Warranty

Warranty information applicable to the 5ESS[®] switch may be obtained from the Lucent Technologies Account Management organization. Customer-modified hardware and/or software is not covered by this warranty.

Ordering Information

This IP is distributed by the Lucent Technologies Customer Information Center in Indianapolis, Indiana.

The order number for this IP is 235-600-500. To order, call:

1-888-LUCENT8 (1-888-582-3688) or fax to 1-800-566-9568 (From inside the continental United States)

1-317-322-6847 or fax to 1-317-322-6699 (From outside the continental United States).

Support Telephone Numbers

Information Product Support Telephone Number: To report errors or ask nontechnical questions about this or other IPs produced by Lucent Technologies, call 1-800-645-6759.

Technical Support Telephone Numbers: For initial technical assistance, call the North American Regional Technical Assistance Center (NARTAC) at 1-800-225-RTAC (1-800-225-7822). For further assistance, call the Customer Technical Assistance Management (CTAM) Center:

1-800-225-4672 (From inside the continental United States)

1-630-224-4672 (From outside the continental United States).

The CTAM center is staffed 24 hours a day, 7 days a week.

Acknowledgment

1. INTRODUCTION

1.1 PURPOSE

The 5ESS[®] Switch Asserts Manual is a guide to the assert output messages that are produced in response to failed defensive checks. Its purpose is to help the user interpret the assert output messages.

This document includes software releases 5E11 through 5E14 and is intended for use by personnel who operate and maintain the 5ESS[®] switch. This document assumes the reader has advanced training on the 5ESS[®] switch, preferably through the 5ESS[®] Switch Maintenance: Trouble Analysis (ES5862) course.

1.2 UPDATE INFORMATION

1.2.1 General

This document is being updated to include new and updated asserts.

1.2.2 Supported Software Releases

In accordance with the 5ESS[®] Switch Software Support Plan, the 5E11 software release will be rated Discontinued Availability (DA) on November 13, 1999. The information supporting 5E11 and earlier is being removed over time, instead of concurrently, from all documentation.

If you are supporting offices using a software release prior to 5E12 and have a need for the information that is being removed, it is recommended that you retain the associated pages as they are removed from the paper documents or the earlier copy of the CDRom.

1.2.3 Terminology

This 5ESS[®] switch document may contain references to the 5ESS[®] switch, the 5ESS-2000 switch, and the 5ESS AnyMedia Switch. The official name of the product has been changed back to the 5ESS[®] switch. The documentation will not be totally reissued to change these references. Instead, the changes will be made over time, as technical changes to the document are required. In the interim, assume that any reference to the 5ESS-2000 switch or the 5ESS AnyMedia Switch is also applicable to the 5ESS[®] switch. It should be noted that this name change may not have been carried forward into software-influenced items such as input and output messages, master control center screens, and recent change/verify screens.

National ISDN is an evolving platform in which new features will continue to be introduced for new revenue opportunities, improved operational efficiencies, and for support of specific applications. NI 1, NI 2, and NI 3 represent specific features as documented in Bellcore SRs 1937, 2120, and 2457. The industry is migrating to an additional terminology to more specifically denote the availability of National ISDN features: NI 95, NI 96, etc. A feature is included in a specific version (such as, NI 96) if it is available by the switch vendors by the first quarter of the year.

As a result of the World Telecommunications Standardization Conference held March 1-12, 1993, the International Telegraph and Telephone Consultative Committee (CCITT) no longer exists as an organization under the International Telecommunication Union (ITU). According to the ITU, the CCITT is now referred to as the International Telecommunication Union - Telecommunication Standardization Sector (ITU-TS).

For new and revised Recommendations issued by the ITU-TS, the term "CCITT Recommendation X.xxx" will be replaced by the "ITU-T Recommendation X.xxx" designation. For a transition period from 1993 to 1997, if the Recommendation had a previous CCITT designation, the new name will include "(formerly CCITT Recommendation X.xxx)". Names of existing CCITT Recommendations will not change unless revised.

As of March 18, 1999, Bellcore officially changed its name to Telcordia Technologies. Not all pages of this document are being reissued to reflect this change; instead, the pages will be reissued over time, as technical and other changes are required. Customers on standing order for this document may see that, on previous-issue pages, the Bellcore name is still exclusively used.

Customers receiving new orders for this document will see the Telcordia Technologies name used as appropriate throughout the document, and the Bellcore name used only to identify items that were produced under the Bellcore name. Exceptions may exist in software-influenced elements such as input/output messages, master control center screens, and recent change/verify screens. These elements will not be changed in this document until such time as they are changed in the software code. Document updates will not be made specifically to remove historical references to Bellcore.

1.3 ORGANIZATION

The 5ESS[®] Switch Asserts Manual is organized as follows:

- **Introduction:** Section 1 briefly describes the contents of the Asserts Manual and how they are organized.
- **Overview:** Section 2 presents a high-level overview of asserts and the various assert output messages. Also, this section describes how to locate the assert descriptions in this document.
- **Assert Ranges:** Section 3 defines the assert ranges and charts them through the various software releases.
- **Mnemonic Index:** Section 4 lists the 5ESS[®] switch asserts by mnemonic and range, and maps them to their assert number for each software release.
- **Numeric Indexes:** Section 5 contains one subsection for each software release. Each subsection contains a list of assert error codes particular to that software release. The list provides the Processor Recovery Message (PRM) code, the range, and the mnemonic associated with each error code.
- **Acronyms:** This section expands the acronyms used in this document.
- **Glossary:** This section defines the terms used in this document.
- **Assert Descriptions:** Sections 6, 7, and 8 list the asserts by range/mnemonic and describe the problem that caused a particular assert failure. Manual action assert descriptions contain additional information on the data structures (relations) that are involved and the actions needed to solve the problem.

1.4 USER FEEDBACK

The producers of this document are constantly striving to improve quality and usability. Please use the enclosed feedback form for your comments and to advise us of any errors (available in paper documents only). Or, you can write to us at the following address:

Lucent Technologies
Documentation Services
2400 Reynolda Road
Winston-Salem, NC 27106

Please include the issue number and/or date of the document, your complete mailing address, and telephone number. We will answer all correspondence within 30 days, informing you of the disposition of your comments.

You may also call our Documentation HOTLINE if you need an immediate answer to a documentation question. This HOTLINE is not intended to eliminate the use of the comment forms, but rather to enhance the comment process. The HOTLINE number is 1-800-645-6759 and is available from 7:30 a.m. to 6:00 p.m. Eastern Standard time.

Outside of those hours, the line is served by an answering machine. You can leave a message on the answering machine, and someone will return your call the following business day.

Document users who have access to electronic mail facilities may send comments via electronic mail. The electronic address is **hotline5@wrddo.lucent.com**. When sending comments via electronic mail, please make sure that the document title, document number, document issue number, and/or document date are included in the mail along with the sender's name, phone number, and address.

1.5 DISTRIBUTION

This document is distributed by the Lucent Technologies Customer Information Center in Indianapolis, Indiana. Most operating telephone companies should place orders through their documentation coordinator. Some companies may allow customers to order directly from the Customer Information Center; however, the majority do not. Companies that use documentation coordinators to manage their orders receive a significant discount. If you do not know the name/number of the documentation coordinator for your company, you may call **1-888-LUCENT-8 (1-888-582-3688)** to obtain the name and telephone number.

Customers not represented by a documentation coordinator and Lucent Technologies employees can order the documentation for the 5ESS[®] switch directly from the Customer Information Center. Proper billing information must be provided. These orders may be mailed to:

Lucent Technologies
Customer Information Center
Order Entry
2855 N. Franklin Road
Indianapolis, IN 46219

Orders may also be called in on **1-888-LUCENT-8 (1-888-582-3688)** within the continental United States and **+1-317-322-6416** from outside the continental United States. Orders may be faxed in on **1-317-322-6484**.

1.6 TECHNICAL ASSISTANCE

Technical assistance for the 5ESS[®] switch can be obtained by calling the North American Regional Technical Assistance Center (NARTAC) at **1-800-225-RTAC**. This telephone number is monitored 24 hours a day, 7 days a week. During regular business hours, your call will be answered by your local NARTAC. Outside of normal business hours, all calls will be answered at a centralized technical assistance center where service-affecting problems will be dispatched immediately to your local NARTAC. All other problems will be referred to your local NARTAC on the next regular business day.

1.7 REFERENCES

Following is a list of other Lucent Technologies documents that are referenced in this document.

NOTE 1: An "x" or "x"s in the last three positions of a release specific document number indicate the digits that change from release to release. Refer to 235-001-001, *Documentation Description and Ordering Guide* for the document number associated with each software release.

NOTE 2: This document also contains information concerning the Compact Digital Exchange (CDX) and the Very Compact Digital Exchange (VCDX), which are switching systems based on the 5ESS[®] switch. This document is a standard 5ESS[®] switch document that is also applicable to the CDX and VCDX switching systems. Information applicable only to CDX and VCDX may be found in the following manuals:

- 235-120-010, *Compact Digital Exchange (CDX) Reference Guide*
- 235-120-020, *Compact Digital Exchange (CDX) User's Guide*
- 235-120-120, *Very Compact Digital Exchange (VCDX) User's Guide*

2. OVERVIEW

2.1 5ESS® SWITCH SOFTWARE ARCHITECTURE

The 5ESS® switch software consists of five major areas: operating system, database, call processing, maintenance, and administrative services (see Figure 2-1). Asserts occur in all five areas.

Figure 2-1 5ESS Switch Software Architecture

Operating System	Two operating systems which have asserts control the 5ESS® switch software: operating system for distributed switching (OSDS) and <i>UNIX</i> ®-real time reliable (RTR). OSDS is the operating system that provides an environment in which the application software can execute. It ranks tasks and allocates necessary resources. <i>UNIX</i> ®-RTR is the general-purpose operating system used in the administrative module (AM).
Database	The database area stores the protected and unprotected data needed by other switch software to maintain the system and perform call processing. The 5ESS® switch database can be accessed internally by application code, or externally by end users such as operating company personnel, telephone subscribers, and operations support systems (OSSs).
Call Processing	Telephone subscribers can access and update the database through customer originated recent change (CORC). Other end users must use either recent change and verify (RC/V), the office database editor (ODBE), or the access editor (ACCED). The call processing area sets up and manages calls. It is divided into three subsystems: peripheral control (PC), feature control (FC), and routing and terminal allocation (RTA). The PC subsystem manages the switching equipment; the FC subsystem sets up calls; and the RTA subsystem provides screening, routing, charging information, directory number translation, and other call processing functions.
Maintenance	Asserts from these subsystems are likely to be related to database or code problems that may affect call processing. The maintenance area ensures that the switch functions reliably despite occurrences of hardware or software faults. The maintenance area is divided into six subsystems: system integrity, switch maintenance, terminal

Administrative
Services

maintenance, human machine, utilities, and diagnostic supervisor. Asserts are managed by the system integrity subsystem. The administrative services area consists of measurements, billing, network management, and service evaluation programs which collect, process, and transmit information.

In relationship to other system software, asserts are a maintenance function managed by the system integrity (SI) subsystem. As shown in Figure 2-2, the SI subsystem is a collection of programs that detect, isolate, and in some cases, recover from software errors.

- Integrity monitors and asserts detect software errors, and while they can initiate recovery actions, they cannot directly correct errors.
- Overload control and audits detect and correct software errors.
- Initialization and pump are methods of recovery. Initialization resets the system to a known, safe state and pump downloads text and data from the disk system to a pumpable processor.

Figure 2-2 System Integrity Subsystem Functional Organization

2.2 ASSERT DEFINITION

Asserts are defensive checks, or small segments of code that detect software errors or inconsistencies within a processor. Unlike audits, asserts cannot correct software errors directly. Instead, asserts report the errors they find to the assert handler (discussed in a later section), which initiates the appropriate corrective actions. Asserts can cause system initializations, audits, return to point of interrupts (RPIs), and single process purges (SPPs).

Asserts derive their name from "assertions." An assertion is a logical condition that can be evaluated as either true or false. An assert, also, can be evaluated as either true or false. Each time program control reaches an assert, a test is made to determine the truth of the assertion (or logical condition). If the assertion is true, no action is taken and the program continues. If the assertion is false (for example, a resource in one data block is marked as "idle" while the same resource in another data block is marked as "in use"), the program is interrupted and the error is reported to the assert handler for appropriate action.

Asserts make the following types of checks:

- Range checks on pointers, global data, and function arguments to ensure that reads and writes occur within restricted ranges.
- Redundancy checks made on duplicate copies of data stored at different locations to detect memory corruption.
- Point-to/point-back linkage checks to prevent network data structure corruption.
- Consistency checks between logically related blocks of data.
- Message acknowledgment checks to ensure that static and dynamic data agree.
- Return code checks to detect invalid return values from function calls.

2.3 ASSERT TYPES

Manual action asserts typically report office dependent data (ODD) related problems, such as a missing tuple. This type of assert can be corrected by maintenance personnel in the field.

Defensive check failure (DCF) asserts usually report software errors. This type of assert is more difficult to analyze and may require escalation to the next level of technical support.

2.4 ASSERT HANDLER

The assert handler is the software that is invoked when an assert fails. The assert handler is responsible for formatting assert output messages and taking the appropriate recovery action.

Asserts can be found in several environments which can best be categorized by the processors that use them. Different environments have different assert handlers, and the treatment of the assert varies depending on the environment.

UNIX®-RTR	The assert handler in the <i>UNIX</i> ®-RTR environment uses routines provided by <i>UNIX</i> ® and the application integrity monitor (AIM) to format and log assert output messages. No recovery actions are taken.
AIM	The assert handler in the AIM environment parallels that of the assert handler in the <i>UNIX</i> ®-RTR environment, except that the interface with AIM is different and the AIM assert handler can take some special recovery actions.
PC	Because the peripheral controller (PC) environment (not to be confused with the peripheral control subsystem) does not have an operating system, the PC assert handler is not supported by the system integrity (SI) subsystem, which typically supports the assert handlers in other environments. The interfaces necessary for the reporting and recovery of asserts that come from this environment are provided by switch maintenance. The peripheral controller environment does not contain audits.
OSDS	The assert handler in the OSDS environment can format or log output messages, and initiate

the following recovery actions:

- **Return to point of interrupt (RPI).** The called function returns control back to the calling function and the remainder of the calling function is executed. RPIs are the least severe recovery action.
- **Elevated segmented audits.** Elevated audits are scheduled at a higher priority than routine audits and are run in segmented mode. Segmented mode means an audit runs in pieces or segments for a predetermined amount of time and then relinquishes the central processing unit. When the audit is dispatched again, it continues where it left off the last time and executes more segments. This continues until the audit completes.
- **Directed nonsegmented audits.** Directed audits are started immediately and run in nonsegmented mode, meaning they run to completion with no interrupts. Because they run to completion, directed audits block call processing while they run. Also, directed audits result in a single process purge of the running process.
- **Single process purge (SPP).** An SPP releases the process control block (PCB) and associated resources directly attached to the purged process. Depending on the process, calls might be lost.
- **Packet services initialization (PSINIT).** Used only in the protocol handler (PH) and packet interface (PI), this recovery action initializes packet services data and hardware. Packet switched calls are lost.
- **Selective initialization.** This recovery action is requested when lower level recovery actions are ineffective. It is one of the more severe recovery actions. Selective initialization is usually the result of escalation.

When an assert is evaluated as false, an assert macro (discussed in the next section) calls the assert handler and provides it with an assert mnemonic as an argument. The assert handler uses the mnemonic to locate an entry in an assert failure table. This entry contains information that determines how the assert handler will process the assert failure.

The assert handler tracks the recent history of assert failures in the system via counters. One counter holds the number of assert failures that result in RPIs, and another counter holds the number of assert failures that result in SPPs. If the number of allowable RPIs for a particular assert failure is exceeded within a specified time interval, the assert handler will escalate, that is, request a more severe recovery action. Similarly, if the number of allowable SPPs is exceeded within a specified time interval, the assert handler will escalate. The recovery action is escalated in this manner until the problem is corrected.

2.5 ASSERT MACROS

Assert macros provide the assert handler with the information it needs to process assert failures. Different output messages are printed for different asserts, depending on the macro that was used in the code to call the assert handler. Currently, the following assert macros are supported:

- AUASRTA()** The assert A macro is used in the code to print a basic set of assert output messages which include a stimulus message, a stack trace message, two stack frame messages (one for each of the two functions prior to the macro call), and a processor register dump message. The assert A macro passes two arguments to the assert handler: the logical condition that should be true and the assert mnemonic.
- AUASRTB()** The assert B macro is similar to the assert A macro in that it will print the basic set of assert

output messages. The assert B macro will also print up to three report data messages that each contain up to 160 bytes of additional data (in hexadecimal format) that is specified by a list of pointers. The assert B macro provides two arguments to the assert handler: the assert mnemonic and an array of up to three pointers to data to be printed in the report data messages.

To simplify the assert B interface, three additional assert B macros are defined: ASSERTB1(), ASSERTB2(), and ASSERTB3(). These assert B macros dump data in hexadecimal format starting at one, two, or three memory addresses, respectively.

AUASRTC() The assert C macro is like the assert A macro except that it causes a specified process (usually a non-running process) to be purged. The assert C macro passes three arguments to the assert handler: the logical condition that should be true, the assert mnemonic, and the process ID of the non-running process to be purged. This macro causes the basic set of output messages to be printed, as well as a message pertaining to the purged process. This macro is used only in the OSDS environment.

AUASRTD() The assert D macro is a combination of an assert B and assert C macro. It provides the ability to dump additional data specified by a list of pointers, plus the ability to purge a specified non-running process. This macro passes three arguments to the assert handler: the assert mnemonic, an array of up to three pointers used to dump pertinent data, and the process number within the process ID structure of the process to be purged.

To simplify the assert D interface, three additional assert D macros are defined: ASSERTD1(), ASSERTD2(), and ASSERTD3(). These assert D macros dump data in hexadecimal format starting at one, two, or three memory addresses, respectively.

AUCFTASRT() The manual action assert macro is used to print one output message that reports a problem (typically, an ODD-related problem) that can be corrected manually at the office. It does not produce stack frame messages, stack trace messages, or report data messages containing hexadecimal data dumps. This macro does not contribute to escalation.

To expand the manual action assert interface to support multiple languages three additional manual action asserts are defined: AUCFTAS3(), AUCFTAS6(), and AUCFTA12(). These macros dump 3, 6 or 12 lines of text.

2.6 ASSERT OUTPUT MESSAGES

2.6.1 DEFENSIVE CHECK FAILURE OUTPUT MESSAGES

2.6.1.1 General

Defensive check failure (DCF) messages are the most common assert messages and are triggered by a variety of causes, including invalid, missing, or inconsistent data. These messages are initiated by assert A, assert B, assert C, or assert D macros.

DCF messages are identified either by a "DEF-CHK-FAIL=" field followed by a number, or by a "SRC=DCF" field. Both fields identify the source of the output message as a defensive check failure. The number that follows the "DEF-CHK-FAIL=" field is the assert error code. This number is used to locate the assert range (functional area) and mnemonic, and the associated assert description in the Asserts Manual.

While not all asserts use them, the following set of messages can be generated by DCF asserts:

- stimulus

- stack trace
- stack frame
- register dump
- report data

See the Output Messages Manual (235-600-750) for a complete description of these output messages.

2.6.1.2 Stimulus Message

The stimulus message is the first of the basic DCF assert messages that will print on the receive only printer (ROP). It has the following key fields:

- **Processor.** Identifies where the failing (also called asserting) code resides.
- **Init Level.** Identifies the level of initialization, such as, RPI, SPP, or selective initialization (SI).
- **DCF Code.** Contains the DCF assert error code used to locate the assert range and mnemonic, and the associated description in the Asserts Manual.
- **Event.** Contains a unique number in the AM, SM, or CMP which correlates output messages associated with a single event.
- **Failing Address.** Contains the virtual address of execution at the time the assert failed.
- **Time.** Contains the time the assert failed in minutes, seconds, and tenths of seconds. The time and the event number can be used to tie related messages together.

SM Stimulus Message:

```
INIT SM=7,0 LVL=RPI EVENT=12 COMPLETED
DEF=CHK-FAIL=25549 NO-AUD-SCHED
FAILING-ADDR=H'1b4c23c SM-MODE=NORMAL TIME=56:38.3
PROCESS: BG=106,0,H'1b4c736,RPI CM=NONE, FG=NONE,,
```

CMP Stimulus Message:

FCODE=0 REQ-PROC=0 HDW-LVL=0 SPP-COUNTS=0,0
```

Exhibit 2-1 Stimulus Message (5E13 Software Release)

2.6.1.3 Stack Trace Message

The stack trace is the second of the basic DCF assert messages that will print on the ROP. It contains a sequence of program addresses that are associated with the calling function.

The stack trace message has three key fields: the environment in which the assert was triggered, the event number, and the function addresses. The first address is that of the failing function and the second address is that of the function that called the failing function. These two addresses should match the function addresses given in the stack frame messages which print following the stack trace message.

Program addresses from the user, system, and/or recovery stacks may be printed in this output message. If no addresses are stored for a particular stack, then that stack will not print. Several combinations of output are possible, but the order of printing is always the same. The user stack prints first, followed by the system stack, followed by the recovery stack. Depending on the point of assertion, each stack may contain a list of up to nineteen hexadecimal addresses, with the failing function printed first.

- **User.** The user stack contains common processes from subsystems such as feature control, peripheral control, and administrative software.
- **System.** The system stack is used by the operating system (OS) during OS processes and interrupt invocation.
- **Recovery.** The recovery stack is used for assert handling and call processing when asserts continue to fire.

SM Stack Trace Message:

```

```

Exhibit 2-2 Stack Trace Message (5E13 Software Release)

2.6.1.4 Stack Frame Message

Two stack frame messages follow the stack trace message. The first stack frame contains the stack of the failing

function. The second stack frame contains the stack of the function that called the failing function. Each stack frame consists of three sections: function address, parameters, and local data.

- **Function Address.** This section contains the address of the function whose stack frame is being printed. The function addresses in the two stack frame messages should match the first two addresses in the related stack trace.
- **Parameters.** This section consists of hexadecimal values that represent pointers to particular values or the values themselves. These values are passed from the calling function to the called function.
- **Local Data.** This section consists of hexadecimal values which represent local variables within that function. These values may range from a one-bit bitfield to extremely large structures.

Exhibit 2-4 Register Dump Message (5E13 Software Release)

2.6.1.6 Report Data Message

The report data message is an optional hexadecimal data dump that is used to dump pertinent debugging information such as port, party, or other values that are not part of the normal stack frame output. This message is output only when the assert B or assert D macros are used. The report data message is also used to dump process control block (PCB) and process control block link area (PCBLA) data for a single process purge. In the latter case, the "SRC=" field is followed by "SPP" instead of "DCF." The report data message is sometimes referred to as a data dump, a hex dump, or a user-supplied data dump.

Two things to note about the report data message are:

- Up to three report data messages per DCF assert may print.
- The address specified in each report data message is the physical address where the data array or structure is stored.

Exhibit 2-5 Report Data Message (5E13 Software Release)

2.6.1.7 Process Message Data Block

There are two additional messages that may be printed on the ROP when the SM assert fires and when a terminal process is purged. These messages are:

PMDB-IN Contains a message received by a terminal process prior to that process being purged.

PMDB-OUT Contains a message being formatted, or sent, by a terminal process prior to that process being purged.

```

Exhibit 2-6 PMDB-IN and PMDB-OUT Messages (5E13 Software Release)

The first 8 bytes of the message contains header information that is formatted and printed in the second and third lines of the output message. The header contains information about the message being printed, including the message type, length, and priority. Information about the sending process, which includes the process, processor number, and uniqueness, also appears in the header.

The text portion of the dump immediately follows the header information and is a hexadecimal dump of the message. The length of the dump will vary with the length of the message.

2.6.1.8 Protocol Handler and Packet Interface Assert Messages

Protocol handler (PH) and packet interface (PI) asserts are unique in that they print a combined stimulus and stack trace message. No other messages are printed for PH1 and PH2 asserts. Report data messages are printed for all other PH types or PI asserts when an assert B macro is used. In the PH, packet switching data structures LLCB, ALCB, and/or LCCB that are implicated during a non-returning assert are dumped. PH and PI asserts are normally logged rather than printed on the ROP.

Exhibit 2-10 Protocol Handler 4 Assert Message (5E13 Software Release)

2.6.1.9 RTA DCF Messages

The RTA DCF asserts are used to monitor the state of call processing in the AM, SM, and CMP processors. RTA DCF asserts are triggered from within the RTA subsystem and can indicate office-dependent data (ODD) problems, internal logic errors, or other types of exceptions

RTA DCF Messages

The RTA DCF ROUTING output message has the following:

- File names which contain the file where the exception occurred and the decimal line number in the source file indicating the location where the assert was called are printed. This replaces the file numbers that were used in previous releases.
- The internal RTA event number has been replaced with a system integrity (SI) event number.
- If the HUNT field is NONE and/or the SIZE field is 0, the data in GRP and GRPTYPE is invalid.
- Four new fields have been added:
 - LPCR, LPID, and LUNQ contain the process number, processor number, and uniqueness value of the

message sender of the message specified in MSGTYPE.

- RTGSTS contains the decimal values of the internal routing states executed in this iteration of the RTA finite state machine.

```

  RTGSTS    1    0

```

Exhibit 2-11 RTA DCF Routing Error Message (5E13 Software Release)

The AM has a logfile called CALLPLOG for use by call processing exception handling routines. On the *UNIX*® terminal, the pathname to this file is /log/log/CALLPLOG.

New messages have been created to hold additional debugging information when an error in RTA occurs. These messages are always sent to the CALLPLOG file. These messages will not replace the functionality or information provided by the current DCF or RTA DCF ROUTING messages. When these messages are sent to the CALLPLOG file, a REPT DATA DUMP REPORT will print on the ROP to indicate that data has been sent to the CALLPLOG file.

2.6.2 MANUAL ACTION ASSERT MESSAGE

The manual action output message reports problems (typically, ODD-related problems) that can be corrected manually at the office. No stack frame, stack trace, or report data messages are printed. The manual action output message is identified by a "REPT MANUAL ACTION ASSERT=" field followed by a number which is used to locate the assert range and mnemonic, and the associated assert description in the Asserts Manual.

This message identifies the file name which contains the function where the exception occurred and the decimal line number in the source file indicating the location where the assert was called. It also provides a brief description of the problem that caused the assert failure.

```

A  REPT MANUAL ACTION ASSERT=3D40973 SM=3D2  EVENT=3D87
    DBloclog.c AT LINE 1546
    Commit of trigger function for relation FC_LINE failed. Error=3D-1

```

Exhibit 2-12 Manual Action Assert Message (5E13 Software Release)

2.6.3 ASSERT SUMMARY MESSAGE

An assert summary message for each processor may be printed every fifteen minutes. For the previous fifteen minute interval, the message lists the number of times each assert fired, the number of times an attempt was made to print the assert output on the ROP, and the number of times the assert output was discarded. If no failures occur, no summary is printed.

```

DEF-CHK-FAIL CODE : NUMBER OF OCCURRENCES : DISCARDED

25892 : 3 : 1
24035 : 1 : 0

```

Exhibit 2-13 Assert Summary Message (5E11 Software Release)

2.6.4 ASSERT OUTPUT CONTROL

2.6.4.1 Brevity

To avoid ROP clutter from asserts that fire often, output brevity control is provided in the SM, AM, and CMP processors. With brevity allowed, an attempt is made to print the first two complete instances of each assert that fires multiple times within a fifteen minute interval. All further instances of the assert are logged in the daylog. The assert summary message for each processor can be consulted to see the number of times each assert fired, the number of times an attempt was made to print the assert output on the ROP, and the number of times the assert output was discarded. With brevity inhibited, an attempt is made to print all instances of every assert.

Note that only an attempt is made to print assert output messages, regardless of whether brevity is allowed or inhibited. Assert messages can be discarded in favor of messages that have a higher priority, which includes any alarm message. When this happens, the higher-priority messages are printed on the ROP, and the discarded assert messages are lost.

Brevity can be inhibited using the **INH:BREVC** input message, and can be allowed using the **ALW:BREVC** input message. Brevity is allowed by default.

2.6.4.2 Assert Message Classes

The message class (MSGCLS) is a parameter assigned to every output message. It allows messages that have similar function or purpose to be grouped together. Message class is used to control message handling such as output device routing, logging, print suppression, and/or brevity control.

2.6.4.3 Message Volume Reduction

Only the stimulus messages of DCF asserts have a message class of ASRT and will print on the ROP unless full output is specified. The remaining DCF messages have a message class of ASRTMON and are logged in the daylog.

Assert messages that are logged in the daylog can be retrieved based on the event number. The DCF messages can be retrieved using the **OP:LOG** input message.

Manual action assert messages retain a message class of ASRT and are printed on the ROP.

2.6.4.4 Printmode

In the PH and PI, PRINTMODE is used to control assert output. PH and PI assert data is logged when the PRINTMODE option is off, which is the default case. With PRINTMODE on, PH and PI assert data is printed on the ROP.

PRINTMODE is controlled on a per SM basis; that is, from one to all PHs on a given SM may have their PRINTMODE status changed by a single command. Each SM must have its PRINTMODE status changed by separate commands.

2.7 USING THE ASSERTS MANUAL

Two sections of the Asserts Manual are used in tying the error code in an assert output message to the description of the problem that caused the assert failure — the Numeric Indexes section and the Assert Descriptions section.

Numeric Indexes This section is divided into subsections, one for each 5ESS[®] switch software release. Each subsection contains a list of all the error codes that exist in that particular software release. Listed with each error code is the processor recovery message (PRM) code, the assert range, and the assert mnemonic for that error code. For more information on PRMs, see the *Processor Recovery Messages Manual* (235-600-601).

Assert Descriptions This section contains descriptions of the problems that caused a particular assert to fail. The asserts are divided into assert ranges, each range contains functionally related asserts. The assert ranges are listed alphabetically, and the asserts within each range are listed alphabetically.

To find the description for an error code found in an assert output message, look up the error code in the appropriate subsection of the Numeric Indexes (for example, if your office is running under the 5E13 software release, look for the error code in the 5E13 Numeric Index subsection.) When you find the error code, note the assert range and mnemonic for that error code. Find the range in the appropriate subsection of the Assert Descriptions section, then look up the mnemonic.

2.8 New *UNIX*[®] Command For Accessing Assert Descriptions

A new command to access assert descriptions has been added to the 5E13 Software Release. Entered at a *UNIX*[®] prompt, it will output the assert mnemonic and description. To find the mnemonic and assert description of an assert error code, enter the following at a *UNIX*[®] prompt:

```
assert <error code>
```

3. ASSERT RANGES

3.1 ASSERT RANGE DEFINITIONS

Asserts are divided into ranges. Each assert range consists of functionally related asserts. This table lists each assert range (typically one per subsystem) and its definition.

4. MNEMONIC INDEX

4.1 INTRODUCTION

An assert mnemonic may be used in more than one range. For example, the mnemonic CMAPBFEB is found in the cm range as well as the dcm range. When this occurs, the mnemonic is listed with a line of information for each range.

Example:

MNEMONIC	RANGE	5E14	5E13	5E12	5E11
CMAPBADOP	cm	20642	20942	20942	20942
CMAPBFEB	cm	20637	20937	20937	20937
	dcm	3793	3793	3793	-
CMAPBFLL	dcm	3764	3764	3764	3764

5. NUMERIC INDEXES

New *UNIX*® Command For Accessing Assert Descriptions

A new command to access assert descriptions has been added to the 5E13 Software Release. Entered at a *UNIX*® prompt, it will output the assert mnemonic and description. To find the mnemonic and assert description of an assert error code, enter the following at a *UNIX*® prompt:

```
assert <error code>
```

USING THE NUMERIC INDEXES

This section lists the numeric assert error codes for each software release. To use this section, look up the error code from an assert output message in the appropriate subsection of the Numeric Indexes (for example, if your office is running under the 5E14 software release, look for the error code in the 5E14 Numeric Index subsection.) When you find the error code, note the range and mnemonic for that error code. Find the range in the appropriate subsection of the Assert Descriptions section, then look up the mnemonic within that range. (Sections 6 , 7 or 8).

ASSERT ERROR CODES

A group of assert error codes has been assigned to each *5ESS*® switch subsystem or major area of development (range) within a subsystem. If a subsystem outgrows its assigned limits during the development of a software release, its group of codes is grown, which may force the upper and lower limits for other subsystems to shift. The following example shows that the assert error code limits for the system integrity (SI) subsystem shifted between software releases.

Limits	Software Release
24550-24968	5E11
24600-25018	5E12
24600-25018	5E13
24300-24718	5E14

A shift in the assert error code limits between software releases may result in an individual assert mnemonic having different assert error codes in different software releases. It is, therefore, important to reference the mnemonic, the error code, and the software release when escalating an assert problem to your next level of support. The following error codes are for the INPORTLA mnemonic which is an assert found in the SI subsystem.

Mnemonic	Error Code	Software Release
INPORTLA	24760	5E11
INPORTLA	24810	5E12
INPORTLA	24810	5E13
INPORTLA	24510	5E14

PROCESSOR RECOVERY MESSAGE CODES

The Processor Recovery Message (PRM) codes listed in the Numeric Indexes are the hexadecimal equivalents of the assert error codes. If an assert occurs when the AM is not fully operational, a PRM will print in which the fifth digit is "C," the sixth digit is "0," and the thirteenth through sixteenth digits are the assert number in hexadecimal. For example, in the following PRM, the assert error code is 0AB2 in hexadecimal.

```
EE41 C000 0000 0AB2
```

For asserts in PRMs, no additional messages such as stack trace or stack frames are printed.

GLOSSARY

Access Dictionary

An array of access blocks, each of which contains access information for a given version of a relation.

Access Methods Package

The database software that furnishes database access by mapping tuple keys to logical addresses.

Administrative Module (AM)

The 3B20/3B21 unit consisting of control units, disk file controllers, disk drives, main stores, input/output processors, and the common network interface (CNI) ring. The AM controls the overall operation of a 5ESS[®] switch.

Administrative Services Subsystem

The subsystem that collects, processes, and transmits information about switching activities.

Application Integrity Monitor (AIM)

The subsystem environment that oversees the detection and correction of software faults in application software.

Assert

A defensive check used to verify software consistency within a processor. Asserts can detect errors, but cannot recover lost resources.

Assert Handler

The software that is invoked when a defensive check fails. Assert handlers are responsible for reporting and recovering from a defensive check failure.

Assert Message Brevity

The central processor intervention feature that limits the number of assert output messages that are printed on the read only printer (ROP).

American Standard Code for Information Exchange (ASCII)

A standard 8-bit code used for exchanging information among data processing systems and associated equipment.

Attribute

A column of a relation.

Audit

Major programs used to detect, confine, and recover software data errors before system performance is adversely affected.

Automatic Call Back (ACB)

A feature that allows the subscriber, after reaching a busy station, to hang up the telephone then dial the activation code and the busy station directory number to activate automatic call back. When the busy station goes onhook and the calling station is onhook, the calling station will receive a distinctive ringing pattern. When answered, a call will automatically be completed to the previously busy station.

Automatic Line Insulation Test (ALIT)

An automatic system that checks for the presence of foreign potentials (voltages) and for leakage on customer loops. The ALIT does not test 4-party lines with full-selective ringing or 8-party lines.

Automatic Message Accounting (AMA)

The automatic accumulation of call data such as calling number, called number, date, time, duration, etc. that will be processed to render a customer's telephone bill.

Autoquote (AQ)

An operator services position system (OSPS) feature whereby OSPS time and charges are automatically relayed to a printer in an automatic charge quotation service (ACQS) establishment.

Base Relation

A relation that is physically stored in the database.

Basic Rate Interface (BRI)

Provides data and voice communications simultaneously, plus circuit switched and packet switched services. BRI serves small-end systems such as voice-data work stations, multibutton voice stations, and terminal adapters for non-ISDN devices. Also known as digital subscriber loop in the ISDN network.

Block

- 1) A tuple.
- 2) 512 contiguous bytes of memory.

Breakpoint

A programming entity that enables users to halt a process running in a switching module (SM), execute a predefined set of utility functions, and resume execution of the process.

Brevity

The feature that limits the number of output messages that are logged and printed.

Business and Residential Custom Features (BRCS I and II)

The custom calling features and centrex services that can be packaged to meet individual customer needs.

Business and Residential Custom Services (BRCS)

A 5ESS[®] switch feature package that provides a logical grouping of features and groups that are used by a business customer who receives communication services from a 5ESS[®] switch.

BX.25

Lucent Technologies Bell Laboratories version of the Consultative Committee for International Telephone and Telegraph (CCITT) protocol X.25.

C

The high-level programming language which is used to write most of the 5ESS[®] switch software is written.

Call Forwarding (CF)

A 5ESS[®] switch feature that allows the customer to specify a different destination code for incoming calls. When a call comes in for a call-forwarded number, it is rerouted to the specified location.

Call Processing

The activities involved in transmitting voice and data calls from inception, through the network, to their final destination. Three subsystems handle call processing: feature control (FC), routing and terminal allocation (RTA), and peripheral control (PC).

Call Record

A fixed-size block of memory associated with each call processed by the switching system.

Common Channel Signaling (CCS)

An interoffice signaling scheme in which address and supervision signaling is carried over a data network rather than over the message network.

Communications Module (CM)

The hardware that provides the interface between the switching modules (SMs) and the administrative module

(AM). In a multimodule office, the CM consists of the message switch (MSGS) and the time multiplexed switch (TMS).

Concentrator

A digital switching entity that permits a greater number of customers to share common output lines. For example, a 2:1 concentrator permits 48 customers to share the 24-channel capacity of a single T1 line.

Constructed Feature

A feature defined by a 5ESS[®] switch user for their own unique needs.

Consultative Committee for International Telephone and Telegraph (CCITT)

An international advisory committee under United Nations sponsorship that has composed and recommended for adoption worldwide standards for international communications.

Crosscheck

A process that verifies the accuracy and completeness of the office dependent data (ODD) translation assignments.

Customer Originated Recent Change (CORC)

The feature of the Business and Residential Custom Services (BRCS) that allows business and residential customers to enter recent change transactions without assistance from the operating company.

Data Base Manager (DBM)

The subsystem that provides facilities for accessing and updating all translation data.

Data Delivery (DD)

A mechanism that delivers status bits from the administrative module (AM) to the switching modules (SMs) to inhibit and allow routine audits.

Data Tuple

One of the three types of tuples in a relation. Data tuples are the tuples requested and manipulated by call processes.

Defensive Check

A synonym for assert.

Diagnostics

The programs that locate faults and verify repairs.

Dictionaries

A database in the memory structure of the 5ESS[®] switch that contains information such as access type, relation and attribute identification, number of subattributes, and domain identification.

Direct Link Node (DLN)

A type of common network interface (CNI) ring node that moves the common channel signaling (CCS) processing from the administrative module (AM) to the DLN, relieving CCS real time constraints on the AM.

Direct Memory Access (DMA)

Provides main store access control for input/output devices and other processors without requiring direct control from the administrative module (AM).

Directory Number

A 7-digit number consisting of a 3-digit central office code and a 4-digit station number.

Distribute Point Number (DPN)

Identifies the location of distribute points on the metallic service unit (MSU).

DMERT (Duplex Multi-Environment Real-Time system)

The main operating system in the 3B central processor.

Domain

In a database, the set of allowable values that an attribute may have.

Dummy Tuple

One of the three types of tuples in a relation. Dummy tuples are the first tuples in each relation; they normally contain all zeros and are used to detect sporadic system abnormalities such as wild writes.

Dynamic

In the context of data in memory, dynamic means not write-protected. In the context of data structures, dynamic means that the data structure uses linkage.

Dynamic Office Dependent Data (ODD)

Dynamic ODD is switching module (SM) memory that is required for call processing. Dynamic ODD is engineerable, but not assignable. Also known as unprotected ODD (UODD).

Dynamic Relation Dictionary

An array of description blocks, each of which defines the current (most recent) version of the associated relation.

Elevated Segmented Mode

The mode of operation in which audits run at priority 1 and take real-time breaks.

Engineering and Administrative Data Acquisition System (EADAS)

A traffic data collection system and a network administration reports system that provides the interface between an electronic switch and the total network data system (TNDS).

Escalation

A recovery action taken when a critical resource is in error and taking segment breaks before the error is corrected would further degrade processing.

Event

- (1) A system fault. Events are assigned event numbers that are printed in the output messages.
- (2) A two-bit piece of information sent by a process to notify another process about an impending message.

Feature Button (FB)

A one- or two-lamp, nonfixed button on an ISDN station that has been assigned to a specific feature. The feature button is used to request (such as, activate/deactivate) that feature.

Feature Control (FC) Subsystem

The call processing subsystem responsible for sequencing call processing actions at a hardware independent level.

FIFO (first-in, first-out)

A synonym for queue.

Form

A format displayed on a video display terminal and used by maintenance personnel to query and update the office database.

Form Check

A program-initiated operation in which individual attributes on a form are checked for compatibility with every other attribute.

Full Initialization

The form of initialization in which stable calls (those in a stable talking state) are disconnected.

Fully Loaded Switching Module (SM)

An SM that contains the full complement of software releases, allowing that SM to support any 5ESS® switch feature.

Generic Access Program (GRASP)

A utility program residing in the administrative module (AM) that helps verify application programs and localize and resolve problems.

Global Data

The data in memory that is not allocated on a software release basis or at compile time to individual subsystems.

Head Cell

One of the three types of tuples in a relation. Head cells are used as owners for idle resources.

Head Table

A table containing pointers to pages of memory.

Hunting

The process of selecting one of a set of available ports to satisfy a calling customer.

Idle List

- (1) A linked list of available nodes.
- (2) A list of idle resources linked to a head cell.

Incoming Calls

From the perspective of a switch, calls that originate on trunks and are routed either to other trunks (tandem) or to lines.

Index

A number that specifies an element in an array.

Individual Dialing Plan (IDP)

A feature that allows dialed digits to be interpreted according to a line or trunk personalized dialing plan (based on the customer wishes) instead of through the regular digit interpreter.

Insanity

The condition of the system in which abnormal processing occurs.

Integrated Services Digital Network (ISDN)

A collection of features that provides a customer with simultaneous voice and data over an end-to-end digital network.

Integrated Subscriber Loop Carrier System (SLC-96)

The call processing system consisting of remote terminals and hardware in the switching modules (SMs) that provides low-cost service to remote customers.

Inter-LATA Carrier (IC)

A carrier designed to service traffic that crosses a local access and transport area (LATA) boundary.

Interoffice

The trunk groups between two separate switching machines or the traffic carried by such trunk groups.

Interprocessor Data Synchronization (IDS)

A means of synchronizing interprocessor redundant dynamic data by using interprocessor messages.

Item

A word of memory within a tuple, a portion of a word of memory within a tuple, or a number of consecutive words of memory within a tuple.

Kernel Process

A logical collection of software running at the level closest to the machine.

Key

A mandatory attribute of a view that must be completed successfully in order for the user to have access to the database. It is the index into the view.

LIFO (last-in, first-out)

A synonym for stack.

Line Equipment Number (LEN)

An 8-digit number used in translations to identify a customer's line so that it may be accessed. Uses the convention "AAABCDEF," where AAA identifies the switching module (SM) number, B identifies the concentrator group, C identifies the concentrator, D identifies the switch group, E identifies the switch, and F identifies the level.

Line Unit (LU)

An interface unit that terminates individual, party, coin, and range extended lines.

Link

A connection between tuples implemented by placing within one tuple the address (or physical key) of another tuple.

Linked List

A dynamic list in which nodes contain pointers to other nodes.

Link Nodes (LN)

The part of the common network interface (CNI) that performs message handling protocol, control functions, and self-diagnostics. Link nodes establish connections to the signaling network using A-links.

Link-sharing

A type of linkage that is used in special cases such as custom calling features where one process owns many ports.

List Pointer

A type of physical linkage that indicates the first node of a list.

Local Access and Transport Area (LATA)

A defined geographical area where equal access end offices and/or access tandem offices can provide carrier access to the local exchange.

Local Digit Interpreter Table (LDIT)

Defines all area, office, and service codes (numbering plan area [NPA], NXX, X11, etc.) in the office dependent data (ODD).

Logical Key

A number used to specify a tuple. It is equal to the physical key minus the number of head cells plus one.

Maintenance

The activities involved in detecting internal errors and recovering faults.

Mapping

A synonym for linkage.

Master Control Center (MCC)

Provides the manual interface to a 5ESS[®] switch. Consists of a video display terminal with keyboard, a read only printer (ROP), and a key telephone set.

Message

Communication consisting of one or more recognizable bits of data. The method by which processes communicate with each other.

Metallic Service Unit (MSU)

Provides metallic access, miscellaneous scanning and distribution functions, and automatic line insulation test (ALIT) capabilities.

Module Message Processor (MMP)

Circuitry in the message switch (MSGS) that handles control message protocol on the link to the switching modules (SMs).

Multi-level Key

A key consisting of a high-order part used to look up the address of a member page in a head table, and a low-order part used to look up a tuple on the member page.

Multiline Hunt Group (MLHG)

A group of customer facilities that are identified as a group in translations. When calls are placed to the MLHG, the 5ESS[®] switch hunts for an idle member in the group beginning with the dialed directory number (DN).

Network Call Denial (NCD)

Enables a carrier switch to block inter-LATA calls from non-paying customers.

Network Control and Timing (NCT)

A fiber optic link that connects a switching module (SM) to the time multiplexed switch (TMS), provides time slot paths for network connections, carries a control time slot to the SM, and distributes timing to the SM.

Network Management (NM)

A set of real-time procedures for optimizing network performance when the network is under stress due to adverse conditions. The NM provides control and surveillance features that aid in maintaining the network integrity and security during overloads and failures.

Node

A component of a linked list consisting of data and one or more pointers to other nodes.

Nonreturning Assert

An assert that does not return program control to the calling function, and also purges the current process.

Office Data Administration (ODA)

The mechanism for assembling initial translation information for a 5ESS[®] switch. Information is entered by means of a video terminal, assembled in an ODA computer, then sent to the 5ESS[®] switch.

Office Data Base Editor (ODBE)

A feature of 5ESS[®] switch memory management that allows information contained in the database to be changed manually.

Office Dependent Data (ODD)

The database, specific to a particular office, that contains unique trunk and line assignments, thereby allowing the office to process call traffic.

Office Records (OFR)

For the 5ESS[®] switch, tabular listings of actual inventories and assignments to the database that serve as a means for administering an office.

One-to-one Linkage

The linkage between two tuples in which each tuple has a single link to the other tuple.

Operating System (OS)

Software that enables a computer to supervise its own activity.

Operating System for Distributed Switching (OSDS)

The operating system that controls the functions of the switching system. The 5ESS[®] switch contains several instances of OSDS: one in the switching module (SM), one in the switch maintenance kernel process (SMKP), and one in the operational kernel process (OKP).

Operational Kernel Process (OKP)

An environment in the administrative module (AM) in which application-oriented call processing occurs.

Operator Number Identification (ONI)

A means of obtaining billing information by connecting the calling party to an operator position.

Operator Services Position System (OSPS)

A feature of the 5ESS[®] switch that provides operator and attendant services, such as directory assistance and toll and assistance (T/A).

Originating Calls

Calls that originate on lines and are routed either to other lines (intra-office) or to trunks (interoffice).

Owner

A tuple that is linked in an owner-member linkage to a list of member tuples.

Outgoing Calls

Calls that are routed to trunks.

Outgoing Trunk

A one-way trunk that allows only originating traffic to access a distant office to complete telephone calls. Traffic originated at a distant office cannot access this trunk.

Owner-member Linkage

A linkage between an owner tuple and a number of member tuples. The member tuples are arranged in a doubly linked list with each member tuple having an additional link to the owner tuple. The owner tuple has links to the first and last member tuples.

Parameters

Parameters define resources (lines, screening indexes, etc.) that are used as key attributes in database relations to describe the makeup of the 5ESS[®] switch.

Peripheral Control (PC) Subsystem

The call processing subsystem that acts upon customer requests collected by the feature control (FC) subsystem and insulates the FC and terminal maintenance (TM) subsystems from changes in hardware configuration.

Peripheral Controller

Circuitry in the input/output processor (IOP) that interfaces with peripherals outside of the administrative module (AM).

Physical Linkage

The type of linkage occurring between records both in network and in hierarchical databases. Physical linkages use pointers within each record to lead to other records.

Plain Old Telephone Service (POTS)

Basic voice service using a telephone.

Pointer

A variable or item that contains a value giving the location of some entity such as another node, item, or variable.

Point-to/point-back Check

A verification process that determines whether a relation pointed to from a source relation points back to the source relation.

Popping

The operation of removing a node from a stack.

Preconstructed Feature

A feature defined by Lucent Technologies and available to all 5ESS[®] switch users.

Primary Rate Interface (PRI)

A 1.544 Mbps digital interface containing twenty-three 64 Kbps B-channels for the transport of end user information (such as voice and data), plus one 64 Kbps D-channel for control signaling. PRI serves relatively large customer premises such as private branch exchange (PBX) or mainframe computers.

Primitive

An elementary operation performed by one subsystem for another subsystem.

Private Branch Exchange (PBX)

A customer premises switching system that allows a group of lines to make intragroup calls on an extension-dialed basis, and also allows direct inward dialed calls from a regular telephone network.

Private Facilities Access (PFA)

A feature that allows subscribers to have dial access to various types of public and private switching arrangements.

Process

A collection of related logical segments (programs and data) that can be brought into memory to form an executable entity.

Process Errors

The errors associated with a single identifiable process.

Process ID (PID)

The unique identifier assigned to each process as it is created.

Protected Office Dependent Data (ODD)

ODD that establishes the type and amount of equipment that comprises the office (lines, trunks, etc.). Formerly referred to as static ODD.

Pushing

The operation of adding a node to a stack.

Queue

A waiting list, usually consisting of processes or tasks, that the processor will execute when time is available.

Read Only Printer (ROP)

A printer used only for receiving messages at the master control center (MCC).

Recent Change (RC)

A system function that allows field personnel to make in-service, memory assignment changes to the 5ESS® switch database.

Recent Change and Verify (RC/V)

A stand-alone subsystem, provided at the 5ESS® switch office, that allows maintenance personnel to change or verify the database using menu selections at a video terminal. RC/V includes the ability to back out of selected recent change messages and to restore the database to a previous condition.

Record

A collection of data items (attributes) present in a row of the tabular office records database.

Recorded Announcement Function (RAF)

A feature that provides independent playback of prerecorded, variable length, and variable content operator services position system (OSPS) announcements.

Relation

A rectangular data table (matrix) that has rows called tuples and columns called attributes.

Relational Database

A type of database that organizes data in a tabular form of rows and columns.

Re-order Tone

An audible, low tone signal sent to the calling party to indicate that the call cannot be completed. Re-order tone is sometimes called fast busy.

Route Index (RI)

A code used in selecting the path a call will take through an office.

Routing and Terminal Allocation (RTA) Subsystem

The call processing subsystem that determines whether a call can be made between a given source and destination. The appropriate detailed routing information required to allocate system resources for that call is obtained from the database manager (DBM).

Sanity

The normal processing state of the system.

Sanity Timer

The system integrity measure that detects malfunctions by checking the time required to perform system processes.

Screening

A translation process that determines the type of treatment that a line should be given. Screening information is used during routing.

Selective Initialization (SI)

The form of initialization in which transient calls (those not in a stable talking state) are disconnected.

Single Process Purge (SPP)

The form of initialization in which a single process is terminated.

Soak

The process of leaving a software update (formerly called broadcast warning messages [BWMs]) in the switch for a period of time to allow the associated update to interact with other parts of the system.

Software Release

A fixed software program that makes up the basic operating system and is the same in all 5ESS® switch offices with the same software release name and issue. The software release uses individual office translations to allow different features from office to office. Formerly called generic.

Soft Switch

A software switch designed not to interrupt call processing. Often referred to as a "data preserving" software switch.

Software

Programs and routines that are used to communicate with a processor.

Software Change Administration and Notification System (SCANS)

A dial-up system that uses a 2048 data set to distribute stored program control updates to the telephone company in the form of software updates (formerly called broadcast warning messages [BWMs]). SCANS serves the responsible Switching Control Center System (SCCS).

Software Update

A software change administration and notification system (SCANS) message that contains software changes (binary overwrite data) in control programs and or related data for maintenance personnel. Formerly called broadcast warning messages (BWMs).

Speed Calling (SC)

A feature that allows the customer to associate a digit string with a 1- or 2-digit code. The 5ESS® switch looks up the encoded string, then uses it to route the call.

Stable Call

The condition reached after all switching functions have been completed and a talking state is established.

Stack

A linked list in which additions and deletions can only be made at one end. A synonym for a last-in first-out (LIFO) list.

Static

In the context of data in memory, static means write-protected.

Static Office Dependent Data (ODD)

ODD that establishes the type and amount of equipment that comprises the office (lines, trunks, etc.). The protected area of memory. Also known as protected ODD.

Subsystem

The 5ESS® switch software for a specific set of functions.

Switching Module (SM)

Equipment that connects all external lines and trunks to the 5ESS® switch and handles most call processing

tasks. The SM converts signals received from lines and trunks into the internal digital time-division format of the office.

Switch Maintenance Kernel Process (SMKP)

The program that controls the execution of the audits related to 5ESS[®] switch call processing that are not controlled by the operating system for distributed switching (OSDS).

Switch Maintenance (SM) Subsystem

The maintenance subsystem that protects the switching system from hardware problems in the interface modules and peripheral units.

System Integrity Monitor (SIM)

The subsystem environment that oversees the detection and correction of insanity.

System Process (SP)

A process that provides services on a system-wide basis. System processes are created and terminated independent of call processing and do not share their programs with other processes.

Terminal Maintenance (TM) Subsystem

The maintenance subsystem that protects the switching system from problems in trunks, lines, service circuits, and signaling paths.

Terminal Process (TP)

A software process in the switching module processor (SMP) that controls a terminal (line, trunk, or channel) during a call or call attempt. The TP is created and exists only as long as the terminal it controls is active.

Terminating Calls

Calls that are routed to lines.

Three-Way Calling

A custom calling feature available to individual noncoin, non-PBX lines that allows a customer to establish a talking connection between that line and two other lines or trunks.

Time Slot

The unit of time during which a single communication sample is sent through the network.

Traffic Measurement

Data that shows the current status of the 5ESS[®] switch. This data is often used to validate the need for additional switch resources.

Transaction

The means used by the initialization and maintenance code to read port assignments, service status, etc., and to manually add recent change information to the database.

Transient Call

A telephone call that is not in the stable call (talking) state. For example, a call in the dialing or ringing state.

Trigger

An event that causes the occurrence of another event.

Trunk

The facility used for transmission and/or signaling that exists between two different entities, such as central offices, sections of the same switching system, etc.

Trunk Group

In the context of a 5ESS[®] switch, four channels in a trunk unit (TU) that are in the same maintenance failure

group.

Trunk Line and Work Station (TLWS)

Gives maintenance personnel access to lines and trunks, provides an interface to circuit administration, and supports portable testing equipment such as voltmeters and transmission measuring sets.

Trunk Unit (TU)

An analog interface unit that terminates a wide variety of loop and ear and mouth (E&M) trunks. High traffic lines that do not require ringing, such as PBX direct inward dialing (DID) trunks, may also be terminated.

Tuple

A row in a database relation (table). In the 5ESS[®] switch database, a tuple is a fixed-length record that consists of a number of items.

Two-Party Service

Provides telephone service to a maximum of two customers on a common terminal appearance on the network.

UNIX[®]-RTR Operating System

A real-time operating system that uses a UNIX[®] supervisor.

Unprotected Office Dependent Data (UODD)

UODD is switching module (SM) memory that is required for call processing. UODD is engineerable, but not assignable. Formerly referred to as dynamic data.

Verify

A database operation that enables a user to read office data using the view-level interface.

Video Display Terminal (VDT)

In the 5ESS[®] switch, a terminal that provides voice and call information to an operator.

View Mapping

A bi-directional mapping between a database view and its respective base relations.

View

A virtual database relation (table) whose tuples (rows) are not physically stored in the database.

Wild Write

Data corruption that occurs when a program writes meaningless data into an incorrect data area. Wild writes are usually caused by software errors.

6. ASSERT DESCRIPTIONS FOR RANGES ACD - DXTERA

INTRODUCTION

The Assert Descriptions section contains, for each assert, a description of the problem that caused the assert to fail.

A manual action assert description consists of a Problem section which describes the problem, a Data Structures section which identifies the relations that were involved, and an Action section which describes how to fix the problem. Since a manual action assert usually reports office dependent data (ODD) related problems, it can be fixed manually at the office.

A defensive check failure (DCF) assert, however, typically reports software errors that cannot be fixed at the office and may necessitate contacting your next level of support, particularly if it fires often. A DCF assert description contains a description of the problem; but it does not contain a Data Structures or Action section.

The asserts are divided into ranges. The assert ranges are organized alphabetically in this section; then the asserts within each range are listed alphabetically by mnemonic and are presented in the following manner:

MNEMONIC: (software release)

```

(a)                (b)
Recovery Action: (c)      SPP: (d)      Audit: (e)      Audit Mode: (f)
Problem:
(g)
```

where:

(a)	Lists the mnemonic that identifies the assert.
(b)	Lists the software release(s) that this assert is found in.
(c)	Describes the recovery action that is triggered by the assert. Possible values are si The system invoked a selective initialization. spp The system initiated a single process purge. rpi The system returned control to the program at the point of interrupt; escalation possibly occurred. If a dash precedes ``rpi," no escalation occurred.
(d)	Indicates whether the assert initiated a single process purge (SPP) of a nonrunning process. Values are "y" for yes and "n" for no.
(e)	Lists the audit scheduled to run (if any) as a result of the assert failure. Currently, each assert may invoke only one audit. If no audit is scheduled, the value is "null."
(f)	Describes the mode the scheduled audit will run in. Possible values are elev The audit will run in the elevated segmented mode. nonseg The audit will run in the nonsegmented mode. null No audit is scheduled.
(g)	Contains an explanation of the problem that caused the assert to fail. Descriptions of manual action asserts contain additional information describing the data structures that are affected and the action(s) needed to solve the problem.

The technical content of this section is constantly updated. Addendums to this section of the manual have a high priority and are distributed promptly.

Range: acd**1. ACABNCQ (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not get a call queue data block (CQDB) for the call indicated in the MGOP_CABN message. The MGOP_CABN message is dumped.

2. ACABNCQOWN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CQDB	Audit Mode: elev

Problem:

Could not get the owner of a call queue data block (CQDB). The CQDB and the MGOP_CABN message are dumped.

3. ACABNLNK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CQDB	Audit Mode: elev

Problem:

Failed to remove an operator conference or transfer from a queue after the calling party abandoned. The failure occurred when attempting to retrieve the linked rISTQDB tuple for the given rICQDB tuple.

4. ACACDBMG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message type passed as the feature ID (FID) is in the feature activation table (FAT), but the FID is not recognized by this switch statement. The message head is dumped.

5. ACACKMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to forward a login acknowledgement to operator actions (OA) failed. The OSSENDMSG() macro return code is dumped.

6. ACACKPC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A dynamic access (DA) primitive failed to find the owning process control block link area (PCBLA) for a port. The return code is dumped.

7. ACACWMDT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read a tuple in the static relation RLMODATT. The rIMODATT tuple is dumped.

8. ACACWMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The attempt to send the MGCALL_WT message failed. The return code from the OSSENDMSG() macro is dumped.

9. ACACWSVTM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A dynamic access (DA) macro failed to obtain an rHCSESVTM tuple. The rHCSESVTM tuple is dumped.

10. ACADMHCQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the static relation RLCTINFO. The rICTINFO tuple is dumped.

11. ACASVDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The return code from a dynamic access (DA) primitive was not expected. The return code is dumped.

12. ACASVPST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The position state within the serving team queue data block (STQDB) is not an accepted value. The contents of the STQDB is dumped.

13. ACASVSRVT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HCSESVTM	Audit Mode: elev

Problem:

A dynamic access (DA) primitive could not add a serving team queue data block (STQDB) to a queue. The returning error code indicated a problem with the head cell tuple rHCSESVTM.

14. ACASVSTQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HCSESVTM	Audit Mode: elev

Problem:

A dynamic access (DA) primitive could not perform the requested action on a serving team queue data block (STQDB).

15. ACBADQCDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not get the call queue data block (CQDB) for the call indicated in the MGACCHKQUE message. The MGACCHKQUE message is dumped.

16. ACBSDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The return code from a dynamic access (DA) primitive was not expected. The return code is dumped.

17. ACBSPST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The position state in the serving team queue data block (STQDB) is not an expected value. The STQDB contents is dumped.

18. ACBSSRVT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STINFO	Audit Mode: elev

Problem:

A dynamic access (DA) primitive could not perform the requested action. The return code indicated a problem with the head cell.

19. ACBSSTQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HCSERVMT	Audit Mode: elev

Problem:

A dynamic access (DA) primitive could not perform the requested action on a serving team queue data block (STQDB).

20. ACCDANTC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failure occurred when reading the RLAC_TKCT relation with the oppcid (operator pre-call ID) and tgroup (trunk group) keys.

21. ACCDANTK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read error occurred when reading the RLFC_TRUNK relation using the port and party as keys.

22. ACCDNOTC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

*Problem:

A database read failure occurred. No rIAC_TKCT tuple was found for the oppcid (operator pre-call ID) value.

Data Structures:

RLAC_TKCT. Key fields: oppcid, tgroup (trunk group).

Action:

Search the RLAC_TKCT relation for a tuple with the oppcid key. The key tgroup is defaulted to 9999. If no tuple is found, use RC/V to insert a tuple. If a tuple exists, write an initial modification request (IMR).

23. ACCDNOTK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No rIFC_TRUNK tuple was found for the port. A database inconsistency exists between the RLPCBLA and RLFC_TRUNK relations for a given port.

Data Structures:

RLFC_TRUNK. Key field: port.

Action:

Search the RLFC_TRUNK relation for a tuple with the port key. If no tuple is found, use RC/V to insert an rIFC_TRUNK tuple. If a tuple already exists, contact the product engineering control center (PECC) and write an initial modification request (IMR).

24. ACCQDETRD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failure other than "no match" occurred when reading the RLAC_CQDET relation. The DBfrdtup() primitive returned DBRELNAME_BAD (invalid relation name), DBRESOURCE (database resource failure), DBSYS_ERR (database system error), or some other database error other than DBNO_MATCH.

Data Structures:

RLAC_CQDET. Key fields: ta_type, prefix, coin, ospsid, carrier.

25. ACCTDETF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An entry is missing in RC/V View 26.9 (OSPS ACD CALL TYPE) for a particular set of parameters for an incoming operator services position system (OSPS) toll and assistance call type. The RC/V field values for the keys are dumped. For non-decimal keys, the corresponding decimal value is dumped. If a non-decimal key is dumped as "XXX", there is a data dumping problem with the assert. The correct decimal value is dumped.

Data Structures:

RLAC_CTDET. Key fields: CALL ORIGIN, PREFIX, COIN, CARRIER, OSPS ID.

Action:

Use RC/V View 26.9 (OSPS ACD CALL TYPE) to insert an entry with the key values dumped. If an entry exists, there is a code error, base relation data population problem, or data split.

26. ACCTDETQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfrdtup() primitive returned failure when reading the RLAC_CQDET relation; the key could not be found.

Data Structures:

RLAC_CQDET. Key fields: prefix, carrier, ta_type, coin, ospsid. The prefix key is an enumeration of prefixed digits, carrier is an enumeration of carrier, ta_type is an enumeration of toll and assistance (T&A) call, coin is a boolean coin indicator, and ospsid is the operator services position system (OSPS) switch identifier 1-9999.

Action:

Use RC/V View 26.10 (OSPS ACD CALL TYPE) to search the RLAC_CQDET relation for a tuple with the keys printed. If no tuple is found, use RC/V to insert a tuple. If a tuple does exist, contact the product engineering control center (PECC) and write an initial modification request (IMR).

27. ACCWTPDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TAPOSDB	Audit Mode: elev

Problem:

A dynamic access (DA) macro failed to get an rITAPOSDB tuple. An audit of the RLTAPOSDB relation is scheduled.

28. ACECTDDX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The expanded call type determination relation RLAC_DESTX indicates an additional relation read which is erroneous.

Data Structures:

RLAC_DESTX. Key fields: ta_pcid (pre-call identifier), destx (destination index).

Action:

Use RC/V View 26.10 (OSPS ACD CALL TYPE) to search the RLAC_DESTX relation for a tuple with the keys printed. Examine the use_next field. The use_next field may be incorrectly set to DESTX, indicating the same relation. Or, it may be erroneously set to TGRP when the RLAC_TGRP relation was already read.

29. ACECTDTG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The expanded call type determination relation RLAC_TGRP indicates an additional relation read which is erroneous.

Data Structures:

RLAC_TGRP. Key fields: ta_pcid (pre-call identifier), tgroup (trunk group number).

Action:

Use RC/V View 26.10 (OSPS ACD CALL TYPE) to search the RLAC_TGRP relation for a tuple with the keys printed. Examine the use_next field. The use_next field may be incorrectly set to TGRP, indicating the same relation. It may also be erroneously set to DESTX when the RLAC_DESTX relation was already read.

30. ACFDCBCT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The count of automatic call distributor (ACD) call types served by an operator serving team is incorrect.

Data Structures:

RLSTINFO. Key field: serv_tm.

Action:

Contact the product engineering control center (PECC). Verify the operator services position system (OSPS) serving team to call type map for the indicated serving team. Use ODBE to update the rLSTINFO tuple for this team. Set the ct_count value equal to the sum of bits that are on in the verify view. Use ODBE on the AM and all SMs with OSPS positions.

31. ACFDCCLTQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CTINFO	Audit Mode: elev

Problem:

The rHCCALLTQ tuple for the call type was not found, although the call type is equipped; that is, an rCTINFO tuple exists for the call type.

32. ACFDCCQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HCCALLTQ	Audit Mode: elev

Problem:

Could not get the head call's call queue data block (CQDB) from the given rHCCALLTQ tuple. The rHCCALLTQ tuple is dumped.

33. ACFDCNEG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HCCALLTQ	Audit Mode: elev

Problem:

A negative number of calls was encountered in a queue. The rHCCALLTQ tuple is dumped.

34. ACFDCNOCT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rCTINFO tuple was not found for the operator services position system (OSPS) serving team call type given.

Data Structures:

RLCTINFO. Key fields: serving team, call type.

Action:

The indicated call type is not defined in the RLCTINFO relation, although the RLSTINFO relation indicates that the call type should be defined. Verify the OSPS serving team to call type map for the serving team indicated. The indicated call type's bit will be on. Insert this call type via RC/V, using this serving team. Then delete this same call type. Verify that call type's bit is now off in the OSPS serving team to call type map.

35. ACFDCNSST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The team lists queue is listed as a supporting queue in one of the sctmsk attributes in the RLSTINFO relation, but the queue does not list the team as a supporting team in one of the sup_tm attributes in the RLCTINFO relation.

Data Structures:

RLCTINFO, RLSTINFO.

Action:

Determine from administrators whether the team should be listed as a supporting team for this call type queue. If the team is a supporting team for this queue, use ODBE to update the RLCTINFO relation in all SMs and the AM to include this team in the supporting team list. Also, verify the supporting team's delay outflow threshold.

If the team is not a supporting team for this queue, use ODBE to turn off this queue's bit in the appropriate sctmsk attribute in the RLSTINFO relation for all processors listed in operator services position system (OSPS) group 2 [AM and all packet switching modules (PSMs)]. Verify that the attribute sct_count is equal to the count of bits that are on in all the sctmsk attributes. The sctmsk1 attribute refers to queues 1-32, sctmsk2 refers to queues 33-64, sctmsk3 refers to queues 65-96, and sctmsk4 refers to queues 97-128. The rightmost bit corresponds to the lowest numbered queue (for example, bit 0 in sctmsk2 corresponds to queue 33). After updates have been made and correct handling has been verified, backup the office dependent data (ODD). Notify the product engineering control center (PECC) of the problem.

36. ACFDSSPTM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HCSERVTM	Audit Mode: elev

Problem:

The rIHCSERVTM tuple for the supporting serving team was not found. The serving team number is dumped. The AUHCSERVTM audit is scheduled.

37. ACFDSSTQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HCSERVTM	Audit Mode: elev

Problem:

Could not get the head serving team queue data block (STQDB) from the given rIHCSERVTM tuple's available list. The rIHCSERVTM tuple is dumped.

38. ACICLCLTQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to insert a tuple in the RLHCCALLTQ relation. The rIHCCALLTQ tuple is dumped.

39. ACICLCTFO (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read a tuple in the static relation RLCTINFO. The rICTINFO tuple is dumped.

40. ACICLDEF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid mode was given to automatic call distributor (ACD) when initializing the RLHCCALLTQ relation. The rIHCCALLTQ tuple is dumped.

41. ACICQCLTQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CTINFO	Audit Mode: elev

Problem:

A dynamic access (DA) macro failed to obtain an rIHCCALLTQ tuple. An audit of the RLCTINFO relation is scheduled.

42. ACICQCQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to insert a tuple in the RLCQDB relation. The rICQDB tuple is dumped.

43. ACICQGP1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the global parameter Glcqdbx when the DBrfgparm() primitive was called from the ACincqdb() function in the file rta/ACrcv/ACincqdb.c.

44. ACICQGP2 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the global parameter Glcqdbx when the DBrfgparm() primitive was called from the ACincqdb() function in the file rta/ACrcv/ACincqdb.c.

45. ACICQGP3 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the global parameter Glcqdbx when the DBrfgparm() primitive was called from the ACincqdb() function in the file rta/ACrcv/ACincqdb.c.

46. ACICQGP4 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the global parameter Glcqdbx when the DBrfgparm() primitive was called from the ACincqdb() function in the file rta/ACrcv/ACincqdb.c.

47. ACICQLNK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to link an rICQDB tuple to the idle list in the RLHCCALLTQ relation. The rIHCCALLTQ tuple is dumped.

48. ACICTDLP (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A looping of a call characteristic was detected in the flexible ACD call type determination feature function ACTa_factdet(). The operator request message (mgOP_REQ) is dumped containing the call characteristic

information causing the looping.

49. ACICTDRL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown relation name was used in the expanded call type determination feature function ACta_initdet(). The relname variable is dumped.

50. ACILGDEF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid mode was given to automatic call distributor (ACD) when initializing the RLLOGINID relation. The rLOGINID tuple is dumped.

51. ACILGLOG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to insert a tuple in the RLLOGINID relation. The rLOGINID tuple is dumped.

52. ACILGOLGN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read a tuple in the static relation RLOLOGINID. The rLOLOGINID tuple is dumped.

53. ACIRQPST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred when an operator conference or transfer request found the requested operator position in an unknown state.

54. ACIRQSTQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STQDB	Audit Mode: elev

Problem:

A database failure occurred when retrieving the rISTQDB tuple associated with an rLOGINID tuple. A dynamic data inconsistency exists between these two relations.

55. ACISVDEF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid mode was given to automatic call distributor (ACD) when initializing the RLHCSESVTM relation. The rLHCSESVTM tuple is dumped.

56. ACISVIFLW (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not find the rINTERFLW tuple for the serving team. The rSTINFO tuple is dumped.

57. ACISVISTP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read a tuple from the RLST_PARM relation using the DBstfst() or DBstnxt() primitive. This assert is called in the file rta/ACrcv/ACinisvtm. The rIST_PARM tuple is dumped.

58. ACISVSTFO (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read a tuple in the static relation RLSTINFO. The rSTINFO tuple is dumped.

59. ACISVSTVM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to insert a tuple in the relation RLHCSESVTM. The rHCSESVTM tuple is dumped.

60. ACITGPCR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STQDB	Audit Mode: elev

Problem:

The serving team queue data block (STQDB) had an invalid processor number. The STQDB is dumped.

61. ACITQDEF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid mode was given to automatic call distributor (ACD) when initializing the RLSTQDB relation. The rSTQDB tuple is dumped.

62. ACITQLNK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to link a tuple to the unoccupied list in the RLHCSESVTM relation. The rHCSESVTM tuple is dumped.

63. ACITQPPRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read a tuple in the static relation RLPOS_PORT. The rPOS_PORT tuple is dumped.

64. ACITQSTQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to insert a tuple in the RLSTQDB relation. The rISTQDB tuple is dumped.

65. ACITQSVTM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STINFO	Audit Mode: elev

Problem:

A dynamic access (DA) macro failed to obtain an rIHCSERVTM tuple. An audit of the RLSTINFO relation is scheduled.

66. ACLGCLTQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HCCALLTQ	Audit Mode: elev

Problem:

A database failure occurred when logging out an operator that is currently claimed by an operator conference or transfer request. The DAGETCLLTQ() database macro failed to retrieve the rIHCCALLTQ tuple that is associated with a given rICQDB tuple.

67. ACLGLNK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STQDB	Audit Mode: elev

Problem:

A database failure occurred when logging out an operator that was claimed by another operator requesting a conference or transfer. The linked call queue data block (rICQDB tuple) could not be retrieved for the given position data block (rISTQDB tuple) associated with the operator position being logged out.

68. ACLGNLOG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: OLOGINID	Audit Mode: elev

Problem:

A database (DB) primitive could not find the requested rLOGINID tuple.

69. ACLGNMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The attempt to send the MGOALOG_ACK message failed. The return code from the OSSENDMSG() macro is dumped.

70. ACLGTDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The return code from a dynamic access (DA) primitive was not expected. The return code is dumped.

71. ACLGTLOG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STQDB	Audit Mode: elev

Problem:

A database (DB) primitive could not retrieve the rLOGINID tuple indicated in the serving team queue data block (STQDB).

72. ACLGTPS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The position state in the serving team queue data block (STQDB) is not an expected value. The rISTQDB tuple is dumped.

73. ACLGTSRVT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A dynamic access (DA) primitive could not perform the requested action on a serving team queue data block (STQDB). The error code indicates a problem with the head cell. An audit of the RLHCSESRVTM relation is scheduled.

74. ACLGTSTQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HCSESRVTM	Audit Mode: elev

Problem:

A dynamic access (DA) primitive could not remove a serving team queue data block (STQDB) from the available list.

75. ACLOGDEF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator position type (pos_typ) found in the rIPOS_LPRT tuple is not OA_BST or OA_VDT. The rIPOS_LPRT tuple is dumped.

76. ACMTMDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rILPRT_POS tuple was not found using the DBfrdtup() primitive in the ACmsgtrans() function. The message and contents of the relation buffer are dumped.

77. ACMTMERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OSSENDMSG() macro returned with an error (OSELENGTH, OSENMOCNB, or CMerrs) when called from the ACmsgtrans() function. The message encountered trouble in reaching the position terminal process (PTP). The message and rPCBLA tuple are dumped.

78. ACMTMNOP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

The process control block link area (PCBLA) for this position incorrectly indicates that a terminal process exists. The PCBLA audit is scheduled, the message received and the rPCBLA tuple are dumped.

79. ACMTMNOW (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

The indicated port is an operator services position system (OSPS) position that has no owning terminal process. The PCBLA audit is scheduled and the received message is dumped.

80. ACMTQASTQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STQDB	Audit Mode: elev

Problem:

The DAGETSRVTM() macro failed to get the correct serving team head cell rHCSESRVTM tuple for the given rISTQDB tuple.

81. ACMTQCLTQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A dynamic access (DA) macro failed to obtain an rHCCALLTQ tuple. The rHCCALLTQ tuple is dumped.

82. ACMTQGCQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CQDB	Audit Mode: elev

Problem:

Failed to get the head rICQDB tuple. An audit of the RLCQDB relation is scheduled.

83. ACMTQGSTQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STQDB	Audit Mode: elev

Problem:

Failed to get the head rISTQDB tuple. An audit of the RLSTQDB relation is scheduled.

84. ACMTQLNK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CQDB	Audit Mode: elev

Problem:

Failed to find the rISTQDB tuple that is linked to the given rICQDB tuple.

85. ACMTQRCQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to remove the head rICQDB tuple. The rICQDB tuple is dumped.

86. ACMTQRSTQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to remove the head rISTQDB tuple. The rISTQDB tuple is dumped.

87. ACMTQSVTM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A dynamic access (DA) macro failed to obtain the rHCSERVMTM tuple. The rHCSERVMTM tuple is dumped.

88. ACNQRYCT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HCCALLTQ	Audit Mode: elev

Problem:

Unable to get the call_type value from the call queue head cell. The MGACDQRY message is dumped.

89. ACNQRYST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HCSERVMTM	Audit Mode: elev

Problem:

Unable to get the serving team head cell. The MGACDQRY message is dumped.

90. ACNTRBGR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HCSERVMTM	Audit Mode: elev

Problem:

An invalid return code was received when looking for the head of the available list of serving teams. The AUHCSERVMTM audit is scheduled. The rHCSERVMTM tuple is dumped.

91. ACNTRINV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid reason for the creation or initialization of the intraflow system process was encountered.

92. ACNTRSRVT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HCSERVMTM	Audit Mode: elev

Problem:

The automatic call distributor (ACD) intraflow scanning system process found a tuple for the serving team in the static relation RLSTINFO, but not in the dynamic relation RLHCSERVMTM. The AUHCSERVMTM audit will be run. The rLSTINFO tuple is dumped.

93. ACOCNPCR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The serving team queue data block (STQDB) had an invalid processor number. The STQDB is dumped.

94. ACORANCT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failure occurred when reading the RLCTINFO relation using the call_type key.

95. ACORNISF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data base read failure occurred while attempting to read an rINTERFLW tuple using the serving team as the key.

96. ACORNIST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

***Problem:**

A tuple was not found in the static relation RLINTERFLOW for the serv_tm key. The serv_tm value was obtained from the RLCTINFO relation.

Data Structures:

RLINTERFLW.

Action:

Use RC/V (or ODBE, if necessary) to verify that a tuple exists in both the RLSTINFO and RLINTERFLW relations with the serv_tm key. If the rISTINFO tuple exists and the rINTERFLW tuple does not exist, there is a problem with recent change. If the rISTINFO tuple does not exist, verify that the RLCTINFO relation (key = call_type) does not reference an undefined serv_tm.

97. ACORNOCT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

***Problem:**

No rICTINFO tuple was found for the call_type key. A database inconsistency exists between the RLSTINFO relation and the RLCTINFO relation, or between the RLAC_TKCT and RLCTINFO relations.

Data Structures:

RLCTINFO. Key field: call_type.

Action:

Search the RLCTINFO relation for a tuple with the call_type key. If no tuple is found, use RC/V to insert a tuple. If a tuple exists, write an initial modification request (IMR).

98. ACORRRER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ACop_req() function received a call that should have been rerouted. Verify the following conditions in the MGOP_REQ message: (1) The request type is either AC_NORMAL or AC_NORMNOANN. (2) Reroute is active for this team (RLinterflw.rr_on==DBYES). (3) The oa_optype value is OSPSDA, or the ta_type value is either OATDA2VDT, OATNIT, OASRV_DAOT or OASRV_TAOT.

99. ACORUNKR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ACop_req() function detected an unknown request type in the MGOP_REQ message.

100. ACOSNOIF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

***Problem:**

The ACopstatus() function received a MGPOS_STAT message for a position.

Data Structures:

RLIST_PARM. Key field: iserv_tm. RLPOS_PORT. Key field: posnum.

Action:

Use ODBE for the RLIST_PARM relation to determine if the interflow that the position (pos_type=OA_INT) is assigned to is a defined interflow destination (iserv_tm).

101. ACOSNOIH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HCSERVTM	Audit Mode: elev

Problem:

Could not find the rIHCSERVTM tuple for the interflow team indicated in the MGPOS_STAT message, although the interflow serving team is equipped (that is, an rLIST_PARM tuple exists). An audit is scheduled to verify the dynamic data.

102. ACOSTNOST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

***Problem:**

An operator services position system (OSPS) operator ID was assigned to an undefined serving team.

Data Structures:

RLOLOGINID. Key fields: operator ID, serving team.

Action:

Use RC/V View 21.4 (OPERATOR ASSIGNMENT) to change the operator ID's team to one that is defined.

103. ACOSTSRVT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STINFO	Audit Mode: elev

Problem:

Could not find an rIHCSERVTM tuple for the team indicated in the MGPOS_STAT message, although the serving team is equipped (that is, an rSTINFO tuple exists). The serving team queue data block (STQDB) for the position indicated in the message is dumped.

104. ACOSTSTQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not get the serving team queue data block (STQDB) for the position indicated in the MGPOS_STAT

message. The MGPOS_STAT message is dumped.

105. ACPCWMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The attempt to send the MGOACALLWT message failed. The return code from the OSSENDMSG() macro is dumped.

106. ACPCWNOW (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

The indicated port is an operator services position system (OSPS) position that has no owning terminal process. The PCBLA audit is scheduled. The MGOACALLWT message is dumped.

107. ACPCWPDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: POSDB	Audit Mode: elev

Problem:

A database (DB) primitive failed to get an rIPOSDB tuple. An audit of the RLPOSDB relation is scheduled.

108. ACPCWPRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read a tuple in the static relation RLPOS_LPRT. The rIPOS_LPRT tuple is dumped.

109. ACPSANST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failure occurred when reading the RLSTINFO relation using the key serv_tm.

110. ACPSAOCR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return code was received from the ACconn() function.

111. ACPSASTQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HCSERVTM	Audit Mode: elev

Problem:

Could not get the head of the serving team's available list. The rIHCSERVTM tuple is dumped.

112. ACPSNOST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

*Problem:

A database read failure occurred when reading the RLSTINFO relation using the serv_tm (serving team) key. The serving team value was originally determined from the RLLOGINID relation in the SM.

There may be a data inconsistency between the RLLOGINID and RLSTINFO relations. That is, the serving team value in the RLLOGINID relation for a given external operator ID is incorrect and an entry does not exist in the RLSTINFO relation.

Another possibility is that the data in the SM dynamic relation RLPOSDB is corrupted.

Data Structures:

RLSTINFO. Key field: serv_tm.

Action:

Search the RLSTINFO relation for a tuple with the serving team value as the key. Check the AM and SM occurrences of this relation. Examine each rLOGINID tuple to verify that the serving team value in each tuple has a corresponding rSTINFO tuple. The output serving team value should occur at least once in the RLLOGINID relation and only once in the RLSTINFO relation.

The valid range of the serving team is currently 1-128 decimal. If the serving team value is within the range and an rLOGINID tuple exists, but an rSTINFO tuple does not exist, there is a data inconsistency. Audits should have detected and corrected this problem and recent change should not have allowed this situation. Use RC/V to insert an rSTINFO tuple for the given serving team. Contact the product engineering control center (PECC) and resolve the problem with audits and recent change.

If the rLOGINID and rSTINFO tuples exist, either a code error or data corruption occurred in the SM dynamic relation RLPOSDB. Contact the PECC and write an initial modification request (IMR).

113. ACPTLPDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: POSDB	Audit Mode: elev

Problem:

A database (DB) primitive failed to get an rIPOSDB tuple. An audit of the RLPOSDB relation is scheduled.

114. ACPTLPRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read a tuple in the static relation RLPOS_LPRT. The rIPOS_LPRT tuple is dumped.

115. ACPTLSTM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the static relation RLSTINFO. The rSTINFO tuple is dumped.

116. ACPTLTDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A dynamic access (DA) macro failed to get an rITAPOSDB tuple. The rIPOS_LPRT tuple was used to get the rITAPOSDB tuple.

117. ACPTMNOP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

The process control block link area (PCBLA) for this position incorrectly indicates that a terminal process exists. The PCBLA audit is scheduled.

118. ACPTMNOW (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

The indicated port is an operator services position system (OSPS) position that has no owning terminal process. The PCBLA audit is scheduled. The MGPOSTRMRQ message is dumped.

119. ACPTMNPR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ACoprftfail() function returned failure to the ACpos_term() function after the ACpos_term() function could not send the MGPOSTRMRQ message to the position's position terminal process (PTP) because of an OSSENDMSG() macro failure.

120. ACPTMNWR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ACoprftfail() function returned failure to the ACpos_term() function after the ACpos_term() function failed to find an owning process for the operator position indicated in the MGPOSTRMRQ message.

121. ACPTSPDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: POSDB	Audit Mode: elev

Problem:

A database (DB) primitive failed to get an rIPOSDB tuple. An audit of the RLPOSDB relation is scheduled.

122. ACPTSPRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read a tuple in the static relation RLPOS_LPRT. The rIPOS_LPRT tuple is dumped.

123. ACQCLCLTQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A dynamic access (DA) primitive could not perform the requested action on a call queue data block (CQDB). The error code indicates a problem with the head cell. An audit of the RLHCCALLTQ relation is scheduled.

124. ACQCLCQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A dynamic access (DA) primitive could not perform the requested action on a call queue data block (CQDB). The error code indicates a problem with the RLCQDB relation. An audit of the RLCQDB relation is scheduled.

125. ACQCLDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The return code from a dynamic access (DA) primitive was not expected. The return code is dumped.

126. ACQCLINK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CQDB	Audit Mode: elev

Problem:

A failure occurred when queuing an operator conference or transfer request. Could not link the associated rISTQDB and rICQDB tuples.

127. ACQRFNCT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

***Problem:**

A read for the rICTINFO tuple found no match for the call type. A data error exists in the vector that references the call type, or the RLCTINFO relation is out of date and must be updated.

Data Structures:

RLCTINFO.

Action:

No rICTINFO tuple was found for the call_type key. The ROP output provides the call_type value (the decimal value for the call type specified in the vector), and the vector value (the vector that was assigned to the dialed digits and/or trunk group associated with the call).

A GOTOQUE, GOTOAGE, or GOTODLY vector step referenced a non-existent call type; that is, a call type that does not have an rICTINFO tuple. If the call type was not set up, use RC/V View 21.22 (CALL TYPE) to insert the call type. Otherwise, update the vector so that it no longer references the call type by using RC/V View 21.41 (CALL VECTORS).

The offending GOTOQUE, GOTOAGE, or GOTODLY step may not be in the vector identified in the ROP message. The vector number reported is the one that was assigned to the call's dialed digits and/or trunk group. This initial vector may branch (or be redirected) to the vector containing the GOTO step. Thus, some searching of the vectors may be needed. Until corrective steps can be taken, the assigned vector can be de-activated by setting the ACTIVATE field to N on RC/V View 21.41.

128. ACQRFNST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

***Problem:**

A read for the rLSTINFO tuple found no match for the serving team. A data error exists in the vector that references the serving team, or the RLSTINFO relation is out of date and must be updated.

Data Structures:

RLSTINFO.

Action:

No rISTINFO tuple was found for the serv_tm key printed on the ROP. The ROP output provides the serv_tm value (the decimal value for the serving team specified in the vector), and the vector value (the vector that was assigned to the dialed digits and/or trunk group associated with the call).

A GOTOAVL or a GOTOSTA vector step referenced a non-existent serving team; that is, a team that does not have an rISTINFO tuple. If the serving team was not set up, use RC/V View 21.2 (SERVING TEAM) to insert the team. Otherwise, update the vector so that it no longer references the team. Use RC/V View 21.41 (CALL VECTORS) to correct the offending vector.

The offending GOTOAVL or GOTOSTA step may not be in the vector identified in the ROP message. The vector number reported is the one that was assigned to the call's dialed digits and/or trunk group. This initial vector may branch (or be redirected) to the vector containing the GOTO step. Thus, some searching of the vectors may be needed. Until corrective steps can be taken, the assigned vector can be de-activated by setting the ACTIVATE field to N on RC/V View 21.41.

129. ACQRYCTN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HCCALLTQ	Audit Mode: elev

Problem:

Unable to get the call_type value from the call queue head cell. The MGACDQRY message is dumped.

130. ACQRYNCT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HCCALLTQ	Audit Mode: elev

Problem:

Unable to get the call_type from the call queue head cell. The MGACDQRY message is dumped.

131. ACQRYNST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HCSERVMT	Audit Mode: elev

Problem:

Unable to get the serving team head cell. The MGACDQRY message is dumped.

132. ACQRYWQT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The query reason was wrong for the query invoked. The MGACDQRY message is dumped.

133. ACQXCQDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CQDB	Audit Mode: elev

Problem:

Could not get the owner of the call queue data block (CQDB). The MGQUE_XFR message is dumped.

134. ACQXFRCQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CQDB	Audit Mode: elev

Problem:

Could not get the call queue head cell from the call queue data block (CQDB). The MGQUE_XFR message is

dumped.

135. ACQXNOCT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

***Problem:**

A read for the rICTINFO tuple found no match for the call_type. A data error exists in the vector in which the queue transfer exists, or the RLCTINFO relation is out of date and must be updated.

Data Structures:
RLCTINFO.

Action:

No rICTINFO tuple exists for the CALL_TYPE key specified in the destq value. The ROP output provides the destq value (a decimal value for the queue/call type into which a call was to be transferred), and the vector value (the vector that was assigned to the dialed digits and/or trunk group associated with the call).

A vector QUEUE step is referencing a non-existent queue (that is, no rICTINFO tuple exists for the queue). If the queue was not set up, populate the corresponding rICTINFO tuple by using RC/V View 21.22 (CALL TYPE).

However, if the queue should not have been setup, then the vector is in error and must be corrected. The offending QUEUE step may not be in the vector identified in the ROP message. The vector number reported is the one that was assigned to the call's dialed digits and/or trunk group. This initial vector may branch (or be redirected) to the vector containing the QUEUE step. Thus some searching of the vectors may be needed. Until corrective steps can be taken, the assigned vector can be de-activated by setting the ACTIVATE field to N on RC/V View 21.41 (CALL VECTORS).

136. ACRCTDER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was encountered in the ACta_recalldet() function for recall call type determination. The call class value is incorrect and is dumped.

137. ACRCTDIF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was encountered in the ACta_recalldet() function. Initial call type determination was not performed on an interflowed recall; therefore, recall call type determination cannot be performed.

138. ACREQBFR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return code was received from the ACfindserv() function.

139. ACREQBIR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return code was received from the ACintgrty() function.

140. ACREQCLTQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CTINFO	Audit Mode: elev

Problem:

Could not find the rHCCALLTQ tuple for the call type indicated in the MGOP_REQ message, although the call type is equipped (that is, an rICTINFO tuple exists). The MGOP_REQ message is dumped.

141. ACREQCQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HCCALLTQ	Audit Mode: elev

Problem:

Could not get the head call's call queue data block (CQDB) from the given rHCCALLTQ tuple. The rHCCALLTQ tuple is dumped.

142. ACREQIFH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HCSERVMTM	Audit Mode: elev

Problem:

The rHCSERVMTM tuple for the interflow serving team indicated in the MGOP_REQ message was not found, although the interflow serving team is equipped (that is, an rLIST_PARM tuple exists). The valid range of values for the serving team is 129-144. The MGOP_REQ message is dumped.

143. ACREQIST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

***Problem:**

An undefined interflow serving team was encountered. The valid range of serving team values is 129-144. This assert fires when a call has attempted to be interflowed to an OSPS operator at another distant location, and it was not successful due to this problem. The attempted call is sent to REORDER - THE CALL IS LOST. Immediate attention should be given to fixing this problem.

Data Structures:

RLIST_PARM. Key field: iserv_tm. RLINTERFLW. Key field: serv_tm.

Action:

Use ODBE to verify that an rLIST_PARM tuple exists. If the interflow serving team is not defined in the RLIST_PARM relation, there is a data inconsistency with the RLINTERFLW relation. That is, the RLINTERFLOW relation references an undefined interflow serving team (iserv_tm). Use ODBE to do a BATCH REVIEW of both relations, IST_PARM and INTERFLW. If a IST_PARM tuple associated with the interflow serving team (iserv_tm) printed on the ROP for this assert does not exist, then use ODBE to modify the INTERFLW relation. Modify INTERFLW by changing the tuple which has the "iserv_tm" item equal to the one identified on the ROP. This tuple should be modified so that the "iserv_tm" item points to the correct IST_PARM tuple.

144. ACREQNEG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HCCALLTQ	Audit Mode: elev

Problem:

A negative number of calls was found in a queue.

145. ACREQNOCT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

***Problem:**

The rICTINFO tuple for the call type indicated in the MGOP_REQ message does not exist.

Data Structures:

RLCTINFO. Key field: call_type.

Action:

Verify that the rICTINFO tuple with the stated key exists. The AM and SM should be consistent.

146. ACREQNOST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

***Problem:**

An rISTINFO tuple does not exist for the operator services position system (OSPS) call type and serving team given.

Data Structures:

RLCTINFO. Key fields: call type, serving team.

Action:

The serving team indicated is not defined in the RLSTINFO relation, although the RLCTINFO relation indicates that the serving team should be defined. Change the OSPS call type information so that this call type is served by a defined serving team.

147. ACREQNST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STINFO	Audit Mode: elev

Problem:

A database read of the RLSTINFO relation using the key serv_tm failed.

148. ACREQSRVT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STINFO	Audit Mode: elev

Problem:

Could not find the rHCSESRVT tuple for the serving team indicated in the MGOP_REQ message, although the serving team is equipped (that is, an rISTINFO tuple exists). The MGOP_REQ message is dumped.

149. ACRFANST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failure occurred when reading the RLSTINFO relation using the key serv_tm.

150. ACRFNOST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

***Problem:**

A database (DB) read failure occurred when reading the RLSTINFO relation using the serv_tm (serving team) key.

Data Structures:

RLSTINFO. Key field: serv_tm.

Action:

Search the RLSTINFO relation in the AM and in this SM for a tuple with the given serving team key value. If a tuple is found in the AM, but not in the SM, a data inconsistency exists. The system audits should have detected and corrected this problem and recent change should not have allowed this to happen. Use RC/V to correct the RLSTINFO relation in the SM and contact the product engineering control center (PECC) to determine why this condition occurred.

If an RLSTINFO tuple exists in the SM or does not exist in both the AM and SM, or the serving team value is out of range (1-128), write an initial modification request (IMR) or contact the PECC to resolve this problem.

151. ACRIVLGN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

***Problem:**

A database (DB) read of the RLOLOGINID relation failed using the key op_id. The op_id was converted from the BCD4 value found in the rIDAA_DN tuple. There is a data inconsistency between the rIDAA_DN tuple and the RLOLOGINID relation.

Data Structures:

RLOLOGINID.

Action:

On the CMP and SM, search the RLOLOGINID relation for a tuple with the op_id value printed on the ROP as the key. If a tuple is found in the SM but not in the CMP, this is a data inconsistency indicating a problem with recent change (RC). Contact the product engineering control center (PECC).

If the tuple does not exist in either the CMP or SM, there is a code error. Write an initial modification request (IMR) or contact the PECC to resolve this problem.

152. ACRMCLTQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A dynamic access (DA) primitive could not perform the requested action for a call queue data block (CQDB). The error code indicates a problem with the RLHCCALLTQ relation. An audit of the RLHCCALLTQ relation is scheduled.

153. ACRMCCQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HCCALLTQ	Audit Mode: elev

Problem:

Attempted to remove a call queue data block (CQDB) from membership with the RLHCCALLTQ relation, but the dynamic access (DA) primitive indicated that the set was empty. The return code indicates a problem with the RLCQDB relation.

154. ACRMADB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The return code from a dynamic access (DA) primitive was not expected. The return code is dumped.

155. ACRMCLLF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CQDB	Audit Mode: elev

Problem:

When removing an interposition operator conference or transfer from the call queue, the claim linkage failed to be unlinked. The DBunlink() dynamic database primitive returned a value of DBNO_LINK.

156. ACRMCLNK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When removing an interposition operator conference or transfer from the call queue, the DBunlink() primitive failed to unlink the claim linkage between the rICQDB and rISTQDB tuples.

157. ACRMMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to send the MGCLAIM message from automatic call distributor (ACD) in the AM to the SM routing and terminal allocation (RTA) system process.

158. ACSCTCLTQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CTINFO	Audit Mode: elev

Problem:

A dynamic access (DA) macro failed to obtain an rIHCCALLTQ tuple.

159. ACSCTDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The database (DB) primitive used to read the RLSTINFO relation failed. The return code is dumped.

160. ACSFCNLOG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not find an rLOGINID tuple for a new login ID. The MGPOS_STAT message is dumped.

161. ACSFCOLOG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STQDB	Audit Mode: elev

Problem:

Could not get an rLOGINID tuple for an old login ID. The serving team queue data block (STQDB) of the position is dumped.

162. ACTIFIUTM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HCSERVMT	Audit Mode: elev

Problem:

Could not find the rHCSESVTM tuple on an insert or update of an rINTERFLW tuple.

163. ACTISTSVT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The dynamic access (DA) macro failed to obtain the rHCSESVTM tuple for an interflow serving team. The rHCSESVTM tuple is dumped. This assert was called from the file rta/ACrcv/ACTiservtm.c.

164. ACTLGDEF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The default case of a switch statement with four values for the pos_state attribute in the RLSTQDB relation was encountered. The rISTQDB tuple is dumped.

165. ACTLGDLGN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to delete a tuple in the RLLOGINID relation. The rLOGINID tuple is dumped.

166. ACTLGERRN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid case on a switch statement was encountered. An operator must be logged off for an allowable update. If the pos_state attribute of the rISTQDB tuple is ACAVAILABLE, an error has occurred. The rISTQDB and rLOGINID tuples are dumped.

167. ACTLGILGN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LOGINID	Audit Mode: elev

Problem:

Failed to insert a tuple in the RLLOGINID relation. An audit of the RLLOGINID relation is scheduled.

168. ACTLGLGN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: OLOGINID	Audit Mode: elev

Problem:

A database (DB) primitive failed to get an rLOGINID tuple. An audit of the RLLOGINID relation is scheduled.

169. ACTLGRSTQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to remove an rISTQDB tuple. The rISTQDB tuple is dumped.

170. ACTLGSTQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: rpi	SPP: n	Audit: POSPORT	Audit Mode: elev

Problem:

A database (DB) primitive failed to get an rISTQDB tuple. An audit of the RLPOSPORT relation is scheduled.

171. ACTLGSVTM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STINFO	Audit Mode: elev

Problem:

A dynamic access (DA) macro failed to obtain an rHCSERVTM tuple. An audit of the RLSTINFO relation is scheduled.

172. ACTLGTSTQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A dynamic access (DA) primitive failed to get an rISTQDB tuple. The rISTQDB tuple is dumped.

173. ACTPECL1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HCCALLTQ	Audit Mode: elev

Problem:

The dynamic access (DA) macro failed to obtain an rIHCCALLTQ tuple when the macro was called from the ACtctype() function in the file rta/ACrcv/ACtctype.c. An audit of the RLHCCALLTQ relation is scheduled.

174. ACTPECL2 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HCCALLTQ	Audit Mode: elev

Problem:

The dynamic access (DA) macro failed to obtain an rIHCCALLTQ tuple when the macro was called by the ACtctype() function in the file rta/ACrcv/ACtctype.c. An audit of the RLHCCALLTQ relation is scheduled.

175. ACTPECL3 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HCCALLTQ	Audit Mode: elev

Problem:

The dynamic access (DA) macro failed to obtain an rIHCCALLTQ tuple when the macro was called from the ACtctype() relation in the file rta/ACrcv/ACtctype.c. An audit of the RLHCCALLTQ relation is scheduled.

176. ACTPECLTQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A dynamic access (DA) macro failed to obtain an rIHCCALLTQ tuple. The rIHCCALLTQ tuple is dumped.

177. ACTPECQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CQDB	Audit Mode: elev

Problem:

Failed to insert an rICQDB tuple when the DBfintup() primitive was called from the ACtctype() function in the file

rta/ACrcv/ACtctype.c. The rICQDB tuple is dumped. An audit of the RLCQDB relation is scheduled.

178. ACTPEGP1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the global parameter Glcqdbx when the DBrfgparm() primitive was called from the ACtctype() function in the file rta/ACrcv/ACtctype.c.

179. ACTPEGP2 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the global parameter Glcqdbx when the DBrfgparm() primitive was called from the ACtctype() function in the file rta/ACrcv/ACtctype.c.

180. ACTPEICLQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HCCALLTQ	Audit Mode: elev

Problem:

Failed to insert a tuple in the RLHCCALLTQ relation. An audit of the RLHCCALLTQ relation is scheduled.

181. ACTPELNK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HCCALLTQ	Audit Mode: elev

Problem:

Failed to link an rICQDB tuple to the idle list in the RLHCCALLTQ relation in the ACtctype() function in the file rta/ACrcv/ACtctype.c. The rIHCCALLTQ tuple is dumped. An audit of the RLHCCALLTQ relation is scheduled.

182. ACTPTDSTQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to delete the rISTQDB tuple. The rISTQDB tuple is dumped.

183. ACTPTISTQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STQDB	Audit Mode: elev

Problem:

Failed to insert a tuple in the RLSTQDB relation. An audit of the RLSTQDB relation is scheduled.

184. ACTPTLNK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to link the rISTQDB tuple to the unoccupied list. An audit of the RLSTQDB relation is scheduled.

185. ACTPTSTQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database (DB) primitive failed to get an rISTQDB tuple. The rISTQDB tuple is dumped.

186. ACTPTSVTM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STINFO	Audit Mode: elev

Problem:

A dynamic access (DA) macro failed to obtain an rHCSESVTM tuple. An audit of the RLSTINFO relation is scheduled.

187. ACTPTUNLK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to unlink the rISTQDB tuple from the unoccupied list. The rISTQDB tuple is dumped.

188. ACTSTSVTM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A dynamic access (DA) macro failed to obtain an rHCSESVTM tuple. The rHCSESVTM tuple is dumped.

189. ACTSTUSTM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: HCSESVTM	Audit Mode: elev

Problem:

Could not get the rHCSESVTM tuple for the serving team on an update of an rSTINFO tuple. The rHCSESVTM tuple is dumped. The HCSESVTM audit is scheduled.

190. ACUPDAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid addition of a serving team queue data block (STQDB) to a new team's rHCSESVTM tuple occurred. The STQDB is dumped.

191. ACUPDRS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid remove of an rISTQDB tuple from the old team's rHCSESVTM tuple occurred. The rISTQDB tuple is dumped.

192. ACUPDSRVT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STINFO	Audit Mode: elev

Problem:

The rHCSESVTM tuple for the serving team indicated in the MGPOS_STAT message is unequipped. The MGPOS_STAT message is dumped.

Range: ama**1. AMAICRFULL (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The table maximum size was exceeded for the intercom calling restriction table.

2. AMAINVTIMER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid timer fired in the automatic message accounting (AMA) system process.

3. AMASETIMER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid parameter was passed to an operating system (OS) timer primitive.

4. AMBADDTRIG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The AMddtrig() function was called with trigger data for a case that is not supported.

5. AMBADMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The process received an unexpected message.

6. AMBADRTBM (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The AMA real-time call detail code encountered corrupted data in the real time billing memory (RTBM). An attempt will be made to fix the problem. RTCD records may be lost during this recovery procedure. The first data item is the current four-byte SM sequence number, followed by the four-byte SM sequence number of the last RTCD record transmitted. The second data item is the first portion of the next record to be transmitted.

7. AMBADSCFAM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid structure code family was found.

8. AMBCGDA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BCLGCNT	Audit Mode: elev

Problem:

Automatic message accounting (AMA) used the DAgetbgcnt() primitive to read an rBCLGCNT tuple. The tuple returned did not match what was expected.

Data Structures:

RLBCLGCNT. Key field: grpidx.

Action:

The AUBCLLCNT audit will be scheduled to run.

9. AMBCGFDL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BCLGCNT	Audit Mode: elev

Problem:

A dynamic rBCLGCNT tuple could not be deleted using the DBfdltup() function. Bulk calling line identification (BCLID) may be affected.

Data Structures:

RLBCLGCNT. Key field: grpidx.

Action:

The AUBCLGCNT audit will be scheduled to run.

10. AMBCGFIN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BCLGCNT	Audit Mode: elev

Problem:

A failure occurred while inserting a dynamic rBCLGCNT tuple using the DBfintup() primitive for daily local area signaling services (LASS) bulk calling line identification (BCLID) billing.

Data Structures:

RLBCLGCNT. Key field: grpidx.

Action:

The AUBCLGCNT audit will be scheduled to run.

11. AMBCGFRD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BCLGCNT	Audit Mode: elev

Problem:

Automatic message accounting (AMA) received a failure indication from the DBfrdtup() function while trying to read a dynamic rBCLGCNT tuple. AMA data cannot be collected for this local area signaling services (LASS) bulk calling line identification (BCLID) subscriber.

Data Structures:

BLBCLGCNT. Key field: grpidx.

Action:

The AUBCLGCNT audit will be scheduled to run.

12. AMBCGFUP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BCLGCNT	Audit Mode: elev

Problem:

Failed to update a dynamic rBCLGCNT tuple using the DBfuptup() function.

Data Structures:

RLBCLGCNT. Key field: grpidx.

Action:

The AUBCLGCNT audit will be scheduled to run.

13. AMBCGSTFST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BCLGCNT	Audit Mode: elev

Problem:

Automatic message accounting (AMA) received a failure return code from the DBstfst() function while trying to read the first rBCLGCNT tuple. This will prohibit the collection of AMA data for bulk calling line identification (BCLID) subscribers.

Data Structures:

RLBCLGCNT. Key field: grpidx.

Action:

The AUBCLGCNT audit will be scheduled to run.

14. AMBCGSTNXT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BCLGCNT	Audit Mode: elev

Problem:

Automatic message accounting (AMA) received a failure return code from the DBstnxt() function while trying to read the next dynamic rBCLGCNT tuple. The AMbcgclct() function will not be able to collect AMA data for remaining bulk calling line identification (BCLID) subscribers until audits find and correct the problem.

Data Structures:

RLBCLGCNT. Key field: grpidx.

Action:

The AUBCLGCNT audit will be scheduled to run.

15. AMBCLDA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BCLLCNT	Audit Mode: elev

Problem:

Automatic message accounting (AMA) used the DAgetblcnt() primitive to read a rBCLLCNT tuple. The tuple returned did not match what was expected.

Data Structures:

RLBCLLCNT. Key field: bcl_idx.

Action:

The AUBCLLCNT audit will be scheduled to run.

16. AMBCLFDL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BCLLCNT	Audit Mode: elev

Problem:

A dynamic rBCLLCNT tuple could not be deleted using the DBfdltup() function. Bulk calling line identification (BCLID) may be affected.

Data Structures:

RLBCLLCNT. Key field: bcl_idx.

Action:

The AUBCLLCNT audit will be scheduled to run.

17. AMBCLFIN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BCLLCNT	Audit Mode: elev

Problem:

A failure occurred while inserting a dynamic rBCLLCNT tuple using the DBfintup() primitive for daily local area signaling services (LASS) bulk calling line identification (BCLID) billing.

Data Structures:

RLBCLLCNT. Key field: bcl_idx.

Action:

The AUBCLLCNT audit will be scheduled to run.

18. AMBCLFRD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BCLLCNT	Audit Mode: elev

Problem:

Automatic message accounting (AMA) received a failure indication from the DBfrdtup() function while trying to read a dynamic rBCLLCNT tuple. AMA data cannot be collected for this local area signaling services (LASS) bulk calling line identification (BCLID) subscriber.

Data Structures:

RLBCLLCNT. Key field: bcl_idx.

Action:

The AUBCLLCNT audit will be scheduled to run.

19. AMBCLFUP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BCLLCNT	Audit Mode: elev

Problem:

Failed to update a dynamic rBCLLCNT tuple using the DBfuptup() function.

Data Structures:

RLBCLLCNT. Key field: bcl_idx.

Action:

The AUBCLLCNT audit will be scheduled to run.

20. AMBCLSTFST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BCLLCNT	Audit Mode: elev

Problem:

Automatic message accounting (AMA) received a failure return code from the DBstfst() function while trying to read the first rBCLLCNT tuple. This will prohibit the collection of AMA data for bulk calling line identification (BCLID) subscribers.

Data Structures:
RLBCLLCNT. Key field: bcl_idx.

Action:
The AUBCLLCNT audit will be scheduled to run.

21. AMBCLSTNXT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BCLLCNT	Audit Mode: elev

Problem:
Automatic message accounting (AMA) received a failure return code from the DBstnxt() function while trying to read the next dynamic rBCLLCNT tuple. The AMbclclct() function will not be able to collect AMA data for remaining bulk calling line identification (BCLID) subscribers until audits find and correct the problem.

Data Structures:
RLBCLLCNT. Key field: bcl_idx.

Action:
The AUBCLLCNT audit will be scheduled to run.

22. AMBCSTFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
An attempt to broadcast the tracer collect message failed.

23. AMBCSTINUSE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
During an attempt to broadcast the tracer collect message, the dedicated broadcast buffer for automatic message accounting (AMA) was in use.

24. AMCNAMDA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ICLIDIDX	Audit Mode: elev

Problem:
Automatic message accounting (AMA) used the DAGtcnmdat() primitive to read an rLCNAMDATA tuple. The tuple returned did not match what was expected. The AUICLIDIDX audit will be scheduled to recover the RLCNAMDATA relation dynamic data billing tuple.

25. AMCNAMDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
A calling name (CNAM) database error occurred.

26. AMCNAMERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A calling name (CNAM) billing error occurred.

27. AMCNAMFDL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CNAMDATA	Audit Mode: elev

Problem:

A dynamic rCNAMDATA tuple could not be deleted using the DBfdltup() function. Daily analog calling name delivery (CND) billing may be affected. The AUCNAMDATA audit will be scheduled to recover the RLICLIDIDX relation static data tuple.

28. AMCNAMFIN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ICLIDIDX	Audit Mode: elev

Problem:

A failure occurred while inserting a dynamic rCNAMDATA tuple using the DBfintup() primitive during initialization using the RLICLIDIDX relation. The AUICLIDIDX audit will be scheduled to recover the rCNAMDATA tuple of billing data.

29. AMCNAMFRD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ICLIDIDX	Audit Mode: elev

Problem:

Automatic message accounting (AMA) received a failure indication from the DBfrdtup() function while trying to read a dynamic rCNAMDATA tuple. AMA data cannot be collected for this calling name (CNAM) subscriber. The AUICLIDIDX audit will be scheduled to recover the RLCNAMDATA relation dynamic data billing tuple.

30. AMCNAMFUP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update a dynamic rCNAMDATA tuple using the DBfuptup() function.

31. AMCNAMINT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A calling name (CNAM) billing internal error occurred.

32. AMCNAMUFUP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CNAMDATA	Audit Mode: elev

Problem:

Failed to update a dynamic rCNAMDATA tuple using the DBfuptup() function. The AUCNAMDATA audit will be scheduled to recover the RLICLIDIDX relation static data tuple.

33. AMCNDDA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Automatic message accounting (AMA) used the DAGtcnddat() primitive to read an rICNDDATA tuple. The tuple returned did not match what was expected.

34. AMCNDFDL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A dynamic rICNDDATA tuple could not be deleted using the DBfdltup() function. Daily calling number delivery (CND) billing may be affected.

35. AMCNDFIN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to insert a dynamic rICNDDATA tuple using the DBfintup() function for daily local area signaling services (LASS) called number delivery (CND) billing.

36. AMCNDFRD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Automatic message accounting (AMA) received a failure indication from the DBfrdtup() function while trying to read a dynamic rICNDDATA tuple. AMA data cannot be collected for this local area signaling services (LASS) incoming call line identification (ICLID) calling number delivery (CND) subscriber.

37. AMCNDFUP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update a dynamic rICNDDATA tuple using the DBfuptup() function.

38. AMCNDSTFST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Automatic message accounting (AMA) received a failure return code from the DBstfst() function while trying to read the first dynamic rICNDDATA tuple. This will prohibit the 24 hour collection of AMA data for incoming call line identification (ICLID) calling number delivery (CND) subscribers.

39. AMCNDSTNXT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Automatic message accounting (AMA) received a failure return code from the DBstnxt() function while trying to read the next dynamic rICNDDATA tuple. The AMcndclct() function will not be able to collect AMA data for remaining incoming call line identification (ICLID) calling number delivery (CND) subscribers until audits find and correct the problem.

40. AMCNMSTFST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Automatic message accounting (AMA) received a failure return code from the DBstfst() function while trying to read the first dynamic rICNAMDATA tuple. This will prohibit the 24 hour collection of AMA data in the AMcnamclct() function for calling name delivery (CND) subscribers.

41. AMCNMSTNXT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Automatic message accounting (AMA) received a failure return code from the DBstnxt() function while trying to read the next dynamic rICNAMDATA tuple. The AMcnamclct() function will not be able to collect AMA data for remaining calling name delivery (CND) subscribers until the scheduled audit AUICLIDIDX finds and corrects the problem.

42. AMCPIVSEMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The AM billing system process AMCP received an invalid MGSENTRY message from an SM.

43. AMCPNBNCNT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LINE	Audit Mode: elev

Problem:

An error occurred in attempting to access (read or write) the RLCPNBNCNT relation. The AUIS_LINE audit will be scheduled to recover the dynamic tuple of calling party number (CPN)/billing number (BN) event counts.

44. AMCPRECSLOST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The AM billing system process AMCP lost automatic message accounting (AMA) entries. The shared data segment (SDS) is full, or the SDS pointers are invalid.

If this assert appears more than once, all AMA disk partitions are at 100% occupancy, the AMA disk writer process stopped, or the bit indicating AMsdsfull was set incorrectly.

Action:

1. Examine the ROP output to determine if the AMA disk partitions are full.
2. If all AMA partitions are full, the critically alarmed "REPT AMA DISK STORAGE IS 100% FULL" message prints every fifteen minutes. The "REPT AMA DISKSDS FULL" message will print once all three SDS subsegments are full. Verify disk occupancy by using the input message OP:AMA:DISK.
3. If the disks are full, OP:AMA:DISK will report 100% full.
4. To alleviate the problem of partitions being 100% full, write AMA tapes or teleprocess enough AMA data off the disks so that the AMA disk writer process can be automatically restarted by the application integrity monitor (AIM).
5. If the AMA partitions are not 100% full, the AMA disk writer process may have stopped. Execute the OP:AMA:STATUS message. If more than one of the SDS segments are full, then the disk writer has stopped. If no

segment is full, monitor the SDS subsegments until one is full. Once a segment fills, it should empty (the status changes from FULL to EMPTY in the output message), and the time returned by the REPT AMA STATUS output message should change to the present time.

6. Otherwise, ensure the integrity of the AMA disk writer by entering "INIT:AM,AMDW{1,2},FPI" to initialize the disk writer on the appropriate stream, ST1 or ST2.

7. If the disks are not 100% full and the AMA disk writer process has not stopped, then the AMsdsfull bit was set incorrectly. Execute a single process purge (SPP) of the AMCP process using "INIT:AM,SPP" with PID=22.

45. AMCPSQSTATE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The status query state variable AMsqstate of the AM billing system process AMCP is out of range.

46. AMCPTSPSP (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The AM billing system process AMCP detected severe problems in its interface with the automatic message accounting (AMA) disk writer kernel process. AMCP sent a message to the application integrity monitor (AIM) to purge the disk writer.

47. AMCPTRSTATE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The tracer state variable AMtrstate of the AM billing system process AMCP is out of range.

48. AMCPWRSTATE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The write request state variable AMwrstate of the AM billing system process AMCP is out of range.

49. AMCWPTRD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Automatic message accounting (AMA) received a failure indication while attempting to read an rICW_PORT tuple using the DBfrdtup() primitive.

50. AMDNWATSFALL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBSYS_ERR was returned from an attempted insert of an rIDNINWATS tuple.

Data Structures:

RLDNINWATS.

Action:

Report to craft for possible corruption of the RLDNINWATS relation.

51. AMEDSLFRD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Automatic message accounting (AMA) received a failure indication from the DBfrdtup() primitive while trying to access an rIEDSLTRKG tuple in the AMpcnfmt() function. The tuple is being accessed to obtain a billing directory number (DN). PCN-PRI billing will be affected.

52. AMEDSLNXT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to get the next rPCNAM tuple using the DBstnxt() function. Daily billing records for CNAM-PRI feature.

53. AMEDSLSTFST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to get the first rIEDSLTRKG tuple using the DBstfst() function. Daily billing records for CNAM-PRI feature.

54. AMFCAXIT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The call accounting formatting function has returned without generating a call accounting record.

Probable Cause:

A billing formatting algorithm is incorrect.

Action:

This problem should be escalated to field support.

55. AMFCCNMFRD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Automatic message accounting (AMA) received a failure indication from the DBfrdtup() primitive while trying to access an rIFC_LINE tuple in the AMcnamdn() function. The tuple is being accessed to obtain a calling name (CNAM) billing directory number (DN). CNAM billing will be affected.

56. AMFCLNFRD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Automatic message accounting (AMA) received a failure indication from the DBfrdtup() primitive while trying to access an rIFC_LINE tuple.

57. AMFRDMHTG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BCLMHTG	Audit Mode: elev

Problem:

Automatic message accounting (AMA) received a failure indication from the DBfrdtup() primitive while trying to read a dynamic rBCL_MHTG tuple.

Data Structures:

RLBCL_MHTG. Key fields: grpnum, grptype.

Action:

The AUBCLMHTG audit will be scheduled to run.

58. AMFRDTUPFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple that defines the loaded SM could not be found in the RLSMCONF relation.

59. AMICIXNXT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to get an rLICLIDIDX tuple using the DBstnxt() function. Local area signaling services (LASS) called number delivery (CND) 24 hour billing may be affected.

60. AMICIXSTFST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to get the first rLICLIDIDX tuple using the DBstfst() function. Daily billing records for local area signaling service (LASS) called number delivery subscribers may be affected.

61. AMIMBUFFPTR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic message accounting (AMA) message buffer pointer is out of range.

62. AMIMENTRY (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The parameters to the AMloadentry() function are out of range.

63. AMIMINVSCM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid structure code modifier and/or automatic message accounting (AMA) call type was found.

64. AMINPCNT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred in attempting to access (read or write) the RLINSPDATA relation. The AUIS_LINE audit will be scheduled to recover the dynamic tuple of ISDN inspect counts.

65. AMINSPDA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Automatic message accounting (AMA) used the DAGtinspdata() primitive to read an rLINSPDATA tuple. The tuple returned did not match what was expected.

66. AMINSPFDL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A dynamic rLINSPDATA tuple could not be deleted using the DBfdltup() function. Daily National ISDN Inspect billing may be affected.

67. AMINSPFIN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to insert a dynamic rLINSPDATA tuple using the DBfintup() function for National ISDN Inspect.

68. AMINVDATA (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The AMA real-time call detail code encountered invalid data. The invalid data is printed, along with any supporting data. Some RTCD records may have been lost.

69. AMINVFCA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The flexible call accounting (FCA) processing in the SM has detected an error in the FCA data tables, or data required is not available to FCA.

70. AMINVLCC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected class of charge appeared for certain calls. For example, a FWD_CRD_NO class of charge is invalid for a busy line verify call. The default call type is AMBLVOSPS for a busy line verify call, or AMEIOSPS for an emergency interrupt call. The class of charge and the emergency interrupt indicator will be dumped.

71. AMINVLCOMB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the operator services position system (OSPS), certain call type and data group combinations are considered invalid. Default structure codes are used in these cases.

72. AMINVMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The billing system process received an invalid message.

73. AMINVRCL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected rating class appeared for certain calls. For example, a rating class of OANO_RATE_CLS is invalid for a call with class of charge OAPAIID. The prefix, origination service class, and destination type will be dumped.

74. AMINVRSN (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The billing system process was initialized with an invalid operating system for distributed switching (OSDS) reason code.

75. AMISTMNXT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to get the next rlls_TERM tuple using the DBstnxt() function. Daily billing records for National ISDN Inspect feature may be affected.

76. AMISTMSTFST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to get the first rlls_TERM tuple using the DBstfst() function. Daily billing records for National ISDN Inspect feature may be affected.

77. AMKBPTRRS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The pointers pointing to the packet services (PS) automatic message accounting (AMA) billing buffer in the SM were corrupted.

78. AMKINVDNIC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid packet services (PS) automatic message accounting (AMA) office data network identification code (DNIC) number is stored in the Gldnic[] global array.

79. AMKINVMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message was sent to the packet services (PS) automatic message accounting (AMA) SM billing process.

80. AMKINVRATE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid rate period value was read from the packet services (PS) automatic message accounting (AMA) rate period relation.

81. AMKINVRSN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The packet services (PS) automatic message accounting (AMA) SM billing process was started with an invalid reason.

82. AMKINVSGSZ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid packet services (PS) automatic message accounting (AMA) office segment size is stored in the Glsegsz global parameter.

83. AMKINVTMR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected timer was received by the packet services (PS) automatic message accounting (AMA) SM billing process.

84. AMKMDRMERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred while trying to invoke a polling message to the protocol handlers (PHs) using the message reply and distribution capability.

85. AMKNOBDN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The switching module processor (SMP) packet services (PS) automatic messaging accounting (AMA) system

process received a failure indication while attempting to read an rIPBG_INFO tuple using the DBfrdtup() primitive.

86. AMKNOLDVC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The packet services (PS) automatic message accounting (AMA) SM billing process could not successfully initiate a long duration virtual call (LDVC) poll to the protocol handlers (PHs).

87. AMKNOPVC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The packet services (PS) automatic message accounting (AMA) SM billing process could not initiate a permanent virtual call (PVC) poll to the protocol handlers (PHs).

88. AMKSNVERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred while trying to send a message from the packet services (PS) automatic message accounting (AMA) SM billing process to the PS AMA protocol handler (PH) billing process.

89. AMKUMTYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown extended Bellcore automatic message accounting (AMA) format (EBAF) module type was specified in the AMA record sent from the protocol handler (PH) to the SM, or the EBAF module is not specified in the AMkmcodes[] table.

90. AMLASSEV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid event was passed to the AMus_lass() function from feature control (FC). This function does local area signaling service (LASS) billing.

91. AMLASSFT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid feature was passed from feature control (FC) for local area signaling services (LASS).

92. AMLPTFRD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Automatic message accounting (AMA) received a failure indication while attempting to read an rLPT_PT tuple using the DBfrdtup() primitive to get the port and party.

93. AMLTMCNFRD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Automatic message accounting (AMA) received a failure indication while attempting to read an rLTM_PORT tuple using the DBfrdtup() primitive in the AMcnamdn() function to get the port. Calling name (CNAM) billing will be affected.

94. AMLTMFST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BCLLTM	Audit Mode: elev

Problem:

Failed to get the first rBCL_LTM tuple using the DBstfst() function. Billing records for local area signaling services (LASS) bulk calling line identification (BCLID) subscribers may be affected.

Data Structures:

RLBCL_LTM. Key fields: ltm_idx, ltm_type, lead_module.

Action:

The AUBCLLTM audit will be scheduled to run.

95. AMLTMNXT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BCLLTM	Audit Mode: elev

Problem:

A failure occurred while trying to get an rBCL_LTM tuple using the DBstnxt() function. Local area signaling services (LASS) bulk calling line identification (BCLID) billing may be affected.

Data Structures:

RLBCL_LTM. Key fields: ltm_idx, ltm_type, lead_module.

Action:

The AUBCLLTM audit will be scheduled to run.

96. AMLTPTFRD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Automatic message accounting (AMA) received a failure indication while attempting to read an rLTM_PORT tuple using the DBfrdtup() function.

97. AMMDRAMAPID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to send a message detail recording (MDR) counts record to an invalid applications processor (AP). An invalid AP identification (APID) number was specified in the RLMDR_CNTS relation.

Data Structures:

RLMDR_CNTS.

The business customer identification (BCID) number and APID pair containing the invalid APID are provided in the

data dump. Both values are decimal.

Action:

Use RC/V View 24.2 (MDR COUNTS RECORD) to update the BCID and APID pair receiving an MDR counts record. Input a valid value for the APID field. A valid APID can be found using RC/V View 24.7 (DSL APPLICATION PROCESSOR COMMUNICATION DATA). The updates made with View 24.2 will not take effect until after the next MDR counts record is sent to an AP.

98. AMMDRGPBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While generating a message detail recording (MDR) record, the MDR group number of the originating port was not found in the RLMDR_GP relation. This MDR group number was previously retrieved from the RLMDR_PORT relation. Thus, the originating port belongs to an invalid MDR group or an rIMDR_GP tuple is missing.

Data Structures:

RLMDR_GP. Key field: MDR group number (decimal).

RLMDR_PORT. Key field: port.member (hex), port.module (decimal).

Action:

Use RC/V View 24.33 (MDR GROUP PARAMETERS) to assign the originating port to a valid MDR group.

99. AMMDRQADD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message detail recording (MDR) queue head pointer and/or tail pointer was out of range when attempting to add an MDR record to the queue. The MDR queue head and tail pointers are initialized to point to an empty queue. All MDR records in the queue are lost.

100. AMMDRQDIST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message detail recording (MDR) queue head pointer and/or tail pointer was out of range when attempting to remove an MDR record from the queue. The MDR queue head and tail pointers are initialized to point to an empty queue. All MDR records in the queue are lost.

101. AMMDRSMAPID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to send a message detail recording (MDR) record to an invalid applications processor (AP). An MDR group specified an invalid applications processor identification number (APID) in the RLMDR_GP relation.

Data Structures:

RLMDR_GP.

The MDR group number and the invalid APID are provided in the data dump. The value of the MDR group number and invalid APID are given in decimal.

Action:

Use RC/V View 24.33 (MDR GROUP PARAMETERS) to update the MDR group parameter data for the MDR group name corresponding to the MDR group number. Input a valid value for the APID field. A valid APID can be found using RC/V View 24.7 (DSL AP COMMUNICATIONS DATA).

102. AMMHTGFST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BCLMHTG	Audit Mode: elev

Problem:

Failed to get the first rLBCL_MHTG tuple using the DBstfst() function. Billing records for local area signaling services (LASS) bulk calling line identification (BCLID) subscribers may be affected.

Data Structures:

RLBCL_MHTG. Key fields: grpnum, grptype.

Action:

The AUBCLLTM audit will be scheduled to run.

103. AMMHTGNXT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: BCLMHTG	Audit Mode: elev

Problem:

A failure occurred while trying to get an rLBCL_MHTG tuple using the DBstnxt() function. Local area signaling services (LASS) bulk calling line identification (BCLID) billing may be affected.

Data Structures:

RLBCL_MHTG. Key fields: grpnum, grptype.

Action:

The AUBCLMHTG audit will be scheduled to run.

104. AMNSBADCODE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During an attempt to read the RLAMCC_FAM relation with the billing call code to obtain the structure code family, no tuple was found. The affected call is NOT billed. All calls with the indicated call code will not be billed until this problem is corrected.

The call code is returned from the service control point (SCP) for number services (NS) calls, or from the network control point (NCP) for leased network (LN) calls and software defined network (SDN) calls. The SCP or NCP may be sending an invalid call code. This assert is fired in the case of service provider calls, too.

Data Structures:

RLAMCC_FAM. Key fields: call_code, port member, port module.

Action:

Determine if the call code is valid. If the call code is not valid, notify the SCP or NCP that it is sending an incorrect call code value to the switch. The correct NCP or SCP can be determined from the port used for the call.

If the call code is valid, determine the structure code family that should be used for the indicated call code. Use RC/V View 10.18 (STRUCTURE CODE FAMILY) to insert an entry with the STRUCT CODE FAMILY set appropriately.

105. AMODBERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The AModbteardn() primitive was called from a process that does not appear to have a process control block link area (PCBLA) used for an office database (ODB) process. The billing data stored in the PCBLA is not valid. The calling process is probably not an ODB terminal process, or was corrupted.

106. AMOFFICECODE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid normalized office code (NOC) within the dd_number field of an rIPSX25LN tuple has no corresponding tuple in the RLOFFICECODE relation.

Data Structures:

RLPSX25LN, RLOFFICECODE.

Action:

Correct the NOC in the dd_number field of the rIPSX25LN tuple or add a corresponding rLOFFICECODE tuple.

107. AMOSPDAGT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: OCRECORD	Audit Mode: elev

Problem:

The operator services position system (OSPS) call record DAGETOCREC macro returned an invalid pointer to the OSPS call record.

Probable Cause:

A bad call ID was passed as a parameter.

Action:

The OSPS call record audit is scheduled.

108. AMPCNAM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Automatic message accounting (AMA) used the DAgetpcnam() primitive to read an rPCNAM tuple. The tuple returned did not match what was expected.

109. AMPCNMCNT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LINE	Audit Mode: elev

Problem:

An error occurred in attempting to access (read or write) the RLPCNAM relation. The AUIS_LINE audit will be scheduled to recover the dynamic tuple of the count of names (non)delivered.

110. AMPCNMFDL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A dynamic rPCNAM tuple could not be deleted using the DBfdltup() function. Daily CNAM-PRI billing may be affected.

111. AMPCNMFN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to insert a dynamic rPCNAM tuple using the DBfintup() function for CNAM-PRI feature.

112. AMPMDRAPID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to send a message detail recording (MDR) record for a packet call to an invalid applications processor (AP). An invalid AP identifier (APID) was specified in the MDR message to the AP. The MDR message may be corrupted or the office dependent data (ODD) may be inconsistent.

Data Structures:

RLMDR_GP.

The invalid APID is provided in decimal in the data dump.

Action:

If the MDR group has an invalid APID specified, correct the APID by using RC/V View 24.33 (MDR GROUP PARAMETERS) or ODBE on the RLMDR_GP relation.

It is difficult to determine the correct MDR group associated with the MDR record. Use ODBE to perform a batch review of all rIMDR_GP tuples populated on the offending SM. Look for tuples with the packet MDR indicator (pkt_mdr) attribute set to DBYES. Compare the APID in these tuples to RC/V View 24.7 (DSL APPLICATIONS PROCESSOR COMMUNICATIONS DATA). If an invalid APID is found, use RC/V to update the MDR group data with the correct APID for the MDR group name corresponding to the MDR group number found in the rIMDR_GP tuple.

113. AMPSBILLDN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The billdn_flg was set in an rIPSX25LN tuple, but no corresponding rIPSBILLDN tuple exists that has the same protocol handler (PH) and PH channel number.

Data Structures:

RLPSX25LN, RLPSBILLDN.

Action:

Turn off the billing flag in the rIPSX25LN tuple or add a corresponding rIPSBILLDN tuple.

114. AMPSX25LN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid protocol handler (PH) and/or PH channel number was passed to automatic message accounting (AMA) during the setup of an on-demand B-channel connection to a PH. No valid AMA record can be made for this

connection.

115. AMRDSAMEMPTR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During an attempt to read from the stand-alone billing memory, the pointers were out of range or were not in a position corresponding to a structure boundary.

116. AMREASERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The process received an invalid create code.

117. AMSCALTM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Automatic message accounting (AMA) received a failure return code from the database subsystem (DB) while trying to read the static relation RLSCA_LTM. This will prohibit the 24 hour collection of local area signaling services (LASS) AMA data.

118. AMSCFLTM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Automatic message accounting (AMA) received a failure return code from the database subsystem (DB) while trying to read the static relation RLSCF_LTM. This will prohibit the 24 hour collection of local area signaling services (LASS) AMA data.

119. AMSCRLTM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Automatic message accounting (AMA) received a failure return code from the database subsystem (DB) while trying to read the static relation RLSCR_LTM. This will prohibit the 24 hour collection of local area signaling services (LASS) AMA data.

120. AMSDALTM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Automatic message accounting (AMA) received a failure return code from the database subsystem (DB) while trying to read the static relation RLSDA_LTM. This will prohibit the 24 hour collection of local area signaling services (LASS) AMA data.

121. AMSEDESTBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A defensive check of the automatic message accounting (AMA) entry message destination found the value to be incorrect.

122. AMTIMETOL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SM process received a new ATIME and RTIME from the AM that differs from the current value by a large amount.

123. AMTRTOFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The attempt to start a timer to indicate the end of the tracer collect interval in the SM failed.

124. AMVMRNG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The global data, AMvmnments, that contains the number of entries used by the AMATRC process was corrupted. Since this data is globally accessible, another process probably wrote over it. The global data will be re-set.

125. AMWTSAMEMPTR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During an attempt to write to the stand-alone billing memory, the pointers were out of range or were not in a position corresponding to a structure boundary.

Range: amapp**1. AMKINVCODE (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A packet services (PS) billing buffer entry has a corrupted structure code.

2. AMKNORCD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The packet services (PS) automatic message accounting (AMA) record formatting routine was called and there are no billing records on the PS billing buffer.

Range: as**1. APID_DYNAMIC (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid applications processor ID (APID) was found in one of the global hundred second scan (HSS) arrays (MStrkglist[] or MSmlhglist[]) for a particular customer assigned the HSS feature. The problem was probably caused by a wild write, and was automatically corrected. No manual action is necessary.

2. APID_INVALID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the CMapsend() function in the MShtsnd() function failed because of an invalid applications processor ID (APID).

3. APID_STATIC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid applications processor ID (APID) was found in the RLMSAPHSS and RLHSSASGN relations for a particular customer who is assigned the hundred second scan (HSS) feature.

Data Structures:

RLMSAPHSS. Key fields: type of private feature/facility group, group #.

RLHSSASGN. Key fields: business customer ID (BCID), APID.

Action:

The invalid APID in the RLHSSASGN relation can be corrected using RC/V View 24.3 (TRAFFIC DATA, ACA & HSS ASSIGNMENT). The invalid APID in the RLMSAPHSS relation can be corrected using RC/V View 24.12 [100 SECOND SCAN (HSS) ACTIVATION].

4. ASACDNOIN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DBfrdtup() function failed to read the RLIST_PARM relation. The return code was DBNO_MATCH.

Data Structures:

RLIST_PARM. Key field: st_id.

Action:

Use ODBE on the RLIST_PARM relation with the st_id key to verify that the tuple exists. If the tuple does not exist, verify that there are no data inconsistencies between the RLIST_PARM relation and the RLINTERFLW relation.

5. AS_AUTREC_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read an rIAUT_REC tuple.

6. AS_BAD_DB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid database read occurred in the administrative services (AS) subsystem.

7. ASBAD_DSTID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The database (DB) subsystem failed to read an rIDSTID_RR tuple from the MSota5csmcl() function in as/ASospsadm/MSotasmrc.c. TRFC30 data for section 97 of 30-minute traffic report is incomplete.

8. ASBADGACSND (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A problem occurred when sending a message to the receiving operator services position system (OSPS) on an interflowed call using the general access channel. The message was lost because of a problem on the general access channel.

9. ASBAD_ISTPARM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The database (DB) subsystem failed to read an rLIST_PARMS tuple from the MSota5camft() function in as/ASospsadm/MSam30osta.c. TRFC30 data for section 95 of the 30-minute report is incomplete.

10. AS_BADMSGTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The message type received is not known.

11. AS_BADOAPDA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unexpected data was received from the operator services position system (OSPS) administrative processor (OAP).

12. ASBADOSINT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The database (DB) subsystem failed to read an rIOSPS_INT tuple from as/ASospsadm/MSam30osta.c. TRFC30 data for section 96 of the 30-minute traffic report is incomplete.

13. ASBAD_PN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The process ID (PID) received does not have an entry in the DATATABLE.

14. ASBADPSM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DATATABLE.psm entry was not a valid packet switching module (PSM), even though there was a valid process identifier (PID) for that same entry.

15. ASBADTRKG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read an rIRT_TRKG tuple. This may be a warning of a possible database system failure.

Action:

If this assert fires on a regular basis, inform your next level of support.

16. ASBDDIG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The value of digcnt in the structure of the domain directory number (DMDN) is less than 0.

17. ASBDINDX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid index of the DATA TABLE is converted.

18. ASBDMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The MGOAPSEC message was received by the administrative services (AS) SM system process, but the message had an invalid type.

19. ASBEDLIO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The basic encode decode library (BEDL) has detected an unknown return code from DA when accessing RTMSGBUFS during an application protocol data unit (APDU) input/output (IO).

20. ASBGN_TRAN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not begin a database transaction. Auto-reconfiguration was initiated.

21. ASCCLCTERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error has occurred during C interval traffic measurements data collection. This error was detected when an overflow occurred in the C interval data buffer.

Probable Cause:

Some internal error with the traffic measurements C interval collection process.

Action:

Give the dumped data to field support for analysis.

22. AS_CMAPSEND_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to the CMapsend() function in an attempt to send enhanced private switched communication service (EPSCS) hundred second scan (HSS) messages resulted in an unacceptable return code. No action is necessary.

23. AS_DCHAN_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No in-service D-channel from operator services position system (OSPS)-a to OSPS-z was found.

24. ASDDRDERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Administrative Services received an error return from the Data Delivery Read primitive.

25. ASDRAINTM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not read the Gldraintm global parameter. Auto-reconfiguration was initiated.

26. AS_DSTID_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read an rIDSTID_RR tuple.

27. AS_EISDSL_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The MSota6csmcl() function failed to read an rIEISDSL tuple for the 30-minute traffic measurement section 124.

28. ASEND_TRAN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not commit the database transaction. Auto-reconfiguration was initiated.

29. ASERICCVDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBfrdtup returns DBRELNAME_BAD while reading relation RLICCVDB,

Data Structures:

Relation RLICCVDB is missing or corrupted,

Action:

Define relation RLICCVDB.

30. ASERMEASDES (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

DBfrdtup returns DBRELNAME_BAD while reading relation RLMEASDES.

Probable Cause:

Relation RLMEASDES is missing or corrupted.

Action:

Define relation RLMEASDES.

31. ASFAIL_ISTPARM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the RLIST_PARM relation. This may cause the link occupancy for voice links to a receiving operator services position system (OSPS) on section 95 of the TRFC30 report to be invalid.

32. ASFATALBUF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to verify buffer allocation for an operator services position system (OSPS) administrative processor (OAP) terminal process (TP), some other OAP TP was already using the buffer. The former TP is sent a message telling it to call the OSSUICIDE() macro. The latter TP is left alone.

33. ASFBTEDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DAGhdpte() primitive returned DBNULL_SET. No rITEDB tuple was found for the rIDPB tuple.

34. ASGROUPOUT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read an rIGROUP_PORT tuple.

35. AS_HSSPID_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The MShss_crt() function was called to create the enhanced private switched communication service (EPSCS) hundred second scan (HSS) terminal process. However, the value of the previous processor ID (PID), MShsspid, that should have been zeroed out, has an invalid value. No manual action is necessary.

36. AS_IFLOW_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read an rIID_IFLOW tuple.

37. ASINIT_REQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An initialization request can not be made in the update mode for the MGPOLL_RSP message.

38. AS_INTERFLW_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read an rIINTERFLW tuple.

39. ASINV_PCB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not allocate process control block (PCB) space from the OScreate() function.

40. ASINV_PROGID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid program ID argument was received from the OScreate() function.

41. ASINV_SCB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not allocate stack control block (SCB) space from the OScreate() function.

42. AS_ISTPARM_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read an rLIST_PARM tuple.

43. ASMSALWMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default condition was reached in the administrative services (AS) measurements human interface module. The message type contained in the message buffer passed to the MSalwrept() function did not satisfy the switch cases for the possible messages.

Valid message types are MGMSRQ15MT [request for allowing the TRFC15 (15-minute traffic) report], MGMSGREQ [request for allowing the division of revenue hourly (DRHR) report], and MGMSJREQ [request for allowing the PLNTHR (hourly plant) report].

44. ASMSALWSEC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default condition was reached in the administrative services (AS) measurements human interface module. In the MScalwsect() function, the switch on the sectnm value failed to find a valid case for the section name passed to the function. The calling function should have filtered out any section names not meeting the valid names for the MScalwsect() function.

45. ASMSBCBID (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The MSmsgsnd() function failed in a call to the OSBCAST() macro and could not get a valid broadcast ID (BID) value.

46. ASMSBCMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The MSinjrvcv() function was called to process a message of an unexpected type.

47. ASMSBCRPT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The MSmsgsnd() function was called by an unexpected rptype.

48. ASMSCLRPT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default condition was reached in the MSbudgmgr.c file. The report type for the TRFC15, TRFC30, PLNTHR, or DRHR report that was passed to the MShmcalc() function is not a valid report type. The valid reports are outlined in hdr/db/DMrptype.h.

49. ASMSCLCSEC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default condition was reached in the MSbudgmgr.c file. The section name for the TRFC30 report that was passed to the MShmcalc() function was not a valid section enumeration. The valid sections are outlined in hdr/as/MScptcnst.h.

50. ASMSCPCCRPT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The MScpcc() function was called by an unexpected rptype.

51. ASMSHMDEVC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default condition was reached in the administrative services (AS) measurements human interface module. The outdev parameter passed in the craft request message did not satisfy the switch cases for output devices specified in a request for status of the output states of the various device types. Valid possible devices are CLCT (collection of data for TRFC30 report) and ROP (print output directed to the ROP or TRFC channel).

52. ASMSHMOUT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default condition was reached in the MShmout() function in the MSbudgmgr.c file. An invalid report type was passed to this function. The valid report types are defined in hdr/db/DMrptype.h.

53. ASMSHMQERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was returned from the HMquemsg() function. Possibly, a distorted parameter was passed to human/machine interface (HM) in the function call, or the message handler is not resident.

54. ASMSHMVERB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default condition was reached in the administrative services (AS) measurements human interface module. The verb parameter passed in the craft request message did not satisfy the switch cases for valid craft request actions. Valid possible actions are ALLOW, INHIBIT, and OUTPUT (OP).

55. ASMSIBRC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Too many electronic directory service (EDS) or message service (MGS) customers or too many MGS multi-line hunt groups (MLHGs) are being reported from a SM. The maximum number of customers or groups that can be specified for measurements is 25. The control table building process failed, or more than 25 items were entered into the RLMS_AP relation.

Data Structures:

RLMS_AP.

Action:

If the failure is due to process failure, it will self-correct every half-hour as the control tables are rebuilt and updated in the SMs.

If too many items were entered into the RLMS_AP relation, use RC/V to correct the relation.

56. ASMSINHMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default condition was reached in the administrative services (AS) measurements human interface module. The message type contained in the message buffer passed to the MSinhrept() function did not satisfy the switch cases for the possible messages.

Valid message types are MGMSRQ15MT [request for inhibiting the TRFC15 (15-minute traffic) report], MGMSGREQ [request for inhibiting the division of revenue hourly (DRHR) report], MGMSJREQ [request for inhibiting the PLNTHR (hourly plant) report].

57. ASMSINHSEC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default condition was reached in the administrative services (AS) measurements human interface module. In the MScinhsect() function, the switch on the sectnm value failed to find a valid case for the section name passed to the function. The calling function should have filtered out any section names not meeting the valid names for the MScinhsect() function.

58. ASMSPRERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A default condition was reached in the administrative services (AS) measurements human interface module. An error return code was received from the human/machine interface (HM) subsystem during an attempt to put a PRINT status message on the HM queue using the HMquemsg() function.

An invalid message pointer may have been passed to HM, the message structure may have exceeded the maximum limit, or the TTY message handler may be non-existent.

59. ASNODPRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert is displayed as a result of the failure to obtain a D-port for a passed in port. This occurs when the RTGETED() macro is called from within the function ASsndiflow().

Probable Cause:

No tuple found in RLFCPORTTYP for the passed in port.

Action:

Check RC/V View 5.5 (TRUNK MEMBER) for the associated equipment.

60. AS_NOINCID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The administrative services (AS) measurement for the interflow calls received was pegged for a non-existent incoming operator services position system (OSPS) office ID. There was no match in the RLOSPS_INT relation.

61. ASNOPATH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

There is no path in the DATATABLE, but the process identifier (PID) is not null.

62. ASNOPID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The process ID (PID) of the operator services position system (OSPS) administrative processor (OAP) terminal process (TP) was not found in the DATATABLE of the administrative services (AS) SM system process.

63. ASNO_UID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The macro SMSU2DSUBD() was called to obtain a circuit name of a subtending circuit of a DSU2, and failed to obtain the circuit. This failure occurred in the function MSctdmusg().

Probable Cause:

Failure in reading RLCKTDATA or RLUNIT_CKT.

Action:

Verify that a circuit exists for the unit by checking RC/V View 5.5 (TRUNK MEMBER).

64. AS_OAP_SEC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to print an operator services position system (OSPS) security report. However, the security devices are not defined properly.

Data Structures:

RLOSPSPARM. Key fields: office type, office number.

Action:

From the OSPS administrative processor (OAP) security terminal and using the ospsec login, select option 3 (RC/V OSPS Security Parameters).

Verify and update, as necessary, the security devices' attribute definitions associated with RC/V View 21.99 (OSPS PARAMETERS FOR SECURITY TERMINAL) as described in the 5ESS® Switch Operator Services Position System - Administrative Guidelines manual, 250-570-112.

65. ASOPN_REL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not open a relation. Auto-reconfiguration was initiated.

66. AS_OS_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid operating system (OS) call return code was encountered.

67. ASOSCLIMIT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The number of operator service centers (OSCs) in a single SM to which operator measurements will be distributed for the operator services position system (OSPS) 24 hour report, was exceeded.

68. ASOSPSDIST (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The reason for creation of the terminal process MSosps_dist in the AM for the 15 minute operator services position system (OSPS) report is not valid.

69. ASOSPSID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not read the Glospsid global parameter. Auto-reconfiguration was initiated.

70. ASPSMLIMIT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The number of operator services position system (OSPS) integrated services digital network (ISDN) SMs with operators exceeded the maximum for which measurements are reported to the OSPS administrative processors (OAPs). The current limit is 32. The RLDB_AMGPD relation is incorrectly populated for the following keys: grp_type=GPD_OSPS and grp_id=1, or a program update is required to increase this limit.

71. AS_RANGE_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The num_on attribute from the RLIST_PARM or RLDSTID_RR relation is out of range.

72. ASRD_IFOSPS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not read the Glifosps global parameter. Auto-reconfiguration was initiated.

73. ASRD_RROSPS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not read the Glrrosp global parameter. Auto-reconfiguration was initiated.

74. AS_REASON_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The MShsstp() function was entered with a reason other than OSCREATE.

75. AS_RFSH_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Two successive calls to the MShss_rfsh() function in an attempt to update enhanced private switched communication service (EPSCS) hundred second scan (HSS) global data failed. No manual action is necessary.

76. ASSND_OPR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The reason for creation of the terminal process MSsnd_opr in the SM for the 24 hour operator services position system (OSPS) report is not valid.

77. ASTMOAP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the process of initializing or updating the operator services position system (OSPS) administrative services (AS) SM system process's DATATABLE, it was determined that more than four OSPS administrative processors (OAPs) were supposed to be attached to the same packet switching module (PSM). The upper limit is four. The SM system process proceeds as if there are only four OAPs present and uses only the first four in the database.

78. ASTM_ZONE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not read the Gltimezone global parameter. Auto-reconfiguration was initiated.

79. ASUPDAUT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The process could not update the RLAUT_REC relation. Auto-reconfiguration was initiated.

80. ASUPDIFLOW (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not update the RLINTERFLW relation. Auto-reconfiguration was initiated.

81. ASUPD_IFOSPS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not update the Glifosps global parameter. Auto-reconfiguration was initiated.

82. ASUPDPARM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not update the RLST_PARM relation. Auto-reconfiguration was initiated.

83. ASUPD_RROSPS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not update the Glrrosp global parameter. Auto-reconfiguration was initiated.

84. ASUPDSTID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not update the RLDSTID_RR relation. Auto-reconfiguration was initiated.

85. COTNO1MSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The AScotsys() function could not enable the message reception.

86. COTNO2MSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The AScotsys() function could not send a message to the SMaprts() function. The DMERT queue is busy.

87. COTNODDRD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ASctosys() function could not do a DDREAD.

88. COTNODDWT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ASctosys() function could not do a DDWRITE.

89. COTNOOSDS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ASctosys() function could not set up communication with a non-DMERT environment.

90. COTNOPAS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ASctosys() function could not attach to a protected application segment.

91. COTNOPORT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ASctosys() function could not connect to its port.

92. COTSANFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ASctosys() function validity check failed.

93. COTWRGMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The ASctosys() function received an unknown message type.

94. DBBADBLF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to retrieve a block from the dynamic relation RLATTM_BLF.

95. DBBADGRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the RLGROUP_PORT relation. The keys are group type=TM_LINE, group number, and member number. The keys come from the MGISATREQ message.

96. DBBADICX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the RLICX_ICI relation. The key comes from the MGISATREQ message.

97. DBBADIST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the RLISATGRP relation. The key was obtained from the RLRT_MHG relation.

98. DBBADMHG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the RLRT_MHG relation. The key was obtained from the RLAPPFGRP relation.

99. DBBADQICI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to retrieve a block from the dynamic relation RLQO_ICI.

100. DBBADTRM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the RLIS_TERM relation. The keys are term number=0 and logical port. The keys come from the RLGROUP_PORT relation.

101. DBBDLNST (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A corrupted tuple was read from the dynamic relation RLLNSTAT.

102. GPTYPBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid group type was encountered. The group type should be MSMLHGAC or MSMLHGQC as defined in header file DMapptype.

103. GRPNUM_DYNAMIC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid trunk group number or multi-line hunt group (MLHG) number was found in one of the global hundred second scan (HSS) arrays (MStrkglist[] or MSmlhglist[]) for a particular customer assigned the HSS feature. The problem, probably due to a wild write, was automatically corrected. No manual action is necessary.

104. GRPNUM_STATIC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid trunk group or multi-line hunt group (MLHG) number was found in the RLMSAPHSS relation for a particular customer assigned the hundred second scan (HSS) feature.

Data Structures:

RLMSAPHSS. Key fields: type of private feature/facility group, group #.

Action:

The invalid group number can be corrected using RC/V View 24.12 (100 SECOND SCAN [HSS] ACTIVATION) or ODBE (if necessary).

105. GRPTYP_STATIC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid group type was found in the RLMSAPHSS relation for a particular customer assigned the hundred second scan (HSS) feature.

Data Structures:

RLMSAPHSS. Key fields: type of private feature/facility group, group #.

Action:

The invalid group type can be corrected using RC/V View 24.12 (100 SECOND SCAN [HSS] ACTIVATION) or ODBE (if necessary).

106. HSSLIST_ERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Corrupt values were found in the enhanced private switched communication service (EPSCS) hundred second scan (HSS) global data. This data was corrected by the EPSCS HSS software, and requires no manual action.

107. HSS_OVERLAP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The creation of a new enhanced private switched communication service (EPSCS) hundred second scan (HSS) terminal process was not attempted because the previous HSS terminal process was still running after its HSS interval had expired.

108. HSS_TIMEOUT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The global data associated with the hundred second scan (HSS) capability was not refreshed in this particular HSS interval because there was insufficient time remaining.

109. MS_0_ASRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the SM or the AM, the measurements subsystem control table building process MSamctbl() or MSimctbl() could not hash the group ID keys into a lookup table with the required constraints.

The hash failure causes the lookup table to be initialized. However, the measurements for this type of group are effectively turned-off. Measurements will be lost.

Action:

Dump the MS_xxx (where xxx is IDP, CFT, TGSR, MLHG, PFA, or ATT) to determine the keys that could not be hashed.

110. MS_1_ASRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the SM or AM, the measurements control table building process MSamctbl() or MSimctbl() could not complete its assigned task in the allocated time. If the assert fires each half-hour, this probably means the required relations are not populated correctly (RLMS_CFT, RLMS_IDP, RLMS_PFA, RLMS_TGSR, RLMS_MLHG, RLMS_ATT).

Occasional or intermittent asserts are a result of the real-time load causing the process to time-out, or the messages being lost due to link failures. An occasional assert is acceptable because the table is rebuilt during the next time period.

111. MS1SILENTSM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A "SILENT" SM exists and recovery actions are being taken to correct the error. This is the first assert in the recovery procedure. This assert dumps the communication package per link data. The second assert, MS2SILENTSM, dumps more information.

Action:

Save the ROP output starting two hours before the error and ending two hours after the error. Call the 5ESS® switch product engineering control center (PECC) immediately. The module controller/time slot interchanges (MCTSI) should switch sides before this assert is printed.

112. MS_2_ASRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The reason for creation of the terminal process MSimrh in the SM for the 5-minute report is not valid.

113. MS2SILENTSM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This is the second assert in the series of corrective actions to recover a "SILENT" SM. The debugging information gathered during the silent interval is dumped.

Action:

Save the ROP output starting two hours before the error and ending two hours after the error. Call the 5ESS[®] switch product engineering control center (PECC) immediately. The module controller/time slot interchanges (MCTSI) should switch sides before this assert is printed.

114. MS_3_ASRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The reason for creation of the terminal process MS5nm in the AM for the 5-minute report is not valid.

115. MS_4_ASRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In pegging the MSNMCCID() macro, the code control identifier is out of range. The valid range is 0 to 64.

116. MS_5_ASRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the pegging macro MSNMTGCID(), the trunk group control identifier and control identifier did not match any control already stored in measurements data.

117. MS_6_ASRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A pointer used to load information into the engineering and administrative data acquisition system (EADAS) buffer is set to a value pointing to a memory range not belonging to the TRFC30 section identified in the ROP output message.

Generally, the office dependent data (ODD) relation identified by the assert for this section allocation (number of units) is set to a value less than the number of items being reported during collection of data for the section identified.

Action:

Use the output message information (TRFC30 section number, AM ODD relation suspected of being in error, and current value of that AM ODD relation) and office records to determine the error in the AM ODD relation. Once the ODD relation error has been identified, correct the value of it by using RC/V (or ODBE, if necessary).

Section 90:

May be an indication that more concentrators are allowed than the AM reports. Inhibit some or all of the concentrators that were recently inhibited or allowed, ignoring the AM-reported concentrators.

NOTE: Data items should only be checked if the problem is persistent (occurring more than once) because a SM may not receive an update made in time for the next 30 minute report being prepared. This assert may occur intermittently.

Section 77:

The SMs reported more digital subscriber lines (DSLs) than are allowed in the AM. This could happen because the SMs did not receive an inhibit request from the AM. To fix this assert for section 77, type in the following commands:

```
INH:TRFC30:CLCT:DSL=ALL;
ALW:TRFC30:CLCT:DSL:PREV;
```

Then allow the same DSLs that were allowed for ROP output.

Sections 138 and 141:

The SMs reported more remote terminals (RTs) or LINEs, respectively, than are allowed in the AM. If the problem does not correct itself during the following half hour, type in the following input messages:

```
INH:TRFC30,CLCT,IRT,ALL (for section 138)
INH:TRFC30,CLCT,ILINE=ALL (for section 141)
```

Then allow the IDs to be studied.

118. MS_7_ASRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Pointer sent from SM to AM for 5-minute measurements is corrupted. 5-minute measurement packages that are impacted by the corruption will be marked as DATA SUSPECT. If the assert fires on a regular basis, seek technical assistance. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

119. MS_8_ASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Spare MS AUASRTA (when assigned add explanation).

120. MS_9_ASRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A trunk group is identified in the AM, but is not being reported to the AM by any SM for TRFC30 section 12 measurements. The AM office dependent data (ODD) relation RLRT_TRKG or the corresponding SM ODD relation RLIMTGRPS are populated incorrectly. This assert may occur many times after an initialization when links to SMs may not be available; in this case the assert should be ignored.

Data Structures:

RLRT_TRKG, RLIMTGRPS.

Action:

Locate the trunk group identified in the ROP output message in the RLRT_TRKG relation. From the information for the trunk group, determine which SM should be reporting its measurements. Examine the corresponding RLIMTGRPS tuple to see if the trunk group is assigned in the SM. Either the trunk group should not be assigned in

the AM or should be assigned in an SM. Once the ODD relation item in error is identified or the item not being reported is identified, correct it by using RC/V (or ODBE, if necessary).

NOTE: These data items should only be examined if the problem is persistent (occurring more than twice). These types of problems may occur intermittently because an SM may not receive an update of a changed data item, but the problems are self correcting before the next 30 minute report.

121. MS_10_ASRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operator services position system (OSPS) administrative services (AS) system process on the AM found over 30 messages of type MGOAPDG2 on its queue. The process discarded them and reported this assert.

MGOAPDG2 messages are non-critical messages intended for an OSPS administrative processor (OAP). They should not be permitted to threaten the AM with overload. The real-time call details feature uses them. If a back number specified for monitoring by the feature represents many physical phones (e.g. DIOR), a flood of messages can result. Shut down the feature using feature option number 595 in RC/V View 8.31 (OPTIONED FEATURES) until the offending number is removed from OAP security login RC/V View 21.98.

122. MS_11_ASRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The reason of creation for the terminal process MScmphcc (ID MSHP) in the communication module processor (CMP) for the 5-minute report is not valid.

123. MS_77_ASRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

TRFC30 section 77 pointers to the count table were corrupted. To eliminate the corruption, the table was initialized. The data is lost for the next 30 minute report period. Because the counters table that contains the data for digital subscriber lines (DSLs) was initialized, no data is sent to the AM for the SM that asserted.

A "NO-DATA" message prints to the ROP for the study set (arbitrary DSLs or DSLs on an integrated services line unit [ISLU]) that is allowed for collection and ROP. For DSLs allowed on an ISLU basis, only the SM and ISLU numbers appear in the "NO-DATA" message. This is true only for a specified count (HIGH, LOW, or HILO) allowed for ROP output.

Action:

No action is required. The section 77 pointers to the counter array (MSsidslcnts[]) or the pointers array (MSsdlptrs[]) were initialized to remove corruption to the table. The problem is corrected at the next half-hour, or this section can be inhibited for collection then allowed for collection using the following commands: INH:TRFC30:CLCT:DSL=ALL; and ALW:TRFC30:CLCT:DSL=PREV;

124. MS_99_ASRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to access the RLPSTRUNKS relation in the MSpswsm() function in the MS30smpsw.c file returned BDRELNAME_BAD. At least one of the relation identifiers in the rellist parameter does not describe a relation.

Action:

If this continues, contact the product engineering control center (PECC).

125. MS_100_ASRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read the first rIPSTRUNKS tuple returned an end of relation message.

Action:

Verify that the RLPSTRUNKS relation for the specified SM should be empty. If it should be populated, do so.

126. MS_13_6_UPD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

RC/V View 13.6 (LU/[R]ISLU MEASUREMENTS) could not be updated. Additional line units (LUs) were added to the study, and the study is allowed for measurements collection. However, the engineering and administrative data acquisition system (EADAS) memory allocation would be exceeded at the next half-hour if these additional LUs were added to the study. The MSsgalwd[] array and the MSlgcalwd[] array are affected.

Action:

To add LUs to the study, at least one of the actions listed below must be taken:

- Inhibit one or more 30-minute traffic report (TRFC30) sections for collection.
- Inhibit one or more studies (TRFC30 section 144 or 145) for collection.
- Remove some of the LUs from the study before adding additional LUs.

127. MSBAD_LNNODE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid leased network node was encountered. An invalid ars_idx value was found in an rLNNODE_M tuple. The valid range for ars_idx is 1 to 1000. This could only happen if ODBE was used to input the tuple into the relation, since RC/V range checks this value before it is entered.

Data Structures:

RLLNNODE_M.

The following data is dumped: the invalid ars_idx and the invalid rLNNODE_M tuple.

Action:

Use ODBE to remove this tuple and correct the error. If needed, insert a correct tuple using RC/V.

128. MSCHSHOVFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While attempting to insert a component into the hash table for pegging C interval traffic measurements, the maximum number of probes was exceeded for the component. The component was not inserted in the hash table.

Probable Cause:

Either too many components have been included in the hash table or the hashing algorithm is not adequate to support the component keys.

Action:

Give the dumped data to field support for analysis.

129. MSCPEGOVFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While attempting to allocate storage for a section in the C interval pegging buffer the space required exceeded the space available.

Data Structures:

None.

Action:

Turn off collection of unneeded traffic measurements reports and/or components via RC/V views TMRSL, TMSEL, and/or TMLSL.

130. MSCPHPEGOVFL (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While attempting to allocate storage for a section in the C interval PH pegging buffer, the space required exceeded the space available.

Data Structures:

NONE

Action:

Turn off collection of unneeded traffic measurements reports and/or components.

131. MSCROPOVFL (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While attempting to insert a component into the internal AS data structures for ROP printing, the number of allowable components was exceeded.

Probable Cause:

Too many components are allowed in relation RLMSPTLST.

Action:

Inform local field support.

132. MSCSMTDCUMG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An SM to AM message for traffic measurements data collection has been received with an unidentified action type.

Probable Cause:

Either an SM is sending erroneous messages or the software needs to be updated to recognize a new action type.

Action:

Give the dumped data to field support for analysis.

133. MSMAXEDSLEXCED (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

More interflow extended digital subscriber loop B-channels or D-channels were taken out of service than can be defined on a packet switching module (PSM). The incorrect number of extended digital subscriber lines (EDSLs) was specified for the primary rate interfaces, or the number of allowed EDSLs increased and the MSBLISTMAX or MSDLISTMAX parameters were not changed to reflect this.

134. MS_SG_ASRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

More records [service groups (SGs) or line group controllers (LGCs)] were sent from the SMs than were allocated in the engineering and administrative data acquisition system (EADAS) buffer for the TRFC30 section.

TRFC30 section 144 or 145: This problem could have occurred because an INH:TRFC30,CLCT,SG=<study groups> message was not processed or after an attempted update to RC/V View 13.6 (LU/(R)ISLU MEASUREMENTS). The update failed because no additional line units (LUs) could be added to the study.

Action:

TRFC30 section 144 (MSsgalwd[] array):

If this problem does not correct itself at the next half hour, type in the following command:

INH:TRFC30,CLCT,SG=<study group numbers>; (where the "study group numbers" are those that were set up using RC/V View 13.6) and ALW:TRFC30,CLCT,SG=<study groups allowed for collection>;

TRFC30 section 145 (MSlcalwd[] array):

If this problem does not correct itself at the next half hour, type in the following commands:

INH:TRFC30,CLCT,LGC=<study group numbers>; (where the "study group numbers" are those that were set up using RC/V View 13.6) and ALW:TRFC30,CLCT,LGC=<study groups allowed for collection>;

Then re-allow the section for ROP or traffic channel output.

135. PRTIMBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The processor time is not a valid time. No data is being sent.

136. SES_0_ASRT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An SM system process entry default was encountered.

137. SES_1_ASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to find a service evaluation system (SES) voice link trunk.

138. SES_2_ASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid entry reason for a system process (SP) initialization was encountered.

139. SES_3_ASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message is out of sequence.

140. SES_4_ASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Spare SES AUASRTA (when assigned add explanation).

141. SES_5_ASRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Spare SES AUASRTA (when assigned add explanation)

142. SES_6_ASRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Spare SES AUASRTB (when assigned add explanation)

143. SES_7_ASRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Spare SES AUASRTB (when assigned add explanation)

Range: au**1. AU1MRKPAGRC (5E11 and later)**

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return code was returned from the DBmarkpage() function to the DBmm_audit() function in the MEMMAN audit code.

2. AU2MRKPAGRC (5E11 and later)

Problem:

Failed to write to the peripheral configuration data (PCD). Static data may be invalid.

60. AU110SMDDREAD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the desired information from the peripheral configuration data (PCD). Static data may be invalid.

61. AU115SMDWRITE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to write to the peripheral configuration data (PCD). Static data may be invalid.

62. AU120SMDDREAD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the desired information from the peripheral configuration data (PCD). Static data may be invalid.

63. AU130SMDWRITE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to write to the peripheral configuration data (PCD). Static data may be invalid.

64. AU140SMDWRITE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to write to the peripheral configuration data (PCD). Static data may be invalid.

65. AU150SMDWRITE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to write to the peripheral configuration data (PCD). Static data may be invalid.

66. AU160SMDWRITE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to write to the peripheral configuration data (PCD). Static data may be invalid.

67. AU170SMDWRITE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to write to the peripheral configuration data (PCD). Static data may be invalid.

68. AU180SMDWRITE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to write to the peripheral configuration data (PCD). Static data may be invalid.

69. AU190SMDWRITE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to write to the peripheral configuration data (PCD). Static data may be invalid.

70. AU200SMDWRITE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to write to the peripheral configuration data (PCD). Static data may be invalid.

71. AU250SMDDREAD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the desired information from the peripheral configuration data (PCD). Static data may be invalid.

72. AU260SMDDREAD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the desired information from the peripheral configuration data (PCD). Static data may be invalid.

73. AU270SMDDREAD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the desired information from the peripheral configuration data (PCD). Static data may be invalid.

74. AU280SMDDREAD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the desired information from the peripheral configuration data (PCD). Static data may be invalid.

75. AU290SMDDREAD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the desired information from the peripheral configuration data (PCD). Static data may be invalid.

76. AU300SMDDREAD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the desired information from the peripheral configuration data (PCD). Static data may be invalid.

77. AU310SMDDREAD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the desired information from the peripheral configuration data (PCD). Static data may be invalid.

78. AU320SMDDREAD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the desired information from the peripheral configuration data (PCD). Static data may be invalid.

79. AUACCOND (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A condition was set incorrectly by an audit in a report structure.

80. AUACCTYPE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid access type field was encountered. This assert is used in a default statement.

81. AUACID (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid audit name was requested. This assert will fire if the audit does not exist, the audit does not exist in the requested processor, or the audit is valid in the requested processor but is not allowed to run.

82. AUACINIT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A process ID (PID) error was returned from an audit during initialization.

83. AUACSEG (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An audit was taking too many segments.

84. AUAMAPREAD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read automatic message accounting (AMA) billing stream indicators.

85. AUARSPARE1 (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This is a spare assert available for use during software updates to avoid changing the AU assert product in all environments for the update.

Probable Cause:

Varies according to use.

Action:

This is a non-escalating RPI assert.

86. AUARSPARE2 (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This is a spare assert available for use during software updates to avoid changing the AU assert product in all environments for the update.

Probable Cause:

Varies according to use.

Action:

This is an escalating RPI assert.

87. AUARSPARE3 (5E14 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

This is a spare assert available for use during software updates to avoid changing the AU assert product in all environments for the update.

Probable Cause:

Varies according to use.

Action:

This is a purging assert.

88. AUAUDCUR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The audit cursor (AUCursor) variable is out-of-range.

89. AUAUDMAN (5E14 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An audit was entered with an unexpected "manner" parameter value.

Probable Cause:

Either audit control is passing a bad value (unlikely) or the audit is not handling all legal values. For example, the audit may have returned to audit control without completing (for a timebreak or to request an SPP) but does not support a "resume" manner value.

Action:

The running process will be purged. The affected audit should be looked at to be sure it is handling all legal values correctly.

90. AUAUDMAN (5E11 to 5E13)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The audit input parameter AUmanner is invalid.

91. AUAUDMOD (5E14 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Global BSS variable AUmode is set to a value that is not supported by the running audit.

Probable Cause:

There are several possibilities:

- The audit is not allowing directed execution but the corresponding bit in per-audit information is set wrong.
- The audit is not allowing some kind of selective initialization execution but has been put in the selective init table.

- The audit has taken an illegal timebreak and AUmode was reset during the break for another audit or keepalive.
- AUmode has been wild written or otherwise corrupted.

Action:

The running process will be purged. The value of AUmode should be looked at (if available) to see which of the above cases apply.

92. AUAUDMOD (5E11 to 5E13)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The AUmode audit control variable is invalid.

93. AUAUDPID (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Too many traversals were done while looking for the process ID (PID).

94. AUBADDEFAULT (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A switch case failure occurred.

Probable Cause:

New case was added without updating the code hitting this error.

95. AUBADPARAM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A range check of a function parameter has failed.

96. AUBADPCR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The processor number is not in the available range of processors.

97. AUBADPROCNO (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

An invalid process number was passed to the AUfillpcbla() function. Either the process number is out of range or the corresponding rIPCBLA tuple does not exist in the database. The process control block link area (PCBLA) audit will be scheduled so that the missing rIPCBLA tuple can be inserted into the database.

98. AUBADRETCODE (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return was received from a primitive.

Probable Cause:

Varies depending on the primitive and context.

Action:

Use the function trace to find the source of the problem.

99. AUBADTBL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Recovery table could be corrupted for peripheral configuration data (PCD) related audits.

100. AUBDASEC (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Out-of-range error codes are mapped to this entry, which takes no recovery actions. This error code never prints; the out-of-range code will be printed. This code is a place holder for an entry which takes no recovery action.

101. AUBDDDINIT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Data delivery failed to initialize arrays.

102. AUBDGLOBAL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Global data has unexpectedly been overwritten.

103. AUBDINSTCHK (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read Sldapdata[] table information.

104. AUBDMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown operating system for distributed switching (OSDS) message type was received by a routine or elevated audit process.

105. AUBDSITYP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid audit operation (such as inhibit or allow) was received by audit control. Audit control does not know what operation to perform.

106. AUBNKS96 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Maximum number of shelf or banks exceeded in AUrpcsndm.c file. Shelf and bank number range from 0 to 3. If the AUrpcsubunit is not in this range the assert will fire. The AUrpcsubunit is a parameter used to loop through a tuple.

107. AUCDBCCB (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure return was received from a dynamic access (DA) primitive that was trying to follow the linkage from the circuit data block (CDB) to the channel control block (CCB). The DA head table (static data) may be invalid.

108. AUCOLLECTRC (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return code was returned from the DBmm_collect() function to the DBmemman() function in the MEMMAN audit code.

109. AU_CONDITION (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The condition field in an audit report returned by the AUdrtrav() function is out-of-range.

110. AU_CONTROL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The audit control information from the AURD_CNTL() macro that is used by interprocessor audits is invalid.

111. AUCQDBSCHED (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CQDB	Audit Mode: elev

Problem:

A problem was found in the linkages between the RLHCCALLTQ and RLCQDB relations. The call queue data block (CQDB) audit is scheduled.

112. AUDAGTGC (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected value was returned by a database primitive which fetches the address of an rGRP_TGC tuple; the key for the rGRP_TGC tuple is from an rTGC tuple or rDOC tuple.

113. AUDALGLN (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected value was returned by the DAgetlln() primitive. This primitive fetches the address of the indicated rLGLNSTAT tuple.

114. AUDALGTK (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected value was returned by the DAgetltk() primitive. This primitive fetches the address of the indicated rLGTKSTAT tuple.

115. AUDALNST (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected value was returned by the DAgetlnst() primitive. This primitive fetches the address of the indicated rLNSTAT tuple.

116. AUDATGC (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected value was returned by the DAgettg() or DAfextg() primitive. The DAgettg() primitive fetches the address of the indicated rTGC tuple. The DAfextg() primitive fetches the address of an rTGC tuple; the key for the rTGC tuple is from an rEXRR tuple.

117. AUDATKST (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected value was returned by the DAgettkst() primitive. This primitive fetches the address of the indicated rTKSTAT tuple.

118. AUDATOWN (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected value was returned by the DAgettown() primitive. This primitive fetches the address of the indicated rTKOWNER tuple.

119. AUDATQUE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected value was returned by the DARstotq() primitive. This primitive removes the specified rITKQUE tuple from the set owned by an rITKOWNER tuple.

120. AUDBERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: MEMMAN	Audit Mode: elev

Problem:

An unexpected return was encountered during a database operation, such as inserting or deleting a tuple using database primitives. This may indicate a problem with the database dictionaries. The MEMMAN audit is scheduled in elevated mode to attempt to correct the problem.

121. AUDDALW (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A wild write to allow was detected in the routine audit system inhibit status bit.

122. AUDD_CLIDAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to obtain an rICLIDAT tuple using the DBfrdtup() function failed. The return value was not GLSUCCESS.

123. AUDDINH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A wild write to inhibit was detected in the routine audit system inhibit status bit.

124. AUDDREAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DD	Audit Mode: elev

Problem:

Failed to read the desired information from data delivery.

125. AUDDWRITE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to write the desired information to the data delivery key.

Probable Cause:

Possible interface problem with the DDWRITE() macro.

Action:

If this assert occurs continuously, check the audit code then contact the data delivery (DD) area.

126. AU_DRTRAV (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The return from the AUcheck_list() function to the AUdr_trav() function was out-of-range.

127. AUEAPLOST (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A routine audit process was stopped by the elevated audit process for too long.

128. AUER00 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

While an audit was running, it found an error in the audit process ID, or the audit was asked to purge.

129. AUER01 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The AUmode audit control variable is invalid.

130. AUER02 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The audit input parameter AUmanner is invalid.

131. AUER03 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The audit control variable AUpursor is out of range.

132. AUER04 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The audit control variable AUphase is out of range.

133. AUER05 (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The audit control variable AUstate is out of range.

134. AUERALARM (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The alarm index used for transient timing is out of range.

135. AUERAUD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid audit ID was received by a slave interprocessor audit.

136. AUERBDTI (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The bitmask driver table index parameter had an illegal value.

137. AUERCKTYP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid circuit type was found in the RLCKTDATA static relation.

138. AUERDBUP (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful return code was received from a database (DB) update primitive.

139. AUERDICT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The AUgetindx() function was called. The relation for which a tuple key was to be calculated did not have a pointer to the index dictionary from the relation dictionary, or the index type of the relation in the index dictionary was not IND2.

140. AUERERC (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The currently running (AUrunning) operating system for distributed switching (OSDS) audit called its recovery function with an invalid error code.

141. AUERGREL (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The AUdrstatic() function was passed a relation that it was not prepared to support.

142. AUERINSEM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PTSB audit detected an unexpected quarter timeslot specification to idle as part of audit recovery.

143. AUERINTRNL (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The internal data or control structure of an audit was corrupted. This is a general purpose error code for use in any audit.

144. AUERISOL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the DDRISOL bits.

145. AUERLCGT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The LCGREP audit detected invalid data in the AULcgtim global variable.

146. AUEROLDT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Time (RTIME) appears not to be increasing to the process control block link area (PCBLA) audit when this error occurs, probably because the audit's local copy of RTIME in the AUold_time global variable was overwritten.

147. AUERRPCR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid pcrd variable was encountered in the second look for an interprocessor audit.

148. AUERSEM (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return was received from the AUdrdyn() semantic function.

149. AUERSEP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DDREAD() macro failed to read the separation bit status for a remote switching module (RSM) in a multi-mode RSM (MMRSM) site, the returned value was not success.

150. AUERSMINIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read the initialization status of a remote switching module (RSM) in a multi-mode RSM (MMRSM) site failed. The returned value was not success.

151. AUERSMISOL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the DDRSMISOL bits.

152. AUERSMSEP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DDREAD() macro failed. Using the DDRSMSEP key, the returned value was not DDSUCCESS.

153. AUERSPP (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid default was received from a return on an escalation call.

154. AUERSTOP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid value was found in the stop flag for audits.

155. AUERTIME (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The operating system for distributed switching (OSDS) returned an invalid (out-of-range) rtime.

156. AUERTRAN (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An audit called an audit transient timing function that is not in the alarm table.

157. AUESINIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DDREAD() macro failed to read the initialization status bit for a remote switching module (RSM) in a multi-mode RSM (MMRSM) site, the returned value was not success.

158. AUFCHBM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid mode was encountered.

159. AUFCHESC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An audit attempted to escalate to demand/directed mode, but could not be scheduled in the requested mode.

160. AUFCHNFC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An audit failure code could not be found.

161. AUFCHNIT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The currently running audit was not in the request table.

162. AUFCHNRT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Recovery from an audit failure code could not be initiated due to internal data inconsistencies.

163. AU_INDfWRK (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The INdfwrk() function returned failure when attempting to submit a job to schedule an audit. The audit process will be purged and the request for the deferred job will be re-attempted. NO audits can run without a successful return from the INdfwrk() function.

164. AUINHSTATE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid inhibit state was discovered in the AUinhibit[] array.

165. AUINSRTFAIL (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The insert of a static tuple into CCicrtg[] failed. The static tuple dpci and cic are dumped.

Probable Cause:

CCS internal problems or ODD inconsistencies.

Action:

Contact the next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

166. AU_IPCNTL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The AUcontrol field in a message sent by the master data portion of an audit is out-of-range.

167. AULGMEMKEY (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LGMEM	Audit Mode: elev

Problem:

The member bit for a tuple in the dynamic relation RLLGMEM is set to indicate equipage, but no tuple exists in the static relations RLGROUP_PORT or RLPSGP_PRT. The AULGMEM audit will be scheduled to clear the bit.

168. AULSTSTRT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The last starting time record for an audit was overwritten to an invalid value.

169. AUMEMKEY (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: MEM	Audit Mode: elev

Problem:

The member bit for a tuple in the dynamic relation RLMEM is set to indicate equipage, but no tuple exists in the static relations RLGROUP_PORT or RLPSGP_PRT. The AUMEM audit will be scheduled to clear the bit.

170. AUMMAUDRC (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return code was returned from the DBmm_collect() function to the DBmemman() function in the MEMMAN audit code.

171. AUMODATT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The TSDATA audit failed to read the RLMODATT relation. Possibly, a stack wild write occurred, or static data was invalid.

172. AUMRKLOGRC (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return code was returned from the DBmm_collect() function to the DBmemman() function in the MEMMAN audit code.

173. AUMSG_FAIL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to send a message using the OSSENDMSG macro has failed. The message will be lost.

Probable Cause:

Data corruption or system resource problems.

Action:

None. Generally since audits run periodically if the reason the message was needed still exists the message will be sent again later or the receiver will take action because the message was not received.

174. AUMSGINVALID (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A problem was detected with a message that was sent by an audit system process. For example, audit control was unable to generate an AUD DUMP output message as requested by an audit.

175. AUMSLG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message buffer overflow occurred in a routine or elevated audit process.

176. AUN_ELEM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The n-elem field in the IDLPRT audit data message is greater than the number of port member names which may be loaded into the message.

177. AUNEWMAP (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The MEMMAN audit bit maps are corrupted.

178. AUNOCCACT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ACTBASE	Audit Mode: elev

Problem:

The global data read by the CKTDATA audit indicates that neither central control (CC) circuit in the duplex pair is active. The normal operational state of the duplex pair is one CC circuit active and one CC circuit standby.

Probable Cause:

The global data containing the operational states of each CC circuit in the duplex pair is corrupt.

Action:

The ACTBASE audit is scheduled to run in elevated mode to correct the global data problem.

179. AUNOCDACT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ACTBASE	Audit Mode: elev

Problem:

The global data read by the CKTDATA audit indicates that neither CD circuit in the duplex pair is active. The normal operational state of the duplex pair is one CD circuit active and one CD circuit standby.

Probable Cause:

The global data containing the operational states of each CD circuit in the duplex pair is corrupt.

Action:

The ACTBASE audit is scheduled to run in elevated mode to correct the global data problem.

180. AUNOFUNC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No function exists for the audit ID that was scheduled.

181. AUNOSFIAC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ACTBASE	Audit Mode: elev

Problem:

The global data read by the CKTDATA audit indicates that neither service features indicator (SFI) circuit in the duplex pair is active. The normal operational state of the duplex pair is one SFI circuit active and one SFI circuit standby.

Probable Cause:

The global data containing the operational states of each SFI circuit in the duplex pair is corrupt.

Action:

The ACTBASE audit is scheduled to run in elevated mode to correct the global data problem.

182. AU_PARTITION (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The partition cursor, which indicates the SM for an audit to execute on, for a partitioned audit is invalid.

183. AU_PCDUNIT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was found in AUpcdunit[], a static array in the switch maintenance kernel process (SMKP).

184. AUPSLRBDPOOL (5E14 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

The local area network (LAN) receive buffer descriptor (RBD) pool is corrupted.

Probable Cause:
Data corruption.

Action:
The protocol handler must take a high level initialization.

185. AUQ_TEST (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:
A switch statement default was encountered.

186. AURASNIT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
The requested ID had no match in the related audit table.

187. AURASRET (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:
An invalid return was received from the AUaurq() function, which indicates an incompatibility between the related audit table and the request table.

188. AUREASERR (5E14 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:
An audit process was created with an invalid reason.

Probable Cause:
Unknown.

Action:
Contact the next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

189. AUREASERR (5E11 to 5E13)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:
The AUDIR process was created with an invalid reason.

190. AUREFLECT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
An inconsistent state was recognized in the data delivery status bit for routine audit cycle.

191. AUREQDALB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

An error was detected in the audit subsystem software in the RLDALB relation. The DALB audit will be requested.

192. AUREQDPB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DPB	Audit Mode: elev

Problem:

An error was detected in the audit subsystem software in the RLDPB relation. The DPB audit will be requested.

193. AURMTYPE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message type was received by a slave interprocessor audit.

194. AURSTERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid status was returned from the current audit.

195. AU_SENDM (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return was received from the AUSENDM() macro.

196. AUSFGAMST (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The state of the AUSFGALLOC audit, which is stored in a global variable, was not correct. This audit is an inter-processor audit, and the state is the state of the AM portion of the audit.

197. AUSFGSMST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The state of the AUSFGALLOC audit, which is stored in a global variable, was not correct. This audit is an inter-processor audit, and the state is the state of the SM portion of the audit.

198. AUSMRTEC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Switch maintenance called the CLNK audit in directed mode for a particular SM in order to recover from a data inconsistency.

199. AUSTQDBSCHE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STQDB	Audit Mode: elev

Problem:

A problem was found in the linkages between the RLHCSEVTM and RLSTQDB relations. The STQDB audit is scheduled.

200. AUSWITCH (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Encountered the default leg of a switch statement which covers all cases. Static data may be invalid.

201. AUTMERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return was received from terminal maintenance (TM).

202. AUTSMMSG (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A TSDATA audit message from the SM was out of order.

203. AUUNPROCESS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The entry point for the audit processes was called by a non-audit process.

204. AUUTDCKTDATA (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Tried to read the RLCKTDATA relation for universal tone decoder (UTD) information using a computed key. The stack or static data may contain invalid information.

205. AUUTGCKTDATA (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Tried to read the RLCKTDATA relation for universal tone generator (UTG) information using a computed key. The stack or static data may contain invalid information.

206. AU_WGETTYPE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return was received from the AUWGETTYPE() macro.

207. AUWHILE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Encountered the end of an infinite loop. The process is corrupted.

208. AUWPERR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An audit detected an error in a write-protected database dictionary; the pointer to the corrupt dictionary entry is passed back via the assert.

209. AUZAPICC (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

The overseas international control center operators (ICC) system process will be purged on the AUZAP case for the CMIM audit to clean up the CM derived data links (DDL) data structures.

210. KAAPXCTBL (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: APXCTBL	Audit Mode: elev

Problem:

While performing update operations, Keep Alive (Audits) was unable to access a rIAPXCTBL tuple or found linkage data in the tuple in a corrupted state.

Probable Cause:

The associated process was purged before the related data in the RLAPXCTBL relation could be cleaned up.

Action:

Keep Alive update processing for the associated data will be terminated, the APXCTBL audit will be scheduled to recover any data corruption, and an mgINTERRUPT message will be sent to the terminal process (TP) that referred to this tuple, so that the TP is brought down.

211. KABADMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The AM keep alive system process (AM-KASP) received an unrecognized operating system for distributed switching (OSDS) message type from the OSWGETMSG() macro.

No AM keep alive action, such as scheduling the AM keep alive audits to run in keep alive mode using the MGTIMER() macro or routing and terminal allocation (RTA) updates to the AM busy/idle bit maps using the MGSFGKA() macro, will take place. The AM-KASP will wait for a valid OSDS message from the OSWGETMSG() macro.

212. KABADTASK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The keep alive message handler in the CMP received an MGIDSKA message with an invalid or unspecified task.

Probable Cause:

The task was either not marked properly or corrupted.

Action:

The message will be ignored and no interprocessor data synchronization (IDS) keep alive processing will be scheduled.

213. KACALINFO (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: CALINFO	Audit Mode: elev

Problem:

While performing update operations, Keep Alive (Audits) was unable to access a rICAL_INFO tuple or found linkage data in the tuple in a corrupted state.

Probable Cause:

The CALEA bridging process associated with the rICAL_INFO tuple was purged before the associated relational data could be cleaned up.

Action:

Keep Alive processing for the data will be discontinued and the CALINFO audit will be scheduled to recover any data corruption.

214. KACLDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CLDB	Audit Mode: elev

Problem:

While attempting to provide keep alive update on a call park call process, the keep alive terminal process (KATP) could not access an associated rICLDB tuple for the rIPCBLA (call park process) tuple. No keep alive update can be performed on the call park process.

Probable Cause:

The rICLDB tuple was corrupted.

Action:

The CLDB audit is scheduled to try to clean up the problem.

215. KACRECORD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CRECORD	Audit Mode: elev

Problem:

While attempting to perform keep alive update for active simulated facilities group (SFG) calls, the SFG keep alive terminal process (KATP) was unable to access a rICRECORD (call record) tuple to determine if the associated call record is being used for a SFG call.

Probable Cause:

A Call Record tuple should exist for all Call Record Indexes between CRZERO and CRMAX. This assert indicates that there is some sort of corruption of the RLCRECORD relation (perhaps a missing tuple).

Action:

The call record is skipped this invocation of the KATP, and the CRECORD audit is scheduled to run in elevated

mode to correct the problem.

216. KADALB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DALB	Audit Mode: elev

Problem:

While performing update operations, keep alive (Audits) was unable to access, or found linkage data corruption associated with a rDALB tuple.

Probable Cause:

The associated process was purged before the related data in the RLDALB relation could be recovered to an idle state.

Action:

Keep alive update processing for the associated data will be terminated, and the DALB audit will be scheduled to recover any ambient data in the RLDALB relation.

217. KADBFRTUP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read the office dependent data (ODD) using the DBfrdtup() function.

218. KADISP (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: ASPDISP	Audit Mode: elev

Problem:

While performing update operations, Keep Alive (Audits) was unable to access a rIASPDISP tuple or found linkage data in the tuple in a corrupted state.

Probable Cause:

The queuing TP associated with the rIASPDISP tuple was passing the incorrect data or it did not clean up the associated data in the rIPCBLA properly.

Action:

Keep Alive processing for the data will be discontinued and the ASPDISP audit will be scheduled to recover any data corruption.

219. KADPB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DPB	Audit Mode: elev

Problem:

A data error was found in an rDPB tuple. It may be a key error or the tuple may not be populated. The AUDPB audit will be scheduled.

220. KAEQUIPDSL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While attempting to provide keep alive update processing for an on-demand B-channel (ODB) packet multi-line hunt group (MLHG) member, the associated tuple in the static relation RLEQUIPDSL for a permanent packet B-channel (PPB) could not be accessed by the keep alive hunting terminal process (KAHUNTP).

Data Structures:
RLEQUIPDSL.

Action:

Remove the PPB from this MLHG member. If this is a common member, remove the PPB for both members.

If the PPB is desired for the member(s), re-insert the PPB. To re-insert the PPB, obtain the protocol handler (PH) number (ph_number), PH channel number (phcn), and party from the data dumped on the receive only printer (ROP). Using this data and the SM number from which the assert fired, use ODBE to access the corresponding tuple in the static relation RLSPRT_GP. Use the group and member number provided by the rLSPRT_GP tuple to access RC/V View 23.2 (DIGITAL SUBSCRIBER LINE) for the member. Remove the PPB from the MLHG member by blanking out the group (MLHG) and member (TERM) fields. If this is a common member, then the group and member number will correspond to both PPB1 and PPB2, and the PPB must be removed for PPB1 and PPB2. The PPB can be assigned as a single or common member.

221. KAERRDA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return was received from a dynamic access (DA) function.

222. KAERRDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return was received from a database (DB) function.

223. KAGPAXDB (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: GPAXDB	Audit Mode: elev

Problem:

While performing update operations, Keep Alive (Audits) was unable to access a rLGPAXDB tuple or found linkage data in the tuple in a corrupted state.

Probable Cause:

The associated process was purged before the related data in the RLGPAXDB relation could be cleaned up.

Action:

Keep Alive update processing for the associated data will be terminated, and the GPAXDB audit will be scheduled to recover any data corruption.

224. KAGP_PT1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: MUPHST	Audit Mode: elev

Problem:

An inconsistency exists between the rLMUPHST and rLGROUP_PORT tuples. There is an extra rLMUPHST tuple, or an rLGROUP_PORT tuple is missing.

225. KAGP_PT2 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LGLNSTAT	Audit Mode: elev

Problem:

A data error was found in an rLGLNSTAT tuple. It may be a key error or the tuple may not be populated. The AUFC_LGLNSTAT audit will be scheduled.

226. KAGP_PT3 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LNSTAT	Audit Mode: elev

Problem:

A data error was found in an rLNSTAT tuple. It may be key error, or the tuple was not populated. The AUFC_LNSTAT audit will be scheduled.

227. KAGRP_PRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The keep alive function for trunk groups found that an rGRP_PRT tuple is missing.

Data Structures:

RLGRP_PRT. Key field: group number.

Action:

For the group number, port type, and member given in the receive only printer (ROP) output, verify that the rGRP_PRT tuple exists and correct any errors.

228. KAHTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RTMHG	Audit Mode: elev

Problem:

An invalid hunt type was found in the RLRTMHG relation. The RTMHG audit will be scheduled.

229. KA_INTERNAL (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An internal error occurred during the operation of a keep alive system process or terminal process. Data that the process was accessing or updating was corrupted, or the data was in an illegal state that will not allow the keep alive process to properly perform its functions. The calling process will be purged.

230. KAINVREL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid relation ID was encountered.

231. KAISATUCD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: ISATUCD	Audit Mode: elev

Problem:

A data error was found in an rISATUCD tuple. It may be a key error or the tuple may not be populated. The AUISATUCD audit will be scheduled.

232. KAKLGTKST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LGTKSTAT	Audit Mode: elev

Problem:

One of the following occurred:

1. A keep alive function found an invalid key in an rLGTKSTAT tuple.
2. A keep alive function found an invalid hunt type in an rLRT_TRKG tuple.
3. An rLRT_TRKG tuple is missing. The LGTKSTAT audit will be scheduled to clear the error.

233. KAKTKQUE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TKQUE	Audit Mode: elev

Problem:

The keep alive function for trunk hunting found an rITKQUE tuple with an invalid key. The keep alive function for trunk groups found a missing rLKEYPORT tuple. The TKQUE audit will be scheduled to clear the error.

234. KAKTKSTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TKSTAT	Audit Mode: elev

Problem:

One of the following occurred:

1. A keep alive function found an invalid key in an rITKSTAT tuple.
2. A keep alive function found an invalid hunt type in an rLRT_TRKG tuple.
3. An rLRT_TRKG tuple is missing. The TKSTAT audit will be scheduled to clear the error.

235. KA_LGLNSTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LGLNSTAT	Audit Mode: elev

Problem:

A dynamic access (DA) function returned an unmatched rLGLNSTAT tuple key. The LGLNSTAT audit is scheduled to correct the key.

236. KALGMEM1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RTMHG	Audit Mode: elev

Problem:

An inconsistency exists between the rLMUPHST and rLGMEM tuples. There is an extra rLMUPHST tuple, or an rLGMEM tuple is missing.

237. KALGMEM2 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RTMHG	Audit Mode: elev

Problem:

An inconsistency exists between the rLGLNSTAT and rLGMEM tuples. There is an extra rLGLNSTAT tuple, or an rLGMEM tuple is missing.

238. KALGP_PSGP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Keep alive audits the rLGLNSTAT tuple and finds the corresponding tuples in the static relations RLRT_MHG and RLRT_LGMEM. The group and the member bit in the rLRT_LGMEM tuple indicate that the hunt group is equipped; therefore, a tuple in the static relations RLGROUP_PORT or RLPSGP_PRT should exist, but is not found.

Data Structures:

RLRT_MHG, RLRT_LGMEM, RLGROUP_PORT, RLPSGP_PRT.

Action:

For the hunting module, multi-line hunt group (MLHG) number, member, and the member value information given in the receive only printer (ROP) output, use RC/V (or ODBE, if necessary) to verify the RLRT_MHG, RLRT_LGMEM, RLGROUP_PORT, and RLPSGP_PRT relations and correct any inconsistencies.

Check the hunt type in the rLRT_MHG tuple to determine which tuple is missing (rLGROUP_PORT or rLPSGP_PRT) and populate it, or the member bit in the rLRT_LGMEM tuple should be cleared to indicate that the hunt group is not equipped (no rLGROUP_PORT or rLPSGP_PRT tuple should exist).

RC/V View 3.5 (MULTILINE HUNT GROUP), View 3.2 (MULTILINE HUNT GROUP MEMBER), and View 1.2 (MULTILINE HUNT GROUP LINE) are used to display data for the MLHG.

239. KALGRPPORT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: GRPPORT	Audit Mode: elev

Problem:

The DAGETLGMEM() macro returned an unmatched rLGMEM tuple key while running keep alive for a tuple in the dynamic relation RLLGLNSTAT. The GRPPORT audit will be scheduled to verify and insert the missing rLGMEM tuple.

240. KALGRT_SFG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LGSFSTAT	Audit Mode: elev

Problem:

While running in keep alive mode, an attempt was made by the LGSFSTAT audit to access a corresponding tuple in the static relation RLRT_SFG. This tuple could not be found. The attempt to provide keep alive on the rLGSFSTAT tuple will be aborted, and the LGSFSTAT audit will be scheduled to delete the extra rLGSFSTAT tuple.

241. KA_LGSFSTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LGSFSTAT	Audit Mode: elev

Problem:

While running in keep alive segmented mode, the LGSFSTAT audit could not access a rLGSFSTAT dynamic tuple for a given rLRT_SFG static tuple.

Probable Cause:

There is a missing rLGSFSTAT dynamic tuple.

Action:

Keep alive processing is aborted and the LGSFSTAT audit is rescheduled in Routine segmented mode to try to insert the missing rLGSFSTAT dynamic tuple.

242. KALLNSTXTRA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LGLNSTAT	Audit Mode: elev

Problem:

Keep alive running on an rLGLNSTAT tuple determines that it is an extra tuple. The LGLNSTAT audit will be scheduled to verify and delete this tuple.

243. KA_LNSTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LNSTAT	Audit Mode: elev

Problem:

A dynamic access (DA) function returned an unmatched rLNSTAT tuple key. The LGLNSTAT audit will be scheduled to correct the key.

244. KALNSTXTRA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LNSTAT	Audit Mode: elev

Problem:

Keep alive running on an rLNSTAT tuple determines that this is an extra tuple. The LNSTAT audit will be scheduled to verify and delete the tuple.

245. KALPSGRPPORT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PSGRPPORT	Audit Mode: elev

Problem:

The DAGETLGMEM() macro returned an unmatched rILGMEM tuple key while running keep alive for a tuple in the dynamic relation RLLGLNSTAT. The PSGRPPORT audit will be scheduled to verify and insert the missing rILGMEM tuple.

246. KALRTMHG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LGLNSTAT	Audit Mode: elev

Problem:

No tuple was found in the static relation RLRTMHG while running keep alive for a tuple in the dynamic relation RLLGLNSTAT. The LGLNSTAT audit will be scheduled to delete the extra rLGLNSTAT tuple.

247. KALTMSTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LTMSTAT	Audit Mode: elev

Problem:

A data error was found in an rLTMSTAT tuple. It may be a key error or the tuple may not be populated. The AULTMSTAT audit will be scheduled.

248. KAMDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: MDB	Audit Mode: elev

Problem:

While attempting to perform keep alive update for a call park call process, the keep alive terminal process (KATP) could not access the rIMDB tuple associated with the call park process rIPCBLA tuple. No keep alive update can be performed for the "parked" call.

Probable Cause:

The rIMDB tuple for the call park call process was corrupted.

Action:

The MDB audit is scheduled to try to clean up the problem.

249. KAMEM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RTMHG	Audit Mode: elev

Problem:

An inconsistency exists between the rILNSTAT and rIMEM tuples. There is an extra rILNSTAT tuple, or an rIMEM tuple is missing.

250. KAMGRP_PRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Keep alive audits the rIRTMUPHST tuple and finds the corresponding tuples in the static relations RLRT_MHG and RLRT_LGMEM. The group and the member bit in the rIRT_LGMEM tuple indicate that the hunt group is equipped; therefore, an associated tuple in the static relation RLGROUP_PORT should exist, but is not found.

Data Structures:

RLRT_MHG, RLRT_LGMEM, RLGROUP_PORT.

Action:

For the hunting module, multi-line hunt group (MLHG) number, member, and the member value information given in the receive only printer (ROP) output, use RC/V (or ODBE, if necessary) to verify the RLRT_MHG, RLRT_LGMEM, and RLGROUP_PORT relations and correct any data inconsistencies.

Either the rIGROUP_PORT tuple should be populated, or the member bit in rIRT_LGMEM should be cleared to indicate that the hunt group is not equipped (no rIGROUP_PORT tuple should exist).

RC/V View 3.5 (MULTILINE HUNT GROUP), View 3.2 (MULTILINE HUNT GROUP MEMBER) and View 1.2 (MULTILINE HUNT GROUP LINE) are used to display data for the MLHG.

251. KAMRT_LGM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Keep alive audits the rIRTMUPHST tuple and finds the corresponding tuple in the static relation RLRT_MHG. This static data indicates that the current SM is the hunting SM; therefore, an associated tuple in the static relation RLRT_LGMEM should exist, but is not found. An inconsistency exists between the RLRT_MHG and RLRT_LGMEM relations.

Data Structures:

RLRT_MHG, RLRT_LGMEM.

Action:

For the key and SM module given in the receive only printer (ROP) output, use RC/V (or ODBE, if necessary) to verify that the rIRT_MHG and rIRT_LGMEM tuples exist and correct any data inconsistencies. RC/V View 3.5 (MULTILINE HUNT GROUP) and View 1.2 (MULTILINE HUNT GROUP LINE) are used to display data for the multi-line hunt group (MLHG).

252. KAMRTMHG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: MUPHST	Audit Mode: elev

Problem:

No tuple was found in the static relation RLRTMHG while running keep alive for a tuple in the dynamic relation RLRTMUPHST. The MUPHST audit is scheduled to delete the extra rLRTMUPHST tuple.

253. KA_MUPHST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: MUPHST	Audit Mode: elev

Problem:

The DBretrvblk() function failed to get an rLMUPHST tuple while running keep alive for a tuple in the dynamic relation RLMUPHST. The MUPHST audit will be scheduled to verify the rLMUPHST tuple.

254. KANOKAFCN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The keep alive function for the audit identification passed to the KAgetaud() function was not found in the keep alive function table KAfcntbl[].

255. KAODPSOP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The keep alive multi-line hunt group (MLHG) and trunk hunting terminal process (KAHUNTP) could not access an rLODPSOP tuple. This occurred while keep alive was trying to provide update for an on-demand B-channel (ODB) packet associated with an MLHG member.

Data Structures:

RLODPSOP.

Action:

Obtain the port and party dumped on the receive only printer (ROP). Use ODBE to access the rIDSLEQUIP tuple with the dsl (key) field equal to the port dumped. Once the tuple is accessed, modify the odb_mhg field. This field is a bit map. Clear (set to 0) the bit in this map whose position (0 through 7) was dumped for the party on the ROP.

256. KAOORTIMER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The audits keep alive system process received an OSERANGE error from the OSTIMER() macro.

257. KAPCBLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

While performing update operations, keep alive (Audits) was unable to access a rIPCBLA tuple, or found linkage data in the tuple in a corrupted state.

Probable Cause:

The process owing the RLPCBLA data was purged before the associated relational data could be cleaned up.

Action:

Keep alive processing for the data will be discontinued, and the PCBLA audit will be scheduled to recover any

ambient data corruption.

258. KAPCBLAKEY (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

When accessing an rIPCBLA tuple, the key passed to the DAgetpcbla() function and the key of the rIPCBLA tuple do not match. Possible data corruption may have occurred in the rIPCBLA tuple.

259. KAPKLOT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PARKLOT	Audit Mode: elev

Problem:

While attempting to provide keep alive update on a table entry in the RLPARK_LOT relation, keep alive could not find the associated rIPARK_LOT tuple for the call park terminal process requesting the update.

Probable Cause:

When a "parked" call was taken down, the RLPARK_LOT table entry was deleted, but the call park process for the "parked" call was left busy.

Action:

Keep alive will forward an MGCPARKA message to the call park model. After receiving this message, the model will clean up the process and all other related data. In addition, keep alive will schedule the PARKLOT audit to try to clean up any corruption of the entries in the RLPARK_LOT relation.

260. KAPORTGRP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIPORT_GROUP tuple is missing for this multi-line hunt group (MLHG) member.

261. KAPORTLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

A data error was found in an rIPORTLA tuple. It may be a key error or the tuple may not be populated. The AUFC_PORTLA audit will be scheduled.

262. KAPORTTYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While attempting to provide keep alive update processing for a channel selection MLHG member, the associated rIFC_PORTTYP static tuple or rICKT_PORT static tuple for a PPB B-channel could not be accessed by the keep alive hunting terminal process (KAHUNTTP).

Data Structures:

RLFC_PORTTYP
RLCKT_PORT

Action:

The B-channel assigned attribute (bchan2.assigned) in the rICDNCHAN tuple indicates that a second B-channel is

assigned (DBYES) and the B-channel packet switching common channel type attribute (bchan2.cctype) indicates that the second B-channel is a permanent packet B-channel type. However, the corresponding rIFC_PORTTYP tuple for the B-channel port (bport) was not found in the data base or the corresponding rICKT_PORT tuple was not found in the data base. The rICDNCHAN, rIFC_PORTTYP, and rICKT_PORT tuples need to be made consistent in the database.

263. KAPROGERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid keep alive terminal process identification was passed to the OSCREATE() macro. The keep alive terminal process will not be created.

264. KAPRT_GRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The keep alive function for trunk groups found that an rIPORT_GROUP tuple is missing.

Data Structures:

RLPORT_GROUP. Key field: group number.

Action:

For the group number, port type, and member given in the receive only printer (ROP) output, verify that the rIPORT_GROUP tuple exists and correct any errors.

265. KAPSGRP_PRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The keep alive function for trunk groups found that an rIPSGP_PRT tuple is missing.

Data Structures:

RLPSGP_PRT. Key field: group number.

Action:

For the group number, port type, and member given in the receive only printer (ROP) output, verify that the rIPSGP_PRT tuple exists and correct any errors.

266. KAPSPRT_GRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The keep alive function for trunk groups found that an rIPSPRT_GP tuple is missing.

Data Structures:

RLPSRT_GP. Key field: group number for packet switched trunks.

Action:

For the group number, port type, and member given in the receive only printer (ROP) output, verify that the rIPSPRT_GP tuple exists in the SM where the assert fired.

267. KARDTADATA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RDTADATA	Audit Mode: elev

Problem:

While running in keep alive mode, the RDTADATA audit detected a stuck session entry (session data exists in the AM, but no corresponding RDTA process exists in the SM). In the process of correcting the AM data, a corresponding TMrda_ports[] array entry could not be located, and idled out. The RDTADATA routine audit is scheduled to clean up the data inconsistency.

268. KAR_LGM1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: GRPPORT	Audit Mode: elev

Problem:

The DAGETLGMEM() macro returns an unmatched rLGMEM tuple key while running keep alive for a tuple in the dynamic relation RLMUPHST. The GRPPORT audit will be scheduled to verify and insert the missing rLMUPHST tuple.

269. KAR_LGM2 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LGLNSTAT	Audit Mode: elev

Problem:

An inconsistency exists between the rLGLNSTAT and rLRT_LGMEM tuples. There is an extra rLGLNSTAT tuple, or an rLRT_LGMEM tuple is missing.

270. KARSTBSTAT (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Keep Alive (Audits) was unable to access an RSTBSTAT tuple while performing Keep Alive updating operations for the RAIU test AP remote site test bus application.

Probable Cause:

One or more tuples of the RSTBSTAT relation in the AM is in a corrupted state. This error might also suggest that one or more tuples of the SITEOWN relation in the SM is in a corrupted state.

Action:

Processing of the Keep Alive update will be aborted, and the RSTBSTAT audit will be scheduled to try to recover the corruption.

271. KART_LGM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Keep alive audits an rLGLNSTAT tuple and finds the corresponding tuple in the static relation RLRT_MHG. This static data indicates that the current SM is the hunting SM; therefore, an associated tuple in the static relation RLRT_LGMEM should exist, but is not found. An inconsistency exists between the RLRT_MHG and RLRT_LGMEM relations.

Data Structures:

RLRT_MHG, RLRT_LGMEM.

Action:

For the key and SM module given in the receive only printer (ROP) output, verify that the rLRT_MHG and

rIRT_LGMEM tuples exist. Use RC/V (or ODBE, if necessary) to correct any data inconsistencies. RC/V View 3.5 (MULTILINE HUNT GROUP) and View 1.2 (MULTILINE HUNT GROUP LINE) are used to display data for a multi-line hunt group (MLHG).

272. KART_MEM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LNSTAT	Audit Mode: elev

Problem:

An inconsistency exists between the rLNSTAT and rIRT_MEM tuples. There is an extra rLNSTAT tuple, or an rIRT_MEM tuple is missing.

273. KART_SFG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: SFSTAT	Audit Mode: elev

Problem:

While running in keep alive mode, an attempt was made by the SFSTAT audit to access a corresponding tuple in the static relation RLRT_SFG. This tuple could not be found. The attempt to run keep alive on the rLSFSTAT tuple will be aborted, and the SFSTAT audit will be scheduled to delete the extra rSFSTAT tuple.

274. KA_SFGCOR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: SFGCOR	Audit Mode: elev

Problem:

While attempting to perform keep alive update for a simulated facilities group (SFG) call, the keep alive terminal process (KATP) for SFG update could not locate an associated rIFSGCOR tuple for a given rLCRECORD tuple which was on the busy list and had its sfg_call bit set (for non-6 Port SFG calls) or for a given bit marked in the RTccsfg[] conference circuit SFG bitmap array (for 6 port SFG calls).

Probable Cause:

The RLCRECORD and/or RLSFGCOR relations are corrupted, and/or the RTccsfg[] array is corrupted.

Action:

The SFGCOR audit (and CRECORD related audit) is scheduled to correct the problem.

275. KA_SFSTAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: SFSTAT	Audit Mode: elev

Problem:

While running in keep alive segmented mode, the SFSTAT audit could not access a rLSFSTAT dynamic tuple for a given rIRT_SFG static tuple.

Probable Cause:

There is a missing rLSFSTAT dynamic tuple.

Action:

Keep alive processing is aborted and the SFSTAT audit is rescheduled in routine segmented mode to try to insert the missing rLSFSTAT dynamic tuple.

276. KASGP_PSGP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Keep alive audits the rLNSTAT tuple and finds the corresponding tuples in the static relations RLRT_MHG and RLRT_MEM. The group and the member bit in the rLRT_MEM tuple indicate that the hunt group is equipped; therefore, an associated tuple should exist in the static relation rLGROUP_PORT or rLPSGP_PRT, but is not found.

Data Structures:

RLRT_MHG, RLRT_MEM, RLGROUP_PORT, RLPSGP_PRT.

Action:

For the hunting module, multi-line hunt group (MLHG) group number, member, and the member value information given in the receive only printer (ROP) output, use RC/V (or ODBE, if necessary) to verify the RLRT_MHG, RLRT_MEM, RLGROUP_PORT, and RLPSGP_PRT relations and correct any inconsistencies.

Check the hunt type in the rLRT_MHG tuple to determine which tuple is missing (rLGROUP_PORT or rLPSGP_PRT) and populate it, or the member bit in the rLRT_MEM tuple should be cleared to indicate that the hunt group is not equipped (no rLGROUP_PORT or rLPSGP_PRT tuple should exist).

RC/V View 3.5 (MULTILINE HUNT GROUP) and View 3.2 (MULTILINE HUNT GROUP MEMBER) are used to display data for the MLHG.

277. KASGRPPORT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: GRPPORT	Audit Mode: elev

Problem:

The DAGETMEM() macro returned an unmatched rMEM tuple key while running keep alive for a tuple in the dynamic relation RLLNSTAT. The GRPPORT audit will be scheduled to verify and insert missing the rMEM tuple.

278. KASPMS_FAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return from the OSWGETMSG() macro was received by the AM keep alive system process (AM-KASP). The AM-KASP will not attempt to process the message, but will wait for a valid operating system for distributed switching (OSDS) message.

279. KASP_REASON (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The AM keep alive system process (AM-KASP) should be created only after a system initialization, a system re-initialization, or a single process purge (SPP). The AM-KASP was invalidly created and will be purged.

280. KASPSGRPPORT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PSGRPPORT	Audit Mode: elev

Problem:

The DAGETMEM() macro returned an unmatched rMEM tuple key while running keep alive for a tuple in the dynamic relation RLLNSTAT. The PSGRPPORT audit will be scheduled to verify and insert the missing rMEM tuple.

281. KASPTMR_TAG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The AM keep alive system process (AM-KASP) received an MGTIMER message from the OSWGETMSG() macro; however, the timer tag associated with this message was unrecognized by the AM-KASP. No AM keep alive audit scheduling will take place during this particular 10 minute cycle.

282. KASRT_MEM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Keep alive audits the rLNSTAT tuple and finds the corresponding tuple in the static relation RLRT_MHG. This static data indicates that the current SM is the hunting SM; therefore, an associated tuple in the static relation RLRT_MEM should exist, but is not found. An inconsistency exists between the RLRT_MHG and RLRT_MEM relations.

Data Structures:

RLRT_MHG, RLRT_MEM.

Action:

For the key and SM module given in the receive only printer (ROP) output, use RC/V (or ODBE, if necessary) to verify that the rLRT_MHG and rLRT_MEM tuples exist and correct any data inconsistencies. RC/V View 3.5 (MULTILINE HUNT GROUP) is used to display data for the multi-line hunt group (MLHG).

283. KASRTMHG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LNSTAT	Audit Mode: elev

Problem:

No tuple was found in the static relation RLRTMHG while running keep alive for a tuple in the dynamic relation RLNSTAT. The LNSTAT audit will be scheduled to delete the extra rLNSTAT tuple.

284. KATEDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TEDB	Audit Mode: elev

Problem:

A data error was found in an rTEDB tuple. It may be a key error or the tuple may not be populated. The AUTEDB audit will be scheduled.

285. KATIMERTAG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The MGTIMER message which is used by keep alive to create the SM resident keep alive terminal process (KATP), had a timer tag that was not recognized. The only timer tags recognized by keep alive are OSMPT1 (5 minute timer) and OSMPT2 (one shot timer, used when system resources are at a minimum). The attempt to create the KATP was aborted, and control was returned to the SM master system process.

286. KAXTRAMUPHST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: MUPHST	Audit Mode: elev

Problem:

Keep alive running on an rLMUPHST tuple determines that it is an extra tuple. The MUPHST audit will be scheduled to verify and delete this tuple.

Range: aupp**1. AUBADMANNER (5E11 and later)**

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An audit that resides in the protocol handler (PH) or packet interface (PI) processor was invoked in an undefined manner (i.e., not AUZAP or AUSTART). This may indicate a problem in the function that called the entry function, or the stack may have been corrupted since the manner is passed as the first argument to the entry function.

2. AUBADMODE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An audit that resides in the protocol handler (PH) or packet interface (PI) processor was called with a mode that was not AUSEGMENTED, AUINIT1, or AUDEMAND. This may indicate a problem in the function that set up the global variable AUmode and/or called the audit, or the AUmode variable may have been corrupted.

3. AUBADPARAM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An audit that resides in the protocol handler (PH) or packet interface (PI) processor was called with an unexpected parameter.

4. AUBADUSE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An AU function has been called with a bad parameter.

Probable Cause:

The calling function may be trying to use an interface inappropriately.

Action:

Look at the called function to determine the exact problem (that is, which parameter is involved and why it is "bad"). Look at the calling function to determine what the AU function call was intended to do. Either the calling or called function will then need to be modified.

5. AUBDTTY (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from the Slttymsg() function.

6. AUERALARM (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The alarm index used for transient timing is out of range.

7. AUERTRAN (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An audit called an audit transient timing function that is not in the alarm table.

8. AUPSACID (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid audit name was requested in the protocol handler (PH) or packet interface (PI). One of the following may have occurred:

- The audit does not exist.
- The audit does not exist in the requested processor.
- The audit is valid in the requested processor, but is not allowed to run.

9. AUPSACSEG (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An audit was taking too many segments.

10. AUPSBADRET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return was received from a function called by protocol handler (PH) or packet interface (PI) audits.

11. AUPSBDMMS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown operating system for distributed switching (OSDS) message type was received by a routine audit process.

12. AUPSCOND (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A condition was set incorrectly by a protocol handler (PH) or packet interface (PI) audit in a report structure.

13. AUPSERREA (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The AUDIR process was created with an invalid reason.

14. AUPSFUNC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No function exists for the audit ID that was scheduled.

15. AUPSITYP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid audit operation (such as inhibit or allow) was received by audit control. Audit control does not know what operation to perform.

16. AUPSLRBDPOOL (5E11 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

A corruption of the local area network (LAN) receive buffer descriptor (RBD) pool was detected. This problem requires a high level initialization in order to recover reliably.

17. AUPSMOD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The AUmode audit control variable is invalid.

18. AUPSMSLG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message buffer overflow was encountered in a routine audit process.

19. AUPSTOPER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid value was found in the stop flag for audits.

20. AUPSTYLG (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The type field in the dump message was too large, a positive number was found. The type field always expects a negative number.

21. KAPSPGERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While trying to create the keep alive terminal process (KATP) for packet multi-line hunt group (MLHG)/trunk update [all protocol handlers (PHs)], or the KATP for packet business group (PBG) update (PH3s only), an invalid terminal process identifier was passed to the operating system (OS). The affected KATP will not be created in this PH.

Range: ccs**1. CCACBADMSG (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Bad message subtype passed into the CCphdamsg function for the message type MGACCOUNTS.

Probable Cause:

A message was sent to the protocol handler data access (PHDA) system process when it should have gone elsewhere.

Action:

No manual action is needed.

2. CCACCTCODE (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

400 Hz carrier tone requested but not provisioned as system tone for ISUP account code collection on LATA trunks.

ACCT PROMPT (in RC/V View 5.1 [TRUNK GROUP]) == CARRIER or ACCT PROMPT (in RC/V View 8.1 [OFFICE PARAMETERS (MISCELLANEOUS)]) == CARRIER but the field CARRIER TONE (in RC/V View 8.1) == N

The TRUNK GROUP and trunk group MEMBER NUMBER are printed in this assert. The TRUNK GROUP can be used as key to RC/V View 5.1

Data Structures:

- Global parameter, Glcartone
- rIFC_TRUNK.acctprompt
- Global parameter, Glactprmt

Action:

There are two options:

- Set the value of "CARRIER TONE" in RC/V View 8.1 to "Y" or
- If the value of "ACCT PROMPT" in RC/V View 5.1 is set to "GLOBAL", set the value of "ACCT PROMPT" in RC/V View 8.1 to "BEEP2" else set the value of "ACCT PROMPT" in RC/V View 5.1 to "BEEP2".

3. CCADDLSMCC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt has been made to add an entry to the CCismccstat[] table, but the MCC counters (CCtotls, CCfirstls[], and CClastls[]) indicate that the table is full. This would indicate that the RC/V code has allowed a link set addition when it should not have done so, or that the counters have been corrupted. If the counters are bad, audits should eventually CCS protocols. CCS protocol-specific audits handle the portions of the tables appropriate to the CCS protocol which they service. The following audits will correct these counters, if they are wrong, and can be manually

invoked via the "ST-AUDSM:sm=<SM #>, audit=<audit name>,"

C7INTL/C7NATL (CCITT7) link sets: LSATA
 CCSNA7 (North American CCS7) link sets: NA7LS
 CCITT6: LS6

The contents of the MCC counters will be dumped as part of the audit information:

CCtotls Total number of link sets for all protocols in the GSM. A value of CCMAX_LNKSET indicates the table is full.

CCfirstls[] First link set entry in CCIsmmcstat[] table for each protocol. A value of CCMAX_LNKSET indicates that the table is full.

CClastls[] Last link set entry in CCIsmmcstat[] table for each protocol. A value of CCMAX_LNKSET indicates that the table is full.

CCMAX_LNKSET is 80 (decimal) in 5EE3(2)
 Order of entries: C7NATL, CCSNA7, CCITT6, C7INTL

4. CCADM_ELAUD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CVADMGP	Audit Mode: elev

Problem:

For SCCP Conversion table: CCADMGRP a tuple was found to be in error, (either not in the table when it should have been OR in the table when it should not have been), and this condition may have been corrected. Although this is an unlikely situation, it is a very bad indication of trouble in the SM: therefore an assert calling an elevated audit must be called in order to find further errors, (if any), and correct them, (if needed).

5. CCADSIIENT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid entry reason was sent to the CCadsiin() function, the direct link node (DLN) system integrity (SI) system process in the AM.

6. CCADSIUMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return code or an unexpected message was received by the CCadsiin() function, the direct link node (DLN) system integrity (SI) system process in the AM.

7. CCALLOCERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Cannot allocate room for DMERT message using the allocmsg() command.

8. CCAMTOUP_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCamtoup() function could not successfully format a message.

9. CCAODRBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

SM memory for the CCITT7 MTP accounting tables has not been allocated correctly. The translation tables will not be available for the accounting feature. (Either no memory has been allocated or the amount of memory allocated is insufficient).

Probable Cause:

The accounting ODR region was not allocated by SI.

Action:

Re-initialize the GSM.

10. CCAPCI_APC (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: APCIAPC	Audit Mode: elev

Problem:

Failure to insert a tuple in RLAPC_STAT.

Probable Cause:

Unknown.

Action:

This assert will invoke an audit to bring the data back to a consistent state. No manual action is needed.

11. CCAPCRES (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: APCSTAT	Audit Mode: elev

Problem:

A linkage problem has been detected between the owning CCRESTRTMR and the CCAPC_STAT entry.

Probable Cause:

The CCAPC_STAT structure that indicates that the APC was on MTP restart timing structure has unexpectedly been removed from the list of APCs being timed.

Action:

Note occurrence and report problem to field support with all associated ROP data. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

12. CCAPC_STAT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: APCSTAT	Audit Mode: elev

Problem:

Failure to delete or update a tuple in RLAPC_STAT.

Probable Cause:

Unknown.

Action:

This assert will invoke an audit to bring the data back to a consistent state. No manual action is needed.

13. CCAPPL_PLAT (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple was missing from the RLAPPL_PLAT relation which contains information on the signaling system 7 platform to use for direct signaling applications.

Data Structures:

RLAPPL_PLAT. Key fields: switching module, direct signaling application.

Action:

Insert a rIAPPL_PLAT tuple with the appropriate information using RC/V View 8.42 (CCS TCAP APPLICATION).

Verify that all direct signaling applications that are populated on RC/V View 8.17 (DIRECT SIGNALING APPLICATION) are populated on RC/V View 8.42 (CCS TCAP APPLICATION). RC/V view 8.42 contains the switching module and direct signaling application as keys and the platform as an attribute.

14. CCAPXBADDATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Error in SM number or trunk data in this message from the ECPC.

Data Structures:

Input message.

Action:

Consult ECPC/5ESS[®] switch data for this trunk and update as needed

15. CCASMMAPBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The DCSI process detected a error in the *AUTOPLEX*[®] SM bit map in the DLN (us) or PH (intl).

Probable Cause:

Data corruption of the map.

Action:

The map is updated from parameters Glapx1_2sm through Glapx7_2sm prior to calling this assert.

16. CCASPNLOAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An ASP call originated on a common channel signaling, CCITT version 7 (CCS7) integrated services digital network (ISDN) user part (ISUP) trunk, but the PVN_SUP loadable package was not available on this SM. The call will be torn down.

17. CCAUPORTLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

While trying to set up an incoming call over an integrated services digital network (ISDN) user part (ISUP) trunk, a discrepancy was discovered between the port the call was received on and the port identified in the port linkage area. The call was released with a REL message with cause value #41 "temporary failure". This problem was probably caused by corrupt dynamic data in the port linkage area. An audit of the port linkage area will be run.

Action:

Contact the next level of support.

18. CCBAD2_CACHE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to find valid or empty entry in the CCtf_cache array. Dumps array CCtf_cache.

19. CCBADACT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid action code was encountered by PHDA.

20. CCBADAMCMCID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failed while attempting to read the RLAMCMCID relation. The AM cellular mobile carrier ID number data was corrupted or incorrectly populated.

Data Structures:

RLAMCMCID. Key fields: cmc_id.

Action:

Use RC/V View 10.16 (CMC IDENTIFICATION) to insert an rLAMCMCID tuple with the appropriate information for the use of the trunk.

21. CCBADAMTKGP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failed while attempting to read the RLAMTKGP relation. The trunk data was corrupted or incorrectly populated, and the necessary trunk data to process the call is missing.

Data Structures:

RLAMTKGP. Key fields: grpnum.

Action:

Use RC/V View 5.1 (TRUNK GROUP) to insert an rLAMTKGP tuple with the appropriate information for the use of the trunk.

22. CCBADAPXMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A bad *AUTOPLEX*[®] operating system for distributed switching (OSDS) message was received by this process.

Probable Cause:

Invalid OSDS message type field.

23. CCBAD_CACHE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid or unexpected value for the variable of type CCCACHE_ACTION. Dumps array CCtf_cache.

24. CCBADCONGUPD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unexpected value for the congestion update mechanism contained in the global parameter Glcongupd.

25. CCBAD_COS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsupported class of service was encountered while processing an advanced mobile phone system (AMPS) origination. The call was routed from the AMPS digital cellular switch (DCS) to the public switched telephone network (PSTN) via an integrated services digital network (ISDN) user part (ISUP) trunk when the unsupported class of service was encountered.

Probable Cause:

The trunk used to route from the AMPS DCS to the PSTN is assigned an invalid class of service.

Action:

Change the class of service of the trunk whose trunk group number was displayed in the assert data dump to "IC" or "LTOLL".

26. CCBADCPSTATE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The communication module processor (CMP) call processing state was unexpected and it was corrected.

27. CCBADDATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The data did not match the expected range or type.

28. CCBADDDTRG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown parameter was passed to the CCddupdate() function.

29. CCBADDP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A DPC could not be translated to a dpci in relation RLDPC_DPCI.

30. CCBADDEVENT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert indicates that some event other than a message or an OSWAKE1 call was received by PHDA. The event is ignored.

31. CCBADFC_TRUNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failed while attempting to read the RLFC_TRUNK relation. The trunk data was corrupted or incorrectly populated, and the necessary trunk data to process the call is missing.

Data Structures:

RLFC_TRUNK. Key fields: member, module.

Action:

Use RC/V View 5.1 (TRUNK GROUP) to insert an rIFC_TRUNK tuple with the appropriate information for the use of the trunk.

32. CCBADICT (5E11 and later)

Recovery Action: si	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data found in protocol handler data administrator (PHDA) table access dictionary.

33. CCBADJOB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid job type was requested of the protocol handler data administrator (PHDA) system process.

Probable Cause:

The probable cause is a software error with the process that scheduled the job.

Action:

The job is ignored by PHDA. The contents of the job buffer is dumped to the ROP for debugging purposes. This will identify the software process that scheduled the job.

34. CCBADKEY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to access a protocol handler data administrator (PHDA) indexed table with an invalid key.

35. CCBADLEN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Message signal unit of illegal length passed by PI FIFO unloader.

36. CCBAD_LNK_MNG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid or unexpected entry in array lnk_mng. Dumps array lnk_mng starting with element lnk_mng[dpci], where dpci is the point code index being currently examined.

37. CCBADMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid 5ESS[®] switch internal message or common channel signaling (CCS) message was encountered by message formatting using the CCsendmsg() function.

38. CCBADNS_TN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TN	Audit Mode: elev

Problem:

An rNS_TN tuple was not available from the idle list, or errors occurred while trying to add the new NS_TN to the busy list and the process control block link area (PCBLA).

39. CCBADODD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In initializing the protocol handler(s), a discrepancy was found within the SM ODD between one of the following relations:

- RLMDPATH and RLDSLEQUIP
- RLLNKP_LS and RLDSLEQUIP
- RLLAB7_SM and RLDPC_STAT (dynamic data)
- RLLAB7_SM and RLINDX
- RLDPC_INFO and RLDPC_STAT (dynamic data)
- RLDPC_INFO and RLINDX
- RLPOLICING and RLINDX
- RLALGTMRS not populated for all SDL data rates
- RLSS7TMRS unpopulated
- RLOFFPAR unpopulated
- RLQENDPTS unpopulated
- RLDPC_STAT and RLLS_STAT (both dynamic data structures)
- RLLNK_STAT and RLLS_STAT (both dynamic data structures)
- RLPOL_MTX and RLINDX

This problem will result in a failure to initialize the protocol handler(s).

Data Structures:

Data 1: The relation identifier.

Data 2: The key which was used to access the relation.

Action:

If the problem is an ODD inconsistency, then fixes must be made to the tuple in question. If the problem is in one of the dynamic relations, then the appropriate audit for the relation should be called before proceeding with the initialization. If none of the above fixes solve the problem, then there may be an internal software problem within the protocol handler data administrator.

40. CCBADPSUEVNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Common channel maintenance administration (CCMA) process received bogus event in MGsmupdt message at CCsmupdt().

41. CCBADRC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Bad return code.

42. CCBADREQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CCmdopam() could not recognize the type of input for OPST-MD.

43. CCBADSRCH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid "srctype" parameter has been passed to the ccs/CCmcc/CCfindls() function. The "srctype" parameter must be one of the enumerations specified in the CCSRCTYP enumeration in the uhdr/ccs/CCmccupd.G global header. Failure is returned to the calling routine.

44. CCBADSTATE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid common channel signaling (CCS) state (as defined in ccs/hdr/CCstate.h) was encountered.

45. CCBADTID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid protocol handler data administrator (PHDA) table identifier was encountered.

46. CCBADTTY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Input message received by CTTY terminal process was found to be corrupted. CCSLK or MD input command just entered will be aborted.

Data Structures:

None.

Action:

Reenter input command.

47. CCBADUPART (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid common channel signaling (CCS) user part (that is, DBTUP7, DBISUP7, or DBCCIS6) was encountered.

48. CCBCCR_NS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CRECORD	Audit Mode: elev

Problem:

An error indicating an incorrect linkage from the call record to the RLNS_IDX relation occurred when the network services (NS) software tried to retrieve an rINS_IDX tuple that was linked to the call record. The call record audit will be scheduled to clean up the linkage problem.

49. CCB CSTQFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

attempt was made to place a message on the SCCP management broadcast queue when it was full. If this assert occurs the message will not be processed.

50. CCB DRTSD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The call to a remote signaling point (RSP) service domain interface function has returned an indication to the RSP application domain that a parameter passed into the function was invalid. Therefore, the application request will not be honored and the RSP application domain must take recovery actions.

51. CCB GRPNET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During a leased network (LN) common channel signaling (CCS) trunk origination, the automatic route selection (ARS) local group ID associated with this leased network office did not have a corresponding rGRP_NET tuple in its data. The affected call was sent to reorder.

Data Structures:

RLGRP_NET. Key field: argp.

Action:

Determine the validity of the ARS group ID indicated. Use RC/V View 10.5 (ARS GROUP DEFINITION) to insert the missing tuple.

52. CCBLNDAS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A leased network (LN) call requiring a query to the LN network control point (NCP) database was made on a common channel signaling (CCS) LN trunk; but the LN digit analysis selector (DAS), global office parameter GIndas, was not set.

In the RLFC_TRUNK relation, the trunk is marked as an LN query trunk; that is, the In_type attribute is set to LN_QRY. Such trunks are required to send queries to the NCP for routing information. Before a query can be sent to the NCP, a 3-digit screening is required on the number dialed. The LN DAS points to the DAS to be used for this screening.

The affected call was sent to reorder. No LN_QRY calls will complete until this problem is corrected.

Data Structures:

RLFC_TRUNK. Key fields: member, module.

Action:

Determine whether the RLFC_TRUNK In_type field or the LN DAS is incorrect. If the trunk is a valid LN_QRY trunk, set the LN DAS using RC/V View 8.15 (CCS OFFICE PARAMETERS). If the trunk is not a valid LN_QRY trunk, notify your next level of support.

53. CCBNETGRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The automatic route selection (ARS) network group ID received in the initial address message (IAM) at the via switch for the leased network (LN) application, did not have a corresponding local ARS group ID in the RLNET_GPID relation. No LN calls that receive the indicated group ID will complete until this problem is corrected.

Data Structures:

RLNET_GPID. Key field: gpid.

Action:

Determine the corresponding internal ARS group ID for the network ARS ID indicated. Use RC/V View 10.5 (ARS GROUP DEFINITION) to update or insert the rINET_GPID tuple to support the leased network customer network ID.

54. CCBNS_IDX (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: NSIDX	Audit Mode: elev

Problem:

An error indicating incorrect linkages in the RLNS_IDX relation occurred when the network services (NS) software tried to retrieve an rINS_IDX tuple. The AUnsidx audit will be scheduled to clean up the linkage problem.

55. CCC7LCG_INV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LINK	Audit Mode: elev

Problem:

The counter for number of CCITT7 link sets in congestion was found to be negative. As a result, the NMCCS_CONG discrete may be incorrectly set. An audit will be scheduled to correct it.

56. CCC7LOSS_INV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STAT	Audit Mode: elev

Problem:

The counter for number of inaccessible CCITT7 DPCs was found to be negative. As a result, the NMCCS_LOSS discrete may be incorrectly set. An audit will be scheduled to correct it.

57. CCC7RCG_INV (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STAT	Audit Mode: elev

Problem:

The counter for number of remotely congested CCITT7 DPCs was found to be negative. As a result, the NMCCS_CONG discrete may be incorrectly set. An audit will be scheduled to correct it.

58. CCCASE_BAD_SW (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Upon entering the table build function: CCconv_init, (file: CCcv_init.c), for generic 5EE4_3P used to construct the SCCP conversion tables, (CCcldpty.h, CCcngpty.h, CCadmgrp.h); may encounter bad values for two of the input formal parameters. The RC/V screens for these tables are respectively: CCCDP, CCCGP and CCADG. For the 'caller parameter' of type CCALLSCMG or for the 'build_type parameter' of type CCBLDREQ only certain values are expected to be switched on. If other than the expected values are received then must alert developer personnel of this situation so that the problem can be isolated and debugged. Will report back the value being switched on.

59. CCCBCDGOVFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to allocate an unused changeback-code-group to a CB (changeback) segment failed. Presumably, all CB code groups are in use. This should never arise since the number of groups is greater than the number of segments needing groups. The result is that the changeback procedure cannot allocate a changeback group for the instance of changeback, and therefore cannot allocate changeback codes for use in CBD MSUs. CB continues in this case, but without generating any (more) CBD MSUs.

Action:

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual for support, providing all output reports associated with this assert.

60. CCCBCDOVFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A request is received to allocate a changeback code for use in a CBD MSU, but there are no codes left to allocate -- presumably, all are in use for outstanding unacknowledged CBD MSUs. However, this situation should not arise since there are enough codes in each code group to handle the worst-case situation. The data structure for the

changeback code group and the data for the individual changeback codes is dumped when this error occurs.

Action:

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual to report this problem, providing all output reports associated with this assert.

61. CC_CCSSTPDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An excessive number of RLCCSSTPDB (common channel signaling setup data block) tuples are being inserted by one recent change transaction. An internal error in the administration of RLCCSSTPDB tuples has either caused an excessive number of tuples to be needed or has corrupted the data showing how many RLCCSSTPDB tuples have already been created. The data dump contains the following: 1) the number of RLCCSSTPDB tuples to be inserted by this transaction.

62. CCCHGWBUFF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected error occurred when requesting a common network interface (CNI) message buffer.

63. CCCHIOCTL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A common network interface (CNI) channel input/output control (IOCTL) setup failed.

64. CCCHKOPEN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A common network interface (CNI) channel open failed.

65. CCCHRECV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

One of the following errors occurred while receiving a common network interface (CNI) message:

1. A message with zero length was detected.
2. A message with an invalid length was detected.
3. An unexpected return code from the CNI cHrecv() function was encountered.

Corrective action within the operational kernel process (OKP) will take place. In cases 1 and 2, the queue pointers will be adjusted to avoid the corrupt message. In case 3, the CNI channels will be re-initialized.

These errors do not represent a loss of common channel signaling (CCS) call processing. However, due to the automatic recovery within the code, the assert should not occur frequently. If the assert is seen frequently, contact technical support for further analysis.

66. CCCHRTN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A common network interface (CNI) message was returned with an invalid reason code.

67. CCCHXMIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to transmit a common network interface (CNI) message.

68. CCCKTCDDIG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The key used to read the RLCKTCDDIG relation was not set properly, or a tuple is missing from the relation.

Data Structures:

RLCKTCDDIG. Key field: iam.tns.circode.

Action:

Use RC/V to update the RLCKTCDDIG relation.

69. CCCLACLU (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: CLURDB	Audit Mode: elev

Problem:

Linkage error between the owner tuple in RLCLAPCRDB and the member tuple in RLCLU_RDB.

70. CCCLAMDB (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: S7MDB	Audit Mode: elev

Problem:

Linkage error between the owner tuple in RLCLAPCRDB and the member tuple in RLS7MDB.

71. CCCLAPCRDB (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: CLAPCRDB	Audit Mode: elev

Problem:

One or more attributes in a rCLAPCRDB tuple contain invalid values.

72. CCCLARDB (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: S7RDB	Audit Mode: elev

Problem:

Linkage error between the owner tuple in RLCLAPCRDB and the member tuple in RLS7RDB.

73. CCCLASS_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message was received that had an invalid message class associated with it.

74. CCCLD_ELAUD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CVCDPY	Audit Mode: elev

Problem:

For SCCP conversion table: CCCLDPTY a tuple was found to be in error, (either not in the table when it should have been OR in the table when it should not have been); and this condition may have been corrected. Although this is an unlikely situation, it is a very bad indication of trouble in the SM: therefore an assert calling an elevated audit must be called in order to find further errors, (if any), and correct them, (if needed).

75. CCCLDNOA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not compute the called party nature of address based on the data received.

Action:

Check RC/V View 10.2 (ROUTE INDEX [ROUTING]) and RC/V View 9.3 (LOCAL DIGIT (OFFICE DIALING)) for invalid data.

76. CCCLS_STAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STAT	Audit Mode: elev

Problem:

Failure to read a tuple in RLCLS_STAT.

77. CCCLUPCI (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: PCIRTE	Audit Mode: elev

Problem:

Linkage error between the owner tuple in RLCLU_STAT and the member tuple in RLPCI_RTE.

78. CCCLU_RDB (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: CLURDB	Audit Mode: elev

Problem:

Invalid values in one or more attributes of rICLU_RDB tuple.

Probable Cause:

Dynamic data is corrupted.

Action:

Have audits fix the problem.

79. CCCLUS CCP (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: SCCPSTAT	Audit Mode: elev

Problem:

Linkage error between an owner tuple in RLCLU_STAT and a member tuple in RLSCCP_STAT.

80. CCCLU_STAT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: CLUSTAT	Audit Mode: elev

Problem:

One or more attributes in a rICLU_STAT tuple contain invalid values.

81. CCCLUSTERORDER (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: CLUSTAT	Audit Mode: elev

Problem:

The tuples in RLCLU_STAT are not in sorted order.

82. CCCLUSTNUM (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: CLUSTAT	Audit Mode: elev

Problem:

Table CCclu2clix[] is full. The request to insert a new entry is rejected.

83. CCCLUXDPC (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: XDPCSTAT	Audit Mode: elev

Problem:

Linkage error between an owner tuple in RLCLU_STAT and a member tuple in RLXDPCSTAT.

84. CCCMTUNEQ (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCS message transport (CMT) path is not equipped to the GSM.

Probable Cause:

There is an inconsistency between the RLRT_TRKG (view 5.1) and the RLCMTPATH (view 16.16) relations. Attribute psu_mod in the RLRT_TRKG relation indicates the SM is a GSM and there should be a corresponding rICMTPATH tuple for this GSM if a CMT path is equipped to this GSM. A rICMTPATH tuple with the given key cannot be found in the static database. Either the rICMTPATH tuple is missing or the key used to access the tuple is invalid.

Action:

The first data dump contains the pci and the second data dump contains the cic. See next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

85. CCCNG_ELAUD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CVCGPY	Audit Mode: elev

Problem:

For SCCP conversion table: CCCNGPTY a tuple was found to be in error, (either not in the table when it should have been or in the table when it should not have been); and this condition may have been corrected. Although this is an unlikely situation, it is a very bad indication of trouble in the SM: therefore an assert calling an elevated audit must be called in order to find further errors, (if any), and correct them, (if needed).

86. CCCONGTYPE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TABGSM	Audit Mode: elev

Problem:

Unexpected value for congestion type.

87. CCCRBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A procedure in the CCITT7 MTP found an inconsistency in the "cluster-route" table that maintains the status of clusters of signaling destinations as reported to the local MTP by adjacent signaling points.

Probable Cause:

Unknown.

Action:

This assert will invoke an audit to bring the data back to a consistent state. No manual action is needed.

88. CCCRBADN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCITT7 MTP has detected a problem in the "cluster-route", which maintains status for clusters of signaling destinations as reported to the local MTP by adjacent signaling points. The problem is such that immediately invoking an audit over the data will not correct the problem.

Probable Cause:

Unknown. No events should cause this data to become corrupted.

Action:

This failure affects the ability of the CCITT7 MTP to route message traffic correctly. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual and report the problem.

89. CCCRDBXLIST (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: XLIST	Audit Mode: elev

Problem:

Linkage error between the owner tuple in RLCLU_RDB and the member tuple in RLXLIST.

90. CCCTPTY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not create the CTTY terminal process. The CCSLK or MD input command was aborted.

Data Structures:

None.

Action:

Reenter the CCSLK or MD input command.

91. CCCUTTHRU (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The 400 Hz carrier tone is requested but not provisioned as a system tone for ISUP FGD cutthru on LATA trunks.

The "CT FOR DT" field in RC/V View 5.1 (TRUNK GROUP) is set to "Y" but the field "CARRIER TONE" is set to "N".

The TRUNK GROUP and trunk group MEMBER NUMBER are printed in this assert. The TRUNK GROUP value can be used as key to RC/V View 5.1

Data Structures:

- Global parameter, Glcartone
- rIFC_TRUNK.ct_for_dt

Action:

There are two options for the action to be taken:

- Set the field, "CARRIER TONE" in RC/V View 8.1 [OFFICE PARAMETERS (MISCELLANEOUS)] to "Y" or
- Set value of "CT FOR DT" in RC/V View 5.1 to "N"

92. CCCXLISTMR (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: XLISTMR	Audit Mode: elev

Problem:

One or more attributes in the RLXLISTMR tuple contain invalid values.

93. CCCXTMRXLIST (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: XLIST	Audit Mode: elev

Problem:

Linkage error between an owner tuple in RLXLISTMR and a member tuple in RLXLIST.

94. CCDARI_BAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from data access to the RLREPLY relation.

95. CCDDATA_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data was encountered in a direct signaling message.

96. CCDATIMER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The keys used to read the RLDA_TIMER relation were not set properly, or a tuple is missing from the relation.

Data Structures:

RLDA_TIMER. Key fields: servclass, signal, sigtype.

Action:

Use RC/V View 8.5 (TIMING [MISCELLANEOUS]) (or ODBE, if necessary) to cross-check the data for the keys in the relation with the actual keys used. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify your next level of support. The signal for lines is always FCSSNULL; the start signal is not applicable.

97. CCDBDSAPP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple was missing from the RLDS_APP relation that contains information for direct signaling applications.

Data Structures:

RLDS_APP. Key field: direct signaling application.

Action:

Insert an RLDA_APP tuple with the appropriate information via RC/V View 8.17 (DIRECT SIGNALING APPLICATION).

98. CCDBERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return code was received from a database primitive.

99. CCDBERR2 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt failed to read RLIS_DPC for a CCITT7 link set concerned in traffic diversion. Signaling network management functions will have to give up traffic diversion concerning this link set. The RLIS_DPC tuple and the traffic diversion data block are dumped.

Action:

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual to contact support, providing all output reports associated with this assert.

100. CCDBLAB6_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failed while attempting to read the RLLAB6PRT relation. The common channel signaling no. 6 domestic (CCIS6) routing label was not translated into the 5ESS[®] switch internal representation of that SM port (known as gport).

The data dump consists of the following:

sl_group	6 bits
sl_mem	4 bits
sl_vlink	3 bits
fill	3 bits
band	9 bits (translates from band_num)
bmem_num	4 bits (translates from trnk_num)
fill	3 bits
total	32 bits

The band and member number are extracted from the CCIS6 routing label. The band and member from the signal transfer point (STP) can be found by performing a binary to decimal conversion. The CCIS6 routing label is defined as follows:

filler	12 bits
heading	3 bits
sig_info	4 bits
band_num	9 bits (translates to band)
trnk_num	4 bits (translates to bmem_num)
total	32 bits

101. CCDBLAB7_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failed while attempting to read the RLLAB7_PCI relation. The data dump contains the following:

dpc	24 bits
fill	8 bits
opc	24 bits
fill	8 bits

102. CCDBPCI_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failed while attempting to read the RLPCI_PRT relation. The data dump contains the following:

pci	8 bits
fill	8 bits
circuit	14 bits
fill	2 bits

103. CCDBPORTYP_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failed while attempting to read the RLFC_PORTTYP relation.

104. CCDBPRT_PCI_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An rIGROUP_PORT tuple for a common channel signaling (CCS) trunk has no corresponding rIPRT_PCI tuple. The incoming or outgoing signaling type in the trunk group's rIRT_TRKG tuple indicates that this group is a CCS trunk group.

Data Structures:

RLPRT_PCI. Key fields: module, port.

RLGROUP_PORT. Key fields: portgrp.grpnum, member.

Action:

Use RC/V to correct the problem.

105. CCDBRT_TRKG_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The trk_qry attribute in an rLRCTGRPRK tuple is set to DBYES that indicates that common channel signaling (CCS) trunk query is allowed and that this group is a trunk group. However, the corresponding type cannot be read in the RLRT_TRKG relation.

Data Structures:

RLRT_TRKG. Key field: grpnum.

RLRCTGRPRK. Key field: portgrp.grpnum.

Action:

Use RC/V to correct the problem.

106. CCDBSYSERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SM ODD read of the accounting relation ACC_SI was unsuccessful. The build of the accounting translation tables may be invalid.

Data Structures:

rlACC_SI.acclsindx.

Probable Cause:

The read failure is a database (DB) problem.

Action:

None.

107. CCDBTC_AP (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failed while attempting to read the RLDS_APP relation. The RLDS_APP relation is populated for direct signaling applications.

Data Structures:

RLDS_APP.

Action:

The application that is causing this assert can be found in the report data message for the assert. The DS_APP tuple is dumped for the complaining application. The numerical value for the application type can be found by using the Translation Data Manual to translate the data dump. The numerical value can then be converted into the application type by referring to the data domain for DS_APP in the Translation/Dynamic Data Domain Description Manual. Verify that the complaining application is populated on RC/V View 8.17 (DIRECT SIGNALING APPLICATIONS). The subsystem number found on this view must also be populated on RC/V View 15.10

(SUBSYSTEM INFORMATION). If both are populated, the views may have been input in the wrong order. A no change update on RC/V View 8.17 should resolve the problem.

108. CCDBTC_AP (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failed while attempting to read the RLDS_APP relation. The RLDS_APP relation is populated for direct signaling applications.

Data Structures:

RLDS_APP.

Action:

Verify that all direct signaling applications configured in the office are populated on RC/V View 8.17 (DIRECT SIGNALING APPLICATIONS). This RC/V View contains the direct signaling application (key) and the associated subsystem number. The subsystem number must also be populated on RC/V View 15.10 (SUBSYSTEM INFORMATION) for all direct signaling applications.

109. CCDBTC_SS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failed while attempting to read the RLDS_SSN relation. The subsystem number associated with a direct signaling application is missing.

Data Structures:

RLDS_SSN. Key field:

Action:

Update or verify RC/V View 8.17 (DIRECT SIGNALING APPLICATION) with the subsystem numbers associated with the direct signaling applications configured in the office.

110. CCDCSIBADENTRY (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid entry reason to the DCSI system process.

111. CCDCSIBDEVNT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CCdcsiwork() was called for an unexpected reason.

Probable Cause:

Disagreement between OSWAIT events coded by CCdcsimain() and events expected by CCdcsiwork().

Action:

Contact next level of support.

112. CCDDBINIT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A memory protection problem was encountered during direct link node (DLN) database (DB) initialization.

113. CCDDBMPRO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to reprotect the direct link node (DLN) database (DB) memory.

114. CCDDBMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message was received by the direct link node (DLN) database (DB) system process.

115. CCDDBOPER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid recent change operation was encountered by the direct link node (DLN) database (DB) system process.

116. CCDDBRCMP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from the operating system for distributed switching (OSDS) memory protection manager in the direct link node (DLN).

117. CCDDBREID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid relation ID was encountered by the direct link node (DLN) database (DB) access functions.

118. CCDDBUNPRO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not unprotect the direct link node (DLN) database (DB) memory.

119. CCDDFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data delivery read failed.

120. CCDDW_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unsuccessful DDWRITE occurred.

121. CCDELLSMCC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt has been made to delete an entry from the CCIsMccstat[] table, but the MCC counters (CCtotls, CCfirstls[], and CClastls[]) indicate that the table does not have an entry to be deleted. This would indicate that the RC/V code has allowed a link set deletion when it should not have done so, or that the counters have been corrupted. If the counters are bad, audits should eventually correct them. The table and counters handle all CCS protocols. CCS protocol-specific audits handle the portions of the tables appropriate to the CCS protocol which they service. The following audits will correct these counters, if they are wrong, and can be manually invoked via the "ST-AUDSM:sm=<SM #>,audit=<audit name>," command:

C7INTL/C7NATL (CCITT7) link sets: LSDATA CCSNA7 (North American CCS7) link sets: NA7LS CCITT6: LS6

The contents of the MCC counters will be dumped as part of the audit information:

CCtotls	Total number of link sets for all protocols in the GSM. A value of 0 indicates that the table is empty.
CCfirstls[]	First link set entry in CCIsMccstat[] table for each protocol. A value of 0xff indicates that no link sets exist.
CClastls[]	Last link set entry in CCIsMccstat[] table for each protocol. A value of 0xff indicates that no link sets exist.

Order of entries: C7NATL, CCSNA7, CCITT6, C7INTL

122. CCDESTROY (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: PCBLA	Audit Mode: elev

Problem:

While trying to setup an incoming call over an integrated services digital network (ISDN) user part (ISUP) trunk, a failure was encountered in the dynamic linkages between the ISUP trunk port data and the incoming ISUP process data. The call was released with an REL message with cause value #41 "temporary failure". This problem was probably caused by corrupt dynamic data linkages between the ISUP trunk port and the ISUP process.

Action:

If this assert occurs frequently, contact the next level of support.

123. CCDLNINV (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to translate between the ring node address and the direct link node (DLN) index.

124. CCDNFEAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to read an rIDN_FEATS tuple failed. The call continues as though the trunk member had no directory number (DN) features assigned to it. The call will complete unless the terminating station blocks the call due to a business and residential custom services (BRCS) feature, such as a terminal group and station restriction (TGSR) feature (that is, /TGUFT). In this case, the TGSR error treatment assigned to the terminating station applies.

Data Structures:

RLDN_FEATS. Key fields: lead module, ltm index, ltm type.

Action:

The receive only printer (ROP) report will show the keys to the RLDN_FEATS relation. The D-channel portname also prints on the ROP, it prints as zero if this data was unavailable. Verify the features on the trunk member with RC/V View 5.11 (BRCS FEATURE ASSIGNMENT [TRUNK MEMBER]). If the features are correct, use RC/V (or ODBE, if necessary) to verify the existence of an rldn_feats tuple. If the tuple does not exist, verify that the rldn_feats tuple with the same ltm_index and ltm_type has the brc_dn field set to DBNO for the trunk member.

125. CC_DPCIND (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No matching entry found in RLDPCIND for a previously referenced DPC/SSN/NET_NUM.

Data Structures:

RLDPCIND. Key fields: destination point code, subsystem number, network number.

Action:

Add the entry to the relation using RC/V View 16.22 (SCCP PRIMARY/BACKUP DESTINATION).

126. CCDPC_ORDER (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STAT	Audit Mode: elev

Problem:

Non-existent or out-of-order DPC tuple in relation RLDPC_STAT.

127. CCDPCPCI (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: PCIRTE	Audit Mode: elev

Problem:

Linkage error between an owner tuple in RLDPC_STAT and a member tuple in RLPCI_RTE.

128. CCDPCRCG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RCGTMR	Audit Mode: elev

Problem:

Failure in linking or unlinking an RLDPC_STAT tuple with an RLRCGTMR tuple.

129. CCDPC_S2 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STAT	Audit Mode: elev

Problem:

A combined link set listed as a route for a destination point code (DPC) in rldpc_stat cannot be found in the 'clnk_tbl' data used during CCITT7 traffic diversion. The result is that the CLS cannot be used for further CCITT7 signaling network management functions. An audit is invoked to verify and correct the rldpc_stat dynamic data, and the data in clnk_tbl and the concerned rldpc_stat tuple is dumped.

Action:

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual to report this assert, providing all output reports associated with this assert.

130. CCDPCSCCP (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: SCCPSTAT	Audit Mode: elev

Problem:

Linkage error between an owner tuple in RLDPC_STAT and a member tuple in RLSCCPSTAT.

131. CCDPC_STAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DPCI	Audit Mode: elev

Problem:

Failure in owner/member linkage structure or failure to read a tuple in RLDPC_STAT.

132. CCDPCTA2 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STAT	Audit Mode: elev

Problem:

An attempt failed to update the SM copy of the destination point code - link set (DPCLS) routing data for CCITT7 signaling message handling. Some CCITT7 destination points may be incorrectly routed as a result. An audit is scheduled to repair the DPCLS routing data. The DPCLS update job buffer is dumped.

Action:

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual to report this assert to field support, providing all output reports associated with this assert.

133. CCDPCTAB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STAT	Audit Mode: elev

Problem:

STRM-PHDA interface: Failure to update the CCsmdpcls_ht[] array, which is the global SM's copy of one of signaling message handling's outgoing routing tables.

134. CCDSICRPT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An output message queue corruption was found in the direct link node (DLN) system integrity (SI) system process.

135. CCDSIIENT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid entry reason was sent to the CCdsinit() function, the direct link node (DLN) system integrity (SI) system process.

136. CCDSIINSPRC (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The direct link node (DLN) integrity control (DICO) monitor detected a corrupted process in the DLN.

137. CCDSISND (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

The direct link node (DLN) system integrity (SI) system process in the DLN could not send messages to the AM in 10 or more consecutive attempts because DLN transport returned CCBUFFULL (ring buffer full) through the OSsendmsg() function. DLN transport will be purged in an attempt to correct the problem.

138. CCDSIUSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return code was received from the OSwait() function, or an unexpected signal was received by the CCdsinit() function, the direct link node (DLN) system integrity (SI) process in the DLN.

139. CCDSLEQUIP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Read failure occurred of static relation RLDSLEQUIP.

Data Structures:

RLDSLEQUIP.

Action:

Check ODD for incompatibilities. This craft assert fires because the dsl does not exist in the SM database. The dsl and database return code will be dumped in the message. This inconsistency occurs during the initialization of the link member MCC page for a link set of a specific CCS protocol. The key to RLDSLEQUIP is obtained from CCS protocol-specific relations. Check for an inconsistency between the relation indicated below and RLDSLEQUIP:

C7NATL or C7INTL (CCITT7)	: RLLS_LNK CCSNA7
(North American CCS7)	: RLNALSLNK
CCITT6	: RLLS6_LNK

140. CCERRAILS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The destination point code for an AILS query equals the point code from this office (meaning we are trying to send an AILS query to ourselves).

Action:

The query is not sent.

141. CCEXCHRTG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Hop count exhaust. This switch has received a release (REL) message with a cause of "exchange routing error". This means the call exceeded the allowed hops (intermediate switches) and the call has been terminated.

Data Structures:

Called party number

Calling party number (if available)
 Originating point code of succeeding switch
 Circuit code of succeeding switch
 Outgoing trunk group number

Action:

RC/V Trunk Group View 5.1 (TRUNK GROUP) has a field called "MAX HOP CNT" which may be adjusted as necessary to allow enough switches to route the call.

142. CCFAPRET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return code was received from the OSfap() function.

143. CCFCAOVFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The maximum digit string length for ISDN User Part System 7 (ISUP7) was exceeded when attempting to prepend a 0/1X international switching center designation on the front of the CC + NN string for an international call that is being sent out using the fully coded addressing format. The call will be sent out without the prefix string.

Data Structures:

The digit string without the prepended digits is displayed.

Action:

Contact next level of support.

144. CCFCCC_ISC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A problem occurred while reading the RLFCCC_ISC relation. This relation contains country codes (CCs) that require a 2-digit prefix. The prefix is used to route the call to the international switching center (ISC). The RLFCCC_ISC relation is used for fully coded addressing of international outbound calls. The dumped data contains the CC (one byte per digit, subtract hex 30 from each).

Data Structures:

RLFCCC_ISC. Key field: country code.

Action:

The RLFCCC_ISC relation is corrupt. Check the relation and recreate it using RC/V View 9.16 (COUNTRY CODE PREFIX) (or ODBE, if necessary).

145. CCFEATNOTSUP (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A secured feature was detected to be active that is not supported in this office.

Probable Cause:

The secured feature was erroneously activated.

Action:

The secured feature ID is dumped by this assert. Save and provide the relevant read-only printer (ROP) output to the next level of technical support and notify field support. This feature should be deactivated.

146. CCFIXITY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A new CCS protocol was added to an ity file, but the client code that builds the output messages have not been modified.

147. CCFOWNPC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While trying to setup an incoming call over an integrated services digital network (ISDN) user part (ISUP) trunk, an unexpected return code was received. The incoming call was released with an REL message with cause value #41 "temporary failure". This error was probably caused by corrupt dynamic linkages.

Action:

Contact the next level of support.

148. CCFULLDPC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STAT	Audit Mode: elev

Problem:

A request was made to insert an entry into the SM CCdpc2dpci table but the entry cannot be inserted because the table is full. The audit DPC2DPCI will be run.

149. CCFXDGERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was found and corrected in the SCCP fixed digit table (CCGTT_FIXED). The error was one of the following:

Entry already existing on insertion

Entry missing when updating or deleting

This particular inconsistency has been corrected, however, it is possible that there are further inconsistencies in the table.

150. CCGENS7MDB (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: S7MDB	Audit Mode: elev

Problem:

Invalid values in one or more attributes of rIS7MDB tuple.

Probable Cause:

Dynamic data is corrupted.

Action:

Have audits fix the problem.

151. CCGETAPCSTAT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: APCSTAT	Audit Mode: elev

Problem:

Accessing a specified CCAPC_STAT entry was unsuccessful.

Probable Cause:

An invalid adjacent point code index (ACPI) was used to reference a CCAPC_STAT entry.

Action:

Note occurrence and report problem to field support with all associated ROP data. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

152. CCGETCLAPCRDB (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: CLUAPCI	Audit Mode: elev

Problem:

Failure to read a tuple in RLCLAPCRDB.

153. CCGETCLURDB (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: CLUINFO	Audit Mode: elev

Problem:

Failure to read a tuple in RLCLU_RDB.

154. CCGETCLU_STAT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: CLUINFO	Audit Mode: elev

Problem:

Failure to read a tuple in RLCLU_STAT.

155. CCGETDPB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DPB	Audit Mode: elev

Problem:

Failed to get the D-channel port block (DPB) associated with the port. The DPB audit will be scheduled.

156. CCGETLORSTMR (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: LORSTMR	Audit Mode: elev

Problem:

Failure to read a tuple in RLLORSTMR.

157. CCGETNET_STAT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: NETINFO	Audit Mode: elev

Problem:

Failure to read a tuple in RLNET_STAT.

158. CCGETPCI_RTE (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: IPCSPCI	Audit Mode: elev

Problem:

Failure to read a tuple in RLPCI_RTE.

159. CCGETRCG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RCGTMR	Audit Mode: elev

Problem:

Failure to obtain a pointer to a type RLRCGTMR tuple.

160. CCGETRDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: S7RDB	Audit Mode: elev

Problem:

Accessing a specified rIS7RDB tuple, or obtaining the tuple's timer owner was unsuccessful.

161. CCGETRESTRTMR (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: RESTRTMR	Audit Mode: elev

Problem:

Accessing a timer head cell for MTP restart has failed.

Probable Cause:

An invalid timeout value was passed to the function that accesses the array of CCRESTRTMR (timer head cell) structures.

Action:

Note occurrence and report problem to field support with all associated ROP data. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

162. CCGETRST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RSTMR	Audit Mode: elev

Problem:

Accessing a specified rIRSTMR tuple was unsuccessful.

163. CCGETSCCP_STAT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: SCCPPC	Audit Mode: elev

Problem:

Failure to read a tuple in RLSCCPSTAT.

164. CCGETXDPCSTAT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: XDPCSTAT	Audit Mode: elev

Problem:

Failure to read a tuple in RLXDPCSTAT.

165. CCGETXLIST (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: XLIST	Audit Mode: elev

Problem:

Failure to read a tuple in RLXLIST.

166. CCGETXLISTMR (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: XLISTMR	Audit Mode: elev

Problem:

Failure to read a tuple in RLXLISTMT.

167. CCGETXPT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: XPTMR	Audit Mode: elev

Problem:

Accessing a specified RLxptmr tuple was unsuccessful.

168. CCGSCINIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid entry reason to SCMG system process.

169. CCGSMI_BAD (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A global switching module index (GSMI) returned by macro CCGSM2GSMI() is out of range.

Probable Cause:

The possible causes of getting an invalid GSMI are either due to a memory corruption or macro CCGSM2GSMI() receives an invalid global switching module (GSM) value.

Action:

The CCS message transport (CMT) throttling function, CCcmt_throttle(), returns a GLFAIL to indicate that the outbound TCAP message shall be discarded since the CMT path overload condition status cannot be determined. The assert will help to flag the problem if an invalid GSM value was received by macro CCGSM2GSMI().

170. CCGSMNET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert occurs when the CCgsmnet primitive returns a GLFAIL return. It indicates that CCgsmnet was called with an SM number that is not a CCITT7 Global SM, or CCgsmnet had an internal error.

171. CCGSMPRTERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid CCS protocol and GSM combination has been specified. The SM from which this assert fires is not the CCS global SM for the CCS protocol specified.

172. CCGSMTBL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TABGSM	Audit Mode: elev

Problem:

Assert fired in case of failed returns from GSM table primitives (CCgsm2data(), CCnetpc2data(), CCgsmi2data(), and CCrdgsm()). This failure indicates that the primitive was unable to translate the data provided by the calling function. Most likely, the data provided by the calling function (CCITT7 network and OPC, or CCITT7 global SM number, or CCITT7 global SM index) is incorrect. This could result when the ODD data for a CCITT7 circuit is incorrect -- particularly the OPC value. See RLPCI7_LAB and RLLAB7_PCI in the AM and RLPRT7LAB and RLLAB7PRT in the SM. It is also possible that the data table (CCopc_gsm) used by the primitives is corrupt; it should be consistent with RL GSM_OPC. The TABGSM audit is scheduled by this assert to recover the table if necessary. If this audit finds no errors, the problem is certainly in the code calling the primitive or in the ODD used.

173. CCGTRCGTMR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RCGTMR	Audit Mode: elev

Problem:

Failure to access a tuple of the relation RLRCGTMR using the primitive DAGtrcgtmr.

174. CCHMACK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received error return form HMack. HMack sends acknowledgement to the MCC.

175. CCHMERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure has occurred while trying to print information to the read only printer (ROP).

Probable Cause:

Internal error.

Action:

Context next level of support.

176. CCHMMCCMUPD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The function was unable to successfully call the HMmccmupd() multiple MCC update function. This would indicate that MCC update requests were lost. Request a re-initialization of the MCC pages currently displayed (simply execute a poke which will result in re-drawing the MCC page).

177. CCHMMCCPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to connect to HMmcc port from OKP.

178. CCHMMCCUPD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The function was unable to successfully call the HMmccupd() single MCC indicator update function. This would indicate that MCC update requests were lost. If a CCS MCC page was displayed at the time, re-draw the page. If this happens during growth/de-growth of a CCS signaling system, the RC/V activity will need to be re-tried (this error will result in the aborting of the RC/V attempt).

179. CCHOPCNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Hop count exhaust. This call has exceeded the number of allowed hops (intermediate switches) and the call has been terminated at this switch.

Data Structures:

Called party number
 Calling party number (if available)
 Originating point code of preceding switch
 Circuit code of preceding switch
 Incoming trunk group number

Action:

RC/V Trunk Group View 5.1 has a field called "MAX HOP CNT" which may be adjusted as necessary to allow enough switches to route the call. This will be the responsibility of the sending switch since the hop counter was already exhausted when it reached this switch.

180. CCHSHNOTDONE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The total timer for the hashsum checking routine has expired. There are still blocks of memory to be processed. This means that the incoming routing data in the SMP not match the incoming routing data in the PH3.

181. CCICRMEM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

SM memory for the CCITT7 incoming routing tables has not been correctly allocated. (Either no memory has been allocated, or the amount of memory allocated is incorrect.) No incoming routing data will be available to the PH3s.

182. CCILSDPOL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failed attempt has been made by a software process to read the ILSD_POL relation. This is an office-dependent data (ODD) discrepancy because the LS_GRP static relation has indicated that the particular CCS link set is to be

policed by the incoming link set and destination point code (ILS/DPC) feature, however the corresponding tuple entry in the ILSD_POL relation does not exist.

Data Structures:

Data 1: The relation identifier

Data 2: The policed link set number

Action:

If the specified CCS link set is supposed to be policed, as indicated from the LS_GRP relation, the corresponding ILSD_POL tuple must be inserted. If the specified CCS link set is not to be policed, the LS_GRP relation must be updated to indicate this desired state.

183. CCIMS3BRD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected error occurred when the _ims3brd() function was called.

184. CCIMS3BWT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected error occurred when the _ims3bwt() function was called.

185. CCIMSBFR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to free an interprocess message switch (IMS) receive buffer failed.

186. CCIMSOPEN (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not open an interprocess message switch (IMS) channel.

187. CCIMSWRT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected error occurred when the _imswrite() function was called.

188. CCINCGRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Incorrect linkset group value has been found.

189. CCINCLNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Incorrect link member value has been found.

190. CCINCLS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Incorrect linkset value has been found.

191. CCINFOERAUD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CCGINFO	Audit Mode: elev

Problem:

An error was found and corrected in the SCCP global title information table (CC7GTT_INFO). The error was one of the following:

Entry already existing on insertion

Entry missing when updating or deleting

An audit has been scheduled for this specific table.

192. CCINIT_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCtccs_init() function was called for some reason other than initialization.

193. CCINRSPEVNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote signaling point (RSP) system process function has detected an invalid protocol handler (PH) service event.

194. CCINSFLSM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert indicates the function CCinslab7 in the SMP failed to insert a voice trunk tuple into the incoming routing table. This assert will be followed by a data dump containing the tuple that was not inserted.

195. CCINSSNERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was found and corrected in the SCCP SCMG index to SSN table (CC7IND_SSN). The error was one of the following:

Entry already existing on insertion

Entry missing when updating or deleting

This particular inconsistency has been corrected, however, it is possible that there are further inconsistencies.

196. CCINVALIDTRA (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected TRA message was received from a signalling point for which the adjacent restart control was not marked as RESTART.

Probable Cause:

Data inconsistency or corrupted message.

Action:

Provide the assert number and its mnemonic with the data dumped on the ROP to local field support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

197. CCINVCALLTYPE (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCoi_gry() function found an invalid call type for an ASP call. The call type found was referenced by a 9.3 [LOCAL DIGIT (OFFICE DIALING)], a 9.6 [IDDD COUNTRY ACCESS CODE (OFFICE DIALING)], or a 9.9 [REMAINING DIGIT (OFFICE DIALING)] RC/V screen handling this call. To find out the call type please refer to the DESTN domain description in the "Translations/Dynamic Data Domain Description Manual" 235-600-24x for the appropriate software generic. Data dumps contain: a call type, a DN obtained from SCP response plus DAS number to help identify the problem. Please correct (if appropriate) the call type on the 9.3, or 9.6 or 9.9 RC/V screen for this call.

198. CCINVCIRCODE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid circuit code was received for an international call. The following values are valid for common channel signaling (CCS) trunks: 1 - international call, 2 - international operator call.

Action:

Use RC/V View 10.2 (ROUTE INDEX [ROUTING]) and RC/V View 10.23 (CIRCUIT CODE TO DIGIT TRANSLATION) to verify that the circuit code contains the proper 1NX/1N'X digits.

199. CCINVCONV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A return from a data conversion routine indicated that the data could not be converted. The data to be converted contained invalid data (for example, non-ASCII digits).

200. CCINVDPCI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote signaling point (RSP) service domain has been passed a destination point code index (DPCI) segment parameter that has been determined to be invalid (out of range). The RSP service domain function cannot continue

processing the request.

201. CCINVFCOS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The far class of service was invalid, it must be a line or trunk.

202. CCINVGSM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A CCITT7 request has been made (either for national or international CCITT7), but the SM is not global for either of the two CCS protocols (C7NATL or C7INTL). This would indicate that the global parameters Glnatl7sm and Glintl7sm are not properly populated for this SM.

203. CCINVILSDF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data discrepancy has been detected between tuple 0 of the ILSD_POL static relation and the global variable CCdellspcmx. The discrepancy is either tuple 0 had the del_mtx field set to 0 and the CCdellspcmx variable was set to 1, or tuple 0 had the del_mtx field set to a non-zero value and the CCdellspcmx variable was set to 0.

Probable Cause:

The most probable cause for this error is when a failure occurs during a recent change deletion of a CCITT7 destination point code (DPC) that was defined as being policed by the incoming linkset (ILS) and DPC policing feature. The CCdellspcmx variable is set at the beginning of the transaction to 1, then reset to 0 at the end of the transaction. If the transaction was aborted, it may have been possible that tuple 0 was not properly updated.

Action:

The CCdellspcmx variable is corrected to be consistent with the data in ILSD_POL tuple 0. The assert will also dump out the value of the CCdellspcmx variable, which can be used to compare against the copy of the ILSD_POL tuple 0 located on the stack frame for debugging purposes.

204. CCINVMCCACT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid MCC action request has been received. This could indicate that the MCC action was not one of the enumerations specified in uhdr/ccs/CCmccact.G or that the action was one of the enumerations but that the enumeration was not allowed by this particular MCC function.

205. CCINVMCFLAG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid MCC flag has been received that is not in the allowed range as specified in the CCMCCNTFY enumeration in ccs/hdr/CCmcc.L. This points to a software error in the MCC interface to RC/V growth. This will result in a failure in the RC/V activity which is attempting to add or remove a CCS protocol. The RC/V growth/de-growth attempt must be re-tried after a fix is applied to the load.

206. CCINVMRISP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message received for inaccessible signaling point (MRISP) internal message was received. The invalid message is dumped (struct mgSS7TRM).

207. CCINVMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown/invalid message has been received. The unknown/invalid message is output to the ROP for debugging.

208. CCINVPAGE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid MCC page request has been received. The MCC page cannot be displayed or updated. Processing of the request usually will be discontinued.

209. CCINVPLAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was detected by point code index (PCI) status update mechanism. A request for a CNI PCI update was received however according to the Global parameter Glccs in the AM no CCS CNI Platform exists.

The data dumped shows the values of Glccs and The message type this function received. If the message type was an MGTIMER and craft personnel are in the process of degrowing a CNI this assert may occur once. Otherwise see Action below

Data Structures:

Global parameter - Glccs.

Message type

Module number

Action:

Verify that the global parameter Glccs is set correctly in the AM and in the SM. If Glccs is different in any of the processors please refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual for information on contacting technical support to insure parameter is updated properly.

210. CCINVROLE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Common channel signaling (CCS) call processing could not determine where this call was being processed in the network. This value is stored in the CCS feature data block (FDB) of the process control block link area (PCBLA).

The following values are valid:

CC_TRAD - traditional (intraLATA) ISUP7 call

CCE_TRAD	- originating end office for intraLATA call
CCE_IC	- end office to interLATA carrier
CCE_INC	- end office to international carrier
CCE_A_TO	- end office to access tandem to a toll office
CCA_IC	- access tandem to interLATA carrier
CCA_INC	- access tandem to international carrier
CC_XTO	- transit toll office
CCP_XTO	- PRI directly connected to transit toll office I
CC_TTO	- terminating toll office
CCP_TTO	- PRI directly connected to terminating toll office
CC_2STG	- traditional 2-stage international signaling at access tandem
CCE_A_FGB	- FGB signaling at the end office to access tandem
CCA_FGB	- FGB signaling at the access tandem
CCBAD_ROLE	- error case, role not supported

211. CCINVSDL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Trigger function failed during update from automatic allocation to basic allocation. The signaling link is using a signaling data link which is not equal to the predefined signaling data link.

Data Structures:

None.

Action:

Deactivate signaling link and try again.

212. CCINVSLSTAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Trigger function failed because signaling link is in a transient state. The signaling link must be in a stable IS or stable OOS state.

Data Structures:

None.

Action:

Either wait for the SL to go into a stable state or manually deactivate the SL.

213. CCINVTNSC (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Terminating network selection code (TNSC) value is too large for the protocol field, the call will be killed.

Data Structures:

The ROP output indicates the TNSC value that was too large.

Action:

Check sources of the TNSC value and determine where the invalid value came from, then correct that source.

214. CCIPMHD (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not format a common network interface (CNI) interprocess message header.

215. CCIS6MSG_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid common channel signaling system no. 6 domestic (CCIS6) message was received.

216. CCISUPMSG_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid integrated services digital network (ISDN) user part (ISUP) message was received.

217. CCITT7LSMCC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DATA	Audit Mode: elev

Problem:

An attempt to find a CCITT7 link set entry in the CCISmccstat[] MCC table has resulted in failure (either an entry is missing or an invalid entry exists). The LSDATA audit will be scheduled to correct the problem. The CCISmccstat[] table will be dumped as part of the assert information. Since this error only occur during growth or de-growth, the RC/V procedures should be re-tried once the audit has corrected the table.

NOTE: This error could also be seen during SM initialization. This would indicate a software problem, where the CCISmccstat[] table was not being initialized properly.

218. CCJBUFBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: JBUF	Audit Mode: elev

Problem:

One of the following occurred:

- 1) The SM went through a selective initialization - the PHDA audits should always be run.
- 2) During a full initialization, PHDA could not successfully complete linking of its buffers.
- 3) The buffers could not be manipulated off or on either the idle or busy lists.

In all cases, the buffer linkages are in an unknown state, and an audit will be called to check and correct the

linkages.

219. CCJIPFL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to populate the Jurisdiction Information Parameter, an unexpected return code was received from the DBstfst() function that was reading the first tuple in RLNOCCODE. The call will continue, but the JIP parameter will not be populated in the CCS7 IAM message.

Probable Cause:

The RLNOCCODE relation is either not populated or it cannot be read by the software.

Action:

Watch for more errors like this and contact technical support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

220. CCLAB6PCI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failed while attempting to read the RLLAB6_PCI relation. The contents of the first word in the data dump are the following:

sl_group	6 bits
sl_mem	4 bits
sl_vlink	3 bits
fill	3 bits
band	9 bits
bmem_num	4 bits
fill	3 bits

221. CCLABP7ERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failed while reading the common channel signaling (CCS) relation RLLAB7PRT.

222. CCLDPSP1 (5E12 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Spare code.

Data Structures:

Not applicable.

Action:

None.

223. CCLDPSP2 (5E12 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Spare code.

Data Structures:
Not applicable.

Action:
None.

224. CCLGRPMEM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Unable to read the RLLGRPMEM static relation.

Data Structures:
RLLGRPMEM.

Action:
No action.

225. CCLKTSTTBL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Failure to read or insert a tuple in RLLKTSTTBL.

226. CCLNBRET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
An unexpected return code was received from the leased network (LN) transaction handler function FCIntrhdlr() that was communicating with the external network control point (NCP) to get routing information. The affected call was sent to reorder.

Action:
No action is required if this assert occurs singularly. If this assert repeats, call your next level of support. Multiple occurrences indicate the load is suspect.

227. CCLNK_NF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Failure to find a link in STRM lnk_tbl.

228. CCLNK_STAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: DATA	Audit Mode: elev

Problem:
Failure to read a tuple in RLLNK_STAT.

229. CCLNPKG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A leased network (LN) call was attempted, but the LN action point (LNACP) software package was not loaded. The In_type field of the RLFC_TRUNK relation was set to LN_QRY indicating a LN query (QRY) trunk.

Data Structures:

RLFC_TRUNK. Key fields: member, module.

Action:

Determine if the trunk is a valid LN trunk. If the trunk is a valid LN trunk, then the LNACP package is missing. In either case, notify your next level of support.

230. CCLNVRT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During a leased network (LN) common channel signaling (CCS) LN_NOQRY trunk origination, an error in the trunk definition was detected. No calls will be completed on this trunk. The affected call was sent to reorder.

Data Structures:

RLFC_TRUNK. Key fields: port, trunk group number, trunk group member.

Action:

Change LN_VIRT to N via RC/V View 5.1 (TRUNK GROUP).

231. CCLOMEMSM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

There is not enough memory in the optional data region (ODR) for the table that is being grown in. The data that is being dumped is; the ID of the table being grown, the address where the table would end up if it allowed to be grown in and the end address of the ODR buffer. Please contact the first level of field support for further assistance.

232. CCLORSTCLU (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: CLURDB	Audit Mode: elev

Problem:

Linkage error between an owner tuple in RLLORSTMR and a member tuple in RLCLU_RDB.

233. CCLORSTMR (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: LORSTMR	Audit Mode: elev

Problem:

One or more attributes in RLLORSTMR contain invalid values.

234. CCLORSTRDB (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: S7RDB	Audit Mode: elev

Problem:

Linkage error between an owner tuple in RLLORSTMR and a member tuple in RLS7RDB.

235. CCLORSTXLIST (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: XLIST	Audit Mode: elev

Problem:

Linkage error between an owner tuple in RLLORSTMR and a member tuple in RLXLIST.

236. CCLS6LNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Possible population error of office-dependent data relation.

Data Structures:

RLLS6_LNK.

Action:

Verify office-dependent data for RLLS6_LNK.

237. CCLSSMDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LINK	Audit Mode: elev

Problem:

A linkage problem with the RLLS_STAT relation has been detected.

238. CCLS_STAT (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STAT	Audit Mode: elev

Problem:

Failure to read a tuple in RLCLS_STAT.

239. CCLSTAB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: LSTAB	Audit Mode: elev

Problem:

STRM-PHDA interface: Failure to update the CCsmstph_ht[][] array, which is the global SM's copy of one of signaling message handling's outgoing routing tables.

240. CCLVLCG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unexpected value was encountered for the level of congestion.

241. CCMBG2BG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While attempting to send the Business Group parameter in a CCS7 signaling message, an internal terminal restriction value could not be translated to a known CCS7 code point. The code point used has been defaulted to unrestricted.

Probable Cause:

An internal error has caused the restriction value to be out of range.

Action:

Contact the next level of support.

242. CCMBG2TG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CCS7 software could not read rIMBG2TG tuple.

Probable Cause:

The mbgid does not correspond to a tuple in the RLMBG2TG relation.

Action:

Contact the next level of support.

243. CCMCCSTATE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid state has been reached in the CCmccupd() finite state machine. This indicates that a software error has occurred in CCmccupd(). Either the original action passed to CCmccupd() is not a valid action in the uhdr/ccs/CCmccact.G enumeration list, or the CCmccupd() function put itself in an incorrect state. CCmccupd() will automatically quit, aborting any remaining MCC actions that might be required to handle the original input.

244. CCMDBLSS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: S7MDB	Audit Mode: elev

Problem:

A linkage problem has been detected between the owning RLLS_STAT relation and the RLS7MDB member relation.

245. CCMDUNKACT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown action code value was supplied as an argument to the CCmdmccupd() function.

246. CCMG_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected message type was received.

247. CCMGTYPE_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid msgtype was encountered in a common network interface (CNI) header (for example, SPDSPL, SPLKSF,

SPLSET).

248. CCMPCTABL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TABGSM	Audit Mode: elev

Problem:

An internal database error was discovered in table CCgsm_opc during input message validation. An audit has been scheduled to remedy the problem.

249. CC_MSGBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected or invalid operating system for distributed switching (OSDS) message was received. The data dump contains the following:

state - common channel signaling (CCS) state in which the message was received (see hdr/ccs/CCstate.h)

message type - OSDS message received (see hdr/pag/GLmsgids.h)

250. CCMSGNSENT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert indicates that during PHDA processing, a bad return was received from attempting to send a message to either the STRM system process, or to the PH.

251. CCMSGQFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCddupdate() function could not send a message.

252. CCMSGVAL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During input message validation the protocol was not passed to the primitive CCgsmprot(). The primitive may require modification.

253. CCMSUBTYP_BAD (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message has been received that has an unexpected message subtype associated with it.

254. CCMTOCSTAT_BAD (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCS message transport (CMT) path overflow condition status returned from macro PSCMTOCSTAT() is invalid.

Probable Cause:

The possible causes of getting an invalid CMT overflow condition status are either due to a memory corruption or macro PSCMTOCSTAT() gets an invalid non-global switch module (NGSM).

Action:

The CMT throttling function, CCcmt_throttle(), returns a GLFAIL to indicate that the outbound TCAP message shall be discarded due to the unknown CMT path overflow condition status. The assert will help to flag the problem if an invalid NGSM was received by macro PSCMTOCSTAT().

255. CCMTPINITFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to initialize CCS message transport part (MTP) data in the PH an associated STP accounting package during link restoration was not received by the PH.

Probable Cause:

Bad STP accounting packet received.

Action:

Remove and restore the affected linkset member.

256. CCNA7MSGIN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

generated if a message that is currently being processed is not a valid message for NA7 SCCP. Current valid messages are Subsystem Allowed, Subsystem Prohibited, Subsystem Status Test, Subsystem Normal Routing and Subsystem Backup Routing. If this assert occurs, processing of the message is stopped.

257. CCNETGSM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert fires when the CCnetgsm function returns an SM number of 0. This only happens if CCnetgsm is passed a bad network type.

258. CCNETPCI (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: PCIRTE	Audit Mode: elev

Problem:

Linkage error between an owner tuple in RLNET_STAT and a member tuple in RLPCI_RTE.

259. CCNETSCCP (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: SCCPSTAT	Audit Mode: elev

Problem:

Linkage error between an owner tuple in RLNET_STAT and a member tuple in RLSCCPSTAT.

260. CCNET_STAT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: NETSTAT	Audit Mode: elev

Problem:

One or more attributes in a RLNET_STAT tuple contain invalid values.

261. CCNETWORKORDER (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: NETSTAT	Audit Mode: elev

Problem:

The tuples in RLNET_STAT are not in sorted order.

262. CCNETXDPC (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: XDPCSTAT	Audit Mode: elev

Problem:

Linkage error between an owner tuple in RLNET_STAT and a member tuple in RLXDPCSTAT.

263. CCNM_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return code was received from the code control application function.

264. CCNMMBGBK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A MBG call has been originated on the ISUP7 trunk shown. Based on analysis of the called party number, the call should terminate to a terminal that is known by this switch. However, this terminal does not belong to the required terminal group (TGID). The TGID associated with the call is shown. Such calls cannot be terminated. One of the following applies:

The mbgid shown has been associated with the wrong TGID value on RC/V View 4.12.

The called party cannot be intercom dialed from the point where this call originated.

The called party terminal has been placed in the wrong TGID.

The called party terminal has not yet been placed in any TGID.

Data Structures:

TKG MN MBGID TGID CdPN (called number) CPN (calling number).

Action:

Decide which of the above applies and resolve the problem.

265. CCNMSGTTY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Terminal process CTTY was created but did not receive a message. The CCSLK or MD command entered by the

craft was aborted.

Data Structures:
None.

Action:
Reenter command.

266. CCNOBFR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No buffer was available to send a message from the direct link node (DLN) trigger function to the ring monitor kernel process (RINGMON).

267. CCNOBUF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCddupdate() function could not allocate a message buffer.

268. CCNOCCSMMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An operating system for distributed switching (OSDS) message was received that did not contain a common channel signaling (CCS) message.

269. CCNOCHKINTMR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

A timer could not be obtained for the communication module processor (CMP) call processing check-in mechanism.

270. CCNODLNMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No return message was received from the direct link node (DLN).

271. CCNOGSMI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid global switching module index (GSMI) is passed to the message dispenser from the background system process (PSmpup).

Probable Cause:

The GSMI is one of the arguments of CCMrccsdt() passed by PSmpup. The possible causes of getting an invalid GSMI are either due to a memory corruption or PSmpup gets a wrong GSMI.

Action:

The message dispenser returns a GLFAIL to the background system process. The background system process ignores the return value and continues to process the messages from the first in first out (FIFO) queue. The assert will help us to flag the problem if the PSmpup has a wrong GSML.

272. CCNOGSMRQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A message was received in a NGSM requesting the status of an MD path, but the message did not originate in a GSM. That is, the originating SM does not equal one of the following parameters: Glnatl7sm, Glintl7sm, Glccitt6sm, or Glccs7sm. This assert indicates a software bug or and incorrect population of the GSM global parameters.

273. CCNOHSHTIMER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to set the 2:05 am timer for the hashsum checking routine. This timer is used to run the daily hashsum routine between the SMP and the PH's for the incoming routine tables (CCDPC2DPCI, CCICRTG). There was a failure to get a timer.

274. CCNOLCK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

In the SMP the selective peripheral loading feature places each image into an optional data region (ODR). The interface to the ODR includes locking or obtaining ownership of a region in order to perform data manipulation. This assert indicates that the current process was unable to obtain a lock or ownership of the ODR. The lock may have failed due to another process re-arranging the ODR's in memory and not allowing other processes to access a region. Physical memory growth, RC/V activity and Incoming routing table rebuilding will also keep the ownership and hold off other processes. The information in Slolockinfo[SI_ICR_ODR] will be dumped.

275. CCNOLINK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Passed parameters linkset and member cannot be found in RLLS_LNK.

276. CCNOMEM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

There is insufficient memory in the SCCP buffer to allow for a particular entry to be inserted. This problem has been caused by defining more than the maximum translations allowed in rIGTT_MASK. If this assert is seen during a full or SCCP init then SCCP will not build correctly making it virtually useless. If this assert however is caused by an ODBE or RC/V transaction then it just means that there is not enough memory for this new transaction.

Data Structures:

rIGTT_MASK.

Action:

During an ODBE or RC/V transaction then there is no action required since the transaction will fail. During a full or SCCP initialization then refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual to contact support since the problem lies with the ODD.

277. CCNONALNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Link set and member could not be found in RLNALSLNK.

278. CCNONREASON (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Received unknown reason for creation.

279. CCNOPHUPD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A recent change activity which prompted changes in the protocol handler's database could not complete the update to the protocol handler(s). However, the new data is currently in the SM database.

Data Structures:

None.

Action:

Each of the protocol handler's will have to be removed and restored, in order to get a good copy of the ODD contained in the SM.

280. CCNOQUE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A direct link node (DLN) database (DB) trigger function was unable to queue a message to the ring monitor kernel process (RINGMON).

281. CCNORESP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert indicates that PHDA timed out in waiting for a reply from STRM or QPHFR-SMP or from the SCMG system process to initialize dynamic data. The initialization attempt is aborted.

282. CCNORPB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No cyclic timer was available for the request particular band (RPB) update procedure. The RPB update procedure was not running.

Action:

At the master control center (MCC), purge the common channel maintenance administration (CCMA) system process by entering INIT:AM,OKP,SPP for the CCMA system process ID.

283. CCNORTDATA (and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

There is a missing cluster routing data (RC/V View 15.9) and or a missing member routing data (RC/V View 15.18) for the DPC printed in the assert message. The OPC and PCI are printed for sanity check up.

Data Structures:

DPC - Destination Point Code

OPC - Originating Point Code

PCI - Point Code Index

Action:

Please insert the RC/V View 15.9 (CLUSTER ROUTING DATA) and or RC/V View 15.18 MEMBER ROUTING DATA for the listed DPC so the routing data is complete for this point code. Should the OPC be different than the local point code (this office point code) please notify your next higher level support people. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

284. CCNO_SCMG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Attempt to create a signaling connection control part management (SCMG) terminal process via OScreate() has failed.

285. CCNOSCMT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SCCP maintenance terminal process was not created or killed and the GTT audit needs to check the SCCP tables.

286. CCNO_TDTP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Attempt to create a CCITT7 TDTP via OSCREATE() has failed.

287. CCNOTERMPROC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The RTcreatprc() function could not create the common channel signaling (CCS) terminal process.

288. CCNOTMR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unable to allocate an operating system for distributed switching (OSDS) timer.

289. CCNOTQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not allocate a cyclic timer for automatic trunk query. Automatic trunk query was not running.

Action:

Enter ALW:CCSTQ at the master control center (MCC) to correct the problem.

290. CCNRESTTY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unrecognized reason for creation was received by the CTTY terminal process. Used in CCITT and MD craft interface.

291. CCNTFYFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error occurred during RC/V growth or de-growth of a CCS protocol. In particular, the HMmcc *UNIX*[®] process was not able to receive the CCS global parameter updates and/or the MCC screens were not updated properly. To correct this problem, restart DAP (in 5EE3(2) this can be done by going to the 190 MCC page and executing the 805 poke). This will kill all terminal processes and restart them, thereby re-initializing HMmcc so that it will receive the new CCS global parameter values. The specific cause for the error will be documented by an assert which fired previous to this one.

292. CCNTGSMERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was found and corrected in the SCCP network to GSM table (CC7NET_GSM). The error was one of the following:

Entry already existing on insertion

Entry missing when updating or deleting

This particular inconsistency has been corrected, however, it is possible that there are further inconsistencies.

293. CCOC_UNKFAC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The OP:CHANMAP input command has been requested for an unknown facility type. The OP:CHANMAP command can be used on DFACs or DS1SFACs. The input command should only allow DFACs or DS1SFACs to be specified

as input.

Probable Cause:
Internal error.

Action:
Contact next level of support.

294. CCODDBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When initializing the protocol handler(s), a discrepancy was found within the SM ODD between one of the following relations:

- RLLS_SM unpopulated
- RLTN_SSN unpopulated
- RLFUNCTS unpopulated
- RLGTT unpopulated
- RLNSC_DPC unpopulated
- RLLAB6PRT unpopulated

One of previous relations populated incorrectly such that duplicate PHDA table entries would result.

- RLLS6_LNK unpopulated
- RLLS6_LNK with nonunique 'stph' attributes
- RLLSB_LSB unpopulated
- RLLSB_LSB with 'msgtype' attribute = C6LORIG and nonunique 'altlsbX' attributes.
- RLNALKP_LS unpopulated
- RLNALKP_LS and RLDSLEQUIP inconsistent

Data Structures:

Data 1: SM number.

Data 2: The relation identifier.

Action:

If the problem is an ODD inconsistency, then fixes must be made to the relation in question. If the problem is not in the ODD, then there may be an internal software problem within the protocol handler data administrator.

295. CCOFF_PAR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failed attempt has been made by a software process to read the OFF_PAR relation. This is an office-dependent data (ODD) discrepancy since there must always be a tuple with a key of 0 in the relation on a common channel signaling (CCS) global switching module (GSM).

Data Structures:

Data 1: The relation identifier.

Data 2: The global switching module number.

Action:

If the SM number that the assert has occurred on is a CCS GSM for the office, then tuple 0 of the OFF_PAR relation should be inserted. If the assert has occurred on an SM that is not a CCS GSM for the office, the Glnatl7sm, Glintl7sm, or Glglobalsm global parameters could be corrupted on that SM. Otherwise an internal software problem may exist within CCS functionality.

296. CCOGRMEM (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

SM memory for the CCITT7 OGR ODR tables has not been correctly allocated. Either no memory has been allocated or the amount of memory allocated is incorrect.

297. CCOPCGSM2 (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: elev

Problem:

Failure to insert/delete an entry in CCopc2gsm[].

298. CCOS_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to send a message to another process using the OSsendmsg() function failed. The message was lost.

299. CCOSBCSTFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected failure was returned by OSBCAST().

Probable Cause:

An error in the program calling OSBCAST().

Action:

Contact next level of support.

300. CCOS_DEL (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not deliver a message from an interrupt level to the common channel signaling (CCS) transport system process.

301. CCOSPSMON (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A problem was encountered during the setup or operation of the OSPS CCS7 monitor. The message received that caused this assert is dumped along with the related monitor entries. The message is in the first dump and the

monitor entries in the following dumps.

Probable Cause:

If the problem occurs while setting up the monitor the problem is mostly likely a difference in monitor state between the processors. This assert will only occur during monitor operation, if the debug GLOBAL CCospsmon is set.

Action:

If the problem occurs during setup, initialize the monitor and try the setup again. If the problem persists, seek technical assistance. If this assert occurs during monitor operation, then the debug GLOBAL CCospsmon should be set to '0' in the given processor. This GLOBAL should only be used for debugging purposes, otherwise it should be set to '0'.

302. CCOSRETURN (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

When a terminal process attempted to clear the stack and enter a specified entry point [call to the operating system for distributed switching (OSDS), primitives OSRESTART() or OSREPLACE()], control unexpectedly returned. An internal error occurred that caused one of these OSDS primitives to expectedly return. Either the OSDS environment is corrupted or a invalid value of progid was passed to OSRESTART() or OSREPLACE().

303. CCOSWAKE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An interrupt level could not send a signal to the common channel signaling (CCS) transport system process using the OSwakeup() function.

304. CCP6LABERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failed while reading the common channel signaling (CCS) relation RLPRT6LAB.

305. CCP7LABERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A database read failed while reading the common channel signaling (CCS) relation RLPRT7LAB.

306. CCPCINUM (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: PCIRTE	Audit Mode: elev

Problem:

Table CCipcs2pci[] is full. The request to insert a new PCI is rejected.

307. CCPCI_RTE (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: PCIRTE	Audit Mode: elev

Problem:

One or more attributes in an RLPCI_RTE tuple contain invalid values.

308. CCPCLSLNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: LINK	Audit Mode: elev

Problem:

Failure in owner/member linkage structure in RLLS_STAT and RLDPC_STAT.

309. CCPHRDERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unexpected error condition from read of PHDA tables.

310. CCPKTINVAL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The packet/message received for the STP accounting feature in MPUP/RSP SP contained an invalid message subtype.

Probable Cause:

Packet/message subtype may have been incorrectly populated.

Action:

None. The text will drop the packet and continue with the next one in the buffer. The message contents will be sent to the ROP for further debugging.

311. CCPLATINV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

For the originating point code (OPC) provided a valid CCS platform (CNI or PSU) could not be determined.

Probable Cause:

ODD is incorrect.

Action:

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual for assistance.

312. CCPORTBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The data describing this port was invalid. The port linkage area (PORTLA) may be inconsistent.

313. CCPORTCOND (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

TMrdptcond() failed to read the appropriate data from the TMportcond[] table. Problem may have been caused by passing TMrdptcond() an improper port status list.

314. CCPORTLA (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

Unable to read the dynamic RLPORTLA relation. The PORTLA audit will be scheduled.

315. CCPORTLA_DATA (5E13 and later)

Recovery Action: rpi	SPP: n	Audit: PORTLA	Audit Mode: elev

Problem:

Inconsistent data was found associated with a PORTLA tuple.

Probable Cause:

The data was initialized incorrectly by the application or was corrupted.

Action:

Look at the data dumped by the assert and the audit in the receive only printer (ROP) output to determine the cause of this error.

316. CCPP_CF (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCS trunk has the precedence and preemption (PP) feature assigned in the RLDN_FEATS relation and the data for the port is in the RLPP_TRUNK relation, but there is no corresponding data in the RLPP_CF relation.

When attempting to read the RLPP_CF relation, a failure code of DBNO_MATCH was returned. An rIPP_CF tuple is missing or the keys used to read the relation were not set properly.

Data Structures:

RLPP_CF. Key fields: port, feature ID.

Action:

This is a database inconsistency that can only be corrected by manual action. Use RC/V (or ODBE, if necessary) to examine the precedence and preemption feature assignment data on the indicated trunk. See RC/V View 5.11 (BRCS FEATURE ASSIGNMENT TRUNK MEMBER) or the RLDN_FEATS relation.

Obtain the keys to the RLDN_FEATS relation from the RLPORT_GROUP relation. The output data shows the port by module and member as well as the feat_id that is associated with the port in the RLPP_TRUNK relation. See RC/V View 5.31 (PRECEDENCE AND PREEMPTION TRUNK PARAMETERS) or the RLPP_TRUNK relation.

Corresponding feature description data should exist in the RLPP_CF relation for the feature that the assert indicates does not exist. See RC/V View 12.31 (PRECEDENCE AND PREEMPTION FEATURE DEFINITION) or the RLPP_CF relation.

317. CCPP_TRUNK (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The trunk has the precedence and preemption feature assigned in the RLDN_FEATS relation, but there is no corresponding data in the RLPP_TRUNK relation.

When attempting to read the RLPP_TRUNK relation, a failure code of DBNO_MATCH was returned. An rIPP_TRUNK tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLPP_TRUNK. Key fields: port, feature ID.

Action:

This is a database inconsistency that can only be corrected by manual action. Use RC/V (or ODBE, if necessary) to examine the precedence and preemption feature assignment data on the indicated trunk. See RC/V View 5.11 (BRCS FEATURE ASSIGNMENT TRUNK MEMBER) or the RLDN_FEATS relation.

The output data shows the port by module, member, and feat_id. Corresponding trunk parameter data should exist for that port. See RC/V View 5.31 (PRECEDENCE AND PREEMPTION TRUNK PARAMETERS) or the RLPP_TRUNK relation.

318. CCROTERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid CCS protocol type has been found when it should exist.

319. CCPRSQERR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was found and corrected in the SCCP primary and secondary digit table (CCGTT_TRAN). The error was one of the following:

Entry already existing on insertion.

Entry missing when updating or deleting.

This particular inconsistency has been corrected, however, it is possible that there are further inconsistencies in the table.

320. CCPRST_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

BAD switch on the process state of the TDFDB in the PCBLA for CCtf_all().

321. CCPS_CHNG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to change the sum of the primary + secondary digit string mask for relation RLGT_MASK. This action is not supported by RC/V and therefore has most likely been caused using odbe. This transaction has been failed with reason of CCRULE_FAIL.

Data Structures:

RLGT_MASK.

Action:

Use RC/V to make ODD changes since it will flag all invalid actions.

322. CCPSIU_FAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PSIU transport has failed to deliver a message to the MTP. Either the message to be sent had an illegal size or there was an unexpected fail return from the function PSn_msgdel.

323. CCPTDP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

Purge insane or unreachable SS7 traffic diversion terminal process.

324. CCQIWKEY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The common channel signaling (CCS) originating terminal process (OTP) or terminating terminal process (TTP) received unexpected message data that requires Q.931/integrated digital services network (ISDN) user part (ISUP) interworking. Based on the mapping keys, the outgoing message may be incorrect. The following data is dumped: the CCS feature data block in the process control block data link area (PCBLA), and the incoming message data.

325. CCQPHODDBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When initializing data associated with a message delivery QPH(s), a discrepancy was found within the SM ODD between one of the following relations:

A QPH defined in RLQPH is missing a corresponding pipe tuple(s) in RLQPHPIPE for one or both networks.

Action:

Actions must be taken to correct the relation in question.

326. CCQPHUNINIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CCmastcpinit() or CCsndtable() was called by CCqslsddupd() to access the CCSQPHSLS table which has not been successfully initialized yet.

Probable Cause:

None.

Action:

None.

327. CCQPHWQERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to save a message into the QPHFR-SMP work queue or to retrieve a message from the work queue, but found that the number of QLL events in the message is 0. This is a defensive check and also for debugging.

Probable Cause:

Either there is a corruption in the work queue or in the message.

Action:

Check the information dumped and take appropriate action.

328. CCQSLSNOMATCH (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: QENDPT	Audit Mode: elev

Problem:

The tuple reading function CCrdtup returned CCNO_MATCH when trying to read a tuple in the CCqsls_qph[] table.

Probable Cause:

A corruption in the CCqsls_qph[] table.

Action:

Escalate to an audit on the CCqsls_qph[] table.

329. CCQUEUEMNERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Cannot send DMERT message to destination *UNIX*[®] process because of a queue manager error; function queuemn() returned a failure code.

330. CCRCGTMR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failure to insert or update the dynamic tuple RLRCGTMR.

331. CCRCGXDPC (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: XDPCSTAT	Audit Mode: elev

Problem:

Linkage error between an owner tuple in RLRCGTMR and a member tuple in RLXDPCSTAT.

332. CCRDBMDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: S7RDB	Audit Mode: elev

Problem:

A linkage problem has been detected between the owning RLS7RDB relation and the RLS7MDB member relation.

333. CCRDBRST (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: S7RDB	Audit Mode: elev

Problem:

A linkage problem has been detected between the owning RLRSTMR relation and the RLS7RDB member relation.

334. CCRDBXPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: S7RDB	Audit Mode: elev

Problem:

A linkage problem has been detected between the owning RLXPTMR relation and the RLS7RDB member relation.

335. CCRDICCST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return code was received from DBxrdgparm() when attempting to read the value of Gliccsstpdb as a part of a recent change transaction. The recent change operation was aborted.

336. CCRDTUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCrdtup() function did not return success.

337. CCREASNBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

For the 5EE4(3) generic, SCCP signaling system, SCCPBUF area of memory, in the SMP, PHDA system process when trying to modify tuple data in one of the conversion tables the 'REASON' for the update did not fit into one of the available possibilities. This should not happen ... indicates major switch problems involving RC/V and/or DBM and/or PHDA.

338. CCRETCODE_BAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid return code was received from the cHsxhdr() function. The message was dropped.

339. CCRETRN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

General returning assert.

Data Structures:

None

Action:

It is just information; therefore, no action is required by the craft.

340. CCRLMDPATH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The step first, step next traversal of the MDPATH relation failed. Did not reach end of relation.

341. CCRNBFOV (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not allocate a buffer for writing a message to the ring.

342. CCRSTCLU (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: CLURDB	Audit Mode: elev

Problem:

Linkage error between an owner tuple in RLRSTMR and a member tuple in RLCLU_RDB.

343. CCRSTXLIST (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: XLIST	Audit Mode: elev

Problem:

Linkage error between an owner tuple in RLRSTMR and a member tuple in RLXLIST.

344. CCRT_TG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CCS7 software could not translate an rIRT_TG tuple.

Probable Cause:

An internal error has occurred. The tgid value used does not have a tuple in the RLRT_TG relation.

Action:

Contact the next level of support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

345. CCS7MDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: S7MDB	Audit Mode: elev

Problem:

Linkage error on RLS7MDB is suspected. Audit scheduled. This is the private buffer of the CCITT7 STRM System Process.

346. CCS7PSA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

TMccs7psa() has been broken because the OOS MTCE CCSINIT or OOS BLKD port statuses were changed to be AML affecting statuses.

Probable Cause:

The TMPSAML macro was changed.

Action:

Determine why these port statuses were changed to be AML affecting and assess the impacts on TMccs7psa().

347. CCS7RDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: S7RDB	Audit Mode: elev

Problem:

The data found in the RLS7RDB tuples for a destination point code (DPC) is not consistent with static data for the DPC. For example, the RLLS_DPC relation indicates that LS (link set) <l> serves DPC <d>, but none of the RLS7RDB tuples for DPC <d> contains an 'ls' value of <l>. The traffic diversion terminal process (TDTP) feature data block is dumped to get some information about the current diversion activity, including the identity of the link set concerned.

Action:

This assert schedules an audit to check and correct the data in the dynamic RLS7RDB relation. If that audit finds no errors, use 'odbe' to verify that the data in RLLS_DPC is consistent with RLDPC_DPCI and RLDPC_INFO for the DPC concerned. If the data is not consistent, then it may be corrected using 'odbe', or by using recent change to delete and then reinsert the DPC using RC/V View 16.10 (SIGNALING POINT CODE).

348. CCSAEASCCP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The SCCP buffer is not the required 2 megabytes in length after an ODD growth. A problem exists with the SM's critical information files. Any SCCP data in the SM may be invalid. A full SM initialization should be performed to update critical information files and rebuild all the SCCP tables. The values dumped are the current values of the SCCP buffer's start address and end address.

349. CCSBKINV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During a read of RLIND_DPC, the backup index field was found to be out of range.

Data Structures:

Relation RLIND_DPC. Key field: psn_index.

Action:

Via RC/V view CCPBC, remove the backup translation for the entry given by the tuple with the psn_index in the craft assert. After deleting the backup translation, insert the backup translation again. If this error continues to occur after the above actions, the office ODD has been corrupted.

350. CCSCBADADDR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Bad processor address when sending a SCCP build request message.

351. CCSCBADLGTH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Bad message length for MGSCBLDREQ when sending the message to the SCMT terminal process.

352. CCSCBADMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Bad message for MGSCBLDREQ when sending the message to the SCMT terminal process.

353. CCSCCP_STAT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: SCCPSTAT	Audit Mode: elev

Problem:

One or more attributes in an RLSCCPSTAT tuple contain invalid values.

354. CCSCMPREL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During a subsequent read of an SCCP network management relation, a return value of empty relation was received. If this occurs during initialization, the SCCP network management data may not be built.

355. CCSCNMINFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During initialization of the SCMG system process, it was found that the SCMG model code could not be executed. It is possible that the package is not loaded. If this is the case, this should not be a problem. If the package is loaded, try manually executing a single process purge of the process in order to get the code running. To purge the process, type the following MML command:

```
init-smssp:<SM #>,<Process #>;
```

If this should fail, it is likely that the SM package array is corrupted. First level field support should be contacted to write an IMR.

356. CCSCVERE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Out of range SCCP memory layout has been detected. This error has prohibited the allocation of pointers to the data tables that reside in the SCCP memory region in the PH.

Probable Cause:

This error can only occur as a result of a wild write or a coding error.

Action:

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual for information on contacting field support personnel.

357. CCSDAU_SPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

The signaling status data audit (SDAU) terminal process was running longer than expected, or the communication module processor (CMP) signaling status data (SSDC) system process took a single process purge. The SDAU terminal process will be purged, the signaling status data will be initialized by the SSDC system process, and all of the blocked or congested signaling points will be requested from the AM.

358. CCSDNBRET (5E11 and later)

Recovery Action: spp	SPP: n	Audit: PCBLA	Audit Mode: elev

Problem:

An unexpected return code was received from the FCtrhdlr() function that was communicating with an external network control point (NCP) database. The call cannot continue. The transaction data block will be dumped.

359. CCSDNPKG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A software defined network (SDN) call was attempted, but the ACPSDN software package was not loaded. The sdnded field of the RLFC_TRUNK relation was set to DBYES indicating an SDN-dedicated trunk.

Data Structures:

RLFC_TRUNK. Key fields: member, module.

Action:

Determine if the trunk is a valid SDN trunk. If it is a valid SDN trunk, the ACPSDN package is missing and you should call your next level of support. If the trunk is not a valid SDN trunk, change the sdnded field in the RLFC_TRUNK relation to DBNO using RC/V View 5.1 (TRUNK GROUP).

360. CCSDPCSSN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Error reading RLDPC_SSN relation while processing opst-scmg command. The corresponding RC/V view is CCPBD.

Data Structures:

None.

Action:

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual for information on contacting field support personnel.

361. CCSDRQ_SPP (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

A request for all of the signaling status data that was blocked or congested was received from the communication module processor (CMP). The signaling status data request (SDRQ) terminal process is still running and is no longer needed. The SDRQ terminal process will be purged, then restarted to process this request.

362. CCSFTPSCMG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Ten attempts have been made at creating one of the SCCP Network Management terminal processes. All the attempts have failed. No further attempts will be made.

363. CCSGSMNET (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

It was discovered that SCCP is running on this GSM and no entry was found in the relation RL GSM_NET.

Data Structures:

RL GSM_NET: Key fields: GSM.

Action:

Contact field support personnel immediately for further instructions.

364. CCSIG_CICALL (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The signaling protocol does not match the type_ci_call.

Action:

Change RC/V View 10.2 (ROUTE INDEX (ROUTING)) for the signaling protocol and/or RC/V View 9.3 (LOCAL DIGIT (OFFICE DIALING)) for the type_ci_call for one of the following error conditions. The calling number, if available, and the digits to be sent are included to help identify the call.

Error Type 1:	If the signaling protocol is equal access (EA) or international (INC), the type_ci_call must contain carrier information (cannot be NONCI or CI_NULL).
Error Type 2:	If the signaling protocol is international (INC), the type_ci_call cannot be feature group B (TRANSITION, INTERIM) or a type describing a call not crossing a network boundary (INTRALATA).
Error Type 3:	The type_ci_call cannot be IDDD unless the signaling protocol is international (INC).
Error Type 4:	An invalid type_ci_call exists at an access tandem (AT). The error indicates that the call entered the switch on a trunk. The valid values for common channel signaling (CCS) trunks are: • AVT (access via tandem/domestic) • INC (international) • TRANSITION (feature group B) Type_ci_call of INTER and signaling protocol of EA is only valid for a toll/tandem switch if the long distance platform is active.
Error Type 5:	The signaling protocol must be equal access (EA) and the outgoing trunk class must be IC for an LDP tandem cutthru call.

365. CCSIG_CICALL (5E13 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The signaling protocol does not match the type_ci_call.

Action:

Change RC/V View 10.2 (ROUTE INDEX (ROUTING)) for the signaling protocol and/or RC/V View 9.3 (LOCAL DIGIT (OFFICE DIALING)) for the type_ci_call for one of the following error conditions. The calling number, if available, and the digits to be sent are included to help identify the call.

- Error Type 1: If the signaling protocol is equal access (EA) or international (INC), the type_ci_call must contain carrier information (cannot be NONCI or CI_NULL).
- Error Type 2: If the signaling protocol is international (INC), the type_ci_call cannot be feature group B (TRANSITION, INTERIM) or a type describing a call not crossing a network boundary (INTRALATA).
- Error Type 3: The type_ci_call cannot be IDDD unless the signaling protocol is international (INC).
- Error Type 4: An invalid type_ci_call exists at an access tandem (AT). The error indicates that the call entered the switch on a trunk. The valid values for common channel signaling (CCS) trunks are:
- AVT (access via tandem/domestic)
 - INC (international)
 - TRANSITION (feature group B)

Type_ci_call of INTER and signaling protocol of EA is only valid for a toll/tandem switch if the long distance platform is active.

366. CCSIG_CICALL (5E12 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The signaling protocol does not match the type_ci_call.

Action:

Change RC/V View 10.2 (ROUTE INDEX (ROUTING)) for the signaling protocol and RC/V View 9.3 (LOCAL DIGIT (OFFICE DIALING)) for the type_ci_call for one of the following error conditions:

- If the signaling protocol is equal access (EA) or international (INC), the type_ci_call must contain carrier information (cannot be NONCI or CI_NULL).
- If the signaling protocol is international (INC), the type_ci_call cannot be feature group B (TRANSITION) or a type describing a call not crossing a network boundary (INTRALATA).
- The type_ci_call cannot be IDDD unless the signaling protocol is international (INC).
- An invalid type_ci_call exists at an access tandem (AT). The valid values for common channel signaling (CCS) trunks are:

AVT (access using tandem/domestic)

INC (international)

TRANSITION (feature group B)

367. CCSIG_CICALL (5E11 only)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The signaling protocol does not match the type_ci_call.

Action:

Change RC/V View 10.2 (ROUTE INDEX [ROUTING]) for the signaling protocol and RC/V View 9.3 (LOCAL DIGIT [OFFICE DIALING]) for the type_ci_call for one of the following error conditions:

- If the signaling protocol is equal access (EA) or international (INC), the type_ci_call must contain carrier information (cannot be NONCI or CI_NULL).
- If the signaling protocol is international (INC), the type_ci_call cannot be feature group B (TRANSITION) or a type describing a call not crossing a network boundary (INTRALATA).
- The type_ci_call cannot be IDDD unless the signaling protocol is international (INC).
- An invalid type_ci_call exists at an access tandem (AT). The valid values for common channel signaling (CCS) trunks are AVT (access via tandem/domestic), INC (international), and TRANSITION (feature group B).

368. CCSIGTYPE_RT_TRKG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The incoming signaling type or the outgoing signaling type in an rIRT_TRKG tuple was not CCIS6 or ISUP7, but the group's rIRCTGRPRK tuple has trunk query allowed indicating that the group is a common channel signaling (CCS) trunk group.

Data Structures:

RLRT_TRKG. Key field: grpnum.

RLRCTGRPRK. Key field: portgrp.grpnum.

Action:

Use RC/V to correct the problem.

369. CCSINDXI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Index retrieved from relation RLDPCIND is out of the range 1 through 4095.

Data Structures:

RLDPCIND. Key fields: Destination point code, subsystem number, network number.

Action:

- (1) Attempt to delete the entry using RC/V View 16.22 (SCCP PRIMARY/BACKUP DESTINATION).
- (2) If the deletion is not allowed contact field support personnel.
- (3) If the deletion is allowed re-insert the entry using the same RC/V View. This reassigns the index to a valid value.

370. CCSLMTST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unrecognized return was received from the TMInk_tst function.

371. CCSLTEST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A CCITT signaling system 7 link test process was still active when a new one was created

Data Structures:

Relation RLSS7TMRS, attribute SLMT2.

Action:

Use RC/V View "CCS7 Parameters" on page 2 to increase the "LINK TEST DELAY" parameter. This will give more time to the link test process to complete its work before its next invocation. If the parameter is at its maximum value and the assert persists, then a software error is likely. Proceed in accordance with local practices.

372. CCSMDLSTAR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid message was received by SCCP network management. The message will be ignored.

373. CCSMEMQC (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

CCSMEMQC stands for "CCS/SCCP state machine external message queue corrupted". This assert is generated if CCsmemque, CCsmemdque, or CCsmemqhd functions in the SCCP state machine's driver finds the nextamsg index set to an invalid value (that is, greater than the number of slots in the queue). It can also be generated if the CCsmcchk function detects inconsistencies with the message queue when a process is awakened. In either event, this assert indicates that corruption of the queue has occurred.

374. CCSMEMQE (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

CCSMEMQE stands for "CCS/SCCP state machine external message queue empty". This assert is generated if CCsmemdque is called to remove a message from the external message queue and the queue is empty. This would indicate a program fault or corruption of the queue has occurred.

375. CCSMEMQF (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

full". This assert is generated if CCsmemque is called by the SCCP state machine's driver to place a message into the queue when the queue is full. The queue full condition should always be checked using the CCEMQFULL macro before calling CCsmemque. Therefore, this assert indicates that either program fault or queue corruption.

376. CCSMEMQP (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

CCSMEMQP stands for "CCS/SCCP state machine external message queue pointer". This assert is generated if CCsmcchk determines that the pointer to this structure in CCsmstate does not correspond to the queue that should be associated with the process. Since this would indicate data corruption, the process is purged.

377. CCSMIMBF (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

CCSMIMBF stands for "CCS/SCCP state machine internal message buffer full". This assert is generated if the SCCP state machine code calls CCsmimsend to place a message into the internal message buffer when that buffer already contains a message. Since the SCCP machine should never require more than 1 internal message at a time, occurrence of this assert indicates that either data corruption or a program fault has occurred.

378. CCSMMDLI (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert is generated if CCsmsched() finds a message with an invalid source or destination model identifier. This assert can also occur if CCsmcreate is called to create an instance of a non-existent model (i.e., the model ID passed to it is bad). A program fault or memory corruption is indicated.

379. CCSMMIBF (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

CCSMMIBF stands for "CCS/SCCP state machine model information blocks full". Essentially, the SCCP network management state machine attempted to create more instances of its models than it had model information blocks. This is either caused by a fault in the design or corruption of the memory used to hold the model information blocks.

380. CCSMMIBM (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

CCSMMIBM stands for "CCS/SCCP state machine model information block missing". This assert is generated if CCsmsched() cannot find a model information block for the destination of a message. Thus, the current message cannot be processed. This indicates that either a program fault or memory corruption of the message and/or model information blocks has occurred.

381. CCSMMRDF (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert is generated if the CCsmmsgr() is entered from OSDS because a message has been received but the OSWGETMSG macro enough to hold all the messages it expects (and any others up to 252 bytes in length). Consequently, this error should not occur unless an unexpected message bigger than the buffer is sent to the machine or some other OSDS system fault occurs. In any case, if the message cannot be retrieved, the state machine cannot continue to operate.

382. CCSMMSGI (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert is generated if CCsmmdldr() finds a message in the SCCP state machine's internal buffer with an invalid message identifier. Memory corruption is indicated.

383. CCSMMSTI (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert is generated if CCsmmdldr() finds a SCCP model's state set to an invalid value (> the number of states in the model). Memory corruption is indicated.

384. CCSMPARG (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert is generated if CCsmcchk finds that the value passed to CCsmmsgr in the 'arg' parameter is >= CCSMPCNT (the number of processes for which we have CCsmstate and CCemqueue resources) or that it has the wrong value (e.g., CCSMSYSP when OSpdb->procnum is NOT equal to GLPNACPS, the process number of the system process).

385. CCSMRSTR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert is generated if the OSRESTART macro invoked by CCsmmsgr() returns. This macro will also be generated if the OSREPLACE macro invoked by one of the initialization functions (e.g., CCsmmainit, CCsmmbinit, CCsmmininit or CCsmmsinit) returns.

386. CCSMSFRC (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

CCSMSFRC stands for "CCS/SCCP state machine state function return code error". This assert is generated if one of the SCCP models returns an unexpected value to the SCCP state machine's driver functions. A program text fault is indicated.

387. CCSMSJNS (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

CCSMSJNS stands for "CCS/SCCP state machine sequential joystate limit exceeded". This assert is generated if CCsmmdlr finds that a model tries to execute more sequential JOINSTATES than the value contained in CCsmsjns.

388. CCSMTMRL (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert is generated if CCsmtmrset is called to set a timer longer than 1000L milliseconds.

389. CCSMTMRR (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert is generated if CCsmmsgsr determines that the CCsmtmrr CCsmitmc values have become corrupted or the MGTIMER message was somehow lost in the SCCP machine's external message queue.

390. CCSMUNXM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unexpected message type received by CCS/SCCP state machine. message is discarded and the state machine waits for another message to arrive.

391. CCSND1TTY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not send TTY message from ATA system process to PSA system process in the SM. Used in the CCITT craft interface.

392. CCSND2TTY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Could not send an OSDS message from the PSA system process in one SM to the PSA system process in the other SM. Used in the CCITT craft interface feature.

393. CCSND3TTY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

System process PSA (in SM) could not send an OSDS message to the CTTY terminal process. Possible failure of the CCSLK or MD input command just entered.

Data Structures:

None.

Action:

Verify the results of the CCSLK or MD command that was entered.

394. CCSNDBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Attempt to send message to another process using OSSENDMSG has failed.

395. CC_SNDISSETUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A request to send the MGissetup message was received at an incoming integrated services digital network user part (signaling system 7) trunk. No data was found to be used to populate the MGissetup message. A null message is sent. Either an internal error occurred to request data that does not exist or an internal error caused data to be lost that would normally be used to populate the MGissetup message. The data dump contains the following: 1) far process ID and 2) OTP port name.

396. CCSND_KILL (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

An attempt to send the incoming call origination message to the process that will handle the call failed. The call origination message may have been an initial address message (IAM) or a circuit reservation message (CRM). The software primitive that was used to send the call origination message (IAM or CRM) returned a non-resource related failure reason.

Action:

Contact the next level of support.

397. CCSND_NOKILL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A primitive used to send a message returned a non-resource related failure. The message was not sent successfully. The impact of the lost message depends on which message was lost.

Action:

Contact the next level of support.

398. CCSNETGSM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read RLNET_GSM. Either an invalid key was used to read the relation or a tuple is missing from the relation. Verify that the ODD is correct.

399. CCSNOTUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

No tuples found in the RLDPC_SSN relation while processing opst-scmg command.

Data Structures:

None.

Action:

Insert the data in the RLDPC_SSN relation via RC/V view CCPBD. Verify via RC/V if the data is in there. Repeat the opst-scmg command you were trying again.

400. CCSP_ENTRY (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid entry reason was sent to the direct signaling system process.

401. CCSRETURN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A general returning assert.

402. CCSSBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A GPHDA function has been passed an invalid signaling system parameter.

403. CCSSD_FULL (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

The signaling status data point code hash table in the communication module processor (CMP) was full. This has two possible meanings.

1. There are more tuples in the RLLAB7_PCI relation than the maximum allowed. The table can hold 256 point codes.

2. The CCpcfreelist pointer was corrupted.

In either case the point code hash table will be rebuilt.

404. CCSSD_OSWBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return code was received from the OSwgetmsg() function while waiting for an operating system for distributed switching (OSDS) message.

405. CCSSDSP_ENTRY (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid reason for entry was found in the signaling status data system process.

406. CCSSD_TAGBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected timer tag was received.

407. CCSSNIS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to put the signaling connection control part (SCCP) subsystem number in service.

408. CCSSNOOS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to take the signaling connection control part (SCCP) subsystem number out of service.

409. CCSSSNINV (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid subsystem found after successfully reading RLDPC_SSN relation.

Data Structures:

RLDPC_SSN.

Key field : Destination point code.

Network indicator.

Action:

Remove the tuple from relation via RC/V.

410. CCSTATE_INVL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid state.

411. CCSTFPUPC (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Clusters with non-zero members should not have ROUTING FLAG set to UPOPCLU in RC/V View 15.9 (CLUSTER ROUTING DATA). This situation can cause the entire cluster to become isolated if one member belonging to this cluster is blocked (TFP'ed). This assert is fired when trunks are found going to a DPC which is a member of this cluster.

Action:

The routing flag in RC/V View 15.9, for network and cluster of this DPC, should be changed from the current UPOPCLU value. The correct value will depend on your network configuration.

412. CCT7NOTLOADED (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A call to a function in the CT7MPSIU loadable package cannot be executed because the CT7MPSIU package has not been loaded into SM memory. Either the package is missing when it should be present or an erroneous function call has been made.

413. CCTAB_ID_BAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When trying to modify data in the 5EE4(3) generic, SCCP signaling system, SCCPBUF area of memory, in the SMP, an error occurred which then tried to run an audit on that particular table in which the bad tuple was found. An audit for that table ID was not found. This is either a code problem or a major switch problem.

414. CCTABSIZE (5E11 and later)

Recovery Action: -rpi SPP: n Audit:	SPP: n	Audit: null	Audit Mode: null
null Audit Mode: null			

Problem:

A read of the ODD has indicated that the actual number of tuples in this table has exceeded the threshold for this HASH table. This will result in a slowdown of access to this particular table. If message processing slows down this is a possible reason.

Data Structures:

The three conversion tables are: CCCLDPTY, CCCNGPTY, and CCADMGRP in global headers: CCcldpty.h, CCcngpty.h and CCadmgrp.h. The table dictionary definition array information is defined in: ccs/CCphdprim/CCphdadict.c. The RC/V screens for these tables are respectively: CCCDP, CCCGP and CCADG.

Action:

Temporarily some tuple information may be removed to increase speed of accessing data but true corrective action will require that the affected table be reengineered for optimum access of data for the anticipated size of the data requirements. One can use RC/V screens for the ODD relations: rICV_CDPY or rICV_CGPY or rICV_ADMGP, to delete tuples from the affected relation which will then update the affected table in both the SM and PH.

415. CCTATYPE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The keys used to read the RLTATYPE relation were not set properly, or the tuple was missing from this relation.

Data Structures:

RLTATYPE. Key field: tatype.

Action:

Use RC/V View 10.1 (FIXED ROUTE) (or ODBE, if necessary) to cross-check the data for the keys in the RLTATYPE relation with the actual keys used. If the tuple is missing, add it. If the keys used to access the relation were set incorrectly, notify your next level of support.

416. CCTBLDFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to insert an SCCP tuple during a full init. The possible tables that could have failed are: CCgtidx_gt[], CCgtpcidx_opc[], and CCssnidx_ssn[].

Probable Cause:

Data inconsistency.

Action:

Verify that the data being inserted is defined correctly.

417. CCTBL_ERAUD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CCGTBL	Audit Mode: elev

Problem:

An error was found and corrected in the SCCP GTT translation group table (CC7GTT_TBL). The error was one of the following:

Entry already existing on insertion.

Entry missing when updating or deleting.

An audit has been scheduled for this specific table.

418. CCTBLFUL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to insert a tuple into a PHDA table that is full. The table must be re-engineered.

419. CCTCBLEN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The outgoing transaction capabilities application part (TCAP) message had an unexpected length.

420. CCTCCOMP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to format a component in a transaction capabilities application part (TCAP) message.

421. CCTCINVAPP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to find a match on the direct signaling application type when trying to access application specific functions for processing transaction capabilities application part (TCAP) messages.

422. CCTCSCCP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to format the signaling connection control part (SCCP) portion of a direct signaling message (DSM).

423. CCTCTRANS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to format the transaction portion of a transaction capabilities application part (TCAP) message.

424. CCTFPR_DPC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: TFPRDPC	Audit Mode: elev

Problem:

Failure in reading/writing RLtfpr_dpc.G.

425. CCTMHTBLERR (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During insert of CCtmhngsmacc[] tuple, an error was encountered.

Probable Cause:

GPHDA insert error.

Action:

This table can only be accessed internally in the code so let the code go through the flow to correct the problem.

426. CCTMMC7SNDRET (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred while trying to send an integrated services digital network user part (ISUP) blocking message. When the failure occurred, a data dump was sent to the read-only printer (ROP).

Action:

Contact next level of support.

427. CCTMMC7SNDRET (5E11 to 5E12)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure occurred while trying to send an integrated services digital network user part (ISUP) blocking message. When the failure occurred, a data dump was sent to the read-only printer (ROP).

Action:

Contact next level of support.

428. CCTPTBDP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The purge (or purges) of a process considered a runaway has occurred. A table containing the process IDs (PIDs) will be dumped to correlate the pids.

Action:

This assert provides additional data from a purge of a TP controlled by the CCmaint system process. If this occurs frequently contact the product engineering control center (PECC).

429. CCTRANBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A function was entered that required a Transaction ID, however no Transaction ID was provided.

Action:

Contact the product engineering control center (PECC) for support.

430. CCTRANSER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CCITT7 MSU received for a DPC which has another owning network but whose translated value is not found in office data.

Data Structures:

RLDPC_INFO.

Action:

Use recent change to assign an "Other Network Point Code" to the unreachable DPC. Proceed as follows:

- (1) Read DPC and OPC from ROP printout.
- (2) Use RC/V View 16.10 (SIGNALING POINT CODE) with point code equal to the DPC found in step (1) to display the "Owning Network" for the DPC.
- (3) Communicate with personnel of the owning network to determine their value for the point code of the office OPC.
- (4) Use RC/V View 16.10 with point code equal to the OPC and fill in the "Other Network PC" fields (network and PC) with the values determined in steps (2) and (3), respectively.
- (5) If the assert persists, a software error is likely. Proceed in accordance with local practices.

431. CCTRIG_BREL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid relation ID was passed to the direct link node (DLN) database (DB) trigger function.

432. CCTRIG_ROP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A direct link node (DLN) database (DB) trigger function could not send a craft error message to the receive only printer (ROP).

433. CCTRMFEAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A tuple was missing in the RLTRMFEATS relation. The receive only printer (ROP) output provides the SM number (MOD), the source file and line number, and the keys used to read this relation.

Data Structures:

RLFC_TRUNK. Key fields:

RLTRMFEATS. Key fields: lport, lpt_type, range.

Action:

An attempt to read the RLTRMFEATS relation using the original, non-BRCS feature group (BFG) keys was made because a BRCS feature was thought to be assigned directly to the trunk. The keys are as follows:

```
RLtrmfeats.lport = RLfc_trunk.lport
RLtrmfeats.lpt_type = LPT_OTHER
RLtrmfeats.range = 0 through 6 (defaults to 0).
```

Use RC/V (or ODBE, if necessary) to cross-check the data in the indicated SM.

- If the brc_trm value from RLFC_TRUNK is DBNO, the switch software may be in error for attempting to read RLTRMFEATS using the original (non-BFG) keys. Contact the next level of support.
- If the brc_trm value from RLFC_TRUNK is DBYES, the lport from RLFC_TRUNK should equal the lport in the ROP output and the lpt_type must be LPT_OTHER. If the values do not match, further office-dependent data (ODD) inconsistencies may exist or the switch software may be in error. Contact the next level of support.
- If brc_trm is DBYES and the lport and lpt_type values match, an rLTRMFEATS tuple should exist for the original (non-BFG) keys:

```
RLtrmfeats.lport = RLfc_trunk.lport
RLtrmfeats.lpt_type = RLfc_trunk.lpt_type
RLtrmfeats.range = 0
```

Contact the next level of support to insert the appropriate rLTRMFEATS tuple.

434. CCTRSPENT (5E11 and later)

Recovery Action: spp	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid entry reason was sent to the common channel signaling (CCS) transport system process.

435. CCTXNDATA (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt to access TCAP transaction management data with bad data provided by the user. The most probable cause is during an update scenario where the user is trying to update a transaction management entry.

436. CCTXNINFO (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: TXNINFO	Audit Mode: elev

Problem:

A failure to access a tuple of the relation RLTXN_INFO was detected.

Action:

The call attempting the tuple access will be returned a failure and an elevated audit will be run to correct the problem.

437. CCTYP_CI_CALL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While routing a call from a 5ESS® switch digital cellular switch (DCS) to the public switched telephone network (PSTN) via an integrated services digital network (ISDN) user part (ISUP) trunk, an unexpected value was detected in the field that describes what type of carrier interconnect features a call possesses.

Action:

Contact next level of support.

438. CCTYP_ERAUD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CCGTT	Audit Mode: elev

Problem:

An error was found and corrected in the SCCP GTT translation type table (CCTTRAN_TYP). The error was one of the following:

Entry already existing on insertion.

Entry missing when updating or deleting.

An audit has been scheduled for this specific table.

439. CCUIDMBGBK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A MBG call has been originated on the ISUP7 trunk shown. Based on analysis of the CdPN, the call should terminate in this switch. However, the mbgid, provided in the incoming IAM message could not be translated into a tgid value that is associated with terminals on this switch. This switch is deficient in the mbgid to tgid translation data that should have been entered on RC/V View 4.12.

Data Structures:

TKG MN MBGID CdPN (called number) CPN (calling number)

Action:

Insert translations for the mbgid shown using RC/V View 4.12

440. CCUNEXP_STATE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The common channel signaling (CCS) originating terminal process (OTP) received an unexpected state from an ASP function. The call will be torn down. Data dumped is the new state value and the CCS feature data block in the process control block link area (PCBLA).

441. CCUNINIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CCrdtup() or CCgdynupd() was called to access a GPHDA table which has not been successfully initialized yet.

442. CCUNKINIT (5E13 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unknown initialization reason for a system process.

443. CCUNKTDTP (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Message received by CCITT7 STRM system process from an unknown TDTP

444. CCUPDSTPDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was encountered while trying to store the number of common channel signaling setup data blocks needed into a global parameter.

Action:

Contact your next level of support.

445. CCUXPMMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CTTY terminal process (CCITT and MD craft interface) received an unexpected message.

446. CCUXPTTY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unexpected message received by the CTTY terminal process. The CCSLK or MD input command just entered will be aborted.

Data Structures:

None.

Action:
Reenter input command.

447. CCVERBER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
Calling CCmdopam() with improper parameter.

448. CCVQIDERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
The semi-global data area for variable query identifications (QIDs) was corrupted. The software in the ccs/CCopvqid module that detected the corruption will initiate a rebuild of the variable QID lists.

449. CCWBTBLOCK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:
A database read of the wideband trunk block relation failed. This relation contains information that is needed to make wideband (NxDS0) calls. Since this information is not available, the incoming call was released by sending a REL message with cause #41 "temporary failures".

Action:
Contact the next level of support.

450. CCXDPCSTAT (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: XDPCSTAT	Audit Mode: elev

Problem:
One or more attributes in an rIXDPCSTAT tuple contain invalid values.

451. CCXDPCXLIST (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: XLIST	Audit Mode: elev

Problem:
Linkage error between rIXLIST and rIXDPCSTAT tuples.

Probable Cause:
Dynamic data is corrupted.

Action: Have audits fix the problem.

452. CCXLIST (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: XLIST	Audit Mode: elev

Problem:
One or more attributes in an rIXLIST tuple contain invalid values.

453. CCXLUNEXRET (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unexpected return value from xlist handling function.

454. CCXNOMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Input message requesting the status of DPC/APC has not been received by the process.

Data Structures:

OPST.

Action:

- 1) Read message from the ROP print out.
- 2) Request for the status later.

455. CCXPSYNC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

CCS7 software could not send an MGxpsync message to the multi-way system process (MCmwsuperv()).

Probable Cause:

An internal error.

Action:

Contact the next level of support.

456. CCZOMBIE (5E11 and later)

Recovery Action: rpi	SPP: y	Audit: null	Audit Mode: null

Problem:

A terminal process was still alive that should have died.

Action:

The process will be killed.

457. FCPCC_CC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A called number parameter, which includes a country code (CC), was received from an initial address message (IAM) of an equal access international call. The CC in the parameter

Data Structures:

RLFCPCC_CC. Key fields: digit count 1-3, CC.

Action:

The dumped data includes the CC digits, one byte per digit (subtract hex 30 from each), and the incoming trunk (port). Three digits are dumped for the CC, but the country code could consist of the first digit, the first and second digits, or the first, second, and third digits.

Determine whether the digits that were received include a valid CC.

- If the CC is valid and for this CC, use RC/V View 9.18 (PAIRED COUNTRY CODE [PCC] / COUNTRY CODE [CC]) to add the tuple.
- If the CC is not valid, the sending office is possibly sending invalid digits.
- If the CC is valid and a corresponding rIFCPCC_CC tuple exists, then the relation must be corrupt. Check the relation and recreate it using RC/V View 9.18 (PAIRED COUNTRY CODE [PCC] / COUNTRY CODE (CC)) (or ODBE, if necessary).

458. XCCSBADMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A 5ESS[®] switch internal message or BT SS7 message, of a type not recognized has been encountered by one of the BT SS7 formatting functions CCgetbtmsg(), CCputbtmsg(), CCfrombttup(), CCTobttup(). The structure, of type CCEMSG, which contains the message, is dumped, except in the case of the assert being fired in CCfrmbttup(), in which case the dumped data is the received BT SS7 message.

Range: ccsph**1. CCABADOPCI (5E11 and later)**

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A bad originating point code index (OPCI) has been detected in the incoming routing table for CCITT7 trunks. It is likely that all trunks for the associated OPC are unavailable for call processing because of this error. There may be too many DPCs or an invalid DPC in the RLDPC_INFO relation, or in RLDPC_DPCI. This assert is used only after the PH is initialized. It will lead to escalation of recovery.

2. CCACBDSTATE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The state variable CCacc_state for STP message accounting in the PH has been detected as being invalid.

Probable Cause:

This problem can be the result of a software error. Either there is a problem with the finite state machine (FSM) for STP message accounting, or else an unknown software process in the PH has erroneously overwritten the state.

Action:

The state of STP message accounting for this PH is reset back to IDLE after this assert is reported. The global variable CCacc_state and the contents of the last STP message accounting data packet that was transmitted is then dumped to the ROP for further debugging.

3. CCACKFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The acknowledgement message used by PHDA in the PH to inform PHDA in the SMP that all data initialization has completed failed transmission. The function PSendmsg() is the failing function. This will cause the PH to fail initialization.

4. CCAOPCNUM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PH is unable to accept a new destination point code for use in the CCdpc2dpci[] table, because the table is already full. This assert code is used only after initialization is complete. It will escalate.

5. CCARDNOP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote signaling point (RSP) service domain has received a RSP application request for a DPCI segment that is currently not owned by this PH. This is probably the result of a corrupt DPCI segment to PH ownership table in either this PH or the processor that sent the request. The request will be forwarded on to the SM processor and a request will be made to refresh the data.

6. CCBADCRANGE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The internal structure of the incoming routing tables for CCITT7 trunks is corrupt. In particular, the range of CICs for an OPC extends beyond the size of a routing table. Things are rotten in this PH.

7. CCBADDATA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This indicates that PHDA found an irrecoverable inconsistency in the PH tables. A SI macro will be called to assert the error lead.

8. CCBADDEL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PH has received a request from the SM to delete a CCITT7 trunk from the incoming routing table, but that trunk cannot be found. If this assert occurs, there is a good chance that the incoming routing table is corrupt and that some CCITT7 trunks will be unavailable for call processing use.

9. CCBADICT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid data found in PHDA table access dictionary.

10. CCBADKEY (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to access a PHDA indexed table with an invalid key.

11. CCBADMSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This indicates that a PHDA received message is of the wrong type.

12. CCBADNUMCIC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PH has received a request from the SM to insert, delete, or update a CCITT7 trunk, but the number of trunks for the OPC reported by the SM differs from the number recorded in the PH. It is likely that the incoming routing table in the PH is corrupt and that some or all CCITT7 trunks are unavailable for call processing. It is possible that the 'numcic' values in RLDPC_INFO have become inconsistent with the number of trunks in RLLAB7_SM.

13. CCBADOPER (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

PH interject encountered an invalid operation type in a PHDA packet.

14. CCBADPBUF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PHDA interject code for packet data updates has received a bad unbuffer indicator.

15. CCBADPEOT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PHDA interject code for packet data updates has received a bad end of transaction indicator.

16. CCBADPINFO (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PHDA interject code for packet data updates has received an information packet with bad data.

17. CCBADSEQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This indicates that an update message was received out of sequence in the PH. This is an irrecoverable situation, as it is unknown how many update messages were lost. A SI macro will be called to cause the error lead to be asserted.

18. CCBADSM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This assert indicates that during a voice trunk delete operation in the trunk tables in the PH1 or PH3, the SM number of the trunk to be deleted did not match the SM number of the trunk that was found and deleted from the trunk tables. A possible cause of this discrepancy is that an update transaction of this trunk's SM was missed.

19. CCBADSS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

PH interject encountered an invalid signaling system type in a PHDA packet.

20. CCBADTID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Invalid PHDA table identifier was encountered.

21. CCBADTYP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

PH interject encountered an invalid data type in a PHDA packet.

22. CCBADUPD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

There was bad update information contained in an update message sent to PHDA from the SM. This is irrecoverable, so a SI macro will be called to cause the error lead to be asserted.

23. CCBAPCKSUM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The checksum value calculated by the PH and the checksum value calculated by the SM for the APCI to DPCI table are different. A dynamic data refresh will be requested to correct the table.

24. CCBDCCKSUM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The checksum value calculated by the PH and the checksum value calculated by the SM for a dynamic GPHDA table is different. A dynamic data refresh will be requested to correct the table.

25. CCBDCLUCKSUM (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Mismatch in the checksum values calculated by the PH and the SM on CCclust_route[].

Action:

A dynamic data refresh must be requested to correct the table CCclust_route[].

26. CCBNETCKSUM (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A mismatch occurred between the checksum values calculated on table CCnet_route[] in the SMP and the PH.

Action:

A dynamic data refresh is necessary to correct CCnet_route[].

27. CCBDPCKSUM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The checksum value calculated by the PH and the checksum value calculated by the SM for the DPC to LS table are different. A dynamic data refresh will be requested to correct the table.

28. CCBDXLISTCKSUM (5E14 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A mismatch occurred between the checksum values calculated on table CCxlist_route[] in the SMP and in the PH.

Action:

A dynamic data refresh must be requested to correct CCxlist_route[].

29. CCBLSIKSUM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The checksum value calculated by the PH and the checksum value calculated by the SM for the linkset information table (CCls_info[]) are different. A dynamic data refresh will be requested to correct the table.

30. CCBMADPCI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCTfmrsp() function received an STRM MRISP message with an out of range "apc_dpci" field. This field is the destination point code index (DPCI) of the adjacent point code (APC) to which we need to send a transfer prohibit (TFP) signal. If this error occurs, a response TFP signal will not be sent to the APC that generated the bad message. The entire contents of the internal STRM message (struct mgSS7TRM) are dumped.

31. CCBMDPCI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCTfmrsp() function was passed an STRM MRISP message with an out of range DPCI. The DPCI should have been range checked by the caller, so it should never be out of range. If this error occurs, a response TFP will not be sent to the adjacent signaling point that sent the bad message that caused the MRISP. The entire contents of the STRM message (struct mgSS7TRM) are dumped.

32. CCBMSEGIDX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCTfmrsp() function received an STRM MRISP message for a DPCI that the PH on which it is running does not own. This should never happen, as the caller should have verified this information before passing the message to CCTfmrsp().

33. CCBSTCKSUM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The checksum value calculated by the PH and the checksum value calculated by the SM for the ST to PH table are different. A dynamic data refresh will be requested to correct the table.

34. CCCKSUMBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This indicates that the PH copy of the STP OPC policing matrix does not match the SM copy of the policing matrix. This is irrecoverable so a request will be made to repump the PH.

35. CCCLUSTNUM (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Table CCclu2clix[] is full. The request to insert a new cluster value is rejected.

36. CCCLUTBLEMPTY (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Table CCclu2clix[] is empty. The request to delete an entry is rejected.

37. CCD2PFIN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote signaling point (RSP) service domain has failed for some reason to initialize the destination point code index (DPCI) to PH ownership table in this PH. Therefore a data inconsistency now exists regarding the same information in the SM and/or other PHs in this PSU. The consequences of this error is that RSP application work that should be performed by this PH will not be done. However, other attempts will be made by the SM to correct this when it detects the inconsistency.

38. CCDATACORR (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Some PHDA data was found to be inconsistent in the PH tables, but was corrected to match the SM data.

39. CCDDBCNTBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RCGDDB	Audit Mode: elev

Problem:

A data corruption has been detected in a protocol handler (PH) remote congestion (RCG) timer cell. The count of destination data blocks (DDB) linked in a list to the RCG timer cell has been detected as being inconsistent with the actual number of DDBs that really are linked to it.

Action:

The DDB and RCG data will be dumped out to the ROP. The RCGDDB audit will then be elevated to run, at which time the corrupted table should be corrected.

40. CCDDBFail (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure was encountered when attempting to obtain a pointer to a destination data block (DDB). The error is a

result of either a bad destination point code index (DPCI) from a transfer control (TFC) signaling message, or a problem with the DPCI assignments in the protocol handler (PH).

Action:

The TFC MSU information and the local copy of the PH to DPCI segment table will be dumped out to the ROP.

41. CCDDDBIDLE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RCGDDB	Audit Mode: elev

Problem:

Failed to idle a protocol handler (PH) destination data block (DDB). The reason for this failure is that the stored key of the DDB was found to be invalid. Therefore the DDB structures are corrupted. The result of this problem is that a particular CCS destination will not have a correct congestion state.

Action:

The DDB and the TFC MSU information will be dumped out to the ROP. The RCGDDB audit will then be elevated to run, at which time the corrupted table should be corrected.

42. CCDDBLNKBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RCGDDB	Audit Mode: elev

Problem:

A data corruption has been detected in the protocol handler (PH) destination data block (DDB). The linked list of DDBs on a remote congestion (RCG) timer cell has been detected as being corrupted.

Action:

The DDB and RCG data will be dumped out to the ROP. The RCGDDB audit will then be elevated to run, at which time the corrupted table should be corrected.

43. CCDDBOWNBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RCGDDB	Audit Mode: elev

Problem:

A data corruption has been detected in the protocol handler (PH) destination data block (DDB). The owner field of the DDB has been detected as being invalid.

Action:

The DDB data will be dumped out to the ROP. The RCGDDB audit will then be elevated to run, at which time the corrupted table should be corrected.

44. CCDISDPC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A PH data discrepancy has been detected between the CCdpc_info[] data table in the PH and the static SM relation, DPC_DPCI. This table contains the CCITT7 protocol destination point code (DPC) related data. Thus the error can result in odd behavior with some CCITT7 features.

Probable Cause:

This error can be a result of the invalid use of ODBE with the DPC_DPCI relation. If this is not the case and the error occurs repeatedly, a software bug may exist.

Action:

The data discrepancy is corrected after this assert is reported. The CCdpc_info[] table contents and the copy of the data from the SM are dumped to the ROP for further debugging.

45. CCDISILS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A PH data discrepancy has been detected between the CCilsd_pol[] data table in the PH and the static SM relation, ILSD_POL. This table contains the ILS/DPC policing matrix for the CCITT7 protocol. Thus the error can result in odd behavior with the ILS/DPC policing feature.

Probable Cause:

This error can be a result of the invalid use of ODBE with the ILSD_POL relation. If this is not the case and the error occurs repeatedly, a software bug may exist.

Action:

The data discrepancy is corrected after this assert is reported. The CCilsd_pol[] table contents and the copy of the data from the SM are dumped to the ROP for further debugging.

46. CCDISLSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A PH data discrepancy has been detected between the CCIs_grp[] data table in the PH and the static SM relation, LS_GRP. This table contains the CCITT7 protocol Link Set related data. Thus the error can result in odd behavior with some CCITT7 features.

Probable Cause:

This error can be a result of the invalid use of ODBE with the LS_GRP relation. If this is not the case and the error occurs repeatedly, a software bug may exist.

Action:

The data discrepancy is corrected after this assert is reported. The CCIs_grp[] table contents and the copy of the data from the SM are dumped to the ROP for further debugging.

47. CCDISOFF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A PH data discrepancy has been detected between the CCoffpar_ht[] data table in the PH and the static SM relation, OFF_PAR. This table contains the office parameters for the CCITT7 protocol. Thus the error can result in odd behavior with some CCITT7 features.

Probable Cause:

This error can be a result of the invalid use of ODBE with the OFF_PAR relation. If this is not the case and the error occurs repeatedly, a software bug may exist.

Action:

The data discrepancy is corrected after this assert is reported. The CCoffpar_ht[] table contents and the copy of the data from the SM are dumped to the ROP for further debugging.

48. CCDREQFAIL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Either of the following requests failed:

- (1) Request to have an SCCP static table downloaded to all PHs.
- (2) Request to update SCCP static table data due to an SCCP hashsum discrepancy.

49. CCDUPINS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PH has received a request to insert a trunk into its incoming routing table, but it already has a trunk with the same OPC and CIC in its table.

50. CCEXDPSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CCITT7 remote signaling point (RSP) service domain has determined that more than the allowed number of DPCI segments have been assigned to the PH. These extra DPCI segments will not be owned by this PH and the error indicates a data mismatch between the PH and the SM. The consequence of this error is that the SM may assign STRM tasks, such as the generation of TFP, TFA, or RST message signaling units (MSUs) to this PH which may not be performed.

51. CCICRBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency has been detected during initialization of the incoming routing table. The problem is NOT related to the ODD. We will "report only" and carry on PH initialization. It is likely that many CCITT7 trunks may become unavailable for call processing due this error.

52. CCICRODD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

While initializing the incoming routing table for CCITT7 trunks, a data inconsistency has been detected that is probably due to improper trunk data in the ODD. Possible ODD errors include:

- (1) too many trunks with even-numbered (or, independently, odd-numbered) CICs for a single originating point code in RLLAB7_SM.
- (2) Incorrect "num_evencic" or "num_oddcic" value in RLDPC_INFO for some point code, with respect to the number of trunks for that point code in RLLAB7_SM.

53. CCINVPKT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PH has received an STP accounting data packet with invalid contents. The sender of the packet is in error and thus the packet will be discarded.

Probable Cause:

Depending on the packet type the consequences can range from corrupted STP accounting data to STP accounting data being lost.

Action:

If assert occurs frequently, you could restore the affected PH.

54. CCINVPST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PH has received a STP accounting data packet with an invalid packet subtype. The sender of the packet is in error and thus the packet will be discarded.

Probable Cause:

Bad STP accounting packet received.

Action:

If receive many of these asserts, you could remove and restore the linkset on this PH. Follow local practices.

55. CCINVSDRQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PH has received a remote signaling point (RSP) service domain packet with an invalid service domain request type. The sender of the request is in error and thus the request will be discarded. Depending on which RSP application or RSP service domain the sender is, the consequences can range from corrupted DPCI data to CCITT7 MSUs not being generated.

56. CCLAB7NUM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PH has received a request to insert a new CCITT7 trunk, but it has no room left in the incoming routing tables. There are probably too many tuples (trunk) in the RLLAB7_SM relation.

57. CCLOMEMPH (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

There is not enough memory in the optional data region (ODR) for the table that is being grown in. The data that is being dumped is; the ID of the table being grown, the address where the table would end up if it allowed to be grown in and the end address of the ODR buffer. Please contact the first level of field support for further assistance. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual.

58. CCNODPCI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure to convert a DPC to its DPCI was encountered. The DPC was not found in the CCdpc2dpci table in the PH1 or PH3. A possible cause of this is that an insert of a DPC into this table failed.

59. CCNOPHRDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure to get the owning PH route data block (RDB) for a CCITT7 route has occurred. It is possible that the PH RDB table is corrupted or the keys used to search the table were invalid. Therefore, a CCITT7 route will not be placed onto periodic RST timing.

60. CCNOTRUNK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure to find a trunk in the incoming routing tables has occurred. The trunk with the given DPCI and CIC values was not found in the ICR tables.

61. CCNOWP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This indicates that write protection could not be turned on or off around the PHDA data in the PH. It indicates that something is seriously wrong with the PH. A SI macro will be called to assert the error lead in the PH.

62. CCOPCIBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The incoming routing table for CCITT7 trunks contains an invalid originating point code index in the OPC-to-OPCI mapping table. CCITT7 trunks associated with this OPC are likely to be unavailable for call-processing as a result of this error.

63. CCOPCIDX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The number of destination point codes recorded in the PH (protocol handler) as part of the CCITT7 incoming routing data is greater than the maximum allowable and/or does not correspond to the number of entries in the CCdpc2dpci[] table. The number of entries in CCdpc2dpci[] that are considered to have been populated is based on the number of consecutive entries starting with CCdpc2dpci[0] where CCdpc2dpci[N].dpc >= CCdpc2dpci[N+1].dpc and N < NO_DPCI - 1.

Probable Cause:

The incoming routing data is likely to be corrupt, leading to lost CCITT7 calls.

Action:

For a PH1 type of PH, the only possible manual recovery action is to completely reinitialize this PH. For other types of PHs (for example, PH3), the number (CCdpci_idx) has been updated to be consistent with the contents of the CCdpc2dpci[] table so that no manual recovery action is needed.

64. CCOPCNUM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

During initialization of the incoming routing table, too many originating point codes were received from the SM. This could arise if there are too many unique OPCs in the RLLAB7_SM relation.

65. CCP2DPMM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote signaling point (RSP) service domain has discovered a discrepancy between the PH's version of the PH to DPCI segment table and the SM's version. The data will be corrected in the PH, however the consequence of this error is that some RSP application work can be either lost or performed in error.

66. CCPCINUM (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Table CCipcs2pci[] is full. The request to insert a new PCI value is rejected.

67. CCPCITBLEMPTY (5E14 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Table CCipcs2pci[] is empty. The request to delete an entry is rejected.

68. CCPLENBAD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When reading the pc_length field from CCgsm_info structure, found an invalid point code length.

Probable Cause:

CCgsm_info table may have been internally corrupted by software problems.

Action:

Remove and restore the affected PH.

69. CCPHDASPP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PHDA system process went through a single process purge, which leaves the data in an irrecoverable state. A SI macro will be called to assert the error lead in the PH.

70. CCPHRDERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Unexpected error condition from read of PHDA tables.

71. CCPKTBDOFF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PH packet update, executing at interject, has found a buffer descriptor with a null BD pointer and eof unequal to 1.

72. CCPKTSEQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data update packet has been received with an incorrect sequence number.

Probable Cause:

A packet or packets have been lost between the SM and the PH, or there is a software error.

Action:

The contents of the packet is dumped to the ROP for further debugging.

73. CCPKTST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The PHDA interject code for packet data updates is in an incorrect state.

74. CCPKTTOTBL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An error was encountered in PH in copying PHDA data from packet to table.

75. CCPKTTRAN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data packet update has received with an invalid transaction number.

Probable Cause:

A packet or packets have been lost between the SM and the PH, or there is a software error.

Action:

The contents of the packet and the packet update status will be dumped for further debugging.

76. CCPKTUNTBL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unknown PH packet update table type has been requested.

77. CCRCGBAD (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: RCGDDB	Audit Mode: elev

Problem:

A data corruption has been detected in a protocol handler (PH) remote congestion (RCG) timer cell. The head and/or tail of the linked list of destination data blocks (DDB) has been detected as being invalid. Therefore the linked list is corrupted.

Action:

The RCG data will be dumped out to the ROP. The RCGDDB audit will then be elevated to run, at which time the corrupted table should be corrected.

78. CCRCGFAIL (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A failure was encountered when attempting to place a destination data block (DDB) onto remote congestion (RCG) timing as a result of the reception of a transfer control (TFC) signaling message. The consequence of this error is that the remote congestion status for a particular destination will not have the correct state.

Action:

The DDB and RCG cell information will be dumped out to the ROP. If the failure was a result of a data corruption, the RCGDDB audit will have been elevated as a result of another specific assert.

79. CCRDBCNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The count of PH route data blocks (RDBs) linked to a particular PH route set test (RST) timer cell was found to be incorrect with the actual number of PH RDBs on the list. The count is corrected.

80. CCRDBLINK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Periodic CCITT7 route set test (RST) timing has detected the linked list of routing data block (RDB) IDs on an active RST timer cell to be corrupted. Some routes that may have been on RST timing may no longer be actively timed. Therefore, some routes may end up being out of tolerance for the T10 timer specifications. However, the RST audit will run, find these lost routes and place them back onto periodic RST timing.

81. CCRDBRST (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Periodic CCITT7 route set test (RST) timing has detected the routing data block (RDB) ID at the head of the RST list to be out of range. Any other routes that may have been linked to this list for RST timing are lost and therefore no longer being periodically timed. Therefore, some routes may end up being out of tolerance for the T10 timer specifications. However, the RST audit will run, find these lost routes and place them back onto periodic RST timing.

82. CCRINRAR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The remote signaling point (RSP) service domain has received a RSP application request with an invalid request type. The request will not be honored in this PH but instead will be discarded. The consequence is that some RSP application work, such as generating TFP/TFA MSUs or placing a CCITT7 route onto route set test (RST) timing will not be done.

83. CCSCVERE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Out of range SCCP memory layout has been detected. This error has prohibited the allocation of pointers to the data tables that reside in the SCCP memory region in the PH.

Probable Cause:

This error can only occur as a result of a wild write or a coding error.

Action:

Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Asserts manual for information on contacting field support personnel.

84. CCSDSLRATE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Bad DSL rate for update to alignment timers in PH.

85. CCSSDIVA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An STRM packet was received by the STRM service domain for an invalid application as identified by the subtype field in the STRM packet. The STRM packet is dumped in the error report.

86. CCTBLEMPTY (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A request has been made to delete an entry from the PH CCdpc2dpci[] table, but the table is currently empty.

87. CCTBLFUL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An attempt was made to insert a tuple into a PHDA table that is full. The table must be re-engineered.

88. CCTFBADDSEG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The translation from a DPCI segment to a PH DPCI segment Index failed. The

CCGETPH_DPCI_SEGMENT_INDEX() macro is used to make this translation. Some possible causes of the problem are a corrupt CCph2dpci[] table, or an invalid DPCI segment as a parameter to the macro. The following data is dumped:

- (1) The packet containing the bad DPCI segment.
- (2) The DPCI Segment Index to DPCI Segment table.

89. CCTFINVA (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid (out-of-range) APC index (APCI) input parameter was encountered in a TFP/TFA Job Function. This error indicates a possible data mismatch between this PH and another PH or the SM due to data corruption or recent changes to the APCI and/or DPC (DPCI) to link set (LS) translation tables and/or the associated maximum APC index global data parameter (CCapcindx). The requested TFP/TFA job is not performed and the two input parameters, APCI and DPCI, are printed along with the maximum APC index global parameter.

90. CCTFINVD (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid (out-of-range) DPC index (DPCI) input parameter was encountered in a TFP/TFA job function. This error indicates possible corruption to the TFP/TFA job table or a possible data mismatch between this PH and another PH or the SM due to recent changes to the DPC (DPCI) to link set (LS) table and the associated maximum DPC index global parameter (CCdpclsidx). The requested TFP/TFA job is not performed and the job table entry for the given APCI/DPCI pair is cleaned up. The two input parameters, APCI and DPCI, are printed along with the maximum DPC index global parameter.

91. CCTFINVS (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid (out-of-range) DPCI segment index input parameter was encountered in a TFP/TFA job function. This case should never happen except for a programming error. The three input parameters, APCI, DPCI, and DPCI segment index, are printed.

92. CCTFINVT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A TFP/TFA job table processing function was passed an invalid job table, as defined by the DPCI segment index and DPCI group index input parameters, respectively. This ASSERT can only be caused by a programming error. Both the DPCI segment and group indexes are printed.

93. CCTFIPLN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A TFP/TFA packet was received with an invalid length. The packet is discarded. As a result, TFP and/or TFA job request may have been lost. The packet is printed along with the packet length (BD actcount) in the error report.

94. CCTFIT8ID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid (out-of-range) TFP job ID was on T8 timing. The job ID consists of the APCI, the DPCI segment index, and the DPCI within the DPCI segment. The TFP/TFA job table entry for the given job ID cannot be updated when the job ID is out-of-range since there is no data to be checked/updated. If there is any data inconsistency in one of the job tables as a result of a lost T8 timer job, the TFP/TFA job table process will detect the problem and correct it.

95. CCTFITDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The TFP/TFA transmit dirty bit was not set when a TFP/TFA MSU was blocked from being sent as the result of one of the signaling link transmit counters having reached the maximum transmit threshold. The TFP/TFA transmit dirty bit is set so that the transmit counters are cleared on the next 200ms PH interject clock cycle and allow the TFP/TFA MSU to be sent over the appropriate signaling link. The transmit dirty bit is printed in the error report.

96. CCTFITFX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A bundled TFP/TFA packet was received with one or more invalid TFP/TFA job requests. Each invalid job request is discarded. The packet header is printed with the count field set to the number of invalid job requests and the first invalid job request loaded into the first job request slot that follows the packet header. In addition, the maximum DPC index (CCdpclsidx) and APC index (CCapcindx) global parameters are also printed in the error report.

97. CCTFIVA0 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A TFP/TFA packet was received with a job request for APCI zero. The packet is discarded. As a result, TFP or TFA MSUs may be lost. The packet header is printed along with the APCI bit-map in the error report.

98. CCTFIVABIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A TFP/TFA packet was received with job requests for invalid APCIs. The packet is discarded. As a result, TFP or TFA MSUs may be lost. The packet header is printed along with the last valid byte of the APCI bit-map and the maximum APC Index global parameter (CCapcindx) in the error report.

99. CCTFIVACNT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A TFP/TFA packet was received with in invalid APCI count. The packet is discarded. As a result, TFP and/or TFA MSUs may be lost. The packet is printed along with the maximum APC index global parameter (CCapcindx) in the error report.

100. CCTFIVD0 (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A TFP/TFA packet was received with a job request for DPCI zero. The packet is discarded. As a result, TFP or TFA MSUs may be lost. The packet is printed in the error report.

101. CCTFIVDBIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A TFP/TFA packet was received with job requests for invalid DPCIs. The packet is discarded. As a result, TFP or TFA MSUs may be lost. The packet is printed along with the maximum DPC index global parameter (CCdpclsidx) in the error report.

102. CCTFIVDGRP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A TFP/TFA packet was received with job requests for an invalid group of DPCIs. The packet is discarded. As a result, TFP or TFA MSUs may be lost. The packet is printed along with the maximum DPC index global parameter (CCdpclsidx) in the error report.

103. CCTFIVDSEG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A TFP/TFA packet was received with an invalid DPCI segment. The packet is discarded. As a result, TFP or TFA MSUs may be lost. The packet is printed along with the maximum DPC index global parameter (CCdpclsidx) in the error report.

104. CCTFNUL (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid TFP/TFA job was found in the TFP/TFA job table. This error may be caused by data corruption in the TFP/TFA job tables. The job table entry for the given APC/DPC pair is cleaned up. The APC, DPC, and the TFP/TFA job control data block are reported with this assert code.

105. CCTFPROCSTATE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The TFP/TFA process state was invalid upon entry to CcTf_main(). The state will be forced back to idle. This error indicates that the CCtfstate global data item contains a value that is not within range (i.e., less than SZTFSTATE). The data dumped when this assert fires is the current state of the TFP/TFA generation process (local copy of CCtfstate).

106. CCTFSPCE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A TFP/TFA job table processing function was called to generate a TFP or TFA MSU for a given APCI/DPCI pair which was the same point code for both the APC and the referred DPC. The intended MSU is not sent and the job table entry is cleared in the job table for the given APCI/DPCI. The three input parameters, APCI, DPCI, and DPCI segment index, are printed.

107. CCTFSTFUNC (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A TFP/TFA process state function returned an invalid return code to the CCTf_main() function. CCTf_main() calls the state functions indirectly through the CCTfstfunc[] table indexed by state. The table is stored in write protected memory, so the problem is either the state function returning an invalid return code, or CCTf_main() not recognizing a valid return code. The data dumped when this assert fires is:

- (1) the return code from the TFP/TFA state function (ret_code).
- (2) the current state of the TFP/TFA generation process (local copy of CCTfstate).

108. CCTFT8AE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The job summary word for a given TFP/TFA job table indicated that there were T8 timer jobs when no T8 timers were active. This error indicates that either the TFP/TFA job table or the T8 timing table had gotten corrupted. The DPCI segment and group indexes, which identifies the given job table along with the job table summary word are printed. The job table is reinitialized in order that subsequent TFP job requests do not get ignored because of invalid T8 timer job indicators.

109. CCTFT8AI (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The T8 timer audit was triggered to report and correct (reinitialize) a TFP/TFA job table with T8 timer jobs that were not timing out and, after checking the T8 timer tables, the audit should not have been triggered since some T8 timers are still running. This error is an indication that either the T8 timers are never timing out (which should never be the case) or that the TFP/TFA job control data block is getting corrupted. The TFP/TFA job control data block is printed in the error report and the audit trigger count is reset to zero

110. CCUNWAIT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return has been received by the protocol handler data administration (PHDA) system process from OSWAIT().

111. CCUNWGTMSG (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An unexpected return has been received by the protocol handler data administration (PHDA) system process from OSWGETMSG().

112. CCWAKEUP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A wakeup has been received by the protocol handler data administration (PHDA) system process from OSWAIT() when the dynamic data initialization and update method is not using packets. A SI macro will be called to assert the error lead since the PHDA system process should only be receiving wakeups when the method is using packets.

Range: cd**1. CD1MSG (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid value was found in an automatic call distributor (ACD) business and residence custom services (BRCS) message.

Probable Cause:

Software.

Action:

Report only assert. No audit. Return to point of assert. The data dump provides the message header and message text.

2. CD2MSG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An ACD BRCS tuple was accessed using data from an ACD BRCS message, but the primary key of the returned tuple did not match the key used to access the tuple.

Probable Cause:

Bad data in message or corrupted dynamic data.

Action:

Normal escalating assert. No audit. Return to point of assert. The data dump provides the message header and message text.

3. CDAGENTID (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the AGENTID relation, a failure code of DBNO_MATCH was returned. The AGENTID tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLAGENTID. Key field: agent_id.

Action:

This is a database inconsistency that can only be corrected by manual action.

4. CDAUAGTPOS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: AGENTPOS	Audit Mode: elev

Problem:

Failed to access, insert, or delete a tuple in the RLAGENTPOS relation. An audit of the RLAGENTPOS relation is scheduled.

5. CDAUCLLQDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CLLQDB	Audit Mode: elev

Problem:

Failed to insert an rCLLQDB tuple. The rCLLQDB tuple is dumped. An audit of the RLCLLQDB relation is scheduled.

6. CDAUGHCLLQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CLLQDB	Audit Mode: elev

Problem:

Failed to get the head rCLLQDB tuple. An audit of the RLCLLQDB relation is scheduled.

7. CDAUGHSRVQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: SRVQDB	Audit Mode: elev

Problem:

Failed to get the head rLSRVQDB tuple. An audit of the RLSRVQDB relation is scheduled.

8. CDAUHC_CLLQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CLLQ	Audit Mode: elev

Problem:

An invalid value was encountered in a tuple of the call queue head cell relation HC_CLLQ.

Probable Cause:

Corrupted dynamic data.

Action:

Normal escalating assert. Elevated mode audit (AUHC_CLLQ). Return to point of assert. The data dump has the contents of the HC_CLLQ tuple.

9. CDAUSRVQDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: SRVQDB	Audit Mode: elev

Problem:

The DA macro used to obtain a rLSRVQDB tuple was not successful. A RLSRVQDB audit was scheduled.

10. CDBADARG (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This is a general purpose assert indicating that a function was called with an invalid argument.

Probable Cause:

Software.

Action:

Report only assert. No audit. Return to point of assert. The stack backtrace provides the function calling sequence.

11. CDBADYRET (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A dynamic access primitive returned a failure code.

Probable Cause:

Corrupted dynamic data.

Action:

Normal escalating assert. No audit. Return to point of assert. The data dump has the contents of the tuple(s) being manipulated.

12. CDCQMASK (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLCQMASK relation, a failure code of DBNO_MATCH was returned. The rlcqmask tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLCQMASK. Key fields: serv_tm, st_role.

Action:

This is a database inconsistency that can only be corrected by manual action.

13. CDCQPARM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the CQPARM relation, a failure code of DBNO_MATCH was returned. The CQPARM tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

RLCQPARM. Key field: call_que.

Action:

This is a database inconsistency that can only be corrected by manual action.

14. CDDHC_CLLQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to delete a tuple in the RLHC_CLLQ relation. The rLHC_CLLQ tuple is dumped.

15. CDDSRVQ_HC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to delete a tuple in the RLHC_SRVQ relation. The rLHC_SRVQ tuple is dumped.

16. CDGLCLLQDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update and distribute the global parameter Glclqdb across all logical processors.

17. CDIACD_POS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read a tuple in the static relation RLACD_POS. The rIACD_POS tuple is dumped.

18. CDIAGTID (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read a tuple in the static relation RLAGENTID. The rIAGENTID tuple is dumped.

19. CDIAGTPOS (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to insert a tuple in the RLAGENTPOS relation. The rIAGENTPOS tuple is dumped.

20. CDICLLQDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to insert a tuple in the RLCLLQDB relation. The rICLLQDB tuple is dumped.

21. CDICQCLTQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: CQPARM	Audit Mode: elev

Problem:

A dynamic access (DA) macro failed to obtain an rIHC_CLLQ tuple. An audit of the RLCQPARM relation is scheduled.

22. CDICQDEF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid mode was given when initializing the RLHC_CLLQ relation. The invalid mode is dumped.

23. CDICQGP1 (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to update the global parameter Glclqdb when the DBrfgparm() primitive was called.

24. CDICQLNK (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to link an rICLLQDB tuple to the idle list in the RLHC_CLLQ relation. The rICLLQDB tuple is dumped.

25. CDICQPARM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read a tuple in the static relation RLCQPARM. The rICQPARM tuple is dumped.

26. CDIHC_CLLQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to insert a tuple in the RLHC_CLLQ relation. The rHC_CLLQ tuple is dumped.

27. CDIHC_SRVQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STPARM	Audit Mode: elev

Problem:

A dynamic access (DA) macro failed to obtain an rHC_SRVQ tuple. An audit of the RLSTPARM relation is scheduled.

28. CDILGDEF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid mode was given when initializing the RLAGENTPOS relation. The mode is dumped.

29. CDINSODYN (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This is a general purpose assert indicating that the DBfintup() function failed to insert a tuple in a dynamic relation.

Probable Cause:

Unknown.

Action:

Report only assert. No audit. Return to point of assert.

30. CDISRDEF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid mode was given when initializing the RLSRVQDB relation. The invalid mode is dumped.

31. CDISRVQDB (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to insert a tuple in the RLSRVQDB relation. The rLSRVQDB tuple is dumped.

32. CDISRVQ_HC (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to insert a tuple in the RLHC_SRVQ relation. The rLHC_SRVQ tuple is dumped.

33. CDISTPARM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to read a tuple in the static relation RLSTPARM. The rLSTPARM tuple is dumped.

34. CDISVDEF (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid mode was given when initializing the RLHC_SRVQ relation. The invalid mode is dumped.

35. CDQVSTATE (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: STATE	Audit Mode: elev

Problem:

Failed to link an RLQV_STATE tuple to the busy/idle list, unlink an RLQV_STATE tuple from the busy/idle list or traverse the busy/idle list.

Probable Cause:

Data corruption.

Action:

The RLQV_STATE key (qvstnmb) will be printed on the ROP and the AUQV_STATE audit will be scheduled to run. This is a returning assert and it is assumed that the software calling it can recover.

36. CDRGLPRM (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This is a general purpose assert indicating that an error was returned from an attempted read of a global parameter from within a transaction. No audit is available to correct the error.

Probable Cause:

Software.

Action:

Report only assert. No audit. Return to point of assert. The data dump provides the global parameter ID and the return code from the function called to read the global parameter.

37. CDRMHCLLQ (5E11 and later)

Recovery Action: rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to remove the head rCLLQDB tuple. The rCLLQDB tuple is dumped.

38. CDRMHSRVQ (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

Failed to remove the head rISRVQDB tuple. The rISRVQDB tuple is dumped.

39. CDSTPARM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

When attempting to read the RLSTPARM relation, a failure code of DBNO_MATCH was returned. The rLSTPARM tuple is missing or the keys used to read this relation were not set properly.

Data Structures:

Key field: serv_tm.

Action:

This is a database inconsistency that can be corrected using RC/V 6.1 (ACD SERVING TEAM PARAMETERS).

40. CDTLGDEF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The default case of a switch statement for the pos_state attribute in the RLSRVQDB relation was encountered. The rISRVQDB tuple is dumped.

41. CDTLGERRN (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An invalid case on a switch statement was encountered. An agent must be logged off for an allowable update. If the pos_state attribute of the rISRVQDB tuple is AGUNOCCUPIED, an error has occurred. The rISRVQDB and rAGENTPOS tuples are dumped.

42. CDUGLPRM (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

This is a general purpose assert indicating that an error occurred while updating a global parameter.

Probable Cause:

Software.

Action:

Report only assert. No audit. Return to point of assert. The data dump provides the global parameter ID and the return code from the function called to update the global parameter.

43. CD_WHAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The software has encountered an event that cannot be handled. The event will be ignored.

Probable Cause:
Gremlins.

Action:
Report only assert. No audit. Return to point of assert. Data is dumped, in case a developer needs some.

Range: cm**1. CMAPBADOP (5E11 and later)**

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CMapdtrig() trigger function was called for an invalid reason.

2. CMAPBFEAT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CMapsend() function was called to send a message for an invalid feature.

3. CMAPBINDX (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CMapsend() function failed to send a message because of an invalid application processor (AP) index.

4. CMAPDBRDF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An office dependent data (ODD) database read failure occurred within the CMapsend() primitive.

5. CMAPDDRDF (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A data delivery read failure occurred within the CMapsend() primitive.

6. CMAPE911AP (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

A non-E911 feature attempted to use an enhanced 911 (E911) application processor (AP) ID or the E911 feature used a non-E911 AP ID.

Data Structures:

RLCMAPDATA.

Action:

If a non-E911 feature is using an E911 AP ID, determine the correct AP ID for the non-E911 feature and make the appropriate changes in the RLCMAPDATA relation or the Gle911apid global parameter.

If an E911 feature is using a non-E911 AP ID, determine the correct AP ID for the E911 feature and make appropriate changes in the RLCMAPDATA relation or the Gle911apid global parameter.

Contact the AP administrator or your next level of technical support if you cannot determine the correct AP ID for the feature.

7. CMAPISITE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CMapsend() function failed to send a message because of an invalid site identifier.

8. CMAPNEWTB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CMapdtrig() trigger function was called to delete an rICMAPDATA tuple, but the new tuple pointer is not NULL.

9. CMAPNOOPT (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The operating system for distributed switching (OSDS) version of the CMapsend() function was called to send a message to an application processor (AP); however, the Glap_option global office parameter indicates that the AP-communication option is not supported.

10. CMAPODDERR (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An inconsistency exists between the value for the Glap_option global parameter and an rICMSPDATA tuple. Either Glap_option indicates that only the input/output processor (IOP) links are supported to the administrative processors (APs) and the rICMAPDATA tuple indicates that messages should be routed to a digital subscriber line (DSL) supported AP, or Glap_option indicates that only DSL links are supported to APs and the rICMAPDATA tuple indicates that messages should be routed to an IOP supported AP.

Data Structures:

RLCMAPDATA.

Action:

Determine the correct values for the Glap_option parameter and the module field in the rICMAPDATA tuple and make appropriate changes.

11. CMAPOLDTB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The CMapdtrig() trigger function was called on an insert of an rICMAPDATA tuple, but the old tuple pointer is not NULL.

12. CMAPRLIDB (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

The database manager called the CMapdtrig() routine and passed an invalid relation ID.

13. CMAPSECSITE (5E11 and later)

Recovery Action: -rpi	SPP: n	Audit: null	Audit Mode: null

Problem:

An application processor (AP) feature used an AP ID that was defined as a secondary AP ID using the AP link diversification feature.

Data Structures:

RLCMAPDATA. Key fields: AP site ID.

Action:

1. Determine the feature that is using the secondary AP ID.
