being entered in the point code field. If no entry is being made in the Destination Point Code (DPC) (Originating Point Code [OPC]) field, then this field must be left **"Blank"**. Three different formats are available for input: **ATT, ANSI,** or **ISPC**.

ATT is used for AT&T standard input/output which consists of a three digit network indicator, a two digit cluster region, a one digit cluster type, and a three digit cluster member.

1. **NET**: Network Indicator - This value specifies which signaling network will be used for transport. Valid entries are **"000-255"**.

2. **CR**: Cluster Region - This value specifies the region of the signaling network where the office is located. Valid entries are **"00-31"**.

3. **CT**: Cluster Type - Valid entries are **"0-7"**.

4. **MEM**: - Cluster Member - This value specifies the office member number within the cluster. Valid entries are **"000-255"**.

ANSI is used to indicate that the input/output is in the American National Standards Institute format which consists of a three digit network indicator, a three digit cluster, and a three digit member number.

1. **NET**: Network Indicator - This value specifies which signaling network will be used for transport. Valid entries are **"000-255"**.

2. **CLU**: Cluster - This value specifies the cluster of the signaling network where the office is located. Valid entries are **"000-255"**.

3. **MEM**: Member Number - This value specifies the office member number within the cluster. Valid entries are **"000-255"**.

Continued on next page

Form Entries, Continued

PCF (cont'd)

ISPC is used for international signaling point code input/output which consists of a one digit world geographical zone, a three digit area/network identifier, and a one digit signaling point identifier. Reference: International Consultative Committee for International Telephone & Telegraph Signaling System (CCITT) Recommendation "Numbering of International Signaling Point Codes", Vol. VI, Rec. Q.708.

1. **WGZ**: World Geographical Zone - This value specifies the world geographical zone of the office. Valid entries are "**1-7**".

2. **ANI**: Area/Network Identification - This value specifies a geographical area or network in a specific zone. Valid entries are **"000-255"**.

3. **SPID**: Signaling Point Identification - This value specifies a signaling point in a specific geographical area or network. Valid entries are **"0-7"**.

AOPC

Alias Origination Point Code - This field will provide a unique combination of a Local Exchange Carrier (LEC) Signal Transfer Point (STP) Point Code (PC) and an AT&T STP PC for each Local Access Transport Area (LATA) dedicated D-link set via a logical point code. AOPC, if entered, must be entered in the ATT format. See the Point Code Format (PCF) field for the format description. AOPC may only be entered when the PCF field is not **"Blank"**.

Continued on next page

Form Entries, Continued

DPC

Destination Point Code - This field is used to specify the Destination Point Code of the far-end switch.

This field entry is divided into three subfield entries:

1. NET - Network Indicator - This value specifies which signaling network will be used for transport. Valid entries are **"Blank"**, **"000-255"**.

2. CLU - Cluster - This value specifies the cluster of the signaling network where the office is located. Valid entries are **"Blank"**, **"000-255"**.

3. MEM - Cluster Member - This value specifies the office member number within the cluster. Valid entries are **"Blank"**, **"000-255"**.

For the Trunk Subgroup (TSG) forms, nine digits must be entered, depending on the format specified in the Point Code Format (PCF) field. Nine digits must be entered if PCF is American National Standards Institute (ANSI) format. An entry must be made in this field if either the Incoming Signaling Characteristics (ISC) or Outgoing Signaling Characteristics (OSC) field value is **"ISUP"**, **"INUP"**, or **"TUP"**; otherwise this field must be **"Blank"**.

Continued on next page

Form Entries, Continued

FENCLASS This field specifies the classification of the Far End Network (FEN). If the Trunk Subgroup (TSG) is not associated with any FEN, this field is left **"Blank"**. The FEN with which the TSG is to be associated must be described via 4ESS Switch RC 617.

For RC 524, this field identifies the class for accumulating counts.

The following classifications are available:

- **ACCESA** - This identifier specifies that the TSG is a link to an Inter-exchange Carrier (IC) or International Carrier (INC), and the 4ESS Switch is being used by a Local Exchange Carrier (LEC) as an Access Tandem (AT) and/or Service Switching Point (SSP) to switch calls from this TSG.

- **ACCESI** -This identifier specifies that the TSG is a link to an International Carrier (INC), and the 4ESS Switch is being used by an Interexchange Carrier (IC) (e.g., AT&T-C) to switch calls from this TSG.

- **ACCESO** - This identifier specifies that the TSG is a link to an Operating Company and the 4ESS Switch is used as an IC.

- **CAMA** - This identifier specifies that the TSG is terminated on an office which delivers traffic on Centralized Automatic Message Accounting (CAMA) trunks.

- **CMC** - Cellular Mobile Carrier - This identifier specifies that the FEN is a CMC. The TSG connects an Access Tandem (AT) and a CMC.

- **INTL** - This identifier specifies that the TSG is an international link with the far end outside World Zone 1 and that the 4ESS Switch is being used as an International Switching Center (ISC)

- **OWATS** - This identifier specifies that the TSG is a link to a Private Branch Exchange (PBX) over which only Outward Wide Band Area Telephone Service (WATS) calls are allowed.

Continued on next page

Form Entries, Continued

FENCLASS (cont'd)

- **OEO** - Other End Office connecting, meaning an Equal Access End Office (EAEO) owned by a different company. This identifier specifies that the FEN is an OEO. The TSG connects an Access Tandem (AT) and an OEO.
- **PBX** - This identifier specifies that the TSG is a link to a PBX.
- **POTS** - This identifier specifies that the TSG is a link to a switching machine serving either a Local Access Transport Area (LATA) of the Local Exchange Carrier (LEC) owning/sharing the 4ESS Switch, the Continental United States/Plain Old Telephone Service (POTS) (CUSP) network of the IEC owning/sharing the 4ESS Switch, or some other FEN to be treated similarly.

Continued on next page

Form Entries, Continued

FENID

Far End Network (FEN) Identification - This field distinguishes the specific FEN with which this Trunk Subgroup (TSG) is associated. One to six alphanumeric characters may be entered to distinguish among several FENs with the same classification, or the field may be left **"Blank"**. If FENCLASS is **"Blank"**, FENID must also be **"Blank"**.

When the FENCLASS is ACCESA or ACCESI, FENID should consist of type of feature group access and the 4 numeric digits of the Carrier Identification Code (CIC).

The type of feature group definitions are:

- **G** - All access types (B, C, & D).
- **B** - Feature Group B Access.
- **C** - Feature Group C Access.
- **D** - Feature Group D Access.

Examples include:

- **G0288** - Carrier ID 288 has Feature Group B, C, & D access.
- **BC0288** - Carrier ID 288 has Feature Group B & C access.
- **BD0288** - Carrier ID 288 has Feature Group B & D access.
- **B2882** - Carrier ID 2882 has Feature Group B access only.
- **D2882** - Carrier ID 2882 has Feature Group D access only.

For an access type, both B2882 and D2882 can exist but be for different carriers.

Continued on next page

Form Entries, Continued

TFG

Type of Feature Group - This field is used to specify whether the Type of Access for this Trunk Subgroup (TSG) is tariffed under Feature Group B, Feature Group C, or Feature Group D. An entry can only be made if the FENCLASS is ACCESA. If FENCLASS is ACCESA, a **"B"**, **"C"**, or **"D"** must be entered, corresponding to Feature Groups B, C, or D, respectively. FENCLASS is not ACCESA, this field must be left **"Blank"**.

TSGBBC

Trunk Subgroup (TSG) Broadband Capability - Integrated Services Digital Network User Part (ISUP), International ISUP (INUP), and Q.931 signaling systems allow for broadband switching. This entry specifies what type of circuits may be populated in this TSG. Valid entries are:

- **Blank** - 1 trunk circuit
- **0** - 1 trunk circuit
- **1** - 6 trunk circuits
- **2** - 24 trunk circuits
- **3** - Combined usage 1 and 6 trunk circuits
- **4** - Combined usage 1 and 24 trunk circuits
- **5** - Combined usage 6 and 24 trunk circuits
- **6** - Combined usage 1, 6, and 24 trunk circuits.

Continued on next page

Form Entries, Continued

TOT

Type of Trunk - This field specifies the trunk type for this Trunk Subgroup (TSG). TOT entries of **"ETC"** for End Office or Tandem Connecting, **"LCC"** for Local Exchange Carrier Connecting, and **"OCC"** for Other Carrier Connecting are used for network interconnect. When these TOT values are used on Integrated Services Digital Network User Part (ISUP)
trunks, the Local Exchange Carrier (LEC) (Bellcore TR-317) and/or network interconnect version (TR-394) of the ISUP protocol is used. For all other allowed TOT values, the AT&T version of the ISUP protocol is used. The codes that may be entered are as follows:

- **CAMAA** – Centralized Automatic Message Accounting with Automatic Number Identification (ANI).
- **CAMAO** – Centralized Automatic Message Accounting with Operator Number Identification (ONI).
- **ETC** - End Office or Tandem Office Connecting - This Type of Trunk (TOT) is used to identify Equal Access (EA) or Intra Local Access Transport Area (IntraLATA) trunks at a switch serving as an Access Tandem (AT) or Service Switching Point (SSP) where the other end connects to an End Office. This TOT is also used to identify EA trunks between ATs or between an AT and a switch serving as an SSP. When the type of trunk is ETC, the signaling characteristic of the Trunk Subgroup (TSG) must be either Multifrequency Wink (MFWINK) or ISUP.
- **INTL** - International - International circuit with the far end outside of World Zone 1, and having signaling characteristics of International Consultative Committee for International Telephone & Telegraph Signaling System 5 (CCITT5), CCITT6, International ISUP (INUP), and CCITT7 Telephone User Part (TUP).
- **INTLO** - International Overflow - International Overflow circuit (for overflow transit traffic) with the far end inside World Zone 1 in another International Switching Center (either the U.S. or foreign).
- **ITAND** - Inter Tandem - This TOT can be used to handle traffic between two tandem switchers in the same local calling area.

Continued on next page

Form Entries, Continued

TOT (cont'd)

- **ITOLL** - Intertoll - Intertoll trunks will carry toll traffic between class 4 or higher offices, or trunks dedicated to Inter-International Switching Center (inter-ISC) international overflow traffic. This includes final, full and high usage TSGs.
- **ITOP** - International Operator - International Operator tandem trunk from a No. 5 switchboard.
- **ITOPB** - International Operator OBAT B Trunk - Operator bridged access Trunk B from 3C/3CL switchboard.
- **LCC** - Local exchange Carrier Connecting - This TOT is used to identify EA trunks at an AT&T switch This identifier is also used for outgoing ISUP trunks from the Interexchange Carrier/International Exchange Carrier (IC/INC) to an SSP office. When the type of trunk is LCC, the signaling characteristic of the TSG must be either MFWINK or ISUP and the Equal Access Signaling (EAS) field must be marked as either "**E**", "**A**", "**D**" or "**R**".
- **MISC** - Miscellaneous - This designation is used for operator (except for inward, leave word or 2-way operator trunks), service circuit, and other miscellaneous TSGs.
- **OCC** - Other Carrier Connecting - This TOT is used to identify EA trunks at a switch serving as an AT or SSP where the other end connects to an IC or INC switch. This type of trunk should be used when the signaling on the TSG is MFWINK or ISUP.
- **PBX** - Private Branch Exchange - This identifier indicates that the trunks in this TSG terminate on a PBX unit. If the PBX interface is via a 2-wire PBX Channel Unit (J98726ST), then the Incoming Signaling Characteristics (ISC) should be Dial Pulse Immediate (DPIMMED) and the Outgoing Signaling Characteristics (OSC) should be Dial Pulse Wink (DPWINK).
- **SECIT** - Secondary Intertoll - These trunks interconnect toll switching machines and manually operated toll or assistance switchboards for routing of operator completed traffic.

Continued on next page

Form Entries, Continued

TOT (cont'd)

- **STC** - Single Trunk Customer - This TOT is used to designate a TSG for single trunk terminations not supported by a PBX. When TOT is STC, the following TSG fields must be **"Blank"** or **"N"** as allowed: ANISID, APS, BRL, CCIS2WRE, DNHR, DPC, EAS, FAR4E, PBXAW, PBXESGD, REV, RFA, RFMP, SAT, SINDEX, TFG, TSGBBC, WANISID, XCPA.

- **TAND** - Tandem - This code is used for 2-way tandem, tandem completing and tandem connecting TSGs.

- **TOLLC** - Toll Connecting or Completing - This code is used for Direct Distance Dialing (DDD) access, toll connecting or toll completing TSGs.

- **TSPS** - Traffic Service Position System - Enter this designation for TSGs associated with TSPS.

SAT

Satellite - Enter a **"Y"** for Yes or **"N"** for No to indicate whether or not this Trunk Subgroup (TSG) is associated with satellite facilities. This entry performs a screening function to avoid two satellite TSGs from being connected together to complete a call. If the incoming TSG has SAT = "Y", then call processing will insist the outgoing TSG must have SAT = "N". This can also be used for local screening functions even though the TSG is not via a satellite.

For Voice Frequency Link (VFL) TSGs, satellite facilities cannot be used for a domestic Common Channel Interoffice Signaling (CCIS) system, i.e. if DOM is Plain Old Telephone Service (POTS), then SAT must be **"N"**.

Continued on next page

Form Entries, Continued

DOM

DOMAIN - This field designates a community of interest that requires separate routing. The types of Domain are "Direct Distance Dialing (DDD), International Direct Distance Dialing (IDDD), Verify (VRFY)" and a number ranging from **"20-83"** denoting a NON-Plain Old Telephone Service (POTS) domain. DDD is indicated by an entry of **"POTS"** in the DOM field. The Office Data Assembler (ODA) system will automatically build the DDD Domains (0 through 19). The **"VRFY"** Domain enables the Line-Busy Verification feature by operators over a dedicated network. When DOM equals VRFY, then Type of Trunk (TOT) must be ITOLL, MISC, or TSPS or CALLTYP must equal FHT, GNS, or TST. The NON-POTS Domains may be a Common Control Switching Arrangement (CCSA) Network, such as Federal Telecommunications System (FTS). These domains are entered as a number from **"20-69"**.

- The **NON-POTS domain of 78** is used to skip Network Management code controls for quality assurance testing, i.e. CASPER.
- The **NON-POTS domains 79 and 80** are reserved for specific International Switching Center (ISC) use.
- The **NON-POTS domain of 81**, also denoted by **"IVT"** for International Voice Transport, is reserved for call processing to transport international voice calls through the network to an ISC.
- The **NON-POTS domain of 82** is used as the translation domain for Data calls. The Data feature provides the capability for full rate data transmission via the 4ESS Switch over a dedicated network of digital trunks. These digital trunks terminate exclusively on Digital Interface Frames (DIF) at 4ESS Switch locations.
- **N64C** -This domain is used to route 64 kbps clear data calls using the 10-digit North American Numbering Plan (NANP).
- **N64R** -This domain is used to route 64 kbps restricted data calls using the 10-digit North American Numbering Plan.
- **I64C** -This transport domain is used to route 64 kbps clear international data calls up to an ISC.
- **I56D** -This transport domain is used to route 56 kbps international data calls up to an ISC.

Continued on next page

Form Entries, Continued

DOM (cont'd)

The following translations domains are used for the Software Defined Network (SDN) and Private Branch Exchange (PBX) Interface features:

- **SDNA** - Software Defined Network (SDN) Access - This domain is used to translate the digits of an originating SDN (voice or data) call and determine if the call is a 7-digit or 10-digit call. Trunks in the SDNA domain are dedicated to SDN calls. When DOM equals SDNA, then TOT must be CAMAA, CAMAO, ETC, LCC, PBX, STC, TAND, or TOLLC for Trunk Subgroup (TSG) forms or CALLTYP must be CRB, DSD, DSN, EAR, FHT, GNS, INW, IRA, MCT, MMT, MRT, PAS, PRT, RDB, RNR, SDX, SSP, TEL, TST, or TTS for code group forms.

- **DEV** - Dedicated Egress Voice - This domain is available at the terminating 4ESS Switch to translate SDN and Direct Connect voice calls and route them to a directly connected PBX, via direct egress, or to a local office, via switched egress.

  This domain is also used as an access domain for originating Direct Connect voice calls. The calls arrive at the 4ESS Switch as 10-digit calls. When DOM equals DEV, then TOT must be PBX or Single Trunk Customer (STC) for TSG forms or CALLTYP must be CRB, DSD, DSN, EAR, FHT, GNS, INW, IRA, MCT, MMT, MRT, PAS, PRT, RDB, RNR, SDX, SSP, TEL, TST, or TTS for code group forms.

- **DED** -Dedicated Egress Data - This domain is available at the terminating 4ESS Switch to translate the SDN data call and route it to a directly connected PBX, via direct egress, or to a local office, via switched egress.

  This domain is also used as an access domain for originating Direct Connect data calls. The calls arrive at the 4ESS Switch as 10-digit calls and are routed through the network (translations and facilities) via the data domain. When DOM equals DED, then TOT must be PBX or STC for TSG forms or CALLTYP must be CRB, DSD, DSN, EAR, FHT, GNS, INW, IRA, MCT, MMT, MRT, PAS, PRT, RDB, RNR, SDX, SSP, TEL, TST, or TTS for code group forms.

Continued on next page

Form Entries, Continued

DOM (cont'd)

The following translations domains are used for wideband transmission:

- **NH0C** -This domain is used to route 384 kbps clear data calls using the 10-digit North American Numbering Plan (NANP).
- **NH1C** - This domain is used to route 1536 kbps clear data calls using the 10-digit NANP.
- **APN** - Action Point Numbering Plan - This domain is used as an access domain for originating Direct Connect voice or data calls. The calls arrive at the 4ESS Switch as 10-digit calls. When DOM equals APN, then TOT must be PBX or STC for TSG forms.

NOTE: For Voice Frequency Link (VFL) TSGs, this field identifies the domain in which this TSG operates. Valid inputs are "POTS" (if VFL is associated with a domestic Common Channel Interoffice Signaling [CCIS] system).

IT

Intertoll Treatment - This field is used when the domain of the Trunk Subgroup (TSG) is Plain Old Telephone Service (POTS) and the type of trunk is either End Office or Tandem Connecting (ETC) or Other Carrier Connecting (OCC) to specify whether the TSG should receive intertoll treatment (IT="**Y**") or toll connect treatment (IT=**"N"**) or **"Blank"**. Intertoll treatment means that the call is routed in the POTS intertoll domain, that is, a normal 7-digit call will be terminated in the home Numbering Plan Area (NPA).

((4E22>) - Offices using Traditional routing only). Toll connect treatment means that the call is terminated in the NPA specified by the Far End Numbering Plan Area (FENPA) field.

This field should be set to "**Y**" in any FENPA that is not the Home NPA

((4E22>) - Offices using Traditional routing only) or a Served NPA. This field can also be set to "**Y**" in the Home NPAs

((4E22>) - Offices using Traditional routing only) or Served NPAs to force the POTS-IT domain.

Continued on next page

Form Entries, Continued

FAI	Not Applicable - Entries: **"Blank"**
FENPA	Far End Numbering Plan Area/Trunk Subgroup (TSG) - Enter a 3-digit Numbering Plan Area (NPA) code to identify the far end of the subgroup. Valid entries range from **"200-999"**. With an International Trunk Subgroup, if the far end of the Trunk Subgroup is outside World Zone 1, enter the 1-, 2-, or 3-digit country code. Valid ranges of Country Code entries are **"2-9"**, **"20-99"**, and **"200-999"**. This field is the NPA of the Far-End Office. If this office is not in the Home or Served area, then the Domain will be Plain Old Telephone Service-Intertoll/Intertandem (POTS-IT) and the IT field will be forced to **"Y"** in a Local Exchange Carrier (LEC) switch.
FEOFC	Far-End Office Code - This field is used to identify the office code of the far end switch. Typically this value will range from 200-999. Legal entries are: **"Blank"**, **000-999**.
FELATA	Far End Local Access Transport Area/Trunk Subgroup - This field is used to identify the Local Access Transport Area (LATA) of the far end switch. Legal entries are: **"Blank"**," **000-999"**.
FESC6	Far-End 6-Digit Screening - A **"Y"** for Yes or **"N"** for No indicates whether or not the far-end office which outpulsed the incoming digits is doing 6-digit screening. An **"N"** should be entered in this field if it cannot be determined whether or not the far-end is doing 6-digit screening. If this field is equal to yes, then vacant code analysis assumes the far-end office will never outpulse a vacant central office code (NXX), vacant Numbering Plan Area (NPA) code, an originating Inward Wide Band Area Telephone Service (INWATS) call which has been denied originating capabilities, or an incorrect number of digits on this Trunk Subgroup (TSG).

Continued on next page

Form Entries, Continued

IWZ1	International World Zone 1 - Enter **"Y"** if this Trunk Subgroup (TSG) will carry international traffic within World Zone 1. Enter **"N"** or leave **"Blank"** if this TSG will not carry international traffic within World one 1. Valid entries are **"Blank"**, **"N"**, or "**Y**".
MEM	Memory - This field is used to indicate if trunk hunt with memory is to be performed on this Trunk Subgroup (TSG) when searching for an idle trunk. Trunk hunt with memory is not performed on a TSG if the TSGBBC field is greater than zero (the MEM field should be set to **"N"** in this case). Enter **"N"** if trunk hunt with memory is not to be done. Enter **"Y"** or leave **"Blank"** if trunk hunt with memory is to be done.
PSES	Prohibit Service Evaluation - An entry of **"N"** for No specifies that this Trunk Subgroup (TSG) is eligible for service evaluation by the No. 2 Service Evaluation System. An entry of **"Y"** for Yes specifies that the TSG is not eligible for service evaluation. Valid entries are **"Blank"**, **"Y"**, or **"N"**. Blank defaults to "**N**".
INSEP	Incoming Traffic Separation Class - Enter a number in the range of **"0-255"** to indicate a traffic class for measurement purposes. This code will be used with the outgoing destination (Destination Separation [DESEP] on code group forms) to determine the peg and usage counts for traffic flow identification. Test position and test call Trunk Subgroups (TSGs) are generically assigned to Incoming Separation Class (INSEP) 31. This should be considered before assigning any other TSG to INSEP 31. Also, since service circuits, other non-message circuits, and 1-way outgoing TSGs have a generically assigned INSEP of zero, they will appear as part of TSG listings for INSEP zero. This fact should be considered before assigning any other Trunk Subgroup to INSEP zero.

Continued on next page

Form Entries, Continued

MTSC	Multiple Treatment Screening Class - This field is used to assign an MTSC to this Trunk Subgroup (TSG). Multiple treatment screening may be used to separate routing treatments for TSGs in the same domain. An example is giving independent company trunks a different routing even though the received digits and domain are the same as some other TSG. All TSGs must have an MTSC in the range of **"0-63"**.
GNSC	Go/No Go Screening Class - Go/No Go Screening may be used to block traffic dialing specific digits over a Trunk Subgroup (TSG). All incoming and two-way message TSGs are given a Go/No Go class in the range of **"0-3**". When this type of screening is required for a group of codes, those codes are correlated with a specific class and a "Go" or "No Go" condition (RC Forms 300-304). If a group of codes specify "Go" on a given class, those codes will be blocked on TSGs having a class other than the specified class. For a "No Go" correlation, a set of codes will not be blocked except on TSGs having the specified class. All blocked traffic is given the vacant code Final Handling Treatment (FHT).
GEOSEP	Geographical Traffic Separation Class - Valid entries for this field are one or two digits in the range of "**0-31**" to indicate a traffic class for measurement purposes. This code is used with the Announcement Separation Class to score geographical survey counts in Mass Announcement System (MAS) offices.

Continued on next page

Form Entries, Continued

ISC

Incoming Signaling Characteristics - Enter one of the following codes to specify the incoming signaling characteristics required for this Trunk Subgroup (TSG).

- **DPDDSD** - Dial Pulse with Delay Dial/Start Dial.
- **DPIMADG** - Dial Pulse with Immediate start and "A" Digit reconstruction.
- **DPIMMED** - Dial Pulse with Immediate start (no delay).
- **DPIMPSW** - Dial Pulse Immediate Start Permanent Signal Wink Off.
- **DTMFWK** - Dual-Tone Multifrequency (DTMF) with Wink Start.
- **DTS** - Dial-Tone Start.
- **ISUP** - CCITT7 Integrated Services Digital Network (ISDN) User Part.
- **MFDDSD** - MF with Delay Dial/Start Dial.
- **MFOPWK** - MF Operator trunk with Wink start - International operator trunks.
- **MFWINK** - MF with Wink start.
- **TOLLMFD** - Toll operator MF Delay dial.
- **TSPSMFD** - Traffic Service Position System with MF Delay dial.
- **TSPSMFW** - Traffic Service Position System with MF Wink start.

Continued on next page

Form Entries, Continued

RFA	Ring Forward Allowed - Enter a **"Y"** for Yes or **"N"** for No to indicate if ring forward is allowed. All intertoll (ITOLL) trunks (Type of Trunk [TOT] field is equal to ITOLL) will require the RFA feature. All trunks that have the possibility of receiving operator calls from lower class offices will also require this feature. Each 4ESS Switch office must determine which Trunk Subgroups (TSGs) may receive operator type calls. These TSGs must have the RFA feature assigned.
ADIG	"A" Digit - Reconstruction will be necessary when receiving digits from a machine that absorbs the first digit of a dialed address. Valid entries are **"0"** or **"2-9"** if International Switching Center (ISC) equals DPIMADG. This field is **"Blank"** for all other cases.

Continued on next page

Form Entries, Continued

CCIS2WRE Common Channel Interoffice Signaling (CCIS) 2-Wire - This field should be **"Blank"** for a non-Common Channel Signaling (CCS) Trunk Subgroup (TSG). If this is a CCIS or Integrated Services Digital Network User Part (ISUP) TSG, then it must be determined whether the far end office will terminate the trunks in this TSG on a 2-wire or 4-wire switching network in order to perform the continuity check test on CCIS or ISUP trunks. The CCS continuity check tests will be performed by using the transceiver in either a transceive mode for 4-wire CCS trunks or in a transpond mode for 2-wire CCS trunks. Enter a **"Y"** for Yes if the far end office has a 2-wire network, e.g., 1 ESS/1A ESS 2-wire. Enter an **"N"** for No if the far end office has a 4-wire network, e.g., 1 ESS/1A ESS HILO, 4ESS, 5ESS®, etc.

CBNPR Calling Party Number/Billing Number Default Presentation Restriction Indicator - This field indicates whether the received CPN/BN can be passed from the network at the egress point or not. Enter **"Y"** if the default condition for the presentation of CPN/BN should be to restrict it. Enter **"N"** or leave **"Blank"** if the default condition for the presentation of CPN/BN should be unrestricted. This field applies to incoming trunks for which CPN/BN is pre-stored or on which CPN/BN can be received. For Integrated Services Digital Network User Part (ISUP) Trunk Subgroups (TSGs) with Type of Trunk (TOT) or Local Exchange Carrier Connecting (LCC), this field should be populated with a **"Y"**.

For 4E17 and later generics: Enter **"PA"** or **"Blank"** if the default condition for the presentation of CPN/BN should be unrestricted. Enter **"PR"** if the default condition for the presentation of CPN/BN should be to restrict it.

Continued on next page

Form Entries, Continued

BN	Billing Number/Trunk Subgroup- This field is used to specify a BN associated with the TSG. It may be left **"Blank"**, or a **"3-"**, **"4-"**, or **"10-digit"** number may be entered. If FENCLASS is ACCESA or ACCESI, BN must be a 4-digit number (4-digit number if Type of Feature Group [TFG] is "B") equal to the (X)XXX corresponding to the inter-Local Area Transport Access (LATA) or International Carrier at the far end of the TSG. If FENCLASS is CMC, OWATS, or PBX, BN must be a 10-digit number. If the Automatic Call Distributor (ACD) field is **"Y"**, then BN must be a 10-digit number specifying the billing number of the INWATS ACD customer. If the ACD field is **"T"**, then BN must be **"199"**.
BRL	Billing Record Length - This field is used to specify whether long or short Automatic Message Accounting (AMA) records should be created for calls on this Trunk Subgroup (TSG). An "**S"** should be entered if Short AMA records are required or an **"L"** should be entered if Long AMA records are required. If **"L"** is entered, both answered and unanswered calls are recorded. If **"S"** is entered, only answered calls are recorded. If this field is left **"Blank"**, short AMA records will be made (if necessary). **NOTE: There is only one record length for Private Branch Exchange (PBX) calls, so this field should be used to indicate whether both answered and unanswered.**
ITC	Incoming Trunk Class - This value identifies the incoming trunk as belonging to one of four incoming classes. The ITC is used in conjunction with Local Exchange Carrier (LEC) Service Switching Point (SSP) call routing instructions to identify which Number Services Data Block (NDB) will be selected for picking a trunk to an Interexchange Carrier/International Carrier (IC/INC). The use of this field is similar to that of Multiple Treatment Screening (MTS) but is associated with the BOC SSP feature. Legal entries are **"Blank"** or "**0**-**3**".
GSDN.tsg	Not Applicable - Entries: **"Blank"**

Continued on next page

Form Entries, Continued

GSDNPHSE Not Applicable - Entries: **"Blank"**

EAS Equal Access Signaling - This field is used to specify if Equal Access Signaling (EAS) will be received on this Trunk Subgroup (TSG), and if so, whether Automatic Number Identification (ANI) is expected for the EAS calls. Note that this field only applies to an Inter-Local Access Transport Area (LATA) Carrier switch receiving EAS or an office with the Service Switching Point (SSP) feature receiving EAS. This field must be set to **"N"** for None if EAS is not received on the TSG. If EAS can be received on the TSG, but ANI is not expected for the EAS calls, then an **"E"** must be entered. If EAS can be received on the TSG, and ANI is expected on the EAS calls, then an **"A"** must be entered.

Entries of **"D"** and **"R"** in the EAS field are used to designate Feature Group D (FGD) only. If only FGD is received on the TSG, but ANI is not expected, then a **"D"** must be entered. If only FGD is received on the TSG, and ANI is expected, then a **"R"** must be entered.

This field only applies to an Inter-LATA Carrier switch receiving Equal Access Signaling (EAS), i.e., the Type of Trunk (TOT) value is Local Exchange Carrier Connecting (LCC).

CMTYP Centralized Automatic Message Accounting (CAMA) Type - This field is used to specify the type of CAMA record made on this Trunk Subgroup (TSG). Enter **"1"** if the standard Operating Company CAMA record must be made on this TSG. Enter **"2"** if an Inter-Local Area Transport Access (LATA) Carrier CAMA record and an Operating Company access record must be made on this TSG. If TOT is not CAMAA or CAMAO, this field must be **"Blank"**.

NOTE: The entries correspond to the number of records which will be made.

Form Entries, Continued

NPARINH	Inhibit Numbering Plan Area (NPA) Reconstruction - This field is used to specify whether NPA reconstruction for equal access calls or SDN should be inhibited on this TSG or not. ANI is taken to be NPA if only seven digits are received. If NPA reconstruction should be inhibited, enter **"Y"**, otherwise enter **"N"** or leave **"Blank"**. This field only applies to Local Exchange Carrier Connecting (LCC) Type of Trunks (TOTs). Valid entries are **"Blank"**, "**Y"**, or **"N"**.
WATSBN	General Wide Area Telephone Service (WATS) Billing Number - Enter a 10-digit billing number for each Trunk Subgroup (TSG) which will be used to carry WATS type traffic. If an entry is not required, then the field must be "**Blank**" . Valid entries are **"0000000000-999999999"** and **"Blank"** .
PSUUI	Prohibit Sending User-to-User Information - This field indicates whether to accept/send Message Associated (MA) UUI on this Trunk Subgroup (TSG). Legal values are **"Blank"**, **"Y"**, or **"N"**. Enter **"Y"** if MA-UUI should not be sent. This value should be used on access TSGs to prohibit the receipt of MA-UUI, and it should be used on egress TSGs to prohibit the sending of MA-UUI. The default condition is **"N"**. This field applies to Integrated Services Digital Network User Part (ISUP), International ISUP (INUP), and Q931 trunks only.
BNPT	Not Applicable - Entries: **"Blank"**
WBNPT	Not Applicable - Entries: **"Blank"**
CMERGE	Not Applicable - Entries: **"Blank"**
SCFN	Send Confusion Messages - This field indicates if received Confusion messages are counted and if Confusion messages are to be sent when an unimplemented message is received. Valid entries are **"Blank"**, **"Y"**, or **"N"**.

Continued on next page

Form Entries, Continued

OVLP	Overlap Signaling- This field indicates if Consultative Committee for International Telephone & Telegraph Signaling System 7 (CCITT7) Overlap Signaling is allowed when processing an International Integrated Services Digital network User Part (INUP) or CCITT7 Telephone User Part (TUP) call. If OVLP is set to **"Y"**, then Overlap Signaling will be allowed on transit non-operator, non-test calls. The default value for this field is: **"Blank"** (Overlap Signaling not allowed).
PRIT	Not Applicable - Entries: **"Blank"**
APS	Accunet® Packet Service - This field is used to indicate if Accunet packet service can be performed on this Trunk Subgroup (TSG). Enter **"Y"** if Accunet packet service is allowed. Enter **"N"** or leave **"Blank"** if Accunet packet service is not allowed.
PSATP	Prohibit Sending Access Transport Parameters - This field indicates whether Access Transport Parameters (ATP) can be passed to or from a connecting network. Legal values are **"Blank"**, **"Y"** or **"N"**. Enter **"Y"** if ATP should not be sent. This value should be used on access Trunk Subgroups (TSGs) to prohibit the receipt of ATP; it should be used on egress TSGs to prohibit the sending of ATP. The default condition is **"N"**. This field applies to Integrated Services Digital Network User Part (ISUP), International ISUP (INUP), and Q931 trunks only. This new field will not affect the sending of ATP at an Access Tandem (AT) switch.
PBXESGD	Private Branch Exchange (PBX) Expect Station Group Designation - This field is used for the Software Defined Network (SDN) feature and is set equal to **"Y"** if the SDN customer has a direct connect PBX that will append an extra digit to the dialed number to indicate authorization of calling station. A **"Y"** or **"N"** must be entered in this field if Type Of Trunk (TOT) is PBX and Domain (DOM) is Software Defined Network Access (SDNA), otherwise it must be set to **"N"** or left **"Blank"**.

Continued on next page

Form Entries, Continued

PBXAW	Private Branch Exchange Answer Withheld - This field is used to specify whether Answer Supervision can or cannot be sent to the PBX. An entry can only be made if Type Of Trunk (TOT) is PBX. A **"Y"** is entered if Answer Supervision is to be withheld. An **"N"** is entered if Answer Supervision should not be withheld (i.e., Answer Supervision is returned). If this field is left **"Blank"** Answer Supervision is returned (not withheld).
FAR4E	The FAR4E field is set to **"Y"** for Yes whenever the far end of the trunks in this Trunk Subgroup (TSG) is terminated on a 4ESS Switch with the international announcements. This is used in common channel signaling (Incoming Signaling Characteristics [ISC] is Domestic Common Channel Interoffice Signaling [DOMCCIS] or Integrated Services Digital Network User Part [ISUP]) to control sending backward failure messages on failed international calls. These switches are equipped with the international announcements. The FAR4E field also controls common channel signaling sending network management call preference data in a forward direction (OSC is DOMCCIS or ISUP). Such data must not be sent forward to switches not equipped to handle it. Enter **"N"** if the far end is not a 4ESS Switch or the 4ESS Switch does not have the international announcements. This field should be left **"Blank"** for International Consultative Committee for International Telephone & Telegraph Signaling System 7 [CCITT7] ISUP (INUP) trunks.
MEGC	Not Applicable - Entries: **"Blank"**
SDNA	Not Applicable - Entries: **"Blank"**
OWAT	Not Applicable - Entries: **"Blank"**

BFTIS	Backward Failure Treatment Integrated Services Digital Network User Part (ISUP) all the way. This field is used to specify whether an Announcement (ANN) should be played or a Release (REL) message should be sent when a call has gone ISUP all the way. On the Trunk Subgroup (TSG) Forms, this field is only used when signaling is ISUP and the type of trunk is OCC. Valid entries are **"Blank"**, **"ANN"**, or **"REL"**. If left **"Blank"**, this field will default to **"REL"** when it applies. For Office Data Assembler (ODA) Form 406Z, this field is used for designating the action for intra-Local Access Transport Area (LATA) ISUP call failures occurring at the switch. Valid entries are **"Blank"**, **"ANN"**, or **"REL"**. If left **"Blank"**, this field will default to **"REL"**.

BFTNI

Backward Failure Treatment not Integrated Services Digital Network User Part (ISUP) all the way. This field is used to specify whether an Announcement (ANN) should be played or a Release (REL) message should be sent when a call has not gone ISUP all the way.

On the Trunk Subgroup (TSG) Forms, this field is only used when signaling is ISUP and the type of trunk is OCC. Valid entries are **"Blank"**, **"ANN"**, or **"REL"**. If left **"Blank"**, this field will default to **"ANN"** when it applies.

For Office Data Assembler (ODA) Form 406Z, this field is used for designating the action for intra- Local Access Transport Area (LATA) ISUP call failures occurring at the switch when a call has not gone ISUP all the way. Valid entries are **"Blank"**, **"ANN"**, or **"REL"**. If left **"Blank"**, this field will default to **"ANN"**.

SKSP

Not Applicable - Entries: **"Blank"**

PBXNWW

Private Branch Exchange (PBX) No Wait for Wink - An entry of **"Y"** in this field is used to specify that the Trunk Subgroup (TSG) has a PBX which does not wait for a wink from the 4ESS Switch before outpulsing digits. This field is used only for TSGs with a type-of-trunk value of PBX and signaling of Dual Tone Multifrequency Wink (DTMFWK). Enter **"Y"** if the PBX does not wait for a wink from the 4ESS Switch. Otherwise, enter **"N"** or leave **"Blank"**.

HYBRD

Not Applicable - Entries: **"Blank"**

CCTT

Not Applicable - Entries: **"Blank"**

INCID

Number of Carrier ID digits to be received - An entry of **"3"** specifies that the Trunk Subgroup (TSG) should expect to receive a 3-digit CID. An entry of **"4"** specifies that the TSG should expect to receive a 4-digit CID. An entry of **"B"** specifies that the TSG should expect to receive a 3- or 4-digit CID.

CBN	Call Back Number - CBN is a seven or 10 digit telephone number associated with the Centralized Automatic Reporting On Trunks (CAROT) control location. It is used by the 4ESS Switch as part of the CAROT/ROTL interface.
CID	Carrier ID. This field is populated with the pre-subscription carrier selected by the customer to handle inter-Local Access Transport Area (LATA) calls; and intra-LATA calls when intra-LATA competition is allowed. It is a 4-digit number with a range of **"0000-9999"**, indicating the XXXX digits of the desired carrier. This field is only populated for ISC/OSC=Q.931.

STBI.tsg Not Applicable - Entries: **"Blank"**

CAREA Control Area - Valid input for this field is a single digit in the range of **"0-9"**. This number identifies the Control Area that is to be associated with this Trunk Subgroup (TSG) for trouble reporting. The number assignable in a given office is limited, however, to the highest control area assigned at Office Data Assembler (ODA) time as defined by the highest Member Number for a test position. This is because of engineered memory allocated for plant measurement purposes. Each Control Area can have a maximum of 10 (0-9) associated Control Positions (CPOS). The Control Area number and the CPOS number combined make up the testboard position number. For example CAREA-2 and CPOS-5 would be testboard position 25. A maximum of 100 (0-99) testboard positions may be installed for a 4ESS Switch location.

Any test position can access every trunk assigned to the 4ESS Switch with the exception of international trunks. International trunks having Incoming Signaling Characteristic (ISC) or Outgoing Signaling Characteristic (OSC) equal to Consultative Committee for International Telephone & Telegraph 5 (CCITT5) must be assigned to a CAREA that is equipped with 51AL6 test positions. The 51AL6 test position can access any trunk assigned to the 4ESS Switch However, the alarms, Teletype (TTY) printouts, and 101 calls associated with a particular TSG will only be transmitted to the CAREA and CPOS that is specified on the input form for a TSG. A single trouble receiving location could be specified for all TSGs in the office. Trouble tickets might be originated here and distributed to occupied test positions as necessary. Some other typical applications could be to assign the TSGs to testboard positions alphabetically, by direction, by ownership, or by Type of Trunk (TOT).

The only other restraint on assigning a TSG to a particular CAREA and CPOS is that all positions might not have the optional equipment required to satisfactorily test some Trunk Subgroups. The arrangement in a given office depends on the administrative decisions made for that office.

Form Entries, Continued

CAREA
(cont'd.)

Position 00 (CAREA 0, CPOS 0) has been assigned to the Master Test and Control Channel (MTC) teletype in the Maintenance Operating Center (MOC). This position was established to receive trouble reports for certain non-message type TSGs. Lucent Technologies recommend that positions
01-09 not be assigned in an office at this time. The circuits that should be assigned to test position 00 are:

- ACI*DCHN - D-Channel circuits to the Common Network Interface (CNI) Ring
- CLN*DLPC - Loopback/complement Data Test
- MAS*BIPB - Mass Announcement System (MAS) Barge-in Playback Trunk
- MIS*AART - Auxiliary Audible Ring Trunk
- MIS*TERM - Common Channel Interoffice Signaling (CCIS) Terminals
- SVC*AIN* - Advanced Intelligent Network (AIN)
- SVC*DMRV - Dual-Tone Multifrequency (MF) Receivers (DTMFR)
- VC*DMXM - Dual-Tone Multifrequency Transmitters (DTMFT)
- SVC*MFR* - Multifrequency Receivers
- SVC*MFX* - Multifrequency Transmitters
- SVC*XCVR - CCIS Continuity Check Transceivers
- SVC*XCVT - CCIS Continuity Check Transceiver Test Circuit
- SVC*MFRT - Multifrequency Receiver Test Circuits
- SVC*MFXT - Multifrequency Transmitter Test Circuits
- SVC*SCAN - Service Circuit System Expanded Announcements
- SVC*SCBN - Service Circuit System Expanded Announcements
- SVC*SCNS - Network Services Complex Set S
- TAS*ANN* - Recorded announcements
- TAS*TONE - Tone Circuits
- TAS*MWAT - 1004 hz at 0 dBm
- TAS*MW10 - 1004 hz at 10 dBm

Form Entries, Continued

CAREA (cont'd.)

The balance of the non-message type TSG may be assigned to working testboard positions.

For RC Forms 604 and 605, this number identifies the Control Area that is to be associated with this announcement trouble report. The number assignable in a given office is limited, however, to the highest control area assigned at ODA time as defined by the highest Member Number for a test position. This is because of engineered memory allocated for plant measurement purposes. Each Control Area can have a maximum of 10 (0-9) associated Control Positions (CPOS). The Control Area number and the CPOS number combined make up the testboard position number. For example CAREA-2 and CPOS-5 would be testboard position 25. A maximum of 100 (0-99) testboard positions may be installed for a 4ESS Switch location. If CAREA 0,
CPOS 0 is specified, all MAS messages will be sent to the MTC channel in the MOC.

CPOS

Control Position - Enter a number from **"0-9"** to specify the testboard position that is to be associated with the Trunk Subgroup (TSGs) and Control Area (CAREA) for test reporting purposes. This assignment together with the CAREA designation can be used to distribute the maintenance responsibility for Trunk Subgroups. This assignment does not prevent any test position from accessing a particular group of trunks. It is only for reporting purposes.

For RC Forms 604 and 605, enter a number from **"0-9"** to specify the testboard position that is to receive the announcement trouble reports. If CAREA is 0, only CPOS 0 is allowed. When the Message Announcement System (MAS) is administered by the Operations National Administration Center (ONAC), assign the CPOS that has been dedicated for its use.

SINDEX

Access Change Verification Sampling Rate Index value - This field specifies the rate at which calls will be sampled for access charge verification. Legal values are **"Blank"**, **"0"**, **"1"**, **"2"**, **"4"**, **"8"**, **"16"**, **"32"**, **"64". "Blank"** and **"0"** imply no verification recording. Otherwise, one call out of the number entered will be recorded.

Form Entries, Continued

S1-10

These fields are reserved for future use in order to be able to implement new capabilities in a more timely fashion. When a new capability is requested for Generic Programs currently deployed in the field, one of these spare fields will be designated for use in implementing that capability.

S1 - Valid entries are **"Blank"**, or **"0-7"**.
S2-10 - Valid entries are **"Blank"**, **"Y"**, or **"N"**.

- S2 - (4E18/4E19/4E20) - An entry of **"Y"** in this field identifies Signaling System 7 (SS7) trunks which have their Per Channel Inhibit Signaling (PCIS) bits reset to force a steady state AB bit indication. Otherwise, enter **"N"** or leave **"Blank"**. In 4E21, the CODSC field will replace the use of S2 for this purpose.

- S2 - (4E21R4) This Trunk Subgroup (TSG) parameter allows TSG circuits to trigger the Advanced Intelligent Network (AIN) processing. The parameter can have the following values: **"Blank"**, **"N"** for no access allowed, and **"Y"** for access allowed. The default is **"N"**.

- S5 - Unassigned - Reserved for future use.

- S6 (4E18/19/20) - this Trunk Subgroup (TSG) parameter indicates the allowed Information Transfer Capability (ITC) coding in the outgoing Initial Address Message (IAM). The parameter can have the following values: **"Blank"**, **"N"** (use office) to encode the outgoing IAM, User Service Information (USI) parameter ITC field, the same as used in the office indicator, and **"Y"** (use opposite of office) to encode the outgoing IAM, USI parameter ITC field, with the opposite of what is used in the office indicator. The default is "use office".

NOTE: An entry of "0-7" in the S1 field or a "Y" in any of the fields S2 thru S10 without knowledge of the capability to which the field has been assigned may result in undesirable switch behavior.

RC Form 109

General

Recent Change (RC) Form 109 changes the translations for a one-way Outgoing Trunk Subgroup (TSG). This message is classed as a Recent Change Data Message (RCDM). There are two characteristics that are not changeable with this form: the Circuit Identification Name (CIN) (use RC Form 802) and the Quantity of Traffic Numbers (QTFN) (use RC Forms 104 or 105).

The restrictions imposed for changing the Domain (DOM) are:

- The existing domain has to be in the range of 20 through 69.
- The new domain has to be in the range of 20 through 69.

All other changes to the Domain are prohibited.

Certain characteristics cannot be changed unless all trunks in the TSG are in a particular state. For more information, Refer to Table 3 – Relationship Between Characteristics and State of Trunks in Trunk Subgroup. This table confirms that almost all of the popular characteristics related to a TSG change require the trunks to be either put in the CADOOS state or removed. Therefore, it should be noted that it may be much easier and more efficient (maintaining service) to build the new TSG. Then, as the trunks from the old TSG are put to the CADOOS state, they can be removed from the old TSG and reassigned to the new TSG. This is a prudent choice as service could be working on both TSGs as some of the trunks are being turned down and reassigned to the new TSG. Also, the new two-way TSG is more apt to have the more accurate TFNB numbering scheme as a result of the Reverse (REV) considerations while building the new TSG. After all of the trunks are removed from the old TSG (this transition could be over a number of days if desired), it can be entirely removed.

If input to the FEAREA and/or IWZ1 field are modified, the RC Form must update Routing Data Block (RDB) Alternate Route Lists. If the Roll Back Area becomes full from these updates, the Form will print a warning message that not all of the RDB Route Lists have been updated and that the TSG form must be reentered. The user must reenter the form to complete building the RDB Route Lists.

An alphabetical keyword list is included in this section, starting on page 51.

Form Entries

RC:TSG;CHG;OPT(OUT1WAY),---:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

ORNU Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

Form Entries, Continued

TSG

Trunk Subgroup - This series of codes identifies a Trunk Subgroup. The TSG is a set of trunks within a Trunk Group having certain identical characteristics. A Trunk Group must have a common destination. In addition to group characteristics, a TSG also has common signaling characteristics, transmission delay, originating Numbering Plan Area (NPA), domain, traffic separation index and screening classes. The Trunk Group and TSG are identified by a series of codes that specify the near and far ends of the trunk. In most cases, the full near end definition is not required because it will always be the same. The Trunk Group designation is comprised of the town, state, building and building subdivision for the far end plus the near end building subdivision. A TSG is uniquely identified by adding a Base Traffic Number reference. Trunk Group and TSG definitions are available in the 4ESS Switch as abbreviated Circuit Identification Names (CINs). Common Language Location Identification (CLLI) codes must be entered in the fields that make up the Trunk Group definition. Rules for establishing these codes are covered in Lucent Technologies Practices 795-100-100. The code for any established office may be found by referring to the location code index in that same Lucent Technologies Practices. For non-message TSGs, the format does not include mnemonics for identifying the far end of the trunk. The TSG will mnemonically identify the type of trunk category by function. Asterisks are used in columns where no information is necessary. The following paragraphs describe the individual fields within a TSG definition.

Continued on next page

Form Entries, Continued

TSG
(cont'd)

- **BTFN** - Base Traffic Number - The BTFN is a number in the range of **"0-9976"** that is part of the TSGs designation (which consists of the BTFN, TOWN, ST, BL, FBS, and NBS). The BTFN is the first traffic number in the first block of traffic numbers that is assigned to a TSG. Additional traffic numbers, which are assigned in blocks of 24, either higher or lower in numerical value than the BTFN can be assigned to the TSG, but the BTFN remains as defined above. All non-message trunks have a BTFN of **"0000"**. For RC 104, the BTFN is stored as the starting point for a block of traffic numbers that range up to the limit originally defined on RC Forms 100, 101 and 102 when the TSG was first built. Other blocks of traffic numbers, either higher or lower in numerical value, may be assigned to this TSG, via Recent Change (RC) procedures. In this case the original BTFN would still apply, but the QTFN field would contain the number of new traffic numbers to be assigned following the First Traffic Number (FTFN) specified.

- **TOWN** - Town is a 4-character alphabetic field - The code must represent the bona fide town, city or location per Lucent Technologies Practices 795-100-100 for the far end of the TSG.

- **ST** - State - This field represents the state, province or foreign country in which the far end office is located. The code in ST must be a standard 2-character alphabetic combination. Valid standard abbreviations for states, Canadian provinces and foreign countries may be found in Lucent Technologies Practices 795-100-100.

- **BL** - Building - The BL field contains the office identity for the far end of a TSG. This code consists of either two alphabetic characters or two numeric characters. Independent Telephone Company locations are always designated by an **"X"** plus some alpha character in this field. If the TSG terminates in a customer's building and it is not necessary to identify that particular building, this code may be arbitrary.

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

TSG (cont'd)

- **FBS** - Far Building Subdivision - This field contains a code that identifies the internal building subdivision for the far end of a TSG. The code is a traffic, plant, or administrative assignment. It must be a 3-character alphanumeric combination. For non-message TSGs, this field is not required. Three asterisks are pre-printed on the form to provide an entry for this field.

- **NBS** - Near Building Subdivision - The NBS designation is the internal building identity for the near end termination of a TSG. It is always a 3-character alphanumeric code. This field should be left **"Blank"** if the NBS for this TSG is the same as the NBS assigned in the near office Circuit Identification Number (CIN) for the 4ESS Switch. The Office Data Assembler (ODA) system will add the NBS on a default basis.

Continued on next page

Form Entries, Continued

PCF

Point Code Format - This field is used to specify the format of the point code that is being entered in the point code field. If no entry is being made in the Destination Point Code (DPC) (Originating Point Code [OPC]) field, then this field must be left **"Blank"**. Three different formats are available for input: **ATT, ANSI,** or **ISPC**.

ATT is used for AT&T standard input/output which consists of a three digit network indicator, a two digit cluster region, a one digit cluster type, and a three digit cluster member.

1. **NET**: Network Indicator - This value specifies which signaling network will be used for transport. Valid entries are **"000-255"**.

2. **CR**: Cluster Region - This value specifies the region of the signaling network where the office is located. Valid entries are **"00-31"**.

3. **CT**: Cluster Type - Valid entries are **"0-7"**.

4. **MEM**: - Cluster Member - This value specifies the office member number within the cluster. Valid entries are **"000-255"**.

ANSI is used to indicate that the input/output is in the American National Standards Institute format which consists of a three digit network indicator, a three digit cluster, and a three digit member number.

1. **NET**: Network Indicator - This value specifies which signaling network will be used for transport. Valid entries are **"000-255"**.

2. **CLU**: Cluster - This value specifies the cluster of the signaling network where the office is located. Valid entries are **"000-255"**.

3. **MEM**: Member Number - This value specifies the office member number within the cluster. Valid entries are **"000-255"**.

Continued on next page

Form Entries, Continued

PCF (cont'd)

ISPC is used for international signaling point code input/output which consists of a one digit world geographical zone, a three digit area/network identifier, and a one digit signaling point identifier. Reference: International Consultative Committee for International Telephone & Telegraph Signaling System (CCITT) Recommendation "Numbering of International Signaling Point Codes", Vol. VI, Rec. Q.708.

1. **WGZ**: World Geographical Zone - This value specifies the world geographical zone of the office. Valid entries are "**1-7**".

2. **ANI**: Area/Network Identification - This value specifies a geographical area or network in a specific zone. Valid entries are **"000-255"**.

3. **SPID**: Signaling Point Identification - This value specifies a signaling point in a specific geographical area or network. Valid entries are **"0-7"**.

AOPC

Alias Origination Point Code - This field will provide a unique combination of a Local Exchange Carrier (LEC) Signal Transfer Point (STP) Point Code (PC) and an AT&T STP PC for each Local Access Transport Area (LATA) dedicated D-link set via a logical point code. AOPC, if entered, must be entered in the ATT format. See the Point Code Format (PCF) field for the format description. AOPC may only be entered when the PCF field is not **"Blank"**.

Continued on next page

Form Entries, Continued

DPC

Destination Point Code - This field is used to specify the Destination Point Code of the far-end switch.

This field entry is divided into three subfield entries:

1. NET - Network Indicator - This value specifies which signaling network will be used for transport. Valid entries are **"Blank"**, **"000-255"**.

2. CLU - Cluster - This value specifies the cluster of the signaling network where the office is located. Valid entries are **"Blank"**, **"000-255"**.

3. MEM - Cluster Member - This value specifies the office member number within the cluster. Valid entries are **"Blank"**, **"000-255"**.

For the Trunk Subgroup (TSG) forms, nine digits must be entered, depending on the format specified in the Point Code Format (PCF) field. Nine digits must be entered if PCF is American National Standards Institute (ANSI) format. An entry must be made in this field if either the Incoming Signaling Characteristics (ISC) or Outgoing Signaling Characteristics (OSC) field value is **"ISUP"**, **"INUP"**, or **"TUP"**; otherwise this field must be **"Blank"**.

Continued on next page

Form Entries, Continued

FENCLASS This field specifies the classification of the Far End Network (FEN). If the Trunk Subgroup (TSG) is not associated with any FEN, this field is left **"Blank"**. The FEN with which the TSG is to be associated must be described via 4ESS Switch RC 617.

For RC 524, this field identifies the class for accumulating counts.

The following classifications are available:

- **ACCESA** - This identifier specifies that the TSG is a link to an Inter-exchange Carrier (IC) or International Carrier (INC), and the 4ESS Switch is being used by a Local Exchange Carrier (LEC) as an Access Tandem (AT) and/or Service Switching Point (SSP) to switch calls from this TSG.

- **ACCESI** -This identifier specifies that the TSG is a link to an International Carrier (INC), and the 4ESS Switch is being used by an Interexchange Carrier (IC) (e.g., AT&T-C) to switch calls from this TSG.

- **ACCESO** - This identifier specifies that the TSG is a link to an Operating Company and the 4ESS Switch is used as an IC.

- **CMC** - Cellular Mobile Carrier - This identifier specifies that the FEN is a CMC. The TSG connects an Access Tandem (AT) and a CMC.

- **INTL** - This identifier specifies that the TSG is an international link with the far end outside World Zone 1 and that the 4ESS Switch is being used as an International Switching Center (ISC)

- **OWATS** - This identifier specifies that the TSG is a link to a Private Branch Exchange (PBX) over which only Outward Wide Band Area Telephone Service (WATS) calls are allowed.

Continued on next page

Form Entries, Continued

FENCLASS (cont'd)

- **OEO** - Other End Office connecting, meaning an Equal Access End Office (EAEO) owned by a different company. This identifier specifies that the FEN is an OEO. The TSG connects an Access Tandem (AT) and an OEO.
- **PBX** - This identifier specifies that the TSG is a link to a PBX.
- **POTS** - This identifier specifies that the TSG is a link to a switching machine serving either a Local Access Transport Area (LATA) of the Local Exchange Carrier (LEC) owning/sharing the 4ESS Switch, the Continental United States/Plain Old Telephone Service (POTS) (CUSP) network of the IEC owning/sharing the 4ESS Switch, or some other FEN to be treated similarly.

Continued on next page

Form Entries, Continued

FENID

Far End Network (FEN) Identification - This field distinguishes the specific FEN with which this Trunk Subgroup (TSG) is associated. One to six alphanumeric characters may be entered to distinguish among several FENs with the same classification, or the field may be left **"Blank"**. If FENCLASS is **"Blank"**, FENID must also be **"Blank"**.

When the FENCLASS is ACCESA or ACCESI, FENID should consist of type of feature group access and the 4 numeric digits of the Carrier Identification Code (CIC).

The type of feature group definitions are:

- **G** - All access types (B, C, & D).
- **B** - Feature Group B Access.
- **C** - Feature Group C Access.
- **D** - Feature Group D Access.

Examples include:

- **G0288** - Carrier ID 288 has Feature Group B, C, & D access.
- **BC0288** - Carrier ID 288 has Feature Group B & C access.
- **BD0288** - Carrier ID 288 has Feature Group B & D access.
- **B2882** - Carrier ID 2882 has Feature Group B access only.
- **D2882** - Carrier ID 2882 has Feature Group D access only.

For an access type, both B2882 and D2882 can exist but be for different carriers.

Continued on next page

Form Entries, Continued

TFG

Type of Feature Group - This field is used to specify whether the Type of Access for this Trunk Subgroup (TSG) is tariffed under Feature Group B, Feature Group C, or Feature Group D. An entry can only be made if the FENCLASS is ACCESA. If FENCLASS is ACCESA, a **"B"**, **"C"**, or **"D"** must be entered, corresponding to Feature Groups B, C, or D, respectively. FENCLASS is not ACCESA, this field must be left **"Blank"**.

TSGBBC

Trunk Subgroup (TSG) Broadband Capability - Integrated Services Digital Network User Part (ISUP), International ISUP (INUP), and Q.931 signaling systems allow for broadband switching. This entry specifies what type of circuits may be populated in this TSG. Valid entries are:

- **Blank** - 1 trunk circuit
- **0** - 1 trunk circuit
- **1** - 6 trunk circuits
- **2** - 24 trunk circuits
- **3** - Combined usage 1 and 6 trunk circuits
- **4** - Combined usage 1 and 24 trunk circuits
- **5** - Combined usage 6 and 24 trunk circuits
- **6** - Combined usage 1, 6, and 24 trunk circuits.

FEPTY Not Applicable - Entries: **"Blank"**

TOT Type of Trunk - This field specifies the trunk type for this Trunk Subgroup (TSG). TOT entries of **"ETC"** for End Office or Tandem Connecting, **"LCC"** for Local Exchange Carrier Connecting, and **"OCC"** for Other Carrier Connecting are used for network interconnect. When these TOT values are used on Integrated Services Digital Network User Part (ISUP) trunks, the Local Exchange Carrier (LEC) (Bellcore TR-317) and/or network interconnect version (TR-394) of the ISUP protocol is used. For all other allowed TOT values, the AT&T version of the ISUP protocol is used. The codes that may be entered are as follows:

- **ETC** - End Office or Tandem Office Connecting - This Type of Trunk (TOT) is used to identify Equal Access (EA) or Intra Local Access Transport Area (IntraLATA) trunks at a switch serving as an Access Tandem (AT) or Service Switching Point (SSP) where the other end connects to an End Office. This TOT is also used to identify EA trunks between ATs or between an AT and a switch serving as an SSP. When the type of trunk is ETC, the signaling characteristic of the Trunk Subgroup (TSG) must be either Multifrequency Wink (MFWINK) or ISUP.

- **INTL** - International - International circuit with the far end outside of World Zone 1, and having signaling characteristics of International Consultative Committee for International Telephone & Telegraph Signaling System 5 (CCITT5), CCITT6, International ISUP (INUP), and CCITT7 Telephone User Part (TUP).

- **INTLO** - International Overflow - International Overflow circuit (for overflow transit traffic) with the far end inside World Zone 1 in another International Switching Center (either the U.S. or foreign).

- **ITAND** - Inter Tandem - This TOT can be used to handle traffic between two tandem switchers in the same local calling area.

Continued on next page

Form Entries, Continued

TOT
(cont'd)

- **ITOLL** - Intertoll - Intertoll trunks will carry toll traffic between class 4 or higher offices, or trunks dedicated to Inter-International Switching Center (inter-ISC) international overflow traffic. This includes final, full and high usage TSGs.

- **ITOP** - International Operator - International Operator tandem trunk from a No. 5 switchboard.

- **LCC** - Local exchange Carrier Connecting - This TOT is used to identify EA trunks at an AT&T switch This identifier is also used for outgoing ISUP trunks from the Interexchange Carrier/International Exchange Carrier (IC/INC) to an SSP office. When the type of trunk is LCC, the signaling characteristic of the TSG must be either MFWINK or ISUP and the Equal Access Signaling (EAS) field must be marked as either **"E"**, **"A"**, **"D"** or **"R"**.

- **MISC** - Miscellaneous - This designation is used for operator (except for inward, leave word or 2-way operator trunks), service circuit, and other miscellaneous TSGs.

- **OCC** - Other Carrier Connecting - This TOT is used to identify EA trunks at a switch serving as an AT or SSP where the other end connects to an IC or INC switch. This type of trunk should be used when the signaling on the TSG is MFWINK or ISUP.

- **PBX** - Private Branch Exchange - This identifier indicates that the trunks in this TSG terminate on a PBX unit. If the PBX interface is via a 2-wire PBX Channel Unit (J98726ST), then the Incoming Signaling Characteristics (ISC) should be Dial Pulse Immediate (DPIMMED) and the Outgoing Signaling Characteristics (OSC) should be Dial Pulse Wink (DPWINK).

- **SECIT** - Secondary Intertoll - These trunks interconnect toll switching machines and manually operated toll or assistance switchboards for routing of operator completed traffic.

Continued on next page

Form Entries, Continued

TOT (cont'd)

- **STC** - Single Trunk Customer - This TOT is used to designate a TSG for single trunk terminations not supported by a PBX. When TOT is STC, the following TSG fields must be **"Blank"** or **"N"** as allowed: ANISID, APS, BRL, CCIS2WRE, DNHR, DPC, EAS, FAR4E, PBXAW, PBXESGD, REV, RFA, RFMP, SAT, SINDEX, TFG, TSGBBC, WANISID, XCPA.

- **TAND** - Tandem - This code is used for 2-way tandem, tandem completing and tandem connecting TSGs.

- **TOLLC** - Toll Connecting or Completing - This code is used for Direct Distance Dialing (DDD) access, toll connecting or toll completing TSGs.

SAT

Satellite - Enter a **"Y"** for Yes or **"N"** for No to indicate whether or not this Trunk Subgroup (TSG) is associated with satellite facilities. This entry performs a screening function to avoid two satellite TSGs from being connected together to complete a call. If the incoming TSG has SAT = "Y", then call processing will insist the outgoing TSG must have SAT = "N". This can also be used for local screening functions even though the TSG is not via a satellite.

For Voice Frequency Link (VFL) TSGs, satellite facilities cannot be used for a domestic Common Channel Interoffice Signaling (CCIS) system, i.e. if DOM is Plain Old Telephone Service (POTS), then SAT must be **"N"**.

Continued on next page

Form Entries, Continued

DOM

DOMAIN - This field designates a community of interest that requires separate routing. The types of Domain are "Direct Distance Dialing (DDD), International Direct Distance Dialing (IDDD), Verify (VRFY)" and a number ranging from **"20-83"** denoting a NON-Plain Old Telephone Service (POTS) domain. DDD is indicated by an entry of **"POTS"** in the DOM field. The Office Data Assembler (ODA) system will automatically build the DDD Domains (0 through 19). The **"VRFY"** Domain enables the Line-Busy Verification feature by operators over a dedicated network. When DOM equals VRFY, then Type of Trunk (TOT) must be ITOLL, MISC, or TSPS or CALLTYP must equal FHT, GNS, or TST. The NON-POTS Domains may be a Common Control Switching Arrangement (CCSA) Network, such as Federal Telecommunications System (FTS). These domains are entered as a number from **"20-69"**.

- The **NON-POTS domain of 78** is used to skip Network Management code controls for quality assurance testing, i.e. CASPER.
- The **NON-POTS domains 79 and 80** are reserved for specific International Switching Center (ISC) use.
- The **NON-POTS domain of 81**, also denoted by **"IVT"** for International Voice Transport, is reserved for call processing to transport international voice calls through the network to an ISC.
- The **NON-POTS domain of 82** is used as the translation domain for Data calls. The Data feature provides the capability for full rate data transmission via the 4ESS Switch over a dedicated network of digital trunks. These digital trunks terminate exclusively on Digital Interface Frames (DIF) at 4ESS Switch locations.
- **N64C** -This domain is used to route 64 kbps clear data calls using the 10-digit North American Numbering Plan (NANP).
- **N64R** -This domain is used to route 64 kbps restricted data calls using the 10-digit North American Numbering Plan.
- **I64C** -This transport domain is used to route 64 kbps clear international data calls up to an ISC.
- **I56D** -This transport domain is used to route 56 kbps international data calls up to an ISC.

Continued on next page

Form Entries, Continued

DOM (cont'd)

The following translations domains are used for the Software Defined Network (SDN) and Private Branch Exchange (PBX) Interface features:

- **SDNA** - Software Defined Network (SDN) Access - This domain is used to translate the digits of an originating SDN (voice or data) call and determine if the call is a 7-digit or 10-digit call. Trunks in the SDNA domain are dedicated to SDN calls. When DOM equals SDNA, then TOT must be CAMAA, CAMAO, ETC, LCC, PBX, STC, TAND, or TOLLC for Trunk Subgroup (TSG) forms or CALLTYP must be CRB, DSD, DSN, EAR, FHT, GNS, INW, IRA, MCT, MMT, MRT, PAS, PRT, RDB, RNR, SDX, SSP, TEL, TST, or TTS for code group forms.

- **DEV** - Dedicated Egress Voice - This domain is available at the terminating 4ESS Switch to translate SDN and Direct Connect voice calls and route them to a directly connected PBX, via direct egress, or to a local office, via switched egress.

  This domain is also used as an access domain for originating Direct Connect voice calls. The calls arrive at the 4ESS Switch as 10-digit calls. When DOM equals DEV, then TOT must be PBX or Single Trunk Customer (STC) for TSG forms or CALLTYP must be CRB, DSD, DSN, EAR, FHT, GNS, INW, IRA, MCT, MMT, MRT, PAS, PRT, RDB, RNR, SDX, SSP, TEL, TST, or TTS for code group forms.

- **DED** -Dedicated Egress Data - This domain is available at the terminating 4ESS Switch to translate the SDN data call and route it to a directly connected PBX, via direct egress, or to a local office, via switched egress.

  This domain is also used as an access domain for originating Direct Connect data calls. The calls arrive at the 4ESS Switch as 10-digit calls and are routed through the network (translations and facilities) via the data domain. When DOM equals DED, then TOT must be PBX or STC for TSG forms or CALLTYP must be CRB, DSD, DSN, EAR, FHT, GNS, INW, IRA, MCT, MMT, MRT, PAS, PRT, RDB, RNR, SDX, SSP, TEL, TST, or TTS for code group forms.

Continued on next page

Form Entries, Continued

DOM (cont'd)

The following translations domains are used for wideband transmission:

- **NH0C** -This domain is used to route 384 kbps clear data calls using the 10-digit North American Numbering Plan (NANP).
- **NH1C** - This domain is used to route 1536 kbps clear data calls using the 10-digit NANP.
- **APN** - Action Point Numbering Plan - This domain is used as an access domain for originating Direct Connect voice or data calls. The calls arrive at the 4ESS Switch as 10-digit calls. When DOM equals APN, then TOT must be PBX or STC for TSG forms.

NOTE: For Voice Frequency Link (VFL) TSGs, this field identifies the domain in which this TSG operates. Valid inputs are "POTS" (if VFL is associated with a domestic Common Channel Interoffice Signaling [CCIS] system).

ACD

Automatic Call Distributor - This field is used to indicate if this Trunk Subgroup (TSG) is used to terminate Inward Wide Band Area Telephone Service (INWATS) traffic. Enter **"Y"** if this TSG will terminate INWATS traffic. Enter **"T"** if INWATS Time of Day (TOD) billing is required. Enter **"N"** or leave **"Blank"** if this TSG will not terminate INWATS traffic.

FAI

Not Applicable - Entries: **"Blank"**

Continued on next page

Form Entries, Continued

FENPA

Far End Numbering Plan Area/Trunk Subgroup (TSG) - Enter a 3-digit Numbering Plan Area (NPA) code to identify the far end of the subgroup. Valid entries range from **"200-999"**. With an International Trunk Subgroup, if the far end of the Trunk Subgroup is outside World Zone 1, enter the 1-, 2-, or 3-digit country code. Valid ranges of Country Code entries are **"2-9"**, **"20-99"**, and **"200-999"**.

This field is the NPA of the Far-End Office. If this office is not in the Home or Served area, then the Domain will be Plain Old Telephone Service-Intertoll/Intertandem (POTS-IT) and the IT field will be forced to **"Y"** in a Local Exchange Carrier (LEC) switch.

FEOFC

Far-End Office Code - This field is used to identify the office code of the far end switch. Typically this value will range from 200-999. Legal entries are: **"Blank"**, **000-999**.

FELATA

Far End Local Access Transport Area/Trunk Subgroup - This field is used to identify the Local Access Transport Area (LATA) of the far end switch. Legal entries are: **"Blank"**," **000-999"**.

IWZ1

International World Zone 1 - Enter **"Y"** if this Trunk Subgroup (TSG) will carry international traffic within World Zone 1. Enter **"N"** or leave **"Blank"** if this TSG will not carry international traffic within World one 1. Valid entries are **"Blank"**, **"N"**, or "**Y**".

MEM

Memory - This field is used to indicate if trunk hunt with memory is to be performed on this Trunk Subgroup (TSG) when searching for an idle trunk. Trunk hunt with memory is not performed on a TSG if the TSGBBC field is greater than zero (the MEM field should be set to **"N"** in this case). Enter **"N"** if trunk hunt with memory is not to be done. Enter **"Y"** or leave **"Blank"** if trunk hunt with memory is to be done.

Continued on next page

Form Entries, Continued

PSES Prohibit Service Evaluation - An entry of **"N"** for No specifies that this Trunk Subgroup (TSG) is eligible for service evaluation by the No. 2 Service Evaluation System. An entry of **"Y"** for Yes specifies that the TSG is not eligible for service evaluation. Valid entries are **"Blank"**, **"Y"**, or **"N"**. Blank defaults to "**N**".

CCIS2WRE Common Channel Interoffice Signaling (CCIS) 2-Wire - This field should be **"Blank"** for a non-Common Channel Signaling (CCS) Trunk Subgroup (TSG). If this is a CCIS or Integrated Services Digital Network User Part (ISUP) TSG, then it must be determined whether the far end office will terminate the trunks in this TSG on a 2-wire or 4-wire switching network in order to perform the continuity check test on CCIS or ISUP trunks. The CCS continuity check tests will be performed by using the transceiver in either a transceive mode for 4-wire CCS trunks or in a transpond mode for 2-wire CCS trunks. Enter a **"Y"** for Yes if the far end office has a 2-wire network, e.g., 1 ESS/1A ESS 2-wire. Enter an **"N"** for No if the far end office has a 4-wire network, e.g., 1 ESS/1A ESS HILO, 4ESS, 5ESS®, etc.

Continued on next page

Form Entries, Continued

OSC

Outgoing Signaling Characteristics - Enter one of the following codes to specify the outgoing signaling characteristics required for this Trunk Subgroup (TSG):

- **DPDDSD** - Dial Pulse with Delay Dial/Start Dial.
- **DPIMMED** - Dial Pulse with Immediate pulsing (no delay).
- **DPWINK** - Dial Pulse with Wink start.
- **DTMFWK** - DTMF with Wink Start.
- **ICOPNOP** - Integrity Check Operator trunk with No Outpulsing. Use this characteristic on trunk subgroups which return a wink signal.
- **ISUP** - CCITT7 ISDN User Part.
- **MFDDSD** - MF with Delay Dial/Start Dial.
- **MFWINK** - MF with WINK start.
- **MIOPNOP** - Miscellaneous Operator with No Outpulsing. This OSC. is used for information and other operator calls. This OSC may be used for Direct Connect calls on 1-way outgoing and 2-way TSGs when Type of Trunk (TOT) is Private Branch Exchange (PBX) or Single Trunk Customer (STC). Use this characteristic only on TSGs which do not return a wink signal.
- **SIOPMFW** - Secondary Intertoll Operator with MF and Wink start. This is used to route inward and leave word operator traffic to a Traffic Service Position System (TSPS) operator.
- **SIOPNOP** - Secondary Intertoll Operator with No Out Pulsing. This type of trunk is used only for the secondary intertoll operator treatment.
- **TWOPDPD** - 2-Way Operator Dial Pulse Delay.
- **TWOPDPI** - 2-Way Operator Dial Pulse Immediate.

Continued on next page

Form Entries, Continued

OSC (cont'd)

- **TWOPDPW** - 2-Way Operator Dial Pulse Wink.
- **TWOPMFW** - 2-Way Operator MF Wink.

RFMP

Ring Forward Miscellaneous Distributor Point - Leave **"Blank"** or enter **"N"** for No to indicate that a miscellaneous distributor point is not associated with the outgoing portion of the Trunk Subgroup (TSG). This feature is only required for outgoing trunks requiring 130V ring forward battery. This feature is presently not available on the outgoing portion of 2-way trunk circuits.

DPSTOP

Dial Pulse Stop - Enter a **"Y"** for Yes if this Trunk Subgroup (TSG) terminates in a panel, Step-by-Step or other office that might not be able to receive a complete train of dial pulse digits without a pause between digits (Outgoing Signaling Characteristic [OSC] equal to DPWINK, DPDDSD, DPIMMED, TWOPDPD, TWOPDPI, or TWOPDPW). This feature will tell the program to look for a DPSTOP signal from the far-end office after any one of the first three digits is outpulsed. Enter an **"N"** for No if this feature is not required for DP outpulsing. For other types of outpulsing, leave this field **"Blank"**.

DELAY

Delay Interval - An entry must be made if the Outgoing Signaling Characteristic (OSC) is CCITT5, DTMFWK, MFWINK, MFDDSD, SIOPMFW, or TWOPMFW. Leave this field **"Blank"**, if any other OSC is specified. If OSC is MFWINK, MFDDSD, SIOPMFW, or TWOPMFW, enter **"20"**, **"80"**, or **"220"** to indicate the delay in milliseconds before outpulsing is started. This delay interval starts when the wink or start dial signal from the other office is recognized. Twenty milliseconds is basic for most offices. A delay of 20 may be associated with 7 or 10 multifrequency digits per second. When the OSC is Dual Tone Multifrequency Wink (DTMFWK), enter **"70"**, **"140"**, **"210"**, or **"280"** to indicate the delay in milliseconds before outpulsing. This delay interval starts when the wink from the Private Branch Exchange (PBX) is received. **"70"** milliseconds is the minimum required for PBXs.

Continued on next page

Form Entries, Continued

MFSPEED	Multifrequency Speed - If Outgoing Signaling Characteristic (OSC) is specified as MFWINK, MFDDSD, SIOPMFW, or TWOPMFW enter **"7"** or **"10"** to indicate the number of outpulsed Multifrequency (MF) digits per second. Enter **"10"** for Lucent Technologies ESS machines. Seven digits per second is used for all electromechanical machines. If OSC is equal to International Consultative Committee for International Telephone & Telegraph Signaling System 5 (CCITT5), this field should indicate an MF speed of 10. Leave this field **"Blank"** for any other value of OSC.

Continued on next page

Form Entries, Continued

XCPA

Transceiver (XC) Pad Adjustment - This item will be left **"Blank"** for non-Common Channel Interoffice Signaling (CCIS) trunks. If the Outgoing Signaling Characteristic (OSC) is equal to International Consultative Committee for International Telephone & Telegraph Signaling System 6 (CCITT6), Domestic CCIS (DOMCCIS), Integrated Services Digital Network User Part (ISUP), International ISUP (INUP), or CCITT7 Telephone User Part (TUP) enter a digit from **"0"** to **"3"** to indicate the pad setting for the CCIS transceiver. The correct entry can be determined by comparing the highest Inserted Connection Loss (ICL) value assigned to a trunk in this Trunk Subgroup (TSG) to the following table. The ICL can be obtained from the Circuit Order Layout Record (COLR) card.

DIGIT	ICL APPLICATION	PAD
• **0**	0 loss trunk	5 DB
• **1**	.1 to .8 loss	3.5 DB
• **2**	.9 to 1.7 loss	1.8 DB
• **3**	1.8 to 4.1 loss	0 DB

DNP

Dialed Number Preferred - This field indicates whether the called user prefers to receive the original dialed number, if available, as delivered to the network rather than the routing number. Enter **"Y"** if the called user prefers receiving the original dialed number, otherwise, enter **"N"** or leave **"Blank"**. This field applies to outgoing Q.931 trunks only.

PSOLI

Prohibit Sending Originating Line Identity - This field indicates whether OLI can be passed to a connecting network. Legal values are **"Blank"**, **"Y"** or **"N"**. **"Y"** specifies that OLI should not be sent. **"N"** specifies that OLI should be sent.

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

BN

Billing Number/Trunk Subgroup- This field is used to specify a BN associated with the TSG. It may be left **"Blank"**, or a **"3-"**, **"4-"**, or **"10-digit"** number may be entered. If FENCLASS is ACCESA or ACCESI, BN must be a 4-digit number (4-digit number if Type of Feature Group [TFG] is "B") equal to the (X)XXX corresponding to the inter-Local Area Transport Access (LATA) or International Carrier at the far end of the TSG. If FENCLASS is CMC, OWATS, or PBX, BN must be a 10-digit number. If the Automatic Call Distributor (ACD) field is **"Y"**, then BN must be a 10-digit number specifying the billing number of the INWATS ACD customer. If the ACD field is **"T"**, then BN must be **"199"**.

BRL

Billing Record Length - This field is used to specify whether long or short Automatic Message Accounting (AMA) records should be created for calls on this Trunk Subgroup (TSG). An **"S"** should be entered if Short AMA records are required or an **"L"** should be entered if Long AMA records are required. If **"L"** is entered, both answered and unanswered calls are recorded. If **"S"** is entered, only answered calls are recorded. If this field is left **"Blank"**, short AMA records will be made (if necessary).

NOTE: There is only one record length for Private Branch Exchange (PBX) calls, so this field should be used to indicate whether both answered and unanswered.

GSDN

Global Software Defined Network/Code Group - This field specifies the index that is used to select a routing treatment when a GSDN type of subsequent digit entry is encountered. Valid entries are **"0-1"**.

Continued on next page

Form Entries, Continued

PSBN

Prohibit Sending Billing Number - This field is used to indicate that the caller's billing number should not be sent in the outgoing signaling messages.

For 4E17 and earlier generic programs, enter **"Y"** if the billing number should not be forwarded. This value should only be used on Trunk Subgroups (TSGs) connecting to another network. Enter **"N"** or leave **"Blank"** if the billing number can be sent. This field applies to outgoing Integrated Services Digital Network User Part (ISUP) trunks only.

For 4E18 and later generic programs, this value should only be used on TSGs connecting to another network. Enter:

- **Blank** or **PNNA** - prohibit sending a billing number with a numbering plan type other than North American Numbering Plan (NANP).
- **SALL -** if the billing number can be sent, regardless of the numbering plan type.
- **PALL -** if all billing numbers are to be prohibited from being sent, regardless of the numbering plan type. This field only applies to outgoing ISUP and Q.931 trunks. The PALL value applies only to ISUP trunks.

PSCPN

Prohibit Sending Calling Party Number - This field is used to indicate that the caller's calling party number should not be sent in the outgoing signaling messages. Enter **"Y"** if the calling party number should not be forwarded. This value should only be used on Trunk Subgroups (TSGs) connecting to another network. Enter **"N"** or leave **"Blank"** if the calling party number can be sent. This field applies to outgoing Integrated Services Digital Network User Part (ISUP) and International ISUP (INUP) trunks only.

ANISID

ANI/SID requester value: This field specifies the type of calling party information which should be transmitted to the customer. Valid entries are:

- **Blank** No information
- **NONE** No information
- **ANI** Automatic Number Identification (ANI) only
- **SID** Service Identity (SID) only
- **PANI** ANI or SID (prefer ANI)
- **PSID** ANI or SID (prefer SID)
- **REQ** Customer will use signaling to specify.

WANISID

Wide Area Telephone Service (WATS) Automatic Number Identification (ANI)/Service Identity (SID) requester value - This field specifies the type of calling party information which should be transmitted to the customer when Megacom* 800 type of traffic is delivered to the customer. Valid entries are:

- **Blank** - No information
- **NONE** - No information
- **ANI** - ANI only
- **SID** - SID only
- **PANI** - ANI or SID (prefer ANI)
- **PSID** - ANI or SID (prefer SID)
- **REQ** - Customer will use signaling to specify.

*Megacom is a registered trademark of AT&T.

PSUUI	Prohibit Sending User-to-User Information - This field indicates whether to accept/send Message Associated (MA) UUI on this Trunk Subgroup (TSG). Legal values are **"Blank"**, **"Y"**, or **"N"**. Enter **"Y"** if MA-UUI should not be sent. This value should be used on access TSGs to prohibit the receipt of MA-UUI, and it should be used on egress TSGs to prohibit the sending of MA-UUI. The default condition is **"N"**. This field applies to Integrated Services Digital Network User Part (ISUP), International ISUP (INUP), and Q931 trunks only.
BNPT	Not Applicable - Entries: **"Blank"**
CMERGE	Not Applicable – Entries: **"Blank"**
SCFN	Send Confusion Messages - This field indicates if received Confusion messages are counted and if Confusion messages are to be sent when an unimplemented message is received. Valid entries are **"Blank"**, **"Y"**, or **"N"**.
PRIT	Not Applicable - Entries: **"Blank"**
APS	Accunet® Packet Service - This field is used to indicate if Accunet packet service can be performed on this Trunk Subgroup (TSG). Enter **"Y"** if Accunet packet service is allowed. Enter **"N"** or leave **"Blank"** if Accunet packet service is not allowed.
CHNEG	Channel Negotiation - This field is used to indicate whether channel negotiation can be performed on this Trunk Subgroup (TSG) or not. Enter **"Y"** if channel negotiation is allowed. Enter **"N"** or leave **"Blank"** if channel negotiation is not allowed.

PSATP	Prohibit Sending Access Transport Parameters - This field indicates whether Access Transport Parameters (ATP) can be passed to or from a connecting network. Legal values are **"Blank"**, **"Y"** or **"N"**. Enter **"Y"** if ATP should not be sent. This value should be used on access Trunk Subgroups (TSGs) to prohibit the receipt of ATP; it should be used on egress TSGs to prohibit the sending of ATP. The default condition is **"N"**. This field applies to Integrated Services Digital Network User Part (ISUP), International ISUP (INUP), and Q931 trunks only. This new field will not affect the sending of ATP at an Access Tandem (AT) switch.
DOFP	Disable Outgoing Fraud Prevention - **"Y"** indicates that Black Box and Blue Box fraud prevention controls are disabled on this Trunk Subgroup (TSG). **"N"** indicates that fraud prevention controls are enabled on this TSG.
SBRIV	Not Applicable - Entries: **"Blank"**
FOSPS	Not Applicable - Entries: **"Blank"**
CCIF	Not Applicable - Entries: **"Blank"**
ONCID	Number of Carrier ID digits to send - An entry of **"3"** specifies that the Trunk Subgroup (TSG) send a 3-digit CID. An entry of **"4"** specifies that the TSG send a 4-digit CID. If the TSG is not going to send a CID leave **"Blank"**.
D3DBN	Not Applicable - Entries: **"Blank"**

Form Entries, Continued

MULAW

This field is used to identify the type of encoding (A-law/Mu-law) used in the user information layer 1 protocol ID field of the User Service Information (USI) parameter. An entry of **"Y"** in this field along with an outgoing signaling characteristic of International Consultative Committee for International Telephone & Telegraph Signaling System 7 (CCITT7) Integrated Services Digital Network User Part (INUP) will indicate that Mu-law encoding is being used. A entry of **"N"** or leaving the field **"Blank"** will indicate that A-law encoding is being used.

CSCSET

Not Applicable - Entries: **"Blank"**

CID

Carrier ID. This field is populated with the pre-subscription carrier selected by the customer to handle inter-Local Access Transport Area (LATA) calls; and intra-LATA calls when intra-LATA competition is allowed. It is a 4-digit number with a range of **"0000-9999"**, indicating the XXXX digits of the desired carrier. This field is only populated for ISC/OSC=Q.931.

ITCENC

Information Transfer Capability Encoding - (4E21>) - This Trunk Subgroup (TSG) parameter indicates the allowed Information Transfer Capability (ITC) coding in the outgoing Initial Address Message (IAM). The parameter can have values shown below:

- **"Blank"**, **"N"** (use office): encode the outgoing IAM, User Service Information (USI) parameter ITC field, the same as used in the office indicator
- **"Y"** (use opposite of office): encode the outgoing IAM, USI parameter ITC field, with the opposite of what is used in the office indicator

The default is **"use office"**.

OFITR

Not Applicable – Entries: **"Blank"**

Continued on next page

Form Entries, Continued

SPN	Signal Ported Number (SPN) outgoing Trunk Subgroup (TSG) indicator - This TSG indicator indicates if the destination switch is capable of supporting the Local Number Portability (LNP). If ""**Blank**"" or **"N"** (the default), the destination switch is considered LNP capable and the Local Routing Number (LRN) will be signaled. If **"Y"**, the destination switch is NOT considered LNP capable and only the Ported Number will be signaled not the LRN.
LNPIC	A Trunk Subgroup (TSG) field not used - valid entries are: **"Blank"**.
NCAR	Not Applicable - Entries: **"Blank"**
TTA	Not Applicable - Entries: **"Blank"**
EACC	Not Applicable - Entries: **"Blank"**

CAREA

Control Area - Valid input for this field is a single digit in the range of **"0-9"**. This number identifies the Control Area that is to be associated with this Trunk Subgroup (TSG) for trouble reporting. The number assignable in a given office is limited, however, to the highest control area assigned at Office Data Assembler (ODA) time as defined by the highest Member Number for a test position. This is because of engineered memory allocated for plant measurement purposes. Each Control Area can have a maximum of 10 (0-9) associated Control Positions (CPOS). The Control Area number and the CPOS number combined make up the testboard position number. For example CAREA-2 and CPOS-5 would be testboard position 25. A maximum of 100 (0-99) testboard positions may be installed for a 4ESS Switch location.

Any test position can access every trunk assigned to the 4ESS Switch with the exception of international trunks. International trunks having Incoming Signaling Characteristic (ISC) or Outgoing Signaling Characteristic (OSC) equal to Consultative Committee for International Telephone & Telegraph 5 (CCITT5) must be assigned to a CAREA that is equipped with 51AL6 test positions. The 51AL6 test position can access any trunk assigned to the 4ESS Switch. However, the alarms, Teletype (TTY) printouts, and 101 calls associated with a particular TSG will only be transmitted to the CAREA and CPOS that is specified on the input form for a TSG. A single trouble receiving location could be specified for all TSGs in the office. Trouble tickets might be originated here and distributed to occupied test positions as necessary. Some other typical applications could be to assign the TSGs to testboard positions alphabetically, by direction, by ownership, or by Type of Trunk (TOT).

The only other restraint on assigning a TSG to a particular CAREA and CPOS is that all positions might not have the optional equipment required to satisfactorily test some Trunk Subgroups. The arrangement in a given office depends on the administrative decisions made for that office.

Continued on next page

Form Entries, Continued

CAREA
(cont'd.)

Position 00 (CAREA 0, CPOS 0) has been assigned to the Master Test and Control Channel (MTC) teletype in the Maintenance Operating Center (MOC). This position was established to receive trouble reports for certain non-message type TSGs. Lucent Technologies recommend that positions
01-09 not be assigned in an office at this time. The circuits that should be assigned to test position 00 are:

- ACI*DCHN - D-Channel circuits to the Common Network Interface (CNI) Ring
- CLN*DLPC - Loopback/complement Data Test
- MAS*BIPB - Mass Announcement System (MAS) Barge-in Playback Trunk
- MIS*AART - Auxiliary Audible Ring Trunk
- MIS*TERM - Common Channel Interoffice Signaling (CCIS) Terminals
- SVC*AIN* - Advanced Intelligent Network (AIN)
- SVC*DMRV - Dual-Tone Multifrequency (MF) Receivers (DTMFR)
- VC*DMXM - Dual-Tone Multifrequency Transmitters (DTMFT)
- SVC*MFR* - Multifrequency Receivers
- SVC*MFX* - Multifrequency Transmitters
- SVC*XCVR - CCIS Continuity Check Transceivers
- SVC*XCVT - CCIS Continuity Check Transceiver Test Circuit
- SVC*MFRT - Multifrequency Receiver Test Circuits
- SVC*MFXT - Multifrequency Transmitter Test Circuits
- SVC*SCAN - Service Circuit System Expanded Announcements
- SVC*SCBN - Service Circuit System Expanded Announcements
- SVC*SCNS - Network Services Complex Set S
- TAS*ANN* - Recorded announcements
- TAS*TONE - Tone Circuits
- TAS*MWAT - 1004 hz at 0 dBm
- TAS*MW10 - 1004 hz at 10 dBm

Continued on next page

Form Entries, Continued

CAREA (cont'd.)

The balance of the non-message type TSG may be assigned to working testboard positions.

For RC Forms 604 and 605, this number identifies the Control Area that is to be associated with this announcement trouble report. The number assignable in a given office is limited, however, to the highest control area assigned at ODA time as defined by the highest Member Number for a test position. This is because of engineered memory allocated for plant measurement purposes. Each Control Area can have a maximum of 10 (0-9) associated Control Positions (CPOS). The Control Area number and the CPOS number combined make up the testboard position number. For example CAREA-2 and CPOS-5 would be testboard position 25. A maximum of 100 (0-99) testboard positions may be installed for a 4ESS Switch location. If CAREA 0,
CPOS 0 is specified, all MAS messages will be sent to the MTC channel in the MOC.

CPOS

Control Position - Enter a number from **"0-9"** to specify the testboard position that is to be associated with the Trunk Subgroup (TSGs) and Control Area (CAREA) for test reporting purposes. This assignment together with the CAREA designation can be used to distribute the maintenance responsibility for Trunk Subgroups. This assignment does not prevent any test position from accessing a particular group of trunks. It is only for reporting purposes.

For RC Forms 604 and 605, enter a number from **"0-9"** to specify the testboard position that is to receive the announcement trouble reports. If CAREA is 0, only CPOS 0 is allowed. When the Message Announcement System (MAS) is administered by the Operations National Administration Center (ONAC), assign the CPOS that has been dedicated for its use.

SINDEX

Access Change Verification Sampling Rate Index value - This field specifies the rate at which calls will be sampled for access charge verification. Legal values are **"Blank"**, **"0"**, **"1"**, **"2"**, **"4"**, **"8"**, **"16"**, **"32"**, **"64". "Blank"** and **"0"** imply no verification recording. Otherwise, one call out of the number entered will be recorded.

Form Entries, Continued

CODSC

Customer Premise Equipment (CPE) Outgoing Disconnect. An entry of **"Y"** in this field is used to specify (from the 4ESS Switch perspective) that a disconnect will be effected faster than normal when the called customer goes on-hook. This field is used only for TSGs with a type-of-trunk value of Private Branch Exchange (PBX) or Single Trunk Customer (STC) and with signaling other than Q.931. Valid entries are **"Blank"**, **"Y"**, or **"N"**.

(4E21>) - CPE Outgoing Disconnect or Signaling System 7 (SS7) Trunk Subgroup (TSG) Control of Per Channel Inhibit Signaling (PCIS) Bits. An entry of **"Y"** specifies that:

1. From the 4ESS Switch perspective, a disconnect will be effected faster than normal when the called customer goes on-hook. This application of CODSC is only for TSGs with a type-of-trunk value of PBX or STC and with signaling other than Q.931.

   or

2. The TSG is to have its PCIS bits reset to force a steady state AB bit indication. This application of CODSC is for non-AT&T offices where the TSG has type-of-trunk of Other Common Carrier (OCC) and outgoing signaling of Integrated Services Digital Network User Part (ISUP).

Valid entries are **"Blank"**, **"Y"**, or **"N"**.

Continued on next page

Form Entries, Continued

NEOTR	Near Operational Test Responsibility - Enter a **"Y"** for Yes or **"N"** for No to indicate whether or not this office is responsible for the operational (signaling) test on outgoing trunks in this Trunk Subgroup (TSG). If a **"Y"** is entered in this field, then the OTSTT and/or OTMTT field(s) must have an entry other than **"N"**. If an **"N"** is entered in this field, then all test types are optional. If OTSTT and OTMTT fields are **"N"**, then NEOTR must be **"N"**. If an office has Near End Operational Test Responsibility but the far end office does not have a test number, an **"N"** should be entered in this field. If Outgoing Signaling Characteristic (OSC) is equal to Domain Class (DOMCCIS) or Integrated Services Digital Network User Part (ISUP), then NEOTR should be **"N"** since operational tests cannot be made on Domestic Common Channel Signaling (CCS) trunks.
TRIDX	Not Applicable - Entries: **"Blank"**

Continued on next page

Form Entries, Continued

OTSTT Operational Thru Switch Test Type - Certain offices (No. 5 Crossbar and 1ESS) can function both as a local and a tandem or as a local and toll office. These offices have trunks that can function in both a through switch mode and a terminating mode. As a result, more than one test is required to test both modes of operation. The OTSTT is used to specify an operational (signaling) test for a trunk in the tandem (thru switch) mode. OTSTT is also used to specify the ATME B test for Consultative Committee for International Telephone and Telegraph Signaling System Number 5 (CCITT5) and Consultative Committee for International Telephone and Telegraph Signaling System Number 6 (CCITT6) trunks which have a far end test line capable of running this test. The following codes may be entered in the OTSTT field.

- **ATMB** - Siemens' ATME B test line - This is a signaling test which applies to CCITT5 and CCITT6 trunks only. The test consists of the far end test line returning a clear back/reanswer in response to a forward transfer.
- **CTX2** - Centrex II test - This test is made toward a No. 5 Crossbar office having Phase II Centrex features. CTX2 is similar to the SYNC test.
- **CTX3** - Centrex III - This test is made to a No. 5 Crossbar office having Phase III Centrex features. CTX3 is similar to the SYNC test.
- **SXS** - Step-by-Step - If the far end of this Trunk Subgroup (TSG) is working in to a Step-by-Step office, this test may be specified.
- **SYNC** - Synchronous test - This test is an automatic series of off hook/on hook transitions (flashes) on the M lead. In the 4ESS Switch, the SYNC test is software controlled and no external hardware is needed. A data table is used to specify the pulsing rate for each series of flashes. The test automatically advances from one pulsing rate to another via a timing procedure. In any system, after all of the flashes are complete, the trunk will be left in the quiet termination state.

Continued on next page

Form Entries, Continued

OTSTT (cont'd)

- **T103 -** 103 Test - The 103 Test is similar to the synchronous test in that a series of flashes are sent on the M lead. However, the sequence of pulses is controlled by the ring forward signal, rather than a timed automatic progression. Flashing of a given rate will continue until a ring forward signal is received, or, in the 4ESS Switch, until an upper limit of flashes has been sent. At this point, the trunk will be put into the quiet termination state until disconnect.

- **"N"** - Enter **"N"** if no thru switch operational test is to be made on this TSG.

OTSTN

Operational Thru Switch Test Number - If Operational Thru Switch Test Type (OTSTT) is **"N"** for None, leave this item **"Blank"**. If a thru switch test of some type is specified, then a corresponding test number in the range of **"000-9999999"** must also be specified. This number will normally be a 3- or 7-digit test number associated with the test specified in the OTSTT field. Test numbers are derived locally and they may differ for each 4ESS Switch location. If OTSTT is Siemens' ATME B test line (ATMB), then OTSTN should specify a 062 for Consultative Committee for International Telephone and Telegraph Signaling System Number 5 (CCITT5) trunks or a 2 for Consultative Committee for International Telephone and Telegraph Signaling System Number 6 (CCITT6) trunks when the far end has an ATME B test line. If the far end has an Siemens' ATME A test line (ATME A), OTSTT equals ATMB and OTSTN should specify 061 for CCITT5 or 1 for CCITT6 trunks.

Continued on next page

Form Entries, Continued

OTMTT Operational Terminating Test Type - If an operational (signaling) test is to be made directly to the far end of this Trunk Subgroup (TSG) terminating mode, enter a code to identify the test.

- **ATMC** - Siemens' ATME C test line - This is a signaling test used with Consultative Committee for International Telephone and Telegraph Signaling System Number 5 (CCITT5) trunks only. The far end returns a busy flash from the test line.
- **CTX2** - Centrex II test - This test is made toward a No. 5 Crossbar office having Phase II Centrex features. This test is similar to the SYNC test.
- C**TX3** - Centrex III - This test is made towards a No. 5 Crossbar office having Phase III Centrex features. This test is similar to the SYNC test.
- **SXS** - Step-by-Step - If the far end of this TSG is working into a Step-by-Step office, this test may be specified.
- **SYNC** - Synchronous test - This test is an automatic series of on hook/off hook transitions (flashes) on the M lead. In the 4ESS Switch, the SYNC test is software controlled and no external hardware is needed. A data table is used to specify the pulsing rate for each series of flashes. The test automatically advances from one pulsing rate to another via a timing procedure. In any system, after all of the series of flashes are complete, the trunk will be left in the quiet termination state.
- **T103** - 103 test - The 103 test is similar to the synchronous test in that a series of flashes are sent on the M lead. However, the sequence of pulses is controlled by the ring forward signal, rather than a timed automatic sequence. Flashing of a given rate will continue until a ring forward signal is received, or, in the 4ESS Switch, until an upper limit of flashes has been sent. At this point, the trunk will be put into the quiet termination state until the originator disconnects.
- "**N**" - None - Enter an "**N**" if no test is to be made on this TSG.

Continued on next page

Form Entries, Continued

OTMTN Operational Terminating Test Number - If OTMTT is **"N"** for None, leave this field **"Blank"**. If a test is specified, then a corresponding test number in the range of "**000-9999999"** must also be specified. This number will normally be a 3- or 7-digit test number associated with the test specified in the OTMTT field. Test numbers are derived locally and they may differ for each 4ESS Switch location. If OTMTT equals Siemens' ATME C test line (ATMC), then OTMTN must specify **"063"**.

XTSTT Transmission Thru Switch Test Type - If a transmission test is to be made in the thru switch (tandem) mode for this Trunk Subgroup (TSG), enter a code to identify the type of test.

- **ATMA** - Siemens' ATME A transmission test line - This entry provides access to an ATME A responder. The ATME A test permits automatic transmission loss and noise measurements in both directions for International Consultative Committee for International Telephone & Telegraph Signaling System 5 (CCITT5),CCITT6, International Integrated Services Digital Network User Part (INUP), or CCITT7 Telephone User Part (TUP) trunks.

- **T100** - 100 code test - This test provides a quiet termination (600 ohms). In the 4ESS Switch, the 100 test provides a sequence of 1000 hz, milliwatt tone for 5.5 seconds followed by the quiet termination until disconnect.

- **T102** - 102 code test - The 102 test provides 1000 hz. milliwatt tone. The 4ESS Switch provides cycles of 9-second tone and 1-second quiet termination until disconnect.

- **T105** - 105 code test - This code provides access to an Automatic Trunk Measuring System (ATMS) responder. The 105 test permits automatic transmission loss and noise measurements in both directions.

- **N** - Enter **"N"** if no test is to be made OR if the presubscription carrier is to be populated.

Continued on next page

Form Entries, Continued

XTSTN

Transmission Thru Switch Test Number - Add Presubscription Carrier. If Transmission Thru Switch Test Type (XTSTT)=N and this field is non-**"Blank"** , then the field is populated with the presubscription carrier selected by the customer to handle inter Local Access Transport Area (interLATA) calls; and intraLATA calls when intraLATA competition is allowed. It is a 4-digit number with a range of **"0000-9999"**, indicating the XXXX digits of the desired carrier. The presubscription carrier can only be populated for Incoming/Outgoing Signaling Characteristics (ISC/OSC) of Q931.

If XTSTT does not equal to N, and this field is non-**"Blank"** , then the field is populated with the transmission thru switch test number. If a test is specified, then a corresponding test number in the range of **"000-9999999"** must also be specified. This number will normally be a 3- or 7-digit test number associated with the test specified in the XTSTT field. Test numbers are derived locally and they may differ for each 4ESS Switch location. If XTSTT is Siemens' ATME A transmission test line (ATMA), the XTSTN should be specified as **"061"** for International Consultative Committee for International Telephone & Telegraph Signaling System 5 (CCITT5) trunks or **"1"** for CCITT6, International Integrated Services Digital Network User Part (INUP), or CCITT7 Telephone User Part (TUP) trunks.

XTMTT

Transmission Terminating Test Type - If a transmission test is to be made directly to the far end of this Trunk Subgroup (TSG) in a terminating mode, enter a code to identify the type of test.

- **T100** - 100 code test - This test provides a quiet termination (600 ohms). In the 4ESS Switch, the 100 code test provides a sequence of 1000 hz. milliwatt tone for 5.5 seconds, followed by quiet termination until disconnect.
- **T102** - 102 code test - The 102 test provides 1000 hz. milliwatt tone. The 4ESS Switch provides cycles of 9-second tone and 1-second quiet termination until disconnect.
- **T105** - 105 code test - This code provides access to a Automatic Trunk Measuring System (ATMS) responder. The 105 test permits automatic transmission loss and noise measurements in both directions.
- If no test is to be made, enter **"N"** for None.

Continued on next page

Form Entries, Continued

XTMTN	Transmission Terminating Test Number - If Transmission Terminating Test Type (XTMTT) is **"N"** for None, leave this field **"Blank"** . If a test is specified, then a corresponding test number in the range of **"000-9999999"** must also be specified. This number will normally be a 3- or 7-digit test number associated with the test specified in the XTMTT field. Test numbers are derived locally and they may differ for each 4ESS Switch location.

Form Entries, Continued

S1-10

These fields are reserved for future use in order to be able to implement new capabilities in a more timely fashion. When a new capability is requested for Generic Programs currently deployed in the field, one of these spare fields will be designated for use in implementing that capability.

S1 - Valid entries are **"Blank"**, or **"0-7"**.
S2-10 - Valid entries are **"Blank"**, **"Y"**, or **"N"**.

- S2 - (4E18/4E19/4E20) - An entry of **"Y"** in this field identifies Signaling System 7 (SS7) trunks which have their Per Channel Inhibit Signaling (PCIS) bits reset to force a steady state AB bit indication. Otherwise, enter **"N"** or leave **"Blank"**. In 4E21, the CODSC field will replace the use of S2 for this purpose.

- S2 - (4E21R4) This Trunk Subgroup (TSG) parameter allows TSG circuits to trigger the Advanced Intelligent Network (AIN) processing. The parameter can have the following values: **"Blank"**, **"N"** for no access allowed, and **"Y"** for access allowed. The default is **"N"**.

- S5 - Unassigned - Reserved for future use.

- S6 (4E18/19/20) - this Trunk Subgroup (TSG) parameter indicates the allowed Information Transfer Capability (ITC) coding in the outgoing Initial Address Message (IAM). The parameter can have the following values: **"Blank"**, **"N"** (use office) to encode the outgoing IAM, User Service Information (USI) parameter ITC field, the same as used in the office indicator, and **"Y"** (use opposite of office) to encode the outgoing IAM, USI parameter ITC field, with the opposite of what is used in the office indicator. The default is "use office".

NOTE: An entry of "0-7" in the S1 field or a "Y" in any of the fields S2 thru S10 without knowledge of the capability to which the field has been assigned may result in undesirable switch behavior.

RC FORM 110

General

Recent Change (RC) Form 110 is used to change the Incoming Separation Class of an existing Trunk Subgroup (TSG) with specifying other TSG characteristics.

An alphabetical keyword list is included in this section on page 5.

Form Entries

RC:TSG;CHG;OPT(INSEP),---:

Recent Change action field – Entries appended to the message header indicate the action to be taken by the Recent Change (RC) system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at a time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks, and also, the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast Activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast Test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

ORNU Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

Form Entries, Continued

CIN

Circuit Identification Name - This is the method of naming Trunk Subgroups (TSGs). Typically the CIN is a reference to the location at the far end of the TSG from a specific switching entity. The BTFN is usually the first circuit number assigned to a TSG but is not a requirement for operation in the 4ESS-2000 Switch. The breakdown of the CIN is as follows:

- **BTFN** - Base Traffic Number - Valid entries: **"0-9976"**
- **TOWN** - Town - Valid entries: Four alphabetic characters
- **ST** - State - Valid entries: Two alphabetic characters
- **BL** - Building name - Valid entries: Two alphanumeric characters
- **FBS** -Far end Building Subdivision - Valid entries: Three alphanumeric characters
- **NBS** - Near end Building Subdivision - Valid entries: Three alphanumeric characters.

INSEP

Incoming Traffic Separation Class - Enter a number in the range of **"0-255"** to indicate a traffic class for measurement purposes. This code will be used with the outgoing destination (Destination Separation [DESEP] on code group forms) to determine the peg and usage counts for traffic flow identification. Test position and test call Trunk Subgroups (TSGs) are generically assigned to Incoming Separation Class (INSEP) 31. This should be considered before assigning any other TSG to INSEP 31. Also, since service circuits, other non-message circuits, and 1-way outgoing TSGs have a generically assigned INSEP of zero, they will appear as part of TSG listings for INSEP zero. This fact should be considered before assigning any other Trunk Subgroup to INSEP zero.

RC FORM 112

General

Recent Change (RC) Form 112 provides the capability to change the traffic number of an existing Trunk Subgroup (TSG) from an old range to a new range. The first traffic number of the old range must match with the first traffic number of an existing traffic number block. All numbers in the new traffic block range must not overlap any part of an existing traffic number block range for any of the TSGs in the affected trunk group. This message is classed as a Recent Change Data Message (RCDM).

WARNING! - If the Old First Traffic Number (OLDFTFN) matches the Base Traffic Number (BTFN) of the TSG, then the New First Traffic Number (NEWFTFN) will be the new BTFN identifying the TSG.

This change capability is prohibited for TSGs with Integrated Services Digital Network User Part (ISUP), International ISDN User Part (INUP), and Consultative Committee for International Telephone & Telegraph Signaling 7 [CCITT7] Telephone User Part (TUP) signaling.

All trunks in the affected trunk blocks must be in the Manually Disabled state.

This message is not allowed for non-message TSGs.

An alphabetical keyword list is included in this section on page 7.

Form Entries

RC:TSG;CHG;OPT(CHGTFNB),---:

Recent Change action field – Entries appended to the message header indicate the action to be taken by the Recent Change (RC) system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at a time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks, and also, the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast Activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast Test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

RC FORM 112, Continued

TSG

Trunk Subgroup - This series of codes identifies a Trunk Subgroup. The TSG is a set of trunks within a Trunk Group having certain identical characteristics. A Trunk Group must have a common destination. In addition to group characteristics, a TSG also has common signaling characteristics, transmission delay, originating Numbering Plan Area (NPA), domain, traffic separation index and screening classes. The Trunk Group and TSG are identified by a series of codes that specify the near and far ends of the trunk. In most cases, the full near end definition is not required because it will always be the same. The Trunk Group designation is comprised of the town, state, building and building subdivision for the far end plus the near end building subdivision. A TSG is uniquely identified by adding a Base Traffic Number reference. Trunk Group and TSG definitions are available in the 4ESS Switch as abbreviated Circuit Identification Names (CINs). Common Language Location Identification (CLLI) codes must be entered in the fields that make up the Trunk Group definition. Rules for establishing these codes are covered in Lucent Technologies Practices 795-100-100. The code for any established office may be found by referring to the location code index in that same Lucent Technologies Practices. For non-message TSGs, the format does not include mnemonics for identifying the far end of the trunk. The TSG will mnemonically identify the type of trunk category by function. Asterisks are used in columns where no information is necessary. The following paragraphs describe the individual fields within a TSG definition.

RC FORM 112, Continued

TSG (cont'd)

- **BTFN** - Base Traffic Number - The BTFN is a number in the range of **"0-9976"** that is part of the TSGs designation (which consists of the BTFN, TOWN, ST, BL, FBS, and NBS). The BTFN is the first traffic number in the first block of traffic numbers that is assigned to a TSG. Additional traffic numbers, which are assigned in blocks of 24, either higher or lower in numerical value than the BTFN can be assigned to the TSG, but the BTFN remains as defined above. All non-message trunks have a BTFN of **"0000"**. For RC 104, the BTFN is stored as the starting point for a block of traffic numbers that range up to the limit originally defined on RC Forms 100, 101 and 102 when the TSG was first built. Other blocks of traffic numbers, either higher or lower in numerical value, may be assigned to this TSG, via Recent Change (RC) procedures. In this case the original BTFN would still apply, but the QTFN field would contain the number of new traffic numbers to be assigned following the First Traffic Number (FTFN) specified.

- **TOWN** - Town is a 4-character alphabetic field - The code must represent the bona fide town, city or location per Lucent Technologies Practices 795-100-100 for the far end of the TSG.

- **ST** - State - This field represents the state, province or foreign country in which the far end office is located. The code in ST must be a standard 2-character alphabetic combination. Valid standard abbreviations for states, Canadian provinces and foreign countries may be found in Lucent Technologies Practices 795-100-100.

- **BL** - Building - The BL field contains the office identity for the far end of a TSG. This code consists of either two alphabetic characters or two numeric characters. Independent Telephone Company locations are always designated by an **"X"** plus some alpha character in this field. If the TSG terminates in a customer's building and it is not necessary to identify that particular building, this code may be arbitrary.

Continued on next page

RC FORM 112, Continued

TSG (cont'd)

- **FBS** - Far Building Subdivision - This field contains a code that identifies the internal building subdivision for the far end of a TSG. The code is a traffic, plant, or administrative assignment. It must be a 3-character alphanumeric combination. For non-message TSGs, this field is not required. Three asterisks are pre-printed on the form to provide an entry for this field.

- **NBS** - Near Building Subdivision - The NBS designation is the internal building identity for the near end termination of a TSG. It is always a 3-character alphanumeric code. This field should be left **"Blank"** if the NBS for this TSG is the same as the NBS assigned in the near office Circuit Identification Number (CIN) for the 4ESS Switch. The Office Data Assembler (ODA) system will add the NBS on a default basis.

OLDFTFN Old First Traffic Number - The old first traffic number for a block of traffic numbers of a Trunk Subgroup (TSG). Valid entries are **"0-9976"**.

NEWFTFN New First Traffic Number - The new first traffic number for a block of traffic numbers of a Trunk Subgroup (TSG). Valid entries are" **0-9976"**.

This field should be left **"Blank"** if the NBS for this TSG is the same as the NBS assigned in the near office Circuit Identification Number (CIN) for the 4ESS Switch. The Office Data Assembler (ODA) system will add the NBS on a default basis.

CIC

Carrier Identification Code. The Carrier Identification Code provides the capability to consolidate trunk groups from Local Exchange Carrier (LEC) switching offices (end or tandem) to Interexchange Carrier (IC) switching offices by delivering carrier code information associated with individual calls to the IC. Up to 16 Carrier Identification Codes can be provisioned per Trunk Subgroup (TSG). If the TSG is provisioned for 3-digit CIC expansion (ONCID=3), then all CICs must be provisioned with a leading zero. Valid entries are: **"Blank"**, **"0000-9999"**. **"Blank"** is treated as a delete.

Trunk Assignments Table Of Contents, Continued

General

This information applies to all sections within this division:

1. The characters > and < are used to indicate which Generic Programs will apply.

   Examples:

   - 4E22> indicates 4E22 and later Generic Programs.
   - <4E22 indicate 4E22 and earlier Generic Programs.
   - 4E22 indicates the 4E22 Generic Program only.
   - >4E22 indicates all Generic Programs up to, but not including, 4E22.

2. Following the general section is a copy of the applicable Recent Change (RC) Form/s. Where there is more than one Generic published, the forms will be filed in ascending order by Generic.

3. The Keyword field names of the form entries in each section are listed in order of appearance on the latest Generic Recent Change Form. (Keywords deleted from the latest form issue will still remain in the form order of the last RC Form that it appeared until finally deleted).

4. The alphabetical "Keyword Index" of the field names is located at the end of each Recent Change Section, following the text, and any tables and/or graphics that may apply.

5. Each Keyword definition will only list the valid entries for the RC Form covered in each applicable section. Some Keywords may have additional valid entries related overall and may be found in the alphabetical Keyword Glossary (Div. 9, Sec. 1).

RC Form 200

General

Recent Change (RC) Form 200 changes the translations for an existing two-way Trunk Subgroup (TSG). This form can also be used to convert a one-way TSG to a two-way TSG. This message is classed as a Recent Change Data Message (RCDM).

An alphabetical keyword list is included in this section, starting on page 12.

TSG (cont'd)

- **BTFN** - Base Traffic Number - The BTFN is a number in the range of **"0-9976"** that is part of the TSGs designation (which consists of the BTFN, TOWN, ST, BL, FBS, and NBS). The BTFN is the first traffic number in the first block of traffic numbers that is assigned to a TSG. Additional traffic numbers, which are assigned in blocks of 24, either higher or lower in numerical value than the BTFN can be assigned to the TSG, but the BTFN remains as defined above. All non-message trunks have a BTFN of **"0000"**. For RC 104, the BTFN is stored as the starting point for a block of traffic numbers that range up to the limit originally defined on RC Forms 100, 101 and 102 when the TSG was first built. Other blocks of traffic numbers, either higher or lower in numerical value, may be assigned to this TSG, via Recent Change (RC) procedures. In this case the original BTFN would still apply, but the QTFN field would contain the number of new traffic numbers to be assigned following the First Traffic Number (FTFN) specified.

- **TOWN** - Town is a 4-character alphabetic field - The code must represent the bona fide town, city or location per Lucent Technologies Practices 795-100-100 for the far end of the TSG.

- **ST** - State - This field represents the state, province or foreign country in which the far end office is located. The code in ST must be a standard 2-character alphabetic combination. Valid standard abbreviations for states, Canadian provinces and foreign countries may be found in Lucent Technologies Practices 795-100-100.

- **BL** - Building - The BL field contains the office identity for the far end of a TSG. This code consists of either two alphabetic characters or two numeric characters. Independent Telephone Company locations are always designated by an **"X"** plus some alpha character in this field. If the TSG terminates in a customer's building and it is not necessary to identify that particular building, this code may be arbitrary.

Continued on next page

Form Entries, Continued

TSG (cont'd)

- **FBS** - Far Building Subdivision - This field contains a code that identifies the internal building subdivision for the far end of a TSG. The code is a traffic, plant, or administrative assignment. It must be a 3-character alphanumeric combination. For non-message TSGs, this field is not required. Three asterisks are pre-printed on the form to provide an entry for this field.

- **NBS** - Near Building Subdivision - The NBS designation is the internal building identity for the near end termination of a TSG. It is always a 3-character alphanumeric code. This field should be left **"Blank"** if the NBS for this TSG is the same as the NBS assigned in the near office Circuit Identification Number (CIN) for the 4ESS Switch. The Office Data Assembler (ODA) system will add the NBS on a default basis.

ES

Not Applicable - Entries: **"N"**

D1D2

This field is only used if the trunks being assigned are connected to a far-end D1D or D2 channel bank and to a digroup in the 4ESS Switch. Enter **"D1"** or **"D2"** in order to indicate a far-end D1D or D2 channel bank, respectively. When D1 or D2 is entered, then the FCHAN field must also contain an entry. For non-D1D or D2 far-end trunks, leave this field **"Blank"**.

An entry in this field will cause the software program to internally assign the time slot of the Trunk Appearance Number (TAN) to correspond to the time slot on the far-end D1D or D2 channel bank. This will internally correct the TAN to traffic number mismatch that occurs when a digroup is connected to a far-end D1D or D2 channel bank.

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

QTRK

Quantity of Trunks - For each line under QTRK, valid entries are a quantity of trunks from **"1-120"** to be assigned sequentially. The QTRK plus the First Time Slot (FTS) must be less than 122.

For RC 200, trunks connected to a far-end D1D or D2 channel bank, international trunks, and service circuits must obey special constraints. Valid entries for trunks to be connected to a D1D or D2 channel bank are **"1-24"**. Valid entries for service circuits depend upon the corresponding Trunk Subgroups (TSGs). Following are the legal ranges of values for the corresponding TSGs:

TSG	QTRK
SVC*DMRV	16, 32, 48, 64 (for digital circuits)
SVC*DMXM	16, 32, 48, 64 (for digital circuits)
SVC*MFR*	1 to 32 (for analog circuits)
SVC*MFR*	16, 32, 48, 64 (for digital circuits)
SVC*MFX*	1 to 32 (for analog circuits)
SVC*MFX*	16, 32, 48, 64 (for digital circuits)
SVC*XCVR	1 to 12
SVC*MFCI	24
SVC*MFCO	24
SVC*SCAN	24
SVC*SCBN	24
SVC*SCNS	24

The Recent Change (RC) System will allow any quantity of trunks from 1 to 64 for digital service circuits (both Multifrequency [MF] and Dual Tone Multifrequency [DTMF]). However, since the hardware for digital service circuits must be grown in increments of 16, it is recommended that only the indicated values above be entered (e.g., 16, 32, 48, 64).

Continued on next page

Form Entries, Continued

FTFN

First Traffic Number - For each line under FTFN, enter the FTN of the block of traffic numbers being assigned on that line. The quantity of trunks assigned on each line will be numbered sequentially by an internal program manipulation beginning with the FTFN specified. Valid inputs are **"0-9999**". Quantity of Trunks (QTRK) plus FTFN must be less than 10001.

For RC 104, this field should specify the first traffic number of the new block of traffic numbers that is being added to the Trunk Subgroup. Valid inputs are **"0-9976"**.

TAN

Trunk Appearance Number - Each block of trunks may be assigned a series of TANs. The TAN defines a fixed relationship to the switching equipment. The first TAN will be associated with the First Traffic Number in the block (FTFN) and the remainder of the TANs will be sequentially assigned to the remaining trunks in the block.

- **TSI** - Time Slot Interchange - The Time slot Interchange (TSI) frame number is assigned in this field. Valid entries are **"0-63"**.
- **SPC** - Switching Permuting Circuit - The SPC identification may be **"0"** or **"1"**.
- **LVL** - Level - The TSI Level appears in this field. Valid entries are **"0"** to **"6"**. For D3U applications, valid entries are **"0-7"** (4E21>).
- **FTS** - First Time Slot - The FTS indicates the specific appearance of the TAN. Valid entries are **"001-120"**; however, the FTS plus the Quantity of Trunks (QTRK) must be less than 122 for each line. For D3U applications (4E21>):
  - When the LVL is **"0"**, FTS is **"1-127"**.
  - When the LVL is **"1-6"**, FTS is **"0-127"**.
  - When the LVL is **"7"**, FTS is **"0-112"**.

Continued on next page

Use pursuant to Company Instructions

Form Entries, Continued

FCHAN	Far End Channel - If the D1D2 field on this form is **"Blank"**, this field is left **"Blank"**. If the D1D2 field contains D1 or D2, valid entries for the FCHAN field range from **"1-24"**. FCHAN is the first (far end) channel. Channels are numbered 1 to 24 and they are assigned to 24 sequential Trunk Assignment Numbers (TANs). FCHAN plus Quantity of Trunks (QTRK) must be equal to or less than 25. This means that each line is restricted to one group of 24 TANs and that a channel number of 25 or greater for any trunk is not acceptable. For each channel, the TAN is determined as follows: the Time Slot Interchange (TSI), Switching and Permuting Circuit (SPC), and Level (LVL) of the block of TANs to be used are entered on the line in the input form. The TS (Time Slot) for each TAN is derived internally from the channel number and First Time Slot (FTS).
LACID	Not Applicable - Entries: **"Blank"**
FAC	Not Applicable - Entries: **"Blank"**
FTRID	Not Applicable - Entries: **"Blank"**

Continued on next page

Form Entries, Continued

VCR

Voice Path Assurance Cancellation Rate - This field specifies the cancellation rate of the Voice Path Assurance (VPA) test. This allows savings of real time processing on Integrated Services Digital Network User Part (ISUP) calls using digitally protected carrier facilities. Valid entries are **"100"**, **"87"**, **"50"**, and **"0"**.

- **100** - 100% cancellation allowed on trunks between 4E-4E and 4E-5E when the entire facility is **"T"**- Carrier or other protected digital carrier.
- **87** - 87 1/2% cancellation on 4E - 1/1A ESS Digital Carrier Trunks (DCT) using protected digital carrier.
- **50** - 50 - 50% cancellation on 4E-Network Service Center (NSC) and 4E to other switches where the D-Bank is at the far end and the carrier facility is digitally protected.
- **0** - "0%" cancellation is the default or used when switches or facilities are analog or unknown.

BBC

Not Applicable - Entries: **"Blank"**

SCGA

Software Carrier Group Alarm - This carrier alarm feature is only used on analog facilities. Valid entries are **"Y"** or **"N"**. For trunks assigned to digital facilities, leave **"Blank"**.

RC Form 202

General

Recent Change (RC) Form 202 is used to delete non-Common Channel Signaling (CCS) and CCS message trunks from existing message Trunk Subgroup (TSG). This message is classed as a Recent Change Data Message (RCDM).

An alphabetical keyword list is included in this section, starting on page 9.

Form Entries

RC:TRK;OUT;---:

Recent Change action field – Entries appended to the message header indicate the action to be taken by the Recent Change (RC) system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at a time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks, and also, the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast Activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast Test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

Form Entries, Continued

TSG

Trunk Subgroup - This series of codes identifies a Trunk Subgroup. The TSG is a set of trunks within a Trunk Group having certain identical characteristics. A Trunk Group must have a common destination. In addition to group characteristics, a TSG also has common signaling characteristics, transmission delay, originating Numbering Plan Area (NPA), domain, traffic separation index and screening classes. The Trunk Group and TSG are identified by a series of codes that specify the near and far ends of the trunk. In most cases, the full near end definition is not required because it will always be the same. The Trunk Group designation is comprised of the town, state, building and building subdivision for the far end plus the near end building subdivision. A TSG is uniquely identified by adding a Base Traffic Number reference. Trunk Group and TSG definitions are available in the 4ESS Switch as abbreviated Circuit Identification Names (CINs). Common Language Location Identification (CLLI) codes must be entered in the fields that make up the Trunk Group definition. Rules for establishing these codes are covered in Lucent Technologies Practices 795-100-100. The code for any established office may be found by referring to the location code index in that same Lucent Technologies Practices. For non-message TSGs, the format does not include mnemonics for identifying the far end of the trunk. The TSG will mnemonically identify the type of trunk category by function. Asterisks are used in columns where no information is necessary. The following paragraphs describe the individual fields within a TSG definition.

Use pursuant to Company Instructions

Form Entries, Continued

TSG (cont'd)

- **BTFN** - Base Traffic Number - The BTFN is a number in the range of **"0-9976"** that is part of the TSGs designation (which consists of the BTFN, TOWN, ST, BL, FBS, and NBS). The BTFN is the first traffic number in the first block of traffic numbers that is assigned to a TSG. Additional traffic numbers, which are assigned in blocks of 24, either higher or lower in numerical value than the BTFN can be assigned to the TSG, but the BTFN remains as defined above. All non-message trunks have a BTFN of **"0000"**. For RC 104, the BTFN is stored as the starting point for a block of traffic numbers that range up to the limit originally defined on RC Forms 100, 101 and 102 when the TSG was first built. Other blocks of traffic numbers, either higher or lower in numerical value, may be assigned to this TSG, via Recent Change (RC) procedures. In this case the original BTFN would still apply, but the QTFN field would contain the number of new traffic numbers to be assigned following the First Traffic Number (FTFN) specified.

- **TOWN** - Town is a 4-character alphabetic field - The code must represent the bona fide town, city or location per Lucent Technologies Practices 795-100-100 for the far end of the TSG.

- **ST** - State - This field represents the state, province or foreign country in which the far end office is located. The code in ST must be a standard 2-character alphabetic combination. Valid standard abbreviations for states, Canadian provinces and foreign countries may be found in Lucent Technologies Practices 795-100-100.

- **BL** - Building - The BL field contains the office identity for the far end of a TSG. This code consists of either two alphabetic characters or two numeric characters. Independent Telephone Company locations are always designated by an **"X"** plus some alpha character in this field. If the TSG terminates in a customer's building and it is not necessary to identify that particular building, this code may be arbitrary.

Form Entries, Continued

TSG
(cont'd)

- **FBS** - Far Building Subdivision - This field contains a code that identifies the internal building subdivision for the far end of a TSG. The code is a traffic, plant, or administrative assignment. It must be a 3-character alphanumeric combination. For non-message TSGs, this field is not required. Three asterisks are pre-printed on the form to provide an entry for this field.

- **NBS** - Near Building Subdivision - The NBS designation is the internal building identity for the near end termination of a TSG. It is always a 3-character alphanumeric code. This field should be left **"Blank"** if the NBS for this TSG is the same as the NBS assigned in the near office Circuit Identification Number (CIN) for the 4ESS Switch. The Office Data Assembler (ODA) system will add the NBS on a default basis.

Continued on next page

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

QTRK

Quantity of Trunks - For each line under QTRK, valid entries are a quantity of trunks from **"1-120"** to be assigned sequentially. The QTRK plus the First Time Slot (FTS) must be less than 122.

For RC 200, trunks connected to a far-end D1D or D2 channel bank, international trunks, and service circuits must obey special constraints. Valid entries for trunks to be connected to a D1D or D2 channel bank are **"1-24"**. Valid entries for service circuits depend upon the corresponding Trunk Subgroups (TSGs). Following are the legal ranges of values for the corresponding TSGs:

TSG	QTRK
SVC*DMRV	16, 32, 48, 64 (for digital circuits)
SVC*DMXM	16, 32, 48, 64 (for digital circuits)
SVC*MFR*	1 to 32 (for analog circuits)
SVC*MFR*	16, 32, 48, 64 (for digital circuits)
SVC*MFX*	1 to 32 (for analog circuits)
SVC*MFX*	16, 32, 48, 64 (for digital circuits)
SVC*XCVR	1 to 12
SVC*MFCI	24
SVC*MFCO	24
SVC*SCAN	24
SVC*SCBN	24
SVC*SCNS	24

The Recent Change (RC) System will allow any quantity of trunks from 1 to 64 for digital service circuits (both Multifrequency [MF] and Dual Tone Multifrequency [DTMF]). However, since the hardware for digital service circuits must be grown in increments of 16, it is recommended that only the indicated values above be entered (e.g., 16, 32, 48, 64).

Continued on next page

Form Entries, Continued

FTFN

First Traffic Number - For each line under FTFN, enter the FTN of the block of traffic numbers being assigned on that line. The quantity of trunks assigned on each line will be numbered sequentially by an internal program manipulation beginning with the FTFN specified. Valid inputs are **"0-9999**". Quantity of Trunks (QTRK) plus FTFN must be less than 10001.

For RC 104, this field should specify the first traffic number of the new block of traffic numbers that is being added to the Trunk Subgroup. Valid inputs are **"0-9976"**.

RC Form 203

General

This form provides the capability to add Common Channel Signaling (CCS) trunks to a Trunk Subgroup (TSG) which has incoming or outgoing signaling characteristics of Integrated Services Digital Network User Part (ISUP).

This message is classed as a Recent Change Data Message (RCDM).

For a Digital Interface Frame (DIF), the Base TANs of a Digital Interface Unit (DIU) are easily determined because the 5 DS1s in a DIU always have a Base TAN in which the First Time Slot (FTS) is either 1, 25, 49, 73, or 97.

For XTSI D3Us, the Base Trunk Appearance Number (TAN) depends on the D3U & DS1 number and "XTSI D3U Base TAN - TABLE F" must be used to determine the Switching and Permuting Circuit (SPC), Level (LVL), and First Time Slot (FTS) of the Base TAN.

An alphabetical keyword list is included in this section on page 14.

TSG

Trunk Subgroup - This series of codes identifies a Trunk Subgroup. The TSG is a set of trunks within a Trunk Group having certain identical characteristics. A Trunk Group must have a common destination. In addition to group characteristics, a TSG also has common signaling characteristics, transmission delay, originating Numbering Plan Area (NPA), domain, traffic separation index and screening classes. The Trunk Group and TSG are identified by a series of codes that specify the near and far ends of the trunk. In most cases, the full near end definition is not required because it will always be the same. The Trunk Group designation is comprised of the town, state, building and building subdivision for the far end plus the near end building subdivision. A TSG is uniquely identified by adding a Base Traffic Number reference. Trunk Group and TSG definitions are available in the 4ESS Switch as abbreviated Circuit Identification Names (CINs). Common Language Location Identification (CLLI) codes must be entered in the fields that make up the Trunk Group definition. Rules for establishing these codes are covered in Lucent Technologies Practices 795-100-100. The code for any established office may be found by referring to the location code index in that same Lucent Technologies Practices. For non-message TSGs, the format does not include mnemonics for identifying the far end of the trunk. The TSG will mnemonically identify the type of trunk category by function. Asterisks are used in columns where no information is necessary. The following paragraphs describe the individual fields within a TSG definition.

TSG (cont'd)

- **BTFN** - Base Traffic Number - The BTFN is a number in the range of **"0-9976"** that is part of the TSGs designation (which consists of the BTFN, TOWN, ST, BL, FBS, and NBS). The BTFN is the first traffic number in the first block of traffic numbers that is assigned to a TSG. Additional traffic numbers, which are assigned in blocks of 24, either higher or lower in numerical value than the BTFN can be assigned to the TSG, but the BTFN remains as defined above. All non-message trunks have a BTFN of **"0000"**. For RC 104, the BTFN is stored as the starting point for a block of traffic numbers that range up to the limit originally defined on RC Forms 100, 101 and 102 when the TSG was first built. Other blocks of traffic numbers, either higher or lower in numerical value, may be assigned to this TSG, via Recent Change (RC) procedures. In this case the original BTFN would still apply, but the QTFN field would contain the number of new traffic numbers to be assigned following the First Traffic Number (FTFN) specified.

- **TOWN** - Town is a 4-character alphabetic field - The code must represent the bona fide town, city or location per Lucent Technologies Practices 795-100-100 for the far end of the TSG.

- **ST** - State - This field represents the state, province or foreign country in which the far end office is located. The code in ST must be a standard 2-character alphabetic combination. Valid standard abbreviations for states, Canadian provinces and foreign countries may be found in Lucent Technologies Practices 795-100-100.

- **BL** - Building - The BL field contains the office identity for the far end of a TSG. This code consists of either two alphabetic characters or two numeric characters. Independent Telephone Company locations are always designated by an **"X"** plus some alpha character in this field. If the TSG terminates in a customer's building and it is not necessary to identify that particular building, this code may be arbitrary.

Form Entries, Continued

TSG (cont'd)	• **FBS** - Far Building Subdivision - This field contains a code that identifies the internal building subdivision for the far end of a TSG. The code is a traffic, plant, or administrative assignment. It must be a 3-character alphanumeric combination. For non-message TSGs, this field is not required. Three asterisks are pre-printed on the form to provide an entry for this field. • **NBS** - Near Building Subdivision - The NBS designation is the internal building identity for the near end termination of a TSG. It is always a 3-character alphanumeric code. This field should be left **"Blank"** if the NBS for this TSG is the same as the NBS assigned in the near office Circuit Identification Number (CIN) for the 4ESS Switch. The Office Data Assembler (ODA) system will add the NBS on a default basis.
ES	Not Applicable - Entries: **"N"**
PTERM	Not Applicable - Entries: **"Blank"**
STERM	Not Applicable - Entries: **"Blank"**

Use pursuant to Company Instructions

Form Entries, Continued

QTRK

Quantity of Trunks - For each line under QTRK, valid entries are a quantity of trunks from **"1-120"** to be assigned sequentially. The QTRK plus the First Time Slot (FTS) must be less than 122.

For RC 200, trunks connected to a far-end D1D or D2 channel bank, international trunks, and service circuits must obey special constraints. Valid entries for trunks to be connected to a D1D or D2 channel bank are **"1-24"**. Valid entries for service circuits depend upon the corresponding Trunk Subgroups (TSGs). Following are the legal ranges of values for the corresponding TSGs:

TSG	QTRK
SVC*DMRV	16, 32, 48, 64 (for digital circuits)
SVC*DMXM	16, 32, 48, 64 (for digital circuits)
SVC*MFR*	1 to 32 (for analog circuits)
SVC*MFR*	16, 32, 48, 64 (for digital circuits)
SVC*MFX*	1 to 32 (for analog circuits)
SVC*MFX*	16, 32, 48, 64 (for digital circuits)
SVC*XCVR	1 to 12
SVC*MFCI	24
SVC*MFCO	24
SVC*SCAN	24
SVC*SCBN	24
SVC*SCNS	24

The Recent Change (RC) System will allow any quantity of trunks from 1 to 64 for digital service circuits (both Multifrequency [MF] and Dual Tone Multifrequency [DTMF]). However, since the hardware for digital service circuits must be grown in increments of 16, it is recommended that only the indicated values above be entered (e.g., 16, 32, 48, 64).

Continued on next page

Form Entries, Continued

FTFN

First Traffic Number - For each line under FTFN, enter the FTN of the block of traffic numbers being assigned on that line. The quantity of trunks assigned on each line will be numbered sequentially by an internal program manipulation beginning with the FTFN specified. Valid inputs are **"0-9999**". Quantity of Trunks (QTRK) plus FTFN must be less than 10001.

For RC 104, this field should specify the first traffic number of the new block of traffic numbers that is being added to the Trunk Subgroup. Valid inputs are **"0-9976"**.

TAN

Trunk Appearance Number - Each block of trunks may be assigned a series of TANs. The TAN defines a fixed relationship to the switching equipment. The first TAN will be associated with the First Traffic Number in the block (FTFN) and the remainder of the TANs will be sequentially assigned to the remaining trunks in the block.

- **TSI** - Time Slot Interchange - The Time slot Interchange (TSI) frame number is assigned in this field. Valid entries are **"0-63"**.
- **SPC** - Switching Permuting Circuit - The SPC identification may be **"0"** or **"1"**.
- **LVL** - Level - The TSI Level appears in this field. Valid entries are **"0"** to **"6"**. For D3U applications, valid entries are **"0-7"** (4E21>).
- **FTS** - First Time Slot - The FTS indicates the specific appearance of the TAN. Valid entries are **"001-120"**; however, the FTS plus the Quantity of Trunks (QTRK) must be less than 122 for each line. For D3U applications (4E21>):
  - When the LVL is **"0"**, FTS is **"1-127"**.
  - When the LVL is **"1-6"**, FTS is **"0-127"**.
  - When the LVL is **"7"**, FTS is **"0-112"**.

Form Entries, Continued

LABEL	Not Applicable - Entries: **"Blank"**
FCIC	Not Applicable - Entries: **"Blank"**
VCR	Voice Path Assurance Cancellation Rate - This field specifies the cancellation rate of the Voice Path Assurance (VPA) test. This allows savings of real time processing on Integrated Services Digital Network User Part (ISUP) calls using digitally protected carrier facilities. Valid entries are **"100"**, **"87"**, **"50"**, and **"0"**. • **100** - 100% cancellation allowed on trunks between 4E-4E and 4E-5E when the entire facility is **"T"**- Carrier or other protected digital carrier. • **87** - 87 1/2% cancellation on 4E - 1/1A ESS Digital Carrier Trunks (DCT) using protected digital carrier. • **50** - 50 - 50% cancellation on 4E-Network Service Center (NSC) and 4E to other switches where the D-Bank is at the far end and the carrier facility is digitally protected. • **0** - "0%" cancellation is the default or used when switches or facilities are analog or unknown.
BBC	Not Applicable - Entries: **"Blank"**
SCGA	Software Carrier Group Alarm - This carrier alarm feature is only used on analog facilities. Valid entries are **"Y"** or **"N"**. For trunks assigned to digital facilities, leave **"Blank"**.

RC Form 205

General

Recent Change (RC) Form 205 is used to nail-up trunks. All trunks being nailed up must be in the CAD.DSA state prior to activating the RC. After the RC activation, transmission paths remain open until the input message **"ORD:TL;RLS:CIN_ _ _ "** is entered for each trunk. This message is classed as a Recent Change Data Message (RCDM).

An alphabetical keyword list is included in this section, starting on page 7.

Form Entries

RC:TRK;NEW;OPT(NAILUP),---:

Recent Change action field – Entries appended to the message header indicate the action to be taken by the Recent Change (RC) system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at a time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks, and also, the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast Activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast Test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

ORNU Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

Continued on next page

Form Entries, Continued

QTRK

Quantity of Trunks - For each line under QTRK, valid entries are a quantity of trunks from **"1-120"** to be assigned sequentially. The QTRK plus the First Time Slot (FTS) must be less than 122.

For RC 200, trunks connected to a far-end D1D or D2 channel bank, international trunks, and service circuits must obey special constraints. Valid entries for trunks to be connected to a D1D or D2 channel bank are **"1-24"**. Valid entries for service circuits depend upon the corresponding Trunk Subgroups (TSGs). Following are the legal ranges of values for the corresponding TSGs:

TSG	QTRK
SVC*DMRV	16, 32, 48, 64 (for digital circuits)
SVC*DMXM	16, 32, 48, 64 (for digital circuits)
SVC*MFR*	1 to 32 (for analog circuits)
SVC*MFR*	16, 32, 48, 64 (for digital circuits)
SVC*MFX*	1 to 32 (for analog circuits)
SVC*MFX*	16, 32, 48, 64 (for digital circuits)
SVC*XCVR	1 to 12
SVC*MFCI	24
SVC*MFCO	24
SVC*SCAN	24
SVC*SCBN	24
SVC*SCNS	24

The Recent Change (RC) System will allow any quantity of trunks from 1 to 64 for digital service circuits (both Multifrequency [MF] and Dual Tone Multifrequency [DTMF]). However, since the hardware for digital service circuits must be grown in increments of 16, it is recommended that only the indicated values above be entered (e.g., 16, 32, 48, 64).

TAN

Trunk Appearance Number - Each block of trunks may be assigned a series of TANs. The TAN defines a fixed relationship to the switching equipment. The first TAN will be associated with the First Traffic Number in the block (FTFN) and the remainder of the TANs will be sequentially assigned to the remaining trunks in the block.

- **TSI** - Time Slot Interchange - The Time slot Interchange (TSI) frame number is assigned in this field. Valid entries are **"0-63"**.
- **SPC** - Switching Permuting Circuit - The SPC identification may be **"0"** or **"1"**.
- **LVL** - Level - The TSI Level appears in this field. Valid entries are **"0"** to **"6"**. For D3U applications, valid entries are **"0-7"** (4E21>).
- **FTS** - First Time Slot - The FTS indicates the specific appearance of the TAN. Valid entries are **"001-120"**; however, the FTS plus the Quantity of Trunks (QTRK) must be less than 122 for each line. For D3U applications (4E21>):
  - When the LVL is **"0"**, FTS is **"1-127"**.
  - When the LVL is **"1-6"**, FTS is **"0-127"**.
  - When the LVL is **"7"**, FTS is **"0-112"**.

Form Entries, Continued

TYP

This field indicates the type of nail-up transmission desired.

- **Blank**
- **C64** - 64 kbs Clear transmission
- **DCH** - D-Channel signaling connection
- **FSP** - Four State Pass Through transmission
- **LNK** - Signaling link connection
- **R56** - 56 kbs Restricted transmission
- **R64** - 64 kbs Restricted transmission

If this field is **"Blank"** and the trunk terminates on a Digital Interface Frame (DIF), the value of the field will be equal to **R64**. If this field is **"Blank"** and the trunk does NOT terminate on a DIF, the value of the field will be equal to **R56**.

RDC

Red Circuit Handling - This field will contain an **"N"** to indicate no special circuit handling or **"Y"** to indicate that special circuit handling is required.

If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast Activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast Test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

ORNU Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

Continued on next page

Form Entries, Continued

QTRK

Quantity of Trunks - For each line under QTRK, valid entries are a quantity of trunks from **"1-120"** to be assigned sequentially. The QTRK plus the First Time Slot (FTS) must be less than 122.

For RC 200, trunks connected to a far-end D1D or D2 channel bank, international trunks, and service circuits must obey special constraints. Valid entries for trunks to be connected to a D1D or D2 channel bank are **"1-24"**. Valid entries for service circuits depend upon the corresponding Trunk Subgroups (TSGs). Following are the legal ranges of values for the corresponding TSGs:

TSG	QTRK
SVC*DMRV	16, 32, 48, 64 (for digital circuits)
SVC*DMXM	16, 32, 48, 64 (for digital circuits)
SVC*MFR*	1 to 32 (for analog circuits)
SVC*MFR*	16, 32, 48, 64 (for digital circuits)
SVC*MFX*	1 to 32 (for analog circuits)
SVC*MFX*	16, 32, 48, 64 (for digital circuits)
SVC*XCVR	1 to 12
SVC*MFCI	24
SVC*MFCO	24
SVC*SCAN	24
SVC*SCBN	24
SVC*SCNS	24

The Recent Change (RC) System will allow any quantity of trunks from 1 to 64 for digital service circuits (both Multifrequency [MF] and Dual Tone Multifrequency [DTMF]). However, since the hardware for digital service circuits must be grown in increments of 16, it is recommended that only the indicated values above be entered (e.g., 16, 32, 48, 64).

Form Entries, Continued

TAN

Trunk Appearance Number - Each block of trunks may be assigned a series of TANs. The TAN defines a fixed relationship to the switching equipment. The first TAN will be associated with the First Traffic Number in the block (FTFN) and the remainder of the TANs will be sequentially assigned to the remaining trunks in the block.

- **TSI** - Time Slot Interchange - The Time slot Interchange (TSI) frame number is assigned in this field. Valid entries are **"0-63"**.
- **SPC** - Switching Permuting Circuit - The SPC identification may be **"0"** or **"1"**.
- **LVL** - Level - The TSI Level appears in this field. Valid entries are **"0"** to **"6"**. For D3U applications, valid entries are **"0-7"** (4E21>).
- **FTS** - First Time Slot - The FTS indicates the specific appearance of the TAN. Valid entries are **"001-120"**; however, the FTS plus the Quantity of Trunks (QTRK) must be less than 122 for each line. For D3U applications (4E21>):
  - When the LVL is **"0"**, FTS is **"1-127"**.
  - When the LVL is **"1-6"**, FTS is **"0-127"**.
  - When the LVL is **"7"**, FTS is **"0-112"**.

RDC

Red Circuit Handling - This field will contain an **"N"** to indicate no special circuit handling or **"Y"** to indicate that special circuit handling is required.

Form Entries

RC:TRK;CHG,---:

Recent Change action field – Entries appended to the message header indicate the action to be taken by the Recent Change (RC) system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at a time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks, and also, the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast Activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast Test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

Form Entries, Continued

TSG

Trunk Subgroup - This series of codes identifies a Trunk Subgroup. The TSG is a set of trunks within a Trunk Group having certain identical characteristics. A Trunk Group must have a common destination. In addition to group characteristics, a TSG also has common signaling characteristics, transmission delay, originating Numbering Plan Area (NPA), domain, traffic separation index and screening classes. The Trunk Group and TSG are identified by a series of codes that specify the near and far ends of the trunk. In most cases, the full near end definition is not required because it will always be the same. The Trunk Group designation is comprised of the town, state, building and building subdivision for the far end plus the near end building subdivision. A TSG is uniquely identified by adding a Base Traffic Number reference. Trunk Group and TSG definitions are available in the 4ESS Switch as abbreviated Circuit Identification Names (CINs). Common Language Location Identification (CLLI) codes must be entered in the fields that make up the Trunk Group definition. Rules for establishing these codes are covered in Lucent Technologies Practices 795-100-100. The code for any established office may be found by referring to the location code index in that same Lucent Technologies Practices. For non-message TSGs, the format does not include mnemonics for identifying the far end of the trunk. The TSG will mnemonically identify the type of trunk category by function. Asterisks are used in columns where no information is necessary. The following paragraphs describe the individual fields within a TSG definition.

•

Form Entries, Continued

TSG
(cont'd)

- **BTFN** - Base Traffic Number - The BTFN is a number in the range of **"0-9976"** that is part of the TSGs designation (which consists of the BTFN, TOWN, ST, BL, FBS, and NBS). The BTFN is the first traffic number in the first block of traffic numbers that is assigned to a TSG. Additional traffic numbers, which are assigned in blocks of 24, either higher or lower in numerical value than the BTFN can be assigned to the TSG, but the BTFN remains as defined above. All non-message trunks have a BTFN of **"0000"**. For RC 104, the BTFN is stored as the starting point for a block of traffic numbers that range up to the limit originally defined on RC Forms 100, 101 and 102 when the TSG was first built. Other blocks of traffic numbers, either higher or lower in numerical value, may be assigned to this TSG, via Recent Change (RC) procedures. In this case the original BTFN would still apply, but the QTFN field would contain the number of new traffic numbers to be assigned following the First Traffic Number (FTFN) specified.

- **TOWN** - Town is a 4-character alphabetic field - The code must represent the bona fide town, city or location per Lucent Technologies Practices 795-100-100 for the far end of the TSG.

- **ST** - State - This field represents the state, province or foreign country in which the far end office is located. The code in ST must be a standard 2-character alphabetic combination. Valid standard abbreviations for states, Canadian provinces and foreign countries may be found in Lucent Technologies Practices 795-100-100.

- **BL** - Building - The BL field contains the office identity for the far end of a TSG. This code consists of either two alphabetic characters or two numeric characters. Independent Telephone Company locations are always designated by an **"X"** plus some alpha character in this field. If the TSG terminates in a customer's building and it is not necessary to identify that particular building, this code may be arbitrary.

-

Continued on next page

Form Entries, Continued

TSG (cont'd)

- **FBS** - Far Building Subdivision - This field contains a code that identifies the internal building subdivision for the far end of a TSG. The code is a traffic, plant, or administrative assignment. It must be a 3-character alphanumeric combination. For non-message TSGs, this field is not required. Three asterisks are pre-printed on the form to provide an entry for this field.

- **NBS** - Near Building Subdivision - The NBS designation is the internal building identity for the near end termination of a TSG. It is always a 3-character alphanumeric code. This field should be left **"Blank"** if the NBS for this TSG is the same as the NBS assigned in the near office Circuit Identification Number (CIN) for the 4ESS Switch. The Office Data Assembler (ODA) system will add the NBS on a default basis.

Form Entries, Continued

QTRK

Quantity of Trunks - For each line under QTRK, valid entries are a quantity of trunks from **"1-120"** to be assigned sequentially. The QTRK plus the First Time Slot (FTS) must be less than 122.

For RC 200, trunks connected to a far-end D1D or D2 channel bank, international trunks, and service circuits must obey special constraints. Valid entries for trunks to be connected to a D1D or D2 channel bank are **"1-24"**. Valid entries for service circuits depend upon the corresponding Trunk Subgroups (TSGs). Following are the legal ranges of values for the corresponding TSGs:

TSG	QTRK
SVC*DMRV	16, 32, 48, 64 (for digital circuits)
SVC*DMXM	16, 32, 48, 64 (for digital circuits)
SVC*MFR*	1 to 32 (for analog circuits)
SVC*MFR*	16, 32, 48, 64 (for digital circuits)
SVC*MFX*	1 to 32 (for analog circuits)
SVC*MFX*	16, 32, 48, 64 (for digital circuits)
SVC*XCVR	1 to 12
SVC*MFCI	24
SVC*MFCO	24
SVC*SCAN	24
SVC*SCBN	24
SVC*SCNS	24

The Recent Change (RC) System will allow any quantity of trunks from 1 to 64 for digital service circuits (both Multifrequency [MF] and Dual Tone Multifrequency [DTMF]). However, since the hardware for digital service circuits must be grown in increments of 16, it is recommended that only the indicated values above be entered (e.g., 16, 32, 48, 64).

Continued on next page

Form Entries, Continued

FTFN	First Traffic Number - For each line under FTFN, enter the FTN of the block of traffic numbers being assigned on that line. The quantity of trunks assigned on each line will be numbered sequentially by an internal program manipulation beginning with the FTFN specified. Valid inputs are **"0-9999**". Quantity of Trunks (QTRK) plus FTFN must be less than 10001. For RC 104, this field should specify the first traffic number of the new block of traffic numbers that is being added to the Trunk Subgroup. Valid inputs are **"0-9976"**.
LACID	Not Applicable - Entries: **"Blank"**
FAC	Not Applicable - Entries: **"Blank"**
FTRID	Not Applicable - Entries: **"Blank"**

Continued on next page

Form Entries, Continued

VCR

Voice Path Assurance Cancellation Rate - This field specifies the cancellation rate of the Voice Path Assurance (VPA) test. This allows savings of real time processing on Integrated Services Digital Network User Part (ISUP) calls using digitally protected carrier facilities. Valid entries are **"100"**, **"87"**, **"50"**, and **"0"**.

- **100** - 100% cancellation allowed on trunks between 4E-4E and 4E-5E when the entire facility is **"T"**- Carrier or other protected digital carrier.
- **87** - 87 1/2% cancellation on 4E - 1/1A ESS Digital Carrier Trunks (DCT) using protected digital carrier.
- **50** - 50 - 50% cancellation on 4E-Network Service Center (NSC) and 4E to other switches where the D-Bank is at the far end and the carrier facility is digitally protected.
- **0** - "0%" cancellation is the default or used when switches or facilities are analog or unknown.

BBC

Not Applicable - Entries: **"Blank"**

SCGA

Software Carrier Group Alarm - This carrier alarm feature is only used on analog facilities. Valid entries are **"Y"** or **"N"**. For trunks assigned to digital facilities, leave **"Blank"**.

ES

Not Applicable - Entries: **"N"**

Code Grouping Table Of Contents, Continued

General

This information applies to all sections within this division:

1. The characters > and < are used to indicate which Generic Programs will apply.

   Examples:

   - 4E22> indicates 4E22 and later Generic Programs.
   - <4E22 indicate 4E22 and earlier Generic Programs.
   - 4E22 indicates the 4E22 Generic Program only.
   - >4E22 indicates all Generic Programs up to, but not including, 4E22.

2. Following the general section is a copy of the applicable Recent Change (RC) Form/s. Where there is more than one Generic published, the forms will be filed in ascending order by Generic.

3. The Keyword field names of the form entries in each section are listed in order of appearance on the latest Generic Recent Change Form. (Keywords deleted from the latest form issue will still remain in the form order of the last RC Form that it appeared until finally deleted).

4. The alphabetical "Keyword Index" of the field names is located at the end of each Recent Change Section, following the text, and any tables and/or graphics that may apply.

5. Each Keyword definition will only list the valid entries for the RC Form covered in each applicable section. Some Keywords may have additional valid entries related overall and may be found in the alphabetical Keyword Glossary (Div. 9, Sec. 1).

RC Form 300

General

The Recent Change (RC) Form 300 is used to change the treatment of a group of three digit codes in the translations of the 4ESS™-2000 Switch. This message is classed as a Recent Change Data Message (RCDM).

"Table 7" shows the code group population rules. "Table 8" shows the Go/No Go Screening conditions.

An alphabetical keyword list is included in this section on page 35

Form Entries, Continued

DOM

DOMAIN - This field designates a community of interest that requires separate routing. The types of Domain are "Direct Distance Dialing (DDD), Verify (VRFY)" and a number ranging from **"20-83"** denoting a NON-Plain Old Telephone Service (POTS) domain. DDD is indicated by an entry of **"POTS"** in the DOM field. The Office Data Assembler (ODA) system will automatically build the DDD Domains (191 through 209). The **"VRFY"** Domain enables the Line-Busy Verification feature by operators over a dedicated network. When DOM equals VRFY, then Type of Trunk (TOT) must be MISC or CALLTYP must equal FHT, GNS, or TST. The NON-POTS Domains may be a Common Control Switching Arrangement (CCSA) Network, such as Federal Telecommunications System (FTS). These domains are entered as a number from **"20-69"**.

- The **NON-POTS domain of 78** is used to skip Network Management code controls for quality assurance testing, i.e., CASPER.
- The **NON-POTS domains 79 and 80** are reserved for specific International Switching Center (ISC) use.
- The **NON-POTS domain of 81**, also denoted by **"IVT"** for International Voice Transport, is reserved for call processing to transport international voice calls through the network to an ISC.
- The **NON-POTS domain of 82** is used as the translation domain for Data calls. The Data feature provides the capability for full rate data transmission via the 4ESS Switch over a dedicated network of digital trunks. These digital trunks terminate exclusively on Digital Interface Frames (DIF) at 4ESS Switch locations.
- **N64C** -This domain is used to route 64 kbps clear data calls using the 10-digit North American Numbering Plan (NANP).
- **N64R** -This domain is used to route 64 kbps restricted data calls using the 10-digit North American Numbering Plan.

Continued on next page

Form Entries, Continued

DOM (cont'd)

The following translations domains are used for wideband transmission:

- **NH0C** -This domain is used to route 384 kbps clear data calls using the 10-digit North American Numbering Plan (NANP).
- **NH1C** - This domain is used to route 1536 kbps clear data calls using the 10-digit NANP.

The following domains are non-translations domains used for routing only:

- **SF00-SF06** - Subscribed Footprint Area 00 to 06 (4E22R4>)
- **SF07-SF39** - Subscribed Footprint Area 07 to 39 (4E23R1>)
- **STCD** - Super Tandem Carrier ID (4E22R4>)
- **ATNS** - Access Tandem Transit Network Selection - This domain is used to translate equal access Integrated Services Digital Network User Part (ISUP) parameters to obtain the routing information.

NTD

Number of Translated Digits - This field specifies the number of digits to be analyzed for this code grouping. For domestic code grouping, this number may range from 3 to 12 depending on the code group form. The first three digits are listed under the ABC field, the remaining digits, if any, are listed in the DEF, GHI, and JKL fields. Valid entry for the RC Form 300 is only **"3"** because the form only changes the ABC digits. Other digit combination changes are performed on subsequent forms.

AC

Area Code - A **"Y"** for Yes indicates that all of the 3-digit codes (ABC digits) on this form are Area Codes. If the ABC digits are office codes, test codes or other non-Area Codes, AC will be **"N"** for No. This field is left **"Blank"** when Domain (DOM) is not equal to Plain Old Telephone Service (POTS).

Continued on next page

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

ORNU Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

CALLTYP The Call Type is used to define the major category for the disposition of the codes listed on this form. The valid Call Type categories are as follows:

- **EAR** - The Emergency Alternate Routing feature will be used to reroute calls. The EAR Call Type will be used for code groups which must be screened for this feature and will indicate that one or more destination numbers in the code group have this feature. This feature allows business customers to redirect calls from a primary location to an alternate location when the primary location is the victim of a natural disaster, a bomb threat, or other terrorist activity.
- **FHT** - Final Handling Treatment. This identifier specifies that the listed codes will be directed to a Final Handling Treatment (FHT) announcement or tone.
- **GNS** - Go/No Go Screening - GNS specifies that this group of codes will be given GNS before the routing is determined. If this call type is entered. GN and GNSC fields must be completed.
- **PAS** - Public Announcement System - This identifier specifies that the codes listed will terminate the customer to the announcement specified in the CALLDATA field.
- **RDB** - Routing Data Block - RDB is used to specify that the set of codes listed in this form will be routed directly to Trunk Subgroups (TSGs) defined by a Routing Data Block (RDB).
- **SDX** - Subsequent Digit Index - This Call Type is used to reference a subsequent digit entry which contains several alternative routing treatments that are selected on the basis of an index determined by the type value entered as AD1. In memory, the SDX call type contains data stating the grid table size: **"1"** meaning a size of 16 entries, **"2"** meaning 128, **"3"** meaning 1024. To obtain the number of SDs, use the VER:CODEGRP:SDINDEX message (4E23>).

Form Entries, Continued

CALLTYP (cont'd.)

- **SSP** - Service Switching Point - This identifier is used to designate the processing of a Numbered Services call.
- **TEL** - TELEVOTE with Public Announcement System - This identifier specifies that the codes listed will terminate the customer to the announcement specified in the CALLDATA field. TEL is only valid in the Plain Old Telephone Service (POTS) Domain.
- **TST** - Test - This identifier is used for the code line test combinations within a translation domain. Three digit codes under this call type would include 10X codes and the synchronous test.

CALLDATA

This field further defines the treatment given to the group of codes listed on this form. CALLDATA is an extension of the Call Type (CALLTYP). For a given CALLTYP, the CALLDATA will define the specific code group treatment. CALLTYP/CALLDATA correlation is shown below.

- **Emergency Alternate Routing (EAR) Call Type** - The CALLDATA for EAR is an RDB index in the range of **"1-8191"**.
- **FHT Call Type** - The Final Handling Treatment (FHT) CALLTYP is used to point a group of codes directly to an announcement or tone. The CALLDATA field identifies that tone or announcement circuit. Valid entries are : **"AR"**, **"BT"**, **"EA1-EA7"**, **"HW"**, **"IFF"**, **"INC"**, **"IVC"**, **"MCA"**, **"NCA"**, **"NCC"**, **"NCD"**, **"NWC"**, **"OOB"**, **"ROA"**, **"SP1"**, **"SP2"**, **"T"**, **"VCA"**, **"DNN"**, **"DPP"**, **E01-E02"**, **"I01-I30"**, **"INF"**, **"ISB"**, **"LDV"**, **"LOB"**, **"LSA"**, **"NCB"**, **"NWN"**, **"OOA"**, **"OTS"**, **"R01-R10"**, **"S01-S19"**, **"SNA"**, **"STO"**, **"TDN"**, **"UNN"**, **"VMA"**, **"WAT"**. Consult Lucent Practices 781-031-100 for further definition of various tones and announcements. See the Routing Data Block Final Handling Treatment (RDBFHT) description for the identifiers that may be specified.

Form Entries, Continued

CALLDATA (cont'd.)

- **GNS Call Type** - If the GNS CALLTYP identifier is used, the CALLDATA field will contain a Routing Data Block Index (RDBI) from **"1-8191"**. This index will be used to direct the call if the Go/No Go Screening (GNSC) passes. The Go No Go (G/N) and GNSC fields specify the Go/No Go conditions. If the GNSC fails, the call is directed to the vacant code Final Handling Treatment (FHT).

- **PAS Call Type** - If Public Announcement System (PAS) Call Type is used, the CALLDATA field must contain a 12-digit announcement identifier. This identifier is made up of the 5-digit Voice Storage System Identity (VSSID) and 7-digit Service Identity (SID).

- **RDB Call Type** - For RDB, the CALLDATA field will contain a Routing Data Block Index (RDBI) from **"1-8191"**. This number will specifically identify a given set of routing parameters as listed in the RDB form with that same RDBI. The RDB entry is used to directly point a group of codes toward routing information.

- **SDX Call Type** - The CALLDATA for SDX is a Subsequent Digit Index (SDX) which identifies a particular subsequent digit entry. Valid values are **"1-16383"**.

- **SSP Call Type** - If Service Switching Point (SSP) Call Type is used, the CALLDATA field must contain one of the following identifiers:

  - **RT** - Retranslate Carrier ID (CID) and Type Of Service (TOS) plus Incoming Trunk Class (ITC) in the Number Services Routing (NSR) domain.
  - **RT00Y** - Retranslate CID TOS plus ITC in the NSR domain with a 00Y for Numbering Plan Area (NPA) lookup.
  - **RTCOIN** - Retranslate CID TOS plus ITC in the NSR domain for a 00X coin call.
  - **ACPN** - The 0ZZ-XXX[X] (or Transit Network Selection [TNS]) translation indicates Analyze the Called Party Number". For the Equal Access Multifrequency (EAMF), the switch will receive the second/third stages of digits and proceeds with digit translation looking for Called Number Triggers.

Continued on next page

Form Entries, Continued

CALLDATA (cont'd.)

- **AIIO** - The 0ZZ-XXX[X] (or TNS) translation indicates "Analyze the Information Digit/Originating Line Information (II/OLI)". This causes the switch to intercept the second and third stages of digits in for EAMF, and to check II/OLI for the "Send Advanced Intelligent Network (AIN) Information Collected Query" (SIAQ) value.
- **DB** - TOS and Database query.
- **DB7** - TOS and Database query for a 7-digit dialed number.
- **DB00Y** - TOS and Database query with a 00Y or NPA lookup.
- **DBCOIN** - TOS and Database query for a 00X coin call.
- **EASDNA** - Receive the Equal Access (EA) sequence and retranslate the address sequence in the Software Defined Network (SDN) Access (SDNA) domain.
- **EASEQ** - Collect the 2nd and 3rd stage digits EA format.
- **NCP12** - 12- or 9-digit address returned from the SDN NCP, the first two digits of which are deleted by the 4ESS Switch before outpulsing, retranslate the CID, TOS, and ITC in the NSR domain.
- **NDB** - Interexchange Carrier/International Carrier (IC/INC) routing. Requires Call Handling Instruction (CHI) entry of Number Services Data Block (ND), Number Services/Inhibit Black Box (NDB) or Number Services/Inhibit Black Box and Blue Box (NDBB).
- **RTP** - Retranslate the routing digits in Plain Old Telephone Service (POTS).
- **SFA** - Subscribed Footprint Area (4E22R4>)
- **SIAQ** - Send Information and Analyze Query.
- **SICQ** - The 0ZZ-XXX[X] (or TNS) translation indicates "Send AIN Information Collected Query". This causes the switch to intercept the second and third stages of digits in the EAMF case and the indicated query is sent to the Service Control Point (SCP) without any analysis of the called number.

CALLDATA (cont'd.)

- **TNSND** - Access Tandem Transit Network Selection Digits -This identifier is used at an Access Tandem (AT) switch to handle incoming calls from equal access Integrated Services Digital Network User Part (ISUP) to outgoing equal access ISUP or MFWINK. This subtype is only used in the Access Tandem Transit Network Selection (ATNS) domain.

- **TEL** Call Type - If TEL Call Type is used, the CALLDATA field must contain a 12-digit announcement identifier. This identifier is made up of the 5-digit VSSID and 7-digit SID.

- **TST** Call Type - This identifier specifies that the group of codes on this form are test codes. The CALLDATA field will identify the test. The following combinations may be assigned.

  - **100** - Balance - provides a quiet termination.
  - **101** - Communication - provides a link to a test board or test position.
  - **102** - Milliwatt - source of 1000 hertz test tone.
  - **103** - Signal/Supervisory - This test provides a series of on-hook/off-hook transitions.
  - **105** - Automatic Transmission Measuring System (ATMS) - provides a connection to an ATMS responder.
  - **108** - Echo Suppressor - The 108 test is used to test Echo Suppressor operation.
  - **109** - This test is used to test Echo Canceller operation.
  - **DLC -** Data loopback/complement test trunk.
  - **SYN** - Synchronous - SYN specifies a signaling/supervision test similar to 103 but on an automatic timed basis.

Form Entries, Continued

AD1

Additional Data 1 - This field further defines the treatment given to a code group translation. AD1 is an extension of the Call Type (CALLTYP) and CALLDATA words. For a given CALLTYPE and CALLDATA, the AD1 will define the specific code group treatment. Valid entries for the appropriate services are:

- **"Blank"**
- **"GNS" (Go/No Go Screening)** - If GNS Call Type is used, the AD1 field is used to enter the Go/No Go value for the Call Type. The field may contain a Go **("G")** or No Go **("N")** condition for the list of codes that appear on this form. The indication is linked with a given GNS Class in the next field. All two-way and incoming Trunk Subgroups (TSGs) are assigned a GNS Class. By manipulating the Go/No Go conditions for a group of codes, incoming traffic can be denied (sent to vacant code) on one or more TSGs and allowed to complete on others.
- **"SDTYPE" (Subsequent Digit Index Type)** - The AD1 field for SDX Call Type is used to identify the type of index that must be used to index the subsequent digit entry. Valid entries are as follows:
  - **MTS** Multiple Treatment Screening class from an incoming trunk. Valid entries are **"Blank"** or **"0 - 63"**.
  - **DC** Digit Count of the incoming call. Valid entries are **"3 - 15"**.
  - **DRTC** Data Rate Transfer Capability for Integrated Services Digital Network user Part (ISUP) to Multifrequency (MF) interworking. Valid entries are **"0 - 7"**.
  - **IPR** ISUP Preference Routing. Valid entries are:
    "0" - ISUP Preferred. The outgoing trunks should be mostly ISUP.
    "1" - ISUP not required. The outgoing trunks should be mostly non-ISUP.
    "2" - ISUP Required. All outgoing trunks must be ISUP.
    "3" - Spare
  - **V31K** - Voice or 3.1kHZ indicator. Valid entries are:
    "0" - 3.1kHZ
    "1" - Voice.

AD1
(cont'd.)

- **"SSP" (Service Switching Point)** Call Type - If SSP Call Type is used, the AD1 field is used to enter either the Type of Service (TOS) indicator value for the CALLDATA of NCP12, RT, RT00Y, RTCOIN, SICQ, DB, DB7, DB00Y, or DBCOIN or the Number Services Data Block (NDB) for the CALLDATA of NDB or TNSND, or the Subscribed Footprint Area Index (SFAI) for the CALLDATA of Subscribed Footprint Area (SFA).
  - **NDBI** - Number Services Data Block Index value defines which Interexchange Carrier or International Carrier routing control block will be used for the call. Valid input values are **"1-1023"**.
  - **SFAI** - Subscribed Footprint Area Index used to calculate a corresponding SFA domain. Valid input is **"0-6"** (**"0-39"** for 4E23>).
  - **TOS** - Type of Service entry defines which number service will be identified with this Call Type entry. Valid input is a number between **"0"** and **"31"**.
- **"SAPN"** - This field is used to specify the Slave Application Number (SAPN) assigned when the Call Type is TEL. Valid range is **"0-63"**.

Continued on next page

Form Entries, Continued

AD2

Additional Data 2 - This field further defines the treatment given to the group of codes listed on this form. AD2 is an extension of the Call Type (CALLTYP), CALLDATA, and AD1. For a given CALLTYPE, CALLDATA, and AD1, the AD2 will define the specific code group treatment. CALLTYPE/CALLDATA/AD1/AD2 correlation is shown below:

- **GNS (Go/No Go Screening)** Call Type - If GNS Call Type is used, the AD2 field is used to enter the Go/No Go Screening Class for the Call Type.
  - This field will have an entry when CALLTYP is GNS and AD1 is not **"Blank"**. The Go/No Go Screening Class specifies the Trunk Subgroup (TSG) class that will be allowed or denied completion to the regular routing. A range of **"0-3"** may appear in this field.
- **SSP (Service Switching Point)** Call Type - If SSP Call Type is used, the AD2 field is used to enter the Carrier IDentification (CID) indicator value for the CALLDATA of NCP12, RT, RT00Y, or RTCOIN.
  - CID - Carrier IDentification number defines which Interexchange Carrier or International Carrier will be used to route the call. Valid input is **"0000-9999"**.

  If either:
  - the DOM is Super Tandem Carrier ID (STCD) and the CALLDATA is Access Tandem Transit Network Selection Digits (TNSND) or
  - the DOM is Number Service Routing (NSR) and CALLDATA is Number Services Data Block (NDB),

  then the AD2 field specifies if the associated Carrier is allowed to receive all possible Information Digit/ Originating Line Information (II/OLI) values or is restricted only to certain values (Restrict II/OLI [RIO]). Allowed entries are:
  - **"Blank"** or **"N"** (Restrict II/OLI forwarding [DEFAULT])
  - **"Y"** (Allow II/OLI forwarding).

Form Entries, Continued

SC

Service Category/Code Group. This field identifies the Service Category (SC) of the code group. This category is used to perform incoming screening on calls received from other carriers. Also, it is used to determine for which calls an Automatic Message Accounting (AMA) record or Access Charge record should be made.

As examples of screening, an Operating Company Access Tandem (AT) switch must deny calls from an Interexchange Carrier (IC) that do not terminate in the Local Access Transport Area (LATA) served by the AT.

As an example of recording, an AT must make a terminating Access Charge record for all calls it receives from an IC or INC which terminate in the LATA.

The SC defines the screening and recording classification to be used for the code group. The SC field only applies if the CALLTYP is CRB, DSD, DSN, EAR, GNS, INW, IRA, MCT, MMT, MRT, PAS, PRT, RDB, RNR, SSP, TEL, TST, or TTS. SC will also be used to specify for which calls a query will be sent to the Network Call Denial (NCD) database.

Valid Service Category entries are:

- **Blank** - If this field is **"Blank"**, the SC is unspecified.
- **ALAP** - Alaskan Plain Old Telephone Service (POTS). ALAP is the classification for POTS code groups in the Alaskan World Zone 1 area.
- **ATAP** - Access Tandem Area Pots. ATAP is only applicable if the 4ESS Switch is owned or leased by an Operating Company and used as an Access Tandem (AT) for a LATA. ATAP is the classification for the POTS code groups in the LATA served by the AT. In addition, ATAP is the category for POTS code groups in Independent Operating Company areas also served by the Tandem Switch.

Form Entries, Continued

SC
(cont'd)

- **CANP** - Canadian POTS. CANP is the classification for POTS code groups in the Canadian World Zone 1 area.
- **CARP** - Caribbean, NON-U.S. Territories, POTS. CARP is the classification for POTS code groups in the Caribbean World Zone1 area which do not include United States territories.
- **CUSP** - Continental U. S. POTS. CUSP is the classification for POTS code groups in the continental U. S., which could not also be classified ATAP.
- **CUTP** - Caribbean, U. S. Territories, POTS. CUTP is the classification for POTS code groups in the part of the Caribbean World Zone 1 area which includes United States territories.
- **DA** - Directory Assistance. DA is used to classify code groups assigned to Directory Assistance.
- **DLT** - DIAl-It*. DLT is used to classify DIAL-It code groups.
- **DSD** - Direct Services Dialing. DSD is used to classify Direct Services Dialing code groups.
- **EASC** - Exchange Access Signaling Code. EASC is used to classify the code groups used for Exchange Access Signaling (EAS) to an Interexchange (IC) or International Carrier (INC).
- **HAWP** - Hawaiian POTS. HAWP is the classification for POTS code groups in the Hawaiian World Zone 1 area.
- **ICIN** - Inter-LATA Carrier switch owner's International Carrier (INC). ICIN is used to classify code groups for calls to the Inter-LATA Carrier switch owner's International Carrier.

* DIAL-It is a registered trademark of AT&T

Use pursuant to Company Instructions

Form Entries, Continued

SC
(cont'd)

- **INCN** - International Carrier but not inter-LATA Carrier switch owner's International Carrier. INCN is used to classify code groups from an Inter-LATA Carrier switch to an International Carrier which is not owned by the Inter-LATA Carrier. In addition, these code groups are not destined for International Operators.

- **INCO** - International Carrier Operator. INCO is the classification for code groups used for calls to an International Carrier Operator.

- **INET** - This is used for Interim Nationwide Emergency Telecommunications System code groups. INW = Inward WATS.

- **INW** is used for Inward WATS code groups. IOP = Inward Operator.

- **IOP** is used to classify code groups assigned to Inward Operator positions.

- **LDA** - Local Directory Assistance. This service category is used to generate the appropriate billing record when used in conjunction with a Centralized Automatic Message Accounting (CAMA) Far End Network (FEN) block.

- **MCPP** - Multiquest Calling Party-Paid. MCPP is used to classify Multiquest code groups paid for by the calling party.

- **MULT** - Multiquest. MULT is used to classify Multiquest code groups.

- **MSC1** through **MSC4** - These miscellaneous categories can be used to classify code groups into miscellaneous categories. These may be especially useful if the 4ESS Switch is shared by an Operating Company and an Interexchange Carrier (IC). In this case, the general categories could be used to classify code groups by the carrier which owns the switch and the miscellaneous categories used for code groups handled by the carrier leasing capacity on the switch.

- **NWZ1** - Non-World Zone 1. NWZ1 is the classification for the code groups used for calls to Non-World Zone 1 area.

Continued on next page

Form Entries, Continued

SC
(cont'd)

- **RSYS** - Restricted System Codes. RSYS is used to classify code groups assigned as special purpose restricted system codes.
- **SC1** through **SC36** - Spare Category 1 through Spare Category 36. These SCs can be used to classify codes in up to 36 SCs. One use for these categories is screening of IntraLATA calls at an Inter-LATA Carrier Switch. For this use, a different category would be assigned to the codes for each LATA to which the InterLATA Carrier Switch connects. Another possible use for these categories is for screening International Switching Center (ISC) terminating and transit traffic. For this use, the SCs would be assigned to the Overseas codes for which special screening is required. Yet another use is extensions of the current use of the Miscellaneous Service Categories (MSCs) (e.g., at shared switches).
- **SDN** - Software Defined Network. SDN is used for calls to a Software Defined Network.
- **SDND** - SDN Data. SDND is used for Software Defined Network Data calls.
- **SPDI** - Sponsor-Paid Dial-It. SPDI is used to classify DIAL-It code groups paid for by the sponsor.
- **SSP** - Local Exchange Carrier (LEC) Service Switching Point (SSP). SSP is used to identify calls that will have SSP processing applied to them.
- **TC** - Teleconferencing. TC is used to classify code groups assigned to network Teleconferencing services.
- **TST** - Test Line. TST is used to classify code groups assigned to trunk test lines.
- **UNSP** - Unspecified. This entry is used for a verify input request of codes that contain no SC.

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

CHI

Call Handling Instructions. This field is used to specify some call handling actions to override present Outgoing Signaling Characteristics (OSCs), recording, and/or fraud prevention controls. This field is needed because of the new call handling requirements for Interexchange Carrier (IC) and International Carrier (INC) Access. The CHI field only applies if the CALLTYP is CRB, DSD, DSN, EAR, GNS, INW, IRA, MCT, MMT, MRT, PAS, RDB, RNR, SSP, TEL, TST, or TTS.

NOTE: This field must be populated for some existing code groups, such as those used for 2-stage International calls and ADD-ON Teleconferencing calls. Failure to populate this field for these calls will result in failure to complete these calls.

Valid entries for CHI field are:

- **"Blank"** - If this field is **"Blank"**, no special call handling instructions are taken.
- **AAT2** - Access Tandem (AT) to IC Traditional Two-stage. This CHI value is used at the AT or Service Switching Point (SSP) to identify that a traditional two-stage international incoming call to the AT/SSP is being passed to the carrier via equal access using Integrated Services Digital Network User Part (ISUP) signaling.
- **ABBB** - Same as ACD, but in addition, disable Black Box and Blue Box fraud prevention.
- **ABLK** - Same as ACD, but in addition, disable Black Box Fraud prevention.
- **ACD** - Inward Wide Band Area Telephone Service (INWATS) ACD. Specifies that a terminating INWATS ACD record is to be made.
- **EAAR** - Expect Automatic Number identification (ANI) Assist Request. EAAR specifies actions at an intermediate toll switch for a call on which an ANI Assist Request is expected. For example, an ANI Assist Request is expected on a call to establish an ADD-ON Teleconference.

Continued on next page

Form Entries, Continued

CHI (cont'd.)

- **EGRH** - Egress Handling. Specifies actions at the egress switch for Direct Connect and Software Defined Network (SDN) calls. Usually, these calls will be directly terminating to a Private Branch Exchange (PBX). However, in some SDN cases, they will terminate to a local switch, either via a dedicated Trunk Subgroup (TSG) or via special NXX codes (unused office codes). EGRH can only be specified if DOM is APN, DED, or DEV. Note that it must be specified for all DED and DEV calls at the Egress switch (and not at intermediate switches) to allow the Direct Connect and/or the SDN (Offnet Egress Privilege) features.
- **ESD2** - Expect Second Start Dial 2. ESD2 specifies actions at an intermediate toll switch for a 3-stage Exchange Access call to an International Carrier (INC), including the Interexchange Carrier (IC) International Switching Center when it is able to receive Exchange Access calls.
- **ESSD** - Expect Second Start Dial. ESSD specifies actions at an intermediate toll switch for a 2-stage International call to an IC International Switching Center.
- **FGB** - Feature Group B. FGB specifies actions for calls to an IC or INC.
- **IBBB** - Same as ICDR, but in addition, disable Black Box and Blue Box fraud prevention.
- **IBLK** - Same as ICDR, but in addition, disable Black Box Fraud prevention.
- **ICDR** - International Call Detail Recording. Specifies that an ICDR record is to be made.
- **IEA** - Interim Exchange Access. IEA specifies actions for calls from an End Office (EO) unequipped to do Exchange Access signaling to an IC or INC able to handle Exchange Access signaling. (Initial plans call for these calls to have ABC digits of 950.)
- **MSC1, MSC2** - Miscellaneous 1 and 2. Two miscellaneous values are included. These can be assigned if an unforeseen set of calls require special call handling instructions.
- **ND** - Number Services Data Block information for outpulsing control.

Continued on next page

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

CHI (cont'd.)

- **NDB** - Number Services Data Block information for outpulsing control, inhibit Black Box.
- **NDBB** - Number Services Data Block information for outpulsing control, inhibit Black Box and Blue Box.
- **NONE** - This entry is used for a verify input request of codes that contain no Call Handling Instruction.
- **WACK** - Wait For Acknowledgment. WACK specifies actions for calls to an INC for which a trunk is seized and digits outpulsed. The talking path is not cut through until an Acknowledgment signal is received from the INC. This entry only applies to a 4ESS Switch owned or operated by an Operating Company as an Access Tandem (AT).
- **WAC2** - Specifies the signaling actions to be performed by an AT when connecting an Equal Access End Office (EAEO) to an INC (possibly through an Intermediate Carrier).
- **WSNO** - Wink Start No Outpulse. WSNO specifies actions for calls for which a trunk to an IC or INC is to be seized but no digits outpulsed. This is one option allowed in Exchange Access signaling, and is chosen by the IC or INC.

DESEP

Destination Separation is used to identify destinations for traffic flow purposes. Peg and usage counts are made as a function of the Trunk Sub-Group (TSG) incoming class (INSEP) and the outgoing destination class (DESEP). All outgoing or successfully terminated traffic is assigned a given destination class from **"1-255"**.

NOTE: DESEP class 63 is assigned generically for test calls. Any other assignment to class 63 should take this fact into consideration.

For code group forms, a DESEP class will be assigned only when the CALLTYP is equal to CRB, DSN, EAR, GNS, MCT, MMT, MRT, PAS, PRT, RDB, RNR, SSP, TEL, or TTS. This field is **"Blank"** for any other Call Type value.

Continued on next page

Form Entries, Continued

DNST Not Applicable - Entries: **"Blank"**

AD3 Not Applicable - Entries: **"Blank"**

ADC Acceptable Digit Count/Code Group - This field specifies the total number of incoming digits expected for a call routed to this Call Type. This field must be entered for the following Call Types: CRB, DSD, DSN, EAR, GNS, INW, IRA, MCT, MMT, MRT, PAS, PRT, RDB, RNR, SSP, TEL, TST, and TTS.

The legal values for this field are digit counts from **"3-15"** for domestic routing.

For the Call Types requiring that an ADC be input, at least one number must be specified. More than one number may be listed as valid. For example, if the Call Type points to an Routing Data Block (RDB), 6, 8 or 10 digits may be valid. Note that the number of incoming digits specified is the number of incoming digits actually received before modification by deletion or prefixing in the RDB but after A-digit reconstruction. When the Call Type treatment points to an international transit RDB (International Domain [IDOM] equals **"T"** on the RDB form) or an international originating RDB (IDOM equals **"O"**), the Language Digit (LD) is never counted in the number of digits that make up the ADC regardless of whether the LD is translated or not.

Dial Pulse (DP) and Dual Tone Multifrequency (DTMF) rely on collecting digits one-at-a-time. A range of **"3-15"** entry causes DP or DTMF critical digit timing (5 second recognize end of dialing) after each digit beyond the third digit since each digit is potentially the last. On any DP or DTMF call with less than 15 digits it causes a five second post dialing delay.

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

ADC (cont'd.)

MF, CCIS, CCITT5, ISUP, and Q931 are en-block (not-one-at-a-time) digit collectors. When the complete address is received on en-block digit collectors or when a 5-second timeout occurs on the one-at-a-time digit collectors, the number of digits received is compared with the various totals specified by the ADC in the Call Type word to which this call has been directed. If the number of digits received does not match one of the totals specified by ADC and this is an en-block call, the call will be given partial dial Final Handling Treatment (FHT). If the number of digits received does not match one of the totals specified by ADC and this is a one-at-a-time call, an additional 10 seconds (total of 15 seconds) will be allowed. If no additional digit is received during this interval, the call is given partial dial FHT (Partial Dial Timeout). If the number of digits on a one-at-a-time call does match one of the totals specified by ADC and no additional digit is received within a 5-second delay, the call will be routed on the number of digits received even if there are additional digits that have not been received yet. Therefore, the ADC should not be set any lower than the number of digits needed to correctly route the call for one-at-a-time digit collectors.

Continued on next page

Form Entries, Continued

ABC The first three digits of a given set of digits (A, B, and C) - This field lists all of the 3-digit codes that make up a code group. If the Area Code (AC) field is marked **"Yes"**, this code group may consist of 3-digit combinations in the range of **"200-999"**. If this code group is not an Area Code grouping (AC = **No**), then any number combination from **"000-999"** is valid. When the AC field is **"Blank"**, ABC may be equal to **"000-999"**.

If DOM equals Plain Old Telephone Service (POTS), the 3-digit code corresponding to the Home Numbering Plan Area (HNPA) may be assigned as ABC digits if permissive dialing is allowed on the HNPA and AC = **"N"** (Offices using Traditional Routing only - (4E22>).

Table 8
GO/NO GO SCREENING CONDITIONS

GN FIELD		GNSC FIELD	TREATMENT
Go	On	0	If the subgroup class is 0, advance to routing. For subgroup class 1, 2, and 3, go to vacant code Final Handling Treatment.
Go	On	1	Class 1 to routing, class 0, 2, and 3 denied.
Go	On	2	Class 2 to routing, class 0, 1, and 3 denied.
Go	On	3	Class 3 to routing, class 0, 1, and 2 denied.
No Go	On	0	If the subgroup class is 0, go to final handling (vacant code). Allow classes 1, 2, and 3 to advance to the regular routing.
No Go	On	1	Deny class1, allow 0, 2, and 3 to advance.
No Go	On	2	Deny class 2, allow 0, 1, and 3 to advance.
No Go	On	3	Deny class 3, allow 0, 1, and 2 to advance.

RC 301

General

The Recent Change (RC) Form 301 changes the treatment of a 4, 5, or 6 digit codes in the translations of the 4ESS™-2000 Switch. This message is classed as a Recent Change Data Message (RCDM).

"Table 9" shows the corresponding code group DEF/EFG digits for a given Incoming Trunk Class, Type of Service, and International Indicator bit grouping.

"Table 10" shows the corresponding code group DE/EF digits for converting the international indicator bit and Access Tandem Transit Network Selection index.

See "Table 7" of Division 3 Section 3a for the code group population rules and "Table 8" of the same section for the Go/No Go Screening conditions.

An alphabetical keyword list is included in this section on page 31.

Form Entries

RC:CODEGRP;CHG;OPT(DIG6),- - -:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

Form Entries, Continued

DOM

DOMAIN - This field designates a community of interest that requires separate routing. The types of Domain are "Direct Distance Dialing (DDD), Verify (VRFY)" and a number ranging from **"20-83"** denoting a NON-Plain Old Telephone Service (POTS) domain. DDD is indicated by an entry of **"POTS"** in the DOM field. The Office Data Assembler (ODA) system will automatically build the DDD Domains (191 through 209). The **"VRFY"** Domain enables the Line-Busy Verification feature by operators over a dedicated network. When DOM equals VRFY, then Type of Trunk (TOT) must be MISC or CALLTYP must equal FHT, GNS, or TST. The NON-POTS Domains may be a Common Control Switching Arrangement (CCSA) Network, such as Federal Telecommunications System (FTS). These domains are entered as a number from **"20-69"**.

- The **NON-POTS domain of 78** is used to skip Network Management code controls for quality assurance testing, i.e., CASPER.
- The **NON-POTS domains 79 and 80** are reserved for specific International Switching Center (ISC) use.
- The **NON-POTS domain of 81**, also denoted by **"IVT"** for International Voice Transport, is reserved for call processing to transport international voice calls through the network to an ISC.
- The **NON-POTS domain of 82** is used as the translation domain for Data calls. The Data feature provides the capability for full rate data transmission via the 4ESS Switch over a dedicated network of digital trunks. These digital trunks terminate exclusively on Digital Interface Frames (DIF) at 4ESS Switch locations.
- **N64C** -This domain is used to route 64 kbps clear data calls using the 10-digit North American Numbering Plan (NANP).
- **N64R** -This domain is used to route 64 kbps restricted data calls using the 10-digit North American Numbering Plan.

Continued on next page

Form Entries, Continued

DOM (cont'd)

The following translations domains are used for wideband transmission:

- **NH0C** -This domain is used to route 384 kbps clear data calls using the 10-digit North American Numbering Plan (NANP).
- **NH1C** - This domain is used to route 1536 kbps clear data calls using the 10-digit NANP.

The following domains are non-translations domains used for routing only:

- **SF00-SF06** - Subscribed Footprint Area 00 to 06 (4E22R4>)
- **SF07-SF39** - Subscribed Footprint Area 07 to 39 (4E23R1>)
- **STCD** - Super Tandem Carrier ID (4E22R4>)
- **ATNS** - Access Tandem Transit Network Selection - This domain is used to translate equal access Integrated Services Digital Network User Part (ISUP) parameters to obtain the routing information.
- **NSR** - Number Services Routing - This domain will be populated with entries to perform Service Switching Point (SSP) Interexchange Carrier (IC) and International Carrier (INC) routing.

NTD

Number of Translated Digits - This field specifies the number of digits to be analyzed for this code grouping. For domestic code grouping, this number may range from 3 to 12 depending on the code group form. The first three digits are listed under the ABC field, the remaining digits, if any, are listed in the DEF, GHI, and JKL fields. Valid entry for the RC Form 300 is only **"3"** because the form only changes the ABC digits. Other digit combination changes are performed on subsequent forms.

Continued on next page

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

AC Area Code - A **"Y"** for Yes indicates that all of the 3-digit codes (ABC digits) on this form are Area Codes. If the ABC digits are office codes, test codes or other non-Area Codes, AC will be **"N"** for No. This field is left **"Blank"** when Domain (DOM) is not equal to Plain Old Telephone Service (POTS).

ABC The first three digits of a given set of digits (A, B, and C) - This field lists all of the 3-digit codes that make up a code group. If the Area Code (AC) field is marked **"Yes"**, this code group may consist of 3-digit combinations in the range of **"200-999"**. If this code group is not an Area Code grouping (AC = **No**), then any number combination from **"000-999"** is valid. When the AC field is **"Blank"**, ABC may be equal to **"000-999"**.

If DOM equals Plain Old Telephone Service (POTS), the 3-digit code corresponding to the Home Numbering Plan Area (HNPA) may be assigned as ABC digits if permissive dialing is allowed on the HNPA and AC = **"N"** (Offices using Traditional Routing only - (4E22>).

ORNU Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

Continued on next page

Form Entries, Continued

CALLTYP The Call Type is used to define the major category for the disposition of the codes listed on this form. The valid Call Type categories are as follows:

- **EAR** - The Emergency Alternate Routing feature will be used to reroute calls. The EAR Call Type will be used for code groups which must be screened for this feature and will indicate that one or more destination numbers in the code group have this feature. This feature allows business customers to redirect calls from a primary location to an alternate location when the primary location is the victim of a natural disaster, a bomb threat, or other terrorist activity.

- **FHT** - Final Handling Treatment. This identifier specifies that the listed codes will be directed to a Final Handling Treatment (FHT) announcement or tone.

- **GNS** - Go/No Go Screening - GNS specifies that this group of codes will be given GNS before the routing is determined. If this call type is entered. GN and GNSC fields must be completed.

- **PAS** - Public Announcement System - This identifier specifies that the codes listed will terminate the customer to the announcement specified in the CALLDATA field.

- **RDB** - Routing Data Block - RDB is used to specify that the set of codes listed in this form will be routed directly to Trunk Subgroups (TSGs) defined by a Routing Data Block (RDB).

- **SDX** - Subsequent Digit Index - This Call Type is used to reference a subsequent digit entry which contains several alternative routing treatments that are selected on the basis of an index determined by the type value entered as AD1. In memory, the SDX call type contains data stating the grid table size: **"1"** meaning a size of 16 entries, **"2"** meaning 128, **"3"** meaning 1024. To obtain the number of SDs, use the VER:CODEGRP:SDINDEX message (4E23>).

Continued on next page

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

CALLTYP (cont'd.)

- **SSP** - Service Switching Point - This identifier is used to designate the processing of a Numbered Services call.
- **TEL** - TELEVOTE with Public Announcement System - This identifier specifies that the codes listed will terminate the customer to the announcement specified in the CALLDATA field. TEL is only valid in the Plain Old Telephone Service (POTS) Domain.
- **TST** - Test - This identifier is used for the code line test combinations within a translation domain. Three digit codes under this call type would include 10X codes and the synchronous test.

CALLDATA

This field further defines the treatment given to the group of codes listed on this form. CALLDATA is an extension of the Call Type (CALLTYP). For a given CALLTYP, the CALLDATA will define the specific code group treatment. CALLTYP/CALLDATA correlation is shown below.

- **Emergency Alternate Routing (EAR) Call Type** - The CALLDATA for EAR is an RDB index in the range of **"1-8191"**.
- **FHT Call Type** - The Final Handling Treatment (FHT) CALLTYP is used to point a group of codes directly to an announcement or tone. The CALLDATA field identifies that tone or announcement circuit. Valid entries are : **"AR"**, **"BT"**, **"EA1-EA7"**, **"HW"**, **"IFF"**, **"INC"**, **"IVC"**, **"MCA"**, **"NCA"**, **"NCC"**, **"NCD"**, **"NWC"**, **"OOB"**, **"ROA"**, **"SP1"**, **"SP2"**, **"T"**, **"VCA"**, **"DNN"**, **"DPP"**, **E01-E02"**, **"I01-I30"**, **"INF"**, **"ISB"**, **"LDV"**, **"LOB"**, **"LSA"**, **"NCB"**, **"NWN"**, **"OOA"**, **"OTS"**, **"R01-R10"**, **"S01-S19"**, **"SNA"**, **"STO"**, **"TDN"**, **"UNN"**, **"VMA"**, **"WAT"**. Consult Lucent Practices 781-031-100 for further definition of various tones and announcements. See the Routing Data Block Final Handling Treatment (RDBFHT) description for the identifiers that may be specified.

Continued on next page

Form Entries, Continued

CALLDATA (cont'd.)

- **GNS Call Type** - If the GNS CALLTYP identifier is used, the CALLDATA field will contain a Routing Data Block Index (RDBI) from **"1-8191"**. This index will be used to direct the call if the Go/No Go Screening (GNSC) passes. The Go No Go (G/N) and GNSC fields specify the Go/No Go conditions. If the GNSC fails, the call is directed to the vacant code Final Handling Treatment (FHT).
- **PAS Call Type** - If Public Announcement System (PAS) Call Type is used, the CALLDATA field must contain a 12-digit announcement identifier. This identifier is made up of the 5-digit Voice Storage System Identity (VSSID) and 7-digit Service Identity (SID).
- **RDB Call Type** - For RDB, the CALLDATA field will contain a Routing Data Block Index (RDBI) from **"1-8191"**. This number will specifically identify a given set of routing parameters as listed in the RDB form with that same RDBI. The RDB entry is used to directly point a group of codes toward routing information.
- **SDX Call Type** - The CALLDATA for SDX is a Subsequent Digit Index (SDX) which identifies a particular subsequent digit entry. Valid values are **"1-16383"**.
- **SSP Call Type** - If Service Switching Point (SSP) Call Type is used, the CALLDATA field must contain one of the following identifiers:
  - **RT** - Retranslate Carrier ID (CID) and Type Of Service (TOS) plus Incoming Trunk Class (ITC) in the Number Services Routing (NSR) domain.
  - **RT00Y** - Retranslate CID TOS plus ITC in the NSR domain with a 00Y for Numbering Plan Area (NPA) lookup.
  - **RTCOIN** - Retranslate CID TOS plus ITC in the NSR domain for a 00X coin call.
  - **ACPN** - The 0ZZ-XXX[X] (or Transit Network Selection [TNS]) translation indicates Analyze the Called Party Number". For the Equal Access Multifrequency (EAMF), the switch will receive the second/third stages of digits and proceeds with digit translation looking for Called Number Triggers.

Continued on next page

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

CALLDATA (cont'd.)

- **AIIO** - The 0ZZ-XXX[X] (or TNS) translation indicates "Analyze the Information Digit/Originating Line Information (II/OLI)". This causes the switch to intercept the second and third stages of digits in for EAMF, and to check II/OLI for the "Send Advanced Intelligent Network (AIN) Information Collected Query" (SIAQ) value.
- **DB** - TOS and Database query.
- **DB7** - TOS and Database query for a 7-digit dialed number.
- **DB00Y** - TOS and Database query with a 00Y or NPA lookup.
- **DBCOIN** - TOS and Database query for a 00X coin call.
- **EASDNA** - Receive the Equal Access (EA) sequence and retranslate the address sequence in the Software Defined Network (SDN) Access (SDNA) domain.
- **EASEQ** - Collect the 2nd and 3rd stage digits EA format.
- **NCP12** - 12- or 9-digit address returned from the SDN NCP, the first two digits of which are deleted by the 4ESS Switch before outpulsing, retranslate the CID, TOS, and ITC in the NSR domain.
- **NDB** - Interexchange Carrier/International Carrier (IC/INC) routing. Requires Call Handling Instruction (CHI) entry of Number Services Data Block (ND), Number Services/Inhibit Black Box (NDB) or Number Services/Inhibit Black Box and Blue Box (NDBB).
- **RTP** - Retranslate the routing digits in Plain Old Telephone Service (POTS).
- **SFA** - Subscribed Footprint Area (4E22R4>)
- **SIAQ** - Send Information and Analyze Query.
- **SICQ** - The 0ZZ-XXX[X] (or TNS) translation indicates "Send AIN Information Collected Query". This causes the switch to intercept the second and third stages of digits in the EAMF case and the indicated query is sent to the Service Control Point (SCP) without any analysis of the called number.

Form Entries, Continued

CALLDATA (cont'd.)

- **TNSND** - Access Tandem Transit Network Selection Digits -This identifier is used at an Access Tandem (AT) switch to handle incoming calls from equal access Integrated Services Digital Network User Part (ISUP) to outgoing equal access ISUP or MFWINK. This subtype is only used in the Access Tandem Transit Network Selection (ATNS) domain.

- **TEL** Call Type - If TEL Call Type is used, the CALLDATA field must contain a 12-digit announcement identifier. This identifier is made up of the 5-digit VSSID and 7-digit SID.

- **TST** Call Type - This identifier specifies that the group of codes on this form are test codes. The CALLDATA field will identify the test. The following combinations may be assigned.

  - **100** - Balance - provides a quiet termination.
  - **101** - Communication - provides a link to a test board or test position.
  - **102** - Milliwatt - source of 1000 hertz test tone.
  - **103** - Signal/Supervisory - This test provides a series of on-hook/off-hook transitions.
  - **105** - Automatic Transmission Measuring System (ATMS) - provides a connection to an ATMS responder.
  - **108** - Echo Suppressor - The 108 test is used to test Echo Suppressor operation.
  - **109** - This test is used to test Echo Canceller operation.
  - **DLC -** Data loopback/complement test trunk.
  - **SYN** - Synchronous - SYN specifies a signaling/supervision test similar to 103 but on an automatic timed basis.

Form Entries, Continued

AD1 Additional Data 1 - This field further defines the treatment given to a code group translation. AD1 is an extension of the Call Type (CALLTYP) and CALLDATA words. For a given CALLTYPE and CALLDATA, the AD1 will define the specific code group treatment. Valid entries for the appropriate services are:

- **"Blank"**
- **"GNS" (Go/No Go Screening)** - If GNS Call Type is used, the AD1 field is used to enter the Go/No Go value for the Call Type. The field may contain a Go **("G")** or No Go **("N")** condition for the list of codes that appear on this form. The indication is linked with a given GNS Class in the next field. All two-way and incoming Trunk Subgroups (TSGs) are assigned a GNS Class. By manipulating the Go/No Go conditions for a group of codes, incoming traffic can be denied (sent to vacant code) on one or more TSGs and allowed to complete on others.
- **"SDTYPE" (Subsequent Digit Index Type)** - The AD1 field for SDX Call Type is used to identify the type of index that must be used to index the subsequent digit entry. Valid entries are as follows:
  - **MTS** Multiple Treatment Screening class from an incoming trunk. Valid entries are **"Blank"** or **"0 - 63"**.
  - **DC** Digit Count of the incoming call. Valid entries are **"3 - 15"**.
  - **DRTC** Data Rate Transfer Capability for Integrated Services Digital Network user Part (ISUP) to Multifrequency (MF) interworking. Valid entries are **"0 - 7"**.
  - **IPR** ISUP Preference Routing. Valid entries are:
    "0" - ISUP Preferred. The outgoing trunks should be mostly ISUP.
    "1" - ISUP not required. The outgoing trunks should be mostly non-ISUP.
    "2" - ISUP Required. All outgoing trunks must be ISUP.
    "3" - Spare
  - **V31K** Voice or 3.1kHZ indicator. Valid entries are:
    "0" - 3.1kHZ
    "1" - Voice.

Continued on next page

Form Entries, Continued

AD1
(cont'd.)

- **"SSP" (Service Switching Point)** Call Type - If SSP Call Type is used, the AD1 field is used to enter either the Type of Service (TOS) indicator value for the CALLDATA of NCP12, RT, RT00Y, RTCOIN, SICQ, DB, DB7, DB00Y, or DBCOIN or the Number Services Data Block (NDB) for the CALLDATA of NDB or TNSND, or the Subscribed Footprint Area Index (SFAI) for the CALLDATA of Subscribed Footprint Area (SFA).
  - **NDBI** - Number Services Data Block Index value defines which Interexchange Carrier or International Carrier routing control block will be used for the call. Valid input values are **"1-1023"**.
  - **SFAI** - Subscribed Footprint Area Index used to calculate a corresponding SFA domain. Valid input is **"0-6"** (**"0-39"** for 4E23>).
  - **TOS** - Type of Service entry defines which number service will be identified with this Call Type entry. Valid input is a number between **"0"** and **"31"**.
- **"SAPN"** - This field is used to specify the Slave Application Number (SAPN) assigned when the Call Type is TEL. Valid range is **"0-63"**.

Use pursuant to Company Instructions

Form Entries, Continued

AD2

Additional Data 2 - This field further defines the treatment given to the group of codes listed on this form. AD2 is an extension of the Call Type (CALLTYP), CALLDATA, and AD1. For a given CALLTYPE, CALLDATA, and AD1, the AD2 will define the specific code group treatment. CALLTYPE/CALLDATA/AD1/AD2 correlation is shown below:

- **GNS (Go/No Go Screening)** Call Type - If GNS Call Type is used, the AD2 field is used to enter the Go/No Go Screening Class for the Call Type.
  - This field will have an entry when CALLTYP is GNS and AD1 is not **"Blank"**. The Go/No Go Screening Class specifies the Trunk Subgroup (TSG) class that will be allowed or denied completion to the regular routing. A range of **"0-3"** may appear in this field.
- **SSP (Service Switching Point)** Call Type - If SSP Call Type is used, the AD2 field is used to enter the Carrier IDentification (CID) indicator value for the CALLDATA of NCP12, RT, RT00Y, or RTCOIN.
  - CID - Carrier IDentification number defines which Interexchange Carrier or International Carrier will be used to route the call. Valid input is **"0000-9999"**.

  If either:
  - the DOM is Super Tandem Carrier ID (STCD) and the CALLDATA is Access Tandem Transit Network Selection Digits (TNSND) or
  - the DOM is Number Service Routing (NSR) and CALLDATA is Number Services Data Block (NDB),

  then the AD2 field specifies if the associated Carrier is allowed to receive all possible Information Digit/ Originating Line Information (II/OLI) values or is restricted only to certain values (Restrict II/OLI [RIO]). Allowed entries are:
  - **"Blank"** or **"N"** (Restrict II/OLI forwarding [DEFAULT])
  - **"Y"** (Allow II/OLI forwarding).

SC

Service Category/Code Group. This field identifies the Service Category (SC) of the code group. This category is used to perform incoming screening on calls received from other carriers. Also, it is used to determine for which calls an Automatic Message Accounting (AMA) record or Access Charge record should be made.

As examples of screening, an Operating Company Access Tandem (AT) switch must deny calls from an Interexchange Carrier (IC) that do not terminate in the Local Access Transport Area (LATA) served by the AT.

As an example of recording, an AT must make a terminating Access Charge record for all calls it receives from an IC or INC which terminate in the LATA.

The SC defines the screening and recording classification to be used for the code group. The SC field only applies if the CALLTYP is CRB, DSD, DSN, EAR, GNS, INW, IRA, MCT, MMT, MRT, PAS, PRT, RDB, RNR, SSP, TEL, TST, or TTS. SC will also be used to specify for which calls a query will be sent to the Network Call Denial (NCD) database.

Valid Service Category entries are:

- **Blank** - If this field is **"Blank"**, the SC is unspecified.
- **ALAP** - Alaskan Plain Old Telephone Service (POTS). ALAP is the classification for POTS code groups in the Alaskan World Zone 1 area.
- **ATAP** - Access Tandem Area Pots. ATAP is only applicable if the 4ESS Switch is owned or leased by an Operating Company and used as an Access Tandem (AT) for a LATA. ATAP is the classification for the POTS code groups in the LATA served by the AT. In addition, ATAP is the category for POTS code groups in Independent Operating Company areas also served by the Tandem Switch.

SC
(cont'd)

- **CANP** - Canadian POTS. CANP is the classification for POTS code groups in the Canadian World Zone 1 area.
- **CARP** - Caribbean, NON-U.S. Territories, POTS. CARP is the classification for POTS code groups in the Caribbean World Zone1 area which do not include United States territories.
- **CUSP** - Continental U. S. POTS. CUSP is the classification for POTS code groups in the continental U. S., which could not also be classified ATAP.
- **CUTP** - Caribbean, U. S. Territories, POTS. CUTP is the classification for POTS code groups in the part of the Caribbean World Zone 1 area which includes United States territories.
- **DA** - Directory Assistance. DA is used to classify code groups assigned to Directory Assistance.
- **DLT** - DIAl-It*. DLT is used to classify DIAL-It code groups.
- **DSD** - Direct Services Dialing. DSD is used to classify Direct Services Dialing code groups.
- **EASC** - Exchange Access Signaling Code. EASC is used to classify the code groups used for Exchange Access Signaling (EAS) to an Interexchange (IC) or International Carrier (INC).
- **HAWP** - Hawaiian POTS. HAWP is the classification for POTS code groups in the Hawaiian World Zone 1 area.
- **ICIN** - Inter-LATA Carrier switch owner's International Carrier (INC). ICIN is used to classify code groups for calls to the Inter-LATA Carrier switch owner's International Carrier.

* DIAL-It is a registered trademark of AT&T

Form Entries, Continued

SC
(cont'd)

- **INCN** - International Carrier but not inter-LATA Carrier switch owner's International Carrier. INCN is used to classify code groups from an Inter-LATA Carrier switch to an International Carrier which is not owned by the Inter-LATA Carrier. In addition, these code groups are not destined for International Operators.

- **INCO** - International Carrier Operator. INCO is the classification for code groups used for calls to an International Carrier Operator.

- **INET** - This is used for Interim Nationwide Emergency Telecommunications System code groups. INW = Inward WATS.

- **INW** is used for Inward WATS code groups. IOP = Inward Operator.

- **IOP** is used to classify code groups assigned to Inward Operator positions.

- **LDA** - Local Directory Assistance. This service category is used to generate the appropriate billing record when used in conjunction with a Centralized Automatic Message Accounting (CAMA) Far End Network (FEN) block.

- **MCPP** - Multiquest Calling Party-Paid. MCPP is used to classify Multiquest code groups paid for by the calling party.

- **MULT** - Multiquest. MULT is used to classify Multiquest code groups.

- **MSC1** through **MSC4** - These miscellaneous categories can be used to classify code groups into miscellaneous categories. These may be especially useful if the 4ESS Switch is shared by an Operating Company and an Interexchange Carrier (IC). In this case, the general categories could be used to classify code groups by the carrier which owns the switch and the miscellaneous categories used for code groups handled by the carrier leasing capacity on the switch.

- **NWZ1** - Non-World Zone 1. NWZ1 is the classification for the code groups used for calls to Non-World Zone 1 area.

SC
(cont'd)

- **RSYS** - Restricted System Codes. RSYS is used to classify code groups assigned as special purpose restricted system codes.

- **SC1** through **SC36** - Spare Category 1 through Spare Category 36. These SCs can be used to classify codes in up to 36 SCs. One use for these categories is screening of IntraLATA calls at an Inter-LATA Carrier Switch. For this use, a different category would be assigned to the codes for each LATA to which the InterLATA Carrier Switch connects. Another possible use for these categories is for screening International Switching Center (ISC) terminating and transit traffic. For this use, the SCs would be assigned to the Overseas codes for which special screening is required. Yet another use is extensions of the current use of the Miscellaneous Service Categories (MSCs) (e.g., at shared switches).

- **SDN** - Software Defined Network. SDN is used for calls to a Software Defined Network.

- **SDND** - SDN Data. SDND is used for Software Defined Network Data calls.

- **SPDI** - Sponsor-Paid Dial-It. SPDI is used to classify DIAL-It code groups paid for by the sponsor.

- **SSP** - Local Exchange Carrier (LEC) Service Switching Point (SSP). SSP is used to identify calls that will have SSP processing applied to them.

- **TC** - Teleconferencing. TC is used to classify code groups assigned to network Teleconferencing services.

- **TST** - Test Line. TST is used to classify code groups assigned to trunk test lines.

- **UNSP** - Unspecified. This entry is used for a verify input request of codes that contain no SC.

CHI

Call Handling Instructions. This field is used to specify some call handling actions to override present Outgoing Signaling Characteristics (OSCs), recording, and/or fraud prevention controls. This field is needed because of the new call handling requirements for Interexchange Carrier (IC) and International Carrier (INC) Access. The CHI field only applies if the CALLTYP is CRB, DSD, DSN, EAR, GNS, INW, IRA, MCT, MMT, MRT, PAS, RDB, RNR, SSP, TEL, TST, or TTS.

NOTE: This field must be populated for some existing code groups, such as those used for 2-stage International calls and ADD-ON Teleconferencing calls. Failure to populate this field for these calls will result in failure to complete these calls.

Valid entries for CHI field are:

- **"Blank"** - If this field is **"Blank"**, no special call handling instructions are taken.
- **AAT2** - Access Tandem (AT) to IC Traditional Two-stage. This CHI value is used at the AT or Service Switching Point (SSP) to identify that a traditional two-stage international incoming call to the AT/SSP is being passed to the carrier via equal access using Integrated Services Digital Network User Part (ISUP) signaling.
- **ABBB** - Same as ACD, but in addition, disable Black Box and Blue Box fraud prevention.
- **ABLK** - Same as ACD, but in addition, disable Black Box Fraud prevention.
- **ACD** - Inward Wide Band Area Telephone Service (INWATS) ACD. Specifies that a terminating INWATS ACD record is to be made.
- **EAAR** - Expect Automatic Number identification (ANI) Assist Request. EAAR specifies actions at an intermediate toll switch for a call on which an ANI Assist Request is expected. For example, an ANI Assist Request is expected on a call to establish an ADD-ON Teleconference.

CHI (cont'd.)

- **EGRH** - Egress Handling. Specifies actions at the egress switch for Direct Connect and Software Defined Network (SDN) calls. Usually, these calls will be directly terminating to a Private Branch Exchange (PBX). However, in some SDN cases, they will terminate to a local switch, either via a dedicated Trunk Subgroup (TSG) or via special NXX codes (unused office codes). EGRH can only be specified if DOM is APN, DED, or DEV. Note that it must be specified for all DED and DEV calls at the Egress switch (and not at intermediate switches) to allow the Direct Connect and/or the SDN (Offnet Egress Privilege) features.
- **ESD2** - Expect Second Start Dial 2. ESD2 specifies actions at an intermediate toll switch for a 3-stage Exchange Access call to an International Carrier (INC), including the Interexchange Carrier (IC) International Switching Center when it is able to receive Exchange Access calls.
- **ESSD** - Expect Second Start Dial. ESSD specifies actions at an intermediate toll switch for a 2-stage International call to an IC International Switching Center.
- **FGB** - Feature Group B. FGB specifies actions for calls to an IC or INC.
- **IBBB** - Same as ICDR, but in addition, disable Black Box and Blue Box fraud prevention.
- **IBLK** - Same as ICDR, but in addition, disable Black Box Fraud prevention.
- **ICDR** - International Call Detail Recording. Specifies that an ICDR record is to be made.
- **IEA** - Interim Exchange Access. IEA specifies actions for calls from an End Office (EO) unequipped to do Exchange Access signaling to an IC or INC able to handle Exchange Access signaling. (Initial plans call for these calls to have ABC digits of 950.)
- **MSC1, MSC2** - Miscellaneous 1 and 2. Two miscellaneous values are included. These can be assigned if an unforeseen set of calls require special call handling instructions.
- **ND** - Number Services Data Block information for outpulsing control.

Continued on next page

Form Entries, Continued

CHI (cont'd.)

- **NDB** - Number Services Data Block information for outpulsing control, inhibit Black Box.
- **NDBB** - Number Services Data Block information for outpulsing control, inhibit Black Box and Blue Box.
- **NONE** - This entry is used for a verify input request of codes that contain no Call Handling Instruction.
- **WACK** - Wait For Acknowledgment. WACK specifies actions for calls to an INC for which a trunk is seized and digits outpulsed. The talking path is not cut through until an Acknowledgment signal is received from the INC. This entry only applies to a 4ESS Switch owned or operated by an Operating Company as an Access Tandem (AT).
- **WAC2** - Specifies the signaling actions to be performed by an AT when connecting an Equal Access End Office (EAEO) to an INC (possibly through an Intermediate Carrier).
- **WSNO** - Wink Start No Outpulse. WSNO specifies actions for calls for which a trunk to an IC or INC is to be seized but no digits outpulsed. This is one option allowed in Exchange Access signaling, and is chosen by the IC or INC.

DESEP

Destination Separation is used to identify destinations for traffic flow purposes. Peg and usage counts are made as a function of the Trunk Sub-Group (TSG) incoming class (INSEP) and the outgoing destination class (DESEP). All outgoing or successfully terminated traffic is assigned a given destination class from **"1-255"**.

NOTE: DESEP class 63 is assigned generically for test calls. Any other assignment to class 63 should take this fact into consideration.

For code group forms, a DESEP class will be assigned only when the CALLTYP is equal to CRB, DSN, EAR, GNS, MCT, MMT, MRT, PAS, PRT, RDB, RNR, SSP, TEL, or TTS. This field is **"Blank"** for any other Call Type value.

Form Entries, Continued

DNST Not Applicable - Entries: **"Blank"**

AD3 Not Applicable - Entries: **"Blank"**

ADC Acceptable Digit Count/Code Group - This field specifies the total number of incoming digits expected for a call routed to this Call Type. This field must be entered for the following Call Types: CRB, DSD, DSN, EAR, GNS, INW, IRA, MCT, MMT, MRT, PAS, PRT, RDB, RNR, SSP, TEL, TST, and TTS.

The legal values for this field are digit counts from **"3-15"** for domestic routing.

For the Call Types requiring that an ADC be input, at least one number must be specified. More than one number may be listed as valid. For example, if the Call Type points to an Routing Data Block (RDB), 6, 8 or 10 digits may be valid. Note that the number of incoming digits specified is the number of incoming digits actually received before modification by deletion or prefixing in the RDB but after A-digit reconstruction. When the Call Type treatment points to an international transit RDB (International Domain [IDOM] equals **"T"** on the RDB form) or an international originating RDB (IDOM equals **"O"**), the Language Digit (LD) is never counted in the number of digits that make up the ADC regardless of whether the LD is translated or not.

Dial Pulse (DP) and Dual Tone Multifrequency (DTMF) rely on collecting digits one-at-a-time. A range of **"3-15"** entry causes DP or DTMF critical digit timing (5 second recognize end of dialing) after each digit beyond the third digit since each digit is potentially the last. On any DP or DTMF call with less than 15 digits it causes a five second post dialing delay.

Continued on next page

Form Entries, Continued

ADC (cont'd.)

MF, CCIS, CCITT5, ISUP, and Q931 are en-block (not-one-at-a-time) digit collectors. When the complete address is received on en-block digit collectors or when a 5-second timeout occurs on the one-at-a-time digit collectors, the number of digits received is compared with the various totals specified by the ADC in the Call Type word to which this call has been directed. If the number of digits received does not match one of the totals specified by ADC and this is an en-block call, the call will be given partial dial Final Handling Treatment (FHT). If the number of digits received does not match one of the totals specified by ADC and this is a one-at-a-time call, an additional 10 seconds (total of 15 seconds) will be allowed. If no additional digit is received during this interval, the call is given partial dial FHT (Partial Dial Timeout). If the number of digits on a one-at-a-time call does match one of the totals specified by ADC and no additional digit is received within a 5-second delay, the call will be routed on the number of digits received even if there are additional digits that have not been received yet. Therefore, the ADC should not be set any lower than the number of digits needed to correctly route the call for one-at-a-time digit collectors.

Form Entries, Continued

DEF

The fourth (D) fifth (E) and sixth (F) digits of a series. This field may contain one, two or three digits. It lists all of the four to six digits (including the three in the ABC field) combinations that belong to this Code Group. A single digit (D) specifies 4-digit translation, two digits (D and E) specifies 5-digit, and all three (DEF) requires 6-digit translation. A numeric or an **"X"** may be used to specify translation. The numeric will define a specific code while the **"X"** will represent all non-vacant numeric from **"0**-**9"**. Translation must be specified equal to the Number of Translated Digits (NTD). A numeric may not follow an **"X"**.

An **"X"** may be used for one, two, or three positions of the DEF field determined by NTD. If one **"X"** is used it must be in the F position if there are two numerics. If two "Xs" are used, they must be in the EF positions. All codes not listed will be routed to Final Handling Treatment-Vacant Code Analysis (FHT-VCA) by the Office Data Assembler (ODA) program.

If NPA + XXX is used with Area Code (AC) equal to yes, then codes 000-199 will be routed to Vacant Code. If it is necessary to route certain codes in the 000-199 range, they should be routed in the following manner.

Example:

- NPA + 0XX to a principal city for Numbering Plan Area (NPA)
- NPA + 1XX to a principal city for NPA
- NPA + XXX to city "A" in NPA.

If Domain (DOM) equals Plain Old Telephone Service (POTS), AC equals Yes, and the ABC digits equal the 3-digit code associated with a Served NPA, then the 3-digit codes corresponding to the Home NPA (Traditional Routing Only - (4E22>)) and the Served NPA must not be assigned as DEF digits.

RC 302

General

The Recent Change (RC) Form 302 changes the treatment of a 7, 8, or 9 digit codes in the translations of the 4ESS™-2000 Switch. This message is classed as a Recent Change Data Message (RCDM).

See "Table 7" of Division 3 Section 3a for the code group population rules and "Table 8" of the same section for the Go/No Go Screening conditions.

See "Table 9" of Division 3 Section 3b for defining for a given Incoming Trunk Class, Type of Service, and International Indicator bit grouping.

An alphabetical keyword list is included in this section on page 25.

Form Entries

RC:CODEGRP;CHG;OPT(DIG789),- - -:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

Form Entries, Continued

DOM

DOMAIN - This field designates a community of interest that requires separate routing. The types of Domain are "Direct Distance Dialing (DDD), Verify (VRFY)" and a number ranging from **"20-83"** denoting a NON-Plain Old Telephone Service (POTS) domain. DDD is indicated by an entry of **"POTS"** in the DOM field. The Office Data Assembler (ODA) system will automatically build the DDD Domains (191 through 209). The **"VRFY"** Domain enables the Line-Busy Verification feature by operators over a dedicated network. When DOM equals VRFY, then Type of Trunk (TOT) must be MISC or CALLTYP must equal FHT, GNS, or TST. The NON-POTS Domains may be a Common Control Switching Arrangement (CCSA) Network, such as Federal Telecommunications System (FTS). These domains are entered as a number from **"20-69"**.

- The **NON-POTS domain of 78** is used to skip Network Management code controls for quality assurance testing, i.e., CASPER.
- The **NON-POTS domains 79 and 80** are reserved for specific International Switching Center (ISC) use.
- The **NON-POTS domain of 81**, also denoted by **"IVT"** for International Voice Transport, is reserved for call processing to transport international voice calls through the network to an ISC.
- The **NON-POTS domain of 82** is used as the translation domain for Data calls. The Data feature provides the capability for full rate data transmission via the 4ESS Switch over a dedicated network of digital trunks. These digital trunks terminate exclusively on Digital Interface Frames (DIF) at 4ESS Switch locations.
- **N64C** -This domain is used to route 64 kbps clear data calls using the 10-digit North American Numbering Plan (NANP).
- **N64R** -This domain is used to route 64 kbps restricted data calls using the 10-digit North American Numbering Plan.

Continued on next page

Form Entries, Continued

DOM (cont'd)

The following translations domains are used for wideband transmission:

- **NH0C** -This domain is used to route 384 kbps clear data calls using the 10-digit North American Numbering Plan (NANP).
- **NH1C** - This domain is used to route 1536 kbps clear data calls using the 10-digit NANP.

The following domains are non-translations domains used for routing only:

- **SF00-SF06** - Subscribed Footprint Area 00 to 06 (4E22R4>)
- **SF07-SF39** - Subscribed Footprint Area 07 to 39 (4E23R1>)
- **STCD** - Super Tandem Carrier ID (4E22R4>)
- **ATNS** - Access Tandem Transit Network Selection - This domain is used to translate equal access Integrated Services Digital Network User Part (ISUP) parameters to obtain the routing information.
- **NSR** - Number Services Routing - This domain will be populated with entries to perform Service Switching Point (SSP) Interexchange Carrier (IC) and International Carrier (INC) routing.

NTD

Number of Translated Digits - This field specifies the number of digits to be analyzed for this code grouping. For domestic code grouping, this number may range from 3 to 12 depending on the code group form. The first three digits are listed under the ABC field, the remaining digits, if any, are listed in the DEF, GHI, and JKL fields. Valid entry for the RC Form 300 is only **"3"** because the form only changes the ABC digits. Other digit combination changes are performed on subsequent forms.

AC

Area Code - A **"Y"** for Yes indicates that all of the 3-digit codes (ABC digits) on this form are Area Codes. If the ABC digits are office codes, test codes or other non-Area Codes, AC will be **"N"** for No. This field is left **"Blank"** when Domain (DOM) is not equal to Plain Old Telephone Service (POTS).

Continued on next page

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

ABC The first three digits of a given set of digits (A, B, and C) - This field lists all of the 3-digit codes that make up a code group. If the Area Code (AC) field is marked **"Yes"**, this code group may consist of 3-digit combinations in the range of **"200-999"**. If this code group is not an Area Code grouping (AC = **No**), then any number combination from **"000-999"** is valid. When the AC field is **"Blank"**, ABC may be equal to **"000-999"**.

If DOM equals Plain Old Telephone Service (POTS), the 3-digit code corresponding to the Home Numbering Plan Area (HNPA) may be assigned as ABC digits if permissive dialing is allowed on the HNPA and AC = **"N"** (Offices using Traditional Routing only - (4E22>).

DEF This field lists the fourth (D) fifth (E) and sixth (F) digits of the code group definition. This field contains three digits.

ORNU Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

Form Entries, Continued

CALLTYP The Call Type is used to define the major category for the disposition of the codes listed on this form. The valid Call Type categories are as follows:

- **EAR** - The Emergency Alternate Routing feature will be used to reroute calls. The EAR Call Type will be used for code groups which must be screened for this feature and will indicate that one or more destination numbers in the code group have this feature. This feature allows business customers to redirect calls from a primary location to an alternate location when the primary location is the victim of a natural disaster, a bomb threat, or other terrorist activity.

- **FHT** - Final Handling Treatment. This identifier specifies that the listed codes will be directed to a Final Handling Treatment (FHT) announcement or tone.

- **GNS** - Go/No Go Screening - GNS specifies that this group of codes will be given GNS before the routing is determined. If this call type is entered. GN and GNSC fields must be completed.

- **PAS** - Public Announcement System - This identifier specifies that the codes listed will terminate the customer to the announcement specified in the CALLDATA field.

- **RDB** - Routing Data Block - RDB is used to specify that the set of codes listed in this form will be routed directly to Trunk Subgroups (TSGs) defined by a Routing Data Block (RDB).

- **SDX** - Subsequent Digit Index - This Call Type is used to reference a subsequent digit entry which contains several alternative routing treatments that are selected on the basis of an index determined by the type value entered as AD1. In memory, the SDX call type contains data stating the grid table size: **"1"** meaning a size of 16 entries, **"2"** meaning 128, **"3"** meaning 1024. To obtain the number of SDs, use the VER:CODEGRP:SDINDEX message (4E23>).

Form Entries, Continued

CALLTYP (cont'd.)

- **SSP** - Service Switching Point - This identifier is used to designate the processing of a Numbered Services call.
- **TEL** - TELEVOTE with Public Announcement System - This identifier specifies that the codes listed will terminate the customer to the announcement specified in the CALLDATA field. TEL is only valid in the Plain Old Telephone Service (POTS) Domain.
- **TST** - Test - This identifier is used for the code line test combinations within a translation domain. Three digit codes under this call type would include 10X codes and the synchronous test.

CALLDATA

This field further defines the treatment given to the group of codes listed on this form. CALLDATA is an extension of the Call Type (CALLTYP). For a given CALLTYP, the CALLDATA will define the specific code group treatment. CALLTYP/CALLDATA correlation is shown below.

- **Emergency Alternate Routing (EAR) Call Type** - The CALLDATA for EAR is an RDB index in the range of **"1-8191"**.
- **FHT Call Type** - The Final Handling Treatment (FHT) CALLTYP is used to point a group of codes directly to an announcement or tone. The CALLDATA field identifies that tone or announcement circuit. Valid entries are : **"AR"**, **"BT"**, **"EA1-EA7"**, **"HW"**, **"IFF"**, **"INC"**, **"IVC"**, **"MCA"**, **"NCA"**, **"NCC"**, **"NCD"**, **"NWC"**, **"OOB"**, **"ROA"**, **"SP1"**, **"SP2"**, **"T"**, **"VCA"**, **"DNN"**, **"DPP"**, **E01-E02"**, **"I01-I30"**, **"INF"**, **"ISB"**, **"LDV"**, **"LOB"**, **"LSA"**, **"NCB"**, **"NWN"**, **"OOA"**, **"OTS"**, **"R01-R10"**, **"S01-S19"**, **"SNA"**, **"STO"**, **"TDN"**, **"UNN"**, **"VMA"**, **"WAT"**. Consult Lucent Practices 781-031-100 for further definition of various tones and announcements. See the Routing Data Block Final Handling Treatment (RDBFHT) description for the identifiers that may be specified.

Form Entries, Continued

CALLDATA (cont'd.)

- **GNS Call Type** - If the GNS CALLTYP identifier is used, the CALLDATA field will contain a Routing Data Block Index (RDBI) from **"1-8191"**. This index will be used to direct the call if the Go/No Go Screening (GNSC) passes. The Go No Go (G/N) and GNSC fields specify the Go/No Go conditions. If the GNSC fails, the call is directed to the vacant code Final Handling Treatment (FHT).

- **PAS Call Type** - If Public Announcement System (PAS) Call Type is used, the CALLDATA field must contain a 12-digit announcement identifier. This identifier is made up of the 5-digit Voice Storage System Identity (VSSID) and 7-digit Service Identity (SID).

- **RDB Call Type** - For RDB, the CALLDATA field will contain a Routing Data Block Index (RDBI) from **"1-8191"**. This number will specifically identify a given set of routing parameters as listed in the RDB form with that same RDBI. The RDB entry is used to directly point a group of codes toward routing information.

- **SDX Call Type** - The CALLDATA for SDX is a Subsequent Digit Index (SDX) which identifies a particular subsequent digit entry. Valid values are **"1-16383"**.

- **SSP Call Type** - If Service Switching Point (SSP) Call Type is used, the CALLDATA field must contain one of the following identifiers:

  - **RT** - Retranslate Carrier ID (CID) and Type Of Service (TOS) plus Incoming Trunk Class (ITC) in the Number Services Routing (NSR) domain.
  - **RT00Y** - Retranslate CID TOS plus ITC in the NSR domain with a 00Y for Numbering Plan Area (NPA) lookup.
  - **RTCOIN** - Retranslate CID TOS plus ITC in the NSR domain for a 00X coin call.
  - **ACPN** - The 0ZZ-XXX[X] (or Transit Network Selection [TNS]) translation indicates Analyze the Called Party Number". For the Equal Access Multifrequency (EAMF), the switch will receive the second/third stages of digits and proceeds with digit translation looking for Called Number Triggers.

Form Entries, Continued

CALLDATA (cont'd.)

- **AIIO** - The 0ZZ-XXX[X] (or TNS) translation indicates "Analyze the Information Digit/Originating Line Information (II/OLI)". This causes the switch to intercept the second and third stages of digits in for EAMF, and to check II/OLI for the "Send Advanced Intelligent Network (AIN) Information Collected Query" (SIAQ) value.
- **DB** - TOS and Database query.
- **DB7** - TOS and Database query for a 7-digit dialed number.
- **DB00Y** - TOS and Database query with a 00Y or NPA lookup.
- **DBCOIN** - TOS and Database query for a 00X coin call.
- **EASDNA** - Receive the Equal Access (EA) sequence and retranslate the address sequence in the Software Defined Network (SDN) Access (SDNA) domain.
- **EASEQ** - Collect the 2nd and 3rd stage digits EA format.
- **NCP12** - 12- or 9-digit address returned from the SDN NCP, the first two digits of which are deleted by the 4ESS Switch before outpulsing, retranslate the CID, TOS, and ITC in the NSR domain.
- **NDB** - Interexchange Carrier/International Carrier (IC/INC) routing. Requires Call Handling Instruction (CHI) entry of Number Services Data Block (ND), Number Services/Inhibit Black Box (NDB) or Number Services/Inhibit Black Box and Blue Box (NDBB).
- **RTP** - Retranslate the routing digits in Plain Old Telephone Service (POTS).
- **SFA** - Subscribed Footprint Area (4E22R4>)
- **SIAQ** - Send Information and Analyze Query.
- **SICQ** - The 0ZZ-XXX[X] (or TNS) translation indicates "Send AIN Information Collected Query". This causes the switch to intercept the second and third stages of digits in the EAMF case and the indicated query is sent to the Service Control Point (SCP) without any analysis of the called number.

Form Entries, Continued

CALLDATA (cont'd.)

- **TNSND** - Access Tandem Transit Network Selection Digits -This identifier is used at an Access Tandem (AT) switch to handle incoming calls from equal access Integrated Services Digital Network User Part (ISUP) to outgoing equal access ISUP or MFWINK. This subtype is only used in the Access Tandem Transit Network Selection (ATNS) domain.

- **TEL** Call Type - If TEL Call Type is used, the CALLDATA field must contain a 12-digit announcement identifier. This identifier is made up of the 5-digit VSSID and 7-digit SID.

- **TST** Call Type - This identifier specifies that the group of codes on this form are test codes. The CALLDATA field will identify the test. The following combinations may be assigned.

  - **100** - Balance - provides a quiet termination.
  - **101** - Communication - provides a link to a test board or test position.
  - **102** - Milliwatt - source of 1000 hertz test tone.
  - **103** - Signal/Supervisory - This test provides a series of on-hook/off-hook transitions.
  - **105** - Automatic Transmission Measuring System (ATMS) - provides a connection to an ATMS responder.
  - **108** - Echo Suppressor - The 108 test is used to test Echo Suppressor operation.
  - **109** - This test is used to test Echo Canceller operation.
  - **DLC -** Data loopback/complement test trunk.
  - **SYN** - Synchronous - SYN specifies a signaling/supervision test similar to 103 but on an automatic timed basis.

Form Entries, Continued

AD1 Additional Data 1 - This field further defines the treatment given to a code group translation. AD1 is an extension of the Call Type (CALLTYP) and CALLDATA words. For a given CALLTYPE and CALLDATA, the AD1 will define the specific code group treatment. Valid entries for the appropriate services are:

- **"Blank"**
- **"GNS" (Go/No Go Screening)** - If GNS Call Type is used, the AD1 field is used to enter the Go/No Go value for the Call Type. The field may contain a Go **("G")** or No Go **("N")** condition for the list of codes that appear on this form. The indication is linked with a given GNS Class in the next field. All two-way and incoming Trunk Subgroups (TSGs) are assigned a GNS Class. By manipulating the Go/No Go conditions for a group of codes, incoming traffic can be denied (sent to vacant code) on one or more TSGs and allowed to complete on others.
- **"SDTYPE" (Subsequent Digit Index Type)** - The AD1 field for SDX Call Type is used to identify the type of index that must be used to index the subsequent digit entry. Valid entries are as follows:
  - **MTS** Multiple Treatment Screening class from an incoming trunk. Valid entries are **"Blank"** or **"0 - 63"**.
  - **DC** Digit Count of the incoming call. Valid entries are **"3 - 15"**.
  - **DRTC** Data Rate Transfer Capability for Integrated Services Digital Network user Part (ISUP) to Multifrequency (MF) interworking. Valid entries are **"0 - 7"**.
  - **IPR** ISUP Preference Routing. Valid entries are:
    "0" - ISUP Preferred. The outgoing trunks should be mostly ISUP.
    "1" - ISUP not required. The outgoing trunks should be mostly non-ISUP.
    "2" - ISUP Required. All outgoing trunks must be ISUP.
    "3" - Spare
  - **V31K** Voice or 3.1kHZ indicator. Valid entries are:
    "0" - 3.1kHZ
    "1" - Voice.

Form Entries, Continued

AD1
(cont'd.)

- **"SSP" (Service Switching Point)** Call Type - If SSP Call Type is used, the AD1 field is used to enter either the Type of Service (TOS) indicator value for the CALLDATA of NCP12, RT, RT00Y, RTCOIN, SICQ, DB, DB7, DB00Y, or DBCOIN or the Number Services Data Block (NDB) for the CALLDATA of NDB or TNSND, or the Subscribed Footprint Area Index (SFAI) for the CALLDATA of Subscribed Footprint Area (SFA).
  - **NDBI** - Number Services Data Block Index value defines which Interexchange Carrier or International Carrier routing control block will be used for the call. Valid input values are **"1-1023"**.
  - **SFAI** - Subscribed Footprint Area Index used to calculate a corresponding SFA domain. Valid input is **"0-6"** (**"0-39"** for 4E23>).
  - **TOS** - Type of Service entry defines which number service will be identified with this Call Type entry. Valid input is a number between **"0"** and **"31"**.
- **"SAPN"** - This field is used to specify the Slave Application Number (SAPN) assigned when the Call Type is TEL. Valid range is **"0-63"**.

Use pursuant to Company Instructions

Form Entries, Continued

AD2

Additional Data 2 - This field further defines the treatment given to the group of codes listed on this form. AD2 is an extension of the Call Type (CALLTYP), CALLDATA, and AD1. For a given CALLTYPE, CALLDATA, and AD1, the AD2 will define the specific code group treatment. CALLTYPE/CALLDATA/AD1/AD2 correlation is shown below:

- **GNS (Go/No Go Screening)** Call Type - If GNS Call Type is used, the AD2 field is used to enter the Go/No Go Screening Class for the Call Type.
  - This field will have an entry when CALLTYP is GNS and AD1 is not **"Blank"**. The Go/No Go Screening Class specifies the Trunk Subgroup (TSG) class that will be allowed or denied completion to the regular routing. A range of **"0-3"** may appear in this field.
- **SSP (Service Switching Point)** Call Type - If SSP Call Type is used, the AD2 field is used to enter the Carrier IDentification (CID) indicator value for the CALLDATA of NCP12, RT, RT00Y, or RTCOIN.
  - CID - Carrier IDentification number defines which Interexchange Carrier or International Carrier will be used to route the call. Valid input is **"0000-9999"**.

  If either:
  - the DOM is Super Tandem Carrier ID (STCD) and the CALLDATA is Access Tandem Transit Network Selection Digits (TNSND) or
  - the DOM is Number Service Routing (NSR) and CALLDATA is Number Services Data Block (NDB),

  then the AD2 field specifies if the associated Carrier is allowed to receive all possible Information Digit/ Originating Line Information (II/OLI) values or is restricted only to certain values (Restrict II/OLI [RIO]). Allowed entries are:
  - **"Blank"** or **"N"** (Restrict II/OLI forwarding [DEFAULT])
  - **"Y"** (Allow II/OLI forwarding).

Continued on next page

Form Entries, Continued

SC

Service Category/Code Group. This field identifies the Service Category (SC) of the code group. This category is used to perform incoming screening on calls received from other carriers. Also, it is used to determine for which calls an Automatic Message Accounting (AMA) record or Access Charge record should be made.

As examples of screening, an Operating Company Access Tandem (AT) switch must deny calls from an Interexchange Carrier (IC) that do not terminate in the Local Access Transport Area (LATA) served by the AT.

As an example of recording, an AT must make a terminating Access Charge record for all calls it receives from an IC or INC which terminate in the LATA.

The SC defines the screening and recording classification to be used for the code group. The SC field only applies if the CALLTYP is CRB, DSD, DSN, EAR, GNS, INW, IRA, MCT, MMT, MRT, PAS, PRT, RDB, RNR, SSP, TEL, TST, or TTS. SC will also be used to specify for which calls a query will be sent to the Network Call Denial (NCD) database.

Valid Service Category entries are:

- **Blank** - If this field is **"Blank"**, the SC is unspecified.
- **ALAP** - Alaskan Plain Old Telephone Service (POTS). ALAP is the classification for POTS code groups in the Alaskan World Zone 1 area.
- **ATAP** - Access Tandem Area Pots. ATAP is only applicable if the 4ESS Switch is owned or leased by an Operating Company and used as an Access Tandem (AT) for a LATA. ATAP is the classification for the POTS code groups in the LATA served by the AT. In addition, ATAP is the category for POTS code groups in Independent Operating Company areas also served by the Tandem Switch.

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

SC
(cont'd)

- **CANP** - Canadian POTS. CANP is the classification for POTS code groups in the Canadian World Zone 1 area.
- **CARP** - Caribbean, NON-U.S. Territories, POTS. CARP is the classification for POTS code groups in the Caribbean World Zone1 area which do not include United States territories.
- **CUSP** - Continental U. S. POTS. CUSP is the classification for POTS code groups in the continental U. S., which could not also be classified ATAP.
- **CUTP** - Caribbean, U. S. Territories, POTS. CUTP is the classification for POTS code groups in the part of the Caribbean World Zone 1 area which includes United States territories.
- **DA** - Directory Assistance. DA is used to classify code groups assigned to Directory Assistance.
- **DLT** - DIAl-It*. DLT is used to classify DIAL-It code groups.
- **DSD** - Direct Services Dialing. DSD is used to classify Direct Services Dialing code groups.
- **EASC** - Exchange Access Signaling Code. EASC is used to classify the code groups used for Exchange Access Signaling (EAS) to an Interexchange (IC) or International Carrier (INC).
- **HAWP** - Hawaiian POTS. HAWP is the classification for POTS code groups in the Hawaiian World Zone 1 area.
- **ICIN** - Inter-LATA Carrier switch owner's International Carrier (INC). ICIN is used to classify code groups for calls to the Inter-LATA Carrier switch owner's International Carrier.

* DIAL-It is a registered trademark of AT&T

Continued on next page

Form Entries, Continued

SC
(cont'd)

- **INCN** - International Carrier but not inter-LATA Carrier switch owner's International Carrier. INCN is used to classify code groups from an Inter-LATA Carrier switch to an International Carrier which is not owned by the Inter-LATA Carrier. In addition, these code groups are not destined for International Operators.

- **INCO** - International Carrier Operator. INCO is the classification for code groups used for calls to an International Carrier Operator.

- **INET** - This is used for Interim Nationwide Emergency Telecommunications System code groups. INW = Inward WATS.

- **INW** is used for Inward WATS code groups. IOP = Inward Operator.

- **IOP** is used to classify code groups assigned to Inward Operator positions.

- **LDA** - Local Directory Assistance. This service category is used to generate the appropriate billing record when used in conjunction with a Centralized Automatic Message Accounting (CAMA) Far End Network (FEN) block.

- **MCPP** - Multiquest Calling Party-Paid. MCPP is used to classify Multiquest code groups paid for by the calling party.

- **MULT** - Multiquest. MULT is used to classify Multiquest code groups.

- **MSC1** through **MSC4** - These miscellaneous categories can be used to classify code groups into miscellaneous categories. These may be especially useful if the 4ESS Switch is shared by an Operating Company and an Interexchange Carrier (IC). In this case, the general categories could be used to classify code groups by the carrier which owns the switch and the miscellaneous categories used for code groups handled by the carrier leasing capacity on the switch.

- **NWZ1** - Non-World Zone 1. NWZ1 is the classification for the code groups used for calls to Non-World Zone 1 area.

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

SC
(cont'd)

- **RSYS** - Restricted System Codes. RSYS is used to classify code groups assigned as special purpose restricted system codes.

- **SC1** through **SC36** - Spare Category 1 through Spare Category 36. These SCs can be used to classify codes in up to 36 SCs. One use for these categories is screening of IntraLATA calls at an Inter-LATA Carrier Switch. For this use, a different category would be assigned to the codes for each LATA to which the InterLATA Carrier Switch connects. Another possible use for these categories is for screening International Switching Center (ISC) terminating and transit traffic. For this use, the SCs would be assigned to the Overseas codes for which special screening is required. Yet another use is extensions of the current use of the Miscellaneous Service Categories (MSCs) (e.g., at shared switches).

- **SDN** - Software Defined Network. SDN is used for calls to a Software Defined Network.

- **SDND** - SDN Data. SDND is used for Software Defined Network Data calls.

- **SPDI** - Sponsor-Paid Dial-It. SPDI is used to classify DIAL-It code groups paid for by the sponsor.

- **SSP** - Local Exchange Carrier (LEC) Service Switching Point (SSP). SSP is used to identify calls that will have SSP processing applied to them.

- **TC** - Teleconferencing. TC is used to classify code groups assigned to network Teleconferencing services.

- **TST** - Test Line. TST is used to classify code groups assigned to trunk test lines.

- **UNSP** - Unspecified. This entry is used for a verify input request of codes that contain no SC.

Form Entries, Continued

CHI

Call Handling Instructions. This field is used to specify some call handling actions to override present Outgoing Signaling Characteristics (OSCs), recording, and/or fraud prevention controls. This field is needed because of the new call handling requirements for Interexchange Carrier (IC) and International Carrier (INC) Access. The CHI field only applies if the CALLTYP is CRB, DSD, DSN, EAR, GNS, INW, IRA, MCT, MMT, MRT, PAS, RDB, RNR, SSP, TEL, TST, or TTS.

NOTE: This field must be populated for some existing code groups, such as those used for 2-stage International calls and ADD-ON Teleconferencing calls. Failure to populate this field for these calls will result in failure to complete these calls.

Valid entries for CHI field are:

- **"Blank"** - If this field is **"Blank"**, no special call handling instructions are taken.
- **AAT2** - Access Tandem (AT) to IC Traditional Two-stage. This CHI value is used at the AT or Service Switching Point (SSP) to identify that a traditional two-stage international incoming call to the AT/SSP is being passed to the carrier via equal access using Integrated Services Digital Network User Part (ISUP) signaling.
- **ABBB** - Same as ACD, but in addition, disable Black Box and Blue Box fraud prevention.
- **ABLK** - Same as ACD, but in addition, disable Black Box Fraud prevention.
- **ACD** - Inward Wide Band Area Telephone Service (INWATS) ACD. Specifies that a terminating INWATS ACD record is to be made.
- **EAAR** - Expect Automatic Number identification (ANI) Assist Request. EAAR specifies actions at an intermediate toll switch for a call on which an ANI Assist Request is expected. For example, an ANI Assist Request is expected on a call to establish an ADD-ON Teleconference.

Continued on next page

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

CHI (cont'd.)

- **EGRH** - Egress Handling. Specifies actions at the egress switch for Direct Connect and Software Defined Network (SDN) calls. Usually, these calls will be directly terminating to a Private Branch Exchange (PBX). However, in some SDN cases, they will terminate to a local switch, either via a dedicated Trunk Subgroup (TSG) or via special NXX codes (unused office codes). EGRH can only be specified if DOM is APN, DED, or DEV. Note that it must be specified for all DED and DEV calls at the Egress switch (and not at intermediate switches) to allow the Direct Connect and/or the SDN (Offnet Egress Privilege) features.
- **ESD2** - Expect Second Start Dial 2. ESD2 specifies actions at an intermediate toll switch for a 3-stage Exchange Access call to an International Carrier (INC), including the Interexchange Carrier (IC) International Switching Center when it is able to receive Exchange Access calls.
- **ESSD** - Expect Second Start Dial. ESSD specifies actions at an intermediate toll switch for a 2-stage International call to an IC International Switching Center.
- **FGB** - Feature Group B. FGB specifies actions for calls to an IC or INC.
- **IBBB** - Same as ICDR, but in addition, disable Black Box and Blue Box fraud prevention.
- **IBLK** - Same as ICDR, but in addition, disable Black Box Fraud prevention.
- **ICDR** - International Call Detail Recording. Specifies that an ICDR record is to be made.
- **IEA** - Interim Exchange Access. IEA specifies actions for calls from an End Office (EO) unequipped to do Exchange Access signaling to an IC or INC able to handle Exchange Access signaling. (Initial plans call for these calls to have ABC digits of 950.)
- **MSC1, MSC2** - Miscellaneous 1 and 2. Two miscellaneous values are included. These can be assigned if an unforeseen set of calls require special call handling instructions.
- **ND** - Number Services Data Block information for outpulsing control.

Continued on next page

Form Entries, Continued

CHI (cont'd.)

- **NDB** - Number Services Data Block information for outpulsing control, inhibit Black Box.
- **NDBB** - Number Services Data Block information for outpulsing control, inhibit Black Box and Blue Box.
- **NONE** - This entry is used for a verify input request of codes that contain no Call Handling Instruction.
- **WACK** - Wait For Acknowledgment. WACK specifies actions for calls to an INC for which a trunk is seized and digits outpulsed. The talking path is not cut through until an Acknowledgment signal is received from the INC. This entry only applies to a 4ESS Switch owned or operated by an Operating Company as an Access Tandem (AT).
- **WAC2** - Specifies the signaling actions to be performed by an AT when connecting an Equal Access End Office (EAEO) to an INC (possibly through an Intermediate Carrier).
- **WSNO** - Wink Start No Outpulse. WSNO specifies actions for calls for which a trunk to an IC or INC is to be seized but no digits outpulsed. This is one option allowed in Exchange Access signaling, and is chosen by the IC or INC.

DESEP

Destination Separation is used to identify destinations for traffic flow purposes. Peg and usage counts are made as a function of the Trunk Sub-Group (TSG) incoming class (INSEP) and the outgoing destination class (DESEP). All outgoing or successfully terminated traffic is assigned a given destination class from **"1-255"**.

NOTE: DESEP class 63 is assigned generically for test calls. Any other assignment to class 63 should take this fact into consideration.

For codegroup forms, a DESEP class will be assigned only when the CALLTYP is equal to CRB, DSN, EAR, GNS, MCT, MMT, MRT, PAS, PRT, RDB, RNR, SSP, TEL, or TTS. This field is **"Blank"** for any other Call Type value.

Continued on next page

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

DNST	Not Applicable – Entries: **"Blank"**
AD3	Not Applicable - Entries: **"Blank"**
ADC	Acceptable Digit Count/Code Group - This field specifies the total number of incoming digits expected for a call routed to this Call Type. This field must be entered for the following Call Types: CRB, DSD, DSN, EAR, GNS, INW, IRA, MCT, MMT, MRT, PAS, PRT, RDB, RNR, SSP, TEL, TST, and TTS. The legal values for this field are digit counts from **"3-15"** for domestic routing. For the Call Types requiring that an ADC be input, at least one number must be specified. More than one number may be listed as valid. For example, if the Call Type points to an Routing Data Block (RDB), 6, 8 or 10 digits may be valid. Note that the number of incoming digits specified is the number of incoming digits actually received before modification by deletion or prefixing in the RDB but after A-digit reconstruction. When the Call Type treatment points to an international transit RDB (International Domain [IDOM] equals **"T"** on the RDB form) or an international originating RDB (IDOM equals **"O"**), the Language Digit (LD) is never counted in the number of digits that make up the ADC regardless of whether the LD is translated or not. Dial Pulse (DP) and Dual Tone Multifrequency (DTMF) rely on collecting digits one-at-a-time. A range of **"3-15"** entry causes DP or DTMF critical digit timing (5 second recognize end of dialing) after each digit beyond the third digit since each digit is potentially the last. On any DP or DTMF call with less than 15 digits it causes a five second post dialing delay.

Continued on next page

Form Entries, Continued

ADC (cont'd.)

MF, CCIS, CCITT5, ISUP, and Q931 are en-block (not-one-at-a-time) digit collectors. When the complete address is received on en-block digit collectors or when a 5-second timeout occurs on the one-at-a-time digit collectors, the number of digits received is compared with the various totals specified by the ADC in the Call Type word to which this call has been directed. If the number of digits received does not match one of the totals specified by ADC and this is an en-block call, the call will be given partial dial Final Handling Treatment (FHT). If the number of digits received does not match one of the totals specified by ADC and this is a one-at-a-time call, an additional 10 seconds (total of 15 seconds) will be allowed. If no additional digit is received during this interval, the call is given partial dial FHT (Partial Dial Timeout). If the number of digits on a one-at-a-time call does match one of the totals specified by ADC and no additional digit is received within a 5-second delay, the call will be routed on the number of digits received even if there are additional digits that have not been received yet. Therefore, the ADC should not be set any lower than the number of digits needed to correctly route the call for one-at-a-time digit collectors.

GHI

This field lists the seventh (G), eighth (H) and ninth (I) digits that complete the code group definition. One (7-digit translation), two (8-digit) or three (9-digit translation required) digits may be listed in this field. A numeric or an **"X"** may be used to specify translation. A numeric may not follow an **"X"**. The numeric will define a specific code while the **"X"** will represent all numerics from 0 to 9. Translation must be specified equal to the Number of Translated Digits (NTD). An **"X"** may be used for one, two, or three positions of GHI field, determined by the NTD. If only one **"X"** is used, it must be in the I position if there are two numerics. If two "**X**s" are used they must be in the HI position if there is one numeric. Any code not specified will be routed to vacant code Final Handling Treatment (FHT) by the Office Data Assembler (ODA) program.

RC 303

General

The Recent Change (RC) Form 303 changes the treatment of a 10, 11, or 12 digit codes in the translations of the 4ESS™-2000 Switch. This message is classed as a Recent Change Data Message (RCDM).

See "Table 7" of Division 3 Section 3a for the code group population rules and "Table 8" of the same section for the Go/No Go Screening conditions.

An alphabetical keyword list is included in this section on page 25.

Form Entries

RC:CODEGRP;CHG;OPT(DIG12),- - -:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

Form Entries, Continued

DOM

DOMAIN - This field designates a community of interest that requires separate routing. The types of Domain are "Direct Distance Dialing (DDD), Verify (VRFY)" and a number ranging from **"20-83"** denoting a NON-Plain Old Telephone Service (POTS) domain. DDD is indicated by an entry of **"POTS"** in the DOM field. The Office Data Assembler (ODA) system will automatically build the DDD Domains (191 through 209). The **"VRFY"** Domain enables the Line-Busy Verification feature by operators over a dedicated network. When DOM equals VRFY, then Type of Trunk (TOT) must be MISC or CALLTYP must equal FHT, GNS, or TST. The NON-POTS Domains may be a Common Control Switching Arrangement (CCSA) Network, such as Federal Telecommunications System (FTS). These domains are entered as a number from **"20-69"**.

- The **NON-POTS domain of 78** is used to skip Network Management code controls for quality assurance testing, i.e., CASPER.
- The **NON-POTS domains 79 and 80** are reserved for specific International Switching Center (ISC) use.
- The **NON-POTS domain of 81**, also denoted by **"IVT"** for International Voice Transport, is reserved for call processing to transport international voice calls through the network to an ISC.
- The **NON-POTS domain of 82** is used as the translation domain for Data calls. The Data feature provides the capability for full rate data transmission via the 4ESS Switch over a dedicated network of digital trunks. These digital trunks terminate exclusively on Digital Interface Frames (DIF) at 4ESS Switch locations.
- **N64C** -This domain is used to route 64 kbps clear data calls using the 10-digit North American Numbering Plan (NANP).
- **N64R** -This domain is used to route 64 kbps restricted data calls using the 10-digit North American Numbering Plan.

Continued on next page

Form Entries, Continued

DOM (cont'd)

The following translations domains are used for wideband transmission:

- **NH0C** -This domain is used to route 384 kbps clear data calls using the 10-digit North American Numbering Plan (NANP).
- **NH1C** - This domain is used to route 1536 kbps clear data calls using the 10-digit NANP.

The following domains are non-translations domains used for routing only:

- **SF00-SF06** - Subscribed Footprint Area 00 to 06 (4E22R4>)
- **SF07-SF39** - Subscribed Footprint Area 07 to 39 (4E23R1>)
- **STCD** - Super Tandem Carrier ID (4E22R4>)
- **ATNS** - Access Tandem Transit Network Selection - This domain is used to translate equal access Integrated Services Digital Network User Part (ISUP) parameters to obtain the routing information.

NTD

Number of Translated Digits - This field specifies the number of digits to be analyzed for this code grouping. For domestic code grouping, this number may range from 3 to 12 depending on the code group form. The first three digits are listed under the ABC field, the remaining digits, if any, are listed in the DEF, GHI, and JKL fields. Valid entry for the RC Form 300 is only **"3"** because the form only changes the ABC digits. Other digit combination changes are performed on subsequent forms.

AC

Area Code - A **"Y"** for Yes indicates that all of the 3-digit codes (ABC digits) on this form are Area Codes. If the ABC digits are office codes, test codes or other non-Area Codes, AC will be **"N"** for No. This field is left **"Blank"** when Domain (DOM) is not equal to Plain Old Telephone Service (POTS).

Continued on next page

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

ABC	The first three digits of a given set of digits (A, B, and C) - This field lists all of the 3-digit codes that make up a code group. If the Area Code (AC) field is marked **"Yes"**, this code group may consist of 3-digit combinations in the range of **"200-999"**. If this code group is not an Area Code grouping (AC = **No**), then any number combination from **"000-999"** is valid. When the AC field is **"Blank"**, ABC may be equal to **"000-999"**. If DOM equals Plain Old Telephone Service (POTS), the 3-digit code corresponding to the Home Numbering Plan Area (HNPA) may be assigned as ABC digits if permissive dialing is allowed on the HNPA and AC = **"N"** (Offices using Traditional Routing only - (4E22>).
DEF	This field lists the fourth (D) fifth (E) and sixth (F) digits of the code group definition. This field contains three digits.
GHI	This field lists the seventh (G), eighth (H) and ninth (I) digits of the code group definition. Three digits must be listed in this field.
ORNU	Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

Form Entries, Continued

CALLTYP The Call Type is used to define the major category for the disposition of the codes listed on this form. The valid Call Type categories are as follows:

- **EAR** - The Emergency Alternate Routing feature will be used to reroute calls. The EAR Call Type will be used for code groups which must be screened for this feature and will indicate that one or more destination numbers in the code group have this feature. This feature allows business customers to redirect calls from a primary location to an alternate location when the primary location is the victim of a natural disaster, a bomb threat, or other terrorist activity.

- **FHT** - Final Handling Treatment. This identifier specifies that the listed codes will be directed to a Final Handling Treatment (FHT) announcement or tone.

- **GNS** - Go/No Go Screening - GNS specifies that this group of codes will be given GNS before the routing is determined. If this call type is entered. GN and GNSC fields must be completed.

- **PAS** - Public Announcement System - This identifier specifies that the codes listed will terminate the customer to the announcement specified in the CALLDATA field.

- **RDB** - Routing Data Block - RDB is used to specify that the set of codes listed in this form will be routed directly to Trunk Subgroups (TSGs) defined by a Routing Data Block (RDB).

- **SDX** - Subsequent Digit Index - This Call Type is used to reference a subsequent digit entry which contains several alternative routing treatments that are selected on the basis of an index determined by the type value entered as AD1. In memory, the SDX call type contains data stating the grid table size: **"1"** meaning a size of 16 entries, **"2"** meaning 128, **"3"** meaning 1024. To obtain the number of SDs, use the VER:CODEGRP:SDINDEX message (4E23>).

Continued on next page

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

CALLTYP (cont'd.)

- **SSP** - Service Switching Point - This identifier is used to designate the processing of a Numbered Services call.
- **TEL** - TELEVOTE with Public Announcement System - This identifier specifies that the codes listed will terminate the customer to the announcement specified in the CALLDATA field. TEL is only valid in the Plain Old Telephone Service (POTS) Domain.
- **TST** - Test - This identifier is used for the code line test combinations within a translation domain. Three digit codes under this call type would include 10X codes and the synchronous test.

CALLDATA

This field further defines the treatment given to the group of codes listed on this form. CALLDATA is an extension of the Call Type (CALLTYP). For a given CALLTYP, the CALLDATA will define the specific code group treatment. CALLTYP/CALLDATA correlation is shown below.

- **Emergency Alternate Routing (EAR) Call Type** - The CALLDATA for EAR is an RDB index in the range of **"1-8191"**.
- **FHT Call Type** - The Final Handling Treatment (FHT) CALLTYP is used to point a group of codes directly to an announcement or tone. The CALLDATA field identifies that tone or announcement circuit. Valid entries are : **"AR"**, **"BT"**, **"EA1-EA7"**, **"HW"**, **"IFF"**, **"INC"**, **"IVC"**, **"MCA"**, **"NCA"**, **"NCC"**, **"NCD"**, **"NWC"**, **"OOB"**, **"ROA"**, **"SP1"**, **"SP2"**, **"T"**, **"VCA"**, **"DNN"**, **"DPP"**, **E01-E02"**, **"I01-I30"**, **"INF"**, **"ISB"**, **"LDV"**, **"LOB"**, **"LSA"**, **"NCB"**, **"NWN"**, **"OOA"**, **"OTS"**, **"R01-R10"**, **"S01-S19"**, **"SNA"**, **"STO"**, **"TDN"**, **"UNN"**, **"VMA"**, **"WAT"**. Consult Lucent Practices 781-031-100 for further definition of various tones and announcements. See the Routing Data Block Final Handling Treatment (RDBFHT) description for the identifiers that may be specified.

Continued on next page

Form Entries, Continued

CALLDATA (cont'd.)

- **GNS Call Type** - If the GNS CALLTYP identifier is used, the CALLDATA field will contain a Routing Data Block Index (RDBI) from **"1-8191"**. This index will be used to direct the call if the Go/No Go Screening (GNSC) passes. The Go No Go (G/N) and GNSC fields specify the Go/No Go conditions. If the GNSC fails, the call is directed to the vacant code Final Handling Treatment (FHT).

- **PAS Call Type** - If Public Announcement System (PAS) Call Type is used, the CALLDATA field must contain a 12-digit announcement identifier. This identifier is made up of the 5-digit Voice Storage System Identity (VSSID) and 7-digit Service Identity (SID).

- **RDB Call Type** - For RDB, the CALLDATA field will contain a Routing Data Block Index (RDBI) from **"1-8191"**. This number will specifically identify a given set of routing parameters as listed in the RDB form with that same RDBI. The RDB entry is used to directly point a group of codes toward routing information.

- **SDX Call Type** - The CALLDATA for SDX is a Subsequent Digit Index (SDX) which identifies a particular subsequent digit entry. Valid values are **"1-16383"**.

- **SSP Call Type** - If Service Switching Point (SSP) Call Type is used, the CALLDATA field must contain one of the following identifiers:

  - **RT** - Retranslate Carrier ID (CID) and Type Of Service (TOS) plus Incoming Trunk Class (ITC) in the Number Services Routing (NSR) domain.
  - **RT00Y** - Retranslate CID TOS plus ITC in the NSR domain with a 00Y for Numbering Plan Area (NPA) lookup.
  - **RTCOIN** - Retranslate CID TOS plus ITC in the NSR domain for a 00X coin call.
  - **ACPN** - The 0ZZ-XXX[X] (or Transit Network Selection [TNS]) translation indicates Analyze the Called Party Number". For the Equal Access Multifrequency (EAMF), the switch will receive the second/third stages of digits and proceeds with digit translation looking for Called Number Triggers.

Continued on next page

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

CALLDATA (cont'd.)

- **AIIO** - The 0ZZ-XXX[X] (or TNS) translation indicates "Analyze the Information Digit/Originating Line Information (II/OLI)". This causes the switch to intercept the second and third stages of digits in for EAMF, and to check II/OLI for the "Send Advanced Intelligent Network (AIN) Information Collected Query" (SIAQ) value.
- **DB** - TOS and Database query.
- **DB7** - TOS and Database query for a 7-digit dialed number.
- **DB00Y** - TOS and Database query with a 00Y or NPA lookup.
- **DBCOIN** - TOS and Database query for a 00X coin call.
- **EASDNA** - Receive the Equal Access (EA) sequence and retranslate the address sequence in the Software Defined Network (SDN) Access (SDNA) domain.
- **EASEQ** - Collect the 2nd and 3rd stage digits EA format.
- **NCP12** - 12- or 9-digit address returned from the SDN NCP, the first two digits of which are deleted by the 4ESS Switch before outpulsing, retranslate the CID, TOS, and ITC in the NSR domain.
- **NDB** - Interexchange Carrier/International Carrier (IC/INC) routing. Requires Call Handling Instruction (CHI) entry of Number Services Data Block (ND), Number Services/Inhibit Black Box (NDB) or Number Services/Inhibit Black Box and Blue Box (NDBB).
- **RTP** - Retranslate the routing digits in Plain Old Telephone Service (POTS).
- **SFA** - Subscribed Footprint Area (4E22R4>)
- **SIAQ** - Send Information and Analyze Query.
- **SICQ** - The 0ZZ-XXX[X] (or TNS) translation indicates "Send AIN Information Collected Query". This causes the switch to intercept the second and third stages of digits in the EAMF case and the indicated query is sent to the Service Control Point (SCP) without any analysis of the called number.

Continued on next page

Form Entries, Continued

CALLDATA (cont'd.)

- **TNSND** - Access Tandem Transit Network Selection Digits -This identifier is used at an Access Tandem (AT) switch to handle incoming calls from equal access Integrated Services Digital Network User Part (ISUP) to outgoing equal access ISUP or MFWINK. This subtype is only used in the Access Tandem Transit Network Selection (ATNS) domain.

- **TEL** Call Type - If TEL Call Type is used, the CALLDATA field must contain a 12-digit announcement identifier. This identifier is made up of the 5-digit VSSID and 7-digit SID.

- **TST** Call Type - This identifier specifies that the group of codes on this form are test codes. The CALLDATA field will identify the test. The following combinations may be assigned.

  - **100** - Balance - provides a quiet termination.
  - **101** - Communication - provides a link to a test board or test position.
  - **102** - Milliwatt - source of 1000 hertz test tone.
  - **103** - Signal/Supervisory - This test provides a series of on-hook/off-hook transitions.
  - **105** - Automatic Transmission Measuring System (ATMS) - provides a connection to an ATMS responder.
  - **108** - Echo Suppressor - The 108 test is used to test Echo Suppressor operation.
  - **109** - This test is used to test Echo Canceller operation.
  - **DLC -** Data loopback/complement test trunk.
  - **SYN** - Synchronous - SYN specifies a signaling/supervision test similar to 103 but on an automatic timed basis.

Form Entries, Continued

AD1 Additional Data 1 - This field further defines the treatment given to a code group translation. AD1 is an extension of the Call Type (CALLTYP) and CALLDATA words. For a given CALLTYPE and CALLDATA, the AD1 will define the specific code group treatment. Valid entries for the appropriate services are:

- **"Blank"**
- **"GNS" (Go/No Go Screening)** - If GNS Call Type is used, the AD1 field is used to enter the Go/No Go value for the Call Type. The field may contain a Go **("G")** or No Go **("N")** condition for the list of codes that appear on this form. The indication is linked with a given GNS Class in the next field. All two-way and incoming Trunk Subgroups (TSGs) are assigned a GNS Class. By manipulating the Go/No Go conditions for a group of codes, incoming traffic can be denied (sent to vacant code) on one or more TSGs and allowed to complete on others.
- **"SDTYPE" (Subsequent Digit Index Type)** - The AD1 field for SDX Call Type is used to identify the type of index that must be used to index the subsequent digit entry. Valid entries are as follows:
  - **MTS** Multiple Treatment Screening class from an incoming trunk. Valid entries are **"Blank"** or **"0 - 63"**.
  - **DC** Digit Count of the incoming call. Valid entries are **"3 - 15"**.
  - **DRTC** Data Rate Transfer Capability for Integrated Services Digital Network user Part (ISUP) to Multifrequency (MF) interworking. Valid entries are **"0 - 7"**.
  - **IPR** ISUP Preference Routing. Valid entries are:
    "0" - ISUP Preferred. The outgoing trunks should be mostly ISUP.
    "1" - ISUP not required. The outgoing trunks should be mostly non-ISUP.
    "2" - ISUP Required. All outgoing trunks must be ISUP.
    "3" - Spare
  - **V31K** Voice or 3.1kHZ indicator. Valid entries are:
    "0" - 3.1kHZ
    "1" - Voice.

Form Entries, Continued

AD1
(cont'd.)

- **"SSP" (Service Switching Point)** Call Type - If SSP Call Type is used, the AD1 field is used to enter either the Type of Service (TOS) indicator value for the CALLDATA of NCP12, RT, RT00Y, RTCOIN, SICQ, DB, DB7, DB00Y, or DBCOIN or the Number Services Data Block (NDB) for the CALLDATA of NDB or TNSND, or the Subscribed Footprint Area Index (SFAI) for the CALLDATA of Subscribed Footprint Area (SFA).
  - **NDBI** - Number Services Data Block Index value defines which Interexchange Carrier or International Carrier routing control block will be used for the call. Valid input values are **"1-1023"**.
  - **SFAI** - Subscribed Footprint Area Index used to calculate a corresponding SFA domain. Valid input is **"0-6"** (**"0-39"** for 4E23>).
  - **TOS** - Type of Service entry defines which number service will be identified with this Call Type entry. Valid input is a number between **"0"** and **"31"**.
- **"SAPN"** - This field is used to specify the Slave Application Number (SAPN) assigned when the Call Type is TEL. Valid range is **"0-63"**.

Continued on next page

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

AD2

Additional Data 2 - This field further defines the treatment given to the group of codes listed on this form. AD2 is an extension of the Call Type (CALLTYP), CALLDATA, and AD1. For a given CALLTYPE, CALLDATA, and AD1, the AD2 will define the specific code group treatment. CALLTYPE/CALLDATA/AD1/AD2 correlation is shown below:

- **GNS (Go/No Go Screening)** Call Type - If GNS Call Type is used, the AD2 field is used to enter the Go/No Go Screening Class for the Call Type.
  - This field will have an entry when CALLTYP is GNS and AD1 is not **"Blank"**. The Go/No Go Screening Class specifies the Trunk Subgroup (TSG) class that will be allowed or denied completion to the regular routing. A range of **"0-3"** may appear in this field.
- **SSP (Service Switching Point)** Call Type - If SSP Call Type is used, the AD2 field is used to enter the Carrier IDentification (CID) indicator value for the CALLDATA of NCP12, RT, RT00Y, or RTCOIN.
  - CID - Carrier IDentification number defines which Interexchange Carrier or International Carrier will be used to route the call. Valid input is **"0000-9999"**.

  If either:
  - the DOM is Super Tandem Carrier ID (STCD) and the CALLDATA is Access Tandem Transit Network Selection Digits (TNSND) or
  - the DOM is Number Service Routing (NSR) and CALLDATA is Number Services Data Block (NDB),

  then the AD2 field specifies if the associated Carrier is allowed to receive all possible Information Digit/ Originating Line Information (II/OLI) values or is restricted only to certain values (Restrict II/OLI [RIO]). Allowed entries are:
  - **"Blank"** or **"N"** (Restrict II/OLI forwarding [DEFAULT])
  - **"Y"** (Allow II/OLI forwarding).

Continued on next page

Form Entries, Continued

SC

Service Category/Code Group. This field identifies the Service Category (SC) of the code group. This category is used to perform incoming screening on calls received from other carriers. Also, it is used to determine for which calls an Automatic Message Accounting (AMA) record or Access Charge record should be made.

As examples of screening, an Operating Company Access Tandem (AT) switch must deny calls from an Interexchange Carrier (IC) that do not terminate in the Local Access Transport Area (LATA) served by the AT.

As an example of recording, an AT must make a terminating Access Charge record for all calls it receives from an IC or INC which terminate in the LATA.

The SC defines the screening and recording classification to be used for the code group. The SC field only applies if the CALLTYP is CRB, DSD, DSN, EAR, GNS, INW, IRA, MCT, MMT, MRT, PAS, PRT, RDB, RNR, SSP, TEL, TST, or TTS. SC will also be used to specify for which calls a query will be sent to the Network Call Denial (NCD) database.

Valid Service Category entries are:

- **Blank** - If this field is **"Blank"**, the SC is unspecified.
- **ALAP** - Alaskan Plain Old Telephone Service (POTS). ALAP is the classification for POTS code groups in the Alaskan World Zone 1 area.
- **ATAP** - Access Tandem Area Pots. ATAP is only applicable if the 4ESS Switch is owned or leased by an Operating Company and used as an Access Tandem (AT) for a LATA. ATAP is the classification for the POTS code groups in the LATA served by the AT. In addition, ATAP is the category for POTS code groups in Independent Operating Company areas also served by the Tandem Switch.

Form Entries, Continued

SC
(cont'd)

- **CANP** - Canadian POTS. CANP is the classification for POTS code groups in the Canadian World Zone 1 area.
- **CARP** - Caribbean, NON-U.S. Territories, POTS. CARP is the classification for POTS code groups in the Caribbean World Zone1 area which do not include United States territories.
- **CUSP** - Continental U. S. POTS. CUSP is the classification for POTS code groups in the continental U. S., which could not also be classified ATAP.
- **CUTP** - Caribbean, U. S. Territories, POTS. CUTP is the classification for POTS code groups in the part of the Caribbean World Zone 1 area which includes United States territories.
- **DA** - Directory Assistance. DA is used to classify code groups assigned to Directory Assistance.
- **DLT** - DIAl-It*. DLT is used to classify DIAL-It code groups.
- **DSD** - Direct Services Dialing. DSD is used to classify Direct Services Dialing code groups.
- **EASC** - Exchange Access Signaling Code. EASC is used to classify the code groups used for Exchange Access Signaling (EAS) to an Interexchange (IC) or International Carrier (INC).
- **HAWP** - Hawaiian POTS. HAWP is the classification for POTS code groups in the Hawaiian World Zone 1 area.
- **ICIN** - Inter-LATA Carrier switch owner's International Carrier (INC). ICIN is used to classify code groups for calls to the Inter-LATA Carrier switch owner's International Carrier.

* DIAL-It is a registered trademark of AT&T

Continued on next page

Form Entries, Continued

SC
(cont'd)

- **INCN** - International Carrier but not inter-LATA Carrier switch owner's International Carrier. INCN is used to classify code groups from an Inter-LATA Carrier switch to an International Carrier which is not owned by the Inter-LATA Carrier. In addition, these code groups are not destined for International Operators.

- **INCO** - International Carrier Operator. INCO is the classification for code groups used for calls to an International Carrier Operator.

- **INET** - This is used for Interim Nationwide Emergency Telecommunications System code groups. INW = Inward WATS.

- **INW** is used for Inward WATS code groups. IOP = Inward Operator.

- **IOP** is used to classify code groups assigned to Inward Operator positions.

- **LDA** - Local Directory Assistance. This service category is used to generate the appropriate billing record when used in conjunction with a Centralized Automatic Message Accounting (CAMA) Far End Network (FEN) block.

- **MCPP** - Multiquest Calling Party-Paid. MCPP is used to classify Multiquest code groups paid for by the calling party.

- **MULT** - Multiquest. MULT is used to classify Multiquest code groups.

- **MSC1** through **MSC4** - These miscellaneous categories can be used to classify code groups into miscellaneous categories. These may be especially useful if the 4ESS Switch is shared by an Operating Company and an Interexchange Carrier (IC). In this case, the general categories could be used to classify code groups by the carrier which owns the switch and the miscellaneous categories used for code groups handled by the carrier leasing capacity on the switch.

- **NWZ1** - Non-World Zone 1. NWZ1 is the classification for the code groups used for calls to Non-World Zone 1 area.

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

SC
(cont'd)

- **RSYS** - Restricted System Codes. RSYS is used to classify code groups assigned as special purpose restricted system codes.

- **SC1** through **SC36** - Spare Category 1 through Spare Category 36. These SCs can be used to classify codes in up to 36 SCs. One use for these categories is screening of IntraLATA calls at an Inter-LATA Carrier Switch. For this use, a different category would be assigned to the codes for each LATA to which the InterLATA Carrier Switch connects. Another possible use for these categories is for screening International Switching Center (ISC) terminating and transit traffic. For this use, the SCs would be assigned to the Overseas codes for which special screening is required. Yet another use is extensions of the current use of the Miscellaneous Service Categories (MSCs) (e.g., at shared switches).

- **SDN** - Software Defined Network. SDN is used for calls to a Software Defined Network.

- **SDND** - SDN Data. SDND is used for Software Defined Network Data calls.

- **SPDI** - Sponsor-Paid Dial-It. SPDI is used to classify DIAL-It code groups paid for by the sponsor.

- **SSP** - Local Exchange Carrier (LEC) Service Switching Point (SSP). SSP is used to identify calls that will have SSP processing applied to them.

- **TC** - Teleconferencing. TC is used to classify code groups assigned to network Teleconferencing services.

- **TST** - Test Line. TST is used to classify code groups assigned to trunk test lines.

- **UNSP** - Unspecified. This entry is used for a verify input request of codes that contain no SC.

Form Entries, Continued

CHI

Call Handling Instructions. This field is used to specify some call handling actions to override present Outgoing Signaling Characteristics (OSCs), recording, and/or fraud prevention controls. This field is needed because of the new call handling requirements for Interexchange Carrier (IC) and International Carrier (INC) Access. The CHI field only applies if the CALLTYP is CRB, DSD, DSN, EAR, GNS, INW, IRA, MCT, MMT, MRT, PAS, RDB, RNR, SSP, TEL, TST, or TTS.

NOTE: This field must be populated for some existing code groups, such as those used for 2-stage International calls and ADD-ON Teleconferencing calls. Failure to populate this field for these calls will result in failure to complete these calls.

Valid entries for CHI field are:

- **"Blank"** - If this field is **"Blank"**, no special call handling instructions are taken.
- **AAT2** - Access Tandem (AT) to IC Traditional Two-stage. This CHI value is used at the AT or Service Switching Point (SSP) to identify that a traditional two-stage international incoming call to the AT/SSP is being passed to the carrier via equal access using Integrated Services Digital Network User Part (ISUP) signaling.
- **ABBB** - Same as ACD, but in addition, disable Black Box and Blue Box fraud prevention.
- **ABLK** - Same as ACD, but in addition, disable Black Box Fraud prevention.
- **ACD** - Inward Wide Band Area Telephone Service (INWATS) ACD. Specifies that a terminating INWATS ACD record is to be made.
- **EAAR** - Expect Automatic Number identification (ANI) Assist Request. EAAR specifies actions at an intermediate toll switch for a call on which an ANI Assist Request is expected. For example, an ANI Assist Request is expected on a call to establish an ADD-ON Teleconference.

Use pursuant to Company Instructions

Form Entries, Continued

CHI (cont'd.)

- **EGRH** - Egress Handling. Specifies actions at the egress switch for Direct Connect and Software Defined Network (SDN) calls. Usually, these calls will be directly terminating to a Private Branch Exchange (PBX). However, in some SDN cases, they will terminate to a local switch, either via a dedicated Trunk Subgroup (TSG) or via special NXX codes (unused office codes). EGRH can only be specified if DOM is APN, DED, or DEV. Note that it must be specified for all DED and DEV calls at the Egress switch (and not at intermediate switches) to allow the Direct Connect and/or the SDN (Offnet Egress Privilege) features.
- **ESD2** - Expect Second Start Dial 2. ESD2 specifies actions at an intermediate toll switch for a 3-stage Exchange Access call to an International Carrier (INC), including the Interexchange Carrier (IC) International Switching Center when it is able to receive Exchange Access calls.
- **ESSD** - Expect Second Start Dial. ESSD specifies actions at an intermediate toll switch for a 2-stage International call to an IC International Switching Center.
- **FGB** - Feature Group B. FGB specifies actions for calls to an IC or INC.
- **IBBB** - Same as ICDR, but in addition, disable Black Box and Blue Box fraud prevention.
- **IBLK** - Same as ICDR, but in addition, disable Black Box Fraud prevention.
- **ICDR** - International Call Detail Recording. Specifies that an ICDR record is to be made.
- **IEA** - Interim Exchange Access. IEA specifies actions for calls from an End Office (EO) unequipped to do Exchange Access signaling to an IC or INC able to handle Exchange Access signaling. (Initial plans call for these calls to have ABC digits of 950.)
- **MSC1, MSC2** - Miscellaneous 1 and 2. Two miscellaneous values are included. These can be assigned if an unforeseen set of calls require special call handling instructions.
- **ND** - Number Services Data Block information for outpulsing control.

Continued on next page

Form Entries, Continued

CHI (cont'd.)

- **NDB** - Number Services Data Block information for outpulsing control, inhibit Black Box.
- **NDBB** - Number Services Data Block information for outpulsing control, inhibit Black Box and Blue Box.
- **NONE** - This entry is used for a verify input request of codes that contain no Call Handling Instruction.
- **WACK** - Wait For Acknowledgment. WACK specifies actions for calls to an INC for which a trunk is seized and digits outpulsed. The talking path is not cut through until an Acknowledgment signal is received from the INC. This entry only applies to a 4ESS Switch owned or operated by an Operating Company as an Access Tandem (AT).
- **WAC2** - Specifies the signaling actions to be performed by an AT when connecting an Equal Access End Office (EAEO) to an INC (possibly through an Intermediate Carrier).
- **WSNO** - Wink Start No Outpulse. WSNO specifies actions for calls for which a trunk to an IC or INC is to be seized but no digits outpulsed. This is one option allowed in Exchange Access signaling, and is chosen by the IC or INC.

DESEP

Destination Separation is used to identify destinations for traffic flow purposes. Peg and usage counts are made as a function of the Trunk Sub-Group (TSG) incoming class (INSEP) and the outgoing destination class (DESEP). All outgoing or successfully terminated traffic is assigned a given destination class from **"1-255"**.

NOTE: DESEP class 63 is assigned generically for test calls. Any other assignment to class 63 should take this fact into consideration.

For code group forms, a DESEP class will be assigned only when the CALLTYP is equal to CRB, DSN, EAR, GNS, MCT, MMT, MRT, PAS, PRT, RDB, RNR, SSP, TEL, or TTS. This field is **"Blank"** for any other Call Type value.

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

DNST Not Applicable - Entries: **"Blank"**

AD3 Not Applicable - Entries: **"Blank"**

ADC Acceptable Digit Count/Code Group - This field specifies the total number of incoming digits expected for a call routed to this Call Type. This field must be entered for the following Call Types: CRB, DSD, DSN, EAR, GNS, INW, IRA, MCT, MMT, MRT, PAS, PRT, RDB, RNR, SSP, TEL, TST, and TTS.

The legal values for this field are digit counts from **"3-15"** for domestic routing.

For the Call Types requiring that an ADC be input, at least one number must be specified. More than one number may be listed as valid. For example, if the Call Type points to an Routing Data Block (RDB), 6, 8 or 10 digits may be valid. Note that the number of incoming digits specified is the number of incoming digits actually received before modification by deletion or prefixing in the RDB but after A-digit reconstruction. When the Call Type treatment points to an international transit RDB (International Domain [IDOM] equals **"T"** on the RDB form) or an international originating RDB (IDOM equals **"O"**), the Language Digit (LD) is never counted in the number of digits that make up the ADC regardless of whether the LD is translated or not.

Dial Pulse (DP) and Dual Tone Multifrequency (DTMF) rely on collecting digits one-at-a-time. A range of **"3-15"** entry causes DP or DTMF critical digit timing (5 second recognize end of dialing) after each digit beyond the third digit since each digit is potentially the last. On any DP or DTMF call with less than 15 digits it causes a five second post dialing delay.

Continued on next page

Form Entries, Continued

ADC (cont'd.)

MF, CCIS, CCITT5, ISUP, and Q931 are en-block (not-one-at-a-time) digit collectors. When the complete address is received on en-block digit collectors or when a 5-second timeout occurs on the one-at-a-time digit collectors, the number of digits received is compared with the various totals specified by the ADC in the Call Type word to which this call has been directed. If the number of digits received does not match one of the totals specified by ADC and this is an en-block call, the call will be given partial dial Final Handling Treatment (FHT). If the number of digits received does not match one of the totals specified by ADC and this is a one-at-a-time call, an additional 10 seconds (total of 15 seconds) will be allowed. If no additional digit is received during this interval, the call is given partial dial FHT (Partial Dial Timeout). If the number of digits on a one-at-a-time call does match one of the totals specified by ADC and no additional digit is received within a 5-second delay, the call will be routed on the number of digits received even if there are additional digits that have not been received yet. Therefore, the ADC should not be set any lower than the number of digits needed to correctly route the call for one-at-a-time digit collectors.

JKL

This field lists the tenth (J), eleventh (K), and twelfth (L) digits that complete the code group definition. One (10-digit translation), two (11-digit), or three (12-digit translation required) digits may be listed in this field. A numeric or an **"X"** may be used to specify translation. A numeric may not follow an **"X"**. The numeric will define a specific code while the **"X"** will represent all numerics from "**0**-**9**". Translation must be specified equal to the Number of Translated Digits (NTD). An **"X"** may be used for one, two, or three positions of GHI field, determined by the NTD. If only one **"X"** is used, it must be in the I position if there are two numerics. If two **"Xs"** are used they must be in the KL position if there is one numeric. Any code not specified will be routed to vacant code Final Handling Treatment (FHT) by the Office Data Assembler (ODA) program.

RC 304

General

The Recent Change Form 304 is used to create or change a subsequent digit entry.

"Table 11" - Valid Call Types And Domain Class For PRT Blocks - shows which call types are valid for each domain class.

See "Table 7" of Division 3 Section 3a for the code group population rules and "Table 8" of the same section for the Go/No Go Screening conditions.

An alphabetical keyword list is included in this section, starting on page 25.

Form Entries

RC:CODEGRP;CHG;OPT(SDX),---:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

SDINDEX Subsequent Digit Routing Index - This number specifies the subsequent digit entry being affected. Legal inputs are: **"1-16383"**.

Continued on next page

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

SIZE

This number specifies the size of the subsequent digit entry that is being created. Legal inputs are: **"1"**, **"2"**, **"3"**.

- A size of 1 will create a 16-word block (index values 0-14).
- A size of 2 will create a 128-word block (index values 0-126).
- A size of 3 will create a 1024-word block (index values 0-1022).

DOMCLASS

Domain class - This field is used to specify the class of routing that the SDX block will be used for. Each class of SDX block is only allowed in certain domains. Valid entries are **"DOM"** (domestic), **"NSR"** (number services routing), and **"ATNS"** (access tandem transit network selection). . The domains in which the class of SDX block are allowed are as follows:

CLASS	DOMAIN
DOM	POTS, nonPOTS (20-80,82,83), SDNA, DEV, DED, SF00-SF06 (4E22R4>), SF07-SF039 (4E23R1>), DEC6, DER6, DEC0, DER0, DEC1, DER1, INCD, N64C, N64R, NH0C, NH1C.
NSR	NSR.
ATNS	STCD (4E22R4>), ATNS.

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

Continued on next page

Form Entries, Continued

ACTION

Action - Add, Change, or Delete. Enter **"A"** if the associated data on this form is being added. Enter **"C"** if the associated data on this form changes existing data.

INDEX

This number specifies the index number of the SDTYPE entered in AD1 of the appropriate code group RC Form. Legal values are:

SIZE	INDEX
1	0 - 14
2	0 - 126
3	0 - 1022

When the index values are of the Data Rate Transfer Capability (DRTC) subsequent digit type (the Subsequent Digit Index [SDINDEX] is pointed to by a code group with Additional Data 1 [AD1] of DRTC), the INDEX values of 0 to 6 are defined as follows: voice (0), 3.1 kb modem (1), 56 kb (2), 64 kb restricted (3), 64 kb clear (4), 384 kb (5), and 1536 kb (6). Value 7 is currently undefined.

When the index values are of the Voice or 3.1 kHZ Indicator (V31K) subsequent digit type, this field specifies the index that is used to select a routing treatment when a V31K type of subsequent digit entry is encountered. Index 0 will be interpreted as 3.1 kHZ, and Index 1 will be interpreted as normal speed.

The treatments for all unspecified INDEXes will be defaulted to Final Handling Treatment-Vacant Code Analysis (FHT-VCA).

Continued on next page

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

CALLTYP The Call Type is used to define the major category for the disposition of the codes listed on this form. The valid Call Type categories are as follows:

- **EAR** - The Emergency Alternate Routing feature will be used to reroute calls. The EAR Call Type will be used for code groups which must be screened for this feature and will indicate that one or more destination numbers in the code group have this feature. This feature allows business customers to redirect calls from a primary location to an alternate location when the primary location is the victim of a natural disaster, a bomb threat, or other terrorist activity.

- **FHT** - Final Handling Treatment. This identifier specifies that the listed codes will be directed to a Final Handling Treatment (FHT) announcement or tone.

- **GNS** - Go/No Go Screening - GNS specifies that this group of codes will be given GNS before the routing is determined. If this call type is entered. GN and GNSC fields must be completed.

- **PAS** - Public Announcement System - This identifier specifies that the codes listed will terminate the customer to the announcement specified in the CALLDATA field.

- **RDB** - Routing Data Block - RDB is used to specify that the set of codes listed in this form will be routed directly to Trunk Subgroups (TSGs) defined by a Routing Data Block (RDB).

- **SDX** - Subsequent Digit Index - This Call Type is used to reference a subsequent digit entry which contains several alternative routing treatments that are selected on the basis of an index determined by the type value entered as AD1. In memory, the SDX call type contains data stating the grid table size: **"1"** meaning a size of 16 entries, **"2"** meaning 128, **"3"** meaning 1024. To obtain the number of SDs, use the VER:CODEGRP:SDINDEX message (4E23>).

Continued on next page

Form Entries, Continued

CALLTYP (cont'd.)

- **SSP** - Service Switching Point - This identifier is used to designate the processing of a Numbered Services call.
- **TEL** - TELEVOTE with Public Announcement System - This identifier specifies that the codes listed will terminate the customer to the announcement specified in the CALLDATA field. TEL is only valid in the Plain Old Telephone Service (POTS) Domain.
- **TST** - Test - This identifier is used for the code line test combinations within a translation domain. Three digit codes under this call type would include 10X codes and the synchronous test.

CALLDATA

This field further defines the treatment given to the group of codes listed on this form. CALLDATA is an extension of the Call Type (CALLTYP). For a given CALLTYP, the CALLDATA will define the specific code group treatment. CALLTYP/CALLDATA correlation is shown below.

- **Emergency Alternate Routing (EAR) Call Type** - The CALLDATA for EAR is an RDB index in the range of **"1-8191"**.
- **FHT Call Type** - The Final Handling Treatment (FHT) CALLTYP is used to point a group of codes directly to an announcement or tone. The CALLDATA field identifies that tone or announcement circuit. Valid entries are : **"AR"**, **"BT"**, **"EA1-EA7"**, **"HW"**, **"IFF"**, **"INC"**, **"IVC"**, **"MCA"**, **"NCA"**, **"NCC"**, **"NCD"**, **"NWC"**, **"OOB"**, **"ROA"**, **"SP1"**, **"SP2"**, **"T"**, **"VCA"**, **"DNN"**, **"DPP"**, **E01-E02"**, **"I01-I30"**, **"INF"**, **"ISB"**, **"LDV"**, **"LOB"**, **"LSA"**, **"NCB"**, **"NWN"**, **"OOA"**, **"OTS"**, **"R01-R10"**, **"S01-S19"**, **"SNA"**, **"STO"**, **"TDN"**, **"UNN"**, **"VMA"**, **"WAT"**. Consult Lucent Practices 781-031-100 for further definition of various tones and announcements. See the Routing Data Block Final Handling Treatment (RDBFHT) description for the identifiers that may be specified.

Continued on next page

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

CALLDATA (cont'd.)

- **GNS Call Type** - If the GNS CALLTYP identifier is used, the CALLDATA field will contain a Routing Data Block Index (RDBI) from **"1-8191"**. This index will be used to direct the call if the Go/No Go Screening (GNSC) passes. The Go No Go (G/N) and GNSC fields specify the Go/No Go conditions. If the GNSC fails, the call is directed to the vacant code Final Handling Treatment (FHT).

- **PAS Call Type** - If Public Announcement System (PAS) Call Type is used, the CALLDATA field must contain a 12-digit announcement identifier. This identifier is made up of the 5-digit Voice Storage System Identity (VSSID) and 7-digit Service Identity (SID).

- **RDB Call Type** - For RDB, the CALLDATA field will contain a Routing Data Block Index (RDBI) from **"1-8191"**. This number will specifically identify a given set of routing parameters as listed in the RDB form with that same RDBI. The RDB entry is used to directly point a group of codes toward routing information.

- **SDX Call Type** - The CALLDATA for SDX is a Subsequent Digit Index (SDX) which identifies a particular subsequent digit entry. Valid values are **"1-16383"**.

- **SSP Call Type** - If Service Switching Point (SSP) Call Type is used, the CALLDATA field must contain one of the following identifiers:

  - **RT** - Retranslate Carrier ID (CID) and Type Of Service (TOS) plus Incoming Trunk Class (ITC) in the Number Services Routing (NSR) domain.
  - **RT00Y** - Retranslate CID TOS plus ITC in the NSR domain with a 00Y for Numbering Plan Area (NPA) lookup.
  - **RTCOIN** - Retranslate CID TOS plus ITC in the NSR domain for a 00X coin call.
  - **ACPN** - The 0ZZ-XXX[X] (or Transit Network Selection [TNS]) translation indicates Analyze the Called Party Number". For the Equal Access Multifrequency (EAMF), the switch will receive the second/third stages of digits and proceeds with digit translation looking for Called Number Triggers.

Continued on next page

Form Entries, Continued

CALLDATA (cont'd.)

- **AIIO** - The 0ZZ-XXX[X] (or TNS) translation indicates "Analyze the Information Digit/Originating Line Information (II/OLI)". This causes the switch to intercept the second and third stages of digits in for EAMF, and to check II/OLI for the "Send Advanced Intelligent Network (AIN) Information Collected Query" (SIAQ) value.
- **DB** - TOS and Database query.
- **DB7** - TOS and Database query for a 7-digit dialed number.
- **DB00Y** - TOS and Database query with a 00Y or NPA lookup.
- **DBCOIN** - TOS and Database query for a 00X coin call.
- **EASDNA** - Receive the Equal Access (EA) sequence and retranslate the address sequence in the Software Defined Network (SDN) Access (SDNA) domain.
- **EASEQ** - Collect the 2nd and 3rd stage digits EA format.
- **NCP12** - 12- or 9-digit address returned from the SDN NCP, the first two digits of which are deleted by the 4ESS Switch before outpulsing, retranslate the CID, TOS, and ITC in the NSR domain.
- **NDB** - Interexchange Carrier/International Carrier (IC/INC) routing. Requires Call Handling Instruction (CHI) entry of Number Services Data Block (ND), Number Services/Inhibit Black Box (NDB) or Number Services/Inhibit Black Box and Blue Box (NDBB).
- **RTP** - Retranslate the routing digits in Plain Old Telephone Service (POTS).
- **SFA** - Subscribed Footprint Area (4E22R4>)
- **SIAQ** - Send Information and Analyze Query.
- **SICQ** - The 0ZZ-XXX[X] (or TNS) translation indicates "Send AIN Information Collected Query". This causes the switch to intercept the second and third stages of digits in the EAMF case and the indicated query is sent to the Service Control Point (SCP) without any analysis of the called number.

CALLDATA (cont'd.)

- **TNSND** - Access Tandem Transit Network Selection Digits -This identifier is used at an Access Tandem (AT) switch to handle incoming calls from equal access Integrated Services Digital Network User Part (ISUP) to outgoing equal access ISUP or MFWINK. This subtype is only used in the Access Tandem Transit Network Selection (ATNS) domain.

- **TEL** Call Type - If TEL Call Type is used, the CALLDATA field must contain a 12-digit announcement identifier. This identifier is made up of the 5-digit VSSID and 7-digit SID.

- **TST** Call Type - This identifier specifies that the group of codes on this form are test codes. The CALLDATA field will identify the test. The following combinations may be assigned.

  - **100** - Balance - provides a quiet termination.
  - **101** - Communication - provides a link to a test board or test position.
  - **102** - Milliwatt - source of 1000 hertz test tone.
  - **103** - Signal/Supervisory - This test provides a series of on-hook/off-hook transitions.
  - **105** - Automatic Transmission Measuring System (ATMS) - provides a connection to an ATMS responder.
  - **108** - Echo Suppressor - The 108 test is used to test Echo Suppressor operation.
  - **109** - This test is used to test Echo Canceller operation.
  - **DLC -** Data loopback/complement test trunk.
  - **SYN** - Synchronous - SYN specifies a signaling/supervision test similar to 103 but on an automatic timed basis.

Continued on next page

Form Entries, Continued

AD1 Additional Data 1 - This field further defines the treatment given to a code group translation. AD1 is an extension of the Call Type (CALLTYP) and CALLDATA words. For a given CALLTYPE and CALLDATA, the AD1 will define the specific code group treatment. Valid entries for the appropriate services are:

- **"Blank"**
- **"GNS" (Go/No Go Screening)** - If GNS Call Type is used, the AD1 field is used to enter the Go/No Go value for the Call Type. The field may contain a Go **("G")** or No Go **("N")** condition for the list of codes that appear on this form. The indication is linked with a given GNS Class in the next field. All two-way and incoming Trunk Subgroups (TSGs) are assigned a GNS Class. By manipulating the Go/No Go conditions for a group of codes, incoming traffic can be denied (sent to vacant code) on one or more TSGs and allowed to complete on others.
- **"SDTYPE" (Subsequent Digit Index Type)** - The AD1 field for SDX Call Type is used to identify the type of index that must be used to index the subsequent digit entry. Valid entries are as follows:
  - **MTS** Multiple Treatment Screening class from an incoming trunk. Valid entries are **"Blank"** or **"0 - 63"**.
  - **DC** Digit Count of the incoming call. Valid entries are **"3 - 15"**.
  - **DRTC** Data Rate Transfer Capability for Integrated Services Digital Network user Part (ISUP) to Multifrequency (MF) interworking. Valid entries are **"0 - 7"**.
  - **IPR** ISUP Preference Routing. Valid entries are:
    "0" - ISUP Preferred. The outgoing trunks should be mostly ISUP.
    "1" - ISUP not required. The outgoing trunks should be mostly non-ISUP.
    "2" - ISUP Required. All outgoing trunks must be ISUP.
    "3" - Spare
  - **V31K** Voice or 3.1kHZ indicator. Valid entries are:
    "0" - 3.1kHZ
    "1" - Voice.

AD1
(cont'd.)

- **"SSP" (Service Switching Point)** Call Type - If SSP Call Type is used, the AD1 field is used to enter either the Type of Service (TOS) indicator value for the CALLDATA of NCP12, RT, RT00Y, RTCOIN, SICQ, DB, DB7, DB00Y, or DBCOIN or the Number Services Data Block (NDB) for the CALLDATA of NDB or TNSND, or the Subscribed Footprint Area Index (SFAI) for the CALLDATA of Subscribed Footprint Area (SFA).
  - **NDBI** - Number Services Data Block Index value defines which Interexchange Carrier or International Carrier routing control block will be used for the call. Valid input values are **"1-1023"**.
  - **SFAI** - Subscribed Footprint Area Index used to calculate a corresponding SFA domain. Valid input is **"0-6"** (**"0-39"** for 4E23>).
  - **TOS** - Type of Service entry defines which number service will be identified with this Call Type entry. Valid input is a number between **"0"** and **"31"**.
- **"SAPN"** - This field is used to specify the Slave Application Number (SAPN) assigned when the Call Type is TEL. Valid range is **"0-63"**.

Continued on next page

Form Entries, Continued

AD2

Additional Data 2 - This field further defines the treatment given to the group of codes listed on this form. AD2 is an extension of the Call Type (CALLTYP), CALLDATA, and AD1. For a given CALLTYPE, CALLDATA, and AD1, the AD2 will define the specific code group treatment. CALLTYPE/CALLDATA/AD1/AD2 correlation is shown below:

- **GNS (Go/No Go Screening)** Call Type - If GNS Call Type is used, the AD2 field is used to enter the Go/No Go Screening Class for the Call Type.
  - This field will have an entry when CALLTYP is GNS and AD1 is not **"Blank"**. The Go/No Go Screening Class specifies the Trunk Subgroup (TSG) class that will be allowed or denied completion to the regular routing. A range of **"0-3"** may appear in this field.
- **SSP (Service Switching Point)** Call Type - If SSP Call Type is used, the AD2 field is used to enter the Carrier IDentification (CID) indicator value for the CALLDATA of NCP12, RT, RT00Y, or RTCOIN.
  - CID - Carrier IDentification number defines which Interexchange Carrier or International Carrier will be used to route the call. Valid input is **"0000-9999"**.

  If either:
  - the DOM is Super Tandem Carrier ID (STCD) and the CALLDATA is Access Tandem Transit Network Selection Digits (TNSND) or
  - the DOM is Number Service Routing (NSR) and CALLDATA is Number Services Data Block (NDB),

  then the AD2 field specifies if the associated Carrier is allowed to receive all possible Information Digit/ Originating Line Information (II/OLI) values or is restricted only to certain values (Restrict II/OLI [RIO]). Allowed entries are:
  - **"Blank"** or **"N"** (Restrict II/OLI forwarding [DEFAULT])
  - **"Y"** (Allow II/OLI forwarding).

Form Entries, Continued

SC

Service Category/Code Group. This field identifies the Service Category (SC) of the code group. This category is used to perform incoming screening on calls received from other carriers. Also, it is used to determine for which calls an Automatic Message Accounting (AMA) record or Access Charge record should be made.

As examples of screening, an Operating Company Access Tandem (AT) switch must deny calls from an Interexchange Carrier (IC) that do not terminate in the Local Access Transport Area (LATA) served by the AT.

As an example of recording, an AT must make a terminating Access Charge record for all calls it receives from an IC or INC which terminate in the LATA.

The SC defines the screening and recording classification to be used for the code group. The SC field only applies if the CALLTYP is CRB, DSD, DSN, EAR, GNS, INW, IRA, MCT, MMT, MRT, PAS, PRT, RDB, RNR, SSP, TEL, TST, or TTS. SC will also be used to specify for which calls a query will be sent to the Network Call Denial (NCD) database.

Valid Service Category entries are:

- **Blank** - If this field is **"Blank"**, the SC is unspecified.
- **ALAP** - Alaskan Plain Old Telephone Service (POTS). ALAP is the classification for POTS code groups in the Alaskan World Zone 1 area.
- **ATAP** - Access Tandem Area Pots. ATAP is only applicable if the 4ESS Switch is owned or leased by an Operating Company and used as an Access Tandem (AT) for a LATA. ATAP is the classification for the POTS code groups in the LATA served by the AT. In addition, ATAP is the category for POTS code groups in Independent Operating Company areas also served by the Tandem Switch.

Continued on next page

Form Entries, Continued

SC
(cont'd)

- **CANP** - Canadian POTS. CANP is the classification for POTS code groups in the Canadian World Zone 1 area.
- **CARP** - Caribbean, NON-U.S. Territories, POTS. CARP is the classification for POTS code groups in the Caribbean World Zone1 area which do not include United States territories.
- **CUSP** - Continental U. S. POTS. CUSP is the classification for POTS code groups in the continental U. S., which could not also be classified ATAP.
- **CUTP** - Caribbean, U. S. Territories, POTS. CUTP is the classification for POTS code groups in the part of the Caribbean World Zone 1 area which includes United States territories.
- **DA** - Directory Assistance. DA is used to classify code groups assigned to Directory Assistance.
- **DLT** - DIAl-It*. DLT is used to classify DIAL-It code groups.
- **DSD** - Direct Services Dialing. DSD is used to classify Direct Services Dialing code groups.
- **EASC** - Exchange Access Signaling Code. EASC is used to classify the code groups used for Exchange Access Signaling (EAS) to an Interexchange (IC) or International Carrier (INC).
- **HAWP** - Hawaiian POTS. HAWP is the classification for POTS code groups in the Hawaiian World Zone 1 area.
- **ICIN** - Inter-LATA Carrier switch owner's International Carrier (INC). ICIN is used to classify code groups for calls to the Inter-LATA Carrier switch owner's International Carrier.

* DIAL-It is a registered trademark of AT&T

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

SC
(cont'd)

- **INCN** - International Carrier but not inter-LATA Carrier switch owner's International Carrier. INCN is used to classify code groups from an Inter-LATA Carrier switch to an International Carrier which is not owned by the Inter-LATA Carrier. In addition, these code groups are not destined for International Operators.

- **INCO** - International Carrier Operator. INCO is the classification for code groups used for calls to an International Carrier Operator.

- **INET** - This is used for Interim Nationwide Emergency Telecommunications System code groups. INW = Inward WATS.

- **INW** is used for Inward WATS code groups. IOP = Inward Operator.

- **IOP** is used to classify code groups assigned to Inward Operator positions.

- **LDA** - Local Directory Assistance. This service category is used to generate the appropriate billing record when used in conjunction with a Centralized Automatic Message Accounting (CAMA) Far End Network (FEN) block.

- **MCPP** - Multiquest Calling Party-Paid. MCPP is used to classify Multiquest code groups paid for by the calling party.

- **MULT** - Multiquest. MULT is used to classify Multiquest code groups.

- **MSC1** through **MSC4** - These miscellaneous categories can be used to classify code groups into miscellaneous categories. These may be especially useful if the 4ESS Switch is shared by an Operating Company and an Interexchange Carrier (IC). In this case, the general categories could be used to classify code groups by the carrier which owns the switch and the miscellaneous categories used for code groups handled by the carrier leasing capacity on the switch.

- **NWZ1** - Non-World Zone 1. NWZ1 is the classification for the code groups used for calls to Non-World Zone 1 area.

Continued on next page

Form Entries, Continued

SC
(cont'd)

- **RSYS** - Restricted System Codes. RSYS is used to classify code groups assigned as special purpose restricted system codes.
- **SC1** through **SC36** - Spare Category 1 through Spare Category 36. These SCs can be used to classify codes in up to 36 SCs. One use for these categories is screening of IntraLATA calls at an Inter-LATA Carrier Switch. For this use, a different category would be assigned to the codes for each LATA to which the InterLATA Carrier Switch connects. Another possible use for these categories is for screening International Switching Center (ISC) terminating and transit traffic. For this use, the SCs would be assigned to the Overseas codes for which special screening is required. Yet another use is extensions of the current use of the Miscellaneous Service Categories (MSCs) (e.g., at shared switches).
- **SDN** - Software Defined Network. SDN is used for calls to a Software Defined Network.
- **SDND** - SDN Data. SDND is used for Software Defined Network Data calls.
- **SPDI** - Sponsor-Paid Dial-It. SPDI is used to classify DIAL-It code groups paid for by the sponsor.
- **SSP** - Local Exchange Carrier (LEC) Service Switching Point (SSP). SSP is used to identify calls that will have SSP processing applied to them.
- **TC** - Teleconferencing. TC is used to classify code groups assigned to network Teleconferencing services.
- **TST** - Test Line. TST is used to classify code groups assigned to trunk test lines.
- **UNSP** - Unspecified. This entry is used for a verify input request of codes that contain no SC.

Use pursuant to Company Instructions

Form Entries, Continued

CHI

Call Handling Instructions. This field is used to specify some call handling actions to override present Outgoing Signaling Characteristics (OSCs), recording, and/or fraud prevention controls. This field is needed because of the new call handling requirements for Interexchange Carrier (IC) and International Carrier (INC) Access. The CHI field only applies if the CALLTYP is CRB, DSD, DSN, EAR, GNS, INW, IRA, MCT, MMT, MRT, PAS, RDB, RNR, SSP, TEL, TST, or TTS.

NOTE: This field must be populated for some existing code groups, such as those used for 2-stage International calls and ADD-ON Teleconferencing calls. Failure to populate this field for these calls will result in failure to complete these calls.

Valid entries for CHI field are:

- **"Blank"** - If this field is **"Blank"**, no special call handling instructions are taken.
- **AAT2** - Access Tandem (AT) to IC Traditional Two-stage. This CHI value is used at the AT or Service Switching Point (SSP) to identify that a traditional two-stage international incoming call to the AT/SSP is being passed to the carrier via equal access using Integrated Services Digital Network User Part (ISUP) signaling.
- **ABBB** - Same as ACD, but in addition, disable Black Box and Blue Box fraud prevention.
- **ABLK** - Same as ACD, but in addition, disable Black Box Fraud prevention.
- **ACD** - Inward Wide Band Area Telephone Service (INWATS) ACD. Specifies that a terminating INWATS ACD record is to be made.
- **EAAR** - Expect Automatic Number identification (ANI) Assist Request. EAAR specifies actions at an intermediate toll switch for a call on which an ANI Assist Request is expected. For example, an ANI Assist Request is expected on a call to establish an ADD-ON Teleconference.

Continued on next page

Form Entries, Continued

CHI (cont'd.)

- **EGRH** - Egress Handling. Specifies actions at the egress switch for Direct Connect and Software Defined Network (SDN) calls. Usually, these calls will be directly terminating to a Private Branch Exchange (PBX). However, in some SDN cases, they will terminate to a local switch, either via a dedicated Trunk Subgroup (TSG) or via special NXX codes (unused office codes). EGRH can only be specified if DOM is APN, DED, or DEV. Note that it must be specified for all DED and DEV calls at the Egress switch (and not at intermediate switches) to allow the Direct Connect and/or the SDN (Offnet Egress Privilege) features.
- **ESD2** - Expect Second Start Dial 2. ESD2 specifies actions at an intermediate toll switch for a 3-stage Exchange Access call to an International Carrier (INC), including the Interexchange Carrier (IC) International Switching Center when it is able to receive Exchange Access calls.
- **ESSD** - Expect Second Start Dial. ESSD specifies actions at an intermediate toll switch for a 2-stage International call to an IC International Switching Center.
- **FGB** - Feature Group B. FGB specifies actions for calls to an IC or INC.
- **IBBB** - Same as ICDR, but in addition, disable Black Box and Blue Box fraud prevention.
- **IBLK** - Same as ICDR, but in addition, disable Black Box Fraud prevention.
- **ICDR** - International Call Detail Recording. Specifies that an ICDR record is to be made.
- **IEA** - Interim Exchange Access. IEA specifies actions for calls from an End Office (EO) unequipped to do Exchange Access signaling to an IC or INC able to handle Exchange Access signaling. (Initial plans call for these calls to have ABC digits of 950.)
- **MSC1, MSC2** - Miscellaneous 1 and 2. Two miscellaneous values are included. These can be assigned if an unforeseen set of calls require special call handling instructions.
- **ND** - Number Services Data Block information for outpulsing control.

Continued on next page

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

CHI (cont'd.)

- **NDB** - Number Services Data Block information for outpulsing control, inhibit Black Box.
- **NDBB** - Number Services Data Block information for outpulsing control, inhibit Black Box and Blue Box.
- **NONE** - This entry is used for a verify input request of codes that contain no Call Handling Instruction.
- **WACK** - Wait For Acknowledgment. WACK specifies actions for calls to an INC for which a trunk is seized and digits outpulsed. The talking path is not cut through until an Acknowledgment signal is received from the INC. This entry only applies to a 4ESS Switch owned or operated by an Operating Company as an Access Tandem (AT).
- **WAC2** - Specifies the signaling actions to be performed by an AT when connecting an Equal Access End Office (EAEO) to an INC (possibly through an Intermediate Carrier).
- **WSNO** - Wink Start No Outpulse. WSNO specifies actions for calls for which a trunk to an IC or INC is to be seized but no digits outpulsed. This is one option allowed in Exchange Access signaling, and is chosen by the IC or INC.

DESEP

Destination Separation is used to identify destinations for traffic flow purposes. Peg and usage counts are made as a function of the Trunk Sub-Group (TSG) incoming class (INSEP) and the outgoing destination class (DESEP). All outgoing or successfully terminated traffic is assigned a given destination class from **"1-255"**.

NOTE: DESEP class 63 is assigned generically for test calls. Any other assignment to class 63 should take this fact into consideration.

For codegroup forms, a DESEP class will be assigned only when the CALLTYP is equal to CRB, DSN, EAR, GNS, MCT, MMT, MRT, PAS, PRT, RDB, RNR, SSP, TEL, or TTS. This field is **"Blank"** for any other Call Type value.

Continued on next page

Form Entries, Continued

DNST Not Applicable – Entries: **"Blank"**

AD3 Not Applicable - Entries: **"Blank"**

ADC Acceptable Digit Count/Code Group - This field specifies the total number of incoming digits expected for a call routed to this Call Type. This field must be entered for the following Call Types: CRB, DSD, DSN, EAR, GNS, INW, IRA, MCT, MMT, MRT, PAS, PRT, RDB, RNR, SSP, TEL, TST, and TTS.

The legal values for this field are digit counts from **"3-15"** for domestic routing.

For the Call Types requiring that an ADC be input, at least one number must be specified. More than one number may be listed as valid. For example, if the Call Type points to an Routing Data Block (RDB), 6, 8 or 10 digits may be valid. Note that the number of incoming digits specified is the number of incoming digits actually received before modification by deletion or prefixing in the RDB but after A-digit reconstruction. When the Call Type treatment points to an international transit RDB (International Domain [IDOM] equals **"T"** on the RDB form) or an international originating RDB (IDOM equals **"O"**), the Language Digit (LD) is never counted in the number of digits that make up the ADC regardless of whether the LD is translated or not.

Dial Pulse (DP) and Dual Tone Multifrequency (DTMF) rely on collecting digits one-at-a-time. A range of **"3-15"** entry causes DP or DTMF critical digit timing (5 second recognize end of dialing) after each digit beyond the third digit since each digit is potentially the last. On any DP or DTMF call with less than 15 digits it causes a five second post dialing delay.

Form Entries, Continued

ADC (cont'd.)

MF, CCIS, CCITT5, ISUP, and Q931 are en-block (not-one-at-a-time) digit collectors. When the complete address is received on en-block digit collectors or when a 5-second timeout occurs on the one-at-a-time digit collectors, the number of digits received is compared with the various totals specified by the ADC in the Call Type word to which this call has been directed. If the number of digits received does not match one of the totals specified by ADC and this is an en-block call, the call will be given partial dial Final Handling Treatment (FHT). If the number of digits received does not match one of the totals specified by ADC and this is a one-at-a-time call, an additional 10 seconds (total of 15 seconds) will be allowed. If no additional digit is received during this interval, the call is given partial dial FHT (Partial Dial Timeout). If the number of digits on a one-at-a-time call does match one of the totals specified by ADC and no additional digit is received within a 5-second delay, the call will be routed on the number of digits received even if there are additional digits that have not been received yet. Therefore, the ADC should not be set any lower than the number of digits needed to correctly route the call for one-at-a-time digit collectors.

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

SDINDEX

Subsequent Digit Routing Index - This number specifies the subsequent digit entry being affected. Legal inputs are: **"1-16383"**.

If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

ONPA

Originating Numbering Plan Area - ONPA is used to identify the area from which a 7-digit inter-area call may originate. The NPA must be a 3-digit area code (**200-999**) for either the home NPA or one of the served NPAs that are in Office Data Assembler (ODA).

Continued on next page

Form Entries, Continued

ORNU Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

TNPA Terminating Numbering Plan Area - For codegroup forms, this field identifies the specific Numbering Plan Area (NPA) to which a 7-digit inter-area call may be directed. Any NPA (including home and served) may be entered in this field. The range is **"200-999"**.

NOTE: Even though the call may be originated on a 7-digit basis, the 4ESS Switch will prefix the destination area code (before translation) for all NPAs except the home NPA. In addition to being specified on the RC Form 308 each terminating office code must also be listed on an RC Form 301 or 302 as the DEF digits, with the TNPA specified as the ABC digits. For Centralized Automatic Message Accounting (CAMA) forms, this field identifies the area code associated with the office codes listed on this form. When a local calling area crosses an NPA boundary, more than one terminating NPA may be represented by a given profile index. In this case, separate RC 402 Forms with the same profile index are prepared for each NPA (up to four). Valid entries range from "200-999".

For RC Form 403, this field lists the 3-digit codes that are to be blocked when received as the called (terminating) area code component of a CAMA call. Blocked codes will be directed to the "Unauthorized CAMA" announcement. Valid entries range from **"200-999"**.

PROTECT This field appears on the Recent Change (RC) forms for defining protected office codes in an originating Numbering Plan Area (NPA). These codes are those in another NPA that may be dialed on a seven digit basis. Since those NXX office code combinations cannot be directed to both the local area and the foreign area, they must be "protected" (not assigned) in the originating NPA. This field may be **"Y"** for Yes or **"N"** for No to specify whether or not the codes listed are to be protected in the originating NPA.

Use pursuant to Company Instructions

Form Entries, Continued

TOFC Terminating Office Code - For codegroup forms, TOFC identifies the NXX (200-999) office code that may be dialed on a 7-digit basis from the Originating Numbering Plan Area (ONPA) to the Terminating NPA (TNPA). This list will contain all of the office codes that can be reached by 7-digit inter-area dialing between the ONPA and TNPA.

NOTE: If the ONPA is the home NPA the TOFC listed on this form may not be entered on RC Form 307. If the ONPA is entered on RC Form 300 as a served NPA the TOFC listed on this form may not be entered on an RC Form 301 or 302 as the DEF digits for that Served NPA (SNPA).

For Centralized Automatic Message Accounting (CAMA) forms, The TOFC fields list the terminating office codes within a given NPA for a local call area definition. This definition is used to prevent local calls from being completed. The valid range for office codes is from **"200-999"**.

For RC Form 404, this field lists the 3-digit codes that are to be blocked when received as the called (terminating) office code component of a CAMA call. The range of valid entries is from **"200-999"**. The Office Data Assembler (ODA) system will automatically block codes in the range of **"000-199"**.

RC Form 309

General

The Recent Change (RC) Form 309 is used to add a new domain (non-Direct Distance Dialing [non-DDD]) and specifies the storage requirement for that domain.

Low numbered Non-Plain Old Telephone Service (Non-POTS) domains (20-69) should be assigned first, where possible. High numbered domains (70-83) may, in the future, be reserved for special purposes, just as domains 81 and 82 are today, and may require special inter-working rules. Unless the rules governing the use of these domains are obeyed, these domains should NOT be used. In order to avoid possible mishandling of calls due to incorrect use of a special domain, and unnecessary administrative effort associated with changing domains, these high numbered domains should be used with extreme caution.

An alphabetical keyword list is included in this section on page 6.

DOM

DOMAIN - This field designates a community of interest that requires separate routing. The types of Domain are a number ranging from **"20-83"** denoting a NON-Plain Old Telephone Service (POTS) domain. The NON-POTS Domains may be a Common Control Switching Arrangement (CCSA) Network, such as Federal Telecommunications System (FTS). These domains are entered as a number from **"20-69"**.

- The **NON-POTS domain of 78** is used to skip Network Management code controls for quality assurance testing, i.e., CASPER.
- The **NON-POTS domain of 82** is used as the translation domain for Data calls. The Data feature provides the capability for full rate data transmission via the 4ESS Switch over a dedicated network of digital trunks. These digital trunks terminate exclusively on Digital Interface Frames (DIF) at 4ESS Switch locations.
- **N64C** -This domain is used to route 64 kbps clear data calls using the 10-digit North American Numbering Plan (NANP).
- **N64R** -This domain is used to route 64 kbps restricted data calls using the 10-digit North American Numbering Plan.

The following translations domains are used for wideband transmission:

- **NH0C** -This domain is used to route 384 kbps clear data calls using the 10-digit North American Numbering Plan (NANP).
- **NH1C** - This domain is used to route 1536 kbps clear data calls using the 10-digit NANP.

RC 311

General

The Recent Change (RC) Form 311 is used to change the number of digits to be translated for a given dialed address.

This Recent Change message can be used to make the following changes to the number of translatable digits:

OLD	NEW
3	4, 5, 6
6	7, 8, 9
9	10, 11, 12
4, 5, 6	3
7, 8, 9	6
10, 11, 12	9

When this form is used to decrease the Number of Translatable Digits (NTD), the routing treatment for all codes being decreased must be identical.

When this form is used to decrease the NTD, an area code cannot be reduced below an NTD of 6.

An alphabetical keyword list is included in this section on page 7.

DOM

DOMAIN - This field designates a community of interest that requires separate routing. The types of Domain are "Direct Distance Dialing (DDD), Verify (VRFY)" and a number ranging from **"20-83"** denoting a NON-Plain Old Telephone Service (POTS) domain. DDD is indicated by an entry of **"POTS"** in the DOM field. The Office Data Assembler (ODA) system will automatically build the DDD Domains (191 through 209). The **"VRFY"** Domain enables the Line-Busy Verification feature by operators over a dedicated network. When DOM equals VRFY, then Type of Trunk (TOT) must be MISC or CALLTYP must equal FHT, GNS, or TST. The NON-POTS Domains may be a Common Control Switching Arrangement (CCSA) Network, such as Federal Telecommunications System (FTS). These domains are entered as a number from **"20-69"**.

- The **NON-POTS domain of 78** is used to skip Network Management code controls for quality assurance testing, i.e., CASPER.
- The **NON-POTS domains 79 and 80** are reserved for specific International Switching Center (ISC) use.
- The **NON-POTS domain of 81**, also denoted by **"IVT"** for International Voice Transport, is reserved for call processing to transport international voice calls through the network to an ISC.
- The **NON-POTS domain of 82** is used as the translation domain for Data calls. The Data feature provides the capability for full rate data transmission via the 4ESS Switch over a dedicated network of digital trunks. These digital trunks terminate exclusively on Digital Interface Frames (DIF) at 4ESS Switch locations.
- **N64C** -This domain is used to route 64 kbps clear data calls using the 10-digit North American Numbering Plan (NANP).
- **N64R** -This domain is used to route 64 kbps restricted data calls using the 10-digit North American Numbering Plan.

DOM (cont'd)

The following translations domains are used for wideband transmission:

- **NH0C** -This domain is used to route 384 kbps clear data calls using the 10-digit North American Numbering Plan (NANP).
- **NH1C** - This domain is used to route 1536 kbps clear data calls using the 10-digit NANP.

The following domains are non-translations domains used for routing only:

- **SF00-SF06** - Subscribed Footprint Area 00 to 06 (4E22R4>)
- **SF07-SF39** - Subscribed Footprint Area 07 to 39 (4E23R1>)
- **STCD** - Super Tandem Carrier ID (4E22R4>)
- **ATNS** - Access Tandem Transit Network Selection - This domain is used to translate equal access Integrated Services Digital Network User Part (ISUP) parameters to obtain the routing information.
- **NSR** - Number Services Routing - This domain will be populated with entries to perform Service Switching Point (SSP) Interexchange Carrier (IC) and International Carrier (INC) routing.

AC

Area Code - A **"Y"** for Yes indicates that all of the 3-digit codes (ABC digits) on this form are Area Codes. If the ABC digits are office codes, test codes or other non-Area Codes, AC will be **"N"** for No. This field is left **"Blank"** when Domain (DOM) is not equal to Plain Old Telephone Service (POTS).

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

Continued on next page

Form Entries, Continued

NTD Number of Translated Digits - This field specifies the number of digits to be analyzed for this code grouping. For domestic code grouping, this number may range from 3 to 12 depending on the code group form. The first three digits are listed under the ABC field, the remaining digits, if any, are listed in the DEF, GHI, and JKL fields. Valid entry for the RC Form 300 is only **"3"** because the form only changes the ABC digits. Other digit combination changes are performed on subsequent forms.

CODEGRP For increasing the Number of Translatable Digits (NTD), this field contains the sequence of digits on which the existing (old) translation is being done. The number of digits in this field must equal the value of the OLD NTD field. For decreasing the NTD, this field contains the sequence of digits on which the new translations will be done. The number of digits in this field must equal the value of the NEW NTD field. Valid entries are **"000-999999999"**.

RC 317

General

The Recent Change (RC) Form 317 is used to add Country Code groups to translations at an International Switching Center (ISC) and domestic offices. The population of the translations table is necessary so international calls destined for ISCs can be transported across the network in a single stage via Common Channel Interoffice Signaling (CCIS) or Integrated Services Digital Network User Part (ISUP).

The population of the translations table is also necessary at a Service Switching Point (SSP) switch for Multifrequency (MF) equal access.

The translation table is also necessary at the Access Tandem switch for MF and ISUP network interconnect.

An alphabetical keyword list is included in this section on page 8.

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

CCD

Country Code or Pseudo Country Code - Country Code can be one, two, or three digits with each digit having a value of **"0-9"**. These digits specify the country for which this call is destined. Valid entries are **"0-999"**. Pseudo Country Code will always be three digits.

Continued on next page

Form Entries, Continued

LD	Language Digit - This field is a single digit entry having a value of "**0-9**". A zero (**0**) equals a customer dialed call. A digit of **"1-9**" indicates a non-customer dialed call.
CBONLY	Cable Only indicator - Valid entries are **"Y"** for Yes, cable only routing, or **"N"** for No, unrestricted routing. A **"Y"** would be specified for certain Pseudo Country Codes which imply cable only facilities. A **"Y"** would also be entered for certain Country Codes where the office does not have direct circuits to that foreign country and the "via" country's offices could use satellite routing to complete calls to their destination.
FAXPR	Not Applicable - Entries: **"Blank"**
SCLB	Suppress Clear-back Message Indicator. This field is used to indicate whether clearback suppression applies for a given country code. This field is set to **"Y"** to suppress passing clearback at an International Switching Center (ISC) for calls to a country code known to produce an answer-clearback-reanswer sequence within prescribed time limits. Valid entries are: **"Y"**, **"N"**, **"Blank"**. Blank defaults to **"N"**.
RESELL	Not Applicable - Entries: **"Blank"**
CCRF	Not Applicable - Entries: **"Blank"**
ORNU	Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

Continued on next page

LUCENT TECHNOLOGIES PROPRIETARY

RC 319

General

The Recent Change (RC) Form 319 is used to specify codes to be added to a Digit Type Category.

If the digit type is Universal Treatment Non-area Code (UTC**),** then this form also changes the routing treatment in any Served Numbering Plan Areas (NPAs).

An alphabetical keyword list is included in this section on page 7.

Form Entries

RC:CODEGRP;NEW;OPT(DIGTYP),- - -:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

Form Entries, Continued

DIGTYP Three Digit Type - DIGTYP specifies one of the categories of 3-digit codes or an exclusion code. Valid three DIGIT TYPES are as follows:

- **BNPA** -Billing Number Automatic Number Identification-Numbering Plan Area (ANI NPA). This entry is used to identify that the codes listed are valid billing numbers or ANI NPAs for originating switched Equal Access Signaling (EAS) calls.
- **DEF1-4** - DEF1, DEF2, DEF3, DEF4 - DEF digit codes. These codes correspond to the Fourth [D] Fifth [E] Sixth [F] (DEF) digits of the incoming call. They will enable blocking of customer dialed calls, from specific Far End Networks (FENs), which attempt to access these codes. For example, a specific FEN might be blocked from accessing codes in the DEF1 category, but not in the DEF2 category. DEF1 might include DIGs of the Format N11, DEF2 might include DIG = 555, and DEF3 might include toll center codes. A given DIG code may be in at most one of these four categories.
- **DP3** - Dial Pulse/DTMF 3 Digit codes. This DIGTYP entry specifies that the 3-digit non-area codes listed on this form may be arriving via Dial Pulse(DP)/Dual Tone Multifrequency (DTMF) signaling. Only those 3-digit codes that may be the first three digits (ABC) of 3-, 4-, or 5-digit calls should be entered in this category. Valid entries range from **"200-999"**. All codes of the Form 0XX or 1XX and N11 will be generically set by the Office Data Assembler (ODA) programs.
- **DP6** - Dial Pulse/DTMF 6 Digit Codes - These codes correspond to the DEF digits of 6-digit codes that may arrive by DP/DTMF signaling. Only those non-area codes that total six digits should be entered. No entry is required if the ABC digits are listed under DP3D. Valid entries range from **"200-999"**. All codes of the Form 0XX or 1XX and N11 will be generically set by the ODA program.
- **DT12-DT17** -Spare digit type; reserved for future use.
- **FCID** -Feature Group D (FGD) Carrier Identification Codes (FCID) - Used to indicate if call is a carrier call.
- **I809** - International World Zone 1 codes for the 809 Numbering Plan Area (NPA). The 809 NPA has certain areas that are "domestic" and others that are "international." This DIGTYP entry is used to specify those "international" NXX codes in the 809 NPA to which calls can be placed.

Form Entries, Continued

DIGTYP (cont'd)

- **IWZ1** - International World Zone 1 codes - This DIGTYP entry is used to specify all international WZ1 area codes to which calls can be placed, except for the 809 NPA which has a separate DIGTYP entry.
- **NRA** - Non-re-routable Area Codes - The Numbering Plan Area Codes listed under this 3-digit type will not be rerouted by the Network Management program. The codes in this category can be derived from the Network Management and local routing practices. 0/1XX and 800 codes need not be entered. These codes are automatically marked as non-reroutable by the Office Data Assembler (ODA). Valid three digit entries range from **"200-999"**.
- **NRN** - Non-reroutable Non-area Codes. This category includes 3-digit NXX codes in the home Numbering Plan Area (NPA) only. The codes listed in this category will not be rerouted by the Network Management program. 0/1XX and 800 codes will be automatically marked as non-reroutable by the Office Data Assembler (ODA). Three digit codes from **"200-999"** may be listed on the form associated with NRNAC DIGTYP.
- **NRNX** - I800 Network Routing Number Exhaust. This indicator gives the 4ESS Switch the capability to administratively turn off DEF screening for specific ABC digits indicating the use of the I800 NRNX feature.
- **UTC** - Universal Treatment Non-area Codes - Three digit codes associated with this DIGTYP have a common system destination. These codes are not deleted from a call and appear as the ABC digits of a call. Examples of codes in this category are Toll Center Codes and Office Codes available to all Plain Old Telephone Service (POTS) domains. Another type would be associated with Gateway office operation, such as, overseas operator and Access Codes. Codes of this type may arrive from offices in the areas served directly by the 4ESS Switch. The universal type test codes that are assigned for 10X type test lines and code 011 for International Direct Distance Dialing (IDDD) access set by Office Data Assembler (ODA) should not be entered on this form. (A complete list of 10X type codes may be found in Division 2, Section 6.)
- **WZ1A** - World Zone 1 Area is entered to specify that an R digit is being defined for the 01R equal access signaling protocol. This identifier is needed at all Service Switching Point (SSP) offices. This identifier is also needed in all Access Tandem (AT) switches for Integrated Services Digital Network User Part/Multifrequency (ISUP/MF) inter-working.

Form Entries, Continued

RDIG R-Digit. For international Equal Access Signaling (EAS) to countries covered under the World Zone 1 numbering plan, an **"01R"** sequence for country is used. The "R" digit defines a geographic region within the World Zone 1 area. These "R" values are specified by the Local Exchange Carriers (LECs). Valid entries for the "R" digit are **"Blank"** or **"0-9"**.

ORNU Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

DIG The first, second and third digits of a set of digits. This field contains those 3-digit codes that are assigned under the category listed in the DIGTYP field.

For the input verify message, VER:MISC:FHT AINTRIG, DIG is a mandatory keyword and must be followed with a 3, 6 or 10 digit entry that will be used to match 10-digit Advanced Intelligent Network (AIN) triggers when retrieving information from the AIN trigger table.

DOM

DOMAIN - This field designates a community of interest that requires separate routing. The types of Domain are "Direct Distance Dialing (DDD), Verify (VRFY)" and a number ranging from **"20-83"** denoting a NON-Plain Old Telephone Service (POTS) domain. DDD is indicated by an entry of **"POTS"** in the DOM field. The Office Data Assembler (ODA) system will automatically build the DDD Domains (191 through 209). The **"VRFY"** Domain enables the Line-Busy Verification feature by operators over a dedicated network. When DOM equals VRFY, then Type of Trunk (TOT) must be MISC or CALLTYP must equal FHT, GNS, or TST. The NON-POTS Domains may be a Common Control Switching Arrangement (CCSA) Network, such as Federal Telecommunications System (FTS). These domains are entered as a number from **"20-69"**.

- The **NON-POTS domain of 78** is used to skip Network Management code controls for quality assurance testing, i.e., CASPER.
- The **NON-POTS domains 79 and 80** are reserved for specific International Switching Center (ISC) use.
- The **NON-POTS domain of 81**, also denoted by **"IVT"** for International Voice Transport, is reserved for call processing to transport international voice calls through the network to an ISC.
- The **NON-POTS domain of 82** is used as the translation domain for Data calls. The Data feature provides the capability for full rate data transmission via the 4ESS Switch over a dedicated network of digital trunks. These digital trunks terminate exclusively on Digital Interface Frames (DIF) at 4ESS Switch locations.
- **N64C** -This domain is used to route 64 kbps clear data calls using the 10-digit North American Numbering Plan (NANP).
- **N64R** -This domain is used to route 64 kbps restricted data calls using the 10-digit North American Numbering Plan.

Continued on next page

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

DOM (cont'd)

The following translations domains are used for wideband transmission:

- **NH0C** -This domain is used to route 384 kbps clear data calls using the 10-digit North American Numbering Plan (NANP).
- **NH1C** - This domain is used to route 1536 kbps clear data calls using the 10-digit NANP.

The following domains are non-translations domains used for routing only:

- **SF00-SF06** - Subscribed Footprint Area 00 to 06 (4E22R4>)
- **SF07-SF39** - Subscribed Footprint Area 07 to 39 (4E23R1>)
- **STCD** - Super Tandem Carrier ID (4E22R4>)
- **ATNS** - Access Tandem Transit Network Selection - This domain is used to translate equal access Integrated Services Digital Network User Part (ISUP) parameters to obtain the routing information.
- **NSR** - Number Services Routing - This domain will be populated with entries to perform Service Switching Point (SSP) Interexchange Carrier (IC) and International Carrier (INC) routing.

NTD

Number of Translated Digits - This field specifies the number of digits to be analyzed for this code grouping. This number is **"3"**. The first three digits are listed under the ABC field.

AC

Area Code - A **"Y"** for Yes indicates that all of the 3-digit codes (ABC digits) on this form are Area Codes. If the ABC digits are office codes, test codes or other non-Area Codes, AC will be **"N"** for No. This field is left **"Blank"** when Domain (DOM) is not equal to Plain Old Telephone Service (POTS).

Continued on next page

Form Entries, Continued

ORNU Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

ABC The first three digits of a given set of digits (A, B, and C) - This field lists all of the 3-digit codes that make up a code group. If the Area Code (AC) field is marked **"Yes"**, this code group may consist of 3-digit combinations in the range of **"200-999"**. If this code group is not an Area Code grouping (AC = **No**), then any number combination from **"000-999"** is valid. When the AC field is **"Blank"**, ABC may be equal to **"000-999"**.

If DOM equals Plain Old Telephone Service (POTS), the 3-digit code corresponding to the Home Numbering Plan Area (HNPA) may be assigned as ABC digits if permissive dialing is allowed on the HNPA and AC = **"N"** (Offices using Traditional Routing only - (4E22>).

DESEP Destination Separation is used to identify destinations for traffic flow purposes. Peg and usage counts are made as a function of the Trunk Sub-Group (TSG) incoming class (INSEP) and the outgoing destination class (DESEP). All outgoing or successfully terminated traffic is assigned a given destination class from **"1-255"**.

NOTE: DESEP class 63 is assigned generically for test calls. Any other assignment to class 63 should take this fact into consideration.

For code group forms, a DESEP class will be assigned only when the CALLTYP is equal to CRB, DSN, EAR, GNS, MCT, MMT, MRT, PAS, PRT, RDB, RNR, SSP, TEL, or TTS. This field is **"Blank"** for any other Call Type value.

DOM

DOMAIN - This field designates a community of interest that requires separate routing. The types of Domain are "Direct Distance Dialing (DDD), Verify (VRFY)" and a number ranging from **"20-83"** denoting a NON-Plain Old Telephone Service (POTS) domain. DDD is indicated by an entry of **"POTS"** in the DOM field. The Office Data Assembler (ODA) system will automatically build the DDD Domains (191 through 209). The **"VRFY"** Domain enables the Line-Busy Verification feature by operators over a dedicated network. When DOM equals VRFY, then Type of Trunk (TOT) must be MISC or CALLTYP must equal FHT, GNS, or TST. The NON-POTS Domains may be a Common Control Switching Arrangement (CCSA) Network, such as Federal Telecommunications System (FTS). These domains are entered as a number from **"20-69"**.

- The **NON-POTS domain of 78** is used to skip Network Management code controls for quality assurance testing, i.e., CASPER.
- The **NON-POTS domains 79 and 80** are reserved for specific International Switching Center (ISC) use.
- The **NON-POTS domain of 81**, also denoted by **"IVT"** for International Voice Transport, is reserved for call processing to transport international voice calls through the network to an ISC.
- The **NON-POTS domain of 82** is used as the translation domain for Data calls. The Data feature provides the capability for full rate data transmission via the 4ESS Switch over a dedicated network of digital trunks. These digital trunks terminate exclusively on Digital Interface Frames (DIF) at 4ESS Switch locations.
- **N64C** -This domain is used to route 64 kbps clear data calls using the 10-digit North American Numbering Plan (NANP).
- **N64R** -This domain is used to route 64 kbps restricted data calls using the 10-digit North American Numbering Plan.

DOM (cont'd)

The following translations domains are used for wideband transmission:

- **NH0C** -This domain is used to route 384 kbps clear data calls using the 10-digit North American Numbering Plan (NANP).
- **NH1C** - This domain is used to route 1536 kbps clear data calls using the 10-digit NANP.

The following domains are non-translations domains used for routing only:

- **SF00-SF06** - Subscribed Footprint Area 00 to 06 (4E22R4>)
- **SF07-SF39** - Subscribed Footprint Area 07 to 39 (4E23R1>)
- **STCD** - Super Tandem Carrier ID (4E22R4>)
- **ATNS** - Access Tandem Transit Network Selection - This domain is used to translate equal access Integrated Services Digital Network User Part (ISUP) parameters to obtain the routing information.
- **NSR** - Number Services Routing - This domain will be populated with entries to perform Service Switching Point (SSP) Interexchange Carrier (IC) and International Carrier (INC) routing.

NTD

Number of Translated Digits - This field specifies the number of digits to be analyzed for this code grouping. For domestic code grouping, this number may range from **"4 - 6"** depending on the code group form. The first three digits are listed under the ABC field, the remaining digits are listed in the DEF field.

AC

Area Code - A **"Y"** for Yes indicates that all of the 3-digit codes (ABC digits) on this form are Area Codes. If the ABC digits are office codes, test codes or other non-Area Codes, AC will be **"N"** for No. This field is left **"Blank"** when Domain (DOM) is not equal to Plain Old Telephone Service (POTS).

Continued on next page

Form Entries, Continued

ABC

The first three digits of a given set of digits (A, B, and C) - This field lists all of the 3-digit codes that make up a code group. If the Area Code (AC) field is marked **"Yes"**, this code group may consist of 3-digit combinations in the range of **"200-999"**. If this code group is not an Area Code grouping (AC = **No**), then any number combination from **"000-999"** is valid. When the AC field is **"Blank"**, ABC may be equal to **"000-999"**.

If DOM equals Plain Old Telephone Service (POTS), the 3-digit code corresponding to the Home Numbering Plan Area (HNPA) may be assigned as ABC digits if permissive dialing is allowed on the HNPA and AC = **"N"** (Offices using Traditional Routing only - (4E22>).

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

Use pursuant to Company Instructions

Form Entries, Continued

DEF

The fourth (D) fifth (E) and sixth (F) digits of a series. This field may contain one, two or three digits. It lists all of the four to six digits (including the three in the ABC field) combinations that belong to this Code Group. A single digit (D) specifies 4-digit translation, two digits (D and E) specifies 5-digit, and all three (DEF) requires 6-digit translation. A numeric or an **"X"** may be used to specify translation. The numeric will define a specific code while the **"X"** will represent all non-vacant numeric from **"0**-**9"**. Translation must be specified equal to the Number of Translated Digits (NTD). A numeric may not follow an **"X"**.

An **"X"** may be used for one, two, or three positions of the DEF field determined by NTD. If one **"X"** is used it must be in the F position if there are two numerics. If two "Xs" are used, they must be in the EF positions. All codes not listed will be routed to Final Handling Treatment-Vacant Code Analysis (FHT-VCA) by the Office Data Assembler (ODA) program.

If NPA + XXX is used with Area Code (AC) equal to yes, then codes 000-199 will be routed to Vacant Code. If it is necessary to route certain codes in the 000-199 range, they should be routed in the following manner.

Example:

- NPA + 0XX to a principal city for Numbering Plan Area (NPA)
- NPA + 1XX to a principal city for NPA
- NPA + XXX to city "A" in NPA.

If Domain (DOM) equals Plain Old Telephone Service (POTS), AC equals Yes, and the ABC digits equal the 3-digit code associated with a Served NPA, then the 3-digit codes corresponding to the Home NPA (Traditional Routing Only - (4E22>)) and the Served NPA must not be assigned as DEF digits.

DESEP

Destination Separation is used to identify destinations for traffic flow purposes. Peg and usage counts are made as a function of the Trunk Sub-Group (TSG) incoming class (INSEP) and the outgoing destination class (DESEP). All outgoing or successfully terminated traffic is assigned a given destination class from **"1-255"**.

NOTE: DESEP class 63 is assigned generically for test calls. Any other assignment to class 63 should take this fact into consideration.

For code group forms, a DESEP class will be assigned only when the CALLTYP is equal to CRB, DSN, EAR, GNS, MCT, MMT, MRT, PAS, PRT, RDB, RNR, SSP, TEL, or TTS. This field is **"Blank"** for any other Call Type value.

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

RC 331

General

The Recent Change (RC) Form 331 is used to relate "00Y" codes to a far end office Number Plan Area (NPA) and Local Access and Transport Area (LATA).

The 00Y code is used when the 4ESS™-2000 Switch Access Tandem has an end office homing on it that originates an 800, 888, or 877 call from an NPA other than that listed on the Trunk Subgroup (TSG) characteristics and is not able to forward Automatic Number Identification (ANI). In order to identify the originating NPA, the end office will convert the 800, 888, 877 to a predetermined 00Y code for identification. This 00Y code will also have to be opened in the new locally assigned numeric Domain as is the 800 code.

An alphabetical keyword list is included in this section on page 5.

Form Entries

RC:CODEGRP;CHG;OPT(YCODE),- - -:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

Form Entries, Continued

00Y	The Y digit value of the 00Y signaling sequence which is used to identify the far end Numbering Plan Area (NPA) and Local Access Transport Area (LATA) for an "800" or other Number Service call. Legal values for **"Y"** are: **"0-9"**.
FENPA	Far End Numbering Plan Area/Trunk Subgroup (TSG) - Enter a 3-digit Numbering Plan Area (NPA) code to identify the far end of the subgroup. Valid entries range from **"200-999"**. With an International Trunk Subgroup, if the far end of the Trunk Subgroup is outside World Zone 1, enter the 1-, 2-, or 3-digit country code. Valid ranges of Country Code entries are **"2-9"**, **"20-99"**, and **"200-999"**. This field is the NPA of the Far-End Office. If this office is not in the Home or Served area, then the Domain will be Plain Old Telephone Service-Intertoll/Intertandem (POTS-IT) and the IT field will be forced to **"Y"** in a Local Exchange Carrier (LEC) switch.
FELATA	Far End Local Access Transport Area/Trunk Subgroup - This field is used to identify the Local Access Transport Area (LATA) of the far end switch. Legal entries are: **"Blank"**," **000-999"**.
COIN	This field specifies if the 00Y code will be used to indicate traffic delivered from coin stations. Valid entries are: **"N"** - no, **"Y"** - yes.

RC 334

General

The Recent Change (RC) Form 334 is used to specify the actions to be taken for the valid Information Digits (II) and/or Originating Line Information (OLI) values that can be received by an Inter-Local Access Transport Area (LATA) Carrier switch via Equal Access Signaling (EAS). The II digits are the two information digits which precede the Automatic Number Identification (ANI) (if the ANI option is chosen). The OLI parameter is part of the Integrated Services Digital Network User Part (ISUP) signaling message.

If the ANI option is chosen, eight possible II+ANI sequences can be received: II+3 to II+10 digits. Normally either II+10 digits or II+3 digits will be received. The 10 digit ANI will correspond to the billing number of the originating party. The 3 digit ANI will be received when the originating party cannot be identified (e.g., multi-party lines) and will consist of the originating Numbering Plan Area (NPA). Only the number of ANI digits are included in the number entered in the ANICOUNT field.

An alphabetical keyword list is included in this section on page 7.

Form Entries, Continued

II	Information Digits (II) - This field is used to specify the II digits of Multifrequency (MF) equal access signaling that correspond to the Originating Line Information (OLI) parameter for Integrated Services Digital Network User Part (ISUP). Valid entries are **"Blank"** or **"00-99"**.
OLI	Originating Line Information - This field is used to specify the OLI parameter value of Integrated Services Digital Network User Part (ISUP) that corresponds to the Information Digits (IIs) of Multifrequency (MF) Equal Access Signaling (EAS). Valid entries are **"Blank"** or **"0-255"**.
ANICOUNT	The expected digit count (given that this is a Equal Access Signaling [EAS] Information Digit [II] + Automatic Number Identification [ANI] sequence or Originating Line Information [OLI] value) is specified in this field. The expected digit count is the total number of ANI digits. Valid entries are **"3-10"** for II and **"0"**, **"3"**, **"10"**, or **"X"** for OLI, where **X** means any digit count other than **0**, **3**, or **10**.

Continued on next page

Form Entries, Continued

ANIACTN This field specifies the action to be taken when the first two digits of a call correspond to an Equal Access Signaling (EAS) Information Digit (II) + Automatic Number Identification (ANI) sequence or when an Integrated Services Digital network User Part (ISUP) message is received with a specified Originating Line Information (OLI) value. The following entries are allowed:

- **CANI** - Complete ANI. If the digit count for the call is equal to ANICOUNT, assume this is the ANI sequence and expect the next stage.
- **IAROA** - Incomplete ANI. If the digit count for the call is equal to ANICOUNT, kill the call and play the Reorder Announcement (ROA).
- **IAAFA** - Incomplete ANI. If the digit count for the call is equal to ANICOUNT, assume this is the ANI sequence and expect the next stage. Processing for the call will proceed according to the ANI Failure Action (AFA) field specified for the particular Far End Network (FEN) on the 406L Form.
- **NONEA** - Non Equal Access. This value is used only for II digits and specifies that the call is a traditional call, not equal access.

RESELL Not Applicable - Entries: **"Blank"**

II	Information Digits (II) - This field is used to specify the II digits of Multifrequency (MF) equal access signaling that correspond to the Originating Line Information (OLI) parameter for Integrated Services Digital Network User Part (ISUP). Valid entries are **"Blank"** or **"00-99"**.
SRVCT	Service Type - This field is used to specify the service that the II digit pair or Originating Line Information (OLI) value is being used for. Valid entries are **"EAPOTS"** for Equal Access Plain Old Telephone Service [POTS]), **"SDN"** for Software Defined Network, **"OWATS"** for outwats, **"TRS"** for Telecommunications Relay Service), **"T800"** for translated 800 number, and **"CMC"** for cellular mobile carrier.
OLI	Originating Line Information - This field is used to specify the OLI parameter value of Integrated Services Digital Network User Part (ISUP) that corresponds to the Information Digits (IIs) of Multifrequency (MF) Equal Access Signaling (EAS). Valid entries are **"Blank"** or **"0-255"**.

RC 338

General

The Recent Change (RC) Form 338 is used to specify the Originating Line Information (OLI) value, calling party number handling, billing number handling, and Service Identity/ Automatic Number Identification (SID/ANI) increment message handling at the terminating toll switch for the specified Service Identity Index (SII) value. Fields left blank on this form specify that no change is to be made to the existing setting of the translations data.

An alphabetical keyword list is included in this section on page 6.

RC:EA;CHG;OPT(SII),- - -:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

SII

Service Identity Index. This field is used to specify a particular service for which the customer is paying, e.g., Long Distance Service, International Direct Distance Dialed (DDD) Outbound, Alliance Teleconference, etc. Valid entries are **"0-255"**.

Continued on next page

Form Entries, Continued

ORNU Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

OLI Originating Line Information - This field is used to specify the OLI parameter value of Integrated Services Digital Network User Part (ISUP) that corresponds to the Information Digits (IIs) of Multifrequency (MF) Equal Access Signaling (EAS). Valid entries are **"Blank"** or **"0-255"**.

For RC Form 338, this field is used to specify the OLI value to be used for the specified Service Identity Index (SII) value at the terminating toll switch. This value will only be used if the indicator in the outgoing Trunk Subgroup (TSG) states that OLI can be sent. Valid entries are **"Blank"** or "**0-255"**.

BNA Billing Number Action - This field is used at the terminating toll switch to specify that the Billing Number (BN) should be Passed (**P)**, dropped (**D)**, or that the Trunk Subgroup (TSG) (**T**) control field, Prohibit Sending Billing Number (PSBN), should specify the appropriate action to be taken. Valid entries are **"Blank"**, **"P"**, **"D",** and **"T"**. If left **"Blank"**, this field will default to the TSG control.

CPNA Calling Party Number Action - This field is used at the terminating toll switch to specify the calling party number (CPN). Valid entries are

- **P** The CPN is passed.
- **D** The CPN is dropped.
- **T** The Trunk Subgroup (TSG) field of Prohibit Sending Calling Party Number (PSCPN) shall specify the CPN action.

ASAI Avoid SID/ANI Increment - Enter **"Y"** if a Service Identity/Automatic Number Identification (SID/ANI) increment message should not be sent back to the recording office when the Calling Party Number/Billing Number (CPN/BN) is successfully passed. Otherwise enter **"N"** or leave **"Blank"**.

DESV	Dedicated Egress Service. This field is used at the terminating toll switch to identify the service when the call is routed to a dedicated egress (ISDN) customer. This allows the service from the Service Identity Index (SII) to be sent to the customer on egress Q.931 trunks. Valid entries are **"Blank"**, **"UNK"** (unknown), **"SDN"** (Software Defined Network), **"GSDN"** (Global SDN), **"M800"** (Megacom* 800), **"I800"** (International 800), **"MQ"** (Multiquest), **"SDS"** (Switched Digital Service), "SDI" (Switched Digital International), **"ILDS"** (International Long Distance Service).

*Megacom is a registered trademark of AT&T.

RC 341

General

The Recent Change (RC) Form 341 is used to update the Emergency Alternate Routing Database. In the event of a natural disaster, or a bomb threat or other terrorist activity, the customers' Alternate Number (ALTNUM) and Primary Domain (PRIMDOM) will be used to route a call. This form will only update the database - the service must be activated/deactivated via RC Form 342 or already be active in the 4ESS™-2000 Switch Office Data Assembler (ODA).

An alphabetical keyword list is included in this section on page 5.

RC 342

General

The Recent Change (RC) Form 342 is used to activate/deactivate a customer that is in the Emergency Alternate Routing Database (via the RC FORM 341). When the customer is active the customers' Alternate Number (ALTNUM) and Primary Domain (PRIMDOM) will be used to route a call. When the customer is deactivated the customers' Primary Number (PRIMNUM) and Primary Domain (PRIMDOM) will be used to route a call.

It is possible for RC 342 to fail to Activate or Deactivate all of the alternate routing numbers specified on the form. This may happen when the customer data base is large. In case of such a failure, a warning message is displayed which tells the user the form entries that must be re-entered.

An alphabetical keyword list is included in this section on page 5.

RC 343

General

Form 343, available with 4E18 and later generic programs, is used to expand code groups as given in Table 18 below. (X means any digit from 0-9 and all other explicit digits given are only those cases allowed.) Routable means that no other existing codes will be destroyed when this new code is defined.

Table 18

OLD CODEGROUP	NEW CODEGROUP	RESTRICTIONS
1XX-X	1XX-0X	1XX-0X must be routable
1XX-XX	1XX-0XX	1XX-0XX must be routable
1XX-XXX	1XX-0XX-X	1XX-0XX-X must be routable
1XX-XXX-X	1XX-0XX-XX	1XX-0XX-XX must be routable
1XX-XXX-XX	1XX-0XX-XXX	1XX-0XX-XXX must be routable
1XX-XXX-XXX	1XX-0XX-XXX-X	1XX-0XX-XXX-X must be routable
0XX-X	0XX-0X	0XX-0X must be routable
0XX-XX	0XX-0XX	0XX-0XX must be routable
0XX-XXX	0XX-0XX-X	0XX-0XX-X must be routable

This message is classed as a Recent Change Data Message (RCDM).

DOM

DOMAIN - This field designates a community of interest that requires separate routing. The types of Domain are "Direct Distance Dialing (DDD), Verify (VRFY)" and a number ranging from **"20-83"** denoting a NON-Plain Old Telephone Service (POTS) domain. DDD is indicated by an entry of **"POTS"** in the DOM field. The Office Data Assembler (ODA) system will automatically build the DDD Domains (191 through 209). The NON-POTS Domains may be a Common Control Switching Arrangement (CCSA) Network, such as Federal Telecommunications System (FTS). These domains are entered as a number from **"20-69"**.

- The **NON-POTS domain of 78** is used to skip Network Management code controls for quality assurance testing, i.e. CASPER.
- The **NON-POTS domains 79 and 80** are reserved for specific International Switching Center (ISC) use.
- The **NON-POTS domain of 81**, also denoted by **"IVT"** for International Voice Transport, is reserved for call processing to transport international voice calls through the network to an ISC.
- The **NON-POTS domain of 82** is used as the translation domain for Data calls. The Data feature provides the capability for full rate data transmission via the 4ESS Switch over a dedicated network of digital trunks. These digital trunks terminate exclusively on Digital Interface Frames (DIF) at 4ESS Switch locations.
- **N64C** -This domain is used to route 64 kbps clear data calls using the 10-digit North American Numbering Plan (NANP).
- **N64R** -This domain is used to route 64 kbps restricted data calls using the 10-digit North American Numbering Plan.

The following translations domains are used for wideband transmission:

- **NH0C** -This domain is used to route 384 kbps clear data calls using the 10-digit North American Numbering Plan (NANP).
- **NH1C** - This domain is used to route 1536 kbps clear data calls using the 10-digit NANP.

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

DOM (cont'd)

The following domains are non-translations domains used for routing only:

- **SF00-SF06** - Subscribed Footprint Area 00 to 06 (4E22R4>)
- **SF07-SF39** - Subscribed Footprint Area 07 to 39 (4E23R1>)
- **STCD** - Super Tandem Carrier ID (4E22R4>)

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

ABC-DEF-GHI

The first through ninth digits of the "Old Code Group" are to be expanded as shown in Table 18 on Page 1 of this Section. The "A" digit must be **"0"** or **"1"**. The "B" - "D" digits can be **"0 - 9"**. The "E"- "I" digits can be **"Blank",** or **"0 - 9"** depending on the structure of the Old Code Group. This Recent Change (RC) will enter a **"0"** in the "D" digit of the New Code Group, and the Old Code Group "D" digit will become the New Code Group "E" digit. Any subsequent digits or blanks will be sequentially moved to the right by one digit.

NOTE: Valid CALLTYPs of the digits must be one of the following: SDX, RDB, or GNS.

If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

DOMTYP Domain Type - YES/NO indicators. Valid entries are:

- **FCID** - Entered for a specific Domain (DOM) indicates that the Feature Group D Carrier ID is four digits for that domain. NOTE: There are no domain entry restrictions for this DOMTYP.

- **SDAC** - Entered for a specific Domain (DOM) indicates that the domain is allowed for an Access Tandem 6-Digit Called Number Trigger (CNT) for either the Advanced Intelligent Network (AIN) or the Local Number Portability (LNP) features. Provisioning restrictions: This DOMTYP can only be provisioned if the AIN 6-Digit CNT Expansion (#516) feature has been purchased. Also, the following domain entries are restricted for this DOMTYP: the data domain entries **"N64C"** and **"82"** are only allowed if the AIN Capabilities for Data Calls (#419) feature has been purchased. The footprint domain entries **"SF00-SF39"** are only allowed if the Access Tandem Routing Enhancement (#488) feature has been purchased.

- **TDAC** - Entered for a specific Domain (DOM) indicates that the domain is allowed for an Access Tandem 10-Digit Called Number Trigger (CNT) for the Advanced Intelligent Network (AIN) feature. Provisioning restrictions: This DOMTYP can only be provisioned if the AIN 6-Digit CNT Expansion (#516) feature and the AIN Called Number Trigger Expansion (#442) feature have been purchased. Also, the following domain entries are restricted for this DOMTYP: the data domain entries **"N64C"** and **"82"** are only allowed if the AIN Capabilities for Data Calls (#419) feature has been purchased, and the footprint domain entries **"SF00-SF39"** are only allowed if the Access Tandem Routing Enhancement (#488) feature has been purchased. Call Processing will only reference this domain type indicator if this 10-Digit Domain option is turned **"ON"** via the "F20" FEATURE ITEM feature indicator.

DOM

DOMAIN - This field designates a community of interest that requires separate routing. The types of Domain are "Direct Distance Dialing (DDD), Verify (VRFY)" and a number ranging from **"20-83"** denoting a NON-Plain Old Telephone Service (POTS) domain. DDD is indicated by an entry of **"POTS"** in the DOM field. The Office Data Assembler (ODA) system will automatically build the DDD Domains (191 through 209). The **"VRFY"** Domain enables the Line-Busy Verification feature by operators over a dedicated network. When DOM equals VRFY, then Type of Trunk (TOT) must be MISC, or CALLTYP must equal FHT, GNS, or TST. The NON-POTS Domains may be a Common Control Switching Arrangement (CCSA) Network, such as Federal Telecommunications System (FTS). These domains are entered as a number from **"20-69"**.

- The **NON-POTS domain of 78** is used to skip Network Management code controls for quality assurance testing, i.e. CASPER.
- The **NON-POTS domains 79 and 80** are reserved for specific International Switching Center (ISC) use.
- The **NON-POTS domain of 81**, also denoted by **"IVT"** for International Voice Transport, is reserved for call processing to transport international voice calls through the network to an ISC.
- The **NON-POTS domain of 82** is used as the translation domain for Data calls. The Data feature provides the capability for full rate data transmission via the 4ESS Switch over a dedicated network of digital trunks. These digital trunks terminate exclusively on Digital Interface Frames (DIF) at 4ESS Switch locations.
- **N64C** -This domain is used to route 64 kbps clear data calls using the 10-digit North American Numbering Plan (NANP).
- **N64R** -This domain is used to route 64 kbps restricted data calls using the 10-digit North American Numbering Plan.

The following translations domains are used for wideband transmission:

- **NH0C** -This domain is used to route 384 kbps clear data calls using the 10-digit North American Numbering Plan (NANP).
- **NH1C** - This domain is used to route 1536 kbps clear data calls using the 10-digit NANP.

Continued on next page

Form Entries, Continued

DOM (cont'd)

The following domains are non-translations domains used for routing only:

- **SF00-SF06** - Subscribed Footprint Area 00 to 06 (4E22R4>)
- **SF07-SF39** - Subscribed Footprint Area 07 to 39 (4E23R1>)
- **STCD** - Super Tandem Carrier ID (4E22R4>)
- **ATNS** - Access Tandem Transit Network Selection - This domain is used to translate equal access Integrated Services Digital Network User Part (ISUP) parameters to obtain the routing information.
- **NSR** - Number Services Routing - This domain will be populated with entries to perform Service Switching Point (SSP) Interexchange Carrier (IC) and International Carrier (INC) routing.

RC 345

General

The Recent Change (RC) Form 345 (RC FORM345) is used to set or reset an Advanced Intelligent Network (AIN) trigger in the subsequent digit translations. Some limited field restrictions are described as follows:

If ACTION = A:

1. If FH is **"Blank"** or FH = **"FT"**, then the remaining new fields on the form (DRCC, SCSANN, and DFRN) must be **"Blank"**.

2. If FH = **"DR"**, then DRCC and SCSANN must be entered and DFRN is optional. The exception is when DRCC = **"DRN"**, then DFRN is required.

If ACTION = C, then DOM, AC, ABC, DEFGHIJ, and TOS must be entered (where appropriate) and must match an entry that is already in translations. Therefore, only the new fields (FH, SCSANN, DRCC, and DFRN) can actually change and the input for these fields must correspond to the population rules defined for the add action.

If ACTION = D, then all the fields must be entered (where appropriate) and must match an entry that is already in translations.

An alphabetical keyword list is included in this section on page 8.

Recent Change (RC) action field. Entries appended to the message header

field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

ACTION

Action - Add, Change, or Delete. Enter **"A"** if the associated data on this form is being added. Enter **"C"** if the associated data on this form changes existing data. Enter **"D"** if the associated data on this form is being deleted.

Form Entries, Continued

DOM

DOMAIN - This field designates a community of interest that requires separate routing. The types of Domain are "Direct Distance Dialing (DDD), Verify (VRFY)" and a number ranging from **"20-83"** denoting a NON-Plain Old Telephone Service (POTS) domain. DDD is indicated by an entry of **"POTS"** in the DOM field. The Office Data Assembler (ODA) system will automatically build the DDD Domains (191 through 209). The **"VRFY"** Domain enables the Line-Busy Verification feature by operators over a dedicated network. When DOM equals VRFY, then Type of Trunk (TOT) must be MISC, or CALLTYP must equal FHT, GNS, or TST. The NON-POTS Domains may be a Common Control Switching Arrangement (CCSA) Network, such as Federal Telecommunications System (FTS). These domains are entered as a number from **"20-69"**.

- The **NON-POTS domain of 82** is used as the translation domain for Data calls. The Data feature provides the capability for full rate data transmission via the 4ESS Switch over a dedicated network of digital trunks. These digital trunks terminate exclusively on Digital Interface Frames (DIF) at 4ESS Switch locations.
- **N64C** -This domain is used to route 64 kbps clear data calls using the 10-digit North American Numbering Plan (NANP).

The following domains are non-translations domains used for routing only:

- **SF00-SF06** - Subscribed Footprint Area 00 to 06 (4E22R4>)
- **SF07-SF39** - Subscribed Footprint Area 07 to 39 (4E23R1>)
- **STCD** - Super Tandem Carrier ID (4E22R4>)

AC

Area Code - A **"Y"** for Yes indicates that all of the 3-digit codes (ABC digits) on this form are Area Codes. If the ABC digits are office codes, test codes or other non-Area Codes, AC will be **"N"** for No. This field is left **"Blank"** when Domain (DOM) is not equal to Plain Old Telephone Service (POTS).

ABC-DEF-GHI-J

ABC-DEF-GHI-J Digits. Entries are any numerics **"0 - 9"** for each digit with routing of RDB, GNS, or SDX.

Continued on next page

Form Entries, Continued

TTYPE	Call Type Call Number Trigger Type for: the Advanced Intelligent Network (AIN) and/or the access tandem Local Number Portability (LNP) triggers. The following are valid field entries: **"A"** for AIN, **"L"** for LNP, or **"B"** for both AIN & LNP.
LTOS	Call Type Local Number Portability Type of Service parameter. Valid entries are the same as TOS (**"Blank"** or **"0-31"**).
TOS	This field specifies the Type of Service index value that is being assigned a CODE input. Legal input values are: **"Blank"** or **"0-31"**.
FH	AIN Fault Handling - Valid entries are **"Blank"**, **"FT"**, and **"DR"**. This element specifies the type of fault handling that applies to the Called Number Trigger. • DR is for the Default Routing. • FT is for the Final Treatment, which is the default for this field. • **"Blank"**: translates to FT. Note: **"Blank"** will not be printed for verify.
SCSANN	Announcement number for Service Circuit System (SCS) - For Form RC 345, SCSANN is the SCS Announcement for the Default Routing Voice Announcement. Valid entries are **"Blank"** or a number between **"0 and 65535"**. This element specifies the Service Circuit Unit (SCU0 voice announcement, if any, that will be played before the routing number is determined. **"0"** is the default. Note: **"Blank"** is valid if and only if Advanced Intelligent Network (AIN) Fault Handling (FH) is set to Final Treatment (FT).

Continued on next page

Form Entries, Continued

DRCC - Valid entries are , **"TRM"** **"DRN"**, and . This element specifies the treatment that applies to the to Default Routing (DR).

CPN

- is for Route to Specific Default Routing Number. When this is specified, the Specific Default Routing Number (DFRN) must be
- is for terminate, which is the default.
- **Blank** is valid if and only if AIN FH is set to

DFRN Specific Default Routing Number (DRN) - Valid input is either or a 10 digit routing number. This element specifies the number that will be used

"Blank" zeroes out the 10 routing digits. This field is required only when

Number (DRN); otherwise, this field may either be populated or left **"Blank"** with the exception that DFRN must be **"Blank"**
Network (AIN) Fault Handling (FH) is set to Final Treatment (FT).

RC 349

General

Recent Change (RC) Form 349 is used to specify the default Information Digits (II) that are to be forwarded to an Interexchange Carrier (IC) if Flexible Automatic Number Identification/Information Digit (ANI/II) restrictions apply. The II Digits are two information digits which precede the ANI (if the NAI option is chosen).

Note: The II defaults can only be provisioned if the Tandem Flexible ANI/II Digit Restriction feature has been purchased. Also, a specific II default "IIDF" can only be provisioned (ID1-ID6) if the corresponding default (IID) has been provisioned. These specific "IID" default values are provisioned via RC Form 811 and verified by verify input messages: 13ba-VER:EA:OPT DFI.

The **"PSS"** (for PASS as received) entry is used instead of the default **"ID1-ID6"** entries to indicate when the II digits should be passed as received. Also, if an II digits is specified in the "II" field the accompanying "IDEF" field must be a non-blank entry.

An alphabetical keyword list is included in this section, starting on page 5.

RC 350

General

Recent Change (RC) Form 350 is used to specify the default Originating Line Information (OLI) values that are to be forwarded to an Interexchange Carrier (IC) if Flexible Automatic Number Identification/Information Digit (ANI/II) restrictions apply. The OLI parameter is part of the Integrated Services Digital Network User Part (ISUP) signaling message.

Note: The OLI defaults can only be provisioned if the Tandem Flexible ANI/II Digit Restriction feature has been purchased. Also, a specific OLI default "ODEF" can only be provisioned (OD1 - OD6) if the corresponding default (OLID) has been provisioned. These specific "OLID" default values are provisioned via RC Form 811 and verified by verify input messages: 13bb-VER:EA:OPT DFO.

The **"PSS"** (for PASS as received) entry is used instead of the default **"OD1 - OD6"** entries to indicate when the OLI parameter should be passed as received. Also, if an OLI value is specified in the "OLI" field the accompanying "ODEF" field must be a non-blank entry.

An alphabetical keyword list is included in this section on page 5.

Form Entries

RC:EA;CHG;OPT(EADFO),___:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

General

This information applies to all sections within this division:

1. The characters > and < are used to indicate which Generic Programs will apply.

   Examples:

   - 4E22> indicates 4E22 and later Generic Programs.
   - <4E22 indicate 4E22 and earlier Generic Programs.
   - 4E22 indicates the 4E22 Generic Program only.
   - >4E22 indicates all Generic Programs up to, but not including, 4E22.

2. Following the general section is a copy of the applicable Recent Change (RC) Form/s. Where there is more than one Generic published, the forms will be filed in ascending order by Generic.

3. The Keyword field names of the form entries in each section are listed in order of appearance on the latest Generic Recent Change Form. (Keywords deleted from the latest form issue will still remain in the form order of the last RC Form that it appeared until finally deleted).

4. The alphabetical "Keyword Index" of the field names is located at the end of each Recent Change Section, following the text, and any tables and/or graphics that may apply.

5. Each Keyword definition will only list the valid entries for the RC Form covered in each applicable section. Some Keywords may have additional valid entries related overall and may be found in the alphabetical Keyword Glossary (Div. 9, Sec. 1).

RC Form 400

General

This form defines the valid originating office codes that may be received via a Centralized Automatic Message Accounting (CAMA) Trunk Group.

A Recent Change (RC) Form 400 must be input for each CAMA Trunk Subgroup (TSG) added on an RC Form 101 from a specific building subdivision code. Reference should be made to "CAMA Translations" in Division 5, Section 3, of this TG4 prior to implementation of this form.

For 4E22>, this RC Form is not valid for offices using Served Numbering Plan Area (SNPA) 10-Digit Routing

This message is classed as a Recent Change Data Message (RCDM).

An alphabetical keyword list is included in this section on page 5.

```

Form Entries

RC:CAMASCRN;CHG;OPT(OOFCG),---:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

Continued on next page

Form Entries, Continued

OLCIGI

Originating Local Call Intercept Group Index - The OLCIGI is a number from **"1-255"**. The OLCIGI (except for 1) points to a group of terminating office codes that are to be intercepted. These terminating codes are defined on another Centralized Automatic Message Accounting (CAMA) RC Form 402 with the same OLCIGI index (2-255). OLCIGI 1 is reserved for those Centralized Automatic Message Accounting (CAMA) Trunk Groups from offices that do their own local call intercept. In these cases, the valid office codes are defined in Office Data Assembler (ODA) with an OLCIGI equal to 1. No equivalent RC Form 402 is required.

POVC

Pass Originating Validity Check - This column will normally be marked **"N"** for No for regular code grouping by Centralized Automatic Message Accounting (CAMA) Trunk Group.

A **"Y"** for Yes indicates that the office code listed on the form is to ignore the check for valid CAMA Trunk Group. Normally, an office code will only be valid on one CAMA Trunk Group. If some originating (calling) code may be received on more than one CAMA group, POVC must equal Yes. This should only be required for pseudo office codes associated with special billing (QZ).

If **"No"**, all codes listed in the Originating Office Code (OOFC) fields will be checked against the incoming CAMA Trunk Group for validity.

OOFC

Originating Office Code - This field may contain any 3-digit code from "**0-999"**. For a given form, the originating codes listed in this field are those that are valid for the Centralized Automatic Message Accounting (CAMA) Trunk Group. If any other code is received via Automatic Number Identification (ANI) or Operator Number Identification (ONI) (except for a code with the Pass Originating Validity Check (POVC) set to "**Yes"**), the call will be intercepted.

RC Form 401

General

This form is used to change the terminating office code portion of the Local Call Intercept (LCI) blocking pattern for an established profile. This pattern is used to prevent local calls from being processed over the toll network via Centralized Automatic Message Accounting (CAMA) trunks (Automatic Number Identification [ANI] or Operator Number Identification [ONI]).

Reference should be made to "CAMA Translations" in Division 5, Section 3, of this TG4 prior to implementation of this form.

For 4E22>, this Recent Change (RC) Form is not valid for offices using Served Numbering Plan Area (SNPA) 10-Digit Routing

This message is classed as a Recent Change Data Message (RCDM).

An alphabetical keyword list is included in this section on page 7.

OLCIGI	Originating Local Call Intercept Group Index - The OLCIGI is a number from **"1-255"**. The OLCIGI (except for 1) points to a group of terminating office codes that are to be intercepted. These terminating codes are defined on another Centralized Automatic Message Accounting (CAMA) RC Form 402 with the same OLCIGI index (2-255). OLCIGI 1 is reserved for those Centralized Automatic Message Accounting (CAMA) Trunk Groups from offices that do their own local call intercept. In these cases, the valid office codes are defined in Office Data Assembler (ODA) with an OLCIGI equal to 1. No equivalent RC Form 402 is required.
ORNU	Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

Continued on next page

Form Entries, Continued

TNPA

Terminating Numbering Plan Area - For code group forms, this field identifies the specific Numbering Plan Area (NPA) to which a 7-digit inter-area call may be directed. Any NPA (including home and served) may be entered in this field. The range is **"200-999"**.

NOTE: Even though the call may be originated on a 7-digit basis, the 4ESS Switch will prefix the destination area code (before translation) for all NPAs except the home NPA. In addition to being specified on the RC Form 308 each terminating office code must also be listed on an RC Form 301 or 302 as the DEF digits, with the TNPA specified as the ABC digits. For Centralized Automatic Message Accounting (CAMA) forms, this field identifies the area code associated with the office codes listed on this form. When a local calling area crosses an NPA boundary, more than one terminating NPA may be represented by a given profile index. In this case, separate RC 402 Forms with the same profile index are prepared for each NPA (up to four). Valid entries range from "200-999".

For RC Form 403, this field lists the 3-digit codes that are to be blocked when received as the called (terminating) area code component of a CAMA call. Blocked codes will be directed to the "Unauthorized CAMA" announcement. Valid entries range from **"200-999"**.

BLOCK

The block field specifies whether or not the codes, listed on this form, are to be blocked (intercepted) or allowed to continue as a valid call.

A **"Y"** for yes indicates that the code will be intercepted.

An **"N"** for no indicates that the terminating code is valid as a Centralized Automatic Message Accounting (CAMA) call over the trunk group associated with the profile index (Recent Change [RC] Form 400).

Continued on next page

Form Entries, Continued

TOFC

Terminating Office Code - For code group forms, TOFC identifies the NXX (200-999) office code that may be dialed on a 7-digit basis from the Originating Numbering Plan Area (ONPA) to the Terminating NPA (TNPA). This list will contain all of the office codes that can be reached by 7-digit inter-area dialing between the ONPA and TNPA.

NOTE: If the ONPA is the home NPA the TOFC listed on this form may not be entered on RC Form 300. If the ONPA is entered on RC Form 307 as a served NPA the TOFC listed on this form may not be entered on an RC Form 301 or 302 as the DEF digits for that Served NPA (SNPA).

For Centralized Automatic Message Accounting (CAMA) forms, the TOFC fields list the terminating office codes within a given NPA for a local call area definition. This definition is used to prevent local calls from being completed. The valid range for office codes is from **"200-999"**.

For RC Form 404, this field lists the 3-digit codes that are to be blocked when received as the called (terminating) office code component of a CAMA call. The range of valid entries is from **"200-999"**. The Office Data Assembler (ODA) system will automatically block codes in the range of **"000-199"**.

RC Form 402

General

This form adds a new group of terminating office codes (within a new Numbering Plant Area [NPA]) that should be blocked on Centralized Automatic Message Accounting (CAMA) Trunk Groups. This Local Call Intercept (LCI) blocking pattern prevents local calls from being placed over the toll network via CAMA Trunk Groups (Automatic Number Identification [ANI] or Operator Number Identification [ONI]).

Reference should be made to "CAMA Translations" in Division 5, Section 3, of this TG4 prior to implementation of this form.

For 4E22>, this Recent Change (RC) Form is not valid for offices using Served Numbering Plan Area (SNPA) 10-Digit Routing

This message is classed as a Recent Change Data Message (RCDM).

An alphabetical keyword list is included in this section on page 7.

Form Entries

RC:CAMASCRN;CHG;OPT(UNAOFC),---:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

BLKFCTN Block Function - This field is preset to **UNAOFC** for this form. It indicates that the blocking function defined on this form is for unauthorized terminating office codes associated with the Centralized Automatic Message Accounting (CAMA) Function.

Continued on next page

Form Entries, Continued

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

BLOCK

The block field specifies whether or not the codes, listed on this form, are to be blocked (intercepted) or allowed to continue as a valid call.

A **"Y"** for yes indicates that the code will be intercepted.

An **"N"** for no indicates that the terminating code is valid as a Centralized Automatic Message Accounting (CAMA) call over the trunk group associated with the profile index (Recent Change [RC] Form 400).

TOFC

Terminating Office Code - For code group forms, TOFC identifies the NXX (200-999) office code that may be dialed on a 7-digit basis from the Originating Numbering Plan Area (ONPA) to the Terminating NPA (TNPA). This list will contain all of the office codes that can be reached by 7-digit inter-area dialing between the ONPA and TNPA.

NOTE: If the ONPA is the home NPA the TOFC listed on this form may not be entered on RC Form 300. If the ONPA is entered on RC Form 307 as a served NPA the TOFC listed on this form may not be entered on an RC Form 301 or 302 as the DEF digits for that Served NPA (SNPA).

For Centralized Automatic Message Accounting (CAMA) forms, the TOFC fields list the terminating office codes within a given NPA for a local call area definition. This definition is used to prevent local calls from being completed. The valid range for office codes is from **"200-999"**.

For RC Form 404, this field lists the 3-digit codes that are to be blocked when received as the called (terminating) office code component of a CAMA call. The range of valid entries is from **"200-999"**. The Office Data Assembler (ODA) system will automatically block codes in the range of **"000-199"**.

RC Form 405

General

This form is used to copy a local call intercept profile for Centralized Automatic Message Accounting (CAMA). operation. This message points a new Originating Local Call Intercept Group (OLCIG) at the same terminating Local Call Intercept (LCI) blocking profile(s) as stored for an existing OLCIG. A terminating Numbering Plan Area (NPA) can then be added to or deleted from the new OLCIG using Recent Change (RC) Form 402 or 406.

CAUTION: This message should not be used to add a new OLCIGI if it is expected that different LCI blocking profiles will be required for all TNPAs appearing in both OLCIGs. Any changes made to the LCI blocking profiles for those Terminating Numbering Plan Areas (TNPAs) become applicable to both OLCIGs unless the TNPA is first deleted from and then re-added back to the OLCIGI needing the LCI profile change. A paper record must be maintained to administer the OLCIGIs built with this message to identify jointly used LCI profiles.

Reference should be made to "CAMA Translations" in Division 5, Section 3, of this TG4 prior to implementation of this form.

For 4E22>, this Recent Change (RC) Form is not valid for offices using Served Numbering Plan Area (SNPA) 10-Digit Routing

This message is classed as a Recent Change Data Message (RCDM).

An alphabetical keyword list is included in this section on page 5.

OLCIGI	Originating Local Call Intercept Group Index is a number from **"1-255"**. Index numbers **"2-255"** are links between a group of originating office codes and a group of terminating office codes. This profile is for the purpose of intercepting local calls that should not be placed over the toll network. For this form, the OLCIGI is a new number (not previously assigned) from 2 to 255. OLCIGI 1 is reserved for those Centralized Automatic Message Accounting (CAMA) Trunk Groups from offices that do their own local call intercept. In these cases, the office codes are defined in Office Data Assembler (ODA) with an OLCIGI equal to 1. This new profile will be copied from an existing Local Call Intercept (LCI) profile defined in the OOLCIGI field. Valid entries are **"2-255"**.
ORNU	Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.
OOLCIGI	Original Originating Local Call Intercept Group is the OLCIGI that will be copied using this form. Valid entries are **"2-255"**

RC Form 406

General

This form is deletes a terminating Numbering Plan Area (NPA) from a Local Call Intercept (LCI) profile. The LCI profile is used to block local traffic from being processed by Centralized Automatic Message Accounting (CAMA). Reference should be made to "CAMA Translations" in Division 5, Section 3, of this TG4 prior to implementation of this form.

For 4E22>, this Recent Change (RC) Form is not valid for offices using Served Numbering Plan Area (SNPA) 10-Digit Routing

This message is classed as a Recent Change Data Message (RCDM).

Form Entries, Continued

OLCIGI	Originating Local Call Intercept Group Index - The OLCIGI is a number from **"1-255"**. The OLCIGI (except for 1) points to a group of terminating office codes that are to be intercepted. These terminating codes are defined on another Centralized Automatic Message Accounting (CAMA) RC Form 402 with the same OLCIGI index (2-255). OLCIGI 1 is reserved for those Centralized Automatic Message Accounting (CAMA) Trunk Groups from offices that do their own local call intercept. In these cases, the valid office codes are defined in Office Data Assembler (ODA) with an OLCIGI equal to 1. No equivalent RC Form 402 is required.
ORNU	Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

Continued on next page

Form Entries, Continued

TNPA

Terminating Numbering Plan Area - For code group forms, this field identifies the specific Numbering Plan Area (NPA) to which a 7-digit inter-area call may be directed. Any NPA (including home and served) may be entered in this field. The range is **"200-999"**.

NOTE: Even though the call may be originated on a 7-digit basis, the 4ESS Switch will prefix the destination area code (before translation) for all NPAs except the home NPA. In addition to being specified on the RC Form 308 each terminating office code must also be listed on an RC Form 301 or 302 as the DEF digits, with the TNPA specified as the ABC digits. For Centralized Automatic Message Accounting (CAMA) forms, this field identifies the area code associated with the office codes listed on this form. When a local calling area crosses an NPA boundary, more than one terminating NPA may be represented by a given profile index. In this case, separate RC 402 Forms with the same profile index are prepared for each NPA (up to four). Valid entries range from "200-999".

For RC Form 403, this field lists the 3-digit codes that are to be blocked when received as the called (terminating) area code component of a CAMA call. Blocked codes will be directed to the "Unauthorized CAMA" announcement. Valid entries range from **"200-999"**.

Routing Data Blocks Table Of Contents, Continued

General

This information applies to all sections within this division:

1. The characters > and < are used to indicate which Generic Programs will apply.

   Examples:

   - 4E22> indicates 4E22 and later Generic Programs.
   - <4E22 indicate 4E22 and earlier Generic Programs.
   - 4E22 indicates the 4E22 Generic Program only.
   - >4E22 indicates all Generic Programs up to, but not including, 4E22.

2. Following the general section is a copy of the applicable Recent Change (RC) Form/s. Where there is more than one Generic published, the forms will be filed in ascending order by Generic.

3. The Keyword field names of the form entries in each section are listed in order of appearance on the latest Generic Recent Change Form. (Keywords deleted from the latest form issue will still remain in the form order of the last RC Form that it appeared until finally deleted).

4. The alphabetical "Keyword Index" of the field names is located at the end of each Recent Change Section, following the text, and any tables and/or graphics that may apply.

5. Each Keyword definition will only list the valid entries for the RC Form covered in each applicable section. Some Keywords may have additional valid entries related overall and may be found in the alphabetical Keyword Glossary (Div. 9, Sec. 1).

RC Form 500

General

This form is used to add a new in-chain or Automatic Distribution Group (ADG) Routing Data Block (RDB).

It should be noted that the 4ESS™ 2000-Switch will allow a maximum of **fourteen** Trunk Subgroups (TSGs) to be associated with an in-chain RDB. Also, Recent Change (RC) Form 505 must be used along with this form when more than **seven** TSGs are to be associated with the specified RDB Index (RDBI).

ADG Routing Data Block routes are not required to be contiguous in an RDB. ADG RDB holes in new RDBs will be handled by using dummy TSGs. The dummy TSG will be removed using a delete TSG message and new TSGs will be added using the add TSG message.

"ACCEPTABLE DIGIT COUNT EXAMPLES - Table 40" shows the allowable range of digits valid for this field.

"VALID TSGs IN AN RDB - Table 41" shows the TSG / RDB correlation.

This message is classed as a Recent Change Data Message (RCDM).

An alphabetical keyword list is included in this section on page 15.

Form Entries

RC:RDB;NEW;___:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

RDBI

Routing Data Block Index - RDBI is a link from the digit translation to a series of Trunk Subgroups (TSGs). The TSGs are listed in Routing Data Blocks (RDBs). RDBI points to regular in-chain routing patterns. The range for RDBIs is from **"1-8191"**.

For the RC 524 Form, the RDBI specified in this field identifies the trunks to be used to deliver terminating traffic to the Interexchange Carrier/ International Carrier (IC/INC).

RDBFHT

Routing Data Block Final Handling Treatment - The RDBFHT field identifies the Final Handling Treatment (FHT) to which the call must be connected when an idle trunk cannot be found in the list of Trunk Subgroups (TSGs). This treatment may be a Recorded Announcement or tone. Refer to Lucent Practices 781-031-100 for further information on tones and announcements for Direct Distance Dialing (DDD). Valid entries are:

- **AR** - Audible Ring .
- **BT** - Busy Tone (60 Interruptions Per Minute [IPM]). This entry is used for service terminated directly to a customer's premise such as Inward Wide Band Area Telephone Service (INWATS) to an Automatic Call Distributor or Direct Inward Dialing to a Private Branch Exchange (PBX).
- **DNN** - Disconnected 800 # announcement.
- **DOO** - Destination Out of Order (Signaling System 7 [SS7]).
- **E01** - Emergency Situation.
- **E02** - Severe Weather.
- **E03** - Facility Trouble.
- **E04** - Local Company Trouble.
- **E05** - Airplane Crash.
- **E06** - Hurricane.
- **E07** - Flood.
- **E08** - Tornado.
- **E09** - Forest Fire.
- **E10** - Earthquake.
- **E11** - Mudslide.
- **E12** - Major Network Outage.

Form Entries, Continued

RDBFHT (cont'd)

- **R10** - Intrastate Dialing Plan Change.
- **ROA** - Re-Order Announcement. Type P announcement per Lucent Practices 800-100-100 is used for ROA.
- **SNA** - Service Not Active announcement.
- **S01**-**S19** - Spares.
- **SP1** - Special Announcement Channel 1. This code identifies the first Special Announcement Channel.
- **SP2** - Special Announcement Channel 2. SP2 directs the call to the second Special Announcement Channel.
- **STO** - Sun Transit Outage announcement.
- **T** -Tone If the call is to be directed to a tone, a T will appear in the RDBFHT field and indicates a reorder tone of 120 IPM.
- **TDN** - Temporarily Disconnected 800 #.
- **UNN** - Unallocated # (SS7).
- **VCA** - Vacant Code Announcement.
- **VMA** - Vacant MAS Announcement.
- **WAT** - Waiting for Answer Timeout.

ADG

Automatic Distribution Group - In an International Operating Center, several operator units may provide operator assistance on incoming calls. In non-International Switching Centers (ISCs), this feature can be used with multiple operator units to balance Plain Old Telephone Service (POTS) calls to Directory Assistance, inward operator, etc. Four ADGs can be accommodated with each ADG Routing Data Block (RDB) having up to 32 Trunk Subgroups (TSGs). Valid entries are **"0-3"** or **"Blank"** if not an ADG RDB.

Continued on next page

Form Entries, Continued

ANFHT

ANI Failure Action Final Handling Treatment. This field is used to specify the FHT that should be given to Integrated Services Digital network User Part (ISUP) calls that use this Routing Data Block (RDB) and do not have Automatic Number Identification (ANI). This field may be left **"Blank"** or see RDBFHT for the allowable entries.

TSG

Trunk Subgroup - This series of codes identifies a Trunk Subgroup. The TSG is a set of trunks within a Trunk Group having certain identical characteristics. A Trunk Group must have a common destination. In addition to group characteristics, a TSG also has common signaling characteristics, transmission delay, originating Numbering Plan Area (NPA), domain, traffic separation index and screening classes. The Trunk Group and TSG are identified by a series of codes that specify the near and far ends of the trunk. In most cases, the full near end definition is not required because it will always be the same. The Trunk Group designation is comprised of the town, state, building and building subdivision for the far end plus the near end building subdivision. A TSG is uniquely identified by adding a Base Traffic Number reference. Trunk Group and TSG definitions are available in the 4ESS Switch as abbreviated Circuit Identification Names (CINs). Common Language Location Identification (CLLI) codes must be entered in the fields that make up the Trunk Group definition. Rules for establishing these codes are covered in Lucent Technologies Practices 795-100-100. The code for any established office may be found by referring to the location code index in that same Lucent Technologies Practices. For non-message TSGs, the format does not include mnemonics for identifying the far end of the trunk. The TSG will mnemonically identify the type of trunk category by function. Asterisks are used in columns where no information is necessary. The following paragraphs describe the individual fields within a TSG definition.

Continued on next page

Form Entries, Continued

TSG (cont'd)

- **BTFN** - Base Traffic Number - The BTFN is a number in the range of **"0-9976"** that is part of the TSGs designation (which consists of the BTFN, TOWN, ST, BL, FBS, and NBS). The BTFN is the first traffic number in the first block of traffic numbers that is assigned to a TSG. Additional traffic numbers, which are assigned in blocks of 24, either higher or lower in numerical value than the BTFN can be assigned to the TSG, but the BTFN remains as defined above. All non-message trunks have a BTFN of **"0000"**. For RC 104, the BTFN is stored as the starting point for a block of traffic numbers that range up to the limit originally defined on RC Forms 100, 101 and 102 when the TSG was first built. Other blocks of traffic numbers, either higher or lower in numerical value, may be assigned to this TSG, via Recent Change (RC) procedures. In this case the original BTFN would still apply, but the QTFN field would contain the number of new traffic numbers to be assigned following the First Traffic Number (FTFN) specified.

- **TOWN** - Town is a 4-character alphabetic field - The code must represent the bona fide town, city or location per Lucent Technologies Practices 795-100-100 for the far end of the TSG.

- **ST** - State - This field represents the state, province or foreign country in which the far end office is located. The code in ST must be a standard 2-character alphabetic combination. Valid standard abbreviations for states, Canadian provinces and foreign countries may be found in Lucent Technologies Practices 795-100-100.

- **BL** - Building - The BL field contains the office identity for the far end of a TSG. This code consists of either two alphabetic characters or two numeric characters. Independent Telephone Company locations are always designated by an **"X"** plus some alpha character in this field. If the TSG terminates in a customer's building and it is not necessary to identify that particular building, this code may be arbitrary.

Continued on next page

Form Entries, Continued

TSG (cont'd)

- **FBS** - Far Building Subdivision - This field contains a code that identifies the internal building subdivision for the far end of a TSG. The code is a traffic, plant, or administrative assignment. It must be a 3-character alphanumeric combination. For non-message TSGs, this field is not required. Three asterisks are pre-printed on the form to provide an entry for this field.

- **NBS** - Near Building Subdivision - The NBS designation is the internal building identity for the near end termination of a TSG. It is always a 3-character alphanumeric code. This field should be left **"Blank"** if the NBS for this TSG is the same as the NBS assigned in the near office Circuit Identification Number (CIN) for the 4ESS Switch. The Office Data Assembler (ODA) system will add the NBS on a default basis.

DEL

Delete - This field specifies the number of digits to be deleted from the dialed address before out-pulsing. Up to fifteen digits may be deleted. Enter a zero (**"0"**) in this field if no deleting is required. Digit deletion always begins with the first address digit in a sequence. For example, delete three would remove the ABC digits from a dialed address. When both deleting and prefixing is being done on a dialed address, digit deletion takes place first. For Routing Data Block (RDB) forms, each Trunk Subgroup (TSG) in the RDB may have its own delete/prefix definition. The requirement for manipulation is determined by the far-end office's ability to accept various digit combinations.

NOTE: Intrastate Inward Wide Band Area Telephone Service (INWATS) to a customer's Automatic Call Distributor (ACD) should delete all digits (7 or 10) when using an in-chain RDB.

Continued on next page

Form Entries, Continued

PREFIX

This field is **"Blank"** if no prefixing is required. If prefixing is required, the digit or digits that appear in this field will be added to the dialed address after any digit deletion. Any number up to six digits may be specified as a digit prefix. Valid range is **"0-999999"** for domestic Routing Data Blocks (RDBs) and up to six digits with each digit having a value of **"0-9"**, **"B"** for Code 11, or **"C"** for Code 12 for international RDBs.

NOTE: Intrastate Inward Wide Band Area Telephone Service (INWATS) to a customer's Automatic Call Distributor (ACD) should prefix the digit 2 when using an in-chain RDB.

DNHRTYPE

This keyword field is used for Number Portability (NP) calls. The entry **"ID"** specifies delete/prefix digits ignored for NP calls routed on a Location Routing Number (LRN) where signaling is done on the ported numbers. Valid entries: **"Blank"** or **"ID"**.

Form Entries, Continued

Table 40 ACCEPTABLE DIGIT COUNT EXAMPLES

NONAREA CODE	AREA CODE	INWATS	TEST
1X1	NPA-1X1	800-NXX-XXXX	10X
* TTC-1X1	NPA-TTC-1X1	00X-NXX-XXXX	TTC-10X
NXX-XXXX	NPA-NXX-XXXX	08Z-NNX-XXXX 1BZ-XXXX	NXX-XXXX
** 11NX	NPA-11NX		
11NXX	NPA-11NXX		
TTC-11NX TTC-11NXX	NPA-TTC-11NX		

POSSIBLE ADC COMBINATIONS SEE NOTE 1

NONAREA CODE	AREA CODE	INWATS	TEST
ADC 3, 4, 5, 6, 7, 8,	6, 7, 8, 9, 10, 11	7, 10	3, 6, 7

* TTC - TERMINATING TOLL CENTER CODE MAY BE 0XX/1XX COMBINATION

** LEAVE WORD 2 AND 3 DIGIT OPERATOR CODES, USUALLY, ONLY 2-DIGIT CODES ARE USED WITH THE NPA AND THE TTC.

NOTE 1

Not every office will have all of the possible digit combinations.

Example:
If an NPA uses Terminating Toll Center codes for routing operator codes, the area code combinations might be similar to the following.

NPA-TTC-1X1
NPA-NXX-XXXX
NPA-TTC-11NX

In this case the possible digit combinations specified for the RDB would be 9 and 10.

The non-area code combinations in the home NPA might not use the TTC. Then combinations might be:

1X1
NXX-XXXX
11NXX

In this case then the ADC setting for the RDB would be 3, 5 and 7.

Form Entries

RC:RDB;CHG;OPT(RDBCHAR),___:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

RDBI

Routing Data Block Index - RDBI is a link from the digit translation to a series of Trunk Subgroups (TSGs). The TSGs are listed in Routing Data Blocks (RDBs). RDBI points to regular in-chain routing patterns. The range for RDBIs is from **"1-8191"**.

For the RC 524 Form, the RDBI specified in this field identifies the trunks to be used to deliver terminating traffic to the Interexchange Carrier/ International Carrier (IC/INC).

Continued on next page

Form Entries, Continued

ORNU	Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.
TTSI	Not Applicable - Entries: **"Blank"**

Continued on next page

Form Entries, Continued

RDBFHT

Routing Data Block Final Handling Treatment - The RDBFHT field identifies the Final Handling Treatment (FHT) to which the call must be connected when an idle trunk cannot be found in the list of Trunk Subgroups (TSGs). This treatment may be a Recorded Announcement or tone. Refer to Lucent Practices 781-031-100 for further information on tones and announcements for Direct Distance Dialing (DDD). Valid entries are:

- **AR** - Audible Ring .
- **BT** - Busy Tone (60 Interruptions Per Minute [IPM]). This entry is used for service terminated directly to a customer's premise such as Inward Wide Band Area Telephone Service (INWATS) to an Automatic Call Distributor or Direct Inward Dialing to a Private Branch Exchange (PBX).
- **DNN** - Disconnected 800 # announcement.
- **DOO** - Destination Out of Order (Signaling System 7 [SS7]).
- **E01** - Emergency Situation.
- **E02** - Severe Weather.
- **E03** - Facility Trouble.
- **E04** - Local Company Trouble.
- **E05** - Airplane Crash.
- **E06** - Hurricane.
- **E07** - Flood.
- **E08** - Tornado.
- **E09** - Forest Fire.
- **E10** - Earthquake.
- **E11** - Mudslide.
- **E12** - Major Network Outage.

RDBFHT (cont'd)

- **I11-I23** - Dialing Plan Changes (International).
- **I24-I30** - Reserved International Network Management.
- **IFF** - International call failed to complete in a foreign office.
- **INC** - International No Circuit. This recording indicates all circuits busy to a foreign country.
- **INF** - Info 1 ANI Failure.
- **ISB** - International Subscriber Busy.
- **IVC** - International Vacant Code announcement .
- **LDV** - AT&T Dial 1 (700-555-4141).
- **LOB** - Logging on Busy.
- **LSA** - IntraLATA Call Screening.
- **MCA** - Misrouted CAMA announcement.
- **NCA** - No Circuit Announcement. This recording is usually an announcement type N in Lucent Practices 800-100-100.
- **NCB** - Local Exchange Carrier (LEC) Egress Busy.
- **NCC** - No Circuit to Designated Carrier.
- **NCD** - Network Call Denial screening.
- **NWC** - No Wink from Carrier.
- **NWN** - Vacant 800 # announcement.
- **OOA** - Out of Area (LEC Mass Announcement System [MAS] Service).
- **OOB** - Inward Wide Band Area Telephone Service (INWATS) Out-of-Band announcement.
- **OTS** - HICAP Out of Time Slot announcement.
- **R01**-**R09** - Dialing Plan Change (Domestic).

RDBFHT (cont'd)

- **R10** - Intrastate Dialing Plan Change.
- **ROA** - Re-Order Announcement. Type P announcement per Lucent Practices 800-100-100 is used for ROA.
- **SNA** - Service Not Active announcement.
- **S01**-**S19** - Spares.
- **SP1** - Special Announcement Channel 1. This code identifies the first Special Announcement Channel.
- **SP2** - Special Announcement Channel 2. SP2 directs the call to the second Special Announcement Channel.
- **STO** - Sun Transit Outage announcement.
- **T** -Tone If the call is to be directed to a tone, a T will appear in the RDBFHT field and indicates a reorder tone of 120 IPM.
- **TDN** - Temporarily Disconnected 800 #.
- **UNN** - Unallocated # (SS7).
- **VCA** - Vacant Code Announcement.
- **VMA** - Vacant MAS Announcement.
- **WAT** - Waiting for Answer Timeout.

ADG	Automatic Distribution Group - In an International Operating Center, several operator units may provide operator assistance on incoming calls. In non-International Switching Centers (ISCs), this feature can be used with multiple operator units to balance Plain Old Telephone Service (POTS) calls to Directory Assistance, inward operator, etc. Four ADGs can be accommodated with each ADG Routing Data Block (RDB) having up to 32 Trunk Subgroups (TSGs). Valid entries are **"0-3"** or **"Blank"** if not an ADG RDB.
ANFHT	ANI Failure Action Final Handling Treatment. This field is used to specify the FHT that should be given to Integrated Services Digital network User Part (ISUP) calls that use this Routing Data Block (RDB) and do not have Automatic Number Identification (ANI). This field may be left **"Blank"** or see RDBFHT for the allowable entries.

Form Entries

RC:RDB;CHG;OPT(ADDTSGS),___:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

RDBI

Routing Data Block Index - RDBI is a link from the digit translation to a series of Trunk Subgroups (TSGs). The TSGs are listed in Routing Data Blocks (RDBs). RDBI points to regular in-chain routing patterns. The range for RDBIs is from **"1-8191"**.

For the RC 524 Form, the RDBI specified in this field identifies the trunks to be used to deliver terminating traffic to the Interexchange Carrier/ International Carrier (IC/INC).

Continued on next page

Form Entries, Continued

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

ADG

Automatic Distribution Group - In an International Operating Center, several operator units may provide operator assistance on incoming calls. In non-International Switching Centers (ISCs), this feature can be used with multiple operator units to balance Plain Old Telephone Service (POTS) calls to Directory Assistance, inward operator, etc. Four ADGs can be accommodated with each ADG Routing Data Block (RDB) having up to 32 Trunk Subgroups (TSGs). Valid entries are **"0-3"** or **"Blank"** if not an ADG RDB.

REFTSG

Reference Trunk Subgroup - The TSG entered here will be the reference point of which to specify the place in order for the New added TSG (NEWTSG) on the RDB. The location of the New TSG will be placed either before or after this REFTSG as directed by the INSERT NEWTSG entry. Entries here apply to regular parameters for **TSG**.

INSERT NEWTSG

This field identifies the position to insert the NEWTSG in relation to the Reference Trunk Subgroup (REFTSG) in the list associated with a routing data block. Use **"A"** to insert above or **"B"** to insert below the REFTSG.

For an Automatic Distribution Group Routing Data Block (RDB), this field supplies the position information within the RDB. Entries are **"1-32"** and REFTSG must be **"Blank"**.

NEWTSG

New Trunk Subgroup - The TSG entered in these fields list the new TSGs and the routing order of each as listed if more than one. This TSG, or group of TSGs will be placed on the RDB either immediately before or immediately after the REFTSG depending on the entry for INSERT NEWTSG. Entries here apply to regular parameters for **TSG**.

Continued on next page

Form Entries, Continued

DEL

Delete - This field specifies the number of digits to be deleted from the dialed address before out-pulsing. Up to fifteen digits may be deleted. Enter a zero (**"0"**) in this field if no deleting is required. Digit deletion always begins with the first address digit in a sequence. For example, delete three would remove the ABC digits from a dialed address. When both deleting and prefixing is being done on a dialed address, digit deletion takes place first. For Routing Data Block (RDB) forms, each Trunk Subgroup (TSG) in the RDB may have its own delete/prefix definition. The requirement for manipulation is determined by the far-end office's ability to accept various digit combinations.

NOTE: Intrastate Inward Wide Band Area Telephone Service (INWATS) to a customer's Automatic Call Distributor (ACD) should delete all digits (7 or 10) when using an in-chain RDB.

PREFIX

This field is **"Blank"** if no prefixing is required. If prefixing is required, the digit or digits that appear in this field will be added to the dialed address after any digit deletion. Any number up to six digits may be specified as a digit prefix. Valid range is **"0-999999"** for domestic Routing Data Blocks (RDBs) and up to six digits with each digit having a value of **"0-9"**, **"B"** for Code 11, or **"C"** for Code 12 for international RDBs.

NOTE: Intrastate Inward Wide Band Area Telephone Service (INWATS) to a customer's Automatic Call Distributor (ACD) should prefix the digit 2 when using an in-chain RDB.

DNHRTYPE

This keyword field is used for Number Portability (NP) calls. The entry **"ID"** specifies delete/prefix digits ignored for NP calls routed on a Location Routing Number (LRN) where signaling is done on the ported numbers. Valid entries: **"Blank"** or **"ID"**.

RC Form 508

General

This form is used to delete Trunk Subgroups (TSGs) from an existing in-chain Routing Data Block (RDB). This Recent Change (RC) message can be used to delete any TSG except for the last remaining TSG. RC Form 510 must be used to delete the last remaining TSG and the RDB. If all of the TSGs are to be removed at one time, then RC Form 510 may be used to remove the RDB and all of the TSGs with one message.

This message is classed as a Recent Change Data Message (RCDM).

An alphabetical keyword list is included in this section on page 5.

Form Entries

RC:RDB;CHG;OPT(OUTTSGS),___:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

RDBI

Routing Data Block Index - RDBI is a link from the digit translation to a series of Trunk Subgroups (TSGs). The TSGs are listed in Routing Data Blocks (RDBs). RDBI points to regular in-chain routing patterns. The range for RDBIs is from **"1-8191"**.

For the RC 524 Form, the RDBI specified in this field identifies the trunks to be used to deliver terminating traffic to the Interexchange Carrier/ International Carrier (IC/INC).

RC Form 510

General

This form is used to delete an entire In-Chain Routing Data Block (RDB). The RDB can be deleted even though it may have Trunk Subgroups (TSGs) assigned to it.

This message is classed as a Recent Change Data Message (RCDM).

An alphabetical keyword list is included in this section on page 5.

RC:RDB;OUT;___:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

RC Form 513

General

This form is used to add a Trunk Subgroup (TSG) to the set of outgoing routes associated with up to 24 In-Chain Routing Data Blocks (RDBs). This message is used to establish a new TSG with the delete and prefix information assumed from the reference TSG. The reference TSG can then have its characteristics changed, as when converting from Multifrequency (MF) to Common Channel Signaling (CCS).

This message is classed as a Recent Change Data Message (RCDM).

An alphabetical keyword list is included in this section on page 5.

RC:RDB;CHG;OPT(ADD1TSG),___:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

ORNU Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

Continued on next page

Form Entries, Continued

REFTSG

Reference Trunk Subgroup - The TSG entered here will be the reference point of which to specify the place in order for the New added TSG (NEWTSG) on the RDB. The location of the New TSG will be placed either before or after this REFTSG as directed by the INSERT NEWTSG entry. Entries here apply to regular parameters for **TSG**.

INSERT NEWTSG

This field identifies the position to insert the NEWTSG in relation to the Reference Trunk Subgroup (REFTSG) in the list associated with a routing data block. Use **"A"** to insert above or **"B"** to insert below the REFTSG.

For an Automatic Distribution Group Routing Data Block (RDB), this field supplies the position information within the RDB. Entries are **"1-32"** and REFTSG must be **"Blank"**.

NEWTSG

New Trunk Subgroup - The TSG entered in these fields list the new TSGs and the routing order of each as listed if more than one. This TSG, or group of TSGs will be placed on the RDB either immediately before or immediately after the REFTSG depending on the entry for INSERT NEWTSG. Entries here apply to regular parameters for **TSG**.

DNHRTYPE

This keyword field is used for Number Portability (NP) calls. The entry **"ID"** specifies delete/prefix digits ignored for NP calls routed on a Location Routing Number (LRN) where signaling is done on the ported numbers. Valid entries: **"Blank"** or **"ID"**.

RDBI

Routing Data Block Index - RDBI is a link from the digit translation to a series of Trunk Subgroups (TSGs). The TSGs are listed in Routing Data Blocks (RDBs). RDBI points to regular in-chain routing patterns. The range for RDBIs is from **"1-8191"**.

For the RC 524 Form, the RDBI specified in this field identifies the trunks to be used to deliver terminating traffic to the Interexchange Carrier/ International Carrier (IC/INC).

RC Form 514

General

This form is used to delete a Trunk Subgroup (TSG) from the set of outgoing routes associated with up to 24 In-Chain Routing Data Blocks (RDBs). This message is used to establish a new TSG with the delete and prefix information assumed from the reference TSG. The reference TSG can then have its characteristics changed, as when converting from Multifrequency (MF) to Common Channel Signaling (CCS). This Recent Change (RC) message is used primarily in conjunction with RC Forms 107-109 to change TSG characteristics.

This message is classed as a Recent Change Data Message (RCDM).

An alphabetical keyword list is included in this section on page 5.

Form Entries

RC:NDB;CHG;___:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

NDB

Number Services Routing Data Block index -This field specifies which Number Services Interexchange Carrier (IC) and International Carrier (INC) Routing Data Block (RDB) is to be populated. Legal input values are:
"1-1023".

Continued on next page

Form Entries, Continued

ACTION

Action - Add, Change, or Delete. Enter **"A"** if the associated data on this form is being added. Enter **"C"** if the associated data on this form changes existing data. Enter **"D"** if the associated data on this form is being deleted.

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

FENCLASS

This field specifies the classification of the Far End Network (FEN). If the Trunk Subgroup (TSG) is not associated with any FEN, this field is left **"Blank"**. The FEN with which the TSG is to be associated must be described via 4ESS Switch RC 617.

For RC 524, this field identifies the class for accumulating counts.

The following classifications are available:

- **ACCESA** - This identifier specifies that the TSG is a link to an Inter-exchange Carrier (IC) or International Carrier (INC), and the 4ESS Switch is being used by a Local Exchange Carrier (LEC) as an Access Tandem (AT) and/or Service Switching Point (SSP) to switch calls from this TSG.
- **ACCESI** -This identifier specifies that the TSG is a link to an International Carrier (INC), and the 4ESS Switch is being used by an Interexchange Carrier (IC) (e.g., AT&T-C) to switch calls from this TSG.
- **ACCESO** - This identifier specifies that the TSG is a link to an Operating Company and the 4ESS Switch is used as an IC.
- **CAMA** - This identifier specifies that the TSG is terminated on an office which delivers traffic on Centralized Automatic Message Accounting (CAMA) trunks.
- **CMC** - Cellular Mobile Carrier - This identifier specifies that the FEN is a CMC. The TSG connects an Access Tandem (AT) and a CMC.

Continued on next page

Form Entries, Continued

FENCLASS (cont'd)

- **INTL** - This identifier specifies that the TSG is an international link with the far end outside World Zone 1 and that the 4ESS Switch is being used as an International Switching Center (ISC)
- **OWATS** - This identifier specifies that the TSG is a link to a Private Branch Exchange (PBX) over which only Outward Wide Band Area Telephone Service (WATS) calls are allowed.
- **OEO** - Other End Office connecting, meaning an Equal Access End Office (EAEO) owned by a different company. This identifier specifies that the FEN is an OEO. The TSG connects an Access Tandem (AT) and an OEO.
- **PBX** - This identifier specifies that the TSG is a link to a PBX.
- **POTS** - This identifier specifies that the TSG is a link to a switching machine serving either a Local Access Transport Area (LATA) of the Local Exchange Carrier (LEC) owning/sharing the 4ESS Switch, the Continental United States/Plain Old Telephone Service (POTS) (CUSP) network of the IEC owning/sharing the 4ESS Switch, or some other FEN to be treated similarly.

Continued on next page

Form Entries, Continued

FENID

Far End Network (FEN) Identification - This field distinguishes the specific FEN with which this Trunk Subgroup (TSG) is associated. One to six alphanumeric characters may be entered to distinguish among several FENs with the same classification, or the field may be left **"Blank"**. If FENCLASS is **"Blank"**, FENID must also be **"Blank"**.

When the FENCLASS is ACCESA or ACCESI, FENID should consist of type of feature group access and the 4 numeric digits of the Carrier Identification Code (CIC).

The type of feature group definitions are:

- **G** - All access types (B, C, & D).
- **B** - Feature Group B Access.
- **C** - Feature Group C Access.
- **D** - Feature Group D Access.

Examples include:

- **G0288** - Carrier ID 288 has Feature Group B, C, & D access.
- **BC0288** - Carrier ID 288 has Feature Group B & C access.
- **BD0288** - Carrier ID 288 has Feature Group B & D access.
- **B2882** - Carrier ID 2882 has Feature Group B access only.
- **D2882** - Carrier ID 2882 has Feature Group D access only.

For an access type, both B2882 and D2882 can exist but be for different carriers.

Continued on next page

Form Entries, Continued

RDBI	Routing Data Block Index - RDBI is a link from the digit translation to a series of Trunk Subgroups (TSGs). The TSGs are listed in Routing Data Blocks (RDBs). RDBI points to regular in-chain routing patterns. The range for RDBIs is from **"1-8191"**. For the RC 524 Form, the RDBI specified in this field identifies the trunks to be used to deliver terminating traffic to the Interexchange Carrier/ International Carrier (IC/INC).
NXZZ	NXZZ TelCo BCD digits to be used for Equal Access Signaling (EAS) to a Interexchange Carrier/International Carrier (IC/INC). The NX defines the signaling digits in the 1NX sequence used for international EAS. The ZZ defines the signaling digits in the 0ZZ-XXX EAS sequence required to route calls through a tandem office. Legal input values are: "**00-99**".
NNDB	Next Number Services Routing Data Block index - This field specifies which Number Data Block (NDB) should be searched next if an idle trunk cannot be obtained from the trunk subgroups identified by the NDB. Call processing will search at most two NDBs per call. Legal inputs are "**Blank**" or "**1-1023**". For RC 524, an **"*"** entry is used to make a positive request to have the associated data structures set to unassigned.
FG	Signaling Feature Group - This field identifies what type of signaling the Interexchange Carrier (IC)/International Carrier (INC) will be expecting. Legal inputs are: **"C"** for Feature Group C (traditional) and **"D"** for Feature Group D (Equal Access).
ANI	ANI send indicator. This field identifies if the Interexchange Carrier (IC)/ International Exchange Carrier (INC) is expecting the callers Automatic Number Identification (ANI) to be delivered. This information is only used at an Service Switching Point (SSP) office. Valid inputs are: **"N"** - No, **"Y"** - Yes.

Continued on next page

Form Entries, Continued

CPN

Calling Party Number - This field identifies if the Interexchange Carrier/ International Carrier (IC/INC) is expecting the calling party number to be delivered. This information is only used at an Service Switching Point (SSP) office. Valid entries are: **"N"** - No, **"Y"** - Yes.

PATH

Signaling path type - This field specifies the number of winks that the Service Switching Point (SSP) switch expects to process. The number of winks is related to what type of office the SSP switch is connected to, e.g., Inter-exchange Carrier (IC), International Carrier (INC), or Access Tandem (AT).

- **DIR** - direct to IC/INC, no winks.
- **ATD** - signaling to AT then to IC/INC, 1 wink.
- **ATI** - signaling to INC, 2 winks.

INTL

International Signaling indicator in the Number Services Routing Data Block Index (NDB) - The legal inputs for this field are **"N"** or **"Y"**. An **"N"** indicates that the signaling to the Interexchange Carrier/International Carrier (IC/INC) is in the domestic Equal Access (EA) format. A **"Y"** indicates that the signaling to the IC/INC is in the international EA format. This field should be a **"Y"** for routing International World Zone 1 calls to an INC. This field should be an **"N"** for routing International World Zone 1 calls to an IC Consolidated Carrier (CC). This field should be an **"N"** for routing domestic calls to a CC and should be a **"Y"** for routing International Non-World Zone 1 calls to a CC or to an INC.

Miscellaneous Table Of Contents, Continued

General

This information applies to all sections within this division:

1. The characters > and < are used to indicate which Generic Programs will apply.

   Examples:

   - 4E22> indicates 4E22 and later Generic Programs.
   - <4E22 indicate 4E22 and earlier Generic Programs.
   - 4E22 indicates the 4E22 Generic Program only.
   - >4E22 indicates all Generic Programs up to, but not including, 4E22.

2. Following the general section is a copy of the applicable Recent Change (RC) Form/s. Where there is more than one Generic published, the forms will be filed in ascending order by Generic.

3. The Keyword field names of the form entries in each section are listed in order of appearance on the latest Generic Recent Change Form. (Keywords deleted from the latest form issue will still remain in the form order of the last RC Form that it appeared until finally deleted).

4. The alphabetical "Keyword Index" of the field names is located at the end of each Recent Change Section, following the text, and any tables and/or graphics that may apply.

5. Each Keyword definition will only list the valid entries for the RC Form covered in each applicable section. Some Keywords may have additional valid entries related overall and may be found in the alphabetical Keyword Glossary (Div. 9, Sec. 1).

RC Form 600

General

This form is used simultaneously to advance a number of Recent Changes (RCs) that reside in buffer. The messages entered on this form will be processed in the sequence in which they are listed.

Even though this message is called a Multi-activate message, it still must be called up and entered in the appropriate state (usually buffered).

The Order Number (ORNU) messages listed must have been previously placed in the buffer. When the RC Form 600 on which they are listed is put into the test state by an RCTST message, all of the ORNU messages on the form will be activated. This message does not have an activate state.

An alphabetical keyword list is included in this section on page 4.

                   ASSOCIATED VERIFY MESSAGES - NONE
```

Form Entries

RC:MISC;NEW;OPT(MULTACT),---:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

The columns of ORNUs list the Order Numbers of the RC Messages that are to be activated. These Order Numbers must already be in the buffer. These messages will be tested and activated as this (MULTACT) RC is put in the "TST" state. Internally, each message is still processed serially and individually.

RC Form 601

General

This form is used to add a new Dial Up Port Client descriptor. Adding a client to the Dial Up Port feature allows the client to access data via a Data Link established over a Direct Distance Dialing (DDD) connection. 255 dial-up clients may interface with the 4ESS™-2000 Switch.

This message is classed as a Recent Change Data Message (RCDM).

An alphabetical keyword list is included in this section on page 5.

Form Entries

RC:DIALUP;NEW;___:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

Form Entries, Continued

CTYPE Client Type - To indicate the use of the Dial Up Port, a client type must be assigned. Valid entries for this field are: **"TDAS"** - client has access to Traffic Data Acquisition System (TDAS) data, **"VSS"** - Voice Storage System client, and **"TVSP"** - Televote Sponsor.

DUPID Dial Up Port Identification - This field assigns an identifier to a client. All client identifiers for the office must be unique. Identifier assignments are based on the client type as follows:

CTYPE	ID
VSS	00001-99999
TDAS or **TVSP**	Two characters which may be either a letter (**"A-Z"**) or digit (**"0-9"**).

For RC Form 607, this field identifies the TELEVOTE sponsor to whom master TELEVOTE counts will be sent. Valid entry is a two character alphanumeric. The first must be a letter **"A-Z"**, the second may be a letter **"A-Z"** or digit **"0-9"**. This entry corresponds to the DUPID entered on the RC Form 603.

NOTE: This field must be **"Blank"** if MSI is **"S"**. This field may optionally be **"Blank"** for MSI of **"M"** or **"B"**, if real time output to the sponsor is not required

PTCL Protocol - This field identifies the clients Data Link protocol. Valid entry is **"A"** for Asynchronous. This entry must have a related Input/Output channel specified in Office Data Assembler (ODA) by Lucent engineering.

DUPCBN Dial Up Port Call Back Number - This field specifies the clients unique Call Back Number and may be any number of digits from a minimum of one to a maximum of eleven. Call back numbers for Traffic Data Acquisition System (TDAS) clients must be unique. For Televote Sponsor (TVSP) and Voice Storage System (VSS) clients, they do not have to be unique. Valid entries are **"0-99999999999"**.

- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

TYPE

The announcement Type is entered in this field. Valid entries are as follows:

- **BI** - Barge-in announcement.
- **SCS** - Service Circuit System.

Continued on next page

Form Entries, Continued

UFH

Use Final Handling. This field is only valid when defining the Public Announcement System (PAS) Vacant Code announcement (SID = 9999901) or the PAS Inactive announcement (Service Identity [SID]= 9999902). Valid entries are **"Blank"**, **"Y"**, or **"N"**. If this field is **"Blank"** or **"N"**, then the announcement played will be the announcement for the entered Announcement Number (ANNUM). An entry of **"Y"** signifies that the call is to be final handled. The Final Handling Treatment (FHT) will be Vacant Mass Announcement System (MAS) Announcement if SID is 9999901 or Service Not Active if SID is 9999902.

VSSID

Voice Storage System (VSS) Identity. This five digit field is the first part of the External Announcement Identity (EAID) code identifying the announcement. For announcements updated from a VSS, the VSS Identity is entered. Valid entries are **"1-99999"**. For barge-in announcements, direct producer updated announcements, or service circuit system announcements, the VSSID must be **"0"**. With VSS updated announcements, the VSSID must be a valid VSS client in the Dial Up Port translator.

SID

Service Identity - This field is a seven digit entry which identifies the type of announcement.

A. VSS Updated -	**"0000000-9990000"** **"9999901"** and **"9999902"**
B. Direct Producer -	**"9990001-9999000"** **"9999901"** and **"9999902"**
C. Barge-In -	**"9999001-9999511"** **"9999901"** and **"9999902"**
D. SCS -	**"0000000-9990000"** **"9999901"** and **"9999902"**

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

Continued on next page

Form Entries, Continued

STRTT

The Start Time field specifies what time within a 24-hour period following the Start Date that the Cut-Through or Televote function will start. The Start Time field is composed of four digits, two for hours, and two for minutes. A **"Blank"** field is not permitted. The first two digits of the field representing the Start Time hour must be **"0-23"**. The last two digits representing the minutes of the Start Time must be **"0-59"**. For Start Date equal to Stop Date, the Start Time must be less than the Stop Time.

STOPT

The daily Stop Time field specifies what time within 24 hours following the Start Date that the Cut-Through or Televote function will stop. For successive days thereafter the Cut-Through or Televote service is stopped within each 24-hour period at the Stop Time until the Stop Date is reached. The Stop Time must be specified if the Stop Date has been specified. If the Stop Date has been left **"Blank"**, then the Stop Time can be specified or left **"Blank"**. If the Stop Date is left **"Blank"** but not the Stop Time, the Cut-Through service will cycle on and off each day (after the Start Date). The first two digits of the field representing Start Time hour is **"0-23"**. The last two digits representing minutes is **"0-59"**. If the Stop Time is specified, the value must be later than the Start Time when the Start and Stop Dates are equal.

LENGTH

The length of the announcement in seconds ranges from **"5-300"**. For Voice Storage System (VSS) updated and direct producer updated announcement, the length must be in multiples of 30 seconds, i.e., 30, 60, 90, etc. For a barge-in announcement the length may be specified in one second increments. For an Service Circuit System (SCS) announcement, length must be in the range of **"5-260"**.

Continued on next page

Form Entries, Continued

PLAYS

The number of playbacks of an announcement that a caller may listen to before being automatically disconnected. Valid entries are **"1-15"**, corresponding to the desired number of plays, or a **"U"** for an unlimited number of plays. It should be noted that the product of LENGTH times PLAYS (and the value of PLAYS can be changed via a Recent Change (RC) Message) equals the total time before the system will automatically disconnect the Public Announcement System (PAS) announcement.

For a barge-in announcement only, to insure that the caller hears at least one complete play of an announcement, either the number of plays should be 2 or the LENGTH should be specified as twice the actual length.

ANSWR

Answer Supervision - This field is used to specify whether or not Answer Supervision is to be returned on the incoming trunk. A **"Y"** specifies return Answer supervision. An **"N"** specifies do not return Answer supervision. Valid entries are **"Y"** and **"N"**.

NOTE: The Public Announcement System (PAS) vacant code announcement and the PAS announcement inactive announcement should have an "N" entered.

ANNUM

Announcement Number - This field is used to specify a unique internal 4ESS Switch/Mass Announcement System (MAS) ANNUM for each Public Announcement System (PAS) announcement.

Valid entries are **"1-511"** that is not used by any other announcement assigned to the same MAS frame.

Valid entries for Barge-In announcements are **"1-511"** that is not used by any other announcement.

Form Entries, Continued

CAREA

Control Area - Valid input for this field is a single digit in the range of **"0-9"**. This number identifies the Control Area that is to be associated with this Trunk Subgroup (TSG) for trouble reporting. The number assignable in a given office is limited, however, to the highest control area assigned at Office Data Assembler (ODA) time as defined by the highest Member Number for a test position. This is because of engineered memory allocated for plant measurement purposes. Each Control Area can have a maximum of 10 (0-9) associated Control Positions (CPOS). The Control Area number and the CPOS number combined make up the testboard position number. For example CAREA-2 and CPOS-5 would be testboard position 25. A maximum of 100 (0-99) testboard positions may be installed for a 4ESS Switch location.

Any test position can access every trunk assigned to the 4ESS Switch with the exception of international trunks. International trunks having Incoming Signaling Characteristic (ISC) or Outgoing Signaling Characteristic (OSC) equal to Consultative Committee for International Telephone & Telegraph 5 (CCITT5) must be assigned to a CAREA that is equipped with 51AL6 test positions. The 51AL6 test position can access any trunk assigned to the 4ESS Switch. However, the alarms, Teletype (TTY) printouts, and 101 calls associated with a particular TSG will only be transmitted to the CAREA and CPOS that is specified on the input form for a TSG. A single trouble receiving location could be specified for all TSGs in the office. Trouble tickets might be originated here and distributed to occupied test positions as necessary. Some other typical applications could be to assign the TSGs to testboard positions alphabetically, by direction, by ownership, or by Type of Trunk (TOT).

The only other restraint on assigning a TSG to a particular CAREA and CPOS is that all positions might not have the optional equipment required to satisfactorily test some Trunk Subgroups. The arrangement in a given office depends on the administrative decisions made for that office.

Continued on next page

Form Entries, Continued

CAREA
(cont'd.)

Position 00 (CAREA 0, CPOS 0) has been assigned to the Master Test and Control Channel (MTC) teletype in the Maintenance Operating Center (MOC). This position was established to receive trouble reports for certain non-message type TSGs. Lucent Technologies recommend that positions
01-09 not be assigned in an office at this time. The circuits that should be assigned to test position 00 are:

- ACI*DCHN - D-Channel circuits to the Common Network Interface (CNI) Ring
- CLN*DLPC - Loopback/complement Data Test
- MAS*BIPB - Mass Announcement System (MAS) Barge-in Playback Trunk
- MIS*AART - Auxiliary Audible Ring Trunk
- MIS*TERM - Common Channel Interoffice Signaling (CCIS) Terminals
- SVC*AIN* - Advanced Intelligent Network (AIN)
- SVC*DMRV - Dual-Tone Multifrequency (MF) Receivers (DTMFR)
- VC*DMXM - Dual-Tone Multifrequency Transmitters (DTMFT)
- SVC*MFR* - Multifrequency Receivers
- SVC*MFX* - Multifrequency Transmitters
- SVC*XCVR - CCIS Continuity Check Transceivers
- SVC*XCVT - CCIS Continuity Check Transceiver Test Circuit
- SVC*MFRT - Multifrequency Receiver Test Circuits
- SVC*MFXT - Multifrequency Transmitter Test Circuits
- SVC*SCAN - Service Circuit System Expanded Announcements
- SVC*SCBN - Service Circuit System Expanded Announcements
- SVC*SCNS - Network Services Complex Set S
- TAS*ANN* - Recorded announcements
- TAS*TONE - Tone Circuits
- TAS*MWAT - 1004 hz at 0 dBm
- TAS*MW10 - 1004 hz at 10 dBm

Form Entries, Continued

CAREA (cont'd.)

The balance of the non-message type TSG may be assigned to working testboard positions.

For RC Forms 604 and 605, this number identifies the Control Area that is to be associated with this announcement trouble report. The number assignable in a given office is limited, however, to the highest control area assigned at ODA time as defined by the highest Member Number for a test position. This is because of engineered memory allocated for plant measurement purposes. Each Control Area can have a maximum of 10 (0-9) associated Control Positions (CPOS). The Control Area number and the CPOS number combined make up the testboard position number. For example CAREA-2 and CPOS-5 would be testboard position 25. A maximum of 100 (0-99) testboard positions may be installed for a 4ESS Switch location. If CAREA 0,
CPOS 0 is specified, all MAS messages will be sent to the MTC channel in the MOC.

CPOS

Control Position - Enter a number from **"0-9"** to specify the testboard position that is to be associated with the Trunk Subgroup (TSGs) and Control Area (CAREA) for test reporting purposes. This assignment together with the CAREA designation can be used to distribute the maintenance responsibility for Trunk Subgroups. This assignment does not prevent any test position from accessing a particular group of trunks. It is only for reporting purposes.

For RC Forms 604 and 605, enter a number from **"0-9"** to specify the testboard position that is to receive the announcement trouble reports. If CAREA is 0, only CPOS 0 is allowed. When the Message Announcement System (MAS) is administered by the Operations National Administration Center (ONAC), assign the CPOS that has been dedicated for its use.

ANSEP

The Announcement Separation Class (ANSEP) ranges from **"0-31"** to indicate a traffic class for measurement purposes. For ANSEP classes greater than **0**, only one announcement may be assigned to any one class. ANSEP is used with the Geographical Traffic Separation Class (GEOSEP on the Trunk Subgroup [TSG] Forms) to peg geographical survey counts in Mass Announcement System (MAS) offices.

RC Form 605

General

This form is used to modify the parameters of an existing Public Announcement System (PAS) announcement. Only parameters which may be changed are present on the form, with exception of the fields TYPE, VSSID, and SID. These three fields are used solely for identification of the announcement being updated. The other parameters of the announcement (e.g., MEMN and ANNUM) may not be changed. (The MEMN and ANNUM fields on the ADSI line may be changed.) Only by deleting the announcement and subsequently redefining it may these parameters be altered.

A blank input field will leave the field unchanged. Setting the field back to the system default (i.e., deleting the field) is accomplished by entering an asterisk in the field. Only the time fields and the ADFHT, MEMN and ANNUM fields on the ADSI line may be deleted.

This message is classed as a Recent Change Data Message (RCDM).

An alphabetical keyword list is included in this section on page 11.

Form Entries

RC:PAS;CHG;OPT(ANN);___:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

TYPE

The announcement Type is entered in this field. Valid entries are as follows:

- **BI** - Barge-in announcement.
- **SCS** - Service Circuit System.

Continued on next page

Form Entries, Continued

UFH

Use Final Handling. This field is only valid when defining the Public Announcement System (PAS) Vacant Code announcement (SID = 9999901) or the PAS Inactive announcement (Service Identity [SID]= 9999902). Valid entries are **"Blank"**, **"Y"**, or **"N"**. If this field is **"Blank"** or **"N"**, then the announcement played will be the announcement for the entered Announcement Number (ANNUM). An entry of **"Y"** signifies that the call is to be final handled. The Final Handling Treatment (FHT) will be Vacant Mass Announcement System (MAS) Announcement if SID is 9999901 or Service Not Active if SID is 9999902.

VSSID

Voice Storage System (VSS) Identity. This five digit field is the first part of the External Announcement Identity (EAID) code identifying the announcement. For announcements updated from a VSS, the VSS Identity is entered. Valid entries are **"1-99999"**. For barge-in announcements, direct producer updated announcements, or service circuit system announcements, the VSSID must be **"0"**. With VSS updated announcements, the VSSID must be a valid VSS client in the Dial Up Port translator.

SID

Service Identity - This field is a seven digit entry which identifies the type of announcement.

A. VSS Updated -	**"0000000-9990000"** **"9999901"** and **"9999902"**
B. Direct Producer -	**"9990001-9999000"** **"9999901"** and **"9999902"**
C. Barge-In -	**"9999001-9999511"** **"9999901"** and **"9999902"**
D. SCS -	**"0000000-9990000"** **"9999901"** and **"9999902"**

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

Continued on next page

Form Entries, Continued

STRTT

The Start Time field specifies what time within a 24-hour period following the Start Date that the Cut-Through or Televote function will start. The Start Time field is composed of four digits, two for hours, and two for minutes. A **"Blank"** field is not permitted. The first two digits of the field representing the Start Time hour must be **"0-23"**. The last two digits representing the minutes of the Start Time must be **"0-59"**. For Start Date equal to Stop Date, the Start Time must be less than the Stop Time.

STOPT

The daily Stop Time field specifies what time within 24 hours following the Start Date that the Cut-Through or Televote function will stop. For successive days thereafter the Cut-Through or Televote service is stopped within each 24-hour period at the Stop Time until the Stop Date is reached. The Stop Time must be specified if the Stop Date has been specified. If the Stop Date has been left **"Blank"**, then the Stop Time can be specified or left **"Blank"**. If the Stop Date is left **"Blank"** but not the Stop Time, the Cut-Through service will cycle on and off each day (after the Start Date). The first two digits of the field representing Start Time hour is **"0-23"**. The last two digits representing minutes is **"0-59"**. If the Stop Time is specified, the value must be later than the Start Time when the Start and Stop Dates are equal.

PLAYS

The number of playbacks of an announcement that a caller may listen to before being automatically disconnected. Valid entries are **"1-15"**, corresponding to the desired number of plays, or a **"U"** for an unlimited number of plays. It should be noted that the product of LENGTH times PLAYS (and the value of PLAYS can be changed via a Recent Change (RC) Message) equals the total time before the system will automatically disconnect the Public Announcement System (PAS) announcement.

For a barge-in announcement only, to insure that the caller hears at least one complete play of an announcement, either the number of plays should be 2 or the LENGTH should be specified as twice the actual length.

Continued on next page

Form Entries, Continued

ANSWR Answer Supervision - This field is used to specify whether or not Answer Supervision is to be returned on the incoming trunk. A **"Y"** specifies return Answer supervision. An **"N"** specifies do not return Answer supervision. Valid entries are **"Y"** and **"N"**.

NOTE: The Public Announcement System (PAS) vacant code announcement and the PAS announcement inactive announcement should have an "N" entered.

RC Form 606

General

This form is used to DELETE a Public Announcement System (PAS) announcement. This Recent Change (RC) will not delete the audio from the Mass Announcement System (MAS) unit. Audio can be deleted manually. To delete an active audio set, use RC Form 605 to stop the announcement. To delete standby audio, use the Trunk Maintenance TTY message (RMV:STBY…).

This message is classed as a Recent Change Data Message (RCDM).

An alphabetical keyword list is included in this section on page 5.

RC Form 607

General

This form is used to ADD Public Announcement System (PAS) with TELEVOTE. This service provides a telephone voting mechanism so that callers can dial an advertised set of numbers to register their opinion concerning an advertised issue. Counts are kept on the number of calls and delivered via a Dial Up Port to the sponsor.

See "TELEVOTE - Table 45" for the required entries corresponding to the Televote application.

This message is classed as a Recent Change Data Message (RCDM).

An alphabetical keyword list is included in this section on page 11.

Form Entries

RC:PAS;NEW;OPT(TELEVOTE);___:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

MSI

Master/Slave Indicator/Mass Announcement System - This one character field is used to specify whether this 4ESS Switch/MAS Switch office is a Master office (M), Slave office (S), or Both (B) for this Televote application. Valid entries are **"M"**, **"S"**, or **"B"**.

Continued on next page

Form Entries, Continued

SAPN	Slave Application number - This field identifies a particular slave TELEVOTE application. If the Master Slave Indicator (MSI) field is **"B"** or **"S"**, an entry must be made in the SAPN field. Valid entries are **"Blank"** or **"0-63"**.
MAPN	Master Application Number. This field identifies a particular master TELEVOTE application. Valid entries are **"0-63"**.
ORNU	Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.
START DATE	The Start Date is the date on which the Cut-Through or Televote application is to be activated. The Start Date is composed of the Start Month, Start Day, and Start Year. The Start Month has a valid entry of **"1-12"**. The Start Day has a valid entry of **"1-31"**. The Start Year has a valid entry of **"00-99"**.
STRTM	Start Month - see START DATE.
STRTD	Start Day - see START DATE.
STRTY	Start Year - see START DATE.

Continued on next page

Form Entries, Continued

STOP DATE	The Stop Date is the date on which the Cut-Through or Televote application is to stop. The Stop Date is composed of the Stop Month, Stop Day, and Stop Year. All three fields must be specified, or all three may be **"Blank"**. Blank fields imply that the service is to be available on a permanent basis until removed by a Recent Change (RC). If the Stop Date fields are not all **"Blank"**, the stop time field must have an entry. Stop Month has a valid entry of "**1**-**12**". Stop Day has a valid entry of "**1**-**31**". Stop Year has a valid entry of "**00**-**99**".
STOPM	Stop Month - see STOP DATE.
STOPD	Stop Day - see STOP DATE.
STOPY	Stop Year - see STOP DATE.

Continued on next page

Form Entries, Continued

STRTT

The Start Time field specifies what time within a 24-hour period following the Start Date that the Cut-Through or Televote function will start. The Start Time field is composed of four digits, two for hours, and two for minutes. A **"Blank"** field is not permitted. The first two digits of the field representing the Start Time hour must be **"0-23"**. The last two digits representing the minutes of the Start Time must be **"0-59"**. For Start Date equal to Stop Date, the Start Time must be less than the Stop Time.

STOPT

The daily Stop Time field specifies what time within 24 hours following the Start Date that the Cut-Through or Televote function will stop. For successive days thereafter the Cut-Through or Televote service is stopped within each 24-hour period at the Stop Time until the Stop Date is reached. The Stop Time must be specified if the Stop Date has been specified. If the Stop Date has been left **"Blank"**, then the Stop Time can be specified or left **"Blank"**. If the Stop Date is left **"Blank"** but not the Stop Time, the Cut-Through service will cycle on and off each day (after the Start Date). The first two digits of the field representing Start Time hour is **"0-23"**. The last two digits representing minutes is **"0-59"**. If the Stop Time is specified, the value must be later than the Start Time when the Start and Stop Dates are equal.

Continued on next page

Form Entries, Continued

DUPID

Dial Up Port Identification - This field assigns an identifier to a client. All client identifiers for the office must be unique. Identifier assignments are based on the client type as follows:

CTYPE	ID
VSS	00001-99999
TDAS or **TVSP**	Two characters which may be either a letter (**"A-Z"**) or digit (**"0-9"**).

For RC Form 607, this field identifies the TELEVOTE sponsor to whom master TELEVOTE counts will be sent. Valid entry is a two character alphanumeric. The first must be a letter **"A-Z"**, the second may be a letter **"A-Z"** or digit **"0-9"**. This entry corresponds to the DUPID entered on the RC Form 603.

NOTE: This field must be **"Blank"** if MSI is **"S"**. This field may optionally be **"Blank"** for MSI of **"M"** or **"B"**, if real time output to the sponsor is not required

DSFUN

Common Channel Interoffice Signaling (CCIS) Direct Signaling Function Number. This field identifies the master office designated to accumulate Televote counts for this Televote application. If the MSI field is **"M"** or **"B"**, this field is **"Blank"**. Valid entries in this field are **"1-32767"**.

SKEW

The SKEW is a number from 0-300 that specifies the offset in seconds from Start Time when the count will be transmitted the first time from slave to master. Valid entries are **" 0-300"** or **"Blank"** if the Master Slave Indicator (MSI) is M or B.

Continued on next page

Form Entries, Continued

MAN

Mass Announcement Number - For the Televote forms, this field is used to specify the Direct Distance Dialing (DDD) number to be called to register a particular Televote vote or opinion (and to hear the associated Public Announcement System (PAS) announcement). A separate MAN is entered for each unique vote or opinion choice. The entry format is **NPA-NXX-XXXX**.

NOTE:

- The PAS announcement to be heard with a particular vote or opinion must be defined on RC 604 Form.
- When Master Slave Indicator (MSI) is **"S"** or **"B"**, a unique 10 digit DDD Number (MAN) must be specified on a code group form.
- When MSI is an **"M"**, a four digit line number is entered.

For the PAS with Cut-Through forms, this field is used to specify the DDD number which callers dial for the PAS announcements, and to which this Cut- Through application applies. The format of the entry is **NPA-NXX-XXXX**. A MAN can be a 6- to 10-digit number. When there are MANs that have overlapping code groups, the system only cuts through for the MAN with the most number of digits. For example, the Cut-Through MAN digits of the 9-digit code group of 212979123 include the Cut-Through digits of all 10-digit code groups that start with the first nine digits of 212979123, and if there is a 10-digit MAN defined, the system will cut through for the 10-digit MAN and not the 9-digit MAN. The MAN must be routed to a PAS or Televote (TEL) call type on a code group form.

VSSID

Voice Storage System (VSS) Identity. This five digit field is the first part of the External Announcement Identity (EAID) code identifying the announcement. For announcements updated from a VSS, the VSS Identity is entered. Valid entries are **"1-99999"**. For barge-in announcements, direct producer updated announcements, or service circuit system announcements, the VSSID must be **"0"**. With VSS updated announcements, the VSSID must be a valid VSS client in the Dial Up Port translator.

Continued on next page

Form Entries, Continued

SID Service Identity - This field is a seven digit entry which identifies the type of announcement.

A. VSS Updated -	**"0000000-9990000"** **"9999901"** and **"9999902"**
B. Direct Producer -	**"9990001-9999000"** **"9999901"** and **"9999902"**
C. Barge-In -	**"9999001-9999511"** **"9999901"** and **"9999902"**
D. SCS -	**"0000000-9990000"** **"9999901"** and **"9999902"**

TCNTR Televote Counter Index is a number between **"0-127"** assigned to the slave Televote application for the Direct Distance Dialing (DDD) number if Master Slave Indicator (MSI) is **"S"** or **"B"**. This field is **"Blank"** if MSI is **"M"**. Up to 64 entries may be specified by using RC Form 608.

ACNTR Accumulating Counter - Accumulating Counter Index is a number between **"0-127"** that is assigned to the master Televote application for a line number. Up to 64 entries can be specified using RC Form 608. This field is **"Blank"** if Market Segment Indicator (MSI) equals **S**.

RC Form 608

General

This form is used to ADD an additional 60 TELEVOTE options to the initial four assigned on Recent Change (RC) Form 607. Additional Mass Announcement Numbers (MANs) can be assigned in increments of up to 10 using this form. This form may be used to delete specific TELEVOTE entries without having to delete the entire application. The entry and the corresponding counters may then be reassigned to the same or to some other application.

Before deleting a TELEVOTE entry, applicable code group change RC Forms 300-304 should be entered to remove TELEVOTE Call Type work linkages.

See "TELEVOTE - Table 45" for the required entries corresponding to the Televote application.

This message is classed as a Recent Change Data Message (RCDM).

An alphabetical keyword list is included in this section on page 8.

Form Entries, Continued

MAN

Mass Announcement Number - For the Televote forms, this field is used to specify the Direct Distance Dialing (DDD) number to be called to register a particular Televote vote or opinion (and to hear the associated Public Announcement System (PAS) announcement). A separate MAN is entered for each unique vote or opinion choice. The entry format is **NPA-NXX-XXXX**.

NOTE:

- The PAS announcement to be heard with a particular vote or opinion must be defined on RC 604 Form.
- When Master Slave Indicator (MSI) is **"S"** or **"B"**, a unique 10 digit DDD Number (MAN) must be specified on a code group form.
- When MSI is an **"M"**, a four digit line number is entered.

For the PAS with Cut-Through forms, this field is used to specify the DDD number which callers dial for the PAS announcements, and to which this Cut- Through application applies. The format of the entry is **NPA-NXX-XXXX**. A MAN can be a 6- to 10-digit number. When there are MANs that have overlapping code groups, the system only cuts through for the MAN with the most number of digits. For example, the Cut-Through MAN digits of the 9-digit code group of 212979123 include the Cut-Through digits of all 10-digit code groups that start with the first nine digits of 212979123, and if there is a 10-digit MAN defined, the system will cut through for the 10-digit MAN and not the 9-digit MAN. The MAN must be routed to a PAS or Televote (TEL) call type on a code group form.

VSSID

Voice Storage System (VSS) Identity. This five digit field is the first part of the External Announcement Identity (EAID) code identifying the announcement. For announcements updated from a VSS, the VSS Identity is entered. Valid entries are **"1-99999"**. For barge-in announcements, direct producer updated announcements, or service circuit system announcements, the VSSID must be **"0"**. With VSS updated announcements, the VSSID must be a valid VSS client in the Dial Up Port translator.

Continued on next page

Form Entries, Continued

SID

Service Identity - This field is a seven digit entry which identifies the type of announcement.

A. VSS Updated -	**"0000000-9990000"** **"9999901"** and **"9999902"**
B. Direct Producer -	**"9990001-9999000"** **"9999901"** and **"9999902"**
C. Barge-In -	**"9999001-9999511"** **"9999901"** and **"9999902"**
D. SCS -	**"0000000-9990000"** **"9999901"** and **"9999902"**

TCNTR

Televote Counter Index is a number between **"0-127"** assigned to the slave Televote application for the Direct Distance Dialing (DDD) number if Master Slave Indicator (MSI) is **"S"** or **"B"**. This field is **"Blank"** if MSI is **"M"**. Up to 64 entries may be specified by using RC Form 608.

ACNTR

Accumulating Counter - Accumulating Counter Index is a number between **"0-127"** that is assigned to the master Televote application for a line number. Up to 64 entries can be specified using RC Form 608. This field is **"Blank"** if Market Segment Indicator (MSI) equals **S**.

RC Form 610

General

This form is used to ADD the Cut-Through function to a Public Announcement Service (PAS) announcement.

PAS with Cut-Through provides a dynamic choking service for callers who dial an advertised number. Only a limited number of callers will be cut through from this advertised number to another Direct Distance Dialing (DDD) number. Callers who are not cut through will hear a PAS announcement.

This message is classed as a Recent Change Data Message (RCDM).

An alphabetical keyword list is included in this section on page 10.

Form Entries

RC:PAS;NEW;OPT(CUTTHRU);___:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

CAPPN

The Cut-Through Application Number is a unique number from **"0-63"** which identifies a particular Cut-Through Application within the 4ESS Switch/Mass Announcement System (MAS) office.

Continued on next page

Form Entries, Continued

CTTYPE

Cut-Through Type - This field is used to indicate which type of Cut-Through is desired. With Type 1 Cut-Through, the system cuts calling parties through to another number (the Cut-Through Number) which has been specified on a Recent Change (RC) 610 Form, without receiving a Public Announcement System (PAS) announcement. The frequency of calls being Cut-Through is based on a call gapping interval index. Also for Type 1 Cut-Through, calls which are Cut-Through will register for Televote counts if Televote has been defined.

With Type 2 Cut-Through, the system cuts calling parties through to the Cut-Through Number, also based on the call gapping interval index, after the PAS announcement has played a specified number of times. Televote is registered for calls which have been Cut-Through if it has been defined. With Type 2 Cut-Through, the total announcement time (length-play) must not exceed 270 seconds due to Call Register (CR) maximum holding time limitation of 5 minutes.

Valid entries for CTTYPE are **"1"** or **"2"** corresponding to Type 1 and Type 2 Cut-Through.

VSSID

Voice Storage System (VSS) Identity. This five digit field is the first part of the External Announcement Identity (EAID) code identifying the announcement. For announcements updated from a VSS, the VSS Identity is entered. Valid entries are **"1-99999"**. For barge-in announcements, direct producer updated announcements, or service circuit system announcements, the VSSID must be **"0"**. With VSS updated announcements, the VSSID must be a valid VSS client in the Dial Up Port translator.

Continued on next page

Form Entries, Continued

SID Service Identity - This field is a seven digit entry which identifies the type of announcement.

A. VSS Updated -	**"0000000-9990000"** **"9999901"** and **"9999902"**
B. Direct Producer -	**"9990001-9999000"** **"9999901"** and **"9999902"**
C. Barge-In -	**"9999001-9999511"** **"9999901"** and **"9999902"**
D. SCS -	**"0000000-9990000"** **"9999901"** and **"9999902"**

ORNU Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

START DATE The Start Date is the date on which the Cut-Through or Televote application is to be activated. The Start Date is composed of the Start Month, Start Day, and Start Year. The Start Month has a valid entry of **"1-12"**. The Start Day has a valid entry of **"1-31"**. The Start Year has a valid entry of **"00-99"**.

STRTM Start Month - see START DATE.

STRTD Start Day - see START DATE.

STRTY Start Year - see START DATE.

Continued on next page

Form Entries, Continued

STOP DATE	The Stop Date is the date on which the Cut-Through or Televote application is to stop. The Stop Date is composed of the Stop Month, Stop Day, and Stop Year. All three fields must be specified, or all three may be **"Blank"**. Blank fields imply that the service is to be available on a permanent basis until removed by a Recent Change (RC). If the Stop Date fields are not all **"Blank"**, the stop time field must have an entry. Stop Month has a valid entry of "**1-12**". Stop Day has a valid entry of "**1-31**". Stop Year has a valid entry of "**00-99**".
STOPM	Stop Month - see STOP DATE.
STOPD	Stop Day - see STOP DATE.
STOPY	Stop Year - see STOP DATE.

Continued on next page

Form Entries, Continued

STRTT

The Start Time field specifies what time within a 24-hour period following the Start Date that the Cut-Through or Televote function will start. The Start Time field is composed of four digits, two for hours, and two for minutes. A **"Blank"** field is not permitted. The first two digits of the field representing the Start Time hour must be **"0-23"**. The last two digits representing the minutes of the Start Time must be **"0-59"**. For Start Date equal to Stop Date, the Start Time must be less than the Stop Time.

STOPT

The daily Stop Time field specifies what time within 24 hours following the Start Date that the Cut-Through or Televote function will stop. For successive days thereafter the Cut-Through or Televote service is stopped within each 24-hour period at the Stop Time until the Stop Date is reached. The Stop Time must be specified if the Stop Date has been specified. If the Stop Date has been left **"Blank"**, then the Stop Time can be specified or left **"Blank"**. If the Stop Date is left **"Blank"** but not the Stop Time, the Cut-Through service will cycle on and off each day (after the Start Date). The first two digits of the field representing Start Time hour is **"0-23"**. The last two digits representing minutes is **"0-59"**. If the Stop Time is specified, the value must be later than the Start Time when the Start and Stop Dates are equal.

Form Entries, Continued

MAN

Mass Announcement Number - For the Televote forms, this field is used to specify the Direct Distance Dialing (DDD) number to be called to register a particular Televote vote or opinion (and to hear the associated Public Announcement System (PAS) announcement). A separate MAN is entered for each unique vote or opinion choice. The entry format is **NPA-NXX-XXXX**.

NOTE:

- The PAS announcement to be heard with a particular vote or opinion must be defined on RC 604 Form.
- When Master Slave Indicator (MSI) is **"S"** or **"B"**, a unique 10 digit DDD Number (MAN) must be specified on a code group form.
- When MSI is an **"M"**, a four digit line number is entered.

For the PAS with Cut-Through forms, this field is used to specify the DDD number which callers dial for the PAS announcements, and to which this Cut- Through application applies. The format of the entry is **NPA-NXX-XXXX**. A MAN can be a 6- to 10-digit number. When there are MANs that have overlapping code groups, the system only cuts through for the MAN with the most number of digits. For example, the Cut-Through MAN digits of the 9-digit code group of 212979123 include the Cut-Through digits of all 10-digit code groups that start with the first nine digits of 212979123, and if there is a 10-digit MAN defined, the system will cut through for the 10-digit MAN and not the 9-digit MAN. The MAN must be routed to a PAS or Televote (TEL) call type on a code group form.

CTN

Cut-Through Number - The Cut-Through Number (CTN) specifies the Direct Distant Dialing (DDD) number for routing calls selected for Cut-Through. The CTN field must be a **ten-digit number** if specified. A **"Blank"** field will be accepted since the Cut-Through number may be specified later via a Voice Storage System (VSS) update when audio is sent of via Recent Change (RC) form. However, if Voice Storage System Identity (VSSID) is 0, the CTN must be specified. The CTN field must route to an RDB, INW, TTS, PAS, or TEL Call Type in the Plain Old Telephone Service (POTS) domain.

GAPI

Gapping Interval Index. This two digit field is used to specify a GAPI representing the interval in seconds between the selection of calls which are to be Cut-Through (forwarded) for live answer. One call per the number of seconds indicated is selected for Cut-Through. The available GAPIs and the associated interval in seconds are as follows:

Gap Interval Index	Gap Interval in Seconds
0	Gap control is off
1	0 (all calls advance).
2	0.1
3	0.25
4	0.5
5	1.0
6	2.0
7	5.0
8	10
9	15
10	30
11	60
12	120
13	300
14	600
15	INFINITE (100% code block).

RC Form 611

General

This form is used to CHANGE the Cut-Through function to a Public Announcement Service (PAS) announcement.

PAS with Cut-Through provides a dynamic choking service for callers who dial an advertised number. Only a limited number of callers will be cut through from this advertised number to another Direct Distance Dialing (DDD) number. Callers who are not cut through will hear a PAS announcement.

This message is classed as a Recent Change Data Message (RCDM).

An alphabetical keyword list is included in this section on page 9.

Form Entries

RC:PAS;CHG;OPT(CUTTHRU);___:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

CAPPN

The Cut-Through Application Number is a unique number from **"0-63"** which identifies a particular Cut-Through Application within the 4ESS Switch/Mass Announcement System (MAS) office.

Continued on next page

Form Entries, Continued

CTTYPE

Cut-Through Type - This field is used to indicate which type of Cut-Through is desired. With Type 1 Cut-Through, the system cuts calling parties through to another number (the Cut-Through Number) which has been specified on a Recent Change (RC) 610 Form, without receiving a Public Announcement System (PAS) announcement. The frequency of calls being Cut-Through is based on a call gapping interval index. Also for Type 1 Cut-Through, calls which are Cut-Through will register for Televote counts if Televote has been defined.

With Type 2 Cut-Through, the system cuts calling parties through to the Cut-Through Number, also based on the call gapping interval index, after the PAS announcement has played a specified number of times. Televote is registered for calls which have been Cut-Through if it has been defined. With Type 2 Cut-Through, the total announcement time (length-play) must not exceed 270 seconds due to Call Register (CR) maximum holding time limitation of 5 minutes.

Valid entries for CTTYPE are **"1"** or **"2"** corresponding to Type 1 and Type 2 Cut-Through.

VSSID

Voice Storage System (VSS) Identity. This five digit field is the first part of the External Announcement Identity (EAID) code identifying the announcement. For announcements updated from a VSS, the VSS Identity is entered. Valid entries are **"1-99999"**. For barge-in announcements, direct producer updated announcements, or service circuit system announcements, the VSSID must be **"0"**. With VSS updated announcements, the VSSID must be a valid VSS client in the Dial Up Port translator.

Continued on next page

Form Entries, Continued

SID Service Identity - This field is a seven digit entry which identifies the type of announcement.

A. VSS Updated -	**"0000000-9990000"** **"9999901"** and **"9999902"**
B. Direct Producer -	**"9990001-9999000"** **"9999901"** and **"9999902"**
C. Barge-In -	**"9999001-9999511"** **"9999901"** and **"9999902"**
D. SCS -	**"0000000-9990000"** **"9999901"** and **"9999902"**

ORNU Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

START DATE The Start Date is the date on which the Cut-Through or Televote application is to be activated. The Start Date is composed of the Start Month, Start Day, and Start Year. The Start Month has a valid entry of **"1-12"**. The Start Day has a valid entry of **"1-31"**. The Start Year has a valid entry of **"00-99"**.

STRTM Start Month - see START DATE.

STRTD Start Day - see START DATE.

STRTY Start Year - see START DATE.

Continued on next page

Form Entries, Continued

STOP DATE	The Stop Date is the date on which the Cut-Through or Televote application is to stop. The Stop Date is composed of the Stop Month, Stop Day, and Stop Year. All three fields must be specified, or all three may be **"Blank"**. Blank fields imply that the service is to be available on a permanent basis until removed by a Recent Change (RC). If the Stop Date fields are not all **"Blank"**, the stop time field must have an entry. Stop Month has a valid entry of "**1-12**". Stop Day has a valid entry of "**1-31**". Stop Year has a valid entry of "**00-99**".
STOPM	Stop Month - see STOP DATE.
STOPD	Stop Day - see STOP DATE.
STOPY	Stop Year - see STOP DATE.

Form Entries, Continued

STRTT

The Start Time field specifies what time within a 24-hour period following the Start Date that the Cut-Through or Televote function will start. The Start Time field is composed of four digits, two for hours, and two for minutes. A **"Blank"** field is not permitted. The first two digits of the field representing the Start Time hour must be **"0-23"**. The last two digits representing the minutes of the Start Time must be **"0-59"**. For Start Date equal to Stop Date, the Start Time must be less than the Stop Time.

STOPT

The daily Stop Time field specifies what time within 24 hours following the Start Date that the Cut-Through or Televote function will stop. For successive days thereafter the Cut-Through or Televote service is stopped within each 24-hour period at the Stop Time until the Stop Date is reached. The Stop Time must be specified if the Stop Date has been specified. If the Stop Date has been left **"Blank"**, then the Stop Time can be specified or left **"Blank"**. If the Stop Date is left **"Blank"** but not the Stop Time, the Cut-Through service will cycle on and off each day (after the Start Date). The first two digits of the field representing Start Time hour is **"0-23"**. The last two digits representing minutes is **"0-59"**. If the Stop Time is specified, the value must be later than the Start Time when the Start and Stop Dates are equal.

CTN

Cut-Through Number - The Cut-Through Number (CTN) specifies the Direct Distant Dialing (DDD) number for routing calls selected for Cut-Through. The CTN field must be a **ten-digit number** if specified. A **"Blank"** field will be accepted since the Cut-Through number may be specified later via a Voice Storage System (VSS) update when audio is sent of via Recent Change (RC) form. However, if Voice Storage System Identity (VSSID) is 0, the CTN must be specified. The CTN field must route to an RDB, INW, TTS, PAS, or TEL Call Type in the Plain Old Telephone Service (POTS) domain.

RC Form 613

General

This form is used to ASSIGN Trunk Subgroups (TSGs) to cliques of a Time Assignment Speech Interpolation (TASI-E) Frame.

The Recent Change (RC) System will not deny the addition of any message TSG per TASI-E Frame. Since the TASI-E frames are outside the administration boundary of the 4ESS™-2000 Switch, it is assumed that further restrictions upon these assignments lies beyond the responsibility of the RC System.

This message is classed as a Recent Change Data Message (RCDM).

An alphabetical keyword list is included in this section on page 7.

Form Entries

RC:TASI;NEW;___:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

FRAME

Time Assignment Speech Interpolation (TASI) Frame number/ Miscellaneous - Valid entries for this field are numbers in the range **"0-255"**.

Continued on next page

Form Entries, Continued

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

TSG

Trunk Subgroup - This series of codes identifies a Trunk Subgroup. The TSG is a set of trunks within a Trunk Group having certain identical characteristics. A Trunk Group must have a common destination. In addition to group characteristics, a TSG also has common signaling characteristics, transmission delay, originating Numbering Plan Area (NPA), domain, traffic separation index and screening classes. The Trunk Group and TSG are identified by a series of codes that specify the near and far ends of the trunk. In most cases, the full near end definition is not required because it will always be the same. The Trunk Group designation is comprised of the town, state, building and building subdivision for the far end plus the near end building subdivision. A TSG is uniquely identified by adding a Base Traffic Number reference. Trunk Group and TSG definitions are available in the 4ESS Switch as abbreviated Circuit Identification Names (CINs). Common Language Location Identification (CLLI) codes must be entered in the fields that make up the Trunk Group definition. Rules for establishing these codes are covered in Lucent Technologies Practices 795-100-100. The code for any established office may be found by referring to the location code index in that same Lucent Technologies Practices. For non-message TSGs, the format does not include mnemonics for identifying the far end of the trunk. The TSG will mnemonically identify the type of trunk category by function. Asterisks are used in columns where no information is necessary. The following paragraphs describe the individual fields within a TSG definition.

Continued on next page

Form Entries, Continued

TSG (cont'd)

- **BTFN** - Base Traffic Number - The BTFN is a number in the range of **"0-9976"** that is part of the TSGs designation (which consists of the BTFN, TOWN, ST, BL, FBS, and NBS). The BTFN is the first traffic number in the first block of traffic numbers that is assigned to a TSG. Additional traffic numbers, which are assigned in blocks of 24, either higher or lower in numerical value than the BTFN can be assigned to the TSG, but the BTFN remains as defined above. All non-message trunks have a BTFN of **"0000"**. For RC 104, the BTFN is stored as the starting point for a block of traffic numbers that range up to the limit originally defined on RC Forms 100, 101 and 102 when the TSG was first built. Other blocks of traffic numbers, either higher or lower in numerical value, may be assigned to this TSG, via Recent Change (RC) procedures. In this case the original BTFN would still apply, but the QTFN field would contain the number of new traffic numbers to be assigned following the First Traffic Number (FTFN) specified.

- **TOWN** - Town is a 4-character alphabetic field - The code must represent the bona fide town, city or location per Lucent Technologies Practices 795-100-100 for the far end of the TSG.

- **ST** - State - This field represents the state, province or foreign country in which the far end office is located. The code in ST must be a standard 2-character alphabetic combination. Valid standard abbreviations for states, Canadian provinces and foreign countries may be found in Lucent Technologies Practices 795-100-100.

- **BL** - Building - The BL field contains the office identity for the far end of a TSG. This code consists of either two alphabetic characters or two numeric characters. Independent Telephone Company locations are always designated by an **"X"** plus some alpha character in this field. If the TSG terminates in a customer's building and it is not necessary to identify that particular building, this code may be arbitrary.

Continued on next page

Form Entries, Continued

TSG (cont'd)

- **FBS** - Far Building Subdivision - This field contains a code that identifies the internal building subdivision for the far end of a TSG. The code is a traffic, plant, or administrative assignment. It must be a 3-character alphanumeric combination. For non-message TSGs, this field is not required. Three asterisks are pre-printed on the form to provide an entry for this field.

- **NBS** - Near Building Subdivision - The NBS designation is the internal building identity for the near end termination of a TSG. It is always a 3-character alphanumeric code. This field should be left **"Blank"** if the NBS for this TSG is the same as the NBS assigned in the near office Circuit Identification Number (CIN) for the 4ESS Switch. The Office Data Assembler (ODA) system will add the NBS on a default basis.

CLIQUE

A CLIQUE is the part of a Time Assignment Speech Interpolation frame (TASI-E) that is uniquely associated with a Miscellaneous Scan Point to provide Dynamic Load Control (DLC). Valid entries are **"0-4"**.

RC Form 614

General

This form is used to DELETE Trunk Subgroups (TSGs) from cliques of a Time Assignment Speech Interpolation (TASI-E) Frame.

The Recent Change (RC) System will not deny the addition of any message TSG per TASI-E Frame. Since the TASI-E frames are outside the administration boundary of the 4ESS™-2000 Switch, it is assumed that further restrictions upon these assignments lies beyond the responsibility of the RC System.

This message is classed as a Recent Change Data Message (RCDM).

An alphabetical keyword list is included in this section on page 7.

Form Entries

RC:TASI;OUT;___:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

FRAME

Time Assignment Speech Interpolation (TASI) Frame number/ Miscellaneous - Valid entries for this field are numbers in the range **"0-255"**.

Continued on next page

Form Entries, Continued

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

TSG

Trunk Subgroup - This series of codes identifies a Trunk Subgroup. The TSG is a set of trunks within a Trunk Group having certain identical characteristics. A Trunk Group must have a common destination. In addition to group characteristics, a TSG also has common signaling characteristics, transmission delay, originating Numbering Plan Area (NPA), domain, traffic separation index and screening classes. The Trunk Group and TSG are identified by a series of codes that specify the near and far ends of the trunk. In most cases, the full near end definition is not required because it will always be the same. The Trunk Group designation is comprised of the town, state, building and building subdivision for the far end plus the near end building subdivision. A TSG is uniquely identified by adding a Base Traffic Number reference. Trunk Group and TSG definitions are available in the 4ESS Switch as abbreviated Circuit Identification Names (CINs). Common Language Location Identification (CLLI) codes must be entered in the fields that make up the Trunk Group definition. Rules for establishing these codes are covered in Lucent Technologies Practices 795-100-100. The code for any established office may be found by referring to the location code index in that same Lucent Technologies Practices. For non-message TSGs, the format does not include mnemonics for identifying the far end of the trunk. The TSG will mnemonically identify the type of trunk category by function. Asterisks are used in columns where no information is necessary. The following paragraphs describe the individual fields within a TSG definition.

Continued on next page

Form Entries, Continued

TSG (cont'd)

- **BTFN** - Base Traffic Number - The BTFN is a number in the range of **"0-9976"** that is part of the TSGs designation (which consists of the BTFN, TOWN, ST, BL, FBS, and NBS). The BTFN is the first traffic number in the first block of traffic numbers that is assigned to a TSG. Additional traffic numbers, which are assigned in blocks of 24, either higher or lower in numerical value than the BTFN can be assigned to the TSG, but the BTFN remains as defined above. All non-message trunks have a BTFN of **"0000"**. For RC 104, the BTFN is stored as the starting point for a block of traffic numbers that range up to the limit originally defined on RC Forms 100, 101 and 102 when the TSG was first built. Other blocks of traffic numbers, either higher or lower in numerical value, may be assigned to this TSG, via Recent Change (RC) procedures. In this case the original BTFN would still apply, but the QTFN field would contain the number of new traffic numbers to be assigned following the First Traffic Number (FTFN) specified.

- **TOWN** - Town is a 4-character alphabetic field - The code must represent the bona fide town, city or location per Lucent Technologies Practices 795-100-100 for the far end of the TSG.

- **ST** - State - This field represents the state, province or foreign country in which the far end office is located. The code in ST must be a standard 2-character alphabetic combination. Valid standard abbreviations for states, Canadian provinces and foreign countries may be found in Lucent Technologies Practices 795-100-100.

- **BL** - Building - The BL field contains the office identity for the far end of a TSG. This code consists of either two alphabetic characters or two numeric characters. Independent Telephone Company locations are always designated by an **"X"** plus some alpha character in this field. If the TSG terminates in a customer's building and it is not necessary to identify that particular building, this code may be arbitrary.

Continued on next page

Form Entries, Continued

TSG (cont'd)

- **FBS** - Far Building Subdivision - This field contains a code that identifies the internal building subdivision for the far end of a TSG. The code is a traffic, plant, or administrative assignment. It must be a 3-character alphanumeric combination. For non-message TSGs, this field is not required. Three asterisks are pre-printed on the form to provide an entry for this field.

- **NBS** - Near Building Subdivision - The NBS designation is the internal building identity for the near end termination of a TSG. It is always a 3-character alphanumeric code. This field should be left **"Blank"** if the NBS for this TSG is the same as the NBS assigned in the near office Circuit Identification Number (CIN) for the 4ESS Switch. The Office Data Assembler (ODA) system will add the NBS on a default basis.

CLIQUE

A CLIQUE is the part of a Time Assignment Speech Interpolation frame (TASI-E) that is uniquely associated with a Miscellaneous Scan Point to provide Dynamic Load Control (DLC). Valid entries are **"0-4"**.

RC Form 616

General

This form is used to CHANGE cell grouping indexes for traffic separations by specifying the Incoming Separation Class - Destination Separation (INSEP-DESEP) pair and its related cell group index. Cell Group Index 1 should be used only for test calls, i.e., for INSEP-DESEP pairs which includes INSEP 31. INSEP 31 and DESEP 63 are related to Cell Group Index 1 generically by Office Data Assembler (ODA).

This message is classed as a Recent Change Data Message (RCDM).

An alphabetical keyword list is included in this section on page 5.

Form Entries

RC:IDAM;CHG;---:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

Continued on next page

Form Entries, Continued

FINSEP	First Incoming Separation Class (INSEP) in a range of INSEPs associated with a Destination Separation (DESEP) or range of DESEPs and a Cell Grouping Index. If a single INSEP is desired, Quantity of INSEP (QINSEP) should equal one. Valid range is **"0-255"**.
QINSEP	Quantity of Incoming Separations (INSEPs) desired in a range starting with INSEP value assigned in First INSEP (FINSEP) field. If a single INSEP is desired QINSEP should equal one. Valid range is **1-256**. For the combined FINSEP-QINSEP pair, the value of FINSEP + (QINSEP - 1) must be less than 256.
FDESEP	First Destination Separation in a range of Destination Separations (DESEPs) associated with an Incoming Separation (Incoming Separation Class) or range of INSEPs and a Cell Grouping Index. If only one DESEP is desired, then the value of QDESEP must be **"1"**. Valid range is **"1-255".**
QDESEP	Quantity of Destination Separations (DESEPs) desired in a range starting with DESEP value in First DESEP (FDESEP) field. If a single DESEP is desired, then QDESEP should equal one. Valid range is **"1-255"**. For the combined FDESEP - QDESEP pair, the value of FDESEP + (QDESEP - 1) must be less than 256.
CELL GROUP	Cell Grouping Index associated with Incoming Separation Class (INSEP) and Destination Separation (DESEP) specified on input form. Valid range is **"1-1023"**. **"0"** is reserved for generic auditing purposes. All INSEP and DESEP values not assigned to a Cell Grouping will be set to index 1023 by the Office Data Assembler (ODA) system. Cell Grouping Index 1, which is used for test calls, is generically associated with INSEP-DESEP Pair 31-63 in all offices. This form may be used to associate all other INSEP-DESEP Pairs which include INSEP 31 to Cell Grouping Index 1.

Form Entries, Continued

CLASS

This field specifies the classification of the Far End Network (FEN). Valid entries are:

- **ACCESA** - This identifier specifies that the FEN is an Interexchange Carrier (IC) or International Carrier (INC), and the 4ESS Switch is being used by a Local Exchange Carrier (LEC) as an Access Tandem (AT) to switch calls from this FEN.
- **ACCESI** - This identifier specifies that the FEN is an INC, and the 4ESS Switch is being used by an IEC (e.g., ATTIX) to switch calls from this FEN.
- **ACCESO** - This identifier specifies that the FEN is an Operating Company.
- **CAMA** - This identifier specifies that the Trunk Subgroup (TSG) is terminated on an office which delivers traffic on CAMA trunks.
- **CMC** - Cellular Mobile Carrier - This identifier specifies that the FEN is a CMC. The TSG connects an Access Tandem (AT) and a CMC.
- **INTL** - This identifier specifies that the FEN is outside World Zone 1, and the 4ESS Switch is being used as an International Switching Center (ISC).
- **ITS** - This identifier specifies that the TSG is a link to an Other Common Carrier or Direct Connect Customer who is delivering international traffic to the network.
- **OEO** - Other End Office connecting, meaning an Equal Access End Office (EAEO) owned by a different company. This identifier specifies that the FEN is an OEO. The TSG connects an AT and an OEO.
- **OWATS** - This identifier specifies that the FEN is a Private Branch Exchange (PBX) which only places Outward Wide Band Area Telephone Service (OWATS) calls.
- **PBX** - This identifier specifies that the FEN is a Private Branch Exchange (PBX).
- **POTS** - This identifier specifies that the FEN is either the Local Access Transport Area (LATA) of the LEC owning/sharing the 4ESS Switch, the Continental United States POTS (CUSP) network of the IC owning/ sharing the 4ESS Switch, or some other FEN to be treated similarly.

Form Entries, Continued

FID

Far End Network (FEN) Identification - This field identifies the particular FEN within the specific class of FENs. It may be left **"Blank"** or entered as 1 to 6 alphanumeric characters. When CLASS is ACCESA or ACCESI, FID should consist of type of feature group access and the 4 numeric digits of the Carrier Identification Code.

The type of feature group definitions are:

- **G** - All access types (B, C, & D).
- **B** - Feature Group B Access.
- **C** - Feature Group C Access.
- **D** - Feature Group D Access.

Examples include:

- **G0288** - Carrier ID **288** has Feature Group B, C, & D access.
- **BC0288** - Carrier ID **288** has Feature Group B & C access.
- **BD0288** - Carrier ID **288** has Feature Group B & D access.
- **B2882** - Carrier ID **2882** has Feature Group B access only.
- **D2882** - Carrier ID **2882** has Feature Group D access only.

For an access type, both **B2882** and **D2882** can exist but be for different carriers.

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

Continued on next page

Form Entries, Continued

AFA

ANI Failure Action - This field is used to specify the actions that must be taken for Equal Access Signaling (EAS) calls for which Automatic Number Identification (ANI) is expected but not received. This field is only applicable for Inter-LATA Carrier switches which receive EAS calls. If EAS calls cannot be received from this particular Far End Network (FEN), then this field must be left **"Blank"**. If EAS calls can be received from this FEN, then enter one of the following:

- **RR** - Route the call normally and make a special Record of the call using existing data.
- **KA** - Kill the call and play the Reorder Announcement (ROA) to the caller.
- **KW** - Kill the call by sending an unexpected wink (long off-hook) while the ROA announcement is played. This is a particularly effective way to find out which End Office (EO) is not passing ANI for calls which are received from an Access Tandem (AT) (the ANI and called sequences of EAS calls are transparent to the AT). However, this should not be used indiscriminately, since it causes trouble reports to be generated.

UNSP

Unspecified - This field specifies the disposition of calls in the UNSP Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is UNSP.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

Form Entries, Continued

ATAP

Access Tandem Area Plain Old Telephone Service (POTS) - This field specifies the disposition of calls in the ATAP Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is ATAP.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

CUSP

Continental United States Plain Old Telephone Service (POTS) This field specifies the disposition of calls in the CUSP Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is CUSP.

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

CARP

Caribbean, Non-US Territories, Plain Old Telephone Service (POTS) - This field specifies the disposition of calls in the CARP Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is CARP .

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

Continued on next page

Form Entries, Continued

CANP

Canadian Plain Old Telephone Service (POTS) - This field specifies the disposition of calls in the CANP Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is CANP.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

HAWP

Hawaiian Plain Old Telephone Service (POTS) - This field specifies the disposition of calls in the HAWP Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is HAWP.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

NWZ1

Non-World Zone 1- This field specifies the disposition of calls in the NWZ1 Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is NWZ1.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

TC

Teleconferencing - This field specifies the disposition of calls in the TC Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is TC.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

DA

Directory Assistance - This field specifies the disposition of calls in the DA Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is DA.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

IOP

Inward Operator - This field specifies the disposition of calls in the IOP Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is IOP.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

Form Entries, Continued

TST

Test Line - This field specifies the disposition of calls in the TST Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is TST.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

RSYS

Restricted System Codes - This field specifies the disposition of calls in the RSYS Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is RSYS.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

MSC1-4

Miscellaneous 1 to 4 - This field specifies the disposition of calls in the MSC1-4 Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is MSC1-4.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

Form Entries, Continued

INCN

International Carrier, not IC switch owner's INC - This field specifies the disposition of calls in the INCN Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is INCN.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

ALAP

Alaskan Plain Old Telephone Service (POTS) - This field specifies the disposition of calls in the ALAP Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is ALAP.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

CUTP

Caribbean, United States Territories, Plain Old Telephone Service (POTS) This field specifies the disposition of calls in the CUTP Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is CUTP.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

INCO

International Carrier - This field specifies the disposition of calls in the INCO Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is INCO.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

EASC

Exchange Access Signaling Code - This field specifies the disposition of calls in the EASC Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is EASC.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

ICIN

This field specifies the disposition of calls in the Inter-Local Access Transport Area (LATA) Carrier Switch's International Carrier (ICIN) Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is ICIN.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

Form Entries, Continued

SC1-SC36

Spare Categories 1 to 36 - These fields specify the disposition of calls in the SC1-36 Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is SC1-36.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

SDN

Software Defined Network - This field specifies the disposition of calls in the SDN Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is SDN.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

LDA

Inward Operator - This field specifies the disposition of calls in the LDA Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is LDA.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

SSP

Service Switching Point - This field specifies the disposition of calls in the SSP Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is SSP.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

SPDI

Sponsor-Paid Dial-It (Dial-It calls paid for by the sponsor) - This field specifies the disposition of calls in the SPDI Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is SPDI.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

MULT

Multiquest - This field specifies the disposition of calls in the MULT Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is MULT.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

MCPP

Multiquest Calling Party-Paid - This field specifies the disposition of calls in the MCPP Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is MCPP.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

INET

Interim Nationwide Emergency Telecommunications System - This field specifies the disposition of calls in the INET Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is INET.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

SDND

Software Defined Network Data calls - This field specifies the disposition of calls in the SDN Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is SDN.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

Form Entries, Continued

QTM Not Applicable - Entries: **"Blank"**

DEF1 This field is used to deny calls in the DEF1 category, i.e., codes entered on the RC Form 319 with DIGTYP equal to DEF1. A **"Y"** is entered if calls in the DEF1 category must be denied. An **"N"** is entered if calls in the DEF1 category are allowed. If this field is left **"Blank"**, calls in the DEF1 category will not be denied.

DEF2 This field is used to deny calls in the DEF2 category, i.e., codes entered on the RC Form 319 with DIGTYP equal to DEF2. A **"Y"** is entered if calls in the DEF2 category must be denied. An **"N"** is entered if calls in the DEF2 category are allowed. If this field is left **"Blank"**, calls in the DEF2 category will not be denied.

DEF3 This field is used to deny calls in the DEF3 category, i.e., codes entered on the RC Form 319 with DIGTYP equal to DEF3. A **"Y"** is entered if calls in the DEF3 category must be denied. An **"N"** is entered if calls in the DEF3 category are allowed. If this field is left **"Blank"**, calls in the DEF3 category will not be denied.

DEF4 This field is used to deny calls in the DEF4 category, i.e., codes entered on the RC Form 319 with DIGTYP equal to DEF4. A **"Y"** is entered if calls in the DEF4 category must be denied. An **"N"** is entered if calls in the DEF4 category are allowed. If this field is left **"Blank"**, calls in the DEF4 category will not be denied.

DFHT This field is used to specify Final Handling Treatment (FHT) for calls which are denied. Refer to Lucent Technologies Practice 781-031-100 for further information on tones and announcements. If this field is left **"Blank"**, the Final Handling Treatment given will be Revenue Accounting Office (ROA). See the RDBFHT description for the allowable entries.

RC Form 618

General

This form is used to CHANGE the characteristics of an existing Far End Network (FEN). These characteristics then apply to all Trunk Subgroups (TSGs) defined to be within this FEN. It should be noted that all relevant data fields must contain an entry, even though some of these characteristics are not being changed.

The Classification (CLASS) and FEN Identification (FID) entered on this form must match an existing FEN.

An alphabetical keyword list is included in this section, starting on page 18.

Form Entries

RC:FEN;CHG;---:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

Form Entries, Continued

CLASS

This field specifies the classification of the Far End Network (FEN). Valid entries are:

- **ACCESA** - This identifier specifies that the FEN is an Interexchange Carrier (IC) or International Carrier (INC), and the 4ESS Switch is being used by a Local Exchange Carrier (LEC) as an Access Tandem (AT) to switch calls from this FEN.
- **ACCESI** - This identifier specifies that the FEN is an INC, and the 4ESS Switch is being used by an IEC (e.g., ATTIX) to switch calls from this FEN.
- **ACCESO** - This identifier specifies that the FEN is an Operating Company.
- **CAMA** - This identifier specifies that the Trunk Subgroup (TSG) is terminated on an office which delivers traffic on CAMA trunks.
- **CMC** - Cellular Mobile Carrier - This identifier specifies that the FEN is a CMC. The TSG connects an Access Tandem (AT) and a CMC.
- **INTL** - This identifier specifies that the FEN is outside World Zone 1, and the 4ESS Switch is being used as an International Switching Center (ISC).
- **ITS** - This identifier specifies that the TSG is a link to an Other Common Carrier or Direct Connect Customer who is delivering international traffic to the network.
- **OEO** - Other End Office connecting, meaning an Equal Access End Office (EAEO) owned by a different company. This identifier specifies that the FEN is an OEO. The TSG connects an AT and an OEO.
- **OWATS** - This identifier specifies that the FEN is a Private Branch Exchange (PBX) which only places Outward Wide Band Area Telephone Service (OWATS) calls.
- **PBX** - This identifier specifies that the FEN is a Private Branch Exchange (PBX).
- **POTS** - This identifier specifies that the FEN is either the Local Access Transport Area (LATA) of the LEC owning/sharing the 4ESS Switch, the Continental United States POTS (CUSP) network of the IC owning/ sharing the 4ESS Switch, or some other FEN to be treated similarly.

Continued on next page

Form Entries, Continued

FID

Far End Network (FEN) Identification - This field identifies the particular FEN within the specific class of FENs. It may be left **"Blank"** or entered as 1 to 6 alphanumeric characters. When CLASS is ACCESA or ACCESI, FID should consist of type of feature group access and the 4 numeric digits of the Carrier Identification Code.

The type of feature group definitions are:

- **G** - All access types (B, C, & D).
- **B** - Feature Group B Access.
- **C** - Feature Group C Access.
- **D** - Feature Group D Access.

Examples include:

- **G0288** - Carrier ID **288** has Feature Group B, C, & D access.
- **BC0288** - Carrier ID **288** has Feature Group B & C access.
- **BD0288** - Carrier ID **288** has Feature Group B & D access.
- **B2882** - Carrier ID **2882** has Feature Group B access only.
- **D2882** - Carrier ID **2882** has Feature Group D access only.

For an access type, both **B2882** and **D2882** can exist but be for different carriers.

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

Continued on next page

Form Entries, Continued

AFA

ANI Failure Action - This field is used to specify the actions that must be taken for Equal Access Signaling (EAS) calls for which Automatic Number Identification (ANI) is expected but not received. This field is only applicable for Inter-LATA Carrier switches which receive EAS calls. If EAS calls cannot be received from this particular Far End Network (FEN), then this field must be left **"Blank"**. If EAS calls can be received from this FEN, then enter one of the following:

- **RR** - Route the call normally and make a special Record of the call using existing data.
- **KA** - Kill the call and play the Reorder Announcement (ROA) to the caller.
- **KW** - Kill the call by sending an unexpected wink (long off-hook) while the ROA announcement is played. This is a particularly effective way to find out which End Office (EO) is not passing ANI for calls which are received from an Access Tandem (AT) (the ANI and called sequences of EAS calls are transparent to the AT). However, this should not be used indiscriminately, since it causes trouble reports to be generated.

UNSP

Unspecified - This field specifies the disposition of calls in the UNSP Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is UNSP.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

Continued on next page

Form Entries, Continued

ATAP

Access Tandem Area Plain Old Telephone Service (POTS) - This field specifies the disposition of calls in the ATAP Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is ATAP.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

CUSP

Continental United States Plain Old Telephone Service (POTS) This field specifies the disposition of calls in the CUSP Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is CUSP.

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

CARP

Caribbean, Non-US Territories, Plain Old Telephone Service (POTS) - This field specifies the disposition of calls in the CARP Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is CARP .

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

Continued on next page

Form Entries, Continued

CANP

Canadian Plain Old Telephone Service (POTS) - This field specifies the disposition of calls in the CANP Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is CANP.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

HAWP

Hawaiian Plain Old Telephone Service (POTS) - This field specifies the disposition of calls in the HAWP Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is HAWP.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

NWZ1

Non-World Zone 1- This field specifies the disposition of calls in the NWZ1 Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is NWZ1.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

Continued on next page

Form Entries, Continued

INW

Inward Wide Area Telephone Service (WATS) - This field specifies the disposition of calls in the INW Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is INW.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

DSD

This field specifies the disposition of calls in the Direct Services Dialing (DSD) Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is DSD.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

DLT

This field specifies the disposition of calls in the DLT Service Category, i.e., codes pointing to a Call Type (CT) for which the Service Category (SC) Item is DLT (Dial-It).

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

TC

Teleconferencing - This field specifies the disposition of calls in the TC Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is TC.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

DA

Directory Assistance - This field specifies the disposition of calls in the DA Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is DA.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

IOP

Inward Operator - This field specifies the disposition of calls in the IOP Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is IOP.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

TST

Test Line - This field specifies the disposition of calls in the TST Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is TST.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

RSYS

Restricted System Codes - This field specifies the disposition of calls in the RSYS Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is RSYS.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

MSC1-4

Miscellaneous 1 to 4 - This field specifies the disposition of calls in the MSC1-4 Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is MSC1-4.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

INCN

International Carrier, not IC switch owner's INC - This field specifies the disposition of calls in the INCN Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is INCN.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

ALAP

Alaskan Plain Old Telephone Service (POTS) - This field specifies the disposition of calls in the ALAP Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is ALAP.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

CUTP

Caribbean, United States Territories, Plain Old Telephone Service (POTS) This field specifies the disposition of calls in the CUTP Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is CUTP.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

INCO

International Carrier - This field specifies the disposition of calls in the INCO Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is INCO.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

EASC

Exchange Access Signaling Code - This field specifies the disposition of calls in the EASC Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is EASC.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

ICIN

This field specifies the disposition of calls in the Inter-Local Access Transport Area (LATA) Carrier Switch's International Carrier (ICIN) Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is ICIN.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

Continued on next page

Form Entries, Continued

SC1-SC36

Spare Categories 1 to 36 - These fields specify the disposition of calls in the SC1-36 Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is SC1-36.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

SDN

Software Defined Network - This field specifies the disposition of calls in the SDN Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is SDN.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

LDA

Inward Operator - This field specifies the disposition of calls in the LDA Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is LDA.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

Continued on next page

Form Entries, Continued

SSP

Service Switching Point - This field specifies the disposition of calls in the SSP Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is SSP.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

SPDI

Sponsor-Paid Dial-It (Dial-It calls paid for by the sponsor) - This field specifies the disposition of calls in the SPDI Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is SPDI.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

MULT

Multiquest - This field specifies the disposition of calls in the MULT Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is MULT.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

Continued on next page

Form Entries, Continued

MCPP

Multiquest Calling Party-Paid - This field specifies the disposition of calls in the MCPP Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is MCPP.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

INET

Interim Nationwide Emergency Telecommunications System - This field specifies the disposition of calls in the INET Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is INET.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

SDND

Software Defined Network Data calls - This field specifies the disposition of calls in the SDN Service Category (SC), i.e., codes pointing to a Call Type (CT) for which the SC Item is SDN.

This entry specifies whether calls in this category are denied, allowed or allowed with an Automatic Message Accounting (AMA) record made. Valid entries are:

- **R** - Calls allowed, make AMA recording
- **D** - Deny Calls in this SC
- **N** - Calls allowed, no AMA recording.

Continued on next page

Form Entries, Continued

QTM	Not Applicable - Entries: **"Blank"**
DEF1	This field is used to deny calls in the DEF1 category, i.e., codes entered on the RC Form 319 with DIGTYP equal to DEF1. A **"Y"** is entered if calls in the DEF1 category must be denied. An **"N"** is entered if calls in the DEF1 category are allowed. If this field is left **"Blank"**, calls in the DEF1 category will not be denied.
DEF2	This field is used to deny calls in the DEF2 category, i.e., codes entered on the RC Form 319 with DIGTYP equal to DEF2. A **"Y"** is entered if calls in the DEF2 category must be denied. An **"N"** is entered if calls in the DEF2 category are allowed. If this field is left **"Blank"**, calls in the DEF2 category will not be denied.
DEF3	This field is used to deny calls in the DEF3 category, i.e., codes entered on the RC Form 319 with DIGTYP equal to DEF3. A **"Y"** is entered if calls in the DEF3 category must be denied. An **"N"** is entered if calls in the DEF3 category are allowed. If this field is left **"Blank"**, calls in the DEF3 category will not be denied.
DEF4	This field is used to deny calls in the DEF4 category, i.e., codes entered on the RC Form 319 with DIGTYP equal to DEF4. A **"Y"** is entered if calls in the DEF4 category must be denied. An **"N"** is entered if calls in the DEF4 category are allowed. If this field is left **"Blank"**, calls in the DEF4 category will not be denied.
DFHT	This field is used to specify Final Handling Treatment (FHT) for calls which are denied. Refer to Lucent Technologies Practice 781-031-100 for further information on tones and announcements. If this field is left **"Blank"**, the Final Handling Treatment given will be Revenue Accounting Office (ROA). See the RDBFHT description for the allowable entries.

RC Form 619

General

This form is used to CHANGE the characteristics of an existing Far End Network (FEN). These characteristics then apply to all Trunk Subgroups (TSGs) defined to be within this FEN. It should be noted that all relevant data fields must contain an entry, even though some of these characteristics are not being changed.

The Classification (CLASS) and FEN Identification (FID) entered on this form must match an existing FEN.

An alphabetical keyword list is included in this section on page 6.

```
# FORM 619   DELETE A FAR END NETWORK

     RC:FEN;OUT;---:                        CLASS ------,       FID ------,

     ORNU ------,

     REMARKS ------------------------------------------------!

                    EQUIVALENT ODA INPUT FORM - NONE

                       ASSOCIATED VERIFY MESSAGES

                           INPUT-16m-VER:FEN

                           OUTPUT-6r-VER:FEN
```

Form Entries

RC:FEN;OUT;---:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

Form Entries, Continued

CLASS

This field specifies the classification of the Far End Network (FEN). Valid entries are:

- **ACCESA** - This identifier specifies that the FEN is an Interexchange Carrier (IC) or International Carrier (INC), and the 4ESS Switch is being used by a Local Exchange Carrier (LEC) as an Access Tandem (AT) to switch calls from this FEN.
- **ACCESI** - This identifier specifies that the FEN is an INC, and the 4ESS Switch is being used by an IEC (e.g., ATTIX) to switch calls from this FEN.
- **ACCESO** - This identifier specifies that the FEN is an Operating Company.
- **CAMA** - This identifier specifies that the Trunk Subgroup (TSG) is terminated on an office which delivers traffic on CAMA trunks.
- **CMC** - Cellular Mobile Carrier - This identifier specifies that the FEN is a CMC. The TSG connects an Access Tandem (AT) and a CMC.
- **INTL** - This identifier specifies that the FEN is outside World Zone 1, and the 4ESS Switch is being used as an International Switching Center (ISC).
- **ITS** - This identifier specifies that the TSG is a link to an Other Common Carrier or Direct Connect Customer who is delivering international traffic to the network.
- **OEO** - Other End Office connecting, meaning an Equal Access End Office (EAEO) owned by a different company. This identifier specifies that the FEN is an OEO. The TSG connects an AT and an OEO.
- **OWATS** - This identifier specifies that the FEN is a Private Branch Exchange (PBX) which only places Outward Wide Band Area Telephone Service (OWATS) calls.
- **PBX** - This identifier specifies that the FEN is a Private Branch Exchange (PBX).
- **POTS** - This identifier specifies that the FEN is either the Local Access Transport Area (LATA) of the LEC owning/sharing the 4ESS Switch, the Continental United States POTS (CUSP) network of the IC owning/ sharing the 4ESS Switch, or some other FEN to be treated similarly.

Continued on next page

Form Entries, Continued

FID

Far End Network (FEN) Identification - This field identifies the particular FEN within the specific class of FENs. It may be left **"Blank"** or entered as 1 to 6 alphanumeric characters. When CLASS is ACCESA or ACCESI, FID should consist of type of feature group access and the 4 numeric digits of the Carrier Identification Code.

The type of feature group definitions are:

- **G** - All access types (B, C, & D).
- **B** - Feature Group B Access.
- **C** - Feature Group C Access.
- **D** - Feature Group D Access.

Examples include:

- **G0288** - Carrier ID **288** has Feature Group B, C, & D access.
- **BC0288** - Carrier ID **288** has Feature Group B & C access.
- **BD0288** - Carrier ID **288** has Feature Group B & D access.
- **B2882** - Carrier ID **2882** has Feature Group B access only.
- **D2882** - Carrier ID **2882** has Feature Group D access only.

For an access type, both **B2882** and **D2882** can exist but be for different carriers.

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

                        OUTPUT-6ac-VER:MISC,OPT(TOS)
```

Form Entries

RC:TOS;CHG;---:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

TOS

This field specifies the Type of Service index value that is being assigned a CODE input. Legal input values are: **"Blank"** or **"0-31"**.

Continued on next page

Form Entries, Continued

TT

Translation Type - This field specifies the Signaling System 7 (SS7) Translation Type to be used with the global title address so that the Signal Transfer Point (STP) can route the signaling message to the correct database. Legal input values are: **"0-255"**.

SSN

Subsystem Number - This field specifies the Signaling System 7 (SS7) Signaling Connection Control Point (SCCP) Subsystem Number to be used for the identified Local Exchange Carrier (LEC) Service Switching Point (SSP) Type Of Service (TOS) on RC Form 626 or for the Network Call Denial (NCD) Network Control Point (NCP) destination on RC Form 632. Legal input values are: **"232-255".**

Note: For Advanced Intelligent Network (AIN), one SSN is assigned for a given office by using RC Form 810/Office Data Assembler (ODA) Form 406Z. The legal value for AIN SSN values are **"0-255"** excluding **2**, **3**, and **5**. TOS to Translation Type (TT) mapping is still contained in the TOS to TT mapping table created through RC Form 626/ODA Form 406Z, but the SSN value contained in this mapping table will not be used by call processing (in other words, the SSN field on RC Form 626/ODA Form 406Z will not be used by AIN call processing).

CODE

This field specifies the three digit code which will be associated with the Type Of Service (TOS) index value. Valid inputs values are: **"000-999"**.

AIN TFREE

AIN 800/Tollfree Indicator. Valid entries are **"Blank"**, **"Y"**, and **"B"**. This element indicates whether the Type of Service (TOS) has Tollfree (TFREE) designation. This field can only be entered on the form if the Advanced Intelligent Network (AIN) 800/Tollfree feature has been purchased.

- **Y** is for when the TOS has TFREE designation.
- **N** is for when the TOS does not have TFREE designation.

"Blank" translates to **"N"**.

Form Entries

RC:SERVICE;CHG;OPT(PARAMS),___:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

Form Entries, Continued

SRVC Service - This field identifies the service whose parameters are being defined. Some services are identified by domain names. Legal inputs are: **"MEGC"**, **"NCAT"** for Non Call Associated Temporary Signaling Connection (TSC), **"INTV"** forWZ1 international voice, **"INTD"** for WZ1 international data, **"20-74"**, **"75"**, **"76"**, **"81"**, **"82"**, **"APN"**, **"INTO"**, **"INTT"**, **"SDNA"**, **"DEV"**, **"DED"**, **"INCD"**, **"IO56"**, **"IO64"**, **"ITD"**, **"IVT"**, **"NH0C"**, **"NH1C"**.

ORNU Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

RTDOM Routing Domain - This field specifies the domain where the routing for this service is actually populated. Legal inputs are: **"Blank"**, **"APN"**, **"HNPA"**, **"IT"**, **"20-83"**, **"INTO"**, **"INTT"**, **"SDNA"**, **"SF00-SF06"** (4E22R4>), **"SF07-SF39"** (4E23R1>), **"DEV"**, **"DED"**, **"INCD"**, **"NH0C"**, **"NH1C"**. (4E22>) - The **"HNPA"** entry is allowed only in offices using Traditional Routing.

RSI Route Selection Index - This field specifies the index that is to be used to select a routing treatment when an RSI type of subsequent digit entry is encountered. Legal inputs are: **"Blank"** or **"0-126"**.

RSIDF Route Selection Index Default - This field specifies the default action that should be performed when no Route Selection Index (RSI) type of subsequent digit entry is encountered during routing. Enter **"A"** to allow the call to proceed using the treatment encountered. Enter **"D"** to deny the call. Legal inputs are: **"A"** or **"D"**.

RSFHT Route Selection Final Handling Treatment (FHT) - This field specifies the FHT that should be given to a call that is denied because of the absence of an Route Selection Index (RSI) type of subsequent digit entry. This field may be left **"Blank"** or see the RDBFHT description for the allowable entries.

RC Form 633

General

This form is used to add or delete a Carrier ID (CID) code and to designate the type of call associated with each of the valid Transit Network Selection (TNS) values.

An ACTION of **"A"** is used to initially define TNS values for a CID. If ACTION=A, the entry must currently be unassigned for the CID (i.e., all Access Tandem Transit Network Selection Index (TNSI) values for the CID must have an Access Tandem Transit Network Selection Type (TNSTYP) currently set to **"INV"** for Invalid).

An ACTION of **"C"** is used to change TNS values for a CID. If ACTION=C, at least one TNSI value must not have a TNSTYP set to **"INV"** and the entry must currently be assigned.

An Action of **"D"** is used to remove a Carrier ID. If ACTION=D, all TNSI values must have a TNSTYP set to **"INV"** and the entry must currently be assigned

This message is classed as a Recent Change Data Message (RCDM).

An alphabetical keyword list is included in this section on page 5.

Form Entries

RC:TOS;CHG;---:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

CID

Carrier ID. This field is populated with the pre-subscription carrier selected by the customer to handle inter-Local Access Transport Area (LATA) calls; and intra-LATA calls when intra-LATA competition is allowed. It is a 4-digit number with a range of **"0000-9999"**, indicating the XXXX digits of the desired carrier. This field is only populated for ISC/OSC=Q.931.

Form Entries, Continued

ORNU	Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.
ACTION	Action - Add, Change, or Delete. Enter **"A"** if the associated data on this form is being added. Enter **"C"** if the associated data on this form changes existing data. Enter **"D"** if the associated data on this form is being deleted.
TNSI	Access Tandem Transit Network Selection Index - Valid entries are **"0-15"**.
TNSTYP	Access Tandem Transit Network Selection Type. This field is used to specify the type of call associated with the given Transit Network Selection (TNS) value. Legal values are **"IOT"** for International Outbound Transport, **"GSDN"** for Global Software Defined Network (SDN), or **"INV"** for Invalid.

RC Form 634

General

Recent Change (RC) Form 634, for 4E17 and later Generic Programs, is used to specify per-announcement data. Fields AIR, AN4R, and ANIR are only used by Integrated Services Digital Network User Part (ISUP) for AT&T offices. Fields CAUSE, CIVO, and LOC are not used by ISUP when determining clearing treatments when Type of Trunk (TOT) is End Office and Tandem Connecting (ETC) and Other Carrier Connecting (OCC). Field TUBM may be left blank and is used by CCITT7 Telephone User Part (TUP), Small Scale Integration (SSI), Service Announcement Number (SAN).

For 4E18 and later Generic Programs, fields AIR, ANIR, CIVO, CAUSE, LOC, NPLY, and OFHT may be left blank which will result in the translations data corresponding to the blank fields to not change.

For 4E25R1 and Later Generic Programs, the FEALN field was added.

If a release message is to be sent, then this form can specify the cause value to be used in the release message.

Table 47 lists the cause values and their meanings.

Table 48 lists the locations and their meanings.

Table 49 lists the meanings of TUP Unsuccessful Backwards Messages (TUBM).

This message is classed as a Recent Change Data Message (RCDM).

An alphabetical keyword list is included in this section on page 10.

Form Entries

For this form, if a blank is entered and allowed for a field no changes will be made to the current corresponding translation value.

RC:SCS;CHG;OPT(FHT),___:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

CIVO

Common Channel Signal (ISUP, INUP, and TUP) Voice Calls and Old Announcements is an indicator used to determine whether to send a backwards release or play announcement. Valid values are **"Blank"** for no translation change, **"PA"** for Play announcement or **"REL"** for Release.

NOTE: Intra IC ISUP trunks use both the CIVO and AIR fields to determine whether a voice call is to be released or an announcement is to be played. When CIVO=REL, a Release with cause (no announcement ID) will be sent to release the call. When CIVO=PA and AIR=Y, a Release with cause and announcement ID will be sent to release the call. Otherwise, the announcement will be played.

CAUSE

Cause value - A cause value is used to specify the information to be sent in a release message indicating the cause for a connection release. This field is used to override the existing cause value contained in the release message with the cause value that is specified. Valid entries are **"Blank"** for no translation change or **"0-127"**.

FEALN

(4E25R1>) Far End AT&T Local Network Recent Change (RC) Form 634 to determine the Final Handling Treatment (FHT) announcement which is to either send a release (with CAUSE) message or to play an announcement. Legal values are **"Blank"** for no change, or **"REL"** for Release, or **"PA"** for Play Announcement.

Continued on next page

Form Entries, Continued

LOC

Location used by Integrated Services Digital Network (ISDN) protocols and will be sent with the CAUSE value. Legal values are **"Blank"** for no translation change or **"0-15"** (the meanings of the values are as follows).

Input	Description
0	- User
1	- Local Private Network
2	- Local Local Network
3	- Transit Network
4	- Remote Local Network
5	- Remote Private Network
6	- Local Interface Controlled By This Signal Link
7	- International Network
8	- Spare
9	- Spare
10	- Unknown
11-15	- Spare

NPLY

Number of Plays - the number of times to play an announcement. Legal values are **"Blank"** for no translation change or **"1-4"**.

OFHT

Old Final Handling Treatments used when Main Transitions are OLD or Service Circuit System (SCS) ports cannot be hunted. Legal values are **"Blank"** for no translation change, **"AR"**, **"BT"**, **"EA1"**, **"EA2"**, **"EA3"**, **"EA4"**, **"EA5"**, **"EA6"**, **"EA7"**, **"HW"**, **"IFF"**, **"INC"**, **"IVC"**, **"MCA"**, **"NCA"**, **"NCC"**, **"NCD"**, **"NWC"**, **"OOB"**, **"ROA"**, **"SP1"**, **"SP2"**, **"T"**, and **"VCA"**.

SAN

This field is used to specify the Service Circuit System (SCS) Announcement Number. The announcement number will be used in the peripheral unit order sent to the SCS. Valid entries are **"Blank"** or **"1-4095"**. (Legal values for SAN on RC form 634 are **"Blank"** or **"1-511"**.)

Continued on next page

Form Entries, Continued

SSI

This field is used to specify the Service Circuit System (SCS) Service Circuit Trunk Subgroup (TSG) from which an available trunk will be selected. Valid entries are **"Blank"**, **"FHA"**, and **"FHB"**.

TUBM

This field is an indicator used for International Consultative Committee for International Telephone & Telegraph Signaling System 7 (CCITT7) Telephone User Part (TUP) unsuccessful backwards messages. Legal values are:

Entry	Description
• **Blank**	
• **ADI**	- Address incomplete signal
• **CFL**	- Call failure signal
• **CGC**	- Circuit group congestion signal
• **SEL**	- Switching equipment congestion signal
• **SP1**	- Spare 1
• **SP2**	- Spare 2
• **SSB**	- Subscriber busy signal
• **UNN**	- Unallocated number

Form Entries

RC:AIN;OPT(ANNUM):___:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

SCPANN

Announcement Index number received from Service Control Point (SCP).
Valid entries: **"0-255"**.

Continued on next page

Form Entries, Continued

SCSANN Announcement number for Service Circuit System (SCS) - For Form RC 345, SCSANN is the SCS Announcement for the Default Routing Voice Announcement. Valid entries are **"Blank"** or a number between **"0 and 65535"**. This element specifies the Service Circuit Unit (SCU0 voice announcement, if any, that will be played before the routing number is determined. **"0"** is the default. Note: **"Blank"** is valid if and only if Advanced Intelligent Network (AIN) Fault Handling (FH) is set to Final Treatment (FT).

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

BIN

Bin - Preprinted field denotes either the 15-minute or 24-hour bin used when defining the Performance Monitoring Thresholds for Expanded Time Slot Interchange (XTSI) applications.

RC Form 667

General

(4E23R3>) Form #667 is used to assign 6-digit, Numbering Plan Area-NXX (NPA-NXX), to Advanced Intelligent Network/Local Number Portability (AIN/LNP) Called Number Triggers. One of the following four different Called Number Trigger (CNT) assignments are possible for a 6-digit code:

- **"NONE"** or **"Blank"** - No 6-digit AIN/LNP trigger assigned (default)
- **"AIN"** - A 6-digit AIN trigger assigned
- **"LNP"** - A 6-digit LNP trigger assigned
- **"BOTH"** - A 6-digit AIN & LNP trigger are both assigned.

This message is classed as a Recent Change Data Message (RCDM).

An alphabetical keyword list is included in this section on page 5.

RC Message #6dg

General

This message is used to add or delete up to 16 10-digit Advanced Intelligent Network (AIN) triggers at one time.

An alphabetical keyword list is included in this section on page 6.

Continued on next page

RC Message #6dg, Continued

General
(cont'd)

```
                        SAMPLE MESSAGES

  1. To add three 10-digit AIN triggers
     (3125551234,3125559999,3125551995) with a TOS (0).

        RC:MISC;FHT,FTA:AINTRIG00,00001,A,P,3125551234,3125559999,3125551995!

  2. To add two 10-digit AIN triggers (7085551111,7085555555)
     with a TOS (31).

        RC:MISC;FHT,FTA:AINTRIG31,99999,A,P,7085551111,7085555555!

  3. To delete two 10-digit AIN triggers (3125551234,3125559999)
     with the corresponding TOS (0).
     Note, the TOS must match what was entered when the trigger
     was added for all triggers being deleted.

        RC:MISC;FHT,FTA:AINTRIG00,00002,D,P,3125551234,3125559999!

  4. To delete one 10-digit AIN trigger (7085555555) with a TOS
     (31).

        RC:MISC;FHT,FTA:AINTRIG31,99998,D,P,7085555555!

                EQUIVALENT ODA INPUT FORM - NONE

                   ASSOCIATED VERIFY MESSAGES

           INPUT - 16dg - VER:MISC:FHT AINTRIG, DIG a

              OUTPUT - 6dg - VER:MISC:FHT AINTRIG:
```

Form Entries

RC:MISC;FHT,FTA:AINTRIGnn,a,b,c,d!

The above format represents the input message that must be entered. The upper case letters represent data that must be entered exactly as shown. The lower case letters are acronyms for variable fields that require user input data. The exclamation point (!) following the message denotes the end of the input message. The following paragraphs define the entries for each of the variable items.

nn This field is the Type Of Service (TOS), which is encoded in the nine character ASCII coding scheme. The TOS must be within the ASCII coding scheme and must be two numeric characters. When concatenated, the characters must be between **"00"** and **"31"**, inclusive.

a This is the order number. It must be a unique number in the range **"000001"** to **"999999"**.

b This field specifies the action required. Entries are:

- **"A "** - add
- **"D"** - delete

When adding, the trigger entered must not already be present. When deleting, the trigger must be present and the Type Of Service (TOS) must match what was entered when the trigger was added. If there is an error for any one trigger for a message, the entire message fails and there is no action taken for any trigger. (For example, the fifth trigger being deleted has a different TOS between what was entered on the form and what is currently in translations,
then the message will fail and no triggers will be deleted.)

c This field specifies the domain. The only valid entry is **"P"**, which indicates that all Advanced Intelligent Network (AIN) 10-digit triggers for this message are in the Plain Old Telephone Service (POTS) domain.

Continued on next page

Form Entries, Continued

d	This field is for the 10-digit triggers. All triggers must be 10 digits. There must be at least one trigger entered, but no more than 16 triggers (separated by a comma) on a single message.

Error Codes

Number Error Codes

If the input message cannot be successfully processed, an error code or error code with message is output. For almost all syntax errors, the following numeric error code will be printed (shown below). The remaining errors, which relate to form usage, will print an error code with a message or description of the error (these are not listed below).

CODE	EXPLANATION
0010, 448	Invalid Recent Change Message

General

This information applies to all sections within this division:

1. The characters > and < are used to indicate which Generic Programs will apply.

   Examples:

   - 4E22> indicates 4E22 and later Generic Programs.
   - <4E22 indicate 4E22 and earlier Generic Programs.
   - 4E22 indicates the 4E22 Generic Program only.
   - >4E22 indicates all Generic Programs up to, but not including, 4E22.

2. Following the general section is a copy of the applicable Recent Change (RC) Form/s. Where there is more than one Generic published, the forms will be filed in ascending order by Generic.

3. The Keyword field names of the form entries in each section are listed in order of appearance on the latest Generic Recent Change Form. (Keywords deleted from the latest form issue will still remain in the form order of the last RC Form that it appeared until finally deleted).

4. The alphabetical "Keyword Index" of the field names is located at the end of each Recent Change Section, following the text, and any tables and/or graphics that may apply.

5. Each Keyword definition will only list the valid entries for the RC Form covered in each applicable section. Some Keywords may have additional valid entries related overall and may be found in the alphabetical Keyword Glossary (Div. 9, Sec. 1).

RC Form 700

General

Form 700 is a Recent Change (RC) message used to change the equipage state of 4 ESS™-2000 Switch equipment for growth purposes. This message is normally associated with special growth procedures for adding new equipment.

An alphabetical keyword list is included in this section on page 9.

UTYN

This field specifies the type of equipment whose growth is to be defined. The following acronyms may be entered.

DIF	-	Digital Interface Frame
DT	-	Digroup Terminal
DUS	-	Data Unit Selector
EST	-	Digital Echo Suppressor Terminal
FS	-	File Store
GRID	-	Alarm Grid
MFS	-	Multifrequency Signaling Frame
PUBB	-	Peripheral Unit Bus Branching Frame
SCS	-	Service Circuit System
SP	-	Signal Processor
TAC	-	Terminal Access Circuit
TGR	-	CCIS Terminal Group
TMS	-	Time Multiplex Switching Frame
TMSP	-	Time Multiplex Switch Pair
TPOS	-	Test Position
TSI	-	Time Slot Interchange
TUC	-	Tape Unit Controller
VIF	-	Voiceband Interface Frame
XTSI	-	eXpanded TSI

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

Continued on next page

Form Entries, Continued

MEMN Member Number - The MEMN field specifies the member number of a particular unit. The range of entries for each unit is as follows:

UTYN	MEMN	
DIF	2 - 31	
DT	0 - 127	
DUS	0 - 3	
EST	0 - 31	
FS	0 - 3	
GRID	1 - 15	
MAS	0 - 7	
MFS	0 - 31	
PUBB	0	
PUC	0 - 7	
SCS	0 - 7	
SP	0 - 31	
TAC	0 - 15

TPOS	0 - 99	
TSI	0 - 63	SEE NOTE
TUC	0 - 31	
VIF	0 - 127	
XTSI	0 - 63	SEE NOTE

NOTE: Only the even member will be allowed in the MEMN field for a cost reduced or eXpanded Time Slot Interchange (TSI) if no sub-memn is specified. Both are allowed if sub-memn is specified although only even member number should be used for eXpanded TSI.

Continued on next page

Form Entries, Continued

ME

Member Equipage - This field indicates the equipage state for the unit. Valid entries are:

- **UNEQ** - Unequipped
- **GROW** - First stage of growth
- **SGRO** - Special growth
- **OPER** - Operational

The states must be activated in succession. For example, if a frame is unequipped (UNEQ), the next state must be GROW; then SGRO and finally OPER. When removing the unit from service, the order must be reversed. An exception to sequential growth exists for Toll Terminal Frames. Equipage for all Toll Terminal Frames (TTF) changes will be done in one step. Entries will be (OLD) UNEQ, (NEW) OPER. This field is completed only when changing Member Equipage. It must be left blank when changing Sub-Member Equipage.

Continued on next page

Form Entries, Continued

SUBMEM

Sub-member - The SUBMEM field defines the Sub-Member Equipage. Each of the unit types has specific entries to identify individual subcategories. The numbers in parentheses indicate the valid range for that character(s). There may be no blanks or spaces embedded in the entry. For example, the Sub-Member entries for TSIF are:

TOPRTEQ0,	TOPRTEQ1,	TOPRTEQ2,
TOPRTEQ3,	TOPRTEQ4,	TOPRTEQ5,
TOPRTEQ6,	T1PRTEQ0,	T1PRTEQ1,
T1PRTEQ2,	T1PRTEQ3,	T1PRTEQ4,
T1PRTEQ5,	T1PRTEQ6.	

This field is completed only when changing Sub-Member Equipage. It must be left blank when changing Member Equipage.

Form Entries, Continued

SME

Sub-Member Equipage - The SME field indicates the equipage state of the individual subcategories defined in the SUBMEM field. Valid entries are:

- **UNEQ** - Unequipped
- **GROW** - First stage of growth
- **SGRO** - Special growth
- **OPER** - Operational

The states must be activated in succession. For example, if the unit was previously unequipped (UNEQ), the next stage must be GROW. The GROW stage must be followed by SGRO and SGRO must be followed by OPER. When removing the unit from service, the order must be followed in reverse. This field is completed only when changing sub-member equipage.

VIF	-	Voiceband Interface Frame
XTSI	-	eXpanded TSI

ORNU Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

Continued on next page

Form Entries, Continued

MEMN Member Number - The MEMN field specifies the member number of a particular unit. The range of entries for each unit is as follows:

UTYN	MEMN	
DIF	2 - 31	
DT	0 - 127	
DUS	0 - 3	
EST	0 - 31	
FS	0 - 3	
GRID	1 - 15	
MAS	0 - 7	
MFS	0 - 31	
PUBB	0	
PUC	0 - 7	
SCS	0 - 7	
SP	0 - 31	
TAC	0 - 15	
TGR	0 - 15	
TMS	0 - 3	
TMSP	0 - 3	
TPOS	0 - 99	
TSI	0 - 63	SEE NOTE
TUC	0 - 31	
VIF	0 - 127	
XTSI	0 - 63	SEE NOTE

NOTE: Only the even member will be allowed in the MEMN field for a cost reduced or eXpanded Time Slot Interchange (TSI) if no sub-memn is specified. Both are allowed if sub-memn is specified although only even member number should be used for eXpanded TSI.

Form Entries, Continued

ME Member Equipage - This field indicates the equipage state for the unit. Valid entries are:

- **UNEQ** - Unequipped
- **GROW** - First stage of growth
- **SGRO** - Special growth
- **OPER** - Operational

The states must be activated in succession. For example, if a frame is unequipped (UNEQ), the next state must be GROW; then SGRO and finally OPER. When removing the unit from service, the order must be reversed. An exception to sequential growth exists for Toll Terminal Frames. Equipage for all Toll Terminal Frames (TTF) changes will be done in one step. Entries will be (OLD) UNEQ, (NEW) OPER. This field is completed only when changing Member Equipage. It must be left blank when changing Sub-Member Equipage

Continued on next page

Form Entries, Continued

SUBMEM

Sub member - The SUBMEM field defines the Sub-Member Equipage. Each of the unit types has specific entries to identify individual subcategories. The numbers in parentheses indicate the valid range for that character(s). There may be no blanks or spaces embedded in the entry. For example, the Sub-Member entries for TSIF are:

TOPRTEQ0,	TOPRTEQ1,	TOPRTEQ2,
TOPRTEQ3,	TOPRTEQ4,	TOPRTEQ5,
TOPRTEQ6,	T1PRTEQ0,	T1PRTEQ1,
T1PRTEQ2,	T1PRTEQ3,	T1PRTEQ4,
T1PRTEQ5,	T1PRTEQ6.	

This field is completed only when changing Sub-Member Equipage. It must be left blank when changing Member Equipage.

UTYN	VALID SUBMEN ENTRIES
DIF	DIUEQ (0-31), DIUSPQ (A&B)
DT	DTUEQ (0 - 7)
DUS	None
EST	ESEQ (0 - 14)
FS	FSEQSME (0 - 3)
GRID	None
MAS	MAUEQ (0 - 1)
MFS	None
PUBB	CKHEQ (0 - 7)
PUC	PUCUEQ (0 - 29)
SCS	SCUEQ (0 - 15)
SP	BFE, CFE, MDNBLK (0 or 1), MSNBLK (0 or 1) SP2EQ (0 - 3), TDNBLK (0 - 3), TSNBLK (0 - 3)
TAC	TMGRP (0 - 15)
TGR	TMGRP (0 - 15)
TMS	C (0 or 1) MBLK (0 - 3), C (0 or 1) GRWTH
TMSP	C (0 or 1) MBLK (0 - 3), C (0 or 1) GRWTH
TPOS	None
TSI	T (0 or 1) PRTEQ (0 - 6)
TUC	None
VIF	VIUEQ (0 - 6)
XTSI	XTSID3U (0-7, 6 & 7 are Spare)

Form Entries, Continued

SME

Sub-Member Equipage - The SME field indicates the equipage state of the individual subcategories defined in the SUBMEM field. Valid entries are:

- **UNEQ** - Unequipped
- **GROW** - First stage of growth
- **SGRO** - Special growth
- **OPER** - Operational

The states must be activated in succession. For example, if the unit was previously unequipped (UNEQ), the next stage must be GROW. The GROW stage must be followed by SGRO and SGRO must be followed by OPER. When removing the unit from service, the order must be followed in reverse. This field is completed only when changing Sub-Member Equipage.

RC Form 702

General

Form 702 provides the capability to change the functional capability of the SM9 and SM10 based Digital Interface Unit (DIU). These DIUs can take on multiple functions based on the Type of Digital Interface Unit (TDIU) value of the DIU in the Digital Interface Frame (DIF) unit type.

"Type Hardware - Table 50" lists possible combinations for Type of Hardware (THW), THW5, and Type of Digroup (TDG) DIGROUP1 through DIGROUP5 for generics 4E21 and later.

Note that SM9 values cannot be changed to SM10 and SM10 values cannot be changed to SM9 by this form.

An alphabetical keyword list is included in this section on page 6.

Form Entries

RC:UTYPE;CHG;OPT(DIU),TST:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

Form Entries, Continued

DIF MEMN

This field specifies the Digital Interface Frame (DIF) Member Number where the Digital Interface Unit (DIU) to be changed is located. Legal values are **"2-31"**.

DIU MEMN

This field specifies the Digital Interface Unit (DIU) Member Number within the Digital Interface Frame (DIF). Legal values are **"0-31"**.

THW

Type of Hardware. Valid entries are: **"Blank"**, **"1"** (SM1B), **"6"** (SM6), **"7"** (SM7), **"9"** (SM9), or **"10"** (SM10).

THW5

Type of Hardware for Digroup5. Valid entries are: **"Blank"**, **"1"** (SM1B), , **"9"** (SM9), or **"10"** (SM10).

TDG DIGROUP1 - DIGROUP5

Type of Digroup. Valid Entries are :

- "Blank"
- "1" for SF+ZCS (SM1B equivalent)
- "2" for SF+B8ZS (RB or 64CC as determined by TSG signaling char.)
- "3" for SF+ZCS (International CCITT5)
- "4" for ESF+B8ZS (International CCITT5)
- "5" for ESF+ZCS (64kb restricted)
- "6" for ESF+B8ZS (RB or 64CC as determined by TSG signaling char.)
- "7" for ESF+B8ZS (64CC only - not RB)
- "8" for ESF+B8ZS (64CC only, with PCC)

Form Entries

RC:UTYPE;CHG;OPT(SCU),TST:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

SCS Service Circuit System - This field is used to specify the SCS member number. A maximum of eight SCS frames may be provisioned. Valid entries are **"0-7"**.

SCU Service Circuit Unit - This field is used to specify the SCU member number. Valid entries are **"0-15"**.

Continued on next page

Form Entries, Continued

DLAN	Duplexed Local Area Network Valid entries are **"Blank"**, **"Y"**, or **"No"**.
ORNU	Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.
SVCT	Service Type - This field is used to specify the function for which the Service Circuit System (SCS) sub-unit is being used. Valid entries are **"0-7"**. An entry of **"0"** designates an Service Circuit Unit (SCU) with the Mass Announcement System (MAS)/final handling announcement set. An entry of **"1"** designates an SCU with Network Services Complex (NSCX) announcement set S. An entry of **"3"** designates an SCU with Advanced Intelligent Network (AIN) announcement set. An entry of **"4"** designates an SCU with announcement set B (music on hold). An entry of **"5"** designates an SCU with announcement set D. Entries **"2"**, **"6"**, and **"7"** are currently unused.
SCUFV	Service Circuit Unit Firmware Version - This field is used to specify which version of the firmware the SCU is equipped. Valid entries are **"Blank"** or **"0-3"**. The initial firmware version for the SCU, used for final handling and NSCX, has a value of zero.
LANADDR	Local Area Network (LAN) Address - A LAN exists between the Service Circuit Unit (SCU) and the Announcement Administration Processor (AAP) in order to update the announcements on the disks in the SCU. This field identifies the LAN address. Valid entries are **"Blank"** or an address which should be equivalent to: [(Service Circuit System {SCS} number) x 16] + (SCU number). This address must be populated in 4E17 and later generics to ensure SCU Utility capabilities are functional.

Continued on next page

Form Entries, Continued

MON Not Applicable - Entries: **"Blank"**

ASRAPP Automatic Speech Recognition Application - Entries: **"Blank"** or **"0-7"**. The current ASRAPP definitions are:

- **0** - No Automatic Speech Recognition Application
- **1** - ASR Application Type 1 which has the ability to capture isolated or connected digits, keywords and TDD.

See also NCDSU for interactions between ASRAPP and Number of Customer Data Service Units Installed (NCDSU).

Continued on next page

Form Entries, Continued

NCDSU

Number of Customer Data Service Units (CDSUs) Installed - Entries: **"Blank"**, **"0"** to remove (no CDSUs), or **"1-5"** (**"1-2"** when CDSU Hardware Version [HV]is 2).

When Automatic Speech Recognition Application (ASRAPP) is 1-7 the NCDSU field is used to input the number of CDSU connected to the Service Circuit Unit (SCU). When ASRAPP is 1-7 and CDSU HV is 0 or 1, this field will correspond to the number of Digroups (a Digroup is 24 consecutive trunks) on the SCU with Automatic Speech Recognition (ASR) hardware present. There are 5 Digroups on an SCU and NCDSU input is used to determine how many consecutive Digroups (starting with the first Digroup) are to have the ASR capability. The remainder of the Digroups can be assigned to Trunk Subgroups (TSGs) corresponding to ASR application of 0 (no ASR capabilities).

When ASRAPP is 1-7, CDSU HV is 2, and NCDSU is 1, this will provision the first 2 consecutive Digroups (a Digroup is 24 consecutive trunks) on the SCU to have Automatic Speech Recognition (ASR) hardware present. The remainder of the Digroups can be assigned to TSGs corresponding to ASR application of 0 (no ASR capabilities).
When ASRAPP is 1-7, CDSU HV is 2, and NCDSU is 2, this will provision the all 5 Digroups (a Digroup is 24 consecutive trunks) on the SCU to have Automatic Speech Recognition (ASR) hardware present.

When ASRAPP is 0 and Mass Announcement System (MAS) Final Handling (FH) Advanced Intelligent Network (AIN) is **"Blank"** or **"N"**, the NCDSU filed must be 0. This combination indicates no ASR capabilities are available for this SCU and MAS FH AIN announcements are not combined on this SCU. Entering ASRAPP of 0 and NCDSU of 0 will delete ASR capabilities from this SCU.

When ASRAPP is **"Blank"**, the NCDSU and MAS FH AIN fields must be **"Blank"**.

When ASRAPP is 0 and MAS FH AIN is **"Y"**, the NCDSU field is used to tell how many consecutive Digroups (starting with the first Digroup) are to be used for Mass Announcement Systems/Final Handling announcements. The remainder of the Digroups can be assigned to AIN TSGs corresponding to an ASR application of 0.

Continued on next page

Form Entries, Continued

SCUHV

Service Circuit Unit Hardware Version (4E22R4>). This field is used to specify which version of the hardware the SCU is equipped. Valid entries are **"Blank"** or **"0-7"**. The initial hardware version for the SCU is 0.

- A value of 1 specifies an SCU with the TN9001 pack.
- A value of 2 specifies an SCU with the TN9002 pack.
- A value of 3 specifies an SCU with the TN9001 and TN9002 packs.

MAS FH AIN

Mass Announcement Systems (MAS), Final Handling (FH), and Advanced Intelligent Network (AIN) announcements all combines on one Service Circuit Unit (SCU). Valid entries are: **"Blank"**, **"Y"**, or **"N"**.

CDSU HV

Custom Data Service Unit Hardware Version (4E21>) - Valid entries are: **"Blank"**, **"0"** to remove (Hardware Version Undefined), **"1"** for CDSU Vintage version, **"2"** for CDSU Version 2.

CDSC UL

Customer Data Service Cabinet Upper/Lower Indicator for CDSC of HV of 2 (4E21>) - Valid entries are: **"Blank"**, **"U"** for upper half of CDSC, or **"L"** for lower half of the CDSC.

CDSC NUM

Customer Data Service Cabinet Number (4E21>) - Valid entries are: **"Blank"**, **"0-63"**.

CDSC GRID

Unit Type Member Number of the office GRID Alarm the Customer Data Service Cabinet is wired to (4E21>). Valid entries are: **"Blank"**, **"0"** to remove or **"1-15"**.

Continued on next page

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Form Entries, Continued

CDSC FLOOR	Custom Data Service Cabinet Floor Location (must correspond to an Office Alarm GRID) (4E21>) - Valid entries are: **"Blank"**, **"0-99"**.
CDSC LINE NUM	Custom Data Service Cabinet Line Number (4E21>) - Valid entries are: **"Blank"**, **"0-999"**.
CDSC FRAME NUM	Custom Data Service Cabinet Frame (or Bay) Number (4E21>) - Valid entries are: **"Blank"**, **"0-99"**.
CDSC GLF	Octal representation of the Custom Data Service Cabinet's GRID Unit Type Member Number, Line Number, and Frame/Bay Number. Valid entries are: **"Blank"** or eight octal digits.
MSBEQ0-3	Multiple Signal Processor Board (MSPB) Equipage - There is a maximum of six MSPBs per Service Circuit Unit (SCU) which may be used to detect Dual Tone Multifrequency (DTMF) tones and report the collected digits to the SCU processor. This field specifies the equipage status of the MSPBs. Valid entries are **"Blank"**, **"P"** for present/operational, **"S"** for special growth, **"G"** for growth, or **"F"** for future/unequipped.
MIPEQ0-1	Multifunctional Interface Processor Board Equipage is used to indicate installation of the Processor Board for the Service Circuit System Unit Type using RC Form 703. Valid entries are **"Blank"**, **"P"**, **"S"**, **"G"**, or **"F"**.
MSBFV0-3	Multiple Signal Processor Board (MSPB) Firmware Version - This field is used to specify the firmware version being used in each of the six possible MSPBs. Valid entries are **"Blank"** or **"0-3"**. The initial MSBFV firmware version has a value of zero.

Continued on next page

Form Entries, Continued

DSKEQ0-1 (4E22 Release)

For 4E22 Release 4 and later, there is a maximum of two disk pairs per Service Circuit Unit (SCU) which are used to store the announcements. Each disk is mirrored for reliability. This field specifies the equipage status for each of the disk pairs. Valid entries are **"Blank"**, **"P"** (present/operational), **"S"** (special growth), **"G"** (growth), or **"F"** (future/unequipped). Disk Pairs should be populated in order: 0, 1 (i.e., Disk Pair 1 cannot be populated if 0 = **"Blank"**).

DSKC0-3 (<4E22 Release 3) DSKC0-1 (4E22 Release 4>)

Disk Capacity - This field is used to specify the capacity for each of the disk pairs. Valid entries are **"Blank"** or **"0"** to **"3"**. A **"0"** specifies a .5 Gigabyte capacity, **"1"** specifies a 2 Gigabyte capacity, **"2"** specifies a 4 Gigabyte capacity, and **"3"** specifies a 9 Gigabyte capacity.

For 4E22 Release 3 and earlier, up to 4 Disk Pairs could be specified.
For 4E22 Release 4 and later, up to 2 Disk Pairs could be specified.

All four Disk Pairs should not be specified with a capacity of **"1"**. At least one pair should be specified with a **"0"** or left **"Blank"** (unequipped).

A disk capacity of **"2"** is only allowed in the 0 and 2 slot. If a **"2"** is specified in the 0 or 2 slot, then the DSKC(i+1) slot in translations will automatically be populated with a **"2"**. Therefore, the following checks are applied when DSKC(0)=**"2"** or DSKC(2)=**"2"**.

1. If DSKC(0) is set to **"2"**, then DSKC(1) and DSKEQ(1) must be **"Blank"**.

2. If DSKC(0) is set to **"2"**, then DSKEQ(0) must be non-**"Blank"**. If the DSKC(0) is being changed from a **"2"** to another value, then both the DSKC(0) and DSKC(1) must be non-**"Blank"**.

RC Form 704

General

Form 704, available with 4E21 and later Generic Programs, is used to equip a DS3 on an Expanded Time Slot Interchange (XTSI) frame/member number including all required DS1 data.

Field that are left blank will leave the corresponding translations data unchanged.

When **"E"** or **"S"** is entered for FRMFnn, the corresponding EQPnn must be entered as **"F"** by a previous Recent Change (RC) 704 form.

An alphabetical keyword list is included in this section on page 7.

Form Entries

RC:UTYPE;CHG;OPT(D3U),---:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

XTSI MEMN

Time Slot Interchange (TSI) Member Number of an Expanded Time Slot Interchange (XTSI) (4E22>).
Valid entries are **"2-62"** - even numbers only.

Continued on next page

Form Entries, Continued

D3UN	D3U Number - This entry is used to identify the D3 Unit Number in Unit Type Recent Changes (RCs). Valid entries for the even numbered Time Slot Interchange Member Number (TSI MEMN) are **"0-2"**. Valid entries for the odd numbered TSI MEMN are **"3-5"**. For RC Form 705, the spare D3Us are also identified by entry **"6"** for the even numbered TSI MEMN and **"7"** for the odd numbered TSI MEMN.
ORNU	Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.
REM ALARM	Remote Alarm Indication. Entries are **"Blank"**, **"STD"** for Standard, **"INV"** for Inverted, or **"IGN"** for Ignore.
MAX LBO	Maximum Line Build Out for cable length. Valid entries are **"Blank"**, **"225"** (for 0-255), or **"450"** (for 255-450).
DS3 APPL	DS3 Application is used to specify the appropriate application when equipping a DS3 to an Expanded Time Slot Interchange (XTSI) frame/member. Valid entries are **"Blank"**, **"CBP"**, **or "M23"**.
INBAND D3U	In-band signaling state enabled for the D3U. This is used on the RC Form 704 to equip a DS3 on an Expanded Time Slot Interchange (XTSI) frame/member number. Valid entries are **"Blank"**, **"N"** for In-band disabled, and **"Y"** for In-band enabled.
EQP01 through EQP28	Equipage for the 1st through the 28th DS1 for this D3U (<4E23). Entries are **"Blank"**, **"F"** for Future or **"P"** for present/provisioned.

Continued on next page

Form Entries, Continued

FRMF01 through FRMF28	Equipage for the 1st through the 28th DS1 for this D3U (<4E23). Entries are **"Blank"**, **"E"** for Extended Superframe or **"S"** for Superframe.
DS1	DS1 Number is used to change any or all of the related configuration information assignments to one or a multiple amount of DS1 digroups in a D3U of an Expanded Time Slot Interchange (XTSI) frame. The RC 707 Form can change one (1) DS1 per update. The RC 704 Form can change multiple DS1s per update. The numbers **"1-28"**, either pre-printed or free field entry, specify the DS1 to be changed.
EQUIPAGE	Equipage for the 1st through the 28th DS1 for this D3U (4E24>). Entries are **"Blank"**, "**F**" for Future or **"P"** for present/provisioned.
FRAME FORMAT	Frame Format for the 1st through the 28th DS1 for this D3U (4E24>). Entries are **"Blank"**, **"E"** for Extended Superframe or **"S"** for Superframe.
STATIC A/B	Static A/B enabled for this DS1 (4E24>). Entries are **"Blank"**, **"Y"** for Static A/B -56R or **"N"** for 64 clear channel.
INBAND DS1	In-band signaling state enabled for the DS1. This is used on the RC Form 704 to equip a DS1 on an Expanded Time Slot Interchange (XTSI) frame/member number. It is also used on the RC Form 707 to change the static A/B signaling bit configuration for an XTSI DS1. Valid entries are **"N"** for In-band disabled and **"Y"** for In-band enabled.

RC Form 705

General

Form 705, available with 4E21 and later Generic Programs, is used to set the software versions for a D3U on an Expanded Time Slot Interchange (XTSI) frame/member number.

For 4E22 and later Generic Programs, this form is also used to set the Signal Processing Unit (SPU) Software Version, SPU Hardware Version, SPU Equipage, XTSI Controller Software Version, XTSI Controller Hardware Version, and D3U Hardware Version.

Fields that are left blank will leave the corresponding translations data unchanged.

An alphabetical keyword list is included in this section on page 8.

RC Form 707

General

Form 707, available with 4E21 Release 4, 4E22 Release 2 and later Generic Programs, is used to change the Static A/B signaling bit configuration for an Expanded Time Slot Interchange (XTSI) DS1.

Beginning with 4E24 Release 1, this form is used to change all of the DS1-related configuration information, not just the Static A/B data.

Note: While this form is used to update DS1 configuration information for a single DS1 in a D3U, Recent Change (RC) Form 704 can be used to update information for multiple DS1s in a D3U.

An alphabetical keyword list is included in this section on page 6.

XTSI MEMN Time Slot Interchange (TSI) Member Number of an Expanded Time Slot Interchange (XTSI) (4E22>). Valid entries are **"2-62"** - even numbers only.

Continued on next page

Form Entries, Continued

D3UN

D3U Number - This entry is used to identify the D3 Unit Number in Unit Type Recent Changes (RCs). Valid entries for the even numbered Time Slot Interchange Member Number (TSI MEMN) are **"0-2"**. Valid entries for the odd numbered TSI MEMN are **"3-5"**. For RC Form 705, the spare D3Us are also identified by entry **"6"** for the even numbered TSI MEMN and **"7"** for the odd numbered TSI MEMN.

DS1

DS1 Number is used to change any or all of the related configuration information assignments to one or a multiple amount of DS1
digroups in a D3U of an Expanded Time Slot Interchange (XTSI) frame. The RC 707 Form can change one (1) DS1 per update. The RC 704 Form can change multiple DS1s per update. The numbers **"1-28"**, either pre-printed or free field entry, specify the DS1 to be changed.

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

EQUIPAGE

Equipage for the 1st through the 28th DS1 for this D3U (4E24>). Entries are **"Blank"**, "**F**" for Future, or **"P"** for present/provisioned.

.

FRAME FORMAT

Frame Format for the 1st through the 28th DS1 for this D3U (4E24>). Entries are **"Blank"**, **"E"** for Extended Superframe, or **"S"** for Superframe.

STATIC A/B

Static A/B enabled for this DS1 (4E24>). Entries are **"Blank"**, **"Y"** for Static A/B -56R or **"N"** for 64 clear channel.

INBAND DS1

In-band signaling state enabled for the DS1. This is used on the Recent Change (RC) Form 704 to equip a DS1 on an Expanded Time Slot Interchange (XTSI) frame/member number. It is also used on the RC Form 707 to change the static A/B signaling bit configuration for an XTSI DS1. Valid entries are **"N"** for In-band disabled and **"Y"** for In-band enabled.

Form Entries

RC:UTYPE;CHG;OPT(XTSIAB),___:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

XTSI MEMN Time Slot Interchange (TSI) Member Number of an Expanded Time Slot Interchange (XTSI) (4E22>). Valid entries are **"2-62"** - even numbers only.

Continued on next page

Form Entries, Continued

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

TANS RESERVED

Indicates whether the Trunk Appearance Numbers (TANs) associated with the In-Band Unit (IBU) should be reserved. Entries are **"Blank**, **"N"**, or **"Y"**.

MF OR DTMF

Multifrequency or Dual Tone Multifrequency - Type of signaling (receivers/ transmitters) supported by the In-Band Unit (IBU). Entries are **"Blank"**, **"MF"**, or **"DTMF"**.

XCVR CONFIG

Transceiver Configuration - Type of miscellaneous service circuits the In-Band Unit (IBU) supports. There are two possible types:

- 16 Continuity Check Transceivers (CCT), or
- 12 CCTs plus 4 miscellaneous service circuits (i.e., digital Milliwatt, digital Milliwatt-10, Common Systems Tone Detector, and CCT test).

Entries are **"Blank"**, **"CCT"** (for 16 CCTs), or **"MISC"** (for 12 CCTs and miscellaneous circuits).

Special Table Of Contents, Continued

General

This information applies to all sections within this division:

1. The characters > and < are used to indicate which Generic Programs will apply.

   Examples:

   - 4E22> indicates 4E22 and later Generic Programs.
   - <4E22 indicate 4E22 and earlier Generic Programs.
   - 4E22 indicates the 4E22 Generic Program only.
   - >4E22 indicates all Generic Programs up to, but not including, 4E22.

2. Following the general section is a copy of the applicable Recent Change (RC) Form/s. Where there is more than one Generic published, the forms will be filed in ascending order by Generic.

3. The Keyword field names of the form entries in each section are listed in order of appearance on the latest Generic Recent Change Form. (Keywords deleted from the latest form issue will still remain in the form order of the last RC Form that it appeared until finally deleted).

4. The alphabetical "Keyword Index" of the field names is located at the end of each Recent Change Section, following the text, and any tables and/or graphics that may apply.

5. Each Keyword definition will only list the valid entries for the RC Form covered in each applicable section. Some Keywords may have additional valid entries related overall and may be found in the alphabetical Keyword Glossary (Div. 9, Sec. 1).

RC Form 800

General

Recent Change (RC) Form 800 is used to change one or more bits (maximum 24) in a word at some absolute address. This form is classed as a Recent Change Data Message (RCDM).

Up to 24 bits in a word can be altered by this message. For example, a word may be made up of several groups of bits. Let A thru F represent the groups. A 24-bit word might look like CFFFFEEDDDDDDDDAAAAAAABB. The letters represent the bits where a given item appears. To change the entire word, a size of 24 with a displacement of zero would be used. This means, "change 24 bits beginning zero places from the right."

A single item may be changed with the remaining bits left untouched. As an example, to change item A in the preceding word, a size of seven with a displacement of two would be used. Items E and F could be changed by specifying a size of 6 with a displacement of 17.

An alphabetical keyword list is included in this section on page 6.

Form Entries

RC:FUNC;CHG;OPT(ABSOLUTE),- - -:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

FSONLY

Enter a **"Y"** for Yes in this field if the data to be changed resides only in file store. Enter an **"N"** for No in this field if the data to be changed resides in core, backed up by file store. It is not possible to change the file store copy of a word that resides in core with file store back up by specifying the file store address and setting FSONLY to **"Y"**. If this is attempted, an error message will be received.

Continued on next page

Form Entries, Continued

ADDRESS If the WORDNO field is left blank, then this field will contain the absolute address of the word to be changed. If the WORDNO field contains input data, then this field will specify the starting address of a translations entry. The address must be an octal number (to the base eight). Valid addresses range from **"0-33577777"** if FSONLY equals **"N"**. If FSONLY is equal to **"Y"** the addresses range from **"0-11607777"** for file store community 0 or **"20000000-31607777"** for file store community 1.

ORNU Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

WORDNO The decimal value specified will be internally added to the starting address of a translations entry specified in the ADDRESS field to yield the absolute address of the word to be changed. Valid entries may range from **"0-1023"** or this field may be left **"Blank"**.

SIZE The size field specifies the number of bits to be changed in the translation word. This number can range from **"1-24"** (decimal).

Continued on next page

Form Entries, Continued

DISP	Displacement - This field identifies the right most bit position of the data to be changed within the specified translation word. The displacement of the data refers to the number of places (bits) from the right. In this case, the data specified in the NEWDATA field will be inserted in the translation word at a point displaced from the right most bit as specified by this field (DISP). The size of the data (SIZE) plus the displacement of the data (DISP) cannot exceed 24 (Decimal). Valid entries range from **"0-23"** (Decimal).
BINOCT	Binary/Octal - This field indicates if the data fields (NEWDATA and OLDDATA) contain octal or binary information. Valid entries are **"B"** for binary or **"O"** for octal.
NEWDATA	This field contains the NEWDATA to be inserted into the translation word. The right most bit position in this field will replace the right most bit of the data to be changed as specified by the DISP field. This field may contain up to 24 binary bits or an octal number from **"0-77777777"**. The entry in this field may not exceed the number of bits to be changed as specified in the SIZE field.
OLDDATA	This field contains the current contents of the data in the translation word as specified by SIZE and DISP. The right most bit position of the data to be changed in this word will be replaced by the right most bit in the NEWDATA field. This field may contain up to 24 binary bits or an octal number from **"0-77777777"**. The entry in this field may not exceed the number of bits to be changed as specified in the SIZE field.

RC Form 801

General

Recent Change (RC) Form 801 will be used to modify one word of data in the Miscellaneous Scanner Number (MSN), Miscellaneous Distributor Number (MDN) or Unit Type translator. This change is different from the absolute word change (Form 800) in that it identifies the word to be altered by its relative position in the translator rather than by the absolute address. This form is classed as a Recent Change Data Message (RCDM).

Up to 24 bits in a word can be altered by this message. For example, a word may be made up of several groups of bits. Let A thru F represent the groups. A 24-bit word might look like CFFFFEEDDDDDDDDAAAAAAA BB. The letters represent the bits where a given item appears. To change the entire word, a size of 24 with a displacement of zero would be used. This means, "change 24 bits beginning zero places from the right."

A single item may be changed with the remaining bits left untouched. As an example, to change item A in the preceding word, a size of seven with a displacement of two would be used. Items E and F could be changed by specifying a size of 6 with a displacement of 17.

An alphabetical keyword list is included in this section on page 7.

TRANSID This variable length field identifies the translator in which the change is to occur. Valid entries are:

ADG	- Automatic Distribution Group
MSN	- Miscellaneous Scanner Number
MDN	- Miscellaneous Distributor Number
UT	- Unit Type

The Unit Type (UT) must be one of the following entries:

CCDS	- CCIS Data set Frame
CCT	- CCIS Transceiver
CS	- Call Store
DIF	- Digital Interface Frame
DT	- Digroup Terminal
DUS	- Data Unit Selector
EST	- Digital Echo Suppressor
FS	- File Store
IOUS	- Input/Output Unit Selector
MB	- Miscellaneous Frame B
MCF	- Miscellaneous Frame C
MFS	- Multifrequency Signaling
OA	- Office Dependent Alarm
PS	- Program Store
PUBB	- Peripheral Unit Bus Branching Frame
SCS	- Service Circuit System (4E17>)
SP	- Signal Processor
TGR	- CCIS Terminal Group
TMSP	- Time Multiplex Switching Port
TPOS	- Test Position
TSI	- Time Slot Interchange frame
TTFN	- Toll Terminal Frame (when N ranges from 0 to 7)
TUC	- Tape Unit Controller
VIF	- Voiceband Interface Frame
XTSI	- eXpanded Time Slot Interchange frame

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

ENTRY

If the Miscellaneous Scanner Number (MSN) or Miscellaneous Distributor Number (MDN) translator is specified, the field will contain the Signal Processor (SP) **"0-31"**, Matrix **"0-1"**, Row **"0-63"** and Column **"0-15"**. All seven spaces must be completed in the following arrangement:

SP MML ROW COLUMN

If the Unit Type translator is specified, this field will contain a Member Number. The valid Member Number range for the different Unit Types are as follows:

ADG	- 0-3	PUC	- 0-7
CCDS	- 0-15	OA	- 0-127
CCT	- 0-19	PS	- 0-32
CS	- 0-63	SCS	- 0-7
DIF	- 2-31	SP	- 0-31
DT	- 0-127	TGR	- 0-15
DUS	- 0-3	TMS	- 0-3
FS	- 0-3	TP51A	- 0-99
IOUS	- 0-15	TPOS	- 0-99
MAS	- 0-7	TSI	- 0-63
MB	- 0-6	TTFO	- TTF7 - 0-127
MCF	- 0	TUC	- 0-31
MFS	- 0-31	VIF	- 0-127
PUBB	- 0	XTSI	- 2 - 63

Form Entries, Continued

WORDNO	This decimal number identifies a word within a Unit Type entry. Enter a zero in this field when the Miscellaneous Scanner Number (MSN) or Miscellaneous Distributor Number (MDN) translator is specified. If no entry is made in this field it will default to zero.
SIZE	The size field specifies the number of bits to be changed in the translation word. This number can range from **"1-24"** (decimal).
DISP	Displacement - This field identifies the right most bit position of the data to be changed within the specified translation word. The displacement of the data refers to the number of places (bits) from the right. In this case, the data specified in the NEWDATA field will be inserted in the translation word at a point displaced from the right most bit as specified by this field (DISP). The size of the data (SIZE) plus the displacement of the data (DISP) cannot exceed 24 (Decimal). Valid entries range from **"0-23"** (Decimal).
BINOCT	Binary/Octal - This field indicates if the data fields (NEWDATA and OLDDATA) contain octal or binary information. Valid entries are **"B"** for binary or **"O"** for octal.
NEWDATA	This field contains the NEWDATA to be inserted into the translation word. The right most bit position in this field will replace the right most bit of the data to be changed as specified by the DISP field. This field may contain up to 24 binary bits or an octal number from **"0-77777777"**. The entry in this field may not exceed the number of bits to be changed as specified in the SIZE field.
OLDDATA	This field contains the current contents of the data in the translation word as specified by SIZE and DISP. The right most bit position of the data to be changed in this word will be replaced by the right most bit in the NEWDATA field. This field may contain up to 24 binary bits or an octal number from **"0-77777777"**. The entry in this field may not exceed the number of bits to be changed as specified in the SIZE field.

RC Form 802

General

Recent Change (RC) Form 802 is a dual purpose form. Its function depends on whether the TSGBTFN field is blank or not.

If the TSGBTFN field is blank, this form will be used to change the Far Building Subdivision (FBS) code and/or the building subdivision for the near end of the Trunk Group (NBS). No other Fields may be changed.

If the TSGBTFN field is not blank, this form can also be used to change the TOWN, ST, BL, FBS, and NBS, for a Trunk Subgroup (TSG) resulting in the renaming of or the moving of the TSG from one Trunk Group to another, different Trunk Group.

Restrictions for renaming/moving a TSG:

A. The TSG being renamed/moved cannot have an assigned Destination Point Code (DPC) (see DIV. 3, SEC. 1a-1c & 1h-1j.

B. The renaming/moving of TSGs is not allowed for non-message TSGs.

C. All trunks in the affected TSG must be in the Manually Disabled state.

An alphabetical keyword list is included in this section on page 6.

Form Entries, Continued

NEWTG

New Trunk Group - This series identifies the Trunk Group. The Town, State, Building and building subdivision for the distant end of the trunk, plus the Near end Building Subdivision, make up the Trunk Group designation. This Common Language Location identification (CLLI) code is used in the Long Lines Routing Guide. Rules for establishing these codes are covered in Lucent Practice 795-100-100.

- **TOWN** - Town is a four character alphabetic combination representing the town, city, or location of the terminating toll switch.
- **ST** - State is a two character alphabetic code for the state, province or foreign country of the terminating toll switch.
- **BL** - Building is either a two character alphabetic or numeric code to identify the terminating toll switch.
- **FBS** - Far Building Subdivision code is a three character alphanumeric combination for internal building identification.
- **NBS** - Near Building Subdivision code is a three character alphanumeric combination for internal building identification.

TOWN, ST, and BL must be equal to entry for the OLDTG (unless TSGBTFN is not blank).

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

ORNU

Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

FEATURE ITEM

Feature Item (RC Form 809) - This names feature items to be turned on or off. Valid entries are:

- **AASE** - Announcement Administration System Equipment Office Parameter - This office parameter specifies if the AASE (either Administration Processor [AAP] or the Announcement Systems Manager [ASM]) is equipped or not equipped. If FEATURE ITEM is set to **"AASE"** and ON-OR-OFF is set to **"OFF"**, the AASE is set to NOT equipped. If ON-OR-OFF is set to **"ON"** the AASE is set to equipped.

- **AINON** - Advanced Intelligent Network ON-OR-OFF Switch

- **AINRDFLT** - AIN Route Using Default

- **ASM** - Service Circuit System (SCS) Update Type-Announcement Systems Manager (ASM)/Administration Processor (AAP) - FEATURE ITEM input **"ASM"** specifies the protocol to be used on the LAN for the SCS Update System Type. If FEATURE ITEM is set to **"ASM"** and ON or OFF is set to **"ON"**, then the ASM protocol will be used in Local Area Network (LAN) communications. If FEATURE ITEM is set to **"ASM"** and ON or OFF is set to **"OFF"**, then the AAP protocol will be used in LAN communications.

- **CPESR** - Call Prompter with Enhanced Speech Recognition

- **F1** - F1 is used to indicate the Network Access Interrupt (NAI) ON-OR-OFF indicator. To activate the Network Access Interrupt Feature, set FEATURE ITEM to **"F1"** and ON-OR-OFF to **"ON"**. To de-activate the Network Access Interrupt Feature, set FEATURE ITEM to **"F1"** and ON-OR-OFF to **"OFF"**. The default is **"OFF"**. Note: The Network Call Denial (NCD) Query feature bit must be turned off prior to activating the NAI feature bit; otherwise, Form 809 will not activate the NAI feature bit.

- **F2** - Spare Non-Proprietary Activation Bits reserved for future use

Continued on next page

Form Entries, Continued

FEATURE ITEM (cont'd)

- **F3** - ON-OR-OFF bit for Multiple 4ESS Switch Network Announcements. This bit is set to **"ON"** to provide cross service Final Handling Treatment (FHT) Announcements and service terminating announcements in different languages based on the location of the caller. If this bit is set to **"OFF"**, then the default office announcement group will be used in final handling in Service Circuit System (SCS) offices.

- **F4** - I800 Overseas 10D Global Title Translation (GTT) Feature bit. The I800 Overseas 10D GTT Feature is activated/deactivated by populating the FEATURE ITEM field with **"F4"** and setting the ON-OR-OFF field to either **"ON"** or **"OFF"**. To activate the feature, set the ON-OR-OFF field to **"ON"**. To deactivate the feature, set the ON-OR-OFF field to **"OFF"**. The feature is defaulted to **"OFF"**.

- **F5** - Spare Non-Proprietary Activation Bits reserved for future use

- **F6** - F6 is used to indicate the Information Transfer Capability (ITC) in the outgoing Initial Address Message (IAM): To encode the outgoing IAM, User Service Information (USI) parameter ITC field, 3.1kHz audio, set FEATURE ITEM to **"F6"** and ON-OR-OFF to **"ON"**. To encode the outgoing IAM, USI parameter ITC field, "speech", set FEATURE ITEM to **"F6"** and ON-OR-OFF to **"OFF"**. The default is **"OFF (speech)"**.

- **F7** - Provide Phase I Advanced Intelligent Network (AIN) default routing for Called Number Trigger (CNT) calls by populating the FEATURE ITEM field with **"F7"** and setting the ON-OR-OFF field to either **"ON"** or **"OFF"**. To indicate that the office provides Phase I AIN default routing, set the ON-OR-OFF field to **"ON"**. To indicate that Phase I AIN default routing is not provided, set the ON-OR-OFF field to **"OFF"**. The default is **"OFF"**.

- **F8** - Spare Non-Proprietary Activation Bits reserved for future use

Continued on next page

Form Entries, Continued

FEATURE ITEM (cont'd)

- **F9** - The basic rather than improved processing of non-idle Q.931 trunks is activated/deactivated by populating the FEATURE ITEM field with **"F9"** and setting the ON-OR-OFF field to either **"ON"** or **"OFF"**. To activate the feature, set the ON-OR-OFF" field to **"ON"**. To deactivate the feature, set the ON-OR-OFF field to **"OFF"**. The feature is defaulted to **"OFF"**. When this feature is not active (OFF), the switch will perform the improved processing. This allows the Q.931 trunk hunt to rehunt when the initial hunt is to a non-idle trunk, and to final handle calls for which the switch receives a SETUP message that it believes to be an already stable call. When this feature is active (ON), the switch will perform basic processing rather than the above improved processing.

- **F10** - This item is used to transition performance monitoring from Digital Interface Frame (DIF) type of performance monitoring to Expanded Time Slot Interchange (XTSI) Release 2 type of performance monitoring for XTSI Trunks. Recent Change (RC) Form 664 is used to set the thresholds for XTSI Release 2 type of performance monitoring. The default setting is OFF and means performance monitoring transition to the XTSI version has not occurred. When F10 is set to **"ON"**, transitioning to XTSI Release 2 version of performance monitoring occurs. Once F10 is set to **"ON"**, it cannot be changed back to **"OFF"**.

- **F11** - The Terminating Bandwidth Screening is activated/deactivated by populating the FEATURE ITEM field with **"F11"** and setting the ON-OR-OFF field to either **"ON"** or **"OFF"**. To activate Terminating Bandwidth Screening, set the ON-OR-OFF field to **"ON"** which causes the terminating 4ESS Switch to invoke bandwidth screening. To deactivate terminating bandwidth screening, set the ON-OR-OFF field to "OFF" in which case the terminating 4ESS Switch will not attempt to compare the bearer capability with the Outgoing Signaling Characteristic (OSC) of the terminating egress facility to make decisions about routing of the call. The default is **"OFF"**.

FEATURE ITEM (cont'd)

- **F12** - Provisioning of this committed internal development (800 Toll Free Treatment for 888 & 877) is accomplished by populating the FEATURE ITEM with **"F12"** and setting the ON or OFF field to either **"ON"** or **"OFF"**. To activate the feature, set the ON OR OFF field to **"ON"**. To deactivate the feature, set the ON OR OFF field to **"OFF"**. NOTE, setting this item to **"OFF"** will also cause the following *automatic-provisioning* to occur: F28 (LEC Service Switching Point-800 (SSP-800) Support for Service Access Codes (SACs) 866 through 822 feature (#571) (4E24R3>)), will be set to **"OFF"**.

- **F13** - The 15 Digit International Numbering Plan feature is activated/ deactivated by populating the FEATURE ITEM field with **"F13"** and setting the ON-OR-OFF field to either **"ON"** or **"OFF"**. To activate the feature, set the ON-OR-OFF field to **"ON"** which causes the Extended Bellcore Automatic Message Accounting [AMA] Format (EBAF) Module 164 to appear in Local Exchange Carrier (LEC) billing records when the terminating number is > 12 digits or when the originating number is > 10 digits. To deactivate the feature, set the ON-OR-OFF field to **"OFF"** in which case the EBAF Module 164 will not appear. The feature is defaulted to **"OFF"**.

Continued on next page

Form Entries, Continued

FEATURE ITEM (cont'd)

- **F14** - (4E23>) The Message Header Reduction for Attached Processor Interface (API) Capacity feature is activated/deactivated by populating the FEATURE ITEM field with **"F14"** and setting the ON-OR-OFF field to either **"ON"** or **"OFF"**. To activate the feature, set the ON-OR-OFF field to **"ON"**. This will remove the 6 words of unused header in all International Consultative Committee for international Telephone & Telegraph [CCITT7] Integrated Services Digital Network User Part (INUP) messages, CCITT7 Telephone User Part (TUP) messages and Transaction Capabilities Application Part (TCAP) Queries, the 8 words of unused header in all TCAP Responses, the 2 words of unused header in all Q.931 messages, and the 3 words of unused header in all Access Transport Parameter (ATP) messages sent through the API. This in turn will increase the effective throughput of the API. To deactivate the feature, set the ON-OR-OFF field to **"OFF"** in which case the removal of the unused words of the header for the above mentioned messages sent through the API will not occur. The feature is defaulted to **"OFF"**.

  (4E22>) The API Capacity Improvement feature is activated/deactivated by populating the FEATURE ITEM field with **"F14"** and setting the ON-OR-OFF field to either ON-OR-OFF. To activate the feature, set the ON-OR-OFF field to **"ON"**. This will remove the 8 words of unused header in all ISUP messages sent through the API. This in turn will Increase the effective throughput of the API. To deactivate the feature, set the ON-OR-OFF field to **"OFF"** in which case the removal of the 8 words of unused header in all ISUP messages sent through the API will not occur. The feature is defaulted to **"OFF"**.

FEATURE ITEM (cont'd)

- **F15** - The CVU Echo-back Interface feature is activated/deactivated by populating the FEATURE ITEM field with **"F15"** and setting the ON-OR-OFF field to either **"ON"** or **"OFF"**. To activate the feature, set the ON-OR-OFF field to **"ON"**. To deactivate the feature, set the ON-OR-OFF field to **"OFF"**. The feature is defaulted to **"OFF"**.

- **F16** - To activate the Extend Address Complete Message (ACM) Timer for Common Channel Signaling 7 (CCS7) Feature, populate the FEATURE ITEM field with **"F16"** and set the ON-OR-OFF field to **"ON"**. To deactivate the Extend ACM Timer for CCS7 Feature, set the ON-OR-OFF field to **"OFF"**.

- **F17** - To activate the Network Access Interruption (NAI) for Direct Connect Calls Feature, populate the FEATURE ITEM field with **"F17"** and set the ON-OR-OFF field to **"ON"**. To deactivate the NAI for Direct Connect Calls Feature, set the ON-OR-OFF field to **"OFF"**.

- **F18** - (4E22R4>) To ignore Advanced Intelligent Network (AIN) Called Number Triggers on Location Routing Numbers (LRN) populate the FEATURE ITEM field F18 to **"ON"**. To process or act on AIN Called Number Triggers (CNTs) populate the FEATURE ITEM field F18 to **"OFF**". The default is **"OFF"**.

- **F19** - (4E23R3>) The Analyze Ported Number Generic Address Parameter (GAP) for Advanced Intelligent Network (AIN) Called Number Triggers (CNTs) feature (#515) is activated/deactivated by populating the FEATURE ITEM field with **"F19"** and setting the ON-OR-OFF field to either **"ON"** or **"OFF"**. To activate the feature, set the ON-OR-OFF field to **"ON"** (NOTE: this feature cannot be activated unless it has been purchased). To deactivate the feature, set the ON-OR-OFF field to **"OFF"**. The default is **"OFF"**.

Continued on next page

Form Entries, Continued

FEATURE ITEM (cont'd)

- **F20** - (4E23R3>) The Expanded Advanced Intelligent Network (AIN) Called Number Triggers(CNT) for the 10-Digit Domain option capability is activated/deactivated by populating the FEATURE ITEM field with F20 and setting the ON-OR-OFF field to either **"ON"** or **"OFF"**. To activate this capability, set the ON-OR-OFF field to "ON" (NOTE: this capability can not be activated unless both the AIN 6-Digit CNT Expansion (#516) and the AIN Called Number Trigger Expansion (#442) features have been purchased). To deactivate this capability, set the ON-OR-OFF field to **"OFF"**. The default is **"OFF"**.

- **F21** - (4E22>) The Local Exchange Carrier (LEC) Local Number Portability (LNP)/Advanced Intelligent Network (AIN) Domain Option (#534) feature is activated/deactivated by populating the FEATURE ITEM field with **"F21"** and setting the ON-OR-OFF field to either **"ON"** or "OFF". To activate or enable the feature set the ON-OR-OFF field to **"ON".** To deactivate or disable this feature set the ON-OR-OFF field to **"OFF"**. The feature default is **"OFF"**. Note: this indicator is only applicable if AIN Feature 375 and LNP Feature 450 have been purchased.

- **F22** - (4E23R3>) The Local Exchange Carrier (LEC) Originating Local Number Portability (LNP) Module Automatic Message Accounting (AMA) Enhancements feature (#537) is activated/deactivated by populating the FEATURE ITEM field with **"F22"** and setting the ON-OR-OFF field to either **"ON"** or **"OFF"**. To activate the feature, set the ON-OR-OFF field to **"ON"** (NOTE: This feature cannot be activated unless it has been purchased.) To deactivate the feature, set the ON-OR-OFF field to **"OFF"**. The default is **"OFF"**.

Continued on next page

Form Entries, Continued

FEATURE ITEM (cont'd)

- **F23 -** (4E24R1>) The Tandem Flexible Automatic Number Identification (ANI)/II Digit Restriction Feature (#539) is activated/deactivated by populating the FEATURE ITEM field with **"F23"** and setting the ON OR OFF field to either **"ON"** or **"OFF"**. To activate the feature, set the ON OR OFF field to **"ON"**.

  NOTE: This feature cannot be activated unless:

  - the feature has been purchased
  - all possible II digits have a valid II default type provisioned via Recent Change (RC) Form 349
  - all possible Originating Line Information (OLI) values have a valid OLI default type provisioned via RC 350.

To deactivate the feature, set the ON OR OFF field to **"OFF"**. The default is **"OFF"**.

- **F24** - (4E24R1>) The Connecting Network Access Record (CNAR) Trunk Subgroup (TSG) Billing Number Option (#547) Feature is activated/ deactivated by populating the FEATURE ITEM field with **"F24"** and setting the ON OR OFF field to either **"ON"** or **"OFF"**. To activate the feature, set the ON OR OFF field to **"ON"**. To deactivate the feature, set the ON OR OFF field to **"OFF"**. The default is **"OFF"**.

- **F25 -** (4E24R3>) LEC Non-GETS Initial Address Message/Circuit Reservation Message (IAM/CRM) priority setting indicator feature (#555)

- **F26** - (4E24R3>) The LEC Flexible Automatic Number Identification/ Information Identifying Digits (ANI/II) 800 to Plain Old Telephone Service (POTS) feature (#567) is activated/deactived by populating the FEATURE ITEM field with F26 and setting the ON OR OFF field to either **"ON"** or **"OFF"**. To activate the feature, set the ON OR OFF field to **"ON"**. To deactivate the feature, set the ON OR OFF field to **"OFF"**. The default is **"OFF"**.

  NOTE: This feature cannot be activated unless this feature has been purchased.

Continued on next page

Form Entries, Continued

FEATURE ITEM (cont'd)

- **F27** - (4E24R3>) The AIN 3-Digit Number Trigger Criteria Type feature (#569) is activated/deactived by populating the FEATURE ITEM field with **"F27"** and setting the ON OR OFF field to either **"ON"** or **"OFF"**. To activate the feature, set the ON OR OFF field to **"ON"**. To deactivate the feature, set the ON OR OFF field to **"OFF"**. The default is **"OFF"**.

  NOTE: This feature cannot be activated unless this feature has been purchased.

- **F28** - (4E24R3>) LEC Service Switching Point-800 (SSP-800) Support for Service Access Codes (SACs) 866 through 822.

- **F29 -72** - Spare Non-Proprietary Activation Bits reserved for future use.

- **SUA** - Software Update Automation. When this feature bit is set to "ON", Software Update Automation is enabled.

ON OR OFF ON or OFF
Valid entries are **"ON"** or **"OFF"**.

FEATURE INFO

Feature Information (RC Form 811) - This field is used to identify the feature for which data is to be changed. Valid entries are:

- **IID -** There are six different office wide II Digit Defaults (ID1 through ID6) that can be provisioned via RC 811. These Defaults, when provisioned, can be assigned via RC 349 to replace specific II digits in forwarding calls to an Interexchange Carrier (IC) if Flexible Automatic Number Identification (ANI)/II restrictions apply. Valid **INDX** entries are **"1-6"**. Valid default II **DATA** entries are **"00-99"**. The associated Verify is input message 13ba and output form 3ba.

  NOTE: These defaults can only be provisioned if the Tandem Flexible ANI/II Digit Restriction Feature (#539) has been purchased.

- **IPPD** (4E24R3>) - (#567)

- **OLID -** There are six different office wide Originating Line Identifier (OLI) Defaults (OD1-OD6) that can be provisioned via RC 811. These Defaults, when provisioned, can be assigned via RC 350 to replace specific OLIs in forwarding calls to an Interexchange Carrier (IC) if Flexible Automatic Number Identification (ANI)/II restrictions apply. Valid **INDX** entries are **"1-6"**. Valid default OLI **DATA** entries are **"0-255"**. The associated Verify is input message 13bb and output form 3bb.

  NOTE: These defaults can only be provisioned if the Tandem Flexible ANI/II Digit Restriction Feature (#539) has been purchased.

- **OPPD** (4E24R3>) - (#567)

- **RVASRNSX** - Reserved Automatic Speech Recognition (ASR) Service Circuit System (SCS) Service Circuit Unit (SCU) Channels.

Form Entries, Continued

INDX

Translator Index - Entries:

- IID (4E24>) - **"1-6"**
- IPPD (4E24R3>) - **"0-99"** (#567)
- OLID (4E24>) - **"1-6"**
- OPPD (4E24R3>) - **"0-255"** (#567)
- RVASRNSX - **"0-7"**

DATA

New Data - Entries:

- IID (4E24>) - **"00-99"**
- IPPD (4E24R3>) - **"0"** or **"1"** (0=No & 1=Yes) (#567)
- OLID (4E24>) - **"0-255"**
- OPPD (4E24R3>) - **"0"** or **"1"** (0=No & 1=Yes) (#567)
- RVASRNSX - **"1-30"**

ASSOCIATED VERIFY MESSAGES

Associated Verify Messages for new data keyword population:

- IID (4E24>) - verify input message 13ba "VER:EA;OPT DFI" and verify output form 3ba "ID1 through ID6".
- IPPD (4E24R3>) - verify input message 13bf "VER:EA;OPT IPPD" and verify output form 3bf (#567).
- OLID (4E24>) - verify input message 13bb "VER:EA:OPT DFO" and verify output form 3bb "OD1 through OD6".
- OPPD (4E24R3>) - verify input message 13bg "VER:EA;OPT OPPD" and verify output form 3bg (#567).

RC Form 812

General

Recent Change (RC) Form 812, available with 4E21 and later Generic Programs, is used to change one or more bits of a maximum of 24 words of Office Data Assembler (ODA) translation data which is in core, backed up on disk, or is disk only data. This form is classed as a Recent Change Data Message (RCDM).

Up to 24 bits in a word can be altered by this message. For example, a word may be made up of several groups of bits. Let A thru F represent the groups. A 24-bit word might look like CFFFFEEDDDDDDDDAAAAAAABB. The letters represent the bits where a given item appears. To change the entire word, a size of 24 with a displacement of zero would be used. This means, "change 24 bits beginning zero places from the right."

A single item may be changed with the remaining bits left untouched. As an example, to change item A in the preceding word, a size of seven with a displacement of two would be used. Items E and F could be changed by specifying a size of 6 with a displacement of 17.

An alphabetical keyword list is included in this section on page 6.

Form Entries

RC:FUNC;CHG;OPT(ENHABS),_ _ _:

Recent Change (RC) action field. Entries appended to the message header indicate the action to be taken by the RC system. If no entry is made in this field, it will default to the buffered state.

- **BUF** – Buffer state sends the Recent Change Data Message (RCDM) to the 1B Processor to perform range, syntax, and format checks. If the RCDM passes all checks, the data is placed in the Buffer state on disk in the Attached Processor System (APS). A maximum of 511 Buffered RCDMs can occupy the disk at one given time.
- **TST** – Test state entry sends the RCDM directly through the Buffer checks and also the Test state defensive checks for compatibility to the existing translations in the 1B Processor. If all BUF and TST checks are successful, the RCDM will be stored in the Buffer state on disk. If the message is entered directly to TST and fails any checks, the data will be rejected and purged from the screen requiring re-entry to the terminal.
- **ACT** – Activate entry indicates the message is to be immediately activated following the Buffer and Test checks. This RCDM will never be buffered on disk.
- **FTA** – Fast activate is a special form of the ACT action which limits output text during the processing of the RCDM activation to that of a success or a failure message.
- **FTB** – Fast Buffer is a special form of the BUF action which limits output text during the processing of the action to a success or a failure message.
- **FTT** – Fast test is a special form of the TST action which limits output text during the processing of the action to a success or a failure message.

FSONLY

Enter a **"Y"** for Yes in this field if the data to be changed resides only in file store. Enter an **"N"** for No in this field if the data to be changed resides in core, backed up by file store. It is not possible to change the file store copy of a word that resides in core with file store back up by specifying the file store address and setting FSONLY to **"Y"**. If this is attempted, an error message will be received.

Continued on next page

Form Entries, Continued

FSEG The FSEG field specifies the File Segment that the translation words store. Valid entries are **"0"**, **"1"**, **"2"**, or **"3"**.

ORNU Order Number - The Order Number identifies a particular Recent Change (RC) message. This number may range from **"1-999999"**. Each message in the buffer must have a unique Order Number.

ADDRESS If the ADDRESS contains input data, then this field will specify the starting address of a translation entry. The address must be an octal number (to the base eight). The program will check for valid address. For consecutive addresses, the field can be **"Blank"**, but SIZE, DISP, OLDDATA, and NEWDATA must have input data.

SIZE The size field specifies the number of bits to be changed in the translation word. This number can range from **"1-24"** (decimal).

DISP This field identifies the right most bit position of the data to be changed within the specified translation word. The displacement of the data refers to the number of places (bits) from the right. In this case, the data specified in the NEWDATA field will be inserted in the translation word at a point displaced from the right most bit as specified by this field (DISP). The size of the data (SIZE) plus the displacement of the data (DISP) cannot exceed 24 (Decimal). Valid entries range from **"0-23"** (Decimal).

Continued on next page

Form Entries, Continued

OLDDATA This field contains the current contents of the data in the translation word as specified by SIZE and DISP. The right most bit position of the data to be changed in this word will be replaced by the right most bit in the NEWDATA field. This field will contain an octal number from **"0-77777777"**. The entry in this field may not exceed the number of bits to be changed as specified in the SIZE field.

NEWDATA This field contains the NEWDATA to be inserted into the translation word. The right most bit position in this field will replace the right most bit of the data to be changed as specified by the DISP field. This field will contain an octal number from **"0-77777777"**. The entry in this field may not exceed the number of bits to be changed as specified in the SIZE field.

Continued on next page

Administrative Table Of Contents, Continued

General

This information applies to all sections within this division:

1. The characters > and < are used to indicate which Generic Programs will apply.

   Examples:

   - 4E22> indicates 4E22 and later Generic Programs.
   - <4E22 indicate 4E22 and earlier Generic Programs.
   - 4E22 indicates the 4E22 Generic Program only.
   - >4E22 indicates all Generic Programs up to, but not including, 4E22.

2. Following the general section is a copy of the applicable Recent Change (RC) Form/s. Where there is more than one Generic published, the forms will be filed in ascending order by Generic.

3. The Keyword field names of the form entries in each section are listed in order of appearance on the latest Generic Recent Change Form. (Keywords deleted from the latest form issue will still remain in the form order of the last RC Form that it appeared until finally deleted).

4. The alphabetical "Keyword Index" of the field names is located at the end of each Recent Change Section, following the text, and any tables and/or graphics that may apply.

5. Each Keyword definition will only list the valid entries for the RC Form covered in each applicable section. Some Keywords may have additional valid entries related overall and may be found in the alphabetical Keyword Glossary (Div. 9, Sec. 1).

Administrative Recent Changes

Messages

RCAM (Recent Change Action Message)	RCAD (Recent Change Administrative Message)
• CLR:CHAN!	• OP:RCBMSG,ORNU_!

• RCCNL:RCTORNU!	• OP:RCRORNU,_ _ _ _ _!
• RCCNL:ROLLBACK!	• OP:RCTORNU!
• RCTST:ORNU_!	

General

These messages are for Recent Change (RC) Administration. They are one-line messages that cause some action to a Recent Change Data Message (RCDM) or provide information (RCAD).

Message Description

CLR:CHAN! (CLeaR:CHANnel) This message clears any and all displays from the channel on which it is input.

CLR:RCB! (CLeaR:Recent Change Buffer) The CLR message causes all messages on the RC disk buffer to be cleared.

RCACT:ORNU_! (Recent Change ACTivate:Order NUmber) This message activates a previously entered RC that is in the test state. Identity is by order number in the range of **1 to 999999.** This message activates a previously entered Recent Change that is in the buffer.

RCCNL:RCBORNU_! (Recent Change CaNceL:Recent Change Buffer Order NUmber) The RCCNL input cancels a previously buffered message. ORNU range is **"1 - 999999"**.

RCCNL:RCTORNU_! (Recent Change CaNceL:Recent Change Test ORder NUmber) This message cancels an RC that is presently in the test state. Identity is by order number in the range of **"1 - 999999"**.

Continued on next page

Administrative Recent Changes, Continued

Message Description (cont'd.)

RCCNL:ROLLBACK! (Recent Change CaNceL:ROLLBACK) This message causes the last Recent Change Message that was activated to be rolled back. Messages that potentially can cause machine disruption if rolled back must be rolled back with the Unconditional (UCL) keyword.

RCTST:ORNU_! (Recent Change TeST:ORder NUmber) The RCTST message advances a buffered RCDM to the test state. The RCDM is identified by an order number from **"1 - 999999"**. This message causes all defensive checks to be performed on the RCDM.

OP:RCBMSG,ORNU_! (OutPut:Recent Change Buffer MeSsaGe, Order NUmber) This message request prints a copy of a buffered message. The buffered message is identified by an order number in the range of **"1 - 999999"**.

OP:RCBORNU! (OutPut:Recent Change Buffer ORder NUmber) A list of all order numbers in the RC buffer is displayed or printed out, in ascending numerical order, via this message.

OP:RCBSPACE! (OutPut:Recent Change Buffer SPACE) This message displays or prints the available buffer storage space as unused 32-word blocks.

OP:RCFORM_! (OutPut:Recent Change FORM) This message is used to call up one of the Recent Change Data Message forms. These forms are referenced by a three-digit Recent Change number.

Use pursuant to Company Instructions

Administrative Recent Changes, Continued

Message Description (cont'd.)

OP:RCRORNU,aaaa/aN! (OutPut:Recent Change Rollback ORder NUmber) This message is used to list the order numbers in the rollback area in reverse chronological order.

A slash through a letter a indicates that this is an optional space. Aaaa/ indicates two possible entries: **"ALL"** or **"LAST"**. N may be either a decimal number or TAPE. When **"ALL"** is specified, all of the entries in the rollback area are listed. If a decimal is used with **"LAST"**, then the last **"N"** entries are listed. If TAPE is used with **"LAST"**, then all entries since the last translation tape dump are listed. If no entry is specified, this field will default to LAST TAPE.

OP:RCTORNU! (OutPut:Recent Change Test ORder NUmber) This message requests a printout of all order numbers that are presently in the test state.

Carrier Interconnect

Introduction

Certain fields on Recent Change (RC) Forms are uniquely used at an Access Tandem (AT). This section is intended to identify these unique fields and entries.

This section describes the impact as a result of Carrier Interconnect.

In This Section

This section contains the following topics:

Topic	See Page
Introduction	***1***
In This Section	***1***
Carrier Interconnect Architecture	***2***
Description	**3**
Carrier Interconnect Call Flow	***4***
EAEO Access Via AT to IC - MF Signaling	**5**
Carrier Interconnect	***6***
Far End Network - RC 617	**6**
Trunk Subgroup - RC 100	**8**
Routing Data Block - RC 500	**10**
Translatable Digits - RC 311	**12**
Translatable Digits - RC 319	**14**
Digits Translation - RC 302	**16**

Carrier Interconnect Architecture (cont'd.)

Description

Carrier Interconnect consists of multifrequency signaling between the Local Exchange Carrier (LEC) and the Interexchange Carrier (IC) Networks.

This signaling provides Feature Group D (FG-D) Equal Access Signaling. Equal Access Signaling provides for first and second stage of digit processing as shown on the following page.

Carrier Interconnect, Continued

Carrier Interconnect Call Flow (cont'd.)

EAEO Access Via AT to IC - MF Signaling

This example is built with Multifrequency (MF) signaling to the AT and MF signaling to the IC. Shown on the opposite page is the means by which the Called Number and the Automatic Number Identification (ANI) are delivered to the IC when the EAEO is located behind an AT. This arrangement enables the AT to receive the Carrier Identification Code from the EAEO, seize a trunk to an IC, and cut through on receipt of a wink start from the IC.

All subsequent call setup functions are now performed between the EAEO and the IC with no further action required by the AT except to repeat winks and return answer supervision.

Call Flow Legend:

KP	-	Key Pulse
0ZZ	-	Equal Access Identifier, Local Access Transport Area (LATA) specific, locally assigned
XXXX	-	4-Digit Carrier Identification Code
II	-	Information Identifying Digits
ANI	-	Automatic Number Identification (equal to billing number)
Wink Start	-	Access Charges begin upon receipt of wink start from the IC

The remainder of this section shows how to provision to make the above scenario work.

Carrier Interconnect (cont'd.)

Far End Network - RC 617

This example is being built in recent change order sequence. This allows defensive checks to pass on later forms.

The Far End Network (FEN) block must be established for every IC that terminates into that LATA. This ensures recording for terminating access charges. Also, some screening may be needed since calls are originating and terminating in another network. This can also be accomplished on the FEN Block.

Key Fields:

- **CLASS** - FEN Class
  ACCESA is used for trunks connecting to the IC network.

- **FID** - FEN Identification
  4-digit Carrier ID (CID). (If 3-digit CID, add 0 in front on CID.)

- **SC** - Service Categories
  Valid Entries:
  D - Deny all calls
  N - Calls allowed, no recording
  R - Route call and record.

  Call processing will access the SC on the code groups and will link to the appropriate FEN.

NOTE: If Unspecified (UNSP) service category is not on codegroup, ensure this field contains an "N" or "D" appropriately.

Translatable Digits - RC 311

0ZZ Code

As previously discussed, 0ZZ Codes are assigned, usually on a LATA basis, to identify equal access offices. All ABC digits, i.e., 0ZZ, are always defined in the switch as vacant codes. The switch translates on the three digits.

In Example 1, the 0ZZ Code of 050 is expanded to a three digit carrier identification code.

In Example 2, the 0ZZ Code of 050 is expanded to a four digit carrier identification code. This allows 7 digits for analysis.

NOTE: Digits are expanded by building up of groups of 3 until the remainder is less than 3. Seven (7) digits are two groups of 3 and remainder of 1.

Carrier Interconnect (cont'd.)

Digit Translation - RC 302

At this point, we have built the FEN block, Trunk Subgroups and the Routing Data Blocks (RDBs) for the IC.

The new Carrier Identification Code (CIC) on the code group form must now be pointed to the RDB. This instructs the system to cut through the End Office (EO) to the IC. This is accomplished by populating the Call Handling Instructions (CHIs).

Key Field:

- **CHI** - Call Handling Instructions
  These CHIs must be negotiated with the ICs

Domestic Use:

- **WSNO —** Wink Start No Outpulse

International Use:

- **WACK —** Wait for Acknowledgment
- **WAC2 —** Wait for Acknowledgment (Intermediate Carriers)

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Network Interconnect, Continued

Network Interconnect Architecture (cont'd.)

Description

Network Interconnect consists of out-of-band signaling between the Local Exchange Carrier (LEC) and Interexchange Carrier (IC) networks. Signaling System 7 (SS7), out-of-band signaling, is defined as Integrated Service Digital Network User Part (ISUP) signaling in the 4ESS Switch software translations.

Network Interconnect resulted in the addition of new Signaling Links between each LEC's Signal Transfer Points (STP) to each IC. Each Equal Access End Office (EAEO) or Access Tandem (AT) now uses the ISUP links for communication. The use of Multifrequency Receivers and Transmitters has dropped as the cutover progresses.

Shown on the opposite page is the Network Architecture.

Network Interconnect, Continued

Network Interconnect Call Flow (cont'd.)

Network Interconnect Using ISUP — ISUP at Access Tandem

Network Interconnect provides end to end use of ISUP signaling for call setup. The call flow consists of the following:

Initial Address Message (IAM) from EAEO to AT identifies the Transit Number Selection parameter which includes the Carrier ID and circuit code digits, Charge Number (Cgn) and Called Party Number (CPN).

The AT seizes a trunk to the appropriate carrier and sends an IAM. An Exit Message (EXM) is returned to the EAEO in order to start Access Charging.

The Continuity Check of the facilities may be omitted if the switches and facilities are all digital. The COntinuity Test (COT) would not be sent in that case. The COT will occur before the EXM.

The IC routes the call to the terminating location.

If the call is successful, the last ISUP office returns an Address Complete Message (ACM) and connects the Incoming Trunk (ICT) to the Outgoing Trunk (OGT).

Each preceding office, upon receipt of the ACM, connects the ICT to the OGT and repeats the ACM to the previous office.

The originating EAEO completes the connection to the originating customer and that customer hears ringing from the terminating EAEO.

An Answer Message (ANM) is returned when the called party answers.

Network Interconnect, Continued

Network Interconnect

Terminology Changes

Terminology Changes

EA/MF	ISDN-UP Parameter
0ZZ + XXXX 1NX + XXXX	Transit Network Selection (TNS) (Carrier ID Circuit Code)
II	Originating Line Information (OLI)
ANI	Charge Number
Called Number	Called Party Number

Continued on next page

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Network Interconnect, Continued

Network Interconnect (cont'd.)

Terminology Changes

The currently assigned 0ZZ/1NX-XXXX codes in an equal access environment are changed in an ISUP environment. The Transit Network Selection (TNS) parameter in an ISUP environment will be in the form of XXXX-YY. The XXXX will be the Carrier Identification. The circuit code (YY) will be a replacement for the ZZ digits. There is no correlation of ZZ to circuit code.

The existing II digits in the ANI stream are replaced by Originating Line Information (OLI). The present range of 00-99 for II is expanded to 000-255 for OLI. Currently the same values are used for II and OLI.

Called/ANI Description
The ANI digits are called the charge number. It is indeed the billing number for this call and may not be the calling number of the line.

ISC	Incoming Signal Characteristic	UNK	Unknown

Continued on next page

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Network Interconnect, Continued

Network Interconnect (cont'd.)

Type of Trunks

There are three TOT codes that enable the 1B Processor to identify if a call is a Network Interconnect call.

These codes are:

- **LCC** - Local Exchange Carrier Connecting. Used at an IC switch to identify trunks to the Local Exchange Company.
- **OCC** - Other Carrier Connecting. Used at an AT to identify trunks to an IC.
- **ETC** - End Office/Access Tandem Connecting. Used at an AT to identify trunks to another AT and subtending End Offices.

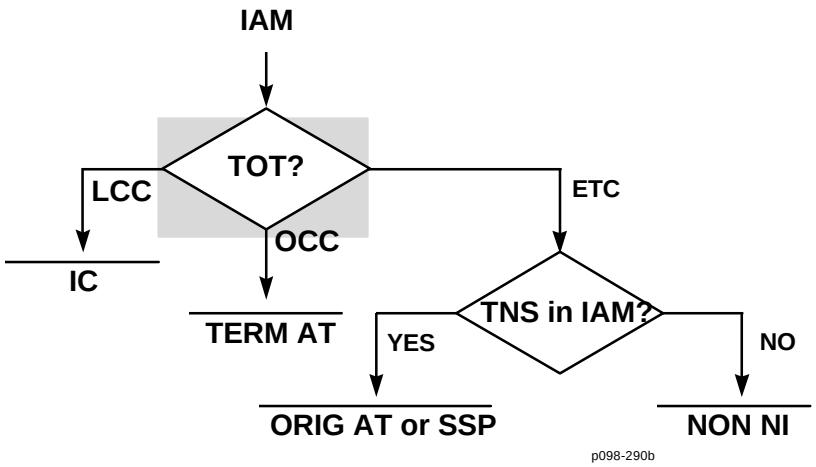
Office Functionality

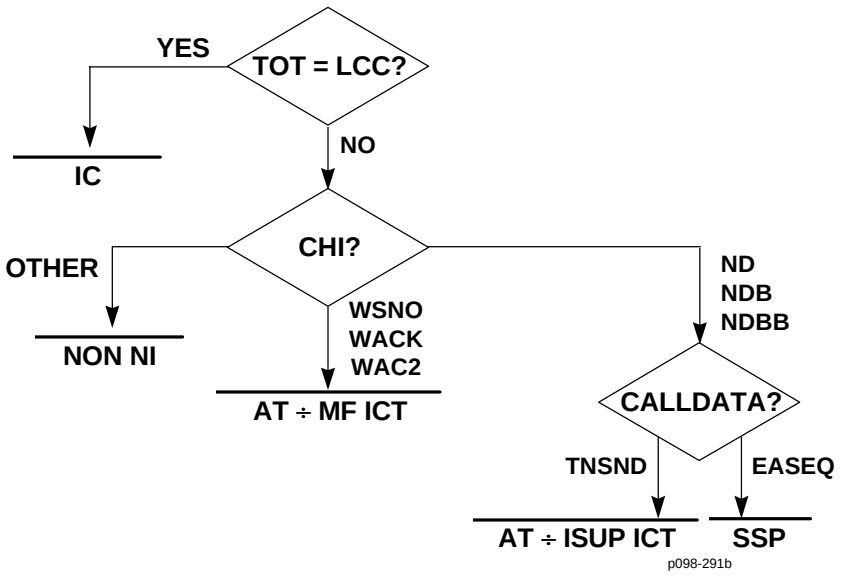
TYPE OF OFFICE FUNCTION DETERMINATION

ISUP INCOMING TRUNK (ICT)



TYPE OF OFFICE FUNCTION DETERMINATION

ISUP OUTGOING TRUNK (OCT)



Continued on next page

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Network Interconnect, Continued

Network Interconnect (cont'd.)

Office Function Determination

A new Type of Trunk (TOT) was necessary for the proper call processing to be performed. Anytime the signaling type for Incoming Signaling Characteristic (ISC) or Outgoing Signaling Characteristic (OSC) is ISUP, a determination must be made of the call type.

ISUP Incoming Trunk

- If the TOT is LCC, then the call is being received at a Toll Office.
- If the TOT is OCC, the call is being received at an AT from an IC.
- If the TOT is neither LCC or OCC, then is there a TNS identified in the IAM? If yes, the call is at an originating AT. If no, the call is not Network Interconnect.

ISUP Outgoing Trunk

- If TOT is LCC, then the call is going to an AT or End Office from an IC.
- If TOT is not LCC, a determination of the origin of the call is made to determine how call processing is to be performed. This is done using the Call Handling Instructions (CHI) field which appears on the Code Group, RC 300-303 Forms.

Access Tandem Call Failures

Inter-Local Access Transport Area Calls (InterLATA)
The RC 100 Forms contain critical fields used in the event of call failures.

Call Failure Key Fields:

- **BFTIS**- Backward Failure Treatment ISUP all the way

  Valid Entries:
  ANN - Play Announcement
  REL or Blank - Send REL message with Cause Value

- **BFTNI**- Backward Failure Treatment not ISUP all the way

  Valid Entries:
  ANN or Blank - Play Announcement
  REL - Send REL message with Cause Value.

These two fields must also be populated on the 406Z Form. The type of failure determines where the software accesses this data. This will be covered in more detail on the following page.

Other Key Fields:

- **ISC/OSC**- Incoming/Outgoing Signaling characteristics
  ISUP is used for SS7 signaling

- **TFG** - Type of Feature Group
  D is used for Feature Group D

- **TOT** - Type of Trunk
  OCC is used for Other Carrier Connecting

ODA 406Z Form

Call Failures for Intra-LATA Calls
The Office Data Assembler (ODA) 406Z Form contains the fields BFTIS (Backward Failure Treatment ISUP all the way) and BFTNI (Backward Failure Treatment not ISUP all the way).

These fields identify the disposition of Intra-LATA ISUP call failures.

- **BFTIS**- Backward Failure Treatment ISUP all the way

  Valid Entries:
  ANN - Play Announcement
  REL or Blank - Send REL message with Cause Value

- **BFTNI**- Backward Failure Treatment not ISUP all the way

  Valid Entries:
  ANN or Blank - Play Announcement
  REL - Send REL message with Cause Value.

Tone and Announcement Treatment for Call Failure

Cause Value Table

With network interconnect, a decision has to be made as to where failure announcements are to be played. The tone and announcement may be played at the terminating switch, or a cause value may be inserted in the ISUP REL (Release Message) returned in the backward direction. On the opposite page is a list of currently assigned cause values along with the recommended Final Handling Treatment (FHT). This value is inserted in the REL message by the particular switch that experienced the failure.

Refer to Call Irregularity Handbook 234-010-315 for additional information.

LEC Domain Selection

Domain Modifications

Domains are modified in call processing based on the call characteristics, i.e., type of call, parameters, database response. The chart on the opposite page depicts these types of modifications.

The Selector column denotes where a domain is specified. The domain lists the possible values for that category. The application indicates the type of calling that is to be executed.

Routing Translations

Access Tandem Transit Network Selection (ATNS) is a Routing Domain used at an AT to route Network Interconnect calls. This Domain is accessed with the 4-digit Carrier ID and possibly two additional digits called the Transit Network Selection Index (TNSI). The TNSI is derived from the circuit code.

Valid CALLTYP - The following are the only CALLTYP words which are valid in the ATNS Domain:

- **FHT** - Final Handling Treatment
- **SSP** - Service Switching Point
- **SDX** - Manual Subsequent Index
  The translations personnel must assign further translations in the AD1 field to indicate the type of indexing, i.e., MTS - Multiple Treatment Screening.

CALLDATA - TNSND (Transit Network Selection Digits)
This CALLDATA word is encountered when a valid Carrier ID is received from an EAEO on an Incoming ISUP trunk. This CALLDATA is used only in the ATNS Domain with CALLTYP = SSP.

AD1 - DRTC (Data Rate Transfer Capability)
The received IAM contains the User Service Information (USI) parameter. The USI will identify whether the call attempt is voice or data and is used with CALLTYP = SDX, CALLDATA = SDX Index, and AD1 = DRTC. An RC 304 Form (Subsequent Digit Routing) is required when using the DRTC parameter. DRTC is another form of screening.

ISUP ICT to ISUP OGT Call Processing

The diagram on the opposite page identifies the call processing steps performed at an AT.

1. The Trunk Subgroup (TSG) characteristics indicate the TOT of ETC and the ISC of ISUP. When the IAM contains the TNS parameter with a Carrier ID, the call is identified as a Network Interconnect call. This results in Digit Translation being performed in a new Routing Only Domain called Access Tandem Transit Network Selection (ATNS).

2. Digit translation may be done on either a 4-digit or 6-digit basis.

   - The 4-digit basis uses only the 4-digit carrier ID.

   - The 6-digit basis uses the 4-digit carrier ID and the 2-digit code called Transit Network Selection Index (TNSI), which equates to the existing 0ZZ or 1NX code.

   - TNSI is a number in the range of 00 - 15, indicating a specific 0ZZ or 1NX code. The international bit is set based on coding in the Called Party Address Parameter.

3. If the Carrier Code is valid, a Number Services Data Block Index (NDBI) will be reached.

Transit Network Selection

TNSI to EF Conversion (Access Tandem Only)
A capability exists where 6-digit translation may be performed using more than one circuit code within a Local Access Transport Area (LATA).

The table on the opposite page indicates the relationship of the assigned TNSI (circuit code) to the associated EF digits that would be used in digit translation. The first 4 digits (ABCD Digits) identify the carrier (AT&T, in this case) and the 00 identifies the circuit code. The correct EF digits = 00.

Example 1: Domestic Call (ITL=0)
Received digits 0288+00

Example 2: International Call (ITL=1) non-operator
Received 0288 01 EF Digits = 17
Received 0288 02 EF Digits = 18

Number Data Block - RC 524

A Number Data Block (NDB) is used to route number service calls to an IC. Before the codegroup can be built, an NDB must be built since the NDB will be input on the codegroup form. The NDB contains additional information that is not on an RDB for IC calls.

Key Fields:

- **NDBI** - NDB Index - One of the 1024 in the office
- **FENCLASS** - ACCESA - Indicates an IC network.
- **FENID** - Far End network ID - The Carrier Identification Code (CIC)
- **RDBI** - The RDB with the TSG list for this carrier
- **NXZZ** - The NX or ZZ part of the 1NX or 0ZZ sequence. This is needed if call is tandeming through to the access tandem or is an international call. Recommend using the standard ZZ used for IXC traffic.
- **NNDB** - Next NDB index if needed
- **FG** - Feature Group (B, C, D)
- **ANI** - Send ANI
- **CPN** - Send Calling Party Number
- **PATH** - DIR: The next switch is the IC switch
  INDIR: The next switch is the AT
- **INTL** - International call - Use international signaling.

Code Group - RC 301

At this point, it is assumed that the TSG and the RDB have been built and that the circuit code is equal to 00.

When a call arrives on an ISUP trunk, the ATNS domain must contain an entry for each carrier ID that is valid. The form on the opposite page identifies the entries required for routing these equal access calls, which do not need to go to the SSP 800 database.

DOMAIN	- Entry: ATNS
CALLTYP	- Entry: SSP
CALLDATA	- Entry: TNSND
AD1	- Entry: Populate with the NDB Index in range of 1023
ADC	- Entry: 4 or 6 Digits
CHI	- Entry: Must be populated with Number Services Data Block (ND), Number Services/Inhibit Black box (NDB), or Number Services/Inhibit Black box (NDBB)
DESEP	- Entry: Populate with assigned DESEP
ABCD	- Carrier ID - Note: 3 digit codes need to be prefixed with 0
EF	- Circuit code possibly modified by INTL Bit
AC	- Entry: Blank
NTD	- Entry: 6

Network Interconnect (cont'd.)

MF to ISUP Interworking

During the transition of signaling from MF to ISUP, the capability must be present at an AT for the interworking of MF and ISUP signaling. The call flow consists of the following:

1. The AT receives a seizure from an EAEO and returns a wink start when ready to receive the MF digits. The EAEO then out pulses the Carrier Identification to the AT (0ZZ-XXXX).

2. The AT analyzes the 0ZZ-XXXX to find an RDB to the carrier with the CHI of Wink Start No Outpulse (WSNO) and finds an idle trunk to the IC and sends a Circuit Reservation Message (CRM) to the IC.

3. The IC responds with a Circuit Reservation Acknowledge (CRA) message. The AT returns a wink start so the EAEO begins Access Charges.

4. If a Continuity Check is performed, the COT message may occur before or after the CRA message.

5. The EAEO now out pulses the ANI and the Called Party Number (CdP) to the AT. The AT returns an Acknowledgment wink.

6. The AT now generates an IAM to the IC using the information from MF digit stream.

7. When the last ISUP office returns an ACM, each preceding office connects the ICT to the OGT and returns an ACM to the preceding office.

8. The CPN now hears the ringing tone from the terminating end office.

9. An ANM is returned when the Called Party answers.

NOTE = The initial code grouping was covered in the Carrier Interworking section.

Change NX or ZZ to TNSI Translator - Form 335

In this interworking case, the call is received on an MF trunk and sent out on an ISUP trunk. The 4ESS must be able to convert the MF input into the appropriate ISUP output. For the most part, this is possible without any additional information.

However, if a TNS parameter is required in the outgoing IAM, a means to determine the correct circuit code is required and that is the purpose of the RC 335 Form.

The translator is used to convert the existing NX and ZZ codes used for Equal Access MF signaling to the ISUP format when TNS is required for an outgoing IAM.

Entries are as follows:

- **TNSD** - Use NX or ZZ to indicate entry type.

NOTE: Normal usage is for NX conversion; however, the ZZ case is needed if tandeming to another AT.

- **NX/ZZ Digits** - Enter all the valid NX or ZZ codes depending on TNSD entry above.
- **TNSI** - Enter value from 00 to 15. These may be used once for each NX and ZZ. These values are used to identify to the Interexchange Carrier what type of service is required for this call.
- **OPR** - Operator Indicator. If TNSD = ZZ, then leave this field blank. If TNSD = NX, then enter a Y or N to indicate whether an International Operator is required.

The current format for International calling is as follows:

138-028-800-7 - The 138 identifies the call as International Direct Dialed Digits (IDDD) with country code 7, IC 288.

158-028-800-7 - The 158 identifies the call as requiring an International Operator for same case.

Network Interconnect (cont'd.)

ISUP to MF Interworking

The AT has the capability of receiving ISUP messages from an EAEO and signaling to the IC using MF. The call flow consists of the following:

1. The EAEO generates an IAM to the AT containing the Transit Network selection parameter Carrier ID and the Circuit Code Digits, Charge Number (CgN) and the CdP.
2. The Continuity Check may or may not be performed.
3. The CID and Country Code (CC) are translated in the ATNS Domain to get the NDBI for this carrier and the outgoing trunk is selected and an Off Hook is sent after the receipt of the COT message.
4. When the Wink Start is received from the IC, an ACM is returned to the EAEO and Access Charges begin.
5. The Called Number and the ANI are now MF out pulsed from the AT to the IC. If the call is international or tandeming to an AT, then the NX/0ZZ sequence is outpulsed.
6. An Acknowledgment Wink is then returned from the IC and the ICT is connected to the OGT at the AT.
7. An Answer is received at the AT and an ANM is returned to the EAEO.

SS7 to MF Interworking

In this interworking case, the call is received on an ISUP trunk and sent out on an MF trunk. The 4ESS Switch must be able to convert the ISUP inputs to the MF outputs. For the most part, this is possible without any further additional information.

When the SS7 call is received, a TNS parameter is received which contains the CID and CC which will be used for translation in the ATNS domain. The result will be an SSP calltype, TNSND call data, on an NDBI. The previous page shows three possibilities for domestic and international calls.

The following summarizes how to get the information from the call flows and the NDBs.

Information Needed	Source of Information
Domestic vs International	INTL Field N=Domestic, Y=International
ZZ or NX	NXZZ Field
XXXX	From TNS Parameter in IAM
CCC	From Country Code Conversion Table (see Next Pages)
II	From OLI in IAM + OLI/II translater (see RC 3xx)
ANI	From Charge Number (CgN) Parameter in IAM
7/10D*	From CdP parameter in IAM

NOTE: * For international calls, 7/10 can be up to 15 digits long.

Adding a Country Code - RC 317

To put in the correct country code, another translator is needed. The RC 317 performs this function. However, it is not obvious how to handle this form since country codes are one, two, or three digits long. Also, the software uses the ABC digits of the called party number to derive the country code. The system has to be told the country code digits and the remaining digits that make up the ABC digits.

For a one digit country code, there are 100 combinations to be entered.

For two digit country codes, there are 10 combinations to be entered.

For three digit country codes, there is only one combination to be entered.

It is recommended that all be built to avoid a complex administration process when phone numbers are added in a country code. In other words, do it once and it is done. It avoids a late night call because of customer complaints about not being able to reach a particular number.

In this example, country code 52 is added with the ten possible other digits possible in the first three digits.

A sample of how to verify is included. Putting in an ABC combination gets all the entries in the system to match that country code if it exists.

Network Interconnect (cont'd.)

Subsequent Digit Routing DRTC (Access Tandem Only)

Unique items required on the RC 304 Form to support DRTC are as follows:

- **SDINDEX** - Index used on the 301 Code Group Form.
- **SIZE** - *Enter* a "1". This assigns 16 words in software for this function.
- **DOMCLASS** - Domain Class - ATNS.
- **INDEX** - *Enter* 0 - 6 on seven lines. Their meanings are as follows:

  0 = Speech
  1 = 3.1 kHz Audio
  2 = 56 kb/s
  3 = 64 kb/s Restricted
  4 = 64 kb/s Clear
  5 = 384 kb/s Clear
  6 = 1.536 Mb/s Clear

Speech allows a call to receive Time Assignment Speech Interpolation (TASI) and Low Bit Rate Voice (LBRV) encoding. (This is not a North American issue.)

The 3.1 kHz audio carries voiceband data (facsimile, modems, etc.) and TASI and LBRV will not be used.

The balance of the form contains the same fields as the Code Group Tables.

It is expected that voice and 3.1 kHz audio will share the same domestic facilities. It is likely that 56 kb/s, 64 kb/s restricted and possibly 64 kb/s clear will share the same facilities.

Change 4, 5, or 6 Digit Translation - Form 301

Data Rate Transfer Capability (DRTC)

DRTC is a feature that provides the capability of identifying the type of call as *voice* or *data*. This information then is used to determine the type of *facility* to be used in completing the call.

DRTC uses the USI parameter.

When this feature is used, an RC 301 Form must be populated:

CALLTYP	*Entry:* SDX (Subsequent Digit Index)
CALLDATA	*Entry:* Manual SDX in range of 1-16383
AD1	*Entry:* DRTC (Data Rate Transfer Capability).

SSP-800
Call Flow MF
(cont'd.)

EAEO Access VIA AT/SSP to IC

The SSP feature is used to provide Equal Access 800 service. Equal Access 800 means that any 10-digit 800 number can be routed to the carrier chosen by the customer.

The 800 number is sent to a Service Control Point (SCP) to determine whether the 800 number is Inter- or Intra-LATA. The SCP can respond with the Carrier Identification Code or a routable Plain Old Telephone Service (POTS) number.

This is an example of the call processing steps for SSP-800 calls using Multifrequency (MF) signaling.

1. The Equal Access End Office (EAEO) collects the 800 number dialed by the customer.
2. The EAEO sends the 800 number, the charge number, the Originating Line Information (OLI), the pseudo carrier (110), and the circuit code in the Initial Address Message (IAM) to the AT/SSP.
3. The AT/SSP translates the carrier information and the 800 number to determine that a Data Base (DB) query is required.
4. The DB query is sent using appropriate information from the originating IAM.
5. The DB translates the received messages and returns a routing response to the AT/SSP (Interexchange Carrier (IC) with either 800 number or routing number).
6. The AT/SSP selects a route based on the carrier (IC or LEC) and sends an IAM with the called number and the Automatic Number Identification (ANI) received.
7. The AT/SSP receives an Address Complete Message (ACM) when the call is set up to complete to an idle line.
8. The answer is received when the call is answered and sent to the end office.

SSP-800 Call Flow MF (cont'd.)

Code Group - RC 302

For MF SSP/800 calls, the normal carrier interconnect equal access signaling is used using a unique Carrier Identification Code 110/0110. This is the industry accepted pseudo carrier that is used to indicate a Data Block (DB) dip is required to route the call.

This time, the translation will yield an SSP call type with a call data of Equal Access Sequence (EASEQ) which is the SSP/800 equivalent for the Wink Start No Outpulse (WSNO) in the CHI which is used for POTS calls. The 4ESS will wink back to the previous switch and receive the second stage of digits for the next stage of analysis.

EAEO Access Via AT/SSP to IC

This is an example of the call processing steps for SSP-800 calls using ISUP signaling.

1. EAEO collects 800 number dialed by customer.
2. It sends 800 number, Charge Number (CHGN), OLI and pseudo carrier (110) and circuit code in IAM to AT/SSP.
3. AT/SSP translates carrier information and 800 number to determine that a Data Block (DB) query is required.
4. DB query is sent using appropriate information from the originating IAM.
5. DB translates received message and returns routing response to AT/SSP (IC and either 800 number or routing number).
6. AT/SSP selects route based on carrier (IC or LEC) and sends IAM with called number and ANI received.
7. AT/SSP receives an Address Complete Message (ACM) when call set up is complete to an idle line.
8. Answer Message (ANM) is received when call is answered and send to the end office.

SSP-800
Call Flow SS7
(cont'd.)

Code Group - RC 301

For Signaling System (SS7), the carrier identification code and circuit codes are contained in the Transit Network Selection (TNS) parameter in the IAM. The presence of this parameter forces the information to be translated in the Access Tandem Transit Network Selection (ATNS) domain.

The unique condition for this call is the carrier identification code which is 110/0110. This is called the pseudo carrier and is used industry wide to indicate that the call is to be processed by a DB for routing treatment.

The call type of SSP and call data of EASEQ indicate that this is the first part of an SSP/800 call. In this case, the software will figure out that the Incoming Trunk (ICT) is Integrated Services User Part (ISUP) and will not send back a wink but get the 2nd stage digits from the IAM for continuing processing.

The following is an example of operating a Carrier Identification Code and Circuit Code.

Key Fields:

- **DOM** - Domain
  ATNS - Access Tandem Transit Network Selection
- **CALLTYP** - Call Type Word
  SSP - Service Switch Point
- **CALLDATA** - Call Data Word
  EASEQ - Collect the 2nd and 3rd stage digits in EA format
- **ABC** - First, Second, Third Digit
  011
- **DEF** - Fourth, Fifth, Sixth Digit
  008

Building the EADOM/NSR NonPOTS Domain

Since these calls allow some additional screening beyond the initial translations, additional domains are used. The first is used in the first part of the call; the second is used in the second part or response processing part of the call.

In the first part, the second stage of digits, typically the 800 number, will be translated in the Equal Access Domain (EADOM), a nonPOTS domain arbitrarily chosen by you.

In this example, Domain 22 is chosen. Since it is a nonPOTS domain, it is not opened automatically. The RC 309 Form does this function and populates the ABC digits with VCA.

NOTE: If an EADOM is not assigned via the 406C/Z Form, then the domain of the ICT will be used.

For the response processing, another nonPOTS domain, Number Services Routing (NSR), is used. Again this must be opened before populating codes in it.

We will see usage of NSR later in this section.

Type of Service (TOS) Mapping - Form RC 626

In order for the query to get to the appropriate data base, the 4ESS must have some data populated in the 1B processor and the Common Network Interface (CNI) so that the correct STP gets the message in order to find the data base. The RC 626 assigns a TOS which will be used on the code group that is used to route this number. The fields are used as follows:

- **TOS** - Type of Service
  An arbitrary choice between 0 - 31
- **TT** - Translation Type
  An arbitrary choice 1- 255 that is used to specify a particular service such as SSP/800. The STP uses this number plus the called number which is called the Global Title to find the Data Base Point code and Subsytem Number (SSN).
- **SSN** - Subsystem Number (Range 232 -254)
  Each application using this type of processing assigns an SSN to identify the particular software to process the response. This number is sent to the DB so that the DB can send the response to the correct software in the switch.

  NOTE: The STP needs to have the SSN of the DB populated but it does not have to be the same as the 4ESS. However, it usually is identical. If the information is not populated in the STP, the query will fail.

- **OLD CODE** - Notice that this is a change form.
  The SSP functionality has a way of changing the ABC digits under certain conditions. An unassigned Type of Service (TOS) has a default value of 000.
- **NEW CODE** - For this feature, the substituted code is 800 and is typically used for 00Y substitution.

  NOTE: The 00Y capability is not available for the new toll-free codes, such as 888, 877, etc.

- **AIN TFREE** - Advanced Intelligent Network (AIN) 800/Tollfree Indicator
  For use if using the AIN version of SSP/800 service.

SSP-800 Domains (cont'd.)

Type of Service (TOS) Mapping - Form RC 626

The CNI part of the story is shown on the bottom part. In the Data Management System (DMS) of CNI, a form gttran is used to tell the CNI how to deliver the message to the correct STP. There is more than one STP pair in a network and only one of them has the global title translation capability for a particular service. The CNI needs to be told the appropriate information.

The Translation Type is the same as the TT on the Form RC 626. The Point Codes (PC) can take on a couple of forms. The previous page uses the capability code or alias point code method where the same number represents either of the pair.

The other method uses the correct even and odd actual point code format for each member of the pair. There is an operational advantage in failure mode for the alias point code method.

Failure to have this form filled in on the CNI will cause a query failure in the 4ESS Switch and never get to the STP.

Service Switching Point (cont'd.)

Second Stage Digits - Equal Access Calls

After the AT has received the specially assigned 0ZZ-XXXX and the Carrier Identification Code/Circuit Code digits that represent an SSP call, the 4ESS Switch has to examine the second stage of digits. These digits are comprised of the calling line information, (II) billing number, ANI and the called number.

The RC 300 Form shown on the opposite page is an example of the called number code group portion of the second stage digits. This form cannot be activated until the new numbered domain is opened for the SSP service.

NOTE: If the EADOM is not specified, the domain on the incoming trunk is used for translating the 800 numbers.

DOM	=	A numeric domain is opened for second-stage digit translation. In this case, 22 was used.
AC	=	The area code should be left blank since a non-Plain Old Telephone Service (POTS) domain is being used.
CALLTYP	=	**SSP** is the only entry for this 800 code usage.
CALLDATA	=	**DB** further defines the SSP call type as a database dip to be encountered.
AD1	=	**0** This entry represents the Type-Of-Service (TOS) to be assigned for the transaction. Valid entries are 0 to 31 but only 0 is being used at this time.
ADC	=	**10** The acceptable digit count for 800 calls is ten.
CHI	=	This entry should be blank.
DESEP	=	The destination separation information is administrated locally for assignment.
SC	=	The service category is left **blank**
ABC	=	800

Now, the translation has been completed to launch a query to the database. This query includes the "calling" number 10-digit ANI and II digits received in the second stage of the equal access call. Also the "called" 800 number is sent. Finally, your Subsystem Number (SSN) and the Translation Type (TT) for the Service Control Point (SCP) are sent.

Continued on next page

SSP-800, Continued

SSP-800 Screening (cont'd.)

Description

It is possible to do some additional screening for delivery of the 800 call to a particular carrier. This is accomplished by adding translations based on three additional digits that are chosen by the switch data administrators.

The table on the previous page shows the method the switch will use to get these digits if the Number of Translated Digits (NTDs) is greater than 4. The following procedure is how the table works.

NOTE: This table is just one page of the whole table in the Translations Guide (TG). Always use that document when doing your translations. This page is for training use only.

The information used is:

1. The Incoming Trunk Class (ITC) entry on the TSG - range 0 to 3.
2. The TOS from the incoming digits code group.
3. The International Bit (ITL) is usually 0 when 800 returned from DB. If a real number returned, it is possible to get the international bit set.
4. The Operator bit is used for AIN only. Use 0 for SSP-800.

The software concatenates the ITC, ITL, OPER bits with the TOS to calculate these digits. Find the column with the correct ITC, ITL, OPER values and then find the TOS used from the 800 number translations.

The intersection of the TOS and the correct column will yield the EFG digits.

Example: For ITC = 0, ITL = 0, and OPER = 0 with TOS = 7 yields
EFG = 070.

The use of this capability is usually to route the call to a different Point Of Presence (POP) depending on where the call came from, i.e., based on the incoming TSG.

Number Data Block

Key Fields:

ANI = Automatic Number Identification - Enter "Y" if IC expects to receive ANI and "N" if not.

CPN = Called Party Number - This field identifies if the IC is expecting the CPN to be delivered. This information is used only at an SSP office.
Entries: Y or N

PATH = Defines the number of winks the AT expects to see returned.
(1) If the group is direct to an IC,, then enter "DIR".
(2) If connected to another AT then to IC, enter "ATD" and expect 1 wink.
(3) If connected to IC, enter "ATT" and expect 2 winks.

INTL = International Signaling Indicator - Specifies if International calls are to be signaled to the IC in the International Equal Access format.
If FG=C, then INTL must equal N.
Entries: Y or N

Announcements

The SSP feature has a capability to tell the querying switch to play an announcement about some condition that it detects when it processes a query.

The form shown on the previous page shows the mapping of the response numbers to the correct final handling announcement names used in the switch. These are the same as those used for RDB final handling treatment.

The following is the mapping of a number to the type of announcement desired:

1 - Out of band
2 - Vacant code
3 - Disconnected Number
4 - Reorder Tone (120 IPM)
5 - Busy (60 IPM)
6 - No Circuit Available.

NOTE: The use of International No Circuit (INC) is used for the disconnected number announcement. In a LEC office, that is not used.

Advanced Intelligent Network - Feature 375

Introduction

Advanced Intelligent Network (AIN) is the term used to define a set of switch and network database capabilities to be used in the Local Exchange Carrier (LEC) environment to provide advanced services via switch and database interaction.

Advanced Intelligent Network - Feature 375, Continued

Description
(cont'd.)

Term	Description
AIN	AIN provides a general platform of service capabilities, service logic programs, and data that can be combined in many ways to provide many services. The service logic and data can be located at a remote node or nodes in the network, rather than in each individual switching system node along with the service capabilities.
AIN Trigger	Action which causes a Service Switching Point (SSP) to identify a call that needs treatment according to AIN service logic. All trigger types described in this document are AIN Triggers.
Dialed Number	A dialed number may consist of a prefix plus address digits or an access code.
Dialed Number Trigger (DNT)	A trigger used to initiate AIN action for services based on the analysis of DIALED NUMBER or Service Control Point (SCP) returned routing numbers. (See Serial Triggering) [5ESS® Documentation refers to this trigger as Dialed Number Trigger (DNT). LEC refers to this trigger as 3/6/10 Digit Trigger.]
Caller Interaction	The SCP requests the SSP to obtain Additional information from the caller, using a Transaction Capabilities Application Part (TCAP) conversation with Permission message. The SSP prompts through an announcement and collects the information from the caller and returns that information to the SCP in a TCAP Conversation message.

Description
(cont'd.)

Term	Description
Inter-Office Trunk Trigger	A trigger used to initiate AIN action for services based on carrier code, service code, and Information Digits/Originating Line Information Digits (II/OLI). [LEC and 5ESS refer to this trigger as Shared Inter-office Trigger.]
Incoming Access	The path at an SSP toward the calling party may be an incoming Signaling System 7 (SS7) or Equal Access Multifrequency (EAMF) trunk within the local network.
Pre-Query	The time from when a trigger is detected until a query is launched.
Post-Query	The time from when a query is launched until a new query is launched or the call is completed.

Advanced Intelligent Network - Feature 375, Continued

Description
(cont'd.)

Term	Description
Routing Response	The term Routing Response or Routing Message is used to indicate an SCP Response message which causes the SSP to attempt to Route the call.
Serial Triggering	Serial Triggering allows a single SSP to query the SCP data base multiple times for a single AIN call. Each response from the SCP can cause another query to be made by the SSP.
SSP	A Service Switching Point is a switch with AIN SSP functionality. AIN SSP functionality allows a switching system to identify calls associated with AIN services.
Terminating Egress	The path at an SSP toward the dialed party. This may be any outgoing signaling type.
Termination Notification	The SCP Response includes a request to be notified when the call ends. The SSP notifies the SCP when the call is disconnected or cleared using a TCAP Unidirectional message.
Querying	The process of assembling an SS7 TCAP query message and launching the query across the SS7 network.

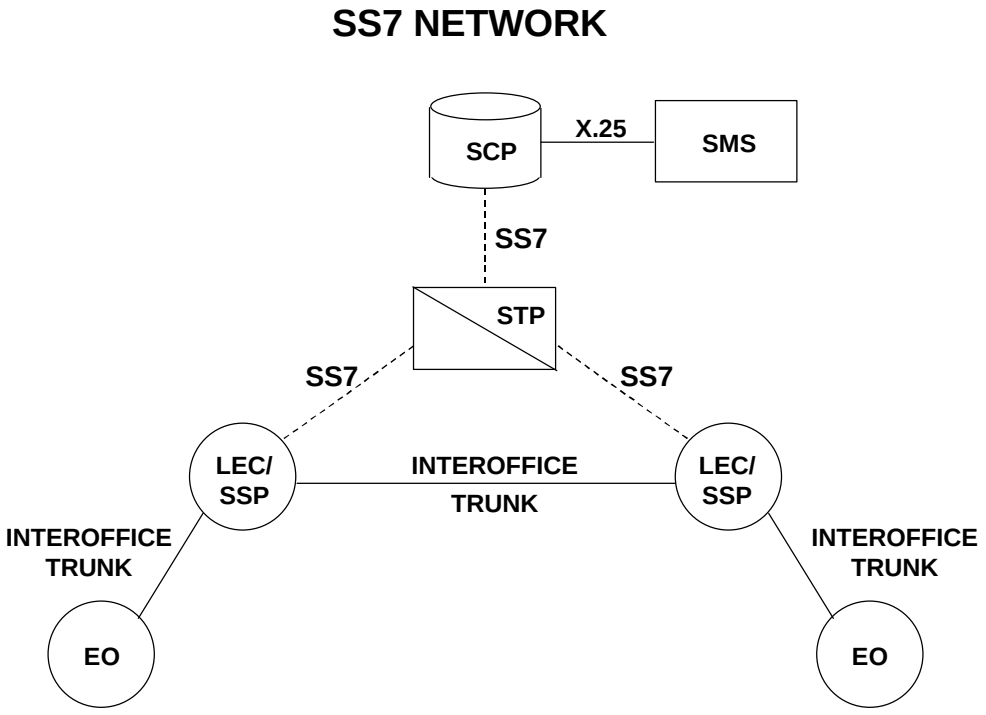
Components



Continued on next page

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Advanced Intelligent Network - Feature 375, Continued

Components (cont'd.)

Service Switching Point (SSP)

The service capabilities in the LEC 4ESS™ Switch or SSP enable the switch to detect AIN service calls, assemble and launch a query to an SCP, and respond to commands received. The interface with the SCP data base uses SS7 Transaction Application Part protocol.

Service Control Point (SCP)

The SCP provides real-time call processing service logic for AIN calls. It receives queries from the SSPs in the network and determines which service to provide for a particular call. Messages are sent back to the SSP, instructing it on how to process the call.

Signal Transfer Point (STP)

The STP provides routing of the TCAP messages sent between the SSP and SCP.

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Advanced Intelligent Network - Feature 375, Continued

Components (cont'd.)

Interoffice Trunk Trigger

Interoffice trunk subgroups can carry SSP/800, AIN and Plain Old Telephone Service (POTS) traffic. Because of this, the SSP must be able to detect which calls are AIN calls so that it can send a query. This detection mechanism is known as the Shared Interoffice Trunk Trigger.

The signaling used between the End Office (EO) and SSP for AIN is very similar to the EAMF/Integrated Service Digital Network (ISDN) User Part End Office (ISUP) signaling used between an Equal Access End Office (EAEO) and an Access Tandem (AT) for inter-LATA traffic. Only this type of signaling is supported between the EAEO and SSP for AIN.

The SSP is able to distinguish the various types of traffic by using the signaling parameters shown on the opposite page. This table lists:

- EAMF Parameters
- ISUP Parameter
- Inter-Local Area Tandem Access (LATA) POTS Usage
- AIN Usage

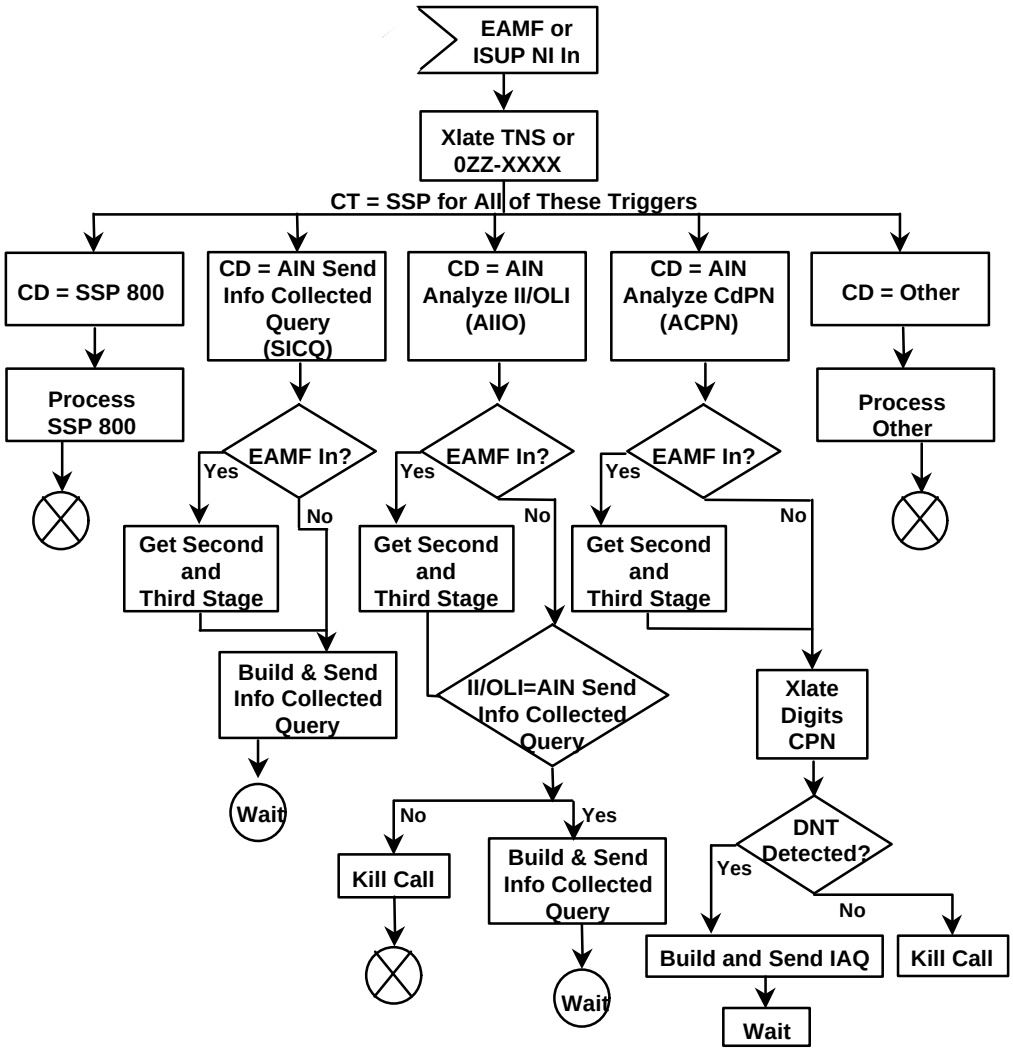
EAMF/ISUP NI TRIGGERS



Continued on next page

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Advanced Intelligent Network - Feature 375, Continued

Process Shared Interoffice Triggers (cont'd.)

EAMF/ISUP NI Triggers

This capability utilizes the 0ZZ-XXXX portion of the EAMF signaling sequence or the TNS parameter in the ISUP Initial Address Message (IAM) to identify AIN calls. The Code Group Call Type is SSP for all of these triggers.

CODE GROUP Call DATA WORDS (Triggers)

- **Send AIN Information Collected Query (SICQ)**
- **Analyze the II/OLI digits (AIIO)**
- **Analyze the Called Party Number (ACPN)**

Some examples are:

Send AIN Information Collected Query (SICQ) — The 0ZZ-XXXX or TNS translation indicates "Send AIN Information collected query (SICQ)." This results in the Automatic Number Identification (ANI) and Dialed Number to be sent to the SCP.

Analyze the II/OLI digits (AIIO) — The 0ZZ-XXXX or TNS translation indicates "Analyze the II/OLI (AIIO) digits." This causes the switch to check the II or OLI digits for "Send AIN information collected query." If II/OLI = AIN, then the Information Collected query is sent to the SCP.

Analyze the Called Party Number (ACPN) — The 0ZZ-XXXX or TNS translation indicates "Analyze the Called Party Number (ACPN)." The switch proceeds with Digit Translation looking for DNT.

NOTE: In an Equal Access MF/ISUP environment, the Dialed Number Trigger is initiated upon the receipt of the digit string of 0ZZ-0110. The 0ZZ/CC digits must be unique. The 0ZZ/CC used for Equal Access 800 cannot be used. A CALLDATA word of Analyze Called Party Number (ACPN) is encountered which results in the ANI and Dialed Number being Collected.

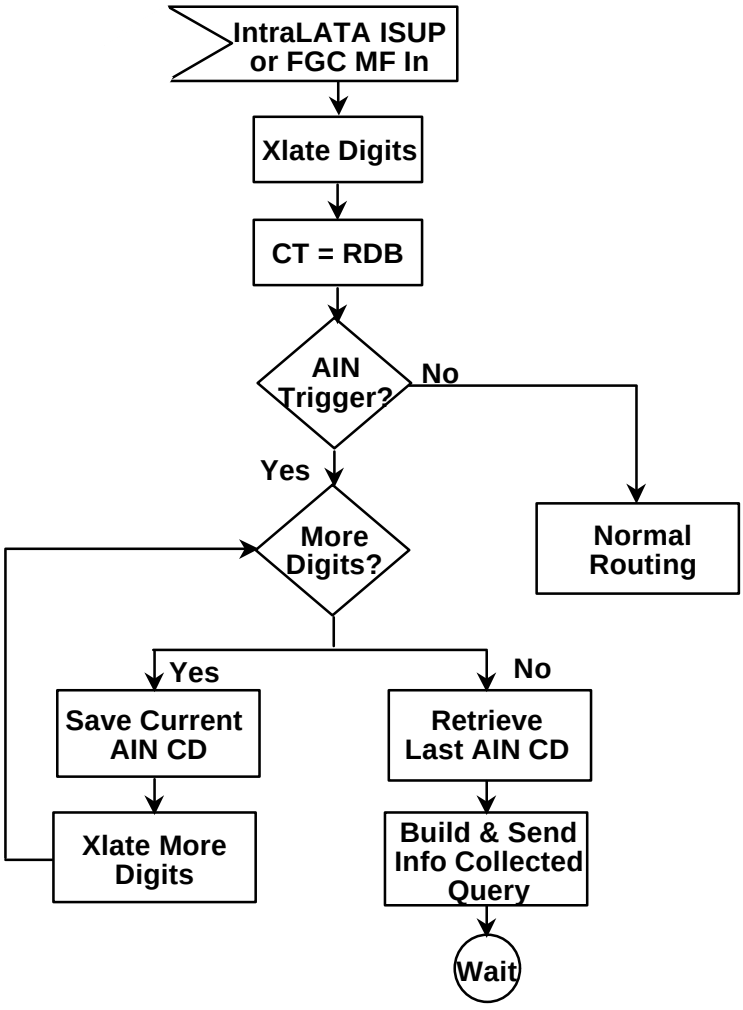
DIALED NUMBER TRIGGERS



Continued on next page

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Advanced Intelligent Network - Feature 375, Continued

Process Shared Interoffice Triggers (cont'd.)

Dialed Number Triggers (DNTs)

For EAMF and ISUP Network Interconnect calls, the only way to detect DNTs is via 0ZZ-XXXX or TNS translation. For traditional (i.e., Feature Group C) or non-Network Interconnect ISUP call, normal digit translation can also result in DNTs. A DNT is indicated by the "Send Information Analyzed Query."

AIN DNTs can be defined for any number of digits in the dialed number from 3 to 10 digits. The DNT defined for the longer string of digits is always used if multiple DNTs are encountered during digit translations (e.g., a trigger defined for 630-971-5133 would be used even if another trigger existed for 630). This means a DNT encountered during translation must be saved, translation continues, and the last DNT detected is the one used to build and send the query to the SCP.

NOTE: The DNT indication is defined in addition to the normal routing information for the digit string. We must be able to provide actual routing for the same number if it is received in the response from the SCP with the LEC carrier ID.

Use pursuant to Company Instructions

Advanced Intelligent Network - Feature 375, Continued

Example Call Flows (cont'd.)

On the opposite page are two examples of how call flow occurs in the AIN.

AIN Routed to an Interexchange Carrier (IC)

1. EAMF call arrives from EAEO. 0ZZ-XXXX translation indicates "Send Information Collected Query."

2. SSP gets second stage digits (II + ANI) and third stage digits (called number) from EAEO.

3. SSP builds and sends Information Collected Query to SCP.

4. SCP returns Analyze Route Response with a Carrier ID of IC, billing information, and termination notification request.

5. SSP creates AIN billing record, translates Carrier ID and sends call to IC.

6. When the call disconnects, SSP sends termination notification to SCP.

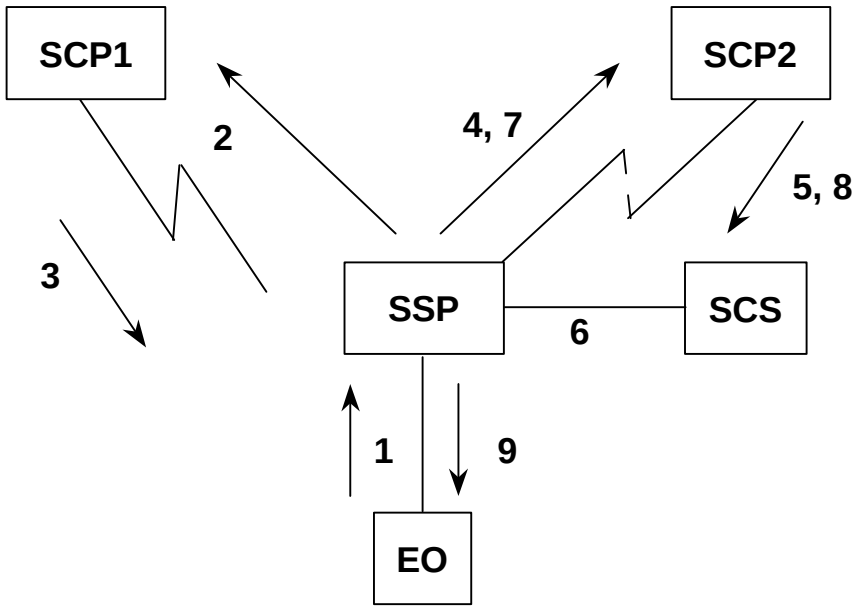
Advanced Intelligent Network - Feature 375, Continued

Example Call Flows
(cont'd.)

AIN CALL ROUTED VIA LEC



Continued on next page

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Advanced Intelligent Network - Feature 375, Continued

Example Call Flows (cont'd.)

AIN Call Routed via LEC (Call Type = SSP, Call Data = ACPN)

1. Call arrives from EAEO via ISUP Network Interconnect. SSP translates TNS resulting in indication "Analyze Called Party Number" and also translates called party number and determines if DNT detected.

2. SSP builds and sends Information Analyzed Query to SCP1.

3. SCP sends Analyze Route response indicating the LEC Carrier ID and billing information. SSP creates AIN billing record and translates dialed party number received from SCP1 which results in detecting a DNT.

4. SSP builds and sends Information Analyzed Query to SCP2.

5. SCP2 sends Send to Resource requesting play announcement and collect digits.

6. SSP plays announcement and collect digits via SCS.

7. Collected digits are returned to SCP2 in Resource Clear Message.

8. SCP2 sends Analyze Route response indicating LEC Carrier ID with the same dialed number previously received from SCP1 and used in detecting this DNT along with billing information.

9. Since the number returned is the same as the number used to detect this DNT, the SSP routes the call normally to the EAEO and creates another AIN billing record.

Input Forms Required (cont'd.)

ODA 406C Form

Various fields have to be populated in order to turn on the AIN Feature. These are:

Valid Entries:

- AINON (AIN On/Off Switch) — This field activates AIN if populated with "Y". Otherwise it is populated with "N".
- OFFLATA (Office LATA) — This identifies the LATA for AIN calls. Valid entries are 000-999.
- SSP (Service Switching Point) — This field is populated with "Y" or "N".

Population Rule
If AINON is "Y", then SSP on 406C must be "Y".

Input Forms Required (cont'd.)

ODA 406Z Form

Six new fields were added to the ODA 406Z Form to activate the AIN feature. These are:

AINCFRTH — **AIN Call Forwarding Redirection Threshold** — This field is used to specify the number of times an AIN call can be redirected. If this threshold is exceeded, this call receives Final Handling Treatment (FHT). Valid entries are blank or 1-32. The default value is 5.

AINCGFHT — **AIN Automatic Call Gap Final Handling Treatment** — This defines the final handling treatment to be used in the event of call failure to Automatic Call Gapping. All entries for field RDBFHT on RC 500 are valid. This field requires the numeric value for the announcement. The default value is 2.

AINFHT — **AIN Final Handling Treatment** — AINFHT is used to define a final handling treatment if the AIN call fails. All entries for field RDBFHT on RC 500 form are valid. This field requires the numeric value for the announcement. The default value is 2.

AINRESP — **AIN Response Timer** —This field is used to indicate the length of time the SSP must wait for a response from the SCP. The entries are in Centiseconds in the range of 100-500 or blank. The default is 300 Centiseconds (3 seconds).

AINSSN — **AIN Subsystem Number** — This field is used to assign the AIN Subsystem number. Valid entries are blank and 0-255, except 2, 3 and 5.

AINTRIG — **AIN Trigger** — AINTRIG defines the maximum number of queries which can be sent to an SCP database per call. Entries are blank or 1-6. The default is 6.

Input Forms Required (cont'd.)

Recent Change 810 Form (ODA — None)

This form is used to add various parameters for your particular office. There are eight (8) entries to be made in the FEATURE INFO field with a corresponding entry in the DATA field.

Below are listed the entries by FEATURE INFO field name with their corresponding entries in the DATA field.

- **AINCFRTH** — AIN Call Redirection Threshold
- **AINCGFHT** — AIN Call Gap Final Handling Treatment
- **AINFHT** — AIN Final Handling Treatment
- **AINRESP** — AIN Response Timer
- **AINSSN** — AIN Subsystem Number
- **AINTRIG** — AIN Trigger

These features may also be set by using the ODA 406Z Form.

- **OFFLATA** — Office LATA
  This is used to identify to the SCP in what LATA the switch resides. Valid entries are 000-999.

This feature may also be set by using the ODA 406C Form.

- **ATOSI** — AIN Type of Service Index
  New field for 4E22 generic. This is an office wide parameter which is used instead of the Call Type TOS when querying an AIN database based on an AIN TSG trigger. Valid Entries: Blank, 0-31.

Provisioning (cont'd.)

Global Title Translation (gttran)

The purpose of the gttran function is to allow the ability to select a global title translator based on service type. Global title translations are typically performed at an STP to translate called or calling number for a Destination/Direct Common Channel Interoffice Signaling (DCIS) or Transaction Application Part (TCAP) service and decide which database (Service Control Point [SCP], Network Control Point [NCP], etc.) will perform the final translations. The value of the translation type corresponds to the values input on the 4E Recent Change Form 626, and Office Data Assembler (ODA) Form 406C. This function allows the user to assign the pointcodes of the STP on a per translation type basis.

Refer to the TG4, Division 12 for additional information.

Assigned Announcements (cont'd.)

For AIN services, the announcement for final handling treatment must be assigned on the 406Z Form. The numeric announcement identification must be input on the following fields:

- AINCGFHT - AIN Call Gap Final Handling Treatment
- AINFHT - AIN and Final Handling Treatment

On the opposite page and the next four pages is a list of the available announcements. An Access Tandem (AT) could use them as they wish. One example would be to have a particular announcement in more than one language.

The existing tones and announcements up to International Vacant Code (IVC) are currently available with the existing ringing and tone plant and the Phased Announcement System (PAS).

Dialed Number Trigger
(cont'd.)

Code Grouping AIN Information

Dialed Number Triggers (DNTs) apply to the North American Numbering Plan (NANP). An AIN trigger can be added anywhere in a code string where there is currently a calltype treatment of Routing Data Block (RDB), Subsequent Digits (SD1, SD2, SD3), Subsequent Digit Index (SDX) or Go/No Go Screening (GNS) in the code grouping translations. Triggers are added or deleted one at a time using the RC 345 Form. Triggers cannot be added for calltypes in Subsequent Digit Indexes using RC 304 Forms.

The opposite page shows all the combinations where an AIN trigger may be encountered and the maximum number of AIN triggers that can be added for a code string. For example: 10 Digit routed number can have anywhere from 1 to 4 AIN triggers. When four AIN triggers are added for 630-971-513-3, an AIN trigger could be added at: 630, 971, 513 & 3. Four RC 345 Forms would have to be added. Each form adds one trigger.

Dialed Number Trigger (cont'd.)

Verify Code Group

When VERIFY System encounters an AIN trigger, Verify outputs the last AIN trigger present. Verify also gives the last AIN trigger number. Verify outputs the last AIN trigger which exists in the digit string when code group is verified.

For example – for digits 630-971-513-3, a 10-digit routed number

with 2 AIN triggers: AINDEX 1 at 630 and AINDEX 2 at 513. When the user requests a verification:

Verify ABC 630 – Then the user will be given AIN TRIGGER PRESENT – NUMBER 1.

Verify ABC 630, DEF 971 –AIN TRIGGER PRESENT – NUMBER 1

Verify ABC 630, DEF 971, EFG 513 – AIN TRIGGER PRESENT – NUMBER 2

Verify ABC 630, DEF 971, EFG 513, H 3 – AIN TRIGGER PRESENT – NUMBER 2

Test Query — Input Message

This test query is sent to the Service Control Point (SCP) from the 4ESS Switch serving as an SSP. This test query enables office personnel, via input messages, to initiate queries to verify the contents of specific fields in the SCP response message. This test query tests the integrity of the SS7 network between the two end points utilizing the ANSI* based TCAP protocol. It also serves as a tool to test the data for a particular AIN customer. The queries sent to the SCP can be either for Info_Collected or Info_Analyzed.

Consult the I/O Manuals for the meaning of the input variables. The Continue Data (CD) keyword is used to put in long messages within the limitations of input message handling for remote systems.

To continue the input, the text from TEST through QRYTYPE n: must be repeated and then the new parameters added.

The LIST keyword outputs the raw message data for the query and the response.

* ANSI is a registered trademark of American National Standards Institute, Inc., New York, New York.

Dialed Number Trigger (cont'd.)

EAMF Translations

The Dialed Number that is to be triggered must exist in an existing Code Group. This can be accomplished by adding the Dialed Number using an RC 300-303 Form.

On the opposite page is an example of a completed RC 301 Form identifying the number which has a trigger assigned to it.

Dialed Number Trigger (cont'd.)

EAMF Translations

The RC 345 Set/Reset AIN Trigger form is used to identify the digits which will be used as the trigger.

Valid entries:

ABC DEF GHI J	These fields are used to identify the digits to be used as the trigger. 2-9 are valid as the A digit and 0-9 are valid for B-J digits.
AC (Area Code)	Enter Y if ABC digits are an Area Code in the POTS Domain. Otherwise, enter an N.
DOM (Domain)	Enter POTS or numeric non-POTS domain.
TOS (Type of Service)	A value of 0-31 is assigned for the TOS. Do not use the TOS that is assigned to EA800.
TTYPE (Trigger Type)	A-AIN Services

Database Response – Intra-LATA Calls

When an AIN query is returned, the 4ESS Switch has to be able to translate on the returned carrier identification code instead of the returned number. Translate on return carrier identification code in the NSR domain.

The RC 301 Form shown opposite is an example of the database response code group.

DOM	=	**NSR** for the Number Services Routing application.
AC	=	The *entry* will be **blank** as the area code does not apply.
CALLTYP	=	**SSP** for the Service Switching Point feature.
CALLDATA	=	**RTP** (Return To POTS) to identify the retranslation of the routing digits in the POTS domain. This is for calls that are intra-LATA and will not be delivered to an IC.
AD1	=	**Blank**
AD2	=	**Blank**
ADC	=	Allows any digit count in the range of 4 - 15
SC	=	**Blank**
CHI	=	**Blank**
ABC	=	011 digits returned from the SCP denotes the call will complete within the LATA
DEF	=	0

Local Number Portability - Feature 450

Introduction

The Local Number Portability (LNP) feature – Feature 450 – allows the end user the capability of moving their original directory number from one central office to another central office.

Local Number Portability - Feature 450, Continued

Advantages/ Benefits

This feature is a necessary capability in order for local loop competition to take place. Local loop competition is a requirement for the Local Exchange Carriers (LECs) to enter new markets like long distance and video.

Definitions

The following are definitions of terms used throughout this document:

Terms	Definitions
Advanced Intelligent Network (AIN) Dialed Number Trigger (DNT)	This is an existing capability which utilizes switch logic and network data bases to provide enhanced features for specific called numbers.
Dialed Number (DN)	A dialed number may consist of a prefix plus address digits or an access code.
Geographic Portability	Allows the end-user to retain his/her dialed number after changing physical locations.
Incumbent Exchange	The switch the dialed number was initially ported from, also referred to as the "donor switch."
IntraLATA Portability	Providing Local Number Portability within a Local Area Transport Access (LATA).
LATA	Defined geographic area.
Location Routing Number (LRN)	A 10-digit number used to route calls to a switch that serves ported numbers. The Numbering Plan Area-Central Office Code (NPA-NXX) portion of the LRN is used to uniquely identify the switch (end office within the switch) and the last four digits of the LRN corresponds to an unassigned line number within that NPA-NXX. LRN is also known as Network Routing Address (NRA).

Local Number Portability - Feature 450, Continued

Definitions
(cont'd.)

Terms	Definitions
Non-involved Switch	A switch that does not have any numbers ported to/from it.
Non-LNP Capable Switch	A switch that does not have LNP capability but may still have numbers ported to/from it.
Portable NPA-NXX	NPA-NXX which has at least one number ported from it.
Ported Number	A dialed number that has been moved from one exchange to another exchange or from one rate center to another on the same switch.
Rate Center	The division of an exchange into zones for billing purposes.
Service Portability	Allows an end-user to retain his/her dialed number after changing services, e.g., Plain Old Telephone Service (POTS) to Integrated Services Digital Network (ISDN).
Service Provider Portability	Allows an end-user to retain his/her dialed number after changing service providers.
Serving Exchange	The switch the dialed number is ported to (also referred to as the “recipient” switch) or the switch providing LNP capability for an old-technology switch the dialed number is ported to.
Signal Ported Number	Outgoing Trunk Subgroup (TSG) indicator which tells if the destination switch supports Local Number Portability. The population of this indicator is: Y if destination switch is not LNP capable so only ported number is signaled, blank or N if destination switch is LNP capable so LRN is signaled.

Continued on next page

Local Number Portability - Feature 450, Continued

Background

Local Number Portability utilizes two existing facets of the network: Advanced Intelligent Network (AIN) capabilities and the Signaling System 7 (SS7) capabilities. So the triggering (determining that an NPA-NXX requires a database query), querying of a database and receiving a response from a database operate with AIN functionality. The signaling network facilities,
i.e., the signaling links, Signal Transfer Points (STPs), Service Control Points (SCPs), and System Management System (SMS) provide the mechanism to accomplish the querying and response processes.

SS7 signaling links must be engineered to handle the additional load of Local Number Portability queries and SS7 call legs needed to route calls to ported customers from a switch.

AIN Existing Capabilities

Advanced Intelligent Network (AIN) capabilities are utilized by this feature. These capabilities allow the LEC 4ESS Switch, referred to as the Service Switching Point (SSP), to recognize calls that require advance call treatment and to obtain instructions for processing the call from a centralized database, known as a Service Control Point (SCP), instead of from logic contained in the switch. The SCP database is connected via data links to a Signal Transfer Point (STP) as well as the SSP office. The interface with the SCP database uses SS7 Transaction Application Part (TCAP) protocol. The STP provides routing of the TCAP messages sent between the SSP and the SCP. The process of identifying calls that require AIN processing is known as “triggering” since a particular characteristic of the call “triggers” the switch into providing AIN treatment. Once a trigger occurs, the SSP temporarily suspends the call processing and sends a query message to the SCP requesting instructions. Based on information contained in the query message, the SCP determines which service is being requested and provides appropriate information, such as routing and billing instructions, that the SSP then executes to complete the call.

Use pursuant to Company Instructions

Local Number Portability - Feature 450, Continued

Feature Description

This feature allows the 4ESS™ Switch Access Tandem (AT) to act as an LNP capable tandem exchange in local networks which supports Local Number Portability. The methodology uses a 10-digit Local Routing Number (LRN) (also referred to as a Network Routing Address) to route to the switch serving the ported number. Only intra-Local Area Transport Access (intraLATA) geographic portability is supported at this time.

LNP Dialed Number Trigger (DNT)

This feature introduces a new AIN DNT, termed an LNP DNT. When an NPA-NXX is defined as portable, an LNP DNT is assigned to that number in the switch so that a query to the SCP is made. SCP service logic is defined to return a Local Routing Number (LRN) of the serving switch for the dialed numbers within the NPA-NXX that have been ported. When the SSP receives the LRN from the SCP, the LRN is used to route the call to its correct destination.

ISUP and TCAP Messages

The LRN is forwarded in the ISDN User Part (ISUP) Initial Address Message (IAM) in the Called Party Number parameter. The actual called party number will be carried in the Generic Address Parameter (GAP). The Forward Call Indicator (FCI) parameter in the IAM is used to indicate whether an LNP query has been performed. This is used to prevent more than one LNP query from being launched on a call.

Non-ported dialed numbers in portable NPA-NXXs result in the SCP sending an Analyze Route with the actual called number and no LRN.

AIN Default routing may be applied if the SCP cannot be accessed due to abnormal circumstances. If AIN Default routing has not been purchased or has not been provisioned, the call receives final handling.

LNP Queries

LNP Queries are made by the network “owning” the call. For calls routed to an Interexchange Carrier (IEC) network, the Local Exchange Carrier (LEC) forwards the call without making an LNP query, and the carrier performs the LNP query. Calls routed entirely within the LEC network have the LNP query performed by the first LNP-capable switch handling the call, typically the originating end office. If the switch serving the calling subscriber does not have LNP capability, the call is routed to a tandem switch which is LNP-capable, and the tandem launches the query to determine routing.

Use pursuant to Company Instructions

Local Number Portability - Feature 450, Continued

Call Flow (Intermediate 4ESS Switch Performs LNP Query) (cont'd.)

Task	Description
1	Line A (708-224-1111) dials Line B (708-713-2222).
2	The Originating Exchange (non-LNP-capable) performs digit analysis on the called number and routes the call to the 4ESS Intermediate Exchange.
3	The 4ESS Intermediate Exchange translates the called number and encounters an LNP DNT. The switch sends a query to the LNP-SCP.
4	The SCP response contains the LRN of the Serving Exchange.
5	The 4ESS translates the LRN and determines an ISUP route out of the office. The "signal ported number" option is NO for the outgoing TSG, so the LRN is forwarded in the Called Party Number (CdPN) parameter and the called party number received from the Originating Exchange is forwarded in the Generic Address Parameter (GAP). The 4ESS sets the Forward Call Indicator (FCI) Translated Called Number Indicator to indicate that an LNP query has been performed (i.e., set to 1).
6	The Serving Exchange receives and processes the Initial Address Message (IAM). It recognizes the LRN as its own, so it uses the called party digits stored in the GAP parameter to complete the call to the subscriber.

The following are the implications of the above call flow as pertains to the different network entries involved:

1. The LNP data base must be provisioned with ported numbers.

2. STP pairs must be specified, i.e., subsystem numbers assigned for Global Title Translation (GTT).

3. RC 345 form must be defined for each NPA-NXX used for porting and used as triggering mechanism between 4E/STP/database.

4. Each LEC must determine how many digits to be used for populating RC 345 form, i.e., which switch makes the query.

5. Data base responds with LRN (**remember**, routing must be defined for LRN).

Local Number Portability - Feature 450, Continued

Call Flow (Originating and Terminating Exchanges Both LNP-Capable) (cont'd.)

Task	Description
1	Line A (708-224-1111) dials Line B (708-713-2222).
2	The originating exchange encounters an LNP trigger on 708-713 and queries the LNP-SCP.
3	The SCP response contains the LRN of the Serving Exchange.
4	The originating exchange translates the LRN and routes the call to the 4ESS intermediate exchange. The LRN is forwarded in the CdPN parameter, the called party number is forwarded in the GAP, and the FCI Translated Called Number Indicator is set to indicate an LNP query has already been performed (i.e., set to 1).
5	The 4ESS Intermediate Exchange receives and processes the IAM. The outgoing route is chosen based on translation of the LRN. The outgoing TSG is marked to outpulse the LRN ("signal ported number," option set to NO), so the LRN (contained in the CdPN), the GAP, and FCI are forwarded to the Serving Exchange.
6	The Serving Exchange receives and processes the contents of the IAM. It recognizes the LRN as its own, so it uses the called party digits contained in the GAP parameter to complete the call to the subscriber.

Local Number Portability - Feature 450, Continued

Call Flow (Intermediate LNP Hub for Non-LNP Capable Terminating EO) (cont'd.)

Task	Description
1	Line A (708-224-1111) dials Line B (708-713-2222).
2	The originating exchange encounters an LNP trigger on 708-713 and queries the LNP-SCP.
3	The SCP response contains the LRN of the Serving Exchange. The originating exchange translates the LRN and routes the call to the 4ESS intermediate exchange. The LRN is forwarded to the CdPN parameter, the called party number is forwarded in the GAP, and the FCI Translated Called Number Indicator is set to indicate an LNP query has already been performed (i.e., set to 1).
4	The 4ESS Intermediate Exchange receives and processes the IAM. The outgoing route is chosen based on translation of the LRN. The outgoing ISUP TSG's "signal ported number" option is marked YES (outpulse the called party number rather than the LRN) so the 4ESS is acting as an LNP Hub for a non-LNP capable end office.
5	Because of the TSG marking (ISUP) or in-band signaling (MF), the 4ESS replaces the LRN with the called party number digits contained in the ported number GAP parameter to signal to the non-LNP capable exchange.

RC 100 – Series Trunk Subgroup Group

New Trunk Subgroup (TSG) characteristics are added on the RC 100 Series forms. Four new fields are added for this feature:

CBN -	Incoming trunk connecting network access billing number option. Valid entries: "blank" - no special Automatic Message Accounting(AMA) recording options (the default), "N" - Non-Feature group-D signaled calls, and "L" - Local Number Portability Non-Feature group-D signaled calls.
CBN DIGS -	Incoming Trunk TSG connecting network access billing number digits. Valid entry: 10-digit number.
LRN -	Local Routing Number. Valid entry: 10-digit number identifying a Local Service Provider (LSP) End Office. LRN is used to provide Jurisdiction Information Parameter (JIP) if not present in initial ISUP IAM or Incoming Trunk (ICT) is Multifrequency (MF). Will use first six digits of LRN. NOTE: The translation domain for LRN must be in the POTS domain. The exception would be for data calling which must be translated in the data domain.
SPN -	Signal Ported Number (SPN) outgoing TSG indicator. Valid entries: Y, N, blank (if "Y," the destination switch is not considered LNP-capable and only the Ported Number will be signaled, not the LRN. SPN is used if destination switch is not LNP capable.

Whether to bill call, used for Competitive Local Exchange Carrier (CLEC). Always get bill for interLATA calls.

CBN	CBN Digits	
N	10D	IntraLATA calls billed LNP & others
L	10D	LNP (queried)

RC 345 – AIN Trigger

Triggers are added or deleted one at a time using the RC345 Form. Two new fields (TTYPE and LTOS) are being added to accommodate this feature. These new fields are required to differentiate an AIN trigger from an LNP trigger, allowing a trigger to be assigned as either LNP, AIN, or both. Also, the population rules for the existing TOS requires updating to have it relate to the new Trigger Type indicators for both AIN and LNP.

TTYPE -	Trigger Type. Valid entries can be either AIN (A), LNP (L), or Both (B).
LTOS -	Local Number Portability Type of Service. Valid entries: 0 to 31 or blank.
TOS -	Call Type - Type of Service. Valid entries: 0 to 31, blank.

Valid form entries - TTYPE versus LTOS & TOS if the LTOS/TOS "must be" conditions are not met reject RC Form 345		
Valid Entries	**LTOS must be**	**TOS must be**
TTYPE is "A"	blank	0 - 31
TTYPE is "L"	0 - 31	blank
TTYPE is "B"	0 - 31	0 - 31

Global Title Translation

Global Title Translation (gttran) Data Items

GTTRAN DATA ITEMS	DATA TYPE	RANGE
ITEM NUMBER	numeric	001 to 999
TRANSLATION TYPE	numeric	0 to 256
EVEN STP PC	numeric	9 characters
ODD STP PC	numeric	9 characters

Global Title Translator (gttran) - (chg) Page Example

```
***** CNI DATA MANAGEMENT SYSTEM ***** DATE:  04/23/86  TIME:  13:42 *****
FUNCTION:  gttran  ACTION:  chg  ORDER:  06Y00055500   OFFICE:  NPVLILIH2MD

                          GLOBAL TITLE TRANSLATIONS

                          ITEM:                    001

                          TRANSLATION TYPE:        241
                          EVEN STP PC:             250007000
                          ODD STP PC:              250007000
```

The purpose of the gttran function is to allow the ability to select a global title translator based on service type. Global title translations are typically performed at an STP to translate called or calling number for a Destination/Direct Common Channel Interoffice Signaling (DCIS) or Transaction Application Part (TCAP) service and decide which database (Service Control Point [SCP], Network Control Point [NCP], etc.) will perform the final translations. The value of the translation type corresponds to the values input on the 4E Recent Change Form 626, and Office Data Assembler (ODA) Form 406C. This function allows the user to assign the pointcodes of the STP on a per translation type basis.

Refer to the TG4, Division 12 for additional information.

Feature Implementation

An On/Off purchased bit must be assigned to activate this feature. Refer to the LNP-LRN Feature User Guide (234-090-020) for implementation of this feature. This feature is available with the 4E22 Generic.

AMA

A flexible new LNP AMA module (720) is appended to existing AMA records for calls encountering the LNP trigger which result in querying the LNP SCP.

The Module 720 appears as follows:

Information	Table Number	# of Characters
Module Code	88	4
Party Identifier	730	4
LRN	731	12
Service Provider Identity	732	10
Location	733	16
Supporting Info	734	8

In addition, a new AMA call code is defined to support "Connecting Network Access" charge recording for calls which cross local network boundaries but for which existing access charge recording does not apply. This new "Connecting Network Access" call code is used in conjunction with existing AMA structure code.

Measurements

Three new counts are added to the existing set of AIN measurements for this feature.

These counts are:

- LNP queries sent
- LNP queries successful
- LNP Ported Number calls

TDIU REDEFINITION

Continued on next page

TDIU Redefinition – Feature 4099, Continued

This page is intentionally left blank.

Continued on next page

TDIU Redefinition – Feature 4099, Continued

Feature Description

The TDIU redefinition feature allows the type of hardware to be separated from the type of service or function and provides for the individual programming of each Digital Signal 1 (DS1) interface.

The TDIU refers to the hardware configuration and the service/function that is provided by the facilities in the Digital Interface Unit (DIU). With this feature, the existing TDIU values are re-assigned to the following three new data parameters:

Type of Hardware (THW)
Type of Digroup (TDG)
THW for the fifth digroup of service circuit DIUs only (THW5).

With this re-assignment, the total number of TDIU states are drastically reduced since most of the previous 48 states were seldom, if ever, used. The THW, TDG, and THW5 parameters are discussed in detail in the Provisioning section of this document.

Availability

Feature 4099 became available in 4E21R1.

Environment

This feature was provisioned as an enhancement to the 4ESS™ Switch to better utilize the assignments of the individual DS1s in the DIUs. As a result, this feature eliminates “stranded capacity.”

Continued on next page

TDIU Redefinition – Feature 4099, Continued

Background

The 4ESS Switch uses the Digital Interface Frame (DIF) to terminate 160 Digital Signal 1 (DS1) facility lines. The DIF is further defined as having 32 Digital Interface Units (DIUs), with each DIU made up of 5 DS1s, thus equaling the 160 DS1s in a DIF (5 DS1s per DIU times 32 DIUs = 160 DS1s).

Previous configurations dealing with original DIUs only allowed one Type of Digital Interface Unit (TDIU) to be assigned per DIU. If a DS1 had to be provisioned for a particular TDIU, it could only have been assigned to a DIU that had an idle DS1 slot that matched the requested TDIU state. This resulted in having many underutilized DS1 slots on DIUs where demand for that type of TDIU value was not high.

Now, multiple Type of Digroups (TDGs) are allowed to be provisioned on a DIU by assigning the appropriate values to the DS1s in the DIU rather than the whole DIU. This new structuring provides greater flexibility in the overall provisioning process on the 4ESS Switch.

Continued on next page

TDIU Redefinition – Feature 4099, Continued

Feature Operation

Call Flow

Call flow is not affected by the implementation of this feature.

Operation

Feature operation is not affected by the implementation of this feature.

4ESS Switch Personnel

To ensure that the DIFE1 frames that are equipped with Service Circuit (SM6 circuit packs) are running the new Maintenance Software (MP) software, the 4ESS Switch personnel should verify the DIFE1s unit type image and inspect Word 60 for both controllers.

The input message to do this is: **VER:UTYPE:DIF x!**

The DIFE1 (DTMF/SM7 circuit pack) Word 60 that should be the result of the above input message is 01460146, and the DIFE1 (MF4ST/SM6 circuit pack) Word 60 is 01270127.

User

No telephone customer action is required for this feature.

Dependencies

In Generic 4E20R4, the new MP software was made available in MP Versions 6 and 7 and is also maintained in the 4E21R1 generic.

Interactions

No interactions or limitations are associated with this feature

Incompatibilities

No incompatibilities are associated with this feature.

Continued on next page

TDIU Redefinition – Feature 4099, Continued

Administration/ Engineering

Hardware Resources

Although no new hardware is associated with this feature, Feature 4099 adds the additional capability to allow any of the 2 DS1 interface packs (SM1B and SM9) to be located in the fifth digroup when service circuits occupy the first four slots. Prior to this feature, only SM1 circuit packs were supported in the fifth slot of a service circuit DIU.

Transition Considerations

Before the 4ESS Switch office is retrofitted to Generic 4E21R1, the DIF1 frames must have their Maintenance Processors (MPs) pumped to the new software.

By having one MP software version cover both generics, transition from the TDIU values to THW/TDG values relieves the retrofit process of the extra time it would need to stop and pump all of the DIFE1 frames. And, if a problem occurred, the frames would not have to be pumped back to the original software.

The THW and the TDG values are provided to replace the existing TDIU values. At the time of retrofit, the TDIU values used prior to 4E21R1 are automatically converted to the TDG values.

This feature is turned on automatically by software deployment and it is not necessary for all 4ESS Switches in the network to be running the 4E21R1 Generic for this feature to be fully operational. That is, this feature operates on a generic, per-switch basis.

Assignment Rules

No new assignment rules are required for this feature.

Measurements

No new measurements are required for this feature.

Automatic Message Accounting

No billing considerations are required for this feature.

Continued on next page

TDIU Redefinition – Feature 4099, Continued

Provisioning

Recent Change

The following must be done in order to provision this feature:

Understand Type of Hardware (THW), Type of Digroup (TDG) and Type of Hardware in Fifth Digroup (THW5) values.
Populate RC Form 702.
Know the population rule changes for RC Forms 700 and 701.
Verify the DIF Unit Submember with Form 7b.

THW
The THW parameter specifies the type of facility interface card or service circuit card that is equipped in a DIU. As in the current assignment scheme, only one hardware type of DS1 interface is supported per DIU (*except in service circuit DIUs where the first four slots have SM6 interface cards and the fifth slot can be either SM1 or SM9 packs).*

TDG
The TDG parameter specifies the function/service for a given DS1 facility terminating on the DIU and allows for a maximum of 16 service/function types to be assigned. Each DS1 interface circuit pack can handle a certain set of DS1 format/signaling types.

THW5
The THW5 parameter is only used to identify the hardware type in the fifth Digroup in a service circuit DIU. The THW5 parameter follows the THW parameters.

Recent Change Form 702

RC Form 702, DIU Function Assignment, is used to change Digroup circuitry and the functional capabilities of DIUs.

TDIU Redefinition – Feature 4099, Continued

Provisioning (cont'd.)

Additional Population Rules for Form 702

The following population rules also apply to the seven new fields that have been added to RC Form 702. For complete information on the population rules, refer to the *4ESS Switch Translation Guide (TG-4,DIV.7, SEC.7c).* Table 16-C (also included below) of the TG4 contains the various combinations for the THW and TDG values.

A. When the THW entry is 6 or 7, the DIU Member number must be 1, 9, 18, or 26.
B. The THW5 field must be blank when the THW is 1 or 9.
C. The valid entries for the TDG Digroup fields depends on the THW and the THW5 entries. The Digroups are populated as follows:

When THW is 1, DIGROPU1-DIGROUP5 entry is 1.
When THW is 9, DIGROUP1-DIGROUP5 entries are 1-7.
When THW is 6, DIGROUP1-DIGROUP4 entries are blank. The TDG for DIGROUP5 depends on the THW5 entry. The valid entries for DIGROUP5 are 1, 2, 5, 6, 7, and 8. This field is populated as follows:

When THW5 is 1, DIGROUP5 entry is 1.
When THW5 is 9, DIGROUP5 entry is 1, 2, 5, 6, and 7.

When assigning a TDG 3 or 4, DIGROUP1-DIGROUP5 must be 3 or 4.

NOTE: The reason that each Digroup must be in a 4-state (4ST) mode is because the controller only works 4-state signaling on a DIU basis.

When any Digroup's TDG is 3 or 4, the DIU Member Number must be an even number. For example, DIU 0, 2, 4, 6, . . .30.

Recent Change Form 700

RC Form 700, Grow Unit Type Equipage Bits, is used to change the equipage state of the 4ESS Switch equipment to allow for growth. There are no changes to the actual layout of this form. However, there is a population rule change.

The population rule change is:

When the DIF Sub-Member Equipage *(SME)* field is changed from *UNEQ* (unequipped) to *GROW*, the corresponding **THW** field from the RC form 702 must **not** be zero.

Recent Change Form 701

RC Form 701, Degrow Unit Equipage Bits, is used to change the equipage state of 4ESS Switch equipment to allow for degrowth. There are also no changes to the layout of this form. However, there is a population rule change.

The population rule change is:

When the UTYN field is DIF and the SME field is UNEQ, the corresponding XL4UTHWii (where ii is the Sub-Member), XL4U5THW and XL4UDIUTDGD items must be set to “0”.

Home NPA (HNPA) Split Guidelines

General

These Home Numbering Plan Area (NPA) Split Guidelines are recommended by 4ESS™ Field System Evaluation and the 4ESS Field Support Groups. These recommendations should serve as a guide in the implementation of a Home NPA (HNPA) Split.

If the NPA Split requires only adding a new Served NPA (SNPA), these guideline are not applicable. To accommodate this type of NPA Split, follow the steps involved in opening a new domain.

Open communication and adhesion to these guidelines should help in the smooth transition to the new HNPA.

Dialing Plan Conversion

When it has been determined that a change is required for a new NPA, a dialing plan conversion schedule will be established. The dialing plan conversion schedule allows for three stages of implementation to provide adequate time to prepare translation changes. These dialing plan conversion schedules are applicable for both HNPA and SNPA Split conversions. HNPA Splits require more translations changes, therefore, may require a longer length in the three dialing periods.

Pre - Permissive Dialing Period

A user may dial the old dialing plan. The pre-permissive period starts when the office has been retrofitted to include the new dialing plan.

Permissive Dialing Period

A user may dial the new dialing plan during the permissive dialing period. The permissive dialing period will be introduced by setting an office parameter.

Post-Permissive Dialing Period

A user may dial only the new dialing plan during the post-permissive dialing period. The post-permissive dialing period will be introduced by setting a Recent Change (RC) office parameter.

Home NPA (HNPA) Split Guidelines, Continued

Overview of HNPA Cutover Strategy

Develop an implementation plan to coordinate the trunking and RC activity between the 4ESS Switch and its Local End Offices.

Create an SNPA with the NPA that has been selected as the new HNPA.

Replicate all HNPA routing in the new SNPA. Restrict all RC activity unless the HNPA needs changes, then duplicate those changes in the new SNPA. (The goal is to have the two domains remain identical.)

Request from Lucent Technologies the overwrites needed to reassign the SNPA as the new HNPA. (Note: These overwrites cannot include HNPA deletion.)

Do office validation verifies prior to applying the NPA Split overwrites. This will verify that no trunking or codegroup RC activity has occurred in the new SNPA which would make it different from the current HNPA.

Apply the overwrites to exchange the SNPA and the existing HNPA.

Apply RCs needed for the NPA Split. This includes updating the Far End Numbering Plan Area (FENPA) for all TSGs in the HNPA domain.

Delete the old HNPA. This cannot be done until all trunking with FENPA = to old HNPA is changed to the new HNPA.

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Home NPA (HNPA) Split Guidelines, Continued

Timeframe 8 - 12 weeks Prior to NPA Split

VER:CODEGRP:DOM POTS, AC N, ABC 000-999! to verify all code groups in current environment that will be impacted by this NPA split. Analyze your existing 7/10 digit dialing pattern. Determine if adjustments are necessary, i.e., prefixing and deleting of digits.

Build an RC 307 to create a new HNPA as an SNPA. Open new area code for 6-digit translation via the RC 311 Form. Check dialing plan to determine appropriate digit translation.

Replicate all HNPA, AC=N routing in the new SNPA so that the two domains have identical routing. The output of the following two messages should yield the same routing treatment:

VER:CODEGRP:DOM POTS, AC N, ABC 000-999!

VER:CODEGRP:DOM POTS, AC Y, ABC(new HNPA), DEF 000-999!

VER:TSGLIST:FD1 DOM,DT 1 HNPA! to get a list of all Trunks Subgroups which will be involved in the change. The FENPA field on the Trunk Subgroups (TSGs) will need to be adjusted but will be changed later.

At this time, verify the population of the Intertoll (IT) field on all affected TSGs with a type of trunk of End Office or Tandem Connecting (ETC) or Other Carrier Connecting (OCC). The IT field is used in call processing. If the far end is an end office, the IT field should be “N”. if the far end is a tandem, the IT field should be “Y”.

Contact your Service Control Point (SCP) database personnel about the pending NPA split. They need to ensure that the new NPA has been added to the screening tables.

Contact the Automatic Message Accounting (AMA) organization so they may make appropriate billing record adjustments for all non-conforming Feature Group C offices.

Coordinate with all respective end offices which will be impacted by the split. Each office impacted will have to coordinate the routing changes required for dialing the new NPA.

Continued on next page

Home NPA (HNPA) Split Guidelines, Continued

Timeframe 4 - 6 Weeks Prior to NPA Split

Ensure that all routing RC orders have been activated.

Coordinate scheduling for the split with all of the support organizations. Coordinate call through testing with end offices. Ensure that all support folks (i.e., Billing, SCP databases) have completed their preliminary work.

Notify Operator Services of the upcoming date and time of cutover in the event that they receive trouble reports.

Timeframe NPA Split Cutover Date

VER:TSGLIST:FD1 DOM, DT1 HNPA! to pull a current list of TSGs which will be involved in this change. These are all of the TSGs that may need to change after the NPA split.

VER:TSGLIST:FD1 DOM, DT1 (SNPA location of new NPA)! to pull a current list of any TSGs that may have been built in the new SNPA. This should result in no TSGs being output. Any that are found need to be corrected before the split.

Have 4ESS Switch Field Support Group apply the overwrites to swap the Home NPA.

An overwrite will have to be done to swap the HNPA and the SNPA entries in the PREFIX digits translator.

Several overwrites will have to be done in the 3- digit translators that are active, i.e., HNPA, Area Code (AC), IT, SNPA to swap the entries for codes in the old area code and the new area code. This will include at least 8 overwrites.

Once this is done, all TSGs having a FENPA of the old area code will have to be changed using RC 107, 108 or 109 Forms. Those that are moving to the new area code will have their FENPA changed. Those that are staying in the old area code will have to have an RC performed on them even though none of the data is changed. This will change the TSG translation domain to the served NPA domain

Some Cellular Mobile Carrier (CMC) trunks may need to have the TSG Billing Number (BN) field changes as a result of the split. If possible, (AMA ready to handle) change them now.

Continued on next page

Home NPA (HNPA) Split Guidelines, Continued

Timeframe: Post-NPA Split Cutover

Follow up to ensure that accurate billing records are received, i.e., CMC, AMA.

If SCP database group indicated they needed to do coordinated changes, notify them so that the changes can be done as quickly as possible.

After the NPA split is complete in the switch and all end offices, the duplicated routing may be deleted.

Screening Applications

General

The objective of the telephone network is to allow digits to be dialed that will make someone else's telephone ring. Only one ten digit number can be assigned to each telephone in this country. The digits dialed are **translated** by telephone company offices to determine **routing** required to find that called telephone. These offices make connections between lines and trunks until a talk path can be established between the calling telephone and the called telephone.

Sometimes one of the companies in the telephone network is required to **block** a certain call from completing on a specific Trunk Subgroup (TSG). This blocking may be necessary due to marketing strategies, government regulations, telephone company selection, etc. The blocking may require the call to be totally killed or just sent to a different TSG. When this option of blocking a call and/or routing it to a different TSG is required, the process is called **screening.** The screening process is based on the:

- Digits dialed
- Call origination

For example, if certain digits 847+977-XXXX are dialed originating at End Office "A", the 4ESS™-2000 Switch tandem office can complete the call to the designated telephone. However, if the 4ESS-2000 Switch is instructed to not complete these specific dialed digits if they originate in Office "A" by blocking the call or routing to a different TSG, a **screening** plan must be implemented. This plan may even get more complex, i.e., for the dialed digits 847+977-XXXX sent via the 4ESS-2000 Switch:

- If the call originates from Office "A" - kill the call with Final Handling Treatment (FHT).
- If the call originates from Office "B" - route to TSG #1.
- If the call originates from Office "C" - route to TSG #2.

This section explains two **code group** screening options available in the 4ESS-2000 Switch.

Continued on next page

Screening Applications, Continued

Go/NoGo Screening

This first "Screening" option very simply presents a method of specifying a Code/s that **will be able** or **will not be able** to complete based on the calling origination. This method of "Screening" available in the 4ESS-2000 Switch is called **"Go/NoGo Screening" (GNS)**.

Multiple Treatment Screening

This second "Screening" option is a method of specifying a Code/s that will be allowed to complete to **various** destinations based on the calling origination. This method of "Screening" available in the 4ESS-2000 Switch is called **"Multiple Treatment Screening" (MTS)**.

As the two options refer to screening controls based on offices of origination, this control could also be intended to control the routing strategy of TSGs, i.e., the call originating from Office "A" may be allowed to complete via the 4ESS-2000 Switch only if it receives the digits via a specified TSG and NOT from another TSG. One reason for implementing this type of screening could be for administration of different Interexchange Carriers.

Continued on next page

Screening Applications, Continued

Screening Administration

Both **Go/NoGo** and **Multiple Treatment Screening** have potential to be very dynamic by application. Each screening type may only be used for one or two applications of code controlling in the 4ESS-2000 Switch office, or the screening application may have a major routing impact for the entire 4ESS-2000 Switch office.

One must be aware that an active **Go/NoGo** application will option a code to complete or be sent to Vacant Code - Final Handling Treatment (FHT). A **Multiple Treatment Screening** application can send the call to any of the FHT treatments available in the 4ESS-2000 Switch. FHT for **MTS** does not have to be only VCA as for **GNS**. FHT assigned via MTS could be an information message for a marketing strategy, customer calling information, etc.

Screening arrangement paper records should be very diligently planned and accurately maintained. The great power of screening can be totally overwhelming when troubleshooting routing service problems. Each application should be charted with a global scope of the effect and the total list of **"Indices"**, i.e., RDBI, SDINDEX, etc. being used. If allowed, the 4ESS-2000 Switch will automatically assign a random number to each of the indices as one is created. It is recommended that personal intervention be initiated to assign the index numbers with a structured plan, i.e., RC 304 field ORIGIN enter MAN for manual number assignment instead of AUTO. A specific block of index numbers could possibly be assigned to have a relationship to a particular service type, routing application, etc. This strategy could greatly assist with the immediate awareness of a screening arrangement while troubleshooting routing problems. The awareness of the screening profile is also very often necessary when augmenting trunking or routing Recent Changes. This record keeping precludes that the overall screening application of each office be under the guidance of a managing entity for specific control.

Go/NoGo Screening (cont'd)

Go/NoGo Screening performs exactly what its name implies. The called code is either going to **Go** and complete or it is **Not going to Go** as attempted (i.e., blocked) and sent to FHT-VCA.. As mentioned earlier, the code originated in a specific area may not be authorized for whatever reason or an office may have routed the called code via a TSG that is not allowed to handle said traffic of the CALLTYPE. These Trunk Subgroups may continue routing regular call traffic (i.e., RDB CALLTYPE) normally, even if the GNSC (Go/NoGo Screening Class) has been set to a specific number assignment on the TSG Characteristics. It is only when the code/s intended to be screened (go or not) are reassigned from regular Routing Data Block (RDB) routing and given the GNS Call Type that the screening activity begins for those codes only.

To implement a Go/NoGo Screening arrangement the effect to the overall network in the specific 4ESS-2000 Switch must first be evaluated. If a proposed screening scheme is prepared by each of five different people, several different solutions could be produced. Each scheme could be correct and effective. The "most" correct will be determined in time when a future application change for code screening or trunking arrangement is necessary. This "best" scheme will require the least translation changes to implement the new arrangement.

Example #1:

The hypothetical example in this case will be the code "847+977". We want to change the incoming TSG from office "A & B" so that an "847+977" call will be sent to **FHT-VCA**. See Figure #1 and Verify Form #1 for the existing routing arrangement.

Screening Applications, Continued

GNS Options

At this stage, we see that all of the TSGs shown on Figure #1 have the Go/NoGo Screening Class (GNSC set to "0"). The verify Form #1 reflects the six-digit code 847-977 with a CALLTYP of "RDB" and the CALLDATA of RDBI "731" The Figure #1 also shows the RDBI "731" pointing toward "Office E".

The new GNS application arrangement considerations should be:

1. Is just one or maybe several Incoming TSGs to the 4ESS-2000 Switch planned for 847-977 screening? - **Yes**
2. Are many or almost all of the Incoming TSGs to the 4ESS-2000 Switch planned for 847-977 screening? - **No**
3. Are any incoming TSGs to the 4ESS-2000 already blocking "847-977" at this time? - **No**

Then, determine if any other codes incoming to the 4ESS-2000 Switch office presently have GNS applied.

1. Are any incoming TSGs to the 4ESS-2000 Switch presently blocking any "Other Code"? - **No**
2. Are all of the TSGs scheduled to block "847+977" (Office A & B in this example) also blocking other codes at this time? - **No**
3. Are some TSGs that are to block "847+977" (Office A or B in this example) also blocking other codes at this time? (mixed) - **No**

These questions are necessary to determine the possible effect of other GNS translations presently working or planned for the future. If these questions are not addressed when preparing the screening plan, it is likely other codes may be "Vacant Coded" and service denied wrongfully. This leads to anxious troubleshooting and can be quite confusing to a person that did not have a part in the GNS planning. This precludes the need for comprehensive documentation mentioned earlier in "Screening Administration".

After the answers to the previous questions have been analyzed, it is necessary to study the following "Go" and "NoGo" tables. (See Fig. 2)

From the "Go" and the "NoGo" tables we can see the basic four options available to apply the screening. Use the following options to accomplish the 847-977 code screening to FHT for Office "A & B".

GNS Options (cont'd)

GNS Option #1

If only one or several of the TSGs in the 4ESS-2000 Switch were to be screened, we could effectively refer to the "Go" table to:

- Change the incoming TSG for Office "A & B" GNSC to "1" (Fig. #3).
- Use the code group form to change the 847-977 CALLTYP from RDB to GNS.
- Change the AD1 to "G" and the AD2 to "0" (Form #2).

Upon activation, 847-977 will only **"Go on 0"**. Therefore, we can see from the "Go" table, a "Go on 0" will **ALLOW** the 847-977 from TSGs with a GNSC of "0". It will **DENY** the code from TSGs (Office A & B in this example) with GNSC of "1" or even "2 or 3" and send the code to FHT.

Screening Applications, Continued

GNS Options (cont'd)

GNS Option #2

If a large number or most of the TSGs in the switch were to be screened, it would require less effort to leave the GNSC at "0" on these (Fig. #4). Again referring to the "Go" table:

- Change the incoming TSGs allowing the code (Office "C & D") GNSC to "1" (or even "2, or 3").
- Use the code group form to change the 847-977 CALLTYP from RDB to GNS.
- Change the AD1 to "G" as before but this time change AD2 to "1" (or whatever the TSGs were changed to). (Form #3)

Upon activation, 847-977 will only **"Go on 1"** and the code from Office "A & B" is still going to FHT because there is no GNSC "1" to GO on. The "Go" table shows a "Go on 1" will **ALLOW** the code from the other TSGs set to GNSC "1". Also, it will **DENY** the code from TSGs with GNSC of "0 and also those TSGs with a GNSC of 2 or 3"

Screening Applications, Continued

GNS Options (cont'd)

GNS Option #3

Once again, if only a few amount of TSGs were to be screened and we needed to use the "NoGo" Table, we could:

- Change the screened TSGs to a GNSC of "1" (or even "2" or 3") (Same as Fig #3 again).
- Use the code group form to change the 847-977 **CALLTYP** from RDB to GNS.
- Change the AD1 to "N" and the AD2 to 1 (Form #4).

The code group form would change the CALLTYP to GNS and now the AD1 to "N".

Upon activation, 847-977 will only **"NoGo on 1"**. The "NoGo" table shows the TSGs with a GNSC of "1" will **DENY** the code. The TSGs with a GNSC of "0, 2, & 3" will **ALLOW** the 847-977 code successfully.

GNS Options (cont'd)

GNS Option #4

The final option available is the NoGo on "0". This could be initiated if the least Recent Change effort was to:

- Change the TSGs planned to pass 847-977 to GNSC of "1" (or even 2 or 3) (Same as Fig. #4 again).
- Use the code group form to change the 847-977 CALLTYP from RDB to GNS.
- Change the AD1 to "N" and the AD2 to "0" (Form #5).

Upon activation, 847-977 will **"NoGo on 0"**. The "No Go" table shows the TSGs with GNSC of "0" will **DENY** the code. The TSGs with a GNSC of "1, 2, or 3" will **ALLOW** the code.

NOTE: All codes not assigned to a GNS CALLTYP (i.e., RDB) will not be affected by the GNSC of the TSG. Therefore, only codes that are assigned to a GNS CALLTYP will be controlled by the GNSC of the TSG.

Future GNS Screening

The proof of the most correct decision made from Options 1 through 4 of the preceding paragraphs will prevail at some time in the future when another code has to be screened from the same TSGs already using GNS. If the network plan now states that code 847-455 also must be sent to FHT when originated from certain offices, the overall screening plan must be addressed again. If the office pattern for screening the new code was to be the same as those in Options 1 through 4 earlier, the solution is easy. For example, if the new code was to be blocked from Office "A & B" only, the new code would be reassigned the same GNS data as the 847-977. If the new code was to pass from Offices "A & B" and be blocked from the other offices, the new code would simply be assigned to a GNS CALLTYP with the opposite blocking information of 847-977. Example: If Office "A & B" have a GNSC of "0" and 847-977 is assigned **"NoGo on 0"**, then 847-455 could be assigned a **"Go on 0"** or a **"NoGo on 1"**.

Problems arise if the screening for the new code 847-455 is planned on only some of the offices already in the screening pattern for 847-977. This overlap makes it virtually impossible to implement GNS on an overall 4ESS-2000 Switch basis. GNS may best be left to use on single or several TSGs only with certain codes being blocked. For more dynamic screening, the use of **Multiple Treatment Screening** should be used. It is also possible to implement GNS on a Subsequent Digit Index (SDI) with Multiple Treatment Screening.

Multiple Treatment Screening (cont'd)

Multiple Treatment Screening (MTS) is an extremely powerful and dynamic feature. It allows the routing translations personnel of the 4ESS-2000 Switch the ability to control a considerable number of destinations of a called code based on the origination. Up to 64 unique classes are allowed for screening. Whereas, Go/NoGo Screening controlled the codes of pre- designated originations to FHT, **MTS** can virtually send one called code to 64 different destinations based on the origination of the call. Any of these destinations can also be FHT (not just FHT-VCA). Embellishing on the power and dynamics of **MTS** is the relationship to Subsequent Digit Index **(SDX)** assignments that allow virtually 16,383 different code group to 64 MTSC configurations. **MTS** is not limited to just 999 different code group combinations as codes assigned as 847+977-1XXX, 847+977-2XXX, etc. could add many thousands of variations to assign screening assignments. Remember, the Intra-LATA translatable digits can range from 3 to 10.

MTS Example #1

For an example of MTS, let us assume the 4ESS-2000 Switch Access Tandem for Local Exchange Carrier (LEC) is presently performing plain Routing Data Block (RDB) routing based on seven digit OZZ+CIC codes. The Inter-exchange Carrier (IC) named Coast to Coast Telephone Co. (CCTEL) orders all traffic identified with their Carrier Identification Code (CIC) delivered to their network at office Point of Presence (POP) "A". Another IC named All-States Telephone Company (ASTEL) orders all of their traffic delivered to office ASTEL POP "X". In this scenario, all originating offices are Offices "A through D" (See Figure #5) and the incoming TSGs are assigned MTSC 00. This presents no intricate routing screening as all IC traffic to CCTEL is delivered to its POP "A" For this example, the 0ZZ-XXXX (CIC) for CCTEL is 050-0228. This code will be pointed to an RDBI #456 that routes to the TSG for CCTEL POP "A". (See Verify Form #6)

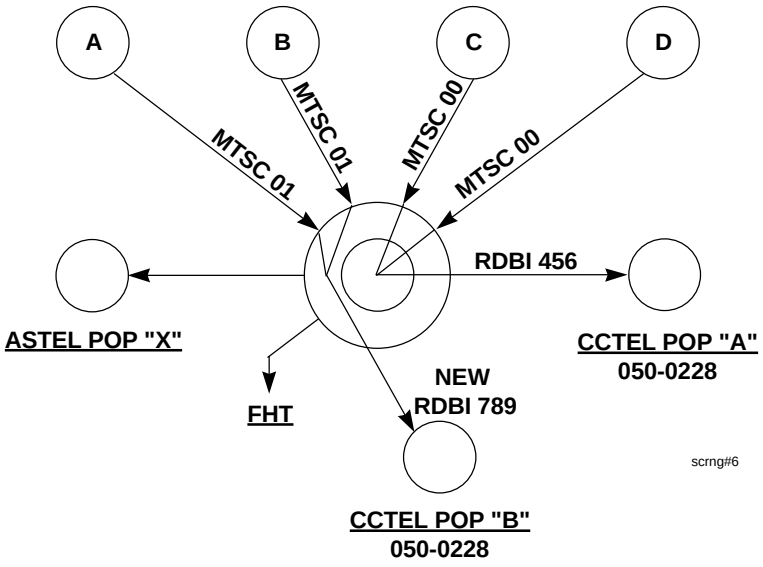
Multiple Treatment Screening (cont'd)

Figure #6

(CCTEL Traffic Only Shown)



Continued on next page

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Screening Applications, Continued

Multiple Treatment Screening (cont'd)

Due to unique facility arrangements for the IC CCTEL, they are ordering that all CCTEL traffic originating from Office "A & B" be delivered to new CCTEL POP "B". Traffic originating from Office "C & D" remain delivered to CCTEL POP "A". This requires the application of **Multiple Treatment Screening (MTS)**.

MTS Step #1

The first step is to decide the number to assign for the Multiple Treatment Screening Class (MTSC) to each incoming TSG involved in the screening scenario (See Figure #6). (At this point, the MTSC number selection is arbitrary as there are no other MTS screening applications assigned in the office.)

Multiple Treatment Screening (cont'd)

MTS Step #2

The next step is to build a subsequent digit index (SDX) with an RC Form 304 to implement the MTS (See Form #7).

- Enter assigned SDX index number in **SDINDEX**.
- **SIZE** = 2 (always for MTS).
- **DOMCLASS** = DOM (for regular voice traffic).
- **INDEX** = Enter the MTSC numbers that were assigned to the incoming TSGs from the offices to be screened. Valid entries are from 0 to 63.
- **CALLTYP** = RDB.
- **CALLDATA** = RDBI for each of the POP destinations.
- **ADC** = 7 (See Form #7).

When this is activated, no traffic routing has been changed as of yet.

Screening Applications, Continued

Multiple Treatment Screening (cont'd)

MTS Step #3

The 7-Digit Code group change RC Form 302 is used to change the:

- **CALLTYP** form RDB to SDX .
- **CALLDATA** must be changed from the RDBI number to the SDINDEX number (See Form #8).

When this form is activated, the traffic will now complete for CCTEL as shown in Figure #6 to both POPs as directed by origination of service.

NOTE: If CCTEL were to assign a third POP "C" for delivery of traffic from various originating offices:

1. **A new MTSC ## (i.e., 02) would have to be assigned to the appropriate offices incoming TSGs.**
2. **The new RDB assigned to the POP "C" would have to be added to the existing SDINDEX #444 following the new MTSC INDEX ##.**

Centralized Automatic Message Accounting (CAMA)

CAMA Function

The Centralized Automatic Message Accounting (CAMA) function is to record toll billing data in the 4ESS™-2000 Switch for the connecting offices that do not have their own Localized Automatic Message Accounting (LAMA) capability. The Automatic Message Accounting (AMA), Local or Centralized, is billing data consisting of, but is not limited to, the calling and called numbers themselves, answer and disconnect times, plus a charge index to be used by the operating company. The 4ESS can also provide CAMA service for special billing (QZ) and multiparty calls in LAMA and non-LAMA offices. This billing data is stored on a recording medium (usually tape) for later delivery to the Regional Accounting Office (RAO). Electronic transmittal or physical shipping of the tapes may accomplish the delivery process.

The 4ESS™-2000 Switch can obtain the calling number AMA information:

1. Automatically from the office Automatic Number Identification (ANI) information provisioning, the dialed digits, and the translation process.

2. Via a CAMA Operator Number Identification (ONI) that intercepts the call from a remote operator location. The intercept response can vary from a "Operator - May I help you?" to a "What number are you calling from?" depending on the vintage of the connecting office equipment.

The rest of the information is derived from the digits and translation. The 4ESS Switch is conditioned for ANI or ONI by the Type of Trunk (TOT) category on the Trunk Subgroup (TSG) characteristics Recent Change (RC) Form 101. The CAMA TSG will always be a "One-way Incoming" type. Note that as the CAMA TSG characteristics determine the need for the CAMA RC Form 400, it is built on a Trunk Group (TG) basis. This concludes that a series of CAMA translations for a specific RC Form 400 TG will affect all (up to four) CAMA TSGs from the same office building subdivision code. The RC Forms 403 & 404 will affect ALL CAMA TSGs to the 4ESS™-2000 Switch office.

Continued on next page

Centralized Automatic Message Accounting (CAMA),
Continued

CAMA Screening

A series of checks (screening) must be made on calls directed to the CAMA processing via a CAMA Trunk Group. These checks identify unauthorized, invalid, and misdirected CAMA calls. These categories are defined as follows:

- Unauthorized - These codes are three digit area and office codes that are not allowed on any CAMA Trunk. Operator codes and some test codes are included in this category.

- Invalid - Invalid codes are those NPA-NXX combinations that are handled by some AMA function other than this 4ESS Switch.

- Misdirected - Misdirected calls are local calls that should not have been placed through the toll hierarchy. This check is made after the invalid and unauthorized checks. Both the originating and terminating NPA-NXX combinations must be analyzed to determine if a call is misdirected. These combinations are called local call intercept groups. This check is only made if the local office is unable to perform local call intercept screening. Generally, if the local office has common control equipment, it can perform its own call intercept. However, some step-by-step offices do not have common control equipment and the 4ESS Switch must provide local call intercept for the CAMA operation.

RC Forms 400, 402, 403, & 404 DEFINE the parameters to be used for CAMA screening as follows:

- RC Form 400 lists the originating office codes that are valid for a specific CAMA Trunk Group and points them to a profile.

- RC Form 402 lists the terminating office codes that should be blocked on CAMA Trunk Groups of a profile.

- RC Form 403 lists the terminating area codes (Numbering Plan Areas [NPAs]) that are unauthorized for any CAMA Trunk Groups.

- RC Form 404 lists the terminating office codes that are unauthorized for any CAMA Trunk Groups.

LUCENT TECHNOLOGIES PROPRIETARY
Use pursuant to Company Instructions

Centralized Automatic Message Accounting (CAMA),
Continued

CAMA Screening (cont'd)

RC Forms 401, 405, & 406 CHANGE the parameters to be used for CAMA screening as follows:

- RC Form 401 changes the terminating office codes portion of a Local Call Intercept (LCI) profile established blocking pattern.
- RC Form 405 is used to point a new Originating Local Call Intercept Group Index (OLCIGI) to the same LCI profile as stored for an existing OLCIGI. This is used prior to adding or deleting a terminating NPA from the new OLCIGI.
- RC Form 406 deletes a terminating NPA from an LCI profile.

RC 400

The first step of CAMA Screening is defined by listing the valid originating (calling) office codes that may be received via ANI or ONI on a CAMA Trunk Group. It is established using the RC Form 400 to list only the valid Originating Office Codes (OOFC) for a specific Trunk Group. The OOFCs listed must all reside in the same NPA that is determined by the Far End NPA (FENPA) entered on the TSG characteristics for the Trunk Group. Each CAMA Trunk Group can only serve one NPA. If another NPA is to be served by the same codes, another CAMA TG must be established. With one exception, only those OOFC codes listed on the RC Form 400 will pass the originating validity check for that CAMA TG. The one exception is made for special pseudo office codes associated with special billing (QZ). These codes are entered on a separate RC Form 400 with the Pass Originating Validity Check (POVC) field marked "**Yes**". This allows those codes to pass the validity check regardless of the Trunk Group on which they arrive. All codes not on the list are invalid originating office codes for the specific Trunk Group and will be intercepted (blocked). An RC Form 400 must be completed for each ANI or ONI CAMA Trunk Group identified by the first TSG RC Form 101 for a TG. The Routing Group is responsible for the RC Forms 400. However, in some companies the Machine Administrator may have the information required to prepare this form so a coordinated effort is required to implement the recent change.

Continued on next page

Centralized Automatic Message Accounting (CAMA),
Continued

RC 402

When a Local Call Intercept (LCI) group is required to screen misdirected calls (local codes called that should not have originated on the CAMA Trunk Group to the toll network), the RC Form 402 is prepared. Each RC Form 402 will be coordinated with a specific RC Form 400, creating an LCI profile. Each RC Form 402 can represent codes in only one terminating NPA. A maximum of four RC Form 402s can be coordinated with each RC Form 400. The Terminating Office Codes (TOFC) listed on the RC Form 402 will not be allowed to complete from the CAMA Trunk Group of the associated RC Form 400. The profile index number for each RC Form 400 LCI pattern is the Originating Local Call Intercept Group Index (OLCIGI). The OLCIGI that is unique to each RC Form 400 will link each associated RC Form 402 (maximum four). Allowable entries for OLCIGI are "**2-255"**. If the CAMA office on the RC Form 400 can perform its own screening of local codes, the OLCIGI of "**1**" is entered on the RC Form 400 and no RC Form 402s will be implemented.

RC 401

To change a TOFC in an LCI profile, the RC Form 401 is implemented. To change existing allowance for TOFCs to continue as a valid call, enter those TOFCs on the RC Form 401 and enter "**N**" for BLOCK entry. To add new TOFCs to the profile in an NPA, add the new TOFCs and enter "**Y**" for BLOCK entry for normal intercept.

RC 403

To change the list of called Area Codes authorized from originating on any CAMA Trunk Groups in the 4ESS™-2000 Switch, the RC Form 403 must be implemented. The Terminating Numbering Plan Area (TNPA) to be changed are listed on the RC Form 403 and Office Data Assembler (ODA) will direct blocked code entries from "**200 to 999"** to the "Unauthorized CAMA" announcement. Typical application of this form is to list a test or special code that may not be dialed by the customer. The ODA system will automatically block codes in the range of **"001-199"**. **"000"** represents the home NPA since the Home Numbering Plan Area (HNPA) does not appear as part of the called digits.

Continued on next page

Centralized Automatic Message Accounting (CAMA),
Continued

RC 404 To change the list of called (terminating) office codes that are authorized for any CAMA Trunk Groups in the 4ESS™-2000 Switch, the RC Form 404 must be implemented. The TOFCs to be changed are listed on the RC Form 404 and the BLOCK entry of "**Y**" for yes or "**N**" for no will determine if the codes should be blocked. An entry of "**Y**" indicates the terminating office codes are to be blocked and sent to "Unauthorized CAMA" announcement. Vacant (unassigned) office codes need not be entered.

RC 405 To copy an existing LCI profile for CAMA operation, an RC Form 405 must be implemented. This message points a new OLCIGI at the same terminating LCI blocking profiles as stored for an existing OLCIGI. A terminating NPA can then be added to or deleted from the new OLCIGI using RC Form 402 or RC Form 406.

CAUTION: This message should not be used to add a new OLCIGI if it is expected that different LCI blocking profiles will be required for all TNPAs appearing in both OLCIGIs. Any changes made to the LCI blocking profiles for those TNPAs become applicable to both OLCIGIs unless the TNPA is first deleted from and the re-added back to the OLCIGI needing the LCI profile change. A paper record must be maintained to administer the OLCIGIs built with this message to identify LCIO profiles used jointly.

RC 406 To delete a terminating NPA from an existing LCI profile, the RC Form 406 must be implemented. The TNPA entered on this form will be removed from the associated LCI profile identified by the OLCIGI entry. If the TNPA being removed is the only one currently assigned to an LCI profile, the entire profile will be deleted. Valid entries for TNPA are "**200-999**".

For 4E22> Generics, CAMA translations are not valid for offices using Served Numbering Plan Area (SNPA) 10-Digit Routing.

Section 1a-1b 406 Series - Miscellaneous

ODA 406C Miscellaneous

General

Form ESS 406C defines a number of miscellaneous office data structures. The information on this form can be generally classified as parameter type information. Several of the items are closely related to Network Management and Automatic Message Accounting procedures. Responsible parties in each of these areas should be consulted when preparing this form.

In addition, this form is used to allocate memory space for various data collection purposes. The major reference for those items that allocate memory space is the Traffic Order. The 4ESS Switch Engineering/ Administration Tool (4ESEAT) Program is designed to assist in the preparation of this form. The 406C field definitions, as well as the valid entries, are included in this program. All users should refer to this program when preparing the 406C Forms. The 4ESEAT Program has been updated for Generic 4E23 and is available as of April, 1998.

4ESEAT is a stand-alone executable program that can be run on an MS-DOS operating system compatible Personal Computer.

4ESEAT allows users to order 4ESS growth hardware and 4E17 - 4E23 Software Right To Use (RTU) fees through a mechanized program that:

- Monitors users inputs for valid system configurations
- Stores and retrieves user retrofit and growth orders
- Allows user to generate their own configuration through edits
- Generates a Telephone Equipment Order (TEO) for input to the regional engineering center.

Form Entries

- **FORM CODE**

This field is always preprinted with 6C.

- **A800TT**
  - Advanced 800 Translation Type
    Entries: “Blank” or 0 to 255.

- **ACITRANS**
  - AT&T Customer Interface (ACI)Translation Space
    Entries: “Blank” or 100 to 511.

- **ACVLIMIT**
  - Access Charge Verification (ACV) Trunk Limit
    Entries: “Blank” or 0 to 99999.

- **AHRNA**
  - Not Applicable
    Entries: “Blank”.

- **AINON**
  - Advanced Intelligent Network On/Off Switch (4E18>)
    Entries: Y or N.

- **AINTRG_IN_WCS**
  - AIN Triggers in Windowed Call Store (4E21>)
    Entries: Y or N.

- **AMABUFER**
  - AMA Buffer
    Entries: 8 to 24.

- **ANI_IN_WSC**
  - Not Applicable
    Entries: "Blank".

Form Entries (cont'd.)

- **ASGHC**
  - Adjunct Trunk Subgroup Headcell
    Entries: 64 to 1024 (2048 for 4E18>) by 4.

- **AT**
  - Access Tandem
    Entries: Y or N.

- **BBFPMFR**
  - Blue Box Fraud Prevention MF Receiver Allocation
    Entries: “Blank” or 0 to 127.

- **BLCNT**
  - Billing Count Blocks
    Entries: “Blank” or 1 to 512.

- **BOUNDUPA**
  - Boundary Upper Protect Address
    Entries: 1 to 1336 (4E20R1>).

- **CCISOSO**
  - CCIS Inwats Originating Screening Office
    Entries: N, 1STP, 2STP, DCIS, or TCAP.

- **CCPAS**
  - Customer Calls to Public Announcement System
    Entries: “Blank” or 1 to 8.

- **CNIINBF**
  - CNI Ring Input Buffer
    Entries: “Blank”, 0, or 1000 to 32000.

- **CNIOPR**
  - CNI Operational Status
    Entries: “Blank”, Y, or N.

ODA 406Z Miscellaneous

General

Form ESS 406Z defines a number of miscellaneous office data structures. The information on this form can be generally classified as parameter type information. Several of the items are closely related to Network Management and Automatic Message Accounting procedures. Responsible parties in each of these areas should be consulted when preparing this form.

In addition, this form is used to allocate memory space for various data collection purposes. The major reference for those items that allocate memory space is the Traffic Order. The 4ESS Switch Engineering/ Administration Tool (4ESEAT) Program is designed to assist in the preparation of this form. The 406Z field definitions, as well as the valid entries, are included in this program. All users should refer to this program when preparing the 406Z Forms. The 4ESEAT Program has been updated for Generic 4E23 and is available as of April, 1998.

4ESS Switch Engineering/Administration Tool (4ESEAT) is a stand-alone executable program that can be run on an MS-DOS operating system compatible Personal Computer.

4ESEAT allows users to order 4ESS growth hardware and 4E17 - 4E23 Software Right To Use (RTU) fees through a mechanized program that:

- Monitors users inputs for valid system configurations
- Stores and retrieves user retrofit and growth orders
- Allows user to generate their own configuration through edits
- Generates a Telephone Equipment Order (TEO) for input to the regional engineering center.

INDEX

Section 1	Trunk Subgroup Characteristics
Section 2	Trunk Assignments
Section 3	Code Grouping
Section 4	Centralized Automatic Message Accounting Screening
Section 5	Routing Data Blocks
Section 6	Miscellaneous
Section 7	Unit Type
Section 8	Special
Section 10	Administrative

SECTION 1 - TRUNK SUBGROUP CHARACTERISTICS

SECTION	RC#	
1a	100	Establish a new two-way Trunk Subgroup
1b	101	Establish a new one-way incoming Trunk Subgroup
1c	102	Establish a new one-way outgoing Trunk Subgroup
1d	103	Establish a new voice frequency link Trunk Subgroup
1e	104	Add a traffic number block to an existing Trunk Subgroup
1f	105	Delete a traffic number block from an existing Trunk Subgroup
1g	106	Delete a Trunk Subgroup
1h	107	Change the characteristics of an existing two-way Trunk Subgroup
1i	108	Change the characteristics of an existing one-way incoming Trunk Subgroup
1j	109	Change the characteristics of an existing one-way outgoing Trunk Subgroup
1k	110	Change the Incoming Separation Class of an existing Trunk Subgroup
1l	111	Trunk Subgroup conversion (CCIS6/CCS7)
1m	112	Change the first traffic number of an existing TSG traffic number block
1n	113	TSG Carrier Identification Code list

1. General Information

This information applies to all sections within this division.

1.01 The characters > and < are used to indicate which Generic Programs will apply (Ex. 4E18> indicates 4E18 and later Generic Programs, <4E18 indicates 4E18 and earlier Generic Programs, 4E18 indicates the 4E18 Generic Program only).

1.02 The field names of the form entries in each section are listed alphanumerically.

1.03 See Glossary Division 2, Section 6 for the complete description of the form entries.

RC:TSG;NEW;OPT(TWOWAY),- - -:

FORM # 100 ESTABLISH A NEW TWO-WAY TRUNK SUBGROUP

1. GENERAL

1.01 Form #100 establishes the translations for a new two-way Trunk Subgroup. This message is classed as a Recent Change Data Message (RCDM).

2. FORM ENTRIES

2.01 RC:TSG;NEW;OPT(TWOWAY),- - -:
Entries: BUF, TST, ACT, FTA, FTB, FTT.

2.02 **ACCDTA** - Entries: blank.

2.03 **ACCID** - Entries: blank.

2.04 **ACD** - Automatic Call Distributor
Entries: blank, Y, N, or T.

2.05 **ADIG** - 'A' Digit Reconstruction
Entries: blank, 0, or 2 to 9.

2.06 **ANCR** - Entries: blank.

2.07 **ANISID** - ANI/SID Request
Entries: blank, NONE, ANI, PANI, PSID, REQ, or SID.

2.08 **AOPC** - Alias Origination Point Code
Entries: blank or

— NET = 000 to 255.
— CR = 00 to 31.
— CT = 0 to 7.
— MEM = 000 to 255.

2.09 **APS** - Accunet® Packet Service
Entries: blank, Y, or N.

2.10 **ATRIG** - AIN TSG Trigger (4E22>)
Entries: blank, Y, or N.

2.11 **BFTIS** - Backward Failure Treatment all ISUP
Entries: blank, ANN, or REL.

2.12 **BFTNI** - Backward Failure Treatment not all ISUP
Entries: blank, ANN, or REL.

2.13 **BN** - Billing Number
Entries: blank, 3, 4, or 10 digit number.

2.14 **BNPT** - Entries: blank.

2.15 **BRL** - Billing Record Length
Entries: blank, L, or S.

2.16 **CAREA** - Control Area
Entries: 0 to 9.

2.17 **CARSON** - Entries: blank.

2.18 **CBC** - Entries: blank.

2.19 **CBN** - Incoming Trunk Connecting Network Access Billing Number option (4E22R2>)
Entries: blank, N, or L.

2.20 **CBN DIGS** - Incoming Trunk Connecting Network access Billing Number (4E22R2>)
Entries: blank or 10 digit number.

2.21 **CBNPR** - Calling Party Number/Billing Number Default Presentation Restriction Indicator
Entries: blank, PA, or PR.

2.22 **CCIF** - Entries: blank.

2.23 **CCIS2WRE** - Common Channel Interoffice Signaling 2Wire
Entries: blank, Y, or N.

2.24 **CCTT** - Entries: blank.

2.25 **CHNEG** - Channel Negotiation
Entries: blank, Y, or N.

2.26 **CID** - Carrier ID(4E20>)
Entries: blank or 0000 to 9999.

2.27 **CMERGE** - Entries: blank.

2.28 **CODSC** - CPE Outgoing Disconnect (<4E20) or CPE Outgoing Disconnect/Reset SS7 TSG PCIS Bits (4E21>)
Entries: blank, Y, or N.

2.29 **CPOS** - Control Position
Entries: 0 to 9.

2.30 **CSCSET** - Entries: blank.

2.31 **CSN** - Entries: blank.

2.32 **D3DBN** - Entries: blank.

2.33 **DATA** - Data Service
Entries: blank, Y, or N.

2.34 **DATAF** - Entries: blank.

2.35 **DDD** - Entries: blank.

2.36 **DELAY** - Delay Interval
Entries: blank, 20, 80, 220, or 70, 140, 210, or 280.

2.37 **DNHR** - Dynamic Non-Hierarchical Routing
Entries: Y or N.

2.38 **DNP** - Dialed Number Preferred
Entries: blank, Y, or N.

2.39 **DOFP** - Disable Outgoing Fraud Prevention
Entries: Y or N.

2.40 **DOM** - Domain
Entries: POTS, 20 to 83, INTL, VRFY, SDNA, DED, DEV, IVT, I56D, I64C, N64C, N64R, APN, NH0C, NH1C.

2.41 **DPC** - Destination Point Code
If PCF equals ATT, then DPC is composed of:

— NET = 000 to 255.
— CR = 00 to 31.
— CT = 0 to 7.
— MEM = 000 to 255.

If PCF equals ANSI, then DPC is composed of:

— NET = 000 to 255.
— CLU = 000 to 255.
— MEM = 000 to 255.

If PCF equals ISPC, then DPC is composed of:

— WGZ = 1 to 7.
— ANI = 000 to 255.
— SPID = 0 to 7.

2.42 **DPSTOP** - Dial Pulse Stop
Entries: blank, Y, or N.

2.43 **E1T1** - Entries: blank.

2.44 **EACC** - Entries: blank.

2.45 **EAS** - Equal Access Signaling
Entries: N, A, E, D, or R.

2.46 **EXSEQ** - Entries: blank.

2.47 **FAI** - Entries: blank.

2.48 **FAR4E** - Far End 4E
Entries: blank, Y, or N.

2.49 **FEAREA** - Entries: blank.

2.50 **FELATA** - Far End Local Access and Transport Area
Entries: blank or 000 to 999.

2.51 **FELN** - Entries: blank.

2.52 **FENCLASS** - Far End Network Class
Entries: blank, ACCESA, ACCESI, ACCESO, CMC, INTL, OEO (4E21>), OWATS, PBX, or POTS.

2.53 **FENID** - Far End Network ID
Entries: blank or 1 to 6 alphanumeric characters.

2.54 **FENPA** - Far End Numbering Plan Area
Entries: 200 to 999 and, for international, 2 to 9 and 20 to 99.

2.55 **FEOFC** - Far End Office
Entries: blank or 000 to 999.

2.56 **FEPTY** - Entries: blank.

2.57 **FESC6** - Far End 6-Digit Screening
Entries: Y or N.

2.58 **FESWID** - Entries: blank.

2.59 **FLDSPR** - Entries: blank.

2.60 **FOLI** - Entries: blank.

2.61 **FOSPS** - Entries: blank.

2.62 **FVSR** - Entries: blank.

2.63 **GEOSEP** - Geographical Traffic Separation Class
Entries: 0 to 31.

2.64 **GLARE** - Glare Control
Entries: blank, A, E, O, N.

2.65 **GNSC** - Go/No Go Screening Class
Entries: 0 to 3.

2.66 **GSDN** - Entries: blank.

2.67 **GSDNPHSE** - Entries: blank.

2.68 **HUNT** - Entries: blank.

2.69 **HYBRD** - Entries: blank.

2.70 **IDDD** - Entries: blank.

2.71 **IFITR** - Entries: blank.

2.72 **INCID** - Number of Carrier ID digits to be received (4E18>)
Entries: blank, 3, 4, or B.

2.73 **INSEP** - Incoming Traffic Separation Class
Entries: 0 to 255 (non-AT&T offices) or 0 to 127 (AT&T offices).

2.74 **ISC** - Incoming Signaling Characteristics
Entries: CCITT5, CCITT6, DOMCCIS, DPDDSD, DPIMADG, DPIMMED, DTMFWK, DTS, INUP, ISUP, MFDDSD, MFOPWK, MFWINK, Q931, or TUP.

2.75 **IT** - Intertoll Treatment
Entries: blank, Y, or N.

2.76 **ITC** - Incoming Trunk Subgroup Class
Entries: blank or 0 to 3.

2.77 **ITCENC** - Information Transfer Capability (4E21>).
Entries: blank, Y, or N.

2.78 **ITELCO** - Entries: blank.

2.79 **IWZ1** - International World Zone 1
Entries: blank, Y, or N.

2.80 **IXC** - Entries: blank.

2.81 **LCVT** - Entries: blank.

2.82 **LNPIC** - A TSG field not used
Entries: blank.

2.83 **LRN** - Location Routing Number (4E22R2>)
Entries: blank or 10 digit number.

2.84 **LSST** - LATA/state Screening State (<4E21)
Entries: blank or two alphabetic characters.

2.85 **MEGC** - Entries: blank.

2.86 **MEM** - Trunk Hunt with Memory
Entries: blank, Y, or N.

2.87 **MFSPEED** - Multi-Frequency Speed
Entries: blank, 7, or 10.

2.88 **MTSC** - Multiple Treatment Screening Class
Entries: 0 to 63.

2.89 **MULAW** - A-law/Mu-law Encoding (4E18>)
Entries: blank, Y, or N.

2.90 **NEOTR** - Near Operational Test Responsibility
Entries: Y or N.

2.91 **NCAR.tsg** - Entries: blank.

2.92 **NPARINH** - Inhibit NPA Reconstruction
Entries: blank, Y, or N.

2.93 **OFITR** - Entries: blank.

2.94 **ONCID** - Number of Carrier ID digits to send (4E18>)
Entries: blank, 3, or 4.

2.95 **ORNU** - Order Number
Entries: 1 to 999999.

2.96 **OSC** - Outgoing Signaling Characteristics
Entries: CCITT5, CCITT6, DOMCCIS, DPDDSD, DPIMMED, DPWINK, DTMFWK, ICOPNOP, INUP, ISUP, MFDDSD, MFWINK, MIOPNOP, Q931, or TUP.

2.97 **OTMTN** - Operational Terminating Test Number
Entries: blank or 000 to 9999999.

2.98 **OTMTT** - Operational Terminating Test Type
Entries: N, ATMC, CTX2, CTX3, SXS, SYNC, or T103.

2.99 **OTSTN** - Operational Thru Switch Test Number
Entries: blank or 000 to 9999999.

2.100 **OTSTT** - Operational Thru Switch Test Type
Entries: N, ATMB, CTX2, CTX3, SXS, SYNC, or T103.

2.101 **OVLP** - Overlap Signaling
Entries: blank, Y, or N.

2.102 **OWAT** - Entries: blank.

2.103 **PBXAW** - PBX Answer Withheld
Entries: blank, Y, or N.

2.104 **PBXESGD** - PBX Expect Station Group Designation
Entries: blank, Y, or N.

2.105 **PBXNWW** - PBX No Wait for Wink
Entries: blank, Y, or N.

2.106 **PCF** - Point Code Format
Entries: blank, ATT, ANSI, or ISPC.

2.107 **PCPEACEL** - Entries: blank.

2.108 **PRIT** - Entries: blank.

2.109 **PSATP** - Prohibit Sending Access Transport Parameters
Entries: blank, Y, or N.

2.110 **PSBN** - Prohibit Sending Billing Number
Entries: blank, PNNA (4E18>), PALL (4E18>), or SALL (4E18>).

2.111 **PSCPN** - Prohibit Sending Calling Party Number
Entries: blank, Y, or N.

2.112 **PSES** - Prohibit Service Evaluation
Entries: blank, Y, or N.

2.113 **PSOLI** - Prohibit Sending Originating Line Identity
Entries: blank, Y, or N.

2.114 **PSTNG** - Entries: blank.

2.115 **PSUUI** - Prohibit Sending User-to-User Information
Entries: blank, Y, or N.

2.116 **QTFN** - Quantity of Traffic Numbers
Entries: 24 to 504 by 24s.

2.117 **REV** - Reverse Traffic Numbers
Entries: Y or N.

2.118 **REVAMP** - Entries: blank.

2.119 **RFA** - Ring Forward Allowed
Entries: Y or N.

2.120 **RFMP** - Ring Forward Miscellaneous Distributor Point
Entries: blank, Y, or N.

2.121 **S1** - Spare 1
Entries: blank or 0 to 7.

2.122 **S2-S10** - Spares 2 through 10
Entries: blank, Y, or N.

2.123 **S5DIG** - Entries: blank.

2.124 **SAT** - Satellite
Entries: Y or N.

2.125 **SBRIV** - Entries: blank.

2.126 **SCFN** - Send Confusion Message
Entries: blank, Y, or N.

2.127 **SDNA** - Entries: blank.

2.128 **SDNPLAN** - Entries: blank.

2.129 **SDS** - Entries: blank.

2.130 **SINDEX** - Access Charge Verification Sampling Rate Index
Entries: blank, 0, 1, 2, 4, 8, 16, 32, or 64.

2.131 **SKSP** - Entries: blank.

2.132 **SOIP** - Entries: blank.

2.133 **SPN** - Signal Ported Number (4E22R2>)
Entries: blank, Y, or N.

2.134 **STBI** - Entries: blank.

2.135 **SUPBLK** - Entries: blank.

2.136 **TCC** - Entries: blank.

2.137 **TFG** - Type of Feature Group
Entries: blank, B, C, or D.

2.138 **TOT** - Type of Trunk
Entries: ETC, INTL, INTLO, ITAND, ITOLL, ITOPA, LCC, NSDSD, OCC, PBX, SECIT, STC, TAND, or TOLLC.

2.139 **TRIDX** - Entries: blank.

2.140 **TSG** - Trunk Subgroup

— BTFN = 0 to 9976.

— TOWN = alphabetic.

— ST = alphabetic.

— BL = alphabetic or numeric.

— FBS = alphanumeric.

— NBS = alphanumeric.

2.141 **TSGBBC** - TSG BroadBand Capability
Entries: blank or 0 to 6.

2.142 **TTA** - Entries: blank.

2.143 **UT15DA** - Entries: blank.

2.144 **VDCAP** - Entries: blank.

2.145 **WANISID** - WATS Service ANI/SID Request
Entries: blank, NONE, ANI, PANI, PSID, REQ, or SID.

2.146 **WATSBN** - WATS Billing Number
Entries: blank or 10 digit number.

2.147 **WBNPT** - Entries: blank.

2.148 **XCPA** - Transceiver (XC) Pad Adjustment
Entries: blank or 0 to 3.

2.149 **XTMTN** - Transmission Terminating Test Number
Entries: blank or 000 to 9999999.

2.150 **XTMTT** - Transmission Terminating Test Type
Entries: N, T100, T102, or T105.

2.151 **XTSTN** - Transmission Thru Switch Test Number
Entries: blank or 000 to 9999999.

2.152 **XTSTT** - Transmission Thru Switch Test Type
Entries: N, ATMA, T100, T102, or T105.
