Examine the stack back trace to determine the function that called the OAznnext() function and why the bits are set to DBYES. Contact field support personnel.

807. OARATCQFWD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The rate_quote, conn_pending, qry_pending, and fwd_chk attributes in an rITALOOPDB tuple were all DBYES when the OAZNNEXT() macro was called from SDL code. These bits should never be DBYES at the same time. The OAZNNEXT() macro called the OAznnext() function, which called this assert.

Action:

Examine the stack back trace to determine the function that called the OAznnext() function and why these bits are set to DBYES. Contact field support personnel.

808. OARATECONN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In a rITALOOPDB tuple, the rate_quote and conn_pending values were both DBYES when the OAZNNEXT() macro was called from SDL code. The value of the qry_pending attribute is independent of this assert. The OAZNNEXT() macro is defined to be the OAznnext() function, and the OAznnext() function calls this assert. Use the stack back

trace to determine the function that called the OAZnnext() function (via the OAZNNEXT() macro), then determine why both values are set to DBYES.

809. OARATFWD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The rate_quote and fwd_chk attributes in an rITALOOPDB tuple were both DBYES when the OAZNNEXT() macro was called from SDL code. These two bits should never be DBYES at the same time. The OAZNNEXT() macro called the OAZnnext() function, which called this assert.

Action:

Examine the stack back trace to determine the function that called the OAZnnext() function and why both bits are set to DBYES. Contact field support personnel.

810. OARATQFWD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The rate_quote, qry_pending, and fwd_chk attributes in an rITALOOPDB tuple were all DBYES when the OAZNNEXT() macro was called from SDL code. These three bits should never be DBYES at the same time. The OAZNNEXT() macro called the OAZnnext() function, which called this assert.

Action:

Examine the stack back trace to determine the function that called the OAZnnext() function and why these bits are set to DBYES. Contact field support personnel.

811. OARCLTYPFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The recall delay type (rcl_dly_type) found in the rISRVOT tuple is invalid. Acceptable recall delay type values are specified in the file uhdr/db/DMdlytyp.G. The invalid value is dumped.

812. OARCNBFL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: COINOT	Audit Mode: elev

Problem:

The OAcndatrls() function encountered an error when removing an rCOINOT tuple from the headcell busy list. An elevated AUOCOINOT audit is scheduled and processing returns to the calling function.

813. OARCNIFL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: COINOT	Audit Mode: elev

Problem:

The OAcndatsz() function encountered an error when removing an rCOINOT tuple from the headcell idle list. An elevated AUOCOINOT audit is scheduled and processing returns to the calling function.

814. OARESX_READ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A system error occurred while reading the RLRESXDL relation. The error was not DB_RESOURCE.

815. OARET_ERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An if statement or function returned something other than success or failure.

816. OARETINVALID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) model called the OAeispsez() primitive; the primitive returned an unexpected value. This can occur when the MGOAMPOS_SZ or MGOAMUROP1 message is received.

When the MGOAMPOS_SZ message is received, the expected return values are OAEIS_CONT, OAEIS_SINF, OAEIS_FINF, OAEIS_SDSP, or OAEIS_FDSP. With the MGOAMUROP1 message, the expected values are OAEIS_CONT, OAEIS_SINF, or OAEIS_FINF. A value other than those listed was returned.

817. OARFBNARET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) interface call event point function OAeisbna() returned an unexpected code when it was called by the OAEvent() function in the OAEROUTEF event. The unexpected return code is dumped.

Probable Cause:

The OAeisbna() function returned an invalid code, or the OAEvent() function is not accepting valid return codes.

Action:

Contact field support personnel.

818. OARGLPRM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error has been returned from an attempted read of a global parameter from within a transaction.

Probable Cause:

Unknown.

Action:

None.

819. OARHHCSL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: SDAPSDL	Audit Mode: elev

Problem:

An attempt to remove an SDAP SDL tuple from the head of the idle list failed. An elevated SDAP SDL audit is scheduled and processing returns to the calling function.

820. OAR_INCRSN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The reason for creation of the real time rating system (RTRS) terminal process (TP) was not OSRREPLACE. The reason field is dumped.

821. OARMBUSYF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TALOOPDB	Audit Mode: elev

Problem:

An error occurred while removing the toll and assistance LOOP database (TALOOPDB) from the DB_HEADC busy list. The assert will schedule an elevated TALOOPDB audit, and return to the caller.

822. OARMIDLEF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TALOOPDB	Audit Mode: elev

Problem:

A failure occurred while removing the toll and assistance LOOP database (TALOOPDB) from the DB_HEADC idle list. The TALOOPDB audit is scheduled.

823. OARMTAPF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TALOOPDB	Audit Mode: elev

Problem:

A failure occurred while removing the toll and assistance (T/A) LOOP database (TALOOPDB) from its T/A operator position data block (TAPOSDB) owner. The assert schedules an elevated TALOOPDB audit, and returns to the caller.

824. OARNOMATCH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No match was found for the real time rating system (RTRS) global port.

825. OA_RPDBP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The function OAtlpcreat was called to create a loop and failed. The port will be displayed.

Probable Cause:

This failure occurred because an invalid port was found in a RLTAPOSD tuple.

Action:

Verify that a tuple exists for the port either in RC/V View 21.30 (OSPS - DSL PORT) or 21.4 (OPERATOR ASSIGNMENT).

826. OARPDBPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The function OAtalpcreat() was called by FM to create a loop, and failed. The port and the class of charge will be dumped.

Probable Cause:

The failure occurred because the port found in RLTAPOSDB is a non-OSPS B-port.

Action:

Verify that the port exist on RC/V View 21.30, (OSPS - DSL PORT) or 21.4 (OPERATOR ASSIGNMENT).

827. OA_R_PRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The macro RTGETED() was called to obtain a D-port using a port retrieved from the process control block link area (PCBLA). However, the utility function Rlgeted() called from this macro was unsuccessful while reading databases to determine the D_port because a system error occurred, and thus returned GLERRPORT to the function OAgacdie(). This assert will display the passed in port. Other recovery actions will place the port on the out of service disable list.

828. OARQTYPINVALID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) model was given a call that had a TALLOOPDB->acd_data.req_type value that was not AC_NORMTRANS, AC_OPERTRANS, AC_POSTRANS, AC_NORMAL, or AC_RECALL. Also, the TALLOOPDB->oa_data.orig_cos value was not OA_TAOPER. This condition is not expected by this model.

829. OARSPCSL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: SDAPSDL	Audit Mode: elev

Problem:

An attempt to remove a specific SDAP_SDL tuple from a process control block link area (PCBLA) owner tuple failed. An elevated SDAP_SDL audit is scheduled and processing returns to the calling function.

830. OARSP_ENTRY (5E12 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization of a system process failed because of an invalid entry reason.

Result:

The system process is purged.

Action:

Contact OSPS field support personnel. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

831. OARSP_ENTRY (5E11 only)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid reason was passed to the OArspin() function in the real time rating system (RTRS) system process.

832. OARSPUNXP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The real time rating system (RTRS) system process received a MGRTRS message with an unexpected message type.

833. OARSTATFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAlinkstat() function failed to update the real time rating system (RTRS) link status array.

834. OA_RSTPID (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The autoquote originating terminal process (AQ-OTP) could not be restarted because an invalid program ID was passed to the OSRESTART() macro.

835. OA_RSTTM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The autoquote originating terminal process (AQ-OTP) could not be restarted because an invalid maxtime parameter was passed to the OSRESTART() macro.

836. OARTCRERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The global default route number carrier for an operator services position system (OSPS) non-floatable call is not a valid carrier or can not handle a call.

Data Structures:

RLFC_CARR. Key field: carrid.

RLOCNTWK. Key fields: oanpa, oattc, oaosdc.

RLFCRSMCAT. Key fields: carrid, rsm_num, featgrp.

Action:

The global route carrier in global parameter Glrt_carr is printed in decimal. Use the carrier ID and feature group D as keys to RC/V View 10.3 (INTERLATA CARRIER) to verify that the carrier is valid and is an interexchange or a consolidated carrier. If this is not the case, then the global parameter is not set properly. Determine the correct carrier and use RC/V View 8.9 (OSPS OFFICE PARAMETERS) to update the route number carrier.

If the carrier is valid and the SM number printed is a remote SM (RSM), use RC/V View 26.22 (OSPS RSM/CARRIER DATA) to verify that an entry exists for this carrier, feature group D, and SM number. If an entry is not present, the appropriate RSM dependent routing data must be inserted for this carrier to be used.

If the carrier is valid, the carrier can not handle the call to the printed route number dialed. If the dialed digits consist

of an NPA-TTC-OSDC (where TTC is the terminating toll center and OSDC is an operator special dial code) and if another carrier should handle this number, use RC/V View 26.21 (OSPS CARRIER FOR OPERATOR SPECIAL DIALED CODES) to insert an rIOCNTWK tuple with the correct carrier.

837. OAR_UNEXMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The real time rating system (RTRS) terminal process (TP) received an unexpected operating system for distributed switching (OSDS) message from the OSWGETMSG() macro. The message is dumped.

838. OASACDRIERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The carrier identified by digit analysis for a service access code (SAC) call can not do remote SM (RSM) routing.

Data Structures:

RLFCRSMCAR. Key fields: carrid, rsm_num, featgrp.

Action:

The carrier ID from the RLDAPRIMDGT relation is printed in decimal. The SM number printed should be for an RSM. If SAC calls from this RSM to this carrier should be handled by this operator services position system (OSPS), determine the routing data and use RC/V View 26.22 (OSPS RSM/CARRIER DATA) to insert an rIFCRSMCAR tuple for the feature group D (FGD) carrier.

839. OASACERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The carrier identified for a service access code (SAC) call was invalid.

Data Structures:

RLFC_CARR. Key field: carrid.

Action:

The SAC call carrier, determined by digit analysis, could not handle a call. The carrier ID from the RLDAPRIMDGT relation is printed in decimal. Use the carrier ID and feature group D as keys to RC/V View 10.3 (INTERLATA CARRIER) to verify that the carrier is valid.

The second number printed is the dialed digits. If the carrier is not valid, determine the correct carrier for this dialed number and update RC/V View 9.3 (LOCAL DIGIT [OFFICE DIALING]). If the carrier listed is correct, but there is no rIFC_CARR tuple, determine the routing data and add an entry in RC/V View 10.3

840. OASCCSPERR (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The switch connection control system process (SCCSP) encountered an unexpected event or stimulus.

Probable Cause:

Check data dumped to determine the problem. Either the 5ESS® switch software or adjunct software needs to be updated to fix this problem.

Action:
Contact OSPA field support.

841. OASDAPPRMT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A 1+800 speed dial auto-provisioning (SDAP) call was sent to reorder. ACCS special prompt treatment had specified the call was to be sent to an operator but 1+800 SDAP calls are never to be routed to an operator.

Action:

From View 27.70 determine the SSC WXY number for the tuple with 'SDAP' SERVICE TYPE. Using that number as the TN in View 27.70, insure that the corresponding PROMPT TREAT field is not 'OP'.

842. OASDNDESTERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

On a software defined network (SDN) network remote access (NRA) call, an SDN routing number had an invalid call type (dest_type) on an operator services position system (OSPS) call. The SDN routing number is sent to OSPS in a query reply from the customer account services/network control point (CAS/NCP) database when validating a CAS calling card.

This problem may be caused by an invalid CALL TYPE in the local digit interpreter table (LDIT) data, or by an invalid SDN NRA digit analysis selector (DAS). The call is changed to a public network call, and an error message is displayed to the OSPS operator.

Data Structures:

RLDAPRLFNL. Key field: previous (LDIT of previous digit).

RLDAPRMFNL. Key field: previous.

The Glsdnds global parameter, which contains the DAS of SDN routing numbers, is also involved.

Action:

If the CALL TYPE in the LDIT data is not valid:

1. Obtain the LDIT from RC/V View 9.1 (DIGIT ANALYSIS SELECTOR [OFFICE DIALING]) using the DAS printed on the ROP as the key.
2. Use the LDIT obtained from View 9.1 and the SDN routing number digits printed on the ROP as keys to locate the invalid call type using RC/V View 9.3 (LOCAL DIGIT [OFFICE DIALING]) or office records form 5300-3/5 (LDIT). Correct the invalid CALL TYPE field using RC/V View 9.3.

If the SDN NRA DAS is not valid, correct the SDN NRA DAS field of the AATOS/SDN NRA section in RC/V View 8.9 (OSPS OFFICE PARAMETERS).

843. OASEND_FAL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The monitoring process could not send a request to the administrative services AM system process to de-activate the position as a monitor. The switch value contains the position number. The position is not de-activated as a monitor position.

844. OASENDMSGFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSENDMSG() macro failed because it could not send a message to the operator services position system (OSPS) AM-SM message handler. This process is identified by the ospssid structure that is dumped.

845. OASETNRAF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the Glnraf global parameter using the DBrfgparm() primitive when it was called from the OAINACCSDB() function.

Probable Cause:

Unknown.

Action:

None.

846. OASEZ_TYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The MGPOSTMRQ message seizure type or the rLOOPDB tuple seize_type field is corrupted. The MGPOSTMRQ message is sent from the automatic call distributor (ACD) to the operator services position system (OSPS) feature model.

847. OASIDRETBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return value from the oa/OAeisot/OAsrv_id() function was detected. The return value will be dumped.

848. OASIGTRKCN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

After an operator services position system (OSPS) origination on a non-intermediate switching point (non-ISP) trunk group, an inconsistency was found between the signaled automatic number identification (ANI) information digits and the trunk group data while attempting to identify the originating station type.

The ANI information digits indicated that the originating station was coin, but trunk group data (the cn_ind or pp_ind attributes in the RLFC_OPRTK relation) indicates that coin traffic is not allowed on this group.

Data Structures:

RLFC_OPRTK. Key field: trunk group.

Action:

There are two possible explanations:

1. A coin call was misrouted over the trunk group from the originating office. The originating number (NPA-NXX-LINENO) is dumped on the ROP. Trace back to the originating office and inform them of the misrouting.
2. Coin traffic should be allowed on the trunk group. Access RC/V View 26.26 (ACCESS TANDEM INCOMING TRUNK GROUPS) using the trunk group dumped on the ROP to update the coin fields to allow coin traffic.

849. OASMIGP1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to initialize the Glnvdt global parameter using the DBrfgparm() primitive when it was called from the OAsminit() function in oa/OAfex/OAsminit.c.

850. OASMIGP2 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to initialize the Glnint global parameter using the DBrfgparm() primitive when it was called from the OAsminit() function in oa/OAfex/OAsminit.c.

851. OASMIGP3 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the Glnvdt global parameter using the DBrfgparm() primitive when it was called from the OAsminit() function in oa/OAfex/OAsminit.c.

852. OASMIGP4 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the Glnint global parameter using the DBrfgparm() primitive when it was called from the OAsminit() function in oa/OAfex/OAsminit.c.

853. OASMOTMISS (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A specific call requires that the OPSMOT package be loaded on the SM. Since it is not, the call cannot be further processed. The process is be purged. The port is dumped in the first 2 bytes of data.

Action:

Either move the specific trunk member to an SM that has the OPSMOT package by looking at RC/V View 18.1 to find the SM, or convert the SM where the trunk member is located (where the assert fired from) to a CONFIGURATION on RC/V View 18.1 that contains the OPSMOT package.

854. OASOLO_ACD (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The Operator Services Position System (OSPS) automatic call distribution (ACD) data has sent a call to the OSPS - enhanced services platform which the platform cannot handle. This includes 2 party recalls, 1+ coin calls and more efficient call handling (MECH) calls. The call is sent to reorder and the offending call type is printed.

Data Structures:

RLCTINFO, Key field: call_type

Action:

Use the call type printed along with RC/V View 21.22 (OSPS CALL TYPE) to determine the serving teams associated with this call type. Update the data so no team associated with this call type has an OSPS - enhanced services platform login.

855. OASRBNARET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) interface call event point function OAeisbna() returned an invalid code when it was called by the OAevent() function in the OASUCROUTE event. The invalid return code is dumped.

Probable Cause:

The OAeisbna() function returned an invalid code, or the OAevent() function is not accepting valid return codes.

Action:

Contact field support personnel.

856. OASRCCFLRET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) interface call event point function OAeiscfl() returned an invalid code when it was called by the OAevent() function in the OASUCROUTE event. The invalid return code is dumped.

Probable Cause:

The OAeiscfl() function returned an invalid code, or the OAevent() function is not accepting valid return codes.

Action:

Contact field support personnel.

857. OASRVCINV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected service code was found in the external information system (EIS) call tuple during translation of an incoming EIS message. The invalid service code is dumped.

858. OASRVIDBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call with an associated service that does not require call type data or an operator seizure (for example, specialized 700 number) was identified in the oa/OAotoper/OAsrv_init() function with an invalid service ID. The invalid service ID will be dumped.

859. OASRVINIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SRVOT initialization function, called during SM initialization, failed to insert a tuple or link a tuple to the idle list.

Probable Cause:

Unknown.

Action:**860. OASS7AILS (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An SS7 Signaled call was received with foreign ANI or foreign PBX billing number. If the AILS feature is turned on, an AILS query will be sent to the normal serving OSPA office to obtain screening and time variance data associated with the signaled PBX billing number or ANI. This problem is caused by an error in 4ESSTM routing, or routing may have been altered due to temporary network emergency. Although this assert is identifying a problem, the call is allowed to continue.

The ROP output provides the signaled ANI or PBX billing number, and the originating trunk group number and member.

Action:

If the problem persists, contact the originating 4ESSTM toll office and inform them of the routing error.

861. OASTATREL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLITNASTAT tuple was not found. This relation is used by the improved third number acceptance (ITNA) feature.

Data Structures:

RLITNASTAT. Key field: originating station type.

The carrier, tgn, and set_id attributes are also printed.

Action:

Add the originating station to the RLITNASTAT relation via RC/V View 26.33 (OSPA IMPROVED THIRD NUMBER ACCEPTANCE CALL TREATMENT).

862. OASTATUPDT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Update of the hotel billing information system (HOBIS)/hotel billing information center (HOBIC) link status array in the OAlnkupdt() function failed.

863. OASTINDATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator type attribute value in the rISTINFO tuple with the directory assistance login ID is invalid.

Data Structures:

RLSTINFO. Key fields: serving team, serv_tm.

Action:

The rISTINFO tuple should be dumped and examined by a maintenance personnel. Use RC/V View 21.2 (SERVING TEAM) to set the value of st_optype to OSPSDA. File a trouble report.

864. OASTIN_OAEDI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

RLstinfo. oaedi is corrupted.

865. OASTIN_RD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A system error occurred while reading the RLSTINFO relation. The error was not DB_RESOURCE.

866. OASTIN_TUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rISTINFO tuple is missing.

867. OASTWACKUXM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received in OT OAopsetup function, FCWACK state. The message is ignored. Dump msg.msghead.

868. OATADA_MIX (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call seized a toll and assistance position, but the operator type (oa_optype) in the position termination message is not OSPSTA; or a call seized a directory assistance position, but the operator type (oa_optype) in the position termination message is not OSPSDA.

The data dump contains the text of position termination request message. Contact the office data administration (ODA) organization. Direct attention to those static relations that are responsible for routing a call to a position.

869. OATANTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in setting the keys used to read the RLATATYPE relation, or the rLATATYPE tuple is missing.

Data Structures:
RLTATYPE. Key field: tatype.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLTATYPE relation with the actual key used to access the relation. If the tuple is missing, add it. If the key used to access the relation was set incorrectly, notify your next level of support. This relation is updated by RC/V View 10.1 (FIXED ROUTE [ROUTING]).

870. OATAPAPBF (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The associated process block (APB) to toll and assistance operator position data block (TAPOSDB) linkage was invalid and the dynamic access (DA) primitive failed. A single process purge was called.

871. OATAVT_A (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The parameters passed to a toll and assistance (T&A) virtual terminal (VT) output function were inappropriate for that function, or the data that a T&A VT output function needed to access was invalid.

The following information is dumped. The defined values needed for translation of the dumps are found in the local header file oa/hdr/OAvtasrt.L.

1. An identifier specifying the VT output function that called the assert. The identifiers print as the following hex values: (1)OAvtack(), (2)OAvtlchg(), (3)OAvtscrm(), (4)OAvtlsup() or OAvtlcon(), (5)OAvtclr() or OAvtficlr(), (6)OAvtdep(), (7)OAvtone(), (8)OAvtrevl(), (9)OAvtdisp() or OAvttdisp(), (A)OAvtterr() or OAerrmsg(), (B)OAvtldkb(), (C)OAvtchkbk(), (D)OAvtredisp(), (E)OAmultstor(), (F)OAmultsend(), (11)OAvtfhan(), (12)OAvtcnpg(), (13)OAvttnsn(), (14)OAvtamlb(), (15)OAvtcnct(), (16)OAvtavt.sd, (17)OAblkkeys.h, (18)OAer_ind(), (19)OAvtcid(), (1A)OAvttrcll(), (1B)OAvtmnrevl(), (1C)OAmnta_vt.sd, (1D)OAvtiddata(), (1E)OAvtifk(), (1F)OAvtikup(), (21)OAmont_send(), (22)OAabsterrmsg(), (23)OAvtpcntl(), (24)OAmnt_send()

2. An identifier indicating whether the error condition was caused by invalid parameters or invalid data. The identifiers print as the following hex values: (1)invalid parameters, (2)invalid data.

3. An identifier specifying the parameter or data that was inappropriate. If the second field indicated invalid data, the data is dumped in this field. If the second field indicated an invalid parameter value, the following identifiers specify the parameters that were invalid: (1)first parameter, (2)second parameter, (3)third parameter, (4)fourth parameter.

872. OATCMOBF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

There was not enough space for the traveling class mark (TCM) digits in the outpulsing buffer. The digits were outpulsed without the TCM. This could be an indication of errors in the prefixing and deleting data.

The first data dump (hexadecimal) is the trunk port on which the error occurred. The second data dump (hexadecimal) contains the digits outpulsed. This is the string, in ASCII, after prefixing and deleting has already been done. To convert, subtract 30 from each digit. The third data dump (hexadecimal) is the TCM that could not be appended.

Data Structures:

Key fields: outp_digs.dn, outtcm, alartcm.port.

Action:

Use RC/V to look up the port in the RLPORT_GROUP relation to find the trunk group that the port is in. Search the AM relation RLRT_MCRT for tuples that may route to the trunk group. Check that the prefixing and deleting could not result in a digit string longer than 14 for a 1-digit TCM or 13 for a 2-digit TCM.

If the resulting digit string is too long, correct the prefixing and deleting attributes using RC/V View 10.4 (BRCS MC ROUTE INDEX EXPANSION).

873. OATCS_NMTCH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No tuple was found when attempting to read the RLTCSTEXT or RLTCSSCRN relation using the screen code key printed on the ROP. This is an unexpected condition; a tuple matching this key should exist.

Data Structures:

RLTCSTEXT. Key field: scrncode (screen code).

RLTCSSCRN. Key field: scrncode.

Action:

The ROP output provides the relation name and the screen code key used to access the relation.

A data provisioning error has likely occurred. Access RC/V View 27.1 (OSPS TERMINATING CODE SCREENING TEXT AND RESTRICTIONS) using the screen code printed as the key. If a tuple exists, an internal error has occurred; contact your local support organization.

If the tuple does not exist, use RC/V View 27.1 to insert the tuple. If this is undesirable, change the corresponding tuple in RC/V View 27.2 (OSPS TERMINATING CODE SCREENING FOR NPA-NXX) or View 27.3 (OSPS TERMINATING CODE SCREENING & PCC FOR COUNTRY CODE) to use a screen code that is already defined in View 27.1. The appropriate keys for Views 27.2 and 27.3 can be found by inspecting the office records. Again, contact your local support organization because an RC/V cross-check may not be working properly.

874. OATDFRRET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) interface call event point function OAeisfr() returned an invalid code when it was called by the OAevent() function in the OAETKDISCON event. The invalid return code is dumped.

Probable Cause:

The OAeisfr() function returned an invalid code, or the OAevent() function is not accepting valid return codes.

Action:

Contact field support personnel.

875. OATFBNARET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) interface call event point function OAeisbna() returned an invalid code when it

was called by the OAEvent() function in the OAETERMFAIL event. The invalid return code is dumped.

Probable Cause:

The OAeisbna() function returned an invalid code, or the OAEvent() function is not accepting valid return codes.

Action:

Contact field support personnel.

876. OATFSTLVL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAtfsetup() function received an unexpected value in the level field of the MGACQUEUED message. The level field is dumped.

877. OATIMEREL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The rTIMESET tuple was not found. This relation is used by the improved third number acceptance (ITNA) feature.

Data Structures:

RLTIMESET. Key field: time set ID.

The start and end time attributes are also printed.

Action:

Add the missing time set ID to the RLTIMESET relation with the associated start and end times via RC/V View 26.30 (OSPS IMPROVED THIRD NUMBER ACCEPTANCE TIME SET ID).

878. OATKCRERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The default carrier identified in the operator trunk data was not valid.

Data Structures:

RLFC_OPRTK. Key field: tgroup.

RLFC_CARR. Key field: carrid.

RLFCRSMCAR. Key field: carrier, rsm_num, featgrp.

Action:

The carrier ID in the RLFC_OPRTK relation is printed in decimal. Use RC/V View 10.3 (INTERLATA CARRIER) to verify that this feature group D (FGD) carrier is valid and that it is not an international or local exchange carrier.

If the carrier is valid and the SM number printed is a remote SM (RSM), use RC/V View 26.22 (OSPS RSM/CARRIER DATA) to verify that there is an rFCRSMCAR tuple for the carrier ID, FGD, and RSM number.

If the carrier is valid, but does not have an entry in View 26.22, determine the routing data needed and insert an rFCRSMCAR tuple. If the carrier is not valid, determine what the correct carrier should be and update the inter ID carrier on RC/V View 26.26 (ACCESS TANDEM INCOMING TRUNK GROUPS).

879. OATKLCERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

One of the carriers identified in the operator trunk data is not valid.

Data Structures:

RLFC_OPRTK. Key field: tgroup.

RLFC_CARR. Key field: carrid.

RLFCRSMCAR. Key fields: carrier, rsm_num, featgrp.

Action:

The carrier ID found in the RC/V View 26.26 (OSPS INCOMING TRUNK GROUP) is printed in decimal. Use RC/V View 10.3 (INTER-LATA CARRIER) to determine if this feature group D (FGD) carrier is valid.

to determine if this feature group D (FGD) carrier is valid. If the carrier is valid and the SM number printed is a remote SM (RSM), use RC/V View 26.22 (OSPS RSM/CARRIER DATA) to determine if an rIFCRSMCAR tuple exists for the carrier ID, FGD, and RSM number.

If the carrier is valid, but does not have an entry in RC/V View 26.22, determine the routing data needed and insert an rIFCRSMCAR tuple.

If the carrier is not valid, determine the correct carrier and update that carrier in RC/V View 26.26 (OSPS INCOMING TRUNK GROUPS).

880. OATKORTERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) external information system (EIS) function OAespgtmsg() received an internally formatted message from an EIS on a call processing data link (CPDL) terminating on another SM. The EIS system process of this SM received the message due to the EIS SM specified in the message; however, no CPDLs to any EIS are available on this particular SM.

The EIS SM value may have been corrupted. The message received is dumped to indicate the SM from which it was sent, along with the message type and the EIS ID of the EIS sending the message.

881. OATKOVERBD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert only prints when the operator services position system (OSPS) external information system (EIS) integrity monitor flag OAeisim is set to DBYES (1). On a link takeover incoming message from the external vendor, the version ID in the incoming message differed from the version ID in the associated rIEISCALL tuple. The incoming message, rIEISCALL tuple, and rIEIS_LNK tuple are dumped. The incoming message is dropped.

Probable Cause:

The version ID was corrupted in the incoming message or in the rIEISCALL tuple.

Action:

Contact field support personnel.

882. OATLAAS1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CBDB	Audit Mode: elev

Problem:

Failed to add an rICBDB tuple to the idle list using the DAahhccb() primitive in the OAtlprtacc() function in oa/OAopinit/OAtlprtacc.c. An elevated FC_CBDB audit is scheduled and processing returns to the caller.

883. OATLAFI1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CBDB	Audit Mode: elev

Problem:

Failed to insert an rICBDB tuple using the DBfintup() primitive in the OAtlprtacc() function in oa/OAopinit/OAtlprtacc.c. An elevated FC_CBDB audit is scheduled and processing returns to the caller.

884. OATLAGP1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the Glcddb global parameter using the DBrfgparm() primitive in the OAtlprtacc() function in oa/OAopinit/OAtlprtacc.c.

885. OATLAGP2 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the Glcddb global parameter using the DBrfgparm() primitive in the OAtlprtacc() function in oa/OAopinit/OAtlprtacc.c.

886. OATLAGP3 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the Glcddb global parameter using the DBrfgparm() primitive in the OAtlprtacc() function in oa/OAopinit/OAtlprtacc.c.

887. OATMAREA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid local time zone area was received when an attempt was made to determine the time zone area in which the calling customer resides. This is caused by one of two reasons:

1. The time zone area specified in the RLFC_TMZN relation for the calling numbering plan area (NPA) was invalid.
2. The time zone area specified in the RLFC_NXXZN relation for the calling NPA and office code (NXX) is invalid.

Data Structures:

RLFC_TMZN. Key field: NPA.

RLFC_NXXZN. Key fields: NPA, NXX.

Action:

Use RC/V to verify that the time zone attribute specified in the rIFC_TMZN tuple and rIFC_NXXZN tuple for the specified NPA is one of the allowed values. If necessary, correct the problem by using RC/V View 26.14 (OSPS NPA TIME ZONES) for the RLFC_TMZN relation and View 26.12 (OSPS NXX OUTSIDE OF MAJORITY TIME ZONE) for the RLFC_NXXZN relation.

The allowed values are:

PRI - same time as the operator services position system (OSPS) base system clock.

ALT1 - a telephone company administration (TCA) specified area whose time may differ from the time at the OSPS switch; the time difference can be found in the Gla1zone global parameter.

ALT2 - a second TCA specified area whose time may differ from the time at the OSPS switch; the time difference can be found in the Gla2zone global parameter.

888. OATMREL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLFC_TMZN relation could not be found when an attempt was made to determine if a tuple was present. This relation contains data about the time zone for each numbering plan area (NPA).

Data Structures:

RLFC_TMZN. Key field: npa.

Action:

Add the RLFC_TMZN relation using RC/V View 26.14 (OSPS NPA TIME ZONES) according to the Translation Data Manual. Actual data may be obtained from the operator services position system (OSPS) switch data engineer.

889. OATMSCOPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During interflow initialization, an unrecognized value for the initialization scope parameter was passed from terminal maintenance (TM) to operator actions (OA). The only acceptable values are TM_DSL_SCOPE for initializing a digital subscriber line (DSL) facility, and TM_B_SCOPE for initializing a single B-channel. Defensive action is taken by TM when the OA function returns an error code.

890. OATMZN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rRFC_TMZN tuple was missing when an attempt was made to obtain time zone data about a numbering plan area (NPA).

Data Structures:

RLFC_TMZN. Key field: npa.

Action:

If the rRFC_TMZN tuple is missing, verify that the NPA is handled by this office. If so, use RC/V View 26.14 (OSPS NPA TIME ZONES) to add the tuple. Information on relations can be found in Translation Data Manual. Actual data may be obtained from operator services position system (OSPS) switch data engineers.

891. OATNSBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure has occurred while attempting to populate the transit network selection parameter into the MGISSETUP message for operator services position system (OSPS) calls. The following data is dumped. The feature indicators that show what type of call was populating the data, the feature information that includes the data to populate the message, and the transit network selection data that has failed.

892. OATPOAS1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LOOPDB	Audit Mode: elev

Problem:

Failed to add an rLOOPDB tuple to the idle list using the DBaddset() primitive when it was called from the OAtposlprt() function in oa/OAfex/OAtposlprt.c. An elevated LOOPDB audit is scheduled and processing returns to the caller.

893. OATPOAS2 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TALOOPDB	Audit Mode: elev

Problem:

Failed to add an rTALOOPDB tuple to the idle list using the DBaddset() primitive when it was called from the OAtposlprt() function in oa/OAfex/OAtposlprt.c. An elevated TALOOPDB audit is scheduled and processing returns to the caller.

894. OATPOAS3 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CBDB	Audit Mode: elev

Problem:

Failed to add an rCBDB tuple to the idle list using the DAahhccb() primitive in the OAtposlprt() function in oa/OAfex/OAtposlprt.c. The elevated FC_CBDB audit is scheduled and processing returns to the caller.

895. OATPOFI1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LOOPDB	Audit Mode: elev

Problem:

Failed to insert an rLOOPDB tuple using the DBfintup() primitive when it was called from the OAtposlprt() function in oa/OAfex/OAtposlprt.c. An elevated LOOPDB audit is scheduled and processing returns to the caller.

896. OATPOFI2 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TALOOPDB	Audit Mode: elev

Problem:

Failed to insert an rTALOOPDB tuple using the DBfintup() primitive when it was called from the OAtposlprt() function in oa/OAfex/OAtposlprt.c. An elevated TALOOPDB audit is scheduled and processing returns to the caller.

897. OATPOFI3 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CBDB	Audit Mode: elev

Problem:

Failed to insert an rCBDB tuple using the DBfintup() primitive in the OAtposlprt() function in oa/OAfex/OAtposlprt.c. The elevated FC_CBDB audit is scheduled and processing returns to the caller.

898. OATPOGP1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the Gloop global parameter using the DBrfgparm() primitive when it was called from the OAtposlprt() function in oa/OAfex/OAtposlprt.c.

899. OATPOGP2 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the Gloop global parameter using the DBrfgparm() primitive when it was called from the OAtposlprt() function in oa/OAfex/OAtposlprt.c.

900. OATPOGP3 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the Gtloop global parameter using the DBrfgparm() primitive when it was called from the OAtposlprt() function in oa/OAfex/OAtposlprt.c.

901. OATPOGP4 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the Gtloop global parameter using the DBrfgparm() primitive when it was called from the OAtposlprt() function in oa/OAfex/OAtposlprt.c.

902. OATPOGP5 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the Gloop global parameter using the DBrfgparm() primitive in the OAtposlprt() function in oa/OAfex/OAtposlprt.c.

903. OATPOGP6 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the Gtloop global parameter using the DBrfgparm() primitive in the OAtposlprt() function in oa/OAfex/OAtposlprt.c.

904. OATPOGP7 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the Glcddb global parameter using the DBrfgparm() primitive in the OAtposlprt() function in oa/OAfex/OAtposlprt.c.

905. OATPOGP8 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the Glcddb global parameter using the DBrfgparm() primitive in the OAtposlprt() function in oa/OAfex/OAtposlprt.c.

906. OATPOGP9 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the Glcddb global parameter using the DBrfgparm() primitive in the OAtposlprt() function in oa/OAfex/OAtposlprt.c.

907. OATPSDPOS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to delete a tuple in the RLPOSDB relation. The rIPOSDB tuple key is dumped.

908. OATPSDTP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to delete a tuple in the RLTAPOSDB relation. The rITAPOSDB tuple key is dumped.

909. OATPSGTP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The dynamic access (DA) macro used to obtain the rITAPOSDB tuple failed. The rITAPOSDB tuple key is dumped.

910. OATPSIPOS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to insert a tuple in the RLPOSDB relation. The rIPOSDB tuple is dumped.

911. OATPSITP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to insert a tuple in the RLTAPOSDB relation. The rITAPOSDB tuple is dumped.

912. OATPSPRLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The database (DB) primitive used to obtain the rIORTLA tuple failed. The rIORTLA tuple key is dumped.

913. OATPSPSDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The dynamic access (DA) macro used to obtain the rIPOSDB tuple failed. The rIPOSB tuple key is dumped.

914. OATRKCK_COC_OPINIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAcocck() function called the OAcotrckk() function to determine the trunk type that the call came in on. This is an operated initiated call; that is, it is a guest call but not an automatic charge quotation service (ACQS) origination, or the call has a class of charge of hotel but it is not an ACQS origination.

To reach this point, the OAbknoinfo() function called the OAacqstrnk() function that called the OA_acqsck() function. OA_acqsck() determined whether or not the back number was from an ACQS establishment. If this point is reached, then an error has occurred.

Action:

The call will automatically be converted into an ACQS call and class of charge screening will be performed. No manual intervention is needed.

915. OATRKGRP_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid or unexpected enumeration value was encountered on the switch on loop_ptr->ta_data.acqs_trkgrp. This switch is located in the OAacqstrnk() function, which is called by the OAbkno_info() function, which in turn is called when the back number is entered.

Action:

The OAacqstrnk() function calls the assert and continues. The loop_ptr->ta_data.acqs_trkgrp value is dumped. No manual intervention is required.

916. OATRN_BAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The transfer function OATrncheck() returned an invalid return value to the calling code. The address of the return value is given, and a macro call is made to go on to the next appropriate state.

917. OATRNCATED (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A truncated message was returned to the OAtty_test() function by the OSWGETTYPE() macro.

918. OATRNGREL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The rIITNATGN and rIITNATRNG tuples were not found. These relations are used by the improved third number acceptance feature.

Data Structures:

RLITNATGN. Key fields: orig_stat, carrier, trunk_num.

RLITNATRNG. Key fields: orig_stat, carrier, tupnum.

The attributes printed from the RLITNATGN relation includes the orig_stat (originating station type), carrier, trunk_num (trunk group number), and set_id (time set ID).

The attributes printed from the RLITNATRNG relation includes the orig_stat, carrier, tupnum (tuple number), num_rng (number of ranges specified for a given tuple), and tgnrng (trunk group number ranges). The tgnrng attribute is a structure containing a beginning and ending trunk group number and an associated time set ID.

Action:

Add the missing information to the database via RC/V View 26.33 (OSPS IMPROVED THIRD NUMBER ACCEPTANCE CALL TREATMENT).

919. OATRNOLES (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred why doing originating line screening (OLS) on the trunk rating number (TRN) contained in the generic operation parameter (GOP) for an incoming CCS7 wireless originated call. The first argument dumped in the assert indicates what type of error occurred.

Error type 1: TRN received was of the form NPA-000-0000 and a true billing number (TBN) was not found in RC/V View 26.2 [OSPS BACK NUMBER SCREENING LIST (VLIST)].

Error type 2: An incoming CCS7 wireless call was received indicating that it arrived on a combined wireline/wireless trunk, but the TRN was not found in RC/V View 26.2 or a "Scrn Code" value of 0 was assigned to the TRN in RC/V View 26.2.

The ROP output provides the error type and the TRN's NPA, NXX, line number.

Action:

Error type 1: In RC/V View 26.2 using the TRN printed in the ROP output as the keys, either update the existing tuple with a TBN, or add a new tuple that contains a TBN.

Error type 2: In RC/V View 26.2 using the TRN printed in the ROP output as the keys, either update the existing tuple with a non-zero "Scrn Code", or add a new tuple that contains a non-zero "Scrn Code".

920. OATSTACCS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The dynamic access (DA) macro used to obtain the rIACCSDB tuple was not successful. The rIACCSDB tuple is dumped.

921. OATTKUXM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received in the OAopto_tlk() function. The message header is dumped.

922. OAUESCTN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Office data specified an invalid voice messaging service (VMS) interface access telephone number (TN). The call could not be transferred to the VMS as the customer requested. If the call was handled by an operator, the operator received an error display. If the call was handled in the automated calling card service (ACCS), the caller received the same treatment as if they had dialed an incorrect number (typically, an error announcement or re-order if the dialing error threshold was reached).

Data Structures:

RLESPINFO. Key fields: VMSI access codes, access TNs.

The access code (XXX), access TN (NPA-NXX-XXXX), and digit analysis selector (DAS) (XXX) are dumped on the ROP.

Action:

The access code indicates the VMS that was requested by the operator or the caller. Determine the correct access TN for the access code. If the access TN printed is not correct, use RC/V View 27.65 (VOICE MESSAGING SERVICE INTERFACE) with the access code as the key, to correct the access TN. (ODBE may be used, if necessary, on relation RLESPINFO.)

If the access TN is correct, verify that routing data exists for this TN. Use RC/V View 9.1 (DIGIT ANALYSIS SELECTOR [OFFICE DIALING]) with the DAS as the key to find the INC DIT and LDIT values. Use RC/V View 9.5 (INCOMING TRUNK DIGITS [OFFICE DIALING]) with INC DIT as the key and the access TN as the INC DIGS to verify the routing data for this TN.

If the LDIT field is Y in RC/V View 9.5, use RC/V View 9.3 (LOCAL DIGIT [OFFICE DIALING]) with the LDIT from View 9.1 and the access TN as the INC DIGS to verify the routing data for this TN.

RC/V Views 9.5 and 9.3 may use only part of the access TN, or they may use the entire number.

923. OA_UESNMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic charge quotation service system process (ACQS-SP) received an unexpected return from the OSSENDMSG() macro.

924. OAUEXPMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ATP received an unexpected message from the OSWGETMSG() macro.

925. OAUEXPRET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ATP received an unexpected return from the OSWGETMSG() macro.

926. OAUGLPRM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

There has been an error in updating a global parameter.

Probable Cause:

Unknown.

Action:

None.

927. OAUKN_MSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The virtual network (VN) model sent an invalid message type to near position release when a transfer or position release failed. The code returns to the wait action state, so no recovery action is needed.

928. OAUMSGWR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message type was received. The message buffer is printed. Return to the function that issued the assert request.

929. OAUNEECDPDL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call was routed to an SM that contains no call processing data links (CPDLs) to the EIS selected for the call. The rIEISLKSEL (external information system [EIS] link select) tuple associated with the indicated EIS may not have been inserted.

Data Structures:

RLEISLKSEL.

Action:

The CPDLs need to be grown on this SM, or operators who provide services requiring this EIS must log in on terminals connected to SM's terminating CPDLs for the needed EIS. If the rIEISLKSEL tuple was not inserted, the RLEISLKSEL audit should correct the problem.

930. OA_UNEXCLSS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAhbc_hdlr() function detected an invalid message class; the quote is not sent to the hotel billing information center (HOBIC).

931. OAUNEXFWCKR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) position terminal process (PTP) NEAR MAIN model received a forward number check reply (OAMFRPLY) input when the fwd_chk attribute in the rITALOOPDB tuple was set to DBNO. This input should never be received by this model when fwd_chk is DBNO.

Probable Cause:

The external information system (EIS) model incorrectly forwarded this input to the NEAR model, or the fwd.chk attribute in the rITALOOPDB tuple was updated incorrectly.

Action:

Contact field support personnel.

932. OAUNEXPTR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PTRDB	Audit Mode: elev

Problem:

While creating the ACCS-TP or pseudo ACCS-TP process, it was found that a PTRDB tuple was already attached to the PCBLA for that process. This should never occur because all resources are unlinked when a process dies. No idle resources should be linked to anything.

Probable Cause:

A failure occurred while unlinking resources from a previous process. There is a case missing where resources must be unlinked.

Action:

Schedule the PTRDB audit.

933. OAUNEXQRY (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: QRYDB	Audit Mode: elev

Problem:

While creating the ACCS-TP, it was found that a QRYDB tuple was already attached to the PCBLA for that process. This should never occur because all resources are unlinked when a process dies. No idle resources should be linked to anything.

Probable Cause:

A failure occurred while unlinking resources from a previous process. There is a case missing where resources must be unlinked.

Action:

Schedule the QRYDB audit.

934. OAUNEX_RET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return value was received from a function call in the automated calling card service (ACCS) NEAR model.

935. OA_UNEXWMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic charge quotation service (ACQS) system process received an unexpected message from the

OSWGETMSG() macro.

936. OAUNK_CARR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This call used a carrier that was defined in RC/V View 10.3 (INTER-LATA CARRIER), but the carrier data needed in RC/V View 26.25 (ACCESS TANDEM ROUTE INFO. FOR PRIMARY & ALTERNATE TOLL & ASSIST. O.S.) was missing. The carrier data is from the RLFC_DIOPR relation.

Data Structures:

RLFC_DIOPR. Key fields: carrier, bcarrier.

Action:

Use RC/V View 26.25 to insert the missing carrier data. If the data exists, use RC/V View 21.33 (OSPS SWITCHING MODULE GROWTH) for the asserting SM to set the OPRT 2 field to Y.

937. OAUNONOFF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLUNONOFF tuple was not found with the associated keys.

Data Structures:

RLUNONOFF. Key fields: ARS group ID, on-network digits.

Action:

An rLUNONOFF tuple must be inserted into the database. The ROP information provides the automatic route selection (ARS) group ID and the on-network network number.

Use the base relation RLFACNAME to recover the ARS group name associated with the reported ARS group index. Use RC/V View 9.23 (ON NETWORK NUMBER CONVERSION) to insert the appropriate tuple. File a trouble report.

938. OAUNRLOFFON (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLUNOFFON tuple was not found with the associated keys.

Data Structures:

RLUNOFFON. Key fields: ARS group ID, value of the conversion index.

Action:

An rLUNOFFON tuple must be inserted into the database. The ROP information provides the automatic route selection (ARS) group ID, the conversion index value, the off-network network number, and the current dialing plan number.

Use the base relation RLFACNAME to recover the ARS group name associated with the reported ARS group index. Use RC/V View 9.22 (OFF NETWORK NUMBER CONVERSION) to insert the appropriate tuple. File a trouble report.

939. OAUNSDS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLUNSDS tuple was not found with the associated keys.

Data Structures:

RLUNSDS. Key fields: ARS group ID, value of the conversion index.

Action:

An rLUNSDS tuple must be inserted into the database. The ROP information provides the automatic route selection (ARS) group ID, the conversion index, and the dialed digits.

Use the base relation RLFACNAME to recover the ARS group name associated with the reported ARS group index. Use RC/V View 9.21 (PRIVATE NETWORK DIALING PLAN) to populate the appropriate tuple. File a trouble report.

940. OAUNTRANROW (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLUNCNFLCT tuple was not found.

941. OAUNXDESTTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid call type was populated for the local digit interpreter table (LDIT)/incoming digits (INC DIGITS) combination.

Data Structures:

RLFC_TRUNK. Key field: port

Action:

Use the digit analysis selector (DAS) value dumped as the key for RC/V View 9.1 (DIGIT ANALYSIS). This view gives the LDIT associated with the call. The LDIT and the INC DIGITS are the keys for RC/V View 9.3 (LOCAL DIGITS). Change the call type field to a valid value for this LDIT/INC DIGITS combination. See the Translation Guide 5ESS[®] Switch TG-5 Vol. 1, Div. 3 (Translation Administration), Sec 3c (Routing and Charging Forms - Local Digit Interpreter Table (5300-3/5) - LDIT) for valid values.

942. OAUNXMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An operator services position system (OSPS) operator actions model received an unexpected message. This is usually a symptom of another problem. The message is ignored and processing continues.

943. OAUNXPATHTREL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The virtual network (VN) model received the MGPATHT_REL message from a terminating terminal process (TTP), originating terminal process (OTP), or conference circuit; this message should not have been received. This may be the result of improper call handling, a path continuity error, or a hardware error.

If the MGPATHT_REL message is from a conference circuit, the path that was dropped is dumped. The following

information is also dumped: associated process block (APB) key, model ID, state of the model, type of input message, where the message is from, far process ID, APB tag, value switched on, and external message header.

944. OAUNX_PID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The APB_ptr->int_msg.from value is corrupted in an incoming internal message. The pid value is unknown.

945. OAUNXREL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The monitored process received an unexpected path release message.

946. OAUNXRES (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected response was received in a message. This is most likely caused by falling into the default case of a switch statement.

Action:

Add the appropriate handling of the response in the switch statement.

947. OAUNXSIG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) operator actions (OA) model received an unexpected signal. This is usually indicates incorrect logic or another problem. The message is ignored and processing continues.

948. OAUPCCB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CBDB	Audit Mode: elev

Problem:

Failed to unlink the call build up data block (CBDB) and the process control block link area (PCBLA). As a result, the CBDB cannot be released. The call is not affected.

949. OA_U_PRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The macro RTGETED() was called from within the function OAgacdie() to obtain a D-port for a port retrieved from the process control block link area (PCBLA). In the process of obtaining the D-port the utility function RIgeted() called from the macro failed and returned GLNULPORT. This assert will dump the port that was used to determine the D-port.

950. OAUXPMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown or unexpected message was received. Note the occurrence and continue.

951. OAUXRCLR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received in the OAatp_init() function after the MGCLR_BACK message was sent to the originating terminal process (OTP). The call is idled.

952. OAVMS_BADPARM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An operator services position system (OSPS) automated calling card service terminal process (ACCS-TP) received an internal MGVMS_ANN message from the originating terminal process (OTP) that requested playing a voice messaging service interface (VMSI) announcement prompt, or aborting the prompt in progress.

The information in the message (that is, the action to take [play or abort]) was not consistent with the state of the ACCS-TP, or call disposition is indeterminate. The message header and the text containing the action and the call disposition will be dumped.

953. OAVMSUNXCDSP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) originating terminal process (OTP) received one of the following messages: MGOSPS_RPLY from the common channel signaling system 7 (CCS7) terminating terminal process (TTP), MGVMS_CMP from the automated calling card service terminal process (ACCS-TP), or MGTIMER when the FCVMSWCMP timer expires. The message received had an invalid call disposition. The OTP action was to play a VMSI-3 announcement prompt (for MGOSPS_RPLY) or to abort the prompt in progress (for MGVMS_CMP or MGTIMER), and the call disposition was not ring or busy. The process control block link area (PCBLA) data and the requested action (play or abort) will be dumped.

954. OAVMS_UNXEV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An operator services position system (OSPS) originating terminal process (OTP) received an external MGOSPS_RPLY message from a common channel signaling system 7 (CCS7) terminating terminal process (TTP) with an invalid event type. The OTP could not determine the call disposition. The message content and the process control block link area (PCBLA) data will be dumped in addition to the stack data.

955. OAVT_BADPSDB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAmultstor() function (in operator services position system [OSPS] virtual terminal [VT] code) found an invalid pointer to the RLGDA, RLPTRDB, or RLTAPOSDB relation. Without access to this data, the messages intended for the operator position or interflow position cannot be sent. Because the process is no longer able to function, a single process purge is requested.

956. OAVTBD_DB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interflow virtual terminal (VT) input model (OAtavt.sd) received an MGISDNDATA message, and the consistency check between the RLTALOOPDB relation and the RLTAPOSDB relation failed. The looptype in the rITALLOOPDB tuple indicates OSPS-z, and the if_pos and loopif in the rITAPOSDB tuple does not indicate OSPS-z. The data referenced by both tuples is dumped.

957. OAVT_BD_IFM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interflow virtual terminal (VT) input model (OAtavt.sd) on OSPS-a received an MGIFISDNDATA keystroke message and the key is not known. The message is dumped.

958. OAVTE_KILD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interflow virtual terminal (VT) input model (OAtavt.sd) received an MGOAMKILLD message on a wrong operator services position system (OSPS) switch, that is, OSPS-a or interflow position. The VT ignores this input and returns to the wait state.

959. OAVTE_MRCV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interflow virtual terminal (VT) input model (OAtavt.sd) received an MGMNRCVR (monitor recover call request) message on the wrong operator services position system (OSPS) switch. The VT ignores this input and returns to wait state.

960. OAVT_OLS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failure occurred while reading the RLFCSCRCDE or RLOLSR relation. Both relations are populated in RC/V View 26.3 (OSPS BACK SCREEN CODE TABLE).

Data Structures:

RLFCSCRCDE. Key field: scrncode (originating line screening [OLS] code).

RLOLSR. Key field: scrncode.

Action:

Use RC/V View 26.3 (or ODBE, if necessary) to check the key used for accessing the RLFCSCRCDE or RLOLSR relation with the actual keys for the relation. Verify that the relation or tuple exists, and if necessary add the relation or the tuple.

961. OAVT_TCS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failure occurred while reading the RLTCSTEXT relation.

Data Structures:

RLTCSTEXT. Key field: scrncode (terminating screening code [TCS] code).

Action:

Use RC/V View 27.1 (OSPS TERMINATING CODE SCREENING TEXT AND RESTRICTIONS) (or ODBE, if necessary) to check the key used for accessing the RLTCSTEXT relation as output on ROP with the actual keys for the relation. Verify that the relation or the tuple exists; if necessary, add the relation or the tuple.

962. OAWARBNARET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) interface call event point function OAeisbna() returned an invalid code when it was called by the OAevent() function in the OAEWAREPLY event. The invalid return code is dumped.

Probable Cause:

The OAeisbna() function returned an invalid code, or the OAevent() function is not accepting valid return codes.

Action:

Contact field support personnel.

963. OAWATBNARET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) interface call event point function OAeisbna() returned an invalid code when it was called by the OAevent() function in the OAEWATIMER event. The invalid return code is dumped.

Probable Cause:

The OAeisbna() function returned an invalid code, or the OAevent() function is not accepting valid return codes.

Action:

Contact field support personnel.

964. OAWDISCUXM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received by OT OAopsetup function, FCWDISCON state. The message is ignored. Dump msg.msghead.

965. OAWRAFUXM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received in the OAWRAFDISC state of the originating terminal process (OTP) OAopsetup() function after the MGONHOOK or MGINTERRUPT message was previously received by the OTP. The call will be idled.

966. OAWRLBNARET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The external information system (EIS) interface call event point function OAeisbna() returned an invalid code when it was called by the OAevent() function in the OAEWARELEASE event. The invalid return code is dumped.

Probable Cause:

The OAeisbna() function returned an invalid code, or the OAevent() function is not accepting valid return codes.

Action:

Contact field support personnel.

967. OAWSETUXM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received in OT OAopsetup function, FCWSETUP or FCRWSETUP states. The message is ignored. Dump msg.msghead.

968. OAZANCTYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An announcement type of 0 was detected; the announcement type is dumped.

969. OAZERONPA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An improper numbering plan area (NPA) was found on RC/V View 26.26 (ACCESS TANDEM INCOMING TRUNK GROUPS).

Data Structures:

RLFC_OPRTK. Key field: tgroup.

Action:

The ORIG NPA field on RC/V View 26.26 was set improperly. The ROP output provides the trunk group number and the ORIG NPA value associated with the trunk group.

For intercept, the ORIG NPA field must be set to the NPA from which the intercept traffic is originating. However, an invalid value was found for the printed trunk group number. Use RC/V View 26.26 for the indicated trunk group to change the ORIG NPA field to the correct value (the NPA of the far end of the trunk group).

970. OAZIP_OTDBS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to obtain a OAOTDB from the idle list. The incoming trunk group is printed.

Probable Cause:

There are not enough OAOTDBs tuples.

Action:

Verify for all incoming trunk groups carrying operator traffic that there exists an entry in RC/V View 26.26.

If RC/V View 26.26 exists for all trunk groups on this SM that are receiving operator traffic, allocate more RLOATDBs using IOAOTDB on RC/V 8.40, "SRE INCREMENTAL GLOBALS."

If the problem persists, contact your next level of support.

Range: op**1. OP_AR_ACC_DB (5E14 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This ASSERT is called when DB(read/update)tup != GLSUCCESS.

2. OP_AR_END_DB (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This ASSERT is called when DBendtrn != GLSUCCESS.

3. OP_AR_OPN_DB (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This ASSERT is called when DBopnrel != GLSUCCESS. The macro DBOPNREL, found in op/OPsyspro/OPautmsg.h, is called from op/OPsyspro/OPautrec() to open a relation in the database.

4. OP_BADMSGTYPE (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message type received is not known.

5. OPBADROUTE_ENTRY (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A bad route entry was found in the TCP/IP route tables.

Probable Cause:

An unexpected condition occurred.

6. OPBADTRGRS (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert will be used as a result of failure when trigger function is called with invalid reason.

7. OPCSADASRT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Bad OS primitive calls for CSADB/RSDS features.

8. OPINVALID_PID (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid PID was found to exist for a TCP/IP link.

Action:

Remove and then restore the TCP/IP link that is bad.

9. OPNOPORTLA (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

A key used to access the PORTLA tuple using the DAGETPTLA macro does not match the key contained in the tuple referenced. The elevated audit requested should reconstruct the PORTLA tuple from static data and schedule the appropriate recovery. It may be possible that the corresponding rIFC_PORTTYP tuple is missing or corrupt for the identified port; if this ASSERT repeats, this static data should be interrogated using Recent Change or ODBE. The key used to access the tuple and the key contained in the tuple are dumped, respectively.

10. OP_OS_BAD (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid operating system (OS) call return code was encountered.

11. OP_RANGE (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The data is out of range.

12. OPUNXMSG (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The AS SM system process has received an unexpected message. Dump of message follows on ROP.

13. SES_2_ASRT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Bad entry reason for SP initialization.

14. TP_BADMSG (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A BAD MESSAGE was received by the process. The message will printed on the ROP.

15. TPBADTCPMSG (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The TCP received a BAD TCP message from the remote side or lower layers have not processed the message correctly.

16. TPDBOPFAIL (5E14 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The DB operation of one of the relations has failed. The process associated with the relation has been purged because it could cause the process to remain forever.

17. TPGLTCPPKTINVAL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When a attempt was made to increase rITCPPKT, either the tuple with key of GLtcpkt was not found or the value of the GLtcpkt is incorrect.

18. TPINCORRECTHDR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A TCP header was formatted with no sync, reset or ack bit set. This is an error.

19. TP_INVACTION (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The action for the control is invalid.

20. TP_INVALHDRSEQ (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The sequence in the TCP header is invalid.

21. TPINVBLKSTATE (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The state of the TCP block is invalid.

22. TP_INVCTRL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The control received is invalid for this controller.

23. TPINERROR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The error value in the TCP block is incorrect. The error value is dumped.

24. TPINVLDPROC (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A process has called the transport with a incorrect processor type.

25. TPNODALB (5E14 and later)

Recovery Action: spp	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

There has been a failure to access the DALB associated with an active process. With no DALB, the process is isolated from its port. Without access to the "real world", there is no reason to continue being a process. The process is purged and the DALB audit is scheduled.

26. TPNOPORTYPE (5E14 and later)

Recovery Action: spp	SPP: n	Audit: PORTTYP	Audit Mode: elev

Problem:

There has been a failure to access the PORT_TYPE associated with an active process. With no PORT_TYPE, the process cannot be associated with a OAP. The process is purged.

27. TP_NOSHORTBNDRY (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The TCP data need to be on a short boundary to compute the check sum. If this is not true, then the process can be purged due to alignment requirement for the CPU. TCP is trying to compute checksum for data not aligned on a short boundary.

28. TPOPDBFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database access failed in the OAP terminal process.

29. TPOPPRFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAP terminal process called a primitive that failed.

30. TP_RANGE (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Either the action or the control associated with the transport connection is out of range.

31. TPRCV_ERROR (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: TCPCRCV	Audit Mode: elev

Problem:

There is a problem with the receive request queue for a TCP connection. The RLTCPCRCV audits will be scheduled.

Range: opsp**1. IN2KALIGN (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Following an offline SM pump, the dynamic random access memory (RAM) start or end address was not 2K aligned.

2. SIBADOPTYPE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Offline pump system process (OPSP) has detected an invalid value in Sloptype. The invalid value will be dumped to the ROP and OPSP will be purged.

3. SINIPINVODRID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid ODRID has been passed to Slnipstrt(). The invalid ODRID will be dumped on the ROP and the NIPMP request aborted.

4. SIOFLBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Offline pump (OP) could not verify the state due to a mate conditioning failure.

5. SIOPBBUSY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The offline pump system process (OPSP) was in the wrong state for receiving a BUSY message from the AM.

6. SIOPBFINIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The offline pump system process (OPSP) was in an invalid state for receiving the FINISHED INIT message from the AM. The OPSP and AM are out of sync.

7. SIOPBFPMP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The offline pump system process (OPSP) was in an invalid state for receiving a FINISHED PUMPING message from the AM. The OPSP and AM are out of sync.

8. SIOPBREADY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The offline pump system process (OPSP) was in an invalid state for receiving a READY message from the AM. The OPSP and AM are out of sync.

9. SIOPBSETUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The offline pump system process (OPSP) was in an invalid state for receiving a SETUP OP PATH message from the AM. The OPSP and AM are out of sync.

10. SIOPDBBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return was received from a database (DB) primitive, such as the DBfrdtup() primitive.

11. SIOPDDFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DDWRITE() macro returned failure when writing the DDSOPSTAT key value. The failure return code is printed on the ROP.

12. SIOPHSRGBAD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The number of hashsum ranges does not equal the number of hashsum tables as listed in the critical information. The numbers must be the same and in corresponding locations; if not, the offline pump system process (OPSP) will not correctly complete its hashsum check.

13. SIOPINVCC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The FINISHED PUMPING message from the AM contained an invalid completion code.

14. SIOPINVKEY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The offline pump trigger function was passed invalid data.

15. SIOPINVREAS (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid startup reason was given for process initialization.

16. SIOPINVSTATE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The offline pump system process (OPSP) is in an invalid state.

17. SIOPMSGID (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The Slopptysend() function received an invalid message ID to print.

18. SIOPPRSTATE (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An invalid offline pump system process (OPSP) state was found in a call to an OPSP primitive.

19. SIOPREQTYPINV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid hardware action request type was passed to the Slopbusy() function. The invalid request type is printed.

20. SIOPRNGFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A range check for the DDOPSTAT value failed. The value was out of range. The invalid DDOPSTAT value is printed.

21. SIOPSMFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The offline pump system process (OPSP) failed to send an interprocess message using the OSSENDMSG() macro.

22. SIOPUNMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The offline pump system process (OPSP) received a message that it did not expect.

23. SIOPWMFAIL (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The offline pump system process (OPSP) received a failure while waiting for an operating system for distributed

switching (OSDS) message.

24. SITERMREAS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal reason for aborting peripheral offline pump was found. The invalid request reason is printed.

Range: os**1. OSACE0 (5E11 and later)**

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid or unexpected message was received by the AMCT (in the AM's operational kernel process [OKP]), the AMSM (in the AM's switch maintenance kernel process [SMKP]), or the AMIT (in the SM or CMP) clock accuracy system process. The message will be dumped to the ROP and otherwise ignored.

2. OSACE1 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The AM, SM, or CMP system process in charge of clock synchronization (absolute time [ATIME] and operating system for distributed switching [OSDS] time relative to switch initialization [RTIME]) was created with an invalid reason. The process will be purged.

3. OSACE2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The asserting processor received a new operating system for distributed switching (OSDS) time relative to switch initialization (RTIME) value that differs from its current RTIME by more than 5 seconds. The new RTIME value will be used and no further recovery action is taken. In the field, repeated occurrences of this assert indicate clock drift and/or time distribution problems. In a lab environment, this assert will be common (and is to be expected) when a processor is in DART or SMITS.

4. OSACE3 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSCREATE(), OSREPLACE(), or OSRSTART() primitive received a program ID for the null program, sysint(), which is used to fill unused OSprogtab[] entries. The running process will be purged.

5. OSACE4 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSCREATE() primitive, which creates only terminal processes, was called with a program ID for a system process. The running process will be purged.

6. OSACE5 (5E11 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

Returned to the kfault() function from a call to the Slkfault() function. This should never happen. A selective initialization will be performed.

7. OSACE6 (5E11 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

Returned to the kevent() function from a call to the OSkevent() function. This should never happen. A selective initialization will be performed.

8. OSACE7 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The program sysint(), used to fill unused OSprogtab[] entries, has been called. This should never happen. The running process will be purged.

9. OSACE8 (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

The OSprscnt() function found an invalid program ID in the process control block (PCB) of some active process.

10. OSACE9 (5E11 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

In the AM's operational kernel process (OKP), the *UNIX*[®]-RTR kernel call to the ptimer() function failed while requesting a timer. A selective initialization will be performed.

11. OSACE12 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSATIMER() primitive received a time parameter that was out of range.

12. OSACE13 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

OSCREATE() was called during system initialization. A terminal process is not allowed to be created during initialization. OSEPROC will be returned to the caller and the terminal process will not be created.

13. OSACE15 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSrtcheck() function failed. This function verifies the consistency between the physical memory layout and the offsets or array sizes defined for certain operating system (OS) stack structures.

In the AM's operational kernel process (OKP), this assert indicates that the segment table offset constant OSSGTOFFSET disagrees with the kernel process control block's actual physical segment table offset.

In the SM or CMP, the number of stacks supported by the operating system for distributed switching (OSDS) conflicts with the amount of physical memory space allocated for the stacks. When this assert fires, THE ONLY

SOLUTION IS TO REBUILD THE LOAD. Although this assert will not escalate or cause a single process purge, it will fire roughly once an hour until the problem is corrected.

14. OSACE16 (5E11 and later)

Recovery Action: spp	SPP: y	Audit: PCB	Audit Mode: nonseq

Problem:

A process control block (PCB) had an invalid state. Both the running process and the process associated with the invalid PCB will be purged. A demand-mode PCB audit will also be invoked. Recovery actions associated with a hardware error (for example, a correctable memory bit error, parity error, or cache error, etc.) may cause sporadic occurrences of this assert.

15. OSACE17 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A system process's entry function defaulted to the OSdfiltproc() function. This should not happen in a correctly built load and the problem must be corrected. The system process's process control block (PCB) will be dumped.

16. OSACE18 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A terminal process's entry function defaulted to the OSdfiltproc() function. This should not happen in a correctly built load and the problem must be corrected. The terminal process's process control block (PCB) and its parent's PCB and operating system process ID (OSPID) will be dumped.

17. OSACE19 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The system or terminal process default entry function, OSdfiltproc(), is not executing under the control of a running process. The function should not be defaulted to in a correctly built load. It must be determined why the function was defaulted to, and why it was not executing under the control of a running process.

18. OSACE20 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the AM's operational kernel process (OKP), the operating system for distributed switching (OSDS) AMCT clock accuracy system process failed to obtain its cyclic hourly time synchronization timer or a daylight savings time (DST) adjustment timer. In the former case, time synchronization and clock accuracy throughout the system will be impacted. In the latter case, which could only occur between 00:00 and 02:00am on the DST transition days, the 02:00am DST adjustment will not occur automatically. Timers can be obtained to remedy both situations by setting the system time with a SET:CLK input command or manually purging the asserting process with the INIT:SPP input command.

In the AM's switch maintenance kernel process (SMKP), the OSDS AMSM clock accuracy system process failed to obtain a retry timer for its time request to OKP. As a result, SMKP may run with unsynchronized time for up to an hour before OKP automatically resynchronizes SMKP's time. This situation can be corrected sooner by setting the system time with a SET:CLK input command or manually purging the asserting process with the INIT:SPP input command.

command.

In the SM or CMP, the OSDS AMIT clock accuracy system process failed to obtain its cyclic time verification timer during an initialization. This will lead to time drift in the asserting processor unless corrected by manually purging the asserting process with the INIT:SPP input command.

19. OSACE21 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was detected between the daylight savings time (DST) field in the absolute time (ATIME) variable and a redundant copy. To correct the inconsistency, a new ATIME has been requested from the AM.

20. OSACE22 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSENDLNK() primitive was called to send a message to a process on the same processor. The CMDESTF error code will be returned to the caller and the message contents will be dumped to the ROP.

21. OSACE23 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSLASTPROGID() primitive encountered a corrupt previous program ID for a process. The process's process control block (PCB) and OSPRGSTATEA() structures will be dumped. The process's previous program ID will be reinitialized, and the OSEPROG error code will be returned to the caller of the primitive.

22. OSACE24 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The insertion of an RLCCBCOM, RLOSPCB, RLOSTCB, or RLPCBLA tuple failed.

If this occurred during the initialization of an SM, it is quite unlikely that the processor will initialize, or if it did, that call processing functionality will be fully available.

If this occurred when an SM was fully operational, during the growth of an SM resource, it is most likely because of a shortage of unprotected office dependent data (UODD), in which case more memory needs to be added, to allow for growth of all related resources.

23. OSACE25 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the OSdeliver() function, the processor ID in a message header was invalid, forcing delivery of the message to the data delivery (DD) system process.

24. OSACE26 (5E11 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSIS_ITIME() macro failed, indicating that the operating system for distributed switching (OSDS) internal clock (ITIME) was out of range. A selective initialization will be performed.

25. OSACE27 (5E11 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSGETITIME() primitive failed, indicating that the operating system for distributed switching (OSDS) internal clock (ITIME) was out of range. A selective initialization will be performed.

26. OSACE28 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSCATIMER() primitive received a time parameter that was out of range.

27. OSACE29 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSCTIMER() primitive received a time parameter that was out of range.

28. OSACE30 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBxrdgparm() function returned an error when an attempt was made to read the global parameter GLTBLLINES while in a recent change transaction.

29. OSACE31 (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

The operating system for distributed switching (OSDS) time relative to switch initialization (RTIME) clock is out of range. The timing system process will be purged. The RTIME clock will be corrected when the timing system process reinitializes.

30. OSACE32 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operating system for distributed switching (OSDS) master system process (MSP) was created with an invalid reason.

31. OSACE33 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operating system for distributed switching (OSDS) master system process (MSP) received an invalid message

type.

32. OSACE34 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSWGETMSG() primitive returned a value other than OSMSG to the operating system for distributed switching (OSDS) master system process (MSP).

33. OSACE35 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operating system for distributed switching (OSDS) master system process (MSP) received an unrecognized MGTIMER message.

34. OSACE36 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSETATIME() primitive received an absolute time (ATIME) parameter that was out of range.

35. OSACE37 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBxrdgparm() function returned an error when an attempt was made to read the global parameter GLTNALINES while in a recent change transaction.

36. OSACE38 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSETRTIME() primitive received an operating system for distributed switching (OSDS) time relative to switch initialization (RTIME) parameter that was out of range.

37. OSACE39 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSTIMER() primitive received a time parameter that was out of range.

38. OSACE40 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBxrdgparm() function returned an error when an attempt was made to read the global parameter GLTATLINES while in a recent change transaction.

39. OSACE41 (5E11 and later)

Recovery Action: spp	SPP: y	Audit: null	Audit Mode: null

Problem:

The process state of a process control block (PCB) is RUNNING, but the running process variable does not point to this PCB. The process associated with the PCB will be purged.

40. OSACE42 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: PCB	Audit Mode: nonseg

Problem:

The OSIS_RUNNING() or OSIS_PTRRUNNING() macro failed. The running process variable contains an invalid process ID or its associated process control block (PCB) is not in the RUNNING state. The process will be purged and a demand-mode PCB audit invoked.

41. OSACE43 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

MICO is being purged and has either too many timers in its TCB list or its TCB list has been corrupted and is no longer valid. MICO's timers have therefore been deallocated.

42. OSACE44 (5E11 and later)

Recovery Action: spp	SPP: y	Audit: null	Audit Mode: null

Problem:

In the OSdispatch() function, a system process that can be signaled to run should not have an outstanding timeout timer; however, the system process had an outstanding timeout timer. The process will be purged.

43. OSACE46 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: PCB	Audit Mode: nonseg

Problem:

A purged process could not be unlinked from its ready queue head cell. The ready queue head cells and the process control block (PCB) of the purged process will be dumped to the ROP. A demand-mode PCB audit will be invoked to recover the ready queue. This type of error may occur sporadically (and is unavoidable) when hardware errors, tight loop detection, purging initializations, or other interrupt-level activities result in a single process purge of a running process while the operating system (OS) is manipulating the ready queue.

44. OSACE47 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was found in the per process message queue of the running process. The process will be purged.

45. OSACE48 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: PCB	Audit Mode: nonseg

Problem:

An error was found in the process control block (PCB) idle list. The running process will be purged and a demand-mode PCB audit will be invoked.

46. OSACE49 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was found in the per process stack linkage. The process associated with the stack will be purged.

47. OSACE50 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: PCB	Audit Mode: nonseg

Problem:

An error was found in the process ready queue. The process will be purged and a demand-mode process control block (PCB) audit will be invoked.

48. OSACE51 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: SCB	Audit Mode: nonseg

Problem:

In the OSdispatch() function, a stack could not be allocated for a restarting process. The restarting process will be purged and a demand-mode stack control block (SCB) audit invoked.

49. OSACE52 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSlocalmsg() function or an operating system for distributed switching (OSDS) message sending primitive was passed a message with an invalid priority. The offending message will be dumped to the ROP. The message's priority will then be set to 0, and the message will be delivered as usual.

50. OSACE53 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: TCB	Audit Mode: nonseg

Problem:

An error was found in the timer control block (TCB) idle list. The running process will be purged and a demand-mode TCB audit invoked.

51. OSACE54 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: PCB	Audit Mode: nonseg

Problem:

A process control block (PCB) had an invalid process priority (procprior). The running process will be purged and a demand-mode PCB audit invoked.

52. OSACE55 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: TCB	Audit Mode: nonseg

Problem:

An error was found in the per process timer list. The running process will be purged and a demand-mode timer control block (TCB) audit will be invoked.

53. OSACE56 (5E11 and later)

Recovery Action: spp	SPP: y	Audit: TCB	Audit Mode: nonseg

Problem:

An error was found in the per process timer list. The associated process will be purged and a demand-mode timer control block (TCB) audit will be invoked.

54. OSACE57 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: TCB	Audit Mode: nonseg

Problem:

An error was found in the timer heap structure. The running process will be purged and a demand-mode timer control block (TCB) audit will be invoked.

55. OSACE59 (5E11 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

A system process was unsuccessfully initialized. A selective initialization will occur.

56. OSACE60 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: SCB	Audit Mode: nonseg

Problem:

An error was found in the stack control block (SCB) idle list. The running process will be purged and a demand-mode SCB audit invoked.

57. OSACE61 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The running process is linked to an invalid stack. The process will be purged.

58. OSACE62 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSbecome() or OSsfentry() function received an invalid system process number parameter. The running process will be purged.

59. OSACE63 (5E11 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

In the OSsyspinit() function, the process number parameter was out of range. A selective initialization will be performed.

60. OSACE64 (5E11 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

In the OSsyspinit() function, the program number parameter was out of range. A selective initialization will be performed.

61. OSACE65 (5E11 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

In the OSsyspinit() function, a stack could not be allocated for a system process. A selective initialization will be performed.

62. OSACE67 (5E11 and later)

Recovery Action: spp	SPP: y	Audit: null	Audit Mode: null

Problem:

An error was found with a process control block's (PCB's) timeout timer. The process will be purged.

63. OSACE68 (5E11 and later)

Recovery Action: spp	SPP: y	Audit: null	Audit Mode: null

Problem:

An error was found in a process's message queue. The process will be purged.

64. OSACE69 (5E11 and later)

Recovery Action: spp	SPP: y	Audit: null	Audit Mode: null

Problem:

In the OSdispatch() function, a system process that can be signaled to run should not have an outstanding timeout timer; however, the system process had an outstanding timeout timer. The process will be purged.

65. OSACE70 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: MCB	Audit Mode: nonseq

Problem:

An error was found in the message control block (MCB) idle list. The running process will be purged and a demand-mode MCB audit invoked.

66. OSACE71 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: MCB	Audit Mode: nonseq

Problem:

In the OSfreemcb() function, the OSIS_PCBI() macro failed. The mowner field of a message control block (MCB) contained an invalid process ID. The running process will be purged and a demand-mode MCB audit will be invoked.

67. OSACE72 (5E11 and later)

Recovery Action: spp	SPP: y	Audit: null	Audit Mode: null

Problem:

A dynamic access (DA) primitive that accessed the RLDB_HEADC, RLOSBIT or RLOSBCB unprotected relation failed, indicating corrupted tuples or linkages in one or more of these relations. The broadcast system process will

be purged. The post-single process purge initialization of this process will restore the tuples and linkages of these relations.

68. OSACE73 (5E11 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

The *UNIX*[®]-RTR kernel process call to the *idlevent()* function is used by the AM's operational kernel process (OKP) to get an event when *UNIX*[®]-RTR enters idle loop. This call returned a failure because an invalid OKP process number was supplied. A selective initialization will be performed.

69. OSACE74 (5E11 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

A *UNIX*[®]-RTR kernel call to the *ptimer()* function to request a timeout event returned failure because the process specified was invalid. A selective initialization will be performed.

70. OSACE75 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: PCB	Audit Mode: nonseg

Problem:

A process control block (PCB) had an invalid program ID. The running process will be purged and a demand-mode PCB audit invoked.

71. OSACE76 (5E11 and later)

Recovery Action: spp	SPP: y	Audit: PCB	Audit Mode: nonseg

Problem:

The process ID passed to the *OSPIDPGM()* primitive had an invalid program ID associated with it. The process will be purged, a demand-mode process control block (PCB) audit will be invoked, and an error will be returned to the caller of the primitive.

72. OSACE77 (5E11 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

A *UNIX*[®]-RTR kernel call to the *ptimer()* function to cancel a pending *UNIX*[®]-RTR timer returned failure because the specified process was invalid. A selective initialization will be performed.

73. OSACE78 (5E11 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

The AM's operational kernel process (OKP) uses the *UNIX*[®]-RTR kernel call to the *ptimer()* function to cancel the pending *UNIX*[®]-RTR timer for OKP. This call returned a failure because the specified process was invalid. A selective initialization will be performed.

74. OSACE79 (5E11 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the *UNIX*[®]-RTR spy_time() function failed in the OSGETSPY() primitive.

75. OSACE81 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the *UNIX*[®]-RTR spy_kinit() function failed in the OSINITSPY() primitive.

76. OSACE82 (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

The absolute time (ATIME) clock is out of range. The timing system process will be purged. The ATIME clock will be corrected when the timing system process reinitializes.

77. OSACE84 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid request to manipulate stack/write protection was found. The running process will be purged.

78. OSACE85 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The absolute time (ATIME) clock in a protocol handler (PH) was corrupted or updated incorrectly. The PH will zero the ATIME and request a new time from its SM.

79. OSACE86 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A user of the OSBCAST() primitive requested that a message be transmitted locally. It is illegal to transmit a message to the originating processor with the OSBCAST() primitive.

80. OSACE89 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSdispatch() function in the SM found that the stored number of supported stack control blocks (SCBs) was overwritten. The prime candidate is the process relinquishing control of the processor. The corrupted value and the process control block (PCB) of the running (candidate) process will be dumped to the ROP. The stored number will then be corrected to match the number of stacks derived from the user stack memory layout symbols and the SM type.

81. OSACE90 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: PCB	Audit Mode: nonseg

Problem:

An unexpected interject state was encountered during interject message handling, indicating that an unexpected or invalid interject client was attempting to use an operating system (OS) primitive (most likely), or that the running process variable is corrupt. This assert will reinitialize the interject environment by purging interject, and it will invoke a demand-mode PCB audit to recover any process control block (PCB) inconsistencies. A DUMP TTY ERROR may accompany this assert if the interject environment variable is indeed out of range.

82. OSACE91 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A primitive that manipulated the RLOSBIT or RLOSBCB relation failed. The broadcast system process will be purged. The post-single process purge initialization of the broadcast system process will reinitialize all broadcast buffers.

83. OSACE92 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The OScallbcst() function encountered an error when accessing the RLOSBIT or RLOSBCB relation. The running process (if any) will be purged.

84. OSACE93 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSbcbcinit() function failed to initialize the RLOSBIT and RLOSBCB relations. The running process will be purged.

85. OSACE94 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Checks on data read from the RLOSBIT relation failed. The RLOSBIT audit (and possibly the RLOSBCB audit) will be invoked in demand-mode.

86. OSACE95 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Checks on data read from the RLOSBCB relation failed. The RLOSBCB audit will be invoked in demand-mode.

87. OSACE97 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSBCAST() primitive attempted to start a job with a preassigned broadcast ID (BID), but the BID was already in use. The associated rIOSBIT tuple and the process control block (PCB) using the BID will be dumped to the ROP.

88. OSACE99 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The broadcast system process received an error return from a function call which does not manipulate the RLOSBIT or RLOSBCB relation.

89. OSACE100 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OScallbcst() function received an invalid return code from a user's broadcast reply processing function. The user's process ID and broadcast ID will be dumped to the ROP.

90. OSACE101 (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An error was found in a process's message control block linkages. The process will be purged.

91. OSACE102 (5E11 and later)

Recovery Action: spp	SPP: y	Audit: PCB	Audit Mode: nonseg

Problem:

An error was found with a process control block's (PCB's) state. A demand-mode PCB audit will be invoked.

92. OSACE103 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A feature function that specifies OSsodef2_msg() as its default function, is not loaded in the system. This situation can occur due to an error in the code, wrong or mutilated office dependent data (ODD) or an error in the feature activation table (FAT).

Use the assert information (the stack frame contains the two functions prior to the assert macro call) to determine the function that called the unloaded function. The first parameter on the stack will be the address of the FAT that was used and the second parameter will be the address of the feature identifier (FID) value. Use these two parameters to determine the feature function that was called but not loaded.

93. OSACE104 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A feature function that specifies OSsodef3_log() as its default function, is not loaded in the system. This situation can occur due to an error in the code, wrong or mutilated office dependent data (ODD) or an error in the feature activation table (FAT).

Use the assert information (the stack frame contains the two functions prior to the assert macro call) to determine the function that called the unloaded function. The first parameter on the stack will be the address of the FAT that was used and the second parameter will be the address of the feature identifier (FID) value. Use these two parameters to determine the feature function that was called but not loaded.

94. OSACE105 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A feature function that specifies OSsodef4_spp() as its default function, is not loaded in the system. This situation can occur due to an error in the code, wrong or mutilated office dependent data (ODD) or an error in the feature activation table (FAT).

Use the assert information (the stack frame contains the two functions prior to the assert macro call) to determine the function that called the unloaded function. The first parameter on the stack will be the address of the FAT that was used and the second parameter will be the address of the feature identifier (FID) value. Use these two parameters to determine the feature function that was called but not loaded.

95. OSACE106 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The reply management timer expired, causing the OSmdeoj() function to be called to end a message distribution and reply management (MD&RM) job. The job's resource error counter for message distribution to the protocol handlers (PHs) has a positive value, which is impossible with the job in a pending state.

96. OSACE107 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message distribution and reply management (MD&RM) job is in an invalid state when the OSmdeoj() function is called to end the job.

97. OSACE108 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the OSmdintj() function, a protocol handler (PH) reply message was received during packet interface (PI) interject with a valid ID for an active job; however, the state of the job is pending, implying that no messages have been distributed to the PHs.

98. OSACE109 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the OSmdintj() function, the last protocol handler (PH) reply message was received for a message distribution and reply management (MD&RM) job; however, the job is not in the reply management state.

99. OSACE110 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the OSmdintj() function, a message distribution and reply management (MD&RM) job is in an invalid state when processing a protocol handler (PH) reply message. The reply was not the last one for the user's job, and it caused the user's reply collection buffer to become completely filled. The collection buffer should have been transmitted to the user before this error condition occurred.

100. OSACE111 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When sending a message containing collected protocol handler (PH) replies to the user, the OSmdsndusr() function returned an incorrect value to the OSmdintj() function.

101. OSACE112 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSmdrtnhdl() function received an invalid return from a user supplied function to process a protocol handler (PH) reply message during interject.

102. OSACE113 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the OSmdsched() function, a message distribution and reply management (MD&RM) job is incorrectly in the distribution state when a job is being scheduled.

103. OSACE114 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the OSmdphdist() function, the PSsendmsg() function returned the PSERROR error code when trying to distribute a message to the protocol handlers (PHs).

104. OSACE115 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSmdphdist() function received an unrecognized return code from the PSsendmsg() function when trying to distribute a message to the protocol handlers (PHs).

105. OSACE116 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

For a simultaneous message distribution to the protocol handlers (PHs), the PSsendmsg() function returned the PSERROR error code to the OSmdreqhdl() function, indicating an error in user input.

106. OSACE117 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the OSmdsndusr() function, the message distribution and reply management (MD&RM) facilities should be set up for sending a message to a user; however, the state of the user's job is idle.

107. OSACE118 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSWAIT() primitive was executed after an attempt to obtain a message distribution timer failed. After returning from OSWAIT(), the OSmdrm() function found that the stored status of which user job was currently active for message distribution had been corrupted.

108. OSACE119 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSmdrm() function could not obtain a valid message distribution and reply management (MD&RM) user from the tag of a timer.

109. OSACE120 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the OSmdrm() function, an unrecognized message was received by the MDRM message distribution and reply management (MD&RM) system process.

110. OSACE121 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the OSmdrm() function, an invalid value was returned by the OSWGETMSG() primitive.

111. OSACE122 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSmdrm() function found that the stored status of whether the previous timer request was successful or unsuccessful had been corrupted.

112. OSACE123 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSmdrmentry() function encountered an invalid reason for system process creation.

113. OSACE124 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the OSmdsndusr() function, the OSSENDMSG() primitive returned OSEPROC (the receiving process ID was invalid), OSELENGTH (the message was longer than the buffer allocated by the receiving process), or an invalid value when it tried to send a message to a user.

114. OSACE125 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the OSmdsndusr() function, the PSendmsg() function returned the PSERROR error code or an invalid value when trying to send a message to a user.

115. OSACE126 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the OSmdsndusr() function, a call to the OSWAIT() primitive returned an unexpected value.

116. OSACE127 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the OSmdtmrreq() function, an error was found in the input to the OSTIMER() primitive.

117. OSACE128 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the OSmdtmrreq() function, the OSWAIT() primitive returned an unexpected value.

118. OSACE129 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSmdtplfas() function encountered an invalid message distribution and reply management (MD&RM) user.

119. OSACE130 (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

The OSTAKETMRS() primitive encountered an error in the timer control block (TCB) list associated with the caller of the primitive.

120. OSACE131 (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

The OSTAKETMRS() primitive encountered an error in the timer control block (TCB) list associated with the "from" process that was passed as a parameter.

121. OSACE132 (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

The OSTAKETMRS() primitive encountered an error in the message control block (MCB) list associated with the caller of the primitive.

122. OSACE133 (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

The OSTAKETMRS() primitive encountered an error in the message control block (MCB) list associated with the "from" process that was passed as a parameter.

123. OSACE134 (5E11 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

In the protocol handler (PH) or packet interface (PI), the OSdispatch() function encountered an error in the ready queues. A selective initialization will be performed.

124. OSACE135 (5E11 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

In the protocol handler (PH) or packet interface (PI), the OSdispatch() function encountered an error with the process that was to be dispatched next. A selective initialization will be performed.

125. OSACE136 (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

The OSchgmsgfrms() function encountered an error in the message control block (MCB) list.

126. OSACE142 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSRESTART() primitive in the CMP was called to restart to a program ID requiring a 32 Kbyte recent change (RC) "big" stack. Restarting to such program IDs is not supported to prevent possible split database (DB) transactions when all 32 Kbyte RC stacks are in use.

127. OSACE143 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the CMP, invalid users of the 32 Kbyte recent change (RC) "big" stacks have been detected. A demand-mode stack control block (SCB) audit will be invoked to recover the illegally used stack(s).

128. OSACE144 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

One of the periodic time verification checks failed in an SM or CMP. The stack, register, and data dumps will identify the failing check. Time will be marked invalid in the asserting processor and a new absolute time (ATIME) and operating system for distributed switching (OSDS) time relative to switch initialization (RTIME) will be requested from the AM's operational kernel process (OKP). Recovery of the hardware counter may be automatically initiated in the SM.

This assert may occur sporadically if the processor has taken numerous maintenance interrupts (hardware errors) in the last 5 minutes, or if an SM has been in standalone for long periods of time (15 minutes or more). For all practical purposes, such transient occurrences of this assert can be ignored.

The constant occurrence of this assert every 5 minutes indicates a more serious clock drift problem. In the SM, this may be caused by a bad hardware counter on the module controller/time slot interchange (MCTSI) board, in which case real time counter sanity timer failures will also be reported on the ROP; the MCTSI board should be reseated or replaced in such cases. In the CMP, this condition could occur because of a corrupted internal clock or a faulty 10 millisecond timer; in either case, a selective initialization of the CMP will be needed to correct the problem.

Finally, another source of recurrent drift problems in both the SM and the CMP is excessive blocking of interrupts. This is commonly caused by frequent (rolling) hardware errors, or by generic utility breakpoints that are being executed too often; correcting the source of these hardware errors or disabling the generic utility breakpoints will stop this assert.

129. OSACE145 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSTimemsg() function received an invalid stimulus or pcr parameter. The function will return without sending an MGOSTIME message.

130. OSACE146 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSTimesync() or OSit_work() function received an invalid MGOSTIME message. The message will be dumped to the ROP and ignored.

131. OSACE147 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The clock accuracy system process base level loop received an unexpected return code from the OSWAIT() or OSWGETMSG() primitive. The return will be ignored.

132. OSACE148 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSWGETTPOM() primitive received an unknown return code from the OSWGETTYPE() primitive. The calling process will be purged.

133. OSACE149 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSssphase variable disagrees with the SMswcmpip flag. OSssphase indicates a CMP soft switch is in progress while the SMswcmpip variable doesn't. OSssphase will be set to OSBLKNO to indicate that a CMP soft switch is not occurring. Both variables will be dumped.

134. OSACE150 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSBLOCK() primitive was called by some process other than the CICO system process. The calling process will be purged.

135. OSACE152 (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The caller of an operating system for distributed switching (OSDS) message sending primitive attempted to send a message to processor 0, an invalid processor ID. A failure code will be returned to the primitive caller. The offending message will be in the first data dump.

136. OSACE152 (5E11 to 5E12)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The caller of an operating system for distributed switching (OSDS) message sending primitive attempted to send a message to processor 0, an invalid processor ID. A failure code will be returned to the primitive caller. The offending message will be in the first data dump.

137. OSACE153 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSlocalmsg() function received a message with a length that exceeded OSMAXMSGTXT, the maximum supported message text size. The offending message will be dumped to the ROP and OSELENGTH will be returned to the caller of the function.

138. OSACE154 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSEENDBFM() or OSBFMLOCALDEL() primitive received a message with an unsupported large message type and a text size greater than 254 bytes. The offending message will be dumped to the ROP and the caller of the primitive will be purged. Large message types must be authorized by the communication package (CM) and operating system (OS) subsystem engineers before the large message sending primitives will support them.

139. OSACE155 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSEENDBFM() or OSBFMLOCALDEL() primitive received an invalid text size parameter. For standard message types, this assert fires when the text size parameter exceeds 254 bytes, the maximum supported text size for standard (normal) messages. For large message types, this assert fires when the text size parameter exceeds OSMAXMSGTXT bytes, the maximum supported large message text size. The offending message will be in the first data dump. An OSELENGTH error code will be returned to the caller of the primitive.

140. OSACE156 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSENDERBFM() primitive was called to send a large message to a processor that does not support large messages. Large messages are only supported in and between the AM's operational kernel process (OKP), CMP, SM and direct link node (DLN) environments. The OSSENDERBFM() primitive was passed a large message with a destination process ID (PID) that is not in one of these environments. The offending message will be in the first data dump. The CMDESTF error code will be returned to the caller of the primitive.

141. OSACE157 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSdecomp() function found the compressed message size or the original message text size obtained from the compressed message to be invalid. The offending message will be dumped to the ROP and OSCOMPFAIL returned to the caller of the function, probably causing the message to be dropped.

142. OSACE158 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSENDQLPS() primitive, whose use is restricted to the integrity monitor (IMIM) and CLNK/QLNK fault recovery (CLSP) system processes, was called by some process other than IMIM or CLSP. The calling process will be purged.

143. OSACE159 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The 'qlpsnet' or 'endpoint' parameter passed to OSSENDQLPS() was invalid. The value of the 'qlpsnet' parameter must be less than SMQLPSNUMNETS, while the value of the 'endpoint' parameter must fall between SMQL1STENDPT and SMQLLASTENDPT, inclusive. CM_ERROR will be returned to the OSSENDQLPS() primitive caller.

144. OSACE160 (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSnumrlpcb() function received an error return from the DBxrdgparm() function when an attempt was made to read the global parameter GLIOSPCB while in a recent change transaction.

145. OSACE161 (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSnumrlpcb() function received an error return from the DBxrdgparm() function when an attempt was made to read the global parameter GLCALLTRN while in a recent change transaction.

146. OSACE162 (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSnumrlpcb() function received an error return from the DBxrdgparm() function when an attempt was made to read the global parameter GLEDS_PORT while in a recent change transaction.

147. OSACE163 (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSnumrltcb() function received an error return from the DBxrdgparm() function when an attempt was made to read the global parameter GLIOSTCB while in a recent change transaction.

148. OSACE164 (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBxrdgparm() function returned an error when an attempt was made to read the global parameter GLORGNATRG while in a recent change transaction.

149. OSACE165 (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBxrdgparm() function returned an error when an attempt was made to read the global parameter GLORGBLTRG while in a recent change transaction.

150. OSACE166 (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBxrdgparm() function returned an error when an attempt was made to read the global parameter GLOBLNALIN while in a recent change transaction.

151. OSACE188 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was found in the stack control block (SCB) idle list. A demand-mode SCB audit will be invoked.

152. OSACE189 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSrtcheck() function failed. The number of process message data blocks (PMDBs) in an SM is not greater than or equal to the maximum number of possible terminal processes that may own stacks simultaneously. This can only be corrected by increasing the number of PMDBs and REBUILDING THE LOAD. Although this assert will not escalate or cause single process purges, it will fire roughly once an hour until the problem is corrected.

153. OSACE190 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: spp	SPP: n	Audit: PMDB	Audit Mode: nonseg

Problem:

A process message data block (PMDb) had a corrupt sentinel field indicating that an overwrite of a PMDB structure(s) occurred. The owning process will be purged.

154. OSACE191 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A terminal process does not own its stack control block (SCB) or the SCB does not have an associated process message data block (PMDb). The process will be purged.

155. OSACE192 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A process message data block (PMDb) had a corrupt sentinel field indicating that an overwrite of a PMDB structure(s) occurred. A demand-mode PMDB audit will be invoked.

156. OSACE193 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The stack control block (SCB) at the beginning of the SCB idle list did not have an associated process message data block (PMDb). A demand-mode SCB audit will be invoked to reorder the SCB idle list.

157. OSACE194 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A broadcast job had an invalid or deceased owner. The owner's process control block (PCB), and the rIOSBIT and rIOSBCB tuples will be dumped and the job will be killed.

158. OSACE195 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown value was found in the verb field of the OSMTRREQMSG message. The text of the message will be dumped to the ROP.

159. OSACE197 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: ACB	Audit Mode: nonseg

Problem:

Error encountered in the dynamic memory allocation control block (ACB) free list. Either an invalid/unexpected free list linkage was found, or invalid/unexpected data was found in what should be a free ACB. The running process will be purged and a demand-mode ACB audit invoked.

160. OSACE198 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: PCB	Audit Mode: nonseg

Problem:

Error encountered in the list of processes waiting for dynamic memory. Either an invalid/unexpected list linkage was found, or a process control block (PCB) in the list contained invalid/unexpected data. The erroneous process will be purged and a demand-mode PCB audit invoked.

161. OSACE199 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: ACB	Audit Mode: nonseg

Problem:

Error encountered in the list of dynamic memory allocation control blocks (ACBs) attached to a process. Either an invalid/unexpected list linkage was found, invalid/unexpected data was found in an ACB supposedly owned by the process, or the owning process control block (PCB) contained invalid/unexpected data. The owning process will be purged, if possible, and a demand-mode ACB audit invoked.

162. OSACE200 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: ACB	Audit Mode: nonseg

Problem:

Invalid dynamic memory allocation control block (ACB) data was found. Either the ACB index itself is invalid, or an otherwise valid ACB contains an invalid/unexpected owning process or number of blocks. The running process will be purged and a demand-mode ACB audit invoked.

163. OSACE201 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An out of range requested memory size parameter, an out of range wait time parameter, and/or an invalid process number parameter was passed to the OSALLOC() or OSMALLOC() dynamic memory allocation primitive. An OSERANGE error code will be returned to the primitive caller.

164. OSACE203 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A process attempted to store its dynamic memory handle in write protected memory it does not own (e.g., in another process's stack). The process will be purged.

165. OSACE205 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The calculation of the physical address of the *UNIX*[®] occupancy meter or *UNIX*[®] occupancy turn-off value for routine audits throttling in the AM has failed. This assert returns to the caller and results in normal throttling of audits based only on 3.125% of AM real time.

Range: pc**1. PC1CCSNK (5E11 and later)**

Recovery Action: rpi	SPP: n	Audit: CCBCOM	Audit Mode: elev

Problem:

The linkage between the channel control block common area (CCBCOM) and the channel data block (CHDB) was corrupted. The CCBCOM that is pointed to by the CHDB does not point back to the CHDB.

2. PC1PCBLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

Could not send a message to the terminal process whose process ID was obtained by the PCitopid() function. Normally, the channel data block (CHDB), the channel control block (CCB) that is linked to the CHDB, and the process control block link area (PCBLA) that is linked to the CCB are dumped. If any of these are not available, other dumps are substituted.

3. PCABGTIMER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PHDB	Audit Mode: elev

Problem:

A path data block (PHDB) with an out-of-range PHDB number was found on the peripheral control (PC) background (BG) timing list (global internal structure hdr/pc/pcbgtimelist.h).

4. PCABRGCC (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: BRGDB	Audit Mode: elev

Problem:

Error in set-owner/set-member linkage between BRGDB to CCBCOM. For example, errors updating the list if BRGDBs linked to an owner CCBCOM.

Probable Cause:

Some database corruption has occurred.

Action:

A BRGDB audit is scheduled to try and correct the problem. There is no action the office technician can take to correct this problem. Contact next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

5. PCACBGS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CBHC	Audit Mode: elev

Problem:

A dynamic access (DA) primitive returned a failure. This failure involved the concentrated buffer head cell (CBHC).

6. PCACCBCH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CCBCOM	Audit Mode: elev

Problem:

The one-to-one linkage between the channel control block common area (CCBCOM) and the channel data block

(CHDB) was corrupted. Could not follow the linkage from the CCBCOM to the CHDB.

7. PCACCBRG (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: CCBCOM	Audit Mode: elev

Problem:

Error in set-owner linkage from CCBCOM to BRGDB. For example, we failed to get head BRGDB linked to a CCBCOM.

Probable Cause:

Some database corruption has occurred.

Action:

A CCBCOM audit is scheduled to try and correct the problem. There is no action the office technician can take to correct this problem. Contact next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

8. PCACCCD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CCBCOM	Audit Mode: elev

Problem:

The linkage between the owner rCCBCOM tuple and the member rCDBCOM tuple was corrupted.

9. PCACCCQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CCBCOM	Audit Mode: elev

Problem:

The linkage between the owner rCCB tuple and the member rCQB tuple was corrupted.

10. PCACCPD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CCBCOM	Audit Mode: elev

Problem:

Could not follow the owner linkage from the Channel Control Block (CCB) to the PCBLA.

11. PCACCPH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CCBCOM	Audit Mode: elev

Problem:

Could not follow the linkage from the channel control block (CCB) to the path data block (PHDB).

12. PCACCSNK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CCBCOM	Audit Mode: elev

Problem:

The linkage between the owner rCCBCOM tuple and the member rCHDB tuple (sink) was corrupted.

13. PCACCSRC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CCBCOM	Audit Mode: elev

Problem:

An unexpected failure involved one of the dynamic access (DA) primitives manipulating the one-to-one linkage from the channel control block (CCB) to the source channel data block (CHDB).

14. PCACDBCOM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CDBCOM	Audit Mode: elev

Problem:

Invalid data was found in an rIDCDBCOM tuple.

15. PCACDCH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CDBCOM	Audit Mode: elev

Problem:

The linkage between the circuit data block (CDB) and the channel data block (CHDB) was corrupted.

16. PCACDCQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CDBCOM	Audit Mode: elev

Problem:

The linkage between the owner rIDCDBCOM tuple and the member rICQB tuple was corrupted.

17. PCACHAN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

The channel circuit name was not found in the RLCHAN relation.

18. PCACHCD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CHDB	Audit Mode: elev

Problem:

The linkage between the channel data block (CHDB) and the circuit data block (CDB) was corrupted.

19. PCACTNG_T_C (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An Activation Reply and the CCB is invalid and NOT Transient.

20. PCADSCC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

The digital service circuit common control (DSCC) circuit name was not found in the RLDSCC relation.

21. PCAHLSC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HLSC	Audit Mode: elev

Problem:

The high level service circuit (HLSC) name was not found in the RLHLSC relation.

22. PCANGACT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid Activation Request. Circuit is already Activated.

23. PCANGCCB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid CCB is requesting an Activation of a LDSF circuit.

24. PCANGDEACT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid activation request. Circuit is being de-activated.

25. PCAPCCC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

The linkage between the owner rPCBLA tuple and the member rCCBCOM tuple was corrupted.

26. PCAPCPH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

Could not follow the linkage from the process control block link area (PCBLA) to the path data block (PHDB).

27. PCAPCPO (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

A process control block link area (PCBLA) to port linkage area (PORTLA) linkage error was found. An audit was scheduled.

28. PCAPDU (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An application protocol data unit (APDU) linkage corruption was detected.

29. PCAPHCC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PHDB	Audit Mode: elev

Problem:

Could not follow the linkage from the path data block (PHDB) to the channel control block (CCB).

30. PCAPHDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PHDB	Audit Mode: elev

Problem:

An invalid state field was encountered in the path data block (PHDB).

31. PCAPHPC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PHDB	Audit Mode: elev

Problem:

Could not follow the linkage from the path data block (PHDB) to the process control block link area (PCBLA).

32. PCAPHSNK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PHDB	Audit Mode: elev

Problem:

Could not follow the linkage from the path data block (PHDB) to the sink time slot data block (TSDB).

33. PCAPHSRC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PHDB	Audit Mode: elev

Problem:

Could not follow the linkage from the path data block (PHDB) to the source time slot data block (TSDB).

34. PCAPMAPBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: AIUAP	Audit Mode: elev

Problem:

Data problem with PCaiuap[].

35. PCAPOPC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

A port linkage area (PORTLA) to process control block link area (PCBLA) linkage problem was found. An audit was scheduled.

36. PCARG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RGOcup	Audit Mode: elev

Problem:

A problem was detected between the linkages of the PCrgocup[] array and the PCrgtdb[] array.

37. PCASMEST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

The circuit did not have a proper entry in the RLSMOOS status relation.

38. PCASNKCC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CCBCOM	Audit Mode: elev

Problem:

The DAgoccch() function failed unexpectedly.

39. PCASNKPH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TSDB	Audit Mode: elev

Problem:

Could not follow the linkage from the sink time slot data block (TSDB) to the path data block (PHDB).

40. PCASRCCC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CCBCOM	Audit Mode: elev

Problem:

The linkage between the channel data block (CHDB) and the channel control block common area (CCBCOM) was corrupted. The point-to-point-back check by the dynamic access (DA) primitive resulted in a DBSYS_ERR return code.

41. PCASRCPH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TSDB	Audit Mode: elev

Problem:

Could not follow the linkage from the source time slot data block (TSDB) to the path data block (PHDB).

42. PCATONE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

The system tone circuit was not found in the RLONECH relation.

43. PCATSDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TSDB	Audit Mode: elev

Problem:

Invalid data was found in a time slot data block (TSDB). The TSDB audit will be run to correct the problem.

44. PCATSPH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TSDB	Audit Mode: elev

Problem:

A time slot data block (TSDB) to path date block (PHDB) linkage error was found. An audit was scheduled.

45. PCAUAPDU (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: APDU	Audit Mode: elev

Problem:

Linkage corruption was detected in the application protocol data unit (APDU). The AUAPDU audit will be scheduled in elevated mode.

46. PCAUBCH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: UBHC	Audit Mode: nonseg

Problem:

The database (DB) primitive manipulating the linkage from the unconcentrated buffer head cell (UBHC) to the channel data block (CHDB) failed unexpectedly.

47. PCAUDALB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

D-Channel Application Linkage Block (DALB) linkage corruption has been detected.

Probable Cause:

Linkage corruption due to software fault or memory corruption.

Action:

The DALB audit will be scheduled in elevated mode. Ultimately, the software fault or memory must be repaired.

48. PCAUDPB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DPB	Audit Mode: elev

Problem:

Linkage corruption was detected in the data port block (DPB).

49. PCAUHLPG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An audit called by the PChlconfig() function found the dynamic tables Hltab1[] and Hltab2[] to be incorrect. These tables are used for sequencing ringing and non-ringing preferred high level service circuits (HLSCs). The PChlconfig() function will reconfigure Hltab1[] and Hltab2[].

50. PCAULLM_IDCU (5E11 only)

Recovery Action: rpi	SPP: n	Audit: LLMIDCU	Audit Mode: elev

Problem:

Linkage corruption was detected in the RLLLM_IDCU relation. The AULLMIDCU audit will be scheduled in elevated mode.

51. PCAULLM_RDT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: LLMRDT	Audit Mode: elev

Problem:

Linkage corruption was detected in the RLLLM_RDT relation.

Probable Cause:

The switch software did not build the links correctly.

Action:

The LLMRDT audit will be scheduled in elevated mode.

52. PCAUMALLOC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: MALLOC	Audit Mode: elev

Problem:

Linkage corruption was detected in the RLMALLOC relation. The AUMALLOC audit will be scheduled in elevated mode.

53. PCAUPCBLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

Linkage corruption was detected in the process control block link area (PCBLA). The AUFC_PCBLA audit will be scheduled in elevated mode.

54. PCAURTEILA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RTEILA	Audit Mode: elev

Problem:

Linkage corruption was detected in the RLRTEILA relation. The AURTEILA audit will be scheduled in elevated mode.

55. PCAURTLB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RTLB	Audit Mode: elev

Problem:

Linkage corruption was detected in the RLRTLb relation. The AURLTLB audit will be scheduled in elevated mode.

56. PCAURMSGBUF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RTMSGBUF	Audit Mode: elev

Problem:

Linkage corruption was detected in the RLRTSMGBUF relation. The AURMSGBUF audit will be scheduled in elevated mode.

57. PCAUUNIT2RDT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: UNIT2RDT	Audit Mode: elev

Problem:

Missing LLM_RDT tuple was encountered.

Probable Cause:

5ESS[®] switch software has corrupted the data relation.

Action:

AUUNIT2RDT audit is scheduled to insert the missing associated LLM_RDT tuple.

58. PCBADBRGDB (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Data in a rIBRGDB tuple was found to be incorrect.

Action:

The contents of the tuple are printed on the ROP. There is no action office personnel can take to correct this problem. Contact the next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

59. PCBADDT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DT	Audit Mode: elev

Problem:

Invalid data was read from data transport (DT).

60. PCBADFREE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PCfree() function failed. A segment header key was not found when attempting to free a memory segment, or the pointer passed to the PCfree() function did not belong to an existing rIMALLOC tuple.

61. PCBADGCK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid global service circuit data was encountered in the RLGCKTI relation.

62. PCBADLUTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

An invalid line unit (LU) type was encountered.

63. PCBADMALLOC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PCmalloc() function failed. A memory allocation request exceeded 252 bytes, or the PCmalloc() function was unable to find free memory in a freshly allocated rIMALLOC tuple.

64. PCBADMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received by a process.

65. PCBADMTPTBL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

An invalid music terminal process (MTP) ID was found in the MTP table PCmtpbl[]. The entry will be removed and a PCBLA audit will be scheduled. The table will be dumped.

66. PCBADNOOWN (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: TSDB	Audit Mode: elev

Problem:

During the setup of a multi-module remote switching module (MMRSM) call over an intra-cluster link (ICL), the time slot data block (TSDB) corresponding to a PCNO_OWN time slot was not found in the idle list, where it was expected. The process with the path data block (PHDB) that owns the TSDB will be tracked and purged.

67. PCBAD_NTSTATE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DPB	Audit Mode: elev

Problem:

Invalid ntstate. Need to audit DPB.

68. PCBADPARAM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

One of the following conditions occurred:

1. A switch state defaulted erroneously; that is, the switch was switching on an invalid parameter.
2. An invalid input parameter was passed to a function.

69. PCBADPDESC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The state in the path descriptor was invalid for the primitive called.

70. PCBADPIDBTS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The from pidb timeslot is not equal to the to pidb timeslot in TScp_dx. This will cause the saving of the call to fail.

Probable Cause:

Unknown.

Action:

None.

71. PCBADPMH (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The peripheral messaging message handler (MH) number obtained from PCUNIT2MH() (i.e. PCunit2mh[]) is inconsistent with the MH number extracted from the associated virtual peripheral interface control bus (PICB)

number.

Probable Cause:
Unknown.

Action:
Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual for information on contacting technical support.

72. PCBADPORT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

The global port name passed as a parameter from TM to PC is inconsistent with the port information in the PCBLA. The parameter port name is dumped followed by the PCBLA port name.

Probable Cause:
Unknown.

Action:
Contact next level of technical support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

73. PCBADREASON (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

When a peripheral control (PC) process was created, it was passed an invalid reason for being entered.

74. PCBADSGLIST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was detected in reading an rISMEST tuple for a switch group marked for measurement generation in the administrative services (AS) global array MSsglist[]. This error was detected during the 100 second scan of the switch group for usage. The switch group will be temporarily inhibited for generation until routine audits cleanup the MSsglist[] array.

75. PCBADTMSLNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Peripheral control is trying to send a time multiplexed switch (TMS) connect order to the foundation peripheral controller (FPC), but one of the TMS link numbers is invalid. This is a severe problem because it prevents inter-module calls from terminating on the SM that reported the problem.

Data Structures:

Two SM global parameters specify the TMS link numbers: Gltms_evenlnk and Gltms_oddlnk. TMS link numbers are also found in the cts_even and cts_odd fields of the rIMODATT relation in the AM.

Action:

Use ODBE to update the global parameters. The TMS link numbers can be found in the rIMODATT relation or on pages 1231-1234 of the MCC display. The values of Gltms_evenlnk and Gltms_oddlnk should be the same as the

values of the `cts_even` and `cts_odd` fields in the `rIMODATT` relation, except in RSMS, where the value of the global parameters should be the same as the Host SM's `cts_even` and `cts_odd` values.

76. PCBADTONE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Attempting to play a tone over a path which already has a tone playing on it.

Probable Cause:

Software problem -- client software calling peripheral control (PC) has not removed the tone playing on the path before attempting to play a new tone.

Action:

Nothing can be performed by the office technician to correct this problem. The necessary data will be dumped to the ROP. Please contact 5ESS[®] switch field support for help.

77. PCBADTRGT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Each feature assigned to a feature button must have a target. The target value is an integer from 1 through 8. A feature button was depressed that did not have a valid target field in the `RLBNFEAT` relation.

Data Structures:

`RLBNFEAT`.

Action:

Populate the target field in the `rlBNFEAT` tuple.

78. PCBGCKTI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not access the conference circuit access table (`CCATBL`).

79. PCBGTRNER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not begin a database transaction.

80. PCBRGDBGONE (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A bridging request has been denied because all of the bridging data blocks (`BRGDBs`) are in use.

Data Structures:

`RLBRGDB`.

Action:

The number of BRGDBs is engineerable on a per-SM basis and can be increased by Recent Change.

81. PCBRIVLN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

One of three violations of the basic rate interface (BRI) specification occurred.

1. A Q.931 INFO message with another call reference information element was received from customer premises equipment (CPE) that requires terminal management functions (TMF).
2. A Q.931 INFO message with switchhook status was received from a CPE that does not require TMF, or the message has a call reference type that is not null.
3. A Q.931 INFO message with a key pad information element and a feature activation element was received.

Cases 1 and 2 may be the result of a customer swapping a CPE that requires TMF for one that does not (non-TMF), or vice versa, and the cpetype field in the static data relation RLIS_TERM was not updated. IS_TYPEA and IS_TYPEC are for non-TMF terminals while IS_TYPEB, IS_TYPED, and IS_TYPATT are for TMF terminals.

Data Structures:

RLIS_TERM.

Action:

Change the line assignment terminal type in the RLIS_TERM tuple to match the CPE.

82. PCCBCRDUMP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A channel control block communication region (CCBCR) data problem was encountered.

83. PCCCBTMR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The channel control block communication region (CCBCR) was missing from the foreground channel control block (CCB) timing list.

84. PCCCSQFAIL (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

While trying to throttle an incoming call over an integrated services digital network (ISDN) user part (ISUP) trunk due to lack of switch resources, a failure was encountered which prevented the call from being queued. The call was released with an ISUP REL message that contained cause value #42 "switching equipment congestion".

Action:

Contact the next level of support.

85. PCCDBPURGE (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

A remote SM (RSM) selected a host digital facilities interface (HDFI) channel for a call through the host SM (HSM). At the HSM, the circuit data block (CDB) was incorrectly owned by another process. This process failed to respond to the MGINTERRUPT message. The process was purged and the data dump provides information about the process.

86. PCCGDS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RCGTMR	Audit Mode: elev

Problem:

Failure to link or unlink a RLDPC_STAT tuple to or from a RLRCGTMR tuple.

87. PCCHANGONE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The peripheral control (PC) switching resource allocator received a request to dedicate more than 512 peripheral time slots to the peripheral circuits associated with an SM. This could be the result of over-engineering the SM, corrupted data in the RLCKTDATA relation in the office dependent data (ODD), or too many nail-up channels connected to a particular peripheral interface data bus (PIDB) time slot (that is, more than 8 trunks for one PIDB time slot.)

Data Structures:

RLCKTDATA.

Action:

If this is the first power-up initialization for the office, then the ODD should be checked for an illegal peripheral configuration. If this is circuit growth, then an illegal peripheral configuration is being grown into, and should be terminated promptly. Applicable SM hardware equipage limits are:

- a. The total quantity of channels may not exceed 512.
- b. A maximum of eight channels can be assigned to each data interface (DI)/PIDB time slot combination that does not serve any system tones.
- c. If a DI/PIDB time slot combination serves at least some allocated channels (PCALLOCHAN) then one to three system tones may also be assigned to this DI/PIDB time slot. In this case, the maximum number of channels assigned to the DI/PIDB time slot is 11 in a SM that serves Autovon or 5E-AMPS, 10 for all other SMs. Circuit growth routines automatically try to move system tones to prevent sharing if possible.

If the assert fired during equipment growth, then one of the limits would be violated by the new equipment. See prl/poprules/RLcktdata.R to determine the requirements of the equipment being grown. Steps 1-3 below can be used to determine the current quantity of channels in use and the number of channels assigned per DI/PIDB time slot:

1. Locate all rLCKTDATA tuples with the "chnasn" attribute equal to PCINITCHAN or PCALLOCHAN:

- a. Ignore tuples with "type" of PCBTRSR_CH

- b. For "type" PCPIDBISLU with "pidbtype" PCISLUPIDB/PCDUALPIDB or "type" PCPIDBIDCU with "pidbtype" PCDUALPIDB:

Tuples occur in pairs, one per service group. For each pair:

- 32 channels are used

- DI number is bit 4 of "pidb"
- PIDB time slots used are 0 through 31

c. For "type" of PCPIDBRISLU with "pidbtype" of PCRDUALPIDB:

- RISLU spare facilities should not be counted. When rRISLUPIDB keyed by the remote PICB has "cdconfinf" of PCSPROSPS, "pidb0" is a spare.
- Up to 24 time slots are available. A time slot doesn't count towards channel usage or DI/PIDB channel combinations if:

a. It is a control time slot (CTS), indicated by rRISLUDFI "ncts" attribute. Normally, DFI-H1s have one CTS and DFI-H2s have zero, except in OSPA sparing.

b. It is used for signaling.

DFI mode of SMDFRSM or SMDFB8ZS: 1 signaling channel

DFI mode of SMT1FE or SMT1FE8Z: 0 signaling channel

- The value of "dbchan" is the stuffing phase, range 0-3. See prl/poprules/RLcktdata.R "chnasn" attribute for a table of channels used by stuffing phase and excluded by DFI mode.

d. For all other rICKTDATA tuples with PCINITCHAN or PCALLOCHAN:

- One channel is used per tuple
- DI number is bit 4 of "pidb"
- PIDB time slot is the value of "dbchan"

2. In SMs that serve precedence and preemption subscribers (Autovon) or the 5E-AMPS application, 3 channels are used by system tones. In all other SMs, 2 channels are used by system tones. For each of the parameters:

- Glidlech (Idle code, all SMs)
- Glaudring (Audible ring, all SMs)
- Glpauddring (Precedence audible ring, autovon or 5E AMPS only) the parameter gives the channel used by the system tone where:
- DI number is the complement of the parameter bit 0
- PIDB time slot is bits 8-4 of the parameter

3. A host SM (HSM) uses channels for RSM control time slots. For each tuple in rRSMCHAN:

- One channel is used per tuple
- DI number is the complement of bit 0 of "chdb_num"
- PIDB time slot is bits 8-4 of "chdb_num"

88. PCCHKUCFG (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: UNITCFG	Audit Mode: elev

Problem:

If the controller side select for a ring generator becomes out of date, a control job sent to this pack will loop back and be erroneously interpreted as a scan report. This assert fires when the PC scanning code finds an apparent scan report from an RG. It schedules an AUUNITCFG audit to check (and update) the side select for that application pack.

Probable Cause:

Out-of-date controller side select for a ring generator.

Action:

If this assert fires, please notify your next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

89. PCCHKUDSL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to get control of resource after RTchk_udsl_rsc() determined that the resource was idle.

90. PCCILCSMSK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LCSMSK	Audit Mode: elev

Problem:

An inconsistency was found that is related to the Cllcsmk[] array. This array holds the enables (1=enabled) for grids in a line unit. A line unit's grids were enabled in peripheral controller (PC) foreground, but it was not a line unit with grids that should be scanned in the Cllcsscn() function. The report sent to PC background initiated the assert. The array was corrected (the affected line unit's grids were masked) in foreground.

91. PC_CKDATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred while attempting to read an rLCKTDATA tuple in the function PCpt2chan(), using a circuit name obtained from either the rLPORTLA or rLFC_PORTTYP. No tuple was found for the specified circuit name.

Data Structures:

RLFC_PORTTYP. Key fields: portname, RLPORTLA. Key field: portname, and RLCKTDATA. Key fields: circuit name.

Action:

Check RC/V View 5.5 (CIRCUIT DATA) for the specified circuit.

92. PCCKRDFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBfrdtup() failed due to a failure in the function PCpt2chan() while attempting to read an rLCKTDATA tuple.

Probable Cause:

RLCKTDATA. Key fields: cktname.

Action:

The system will perform normal recovery actions that are consistent with a DBfrdtup() failure.

93. PCCKTDATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was found in the RLCKTDATA relation. There may be errors in this relation in a new office or in a new office dependent data (ODD) database.

Data Structures:

RLCKTDATA.

Action:

Correct the ODD.

94. PCCKTPORT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure from DBfrdtup while obtaining port data from RLCKT_PORT.

95. PCCLOP_TONE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Client software is asking peripheral control (PC) to close/open a path which is currently playing a tone. This will cause the tone to be cut off.

Probable Cause:

Software Error -- Client software should remove the tone before attempting a close/open on the path.

Action:

Nothing can be done by the office technician to correct this problem. All the necessary data will be sent to the ROP. Please contact 5ESS® switch field support for help.

96. PCCMRSAPDU (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected remote operations service element (ROSE) application protocol data unit (APDU) type was received.

97. PCCNDERROR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Calling number display (CND) message transmission did not complete in the time allotted for the task.

98. PCCOMMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read of the relation rIUNIT_CKT has failed. The probable cause is either the tuple is missing or the keys from GLpicb or rIRC_LOCEQ are incorrect. The scanning of the peripheral interface control bus (PICB) associated with the rIUNIT_CKT tuple is inhibited.

Data Structures:

A tuple of rIUNIT_CKT. key from GLpicb = picbno keys from rIRC_LOCEQ = GI_pcrd, picbno + 1.

Action:

The report prints the PICB number. Verify consistency between the PICB number and GLpicb, rIRC_LOCEQ, and rIUNIT_CKT. After correcting, perform aud:scnmsk,sm=<#> to restart scanning on the PICB.

99. PCCPTSDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not retrieve time slot data in the CMP.

100. PCCQBGONE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A circuit request could not be queued because all of the circuit queuing blocks (CQBs) are in use.

Data Structures:

RLCQB.

Action:

The number of CQBs is engineerable on a per-office basis and can be increased by RC/V.

101. PCCRDBXLIST (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: XLIST	Audit Mode: elev

Problem:

Linkage error between the owner tuple in RLCLU_RDB and the member tuple in RLXLIST.

Probable Cause:

Dynamic database corruption.

Action:

Problem is being automatically fixed by Audit.

102. PCCREATEFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A non-resource related failure occurred while attempting to create a common channel signaling system 7 (CCS7) originating terminal process.

Action:

Contact the next level of support.

103. PCCSO_NT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Tried to deactivate a NT1 that is a cold start only NT.

Data Structures:

The static relation rIDSLEQUIP and the dynamic relation rIDPB have a field called dea_allow which indicates if the NT1 can be deactivated. The key to both of these relations is the port.

Action:

The static relation rIDSLEQUIP, for the port, needs to be updated to marked dea_allow to DBNO. Then an audit of the rIDPB should be run.

104. PCCTONEBAD (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid signal type was found in the global parameter Glctone. The permitted values for Glctone are {DB_PCNULL, PCHIGHTN}.

Data Structures:

Glctone.

Action:

Correct ODD.

105. PCD303RT2DS1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RT303DS1	Audit Mode: elev

Problem:

A data problem was found in the PC303rt2ds1[][] array. A digital signal level 1 (DS1) was not found in this data structure for the integrated digital carrier unit (IDCU) and the remote terminal (RT) associated with a half-call. The call will fail. The RT303DS1 audit will be scheduled.

106. PCDACCBTMR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The channel control block communication region (CCBCR) could not be removed from the foreground channel control block (CCB) timing list.

107. PCDAIGSDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: AIGSDB	Audit Mode: elev

Problem:

Data problem with relation AI_GSDB. May be a linkage problem between AI_GSDB and GSLK. If necessary, appropriate data will be dumped.

Probable Cause:

Linkage errors, SPPs, lost tuples.

Action:

None, audit has been scheduled.

108. PCDANGDEACT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid deactivation request. The circuit is being deactivated.

109. PCDANGNACT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid deactivation request. Circuit is not activated.

110. PCDANGT_C (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A reply from the local digital service function (LDSF) and the channel control block (CCB) is not own or TRANSIENT.

111. PCDAOUTSCH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The channel control block communication region (CCBCR) could not be removed from the foreground channel control block (CCB) timing list.

112. PCDAPP2TSP (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid or missing data in RLAPP2TSP relation.

Data Structures:

RLAPP2TSP.

Action:

Correct the ODD.

113. PCDAPP2TSP (5E12 only)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Database read of RLAPP2TSP relation has failed.

Probable Cause:

Invalid relation key(s) provided.

Action:

None.

114. PCDAS_MON (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred while trying to insert a tuple in relation RLAS_MON.

115. PCDATAPROB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was found in transient data. Static office dependent data (ODD) is always assumed to be valid. Normally this problem indicates invalid data in a dynamic relation, but it could also indicate corrupted static data, an invalid input parameter to a function, an invalid return code from a function call, or a relation that could not be read.

Action:

Save the receive only printer (ROP) output and call for technical assistance.

116. PCDBRCSDALB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

A data problem was found in the RLDALB relation. Three data structures, up to 160 bytes each, are dumped.

117. PCDBRDFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred when trying to read a tuple from a static relation.

Data Structures:

The name of the relation being read and the keys being used to read the relation along with any other relevant information. See the output report for specific details.

Action:

Check the information dumped and use RC/V (or ODBE, if necessary) to either insert a new tuple or otherwise correct the ODD.

118. PCDCBHC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data problem was encountered in the RLCBHC relation.

119. PCDCCBCOM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CCBCOM	Audit Mode: elev

Problem:

A data problem was encountered in the RLCCBCOM relation.

120. PCDCCCM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data problem was encountered in an rLCCBCOM tuple.

121. PCDCCCR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was found in the fgbgbyte field in the channel control block communication region (CCBCR) on a job return.

122. PCDCDBCOM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CDBCOM	Audit Mode: elev

Problem:

A data problem was encountered in the RLCDBCOM relation.

123. PCDCHAN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data problem was encountered in the RLCHAN relation.

124. PCDCHDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data problem was encountered in an item in the channel data block (CHDB).

125. PCDCKT2GRP (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Tuple missing in the relation RLCKT2GRP.

Data Structures:

RLCKT2GRP

Action:

Verify if valid key(s) used; if yes, manually insert tuple.

126. PCDCKTD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

The DBfrdtup() function returned a failure when updating a tuple for a circuit data block (CDB) with information from the RLCKTDATA relation. Either the CDB name was invalid, or the rICKTDATA tuple was corrupted.

127. PCDCOND (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

The DBfrdtup() function failed when retrieving data from the RLPORTCOND relation. The portlaptr[] list was invalid, or the rIORTCOND tuple was corrupted.

128. PCDCQB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data problem was encountered in the RLCQB relation.

129. PCDDALB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

A data problem was encountered in the RLDALB relation.

130. PCDDFLINK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DFMAP	Audit Mode: elev

Problem:

A timeslot was read from a peripheral interface data bus (PIDB) time slot block (PTSB), but the key of the PTSB conflicted with the time slot's entry in the PCdflink[] array.

131. PCDDFMAP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DFMAP	Audit Mode: elev

Problem:

A data problem was found with the PCdfmap[][] array.

132. PCDDFNBLNK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DFNIBBLE	Audit Mode: elev

Problem:

A conflict was found with a time slot's entry in the PCdfnblink[][] array.

133. PCDDFNIBBLE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DFNIBBLE	Audit Mode: elev

Problem:

A data problem was found with the PCdfnibble[] array. This may be a symptom of a data problem with the PCdfnidle[] array and the PCdf1nidle[] array.

134. PCDDPB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DPB	Audit Mode: elev

Problem:

A data problem was encountered in the RLDPB relation. The software could have been passed an invalid D-channel port block (DPB) key.

135. PCDDS0B (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DS0B	Audit Mode: elev

Problem:

A field within an rIDS0B tuple was corrupted. The DS0B audit was scheduled.

136. PCDDSC3PIDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred trying to read relation RLDSC3PIDB.

137. PCDDSCC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data problem was encountered in the RLDSCC relation.

138. PCDEA_ALLOW (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DPB	Audit Mode: elev

Problem:

LPdea_nt() was called with dea_allow set to DBNO - deactivation not allowed. Probably due to a problem with a trigger function TMtfdslequip(). Need to audit the DPB.

139. PCDEFAULT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A problem was encountered with dynamic data. If this problem continues, contact your next level of support.

140. PCDESTROY (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

This process has detected an error that requires it to destroy a different process it has just created.

Action:

The other process just created by this process will be destroyed.

141. PCDFPHCHNLS (5E11 to 5E12)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBfrdtup() failed when reading RLFPHCHNLS. The problem was either invalid keys or bad tuple data. The two keys, "rsm" and "fpdpi" are printed out with this assert.

142. PCDF_VPIDB (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Tuple missing in the relation RLF_VPIDB.

Data Structures:

RLF_VPIDB

Action:

Verify if valid key(s) used; if yes, manually insert tuple.

143. PCDGLSHIST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred while trying to insert a tuple into relation RLGLSHIST.

144. PCDGNGCCB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid digit reply has been received from the local digital service function (LDSF) for an invalid channel control block (CCB).

145. PCDGNGTRANS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The circuit is transient and the deact_sent is not set.

146. PCDGRP_RI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure was returned from the DBfrdtup() function when attempting to read the RLDGRP_RI relation. The Glpsubase global parameter may have an invalid value.

147. PCDGSDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: GSDB	Audit Mode: elev

Problem:

A data problem was encountered in the RLGSDB relation.

148. PCDGSLK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: GSLK	Audit Mode: elev

Problem:

Data problem with relation GSLK. May be a linkage problem between GSLK and GSDB, or AI_GSDB, or CBHC. If necessary, appropriate data will be dumped.

Probable Cause:

Linkage errors, SPPs, lost tuples.

Action:

None, audit has been scheduled.

149. PCDHLSC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data problem was encountered in the RLHLSC relation.

150. PCDHTU2RSM (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBfrdtup() failed when reading RLHTU2RSM. The problem was either an invalid key or bad tuple data. The key,

"htu_num" is printed out with this assert.

151. PCDICL_MSK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read of the RLICL_MSK relation failed.

152. PCDIDDS1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: IDDS1	Audit Mode: elev

Problem:

A data problem was found in the PCidds1[] array. The status of a digital signal level 0 (DS0) in the PCidds1[] array conflicts with the status of the rIDS0B tuple as determined by the system resource allocator.

153. PCDIDPIDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: IDPIDB	Audit Mode: elev

Problem:

A data problem was found in the PCidpidb[] array. The status of a peripheral interface data bus (PIDB) time slot in the PCidpidb[] array conflicts with the status of the rIPTSB tuple as determined by the system resource allocator.

154. PCDISPIDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read an rIISLUPIDB tuple.

155. PCDLINE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure was received from the DBfrdtup() function while reading the RLFC_LINE relation. The key attribute was retrieved from the process control block link area (PCBLA).

156. PCDLNK_PLI (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read of the relation RLLNK_PLI failed while trying to obtain the TSI slice number and TSI link number associated with a relative PCT link. PC will not be able to activate or idle the MH message path to the relative PCT link based peripheral.

Data Structures:

RLLNK_PLI - Keys = unit number, unit type, relative PCT link.

Action:

Insert the rLNK_PLI tuple.

157. PCDLNK_PLI (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read of the relation rLNLK_PLI failed while trying to obtain the time slot interchange (TSI) slice number and TSI link number associated with a peripheral configuration table (PCT) link. Peripheral control (PC) will not be able to activate or idle the message handler (MH) message path to the PCT link based peripheral.

Data Structures:

RLLNK_PLI - Keys = unit number, unit type, PCT link.

Action:

Insert the rLNLK_PLI tuple.

158. PCDLNK_USE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data inconsistency was found in relation rLNLK_USE, or a database operation (such as DBfintup()) on relation rLNLK_USE returned a failure code.

159. PCDLS_MON (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred while trying to insert a tuple into relation RLLS_MON.

160. PCDMDATT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not read the RLMDATT relation with the given SM number. One of the following problems occurred:

1. The SM number was valid (1-192), but no rLMDATT tuple was populated for that number, or the tuple was corrupted.
2. The SM number was not valid.

Data Structures:

RLMDATT.

Action:

If the SM number was not valid, use RC/V (or ODBE, if necessary) to verify that the RLMDATT relation is populated for the SM specified. If it is not, insert the tuple. If the SM number was entered incorrectly at the master control center (MCC) during an automatic line insulation test (ALIT), re-enter the SM number.

161. PCDMHPIPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred trying to read relation rLMHPIPE.

162. PCDMH_UNIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Data of rIMH_UNIT tuple is bad or the tuple does not exist.

Data Structures:

rIMH_UNIT; key: mh_num and channel.

Action:

Inserts the tuple or checks up unit number and unit type.

163. PCDDMMOPDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failure to insert or link a tuple of relation RLMMOPDB.

164. PCDMNBSTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DFNIBBLE	Audit Mode: elev

Problem:

A data problem was found with the PCmnbstat global structure.

165. PCDNLI_LNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert fires to indicate that a database read of the RLNLI_LNK relation has been unsuccessful. The reasons for the failure could be the following:

- The "sm" key is out of range (1-192).
- The "nli" key is out of range (0-23), or is greater than or equal to the "eq_lis" (1-24) value in the RLMODATT relation for the specified SM.

Data Structures:

RLNLI_LNK.

Action:

Check the office-dependent data (ODD) and see if the RLNLI_LNK relation is populated correctly for the specified (E)NLI and specified SM. If not, insert the data using ODBE.

166. PCDPB_DALB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

The linkage between the head rIDALB tuple and the owning rIDPB tuple was corrupt.

167. PCDPBX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure was received from the DBfrdtup() function while reading the RLFC_PBX relation. The key attribute was retrieved from the previous read of the RLFC_LINE relation. This may indicate an office dependent data (ODD) population error.

168. PCDPC_STAT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: DPCI	Audit Mode: elev

Problem:

Error accessing tuple in RLDPC_STAT.

Probable Cause:

Dynamic database corruption.

Action:

Problem is being automatically fixed by Audit.

169. PCDPF_SLCP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLFP_SLCP relation has two attributes: slv_port and cpe_port.

The slv_port attribute is the global port ID of the private facility access (PFA) sleeve port and is divided into the subattributes port.member and port.module. port.member is the port name of a trunk, and port.module is the SM number that this port terminates on. The slv_port attribute depends on the existence of an rIFC_TRUNK tuple and an rIFC_PORTTYP tuple for this port with the following attribute values:

```
rIPORTTYPE.servclass = FC_PFSLV
rIPORTTYPE.porttype = TM_TRK
rIPORTTYPE.testpont = DBNO
rIPORTTYPE.els_loss = DBNO
```

The cpe_port attribute is the global port ID of the customer premises equipment (CPE) port used in the private facility (PF) feature. It is divided into the subattributes port.member, the port name of a line, and port.module, the SM number that this port terminates on. cpe_port depends on the existence of an rIFC_TRUNK tuple and an rIFC_PORTTYP tuple for this port with the following attribute values:

```
rIPORTTYPE.servclass = FC_PFCPE
rIPORTTYPE.lptyp = PCTRKOG
rIPORTTYPE.porttype = TM_TRK
rIPORTTYPE.testpont = DBNO
rIPORTTYPE.els_loss = DBNO
```

Data Structures:

RLFC_TRUNK, RLFC_PORTTYP.

Action:

Using RC/V (or ODBE, if necessary), check the office dependent data (ODD) to verify that the RLFC_TRUNK and RLFC_PORTTYP relations are populated according to the above information.

170. PCDPHDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data problem was encountered in the RLPHDB relation.

171. PCDPIDB_PT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read the RLPIDB_PT relation failed for the tuple keyed by the values printed on the receive only printer (ROP).

Data Structures:

RLPIDB_PT. Key fields: dpidb [directly connected peripheral interface data bus (DPIDB) circuit name] keyslot (0 or 16).

Action:

Insert the rDPIDB_PT tuple for this DPIDB.

172. PCDPLI_LNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read of the relation rIPLI_LNK failed while trying to obtain the unit number, unit type, and the peripheral configuration table (PCT) link number associated with the given time slot interchange (TSI) link number.

Data Structures:

RLPLI_LNK - Key = TSI link number.

Action:

Insert the rIPLI_LNK tuple.

173. PCDPORT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

The DBfrdtup() function returned a failure when obtaining port data from the RLFC_PORTTYP relation. Either the port name was invalid, or the tuple data was corrupted.

174. PCDPTSB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PTSB	Audit Mode: elev

Problem:

A data problem was encountered in the RLPTSB relation.

175. PCDQPHPIPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred trying to read relation rIQPHPIPE.

176. PCDQPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred trying to read relation rlQPORT.

177. PCDRDT2UNIT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Database read of RLRDT2UNIT has failed.

Probable Cause:

Invalid relation key(s) provided.

Action:

None.

178. PCDRDTCPDAT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: UNIT2RDT	Audit Mode: elev

Problem:

Database read of RLRDTCPDAT relation has failed.

Probable Cause:

Invalid relation key(s) provided.

Action:

None. Audit has been scheduled.

179. PCDRSM2HTU (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBfrdtup() failed when reading RLRS2HTU. The problem was either an invalid key or bad tuple data. The key, "rsm_num" is printed out with this assert.

180. PCDRSMCHAN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read of the RLRS2CHAN relation failed.

181. PCDRSMNTS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read of the RLRS2MNTS relation failed.

182. PCDRTS_HCN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read of the RLRTS_HCN relation failed.

183. PCDRTS_RTS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read of the RLRTS_RTS relation failed while trying to set up a path between SMs in a multi-module remote switching module (MMRSM) on an intra-cluster link (ICL). There may be an inconsistency between the RLICL_MSK and RLRTS_RTS relations. Either an extra bit was set in an rLICL_MSK tuple, or an rIRTS_RTS tuple was missing.

Data Structures:

RLRTS_RTS, RLICL_MSK.

Action:

Verify that the RLICL_MSK and RLRTS_RTS relations are consistent with each other.

In the SM that originated the assert, there is an rLICL_MSK tuple for each SM in the MMRSM cluster, one for the host SM, and one in which the key is zero. Ignore the tuples that have as keys the asserting SM's module number or the host SM's module number. The fields in an rLICL_MSK tuple are hex numbers, each field representing 32 time slots. The bits are read left to right, first the even numbers followed by the odd numbers. The first bit on the left of field msk01 is time slot 0, the next is 2, then 4, and so on through 62. The mask02 field represents even time slots 64 through 126; and so on. The odd time slots start with the msk09 field, and count off 1, 3, 5,...,511.

If the bit for a time slot is 1, there should be a corresponding rIRTS_RTS tuple. If an rIRTS_RTS tuple does not exist, use RC/V (or ODBE, if necessary) to change the 1 bit to a 0. For example, if time slot 14 is in question, it is the eighth bit in msk01. msk01 might contain c3000808. The eighth bit is the least significant bit of the second hex digit, the 3. To set the eighth bit to zero, change the 3 to a 2. The updated msk01 contains c2000808.

If the bit is not set for any of the tuples for the SMs in the cluster, the error may be on another SM. In some cases, an SM selects an ICL time slot, sends it in a message to another SM, which tries to discover the module number of the first SM by reading rIRTS_RTS. In such cases, it could be the first SM that has the rLICL_MSK problem, while the second SM asserts. The consistency check may need to be repeated for each SM in the MMRSM cluster.

It is possible that RLICL_MSK relation is correct and an rIRTS_RTS tuple is missing. Verify that all ICL time slots that are equipped are represented in RLRTS_RTS. Count the number of ICL time slots. There are 23 time slots for each communication link digital facility interface (CDFI) on the SM, but only 22 each for facilities interface data bus (FIDB) 01 and FIDB 11. There should be an rIRTS_RTS tuple for each time slot. If a tuple is missing, refer to the data population rules for the RLICL_MSK relation to insert the tuple.

184. PCDS1_PT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read the RLDS1_PT relation failed for the tuple keyed by the values printed on the receive only printer (ROP).

Data Structures:

RLDS1_PT. Key fields: ds1name [digital signal level 1 (DS1) circuit name] key_slot (0 or 12).

Action:

Insert the rIDS1_PT tuple for this DS1.

185. PCDS12RT (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read the RLDS12RT relation failed. The RLDS12RT relation contains information associated with a TR-303 (or TR-008) DS1 facility, including which RT (remote terminal) it serves.

Data Structures:

RLDS12RT. Key field: ds1name (DS1 circuit name).

Action:

Insert the rIDS12RT tuple for this DS1.

186. PCDS12RT (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read the RLDS12RT relation failed for the integrated digital carrier unit (IDCU) digital signal level 1 (DS1) circuit name printed on the receive only printer (ROP).

Data Structures:

RLDS12RT. Key field: ds1name (DS1 circuit name).

Action:

Insert the rIDS12RT tuple for this DS1.

187. PCDS96ABSIG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

One of the following problems occurred:

1. The RLFC_PORTTYP relation was not populated for the specific channel unit type.
2. The RLS96ABSIG relation was not populated for the specific channel unit type.
3. One of the key fields specified was corrupted.

Data Structures:

RLFC_PORTTYP, RLS96ABSIG.

Action:

Using RC/V, access the RLFC_PORTTYP relation to verify that a tuple exists for the channel unit type specified. If it does not, check the population rules and insert a tuple for this channel unit type.

If the rLFC_PORTTYP tuple does exist and is valid, verify that the rLS96ABSIG tuple for the specified channel unit type exists. If it does not, insert the values specified by the population rules.

188. PCDS96BASE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BASE	Audit Mode: elev

Problem:

The OPs96dsel() function could not access the RLS96BASE relation to connect a peripheral interface control bus

(PICB) to a SLC®-96 digital facility interface (S-DFI).

189. PCDS96DFI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: EQUIP	Audit Mode: elev

Problem:

SLC®-96 origination processing was passed a SLC®-96 digital facility interface (DFI) name by the control interface (CI) scan. The DFI name is used to access the RLS96DFI relation to determine the shelf name; but access to this relation failed.

190. PCDSGDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data problem was encountered in the RLSGDB relation.

191. PCDSLEQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfrdtup() function failed when trying to read an rIDSLEQUIP tuple.

192. PCDSL_EQ_CRFT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was found in the RLDSLEQUIP relation. This may indicate an error in this relation for a new office, or an error in a new office dependent data (ODD) database.

Data Structures:

RLDSLEQUIP.

Action:

The message printed specifies the key used to retrieve an rIDSLEQUIP tuple and the attribute that is suspected to be incorrect. Use RC/V (or ODBE, if necessary) to properly set the attribute.

193. PCDSPDCON (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A Q.931 message from the customer premises equipment (CPE) must be routed to the display terminal process, but the disp_dalb field in the RLTEDB relation was corrupted. This field identifies the destination terminal process. The disp_dalb field was nulled to prevent repetitive routing failures.

194. PCDT1USG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the RLS96T1USG relation, or too many mode 2 special services channel units (CUs) were assigned.

195. PCDTONE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data problem was encountered in the RLNONECH relation.

196. PCDTRCUPATH (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Tuple missing in the relation RLTRCUPATH.

Data Structures:

RLTRCUPATH.

Action:

Verify if valid key(s) used; if yes manually insert tuple.

197. PCDTSDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data problem was encountered in the RLTSDB relation.

198. PCDTSP2APP (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid or missing data in RLTS2APP relation.

Data Structures:

RLTS2APP.

Action:

Correct the ODD.

199. PCDTSP2APP (5E12 only)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Database read of RLTS2APP relation has failed.

Probable Cause:

Invalid relation key(s) provided.

Action:

None.

200. PCDUBHC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data problem was encountered in the RLUBHC relation.

201. PCDUNIT_CKT (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failure from DBfrdtup() when reading RLUNIT_CKT. The problem was caused by either invalid keys or bad tuple data.

202. PCDUNIT_CKT (5E11 to 5E12)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failure from DBfrdtup() when reading RLUNIT_CKT. The problem was caused by either invalid keys or bad tuple data.

203. PCDUTD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

A data problem was encountered in the RLUTD relation.

204. PCDVPIDB_F (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Data inconsistency of rVPIDB_F tuple or tuple is missing.

Data Structures:

RLVPIDB_F; key: unit number, utype, rel pct, and rel vp.

Action:

Check up unit number and unit type or insert the tuple.

205. PCEBFGERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A foreground to background error indicator in the function PCebrprt() is set to an unknown error value.

206. PCEBSPRET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The foreground e-bit scanning function PCebscan() has detected an unknown return value from the function SP_popspf(). The return value is in the local variable PCebscan'nts.

207. PCEBSTATE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected state has been detected during e-bit scanning. The time slot data block (TSDB) and associated path

data block (PHDB) will be dumped for the time slot found to be in error.

208. PCENDTRNER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Could not close a database transaction.

209. PCFCHPT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CHDB	Audit Mode: elev

Problem:
Could not follow the linkage from the rICHDB tuple to the rIPTSB tuple.

210. PCFCPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
The DBfrdtup() function failed when trying to read an rIFC_PORTTYP tuple.

211. PC_FCPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
While attempting to read an rIFC_PORTTYP tuple using a port that was passed to the PCpt2chan() function, a system error occurred.

Data Structures:
RLFC_PORTTYP. Key fields: port.

Action:
The system will perform normal recovery actions that are consistent with a DBfrdtup() failure.

212. PCFGERROR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
An operating system (OS) timeout return code was received because a process was not awakened after foreground (FG) timing.

213. PCFPCDA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:
Could not follow the linkage from a process control block link area (PCBLA) to a D-channel application linkage block (DALB).

214. PCFPTCH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PTSB	Audit Mode: elev

Problem:

Could not follow the linkage between the peripheral interface data bus (PIDB) time slot block (PTSB) and the channel data block (CHDB).

215. PCFPTPT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PTSB	Audit Mode: elev

Problem:

A one-to-one linkage error was found between two peripheral interface data bus (PIDB) time slot blocks (PTSBs). The PTSB audit will be scheduled to check the integrity of the data.

216. PCFTDCON (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A Q.931 message from the customer premises equipment (CPE) must be routed to the feature terminal process, but the feat_dalb field in the RLTEDB relation was corrupted. This field identifies the destination terminal process. The feat_dalb field was nulled to prevent repetitive routing failures.

217. PCF_VPIDB (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Database read of RLF_VPIDB relation has failed.

Probable Cause:

Invalid relation key(s) provided.

Action:

None.

218. PCGDSFPICBERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not find peripheral interface control bus (PICB) in global digital service function (GDSF) queue index table.

Probable Cause:

Corrupt data queue table entry.

Action:

None.

219. PCGETCBHC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The dynamic access (DA) primitive DAgetcbhc() failed unexpectedly.

220. PCGETCCB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not find the rCCBCOM tuple specified by the key.

221. PCGETCDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CDBCOM	Audit Mode: elev

Problem:

An rCDBCOM tuple for a given key was not found.

222. PCGETCHAN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

Could not find the rCHAN tuple specified by a given key.

223. PCGETCHDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not find the rCHDB tuple specified by the key.

224. PCGETCQB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CCBCOM	Audit Mode: elev

Problem:

Could not find the rCQB tuple specified by the key.

225. PCGETDPB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to get the D-channel port block (DPB) associated with the port. Probably used the DAGETDPB macro.

226. PCGETGSDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: GSDB	Audit Mode: elev

Problem:

A dynamic access (DA) primitive failed. The failure involved the grid summary scan data block (GSDB) and the DAgetgsdb() function.

227. PCGETPCBLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

No rPCBLA tuple exists for a given process control block link area (PCBLA) key. For example, the DAgetpcbla() function may have failed. The PCBLA audit is scheduled.

228. PCGETPHDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not retrieve an rIPHDB tuple.

229. PCGETPICB (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: DYNPICB	Audit Mode: elev

Problem:

A data problem was found in the RLDYNPICB relation which is a copy of the RLPICB relation, but in dynamic data. This assert is also used for problems in RLSGDB.

230. PCGETPICB (5E11 to 5E12)

Recovery Action: rpi	SPP: n	Audit: PICB	Audit Mode: elev

Problem:

A data problem was encountered with a peripheral interface control bus (PICB) data block or a service group data block (SGDB). The block's key does not equal the access key.

231. PCGETPTLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

Could not find the rIORTLA tuple specified by the portname key.

232. PCGETPTSB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to get the peripheral interface data bus (PIDB) time slot data block (PTSB) associated to the PTSB key found in the DPB.

233. PCGETRESTRMTR (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: RESTRMTR	Audit Mode: elev

Problem:

Accessing a timer head cell for MTP Restart has failed.

Probable Cause:

An invalid timeout value was passed to a function that accesses the array of CCRESTRMTR (timer head cell) structures.

Action:

Note occurrence and report problem to field support with all associated ROP data.

234. PCGETTONE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

An rITONECH tuple was not found for the specified key.

235. PCGETTSDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PHDB	Audit Mode: elev

Problem:

Could not get a pointer to the time slot data block (TSDB).

236. PCGETUBHC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The dynamic access (DA) primitive DAgetubhc() failed unexpectedly.

237. PCGQINDXOOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Index into the SMP->GDSF message queue was found out of range.

Probable Cause:

Corrupted data in PCgdsf_q for unit number.

Action:

None.

238. PCHTIMDUMP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The data dump contains 160 bytes of data that was collected by the peripheral control (PC) hardware trace SM function. This 160-byte struct (PCHTIM_OUT) is printed in the report data message.

239. PCIBRGDB (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred while trying to insert a tuple in relation RLBRGDB.

Action:

Contact next level of technical support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

240. PCIDCKT2GP (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read an rIIDCKT2GP tuple failed for the integrated digital carrier unit (IDCU) number, the remote terminal (RT) number, and the group number printed on the read only printer (ROP).

Data Structures:

RLIDCKT2GP. Key fields: IDCU number, RT number, and group number.

Action:

Insert the rIIDCKT2GP tuple.

241. PCIDLCCBLST (5E14 and later)

Recovery Action: spp	SPP: n	Audit: CCBCOM	Audit Mode: nonseg

Problem:

When removing an rCCBCOM tuple from the idle list, existing linkages were found to be corrupt.

This assert will purge the running process and will run the rCCBCOM audit in DIRECT mode to recover the idle list quickly and resume call processing.

242. PCIDPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read an rFC_PORTTYP tuple failed.

Data Structures:

RLFC_PORTTYP. Key field: port [remote terminal (RT) port name].

Action:

Insert the rFC_PORTTYP tuple for this RT port.

243. PCINMODE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Peripheral Control (PC) function used exclusively during switch unsegmented mode only (i.e., initialization) was entered during switch segmented mode.

Probable Cause:

Client called PC too late during an initialization.

Action:

Nothing can be done by the office technician to correct this problem. All the necessary data will be sent to the ROP. Please contact 5ESS[®] switch field support for help.

244. PCINSGDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

PROBLEM: An attempt was made to initialize an RLSGDB tuple based on data in an RLCDFI_MAP tuple.

Probable Cause:

Office dependent data (ODD) data in in RLCDFI_MAP is not consistent with data in the RLCKTDATA tuple for that communication digital facility (CDFI) facility.

Action:

Verify ODD data consistency between RLCDFI_MAP and RLCKTDATA.

245. PCINVALREPLY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An AIU reply message was received with class codes CX_INVALID, CXBADJOB, AX_INVALID, or AXBADJOB.

Probable Cause:

An attempt was made to send unsupported job to AIU's COMDAC or AP.

Action:

None.

246. PCINVBONOP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid connector operation was found in a message to the PH3port terminal process.

247. PCINVBRGENT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A bridge operation failed due to an invalid bridge entry condition. The operation could not be performed and failure was returned to the process requesting the operation.

Probable Cause:

The entry condition for the bridge operation was violated due to incorrect data or invalid feature interactions.

Action:

Two data items are dumped to provide information about the process controlling the port being monitored and the process controlling the bridge. These data dumps should be analyzed to determine the cause of the problem.

248. PCINVCKTNM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid internal circuit name (DMCIRCUIT) has been encountered.

Probable Cause:

1) A read of the UNIT_CKT relation failed; the relation read failed probably due to an incorrect key used; UNIT_CKT is usually read to determine an internal circuit name ('cktname' is a non-key attribute of UNIT_CKT).

2) An invalid circuit name was supplied to the PC subsystem by another subsystem via function call or message passing.

Any subsequent attempts to access the database (using the invalid circuit name) will fail.

Action:

Evaluate stack frames (and any additional data) provided on the ROP to determine why the invalid circuit name was encountered.

249. PCINVGMBX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A global digital service function (GDSF) unified control interface (UCI) mailbox has been found to be invalid.

Probable Cause:
Unknown.

Action:
None.

250. PCINVLD_DATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Peripheral control (PC) software has detected invalid data.

Probable Cause:
Either client software has called PC incorrectly or the office dependent data (ODD) has been corrupted.

Action:
The location of the assert and the additional data dumped will be needed to analyze the problem. No exchange technician action is required.

251. PCINVMANN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
An error in setting the keys used to read the RLFC_ANOUNCE relation occurred, or the rLFC_ANOUNCE tuple representing the trunk member for the music source was missing.

Data Structures:
RLFC_ANOUNCE. Key fields: port.module, port.member.

Action:
Using RC/V (or ODBE, if necessary), access RC/V View 5.1 (TRUNK GROUP) and RC/V View 5.5 (TRUNK MEMBER) to cross-check the data for the keys in the RLFC_ANOUNCE relation with the actual keys used. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify your next level of support.

252. PCINVMTRK (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
An error in setting the keys used to read the RLFC_TRUNK relation occurred.

Data Structures:
RLFC_TRUNK. Key fields: port.module, port.member

Action:
Using RC/V (or ODBE, if necessary), access RC/V View 5.1 (TRUNK GROUP), RC/V View 5.5 (TRUNK MEMBER), and RC/V View 1.11 (BRCS FEATURE ASSIGNMENT) to cross-check the data for the keys in the RLFC_TRUNK relation with the actual keys used.

If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify your next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

253. PCINVMTRK (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error in setting the keys used to read the RLFC_TRUNK relation occurred, or the rIFC_TRUNK tuple representing the music source was missing.

Data Structures:

RLFC_TRUNK. Key fields: port.module, port.member.

Action:

Using RC/V (or ODBE, if necessary), access RC/V View 5.1 (TRUNK GROUP), RC/V View 5.5 (TRUNK MEMBER), and RC/V View 1.11 (BRCS FEATURE ASSIGNMENT) to cross-check the data for the keys in the RLFC_TRUNK relation with the actual keys used.

If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify your next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

254. PCINVMUSIC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid music port was requested for sourcing music. One of the following problems occurred:

1. No tuple was found in the RLFC_PORTTYP relation for the given music port.
2. The music port was not populated as a PCRECDANN trunk.
3. The music_ind attribute in the rIFC_PORTTYP tuple was not set to DBYES.

Data Structures:

RLFC_PORTTYP. Key fields: port.module (SM number), port.member (member ID).

Action:

Use the input message OP:CONV,PORT to verify that the port key for the rIFC_PORTTYP tuple is a valid trunk member port. With the trunk group number and member number from the OP:CONV,PORT message, use RC/V to review RC/V View 5.1 (TRUNK GROUP) and RC/V View 5.5 (TRUNK MEMBER) for the associated tuple.

If the tuple is not found, insert the port information on View 5.1 and View 5.5. Change the trunk service class (TRK CLASS) to ANNCMNT on View 5.1. Set the MUSIC SOURCE field to "Y" on View 5.5.

255. PCINVNPMMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The N-port terminal process associated with a conference circuit received a message to perform a remote procedure call, but the data in the message was invalid. The additional data dump is the message buffer, starting with the message header. Although the problem was detected in the N-port process, the source of the error is in the sender; the most likely strategy for debugging is to trap the message being sent.

256. PCINVPGM (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

It is not valid for this function to be called by the currently running program.

257. PCINVPHSNKDS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The sink data stream attribute in the path data block (PHDB) was set to PHGSIGNAL, indicating that the PHDB was linked to a music terminal process (MTP). However, the PHDB was linked to a process other than the MTP. The PHDB will be dumped.

258. PCINVUSER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This Assert indicates that PCI1cntl has been called by terminal maintenance to perform tasks inhibiting or allowing scanning of NT1 user errors for an NT1 type incapable of sending the user error bits (PS1, PS2, or NTM).

259. PCISCDCFG (5E11 and later)

Recovery Action: spp	SPP: n	Audit: ISCDCFG	Audit Mode: nonseg

Problem:

Invalid or inconsistent data was found in the PCiscdconfig[] table, or in the common data (CD) circuit pack's status bits in the universal control interface (UCI) of the peripheral.

260. PCISMANBUS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CDBCOM	Audit Mode: elev

Problem:

A circuit data block (CDB) problem was encountered with a request. The integrated services line unit (ISLU) line group controllers (LGCs) 00-07 may have Z-cards or U-cards that are equipped, but do not have metallic access network (MAN) pack 00 and MAN pack 10 equipped; or ISLU LGCs 08-15 may have Z-cards or U-cards equipped, but do not have MAN pack 01 and MAN pack 11 equipped.

261. PCJBSPROB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure was received from peripheral control (PC) job scheduling.

262. PCK2CKMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read of the relation rUNIT_CKT has failed. The cause is an inconsistency in or a missing tuple. The scanning of the PICB associated with the tuple has been inhibited.

Data Structures:

Tuple of rUNIT_CKT keys to rUNIT_CKT = picb tuple unitnum picb tuple unittype ckt index from picb tuple service group

Action:

The report prints the PICB number associated with the rUNIT_CKT tuple. Verify consistency between the PICB tuple and rUNIT_CKT. After correcting, perform aud:scnmsk,sm=<#> to enable scanning on the PICB.

263. PCLAPBSUB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to read a tuple in the RLLAPBSUB relation for a packet switching B (PSB) channel. Tuples exist in the RLDSEQUIP and RLFC_PORTTYP relations with data indicating that this port is a PSB.

Data Structures:

RLLAPBSUB. Key field: bport [digital subscriber line (DSL) B-channel port name]

Action:

Convert the port name printed on the receive only printer (ROP) to the appropriate key for RC/V View 23.1 (DSL USERS). Verify that the B1/B2 packet parameters, fields 32-36, are populated correctly for the port in question.

264. PCLBINPRG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Client called peripheral control (PC) requesting a layer 1 loop back test of the message handler (MH) message path to a peripheral configuration table (PCT) link base peripheral while a loop back test was already in progress.

Probable Cause:

Concurrent operations illegally being performed on message path with out proper ownership.

Action:

Nothing can be done by the office technician to correct this problem. All the necessary data will be sent to the ROP. Please contact 5ESS® switch field support for help.

265. PCLBRGCC (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: BRGDB	Audit Mode: elev

Problem:

Error in one-to-one linkage from BRGDB to CCBCOM. For example, getting the CCBCOM from the BRGDB.

Probable Cause:

Some database corruption has occurred.

Action:

A BRGDB audit is scheduled to try and correct the problem. There is no action the office technician can take to correct this problem. Contact next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

266. PCLCBGS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CBHC	Audit Mode: elev

Problem:

An rCBHC tuple did not exist, an rIGSDB tuple did not exist, an rCBCH tuple did not own an rIGSDB tuple, or the linkage was corrupted.

267. PCLCCBRG (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: BRGDB	Audit Mode: elev

Problem:

Error in one-to-one linkage from BRGDB to CCBCOM. For example getting the CCBCOM from the BRGDB.

Probable Cause:

Some database corruption has occurred.

Action:

A BRGDB audit is scheduled to try and correct the problem. There is no action the office technician can take to correct this problem. Contact next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

268. PCLCCCD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CCBCOM	Audit Mode: elev

Problem:

The specified rCCBCOM tuple did not own an rCDB tuple, the specified rCCBCOM tuple was not found, the specified rCDB tuple was not found, or the linkage was corrupted.

269. PCLCCCQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CQB	Audit Mode: elev

Problem:

The rCCBCOM tuple was not found, the rCQB tuple was not found, the rCCBCOM tuple did not own an rCQB tuple, or the linkage was corrupted.

270. PCLCCDS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CCBCOM	Audit Mode: elev

Problem:

A linkage error from the rCCBCOM tuple to the rIDS0B tuple was encountered.

271. PCLCCPH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CCBCOM	Audit Mode: elev

Problem:

Could not follow the linkage from the channel control block (CCB) to the path data block (PHDB).

272. PCLCCPT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PTSB	Audit Mode: elev

Problem:

A linkage error was encountered between the RLCCBCOM relation and the RLPTSB relation.

273. PCLCCSNK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CCBCOM	Audit Mode: elev

Problem:

The specified rCCBCOM tuple did not own an rCHDB tuple, the specified rCCBCOM tuple was not found, the specified rCHDB tuple was not found, or the linkage was corrupted.

274. PCLCCSRC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CCBCOM	Audit Mode: elev

Problem:

The rCCBCOM tuple was not linked to an rCHDB tuple, the rCCBCOM tuple was not found, the rCHDB tuple was not found, or the existing linkage was corrupted.

275. PCLCDCH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CDBCOM	Audit Mode: elev

Problem:

An rCHDB tuple was not linked to the specified rCDB tuple, the specified rCDB tuple was not found, the specified rCHDB tuple was not found, or the linkage was corrupted.

276. PCLCGSSMASK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LCGSSMASK	Audit Mode: elev

Problem:

An inhibited grid on a line unit model 4 reported a transition. A grid summary scan mask audit was requested.

277. PCLCHCD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CHDB	Audit Mode: elev

Problem:

The specified rCHDB tuple was not linked to the rCDB tuple, the specified rCHDB tuple was not found, the specified rCDB tuple was not found, or the linkage was corrupted.

278. PCLCHDS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CHDB	Audit Mode: elev

Problem:

A linkage error from the rCHDB tuple to the rIDS0B tuple was encountered.

279. PCLCHPT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CHDB	Audit Mode: elev

Problem:

A linkage error was encountered between the RLCHDB relation and the RLPTSB relation.

280. PCLDSCC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DS0B	Audit Mode: elev

Problem:

A linkage error from the rIDS0B tuple to the rCCBCOM tuple was encountered. The DS0B audit was scheduled.

281. PCLDSCH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DS0B	Audit Mode: elev

Problem:

A linkage error from the rIDS0B tuple to the rCHDB tuple was encountered.

282. PCLDSPT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DS0B	Audit Mode: elev

Problem:

A linkage error from the rIDS0B tuple to the rIPTSB tuple was encountered. The DS0B audit was scheduled.

283. PCLGRPMEM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to read the RLLGRPMEM static relation.

Data Structures:
RLLGRPMEM.

Action:

No Action.

284. PCLINKPROB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A linkage that should have been set by the peripheral controller (PC) does not exist.

285. PCLK6DATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LK6	Audit Mode: elev

Problem:

Failure to read a tuple in the dynamic relation RLLK6_DATA.

286. PCLMCCB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CCBCOM	Audit Mode: elev

Problem:

A set linkage problem was encountered among the channel control block (CCB) set members, or the specified rCCBCOM tuple was not found.

287. PCLMCDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CDBCOM	Audit Mode: elev

Problem:

A set linkage problem was found among the circuit data block (CDB) set members, or the specified rCDB tuple was not found.

288. PCLMCHDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CHDB	Audit Mode: elev

Problem:

A set linkage problem was encountered among the channel data block (CHDB) set members, or the specified rCHDB tuple was not found.

289. PCLMCPLR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CPLR	Audit Mode: elev

Problem:

A set linkage problem was encountered among the coupler data block (CPLR) set members, or the rICPLR tuple was not found.

290. PCLMPHTS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TSDB	Audit Mode: elev

Problem:

A set linkage problem was encountered among the time slot data block (TSDB) set members, or the specified rITSDB tuple was not found in the file LPsig_relay.

291. PCLMTSDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TSDB	Audit Mode: elev

Problem:

A set linkage problem was encountered among the time slot data block (TSDB) set members, or the specified rITSDB tuple was not found in the file LPno_relay.

292. PCLNKAPDU (5E11 and later)

Recovery Action: spp	SPP: n	Audit: APDU	Audit Mode: nonseg

Problem:

An application protocol data unit (APDU) linkage error has been detected. This may be an APDU-APDU linkage error, or an APDU-DB_HEADC linkage error.

Probable Cause:

Corruption of the APDU dynamic relation.

Action:

This assert will schedule the APDU audit in demand mode to correct all corrupt linkages and purge the process encountering the error.

293. PCLNKDALB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: DALB	Audit Mode: nonseg

Problem:

A linkage error was encountered between two rIDALB tuples in a set owned by an rIDPB tuple. This could indicate a data problem in the RLDALB relation.

294. PCLNK_PLI (5E11 only)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Database read is not successful .

Probable Cause:

The tuple is missing or the keies are not correct.

Action:

If tuple is missing then insert the tuple.

295. PCLNKPLS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBfrdtup failed when trying to read rLNKP_LS.

296. PCLOSS_TBL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfrdtup() function returned a failure when attempting to read the RLLOSS_TBL relation.

297. PCLOSTTIMER (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

The cyclic timer associated with the SM network control system process was lost. A time slot refresh message was sent as the result of a time slot release, and more than 15 seconds have elapsed since the last message was sent. The system process will be purged to cause the timer to be restarted.

298. PCLPCCC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

An rIPCBLA tuple, rICCB COM tuple, or rICCB COM tuple was not owned by the rIPCBLA tuple, or the existing linkage was corrupted.

299. PCLPCCPLR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

The rIPCBLA tuple was not found, the rPORTCPLR tuple was not found, the rPORTCPLR tuple was not owned by the rIPCBLA tuple, or the linkage was corrupted.

300. PCLPCPH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

The rIPCBLA tuple was not found, the rIPHDB tuple was not found, the rIPCBLA tuple did not own an rIPHDB tuple, or the linkage was corrupted.

301. PCLPHSNK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PHDB	Audit Mode: elev

Problem:

Could not follow the path data block (PHDB) to time slot data block (TSDB) sink linkage.

302. PCLPHSRC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PHDB	Audit Mode: elev

Problem:

Could not follow the path data block (PHDB) to time slot data block (TSDB) source linkage.

303. PCLPHTS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PHDB	Audit Mode: elev

Problem:

The rIPHDB tuple was not found, the rITSDB tuple was not found, the rIPHDB tuple did not own an rITSDB tuple, or the linkage was corrupted.

304. PCLPTDS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PTSB	Audit Mode: elev

Problem:

A linkage error from the rIPTSB tuple to the rIDS0B tuple was encountered. The peripheral interface data bus (PIDB) time slot data block (PTSB) audit was scheduled.

305. PCLS6_LNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBfrdtup failed when trying to read RLLS6_LNK.

306. PCLSLNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBfrdtup failed when trying read rLS_LNK relation.

307. PCLSNKCC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CCBCOM	Audit Mode: elev

Problem:

The specified rICHDB tuple was not owned by the rCCBCOM tuple, the specified rICHDB tuple was not found, the specified rCCBCOM tuple was not found, or the linkage was corrupted.

308. PCLSRCCC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CCBCOM	Audit Mode: elev

Problem:

An rCCBCOM tuple was not linked to the specified rICHDB tuple, the specified rICHDB tuple was not found; the specified rCCBCOM tuple was not found, or the linkage was corrupted.

309. PCLUBCH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: UBHC	Audit Mode: elev

Problem:

The rIUBHC tuple was not found, the rICHDB tuple was not found, the rIUBHC tuple did not own an rICHDB tuple, or the linkage was corrupted.

310. PCMALLOC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage corruption was detected in the RLMALLOC relation.

311. PCMBOXBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The channel field of a GDSF->SMP mailbox was corrupt.

Probable Cause:

Channel incorrectly put into mailbox.

Action:

None.

312. PCMCDSTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid metallic connection description type was encountered. The type does not exist.

313. PCMCLMTB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfrdtup() function failed when reading the RLRC_EQLOC relation. This relation contains the metallic test bus (MTB) number for a line unit.

314. PCMCMSUSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful read of the RLPC_MSUSG relation occurred.

315. PCMCRLPTC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfrdtup() function failed when reading the protocol circuit relation RLPRTC.

316. PCMCTMTB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfrdtup() function failed when reading the RLMTBTST relation. This relation contains the metallic test buses (MTBs) for the test trunks.

317. PCMCTRMTB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfrdtup() function failed when reading the RLLOCEQ relation. This relation contains the metallic test buses (MTBs) for the trunk unit.

318. PCMDPATH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBfrdtup failed when trying to read rIMDPATH.

319. PCMHPIPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Data inconsistency or invalid data was found in relation RLMHPIPE. Either the 'qnetwork' field in RLMHPIPE has invalid value, or the number of network time slots in bitmap array net_slots[] and/or peripheral time slots in bitmap array per_slots[] in RLMHPIPE are not equal to the value 'num_slots' field in RLMHPIPE.

Data Structures:

RLMHPIPE.

Action:

Correct the office-dependent data (ODD). The number of network and peripheral time slot should be the same as the value of 'num_slots' field in RLMHPIPE relation. Also the value of 'qnetwork' field in RLMHPIPE relation has to be in the domain DMQLNTWK. The 'qnetwork' field may have the value of 2 or 3.

320. PCMH_UNIT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read on relation rIMH_UNIT returned a failure code.

Probable Cause:

Database problem.

Action:

None.

321. PCMPHDTO (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A metallic test interconnect bus (MTIB) was stuck; that is, it was busy more than "n" hours. The bus was idled for the old user and reassigned to a new user.

322. PCMTBADSND (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to MTSENDPERF() unexpectedly returned MTBADLENGTH or MTBADPARM.

Probable Cause:

Unknown.

Action:

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual for information on contacting technical support.

323. PCMTBFE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfrdtup() function failed to read an rIMTBFE tuple which contained the type of unit that was connected to the far end [the non-metallic service unit (MSU) end] of the metallic test bus (MTB). Peripheral control (PC) uses this relation to determine whether gated diode crosspoint (GDX) compensation is required during metallic connections to lines.

324. PCMTBS96 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When reading the static relation RLMTBS96, the DBfrdtup() function returned a failure code to the PCmc_mtb() function in the central processor (CP). The failure return code was DBRELNAME_BAD, DBIN_TRAN, or DBSYS_ERR which indicates an internal database (DB) error.

325. PCMTPCBLAERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

An ownership error occurred. A music source was owned by a process other than a far music terminal process (MTP), or an invalid association between the music port and the process was detected. A process control block link area (PCBLA) audit was scheduled.

326. PCMTUNKSND (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to MTSENDPERF() had an unknown return value.

Probable Cause:

Unknown.

Action:

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual for information on contacting technical support.

327. PCMVBRGATT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to move a port [channel control block (CCB)] that was bridged.

328. PCMVCLSDPH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to move a port [channel control block (CCB)] that still had a closed path.

329. PCMVEPROC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A request was made to move a port [channel control block (CCB)] to a nonexistent process.

330. PCNACT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid LDSF Reply. Circuit is Not **Activated**.

331. PCNDACT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid LDSF Reply. Circuit is Not ** De-Activated **.

332. PCNGVPA_STAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid state in PCVPA_STAT.

333. PCNODSL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The specified dport was not found in the RLEQUIPDSL relation.

334. PCNODTP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A Q.931 message from the customer premises equipment (CPE) must be routed to the display terminal process. The disp_dalb field in the RLTEDB relation was set to null, indicating that the display terminal process did not exist.

335. PCNOFTBN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt by the DBfrdtup() function to read the RLFEATBN relation failed. This relation contains the feature to button mapping for integrated services digital network (ISDN) terminals.

Data Structures:

RLFEATBN.

Action:

Populate the RLFEATBN relation.

336. PCNOISTRM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt by the DBfrdtup() function to read the RLIS_TERM relation failed. This relation contains terminal specific data for an integrated services digital network (ISDN) terminal.

Data Structures:

RLIS_TERM.

Action:

Populate the RLIS_TERM relation.

337. PCNOMASTER (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: elev

Problem:

A wideband process with path data blocks (PHDBs) attached to the process control block link area (PCBLA) did not have the first PHDB as the master. The data was corrupted. The process was purged.

338. PCNOTINSP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A Q.931 message from the customer premises equipment (CPE) required the CPE mode to be inspect, but the cpemode field in the rITEDB tuple was not inspect.

339. PCNUDBERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

An attempt was made to set up a port as a non-switched special services nail-up port. This port is marked as a nail-up port in the RLPORTLA relation, but there is a problem reading the RLNAILUP relation for the port. The PORTLA audit checks for consistency between rIPORTLA tuples marked as nail-up and the existence of corresponding rINAILUP tuples. If the rINAILUP tuple is missing, the rIPORTLA tuple is updated to indicate non-nail-up and an output message is printed. This assert returns to point of interrupt because it is called from routine port conditioning.

340. PCNUHRWD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The port type was not supported by nail-up.

Data Structures:

RLCKTDATA. Key field: lp_type.

Action:

The nail-up connection will not be brought up. Verify that the port is supported by nail-up.

341. PCNUSIG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The signaling mode specified for a nail-up connection was inconsistent with the signaling capabilities of the hardware. The signaling mode for the connection will be down-graded to no signaling.

342. PCODPSOP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfrdtup() function failed when trying to read the RLODPSOP relation.

343. PCOPLOSS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message type was received by the PCoploss() function. This function inserts a loss of zero for operator services position system (OSPS) conference calls.

344. PCOPNRELER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not open a static database relation.

345. PCOSDSPROB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid condition or time limit was specified on an operating system for distributed switching (OSDS) primitive call.

346. PCOSLNGTH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The user-supplied operating system for distributed switching (OSDS) message was too long.

347. PCOSSEND (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid process ID was encountered, or too many messages were buffered by the operating system for distributed switching (OSDS).

348. PCOSWAKE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return was received from the OSwake() primitive.

349. PCOUTSCH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The channel control block communication region (CCBCR) was missing from the PCoutsch[] array.

350. PCOWNPROB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

A port control block link area (PCBLA) was found that was not the PCBLA for the current process.

351. PCPHDATAPROB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PHDATA	Audit Mode: elev

Problem:

The dynamic table PCphdata[] was incorrect. This table holds path hunt data for each SM such as time slot data, time multiplexed switch (TMS) network control and timing (NCT) link numbers, and status. For remote SMs (RSMs), it also indicates the host SM and cluster ID number.

One of the following errors may have occurred:

- the host number and cluster ID values were inconsistent
- the host number was corrupted
- an RSM appeared to be a regular SM
- the host number was for an unequipped SM
- the host number was out of range

The AUPHDATA audit will be scheduled to clean up the PCphdata[] table.

352. PCPHDB_BAD_EVENT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A path data block (PHDB) received an invalid event for its current state. The PHDB represents a connection through the switch. A setup or teardown operation was performed out of sequence. The dump includes the PHDB, channel control block (CCB), and process control block link area (PCBLA) for this connection.

353. PCPHTSFRAG (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A path could not be established on a PSU channel group, even though enough free channels do exist on the channel group to accomodate the path.

Probable Cause:

The available channels on the PSU channel group have become fragmented, resulting in there being no available block of contiguous channels large enough to accomodate the path.

Action:

Remove all of the members assigned to the channel group from service. Then restore all of the members back into service. This will result in de-fragmentation of the available channels.

354. PCPORTLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data problem was found in the RLPORTLA relation.

355. PCPQCLRD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The packet trunk input buffer (PTIB) origination queue was cleared.

356. PCPRIDALB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PRISTAT	Audit Mode: elev

Problem:

Error occurred while accessing RLDALB tuple linked off rIPRISTAT tuple. Appropriate recovery action has been taken.

357. PCPRISTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PRISTAT	Audit Mode: elev

Problem:

Error occurred while accessing rIPRISTAT tuple. Appropriate recovery action has been taken.

358. PCPSBADDATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A PSBADDATA error code was returned from the PSmsadt() function or the PSmsudt() function indicating that a protocol handler (PH), terminal endpoint identifier (TEI), or channel was out of range or unequipped.

359. PCPSBADPARM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A PSBADPARM error code was returned from the PSmsadt() function or the PSmsudt() function indicating that the length of the packet was greater than 498 bytes.

360. PCPSL2THRS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to read a tuple in the RLPSL2THRS relation for level 2 threshold limit information for a packet switching trunk group.

Data Structures:

RLPSL2THRS. Key field: grpnum (packet switching trunk group number).

Action:

Convert the port name printed on the receive only printer (ROP) to the trunk group name. Review RC/V View 5.1 (TRUNK GROUP) to verify that the trunk group information is correctly populated.

361. PCPSL3TRKG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to read a tuple in the RLPSL3TRKG relation to access level 3 information for an X.75/X.75' packet switching trunk group.

Data Structures:

RLPSL3TRKG. Key field: grpnum (packet switching trunk group number).

Action:

Convert the port name printed on the receive only printer (ROP) to the trunk group name. Review RC/V View 5.1 (TRUNK GROUP) to verify that the trunk group information is correctly populated for the port in question.

362. PCPSRT_GP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not read a tuple for the packet interswitch trunk (IST) port in the packet switching port to group relation RLPSRT_GP.

Data Structures:

RLPSRT_GP. Key fields: module [SM of digital subscriber line (DSL)], ph_number [protocol handler (PH) number], ph_cn (PH channel number).

Action:

Convert the port name printed on the receive only printer (ROP) to the key for RC/V View 5.5 (TRUNK MEMBER). Verify the accuracy of the trunk member information for the port in question.

363. PCPSTRK_L2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to read a tuple in the RLPSTRK_L2 relation for level 2 information for a packet switching trunk port.

Data Structures:

RLPSTRK_L2. Key field: port (packet switching trunk port).

Action:

Using the port name printed on the receive only printer (ROP), review RC/V View 5.5 (TRUNK MEMBER) to verify that the trunk port information is correctly populated.

364. PCPSTRUNKS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to read a tuple in the RLPSTRUNKS relation for level 2 information for a packet switching trunk group.

Data Structures:

RLPSTRUNKS. Key field: grpnum (packet switching trunk group number).

Action:

Convert the port name printed on the receive only printer (ROP) to find the trunk group name. Review RC/V View 5.1 (TRUNK GROUP) to verify the accuracy of the trunk group information for the port in question.

365. PCPSUPIDB_CRFT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was found in the RLPSIUPIDB relation. This may indicate errors in this relation for a new office, or errors in a new office dependent data (ODD) database.

Data Structures:

RLPSIUPIDB.

Action:

The message printed specifies the key used to retrieve an rLPSIUPIDB tuple and the attribute that is suspected to be incorrect. Use RC/V (or ODBE, if necessary) to properly set the attribute.

366. PCPSX25LN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to read a tuple in the RLPSX25LN relation for a packet switching port. Tuples exist for the port in the RLDSLEQUIP and RLFC_PORTTYP relations with information indicating that the port has packet switching.

Data Structures:

RLPSX25LN. Key fields: ph_number [protocol handler (PH) number], ph_cn (PH channel number).

Action:

Convert the port name printed on the receive only printer (ROP) to the key for RC/V View 23.1 (DSL USERS). Verify that the packet switching information on screen 3 is populated correctly for the port in question.

367. PCPSX75TRK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to read a tuple in the RLPSX75TRK relation for an X.75'/X.75 trunk to access level 3 data.

Data Structures:

RLPSX75TRK. Key fields: ph_number [protocol handler (PH) number], ph_cn (PH channel number).

Action:

Convert the port name printed on the receive only printer (ROP) to the trunk group number, and review RC/V View 5.5 (TRUNK MEMBER) to verify that the trunk port information is populated correctly.

368. PC_PTDATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to read an rRFC_PORTTYP tuple using a port name that was passed to the PCpt2chan() function. No tuple was found that matches the specified port.

Data Structures:

RLFC_PORTTYP. Key fields: portname.

Action:

Check RC/V View 5.5 (CKTDATA) to verify that a trunk exists for this port.

369. PCPTDBOWN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PTDB	Audit Mode: elev

Problem:

An attempt was made to release a task data block (TDB). According to the PCptdbtbl[unit number][TDB number] array, the channel control block (CCB) that was passed to the PCprlstdb() function does not own this TDB.

Probable Cause:

Either the CCB never owned the TDB or the TDB was already released.

Action:

The PTDB audit will be scheduled.

370. PCPTMTPLNK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

The port linkage area (PORTLA) representing the music port could not be linked to the far music terminal process (MTP). The network path setup to the SM containing the music source failed. The PORTLA structure was dumped, and the PORTLA audit was scheduled.

371. PCPTSBDUMP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PTSB	Audit Mode: elev

Problem:

A data problem was encountered in the dynamic relation RLPTSB. The tuple was dumped and the peripheral interface data bus (PIDB) time slot block (PTSB) audit was scheduled.

372. PCQCLRD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The digital subscriber line (DSL) origination queue was cleared.

373. PCQCLRED (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The extended digital subscriber line (EDSL) origination queue was cleared.

374. PCQCLREP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The essential service protection (ESP) origination queue was cleared.

375. PCQPHPIPE (5E11 to 5E12)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was found in relation RLQPHPIPE. The 'qnetwork' field in RLQPHPIPE has invalid value.

Data Structures:
RLQPHPIPE.

Action:

Correct the office-dependent data (ODD). The value of 'qnetwork' field in RLQPHPIPE relation has to be in the domain DMQLNTWK.

376. PCQPHPIPE_ERR (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was found in relation RLQPHPIPE. The *qnetwork* field in RLQPHPIPE has invalid value.

Data Structures:
RLQPHPIPE.

Action:

Correct the ODD. The value of *qnetwork* field in RLQPHPIPE relation has to be in the domain DMQLNTWK.

377. PC_RBLIM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The maximum number of rIRTMGBUF tuples allowed per remote operations service element (ROSE) application protocol data unit (APDU) was exceeded.

378. PCRCGBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RCGTMR	Audit Mode: elev

Problem:

Failure to access a tuple of the relation RLRCGTMR.

379. PCRCGXDP (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: XDPCSTAT	Audit Mode: elev

Problem:

A linkage error between the relation RLRCGTMR (owner) and the relation RLXDPCSTAT (member) has been found.

Probable Cause:

Dynamic database corruption.

Action:

This database inconsistency is being automatically fixed by Audit action.

380. PCRDPORT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

A read of FC_PORTTYP resulted in a NO_MATCH using the key attribute retrieved from the PCBLA. The port name is dumped.

Probable Cause:

Unknown.

Action:

Contact next level of technical support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

381. PCRDT2UNIT (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read the RLRDT2UNIT relation failed for the TR-303 remote digital terminal (RDT) circuit name printed on the receive-only printer (ROP).

Data Structures:

RLRDT2UNIT - Key field: rname (circuit name of the TR-303 RDT).

Action:

Insert the rLRDT2UNIT tuple for this RDT.

382. PCRG2CCBCOM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert is used when there is a problem detected with the linkages between RLCCBCOM and RLRGBUS.

383. PCRI_DGRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read the RLRI_DGRP relation failed for the remote integrated services line unit (RISLU) D-channel port name printed on the receive only printer (ROP).

Data Structures:

RLRI_DGRP. Key field: dport (RISLU D-channel port name).

Action:

Insert the rIRI_DGRP tuple for this port. The pgybkgrp attribute is found in the appropriate rIDGRP_RI tuple.

384. PCRLSNGDEACT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Request to release circuit IS invalid. The circuit is being deactivated.

385. PCRSTCLU (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: CLURDB	Audit Mode: elev

Problem:

Linkage error between an owner tuple in RLRSTMR and a member tuple in RLCLU_RDB.

Probable Cause:

Dynamic database corruption.

Action:

Error is going to be automatically fixed by Audit.

386. PCRSTXLIST (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: XLIST	Audit Mode: elev

Problem:

Linkage error between an owner tuple in RLRSTMR and a member tuple in RLXLIST.

Probable Cause:

Dynamic database corruption.

Action:

Problem is being automatically fixed by Audit.

387. PCRT2DS1 (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read the RLRT2DS1 relation failed; the RLRT2DS1 relation contains information associated with a TR-303 (or TR-008) remote terminal (RT), including which DS1s serve the RT.

Data Structures:

RLRT2DS1. Key field: rname (RT circuit name).

Action:

Insert the rIRT2DS1 tuple for this RT.

388. PCRT2DS1 (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read the RLRT2DS1 relation failed for the integrated digital carrier unit (IDCU) remote terminal (RT) circuit name printed on the receive only printer (ROP).

Data Structures:

RLRT2DS1. Key field: rname (RT circuit name).

Action:

Insert the rLRT2DS1 tuple for this RT.

389. PCRTEILA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage corruption was detected in the RLRTEILA relation.

390. PCRT_LAPD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read an rLRT_LAPD tuple failed.

Data Structures:

RLRT_LAPD. Key field: rname (circuit name of a TR303 remote terminal).

Action:

Verify that the key printed on the receive only printer (ROP) is a valid circuit name for an equipped TR303 remote terminal (RT); reviewing the RLCKTDATA relation is one way to check.

If the key is valid, determine if the tuple exists in the RLRT_LAPD relation. If the tuple does not exist, create it by entering the recent changeable link access protocol D (LAPD) parameters for that RT.

391. PCRTL B (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage corruption was detected in the RLRTL B relation.

392. PCRTMISC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read an rLRT_MISC tuple failed.

Data Structures:

RLRT_MISC. Key field: rname [remote terminal (RT) circuit name].

Action:

Insert the rLRT_MISC tuple for this RT.

393. PCRTMSGBUF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkage corruption was detected in the RLRTMSGBUF relation.

394. PCS3PFail (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A function called by the PH3port terminal process returned a failure indicating a data problem.

395. PCS96EQP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read an rls96EQUIP tuple failed.

Data Structures:

RLS96EQUIP. Key field: s96rtname [remote terminal (RT) circuit name].

Action:

Insert the rls96EQUIP tuple for this RT.

396. PCS96SHELF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When reading the dynamic relation RLS96SHELF, the DBfrdtup() function returned a failure code to the PCck_ddl() function in the SM. This failure includes all database (DB) failure returns which implies an internal DB error.

397. PCSCADCON (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A Q.931 message from the customer premises equipment (CPE) must be routed to the selected call appearance terminal process, but the sca_dalb field in the RLTEDB relation was corrupted. This field identifies the destination terminal process. The sca_dalb field was nulled to prevent repetitive routing failures.

398. PCSCCBRG (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: BRGDB	Audit Mode: elev

Problem:

Error in set-owner/set-member linkage between BRGDB to CCBCOM. For example, errors updating the list if BRGDBs linked to an owner CCBCOM.

Probable Cause:

Some database corruption has occurred.

Action:

A BRGDB audit is scheduled to try and correct the problem. There is no action the office technician can take to correct this problem. Contact next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

399. PCSCCCH (5E11 and later)

Recovery Action: spp	SPP: n	Audit: CCBCOM	Audit Mode: elev

Problem:

Could not follow the linkage from the channel control block (CCB) to the channel data block (CHDB).

400. PCSCCPH (5E11 and later)

Recovery Action: spp	SPP: n	Audit: CCBCOM	Audit Mode: elev

Problem:

Could not follow the linkage from the channel control block (CCB) to the path data block (PHDB).

401. PCSDATAPROB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was found.

402. PCSLCCSRC (5E11 and later)

Recovery Action: spp	SPP: n	Audit: CCBCOM	Audit Mode: elev

Problem:

A channel data block (CHDB) to channel control block common area (CCBCOM) linkage problem was encountered.

403. PCSMC7RCG_INV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STAT	Audit Mode: elev

Problem:

The counter for number of remotely congested CCITT7 DPCs went negative. An audit will be scheduled to correct it. The NM CCS congestion discrete may be incorrectly set.

404. PCSMTPCCPH (5E11 and later)

Recovery Action: spp	SPP: y	Audit: null	Audit Mode: null

Problem:

The channel control block (CCB) to path data block (PHDB) set member linkage of the near music terminal process (MTP) was corrupted. The near MTP will be purged.

405. PCSOSEND (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An error return was received from the OSsendmsg() function.

406. PCSPCCC (5E11 and later)

Recovery Action: spp	SPP: n	Audit: CCBCOM	Audit Mode: elev

Problem:

Could not follow the linkage from the process control block link area (PCBLA) to the channel control block (CCB).

407. PCSPCPH (5E11 and later)

Recovery Action: spp	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

Could not follow the linkage from the process control block link area (PCBLA) to the path data block (PHDB).

408. PCSPHSNK (5E11 and later)

Recovery Action: spp	SPP: n	Audit: PHDB	Audit Mode: elev

Problem:

Could not follow the linkage from the path data block (PHDB) to the sink time slot data block (TSDB).

409. PCSPHSRC (5E11 and later)

Recovery Action: spp	SPP: n	Audit: PHDB	Audit Mode: elev

Problem:

Could not follow the linkage from the path data block (PHDB) to the source time slot data block (TSDB).

410. PCSTOP (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The current process is in an unstable state.

411. PCSUMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read of the relation rUNIT_CKT has failed. The probable cause is a missing tuple or invalid keys. The scanning of the PICB number associated with the rUNIT_CKT tuple has been inhibited.

Data Structures:

Tuple of rUNIT_CKT. Tuple of rCKTDATA key to rCKTDATA = circuit name.

Action:

The report prints the PICB number associated with the rCKTDATA and rUNIT_CKT tuple. Verify consistency between rCKTDATA and rUNIT_CKT for this circuit. After correcting, perform `aud:scnmsk,sm=<#>` to enable scanning of the PICB.

412. PCTBLNOMTCH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

There was no valid match between the metallic connection type and an entry in the line group bus table. The table must contain a corresponding metallic connection type in order to access a valid metallic configuration.

413. PCTDBOWN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TDB	Audit Mode: elev

Problem:

An attempt was made to release a task data block (TDB). According to the `PCtdbtbl[line unit number][TDB number]` array, the channel control block (CCB) that was passed to the `PCrlstdb()` function does not own this TDB. Either the CCB never owned the TDB, or the TDB was already released. The TDB audit will be scheduled.

414. PCTEDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TEDB	Audit Mode: elev

Problem:

A data problem was found in the RLTEDB relation.

415. PCTEILA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TEILA	Audit Mode: elev

Problem:

A data problem was found in the RLTEILA relation.

416. PCTSDBBITBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TSDB	Audit Mode: elev

Problem:

A time slot state was corrupted. The SM bit map is used for rapid location of idle time slots. The time slot data block (TSDB) provides a fully detailed state of time slots.

The SM bit map may have indicated that the specified time slot was busy, and the TSDB indicated that it was idle. Alternatively, the bit map may have indicated that the time slot was idle and available for allocation from the idle list, and the TSDB indicated that it was not on the idle list. Usually, the TSDB, path data block (PHDB), and process control block link area (PCBLA) are dumped. The TSDB audit resynchronizes the TSDB and SM bitmap.

417. PCTSIPOB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A discrepancy exists between the hardware and software versions of the time slot interchange (TSI) type in an SM. The hardware value is determined by physically accessing the TSI during the ROM portion of the initialization, and is kept in the SMtsiopt global variable. The software value is calculated from a PCTSI tuple in the RLCKTDATA relation, and is kept in the Glttsiopt global variable. Bits 6 and 12 of each global variable must match (both bits are 0 for TSIU3, or both are 1 for non-TSIU3). The values of these two variables are dumped.

Data Structures:

RLCKTDATA.

Action:

Check the cli value of the PCTSI tuple in the RLCKTDATA relation against the type of TSI actually installed in the SM. If they do not indicate the same TSI type, change the cli value in the RLCKTDATA tuple to match the type of TSI installed.

418. PCUNEXACT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected activation reply from the local digital service function (LDSF) has been received.

419. PCUNEXDACT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected de-activation reply has been received from the LDSF.

420. PCUNEXP_DATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The code executing processed data that was unexpected. Data is dumped.

Probable Cause:

Unknown.

Action:

None.

421. PCUNIT2RDT (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read the RLUNIT2RDT relation failed for the TR-303 remote digital terminal (RDT) unit name printed on the receive-only printer (ROP).

Data Structures:

RLUNIT2RDT - Key field: rdt_unit (unit number of the TR-303 RDT).

Action:

Insert the rLUNIT2RDT tuple for this RDT.

422. PCUNIT_CKT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read of the relation rLUNIT_CKT has failed. The most probable cause is an inconsistency between this relation and rCKTDATA. The inconsistency may be in a parent - child data relation.

Data Structures:

Tuple of rLUNIT_CKT and rCKTDATA. Key to rCKTDATA = circuit name.

Action:

The report prints the name of a circuit from rCKTDATA and also the relationship (parent-child, etc) to the circuit for which a tuple was not found in rLUNIT_CKT. Verify consistency between rCKTDATA and rLUNIT_CKT for this circuit. Correct the data as necessary between the two relations.

423. PCUNITDATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBfrdtup failed when trying to read rLUNITDATA.

424. PCUNITMH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Database read of a rIMH_UNIT tuple failed.

Probable Cause:

Database problem.

Action:

None.

425. PCUNKTSKTYP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Peripheral control (PC) multiple task return processing was requested, however the task type is unknown to PC.

Probable Cause:

Client did not coordinate the new task with PC multiple task return processing functionality.

Action:

Nothing can be done by the office technician to correct this problem. All the necessary data will be sent to the ROP. Please contact 5ESS® switch field support for help.

426. PCUPHSNK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PHDB	Audit Mode: elev

Problem:

Could not follow the linkage from the path data block (PHDB) to the sink time slot data block (TSDB). The channel control block (CCB) and the PHDB data structures were dumped.

427. PCUSRCPH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TSDB	Audit Mode: elev

Problem:

An unexpected source (one-to-one) linkage was found between the time slot data block (TSDB) and a path data block (PHDB). Normally, the TSDB, the PHDB that is linked to the TSDB, and the process control block link area (PCBLA) that is linked to the PHDB are dumped. If any of these are not available, then other dumps are substituted.

428. PCUTCCCH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CCBCOM	Audit Mode: elev

Problem:

A linkage problem was found when trying to trace from the channel control block common area (CCBCOM) to the channel data block (CHDB). The rCCBCOM tuple was dumped.

429. PCUTPCPO (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

The peripheral control (PC) path trace (part of the utility call trace) found a data or linkage problem while trying to trace from the specified process control block link area (PCBLA) to the port linkage area (PORTLA).

430. PCUXPCPID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The calling party identification (CPID) read from the integrated services line unit (ISLU) card did not match the expected card type from the database.

Data Structures:

RLCKTDATA.

Action:

Check the ISLU card under test and verify the card type against the data found in the RLCKTDATA relation. Either the card must be replaced or the database must be updated via RC/V.

431. PCVPANGCCB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A voice path assurance (VPA) reply from the LDSF for an invalid channel control block (CCB).

432. PCVPANGT_C (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A voice path assurance (VPA) reply from the channel control block (CCB) is not own or TRANSIENT.

433. PCVPIDB_F (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Database read is not successful.

Probable Cause:

Database problems.

Action:

None.

434. PCXDPCXLIST (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: XLIST	Audit Mode: elev

Problem:

Linkage error between RLXLIST and RLXDPCSTAT.

Probable Cause:

Dynamic database corruption.

Action:

Problem is being fixed by Audit.

435. PCXRDTCPDAT (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: RDTCPDAT	Audit Mode: elev

Problem:

Contents of RLRDTCPDAT relation found to be corrupted.

Probable Cause:

Program error.

Action:

If problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

436. XPCOSWGT (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unexpected return from OSWGETTYPE.

Probable Cause:

Unknown.

Action:

Contact next level of technical support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

8. ASSERT DESCRIPTIONS FOR RANGES PCMF - UT

INTRODUCTION

The Assert Descriptions section contains, for each assert, a description of the problem that caused the assert to fail.

A manual action assert description consists of a Problem section which describes the problem, a Data Structures section which identifies the relations that were involved, and an Action section which describes how to fix the problem. Since a manual action assert usually reports office dependent data (ODD) related problems, it can be fixed manually at the office.

A defensive check failure (DCF) assert, however, typically reports software errors that cannot be fixed at the office and may necessitate contacting your next level of support, particularly if it fires often. A DCF assert description contains a description of the problem; but it does not contain a Data Structures or Action section.

The asserts are divided into ranges. The assert ranges are organized alphabetically in this section; then the asserts within each range are listed alphabetically by mnemonic and are presented in the following manner:

MNEMONIC: (software release)

```

(a)                (b)
Recovery Action: (c)      SPP: (d)      Audit: (e)      Audit Mode: (f)
Problem:
(g)
```

where:

(a)	Lists the mnemonic that identifies the assert.
(b)	Lists the software release(s) that this assert is found in.
(c)	Describes the recovery action that is triggered by the assert. Possible values are si The system invoked a selective initialization. spp The system initiated a single process purge. rpi The system returned control to the program at the point of interrupt; escalation possibly occurred. If a dash precedes ``rpi," no escalation occurred.
(d)	Indicates whether the assert initiated a single process purge (SPP) of a nonrunning process. Values are "y" for yes and "n" for no.
(e)	Lists the audit scheduled to run (if any) as a result of the assert failure. Currently, each assert may invoke only one audit. If no audit is scheduled, the value is "null."
(f)	Describes the mode the scheduled audit will run in. Possible values are elev The audit will run in the elevated segmented mode. nonseg The audit will run in the nonsegmented mode. null No audit is scheduled.
(g)	Contains an explanation of the problem that caused the assert to fail. Descriptions of manual action asserts contain additional information describing the data structures that are affected and the action(s) needed to solve the problem.

The technical content of this section is constantly updated. Addendums to this section of the manual have a high priority and are distributed promptly.

Range: pcmf**1. CMFBADMSG (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid message type detected by foundation peripheral controller (FPC) code.

2. CMFFPCCNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The foundation peripheral controller (FPC) received 256 bad connect orders in 30 seconds, which has generated a critical FPC failure.

3. CMFINVDATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data in "whosent field" received in foundation peripheral controller (FPC) function CDnassert().

4. CMFINVRET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid return value detected by the foundation peripheral controller (FPC) during FPC soft switch while disabling interrupts on the office network timing complex (ONTC).

5. CMFLDPTR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Load pointer or unload pointer for base priority queue is out of range. This is a critical error.

6. CMFLOAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Corrupt load pointer found.

7. CMFNONCRIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This is a general non-critical assert.

8. CMFSSOPC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid foundation peripheral controller (FPC) soft switch opcode detected by FPC code. This is a critical error.

9. CMFTMS1CNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid time multiplexed switch (TMS) connect variable used by the foundation peripheral controller (FPC) for the 16-byte message. This is a critical error.

10. CMFTMS1OPC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid time multiplexed switch (TMS) opcode detected within the 16-byte message by foundation peripheral controller (FPC) code. This is a critical error.

11. CMFTMS2CNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid time multiplexed switch (TMS) connect variable used by the foundation peripheral controller (FPC) for the 32-byte message. This is a critical error.

12. CMFTMS2OPC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid time multiplexed switch (TMS) opcode detected within the 32-byte message by foundation peripheral controller (FPC) code. This is a critical error.

13. CMFTPBTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Error in the top or bottom pointers in the dual access memory (DAM).

14. CMFUNITS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Corrupt expected number of units. This is a critical error.

15. CMFUNLOAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Corrupt unload pointer found.

Range: pcmm**1. CMAUACKS (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ACKCMPN bit on the BX.25 level 2 protocol controller (XPC) did not reset in the allocated time. This is a critical error.

2. CMAUBQFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The base priority output queue is full.

3. CMAUBUFT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A corrupt buffer type was encountered. This is a critical error.

4. CMAUCLFR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid function return value was received from the communication link fault recovery (CLFR). This is a critical error.

5. CMAUDCLF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A defensive check failure was encountered for the message length. This is a critical error.

6. CMAUFREE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Corrupt freespace handling information was encountered. This is a critical error.

7. CMAUINFR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid "i" frame was received in the CMrcvmsg() function. This is a critical error.

8. CMAUIQPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid base priority input queue pointers were encountered. This is a critical error.

9. CMAULINK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A corrupt link number was encountered. This is a critical error.

10. CMAULQFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The link queue is full.

11. CMAUMSPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The msgq pointer in the linkstats structure is out of range. This is a critical error.

12. CMAUNOAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The BX.25 level 2 protocol controller's (XPC's) TLOOK address is zero. This is a critical error.

13. CMAUNXST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A corrupt transmit state variable was encountered. This is a critical error.

14. CMAUOPPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid base priority output queue pointers were encountered. This is a critical error.

15. CMAUORCV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not receive a message.

16. CMAUPHSE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The BX.25 phase is corrupted. This is a critical error.

17. CMAUPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A corrupt pointer update type was encountered. This is a critical error.

18. CMAURAMMUT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Dynamic random access memory (RAM) was corrupted. This is a critical error.

19. CMAURLLD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLOOK entry conflicts with the linkstats structure's load pointer. This is a critical error.

20. CMAURLPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLOOK pointer in the linkstats structure is out of range. This is a critical error.

21. CMAURLVR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLOOK's v(r) (protocol sequence number) conflicts with the linkstats structure's load pointer. This is a critical error.

22. CMAURMTS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid state for the rcv interrupt was encountered.

23. CMAUSTAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The BX.25 state is corrupted. This is a critical error.

24. CMAUSUPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A corrupt supervisory command type was encountered. This is a critical error.

25. CMAUTIMT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A corrupt timer type was encountered. This is a critical error.

26. CMAUTLBC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The TLOOK control bits are in conflict with a pointer in the linkstats structure. This is a critical error.

27. CMAUTLLD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The TLOOK entry conflicts with the linkstats structure's load pointer. This is a critical error.

28. CMAUTLPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The TLOOK pointer in the linkstats structure is out of range. This is a critical error.

29. CMAUXMTS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid state for the xmt interrupt was encountered.

Range: pcs**1. PCSAMUNXINP (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected input received by the AM/VLR state machine.

Probable Cause:

Receipt of a known message in a state that was considered in valid.

Action:

Contact AM/VLR developers in the switch and an investigation needs to be undertaken. A course of action must be determined for this input in the state machine of AM/VLR.

2. PCSATHCSD (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DAathcsd() dynamic access (DA) primitive failed to return an rIHDS tuple to the head of the idle list. The rIHDS tuple key is printed on the ROP.

3. PCSATHCSD (5E11 only)

Recovery Action: rpi	SPP: n	Audit: HDS	Audit Mode: elev

Problem:

The DAathcsd() dynamic access (DA) primitive failed to return an rIHDS tuple to the head of the idle list. The rIHDS tuple key is printed on the ROP.

4. PCSATHCUD (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DAathcud() dynamic access (DA) primitive failed to return an rISUDB tuple to the tail of the idle list. The rISUDB tuple key is printed on the ROP.

5. PCSATHCUD (5E11 only)

Recovery Action: rpi	SPP: n	Audit: SUDB	Audit Mode: elev

Problem:

The DAathcud() dynamic access (DA) primitive failed to return an rISUDB tuple to the tail of the idle list. The rISUDB tuple key is printed on the ROP.

6. PCSAUNXMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Access manager received an unexpected operating system for distributed switching (OSDS) message.

Probable Cause:

Some process sent a OSDS message which is not recognized by access manager.

Action:

Contact access manager developers to solve this problem.

7. PCSBADARG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A personal communications service (PCS) function was called with an invalid argument.

8. PCSBADHSKEY (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DAghhcsd() fails to retrieve a pointer to a rIHDS tuple from a DB head cell. The head cell key might be corrupted. The key will be dumped on the ROP with the assert.

9. PCSBADSUDB (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A problem has occurred when unlinking a SUDB tuple from the idle list or when trying to add SUDB to the busy list.

Probable Cause:

It is possible that there is no owner for SUDB tuple or the link between SUDB and VLR is bad.

10. PCSBADSUDB (5E11 only)

Recovery Action: rpi	SPP: n	Audit: SUDB	Audit Mode: elev

Problem:

A problem has occurred when unlinking a SUDB tuple from the idle list or when trying to add SUDB to the busy list.

Probable Cause:

It is possible that there is no owner for SUDB tuple or the link between SUDB and VLR is bad.

Action:

SUDB, VLR audits are being run in an elevated mode to fix the linkage errors.

11. PCSBADVLR (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The VLR tuple is missing or the key used to read this relation was set improperly.

Probable Cause:

Tuple is missing.

12. PCSBADVLR (5E11 only)

Recovery Action: rpi	SPP: n	Audit: VLR	Audit Mode: elev

Problem:

The VLR tuple is missing or the key used to read this relation was set improperly.

Probable Cause:
Tuple is missing.

Action:

The tuple needs to be inserted. There is data inconsistency. Audits must solve this problem or a new tuple needs to be inserted.

13. PCSDNIDX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Either the tuple is missing from RLDN_IDX or the key used to read this relation was set improperly.

Data Structures:

Relation: RLDN_IDX Key field DN.

Action:

The DN is missing from this relation. Use RC/V (or ODBE, if necessary) to insert this record that is missing. Other data inconsistencies may exist. Contact your next level of support

14. PCSFINHDD (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The attempt to insert a rHDD tuple immediately after deleting it failed. The tuple and the return value from DBfintup() are printed on the ROP.

15. PCSFINHDD (5E11 only)

Recovery Action: rpi	SPP: n	Audit: HLR	Audit Mode: elev

Problem:

The attempt to insert a rHDD tuple immediately after deleting it failed. The tuple and the return value from DBfintup() are printed on the ROP.

Action:

AUDIT is scheduled to run in an elevated mode to fix the data inconsistency.

16. PCSINSDYN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfintup() function failed to insert a tuple in a dynamic relation. The stack dumped has the relation ID for which the insert failed.

17. PCSLSDHD (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DAIsdhd() function fails to link a rIHDS tuple to a rIHDD tuple.

Probable Cause:

There might be bad linkage in the HDS or the HDD tuples.

18. PCSLSDHD (5E11 only)

Recovery Action: rpi	SPP: n	Audit: HDS	Audit Mode: elev

Problem:

The DAIsdhd() function fails to link a rIHDS tuple to a rIHDD tuple.

Probable Cause:

There might be bad linkage in the HDS or the HDD tuples.

Action:

AUHDS audit is scheduled to run in elevated mode to fix the linkage.

19. PCSNOCCODE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read a tuple from rINOCCODE. Either the tuple is missing or the key field used for the relation read is set wrong.

Data Structures:

Relation: RLNOCCODE. Key: NXX. The key is printed with the assert message on the ROP.

Action:

1. Use ODBE to check AM or other SM processor to determine if the tuple is missing.
2. Insert the tuple if indeed missing.
3. Contact the next level of support if the key field is possible set improperly.

20. PCSPCS_HLR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read rIPCS_HLR tuple. Either the tuple is missing or the key field used for reading the relation is set improperly.

Data Structures:

Relation: RLPCS_HLR. Key: PCS_IDX. The PCS_IDX is printed with the assert.

Action:

- (1) Verify if the tuple is missing from the ODBE.
- (2) If the tuple is missing, insert the tuple if the subscriber data is known.
- (3) Contact the next level of support if possible data inconsistency existed. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

21. PCSPORT2VSM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Either the tuple is missing from RLPORT2VSM or the key used to read this relation was set improperly.

Data Structures:

Relation: RLPORT2VSM. Key field: PORT.

Action:

Insert this missing tuple either using RC/V (or ODBE, if necessary). Contact your next level of support as other data inconsistencies may exist. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

22. PCSREGDATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Either the tuple is missing from RLREGDATA or the key used to read this relation was set improperly.

Data Structures:

Relation: RLREGDATA. Key Fields WSPID and REGAREA

WSPID and REGAREA keys will be printed on ROP.

Action:

- (1) Use ODBE to cross-check the data in the indicated SM and AM.
- (2) Using WSPID and REGAREA as keys provided in the ROP output read relation RLREGDATA.
- (3) If a tuple does not exist further inconsistencies may exist contact your next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

23. PCSRGLPRM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was returned from an attempted read of a global parameter from within a transaction.

Action:

No audit is available to correct the error.

24. PCSRPCU2NDN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Either the tuple is missing from RLRPCU2NDN or the key used to read this relation was set improperly.

Data Structures:

Relation: RLRPCU2NDN. Key field: RPCU ID.

Action:

Use RC/V (or ODBE, if necessary) to insert this missing tuple. Contact your next level of support as other data inconsistencies may exist. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

25. PCSRSHCSD (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DARshcsd() function fails to remove a HDS tuple from a DB headcell. The key of the HDS tuple is printed on the ROP.

26. PCSRSHCSD (5E11 only)

Recovery Action: rpi	SPP: n	Audit: HDS	Audit Mode: elev

Problem:

The DARshcsd() function fails to remove a HDS tuple from a DB head cell. The key of the HDS tuple is printed on the ROP. An audit is scheduled to run in elevated mode to fix the possible bad linkage.

27. PCSSUBDATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read rISUBDATA tuple. Either the tuple is missing or the key for the tuple is set improperly.

Data Structures:

Relation: rISUBDATA. Key field: PCS_IDX. The PCS_IDX is printed with the assert.

Action:

1. Use ODBE to verify if the tuple is missing.
2. Insert the tuple if the subscriber data is known. Otherwise, contact your next level of support.

28. PCSTEN2REG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Either the tuple is missing from RLTEN2REG or the key used to read this relation was set improperly.

Data Structures:

Relation: RLTEN2REG. Key field: TNTGRPID.

The tenant groupid will be printed on the ROP.

Action:

The tuple does not exist in the relation RLTEN2REG. Either the key is wrong or the tuple is missing. Use ODBE to verify that the tuple is indeed missing.

Office-dependent data (ODD) inconsistencies may exist. Contact your next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

29. PCSTIDGRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Either the tuple is missing from RLIDGRP or the key used to read this relation was set improperly.

Data Structures:

Relation: RLTIDGRP. Key field: tid.

Action:

Use RC/V (or ODBE, if necessary) to insert this missing tuple. Contact your next level of support as other data inconsistencies may exist. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

30. PCSTIDIDX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Either the tuple is missing from RLTID_IDX relation or the key used to read this relation was set improperly.

Data Structures:

Relation: RLTID_IDX Key Field TID.

Action:

Use RC/V (or ODBE, if necessary) to insert this missing tuple into the relation RLTID_IDX. Contact your next level of support as there may be other data inconsistencies.

31. PCSUGLPRM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred while updating a global parameter.

32. PCSUNXRPMMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This is an indication that the RPCU sent a message that is not known to AM/VLR. This may be a new message that AM/VLR needs to handle.

Probable Cause:

AM/VLR is not aware of this message sent by RPCU.

Action:

Contact RPCU and AM/VLR developers and resolve this issue. This is a code bug that needs to be fixed either in the RPCU or AM/VLR.

Range: pmppp**1. INPMPHBF (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While receiving pump frames, a frame was received with unusual characteristics.

2. INPMPHBM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received an unknown acknowledgement type while trying to service a data pump request.

3. INPMPHBT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No soft switch in progress, a NULL protocol handler (PH) type should have been defined.

4. INPMPHCR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The data pump of a protocol handler (PH) for soft switch is complete, received go ahead to start processing but, the reason for creation is invalid.

5. INPMPHEF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While involved in a data pump, encountered a local area network (LAN) hardware error.

6. INPMPHER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While involved in a data pump, received invalid response from PS.

7. INPMPHIA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received a request or setup message and tried to determine whether to use the active or standby packet bus as described in the message, but the field in the message was invalid.

8. INPMPHIF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While setting up the frame table, tried to identify the maximum frame size, but encountered an invalid size.

9. INPMPHIM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received an acknowledgement from the target protocol handler (PH); checked the pump progress marker and the PH type ID, but found one to be invalid.

10. INPMPHIP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While serving a data pump request, received another request. Can not service the recent request.

11. INPMPHIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received a timeout, but could not identify the timer tag.

12. INPMPHLE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Local area network (LAN) structures not available for transmission or LAN transmit error.

13. INPMPHML (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PMPH system process was cycling normally when it received message of an invalid length.

14. INPMPHNA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While in the middle of an acknowledged pump, encountered a negative acknowledgement of pump frames from the target.

15. INPMPHNB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While involved in sending frames across the packet bus, encountered a local area network (LAN) resource deficiency.

16. INPMPHNM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received a request or setup message, but could not match my physical (protocol handler (PH) number with the PH number in the message.

17. INPMPHNR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The target protocol handler (PH) involved in an actual data pump, and could not allocate buffer descriptors for this series of frames.

18. INPMPHPI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Before setting up the pump frame table for data pump, tried to identify whether this protocol handler (PH) is the source or target.

19. INPMPHPT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Completed a successful data pump for soft switch but the PH type ID was invalid.

20. INPMPHPU (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The data pump of a soft switch is complete; the target protocol handler (PH) was pressed into service but, could not purge a system process.

21. INPMPHRS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data preserving switch (soft switch) was in progress and the PMPH system process was bumped off the recovery stack before completion of the data pump.

22. INPMPHSC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Pumped a series of frames to the target protocol handler (PH) and received improper response, can not retransmit.

23. INPMPHSD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Tried to send a message over the packet bus but, was not successful in two attempts.

24. INMPHSM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The data pump of a target protocol handler (PH) is complete; could not set an operating system for distributed switching (OSDS) timer to define the soak interval.

25. INMPHTB (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Allocated data pump table is too small for the size of data. Check the #define for SIDPTSIZE for correctness.

26. INMPHTO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Pumped a series of pump frames across the packet bus and timeout waiting for acknowledgement from the target protocol handler (PH).

27. INMPHTP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received an acknowledgement from a target protocol handler (PH), but could not match the PH number in the message with the PH number saved for this data pump.

Range: pr**1. PRAUNONE (5E11 and later)**

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This is the general packet routing (PR) assert that schedules no audits.

2. PRAUPCBLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

An error was encountered with the RLPCBLA dynamic relation.

3. PRAURTMHG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RTMHG	Audit Mode: elev

Problem:

Inconsistency was found between the static relation RLRT_MHG and the packet routing (PR) dynamic multiline hunt group data. The audit AURTMHG will clear the problem.

4. PRAURTMPG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the RLRT_MPG relation.

Data Structures:

RLRT_MPG. Key field: grpnum.

Action:

Use RC/V (or ODBE, if necessary) to check that the indicated tuple is contained in the RLRT_MPG relation. If the tuple is missing, use ODBE to add the tuple. Also check the RLRT_MHG relation. If the tuple is in the RLRT_MHG relation, then it should be in the RLRT_MPG relation.

5. PRAURTTRKG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RTTRKG	Audit Mode: elev

Problem:

Inconsistency was found between the static trunk group data in the RLRT_TRKG relation and the packet routing (PR) dynamic trunk group data. The AUFC_RTTRKG audit will correct the problem.

6. PRAUTKOWNER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TKOWNER	Audit Mode: elev

Problem:

An error was encountered with the RLTKOWNER dynamic relation.

7. PRAUTKQUE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TKQUE	Audit Mode: elev

Problem:

An error was encountered with the RLTKQUE dynamic relation.

8. PRBAD_DATBL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While attempting to route a permanent virtual circuit (PVC) call, the routing found that the digit analysis table is corrupted. The first five digits will be printed on the ROP.

Data Structures:

RLDA_CONFLCT, RLDAPRLDGT, RLDAPRLFNL, RLDAPRMDGT, RLDAPRMFNL.

Action:

Use RC/V (or ODBE, if necessary) to examine the relations listed in the Data Structures section and make corrections.

9. PRCSTCUG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLPSCSTCUG tuple was not found during routing of a virtual call after routing determined that the originating or terminating line subscribes to the closed user group (CUG)/origination address (OA) or CUG/intercom address (IA) option. There is an inconsistency between the RLPSX25LN and RLPSCSTCUG relations.

Data Structures:

RLPSCSTCUG, RLPSX25LN, RLDSLEQUIP, RLEQUIPDSL.

The protocol handler (PH) number, PH channel number, party, CUG index, CUG data network identification code (DNIC), and international CUG code will be printed on the ROP.

Action:

Use RC/V (or ODBE, if necessary) to examine the contents of the RLPSCSTCUG relation. If the CUG index, ph_number, ph_cn, and party values are valid and no rLPSCSTCUG tuple is found, insert the tuple. If the tuple is invalid, use RC/V (or ODBE, if necessary) to examine the RLPSX25LN, RLDSLEQUIP, and RLEQUIPDSL relations to find and correct the source of the invalid data.

10. PRCUGCST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLPSCUGCST tuple was not found during routing of a virtual call after routing determined that the originating line used the closed user group (CUG) facility in the call setup, and the terminating line subscribes to the CUG.

There is an inconsistency between the RLPSX25LN relation and the RLPSCUGCST relation, or the CUG code (cug_code.dnic and cug_code.icn) in the originating line and terminating line. The cug_code.dnic and cug_code.icn of the originating line and the protocol handler (PH) number, PH channel, and party of the terminating line will be printed on the ROP.

Data Structures:

RLPSCUGCST, RLPSX25LN, RLDSLEQUIP, RLEQUIPDSL.

Action:

Use RC/V (or ODBE, if necessary) to examine the contents of the RLPSCUGCST relation. If the cug_code,

ph_number, ph_channel, and party values are valid and no rIPSCUGCST tuple is found, insert the tuple. If the rIPSCUGCST tuple is not valid, use RC/V (or ODBE, if necessary) to examine the RLPSX25LN, RLDSLEQUIP, and RLEQUIPDSL relations to find and correct the source of the invalid data.

11. PRDATABAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A routing program encountered an inconsistent or invalid value in a control table. Since the control table is constant data, either the (static) data is corrupted or the table was over-indexed. The contents of the table are dumped in a raw (hex) dump on the ROP. Program listings for the program identified by the failing address must be consulted to determine the specifics of this error.

12. PREQUIPDSL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While attempting to read the RLEQUIPDSL relation for a given protocol handler (PH) and PH channel (ph_cn), the rIEQUIPDSL tuple was not found.

Data Structures:

RLEQUIPDSL. Key fields: PH, ph_cn.

Action:

Use RC/V (or ODBE, if necessary) to correct the PH and ph_cn for the digital subscriber line (DSL).

13. PRFACMISSING (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: FACSTAT	Audit Mode: elev

Problem:

An exception has occurred in PRckfacstat() when attempting to obtain the rIFACSTAT tuple. See the stack frame accompanying this assert to determine the exact location of the failure.

Probable Cause:

This assert indicates the dynamic rIFACSTAT tuple is missing.

Action:

The dcf-data dump generated by this assert gives the content of the rIFACSTAT tuple affected. The AUFACSTAT audit is scheduled to clear the problem.

14. PRFCTRUNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While routing a packet switching call from a trunk, no trunk feature data was found in the RLFC_TRUNK relation for the trunk port in question.

All valid ports have an rIFC_PORTTYP tuple, valid trunk ports also have an rIFC_TRUNK tuple, and valid packet switching trunks also have an rIDSLEQUIP tuple that translates the trunk unit port name to the protocol handler (PH) and PH channel number that the trunk connects to.

Data Structures:

RLFC_TRUNK.

The internal port name for the trunk in question is printed on the ROP (in hex).

Action:

Determine if the port name dumped on the ROP is a valid trunk port name. If it is, use RC/V (or ODBE, if necessary) to determine if rIFC_PORTTYP, rIFC_TRUNK, and rIDSLEQUIP tuples exist that contain information that consistently describes the port printed on the ROP as a packet switch trunk.

15. PRGPVCFCL_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During the setup of an X.75/X.75P permanent virtual circuit (PVC), an invalid remote facility type was found in the RLPSPVCINF relation for the X.75/X.75P trunk. The only valid facility type is PSX25.

Data Structures:

RLPSPVCINF.

Action:

The protocol handler (PH) number, PH channel number, party, and local logical channel number for the X.75/X.75P trunk are printed on the ROP. Use these values as keys to read the RLPSPVCINF relation via ODBE and verify the accuracy of the remote facility type. Set the fcftype field to PSX25. The RC/V views for the trunk side are View 5.5 (TRUNK MEMBER) and View 5.13 (TRUNK PACKET SWITCHING PVC LCN ASSIGNMENT); but these views do not have a facility type field. Therefore, use ODBE only.

16. PRGROUP_PRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the RLGROUP_PORT relation.

Data Structures:

RLGROUP_PORT. Key fields: portgrp.grpnum, portgrp.grptype, member.

Action:

Use RC/V (or ODBE, if necessary) to check that the indicated tuple is contained in the RLGROUP_PORT relation. If the tuple missing, use ODBE to add the tuple. Also check the corresponding relation RLPORT_GROUP.

17. PRIECP_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While attempting to route an interlata packet switched data call to the line's default inter-exchange carrier, the system found an invalid stored carrier ID [data network identification code (DNIC)] for this line.

Per-line packet switching feature data for this line is in the RLPSX25LN relation; the iecp_dnic attribute contains the DNIC of the default inter-exchange carrier assigned to this line. No tuple for this DNIC was found in the RLPSDNICRI relation.

Data Structures:

RLPSX25LN, RLPSDNICRI.

The line is identified by the protocol handler (PH) and PH channel number printed (hex) on the ROP. The value of this DNIC is printed (hex) on the ROP.

Action:

Use RC/V to examine the RLPSX25LN relation for the line in question. Verify that the iecp_dnic attribute identifies an existing network that is qualified to act as an inter-exchange carrier network for the integrated services digital network (ISDN). If the iecp_dnic value is valid, examine the RLPSDNICRI relation with RC/V. A tuple should be present for the DNIC in question. If no tuple is found, insert it.

18. PRMDR_GP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIMDR_GP tuple was not found after routing determined that packet message detail recording (PMDR) was active by reading the RLPSX25LN relation. There is an inconsistency between the RLMDR_GP and RLPSX25LN relations. The call will be successfully routed if no other problems are found, but no PMDR records can be generated for this user.

Data Structures:

RLMDR_GP. Key field: mdr_gpid.

RLPSX25LN. Key fields: ph_number, ph_cn, party.

Action:

The gpid, ph, cn, party, and telephone number (TN) fields are printed on the ROP. With ODBE, use the ph, cn, and party keys to read the rLPSX25LN tuple for this line. The pmdr_act field indicates the feature's activation. Check the pmdr_grp field; it is used as the mdr_gpid key to read the RLMDR_GP relation. If the pmdr_grp field is correct, an rIMDR_GP tuple must be created with this field as the key. If the pmdr_grp field is not correct, change it to match the proper group with a corresponding rIMDR_GP tuple.

With RC/V, use the TN value printed on the ROP as the key to RC/V View 23.2 (DIGITAL SUBSCRIBER LINE). Check that the pmdr_grp field is a valid group. If it is, a record must be constructed with RC/V View 24.33 (MESSAGE DETAIL RECORDING GROUP PARAMETERS). If it is not a valid group, change the pmdr_grp field to match the proper group with a corresponding entry in View 24.33.

19. PRMSGBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Routing code encountered an invalid value in some field in the message being processed. A raw (hex) dump of the entire message is printed on the ROP. The program listing associated with the failing address identified in the ROP message is required to determine the nature of this error.

20. PRNO_ISMPH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During routing for a packet switched virtual call or setup of a permanent virtual circuit (PVC), the destination port was located on a different SM. No inter-SM packet switching path was equipped between this SM and the destination SM; therefore, the connection cannot be established.

Action:

Determine if the called directory number (DN) or destination packet switch number (PSN) should be served by a line or trunk on the terminating SM and if virtual calls or PVCs are to be supported between these two SMs. The called DN is all zeros when destination PSN routing is being performed. If the path should exist, use RC/V View 22.13

(INTER-SM NAIL-UP) to assign a nailed-up timeslot path between them. If the path should not exist, then the digit analysis and routing data should be modified to deny calls to the terminating SM.

21. PROFFICE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During packet switching address validation or conversion, an rIOFFICECODE tuple was not found for the given normalized office code (NOC) printed on the ROP.

Data Structures:

RIOFFICECODE. Key field: NOC.

Action:

Using RC/V View 23.1 (DSL USERS) or View 23.2 (DIGITAL SUBSCRIBER LINE), correct the NOC for the protocol handler (PH) and PH channel number printed on the ROP. If the NOC is already correct, use ODBE to add an rIOFFICECODE tuple that corresponds to the correct NOC.

22. PRPBGINFO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The rIPBG_INFO tuple for this packet business group (PBG) is missing, or the PBG number in the MGPRGEN message is corrupted.

Data Structures:

RLPBG_INFO. Key field: psbgrp (PBG number).

Action:

If the call is from an individual directory number (DN), check the orig_pbg field against the psbgrp field in the RLPSX25LN relation. If the fields do not match, then the MGPRGEN message was corrupted.

If the call is from a multi-line hunt group (MHG) DN, check the orig_pbg field against the psbgrp field in the RLRT_MHG relation. If the fields do not match, then the MGPRGEN message was corrupted. If the orig_pbg does match the appropriate psbgrp field, then the rIPBG_INFO tuple for the orig_pbg number is missing. Use RC/V (or ODBE, if necessary) to insert an rIPBG_INFO tuple for the orig_pbg.

23. PRPORT_GRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the RLPORT_GROUP relation.

Data Structures:

RLPORT_GROUP. Key fields: port ID (port.module and port.member).

Action:

Use RC/V (or ODBE, if necessary) to check that the indicated tuple is contained in the RLPORT_GROUP relation. If the tuple missing, use ODBE to add the tuple. To verify that the tuple should be added, check the corresponding relation RLGROUP_PORT.

24. PRPSBILLDN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No separate billing directory number (DN) could be found for the packet switched line, although the per-line data for this line indicated that it had a packet switch billing DN that is different than its own DN.

Per-line packet switching feature data for this line is in the RLPSX25LN relation; the billdn_flg attribute (with a value of DBYES) indicates a separate billing number should be stored in the RLPSBILLDN relation.

Data Structures:

RLPSX25LN, RLPSBILLDN.

The line is identified by the protocol handler (PH) and PH channel number printed on the ROP.

Action:

Use RC/V (or ODBE, if necessary) to examine the RLPSX25LN and RLPSBILLDN relations for this line. Determine if an inconsistency exists between the two relations regarding the assignment of a separate packet switch billing DN. If no separate billing number should exist, set the billdn_flg attribute in the RLPSX25LN relation to DBNO. Otherwise, enter the billing DN for this line in the RLPSBILLDN relation.

25. PRPSGP_PRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the RLPSGP_PRT relation.

Data Structure:

RLPSGP_PRT.

Action:

Use RC/V (or ODBE, if necessary) to check that the indicated tuple is contained in the RLPSGP_PRT relation. If the tuple is missing, use ODBE to add the tuple. Also check the corresponding relation RLPSRT_GP.

26. PRPSIPTST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Packet routing failed to identify the module where a busy internal protocol (IP) trunk group is physically located. The module identity is needed to determine if the call should be cleared or reconnected.

The busy IP trunk group is identified by the next packet switch number (PSN) printed on the ROP. The RLPSIPTST relation is missing a tuple for this next PSN.

Data Structures:

RLPSIPTST.

Action:

Use RC/V (or ODBE, if necessary) to resolve the data inconsistency. The next PSN printed on the ROP was obtained from the RLPSRI_PSN relation. The missing rLPSIPTST tuple can be inserted by copying the rLPSIPTST tuple from any other packet switching SM.

If the rLPSIPTST tuple does not exist on other SMs, create the tuple using data from the following relations and office parameters: RLPSIPTST.npsn is the next PSN from the ROP, RLPSIPTST.module is RLRCTGRPRK.module, RLPSIPTST.npsn_index is the corresponding bit position in the Glnpsn_index global parameter that is not associated with other next PSNs, and RLPSIPTST.size is RLPSTRUNKS.size.

27. PRPSL3TRKG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIPSL3TRKG tuple was not found during routing of an X.75 trunk call. The RLPSL3TRKG relation provides packet switching trunk group level 3 protocol parameters used by operational software. Trunk group intra-LATA competition (ILC) screening information is obtained from this relation for Bellcore technical references (TR) compliant X.75 trunk calls. This ILC screening is applied to X.75 trunk groups only and is clearly different from global office ILC screening which is set in the global office parameter Gliic.

Data Structures:

RLPSL3TRKG. Key field: X.75 trunk group number.

Action:

Use ODBE to verify the contents of the RLPSL3TRKG relation. If the tuple for this trunk group is invalid or missing, correct the data using ODBE.

28. PRPSLINKPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While attempting to route an X.75' outgoing permanent virtual circuit (PVC), the rIPSLINKPT tuple was not found. The link ID and PVC logical channel number will be printed on the ROP.

Data Structures:

RLPSLINKPT, RLPSTRK_L2.

Action:

Use RC/V (or ODBE, if necessary) to examine the RLPSLINKPT and RLPSTRK_L2 relations for this line. If the linkid field is not equal to 0, then there will be exactly one rIPSTRK_12 tuple such that RLpstrk_l2.linkid is RLpslinkpt.linkid. Insert the rIPSLINKPT tuple using the information in the rIPSTRK_L2 tuple.

29. PRPSMHG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While attempting to verify the calling address of a packet switching multi-line hunt group (MLHG) line, an rIPSMHGDNR tuple was not found. The group number, protocol handler (PH) number, and the PH channel number for the line are printed on the ROP.

Data Structures:

RLPSMHGDNR. Key field: group number.

Action:

Using RC/V View 23.1 (DSL USERS) or View 23.2 (DIGITAL SUBSCRIBER LINE), correct the group number for the packet switching MLHG.

30. PRPSPRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While attempting to verify the calling address of a multi-line hunt group (MLHG) line, an rIPSPRT_GP tuple was not found.

Data Structures:

RLPSPRT_GP. Key fields: SM number, PH number, PH channel number.

Action:

Use RC/V View 23.1 (DSL USERS) or View 23.2 (DIGITAL SUBSCRIBER LINE) to correct the digital subscriber line (DSL) group and member number. If these fields are already correct, use ODBE to add an rLPSPRT_GP tuple that corresponds to the SM number, protocol handler (PH) number, and PH channel number printed on the ROP.

31. PRPSPSN_RI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to route an outgoing packet switched call, the destination packet switch number (PSN) being used was invalid. All destination PSNs that are valid for use by packet switched calls must have entries in the RLPSPSN_RI relation.

The destination PSN was obtained from one of the following:

- (1) the psn field in the RLPSRI_PSN relation,
- (2) the RLPSPVCINF relation [only for permanent virtual circuits (PVCs)], or
- (3) the incoming internal protocol (IP) packet (that is, the routable IP packet received over an incoming IP trunk).

No rLPSPSN_RI tuple was found for this destination PSN.

Data Structures:

RLPSPSN_RI.

The destination PSN in question is printed (in hex) on the ROP.

Action:

Use RC/V (or ODBE, if necessary) to find and correct the problem. If the destination PSN is valid, perform a batch review of the RLPSRI_PSN relation and find the tuple with the destination PSN in the psn field. Insert an rLPSPSN_RI tuple using the route index from the rLPSPSN_RI tuple. If no data exists for a valid destination PSN, then it should be added to the switch database according to the switch and network routing plan.

If the destination PSN is not valid, perform a batch review of the RLPSRI_PSN and RLPSPVCINF relations (rLPSPVCINF tuples exist only for PVCs); attempt to find the tuples with the invalid destination PSN. If tuples containing the invalid destination PSN are found, use RC/V (or ODBE, if necessary) to correct the invalid data. If an invalid destination PSN was received in the incoming IP packet, then no corrective action can be taken at the present switch.

32. PRPSRIPSN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While attempting to route an outgoing packet switched data call, the system found that the route index being used was invalid.

All valid route indices for use by packet switched data calls must have entries in the RLPSRI_PSN relation. The route index is from one of the following places:

- (1) the RLPSDNICRI relation,
- (2) digit translators used for packet switching in the RLDAPRELDGT and RLDAPRIMDGT relations,
- (3) the screening relation RLRT_SCRNING,
- (4) the RLPSPSN_RI relation, or
- (5) the secondary route index field in the RLRT_ROUTING relation.

No tuple for this route index was found in the RLPSRI_PSN relation.

Data Structures:

RLPSRI_PSN.

The route index in question is printed (hex) on the ROP.

Action:

Use RC/V (or ODBE, if necessary) to examine the contents of the RLPSRI_PSN relation. If the route index is a valid packet switching route index and no rIPSRI_PSN tuple is found for the index, insert the tuple. If the route index is invalid for packet switching, use RC/V (or ODBE, if necessary) to examine the RLPSDNICRI, RLDAPRELDGT, RLDAPRIMDGT, RLRT_SCRNING, RLPSPSN_RI, and RLRT_ROUTING relations to find and correct the source of the invalid route index.

33. PRPVCFCL_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During the setup of a permanent virtual circuit (PVC), the far end facility type (fcltype attribute in an rLPSPVCINF tuple) had a value of X25. This is inconsistent with the directory number (DN) of the far end of the PVC (rmt_dn attribute) that was analyzed by the digit interpreter to represent an inter-LATA destination. The X25 facility type is only appropriate with intra-LATA destinations. Inter-LATA destinations require a facility type of X75.

Data Structures:

RLPSPVCINF.

Action:

The protocol handler (PH) number (ph_number), PH channel number (ph_cn), and local logical channel number (local_lcn) are printed on the ROP. Use these values as keys to read the RLPSPVCINF relation using ODBE. Verify the accuracy of the remote DN (rmt_dn). Set the facility type to X25 if the destination is intra-LATA, or X75 if the destination is inter-LATA. The associated RC/V View is 23.1 (ISDN INDIVIDUAL DSL LCEN). The associated RC/V field is DSL PROF (facility type).

34. PRPVCINF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLPSPVCINF tuple was not found during routing of a permanent virtual circuit (PVC) call after routing determined that a PVC was defined on the associated digital subscriber line (DSL) by reading the RLPSX25LN relation. There is an inconsistency between the RLPSPVCINF and RLPSX25LN relations.

Data Structures:

RLPSPVCINF, RLPSX25LN, RLPSMAPPVC.

Action:

The protocol handler (PH) number (ph_number), PH channel number (ph_cn), and local logical channel number (local_lcn) are printed on the ROP. Use these values as keys to read the RLPSX25LN, RLPSPVCINF, and RLPSMAPPVC relations using ODBE. In the RLPSX25LN relation, if the h_pvc_lcn attribute is 0, no PVCs should be assigned for this DSL.

If this PVC should exist, but no rLPSPVCINF and rLPSPMAPPVC tuples exist, populate one tuple for each relation. Most of the information needed to populate the rLPSPVCINF tuple can be found in a corresponding rLPSPX25LN tuple by using ODBE with the keys ph_number and ph_cn. The associated RC/V views are View 23.2 (DIGITAL SUBSCRIBER LINE), View 23.8 (DSL/BRCS ASSIGNMENT), and View 23.40 (X.25 (XAT) PACKET SWITCHING CHANNEL ASSIGNMENT), field HIGH PVC LCN.

35. PRPVCRDN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Digit analysis was provided with an invalid terminating directory number (DN) for an X.25 permanent virtual circuit (PVC), or the two ends of the PVC are mismatched.

Data Structures:

RLPSPVCINF.

Action:

The protocol handler (PH) number (ph_number), PH channel number (ph_cn), party (party), and local logical channel number (local_lcn) are printed on the ROP. If the call originated on this switch, the calling DN is also printed. Use this DN as the key to RC/V View 23.11 (DSL PACKET SWITCHING PVC LCN ASSIGNMENT) to verify or update the remote TN field.

If the call is an incoming gateway type, the trunk group and trunk group member are printed on the ROP. Use these values to determine the other switch; maintenance personnel at that switch must provide the correct terminating DN.

36. PRRDLGLNSTAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read an rLGLNSTAT tuple.

37. PRRDLNSTAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read an rLNSTAT tuple.

38. PRRT_MHG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While attempting to read the RLRT_MHG relation, the rLRT_MHG tuple was not found for a given group number.

Data Structures:

RLRT_MHG. Key field: group number.

Action:

Use RC/V (or ODBE, if necessary) to correct the group number for the packet switching multi-line hunt group.

39. PRUXPSTATE (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A routing function was called in an unexpected state. The data block containing the unexpected state is dumped on the ROP.

Probable Cause:

Software problem or data corruption.

Action:

Provide contents of the ROP report to the next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

Range: prpp

1. PRPPTEST (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This is a test assert for PR PH3 asserts.

Range: ps**1. PSAPAMBC (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PSapambc() function could not send a copy of the flow control bit maps to the CMP due to an invalid message.

2. PSAPAMFC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PSapamfc() function could not process a request to update the flow control bit maps and broadcast them to the SMs.

3. PSAPAUBUF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The self-audit function PSapaubuf() detected an error in either the message counts or the link status table. The error was corrected and no audit was necessary.

4. PSAPBADTIMER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A non-existent application processor (AP) flow control timer expired. This is not expected to occur.

5. PSAPBCAST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A request to broadcast the application processor (AP) flow control bit maps to all SMs failed due to an incorrect call to the OSbcast() primitive.

6. PSAPBFEAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application processor (AP) communications package received a message for an invalid AP feature.

7. PSAPBMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application processor (AP) system process received an invalid operating system for distributed processing (OSDS) message type.

8. PSAPBODD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The apindx field is out of range in the RLAPSITE relation. The relation is corrupted.

Data Structures:

RLAPSITE.

Action:

Compare the contents of the RLAPSITE relation with the RLCMAPDATA relation. The apindx is outside of the valid range of 4 through 99 for the SM application processor (AP). List the contents of the relation, and remove tuples which contain invalid data.

9. PSAPBUF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: APBUF	Audit Mode: elev

Problem:

The RLAPBUF relation linkages were corrupted and require auditing.

10. PSAPCLOSE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: APSPB	Audit Mode: elev

Problem:

The PSap13close() function could not restore the link associated data structures to their idle states. The APSPB audit is scheduled.

11. PSAPDALB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

The application processor (AP) communication package found a broken linkage between the D-channel application linkage block (DALB) and the AP D-channel port block (APDPB) or D-channel port block (DPB). The DALB audit will be scheduled.

12. PSAPDDREF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application processor (AP) terminal process could not read the DDRTSMAB DDKEY.

13. PSAPDPB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DPB	Audit Mode: elev

Problem:

The pointer to the rIDPB tuple returned by the DAGETDPB() macro did not point to the rIDPB tuple. The dport key passed to the DAGETDPB() macro was invalid. This probably indicates that the lcen value sent by the application processor (AP) does not match the lcen defined in the RLDPB relation. The lcen parameter serves as a password in establishing the data link between the AP and the switch. If the lcen defined in the RLDPB relation does not match the lcen sent by the AP, the switch will not respond with an ESTABLISH CONFIRMATION message, which results in a failure to establish the data link.

Action:

Contact the AP administrator. Use RC/V View 24.1 (IOP AP COMMUNICATIONS DATA) or View 24.7 (DSL AP COMMUNICATIONS DATA) to check the lcen parameter on the AP side. If an invalid lcen of the digital subscriber line (DSL) is found, correct it based on the corresponding lcen value defined in the RLDPB relation. Contact your next level of support if the LCENs match and the AP data link is not up [this can be verified through master control center (MCC) page 1480].

14. PSAPEPKB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: EPKB	Audit Mode: elev

Problem:

An rLEPKB tuple could not be accessed. The EPKB audit is scheduled.

15. PSAPFCBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A flow control request timer expired on a non-application processor (AP) SM.

16. PSAPFCOMP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: APSITE	Audit Mode: elev

Problem:

The PSapfcmp() function found invalid data in the reqflow field of the PSaplst() function. The field is zeroed out, and the APSITE audit is called.

17. PSAPFCREQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A request to change flow control on an application processor (AP) SM failed due to a problem with a call to the PSapfreq() function.

18. PSAPFCSPL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PSapamfcspl() function could not send a copy of the flow control bit maps to the SM that requested the copy.

19. PSAPFORWD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A request to change flow control on the application processor (AP) SM failed because the PSapffwd() function failed.

20. PSAPFRCV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PSapfrcv() function could not find a valid phase for an application processor (AP) attached to this SM. This is

probably caused by corrupt data in the PSaplst() function.

21. PSAPFSPL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A request for a check of the flow control bit maps on an SM could not be honored due to a failure of the PSapfspl() function.

22. PSAPINAPSPB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLAPSPB relation was not initially created during the call to the PSapindata() function. The probable cause is with the layout of dynamic memory in the load.

23. PSAPINBUF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLAPBUF relation was not initially created in the PSapinbuf() function. The probable cause for this failure is with the layout of dynamic memory in the load.

24. PSAPINDBHC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DBHEADC	Audit Mode: elev

Problem:

An error in the database (DB) head cell was detected in the application processor communication package (APCP). The DB head cell will be audited.

25. PSAPINEPKB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLEPKB relation was not initially created during the call to the PSapindata() function. The probable cause is with the layout of dynamic memory in the load.

26. PSAPINRMB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLRMB relation was not initially created during the call to the PSapindata() function. The probable cause is with the layout of dynamic memory in the load.

27. PSAPINSITE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During the initialization of the RLAPST relation in a call to the PSapindata() function, the RLAPSITE relation could not be accessed. The probable cause is with the layout of dynamic memory in the load.

28. PSAPLOGCH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid logical channel was passed to the PSapi3close() function. The logical channel must be 1 in the 5E4 software release.

29. PS_APLST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: APLST	Audit Mode: elev

Problem:

The application processor (AP) communications package determined that the AP link status table (global data) was contaminated, or the RLAPSITE static relation and the RLDSLXN static relation are inconsistent. The APLST audit will be scheduled.

30. PSAPNOTMR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application processor (AP) level 3 timer is not functioning, indicating an error in the cycling load. Once this error occurs, it will probably roll out.

31. PSAPPKT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid X.25 packet was received by the mini-session layer.

32. PSAPREQFC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the PSapfreq() function returned failure, or an invalid fc state was passed to the PSapreqfc() function.

33. PSAP_RESET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Excessive X.25 resets occurred on a digital subscriber line (DSL) link to an application processor (AP). The port associated with the link is listed in the receive only printer (ROP) assert message.

Action:

Remove the link from service, if needed.

34. PSAPRMB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RMB	Audit Mode: elev

Problem:

An rRMB tuple could not be accessed. The RMB audit is scheduled.

35. PSAPSITE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: APSITE	Audit Mode: nonseg

Problem:

The application processor (AP) communications package determined that the AP link status table is missing tuples. The APSITE audit is called to correct these errors.

36. PSAPSLFAUD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The application processor (AP) system process on the SM could not create the self-audit timer after several tries. The system process will be purged.

37. PSAPSPB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: APSPB	Audit Mode: elev

Problem:

Unable to access an rIAPSPB tuple. The APSPB audit is scheduled.

38. PSAPSPOSIG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The application processor (AP) system process received an invalid signal.

39. PSAPTMRBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The X.25 level 3 timer could not be started by the packet switch module process unloader process (PSMPUP).

40. PSAPTPDALB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

The application processor (AP) terminal process could not access its D-channel application linkage block (DALB). The process is purged, and the DALB audit is scheduled.

41. PSAPTPDPB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: DPB	Audit Mode: elev

Problem:

An application processor (AP) terminal process could not access its D-channel port block (DPB). The process will be purged and the DPB audit will be scheduled.

42. PSAUAPDU (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: APDU	Audit Mode: elev

Problem:

Application protocol data unit (APDU) linkage corruption was detected. The APDU audit will be scheduled in elevated mode.

43. PSAUDPB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DPB	Audit Mode: elev

Problem:

D-channel port block (DPB) linkage corruption was detected. The DPB audit will be scheduled in elevated mode.

44. PSAURTEILA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RTEILA	Audit Mode: elev

Problem:

RTEILA linkage corruption was detected. The RTEILA audit will be scheduled in elevated mode.

45. PSBADAPHC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: APHEADC	Audit Mode: elev

Problem:

The RLAPBUF head cell (RLAP_HEADC) is corrupted.

Probable Cause:

Data corruption.

Action:

An audit will be scheduled to correct the problem.

46. PSBADAPTP (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSrestart() primitive called from the application processor terminal processor (ATPT) failed. The process is purged.

47. PSBADDTRG (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown parameter was passed to a PS DD trigger function.

Probable Cause:

Internal error.

Action:

Contact next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

48. PSBADHC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error in the database (DB) head cell was detected.

Probable Cause:

1. An invalid head cell index or
2. Data corruption or
3. System error

Action:

Verify the head cell index and layout of dynamic memory in the load.

49. PSBADIETYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid Q.931 information element type was detected. The problem may be in the message translation table.

50. PSBADL3PARM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Operator services position system (OSPS) level 3 received an invalid parameter.

51. PSBADLLM (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: LLMRDT	Audit Mode: elev

Problem:

The timeslot management channel (TMC)-Q.931 layer 3 protocol found corrupt or invalid data in the link map, the RLLLM_RDT relation. An audit will be scheduled to verify the link map.

52. PSBADLLM (5E11 only)

Recovery Action: rpi	SPP: n	Audit: LLMIDCU	Audit Mode: elev

Problem:

The timeslot management channel (TMC)-Q.931 layer 3 protocol found corrupt or invalid data in the link map, the RLLLM_IDCU relation. An audit will be scheduled to verify the link map.

53. PSBADMDMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message type of the PSMDMSG domain was received. The message going from the SM to the PH will be thrown away.

54. PSBADMSG (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received by application processor communication package (APCP) process.

55. PSBAD_MSG (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received by application processor communication package (APCP) process.

56. PSBADOMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Operator services position system (OSPS) level 3 processing could not forward a message to a process due to an invalid message length.

57. PSBADPKT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Operator services position system (OSPS) level 3 processing encountered a packet that it could not process (for example, too short, invalid type).

58. PSBADPTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid Q.931 pseudo message type was detected.

59. PSBADQPUPEVNT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The event for awakening the common channel signaling (CCS) QPH background unloader system process PSqpup() is an invalid stimulus.

Probable Cause:

Some unknown process is sending an operating system for distributed switching (OSDS) signal (either on purpose or erroneously) to the CCS QPH background unloader system process that the system process does not recognize.

Action:

Contact local field support.

60. PSBADREASON (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The entry reason for the application processor (AP) terminal process is in error.

61. PSBADRS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid parameter for initializing the packet services (PS) system process was encountered.

62. PSBADSTIM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Operator services position system (OSPS) level 3 timer code was called with an invalid feature identifier (FID).

63. PSBADTRGT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The user sending a packet from the protocol handler (PH) to the SM requested that an unknown function be called when the packet is unloaded.

64. PSBAD_VALUE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A variable, internal to a function, was found to have an undefined, invalid, inconsistent or bad value. This is a general assert used to dump the value that was found to be bad.

65. PSBDNEW_LVL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The 'new_level' in PScI2_rt() is not within the bounds of 0 to 9.

66. PSCFBADMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The common channel signaling (CCS) QPH background unloader system process PSqpup() has unloaded an invalid message from the CCS message handler to switch module (MH->SM) fifo.

Probable Cause:

Some type of corruption has occurred on the CCS MH->SM fifo.

Action:

The invalid message type and the beginning of the message will be dumped to the ROP for further evaluation.

67. PSCMTBADPATH (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

SM and AM CMT path information is out of synchronization.

Probable Cause:

Internal data corruption.

Action:

Contact local field support if problem continues. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

68. PSCMTINVPST (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

AM CMT I/O status processing read an unexpected QPIPE (QLPS pipe) state from the AM PCD or was unable to read the SM version of the QPIPE state.

Probable Cause:

Software error or data corruption.

Action:

Inform local field support if problem continues. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

69. PSCMTIOTO (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Terminal process CMTT was created but did not receive a message. The CMT message entered by office personnel was aborted.

Data Structures:

None.

Action:

Reenter command.

70. PSCMTIOUX (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unexpected message received by the CMTT terminal process. The CMT input command just entered will be aborted.

Data Structures:

None.

Action:

Reenter input command.

71. PSCMTNOMSG (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received by the CMT I/O status processing.

Probable Cause:

Internal data corruption.

Action:

Contact local field support if problem continues. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

72. PSCMTNRES (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unrecognized reason for creation was received by the CMTT terminal process. Used in CMT craft interface.

Probable Cause:

Internal data corruption.

Action:

Contact local field support if problem continues. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

73. PSCMTOSBAD (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

SM CMT I/O status processing could not send a message to request CMT accessibility status from the AM.

Probable Cause:

Internal data corruption.

Action:

Inform local field support if problem continues. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

74. PSCMTROSBAD (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

AM CMT I/O status processing received an invalid message.

Probable Cause:

Internal data corruption.

Action:

Inform local field support if problem continues. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

75. PSCMTT (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not create the PSCMTT terminal process. The CMT input command was aborted.

Data Structures:

None.

Action:

Reenter the CMT input command.

76. PSCMTTSND (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

System process PSA (in SM) could not send an OSDS message to the CMTT terminal process. Possible failure of the CMT input command just entered.

Data Structures:

None.

Action:

Verify the results of the CMT command that was entered.

77. PSCOMMFAIL (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Communication with a process failed, probably due to an operating system (OS) failure.

78. PSDAFAILURE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

One of the dynamic access (DA) primitives failed. This failure was probably due to corruption of the calling function's local data. The calling function took steps to recover from this error.

79. PSDATABAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote terminal (RT) link layer 3 protocol detected or passed corrupted data.

80. PSDDFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data delivery read failed.

Probable Cause:

Internal error.

Action:

Contact next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

81. PSDEFAULT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The default statement in a packet services (PS) switch statement was reached. The case is considered invalid by the function.

82. PS_DEFAULT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A switch statement defaulted when it shouldn't have done so.

83. PSDPB_DALB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

The operator services position system (OSPS) level 3 code could not find the packet layer entity due to a DBSYS_ERR return from the DAghdpda() function. An elevated audit of the D-channel application linkage block (DALB) was scheduled.

84. PSDPKB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: PKB	Audit Mode: nonseg

Problem:

The terminal process is unable to get a packet buffer after the "HOGFINDER" routine is called to free up buffers. This indicates a problem with buffer allocation. The reliable transport of messages to the operator services position system (OSPS) terminal processes is at a standstill. An audit of the RLPKB relation is scheduled.

85. PSDSPB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: SPB	Audit Mode: nonseg

Problem:

The PSotim_ent() function encountered operator services position system (OSPS) level 3 code that was unable to traverse the linked list of OSPS terminal timing for packet acknowledgement. An audit of the RLSPB relation is scheduled to recover the timer list.

86. PS_ELV_APLST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: APLST	Audit Mode: elev

Problem:

The self-audit function PSapaubuf() discovered possible corruption in the link status table. Elevated audit APLST was scheduled to correct the problem.

87. PSEPKB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PKB	Audit Mode: elev

Problem:

A tuple in the RLPKB relation appears to be corrupted. The RLPKB relation is used for packet buffer manipulations by the operator services position system (OSPS) message transport capability. An elevated audit of the RLPKB relation was initiated.

88. PSERRPRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

PSoil3attach was called to calculate the logical channel number and the D-port name associated with an operator services position system (OSPS) extended digital subscriber line (EDSL) port. The utility function that was called as a by product of the invocation of RIGETED() failed, thus returning GLERRPORT. GLERRPORT will be returned to

the calling function under the following conditions:

- (1) An attempt was made to read an UNIT_CKT or CKT_PORT tuple and could not due to some error not including NOMATCH or SYSERROR.
- (2) An attempt was made to read an UNIT_CKT or CKT_PORT tuple and could not due to a system failure (i.e. SYSERROR was returned).

89. PSESPB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: SPB	Audit Mode: elev

Problem:

An invalid tuple in the RLSPB relation was encountered. An elevated audit of the RLSPB relation was scheduled.

90. PSESTIM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The event for awakening the packet services (PS) background system process SM packet unloader process (PSMPUP) was not OSSTIMULUS.

91. PSFCPHDISCARD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An embedded operations channel (EOC) flow control information message (INFO) frame was discarded in the protocol handler (PH).

92. PSFCSMDISCARD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An embedded operations channel (EOC) flow control information message (INFO) frame was discarded in the SM.

93. PSFFCLRD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SM-packet interface (PI) first-in first-out (FIFO) queue was cleared due to out of range pointers.

94. PSFFERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A system error occurred while unloading packets from the packet interface (PI) dual access random access memory (RAM) first-in first-out (FIFO) queue.

95. PSFISTCINV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The feature indication button status type, which is checked in the PSfi_t2r() function, was invalid.

96. PSHMACK (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received error return from HMack. HMack sends acknowledgement to the MCC.

Probable Cause:

Internal data corruption.

Action:

Inform local field support if problem continues. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

97. PSHMERR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure has occurred while trying to print information to the read-only printer (ROP).

Probable Cause:

Internal error.

Action:

Contact next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

98. PSIFBADHEADC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: DBHEADC	Audit Mode: elev

Problem:

The operator services position system (OSPS) interflow message transport capability encountered a linkage from the head cell to the corresponding head of the linked list that was corrupted. An elevated audit of the head cell is scheduled.

99. PSIFBADQMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) interflow message transport function PSoiqprocmsg() encountered an invalid Q.931 message.

100. PSIFBADTMR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) interflow message transport capability encountered a level 3 timer that fired when it should not have. For example, a T25 timer may have fired when there were no outstanding data packets.

101. PSIFCLI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid fwcli value was read from an rLPRT_FW tuple. This field is used to check software release compatibility of the X.25 protocol used for the interflow capability. If an update is made to this relation, a corresponding software update must modify the code in the PSoiispb() function to allow the new value.

102. PSIFDALB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

The operator services position system (OSPS) interflow message transport capability found inconsistent data in the D-channel application linkage block (DALB). The DALB audit is scheduled.

103. PSIFDPB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DPB	Audit Mode: elev

Problem:

The operator services position system (OSPS) interflow message transport capability found inconsistent data in the D-channel port block (DPB). The DPB audit is scheduled.

104. PSIFDSLEQUIP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) interflow message transport capability could not read the RLDSLEQUIP relation to retrieve the logical protocol handler (PH) and PH channel information. The PSoirxmit() function invoked this assert.

105. PSIFEDCHN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLEDSDLCHAN relation had no tuples. At least one tuple is necessary for the operator services position system (OSPS) interflow message transport to function properly.

Data Structures:

RLEDSDLCHAN.

Action:

Populate at least one tuple in the RLEDSDLCHAN relation according to the population rules.

106. PSIFFCP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No tuple was found in the RLFC_PORTTYP relation for an operator services position system (OSPS) interflow dport. The port number is printed.

Data Structures:

RLFC_PORTTYP.

Action:

Use RC/V (or ODBE, if necessary) to populate a tuple in the RLFC_PORTTYP relation for the port.

107. PSIFGNODALB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The group alerting circuit (GAC) terminal process was unable to determine the logical channel that it was attached to when it was replaced.

108. PSIFGNOTMR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The group alerting circuit (GAC) terminal process was unable to obtain a timer that it needs to continue functioning.

109. PSIFGREASON (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The group alerting circuit (GAC) terminal process was replaced with a reason other than OSREPLACE. The invalid reason is dumped.

110. PSIFGTPEVENT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The group alerting circuit (GAC) terminal process found an unexpected event. The operating system for distributed switching (OSDS) message buffer is dumped.

111. PSIFGTPMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The group alerting circuit (GAC) terminal process (TP) received a message from the remote GAC TP that can not be recognized. The dport and message pointer are dumped.

112. PSIFGUSER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A user message with an unrecognizable destination, was received over the group alerting circuit (GAC) and delivered to the user interface. The dport and message pointer are dumped.

113. PSIFID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During initialization, an operator services position system (OSPS) interflow port that belongs to a trunk group had no interflow ID defined for the remote OSPS. The port number and trunk group are printed.

Data Structures:

RLIST_PARM, RLOSPS_INT.

Action:

Use RC/V (or ODBE, if necessary) to populate a tuple for the trunk group in the appropriate relation; that is, the RLIST_PARM relation for a sending interflow link, or the RLOSPS_INT relation for a receiving interflow link.

114. PSIFNOTMR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) interflow message transport capability was unable to obtain an operating system for distributed switching (OSDS) timer for use in timing all OSPS protocol activities. The SM packet unloader process (PSMPUP) system process will be purged.

115. PSIFPKB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PKB	Audit Mode: elev

Problem:

The operator services position system (OSPS) interflow message transport capability found inconsistent data in the packet buffer (PKB). The PKB audit is scheduled.

116. PSIFREASON (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) interflow message transport function PSoix25tmr() was called with an invalid reason parameter.

117. PSIFSPB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: SPB	Audit Mode: elev

Problem:

The operator services position system (OSPS) interflow message transport capability found inconsistent data in the supplementary protocol block (SPB). The SPB audit is scheduled.

118. PSIFTKG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No tuple was found in the RLPORT_GROUP relation for an operator services position system (OSPS) interflow port. The port number is printed.

Data Structures:

RLPORT_GROUP.

Action:

Use RC/V (or ODBE, if necessary) to populate a tuple in the RLPORT_GROUP relation for the port.

119. PSIFTRANSID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An operator services position system (OSPS) interflow link failed its compatibility check during initialization. A tuple could not be found in the RLIFTRANS relation for the translation ID received from the remote OSPS. The translation ID, port number, and trunk group of the interflow link are printed.

Data Structures:

RLIFTRANS.

Action:

Verify that the translation ID, which should be the OSPS parameter Gliftransid on the remote OSPS, is correct. If it is, populate a tuple in the RLIFTRANS relation with the translation ID.

120. PSINERPS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The INcommoninit() function called the PSoindata() function to initialize the dynamic data for operator services position system (OSPS) level 3 on the switch side. PSoindata() did not return GLSUCCESS.

121. PSINETERR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error condition has been detected by the 5ESS[®] switch TCP/IP platform.

Probable Cause:

In general, asserts are not expected out of the 5ESS[®] switch TCP/IP platform. Probable causes include provisioning or software errors. Data dumped as part of the assert include a 16-bit error type and additional supporting data. The error type values are enumerated in the sourcefile ps/PNinet/PNrepterr.h.

Action:

Forward assert report to 5ESS[®] switch TCP/IP platform development.

122. PSINVARG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A PS subsystem function was called with an invalid argument.

Probable Cause:

Invalid argument.

Action:

None.

123. PSINVDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was found.

124. PSIPTST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was encountered while attempting to initialize or refresh protocol handler (PH) data required for packet switching calls that involve an internal protocol (IP) trunk group. required for call setup and packet transport. Incorrect or incomplete data will result in call failure. Data that was collected from the printer (ROP). Consult the program listings for the function identified by the failing address to determine the type of error.

125. PSISPAJHDLR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call from the PSarmvdsi() function to the Tmis pajhdr() primitive failed. The preemption job will not be scheduled.

126. PSL3BADTEI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Operator services position system (OSPS) level 3 processing encountered a terminal endpoint identifier (TEI) value in a message that does not match the TEI value in the D-channel application linkage block (DALB).

127. PSL3DEFAULT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An operator services position system (OSPS) level 3 function encountered a default in a case statement; that is, the case encountered is out of the range expected by the function.

128. PSLPCASSERT (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error condition was detected by the large packet connection mechanism which is used to send large packets between the SMP and its PSU and among PHs within a PSU.

Probable Cause:

The error can be caused by a number of conditions. This assert is intended only to document the error occurrence. This assert dumps an error type the values of which are as follows:

ERROR TYPE SYMBOL	ERROR TYPE VALUE
PSLPCBADARG	1
PSLPCCORRUPTEDDATA	2
PSLPCINVALIDSTATE	3
PSLPCUNEXPECTEDINPUT	4
PSLPCSNDSMSGFAILURE	5
PSLPCOSTIMERFAILURE	6
PSLPCNOTPI2ERROR	7
PSLPCPIMOVEFAILURE	8
PSLPCALIGNERROR	9
PSLPCSIZEERROR	10
PSLPCARBITERERROR	11
PSLPCCDTNOTAVAILABLE	12

Action:

Forward information to protocols subsystem (PS) software development.

129. PSLPT_PT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple is missing from the RLLPT_PT relation.

Data Structures:

RLLPT_PT. Key fields: lport (first data item dumped), lpt_type (second data item dumped).

Action:

This is a database inconsistency that can only be corrected by manual action. Use RC/V (or ODBE, if necessary) to fix the inconsistency.

130. PSMDBADAP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The common channel signaling (CCS) QPH background unloader system process PSqpup() has unloaded a CCS message delivery (MD) message from the message handler to switch module (MH->SM) fifo that is destined for an invalid MD application.

Probable Cause:

Either the message that was unloaded is an invalid message, or the CT7MPSIU loadable software package is not loaded in the switch.

Action:

The 8 byte MD message header, followed by the beginning of the message will be dumped to the ROP for further evaluation.

131. PSMPCTABL (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: TABGSM	Audit Mode: elev

Problem:

An internal database error was discovered in table CCgsm_opc during input message validation. An audit has been scheduled to remedy the problem.

Probable Cause:

Internal data corruption.

Action:

Inform local field support if problem continues. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

132. PSMSGBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The common channel signaling (CCS) QPH background unloader system process has received an OSDS message type that it does not know how to process.

Probable Cause:

Some unknown process is sending an OSDS message (either on purpose or erroneously) to the CCS QPH background unloader system process that the system process does not recognize.

Action:

The invalid message will be dumped to the ROP for further evaluation.

133. PSMSGERR (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A protocol subsystem (PS) function received a PSERROR or PSBADDATA failure return code from the PSsendmsg() function.

Probable Cause:

A PSERROR return code indicates a possible software problem. A PSBADDATA return code indicates that the destination protocol handler is invalid.

Action:

Provide ROP data to the next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

134. PSNOAPCP (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The PSmpup() function discovered that the applications processor communication package (APCP) is not loaded.

135. PSNOAPPL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operating system for distributed switching (OSDS) could not deliver a message to a process via the OSSENDMSG() macro from the operator services position system (OSPS) level 3 message transport code. No application terminal process was running with the process ID being processed.

136. PSNOBRCS (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A timer expired indicating to the switching module packet unloader process (PSMPUP) that message routing for integrated services digital network (ISDN) business and residential custom services (BRCS) button messages should be run; however, the ISDNBRCS package is not loaded in this SM.

137. PSNOCDNCHAN (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLCDNCHAN relation, a failure return code of DBNO_MATCH was received. This indicates that the tuple is missing, or that the keys used to read this relation were not set properly.

Data Structures:

RLCDNCHAN. Key fields: noc (first data item dumped), digits (second data item dumped, displayed as an ASCII string).

Action:

This is a database inconsistency that can only be corrected by manual action. Use RC/V (or ODBE, if necessary) to fix the inconsistency.

138. PSNODPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PSormvdsi() function could not get a D-channel application linkage block (DALB) or a D-channel port block (DPB).

139. PSNODSLEQUIP (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLDSLEQUIP relation, a failure return code of DBNO_MATCH was received. This indicates that the tuple is missing, or that the keys used to read this relation were not set properly.

Data Structures:

RLDSLEQUIP. Key fields: dsl.

Action:

This is a database inconsistency that can only be corrected by manual action. Use RC/V (or ODBE, if necessary) to fix the inconsistency.

140. PSNOEQUIPDSL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLEQUIPDSL relation, a failure return code of DBNO_MATCH was received. This indicates that the tuple is missing, or that the keys used to read this relation were not set properly.

Data Structures:

RLEQUIPDSL. Key fields: dsl_group (first data item dumped), member (second data item dumped).

Action:

This is a database inconsistency that can only be corrected by manual action. Use RC/V (or ODBE, if necessary) to fix the inconsistency.

141. PSNOL3PLE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

Operator services position system (OSPS) level 3 could not find a packet layer entity associated with an OSPS digital subscriber line (DSL). The D-channel application linkage block (DALB) audit is invoked in elevated mode.

142. PSNOODPSOP (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLODPSOP relation, a failure return code of DBNO_MATCH was received. This indicates that the tuple is missing, or that the keys used to read this relation were not set properly.

Data Structures:

RLODPSOP. Key fields: port (first data item dumped), party (second data item dumped).

Action:

This is a database inconsistency that can only be corrected by manual action. Use RC/V (or ODBE, if necessary) to fix the inconsistency.

143. PSNOPSX25LN (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLPSX25LN relation, a failure return code of DBNO_MATCH was received. This indicates that the tuple is missing, or that the keys used to read this relation were not set properly.

Data Structures:

RLPSX25LN. Key fields: ph_number (first data item dumped), ph_cn (second data item dumped), party (third data item dumped).

Action:

This is a database inconsistency that can only be corrected by manual action. Use RC/V (or ODBE, if necessary) to fix the inconsistency.

144. PSNORESET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) interflow message transport capability could not send an MGL3INIT message because the OSSENDMSG() macro failed. The PSoil3init() function invoked the assert.

145. PSNOSPID (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLSPID relation, a failure return code of DBNO_MATCH was received. This indicates that the tuple is missing, or that the keys used to read this relation were not set properly.

Data Structures:

RLSPID. Key fields: spid.uspid.digcnt (first data item dumped), spid.uspid.dig1 through spid.uspid.dig18 (second data item dumped, displayed as an ASCII string).

Action:

This is a database inconsistency that can only be corrected by manual action.

146. PSNOTLOADED (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message was received by PSmpup() for a feature that is not loaded.

Probable Cause:

An unknown process is trying to send a message destined for a loadable software package that is not loaded in the switch.

Action:

The invalid message will be dumped to the ROP for further evaluation.

147. PSNOTMATCHED (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

PSmpup() received an MD packet for an unknown user.

Probable Cause:

A message is being sent that is not supported.

Action:

The invalid message will be dumped to the ROP for further evaluation.

148. PSNOTMMSG (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Operator services position system (OSPS) level 3 code was timing a message and discovered that no message was waiting (that is, an inconsistent event occurred).

149. PSNOTMR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) level 3 processing could not get an operating system for distributed switching (OSDS) timer. The system cannot operate without this timer; a single process purge (SPP) is requested.

150. PSNULPRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This failure occurred when attempt was being made to calculate the logical channel number and D-port name. To determine the D-port name the macro RIGETED() was called, and it failed, returning GLNULPORT. GLNULPORT will be returned under the following conditions:

- 1) An attempt was made to read a UNIT_CKT tuple.
- 2) An attempt was made to read a CKT_PORT tuple.

151. PSODBMSGBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The packet services (PS) code encountered an invalid value in a field in the message being processed. The protocol handler (PH), PH channel, and party numbers are printed on the receive only printer (ROP). The assert assumes that no rIPsx25LN tuples are missing from the database. The keys for the rIPsx25LN tuple are the PH, PH channel,

and party.

Probable Cause:
Corrupted ODD.

Action:
Provide information to next level of support.

152. PSOSREASON (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
An unknown reason for creation was received from the operating system (OS).

153. PSOSSEND (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
The operating system for distributed switching (OSDS) failed to send a message via the OSSENDMSG() macro.

154. PSPARMBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
A packet services (PS) function received a parameter that was out of range.

155. PSPCBLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:
The DAfownpc() primitive (b-port) or the DAfdapc() primitive (d-port) returned an unexpected error code when it was used to find the process control block link area (PCBLA) for a given port.

156. PSPDALB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Operator services position system (OSPS) level 3 code encountered difficulty with a D-channel application linkage block (DALB). No recovery is required (the quarantine bit is set, the following linkage fails.)

157. PSPHDISCARD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
A Q.931 message from the SM to the customer premises equipment (CPE) was discarded in the protocol handler (PH). The SM sent messages to a channel faster than the CPE could process them.

158. PSPHDSCRD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A Q.931 message from the SM to the customer premises equipment (CPE) was discarded in the protocol handler (PH). The SM is sending messages to a particular channel faster than the CPE can process them.

159. PSPIDISCARD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A Q.931 message from the SM to the customer premises equipment (CPE) was discarded in the packet interface (PI). The SM sent messages to a protocol handler (PH) faster than the PH could process them.

160. PSPIDSCRD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A Q.931 message from the SM to the customer premises equipment (CPE) was discarded in the packet interface (PI). The SM is sending messages to a particular protocol handler (PH) faster than the PH can process them.

161. PSPKBINIT (5E11 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) message transport software could not get a packet buffer (PKB) for more than two minutes. A selective initialization will be scheduled.

162. PSPPKB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The dynamic access (DA) primitives which manipulate the RLPKB relation failed. A problem was encountered accessing an rIPKB tuple.

163. PSPRISTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PRISTAT	Audit Mode: elev

Problem:

Error occurred while accessing RLPRISTAT tuple. Appropriate recovery action has been taken.

164. PSPRORNX (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

This assert was evoked as a result of a failure in obtaining an extended subscriber line (EDSL) D-port or a valid D-port with a non-zero port index was retrieved. When an EDSL D-port is needed the macro RIGETED() is evoked. This will in turn call the function RIgeted() to obtain a D-port. RIgeted() will read a port linkage area (PORTLA) tuple for the passed in port. If a tuple exists for the D-port a determination is made to verify that the port is a D-port by checking the port_indx attribute of the PORTLA. A non-zero value for this attribute indicates that the D-port is not an EDSL D-port. This assert will schedule a portla audit if no tuple exists for the passed in port or a non-zero port index is assigned for the EDSL D-port.

165. PSPRTCRD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

This assert was evoked as a result of a failure in obtaining an extended digital subscriber line (EDSL) D-port. This failure resulted when an attempt was made to obtain a port linkage area (PORTLA) tuple from within the utility function RIgeted(). RIgeted() was called when the macro RIGETED() was evoked. The assert schedules the portla audit to cleanup the corrupted PORTLA tuple.

166. PSPSPB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The dynamic access (DA) primitives which manipulate the RLSPB relation returned a failure code. This indicates a problem accessing an rLSPB tuple.

167. PSQMSG2LONG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A raw Q.931 message exceeded the maximum length.

168. PSRETASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unrecognizable return code was received from the PSmsadt() function or the PSmsudt() function primitive call.

169. PSRTDPB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DPB	Audit Mode: elev

Problem:

Layer 3 for remote terminal (RT) TR303 communications found inconsistent data in the D-channel port block (DPB). The DPB audit will be scheduled.

170. PSRTPICB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PICB	Audit Mode: elev

Problem:

Layer 3 for remote terminal (RT) TR303 communications found inconsistent data in the RLPICB relation. The peripheral interface control bus (PICB) audit will be scheduled.

171. PSRUGLPRM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was returned from an attempted read/update of a global parameter from within a transaction.

Probable Cause:

1. Parameter name does not exist or

2. Not a valid transaction or
3. Transaction time allowed exceeded or
4. System error

Action:
None.

172. PSSCCPBDMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
An unexpected value was received in a SCCP message.

173. PSSENDASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:
PSBADATA was returned from the PSmsadt() function or the PSmsudt() function indicating invalid data in the D-channel application linkage block (DALB).

174. PSSENDER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
PS failed to enter a packet into the outgoing PI-SMP FIFO because PSmsendpkt() was passed a bad parameter, or no PI boards operational in this SM.

175. PSSENDMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
An OSSENDMSG() macro call from the application processor communication package (APCP) code failed.

176. PSSINDXI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
is generated if the DPC/SSN index retrieved from the CC7IND_SSN table is out of range. The valid range is 1 to 4095. If this assert occurs, the table data may not be consistent with the associated SM relation, RLDPCIND, or the relation may be populated incorrectly.

177. PSSIXRDF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
generated if a read of the PHDA table CC7IND_SSN returns a value other than GLSUCCESS or CCNO_MATCH. GLSUCCESS means that the tuple was retrieved successfully. CCNO_MATCH means that the tuple did not exist. Any other value would indicate that there is something wrong with the table. If this assert occurs, the table may not be consistent with associated SM relation, RLDPCIND, the relation may be corrupted, or there could be something

wrong with the table access.

178. PSSSTRDF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

generated if a read of the PHDA table CC7SSN_STAT returns a value other than GLSUCCESS. GLSUCCESS means that the tuple was retrieved successfully. Any other value would indicate that there is something wrong with the table, because the key used has already been verified as valid. If this assert occurs, the return code can be used to determine the source of the problem and the appropriate action.

179. PSTCCPERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Transaction capabilities application part (TCAP) function PStcapog() has received a message and a message length from a calling MD function. PStcapog has copied the BDs into a buffer using function PSbd2blk(), but the copied length is different than the message length passed to PStcapog() as a parameter. The following data will be displayed: Passed message length and Copied message length.

Action:

No action is required. This assert is for information purposes only.

180. PSTCMSGEXC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Transaction capabilities application part (TCAP) has received a message on a PH, from a remote application, whose length field indicates that the message exceeds the maximum length allowed of 255 bytes. The following local data will be dumped: Message type and Message size.

Action:

No action is required. This assert is for information purposes only.

181. PSTMHACCNOMATCH (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Doing a CCrdtup() of the CCTMHNGSMACC table gave table not found.

Probable Cause:

The table may not be properly inserted during the TMHI process initialization.

Action:

This table is for internal to the code execution so let the TMHI process execute in order to insert the table during its initialization.

182. PSTMJBFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PSrmvdsI() function received a failure return from the ISpjhdrI() function.

183. PSTPAPSPB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: APSPB	Audit Mode: elev

Problem:

The application processor (AP) terminal process could not access an rIAPSPB tuple. The process is purged, and the APSPB audit is scheduled.

184. PSUKNUSR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DPB	Audit Mode: elev

Problem:

Unexpected event received in PSmpup()

185. PSUNEXEVNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected process event was received.

186. PSUNKNSHSHPKT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert indicated that an unknown packet type was received. This assert should be followed by a data dump of the packet.

187. PSUNXMSG (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Operator services position system (OSPS) level 3 processing encountered an unexpected message in the timer routines.

188. PSUNXMSG (5E11 to 5E12)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Operator services position system (OSPS) level 3 processing encountered an unexpected message in the timer routines.

Range: psi**1. DTBADEV (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMIC system process received an illegal event.

2. DTBADOS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMIC system process received an illegal message.

3. DTBADTIMER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Data transport (DT) switched on an invalid timer type.

4. DTBADTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid timer tag received by the system process SMIC.

5. DTETEFail (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Data transport (DT) has detected an end-to-end check failure, but it appears that the SMP and PI are unloading packets. This could indicate that DT messages have been lost, or that they have not been unloaded fast enough to beat the timer. The FIFO pointers have been stored in `local_array[]`, which can be seen in the stack frame dump associated with this assert.

6. DTOSSEND (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Data transport (DT) received an invalid return from the `OSSENDMSG()` macro.

7. DTREASERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMIC system process received an illegal operating system (OS) create reason.

8. DTSM2PIFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Data transport has failed to place a message on the SMP->PI FIFO for reasons other than resource exhaustion. This could result in end-to-end check failures.

9. INBDCKNM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid circuit name was encountered during a full or selective initialization.

10. INCCSWFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The INpu_start() function called the SMSiccstup() function via the OSfap() function to switch the common controller (CC) during offline verification. INpu_start received a failure return code.

11. INDAHLSC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to get a high level service circuit (HLSC) for selective initialization's circuit initialization.

12. INNRETGEN (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

This is a general system integrity control (SICO) non-returning assert. Save the ROP output to determine where the error occurred.

13. INPU_ERROR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was found in the parallel initialization control table (INit_tbl[]). One peripheral unit is left uninitialized. The first stack frame dump and the layout of the INit_tbl[] array provide more information. The stack back trace also provides information about the error. Contact the product engineering control center (PECC) for further investigation.

14. INUNITERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A unit type that is not currently supported by the function INproc_pidbts() has been encountered. The INproc_pidbts() function should be modified to appropriately handle this unit type. This assert does not take any recovery action.

15. SIBADGRWREQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid optional data region (ODR) growth request type has been passed to Slodgrw(). Collect the associated stack trace and stack frame reports and contact the next level of support.

16. SIBADODRID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid optional data region (ODR) enumeration has been detected. Collect the associated stack trace and stack frame reports and contact next level of support.

17. SIMGTPBADREA (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The system integrity memory management/growth terminal process (MGSI) was created with an invalid creation reason. The process will be purged. Collect stack frame report and contact next level of support for further debugging.

18. SIMGTPINVMSG (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The system integrity memory management/growth terminal process (MGSI) has received an invalid message type. The invalid message type will be dumped, and the terminal process will be purged. Collect associated data dump and contact next level of support.

19. SIMGTPTIMEOUT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The system integrity memory management/growth terminal process (MGSI) has timed out waiting on a request from the module integrity controller system process (MICO). The terminal process has been purged, and the corresponding manual request for optional data region (ODR) growth or SM physical memory growth has been aborted. As the message may have been lost, retry the growth request before contacting the next level of support.

20. SIOALLOCRTN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Slodgrw() has been passed an unexpected return code from Sioalloc(). Collect associated stack trace and stack frame reports and write an initial modification request (IMR) against the system integrity (SI) subsystem for further debugging.

21. SIOLAOOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Slenum_olock() was passed a bad action. This should never happen. Write an IMR against the System Integrity subsystem.

22. SIOLEOOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Slenum_olock() was passed a bad enumeration of an optional data region (ODR) to lock. This should never happen. Write an IMR against the system integrity subsystem.

23. SIOLPHOOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Slenum_olock() was called with action SILOCKPHS but with a optional data region (ODR) enum that was not for a protocol handler (PH) image. Only PH images can be locked in state SILOCKPHS. This assert should never happen. Write an IMR against the system integrity subsystem.

24. SIOM1 (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The overload monitor attempted to contact the AM in order to upload overload data, but the AM did not respond. The overload data will be lost.

25. SIOM2 (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The overload monitor sent numerous messages to the AM requesting access to the Simon local buffer; however, the buffer was always busy. The overload data on the local processor will be lost.

26. SIOM3 (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The overload monitor could not gain access to the operating system for distributed switching (OSDS) monitor's operation structure. The overload monitor data will be lost.

27. SIOM4 (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The overload monitor received an abort message from the AM. The overload data will be lost.

28. SIOM5 (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The overload monitor received a wakeup requesting that overload data be processed, but the global data structure indicating the size of the data had not been initialized.

29. SIOPHBO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During protocol handler (PH) restoration an unrecognized optional data region (ODR) image number was encountered. This should never happen. Write an initial modification report (IMR) against the system integrity subsystem.

30. SIOPHNLI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During an attempt to restore a protocol handler (PH) image, pump code could not acquire an initial lock on the PH peripheral image. Data on the lock state of all optional data region's (ODR's) is dumped as part of this assert for debugging purposes. Contact field support: there may be a problem with the system integrity subsystem.

31. SIOUPMPNL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During an attempt to restore a peripheral image, the unitpump code was unable to acquire a lock on the peripheral optional data region (ODR) image within the allowed timeout. The data dumped by this assert includes locking info (starting with the lockstate of the ODR that pump was unable to lock) and ODR data for this ODR. Contact field support: there may be a problem with the system integrity subsystem.

Range: psph**1. PS1ACTVCBAD (5E11 and later)**

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During a service order processor (SOP) inhibit or a customer premises equipment (CPE) inhibit, the number of virtual circuits (VCs) was not equal to zero, when it was expected to be zero.

2. PS1SBADTIMER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Some timers on the list. While timer tag for the timer control block being deleted is PSTMRNULL indicating timer list and TCB list is inconsistent.

Data Structures:

PS1seclist: Appropriate timer list index

PSscoctcb[tcb_idx]: Timer control block index.

Action:

Invokes PH SCCP-CO audit, AU1SECLIST. If this assert occurs quite often call field support personnel for help.

3. PS2ACTVCBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During a remove of a digital subscriber line (DSL), the active virtual circuit (VC) count was not zero, when it was expected to be zero.

4. PS3ACTVCBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During a campon, the active virtual circuit (VC) count was not equal to zero, when it was expected to be zero.

5. PS4ACTVCBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During a remove on a service order processor (SOP), the active virtual circuit (VC) count was not zero, when it was expected to be zero.

6. PS6NOTIMR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to get prove-in timer.

7. PS10SBADTIMER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Some timers on the list. While timer tag for the timer control block being deleted is PSTMRNULL indicating timer list and TCB list is inconsistent.

Data Structures:

PS10seclist: Appropriate timer list index.

PSscoctcb[tcb_idx]: Timer control block index.

Action:

Invokes PH SCCP-CO audit, AU1SECLIST. If this assert occurs quite often call field support personnel for help.

8. PSABDCHN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid D-channel number was encountered.

9. PSADCL2E (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A D-channel layer 2 (DCL2) system process was entered with an invalid reason. This should result in a single process purge.

10. PSAFRSBD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid frame structure was received from the subscriber gateway. The frame was discarded.

11. PSALCBINVIDX (5E12 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A invalid ALCB index was found in a timeout function, where the ALCB index is stored in udata.

12. PSALDBHD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: PSHC	Audit Mode: nonseg

Problem:

An inconsistency in the access link data block (ALDB) headcell was detected.

13. PSALDBIX (5E11 and later)

Recovery Action: spp	SPP: n	Audit: ALDB	Audit Mode: nonseg

Problem:

An invalid access link data block (ALDB) index was detected.

14. PSALIOOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The logical link control block (LLCB) index was out of range for a D-channel. The LLCB was unlinked from the D-channel control block (DCCB), but it was not idled.

15. PSALKCNR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown control type was found in the D-channel control block (DCCB) link to the logical link control block (LLCB). The idled LLCB was released.

16. PSALLCBT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown timer type was found in the logical link control block (LLCB). The idled LLCB was released.

17. PSALSBERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Read failure for CCITT6 static table, CCalsb_plsb[]. Print the PSS6SU structure containing the current CCITT6 message and the return code from CCrdrup().

18. PSALTUNK (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to associate a logical link control block (LLCB) timeout with a D-channel. This error initiates a single process purge.

19. PSAMSGLG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A length error was received from the OSWGETMSG() macro in the D-channel layer 2 (DCL2) system process.

20. PSAMSGRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to send the operating system (OS) a message due to an unexpected failure return from the PSsendmsg() function.

21. PSAMSGTP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown message was received in the D-channel layer 2 (DCL2) system process.

22. PSATMRTN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to start or stop a timer due to an unexpected error return from the PSt_start() function or the PSt_stop() function. The logical link control block (LLCB) was released.

23. PSAWMSGR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown return value was received from the OSWGETMSG() macro in the D-channel layer 2 (DCL2) system process.

24. PSB_ACTION (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal protocol action was encountered during level 2 link access procedure B (LAPB) processing.

25. PSB_ACTTYPE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal activation type was encountered during level 2 link access procedure B (LAPB) processing.

26. PSBADAHD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The access link control blocks (ALCBs) that were indicated by the ALCB headcell as the head and tail of the ALCB free list were not there.

27. PSBADALK (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The first access link control block (ALCB) on the free list had an index that was out of range, or failed a point-to-point-back check against the next ALCB on the free list (if there was one).

28. PSBADCHD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The logical channel control blocks (LCCBs) that were indicated by the LCCB headcell as the head or tail of the LCCB free list were not there.

29. PSBADCHON (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return was received from PSsgchon. Either the dslrate is incorrect or the phts was incorrect. This resulted in the D-channel not being turned on. Will notify signaling link management to take the appropriate action.

30. PSBADCL2RQT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

QPHFR-PH process received an invalid MGCL2RQT message. Valid requests are of type PSCL2PON, power-on request, or PSCL2POFF, power-off request. The message will be dumped to the ROP.

31. PSBADCLK (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The first logical channel control block (LCCB) on the free list had an index that was out of range, or failed a point-to-point-back check against the next LCCB on the free list (if there was one).

32. PSBADCOCXN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SCCP-CO connection state is invalid. Dump the connection entry.

Data Structures:

PScxn[cxn_idx] Whole connection entry .

Action:

IF this happens number of times in short time, call field support personnel.

33. PSBADCOIMS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Finite state machine driver receives unknown SCCP-CO internal messages. Dump the message.

Data Structures:

PSINT_MSG: Whole message is dumped.

Action:

IF this happens number of times in short time, call field support personnel.

34. PSBADERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown error code was received by the QPHFR-PH error handling function.

35. PSBADIPH (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The point-to/point-back check between the intra-protocol handler (PH) logical link control block (LLCB) and its first internal frame descriptor (IFD) failed. If there are no intra-PH calls active, then the value of PSllcb[PSINPHLL].f_ifd is something other than PSIFDNULL (0x0190), possibly this field was inadvertently zeroed.

36. PSBADLCCB (5E14 and later)

Recovery Action: spp	SPP: n	Audit: LCCB	Audit Mode: nonseg

Problem:

An invalid field was found in the logical channel control block (LCCB). This causes a single process purge.

Probable Cause:

Unknown.

Action:

Seek Technical support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

37. PSBADLNK (5E11 and later)

Recovery Action: spp	SPP: n	Audit: DCCB	Audit Mode: nonseg

Problem:

An error was found in the D-channel control block (DCCB) linkages for the conditional notification queue.

38. PSBADMEM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A function was passed an out-of-range member number parameter.

Probable Cause:

Corrupted data.

Action:

None.

39. PSBADMODE (5E11 and later)

Recovery Action: psinit	SPP: n	Audit: null	Audit Mode: null

Problem:

A packet services (PS) subscriber gateway synchronous/asynchronous protocol data formatter (SPYDER) mode error occurred. This error is caused by an incorrect PSspymode global data value.

40. PSBADNPRIM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Finite state machine (FSM) wants to send N_Primitive to the user application. N_Primitive FSM sent is illegal there is something wrong with the FSM just dump the PSINT_MSG structure received from FSM.

Data Structures:

PSINT_MSG: Whole message is dumped.

Action:

If this happens several times within a short time, call field support personnel.

41. PSBADPRM (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid parameters were passed to a function. Check the receive only printer (ROP) for a function back trace.

42. PSBADRET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from the PSsendmsg() function. No action will be taken.

43. PSBADRFDL (5E11 and later)

Recovery Action: psinit	SPP: n	Audit: null	Audit Mode: null

Problem:

A packet services (PS) subscriber gateway synchronous/asynchronous protocol data formatter (SPYDER) receive frame descriptor (RFD) linkage error occurred. This is caused by corrupted linkages in memory.

44. PSBADRSTAT (5E11 and later)

Recovery Action: psinit	SPP: n	Audit: null	Audit Mode: null

Problem:

A packet services (PS) subscriber gateway synchronous/asynchronous protocol data formatter (SPYDER) receive frame descriptor (RFD) pointer/status error occurred. This error is caused by incorrect linkages memory.

45. PSBADSUBSYS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When N_Primitive is being sent from the user application to the SCCP-CO or from SCCP-CO to the user application. Subsystem is validated by the N_Primitive handler to make sure correct connection is being used by/for the correct user application. The argument passed does not match to the what is stored in the connection database. If this assert indicates connection database is corrupted for some connections.

Data Structures:

PSINT_MSG: Whole message is dumped.

PScxn[cxn_idx].local_ssn: local subsystem name.

Action:

If initialization of PH occurs frequently due to this reason than call field support personnel.

46. PSBADTFDL (5E11 and later)

Recovery Action: psinit	SPP: n	Audit: null	Audit Mode: null

Problem:

A packet services (PS) subscriber gateway synchronous/asynchronous protocol data formatter (SPYDER) transmit frame descriptor (TFD) linkage error occurred. This is caused by corrupted linkages in memory.

47. PSBADVALUE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A variable, internal to a function, was found to have an undefined, invalid, inconsistent or bad value. This is a general assert used to dump the value that was found to be bad.

48. PSBCALIHD (5E14 and later)

Recovery Action: spp	SPP: n	Audit: CALINFO	Audit Mode: nonseg

Problem:

A corrupt linkage was found in the CALEA information block (CAL_INFO) headcell.

Probable Cause:

Data corruption.

Action:

Assert has scheduled the CAL_INFO audit to run.

49. PSBCALILK (5E14 and later)

Recovery Action: spp	SPP: n	Audit: CALINFO	Audit Mode: nonseg

Problem:

Linked list linkage(s) in the CALEA information block (CAL_INFO) had an invalid/unallowed value or failed a point-to-point-back check.

Probable Cause:

Data corruption.

Action:

Assert has scheduled the CAL_INFO audit to run.

50. PSB_CHAN (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal channel number was detected during level 2 link access procedure B (LAPB) processing.

51. PSBDCHAN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid channel number was passed to the PSuct_pkt() function from a requested call trace.

52. PSBDLKRTDB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: RTDB	Audit Mode: nonseg

Problem:

A corrupt linkage was found in the routing data block (RTDB) free list.

53. PSB_ERROR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An internal error occurred during level 2 link access procedure B (LAPB) processing that has been recovered from.

54. PSB_GENFRM (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal frame was passed to the state transition function. The frame should have been handled in the calling function.

55. PSB_IFD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The internal frame descriptor (IFD) list for a link access procedure B (LAPB) link was corrupted.

56. PSBIXLLCB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An out-of-range link access protocol D (LAPD) logical link control block (LLCB) index was passed for de-allocation. The request was ignored.

57. PSBKSTBL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SCCP-CO PH status table may contain bad data.

Data Structures:

PSphtbl[PSlphnum] Whole status entry.

Action:

If this happens several times in a short time period, call field support personnel.

58. PSBLAESHD (5E14 and later)

Recovery Action: spp	SPP: n	Audit: LAESCASE	Audit Mode: nonseg

Problem:

A corrupt linkage was found in headcell of the communications assistance for law enforcement act (CALEA) lawfully authorized electronic surveillance (LAES) case data block (LAESCASE).

Probable Cause:

Data corruption.

Action:

Assert has scheduled the LAESCASE audit to run.

59. PSBLAESLK (5E14 and later)

Recovery Action: spp	SPP: n	Audit: LAESCASE	Audit Mode: nonseg

Problem:

Linked list linkage(s) in the communications assistance for law enforcement act (CALEA) lawfully authorized electronic surveillance (LAES) case data block (LAESCASE) had an invalid/unallowed value or failed a point-to/point-back check.

Probable Cause:

Data corruption.

Action:

Assert has scheduled the LAESCASE audit to run.

60. PSB_MSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message to the switching module processor (SMP) from level 2 link access procedure B (LAPB) processing in the protocol handler (PH) failed to reach the SMP for a non-resource related reason.

61. PSB_PHCTYPE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal protocol handler (PH) channel type was encountered during level 2 link access procedure B (LAPB) processing.

62. PSB_PTCHECK (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The point-to/point-back check between the access link control block (ALCB) and the logical link control block (LLCB) failed on a level 2 link access procedure B (LAPB) link.

63. PSB_REJEVENT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal frame rejection action was encountered during level 2 link access procedure B (LAPB) processing.

64. PSB_STATE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal protocol state was encountered during level 2 link access procedure B (LAPB) processing.

65. PSB_TIMER (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal protocol timer timeout value was encountered during level 2 link access procedure B (LAPB) processing.

66. PSC6PNDMAX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid pndg message buffer size (negative or zero).

67. PSCBADCALL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unexpected caller of the CCITT7 level 3 signaling message handling outgoing routing function. MSU discarded.

68. PSCBADCT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Actual count of bytes in the buffer descriptor is out of range. MSU discarded.

69. PSCBADMET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Method to route the outgoing MSU by CCITT7 L3 SMH is invalid. MSU discarded.

70. PSCBADUPACT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid update action requested for CCITT7 PHDA dynamic tables. A refresh of the CCITT7 PHDA dynamic data is requested.

71. PSCBOVR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A retransmit or transmit buffer overflow has occurred.

72. PSCBSNERST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid bsn-in-error state.

73. PSCCSL2E (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

CCITT7 level 2 system process was entered with an invalid reason. This should result in a single process purge (SPP).

74. PSCDSLRLATE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Bad DSL rate for CCITT7 level 2 system process.

75. PSCDYBUFF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency had been detected with the buffering flag in the CCITT7 PHDA dynamic data. The buffer flag is set in the DPC to linkset table or loadsharing table for an MSU retrieved from the level 2 retransmission buffer. The MSU is discarded. A CCITT7 PHDA dynamic data refresh is requested if the dynamic data update method is via OSDS otherwise the update method is via packets and a count of dynamic data errors is pegged.

76. PSCEMSUTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Locally generated MSU of an invalid type (given by the heading codes (H0/H1 fields) in the MSU). MSU discarded.

77. PSCEMSUUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Locally generated MSU destined to an invalid user part (given by the service indicator code in the MSU). MSU discarded.

78. PSCERRSDLDATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The macro PSGETSDDLATA() unexpectedly did not return GLSUCCESS, or did not return any of its expected return values.

79. PSCFIBERST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid FIB-in-error state.

80. PSCINITST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Message type received by CCITT7 L3 SMH system process when in the incorrect state.

81. PSCL2IACRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid return value received from initial alignment control (IAC) of CCITT7 level 2 system process.

82. PSCL2REQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid CCITT7 level 2 message received by CCITT7 level 2 system process based on the state.

83. PSCL2STATE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid state of CCITT7 level 2 system process.

84. PSCL6BADSPY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Bad return when setting SPYDER mode.

85. PSCL6EVENT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid link input event.

86. PSCL6INVMUM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid MUM linkage.

87. PSCL6LKR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid reset type in link reset message.

88. PSCL6NOTQSP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Transmission queue full.

89. PSCL6NOXQSP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Retransmission queue full.

90. PSCL6STATE (5E11 and later)

Recovery Action: psinit	SPP: n	Audit: null	Audit Mode: null

Problem:
Invalid link state.

91. PSCL6SYNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Invalid level 2 sync type.

92. PSCLATECOMP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
CCITT7 PHDA dynamic data initialization complete message not received by the CCITT7 L3 SMH system process in the expected time. A refresh of the CCITT7 PHDA dynamic data is requested.

93. PSCLATEINIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
CCITT7 PHDA dynamic data initialization start message not received by the CCITT7 L3 SMH system process in the time expected. A refresh of the CCITT7 PHDA dynamic data is requested.

94. PSCLS2SLC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Linkset or signaling link code (SLC) obtained from the appended routing data of the locally generated MSU is out of range. The MSU is discarded.

95. PSCLSBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Linkset obtained from CCITT7 DPC to linkset table is out of range. MSU discarded and CCITT7 PHDA dynamic data refresh requested.

96. PSCLSMBBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Linkset retrieved by PSGETSDLDATA() is out of range. MSU is discarded.

97. PSCLSSUSI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received an LSSU with an invalid status indicator.

98. PSCLTADDBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CCITT7 PHDA loadsharing table add or delete not specified for an entire linkset. A CCITT7 PHDA dynamic data refresh is requested.

99. PSCLTMOBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CCITT7 PHDA loadsharing table modify specified with no SLSSs to be updated. A refresh of the CCITT7 PHDA dynamic data is requested.

100. PSCMSGLG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Length error value received from OSWGETMSG in the CCITT7 level 2 system process.

101. PSCMSGR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unknown OS message received by the CCITT7 level 2 system process.

102. PSCMSGRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to send OS message due to unexpected failure return from OSsendmsg.

103. PSCMSGTYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unknown OSDS message head type received by the CCITT7 level 2 system process

104. PSCMSULGTH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

MSU of an invalid length. MSU discarded.

105. PSCMTHOPCNT (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A CCS message that is being transported between the NGSM and host GSM has made too many hops through the CMT network.

Probable Cause:

The CMT routing data is incorrect.

Action:

Contact local field support if the problem continues. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

106. PSCMTOCSTAT_BAD (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCS message transport (CMT) path overflow condition status returned from macro PSCMTOCSTATGSM() is invalid.

Probable Cause:

The possible causes of getting an invalid CMT path overflow condition status are either due to a memory corruption or macro PSCMTOCSTATGSM() gets an invalid non-global switch module (NGSM).

Action:

The CMT throttling function, PScmt_throttle(), returns a GLFAIL to indicate that the inbound TCAP message shall be discarded due to the unknown CMT path overflow condition status. The assert will help to flag the problem if an invalid NGSM was received by macro PSCMTOCSTATGSM().

107. PSCNOAPD2PH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Locally generated MSU cannot be routed as there is no match in the CCITT7 PHDA signaling link code (SLC) to STPH table for the appended routing data. MSU discarded and the CCITT7 PHDA dynamic data refresh is requested.

108. PSCNOLD SH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No entry in CCITT7 loadsharing table for the linkset obtained from the CCITT7 DPC to linkset table. MSU discarded and CCITT7 PHDA dynamic data refresh requested.

109. PSCNOOPCUNT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The MSU retrieved from the level 2 retransmission buffer and previously destined to an other licensed operator (OLO), cannot be routed as the OPC in the MSU cannot be untranslated, as there is no match for the OPC in the MSU in the DPC translation table. This is due to either the craft deleting an entry from the table or the CCITT7 PHDA OPC and DPC translation tables being inconsistent. The MSU is discarded.

110. PSCNOPH2LS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No active link is assigned to logical channel according to PSGETSDLDATA(), when one was expected.

111. PSCNOSLCPH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Either there is no entry or no available links in the CCITT7 signaling link code (SLC) to ST-PH table for the linkset obtained from the CCITT7 DPC to linkset table. MSU discarded and CCITT7 PHDA dynamic data refresh requested.

112. PSCONGTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The congestion type stored in the structure CCgsm_info has an unexpected value.

Probable Cause:

The data has been corrupted or a new congestion type was introduced without the corresponding text changes.

113. PSCOPCTRBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An outgoing MSU is destined to go out of the office on a linkset that is directly connected to an OLO but there is no match for the DPC in the MSU in the CCITT7 PHDA OLO indicator table, indicating that the MSU is NOT destined to an OLO. Either the CCITT7 PHDA tables are inconsistent or a national office is using an OLO as a signaling transfer point to signal to a national office. The MSU is discarded.

114. PSCOPCUNTBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The MSU is retrieved from the level 2 retransmission buffer of a link that is directly connected to an OLO but the MSU is not destined to an OLO. This is due to either the craft altering the CCITT7 PHDA data since the MSU has been in the Level 2 Retransmission buffer or an error in the data. The MSU is discarded.

115. PSCPCLENBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Point code has length other than 14, 16, or 24.

Probable Cause:
Data corruption.

Action:
Peg static error count.

116. PSCPHTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Invalid channel type on a protocol handler (PH) for CCITT7 level 2 system process.

117. PSCPURG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
The CCITT7 level 3 signaling message handling system process was purged while updating the CCITT7 PHDA dynamic data. The PHDA static data may have been corrupted when the system process was purged.

118. PSCRCNGST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Invalid receive congestion state.

119. PSCREFDYDATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Reached threshold of attempts to refresh CCITT7 PHDA dynamic data.

120. PSCRTBCNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
The value of PScLv2.rtb_cnt is unexpectedly zero.

121. PSCSEQCHK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
The CCITT7 PHDA dynamic data update message received by the CCITT7 L3 SMH system process is out of sequence. A refresh of the CCITT7 PHDA dynamic data is requested.

122. PSCSMHUNRET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unexpected return code from a CCITT7 level 3 SMH function.

123. PSCSNMBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A locally generated CCITT7 signaling network management MSU cannot be routed as there is no match for the DPC in the MSU in the CCITT7 PHDA DPC to linkset table. The MSU is discarded and a refresh of the CCITT7 PHDA dynamic data is requested.

124. PSCSPREAS (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

CCITT7 L3 SMH system process was entered with an invalid reason.

125. PSCSPYRET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid SPYDER error return.

126. PSCSPYRSC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A return value of PSRESRCE was returned from PSspxmit - the SPYDER channel transmit function. This indicates that the frame could not be transmitted because of no available transmit frame descriptors.

127. PSCSZOMBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The size of the output message passed to Slttymsg() is out of range.

128. PSCTCNGST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid transmit congestion state.

129. PSCTMRINT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interval requested by a cyclic timer invocation (OSCTIMER) is out of range.

130. PSCTMRTN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to start timer due to unexpected error return from OSTIMER.

131. PSCUNGTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unexpected return from OSWGETTYPE() to the CCITT7 L3 SMH system process. A refresh of the CCITT7 PHDA dynamic data is requested.

132. PSCUNMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unexpected return from OSWGETMSG() to the CCITT7 L3 SMH system process.

133. PSCUNRET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to read tuple from CCITT7 PHDA table due to unexpected failure return from PHDA read function. MSU discarded.

134. PSCUNUPD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unsuccessful return from CCITT7 PHDA dynamic table update functions. A refresh of the CCITT7 PHDA dynamic data is requested.

135. PSCUNWAIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unexpected return received from OSWAIT() by the CCITT7 level 3 signaling message handling system process. A refresh of the CCITT7 PHDA dynamic data is requested if the dynamic data initialization and update method is via OSDS messages.

136. PSCUPDPC2LS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CCITT7 PHDA DPC to linkset table update specified for incorrect number of tuples. CCITT7 PHDA dynamic data refresh is requested.

137. PSCUPSLC2PH (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CCITT7 PHDA signaling link code (SLC) to ST-PH table update specified with no SLCs indicated to be updated. A

refresh of the CCITT7 PHDA dynamic data is requested.

138. PSCUPSLC2PH (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CCITT7 PHDA SLC[®] to ST-PH table update specified with no SLC[®]s indicated to be updated. A refresh of the CCITT7 PHDA dynamic data is requested.

139. PSCUPTYBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCITT7 PH dynamic data update method as indicated by the variable CCphupty is incorrect. An SI macro will be called to assert the PH's error lead.

140. PSCWMSGR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unknown return value received from OSWGETMSG in the CCITT7 level 2 system process.

141. PSCXMITRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid return from PScI2xmit.

142. PSDCDBERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DCDB	Audit Mode: elev

Problem:

A field of the DCDB was in error.

Probable Cause:

Inconsistent data.

Action:

Assert schedules DCDB audit to run.

143. PSDMAPBDERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: BD	Audit Mode: nonseg

Problem:

The direct memory access (DMA) processor detected a problem with buffer descriptors (BDs) that are to be transmitted out the SPORT to the subscriber. Either a BD had the nextbd field as PSNULLOFF and did not have the end of file (EOF) bit set, or the linked list of BDs associated with the transmit frame descriptor (TFD) was greater than the maximum length of BDs for a frame.

144. PSEBADCB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to release an access link control block (ALCB) or logical channel control block (LCCB) with an index that was out of range.

145. PSEBADLCCB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A logical channel control block (LCCB) was seized, but no slot was available for the LCCB index in the access link control block (ALCB).

146. PSEBADMSGID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A discrepancy was found in a message ID field for a packet that timed out while waiting for a route response.

147. PSEBADPH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid protocol handler (PH) number was returned from the inter-SM routing table.

148. PSEBADRET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid return data was received from the PSsendmsg() function or the PSwist_rout() function when requesting routing data for an incoming, interswitch call request packet (CREQUEST) or permanent virtual call setup packet (CPVC_SETUP). The route response message type might be incorrect.

149. PSEBADSM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid destination SM number that was returned in the route response message was passed to the inter-SM packet transport (ISMPT).

150. PSECBDR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid return from a GPHDA primitive while accessing an ECIS6 table. The remotely generated MSU will be discarded since it is impossible to continue processing it.

151. PSECMXBUF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The buffer is not large enough to hold the MSU plus the 4 byte ECIS6 header. The remotely generated MSU is discarded since it is impossible to continue processing it.

152. PSECNSC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was found in the CCNSC_DPC table in the PH while trying to read the table with a linkset or NSC index key. For incoming ECIS6 MSUs from the NSC, the linkset that is used as the key into the CCNSC_DPC table comes from the CCNA7_LS table. Since both the CCNSC_DPC and CCNA7_LS tables in the PH are built from static relations in the SM, the error lead will be hit for this PH since the data in this PH must be corrupted. (It is assumed that the static data is correct.) For outgoing ECIS6 MSUs, the NSC index that is used as the key into the CCNSC_DPC table comes from the buffer that was passed from call processing. Since the CCNSC_DPC table in the PH is built from the static relation RLNSC_DPC in the SM and the passed NSC index comes from the sl_group attribute of the static relation RLLAB6_PRT in the SM, it is assumed that the static data is correct and the data tables in the PH are corrupt. Therefore, the error lead for the PH is hit.

If this assert happens consistently, a verification of the ODD (relations RLLAB6_PRT and RLNSC_DPC) must be done. The MSU will be discarded since it is impossible to continue processing it.

153. PSECSM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was found in the CCNSC_SM table in the PH. The keys to the CCNSC_SM table are 1) the NSC index, 2) the band and 3) the band member. The NSC index comes from the CCNSC_DPC table in the PH. The band and band member come from the incoming MSU from the NSC. Since part of the key comes from the incoming MSU, the PH error lead will not be hit to remove the PH. If this assert happens consistently, a verification of the ODD for data between the 5ESS® and the NSC must be done. The band and band member assignments must be the same and if they are not, then this assert will fire. The remotely generated MSU will be discarded since it is impossible to continue processing it.

154. PSELINKAGE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Access link control block (ALCB) to logical channel control block (LCCB) linkages were incorrect.

155. PSENDPTINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid QLPS/QPH endpoint has been detected.

Probable Cause:

Unknown.

Action:

Unknown.

156. PSENOL3T (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

No level 3 timers are available to time a route request for an incoming, interswitch, packet-switched call or permanent virtual call (PVC). Timers are probably being used for something other than their intended use.

157. PSG_CAMPON (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The campon flag in the access link control block (ALCB) was enabled while processing level 3 data changes.

158. PSG_DATACHG (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Level 3 data changes for the group alerting circuit (GAC) were made while the access link control block (ALCB) was in the r1, r2, or r3 state. This is invalid for GAC. Level 3 data changes for GAC can only be made when the link is out of service.

159. PSG_LSTATE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid protocol state was found in a logical channel control block (LCCB) while processing a link procedure.

160. PSG_TIMINV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A timer for a link procedure was linked to the access link control block (ALCB), when it should have been canceled.

161. PSICHANTYPE (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The protocol handler (PH) channel type (phctype) was invalid.

162. PSINCON (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistent internal protocol (IP) protocol state was found. A call was queued when the IP protocol state was not NO.

163. PSINETERR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error condition has been detected by the 5ESS[®] switch TCP/IP platform.

Probable Cause:

In general, asserts are not expected out of the 5ESS® switch TCP/IP platform. Probable causes include provisioning or software errors. Data dumped as part of the assert include a 16-bit error type and additional supporting data. The error type values are enumerated in the sourcefile ps/PNinet/PNrepterr.h.

Action:

Forward assert report to 5ESS® switch TCP/IP platform development.

164. PSINVCALI (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid attribute value was found in a CAL_INFO entry.

Probable Cause:

Software problem or data corruption.

Action:

Provide data to next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

165. PSINVFAR_DATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Errors were found while accessing the failure adaptive routing (FAR) table in the protocol handler (PH). Either the FAR table un-initialized or invalid data was in the table.

166. PSINV_FUNC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid function was called based on the image (IACCPH or IGATEPH) that was loaded in the protocol handler (PH). A stub function in that image was called. Stub functions were added to the code as part of the protocol handler 2 (PH2) memory mining capability. This indicates a possible error, since stub functions should not be called.

167. PSINVIPHDR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The destination protocol handler (PH) field or the destination SM field of the internal protocol (IP) header was corrupted. The IP header is dumped.

168. PSINVIPT_DATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Errors were found while accessing the internal protocol (IP) trunk data function PSipt_mod() or PSnpsn_idx() in the protocol handler (PH). Either the table was not initialized or an invalid value was found.

169. PSINVLLCBIDX (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The LLCB index is out of range.

Probable Cause:

Invalid destination endpoint or network

Action:

None, return to the caller or continue processing next destination endpoint.

170. PSINV_MSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A unexpected message has been received. The content of message is dumped.

Data Structures:

None.

Action:

None.

171. PSINVPARM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid parameters were passed to a function.

172. PSINVPKT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A function that expects an X.25 call request packet was passed another type of packet. The packet is dumped to the ROP.

Probable Cause:

Software problem.

Action:

Provide ROP data to next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

173. PSINVPVMT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid CDMA internal message type was received in a PSPTPV_I packet.

Probable Cause:

Field incorrectly set by sending processor.

Action:

None.

174. PSINVQLNT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CCENDPT	Audit Mode: elev

Problem:

The retrieved destination endpoint's preferred network PSqlnetwork[] contains invalid state during the QPH message retrieval procedure.

Probable Cause:

By invalid destination in the QPH retrieval request message, or by invalid preferred network update in the QPH.

Action:

Start QLLCB audit, and continue processing the retrieval procedure for the next endpoint.

175. PSINVRATE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid (out-of-range) bandwidth (DSL rate) was encountered.

Probable Cause:

Corrupted data.

Action:

None.

176. PSIPD001 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected timer timeout occurred.

177. PSIPD002 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The internal protocol (IP) code failed to start a protocol timer. The call cannot continue because each packet services (PS) call requires at least one running timer.

178. PSIPD003 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The internal protocol (IP) code failed to cancel a protocol timer. The logical channel control block (LCCB) or the timing structure was corrupted. The call cannot continue because each packet services (PS) call requires at least one running timer.

179. PSIPD004 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The internal protocol (IP) code failed to restart a protocol timer. The call cannot continue because each packet services (PS) call requires at least one running timer.

180. PSIPD005 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The internal protocol (IP) code failed to restart a timer via the PSASTART() macro. Without a timer, the packet services (PS) call is lost.

181. PSIPHDRINV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PSp_dind() function received an unexpected processor ID. If the PSwrcv() function called this assert, a corrupted IP header was found. This occurs during or shortly after an SM initialization if inter-SM packet calls are attempted during an SM initialization.

After the protocol handlers (PHs) are initialized, the SM must update dynamic routing data in all PHs. If inter-SM packet calls are attempted before this update is complete, then uninitialized data was used to populate the IP header. The switch will correctly handle the corrupted packet through retransmissions while the PH dynamic data is updated.

If the SMs and their peripherals have been initialized and operating stably for several minutes, and this assert continues to fire, then an error condition has occurred that must be investigated.

182. PSIPV001 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The X.25 access capability (XAC) called the internal protocol (IP) code with a packet type that was inconsistent with the IP state.

183. PSIPV002 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The internal protocol (IP) code failed a to-from check with the access link control block (ALCB). The call was lost. The logical channel control block (LCCB) was implicated by the tracks variable.

184. PSIPV003 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The internal protocol (IP) code found an inconsistent retransmit queue in the logical channel control block (LCCB). The call was lost.

185. PSIPV004 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The internal protocol (IP) code found an inconsistent holding queue in the logical channel control block (LCCB). The call was lost.

186. PSIPV005 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The internal protocol (IP) code found a corrupted logical channel control block (LCCB). The call must be cleared.

187. PSIQBADIFD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During the process of updating the link access protocol D (LAPD) multiframe state variable V(A), the first internal frame descriptor (IFD) in the IFD queue (I-queue) had an invalid backward pointer.

188. PSISQPH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An OSDS message which is not a power-off message was received by the CCITT level 2 system process in a PH3 which is a QPH. The message will be dumped to the ROP.

189. PSKBADMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message or message type was received by the packet services (PS) automatic message accounting (AMA) billing process in the protocol handler (PH).

190. PSKBADPTRS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The pointers for storing billing information in the protocol handler (PH) billing buffer were corrupted.

191. PSKINVPOLL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid polling message was received from the SM.

192. PSKINVRATE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid packet services (PS) automatic message accounting (AMA) rate period value was received from the SM.

193. PSKINVRCD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid billing information was stored in the packet services (PS) automatic message accounting (AMA) billing buffer in the protocol handler (PH).

194. PSKINVRSN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The packet services (PS) automatic message accounting (AMA) billing process in the protocol handler (PH) was entered with an invalid start up reason.

195. PSKINVSGSZ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid packet services (PS) automatic message accounting (AMA) office segment size was received from the SM.

196. PSKSDERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in sending the packet services (PS) formatted billing records to the SM.

197. PSL2BADLNK (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The link pointer had unexpected, invalid information; that is, an invalid service access point identifier (SAPI) or terminal endpoint identifier (TEI).

198. PSL2CHANTYPE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The protocol handler (PH) channel type (phctype) was invalid.

199. PSL2NOLLCB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The channel was on, but no logical link control block (LLCB) was found when one was expected.

200. PSL2PARMINV (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid parameter was passed.

201. PSL2PROTOTYPE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The logical link control block (LLCB) was out of range, indicating that an invalid protocol was found.

202. PSL2PTCHECK (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The point-to/point-back check between the access link control block (ALCB) and logical link control block (LLCB) failed.

203. PSL2UNEXLNK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected link was found.

204. PSL3HCTE (5E11 to 5E12)

Recovery Action: spp	SPP: n	Audit: L3TL	Audit Mode: nonseg

Problem:

A check of the first and last headcells against the owner field of the timer elements indicated by the first or last headcell failed. This is a data inconsistency, an audit will be called to clean up the problem. The audit purges any structures listed in the tracks variables, a set of global parameters that indicate the logical link control block (LLCB), access link control block (ALCB), and logical channel control block (LCCB) that were used for this call.

205. PSLANDPX (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the PSwgetact() function, neither local area network (LAN) could initialize after a successful protocol handler (PH) data preserving (DP) switch.

206. PSLANFAIL (5E11 and later)

Recovery Action: psinit	SPP: n	Audit: null	Audit Mode: null

Problem:

During a protocol handler (PH) switch, the local area networks (LANs) did not initialize.

207. PSLCCBINVIDX (5E12 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A invalid LCCB index was found in a timeout function, where the LCCB index is stored in udata.

208. PSLCQBAD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: LCCB	Audit Mode: nonseg

Problem:

An error was found in the logical channel control block (LCCB) queue off the D-channel control block (DCCB). The LCCB audit is scheduled.

209. PS_LL2AL (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The point-to/point-back check from the logical link control block (LLCB) to the access link control block (ALCB) failed. The packet switching link will be re-initialized.

210. PSLLCBINVIDX (5E12 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A invalid LLCB index was found in a timeout function, where the LLCB index is stored in udata.

211. PSLLCBLKERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CCENDPT	Audit Mode: elev

Problem:

There are IFD in-window and/or out-window linkage errors in a LLCB.

Action:

Run demand audit AUCCENDPT.

212. PSLSSMERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Read error for CCITT6 static table, CClls_sm[]. Print the PSS6SU structure containing the current CCITT6 message and the return code from CCrdtup().

213. PSLNKLLCB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: LLCB	Audit Mode: nonseg

Problem:

The point-to/point-back check of a link access protocol D (LAPD) logical link control block (LLCB) found a corrupted linkage.

214. PSLNKRTDB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: RTDB	Audit Mode: nonseg

Problem:

The linkages of the routing data block (RTDB) at the head of the free list were out of range.

215. PSLPBK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal type of loopback request was received by QPHFR-PH.

216. PSLSBERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Read failure for CCITT6 dynamic table, CCIsb_ph[]. Print the PSS6SU structure containing the current CCITT6 message and the return code from CCrdtup().

217. PSMDBADPARM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A calling application to message delivery transport has passed an invalid parameter (either destination SM, PH or PH channel number) to one of it's service functions. The MSU is discarded.

Probable Cause:

The problem lies with the application that is attempting to send a MSU. It is calling the message delivery function with an invalid parameter.

Action:

The MSU and the asserting functions passed parameters, which includes the invalid parameter, will be dumped to the ROP. The function backtrace should be used to determine the calling application.

218. PSMDLPHERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Message delivery transport has been called to transmit a MSU, however the logical PH number of the PH it is executing on is out of range.

Probable Cause:

The calling application is executing on a standby PH, or the global data variable PSIpnum has been corrupted.

Action:

The MSU will be dumped to the ROP. The function backtrace should be used to determine the calling application.

219. PSMDRDERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A read to the message delivery PHDA table failed. Erroneous data returned or the read failed.

220. PSNA7STUB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The North American signaling system 7 (NA7) signaling traffic and route management (STRM) is stubbed out in the US loadline. In the US loadline, the generalized STRM is used for CCS7 signaling.

Probable Cause:

Data corruption or software bug.

Action:

Provide data to next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

221. PSNABADCALL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unexpected caller of the North American version of CCITT7 (CCS7) level 3 signaling message handling (SMH) outgoing routing function. The MSU is discarded.

222. PSNADYBUFF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency has been detected with the buffering flag in the North American version of CCITT7 (CCS7) dynamic data. The buffer flag is set in the DPC to link set table or loadsharing table for an MSU retrieved from the level 2 retransmission buffer. The MSU is discarded. A count of dynamic data errors is pegged.

223. PSNAECBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A locally generated North American version of CCITT7 (CCS7) embedded CCIS6 (ECIS6) MSU cannot be routed as there is no match for the DPC in the MSU in the CCS7 DPC to link set table. The MSU is discarded.

224. PSNAERWAIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unexpected return received from OSWAIT() by NA CCS7 level 3 signaling message handling system process.

225. PSNALS2SLC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Link set or signaling link code (SLC) obtained from the appended routing data of the locally generated MSU is out of range. The MSU is discarded.

226. PSNANMBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A locally generated North American version of CCITT7 (CCS7) signaling network management MSU cannot be routed as there is no match for the DPC in the MSU in the CCS7 DPC to link set table. The MSU is discarded.

227. PSNANOAPD2PH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Locally generated MSU cannot be routed as there is no match in the North American version of CCITT7 (CCS7) signaling link code (SLC) to STPH table for the appended routing data. The MSU is discarded.

228. PSNANODPC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A locally generated North American version of CCITT7 (CCS7) signaling network management MSU cannot be routed as there is no match for the DPC in the MSU in the CCS7 DPC to link set table. The MSU is discarded.

229. PSNANOLDSH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No entry in North American version of CCITT7 (CCS7) loadsharing table for the link set obtained from the CCS7 DPC to link set table. The MSU is discarded.

230. PSNANOSTPH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Either there is no entry or no available links in the North American version of CCITT7 (CCS7) signaling link code (SLC) to ST-PH table for the link set obtained from the CCS7 DPC to link set table. The MSU is discarded.

231. PSNAPHLS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No entry in the North American version of CCITT7 (CCS7) link set and member table for the logical PH number. The MSU is discarded.

232. PSNASCBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A locally generated North American version of CCITT7 (CCS7) signaling connection control part (SCCP) MSU cannot be routed as there is no match for the DPC in the MSU in the CCS7 DPC to link set table. The MSU is discarded.

233. PSNASMHRET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unexpected return code from a North American version of CCITT7 (CCS7) level 3 signaling message handling (SMH) function.

234. PSNASPREAS (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The North American version of CCITT7 (CCS7) signaling message handling (SMH) system process was entered for an unknown reason.

235. PSNAUNMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unexpected message is received by NA7 SMH system process.

236. PSNAURET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to read tuple from North American version of CCITT7 (CCS7) PHDA table due to unexpected failure return from PHDA read function. The MSU is discarded.

237. PSNETINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid QLPS/QPH network number has been detected.

Probable Cause:

Interface problem.

Action:

Correct the interface.

238. PSNOALDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A link change was requested on a user without a packet.

239. PSNOLLCB (5E11 and later)

Recovery Action: psinit	SPP: n	Audit: null	Audit Mode: null

Problem:

A request to allocate a link access protocol D (LAPD) logical link control block (LLCB) could not be served due to resource exhaust; that is, no resources were available. Recovery action is a protocol handler (PH) packet services (PS) initialization.

240. PSNOT3XX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to start a level 3 T3xx timer, but a NULL value was returned. This may have happened during a selective initialization, an audit will clean up the problem.

241. PSOCBADRET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from the Q931 message overload control function OCmsgovld().

242. PSPH2A_INV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid function was called in the protocol handler 2 (PH2) ACCESS image; that is, a stub function was called. This indicates a possible data and/or software error, since the stub function should not be called. This stub function was developed as part of the redefine PH2A feature content capability which removed all X.25 packet switching functionality from the PH2 ACCESS image.

243. PSPHAXER (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A hardware error occurred when activating a protocol handler (PH) in a PH data preserving switch.

244. PSPHDABAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This will indicate that PHDA encountered an unrecoverable error while attempting to read one of the following tables:

- 1) CCdpcls_ht[]
- 2) CCicpol_ht[]
- 3) CCicrtg_ht[]
- 4) CCogpol_ht[]
- 5) CColoind_ht[]
- 6) CCTrdpc_ht[]
- 7) CCTropc_ht[]

The PH error lead will be asserted via a SI macro. This assert had to be defined in the ps subsystem as it is called from a macro which is called from ps subroutines.

245. PSPHESER (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A hardware error occurred when attempting to bring up a protocol handler (PH) as a spare when escalating from a failed PH data preserving switch.

246. PSPKTBNB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Packet binding was initiated on an inappropriate channel or terminal endpoint identifier (TEI).

247. PSPPDBERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: rpi	SPP: n	Audit: PPDB	Audit Mode: elev

Problem:

A field of the PPDB was in error.

Probable Cause:

Inconsistent data.

Action:

Assert will schedule audit to run.

248. PPSUPATH (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unexpected data is received when operating on a PSU path request.

Data Structures:

MGPSUPATH message.

Action:

Possible data corruption in per port data that uses a PSUPATH.

249. PSQBADBCAST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

QPH Level 2 error - Bad broadcast packet received over a pipe.

Probable Cause:

Unknown.

Action:

Provide data to next level of support.

250. PSQBADMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid type OSDS message was received by QPHFR-PH. The message will be dumped to the ROP.

251. PSQBADRAM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Message received with incorrect destination. Destination not equal to this endpoint.

Probable Cause:

Implicates the distant-end's routing data.

Action:

None.

252. PSQBADSTIM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unexpected stimulus received by QPHFR-PH.

253. PSQINVDERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid error type received in PSql_erhldr().

Probable Cause:

Unknown.

Action:

Provide data to next level of support.

254. PSQLML2BLK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

QPHFR-PH received a loopback request with a bad current QLlmbd state of QLML2BLK.

255. PSQLMOOSL1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

QPHFR-PH received a loopback request with a bad current QLlmbd state of QLMOOSL1.

256. PSQLV2RESTR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Level 2 has been restarted on one of the QLLs.

Probable Cause:

One of the following error cases has been reported to PSql_erhldr():

SMQTXRETRY: Exceeded retry limit for RR frames.

SMQTINVPF: Frame received with incorrect P/F bit.

SMQTINVCR: Frame received with incorrect C/R bit.

SMQTUNKPKT: Frame received with unknown packet type.

SMQTUNKFRM: Frame received with unknown frame type.

SMQTINCPKT: Frame received with inconsistent frame/packet type.

SMQTRESTART: Far end requested level 2 restart.

SMQTUXPFRM: Unexpected frame type received.

SMQTUXPPKT: Unexpected packet type received.

SMQTUXPSEQ: Unexpected (but in range) sequence number received.

SMQTFRAMREJ: Frame reject (out of range sequence numbers).

Action:

Provide data to next level of support.

257. PSQPH1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An OSDS message was received by QPHFR-PH on a PH1. A PH1 cannot be a QPH and should not receive messages in QPHFR-PH. The message will be dumped to the ROP.

258. PSQPHLNKL3INV (5E14 and later)

Recovery Action: spp	SPP: n	Audit: QPHLNK	Audit Mode: nonseq

Problem:

A QPHLNK layer 3 range check fault occurred.

Probable Cause:

Either an invalid QPHLNK L3 state range or invalid networks states combination occurred.

Action:

Assert has scheduled the QPHLNK layer 3 audit to run.

259. PSQQUEFULL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

QLL IFD queue full.

Probable Cause:

Resource exhaustion due to IFDs not being returned, or performance max.

Action:

Provide data to next level of support.

260. PSQUNKENDPT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Attempt to talk to un-equipped/un-connected endpoint.

Probable Cause:

Dynamic routing data is corrupt.

Action:

None.

261. PSRBADVC (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The active virtual call (VC) count in the access link control block (ALCB) was greater than zero when the ALCB was requested to be returned to the free pool.

262. PSRESREC (5E11 and later)

Recovery Action: spp	SPP: n	Audit: LLCB	Audit Mode: nonseg

Problem:

An inconsistency was found in the internal frame descriptor (IFD) queue linked to the resource recovery list logical link control block (LLCB).

263. PSRIPKT_BPATH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An internal protocol (IP) routable packet [e.g., call request, permanent virtual call (PVC) setup, PVC migration, reconnect request] using an IP trunk, cannot be forwarded to the destination switch due to a network path problem.

This could be due to one of two events.

1. A looping condition; that is, a switch receiving an already transmitted packet.
2. A max hop count condition; that is, this packet traveled the maximum allowable hops and this switch is not the destination.

Action:

In case 1, the problem may be caused by incorrect office dependent data (ODD) in this switch.

These problems could be a symptom of IP network problems caused by poor network ODD design or incorrect network configuration. Network planners and designers must review the data provided by this event to rectify either the packet trunk ODD in the network switches involved, or the network configuration design.

264. PSRTDBHD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: PSHC	Audit Mode: nonseg

Problem:

A corrupt linkage was found in the routing data block (RTDB) headcell.

265. PSRUNTGUARD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

SCCP-CO FSM driver receives invalid messages while Tguard timer is running.

Data Structures:

PSINT_MSG: Whole message is dumped.

PScxn[cxn_idx] Whole connection entry.

Action:

If this happens several times in short period of time, call field support personnel.

266. PSSCBDCV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Bad conversion of ASCII dialed digits to binary. MSU is returned to user part.

267. PSSCBDMG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Internal error in message from DCIS6 interworking. MSU is discarded.

268. PSSCBDRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Bad return from PHDA primitive when accessing an SCCP table. The MSU is discarded.

269. PSSCBDTB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Inconsistency found in SCCP PH tables. The PH will be re-initialized.

270. PSSCBDYN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Bad return from PHDA primitive when accessing an SCCP table. An SCCP dynamic refresh is requested.

271. PSSCBUDT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An internal error encountered in formatting the SCCP UnitDaTA message.

272. PSSCBUPD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid action field in the SCCP update message (mgSCCPUPD) that was sent from SCCP management in the SMP to the PH(s).

273. PSSCPBADATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Out-of-range data read from SCCP static data table.

274. PSSCPBDMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected value was read while processing an SCCP message. This value may be the sccp type or the sccp state. The corrupted value and the message are dumped.

275. PSSCUDPC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An outgoing signaling connection control part (SCCP) MSU has been received in the MD PH from SCCP management. in the global SM. SCCP management has already determined the destination point code (DPC) for the MSU. If that DPC cannot be found in the MTP tables in the PH that list the known DPC's then this assert will fire. Either the MTP DPC tables are wrong or SCCP management is trying to send an MSU to an unknown destination.

276. PSSCUSN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A incoming MSU for CCS7 contains a signaling connection control part (SCCP) subsystem that is unknown at this office. If the return bit in the MSU is set, the MSU will be returned to the sending office, but this assert will alert craft at this office of a potential problem. Either some other office in the network is sending MSU's with unknown subsystems or the static SCCP data in the global SM at this office does not contain a needed SCCP subsystem.

277. PSSGATOUT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The protocol handler 3 (PH3) subgate code timed out while waiting for ownership of a channel queue.

278. PSSGCHFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected failure was returned to the PH application processor from an interface function with the IOP.

Probable Cause:

Unknown.

Action:

Repeated occurrence should cause escalation to PH init.

279. PSSGFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While powering on a Qpipe, one of the subgate functions, PSsgprof() or PSsgchon(), returned a failure code. The pipe will be powered back off.

280. PSSGITOUT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The protocol handler 3 (PH3) SPORT driver code timed out while waiting for ownership of a channel queue.

281. PSSGRFDBAD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: RFD	Audit Mode: nonseg

Problem:

A packet services (PS) subscriber gateway synchronous/asynchronous protocol data formatter (SPYDER) receive frame descriptor (RFD) error occurred. This indicates an RFD linkage error, a problem with the contents of an RFD, or both.

282. PSSGTFDBAD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: TFD	Audit Mode: nonseg

Problem:

A packet services (PS) subscriber gateway synchronous/asynchronous protocol data formatter (SPYDER) transmit frame descriptor (TFD) error occurred. This indicates a TFD linkage error, a problem with the contents of a TFD, or both.

283. PSSPYERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PSspyinth() function returned an unidentified error.

284. PST3BADHDC (5E11 to 5E12)

Recovery Action: spp	SPP: n	Audit: L3TL	Audit Mode: nonseg

Problem:

An invalid headcell was found on the layer 3 timing list.

285. PST3BADOWN (5E11 to 5E12)

Recovery Action: spp	SPP: n	Audit: L3TE	Audit Mode: nonseg

Problem:

An invalid list owner index was found in a layer 3 timing element.

286. PST3CTMBAD (5E11 to 5E12)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The current hi time indicator (a level 3 protocol current time indicator that runs as a 30 second incrementing timer) was out of range. The valid range is between PST3HISTART and PST3HIEND. The indicator serves as an index into the level 3 hi timing list headcells in the PST3head[] array.

287. PST3CTYPEBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A capability parameter was passed that was not recognized. This parameter defines the entry point that will be used to deliver a timer timeout.

288. PST3DELAYBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A level 3 timer delay that was larger than the code can handle was requested. The delay will be changed to "0", resulting in an immediate timeout.

289. PST3EXLL (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

While updating the level 3 lo timer list, circularly linked logical link control blocks (LLCBs) were encountered.

290. PST3EXTE (5E11 to 5E12)

Recovery Action: spp	SPP: n	Audit: L3TE	Audit Mode: nonseg

Problem:

Circularly linked level 3 timer elements were encountered while trying to increment the level 3 hi timer list.

291. PST3FLNKBAD (5E11 to 5E12)

Recovery Action: spp	SPP: n	Audit: L3TE	Audit Mode: nonseg

Problem:

An invalid linkage was found for a timer element. The timer element was the first element on the timer list. The linkage between the headcell and the timer element was incorrect.

292. PST3HLNKBAD (5E11 to 5E12)

Recovery Action: si	SPP: n	Audit: L3TL	Audit Mode: nonseg

Problem:

The headcell validation between the tail of the headcell and the timer element it was pointing to failed. The timer element did not think it was last on the list. An attempt will be made to rebuild the headcell. This error occurred during the check just before linking a new element to the end of one of the level 3 timer lists.

293. PST3L2CHK (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The point-to/point-back check of the access link control block (ALCB) to the logical channel control block (LCCB) found the linkage to be corrupted. This occurred during timeout processing.

294. PST3L3CHK (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The point-to/point-back check of the access link control block (ALCB) to the logical channel control block (LCCB) found the linkage to be corrupted. This occurred during timeout processing.

295. PST3LLNKBAD (5E11 to 5E12)

Recovery Action: spp	SPP: n	Audit: L3TE	Audit Mode: nonseg

Problem:

An invalid linkage was found for a level 3 timer element. The timer element was the last element on the timer list.

The linkage between the headcell and the timer element was incorrect.

296. PST3LOTIME (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When moving timer elements from the hi level 3 timer list to the lo level 3 timer list, the lo_offset was out of range.

297. PST3MBLNKBAD (5E11 to 5E12)

Recovery Action: spp	SPP: n	Audit: L3TE	Audit Mode: nonseq

Problem:

An invalid linkage was found for a level 3 timer element. The timer element was in the middle of the timer list. The incorrect linkage was in the backward linkage to the previous timer element.

298. PST3MFLNKBAD (5E11 to 5E12)

Recovery Action: spp	SPP: n	Audit: L3TE	Audit Mode: nonseq

Problem:

An invalid linkage was found for a level 3 timer element. The timer element was in the middle of the timer list. The incorrect linkage was in the forward linkage to the next timer element.

299. PST3OFLDBAD (5E11 to 5E12)

Recovery Action: spp	SPP: n	Audit: L3TL	Audit Mode: nonseq

Problem:

The timer element owner field did not match the owning list.

300. PST3PARMBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid index parameter was passed when requesting a level 3 timer or checking on level 3 timers. The parameter was for an access link control block (ALCB), logical channel control block (LCCB), or protocol handler (PH) wide timer index.

301. PST3RUNA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Layer 3 timers were not stopped prior to the application returning an access link control block (ALCB) to the free list.

302. PST3RUNL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Layer 3 timers were outstanding on a logical channel control block (LCCB) while the application was returning the LCCB to the free pool.

303. PST3TAGBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An out-of-range timer tag was passed in the function call. No timer element existed.

304. PST3TMRERR (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: PSTELEM	Audit Mode: elev

Problem:

Starting a T3 timer failed.

Probable Cause:

Lack of resources (timer resources exhausted).

Action:

Assert will schedule timer audit to run.

305. PST3TMRERR (5E11 to 5E12)

Recovery Action: rpi	SPP: n	Audit: L3TE	Audit Mode: elev

Problem:

Starting a T3 timer failed.

Probable Cause:

Lack of resources (timer resources exhausted).

Action:

Assert will schedule timer audit to run.

306. PST3TRUNBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The timer tag passed in either the PSt3_stop() or PSt3_restart() function call was not running or was not on the timeout list. The timer cannot be stopped or restarted.

307. PST3TTYEBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A level 3 timer type parameter was passed that was out of range.

308. PST3XXALCB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PSxt3xxstart() function received an access link control block (ALCB) index parameter that was NULL. The T3xx timer could not be started. An audit will check this timer later.

309. PST3XXLLCB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When the PSxtdtstart() function was preparing to start a T3xx timer, no logical link control block (LLCB) was found for the defined channel. This occurred during a selective initialization of the protocol handler (PH). An audit will correct the problem.

310. PST3XTMR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid level 3 timer was running when a T3xx timer should have been started. This may have happened during a selective initialization, an audit will clean up the problem.

311. PSTCCOPER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Transaction capabilities application part (TCAP) function PStcapog() has received a message and a message length from a calling MD function. PStcapog has copied the BDs into a buffer using function PSbd2blk(), but the copied length is different than the message length passed to PStcapog() as a parameter. The following data will be displayed:

Passed message length
Copied message length.

Action:

No action is required. This assert is for information purposes only.

312. PSTCINDBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An SCCP-TCAP interface function received an invalid indication type parameter.

Probable Cause:

The calling function passed an invalid indication type.

Action:

The indication type parameter is dumped to the ROP. This information should be used for debugging purposes.

313. PSTCMSEXC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Transaction capabilities application part (TCAP) has received a message on a PH, from a local application, whose length exceeds the maximum length allowed. The following local data will be dumped: Message type and a number to indicate where in the function the assert was called.

Action:

No action is required. This assert is for information purposes only.

314. PSTCUSSN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An SCCP-TCAP interface function received a subsystem number (SSN) that does not have an entry in the CCSCCPLSSN PHDA table.

Probable Cause:

No entry in PHDA table for a valid SSN, or an invalid SSN is present in the message passed to the SCCP-TCAP interface function.

Action:

The CCLSSN structure (which contains the SSN key) and the return code from CCrdtup() are dumped to the ROP. Check the validity of the SSN. If the SSN is valid, check if the SSN has a tuple in the rISSN_USER relation in the global SM (GSM).

315. PSTIMFLR (5E11 and later)

Recovery Action: psinit	SPP: n	Audit: null	Audit Mode: null

Problem:

A timer required by the link access protocol type D (LAPD) resource recovery list processing cannot be started. This should result in an internal initialization of the protocol handler (PH).

316. PSTOINJ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected capability type was received from the switching module processor (SMP).

317. PSUNEXLLCB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: LLCB	Audit Mode: nonseg

Problem:

An unexpected link access protocol D (LAPD) logical link control block (LLCB) index was found in the LLCB management control structures.

318. PSUNKNHSHPKT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert indicated that an unknown packet type was received. This assert should be followed by a data dump of the packet.

319. PSUNTMRTG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unexpected timer tag found in SMH system process Unknown timer expired

320. PSUNXPPFRM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A frame was unexpectedly delivered to the PH application processor (AP) for a CDMA packet pipe channel.

Probable Cause:

Unexpected Input/Output processor action.

Action:

AP code will attempt corrective action.

321. PSUNXPROC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PSp_dind() function received an unexpected processor ID. If the PSwrcv() function called this assert, a corrupted IP header was found. This occurs during or shortly after an SM initialization if inter-SM packet calls are attempted during an SM initialization.

After the protocol handlers (PHs) are initialized, the SM must update dynamic routing data in all PHs. If inter-SM packet calls are attempted before this update is complete, then uninitialized data was used to populate the IP header. The switch will correctly handle the corrupted packet through retransmissions while the PH dynamic data is updated.

If the SMs and their peripherals have been initialized and operating stably for several minutes, and this assert continues to fire, then an error condition has occurred that must be investigated.

322. PSVMRNG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The global data that contained the number of entries used by the automatic message accounting tracer (AMATRC) was corrupted. Since this data is globally accessible, another process probably wrote over it.

Action:

The global data will be reset.

323. PSWBDRSN (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid reason was received for creating the inter-SM protocol handler (ISMPH) alternate routing system process.

324. PSWBINVCXN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An n-connect-confirm primitive was received from SCCP with more than 128 bytes of user data.

Data Structures:

PSINT_MSG: Whole message is dumped.

PScxn[cxn_idx]: Entire connection entry.

Action:

None.

325. PSWBINVLEN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message was received by BSSAPI that had an incorrect length.

Data Structures:

DMUSHORT length: Length of packet received.

DMUSHORT length: Length of translated packet.

Action:

None.

326. PSWBINVMMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message was received by BSSAPI that contained unexpected data. This may have been an invalid paging request type, an invalid n-primitive type, or a message that was too long.

Data Structures:

PSWPHMSG or PSWSMMSG: whole message is dumped

Action:

None.

327. PSWINVDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was found by an inter-SM (ISM) function.

328. PSWINVMMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message was received by the inter-SM protocol handler (ISMPH) alternate routing system process.

329. PSWINV PARA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid parameter was passed to an inter-SM (ISM) function.

330. PSWOSWAIT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return was received from the inter-SM (ISM) function OSwait().

331. PSX_ACTION (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid action was received while processing a level 3 link procedure.

332. PSX_ALTIM (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to start a level 3 timer to process a link procedure, but the timer returned a null value. The packet link (P-link) will be purged.

333. PSX_ARETIM (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to restart a timer for a level 3 link procedure. The link will be purged since link procedures depend on the timer being started.

334. PSX_ATYPE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid R state was found in the access link control block (ALCB) while processing the level 3 X.25 access capability (XAC).

335. PSX_BADTDOWN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A link teardown was in progress. The user data type PSXT_CHANRMV was received while the state was not R2 or R4.

336. PSX_INMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message was received from the switching module processor (SMP).

337. PSX_INVACT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The X.25 access capability (XAC) encountered an invalid "action to take" value from the PSxrchk_state or PSxschk_state tables. This occurred in the PSxnot() function or the PSxsnot() function.

338. PSX_INVUD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PSxltimout() function received invalid user data.

339. PSX_LCTIM (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to start a level 3 timer for a logical channel control block (LCCB) during level 3 processing.

340. PSX_LSTATE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid protocol state was found in the protstate field of the logical channel control block (LCCB) while processing a logical channel.

341. PSX_MSGER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The X.25 access capability (XAC) attempted to send a message using the PSsendmsg() function, but PSsendmsg() returned PSERROR. The processing will complete.

342. PSX_NOHUNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A flag in the write protect data stored in the protocol handler (PH) states that this is a multi-line hunt group (MLHG) link; however, there are no huntable logical channel ranges. Huntable ranges are from the low one way incoming channel range to the high two way logical channel range. There were no logical channel ranges for either one way or two way channels.

343. PSX_PMD_ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PSi2thrsd.x75pmd numbering plan mode of operation parameter was not equal to any of the valid enumerations for this parameter.

344. PSX_PT2BK (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The point-to/point-back linkage check between the logical channel control block (LCCB) and the access link control block (ALCB) failed during level 3 processing in the X.25 access capability (XAC).

345. PSX_PTYP (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The X.25 access capability (XAC) received an invalid packet type from the data terminating equipment (DTE).

346. PSX_PVCERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The database relational data for a permanent virtual circuit (PVC) disagreed at the local and remote ends of the circuit.

Note: This assert may be triggered if an existing PVC is being reconfigured via RC/V (or ODBE). The interlude between updating one end of the PVC and the other end may cause a temporary inconsistency. No action is required.

Data Structures:

RLPSPVCINF. Key fields: ph_number, ph_cn, party, local_lcn, rmt_dn.dn

Action:

Using the information printed on the receive only printer (ROP), use RC/V (or ODBE, if necessary) to access View 23.11 (DSL PACKET SWITCHING PVC LCN ASSIGNMENT). This view provides the PVC information for the local end of the PVC and the remote end, if it is on the same switch. If the remote end is on another switch, then the information must be obtained from maintenance personnel at the other switch.

Compare the data items from the local end of the PVC with those from the remote end to determine the inconsistency. Correct the data as appropriate.

347. PSX_QDNULL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A buffer descriptor (BD) offset was expected to be chained to the logical channel control block (LCCB) or the access link control block (ALCB). However, no BD offset link was found while processing a logical channel.

348. PSX_R1BDATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The user data type PSXT_RENTRY was received in the R1 state. PSXT_RENTRY is invalid for this state.

349. PSXRCVBADTPC (5E11 and later)

Recovery Action: spp	SPP: n	Audit: ALCB	Audit Mode: nonseg

Problem:

A value was out of range in the logical channel control block (LCCB). This value represented the receiving throughput for the call, and is used to calculate the MCT receive sum. The access link control block (ALCB) audit is scheduled to recalculate the MCT sums.

350. PSX_RPT2BK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While processing logical channels on a link, a logical channel control block (LCCB) that does not point back to the access link control block (ALCB) was found. Processing continues after nulling the slot in the ALCB.

351. PSXRQTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A MGL3CHGL message was received with a req_type that was not allowed for this action.

352. PSX_RSTBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

User data in the timeout function PSXltimeout() specified that a restart indication needs to be sent. This user data type is invalid if the state is not R0 or R2.

353. PSXSNDDBADTPC (5E11 and later)

Recovery Action: spp	SPP: n	Audit: ALCB	Audit Mode: nonseg

Problem:

A value was out of range in the logical channel control block (LCCB). This value is used to calculate the MCT send sum value. The access link control block (ALCB) audit is scheduled to recalculate the MCT send values.

354. PSX_UDINV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid user data was received when the link was valid and teardown was not in process.

355. PSX_USERD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

User data was received after a timeout that does not agree with the state of the link. A timer should have been cancelled.

356. PSZATALCBERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message was received with an invalid protocol handler (PH) channel number, or the access link control block (ALCB) does not exist. This occurred in the packet switch modem call processing (PSMCP) function PSxmp_atear() when the analog call in the modem pooling call pair was torn down and the X.25 access capability (XAC) received a tear down expected message.

357. PSZBLALCBERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The packet switch modem call processing (PSMCP) function PSxmp_bldn() received an invalid protocol handler (PH) channel number in a message, or the access link control block (ALCB) does not exist.

358. PSZBLMSGERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The packet switch modem call processing (PSMCP) function PSxmp_bldn() received a PSERROR return code from the PSsendmsg() function. PSERROR indicates that the message could not be sent due to a user input error.

359. PSZDTMSGERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The packet switch modem call processing (PSMCP) function PSxmp_dtear() received a PSERROR return code from the PSsendmsg() function. PSERROR indicates that the message could not be sent due to a user input error.

360. PVADTERR (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An operational error has been encountered by an *AUTOPLEX*[®] data trunk.

Data Structures:

None.

Action:

Underlying PHV hardware may be suspect. Repeated failures require diagnostic on PHV board on which the trunk resides.

361. PVCSEENTRY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The virtual finite state machine (VFSM) context switching function has been entered a second time for the current function stack. This is a software error.

Probable Cause:

Software error.

Action:

Provide data to next level of support.

362. PVENVFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A virtual finite state machine (VFSM) environment set up function failed. The queued event will not be able to be processed.

Probable Cause:

Either software error or data corruption.

Action:

Provide data to next level of support.

363. PVERRVOC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A code division multiple access (CDMA) vocoder error has been detected during normal CDMA SH operations.

Data Structures:

None.

Action:

Repeated errors result in fault recovery actions being taken on the vocoder and on the underlying PHV hardware.

364. PVINVEVENT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid or unknown virtual finite state machine (VFSM) event was passed to a VFSM input mapper function.

Probable Cause:

Software error.

Action:

Provide data to next level of support.

365. PVINVINPUT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid or unexpected input (i.e. event) was received by a virtual finite state machine (VFSM).

Probable Cause:

Software error or race condition.

Action:

Provide data to next level of support.

366. PVINVOUTPUT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid or unexpected output (i.e. selector) was passed to a virtual finite state machine (VFSM) output function.

Probable Cause:

Software error.

Action:

Provide data to next level of support.

367. PVINVTMRTYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid timer type was passed to a timer expiration processing function.

Probable Cause:

Software error or timer list corruption.

Action:

Provide data to next level of support.

368. PVINVVFSM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid virtual finite state machine (VFSM) name was passed to the VFSM context switching functionality.

Probable Cause:

Software error.

Action:

Provide data to next level of support.

369. PVQUEFULL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The virtual finite state machine (VFSM) context switching queue is full.

Probable Cause:

Queue size incorrectly engineered during software development.

Action:

Provide data to next level of support.

370. PVTMRFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to start a PSutime timer failed.

Probable Cause:

Timer data corruption or resource shortage.

Action:

Provide data to next level of support.

371. PVUNEXDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected input or data item has been encountered when processing code division multiple access (CDMA) voice or signaling information.

Probable Cause:

Software problem or PHV vocoder hardware problem.

Action:

No direct craft action - escalate to appropriate support personnel.

372. PVUNXTMREXP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A virtual finite state machine (VFSM) received an unexpected timer expiration.

Probable Cause:

Software error or timer list corruption.

Action:

Provide data to next level of support.

373. PVVFSMFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failure has occurred during virtual finite state machine (VFSM) processing. Call to the VFSM interpreter has returned failure.

Probable Cause:

Either data corruption or software error.

Action:

Provide data to next level of support.

Range: pspi**1. PSBADFFU (5E11 and later)**

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The available space in the packet interface (PI) to switching module processor (SMP) first-in first-out (FIFO) queue or the SMP to PI FIFO queue of the PI is out of range.

2. PSF2MNYPKTS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PSfcntpkt() function found an impossible number of packets in the switching module processor (SMP) to packet interface (PI) first-in first-out (FIFO) queue.

3. PSFCNTBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A packet was found in the switching module processor (SMP) to packet interface (PI) first-in first-out (FIFO) queue with an invalid word count field in the FIFO header.

4. PSFLAGBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A packet was found in the switching module processor (SMP) to packet interface (PI) first-in first-out (FIFO) queue with an error flag field in the FIFO header.

5. PSFLASTLOOK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While verifying the packet interface (PI) to switching module processor (SMP) first-in first-out (FIFO) queue, the "last look" variable had an out of range value. This is presumably due to a wild write since the code that updates the variable writes only values that were verified to be within range.

6. PSFROFFBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

One or both of the offsets into the switching module processor (SMP) to packet interface (PI) first-in first-out (FIFO) queue were out of range.

7. PSFTOFFBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

One or both of the offsets into the packet interface (PI) to SM first-in first-out (FIFO) queue were out of range.

8. PSFTOOBIG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to write a packet into the packet interface (PI) to switching module processor (SMP) first-in first-out (FIFO) queue; the packet was larger than the maximum allowed.

9. PSLCBLBAD (5E11 and later)

Recovery Action: psinit	SPP: n	Audit: null	Audit Mode: null

Problem:

In recovering complete commands, the PSICmdrcvy() function detected that end of list checks failed.

10. PSLONGCBL (5E11 and later)

Recovery Action: psinit	SPP: n	Audit: null	Audit Mode: null

Problem:

The PSICmdrcvy() function detected that the command block list (CBL) is looped or otherwise corrupted.

11. PSPBDLST (5E11 and later)

Recovery Action: psinit	SPP: n	Audit: null	Audit Mode: null

Problem:

The buffer descriptor resources in the packet interface (PI) supporting the pump of one or more protocol handlers (PHs) are lost. An internal initialization of the PI is needed to recover.

12. PSPBLKSZ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The size of the pump text block used in the packet interface (PI) pump of one or more protocol handlers (PHs) is less than 64K. A request was made to send a pump text frame with a size greater than or equal to 64K.

Range: pspp**1. PSATMHWFAIL (5E11 and later)**

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Software timed out PHA ATM-complex hardware.

Probable Cause:

Software timer may be too short or there may be a hardware problem.

Action:

This assert should ultimately be replaced with a fault recovery action. In the early stages of development, this assert is being used to ensure that hardware failures are reported.

2. PSBADACTPB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the PSlactpb() function, the current value for the active packet bus is inconsistent with the data transport (DT) packet bus status. The PSlactpb() value will be changed to match the DT status.

3. PSBADARG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A request to allocate an invalid number of general purpose (GP) buffer descriptors (BDs) was made. A null offset was returned to the caller.

4. PSBADBDU (5E11 and later)

Recovery Action: spp	SPP: n	Audit: BD	Audit Mode: nonseg

Problem:

The count of the number of buffer descriptors (BDs) in the general purpose (GP) or the synchronous/asynchronous protocol data formatter (SPYDER) BD free list is out of range.

5. PSBADHDC (5E11 and later)

Recovery Action: spp	SPP: n	Audit: PSHC	Audit Mode: nonseg

Problem:

A defensive check failure occurred that involved the headcell of a packet services (PS) resource.

6. PSBADIFD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: IFD	Audit Mode: nonseg

Problem:

Invalid data was found in a protocol handler (PH) or packet interface (PI) internal frame descriptor (IFD). An IFD audit is called in the packet switching PH; otherwise a PSINIT recovery action is taken.

7. PSBADPBCB (5E12 and later)

Recovery Action: spp	SPP: n	Audit: PBCB	Audit Mode: nonseg

Problem:

An invalid field was found in the packet bus control block (PBCB). This causes a single process purge.

Probable Cause:

Unknown.

Action:

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

8. PSBADSTATE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid protocol state was found in the logical link control block (LLCB). This causes a single process purge.

9. PSBADVPI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid VPI value was passed to a function.

Probable Cause:

Software bug.

Action:

Seek technical support.

10. PSBDCASLOOP (5E11 and later)

Recovery Action: spp	SPP: n	Audit: BD	Audit Mode: nonseg

Problem:

The protocol handler 3 (PH3) application processor (AP) cannot update memory that is shared by the PH3's input/output processor (IOP).

11. PSBDCH2L (5E11 and later)

Recovery Action: spp	SPP: n	Audit: BD	Audit Mode: nonseg

Problem:

A buffer descriptor chain length that exceeded the maximum length expected was encountered in the protocol handler (PH) or packet interface (PI).

12. PSBDGONE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The calling function requested more buffer descriptors (BDs) than are available on the general purpose (GP) BD free list.

13. PSBIXIFD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid protocol handler (PH)/packet interface (PI) internal frame descriptor index was passed.

14. PSCPERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The copy routines detected an internal error during a copy.

15. PSIFDLNK (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Packet bus (PB) internal frame descriptor (IFD) links were corrupted. This causes a single process purge.

16. PSIFDOOR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An internal frame descriptor (IFD) key is out of range. This causes a single process purge.

17. PSINTJOS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An interject received an unexpected return from an operating system for distributed switching (OSDS) primitive.

18. PSINVCOMB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

During protocol processing, an invalid state/event combination was detected by the general frame processing routine. Recovery action is a single process purge.

19. PSINVIDX (5E12 and later)

Recovery Action: spp	SPP: n	Audit: PSTELEM	Audit Mode: nonseg

Problem:

An invalid timer index for an ALCB or LCCB timer array has been found. This causes a single process purge.

Probable Cause:

A timer was started with an invalid timer index.

Action:

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

20. PSINVSEQ (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

During protocol processing, an invalid sequence table value was found in the general frame processing routine. Recovery action is a single process purge.

21. PSINVTIDX (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Attempting to restart a timer, but the timer index is out of range.

22. PSL2HCLLCB (5E13 and later)

Recovery Action: spp	SPP: n	Audit: LLCB	Audit Mode: nonseq

Problem:

Either the first or last entry on the timing headcell (includes the timeout headcell) was found to be in error. The logical link control block (LLCB) indicated by the headcell, and the owner field in the LLCB do not agree. The LLCB will be purged. This error indicates a data inconsistency between the headcell and the LLCBs it is pointing to.

23. PSL2HCLLCB (5E11 to 5E12)

Recovery Action: spp	SPP: n	Audit: L2TL	Audit Mode: nonseq

Problem:

Either the first or last entry on the timing headcell (includes the timeout headcell) was found to be in error. The logical link control block (LLCB) indicated by the headcell, and the owner field in the LLCB do not agree. The LLCB will be purged. This error indicates a data inconsistency between the headcell and the LLCBs it is pointing to.

24. PSLANCRPT (5E11 and later)

Recovery Action: psinit	SPP: n	Audit: null	Audit Mode: null

Problem:

The local area network (LAN) command list links were corrupted.

25. PSLANLNGFRM (5E13 and later)

Recovery Action: psinit	SPP: n	Audit: null	Audit Mode: null

Problem:

A frame was received over the packet bus that that was too long for the receiving processor.

26. PSLANRBDSTART (5E11 and later)

Recovery Action: psinit	SPP: n	Audit: null	Audit Mode: null

Problem:

The element in the PSrbdstart[] array for a local area network (LAN) was corrupted. This array contains one element per LAN, the element normally holds the offset of the first receive buffer descriptor (RBD) in a LAN's RBD pool.

27. PSLINVPARM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid parameter was passed to a function.

28. PSLLCBPTR (5E12 and later)

Recovery Action: spp	SPP: n	Audit: LLCB	Audit Mode: nonseg

Problem:

The logical link control block linkages were corrupted, a demand audit will rebuild the linkages.

29. PSLNKIFD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: IFD	Audit Mode: nonseg

Problem:

An incorrect linkage between the protocol handler (PH)/packet interface (PI) internal frame descriptors was detected.

30. PSLNOTXCMD (5E11 and later)

Recovery Action: psinit	SPP: n	Audit: null	Audit Mode: null

Problem:

Temporarily, there are no available local area network (LAN) transmit command blocks. This could indicate a stuck control fanout (CF) arbiter.

31. PSLPCASSERT (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error condition was detected by the large packet connection mechanism which is used to send large packets between the SMP and its PSU and among PHs within a PSU.

Probable Cause:

The error can be caused by a number of conditions. This assert is intended only to document the error occurrence. This assert dumps an error type the values of which are as follows:

ERROR TYPE SYMBOL	ERROR TYPE VALUE
PSLPCBADARG	1
PSLPCCORRUPTEDDATA	2
PSLPCINVALIDSTATE	3
PSLPCUNEXPECTEDINPUT	4
PSLPCSNDSMSGFAILURE	5
PSLPCOSTIMERFAILURE	6
PSLPCNOTPI2ERROR	7
PSLPCPIMOVEFAILURE	8
PSLPCALIGNERROR	9
PSLPCSIZEERROR	10
PSLPCARBITERERROR	11
PSLPCCDTNOTAVAILABLE	12

Action:

Forward information to protocols subsystem (PS) software development.

32. PSLPIBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The logical packet interface (PI) number in the PSIpnum global variable was corrupted. The PI will be re-initialized via a packet services (PS) initialization. The symptoms of this problem are:

- no dial tone and unable to originate integrated services digital network (ISDN) calls
- inter-SM (ISM) nailup ports dropping out of service (OOS) due to level 2 errors
- some digital subscriber lines (DSLs) reporting OOS DSLINIT
- unable to restore lines that are OOS DSLINIT

Action:

If these symptoms continue after this assert fires, the craft person should perform a module controller/time slot interchange (MCTSI) switch.

33. PS�RFDBAD (5E11 and later)

Recovery Action: psinit	SPP: n	Audit: null	Audit Mode: null

Problem:

The circular list of receive frame descriptors used by the local area networks (LANs) was corrupted.

34. PSŁTFDBAD (5E11 and later)

Recovery Action: psinit	SPP: n	Audit: null	Audit Mode: null

Problem:

The circular list of transmit frame descriptors used by the local area networks (LANs) was corrupted. A PSINIT recovery action is taken.

35. PSŁTIMEOUT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected timer timeout occurred while waiting for the local area network's (LAN) command to be acknowledged or executed by the input/output processor (IOP).

36. PSNOGPBD (5E11 and later)

Recovery Action: psinit	SPP: n	Audit: null	Audit Mode: null

Problem:

An exhaust of general purpose (GP) buffer descriptors (BDs) was detected in the protocol handler (PH) or packet interface (PI). A PSINIT recovery action will be triggered.

37. PSNOIFD (5E11 and later)

Recovery Action: psinit	SPP: n	Audit: null	Audit Mode: null

Problem:

An exhaust of internal frame descriptors was detected in the protocol handler (PH) or packet interface (PI). A PSINIT recovery action is required.

38. PSOWNIFD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: IFD	Audit Mode: nonseg

Problem:

An invalid owner field of a protocol handler (PH)/packet interface (PI) internal frame descriptor was found.

39. PSP8TTYTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid packet bus (PB) timer type was found. It will be set to null, and processing will continue.

40. PSPBTIMRUN (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PSPBCB is about to be reinitialized and a timer has been found running.

41. PSPKTERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid packet type was received on the packet bus.

42. PSSWABMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No swabbing vector was found for an input message ID.

43. PSSWCPY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An internal swabbing error occurred.

44. PSTBADHDC (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid or inconsistent linkage data was encountered during execution of a general purpose timing primitive in a timer headcell.

Probable Cause:

Unknown software bug.

Action:

If this occurs often, seek technical support.

45. PSTBADOWNER (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A invalid or inconsistent headcell owner was encountered by one of the general purpose timing primitives.

Probable Cause:

Software bug.

Action:

If seen often, seek technical support.

46. PSTBADTE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid or inconsistent data was found in a general purpose timer element by general purpose timers.

Probable Cause:

Unknown software bug.

Action:

If this occurs often see technical support.

47. PSTEXLLCB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: LLCB	Audit Mode: nonseg

Problem:

A circular linked logical link control block (LLCB) list was found on timing. The timer audit is called to repair linkages.

48. PSTHCERR (5E11 to 5E12)

Recovery Action: spp	SPP: n	Audit: LLCB	Audit Mode: nonseg

Problem:

The protocol timing headcells were corrupted, a demand audit will rebuild the timing lists.

49. PSTIMCRPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The current time of the protocol timers was corrupted; the time was reset to 0.

50. PSTINPUT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Illegal input or an invalid logical link control block (LLCB) was given to level 2 protocol timers in the protocol handler (PH).

51. PSTRANFRM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error return was received when transmitting on the local area network (LAN).

52. PSUNEXIFD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: IFD	Audit Mode: nonseg

Problem:

A valid but unexpected protocol handler (PH)/packet interface (PI) internal frame descriptor index was found.

53. PSUNEXOFF (5E11 and later)

Recovery Action: spp	SPP: n	Audit: BD	Audit Mode: nonseg

Problem:

An unexpected or out of range buffer descriptor offset was encountered in the protocol handler (PH) or packet interface (PI). A PSINIT recovery action should be initiated unless the buffer descriptor (BD) demand audit is available in the processor.

54. PSUNEXRC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return code from a called function was found.

55. PSUTIMRUN (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Attempting to start a protocol timer, but found a timer already running, therefore the timer could not be started.

Range: rc**1. RCACSRCORPT (5E11 and later)**

Recovery Action: rpi	SPP: n	Audit: RCACSRQ	Audit Mode: elev

Problem:

Data corruption occurred in the dynamic global data structure RCacsr_jobs or in the dynamic relation RLACSR_QC. Elevated audits will be run to correct the data.

2. RCDBERR1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Database (DB) transaction errors occurred when DB primitives were used to read, insert, or update static relations.

3. RCDBERR2 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Database (DB) data errors occurred when DB primitives were used to read, insert, or update static or dynamic relations.

4. RCINTERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The recent change (RC) system detected an internal system error.

5. RCOSERROR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Operating system (OS) errors occurred when sending and receiving messages from other processes.

6. RCOSREASON (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During automatic customer station rearrangement (ACSR) initialization, the operating system for distributed switching (OSDS) process was given an invalid initialization reason.

Range: rita**1. RIAGACDPOSDB (5E11 and later)**

Recovery Action: rpi	SPP: n	Audit: ACDPOSDB	Audit Mode: elev

Problem:

The agent_id attribute in an rIACDPOSDB tuple was used as the key to read the RAGENTID relation, but the RAGENTID tuple was not found. The agent_id attribute in the rIACDPOSDB tuple must have been corrupted, causing this problem. The RLACDPOSDB audit is scheduled to correct the problem.

Probable Cause:

The rIACDPOSDB.agent_id attribute has been corrupted.

Action:

Run the RLACDPOSDB audit to clean up the dynamic data.

2. RIAUACDPOSDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ACDPOSDB	Audit Mode: elev

Problem:

Some attributes in an rIACDPOSDB tuple were corrupted, causing this problem. The RLACDPOSDB audit is scheduled to correct the invalid data.

3. RIAUAPDU (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: APDU	Audit Mode: elev

Problem:

Error occurred while accessing rIAPDU tuple.

4. RIAUBRCSDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BRCSDB	Audit Mode: elev

Problem:

A failure occurred that is related to the business and business and residential custom services (BRCS) data block (BRCSDB). The following BRCSDB related events indicate where the problem may have occurred.

1. Unable to remove the BRCSDB from the idle list. [DArhhcbr()]
2. Unable to link the BRCSDB to the D channel application linkage block (DALB). [DAIbrda()]
3. Unable to get a pointer to the BRCSDB.
4. Unable to unlink the BRCSDB from the DALB. [DAubrda()]
5. Unable to put the BRCSDB back on the idle list. [DAahhcbr()]

5. RIAUDALB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

An error occurred while accessing an rIDALB tuple.

6. RIAUDISPDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DISPDB	Audit Mode: elev

Problem:

A failure occurred that is related to the display data block (DISPDB). The following DISPDB related events indicate where the problem may have occurred.

1. Unable to remove the DISPDB from the idle list. [DArhcdi()]
2. Unable to link the DISPDB to the BRCS data block (BRCSDB). [DAIbrdi()]
3. Unable to get a pointer to the DISPDB.
4. Unable to unlink the DISPDB from the BRCSDB. [DAubrdi()]
5. Unable to put the DISPDB back on the idle list. [DAahhcbi()]

7. RIAUDPB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DPB	Audit Mode: elev

Problem:

An error occurred while accessing an rIDPB tuple.

8. RIAULTMSTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LTMSTAT	Audit Mode: elev

Problem:

A failure occurred while accessing the RLLTMSTAT relation, or corrupted data was detected in the dynamic data structure.

9. RIAUNONE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This is the general rita assert that schedules no audits.

10. RIAUPCBLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

An error occurred that is related to the dynamic data relation RLPCBLA.

11. RIAUORTLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

An error occurred that is related to the dynamic data relation RLPORTLA.

12. RIAUTEDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TEDB	Audit Mode: elev

Problem:

A failure occurred while accessing the relation RLTEDB. Unable to get a pointer to the rITEDB tuple or, for standard interfaces, an inconsistency in the contents of the call position counters/limits or ekts field in the rITEDB tuple was discovered. The terminal equipment data block (TEDB) audit is triggered to reconstruct these fields from the rIIS_LINE tuple or from the calls active on the TEDB.

13. RIAUTEILA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TEILA	Audit Mode: elev

Problem:

An error was found while accessing the RLTEILA relation.

14. RIBADARG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This is a general purpose assert indicating that a function was called with an invalid argument.

15. RIBFGPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A macro called to retrieve a portname has failed to successfully read either FC_PORTTYP or CKT_PORT. This is a database inconsistency - contact your next level of support.

16. RIBIP_SC_INV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Non-initializing terminal (NIT) binding [directory number (DN), service capability (SC)] for a previously base initializing protocol (BIP) bound terminal failed because an invalid service order profile (SOP) capability was requested.

17. RIBREQ_INV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The requested service for B-channel use was invalid.

18. RIBRGAFail (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ACDPOSDB	Audit Mode: elev

Problem: The PHsil2dplx() function was called to apply the observer bridge to target port, but it returned a PCBRGFAIL error code and the monitoring bridge terminal process (MBTP) pid is corrupted. The bridge could not be applied and the message to MBTP was not sent, but the call can continue.

Data Structures:

The first data dump of this assert is the process control block link area (PCBLA) structure of the target position to which monitor bridge application was attempted. The second data dump is the MBTP ID (4 bytes).

Action:

The ACDPOSDB audit is scheduled to correct any inconsistent data in the target position data block.

19. RIBRGFAILL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ACDPOSDB	Audit Mode: elev

Problem: The PHdplx2sil() function returned a PCBRGFAIL error code. It failed to lift a previously applied observer bridge and also the monitoring bridge terminal process (MBTP) pid was corrupted.

Data Structures:

The first data dump of this assert is the process control block link area (PCBLA) of the process for which the attempt to lift monitor bridge failed. The second data dump of this assert is the MBTP pid (4 bytes).

Action:

The ACDPOSDB audit is scheduled to correct any inconsistent data.

20. RIBRGLFAIL (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: ACDPOSDB	Audit Mode: elev

Problem: The PHdplx2sil() function failed to lift the bridge. The call cannot be returned to its original state.

Action:

The process owning the port from which the bridge was to be lifted is purged and the ACDPOSDB is requested to correct inconsistent data.

21. RIBSEL_INV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid B-channel selection parameter was used when making busy/idle all circuit switched voice (CSV) and circuit switched data (CSD) hunt members on the digital subscriber line (DSL) when the DSL became blocked or unblocked.

22. RIB_SOP_INV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A base initializing protocol (BIP) bind request for a previously bound terminal endpoint identifier linkage area (TEILA) failed because an invalid service order profile (SOP) capability was requested.

23. RICHK_SC_INV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A check of the service order profile (SOP) capability failed due to an invalid input value.

24. RICRPT_DATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An automatic customer station rearrangement (ACSR) move was completed; but cross checks of data indicate that data was corrupted during the move.

25. RICVSTATE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STATE	Audit Mode: elev

Problem:

Failed to link an RLCV_STATE tuple to the busy/idle list, unlink an RLCV_STATE tuple from the busy/idle list or traverse the busy/idle list.

Probable Cause:

Data corruption.

Action:

The RLCV_STATE key (cvstnmb) will be printed on the ROP and the AUCV_STATE audit will be scheduled to run. This is a returning assert and it is assumed that the software calling it can recover.

26. RIDESTROY (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

This assert is used to destroy processes.

27. RIDN_FEATS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLDN_FEATS relation, a failure return code of DBNO_MATCH was received. This indicates that the tuple is missing, or that the keys used to read this relation were not set properly.

Data Structures:

RLDN_FEATS. Key fields: lead_module (first data item dumped), ltm_type (second data item dumped), ltm_idx (third data item dumped)

Action:

This is a database inconsistency that can only be corrected by manual action.

28. RIDN_LPT (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the virtual RLDNLPT relation, a failure return code of DBNO_MATCH was received. Either the static rIDN_LPT tuple (RLDN_LPT is the storage relation for RLDNLPT) is missing, or the keys used to read this relation were not set properly.

Data Structures:

RLDNLPT. Key fields: dnlpt.locdn (first data item dumped), dnlpt.lpt_type (second data item dumped), dnlpt.lpt_styp (third data item dumped).

Action:

This is a database inconsistency that can only be corrected by manual action.

Using ODBE, verify the keys used to read rIDNLPT using the data dumped as the keys to the relation. If the tuple in rIDN_LPT is missing, insert it. Otherwise, the keys used to access the relation must have been set incorrectly, so notify the next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of

the Asserts manual for information on contacting technical support.

29. RIDN_LPT (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLDN_LPT relation, a failure return code of DBNO_MATCH was received. The rLDN_LPT tuple is missing, or the keys used to read this relation were not set properly.

Data Structures:

RLDN_LPT. Key fields: dn_lpt.epdn (first data item dumped), dn_lpt.lpt_type (second data item dumped), dn_lpt.lpt_styp (third data item dumped).

Action:

This is a database inconsistency that can only be corrected by manual action.

30. RIDSLEQUIP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLDSLEQUIP relation, a failure return code of DBNO_MATCH was received. This indicates that the tuple is missing, or that the keys used to read this relation were not set properly.

Data Structures:

RLDSLEQUIP. Key field: dsl.

Action:

This is a database inconsistency that can only be corrected by manual action.

31. RIEDSLDCHN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLEDSDCHN relation, a failure return code of DBNO_MATCH was received. This indicates that the tuple is missing, or that the keys used to read this relation were not set properly.

Data Structures:

RLEDSDCHN. Key field: dport.

Action:

This is a database inconsistency that can only be corrected by manual action.

32. RIFAILBRGA (5E11 and later)

Recovery Action: spp	SPP: n	Audit: ACDPOSDB	Audit Mode: elev

Problem: The PHsil2dplx() function was called to apply the observer bridge at the target port, but it returned a PCFAIL error code. Corrupted data was found.

Action:

The call is purged and the AUACDPOSDB audit is scheduled to correct inconsistent data in the target position data block (ACDPOSDB).

33. RIFAP_FAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSfap() function failed. The ISDNBRCS package was not loaded into this SM, and automatic customer station rearrangement (ACSR) counts were not pegged.

34. RIFC_LINE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLFC_LINE relation, a failure return code of DBNO_MATCH was received. This indicates that the tuple is missing, or that the keys used to read this relation were not set properly.

Data Structures:

RLFC_LINE. Key fields: port.member (first data item dumped), port.module (second data item dumped), party (third data item dumped).

Action:

This is a database inconsistency that can only be corrected by manual action.

35. RIFC_PORTTYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLFC_PORTTYP relation, a failure return code of DBNO_MATCH was received. This indicates that the tuple is missing, or that the keys used to read this relation were not set properly.

Data Structures:

RLFC_PORTTYP. Key fields: port.member (first data item dumped), port.module (second data item dumped).

Action:

This is a database inconsistency that can only be corrected by manual action.

36. RIFC_TRUNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple is missing from the RLFC_TRUNK relation, or the keys used to read this relation were not set correctly.

Data Structures:

RLFC_TRUNK. Key fields: port.member, port.module.

Action:

In the first word of the data dump layout for the key values, the first two bytes are port.member, the next byte is filler, and the next byte is port.module.

Use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLFC_TRUNK relation with the actual keys used. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify the next level of support.

37. RIFDAPC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

The dynamic access (DA) primitive DAfdapc() failed to obtain the rIPCBLA tuple pointer by using the rIDALB key. The rIDALB tuple key is printed on the ROP.

Probable Cause:

Dynamic data linkage corruption.

Action:

rIDALB audit will correct the problem.

38. RIINSDYN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This is a general purpose assert indicating that the DBfintup() function failed to insert a tuple in a dynamic relation.

39. RIINV_BIND (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Binding failed because the type of binding requested was invalid.

40. RIINVDEVENT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic call distribution (ACD)/business and residential custom services (BRCS) position manager (POSMGR) function Rlposmgr() received an invalid value for the event parameter. This value should be in the range of the RIPMGREVENT enumeration defined in uhdr/rita/Rlposmgr.G.

Probable Cause:

This error indicates that there is no code in the Rlposmgr() function to handle an event defined by the RIPMGREVENT enumeration; or an invalid event parameter was passed to the Rlposmgr() function via the RIPOSMGR() macro.

Action:

Verify that the rita/Rlposmgr/Rlposmgr.c file is not missing code for the events defined in rita/Rlposmgr.G. If no code is missing, use the rITEDB tuple data that was dumped to the ROP to determine the function that called the POSMGR.

41. RIINV_SOPREQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Non-initializing terminal (NIT) binding [directory number (DN), service capability (SC)] for a previously unbound terminal failed because an invalid service order profile (SOP) capability was requested.

42. RIINV_SPID_PTP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A service profile identifier (SPID) bind request for a point-to-point digital subscriber line (DSL) failed because a SPID

request is invalid for this DSL type.

43. RLIS_LINE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLIS_LINE relation, a failure return code of DBNO_MATCH was received. This indicates that the tuple is missing, or that the keys used to read this relation were not set properly.

Data Structures:

RLIS_LINE. Key fields: lead_module (first data item dumped), ltm_idx (second data item dumped).

Action:

This is a database inconsistency that can only be corrected by manual action.

44. RIISTERM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple is missing from the RLIS_TERM relation, or the keys used to read this relation were not set properly.

Data Structures:

RLIS_TERM. Key fields: lport, termno.

Action:

This is a database inconsistency that can only be corrected by manual action. Validate the keys printed in the error message on the receive only printer (ROP); if they are valid, use RC/V (or ODBE, if necessary) to insert the data for the missing tuple.

45. RLLPT_PT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple is missing from the relation RLLPT_PT.

Data Structures:

RLLPT_PT. Key fields: lport (first data item dumped), lpt_type (second data item dumped).

Action:

This is a database inconsistency that can only be corrected by manual action. Use RC/V (or ODBE, if necessary) to fix the inconsistency.

46. RLLPT_SPID (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the virtual relation, RLLPTSPID, a failure return code of DBNO_MATCH was received. Either the static relation RLLPT_SPID (RLLPT_SPID is the storage relation for RLLPTSPID) tuple is missing, or that the keys used to read this relation were not set properly.

Data Structures:

RLLPTSPID. Key fields: lport (first data item dumped), lpt_type (second data item dumped).

Action:

This is a database inconsistency that can only be corrected by manual action.

47. RILPT_SPID (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLLPT_SPID relation, a failure return code of DBNO_MATCH was received. This indicates that the tuple is missing, or that the keys used to read this relation were not set properly.

Data Structures:

RLLPT_SPID. Key fields: lport (first data item dumped), lpt_type (second data item dumped).

Action:

This is a database inconsistency that can only be corrected by manual action.

48. RIMPRET_INV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Restricted multipoint digital subscriber line (DSL) rebinding failed because of an unexpected return from a binding function.

49. RINDN_SOP_INV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A non-directory number (DN) bind request failed because an invalid service order profile (SOP) capability was requested.

50. RINIP_SC_INV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Non-initializing terminal (NIT) binding [directory number (DN), service capability (SC)] for a previously non-initializing protocol (NIP), fully initializing protocol (FIP), or to be determined (TBD) bound terminal failed because an invalid service order profile (SOP) capability was requested.

51. RINOCCODE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid read of the RLNOCCODE relation occurred.

Data Structures:

RLNOCCODE. Key field: nxx.

Action:

Validate the key printed in the error message on the ROP; if it is valid, insert the data for the missing tuple.

52. RIOFFICECODE (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLOFFICECODE relation, DBNO_MATCH was returned, indicating that there was no tuple in the relation for the NOC used as the key. A tuple is missing or the key was incorrectly set.

Data Structures:

RLOFFICECODE. Key field: noc.

Action:

This is a database inconsistency that must be corrected by manual action.

53. RIPFIXTEI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLPFIXTEI relation, a failure return code of DBNO_MATCH was received. The corresponding RLDSLEQUIP tuple keyed by RLDSLEQUIP.dsl = RLPFIXTEI.port has pfixtei = DBYES. This failure indicates that either the RLPFIXTEI tuple is missing or RLDSLEQUIP.pfixtei is set incorrectly.

Data Structures:

RLPFIXTEI. Key Fields: port.

Action:

This is a database inconsistency that can only be corrected by manual action.

54. RIPOUT_GROUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLPOUT_GROUP relation, a failure return code of DBNO_MATCH was received. This indicates that the tuple is missing, or that the keys used to read this relation were not set properly.

Data Structures:

RLPOUT_GROUP. Key fields: port.member (first data item dumped), port.module (second data item dumped), party (third data item dumped).

Action:

This is a database inconsistency that can only be corrected by manual action.

55. RIPRIFACS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interface identifiers for both ends of a primary rate interface (PRI) do not match, a tuple is missing from the RLPRIFACS relation, or the keys used to read this relation were not set correctly.

Data Structures:

RLPRIFACS. Key fields: prigrp, interf_id.

Action:

In the first word of the data dump layout for the key values, the first two bytes are prigrp, the next byte is filler, and the next byte is interf_id.

It is possible that this assert is firing because of a provisioning change at this office or at the switch at the other end of this PRI.

Use RC/V View 5.2 (or ODBE, if necessary) to cross-check the assignment of facilities, and interface identifiers for those facilities, with the office at the other end of the PRI. The interface identifiers for both ends of the PRI must match exactly. If there is a facility mismatch between offices, then this craft assert may fire repeatedly. If a mismatch is found, then add the interface at this switch or have it deleted from the other switch.

If there is no facility mismatch found, then use RC/V (or ODBE, if necessary) to cross-check the data for the keys in the RLPRIFACS relation with the actual keys used. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify the next level of support.

56. RIPRIGRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple is missing in the RLPRIGRP relation, or the keys used to read this relation were not set correctly.

Data Structures:

RLprigrp. Key field: prigrp.

Action:

Use RC/V (or ODBE, if necessary) to cross check the data for the keys in the RLPRIGRP relation with the actual keys used. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify the next level of support.

57. RIPRISTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PRISTAT	Audit Mode: elev

Problem:

Error occurred while accessing rIPRISTAT tuple.

58. RIPSAPISLINE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The psap flag for this isdn line is set to Y. Since the integrated services digital network (ISDN) public safety answering point (PSAP) special feature has not been purchased, this flag must be set to N.

Data Structures:

RLIS_LINE key fields: lead module ltm_idx.

Action:

This database inconsistency needs to be corrected by manual action. Use RC/V View 23.2 (DIGITAL SUBSCRIBER LINE) or 23.8 (DSL/BRCS ASSIGNMENT) to correct the E911 PSAP field.

59. RIPSX25LN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLPSX25LN relation, a failure return code of DBNO_MATCH was received. This indicates that the tuple is missing, or that the keys used to read this relation were not set properly.

Data Structures:

RLPSX25LN. Key fields: ph_number (first data item dumped), ph_cn (second data item dumped), party (third data item dumped).

Action:

This is a database inconsistency that can only be corrected by manual action.

60. RIPTPRET_INV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Point-to-point digital subscriber line (DSL) rebinding failed because of an unexpected return from a binding function.

61. RIREQSRV_INV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The value of the requested service (i.e., call type) was invalid. Analysis of the stack frames and the value of the requested service output to the receive only printer (ROP) permit development personnel to locate and correct the erroneous call type.

62. RIRETROINT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A stable call saved over an SM retrofit selective initialization has been interrupted. The function trace indicates the code that requested the interrupt.

Action:

Stack and function trace data should be analyzed to determine why the interrupt was sent.

63. RIRET_SPID_INV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A service profile identifier (SPID) bind request failed because of an invalid return from the service order profile (SOP) bind function.

64. RIRGLPRM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This is a general purpose assert indicating that an error was returned from an attempted read of a global parameter from within a transaction. No audit is available to correct the error.

65. RISOPRET_INV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Non-initializing terminal (NIT) binding [directory number (DN), network capability (NC)] failed because of an unknown return from the service order profile (SOP) bind function.

66. RISPID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLSPID relation, a failure return code of DBNO_MATCH was received. This indicates that the tuple is missing, or that the keys used to read this relation were not set properly.

Data Structures:

RLSPID. Key fields: spid.uspid.digcnt (first data item dumped), spid.uspid.dig1 through spid.uspid.dig18 (second data item dumped, displayed as an ASCII string).

Action:

This is a database inconsistency that can only be corrected by manual action.

67. RISPID_RQ_INV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A service profile identifier (SPID) bind request for verify only failed because the request is invalid for this bind type.

68. RISTACDPOSDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ACDPOSDB	Audit Mode: elev

Problem:

The serv_tm attribute in an rIACDPOSDB tuple that was used as the key to read the RLSTPARM relation was corrupted, causing this problem. The RLACDPOSDB audit is scheduled to correct the problem.

69. RISTCMD_INV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid busy/idle status change command for individual circuit switched voice (CSV) or circuit switched data (CSD) hunt members occurred after certain maintenance or binding events.

70. RITEI_PORT_INV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The terminal endpoint identifier (TEI) assignment to the TEI linkage area (TEILA) failed because the port specified cannot be assigned to a TEILA.

71. RITERMKYDN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid read of the RLTERMKYDN relation occurred.

Data Structures:

RLTERMKYDN. Key fields: lport, termno, ca.

Action:

Validate the keys printed in the error message on the receive only printer (ROP); if they are valid, insert the data for the missing tuple.

72. RIUGLPRM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This is a general purpose assert indicating that an error occurred while updating a global parameter.

73. RIUNB_REQ_INV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unbinding failed because the type of binding requested was invalid.

74. RIUNB_SOP_INV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A base initializing protocol (BIP) bind request for a previously unbound terminal endpoint identifier linkage area (TEILA) failed because an invalid service order profile (SOP) capability was requested.

75. RIWBTBLOCK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Tuple missing in the relation RLWBTBLOCK. When attempting to read this relation, a failure return code of DBNO_MATCH was returned. This indicates that the tuple is missing, or that the keys used to read this relation were set improperly.

Data Structures:

RLWBTBLOCK: Key: trunk group number, trunk block (trunk block is calculated by dividing the trunk group member number with 24 and taking the integer portion of the result. e.g if member number is 0-23, trunk block is 0 and if member number is 24-47, trunk group is 1).

RLFC_TRUNK: Keys: port.member port.module.

RLPORT_GROUP: Keys: port.member port.module.

Action:

Office personnel should use RC/V (or ODBE, if necessary) to verify whether the trunk group number is valid. The port member and port module dumped on the ROP can be used to read RLPORT_GROUP and RLFC_TRUNK relations. If both relations indicate the port is a member of the trunk group dumped on the ROP, then the trunk group number is probably a valid one.

If the trunk group number is valid, and wbrate field in the RLFC_TRUNK contains wide band data rate, then the RLWBTBLOCK relation should be checked to see if a tuple exists. Use member field from the relation RLPORT_GROUP to compute the tblock key for the relation RLWBTBLOCK. If the tuple is not populated in RLWBTBLOCK, one should be inserted (consult the office records).

If the trunk group assigned to the port in RLFC_TRUNK is different from the one in RLPORT_GROUP, consult the office records and correct it.

After correction, office personnel should manually restore the trunk back to service.

Range: rpalm**1. HMRP00 (5E14 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote peripheral and XAIU alarm process (RISA) failed to find an empty entry in its internal scan point information table.

2. HMRP00 (5E12 - 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote peripheral alarm process (RPALMP) failed to find an empty entry in its internal scan point information table.

3. HMRP01 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote peripheral and XAIU alarm process (RISA) failed to find an entry for a specified unit in its internal scan point information table. The unit type and unit number will be included in the output report.

4. HMRP01 (5E12 - 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote peripheral alarm process (RPALMP) failed to find an entry for a specified remote peripheral in its internal scan point information table. The remote peripheral unit type and unit number will be included in the ROP report.

5. HMRP02 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A function in the remote peripheral and XAIU alarm process (RISA) was called with an invalid parameter.

6. HMRP02 (5E12 - 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A function in the remote peripheral alarm process (RPALMP) was called with an invalid parameter.

7. HMRP03 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A function in the remote peripheral and XAIU alarm process (RISA) encountered an invalid unit type. The unit type will be included in the output report.

8. HMRP03 (5E12 - 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A function in the remote peripheral alarm process (RPALMP) encountered an invalid remote peripheral unit type. The unit type will be included in the ROP report.

9. HMRP04 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote peripheral and XAIU alarm process (RISA) failed to write a unit's scan point inhibit/allow mask register. The unit type and unit number will be included in the output report.

10. HMRP04 (5E12 - 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote peripheral alarm process (RPALMP) failed to write the scan point inhibit/allow mask register in a remote peripheral unit. The unit type and unit number will be included in the ROP report.

11. HMRP05 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote peripheral and XAIU alarm process (RISA) failed to send an internal message.

12. HMRP05 (5E12 - 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote peripheral alarm process (RPALMP) failed to send an internal message.

13. HMRP06 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote peripheral and XAIU alarm process (RISA) received an invalid message. The message buffer will be included in the output report.

14. HMRP06 (5E12 - 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote peripheral alarm process (RPALMP) received an invalid message. The message buffer will be included in the ROP report.

15. HMRP07 (5E14 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote peripheral and XAIU alarm process (RISA) received an invalid process entry reason. The process will be purged.

16. HMRP07 (5E12 - 5E13)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote peripheral alarm process (RPALMP) received an invalid process entry reason. The process will be purged.

17. HMRP08 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote peripheral and XAIU alarm process (RISA) encountered a failure while trying to read the RLRPSITE relation.

18. HMRP08 (5E12 - 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote peripheral alarm process (RPALMP) encountered a failure while trying to read the RLRPSITE relation.

19. HMRP09 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote peripheral and XAIU alarm process (RISA) encountered a failure while trying to request a timer.

20. HMRP09 (5E12 - 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote peripheral alarm process (RPALMP) encountered a failure while trying to request a timer.

21. HMRP10 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote peripheral and XAIU alarm process (RISA) encountered a failure while trying to queue an output message.

22. HMRP10 (5E12 - 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote peripheral alarm process (RPALMP) encountered a failure while trying to queue an output message.

23. HMRP11 (5E14 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote peripheral and XAIU alarm process (RISA) encountered a failure while trying to request a timer. The process will be purged.

24. HMRP11 (5E12 - 5E13)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote peripheral alarm process (RPALMP) encountered a failure while trying to request a timer. The process will be purged.

25. HMRP12 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote peripheral and XAIU alarm process (RISA) encountered a failure while trying to read the RLAIU2AP relation.

26. HMRP13 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote peripheral and XAIU alarm process (RISA) encountered a failure while trying to read the RLRC_LOCEQ relation.

27. HMRP14 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote peripheral and XAIU alarm process (RISA) encountered a failure while trying to read the RLUNITDATA relation.

Range: rta**1. ARCRTC1 (5E13 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLNOCCODE tuple could not be identified or had an unexpected base numbering plan area (NPA) for the given NPA-NXX of a 10-digit directory number (DN).

Data Structures:

RLNOCCODE.

The RLNOCCODE tuple could not be found for the NPA-NXX or the NXX and NPA retrieved from the RLNOCCODE relation contained an unexpected base NPA. If found, the NPA-NXX of the 10-digit DN are dumped.

Action:

Use the NPA-NXX to inspect the RLNOCCODE tuple. Verify that the office data is consistent with signal transfer point (STP) data for local area signaling services (LASS) global title routing. Correct the NPA in the RLNOCCODE tuple, if appropriate. For NPA splits using SFID 36 (LASS NPA SPLIT), add old - new NPA association in RC/V View 8.25 (LASS NPA SPLIT RESOLUTION).

2. ARCRTC1 (5E11 to 5E12)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLNOCCODE relation had an unexpected numbering plan area (NPA) for the given NXX of a 10-digit directory number (DN).

Data Structures:

RLNOCCODE.

The NXX and NPA retrieved from the RLNOCCODE relation and the expected NPA of the 10-digit DN are dumped.

Action:

Use the NXX to inspect the RLNOCCODE tuple. Verify that the office data is consistent with signal transfer point (STP) data for local area signaling services (LASS) global title routing. Correct the NPA in the RLNOCCODE tuple, if appropriate.

3. ARCRTC2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLCHKLST relation was missing a tuple. One tuple should always be populated with a key of DBNO.

Data Structures:

RLCHKLST.

Action:

Insert an RLCHKLST tuple.

4. AURTAST21 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The gport and pid values are dumped for port-process linkage errors.

5. COBADHEAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

Cutover detected a corrupt linkage in the RLPORTLA relation.

6. COBADPARM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A cutover function was entered with invalid parameters.

7. COCPIMCOST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Cutover encountered a read failure when accessing the RLCPIMCOST relation.

8. COCPTHOST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Cutover encountered a read failure when accessing the RLCPTHCOST relation.

9. CODSLEQUIP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not read the RLDSLEQUIP relation for the current port when the routing and terminal allocation (RTA) cutover program was determining the service status of all the line ports on the current SM.

10. COHMERROR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Cutover encountered human machine interface (HM) failure return codes.

11. COIMCOSTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Cutover encountered a read failure when accessing the RLIMCOSTAT relation.

12. COLSTLIST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

Cutover, after one retry, could not traverse the system list; the system list and the port's port linkage area (PORTLA) list do not coincide.

13. COMODATT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Cutover encountered a read failure when accessing the RLMODATT relation.

14. COPSX25LN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not read the RLPSX25LN relation for an existing port in the RLDSLEQUIP relation when the routing and terminal allocation (RTA) cutover program was determining the service status of all the line ports on the current SM.

15. COREASON (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The cutover system process started for an unknown reason.

16. CORECOSTAT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Data delivery cannot return the COstate value to cutover (data delivery fatal error).

17. CORELINK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

Cutover could not re-link a port linkage area (PORTLA) to a new system list after it had been unlinked.

18. CORTMHG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

For the port with a normalized office code (NOC) of 0 in the RLFC_LINE relation, the directory number (DN) could not be derived from the RLPORT_GROUP and RLRT_MHG relations when the routing and terminal allocation (RTA) cutover program was determining the service status of all the line ports on the current SM.

19. COSTCOSTAT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Data delivery cannot return the SCOSTATE value to cutover.

20. COTHCOSTAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Cutover encountered a read failure when accessing the RLTHCOSTAT relation.

21. COTRGFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When a change to the cutover office parameters was attempted, the trigger function COcptrg() in the CMP failed in its attempt to inform AM resident code of the update. Some data may be out of synch. The first data item dumped on the ROP is the destination process ID, which should be the cutover system process on the AM.

22. COUNLINK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

Cutover could not unlink a port linkage area (PORTLA) from the PORTLA system list.

23. COUXPMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Cutover received an unexpected message.

24. COUXPOSR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Cutover received an unexpected return from an operating system for distributed switching (OSDS) primitive.

25. RT2INQO_MLHG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTmfcqu/RTiinl_dyn.c. During the initialization of line queueing dynamic tuples in the RLQO_MLHG or RLQM_MLHG relation, an error return was received from the RTinInqown() function when attempting to insert an rIQO_MLHG tuple. The first data dump contains the qdata structure containing the information to be populated into the rIQO_MLHG tuple. The second data dump contains the error return value. Study the stack frame dump to gain further insight into this assert.

26. RT2Q_ISAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in the rta/RTmfcqu/RTInq_isat.c, RTisataban.c, RTInqsada.c, or RTisat_nq.c file. During the processing for integrated services attendant (ISAT) line queueing, an error return was received from a database (DB) primitive when attempting to read or update the RLQ_ISAT relation. The first data dump contains the appropriate ISAT index and the second data dump contains the error return value from the DBretrvblk() or DBfintup() primitive. Study the stack frame dump to gain further insight into this assert.

27. RT2QO_ICI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTmfcqu/RTisataban.c or rta/RTmfcqu/RTinqo_ici.c. When attempting to update rIQO_ICI tuples for integrated services attendant (ISAT) line queueing operations, an error return was received from a database (DB) primitive. The first data dump contains the relevant ISAT carrier identification code (CIC) value. The second data dump contains the error return value from the DBfintup(), DBgethead(), or DBretrvblk() primitive. Study the stack frame dump to gain further insight into this assert.

28. RT3QO_ICI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTmfcqu/RTdqisat.c or rta/RTmfcqu/RTisat_nq.c. During the processing of an integrated services attendant (ISAT) line queueing request, an error return was received from the DBretrvblk() function when attempting to retrieve the appropriate rIQO_ICI tuple. The first data assert contains the ISAT index. The second data dump contains the incoming call identification (ICI) index, and the third data dump contains the error return value. Study the stack frame dump to gain further insight into this assert.

29. RTAAR_GP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLARGP relation, a failure code of DBNO_MATCH was returned. The rIARGP tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLARGP. Key field: ar_gpid.

Action:

This is a database inconsistency that can only be corrected by manual action.

30. RTACB_DBRDFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read the relation RLFC_LINE to get the lport was not successful. No audits were run. This assert originates from the RTacb_msg() function.

31. RTACBMG1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTterm/RTacb_msg.c. During processing for the auto-call back feature, an error return was received from the DAfownpc() primitive when attempting to determine the status of a port. The first data dump contains the global port value. The second data dump contains the error return from DAfownpc(). Study the stack frame dump to gain further insight into this assert.

32. RTACCT_GP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLACCT_GP relation, a failure code of DBNO_MATCH was returned. The rLACCT_GP tuple is missing or the key used to read this relation was not set properly.

Data Structures:

RLACCT_GP. Key field: gpid (account group ID).

Action:

This is a database inconsistency that can only be corrected by manual action.

33. RTACDMG1 (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTacdqv/RTacdmfinfo.c. When processing a return to queue request for a call to an automatic call distribution (ACD) directory number (DN), an error return was received when the MGACD_INFO message was sent to the newly created terminating terminal process.

The first data dump contains the process ID of the newly created terminal process. The second data dump contains the error return from the call to the OSSENDMSG() macro. The third data dump contains the reason for creating the terminal process. The newly created terminal process will be purged. Study the stack frame dump to gain further insight into this assert. Output from the RTDUMPDATA() macro call may follow this assert.

34. RTACDPD1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGscreen/RTacdpcdn.c. During post-directory number (DN) translation processing, the routing data block contained an invalid orig_type (that is, neither line nor trunk). The first data dump contains the routing data block information. Output from the RTDUMPDATA() macro call may follow. Study the stack frame dump to gain further insight into the problem.

35. RTACDPD2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGscreen/RTacdpcdn.c. During the post-directory number (DN) translation stage of a routing request, an unexpected value was found for the terminating class in the call flow data block. The first data dump contains the DN translation data area of the call flow data block. Output from the RTDUMPDATA() macro call may follow. Study the stack frame dump to gain further insight into the problem.

36. RTACDQC1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTacdqv/RTacdqvcr.c. When processing a termination request for a call to an automatic call distribution (ACD) directory number (DN), an error return of OSEPROG was received from the call to the OSCREATE() macro.

The first data dump contains the ID passed to the RTacdqvcr() function for the process to be created. The second data dump contains the process ID returned by the OSCREATE() macro. The third data dump contains the termination message that was to have been sent to the newly created terminal process. Study the stack frame dump

to gain further insight into this problem.

37. RTACDQC2 (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTacdqv/RTacdqvcr.c. When processing a termination request for a call to an automatic call distribution (ACD) directory number (DN), an error return was received from the call to the DAgetpcbl() function when attempting to get a pointer to the newly created terminal process' process control block link area (PCBLA).

The first data dump contains the process ID of the newly created terminal process. The second data dump contains the error return from the DAgetpcbl() function. The third data dump contains the reason for creating the terminal process. The newly created terminal process will be purged. Study the stack frame dump to gain further insight into this problem. Output from the RTDUMPDATA() macro call may follow.

38. RTACDQC3 (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTacdqv/RTacdqvcr.c. When processing a termination request for a call to an automatic call distribution (ACD) directory number (DN), the RTacdqvcr() function determined that an invalid termination message was passed to the function. The first data dump contains the process ID of the newly created terminal process. The second data dump contains the message header of the invalid termination message. The third data dump contains the reason for creating the terminal process. The newly created terminal process will be purged. Study the stack frame dump to gain further insight into this problem. Output from the RTDUMPDATA() macro call may follow.

39. RTACDQC4 (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTacdqv/RTacdqvcr.c. When processing a termination request for a call to an automatic call distribution (ACD) directory number (DN), an error return was received when the termination message was sent to the newly created terminating terminal process.

The first data dump contains the process ID of the newly created terminal process. The second data dump contains the error return from the call to the OSSENBFBM() macro. The third data dump contains the reason for creating the terminal process. The newly created terminal process will be purged. Study the stack frame dump to gain further insight into this problem. Output from the RTDUMPDATA() macro call may follow.

40. RTACDQR1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTacdqv/RTacdqreq.c. When processing a termination request for a call to an automatic call distribution (ACD) directory number (DN), an error return was received when the termination message was sent to the originating terminal process. The data dump contains the MGLN_TERM message that should have been sent to the originating terminal process. Study the stack frame dump to gain further insight into this problem. Output from the RTDUMPDATA() macro call may follow.

41. RTACSOPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to reconfigure local area signaling services (LASS) dynamic data.

Data Structures:

RLAN_ILHB, RLIS_ILHB, RLAN_OLHB, RLIS_OLHB.

Action:

Refer to the LASS growth procedures.

42. RTADDLQ1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTmfcqu/RTaddl_que.c. During the initialization of RLQM_MLHG dynamic data blocks, the input argument addnum (the number of tuples to add) was out of range. The first data dump contains the invalid value. Study the stack frame dump to gain further insight into this assert.

43. RTADDLQ2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTmfcqu/RTaddl_que.c. During the initialization and addition of RLQM_MLHG dynamic data blocks due to a RC/V update or insert, the input argument addnum (the number of tuples to add) was out of range. The first data dump contains the invalid value. Study the stack frame dump to gain further insight into this assert.

44. RTADDTQ1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTtkq/RTaddt_que.c. During the initialization or addition (via a RC/V transaction) of rIQM_OGT tuples for modular queueing for outgoing private facilities, the input parameter containing the number of tuples to add was out of range. The first data dump contains the initflag (indicating if this is due to an initialization or a RC/V transaction). The second data dump contains the out-of-range input parameter. Study the stack frame dump to gain further insight into this assert.

45. RTAMBMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code from the OSWGETMSG() macro was encountered by the AM routing and terminal allocation (RTA) system process. No message was received. The return code from the OSWGETMSG() macro is dumped on the ROP.

46. RTAMINT1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGcontl/RTaminteg.c. While checking the links to see if a message can be sent to

the specified SM, an unexpected return was received from the RTim_abnor() function. The first data dump contains the unexpected return value. Study the stack frame dump to gain further insight into this assert.

47. RTAMLNKR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from the RTamlink() function.

48. RTAMUXMG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected or unknown message was received by the AM routing and terminal allocation (RTA) system process. The message head and message text of the message is dumped on the ROP.

49. RTANI_MISSING (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGbrcs/RTsfg_set.c. A data inconsistency is detected in RLRT_MCRT and RLRT_SFG relations. SFG TYPE is found to be of EON SFG type in RLRT_SFG relation. But ANI II DIGS is found missing in RLRT_MCRT relation. The call is blocked with reorder tone.

Data Structures:

RLRT_MCRT. Key field: MC_RI (route index).
 RLRT_MCRT. Non-key field: ANI II DIGS.
 RLRT_MCRT. Non-key field: SFG NUM.

Action:

Use RC/V View 7.3 (PFA SIMULATED FACILITY GROUP), keyed by SFG NUM, to verify the SFG TYPE is of EON SFG. Use RC/V View 10.4 (BRCS MC ROUTE INDEX EXPANSION), keyed by mc_ri, to check the value of the ANI II DIGS field. The value of ANI II DIGS must be in the range 1-99. The current value of ANI II DIGS is printed in the DATA structures. If ANI II DIGS is set to blank on RC/V View 10.4, the default value of 100 will be printed on the ROP.

50. RTANI_MISSING (5E12 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGbrcs/RTsfg_set.c. A data inconsistency is detected in RLRT_MCRT and RLRT_SFG relations. SFG TYPE is found to be of EON SFG type in RLRT_SFG relation. But ANI II DIGS is found missing in RLRT_MCRT relation. The call is blocked with reorder tone.

Data Structures:

RLRT_MCRT. Key field: MC_RI (route index).
 RLRT_MCRT. Non-key field: ANI II DIGS.
 RLRT_MCRT. Non-key field: SFG NUM.

Action:

Use RC/V View 7.3 (PFA SIMULATED FACILITY GROUP), keyed by SFG NUM, to verify the SFG TYPE is of EON SFG. Use RC/V View 10.4 (BRCS MC ROUTE INDEX EXPANSION), keyed by mc_ri, to check the value of the ANI II DIGS field. The value of ANI II DIGS must be in the range 1-99. The current value of ANI II DIGS is printed in the data structures.

51. RTAPBBHT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTprims/RTauptby.c. While initializing multiline hunt group (MLHG) member status to busy, the input MGMHGKA keep alive message contained an invalid hunt type value. The first data dump contains the full text of the message. Study the stack frame dump to gain further insight into this assert.

52. RTAPVBHT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTprims/RTauptav.c. During the initialization of trunk and/or multiline hunt group (MLHG) members, an invalid hunt type was found in the rIRT_TRKG or rIRT_MHG tuple. The first data dump contains the rIRT_TRKG or rIRT_MHG tuple that contained the invalid hunt type. The second data dump contains the passed in port parameter. Study the stack frame dump to gain further insight into this assert.

53. RTAPVBPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTprims/RTauptav.c. During the initialization of trunk or multiline hunt group (MLHG) member status, the tuple retrieved from the RLPORT_GROUP relation contained an invalid group type. The first data dump contains the rLPORT_GROUP tuple. The second dump contains the port value that was passed in. Study the stack frame dump to gain further insight into this assert.

54. RTARCB11 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTarc/RTarc_bi.c. While processing a local area signaling services (LASS) automatic recall/automatic call back (AR/AC) status query, an error return was received from the DAfownpc() primitive when checking the status of a port. The first data dump contains the error return from DAfownpc(). The second data dump contains the affected port. Study the stack frame dump to gain further insight into this assert.

55. RTARCB12 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTarc/RTarc_bi.c. While processing a local area signaling services (LASS) automatic recall/automatic call back (AR/AC) status query, either an unknown context argument was passed, or the context argument was set to ARCSELCA and the class of service value in the input message was unexpected. The first data dump contains the unexpected value for either case. Study the stack frame dump to gain further insight into this assert.

56. RTARCHNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTarc/RTarc_hunt.c or in rta/RTarc/RTarchstat.c. While processing a local area signaling services (LASS) automatic recall/automatic call back (AR/AC) call, an unknown hunt type was found. The first data dump contains the contents of the multiline hunt group (MLHG) global data block where the unknown hunt type was found. Study the stack frame dump to gain further insight into this assert.

57. RTARCRBKFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred while trying to create a local area signaling services (LASS) automatic callback/automatic recall (AC/AR) ring-back terminal process.

58. RTARCSP1 (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTarc/RTarcreat.c. During the creation of a ringback terminal process for local area signaling services (LASS) automatic call back/automatic recall (AC/AR), an error return was received from the DAgetpcbl(), DACppopc(), or Rlupdat_b() function after the process was just created. The ringback terminal process is purged. The first data dump contains the process ID of the process to be purged or the gport. Study the stack frame dump to gain further insight into this assert.

59. RTARCSP2 (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTarc/RTarcreat.c. During the creation of a ringback terminal process for local area signaling services (LASS) automatic call back/automatic recall (AC/AR), an error return was received from the DARhhcbr(), DAibrda(), or DAfpcda() primitive. The newly create terminal process will be purged. The first data dump contains the error return. The second data dump contains the contents of the appropriate business and residential custom services data block (BRCSDB). Study the stack frame dump to gain further insight into this assert.

60. RTARCSP3 (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTarc/RTarcreat.c. During the creation of a ringback terminal process for local area signaling services (LASS) automatic call back/automatic recall (AC/AR), an error return was received from the Rlalloccre() or Rladdalb() primitive. The newly created terminal process will be purged. The first data dump contains the error return from the RI primitive. The second data dump contains the port member on which the update operation was to be performed. Study the stack frame dump to gain further insight into this assert.

61. RTARCTG1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTarc/RTarc_tg.c. While performing terminal group station restriction (TGSR)

screening during a local area signaling services (LASS) automatic recall/automatic call back (AR/AC) termination, an error return was received from the RTsrgen() function in the RTarch_tg() or RTarc_tg() function. The first data dump contains the error return. Study the stack frame dump to gain further insight into this assert.

62. RTASOPCGB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: FCLINE	Audit Mode: elev

Problem:

An attempt to change the local area signaling services (LASS) global access parameters failed. To clean up after the failure, an attempt was made to set the global access parameters and all dynamic data back to its previous state, but that attempt also failed. The FCLINE audit will run to return the dynamic data to the same state as the static data. A local structure that contains the LASS global access parameters is dumped on the ROP. These parameters are the original values prior to the attempt to change the access parameters via recent change (RC).

63. RTASP_LTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLASP_LTM tuple is missing. One of the keys is not populated or is populated incorrectly. An advanced services platform (ASP) terminating feature ID was in the RLDN_FEATS relation for the same directory number (DN)/multi-line hunt group (MLHG) indicated by the keys to the RLASP_LTM relation.

Data Structures:

RLASP_LTM. Key fields: lead module, ltm_idx, ltm_type.

The first three items on the ROP output are the keys used to access the RLASP_LTM relation (lead module, ltm_idx, ltm_type). The lead module is the SM associated with the DN's port for a line, or with the lead member of a MLHG. Member (fourth data item) is the terminating port obtained from RLrt_dntran.portname.member. Module (fifth data item) is the terminating SM obtained from RLrt_dntran.portname.module. Party (sixth data item) is the terminating party obtained from RLrt_dntran.term_name.

Action:

This is a database inconsistency that must be corrected by manual action. Insert a tuple via ODBE in the RLASP_LTM relation in the SM specified by the lead module key. Use the values specified in the data dumped. Leave all other values unpopulated with the default values. Use RC/V View 1.64 (ADVANCED SERVICES PLATFORM LINE PARAMETERS) to update the ASP terminating trigger line parameters for the DN/MLHG.

64. RTASPOTNST (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The trigger number provided as the ASP office-wide busy or ASP office-wide no_answer trigger has an invalid protocol or the rINS_TRIG tuple does not exist. The call will proceed, but will not monitor for busy if the office-wide busy trigger caused the assert, and will not monitor for no_answer if the office-wide no_answer trigger caused the assert.

RC/V View 8.49 (ADVANCED SERVICES PLATFORM PARAMETERS) verifies that the trigger number specified for ORIG BL TRIG and ORIG NA TRIG must exist in rINS_TRIG and must be an ASP R0D1 trigger. Therefore, the trigger number was valid when ORIG BL TRIG and ORIG NA TRIG were set using RC/V View 8.49. The problem was caused by one of the following two situations:

- (1) The trigger number was deleted using RC/V View 9.35 (NETWORK SERVICES TRIGGER DEFINITION).

- (2) The trigger number was updated using RC/V view 9.35. The protocol of the trigger number is no longer R0D1.

Data Structures:

RLNS_TRIG. Key field: trignum.

Action:

To correct the problem caused by a missing rINS_TRIG tuple, perform one of the following actions:

- (1) Using RC/V View 9.35, insert the trigger. Set the APPLICATION to ASP, and the AIN REL to R0D1.
- (2) Using RC/V View 8.49, change the ORIG BL TRIG or ORIG NA TRIG to an existing ASP R0D1 trigger. (Obtain the trigger number using RC/V View 9.35).

To correct the problem caused by a protocol mismatch, perform one of the following actions:

- (1) Using RC/V View 9.35, update the trigger. Set the APPLICATION to ASP, and the AIN REL to R0D1.
- (2) Using RC/V View 8.49, change the ORIG BL TRIG or ORIG NA TRIG to an existing ASP R0D1 trigger. (Obtain the trigger number using RC/V View 9.35).

65. RTASPOTNST (5E12 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The trigger number provided as the ASP office-wide busy or ASP office-wide no_answer trigger has an invalid protocol or the rINS_TRIG tuple does not exist. The call will proceed, but will not monitor for busy if the office-wide busy trigger caused the assert, and will not monitor for no_answer if the office-wide no_answer trigger caused the assert.

RC/V View 8.1 [OFFICE PARAMETERS (MISCELLANEOUS)] verifies that the trigger number specified for ASP BL TRIG NBR and ASP NA TRIG NBR must exist in rINS_TRIG and must be an ASP R0D1 trigger. Therefore, the trigger number was valid when ASP BL TRIG NBR and ASP NA TRIG NBR were set using RC/V View 8.1. The problem was caused by one of the following two situations:

- (1) The trigger number was deleted using RC/V View 9.35 (NETWORK SERVICES TRIGGER DEFINITION).
- (2) The trigger number was updated using RC/V View 9.35. The protocol of the trigger number is no longer R0D1.

Data Structures:

RLNS_TRIG. Key field: trignum.

Action:

To correct the problem caused by a missing rINS_TRIG tuple, perform one of the following actions:

- (1) Using RC/V View 9.35, insert the trigger. Set the APPLICATION to ASP, and the AIN REL to R0D1.
- (2) Using RC/V View 8.1, change the ASP BL TRIG NBR or ASP NA TRIG NBR to an existing ASP R0D1 trigger. (Obtain the trigger number using RC/V View 9.35).

To correct the problem caused by a protocol mismatch, perform one of the following actions:

- (1) Using RC/V View 9.35, update the trigger. Set the APPLICATION to ASP, and the AIN REL to R0D1.
- (2) Using RC/V View 8.1, change the ASP BL TRIG NBR or ASP NA TRIG NBR to an existing ASP R0D1 trigger. (Obtain the trigger number using RC/V View 9.35).

66. RTASRT01 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The function DBfuptup() returned error when attempting to update the multi-line hunt group call forwarding attribute, cfvind, in relation RLRT_MHG.

67. RTASRT02 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The function DBfuptup() returned error when attempting to update the multi-line hunt group call forwarding attribute, cfvind, in relation RLRT_MHG.

68. RTASRT03 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The value of the keystate parameter received by the function RThuntkey() is invalid. The value should be either RTKEYOFF or RTKEYON.

69. RTASRT04 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The value of the attribute grptype in relation RLPORT_GROUP is unknown. The value should be either TM_LINE or TM_TRK.

70. RTASRT05 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The value of the request parameter received by the function RTportstat() is invalid. The value should be either RTIDLE_PORT or RTBUSY_PORT.

71. RTASRT06 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The value of the action parameter received by the function RTupstat() is unknown.

72. RTATCF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLAT_CF relation, a failure code of DBNO_MATCH was returned. The rLAT_CF tuple is missing or the key used to read this relation was not set properly.

Data Structures:

RLAT_CF. Key field: fid (feature ID).

The current module is the second item dumped (not a key).

Action:

This is a database inconsistency that can only be corrected by manual action.

73. RTATCNTMSK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not find an rATCNTMSK tuple using the keys grpnum and hgid. The attempt resulted in the DBNO_MATCH return code. This SM received an MGBLFREPLY message from the routing module for this hundreds group. The rIMODH_BLF and rIMODM_BLF dynamic tuples must exist on the routing module, and the rIATTH_BLF and rIATTM_BLF dynamic tuples must exist on this SM before the busy lamp field (BLF) status could be provided to an integrated services digital network (ISDN) attendant (ISAT) console on this SM.

The necessary rATCNTMSK static tuple is missing on this SM, the key values provided are incorrect, or a problem exists with all of the dynamic tuples mentioned or their linkages.

Data Structures:

The following keys from the attempted read of the RLATCNTMSK relation are dumped: hgid (the hundreds group identifier in hex), and grpnum (the attendant hunt group number in decimal).

Action:

This is a database inconsistency that can only be corrected by manual action. Convert the hgid value to its equivalent ofc code and hund grp values. Examples:

(1) If the hgid value is 935, this is digit 4 (D4) and digit 3 (D3). 935 is a hex value that must be converted to its equivalent decimal value (decimal is also 9 in this case). This decimal value is the noc. Use the RLOFFICECODE relation to convert this noc to its equivalent nxx.

(2) If the hgid value is 5645, this is digit 4 (D4) and digit 3 (D3). 5645 is a hex value that must be converted to its equivalent decimal value (decimal is 86 in this case). This decimal value is the noc. Use the RLOFFICECODE relation to convert this noc to its equivalent nxx.

Read RC/V View 4.26 (ISDN HUNDREDS GROUP BUSY LAMPS) using the nxx as the value for the first key (ofc code) and D4D3 as the value for the second key (hund grp). If this entry does not exist, the dynamic tuples listed in the Problem section and their linkages exist when they should not, or an invalid hgid value was supplied. Purge the BLFSP system process on this SM and on the routing module.

If this entry does exist, there is a discrepancy between the RLATCNTMSK and RLMONI_BLF relations located on the routing module and/or each SM listed on the view must be corrected.

74. RTATGRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLAT_GRP relation, a failure code of DBNO_MATCH was returned. The rLAT_GRP tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLAT_GRP. Key field: acvt_gpid.

The module field is also dumped.

Action:

This is a database inconsistency that can only be corrected by manual action.

75. RTATHPRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLATH_PRT relation, a failure code of DBNO_MATCH was returned. The rLATH_PRT tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLATH_PRT. Key fields: lport, lpt_type.

Action:

This is a database inconsistency that can only be corrected by manual action.

76. RTATH_RLID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An incorrect relation ID was passed as a parameter to the RTath_dtrg() function.

77. RTATHRRL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTprims/RTath_rrel.c. When attempting to obtain authorization code information on the AM, an error return was received from the DBfrdtup() primitive when attempting to read the RLATH_CODE relation - this return was not DBNO_MATCH. The first data dump contains the text of the input MGRT_RDATH message. Study the stack frame dump to gain further insight into this assert.

78. RTATHTRG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTrcv/RTath_dtrg.c. This routing and terminal allocation (RTA) trigger function is normally called to send a MGFC_DLATH message to the SM to delete an authorization code from the SM cache. However, an improper input relid was passed to the RTath_dtrg() function. The first data dump contains the invalid relid. Study the stack frame dump to gain further insight into this assert.

79. RTATTMBL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLATTM_BLF relation, a failure code of DBNO_MATCH was returned. The rIATTM_BLF tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLATTM_BLF. Key field: latidx.

Action:

This is a database inconsistency that can only be corrected by manual action.

80. RTAU3PCBLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

An exception occurred in rta/RTisdn/RTmcaoff.c. During an integrated services digital network (ISDN) multiple call appearance (MCA) origination, an error return of OSEPROC was received from the OSSENDMSG() macro when attempting to send a Q.931 message. The first data dump contains the impacted process control block link area (PCBLA). The second data dump contains the process ID of the message destination, and the third data dump contains the body of the message. The PCBLA audit is called. Study the stack frame dump to gain further insight into this assert.

81. RTAU3PORTLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

An exception occurred in rta/RTnswss/RTnusmsp.c. During the processing of nail-up connections, the RTnuinfo() function received an invalid return from the DAgetptla() primitive when attempting to read the port linkage area (PORTLA) of a nail-up port. The PORTLA audit is called. The first data dump contains the global port impacted. The second data dump contains the appropriate tuple previously read from the RLNAILUP relation. The third dump contains the input RTNUINMSG structure that was passed to the RTnuinfo() function. Study the stack frame dump to gain further insight into this assert.

82. RTAU3QM_MLHG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: MLHG	Audit Mode: elev

Problem:

An exception occurred in rta/RTmfcqu (various files) when performing work related to the line queueing feature. While manipulating RLQM_MLHG dynamic data blocks, an error return was received from a database (DB) or dynamic access (DA) primitive. Three data dumps are printed. Study the stack frame dump to determine the location that this assert was fired from, and the three data dumps to gain further insight into this assert. The AUQM_MLHG audit is called.

83. RTAU4PCBLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

An exception occurred in rta/RTterm/RTlineterm.c. During processing of a line termination to a shared directory number (DN) analog line, an error return was received from the RTbusysa() function. The first data dump contains the port linkage area (PORTLA) for the port to be terminated to. The second data dump contains the error return from RTbusysa(). The process control block link area (PCBLA) audit (and any other related audit) will run. Study the stack frame dump to gain further insight into this assert. Output from the RTDUMPDATA() macro call may follow this assert.

84. RTAU4PORTLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

An exception occurred in rta/RTterm/RTpf_slvld.c. During the processing of an offhook or onhook from a scan point, an unknown return was received from the DAfownpc() function. The first data dump contains the contents of the rIFC_PORTTYP tuple for the port. The second data dump contains the contents of the MGPF_SLV message received by the RTpf_slvld() function. The port linkage area (PORTLA) audit (and any related audits as appropriate) are scheduled. Study the stack frame dump to gain further insight into this assert.

85. RTAUATTH_BLF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BLF	Audit Mode: elev

Problem:

A dynamic access (DA) failure occurred when accessing an rIATTH_BLF tuple.

86. RTAUATTM_BLF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BLF	Audit Mode: elev

Problem:

A dynamic access (DA) failure occurred when accessing an rIATTM_BLF tuple.

87. RTAUBADRD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During the transition out of remote SM (RSM) stand-alone, an inconsistency was found in the RLMEM or RLLGMEM relation. These index accessed dynamic relations are created when an RSM goes into stand-alone and deleted when an RSM comes out of stand-alone.

The RLMEM and RLLGMEM relations are used to indicate which members of a multiline hunt group (MLHG) are located on the RSM. The RLMEM relation is for small MLHGs (all MLHG members are in the range 1-63), the RLLGMEM relation is for large MLHGs (the MLHG has a member 64 or greater). The MLHG group number is the key to these relations.

When the tuple was read, the key found in the tuple did not match the key used to calculate the tuple address. The following data items are dumped: 1) the rIRT_MHG static tuple (the first two bytes are the MLHG group number) and 2) the rIMEM or rILGMEM dynamic tuple (the first two bytes are the MLHG group number).

No recovery action is required since these relations are removed when the RSM comes out of stand-alone. The data will be re-initialized the next time the RSM goes into stand-alone. Contact the next level of support if this assert continues to fire.

88. RTAUBRCSDb (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BRCSDB	Audit Mode: elev

Problem:

A failure occurred that is related to the business and residential custom services (BRCS) data block (BRCSDB). The following list provides BRCSDB related occurrences and a possible key to where the problem may have occurred.

- Unable to remove the BRCSDB from the idle list in the DARhhcbr() primitive.

- Unable to link the BRCSDB to the D-channel application linkage block (DALB) in the DALbrda() function.
- Unable to get a pointer to the BRCSDB.
- Unable to unlink the BRCSDB from the DALB in the DAubrda() primitive.
- Unable to put the BRCSDB back on the idle list in the DAahhcbr() primitive.

89. RTAUCKTDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

An error occurred with the dynamic data relation RLPORTLA.

90. RTAUCPLR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred with the dynamic relation RLCPLR.

Probable Cause:

There is an error in the linkage between the RLPCBLA, RLCPLR, and RLPORTLA relations.

Action:

An audit of the RLCPLR relation is requested. If this assert continues, report the problem to the product engineering control center (PECC).

91. RTAUDALB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

An error occurred while accessing the rIDALB tuple.

92. RTAUDESTROY (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

This assert is used to destroy processes.

93. RTAUDLTBDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DLTBDB	Audit Mode: elev

Problem:

A failure occurred while trying to manipulate the RDLTSBDB relation. To fix the error, the DLTBDB audit will be run. The rIDLTBDB tuple that caused the failure is dumped.

94. RTAUDMBRCSDB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: BRCSDB	Audit Mode: nonseg

Problem:

A failure occurred that is related to the business and residential custom services (BRCS) data block (BRCSDB).

Could not return the BRCSDB to the idle list.

95. RTAUDMDALB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: DALB	Audit Mode: nonseq

Problem:

A failure occurred that is related to the D-channel application linkage block (DALB) data block. Could not return the DALB to the idle list.

96. RTAUDMDISPDB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: DISPDB	Audit Mode: nonseq

Problem:

A failure occurred that is related to the display data block (DISPDB). Could not return the DISPDB to the idle list.

97. RTAUDNLTSDDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DLTSDDB	Audit Mode: elev

Problem:

An exception occurred in the RTrc_Itsbpt() function when attempting to insert or link a new rIDLTSDDB tuple. To fix this error, the DLTSDDB audit will be run. This exception occurred for one of the following reasons: 1) a failure return was received from the DBfintup() primitive when attempting to insert the new rIDLTSDDB tuple, or 2) a failure return was received from the DAathcdt() primitive when attempting link the newly created tuple to the idle list.

See the stack frame dumped to determine the location that the assert was called from. The first data dump contains the rIDLTSDDB tuple to be inserted and the second dump contains the failure return value.

98. RTAUDPB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DPB	Audit Mode: elev

Problem:

An error occurred while accessing an rIDPB tuple.

99. RTAUCITK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLRTICITK relation, a failure code of DBNO_MATCH was returned. The rIRTICITK tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLRTICITK. Key fields: grptype, orig_tgn, icigrp.

Action:

This is a database inconsistency that can only be corrected by manual action.

100. RTAULDAT_BLF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BLF	Audit Mode: elev

Problem:

A dynamic access (DA) failure occurred when accessing an rILDAT_BLF tuple.

101. RTAULGLNSTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LGLNSTAT	Audit Mode: elev

Problem:

An inconsistency was found between the routing and terminal allocation (RTA) dynamic relation RLLGLNSTAT and the static relation RLRT_MHG. The AULGLNSTAT audit will clear the problem.

102. RTAULGSFSTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LGSFSTAT	Audit Mode: elev

Problem:

An exception occurred in rta/RTstatus/RTsccof.c, rta/RTGbrcs/RTsffstht.c, rta/RTinit/RTinlgsfst.c, rta/RTrcv/RTrcsfs_lg.c, or rta/RTstatus/RTsfg_stat.c. A failure occurred when attempting to insert (RTinlgsfst.c), delete (RTrcsfs_lg.c), or retrieve (the rest of the cases) an rLGSFSTAT tuple.

The data dump contains the simulated facilities group (SFG) group number (RTsfg_stat.c) or the contents of the tuple (the rest of the cases). The LGSFSTAT audit will be run. Study the stack frame dump to gain further insight into this problem.

103. RTAULGTKSTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LGTKSTAT	Audit Mode: elev

Problem:

An inconsistency was found between the routing and terminal allocation (RTA) dynamic relation RLLGTKSTAT and the static relation RLRT_TRKG. The AULGTKSTAT audit will correct the problem.

104. RTAULNSTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LNSTAT	Audit Mode: elev

Problem:

An inconsistency was found between the routing and terminal allocation (RTA) dynamic relation RLLNSTAT and the static relation RLRT_MHG. The AULNSTAT audit will clear the problem.

105. RTAULTMSTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LTMSTAT	Audit Mode: elev

Problem:

A failure occurred while accessing the RLLTMSTAT relation or corrupted data was detected in the dynamic data structure.

106. RTAULTSTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LTSBSTAT	Audit Mode: elev

Problem:

Failed to read or update the RLLTSBSTAT relation. An rLTSBSTAT tuple should exist for a given port because the lead_line bit in the RLLTSBPORT relation is set to DBYES, but the tuple does not exist. To correct the problem, the LTSBSTAT audit is run. The rLTSBSTAT tuple that is believed to be in error is dumped.

107. RTAUMODH_BLF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BLF	Audit Mode: elev

Problem:

A dynamic access (DA) failure occurred when accessing an rIMODH_BLF tuple.

108. RTAUMODM_BLF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BLF	Audit Mode: elev

Problem:

A dynamic access (DA) failure occurred when accessing an rIMODM_BLF tuple.

109. RTAUNCKTDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

An exception occurred in rta/RTterm/RTckterm.c, rta/RTterm/RTtrkterm.c, or rta/RTamps/RTapterm.c. An error return was received from the RTfownpc() function when attempting to check the status of the port routed to. The first data dump contains the contents of the port's port linkage area (PORTLA). The second data dump contains the error return. Study the stack frame dump to gain further insight into this assert.

110. RTAUNLGTKSTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LGTKSTAT	Audit Mode: elev

Problem:

An exception occurred in rta/RTrcv/RTtrct_lgt.c. During an RC/V update for trunk groups, the routing and terminal allocation (RTA) trigger function charged with growing the dynamic data block from a RLTKSTAT to a RLLGKSTAT block, failed to delete the old rITKSTAT tuple which led to a second failure when attempting to delete the new rLGTKSTAT tuple. The first data dump contains the contents of the new rLGTKSTAT tuple. The second data dump contains the error return received from the DBfdltup() primitive when attempting to delete the new tuple. The LGTKSTAT audit will be run. Study the stack frame dump to gain further insight into this assert.

111. RTAUNLTMSTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LTMSTAT	Audit Mode: elev

Problem:

An exception occurred in the rta/RTisdn/RTadcasel.c, rta/RTisdn/RTbusysa.c, or RTmcaoff.c file. An unsuccessful attempt to update the status of a sub-address in the RLLTMSTAT relation occurred. The first data dump contains the relevant rLTMSTAT tuple. The second data dump contains the relevant rIIS_LINE tuple. The LTMSTAT audit will be run. Study the stack frame dump to gain further insight into this assert.

112. RTAUNLTSTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LTSBSTAT	Audit Mode: elev

Problem:

An exception occurred in the RTrc_Itsbt() function during the read or update of the RLLTSBSTAT relation. The code expects the rLTSBSTAT tuple to exist for a given port (because the lead_line bit in the dynamic relation RLLTSBPORT is set to DBYES), but the tuple does not exist. To correct the problem, the LTSBSTAT audit is run.

The contents of the rLTSBSTAT tuple that is expected to be in error is dumped. The second dump is the return code from the DBfrdtup(), DBupgparm(), RTltdbnd(), DBfintup(), or DBathcdt() function. See the stack frame dump to determine which function originated the return code.

113. RTAUNONE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This is the general routing and terminal allocation (RTA) assert which schedules no audits.

114. RTAUNPCBLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

An exception occurred in rta/RTisdn/RTfeatdispc.c. During the attempt to send a message to a newly created feature or display terminal process, an error return of OSEPROC was received from the OSSENDMSG() macro. The first data dump contains the process ID of the new process. The second data dump contains the contents of the message. Study the stack frame dump to gain further insight into this assert. The process control block link area (PCBLA) audit will run.

115. RTAUNPORTLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

An exception occurred in rta/RTnswss/RTnuconn.c or in rta/RTisdn/RTfeatdispc.c. During the creation of a nail-up connection, an error return was received from the DAggetptla() primitive in the RTnucreat() function; or during the attempt to create a feature or display terminal process, an error return was received from the DAfownpc() primitive. The first data dump contains the contents of the rINAILUP tuple passed to the RTnucreat() function or the D port. The second data dump contains the rIORTLA tuple of the second nail-up port or of the D port. The PORTLA audit is called. Study the stack frame dump to gain further insight into this assert.

116. RTAUNQM_MLHG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: MLHG	Audit Mode: elev

Problem:

An exception occurred in rta/RTmfcqu (various files) when performing work related to the line queueing feature. While manipulating RLQM_MLHG dynamic data blocks, an error return was received from a database (DB) or dynamic access (DA) primitive. The first data dump contains the key value of the rIQM_MLHG tuple in question. The second data dump contains the error return value. The AUQM_MLHG audit is called. Study the stack frame dump to gain further insight into this assert.

117. RTAUNQO_MLHG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: MLHG	Audit Mode: elev

Problem:

An exception occurred in rta/RTmfcqu (various files) when performing work related to the line queueing feature. During the manipulation of RLQO_MLHG dynamic data blocks, an error return was received from a database (DB) or dynamic access (DA) primitive. The first data dump contains the group number of the rIQO_MLHG tuple in question. The second data dump contains the error return value. The AUQO_MLHG audit is called. Study the stack frame dump to gain further insight into this assert.

118. RTAUNRTMHG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RTMHG	Audit Mode: elev

Problem:

An exception occurred in rta/RTarc/RTarchstat.c. While processing a local area signaling services (LASS) automatic call back/automatic recall (AC/AR) status query, the dynamic data for a multiple position hunt (MUPH) group could not be retrieved. The first data dump contains the error return from the DBretrvblk() primitive. The second data dump contains the value of the MUPH group. Study the stack frame dump to gain further insight into this assert. The multi-line hunt group (MLHG) audit is scheduled.

119. RTAUNTEDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TEDB	Audit Mode: elev

Problem:

An exception occurred in rta/RTblf/RTsndtgbwl.c. During an attempt to turn the integrated services digital network (ISDN) attendant trunk group busy warning lamp on or off, the appropriate RLTEDB dynamic data block was unable to be accessed in the RTlitetone() function. The first data dump contains the D-port value that was passed. The second data dump contains the error return from the ISTEFRSC() macro. The terminal equipment data block (TEDB) audit is called. Study the stack frame dump to gain further insight into this assert.

120. RTAUNTEILA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TEILA	Audit Mode: elev

Problem:

An exception occurred in rta/RTisdn/RTfeatdispc.c. During the attempt to create a new feature or display terminal process, the RTfeatdisp() function could not correctly access the relevant terminal endpoint identifier linkage area (TEILA). The first data dump contains the contents of the relevant terminal equipment data block (TEDB), and the second data dump contains the contents of the TEILA accessed. The TEILA audit is called. Study the stack frame dump to gain further insight into this assert.

121. RTAUPCBLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

An error occurred with the dynamic data relation RLPCBLA.

122. RTAUPORTLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

An error occurred with the dynamic data relation RLPORTLA.

123. RTAUPOSDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ACDPOSDB	Audit Mode: elev

Problem:

An exception occurred in rta/RTisdn/RTacdterm.c. An inconsistency was detected between the RLLTMSTAT and RLACDPOSDB relations concerning the automatic call distribution (ACD) position state. An ACDPOSDB audit is scheduled to clear the problem.

124. RTAUQ_ISAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to insert a tuple into the dynamic relation RLQ_ISAT.

Data Structures:
RLQU_OS, RLQ_ISAT.

Action:

The RLQ_ISAT dynamic relation is based on static data in the RLQU_OS relation. The RLQU_OS relation should be verified.

125. RTAUQM_MLHG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: MLHG	Audit Mode: elev

Problem:

Could not read an rIQM_MLHG tuple or the tuple was not owned by the multiline hunt group.

126. RTAUQMOGT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: OGT	Audit Mode: elev

Problem:

A failure occurred in reading or writing a dynamic modular queueing phase II queue member tuple. The audit AUQM_OGT will clear the problem.

127. RTAUQO_ICI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to insert a tuple into the owner relation RLQO_ICI for integrated services attendant (ISAT) multiline hunt group queueing.

Data Structures:
RLQU_OS, RLQO_ICI.

Action:

The RLQO_ICI relation is initialized based on data in the static relation RLICX_ICI. The RLICX_ICI relation should be verified.

128. RTAUQO_MLHG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: MLHG	Audit Mode: elev

Problem:

Could not read an rIQO_MLHG tuple or the tuple was not owned by the multiline hunt group.

129. RTAUQOOGT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: OGT	Audit Mode: elev

Problem:

A failure occurred in reading or writing a dynamic modular queueing phase II queue owner tuple. The audit AUQO_OGT will clear the problem.

130. RTAUQUOGTOS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: OGTOS	Audit Mode: elev

Problem:

An inconsistency was found in the static relation RLQU_OGTOS and the dynamic data in the dynamic relation RLQO_OGT. The audit AUQU_OGTOS will clear the problem.

131. RTAURCVMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message type and from pid values are dumped for corrupted messages.

132. RTAUREPLYBLF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: REPLYBLF	Audit Mode: elev

Problem:

A dynamic access (DA) failure occurred when accessing an rIREPLYBLF tuple.

133. RTAURTMHG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RTMHG	Audit Mode: elev

Problem:

An inconsistency was found between the static relation RLRT_MHG and the routing and terminal allocation (RTA) dynamic multiline hunt group (MLHG) data. The audit AURTMHG will correct any discrepancies. The group number used to access the dynamic relation may be wrong; or the group number is correct, but the dynamic data does not exist.

Because of the distributed nature of hunting data, certain events can cause this assert to occur occasionally. An SM or remote SM (RSM) going into and out of standalone, or recent change activity affecting the MLHG such as originations and terminations can cause several of these asserts to occur for a short period of time. These occurrences should be ignored. However, if the assert continues to occur or occurs in large numbers, the appropriate organization should be contacted to provide a fix.

134. RTAURTMUPH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: MUPHST	Audit Mode: elev

Problem:

During call processing a data problem was encountered with the multi-position hunt dynamic data. An audit is scheduled to clean up the data inconsistencies.

135. RTAURTTRKG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RTTRKG	Audit Mode: elev

Problem:

An inconsistency was found between the static trunk group data in the RLRT_TRKG relation and routing and terminal allocation (RTA) linearly hunted dynamic trunk group data. The AURTTRKG audit will correct the problem.

136. RTAUSFSTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: SFSTAT	Audit Mode: elev

Problem:

An exception occurred in rta/RTstatus/RTsccof.c, rta/RTGbrcs/RTsffstht.c, rta/RTinit/RTinsfstat.c, rta/RTrcv/RTrcsflg_s.c, rta/RTstatus/RTsfg_stat.c or rta/RTisatnd/RTtgrfsh.c. A failure occurred when attempting to

insert (RTinsfstat.c), delete (RTrcsflg_s.c), or retrieve (the rest of the cases) an rISFSTAT tuple.

The data dump contains the simulated facilities group (SFG) group number (RTsfg_stat.c and RTtgrfsh.c) or the contents of the tuple (the rest of the cases). The SFSTAT audit will be run. Study the stack frame dump to gain further insight into this problem.

137. RTAUTEDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TEDB	Audit Mode: elev

Problem:

A failure occurred while accessing the RLTEDB relation. Could not get a pointer to the rITEDB tuple.

138. RTAUTEILA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TEILA	Audit Mode: elev

Problem:

An error was found when accessing the RLTEILA relation.

139. RTAUTKOWNER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TKOWNER	Audit Mode: elev

Problem:

An error occurred with the dynamic relation RLTKOWNER.

140. RTAUTKQUE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TKQUE	Audit Mode: elev

Problem:

An error was encountered with dynamic relation RLTKQUE.

If a busy trunk member is deleted with RC/V View 5.5 (TRUNK MEMBER), the busy member becomes idle. This is due to a window condition in which call processing attempts to access the RLTKOWNER relation with a key that no longer exists because RC/V deleted it. The assert can be ignored for this situation, since the integrity of the data was not affected.

141. RTAUTKSTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TKSTAT	Audit Mode: elev

Problem:

An inconsistency was found between the routing and terminal allocation (RTA) dynamic linearly hunted trunk group data and the static relation RLRT_TRKG. The AUTKSTAT audit will correct the problem.

142. RTBADBMAPE9 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The valid electronic switching network (ESN) bitmap does not exist.

Data Structures:

RLESN_MAP, RLESNTRAN.

Action:

Use ODBE to verify that the rIESN_MAP tuple actually does not exist. Use ODBE to insert the tuple, or insert any unused ESN temporarily, which will cause this tuple to be inserted. RC/V View 9.40 (SELECTIVE ROUTING AND TRANSFER DATA FOR ESN [SM/DAS]) can also be used to insert the rIESN_MAP tuple.

143. RTBADESNE9 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency exists between the RLESNTRAN relation in the CMP and the RLESCO relation on the SM indicated.

Data Structures:

RLESNRTAN, RLESCO.

Action:

Determine which relation is incorrect.

144. RTBADHTYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While attempting to process a trunk group keep alive request, an illegal hunt type was found. This occurred after the RLRT_TRKG relation was successfully read and the htype attribute was switched on.

Data Structures:

RLRT_TRKG.

The ROP output provides the following fields in the order listed: RLrt_trkg.grpnum and RLrt_trkg.htype.

Action:

This is a database inconsistency because an unknown hunt type value was found in the rLRT_TRKG tuple just read. Verify the accuracy of the tuple on the current module, especially the htype field.

145. RTBADMATE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not determine the originating or terminating remote SM (RSM) mate. A database (DB) failure was returned when reading the RLCL_MATES relation.

146. RTBADRTSTATE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid or undefined routing state was encountered.

147. RTBCERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTinit/RTreqihkys.c. An error return was received from the OSBCAST() macro when

attempting to broadcast to all SMs the request to update all integrated services digital network (ISDN) multiline hunt group (MLHG) huntkeys. The first data dump contains the return value from OSBCAST(), the second data dump contains the process ID of the process to receive the broadcast message on each operational SM, and the third dump contains the body of the MGCHKIHKYS message itself. Study the stack frame dump to gain further insight into this assert.

148. RTBCLCF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rBCL_CF tuple with the given key cannot be found in the static database. The tuple is missing or the key used to access the tuple is invalid.

Data Structures:

RLBCL_CF. Key field: feat_id.

Action:

This is a database inconsistency that can only be corrected by manual action. Use RC/V View 12.62 (BULK CALLING LINE IDENTIFICATION FEATURE DEFINITION) to re-insert the features for that user.

149. RTBCLGCNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data inconsistency was detected when attempting to assign a line identification feature. A duplicate rBCLGCNT tuple was found in an attempt to insert a new tuple. The GRPIDX value dumped is a duplicate (in use) index. The invalid index is acquired from the grptype and grpnum fields of the RLBCL_MHTG relation. The macro used to convert the GRPIDX is RTNUMTYP2IDX(grpnum, grptype).

Data Structures:

RLBCL_MHTG. Key fields: grpnum, grptype.

Action:

Attempt to resolve the data inconsistency with the following audits: AUD:BCLMHTG,SM=x and AUD:BCLGCNT,SM=x (where "x" is the number of the SM where the assert fired), or AUD:BCLMHTG,CMP=0 and AUD:BCLGCNT,CMP=0. If the problem is not corrected by these audits, collect printout data and escalate to your next level of support.

150. RTBCLGRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rBCL_GRP tuple with the given key cannot be found in the static database. The tuple is missing or the key used to access the tuple is invalid.

Data Structures:

RLBCL_GRP. Key field: bcgpid.

Action:

This is a database inconsistency that can only be corrected by manual action. Use RC/V View 4.62 (BULK CALLING LINE IDENTIFICATION GROUP PARAMETERS) to create the group for the customer. Then use RC/V View 1.62 (BULK CALLING LINE IDENTIFICATION LINE PARAMETERS) to assign the group to BCLID.

151. RTBCLLCNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data inconsistency was detected when attempting to assign a line identification feature. A duplicate rBCLLCNT tuple was found in an attempt to insert a new tuple. The BCL_IDX value dumped is a duplicate (in use) index. The invalid index was acquired from the RLBC_LTM and RLBCLLTH relations.

Data Structures:

RLBCLLTH. Key fields: module, bcl_idx, qid.

RLBC_LTM. Key fields: ltm_idx, ltm_type, lead_module.

Action:

Attempt to resolve the data inconsistency with the following audits: AUD:BCLLTM,SM=x and AUD:BCLLCNT,SM=x (where "x" is the number of the SM where the assert fired). If the problem is not corrected by these audits, collect printout data and escalate to your next level of support.

152. RTBCLLTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rBCL_LTM tuple with the given keys cannot be found in the static database. The tuple is missing or the keys used to access the tuple are invalid.

Data Structures:

RLBC_LTM. Key fields: ltm_idx, ltm_type, lead_module.

Action:

This is a database inconsistency that can only be corrected by manual action.

1. Verify that the keys are valid. LTM_TYPE will be 0 or 1, and LTM_IDX must be between 1 and 4095. If the keys are not valid, file a trouble report.
2. Use ODBE in the batch read (BR) mode to read the RL_FCLINE relation from the SM that the assert was fired from into a *UNIX*[®] file. Use the *UNIX*[®] editor to locate the rFC_LINE tuple that has the same LTM_TYPE and LTM_IDX printed on the ROP by checking the ltm_type and ltm_idx attributes.
3. Determine if the rFC_LINE tuple's port and party have been assigned the bulk calling line identification (BCLID) feature. If so, reset the brc_dn bit in the tuple.
4. Use RC/V View 1.11 (BRCS FEATURE ASSIGNMENT [LINE]), or RC/V View 1.8 (ANALOG LINE/BRCS ASSIGNMENT), or RC/V View 23.8 (DSL/BRCS ASSIGNMENT) to re-insert the features for that user.
5. If the rFC_LINE tuple's port and party have not been assigned the BCLID feature, determine if they have been assigned as part of a business and residential custom services (BRCS) features group (BFG).
6. Use RC/V View 12.9 (BRCS FEATURE GROUP CONSTRUCTION AND UPDATE) to re-assign the user to the BFG.
7. If the error cannot be corrected by steps 2-6, file a trouble report.

153. RTBCLMHTG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rBCL_MHTG tuple with the given keys cannot be found in the static database. The tuple is missing or the keys used to access the tuple are invalid.

Data Structures:

RLBCL_MHTG. Key fields: grpnum, grptype.

Action:

This is a database inconsistency that can only be corrected by manual action.

1. If grptype equals 1, use RC/V View 5.1 (TRUNK GROUP) to re-insert the features for that user.
2. If grptype equals 0, use RC/V View 1.11 (BRCS FEATURE ASSIGNMENT [LINE]), or RC/V View 1.8 (ANALOG LINE/BRCS ASSIGNMENT), or RC/V View 23.8 (DSL/BRCS ASSIGNMENT) to re-insert the features for that user.

154. RTBCLOPTS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rBCL_OPTS tuple with the given key cannot be found in the static database. The tuple is missing or the key used to access the tuple is invalid.

Data Structures:

RLBCL_OPTS. Key field: feat_id.

Action:

This is a database inconsistency that can only be corrected by manual action. Use RC/V View 12.62 (BULK CALLING LINE IDENTIFICATION FEATURE DEFINITION) to re-insert the features for that user.

155. RTBFGPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The relation RLCKT_PORT was read with invalid key values, (ckname, port_idx) or a tuple is missing from this relation. This is a database inconsistency - contact your next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

156. RTBFMLG1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGmlg/RTjump.c or rta/RTGmlg/RTbfmlg.c. During the selection of a multiline hunt group (MLHG) group and/or member for a line termination, a standalone condition was encountered. When attempting to perform standalone routing, an invalid return was received from the RTjumpstest() function. The first data dump contains the invalid return value. Study the stack frame dump to gain further insight into this assert.

157. RTBGRP BH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTstatus/RTbusygrp.c. During an attempt to update the group make busy flag for a multiline hunt group (MLHG), an invalid hunt type was passed as an argument. The first data dump contains the MLHG number, and the second data dump contains the hunt type. Study the stack frame dump to gain further

insight into this assert.

158. RT_BIKYPM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was found in the RLBIKYPM relation.

Data Structures:

RLBIKYPM. Key fields: grpnum, member.

Action

Manual action is needed to remove the rBIKYPM tuple.

159. RTBKYPM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLBIKYPM relation, a failure code of DBNO_MATCH was returned. The rBIKYPM tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLBIKYPM. Key fields: grpnum, member.

Action:

This is a database inconsistency that can only be corrected by manual action.

160. RTBLFCL1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTblf/RTblfclock.c. In the RTblfclock(), RTrmreply(), or RTadreply() function, an error return was received from the DAGhhcly() primitive when trying to access the RLLDAT_BLF relation, or an invalid value was found in the rILDAT_BLF tuple accessed. The first data dump contains the key used to access the relation, or the contents of the tuple retrieved. Study the stack frame dump to gain further insight into this assert.

161. RTBLFCL2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTblf/RTblfclock.c. In the RTupdate() function, when attempting to send a message to the 100s group controller, an invalid message type was found in the appropriate array element of the RTupdtq[] structure. The first data dump contains the contents of the appropriate array structure. Study the stack frame dump to gain further insight into this assert.

162. RTBLFCL3 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTblf/RTblfclock.c. In the RTblftimer() or RTadmodm() function, an error return was received from the DARhdhdm() or DAGsdhdm() primitive when attempting to access a tuple in the RLMODM_BLF dynamic relation. The first data dump contains the key to or previous copy of a tuple from that relation. Study the

stack frame dump to gain further insight into this assert.

163. RTBLFCL4 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTblf/RTblfclock.c. In the RTadmodh(), RTrmmodh(), or RTfndmodh() function, an error return was received from the DAghhcdh() primitive when attempting to access a tuple in the RLMDH_BLF dynamic relation. The first data dump contains the key to or previous tuple of the relevant rIMODH_BLF tuple. Study the stack frame dump to gain further insight into this assert.

164. RTBLFCL5 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTblf/RTblfclock.c. In the RTmatth() or RTadatth() function, an error return was received from the DAahhcb() primitive when attempting to access a tuple from the RLATTH_BLF dynamic relation. The first data dump contains the key to or previous tuple of the relevant rIATTH_BLF tuple. Study the stack frame dump to gain further insight into this assert.

165. RTBLFCL6 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTblf/RTblfclock.c. In the RTadattm() function, an error return was received from the DAahbltm() primitive when attempting to add an rIATTM_BLF tuple to the busy list. The first data dump contains the contents of the tuple to be added to the busy list. Study the stack frame dump to gain further insight into this assert.

166. RTBLFMA1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTblf/RTblfmain.c. An error return of OSERANGE was received from the OSWGETMSG() macro. An invalid maxtime was provided to OSWGETMSG(). The first data dump contains the return value from the OSWGETMSG() macro. The second data dump contains the maxtime value that was provided to OSWGETMSG(). Study the stack frame dump to gain further insight into this assert.

167. RTBLFMA2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTblf/RTblfmain.c. An error return of OSELENGTH was received from the OSWGETMSG() macro. A truncated message was received by OSWGETMSG(). The first data dump contains the return value from the OSWGETMSG() macro. The second data dump contains the message received by OSWGETMSG(). Study the stack frame dump to gain further insight into this assert.

168. RTBLFMA3 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTblf/RTblfmain.c. The OSWGETMSG() macro expired because the OSTIMER()

macro was provided an invalid time parameter resulting in an error return of OSERANGE from OSTIMER(). The first data dump contains the return value from the OSWGETMSG() macro. The second data dump contains the return value from the OSTIMER() macro. The third data dump contains the time value that was provided to OSTIMER(). Study the stack frame dump to gain further insight into this assert.

169. RTBLFMA4 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTblf/RTblfmain.c. The OSWGETMSG() macro expired even though there was an outstanding timer via the OSTIMER() macro. The first data dump contains the return value from the OSWGETMSG() macro. The second data dump contains the maxtime value that was provided to OSWGETMSG(). The third data dump contains the time value that was provided to OSTIMER(). Study the stack frame dump to gain further insight into this assert.

170. RTBLFMA5 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTblf/RTblfmain.c. The OSWGETMSG() macro timed out. The first data dump contains the return value from OSWGETMSG(). The second data dump contains the maxtime value that was provided to OSWGETMSG(). Study the stack frame dump to gain further insight into this assert.

171. RTBLFMA6 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTblf/RTblfmain.c. The OSWGETMSG() macro returned an invalid return code. The data dump contains the return value from OSWGETMSG(). Study the stack frame dump to gain further insight into this assert.

172. RTBLFMG1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTblf/RTblfmsghd.c. In the RTblf_msghd() function, an invalid message was received. The data dump contains the contents of the unexpected message. Study the stack frame dump to gain further insight into this assert.

173. RTBOSSERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error return code was received from a call to the OSSENDMSG() macro. The return code indicated that the type of error is due to a routing and terminal allocation (RTA) application logic error, not an internal resource shortage or exception. Study the stack frame dumps to determine the exact location of the exception.

Relevant data was collected and will be printed in the first 3 words of the dump (data after that is irrelevant):

Word 1 - The return code from the OSSENDMSG() macro.

Word 2 - The destination that the message was being sent to. This is a structure of the type OSPID, containing the

process number, the uniqueness, and the destination processor.

Word 3 - The message header of the message to be sent. This is a structure of type OSMSGHEAD and contains the type of the message, the size of the message, and the priority of the message.

174. RTBREQ_INV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The requested service for B-channel use was invalid. In rta/RTisdn/RTacdterm.c, an ACDBRCS hunted call termination was requested for circuit switched data (CSD), but only circuit switched voice (CSV) was allowed.

Problem Cause:

This call should have been blocked earlier, but was not.

Action:

Check the logic in rta/RTGscreen/RTacdscr.c.

175. RTBSYMLG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RTMHG	Audit Mode: elev

Problem:

An exception occurred in rta/RTstatus/RTbusymlg.c. During the attempt to busy out members of a multiline hunt group (MLHG), the DAgetlnstat() primitive could not access the MLHG passed as an argument. The first data dump contains the terminating data block from the MGRT_GEN message. The second data dump contains the text of the MGRTSTFWD message. The AUFC_RTMHG audit is called. Study the stack frame dump to gain further insight into this assert.

176. RTBTMREQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A MGTM_REQ or MGTM_TERM message was received in the AM routing and terminal allocation (RTA) system process. The rt_seq field indicated that the message is not related to a remote measurement system 3 (RMSD3) route request, which is the only terminal maintenance subsystem (TM) type expected to be received in the AM system process.

The data dumped is the actual message received, including the message head and the text of the MGTM_REQ or MGTM_TERM message.

177. RTBTNHN1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTblf/RTbthndlr.c. In the RTbthndlr(), RTfndatth(), or RTblfdsp() function, an error return was received from the DAGETATTM() macro, or from the DAghhcb() or PSqmsginit() function. The first data dump contains the busy lamp field (BLF) message, the key to the rIATTH_BLF tuple, or the error return value from the PSqmsginit() function. Study the stack frame dump to gain further insight into this assert.

178. RTBTNHN2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTblf/RTbthndlr.c. An invalid value was passed to the RTblfdsp() function in the status type argument. The first data dump contains the invalid status type value. Study the stack frame dump to gain further insight into this assert.

179. RTBTNHN3 (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in either rta/RTblf/RTbthndlr.c or rta/RTism/RTism_sm_upd.c. During an attempt to update busy lamp field (BLF) status or terminal status monitoring (TSM) lamp update status, an error return was received from the PSqmsgsend() function when attempting to send the Q931 update message.

The first data dump contains the error return. The second data dump contains the link information structure, and the third data dump contains the qinfo structure of the message. Study the stack frame dump to gain further insight into this assert.

180. RTBTNHN3 (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTblf/RTbthndlr.c. During the attempt to update busy lamp field (BLF) status, an error return was received from the PSqmsgsend() function when attempting to send the Q931 lamp update message. The first data dump contains the error return. The second data dump contains the link information structure, and the third data dump contains the qinfo structure of the message. Study the stack frame dump to gain further insight into this assert.

181. RTBUSYF1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTterm/RTbusyfs.c. During busy feature selection when an integrated services digital network (ISDN) intercom (ICOM) group was present in the terminating message, an error return was received from the RTsel_feat() function. The first data dump contains the error return value. Study the stack frame dump to gain further insight into this assert.

182. RTVBCH1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTterm/RTbvbchan.c. When attempting to determine the B channel status for a busy verify display, an unknown value was returned from the RIgetbstat() function in the bstatus variable. The first data dump contains the port value. Study the stack frame dump to gain further insight into this assert.

183. RTBV_DBRDFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read the relation RLFC_LINE was not successful. No audits were run. This assert originates from the RTbvterm() function.

184. RTBVNOT_LD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An expected feature is not loaded. No audits were run. This assert originates from the RTbvterm() function.

185. RTCAMAI1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in the RTcaminit() function. An office number identification (ONI) call retry attempt was detected or an unexpected message was received. The data dump contains the terminating data block of the routing data block. Inspect the stack frame dump to determine the exact cause of the error and for other useful data.

186. RTCAMAI2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in the RTcamainit() function. An error return from the RTP_htmbr() primitive was received when attempting to obtain trunk group information. The first data dump will contain the terminating data block and the second will contain the return value from RTP_htmbr(). Study the stack frame dump for further information.

187. RTCAMAQ1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred during centralized automatic message accounting (CAMA) queueing. The error occurred in one of four functions: RTconqueue(), RTdelqueue(), RTdequeue(), or RTenqueue(). Study the stack frame dump to determine the function where the error occurred. The data dump contains the CAMA queueing data block (RTcmqdblk).

188. RTCAMAQ2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred during centralized automatic message accounting (CAMA) queueing. The error occurred in one of four functions: RTconqueue(), RTdelqueue(), RTdequeue(), or RTenqueue(). Study the stack frame to determine the function where the error occurred. The first data dump contains the CAMA queueing data block (RTcmqdblk) and the second contains the error return.

189. RTCAMPPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return was received when attempting to read an rIFC_PORTTYP tuple. No audits are scheduled. The assert originates from the RTcampon() function.

190. RTCCSVP1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTccs/RTccs_vpa.c. While processing a common channel signaling (CCS) trunk call, the RTccs_vpa() function was called to determine the percentage of CCS calls to have the voice path assurance (VPA) test performed. However, the value found in the appropriate rIRT_TRKG tuple for that percentage (vpa_rate) was not valid. The first data dump contains the vpa_rate value. Study the stack frame dump to gain further insight into this assert.

191. RTCF_LTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLCF_LTM relation, a failure code of DBNO_MATCH was returned. The rICF_LTM tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLCF_LTM. Key fields: lead module, LTM index, LTM type, feature ID.

Action:

This is a database inconsistency that can only be corrected by manual action.

192. RTCGA_STAT (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLCGA_STAT relation, a failure code of DBNO_MATCH was returned. The rICGA_STAT tuple is missing or the key used to read this relation was not set properly.

Data Structures:

RLCGA_STAT. Key fields: (circuit)NAME, (spn)NAME.

Action:

This is a database inconsistency that can only be corrected by manual action.

193. RTCHRGIDXEXP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLCHRGIDXEXP relation, a failure code of DBNO_MATCH was returned. The rLCHRGIDXEXP tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLCHRGIDXEXP. Key field: charge_x.

Action:

This is a database inconsistency that can only be corrected by manual action.

194. RTCICEX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The identified route has a route description of shared trunk group (STG) and a signaling protocol of equal access or international on RC/V View 10.2 (ROUTE INDEX [ROUTING]), but the route is provisioned to outpulse a three digit carrier identification code (CIC) and the first digit of the CIC is not zero.

Data Structures:

RLRT_ROUTING. Key field: route index (RTI).

The signaling protocol (SIG PRO) is also dumped.

Action:

For feature group D (FGD), provision the CIC on RC/V View 10.2, field CIC 4 to YES in order to outpulse the 4-digit CIC. Note: The far office may also need to be upgraded to receive the 4-digit CIC.

195. RTCKTDATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLCKTDATA relation, a failure code of DBNO_MATCH was returned. The RLCKTDATA tuple is missing or the key used to read this relation was not set properly.

Data Structures:

RLCKTDATA. Key field: (circuit)NAME.

Action:

This is a database inconsistency that can only be corrected by manual action.

196. RTCLIDAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLCLIDAT relation, a failure code of DBNO_MATCH was returned. The RLCLIDAT tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLCLIDAT. Key field: clid.

Action:

This is a database inconsistency that can only be corrected by manual action.

197. RTCLMATEQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Static data was found in the RLCL_MATES relation when a no match was expected for a cluster mate. No audits were run. The assert originates from the RTgenreq() function.

198. RTCMDTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown command type parameter was encountered.

199. RTCMSUS1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in the RTcmsusp() function. An unexpected message was received. The data dump contains the message head of the unexpected message.

200. RTCMSUS2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in the RTcmsusp() function when processing a request to start or end centralized automatic message accounting (CAMA) suspension. One of the following occurred: 1) an attempt to update the DDRCAMASP data delivery (DD) key failed, or 2) an attempt to send status information to human machine interface (HM) via the HMoutmsg() primitive returned a failure value of HMERROR.

Inspect the stack frame dump to determine the exact cause of the error. The first data dump contains the error return code and the second contains either the input message header (for the DD update exception) or the text of the message to be sent to HM (for the HMoutmsg() error).

201. RTCMTUNEQ (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CMT path is not equipped to the GSM.

Probable Cause:

This assert is fired to show an inconsistency between the RLRT_TRKG (view 5.1) and the RLCMTPATH (view 16.16) relations. Attribute psu_mod in RLRT_TRKG relation indicates the GSM used for ISUP signaling. There must be a CCS message transport (CMT) path equipped to this GSM. This assert is fired when an rLCMTPATH tuple cannot be found in the static database. Either the rLCMTPATH tuple is missing or the keys used to access the tuple are invalid.

Action:

The first data dump contains the trunk group number (RLrt_trkg.grpnum) which is the key of the RLRT_TRKG relation. The second and the third data dump contain the gsm and ngsm which are the keys to RLCMTPATH relation. The gsm key used to read RLCMTPATH relation is obtained from RLrt_trkg.psu_mod. The ngsm is also obtained from RLrt_trkg.psu_mod. Currently gsm and ngsm are the same. See next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

202. RTCNDDATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data inconsistency was detected when attempting to assign a line identification feature. The IC_IDX value dumped is a duplicate (in use) index. The invalid index is acquired from the RLIC_LTH relation in the AM.

Data Structures:

RLICLIDIDX. Key fields: LTM_IDX, LTM_TYPE.

RLIC_LTH. Key fields: MODULE, IC_IDX, QID.

Action:

Attempt to resolve the data inconsistency with the following audits: AUD:CNDDATA,SM=x and AUD:ICLIDIDX,SM=x (where "x" is the number of the SM where the assert fired). If the problem is not cleaned up by these audits, collect printout data and escalate through the appropriate channels.

203. RTCOMPFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

After two level compression attempts, the compressed message size is still too large (that is, larger than 254) to be sent over the network control and timing (NCT) links. The original message content is dumped.

204. RTCONVR1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTpp/RTconvrtpl.c. During the conversion of precedence levels for the precedence and preemption (PP) feature, an invalid value was found in the input argument. The first data dump contains the invalid value. Study the stack frame dump to gain further insight into this assert.

205. RTCREAT1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTterm/RTcreatprc.c, rta/RTamps/RTcreatatp.c, or in rta/RTterm/RTpf_slvld.c when attempting to create a new terminal process. The OSCREATE() macro returned the OSEPROG code indicating that an invalid program ID was passed in. The first data dump contains the structure containing the invalid program ID. Study the stack frame dump to gain further insight into this assert.

206. RTCREAT2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTterm/RTcreatprc.c. or in rta/RTamps/RTcreatatp.c. When attempting to create a terminal process for the terminating party of a call, the program ID to be used was that of a system process. The first data dump contains the process data block passed to the RTcreatprc() function. The second data dump contains the termination message. Study the stack frame dump to gain further insight into this assert.

207. RTCRTQT1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTmfcqu/RTcreatqtp.c. During the attempt to create a queueing terminal process (for a termination request that will be queued), an error return of OSEPROG was received from the OSCREATE() macro. The first data dump contains the create data structure input to the OSCREATE() macro. The second data dump contains the process data block passed as an argument to the RTcreatqtp() function and the third data dump contains the MGLNQ_TERM or MGTKQ_TERM message that was to have been sent to the newly created terminal process. Study the stack frame dump to gain further insight into this assert.

208. RTCRTQT2 (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTmfcqu/RTcreatqtp.c. During the attempt to create a queueing terminal process (for a termination request that will be queued), an error return was received from the DAgetpcbl() primitive when attempting to get a pointer to the process control block link area (PCBLA) of the newly created process.

The first data dump contains the error return from DAgetpcbl(). The second data dump contains the process ID of the newly create terminal process. The third data dump contains the create data structure passed to the RTcreatqtp() function. The newly created terminal process is purged. Output from the RTDUMPDATA() macro call may follow this assert. Study the stack frame dump to gain further insight into this assert.

209. RTCTVRWRG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ACDBRCS hunted call could not be terminated because the agent is marked as cutovered. The assert is fired from rta/RTisdn/RTacdterm.c

Data Structures:

The dport is the first data item dumped.

Action:

Use the dport information to check the ACDBRCS cutover data.

210. RTCUSPI1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTmfcqu/RTcuspinit.c. While attempting to initialize the cyclic update system process for multiline hunt group (MLHG) lamp updates, an invalid initialization reason was passed. The first data dump contains the invalid reason. Study the stack frame dump to gain further insight into this assert.

211. RTDAFFCOPC_INV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return value was received from the DAffcopc() primitive.

212. RTDAFSPOPC_INV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return value was received from the DAfspopc() primitive.

213. RTDATABAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A routing program encountered an inconsistent or invalid value in a control table. Since the control table is constant data, either the static data is corrupted or the table was over-indexed. The contents of the table are dumped in a raw (hex) dump on the ROP. Program listings for the program identified by the failing address must be consulted to determine the specifics of this error.

214. RTDBRD_FAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the RLNAILUP relation with the DBfrdtup() function. The return code was not DBNO_MATCH.

215. RTDD1ALNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data delivery (DD) read error was indicated in the ddret parameter.

216. RTDD1IMAB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data delivery (DD) read error occurred on the key DDRTDDC.

217. RTDD1SMAB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data delivery (DD) read error was indicated by the ddret parameter.

218. RTDD1STF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data delivery (DD) read error occurred on one of three keys.

219. RTDD2ALNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data delivery (DD) read error occurred. Route requests are canceled.

220. RTDD2IMAB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data delivery (DD) read error was indicated by the ddret parameter.

221. RTDEFHUNTTYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid hunt type was contained in the RLRT_MHG relation.

Data Structures:

RLRT_MHG. Key field: group number.

The group number (DMGRPNUM) is found in the first four hex digits of the local data.

Action:

Use RC/V to view the RLMLHG (RC_multiline_hunt_group_info) relation. Check the lhntype (type of hunting) attribute and correct it if it is not valid.

222. RTDEFMLHG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid mode was given to routing and terminal allocation (RTA) when initializing the RLRT_MHG relation.

223. RTDEFQKEYPRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid mode was given to routing and terminal allocation (RTA) when initializing the RTintkque() function.

224. RTDEFSFG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid mode was given to routing and terminal allocation (RTA) when initializing the RLRT_SFG relation.

225. RTDEFTRKG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid mode was given to routing and terminal allocation (RTA) when initializing the RLRT_TRKG relation.

226. RTDELFACT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception has occurred in RTrcfacsta().

Probable Cause:

During a RC/V transaction deleting a rIFACSTAT tuple, the appropriate rIFACSTAT tuple was not removed.

Action:

There are 2 dcf-data dumps generated by this assert; the first gives the bad return value from DBfdltup() which caused this assert to fire, and the second gives the content of the rIFACSTAT tuple affected.

227. RTDGCX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTprims/RTdigcvx.c. While attempting to process a route, a data inconsistency was encountered when prefixing and deleting digits was performed. The number of dialed digits was less than the number of digits to delete. The first data dump contains the dialed digit information buffer. Study the stack frame dump to gain further insight into this assert.

228. RTDLTNOT_LD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An expected feature is not loaded. No audits are run. This assert originates from the RTlineterm() function.

229. RTDNBFG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read the RLDN_FEATS relation resulted in a DBNO_MATCH. An rIDN_FEATS tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLDN_FEATS. Key fields: lead module, ltm index, ltm type.

Action:

The ROP report provides the keys to the rIDN_FEATS tuple. Verify the features on the line with RC/V View 1.11 (BRCS FEATURE ASSIGNMENT [LINE]). If these are correct, use ODBE with the keys printed to verify the existence of an rIDN_FEATS tuple. If the tuple does not exist, verify that for the line, the rIFC_LINE tuple with the same ltm_index and ltm_type has the brc_dn field set to DBNO.

230. RTDNFEAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read an rIDN_FEATS tuple resulted in a DBNO_MATCH. The rIDN_FEATS tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLDN_FEATS. Key fields: lead module, ltm type, ltm index.

The ROP report provides the keys to the rIDN_FEATS tuple. The D-channel portname is also printed on the ROP. It will be printed as zero if this data was unavailable.

Action:

Verify the features on the line with RC/V View 1.11 (BRCS FEATURE ASSIGNMENT [LINE]). If these are correct, use ODBE with the keys printed to verify the existence of an rIDN_FEATS tuple. If the tuple does not exist, verify that for the line, the rIFC_LINE tuple with the same ltm_index and ltm_type has the brc_dn field set to DBNO.

231. RTDNRTG1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTarc/RTdnrtgmod.c. While verifying that automatic call back/automatic recall (AC/AR) is allowed for the current directory number (DN), an invalid message type was passed. The first data dump contains that invalid message type. Study the stack frame dump to gain further insight into this assert.

232. RTDNRTG2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTarc/RTdnrtgmod.c. While verifying that automatic call back/automatic recall (AC/AR) is allowed for the current directory number (DN), an inconsistency was found in the choke list. The first data dump

contains the choke list. Study the stack frame dump to gain further insight into this assert.

233. RTDNVTERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unrecognized or corrupt value was passed to the RTdnv_terr() function during the operation of local area signaling services (LASS) screen list editing (SLE) features. The err_type parameter was not matched. The value of the err_type passed in is dumped.

234. RTDQALG1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTmfcqu/RTdq_alg.c. During the attempt to dequeue an integrated services attendant (ISAT) call, an error return was received from the DBretrvblk() function when attempting to obtain a pointer to a tuple in the RLQ_ISAT relation.

The first data dump contains the tuple retrieved (may be corrupted or valid depending on the cause of the error). The second data dump contains the contents of the MGLN_DQUE message received, and the third data dump contains the error return value from DBretrvblk(). Study the stack frame dump to gain further insight into this assert.

235. RTDQALG2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTmfcqu/RTdq_alg.c. During the attempt to dequeue an integrated services attendant (ISAT) call, a data inconsistency was found when inspecting the ISAT queues. The first data dump contains the relevant ISAT member structure contents. Study the stack frame dump to gain further insight into this assert.

236. RTDRVER1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTprims/RTdrvkey.c. When processing an integrated services digital network (ISDN) feature button request, a data inconsistency was found between the appropriate tuples in the RLBIKYPM and RLIS_LINE relations for the given port and LTM index. The first data dump contains the rLBKYPM tuple and the second data dump contains the rLIS_LINE tuple. Study the stack frame dump to gain further insight into this assert.

237. RTDRVER2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTprims/RTdrvkey.c. When processing an integrated services digital network (ISDN) feature button request, an invalid hunt key action type was found in the MGQSETUP message received. The first data dump contains the MGQSETUP message. Study the stack frame dump to gain further insight into this assert.

238. RTDSHBHT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in `rta/RTstatus/RTdestphnt.c`. During an attempt to update the status of the stophunt flag for a multiline hunt group (MLHG), an invalid hunt type was passed as an argument. The first data dump contains the MLHG number. The second data dump contains the invalid hunt type. Study the stack frame dump to gain further insight into this assert.

239. RTDSLEQP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLDSLEQUIP relation, a failure code of DBNO_MATCH was returned. The rIDSLEQUIP tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLDSLEQUIP. Key field: dsl.

Action:

This is a database inconsistency that can only be corrected by manual action.

240. RTDSLSP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

Forced removal of the owner(s) of ANS/® U-interface digital subscriber line (U-DSL) resources for a specified ANS/® U-card occurred in `rta/RTdslown/RTclrdslown.c` (in the `RTclrdslown()` function) or `rta/RTdslown/RTkdsln.c` (in the `RTkill()` function). The owner processes have been purged, a number of dumps will be directed to the ROP for analysis.

241. RTDSNTK1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in `rta/RTpp/RTdsntkby.c`. During the testing of post hunt network management controls for a defense switch network (DSN) call, an invalid return was passed from the `RTF_DSPOSTHUNT_NM()` macro call. The first data dump contains the return structure from that macro call. Study the stack frame dump to gain further insight into this assert.

242. RTDUDALOG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in call processing software. The additional information needed to debug this problem is directed to the `/log/log/CALLPLOG1` file that is accessible on the 3B UNIX® terminal in the office.

Data Structures:

The following information is dumped:

- The name of the source file in which the original call processing error was detected. This is an ASCII name that must be different than the assert header which indicates that this assert fired from the `RTdumpdata.c` file. The `RTdumpdata.c` file performs the work of sending the data to the log file.
- The line number of the source file in which the original call processing error occurred.

- The type of data dump that will follow. See the header `uhdr/rta/RTdumpdata.G` for a list of all possible dumps and read the appropriate section of the Software Analysis Guide for further information on how to use the data dumped.

Action:

Debugging information is directed to the `/log/log/CALLPLOG1` file. This file will wrap around and overwrite this data at some time in the future. Extract and copy the debugging information into a separate file. Save the file for the engineers who will try to solve the original call processing exception. The event number of this assert will map to the same event number (for the given SM) that is part of the relevant data dumped in the `CALLPLOG1` file.

243. RTDUINTERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred while processing data that would have been sent to the ROP or to the `/log/log/CALLPLOG1` file for the purpose of debugging a problem caused by a previous exception. The error occurred in the source file `rta/RTshared/RTdumpdata.c` and the first four words of the data dump contains encoded information that describes the problem.

Word 1 of the dump contains a value indicating the type of error:

- 0 - Potential infinite loops of calls to the `RTdumpdata()` function
- 1 - Bad destination processor
- 2 - Bad return code from the `OSSENDMSG()` macro
- 3 - Process does not exist
- 4 - Invalid data structure to dump
- 5 - A null pointer was passed instead of a valid one
- 6 - Not currently in the RTA finite state machine
- 7 - Invalid return code from the `HMoutmsg()` function

Word 2 contains an enum that indicates the type of dump requested; see the global header file `uhdr/rta/RTdumpdata.G` for the values corresponding to this word.

Word 3 contains the process ID (PID) passed to the `RTdumpdata()` function. This is in the form of the operating system PID (OSPID) structure.

Word 4 contains the current data structure being processed, which is an enumeration of the same type as described in word 2; although, the value dumped here may or may not be the same as dumped in word 2.

Word 5 is used only for error types 2 and 7, in which case it contains the value of the invalid return code.

Word 6 contains the event number of the attempt to dump data from the previous error. This may map to an assert just output to the ROP for error types 4 or greater (in word 1).

The previous processing to dump data was aborted and no more information will be forthcoming. Depending on where the error in the `RTdumpdata()` function occurred, an assert may have printed to the ROP to indicate that data will be printed out on the `CALLPLOG1` file - map the value in word 5 to the event number in the assert.

244. RTE9_BADDN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid directory number (DN) was found during E911 routing. The DN was read from the RLESNTRAN, RLE911PSAP, or RLE911SA relation. The data dump indicates the relation that the DN was read from and the keys to that relation. The reason (ritype from the RTfixedrt() function) is also printed.

Data Structures:

RLESNTRAN. Key field: esn.

RLE911PSAP. Key field: tgn.

RLE911SA. Key fields: sm, das.

Action:

1. Consult the office records to determine if the DN printed on the ROP is defined accurately for the specific instance of the relation indicated. If this is a data entry error, go to step 4 to make the correction.

2. Determine the digit analysis tables that are used to translate E911 DNs by consulting the office records or from the E911 DAS field on RC/V View 8.1 (OFFICE PARAMETERS MISCELLANEOUS). This DAS is the key to the appropriate rIDA_DIGSTRT tuple.

3. Use the noc and digits as keys to determine the corrections that are needed by using ODBE to read the RLRT_DNTRAN relation.

4. Make the corrections in the specified tuple of the appropriate relation (relation name and keys are printed on the ROP).

a. For the RLE911PSAP relation, enter the corrected PSAP RERTE DN on screen 6 of RC/V View 5.1 (TRUNK GROUP) using the TGN provided on the ROP as the key.

b. For the RLE911SA relation, enter the corrected DN in the appropriate field of RC/V View 9.40 (SELECTIVE ROUTING AND TRANSFER DATA FOR ESN (SM/DAS)) using the SM and DAS provided on the ROP as the keys.

c. For the RLESNTRAN relation, enter the corrected DN in the appropriate field of RC/V View 9.40 (SELECTIVE ROUTING AND TRANSFER DATA FOR ESN (SM/DAS)) using the ESN provided on the ROP as the key.

d. If no relation is printed, review all tuples of these three relations and contact technical support.

245. RTE9BADOP (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The global office data parameter Gle911op is populated inconsistently in the office. The inconsistency is detected by the CMP or VCDX SM; the processor that contains the inconsistency is printed on the ROP. This inconsistency causes the indicated processor to attempt to use E911 functionality, which is blocked by the CMP or VCDX SM.

Action:

Determine which processor is at fault and use ODBE to correct the problem by changing the Gle911op parameter to one of the legal values: E9_ESA, E9_NONESA, or E9_INACT.

246. RTE9BADOP (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The global office data parameter Gle911op is populated inconsistently in the office. The inconsistency is detected by the CMP; the processor that contains the inconsistency is printed on the ROP. This inconsistency causes the indicated processor to attempt to use E911 functionality, which is blocked by the CMP.

Action:

Determine which processor is at fault and use ODBE to correct the problem by changing the Gle911op parameter to one of the legal values: E9_ESA, E9_NONESA, or E9_INACT.

247. RTE9BADSFSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The office data global parameter Gle911Insfg or Gle911tksfg has an invalid 0 value.

Data Structures:

On the ROP, the first value dumped is Gle911Insfg and the second value dumped is Gle911tksfg.

Action:

Use the ROP output to determine whether the Gle911Insfg or Gle911tksfg parameter has a zero value. Use RC/V View 7.3 (PFA SIMULATED FACILITY GROUP) to insert an E911 line or trunk simulated facility group (SFG) for the parameter that has a zero value. Use RC/V View 8.1 (OFFICE PARAMETERS [MISCELLANEOUS]) to identify the new SFG as the E911 line or trunk SFG.

248. RTE9_CFBADDN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The integrated services digital network (ISDN) public safety answering point (PSAP) line was unable to route to the call forward to DN. The craft assert string will indicate the ISDN PSAP DN, call forward to DN, and reason.

Action:

RC/V Views 23.8 (DSL/BRCS ASSIGNMENT) or 1.11 (BRCS FEATURE ASSIGNMENT) can be used to change the forward to DN using the ISDN PSAP DN as a key to the view.

249. RTE9INVMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid or unexpected operating system for distributed switching (OSDS) message was received by the RTcmpqh_e9() function. This message will be dumped.

250. RTE9_PSAP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLE911PSAP relation, a failure code of DBNO_MATCH was returned. The rLE911PSAP tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLE911PSAP. Key field: tgn.

Action:

This is a database inconsistency that can only be corrected by manual action.

251. RTEDN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLRT_EDN relation, a failure code of DBNO_MATCH was returned. The rIRT_EDN tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLRT_EDN. Key fields: dn.noc, dn.digits.

Action:

This is a database inconsistency that can only be corrected by manual action.

252. RTEDSLGPRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLEDSPGPRT relation, a failure code of DBNO_MATCH was returned. The rLEDSPGPRT tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLEDSPGPRT. Key fields: eptidx2, grpnum.

Action:

This is a database inconsistency that can only be corrected by manual action.

253. RTEDSLTRKG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLEDSPTRKG relation, a failure code of DBNO_MATCH was returned. The rLEDSPTRKG tuple is missing, or the keys used to read this relation were not set properly.

Data Structures:

RLEDSPTRKG. Key field: trunk group number.

The port.member and port.module fields are also dumped.

Action:

Use RC/V (or ODBE, if necessary) to verify that the trunk group number is valid. The port member and port module dumped on the ROP can be used to read the RLPORT_GROUP and RLFC_TRUNK relations. If both relations indicate that the port is a member of the trunk group dumped on the ROP, then the trunk group number is probably valid.

If the trunk group number is valid, and it has a service class of FCEDSL or FCEDSLHM and a logical port type of PCTBCHAN in the RLFC_PORTTYP relation, then the RLEDSPTRKG relation should be checked to see if a tuple exists. If the rLEDSPTRKG tuple is not populated, insert the tuple (consult the office records).

If the trunk group assigned to the port in the RLFC_TRUNK relation is different than the one in the RLPORT_GROUP relation, consult the office records and correct it. After correction, manually restore the trunk back to service.

254. RTEHKBSA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTstatus/RTendhkey.c. During an integrated services digital network (ISDN) huntkey status update attempt, an invalid value was found in the action or status field of the MGACKBN message passed to the RTendhkey() function. The first data dump contains the text of the input message. The second data dump contains the feature activation portion of the MGQINFO or MGQSETUP message. Study the stack frame dump to gain further insight into this assert.

255. RTENQTM1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTtkq/RTenq_term.c. During the processing of the MGTK_ENQUE message for modular queueing II, the message contained an invalid routine type. The first data dump contains the relevant part of the MGTK_ENQUE message. Study the stack frame dump to gain further insight into this assert.

256. RTEXXMCBSZ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message size is less than or equal to 0 (e.g. unrecognized message type) or it is larger than the message control block (MCB) limit. The content of the original message passed is dumped.

257. RTFACMISSING (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: FACSTAT	Audit Mode: elev

Problem:

An exception has occurred in one of the following functions: RTfac_send(), RTsmfac_up(), or RTcmpfac_up(). See the stack frame accompanying this assert to determine the exact location of the failure.

Probable Cause:

This assert indicates the dynamic rIFACSTAT tuple is missing.

Action:

The dcf-data dump generated by this assert gives the content of the rIFACSTAT tuple affected. The AUFACSTAT audit is scheduled to clear the problem.

258. RTFAILM1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTterm/RTfailmsg.c. The input message to the RTfailmsg() function was unexpected. The first data dump contains the contents of this message. Study the stack frame dump to gain further insight into this assert. Output from the RTDUMPDATA() macro call may follow this assert.

259. RTFCAUTH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return was received when attempting to read an rIATH_CODE tuple. No audits are scheduled. The assert originates from the RTauth_rrel() function.

260. RTFCLINE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLFC_LINE relation, a failure code of DBNO_MATCH was returned. The rIFC_LINE tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLFC_LINE. Key fields: port.member, port.module, party.

Action:

This is a database inconsistency that can only be corrected by manual action.

261. RTFCPBCOS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An integrated services attendant (ISAT) remote busy verification error occurred. The class of service value found in the RLFC_PORTTYP relation was not FC_ATNDVFY. The remote busy verification attempt will fail.

Data Structures:

The following keys and attribute values from the rIFC_PORTTYP tuple are dumped: port.member (key), port.module (key), and servclass.

Action:

This is a database inconsistency that can only be corrected by manual action.

262. RTFCPTYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLFC_PORTTYP relation, a failure code of DBNO_MATCH was returned. The rIFC_PORTTYP tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLFC_PORTTYP. Key fields: port.member, port.module.

Action:

This is a database inconsistency that can only be corrected by manual action.

263. RTFCTRK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLFC_TRUNK relation, a failure code of DBNO_MATCH was returned. The rIFC_TRUNK tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLFC_TRUNK. Key fields: port.member, port.module.

Action:

This is a database inconsistency that can only be corrected by manual action.

264. RTFCTRUNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When routing a packet switching call from a trunk, no trunk feature data was found in the RLFC_TRUNK relation for the trunk port in question.

Data Structures:

RLFC_PORTTYP, RLFC_TRUNK, RLDSLEQUIP.

The trunk's internal port name is printed on the ROP (in hex). All valid ports have an rRFC_PORTTYP tuple. Valid trunk ports also have an rRFC_TRUNK tuple. Valid packet switching trunks also have an rLDSLEQUIP tuple that translates the trunk unit port name to the protocol handler (PH) and PH channel number to which it connects.

Action:

Determine if the port name dumped via the ROP message is a valid trunk port name. If it is valid, use RC/V (or ODBE, if necessary) to determine if tuples exist in the RLFC_PORTTYP, RLFC_TRUNK, and RLDSLEQUIP relations containing information that consistently describes the port printed on the ROP as a packet switch trunk.

265. RTFEATBN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLFEATBN relation, a failure code of DBNO_MATCH was returned. Either the rFEATBN tuple is missing (due either to a database inconsistency or because the assigned configuration group does not contain a feature button for the action printed on the ROP) or the keys used to read this relation were not set properly.

Data Structures:

RLFEATBN. Key fields: config, fid, action.

Action:

This is a database inconsistency that can only be corrected by manual action. Use RC/V View 12.5 (CONFIGURATION GROUP DEFINITION) to insert the correct CONFIG GRP, CPE COMPONENT, RANGE, BUTTON and ACTION. Assigning configuration groups with the needed buttons and actions at the time of terminal assignment will prevent this problem.

266. RTFEATNOTSUP (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A secured feature was detected to be active that is not supported in this office.

Probable Cause:

The secured feature was erroneously activated.

Action:

The secured feature ID is dumped by this assert. Save and provide the relevant read-only printer (ROP) output to the next level of technical support and notify field support. This feature should be deactivated.

267. RTFID_NO_MATCH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The feature identifier (FID) value (fixed route type) does not match any entry in the feature activation point (FAP) table RTraf_tp_fap in file rta/RTgdata/RTraft_fat.c. No audits are run. This assert originates from the RTrafterm() function.

268. RT_FIXRI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLRT_FIXEDRI relation, a failure code of DBNO_MATCH was returned. The rIRT_FIXEDRI tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLRT_FIXEDRI. Key field: noc, ritype.

The values for ritype are the enumerations of DMTREAT for which the values can be found in 235-600-219 Translation/Dynamic Data.

Action:

This is a database inconsistency that can be corrected by manual action. It may be necessary to add an rIRT_FIXEDRI tuple by inserting a new fixed route type via RC/V View 10.1 [FIXED ROUTE (ROUTING)]. The values for the new fixed route type correspond to the ritype key. Further details on each value for the ritype can be found in the 5ESSTM Switch Translation Guide (TG-5), Vol II, Division 3, Section 3g, Part 2.02 (Fixed Route Type).

269. RTFL_DBRD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read the relation RLFC_PORTTYP from the RTmnterm() function failed.

270. RTFRBC_SVC (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read the RLFRBC_SVC relation resulted in a DBNO_MATCH. The rIFRBC_SVC tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLFRBC_SVC. Key fields: gport.

Action:

Verify that the keys printed on the ROP are valid. The gport.member should have the correct port value and the gport.module should have the correct SM number for the particular frame relay bearer channel. If the key is valid, use ODBE to verify that the rIFRBC_SVC tuple does not exist on the SM indicated; then insert the tuple. If the keys are not valid, file a trouble report.

271. RTFSBHTYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTshared/RTfillstat.c. During the population of a fast idle or fast busy message to be sent to the CMP for trunk group status update, an unknown hunt type was found in the TRKG global data block. The first data dump contains the TRKG global data block and the second data dump contains the global port whose status has just changed. Study the stack frame dump to gain further insight into this assert.

272. RTFSMOOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTshared/RTfillstat.c. During the population of a message for trunk group status update, the member size found in the terminating group data block exceeded the maximum value of the trunk group as indicated by the rIRT_TRKG tuple for that trunk group. The first data dump contains the rIRT_TRKG tuple and the second data dump contains the terminating group data block. Study the stack frame dump to gain further insight into this assert.

273. RTFTRKEY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

the keys used to read this relation were not set properly.

Data Structures:**Action:**

This is a database inconsistency that can only be corrected by manual action.

274. RTGENDS1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGcontl/RTgendisc.c or in rta/RTGcontl/RTnw_disc.c. When attempting to remove the network path, an error return was received from the PHrm_ntwk() function. The first data dump contains the error return value. The second data dump contains the destination process ID of the route. Study the stack frame dump to gain further insight into this assert.

275. RTGENIN1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTmain/RTgeninit.c or in rta/RTamps/RTapinit.c. An MGRT_GEN message was received (1) with an unexpected value in the rt_phase field (2) the rt_phase field was set to RTGREQ, but the rt_req field was unknown or (3) the rt_phase was set to RTGSWITCH, but the rt_req field was invalid. The first data dump contains the origdata structure from the MGRT_GEN message. Study the stack frame dump to gain further insight into this assert. Output from the RTDUMPDATA() macro call may follow this assert.

276. RTGENIN2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTmain/RTgeninit.c or in rta/RTamps/RTapinit.c. When the MGRT_GEN message

was received with the `rt_phase` field set to `RTGSWITCH`, an error return was received from the `PHrm_ntwk()` function (needed for serially hunted calls). The first data dump contains the route descriptor field from the `MGRT_GEN` message. Study the stack frame dump to gain further insight into this assert. Output from the `RTDUMPDATA()` macro call may follow this assert.

277. RTGENSCA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the `RLGENSCA` relation, a failure code of `DBNO_MATCH` was returned. The `rlGENSCA` tuple is missing or the keys used to read this relation were not set properly. The key values `SCA_IDX` and `RANGE`, along with the `LTM_INDEX` and `LTM_TYPE` values, will be printed on the ROP.

Data Structures:

`RLGENSCA`. Key fields: `SCA_IDX`, `RANGE`.

Action:

This is a database inconsistency that can only be corrected by manual action.

278. RTGENSCF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the `RLGENSCF` relation, a failure code of `DBNO_MATCH` was returned. The `rlGENSCF` tuple is missing or the keys used to read this relation were not set properly. The key values `SCF_IDX` and `RANGE`, along with the `LTM_INDEX` and `LTM_TYPE` values, will be printed on the ROP.

Data Structures:

`RLGENSCF`. Key fields: `SCF_IDX`, `RANGE`.

Action:

This is a database inconsistency that can only be corrected by manual action.

279. RTGENSCR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the `RLGENSCR` relation, a failure code of `DBNO_MATCH` was returned. The `rlGENSCR` tuple is missing or the keys used to read this relation were not set properly. The key values `SCR_IDX` and `RANGE`, along with the `LTM_INDEX` and `LTM_TYPE` values, will be printed on the ROP.

Data Structures:

`RLGENSCR`. Key fields: `SCR_IDX`, `RANGE`.

Action:

This is a database inconsistency that can only be corrected by manual action.

280. RTGENSDA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the `RLGENSDA` relation, a failure code of `DBNO_MATCH` was returned. The `rlGENSDA` tuple is missing or the keys used to read this relation were not set properly. The key values `SDA_IDX` and `RANGE`,

along with the LTM_INDEX and LTM_TYPE values, will be printed on the ROP.

Data Structures:

RLGENSDA. Key fields: SDA_IDX, RANGE.

Action:

This is a database inconsistency that can only be corrected by manual action.

281. RTGENTM1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTterm/RTgenterm.c when processing a termination. An unknown term_type was populated in the route message. The first data dump contains the contents of the terminating route message. Study the stack frame dump to gain further insight into this assert.

282. RTGENTM2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTterm/RTgenterm.c. The RTacdreq() function was called to complete termination of a call to an automatic call distribution (ACD)/business and residential custom services (BRCS), ACD, or direct agent access (DAA) directory number (DN). The call to the RTacdreq() function failed with a return code of OSNOTLOADED indicating that the ACDBASE loadable package is not loaded in this SM.

The first data dump contains the contents of the terminating route message. Study the stack frame dump to gain further insight into this problem. Output from the RTDUMPDATA() macro call may follow.

283. RTGI_BAD_DATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data representing the routing state was found in a message. This assert originates from the RTgeninit() function which is used to initialize data in a data block. No audits were scheduled.

284. RTGPRMLASS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: FCLINE	Audit Mode: elev

Problem:

An attempt to change the local area signaling services (LASS) global access parameters failed. The LASS global access parameters will return to their original state, and all associated dynamic data will be re-initialized to its previous state. The FCLINE audit will run to check for errors in the line history blocks (LHBs).

285. RTGPSF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLRT_GPSF relation, a failure code of DBNO_MATCH was returned. The rIRT_GPSF tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLRT_GPSF. Key field: grpnum.

Action:

This is a database inconsistency that can only be corrected by manual action.

286. RTGPTOPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLGROUP_PORT relation, a failure code of DBNO_MATCH was returned. The rLGROUP_PORT tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLGROUP_PORT. Key fields: portgrp.grpnum, portgrp.grptype, member.

Action:

This is a database inconsistency that can only be corrected by manual action.

287. RTGTNOT_LD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An expected feature is not loaded. No audits are run. This assert originates from the RTgenterm() function.

288. RTHI_CF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple is missing in the relation RLHI_CF (home intercom/single line variety feature only), or the keys used to read this relation are incorrect. Activation of home intercom (HI) calls is blocked and reorder tone is given.

Data Structures:

RLHI_CF. Key field: fid.

The fid is the first data item printed on the ROP. Additional information about the port is also printed: port.member is the second data item, port.module is the third, and party is the fourth.

Action:

Use ODBE to check the RLHI_CF relation using the fid value printed on the ROP as the key. If the rLHI_CF tuple is not found, insert the tuple. Convert the port information into the directory number (DN) and use RC/V View 1.11 (BRCS FEATURE ASSIGNMENT [LINE]) to assign any pre-constructed HI feature to this DN.

289. RTHKBHKT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTstatus/RThuntkey.c. During the activation or deactivation of a huntkey feature, an invalid hunt type was found in the tuple just retrieved from the RLHUNTKEYS relation. The first data dump contains the rLHUNTKEYS tuple just retrieved. The second data dump contains the port that was passed to this function. Study the stack frame dump to gain further insight into this assert.

290. RTHKBKST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTstatus/RThuntkey.c. During the activation or deactivation of a huntkey feature, an invalid value was found in the key status variable passed in as an argument to this function. The first data dump contains the invalid value. The second data dump contains the appropriate tuple from the RLHUNTKEYS relation. Study the stack frame dump to gain further insight into this assert.

291. RTHKCMP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTstatus/RTupstat.c. A status forward MGRTSTFWD message was received on the CMP with an action field value of RTISHKEY, indicating that an integrated services digital network (ISDN) feature button hunt key was pressed. The hk_action field value is not valid on the CMP. Either the hk_action field is invalid, or the status forward message should have been sent to an SM instead of the CMP. The status forward message is dumped.

292. RTHKFCORC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTstatus/RTendhkey.c. In the RThksubfb() function, during an attempt to update integrated services digital network (ISDN) hunt key feature buttons for all members of an ISDN subgroup within a hunt group, an error return code was received from the DBsmplcorc() primitive when attempting to update the RLBIKYPM relation. The first data dump contains the old rIBIKYPM tuple and the second data dump contains the updated tuple that was to be inserted. Study the stack frame dump to gain further insight into this assert.

293. RTHKSUBBS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTstatus/RTendhkey.c. In the RThksubfb() function, during an attempt to update integrated services digital network (ISDN) hunt key feature buttons for all members of an ISDN subgroup within a hunt group, an invalid status was found in the MGACKBN message that was passed. The first data dump contains the invalid status, and the second data dump contains the entire MGACKBN message. Study the stack frame dump to gain further insight into this assert.

294. RTHNTKYS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLHUNTKEYS relation, a failure code of DBNO_MATCH was returned. The rIHUNTKEYS tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLHUNTKEYS. Key fields: port.member, port.module.

Action:

This is a database inconsistency that can only be corrected by manual action.

295. RTICITK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLRTICITK relation, a failure code of DBNO_MATCH was returned. The rIRTICIRK tuple is missing or the keys used to read this relation were not set properly.

Data Structures:**Action:**

This is a database inconsistency that can only be corrected by manual action.

296. RTICMLST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was detected between the RLICM_TERM and RLICM_1LST relations. A directory number (DN) that is not a member of the integrated services digital network (ISDN) intercom group, was found in the RLICM_1LST relation. The ISDN intercom group and DN will be printed on the ROP.

Data Structures:

RLICM_1LST. Key fields: icmgrp, range.

Action:

The RLICM_1LST relation provides the DNs associated with an ISDN intercom group. The DNs are stored in the binary coded decimal (BCD) format in groups of ten. Use RC/V (or ODBE, if necessary) to remove the inconsistent DN from the RLICM_1LST relation. Use the key values of ICMGRP (printed on the ROP) and RANGE (0-9) to locate the inconsistent DN.

297. RTICMTRM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLICM_TERM relation, a failure code of DBNO_MATCH was returned. The rLICM_TERM tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLICM_TERM. Key fields: lport, termno.

Action:

This is a database inconsistency that can only be corrected by manual action.

298. RT_ICR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLICR relation, a failure code of DBNO_MATCH was returned. The rLICR tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLICR. Key field: sfg_num.

Action:

This is a database inconsistency that can only be corrected by manual action.

299. RTICRDBERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: ICRST	Audit Mode: elev

Problem:
Failed to read the static relation RLICR in the RTicrmg() function.

300. RTICRERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
A read of the static relation RLICR failed.

301. RTICRLG_S_SFG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Deleting a tuple in the dynamic relation RLICRST failed in the function RTicrlgs().

302. RTICRLSTERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
A dynamic read of the RLICRLGST relation failed.

303. RTICRMGAMA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Sending a message to the automatic message accounting (AMA) system process in the tracking SM failed in the function RTicramamg().

304. RTICRMGERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
The RTicrmg() function found an error in the keep alive message to the intercom calling restriction (ICR) tracking SM.

305. RTICRPCBLA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
The wrong input (pcbla_ptr without icr_use) was given to the RTicrmg() function.

306. RTICRS_LG_SFG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Deleting a tuple in the dynamic relation RLICRLGST failed in the function RTicrslg().

307. RTICRSTERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTicr/RTicr_rec.c or in rta/RTicr/RTicr_shnt.c. A dynamic read of the RLICRST relation failed. The first data dump contains the message received in the RTicr_rec() function or the simulated facilities group (SFG) group number in the RTicr_shnt() function. Study the stack frame dump to gain further insight into this problem.

308. RTICXICI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLICX_ICI relation, a failure code of DBNO_MATCH was returned. The rLICX_ICI tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLICX_ICI. Key field: isat_idx.

Action:

This is a database inconsistency that can only be corrected by manual action.

309. RTIDLEF1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTterm/RTidlefs.c during idle port feature selection. During the processing, inconsistent data was found in the routing message in regard to the integrated services digital network (ISDN) intercom (ICOM) group. The first data dump contains the contents of the isdndata structure in the MGLN_TERM message which contains the ICOM information. Study the stack frame dump to gain further insight into this assert.

310. RTIDLES1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGbrcs/RTidlestat.c. When attempting to release a simulated facilities group (SFG) member, the input argument containing the SFG group number was out of range. The first data dump contains the input SFG structure. Study the stack frame dump to gain further insight into this assert.

311. RTIDLES2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGbrcs/RTidlestat.c. When attempting to release a member of a simulated facilities group (SFG), the appropriate dynamic data status block was not found for the regular or large SFG type. The first data dump contains the input SFG structure argument to this function. Study the stack frame dump to gain further insight into this assert.

312. RTIDLES3 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGbrcs/RTidlestat.c. During an attempt to release a member of a simulated facilities group (SFG), an invalid SFG hunt type value was found. The first data dump contains the input SFG structure argument to this function. Study the stack frame dump to gain further insight into this assert.

313. RTIDPACT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLIDP_ACT relation, a failure code of DBNO_MATCH was returned. The rIIDP_ACT tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLIDP_ACT. Key fields: idp_gpid, actsetnum.

Action:

This is a database inconsistency that can only be corrected by manual action.

314. RTIDPGP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLIDP_GP relation, a failure code of DBNO_MATCH was returned. The rIIDP_GP tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLIDP_GP. Key field: idp_gpid.

Action:

This is a database inconsistency that can only be corrected by manual action.

315. RTID_PORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLID_PORT relation, a failure code of DBNO_MATCH was returned. The RLID_PORT tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLID_PORT. Key fields: lport(logical port), lpt_type(logical port type).

Action:

This is a database inconsistency that can only be corrected by manual action.

316. RTIDPPRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLIDP_PORT relation, a failure code of DBNO_MATCH was returned. The rIIDP_PORT tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLIDP_PORT. Key fields: lport, lpt_type.

Action:

This is a database inconsistency that can only be corrected by manual action.

317. RTIDSIDLE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTprims/RTidsidle.c. An invalid hunt type has been found.

Probable Cause:

The calling function passed an illegal or unknown hunt type to the function RTidsidle().

Action:

Study the stack frame dump to gain further insight into this assert.

318. RTIECP_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to route an inter-LATA packet switched data call to the line's default inter-exchange carrier, the data network identification code (DNIC) for this line was invalid.

Data Structures:

RLPSDNICRI, RLPSX25LN.

The line is identified by the protocol handler (PH) and PH channel number printed (hex) on the ROP. Per-line packet switching (PS) feature data for this line is in the RLPSX25LN relation, the iecp_dnic attribute contains the DNIC of the default inter-exchange carrier assigned to this line. The value of this DNIC is printed (hex) on the ROP. No rLPSDNICRI tuple was found for this DNIC.

Action:

Use RC/V to examine the RLPSX25LN relation for the line in question. Verify that the iecp_dnic attribute identifies an existing network that is qualified to act as an inter-exchange carrier network for the integrated services digital network (ISDN). If the iecp_dnic value is valid, examine the RLPSDNICRI relation with RC/V. A tuple should be present for the DNIC in question. If no tuple is found, insert it.

319. RTIGPBHT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTstatus/RTidlegrp.c. During an attempt to update the status of the group make busy field (to off) of a multiline hunt group (MLHG), an invalid hunt type was passed to the RTidlegrp() function. The first data dump contains the invalid hunt type. The second data dump contains the MLHG number. Study the stack frame dump to gain further insight into this assert.

320. RTILACDT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTisdn/RTacdterm.c.

Probable Cause:

An illegal attempt was made to terminate an ACDBRCS hunted call to a standard integrated services digital network

(ISDN) line or to a shared directory number (SHDN).

Action:

The first data dump contains the terminating dport. An automatic call distribution (ACD) agent should not be allowed to log on from a standard line or a SHDN.

321. RTILHB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: FCLINE	Audit Mode: elev

Problem:

Could not read a tuple in the RLAN_ILHB or RLIS_ILHB relation with a dynamic access (DA) macro. The tuple was just inserted by the DBfintup() primitive. The FCLINE audit will be run to correct the problems.

322. RTILLSTCHG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal local toll status change message was sent to the routing and terminal allocation (RTA) global routing system.

323. RTIMMSGC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTmain/RTimmsgproc.c. An unexpected message was received by the routing and terminal allocation (RTA) SM terminating system process. The first data dump contains the message received by the RTimmsgproc() function. Study the stack frame dump to gain further insight into this assert. Output from the RTDUMPDATA() macro call may follow this assert.

324. RTINHUNTKEYS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not access the RLHUNTKEYS static office dependent data (ODD) relation in a remote SM (RSM) that is required for multi-line hunt group (MLHG) customer key-controlled features.

Data Structures:

RLHUNTKEYS.

The ROP output provides the RLHUNTKEYS structure, the key item is the port ID (port.module, port.member) of the master scanner unit (MSU) scan point of the particular customer controlled MLHG key. The first two hex digits are port.module, the second two hex digits are blank space, and the next four hex digits are port.member.

Action:

Use ODBE to check the RLHUNTKEYS relation for the tuple indicated. The tuple may be missing or the key may be incorrectly specified in the RLKEYLIST relation. Use ODBE to correct the problem.

325. RTINISATUCD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to insert a tuple of the dynamic relation RLISATUCD.

326. RTINKEYLIST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not access the RLKEYLIST static office dependent data (ODD) relation in a remote SM (RSM) that is required for multi-line hunt group (MLHG) customer key-controlled features.

The ROP output provides the RLKEYLIST structure, the key item is the port ID (port.module, port.member) of the master scanner unit (MSU) scan point of the particular customer controlled MLHG key. The first two hex digits are port.module, the second two hex digits are blank space, and the next four hex digits are port.member.

327. RTINLGLNSTAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to insert a tuple in the relation RLLGLNSTAT.

328. RTINLGMEM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to insert a tuple in the relation RLLGMEM.

329. RTINLGTKSTAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to insert an rILGTKSTAT tuple.

330. RTINLNSTAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to insert a tuple in the relation RLLNSTAT.

331. RTINMEM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to insert a tuple in the relation RLMEM.

332. RTINMHG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A switch on the value of hunt type failed due to a non-existent or inappropriate value. The data dump provides the contents of a buffer that contains an rIRT_MHG tuple from which the invalid htype value was taken. This buffer may reside in a global data area or it may be from a local (stack) buffer. The office dependent data (ODD) may be invalid or the data from the tuple may have been corrupted after a successful read.

333. RTINMUPH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTinit/RTinsaggc.c. During the transition into standalone, while creating and initializing local copies of dynamic data for multiple position hunt (MUPH) groups, an error return was received from the RTinmuph() function when it was called to create a new dynamic data block, the RLRTMUPHST relation. The first data dump contains the contents of the rIPORT_GROUP tuple passed to the RTinsaggc() function. Study the stack frame dump to gain further insight into this assert.

334. RTINNQM_MLHG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization of the queues for multiline hunt group (MLHG) queueing failed. Could not build the member relation RLQM_MLHG.

Data Structures:

RLQU_OS.

The ROP output provides the MLHG number (first dump) and the error return from the DBfintup() function (second dump).

Action:

This initialization is based on the office dependent data (ODD) static data in the RLQU_OS relation. This relation should be verified for data accuracy.

335. RTINPPLLNST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to insert an rIPPLLNST tuple for large multiline hunt group (MLHG) status.

336. RTINPPLNST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to insert an rIPPLNST tuple for small multiline hunt group (MLHG) status.

337. RTINPPLTKST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to insert an rIPPLTKST tuple describing the status of a large trunk group.

338. RTINPPS1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTpp/RTinppsast.c. While initializing and inserting rIPPSAST tuples, an error return was received from the DBfintup() or DBstnxt() primitive. The first data dump contains the currently used tuple from

the RLIS_LINE relation. Study the stack frame dump to gain further insight into this assert.

339. RTINPPTKST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to insert an rLPPTKST tuple. The RLPPTKST relation keeps the status of the trunk group.

340. RTINPRT_GRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the RLPORT_GROUP relation or an unknown port group type was found in an rLPORT_GROUP tuple. The key was obtained from the RLQKEYPORT relation.

Data Structures:

RLPORT_GROUP. Key fields: port ID (port.member and port.module).

The first four hex digits are the port.member, the second two hex digits are empty, the next two hex digits are the port.module.

Action:

Use RC/V (or ODBE, if necessary) to check that the indicated tuple is contained in the RLPORT_GROUP relation. If it is, check that the port group type is TM_LINE or TM_TRK. Use RC/V (or ODBE, if necessary) to correct the port group type. If the indicated rLPORTGROUP tuple is missing, use ODBE to remove or correct an rLQKEYPORT tuple or add an rLPORTGROUP tuple.

341. RTINPSPT_GP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read an rLPSPT_GP tuple. The port obtained from the RLQKEYPORT relation does not have a corresponding tuple in the packet switched port to group relation RLPSPT_GP.

Data Structures:

RLPSPT_GP, RLQKEYPORT.

In the ROP output, the module is the first byte (in hex), the ph_number is the first seven bits of the second byte (in hex), and the ph_cn is the first seven bits of the third byte (in hex).

Action:

Check that the port group type (grptype) is TM_LINE or TM_TRK. Use RC/V (or ODBE, if necessary) to correct the port group type. If the indicated rLPSPT_GP tuple is missing, use ODBE to remove or correct an rLQKEYPORT tuple or add an rLPSPT_GP tuple.

342. RTINPSSA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTinit/RTinpsagc.c. An invalid grptype was found. The first data dump contains the rLPSPT_GP data structure that was passed in. Check that the port group type (grptype) is TM_LINE or TM_TRK. Use RC/V (or ODBE, if necessary) to correct the port group type.

343. RTINQKEYPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the relation RLQKEYPORT.

344. RTINQM_OGT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization of the queues for a trunk group and simulated facility group queueing failed because the dynamic member relation RLQM_OGT was not built.

Data Structures:

RLQU_OGTOS. Key field: ogt_key.

RLQM_OGT. Key field: mem_key.

Action:

This initialization is based on office dependent data (ODD) static data in the RLQU_OGTOS relation. Check the rIQU_OGTOS tuple in the failing SM's ODD to verify that the tuple with key 4090 is populated correctly. The RQSIZE attribute should be the sum of all the other rIQU_OGTOS tuples' RQSIZE on the SM and the PQSIZE attribute should be the sum of all the other rIQU_OGTOS tuples' PQSIZE on the SM.

Any needed corrections should be made using ODBE. After the corrections are made, the failing SM should have a SELECTIVE INIT done from the SM INH & RCVRY CNTL page of the master control center (MCC) to initialize queueing dynamic data on the SM.

345. RTINQO_MLHG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization of the queues for multiline hunt group (MLHG) queueing failed. Could not build the owner relation RLQO_MLHG.

Data Structures:

RLQU_OS.

The ROP output provides the MLHG number.

Action:

This initialization is based on the office dependent data (ODD) static data in the RLQU_OS relation. This relation should be verified for data accuracy.

346. RTINQO_OGT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization of queues for trunk group and simulated facility group queueing failed because the dynamic owner relation RLQO_OGT was not built.

Data Structures:

RLQU_OGTOS. Key field: ogt_key.

RLQO_OGT. Key field: own_key.

Action:

This initialization is based on office dependent data (ODD) static data in the RLQU_OGTOS relation. Check the rIQU_OGTOS tuple in the failing SM's ODD to verify that the tuple with key 4090 is populated correctly. The RQSIZE attribute should be the sum of all the other rIQU_OGTOS tuples' RQSIZE on the SM and the PQSIZE attribute should be the sum of all the other rIQU_OGTOS tuples' PQSIZE on the SM.

Any needed corrections should be made using ODBE. After the corrections are made, the failing SM should have a SELECTIVE INIT done from the SM INH & RCVRY CNTL page of the master control center (MCC) to initialize queueing dynamic data on the SM.

347. RTINQT_OGTOS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization of queues for trunk group and simulated facility group (SFG) queueing failed because the owner static tuple in the RLQU_OGTOS relation is corrupted or missing.

Data Structures:

RLQU_OGTOS. Key field: ogt_key.

Action:

This initialization is based on office dependent data (ODD) static data in the RLQU_OGTOS relation. Check the rIQU_OGTOS tuple in the failing SM's ODD to verify that the tuple with key 4090 is populated correctly. Verify that the RQSIZE attribute is the sum of all the other rIQU_OGTOS tuples' RQSIZE on the SM and the PQSIZE attribute is the sum of all the other rIQU_OGTOS tuples' PQSIZE on the SM.

Any needed corrections should be made using ODBE. After the corrections are made, the failing SM should have a SELECTIVE INIT done from the SM INH & RCVRY CNTL page of the master control center (MCC) to initialize queueing dynamic data on the SM.

348. RTINQU_OS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization of the queues for multiline hunt group (MLHG) queueing failed. Could not access the owner static relation RLQU_OS or the idle owner tuple in the RLQU_OS relation was corrupted.

Data Structures:

RLQU_OS.

The ROP output provides the MLHG number.

Action:

The RLQU_OS relation should be verified for data accuracy.

349. RTINRTMUPHST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization of the multiposition hunt (MUPH) dynamic data failed.

Data Structures:

RLRTMUPHST. Key field: muph group number.

Action:

Verify the accuracy of the MUPH static data.

350. RTINSAG1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTinit/RTinsagc.c. An invalid return was received from a call to the OSfap() function to create local dynamic data during transition into standalone. See the stack frame dump to determine which call to OSfap() generated this exception. The first data dump contains the contents of the appropriate tuple, and the second dump contains the value of the invalid return from the OSfap() function.

351. RTINSBF1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTblf/RTinsblf.c. While initializing busy lamp field (BLF) related data, an error return was received from a database (DB) primitive. The first data dump contains either the error return code or the tuple buffer. Study the stack frame dump to gain further insight into this assert.

352. RTINSBF2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTblf/RTinsblf.c. While initializing busy lamp field (BLF) related data in the RTblmodh(), RTblatth(), or RTsppreply() function, an error return was received from the DAdyhcnt() primitive when attempting to access the head cell of the RLREPLYBLF relation. The first data dump contains the error return value.

353. RTINSBF3 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTblf/RTinsblf.c. While initializing busy lamp field (BLF) related dynamic data, an error return was received from the DBfintup(), DAahhcdh(), DBfrdtup(), DBfuptup(), DAahbltm(), DAahhcbf(), DAahdhdm(), or DAahhcly() primitive. The first data dump contains the error return.

The second data dump contains the relevant rIATTH_BLF, rIATTM_BLF, rIMODH_BLF, or rIMODM_BLF tuple. Study the stack frame dump to gain further insight into this assert.

354. RTINSTFAC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception has occurred in RTrcfacsta(), RTincmpfac(), or RTinsmfac().

Probable Cause:

During an addition of a rIFACSTAT tuple, the appropriate rIFACSTAT tuple was not inserted.

Action:

There are 2 dcf-data dumps generated by this assert; the first gives the bad return value from DBfintup() which caused this assert to fire, and the second gives the content of the rIFACSTAT tuple affected.

355. RTINTKOWNER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to insert an rITKOWNER tuple.

356. RTINTKSTAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to insert an rITKSTAT tuple.

357. RTINTOWNQUE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to link a tuple to the trunk busy list in the DBTKOWNQUE() macro.

358. RTINTQUE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to insert an rITKQUE tuple.

359. RTINTRASM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

One of the following situations occurred:

1. A fractional digital signal level 1 (DS1) (NxDS0 wideband) call originated from a remote SM (RSM), but terminated on a different SM.
2. A fractional DS1 (NxDS0 wideband) call originated from a non-RSM, but terminated on a RSM.

Data Structures:

The following data is dumped: orig_port (NxDS0 originating master port), orig_sm (originating SM), and term_sm (terminating SM).

Action:

For case 1, orig_sm is a RSM and term_sm is not the same as orig_sm. Modify the routing index so that the call is terminated to the same RSM (intra-RSM).

For case 2, orig_sm is not an RSM and term_sm is a RSM. Modify the routing index so that the call is not terminated to the RSM.

For both cases, the routing index is not set correctly in RC/V View 10.2 (ROUTE INDEX [ROUTING]) for originating trunk ports so the call failed. Correct the routing index so that orig_sm and term_sm are the same RSM, or both orig_sm and term_sm are not an RSM.

360. RTINTRKG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read an rLRT_TRKG tuple. The rLRT_TRKG tuple is missing or the rLPORTGROUP tuple contains an undefined group number.

Data Structures:

RLRT_TRKG. Key field: group number.

The group number is found in the first four hex digits of the local data printed.

Action:

Use ODBE to check for a missing rLRT_TRKG tuple or an undefined group number in the RLPORTGROUP relation.
Use ODBE to correct the problem.

361. RTINVEONSFG (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGbrcs/RTsfg_set.c. When attempting to read the RLRT_SFG relation, the type of SFG does not match with the EOLN call. The call is blocked with reorder tone.

Data Structures:

The originating port, the called number and mc_ri are dumped.

Action:

Use the originating port and called number to check the digit analysis forms. The call should be set up as an EOLN type of call. Use RC/V View 9.21 (PRIVATE NETWORK DIALING PLAN), to verify the NODAL 56K is set to YES. Use RC/V View 10.4 (BRCS MC ROUTE INDEX EXPANSION), keyed by mc_ri, to get the SFG GP NUM. Use RC/V View 7.3 (PFA SIMULATED FACILITY GROUP), keyed by SFG GP NUM, to verify the SFG TYPE is of EON SFG.

362. RTINVEONSFG (5E12 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

***Problem:**

An exception occurs in rta/RTGbrcs/RTsfg_set.c. When attempting to read the RLRT_SFG relation, the type of SFG does not match with the EOLN call. But the call is allowed to complete.

Data Structures:

The originating port, the called number and mc_ri are dumped.

Action:

Use the originating port and called number to check the digit analysis forms. The call should be set up as an EOLN type of call. Use RC/V View 9.21 (PRIVATE NETWORK DIALING PLAN), to verify the NODAL 56K is set to YES. Use RC/V View 10.4 (BRCS MC ROUTE INDEX EXPANSION), keyed by mc_ri, to get the SFG GP NUM. Use RC/V View 7.3 (PFA SIMULATED FACILITY GROUP), keyed by SFG GP NUM, to verify the SFG TYPE is of EON SFG.

363. RTINVHTTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data inconsistency was detected when attempting to read the RLRT_TRKG relation. The hunt type attribute was

set inconsistently for this trunk group.

Data Structures:

RLRT_TRKG. Key field: grpnum.

The hunt type attribute value is also dumped.

Action:

Use RC/V View 5.1 (TRUNK GROUP), keyed by grpnum, to check the value of the hunt type field. The value of hunt type should be set to 2WF, 2WB, LGFD, or LGBD for a wideband capable trunk group.

364. RTINV_PARAM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RTtmtran() function is called with an invalid parameter.

365. RTINVTRKG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to route over an ISUP7 trunk for a trunk in-WATS (TINWATS) call.

Data Structures:

The dump will contain the trunk group number (grpnum), route index to the trunk group (route_x), and the calling party dialed directory number (DN).

Action:

Use the grpnum value from the dump to access RC/V View 5.1 (TRUNK GROUP). If the trunk group is an ISUP7 trunk, then use the route_x value from the dump to access RC/V View 10.2 (ROUTE INDEX [ROUTING]) to reassign the non-ISUP7 trunk group, or use the dialed DN value from the dump to access RC/V View 1.5 (PBX-DID LINE [LINE ASSIGNMENT]) to reassign the route index that will point to the non-ISUP7 trunk group.

366. RTINVTSA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data inconsistency was detected when attempting to select an outgoing common channel signaling, version 7 (CCS7) trunk group for a wideband call. The outgoing trunk group had a flexible (FLEX) channel selection scheme which is not allowed.

Data Structures:

RLRT_TRKG. Key field: grpnum.

The grpnum key is the first data item dumped, the wbttsa_type field is the second data item dumped.

Action:

Use RC/V View 5.1 (TRUNK GROUP) (keyed by grpnum) to check the value of the WB TSA TYPE field. The value should be set to NULL or FLOAT.

367. RTINWBRATE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data inconsistency was detected when attempting to select an outgoing trunk group for a wideband call. Either the `wbtsa_type` and `wb_rate` attributes in the `RLRT_TRKG` relation were set up inconsistently, or the call requested data rate was not consistent with the trunk group data.

Data Structures:

`RLRT_TRKG`.

The ROP output provides the following data: `grpnum` (trunk group number), `req_rate` (enumeration value representing the data rate requested by the call), and `num_chan` (number of channels requested by the call).

Action:

Use RC/V View 5.1 (TRUNK GROUP) (keyed by `grpnum`) to check the values of the WB RATE and WB TSA TYPE fields. These two values must be set up according to the rules specified in the 5ESS® Switch Translation Guide (TG-5).

Verify the data rate requested by the call with the trunk group WB RATE on RC/V View 5.1. The following table lists all combinations of `req_rate`, `num_chan` and WB RATE.

req_rate (ROP)	data rate requested by call	num_chan (ROP)	WB RATE (RC/V View 5.1)				
			384K	1536K	384/1536K	MR	NULL
8	384K	6	OK	X	OK	OK	X
9	1536K	24	X	OK	OK	OK	X
10	num_chan x 64K	6	OK	*	OK	OK	X
10	num_chan x 64K	24	*	OK	OK	OK	X
10	num_chan x 64K	2 5 or 7 23	*	*	*	OK	X

OK in the table indicates a valid data setup.

X indicates an invalid data setup. Corrective actions: remove this trunk group from the appropriate wideband routing list on RC/V View 10.2 (ROUTE INDEX [ROUTING]).

* indicates an allowed data setup.

A trunk group with a WB RATE of 384K, 1536K, or 384/1536K is allowed to be put in a MR wideband routing list - preferably at the end of the routing list. However, a message is printed to indicate a call failure due to the incompatibility between the call requested data rate and WB RATE of the trunk group.

Actions: Remove this trunk group from the appropriate wideband routing list on RC/V View 10.2.

368. RTIPVBHT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in `rta/RTprims/RTinptav.c`. While initializing the trunk or multiline hunt group (MLHG) member status to idle, an invalid hunt type was found in either the `rIRT_TRKG` or `rIRT_MHG` tuple. The first data dump contains the tuple from the appropriate relation. The second data dump contains the input port argument. Study the stack frame dump to gain further insight into this assert.

369. RTIPVBPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in `rta/RTprims/RTinptav.c`. While initializing the trunk or multiline hunt group (MLHG) member status, an invalid group type was found in the tuple retrieved from the `RLPORT_GROUP` relation. The first data dump contains the `rLPORT_GROUP` tuple. The second data dump contains the port passed to the `RTinptav()`

function. Study the stack frame dump to gain further insight into this assert.

370. RTISACOF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLISACOF relation, a failure code of DBNO_MATCH was returned. The rllSACOF tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLISACOF. Key fields: config, idp_gpid, actsetnum.

Action:

This is a database inconsistency that can only be corrected by manual action.

371. RTISATC1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTmain/RTisat_cwl.c. During an attempt to update integrated services attendant (ISAT) call waiting lamps, an error return was received from the DAghdpte() primitive when attempting to obtain a pointer to a terminal equipment data block (TEDB). The first data dump contains the location of the group data block for the ISAT group from the ISATGRP_GDB() macro. Study the stack frame dump to gain further insight into this assert.

372. RTISATC2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTmain/RTisat_cwl.c. During an attempt to update integrated services attendant (ISAT) call waiting lamps, an error return was received from the ISatfbstat() function. The first data dump contains the location of the group data block for the ISAT group from the ISATGRP_GDB() macro. The second data dump contains the dport and the third data dump contains the error return from ISatfbstat(). Study the stack frame dump to gain further insight into this assert.

373. RTISATLMPUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception has occurred in rta/RTmfcqu/RTluminair.c. During the update or refresh of an ISAT lamp or tone, an invalid type of update action was encountered in the incoming data.

Data Structures:

The data dump will contain MGISATWORK message which has the information about the ISAT group which was requesting the update or refresh.

Action:

Study the stack frame to gain insight into this problem.

374. RTISATMP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
the keys used to read this relation were not set properly.

Data Structures:

Action:
This is a database inconsistency that can only be corrected by manual action.

375. RTISATS1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
An exception occurred in rta/RTmfcqu/RTisatstat.c or rta/RTmfcqu/RTmklnqsta.c. During integrated services attendant (ISAT) queue manipulation (for queueing purposes), an invalid action argument was passed. The first data dump contains the multiline hunt group (MLHG) number impacted. The second data dump contains the invalid action argument. Study the stack frame dump to gain further insight into this assert.

376. RTISSCCOF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
When attempting to read the RLISSCCOF relation, a failure code of DBNO_MATCH was returned. The RLISSCCOF tuple is missing or the keys used to read this relation were not set properly.

Data Structures:
RLISSCCOF. Key fields: pftype, grpnum.

Action:
This is a database inconsistency that can only be corrected by manual action.

377. RTISDBST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
An exception occurred in rta/RTstatus/RTisdnstat.c. During an attempt to update the busy/idle status of an integrated services digital network (ISDN) multiline hunt group (MLHG) member, an unknown status request type was found in the MGLT_STAT message that was passed to the RTisdnstat() function. The first data dump contains the text of the MGLT_STAT message. The second and third data dumps contain the appropriate rIRT_MHG and rIORT_GROUP tuples for this update. Study the stack frame dump to gain further insight into this assert.

378. RTISDN1SPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:
An exception occurred in rta/RTisdn/RTfeatdispc.c or in rta/RTisdn/RTmcaoff.c. During the processing of an integrated services digital network (ISDN) multiple call appearance (MCA) origination, an error return was received from the DAgetpcb() primitive when attempting to access the process control block link area (PCBLA) of a newly created terminal process.

The first data dump contains the process ID of this terminal process. The terminal process is purged. Study the stack frame dump to gain further insight into this assert.

379. RTISDN2SPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: DALB	Audit Mode: elev

Problem:

An exception occurred in rta/RTisdn/RTfeatdispc.c. During the creation of a feature or display terminal process, an error return was received from the DARhhcda() primitive when attempting to access a D-channel application linkage block (DALB). The first data dump contains the D port that the DALB is associated with. The terminal process is purged and the DALB audit is called. Study the stack frame dump to gain further insight into this assert.

380. RTISDN3SPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: DPB	Audit Mode: elev

Problem:

An exception occurred in rta/RTisdn/RTfeatdispc.c. During the creation of a feature or display terminal process, an error return was received from the DAahdpda() primitive when attempting to link a D-channel application linkage block (DALB) data block to the D-channel port block (DPB).

The first data dump contains the relevant rITEDB tuple. The second data dump contains the relevant rIDALB tuple. The third data dump contains the D port that the DALB was to be linked to. The terminal process is purged and the DPB audit is called. Study the stack frame dump to gain further insight into this assert.

381. RTISDN4SPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: BRCSDB	Audit Mode: elev

Problem:

An exception occurred in rta/RTisdn/RTmcaoff.c. While processing an integrated services digital network (ISDN) multiple call appearance (MCA) origination, an error return was received from the DARhhcbr() primitive when attempting to get an rIBRCSDB tuple from the idle list.

The first data dump contains the error return value of the relevant D port. The newly created terminal process is purged. The BRCSDB audit is called. Study the stack frame dump to gain further insight into this assert.

382. RTISDN5SPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: BRCSDB	Audit Mode: elev

Problem:

An exception occurred in rta/RTisdn/RTmcaterm.c. While processing an integrated services digital network (ISDN) multiple call appearance (MCA) termination, an error return was received from the DALbrda() primitive when attempting to link the business and residential custom services data block (BRCSDB) to the D-channel application linkage block (DALB).

The first data dump contains the relevant rITEDB tuple. The second data dump contains the relevant rIBRCSDB tuple. The third data dump contains the error return from the DALbrda() primitive. The newly created terminal process is purged and the BRCSDB audit is called. Output from the RTDUMPDATA() macro call may be sent to the /log/log/CALLPLOG1 file. Study the stack frame dump to gain further insight into this assert.

383. RTISDN6SPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: PCBLA	Audit Mode: elev

Problem:

An exception occurred in rta/RTisdn/RTmcaterm.c. While processing an integrated services digital network (ISDN) multiple call appearance (MCA) termination, an error return was received from the DAdetpcbla() primitive when

attempting to obtain the pointer to the process control block link area (PCBLA) of the current owner process.

The first data dump contains the process ID. The newly created terminal process is purged and the PCBLA audit is called. Output from the RTDUMPDATA() macro call may be sent to the /log/log/CALLPLOG1 file. Study the stack frame dump to gain further insight into this assert.

384. RTISDN7SPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTisdn/RTmcatern.c or rta/RTisdn/RTmcaoff.c. While processing an integrated services digital network (ISDN) multiple call appearance (MCA) origination or termination, an error return was received from the RImoveb() function when attempting to move the B channel from the old terminal process to the new terminal process.

The first data dump contains the process control block link area (PCBLA) of the new process or the impacted B port. The second data dump contains the PCBLA of the owning process or the PCBLA of the new process. The third dump contains the process ID of the new terminal process or the PCBLA of the owning process. This assert will also cause a single process purge of that process. Study the stack frame dump to gain further insight into this assert.

385. RTISDN8SPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTisdn/RTmcatern.c. When processing an integrated services digital network (ISDN) multiple call appearance (MCA) termination, an error return was received from the RTBNULLSTAT() macro when attempting to set the originating processor's business and residential custom services data block (BRCSDB) to a null state.

The first data dump contains the contents of the MGLNT_REQ message. The second data dump contains the process ID of the process to be purged and the third data dump contains the error return value. The process indicated in the dump will be purged. Study the stack frame dump to gain further insight into this assert.

386. RTISDN9SPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTisdn/RTmcatern.c, RTacdterm.c, or rta/RTisdn/RTmcaoff.c. When processing an integrated services digital network (ISDN) 1) automatic call distribution (ACD) hunted call termination, or 2) a multiple call appearance (MCA) origination or termination, an error return was received from the Rlputcamp() function.

The first data dump contains 1) the config value passed to the Rlputcamp() function, or 2) the impacted B port. The second data dump contains 1) the impacted B port, or 2) the process ID of the newly created process. The third data dump contains 1) the process ID of the new terminal process, or 2) the error return from the Rlputcamp() function. The new terminal process is purged. Study the stack frame dump to gain further insight into this assert.

387. RTISDN10SPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTisdn/RTmcatern.c, RTacdterm.c, or rta/RTisdn/RTmcaoff.c. When processing an

integrated services digital network (ISDN) 1) ACDBRCS hunted call termination, or 2) a multiple call appearance (MCA) origination or termination, an error return was received from the DAcpopc() primitive.

The first data dump contains 1) the process ID of the new terminal process, or 2) the impacted B port. The second data dump contains 1) the impacted B port, or 2) the process control block link area (PCBLA) of the newly created terminal process. The new terminal process is purged. Study the stack frame dump to gain further insight into this assert.

388. RTISDN11SPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTisdn/RTmcatern.c. When processing an integrated services digital network (ISDN) multiple call appearance (MCA) termination, an error return was received from the Rlalloccre() function when attempting to allocate a call reference value. The first data dump contains the impacted D port. The newly created terminal process is purged. Study the stack frame dump to gain further insight into this assert.

389. RTISDN12SPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTisdn/RTmcatern.c, RTacdterm.c, or rta/RTisdn/RTmcaoff.c. When processing an integrated services digital network (ISDN) 1) ACDBRCS hunted call termination, or 2) a multiple call appearance (MCA) origination or termination, an error return was received from the Rladdalb() function.

The first data dump contains 1) the appropriate rITEDB tuple, or 2) the impacted D port. The second data dump contains 1) the impacted B port, or 2) the appropriate rITEDB tuple. The third data dump contains the relevant rIORTLA tuple. Output from the RTDUMPDATA() macro call may be generated and sent to the /log/log/CALLPLOG1 file. The new terminal process is purged. Study the stack frame dump to gain further insight into this assert.

390. RTISDN13SPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTisdn/RTmcatern.c, RTacdterm.c, or rta/RTisdn/RTmcaoff.c. When processing an integrated services digital network (ISDN) 1) ACDBRCS hunted call termination, or 2) a multiple call appearance (MCA) origination or termination, an error return was received from the DAfpcda() primitive.

The first data dump contains 1) the appropriate rITEDB tuple or 2) the appropriate rIDALB tuple. The second data dump contains the process control block link area (PCBLA) of the new terminal process. The third data dump contains the error return from the DAfpcda() primitive. Output from the RTDUMPDATA() macro call may be generated and sent to the /log/log/CALLPLOG1 file. The new terminal process is purged. Study the stack frame dump to gain further insight into this assert.

391. RTISDN14SPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTisdn/RTmcatern.c or RTacdterm.c. While processing an integrated services digital network (ISDN) ACDBRCS hunted call termination or a multiple call appearance (MCA) termination, an error return was received from the OSSENBFBM() macro.

The first data dump contains the process ID of the newly created terminal process. The second data dump contains the message that should have been sent. The new terminal process is purged. Study the stack frame dump to gain further insight into this assert.

392. RTISDN15SPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTisdn/RTmcaterm.c, RTacdterm.c, or rta/RTisdn/RTmcaoff.c. When processing an integrated services digital network (ISDN) 1) ACDBRCS hunted call termination, or 2) a multiple call appearance (MCA) origination or termination, an error return was received from the DAibrda() primitive.

The first data dump contains 1) the appropriate rITEDB tuple, or 2) the appropriate rIDALB tuple. The second data dump contains the relevant rIBRCSDB tuple. The third data dump contains the error return from the DAibrda() primitive. Output from the RTDUMPDATA() macro call may be generated and sent to the /log/log/CALLPLOG1 file. The new terminal process is purged. Study the stack frame dump to gain further insight into this assert.

393. RTISDN16SPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTisdn/RTmcaoff.c. While processing an integrated services digital network (ISDN) multiple call appearance (MCA) origination, an error return was received from the RTbusysa() function.

The first data dump contains the impacted D port. The second data dump contains the error return value. The newly created terminal process is purged. Study the stack frame dump to gain further insight into this assert.

394. RTISDN17SPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTisdn/RTfeatdispc.c. During the creation of a feature or display terminal process, an error return was received from the DAipcda() primitive when attempting to link the D-channel application linkage block (DALB) to the process control block link area (PCBLA) of the newly created terminal process.

The first data dump contains the relevant rITEDB tuple. The second data dump contains the contents of the DALB that was to have been linked to the PCBLA. The third data dump contains the appropriate D port data block. The terminal process is purged. Study the stack frame dump to gain further insight into this assert.

395. RTISDN18SPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTisdn/RTmcaterm.c. When attempting to process an integrated services digital network (ISDN) termination request, an error return was received from the DAgetpcb() primitive when attempting to obtain a pointer to the newly created termination terminal process's process control block link area (PCBLA).

The first data dump contains the process ID of the newly created process and the second data dump contains the creatdata structure used to create the new terminal process. The new terminal process will be purged. Study the stack frame dump generated to gain further insight into this assert.

396. RTISDN19SPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: BRCSDB	Audit Mode: elev

Problem:

An exception occurred in rta/RTisdn/RTmcaterm.c or RTacdterm.c. While processing an integrated services digital network (ISDN) termination request, an error return was received from the DARhhcbr() primitive when attempting to obtain a pointer to a business and residential custom services data block (BRCSDB) from the idle list.

The first data dump contains the process for the impacted D port. The second data dump contains the terminal equipment data block (TEDB), and the third data dump contains the error return from the DARhhcbr() primitive. The new terminal process is purged, and the BRCSDB audit is run. Study the stack frame dump to gain further insight into this assert.

397. RTISDTGS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLISDTGS relation, a failure code of DBNO_MATCH was returned. The rLISDTGS tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLISDTGS. Key fields: config, pftype, grpnum.

Action:

This is a database inconsistency that can only be corrected by manual action.

398. RTISHBAC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTstatus/RTishkey.c. During the status update of an integrated services digital network (ISDN) huntkey in multiline hunt group (MLHG) dynamic data, an invalid huntkey action was found in the MGISHKEY message.

The first data dump contains the text of the MGRTSTFWD message (into which much of the data from the MGISHKEY message was copied). Study the stack frame dump to gain further insight into this assert.

399. RTISHBHT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTstatus/RTishkey.c. During the attempt to update the status of an integrated services digital network (ISDN) huntkey in the appropriate multiline hunt group (MLHG) dynamic data, an invalid hunt type was found in the rLRT_MHG tuple just read.

The first data dump contains the rLRT_MHG tuple. The second data dump contains the text of the MGRTSTFWD message that was to have been sent. Study the stack frame dump to gain further insight into this assert.

400. RTISLINE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLIS_LINE relation, a failure code of DBNO_MATCH was returned. The rLIS_LINE

tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLIS_LINE. Key fields: lead_module, ltm_idx.

Action:

This is a database inconsistency that can only be corrected by manual action.

401. RTISMBLS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLIS_TMBLST relation, a failure code of DBNO_MATCH was returned. The RLIS_TMBLST tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLIS_TNMLST. Key fields: grpnum, subgrp.

Action:

This is a database inconsistency that can only be corrected by manual action.

402. RTISRMBLST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLISRMBLST relation, a failure code of DBNO_MATCH was returned. The RLISRMBLST tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLIS_TMBLST. Key fields: grpnum, subgrp.

Action:

This is a database inconsistency that can only be corrected by manual action.

403. RT_ISRMBLST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid call termination treatment was found in the RLISRMBLST relation. The only valid values are RMBHUNT, RMBNOHUNT, and RMBBOTH.

Data Structures:

RLISRMBLST. Key fields: grpnum, subgrp.

Action:

Manual action is needed to set a valid call termination treatment.

404. RTISTERM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLIS_TERM relation, a failure code of DBNO_MATCH was returned. The RLIS_TERM tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLIS_TERM. Key fields: lport, termno.

Action:

This is a database inconsistency that can only be corrected by manual action.

405. RTISTGDX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLISTGIDX relation, a failure code of DBNO_MATCH was returned. The rLISTGIDX tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLISTGIDX. Key fields: config, tgidx.

Action:

This is a database inconsistency that can only be corrected by manual action.

406. RTISTGRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLISATGRP relation, a failure code of DBNO_MATCH was returned. The rLISATGRP tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLISATGRP. Key field: isat_idx.

Action:

This is a database inconsistency that can only be corrected by manual action.

407. RTISTLMT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLISATLMT relation, a failure code of DBNO_MATCH was returned. The rLISATLMT tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLISATLMT. Key field: config.

Action:

This is a database inconsistency that can only be corrected by manual action.

408. RTISTMBLST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A corrupted tuple was found in the RLISTMBLST relation.

Data Structures:

RLISTMBLST.

Action:

Use ODBE to correct the rLISTMBLST tuple.

409. RTISTMBR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLISATMBR relation, a failure code of DBNO_MATCH was returned. The rLISTMBR tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLISATMBR. Key field: isat_idx.

Action:

This is a database inconsistency that can only be corrected by manual action.

410. RTISTMOD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLISATMOD relation, a failure code of DBNO_MATCH was returned. The rLISTMOD tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLISATMOD. Key field: isat_idx.

Action:

This is a database inconsistency that can only be corrected by manual action.

411. RTIVGLASS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to change one or more of the local area signaling services (LASS) global access parameters to an invalid state (LASSNULL). This state is not allowed, the valid states are UNAVAILABLE, TEMP_UNAVAIL, SUBSCRIPTION, and GEN_AVAIL.

412. RTIVLASSACS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

One or more of the local area signaling services (LASS) access parameters is set to an invalid value. The global parameters that may be affected are Glcot_access, Glac_access, Glar_access, Glscrac, Glascaac, Glscfac, and Glstdaac.

Data Structures:

RLLASSCONV.

Action:

Use RC/V View 8.18 (LASS FEATURE ACCESS) to change the access parameters to a valid value.

413. RTJ071_1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This is a general purpose assert for ASSERTB1 calls that is used until the routing and terminal allocation (RTA) assert range is increased. Study the stack frame to determine the exact cause of the exception which triggered this assert.

414. RTJ071_2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This is a general purpose assert for ASSERTB2 calls that is used until the routing and terminal allocation (RTA) assert range is increased. Study the stack frame to determine the exact cause of the exception which triggered this assert.

415. RTJ071_3 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This is a general purpose assert for ASSERTB3 calls that is used until the routing and terminal allocation (RTA) assert range is increased. Study the stack frame to determine the exact cause of the exception which triggered this assert.

416. RTJ071_4 (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

This is a general purpose assert to be used for ASSERTD applications until the routing and terminal allocation (RTA) assert range expansion is recognized by the asrtreq tool. An ASSERTD will cause of single process purge of the specified process and will cause one dcf-data dump to be generated, as well as the normal dumps that come out for a single process purge.

417. RTJMPTS1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGsa/RTjumpstest.c. While hunting for an available trunk or multiline hunt group (MLHG) member when a multi-module remote SM (MMRSM) cluster is in a standalone state, the routing state of the route attempt was incorrect or unknown.

The first data dump contains the invalid routing state. Output from the RTDUMPDATA() macro call may follow this assert. Study the stack frame dump to gain further insight into this assert.

418. RTLASSMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred during local area signaling services (LASS) screen list editing (SLE) feature execution. An unknown or corrupted message type value was found during processing in the RTlass_msg() function to send the MGRT_ARC message to a different SM in the process routing data block buffer. The text of the MGRT_ARC message to be sent that is in the process routing data block buffer is dumped.

419. RT_LGMEM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

key used to read this relation was not set properly.

Data Structures:**Action:**

This is a database inconsistency that can only be corrected by manual action.

420. RTLINETM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTterm/RTlineterm.c. An error return was received from the RTfrwdfs() function when processing a line termination request - this is a feature interaction between the call forwarding, multiline hunt group (MLHG), and/or precedence and preemption features.

The first data dump contains the global port to be terminated to. The second data dump contains the error return from RTfrwdfs(). Study the stack frame dump to gain further insight into this assert. Output from the RTDUMPDATA() macro call may follow this assert.

421. RTLMPST1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTmfcqu/RTImp_stat.c. During an attempt to update the status of feature button lamps for line queueing, an error return was received from the ISfbutstat() function.

The first data dump contains the relevant rIGROUP_PORT tuple. The second data dump contains the just read rIFEATBN tuple, and the third data dump contains the error return from ISfbutstat(). Study the stack frame dump to gain further insight into this assert.

422. RTLMPUD1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTmfcqu/RTImp_udte.c. During an attempt to refresh feature button call waiting lamps for multiline hunt groups, an invalid value for the number of lamps to update was passed in the lampdata structure.

The first data dump contains that lampdata structure. Study the stack frame dump to gain further insight into this assert.

423. RTLMPUD2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTmfcqu/RTImp_udte.c. During an attempt to refresh feature button call waiting lamps for multiline hunt groups, an invalid return value was received from the RTcwl_tc() function.

The first data dump contains the invalid return value. The second data dump contains the contents of the relevant rIQO_MLHG tuple. Study the stack frame dump to gain further insight into this assert.

424. RTLNDQU1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGmlg/RTIn_dque.c, RTInq_stat.c, or RTmlghunt.c. During the processing of a line termination which involves hunted lines, a check was made to see if this call could be queued. The hunt type of this multiline hunt group (MLHG) was inappropriate for line queueing.

The first data dump contains the rIRT_MHG tuple in the group data block. Study the stack frame dump to gain further insight into this assert.

425. RTLNEONSFG (5E12 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurs in rta/RTGbrcs/RTsfg_set.c or RTInessx.c. The data is not set correctly for EOLN calls. But the call is allowed to complete.

Data Structures:

The terminating DN, originating port, dialed digits, EON_MCRI and NODAL_IDX are dumped.

Action:

If EON_MCRI is zero:

Use RC/V View 1.8 (ANALOG LINE/BRCS ASSIGNMENT) or 23.8 (DSL/BRCS ASSIGNMENT), keyed by the terminating DN, to find out the terminal group ID of the DN. Use RC/V View 7.2 (PFA TERMINAL GROUP), keyed by the terminal group ID, to verify that eon_mcri is populated with a valid value.

If NODAL_IDX is zero:

Use originating port and the dialed digits, to find the value of NODAL_IDX through digit analysis. NODAL_IDX should have a valid range between 1 and 7.

If both NODAL_IDX and EON_MCRI have valid values:

Use RC/V View 10.4 (BRCS MC ROUTE INDEX EXPANSION), keyed by the sum of NODAL_IDX and EON_MCRI, to get the SFG GP NUM. Use RC/V View 7.3 (PFA SIMULATED FACILITY GROUP), keyed by SFG GP NUM, to verify the SFG TYPE is of EON SFG.

426. RTLNK_PLI (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLLNK_PLI relation, a failure code of DBNO_MATCH was returned. The rILNK_PLI tuple is missing or the key used to read this relation was not set properly.

Data Structures:

RLLNK_PLI. Key fields: unittype, unitnumber, pct_link.

Action:

This is a database inconsistency that can only be corrected by manual action.

427. RTLNQST1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGmlg/RTInq_stat.c. During the processing of a line queueing status message, an invalid value was found in the action field.

The first data dump contains the invalid action. The second data dump contains the contents of the multi-line hunt group (MLHG) global data block. Study the stack frame dump to gain further insight into this assert.

428. RTLNQST2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGmlg/RTInq_stat.c. During the processing of a line dequeue status message, an error return was received from the RTmuph(), RTucd(), RTcircular(), or RT_isatucd() function.

The first data dump contains the error return. The second data dump contains the contents of the multi-line hunt group (MHG) global data block. Study the stack frame dump to gain further insight into this assert.

429. RTLNQST3 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGmlg/RTInq_stat.c. During the processing of a line dequeue status message, when processing a multiple position hunt (MUPH) hunt type group, the start hunt position (ht_strt_pos) was out of range.

The first data dump contains the MUPH information from the multi-line hunt group (MLHG) global data block. Output from the RTDUMPDATA() macro call may follow this assert. Study the stack frame dump to gain further insight into this assert.

430. RTLPT_PT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLLPT_PT relation, a failure code of DBNO_MATCH was returned. The rLLPT_PT tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLLPT_PT. Key fields: lport, lpt_type.

Action:

This is a database inconsistency that can only be corrected by manual action.

431. RTLPTSPD (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the virtual relation RLLPTSPID, a failure code of DBNO_MATCH was returned. Either the static rLLPT_SPID tuple (the storage form of RLLPTSPID) is missing or the keys used to read this relation were not set properly.

Data Structures:

RLLPT_SPID. Key fields: lport, lpt_type.

Action:

This is a database inconsistency that can only be corrected by manual action.

432. RTLPTSPD (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLLPT_SPID relation, a failure code of DBNO_MATCH was returned. The rLPT_SPID tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLLPT_SPID. Key fields: lport, lpt_type.

Action:

This is a database inconsistency that can only be corrected by manual action.

433. RTLPTYFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid value for LP_TYPE was found in the RLFC_LINE relation. The LP_TYPE is neither ANALOG nor ISDN.

434. RTLFSF_CF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLLSF_CF relation, a failure code of DBNO_MATCH was returned. The rLSF_CF tuple is missing or the key used to read this relation was not set properly.

Data Structures:

RLLSF_CF. Key field: FEAT_ID.

The key value FEAT_ID will be printed on the ROP along with the LTM_TYPE and LTM_IDX values.

Action:

The port attempting to use the local area signaling services (LASS) feature selective call forwarding (SCF), selective call rejection (SCR), selective distinctive alerting (SDA), or computer access restriction (CAR) has a feature assigned (an entry exists in the rIDN_FEATS relation for the LTM_IDX and LTM_TYPE), but no rLSF_CF tuple exists that is associated with the LASS selective feature ID.

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM and CMP.

1. Use the FEAT_ID provided in the ROP output to read the RLfid2NAME relation in the CMP where RLfid2name.facid is the LASS selective feature ID, RLfid2name.class is FACBRCS, and RLfid2name.subclass is SCL_NULL.
2. If an rLFID2NAME tuple does not exist for the LASS selective feature ID, further office dependent data (ODD) inconsistencies may exist. Contact the next level of support.
3. If an rLFID2NAME tuple exists for the LASS selective feature ID, insert the appropriate rLSF_CF tuple in the indicated SM. Since RLLSF_CF is an SM redundant relation, the values for RLLSF_CF can be found by reviewing the same tuple in another SM.

435. RTLSEHCA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLLSEHCA relation, a failure code of DBNO_MATCH was returned. The rLSEHCA tuple is missing or the key used to read this relation was not set properly. The key value GRPNUM will be printed on the ROP.

Data Structures:

RLLSEHCA. Key field: GRPNUM.

Action:

This is a database inconsistency that can only be corrected by manual action.

436. RTLSEHCF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLLSEHCF relation, a failure code of DBNO_MATCH was returned. The rLSEHCF tuple is missing or the key used to read this relation was not set properly. The key value GRPNUM will be printed on the ROP.

Data Structures:

RLLSEHCF. Key field: GRPNUM.

Action:

This is a database inconsistency that can only be corrected by manual action.

437. RTLSEHCR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLLSEHCR relation, a failure code of DBNO_MATCH was returned. The rLSEHCR tuple is missing or the key used to read this relation was not set properly. The key value GRPNUM will be printed on the ROP.

Data Structures:

RLLSEHCR. Key field: GRPNUM.

Action:

This is a database inconsistency that can only be corrected by manual action.

438. RTLSEHDA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLLSEHDA relation, a failure code of DBNO_MATCH was returned. The rLSEHDA tuple is missing or the key used to read this relation was not set properly. The key value GRPNUM will be printed on the ROP.

Data Structures:

RLLSEHDA. Key field: GRPNUM.

Action:

This is a database inconsistency that can only be corrected by manual action.

439. RTLFSFSCA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLLSFSCA relation, a failure code of DBNO_MATCH was returned. The rLSFSCA tuple is missing or the keys used to read this relation were not set properly. The key values SCA_IDX and RANGE, along with the LTM_INDEX and LTM_TYPE values, will be printed on the ROP.

Data Structures:

RLLSFSCA. Key fields: SCA_IDX, RANGE.

Action:

This is a database inconsistency that can only be corrected by manual action.

440. RTLFSFCF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLLSFSCF relation, a failure code of DBNO_MATCH was returned. The rLSFSCF tuple is missing or the keys used to read this relation were not set properly. The key values SCF_IDX and RANGE, along with the LTM_INDEX and LTM_TYPE values, will be printed on the ROP.

Data Structures:

RLLSFSCF. Key fields: SCF_IDX, RANGE.

Action:

This is a database inconsistency that can only be corrected by manual action.

441. RTLFSFSCR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLLSFSCR relation, a failure code of DBNO_MATCH was returned. The rLSFSCR tuple is missing or the keys used to read this relation were not set properly. The key values SCR_IDX and RANGE, along with the LTM_INDEX and LTM_TYPE values, will be printed on the ROP.

Data Structures:

RLLSFSCR. Key fields: SCR_IDX, RANGE.

Action:

This is a database inconsistency that can only be corrected by manual action.

442. RTLFSFDA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLLSFSDA relation, a failure code of DBNO_MATCH was returned. The rLSFSDA tuple is missing or the keys used to read this relation were not set properly. The key values SDA_IDX and RANGE, along with the LTM_INDEX and LTM_TYPE values, will be printed on the ROP.

Data Structures:
RLLSFSDA. Key fields: SDA_IDX, RANGE.

Action:
This is a database inconsistency that can only be corrected by manual action.

443. RTLTM_PORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
When attempting to read the RLLTM_PORT relation, a failure code of DBNO_MATCH was returned. The rLTM_PORT tuple is missing or the key used to read this relation was not set properly.

Data Structures:
RLLTM_PORT. Key field: ltm_idx.

Action:
This is a database inconsistency that can only be corrected by manual action.

444. RTLTSBCW (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
An exception occurred in the RTltsb_cwt() function during an attempt to apply call waiting during a termination to a line time slot bridging (LTSB) port. Data in the termination message is not what was expected. The termination message is dumped. The stack frame contains important information for determining the cause of this exception.

445. RTLTSBDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
An exception occurred in the rta/RTltsb/RTltsbdbnd.c file, in function RTltsbdbnd(). A read of the global parameter Glttsbdb discovered a value greater than the maximum number of rLTSB tuples allowed for a given SM. The invalid parameter value is dumped.

446. RTLTSBPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
The RLLTSBPORT relation was missing a tuple for a line time slot bridging (LTSB) group.

Data Structures:
RLLTSBPORT.

The data for the missing rLTSBPORT tuple is dumped.

Action:
Insert an rLTSBPORT tuple.

447. RTLTSBPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLLTSBPORT relation, a failure code of DBNO_MATCH was returned. The rLTSBPORT tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLLTSBPORT. Key field: lport.

Action:

This is a database inconsistency that can only be corrected by manual action.

448. RTLTSBSPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in the RTltsbmsg() function during keep alive processing of line time slot bridging (LTSB) ports. The exception is one of the following: 1) a call to the DAfcltd() primitive returned a value of DBNO_LINK when looking for a LTSB data block (LTSBDB) linked to the call leg data block (CLDB), or 2) a read of the static relation RLLTSBPORT returned DBNO_MATCH indicating no LTSB data exists for the given LTSB port.

The data dump contains the CLDB. Inspect the stack frame dump for further information regarding this exception. This assert will cause a single process purge.

449. RTMAIN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in the routing and terminal allocation (RTA) AM routing system process (rta/RTmain/RTamrtg.c), RTA CMP global routing system process or RTA SM local routing system process (rta/RTmain/RTmainrtg.c), or RTA terminating system process (rta/RTmain/RTimmsgcnt.c). In all cases, an unrecognized initialization reason was passed when the system process was initialized. The first data dump contains the unrecognized reason. Study the stack frame dump to gain further insight into this assert.

450. RTMASK_BLF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIMASK_BLF tuple was missing in this SM when a database read was attempted.

Data Structures:

RLMASK_BLF. Key fields: isat_idx, hgid.

The isat_idx key is the integrated services digital network (ISDN) attendant group and the hgid key is the 100s group identifier (nocx256+d4x16+d3).

Action:

With the hgid and isat_idx values from the dump, use RC/V View 4.26 (ISDN HUNDREDS GROUP BUSY LAMPS) to verify the following: 1. If the rIMASK_BLF tuple does not exist: On this SM, an attendant console with a 100s group select button or a combination of buttons (one noc select button and a DSS button) selected the given 100s group defined, but no corresponding rIMASK_BLF tuple is defined. 2. If the view indicates that an rIMASK_BLF tuple with the right hgid and isat_idx values exists, call the next level of support.

451. RTMBYBHT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTstatus/RTmakebusy.c. During the status update (to busy) of selected multiline hunt group (MLHG) members, an invalid hunt type was found in the passed in argument. The first data dump contains the invalid hunt type. The second data dump contains appropriate rTMBLIST tuple that was read in this function. Study the stack frame dump to gain further insight into this assert.

452. RTMCAOF1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTisdn/RTmcatern.c or in rta/RTisdn/RTfeatdispc.c. During the processing of an integrated services digital network (ISDN) multiple call appearance (MCA) origination or termination, an error return of OSEPROG was received from the OSCREATE() macro when attempting to create a new terminal process. The first data dump contains the process ID returned from OSCREATE(). Study the stack frame dump to gain further insight into this assert.

453. RTMCAOF2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTisdn/RTmcatern.c or in rta/RTisdn/RTfeatdispc.c. During the processing of an integrated services digital network (ISDN) multiple call appearance (MCA) origination or termination, an error return of OSEPROG was received from the OSCREATE() macro when attempting to create a new terminal process.

The first data dump contains the process ID returned from OSCREATE(). The second data dump contains the create data structure passed to OSCREATE(). Study the stack frame dump to gain further insight into this assert.

454. RTMCATE1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTisdn/RTmcatern.c. When processing an integrated services digital network (ISDN) multiple call appearance (MCA) termination, an error return was received from the RTfrwdfs() function.

The first data dump contains the MGLNT_REQ message. The second data dump contains the relevant D port . Study the stack frame dump to gain further insight into this assert.

455. RTMCTR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLRT_MCTR relation, a failure code of DBNO_MATCH was returned. The rIRT_MCTR tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLRT_MCTR. Key field: locdn.

Action:

This is a database inconsistency that can only be corrected by manual action.

456. RTMDLBHT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTstatus/RTmakeidle.c. During the status update (to idle) of selected multiline hunt group (MLHG) members, an invalid hunt type was found in the passed in argument.

The first data dump contains the invalid hunt type. The second data dump contains the appropriate rTMBLIST tuple that was read in the RTmakeidle() function. Study the stack frame dump to gain further insight into this assert.

457. RTMDRSFG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLDB_AMGPD tuple with the given keys cannot be found in the static database. The tuple is missing or the keys used to access the tuple are invalid.

Data Structures:

RLDB_AMGPD. Key fields: grp_id, grp_type.

Action:

This is a database inconsistency that can only be corrected by manual action. Use RC/V View 24.33 (MESSAGE DETAIL RECORDING GROUP PARAMETERS) to insert this group. Then assign this group to RC/V View 7.3 (PFA SIMULATED FACILITY GROUP).

458. RTMGPRC1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTmain/RTmsgproc.c. An unexpected message was received in the routing and terminal allocation (RTA) routing system process. The first data dump contains the contents of the input message buffer. Study the stack frame dump to gain further insight into this assert. Output from the RTDUMPDATA() macro call may follow this assert.

459. RTMHGCF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLMHG_CF relation, a failure code of DBNO_MATCH was returned. The rLMHG_CF tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLMHG_CF. Keyfield: grpnum.

Action:

This is a database inconsistency that can only be corrected by manual action.

460. RTMINSA1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTpp/RTminsast.c. During the attempt to check and/or update the minimum precedence level for a given multiline hunt group (MLHG), the RTminsast() function could not access the relevant

rIPPSAST dynamic tuple.

The first data dump contains the contents of the rIIS_LINE tuple passed to this function. Study the stack frame dump to gain further insight into this assert.

461. RTMKLNQ1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTmfcqu/RTmklnqsta.c. When attempting to determine the status of the queue for a given multiline hunt group (MLHG), an error return was received from the DBretrvblk() primitive when attempting to read the RLQ_ISAT or RLQO_MLHG relation. The first data dump contains the MLHG value passed, The second data dump contains the error return value. Study the stack frame dump to gain further insight into this assert.

462. RTMLGDP1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGmlg/RTmlgdph.c. During the selection of a multi-line hunt group/member for a line termination, the start hunt member for a UCD or LGUCD hunt type group was out of range.

The first data dump contains the dynamic data from the rILNSTAT or rILGLNST tuple for that hunt group. Study the stack frame dump to gain further insight into this assert.

463. RTMLGHT1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGmlg/RTmlghunt.c. While hunting a multi-line hunt group (MLHG)/member, an invalid or unexpected return was received from the RTregular(), RTcircular(), RTucd(), RTisat(), or RTmuph() function.

The first data dump contains the error return. The second data dump contains the multi-line hunt group (MLHG) global data block. Study the stack frame dump to gain further insight into this assert.

464. RTMODATT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception has occurred in RTincmpfac(). During the initialization of rIFACSTAT dynamic tuples in the CMP, an error return was received from DBstfst() or DBstnxt() when stepping through the RLMODATT static relation. As a consequence of this assert, the RLACSTAT dynamic relation is probably not initialized properly.

Probable Cause:

Database (DB) access error.

Action:

There are 2 dcf-data dumps generated by this assert; the first gives the content of rIMODATT tuple, and the second gives the error return. Study the stack frame dump to gain further insight into this assert.

465. RTMONI_BLF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLMONI_BLF tuple was missing in this module when a database read was attempted.

Data Structures:

RLMONI_BLF. Key fields: hgid, index, hglneq.

The hgid key is the 100s group identifier (nocx256+d4x16+d3), the index key is the 100s group line status data index, and the hglneq key is the 100s group line equipment or multi-line hunt group (MLHG) directory number (DN) allocation.

Action:

The dump contains the contents of the RLMONI_BLF relation local buffer. With the hgid from the dump, use RC/View 4.27 (ISDN HUNDREDS GROUP SM STRUCTURE) to verify the following. View 4.27 is a 100s group RLTREE_BLF relation view.

1. If this tree relation tuple is in the same module that the assert error message came from and there is no DN with status being monitored on this module, call the next level of support.
2. If this tree relation tuple is in the same module that the assert error message came from and there is a DN with status being monitored on this module, this is a data inconsistency problem. This may be caused by incomplete ODBE work.
3. If View 4.27 shows that the module is in the tree structure as an SM or AM module, there is a problem with database access or a data inconsistency between the RLMONI_BLF and RLTREE_BLF relations. Call the next level of support.

466. RTMP_UEXP_RET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return value was encountered for a message header type. An operating system (OS) message is expected. This assert originates from the RTmsgproc() function. No audits are scheduled.

467. RTMRSP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTmonitor/RTmrsp.c for the monitor resource system process (MRSP). An unrecognized initialization reason was passed when the system process was initialized. The first data dump contains the reason. Study the stack frame dump to gain further insight into this problem.

468. RTMRTIMER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in the RTMRAUDIT() macro which is defined in rta/hdr/RTmrmacro.L. This macro is called when the monitor resource system process (MRSP) receives a MGTIMER message. The MGTIMER message contains the audit type and starting index of the head queue array RTmrhead[] or list queue array RTmrlist[]. An invalid monitor resource audit type was found. The data dump contains a pointer to the MGTIMER message buffer. Study the stack frame dump to gain further insight into this problem.

469. RTMR_UEXP_MSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received by the monitor resource system process (MRSP). The data dump contains the pointer of the incoming message buffer. Study the stack frame dump to gain further insight into this problem.

470. RTMSGBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Routing code encountered an invalid value in some field in the message being processed. A raw (hex) dump of the entire message is printed on the ROP. The program listing associated with the failing address identified in the ROP message is required to determine the nature of this error.

471. RTMSGCAMA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received by the routing and terminal allocation (RTA) local routing system process, rta/RTmain/RTmsgproc(). An MGSTATCHG, MGINH_CMNI, or MGALW_CMNI message was encountered which should never be received in the SM. The data dump contains the message header of the unexpected message.

472. RTMSG_INV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The nail-up routing and terminal allocation (RTA) SM system process was entered with an invalid reason.

473. RTMSGQFULL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An SM terminal process is sending a port status message to the local routing system process (LRSP) and has detected that the CM output message queue has only 3 message slots available.

Probable Cause:

Software bug. A terminal process is not taking adequate time breaks when sending multiple status messages to the LRSP.

Action:

Use the function back trace provided by the assert to determine if the TP is sending multiple messages to the LRSP without taking an adequate time break to allow the CM output message queue to be unloaded.

474. RTMSKBLF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLMASK_BLF relation, a failure code of DBNO_MATCH was returned. The rIMASK_BLF tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLMASK_BLF. Key fields: isat_idx, hgid.

Action:

This is a database inconsistency that can only be corrected by manual action.

475. RTMSUSP1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTtm/RTmsusp.c. During the initialization of the metallic service unit (MSU) system process, an unknown initialization reason was passed to the RTmsinit() function. The first data dump contains that unknown reason. Study the stack frame dump to gain further insight into this assert.

476. RTMSUSP2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTtm/RTmsusp.c. The metallic service unit (MSU) system process message handler, the RTmsuwork() function, received an error return code from the OSWGETMSG() macro. The first data dump contains that error return. Study the stack frame dump to gain further insight into this assert.

477. RTMSUSP3 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTtm/RTmsusp.c. The metallic service unit (MSU) system process message handler, the RTmsuwork() function, received an unexpected message or the expected message received has an invalid port value. The first data dump contains the full text of the message received. Study the stack frame dump to gain further insight into this assert.

478. RTMSUSP4 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTtm/RTmsusp.c. During the processing of an MGREG_MLHG or MGMSGREG message by the metallic service unit (MSU) system process message handler, an inconsistency was found in the contents of the message in the RTmsgreg() function. The first data dump contains the port being processed. Study the stack frame dump to gain further insight into this assert.

479. RT_NAIL_UP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLNAILUP relation, a failure code of DBNO_MATCH was returned. The rLNAILUP tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLNAILUP. Key field: port1.

Action:

This is a database inconsistency that can only be corrected by manual action.

480. RTNMPSTHTFAIL (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGtrk/RTnmpostht.c. When the original attempt to route to a trunk group failed because the trunk group was busy or otherwise unavailable, alternate routing was attempted. However, during this attempt, an invalid or unknown return was received from network management (NM) posthunt controls. The first data dump contains that return value. Study the stack frame dump to gain further insight into this assert.

481. RTNO_GPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple was not found when attempting to read the relation RLFC_LINE to get the global port. No audits were run. This assert originates from the RTacb_msg() function.

482. RT_NOISMPH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During routing of an X.25 virtual call or setup of a permanent virtual circuit (PVC), the destination port was located on a different SM. No X.25 path is equipped between this SM and the destination SM; the X.25 connection cannot be established.

Action:

Determine if the called directory number (DN) is served by a line on the terminating SM and if X.25 virtual calls or PVCs are supported between these two SMs. If so, use RC/V View 22.13 (INTER-SM NAIL-UP) to assign an X.25 nailed-up timeslot path between them. If not, all packet switch lines and trunks on the originating SM should have their digit interpreters modified to deny calls to DNs on this terminating SM.

483. RTNO_PRIQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The priority queue did not exist when the RTchkqstat() function was called to check its status.

484. RTNORMS_D3 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A non-remote measurement system-digital 3 (RMS-D3) port type was encountered. The assert is followed by the OSSUCCESS code. This assert originates from the RTrmsidle() function. No audits were scheduled.

485. RTNOTKQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When sending a keep alive message from the RTtrkgka() function, an attempt was made to read the dynamic relation RLTKQUE using the qkey attribute from the RLPORT_GROUP static relation. The rIPORT_GROUP tuple was successfully read, but the qkey field was invalid, the rITKQUE dynamic tuple was lost, or the rITKQUE tuple does not exist on this SM because it is a global group. If it is a global group, the module attribute in the RLRT_TRKG

relation is in error.

Data Structures:

RLTKQUE, RLPORT_GROUP, RLRT_TRKG, RLQKEYPORT.

The ROP output provides the following fields in the order listed: RLport_group.port, RLport_group.module, RLport_group.party, RLport_group.qkey, and RLport_group.portgrp.grpnum.

Action:

Since the value of qkey may be incorrect, determine if an rIQKEYPORT tuple with the qkey value exists. If it does, check if the module attribute in the rLRT_TRKG tuple with the key grpnum (fifth argument) is the same as the current module (second argument). If either of these conditions is false, there is a database inconsistency that must be corrected by manual action.

486. RTNSFMAP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLNSFMAP relation, a failure code of DBNO_MATCH was returned. The rLNSFMAP tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLNSFMAP. Key fields: band, carrid, facnum, nsftype, bearcap, scocsid.

Action:

This is a database inconsistency that can only be corrected by manual action. Use the trunk group number (GRPNUM) and the key fields information from the data dump to insert a tuple on RC/V View 5.34.

487. RTNS_TRIG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLNS_TRIG relation has a combination of the following problems: (1) a tuple is missing, (2) a tuple exists, but has the wrong application type, or (3) a tuple exists, but has the wrong protocol type.

Data Structures:

RLNS_TRIG. Key field: trignum.

The ROP output provides the following fields: trignum - key used to read the RLNS_TRIG relation obtained from the RLASP_LTM relation, ltm_type - ltm type of the terminating port obtained from RLrt_dntran.ltm_type, ltm_idx - ltm index of the terminating port obtained from RLrt_dntran.ltm_idx, member - the terminating port obtained from RLrt_dntran.portname.member, module - the terminating SM obtained from RLrt_dntran.portname.module, and party - the terminating party obtained from RLrt_dntran.term_name.

Action:

This is a database inconsistency that must be corrected by manual action. An rLNS_TRIG tuple may need to be updated or inserted.

1. If the rLNS_TRIG tuple is missing, insert the tuple via RC/V View 9.35 (NETWORK SERVICES TRIGGER DEFINITION) using the trigger number obtained from the first data item dumped on the ROP. Set the APPLICATION field to ASP and the AIN REL field to R0D1.

2. If the application type is wrong, update the rLNS_TRIG tuple via RC/V View 9.35 using the trigger number obtained from the first data item dumped on the ROP. Set the APPLICATION field to ASP.

3. If the protocol is wrong, update the rINS_TRIG tuple via RC/V View 9.35 using the trigger number obtained from the first data item dumped on the ROP. Set the AIN REL field to R0D1.

488. RTNTSESPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in the RTntserv() function when attempting to camp-on to a port in order to implement a customer originated recent change (CORC) for night service keys. One of the following occurred:

- 1) a process control block link area (PCBLA) could not be obtained for the newly created terminal process,
- 2) the port linkage area (PORTLA) and PCBLA of the new terminal process could not be linked, or
- 3) a message could not be sent to the new terminal process.

Study the stack frame dump to determine the exact cause of failure. The data dump contains the return value from the failing primitive in the first field. The newly created terminal process is purged.

489. RTNTSRV1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in the RTntserv() function when attempting to perform a customer originated recent change (CORC) due to the activation of a night service key. The port linkage area (PORTLA) for the given port could not be recovered by the DAggetpla() primitive. The attempt to perform the CORC will fail. The port the CORC was to be camped on to is dumped. The complete input message, MGRTKYTOD, is printed on the stack.

490. RTNTSRV2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in the RTntserv() function when attempting to create a camp-on terminal process to customer originated recent change (CORC) night service keys. The attempt to create a terminal process using the OSCREATE() macro failed because an invalid program value was passed to the macro. (NOTE: A resource failure return from the operating system (OS) will not cause this assert).

The first data dump is the contents of the create_data structure passed to the OSCREATE() macro. The second is a dump of the port's port linkage area (PORTLA).

491. RTNUCON1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTnswss/RTnuconn.c. Either an unknown reason was passed to the nail-up trigger function RTnu1trig() or an unknown reason was passed to the RTnucreat() function for the creation of the nail-up terminal process. The first data dump contains the unknown reason. Study the stack frame dump to gain further insight into this assert.

492. RTNUCON2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTnswss/RTnuconn.c. During the creation of a new nail-up connection, an error return of OSEPROG was received from the OSCREATE() macro in the RTnucreat() function.

The first data dump contains the rNAILUP tuple passed to RTnucreat(). The second data dump contains the port linkage area (PORTLA) of the second port of the nail-up connection. Study the stack frame dump to gain further insight into this assert.

493. RTNUMON1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTnswss/RTnumontp.c. During nail-up monitoring in the RTnumproc() function, an error return was received from the DBrdfst() primitive when attempting to read through the RLNAILUP relation. The first data dump contains that error return. Study the stack frame dump to gain further insight into this assert.

494. RTNUROU1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTnswss/RTnuroute.c. During the creation of a nail-up connection, an error return was received from the DAgetptla() primitive in the RTnuserm() function.

The first data dump contains the global port affected. The second data dump contains the MGNU_TERM message input to this function. Study the stack frame dump to gain further insight into this assert.

495. RTNUSDF1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTnswss/RTnusdfi.c. During the processing of the OP:NAILUP:SDFI request, a failure return was received from the SMintex() or SMnuconvert() function.

The first data dump contains the subscriber digital facility interface (SDFI) name. The second data dump contains the text of the nail-up (NU) outmsg, and the third dump contains the input RTNUINMSG structure. Study the stack frame dump to gain further insight into this assert.

496. RTNUSMS1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTnswss/RTnusmsp.c. The input reason given to the RTnuspinit() function upon initialization was unknown. The data dump contains the unknown reason. Study the stack frame dump to gain further insight into this assert.

497. RTNUSMS2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTnswss/RTnusmsp.c. During the processing of the OP:NAILUP master control center (MCC) command, a failure to create a nail-up terminal process was returned from the OSCREATE() macro; the OSEPROG code was returned. The data dump contains the RTNUINMSG structure that was passed to the

RTnuopnu() function. Study the stack frame dump to gain further insight into this assert.

498. RTNUSMS3 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTnswss/RTnusmsp.c. The nail-up system process received a timer message and attempted to create a new nail-up terminal process, but the OSCREATE() macro returned the OSEPROG value. The first data dump contains the nail-up status block. Study the stack frame dump to gain further insight into this assert.

499. RTNUSMS4 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTnswss/RTnusmsp.c. During nail-up processing, the function RTnuto() received an error return from the DAgetptla() primitive when attempting to get information about one of the ports involved in the nail-up connection.

The first data dump contains the RTININMSG structure passed to the RTnuto() function. The second data dump contains a pointer to the port linkage area (PORTLA), and the third dump contains the error return code. Study the stack frame dump to gain further insight into this assert.

500. RTNUSMT1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTnswss/RTnusmtp.c. Either an error return was received from the TMopntrn() function in the RTnuquan() function or from the OSWGETMSG() macro in the RTnuomain() function during nail-up processing.

The first data dump contains the error return and the second data dump contains the input RTNUINMSG structure. Study the stack frame dump to gain further insight into this assert.

501. RTNUSMT2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTnswss/RTnusmtp.c. Either the RTnuoproc() function found an invalid request in the RTNUINMSG structure when processing an OP:NAILUP command (the data dump contains the message), or the RTnufillmg() function received an error return from the OSWGETTYPE() macro (the data dump contains the error return). Study the stack frame dump to gain further insight into this assert.

502. RTNUSPP1 (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTnswss/RTnuconn.c. In the RTnucreat() function, when attempting to start a new nail-up connection, an appropriate rIFC_PORTTYP tuple could not be found. The newly created terminal process will be purged. Study the stack frame dump to gain further insight into this assert.

503. RTNUSPP2 (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTnswss/RTnucreat.c. During the setup of new nail-up connection, a failure return was received from the DAgetpcbl() or DAcppopc() function when attempting to access the new terminal process's data.

The first data dump contains the process ID of the new terminal process. The second data dump contains the rINAILUP tuple passed to the RTnucreat() function. The new terminal process will be purged. Study the stack frame dump to gain further insight into this assert.

504. RTNUSPP3 (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTnswss/RTnusmsp.c. During processing for nail-up connections, an error return was received from the OSCTIMER() macro in the RTnutimemon() function or from the OSSENDMSG() macro in the RTnuopnu() function. The nail-up monitor process will be purged. The first data dump contains the error return. Study the stack frame dump to gain further insight into this assert.

505. RTNUSPP4 (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTnswss/RTnusmsp.c. The RTnumtimer() function determined that the monitor terminal process existed longer than the maximum number of intervals. The terminal process will be purged. The first data dump contains the contents of the status block for nail-up connections. Study the stack frame dump to gain further insight into this assert.

506. RTNWDSC1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGcontl/RTnw_disc.c. After removing the network path, an unexpected rtg_seq value was found in the routing data block. The first data dump contains the unexpected rtg_seq value. Study the stack frame dump to gain further insight into this assert.

507. RTODPSOP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLODPSOP relation, a failure code of DBNO_MATCH was returned. The rLODPSOP tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLODPSOP. Key fields: port, party.

Action:

This is a database inconsistency that can only be corrected by manual action.

508. RTOFFCDE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLOFFICECODE relation, a failure code of DBNO_MATCH was returned. The rLOFFICECODE tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLOFFICECODE. Key field: noc.

Action:

This is a database inconsistency that can only be corrected by manual action.

509. RTOFFICE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During packet switching address validation or conversion, an rLOFFICECODE tuple was not found for the given normalized office code (NOC) printed on the ROP.

Data Structures:

RLOFFICECODE. Key field: NOC.

Action:

Use RC/V View 23.1 (DSL USERS) or View 23.2 (DIGITAL SUBSCRIBER LINE) to correct the NOC for the given protocol handler (PH) and PH channel number printed on the ROP. If the NOC is already correct, use ODBE to add an rLOFFICECODE tuple corresponding to the correct NOC.

510. RTOFHQ1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTtkq/RTofh_enq.c. During the enqueueing of a call for modular queueing II, the queue was overflowing. The first data dump contains the rIQO_OGT tuple (the queue owner tuple). Study the stack frame dump to gain further insight into this assert.

511. RTOFHKE1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTprims/RToffhook.c. When processing an offhook, an invalid class of service was found in the tuple just retrieved from the RLFC_PORTTYP relation. The first data dump contains the entire rIFC_PORTTYP tuple. Study the stack frame dump to gain further insight into this assert.

512. RTOFHKE3 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTprims/RToffhook.c. When processing an offhook, a failure return of OSEPROG was returned from the OSCREATE() macro on the request to create a terminal process. The first data dump contains the "create data" structure passed to OSCREATE(). Study the stack frame dump to gain further insight into this assert.

513. RTOFHPFAP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return was received when attempting to read an rIPF_SLCP tuple. No audits were scheduled. The assert originates from the RToffhook() function.

514. RTOFHPTYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return was received when attempting to read an rIFC_PORTTYP tuple. No audits were scheduled. The assert originates from the RToffhook() function.

515. RTOLHB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: FCLINE	Audit Mode: elev

Problem:

Could not read a tuple in the RLAN_OLHB or RLIS_ILHB relation with a dynamic access (DA) macro. The tuple was just inserted by the DBfintup() primitive. The FCLINE audit will be run to correct the problems.

516. RTONHKE1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTprims/RTonhook.c. During the processing of an onhook request, an invalid class of service was found in the rIFC_PORTTYP tuple that was retrieved. The first data dump contains the rIFC_PORTTYPE tuple. Study the stack frame dump to gain further insight into this assert.

517. RTONHPFAP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return was received when attempting to read an rIPF_SLCP tuple. No audits were scheduled. The assert originates from the RTonhook() function.

518. RTONHPTYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return was received when attempting to read an rIFC_PORTTYP tuple. No audits were scheduled. The assert originates from the RTonhook() function.

519. RTONISTA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in the RTonistat() function. An invalid parameter was passed to this function. The data dump contains the invalid parameter (the charge type, chgtype). Study the stack frame dump for further information.

520. RTOUTSAERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTinit/RToutsa.c. During the transition out of an SM or remote SM (RSM) in standalone (when that module has the standalone call processing option purchased), an error return was received from the DBstfst() or DBstnxt() primitive while reading the RLLAT_LPT relation, or an invalid value was found in the global variable RTgrpundo_stat.

The first data dump contains the value in the RTgrpundo_stat variable and the second data dump contains the contents of the global variable RToint_mode. Study the stack frame dump to gain further insight into this assert.

521. RTPCINT1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTccs/RTpcinit.c. During AM initialization, tuples are inserted into the dynamic relation RLPCI_STAT (point code index) based on the contents of tuples in the RLRT_TRKG relation. An error return was received from the DBfintup() primitive when inserting one of the dynamic tuples.

The first data dump contains the error return. The second data dump contains the contents of the tuple that could not be inserted. Study the stack frame dump to gain further insight into this assert.

522. RTPDBDCNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTshared/RTprefdel.c. During the deletion or addition of digits for trunk outpulsing, the number of digits indicated in the digit analysis data block is not correct. The first data dump contains the contents of the dial_dig structure of the digit analysis data block. Study the stack frame dump to gain further insight into this assert.

523. RTPDNTR1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGscreen/RTpdn_tran.c. During pre-directory number (DN) translation for a line routing attempt, an unexpected rtg_seq value was switched on. The first data dump contains the invalid value. Output from the RTDUMPDATA() macro call may follow this assert. Study the stack frame dump to gain further insight into this assert.

524. RTPEPTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return was received when attempting to read an rIFC_PORTTYP tuple. No audits were scheduled. The assert originates from the RTpreempt() function.

525. RTP_EPTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return was received when attempting to read an rIFC_PORTTYP tuple. No audits were scheduled. The

assert originates from the RTpre_empty() function.

526. RTPF_DBRDFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read the relation RLFC_PORTTYP failed. No audits were run. This assert originates from the RTpf_slvld() function.

527. RTPFSLCP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLPF_SLCP relation, a failure code of DBNO_MATCH was returned. The rIPF_SLCP tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLPF_SLCP. Key fields: slv_port.module, slv_port.member.

Action:

This is a database inconsistency that can only be corrected by manual action.

528. RTPG_TERM_LP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to terminate to a port group (trunk group) member failed because the SM on which the port resides does not have the proper loadable software package installed. The port and SM are dumped. The port group that contains this port as defined by the current office dependent data (ODD) is also dumped.

This port group requires the presence of the proper loadable software package (as dictated by the feature associated with this port group) in each SM to which this port group terminates. This software controls the port once routing has completed.

The hardware on which this port resides may have been installed on the wrong SM.

Data Structures:

RLPORT_GROUP, RLGROUP_PORT, RLQKEYPORT. (routing only, keys vary).

Action:

If the SM indicated does not have the proper loadable software package installed, RC/V View 5.5 (TRUNK MEMBER) should be used to remove this port from the indicated port group (trunk group). In addition, if other ports were similarly populated in this port group, they should be removed. Further information can be found in the 5ESS® Switch Translations and Dynamic Data Manual (235-600-21x).

If the hardware associated with this port should not have been installed on this SM, it should be degrown and removed from this SM, and installed and grown into the proper SM using procedures specific to this type of hardware. If the SM indicated has the proper loadable software package installed, a system error is indicated. If this problem continues to occur and begins to degrade the performance of the switch, a full initialization of the indicated SM should be done from the SM INH & RCVRY CNTL page on the master control center (MCC).

529. RTPHOOS1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The protocol handler (PH) that the message is to be sent to is out of service (OOS). When attempting to send the MGRCPVCINF interprocessor message to PH interject, a failure return was received from the PSsending() function.

Data Structures:

RLPSPVCINF. Key field: psmsghd.to_ph.

Action:

Check the PH indicated to see why it is OOS. It could be a hardware fault, forgot to restore after growing in, etc. Put the PH in service.

530. RTPOLY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLRT_POLY relation, a failure code of DBNO_MATCH was returned. The rIRT_POLY tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLRT_POLY. Key field: pattern.

Action:

This is a database inconsistency that can only be corrected by manual action.

531. RTPPBSY1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTpp/RTppbusy.c. During terminating feature selection for a line with the precedence and preemption (PP) feature assigned to it, a data inconsistency was discovered. The first data dump contains the relevant PP line or terminal equipment data block (TEDB) structure. Study the stack frame dump to gain further insight into this assert.

532. RTPPBTF1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTpp/RTppbtf.c. During terminating feature selection for a trunk with the precedence and preemption (PP) feature assigned to it, the requester was attempting to preempt an invalid type of trunk. The first data dump contains the relevant rIPP_TRUNK tuple. Study the stack frame dump to gain further insight into this assert.

533. RLPP_CF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLPP_CF relation, a failure code of DBNO_MATCH was returned. The rIPP_CF tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLPP_CF. Key field: feat_id.

Action:

This is a database inconsistency that can only be corrected by manual action.

534. RTPPFAC1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return value is returned from trunk hunting function RTpptkhnt(). This unexpected return value indicates the trunk is controlled by fast port inhibition termination feature. Either the PP trunk is assigned to the incorrect trunk unit, or some database is set up incorrectly.

Data Structures:

Trunk group number (first data item dumped).

Trunk member number (second data item dumped).

Action:

Use RC/V 5.5 (keyed by grpnum and member) to check the value of "OE" field. The equipment number type should not have a value of "N". Also check the "tsi_link" attribute of RLGROUP_PORT and RLPORT_GROUP relations. The tsi_link attribute should have a value of 0 for PP type of trunks.

535. RTPPHNT1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTpp/RTpphuntsa.c. During the hunt for an appropriate sub-address in the RLPPSAST relation, the RTpphuntsa() function could not access the correct rPPSAST tuple. The first data dump contains the input LTM index parameter used as the key for access. Study the stack frame dump to gain further insight into this assert.

536. RTPPLTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLPP_LTM relation, a failure code of DBNO_MATCH was returned. The rIPP_LTM tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLPP_LTM. Key fields: lead_module, ltm_idx, ltm_type.

Action:

This is a database inconsistency that can only be corrected by manual action.

537. RTPPSCR1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTpp/RTpp_scrn.c. During screening for the precedence and preemption (PP) feature, an invalid routing type was found in the PP screening call flow data block. The first data dump contains the contents of the PP call flow data block. Study the stack frame dump to gain further insight into this assert.

538. RTPPSET1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTpp/RTppset.c. During the attempt to set the priority level for a hunted port, an out of range multiline hunt group (MLHG) or trunk member value was encountered. The first data dump contains the terminating member value. The second data dump contains the MLHG or trunk group global data block. Study the stack frame dump to gain further insight into this assert.

539. RTPPSET2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTpp/RTppset.c. During the attempt to set the priority level for a hunted port, an invalid multiline hunt group (MLHG) or trunk hunt type value or an invalid group type value was encountered. The first data dump contains the MLHG or trunk global data block or the terminating group global data block. Study the stack frame dump to gain further insight into this assert.

540. RTPPTRUNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLPP_TRUNK relation, a failure code of DBNO_MATCH was returned. The rIPP_TRUNK tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLPP_TRUNK. Key fields: port.member, port.module.

Action:

This is a database inconsistency that can only be corrected by manual action.

541. RTPREC_LEV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected automatic voice network (AUTOVON) precedence level was encountered.

542. RTPREWL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in the RTpre_wl() function. This function is generating a work list of items from the static relation RLTD_SCHED and placing them in a dynamic work list. The dynamic work list is full. The first data dump contains the work list size, and the second contains the rITD_SCHED tuple that failed to be entered into the work list.

543. RTPRIFACS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLPRIFACS relation, a failure code of DBNO_MATCH was returned. The rIPRIFACS tuple is missing or the keys used to access this relation were not set properly.

Data Structures:

RLPRIFACS. Key fields: PRIGRP (PRI group #), INTERF_ID [interface ID (facility)].

Action:

This is a database inconsistency that can only be corrected by manual action. Insert the missing primary rate interface (PRI) facility using RC/V View 5.2 (PRI GROUP ASSIGNMENT).

544. RTPRIGRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLPRIGRP relation, a failure code of DBNO_MATCH was returned. The rIPRIGRP tuple is missing or the key used to access this relation was not set properly.

Data Structures:

RLPRIGRP. Key field: PRIGRP (PRI group number).

Action:

This is a database inconsistency that can only be corrected by manual action. Insert the missing primary rate interface (PRI) group using RC/V View 5.2 (PRI GROUP ASSIGNMENT).

545. RTPRM_TYPE_UNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid port preemption type was requested.

546. RTPSAPISLINE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The psap flag for this isdn line is set to Y. Since the integrated services digital network (ISDN) public safety answering point (PSAP) special feature has not been purchased, this flag must be set to N.

Data Structures:

RLIS_LINE key fields: lead module ltm_idx.

Action:

This database inconsistency needs to be corrected by manual action. Use RC/V View 23.2 (DIGITAL SUBSCRIBER LINE) or 23.8 (DSL/BRCS ASSIGNMENT) to correct the E911 PSAP field.

547. RTPSAPRTMHG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The psap flag for this multiline hunt group is set to Y. Since the integrated services digital network (ISDN) public safety answering point (PSAP) special feature has not been purchased, this flag must be set to N.

Data Structures:

RLRT_MHG key fields: grpnum.

Action:

This database inconsistency needs to be corrected by manual action. Use RC/V) View 3.5 (MULTILINE HUNT GROUP [LINE ASSIGNMENT]) to correct the E911 PSAP field.

548. RTPSBILLDN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No separate billing directory number (DN) could be found for the packet switched line, although the per-line data for this line indicated that it had a packet switch billing number different than its own directory number.

Data Structures:

RLPSX25LN, RLPSBILLDN.

The line is identified by the protocol handler (PH) and PH channel number printed on the ROP. Per-line packet switching (PS) feature data for this line is in the RLPSX25LN relation, the billdn_flg attribute (value of DBYES) indicates that a separate billing number should be stored in the RLPSBILLDN relation.

Action:

Use RC/V (or ODBE, if necessary) to examine the RLPSX25LN and RLPSBILLDN relations for this line. Determine if an inconsistency exists between the two relations regarding the assignment of a separate packet switch billing DN. If no separate billing number should exist, set the billdn_flg attribute in the RLPSX25LN relation to DBNO. Otherwise, enter the billing DN for this line in the RLPSBILLDN relation.

549. RTPSINSA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTinit/RTpsinsa.c. While creating dynamic relations required for packet switching routing in stand-alone, a failure return was received while trying to get the next tuple in the RLPSVRT_GP relation. The first data dump contains the rLPSVRT_GP data structure. Study the stack frame dump to gain further insight into this assert.

550. RTPSMHG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While attempting to verify the calling address of a packet switching (PS) multiline hunt group (MLHG) line, no rLPSMHGDNR tuple was found. The group number, protocol handler (PH) number, and the PH channel number for the line are printed on the ROP.

Data Structures:

RLPSMHGDNR. Key field: group number.

Action:

Use RC/V View 23.1 (DSL USERS) or View 23.2 (DIGITAL SUBSCRIBER LINE) to correct the group number for the packet switching MLHG.

551. RTPSPRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While attempting to verify the calling address of a multiline hunt group (MLHG) line, no rLPSVRT_GP tuple was

found.

Data Structures:

RLPSPRT_GP. Key fields: SM#, PH#, PH channel#, party.

Action:

Use RC/V View 23.1 (DSL USERS) or View 23.2 (DIGITAL SUBSCRIBER LINE) to correct the digital subscriber line (DSL) group and member number. If these fields are already correct, use ODBE to add an rLPSPRT_GP tuple corresponding to the SM number, protocol handler (PH) number, and PH channel number printed on the ROP.

552. RTPSRIPSN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to route an outgoing packet switched data call, the route index being used was invalid.

Data Structures:

RLPSRI_PSN, RLPSDNICRI, RLDAPRELDGT, RLDAPRIMDGT, RLRT_SCRNING.

The route index in question is printed (hex) on the ROP. All route indices valid for use by packet switched data calls must have entries in the RLPSRI_PSN relation. The route index was obtained from one of three places: (1) the RLPSDNICRI relation, (2) the digit translators used for packet switching in the RLDAPRELDGT and RLDAPRIMDGT relations, or (3) the screening relation RLRT_SCRNING. No rLPSPRT_GP tuple was found for this route index.

Action:

Use RC/V (or ODBE, if necessary) to examine the contents of the RLPSRI_PSN relation. If the route index is a valid packet switching route index and no rLPSPRT_GP tuple is found for it, then insert the tuple. If the route index is not valid for packet switching, use RC/V (or ODBE, if necessary) to examine the RLPSDNICRI, RLDAPRELDGT, RLDAPRIMDGT, and RLRT_SCRNING relations to find and correct the source of the invalid route index.

553. RTPSTDN1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGscreen/RTpostdn.c. During post-directory number (DN) translation processing, the routing data block contained an invalid orig_type (that is, neither line nor trunk). The first data dump contains the routing data block information. Output from the RTDUMPDATA() macro call may follow this assert. Study the stack frame dump to gain further insight into this assert.

554. RTPSTDN2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGscreen/RTpostdn.c. During the post-directory number (DN) translation stage of a routing request, an unexpected value was found for the terminating class in the call flow data block. The first data dump contains the DN translation data area of the call flow data block. Output from the RTDUMPDATA() macro call may follow this assert. Study the stack frame dump to gain further insight into this assert.

555. RTPSTDN3 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGscreen/RTpostdn.c. During the post-directory number (DN) translation stage of a routing request, the RTacdpgn() function was called to complete DN translation on a call to an automatic call distribution (ACD)/business and residential custom services (BRCS), ACD, or direct agent access (DAA) DN. The call to the RTacdpgn() function failed with a return code of OSNOTLOADED indicating that the ACDBASE loadable package is not loaded in this SM.

The first data dump contains the DN translation data area of the call flow data block. Output from the RTDUMPDATA() macro call may follow. Study the stack frame dump to gain further insight into this problem.

556. RTPSU_TRKG (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

From the packet pipe trunk group (PP_TRKG) and member (PP_MEM) the PSU community address was derived from the SM that the packet pipe member resides on. From that PSU community address or a connecting PSU community address, a PSU community address has been selected by RTA CDMA service handler pre-trunk hunting to get a list of potential service handler trunk groups in order to find an idle trunk. This trunk must be connected to the packet pipe which is connected to the selected PSU community address. The PSU community address does not have any service handler trunk groups assigned so the CDMA Call cannot be completed.

Data Structures:

RLPSU_TRKG. Key Fields: PSU, Service Type. Non-key Field: Packet Pipe PSU.

Action:

Must add at least one service handler trunk group for this PSU community address [use RC/V 5.1 (TRUNK GROUP) and 5.5 (TRUNK MEMBER)]. If the key field PSU is different than the packet pipe PSU, it means that RTA has looked for the requested service type in 4 rIPSU_TRKG tuples (that is, PSUs), the PSU the packet pipe terminates on and up to 3 connected PSUs, and has not found any service handlers of the requested type. This means that the service handlers of the requested type have not been distributed across the PSUs in the office.

557. RTPSU_TRKG (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

From the packet pipe trunk group (PP_TRKG) and member (PP_MEM) the packet switch unit (PSU) community address was derived from the SM that the packet pipe member resides on. From that PSU community address or a connecting PSU community address, a PSU community address has been selected by the routing and terminal allocation (RTA) code division multiple access (CDMA) speech handler channel pre-trunk hunting to get a list of potential speech handler channel trunk groups in order to find an idle trunk that can be connected to the packet pipe connected to the selected PSU community address. The PSU community address does not have any speech handler channel trunk groups assigned so the CDMA call cannot be completed.

Data Structures:

RLPSU_TRKG Key Field: psu.

Action:

Must add at least one speech handler channel trunk group for this PSU community address [Use RC/V Views 5.1 (TRUNK GROUP) and 5.5 (TRUNK MEMBER)].

558. RTPSX25LN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLPSX25LN relation, a failure code of DBNO_MATCH was returned. The RLPSX25LN tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLPSX25LN. Key fields: ph_number, ph_cn, party.

Action:

This is a database inconsistency that can only be corrected by manual action.

559. RTPTABHT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTstatus/RTportav.c. In the RTportavail() function, during an attempt to idle a trunk or multiline hunt group (MLHG) member, an invalid hunt type was found in the MHG_GDB or TRKG_GDB data block. The first data dump contains the MHG_GDB or TRKG_GDB buffer in the routing and terminal allocation (RTA) global data areas. Study the stack frame dump to gain further insight into this assert.

560. RTPTABPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTstatus/RTportav.c. In the RTportavail() function, during an attempt to idle a trunk or multiline hunt group (MLHG) member, an invalid group type was found in the terminating group data block in the MGRT_GEN message. The first data dump contains the terminating data block structure. Study the stack frame dump to gain further insight into this assert.

561. RTPTAVOOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTstatus/RTportav.c. In the RTportavail() function, during an attempt to idle a trunk or multiline hunt group (MLHG) member, the member number found in the MGRT_GEN message was out of range.

Data Structures:

The first data dump contains the MHG_GDB or TRKG_GDB buffers in the routing and terminal allocation (RTA) global data areas. The second data dump contains the terminating data block structure of the MGRT_GEN message.

Action:

Study the stack frame dump to gain further insight into this assert. Because of the distributed nature of hunting data, this assert may be seen occasionally as a result of recent change activity affecting a hunt group, or as a result of recent change roll forwards occurring as a result of an SM initialization; these occurrences should be ignored. If the assert continues to occur or occurs in large numbers, the appropriate organization should be contacted.

562. RTPTBBHT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTstatus/RTportbusy.c. In the RTportbusy() function, during an attempt to busy out a trunk or multiline hunt group (MLHG) member, an invalid hunt type was found in the MHG_GDB or TRKG_GDB data

block. The first data dump contains the MHG_GDB or TRKG_GDB buffer in the routing and terminal allocation (RTA) global data areas. Study the stack frame dump to gain further insight into this assert.

563. RTPTBBPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTstatus/RTportbusy.c. In the RTportbusy() function, during an attempt to busy out a trunk or multiline hunt group (MLHG) member, an invalid group type was found in the terminating group data block in the MGRT_GEN message. The first data dump contains the terminating data block structure. Study the stack frame dump to gain further insight into this assert.

564. RTPTBOOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTstatus/RTportbusy.c. In the RTportbusy() function, during an attempt to busy out a trunk or multiline hunt group (MLHG) member, the member number found in the MGRT_GEN message was out of range.

The first data dump contains the MHG_GDB or TRKG_GDB buffer in the routing and terminal allocation (RTA) global data areas. The second data dump contains the terminating data block structure of the MGRT_GEN message. Study the stack frame dump to gain further insight into this assert.

565. RTPTBRC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTstatus/RTportbusy.c. In the RTportbusy() function, during an attempt to busy out a precedence and preemption (PP) trunk member, an error return was received from the RTp_hmbr() function.

The first data dump contains the TRKG_GDB buffer in the routing and terminal allocation (RTA) global data areas. The second data dump contains the error return value. Study the stack frame dump to gain further insight into this assert.

566. RTPTTGPG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLPORT_GROUP relation, a failure code of DBNO_MATCH was returned. The RLPORT_GROUP tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLPORT_GROUP. Key fields: port.member, port.module, party.

Action:

This is a database inconsistency that can only be corrected by manual action.

567. RTPTTOLP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in the RTpttolpt() function when attempting to find an associated lport from a port and class of service. The input data could not be successfully converted. The port being converted is dumped. Further information can be found in the stack frame dump.

568. RTPTYP_RDFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read the relation RLFC_PORTTYP failed. No audits were run. This assert originates from the RTbvterm() function.

569. RTPVCFCL_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During setup of a permanent virtual circuit (PVC), the far end facility type (fcltype attribute in the RLPSPVCINF relation) had a value of X25. This is inconsistent with the directory number (DN) of the far end of the PVC (rmt_dn attribute in the RLPSPVCING relation) that was analyzed by the digit interpreter to represent an inter-LATA destination. X25 facility type is only appropriate with intra-LATA destinations. Inter-LATA destinations require a facility type of X75.

Data Structures:

RLPSPVCINF.

Action:

The protocol handler (PH) number (ph_number), PH channel number (ph_cn), and local logical channel number (local_lcn) are printed on the ROP. Use these values as keys to read the RLPSPVCINF relation via ODBE. Verify the accuracy of the remote DN (rmt_dn). Set the facility type to X25 if the destination is intra-LATA or X75 if the destination is inter-LATA. The associated RC/V view is View 23.1 (ISDN INDIVIDUAL DSL LCEN). The associated RC/V field is DSL PROF (facility type).

570. RTPVCINF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLPSPVCINF tuple was not found during routing of a permanent virtual circuit (PVC) call after routing determined that a PVC was defined on the associated digital subscriber line (DSL) by reading the RLPSX25LN relation. There is an inconsistency between the two relations.

Data Structures:

RLPSPVCINF, RLPSX25LN, RLPSMAPPVC.

Action:

The protocol handler (PH) number (ph_number), PH channel number (ph_cn), and local logical channel number (local_lcn) are printed on the ROP. Use these values as keys to read the RLPSX25LN, RLPSPVCINF, and RLPSMAPPVC relations via ODBE.

In the rLPSPVCINF tuple, if the h_pvc_lcn attribute is 0, there should not be any PVCs assigned for this DSL. If this PVC should exist, but no tuples exist in the RLPSPVCINF and RLPSMAPPVC relations, populate one tuple for each relation. Most of the information needed to populate the rLPSPVCINF tuple can be found in a corresponding rLPSPVCINF tuple by using ODBE with the keys ph_number and ph_cn. The associated RC/V view is View 23.2 (ISDN INDIVIDUAL DSL), field: HIGH PVC LCN.

571. RTPVCRDN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Digit analysis was provided an invalid terminating directory number (DN) for an X.25 permanent virtual circuit (PVC) call that is stored in the RLPSPVCINF relation.

Data Structures:

RLPSPVCINF.

Action:

The protocol handler (PH) number (ph_number), PH channel number (ph_cn), and local logical channel number (local_lcn) are printed on the ROP. Use the ph_number, ph_cn, and local_lcn as keys to update RC/V View 23.11 (DSL PACKET SWITCHING PVC LCN ASSIGNMENT). Update the REMOTE TN (telephone number) field because it is currently a vacant directory number.

572. RTQDLAPB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTprims/RTqdlann.c. During an attempt to secure an announcement port for delay treatment for a queued call, an error return was received from the DAgetptla() primitive.

The first data dump contains the owning process's process control block link area (PCBLA). The second data dump contains that error return from DAgetptla(). Study the stack frame dump to gain further insight into this assert.

573. RTQKEYPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While attempting to read the RLQKEYPORT relation, a failure code of DBNO_MATCH was returned. The rIQKEYPORT tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLQKEYPORT. Key field: qkey.

The qkey value is the first data item dumped and the grpnum value (non-key) is the second data item dumped.

Action:

This is a database inconsistency that can only be corrected by manual action.

574. RTQKYST1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTtkq/RTqkeyst.c, RTtkfstht.c, RTtkq_ms.c, or RTtkqupst.c. During processing for the modular queueing II feature, a trunk group with an invalid or inappropriate hunt type was found. The first data dump contains the hunt type. Study the stack frame dump to gain further insight into this assert.

575. RTQTWLS1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTmfcqu/RTqtwlset.c. When attempting to update the queueing threshold warning lamp status (for line queueing), an error return was received from the ISfbstat() function.

The first data dump contains the input MGQTWL message. The second data dump contains the error return value. Study the stack frame dump to gain further insight into this assert.

576. RTQTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown command was found in the array RTpendarray[].

577. RTQTYP_INV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The queue type determined from the tuple passed in a parameter to the RTtkq_nxt() function was unknown.

578. RTQUOGTOS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLQU_OGTOS relation, a failure code of DBNO_MATCH was returned. The rIQU_OGTOS tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLQU_OGTOS. Key field: ogt_key.

Action:

This is a database inconsistency that can only be corrected by manual action.

579. RTAFTNOT_LD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An expected feature is not loaded. No audits are run. This assert originates from the RTrafterm() function.

580. RTRBKPS1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTtkq/RTrbkpsstat.c. During the initial dequeue processing for the MGRET_PSTAT message (for modular queueing II), the status of the queued member was invalid. The first data dump contains the port and group information for that queued call. Study the stack frame dump to gain further insight into this assert.

581. RTRBKPS2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTtkq/RTrbkpsstat.c. During initial dequeue processing for the MGRET_PSTAT

message (for modular queueing II), the message had an invalid or unexpected pstat value. The first data dump contains the contents of the MGRET_PSTAT message. Study the stack frame dump to gain further insight into this assert.

582. RTRB_UEXP_RET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from the TMMkptdubi() function. This assert originates from the RTrmsbusy() function. No audits were scheduled.

583. RTRCAFI1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTrcv/RTrcaddfifomem. During an RC/V transaction to increase the size of a first-in first-out (FIFO) trunk group, an error return was received from the DBstfst() or DBstnxt() primitive when attempting to read the RLQKEYPORT relation. The data dump gives the group number of the impacted trunk group.

584. RTRCAFI2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTrcv/RTrcaddfifomem. During an RC/V transaction to increase the size of a first-in first-out (FIFO) trunk group, an error return was received when attempting to insert or link the new dynamic rITKQUE tuple. The first data dump contains the contents of the tuple buffer, and the second dump contains the error return code.

585. RTRCDFI1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTrtrcv/RTrcdltfifomem. During an RC/V transaction to delete trunk group members, the attempt to delete an rITKQUE tuple from a first-in first-out (FIFO) trunk group failed. The first data dump contains the rITKQUE tuple to be deleted, and the second dump contains the error return from the DBfdltup() primitive. The trunk group impacted can be determined from the stack frame dump.

586. RTRCDFI2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTrcv/RTrcdltfifomem. During a recent change transaction to remove members from a first-in first-out (FIFO) trunk group, an error return of DBSYS_ERR was received from the DARhtotq() primitive when attempting to unlink the head member rITKQUE tuple from the owning rITKOWNER head tuple. The data dump contains the trunk group impacted by this error.

587. RTRCDFI3 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTrcv/RTrcdltfifomem. During an RC/V transaction to remove members from a first-in

first-out (FIFO) trunk group, an error return was received from the DAGstotq() primitive when attempting to read the successor rITKQUE tuple from the FIFO busy list. The first data dump contains the trunk group impacted by this error; the second contains the qkey of the current rITKQUE tuple (that is, not the successor).

588. RTRCDLT1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTrcv/RTrcdltgrp. During an RC/V transaction deleting a trunk group, the appropriate trunk group tuple was not removed. See the stack frame to determine the exact location of the failure. The first data dump gives the trunk group affected, and the second dump gives the invalid return from the DBfdltup() function which caused this assert to fire.

589. RTRCDLT2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTrcv/RTrcdltgrp. An invalid return was received from a call to the OSfap() function to handle a trunk group with a hunt type not found in the base configuration. The first data dump contains the trunk group affected, the second contains the hunt type of that trunk group, and the third contains the invalid return value.

590. RTRCITK1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTrcv/RTrctrkins. During an RC/V transaction to insert a new trunk group and its members, an error return was received from the DBfintup() primitive when attempting to insert a new tuple in the RLTKOWNER, RLTKSTAT, or RLLGTKSTAT dynamic relation.

The first data dump contains the contents of the tuple to be inserted, and the second data dump contains the error return from the DBfintup() primitive.

591. RTRCITK2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTrcv/RTrctkgrp.c. During an RC/V transaction to insert a new trunk group and its members, an error return of DBSYS_ERR was received from the DAGstotq() primitive when attempting to retrieve the successor rITKQUE tuple from the current rITKQUE tuple when attempting to idle out existing busy trunk members. The first data dump contains the trunk group impacted, and the second dump contains the qkey of the current rITKQUE tuple.

592. RTRCITK3 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTrcv/RTrctrkins. During an RC/V transaction to insert a new trunk group and its members, an error return of DBSYS_ERR was received from the DAGhtotq() primitive when attempting to read the head rITKQUE tuple from the busy list. The data dump contains the trunk group impacted by this error.

593. RTRCITK4 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTrcv/RTcrtrkins. During an RC/V transaction to insert a new trunk group and its members, an unsuccessful return was received from the call to the OSfap() function when attempting to process a trunk group with a non-base hunt type.

The first data dump contains the trunk group impacted, the second contains the hunt type of the trunk group, and the third dump contains the value of the unsuccessful return.

594. RTRCLTSB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in the RTRc_ltsbpt() function when attempting to delete a tuple from the RLLTSBSTAT relation. The first data dump is the contents of the rLLTSBSTAT tuple to be deleted and the second data dump is the return code from the DBfdltup() primitive. The stack frame supplies the exact location of the failure and other useful information.

595. RTRCPPS2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTpp/RTrcppsast.c. While inserting or deleting an rPPSAST tuple triggered by a similar change to certain tuples in the RLIS_LINE relation, an invalid transaction type was passed or an error return was received from the DBfintup() or DBfdltup() primitive. The first data dump contains the invalid transaction type or the tuple in question on the database (DB) primitive failure. Study the stack frame dump to gain further insight into this assert.

596. RTRCRLG1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTrcv/RTcrct_lgt. During an RC/V transaction to grow a linear trunk group into a large linear trunk group, the trunks group's dynamic data block (the RLTKSTAT relation) could not be retrieved by the DAgctkst() primitive. The data dump contains the trunk group impacted by this error.

597. RTRCRLG2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTrcv/RTcrct_lgt. During an RC/V transaction to increase the size of a linear trunk group to a large linear trunk group, an error return was received from the DBfintup() primitive when attempting to insert the updated rLGTKSTAT dynamic tuple. The first data dump contains the contents of the tuple that could not be inserted, and the second dump contains the error return code from the DBfintup() primitive.

598. RTRCRLG3 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTrcv/RTcrct_lgt. During an RC/V transaction to increase the size of a linear trunk group

to a large linear trunk group, an error return was received from the DBfdltup() primitive when attempting to delete the old rITKSTAT dynamic data tuple after the new rLGTKSTAT dynamic data tuple had successfully been inserted. The first data dump contains the contents of the rITKSTAT tuple that could not be deleted, and the second dump contains the error return code.

599. RTRCTGR1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTrcv/RTctgrow. During an RC/V transaction to grow or shrink the size of an existing FIFO, LINEAR, or LGLINEAR trunk group, the attempt to read the appropriate dynamic data block (the RLTKOWNER, RLTKSTAT, or RLLGTKSTAT relation) was unsuccessful. The first data dump contains the trunk group impacted, and the second contains the trunk group of the dynamic data block.

600. RTRCTGR2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTrcv/RTctgrow. During an RC/V transaction to increase or shrink the size of a LINEAR or LGLINEAR trunk group, the new size of the trunk group exceeded the maximum size for a large linear trunk group. The first data dump contains the out-of-range size, and the second dump contains the associated RLLGTKSTAT relation information for the trunk group.

601. RTRCTGR3 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTrcv/RTctgrow. During an RC/V transaction to grow or shrink the size of an existing trunk group, an error return was received from the OSfap() function when attempting to grow or shrink a non-base hunt type trunk group. The first data dump contains the trunk group impacted, the second contains the non-base hunt type, and the third contains the error return code.

602. RTRCTK1GR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTrcv/RTctkgrp. An incorrect relation ID was passed to this function (that is, not RLRT_TRKG) during RC/V processing. The data dump will contain the erroneous relation ID.

603. RTRCTK2GR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTrcv/RTctkgrp. An invalid return was received from a call to the OSfap() function for a common channel signaling (CCS) related insert or update of dynamic data. See the stack frame to determine which call to the OSfap() function generated this exception. The first data dump contains the contents of the appropriate update or insert tuple, and the second dump contains the value of the invalid return from OSfap().

604. RTRCTK3GR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTrcv/RTctkgrp. An invalid return code was received from a call to the OSfap() function for handling a common channel signaling (CCS) related dynamic data update. The first data dump gives the contents of the tuple to be updated, the second dump contains the new tuple, and the third dump contains the value of the invalid return code from the OSfap() function.

605. RTRDLGLNSTAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read an rLGLNSTAT tuple.

606. RTRDLNSTAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read an rILNSTAT tuple.

607. RTREASON (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid reason was encountered for a switch statement in the RTtrfcline(), RTtrrmfeats(), and RTtracsopt() functions.

608. RTREHNT2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGhunts/RTrehunt.c. The trunk or multiline hunt group (MLHG) member first selected could not be routed to, and the RTrehunt() function was called to prepare to hunt for a different member in the same group. However, the hunt type of this group is not recognized or is corrupted.

The first data dump contains the error return received from the OSfap() function when determining if this hunt type is recognized by any currently loaded package. Output from the RTDUMPDATA() macro call may follow this assert. Study the stack frame dump to gain further insight into this assert.

609. RTREHNT3 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGhunts/RTrehunt.c. The trunk or multiline hunt group (MLHG) member first selected could not be routed to, and the RTrehunt() function was called to prepare to hunt for a different member in the same group. However, the group type of this group is not recognized or is corrupted. The first data dump contains the terminating port group information. Output from the RTDUMPDATA() macro call may follow this assert. Study the stack frame dump to gain further insight into this assert.

610. RTREPLY1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTblf/RTreplyhnd.c. In the busy lamp field (BLF) status report message handler function RTreplyhndlr(), an invalid destination field was found in the incoming MGBLFREPLY message. The first data dump contains the message. Study the stack frame dump to gain further insight into this assert.

611. RTRERRBC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTshared/RTrtgerr.c. During routing within the routing and terminal allocation (RTA) finite state machine in an SM or CMP, the RTrtgerr() function was called to either process a known error or to divert the routing to a different processor. During this processing, an inconsistency was discovered involving the cause effect data tables which control execution.

The first data dump contains a pointer to the appropriate entry in the cause effect table. The second data dump contains a pointer to the routing data block. Study the stack frame dump to gain further insight into this assert.

612. RTRERTBM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTprims/RTtrerte.c. During the attempt to reroute a call for the call forwarding or series completion feature, an invalid input parameter specifying the message or call type was encountered.

The first data dump contains the invalid type value. The second data dump contains the text of the message to be routed. Study the stack frame dump to gain further insight into this assert.

613. RTRIBAD_RET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from the TMpttype() function. A port type was expected. The OSSUCCESS code is returned after the assert. This assert originates from the RTrmsidle() function. No audits were scheduled.

614. RTRIINV_RET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return was received from an attempt to de-queue a 104 or 105 test port. The assert is followed by an OSSUCCESS code. This assert originates from the RTrmsidle() function. No audits are scheduled.

615. RTRINORMS_D3 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A port type was not of the remote measurement system-digital 3 (RMS-D3) type set. The code OSSUCCESS is returned. This assert originates in the RTrmsidle() function. No audits are scheduled.

616. RTRIRET_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from the TMmkptdubi() function. The assert is followed by an OSSUCCESS code. This assert originates from the RTrmside() function. No audit was scheduled.

617. RTRKMOD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to process a keep alive request for trunk groups, an inappropriate module location for the trunk groups' dynamic data was encountered. The value for the module attribute in the rIRT_TRKG tuple just read was neither 0 (to indicate a global group) or the current SM (for local groups).

Data Structures:

RLRT_TRKG, RLPORT_GROUP.

The ROP output provides the following fields in the order listed: RLrt_trkg.grpnnum, RLrt_trkg.module, port, and party.

Action:

Since the RLPORT_GROUP relation was read first to get the trunk group value, verify that there is an rIORT_GROUP tuple with the port (current module) and party values as dumped. The RLport_group.portgrp.grpnnum value should match the first argument dumped. If they match, the second argument must be either 0 or the current module. If not, this is a database inconsistency that can be corrected by manual action.

618. RTRLFC_PORTTYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read of the RLFC_PORTTYP relation failed.

619. RTRMBLIST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid bsytrt attribute was found in an rIRMBLIST tuple.

Data Structures:

RLRMBLIST.

Action:

Use RC/V (or ODBE, if necessary) to fix the static rIRMBLIST data tuple.

620. RTRMBLST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLRMBLIST relation, a failure code of DBNO_MATCH was returned. The rIRMBLIST tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLRMBLIST. Key field: scanindex.

Action:

This is a database inconsistency that can only be corrected by manual action.

621. RTRMSFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred during a routing attempt in the AM for remote measurement system 3 (RMSD3) type calls. When attempting to send the route failure message back to the originator, a failure return was received from the operating system for distributed switching (OSDS) message sending primitive.

The data dumped on the ROP is the message head and message text of the MGRT_FAIL message. Certain relevant data was saved in the first six bytes of the message text body. The first four bytes are the destination process ID that the message was to be sent to; the next two bytes are the error return code from the OSSENDMSG() macro.

622. RTRNCBAD_RET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RTim_abnor() function returned an invalid return value other than RT_ALLOW, RT_BLKBUSY, or RT_IDLE. This assert originates from the RTrmsnwn() function which is used to connect a remote measurement system-digital 3 (RMS-D3) test access trunk (TAT) to the trunk under test (TUT). No audit was scheduled.

623. RTROUTBP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTprims/RTroute.c. During a request to perform routing for a terminal maintenance (TM) route request message, an invalid module value of 0 was found in the global port value of the message when the rt_req field was set to route by port.

The first data dump contains the global port value. The second data dump contains the entire MGTM_REQ message. Study the stack frame dump to gain further insight into this assert.

624. RTRQBCR1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTprims/RTrtreq.c or in rta/RTamps/RTaproute.c. While setting up a routing request to routing and terminal allocation (RTA), a data inconsistency was found in the MGRT_REQ/MGAP_REQ message between the rte_try and asreport fields in the rtg_data structure (in regard to call record reports). The first data dump contains that rte_try value. Study the stack frame dump to gain further insight into this assert.

625. RTRRCOS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The class of service was not a line or trunk. Corrupted data in a message is suspected. No audits were run. The assert originates from the RTrtreq() function or the RTaproute() function.

626. RTRSMCAM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in the rta/RTcama/RTsrsmcama.c file, in the function RTcamainit(). An attempt to retry an office number identification (ONI) call was detected. The data dump contains the terminating data block.

627. RTRTDNMHG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read the RLRTDN_MHG relation resulted in a DBNO_MATCH. The rLRTDN_MHG tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLRTDN_MHG. Key fields: noc, digits.

Action:

This is a database inconsistency that can only be corrected by manual action.

628. RTRTDNMOD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLRTDNMOD tuple was missing in this module when a database read was attempted.

Data Structures:

RLRTDNMOD. Key fields: dngroup, rtg_mod, ri.

The dngroup key is the directory number group. dngroup is made up of the normalized office code (NOC), d4d3[0] d4, and d4d3[1] d3. The rtg_mod key is the routing module and the ri key is the routing index.

Action:

The dump will contain the contents of the RLRTDNMOD relation local buffer. An attendant console's 100s group select button or a combination of buttons (one NOC select button and one DSS button) selecting the given 100s group was defined, but the dngroup is not defined in this switch. The button assignment should be changed to disable the selection of this 100s group for busy lamp field (BLF) display.

629. RTRTDNMPG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLRTDNPG relation, a failure code of DBNO_MATCH was returned. The rLRTDNPG tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLRTDNPG. Key fields: noc, digits 1-4.

The noc key is the first item dumped and the digits are the second through fifth items dumped.

Action:

This is a database inconsistency that can only be corrected by manual action.

630. RTRT_DNTRAN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read the RLRT_DNTRAN relation resulted in a DBNO_MATCH. The rIRT_DNTRAN tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLRT_DNTRAN. Key fields: noc, digits.

Action:

Verify that the keys printed on the ROP are valid. The normalized office code (NOC) must be in the range 0-250. The digits field consists of four digits. If the keys are valid, use ODBE to verify that the rIRT_DNTRAN tuple does not exist on the SM indicated; then insert the tuple. If the keys are not valid, file a trouble report.

631. RTRT_DTRTX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

There are two possible reasons for this assert to fire:

Case 1) A subscriber is making a circuit switched data call using digit analysis translations that specify a route index that does not have a DATARATE ALT RI populated on RC/V View10.2.

Case 2) An incoming non-SS7 trunk group has a DATARATE specified on the 5.1 view, so all incoming calls are marked as data calls using that datarate, and the DATARATE ALT RI for that datarate is not specified on RC/V View 10.2 for the route index that the call obtains from digit analysis.

Data Structures:

RLRT_DTRTX Key Fields: route_x, datarate.

Action:

Determine the DATARATE for the call by finding the enumeration value in domain DMDATARATE that corresponds to the integer value printed in the DATARATE field in the assert.

1a) If the outgoing trunk group for the route index printed in the assert can carry data calls at the datarate printed in the assert, then RC/V View 10.2 for the route index can be updated to contain the SAME route index value in the DATARATE ALT RI field for the appropriate datarate.

1b) If the outgoing trunk group for the route index printed in the assert CANNOT carry data calls at the datarate printed in the assert, then either:

i) A different route index that can carry calls at the datarate in the assert must be populated in the ALT RI for that datarate on RC/V View 10.2 for the route index printed in the assert,

or

ii) The digit analysis translations for the originator must be modified to provide a different route index.

2a) If the incoming non-SS7 trunk group is supposed to be a data trunk group, then the DATARATE ALT RI on RC/V View 10.2 for the route index printed in the assert must be populated for the datarate that is populated on RC/V View 5.1 for the incoming trunk group.

2b) If the incoming non-SS7 trunk group is NOT supposed to be a data trunk group, the datarate on the trunk group view must be removed.

632. RTRTGCN2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGcontl/RTrtgcont.c. During routing in routing and terminal allocation's (RTA's) local routing system process, the routing state was set to RT_SFG. In a non-CMP environment, this is an error. The first data dump contains the first 160 bytes of the routing data block. Study the stack frame dump to gain further insight into this assert.

633. RTRTGIN1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTmain/RTrtginit.c. Either an unrecognized message was received by the RTrtginit() function as a front end to a routing and terminal allocation (RTA) routing system process, or an MGRTERTE message was received with an unexpected REQTYPE. The first data dump contains the contents of the routing data block for the first case or the REQTYPE for the second case. Study the stack frame dump to gain further insight into this assert. Output from the RTDUMPDATA() macro call may follow this assert.

634. RTRTGIN2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTmain/RTrtginit.c. An unexpected message was received.

The first data dump contains the contents of the unexpected message. The second data dump contains the contents of the RTpendarray[] array. Study the stack frame dump to gain further insight into this assert. Output from the RTDUMPDATA() macro call may follow this assert.

635. RTRTLIST (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read a rIRTLIST tuple, a failure code of DBNO_MATCH was returned. The rIRTLIST tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLRRLIST. Key field: prim_ri.

Action:

This is a database inconsistency that can be corrected by manual action.

636. RTRT_MCRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLRT_MCRT relation, a failure code of DBNO_MATCH was returned. The rIRT_MCRT tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLRT_MCRT. Key field: mc_ri (route index).

Action:

This is a database inconsistency that can only be corrected manual action.

637. RTRT_MEM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLRT_MEM relation, a failure code of DBNO_MATCH was returned. The rIRT_MEM tuple is missing or the key used to read this relation was not set properly.

Data Structures:

RLRT_MEM. Key field: grpnum (multi-line hunt group).

Action:

This is a database inconsistency that can only be corrected by manual action.

638. RTRT_MHG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLRT_MHG relation, a failure code of DBNO_MATCH was returned. The rIRT_MHG tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLRT_MHG. Key field: grpnum.

Action:

This is a database inconsistency that can only be corrected by manual action.

639. RTRTMWCF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLMWCF relation, a failure code of DBNO_MATCH was returned. The rIMWCF tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLMWCF. Key field: feat_id.

Action:

This is a database inconsistency that can only be corrected by manual action.

640. RTRTNOT_LD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An expected feature is not loaded. No audits are run. This assert originates from the RTrafterm() function.

641. RTRTPPSCRN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLRTPPSCRN relation, a failure code of DBNO_MATCH was returned. The

rIRTPPSCRN tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLRTPPSCRN. Key fields: si, di, rte_code, prec_level.

Action:

This is a database inconsistency that can only be corrected by manual action.

642. RTRTROUTING (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLRT_ROUTING relation, a failure code of DBNO_MATCH was returned. The rIRT_ROUTING tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLRT_ROUTING. Key field: route_x.

Action:

This is a database inconsistency that can only be corrected by manual action.

643. RTRTSATLN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLRTSATLN relation, a failure code of DBNO_MATCH was returned. The rIRTSATLN tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLRTSATLN. Key fields: gport.member, gport.module.

Action:

This is a database inconsistency that can only be corrected by manual action.

644. RTRTSEQ_INV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The routing sequence determined by the RTtkqswmsg() function was invalid.

645. RTRT_SFG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLRT_SFG relation, a failure code of DBNO_MATCH was returned. The rIRT_SFG tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLRT_SFG. Key field: GRPNUM.

Action:

This is a database inconsistency that can only be corrected manual action.

646. RTRT_TGBL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLRT_TGBL relation, a failure code of DBNO_MATCH was returned. The rLRT_TGBL tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLRT_TGBL. Key fields: GRPNUM, PFTYPE.

Action:

This is a database inconsistency that can only be corrected by manual action.

647. RTRT_TGID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLRT_TGID relation, a failure code of DBNO_MATCH was returned. The rLRT_TGID tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLRT_TGID. Key field: tgid.

Action:

This is a database inconsistency that can only be corrected by manual action.

648. RTRT_TRKG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLRT_TRKG relation, a failure code of DBNO_MATCH was returned. The rLRT_TRKG tuple is missing or the key used to read this relation was not set properly.

Data Structures:

RLRT_TRKG. Key field: grpnum.

Action:

This is a database inconsistency that can only be corrected by manual action.

649. RTRT_WBRTX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A subscriber is making a wideband circuit switched data call using digit analysis translations that specify a route index that does not have a DATARATE ALT RI populated on the 10.2 RC View for the datarate that the call is attempting to use.

Data Structures:

RLRT_WBRTX Key Fields: route_x, wb_rate.

Action:

Determine the DATARATE for the call by finding the enumeration value in domain DMWB_RATE that corresponds to the integer value printed in the WB_RATE field in the assert.

a) If the outgoing trunk group for the route index printed in the assert can carry data calls at the datarate printed in the assert, then the 10.2 view for the route index can be updated to contain the SAME route index value in the DATARATE ALT RI field for the appropriate datarate.

b) If the outgoing trunk group for the route index printed in the assert CANNOT carry data calls at the datarate printed in the assert, then either:

i) A different route index that can carry calls at the datarate in the assert must be populated in the ALT RI for that datarate on the 10.2 view for the route index printed in the assert,

or

ii) The digit analysis translations for the originator must be modified to provide a different route index.

650. RTS96DFI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLS96DFI relation, a failure code of DBNO_MATCH was returned. The rLS96DFI tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLS96DFI. Key field: dfiname.

Action:

This is a database inconsistency that can only be corrected by manual action.

651. RTSCALTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLSCA_LTM relation, a failure code of DBNO_MATCH was returned. The rISCA_LTM tuple is missing, or the keys used to read this relation were not set properly. The key values LTM_TYPE and LTM_INDEX are printed on the ROP.

Data Structures:

RLSCA_LTM. Key fields: LTM_TYPE, LTM_INDEX.

Action:

This is a database inconsistency that can only be corrected by manual action.

652. RTSCFBHT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTstatus/RTsccof.c. While processing a selective customer control of facilities (SCCOF) request from an integrated services digital network (ISDN) attendant console, an invalid hunt type was found in the trunk group (TRKG) global data area. The first data dump contains the data area. Study the stack frame dump to gain further insight into this assert.

653. RTSCFBPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTstatus/RTsccof.c. While processing a selective customer control of facilities (SCCOF) request from an integrated services digital network (ISDN) attendant console, an invalid private facility type was found in the input message text. The first data dump contains the text of that message. Study the stack frame dump to gain further insight into this assert.

654. RTSCFLTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLSCF_LTM relation, a failure code of DBNO_MATCH was returned. The rLSCF_LTM tuple is missing, or the keys used to read this relation were not set properly. The key values LTM_TYPE and LTM_INDEX will be printed on the ROP.

Data Structures:

RLSCF_LTM. Key fields: LTM_TYPE, LTM_INDEX.

Action:

This is a database inconsistency that can only be corrected by manual action.

655. RTSCM_NSCM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLSCM_NSCM relation, a failure code of DBNO_MATCH was returned. The rLSCM_NSCM tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLSCM_NSCM. Key fields: ltm_idx, ltm_type.

Action:

This is a database inconsistency that can only be corrected by manual action.

656. RTSCR_LTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLSCR_LTM relation, a failure code of DBNO_MATCH was returned. The rLSCR_LTM tuple is missing or the keys used to read this relation were not set properly. The key values LTM_TYPE and LTM_INDEX will be printed on the ROP.

Data Structures:

RLSCR_LTM. Key fields: LTM_TYPE, LTM_INDEX.

Action:

This is a database inconsistency that can only be corrected by manual action.

657. RTSCRNING (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLRT_SCRNING relation, a failure code of DBNO_MATCH was returned. The rLRT_SCRNING tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLRT_SCRNING. Key fields: screen_x, dest_x, prefix.

Action:

This is a database inconsistency that can only be corrected by manual action. Use the following table to map the enum value dumped for PREFIX to its corresponding explanation:

VALUE	EXPLANATION
0	don't care value
1	no prefixed digits
2	dialed 0 +
3	dialed 0 -
4	dialed 1 +
5	dialed 01+ - International
6	dialed 011+ - International

658. RTSDALTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLSDA_LTM relation, a failure code of DBNO_MATCH was returned. The rLSDA_LTM tuple is missing or the keys used to read this relation were not set properly. The key values LTM_TYPE and LTM_INDEX will be printed on the ROP.

Data Structures:

RLSDA_LTM. Key fields: LTM_TYPE, LTM_INDEX.

Action:

This is a database inconsistency that can only be corrected by manual action.

659. RTSEADREQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTse/RTseadreq.c. A request to select a certain type of call for service evaluation treatment was received; however, the call type retrieved from the MGRTSREQ message was unknown. The first data dump contains that call type. Study the stack frame dump to gain further insight into this assert.

660. RTSEL6P1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGbrcs/RTsel_6p.c. When attempting to select simulated facilities group (SFG) access to a 6-port conference circuit, the appropriate SFG dynamic data status block could not be accessed. The first data dump contains the contents of the SFG global data block. Study the stack frame dump to gain further insight into this assert.

661. RTSETSA1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTpp/RTset_sast.c. During the attempt to set the precedence level of a given subaddress of a given LTM index, the RTset_sast() function could not access the appropriate rPPSAST tuple. The

first data dump contains the input LTM index argument. Study the stack frame dump to gain further insight into this assert.

662. RTSFGCOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: SFGCOR	Audit Mode: null

Problem:

An attempt was made to access a tuple in the RLSFGCOR dynamic relation. Either the expected tuple does not exist or an invalid key (crnum) was used to access the relation. Possible software bug.

663. RTSFGINV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was found in an rLRT_SFG tuple.

Data Structures:

RLRT_SFG. Key fields: GRPNUM.

Action:

This is a database inconsistency that can only be corrected by manual action.

664. RTSFGSERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTinit/RTinsfg.c. During the initialization of the rLSFSTAT and rLGSFST dynamic tuples, an error return was received from the DBstfst() or DBstnxt() primitive when stepping through the RLRT_SFG static relation. The first data dump contains the error return. Study the stack frame dump to gain further insight into this assert.

665. RTSFGST1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGbrcs/RTsfg_set.c. During the set up to hunt for a simulated facilities group (SFG) member, an error return was received from the RTsfg_ht() function; an infinite loop of secondary route indices may be occurring in the RLRT_MCRT relation. The first data dump contains the contents of the MC route call flow data block. Study the stack frame dump to gain further insight into this assert.

666. RTSFGSV1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGbrcs/RTsfgsv.c. During the population of the MGSFGSV message, the input call ID argument contained an out of range value. The first data dump contains the call ID value. Study the stack frame dump to gain further insight into this assert.

667. RTSFREL1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGbrcs/RTsfrel.c, RTwsfrel.c, RTsa4owsf.c, RTsfstore.c, or RTsfrrt.c. When attempting to release simulated facilities group (SFG) group members upon the release of the call record, the input call ID argument contained an invalid value. The first data dump contains the invalid call ID. Study the stack frame dump to gain further insight into this assert.

668. RTSFSBHT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTstatus/RTsfg_stat.c. During an attempt to update the selective customer control of facilities (SCCOF) flag for simulated facilities groups (SFGs), an invalid hunt type parameter was passed to the RTsfg_stat() function.

The first data dump contains the invalid hunt type. The second data dump contains the SFG group number. Study the stack frame dump to gain further insight into this assert.

669. RTSHDNLENERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSENDBFM() macro failed during a shared directory number (SHDN) call. When attempting to send a SHDN control message to the shared call system process (SCSP) from the CMP distribution system process (CDSP) within the CMP, the message length exceeded the bounds of the OSSENDBFM() macro. To resolve this problem, contact your next level of support.

670. RTSHTBHT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTstatus/RTstophunt.c. During an attempt to turn on the stop hunt indicator for a multiline hunt group (MLHG), an invalid hunt type was passed to the RTstophunt() function.

The first data dump contains the invalid hunt type. The second data dump contains the MLHG number that was to have been updated. Study the stack frame dump to gain further insight into this assert.

671. RTSHTERM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLSHTERM relation, a failure code of DBNO_MATCH or DBINCONSIST was returned. The rLSHTERM tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLSHTERM. Key fields: lead module, ltm index, range.

Action:

This is a database inconsistency that can only be corrected by manual action.

672. RTSLEDEFAULT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSENDMSG() macro error UNKNOWN was encountered during a local area signaling services (LASS) screen list editing (SLE) session.

673. RTSLELENGTHERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSENDMSG() macro error OSELENGTH was encountered during a local area signaling services (LASS) screen list editing (SLE) session.

674. RTSLEPROCERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSENDMSG() macro error OSEPROC was encountered during a local area signaling services (LASS) screen list editing (SLE) session.

675. RTSMFACUP (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception has occurred in RTsmfac_up(). When RTsmfac_up() is called to update the RLFACSTAT dynamic relation in the SM, the circuit type and circuit name input parameters are not set correctly.

Probable Cause:

The input parameters to RTsmfac_up() are not set correctly.

Action:

There are 3 dcf-data dumps generated by this assert; the first gives the circuit type, the second gives the circuit name, and the third is not consistently used and must be check in function to identify the data dumped. Verify that RTsmfac_up() is called with the correct circuit type and circuit name.

676. RTSMFACUP (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception has occurred in RTsmfac_up(). When RTsmfac_up() is called to update the RLFACSTAT dynamic relation in the SM, the circuit type and circuit name input parameters are not set correctly.

Probable Cause:

The input parameters to RTsmfac_up() are not set correctly.

Action:

There are 3 dcf-data dumps generated by this assert; the first gives the circuit type, the second gives the circuit name, and the third gives the converted STS circuit name. Verify that RTsmfac_up() is called with the correct circuit type and circuit name.

677. RTSMNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data delivery (DD) read error occurred on the key DDRTSMBLK.

678. RTSND_MSG_FL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to send the MGIDLE_PT message to the local routing system process (LRSP) from the function RTtkidlefac().

679. RTSNDTG1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTblf/RTsndtgbwl.c. During an attempt to turn the integrated services digital network (ISDN) attendant trunk group busy warning lamp on or off, the outgoing Q931 message buffer could not be initialized. The first data dump contains the error return from the PSqmsginit() function. Study the stack frame dump to gain further insight into this assert.

680. RTSNDTG2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTblf/RTsndtgbwl.c. During an attempt to turn the integrated services digital network (ISDN) attendant trunk group busy warning lamp on or off, the outgoing Q931 message could not be sent.

The first data dump contains the error return from the PSqmsgsend() function. The second data dump contains the text of the QINFO message, and the third data dump contains the link information structure. Study the stack frame dump to gain further insight into this assert.

681. RTSPAWN1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTterm/RTspawn.c when attempting to create a new terminal process for a line termination. The call to the OSMCREATE() macro returned OSEPROG which means that an invalid program ID was passed to it.

The first data dump contains the program ID. The second data dump contains the createdata structure passed in. Study the stack frame dump to gain further insight into this assert.

682. RTSPCHTRKG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A route is provisioned for a bearer capability of 3.1kHz audio, but the trunk group has speech treatments defined by the speech attribute on RC/V View 5.1 (TRUNK GROUP).

Data Structures:

RLRT_ROUTING. Key field: route index (RTI).

RLRT_TRKG. Key field: trunk group number (TGN).

Action:

Provision a separate route for the identified speech trunk group by assigning a new RTI on RC/V 10.2 (ROUTE INDEX [ROUTING]) with the identified speech trunk group in the TGN field. Assign the NEXT RTI field to the identified RTI or another speech route. On RC/V 10.2, change the TGN field for the identified RTI to a non-speech trunk group in the list identified by the NEXT RTI. On the same view, assign the new separate speech route with the new RTI identifying the speech trunk group using the SPEECH ALT RI field.

Since there now are two routes with the same TGN, remove the redundant route by changing the NEXT RTI to the next real route in the route list.

If this is a toll office, remove the speech assignment from the trunk on RC/V View 5.1 (TRUNK GROUP).

683. RTSPECRI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLRT_SPECRI relation, a failure code of DBNO_MATCH was returned. The rIRT_SPECRI tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLRT_SPECRI. Key fields: dn, digits.

Action:

This is a database inconsistency that can only be corrected by manual action.

684. RTST2VPIDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception has occurred in rta/RTprims/RTsmfac_up(). When attempting to read relation RLST2VPIDB, a failure return code of DBNO_MATCH was returned. This indicates that the tuple is missing, or that the keys used to read this relation were set improperly.

Data Structures:

The key value from the RLST2VPIDB relation is dumped here: Keys: STS_CKTNAME.

Action:

This is a database inconsistency that can only be corrected by manual action.

685. RTSTATC1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in the RTstatchg() function. This error is triggered by an error return from the PHrm_ntwk() function when attempting to remove the network path (when an MGSTATCHG message was received due to a keying trunk failure). The first data dump contains the error return from PHrm_ntwk() and the second dump contains path descriptor data block.

686. RTSTATC2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in the RTstatchg() function. The error is one of the following; 1) an unknown change type (chg_type) in the MGSTATCHG message was encountered, or 2) an unknown message type was received. Study

the stack frame dump to determine which error triggered this assert. The data dump contains the invalid charge type for error 1 or the message head for error 2.

687. RTSTATH1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTblf/RTstathndlr.c. While processing a MGBLFSTAT message with a destination field of RTHGC (100s group), the ins field had an invalid value. The first data dump contains the MGBLFSTAT message. Study the stack frame dump to gain further insight into this assert.

688. RTSTATH2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTblf/RTstathndlr.c. During the processing of the MGBLFSTAT message, the destination field contained an invalid value. The first data dump contains the MGBLFSTAT message. Study the stack frame dump to gain further insight into this assert.

689. RTTAISP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Tandem access for interlata sent paid coin (TAISP) calls introduced a new equal access protocol identified by modified equal access (MEA) and modified equal access international (INCM). Only coin phones can use routes that have these protocols to access a carrier.

The carrier is a traffic service position system (TSPS) class of service and can be directly connected to this office [direct trunk group (DTG)], or the carrier can be indirectly connected via an access tandem [shared trunk group (STG)].

Figure 1 Direct connection

Figure 2 Indirect connection

For a route that has the MEA or INCM signaling protocol, a problem occurs when the originating service class is not FC_COIN or the route descriptor is not DTG or STG.

Data Structures:

The ORIG COS (originating service class) and RI (key to the route used) are dumped.

Action:

An invalid route was specified. Follow these steps to correct the problem.

1. Use the line class code record (see the TG-5 Translation Guide, Section ESS 5306) to determine the class of service and the screening index values associated with the originating line class code (LCC).
2. Use RC/V View 10.2 [ROUTE INDEX (ROUTING)] to determine the trunk group (TGN) associated with the route.
3. Use RC/V View 5.1 (TRUNK GROUP) to determine the carrier ID.
4. Use RC/V View 10.3 (INTERLATA CARRIER) to determine the code index.
5. Once the screening index and code index have been obtained, use RC/V View 10.10 (SCREENING CHARGING) to determine the route.
6. RC/V View 10.10 probably specifies an incorrect route due to the incompatibility of the screening index and the code index. Change the route on RC/V View 10.10 to a compatible route, or change the signaling protocol on RC/V View 10.2 from MEA to EA, or from INCM to INC.

690. RTTDR_INV_INTVL (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTtod/RTtdr_intvl.c.

Probable Cause:

RTtdr_intvl() was not able to determine the status of an time dependent routing (TDR) interval.

Action:

Study the stack dump to gain further insight into this assert.

691. RTTDR_RTI (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to delete a rITDR tuple, a failure code was returned. The trigger function has failed to delete the associated rITDR_RTI tuple due to DB failed. The time dependent routing hourly schedule cannot correct the problem since the rITDR tuple has been removed by the DB.

Data Structures:

RLTDR_RTI. Key field: irte_idx.

Action:

Use ODBE to remove the associated rITDR_RTI tuple.

692. RTTDR_TP (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTtod/RTtdr.c.

Probable Cause:

An error return of OSEPROG was received from the call to the OSCREATE() macro when attempting to create a new terminal process for hourly time dependent routing (TDR) schedule.

Action:

The first data dump contains the process ID returned from OSCREATE(). Study the stack frame dump to gain further insight into this assert.

693. RTTDR_UXMSG (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected or unknown message was received by the time dependent routing (TDR) terminal process (rta/RTtod/RTtdr_entry.c).

Action:

The message head and message text of the message is dumped on the ROP. Study the message dump to gain further insight into this assert.

694. RTTEPUCLMA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Static data was found in the RLCL_MATES relation when a no match was expected for a cluster mate. No audits were run. The assert originates from the RTgenreq() function.

695. RTTERM1SPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTterm/RTbterm.c. While processing a busy verify termination, the routing and terminal allocation (RTA) terminating process was not able to send the termination message to the newly created terminating terminal process as the error return from the RTltstmsg() function indicates. The first data dump contains the error return. The newly created terminal process will be purged. Study the stack frame dump to gain further insight into this assert.

696. RTTERM2SPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTterm/RTlineterm.c. During the setup up of a terminal process for a line termination, an error return was received from the RTbusysa() function. The new terminal process that was created to handle

this termination is purged.

The first data dump contains the contents of the port linkage area (PORTLA) for the port that the termination was intended for. The second data dump contains the error return from RTbusysa(). Study the stack frame dump to gain further insight into this assert. Output from the RTDUMPDATA() macro call may follow this assert.

697. RTTERM3SPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTterm/RTpf_slvld.c rta/RTamps/RTcreatatp.c or rta/RTterm/RTcreatprc.c. During the processing of a termination request and the subsequent creation of a new terminal process (TP), an error return was received from the DAgetpcbl() function when attempting to get the pointer to the new TP's process control block link area (PCBLA). The first data dump contains the process ID of the new process. The second data dump contains the error return from DAgetpcbl() if this problem occurred in the RTcreatprc() function, or the contents of the MGPF_SLV message if the problem occurred in the RTpf_slvld() function. The new terminal process will be purged. Study the stack frame dump to gain further insight into this assert. Output from the RTDUMPDATA() macro call may follow this assert.

698. RTTERM4SPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTterm/RTcreatprc.c or in rta/RTamps/RTcreatatp.c. During the processing of a termination, an error return was received from the DACppopc() function when attempting to couple the port linkage area (PORTLA) and process control block link area (PCBLA) from the newly created terminal process. The first data dump contains the contents of the routing and terminal allocation (RTA) process data block that was passed in. The second data dump contains the error return from DACppopc(). The new terminal process is purged. Study the stack frame dump to gain further insight into this assert. Output from the RTDUMPDATA() macro call may follow this assert.

699. RTTERM5SPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTterm/RTcreatprc.c or in rta/RTamps/RTcreatatp.c. When processing a termination request, an error return was received when the termination message was sent to the newly created terminating terminal process. The new terminal process will be purged. The first data dump contains the process ID of the new terminal process. The second data dump contains the error return from the OSSENBFBM() macro. Study the stack frame dump to gain further insight into this assert. Output from the RTDUMPDATA() macro call may follow this assert.

700. RTTERM6SPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTterm/RTtterm.c or rta/RTterm/RTlineterm.c. When processing a termination request involving line time slot bridging (LTSB), an error return was received from the RTltstmsg() or RTltstst() function.

The first data dump contains the error return or a pointer to the impacted port linkage area (PORTLA). The second data dump contains the contents of the MGTM_TERM message that should have been sent or the error return. The

new terminal process will be purged. Study the stack frame dump to gain further insight into this assert. Output from the RTDUMPDATA() macro call may follow this assert.

701. RTTERM7SPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTterm/RTcreatprc.c. When processing a termination request, an attempt to camp-on to a busy port failed and an error return was received from the RTrtaco() function.

The first data dump contains the routing and terminal allocation (RTA) process data block passed to the RTcreatprc() function. The second data dump contains the error return from the RTrtaco() function. The newly created terminal process will be purged. Output from the RTDUMPDATA() macro call may follow this assert.

702. RTTERM8SPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTterm/RTspawn.c. During the processing of a termination request, an error return was received from the DAgetpcbl() function when attempting to get the pointer to the newly created terminal process's process control block link area (PCBLA).

The first data dump contains the creatdata structure that was passed to the RTspawn() function. The second data dump contains the process ID of the new terminal process. The third dump contains the program ID of the new terminal process. The new terminal process will be purged. Study the stack frame dump to gain further insight into this assert.

703. RTTERM9SPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTterm/RTpf_slvld.c. During the processing of an offhook from a scan point, an error return was received from the DACppopc() function when attempting to couple the port linkage area (PORTLA) to the newly created terminal process's process control block link area (PCBLA).

The first data dump contains the scan point's port. The second data dump contains the error return from DACppopc(). The third dump contains the contents of the MGPF_SLV message received by the RTpf_slvld() function. The new terminal process is purged. Study the stack frame dump to gain further insight into this assert.

704. RTTERMG1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in one of the following files: rta/RTterm/RTannterm.c, rta/RTterm/RTlineterm.c, rta/RTterm/RTpf_slvld.c, rta/RTterm/RTafterterm.c, rta/RTterm/RTses_pu.c, rta/RTamps/RTapterm.c, or rta/RTterm/RTtrkterm.c. The pointer to the port linkage area (PORTLA) that was obtained from the DAgetptla() primitive indicates that the riPORTLA tuple obtained is not consistent with the port value passed. The port value was obtained from the termination message. The first data dump contains the global port value. Study the stack frame dump to gain further insight into this assert. Output from the RTDUMPDATA() macro call may follow this assert.

705. RTTG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLRT_TG relation, a failure code of DBNO_MATCH was returned. The rIRT_TG tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLRT_TG. Key field: tgid.

Action:

This is a database inconsistency that can only be corrected by manual action.

706. RTTG2ATT (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLTGTOATT relation, a failure code of DBNO_MATCH was returned. The rITGTOATT tuple is missing or the keys used to read this relation were not set properly.

If an rIRT_TRKG tuple exists where RLrt_trkg.isdntgbwl is DBYES, then the corresponding rITGTOATT tuple should exist where RLtgoatt.grpnum is RLrt_trkg.grpnum and RLtgoatt.pftype is PFPHYS.

If an rIRT_SFG tuple exists where RLrt_sfg.isdntgbwl is DBYES, then the corresponding rITGTOATT tuple should exist where RLtgoatt.grpnum is RLrt_sfg.grpnum and RLtgoatt.pftype is PFSFG.

Data Structures:

RLTGTOATT. Key fields: grpnum, pftype.

Action:

This is a database inconsistency that can only be corrected by manual action.

Because of the distributed nature of rITGTOATT data, certain recent change events can cause this assert to occur unexpectedly. The assert may be seen when a trunk group or SFG group is initially assigned the ISDN busy warning lamp feature with RC/V View 5.1 (TRUNK GROUP) or RC/V View 7.3 (PFA SIMULATED FACILITY GROUP). Use ODBE to verify the existence of rITGTOATT tuple on the SM where the assert occurs. If the rITGTOATT tuple is there, the integrity of the data is not affected. The assert can be ignored for this situation.

707. RTTG2ATT (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLTGTOATT relation, a failure code of DBNO_MATCH was returned. The rITGTOATT tuple is missing or the keys used to read this relation were not set properly.

If an rIRT_TRKG tuple exists where RLrt_trkg.isdntgbwl is DBYES, then the corresponding rITGTOATT tuple should exist where RLtgoatt.grpnum is RLrt_trkg.grpnum and RLtgoatt.pftype is PFPHYS.

If an rIRT_SFG tuple exists where RLrt_sfg.isdntgbwl is DBYES, then the corresponding rITGTOATT tuple should exist where RLtgoatt.grpnum is RLrt_sfg.grpnum and RLtgoatt.pftype is PFSFG.

Data Structures:

RLTGTOATT. Key fields: grpnum, pftype.

Action:

This is a database inconsistency that can only be corrected by manual action.

708. RTTG_CF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read RLTG_CF relation resulted in a DBNO_MATCH. The rLTG_CF tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLTG_CF. Key fields: feature ID.

Action:

This is a database inconsistency that can only be corrected by manual action.

709. RTTGEONSFG (5E12 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGbrcs/RTsfg_set.c or RTtkessx.c. The data is not set correctly for EOLN calls. But the call is allowed to complete.

Data Structures:

The terminating trunk group number, originating port, dialed digits, EON_MCRI and NODAL_IDX are dumped.

Action:

If EON_MCRI is zero: Use RC/V View 5.1 (TRUNK GROUP), keyed by the trunk group number, to verify that EON_MCRI is populated with a valid value.

If NODAL_IDX is zero: Use originating port and the dialed digits to find the value of NODAL_IDX through digit analysis. NODAL_IDX should have a valid range between 1 and 7.

If both NODAL_IDX and EON_MCRI have valid values: Use RC/V View 10.4 (BRCS MC ROUTE INDEX EXPANSION), keyed by the sum of NODAL_IDX and EON_MCRI, to get the SFG GP NUM. Use RC/V View 7.3 (PFA SIMULATED FACILITY GROUP), keyed by SFG GP NUM, to verify the SFG TYPE is of EON SFG.

710. RTTGFACTMISSING (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: FACSTAT	Audit Mode: elev

Problem:

An exception has occurred in one of the following functions: RTfifo(), RTlinear(), RTtrk_ucd(), RTwbfound(), or RTtkmem(). See the stack frame accompanying this assert to determine the exact location of the failure.

Probable Cause:

This assert indicates the dynamic rIFACSTAT tuple is missing.

Action:

The dcf-data dump generated by this assert gives the trunk port that causes the assert. Use the trunk port information to access the RLPORT_GROUP relation. Verify the trunk has the correct settings of tsi_link and vpidb attributes in the RLPORT_GROUP relation. If the trunk belongs to a fifo group, also verify the value of fast_inh attribute in RLTKQUE relation. The keys to the rIFACSTAT tuple is also generated by this assert. The AUFACSTAT audit is scheduled to clear the problem.

711. RTTGLTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A TGLTM tuple is missing for a member of a terminal group. As a result, it cannot be determined if the member is allowed to have a customer defined restriction displayed when the member is part of a call involving the integrated services digital network (ISDN) attendant console for the centrex network feature.

Data Structures:

RLTGLTM. Key fields: lead_mod, ltm_idx, ltm_type.

The first three items on the ROP output are the keys used to access the TGLTM relation.

Item 1 - LEAD_MOD. The lead module is the SM number associated with the port or is zero if the terminal group station restriction (TGSr) feature was assigned via a business and residential custom services (BRCS) business feature group (BFG).

Item 2 - LTM_TYPE. This is the ltm type of the terminating port.

Item 3 - LTM_IDX. This is the ltm idx of the terminating port. The next three items on the ROP output are useful data for finding out more information about the port with the problem.

Item 4 - MEMBER. This is the port that a was receiving a call.

Item 5 - MODULE. This is the terminating SM of the port.

Item 6 - PARTY. This is the party of the terminating port.

Action:

Use the following steps to recover the TGLTM tuple and to determine a value for the disp_rstrct field:

Step 1. Use odbe to insert a TGLTM on the SM indicated by the MODULE item of the ROP output. Use the LEAD_MOD, LTM_TYPE, and LTM_IDX as the keys. Leave all the other fields with their default values.

Step 2. If you are satisfied with the default value in the disp_rst field you are done, otherwise do the rest of these steps.

Step 3. Do an op:conv,port=MODULE-h'MEMBER substituting the MODULE and MEMBER with the values from the ROP output. This will provide the DN to use for the rest of the steps.

Step 4. If the LEAD_MOD field from the ROP output is zero, the TGSr feature was assigned through a BFG. Use RC view 1.11 to find the BFGN and the TGSr feature. Use RC view 12.9 with the BFGN to find the value of DISP RESTRICT. Use RC view 1.29 to set the value of DISP RESTRICT to the value found on the 12.9 view.

Step 5. If the LEAD_MOD field from the ROP output is not zero there is no BFG involved. The TGSr feature was assigned as an individual DN feature. Use RC view 1.11 to find the TGSr feature. Use RC view 12.21 to get the default DISP RESTRICT value. Use RC view 1.29 to set the value of DISP RESTRICT to the value found on the 12.21 view.

712. RTTKBSY1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGtrk/RTtrkbusy.c. During the attempt to route to a busy or unavailable trunk group, standalone routing was attempted. However, an unknown return value was received from the RTjumpstest() function. The first data dump contains that return value. Study the stack frame dump to gain further insight into this assert.

713. RTTKBSY2 (5E11 to 5E12)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGtrk/RTtrkbusy.c. When the original attempt to route to a trunk group failed because the trunk group was busy or otherwise unavailable, alternate routing was attempted. However, during this attempt, an invalid or unknown return was received from network management (NM) posthunt controls. The first data dump contains that return value. Study the stack frame dump to gain further insight into this assert.

714. RTTKFST1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTtkq/RTtkfstht.c. During fast trunk and/or simulated facilities group (SFG) fast hunt processing for modular queueing II, an error return was received from the RTfifo() or RTlinear() function. The first data dump contains the error return. Study the stack frame dump to gain further insight into this assert.

715. RTTKHNT1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGtrk/RTtrkdpheht.c or rta/RTGtrk/RTtrkhunt.c. During trunk member selection for a trunk termination, an invalid or unexpected hunt type value was found in the rLRT_TRKG tuple for that trunk group. The first data dump contains the entire rLRT_TRKG tuple. Output from the RTDUMPDATA() macro call may follow this assert. Study the stack frame dump to gain further insight into this assert.

716. RTTKHNT2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGtrk/RTtrkhunt.c. During the selection of a trunk group member for a trunk termination, an error return was received from the RTfifo() or RTlinear() function. The first data dump contains that error return. Study the stack frame dump to gain further insight into this assert.

717. RTTKIDL1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTtkq/RTtkfacidle.c or rta/RTtkq/RTtkidlfac.c. During the idling of OUTWATS simulated facilities group (SFG) or trunk group (TG) facilities (for modular queueing II), the group_type parameter contained an invalid value. The first data dump contains the appropriate queue port structure. Study the stack frame dump to gain further insight into this assert.

718. RTTKMEM1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGtrk/RTtkmem.c. or in rta/RTamps/RTap_tkmem.c. During the execution of the call through the test, trunk busy verify feature, or the routing via trunk group and member number, an illegal or unknown hunt type was found in the rLRT_TRKG tuple for the trunk group being terminated to. The first data dump contains the rLRT_TRKG tuple. Study the stack frame dump to gain further insight into this assert.

719. RTTKQCN1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTtkq/RTtkq_can.c. During trunk queue cancellation (as part of modular queueing II), an invalid value was found in the cancel_reason field of the MGTKQ_CAN message. The first data dump contains the entire MGTKQ_QUE message. Study the stack frame dump to gain further insight into this assert.

720. RTTKQMS1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTtkq/RTtkq_ms.c or RTtkqupst.c. During trunk group measurement and/or billing processing for modular queueing II, an invalid group type was found in the MGTKQ_MS message in the routing data block. The first data dump contains the contents of this message. Study the stack frame dump to gain further insight into this assert.

721. RTTKQSL1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTtkq/RTtkq_sel.c. During queue member selection for modular queueing II, an inconsistency was found between the status of the priority or routing queue and the pq_count of the owner tuple. The first data dump contains the owner tuple. Study the stack frame dump to gain further insight into this assert.

722. RTTKQUP1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTtkq/RTtkqupst.c. While updating the queue status in the group dynamic data for modular queueing II, a data inconsistency was found between the MGTKQ_STAT message and the status of or lack of a priority queue.

The first data dump contains the contents of either the trunk group (TRKG) or simulated facilities group (SFG) global data block. Study the stack frame dump to gain further insight into this assert.

723. RTTKSBHT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTstatus/RTtkg_stat.c. During an attempt to update the status of the selective customer control of facilities (SCCOF) flag for a trunk group, an invalid hunt type parameter was passed to the RTtkg_stat() function.

The first data dump contains the invalid hunt type. The second data dump contains the trunk group that was to have been updated. Study the stack frame dump to gain further insight into this assert.

724. RTTKSPR1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGtrk/RTtrkdprht.c or rta/RTGtrk/RTtrksprht.c. During the selection of a trunk group and/or member for a trunk termination, an error return was received from network management (NM) pre-hunt control or from defense switch network (DSN) pre-hunt controls. The first data dump contains the error return. Output from the RTDUMPDATA() macro call may follow this assert. Study the stack frame dump to gain further insight into this assert.

725. RTTMBLIST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was found in an rITMBLIST tuple.

Data Structures:

RLTMBLIST.

Action:

Use RC/V (or ODBE, if necessary) to fix the rITMBLIST tuple causing the problem.

726. RTTMLBLT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLTMBLIST relation, a failure code of DBNO_MATCH was returned. The rITMBLIST tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLTMBLIST. Key field: scndindex.

Action:

This is a database inconsistency that can only be corrected by manual action.

727. RTTMDSC1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTtm/RTtmdisc.c. While processing a terminal maintenance (TM) termination failure, an error return was received from the PHrm_ntwk() function.

The first data dump contains the error return and the second data dump contains the TM network data block including the path descriptor. Study the stack frame dump to gain further insight into this assert.

728. RTTMINT1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTtm/RTtminic.c. During the initial setup of a terminal maintenance (TM) route request, a data inconsistency was found in the routing message (such as, an invalid message type, rt_req value, rte_try value, or rt_check value). The first data dump contains the TM routing data block. Output from the RTDUMPDATA() macro call may follow this assert. Study the stack frame dump to gain further insight into this assert.

729. RTTMMMSG1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGcontl/RTtmmsg.c. When attempting to send a termination message, the message type of the message was unknown. The first data dump contains the contents of the message buffer, including the message head. Study the stack frame dump to gain further insight into this assert.

730. RTTMMMSG2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGcontl/RTtmmsg.c. When attempting to send a terminating message, a data inconsistency was found while processing the MGTK_ENQUEUE message.

The first data dump contains the contents of the pigbk field of the routing message. The second data dump contains the location of the terminating message buffer for the MGTK_ENQUEUE message from the TK_ENQUEUE_TMB() macro. Study the stack frame dump to gain further insight into this assert.

731. RTTMPPTCOND (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to read port priority information from the TMportcond[] array.

732. RTTMPST1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTtm/RTtmpstat.c. During the attempted status update of a hunted port, the input parameter to the RTtmpstat() function was unknown. The first data dump contains the unknown parameter. Study the stack frame dump to gain further insight into this assert.

733. RTTMT_DBRDFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read the relation RLFC_PORTTYP failed. No audits were run. This assert originates from the RTtmterm() function.

734. RTTODAM1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in the RTtodamentry() function, the controller system process for time of day originated recent changes (TORCs). The RTtodamentry() function found one of the following errors:

- 1) an MGTIMER message was received with an unknown timer.tag field, or
- 2) an unknown message was received.

The data dump contains the full message that was received.

735. RTTODSM1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in the RTtodsmentry() function, the SM system process that is responsible for implementing prescheduled and key activated recent changes. One of the following occurred:

- 1) an unknown feature ID was found in the MGRTKYTOD message,
- 2) an unknown roll forward type was found in the MGFCTODRF message,
- 3) an unknown timer.tag field was found in the MGTIMER message,
- or 4) an unknown message was received.

See the stack frame to determine the location that the assert fired at. The complete message will be dumped.

736. RTTRACSRC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in the trigger function/file rta/RTrcv/RTtracsopt.c. In the RTlhbchg() function, during the allocation or de-allocation of rILHB tuples, an error return was received from the DBstfst() or DBstnxt() primitive during the sequential read of tuples in the RLFC_LINE relation. The first data dump contains the error return value. Study the stack frame dump to gain further insight into this assert.

737. RTTREE_BLF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rITREE_BLF tuple was missing in this SM when a database read was attempted.

Data Structures:

RLTREE_BLF. Key fields: hgid, sm1-sm12.

The hgid key is the 100s group identifier (nocx256+d4x16+d3) and the sm1-sm12 fields are the 100s group line modules.

Action:

The dump contains the contents of the RLTREE_BLF relation local buffer. Use the hgid value from the dump to display RC/V View 4.27 (ISDN HUNDREDS GROUP SM STRUCTURE). The 100s group select button is defined or a combination of buttons (a NOC select button and a DSS button) selecting the given 100s group is defined, but no corresponding rITREE_BLF tuple is defined. Change the 100s group select button or NOC select button to make sure that the 100s group will not be selected.

738. RTTRIGWL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in the RTtrigwl() function which triggers a work list for a given time and day. A cross processor read of the static relation RLMHG_TGSR failed. The rLMHG_TGSR tuple is dumped, the first fields contain the valid keys. The stack frame contains the error return code from the DBxfrdtup() primitive call.

739. RTTRMFAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLTRMFEATS relation, a failure code of DBNO_MATCH was returned. The rLTRMFEATS tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLTRMFEATS. Key fields: lport (logical port), lpt_type (logical port type), range.

Action:

This is a database inconsistency that can only be corrected by manual action.

740. RT_TSMBADMSG (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received from the terminal status monitor message handling routine.

Probable Cause:

Incorrect process ID was populated in the OSDS message header information.

Action:

This is a software problem. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

741. RTTSMBTN (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While reading the RLTSMBTN relation, a failure code was returned. Either the rLTSMBTN tuple is missing or an error occurred when populating the keys.

Data Structures:

RLTSMBTN. Key Fields: Monitoring LPORT, Monitoring Stored_parameter.

Action:

This is a database inconsistency that can only be corrected by manual action.

742. RTTSMTRING (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While reading the RLTSMTTRING relation, a failure code was returned. Either the rLTSMTTRING tuple is missing or an error occurred when populating the keys.

Data Structures:

RLTSMTTRING.

Key Fields: Monitored SM, Monitored LTM_TYPE, Monitored LTM_IDX.

Action:

Use ODBE to read RLLTM_PORT with the LTM_IDX from the ROP output and retrieve the port and party information. Read either RLFC_LINE with the port and party information or execute an

"OP:CONV,PORT=x-y (where x = SM, y= port)"

to determine the DN. Once the DN has been determined, use RC/V Views 1.8 (ANALOG LINE/BRCS

ASSIGNMENT) or 23.2 (DIGITAL SUBSCRIBER LINE) to verify that this is a monitored terminal and if so, populate RC/V View 23.24 with the monitoring DN's associated with this monitored DN.

743. RTUCLPMP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unconditional preemption of a stuck process occurred in response to a command from the master control center (MCC), such as RMV:LINE,DN=XXXXXXX,UCL.

In rare cases, the original request from terminal maintenance (TM) or maintenance request administration (MRA) was not honored because the terminal process controlling the port did not accept the MGINTERRUPT message. In such cases, a special routing and terminal allocation (RTA) primitive, RTUclprmt(), is called to unconditionally remove the port from the control of the owning process and give control to the requesting TM or MRA process.

Keep all data dumps from the ROP. Since a stuck process is an unpredictable event, any relevant data is necessary in order to discover the cause of the problem.

Data Structures:

The program ID (PID) will map to the entry function of the terminal process that was controlling the port to be removed unconditionally. The PIDs can be found in the hdr/pag/GLtpxxxx.h files. The procnum is the process number of the stuck process. It can be used to match against the data dumps that will follow. The port is the resource to be preempted.

Action:

Save this data and other data dumps which will follow. The RTUclprmt() primitive will cause a single process purge of the hung process and the subsequent system integrity (SI) and audits (AU) activity will cause data dumps to be sent to the ROP. If the far party of the hung process is on the same SM, the far party will also be purged.

744. RTUEXP_RET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return value was received for the message header type. An operating system (OS) message is expected. This assert originates from the RTimmsgcnt() function. No audits are scheduled.

745. RTUEXP_SFG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTisatnd/RTtgbwl.c. During processing of ISAT or ANALOG attendant SFG group busy/warning lamps, an unexpected request to update a SFG group was found.

Probable Cause:

This assert indicates this is the wrong processor for updating the SFG lamp status.

Action:

The data dump contains the SFG group number and the hunt type. Study the stack frame dump to gain further insight into this assert.

746. RTUNBATERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTinit/RTunbatch.c. When processing an MGRTABATCH message, the batchtype field was not set to a value of UPDHUNTKEYS. The first data dump contains the contents of the MGRTABATCH message. Study the stack frame dump to gain further insight into this assert.

747. RTUNKMFIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTshared/RTfillstat.c. During the processing of a status update request for a hunted port, an unknown value in the filltype parameter was passed to the RTfillstat() function.

The first data dump contains the unknown value. The second data dump contains the global port whose status should be changed. Study the stack frame dump to gain further insight into this assert.

748. RTUNKORIG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown origination type parameter was encountered.

749. RTUNKSTAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTshared/RTfillstat.c. During the processing of a status update request for a hunted port, an unknown value in the statcmd parameter was passed to the RTfillstat() function.

The first data dump contains the unknown value. The second data dump contains the global port whose status should be changed. Study the stack frame dump to gain further insight into this assert.

750. RTUNKWN_MSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unrecognized message was received by the nail-up routing and terminal allocation (RTA) SM system process.

751. RTUPDHKYS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTinit/RTupdhntkys.c. While processing a batched message for updating the status of huntkeys, an unknown value was found in the data passed to the RTupdhntkys() function. The first data dump contains the contents of the RSTMSUKEY structure that was passed. Study the stack frame dump to gain further insight into this assert.

752. RTUPER1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTprims/RTuclprmt.c. In the RTbuclpt() function, during an attempt to unconditionally

preempt a B-channel port, an invalid B-channel was obtained from the business and residential custom services data block (BRCSDB). The first data dump contains the invalid value. Study the stack frame dump to gain further insight into this assert.

753. RTUPER2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTprims/RTuclprmt.c. In the RTbuclpt() function, during an attempt to unconditionally preempt a B-channel, an invalid return was received from the DAfdapc() primitive when attempting to obtain the process's process control block link area (PCBLA) from the known D-channel application linkage block (DALB); or no link was found between the DALB and any PCBLA, but the B-channel was not a shared directory number (SHDN) associated port.

The first data dump contains the return value from the DAfdapc() primitive or the contents of the business and residential custom services data block (BRCSDB). Study the stack frame dump to gain further insight into this assert.

754. RTUIOOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTstatus/RTupisat.c. During the attempt to update the status of an integrated services attendant (ISAT) multiline hunt group (MLHG) member, the member was out of range.

The first data dump contains the MLHG global data area. The second data dump contains the terminating data block structure from the MGRT_GEN message. Study the stack frame dump to gain further insight into this assert.

755. RTUPLAMP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTmain/RTup_lamps.c. During an attempt to update an attendant control of facilities (ACOF) or night service lamp, an error return code was received from the ISfbutstat() function.

The first data dump contains the contents of the MGDSTLMP message received by the RTup_lamps() function. The second data dump contains the terminal equipment data block (TEDB) ID, and the third data dump contains the return from the ISfbutstat() function. Study the stack frame dump to gain further insight into this assert.

756. RTUPUCBS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTstatus/RTupistucd.c. During an attempt to update the out of service (OOS) flag for an integrated services attendant (ISAT) uniform call distribution (UCD) multiline hunt group (MLHG) member, an invalid status type was passed as an argument to the RTupistucd() function.

The first data dump contains the invalid status. The second data dump contains the group global data block and the third data dump contains the multi-line hunt group (MLHG) global data area. Study the stack frame dump to gain further insight into this assert.

757. RTWBTBLOCK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rLWBTBLOCK tuple with the given key cannot be found in the static database. The tuple is missing or the key used to access the tuple is invalid.

Data Structures:

RLWBTBLOCK. Key field: GRPNUM, TBLOCK.

Action:

This is a database inconsistency that can only be corrected by manual action.

758. RT_WRONGMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert was fired in the RTcuspsmsg() function, the message handling routine of the routing and terminal allocation (RTA) cyclic update system process. The RTcuspsmsg() function received the wrong message type. The received message header is dumped.

759. RTWRONG_RET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return value was received from the OSWGETMSG() macro. An operating system (OS) message was expected. The RTcuspsmsg() function (the message handling routine) originates this assert. The OSWGETMSG() macro return value is dumped. No audits were scheduled.

760. RTWSFCERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: WSFCORRAL	Audit Mode: elev

Problem:

A failure occurred in getting an open entry in the wideband (WB) simulated facilities group (SFG) corral array RTwsfcorral[] to store SFG members. Since there should have been enough RTwsfcorral[] entries for the WB call, this problem should never occur. A linkage problem may exist in the WB SFG corral. The first data dump contains the SFG data. An audit will be scheduled to clean up the problem.

761. RTWSFSV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An exception occurred in rta/RTGbrcs/RTwsfsave.c. During the population of the MGWSFSAVE message, the input call ID argument contained an out of range value. This might be a system problem in message sending. The first data dump contains the call ID value. Study the stack frame dump to gain further insight into this problem.

Range: si**1. BADDTRG (5E11 and later)**

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A trigger function was called from data delivery (DD) with an invalid access key (acckey).

2. DDBADCASE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected case was encountered in a switch statement in data delivery (DD) code.

3. DDBADNCT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Inconsistent dynamic data was encountered. The logical link map is updated by communication link fault recovery.

4. DDBADOS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return value was received from the operating system. The invalid return was from an operating system for distributed switching (OSDS) primitive.

5. DDBADTIMER (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not create a cyclic timer for the data delivery (DD) process.

6. DDBADTRIG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An out-of-range parameter was encountered, or an unexpected data delivery (DD) trigger flag was set.

7. DDCPMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was sent to the AM data delivery (DD) process.

8. DDCPSTIM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected stimulus was sent to the AM data delivery (DD) process.

9. DDIMCTS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid data delivery (DD) message was received in the SM; the message was ignored. The communication time slot (CTS) numbers from the input message do not match the CTS numbers from the SM hardware.

The DD data in the AM is corrupted and an AM initialization is required, the AM relation RLMODATT (which is used to initialize the data) is invalid, or the CTS hardware switches are set incorrectly. Repeated reports of this problem could indicate a pseudo-isolated SM.

10. DDIMMAP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid data delivery (DD) message was received in the SM; the message was ignored. The default case of a switch for the physical link was encountered. The link map indicates an invalid physical link for this input message. Repeated reports of this problem could indicate a pseudo-isolated SM.

11. DDIMMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was sent to the SM data delivery (DD) process.

12. DDIMSTIM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected stimulus was sent to the SM data delivery (DD) process.

13. DDREASERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An out-of-range parameter was received from the operating system. An invalid initialization reason was passed to the data delivery (DD) system process.

14. DTFETE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An end-to-end failure occurred for the packet interface (PI) in data transport (DT).

15. DTWRTErr (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DTWRITE() macro return value was not DTSUCCESS.

16. FLOW_ERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An internal inconsistency was detected within a function.

17. GRINVLPR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During generic retrofit/update, the active side (that is, the new software release) tried to obtain the active port type for a stable call; the value obtained was invalid.

18. GRMATEFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During generic retrofit/update, the active side (that is, the new software release) attempted to condition the mate memory for moving an instruction buffer to the mate side; the attempt failed.

19. GRMATESTP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During generic retrofit/update, the active side (that is, the new software release) asked the mate side to do data tracing for some call-related data. The mate was expected to stop in a specified time, but it did not. As a result, the mate was forced to stop by the active side.

20. GRTRCFail (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During generic retrofit/update, the active side (that is, the new software release) asked the mate side to do data tracing for some call-related data; but the trace was unsuccessful.

21. IMABDCASE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid hard coded parameter was received as the default case in a switch statement. Possibly, text was corrupted or a wild transfer occurred.

22. IMABDHST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was detected between the CMP's differential history and the state of communication over the link. The differential history table is dumped.

23. IMACDQMRCVY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The integrity monitor detected a stuck incoming call queue. The ACmtq() "drain queue" primitive was invoked and successfully completed its task.

24. IMAEBIT2 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

Excessive E-bit continuity failures were reported by the SMs. A demand unit status audit was requested.

25. IMAETEIN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A request to initialize end-to-end communication check data in the operational kernel process (OKP) was passed a nonoperational SM number.

26. IMAIMSPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

A lack of activity was detected in a process. The application integrity monitor (AIM) requested a purge of this process.

27. IMALCGSSFL (5E11 and later)

Recovery Action: spp	SPP: n	Audit: LCGSSMASK	Audit Mode: nonseg

Problem:

An inconsistency was detected in the line unit grid summary scan mask. A demand grid summary scan mask audit was requested.

28. IMALCMFL (5E11 and later)

Recovery Action: spp	SPP: n	Audit: LCSMSK	Audit Mode: nonseg

Problem:

An inconsistency was detected in the line concentrator scan masks. A demand scan mask audit was requested.

29. IMALCMUP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Inconsistent return values were sent between the Cllcmask() and Sllcmask() line concentrator scan mask update functions.

30. IMAMRASPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

The integrity monitor requested a purge of a maintenance request administration (MRA) terminal process. An unconditional module processor restore took too long, or something else was running when an unconditional restore was requested while the SM was isolated.

31. IMAOCNUTS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Overload control failed to escalate the level of real-time overload when a priority level 1 lockout condition was detected by the integrity monitor.

32. IMAPBMFL (5E11 and later)

Recovery Action: spp	SPP: n	Audit: SCNMSK	Audit Mode: nonseg

Problem:

An inconsistency was detected in the peripheral interface control bus (PICB) scan masks. A demand PICB scan mask audit was requested.

33. IMAPBMUP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Inconsistent return values were sent between the CImask() and SImask() peripheral interface control bus (PICB) scan mask update functions.

34. IMAPCDSP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

A lack of periodic dispatching was detected for a critical system process (that is, the process stopped running when it should be running). A single process purge of the process was requested.

User data will contain the following information:

1. Purging process number (unsigned short)
2. Current dispatch count for the process being dispatch (unsigned long)
3. Accumulation of the process dispatch counts each time the process dispatch histogram is restarted (unsigned long)
4. Last look of the process dispatch counts (unsigned long)

35. IMAPMPFL (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

A lack of forward progress was detected in pump control (PUCR) processes while one or more SMs were in the pump state. A purge of the fast pump facility handler system process (via the AUASTRC audit) and the PUCR process (via the application integrity monitor [AIM]) was requested.

36. IMAPMPIN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A request to initialize pump monitor data had an invalid pump type parameter.

37. IMARCTRG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A recent change trigger to initialize end-to-end communication check data had an invalid reason parameter for the module attribute.

38. IMARTSPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

A process was causing a real time bottleneck by blocking out lower priority processes for a long period of time. A purge of this process was requested.

39. IMASACP0 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The data delivery key DDRSMSACP had the value DDALLOW; although, the office data indicates that it should have the value DDINHIBIT.

40. IMASACP1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The data delivery key DDRSMSACP had the value DDINHIBIT; although, the office data indicates that it should have the value DDALLOW.

41. IMASTCRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An integrity monitor process was created with an unknown reason.

42. IMASTDBRC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The database recent change terminal process (DBrc) in the CMP exceeded a preliminary real-time segment allocation. DBrc is not purged. There is an upper limit for a real-time segment at which DBrc WILL get purged.

Note the RC/V view or form where this error occurred, the operation performed, and the data associated with the view or form. Send all occurrences of this assert to the product engineering control center (PECC) for analysis.

43. IMASTIMG (5E14 and later)

Recovery Action: spp	SPP: y	Audit: TCB	Audit Mode: nonseg

Problem:

The integrity monitor tight loop detector found a lack of periodic entry to the integrity monitor process at background.

44. IMASTIMG (5E11 to 5E13)

Recovery Action: spp	SPP: y	Audit: null	Audit Mode: null

Problem:

The integrity monitor tight loop detector found a lack of periodic entry to the integrity monitor process at background.

45. IMASTLCNT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The integrity monitor tight loop detector progress counter contained an illegal value (wild write).

46. IMASTLFEX (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

A resource failure occurred; too few rIBUFMSG tuples were available.

47. IMASTMFEX (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

The integrity monitor requested a purge of a process that owned too many rIBUFMSG tuples.

48. IMASTSP (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The integrity monitor tight loop detector found a stuck process. A single process purge was requested.

49. IMBADRSCTYPE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An internal error occurred in the integrity monitor; an invalid resource type was passed to a function.

50. IMBD_DQLNK_MSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A DQLNK level 3 message was received from a process other than the integrity monitor process.

Probable Cause:

Some process other than the integrity monitor process is sending MGSICOMCHK messages or the message is

getting mutilated.

action:

No action is required. Software will correct the problem but the assert number, mnemonic, and any associated ROP should be provided to field support so that the problem can be resolved. The DQLNK level 3 message that was received incorrectly will be dumped.

51. IMBSSWP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The integrity monitor found that write protect was left off a section of write protected BSS.

52. IMDACHKRSC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A particular application is trying to access a data structure that does not exist in this SM. The primitive DAghxxyy() (get head) or DAgtxxyy() (get tail) was invoked and found that the idle list contained no member tuples. These primitives invoked the IMda_ntfy() function to apply overload controls on the resource trying to be accessed; however, IMda_ntfy() found that the resource does not exist on the SM.

The function trace indicates the application code that called DAghxxyy() or DAgtxxyy(). The application code should be investigated to find out why it was trying to access this resource.

53. IMINV_CMP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An SM detected invalid data that pertains to the CMP logical link map (LLM).

54. IMODDWP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The integrity monitor found that write protect was left off a section of office dependent data (ODD).

55. IMQMBDFRD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operational kernel process (OKP) integrity monitor detected a fault when reading the static relation RLCTINFO. Insufficient resources exist to complete the transaction, or an internal database error occurred.

56. IMQMCLLTQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HCCALLTQ	Audit Mode: elev

Problem:

The automated call distribution (ACD) queue integrity monitor suspected that an ACD call queue may be stagnant. The HCCALLTQ audit is scheduled to investigate.

The acdfail structure is an array of 4 shorts (two words) that appear at the beginning of the stack dump. The first two shorts are common to all error types, where q_num is the call queue being visited and error is the type of error (see below). The third and fourth short are described below for each error.

The stack dump prints in reverse order; that is, the numbers are written hhggffee ddcbbbaa and must be rewritten as aabbccdd eeffgghh. For example, if the stack dump reads 01003c0007007400 rewrite the dump as 00740007 003c0001 where:

qnum = 74 (hex)
 error number = 7
 servtm = 3c (hex)
 info = 1 (this translates to the number logged in)

Error No. 1: The call_type attribute in the RLHCCALLTQ relation should be 0 for unequipped queues and the queue number for equipped queues. In the stack dump, servtm is 0 and info is the call_type attribute of the RLHCCALLTQ relation.

Error No. 2: The service objective must be between 1 and 600 seconds. In the stack dump, servtm is 0 and info is the service objective.

Error No. 3: Attempted to read the RLCTINFO relation to find the serving team for the stuck call queue. Could not read the tuple. In the stack dump, servtm is 0 and info is 0.

Error No. 4: The key to the RLHCSESVTM relation is checked. In the stack dump, servtm is the serv_tm attribute from the RLHCSESVTM relation, and info is the serv_tm attribute from the RLCTINFO relation.

Error No. 5: The ACmtq() function did not completely assign available operators to calls on the queue. In the stack dump, servtm is the serv_tm attribute from the RLHCSESVTM relation, and info is the service objective.

Error No. 6: The ACmtq() function successfully corrected the stuck call queue situation and logged in operators. In the stack dump, servtm is the serv_tm attribute from the RLHCSESVTM relation, and info is the service objective.

Error No. 7: The queue is not progressing. There are no available operators, but there should be enough operators logged in to meet the service objective as specified in the RLHCCALLTQ relation. In the stack dump, servtm is the serv_tm attribute from the RLHCSESVTM relation, and info is the num_login value.

Error No. 8: The num_login field in the RLHCSESVTM relation is checked. In the stack dump, servtm is the serv_tm attribute from the RLHCSESVTM relation, and info is the num_login value.

57. IMQMSRVTM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HCSERVTM	Audit Mode: elev

Problem:

The integrity monitor suspects that an automatic call distribution (ACD) serving team is stagnant. The HCSERVTM audit will be scheduled to investigate.

58. IMRSCFEX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No associated process blocks (APBs) were using too many rBUFMSG tuples.

59. IMRSCRCVY (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

The integrity monitor requested a purge of processes that have not released resources.

60. IMSPPRUNPROC (5E14 and later)

Recovery Action: spp	SPP: y	Audit: null	Audit Mode: null

Problem:

This is a general purpose assert used to purge the currently running process specified by OSrunning.

61. IMTITELPW (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This error code indicates that a process is being flagged by the integrity monitor tight-loop detector for using an excessive amount of real-time. If the process continues to use more real-time, it will be purged.

62. INACAERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Call to MSinitaca() failed to initialize the RLACA_HSS relation during a SM full or selective initialization.

63. INAIU_ERROR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to complete initialization of the AIU unit in the parallel initialization control table (INit_tbl[]). This will leave the AIU peripheral unit un-initialized.

Probable Cause:

Hardware may be bad. One can find more information from the first stack frame dump and the layout of INit_tbl[]. The stack back trace will also provide some information why it has happened.

Action:

Contact first level of field support.

64. INAIUISPA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to queue up a port conditioning job for an AIU by INaiu_ispajob() function.

Probable Cause:

When SI calls the TM function TMisspajhdr() function to submit an ISPA job for the conditioning of AIU ports, got one of the following error codes:

1. Invalid job request
2. System error

3. Redundant conditioning job request
4. Job queue is full

The exact failure and the unit number can be found from the first stack frame dump.

65. INAIUMTERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to transfer the control of all APs to mate COMDAC.

Probable Cause:

After switching the control to mate COMDAC, it's state in RLSMEST tuple is still active minor (SMAMI).

66. INBACTORSLT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The initialization control (ICON) to switch maintenance integrity control (SMICO) message had an invalid result or next action field value. The ICON-SMICO message indicates the result of ICON's initialization actions. Processing of the message is terminated.

67. INBADCR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The operating system for distributed switching (OSDS) passed the wrong creation reason for the intra-cluster status transport (ICST) system process.

68. INBADDDREAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data delivery (DD) read failed in the intra-cluster status transport (ICST) system process. An access key or processor key could be invalid.

69. INBADDDWRITE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data delivery (DD) write failed in the intra-cluster status transport (ICST) system process. Possibly, an access key or processor key is invalid, or invalid data is being written.

70. INBADINPUT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A system integrity control (SICO) function was called with an invalid input parameter. Retain the stack trace to determine the function and parameter.

71. INBADLOGRF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Recent change (RC), redundant (RED), or customer originated recent change (CORC) log files were found during the pump, but a failure occurred while rolling them forward during the initialization.

Probable Cause:

The log files could have been formatted incorrectly, transmission errors during the pump may have corrupted the files, or an error internal to the database manager may have occurred during the roll forward.

Action:

None. Deferred roll forward after the initialization will re-apply any outstanding transactions.

72. INBADMHNUM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A bad message handler (MH) number is passed to the function.

Probable Cause:

Unknown.

73. INBADOFF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An intra-cluster status transport (ICST) message was received from a processor that does not have a valid remote SM (RSM) offset number. The RLCLIDAT relation may not agree between the two RSMs. Check that the RLCLIDAT relation is the same in both RSMs (sending and receiving).

74. INBADPCRID (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An intra-cluster status transport (ICST) message was received from a processor that is not in the same multimodule remote SM (MMRSM).

75. INBADTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A system integrity control (SICO) module monitor function was called with an invalid si_type value. Retain the stack back trace to determine the function that was called.

76. INBAIMDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert may be generated in either the AM or SM processor.

AM: The system integrity (SI) operating system for distributed switching (OSDS) presence found AIM's data to be invalid for this DAP's sequence state. Forward progress is allowed past INsynch().

SM: INmode has an invalid value or corruption of data has occurred. This is a serious problem, since INmode will not be automatically corrected to its proper value. Investigate and correct as soon as possible. Forward progress is allowed past INsynch().

77. INBCHKIN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The system integrity (SI) process synchronization check-in counter overflowed.

78. INDBGS5CAL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The INbgs5() function was called in the operational kernel process (OKP). This function should not be called in OKP for Release 1. Processing continues.

79. INBDFREASON (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The duplex failure reason used to request an AM initialization was not within the valid range of values. The program will return without processing the initialization that was requested because of a duplex failure of AM peripheral hardware.

80. INBDPTNM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid port name was encountered during a full or selective initialization.

81. INBINSYNCH (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

INsynch() was called with an invalid input parameter.

82. INBLOCALVAR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An internal variable that is used to track the switch maintenance integrity control (SMICO) to initialization control (ICON) interface message state was out of range. The variable is set to a valid value dependent on the sequence state, and a timer is re-issued.

83. INBNXTACT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The initialization control (ICON) to switch maintenance integrity control (SMICO) message had an invalid next action field value. The ICON-SMICO message indicates the result of ICON's initialization actions. Processing of the message is terminated.

84. INBOSMODE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The IMOSDSMODE variable was an unknown value. The variable is set to normal.

85. INBRSLTFLD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The initialization control (ICON) to switch maintenance integrity control (SMICO) message had an invalid result field value. This field indicates the result of ICON's initialization action. Processing of the message is terminated.

86. INBRTNVAL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The INbgs7() function received an invalid return value from the SMininit_data() function. The software assumes a "success" return condition, and continues program execution.

87. INBSEQINPUT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The system integrity (SI) sequencer function was called with an invalid input message. The si_type value was invalid.

88. INBSEQU (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This kernel process was told to transition to a sequence state that does not apply to the command input request.

89. INBSTATE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The switch maintenance kernel process (SMKP) sequence state was not valid for executing the branch of code associated with this assert. Processing associated with this branch of code is terminated.

90. INBSTEOR TYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The initialization control (ICON) to switch maintenance integrity control (SMICO) message had an invalid si_type and/or sequence state field value. The ICON-SMICO message indicates the result of ICON's initialization actions.

Processing of the message is terminated.

91. INBSTESEQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An initialization control (ICON) to switch maintenance integrity control (SMICO) message had an invalid sequence state value in the phase field.

92. INBTIMEVAL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The time interval requested for timing switch maintenance integrity control (SMICO) to initialization control (ICON) interface message replies was not within a valid range. The program will return without processing the set timer request.

93. INBTRANS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This kernel process was told to transition to a state that does not apply for this kernel process.

94. INBUNBLOCK (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The system integrity (SI) process was asked to unblock processes through a sequence state that does not apply for this kernel process.

95. INBUNSNDRET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The system integrity (SI) INunblock() function received an error return when trying to send a message.

96. INCCBERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was encountered when attempting to access the channel control block common area (CCBCOM) tuple associated with a channel data block (CHDB) tuple. This assert is for analysis only. The problem will be corrected by routine audits.

97. INCDBERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was encountered when attempting to access a circuit data block common area (CDBCOM) tuple. This is a non-escalating assert and is for analysis only. Any problems will be handled by routine audits.

98. INCHDBERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was encountered when attempting to access the channel data block (CHDB) tuple. This assert is for analysis only. The problem will be recovered by routine audits.

99. INCLIDAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred when reading the static relation RLCLIDAT in the intra-cluster status transport (ICST) system process.

Data Structures:

RLCLIDAT. Key field: cluster ID.

Action:

The RLCLIDAT relation should only be found in the AM and in remote SMs (RSMs). The cluster ID used to access the database is given on the ROP. This should be the cluster ID of the RSM that asserted.

Examine the RLCLIDAT relation for this RSM. The cluster ID key should agree with the office parameter Glcid for that RSM. Correct any discrepancies found.

100. INCPLHDER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to initialize couplers in the SM.

101. INDAGSPLPO (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A return other than DBNO_SUCC or DBNULL_SET was received from the dynamic access (DA) subsystem while trying to read the port list.

102. INDBFINER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The fast insert of a tuple for a high level service circuit (HLSC) failed during circuit initialization.

103. INDBREASON (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The database (DB) programs passed an invalid DB reason to the trigger function Slcidattrg(). The valid reasons are update, insert, and delete.

104. INDBRET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PRIGRP	Audit Mode: elev

Problem:

An illegal return value was received from the DBstfst() or DBstnxt() primitive. The PRIGRP audit will run automatically.

105. INDFTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The deferred work router under module integrity control (MICO) received an si_type value that is in range 15, but is not recognized as valid by the INdef_router() function.

106. INECFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The Slimpclet() function received an error return from the DBfrdtup() primitive.

107. INECOMBD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The INinitsg() function detected a logical mismatch between a unit type and a service group common board.

108. INE_ESC (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The system integrity control (SICO) escalation routines were called with an unknown input level.

109. INENDFRQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Illegal entries were found in a deferred work queue.

110. INEORXPT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The INidlexpt() function was called with an out-of-range xpt_type parameter.

111. INERACCS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert was called in INsmhli/INcominit.c. The FCinaccsdb() function returned failure. The RLACCSDB relation could not be initialized.

112. INERACDI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization of the RLACDINFO relation failed.

113. INERACRECORD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization of the RLACRECORD relation failed during an SM full initialization.

Probable Cause:

DBfintup failed or the DAathcar primitive that attaches the element to the idle list failed. Exhausted memory may be the underlying cause.

114. INERADB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization of the idle linked list of analog data blocks (ADBs) during a full or selective initialization of an SM failed.

115. INERAPB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was received from the OAINapb() function when initializing associated process blocks (APBs).

116. INERATTDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During a full or selective initialization of an SM, a failure was encountered while initializing dynamic data for attendant consoles in the RLISATND and RLAWT relations.

117. INERAUTO (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert was called in INsmhli/INcominit.c. The FCpqsmnit() function returned failure. The pointer data block (PTRDB) or query data block (QRYDB) could not be initialized.

118. INERBCGA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic message accounting (AMA) initialization function AMinbcg() failed to initialize the RLBCLGCNT relation.

119. INERBCLA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic message accounting (AMA) initialization function AMInbcl() failed to initialize the RLBCLLCNT relation.

120. INERBFMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLBUFMSG relation cannot be initialized by the OAINbufmsg() function in the file INsmhli/INcominit.c.

121. INERBLFDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization of one or more of the following dynamic relations failed during a full or selective initialization sequence: RLATTH_BLF, RLATTM_BLF, RLRPLY_BLF, RLMODH_BLF, RLMODM_BLF, RLLDATBLF.

122. INERBRCSDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to initialize an idle linked list of business and residential custom services data blocks (BRCSDBs) during full initialization.

123. INERCBDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred when initializing a linked list of idle call build up data blocks (CBDBs) during full or selective initialization.

124. INERCCSSTPDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure was encountered while initializing a linked list of idle rICCSSTPDB tuples during full or selective initialization.

125. INERCLDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was received from the FCincldb() function when initializing call leg data blocks (CLDBs) for business and residential custom services (BRCS) calls.

126. INERCNDA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic message accounting (AMA) initialization function AMincnd() failed to initialize the RLCNDDATA relation.

127. INERCOIN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert was called in INsmhli/INcominit.c. The OAcndatin() function returned GLFAIL. The RLCOINOT dynamic relation could not be initialized.

128. INERCRECORD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization of the RLCRECORD or RLOCRECORD relation failed during an SM full initialization.

129. INERCVST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert was called in INsmhli/INcominit.c. The OAcvstinit() function returned GLFAIL because the RLCV_STATE dynamic relation could not be initialized.

130. INERDALB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failure was returned from the Rlindalb() function during an SM full initialization. Failed to properly initialize the RLDALB relation. This could result in an inability to make integrated services digital network (ISDN), operator services position system (OSPS), extended digital subscriber line (EDSL), etc. calls.

131. INERDBCND (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The initialization of rIDBCND tuples failed during an SM full or selective initialization.

132. INERDDW (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DDwrite() function returned failure when called from the INimsc() or INimtc() function.

133. INERDISPDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to initialize the idle linked list of display data blocks (DISPDBs) during full initialization.

134. INERE911DB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization of the RLE911DB relation failed during SM full initialization.

135. INERGPAX (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The GPAX initialization function returned an error to system integrity (SI).

136. INERICRST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization of the dynamic relation RLICRST or RLICRLGST failed.

137. INERLHBS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During an SM full initialization, the RTIhbinit() function failed to initialize the line history blocks (LHBs).

138. INERLSCMDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization of the idle linked list of large shared call model data blocks (LSCMDBs) failed during a full or selective initialization.

139. INERLTMSTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to initialize the dynamic relation RLLTMSTAT during full initialization.

140. INERMDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was received from the FCinmdb() function when initializing model data blocks (MDBs) for business and residential custom services (BRCS) calls.

141. INERMDRQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLMDRQ relation failed to initialize during a full initialization of the SM. This failure is not correctable by craft action.

142. INERMSU (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Master scanner unit (MSU) scan points data was not synchronized.

143. INERNS_BILL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization of the RLNS_BILL relation failed during an SM selective or full initialization.

144. INERNSDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not insert rINSDB tuples during initialization.

145. INERNS_IDX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization of the RLNS_IDX relation failed during an SM selective or full initialization.

146. INEROAP (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred while initializing one or all of the relations RLLSPDB, RLLTPDB, RLCHNBLK, or RLPKTDB. The OAPs on the failing SM may not be able to communicate with the switch.

147. INEROATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert was called in INsmhli/INcominit.c. The OAsminit() function returned failure. The RLTAPOSDB or RLTALLOOPDB relation could not be initialized.

148. INEROSPS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The INsmhli() or INcominit() function received failure from the OAdatinit() function. The failure return code indicates that an rIPOSDB, rILOOPDB, or rIBUFMSG tuple could not be initialized.

149. INEROTINIT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert was called in INsmhli/INcominit.c. A call to the OAotinit() function returned failure. The data structure OAmtpid could not be initialized.

150. INERPPSAST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization of the dynamic relation RLPPSAST failed during full initialization.

151. INERQVST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CDinqvst() function returned GLFAIL because the RLQV_STATE dynamic relation could not be initialized.

152. INERSCMDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to initialize the idle linked list of shared call model data blocks (SCMDBs) during a full or selective initialization.

153. INERSDAP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to initialize the idle list of speed dial list data blocks (SDAP_SDL) during a full or selective initialization.

154. INERSRV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert was called in INsmhli/INcominit.c. The OAsrvdatin() function returned GLFAIL because the RLSRVOT dynamic relation could not be initialized.

155. INERSTPDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization of the RLSTPDB relation failed during an SM selective or full initialization.

156. INERTAGH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred when initializing remote SM (RSM) local hunt group data during a full or selective initialization. Routing and terminal allocation (RTA) returned a failure code to system integrity (SI).

157. INERTATDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization of the RLATATDB relation failed during an SM full initialization.

158. INERTCPL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RTimcplr() function returned an error to system integrity (SI).

159. INERTEDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to initialize the idle link list for terminal equipment data blocks (TEDBs).

160. INERTEILA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failure was returned from the Rlnteila() function during an SM full initialization. Failed to properly initialize the RLTEILA relation. This could result in the inability to bring integrated services digital network (ISDN) terminals into service.

161. INERTN_INFO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization of the RLTN_INFO relation failed during an SM selective or full initialization.

162. INERWCTX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization of the RLVLRL, RLHDS, RLHDD, or RLSUDB tuple failed during a switching module full or selective initialization.

Probable Cause:

DBfintup() or DBfrdtup() failed. Exhausted memory may be the cause.

Action:

None.

163. INESMINT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMinit() function returned an error to system integrity (SI).

164. INETMPSI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The TMimpsinit() function returned an error to system integrity (SI).

165. INEUTYP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The INinitsg() function detected a unit type that is not handled by the software.

166. INFHBADTS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During a broadcast off-line pump, a SM set up one or more timeslots for the pump that the AM did not request the SM to use. This assert dumps the message that the AM received from the SM that contains the timeslots that the SM is trying to use for this pump.

167. INFHBRMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message was not successfully received.

168. INFHBSLOTS (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

During an offline pump, an SM selected non-requested time slots for the offline pump.

169. INFHBSMSG (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The fast pump facility handler (FPFH) process detected failure while trying to send a message.

170. INFHBSTATE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The fast pump facility handler (FPFH) encountered an invalid state for this event.

171. INFHDDFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Data delivery (DD) returned failure to the fast pump facility handler (FPFH).

172. INFHNOMATCH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The fast pump facility handler (FPFH) could not match the indicated action field of a message received from the message switch kernel process (MSKP) environment.

173. INFHOSBCAST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected failure was received from the OSBCAST() primitive in the fast pump facility handler (FPFH). The message that is being broadcast to a set of SMs is dumped.

174. INFHSPPAS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Upon return from a single process purge, the fast pump facility handler (FPFH) attempted to send a message. A resource failure occurred after repeated tries, or a failure other than resource failure occurred.

In the data dumped, if the first short of the second long is 0x2710, the pump peripheral controller (PPC) could not be shut down. Subsequent pumps could fail.

175. INFHTSMMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to send a message from the fast pump facility handler (FPFH) process in the operational kernel process (OKP). The message buffer is dumped, which provides the message type, message body, and message length. The destination process ID and the OSSENDMSG() macro return value can be obtained from the stack frame or register dumps.

176. INFHUMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The fast pump facility handler (FPFH) process received a message of an unknown type.

177. INGR CIRDF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While executing generic retrofit saving stable calls code, a call to the CI_rd() function returned failure.

178. INGR CIWRF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While executing generic retrofit saving stable calls code, a call to the CI_wr() function returned failure.

179. INGR CKTDATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While executing generic retrofit saving stable calls code, an invalid circuit data type value was obtained.

180. INGRCKTGET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While attempting to save a stable call during a generic retrofit, a circuit name could not be obtained.

Probable Cause:

Possible hardware growth/degrowth occurred prior to the retrofit and was not evolved to the new generic.

181. INGRCXGET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While trying to save a stable call during a generic retrofit, a circuit index could not be obtained.

Probable Cause:

Possible hardware growth/degrowth has occurred prior to the retrofit and was not evolved to the new generic.

182. INGRDFINUM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While executing generic retrofit saving stable calls code, an invalid digital facility interface (DFI) number was obtained.

183. INGRDGET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While trying to save a stable call during a generic retrofit, a data block could not be retrieved from the dynamic access (DA) or database (DB) subsystem. This may indicate that some hardware growth or degrowth occurred prior to retrofit that was not evolved to the new software release.

184. INGRDLINK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While trying to save a stable call during a generic retrofit, two data blocks could not be linked together via the dynamic access (DA) or database (DB) subsystem.

185. INGRINTERNAL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While trying to save a stable call during a generic retrofit, an error occurred in interfacing between functions.

186. INGRNOPIDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While executing generic retrofit saving stable calls code, the peripheral interface data bus (PIDB) corresponding to a peripheral time slot (PTS) could not be obtained.

187. INGRNOXPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While executing generic retrofit saving stable calls code, no closed cross points were found.

188. INGROPFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While executing generic retrofit saving stable calls code, a call to the OPs96() primitive returned failure.

189. INGRPBGET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While trying to save a stable call during a generic retrofit, a peripheral interface control bus (PICB) could not be obtained.

Probable Cause:

Possible hardware growth/degrowth occurred prior to the retrofit and was not evolved to the new generic.

190. INGRPC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While trying to save a stable call during a generic retrofit, a peripheral control (PC) subsystem function returned a failure code that was not expected.

191. INGRPTGET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While trying to save a stable call during a generic retrofit, a portname could not be obtained.

Probable Cause:

Possible hardware growth/degrowth has occurred prior to the retrofit and was not evolved to the new generic.

192. INGRPXGET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While trying to save a stable call during a generic retrofit, a port index could not be obtained.

Probable Cause:

Possible hardware growth/degrowth has occurred prior to the retrofit and was not evolved to the new generic.

193. INGRQMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred when trying to initialize or send a Q.931 message from the retrofit integrated services digital network (ISDN) terminal process.

Probable Cause:

Incorrect dynamic data.

194. INGRTSI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While trying to save a stable call during generic retrofit, a primitive used to read the time slot interchange (TSI) returned a failure code that was unexpected.

195. INGRTSIT1F (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While executing generic retrofit saving stable calls code, the conversion of a time slot interchange (TSI) time slot to a T1 time slot failed.

196. INIDS1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Interprocessor data synchronization (IDS) suffered a nonfatal error.

197. INIDSARGBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An interprocessor data synchronization (IDS) function was called with an invalid or unexpected argument.

198. INIDSBADRET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A function was called by interprocessor data synchronization (IDS) that returned an unexpected value.

199. INIDSDTFAILURE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the DTREAD() or DTWRITE() macro by interprocessor data synchronization (IDS) returned a value that

indicated failure.

200. INIDSPACKAGE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Interprocessor data synchronization (IDS) detected an inconsistency between the settings of its dynamic data and loaded (or not loaded) package(s).

201. INIDSPTYPEBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Interprocessor data synchronization (IDS) received a port that is to be idled, but the port was of an indeterminate type. That is, the port was not a line or a trunk.

202. INIDSREASONBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to invoke interprocessor data synchronization (IDS) with an unexpected or invalid reason, or the reason for the current invocation of IDS is invalid.

203. INIDTMBW (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The integrated display terminal (IDT) request indicator (INidtactive) shows that there are no IDT requests, even though a new IDT request was received.

204. INIDTMIC (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid creation reason was encountered.

205. INIDTMIR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid integrated display terminal (IDT) state was encountered.

206. INIDTMIW (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected wakeup reason was encountered.

207. INIDTMPS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The running integrated display terminal (IDT) does not match the IDT active state.

208. INIDTSBOS (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An interprocessor data transport (IDT) operating system (OS) failure occurred.

209. INIDTSBSM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMno_links value was invalid.

210. INIDTSEFC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An interprocessor data transport (IDT) maxcalls threshold was exceeded.

211. INIDTSICR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An interprocessor data transport (IDT) invalid creation reason was encountered.

212. INIDTSIWS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An interprocessor data transport (IDT) invalid wakeup stimulus was encountered.

213. INIDTSSMR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An interprocessor data transport (IDT) non-timer message was encountered.

214. INIDTSUMR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An interprocessor data transport (IDT) timer tag was not from this process.

215. INIDTSUPS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An interprocessor data transport terminal (IDT) unknown process state was encountered.

216. INIDTSURC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An interprocessor data transport (IDT) unknown client return code was encountered.

217. INIMNOMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

System integrity control (SICO) sent a TTY initialization message to the wrong SM. Module integrity control (MICO) will ignore this message.

218. ININVMSGTYP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The intra-cluster status transport (ICST) system process received an invalid message type.

219. ININVSTIM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid stimulus was sent to the intra-cluster status transport (ICST) system process.

220. INISPARTN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Module integrity control (MICO) passed an invalid input parameter to the integrated services port administrator (ISPA) job handler to remove or restore a protocol handler (PH) during an initialization.

221. INISPHTO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Module integrity control (MICO) timed out while initializing integrated services digital network (ISDN) ports.

222. INJBTRREQERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Either an invalid parameter was passed, or an invalid time state was encountered when a job requested that the INjbt_req() function, log a start or end time operation. This is not a critical error, and no corrective action is necessary.

223. INLINKUSE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unknown use for a given time slot interchange (TSI) link returned from the PCLNK2USE() macro.

224. INLNKPLIERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received a failure return code while reading the RLLNK_PLI relation for a tuple that should have existed. The key used to read RLLNK_PLI will be printed.

Data Structures:

RLLNK_PLI.

Action:

The non-existent key was taken from an RLF_VPIDB tuple. The RLF_VPIDB and RLLNK_PLI relations should be examined to determine if the key taken from the RLF_VPIDB tuple is incorrect or if a tuple is missing from the RLLNK_PLI relation.

225. INLTSBDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RTinltsbdb() function failed to initialize the RLDLTSBDB relation and returned failure to system integrity (SI). Line time slot bridging (LTSB) customers may experience blockage.

226. INLTSTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RTinltstat() function failed to initialize the RLLTSBSTAT relation and returned failure to system integrity (SI). Line time slot bridging (LTSB) lines will not be able to originate.

227. INMATATT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The static relation RLMATATT was read to determine if intra-cluster links existed between two remote SMs (RSMs) in the cluster. A database error occurred while reading the RLMATATT relation.

Data Structures:

RLMATATT. Key field: module number.

Action:

The key to the RLMATATT relation is the module number of a mate to the RSM where the database read error occurred. This number is given on the ROP output. The module number given should be one of the other RSMs in the multimodule RSM.

If the module number given is a member of the multimodule RSM, check the RLMATATT relation to see if a tuple exists for the module number given. If a tuple does not exist, populate a tuple according to the population rules for this relation. If the module number is not a member of the multimodule RSM, check the RLCLIDAT relation and

correct it, if necessary.

228. INMATEFAILTSM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During the trunk status mapping (TSM) portion of an SM generic retrofit selective initialization, the active module controller/time slot interchange (MCTSI) (the new software release) attempted to condition the mate MCTSI (the old software release) memory prior to moving an instruction buffer to the mate MCTSI side. The attempt failed. Trunk out of service (OOS) statuses will not be mapped in this SM.

229. INMATESTPTSM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During the trunk status mapping (TSM) portion of an SM generic retrofit selective initialization, the active module controller/time slot interchange (MCTSI) side (the new software release) asked the mate MCTSI side (the old software release) to perform the TSM "gather" operation.

The mate side was expected to stop in a specified amount of time, but it did not. As a result, the mate side was forced to stop by the active side. Trunk out of service (OOS) statuses will not be mapped in this SM. (Note: The timer specification can be found in si/INgrstabc/INgrtsmdefs.h: #define INTSMTIME.)

230. INMBUFTYP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid parameter was passed to the INbuffer(), INprint(), or INmsgina() function. Valid types are defined in the file si/SIbuftypes.h.

231. INMDFRQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The INdeferred() or INdfwrk() function encountered errors in the module integrity control (MICO)/system integrity control (SICO) deferred work queue.

232. INMICOST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Module integrity control (MICO) was dispatched with an invalid process number in the SImicost() function.

233. INMODATT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred while reading the RLMODATT relation in the AM. The error could be due to an invalid module number (key) or to a database problem. To check the database, use RC/V to determine if the rIMODATT tuple can be retrieved.

234. INMSTYPE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid si-type value was received by the initialization (IN) analysis function. The process that called the print structure is purged.

235. INNS_TN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred while initializing the RLNS_TN relation.

236. INOFLDATATSM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During the trunk status mapping (TSM) portion of an SM generic retrofit selective initialization, the INtsmmap() function detected that failures had been encountered during the gather operation on the module controller/time slot interchange (MCTSI) side with the old software release. No trunk out of service (OOS) statuses were gathered. Trunk OOS statuses will not be mapped in this SM.

237. INOSBDPCBL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

An audit was run on the RLPCBLA relation because errors were found when executing the DAgetpcbla() or DAghdpda() primitive.

238. INOSBDSITYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid si_type value was received from human/machine interface (HM) for a single process purge request from the master control center (MCC).

239. INOSDFBDFRD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An internal system error code was received from a DBfrdtup() primitive call.

240. INOSPSL3 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PSoindata() function failed. It is called from the INsmhli/INcominit() function. The dynamic data for operator services position system (OSPS) level 3 was not initialized; therefore, level 3 can not be established for OSPS ports.

241. INPCBCOIN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

The DAfpcot() primitive returned DBSYS_ERR because the linkage between the RLPCBLA and RLCOINOT relations is corrupt. The elevated audit of the RLPCBLA relation is requested. This assert is used by the system integrity (SI) function INacts_isol() which cleans up the rICOINOT tuple for single process purge.

242. INPHSTATUS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Module integrity control (MICO) tried to condition ports on an unequipped protocol handler (PH), or the PH is in an invalid state.

243. INPICBERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was encountered when attempting to access a peripheral interface control bus (PICB) tuple. No specific action will be taken for recovery by the asserting function. This assert is for analysis only. Routine audits will handle any associated errors.

244. INPIDBERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was encountered when attempting to access the RLPIDB relation as a result of calling either the DBstfst() or DBstnxt() functions from the INproc_pidbts() function.

Action:

Collect the assert data associated with this error instance including: the assert header, the stack back trace, and the stack frame dumps and forward them onto the next level of support for analysis.

245. INPORTDATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A read of the PORTDATA relation failed. This is most likely due to an invalid key being used to read the relation. This assert will only notify that an error has occurred, but will not schedule any recovery action.

246. INPORTLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

Failed to access the RLFCPORTTYP relation; no associated rPORTLA tuple exists.

247. INPRIGRP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PRISTAT	Audit Mode: elev

Problem:

The primary rate interface (PRI) group number found in the rPRIGRP and rPRISTAT tuples do not match. The

group number from the rIPRIGRP tuple is used to retrieve the rIPRISTAT tuple. The PRISTAT audit is run.

248. INPRTGRP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

An error occurred while reading the RLPORT_GROUP relation.

Probable Cause:

A tuple may be missing or corrupted.

Action:

The PORT_LA audit will be run automatically.

249. INPSUUI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred while initializing the RLPSUUI relation.

250. INPTDFRQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The deferred work queue pointers were corrupted, or the queue itself was corrupted.

251. INPUQERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Call to FCpuqinit() failed to initialize the RLPU_QUEUE and RLPU_ENTRY relations during an SM full or selective initialization. The call to FCpuqinit() is made from INcomoninit().

252. INREASERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The fast pump facility handler (FPFH) system process could not be created.

253. INRETGEN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This is a general system integrity control (SICO) returning assert. Save the ROP output to determine where the error occurred.

254. INRSMCHAN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database problem was found when accessing the static relation RLRSCHAN during initialization of the host SM (HSM) time slot interchange (TSI).

255. INRSMNTS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database problem was found when accessing the static relation RLRSMTS during initialization of the host SM (HSM) time slot interchange (TSI).

256. INRTCONFIG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Data initialization for a remote terminal (RT) connected to an integrated digital carrier unit (IDCU) line unit has failed in the IDCU during a full initialization of the IDCU. The RT number and the IDCU number will be in the failing function stack frame as the rt and lu variables respectively.

257. INRTFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A routing and terminal allocation (RTA) or port status administrator (PSA) function returned failure during initialization (transient clear or stable clear). This is a non-critical error.

258. INSABMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message had an si_type value in the range INRNG19; therefore, the message was routed to the stand-alone transition code. However, the si_type did not match the values in the state transition table. The message is discarded, which should correct the problem. Possibly, .data was corrupted in the SM, which will require an initialization.

259. INSABTIME (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When transitioning out of stand-alone, the time of entry to stand-alone was incorrect. The time was zero (stand-alone was entered without setting the time), or invalid (greater than the current time). The ROP should report a duration of zero time, and no time will be added to the stand-alone usage measurement.

260. INSARTAIN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from the routing and terminal allocation (RTA) primitive RTinsa(), possibly indicating invalid static data. The RTinsa() primitive may have been called too many times, indicating that excessive multiline hunts groups (MLHG) are associated with the remote SM (RSM) that generated this assert. Recovery options are few, increasing the threshold for the number of calls to RTinsa() may help.

261. INSARTAOUT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from the routing and terminal allocation (RTA) primitive RToutsa(), possibly indicating invalid static data. The RToutsa() primitive may have been called too many times, indicating that excessive multiline hunts groups (MLHGs) are associated with the remote SM (RSM) that generated this assert. Recovery options are few, increasing the threshold for the number of calls to RToutsa() may help.

262. INSASTATE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inter-processor data synchronization (IDS) check to determine if the remote SM (RSM) is in stand-alone failed because the state variable was invalid. The failing function queues an entry to the stand-alone transition code that should correct the value of the state variable. IDS is told that the RSM is not in stand-alone.

263. INSATRNFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In module integrity control (MICO), a wild write to the Slrsmstate[] array or to the index variable occurred. If the write was to the index, a local variable, the problem will correct itself. If the Slrsmstate[] array was destroyed (in .data), the SM must be re-initialized because write protected memory was destroyed.

264. INSFPTFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

On entry to a system integrity control (SICO) function, a defensive check found that the safe point reason was an unknown type.

265. INSFRET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSsfentry() function returned. This function should not return.

266. INSITEDBG0 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert is reserved exclusively for debugging field problems. It is only to be used in a TMP being supplied to the field site and is used to dump additional data for debugging purposes. If this assert is seen in an office where a TMP has not been applied, it has been used for something other than its intended purpose, and the system integrity help desk should be notified immediately.

267. INSITEDBG1 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert is reserved exclusively for debugging field problems. It is only to be used in a TMP being supplied to the field site and is used to dump additional data for debugging purposes. If this assert is seen in an office where a TMP has not been applied, it has been used for something other than its intended purpose, and the system integrity help desk should be notified immediately.

268. INSITEDBG2 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert is reserved exclusively for debugging field problems. It is only to be used in a TMP being supplied to the field site and is used to dump additional data for debugging purposes. If this assert is seen in an office where a TMP has not been applied, it has been used for something other than its intended purpose, and the system integrity help desk should be notified immediately.

269. INSITEDBG3 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert is reserved exclusively for debugging field problems. It is only to be used in a TMP being supplied to the field site and is used to dump additional data for debugging purposes. If this assert is seen in an office where a TMP has not been applied, it has been used for something other than its intended purpose, and the system integrity help desk should be notified immediately.

270. INSMCRERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A switch maintenance critical error occurred.

271. INSMESTREAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was encountered when attempting to access the SMEST tuple associated with a circuit. This assert is for analysis only. The problem will be corrected by routine audits.

Probable Cause:

Invalid circuit name or dynamic data corruption.

Action:

Look for any audit errors and analyze them.

272. INSMIAERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A switch maintenance interrupt administrator initialization failure occurred.

273. INSYNCHTO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the SM, the INsynch() function returned from the OSWGETTYPE() macro without getting the specified message type (MGINUMT). The waiting time expired, or there was some other problem in getting the message.

The entry in the INblock[] array is removed for the process that called INsynch(). This ensures that the INunblock() function will not send the MGINUMT message to the system process, as system processes do not normally handle this type of message. No further recovery action is needed, although all system processes are now running and competing with module integrity control (MICO), potentially prolonging the time that the SM initialization is fully completed.

274. INSYNFULL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The system integrity (SI) process synchronization table is full.

275. INTRKGRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred while reading the RLRT_TRKG relation.

Data Structures:

RLRT_TRKG relation.

Action:

None.

276. INTSDATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Encountered a problem reading either a rICHDB or rITSDB tuple while quarantining the tuples associated with the time-slots used during selective init with pump.

277. INTSMINTERNAL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During transition status mapping, an error occurred when interfacing between functions.

Probable Cause:

Improper arguments were found in the function call.

278. INTYPEFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

On entry to a system integrity control (SICO) function, a defensive check found that the si_type value was an unknown type.

279. INUNITREAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failure to read the RLUNITDATA static relation.

Probable Cause:

Invalid circuit calculation, ODD inconsistency or DB error.

Action:

Check the consistency of RLUNITDATA.

280. INUNREASON (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The Slsicost() function was entered with an unknown reason. This function is the entry point for system integrity control (SICO), the CRAU routine audit process, and the CEAU elevated audit process.

281. INUN_REQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The system integrity control (SICO) buffering routines were called with an unknown request.

282. INUNREQTYPE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A buffer of an unknown type was requested.

283. INWPBSSFL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The write protected BSS window variable was out of range. Write protect is re-applied to all write protected BSS.

284. INWPODDFL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The write protected office dependent data (ODD) window variable was out of range. Write protect is re-applied to all ODD.

285. MCCBADIND (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid indicator key was passed to the master control center (MCC) page update routines.

286. MCCBADPCR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid processor ID was passed to the master control center (MCC) page update routines.

287. MCCBADPHR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid phrase key was passed to the master control center (MCC) page update routines.

288. MCCBADRSN (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The MCUP terminal process was entered with an unexpected reason in the SImccupd() entry function. MCUP should only be created for a single task.

289. MCCBADSTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid status was passed between the master control center (MCC) display update routines.

290. MSBDSIMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A system integrity (SI) or audits (AU) function received a call return message type from the same SI/AU process in response to an operating system for distributed switching (OSDS) message.

291. MSBDSIRN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

System integrity (SI) or audits (AU) received an unknown si_type message type from the same SI/AU process.

292. MSBDSITP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

System integrity (SI) or audits (AU) received an unknown si_type message from another process.

293. OCBADLPHN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The logical protocol handler (PH) number passed to an overload control for packet switching primitive in the SM is out of range or out of service; or the corresponding physical PH number of the logical PH number passed is

unequipped or unassigned.

294. OCBADPID (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid process identification was passed to the OSCNTMSGGS() primitive.

295. OCDDRDERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Overload control received an error return from the data delivery (DD) read primitive.

296. OCDDWTERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Overload control received an error return from the data delivery (DD) write primitive.

297. OCDTREAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DTREAD() macro returned an error code in overload control.

298. OCHMERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Human machine interface (HM) returned an error code to overload control.

299. OCMSGID (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message ID was not recognized in overload control.

300. OCOSSNDER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSENDMSG() macro returned OSELENGTH or OSEPROC.

301. OCOVLDERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The real-time overload status returned from the DDREAD() macro is invalid.

302. OCPSSNDER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The return status from the PSsendmsg() primitive was not PSSUCCESS or PSRESRCE (resource exhaustion). This assert is used in overload control for packet switching code in the SM.

303. OCRLGETER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In overload control for packet switching in the SM, an error occurred while retrieving a tuple from the database.

304. OCSMDTRD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was encountered in the DTREAD() macro in the SM in overload control for packet switching code.

305. OCSMRDERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Overload control received an error return from the SMddread() primitive.

306. OCUNKSITP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Overload control received an unknown si-type value.

307. SIAUBDMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown operating system for distributed switching (OSDS) message type was received by a routine or elevated audit process.

308. SIBADUNIT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A unknown unit type was found in a switch statement. The bad unit type will be dumped.

309. SIDDFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return was received from the DDREAD() or DDWRITE() macro.

310. SIFLASHUPD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The update of the FLASH memory for a peripheral control and timing link (PCT) based peripheral has failed during the initialization of the peripheral.

Probable Cause:

Bad FLASH memory hardware.

Action:

The INit_tbl[] entry for the peripheral will be dumped. The circuit name of the common control (CC) that contains the bad FLASH Memory will be the second short (2 bytes) of the dump. This circuit name can be used with the OP:CONV command to determine the unit that contains the bad FLASH.

311. SIFPSPBADREA (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The fast pump system process in the host SM (HSM) for the remote SM (RSM) fast pump received an invalid startup reason.

312. SIFPTPBADREA (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The fast pump terminal process in the host SM (HSM) for the remote SM (RSM) fast pump received an invalid startup reason.

313. SIGLCLOFFSET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The Glcl_offset parameter had an invalid offset value. Glcl_offset is populated in a multi-module remote SM (MMRSM) with the cluster ID. It is used to access data for the intra-cluster status transport (ICST) mechanism.

Action:

Using RC/V (or ODBE, if necessary) examine the Glcl_offset parameter for the RSM that asserted to verify that it is populated with the valid offset number ($0 < \text{Glcl\_offset} \leq \text{Glmaxclsz}$).

314. SIIMBDMS (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown operating system for distributed switching (OSDS) message type was received by the integrity monitor system process.

315. SIIMBDMS (5E11 to 5E13)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown operating system for distributed switching (OSDS) message type was received by the integrity monitor system process.

316. SIIMMSLG (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message buffer overflow occurred in the integrity monitor system process.

317. SIIMMSLG (5E11 to 5E13)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message buffer overflow occurred in the integrity monitor system process.

318. SIIMWPINV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The integrity monitor will detect the write protection violation and dump the write protect (WP) addresses as local data. IMwpaddr[] contains starting addresses for all the WPed areas for which WP status is left in invalid state or turned off. IMwpstk[] contains status of WP when the assert is fired.

319. SIINBDMS (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown operating system for distributed switching (OSDS) message type was received by the system integrity control (SICO) or module integrity control (MICO) system process.

320. SIINBDMS (5E11 to 5E13)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown operating system for distributed switching (OSDS) message type was received by the system integrity control (SICO) or module integrity control (MICO) system process.

321. SIINMSLG (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message buffer overflow occurred in the system integrity control (SICO) or module integrity control (MICO) system process.

322. SIINMSLG (5E11 to 5E13)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message buffer overflow occurred in the system integrity control (SICO) or module integrity control (MICO) system process.

323. SIMGTPCREATE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operating system (OS) failed to create the system integrity memory growth terminal process (MGSI). Retry optional data region (ODR) growth or SM memory growth request later.

324. SIOATYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An undefined overload state enumeration was passed to the OCiptpovld() function for an operator services position system (OSPS) interflow position terminal process.

325. SIOCBDMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown operating system for distributed switching (OSDS) message type was received by the overload system process.

326. SIOCMSLG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message buffer overflow occurred in the overload control system process.

327. SIODSFALL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred during operator data synchronization (ODS) for the operator services position system (OSPS). A database (DB) or operating system (OS) primitive failed. ODS is terminated. ODS recovers OSPS data after an AM initialization or a packet switching module (PSM) failure.

328. SIOLIMHOG (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

The integrity monitor routine IMlockchk() has timed out on an optional data region (ODR) lock. A process has held the lock for too long. The process holding the lock will be single process purged. The ODR will be returned to the unlocked state.

The data dumped by this assert includes locking information, starting with the ODR whose lock has timed out. If this assert occurs repeatedly, contact field support: a problem may exist with the system integrity subsystem.

329. SIOLINOOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Sladdr_olock() was called to lock an optional data region (ODR) with an input address that was out of range.

330. SIOM1 (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The overload monitor attempted to contact the AM in order to upload overload data, but the AM did not respond. The overload data will be lost.

331. SIOM2 (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The overload monitor sent numerous messages to the AM requesting access to the Simon local buffer; however, the buffer was always busy. The overload data on the local processor will be lost.

332. SIOM3 (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The overload monitor could not gain access to the operating system for distributed switching (OSDS) monitor's operation structure. The overload monitor data will be lost.

333. SIOM4 (5E11 to)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The overload monitor received an abort message from the AM. The overload data will be lost.

334. SIOM5 (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The overload monitor received a wakeup requesting that overload data be processed, but the global data structure indicating the size of the data had not been initialized.

335. SIOMTDBERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database (DB) primitive returned an error code that must be recorded, but was not severe enough for a demand audit of the dynamic relations for the output message queues. The return value and the pointers to the buffers involved are included on the function stack space and in the stack frame output message.

336. SISMESTFL (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Updating of SMEST failed for a PH.

Probable Cause:
Data corruption or invalid data.

Action:
Report only.

337. SIWAITER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
System integrity control (SICO) or module integrity control (MICO) received an unknown event from the OSWAIT() macro.

338. SIZAPINIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Slzapmem() has been used during a switching module processor (SMP) initialization. Slzapmem() is not intended for use during an SMP initialization.

Action:
Determine under what customer action problem occurred, collect relevant reports and contact next level of support.

339. SIZAPRNGERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
An attempt has been made to zap an illegal region of memory. The target region is either below stand alone billing memory or above physically addressable memory.

Probable Cause:
The probable cause is a client subsystem interface with Slzapmem().

Action:
Determine scenario under which problem occurred (such as office dependent data [ODD] growth,) collect all relevant reports, and contact next level of support.

Range: sipp**1. DTPBADEV (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DT was entered with an unknown reason.

2. DTPBADOS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DT received bad message from the operating system for distributed switching (OSDS).

3. DTPBADTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DT received bad timer.

4. DTPI2SMFAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Data transport has failed to place a message on the PI→SMP FIFO for reasons other than resource exhaustion. This could result in end-to-end check failures.

5. IMAPCDSP (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A lack of periodic dispatching was detected for a critical system process (that is, the process stopped running when it should be running). A single process purge of the process was requested.

User data will contain the following information:

- (1) Purging process number (unsigned short)
- (2) Current dispatch count for the process being dispatch (unsigned long)
- (3) Unused (unsigned long)
- (4) Last look of the process dispatch counts (unsigned long)

Probable Cause:

Software errors.

Action:

No action required. Software will correct the problem but the assert report and associated data should be provided to customer support.

6. IMASTIMG (5E12 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The integrity monitor tight loop detector found a lack of periodic entry to the integrity monitor process at background.

Probable Cause:

Software errors.

Action:

No action required. Process is purged to restart.

7. IMOSMCB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operating system (OS) found out MCB was used up.

8. IMOSPCB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operating system (OS) found out the process control block (PCB) was used up.

9. IMOSSCB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operating system (OS) found out stack control block (SCB) was used up.

10. IMOSTCB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operating system (OS) found out the timer control block (TCB) was used up.

11. IMPASTLCN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Integrity monitor tight loop detector progress counter containing illegal value (wild write) in the PP.

12. IMPASTSPP (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Integrity monitor tight loop detector in the PP has detected as stuck process requested single process purge.

13. IMPHPURGAMA (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

The integrity monitor has detected that the automatic message accounting (AMA) billing process has been found in a stuck state. Either the process is not getting entered regularly or it is not unloading the billing buffer which is determined by the variable (PSkbitems) being greater than 4 messages in the AMA billing buffer.

14. IMPINJTHR (5E14 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The integrity monitor detected that the interject count exceeded the threshold; a system process purge was requested.

15. IMPINJTHR (5E11 to 5E13)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

Integrity monitor detected that the interject count exceeded the threshold, selective INIT is requested.

16. IMPRPIAST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This error code indicates that a process is being flagged by the integrity monitor tight-loop detector for using an excessive amount of real-time. If the process continues to use more real-time, it will be purged.

Probable Cause:

Process has exceeded its allotted real-time segment.

Action:

If problem persists, provide data to the next level of support.

17. IMPSPAST (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The integrity monitor tight-loop detector purged a process for using an excessive amount of real-time.

Probable Cause:

Process has exceeded its allotted real-time segment.

Action:

If problem persists, provide data to the next level of support.

18. IMPWPINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Integrity monitor has detected that write protect has been left off a section of write protected BSS in the PP.

19. IMRSCRCVY (5E12 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

The integrity monitor requested a purge of processes that have not released resources.

20. INAUDTEST (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: PCB	Audit Mode: elev

Problem:

Test assert for testing assert/audit interface.

Probable Cause:

Special overwrites performed for test purposes.

Action:

This should not occur in the field. If it does, collect associated ROP output and provide that information to technical support.

21. INDFTYPE (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The deferred work router under peripheral integrity control (PICO) received an si_type value that is in range 15, but is not recognized as valid by the INdef_router() function.

22. INIDSPSSNDMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An interprocessor data synchronization (IDS) call to PSsndmsg returned a code other than PSRESRCE and PSSUCCESS.

23. INMGBADPARAM (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Unsupported requester type, the message will be dumped with the assert.

Probable Cause:

Function passed a parameter which is not yet supported, or function interface not correctly followed.

Action:

Switch personnel should contact local field support with the assert number, mnemonic, and any associated ROP output to resolve the problem. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

24. INMGBADTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid message type passed in to this function.

Probable Cause:

Message ID not defined for use by this function.

Action:

Craft personnel should contact local field support with the assert number, mnemonic, and any associated ROP output to resolve the problem.

25. INMGINVALID (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid parameter or data passed to this function.

Probable Cause:

Called with old or wrong data.

Action:

Craft personnel should contact local field support with the assert number, mnemonic, and any associated ROP output to resolve the problem.

26. INPCPHBC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Out of range block count received from switching module processor (SMP) during protocol handler (PH) pump.

27. INPCPHBS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data pump of a protocol handler (PH) was in progress, and a check was made on the progress marker and the progress marker contents was invalid.

28. INPCPHCR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Illegal operating system for distributed switching (OSDS) create reason.

29. INPCPHEP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A request for a text pump was received, and a check for an existing data pump was made. The check revealed that the protocol handlers (PHs) needed for a text pump are being used in a data pump.

30. INPCPHIA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The source protocol handler (PH) has sent a setup message to the target PH, and the response from the target PH

was not defined.

31. INPCPHIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PCPH system process in the packet interface (PI) received a timeout and no data pump was in progress: No timer should have been set.

32. INPCPHMD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Interface error between pump control and message distribution.

33. INPCPHMR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Illegal operating system for distributed switching (OSDS) message received.

34. INPCPHPR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Pump process illegal pump request received.

35. INPCPHPS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

PSsendmsg() send error in the packet interface (PI).

36. INPCPHSE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Pump process internal state/data error.

37. INPCPHTT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Illegal operating system for distributed switching (OSDS) timer tag received.

38. INPPBCHKIN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The system integrity (SI) process synchronization check-in counter has overflowed.

39. INPPBDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The system integrity (SI) operating system for distributed switching (OSDS) presence found data to be invalid for this state. function INsynch().

40. INPPBDMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unknown OSDS message type in PICO. Function Slinmain()

41. INPPBINSYN (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

INsynch() was called with an input parameter which is completely invalid.

42. INPPBSNDRET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The system integrity (SI) INblock() received an error return when trying to send a message.

43. INPPBUNBLK (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The system integrity (SI) process was asked to unblock processes through a sequence state that does not apply.

44. INPPENDFRQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Illegal entries found in deferred work queue.

45. INPPMSGGLG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Message buffer overflow in packet integrity controller (PICO) system process.

46. INPPMSTYPE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Bad si_type received by INanalysis().

47. INPPICOST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Packet integrity controller (PICO) was dispatched with a bad proc no or bad reason. function Slsp_init().

48. INPPRETGEN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

General packet integrity controller (PICO) returning assert. Save assert output to determine where the error occurred.

49. INPPSYNFULL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The system integrity (SI) process asynchronization table is full.

50. INPPTMOT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Process time out, a process didn't call INsynch, recovery single process purge (SPP) which should cause init to restart if software check inhibits are off.

51. INPPWAITER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unknown event received by process integrity controller (PICO) from OSWAIT().

52. INPSBADRET (5E11 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

Bad return from PSinit().

53. INPSINIT (5E13 and later)

Recovery Action: psinit	SPP: n	Audit: null	Audit Mode: null

Problem:

Test assert for testing the PS Init initialization level.

Probable Cause:

Special overwrites performed for test purposes.

Action:

This should not occur in the field. If it does, collect associated ROP output and provide that information to technical support.

54. OCBADBUFP (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Illegal buffer pool has been passed to OCovlvl().

55. OCBADCHTP (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Illegal protocol handler (PH) channel type has been found in PSdcdh for a channel passed to OCchtype().

56. OCBADCNT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Protocol handler (PH) buffer descriptor (BD) overload control found the overload control counts for general purpose BDs on the free list to be out of range. The value of OCgpcnt[OCCH_FREE] will be set to PSTNGPBDs prior to firing this assert.

57. OCBADID (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Overload control received a bad message ID in the peripherals.

58. OCBADLLCB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Illegal logical link control block (LLCB) index has been passed to OCovlvl().

59. OCBADOS (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Illegal message has been received by overload control system process in OCppmain().

60. OCBADREAS (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Illegal operating system for distributed switching (OSDS) reason code has been passed to overload control initialization routines.

61. OCDTRDERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert means that overload control in the peripherals received a bad return from a DTREAD.

62. OCDTWERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert means that a bad return was received by overload control in the peripherals from a DTWRITE

63. OCOORLLCB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Illegal logical link control block (LLCB) index has been passed to OCbufmtr().

64. OCOORLVL (5E11 and later)

Recovery Action: spp	SPP: n	Audit: BD	Audit Mode: nonseq

Problem:

Out-of-range overload level has been detected in OCbufmtr() and directed audit of AUBD has been requested.

65. OCPIPSSND (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Error encountered on primitive, PSsendmsg(). Return status was anything other than PSSUCCESS or PSRESRCE (resource exhaustion).

66. OCPREASERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Overload control in the PP got entered because of a wrong reason.

67. SIBADRET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A bad return value was received from PSsendmsg(). No action will be taken.

68. SIBADTBL (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The number of frames declared for the data pump table (SldpmpTbl) is too small for the soft switch. Contact the SI PH soft switch expert.

69. SIHSCOVFLW (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The array containing PH hash sum check requests has run out of room. The array will be dumped for analysis.

Probable Cause:

The only "valid" way this can happen is if more than SINUMPHTYP different types of PHs were equipped on a single SM.

Action:

The problem should correct itself after the current PH pump request completes.

70. SITYBDEV (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The COPP system process detected an invalid output event or timer.

71. SITYBDMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid or unknown message type was received by the COPP system process.

72. SITYRERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The COPP system process received an illegal operating system (OS) create reason.

73. SITYRESET (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The TTY output message queue pointers are out of range or pointing at an invalid message.

74. SITYRESET (5E11 to 5E12)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The TTY output message queue pointers are out of range or pointing at an invalid message.

Range: smim**1. SM2KACC_FLT (5E12 and later)**

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

While attempting to continue with initialization (after setting MINMODE) in which ACCESS FAULT occurred. The opcode at the beginning of the instruction which caused the access fault was NOT located or found in the table SMopc_intbl[].

Action:

NOTE: The table SMopc_intbl[] does NOT contain all opcodes. This implies that SMopc_intbl[] needs to be updated to include the opcode and the length of the instruction.

The SM will NOT be permitted to successfully initialize until this problem is fixed or the original problem which caused the access fault is fixed.

2. SM2KMMUERR (5E11 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

While attempting to initialize the MC68040's memory management unit (MMU), the initialization software detected an inconsistency in the generated MMU translation table. Either a B-level descriptor overwrote a C-level descriptor and/or the MMU TT (SMmmutt[]) size is not adequate. This is a critical error because the processor will not function in the operating system for distributed switching (OSDS) environment without the MMU TT being properly initialized. This probably represents a problem of some sort with the disk image, as the MMU TT initialization is independent of actual memory use and equipage. The SM will not be permitted to successfully initialize until this problem is fixed.

3. SM2MH_CMER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The switching module processor (SMP) failed to send maintenance message using OSSENDMH() to a message handler (MH) during mate module controller/time slot interchange (MCTSI) restoration. The failure was due either to

- (1) the MH number is out of range,
- (2) the MH is unequipped or
- (3) the size of the message being sent exceed the maximum supported text size for standard messages.

Action:

No action is required; the restoration gets aborted and the mate MCTSI is automatically removed from service. If the MH number is out of range then the office-dependent data (ODD) is broken, and needs to be fixed by craft or maintenance personnel.

4. SM2MH_HSHE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The switching module processor (SMP) failed to send maintenance message using OSSENDMH() to a message

handler (MH) during routine hashsum checking.

Probable Cause:

The failure was due either to (1) the MH number is out of range, (2) the MH is unequipped or (3) the size of the message being sent exceeds the maximum supported text size for standard messages.

Action:

No action is required; hashsum checking for this MH is aborted. If the assert occurs regularly the ODD should be checked by maintenance personnel.

5. SMABTREQ (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: SMXRF	Audit Mode: elev

Problem:

A craft request to abort a maintenance request administrator (MRA) process calls this assert. The assert should purge the process indicated in the third parameter and return to the calling program.

6. SMACTFLD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was found in the action option field.

7. SMACTSPRFL (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

RLACTSPR read failure in SMchkspr() for ISLU2 sparing.

8. SMALLNOTDONE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the SMhwck() function, the inhibit or allow of all processing was not completed. An invalid return was received from the SMiainh() or SMiaallpr() function.

9. SMASDFRA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default case in a switch statement was encountered; an invalid recovery action was passed to the SMprdfra() function.

10. SMATDISERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Automatic timeslot switching (AUTISS) was disabled in this SM when it should have been enabled.

11. SMATENERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Automatic timeslot switching (AUTISS) was enabled in this SM when it should have been disabled.

12. SMATHWCONFIG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Automatic timeslot switching (AUTISS) fault recovery (FR) found an error in the timeslot interchange (TSI) data or timing selects.

13. SMATONLD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic timeslot switching (AUTISS) online functional check encountered an unstable condition.

14. SMATRMVTSI (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Online checking of the automatic timeslot switching (AUTISS) circuits found a problem. AUTISS fault recovery will remove a module controller/timeslot interchange (MCTSI) side if the error could be associated with a single MCTSI side. If both MCTSI sides have the same error, no automatic fault recovery action will occur.

15. SMATRMVTSI (5E11 to 5E13)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A module controller/timeslot interchange (MCTSI) was removed by automatic timeslot switching (AUTISS) fault recovery.

16. SMAUTOINHERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the SMhwck() function, the data delivery bits DDRAHWCK and DDRMHWCK are in an invalid state during an automatic inhibit of all hardware error checks.

17. SMBAD1DBRET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Bad database return due to database OR data problem. This assert is used to flag an internal error and dump data so that the cause of the error can be investigated by local field support and a software developer.

Action:

Notify local field support of this problem so that it can be investigated and corrected. No other corrective actions can be taken asserts time.

18. SMBAD2DBRET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Bad database return due to database OR data problem. This assert is used to flag an internal error and dump data so that the cause of the error can be investigated by local field support and a software developer.

Action:

Notify local field support of this problem so that it can be investigated and corrected. No other corrective actions can be taken at this time.

19. SMBAD3DBRET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Bad database return due to database OR data problem. This assert is used to flag an internal error and dump data so that the cause of the error can be investigated by local field support and a software developer.

Action:

Notify local field support of this problem so that it can be investigated and corrected. No other corrective actions can be taken at this time.

20. SMBADACT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMprcount() function received an invalid action parameter.

21. SMBADCISCAN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Control interface (CI) scan sent a data value to digital carrier line unit (DCLU) peripheral fault recovery (PFR) that is not used. The data sent was "DFNULL (=0)" which indicates an internal digital facility interface (DFI) inconsistency.

22. SMBADDBRET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Bad database (DB) return in function SMprms.

23. SMBAD_DX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

SMpebuf_num() or SMparbuf() was called with an out-of-range DX number. The function returned early and took no actions.

24. SMBADECPICMD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid enhanced central processor intervention (ECPI) command was received.

25. SMBAD_ENTRY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The function SMparbuf() was called with an out-of-range entry number to read from the parity error buffer. SMparbuf() will return without reading the buffer.

26. SMBADFLTTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid fault type was passed to a switch maintenance for the SM (SMIM) unit-dependent fault recovery function.

27. SMBADFUMODE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The central processor intervention (CPI) polling process has received a request to begin a time multiplexed switch (TMS) fabric update. However, the portion of the message identifying the network link interface (NLI) sublinks that are to be updated is invalid. This is an informational assert, the fabric update will proceed as if both sublinks were requested.

28. SMBADHWCGIMG (5E12 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The initialization time check on SMhwcg_img table fail.

Probable Cause:

Missing entry found in SMhwcg_img array.

Action:

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual and contact the next level of support with collected data.

29. SMBADHWCGMXCH (5E12 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The initialization time check on SMhwcg_mxch table fail.

Probable Cause:

Missing entry found in SMhwcg_mxch array.

Action:

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual and contact the next level of support with collected data.

30. SMBADINPUT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A peripheral fault recovery function received invalid input information.

31. SMBADMCSTATE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid hardware state for the module controller/time slot interchange (MCTSI) was detected.

- If the asserting function is SMmtckact(), the module processor update bus was found to be enabled while the MCTSIs were simplex. Prior to asserting, the update bus was turned off.

- If the asserting function is SMfr_mctsi(), SMswtch(), or SMstby_sw(), the reset counter was found to be nonzero when it should be zero. Prior to asserting, the reset counter was zeroed.

32. SMBADMRA_ACK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMcpipol() function received an invalid message type in a reply message from the maintenance request administrator (MRA). The SMcpipol() function requests switch actions based on central processor intervention (CPI) information.

33. SMBADMSGTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The peripheral fault recovery system process received a message with an invalid message type. The message is printed with the assert history data.

34. SMBADPAR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Bad parameter was passed to switch maintenance for the switching module (SMIM) integrated services line unit (ISLU) code.

35. SMBADQPIPEODD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to assign or unassign a quad-link packet switch (QLPS) message handler pipe failed.

Probable Cause:

The network 0 and network 1 message handler pipes for a given SM were not assigned or unassigned consecutively. Refer to 235-105-210, Routine Operations and Maintenance Procedures, for information on the growth and degrowth of QLPS message handler (MH) pipes.

Action:

Continue with the assignment or unassignment of the mate-network pipe of the last endpoint successfully entered.

36. SMBAD RDFI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid remote digital facility interface (RDFI) was passed to the SMrcrmv() function from the SMrdfrmv() function in the file smim/SMrsmrli/SMrsmmra.c. This code removes a control channel-carrying RDFI. Also RDFI RMV will fail with an "INTERNAL DATA TROUBLE" indication.

37. SMBAD SDFISEL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A control order failure occurred when accessing a subscriber digital facility interface (S-DFI). The S-DFI that was indicated is invalid.

38. SMBAD_SP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid signal processor (SP) number was passed either to SMiaspf() (the first parameter) or SMmcrf_spff() (the data register %d3). Either it was out of range or the time slot interchanger (TSI) board corresponding to the absolute SP number was not operational. Neither function modified any registers.

39. SMBADSPUSE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

SMck_use() has encountered a type of time slot interchanger (TSI) link that it does not recognize or support. The supported link usages are as follows:

VALUE	ENUM	USE
0	TS_NO_TSI	no equipped TSI (time slot interchanger) board
1	TS_UNEQ	unequipped TSI links
2	TS_NLI	NLI (network link interface)
3	TS_DX	DX (data expansion)
4	TS_MCP	MCP (messaging, central processor intervention, and pump)

Probable Cause:

Software has not been updated to support a new TSI link type or corrupted data in the PClnk2use[] global array.

Action:

Verify the usage of the TSI links and correct as necessary. First determine the bad usage value. The TSI link number provided in the assert can be used as a key to the RLLNK_USE relation and to index into the PClnk2use[] array. The steps to resolve this problem are: sp 1) If value of the 'use' attribute in RLLNK_USE for this TSI link is not in db/DMlnk_use.h, then the database was corrupted somehow and must be corrected, probably using ODBE.

2) If the usage is not one of those listed above as a supported use then the problem is missing software and technical assistance is required.

3) Dump the contents of PClnk2use[] for that link and verify that it matches the contents of RLLNK_USE for that link. If it does not match, then PClnk2use[] has been corrupted and must be corrected by overwriting it, because the software cannot normally write to that data.

40. SMBADTIMER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A timer was received by a switch maintenance for the SM (SMIM) process, but the timer did not belong to that process (as determined by the timer's "tag").

41. SMBADTRCU3SU (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected error occurred when attempting to set up the path from the timeslot interchanger (TSI) to a transmission rate converter unit model 3 (TRCU3).

Probable Cause:

Possible stack corruption or a software error.

Action:

If this assert only occurs once, then it was apparently caused by a stack corruption problem that has since been repaired. If it occurs repeatedly, provide data to next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

42. SMBADUNIT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid unit type was found. Invalid data may have been passed, or an invalid hardware address may have been accessed by previous software.

43. SMBADUTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid unit type was encountered on a database (DB) return from the RLCKTDATA relation.

44. SMBDCAST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A mismatch has been found and corrected between the state of the processor's external cache hardware and it's associated software.

Probable Cause:

Software bug.

Action:

None

45. SMBDLNKGPR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMddlehdr() function passed an invalid link group number.

46. SMBDSHLFDTBL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ICR and/or SCCP data tables were not pumped for all CCS PH3s and higher for which the Sldatpstat array was set due to the data table not being ready at the time of the shelf restoration. A dump of Sldatpstat[] is included for analysis. All these PHs have their data in a degraded state. This problem needs investigation since it can result in a C7 outage due to missing ICR tables and no global title translation will be possible due to missing SCCP tables on the global SM.

47. SMBGNTRN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database (DB) begin transaction failure occurred in the operating system for distributed switching in the AM (OSDS-C).

48. SMBGSELMT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The network link interface (NLI) background select check audit [SMnl_ifsel_chk()] has found one or more NLIs or peripheral link interfaces (PLIs) that have either been taking control from the non-active module controller/time slot interchange (MCTSI) or that had to have their selects programmed incorrectly (inverted) to prevent them from taking control from the non-active MCTSI. The error observed indicates that the non-active MCTSI is outputting the incorrect select signal to the NLI/PLI(s). This error has been present for at least five minutes and the NLI/PLI has remained error-free for that time; however, this does represent a latent error that could surface if the standby MCTSI were removed from service. Therefore, the standby MCTSI will be removed from service, if the MCTSIs are currently duplex, and scheduled to be conditionally restored.

In conjunction with this assert, the SMnl_bgtab_indx array will be dumped to indicate the particular error that was observed and the SMnl_esrs array will also be dumped to identify the NLIs/PLIs' select lead settings.

Action:

None. The MCTSI has been scheduled for diagnostics which should fail. Fix the problem by replacing the packs on the diagnostic's trouble locating procedure (TLP) list. If the MCTSIs are simplex (and the diagnostic was therefore not run), this assert was to identify that a problem has been observed. The NLI/PLI is currently error-free so no action is required.

49. SMBGSELMT (5E11 only)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The network link interface (NLI) background select check audit [SMnl_ifsel_chk()] has found one (or more) NLI(s) that have either been taking control from the non-active module controller/time slot interchange (MCTSI) or that had to have their selects programmed incorrectly to prevent them from taking control from the non-active MCTSI. The error observed indicates that the non-active MCTSI is outputting the incorrect select signal to the NLI(s). This error has been present for at least five minutes and the NLI has remained error-free for that time; however, this does represent a latent error that could surface if the standby MCTSI were removed from service. Therefore, the standby

MCTSI will be removed from service, if the MCTSIs are currently duplex, and scheduled to be conditionally restored.

In conjunction with this assert, the SMnl_bgtab_idx array will be dumped to indicate the particular error that was observed and the SMnl_esrs array will also be dumped to identify the NLIs' select lead settings.

Action:

None. The MCTSI has been scheduled for diagnostics which should fail. Fix the problem by replacing the packs on the diagnostic's trouble locating procedure (TLP) list. If the MCTSIs are simplex (and the diagnostic was therefore not run), this assert has to identify that a problem has been observed. The NLI is currently error-free so no action is required.

50. SMBGSELNLI (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The network link interface/peripheral link interface (NLI/PLI) background select check audit [SMnl_ifsel_chk()] has found one or more NLIs/PLIs that have either been taking control from the non-active module controller/time slot interchange 9MCTSI) or that had to have their selects programmed incorrectly (inverted) to prevent them from taking control from the non-active MCTSI. This error has been present for at least five minutes and the NLI/PLI has remained error-free for that time; however, this does represent a latent error that could surface if the MCTSIs were simplexed. Therefore, the faulty NLI (only one if multiple errors were found) or peripheral associated with the faulty PLI will be removed from service and scheduled to be conditionally restored.

In conjunction with this assert, the SMnl_bgtab_idx array will be dumped to indicate the particular error that was observed and the SMnl_esrs array will also be dumped to identify the NLIs/PLIs' select lead settings.

Action:

None. The NLI/peripheral associated with the PLI has been scheduled for diagnostics which should fail. Fix the problem by replacing the packs on the diagnostic's trouble locating procedure (TLP) list.

51. SMBGSELNLI (5E11 only)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The network link interface (NLI) background select check audit [SMnl_ifsel_chk()] has found one (or more) NLI(s) that have either been taking control from the non-active module controller/time slot interchange (MCTSI) or that had to have their selects programmed incorrectly to prevent them from taking control from the non-active MCTSI. This error has been present for at least five minutes and the NLI has remained error-free for that time; however, this does represent a latent error that could surface if the MCTSIs were simplexed. Therefore, the NLI (only one if multiple errors were found) will be removed from service and scheduled to be conditionally restored.

In conjunction with this assert, the SMnl_bgtab_idx array will be dumped to indicate the particular error that was observed and the SMnl_esrs array will also be dumped to identify the NLIs' select lead settings.

Action:

None. The NLI has been scheduled for diagnostics which should fail. Fix the problem by replacing the packs on the diagnostic's trouble locating procedure (TLP) list.

52. SMBGSELOC (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The network link interface (NLI) background select check audit [SMnl_ifsel_chk()] has found one or more NLIs or

peripheral link interfaces (PLIs) that have either been taking control from the non-active module controller/time slot interchange (MCTSI) or that had to have their selects programmed incorrectly (inverted) to prevent them from taking control from the non-active MCTSI. The error observed indicates that the active MCTSI is outputting the incorrect select signal to the NLI(s). This error has been present for at least five minutes and the NLI/PLI has remained error-free for that time; however, this does represent a latent error that could surface if the standby MCTSI were removed from service. Therefore, the active MCTSI will be removed from service, if the MCTSIs are currently duplex, and scheduled to be conditionally restored.

In conjunction with this assert, the SMnl_bgtab_idx array will be dumped to indicate the particular error that was observed and the SMnl_esrs array will also be dumped to identify the NLIs/PLIs' select lead settings.

Action:

None. The MCTSI has been scheduled for diagnostics which should fail. Fix the problem by replacing the packs on the diagnostic's trouble locating procedure (TLP) list. If the MCTSIs are simplex (and the diagnostic was therefore not run), this assert has to identify that a problem has been observed. The NLI/PLI is currently error-free so no action is required.

53. SMBGSELOC (5E11 only)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The network link interface (NLI) background select check audit [SMnl_ifsel_chk()] has found one (or more) NLI(s) that have either been taking control from the non-active module controller/time slot interchange (MCTSI) or that had to have their selects programmed incorrectly to prevent them from taking control from the non-active MCTSI. The error observed indicates that the active MCTSI is outputting the incorrect select signal to the NLI(s). This error has been present for at least five minutes and the NLI has remained error-free for that time; however, this does represent a latent error that could surface if the standby MCTSI were removed from service. Therefore, the active MCTSI will be removed from service, if the MCTSIs are currently duplex, and scheduled to be conditionally restored.

In conjunction with this assert, the SMnl_bgtab_idx array will be dumped to indicate the particular error that was observed and the SMnl_esrs array will also be dumped to identify the NLIs' select lead settings.

Action:

None. The MCTSI has been scheduled for diagnostics which should fail. Fix the problem by replacing the packs on the diagnostic's trouble locating procedure (TLP) list. If the MCTSIs are simplex (and the diagnostic was therefore not run), this assert has to identify that a problem has been observed. The NLI is currently error-free so no action is required.

54. SMCANTSEND (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSENDMSG() macro failed to send a central processor intervention (CPI) generated module processor soft switch request from the SMcpipol() function to the maintenance request administrator (MRA).

55. SMC_CMRLMAP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The inter-remote SM (RSM) communication links (ICL) link map is inconsistent with CM/ICC protocol.

56. SMC_DBCDFI_MAP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMrsmcdfh() process or the SMdfi() function E bit fault recovery code could not read an rLCDFI_MAP tuple.

57. SMC_DBCLIDAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMrsmcdfh() process could not read an rCLIDAT tuple.

58. SMC_DBMATATT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMrsmcdfh() process or the SMdfi() function E bit fault recovery code could not read an rIMATATT tuple.

59. SMC_DBSMEST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMrsmcdfh() process could not read an rISMEST tuple.

60. SMC_DBWSMEST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMrsmcdfh() process could not update an rISMEST tuple.

61. SMC_DDERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was returned from a data delivery primitive call in the communication link digital facility interface handler (CDFH) system process.

62. SMCDFIMAP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the RLCDFI_MAP relation in the SMiainit() function.

63. SMC_EVDDL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid event type was passed to the SMddlevent() function.

64. SMCHDBRSM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CHDB	Audit Mode: elev

Problem:

The channel data block (CHDB) for one of the remote SM (RSM) communication links is in error. The CHDB is being used by another user, but its process control block link area (PCBLA) is invalid. The CHDB is dumped to help find the cause of the problem, and the CHDB audit is scheduled to correct the problem.

65. SMCIERT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid control interface (CI) error type was returned from the SMprconvt() function. Module control unit fault recovery passed a message with invalid data to peripheral fault recovery. The message is printed in the assert history data.

66. SMC_INITREA (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication link digital facility interface handler (CDFH) system process entry reason was undefined. The process was purged.

67. SMCKTDATFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The return from reading the RLCKTDATA relation via the DBfrdtup() function is DBNO_MATCH. The relation may have been accessed with an invalid circuit name.

68. SMCKTINDXNM (5E11 only)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A switch maintenance in the switching module (SMIM) database (DB) read macro returned a DBNO_MATCH when a valid circuit index was expected.

69. SMCKT_NAMENM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A switch maintenance in the switching module (SMIM) database (DB) read macro returned a DBNO_MATCH when a valid circuit name was expected.

70. SMCKTNUMNM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A switch maintenance in the switching module (SMIM) (DB) read macro returned a DBNO_MATCH when a valid unit or service group number was expected.

71. SMCKTRCLK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was found between the RLCKTDATA relation and the remote clock global parameters.

Data Structures:

RLCKTDATA.

Action:

The circuit, ckttype, and the two expected circuit names are dumped. This information will be used to correct the inconsistency in the RLCKTDATA relation.

72. SMCLER10 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

SM-2000 switching module processor (SMP) resident communication link fault recovery (CLFR) detected an inconsistency between it's version of the number of active communication links (CLNKs) and the message handler's (MH's) version. The MH version is assumed to be correct. The message from the MH is dumped, along with the SMP global variable SMno_links.

73. SMCLER11 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Before processing a communication link (CLNK) request, the CLSP system process audits the maintenance busy/idle status of units in SMmccustat[]. It found a unit that was incorrectly left "busy" by CLSP. The unit's SMmccustat[] entry will be marked "idle".

74. SMCLER12 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication link (CLNK) error handler in an SM-2000 switching module processor (SMP) was called with an invalid error type.

75. SMCLERR1 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid link ID was encountered in the AM link configuration request.

76. SMCLERR2 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: SMXRF	Audit Mode: elev

Problem:

There was a request from the AM to remove a link. The link status changed due to communication link (CLNK) fault recovery while messages queued for the link were being transmitted. The link was not removed. The SMmccustat[] array entry for the link is dumped.

77. SMCLERR3 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The AM told the SM to remove the last link. The link was not removed. This is a race condition. To remove the last link, a special message is needed to isolate the SM.

78. SMCLERR4 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The AM requested the start of a third link.

79. SMCLERR5 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid link map was encountered in the SM.

80. SMCLERR6 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

SM-2000 switching module processor (SMP) resident communication link fault recovery (CLFR) either could not send a maintenance (MTCE) message to the message handler (MH) or received a failure response from the MH for an SMP-specified action.

81. SMCLERR7 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication link fault recovery (CLFR) primitive SMdet_lk() was passed an illegal communication link (CLNK) identifier in an SM-2000 switching module processor (SMP). This problem is caused by a software coding error.

82. SMCLERR8 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CLSP system process was unable to obtain an operating system for distributed switching (OSDS) cyclic timer during process initialization. CLSP will try again each time it receives a message, until OSDS is able to successfully allocate a timer.

83. SMCLERR9 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

SM-2000 switching module processor (SMP) resident communication link fault recovery (CLFR) received an invalid message type or action. The invalid message is dumped.

84. SMCLERROR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Communication link fault recovery detected an inconsistency in the link status. Both links are placed in a known state and restarted.

85. SMCLIDATDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the RLCLIDAT relation in the SMrmclsep() function.

86. SMC_LLATAB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The low level access (LLA) state table was corrupted in the communication link digital facility interface handler (CDFH) system process.

87. SMCLNKNUMINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The number of ACTIVE CLNKS is greater than the acceptable maximum value of 2.

Probable Cause:

The variable containing the CLNK count has become corrupted.

Action:

Provide data to the next level of support.

88. SMCNBSTE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMprcount() function found an invalid state in the bas_stat field of an rSMEST tuple.

89. SMCNDB0 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message primitive error occurred.

90. SMCNDB1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMprcount() function received an invalid return code from the DAclckterr() function when accessing the RLSMPERBLK relation.

91. SMCNDB2 (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

There has been an error detected within the SMmcustat array. One of the TMSLNKs is OOS while the parent RLIs are ACT/STBY. This state should not be allowed to persist because it may cause calls to be unnecessarily blocked. The OOS TMSLNK will be updated to active and the parent RLI will be removed and diagnosed.

92. SMCNDB2 (5E11 to 5E12)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Currently unused.

93. SMCNDB3 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMprcount() function received an invalid return code from the DAfndckter() or DAfndert() function when accessing the RLSMPERBLK relation.

94. SMCNDB4 (5E11 only)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMprcount() function received an invalid return code from the DBfrdtup() function when accessing the RLSMEST relation.

95. SMC_NRCLMAP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A remote communication link (RCL) is marked active in the RLSMEST relation, but it is not in the remote SM (RSM) communication links (ICL) link map.

96. SMC_OSDSRET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication link digital facility interface handler (CDFH) system process received an unexpected return value from the OSWGETMSG() macro.

97. SMCPIDDWRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A DDWRITE() macro request failed.

98. SMCRBEND (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A request was made to end a critical region when the user did not have one in effect. Another user had a region in effect, or no users had one. The data concerning a possible existing critical region (who had one and what kind it was) is dumped.

99. SMC_RCLMAP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A remote communication link (RCL) and/or communication facility (CFAC) are marked out of service (OOS) in the RLSMEST relation, but they are listed in the remote SM (RSM) communication links (ICL) link map.

100. SMCRCLOB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The global data that indicates the critical region status contained an illegal value.

101. SMCRCOUNT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A request to begin a second critical region was received while a critical region was already in force. Critical region data may be corrupted.

102. SMCREATE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An OSCREATE() macro failure message was encountered.

103. SMCRELEV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid level parameter was passed to the critical region function SMcrbegin() or SMcrend().

104. SMCRFORE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to enter a critical region from foreground. This is not allowed.

105. SMCRLEVEL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid level parameter was passed to the critical region function SMcrbegin() or SMcrend().

106. SMCRNOBEG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The critical region end routine SMcrend() was called when no critical region was in force. Data the SMcrdata[] global array may have been corrupted.

107. SMCRNULK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to enter a critical region using the null identifier. This is not allowed.

108. SMC_SRC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid source field was passed to a function in the communication link digital facility interface handler (CDFH) system process.

109. SMC_TIMER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A problem with a low level access (LLA) entry timer was encountered in the communication link digital facility interface handler (CDFH) system process.

110. SMC_UNKMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown message was received by the communication link digital facility interface handler (CDFH) system process.

111. SMDBADERRTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMddlehdr() function received an invalid error type. Derived data links (DDL) error types are reported by the XPC-8 device on a remote communication link (RCL).

112. SMDBFLT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from the DBfrdtup() function when accessing the RLCKTDATA relation.

113. SMDBFLT1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database access error occurred via the DBfrdtup() function in the SMtusa_cont() function. The returned value is corrupted.

114. SMDBFLT2 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database access error occurred via the DBfrdtup() function in the SMtusa_cont() function. The returned value is corrupted.

115. SMDBFLT3 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database (DB) access error occurred while trying to read relation rISMPSU.

Probable Cause:

DB may be corrupted.

Action:

Provide data to next level of support.

116. SMDBFLT4 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database (DB) access error occurred while trying to read relation rIPSULNK.

Probable Cause:

DB may be corrupted.

Action:

Provide data to next level of support.

117. SMDBFLT5 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database (DB) access error occurred while trying to read relation rICKTLNK.

Probable Cause:

DB may be corrupted.

Action:

Provide data to next level of support.

118. SMDBFLT6 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBfrdtup failed with reason other than tuple not found.

Probable Cause:

The database (DB) may be corrupted.

Action:

Provide data to next level of support.

119. SMD5BP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid parameter was passed to the switch maintenance for the SM (SMIM) digital carrier line unit - 5 (DCLU-5) code.

120. SMD5RLSTI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid or inconsistent data was found in the digital carrier line unit-5 (DCLU-5) relation RLSTI. The RLSTI relation details the hardware configuration associated with a DCLU-5 switching transmission interface (STI). There must be RLSTI tuples present for both STI halves for each RLCKTDATA STI entry. This problem was caused by incorrect population of the RLSTI and/or RLCKTDATA relations for the STI circuit name specified.

Data Structures:

RLSTI, RLCKTDATA.

The SM number and the STI circuit name are printed. The STI circuit name breaks down as follows: bits 0-3 are the STI number, bit 4 is unused, bits 5-7 are the DCLU-5 number, bits 8-11 are unused, and bits 12-15 are the STI circuit identifier (0x6000).

Action:

The RLSTI relation can be changed through RC/V View DCLU-5 - STIU. Both attributes (RT and digroup for each STI half) must be provided for each STI present in the RLCKTDATA relation.

121. SMD5TIDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was found between the digital carrier line unit-5 (DCLU-5) transmission interface data bus (TIDB) status table and the associated switching transmission interface (STI) status information. The TIDB status table is a data table used by the DCLU-5 to track the operational state of each TIDB (digroup) associated with a DCLU-5 STI.

The STI status information is obtained from the switch maintenance equipment status table (SMEST) using the circuit name specified. This inconsistency is a result of an incorrect initialization or update of the TIDB status table.

Data Structures:

The SM number and the STI circuit name are printed. The STI circuit name breaks down as follows: bits 0-3 are the STI number, bit 4 is unused, bits 5-7 is the DCLU-5 number, bits 8-11 are unused, and bits 12-15 are the STI circuit identifier (0x6000).

Action:

To recover the TIDB status information for an STI, the STI should be restored to service (RST:DCLU5STI). This action will affect any call traffic in progress on the STI.

122. SMDCCOUNT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal or unexpected return code was received as a result of a call to the SMprcount() function to increment a directly connected test unit (DCTU) count. Recovery consists of ignoring the original error report.

123. SMDCERTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An incoming error message identifying a directly connected test unit (DCTU) fault had an illegal or unexpected error type. Recovery consists of ignoring the message. The message may be corrupted.

124. SMDCILRCVY (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal or unexpected recovery action was detected. Recovery consists of ignoring the original error message.

125. SMDCLFRBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Indexing into the SMs96sgsw() function fault recovery table produced an undefined action.

126. SMDCLIRQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The maintenance request administrator (MRA) tried to take both digital carrier line unit (DCLU) service groups out of service (OOS).

127. SMDCLNOCC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The maintenance request administrator (MRA) passed an invalid circuit name parameter to the SMs96sgsw() routine.

128. SMDCLPARM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The maintenance request administrator (MRA) passed an invalid state parameter to the SMs96sgsw() routine.

129. SMDCLPICB (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the peripheral interface control bus data relation (RLPICB).

Probable Cause:

This indicates an error in the setting of the keys used to read the RLPICB relation, or the tuple is missing from the RLPICB relation.

Action:

Use ODBE or RC/V to crosscheck the data set for the keys in the relation with the actual key used to access the relation. The actual key used is one byte long and will be printed out as supplementary data for this assert.

130. SMDCLRSMEST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

The DBfrdtup() function returned DBNO_MATCH when reading the RLSMEST relation from the SMs96sgsw() function.

131. SMDCLU1PFR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMdclpdba() function was called with an out of range parameter. The list parameter should be 0 or 1.

132. SMDCLUBASE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BASE	Audit Mode: elev

Problem:

The DBfuptup() function returned DBNO_MATCH when updating the RLS96BASE relation from the SMs96sgsw() function.

133. SMDCLUICT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was detected between the RLPICB and RLCKTDATA relations for a digital carrier line unit (DCLU).

Data Structures:

RLPICB, RLCKTDATA.

Action:

Fault recovery received a message indicating that a problem was reported on a DCLU peripheral interface control bus (PICB); that is, the unit type in the rPICB tuple is SMDCLU. However, the rLCKTDATA tuple for the circuit name does not have a DCLU circuit type (PCDCLCC, PCDCLM1DFI, or PCDCLM2DFI). The RLPICB relation or the RLCKTDATA relation needs to be changed to make things consistent.

134. SMDDL_SEND (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the RLCKTDATA relation before sending a derived data link (DDL) message over a digital facility interface (DFI).

135. SMDDRDHWCK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the SMhwck() function, the hardware checks (HWCK) system process received an unsuccessful return from the DDread() function.

136. SMDDWTHWCK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the SMhwck() function, the hardware checks (HWCK) system process received an unsuccessful return from the DDwrite() function.

137. SMDEBUG1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert is a general debugging report-only assert. It is designed to be used by developers needing to flag code execution. In general, this assert should not be seen at any time unless a temporary debugging software update has been applied. Any other occurrence of this assert at any time should be reported to and investigated by a switch maintenance engineer.

138. SMDEBUG2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert is a general debugging report-only assert. It is designed to be used by developers needing to flag code execution and print out data. In general, this assert should not be seen at any time unless a temporary debugging software update has been applied. Any other occurrence of this assert at any time should be reported to and investigated by a switch maintenance engineer.

139. SMDFQOSCHK (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default case in a switch statement was encountered; an invalid verb was passed to SMpsqoschk() function.

140. SMDFUNLKTS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data fanout (DF) in the packet switch unit (PSU) detected invalid parity on one or more timeslots, but no owner was found for those timeslots (no entry exists in the RLPTSB relation). The data dumped is a set of shorts; the first is the event number of the parity error, the second is the number of valid entries in the dump, and the rest are the failing timeslots.

141. SMDLDSL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

There are fewer datalinks of a particular type in the protected relation RLDLDSL than implied by the corresponding global parameter.

Data Structures:

RLDLDSL.

Action:

This problem is related to the use of the master control center (MCC) display page for datalinks (page 147YYZ,X where X is the SM number, YY is the datalink type, and Z is the screen number). The ROP will report the number of datalink tuples of a certain type found in the RLDLDSL relation on the SM. The ROP will also provide the global parameter name and value that disagrees with the rIDLDSL tuple count.

Use ODBE to investigate the RLDLDSL relation in the SM and in the CMP. If the SM and CMP relations agree with respect to the datalink tuples for the SM involved, then the global parameter is likely incorrect and should be corrected using ODBE. If the SM and CMP RLDLDSL relations are inconsistent, consult your next level of support prior to taking corrective action.

142. SMDPAMSEND (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The code in the AM that processes and administers the *SLC*[®] remote terminal (RT) alarm distribute points could not send a message to an SM. A parameter was incorrect or the message was too large. This coding error must be corrected before the AM can properly administer the *SLC*[®] alarm distribute points.

143. SMDPBCAST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The AM code that gathers information about the *SLC*[®] alarms (for administering the distribute points) could not create the broadcast job for collecting information from the SMs about the *SLC*[®] alarms that are active. This coding error should be fixed to ensure proper administration of the *SLC*[®] alarm distribute points. The return will be in the stack frame.

144. SMDPCREATE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The code in the AM that administers the *SLC*[®] alarm distribute points attempted to create a terminal process, but failed because of a non-resource problem. This coding problem should be remedied so that the *SLC*[®] alarm distribute points will be administered correctly.

145. SMDPDDFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to set the data delivery (DD) key that tells the SMs that this office is using the *SLC*[®] alarm distribute point feature. The distribute points will not be administered until this problem is corrected, because the SMs do not know to send the alarm information to the AM, where the distribute points are administered.

Data Structures:
RLISLC_ALM.

Action:

If the office is not using the SLC[®] alarm distribute point feature, then all tuples in the RLISLC_ALM relation in the AM should be deleted. Otherwise, the problem in DD must be resolved. Once it is resolved, purge (INIT:AM,OKP,SPP,PID=x) the SMC0 process (pid=40) in the AM to get the DD key into the proper state.

146. SMDPMISSING (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Distribute point information was missing for SLC[®] alarms.

Data Structures:
RLMTBS96, RLISLC_ALM.

Action:

The printout specifies whether the RLMTBS96 or RLISLC_ALM AM relation is in error. If relation RLMTBS96 is in error, the distribute point for the remote terminal (RT) specified is missing. Use RC/V View 18.10 (REMOTE TERMINAL ASSIGNMENT) to enter the distribute point for digital carrier line unit (DCLU) terminated RTs (field "SLC ID DP"), use RC/V View 18.15 (REMOTE TERMINAL) to enter the distribute point for integrated digital carrier unit (IDCU) terminated RTs (field "RT ID DPN"), or use ODBE to insert an RLMTBS96 tuple (the distribute point name will be in attribute sid_dp).

If the problem is in the RLISLC_ALM relation, one of the alarm types/locations does not have a distribute point assigned to it. Use RC/V View 18.14 (REMOTE TERMINAL ALARM TYPE ASSIGNMENT) to enter the appropriate distribute point for the alarm type/location specified. If this office does not want to use this feature, delete all RLISLC_ALM tuples by deleting RC/V View 18.14.

147. SMDPSMSEND (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The code in the SM that gathers SLC[®] remote terminal (RT) alarm information (for the administration of alarm distribute points) could not send a message to the AM. A parameter was incorrect or the message was too large. This coding error must be fixed before the SM will be able to send this message to the AM.

148. SMDPTIMER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A timer was requested by the AM code that administers the clearing of SLC[®] alarm distribute points, but the timer function failed for reasons other than lack of resources. Something is wrong with the use of the timer function; this error should be fixed to ensure that the SLC[®] alarm distribute points are always in synch. The failure code from the timer primitive is dumped.

149. SMDPTPSEND (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The code in the AM that creates a terminal process to clear the SLC[®] remote terminal (RT) alarm distribute points,

was unable to send a message to the terminal process. An incorrect parameter was used or a message was too large. This coding error must be corrected before the AM can automatically clear the *SLC*[®] alarm summary distribute points.

150. SMDPUPDFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The code in the AM could not communicate with the SM in which the *SLC*[®] alarm distribute points reside because of a lack of resources or communication was down to the SM. The lights representing the integrated *SLC*[®] alarms are probably out of synch for the particular remote terminal (RT).

Action:

Verify that the AM is in communication with both the SM containing the distribute points and the SM containing the RT, and that the AM and the SMs are not in overload (both SM numbers are in the assert message, the SM number for the RT is the first number after "LRT="). The RT identity is provided in the printout. Enter the command `OP:S96,LRT=a-b-c` for that RT, which will cause the distribute points for that RT to be reprocessed and brought back into synch.

151. SMDPWAIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The AM code that gathers information about *SLC*[®] alarms (for administering the distribute points) received a failure while waiting for the message from the broadcast job that was gathering information from the SMs. An invalid parameter was used or the received message was too large. This coding error should be fixed to ensure proper administration of the *SLC*[®] alarm distribute points.

152. SMDPWRONG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal distribute point name was found for a *SLC*[®] alarm. The name was bitwise ANDed with 0xf000 and was not equal to 0xe000.

Data Structures:

RLMTBS96, RLISLC_ALM.

Action:

For the RLMTBS96 relation, use RC/V View 18.10 (REMOTE TERMINAL ASSIGNMENT) to correct the distribute point name (field "SLC ID DP"). The remote terminal (RT) identity is provided in the ROP message. (If necessary, use ODBE to fix the sid_dp attribute, the key to the RLMTBS96 relation is provided in the ROP message.)

For the RLISLC_ALM relation, use RC/V View 18.14 (REMOTE TERMINAL ALARM TYPE ASSIGNMENT) to correct the distribute point name. (If necessary, use ODBE to correct the attribute in the RLISLC_ALM relation, the key is 0.)

153. SMDQLNKNUMINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The number of ACTIVE DLNKS is not within the acceptable range of 0 - 2.

Probable Cause:

We may have missed the message for the DQLNK going down or the variable containing the DQLNK count has become corrupted.

Action:

Examine the data produced by the assert to determine the source of the problem. Do not correct the data! Quad-link fault recovery (QLFR) - switching module processor (SMP) system process (QLSP) will correct the data either due to its self auditing mechanism or due to the Integrity Monitor detecting a problem and calling QLSP to correct it.

154. SMDQLSINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DQLNK or QLNK state is invalid.

Probable Cause:

The DQLNK or QLNK state is not being maintained properly by quad-link fault recovery (QLFR) - switching module processor (SMP) system process (QLSP) or the state is being corrupted in memory.

Action:

Examine the data produced by the assert to determine the source of the problem. It is also possible to overwrite the DQLNK or QLNK state array to be valid.

155. SMDS2RCVY (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A digital service unit (DSU) recovery internal error was encountered. An invalid recovery action was found for peripheral interface data bus (PIDB) parity errors.

156. SMDSCOUNT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A digital service unit (DSU) recovery internal error was encountered. The SMprcount() function returned an unexpected error return.

157. SMDSCTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

Digital service unit (DSU) fault recovery received a circuit name that is found in the RLCKTDATA relation, but the circuit type is not handled by DSU fault recovery. High level fault recovery should have sent this circuit to some other portion of fault recovery.

158. SMDSERTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A digital service unit (DSU) recovery internal error was encountered. Error analysis found an illegal low level error

type from source analysis.

159. SMDSILRCVY (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An internal error was encountered in digital service unit (DSU) recovery. Error analysis passed an invalid recovery action to the recovery action module.

160. SMDSNEQIP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Digital service unit (DSU) recovery detected an interrupt on a non-equipped circuit, according to the RLCKTDATA relation.

161. SMDSNODSU (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Digital service unit (DSU) fault recovery tried to read a copy of the RLDSUIMG relation, but the database (DB) subsystem returned the code DBNO_MATCH.

162. SMDSNOPER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

Digital service unit (DSU) fault recovery received a circuit name that is in the RLCKTDATA relation, but is not in an operational state. Interrupts should not be allowed on this circuit.

163. SMDSOOS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Digital service unit (DSU) recovery received an interrupt on an out of service (OOS) circuit.

164. SMDSPDBATY (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

An invalid circuit type was found in the RLCKTDATA relation for a digital service unit (DSU) subtending circuit. This occurred during recovery from a peripheral detected bad address (PDBA) control order failure on the DSU.

165. SMDSTMNAME (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Digital service unit (DSU) recovery detected an invalid internal name that was passed from terminal maintenance (TM) for transmission test function (TTF)-related error reports.

166. SMDSTMTTF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Terminal maintenance (TM) sent an invalid error type for transmission test function (TTF)-related error reports to digital service unit (DSU) recovery. The entire message is printed in the assert history data.

167. SMDSTSI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Digital service unit (DSU) recovery received an invalid time slot interchange (TSI) error type from module control unit fault recovery for local DSU bus parity errors. The entire input message is printed with the assert history data.

168. SMDSTTFSUB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Digital service unit (DSU) recovery found that transmission test function (TTF) subtending circuits are causing faults. These faults should be masked.

169. SMDSUINIT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not insert or update an rIDSUIMG tuple for a digital service unit (DSU). An error exists in the office-dependent data (ODD) dictionary.

Data Structures:

RLCKTDATA, RLDSUIMG.

The first two bytes of the first data dump contain the database (DB) return code. The second data dump contains the associated rLCKTDATA tuple. The third data dump contains the rIDSUIMG tuple to update. Action. Seek assistance from the product engineering control center (PECC). If this problem occurs during retrofit, STOP. ODD must be rebuilt with a compatible version of the DBgen tool.

170. SMDSUTSSR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Digital service unit (DSU) recovery detected invalid data in the digital service circuit common (DSCCOM) time slot select register (TSSR). Masks for parity checking may be wrong.

171. SMELACKFAIL (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ethernet link fault recovery system process (ELSP) received a failure acknowledgement in response to a maintenance request sent to the message handler. Maintenance requests are not expected to fail.

Probable Cause:

Software error or data/message corruption.

Action:

Examine the acknowledgement message dumped by the assert to determine the source of the problem.

172. SMELACKTO (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ethernet link fault recovery system process (ELSP) timed out waiting for an acknowledgement in response to a maintenance request sent to the message handler.

Probable Cause:

Message handler fault, software error, or lost/corrupted message.

Action:

System will execute appropriate corrective action. If the problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual and provide assert data to next level of support.

173. SMELBADIPNUM (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ethernet link fault recovery system process (ELSP) received a message from the message handler (MH) reporting an MELNK address number that is either invalid or inconsistent with the current MELNK status.

Probable Cause:

Software error, SMP/MH inconsistency, or message corruption.

Action:

The system will execute appropriate corrective action. If the problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual and provide assert data to next level of support.

174. SMELBADPTCNT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ethernet link fault recovery system process (ELSP) received an MELNK maintenance message from the message handler containing an in-service port count that is either invalid or inconsistent with the expected value.

Probable Cause:

Software error, lost message, or data/message corruption.

Action:

System will execute appropriate corrective action. If the problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual and provide assert data to next level of support.

175. SMELBADRPTUNIT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A bad unit type was passed to an ELFR function responsible for printing fault recovery output messages.

Probable Cause:
Software error.

Action:

Gather all data generated by the assert and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual to report the problem.

176. SMELDATAINC (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: MELNK	Audit Mode: elev

Problem:

The ethernet link fault recovery system process (ELSP) detected an inconsistency in internal data.

Probable Cause:

Software error or data corruption.

Action:

System will execute appropriate corrective action and the MELNK audit may correct a data problem. If the problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual and provide assert data to next level of support.

177. SMELDBESERV (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert indicates a problem with static data related to ethernet service types. Each MCTSI-based ethernet link (MELNK) on a switching module (SM) has a specific service type defined in the RLENETLINK relation. This data in RLENETLINK should be consistent with global parameters that associate service types with switching modules.

Data Structures:

RLENETLINK, Glprtd, Gleecsm.

Action:

Ensure that appropriate RLENETLINK tuples exist for any service types that the above global parameters indicate are supported by the switching module. Also verify that no rLENETLINK tuples exist for service types that are not supported by the switching module.

178. SMELDBNOMEPIPE (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert indicates an inconsistency between the RLENETPIPE relation [which defines MCTSI-based ethernet pipes (MEPIPEs)] and either the RLENETLINK relation or global parameters that associate ethernet service types with switching modules (SMs). The static data indicates that the SM is equipped with an MCTSI-based ethernet link (MELNK) without a supporting MEPIPE (which should not be possible).

Data Structures:

RLENETPIPE, RLENETLINK, Glprtd, Gleecsm.

Action:

If MELNKs should be supported on the SM, ensure that an appropriate rLENETPIPE tuple exists for the MEPIPE. Otherwise, ensure that the RLENETLINK relation and the above global parameters do not indicate that MELNKs are equipped on the SM.

179. SMELDBOORKEY (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple for an MCTSI-based ethernet link in the RLENETLINK relation contains an invalid value for one of the key attributes ("epipe" or "elnk").

Data Structures:

RLENETLINK.

Action:

Correct the invalid data in the RLENETLINK relation. The keys to the incorrect tuple are dumped by this assert.

180. SMELFMHINIT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ethernet link fault recovery system process (ELSP) received an unexpected return value for an MH initialization request.

Probable Cause:

Software error.

Action:

If problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual and provide assert data to the next level of support.

181. SMELINCREPT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ethernet link fault recovery system process (ELSP) detected an inconsistency in information used to produce MELNK and MEPIPE fault recovery reports.

Probable Cause:

Software error.

Action:

Monitor the status of MEPIPEs and MELNKs to determine whether MELNK functionality has been lost and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual providing assert data to next level of support.

182. SMELINVAURCVY (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A recovery action requested by the MELNK audit (after detection of an MEPIPE or MELNK data problem) is either invalid or unsupported.

Probable Cause:

Software error or message corruption.

Action:

Monitor the status of MEPIPEs and MELNKs to determine whether MELNK functionality has been lost and refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual, providing assert data to next level of support.

183. SMELINVDDTRAN (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: MELNK	Audit Mode: elev

Problem:

The ethernet link fault recovery system process (ELSP) is attempting an invalid or unsupported MELNK state transition. MELNK-based data delivery keys may be inconsistent with MELNK status.

Probable Cause:

Software error or data corruption.

Action:

The system will execute appropriate corrective action and the MELNK audit may correct a data problem. If the problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual and provide assert data to next level of support.

184. SMELINVELNKACT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: MELNK	Audit Mode: elev

Problem:

The ethernet link fault recovery system process (ELSP) detected an in progress MELNK maintenance action that is invalid or inconsistent with the current MELNK state.

Probable Cause:

Software error or data corruption.

Action:

The MELNK audit should correct the problem. However, if the problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual and provide assert data to next level of support.

185. SMELINVELNKST (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: MELNK	Audit Mode: elev

Problem:

An invalid MELNK state was detected by the ethernet link fault recovery system process (ELSP).

Probable Cause:

Software error or data corruption.

Action:

The MELNK audit should correct the problem. However, if the problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual and provide assert data to next level of support.

186. SMELINVEPIPEACT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: MELNK	Audit Mode: elev

Problem:

The ethernet link fault recovery system process (ELSP) detected an in progress MEPIPE maintenance action that is invalid or inconsistent with the current MEPIPE state.

Probable Cause:

Software error or data corruption.

Action:

The MELNK audit should correct the problem. However, if the problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual and provide assert data to next level of support.

187. SMELINVEPIPESERV (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: MELNK	Audit Mode: elev

Problem:

Invalid MEPIPE ethernet service type selected.

Probable Cause:

Software error or data corruption.

Action:

The MELNK audit should correct the problem. However, if the problem persists, provide assert data to the next level of support.

188. SMELINVEPIPEST (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: MELNK	Audit Mode: elev

Problem:

An invalid MEPIPE state (or MEPIPE/MELNK parent/child state combination) was detected by the ethernet link fault recovery system process (ELSP).

Probable Cause:

Software error or data corruption.

Action:

The MELNK audit should correct the problem. However, if the problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual and provide assert data to next level of support.

189. SMELINVEQUIP (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: MELNK	Audit Mode: elev

Problem:

Ethernet link fault recovery software has detected an equipage inconsistency between static and dynamic data for an MCTSI-based ethernet link (MELNK) or MCTSI-based ethernet pipe (MEPIPE). Either static data indicates the MELNK/MEPIPE is equipped and dynamic data indicates it is not, or vice versa.

Probable Cause:

Static and/or dynamic data corruption, or a software error.

Action:

System will execute appropriate corrective action. The MELNK audit may correct a data problem, recovering the MELNK/MEPIPE. If the problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION

section of the Asserts manual, providing assert and audit data to next level of support.

190. SMELINVMELNK (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid MELNK number was detected by the ethernet link fault recovery system process (ELSP).

Probable Cause:

Software error or data/message corruption.

Action:

System will execute appropriate corrective action. If the problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual and provide assert data to next level of support.

191. SMELINVMEPIPE (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid MEPIPE number was detected by the ethernet link fault recovery system process (ELSP).

Probable Cause:

Software error or data/message corruption.

Action:

System will execute appropriate corrective action. If the problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual and provide assert data to next level of support.

192. SMELINVRET (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An ethernet link maintenance or fault recovery function returned a value that was invalid or unexpected for the situation in which the function was invoked.

Probable Cause:

Software error.

Action:

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual and provide assert data to next level of support.

193. SMELINVTO (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: MELNK	Audit Mode: elev

Problem:

The ethernet link fault recovery system process (ELSP) received the expiration of a timer not found in its dynamic data.

Probable Cause:

Software error or data corruption.

Action:

System will execute appropriate corrective action. The MELNK audit may recover a timer and/or dynamic data problem. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual, providing assert and audit data to next level of support.

194. SMELLOSTPTMR (5E13 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The ethernet link fault recovery system process (ELSP) lost its periodic timer.

Probable Cause:

Software error or data corruption.

Action:

System will execute appropriate corrective action. Provide assert data to next level of support.

195. SMELPSSWMODE (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ethernet link fault recovery system process (ELSP) detected an MELNK for which status information was not correctly re-synchronized between the switching module processor (SMP) and message handler (MH) following a module controller time slot interchanger (MCTSI) soft switch.

Probable Cause:

Software error, message handler fault, data corruption, or a lost message.

Action:

The system will execute appropriate corrective action. If the problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual and provide assert data to next level of support.

196. SMELSPINVMMSG (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ethernet link fault recovery system process (ELSP) received a message containing invalid data.

Probable Cause:

Software error or message corruption.

Action:

Examine the message dumped by the assert to determine the source of the problem.

197. SMELTCTCB (5E12 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid and/or inconsistent data detected in the ethernet link fault recovery timer control block. The assert dumps the timer control block. The ethernet link fault recovery system process (ELSP) will be purged; its timer control block will be (re)initialized when ELSP is restarted following the purge.

Probable Cause:

Wild write, ELSP software bug, or ELSP was previously purged while manipulating its timer data structures.

Action:

System will execute appropriate corrective action. Provide assert data to next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual for information on contacting technical support.

198. SMELTEXH (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to obtain an ethernet link fault recovery software timer because all such timers were in use.

Probable Cause:

Either ethernet link fault recovery software is using its timers inappropriately or the number of timers is under-engineered for the number of Module Controller/Time Slot Interchanger (MCTSI) MCTSI ethernet links equipped on the SM.

Action:

System will execute appropriate corrective action. Any failed manual request (such as an MELNK remove or restore) should be reattempted. Provide assert data to next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual for information on contacting technical support.

199. SMELTNEXP (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ethernet link fault recovery system process (ELSP) found no expired timer when it timed out.

Probable Cause:

ELSP software bug.

Action:

System will execute appropriate corrective action. Provide assert data to next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual for information on contacting technical support.

200. SMELTSAREFULL (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A table used to store parts of an ELFR fault recovery output message was full when a request was made to add additional data.

Probable Cause:

Software error.

Action:

Gather the data generated by the assert and report the error to the next level of technical support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

201. SMELTTCBC (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid and/or inconsistent data detected in the ethernet link fault recovery timer control block. The assert dumps the timer control block.

Probable Cause:

Wild write, ethernet link fault recovery system process (ELSP) software error, or ELSP was previously purged while manipulating its timer data structures.

Action:

System will execute appropriate corrective action. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual, providing assert data to next level of support.

202. SMELUMCST (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: MELNK	Audit Mode: elev

Problem:

The ethernet link fault recovery system process (ELSP) MCTSI/MH recovery state was set to an unexpected value.

Probable Cause:

Software error.

Action:

This assert will trigger the MELNK audit and the audit may correct the data problem. If the problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual, providing assert data to the next level of support.

203. SMELUXPEVELNK (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: MELNK	Audit Mode: elev

Problem:

The ethernet link fault recovery system process (ELSP) was notified of an MELNK fault recovery or maintenance event that is not expected to occur when the MELNK is in its current state.

Probable Cause:

Software error or data corruption.

Action:

The system will execute appropriate corrective action and the MELNK audit may correct a data problem. If the problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual and provide assert data to next level of support.

204. SMELUXPEVEPIPE (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: MELNK	Audit Mode: elev

Problem:

The ethernet link fault recovery system process (ELSP) was notified of an MEPIPE fault recovery or maintenance event that is not expected to occur when the MEPIPE is in its current state.

Probable Cause:

Software error or data corruption.

Action:

The system will execute appropriate corrective action and the MELNK audit may correct a data problem. If the

problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual and provide assert data to next level of support.

205. SMELUXPMHEVENT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ethernet link fault recovery system process (ELSP) received a message from the message handler (MH) reporting an unknown event type.

Probable Cause:

Software error, SMP/MH inconsistency, or message corruption.

Action:

Examine the message dumped by the assert to determine the source of the problem.

206. SMERBLKRES (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Fault recovery code detected that no rISMPERBLK tuples are on the idle list. A directed BLOCK audit may be scheduled to recover available tuples.

207. SMESTRET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read remote digital facility interface (RDFI) information from the RLSMEST relation failed during a manual communication link (CLNK) restoration in a remote SM (RSM). The CLNK restoration will fail with a "TIMEOUT BEFORE PROTOCOL ESTABLISHED" response. This problem may occur in RSMs that have only two control time slot (CTS) umbilicals, if the RSM CTS DIP switches are missing or set incorrectly.

208. SMFDBRDFL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMfdb_sw() function could not read an rISMFDB_SGN tuple.

209. SMFFEMPTY (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The function SMprspff() was invoked to analyze a full signal processor (SP) first-in, first-out (FIFO), but no entries were found in the FIFO or the code had difficulty translating the entries into useful data.

Probable Cause:

Code error, but it could also be a fault SP on a time slot interchange (TSI) board.

Action:

Observe the progress of fault recovery. If the hardware is not being recovered automatically, try switching module controller/time slot interchange (MCTSI) sides to see if that helps.

210. SMFFLIST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The function SMprspff() found more peripheral interface data buses (PIDBs) in the signal processor (SP) first-in, first-out (FIFO) than it expected was possible to find.

Probable Cause:

Coding error.

Action:

The code will proceed and perform fault recovery based on the PIDBs it has already found filling the FIFO, which are probably the ones causing the problem. But this assert should be reported to the code owner.

211. SMFLXINC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency between CF firmware (that supports flex and non-flex mode) initialization status indication and GI_dfflex poprle.

Probable Cause:

Either the CF firmware version is not for the flex-mode as indicated by the GI_dfflex poprle or the GI_dfflex is not populated correctly.

Action:

Replace CF circuit pack with the correct firmware version or have the GI_dfflex populated correctly.

212. SMFUBADNLI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The central processor intervention (CPI) polling process has discovered multiple network link interface (NLIs) to be concurrently performing time multiplexed switch (TMS) Fabric Updates. This indicates a software error. The update on the NLI performing the update in error will be aborted. The other NLI will be permitted to proceed.

213. SMFURBADDATA (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The fast unit reconfiguration (FUR) process has encountered an unexpected piece of data. This data is dumped.

Probable Cause:

Internal data block or request parameter corruption.

Action:

Nothing. Request will be submitted to MRA anyway.

214. SMFURNOMASTER (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: REQBLOCK	Audit Mode: elev

Problem:

The fast unit reconfiguration (FUR) process has encountered a subtending (child) request with no master request.

Probable Cause:
Internal data block corruption.

Action:
Nothing. The child processes may complete normally, but no master request will be sent to deferred MRA.

215. SMFURNOSUBS (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
The fast unit reconfiguration (FUR) process has encountered a master request with no subtending (child) requests.

Probable Cause:
Internal data block corruption.

Action:
Nothing. The master request will be forwarded to deferred maintenance request administrator (MRA).

216. SMFURQBPROB (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: REQBLOCK	Audit Mode: elev

Problem:
The fast unit reconfiguration (FUR) process has encountered a data or linkage problem with one or more RLREQBLOCK tuples. The REQBLOCK audit has been requested.

Probable Cause:
Internal data block corruption.

Action:
Nothing. The REQBLOCK audit will clean up the corrupted data.

217. SMFURQPPROB (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: RQTP	Audit Mode: elev

Problem:
The fast unit reconfiguration (FUR) process has encountered a data or linkage problem with one or more RLRQTP tuples. The RQTP audit has been requested.

Probable Cause:
Internal data block corruption.

Action:
Nothing. The RQTP audit will clean up the corrupted data.

218. SMFURTBLKD (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
The fast unit reconfiguration (FUR) process has not been able to dispatch terminal processes.

Probable Cause:

Internal data block corruption.

Action:

Nothing. Data associated with old terminal processes will be cleared.

219. SMFUTSDBFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The central processor intervention (CPI) polling process failed to clear a time slot data block (TSDB) prior to beginning a time multiplexed switch (TMS) fabric update. This assert indicates some type of software error has occurred. No further action can be taken. The network link interface (NLI) will not be fabric updated at this time.

220. SMGDXBESTR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMgdxstate() function received an invalid return code from the DBfrdtup() function when accessing the RLSMEST relation.

221. SMGETCDBERR (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to obtain a pointer to a CDBCOM data structure through the DAGETCDB() macro failed for some reason.

Probable Cause:

A software problem which has probably resulted from an invalid CDBCOM name being requested.

Action:

No action is required. This assert is intended to provide information to the next level of support if the problem persists. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual for information on contacting technical support.

222. SMGETNSFLT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMiabitstat() function returned failure to the SMimiia() function when asked to give normal state for a particular bit.

223. SMGETSMESTERR (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to obtain a pointer to a SMEST data structure through the DAGETSMEST() macro failed for some reason.

Probable Cause:

A software problem which has probably resulted from an invalid SMEST unit_id being requested.

Action:

No action is required. This assert is intended to provide information to the next level of support if the problem persists. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual for information on contacting technical support.

224. SMGMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSWGETMSG() macro failed.

225. SMGPICBFAIL (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: DYNPICB	Audit Mode: elev

Problem:

The DBGETPICB() macro was called with a peripheral interface control bus (PICB) number. The returned pointer does not point to a tuple for the PICB number requested. The rPICB tuple is printed in the assert history data.

226. SMGPICBFAIL (5E11 to 5E12)

Recovery Action: rpi	SPP: n	Audit: PICB	Audit Mode: elev

Problem:

The DBGETPICB() macro was called with a peripheral interface control bus (PICB) number. The returned pointer does not point to a tuple for the PICB number requested. The rPICB tuple is printed in the assert history data.

227. SMGRPNM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple of the relation group_port is missing.

Action:

Check the ODD for the relation GROUP_PORT with the dumped keys.

228. SMHDFHINIT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The HDFH system process was entered with other than the accepted initialization types.

229. SMHDFHMAIN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The system process (HDFH) main work routine received a response other than "OSMSG".

230. SMHDFHUXP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The main work routine for the HDFH system process received an illegal or unexpected operating system for distributed switching (OSDS) message.

231. SMHMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was found in the HMoutmsg() function return.

232. SMHTU2RSM (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was detected between the RLRS2HTU relation and the RLHTU2RSM relation.

Probable Cause:

The host transport unit number in the rHTU2RSM tuple was not the same as the host transport unit number in the rRSM2HTU tuple.

Action:

Find the inconsistency between the rHTU2RSM and rRSM2HTU tuples.

233. SMIABADPARM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An interrupt inhibit administrator (IIA) time slot interchange (TSI) or IIA network link interface (NLI) function has been called with invalid input parameters.

Probable Cause:

Code error.

Action:

None - Normal escalation will occur.

234. SMIABDGBL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert is caused when a global variable is found to contain an invalid value. The global(s) in question can vary, depending on where the assert occurs. Currently, the uses of this assert are:

- (1) IIA - IMIIA audit of the TSI or NLI bits was invoked with either SMiabitno or SMiatsport containing invalid data. This dump will contain the following data, with their size in bytes in parenthesis:

SMialpcnt (2)
SMiacntr (2)
SMiabitno (2)
SMiaactpr (2)
SMiatsport (2)

There is no data corresponding to the second and third portions of this dumps for this case.

- (2) IIA - An invalid entry in SMtsbitinfo[] was found while IMIIA audit was going through the TSI bits. The first portion of this dump will contain the data described in case (1) above.

The second portion of this dump will contain the entry in SMtsbitinfo[] in question in the first 16 bytes.

There is no data corresponding to the third portion of this dump for this case.

Probable Cause:

A wild write or an error in the software that initializes and updates the global data could cause this problem.

Action:

For sporadic occurrences of this problem, no action is required because the software corrects the problem.

However, if the assert continues regularly then a software or hardware problem exists and technical assistance is needed.

235. SMIABGNT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBbgntn() function returned a failure code in the SMiainit() function. The SMiainit() function initializes the interrupt inhibit administrator's (IIA) database.

236. SMIACKTDAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

The database (DB) subsystem returned the code DBNO_MATCH for a metallic service unit (MSU) circuit that was expected to be in the RLCKTDATA relation. This may be a DB, interrupt inhibit administrator (IIA), or data population problem.

237. SMIACKTEST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown circuit state was found in the RLSMEST relation.

238. SMIACLIDATDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the RLCLIDAT relation in the SMiainit() function.

239. SMIATYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

Invalid circuit type information may have been found in the RLCKTDATA relation, or a stack variable was corrupted.

240. SMIADLINM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid dual link interface (DLI) name was detected in the SMiainh() primitive. A stack variable may be corrupted.

241. SMIADSCC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

The time slot interchange (TSI) channel number information in the RLDSCC relation is out of the normal range of values. This relation is used for global digital service units (DSUs).

242. SMIADSUIMG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The database manager (DBM) could not access an rIDSUIMG tuple that should exist. The RLSMEST and RLDSUIMG relations may need to be re-initialized to clean up the problem.

243. SMIAEST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SM inhibit administrator (SMIA) received a DBNO_MATCH error when reading the RLSMEST relation.

244. SMIAFILPA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal parameter was passed to the SMiaifi() function. The valid link parameter values are 0x16 (SMDLI0I), 0x17 (SMDLI1I), 0x24 (SMDLIALINK), and 0x25 (SMDLIBLINK). The valid side parameter values are 0 (SMIAACT) and 1 (SMIAMATE). The interrupt inhibit administrator (IIA) functions that call the SMiaifi() function are SMiaidli(), SMiaimp(), SMiamprf(), and SMiamp().

245. SMIAFUPTUP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

The database manager (DBM) function DBfuptup() returned the code DBNO_MATCH for a circuit that was expected to be found in the RLSMEST relation.

246. SMIAHDWDAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The maintenance request administrator (MRA) primitive SMhdwrel() returned a nonexistent circuit in the return structure.

247. SMIAHDWREL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The maintenance request administrator (MRA) primitive SMhdwrel() passed an error return to the interrupt inhibit administrator (IIA).

248. SMIAILACT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid action parameter was passed to the interrupt inhibit administrator (IIA).

249. SMIAILBIT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal bit parameter was passed to the interrupt inhibit administrator (IIA) function SMiainh().

250. SMIAILBLK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid block parameter was passed to the SMiainit() function. The SMiainit() function initializes the interrupt inhibit administrator's (IIA) data for the module processor (MP) and periphery. A stack variable may be corrupted.

251. SMIAILBNAME (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal bit name parameter was passed to the SMiainh() or SMiamprf() function.

252. SMIAILCQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: IMIIA	Audit Mode: elev

Problem:

The inhibit status qualifier was out of range. Data in the RLSMEST relation is invalid or a stack variable is corrupted.

253. SMIAILNAME (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid name parameter was passed to the interrupt inhibit administrator (IIA) function SMiainh(). The circuit does not exist in the RLCKTDATA relation.

254. SMIAILQUAL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid qualifier parameter was passed to the interrupt inhibit administrator (IIA) function SMiainh().

255. SMIAILSIDE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid side parameter (should be active or mate) was passed to the SM interrupt inhibit administrator (IIA). A stack variable may be corrupted.

256. SMIALSTATE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: IMIIA	Audit Mode: elev

Problem:

An illegal current state was found in the RLSMEST relation. A stack variable may be corrupted.

257. SMIALSUB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

The internal name passed to the SMiainh() primitive had an unknown unittpe. The unittpe may be wrong in the RLCKTDATA relation.

258. SMIALUNIT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

The interrupt inhibit administrator (IIA) found a unit in the RLCKTDATA relation that is marked for an entry in the RLSMEST relation, but the unittpe field in the RLCKTDATA tuple is illegal.

259. SMIAMCNT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error return was received from the maintenance request administrator (MRA) function SMmcnt(). The SMmcnt() function provides offsets into the global equipment status table information for the module processor (MP).

260. SMIANOEST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

No entry in the RLSMEST relation corresponds to an entry in the RLCKTDATA relation. The database (DB) subsystem returned the code DBNO_MATCH when a match was expected in the interrupt inhibit administrator (IIA).

261. SMIAOPAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TSDB	Audit Mode: elev

Problem:

Indicates an error return other than OPLINKER was returned by OPadchan to the inhibit administrator.

262. SMIAOPNR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBopnrel() function returned an error code to the SMiainit() function. The SMiainit() function initializes the interrupt inhibit administrator's (IIA) data for peripheral circuits.

263. SMIARDFST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The database manager (DBM) function DBrdfst() returned an error code to the SMiainit() function when accessing the RLSMEST relation. The SMiainit() function initializes the interrupt inhibit administrator's (IIA) database for peripheral circuits.

264. SMIARDNXT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The database manager (DBM) function DBrdnxt() returned an error code to the SMiainit() function when accessing the RLSMEST relation. The SMiainit() function initializes the interrupt inhibit administrator's (IIA) data for peripheral circuits.

265. SMIASTACT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid message action requested.

Probable Cause:

An inconsistent command/action combination. OSDS msg might be corrupted.

Action:

Nothing. The process will commit suicide and the user can try again later.

266. SMIASTCMD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid CPI command requested.

Probable Cause:

An unrecognized CPI commands has been received. Maybe the OSDS message is corrupted.

Action:

Nothing. The process will commit suicide and the user can try again.

267. SMIASTMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Message error (return or type).

Probable Cause:

Program internal state insane.

Action:

Nothing. The process will commit suicide and the user may try again.

268. SMIASRC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Invalid message source

Probable Cause:
OSDS message maybe corrupted, or an unexpected process is sending a CPI request.

Action:
Nothing.

269. SMIASST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Invalid program state.

Probable Cause:
Internal program state variable corrupted.

Action:
Nothing. The process will commit suicide.

270. SMIASSTRG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Invalid SM number received from DD trigger function.

Probable Cause:
DD message may be corrupted because we have only one SM.

Action:
Nothing. The error report will indicate that the user should try it again.

271. SMIAUPEST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
An invalid return code was received from the DBfuptup() function when accessing the RLSMEST relation.

272. SMIAUPTUP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
The DBuptup() function returned the code DBNO_MATCH to the SMiainit() function for a circuit that was previously found in the RLSMEST relation by the DBrdnxt() function.

273. SMIDAUD1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The integrated digital carrier unit (IDCU) remote terminal (RT) auditing terminal process received a reason for creation that was not expected.

274. SMIDAUD2 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The integrated digital carrier unit (IDCU) remote terminal (RT) auditing terminal process timed out while waiting for a stimulus from GLPNS96M (e.g., the RT alarm handler system process). The RT auditing terminal process waits up to 2 minutes after it is created for instructions regarding the next RT to audit.

275. SMIDAUD3 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The integrated digital carrier unit (IDCU) remote terminal (RT) auditing terminal process received an unexpected operating system for distributed switching (OSDS) message from GLPNS96M (e.g., the RT alarm handler system process).

276. SMIDBD01 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A problem occurred in the alarms handler for remote terminals (RTs) that are connected to the integrated digital carrier unit (IDCU). The mode for invoking an alarms handler function was not S96MAN or S96AUTO.

277. SMIDBDEV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A TR303 remote terminal (RT) terminated on the integrated digital carrier unit (IDCU) reported an environment alarm that is using an unsupported SENSOR ID. Valid SENSOR IDs are 1 or 2 only.

278. SMIDCKTD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An alarm report or a request for alarm status was received for a remote terminal (RT) or integrated digital carrier unit (IDCU) facility (IFAC), but no rICKTDATA tuple was found for the circuit.

Data Structures:
RLCKTDATA.

Action:

Populate an rICKTDATA tuple for the RT or IFAC circuit. The population rules require at least shelf A and facility A to have rICKTDATA tuples.

279. SMIDDA01 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The integrated digital carrier unit (IDCU) alarm handler received an unexpected return code when accessing the database. The alarm handler usually accesses the RLSMEST or RLCKTDATA relations for remote terminals (RTs) or IDCU facilities (IFACs). Typically, the error code returned indicates that no tuple was found in the database for the RTs or IFACs, but one was expected.

280. SMIDDS12 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No tuple was found when accessing the RLDS12RT relation for a particular integrated digital carrier unit (IDCU) digital signal level 1 (DS1). This database access was triggered by a virtual pinjack request on the DS1 (i.e., far-end loop, protection line switch, inhibit/allow protection line switching on a DS1), and is part of the remote terminal (RT) alarms functionality of IDCU.

Data Structures:

RLDS12RT.

Action:

The above actions should result in an RT alarm being declared. However, since the RLDS12RT relation does not contain a tuple for the particular DS1, there is no way to know which RT to alarm. Consequently, no alarm was declared.

281. SMIDMISC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A problem was encountered when accessing the RLRTMISC relation for a remote terminal (RT). No tuple was found for the RT.

Data Structures:

RLRTMISC.

Action:

The site identifier (SID) and alarm severity assigned to a power/miscellaneous alarm were assigned to default values. Processing continued with the defaults in effect.

282. SMIDNOEV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A TR303 remote terminal (RT) terminated via the integrated digital carrier unit (IDCU) reported an environmental alarm. The alarm severity and 25-character problem description is provisioned using the RLRTENVALM relation. No rLRTENVALM tuple was found for the internal RT circuit name dumped.

Data Structures:

RLRTENVALM.

Action:

Provision the TR303 environmental alarm data.

283. SMIDNOSM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: SMEST	Audit Mode: elev

Problem:

An inconsistency was detected between the RLSMEST relation and the RLCKTDATA relation for a remote terminal (RT) or facility connected to the integrated digital carrier unit (IDCU). An rLCKTDATA tuple exists for an RT circuit or IDCU facility (IFAC), but no corresponding rLSMEST tuple was found.

284. SMIDPASR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Integrated digital carrier unit (IDCU) resident protection line switch (PLS) software detected a problem with resident PLS data. The data dump provides details as to the type of error and the data involved.

285. SMIDPPJK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to unequip a digital signal level 1 (DS1) without first inhibiting protection line switching on that DS1.

Action:

Before unequipping the DS1, inhibit protection line switching on that DS1.

286. SMIDPRTD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency exists between the RLRT2DS1 and RLDS12RT relations.

Data Structures:

RLRT2DS1, RLDS12RT.

Action:

The population of the SM relation RLRT2DS1 and the SM relation RLDS12RT violated the population rules. An rLRT2DS1 tuple contains a digital signal level 1 (DS1) linkage, but this DS1 does not have a corresponding rLDS12RT tuple.

287. SMIDRTAM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A TR303 remote terminal (RT) connected to the integrated digital carrier unit (IDCU) reported an alarm that the 5ESS(R) switch does not support. Only network, equipment, power, environmental, equipment holder, and memory object alarms are handled by the RT alarms handler.

288. SMIDSEND (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The integrated digital carrier unit (IDCU) alarm handler process experienced an unexpected error when sending an operating system for distributed switching (OSDS) message.

289. SMIDTASK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The task that updates data in the integrated digital carrier unit (IDCU) failed during a trigger function update of the RLFAC_CAB relation. The new static data was successfully updated in the switching module processor (SMP); but this data is inconsistent with data in the IDCU. The SMP has the new updated data, while the IDCU has the old data. (This task can fail for a variety of reasons.)

Data Structures:

RLFAC_CAB.

Action:

The distance and/or cable_series attributes in the rIFAC_CAB tuple were updated. The attribute changed can be undone and the new value re-updated. If this fails, the IDCU can be duplex failed and restored from duplex failure. In the process of restoring the unit from duplex failure, the new cable information gets downloaded in the IDCU.

290. SMILINAM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal internal name was encountered.

291. SMILSEPACT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal action parameter was passed to the SMic1sep() function.

292. SMIMMBUR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An AM switch maintenance for the SM (SMIM) master control center (MCC) display program received an invalid or an unknown unit from an SM.

293. SMINTRLRCB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the RLRCB_HCB relation in the SMiainit() function.

294. SMINVCKT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMtuea_cont() function received an invalid circuit type from the SMprtu() function.

295. SMINVFUABT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The central processor intervention (CPI) polling process has received a request to abort a time multiplexed switch (TMS) fabric update. However, the network link interface (TMS) specified in the message received does not match the NLI being updated. This is an informational assert. The NLI currently performing the update will be unaffected by this request.

296. SMINVFURETURN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The central processor intervention (CPI) polling process detected an invalid return from the function SMfab_upd(). This is an indication of a software error and will abort the time multiplexed switch (TMS) fabric update that was in-progress.

297. SMINVFUSTATE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The central processor intervention (CPI) polling process has discovered a network link interface (NLI) in an invalid time multiplexed switch (TMS) fabric update state. This is an indication of a software error. The NLI will be returned to the IDLE state.

298. SMINVPNPT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid port name and/or port type was encountered.

299. SMISPIDB_NO (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMckispdb() function received a DBNO_MATCH code when a valid rSMEST tuple was expected for an integrated services line unit (ISLU) peripheral interface data bus (PIDB). The SMckispdb() function passed the common data (CD) pack hierptr which should have specified all of the CD's equipped PIDBs. The hierptr may have been corrupted.

300. SMIXRFPARAM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Maintenance code that supports a SM's external timing references (EXREF) encountered an invalid parameter, or combination of parameters, passed to a function.

Probable Cause:

This is most likely a software problem or could be the result of a corrupted stack.

301. SMLDWP_BAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

SMld_mwp() has been called but write-protect is apparently not yet initialized. This is a violation because the SM-2000 SMld_mwp() requires that the memory management unit (MMU) translation table be built so SMld_mwp() can update it. The actual check is to see that the global variable INldwp_ok is DBYES; so this assert can fire on a true initialization sequence problem, or if the variable is corrupted. INldwp_ok is dumped with this assert (single byte, type DMBBOOL).

Standard single process purge (SPP) processing will set the variable back to its normal state if corrupted, so no manual action is required in this case. If the assert occurs during an SM initialization (that is, before INwp_init() is called) this indicates a violation of the initialization sequence requirements, and represents a software [design] problem.

302. SMLNK_NUM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

SMIM DB read returned a DBNO_MATCH when a link number was expected from relation rICKTLNK.

Probable Cause:

No rICKTLNK tuple exists for the given key.

Action:

Provide data to next level of support.

303. SMLOCK_ERROR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMca_check() function detected that the global variable representing the number of banks to be locked (SMbanks_locked) is out of range, or an attempt to lock the banks of cache indicated by the SMbanks_locked variable failed.

304. SMMALWOOS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: IMIIA	Audit Mode: elev

Problem:

Interrupts were allowed on an out-of-service (OOS) module controller (MC) circuit. This occurred while determining a list of MC off-normal circuits.

305. SMMANINHERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the SMhwck() function, the data delivery bits DDRAHWCK and DDRMHWCK are in an invalid state during a manual inhibit of all hardware error checks.

306. SMMATATTDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the RLMATATT relation in the SMiclsep() function.

307. SMMCNTFLT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from the SMmcnt() function.

308. SMMHAUPARM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

SMmhautrig(), a function that sends routine audit inhibit/allow status to the message handlers (MHs), was passed an invalid audit status parameter. No audit status update will occur in the MHs as a result of this error.

Probable Cause:

Software programming error in the code that called SMmhautrig().

Action:

If the assert persists, provide data to the next level of support.

309. SMMHAUSND (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

SMmhautrig(), a function that sends routine audit inhibit/allow status to the message handlers (MHs), failed to send an audit status update message to an MH because the OSSENDMH() primitive returned failure. No audit status update will occur in the target MH as a result of this error.

Probable Cause:

An invalid or unequipped MH number was passed to OSSENDMH(), the message length exceeded the maximum supported text size for standard messages, or the SM to MH maintenance first-in, first-out (FIFO) overflowed. All three are software programming problems.

Action:

If the assert persists, provide data to the next level of support.

310. SMMH_HASHE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message handler (MH) failed to respond to a request to perform hashsum checks.

Probable Cause:

MH internal failure during or after hashsum message sent

Action:

Verify additional recovery reports indicating MH error occurred.

311. SMMRA_DBRR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfrdtup() primitive failed to read an rLDLSL tuple to update the 147YYZ,X display page. No tuple was found

for the global port name that was passed as a key for reading this relation.

Data Structures:

RLDLDL. Key field: gdport (global port).

Action:

Check RC/V View 21.30 (OSPS-DSL PORT) to determine if the port associated with this digital subscriber line (DSL) was removed. If the rLDLDSL tuple associated with the specified port was removed, re-insert the tuple. Once the port is re-inserted, the display page must be refreshed to reflect the current DSL status.

312. SMMSGBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Peripheral fault recovery (PFR) detected invalid data in a received message (for example, the circuit ID of the faulty circuit is zero). The message sent to the fault recovery function SMprin() is dumped.

313. SMMSGREC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid message received.

314. SMMSGTRE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message translation error occurred.

315. SMMSGTYPEBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The peripheral fault recovery system process received a message with an unexpected error type. The message is printed with the assert history data.

316. SMMXDSL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

There are too many digital subscriber lines (DSLs) of a specific type on an SM.

Data Structures:

RLDLDL.

The ROP output provides the DSL type that has too many ports, the SM that the offending DSLs are on, the number of offending DSL ports that are equipped on the SM, and the maximum number of DSL ports of that type permitted.

Action:

Redistribute the offending DSLs among the SMs so that none of the SMs have more than the maximum allowed. Use the growth and degrowth procedures described in the "OSPS Descriptions and Procedures Manual" when rearranging the DSLs among the SMs.

317. SMNLIMAP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The function SMiasp_nli() has been passed a bit-map of network link interfaces (NLIs) that have changed state and one of the specified NLIs is invalid. This most likely means that the calling function set the wrong bit in the bit-map.

318. SMNOFIU (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMprfi() function is used only as a stub for the normal SM; it should never receive control.

319. SMNOPORTLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

A port in the RLDLDSL relation has no rIORTLA tuple. Since all ports must have an rIORTLA tuple, either the RLDLDSL relation has an extra tuple or the rIORTLA tuple is missing. RLPORTLA is assumed to be in error because it is a dynamic relation; RLDLDSL is a static relation. An audit of the RLPORTLA relation is scheduled.

320. SMNOPSIUPIDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The shelf reporting parity errors should have been found in the RLPSIUPIDB relation; however, no match was returned.

Data Structures:

RLPSIUPIDB.

Action:

The shelf number and the key used to access the RLPSIUPIDB relation are printed.

321. SMNUMDX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An ISLU(2) was found to be connected to more than SMISLUDIMAX DIs. The function SMlidxpdb() looks for all the DIs that an ISLU(2) is connected to and puts them in the list SMisidx[] of size SMISLUDIMAX. In this case, it has found more DIs than it has room for in the list.

Probable Cause:

The number of DIs that can be connected to an ISLU(2) has increased and the associated #define for SMISLUDIMAX has not been updated.

Action:

Nothing. The process will continue to process the valid DIs.

322. SMODDCKT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert is used to indicate that a tuple was not found in the database relation RLCKTDATA.

Data Structures:

RLCKTDATA. Key field: internal circuit name.

Action:

This assert will dump the internal circuit name and the circuit type. This information will help the craft to look in the data base relation RLCKTDATA to correct the inconsistency.

323. SMODDLOCEQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was encountered in the database relation RLRC_LOCEQ in the office-dependent data (ODD).

Data Structures:

RLRC_LOCEQ. Key field: SM number, PICB number.

Action:

The SM number, peripheral interface control bus (PICB) number, internal circuit name, circuit type, and the process that sent the message are dumped. This information will be used to locate the inconsistency in the RLRC_LOCEQ relation.

324. SMODDPIDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

SM-2000 Active/Standby peripherals must use even-numbered PIDBs for call processing. However, peripheral fault recovery encountered an error for an odd-numbered PIDB on an Active/Standby peripheral that was being used in an active path.

Probable Cause:

Some code somewhere is allocating time slots from odd-numbered PIDBs of an Active/Standby peripheral and should not be.

Action:

The allocation software needs to be modified to not allocate time slots on odd-numbered PIDBs of active/standby peripherals on an SM-2000.

325. SMODDUNIT_CKT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert is used to indicate that a tuple was not found in the database relation RLUNIT_CKT.

Data Structures:

RLUNIT_CKT

Action:

This assert will dump the unit number, the unit type, and the circuit index. This information will help the technician to look in the database relation RLUNIT_CKT to correct the inconsistency. ODBE can be used to look at and correct

RLUNIT_CKT. If the root cause of the problem is incorrect use of ODBE, then ODBE may be used to reinsert the missing tuple, after getting all the necessary tuple information. The problem may be caused by a bug in ODA, in which case there may be more than one tuple or relation that is incorrect. Finally, the cause may be a bug in the switch software that causes incorrect calculation of the circuit index, in which case you must contact your local field support and file a problem statement. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

326. SMOFF1NRM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return was received from the SMiabitstat() function in the SMmpoffnrm() function.

327. SMOPERTST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SM unexpectedly called the SMopertst() function, or the user mistakenly called the SMopertst() function. The OSSUICIDE() macro is called to prevent the SMopertst() function from being executed unexpectedly. The OSSUICIDE() macro terminates the terminal process quietly.

328. SMOPNREL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database (DB) open relation failure occurred in the operating system for distributed switching in the AM (OSDS-C).

329. SMOSWPROB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid condition or time limit was exceeded on an operating system for distributed switching (OSDS) wait primitive.

330. SMOTHINIT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to access an rISMEST tuple. An error exists in the office-dependent data (ODD) dictionary.

Data Structures:

RLSMEST, RLCKTDATA.

The first two bytes of the first data dump contain the database (DB) return code. The second data dump contains the associated rICKTDATA tuple. The third data dump contains the rISMEST tuple to be updated.

Action:

Seek assistance from the product engineering control center (PECC). If this problem occurs during retrofit, STOP. The ODD must be rebuilt with a compatible version of the DBgen tool.

331. SMOUTINIT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update an rISMEST tuple. An error exists in the office-dependent data (ODD) dictionary.

Data Structures:

RLSMEST.

The first two bytes of the first data dump contain the database (DB) return code. The second data dump contains the rISMEST tuple that failed.

Action:

Seek assistance from the product engineering control center (PECC). If this problem occurs during retrofit, STOP. The ODD must be rebuilt with a compatible version of the DBgen tool.

332. SMPALWOOS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

Interrupts were allowed on an out of service (OOS) SM circuit (peripheral). This occurred while determining a list of off-normal circuits.

333. SMPARFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interrupt inhibit administrator (IIA) function SMiainh() returned an invalid value.

334. SMPFRUSE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The function SMprspff() hit the default case when switching on the use of a link (from PClnk2use[]) that filled up an SP FIFO.

Probable Cause:

Someone probably forgot to update either SMspff_msg(), which sends the message to PFR that SMprspff() is handling, or forgot to update SMprspff().

Action:

Resolve the inconsistency between SMspff_msg() and SMprspff().

335. SMPHATBL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was found in the SMphalnkdat global array.

Probable Cause:

SMphalnkdat[] may be corrupted.

Action:

Provide data to next level of support.

336. SMPHDATDGR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: SMEST	Audit Mode: null

Problem:

The ICR and/or SCCP data tables were not pumped for the PH listed in the data that accompanies this assert. The PH will have its data in a degraded state. Try removing and restoring the PH. If the PH data is not subsequently degraded, the problem was temporary. Otherwise, this problem needs investigation. Without ICR tables, there can be C7 call processing downtime and without SCCP tables no global title translation can be done.

337. SMPHRNGCHKF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PHDSLGP	Audit Mode: elev

Problem:

Invalid PH image detected during PH switch.

Probable Cause:

SMph_dslgp[] maybe corrupted.

Action:

Provide data to next level of support.

338. SMPICB_NUMNM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The switch maintenance for the switching module (SMIM) database (DB) read macro returned a null peripheral interface control bus (PICB) number when a valid PICB number was expected.

339. SMPIDB1EA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMprcount() function sent an invalid return to the SMpidbea() function.

340. SMPIDB1RA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown recovery action was passed to the SMpidbra() function.

341. SMPIDB2EA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMprcount() function sent an unknown return to the SMpidbea() function.

342. SMPIDB2RA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The recovery action passed from the SMpidbea() function for a particular channel is not a valid. This assert fires from the SMpidbra() function.

343. SMPIDBFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Peripheral fault recovery (PFR) could not find a peripheral interface control bus (PIDB) number in the RLPIDB relation that it expected to be there. Two functions use this assert:

(1) SManalbuff(), which performs analysis of PIDB parity errors, and (2) SMprspff(), which performs analysis of signal processor (SP) FIFO-FULL events for peripheral circuits.

In either case, the hardware indicated that time slots on a specific PIDB were suspect, but the PIDB was not found in the RLPIDB relation. PFR is unable to continue in this situation, so no fault recovery action was taken on this PIDB. The number of the suspect PIDB can be found in the local variable 'rlpidb.pidb' in the stack frame dump for either function.

344. SMPLILNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Peripheral fault recovery (PFR) could not find a time slot interchange (TSI) link number in the RLPLI_LNK relation that it expected to be there. This assert is printed by the SMprspff() function when it is analyzing an signal processor (SP) FIFO-Full event for a PLI-based peripheral. The hardware indicated the time slots on the PLI link were suspect, but the tuple for that PLI was not found in the database. PFR was unable to continue with its analysis.

Probable Cause:

PFR determined it was a PLI because the PClnk2use[] array (based on the RLLNK_USE relation) indicated that the link number corresponded to a PLI. There appears to be an inconsistency between the PClnk2use[] array (or RLLNK_USE relation) and the RLPLI_LNK relation.

Action:

Resolve the inconsistency. The link number in question can be found in the local variable 'pli_lnk.tsi_link' in the stack frame dump.

345. SMPORTLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

Could not retrieve an rIORTLA tuple.

346. SMPPGFULL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

An item representing a SM peripheral unit was to have been inserted into a SMppg*[] global linked list array, but the particular array was found to be full. The new item was ignored, leaving the linked list as it was. This will prevent the unit in question from being recognized for inclusion on the MCC 1010 page and/or its related Unit Summary pages (e.g., 1011).

One run-time data item is dumped: The RLCKTDATA tuple for the common board representing the SM peripheral unit that was not inserted into the linked list because of lack of space. Other function parameter values provided via the associated stack frame dump will identify the specific SMppg*[] array in question, as well as its size in terms of defined maximum number of elements.

This condition is most likely the result of a software design oversight in failing to increase the size of the array when defining a new SM peripheral unit type or unit category, or when increasing the defined maximum equipage capacity for a certain type of unit in an SM. Various run-time faults could also induce this problem: Corruption in the SMppg*[] linked list, or incorrect software mapping of an SM peripheral unit type to the specific SMppg*[] array. If run-time corruption is suspected, a full initialization of the SM must be performed to reconstruct the SMppg*[] array's linked list.

347. SMPPGNOMATCH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An item representing a SM peripheral unit was to have been updated within, or deleted from, a SMppg*[] global linked list array (as during a hardware degrowth procedure), but the target item was not found in the list. The intended manipulation of the linked list was not performed, leaving the linked list as it was. This will prevent the unit or service group in question from disappearing from the MCC 1010 page and/or its related Unit Summary pages (e.g., 1011).

One run-time data item is dumped: The RLCKTDATA tuple for the common board representing the SM peripheral unit that was not updated within, or deleted from, the linked list. Other function parameter values provided via the associated stack frame dump will identify the specific SMppg*[] array in question. This condition is most likely the result of corruption in the SMppg*[] linked list, or incorrect software mapping of an SM peripheral unit type to the specific SMppg*[] array. A Full Initialization of the SM must be performed to reconstruct the SMppg*[] array's linked list.

348. SMPPILAFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A port processor (PP) loss of layer 2 error occurred due to an idle link assurance (ILA) failure. The SMph_dslgp[] array, incoming error message and post mortem buffer are dumped.

349. SMPRGDGN (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: CKTDATA	Audit Mode: elev

Problem:

Diagnostics were purged due to hardware reconfiguration.

350. SMPRMRA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

The DBfrdtup() function failed when accessing the RLSMEST relation.

351. SMPRPICKT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

A circuit list created by audits recovery for hardware initialization contains circuits that are not in the office-dependent data (ODD). The assert fired in the peripheral circuit initialization system process. The offending member of the list was deleted from the RLCDBCOM relation. The CKTDATA audit will be run.

352. SMPRPIIDL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Audits placed a circuit with no known idle list on a list of peripheral circuits to be initialized. The assert fired in the peripheral initialization system process. The circuit was assigned to a default idle list. No recovery action is necessary.

353. SMPRPIMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The peripheral initialization system process received a message when none was expected. No recovery action is taken.

354. SMPRPIRES (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The peripheral circuit initialization process was started with an illegal reason parameter. This process is purged.

355. SMPRPISRA (5E11 and later)

Recovery Action: spp	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

Peripheral control (PC) cannot allocate a circuit that appears on a list of circuits to be initialized by the peripheral initialization system process. This process is purged and the CKTDATA audit is run to correct the problem.

356. SMPRT_NAMENM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The peripheral control (PC) database (DB) read macro returned a null port name when a valid port name was expected.

357. SMPSCKTNV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid circuit type was passed to packet switch unit (PSU) error analysis.

358. SMPSERNV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid error type was encountered in the SMpsthshld() function.

359. SMPSLNK_INFO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

SMIM DB read returned a DBNO_MATCH when a PSU link tuple was expected from relation rIPSULNK.

Probable Cause:

No rIPSULNK tuple exists for the given keys.

Action:

Provide data to next level of support.

360. SMPSLNKOOR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

PSU link number out of range.

Probable Cause:

PSU link number is outside of the valid range, 1-10.

Action:

Contact software developer.

361. SMPSSSND (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSENDMSG() macro failed in the SMpsiurcvy() function.

362. SMPSPRCNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMpsiuea() function received an invalid return from the SMprcount() function.

363. SMPSRCVNV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid recovery action was encountered in the SMpsiurcvy() function.

364. SMPSRSMST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMpsiurcvy() function failed to read an rISMEST tuple.

365. SMPSU_CA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

SMIM DB read returned a DBNO_MATCH when a valid PSU community address was expected from relation rISMPSU.

Probable Cause:

No rISMPSU tuple exists for the given key.

Action:

Provide data to next level of support.

366. SMPSUIAAUER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The peripheral interrupt inhibit administrator (IIA) audit for the packet switch unit (PSU) detected an inconsistency. Since the audit runs in refresh mode, the inconsistency was corrected.

367. SMPSULOGDUMP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert will be used to help debug the root cause of a PSU duplex failure and to help debug improper recovery procedure. Also should be used when the PSU is going to Simplex Degraded. All other cases, SMSavepsu should have assert set to DBNO.

368. SMPSUSMST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMpsiurcvy() function failed to update an rISMEST tuple.

369. SMPTSB2CHDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PTSB	Audit Mode: elev

Problem:

The function SMLidxpdb() or SMpsirotp() could not find an RLCHDB tuple linked to an RLPTSB tuple, when an RLCHDB was linked to that RLPTSB tuple in an earlier phase -- function SManalbuff(). The function DAfpbch() returned DBNO_LINK. No peripheral interface data bus (PIDB) parity error fault recovery could be attempted for the time slot corresponding to the PIDB time slot block (PTSB) because of this error.

370. SMPTSBBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PTSB	Audit Mode: elev

Problem:

An inconsistency was found in the RLPTSB relation.

371. SMPTSBFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PTSB	Audit Mode: elev

Problem:

DAGETPTSB() failed to return a valid pointer to an RLPTSB tuple. SMLidxdb() passed an RLPTSB key that was originally obtained from an RLPTSB tuple. No fault recovery could be attempted for the peripheral interface data bus (PIDB) parity error on the time slot corresponding to the PIDB time slot block (PTSB).

372. SMQENDPTS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The read of the RLQENDPTS by the DBfrdtup() function returned DBNO_MATCH.

Probable Cause:

The office-dependent data (ODD) relation RLQENDPTS does not exist.

Action:

Examine the data produced by the assert to determine the source of the problem. If the RLQENDPTS should exist in the ODD, then ODBE can be used to insert the relation.

373. SMQLCOMMFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The attempt to send a message from the quad-link fault recovery (QLFR) - switching module processor (SMP) system process (QLSP) to QLFR-MH in the message handler (MH) failed.

Probable Cause:

The MH message queue is full or the MH did not send an acknowledgement back within a time period specified by QLSP.

Action:

Examine the data produced by the assert to determine the source of the problem. If the MH queue is full, then SMP related fault recovery will be invoked. If an acknowledgement message is not being received, then the QLSP timer value may need to be increased.

374. SMQLEGETPROF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Profile data does not exist for the indicated class.

Probable Cause:

The error, summary, or action profile tables are being used inappropriately.

Action:

Provide data to the next level of support.

375. SMQLEMSGINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The link establishment (LE) message received by the quad-link fault recovery (QLFR) - switch module processor (SMP) system process (QLSP) was invalid.

Probable Cause:

The sender of the link establishment (LE) message filled it in inappropriately, QLSP is interpreting the message inappropriately or the message was corrupted before being received by QLSP.

Action:

Examine the data produced by the assert to determine the source of the problem.

376. SMQLEPINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The quad-link fault recovery (QLFR) - switch module processor (SMP) system process (QLSP) endpoint is invalid.

Probable Cause:

The QLPS endpoint parameter specified by the calling function was invalid or the QLPS endpoint parameter was corrupted during the function call.

Action:

Examine the data produced by the assert to determine the source of the problem.

377. SMQLEPMMSGINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The endpoint data contained in the link establishment (LE) message is invalid.

Probable Cause:

The sender of the LE message either filled in the data inappropriately or the message was corrupted before being received.

Action:

Examine the data produced by the assert to determine the source of the problem.

378. SMQLERRPROF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt is being made to read a summary profile table for an error that does not have summary profile data.

Probable Cause:

The summary profile table is being used inappropriately.

Action:

Provide data to the next level of support.

379. SMQLERRTYPINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The err_typ (error type) parameter is invalid.

Probable Cause:

The err_typ specified by the caller is an invalid error type or the err_typ parameter is being handled inappropriately

by the called function.

Action:

Examine the data produced by the assert to determine the source of the problem.

380. SMQLIDQLNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The switch maintenance for the switching module (SMIM) quad-link fault recovery (QLFR) system process has detected a mismatch between the message handler (MH) and switching module processor (SMP) D/QLNK state.

Probable Cause:

The SM has not detected an MH transition.

Action:

QLFR system process has taken recovery.

381. SMQLPIPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The switch maintenance for the switching module (SMIM) quad-link fault recovery (QLFR) system process has found a mismatch between the message handler (MH) pipe state and the SM pipe state.

Probable Cause:

MH transition has not been detected by the SM.

Action:

The system process has taken a recovery action.

382. SMQLIQLL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The switch maintenance for the switching module (SMIM) quad-link fault recovery (QLFR) system process has found a mismatch between the message handler (MH) and SM QLL state.

Probable Cause:

SM has not detected the MH transition.

Action:

QLFR system process has taken recovery.

383. SMQLLMINVST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The state or order of the switching switching module processor (SMP) or message handler (MH) link map data is invalid.

Probable Cause:

The SMP or MH link map has become corrupted, actual cause is unknown.

Action:

Remove and restore the QPIPES for both networks which will tear everything down and start over.

384. SMQLMHPIPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The attempt to read the office-dependent data (ODD) relation RLMHPIPE by the DBfrdtup() function returned DBNO_MATCH.

Probable Cause:

The RLMHPIPE relation does not exist in the ODD.

Action:

Examine the data produced by the assert to determine the source of the problem.

385. SMQLMQPSINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message handler (MH) QPIPE state returned by quad-link fault recovery (QLFR)-MH in the loopback test acknowledgement message to the QLFR-switching module processor (SMP) system process (QLSP) is invalid.

Probable Cause:

The MH QPIPE state is invalid in the MH, QLSP is handling the MH QPIPE state inappropriately, or the loopback test acknowledgement message was corrupted before being received by QLSP.

Action:

Examine the data produced by the assert to determine the source of the problem.

386. SMQLNETINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The quad-link fault recovery (QLFR) - switching module processor (SMP) system process (QLSP) network parameter is invalid.

Probable Cause:

The QLPS network specified by the calling function is invalid or the QLPS network parameter was corrupted during the function call.

Action:

Examine the data produced by the assert to determine the source of the problem.

387. SMQLNKCNT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The number of in-service QLNCs count is not correct.

Probable Cause:

A message indicating the transition of a Level 2 link (QLL) from in-service to out-of-service or visa versa was not

sent to the quad-link (QLFR) - switching module processor (SMP) system process (QLSP) or the message was not handled properly by QLSP.

Action:

Examine the data produced by the assert to determine the source of the problem. DO NOT correct the data! QLSP will correct the data either due to its self auditing mechanism or due to the integrity monitor detecting a problem and calling QLSP to correct it.

388. SMLNKSNUMINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The number of ACTIVE QLNKS is not within the acceptable range of 0-4.

Probable Cause:

May have missed a message from quad-link fault recovery (QLFR) - message handler (MH) indicating the QLL has gone down and we are just seeing the transition of the QLL coming up again. The variable that contains the counts for the QLNKS may have become corrupted.

Action:

Examine the data produced by the assert to determine the source of the problem. Do not correct the data! The QLFR - switching module processor (SMP) system process (QLSP) will correct the data either due to its self auditing mechanism or due to the Integrity Monitor detecting a problem and calling QLSP to correct it.

389. SMLPBBKINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The loopback test acknowledgement message from quad-link fault recovery (QLFR) - message handler (MH) to the QLFR - switching module processor (SMP) system process (QLSP) is invalid.

Probable Cause:

QLSP is inappropriately handling the loopback test acknowledgement message or the message was corrupted before being received by QLSP.

Action:

Examine the data produced by the assert to determine the source of the problem.

390. SMLPCCONN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The call to peripheral control (PC) to connect the message handler (MH) QPIPE time slots in the module controller/time slot interchange (MCTSI) complex failed.

Probable Cause:

PC was unable to connect the time slots indicated in the RLMHPIPE relation for a QLPS MH QPIPE.

Action:

Examine the data produced by the assert to determine the source of the problem.

391. SMLPROFILE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The error, summary, or action profile data is invalid.

Probable Cause:

The error, summary, or action profile table is being used inappropriately for the indicated error.

Action:

Provide data to the next level of support.

392. SMLSPACINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The action or cmd_type specified in the message received by the quad-link fault recovery (QLFR) - switching module processor (SMP) system process (QLSP) is invalid.

Probable Cause:

The function sending the message filled in the field wrong or the message was corrupted before being received by QLSP.

Action:

Examine the data produced by the assert to determine the source of the problem.

393. SMLSPCTIMER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The attempt to create the quad-link fault recovery (QLFR) - switching module processor (SMP) system process (QLSP) cyclic timer failed.

Probable Cause:

The timer tag specified in the operating system for distributed switching (OSDS) function call was invalid.

Action:

Examine the data produced by the assert to determine the source of the problem.

394. SMLSPMGINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The quad-link fault recovery (QLFR) - switching module processor (SMP) system process (QLSP) received an invalid message.

Probable Cause:

The operating system for distributed switching (OSDS) sent the message to QLSP inappropriately or QLSP is not handling messages appropriately.

Action:

Examine the data produced by the assert to determine the source of the problem.

395. SMLSPOSRTN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The return code from an operating system for distributed switching (OSDS) function call was not the expected value.

Probable Cause:

The parameters used to call the OSDS function were invalid or the value returned was not expected by the calling function.

Action:

Examine the data produced by the assert to determine the source of the problem.

396. SMQLSPREASERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The reason parameter passed to the quad-link fault recovery (QLFR) - switching module processor (SMP) system process (QLSP) is invalid.

Probable Cause:

The operating system for distributed switching (OSDS) specified an invalid reason in the call to QLSP or the reason parameter was corrupted during the function call.

Action:

Examine the data produced by the assert to determine the source of the problem.

397. SMQLSPTMRINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The quad-link fault recovery (QLFR) - switching module processor (SMP) system process (QLSP) received a MGTIMER message with an invalid tag.

Probable Cause:

The operating system for distributed switching (OSDS) sent an invalid MGTIMER message QLSP or QLSP is not handling MGTIMER messages appropriately.

Action:

Examine the data produced by the assert to determine the source of the problem.

398. SMQLSTAINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The data delivery status of communication module (CM) hardware does not agree with the in-service/out-of-service status of the message handler QPIPE.

Probable Cause:

The data delivery status of the CM hardware is invalid or quad-link fault recovery (QLFR) - switching module processor (SMP) system process (QLSP) is not maintaining the message handler (MH) QPIPE properly.

Action:

Examine the data produced by the assert to determine the source of the problem.

399. SMQOSELNGTH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The call to OSSENDMSG() returned an error indicating that the length of the message to be sent was too large.

Probable Cause:

The calling function is attempting to send too large of a message.

Action:

Provide data to the next level of support.

400. SMQPACTCMOOS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A QPIPE for a network has transitioned to active. However, the communication module (CM/ONTIC) data delivery status indicates that there is CM hardware out-of-service (OOS). If this is true, then the QPIPE should not be active.

Probable Cause:

Data delivery is not being received before the quad-link fault recovery (QLFR) - switching module processor (SMP) CM reconfiguration timer times out.

Action:

Provide data to the next level of support.

401. SMQPDDTIMER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The attempt to create a timer to wait before sending a message handler (MH) QPIPE up or down message to the AM failed.

Probable Cause:

The time specified in the call to operating system for distributed switching (OSDS) was out of range.

Action:

Examine the data produced by the assert to determine the source of the problem.

402. SMQPRTINIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During initialization of the dynamic relation RLPORTCLSS, a static database inconsistency was found.

Data Structures:

RLCKT2CODE, RLPORTCLSS.

Action:

Three possible error scenarios exist:

1. The RLCKT2CODE tuple has a value of zero in the d_code, b1_code, or b2_code attribute. Zero is an illegal value. Update the attribute to a legal value, or delete the tuple.
2. The RLCKT2CODE tuple has a value in the d_code, b1_code, or b2_code attribute that is not found as a key in the

RLPORTCLSS relation. The rIORTCLSS tuple is missing and should be added, or the rICKT2CODE tuple should be updated to reference an existing rIORTCLSS tuple.

3. The rICKT2CODE tuple has a value in the d_code, b1_code, or b2_code attribute that matches the value in another rICKT2CODE tuple. Each portcode value should only be used once. Examine the RLCKT2CODE relation for repetitions, any repetitions must be removed by updating or deleting rICKT2CODE tuples.

403. SMQPSTINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The quad-link fault recovery (QLFR) - switching module processor (SMP) system process (QLSP) message handler (MH) QPIPE state is invalid.

Probable Cause:

The MH QPIPE state is being handled inappropriately by QLSP or the MH QPIPE state is being corrupted in memory.

Action:

Examine the data produced by the assert to determine the source of the problem.

404. SMQPUPINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The quad-link fault recovery (QLFR) - switching module processor (SMP) system process (QLSP) has received a message from QLFR-MH indicating that the message handler (MH) QPIPE has transition to in-service, however, the RLMHPIPE relation does not exist.

Probable Cause:

QLFR-MH was sent a MH QPIPE initialization message inappropriately or the office-dependent data (ODD) has been corrupted.

Action:

Examine the data produced by the assert to determine the source of the problem. If the RLMHPIPE relation should exist, then use ODBE to insert the relation.

405. SMRABADCKT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DGcleqid() equipment location (EQL) offset read failures occurred while processing trouble location procedure (TLP).

Probable Cause:

One of the TLP DGsmcktdrv() or DGcmcktdrv() keys (unit type, circuit type, change level indicator (CLI) or member number) was invalid or missing/wrong DG TLP CKT data.

Action:

Provide data to next level of support.

406. SMRABADEQL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DGsmintex() equipment location (EQL) offset read failures occurred while processing trouble location procedure (TLP).

Probable Cause:

one of the TLP DGsmeqldrv() or DGcmeqldrv() keys (unit type, circuit index, or member number) was invalid or missing EQL data.

Action:

Provide data to next level of support.

407. SMRACPS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Communication link fault recovery (CLFR)/AM sent an MGCPS message to the maintenance request administrator (MRA). A problem occurred in CLFR/AM or invalid fields are in the message.

408. SMRADBR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Database (DB) read failures occurred in the maintenance request administrator (MRA).

409. SMRADBW (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Database (DB) write failures occurred in the maintenance request administrator (MRA).

410. SMRAHDW (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMhdwrel() function failed to return current circuits in the maintenance request administrator (MRA).

411. SMRAHID (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMhrdid() function failed to retrieve a valid circuit type in the maintenance request administrator (MRA).

412. SMRAMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unrecognizable message type was received in the maintenance request administrator (MRA).

413. SMRAOS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Operating system for distributed switching (OSDS) failures occurred in the maintenance request administrator (MRA).

414. SMRAPCB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Peripheral control (PC) channel control block (CCB) request and release failures occurred in the maintenance request administrator (MRA).

415. SMRAPM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unrecognizable parameter was passed in a function in the maintenance request administrator (MRA). An aborted integrated services line unit (ISLU) common controller (CC) postmortem message may have left invalid data in the postmortem control table. Running the postmortem again with a manual request message should clear up the problem. Refer to the Input Manual pages for additional information.

416. SMRAPRL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Peripheral control (PC) release circuit failures occurred in the maintenance request administrator (MRA).

417. SMRAPRQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Peripheral control (PC) request for circuit failures occurred in the maintenance request administrator (MRA).

418. SMRAQUE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A problem was encountered in a queue in the maintenance request administrator (MRA).

419. SMRARTA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Routing and terminal allocation (RTA) primitive failures occurred in the maintenance request administrator (MRA).

420. SMRATM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Terminal maintenance (TM) failures occurred in the maintenance request administrator (MRA).

421. SMRAUID (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unrecognizable unit ID was sent to the maintenance request administrator (MRA).

422. SMRAVB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unrecognizable verb was sent to the maintenance request administrator (MRA).

423. SMRAXRF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A cross reference list problem was encountered in the maintenance request administrator (MRA).

424. SMRDACT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfrdtup() function failed when accessing the RLSMEST relation for a new active gated diode crosspoints (GDX) controller.

425. SMRDFHINIT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The RDFH system process was entered with other than the accepted initialization types.

426. SMRDFHMAIN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The system process (RDFH) main work routine received a response other than type "OSMSG".

427. SMRDFHTCSC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the RLCGA_STAT or RLSMEST relation in one of the remote digital facility interface (RDFI) handler routines.

428. SMRDFHUXP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The main work routine of the RDFH system process received an illegal or unexpected operating system for distributed switching (OSDS) message.

429. SMRDMATE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfrdtup() function failed when accessing the RLSMEST relation for the mate gated diode crosspoints (GDX) controller.

430. SMRDNINIT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMstfst() or SMstnxt() function failed to read the RLCKTDATA relation. An error exists in the office-dependent data (ODD) dictionary.

Data Structures:

RLCKTDATA.

The first two bytes of the first data dump contain the database (DB) return code. The second data dump contains the RLCKTDATA tuple that failed.

Action:

Seek assistance from the product engineering control center (PECC). If this problem occurs during retrofit, stop. The ODD must be rebuilt with the proper version of the DBgen tool.

431. SMREASERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

In the switch maintenance for the SM (SMIM) subsystem, an unexpected reason was encountered for the initialization of a SMIM system process.

432. SMRLNKRET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMdet_rlnk() function returned an illegal value to the SMlk_start() function in a remote SM (RSM). The manual RSM communication link (CLNK) restoration will fail with a "TIMEOUT BEFORE PROTOCOL ESTABLISHED" response.

433. SMROTPNF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMprtsi() function indicated that a digital carrier line unit (DCLU) service group had a peripheral interface data bus (PIDB) parity error. The array containing the parity error information (smprrotpar.entry[]) is empty.

434. SMRSM2HTU (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was detected between the RLHTU2RSM relation and the RLRS2HTU relation.

Probable Cause:

No rLRSM2HTU tuple was found for the given host transport unit number.

Action:

The rLRSM2HTU tuple which is keyed by rLHTU2RSM.rsm_num was not found. Verify that the rLHTU2RSM tuple is correct and insert the corresponding rLRSM2HTU tuple.

435. SMRSMCHALLOC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CHALLOC	Audit Mode: elev

Problem:

The channel data block (CHDB) busy/idle bit map was in error for one of the remote SM (RSM) CHDBs.

436. SMRSMCHDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CHDB	Audit Mode: elev

Problem:

The channel data block (CHDB) for one of the remote SM (RSM) communication links is in error. The CHDB is being used by another user.

437. SMRSMCOMM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the RLHMRSMCL relation in one of the host digital facility interface (HDFI) handler routines.

438. SMRSM_NAILUP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the RLCKTDATA, RLRS2CHAN, or RLHMRSMCL relation before "nailing up" a control time slot through the host SM (HSM).

439. SMRSMPCBLA (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: CHDB	Audit Mode: elev

Problem:

One of the remote SM (RSM) communication link channel data blocks (CHDBs) is being used by another process. That process is purged.

440. SMS96A01 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

SM system process (S96M) was created with an invalid reason.

441. SMS96A02 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return was received from the OSTIMER() macro due to invalid parameters.

442. SMS96A03 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid maintenance request administrator (MRA) request was received by the SLC® 96 protection line switch process.

443. SMS96A04 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

SM system process (S96M) received a message with an invalid message type.

444. SMS96A05 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SLC®-96 remote terminal (RT) circuit name derived from the message received by the S96M system process is invalid.

445. SMS96A06 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

The S96M system process received a failure return from the DBfrdtup() function when trying to read the RLSMEST dynamic relation for T1 line states.

446. SMS96A07 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The S96M system process received a control interface (CI) scan message that reported activity on a channel control block (CCB) location. This process should not have received the message.

447. SMS96A08 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

A system process found an inconsistency between the RLS96EQUIP static relation and the RLSMEST dynamic relation on unequipped states of a circuit.

448. SMS96A09 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DFISHELF	Audit Mode: elev

Problem:

The S96M system process could not create a protection line switch process. An audit of the RLS96DFI and RLS96SHELF dynamic relations is requested.

449. SMS96A10 (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: DFISHELF	Audit Mode: elev

Problem:

A system process could not read the RLS96DFI dynamic relation in order to determine the serving shelf, or the value read for the serving shelf was not valid (0xFFFF), indicating that a DCLU PLS process may have been purged.

450. SMS96A10 (5E13 only)

Recovery Action: rpi	SPP: n	Audit: DFISHELF	Audit Mode: elev

Problem:

A system process could not read the RLS96DFI dynamic relation in order to determine the serving shelf.

451. SMS96A10 (5E11 to 5E12)

Recovery Action: rpi	SPP: n	Audit: DFISHELF	Audit Mode: elev

Problem:

A system process could not read the RLS96DFI dynamic relation in order to determine the serving shelf, or the value read for the serving shelf was not valid (0xFFFF), indicating that a DCLU PLS process may have been purged.

452. SMS96A11 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A system process could not create a protection line switch due to operating system for distributed switching (OSDS) calls in the SMS96cr_pl() function (the create protection line process).

453. SMS96A13 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DFISHELF	Audit Mode: elev

Problem:

A system process could not read the RLS96SHELF dynamic relation containing the shelf name to get the serving digital facility interface (DFI).

454. SMS96A14 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The S96M system process could not resolve a bank state for the remote terminal.

455. SMS96A17 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DFISHELF	Audit Mode: elev

Problem:

A system process could not read the RLS96SHELF dynamic relation; therefore, the current state of the serving T1 line could not be determined.

456. SMS96A18 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

A system process could not read the RLSMEST dynamic relation for the T1 line circuit state.

457. SMS96A19 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

A system process could not read the RLSMEST dynamic relation to determine the circuit state of the T1 line currently serving the shelf.

458. SMS96A21 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return from the OSSENDMSG() macro restricted a system process from sending a remove or restore message to the maintenance request administrator (MRA). The bank state could not be changed and the system process must try again later.

459. SMS96A22 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return from the OSSENDMSG() macro restricted a system process from sending a remove or restore message to the maintenance request administrator (MRA) for the shelf circuit. Therefore, the shelf circuit could not be changed and the system process must try again later.

460. SMS96A24 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was detected in the population of the RLS96EQUIP relation.

Data Structures:

RLS96EQUIP.

Action:

The population of the RLS96EQUIP relation violated the population rules. These are the specific checks that can cause this assert:

1. If the rls96EQUIP tuple exists, the bank0mode attribute must not be PCUNEQ (=0).
2. If the bank0mode attribute is PCMODE1 (=1) or PCMODE2 (=2), the dfia attribute must be non-zero.
3. If the bank0mode attribute is PCMODE2, the dfib attribute must be zero.
4. If the bank1mode attribute is PCMODE1 or PCMODE2, either the dfic or dfid attribute must be non-zero.
5. If the bank1mode attribute is PCMODE2, the dfic attribute must be non-zero and the dfid attribute must be zero.

6. If the bank1mode attribute is PCUNEQ, both the dfic and dfid attributes must be zero.

If the rules regarding bank 0 are violated, the data found in the rIS96EQUIP tuple for bank 0, the A-subscriber digital facility interface (SDFI), and the B-SDFI are printed. Otherwise, the data for bank 1 was in error, so the data for bank 1, the C-SDFI, and the D-SDFI will be given. In both cases, the remote terminal (RT) internal circuit name will be provided. Use the RT name to look at its rIS96EQUIP tuple and resolve the inconsistency. Change the bank mode, put in the appropriate SDFI name, zero out the appropriate SDFI name, or delete the tuple.

461. SMS96A25 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A timer message was encountered, so the RLS96EQUIP relation could not be read.

462. SMS96A30 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfrdtup() function returned an error code when the SMreport() function tried to read the RLS96EQUIP relation. The internal name for the remote terminal (RT) involved is dumped.

463. SMS96A31 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DFISHELF	Audit Mode: elev

Problem:

The DBfrdtup() function returned an error code when the SMreport() function tried to access the RLS96DFI relation.

464. SMS96A32 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DFISHELF	Audit Mode: elev

Problem:

The DBfrdtup() function returned an error code when the SMreport() function tried to access the RLS96SHELF relation.

465. SMS96A34 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

The DBfrdtup() function returned an error code when the SMreport() function tried to access the RLSMEST relation for a subscriber digital facility interface (S-DFI).

466. SMS96A35 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

The DBfrdtup() function returned an error code when the SMreport() function tried to access the RLSMEST relation for a T1 facility.

467. SMS96A36 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The *SLC*[®]-96 report module was passed an invalid remote terminal (RT) name and cannot formulate a message. There may be a problem in RT and T1 peripheral fault recovery (PFR), or in the maintenance request administrator (MRA).

468. SMS96A51 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was detected in the RLS96EQUIP relation.

Data Structures:

RLS96EQUIP.

Action:

During initialization, the function that populates the dynamic relations RLS96DFI and RLS96SHELF discovered an inconsistency. Although the rIS96EQUIP tuple has a bank0mode attribute that is PCMODE1 (=1) or PCMODE2 (=2), the dfia attribute is zero. Either the A-subscriber digital facility interface (SDFI) name should be entered in the dfia attribute, or the tuple should be deleted.

469. SMS96A60 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMS96pls() terminal process was created with an invalid entry reason.

470. SMS96A61 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMS96pls() terminal process did not get a protection line switch (PLS) request from the SMS96m() system process.

471. SMS96A62 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DFISHELF	Audit Mode: elev

Problem:

An error occurred in setting the keys used to read the RLS96SHELF dynamic relation, or the rIS96SHELF tuple is missing for the named *SLC*[®]-96 shelf or bank.

472. SMS96A63 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMS96pls() terminal process failed to find an rIS96EQUIP tuple for the named *SLC*[®]-96 remote terminal (RT). The RT internal circuit name (the key to the rIS96EQUIP tuple) will be dumped in the first four digits in the data dump.

Data Structures:

RLS96EQUIP.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data set for the keys in the RLS96EQUIP relation with the actual key used to access the relation.

473. SMS96A64 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DFISHELF	Audit Mode: elev

Problem:

An error occurred in setting the keys used to read the dynamic relation RLS96DFI, or the rLS96DFI tuple is missing for the subscriber digital facility interface (S-DFI).

474. SMS96A65 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

An error occurred in setting the keys used to read the dynamic relation RLSMEST or the rLSMEST tuple is missing for the subscriber digital facility interface (S-DFI) or the SLC[®]-96 facility.

475. SMS96A66 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DFISHELF	Audit Mode: elev

Problem:

An error occurred in setting the keys used to read the dynamic relation RLS96SHELF, or the rLS96SHELF tuple is missing for the named SLC[®]-96 shelf or bank.

476. SMS96A67 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

An error occurred in setting the keys used to read the RLCKTDATA relation or the rLCKTDATA tuple is missing for the named subscriber digital facility interface (S-DFI). The name will be in the first short in the data dump.

Action:

Use RC/V (or ODBE, if necessary) to cross-check the data set for the keys in the static relation RLCKTDATA with the actual keys used to access the relation.

477. SMS96A68 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CHDB	Audit Mode: elev

Problem:

An error occurred in setting the keys used to read the dynamic relation RLCHDB or the rLCHDB tuple is missing.

478. SMS96A69 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

An error occurred in setting the keys used to read the dynamic relation RLCDBCOM or the rLCDBCOM tuple is missing.

479. SMS96BASEFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BASE	Audit Mode: elev

Problem:

The DBfrdup() function returned DBNOMATCH when reading the RLS96BASE relation. The relation may have been accessed with an invalid digital carrier line unit (DCLU) unit number and service group number.

480. SMS96CKT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was detected between the RLCKTDATA relation and the RLS96EQUIP relation.

Data Structures:

RLCKTDATA, RLS96EQUIP.

Action:

The population of the SM relations RLCKTDATA and RLS96EQUIP violated the population rules. The specific checks that can cause this assert are as follows.

1. An rLS96EQUIP tuple does not have a corresponding rLCKTDATA tuple for the A-shelf (or AB bank if mode2).
2. An rLS96EQUIP tuple contains an A-subscriber digital facilities interface (SDFI) name attribute that does not have an rLCKTDATA tuple.

In the first case, the remote terminal (RT) internal name and the A-shelf (AB bank if mode2) internal name will be provided. Use the A-shelf name to access the RLCKTDATA relation and use the RT internal name to access the RLS96EQUIP relation. Resolve the inconsistency by inserting an A-shelf rLCKTDATA tuple or by deleting the RT rLS96EQUIP tuple.

In the second case, the RT internal name and the A-SDFI internal name will be provided. Use the A-SDFI name to access the RLCKTDATA relation and use the RT internal name to access the RLS96EQUIP relation. Resolve the inconsistency by inserting an A-SDFI rLCKTDATA tuple or by deleting the RT rLS96EQUIP tuple.

481. SMS96CTO (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

A camp-on timeout occurred during a restoration or removal of a SLC[®]-96 shelf or bank circuit. Ports associated with this unit may have been left in an inconsistent state.

482. SMSENDMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSENDMSG() macro failed.

483. SMSEPSMEST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the RLSMEST relation in the SMclsep() function.

484. SMSGN_NAMENM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The switch maintenance for the switching module (SMIM) database (DB) read macro returned a null service group number when a valid service group number was expected.

485. SMSLCKTERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The digital carrier line unit (DCLU) error analysis function detected an unexpected circuit ID (non-SLC[®] circuit type) in a post-mortem buffer. The contents of the input message to peripheral fault recovery (PFR) and the contents of the PFR post mortem buffer are dumped.

486. SMSLERRNOIMPCK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The digital carrier line unit (DCLU) error analysis function was called to analyze a post-mortem buffer report that contained no implicated circuits. The contents of the input message to peripheral fault recovery (PFR) and the contents of the PFR post-mortem buffer are dumped.

487. SMSLERRTYPERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The digital carrier line unit (DCLU) error analysis function received an error type that could not be mapped to a post-mortem report error type. The invalid error type received by the DCLU error analysis function, the contents of the input message to peripheral fault recovery (PFR), and the contents of the PFR post-mortem buffer are dumped.

488. SMSLPRCOUNTERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMprcount() function returned an invalid or unexpected code to one of the digital carrier line unit (DCLU) error analysis functions. The invalid return code from the SMprcount() function, the contents of the input message to peripheral fault recovery (PFR), and the contents of the PFR post mortem buffer are dumped.

489. SMSLRCVYACTERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The digital carrier line unit (DCLU) error recovery function detected an unexpected action in a post mortem buffer. The contents of the input message to peripheral fault recovery (PFR), the contents of the PFR post mortem buffer type 1, and the contents of the PFR post mortem buffer type 2 are dumped.

490. SMSLTHRESHERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid threshold value was returned by the digital carrier line unit (DCLU) threshold function.

491. SMSPPFAUD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A signal processor (SP) had one or more of the following problems: ignore link control bit A, ignore link control bit B, or peripheral control (PC) scanning was incorrectly set. The register dump for SMsp_aud() contains the following information which is dependent on compiler changes:

%d3 = SP number

%d4 = Network link interface (NLI) number if the local lnk1_use is the TS_NLI enum

%d5 = SP link 1 number

%d6 = Expected state of link A

%d7 = Expected state of link B

%a2 = SP base address

%a3 = Actual state of link B

%a4 = Actual state of link A

%a5 = State of the SP control random access memory (RAM) inhibit link access bit (should always be 0)

Only local data is provided in the stack frame because no arguments are passed to the audit function. The stack local data is provided as follows (note on data marked swabbed, reverse first and second byte): LOCAL DATA: aaaabbcc

NAME	KEY	LOCATION
opr_sps	a	-2(%fp) to -1(%fp) [swabbed]
lnk1_use	b	-3(%fp)
lnk2_use	c	-4(%fp)

The opr_sps is the last operational SP to be audited and will be the maximum value for the SP number. The registers for iglka and iglkb are the values set in the hardware for the ignore link control bits A and B. The variables lnk1_use and lnk2_use are the uses for link A and link B respectively on the SP. The enumeration values are as follows:

VALUE	ENUM	USE
0	TS_NO_TSIS	No equipped time slot interchanger board
1	TS_UNEQ	Unequipped SP links
2	TS_NLI	NLI
3	TS_DX	Data expansion (DX)
4	TS_MCP	Messaging, central processor intervention, and pump (MCP)
5	TS_LOOP	Loop-back time slots

The problem source can be determined by comparing the expected state of the inspected bits to their actual state to find the non-matching set. If none of these tests fails, then scanning was not allowed on the SP. The conditions to test for are as follows:

1) expected of link A should equal the actual state of link A

2) expected of link B should equal the actual state of link B

3) SP control RAM inhibit link access bit should equal 0

Probable Cause:

A wild write or a purge of SP FIFO fault recovery while handling an SP FIFO full condition would cause problems with scanning, link A or link B. The SP control RAM inhibit link access bit may be set if the hardware is faulty or a software problem exists.

Action:

For sporadic occurrences of this problem, no action is required because the software corrects the problem. However, if the assert continues regularly then a software or hardware problem exists and technical assistance is needed.

492. SMSPLESEQINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The link establishment (LE) message received is inappropriate for the current state of the link indicating the sequence is out of order.

Probable Cause:

May have missed a message relating to this link or could be a spurious message.

Action:

Examine the data dumped to determine the source of the problem

493. SMSPRSMEST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Read failure on SMEST relation in ISLU2 sparing action.

494. SMSWBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the SMfr_mctsi() function, the remove reason found in the variable SMas_sftw_sw was not valid.

495. SMTBLBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PHDSLGP	Audit Mode: elev

Problem:

An inconsistency was found in the SMph_dslgp[] and/or SMdslgp_ph[] global arrays.

496. SMTRCUAUD (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert indicates that the transmission rate converter unit (TRCU) check, performed by the function SMtrcu_aud(), found a mismatch between the data structures used to identify the TRCU type(s) that the SM supports and the data in the RLTRCUPATH relation within the ODD.

Probable Cause:

This assert indicates that some software error has occurred or that the audited data structures have been corrupted.

Action:

No action is required. This assert is intended to provide information to the next level of support if the problem persists. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual. In addition to printing this assert, the function SMtrcu_aud() has also performed corrective action in an attempt to prevent this error from re-occurring.

497. SMTSIBUT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid unit type was communicated to the SMprtsi() function by the SMpr() function.

498. SMTSIDBF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The database subsystem (DB) returned an invalid value to the SMprtsi() function.

499. SMTSIUNLK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Parity checking is allowed (and errors are generated) on peripheral channels, but the software could not find an owning circuit for this timeslot/channel. Channel data blocks (CHDBs), peripheral interface data bus (PIDB) timeslot data blocks (PTSBs), and the RLHMRSML relation can all claim a timeslot.

Data Structures:

RLHMRSML.

The SMts[] array contains the information dumped to the ROP. SMts[] is an array of shorts (two bytes each); the first two entries are the event number of the PIDB parity interrupt (REPT:SM-HWLVL, TSI DI-ERR-BUFF) and the number of valid entries in SMts[]. Succeeding shorts contain the PIDB number in the bottom digit and the channel number in the first three digits. To get a "system PIDB number" as used in the RLCKTDATA and RLPICB relations, invert the bottom bit of the channel number, multiply by 16, and add to the PIDB number.

Action:

Check the office-dependent data (ODD) for multiple definitions of some circuits. Possibly, multiple ports are defined with the same offset (for example, channel 4), different circuit names (different PICBs), and the same base address (RLCKTDATA).

There may be a software problem, in which case the information of the associated timeslot interchange (TSI) interrupt should be examined. If some data is not printed due to message size limitations or brevity control, the SMts[] array may be dumped manually (dump:ut:sm).

500. SMTSMKERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

One or more time slot interchange (TSI) registers had bits set that cause errors to be inhibited. These bits should never be set, as interrupt inhibit administrator (IIA) owns all error inhibiting functionality. The DX register checked is

the TSDXDNC (diagnostic control register). The signal processor (SP) register checked is the SPCNTL (SP control register).

Probable Cause:

Software error. Non-IIA owned TSI registers were erroneously set.

Action:

None. The registers in questions were cleaned up. A bit map of the DX/SPs in error is dumped as part of the assert register dump (register d4). The DXs in error are identified in the lower byte and the SPs in error in bytes one through three.

501. SMUNEXPCAL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected call was made to dead code (a stubbed out function). The function returns OSNOTLOADED if it is of type RET_VAL (hdr/db/GLretrns.G).

502. SMUNITDATNM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBfrdtup() returned a DBNO_MATCH when a valid circuit was expected in RLUNITDATA.

503. SMUNKRCVY (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Bad parameter (recovery action) passed to SMtura_cont.

504. SMUNKRQST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A restore request was received from an unrecognized source (that is, an unknown message type). The message buffer contents appear with the data dump for this event.

505. SMUPACT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfuptup() function failed when accessing the RLSMEST relation for a new active gated diode crosspoints (GDX) controller.

506. SMUPMATE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfuptup() function failed when accessing the RLSMEST relation for the mate gated diode crosspoints (GDX) controller.

507. SMUTYPEBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unrecognized unit type was detected. The specific unit type value in question may be determined based on the contents of the run-time data structure included in the dump.

508. SMVER_CONN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the RLRCB_HCB relation when verifying the connection of a remote digital facility interface (RDFI) with its associated host DFI (HDFI).

509. SMWREASON (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The terminal process GLPGSMLB was created with an invalid entry reason. The SM or the user mistakenly called the SMIb_entry() function. This assert precedes a call to the OSSUICIDE() macro to prevent the SMIb_entry() function from being executed unexpectedly.

510. SMXRFAUDERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert is used to indicate that the function SMxrf_aud() found some type of error.

Data Structures:

RLCKTDATA, SMxrf_config, SMxrf_dli[].

Action:

No action is required. This assert is intended to provide information to the next level of support if the problem persists. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

511. SMXRHSMISMATCH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert is used to indicate that the function SMxrf_aud() has found an inconsistency between the TSICOM's CLI value in the ODD and the hardware status reflected in the TSICOM's clock control register.

Data Structures:

RLCKTDATA, SMtscmver[]

Action:

The probable cause of this assert is the berg on the back of the TSICOM that brings the external references into the TSI has been disconnected. This causes the hardware to believe that external references aren't being used, while the TSICOM's CLI has either bit 2 or 3 set which causes most of the software to believe that they are. The TSICOM's clock control register and version register, as well as the TSICOM's CLI value will all be dumped to the ROP with this assert. In addition, the affected TSI's circuit name will also be printed. A circuit name of 0x34 indicates that the inconsistency was found with the TSICOM on side 0 and a value of 0x54 indicates that the problem was

identified with side 1.

Range: smkp**1. CHBUGACTION (5E11 and later)**

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid action field was found in a message to a core strategy system process (SPP).

2. CHBUGAQUAL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid action qualifier field was found in a message to a core strategy system process (SSP).

3. CHBUGCLASS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid event class was found in a message to a core strategy system process (SPP).

4. CHBUGCSTENTRY_ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid entry was found in a core strategy table.

5. CHBUGDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Office network and timing complex (ONTC) strategy system process (SSP) or time multiplexed switch (TMS) CON received a LOAD UT TMS command with either an invalid command count (first byte dumped) or an invalid length (second byte dumped).

Probable Cause:

Software error.

Action:

Seek technical assistance. Stop attempting "load UT" commands until the problem is resolved.

6. CHBUGEID (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid event index was encountered. An invalid return was received from the CHsspasync() function.

7. CHBUGEINITYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid software initialization type was encountered for a core switch maintenance error recognition (SMER) process.

8. CHBUGERRTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid error type field was found in a message to a core strategy system process (SSP).

9. CHBUGESIDE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid eqid.lev0unum field was found in a message to a core switch maintenance error recognition (SMER) process.

10. CHBUGESMTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message type parameter was passed to the CHesync() function.

11. CHBUGEUNIT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid eqid.unit field was found in a message to a core switch maintenance error recognition (SMER) process.

12. CHBUGEVCAUSE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid event cause was returned from the CHerasync() function.

13. CHBUGINITYPE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid software initialization type was encountered for a core strategy system process (SSP).

14. CHBUGMMSTATE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid core state was encountered for min mode.

15. CHBUGMSGTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The office network timing and control (ONTC) strategy system process (SSP) switch maintenance analysis and recovery strategic process has received a message with an unexpected message type.

Probable Cause:

Either the sending process sent the message in error or the ONTC SSP has gotten out of synchronization between the CHsspasync() and CHsyncmsg() functions.

Action:

This assert has been added to simplify the debugging of a bad message. This is an informational assert indicating a software problem. No action can be taken other than analyzing the erroneous message, which is dumped by this assert in data block 1.

16. CHBUGNCCRTN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid reason field was found in an acknowledgment from the network clock configuration (NCCON) process.

17. CHBUGOOSERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A core out-of-service (OOS) side error threshold was exceeded.

18. CHBUGOSSRTN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return was received from the OSSENDMSG() macro.

19. CHBUGOSWRTN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The return message from the OSWGETFROM() or OSWGETMSG() macro was not the OSMSG message type.

20. CHBUGPF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid percent fail value was encountered for core.

21. CHBUGPOSTPARM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid event type parameter was passed from the CHercntrl() function.

22. CHBUGREAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The office network timing complex (ONTC) strategy system process (SSP) received a failure return from the SMddread() or DDread() function.

23. CHBUGSIDE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid eqid.lev0unum field was found in a message to a core strategy system process (SSP).

24. CHBUGSMNUM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The office network timing complex (ONTC) strategy system process (SSP) received a request with an invalid SM number, or a failure return from the SMddread() or DDread() function with an invalid SM number.

25. CHBUGSMRTN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return was received from the CHsyncmsg() function.

26. CHBUGSMTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid parameter was encountered on a CHsyncmsg() function call.

27. CHBUGSTATE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The office network timing complex (ONTC) state was invalid when the ONTC strategy system process (SSP) received a request.

28. CHBUGTOCAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The office network timing complex (ONTC) strategy system process (SPP) is waiting for an acknowledgement message for configuration administration (CAD).

29. CHBUGTOIIA (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

The office network timing complex (ONTC) strategy system process (SSP) detected a timeout of the interrupt inhibit administrator (IIA) process during inhibit (INH)/allow (ALW) action.

30. CHBUGUDGR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The office network timing complex (ONTC) strategy system process (SSP) detected an ONTC in a degraded (DGRD) state when it should have been in an active (ACT) state. The ONTC is updated to ACT.

31. CHBUGUNIT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid unit field was found in a message to a core strategy system process (SSP).

32. CHBUGWRITE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The office network timing complex (ONTC) strategy system process (SSP) received a failure return from the SMddwrite() or DDwrite() function.

33. PIASTACT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message action was requested.

34. PIASTCMD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid central processor intervention (CPI) command was requested.

35. PIASTDBR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred during a database (DB) read.

36. PIASTELP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Data collected during central processor intervention (CPI) broadcast was corrupted.

37. PIASTLLS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred while determining the logical link status.

38. PIASTMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message return or message type was received in the central processor intervention (CPI) strategy system process (SPP).

39. PIASTREA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid reason for process was encountered.

40. PIASTSRC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message source was encountered.

41. PIASTST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid program state was encountered.

42. PIASTTRG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid SM number was received from a data delivery (DD) trigger function.

43. SM2WAYTMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMddwrite() function returned an invalid completion code while attempting to write the time multiplexed switch (TMS) 2-way connect flag.

44. SMARBARG (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid parameter was found on entry to switch maintenance analysis and recovery strategies (SMARS). The parameter should be OSRSPP (single process purge) or OSRREPLACE (due to initialization).

45. SMARBDON (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The done message or the done and reschedule message did not match the in-progress queue entry.

46. SMARBETY (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The event type field in the SMERMSG message structure was invalid or out of range.

47. SMARBRET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The return value from the OSWGETMSG() macro was not OSMSG.

48. SMARBRSN (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The reason for entry to switch maintenance analysis and recovery strategies (SMARS) was invalid. The reason should be OSRREPLACE.

49. SMARBSND (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSENDMSG() macro returned a failure code other than a resource problem.

50. SMARQDAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The switch maintenance analysis and recovery strategies (SMARS) queue data was inconsistent or invalid.

51. SMARSSPT (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: PCD	Audit Mode: elev

Problem:

On strategy system process (SSP) timeout, the SSP is purged to allow processing to continue.

52. SMBADACTTMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown action field was found in the received message.

53. SMBADNEQTMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A fixed number of equipage commands required for degrading was not returned by the time multiplexed switch (TMS) hardware.

54. SMBADODD (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While reading relation RL GSM_OPC in ODD an indexing error occurred.

Probable Cause:

Bad originating point code relations in the ODD.

Action:

Check relation RL GSM_OPC in ODD. Get help from next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

55. SMBADREASON (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The reason code for a recent change trigger was not insert, delete or update.

Probable Cause:

Software error.

Action:

Report problem to next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

56. SMBADTMSFUNC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The time multiplexed switch configuration (TMSCON) process was requested to perform an unknown function.

57. SMBADUNITTMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown unit field was found in the received message.

58. SMC5DBNOK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Configuration administration (CAD) received a failure return from the SMddread() function.

59. SMC5DETIME (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Configuration administration (CAD) received an unexpected return from the OSDETIMER() macro.

60. SMC5ELGTH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Configuration administration (CAD) received an unexpected return from the operating system for distributed switching (OSDS); the length of the message sent or received was greater than allocated.

61. SMC5ELOOP (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Activation of a configuration administration (CAD) driver resulted in a looping error.

62. SMC5EPROC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Configuration administration (CAD) received an invalid process ID in a return from the operating system for distributed switching (OSDS).

63. SMC5FEXEC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

The configuration administration (CAD) driver failed to activate.

64. SMC5IABT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Configuration administration (CAD) received an abort message with an unexpected process identifier (PID).

65. SMC5IBACK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The configuration administration (CAD) driver was not expecting an acknowledgement message.

66. SMC5IBLK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Configuration administration (CAD) received a new request message while it was busy processing a request. CAD can only process one request at time.

67. SMC5IBNR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The configuration administration (CAD) driver was busy when a new request was received.

68. SMC5ICHID (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The configuration administration (CAD) child driver was not recognized.

69. SMC5IDREAS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Configuration administration (CAD) detected an invalid driver activation reason.

70. SMC5IDRID (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Configuration administration (CAD) detected an invalid driver value.

71. SMC5IDTCC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Configuration administration (CAD) detected an invalid timer tag value.

72. SMC5IEARG (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A configuration administration (CAD) entry routine was invoked with an invalid parameter.

73. SMC5IEQID (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Configuration administration (CAD) internally detected an invalid equipment ID.

74. SMC5IEREAS (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A configuration administration (CAD) entry routine was invoked with an invalid reason.

75. SMC5IEVMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Configuration administration (CAD) received a message with an invalid event number; the event number was equal to 0, or an acknowledging message's event number did not match the original event number that was expected.

76. SMC5IFPC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

No active foundation peripheral controllers (FPCs) were available to connect to the control and diagnostic access link (CDAL) for an office network timing complex (ONTC) configuration.

77. SMC5IMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Configuration administration (CAD) received a request message, but could not find a routine to process it. CAD received an invalid unit and/or action and/or action qualifier.

78. SMC5IMSTY (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Configuration administration (CAD) was invoked with an invalid message type.

79. SMC5IMTAG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Configuration administration (CAD) detected an invalid message buffer index value. The CAD's message buffer will not be freed.

80. SMC5IRCV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Configuration administration (CAD) received an invalid return value from the operating system for distributed switching (OSDS).

81. SMC5ISMTHD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Configuration administration (CAD) internally detected an invalid search method.

82. SMC5ISND (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Configuration administration (CAD) received an invalid return from the OSSENDMSG() macro.

83. SMC5ITIMER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Configuration administration (CAD) received a timer message that was not recognized.

84. SMC5ITRNG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Configuration administration (CAD) received an unexpected timer return range from the operating system for distributed switching (OSDS).

85. SMC5MSTE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Configuration administration (CAD) received an unexpected timer error from the operating system for distributed switching (OSDS).

86. SMC5NOMBUF (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Configuration administration (CAD) could not find a free message buffer to save the original request message.

87. SMC5NOTCC (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Configuration administration (CAD) could not find a free timing cell.

88. SMC5STRAY (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Configuration administration (CAD) received a stray acknowledgement message.

89. SMC5TCLC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CLNK	Audit Mode: elev

Problem:

Configuration administration (CAD) timed out on communication link configuration (CLCON).

90. SMC5TDLI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DLI	Audit Mode: elev

Problem:

Configuration administration (CAD) timed out on dual link interface configuration (DLICON).

91. SMC5TDRVR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

The configuration administration (CAD) driver timed out.

92. SMC5TFPC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

Configuration administration (CAD) timed out on foundation peripheral controller configuration (FPCCON).

93. SMC5TIIA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

Configuration administration (CAD) timed out on the interrupt inhibit administrator (IIA).

94. SMC5TLI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

Configuration administration (CAD) timed out on link interface configuration (LICON).

95. SMC5TMI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

Configuration administration (CAD) timed out on message interface configuration (MICON).

96. SMC5TMMP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

Configuration administration (CAD) timed out on module message processor configuration (MMPCON).

97. SMC5TMSC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

Configuration administration (CAD) timed out on message switch control unit configuration (MSCUCON).

98. SMC5TNC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

Configuration administration (CAD) timed out on network clock configuration (NCCON).

99. SMC5TPIP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Configuration administration (CAD) timed out on CMP configuration (CMPCON).

100. SMC5TPPC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

Configuration administration (CAD) timed out on pump peripheral controller configuration (PPCCON).

101. SMC5TQGP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

The configuration administration (CAD) process in switch maintenance kernel process (SMKP) timed out while waiting for quad gateway processor fault recovery controller (GPCON).

Action:

None

102. SMC5TQLC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: QLNK	Audit Mode: elev

Problem:

The configuration administration (CAD) process in switch maintenance kernel process (SMKP) timed out while waiting for quad-link fault recovery controller (QLCON).

Action:

None

103. SMC5TTMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TMSLNK	Audit Mode: elev

Problem:

Configuration administration (CAD) timed out on time multiplexed switch configuration (TMSCON).

104. SMCLACKMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to send an acknowledgement message from the SMclmanual() function.

105. SMCLBADLK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid link was specified as input to the interrupt inhibit function SMia_clim() for communication links.

106. SMCLBADMSG (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The operating system for distributed switching (OSDS) returned an invalid value when the SMclcon() process was waiting "forever" for a message.

107. SMCLBADSRC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid source field was specified in a message.

108. SMCLBIMO (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No SM relation was found for an SM that was in a synchronous data link controller (SDLC) relation.

109. SMCLBIMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid SM number in a switch logical links message was sent to the SMclcon() function.

110. SMCLBNMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid value was in the action field of a request message to communication link normalization (CLNORM).

111. SMCLBOSRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return value was received from an operating system for distributed switching (OSDS) message receiving primitive.

112. SMCLBRMV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid identifier was found in a remove message that was sent to the SMclcon() function.

113. SMCLBRST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid unit identifier was found in a restore message that was sent to the SMclcon() function.

114. SMCLCADMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return was received when trying to send configuration administration (CAD) a message.

115. SMCLCADRTN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to send a message to configuration administration (CAD).

116. SMCLCINVAL (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid reason was passed for the SMclcon() function entry.

117. SMCLDB1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMddwrite() function failed to write the communication link state to the link map.

118. SMCLDB2 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read static data from the RLSSDLC relation.

119. SMCLDB3 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMddread() function failed for a logical link map read.

120. SMCLDB4 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A logical link map write returned a failure.

121. SMCLDB8 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return was received from the DBfrdtup() function when it was called by communication link (CL) switch maintenance error recognition (SMER) to read the RLSSDLC relation. No SM number could be found which matched the control time slot specified in an SM link error message. This error may occur when the SM loses its A flip-flop.

122. SMCLDBO (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMddread() function returned an unknown state of the communication link from the link map.

123. SMCLDD1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMddread() function failed during a communication link action.

124. SMCLDDREAD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return was received from the SMddread() function. The SMddread() return code will be in the first report data message, and the link map eqid parameter will be in the second message.

125. SMCLDELTIM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A problem occurred with killing an operating system for distributed switching (OSDS) timer in the communication link normalization (CLNORM) system process. Either the timer did not exist, or was already expired.

126. SMCLDMAMMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to send deferred maintenance administrator and monitor (DMAN) an acknowledgement message after a restore function.

127. SMCLEIMMSG (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Communication link (CL) switch maintenance error recognition (SMER) received an invalid link identifier in an SM level 2 error message. The error message will be dumped.

128. SMCLERRMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Communication link (CL) switch maintenance error recognition (SMER) received an invalid failure type in an SM end to end communication failure message.

129. SMCLESEND (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return code was received from the OSSENDMSG() macro in communication link (CL) switch maintenance error recognition (SMER) or switch maintenance analysis and recovery strategies (SMARS). The OSSENDMSG() return code will be in the first report data message, the topid parameter will be in the second report data message, and the message will be in the third report data message.

130. SMCLEWAIT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from the OSWAIT() macro in communication link (CL) switch maintenance error recognition (SMER) or switch maintenance analysis and recovery strategies (SMARS). The process already received an out-of-msg-buffers response from the OSSENDMSG() macro, and was waiting a short time before sending another message when it received a failure return from OSWAIT(). The OSWAIT() return code will be dumped.

131. SMCLFPCMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to send a message to the foundation peripheral controller (FPC) handler in the message switch kernel process (MSKP).

132. SMCLICADTMOUT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message timer timed out while waiting for an initialization and configuration administration (ICAD) response in the configuration link (CL) switch maintenance analysis and recovery strategies (SMARS) process.

133. SMCLIIAREQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid interrupt inhibit administrator (IIA) request was received.

134. SMCLIM (and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return was received when sending a message to an SM.

135. SMCLINERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An internal error occurred in the SMclcon() function while working on a particular SM and link.

136. SMCLINVAL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid reason code was sent to the CLMANUAL system process.

137. SMCLINVPAR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid parameters were passed to the operating system for distributed switching (OSDS) by the communication link normalization (CLNORM) system process when requesting a timer.

138. SMCLINVSM (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Communication link fault recovery received a message containing an invalid SM number.

Probable Cause:

Software error or data corruption.

Action:

System will execute appropriate corrective action. If problem persists, provide assert data to next level of support.

139. SMCLISOL (5E11 to 5E12)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid SM number was specified on an isolate SM request.

140. SMCLKFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred while trying to get the real time clock using the operating system for distributed switching (OSDS) macro OSGETRTIME(). The clock may not have been set or the macro may have returned invalid data.

141. SMCLMANDONE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CLMANUAL system process' strategy system process (SSP) failed to send a done message to switch maintenance analysis and recovery strategies (SMARS).

142. SMCLMANMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message was received by the CLMANUAL system process.

143. SMCLMMPMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to send a message to the module message processor (MMP) handler in the message switch kernel process (MSKP).

144. SMCLMSFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The module message processor (MMP) handler returned a failure acknowledgement to communication link (CL) switch maintenance error recognition (SMER) in response to the request to read error counts from the MMP. The acknowledgement message will be dumped.

145. SMCLMSKP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to send a message to the message switch kernel process (MSKP).

146. SMCLMSMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to send a message to the message switch control unit (MSCU) handler in the message switch kernel process (MSKP).

147. SMCLMSRET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) returned an invalid message.

148. SMCLNINVAL (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid reason was passed for the SMInorm() function entry.

149. SMCLNMBM (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication link normalization (CLNORM) process's operating mode that was read by CLNORM was invalid.

150. SMCLNMTYP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message type was sent to the communication link normalization (CLNORM) process.

151. SMCLNOMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return code was received from the OSWGETMSG() macro in the communication link (CL) switch

maintenance error recognition (SMER) or switch maintenance analysis and recovery strategies (SMARS) system process. The OSWGETMSG() return code will be in the first report data message. The error message will be in the second report data message.

152. SMCLNORMREQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CLMANUAL system process received an invalid request from the communication link normalization (CLNORM) process.

153. SMCLNOTCLNC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CLMAN process in the switch maintenance kernel process (SMKP) received a request from an unexpected source. This process handles manual or deferred requests related to communication links.

154. SMCLNOTINIT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Communication link initialization received an invalid action.

155. SMCLNOTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return was received from the OSWGETTYPE() macro when communication link (CL) switch maintenance error recognition (SMER) attempted to wait for the message from the module message processor (MMP) handler with the MMP error counts. The OSWGETTYPE() return code will be in the first report data message, and the message will be in the second report data message.

156. SMCLPREF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid preferred link configuration action was specified to the SMclprefconf() function.

157. SMCLREASON (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid reason code was given to communication link (CL) switch maintenance error recognition (SMER) or switch maintenance analysis and recovery strategies (SMARS) at the process initialization entry point. The reason code will be dumped.

158. SMCLREQFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization and configuration administration (ICAD) sent a failure return to the configuration link (CL) switch maintenance analysis and recovery strategies (SMARS) process in acknowledgement of a recovery request message.

159. SMCLRS3LNK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During communication link (CLNK) re-synchronization, more than two CLNKs to an SM were active. CLNK-related data from the message switch control unit (MSCU) translation tables is suspect.

160. SMCLRSBMMP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During communication link (CLNK) re-synchronization, an invalid physical module message processor (MMP) number was found in the message switch control unit (MSCU) translation table (MTT). The MSCU copied the MTT to the AM via direct memory access (DMA) in response to the re-couple physical input/output (PIO).

161. SMCLRSBONTC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During communication link (CLNK) re-synchronization, an active remote switching module (RSM) CLNK was on an in-service office network timing complex (ONTC) that was not major. RSM CLNKs should only be active on the major ONTC. CLNK-related data from the message switch control unit (MSCU) or module message processor (MMP) is suspect.

162. SMCLRSDDFL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Communication link (CLNK) re-synchronization software received a failure indication when attempting to obtain the number of an equipped SM from data delivery.

163. SMCLRSEND (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return code was received from the OSSENDMSG() macro when the communication link (CL) switch maintenance error recognition (SMER) process attempted to send a message to the module message processor (MMP) handler to read the MMP error counts. The OSSENDMSG() return code will be in the first report data message, the topid parameter will be in the second, and the message will be in the third.

164. SMCLRSMO (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Communication link (CLNK) re-synchronization software failed to read the RLMODATT relation.

165. SMCLRSMTT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During communication link (CLNK) re-synchronization, an invalid or inconsistent logical link configuration was found in one of the message switch control unit (MSCU) translation tables (MTTs). Each MSCU copied its MTT to the AM via direct memory access (DMA) in response to the re-couple physical input/output (PIO).

166. SMCLRSPC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Communication link (CLNK) re-synchronization software failed to read the RLSPC relation to determine the type (even or odd) of module message processor (MMP).

167. SMCLSMIF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication link configuration process (CLCON) function SMSndmimsg() returned a failure code. Message interface (MI) receive switches may not have been set correctly.

168. SMCLSEND1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to send a communication link configuration message to an SM.

169. SMCLSSPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication link (CL) switch maintenance analysis and recovery strategies (SMARS) strategy system process (SSP) reached a state in which no strategy was planned for recovering from link errors. The error message will be in the first report data message, and the error counts and the interrupt inhibit status of the link will be in the second report data message.

170. SMCLSSPMMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message type received in the function that processes communication link (CLNK) errors was invalid. The message type should be MGSMEVENT.

171. SMCLSSPOOS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication link (CLNK) strategy system process (SSP) determined that the threshold for errors on an out-of-service communication link was exceeded. A CLNK initialization will be performed for the affected SM.

172. SMCLSSPTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication link (CL) switch maintenance analysis and recovery strategies (SMARS) strategy system process (SSP) received an unexpected error type in a switch maintenance error recognition (SMER) message. The error message will be dumped.

173. SMCLSSPUNIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

SMCLNK was not received as a unit in the SMcl_analyze() function in the SMcl_proc.c file.

174. SMCLTMSIDE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid time multiplex switch (TMS) number was passed to a function that re-establishes the control time slot (CTS) connections through the TMS. A parameter was corrupted before the called function received it.

175. SMCLWGET (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return was received from the OSWGETMSG() macro in the communication link (CL) switch maintenance analysis and recovery strategies (SMARS) process while awaiting acknowledgement of a request from initialization and configuration administration (ICAD). The OSWGETMSG() return code will be in the first report data message; the message will be in the second report data message.

176. SMCLWRAC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid action field was found in a message to the SMclcon() function.

177. SMCLWRSORC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid source field was found in a message to the SMclcon() function.

178. SMCLWRTYPE (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message to the communication link configuration (CLCON) process contained an invalid or unexpected message type.

Probable Cause:

Software error or data corruption.

Action:

System will execute appropriate corrective action. If problem persists, provide assert data to next level of support.

179. SMCLWRTYPE (5E11 to 5E12)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message type was passed in a message to the SMclcon() function.

180. SMCLWRUNIT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid unit field was found in a message to the SMclcon() function.

181. SMDBCTSTMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The database access function SMtmscts() returned an invalid completion code.

182. SMDBEQTMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The time multiplexed switch (TMS) equipage static database access function SMtmseq() returned an invalid completion code.

183. SMDBLNKTMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The dynamic database access function SMddwrite() or SMwrite() returned an invalid completion code when attempting to write to the time multiplexed switch (TMS) network control and timing (NCT) link database.

184. SMDDRQLPS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: QLPS	Audit Mode: elev

Problem:

Time multiplexed switch configuration (TMSCON) received an error return from SMddread().

Probable Cause:

Invalid key used, or peripheral configuration data (PCD) corrupted.

Action:

Schedule audits of quad-link fault recovery (QLFR) - switch module processor (SMP) system process (QLPS) PCD.

185. SMDFRERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid reason was passed to the SMdfail() function.

186. SMDIVZERO (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While initializing the SMcmwtws array, a division by zero occurred.

Probable Cause:

Data is corrupt in array SMcmtpath_both, CMT path connectivity data in ODD is invalid or software error.

Action:

Verify CMT path data in ODD or provide data to next higher level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

187. SMDLIANA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not perform analysis of the dual link interface configuration (DLICON) input configuration request message to determine the configuration data to be sent to the SM(s).

188. SMDLIAUTISS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid result was returned from automatic timeslot switching (AUTISS).

189. SMDLIDDDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data delivery data was passed to the dual link interface (DLI).

190. SMDLIMODDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid module data was passed to the dual link interface (DLI).

191. SMDLIMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message was passed to the dual link interface (DLI).

192. SMDLI_READ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from the DDread() function.

193. SMDLIREASON (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid reason was passed to the dual link interface (DLI).

194. SMDLI_SIDE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid side was passed to the dual link interface (DLI).

195. SMDLISMNO (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from the call to the DDread() function with the SM number parameter.

196. SMDLIUNIT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid unit was passed to the dual link interface (DLI).

197. SMDLIWRTE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from the DDwrite() function.

198. SMDMBADLOG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in the physical to logical translation for a valid unit.

199. SMDMILLID (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal unit identification was received for updating maintenance display pages.

200. SMEQQLPSTG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: QLPS	Audit Mode: elev

Problem:

The function SMqlpstgwk() received a bad equippage status in RLQLPS.

Probable Cause:
Corrupted rQLPS tuple.

Action:
Compare the dumped "eqstat" with the expected "eqstat" and correct.

201. SMEQSTIMTG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CLNK	Audit Mode: elev

Problem:

An invalid equipage state for a unit was received in the message to the TRIG system process in the switch maintenance kernel process (SMKP). The valid and invalid values vary depending on the unit.

For an SM, the valid values for the trigeqstat local variable in the TRIG function SMimtgwork() are SMUNEQ, SMSGRO, and SMOPER. The invalid value of trigeqstat is SMGROW. This assert will dump the trigeqstat local variable of the enumeration type DMEQSTAT.

202. SMEQSTLNKTG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

An invalid equipage state for a unit was received in the message to the TRIG system process in the switch maintenance kernel process (SMKP). The valid and invalid values vary depending on the unit.

For a time multiplexed switch (TMS) link, the valid values for the neweqstat local variable in the TRIG function SMimtgwork() are SMGROW, SMSGRO, and SMOPER. The valid value for the oldeqstat local variable is SMGROW. The invalid value for either variable is SMUNEQ. This assert will dump the neweqstat and oldeqstat local variables of the enumeration type DMEQSTAT.

203. SMEQSTMMPTG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

An invalid equipage state for a unit was received in the message to the TRIG system process in the switch maintenance kernel process (SMKP). The valid and invalid values vary depending on the unit.

For a module message processor (MMP), the valid values for the oldeqstat and neweqstat local variables in the TRIG function SMimtgwork() are SMGROW and SMOPER. The invalid values are SMUNEQ and SMSGRO.

For the oldgrweqstat and newgrweqstat local variables in the TRIG function SMimtgwork(), the valid values are SMUNEQ, SMGROW, and SMOPER. The invalid value is SMSGRO.

Asserts can not dump more than three pointers; however, there are four possible local variables to be analyzed. This assert will dump the text portion of the message which contains the same data as the four local variables. Only two of the four attributes in the message need be analyzed, depending on the recent change reason.

1. If the attribute msgptr->text.pctrig.reason is equal to DB_INSERT or DB_UPDATE, the two attributes to analyze are msgptr->text.pctrig.newpctup.eqstat and msgptr->text.pctrig.newpctup.grweqstat.

2. If the attribute msgptr->text.pctrig.reason is equal to DB_DELETE, the two attributes to analyze are msgptr->text.pctrig.oldpctup.eqstat and msgptr->text.pctrig.oldpctup.grweqstat.

204. SMERANGE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

When message switch control unit configuration (MSCUCON) was waiting for the MSCU handler to acknowledge, an invalid wait time was specified.

205. SMERCATTMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The error category or return code from the SMerrck() function does not exist.

206. SMFABRSTMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown type of fabric update was indicated to be performed.

207. SMFACK (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown process sent an invalid return code to the foundation peripheral controller (FPC) strategy system process (SSP) configuration administration (CAD) acknowledgement routine.

208. SMFALREASON (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid reason was found for creating message switch control unit configuration (MSCUCON).

209. SMFAUST (5E11 and later)

Recovery Action: spp	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

The status of the foundation peripheral controller (FPC) could not be read. An audit of the FPC is requested, then the process is purged.

210. SMFBDACK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid acknowledgement was received from initialization and configuration administration (ICAD). Either the acknowledgement was successfully received and found to be invalid, or an error occurred while waiting for the acknowledgement. Execution will continue and the message sent to ICAD and the acknowledgement message received will be dumped.

211. SMFBDCNT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid error count was returned from the error count checking routine SMerrck(). The two error counters are dumped.

212. SMFBMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message was received by the foundation peripheral controller (FPC) strategy system process (SSP). Probably corrupted data was found within the message.

213. SMFBDOS (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred while waiting for an acknowledgement from configuration administration (CAD). The return code from the OSWGETTYPE() macro was either OSTIMEOUT or an invalid return code. The message sent will be dumped and the foundation peripheral controller (FPC) strategy system process (SSP) will be purged.

214. SMFINV (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

When the foundation peripheral controller (FPC) strategy system process (SSP) checked the state and event for a specific action to be taken, the event was invalid for the determined state. This could indicate that the error counters are out of synchronization with the system states.

215. SMFOSND (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSENDMSG() macro returned failure for a reason other than a resource problem. Possibly, the destination process did not exist or the destination process expected a message of a different size. The data dumped contains the message that OSSENDMSG() attempted to send.

216. SMFPC1SND (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from the OSSENDMSG() macro. The process will be purged and the message buffer will be dumped for analysis.

217. SMFPC2SND (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code from the OSSENDMSG() macro indicated that the message sent was the wrong length. The message will be dumped for analysis.

218. SMFPCBMSGR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The foundation peripheral controller configuration process (FPCCON) received an invalid message type.

219. SMFPCCTO (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The foundation peripheral controller configuration process (FPCCON) timed out while waiting for an acknowledgement from an OSWGETTYPE() macro message.

220. SMFPCDDBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

An invalid value for the foundation peripheral controller (FPC) duplex failure data delivery (DD) key DDFPCDFTRIG was encountered.

221. SMFPCDDUPDT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Data delivery or a central processor intervention (CPI) write failed.

222. SMFPCINP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The foundation peripheral controller configuration process (FPCCON) received an invalid equipment ID or request action.

223. SMFPCINSIDE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid side was passed to the foundation peripheral controller configuration process (FPCCON). Side 0 is assumed.

224. SMFPCMNF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message was not found in its saved input buffer in the foundation peripheral controller configuration process (FPCCON) code.

225. SMFPCMRR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The foundation peripheral controller (FPC) handler sent an invalid message to the FPC configuration process (FPCCON). The message pointer and the message buffer sent to the FPC handler will be dumped.

226. SMFPCNOACT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

No active foundation peripheral controller (FPC) was found while the FPC duplex failure was not in effect.

227. SMFPCNOCH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The foundation peripheral controller (FPC) duplex failure code could not determine the invalid state that the FPCs were put in.

228. SMFPCOSWT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The foundation peripheral controller configuration process (FPCCON) sent a message to the FPC handler, but an error occurred when the OSWGETTYPE() macro was called in FPCCON.

229. SMFPCPCD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The foundation peripheral controller (FPC) duplex failure code found the FPC states in an invalid combination for FPC duplex failure.

230. SMFPCPTO (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The foundation peripheral controller (FPC) strategy system process (SSP) timed out while waiting for an acknowledgement from configuration administration (CAD).

231. SMFPCREA (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid reason code was sent to the foundation peripheral controller (FPC) process. A valid reason is stable clear, transient clear, or single process purge.

232. SMFPCSWE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The foundation peripheral controller (FPC) was in an invalid state of active or standby during the conditional

restoration of a message switch control unit (MSCU). The normal state for an FPC during this restoration should be OOS/AUTO/FAMILY removed.

233. SMFPCSWR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

The foundation peripheral controller configuration process (FPCCON) could not update the FPC status. An audit is called and the currently running process is purged.

234. SMFPCTIME (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The foundation peripheral controller (FPC) strategy system process (SSP) received an invalid timer tag. All FPC SSP timers concern FPC duplex failure operations. The timers are retired and rescheduled.

235. SMFPCTMR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The foundation peripheral controller (FPC) received a request to restore the standby unit. The FPC configuration process (FPCCON) sent a message to the FPC handler and a timer was placed on this message. The timer failed before the message was returned to FPCCON.

236. SMFPCWAIT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in sending a message to the switch maintenance analysis and recovery strategies (SMARS) process. No message buffers were available. The current running process is purged.

237. SMFPCWGET (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The calling process sent an invalid message to the foundation peripheral controller (FPC). The process will be purged and data will be dumped to help identify the calling process.

238. SMFPCWMF (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid timer value return type was received from an OSWGETTYPE() macro message that was used in the foundation peripheral controller configuration process (FPCCON). The running process is purged.

239. SMFPCWMT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A buffer size was incorrect on an OSWGETTYPE() macro call.

240. SMGETPTA (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Message switch control unit configuration (MSCUCON) failed while trying to get page table addresses and segment IDs. An invalid pointer may have been used to obtain the information.

241. SMHMSGFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch control unit (MSCU) handler incorrectly filled in the fields for the acknowledgement to MSCU configuration (MSCUCON), or the message size was too long. The loads may be incompatible.

242. SMHMTMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The human machine (HM) function HMoutmsg() returned an invalid completion code.

243. SMIABDAMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interrupt inhibit administrator (IIA) received a message with an unrecognizable action field.

244. SMIABDINIT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interrupt inhibit administrator (IIA) process was entered with an unrecognizable reason argument.

245. SMIABDTMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interrupt inhibit administrator (IIA) received a message with an invalid message type.

246. SMIABDUNIT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interrupt inhibit administrator (IIA) received a message with an equid field containing an unrecognizable unit.

247. SMIADBRDF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfrdtup() function failed in the interrupt inhibit administrator (IIA).

248. SMIADDRDF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMddread() function failed in the interrupt inhibit administrator (IIA).

249. SMIAIEMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interrupt inhibit administrator (IIA) received an unrecognizable error code (return code) from an OSWGETMSG() macro call.

250. SMIAINVPROC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSENDMSG() macro returned an invalid process error when the interrupt inhibit administrator (IIA) tried to send a message.

251. SMIALEMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interrupt inhibit administrator (IIA) received an OSELENGTH return code on an OSWGETMSG() macro call.

252. SMIAMEMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interrupt inhibit administrator (IIA) received one of the following return codes from an OSWGETMSG() macro call - OSERANGE, OSENOTCB, or OSTIMEOUT.

253. SMIANOMCB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interrupt inhibit administrator (IIA) received an OSENOMCB error on an OSSENDMSG() macro call.

254. SMIAOSEUN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interrupt inhibit administrator (IIA) received an OSEUN error on an OSSENDMSG() macro call.

255. SMIBADNLI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The relation rNLI_LNK could not be read for a network link interface (NLI) less than the number of equipped NLIs stated by the eq_lis attribute in the relation rMODATT. The local version of eq_lis in PHDATA has been re-adjusted and initialization control (ICON) will try to continue.

256. SMIEXLIMAX (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The eq_lis attribute in the relation rMODATT exceeds the maximum number of NLIs for a SM-2000 (as defined by SMNLIMAX).

257. SMIMCTSTMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The maximum number of allowable control time slot (CTS) buffers was exceeded.

258. SMINLINVLT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The equipage state (eq_stat) of a NLI read from the rNLI_LNK relation is invalid (not operational, unequipped, or grow). The NLI will be marked as unequipped and ICON will try to continue.

259. SMINMT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid or unexpected message type was sent to a switch maintenance analysis and recovery strategies (SMARS) process.

260. SMINRC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return was received from the OSWGETMSG() macro.

261. SMINREATG (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid system process initialization reason was passed to the TRIG system process in the switch maintenance kernel process (SMKP). The expected valid reasons are OSRSTCLR, OSRTRCLR, or OSRSPP. This assert will dump the reason local variable of type short.

262. SMINVACQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected action qualifier was encountered.

263. SMINV_CMP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was detected by the SM, peripheral configuration data (PCD) audit, or the switch maintenance kernel process (SMKP) pertaining to the communication module processor (CMP) logical link map (LLM) or PCD.

264. SMINVDDR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read error occurred.

265. SMINVNLIMAP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The path hunt data (PHDATA) entry for a SM and initialization control's (ICON's) network link interface (NLI) map (SMinref.nli_map) are in disagreement. One indicates that the SM is a SM-2000 and the other indicates that it is not.

266. SMINVREQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected action request was encountered.

267. SMINVRSM2K (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The path hunt data (PHDATA) entry for a SM indicated that the SM was an SM-2000; but DD indicated that the IMTYPE of that SM was a remote SM (RSM). RSM-2000's are not supported! The SM will be treated as if it was unequipped.

268. SMINVRSTRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMrs_startup() function was called with an invalid argument during an initialization (INIT) mode CM re-synchronization.

269. SMINVSFC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A force write error occurred.

270. SMINVU (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid or improper equipment identification was passed to a switch maintenance analysis and recovery strategies (SMARS) process.

271. SMIPACTION (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message was received by initialization control (ICON) or initialization fault recovery strategy (IFRS) that contained an unexpected value in the action field. The data dumped contains the SMinmail message structure for a message to ICON, or the SMifmail message structure for a message to IFRS.

272. SMIPACTQUAL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message was received by initialization control (ICON) or initialization fault recovery strategy (IFRS) that contained an unexpected value in the action qualifier field. The data dumped contains the SMinmail message structure for a message to ICON, or the SMifmail message structure for a message to IFRS.

273. SMIPCLFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

More communication link (CL) errors were reported than can fit in the initialization fault recovery strategy (IFRS) buffer for CL error reports. The data dumped contains the SMifclcount value, the SMifclfail[] array, and the SMifmail message structure for the message to IFRS. The error report is ignored.

274. SMIPCMHDR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A CMP error occurred during the hardware initialization (INHARDINIT) phase. This error should not occur since the CMP should still be in the hardware initialization state. The initialization fault recovery strategy (IFRS) function SMifcmp() generated this error.

275. SMIPDDREAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DDREAD() primitive returned an unexpected value.

276. SMIPEQID (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message was received by initialization control (ICON) or initialization fault recovery strategy (IFRS) that contained an unexpected value in the eqid field. The data dumped contains the SMinmail message structure for a message to ICON, or the SMifmail message structure for a message to IFRS.

277. SMIPFRCINCONSIST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization control (ICON) or initialization fault recovery strategy (IFRS) detected an inconsistent force state. No force is assumed.

278. SMIPFROMPID (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message was received by initialization control (ICON) or initialization fault recovery strategy (IFRS) from an unexpected sender. The data dumped contains the SMinmail message structure for a message to ICON, or the SMifmail message structure for a message to IFRS.

279. SMIPHLEVEL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid H level of initialization was detected.

280. SMIPHY2LOGFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A physical to logical unit translation failed.

281. SMIPINCDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Inconsistencies were detected between the RLSLNKTMS and RLMODATT relations. A time multiplexed switch (TMS) link was equipped, but the SM was unequipped; or a TMS link was unequipped, but the SM was equipped.

282. SMIPINREF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization control's (ICON) INREF entry was corrupted.

283. SMIPINTINCONSIST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency was detected in the internal data for initialization control (ICON).

284. SMIPMSGTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message was received by initialization control (ICON) or initialization fault recovery strategy (IFRS) that is of an unexpected type. The data dumped contains the SMinmail message structure for a message to ICON, or the SMifmail message structure for a message to IFRS.

285. SMIPNCTMOD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A network control and timing (NCT) link was operational, but the corresponding SM was not operational. This condition may be true for other SM and time multiplexed switch link (TMSLNK) pairs; however, only one assert will be fired.

286. SMIPODDINCONSIST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Inconsistencies were detected on tuples read from the office dependent data (ODD).

287. SMIPOPTIONS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message was received by initialization control (ICON) or initialization fault recovery strategy (IFRS) that contained an unexpected value in the option field. The data dumped contains the SMinmail message structure for a message to ICON, or the SMifmail message structure for a message to IFRS.

288. SMIPPCEQSTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple was retrieved from the RLSPC relation that has an unexpected equipage state.

289. SMIPPCID (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple was retrieved from the RLSPC relation that has an invalid physical ID or peripheral controller (PC) type, or the tuple is in an incorrect slot.

290. SMIPPCSIDE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple was retrieved from the RLSPC relation that has an invalid system side.

291. SMIPQPFail (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

More QPIPE errors (up or down indications) have been received by initialization fault recovery strategy (IFRS) than can fit into the QPIPE error queue. The data dumped is SMifmail, SMifqpr, and SMifqpfptr. The previous last QPIPE error was overwritten in the buffer.

Probable Cause:

Too many QPIPE autonomous recovery actions occurring.

Action:

Previous error was overwritten.

292. SMIPREASON (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message was received by initialization control (ICON) that contains an unexpected value in the reason field. The data dumped contains the SMinmail message structure.

293. SMIPRESULT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message was received by initialization control (ICON) or initialization fault recovery strategy (IFRS) that contained an unexpected value in the result field. The data dumped contains the SMinmail message structure for a message to ICON, or the SMifmail message structure for a message to IFRS.

294. SMIPRETURN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A primitive provided for initialization control (ICON) returned an unexpected value.

295. SMIPSLEVEL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid S level of initialization was detected.

296. SMIPSMDDREAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMddread() function returned a value other than SMDBOK.

297. SMIPSMWRITE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMddwrite() function returned a value other than SMDBOK.

298. SMIPSNMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSENDMSG() macro returned a value other than OSSUCCESS or OSENOVCB.

299. SMIPSYSTAG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSYSTAG value could not be retrieved from the SMinform[] array via a call to the SMinstat() function.

300. SMIPVINT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid vintage flag was indicated.

301. SMIPWGFROM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSWGGETFROM() macro returned a value other than OSMSG, OSMTIMEOUT, or OSENOTCB.

302. SMIPWGMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSWGGETMSG() macro returned a value other than OSMSG, OSMTIMEOUT, or OSENOTCB.

303. SMIPWGTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSWGGETTYPE() macro returned a value other than OSMSG, OSMTIMEOUT, or OSENOTCB.

304. SMISACTION (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMinifrs() function was called with an unexpected argument.

305. SMISARGUMENT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An internal function was called with unexpected parameters.

306. SMISBADSTATE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMinstat() function returned an invalid state for the event currently being processed.

307. SMISCLIDAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMclisolate() function failed to read the RLCLIDAT relation.

308. SMISCREASON (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected reason for recreation was detected.

309. SMISDDREAD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The DDread() function returned an illegal value.

310. SMISDDWRITE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The DDWRITE() macro returned a failure code when it was called by initialization control (ICON) or initialization fault recovery strategy (IFRS).

311. SMISDMDSP (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMdmd_spp() function returned a value other than SUCCESS.

312. SMISHWESCAL (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected value was detected for the SMinhwescal global variable.

313. SMISINITPARM (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid combination of the software and hardware initialization levels and the initialization in progress flag value was detected by the SM database initialization function.

314. SMISNEXTACT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A message was received from the switch maintenance integrity controller (SMICO) that specifies an unrecognized next action.

315. SMISNOOPIMS (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

There are no operational SMs indicated in the office dependent data (ODD) according to the DDread() primitive.

316. SMISOLDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMclisolate() function failed to read the RLMODATT relation using the DBfrdtup() primitive for a particular SM. The assert is passed the dbret parameter (the location of the DBfrdtup() failure return) and the imbuff parameter (the location of the SM tuple that failed).

317. SMISOLDD (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the DDRSMISOL data delivery key for a particular host SM (HSM).

Probable Cause:

Software error or data corruption.

Action:

System will execute appropriate corrective action. If problem persists, provide assert data to next level of support.

318. SMISOLDD (5E11 to 5E12)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read the DDRSMISOL word for a particular host SM (HSM) failed in the SMclisolate() function. The pointer passed to the assert contains the location of the value returned by the DDREAD() primitive.

319. SMISPRMCLASS (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMinprm() function was called with an unexpected class parameter.

320. SMISPRMDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMinprm() function was called with an unexpected data parameter.

321. SMISPRMTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMinprm() function was called with an unexpected value for the process recovery message (PRM) type.

322. SMISPRMUNIT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMinprm() function was called with an unexpected value for the unit type.

323. SMISREPLACE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSREPLACE() macro returned control to the point after its call.

324. SMISRETURN (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An internal function returned an unexpected value.

325. SMISSEQST (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The INSEQST() macro returned an unexpected state of the switch maintenance kernel process (SMKP).

326. SMISSMDDREAD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMddread() function returned a value other than SMDBOK.

327. SMISSMWRITE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMddwrite() function returned a value other than SMDBOK.

328. SMISTIMER (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSTIMER() macro returned a value less than 0. OSTIMER() failed to get the OSSYSTAG timer identifier value.

329. SMLBIV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The time in the leaky bucket database was later than the current time.

330. SMLCDATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert is a mechanism to dump offline boot (OFLBOOT) low core memory for debugging purposes. Data dumps contain valid low core data related to AM offline boot.

331. SMLCFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Low core was inaccessible or contained invalid data.

332. SMLIBACT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In a message received by link interface configuration (LICON), the text.comshdr.action field was an invalid action for LICON. This occurs in the SMLifr() function.

333. SMLIBCC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid completion code was found in the acknowledgment message from the foundation peripheral controller handler (FPCH).

334. SMLIBCNTR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Link interface configuration (LICON) received an invalid return value from the SMerrck() function.

335. SMLIBSNT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Link interface configuration (LICON) received an acknowledgement message from the foundation peripheral controller handler (FPCH), but the completion code indicated that an invalid side or byte count was sent in the request message to the FPCH.

336. SMLIBSTR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the request message sent to link interface configuration (LICON), the text.comshdr.state.qual1 field was incorrect. The SMLirst() function restores the link interface (LI) to one of three states - SMQ1FRCD, SMQ1MAJ, or SMQ1MIN.

337. SMLIBSWINIT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

During a software initialization, link interface configuration (LICON) was initialized for the wrong reason. The three valid reasons are OSRSTCLR, OSRTRCLR, and OSRSSP.

338. SMLIBTYM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message sent to link interface configuration (LICON) requested an incorrect side. The valid values are SMZERO, SMONE, and SM_BOTH. This problem should not occur because deferred maintenance administration and monitor (DMAM) should check this field.

339. SMLIBVINT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid CM vintage was encountered; or a message was received from CM2, but CM2 does not have a link interface (LI).

340. SMLL0NOLNK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CLNK	Audit Mode: elev

Problem:

Logical link 0 was inactive, but logical link 1 was active.

341. SMLL1NOLNK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CLNK	Audit Mode: elev

Problem:

Logical link 1 was inactive, but logical link 0 was active.

342. SMLV0IIATMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The level 0 field of the received message was invalid.

343. SMLV1IIATMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The level 1 field of the received message was invalid.

344. SMMCACKBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid acknowledgement was received from the message switch control unit (MSCU) handler when the interrupt inhibit administrator (IIA) or AUDITS was waiting for an acknowledgement from the request to read or configure the MSCU - model 2 (MSCU2) interrupt data.

345. SMMCBD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interrupt inhibit administrator (IIA) or AUDITS passed an invalid request parameter when configuring or reading interrupt data for the message switch control unit - model 2 (MSCU2).

346. SMMCCBDDRWF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from the SMddread() function or the SMddwrite() function.

347. SMMCCDDRWF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from the SMddread() function or the SMddwrite() function.

348. SMMCSEND (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was detected in sending a message to the message switch control unit (MSCU) handler when the interrupt inhibit administrator (IIA) or AUDITS was trying to read or configure MSCU - model 2 (MSCU2) interrupt data.

349. SMMCWGBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return was received from the OSWGETTYPE() primitive while the interrupt inhibit administrator (IIA) or AUDITS was waiting for an acknowledgement for the request to read or configure the message switch control unit - model 2 (MSCU2) interrupt data.

350. SMMIBACT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In a message received by message interface configuration (MICON), the text.comshdr.action field was an invalid action for MICON. This occurs in the SMmifr() function.

351. SMMIBAQCPI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid action qualifier for central processor intervention (CPI) was passed to a function.

352. SMMIBCC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid completion code was found in the acknowledgment message from the foundation peripheral controller handler (FPCH).

353. SMMIBCNR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return value was received from the SMerrck() function during fault recovery for the message interface (MI).

354. SMMIBFORLP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The for loop index was invalid. This could indicate hardware or text problems.

355. SMMIBREQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid input request was detected in the SMmittout() function. This problem should not occur since the deferred maintenance administrator and monitor (DMAM) should check the input message. In the request message, the text.options field was invalid.

356. SMMIBSIDE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the SMmittout() function, an invalid side was requested for an output message. This problem should not occur since the deferred maintenance administrator and monitor (DMAM) should check the input message.

357. SMMIBSIZE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid time multiplexed switch (TMS) fabric size was passed in a message.

358. SMMIBSNT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Message interface configuration (MICON) received an acknowledgement message from the foundation peripheral controller handler (FPCH), but the completion code indicated that an invalid side or byte count was in the request message sent to the FPCH.

359. SMMIBSWINIT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

During a software initialization, message interface configuration (MICON) was initialized for the wrong reason. The three valid reasons are OSRSTCLR, OSRTRCLR, and OSRSSP.

360. SMMIBVINT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CM vintage in the office dependent data (ODD) was not populated correctly for either CM version.

361. SMMIMODFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Module arithmetic failed. This could indicate hardware or text problems.

362. SMMMACTIONERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message contained invalid data in the action code field. Possibly, the sending process incorrectly assigned the action code, the receiving process incorrectly verified the action code, or the message was corrupted.

363. SMMMAQERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message contained invalid data in the action qualifier field. Possibly, the sending process incorrectly assigned the action qualifier, the receiving process incorrectly verified the action qualifier, or the message was corrupted.

364. SMMMAUREADERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The asserting process received a read failure return code from the SMddread() function. The function could not read data for the module message processor (MMP) from the protected application segment (PAS) dynamic status database. Possibly, a problem occurred in the asserting process's call to SMddread() or in accessing the PAS database.

365. SMMMBADINIT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The initialization control (ICON) process sent module message processor configuration (MMPCON) an initialization message with an invalid action field. Something other than an H3 or H4 was specified.

366. SMMMBIDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message from the interrupt inhibit administrator (IIA) or audits (AU) process in the switch maintenance kernel process (SMKP) contained invalid data.

367. SMMMBMMPH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message from the module message processor (MMP) handler in the message switch kernel process (MSKP) contained invalid data.

368. SMMMBSTATE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Validation checks found the module message processor (MMP) in an invalid state for the present circumstances.

369. SMMMBUSTYPERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The asserting process received an invalid mib-bus type from a read of the office dependent data (ODD) database (only ALPHA or BETA mib-bus types should be received). Possibly, invalid data was entered in the ODD database, the asserting process incorrectly verified the mib-bus type, or the buffer read from the ODD database was corrupted.

370. SMMMCADTIMO (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: PCD	Audit Mode: elev

Problem:

The asserting process timed out on configuration administration (CAD) while waiting for an acknowledgment message. Possibly, the CAD process was corrupted, or the asserting process's timer period was too short.

371. SMMMDATAERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A data inconsistency was detected by the asserting process. Possibly, the text or stack segment of the running process was corrupted. The error is localized to this process as this is a self-check of a process's own data.

372. SMMMDREAD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The asserting process received a read failure return code from the DDread() function. The function could not read data from data delivery. Possibly, a problem occurred in the asserting process's call to DDread() or in accessing the data delivery database.

373. SMMMDTIMER (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the operating system for distributed switching (OSDS) macro OSDETIMER() yielded a failure code. Possibly, the calling process specified an invalid timer tag when a current timing request was removed or did not own the specified timer.

374. SMMMDUPERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The module message processor configuration (MMPCON) process received redundant initialization messages from initialization control (ICON). In particular, more than one message was received to initialize the same message switch (MSGs) side.

375. SMMMERRTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The asserting process received an invalid value in the error type field of the input message. Possibly, the sending process incorrectly assigned the error type field, the asserting process incorrectly verified the error type field, or the message was corrupted.

376. SMMMEVCLERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message contained invalid data in the event class field. Possibly, the sending process incorrectly assigned the event class, the receiving process incorrectly checked the event class, or the message was corrupted.

377. SMMMEVTNOERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The module message processor configuration (MMPCON) process received a timeout message with an unexpected event number. Possibly, the MMPCON process had an outstanding timing request that it was unaware of, or the error was internal to the operating system (OS).

378. SMMMFROMERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message was received from a process that should not send the asserting process a message. Possibly, the sending process incorrectly assigned the operating system process identification (OSPID) of the process it was sending to, the asserting process incorrectly verified the OSPID of the sending process, or the message was corrupted.

379. SMMMGETMSGERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operating system for distributed switching (OSDS) message macro OSWGETFROM() or OSWGETMSG() returned a failure code to the asserting process while it was waiting to receive a message. Possibly, the asserting process set the parameters to the OSDS macro incorrectly or the OSDS process encountered a software error.

380. SMMMGLIMIT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Switch maintenance analysis and recovery strategies (SMARS) placed a message on the module message processor (MMP) process queue while the MMP process was executing. Possibly, a problem in SMARS placed an entry on the MMP process queue before the executing process had finished.

381. SMMMINVDGN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message contained invalid data in the diagnostic result field. Possibly, the sending process incorrectly assigned the diagnostic result, the receiving process incorrectly verified the diagnostic result, diagnostic results were added without proper code modification, or the message was corrupted.

382. SMMMNO MMP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The asserting process received a NO MATCH return code from the DBfrdtup() function. The module message processor (MMP) number could not be found in the office dependent data (ODD) database. Possibly, an invalid MMP number was entered in the ODD database, the asserting process had a problem in its call to the ODD database, a problem occurred in accessing the ODD database, or text was corrupted.

383. SMMMODDREAD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The asserting process received a read failure return code from the DBfrdtup() function. The function could not read data from the office dependent data (ODD) database. Possibly, invalid data was entered in the ODD database, or a problem occurred in the asserting process's call to DBfrdtup() or in accessing the ODD database.

384. SMMMOSELENGTH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message received or sent by the asserting process had an invalid length. Possibly, the asserting process incorrectly set the message length or the message was corrupted.

385. SMMMOSEND (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operating system for distributed switching (OSDS) macro OSSENDMSG() failed in its attempt to send a message for a reason other than OSELENGTH (length error), OSENO MCB (no message buffers available), or OSEMSG (no DMERT buffers). Possibly, the asserting process incorrectly built OSMSGHEAD data, the OSDS

process had software problems, or the message was corrupted.

386. SMMMPHYSEERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message contained invalid data in the equipment ID field. Possibly, the sending process incorrectly assigned the physical equipment ID, the receiving process incorrectly verified the physical equipment ID, or the message was corrupted.

387. SMMMREADERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

The asserting process received a read failure return code from the SMddread() function. The function could not read data for the module message processor (MMP) from the protected application segment (PAS) dynamic status database. Possibly, a problem occurred in the asserting process's call to SMddread() or in accessing the PAS database.

388. SMMMREASERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The asserting process was created for a reason other than the reasons it is designed to accept. Possibly, a new and valid reason was added but this code was not updated, a problem occurred in the creation process, or text was corrupted.

389. SMMMSEWAIT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSWAIT() macro returned a value other than OSTIMEOUT. Possibly, an invalid condition or invalid maxtime was encountered, or no condition occurred and no timer was specified in the call to OSWAIT(). There may be a problem within the asserting process or text may be corrupted.

390. SMMMSIDERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message was detected by the receiving process. A message switch control unit (MSCU) side other than 0 or 1 was specified in the message.

391. SMMMSNDMSGERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The operating system for distributed switching (OSDS) macro OSSENDMSG() failed in its attempt to send a message for a reason other than OSELENGTH (length error), OSENCOMCB (no message buffers available), or OSEMSG (no DMERT buffers). Possibly, the asserting process incorrectly built OSMSGHEAD data, the OSDS process had software problems, or the message was corrupted.

392. SMMMSRCERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message contained invalid data in the source field. Possibly, the sending process incorrectly assigned the source field, the receiving process incorrectly verified the source field, or the message was corrupted.

393. SMMMTBLMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message parameter had invalid data. The event described by this parameter was not expected.

394. SMMMTBLREAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A read of the peripheral controller (PC) state failed.

395. SMMMTIMERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the operating system for distributed switching (OSDS) macro OSTIMER() yielded a failure code. Possibly, the calling function specified an out of range timer value or the operating system (OS) was unable to allocate a timer control block.

396. SMMMTIMOCAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The asserting process timed out on configuration administration (CAD) while waiting for an acknowledgment message. Possibly, the CAD process was corrupted, or the asserting process's timer period was too short. This assert is used when it is undesirable to purge the running process.

397. SMMMTMMPH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The module message processor configuration (MMPCON) process timed out on a message sent to the MMP handler. Possibly, the asserting process's timer period was too short or the MMP handler's text or data segment was corrupted.

398. SMMMTYPERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message contained invalid data in the message type field. Possibly, the sending process incorrectly assigned the message type, the receiving process incorrectly verified the message type, or the message was corrupted.

399. SMMMUNITERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid equipment ID was specified in a message to the asserting process in the switch maintenance kernel process (SMKP). Possibly, the unit type was not MMP, or the physical module message processor (MMP) number specified was not within the valid range. The problem was probably caused by the sending process.

400. SMMMWRITERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

The asserting process received a write failure return code from the SMddwrite() function. The function could not write module message processor (MMP) dynamic data into the protected application segment (PAS) database. Possibly, a problem occurred in the asserting process's call to SMddwrite() or in accessing or updating the PAS database.

401. SMMSCTIM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The asserting process timed out on configuration administration (CAD) while waiting for a message; that is, the OSWGETMSG() macro returned OSTIMEOUT. This may be due to a software recovery event elsewhere that affects one or more processes with which this process interfaces.

402. SMMSDREAD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The DDread() function failed to read the MIN MODE indicator. In this case, the message switch control unit (MSCU) strategy system process (SSP) will be purged because different actions are taken if the system is in MIN MODE.

403. SMMSERMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message was successfully received, then found to be invalid; or an error occurred in receiving the message (the OSWGETMSG() macro returned failure). The message is dumped, then discarded. Analyze the message to determine the source of the problem.

404. SMMSESEND (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSENDMSG() macro returned failure for a reason other than resource problems. The most likely cause is that the destination process does not exist or the destination process was expecting a different sized message. In both cases, the message is dumped and should be analyzed.

405. SMMSEVCLASS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The asserting process received a message from the switch maintenance analysis and recovery strategies (SMARS) process that contained an invalid event class field. The most likely cause of the problem is that a new and valid event class value was adopted, but this process was not updated to reflect the change. The message is dumped.

406. SMMSEWAIT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the OSWAIT() macro failed indicating that a critical software problem exists. This problem may be due to typographical errors.

407. SMMMSGFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Initialization and configuration administration (ICAD) sent a message to message switch control unit configuration (MSCUCON) that had incorrect fields. The loads may have been incompatible, or there may have been a problem in the interfacing.

408. SMMSGTPTG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The TRIG system process received an invalid message type. The valid message types are

- MGIMSMTRIG which is sent from the SMmodtrigs() function in the operational kernel process (OKP)
- MGPCSMTRIG which is sent from the SMpctrig() function in the OKP
- MGLNKSMTTRIG which is sent from the SMlnktrig() function in the OKP

The msg_type local variable of the type unsigned short is dumped.

409. SMMSHTIM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The asserting process timed out on a process outside of the switch maintenance kernel process (SMKP) while waiting for a message; that is, the OSWGETMSG() macro returned OSTYPEOUT. This may be due to a software recovery event elsewhere that affects one or more processes with which this process interfaces.

410. SMMSPERMSG (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in receiving a message (the OSWGETMSG() macro returned failure). The message will be dumped, then discarded and purged. Analyze the message to determine the source of the problem.

411. SMMSPSEND (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSENDMSG() macro returned failure for a reason other than resource problems. Possibly, the destination process did not exist or the destination process expected a different sized message. In both cases, the message is dumped and should be analyzed.

412. SMMSPPFail (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

When the message switch control unit (MSCU) strategy system process (SSP) times out on configuration administration (CAD), it must clean up the sequence of message passing by purging CAD. The Sldmd_spp() function is used to purge CAD, but the purge failed. The SSP may have called for a process identifier (PID) that did not exist.

413. SMMSREADD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The dynamic protected database primitives SMddread() and SMddwrite() returned failure to the asserting process. This could be due to corrupted text or corrupted data. The peripheral configuration data (PCD) audit should correct corrupted data. Corrupted text requires some level of AM initialization.

414. SMMSREASON (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The asserting process was created for a reason that it was not designed to accept. Possibly, a new and valid reason was created, but the code was not updated to reflect it. This problem may cause an endless loop; the process is created then purged due to an invalid reason.

415. SMMSWGGET (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSWGGETMSG() macro returned something other than OSMSG or OSTIMEOUT. Possibly, the message was a different size than expected.

416. SMNCADPR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid request to audit an out-of-service (OOS) primary reference on the major clock was encountered.

417. SMNCADSR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid request to audit an out-of-service (OOS) secondary reference on the major clock was encountered.

418. SMNCADXR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid request to audit a cross couple reference on the major clock was encountered.

419. SMNCBDRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Network clock (NCLK) received an invalid return from the database, or remote clock (RCLK) received an unsuccessful return from a database read or write of the RLCLK_SC, RLCKTDATA, or RLSMEST relation. This may be caused by a corrupted unit ID or an attempt to read an unequipped unit.

420. SMNCBDVR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown clock type was read from the database.

421. SMNCDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unknown data was passed within network clock configuration (NCCON).

422. SMNCDBUN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid unit was encountered during a database read or write.

423. SMNCFRAC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The peripheral configuration data (PCD) and the network clock (NCLK) hardware do not agree.

424. SMNCFRRC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid command to remove the network clock (NCLK) during fault recovery was encountered.

425. SMNCIASD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The interrupt inhibit administrator (IIA) passed an invalid side to network clock configuration (NCCON).

426. SMNCIIAAC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid interrupt inhibit administrator (IIA) action was passed to network clock configuration (NCCON).

427. SMNCINAC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid action was passed to network clock configuration (NCCON), or an invalid action was passed to the remote clock (RCLK) ported initialization supervisor function SMnc2_initsup(), the ported configuration supervisor function SMnc2_confsup(), or the configuration interface to the maintenance request administrator (MRA) function SMrc_config(). There may be problems in the MRA or in the initialization interface to the system hardware initialization function SMrclk_init().

428. SMNCINBS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid base-state was passed to network clock configuration (NCCON).

429. SMNCINEN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid reason was found for entering the network clock (NCLK) function SMsupnc() or the remote clock (RCLK) system process initialization function SMsprc_init().

430. SMNCINMD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid phase lock mode was passed to network clock configuration (NCCON).

431. SMNCINMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message was passed within network clock configuration (NCCON), or an invalid message type was passed to the remote clock (RCLK) function SMrclk_fr(). Examine the SMrclk_mess[] local message structure (dumped with the stack) to locate the originator of the message.

432. SMNCINQ1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid state first qualifier was passed to network clock configuration (NCCON).

433. SMNCINQ2 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid state second qualifier was passed to network clock configuration (NCCON).

434. SMNCINREF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid reference was passed to network clock configuration (NCCON).

435. SMNCINSD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid side was passed to network clock configuration (NCCON).

436. SMNCINST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid state was received in network clock configuration (NCCON).

437. SMNCINUN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid unit was passed to network clock configuration (NCCON), or an invalid remote clock (RCLK) side or unit ID was passed to the SMrclk_fr() function from the general metallic service unit (MSU) alarm process or from control interface (CI) scanning in the peripheral controller (PC).

438. SMNCRDCL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid parameter was found when comparing the state with the peripheral configuration data (PCD).

439. SMNCRICE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown phase lock error was returned to the SMrst_int_nc() function.

440. SMNCRICS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A request to phase lock to an unknown reference on the active minor (standby) side was encountered.

441. SMNCRIPS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown primary reference state was encountered.

442. SMNCRIRP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A request to phase lock to an unknown reference on the active major side was encountered.

443. SMNCRISS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown secondary reference state was encountered.

444. SMNCRITL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown unit [not the time multiplexed switch (TMS) or link interface (LI)] was encountered to interface with the network clock (NCLK).

445. SMNCRIXS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown cross couple reference state was encountered.

446. SMNCRRER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown error code was returned from the SMnc_ia_msg() function.

447. SMNCSPCM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message was passed between the SMcomm_nc() and SMnccon() functions.

448. SMNCTTYO (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown action requested a TTY output message.

449. SMNCUNEX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexplained error has been reported to the network clock configuration process (NCCON).

Probable Cause:

1. Interface problem between NCCON and the foundation peripheral controller error handling and reporting code.
2. Interface problem between NCCON and the network clock firmware.
3. Garbaged data inside NCCON.

Action:

Provide data to the next level of support.

450. SMNCWTUN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown unit was requested to write to the database.

451. SMNULLREATMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected value was received for determining the contents of the reason field for returning a message.

452. SMODDPCIV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return was received from the DBfrdtup() function.

453. SMOORQIX (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An out-of-range index to the switch maintenance analysis and recovery strategies (SMARS) queue was encountered.

454. SMOSRETTG (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from the operating system for distributed switching (OSDS) macro OSWGETMSG() when forever waiting was encountered in the TRIG system process in the switch maintenance kernel process (SMKP). The valid expected return is OSMSG.

455. SMOSRTMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The time multiplexed switch configuration (TMSCON) process was entered with an invalid operating system for

distributed switching (OSDS) reason.

456. SMOUTMSGFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A process tried to log data, but failed. Possibly, *UNIX*[®] was down, a message class was out of range, or a message pointer was invalid.

457. SMPACK (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from initialization and configuration administration (ICAD).

458. SMPAUST (5E11 and later)

Recovery Action: spp	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

The status of the pump peripheral controller (PPC) could not be read. An audit of the PPC is requested then the process is purged.

459. SMPBDACK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid acknowledgement was received from initialization and configuration administration (ICAD). Either the acknowledgement was successfully received and found to be invalid, or an error occurred while waiting for the acknowledgement. Execution will continue and the message sent to ICAD and the acknowledgement message received will be dumped.

460. SMPBDCNT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid error count was returned from the error count checking routine SMerrck(). The two error counters are dumped.

461. SMPBDMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The pump peripheral controller (PPC) strategy system process (SSP) received an invalid message. Probably corrupted data was found within the message.

462. SMPBDOS (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred while waiting for an acknowledgement from configuration administration (CAD). The return code

from the OSWGETTYPE() macro is either OSTYPEOUT or an invalid return code. The message sent will be dumped and the pump peripheral controller (PPC) strategy system process (SSP) will be purged.

463. SMPHY2LOG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Message switch control unit configuration (MSCUCON) failed while trying to convert the equipment ID to a logical unit. An invalid equipment ID may have been used or the load may be invalid.

464. SMPIACK (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown process sent an invalid return code to the CMP strategy system process (SSP) configuration administration (CAD) acknowledgement routine.

465. SMPIACTIONERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message contained invalid data in the action code field. Possibly, the sending process incorrectly assigned the action code, the receiving process incorrectly verified the action code, or the message was corrupted.

466. SMPIAQERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message contained invalid data in the action qualifier field. Possibly, the sending process incorrectly assigned the action qualifier, the receiving process incorrectly verified the action qualifier, or the message was corrupted.

467. SMPIBDACK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid acknowledgement was received from initialization and configuration administration (ICAD). Either the acknowledgement was successfully received and found to be invalid, or an error occurred while waiting for the acknowledgment. Execution will continue and the message sent to ICAD and the acknowledgement message received will be dumped.

468. SMPIBDMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message was received by the CMP strategy system process (SSP). Probably corrupted data was found within the message. The data dump contains the invalid message.

469. SMPIBMSGLENGTH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message received or sent by the asserting process had an invalid length. The first data dump contains the in-progress request and the second data dump contains the message with the invalid length.

470. SMPICEVTNOERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CMP configuration process (CMPCON) received a timeout message that does not match CMPCON's current event in progress. The data dump contains the timeout message.

471. SMPICLEACCESS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in the PIPCON system process while processing the link establish message from the CMP. Either the level 2 data delivery (DD) communication or the LLSTAT data could not be written.

472. SMPICLEBADMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The link establish message sent from the communication module processor (CMP) to the CMP configuration (CMPCON) process had invalid data.

473. SMPICONTO (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CMP configuration process (CMPCON) timed out while waiting for a response from a CMP. The data dump contains the in-progress request.

474. SMPICRETBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication module processor configuration (CMPCON) non-blocking message receiving function SMPicgmsg() returned an unexpected value. The data dump contains the original in-progress request.

475. SMPIERRTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The asserting process received an invalid value in the error type field of the input message. Possibly, the sending process incorrectly assigned the error type field, the asserting process incorrectly verified the error type field, or the message was corrupted.

476. SMPIEVCLERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message contained invalid data in the event class field. Possibly, the sending process incorrectly assigned the event class, the receiving process incorrectly checked the event class, or the message was corrupted.

477. SMPIFROMERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message was received from a process that should not send the asserting process a message. Possibly, the sending process incorrectly assigned the operating system process identification (OSPID) of the process it was sending to, the asserting process incorrectly verified the OSPID of the sending process, or the message was corrupted.

478. SMPGETMSGERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operating system for distributed switching (OSDS) message macro OSWGETFROM() or OSWGETMSG() returned a failure code to the asserting process while it was waiting to receive a message. Possibly, the asserting process set the parameters to the OSDS macro incorrectly or the OSDS process encountered a software error.

479. SMPINVTABT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid abort request type was received by the CMP soft switch abort function SMpabwt() in the CMP configuration process (CMPCON).

480. SMPINVDGN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message contained invalid data in the diagnostic result field. Possibly, the sending process incorrectly assigned the diagnostic result, the receiving process incorrectly verified the diagnostic result, the diagnostic results were added without proper code modification, or the message was corrupted.

481. SMPINVMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CMP configuration process (CMPCON) received an invalid message while performing an action. The first data dump contains the in-progress request and the second data dump contains the invalid message that was received.

482. SMPIMATEGET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMpimate() function returned a value other than SMDBOK.

483. SMPINODDACK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CMP strategy system process (SSP) timed out while waiting for an acknowledgement from the office dependent data (ODD) backup process.

484. SMPINV (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

When the pump peripheral controller (PPC) strategy system process (SSP) checked the state and event for a specific action to be taken, the event was invalid for the determined state. This could indicate that the error counters are out of synchronization with the system states.

485. SMPIOSELENGTH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message received or sent by the asserting process had an invalid length. Possibly, the asserting process incorrectly set the message length or the message was corrupted.

486. SMPIOSSNDMSGERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSENDMSG() macro returned an unexpected value. The data dump contains the in-progress request.

487. SMPIPHYSERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message contained invalid data in the equipment ID field. Possibly, the sending process incorrectly assigned the physical equipment ID, the receiving process incorrectly verified the physical equipment ID, or the message was corrupted.

488. SMPIPTO (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CMP strategy system process (SSP) timed out while waiting for an acknowledgement from configuration administration (CAD).

489. SMPIPURGE (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An unsuccessful acknowledgement was received from configuration administration (CAD) during a CMP soft switch abort (manual or automatic). CAD and the CMP configuration process (CMPCON) are purged prior to aborting the soft switch.

490. SMPIRDERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The asserting process received a read failure return code from the SMddread() function.

491. SMPIRDEVER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error type was not found in the pierrabt[] table.

492. SMPIRDWRERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CLNK	Audit Mode: elev

Problem:

The SMpiwtll() function, which updates the CMP logical link status to the AM logical link map, returned a value other than SUCCESS. An elevated audit will be scheduled in an attempt to deal with potential logical link map inconsistencies.

493. SMPIREADERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

The asserting process received a read failure return code from the SMddread() function. The function could not read data for the CMP from the protected application segment (PAS) dynamic status database. Possibly, a problem occurred in the asserting process's call to SMddread() or in accessing the PAS database.

494. SMPIREASERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The asserting process was created for a reason other than the reasons it is designed to accept. Possibly, a new and valid reason was added but this code was not updated, an error occurred in the creation process, or text was corrupted.

495. SMPIRSNERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message switch kernel process (MSKP) returned a failing return code (reason) that is unknown to the switch maintenance kernel process (SMKP).

496. SMPISEWAIT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSWAIT() macro returned a value other than OSTYPEOUT. Possibly, an invalid condition or invalid maxtime was encountered, or no condition and no timer were specified in a call to OSWAIT(). This problem may be due to an error within the asserting process or corrupted text.

497. SMPISIDERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message was detected by the receiving process. A message switch control unit (MSCU) side other than 0 or 1 was specified in the message.

498. SMPISNDMSGERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The operating system for distributed switching (OSDS) macro OSSENDMSG() failed to send a message for a reason other than OSELENGTH (length error), OSENCB (no message buffers available), or OSEMSG (no DMERT buffers). Possibly, the asserting process incorrectly built the OSMSGHEAD data, the OSDS process had software problems, or the message was corrupted.

499. SMPISRCERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message contained invalid data in the source field. Possibly, the sending process incorrectly assigned the source field, the receiving process incorrectly verified the source field, or the message was corrupted.

500. SMPISRETBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CMP strategy system process's (SSP's) non-blocking message receiving function SMPisgmsg() returned an unexpected value. The data dump contains the original in-progress request.

501. SMPISWINSANE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CMP soft switch was in an unstable state.

502. SMPITIMERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the operating system for distributed switching (OSDS) macro OSTIMER() yielded a failure code. Possibly, the calling function specified an out of range timer value or the operating system (OS) could not allocate a timer control block (TCB).

503. SMPITMCMPPH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication module processor configuration (CMPCON) process timed out while waiting for an acknowledgement from the CMP handler or the link establish (LE) message from the CMP.

504. SMPITYPERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message contained invalid data in the message type field. Possibly, the sending process incorrectly assigned the message type, the receiving process incorrectly verified the message type, or the message was corrupted.

505. SMPIUNITERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid equipment ID was specified in a message to the asserting process in the switch maintenance kernel process (SMKP). Possibly, the message contained an invalid unit ID. The unit type was not CMP or the physical CMP number specified was not within the valid range. This problem was probably the fault of the sending process.

506. SMPIUPDTERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal update request was passed to the SMpiwll() function. The message switch control unit (MSCU) translation tables for both sides are updated by default.

507. SMPIWGTER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSWGETTYPE() macro returned an unexpected value. The data dump contains the in-progress request.

508. SMPIWRITER (5E11 and later)

Recovery Action: spp	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

The asserting process received a write failure return code from the SMddwrite() function. The function could not write CMP dynamic data into the protected application segment (PAS) database. Possibly, an error occurred in the asserting process's call to SMddwrite() or in accessing or updating the PAS database.

509. SMPIWTERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The asserting process received a write failure return code from the SMddwrite() function.

510. SMPMSGFAIL (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Message switch control unit configuration (MSCUCON) received a message from initialization and configuration administration (ICAD) that was too long, or an invalid wait time was used to get the message, or a timeout occurred while waiting forever. The load may be incompatible, or the text may be corrupted.

511. SMPOSND (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSENDMSG() macro returned failure for a reason other than a resource problem. Possibly, the destination process did not exist or the destination process expected a message of a different size. The data dumped contains the message that OSSENDMSG() attempted to send.

512. SMPPC1SND (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The return code from the OSSENDMSG() macro was OSEPROC or an unexpected code (default).

513. SMPPC2SND (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return code of OSELENGTH was returned from the OSSENDMSG() macro. This indicates that an invalid message length was passed to OSSENDMSG().

514. SMPPCBMSGR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was detected in a message received by the pump peripheral controller (PPC) switch maintenance error recognition (SMER) and/or the PPC configuration process (PPCCON).

515. SMPPCINP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid input parameter was received from the interrupt inhibit administrator (IIA). This indicates a problem in receiving or sending the parameter.

516. SMPPCMNF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The original request message to the pump peripheral controller configuration process (PPCCON) was not found in its input buffer. The message was destroyed or lost. The input message buffer will be dumped.

517. SMPPCMRR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid acknowledgement message was received from the pump peripheral controller (PPC) handler in the message switch kernel process (MSKP). The message sent to MSKP and the acknowledgement will be dumped.

518. SMPPCOSWT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSWGETTYPE() macro returned a return code indicating a failure in the pump peripheral controller configuration process (PPCCON) interrupt inhibit administrator (IIA) routine. The return code is something other than a resource problem.

519. SMPPCREA (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Pump peripheral controller (PPC) switch maintenance error recognition (SMER) and/or the PPC configuration process (PPCCON) were created for an invalid reason.

520. SMPPCSWE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

After a message interface control unit (MICU) restoration, the database was read to check the state of the pump peripheral controller (PPC). The PPC was in an invalid state.

521. SMPPCSWR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

The pump peripheral controller configuration process (PPCCON) could not access the database to change or determine the PPC status.

522. SMPPCTMR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from the request for a timer that was sent to the OSTIMER() macro.

523. SMPPCWAIT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the OSWAIT() macro failed. This problem may be due to typographical errors.

524. SMPPCWGET (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSWGETMSG() macro failed. The message received from OSWGETMSG() was invalid.

525. SMPPCWMF (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The return code from the OSWGETTYPE() macro was OSERANGE. This indicates that the timer value passed to OSWGETTYPE() was out of range. The pump peripheral controller configuration process (PPCCON) will be purged.

526. SMPPCWMT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure code of OSELENGTH was returned from the OSWGETTYPE() macro. This indicates that a message of an invalid length was returned by the pump peripheral controller (PPC) handler.

527. SMPSENFFAIL (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Tried to send a message to an invalid process. The loads may be incompatible, or the global parameter OSPID may have been invalid.

528. SMQACKTG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The function Smpipetgwk() detected an acknowledgment timeout or failure.

Probable Cause:

Timeout or resource problem while waiting for ACK from quad-link fault recovery (QLFR) - strategy system process (SSP).

Action:

If persistent, may need to extend timer value.

529. SMQCACTIONERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid action received by quad-link fault recovery configuration process (QLFR CON).

Probable Cause:

Software error.

Action:

Provide data to the next level of support so programming error can be fixed.

530. SMQCBRTACK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A quad-link packet switch link fault recovery configuration process (QLFR CON) received an acknowledgement from the quad-link gateway processor handler (QGPH) in the message switch kernel process (MSKP), indicating that a problem occurred during an attempt to update QLTK routing in the quad-link gateway processor (QGP). Routing may not have been updated in the QGP, and the AM will not make the QLTK active.

Probable Cause:

Software or hardware errors in the AM or QGP.

Action:

Provide data to the next level of support.

531. SMQCATAERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unexpected data received by quad-link fault recovery configuration process (QLFR CON) in message from the quad-link gateway processor (QGP) handler.

Probable Cause:

Hardware or software problems in the QGP, or software problem in QLFR CON or the QGP handler.

Action:

Provide data to the next level of support so programming error can be fixed.

532. SMQCDDRDFL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A quad-link packet switch link fault recovery (QLFR) software in the administrative module (AM) received a failure return code from SMddread().

Probable Cause:

A software error in QLFR-AM or SMddread().

Action:

Provide data to the next level of support.

533. SMQCDDWRFL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A quad-link packet switch link fault recovery (QLFR) software in the AM (administrative module) received a failure return code from SMddwrite().

Probable Cause:

A software error in QLFR-AM or SMddwrite().

Action:

Provide data to the next level of support.

534. SMQCIMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A quad-link packet switch link fault recovery configuration process (QLFR CON) received an invalid message type.

Probable Cause:

Software error.

Action:

Provide data to next level of support.

535. SMQCINVACT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A quad-link packet switch link fault recovery configuration process (QLFR CON) received a request to perform an invalid or unexpected action. The request message may have been corrupted.

Probable Cause:

AM software error.

Action:

Provide data to the next level of support.

536. SMQCINVLE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A quad-link packet switch link fault recovery (QLFR CON) configuration process received an invalid message related to QLNK establishment. The message may be (1) reporting that level 2 has been established on a QLNK, (2) an link establishment (LE) message from an SM attempting to establish end-to-end communication on a QLNK, or (3) a routing update acknowledgement from the quad-link gateway processor (QGP). The message will be discarded because it contains invalid or corrupted information. The invalid message will be dumped.

Probable Cause:

Software or hardware errors in the AM, SM, or QGP.

Action:

Provide data to the next level of support.

537. SMQCINVPARAM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A quad-link packet switch link fault recovery configuration process (QLFR CON) function was passed invalid or inconsistent parameters.

Probable Cause:

A software error in QLFR CON.

Action:

Provide data to next level of support.

538. SMQCINVSTATE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A quad-link packet switch link fault recovery configuration process (QLFR CON) found a QLNK or parent unit in an invalid or unexpected state. An audit will be invoked to correct the invalid state.

Probable Cause:

AM software problem or data corruption.

Action:

Provide data to the next level of support.

539. SMQCINVUNIT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A quad-link packet switch link fault recovery (QLFR CON) received a request to perform an action on an unexpected unit. Either the unit is invalid, the action cannot be performed on the specified unit, or the message was corrupted.

Probable Cause:

AM software error.

Action:

Provide data to the next level of support.

540. SMQCLESTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: QLNK	Audit Mode: elev

Problem:

A quad-link packet switch link fault recovery (QLFR CON) configuration process received a message related to QLNK establishment but the associated QLNK was in an unexpected state. The message may be (1) reporting establishment or loss of level 2 on a QLNK, (2) an link establishment (LE) message from an SM attempting to establish end-to-end communication on a QLNK, or (3) a routing update acknowledgement from the quad-link gateway processor (QGP). The message will be discarded and the QLNK audit will be scheduled.

Probable Cause:

Software or hardware errors in the AM, SM, or QGP.

Action:

Provide data to the next level of support.

541. SMQCNTTMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The time multiplexed switch (TMS) error queue length was not a valid size.

542. SMQCODDRD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Aquad-link packet switch link fault recovery configuration process (QLFR CON) received a failure return code from an office dependent data (ODD) read, or the ODD data was unexpected/inconsistent.

Probable Cause:

Software error or ODD corruption.

Action:

Provide data to next level of support.

543. SMQCOPQGP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A quad-link packet switch link fault recovery configuration process (QLFR CON) detected an invalid or unexpected value for the operational quad-link gateway processor (QGP) global parameter (Glqgpopper).

Probable Cause:

Software error or data corruption.

Action:

Provide data to the next level of support.

544. SMQCOSER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A quad-link packet switch link fault recovery configuration process (QLFR CON) received an unexpected return value from an operating system for distributed switching (OSDS) primitive/macro.

Probable Cause:

Software error.

Action:

Provide data to the next level of support.

545. SMQCOSRCV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A quad-link packet switch link fault recovery configuration process (QLFR CON) received an un-expected return value from an operating system for distributed switching (OSDS) message receive primitive/macro.

Probable Cause:

Software error.

Action:

Provide data to next level of support.

546. SMQCPCDER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A quad-link fault recovery configuration process (QLFR CON) detected some invalid/unexpected AM peripheral configuration data (PCD).

Probable Cause:

Software error or data corruption.

Action:

Provide data to the next level of support.

547. SMQCPHYSERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid physical unit received by the quad-link fault recovery configuration process (QLFR CON).

Probable Cause:

Software error.

Action:

Provide data to the next level of support so programming error can be fixed.

548. SMQCPPAR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A quad-link fault recovery configuration process (QLFR CON) detected an inconsistency between a QPIPE peripheral configuration data (PCD) state and it's parent state.

Probable Cause:

Software error.

Action:

Provide data to the next level of support.

549. SMQCPSTATE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A quad-link fault recovery configuration process (QLFR CON) detected a QPIPE in an invalid or unexpected state. An audit will be invoked to correct the QPIPE state.

Probable Cause:

Software error or data corruption.

Action:

Provide data to the next level of support.

550. SMQCQEODD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A quad-link fault recovery configuration process (QLFR CON) detected an inconsistency between network 0 and 1 tuples in the RLQENDPTS relation. The set of endpoints should be the same for each network.

Probable Cause:

The RLQENDPTS relation in office-dependent data (ODD) is incorrect.

Action:

Determine the correct set of endpoints for network 0 and 1, and update the RLQENDPTS relation.

551. SMQCRSTATE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A quad-link fault recovery configuration process (QLFR CON) processed a request with an invalid/unexpected state specified.

Probable Cause:

Software error.

Action:

Provide data to the next level of support.

552. SMQCSNDER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A quad-link fault recovery configuration process (QLFR CON) received an unexpected return value from an operating system for distributed switching (OSDS) send primitive/macro.

Probable Cause:

Software error.

Action:

Provide data to next level of support.

553. SMQCTOFPC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A quad-link fault recovery configuration process (QLFR CON) timed out on an expected acknowledgement from the foundation peripheral (FPC) handler (message switch kernel process [MSKP]).

Probable Cause:

Software error.

Action:

Provide data to the next level of support.

554. SMQCTOQGP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A quad-link fault recovery configuration process (QLFR CON) timed out on an expected acknowledgement from the quad-link gateway processor (QGP) handler (message switch kernel process [MSKP]).

Probable Cause:

Software error.

Action:

Provide data to the next level of support.

555. SMQCUMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A quad-link fault recovery configuration process (QLFR CON) received an un-expected message.

Probable Cause:
Software error.

Action:
Provide data to next level of support.

556. SMQGACTIONERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
The message contains invalid data in the action code field. The pointer to the message is printed.

Probable Cause:
The sending process incorrectly assigned the action code, the receiving process incorrectly verified the action code (both are software bugs), or the message was corrupted.

Action:
Provide data to the next level of support.

557. SMQGAQERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
The message contains invalid data in the action qualifier field. The pointer to the message is printed.

Probable Cause:
The sending process incorrectly assigned the action qualifier, the receiving process incorrectly verified the action qualifier (both are software bugs), or the message was corrupted.

Action:
Provide data to the next level of support.

558. SMQGAUPARM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
An invalid audit status parameter was passed to the SMqgautrig() function when attempting to allow or inhibit quad-link gateway processor (QGP) audits. The QGP audit status will not be changed as a result of this error.

Probable Cause:
A software programming error in the code that calls SMqgautrig() caused an unexpected audit status parameter value to be passed to SMqgautrig().

Action:
If the assert persists, provide data to the next level of support.

559. SMQGBADINIT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:
An initialization message with a bad action field was received. Something other than an H3 or H4 was specified. The

message pointer is printed.

Probable Cause:

Corrupt message or programming error.

Action:

Provide data to the next level of support.

560. SMQGBIDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While inhibiting or allowing quad-link gateway processor (QGP) interrupts, an invalid QGP equipment ID or action parameter was passed to SMia_qgp() by the interrupt inhibit administrator (IIA) or audits (AU) process. The QGP inhibit/allow interrupt request will be failed.

Probable Cause:

Programming error in function calling SMia_qgp().

Action:

Inform next level of support if problem continues.

561. SMQGBQGP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The asserting process received an unexpected response message or a response message containing invalid data from the quad-link gateway processor handler (QGPH) in the message switch kernel process (MSKP). The offending message will be dumped to the ROP.

Probable Cause:

The message is probably a response to a previous maintenance request, potentially out of date or out of sequence. Message corruption or an incorrectly populated message is a less likely possibility. All are maintenance software programming errors.

Action:

If the assert persists, provide data to the next level of support.

562. SMQGCADTIMO (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

The asserting process timed-out while waiting for an acknowledgment message from the configuration administrator (CAD) process.

Probable Cause:

The CAD process was corrupted or contains a software bug, or the asserting process's timer period is too short.

Action:

Provide data to the next level of support.

563. SMQGDDREAD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The asserting process received a read fail return code from DDREAD(). It could not read data from the data delivery.

Probable Cause:

Software error in the asserting process's call to DDREAD() or a serious software problem in accessing the data delivery database.

Action:

Provide data to the next level of support.

564. SMQGDDWRITE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DDWRITE returned a failure in the quad-link gateway processor configuration process control (QGPCON) process.

Probable Cause:

Software or hardware errors in the AM.

Action:

Provide data to the next level of support.

565. SMQGDTIMER (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the operating system for distributed switching (OSDS) primitive, OSDETIMER(), yielded a failure code.

Probable Cause:

Calling process specified an invalid timer tag when a current timing request was removed or did not own the specified timer.

Action:

If problem persists, provide data to next level of support.

566. SMQGDUPERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Redundant initialization messages were received. In particular, more than one message has been received to initialize the same message switch (MSGs) side. The message pointer is printed.

Probable Cause:

Software programming error has occurred.

Action:

Provide data to the next level of support.

567. SMQGERRTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The asserting process received an invalid value in the error type field of the input message.

Probable Cause:

The sending process incorrectly assigned the error type field, the asserting process incorrectly verifies the error type field (both are software bugs), or the message was corrupted.

Action:

Provide data to the next level of support.

568. SMQGEVCLERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message contains invalid data in the event class field. The pointer to the message is printed.

Probable Cause:

The sending process incorrectly assigned the event class, the receiving process incorrectly checked the event class field (both are software bugs), or the message was corrupted.

Action:

Provide data to the next level of support.

569. SMQGEVTNOERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A timeout message with an unexpected event number was received by the quad link packet switch gateway processor control (QGPCON) process. A pointer to SMqgreply is printed along with pointers to each element of SMqgbox[].

Probable Cause:

QGPCON process may have an outstanding timing request that it is unaware of. Else the error is probably internal to the operating system.

Action:

Provide data to the next level of support.

570. SMQGFROMERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received a message from a process that should not send the asserting process a message. ERROR POSSIBILITIES: The sending process incorrectly assigned the operating system process ID (OSPID) of the process it was sending to (software bug), the asserting process incorrectly verifies the OSPID of sending process, or the message was garbaged.

571. SMQGGETMSGERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An operating system for distributed switching (OSDS) message primitive (OSWGETFROM or OSWGETMSG) returned a failure code to the asserting process while it was waiting to receive a message. ERROR

POSSIBILITIES: The asserting process set the parameters to the OSDS primitive incorrectly or the OSDS process encountered a software error.

572. SMQGGLIMIT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The switch maintenance and recovery strategies (SMARS) process placed a message on the quad link packet switch gateway processor (QGP) process queue while the QGP process was executing. The pointer to the message is printed.

Probable Cause:

A software bug in SMARS which places an entry on the QGP process queue before the executing process has finished.

Action:

Provide data to the next level of support.

573. SMQGINVDGN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message contains invalid data in the diagnostic result field. The pointer to the message is printed.

Probable Cause:

The sending process incorrectly assigned the diagnostic result, the receiving process incorrectly verifies the diagnostic result, the addition of diagnostic results without proper code modification (all are software bugs), or the message was corrupted.

Action:

Provide data to the next level of support.

574. SMQGOSELENGTH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message received or sent by the asserting process had an invalid length. The pointer to the message is printed.

Probable Cause:

The asserting process incorrectly set the message length (software bug) or the message was corrupted.

Action:

Provide data to the next level of support.

575. SMQGOSSEND (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operating system for distributed switching (OSDS) primitive, OSSENDMSG(), failed in its attempt to send a message for a reason other than OSELENGTH (length error), OSENOVCB (no message buffers available), or OSEMSG (no DMERT buffers). The pointer to the message is printed.

Probable Cause:

The asserting process incorrectly built OSMSGHEAD data (software bug), the OSDS process has software problems, or the message was corrupted. (does not purge)

Action:

Provide data to the next level of support.

576. SMQGPYSERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message contains invalid data in the equipment ID field. The pointer to the message is printed.

Probable Cause:

The sending process incorrectly assigned the physical equipment id, the receiving process incorrectly verifies the physical equipment ID (both are software bugs), or the message was corrupted.

Action:

Provide data to the next level of support.

577. SMQGREADERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: QGP	Audit Mode: elev

Problem:

The asserting process received a read fail return code from SMddread(). It could not read data for the quad link packet switch gateway processor (QGP) from the protected application segment (PAS) database containing dynamic status.

Probable Cause:

A software bug in asserting process's call to SMddread() or a serious software problem in accessing the PAS (dynamic status) database.

Action:

Provide data to the next level of support.

578. SMQGREASERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The asserting process was created for a reason other than the ones it is designed to accept. ERROR POSSIBILITIES: A new and valid reason was added but this code was not updated, a software bug in the creation process, or garbaged text.

579. SMQGSEWAIT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Use of the OSWAIT() primitive returned a value other than OSTEIMEOUT.

Probable Cause:

Either an invalid condition, invalid maxtime, or no condition and no timer were specified in a call to OSWAIT(). Probably due to a software bug within the asserting process or corrupted text.

Action:

Provide data to the next level of support.

580. SMQGSIDERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message has been detected by the receiving process. An message switch control unit (MSCU) side other than 0 or 1 has been specified in the message. The message pointer is printed.

Probable Cause:

Corrupted message or programming error.

Action:

If problem persists, provide data to next level of support.

581. SMQGSNDMSGERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The operating system for distributed switching (OSDS) primitive, OSSENDMSG(), failed in its attempt to send a message for a reason other than OSELENGTH (length error), OSENCOMCB (no message buffers available), or OSEMSG (no DMERT buffers). The pointer to the message is printed.

Probable Cause:

The asserting process incorrectly built OSMSGHEAD data (software bug), the OSDS process has software problems, or the message was corrupted.

Action:

Provide data to the next level of support.

582. SMQGSRCERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message contains invalid data in the source field. The pointer to the message is printed.

Probable Cause:

The sending process incorrectly assigned the source field, the receiving process incorrectly verifies the source field (both are software bugs), or the message was corrupted.

Action:

Provide data to the next level of support.

583. SMQGTAGERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The timer message received contains an unrecognized timer tag.

Probable Cause:

Software bug in receiving process.

Action:

If problem persists, provide data to next level of support.

584. SMQGTIMERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the operating system for distributed switching (OSDS) primitive OSTIMER() yielded a failure code. A pointer to the timer tag is printed.

Probable Cause:

The calling function specified an out of range timer value or the OS was unable to allocate a timer control block.

Action:

If problem persists, provide data to next level of support.

585. SMQGTIMIDX (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not find message in SMqgmbox[] for given event.

Probable Cause:

Programming error, or corrupted memory.

Action:

Inform next level of support.

586. SMQGTIMOCAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The asserting process timed-out while waiting for an acknowledgment message from the configuration administrator (CAD) process. The pointer to the message is printed.

Probable Cause:

The CAD process was corrupted or contains a software bug, or the asserting process's timer period is too short. (This code is used when it is undesirable to purge running process).

Action:

Provide data to the next level of support.

587. SMQGTQGPH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A quad-link gateway processor control (QGPCON) process or function timed out on a message sent to the QGP handler.

Probable Cause:

Asserting process's timer period is too short or QGP handler's text or data segment has become garbaged or has a bug.

Action:

Inform next level of support if problem continues.

588. SMQGTYPERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message contains invalid data in the message type field. ERROR POSSIBILITIES: The sending process incorrectly assigned the message type, the receiving process incorrectly verifies the message type (both are software bugs), or the message was garbaged.

589. SMQGUNITERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Bad equipment ID was specified in a message to the asserting process in the switch maintenance kernel process (SMKP). The message pointer is printed.

Probable Cause:

Message contained an invalid unit ID. The unit type was not quad-link gateway processor (QGP) or the physical QGP number specified was not within the valid range.

Action:

Provide data to the next level of support so programming error can be fixed.

590. SMQGWRITERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: QGP	Audit Mode: elev

Problem:

The asserting process received a write fail return code from SMddwrite(). It could not write quad link packet switch gateway processor (QGP) dynamic data into the protected application segment (PAS) database.

Probable Cause:

A software bug in asserting process's call to SMddwrite() or a serious software problem in accessing or updating the PAS (dynamic status) database.

Action:

Provide data to the next level of support.

591. SMQINITABT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Time multiplexed switch configuration (TMSCON) received abort return code for DNCINIT message.

Probable Cause:

Bad parameter passed in DNCINIT.

Action:

Dump init type, current option, and new option bytes.

592. SMQLACTERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid action received by quad-link fault recovery (QLFR) strategy system process (SSP) from switch maintenance analysis and recovery strategies (SMARS).

Probable Cause:

Software error.

Action:

Provide data to next level of support.

593. SMQLALARMERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid alarm level value was received by quad-link fault recovery (QLFR) strategy system process (SSP) process.

Probable Cause:

Software error.

Action:

Provide data to next level of support.

594. SMQLBADACT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid action requested to be performed for indicated unit by quad-link fault recovery (QLFR) strategy system process (SSP) process.

Probable Cause:

Software error.

Action:

Provide data to next level of support.

595. SMQLBADERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid error type received by quad-link fault recovery (QLFR) switch maintenance error recognition (SMER) or strategy system process (SSP) process.

Probable Cause:

Software error.

Action:

Provide data to next level of support.

596. SMQLBADMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unknown message type or message with bad event number received by quad-link fault recovery (QLFR) switch

maintenance error recognition (SMER) or strategy system process (SSP).

Probable Cause:
Software error.

Action:
Provide data to next level of support.

597. SMQLBADTMR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Bad operating system for distributed switching (OSDS) timer parameter in quad-link fault recovery (QLFR) strategy system process (SSP) process.

Probable Cause:
Software error.

Action:
Provide data to next level of support.

598. SMQLCREATEERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Quad-link fault recovery (QLFR) switch maintenance error recognition (SMER) or strategy system process (SSP) system process created with invalid reason.

Probable Cause:
Software error.

Action:
Provide data to next level of support.

599. SMQLEPINDX (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid event/error profile index value received by quad-link fault recovery (QLFR) strategy system process (SSP) process.

Probable Cause:
Software error.

Action:
Provide data to next level of support.

600. SMQLEVERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid event class received by quad-link fault recovery (QLFR) strategy system process (SSP) from switch maintenance analysis and recovery strategies (SMARS).

Probable Cause:
Software error.

Action:
Provide data to next level of support.

601. SMQLGETMSGERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Quad-link fault recovery (QLFR) strategy system process (SSP) process requested timer with invalid timeout argument.

Probable Cause:
Software error.

Action:
Provide data to next level of support.

602. SMQLINVEP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Quad-link fault recovery (QLFR) switch maintenance error recognition (SMER) process received a QLL error message from a quad-link gateway processor (QGP) with an invalid SM end point number.

Probable Cause:
Software error or database corruption.

Action:
Provide data to next level of support.

603. SMQLNOMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Invalid event received from OSWGETMSG.

Probable Cause:
Software error.

Action:
Provide data to next level of support.

604. SMQLOSELENGTH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Quad-link fault recovery (QLFR) strategy system process (SSP) process received a truncated message.

Probable Cause:
Software error.

Action:

Provide data to next level of support.

605. SMQLPHYSERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid or out-of-range equipment ID encountered by quad-link fault recovery (QLFR) switch maintenance error recognition (SMER) or strategy system process (SSP).

Probable Cause:

Software error.

Action:

Provide data to next level of support.

606. SMQLREADERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unit is in an invalid state (according to the peripheral configuration data [PCD]).

Probable Cause:

Software error or data corruption.

Action:

Provide data to next level of support.

607. SMQLSMINDX (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid SM-2000 end point index number in quad-link fault recovery (QLFR) strategy system process (SSP) process.

Probable Cause:

Software error or data corruption.

Action:

Provide data to next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

608. SMQLSRCERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid source for request received by quad-link fault recovery (QLFR) strategy system process (SSP).

Probable Cause:

Software error.

Action:

Provide data to next level of support.

609. SMQLTIMO (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Quad-link fault recovery (QLFR) strategy system process (SSP) process timed out waiting for response for configuration administration (CAD) request.

Probable Cause:

Software or hardware error.

Action:

Provide data to next level of support.

610. SMQONTCPD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: QLPS	Audit Mode: elev

Problem:

BAD quad-link fault recovery (QLPS) peripheral configuration data (PCD) access.

Probable Cause:

Bad param passed into SMddread or SMddwrite, or corrupted PCD data accessed directly or through office network and timing complex (ONTC) call to SMddread or SMddwrite.

Action:

Audit scheduled for QLPS PCD, and parameter dump of input eqid.

611. SMQPIPEABT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Time multiplexed switch configuration (TMSCON) received abort return code for DNCQPODD or DNCQPEVN.

Probable Cause:

Bad parameter specified in DNCQPODD or DNCQPEVN.

Action:

Dump QTMSLNK/2, TMSLNK/2, and destination ID byte.

612. SMQPIPECNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Time multiplexed switch configuration (TMSCON) found inconsistency between pipes requested and returned.

Probable Cause:

Foundation peripheral controller (FPC) or TMS firmware error.

Action:

Dump number of pipes requested, number of opcodes recv.

613. SMQRSCPF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Quad-link fault recovery (QLFR) re-synch software received an invalid entry in the QTMSLNK call processing table during a hardware read.

Probable Cause:

Software or hardware error.

Action:

Provide data to next level of support.

614. SMQRSEQF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Quad-link fault recovery (QLFR) re-synch software received an invalid entry in the QTMSLNK equipage processing table during a hardware read.

Probable Cause:

Software or hardware error

Action:

Provide data to next level of support.

615. SMQSTABORT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: QLPS	Audit Mode: elev

Problem:

Time multiplexed switch configuration (TMSCON) received an abort return for a DNCQSTAT message.

Probable Cause:

Invalid QTMSLNK number in DNCQSTAT.

Action:

Dump (1) QTMSLNK/2 and (2) E/O fabric & ACT/STBY bits.

616. SMQSTBCFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Time multiplexed switch configuration (TMSCON) received a broadcast failed return from the TMS firmware.

Probable Cause:

TMS broadcast interval too short.

Action:

Adjust values defined in SMqdata.c for DNC[A,B]DRN.

617. SMRCENCI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Remote clock fault recovery (RCLKFR) could not enable control interface (CI) scanning of the remote clock's (RCLK's) peripheral interface control bus (PICB) after processing a fault recovery service request.

618. SMRCINEC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid error cause was passed to the SMcriterr() function. There may be a problem in the SMnc2_smerf() function.

619. SMRCINER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid error code was passed to the SMrc_recov() function. There may be a problem in the SMnc2_smerf() function.

620. SMRCINRM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMrc_crit() function received a request to remove a non-existent side [not 0 or 1, or both remote clock (RCLK) sides were specified].

621. SMRCSPRD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The low level peripheral control (PC) function used to read scan point status returned a failure. There may be a problem with the equipage status of the scan points in the office data.

622. SMREAIMTG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CLNK	Audit Mode: elev

Problem:

An invalid recent change reason was found in a message. The reason was not INSERT, UPDATE, or DELETE.

The TRIG system process in the switch maintenance kernel process (SMKP) found corrupted data in the message. The message was received from the SM trigger function SMmodtrigs() in the operational kernel process (OKP) during a recent change to the office dependent data (ODD) relation RLMODATT. The rcreason local variable of the enumeration type DBTRIGGER is dumped.

623. SMREALNKTG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

An invalid recent change reason was found in a message. The reason was not INSERT, UPDATE, or DELETE. The TRIG system process in the switch maintenance kernel process (SMKP) found corrupted data in the message that was received from the SM trigger function SMlnktrig() in the operational kernel process (OKP) during a recent change to the office dependent data (ODD) relation RLSLNTMS. This assert will dump the rcreason local variable of the enumeration type DBTRIGGER.

624. SMREAMMPTG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

An invalid recent change reason was found in a message. The reason was not INSERT, UPDATE, or DELETE. The TRIG system process in the switch maintenance kernel process (SMKP) found corrupted data in the message that was received from the SM trigger function Smpctrig() in the operational kernel process (OKP) during a recent change to the office dependent data (ODD) relation RLSPC. This assert will dump the rcreason local variable of the enumeration type DBTRIGGER.

625. SMREAQLPS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: QLPS	Audit Mode: elev

Problem:

The function SMqlpstgwk() detected a bad recent change (RC) reason in a rQLPS tuple.

Probable Cause:

Bug in RC code or subsequent corruption of data passed to trigger.

Action:

Examine the dumped "reason" and compare with the expected "reason".

626. SMREAQPIPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: QLPS	Audit Mode: elev

Problem:

The function Smpipetgwk() detected a bad recent change (RC) reason in a rTMSPIPE tuple.

Probable Cause:

Bug in RC code, or subsequent corruption of data passed to trigger.

Action:

Examine dump of invalid "reason".

627. SMREASERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid startup code was passed to a process.

628. SMREFBADDAT (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A refresh of the CMT weights array found bad data. The data was corrected. The CMT weights are the basis for any reconfiguration by the optimal/predictor algorithm. A refresh is done nightly to verify the weights and report any problems.

Probable Cause:

Software error or wild writes into the weights array area.

Action:

Provide data to the next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

629. SMRIIAIMTG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CLNK	Audit Mode: elev

Problem:

A failure return code (not SMDBOK) was received from the SMddread() primitive when reading the iia_state attribute in the global array SMIm. The expected successful return code is SMDBOK. This assert is in the SMimtgwork() function in the TRIG system process in the switch maintenance kernel process (SMKP). This assert will dump the eqid and buff arguments from the SMddread() primitive.

630. SMRSCARG (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The AM to CM resynchronization (RCON) process in the switch maintenance kernel process (SMKP) was created by the OSREPLACE() macro, but the argument passed by the macro was invalid.

631. SMRSCREASON (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The AM to CM resynchronization (RCON) process in the switch maintenance kernel process (SMKP) was created by something other than the OSREPLACE() macro. RCON will be purged.

632. SMRSINVESCAL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMrsescal() function was called with an invalid argument. As a result, the AM to CM resynchronization (RCON) process in the switch maintenance kernel process (SMKP) defaulted to the highest level of escalation (H4 init).

633. SMRSINVMODE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The AM to CM resynchronization (RCON) process in the switch maintenance kernel process (SMKP) found the SMrsmode flag set to an invalid value during escalation. Resynchronization strategies differ for normal and initialization mode resynchronizations. The type of resynchronization could not be determined; therefore, RCON could not continue with the resynchronization.

634. SMRSINVSEQST (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The AM to CM resynchronization (RCON) process in the switch maintenance kernel process (SMKP) was running in an invalid sequence state during escalation. The SMrsescal() function was called incorrectly or the sequence state flag SMrs_seqst was corrupted.

635. SMRSISPP (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMrsspp() function discovered that the AM to CM resynchronization (RCON) process in the switch maintenance kernel process (SMKP) was in an invalid sequence state while processing a single process purge.

636. SMRSM2HSM (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to map an RSM to its host SM number using the RLMODATT relation. Either the SM type (RLmodatt.imtype attribute) is not an RSM or the host SM number (RLmodatt.hostnum attribute) is not a valid (H)SM number.

Probable Cause:

Either the SM number used as a key to RLMODATT (RLmodatt.module attribute) was not an RSM, or the RSM's RLmodatt.imtype and/or RLmodatt.hostnum attributes contain invalid data.

Action:

System will execute appropriate corrective action. If problem persists, provide assert data to next level of support.

637. SMRSMOFST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SMclisolate() function found incorrect information from the RLMODATT relation for a particular SM. The assert is passed the imbuff parameter containing the location of the SM tuple with invalid data.

638. SMRSTIMEOUT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The gross timer expired in the AM to CM resynchronization (RCON) process in the switch maintenance kernel process (SMKP). RCON was running for more than two minutes (normal mode AM/CM resynchronization usually takes less than 5 seconds). The resynchronization will be aborted and the CM will be placed back in isolation.

639. SMSCORE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failure to DBfrdtup() relation RLSCORE.

Probable Cause:

Corrupted or missing tuple.

Action:

Check for missing tuple and add it to the office dependent data (ODD).

640. SMSSENDFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Message switch control unit configuration (MSCUCON) failed while trying to send a message to the MSCU handler or initialization and configuration administration (ICAD). The loads may be incompatible (different size buffers).

641. SMSEPDD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DDREAD() macro returned failure to the SMclisolate() function when attempting to read the DDRSMSEP key value.

642. SMSETLNKTMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The link status array access function SMsetlnkst() returned an invalid completion code.

643. SMSLNKTMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The time multiplexed switch (TMS) network control and timing (NCT) link static database read function DBfrdtup() returned an invalid completion code.

644. SMTIMEOUT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A timeout occurred in message switch control unit configuration (MSCUCON) when an acknowledgement message was expected from the MSCU handler.

645. SMTMCOMM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Time multiplexed switch configuration (TMSCON) returned a failure from SMcomm_tms(). The TMS shared buffer received data area is output.

Probable Cause:

TMS or foundation peripheral controller (FPC) hardware error.

Action:

Provide data to the next level of support.

646. SMTMR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid return data was received from the OSTIMER() macro.

647. SMTMSCPAUD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The call processing audit found a mismatch between the time multiplexed switch link (TMSLNK) status in the peripheral control data (PCD) and the time multiplexed switch (TMS) memory. The TMS memory was updated to match the TMSLNK status in the PCD.

648. SMTMSDLK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid state was encountered for writing to the time multiplexed switch (TMS) network control and timing (NCT) link dynamic database.

649. SMUNKFUNTMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The time multiplexed switch configuration (TMSCON) process was requested to perform an unknown function.

650. SMUNKMTST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The packet switching module (PSM) switch maintenance kernel process (SMKP) function received an unknown maintenance state.

651. SMUNKOPTMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected opcode was returned by the time multiplexed switch (TMS) hardware in response to a read.

652. SMVBLIST (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Elements in the switch maintenance analysis and recovery strategies (SMARS) vector linked lists were lost or duplicated. The array of headcells and the array of vector elements are dumped.

653. SMVBRLNK (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An incorrect link was found in the vector processing; the element counter exceeded the threshold. The array of headcells and the array of vector elements are dumped.

654. SMVCOAFP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

An inconsistent software status was encountered. The core was active, but no foundation peripheral controller (FPC) was active. The equipment ID and the SMddread() function buffer parameter are dumped.

655. SMVDDRWF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A dynamic data access failure occurred in a switch maintenance analysis and recovery strategies (SMARS) process.

656. SMVGTUPBD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The upper bound on weights was exceeded in the switch maintenance analysis and recovery strategies (SMARS) vector process.

657. SMVIDATA (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was found in switch maintenance analysis and recovery strategies (SMARS) vectors.

658. SMVINVET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid or unexpected error or event type was found in the switch maintenance analysis and recovery strategies (SMARS) process. The message is dumped.

659. SMVINVMM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return value for the min mode status indicator was found. The return value is dumped.

660. SMVINVNL (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An improper null index was found in the switch maintenance analysis and recovery strategies (SMARS) vector linked list. The index and the vector elements are dumped.

661. SMVINVRD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid reduction amount was found in a switch maintenance analysis and recovery strategies (SMARS) primitive.

662. SMVINVRQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid or improper request was sent to a switch maintenance analysis and recovery strategies (SMARS) primitive. The request and the equipment identification are dumped.

663. SMVISTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

An invalid or inconsistent software status was encountered. The peripheral configuration data (PCD) audit will be run to correct the error.

664. SMVIUNIT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid or unexpected unit was found in switch maintenance analysis and recovery strategies (SMARS) vector processing.

665. SMVLPRCF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from the SMlog2phy() function. The return code and logical unit ID are dumped.

666. SMVNFREE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

No free elements in the switch maintenance analysis and recovery strategies (SMARS) vector linked list were available. The message, weight, and vector elements are dumped.

667. SMVOORIX (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The index to the linked list in the switch maintenance analysis and recovery strategies (SMARS) vector was out of range. The index and the array of vector elements are dumped.

668. SMVPCAMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

An inconsistent software status was encountered. The peripheral controller (PC) was active, but the connected message switch control unit (MSCU) was not active. The equipment ID and the SMddread() function parameters item and buffer are dumped.

669. SMVQGLIP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

Inconsistent software status: QGL is active, but the parent quad-link gateway processor (QGP) or QTMSLNK is not active. The equipment id, SMddread parameters item and buffer are printed.

Probable Cause:

The PCD has been corrupted.

Action:

None. An audit has been requested.

670. SMWAITFAIL (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid wait time was specified.

671. SMWDGNMMPTG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

A failure return code was received from the SMddwrite() primitive when updating the module message processor (MMP) diagnostic state attribute dgn_rslt contained in the global array SMdpc. The expected return code is SMDBOK. This assert is in the SMpctgwork() function in the TRIG system process in the switch maintenance kernel process (SMKP). This assert will dump the eqid and buff arguments from the SMddwrite() primitive.

672. SMWIIAIMTG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CLNK	Audit Mode: elev

Problem:

A failure return code was received from the SMddwrite() primitive when updating the iia_state attribute in the global array SMlrm. The expected return code is SMDBOK. This assert is in the SMimtgwork() function in the TRIG system process in the switch maintenance kernel process (SMKP). This assert will dump the eqid and buff arguments from the SMddwrite() primitive.

673. SMWIIAMMPTG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

A failure return code was received from the SMddwrite() primitive when updating the iia_state attribute in the global array SMdpc. The expected return code is SMDBOK. This assert is in the SMpctgwork() function in the TRIG system process in the switch maintenance kernel process (SMKP). This assert will dump the eqid and buff arguments from the SMddwrite() primitive.

674. SMWMMPIMTG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CLNK	Audit Mode: elev

Problem:

A failure return code was received from the SMddwrite() primitive when updating the mmpnum attribute in the communication link (CL) link map contained in the global array SMlrm. The expected successful return code is SMDBOK. This assert is in the SMimtgwork() function in the TRIG system process in the switch maintenance kernel process (SMKP). This assert will dump the eqid and buff arguments from the SMddwrite() primitive.

675. SMWRTFAIL (5E11 and later)

Recovery Action: spp	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

Could not write to the database. Possibly, an invalid unit tried to be updated or the load was invalid.

676. SMWRTNOPCD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The switch maintenance kernel process (SMKP) could not read or write the state in the peripheral configuration data (PCD) of the message switch control unit (MSCU) for reasons of an out-of-range key, an invalid item, or an invalid unit. If the SMddwrite() function returns an invalid eqid value, then no PCD audit is scheduled.

677. SMWSDLCIMTG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CLNK	Audit Mode: elev

Problem:

A failure return code (not SMDBOK) was received from the SMddwrite() primitive when updating the sdlcnum attribute in the communication link (CL) link map contained in the global array SMlm. The expected successful return code is SMDBOK. This assert is in the SMimtgwork() function in the TRIG system process in the switch maintenance kernel process (SMKP). This assert will dump the eqid and buff arguments from the SMddwrite() primitive.

678. SMWSTIMTG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CLNK	Audit Mode: elev

Problem:

A failure return code was received from the SMddwrite() primitive when updating the state attribute in the global array SMlm. The expected return code is SMDBOK. This assert is in the SMimtgwork() function in the TRIG system process in the switch maintenance kernel process (SMKP). This assert will dump the eqid and buff arguments from the SMddwrite() primitive.

679. SMWSTLNKGTG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

A failure return code was received from the SMddwrite() primitive when updating the state attribute in the global array SMlnktnms. The expected return code is SMDBOK. This assert is in the SMlnktgwork() function in the TRIG system process in the switch maintenance kernel process (SMKP). This assert will dump the eqid and buff arguments from the SMddwrite() primitive.

680. SMWSTMMPTG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

A failure return code was received from the SMddwrite() primitive when updating the state attribute in the global array SMdpc[]. The expected return code is SMDBOK. This assert is in the SMPctgwork() function in the TRIG system process in the switch maintenance kernel process (SMKP). This assert will dump the eqid and buff arguments from the SMddwrite() primitive.

681. SMWSTQGPTG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCD	Audit Mode: elev

Problem:

Failure return from SMddwrite() when updating SMdpc[].

Probable Cause:

Invalid key passed to SMddwrite().

Action:

Examine SMddwrite arguments "eqid" and "buff".

682. SMWSTQLPSTG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: QLPS	Audit Mode: elev

Problem:

Failure return from SMddwrite() when updating SMdqpls[].

Probable Cause:

Invalid key passed to SMddwrite().

Action:

Examine SMddwrite arguments "eqid" and "buff".

683. SMWSTQPIPETG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: QLPS	Audit Mode: elev

Problem:

Failure from SMddwrite() when updating QPIPE state in SMdqpipe[].

Probable Cause:

Invalid key passed to SMddwrite() from the function SMqpipetgwk().

Action:

Examine the dumped arguments "eqid" and "buff".

684. SMWSTQTMSTG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: QLPS	Audit Mode: elev

Problem:

Failure from SMddwrite() when updating QTMSLNK state in SMdqpls[].

Probable Cause:

Invalid SMddwrite() key generated in the trigger function SMqlpstgwk().

Action:

Examine the SMddwrite() arguments "eqid" and "buff".

685. SMWTSMODEBAD (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The mode control flag SMwtmode for the CMT weights update function is invalid.

Probable Cause:
Software error.

Action:

Provide data to next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

Range: smpp**1. PP2NDPROV (5E11 and later)**

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A second (or third, etc.) PHA channel provisioning message was received.

Probable Cause:

This could be a programming problem.

Action:

Collect data and contact next level of support.

2. PPACBADMACH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PHA's PACM system process detected an invalid virtual finite state machine (VFSM) machine name.

Probable Cause:

This is a software problem that can occur in various ways.

Action:

Contact next level of support with data from the assert.

3. PPACFSMFAIL (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The PACMAN virtual finite state machine (VFSM) executor fails.

Probable Cause:

This may be a problem of PACMAN control spec.

Action:

Contact next level of support with data from the assert.

4. PPACUNXEVT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid virtual finite state machine (VFSM) virtual event is received.

Probable Cause:

This could be a programming problem.

Action:

Collect data and contact next level of support.

5. PPACUNXINPUT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The expected input set was not generated by the virtual finite state machine (VFSM) translation.

Probable Cause:

Either the PACMAN data environment is corrupted or the virtual finite state machine (VFSM) is not working properly.

Action:

Collect data and contact software developer.

6. PPACUNXMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PHA's PACM system process received an unexpected OSDS message.

Probable Cause:

The PPrd_msg() function received an unexpected OSDS message.

Action:

Contact next level of support with data from the assert.

7. PPACVFSM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A virtual finite state machine (VFSM) machine running under the PHA PACM system process has generated an assert from within the VFSM control specification.

Probable Cause:

This indicates that there is a problem with the asserting machine's control specification. For example, it may have entered an illegal state or received an invalid input.

Action:

Contact software developer with data from the assert.

8. PPASNSTP (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The PACMAN virtual finite state machine (VFSM) synchronization mechanism has stopped.

Probable Cause:

PACMAN was probably insane due to any reason.

Action:

Contact next level of support with collected data.

9. PPBADENUM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid enum value detected in the PACMAN system process.

Probable Cause:

This is may be a programming problem.

Action:

Context next level of support with data from the assert.

10. PPBADERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Port processor (PP) fault recovery found misalignment in the PPerrint[] array and the PPERRTY enumeration list of PP interrupts.

11. PPBADINIT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The port processor fault recovery (PPFR) system process was started with an invalid reason.

12. PPBADINTINFO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Port processor (PP) fault recovery found misalignment in the PPintinfo[] array and the PPINTRPTS enumeration list.

13. PPBADINUSE (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The region PPtm_dynamic[] used for storing timer manager data is suspect. In particular, the field "in_use" has a non-boolean value.

Probable Cause:

Corruption of PPtm_dynamic[] due to a software error.

Action:

Contact next level of support with data from the assert. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

14. PPBADMETAG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A process has requested a timer manager action, but with an invalid timer tag.

Probable Cause:

This is a software error.

Action:

Contact next level of support with data from the assert.

15. PPBADMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Port processor (PP) fault recovery received an illegal input message.

16. PPBADOSEVENT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected OSWAIT return value was received by PHA's PACM system process.

Probable Cause:

The PACM interface function, Pppacintf(), received an unexpected OSWAIT return value.

Action:

Contact next level of support with the data from the assert.

17. PPBADPH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Port processor (PP) fault recovery found a protocol handler (PH) number that was out of range.

18. PPBADPI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Port processor (PP) fault recovery found a packet interface (PI) number that was out of range.

19. PPBADTHRESH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Port processor (PP) fault recovery found misalignment in the PPthresh[] array and the PPERRTY enumeration list of PP interrupts.

20. PPBADTMSTATIC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The initial value of the timer manager control data is inconsistent.

Probable Cause:

This is a software error.

Action:

Contact next level of support with data from the assert.

21. PPBADTTYTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A process has requested the start of a timer with a bad type. For example, good types include a one shot timer or a cyclic timer.

Probable Cause:

This is a software error.

Action:

Contact next level of support with data from the assert.

22. PPCHANBIG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Port processor (PP) fault recovery found an illegal D-channel number.

23. PPCHGBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The channel group number (PSIphnum) assigned to a protocol handler (PH) was inconsistent with data transport (DT). The channel group number was refreshed to agree with DT.

24. PPCHIPBIG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Port processor (PP) fault recovery found an illegal chip number.

25. PPCICTR1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Port processor (PP) fault recovery interrupt control received a control argument that makes no sense.

26. PPCICTR2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Port processor (PP) fault recovery interrupt control received a control argument that makes no sense.

27. PPCIINT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Port processor (PP) fault recovery received an interrupt argument that makes no sense.

28. PPIMQFULL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The virtual finite state machine (VFSM) inter-machine queue (IMQ) of PHA's PACM system process is full.

Probable Cause:

This may be due to under-engineered of the IMQ size.

Action:

Contact next level of support with data from the assert.

29. PPIMQINFLOOP (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

PACMAN interface function appears to be in an infinite loop since it exceeds the maximum number of intermachine events allowed per XMQ event loop.

Probable Cause:

There may be a problem in the PACMAN control spec.

Action:

Contact next level of support with data from the assert.

30. PPIMQNOTEMPTY (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PACMAN IMQ is not empty as expected.

Probable Cause:

This may be a problem in the interface function.

Action:

Contact next level of support with data from the assert.

31. PPINPSZOOB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

PACMAN imap virtual input array index out of bounds.

Probable Cause:

The actual number of inputs in one of the PACMAN imap functions is more than the max size of the array.

Action:

Contact next level of support with data from the assert.

32. PPISMBABBLE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inter-SM (ISM) trunk ran out of receive frame descriptors (RFDs), or took an excessive number of synchronous/asynchronous block modes (SABMs). Neither condition should happen for ISM.

33. PPLPIBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The logical packet interface (PI) number (PSlphnum) was corrupted. The PI will be re-initialized via a packet switching (PS) initialization. The symptoms of this problem are:

- 1) no dial tone and unable to originate integrated services digital network (ISDN) calls,
- 2) inter-SM (ISM) nailup ports dropping out-of-service (OOS) due to level 2 errors,
- 3) some digital subscriber lines (DSLs) reporting OOS dslinit, and
- 4) unable to restore lines that are OOS dslinit. If these symptoms continue after this assert fires, it is recommended that a module controller/time slot interchange (MCTSI) switch be performed.

34. PPMASKTIMREQF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Out of range failure while requesting VISA ACT PHDB sync error masking timer.

Probable Cause:

Timer request falls out of range.

Action:

Provide data to next level of support.

35. PPMETAGINUSE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A process has requested the start of a timer that is already in use.

Probable Cause:

This is a software error.

Action:

Contact next level of support with data from the assert.

36. PPMUCRITERR (5E11 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

While attempting to initialize the MC68030's memory management unit (MMU), the initialization software detected an inconsistency in the memory layout (critical information). The processor will not function in the operating system for distributed switching (OSDS) environment if the MMU is not properly initialized.

37. PPNOGETTIMER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A process has requested the start of a timer, but no timers are available.

Probable Cause:

This is a software error.

Action:

Contact next level of support with data from the assert.

38. PPNOSTOP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A process has requested the stop of a timer, but it cannot be stopped.

Probable Cause:

This is a software error.

Action:

Contact next level of support with data from the assert.

39. PPPACINAME (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The given virtual finite state machine (VFSM) input name is not a member of the input set of this VFSM machine.

Probable Cause:

Probably a numerical value (rather than symbol), which happens to be outside of the range of the input set, is used.

Action:

Collect data and contact software developer.

40. PPPACMINIT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The port processor's PHA channel management (PACM) system process was started with an invalid reason.

Probable Cause:

PPpacm() was started with reason that the PPpacinit() didn't understand.

Action:

Contact next level of support with the steps to recreate the scenario.

41. PPPHZEVEHANDLE (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Returned the failure of PPphzEventHandler. This case can be found in PPphssw_lpc().

42. PPPHZINEVENT (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received the invalid event in the current state. This event can be found in PPphzEventHandler().

43. PPPHZINVEVENT (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received the unexpected event in the current state. This invalid event is sent by PPphEventHandler().

44. PPPHZMISBITS (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received the mismatch in bits. This input can be found in PPphssw_lpc().

45. PPPHZMISSEQ (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received the sequence number is mis-sequenced. This sequence number found in PPphssw_lpc().

46. PPPHZMISSEQ (5E13 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received the sequence number is mis-sequenced. This sequence number found in PPphzcallout().

47. PPPHZTIMEOUT (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received time-out event from PPphssw_lpc() when the time has been expired - PSLPCOPEN/PSLPCSEND.

48. PPPHZTIMEOUT (5E13 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received time-out event from PPphzcallout() when the time has been expired - PSLPCOPEN/PSLPCSEND.

49. PPPHZUNCLOSE (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received the invalid input in the current state. This input can be found in PPphzEventHandler().

50. PPPHZUNEXPLPC (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received the unexpected input in the current state. This input can be found in PPphssw_lpc().

51. PPPHZUNEXPLPC (5E13 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received the unexpected input in the current state. This input can be found in PPphzcallout().

52. PPPHZUNKEVENT (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received the unknown event in the current state. This event can be found in PPphzEventHandler().

53. PPPHZUNKSTATE (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received the invalid state. This state is invalid in PPphzEventHandler().

54. PPPHZUNOPENLPC (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Attempting to open the LPC but unable to open the LPC. This assert can be found in PPphzEventHandler().

55. PPPHZUNWAKEUP (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to send a wakeup message to the fault recovery system in PH. This assert is found in PPphzEventHandler().

56. PPREPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Port processor (PP) fault recovery reported an error of an undetermined type.

57. PPVASYNINTER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

PHV fault recovery failed to either mask VISA error source register bits while receiving active PHDB synchronization error or unmask the error while executing under threshold hardware recovery function.

Probable Cause:

PHV interrupt control function perform VISA Error Source Register interrupt inhibit/allow functionality improperly.

Action:

Provide data to the next level of support.

58. PPWPSKOV (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The write protect stack (a global data structure) overflowed.

59. PPWPSKUV (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The write protect stack (a global data structure) underflowed.

60. PPWPUSER (5E11 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

A process is attempting to pop the write protect stack by restoring write protect when it was not the last process to push something on the stack.

61. PPXMQFULL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The virtual finite state machine (VFSM) inter-machine queue (IMQ) of PHA's PACM system process is full.

Probable Cause:

This may be due to under-engineered of the IMQ size.

Action:

Contact next level of support with data from the assert.

62. PPXMQNOTEMPTY (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PACMAN XMQ is not empty as expected.

Probable Cause:

This may be a problem in the interface function.

Action:

Contact next level of support with data from the assert.

63. SMBADCONN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The table used for routing to PHVs over PHAs is corrupted. The entry will be dumped in the data buffer.

64. SMBADPARAM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A bad value was passed to the asserting function.

Probable Cause:

Coding error.

Action:

Collect stack information.

65. SMBADPSUCA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

SMpsuconn() entered with invalid PSU community address.

66. SMBAD_UNIT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid unit type was found.

Probable Cause:

Invalid data may have been passed, or an invalid hardware address may have been accessed by previous software.

Action:

Collect stack information.

67. SMCONNMSGBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message received for updating the table used for routing over PHAs to PHVs is bad.

68. SMCRBEND (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A request was made to end a critical region when the user did not have a region in effect. Either another user had a region, or no users had one. The data concerning possible existing critical regions (who had it and what kind it was) is dumped.

69. SMCRCOUNT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A request to begin a second critical region was received while a request was already in force, or critical region data was corrupted.

70. SMCRFORE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to enter a critical region from foreground. This is not allowed.

71. SMCRLEVEL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid level parameter was passed to the critical region function SMcrbegin() or SMcrend().

72. SMCRNOBEG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The critical region end routine SMcrend() was called when no critical region was in force. The global data structure SMcrdata may have been corrupted.

73. SMCRNULK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During an attempt to enter a critical region, the null identifier was used. This is not allowed.

74. SMELDATACRPT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ELFR-MH event handler found an invalid entry in the error profile table (a .data table).

Probable Cause:

Software error, bad pump of the MH, or bad MH hardware.

Action:

If error persists, switch module controller/time slot interchange (MCTSI) sides and see if the problem clears. If the assert stops, remove and diagnose the standby MCTSI side. If the assert continues to be reported, gather the data dumped by the assert and report to the next level of technical support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

75. SMELINVPTCNT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

ELFR-MH obtained an invalid count of active ports.

Probable Cause:

Software error or data corruption.

Action:

Examine the data dumped by the assert to determine the source of the problem.

76. SMELMHINVCMD (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

ELFR-MH received a maintenance message from the SMP with an invalid command type.

Probable Cause:

Software error or message corruption.

Action:

Examine the message dumped by the assert to determine the source of the problem.

77. SMELMHINVELNK (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ELFR-MH error/event handler was passed an invalid MELNK number.

Probable Cause:

Software error or data corruption.

Action:

Examine the data dumped by the assert to determine the source of the problem.

78. SMELMHINVEVENT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ELFR-MH event handler was invoked for an invalid or unexpected event.

Probable Cause:

Software error.

Action:

Examine the data dumped by the assert to determine the source of the problem.

79. SMELMHINVMDATA (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

ELFR-MH received a maintenance message containing invalid data.

Probable Cause:

Software error or message corruption.

Action:

Examine the message dumped by the assert to determine the source of the problem.

80. SMELMHINVMSG (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

ELFR-MH received an invalid maintenance message.

Probable Cause:

Software error or message corruption.

Action:

Examine the message dumped by the assert to determine the source of the problem.

81. SMELPSTINVDATA (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

ELFR-MH detected invalid or inconsistent data while responding to a pipe status audit data request from the ethernet link fault recovery system process (ELSP).

Probable Cause:

Software error or data corruption.

Action:

The system will execute appropriate corrective action. If the problem persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual, providing assert data to the next level of support.

82. SMEQGP_RID (5E11 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

A quad-link fault recovery (QLFR) - switching module processor (SMP) system process (QLPS) bad broadcast error was reported and either the SIms_side or SMqgp_rid variable was found to be invalid.

Probable Cause:

Either the SIms_side and or SMqgp_rid variable is being initialized to an invalid value.

Action:

Provide data to the next level of support.

83. SMMHAUINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message handler (MH) received an audit status update maintenance message containing an invalid audit status (a status other than inhibit or allow). The offending maintenance message will be dumped. No audit status update will occur in the MH as a result of this error.

Probable Cause:

The audit status update message was populated incorrectly in the SM (most likely), or it was corrupted during transmission to the message handler (MH). Both are software programming problems.

Action:

If the assert persists, provide data to the next level of support.

84. SMMHCLE1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CLFR-MH received an invalid MTCE message from the SMP. The message is dumped.

85. SMMHCLE2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

There was a request from the AM/switch module processor (SMP) to remove a link. The link status changed due to communications link (CLNK) fault recovery while messages queued for the link were being transmitted. The link was not removed. This assert is informational. The SMmhclnkstat[] entry for the link is dumped.

86. SMMHCLE3 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The AM/switch module processor (SMP) told communications link fault recovery-message handler (CLFR-MH) to remove the last active communications link (CLNK). The link was not removed. This assert can occur due to a race condition or data corruption. If maintenance personnel really want to remove the last CLNK, the SM isolation command should be used.

87. SMMHCLE4 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The AM/switch module processor (SMP) told communications link fault recovery-message handler (CLFR-MH) to restore a 3rd active communications link (CLNK). The link was not restored. This assert can occur due to a race condition between CLNK fault recovery and a manual CLNK restoration, or due to data corruption.

88. SMMHCLE5 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

communications link fault recovery-message handler (CLFR-MH) detected an inconsistency in communication link status while processing a manual communications link (CLNK) removal or restoration. This error causes both links to be initialized to a known state.

89. SMQGLCMDINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The cmd_type specified in the message received by quad-link fault recovery-quad-link gateway processor (QLFR-QGP) is invalid.

Probable Cause:

The cmd_type specified by QLCON is invalid, the message was corrupted before being received by quad-link fault recovery-quad-link gateway processor (QLFR-QGP), or QLFR-QGP is not handling the message properly.

Action:

Examine the data produced by the assert to determine the source of the problem.

90. SMQGLDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The QGL state indicated in the QGL configuration data received from QLCON is invalid.

Probable Cause:

The QGL state specified by QLCON was invalid or the QGL state was corrupted before being received by QLFR-QGP.

Action:

Examine the data produced by the assert to determine the source of the problem.

91. SMQGLMSGINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message received by quad-link fault recovery-quad-link gateway processor (QLFR-QGP) is invalid.

Probable Cause:

The message received from QLCON was invalid, the message was corrupted before being received by quad-link fault recovery-quad-link gateway processor (QLFR-QGP), or QLFR-QGP is not handling the message properly.

Action:

Examine the data produced by the assert to determine the source of the problem.

92. SMQGLSSINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The quad-link fault recovery (QLFR) - switch module processor (SMP) system process (QPLS) soft switch end QGL configuration data is invalid.

Probable Cause:

The QGL configuration data received from QLCON that was saved for use at the end of the QLPS soft switch is invalid or the saved QGL configuration data was corrupted or the QGL state is information is invalid. It is also possible that the start broadcast frame was not received from an active QGL.

Action:

Examine the data produced by the assert to determine the source of the problem.

93. SMQGLSTINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The quad-link fault recovery-quad-link gate processor (QLFR-QGP) QGL state is invalid.

Probable Cause:

The QGL state is corrupt or the packet bus media controller (PBMAC) number stored in SMqIn2pb[network] is invalid.

Action:

Examine the data produced by the assert to determine the source of the problem.

94. SMQGLSWINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The QGL state indicated in the QGL configuration data received from QLCN and saved to be used at the end of a soft switch is invalid.

Probable Cause:

The QGL configuration data received from QLCN was invalid, the QGL configuration data was corrupted before being received by quad-link fault recovery-quad-link gate processor (QLFR-QGP), or the saved QGL configuration data was corrupted.

Action:

Examine the data produced by the assert to determine the source of the problem.

95. SMQLBDACTON (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The recovery action to be performed is invalid.

Probable Cause:

The recovery action in the SMqlerrprof[], SMqlsumprof[], or SMqlactprof[] is invalid.

Action:

Provide data to the next level of support.

96. SMQLCMDINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The cmd_type specified in the message received by quad-link fault recovery-quad-link gateway processor (QLFR-QGP) is invalid.

Probable Cause:

The function sending the message filled in the field wrong or the message was corrupted before being received by QLFR-MH.

Action:

Examine the data produced by the assert to determine the source of the problem.

97. SMQLEGETPROF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Profile data does not exist for the indicated class.

Probable Cause:

The error, summary, or action profile tables are being used inappropriately.

Action:

Provide data to the next level of support.

98. SMQLEPNETINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The QLPS endpoint and or network parameter is invalid.

Probable Cause:

The QLPS endpoint and or network parameter specified by the calling function was invalid or the parameter was corrupted during the function call.

Action:

Examine the data produced by the assert to determine the source of the problem.

99. SMQLEPNOTOSDS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The quad-link fault recovery (QLFR) - switch module processor (SMP) system process (QLPS) endpoint in the quad-link gateway processor (QGP) is invalid.

Probable Cause:

The QLPS endpoint parameter specified by the calling function was invalid for a QGP (the QGP should only have endpoints in the operating system for distributed switching [OSDS] range) or the endpoint parameter was corrupted during the function call.

Action:

Examine the data produced by the assert to determine the source of the problem.

100. SMQLEPWPINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The endpoint parameter specified by the calling function could not be found in the write protected endpoint data.

Probable Cause:

The write protected endpoint data is invalid.

Action:

Examine the data produced by the assert to determine the source of the problem.

101. SMQLERRPROF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt is being made to read a summary profile table for an error that does not have summary profile data.

Probable Cause:

The summary profile table is being used inappropriately.

Action:

Provide data to the next level of support.

102. SMQLERRTYPINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The err_typ (error type) parameter is invalid.

Probable Cause:

The err_typ specified by the caller is an invalid error type or the err_typ parameter is being handled inappropriately by the called function.

Action:

Examine the data produced by the assert to determine the source of the problem.

103. SMQLMHMSGINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Quad-link fault recovery - message handler (QLFR-MH) received an invalid message.

Probable Cause:

CM sent the message to QLFR-MH inappropriately or QLFR-MH is not handling messages appropriately.

Action:

Examine the data produced by the assert to determine the source of the problem.

104. SMQLMQPSINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The QPIPE state returned by the link manager in the loopback test acknowledgement data to quad-link fault recovery (QLFR-QGP) is invalid.

Probable Cause:

The link manager QPIPE state is invalid, QLFR-QGP is handling the link manager QPIPE state inappropriately, or the loopback test acknowledgement data was corrupted before being received by QLFR-QGP.

Action:

Provide data to the next level of support.

105. SMQLN2PB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The packet bus media access controller (PBMAC) number passed as a parameter or stored in SMqIn2pb[] is invalid.

Probable Cause:

The PBMAC number parameter specified by the calling function was invalid or the PBMAC number parameter was corrupted during the function call. In the case where the PBMAC number stored in SMqIn2pb[] was found to be invalid, then either SMqIn2pb[] was initialized with an invalid PBMAC number or the function using the PBMAC number found in SMqIn2pb[] is using it invalidly.

Action:

Provide data to the next level of support.

106. SMQLNETINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The quad-link fault recovery (QLFR) - switch module processor (SMP) system process (QLPS) network parameter is invalid.

Probable Cause:

The QLPS network specified by the calling function is invalid or the QLPS network parameter was corrupted during the function call.

Action:

Provide data to the next level of support.

107. SMQLPBKINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The loopback test acknowledgement data from the link manager to quad-link fault recovery - quad-link gateway processor (QLFR-QGP) is invalid.

Probable Cause:

QLFR-QGP is inappropriately handling the loopback test acknowledgement data returned by the link manager or the loopback test acknowledgement data was corrupted before being received by QLFR-QGP.

Action:

Provide data to the next level of support.

108. SMQLPROFILE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The error, summary, or action profile data is invalid.

Probable Cause:

The error, summary, or action profile table is being used inappropriately for the indicated error.

Action:

Provide data to the next level of support.

109. SMQLQFULL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Quad-link fault recovery (QLFR) switch module processor (SMP) system process (QLPS) level 2 internal frame descriptor (IFD) queue full errors are occurring and are being reported due to the SMqlqfull flag being set to DBYES.

Probable Cause:

QLPS Level 2 frame processing is being delayed.

Action:

Provide data to the next level of support.

110. SMQLUDINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The QLL up/down job scheduler control data is invalid.

Probable Cause:

The QLL up/down job scheduler control data has been corrupted.

Action:

Provide data to the next level of support.

111. SMQPEQINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Quad-link fault recovery - quad-link gateway processor (QLFR-QGP) has received an indication that the QPIPE for a QLPS - switch module processor (SMP) system process (QLPS) network has transitioned to in-service, however, the current QLFR-QGP QPIPE state is unequipped.

Probable Cause:

The link manager was called to initialize the QGP QPIPE inappropriately or the QPIPE state has been corrupted.

Action:

Provide data to the next level of support.

112. SMQPSTINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The quad-link fault recovery - quad-link gateway processor (QLFR-QGP) QPIPE state is invalid.

Probable Cause:

The link manager QPIPE state is being handled inappropriately by QLFR-QGP or the link manager QPIPE state has been corrupted in memory.

Action:

Provide data to the next level of support.

113. SMSIMS_SIDE (5E11 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

A quad-link fault recovery (QLFR) - switch module processor (SMP) system process (QLPS) bad broadcast error was received and the Slms_side variable was found to be invalid.

Probable Cause:

The Slms_side variable is being initialized to an invalid value.

Action:

Provide data to the next level of support.

114. SMSWBABORT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

If this assert is called from the SMswabort() function, then CMP soft switch received an invalid abort request. The message received is dumped in the first data dump.

If this assert is called from the SMswsndself() function, then a CMP soft switch request is being aborted due to a software or hardware problem detected by the active CMP. The CMP soft switch control data structure SMswctl[] is dumped in the first data dump.

115. SMSWBADACTION (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CMP soft switch operating system trap handler received an unknown or unsupported action to process. The calling function will be on the user stack in the stack dump. The action type (value) is dumped in the local data stack dump.

116. SMSWBMMUPTR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CMP soft switch failed to get a valid page descriptor to a memory region from the memory management unit (MMU) support routine.

117. SMSWBSITYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CMP soft switch received an invalid operating system for distributed switching (OSDS) message. The message received is dumped in the first data dump.

118. SMSWCHSIZE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CMP soft switch copy or hash sum routine was called with a buffer size that was not a multiple of 4. The buffer will be copied; however, it will be truncated to the nearest multiple of 4.

119. SMSWGACKF (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

CMP soft switch did not receive an acknowledgement to the stop message from the process being purged for some reason. The process is assumed to be unstable and is purged.

120. SMSWHPQMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CMP soft switch received an unrecognized high priority message. The high priority message is dumped in the local

data dump.

121. SMSWRETSWOS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CMP soft switch operating system unexpectedly returned to the caller. This implies that the CMP is not in the correct state for the switch and the requested CMP switch will be aborted.

122. SMUNEXHWSTATE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected hardware state or condition was encountered by software.

Probable Cause:

A hardware state transition has occurred that was not planned for in the software design.

Action:

None. This assert is for information only. The software will put the hardware in a known state.

Range: tm**1. TM3INCDATA (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data inconsistency was found in TM PSA port recovery or NT mismatch testing area. Up to three pieces of data will be dumped. If the assert fires repeatedly, contact your next level of support (i.e. Field support or TM subsystem contact).

2. TM7UBLERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred while attempting to setup the unblocking data for CCS7 trunks. Some or all CCS7 trunks may be left in the remotely blocked state until the trunk status query mechanism recovers them (if enabled). Some or all incoming one-way CCS7 trunks may be left remotely blocked until manual action is taken.

Data Structures:

Relation: RLPCI7GR

The values of the PCI and CIC being used at the time of failure are given. PCI and CIC values of zero are an indication that a failure occurred while attempting to set up the first set of data and therefore all CCS7 trunks may be left in the remotely blocked state.

Action:

Use of the trunk status query mechanism is required to recover the remaining 2-way and outgoing CCS7 trunks. A manual removal followed by a manual restoration of all one-way incoming CCS7 trunks must be performed for recovery.

3. TMABTTSK (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

Removed an unstable process as requested by a manual request or by an automatic request from the AATA system process to purge the indicated process. The AATA system process handles requests primarily from the AUTOPLEX[®] executive cellular processor (ECP).

4. TMACCSDERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The static data for a remote alarm section (RAS) equipped digital subscriber line (DSL) was found to be inconsistent when attempting to restore the DSL into service.

Data Structures:

RLRIBM_SC. The RLRIBM_SC relation contains the following information about remote integrated services line unit (RISLU) RAS building/miscellaneous alarm scan points.

- (1) The first key attribute is the RISLU site number. This value for the RAS equipped DSL is dumped (in hex).
- (2) The second key attribute is the alarm scan point number (0-31). For each RISLU site number, a tuple must

exist for alarm scan point numbers 0 and 1.

- (3) The `mccname` attribute is the office-assignable label to be displayed on the Master Control Center (MCC) for the name of the point.
- (4) The `ttname` attribute is the office-assignable label that appears in the craft output messages concerning the alarm scan point.
- (5) The `alm_lvl` attribute is the alarm level [critical (CRIT), major (MAJ), minor (MIN), action (ACT), or information (INFO)] that is generated when this point goes off normal.
- (6) The `prot_rc` attribute protects the tuple by denying recent change activity.

Action:

For each RAS equipped DSL, there must exist at least two tuples in the `RLRIBM_SC` relation for the RAS's corresponding RISLU site number; that is, one tuple for alarm scan point number 0, and one tuple for alarm scan point number 1. Use RC/V View 26.15 (RISLU RAS SCAN POINT ASSIGNMENT) to examine and update the tuples for this RAS equipped DSL.

5. TMACTBFAIL (5E11 and later)

Recovery Action: <code>rpi</code>	SPP: <code>n</code>	Audit: <code>null</code>	Audit Mode: <code>null</code>

Problem:

Failed to activate a B-channel port for all failures other than resource failures.

6. TMAMPCI7GR (5E12 and later)

Recovery Action: <code>-rpi</code>	SPP: <code>n</code>	Audit: <code>null</code>	Audit Mode: <code>null</code>

Problem:

The `RLAMPCI7GR` relation is populated incorrectly.

Data Structures:

The platform CNI and the AM and SM CADN bits do not match.

Action:

First determine the trunk's trunk group and member number by using the `OP:CONV` input message with the "port" option. Next, check the status of the trunk using the `OP:STATUS` input message. If the trunk is in an OOS CADN state, enter a `RMV:TRK` input message for the trunk specifying the same OOS CADN status that is on the trunk. If the trunk is not in an OOS CADN state, first use the `RMV:TRK` input message to add the OOS CADN `DSBLD` status to the trunk and then use the `RST:TRK` input message to restore the trunk to service. Both of these actions will cause the switch to make another attempt at updating the `RLAMPCI7GR` relation in the AM. If this causes another assert of this type to fire, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

7. TMA_NOPID (5E11 and later)

Recovery Action: <code>rpi</code>	SPP: <code>n</code>	Audit: <code>null</code>	Audit Mode: <code>null</code>

Problem:

No matching process ID was found in the `TMa_tpq[]` array.

8. TMA_NOSIG (5E11 and later)

Recovery Action: <code>rpi</code>	SPP: <code>n</code>	Audit: <code>null</code>	Audit Mode: <code>null</code>

Problem:

The terminal process did not receive the expected signal.

9. TMAPBDBERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: APB	Audit Mode: elev

Problem:

Failed to initialize and link an rAPB tuple to an rPCBLA tuple.

10. TMAPC_INFO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred while attempting to do a fast read of relation RLAPC_INFO.

11. TMAPTBADRET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return value was received from an automatic progression testing (APT) activation attempt.

12. TMAQADPERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The static relation RLAQTE_ADP maps the autoquote analog port to its D port; and the relation RLAQTE_DAP maps the autoquote D port to its analog port. For each D port number, there must be an associated analog port number in the RLAQTE_DAP and RLAQTE_ADP relations. For each analog port number, there must be an associated D port number in the RLAQTE_DAP and RLAQTE_ADP relations. The RLAQTE_ADP relation did not have the same D port number (dig_port) as the RLAQTE_DAP relation for the given analog port number (anl_port); or no tuple could be found for the given analog port number.

Data Structures:

RLAQTE_DAP, RLAQTE_ADP.

Action:

Check the output on the receive only printer (ROP) for the analog port (in hex) and the D port (in hex). Use RC/V to check and correct tuples in the RLAQTE_DAP and RLAQTE_ADP relations.

13. TMAQDAPERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In static relation RLAQTE_DAP, no corresponding analog port number (anl_port) could be found for the given D port number (dig_port). For each D port number, there must be an associated analog port number in the RLAQTE_DAP and RLAQTE_ADP relations.

Data Structures:

RLAQTE_DAP, RLAQTE_ADP.

The RLAQTE_DAP relation maps the autoquote D port to its analog port; and the RLAQTE_ADP relation maps the

autoquote analog port to its D port.

Action:

Check the output on the receive only printer (ROP) for the D port (in hex). Use RC/V to check and correct the rIAQTE_DAP tuple.

14. TMAQMODERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In configuring the Model 4000 modem for autoquote digital subscriber line (DSL) initialization, the modem was in the online mode. It should not be in the online mode. The process that was controlling the modem was purged by system integrity; therefore, the software that would cause the line to be dropped cleanly could not be executed and the modem was not put into the required offline mode.

15. TMASHTERM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The circuit lport from the RLSPID relation was not found in the RLSHTERM relation for the ltm_index and lead_module in the RLIS_LINE relation. The data dump shows the rISPID tuple in the first block and the rIS_LINE tuple in the second.

16. TMAUANQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ANQ	Audit Mode: elev

Problem:

Corrupted linkages were found for the automatic terminal setup notification queue (ANQ). The ANQ audit is scheduled.

17. TMAUAPDU (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: APDU	Audit Mode: elev

Problem:

Corrupted linkages were found between the application protocol data unit (APDU) and the remote terminal message buffer (RTMSGBUF). The APDU audit is scheduled.

18. TMAUDALB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

Corrupted linkages were found between the D-channel application linkage block (DALB) and the application protocol data unit (APDU). The DALB audit is scheduled.

19. TMAUDPDA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

The owner linkage from the D-channel application linkage block (DALB) to the D-channel port block (DPB) was corrupted. The DALB audit is scheduled.

20. TMAULLM_RDT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: LLMRDT	Audit Mode: elev

Problem:

Linkage corruption was detected in the RLLLM_RDT relation.

Probable Cause:

Switch software has corrupted the data relation.

Action:

AULLMRDT audit will be scheduled in elevated mode.

21. TMAUNODALB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

Corrupted linkage was found between the process control block link area (PCBLA) and the D-channel application linkage block (DALB). The PCBLA audit is scheduled.

22. TMAUNOTEILA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

The terminal endpoint identifier linkage area (TEILA) key information in the D-channel application linkage block (DALB) was corrupted. The DALB audit is scheduled.

23. TMAURTMGBUF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RTMSGBUF	Audit Mode: elev

Problem:

Corrupted linkages were found between remote terminal message buffers (RTMSGBUFs). The RTMSGBUF audit is scheduled.

24. TMAUSMEST (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: CKTDATA	Audit Mode: elev

Problem:

An RLSMEST tuple could not be read. The tuple should exist.

Probable Cause:

A tuple may be missing from the RLSMEST relation, or it may be corrupt.

Action:

This assert will schedule the AUFC_CKTDATA audit to correct the data. Report occurrence along with all possible supporting data.

25. TMAUSMEST (5E11 only)

Recovery Action: rpi	SPP: n	Audit: SMEST	Audit Mode: elev

Problem:

An RLSMEST tuple could not be read. The tuple should exist.

Probable Cause:

A tuple may be missing from the RLSMEST relation, or it may be corrupt.

Action:

This assert will schedule the AUSMEST audit to correct the data. Report occurrence to PECC along with all possible supporting data.

26. TMAUTEILA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TEILA	Audit Mode: elev

Problem:

An error was found while accessing the RLTEDB relation using the terminal equipment data block (TEDB) key stored in the RLTEILA relation. The RLTEILA information will be dumped.

27. TMAUUNIT2RDT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: UNIT2RDT	Audit Mode: elev

Problem:

Missing LLM_RDT tuple was encountered.

Probable Cause:

5ESS[®] software has corrupted the data relation.

Action:

AUUNIT2RDT audit should be scheduled to insert the missing associated LLMRDT tuple.

28. TMBADCGATYP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid carrier group alarm (CGA) type was reported to terminal maintenance (TM) CGA processing.

29. TMBADDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unexpected data was discovered.

30. TMBADDAY (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid day-of-week was returned from the AMday() function. Automatic progression testing (APT) will be activated without checking the office option for the day-of-week.

31. TMBADDISC (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid parameter was given to the metallic connection disconnect routine; the parameter specified an invalid disconnect type.

32. TMBADLIST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

Could not retrieve a port from a system list.

33. TMBADLIT_TC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was found in the external line insulation test (LIT) table TMLit_tc[].

34. TMBAD_LMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The inter-SM (ISM)-SM system process received an invalid long message.

35. TMBADLPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This indicates that a disallowed logical port type was found in RLFC_PORTTYP for the message received (MGMDTERM).

36. TMBADMAP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid status was read from the D-channel port block (DPB) lvi1stat field. The TMLvi1map() function will take the action necessary for this problem.

37. TMBADMDII (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Trunk error analysis received a machine detected interoffice irregularities (MDII) type that it is not currently set up to process.

38. TMBADMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message was damaged in transit from one process to another.

39. TMBADPARM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid value was passed as a parameter to a terminal maintenance (TM) function. Parameters are shown with the user stack frames that are dumped.

40. TMBADPID (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSGETPID() macro returned OSnullpid, or the process ID was invalid.

41. TMBADPOLIST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

Failed to retrieve a port from the dynamic relation RLPORTLA. As a result, a port's in-service or out-of-service status could not be changed.

42. TMBADSDLREQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A bad request type was specified in a MGSDLALLOC message.

43. TMBAD_SMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The inter-SM (ISM)-SM system process received an invalid short message.

44. TMBADSTATE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

While a process was waiting for a setup complete message, a check of the process's state variable found an unexpected value.

45. TMBADTG2SM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rITG2SM tuple was found in the AM office dependent data (ODD) that has a trunk group number greater than the allowed maximum value.

Data Structures:

RLTG2SM. Key field: tgnum (trunk group number).

Action:

Use RC/V (or ODBE, if necessary) to verify and delete (as needed) the data in the RLTG2SM relation.

46. TMBADTMR (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: GPFTIMER	Audit Mode: elev

Problem:

Received a corrupted general purpose timer.

Probable Cause:

Tuple is missing or corrupted.

Action:

GPFTIMER audit will recover the timer to a valid list

47. TMBADWBPRT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

An out-of-range value was encountered when obtaining wideband ports.

Probable Cause:

Software error in obtaining ports.

Action:

Contact your next level of support.

48. TMBD_ACK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message was received by the inter-SM (ISM) craft terminal process.

49. TMBD_ACTN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid action was specified in the inter-SM port (ISMPT) reconfiguration (craft or auto request). The message in TMismsmsg was dumped.

50. TMBDATCN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid action parameter was specified in the TMism2ph() function or the TMinist_msg() function.

51. TMBD_DESTSM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid destsm parameter was specified.

52. TMBD_DLT_DATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DLTDATA	Audit Mode: elev

Problem:

A function associated with inter-SM nailup recovery detected a corrupt TMdlt_data[] array entry. The elevated audit

requested should synchronize this dynamic array with static data.

Repeated asserts associated with the same port (the port or dlt is identified as a parameter or local variable in the stack trace of the calling function) indicate that the recovery was not successful. This may be due to missing or mutilated static data. Use RC/V (or ODBE, if necessary) to interrogate the rIDSLEQUIP and rIISMPATH tuples associated with the identified port.

53. TMBD_EVNT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Inconsistent information was encountered regarding the queued inter-SM (ISM)-SM system process messages. A single process purge is required.

54. TMBDIN_MSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid input message was received by the inter-SM (ISM) craft terminal process. The input message will be dumped.

55. TMBD_ISMTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid ismtype was received in a message. The message contents will be dumped.

56. TMBD_JOB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid integrated services port administrator (ISPA) job was detected for an inter-SM port (ISMPT).

57. TMBD_MATESM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: MATESM	Audit Mode: elev

Problem:

The inter-SM (ISM)-SM system process detected corrupt TMmatesm[destsm] data. An audit is required to correct the data.

58. TMBD_MSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The inter-SM (ISM)-SM system process received an invalid message from the mate SM.

59. TMBD_OOSDLI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The TMOosdli variable had an invalid value.

60. TMBDPTYP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown port type was received in a message.

61. TMBD_RESP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The inter-SM (ISM) craft messages were not sent to any SM. Check the response local variable.

62. TMBD_SM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid SM number was specified in the craft message for inter-SM port (ISMPT) reconfiguration. The message in TMismsmg or TMismlmsg was dumped.

63. TMBLRFULL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The dynamic data (TMblrpids[]) used to time CCS blocking reception has reached its capacity limits one or more times in the last 15 minutes. The number of times the limit was reached is identified, along with other data which is useful when analyzing the cause of the condition.

Probable Cause:

See next section.

Action:

CCS blocking messages are timed upon reception so that output reports will not be generated until a trunk has been blocked for at least a minimal time interval based on protocol.

When the CCS blocking reception timing mechanism reaches capacity, any incoming BLO message is dropped and is not acknowledged or processed.

This behavior may result in a near-end trunk that is in-service but the far-end of the trunk is locally blocked and not capable of carrying traffic. If the near-end office selects this trunk for an outgoing call, the far-end office will deny the request by returning a BLO message.

The far-end office should resent the BLO message in 4-15 seconds yielding another attempt to access the CCS blocking reception mechanism.

The system was designed to work with occasional shortages, and performance should not be seriously degraded by infrequent occurrences.

If the shortages occur regularly, exhibit a pattern, or can be linked to a concurrent event, report this problem to the product engineering control center (PECC) for analysis. Please include all data associated with this assert along with any data collected during the investigation of this problem when reporting this to PECC.

64. TMBR_KEY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid relation name was encountered when trying to read the SM office dependent data (ODD) relation RLKEY_TALK during an SM initialization. This indicates that the relation ID for RLKEY_TALK is not in this SM's access dictionary that resides in the ODD.

Action:

Contact the office data administration (ODA) organization. They will build a new ODD for this SM with an access dictionary that includes the relation ID for RLKEY_TALK.

65. TMBR_LA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid relation name was encountered when trying to clear the dynamic relation RLPORTLA during an SM initialization. This indicates that the relation ID for RLPORTLA is not in this SM's access dictionary in the office dependent data (ODD). As a result, RLPORTLA was not initialized on this SM. This problem affects service since the RLPORTLA relation is needed for call processing.

Action:

Contact the office data administration (ODA) organization. They will build and install a new ODD for this SM which contains an access dictionary that includes the relation ID for RLPORTLA.

66. TMBR_PHIST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid relation name was encountered while trying to clear the dynamic relation RLPHISTORY during an SM initialization. This indicates that the relation ID for RLPHISTORY is not in this SM's access dictionary in the office dependent data (ODD).

Action:

Contact the office data administration (ODA) organization. The ODA will build a new ODD for this SM which contains an access dictionary that includes the relation ID for RLPHISTORY.

67. TMBR_PORTTYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid relation name was encountered when trying to read the SM office dependent data (ODD) relation RLFC_PORTTYP during an SM initialization. This indicates that the relation ID for RLFC_PORTTYP is not in this SM's access dictionary which resides in the ODD.

Action:

Contact the office data administration (ODA) organization. They will build a new ODD for this SM which contains an access dictionary that includes the relation ID for the RLFC_PORTTYP relation.

68. TMBR_PRTLST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid relation name was encountered when trying to insert a tuple in the dynamic relation RLPRTLST during an SM initialization. This indicates that the relation ID for RLPRTLST is not in this SM's access dictionary in the office dependent data (ODD).

Action:

Contact the office data administration (ODA) organization. They will build and install a new ODD for this SM which contains an access dictionary that includes the relation ID for RLPRTLST.

69. TMBR_TRUNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid relation name was encountered when trying to read the SM office dependent data (ODD) relation RLFC_TRUNK during an SM initialization. This indicates that the relation ID for RLFC_TRUNK is not in this SM's access dictionary that resides in the ODD.

Action:

Contact the office data administration (ODA) organization. They will build a new ODD for this SM with an access dictionary that includes the relation ID for RLFC_TRUNK.

70. TMC7CADNFAIL (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A CCS7 port has been found which needs to be removed CADN. The port was attempted to be processed but failed.

Probable Cause:

An attempt was made to load the port into a table, but the table was full. Other resource limitations could have been reached such as the maximum number of message buffers reached or failure to get ownership of the port when trying to remove the port.

Action:

Office personnel should run circuit query for the office in order to find any possible port mismatches between the near end office and the far end. If requested through the command, recovery actions will automatically be attempted for any port mismatches.

71. TMC7ERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CINDX7	Audit Mode: elev

Problem:

Trouble has been detected with the data used to send common channel signaling system 7 (CCS7) blocking, unblocking and reset messages. Temporary inter-office trunk status conflicts are possible. These inconsistencies should self-correct over time as incoming and outgoing CCS7 calls occur on those trunks with inconsistent data. The CCS7 trunk status query feature can also be used to correct such inconsistencies, but it will run only if the status query feature is enabled.

Action:

The data problem detected was associated with the RLCINDX7 relation. This assert will schedule the AUCINDX7 audit to verify the data in the RLCINDX7 relation tuples and recover any bad data found. The RLCINDX7 relation is closely inter-related with three other dynamic relations (RLPCILST7, RLENTY7, and RLTIMER7). Problems detected by the AUCINDX7 audit may cause one or more of the audits for these related relations to run also.

If this assert continues to occur after the audit runs to completion, send the information from the assert output to the product engineering control center (PECC) for analysis. Up to three additional data blocks may also be included in the assert output to assist PECC in the isolation/resolution of the problem. Please include all data output as part of the assert when reporting the occurrence of this assert to PECC.

72. TMCAMATRK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the rITALK_KEY tuple associated with a centralized automatic message accounting (CAMA) operator number identification (ONI) talking trunk; therefore, the trunk's CAMA ONI keying trunk pair did not have the port status updated.

73. TMCCSCADN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLAMPCI7GR relation in the AM could not be updated correctly for a common channel signaling (CCS) trunk that transitioned to or from an out-of-service (OOS) cellular access digital network (CADN) port state.

Data Structures:

The SM number, port name, pci, and cic values of the trunk are dumped. The cic_offset of the trunk is also dumped and is a key to the RLAMPCI7GR relation along with the SM number and the pci value.

Action:

First determine the trunk's trunk group and member number by using the OP:CONV input command with the "port" option. Next, check the status of the trunk using the OP:STATUS input command. If the trunk is in an OOS CADN state, enter a RMV:TRK input command for the trunk specifying the same OOS CADN status that is on the trunk. If the trunk is not in an OOS CADN state, first use the RMV:TRK input command to add the OOS CADN DSBLD status to the trunk and then use the RST:TRK input command to restore the trunk to service. Both of these actions will cause the switch to make another attempt at updating the RLAMPCI7GR relation in the AM. If this causes another assert of this type to fire, contact a higher level of support.

74. TMCFHFAIL (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

When call failure handling (CFH) dynamic relations are cleared during initialization, a check is made to determine if the relations were cleared. The return code from this check was a failure type.

75. TMCFRDT2UNIT (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to access the tuple in the relation RLRDT2UNIT.

Data Structures:

A tuple is missing from the RLRDT2UNIT relation.

Action:

Insert the rLRDT2UNIT tuple for this RDT.

76. TMCGA1ODD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A master scanner unit (MSU) scan point fired. This point had an action of TMCONDITION from the RC/V View 8.10 (CARRIER GROUP ALARM). RC/V View 5.5 (TRUNK MEMBER) did not specify the ports that should be conditioned in association with this point.

Data Structures:

The receive only printer (ROP) output provides the SM number (in decimal) and the MSU scan point number (in hex).

Action:

Use RC/V View 5.5 (TRUNK MEMBER) to populate the office dependent data (ODD) with the port(s) that should be conditioned in association with this MSU scan point. If no ports should be conditioned, use RC/V View 8.10 (CARRIER GROUP ALARM) to change the action for this MSU scan point.

77. TMCGABLIST (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: CGACKT	Audit Mode: elev

Problem:

There is a bad linkage associated with an RLCGALIST tuple.

Probable Cause:

A tuple is missing from RLCGALIST, the database is corrupt, or there is a failure in the database access routines.

Action:

Report occurrence along with all possible supporting data.

78. TMCGABLIST (5E11 only)

Recovery Action: rpi	SPP: n	Audit: CGACKT	Audit Mode: elev

Problem:

There is a bad linkage associated with an RLCGALIST tuple.

Probable Cause:

A tuple is missing from RLCGALIST, the database is corrupt, or there is a failure in the database access routines.

Action:

Report occurrence to PECC along with all possible supporting data.

79. TMCGAC2R (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: CGACKT	Audit Mode: elev

Problem:

A mismatch has occurred between the "src_map" field of an rICGACKT tuple and the RLCGAREL relation.

Probable Cause:

An error in dynamic data may be caused by use of ODBE, or errors in trigger and initialization functions.

Action:

Report occurrence along with all possible supporting data.

80. TMCGAC2R (5E11 only)

Recovery Action: rpi	SPP: n	Audit: CGACKT	Audit Mode: elev

Problem:

A mismatch has occurred between the "src_map" field of an RLCGACKT tuple and the RLCGAREL relation.

Probable Cause:

An error in dynamic data may be caused by use of ODBE, or errors in trigger and initialization functions.

Action:

Report occurrence to PECC along with all possible supporting data.

81. TMCGACKT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: CGASTAT	Audit Mode: elev

Problem:

A Failure occurred during a database (DB) read of the RLCGACKT relation.

Probable Cause:

A tuple may be missing from the RLCGACKT relation or DB can not access the tuple.

Action:

Report occurrence along with all possible supporting data.

82. TMCGACKT (5E11 only)

Recovery Action: rpi	SPP: n	Audit: CGASTAT	Audit Mode: elev

Problem:

A Failure occurred during a database (DB) read of the RLCGACKT relation.

Probable Cause:

A tuple may be missing from the RLCGACKT relation or DB can not access the tuple.

Action:

Report occurrence to PECC along with all possible supporting data.

83. TMCGAFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Carrier group alarm processing failed. No corrective action was possible.

84. TMCGALIST (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred during a database (DB) access of the RLCGALIST relation.

Probable Cause:

Either a tuple is missing, cannot be read, or cannot be inserted.

Action:

Report occurrence along with all possible supporting data.

85. TMCGALIST (5E11 only)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred during a database (DB) access of the RLCGALIST relation.

Probable Cause:

Either a tuple is missing, cannot be read, or cannot be inserted.

Action:

Report occurrence to PECC along with all possible supporting data.

86. TMCGAPORT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: CGASTAT	Audit Mode: elev

Problem:

A failure occurred during a database (DB) read of the RLCGAPORT relation.

Probable Cause:

A tuple is missing from the RLCGAPORT relation or DB can not access the tuple.

Action:

Report occurrence along with all possible supporting data.

87. TMCGAPORT (5E11 only)

Recovery Action: rpi	SPP: n	Audit: CGASTAT	Audit Mode: elev

Problem:

A failure occurred during a database (DB) read of the RLCGAPORT relation.

Probable Cause:

A tuple is missing from the RLCGAPORT relation or DB can not access the tuple.

Action:

Report occurrence to PECC along with all possible supporting data.

88. TMCGAPTLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

An inconsistency was found during normal carrier group alarm (CGA) processing. This assert is for port conditioning operations.

89. TMCGAREL (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred in the access of an RLCGAREL tuple

Probable Cause:

A tuple may be missing from the system, or some data access code failed.

Action:

Report occurrence along with all possible supporting data.

90. TMCGAREL (5E11 only)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred in the access of an RLCGAREL tuple.

Probable Cause:

A tuple may be missing from the system, or some data access code failed.

Action:

Report occurrence to PECC with all possible supporting data.

91. TMCGASTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred during a database (DB) read of the RLCGA_STAT relation.

92. TMCGATYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to access the RLCGATYPE relation.

93. TMCHKSLCPC (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The office data of the sending and receiving offices for a link test message signaling unit (MSU) conflict. The signaling link code (SLC) and/or origination point code (OPC) contained in the link test MSU which was sent from another office conflicts with the values that this office determined for these parameters.

Data Structures:

RLlnkp_ls[] -- keyed by dltnum

RLls_grp[] -- keyed by lsnum

RLapci_apc[] -- keyed by apcig

RLapc_info[] -- keyed by apcindx

Action:

The ROP output displays the linkset and member of the link the link test MSU came in on. The data following the heading "RECEIVED DATA" is the OPC of the office which sent the link test MSU and the SLC of the link over which the link test MSU was sent -- this data was taken from the MSU. The data following the heading "OFFICE DATA" is the destination point code (DPC) which corresponds to the office which sent the link test MSU and the SLC of the

link over which the link test MSU arrived -- this data was derived using data structures from this office.

The OPC following the heading "RECEIVED DATA" and the DPC following the heading "OFFICE DATA" should be the same. Likewise, the SLC following the heading "RECEIVED DATA" and the SLC following the heading "OFFICE DATA" should be the same.

Use recent change to verify that the SLC and DPC displayed in the section "OFFICE DATA" on the ROP output are the proper values for the the linkset and member displayed on the ROP.

Follow these steps:

- (1) Use the recent change "LINK SET VIEW" to find the adjacent point code (APC) for for the linkset -- this should correspond to the DPC displayed in the section "OFFICE DATA" on the ROP output
- (2) Use the recent change "LINK SET AND MEMBER VIEW" to find the SLC that is associated with the linkset and member that the MSU came in on -- this should correspond to the SLC displayed in the section "OFFICE DATA" on the ROP output
- (3) If either of the values found by steps 1 or 2 conflict with the output from the ROP, a dynamic relation (RLInk_stat[] or RLIs_stat[]) is suspect of being in error. Audits run routinely on these relations and should clear up the problem. Audits may be manually requested to run on these relations by entering the following commands at the MCC:

```
st-audsm: sm#, lsdata;
st-audsm: sm#, lnkdata;
```

- (4) If the values found by steps 1 and 2 match the output from the ROP, then the two offices are using different values for the SLC of the link and the point code of the office which sent the link test MSU -- communicate with personnel of other office to resolve data conflict

94. TMCHKSLCPC (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The office data of the sending and receiving offices for a link test message signaling unit (MSU) conflict. The signaling link code (SLC) and/or origination point code (OPC) contained in the link test MSU which was sent from another office conflicts with the values that this office determined for these parameters.

Data Structures:

RLInkp_Is[] -- keyed by dltnum.
 RLIs_grp[] -- keyed by lsnum.
 RLapci_apc[] -- keyed by apcig.
 RLapc_info[] -- keyed by apcindx.

Action:

The ROP output displays the linkset and member of the link the link test MSU came in on. The data following the heading "RECEIVED DATA" is the OPC of the office which sent the link test MSU and the SLC of the link over which the link test MSU was sent -- this data was taken from the MSU. The data following the heading "OFFICE DATA" is the destination point code (DPC) which corresponds to the office which sent the link test MSU and the SLC of the link over which the link test MSU arrived -- this data was derived using data structures from this office.

The OPC following the heading "RECEIVED DATA" and the DPC following the heading "OFFICE DATA" should be the same. Likewise, the SLC following the heading "RECEIVED DATA" and the SLC following the heading "OFFICE

DATA" should be the same.

Use recent change to verify that the SLC and DPC displayed in the section "OFFICE DATA" on the ROP output are the proper values for the linkset and member displayed on the ROP. Follow the steps outlined below:

- 1) Use the recent change "LINK SET VIEW" to find the adjacent point code (APC) for the linkset -- this should correspond to the DPC displayed in the section "OFFICE DATA" on the ROP output
- 2) Use the recent change "LINK SET AND MEMBER VIEW" to find the SLC that is associated with the linkset and member that the MSU came in on -- this should correspond to the SLC displayed in the section "OFFICE DATA" on the ROP output
- 3) If either of the values found by steps 1 or 2 conflict with the output from the ROP, a dynamic relation (RLnk_stat[] or RLls_stat[]) is suspect of being in error. Audits run routinely on these relations and should clear up the problem. Audits may be manually requested to run on these relations by entering the following commands at the MCC:

```
st-audsm: sm#, lsdata;
and
st-audsm: sm#, lnkdata;
```

- 4) If the values found by steps 1 and 2 match the output from the ROP, then the two offices are using different values for the SLC of the link and the point code of the office which sent the link test MSU -- communicate with personnel of other office to resolve data conflict

95. TMCICLKGRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database error occurred while attempting to do a fast read of relation RLCICLKGRP.

96. TMCKTDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database error occurred while reading the RLCKTDATA relation.

97. TMCKTLPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency exists in the tuples of the office dependent data (ODD) relations RLSPID and RLLPT_SPID. The lport key of the rLPT_SPID tuple does not match the ckt_lport attribute of the rLSPID tuple.

Data Structures:
RLSPID, RLLPT_SPID.

The first field dumped is the digcnt key of the missing rLSPID tuple, and the second field contains the USPIDs of the missing tuple. The USPIDs are stored and printed as right justified. If the USPIDs are less than 18 digits, then the most significant digits are padded with zeros.

The third field is the lport key of the rLPT_SPID tuple. The fourth field is the numeric value of the lpt_type key of the rLPT_SPID tuple. (The enumeration strings for the lpt_type key are in the global header db/DMlpt_type.h)

Action:

Use RC/V (or ODBE, if necessary) to fix the ODD inconsistency. If ODBE is used to update the tuple, keep in mind

that the USPID digits are stored right justified and if the USPID is less than 18 digits, the most significant digits are padded with zeros.

98. TMCKT_PORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Tuple missing in the relation RLCKT_PORT. When attempting to read this relation, a failure return code of DBNO_MATCH was returned. This indicates that the tuple is missing, or that the keys used to read this relation were set improperly.

Data Structures:

RLCKT_PORT.

Action:

This is a database inconsistency that can only be corrected by manual action.

99. TMCKTREL (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database error occurred while reading the RLCKT_REL relation.

100. TCMCKP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed in communication with the communications kernel process (CMKP).

101. TMCNTFDASP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

The dynamic access (DA) primitive DAfdasp() was called from within the TMospsinit() function to obtain the restart request response timer and the restart request retransmission count in the supplementary protocol block (SPB). However, the linkage from the D-channel application linkage block (DALB) to the SPB could not be followed to obtain an rISPB tuple. The DALB will be quarantined and the DALB audit will be scheduled to clean up the DALB.

102. TMCOMMFAIL (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to communicate with a process. This problem was probably due to an OSSENDMSG() macro failure.

103. TMCOTCHECK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown report or result was received from a continuity check.

104. TMC_PHIST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was encountered while attempting to clear the dynamic relation RLPHISTORY during an SM initialization. There may be a problem in this SM's office dependent data (ODD) access dictionary entry for the RLPHISTORY relation.

Action:

Contact the office data administration (ODA) organization. They will examine the access dictionary paying particular attention to the entry for the RLPHISTORY relation. When the error is found, a new ODD for this SM will be built and installed.

105. TMC_PORTLA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was encountered when attempting to clear the dynamic relation RLPORTLA during an SM initialization. This most likely indicates a problem in this SM's office dependent data (ODD) access dictionary entry for the RLPORTLA relation. As a result, the RLPORTLA relation was not initialized. This problem affects service because RLPORTLA is needed for call processing.

Action:

Contact the office data administration (ODA) organization. They will examine the access dictionary paying particular attention to the entry for the RLPHISTORY relation. When the error is found, a new ODD for this SM will be built and installed.

106. TMCPTIMEOUT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

IM timed out waiting for the CP to respond to a status change.

107. TMCR_ABRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The inter-SM (ISM) craft AM abort variable indicates that an SM is out-of-range. The global variable will be dumped.

108. TMCRT_TIMER (5E11 and later)

Recovery Action: spp	SPP: n	Audit: TCB	Audit Mode: nonseg

Problem:

A critical inter-SM (ISM)-SM system process timer was not established.

Action:

Purge operating system for distributed switching (OSDS) process #113 in the affected SM to correct the problem.

109. TMCRT2DS1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read an rIRT2DS1 tuple failed with a DBNO_MATCH error.

Data Structures:

RLRT2DS1. Key field: rname.

Action:

Insert an rIRT2DS1 tuple for this rname key value.

110. TMCTP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A terminal process could not be started for a message that was just removed from the queue (ATA_QUE).

111. TMCUR_PORTTYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid cursor error was encountered when trying to read the office dependent data (ODD) relation RLFC_PORTTYP during an SM initialization. As a result, the dynamic relation RLPORTLA was only partially initialized. The port linkage area (PORTLA) audit should finish building the RLPORTLA relation.

112. TMDACATPS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RCATPS	Audit Mode: elev

Problem:

An unsuccessful return was received from the DAGTCATPS() macro. The twelve control area tuples should always exist.

113. TMDALHPTPN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RLHPTPN	Audit Mode: elev

Problem:

An unsuccessful return was received from the DAGTLHPTPN() macro. The twelve list head tuples should always exist.

114. TMDAMCATPS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RMCATPS	Audit Mode: elev

Problem:

An unsuccessful return was received from the DAGTMCATPS() macro. Both master control area tuples should always exist.

115. TMDASPTPN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RQKEYPT	Audit Mode: elev

Problem:

A tuple in the static relation RLR_QKEYPT did not have a corresponding tuple in the dynamic relation RLR_SPTPN.

116. TMDA_TIMER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not read the RLDA_TIMER relation.

117. TMDATPSTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RTPSTAT	Audit Mode: elev

Problem:

An unsuccessful return was received from the DAGTTPSTAT() macro. The 100 test position tuples should always exist.

118. TMDBAML (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not get information from the RLRT_TRKG relation; therefore, the craft request to print the automatic maintenance limit of a specified trunk group was not completed successfully.

119. TMDBERRS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The limit of database (DB) errors allowed in one of the terminal maintenance (TM) dynamic data initialization functions was exceeded. The function stops its initialization.

120. TMDBRDFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfrdtup() primitive failed to read a relation. The first block of data dumped provides the ID of the relation being read, the number of keys to the relation, and the keys (each key printed separately).

```

relid  1  key1...
relid  2  key1  key2...
relid  3  key1  key2  key3...
relid  N  key1  key2  key3...  keyN

```

Exhibit 1 Examples with one data block:

If the key is larger than 32 bits, then a second and third block of data will be printed containing the keys.

BLOCK 1 DUMP:

```
relid  0  ...
```

BLOCK 2 DUMP:

```
key1...
```

BLOCK 3 DUMP:

key2...

Exhibit 2 Example with two or three data blocks:

121. TMDRTLWS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLTLWSR relation was not populated correctly, or could not be read.

122. TMDLWS101 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLTM_WS101 relation was incorrectly populated or could not be read.

123. TMDLHN_PRI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple is missing from the office dependent data (ODD) relation RLDLHNPRI.

Data Structures:

RLDLHNPRI.

The first field dumped is the member key (port name) of the missing tuple, the second field is the module key (SM number).

Action:

Use RC/V (or ODBE, if necessary) to correct the ODD inconsistency.

124. TMDCOND (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

The DBfrdtup() function failed when retrieving data from the TMportcond[] table.

Probable Cause:

The PORTLA list was invalid or the TMportcond[] table was corrupted.

Action:

The PORTLA audit will recover the port to a valid list

125. TM_DDEIFR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When reading the RLEISDSL static relation with the SM relative link (sm_rel_lnk) as a key, the database read failed.

The sm_rel_lnk that was used as a key and the sm_rel_lnk that was read from the RLEISDSL relation will be

dumped.

Data Structures:

RLEISDSL. Key field: sm_rel_Ink.

Action:

If this assert fires continuously, check RC/V View 21.30 (OSPS - DSL PORT). Compare the sm_rel_Ink key with the values dumped. If the data could not be obtained using RC/V, delete the rLEISDSL tuple then re-insert it.

126. TMDDFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Indicates a failure of data delivery.

127. TMDDREAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DDread() primitive failed; that is, it returned a negative value.

128. TM_DDSMFR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When reading the RLEIS_SM static relation with the external information system (EIS) ID (eisd) as a key, the database read failed. The EIS ID that was used as a key and the EIS ID that was read from the RLEIS_SM relation will be dumped.

Data Structures:

RLEIS_SM. Key field: eisd.

Action:

If this assert fires continuously, check RC/V View 21.52 (OSPS SM SPECIFIC DATA FOR EIS). Compare the eisd key with the values dumped. If the data could not be obtained using RC/V, delete the rLEIS_SM tuple then re-insert it.

129. TMDEL_CON (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to remove a power cross status from the line failed.

130. TMDETIMER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSDETIMER() macro failed to remove an existing timer. The timer tag is contained in the user stack frames that are dumped.

131. TMDF2THRSH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to access or update the rIDF2THRSH tuple for this key.

132. TMDFITIMER (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A cyclic timer cannot be set.

133. TMDLSDERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The static data for an operator services position system (OSPS) data link digital subscriber line (DSL) was inconsistent. For each data link DSL, there must be an rIDLDSL tuple with the key of the global port of the D-channel port.

Data Structures:

RLDLDSL.

Action:

Use RC/V (or ODBE, if necessary) to add the required rIDLDSL tuple.

134. TMDNOFCPTUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The given integrated services digital network (ISDN) port had a corresponding rIDSLEQUIP tuple, but did not have an rIFC_PORTTYP tuple. ISDN ports terminate at a protocol handler (PH).

Data Structures:

RLDSLEQUIP, RLFC_PORTTYP.

Action:

For the given port, use RC/V to verify the corresponding rIDSLEQUIP and rIFC_PORTTYP tuples and correct any inconsistencies. The RC/V views that display data for ports known to have tuples in the RLDSLEQUIP relation are View 5.5 (TRUNK MEMBER), View 21.30 (OSPS DSL PORT ASSIGNMENT), View 22.13 (INTER SM NAIL UP), and View 23.1 (ISDN INDIVIDUAL DSL - LCEN).

135. TMDNTRAN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt by the DBfrdtup() function to read the AM static relation RLRT_DNTRAN failed, indicating that a non-resource failure problem exists. DBNO_MATCH was not the failure code.

136. TMDPB4ISM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DPB	Audit Mode: elev

Problem:

The expected D-channel port block (DPB) for an inter-SM (ISM) port could not be retrieved by database (DB) primitives.

137. TMDPBINIT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DPB	Audit Mode: elev

Problem:
Failed to initialize the rDPB tuple via the TMimdpbint() function.

138. TMDPBINV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DPB	Audit Mode: elev

Problem:
The D-channel port block (DPB) was inconsistent with static data.

Probable Cause:
The DPB was corrupted.

Action:
The DPB audit will be scheduled to correct the problem.

139. TMDPC_DPCI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
An error occurred while attempting to do a fast read of relation RLDPC_DPCI.

140. TMDPC_INFO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
An error occurred while attempting to do a fast read of relation RLDPC_INFO.

141. TMDS12RT (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Failed to access the tuple in relation RLDS12RT.

Probable Cause:
The tuple is missing or corrupted.

Action:
Contact office-dependent data (ODD) administrator and/or developer.

142. TMDSLEQUIP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
A failure was reported from the RLDSLEQUIP relation trigger function TMtdsleq2().

143. TMDSLRMFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The TMDslrmv() primitive failed to add out of service states for a port.

144. TME7ERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ENTRY7	Audit Mode: elev

Problem:

Trouble has been detected with the data used to send common channel signaling system 7 (CCS7) blocking, unblocking and reset messages. Temporary inter-office trunk status conflicts are possible. These inconsistencies should self-correct over time as incoming and outgoing CCS7 calls occur on those trunks with inconsistent data. The CCS7 trunk status query feature can also be used to correct such inconsistencies, but it will run only if the status query feature is enabled.

Action:

The data problem detected was associated with the RLENTY7 relation. This assert will schedule the AUENTRY7 audit to verify the data in the RLENTY7 relation tuples and recover any bad data found. The RLENTY7 relation is closely inter-related with three other dynamic relations (RLPCILST7, RLCINDX7, and RLTIMER7). Problems detected by the AUENTRY7 audit may cause one or more of the audits for these related relations to run also.

If this assert continues to occur after the audit runs to completion, send the information from the assert output to the product engineering control center (PECC) for analysis. Up to three additional data blocks may also be included in the assert output to assist PECC in the isolation/resolution of the problem. Please include all data output as part of the assert when reporting the occurrence of this assert to PECC.

145. TM_EDDKBD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

On reading the RLDLDSL static relation with a key constructed from the processor number and a port passed to the TMeis_dd() function, a call to read the database was unsuccessful. The port that was passed to TMeis_dd() is dumped, followed by the port that was read from the RLDLDSL relation.

Data Structures:

RLDLDSL. Key field: gdport (global D port).

Action:

If this assert fires multiple times, check RC/V View 21.30 (OSPS - DSL PORT). Compare the port on this view with the values dumped. If the data could not be obtained using RC/V, delete the rIDLDSL tuple then re-insert it.

146. TMEHBFLR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OAEishrtbt() function was called to send out a heart beat message and was not successful. Either an unexpected parameter was passed to the function, or the function could not send a message.

The parameters that are passed to this function are

- eislnk_ptr, a pointer to the RLEIS_LNK dynamic relation
- msg_type, the type of message that was requested or responded to

- msg_ptr, a pointer to the message structure

Data Structures:

RLEIS_LNK, RLEIS_DATA.

Action:

The message buffer, msg_ptr, and eisdata_ptr from the RLEIS_DATA relation will be dumped. Check the RLEIS_DATA structure to verify that the message was populated with the correct values.

147. TMEIDSLNRD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the DBfrdtup() primitive in the TMps_eis() function to obtain an rLEISDSL tuple failed. The database (DB) primitive returned DBNO_MATCH or DBRELNAME_BAD.

The SM relative link (sm_rel_lnk) key used to read the rLEISDSL tuple was calculated from the links assigned (lnks_asgnd) attribute read from an rLEIS_SM tuple. The lnks_asgnd attribute is a bit map containing from 0-15 bits. Bits that are set to 1 in the bit map correspond to links that are assigned on the SM, and the position of that bit in the bit map is the SM relative link number (sm_rel_lnk).

For example, if the lnks_asgnd attribute has the value 7 then bits 0, 1, and 2 are set to 1 and the SM has relative links 0, 1, and 2 respectively assigned. If the bit map has an out of range value, an invalid key may be used to read an rLEISDSL tuple.

Data Structures:

RLEISDSL. Key field: sm_rel_lnk.

RLEIS_SM. Key field: eisid [external information system (EIS) ID].

Action:

Compare the SM relative link and the links assigned that are dumped against the values on RC/V View 21.30 (OSPS - DSL PORT) and View 21.52 (OSPS SM SPECIFIC DATA FOR EIS) for the RLEISDSL and RLEIS_SM relations, respectively.

148. TMEIMSGLE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operating system for distributed switching (OSDS) tried to process a heart beat message that overflowed its message buffer.

Action:

Place the link on the OOS/DSLINIT list.

149. TMEI_NORD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The port that was passed to the TMps_eis() function was used to construct a key to read a static relation. An attempt to read the static relation failed and DBNO_MATAch or DBBRELNAME_BAD was returned.

This failure disallows the update of the recent overload (recent_ovld) and approximate usage (appx_usage) attributes when the status of an external information system (EIS) data link is requested.

Data Structures:
RLDLSL. Key field: gdport.

Action:

The RLDLSL static relation has an invalid or corrupted key. The key is a structure containing two fields, a port and the SM or processor number. Check RC/V View 21.30 (OSPS - DSL PORT) for consistency between the port that was dumped and the port on this view. If the information could not be determined using RC/V, delete the rldlsL tuple then re-insert it.

150. TMEINOREP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During the initialization of an external information system (EIS) data link, the integrated services port administrator (ISPA) terminal process could not replace to the EIS terminal process. The OSREPLACE() macro returned, which should not happen.

151. TMEIS_DDUNX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return was received from a database read. The database primitive DBfrdtup() was called from the TMeis_dd() function to read a static relation. DBfrdtup() failed and returned a value that was not tested for in the TMeis_dd() function.

152. TMEISDEBUG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The global variable OAeisim [the external information system (EIS) integrity monitor] was enabled. The port that was active in the leg of code where the error occurred will be dumped.

Action:

Check the code where the error occurred or the value of the port.

153. TMEISDYERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LNK	Audit Mode: elev

Problem:

While populating a dynamic relation, the key was tested against the corresponding attribute in the static relation. The key was invalid.

Data Structures:

RLEIS_LNK. Key field: smrlnk (SM relative link).
RLDLSL. Key field: gdport (global port).

Action:

The AUEIS_LNK audit is scheduled in elevated mode. The audit will correct the discrepancy found in the dynamic relation.

154. TMEISMSGER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While checking an external information system (EIS) system status request or EIS system status response message, the message set ID (msg_set_id) or the switch identifier (eis_swid) was incorrect.

Data Structures:

RLEIS_DATA. Key field: eis_id (EIS identifier).

Action:

Check RC/V View 21.51 (OSPS EXTERNAL INFORMATION SYSTEM (EIS) DATA). This view contains the msg_set_id. The data that is considered invalid will be displayed. Also check the contents of the message that was sent.

155. TMEIS_PSUNX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfrdtup() primitive was called from the TMps_eis() function. DBfrdtup() returned a value that was not tested for in a switch statement. This unexpected return value occurred when an attempt was made to read the RLDLDSL relation.

156. TMEISSDBERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While reading static data in an attempt to initialize an external information system call (EIS) call processing data link (CPDL), an error was encountered in the database read.

The static consistency checks will be performed between attributes from the RLEISDATA, RLEISDSL, and RLDLDSL static relations. The data that is dumped indicates the attributes which were found to be flawed during the database read.

Data Structures:

RLDLDSL. Key field: gdport (global port).

RLEIS_DATA. Key field: sm_rel_lnk (SM relative link).

RLEISDSL. Key field: eis_id (EIS identifier).

Action:

Check RC/V View 21.30 (OSPS - DSL PORT) and RC/V View 21.51 (OSPS EXTERNAL INFORMATION SYSTEM (EIS) DATA). If no information can be obtained from View 21.30, use RC/V to delete the rLEISDSL tuple or the rIDLDSL tuple then re-insert the tuple. If no information can be obtained from View 21.51, delete the rLEIS_DATA tuple then re-insert the tuple.

157. TMEIS_SM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In an attempt to read an rLEIS_SM tuple, DBNO_MATCH was returned. This indicates that the key used to read this tuple was not valid. If an rLEIS_SM tuple does not exist, then the number of data links connecting the external information system (EIS) to a position switching module (PSM) will not be obtained. This information is needed to update the EIS entry on display page 1460.

Data Structures:

RLEIS_SM. Key field: eis_id.

The SM relative link (eis_id) key will be printed on the receive only printer (ROP).

Action:

Use RC/V View 21.30 (OSPS - DSL PORT) to verify that the EIS ID that was printed on the ROP exists. If it does not exist, then determine if a tuple associated with that EIS ID must be supported.

158. TMEISSTCHK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While reading static data in an attempt to initialize an external information system (EIS) call processing data link (CPDL), an error was encountered.

Data Structures:

RLDLDSL. Key field: gdport (global port).

RLEIS_DATA. Key field: sm_rel_lnk (SM relative link number).

RLEISDSL. Key field: eis_id (EIS identifier).

This assert is called from the TMeis_stchk() function. When an inconsistency occurs that corresponds to one of the following items, the data specified will be dumped.

1. The SM relative link numbers contained in the RLEISDSL and RLDLDSL relations and the EIS ID.
2. The EIS ID contained in the RLEISDSL and RLDLDSL relations and the SM relative link numbers.
3. The maximum link capacity contained in the RLEISDSL and RLEIS_DATA relations, the EIS ID, and the SM relative link number.
4. The servclass obtained from the RLDLDSL relation and the servclass passed to the function, along with the sm_rel_lnk and eis_id.
5. The port obtained from the RLDLDSL and RLEISDSL relations, as well as the sm_rel_lnk and eis_id.

Action:

Check View 21.30 (OSPS - DSL PORT) and View 21.51 (OSPS EXTERNAL INFORMATION SYSTEM (EIS) DATA). If there is a problem with the RLDLDSL, RLEIS_DATA, or RLEISDSL relations, use RC/V to delete the offending tuple then re-insert the tuple.

159. TM_EISYSER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In an attempt to read the RLDLDSL static relation, the database read was unsuccessful because of a system error.

Data Structures:

RLDLDSL. Key field: gdport (global D port).

160. TMEITRSLT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The TMemtrnslate() function could not translate an external message type to its corresponding internal form. The

message set ID that was passed as a parameter to TMemtrnslate() was invalid or not yet defined, or the external message type was invalid.

Data Structures:
RLEIS_DATA.

Action:

The msg_set_id parameter in the heart beat message will be dumped. Check that the msg_set_id attribute in the RLEIS_DATA relation corresponds to the current value in the heart beat message. Also, verify that the data in the heart beat message is valid. The message set ID information can be found on RC/V View 21.51 (OSPS EXTERNAL INFORMATION SYSTEM (EIS) DATA).

161. TMELNK_KEY (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LNK	Audit Mode: elev

Problem:

A call to the DAGETLNK() macro in the TMps_eis() function returned a key (SM relative link number) that does not match the SM relative link attribute obtained from an rLEISDSL tuple. The AUEIS_LNK audit will be scheduled in elevated mode to reconstruct the rLEIS_LNK tuple from static data.

If the assert fires repeatedly, then the SM relative link (sm_rel_lnk) attribute obtained from the RLEISDSL relation or RLDLDSL relation is invalid.

Data Structures:

RLEIS_LNK. Key field: sm_rlnk (SM relative link).

RLDLDSL. Key field: gdport (global port).

RLEISDSL. Key field: sm_rel_lnk (SM relative link).

Action:

Compare the SM relative link number dumped against that in RC/V View 21.30 (OSPS - DSL PORT) for the rLEISDSL tuple. Update View 21.30 to reflect the correct data, or delete the rLEISDSL tuple then re-insert it.

162. TME_MSUNEX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The TMemsgchk() function found an unexpected external information system (EIS) message type while validating the contents of a message. The link will be placed on the level three error list.

163. TMENDTRN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not end an update transaction.

164. TMEPREMT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

On initialization of an external information system (EIS) call processing data link (CPDL), either an MGINTERRUPT or an MGISDNDFAIL message was received. This caused the initialization to be preempted.

A window exists, such that an MGINTERRUPT message can be generated by typing RST:DATA LINK then

RMV:DATALINK at the master control center (MCC). The link is not placed on the OOS/DSBLD list as may be expected; however, the link is placed on the OOS/DSLINIT list and restored after a specified time when initialization is resumed.

165. TMEPRNVLD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSWGETMSG() macro was called from the TMemsghdr() function with an invalid parameter. Actions: Check the parameters that were passed to this macro. The link will be placed on the OOS/DSLINIT list.

166. TMEQLOC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt by the DBfrdtup() function to access database (DB) relation RLRC_EQLOC failed. This indicates a non-resource related problem with DB access to this relation.

167. TMEQUIPLPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency exists in the tuples of the office dependent data (ODD) relations RLDSLEQUIP and RLLPT_PT. The port attribute in the rLPT_PT tuple does not match the dsl key in the rIDSLEQUIP tuple.

Data Structures:

RLDSLEQUIP, RLLPT_PT.

The first field dumped is the dsl key (port name) of the rIDSLEQUIP tuple. The second field is the lport key of the rLPT_PT tuple. The third field is the number value of the lpt_type key of the rLPT_PT tuple. (The enumeration strings for the lpt_type key are in the global header db/DMlpt_type.h)

Action:

Use RC/V (or ODBE, if necessary) to fix the ODD inconsistency.

168. TMEQUIPPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency exists in the tuples of the office dependent data (ODD) relations RLDSLEQUIP and RLFC_PORTTYP.

Case 1: No corresponding rIDSLEQUIP tuple could be found for the given service class attribute in the rLFC_PORTTYP tuple.

Case 2: The D channel was not assigned for the given D port, but the service class attribute in the rLFC_PORTTYP tuple was incorrectly set to a value which indicates that the D channel has been assigned.

Data Structures:

RLDSLEQUIP. Key field: dsl (port name).

RLFC_PORTTYP. Key fields: port.member (port name), port.module, servclass (class of service).

Action:

Case 1: If the rIDSLEQUIP tuple is missing, use RC/V View 23.40 (T1 PACKET SWITCHING CHANNEL ASSIGNMENT) to fix the ODD inconsistency.

Case 2: If the class of service attribute for the rRFC_PORTTYP tuple has been incorrectly set, use RC/V View 23.40 to fix the inconsistency. (The enumeration strings for the class of service are in the global header db/DMservclass.h).

169. TMERR_DSLEQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLDSLEQUIP relation has the briclass attribute defined as a Bellcore standard interface basic rate interface (BRI). This port does not support the Bellcore standard interface.

Data Structures:

RLDSLEQUIP.

The ROP output specifies the SM (in decimal) and the port (in hex).

Action:

Examine the rIDSLEQUIP tuple for the port specified. Use RC/V (or ODBE, if necessary) to correct the tuple.

170. TMERR_LA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was encountered when trying to insert a tuple in the SM dynamic relation RLPORTLA. This most likely indicates an error in the RLPORTLA entry in the access dictionary which is maintained in the SM's office dependent data (ODD).

The first data dump contains the rLPORTLA tuple that was being inserted when the assert fired. The second data dump contains the SM ODD rRFC_PORTTYP tuple that indicated that an rLPORTLA tuple needed to be added for the port. The entire first two bytes of each dump contains the local port name. The entire fourth byte of the second dump contains the SM number.

Action:

Contact the office data administration (ODA) organization. They will examine the access dictionary entry for the RLPORTLA relation. The most likely cause of the problem is an incorrect value in the maximum tuple field (rel_tmax).

Other likely candidates for the error are the head page size field (rel_hsze), data page size field (rel_dsize), tuple per page field (acc_tpag), and the number of data pages field (acc_npag). When the error is found, a new ODD correcting the access dictionary problem will be built and installed for the SM.

171. TMERR_PHIST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was encountered when the dynamic relation RLPHISTORY was initialized during an SM initialization. This indicates an error in the RLPHISTORY entry in the access dictionary which is stored in this SM's office dependent data (ODD).

Action:

Contact the office data administration (ODA) organization. They will examine the access dictionary entry for the RLPHISTORY relation. The most likely cause of the problem is an incorrect value in the maximum tuple field (rel_tmax).

The data dump should be examined to verify that the rel_tmax value is the problem. The entire first two bytes of the dump contain the key that was used to insert a tuple. If this key is equal to or greater than the value of rel_tmax, then rel_tmax was set too low and should be increased.

Otherwise, the error is in one of the other fields of the RLPHISTORY entry in the access dictionary; such as, the head page size (rel_hsze), data page size (rel_dsize), tuples per page (acc_tpag), or the number of data pages (acc_npag). When the error is found, a new ODD correcting the access dictionary problem will be built and installed for this SM.

172. TMERR_PORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was encountered when trying to read the SM office dependent data (ODD) relation RLFC_PORTTYP during an SM initialization. This most likely indicates a problem in this SM's ODD access dictionary entry for the RLFC_PORTTYP relation.

The data dump contains the last RLFC_PORTTYP tuple successfully read. The entire first two bytes contain the local port name. The entire fourth byte contains the SM number.

Action:

Contact the office data administration (ODA) organization. They will examine the access dictionary entry for the RLFC_PORTTYP relation. When the error is found, a new ODD for this SM correcting the access dictionary problem will be built and installed.

173. TMERR_PRTLST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was encountered when the dynamic relation RLPRTLST was initialized during an SM initialization. This indicates an error in the RLPRTLST entry in the access dictionary which is stored in this SM's office dependent data (ODD).

Action:

Contact the office data administration (ODA) organization. They will examine the access dictionary entry for the RLPRTLST relation. The most likely cause of the problem is an incorrect value in the maximum tuple field (rel_tmax).

The data dump should be examined to verify that the rel_tmax value is the problem. The entire first 2 bytes of the dump contain the key that was used to insert a tuple when the assert fired. If this key is equal to or greater than the value of rel_tmax minus 1, then rel_tmax was set too low and should be increased.

Otherwise, the error is in one of the other fields of the RLPRTLST entry in the access dictionary; such as, the head page size (rel_hsze), data page size (rel_dsize), tuples per page (acc_tpag), or the number of data pages (acc_npag). When the error is found, a new ODD correcting the access dictionary problem will be built and installed for this SM.

174. TMETIMOUT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The TMeisinit() function timed out while waiting for a response from the external information system (EIS). Possibly, the OAeishrtbt() function did not allocate a timer, or the EIS could not send a response.

175. TMFACPROV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to read relation rIFAC_PROV.

Probable Cause:

Corrupt database.

Action:

Fix database.

176. TMFAC_PROV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database error occurred while reading the RLFAC_PROV relation.

Probable Cause:

Either there is no tuple exists for for the ckname used to read this relation, or there is a database error.

Action:

Use ODBE to read FAC_PROV relation using the ckname (4 bytes long) dumped on the ROP. If a tuple exists, then it could have been a database error. Otherwise, if no tuple exists insert one.

177. TMFACSTAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to read relation rIFACSTAT.

Probable Cause:

Corrupt database.

Action:

Fix database.

178. TMFACTHRSH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to access or update an rFACTHRSH tuple for a digital signal level 1 (DS1) performance monitoring group.

179. TMFC_LINE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not read the RLFC_LINE relation to check the line for devised origination.

180. TMFC_OPRTK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database error occurred during a fast read of the RLFC_OPRTK relation.

181. TMFC_PORTYP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to access the RLFC_PORTTYP relation using the database (DB) primitives.

182. TMFCPRterr (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database (DB) primitive returned a failure code when attempting to access the RLFC_PORTTYP relation.

183. TMFC_TRUNK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database error occurred during a fast read of the RLFC_TRUNK relation.

184. TMFPMFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Digital signal level 1 (DS1) performance monitoring code failed.

185. TMFRDRLN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfrdtup() function failed to read a relation.

186. TMFTH_LIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RLRC_OEINFO relation has line insulation testing (ALIT/DLIT) enabled for a fiber to the home line. LIT should never be allowed on fiber to the home lines.

Data Structures:

RLRC_OEINFO.

The ROP output specifies the SM (decimal) and port (hex).

Action:

Examine the rLRC_OEINFO tuple and inhibit LIT testing by setting the tmalit_ihb attribute to YES, via RC/V (or

ODBE, if necessary).

187. TMGDSFFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert indicates a failure in the TM/PC/GDSF interface.

188. TMGETDPB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTTYP	Audit Mode: elev

Problem:

Failed to get the D-channel port block (DPB) associated with the port. The DAGETDPB() macro was probably used.

189. TMGETISMDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DSLEQUIP	Audit Mode: elev

Problem:

Failed to get the integrated services digital network (ISDN) maintenance data block (ISMDB) that is associated with the digital subscriber line (DSL) group and member. The DAGETISMDB() macro was used.

190. TMGETLHD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RSPTPN	Audit Mode: elev

Problem:

The DAgolhsn() function did not successfully access the owner rIR_LHPTPN tuple of the specified rIR_SPTPN tuple.

191. TMGETMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A terminal or system process could not receive the message that it was created to process for reasons other than resource failures.

192. TMGETPORT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An incorrect process ID was encountered.

193. TMGETPTSB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not successfully read a tuple from the peripheral time slot tlock (PTSB).

194. TMGETTMR (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: GPFTIMER	Audit Mode: elev

Problem:

Failed to get pointer to rIGPFTIMER from dynamic ODD.

Probable Cause:

Broken linkage between rIGPFTIMER and headcell, rIOHTIMER

Action:

GPFTIMER audit will recover the timer to a valid list.

195. TMGHCATPS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RCATPS	Audit Mode: elev

Problem:

The DAGhcatp() function did not successfully access the head rIR_TPSTAT tuple from the set owned by the rIR_CATPS tuple.

196. TMGL7ERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A global parameter was attempting to be modified to an out of range value. The global parameter name is dumped in the output.

Data dumped with the assert: Parameter name, Processor, the current value of the parameter, the attempted new value of the parameter and an operation (increment, decrement, NA, etc).

Action:

Correct the specified global Parameter according to the population rules for the global parameter. If assistance is required in populating the global parameter, contact the product engineering control center (PECC). Populating the parameter incorrectly may result in system degradation.

197. TMGLEISEQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data inconsistency was found between data in rLPARAMETER and rLEIS_SM tuples. The gleiseq attribute in the RLPARAMETER relation indicates the number of links from all external information systems (EISs) that are currently assigned on a position switching module (PSM). The Inks_on_sm attribute in the RLEIS_SM relation provides the total number of EIS data links for a specified EIS connecting a PSM. The sum of all Ink_on_sm attributes for all EISs connected to that PSM should equal the number of links that the gleiseq attribute indicates are assigned. A comparison was made and failed. If the number of links indicated in gleiseq does not match the sum of all Inks_on_sm attributes, then the indicator shown on page 1460 for EIS data links may not reflect the correct SM summary status of EIS data links.

Data Structures:

RLPARAMETER, RLEIS_SM.

The expected and calculated value of the number of EIS data links on the PSM will be printed on the receive only printer (ROP).

Action:

Use RC/V (or ODBE, if necessary) to cross check the data in the RLPARAMETER relation. The gleiseq attribute may have been updated using ODBE, if so change it back or contact your next level of support.

198. TMGLESNXPR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected value for the port flag was passed to the TMgleischk() function. As a result, GLFAIL will be returned to the TMeis_dd() function which invoked TMgleischk().

199. TMGLRDERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read a global parameter has failed.

200. TMGLUPDERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to update a global parameter failed.

201. TMGRSBUFFUL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While loading up reset messages during SM initialization an overflow condition was reached. CCS7 trunk reset requests that were not initially loaded will be picked up by the first interval of periodic reset.

Data Structures:

RLPCI7GR. Key Fields: pci, cic_offset.

Action:

The RLPCI7GR relation was being read sequentially when the failure occurred. The data shows the last successfully accessed tuple. If the keys are all zero then the failure occurred on the first tuple access.

The allocated memory for the dynamic relation(s) used for the MCAH process are not sufficient for the CCS7 cic assignments. These relations must be re-engineered to match the assignments. Contact the office data administration (ODA) organization for assistance.

202. TMGRSFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While loading up reset messages during an SM full initialization an error occurred that left CCS7 trunk reset requests to be picked up by the first interval of periodic reset. The RLPCI7GR relation was being read sequentially when the failure occurred. The data shows the number of trunks being processed by periodic reset for a given SM. A trunks being processed value of 65535 indicates that all CCS7 trunks were processed by periodic reset. A value from 1-65534 indicates the actual number of CCS7 trunks being processed.

Data Structures:

None. RLPCI7GR provided by a previous TMGRSBUFFUL or TMGRSORIG assert.

Action:

None. The error is self recovering via periodic reset. This assert is informational only. The error source is explained

in the TMGRSBUFFUL or TMGRSORIG assert which should have been reported during the unsegmented initialization phase.

203. TMGRSORIG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred while trying to set up the data for CCS7 trunk initialization. All CCS7 ports will be left in the CCSINIT state until the periodic reset mechanism collects them. A longer than normal total reset interval will be experienced.

Data Structures:

RLPCI7GR. Key Fields: pci, cic_offset

Action:

RLPCI7GR relation was being read sequentially when the error occurred. The data shows the last successfully accessed tuple. If the keys are all zero then the failure occurred on the first tuple access.

Use RC/V procedures to correct the access to RLPCI7GR tuples. CCS7 trunks will initialize without intervention, however, at a much slower rate than normal.

Contact the office data administration (ODA) organization for assistance.

204. TMGSM_OPC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read RL GSM_OPC static relation.

Data Structures:

RL GSM_OPC.

Action:

No action.

205. TMHISDFIPM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to access or update the rIHISDFIPM dynamic tuple for this key.

206. TMHMACK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not acknowledge or process a TTY input message.

207. TMIALENDX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The TMdtphle() function encountered an invalid index into the automatic line evaluation (ALE) data table.

208. TMICMTC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid test code for an incoming maintenance test call was encountered.

209. TMICRFT_MSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The inter-SM (ISM)-SM system process received an invalid craft input message.

210. TMIDLETMR (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Retrieved a non-active timer. Timer should not be on free pool.

Probable Cause:

Timer had previously been retired or expired.

Action:

Contact Lucent PECC with associated data for support.

211. TMIDLSTAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid port status was found in the AM.

212. TMIFNADD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The TMfaradd() function found that TMfar.number had been corrupted.

213. TMIFNDEL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The TMfardel() function found that TMfar.number had been corrupted.

214. TMIFNURT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The TMuroute() function found that TMfar.number had been corrupted.

215. TMIHMERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message was received from the human machine interface (HM). The message could not be processed.

216. TMILSDPOL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failed attempt has been made by a common channel signaling (CCS) signal link management (SLM) function to read the static ILSD_POL relation. This is an office dependent data (ODD) discrepancy because the LS_GRP static relation has indicated that the particular CCS link set is to be policed by the incoming link set and destination point code (ILS/DPC) feature, however the corresponding tuple entry in the ILSD_POL relation does not exist.

Data Structures:

Data 1: The relation identifier.

Data 2: The policed link set number.

Action:

If the specified CCS link set is supposed to be policed, as indicated from the LS_GRP relation, the corresponding ILSD_POL tuple must be inserted. If the specified CCS link set is not to be policed, the LS_GRP relation must be updated to indicate this desired state.

217. TMIMTCKT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The data in the AM relation RLRT_TRKG and the SM relation RLIMTRKS does not match the circuit connections.

Data Structures:

RLRT_RTKG, RLIMTRKS.

The SM numbers, trunk group numbers, and trunk member numbers for the originating and terminating ends are dumped.

Action:

Use RC/V (or ODBE, if necessary) to verify and modify (as needed) the data in the RLRT_TRKG and RLIMTRKS relations. Use the group numbers as the tuple keys for RLRT_TRKG, and the group and member numbers as the tuple keys for RLIMTRKS. Determine whether the data matches the actual physical wiring.

218. TMIMT_KS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A missing tuple from the SM office dependent data (ODD) relation RLIMTRKS resulted in a database read failure.

Data Structures:

RLIMTRKS.

The SM numbers, trunk group numbers, and trunk member numbers for the originating and terminating ends are dumped.

Action:

Use RC/V (or ODBE, if necessary) to verify and modify (as needed) the data in the RLIMTRKS relation. Use the

group numbers and member numbers as the tuple keys.

219. TMIMTRKG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A missing tuple from the AM office dependent data (ODD) relation RLRT_TRKG resulted in a database read failure.

Data Structures:

RLRT_TRKG.

The SM numbers, trunk group numbers, and trunk member numbers for the originating and terminating ends are dumped.

Action:

Use RC/V (or ODBE, if necessary) to verify and modify (as needed) the data in the RLRT_TRKG relation. Use the group numbers as the tuple keys.

220. TMIMXJBS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The TMdtphmj() function found that the maxjobs local variable had been corrupted since the last process dispatch.

221. TMINCINTDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Inconsistent internal data was encountered. The inconsistent data will be dumped.

222. TMINCPTLH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RLHPTPN	Audit Mode: elev

Problem:

Corrupt linkages or inconsistent data was found between an rIR_SPTPN tuple and an rIR_LHPTPN tuple.

223. TMINCPTPN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RSPTPN	Audit Mode: elev

Problem:

An inconsistency was found within an rIR_SPTPN tuple.

224. TMINCPTTP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RTPSTAT	Audit Mode: elev

Problem:

An inconsistency was found between an rIR_SPTPN tuple and an rIR_TPSTAT tuple.

225. TMINCRECDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Incorrect record data was encountered. The incorrect records will be dumped.

226. TMINHCORC (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to update at least one RLAMPCI7GR that was found to be out of date with the corresponding SM PCI7GR tuple. However it appears that CORCs are inhibited so the update cannot take place.

Data Structures:

None.

Action:

Insure that CORCs are allowed within the next 24 hours. If CORCs are currently allowed, contact Lucent PECC for support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

227. TMINSPN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RSPTN	Audit Mode: elev

Problem:

The DBfintup() function did not successfully insert a tuple into the RLR_SPTN relation.

228. TMINSTPS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RTPSTAT	Audit Mode: elev

Problem:

The DBfintup() function did not successfully insert a tuple into the RLR_TPSTAT relation.

229. TMINV_APMTP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid application protocol data unit (APDU) message type was encountered.

230. TMINVCLLI (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid value for the common language location identifier (CLLI) was encountered in data found in the AM relation RLRACTGRPRK. While this problem does not impact call processing, it should be corrected for the proper operation of CCS XLATE functionality.

Data Structures:

The AM relation RLRACTGRPRK has two attributes that contain CLLI data. The 'ne_clli' attribute contains the CLLI character string identifying the location of the near-end of the trunk group. The 'fe_clli' attribute contains the CLLI character string identifying the location of the far-end of the trunk group.

Action:

Both CLLI values (near-end CLLI and far-end CLLI) for the trunk group should be examined for validity. Each CLLI should be an 11 character string. CLLI strings that are less than 11 characters do not conform to specifications for CLLI format found in document GR-317. The RC/V View 1.5 [PBX-DID LINE (LINE ASSIGNMENT)] should be used

to inspect (and update if necessary) CLLI values for the trunk group. Use of ODBE to inspect/update the RLRCTGRPRK tuple directly should only be used if unable to use the RC/V View to do so (the keys to the RLRCTGRPRK tuple with the apparently invalid CLLI data are given in the associated assert output).

231. TMINV_DATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was passed to the function.

Probable Cause:

Difficult to say, need to trace the sender, the caller or the one who generated the data.

Action:

The invalid data will be dumped. Trace the source of the data for resolution of the problem.

232. TMINVJOB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The integrated services port administration (ISPA) software received an invalid job request.

233. TMINVPH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid protocol handler (PH) was received as an input.

234. TMINVPRI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The integrated services port administration (ISPA) software received a job request with a job priority that was not valid for that job.

235. TMINVPROT (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid protocol was specified as part of the protocol error record (PER) input buffer.

236. TMINVPROT (5E11 to 5E13)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid protocol was specified as part of the protocol error record (PER) input buffer.

237. TMINVPSTAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid port status (pstatus) was encountered for this type of port (logical port type or service class).

238. TMINVREQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A function was given an invalid request.

Probable Cause:

There is an interface problem between two functions.

Action:

Save the assert data and contact a higher level of support. If the problem is reproducible, record how the assert can be reproduced.

239. TMINVSCOPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The integrated services port administration (ISPA) software received an invalid scope or an invalid combination of scopes for a given job.

240. TMINVXLDATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The Q.931 message translation to the external format could not be accomplished because invalid data was provided.

241. TMIPCI7LAB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid point code index value (field 'pci') was detected for the specified tuple of the RLPCI7_LAB relation.

Data Structures:

The data identified in the assert output consists of the following:

PCI - point code index (key to the RLPCI7_LAB relation found to be in error).

OPC - origination point code (attribute from RLPCI7_LAB, but partial key to the inverse relation RLLAB7_PCI).

DPC - destination point code (attribute from RLPCI7_LAB, but partial key to the inverse relation RLLAB7_PCI).

Action:

Check the validity of the data in the RLPCI7_LAB tuple identified in the assert output. Correct any invalid data found. Also check the inverse relation RLLAB7_PCI, which contains similar data to RLPCI7_LAB and may also contain invalid data.

242. TMISCLCNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The integrated services port administration (ISPA) system process audited and corrected the count of the number of ISPA terminal processes that are either loop around test jobs or camp-on jobs.

243. TMISDBHC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DBHEADC	Audit Mode: elev

Problem:

A linkage error was detected with a database (DB) head cell tuple.

244. TMIS_FAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was encountered when attempting to insert the in-service system list tuple into the dynamic relation RLPRTLST during an SM initialization. This indicates an error in the RLPRTLST entry in the access dictionary which is stored in this SM's office dependent data (ODD). As a result, the dynamic relation RLPORTLA was not initialized. This problem affects service because the RLPORTLA relation is needed for call processing.

Action:

Contact the office data administration (ODA) organization. They will examine the access dictionary entry for the RLPRTLST relation. The most likely cause of the problem is an incorrect value in the maximum tuple field (rel_tmax).

Other likely candidates for the error are the head page size field (rel_hsze), the data page size field (rel_dsze), tuples per page field (acc_tpag), and the number of data pages field (acc_npag). When the error is found, a new ODD correcting the access dictionary problem will be built and installed for this SM.

245. TMISINVPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid port was given as an input.

246. TMISM_GLOBAL (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The inter-SM (ISM)-SM system process global status variables were corrupted. This problem can be corrected by a single process purge.

247. TMISMHSMDLI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote switching module (RSM) received a message that a parent host switching module (HSM) dual link interface (DLI) made a transition from the ACT state to the OOS/UNAV state.

248. TMISMPATH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the SM office dependent data (ODD) relation RLISMPATH.

Data Structures:

RLISMPATH. Key field: logical port name.

Action:

Use RC/V (or ODBE, if necessary) to add or delete an RLISMPATH tuple with the specified logical port name.

249. TMISMRSRSM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert is fired under the following conditions:

1) The static relation RLISMRSRSM is missing from the asserting SM. This relation must be populated in the asserting SM.

2) The static relation RLISMRSRSM contained out-of-range SM numbers (as determined by the inter-SM nailup maintenance code).

Data Structures:

RLISMRSRSM. The RLISMRSRSM relation is keyed by host SM number and contains a list of child remote switching modules (RSMs) containing inter-SM nailups.

Action:

Use RC/V (or ODBE, if necessary) to add the missing tuple to the asserting SM or to check and correct the out-of-range SM numbers.

250. TMISMSEND (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from the OSSENDMSG() macro [inter-SM (ISM) nailup maintenance].

251. TMISPABUF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ISPABUF	Audit Mode: elev

Problem:

The integrated services port administration (ISPA) software detected a linkage error with an RLISPABUF tuple.

252. TMISPATPC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A problem occurred in the integrated service port administration (ISPA) processes. The two key ISPA control structures are dumped. The first dump is the ISPABUF structure which contains the control information for the entire ISPA job. The second dump is the TPCBUF structure which contains control information for a particular ISPA terminal process.

253. TMISSPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

The integrated services port administration (ISPA) system process detected a time out of an ISPA terminal process, and requested that the terminal process be purged.

254. TMIST_TRUNK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The inter-SM (ISM)-SM system process encountered a database (DB) primitive error while trying to access the RLPSTRUNKS relation.

255. TMITAC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return code was received when trying to add a condition to the port status for integrated services digital network (ISDN) trunks.

256. TMITDC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return code was received when trying to delete a condition from the port status for integrated services digital network (ISDN) trunks.

257. TMITIS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error in the packet services subsystem (PS) code indicates that an integrated services digital network (ISDN) trunk is in the information transfer state; this state is not valid.

258. TMIV_REFR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid inter-SM (ISM) refresh type was encountered by the TMismrefr() function.

259. TML3PRIMERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

A level 3 primitive failed during a digital subscriber line (DSL) initialization.

260. TMLAB7PRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A missing tuple from the office dependent data (ODD) relation RLLAB7PRT resulted in a database read failure. No CCS call processing or maintenance activity can occur for the port until the missing tuple is inserted.

Data Structures:

RLLAB7PRT. Key fields: cic (Circuit Identifier Code) opc (originating point code) dpc (destination point code).

Action:

There must be a corresponding RLLAB7PRT tuple for every RLPRT7LAB tuple. The keys for the RLPRT7LAB relation are cic, opc and dpc.

Contact the office data administration (ODA) organization.

261. TMLA_FULL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A relation full error was encountered when trying to insert a tuple in the SM dynamic relation RLPORTLA. This indicates that too little space was allocated for the RLPORTLA relation. The access dictionary in the office dependent data (ODD) defines how much space the relation is allocated. The first data dump contains the rIORTLA tuple that was being inserted when the assert fired. The second data dump contains the SM ODD rIFC_PORTTYP tuple that indicated that an rIORTLA tuple needed to be added for the port. The entire first two bytes of each dump contains the local port name. The entire fourth byte of the second dump contains the SM number.

Action:

Contact the office data administration (ODA) organization. They will examine the access dictionary entry for the RLPORTLA relation. The most likely cause of the problem is an incorrect value in the maximum tuple field (rel_tmax).

Other likely candidates for the error are the head page size field (rel_hsze), data page size field (rel_dsze), tuple per page field (acc_tpag), and the number of data pages field (acc_npag). When the error is found, a new ODD correcting the access dictionary problem will be built and installed for the SM.

262. TMLA_KEY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid key was encountered when trying to insert a tuple in the SM dynamic relation RLPORTLA. This most likely indicates an error in the RLPORTLA entry in the access dictionary which is maintained in the SM's office dependent data (ODD).

The first data dump contains the rIORTLA tuple that was being inserted when the assert fired. The second data dump contains the SM ODD rIFC_PORTTYP tuple that indicated that an rIORTLA tuple needed to be added for the port. The entire first two bytes of each dump contains the local port name. The entire fourth byte of the second dump contains the SM number.

Action:

Contact the office data administration (ODA) organization. They will examine the access dictionary entry for the RLPORTLA relation. The most likely cause of the problem is an incorrect value in the maximum tuple field (rel_tmax).

Other likely candidates for the error are the head page size field (rel_hsze), data page size field (rel_dsze), tuple per page field (acc_tpag), and the number of data pages field (acc_npag). When the error is found, a new ODD correcting the access dictionary problem will be built and installed for the SM.

263. TMLGRPMEM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Either failed to read or bad data found in static relation RLLGRPMEM.

Data Structures:

RLLGRPMEM.

Action:

No action.

264. TMLITDUR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic line insulation test's (ALIT) duration timer could not be set.

265. TMLITINIT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The line insulation test system process was unable to initialize the timer for the next audit session.

266. TMLITOVFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic line insulation test (ALIT) internal table, TMLit_tc[], encountered overflow; that is, more ALIT circuits were equipped in the office than there was room for in the ALIT table. The ALIT program can continue to function normally, testing lines with slightly less than the total number of equipped ALIT circuits in use simultaneously.

267. TMLKTSTTBL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failure to read, insert, or delete a tuple from RLlktsttbl[].

268. TMLLM_IDCU (5E11 to 5E12)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database (DB) primitive returned a failure code when attempting to access the RLLLM_IDCU relation.

269. TMLNKBPH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PHISTORY	Audit Mode: elev

Problem:

Failed to link an rPHISTORY tuple to a busy head cell; therefore, a port's status change was not complete.

270. TMLNKGRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Either an error occurred in a fast read of a tuple from relation RLLNKGRP or RLLNKGRP contains bad data.

271. TMLNKIPH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PHISTORY	Audit Mode: elev

Problem:

Failed to link an rIPHISTORY tuple to an idle head cell; therefore, a port's status change was not complete.

272. TMLNKP_LS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read RLLNKP_LS static relation.

Data Structures:

RLLNKP_LS.

Action:

No action.

273. TMLNKPOPH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

Failed to link an rIPORTLA tuple to an rIPHISTORY tuple. A port no longer has a record of any pending out-of-service status.

274. TMLNKPTLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

Failed to link a port to its system list. The port's linkage may now be broken.

275. TMLNKTMER (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: GPFTIMER	Audit Mode: elev

Problem:

Failed to link general purpose timer rGPFTIMER to its headcell.

Probable Cause:

Broken linkage at rOHTIMER headcell.

Action:

GPFTIMER audit will recover the timer to a valid list.

276. TMLNOFCPTUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The given port had a corresponding rLAPBSUB tuple, but did not have an rRFC_PORTTYP tuple. The port is probably an integrated services digital network (ISDN) port. Each port with an rLAPBSUB tuple [e.g., digital subscriber line (DSL) B-channels with packet switching and packet switched trunks] should have an rRFC_PORTTYP tuple.

Data Structures:

RLLAPBSUB. Key field: bport.

RLFC_PORTTYP. Key fields: member, module.

Action:

For the given port, use RC/V to verify the corresponding rLAPBSUB and rRFC_PORTTYP tuples and correct any inconsistencies. The RC/V views that display data for ports known to have tuples in the RLLAPBSUB relation are View 23.1 (ISDN INDIVIDUAL DSL - LCEN) and View 5.5 (TRUNK MEMBER).

277. TMLOAD_IST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The Tmload_ist() function found that no data was collected during data gathering by message delivery primitives.

278. TMLOOPDBERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LOOPDB	Audit Mode: elev

Problem:

Could not link an rLOOPDB tuple during initialization of an operator services position system (OSPS) position digital subscriber line (DSL).

279. TMLS_GRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read RLLS_GRP static relation.

Data Structures:

RLLS_GRP.

Action:

No action.

280. TMLS_LNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read RLLS_LNK static relation.

Data Structures:

RLLS_LNK.

Action:

No action.

281. TMMC7IFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unrecoverable failure was encountered while trying to initialize the dynamic data used to process CCS7 trunk maintenance actions. The dynamic relations which make up the CCS7 trunk maintenance data are RLPCILST7, RLCINDX7, RLENTY7, and RLTIMER7. The number of tuples required for the RLCINDX7 relation is indicated by the global parameter Glcindx7; the number of tuples required for the RLENTY7 relation is indicated by the global parameter Glentry7. The values of Glcindx7 and Glentry7 are identified in the assert output.

Data Structures:

The value of the global office parameters Glcindx7 and Glentry7 (which indicate the number of tuples of the RLCINDX7 and RLENTY7 relations to create, respectively) are included in the output printed by this craft assert.

Action:

The impact of this failure to the office depends in part on the location of the failure. When this failure occurs in a switching module (SM), it is possible that no CCS7 trunks can be used to complete calls until the cause of the failure is identified and corrected. Failures occurring in OKP will seriously degrade the CCS7 trunk maintenance functionality, but will not prevent trunks from being used to complete calls.

Follow these steps when an initialization failure occurs:

- 1) Identify the cause of the initialization failure and correct. Initialization failures may occur because of relation access problems, or because the number of tuples specified by the system resource engineering (SRE) sizing algorithms (fewer RLCINDX7 tuples than RLPCILST7 tuples will cause a failure, too many RLCINDX7 and/or RLENTY7 tuples may cause the available unprotected ODD capacity to be exhausted). Contact the office data administration (ODA) organization. If unable to identify the cause of the problem or the initialization failures continue to re-occur, report this problem to the product engineering control center (PECC) for analysis. Please include all data associated with this assert along with any data collected during the investigation of this problem when reporting this to PECC. In particular, output from all asserts that occurred at the same time in the same processor as the initialization failure would be most useful.
- 2) Once the initialization of the data completes successfully, it is recommended (to reduce possible further negative effects from this occurrence), that the steps which follow also be taken. (OKP NOTE: Since call attempts over the trunks will correct any inconsistencies over time, enabling the trunk status query feature for OKP failures would be beneficial, but is not considered essential.)
 - a) Verify that the CCS trunk status query feature is enabled. If it is inhibited, enable it for a period of time to allow any inter-switch CCS status inconsistencies to be resolved. If conditions exist that prevent enabling the feature, proceed on to step 2b below.
 - b) Without the trunk status query feature enabled, CCS7 state inconsistencies will correct over time as calls over the trunks are attempted. The exception is that some inconsistencies for one-way incoming CCS7 trunks will not correct, since no call attempts will be made to the trunks. To correct this problem, conditionally remove from service (using the RMV:TRK command) and then restore to service (using the RST:TRK command), all CCS7 one-way incoming trunks in the SM.

282. TMMC7TFULL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The dynamic data (the RLENTY7 relation) used to process CCS7 trunk maintenance actions has reached its capacity limits one or more times in the most recent interval checked. The number of times the limit was reached is identified, along with other data which is useful when analyzing the cause of the condition.

Data Structures:

All data displayed in the output (except for the limit reached count) was collected at the time the RLENTY7 tuple shortage was detected. If multiple shortages were detected, the worst case data is displayed. The following data is provided in the output of this assert:

- the number of times the limit was reached in the last interval.
- the value of the Glentry7 office parameter (which is the number of RLENTY7 tuples that exist under normal conditions).
- the threshold value of the number of idle-list RLENTY7 tuples that are maintained for internal use. A table full condition is when the idle list count drops below this value for a new request.
- the worst case value for the number of remaining idle RLENTY7 tuples. This value would be zero if all RLENTY7 tuples were in use. Since some RLENTY7 tuples are reserved for internal use, the number of remaining idle RLENTY7 tuples will indicate the fewest number of idle tuples that existed at a time that a CCS7 maintenance request was denied due to a shortage of idle RLENTY7 tuples.
- the value of the TMmc7pcnt global data, which indicates the number of RLENTY7 tuples linked to RLCINDX7 tuples. This is basically the number of RLENTY7 tuples in use (except for those in a transient state).
- the value of the TMmc7tcnt global data, which indicates the number of RLENTY7 tuples linked to a RLTIMER7 tuple and being timed to be sent/re-sent.
- the value of the TMmc7acnt global data, which indicates in an SM the number of RLENTY7 tuples awaiting processing after reception of an acknowledgment to a CCS7 RESET message. In the AM this count should always be zero.

Action:

CCS7 trunk circuit identification codes (CICs) should be engineered sequentially within an SM. When the engineering guidelines are not followed closely, it is possible that RLENTY7 tuples will be used inefficiently, which could result in the RLENTY7 capacity limit reached condition occurring. Verify that the engineering guidelines for CIC assignment have been followed. If not, it is recommended that the CIC assignment be re-engineered to follow the guidelines.

If the CICs are engineered properly and a capacity limit reached condition occurs infrequently, then further action is not necessary. The system was designed to work with such occasional shortages, and performance should not be seriously degraded by infrequent occurrences. The most demand for RLENTY7 tuples results from processor isolation and initialization events, which are very rare. Increasing the number of RLENTY7 tuples to never reach capacity limits for these times may not be the best use of the processor's available memory.

If the CICs are engineered properly and a capacity limit reached condition is still occurring regularly, it is suggested to increase the number of RLENTY7 tuples allocated. This should be done using RC/V to increase the Software Resource Engineering (SRE) incremental for ENTRY7 in the appropriate processor. Consider the fact that once increased, the memory allocated in this manner can not be easily reclaimed, so increase relation allocations gradually until the problem appears to be corrected. For this reason, increase the number of tuples only on those processors experiencing the shortage.

Continue to monitor for future occurrences of this condition. If proper engineering of CIC assignment and reasonable increases to the number RLENTY7 tuples does not prevent this condition from occurring, report this problem to the product engineering control center (PECC) for analysis. Please include all data associated with this assert along with any data collected during the investigation of this problem when reporting this to PECC.

283. TMMC7TZAP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The dynamic data associated with CCS7 maintenance message processing has been initialized in the specified processor. This may result in inconsistent CCS7 state information between this switch and any switch that terminates CCS7 trunks from this switch.

The dynamic relations initialized by this action are RLCINDX7, RLENTY7, RLPCILST7, and RLTIMER7.

The initialization may be due to excessive audit errors detected in the above relations or excessive purges of processes using the data. In addition, when using RC/V to insert the first CCS7 trunk into an SM the data will be initialized (to insert the data), as well as when the last CCS7 trunk in an SM is deleted (to remove the data).

Data Structures:

None.

Action:

If the specified processor was a switching module (SM), it is recommended (to reduce possible negative effects from this occurrence), that the following actions be taken:

1) Verify that the CCS trunk status query feature is enabled. If it is inhibited, enable it for a period of time to allow any inter-switch CCS status inconsistencies to be resolved. If conditions exist that prevent enabling the feature, proceed on to step 2 below.

2) Without the trunk status query feature enabled, CCS7 state inconsistencies will correct over time as calls over the trunks are attempted. The exception is that some inconsistencies for one-way incoming CCS7 trunks will not correct, since no call attempts will be made to the trunks. To correct this problem, conditionally remove from service (using the RMV:TRK command) and then restore to service (using the RST:TRK command), all CCS7 one-way incoming trunks in the SM.

If the specified processor was OKP, no additional recovery actions are needed, since call attempts over the trunks will correct all inconsistencies (enabling the trunk status query feature might be beneficial, but its use is not essential).

If the cause of the problem is not identifiable or the initializations continue to re-occur unexpectedly, report this problem to the product engineering control center (PECC) for analysis. Please include all data associated with this assert along with any data collected during the investigation of this problem when reporting this to PECC.

284. TMMCAHPTLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

An inconsistency has been found in the RLPORTLA fields: reset_inprog and list, and the MCAH data community population of a CCS7 trunk.

The CCS7 trunk was probably recently involved in sending reset to the far-end office.

Probable Cause:

Incorrect field setting due to unforeseen scenario.

Action:

Report occurrence to the product engineering control center (PECC) along with all possible supporting data.

285. TMMISPCI7LAB (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failed while attempting to read the RLPCI7_LAB relation.

Data Structures:

RLPCI7_LAB. Key Field: pci (point code index).

Action:

Contact Lucent PECC with associated data for support.

286. TMMODATT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office dependent data (ODD) inconsistency exists between the AM ODD relation RLMODATT and the AM ODD relation RLRC_EQLOC. An rIRC_EQLOC tuple for a metallic service unit (MSU) has a value for the sm attribute that cannot be matched in the RLMODATT relation.

Data Structures:

RLMODATT, RLRC_EQLOC.

The first field dumped is the sm value in question. The second field is the unit type (from DMunittype.h) of the unit being tested (e.g., SMLU, SMC1LU, or SMDCLU). The third field is the unit number, and the fourth field is the service group.

Action:

Determine where the inconsistency exists, then use RC/V (or ODBE, if necessary) to correct the problem. If the office has an SM of the number in the first field, insert an rIMODATT tuple for that SM.

If the office does not have an SM for the number in the first field, update the sm attribute in the rIRC_EQLOC tuple to a valid SM number for the office.

287. TM_MODATT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not access the RLMODATT relation using the database (DB) primitives.

288. TMMSGENAB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to enable message reception with a DMERT primitive call to MSGCNAB.

289. TMMSGLOSS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert occurs for export CCITT7 signaling links when a "deloaded" message (indicates that there is no traffic on the link and no messages are buffered for this link) was expected, but not received; as a result, signaling information may be lost due to the fact that the protocol handler associated with this link is being powered off. If this assert occurs often, it may be due to a software problem (either the message is not being sent within a specified time period or else spurious messages are being interjected). In this case, CCITT7 software developers should be notified.

290. TMNOAMPCI7GR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A missing tuple from the office dependent data (ODD) relation RLAMPCI7GR resulted in a database read failure.

Data Structures:

RLAMPCI7GR. Key Field: SM number

Key Field: CCS Trunk's PCI

Key Field: CCS Trunk's cic_offset

CCS Trunk's CIC.

Action:

Contact the office data administration (ODA) organization.

291. TMNO_BSERV (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A B-channel Q.931 SERVICE message was received on a National PRI which is not provisioned with B-channel availability signaling procedures feature (that is, not provisioned to accept B-channel SERVICE messages). A provisioning inconsistency exists between the 5ESS[®] PRI and the PRI at the far end equipment.

Data Structures:

RLPRISTAT: Key field: prigrp (PRI group number).

Action:

Determine if this National PRI should be provisioned for B-channel SERVICE messages. If so, use RC/V (or ODBE, if necessary) to correct the provisioning inconsistency. If not, modify the PRI provisioning at the far end equipment.

292. TMNOCCB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

Could not find a channel control block (CCB) owned by the current process after a port was activated.

293. TMNOCCODE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A missing tuple from the office dependent data (ODD) relation RLNOCCODE resulted in a database read failure.

Data Structures:

RLNOCCODE. Key field: nxx (office code).

Action:

Use RC/V View 8.2 (NOC CODES) to verify or modify the data in the RLNOCCODE relation.

294. TMNOCDBCOM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Attempted to access the RLCDBCOM relation with an invalid circuit name.

295. TMNOCKTDATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A missing tuple from the office dependent data (ODD) relation RLCKTDATA resulted in a database read failure.

Data Structures:

RLCKTDATA. Key field: name.

Action:

The RLCKTDATA relation is missing a tuple. There are corresponding tuples keyed by the same circuit name in relations RLISLULGC, RLISLU2LG, RLSMGTGDXC and other static relations. Also, the circuit name is populated in the ckname attribute in relation RLFC_PORTTYP. The relation name that is dumped is the relation whose data was used to retrieve the circuit name. Therefore, there is at least a database inconsistency between RLCKTDATA and this relation.

Use RC/V (or ODBE, if necessary) to fix the ODD inconsistencies.

296. TMNOCKTSOP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency exists in a tuple of the office dependent data (ODD) relation RLSPID. The ckt_lport attribute of the rISPID tuple is zero, but it should be non-zero.

Data Structures:

RLSPID.

The first field dumped is the digcnt key of the missing rISPID tuple, and the second field contains the USPID keys of the missing tuple. The USPID is stored and printed as right justified. If the USPID is less than 18 digits, then the most significant digits are padded with zeros.

Action:

Use RC/V (or ODBE, if necessary) to fix the ODD inconsistency. If ODBE is used to update the tuple, keep in mind that the USPID digits are stored right justified and if the USPID is less than 18 digits, the most significant digits are padded with zeros.

297. TMNODS1_PT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read rIDS1_PT tuple failed with a DBNO_MATCH error.

Data Structures:

RLDS1_PT. Key field: ds1name.

Action:

Insert an RLDS1_PT tuple with this ds1name key value.

298. TMNODSCNLUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple in the office dependent data (ODD) relation RLNAILUP is missing. This port was identified as a 5E-AMPS dedicated switch connection (DSC) which requires an rNAILUP tuple.

Data Structures:
RLNAILUP. Key field: port1.

Action:
Use RC/V (or ODBE, if necessary) to fix the ODD inconsistency.

299. TMNODSLEQUIP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Failed to find a tuple in the SM office dependent data (ODD) relation RLDSLEQUIP that matches the given D-channel port name.

Data Structures:
RLDSLEQUIP. Key field: dsl (port name).

The first field dumped is the given D-channel port. The second field is the SM number.

Action:
Use RC/V (or ODBE, if necessary) to verify and modify (as needed) the data in the RLDSLEQUIP relation.

300. TMNOEQUIPDSL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
A missing tuple in the SM office dependent data (ODD) relation RLEQUIPDSL resulted in a database read failure.

Data Structures:
RLEQUIPDSL. Key fields: dsl_group, member [protocol handler (PH) channel].

Action:
If this is a valid port, use RC/V (or ODBE, if necessary) to correct the inconsistency. The RLEQUIPDSL relation uses the same attributes as the RLDSLEQUIP relation. Therefore, the two relations must match on the key attributes (dsl_group and member) as well as the dsl (port name) attribute. Use RC/V View 23.40 (T1 PACKET SWITCHING CHANNEL ASSIGNMENT) to populate this tuple.

301. TMNOFC_LINE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
A tuple was missing from the office dependent data (ODD) relation RLFC_LINE.

Data Structures:
RLFC_LINE.

The first field dumped is the member key (port name) of the missing tuple, the second field is the module key (SM number), and the third field is the party key.

Action:
Use RC/V (or ODBE, if necessary) to correct the ODD inconsistency.

302. TMNOFC_PORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple was missing from the office dependent data (ODD) relation RLFC_PORTTYP.

Data Structures:

RLFC_PORTTYP.

The first field dumped is the member key (port name) of the missing tuple. The second field is the module key (SM number) of the missing tuple.

Action:

Use RC/V (or ODBE, if necessary) to fix the ODD inconsistency.

303. TMNOFC_TRUNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A missing tuple from the office dependent data (ODD) relation RLFC_TRUNK resulted in a database read failure.

Data Structures:

RLFC_TRUNK. Key fields: port.member (trunk port), port.module (SM number).

Action:

Contact the office data administration (ODA) organization.

304. TMNOGROUP_P (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A missing tuple in the office dependent data (ODD) relation RLGROUP_PORT resulted in a database read failure.

Data Structures:

RLGROUP_PORT. Key fields: portgrp.grpnum (trunk group number), portgrp.grptype (TM_TRK), member (trunk group member number).

Action:

The RLGROUP_PORT relation on a given SM is populated by examining the RLPORT_GROUP relation on the same SM. For each tuple found in the RLPORT_GROUP relation, a corresponding tuple should exist in the RLGROUP_PORT relation for that SM such that:

PORT_GROUP.portgrp.grpnum = GROUP_PORT.portgrp.grpnum.

PORT_GROUP.member = GROUP_PORT.member.

Use RC/V View 5.5 (TRUNK MEMBER) (or ODBE, if necessary) to insert an rlgROUP_PORT tuple.

305. TMNOHCELL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No head cell was found for the specified key.

306. TMNOHIST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

Failed to retrieve the rIPHISTORY tuple linked to an rIORTLA tuple. Either a port's status change could not complete, or the output message was incomplete.

307. TMNOISMPH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: DLTDATA	Audit Mode: elev

Problem:

An illegal value for an inter-SM nailup channel group was found in a TMdlt_data[] array element. The elevated audit scheduled should synchronize this dynamic data to static office dependent data (ODD).

If the assert appears repeatedly for the same port (the port or dlt appears as a parameter or local variable in the stack trace of the calling function), the recovery was not successful. The associated rIDSLEQUIP tuple may be missing or corrupted (use RC/V, or ODBE if necessary, to verify).

308. TMNOLOCEQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A missing tuple in the AM office dependent data (ODD) relation RLRC_LOCEQ resulted in a database read failure.

Data Structures:

RLRC_LOCEQ. Key fields: im (SM number), picb.

Action:

Use RC/V View 18.1 (SWITCHING MODULE) to verify or modify the data in the RLRC_LOCEQ relation.

309. TMNOLPT_PT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple was missing from the office dependent data (ODD) relation RLLPT_PT.

Data Structures:

RLLPT_PT.

The first field dumped is the lport key of the missing tuple. The second field is the numeric value of the lpt_type key of the missing tuple. (The enumeration string of the lpt_type key is in the global header db/DMlpt_type.h.).

Action:

Use RC/V (or ODBE, if necessary) to fix the ODD inconsistency.

310. TMNOL_SPID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple was missing from the office dependent data (ODD) relation RLLPT_SPID.

Data Structures:

RLLPT_SPID.

The first field dumped is the lport key of the missing tuple, and the second field is the numeric value of the lpt_type key. (The enumeration strings for the lpt_type key are in the global header db/DMlpt_type.h)

Action:

Use RC/V (or ODBE, if necessary) to correct the ODD inconsistency.

311. TMNOMDPATH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This indicates that RLFC_PORTTYP indicated that this port was a message delivery port, but there was no corresponding tuple in RLMDPATH.

312. TMNOMODATT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A missing tuple from the office dependent data (ODD) relation RLMODATT resulted in a database read failure.

Data Structures:

RLMODATT. Key field: module.

Action:

Use RC/V View 18.1 (SWITCHING MODULE) to verify or modify the data in the RLMODATT relation.

313. TMNOMSG (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A system process was restarted with the reason equal to OSMSG. When the OSWGETMSG() macro was executed to get the message, no message existed.

314. TMNOMTBS96 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A missing tuple from the SM office dependent data (ODD) relation RLMTBS96 resulted in a database read failure.

Data Structures:

RLMTBS96. Key fields: s96cktname circuit [remote terminal (RT) name], s96cktname module (SM number serving this RT).

Action:

Use RC/V View 18.10 (REMOTE TERMINAL ASSIGNMENT) to verify or modify the data in the RLMTBS96 relation.

315. TMNONREASON (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown or unexpected reason for starting a system or terminal process was detected by the process.

316. TMNOODPSOP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency exists in a tuple of the office dependent data (ODD) relation RLSPID. The odp_lport attribute of the rISPID tuple is zero, but it should be non-zero.

Data Structures:

RLSPID.

The first field dumped is the digcnt key of the missing rISPID tuple, and the second field contains the USPID keys of the missing tuple. The USPID is stored and printed as right justified. If the USPID is less than 18 digits, then the most significant digits are padded with zeros.

Action:

Use RC/V (or ODBE, if necessary) to fix the ODD inconsistency. If ODBE is used to update the tuple, keep in mind that the USPID digits are stored right justified and if the USPID is less than 18 digits, the most significant digits are padded with zeros.

317. TMNOPCI7GR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A missing tuple from the office dependent data (ODD) relation RLPCI7GR resulted in a database read failure.

Data Structures:

RLPCI7GR. Key Field: CCS Trunk's PCI

Key Field: CCS Trunk's cic_offset CCS Trunk's CIC.

Action:

Contact the office data administration (ODA) organization.

318. TMNOPICB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A missing tuple from the office dependent data (ODD) relation RLPICB resulted in a database read failure.

Data Structures:

RLPICB. Key field: picb.

Action:

Use RC/V (or ODBE, if necessary) to verify or modify the data in the RLPICB relation.

319. TMNOPORTLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

A valid rIORTLA tuple could not be accessed via the DAgetptla() primitive. The elevated audit requested should reconstruct the rIORTLA tuple from static data, and schedule the appropriate recovery.

Repeated asserts associated with the same port (the portname will usually be available in the assert stack trace, either as a parameter or local variable associated with the function calling the assert) indicate that recovery was not successful. It is possible that the corresponding rIFC_PORTTYP tuple is missing or corrupt. This static data relation should be interrogated with ODBE.

320. TMNOPPDSOP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency exists in a tuple of the office dependent data (ODD) relation RLSPID. The ppd_lport attribute of the rISPID tuple is zero, but it should be non-zero.

Data Structures:

RLSPID.

The first field dumped is the digcnt key of the missing rISPID tuple, and the second field contains the USPID keys of the missing tuple. The USPID is stored and printed as right justified. If the USPID is less than 18 digits, then the most significant digits are padded with zeros.

Action:

Use RC/V (or ODBE, if necessary) to fix the ODD inconsistency. If ODBE is used to update the tuple, keep in mind that the USPID digits are stored right justified and if the USPID is less than 18 digits, the most significant digits are padded with zeros.

321. TMNOPRT_GRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A missing tuple from the office dependent data (ODD) relation RLPORT_GROUP resulted in a database read failure.

Data Structures:

RLPORT_GROUP. Key fields: port.member, port.module, party.

Action:

The RLPORT_GROUP relation on a given SM is populated by examining the RLRT_DNTRAN relation on the same SM. Each tuple in the RLRT_DNTRAN relation in a SM with a terminating class of RTTC_PORTGRP or RTTC_INWATS should have a corresponding rPORT_GROUP tuple for that SM. Contact the office data administration (ODA) organization.

322. TMNOPSX25LN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple was missing from the office dependent data (ODD) relation RLPSX25LN.

Data Structures:

RLPSX25LN.

The first field dumped is the ph_number key of the missing tuple, the second field is the ph_cn key, and the third field is the party key.

Action:

Use RC/V (or ODBE, if necessary) to correct the ODD inconsistency.

323. TMNOPTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This indicates that an MGMDRTE message was received for a port which is considered invalid in RLFC_PORTTYP. This message should only be received for DLT or SDL ports. The database in both the originating and receiving SM should be checked for consistency if this error occurs.

324. TMNOQMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The inter-SM (ISM)-SM system process expected a message in the queue; however, it could not retrieve it.

325. TMNORC_EQLOC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A missing tuple from the office dependent data (ODD) relation RLRC_EQLOC resulted in a database read failure.

Data Structures:

RLRC_EQLOC. Key fields: im (SM number unittype, unit_no, service_group).

Action:

Use RC/V View 18.1 (SWITCHING MODULE) (or ODBE, if necessary) to verify or modify the data in the RLRC_EQLOC relation.

326. TMNORETRN (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

General non-returning assert.

327. TMNOROUT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A missing tuple from the SM office dependent data (ODD) relation RLRT_ROUTING resulted in a database read failure.

Data Structures:

RLRT_ROUTING. Key field: route_x (route index).

Action:

Use RC/V View 10.2 (ROUTE INDEX) to verify or modify the data in the RLRT_ROUTING relation.

328. TMNORT_TRKG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office dependent data (ODD) inconsistency exists between the AM ODD relations RLRT_TRKG and RLRT_ROUTING. An RLRT_ROUTING tuple has its grpnun attribute set to a value that cannot be matched in the RLRT_TRKG relation.

Data Structures:

RLRT_TRKG. Key field: grpnum (trunk group number).

Action:

Use RC/V View 5.1 (TRUNK GROUP) (or ODBE, if necessary) to verify or modify the data in the RLRT_TRKG relation. If this is a valid trunk, insert an rIRT_TRKG tuple.

329. TMNOSPID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple was missing from the office dependent data (ODD) relation RLSPID.

Data Structures:

RLSPID.

The first field dumped is the digcnt key of the missing rISPID tuple, and the second field contains the USPID keys of the missing tuple. The USPID is stored and printed as right justified. If the USPID is less than 18 digits, then the most significant digits are padded with zeros.

Action:

Use RC/V (or ODBE, if necessary) to fix the ODD inconsistency. If ODBE is used to update the tuple, keep in mind that the USPID digits are stored right justified and if the USPID is less than 18 digits, the most significant digits are padded with zeros.

330. TMNOTG2SM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to find an rITG2SM tuple in the AM office dependent data (ODD) that matches the given trunk group number.

Data Structures:

RLTG2SM. Key field: tgnum (trunk group number).

Action:

Use RC/V (or ODBE, if necessary) to verify and modify (as needed) the data in the RLTG2SM relation.

331. TMNOTIMR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic line insulation test's (ALIT) start or duration timer was not set.

332. TMNOTPHPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The database does not correctly define this port as an integrated services digital network (ISDN) port. ISDN ports terminate at a protocol handler (PH).

Data Structures:

RLDSLEQUIP. Key field: dsl.

RLFC_PORTTYP. Key fields: member, module.

Action:

Verify that the dserv [digital subscriber line (DSL) D-channel service] attribute in the RLDSLEQUIP relation and the lp_type (logical port type) attribute in the RLFC_PORTTYP relation define a valid ISDN port. If a valid ISDN port is not defined, use RC/V to correct the problem.

The RC/V views that display data for ISDN ports are View 23.1 (ISDN INDIVIDUAL DSL - LCEN), View 22.13 (INTER SM NAIL UP), and View 5.5 (TRUNK MEMBER).

333. TMNOTRAN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Global port has no group, member, or directory number/len translation.

334. TMNOTRKG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A trunk group had no rIRT_TRKG tuple.

335. TMNXTPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The integrated services port administrator (ISPA) found more ports than are valid for the SMPSCOPE value associated with this job.

336. TMODPLPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency exists in tuples of the office dependent data (ODD) relations RLSPID and RLLPT_SPID. The lport key of the rLPT_SPID tuple does not match the odp_lport attribute of the rLSPID tuple.

Data Structures:

RLSPID, RLLPT_SPID.

The first field dumped is the digcnt key of the missing rLSPID tuple, and the second field contains the USPIDs of the missing tuple. The USPIDs are stored and printed as right justified. If the USPIDs are less than 18 digits, then the most significant digits are padded with zeros.

The third field is the lport key of the rLPT_SPID tuple. The fourth field is the numeric value of the lpt_type key of the rLPT_SPID tuple. (The enumeration strings for the lpt_type key are in the global header db/DMlpt_type.h.)

Action:

Use RC/V (or ODBE, if necessary) to fix the ODD inconsistency. If ODBE is used to update the tuple, keep in mind that the USPIDs are stored right justified and if the USPIDs are less than 18 digits, the most significant digits are padded with zeros.

337. TMOEINFO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency exists between the AM office dependent data (ODD) relation RLRC_OEINFO and the SM ODD relation RLFC_PORTTYP. A line was found that had an rIRC_PORTTYP tuple, but did not have a corresponding rIRC_OEINFO tuple.

Data Structures:

RLRC_OEINFO, RLFC_PORTTYP.

The first field dumped is the port name of the line. The second field is the SM which contains the rIRC_PORTTYP tuple in question.

Action:

Determine if this line actually exists, then use RC/V (or ODBE, if necessary) to correct the inconsistency. If this is a valid line, insert an rIRC_OEINFO tuple for the line.

If this is not a valid line, determine if the hardware that the line terminates on [that is, the grids for lines on a line unit 1 (LU1) or LU2, etc.] is equipped. If the hardware is not equipped, delete the rIRC_PORTTYP tuple for the line.

If the hardware is equipped, change the servclass field in the rIRC_PORTTYP tuple to RC_PORTUNA for lines on an integrated services line unit (ISLU) or remote ISLU (RISLU), or RC_UNASSIGN for all other cases.

338. TMOFFPAR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failed attempt has been made by a common channel signaling (CCS) signal link management (SLM) function to read the static OFF_PAR relation. This is an office dependent data (ODD) inconsistency since there must always be a tuple with a key of 0 in this relation on a CCS global switching module (GSM).

Data Structures:

Data 1: The relation identifier.

Data 2: The GSM number.

Action:

If the SM number that the assert has occurred on is a CCS GSM for the office, then tuple 0 of the OFF_PAR relation should be inserted. If the assert has occurred on an SM that is not a CCS GSM for the office, the Glnat17sm, Glint17sm, or Glglobalsm global parameters could be corrupted on that SM. Otherwise an internal software problem may exist within CCS SLM functionality.

339. TMOHMERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to send a message to the craft via the HMprint() function failed.

340. TMOOSTMR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A timer for an out-of-service (OOS) list that is printed periodically cannot be set.

341. TMOPBADRET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected operational test request return was encountered.

342. TMOPDBPARM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office dependent data (ODD) inconsistency exists between the RLOPEXTDB relation and the RLOPDBPARM relation. For every database type found in the RLOPEXTDB relation, an rLOPDBPARM tuple must exist.

In this case, a database type was found in the RLOPEXTDB relation that was not found in the RLOPDBPARM relation. Either the db_type is incorrect in the RLOPEXTDB relation in the reported SM, or the rLOPDBPARM tuple is missing on the SM reported for that relation.

Data Structures:

RLOPEXTDB. Key fields: db_num (database number). ofc_num (operator service center number) serv_tm (serving team number).

RLOPDBPARM. Key field: db_type (database type).

Action:

The keys to the rLOPEXTDB tuple are printed in the message. Using these keys, access the rLOPEXTDB tuple to determine the database type. Use ODBE with processor option ALL to get the tuple from every SM. Do the same for the RLOPDBPARM relation, using the proper value for db_type for a key. Analyze this data along with any available office records to correct the discrepancy.

343. TMOPNTRN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A terminal maintenance (TM) function failed to open a database transaction on a relation.

344. TMOSARGUMENT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A process was created with an invalid entry function argument.

345. TMOSCREATE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to create a terminal process. The OSCREATE() macro returned an unexpected return value. The stimulus message will be dumped.

346. TMOSFAP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSfap() function call returned failure.

347. TMOSLTIME (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSGETLTIME() macro returned a time with out-of-range hours and minutes.

348. TMOSREASON (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown reason for creation was received from the operating system (OS).

349. TMOSRESTART (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSRESTART() macro failed.

350. TMOSTIMER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSTIMER() macro returned an error code.

351. TMOSTMR (5E12 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Operating system for distributed switching (OSDS) timedout GTMR cyclical timer

Probable Cause:

Incorrect timer handling

Action:

Contact Lucent PECC with associated data for support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

352. TMOUTCINDX7 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The dynamic data (the RLCINDX7 relation) used to process CCS7 trunk maintenance actions has reached its limit and exhausted all idle RLCINDX7 tuples one or more times in the most recent interval checked. The number of times the limit was reached is identified, along with other data which is useful when analyzing the cause of the condition.

Data Structures:

All data displayed in the output (except for the limit reached count) was collected at the time the RLCINDX7 tuple shortage was detected. If multiple shortages were detected, the data for the last occurrence is reported.

The following data is provided in the output of this assert:

- the number of times the limit was reached in the last interval.

- the value of the Glcindx7 office parameter, which is the number of RLCINDX7 tuples that exist under normal conditions.
- the value of the Glentry7 office parameter, which is the number of RLENTY7 tuples that exist under normal conditions and is related to the number of RLCINDX7 tuples which are needed.
- the value of the Glpci7lab office parameter, which is the number of RLCINDX7 tuples that are initially linked to RLPCILST7 tuples when the data structures are initialized. Additional RLCINDX7 tuples are linked to specific RLPCILST7 tuples as needed to handle the CCS7 maintenance activity for that RLPCILST7.
- the values of the TMmc7pcnt global value, which indicates how many RLENTY7 tuples are linked to all RLCINDX7 tuples.

Action:

CCS7 trunk circuit identification codes (CICs) should be engineered sequentially within an SM. When the engineering guidelines are not followed closely, it is possible that RLCINDX7 tuples will be used inefficiently, which could result in the RLCINDX7 capacity limit reached condition occurring. Verify that the engineering guidelines for CIC assignment have been followed. If not, it is recommended that the CIC assignment be re-engineered to follow the guidelines.

If the CICs are engineered properly and a capacity limit reached condition still occurs, it is suggested to increase the number of RLCINDX7 tuples allocated. This should be done using RC/V to increase the Software Resource Engineering (SRE) incremental for CINDX7 in the appropriate processor. Consider the fact that once increased, the memory allocated in this manner can not be easily reclaimed, so increase relation allocations gradually until the problem appears to be corrected. For this reason, increase the number of tuples only on those processors experiencing the shortage.

Continue to monitor for future occurrences of this condition, and if reasonable increases to the number RLCINDX7 tuples does not prevent this condition from occurring, report this problem to the Product Engineering Control Center (PECC) for analysis. Please include all data associated with this assert along with any data collected during the investigation of this problem when reporting this to PECC.

353. TMP7ERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCILST7	Audit Mode: elev

Problem:

Trouble has been detected with the data used to send common channel signaling system 7 (CCS7) blocking, unblocking and reset messages. Temporary inter-office trunk status conflicts are possible. These inconsistencies should self-correct over time as incoming and outgoing CCS7 calls occur on those trunks with inconsistent data. The CCS7 trunk status query feature can also be used to correct such inconsistencies, but it will run only if the status query feature is enabled.

Action:

The data problem detected was associated with the RLPCILST7 relation. This assert will schedule the AUPCILST7 audit to verify the data in the RLPCILST7 relation tuples and recover any bad data found. The RLPCILST7 relation is closely inter-related with three other dynamic relations (RLCINDX7, RLENTY7, and RLTIMER7). Problems detected by the AUPCILST7 audit may cause one or more of the audits for these related relations to run also.

If this assert continues to occur after the audit runs to completion, send the information from the assert output to the product engineering control center (PECC) for analysis. Up to three additional data blocks may also be included in the assert output to assist PECC in the isolation/resolution of the problem. Please include all data output as part of the assert when reporting the occurrence of this assert to PECC.

354. TMPCLL (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: GSDB	Audit Mode: null

Problem:

Peripheral control (PC) could not read a port's last look because of database errors in the RLFC_PORTTYP relation or the group summary data block.

355. TMPCLL (5E11 to 5E12)

Recovery Action: -rpi	SPP: n	Audit: GSDB	Audit Mode: elev

Problem:

Peripheral control (PC) could not read a port's last look because of database errors in the RLFC_PORTTYP relation or the group summary data block.

356. TMPC_MSUSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A missing tuple from the office dependent data (ODD) relation RLPC_MSUSG resulted in a database read failure.

Data Structures:

RLPC_MSUSG. Key field: msusg [master scanner unit (MSU) service group number].

Action:

Use RC/V View 19.7 (METALLIC SERVICE UNIT) (or ODBE, if necessary) to verify or modify the data in the RLPC_MSUSG relation.

357. TMPCTFERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The per-call test failure (PCTF) value passed to the Tmpctf() or Tmpctf1() functions was not a recognized value. The value is not defined in the domain (DMPCTF), or it was not added to the type check that is performed when a PCTF is reported.

358. TMPGGINFO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A missing tuple from the office dependent data (ODD) relation RLRT_TRKG resulted in a database read failure.

Data Structures:

RLRT_TRKG: Key Field: grpnum (group number).

Action:

There must be a corresponding RLRT_TRKG tuple for every RLPORT_GROUP tuple. The key for the RLRT_TRKG relation is grpnum. Contact the office data administration (ODA) organization to correct the problem.

359. TMPHIST_FULL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A relation full error was encountered when the dynamic relation RLPHISTORY was initialized during an SM initialization. This indicates an error in the RLPHISTORY entry in the access dictionary which is stored in this SM's office dependent data (ODD).

Action:

Contact the office data administration (ODA) organization. They will examine the access dictionary entry for the RLPHISTORY relation. The most likely cause of the problem is an incorrect value in the maximum tuple field (rel_tmax).

The data dump should be examined to verify that the rel_tmax value is the problem. The entire first two bytes of the dump contain the key being used to insert a tuple. Subtract 1 from this key value to determine the number of tuples that were successfully inserted. If this number is equal to rel_tmax, then rel_tmax was set too low and should be increased.

Otherwise, the error is in one of the other fields of the RLPHISTORY entry in the access dictionary; such as, the head page size (rel_hsze), data page size (rel_dsze), tuples per page (acc_tpag), or the number of data pages (acc_npag). When the error is found, a new ODD correcting the access dictionary problem will be built and installed for this SM.

360. TMPH_KEY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid key error was encountered when the dynamic relation RLPHISTORY was initialized during an SM initialization. This indicates an error in the RLPHISTORY entry in the access dictionary which is stored in this SM's office dependent data (ODD).

Action:

Contact the office data administration (ODA) organization. They will examine the access dictionary entry for the RLPHISTORY relation. The most likely cause of the problem is an incorrect value in the maximum tuple field (rel_tmax).

The data dump should be examined to verify that the rel_tmax value is the problem. The entire first two bytes of the dump contain the key that was used to insert a tuple. If this key is equal to or greater than the value of rel_tmax, then rel_tmax was set too low and should be increased.

Otherwise, the error is in one of the other fields of the RLPHISTORY entry in the access dictionary; such as, the head page size (rel_hsze), data page size (rel_dsze), tuples per page (acc_tpag), or the number of data pages (acc_npag). When the error is found, a new ODD correcting the access dictionary problem will be built and installed for this SM.

361. TMPHRTCONG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A read of the database relation RLPHRTCONG failed, this relation holds the congestion thresholds and the transmission rate of message signal units (MSUs) by a SDL. The relation is keyed by port name, ie for every active SDL in an office there must be an entry in this relation. If not then the CCITT7 link state control (LSC) power on message can not be sent, therefore an SDL cannot be active.

Data Structures:

rIPHRTCONG.

Action:

This assert will be generated when a read of RLPHRTCONG failed as no tuple could be found using the given key. It indicates that a CCITT7 signaling link may not have been correctly assigned, or the RLPHRTCONG relation may have become corrupted.

SOLUTION:

There are three methods by which this error can be fixed:

- (1) Using ODBE, insert a tuple in RLPHRTCONG, the key used should be the value of the dsl attribute of the rIDSLEQUIP tuple associated with the SDL for which the read of RLPHRTCONG failed. The key to the rIDSLEQUIP tuple is dsl, for PHs this takes values of 0xA2yyy. A2 is a fixed constant in hex, yyy is the PH port ID which is the st_dlt attribute of the RLLS_LNK relation. This relation is keyed by link set and member numbers of the CCITT7 link using that ST-PH.
- (2) Using RC/V access the signaling link and member view (in insert mode) assign a CCITT7 link to the ST-PH which does not have a tuple in RLPHRTCONG. The congestion thresholds and transmission rate are required, so RC/V will ensure that a tuple in RLPHRTCONG is inserted.
- (3) Initialize the SM database on which the SDL being put into service is located, from disk.

NOTE: Use method 1 when a CCITT7 signaling link have been correctly defined but RLPHRTCONG became corrupted. Method 2 should be used to set up a link to use an ST-PH. Re-initializing the SM database (method 3) should be a last resort.

362. TMPMDSLGRP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database (DB) primitive returned a failure code when attempting to access the RLPMDSLGRP relation.

363. TMPMFACGRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to access or update an rIPMFACGRP tuple for a digital signal level 1 (DS1) facility.

364. TMPMFACINT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The system could not initialize the performance measure for a given facility.

Data Structures:

RLCKTDATA.

The first field dumped is the name attribute from the rLCKTDATA tuple, this is the circuit name of the facility in question.

Action:

Determine the external facility name for the facility identified in the RLCKTDATA relation. Then run INIT:FAC or INIT:REG for the given facility, if it is supported.

365. TMPMTHRESH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database (DB) primitive returned a failure code when attempting to access the RLPMTHRESH relation.

366. TMPMTHUD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office dependent data (ODD) inconsistency exists from the RLPCKTGRP relation and/or RLPCKT relation to the RLPMTRESH relation. When pmgrp from RLPCKTGRP and/or RLPCKT was used as a key to the RLPMTRESH relation, no RLPMTRESH tuple was found.

Data Structures:

RLPCKTGRP, RLPCKT, RLPMTRESH.

The port name (in hex), performance monitoring (PM) group number (in decimal), and SM identifier (in decimal) are dumped.

Action:

If pmgrp is a valid PM group for the office, insert an RLPMTRESH tuple for the pmgrp. If pmgrp is not a valid PM group, then change references to this PM group in the RLPCKTGRP and/or RLPCKT relations to a valid PM group in the RLPMTRESH relation.

367. TMPMUNIT2RDT (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred during a database (DB) read of the RLUNIT2RDT relation.

Probable Cause:

A tuple is missing from the RLUNIT2RDT relation or the DB can not access the tuple.

Action:

Report occurrence along with all possible supporting data.

368. TMPMUXPMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A protocol monitoring process received an unexpected or invalid operating system for distributed switching (OSDS) message. The invalid message and the protocol monitoring job table will be dumped.

369. TMPOFC_PINC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

A data inconsistency was encountered between the RLPORTLA relation and the RLFC_PORTTYP relation.

370. TMPOPHINC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PHISTORY	Audit Mode: elev

Problem:

A data inconsistency was encountered between the RLPORTLA relation and the RLPHISTORY relation.

371. TMPORTBUSY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During a recent change transaction, a terminal maintenance trigger found a port busy. The transaction cannot be committed until the port is idle.

Action:

Wait until the port is idle, then re-execute the recent change transaction. Or, manually remove the port from service, then re-execute the recent change transaction.

372. TIMPORTCOND (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

TMrdptcond() failed to read the appropriate data from the TMportcond[] table. Problem may have been caused by passing TMrdptcond() an improper port status list.

373. TIMPORTIS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The recent change transaction was blocked because the port was in service.

Action:

Manually remove the port from service; e.g., via the rmv:line or rmv:trk master control center (MCC) commands.

374. TIMPORTLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

Failed to link a port to a system list.

375. TIMPORTLA_DATA (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

Inconsistent data was found associated with a PORTLA tuple.

Probable Cause:

The data was initialized incorrectly by the application or was corrupted.

Action:

Look at the data dumped by the assert and the audit in the receive-only printer (ROP) output to determine the cause of this error.

376. TMPOSDBERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: POSDB	Audit Mode: elev

Problem:

Could not link a position data block (POSDB) during initialization of an operator services position system (OSPS) position digital subscriber line (DSL).

377. TMPOSNUM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A function parameter range check on a test position number failed.

378. TMPOSSDERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The static data for an operator services position system (OSPS) position was inconsistent. There must be an rLPRT_POS tuple for each OSPS position, the key is the local port number. Also, there must be an rIPOS_LPRT tuple for each position, the key to this relation is the position number. The position number and the local port number must be consistent between the two relations.

Data Structures:

RLLPRT_POS, RLPOS_LPRT.

Action:

Use RC/V (or ODBE, if necessary) to add or correct the rLPRT_POS or rIPOS_LPRT tuples.

379. TMPOSTPERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The static data in the database for an operator services position system (OSPS) position was found to be inconsistent. There must be an rLPRT_POS tuple for each OSPS position, the key is the local port number (lport). Also, there must be an rIPOS_LPRT tuple for each position, the key to this relation is the position number (posnum).

Data Structures:

RLLPRT_POS. Key field: lport.

RLPOS_LPRT. Key field: posnum.

Action:

The RLLPRT_POS relation is used for local port to position mapping. The RLPOS_LPRT relation is used for position number to local port mapping. The position number and the local port number must be the same in the corresponding tuples. Also, the value for the position type (pos_typ) attribute in the rLPRT_POS and rIPOS_LPRT tuples must be the same for an OSPS position. If the position is for a directory assistance operator at a basic service terminal (BST), the value of the position type must be OA_BST in both tuples. If the position is for a toll and assistance operator at a video display terminal (VDT), the value of the position type must be OA_VDT in both tuples.

Use RC/V View 21.32 (OSPS POSITION TO PORT MAPPING) to verify, insert, or correct the rLPRT_POS and/or rIPOS_LPRT tuples.

380. TMPPDLPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency exists in tuples of the office dependent data (ODD) relations RLSPID and RLLPT_SPID. The lport key of the rLPRT_SPID tuple does not match the ppdlport attribute of the rSPID tuple.

Data Structures:

RLSPID, RLLPT_SPID.

The first field dumped is the digcnt key of the missing rISPID tuple, and the second field contains the USPID keys of the missing tuple. The USPID is stored and printed as right justified. If the USPID is less than 18 digits, then the most significant digits are padded with zeros.

The third field is the lport key of the rILPT_SPID tuple. The fourth field is the numeric value of the lpt_type key of the rILPT_SPID tuple. (The enumeration strings for the lpt_type key are in the global header db/DMLpt_type.h.)

Action:

Use RC/V (or ODBE, if necessary) to correct the ODD inconsistency. If ODBE is used to update the tuple, keep in mind that the USPID digits are stored right justified and if the USPID is less than 18 digits, the most significant digits are padded with zeros.

381. TMPRIDST_ERR (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: SM	Audit Mode: elev

Problem:

Unable to retrieve a PRIDSTAT dynamic data tuple.

Probable Cause:

The PRIDSTAT tuple is missing or data is corrupted.

Action:

The PRI_SM audit will be scheduled to insert the PRIDSTAT tuple if it should exist or fix the corrupted data.

382. TMPRI_FACS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read an rLPRIFACS tuple failed.

Data Structures:

RLPRIFACS.

The first field dumped is the primary rate interface (PRI) group number (prigrp) of the missing tuple, the second field is the interface ID (interf_id).

Action:

Use RC/V (or ODBE, if necessary) to correct the ODD inconsistency.

383. TMPRI_GRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple is missing from the office dependent data (ODD) relation RLPRIGRP.

Data Structures:

RLPRIGRP.

The prigrp field is the member key of the missing tuple.

Action:

Use RC/V (or ODBE, if necessary) to correct the ODD inconsistency.

384. TMPRIINVD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

An invalid D-channel port status was found on a primary rate interface (PRI), or an invalid combination of D-channel port statuses was found on a PRI with D-channel backup.

Probable Cause:

A process may have been purged such that the D-channel or D-channels were left in an invalid state.

Action:

Look at the data in the relations dumped in the audit associated with the PRI implicated by this assert, and the ROP output prior to the assert to determine the scenario that could have been associated with this error.

385. TMPRISTAT_DATA (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: PRISTAT	Audit Mode: elev

Problem:

Inconsistent data was found associated with a PRISTAT tuple.

Probable Cause:

The data was initialized incorrectly by the application or was corrupted.

Action:

Look at the data dumped by the assert and the audit in the receive-only printer (ROP) output to determine the cause of this error.

386. TMPRIST_ERR (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: PRIGRP	Audit Mode: elev

Problem:

Unable to retrieve a PRISTAT dynamic data tuple.

Probable Cause:

The PRISTAT tuple is missing or data is corrupted.

Action:

The PRIGRP audit will be scheduled to insert the PRISTAT tuple if it should exist.

387. TMPRISTINV (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: DPB	Audit Mode: elev

Problem:

An error was found when retrieving the PRISTAT tuple using data from the DPB tuple.

Probable Cause:

The data in the DPB tuple was not initialized correctly or was corrupted.

Action:

An audit of the DPB dynamic relation will be scheduled to check for corrupted data.

388. TMPRISTINV (5E11 only)

Recovery Action: rpi	SPP: n	Audit: PRIGRP	Audit Mode: elev

Problem:

An error was found in the dynamic data relation RLPRISTAT.

Probable Cause:

The RLPRISTAT relation was not up to date.

Action:

An audit of the RLPRIGRP relation will be scheduled to populate the dynamic data.

389. TMPROVERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was reported during TR303 remote terminal (RT) provisioning which may indicate a software fault.

390. TMPROVUERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected error was returned during an attempt to provision a TR303 remote terminal (RT).

391. TMPRT6LAB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A missing tuple from the office dependent data (ODD) relation RLPRT6LAB resulted in a database read failure.

A common channel signaling (CCS) trunk has the in_sigtyp and/or out_sigtyp attribute of its rIFC_TRUNK tuple set to DBCCIS6, but there is no corresponding rLPRT6LAB tuple. No CCS call processing or maintenance activity can occur until the missing tuple is inserted.

Data Structures:

RLPRT6LAB. Key fields: gport.member (port name), gport.module (SM number).

Action:

Tuples in the RLPRT6LAB relation may not be updated by RC/V since that would violate rules associated with external labels for all tuples in a trunk block. Contact the office data administration (ODA) organization.

392. TMPRT7LAB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A missing tuple from the office dependent data (ODD) relation RLPRT7LAB resulted in a database read failure.

A common channel signaling (CCS) trunk has the in_sigtyp and/or out_sigtyp attribute of its rIFC_TRUNK tuple set to DBISUP7, but there is no corresponding rLPRT7LAB tuple. No CCS call processing or maintenance activity can occur until the missing tuple is inserted.

Data Structures:

RLPRT7LAB. Key fields: gport.member (port member), gport.module (SM number).

Action:

There must be a corresponding rLPRT7LAB tuple for every rLAB7PRT tuple. The keys for the RLLAB7PRT relation are gport.member and gport.module. Use RC/V (or ODBE, if necessary) to modify data in the RLPRT7LAB relation (as needed).

393. TMPRTCLS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read an rLPRTCLS tuple failed.

Data Structures:

RLPORTCLSS. Key field: portcode (code representing a block of ports).

Action:

Insert the rLPRTCLS tuple for this portcode.

394. TMPRT_FULL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A relation full error was encountered when the dynamic relation RLPRTLST was initialized during an SM initialization. This indicates an error in the RLPRTLST entry in the access dictionary which is stored in this SM's office dependent data (ODD).

Action:

Contact the office data administration (ODA) organization. They will examine the access dictionary entry for the RLPRTLST relation. The most likely cause of the problem is an incorrect value in the maximum tuple field (rel_tmax).

The data dump should be examined to verify that the rel_tmax value is the problem. The entire first two bytes of the dump contain the key used to insert an rLPRTLST tuple. Add 1 to this key value to determine the number of tuples that were successfully inserted before the error occurred. If this number is equal to rel_tmax, then rel_tmax was set too low and should be increased.

Otherwise, the error is in one of the other fields of the RLPRTLST entry in the access dictionary; such as, the head page size (rel_hsze), data page size (rel_dsze), tuples per page (acc_tpag), or number of data pages (acc_npag). When the error is found, a new ODD correcting the access dictionary problem will be built and installed for this SM.

395. TMPRT_PCIFAIL (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failed while attempting to read the RLPRT_PCI relation.

Data Structures:

RLPRT_PCI. Key Field: SM number. Key Field: CCS trunk's port number.

Action:

Contact Lucent PECC with associated data for support.

396. TMPRT_PCIFAIL (5E12 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failed while attempting to read the RLPRT_PCI relation.

Data Structures:

RLPRT_PCI. Key Field: SM number. Key Field: CCS trunk's port number, CCS trunk's point code index (pci), CCS trunk's CIC, CCS trunk's protocol.

Action:

Contact the office data administration (ODA) organization.

397. TMPSATIMER (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not set a port status administrator (PSA) timer.

398. TMPSBADRET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return was received from the port status administrator (PSA) during a status change.

399. TMPSTRK_L2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to access an rLPSTRK_L2 tuple via the DBfrdtup() function.

Data Structures:

RLPSTRK_L2.

Action:

The rLPSTRK_L2 tuple is missing, it is needed for X.25 access on T1 facility (XAT) ports. Use RC/V (or ODBE, if necessary) to insert the tuple.

400. TMPSTRUNKS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A missing tuple from the SM office dependent data (ODD) relation RLPSTRUNKS resulted in a database read failure.

Data Structures:

RLPSTRUNKS. Key field: tg (packet switching trunk group number).

Action:

Use RC/V View 5.1 (TRUNK GROUP ASSIGNMENT) to add an rLPSTRUNKS tuple with the specified packet switching trunk group number.

401. TMPTRDBERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PTRDB	Audit Mode: elev

Problem:

Could not link an rIPTRDB tuple during initialization of an operator services position system (OSPS) video display terminal (VDT) digital subscriber line (DSL).

402. TMPTRMTPER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A request to initialize an operator services position system (OSPS) digital subscriber line (DSL) was issued from a position terminal. The request failed. This failure indicates a firmware failure with the position terminal.

Action:

Check the receive only printer (ROP) output for the port number associated with the position terminal which has the firmware failure. The position terminal needs to be replaced with an equivalent position terminal, or the firmware needs to be changed with an equivalent firmware before initialization of the OSPS DSL will be completed.

403. TMPVMAPINIT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

TR303 remote terminal (RT) provisioning software encountered a problem while attempting to initialize process data during a system initialization. Since purging a process at this time would cause escalation of the initialization, it is recommended that the PVSP system process be purged once the system has stabilized. This will result in another attempt to initialize the data.

404. TMQRYDBERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: QRYDB	Audit Mode: elev

Problem:

Could not link an rIQRYDB tuple during initialization of an operator services position system (OSPS) video display terminal (VDT) digital subscriber line (DSL).

405. TMQUEFULL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Queue is full. The system is experiencing too many carrier group alarms.

Data Structures:

None.

Action:

Clear the carrier group alarms.

406. TMRC_TKTXCFAIL (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failed while attempting to read the RLRC_TKTXC relation.

Data Structures:

RLRC_TKTXC. Key Field: trunk transmission class.

Action:

Contact Lucent PECC with associated data for support.

407. TMRC_TKTXCFAIL (5E12 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failed while attempting to read the RLRC_TKTXC relation.

Data Structures:

RLRC_TKTXC. Key Field: trunk transmission class, far end type, near end transmission level point, trunk type, far end toll class, trunk class count.

Action:

Contact the office data administration (ODA) organization.

408. TMRC_TRKFAIL (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failed while attempting to read the RLRC_TRK relation.

Data Structures:

RLRC_TRK. Key Field: logical port group number. Key Field: member number.

Action:

Contact Lucent PECC with associated data for support.

409. TMRC_TRKFAIL (5E12 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failed while attempting to read the RLRC_TRK relation.

Data Structures:

RLRC_TRK. Key Field: logical port group number. Key Field: member number, common language circuit identifier (CLCI), trunk transmission class.

Action:

Contact the office data administration (ODA) organization.

410. TMRDLI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The inter-SM (ISM)-SM system process could not read the RDLI entry in Data Delivery.

411. TMRDT2UNIT (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred during a database (DB) read of the RLRDT2UNIT relation.

Probable Cause:

A tuple is missing from the RLRDT2UNIT relation or the DB can not access the tuple.

Action:

Report occurrence along with all possible supporting data.

412. TMRDTARD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred while reading, updating, deleting, or inserting an rLRDTA_DATA tuple.

Data Structures:

RLRDTA_DATA. Key fields: gport.member (port member), gport.module (SM number).

Action:

A discrepancy exists between the RLRDTA_DATA relation and the TMRdta_ports[] .bss dynamic memory. Audits will fix the discrepancy.

413. TMREAD_MM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DDread() primitive failed to read the SM minmode status.

414. TMRECVW (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to receive a message using a DMERT primitive call to RECVW.

415. TMRETRN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

General returning assert.

416. TMRISDERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The static data for a remote alarm section (RAS) equipped digital subscriber line (DSL) was found to be inconsistent when attempting to restore the DSL into service by any type of restoration request.

Data Structures:

RLRISITE. Key field: risiteid (RISLU site number).

The RLRISITE relation contains configuration information about each remote integrated service line unit (RISLU) site. The value for this RAS equipped DSL is dumped (in hex). This value was obtained from the xnamid attribute in the rIDLDSL tuple for the port being configured. The ras_eqp attribute indicates whether the RISLU is equipped with

a RAS. This assert is called from the code that configures the RAS; therefore, this field should be set to DBYES.

Action:

For each RAS equipped DSL, there must be an rIRISITE tuple for its corresponding RISLU site number, and the ras_eqp attribute must be DBYES.

Determine the RISLU site number by looking at the xnamid attribute in the rIDLDSL tuple for this port. Use RC/V View 22.11 (RISLU SITE ALARMS) to examine and update the tuple for this RAS equipped DSL.

417. TMRLFACPM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred in the access or update of an rIFACPM dynamic tuple.

418. TMRMDSLFL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return code was received from the RTrmdsl() function. A digital subscriber line (DSL) could not be removed from service.

419. TMRMSDBINIT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to zap or initialize the remote measurement system - digital 3 (RMS-D3) database relations. The relations are zapped and initialized by the functions TMrmszap() and TMrdbinit(), respectively. As a result of this failure, no RMS-D3 data can be populated or used by the RMS-D3 or the 5ESS® switch.

420. TMRPCU2NDN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A read of an rLRPCU2NDN tuple failed with a DBNO_MATCH error.

Data Structures:

RLRPCU2NDN. Key fields rpcu_id & rpcu_idx.

Action:

Insert an rLRPCU2NDN tuple for this rpcu_id.

421. TMRT2DS1 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to access or update an rIRT2DS1 tuple for determining which DS1s terminate on a remote terminal.

422. TMRTA5FAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to send the RTA5 command to the remote measurement system - digital 3 (RMS-D3) requesting a test access trunk (TAT) assignment update to maintain consistent data.

423. TMRTAFail (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The routing and terminal allocation (RTA) function RTsetpriority() returned a failure.

424. TMRTE_FAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RTroute() function returned failure to the automatic line insulation test (ALIT) calling function. One of the following occurred:

- all ALIT ports were busy in the SM routed to
- the desired terminal process was unable to be created in the module
- routing and terminal allocation (RTA) could not forward the MGMTTERM message to that process
- RTA found a problem with the MGMTM_REQ message

The exact failure return is in the third parameter of the first user stack frame dumped to the receive only printer (ROP) printout. This parameter will contain a value of type hdr/db/DMtreat.h. RTA may also output a defensive check failure (DCF) to the ROP.

425. TMRTLAPD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database primitive returned a failure code when attempting to access the relation RLRT_LAPD, during IDCU TR303 Remote Terminal Provisioning.

426. TMRT_MISC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read an rIRT_MISC tuple failed with a DBNO_MATCH error.

Data Structures:

RLRT_MISC. Key field: rname.

Action:

Insert an rIRT_MISC tuple for this rname key value.

427. TMRTSMBLK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The inter-SM (ISM)-SM system process was unable to read the DDRTSMBLK entry in data delivery.

428. TMS96ABSIG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read an rls96ABSIG tuple failed with a DBNO_MATCH error.

Data Structures:

RLS96ABSIG. Key field: chanutype.

Action:

Insert an rls96ABSIG tuple for this chanutype key value.

429. TMS96DDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The static relation RLS96DIODE was not populated correctly. The DBfrdtup() function returned a DBNOMATCH. Recent change (RC) should correct this relation.

430. TMS96DIODE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An internal database error occurred while executing the DBfrdtup() function on the RLS96DIODE relation for a SLC[®]-96 metallic connection.

431. TMS96EQUIP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A read of the SM relation RLS96EQUIP failed.

432. TMS96SMTB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfrdtup() function failed on the RLS96SMTB relation while executing the Tms96ch() function. For all returns except SUCCESS and DBNO_MATCH.

433. TMSDLCOTYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid signaling data link connection order message type specified in message or parameter.

434. TMSDLI (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The inter-SM (ISM)-SM system process was unable to read the DDSDLI entry in data delivery.

435. TMSDLLPTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A invalid port type was found in RLFC_PORTTYP for a signaling data link (SDL) or the port was incorrectly inserted in RLLGRPMEM.

436. TMSEGMENT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Large Q.931 message requires too many segments to send.

Data Structures:

The ROP output will show the port, party, tei, and cr.

Action:

Contact service personnel.

437. TSENDMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A terminal or system process was unable to communicate via the OSSENDMSG() macro to the supervising process for reasons other than resource failures.

438. TSENDPW (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to send a message using a DMERT primitive call to SENDPW.

439. TMSKCN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not read or update the stuck coin list relation RLSKCNLIST.

440. TMSL2TEC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SLIM2 test equipment process has returned an unexpected error message back to the SLIM2 routine mode terminal process.

Probable Cause:

SLIM board been removed from service or encountering hardware problems.

Action:

Check the status of the SLIM2 board that was used by the SLIM routine mode test session.

441. TMSMDCHN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple of the office dependent data (ODD) relation RLSM_DCHN is missing.

Data Structures:

RLSM_DCHN. Key fields: sm, dchn_idx.

Action:

Use RC/V (or ODBE, if necessary) to correct the ODD inconsistency.

442. TMSMEST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed in an attempt to access an rISMEST tuple.

443. TMSMIDLSTAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid port status was found in the SM.

444. TMSMIMSEND (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSENDMSG() macro returned a failure value for a message to a switch maintenance for the SM (SMIM) terminal process from the TMoalmrcvy() function.

445. TMSTADDFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The return code from a call to the TMckacit() function indicated a failure to add a state to the port. The state may have been invalid.

446. TMSTATUS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

A port's out-of-service status could not be removed by MSPS, misplaced start pulse [machine detected interoffice irregularities (MDII)].

447. TMT7ERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TIMER7	Audit Mode: elev

Problem:

Trouble has been detected with the data used to send common channel signaling system 7 (CCS7) blocking,

unblocking and reset messages. Temporary inter-office trunk status conflicts are possible. These inconsistencies should self-correct over time as incoming and outgoing CCS7 calls occur on those trunks with inconsistent data. The CCS7 trunk status query feature can also be used to correct such inconsistencies, but it will run only if the status query feature is enabled.

Action:

The data problem detected was associated with the RLTIMER7 relation. This assert will schedule the AUTIMER7 audit to verify the data in the RLTIMER7 relation tuples and recover any bad data found. The RLTIMER7 relation is closely inter-related with three other dynamic relations (RLPCILST7, RLCINDX7, and RLENTY7). Problems detected by the AUTIMER7 audit may cause one or more of the audits for these related relations to run also.

If this assert continues to occur after the audit runs to completion, send the information from the assert output to the product engineering control center (PECC) for analysis. Up to three additional data blocks may also be included in the assert output to assist PECC in the isolation/resolution of the problem. Please include all data output as part of the assert when reporting the occurrence of this assert to PECC.

448. TMTAPOSDBERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TAPOSDB	Audit Mode: elev

Problem:

Could not link an rITAPOSDB tuple during initialization of an operator services position system (OSPS) video display terminal (VDT) digital subscriber line (DSL).

449. TMTEDBLNK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TEDB	Audit Mode: elev

Problem:

A terminal maintenance (TM) trigger detected a terminal equipment data block (TEDB) linkage error.

450. TMTEILA_DATA (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: TEILA	Audit Mode: elev

Problem:

Inconsistent data was found associated with a TEILA tuple.

Probable Cause:

The data was initialized incorrectly by the application or was corrupted.

Action:

Look at the data dumped by the assert and the audit in the receive-only printer (ROP) output to determine the cause of this error.

451. TMTERAFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During a database (DB) access, an attempt to clear the trunk error analysis relation failed.

452. TMTERAUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred while trying to update a known tuple for a trunk error analysis relation. A system error may have occurred.

453. TMTFBADREASON (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred during an RC/V (or ODBE) change that touched the given static relation tuple. The associated trigger function was entered with an invalid reason argument. There may be an error in the REL_DICT section of the relation definition.

454. TMTGRPRK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office dependent data (ODD) inconsistency exists between the AM ODD relations RLRCTGRPRK and RLPORT_GROUP. No corresponding rLRCTGRPRK tuple could be found for the given portgrp attribute in the rLPORT_GROUP tuple.

Data Structures:

RLRCTGRPRK. Key fields: portgrp.grpnum (trunk group number), portgrp.grptype (TM_TRK).

Action:

Use RC/V View 5.1 (TRUNK GROUP ASSIGNMENT) (or ODBE, if necessary) to correct the ODD inconsistency.

455. TMTLWSUJOB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown job type was in the trunk and line workstation (TLWS) active task buffer.

456. TMTMS_INTER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The inter-SM port (ISMPT) time multiplexed switch link (TMSLNK) interconnectivity probe was received illegally by a master port.

457. TMTPCBUF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TPCBUF	Audit Mode: elev

Problem:

The integrated services port administration (ISPA) software detected a linkage error with an rITPCBUF tuple.

458. TMTRANBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A function was entered that required a transaction ID, however no transaction ID was provided.

Action:

Contact the product engineering control center (PECC) for support.

459. TMTRK_ERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was encountered when attempting to read the office dependent data (ODD) relation RLFC_TRUNK. There may be a problem in the ODD's access dictionary entry for the RLFC_TRUNK relation.

Data Structures:

RLFC_TRUNK. Key fields: port.member (trunk port), port.module (SM number). The data dump contains the two keys that were used to read the relation.

Action:

Contact the office data administration (ODA) organization. They will examine the access dictionary entry for the RLFC_TRUNK relation. The problem may be caused by an incorrect value in the maximum tuple field (rel_tmax), head page size field (rel_hsze), data page size field (rel_dsze), tuple per page field (acc_tpag), or the number of data pages field (acc_npag). When the error is found, a new ODD correcting the access dictionary problem will be built and installed for the SM.

460. TMTTATFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The stub for the TTAT process was called.

461. TMTTSTDATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred while attempting to get data for a trunk test. The RLTM_ATTT relation could not be read, or invalid data was retrieved from the relation.

462. TMTTSTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid test type was requested for a tuple test.

463. TMULNKBPH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PHISTORY	Audit Mode: elev

Problem:

Failed to unlink an rPHISTORY tuple from a busy head cell; therefore, a port's status change was not complete.

464. TMULNKIPH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PHISTORY	Audit Mode: elev

Problem:

Failed to unlink an rPHISTORY tuple from an idle head cell; therefore, a port's status change was not complete.

465. TMULNKPOPH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

Failed to unlink an rIPORTLA tuple and an rIPHISTORY tuple. A port now has an out-of-date status.

466. TMULNKPTLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

Failed to unlink a port from its system list. There may be a discrepancy between the RLPORTLA relation and the RLPRTLST relation.

467. TMULNKTMR (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: GPFTIMER	Audit Mode: elev

Problem:

Failed to unlink an rIGPFTIMER tuple associated with gp timer.

Probable Cause:

Broken linkage between rIGPFTIMER and headcell rIOHTIMER.

Action:

GPFTIMER audit will recover the timer to a valid list.

468. TMUMSGNOR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received.

469. TMUNERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was encountered. The process cannot continue.

470. TMUNEXEVT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received an unexpected process event.

471. TMUNEXRTN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received an unexpected return code from a primitive.

472. TMUNIT2RDT (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to access the tuple in relation RLUNIT2RDT.

Probable Cause:

A tuple is missing from the RLRDT2UNIT relation.

Action:

Contact office-dependent data (ODD) administrator and/or developer.

473. TMUNIT_CKT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Tuple missing in the relation RLUNIT_CKT. When attempting to read this relation, a failure return code of DBNO_MATCH was returned. This indicates that the tuple is missing, or that the keys used to read this relation were set improperly.

Data Structures:

RLUNIT_CKT.

Action:

This is a database inconsistency that can only be corrected by manual action.

474. TMUNKCLS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A line tuple read from the AM office dependent data (ODD) relation RLRT_DNTRAN contains an unknown terminating class of service.

Data Structures:

RLRT_DNTRAN. Key field: locdn.

The first field (NOC) and the second field (local digits) of the dump make up the key field, LOCDN (NOC + last 4 digits). The third field is the termclass attribute which contains the unknown terminating class of service (defined in DMtermclass.h).

Action:

Examine the RLRT_DNTRAN tuple for the specified LOCDN to check if the termclass attribute is correct. If not, use RC/V (or ODBE, if necessary) to correct the tuple.

475. TMUNK_SM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The TMIId2smdat() function received a message from an unknown SM. Check the input parameters.

476. TMUNK_TIMER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown timer fired.

477. TMUNK_VALUE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown value was received.

478. TMUNLIST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

The system list type received from routing and terminal allocation (RTA) was unknown.

479. TMUNLKLH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RSPTPN	Audit Mode: elev

Problem:

The DAatlsn() or DARslhsn() function did not successfully link or unlink an rIR_SPTPN tuple to/from the set owned by an rIR_LHPTPN tuple.

480. TMUNXP_TIMER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected timer fired in the inter-SM (ISM) craft terminal process.

481. TMUPCAMCA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RTPSTAT	Audit Mode: elev

Problem:

The TMuptupca() function did not successfully update the RLR_MCATPS relation and the RLR_CATPS relation. The update was an add or a delete.

482. TMUPDCADN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The circuit administration (CADN) field in the RLFC_PORTTYP relation for one or more trunks may not have been updated correctly during the trunk status mapping stage of an SM generic retrofit selective initialization. This assert is internally limited so that it can only fire a maximum of five times per assert call per SM.

Data Structures:

The SM number, trunk group number, trunk member number, gport.member (port name), and number of times this assert has fired from this SM are dumped.

Action:

After the SM generic retrofit selective initialization completes, follow the procedures in the generic retrofit, generic update, or large terminal growth (LTG) manual for dumping the trunk out-of-service (OOS) list.

In the section of the trunk OOS list that is generated for the SM from which this assert fired, find the particular OOS

CADN status that was listed for the trunk in the assert. Use RC/V (or ODBE, if necessary) to look at and possibly update the RLFC_PORTTYP relation for this trunk. The CADN field should be set to TMIOCD if the trunk is OOS CADN DSBLD and set to TMIOCL if the trunk is OOS CADN LKDO.

If the assert count is equal to 5, check all of the OOS CADN trunks on the SM to determine if they have been updated correctly in the office dependent data (ODD).

483. TMUPDERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The circuit administration (CADN) field in the RLFC_PORTTYP relation, RLPCI7GR relation, and/or RLAMPCI7GR relation for a CCS trunks may not be consistent due to recent maintenance activity.

Data Structures:

trunk group number port name.

Action:

Investigate recent maintenance activity involving the trunk group (and in particular the port) specified. Changes to the OOS,CADN statues may have left the static ODD data relations: RLAMPCI7GR, RLPCI7GR, and/or RLFC_PORTTYP, indicating the trunk is still equipped in the office.

Change from an OOS,CADN status may have left the same static ODD data relations indicating the trunk is not yet operational.

Failure to correct the ODD will result in sending blocking, unblocking and/or reset during and/or following SM impairment for unequipped CCS trunks. In action, now operational CCS trunk will not send blocking, unblocking, and/or reset following and/or following SM impairment. This message exchanges is necessary to insure consistent trunk state between offices. Inconsistent trunk status results in an increase ineffective call rate and call setup time.

The AUD:CCSXLATE command can be used to locate the relation(s) in error. Use the ODBE, and poprles to correct the faulty relation identified by AUD:CCSXLATE. Use the AUD:CCSXLATE after each relation is updated until ATP ("all test passed") is obtained.

There is an automatic periodic recovery method in the 5ESS[®] switch to correct some of the CADN inconsistencies. Every midnight, trunks in the OOS,CADN status are verified against the static ODD to insure correctness. If a mismatch is located, automatic correction is attempted. This automatic recovery is however directional. Trunks that are operational (not OOS,CADN) are not check.

484. TMUPDSMEST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed in an attempt to update an rISMEST tuple.

485. TMUPPAGE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to update or display a trunk and line work station (TLWS) menu page.

486. TMUSNOPRTLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

The TMps_eis() function failed in an attempt to check if a port is in service. The DA primitive DAgetprtla() could not read an rIORTLA tuple. The port linkage area (PORTLA) audit will be scheduled in elevated mode and will attempt to reconstruct the RLPORTLA relation from static data.

If the assert fires repeatedly, then the port obtained from the RLEISDSL static relation and used as a key to read an rIORTLA tuple is invalid.

Data Structures:

RLEISDSL. Key field: sm_rel_lnk (SM relative link number).

RLDLSL. Key field: gdport (global port).

Action:

Compare the port retrieved from the rIORTLA tuple and the port that was dumped against the corresponding port given on RC/V View 21.30 (OSPS - DSL PORT) for the rLEISDSL tuple. If a data mismatch is found, use RC/V View 21.30 to correct the data.

487. TMUXALMTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred while terminal maintenance (TM) was processing a red carrier group alarm (CGA) on a host digital facility interface (HDFI). The reported alarm state was neither ON nor OFF.

488. TMUXDFITYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal digital facility interface (DFI) type was encountered when clearing the DFI's slip and out-of-frame counters to zero.

489. TMUXPMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown or unexpected message was received. Note the occurrence.

490. TMUXR_GDCHK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the TMgleischk() function, an unexpected value (GLFAIL) was returned from a call to the DBfrdtup() primitive while attempting to read a tuple. This does not affect the update of the data delivery key.

491. TMVPIDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to read rIVPIDB_F or rIF_VPIDB.

Probable Cause:

Corrupt database.

Action:
Fix database.

492. TMWDBRD_FAIL (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:
A database (DB) read failure occurred on a wideband port.

Probable Cause:
Software error in reading the relation to the wideband port.

Action:
Contact your next level of support.

493. TMWGETMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
The system process woke up for a message, but the OSWGETMSG() macro failed.

494. TMWGMFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
OSWGETMSG failed to get a message.

495. TMWGTFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
OSWGETTYPE failed to get a message.

496. TMXAMPCI7GR (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
At least one extra tuple was found in the office dependent data (ODD) relation RLAMPCI7GR. The RLAMPCI7GR relation has been checked against the RLPCI7_LAB relation to verify that no tuples exists on the AM for PSU controlled CCS7 ISUP trunks. This assert indicates that tuples in RLAMPCI7GR were found where either the corresponding RLPCI7_LAB tuple contained a psu_mod attribute with a value other than zero or the corresponding RLPCI7_LAB tuple does not exist.

Data Structures:

Missing RLPCI7_LAB count - number of RLAMPCI7GR tuples that do not have corresponding RLPCI7_LAB tuples.

Error Tuple count - number of RLAMPCI7GR tuples that contain PCIs that are PSU-controlled.

RLAMPCI7GR. Key fields: MODULE, PCI (point code index), CIC_OFFSET.

Action:

Contact Lucent PECC with associated data for support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

497. TMXDSLEQUIP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to access an rIDSLEQUIP tuple via the DBfrdtup() function.

Data Structures:

RLDSLEQUIP.

Action:

The rIDSLEQUIP tuple is missing, it is needed for X.25 access on T1 facility (XAT) ports. Use RC/V (or ODBE, if necessary) to insert the tuple.

498. TMX_ISM (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

While restoring a protocol handler (PH), corrupt inter-SM (ISM)-SM system process global variables were found, requiring the system process to be purged.

499. TMXPICB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency exists between the AM office dependent data (ODD) relation RLRC_EQLOC and the SM ODD relation RLPICB. RLRC_EQLOC contains a peripheral interface control bus (PICB) for which there is no corresponding tuple in the RLPICB relation.

Data Structures:

RLRC_EQLOC, RLPICB.

The first field dumped, picb, is the key. The second field is the SM number. The third field is the unit type (from DMunittype.h) of the unit being tested (e.g., SMLU, SMC1LU, or SMDCLU). The fourth field is the unit number, and the fifth field is the service group.

Action:

Determine the cause of the problem, then use RC/V (or ODBE, if necessary) to correct the problem. There are three possible errors.

1. The SM number in the RLRC_EQLOC relation is incorrect; the PICB actually resides on a different SM. Update RLRC_EQLOC to reflect the correct configuration.
2. The PICB number in the RLRC_EQLOC relation is incorrect. Update RLRC_EQLOC to reflect a valid PICB number.
3. The SM and PICB numbers in the rIRC_EQLOC tuple are correct; but the corresponding rIPICB tuple is missing. Insert a tuple in the RLPICB relation on the SM, use the PICB number as the key.

500. TMXPORTLA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt by the DBxfrdtup() function to read the RLPORTLA relation failed for a non-resource failure reason. DBNO_MATCH was not the error code.

501. TMXSMEST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency exists between an SM's RLCKTDATA relation in the office dependent data (ODD) and the SM's RLSMEST dynamic relation. The RLSMEST relation is built from the RLCKTDATA relation.

Data Structures:

RLCKTDATA, RLSMEST, RLPICB, RLRC_EQLOC.

The first field dumped is the automatic line insulation test (ALIT) circuit ID for which status information is desired. This value is used as the key unit_id to the RLSMEST relation. The second field is the SM containing the two relations in question.

Action:

Examine the RLCKTDATA relation for the SM to verify that an RLCKTDATA tuple exists for the ALIT circuit with this unit_id. The key to the relation is the ALIT circuit name (unit_id). The type attribute should be PCMSALIT, and the utype attribute should be SMMSU or SMMODMSU. The upper 8 bits of the baseadd attribute should be equal to 1 less than the upper 8 bits of the unit_id. If the tuple does not exist, add the tuple to the RLCKTDATA relation.

If an RLCKTDATA tuple exists, verify that the ALIT circuit name (unit_id) is valid. The lower 8 bits of the unit_id represents the board position of the ALIT circuit in the metallic service unit (MSU) or modular MSU (MMSU). The upper 8 bits of the unit_id represent the peripheral interface control bus (PICB) + 1. Examine the SM's ODD relation RLPICB. The key to the RLPICB relation is the picb, not the picb + 1. The brd?type attribute should be equal to PCALITBRD. The question mark in brd?type refers to the board position. Verify that the picb in RLPICB is correct by examining the AM ODD relation RLRC_EQLOC. The key to RLRC_EQLOC is the SM number. Search the unittype attribute for SMMSU or SMMODMSU. The picb attribute located in the RLRC_EQLOC relation should be equal to the picb used to access RLPICB. If any of these relations are incorrect, use RC/V (or ODBE, if necessary) to correct the tuples.

502. TMZOMBIE (5E11 and later)

Recovery Action: -rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

A terminal process was still alive that should have been killed. The process will be killed.

503. XTMBADMSGGEN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message was received with an incorrect enumeration.

504. XTMMODATT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBfrdtup() of AM static data base relation RLMODATT failed (DBNOMATCH), indicating that an inconsistency exists - SLIM path handling software was requested to use a SLIM device in a particular SM and RLMODATT has no data for that SM. The requested SM number, of type DMMODULE, is dumped.

505. XTMNOPTYP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

Database failure when trying to access the relation RLFC_PORTTYP.

506. XTMRTR_FAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

RTroute() returned failure to SLIM calling function. Either all SLIM ports were busy in the SM routed to, or the desired terminal process was unable to be created in the module or RTA was unable to forward the MGTM_TERM message to that process, or RTA found some problem with the MGTM_REQ message. The exact failure return is contained in the third parameter of the first user stack frame dumped out by this assert. This parameter will contain a value of the type hdr/db/DMtreat.h. RTA also outputs its own asserts in many cases.

507. XTMSLRLT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return from the primitive PCriscct.

Range: trc**1. TRBADMSG (5E11 and later)**

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message was received.

2. TRBAD_SM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid SM was detected.

3. TRSYSPROC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The reason for entering the system process is invalid.

Range: unk**1. OUT_OF_RANGE (5E13 and later)**

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An assert error code that was out of range was passed to an ASSERT macro. The process that passed the invalid error code will be purged. No audits will be run. This ASSERT indicates a problem in the calling function's interface to the ASSERT handler.

2. OUT_OF_RANGE (5E11 to 5E12)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An assert error code that was out of range was passed to an assert macro. The process that passed the invalid error code will be purged. No audits will be run. This assert indicates a problem in the calling function's interface to the assert handler.

Range: unkpp**1. OUT_OF_RANGE (5E13 and later)**

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An assert error code that was out of range was passed to an ASSERT macro. The process that passed the invalid error code will be purged. No audits will be run. This ASSERT indicates a problem in the calling function's interface to the ASSERT handler.

Range: up**1. BADSMPADDR (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Call to Slsmtomhadr() failed.

2. UPBADADDR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

UPsmpaddr() is passed an invalid peripheral disk image address for the target peripheral type.

3. UPBADCKT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to obtain the mate common circuit name for a given circuit name has failed using the SMPICB2MTCOM() macro. The mate circuit's peripheral interface control bus (PICB) is not found and the circuit may not be equipped. The given circuit name is dumped as part of the assert output. Or, if the unit is a protocol handler (PH), an attempt to obtain the common name for a given shelf+ph# value name has failed using the SMSHFNRPHN2PH() macro. The circuit may not be equipped or trouble was encountered in attempting to access the database. In this later case, the peripheral number identifier "perinum" is dumped as part of the assert output. In either case if the named unit is equipped, contact your next level of support for assistance.

4. UPBADMH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message handler (MH) number was passed to the MH transfer vector (TV) overwrite function. Check whether the range of MH numbers (SMMH0_ID to SMMH_MAX) has been changed. If not, this is probably a software problem.

5. UPBADMODE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Data and/or transfer vector (TV) overwrites can not fit in one UP-SMIM interface buffer even though an earlier calculation determined they can. Check the size of the interface buffer (SMMHBUFF for MH), the number of data overwrites loaded, and the number of TV overwrites loaded. Since the lengths of data overwrites vary, the number of data overwrites do not tell the total length of all the data overwrites, which can be calculated by analyze the last update buffer (LUB) file.

6. UPBADPICB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A peripheral interface control bus (PICB) value validity check using the SMIS_PICB() macro has failed while performing a software update task. This validity check is performed before an attempt is made to convert a PICB to

a common circuit name via the SMPICB2COM() macro. The assert will dump the PICB value for the circuit in question. Contact your next level of support for assistance.

7. UPBADSMEST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected (bas_stat, qual_2) combination is found in a rISMEST tuple.

Probable Cause:

A new (base_stat, qual_2) combination was recently introduced or an incorrect rISMEST tuple was read, which may have been caused by passing in an incorrect key (unit_id).

Action:

The key to the tuple read, base_stat, and qual_2 are dumped as data 0, 1, and 2, respectively. If the information is correct, contact a developer to correct the software so that the state can be properly handled.

8. UPBADSTAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Peripheral units were found in a state inconsistent with a previously reported result of upd:pmpperf. This may include scenarios such as: degraded TMUXs were found after a successful upd:pmpperf; or no degraded or inconsistent TMUX was found after a failed upd:pmpperf.

Probable Cause:

The upd:pmpperf result was first reported by maintenance request administrator (MRA) then mapped by UP into a local "context". This is probably a software problem.

Action:

The reported result (or context) is dumped as the first data. The stack dump contains the target peripheral type (e.g. DNUS-CC, TMUX). Compare the states of the units with the reported result. If an unit should be consistent and in-service but is not, manually restore it to STBY or ACT, followed by re-poking upd:pmpperf. Also talk to UP developers.

9. UPCKT2CX (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A circuit index can not be obtained given a circuit name, which is dumped by the assert. Check the existence of the CKTDATA tuple using the circuit name as the key.

10. UPCKTDATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Error reading a rICKTDATA tuple.

Probable Cause:

Invalid key, missing tuple, or software problem.

Action:

Investigate the error returned by the database read. Verify that the tuple exists. The tuple buffer and the return code

are dumped as the first and second data, respectively.

11. UPCPLIST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A problem was encountered in the operating system for distributed switching - central processor (OSDS-C).

12. UPDFADRER (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The UPimdufr() function found an attempt to overwrite memory that was not field updatable.

13. UPDNCKT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A mapping from a circuit name (DMCIRCUIT) to unit number and CC number failed. As a result, the ROP output message for this circuit was not properly formatted.

Probable Cause:

To do the mapping, the circuit name was used as the key to search the global UPdncircuit[unitno][cc] where each element was a circuit name. Although a match was expected, there was no UPdncircuit[][] entry that contained the circuit name. This is probably a software problem.

Action:

Collect the data (the circuit name and UPdncircuit[]) on ROP and seek technical support.

14. UPFAPFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An OSfap() function call from the UPgetptchs() function failed.

15. UPIMCDA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data mismatch was encountered.

16. UPIMCDTVM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A transfer vector mismatch was encountered in data space.

17. UPIMCH2K (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The computed hash sum for a 2K block does not match the hash sum in the last update buffer (LUB).

18. UPIMCHADR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A hash sum address was not in the hash sum table.

19. UPIMCHEQU (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The old hash sum and the new hash sum are the same.

20. UPIMCHMM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A hash sum mismatch was encountered.

21. UPIMCTTVM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A transfer vector mismatch was encountered in text space.

22. UPIMCTX (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A text mismatch was encountered.

23. UPIMDESV (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The UPimdufr() function found an inconsistency in the program update status vector structure.

24. UPIMHSER (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A hash sum error was found after memory overwriting completed.

25. UPIMLIST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A problem was encountered in the operating system for distributed switching - switching module (OSDS-SM).

26. UPIMRBIH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid hash sum was detected during recovery in the backout mode or the install mode.

27. UPIMRD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid mode was detected in recovery.

28. UPIMRIBH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid hash sum was detected during recovery in the install mode or the backout mode.

29. UPIMRIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The last update buffer could not be used for recovery because it was inconsistent.

30. UPIMRRBH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid hash sum was detected during recovery in the reclaim mode or the backout mode.

31. UPIMTVSV (5E11 and later)

Recovery Action: spp	SPP: y	Audit: null	Audit Mode: null

Problem:

The UPimtrop() function found an inconsistency in the program update status vector structure.

32. UPODRULK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to Slenum_olock() failed to unlock an SM optional data region (ODR) where a peripheral image resides.

Probable Cause:

The image may already be in the requested state (i.e. unlocked), the image may be locked by another process, or bad parameters were passed.

Action:

Investigate why the image in ODR can't be unlocked. This unlock was requested after finishing all the read and/or write operations during update installation or consistency check. Since this error did not affect the operation, it is

ignored. If the ODR is still locked and not unlocked by the integrity monitor by the time the next lock request comes in, the lock request will fail. The integrity monitor will eventually clean up the lock.

33. UPPHMSGERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The UPphconchk() function received an unexpected message type from the PSsendmsg() function during protocol handler (PH) patch collection.

34. UPPHN2PH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A packet switch unit (PSU) protocol handler (PH) circuit name can not be obtained given a physical ph number (0-95). Check existence of the UNIT_CKT tuple using the circuit index (second data dump) as part of the key.

35. UPSMEST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Error reading a rISMEST tuple. As a result, the intended procedure, e.g. UP consistency audit, may have been skipped for this circuit.

Probable Cause:

Incorrect circuit name or software problem.

Action:

The circuit name and the DBfrdtup() return code are dumped as the first and second data dumps. Determine whether a rISMEST tuple exists for this circuit then contact a UP developer.

36. UPTMXMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DNU-S CC resident software (RSW) returned a TMUX software update consistency check error code not recognizable by Program Update.

Probable Cause:

Software problem. UP probably has not been notified of the new error code defined by RSW.

Action:

Collect ROP data and seek technical support. The first data dump is the result returned from the RSW update consistency check task. The second data dump is the originator of the consistency check, e.g. periodic audit or manual AM request.

37. UPUNITCKT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Error reading a rIUNIT_CKT tuple.

Probable Cause:

Invalid key, missing tuple, or software problem.

Action:

Investigate the error returned by the database read. Verify that the tuple exists. The tuple buffer and the return code are dumped as the first and second data, respectively.

Range: upump**1. SIACKINTF (5E12 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Peripheral pump could not read the acknowledgement for a command from the target processor.

2. SIBADCKT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Protocol handler (PH) pump failed to read circuit data for the PH.

3. SIBADCMD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Slmc_sndcmd() was passed an invalid command type.

Probable Cause:

Software bug, interface error, or text corruption.

Action:

Report problem through local field support personnel.

4. SIBADIMG (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid image type was passed to the asserting function.

5. SIBADIMG (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid image type was passed to the Slunitpump() function.

6. SIBADINDX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The index used to link back to global tables has been corrupted.

Probable Cause:

One of the multicast pump functions is corrupting the data.

Action:

Provide any ROP output to local field support for analysis.

7. SIBADPHTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The protocol handler (PH) type passed to the Slpumpph() function is an invalid PH type.

8. SIBADPIDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Pump failed to read digital subscriber line (DSL) data from a relation.

9. SIBADPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Protocol handler (PH) pump received a bad pump type

10. SIBADSMADD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Peripheral pump found an invalid switch module processor (SMP) address corresponding to a requested peripheral address.

11. SICCAK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Common control (CC) acknowledgment indicated that the pump was not complete after an END command.

12. SICCBDRY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A common control (CC) pump request was not on a 2K boundary.

13. SICCFMBX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Common control (CC) failed to clear a final mailbox after a pump.

14. SICCFRST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Common control (CC) reset failed before a pump.

15. SICCHFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Common control (CC) did not complete hashsum checks after a CC pump.

16. SICCIMBX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Common control (CC) failed to clear a mailbox during a pump.

17. SICCKPCB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Common control (CC) pump did not get a valid CC acknowledgement after sending a command.

18. SICCNCOMP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Common control (CC) pump did not receive a complete acknowledgement after hashsum checks.

19. SICCSTAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Common control (CC) pump received an invalid status from the CC after sending a command.

20. SICMDINTF (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Peripheral pump could not send a command to the target processor.

21. SIESCPMP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Pump escalated to a full pump.

22. SIHSCERRLD (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Found PH raised error_lead after hashsum check in PH restore. This assert is for information only.

23. SIHSCNFEA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A hashsum check for peripheral pump did not have the feature loaded in the feature activation table (FAT).

24. SIHSCNOMAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No match was found in the feature activation table (FAT) for a peripheral pump hashsum check.

25. SIHSCSTAT (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Peripheral pump was in the process of hashsum checking a unit and found the unit in an illegal state.

26. SIINITERRLD (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Found PH which raised error_lead after INIT in PH restore. This assert is for information only.

27. SIJMP2ERRLD (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

PH did not raise error_lead after jump to phase 2 during PH restore. No action taken. This assert is for information only.

28. SIJMP3ERRLD (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

PH did not raise error_lead after jump to phase 3 during PH restore. No action taken. This assert is for information only. Probably caused by interface errors.

29. SINOFEAPMP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A peripheral pump feature was not loaded in the feature activation table (FAT).

30. SINOIMAGE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The switch module processor (SMP) image for this peripheral unit is not loaded.

31. SINOMATPMP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No match was found in the feature activation table (FAT) when trying to pump a peripheral.

32. SINOUIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The unit information table was not found for peripheral pump.

33. SIPH3SETUP (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Some PHs (PH3/4/6) did not get phase 3 pump setup messages. No error_lead raised for those PHs. No action taken. This assert is for information only.

34. SIPHBDRY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Protocol handler (PH) pump received a request that was not on a 2K boundary.

35. SIPHBUF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Protocol handler (PH) pump in the switch module processor (SMP) timed out while waiting for a pump complete flag in the protocol interface (PI).

36. SIPHCDE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Protocol handler (PH) pump in the switch module processor (SMP) did not get a valid complete code during a PH hash sum check (HSC).

37. SIPHDATAPMP (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PH data ODR pump bits are set invalidly. The system is unable to pump the requested data ODR(s) to some protocol handlers (PHs). This is a software problem and needs to be addressed quickly.

38. SIPHDATAPMP (5E11 only)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PH data pump bits have been corrupted. The PHs may be out of date. This is a software problem and needs to be addressed quickly. No "data" has been pumped the the PHs (TEXT has been pumped).

39. SIPHFLG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Protocol handler (PH) pump in the switch module processor (SMP) did not receive valid pump buffer addresses.

40. SIPHFRST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The protocol handler (PH) failed to reset during a pump.

41. SIPHRDBF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The protocol handler (PH) pump in the switch module processor (SMP) timed out while waiting to read the next pump buffer.

42. SIIBDRY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Protocol interface (PI) pump received a request that was not on a 2K boundary.

43. SIPIHFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The protocol interface (PI) did not return SUCCESS, or a hash sum check (HSC) failure occurred.

44. SIPIRNFEA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The protocol interface (PI) reset for peripheral pump did not have the feature loaded in the feature activation table (FAT).

45. SIPIRNOMAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No match was found in the feature activation table (FAT) for the Pireset command.

46. SIPIRSTF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The protocol interface (PI) was not released from a hold state after a pump.

47. SISENDFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PSsendmsg() function failed during a protocol handler (PH) pump.

48. SISMBADSTAT (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Peripheral pump could not send a command because the target unit was not in the correct state.

49. SIUPPIOS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An illegal request to pump the mate protocol interface (PI) was encountered while the switch module processor (SMP) was in an unsegmented mode.

Range: ut

1. UTLAST (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

A library supervisor purge of the library client program occurred.
